

Introduction

In automotive more and more often comes in foreground the question of safety. For this reason the ST's PowerPC microcontrollers are embedded with various self-test features and procedures. This document provides detailed view on ADC built-in self-tests (BIST's), along with demonstration examples to guide the customer for correct use of the ADC BIST's.

1 ADC built-in self-test

For safety relevant applications, it is important to perform the ADC functionality check at regular intervals^(a). For this purpose, hardware build in self testing feature has been incorporated inside the ADC. Tests at application level can be used in place of the ADC self-test to verify the integrity of the ADC itself. It is a user's tasks to choose the counter-measure which better fit his needs.

Three types of Self Testing algorithms have been implemented inside ADC analog.

- Supply Self test: Algorithm S
- Resistive-Capacitive Self test: Algorithm RC
- Capacitive Self test: Algorithm C

The built-in self-tests use analog watchdogs to verify the result of self-test conversions. During the production factory testing, accurate threshold values for these watchdogs are stored in the Test sector of the flash memory. Each testing algorithm contains its own threshold values. Each microcontroller has its own threshold values. Most values are identical or very similar across the microcontrollers. The build-in self-tests can be executed in CPU mode as well as in CTU (Cross Triggering Unit) mode^(b).

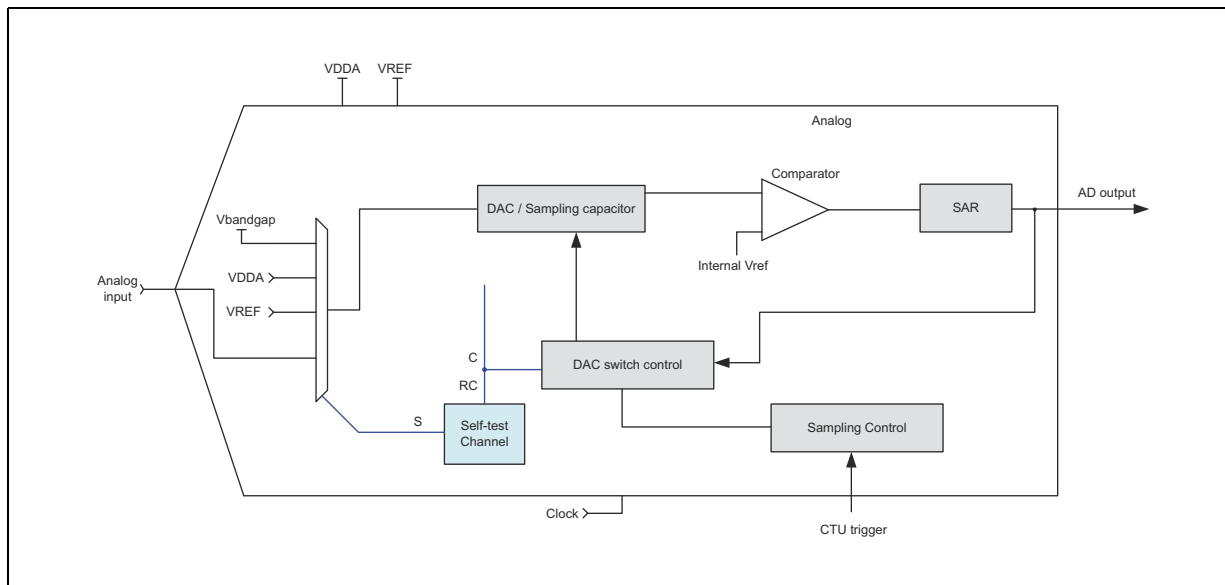

1.1 ADC Built-in self-test description

The ADC implements a channel (self-test channel) dedicated for self-testing. The self-test schedule is done via special set of self-test registers in ADC. ADC also offers capability of monitoring the converted data using analog watchdog registers and flags the error to the Fault Collection and Control Unit (FCCU) in case any of the algorithms fails.

a. depending on the specific safety concept, the ADC self-test can be run only once after the boot

b. this AN focuses on ADC working in CPU mode

Figure 1. ADC block diagram

1.2 ADC self-test important note

In case of Injected conversions, test channel conversion is not performed. It is performed only during Normal conversions. If during a test channel conversion, injection conversion arrives, then the test channel is aborted (just as a normal functional channel) and injected conversions are done. After injected conversions are completed, the test channel resumes from the Step at which it was aborted.

For self testing, Mode bit should be programmed (at least one cycle) BEFORE setting MCR.NSTART bit and should not be changed thereafter until conversion is ongoing.

1.3 ADC calibration data

To verify if the measured ADC BIST results are correct, the threshold registers are used. For correct execution of self-test sequence it is necessary to compare if measured values are in range of factory defined thresholds. This is done automatically by the hardware watchdog. In case the ADC BIST results are out these boundaries a fault is triggered to the FCCU.

1.4 Reading from Test Flash

There are some factory settings stored during final test in the Test Flash (mostly calibration information), which are needed by application software. The related data is:

- a) Temperature Sensor 1 Calibration Word 1...4
- b) Temperature Sensor 2 Calibration Word 1...4
- c) ADC 0 Calibration Word 1...8
- d) ADC 1 Calibration Word 1...8

Accessing the Test Flash requires to set the SCTR TFE bit in the SSCM (System Status and Configuration Module), which will replace the “normal” Flash memory space with the Test Flash block (while TFE is set).

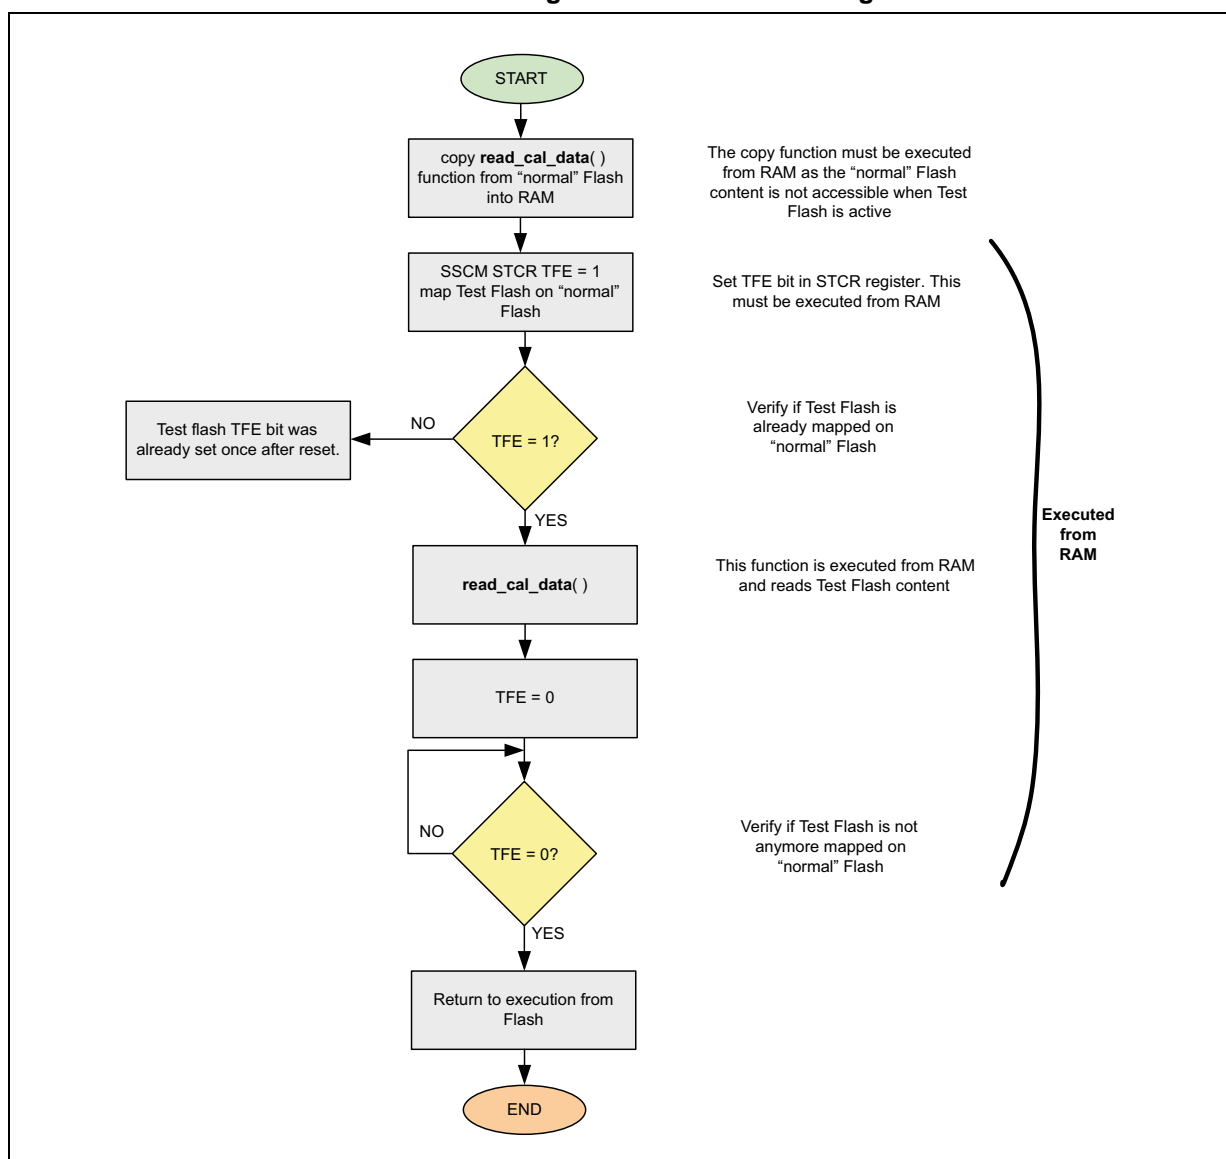

Note: This is only possible one time after a reset of the device and only after destructive, power-on or long external reset!

After other sources of reset, than listed three above, the test flash enable bit cannot be set.

The Test Flash content is read via function executed out of the RAM as the “normal” Flash content is not accessible while TFE flag is asserted. After reading Test Flash, just before jump back to the “normal” Flash, it is recommended to check if Flash content switch was finished properly. This is done via checking bit TFE = 0 in SCTR register in SSCM module.

Therefore retrieving these values usually requires several steps.

Figure 2. Test Flash reading

1.4.1 Flash content

Flash memory Test sector contains calibration and other chip-specific data. This information is summarized in [Table 1](#) below.

Table 1. Test Flash Content

Address	Word name	Function
0x0000	TSENS_0_CAL W2/W4	TSENS_0 Calibration data W2 (P2/PTAT) and W4 (C2/CTAT) at cold temperature
0x0004	TSENS_1_CAL W2/W4	TSENS_1 Calibration data W2 (P2/PTAT) and W4 (C2/CTAT) at cold temperature
0x0008	TSENS_0_CAL W1/W3	TSENS_0 Calibration data W1 (P1/PTAT) and W3 (C1/CTAT) at hot temperature
0x000C	TSENS_1_CAL W1/W3	TSENS_1 Calibration data W1 (P1/PTAT) and W3 (C1/CTAT) at hot temperature
0x0010	ADC0_CAL W1	ADC0 Self-Test calibration - RC algo
0x0014	ADC0_CAL W2	ADC0 Self-Test calibration - C algo S0 step
0x0018	ADC0_CAL W3	ADC0 Self-Test calibration - C algo Sn step
0x001C	ADC0_CAL W4	ADC0 Self-Test calibration - S algo S0 step - 3.3 V
0x0020	ADC0_CAL W5	ADC0 Self-Test calibration - S algo S0 step - 5.0 V
0x0024	ADC0_CAL W6	ADC0 Self-Test calibration - S algo S1 step - integer
0x0028	ADC0_CAL W7	ADC0 Self-Test calibration - S algo S1 step - float
0x002C	ADC0_CAL W8	ADC0 Self-Test calibration - S algo S2 step
0x0030	ADC0 Reserved	ADC0 reserved
0x0034	ADC1_CAL W1	ADC1 Self-Test calibration - RC algo
0x0038	ADC1_CAL W2	ADC1 Self-Test calibration - C algo S0 step
0x003C	ADC1_CAL W3	ADC1 Self-Test calibration - C algo Sn step

0x0044	ADC1_CAL W5	ADC1 Self-Test calibration - S algo S0 step - 5.0 V
0x0048	ADC1_CAL W6	ADC1 Self-Test calibration - S algo S1 step - integer
0x004C	ADC1_CAL W7	ADC1 Self-Test calibration - S algo S1 step - float
0x0050	ADC1_CAL W8	ADC1 Self-Test calibration - S algo S2 step
0x0054	ADC1 Reserved	ADC1 Reserved

Table 2. Typical values stored in Test sector of Flash memory

Word	Flash location offset	Value in flash	Loads to STAWxR	Step	THRH	THRL
W1	10h	0xFE20F1E0	STAW3R	RC	0xE20h	0x1E0h
W2	14h	0xF856F732	STAW4R	C0	0x856h	0x732h

Table 2. Typical values stored in Test sector of Flash memory (continued)

Word	Flash location offset	Value in flash	Loads to STAWxR	Step	THRH	THRL
W3	18h	0xF873F732	STAW5R	C1-C17	0x873h	0x732h
W4	1Ch	0xF75AF4DF	STAW0R	S0_3.3V	0x75Ah	0x4DFh
W5	20h	0xF4D0F2DB	STAW0R	S0_5.0V	0x4D0h	0x2DBh
W6	24h	0xF003F002	STAW1AR	S1(INT)	0x3h	0x2h
W7	28h	0xF3D9F1E3	STAW1BR	S1(FRAC)	0x3D9h	0x1E3h
W8	2Ch	0xFFFFFFFF9	STAW2R	S2	0xFFFh	0xFF9h

Note: *These values are unique for each sample.*

2 ADC built-in self-test algorithms

ADC contains three self test algorithms in order to test its functionality.

The SPC56xx uses two types of parameter settings to define the ADC self-test operation:

- Sample phase duration settings programmed into the INPSAMP_S, INPSAMP_RC, and INPSAMP_C fields of the Self-Test Configuration Register (STCR1).
- Threshold values for analog watchdog algorithms

In order to support different loading and switching times, several different conversion timing registers (CTR) are present. There is one register per channel type.

Table 3. Sampling phase duration for the test conversions

INPSAMP_C	Sampling phase duration for the test conversions related to the algorithm C. Valid self-test values for this field are given below. Minimum: 0x18 Maximum: 0xFF
INPSAMP_RC	Sampling phase duration for the test conversions related to the algorithm RC. Valid self-test values for this field are given below. Minimum: 0x60 Maximum: 0xFF
INPSAMP_S	Sampling phase duration for the test conversions related to the algorithm S. Valid self-test values for this field are given below. Minimum: 0xFF Maximum: 0xFF

Table 2 represents the typical values for INPSAMP_x register. For detailed description of INPSAMP_x calculation please refer to the Reference Manual.

Table 4. Sample phase settings

Register field	Recommended setting
INPSAMP_C	0x18h
INPSAMP_RC	0x60h
INPSAMP_S	0xFFh

Recommended setting for INPSAMP_S is the maximum value of this register field due to slow sample capacitor settling time at low temperature for S0 algorithm.

2.1 Self-test execution flow

The number of channels converted at the end of each chain is 1 (except for Algorithm S, in which all the steps are performed at once without any functional conversion interleaved). In Scan Mode, consecutive steps of selected self test algorithm are converted continuously at the end of each chain of normal conversions.

Figure 3. Self-test execution sequence example C and RC in scan mode

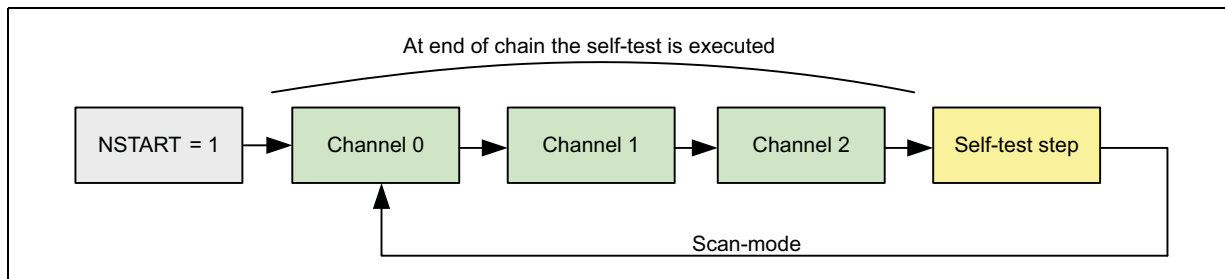

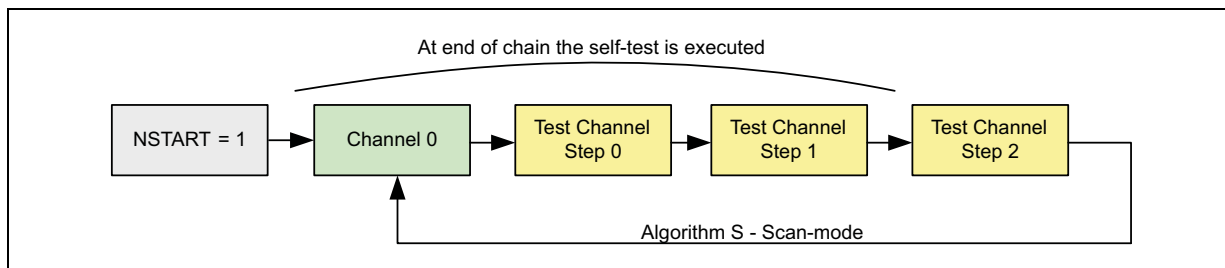

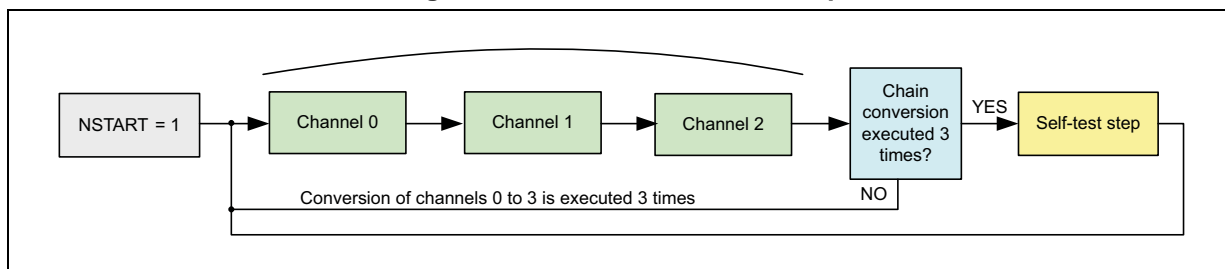

Figure 4. Self-test execution sequence flow example S in scan mode

In the case there is required to schedule self-test channel execution in defined sequence the baud rate is implemented in ADC. This control defines the scheduling of test channel between the normal conversions. The scheduling rate is specified by STBRR[BR].

Figure 5. Self-test baud rate example C and RC

By default, if test channel is enabled, one Step of selected algorithm is executed after every chain of normal conversion. STBRR[BR] field provides flexibility by scheduling the test channel conversion to be performed not at the end of every chain but at the end of BR+1 number of chains.

Note: This feature is applicable only for scan mode of operation and not for one shot mode. The STBRR.BR should be set to zero for one shot mode.

2.2 Supply self-test – Algorithm S

Algorithm S consists of 3 steps. Not allowed to be interleaved with normal conversion. At the end of chain of the normal conversions, (assuming default value of STCR3.ALG) all steps of Algorithm S are performed (as Algorithm S is always atomic).

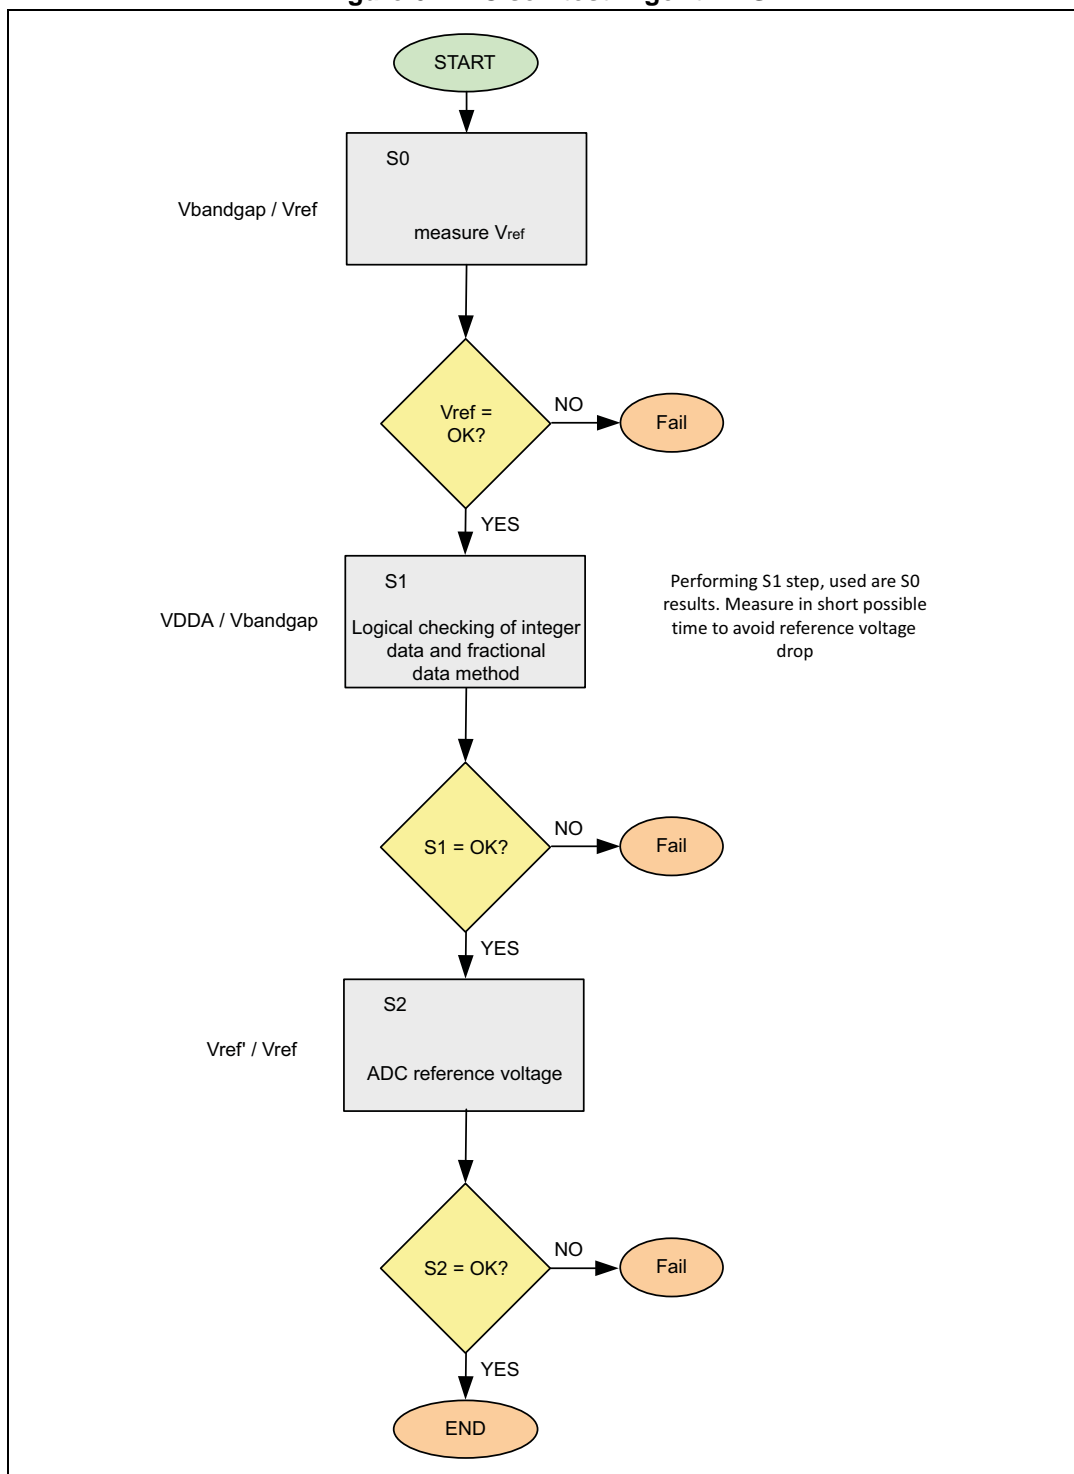

MSR.SELF_TEST_S is set.

It includes the conversion of:

- ADC internal bandgap voltage (S0 - step0) – ($V_{bandgap} / V_{ref}$)
- ADC supply voltage (S1 - step1) – ($V_{DDA} / V_{bandgap}$)
- ADC reference voltage (S2 - step2) – ($V_{ref}^{(c)} / V_{ref}$)

c. $V_{ref}^{(c)}$ is an internal positive reference voltage.

Figure 6. ADC self-test Algorithm S

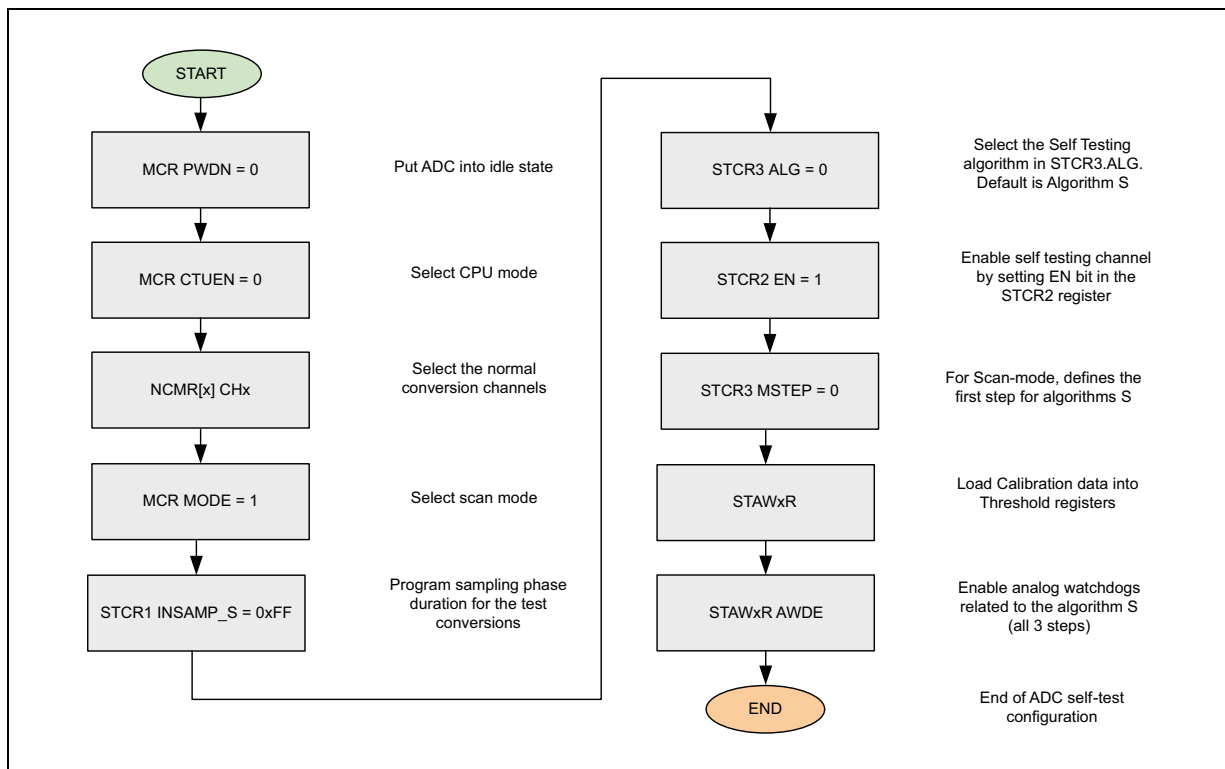

2.2.1 Supply self-test in CPU mode

To properly execute supply self-test it is required to use ADC in scan mode. The scan mode is requested for S algorithm, because S1 (ratio) result is based on S0 result. If these

conversions are distant in term of time, there is a temporal non-correlation that makes the result unreliable. With S algorithm S0 (step) is measured if the ADC internal bandgap voltage (V_{ref}) is proper. If yes, then it is feasible to measure the supply voltage. In case that S1 measurement is delayed from the S0 measurement, then a reference voltage drop may occur. Performing then S1 measurement, where are to be used S0 results, which was good at the time when it were measured, but not correct for actual measurement. The problem may be masked here. This is the reason why is ADC one-shot conversion mode not suitable for algorithm S measurement.

In the ideal environment results must be same in both, one-shot and scan mode. Because there is never any voltage drop in the ADC reference or supply due to ideal environment.

Figure 7. ADC self-test configuration – Algorithm S

On [Figure 8](#) below is presented the basic self-test flow for algorithm S. The test channel is started automatically after normal channel conversion as presented on [Figure 9](#).

Figure 8. Example test execution flow for Algorithm S

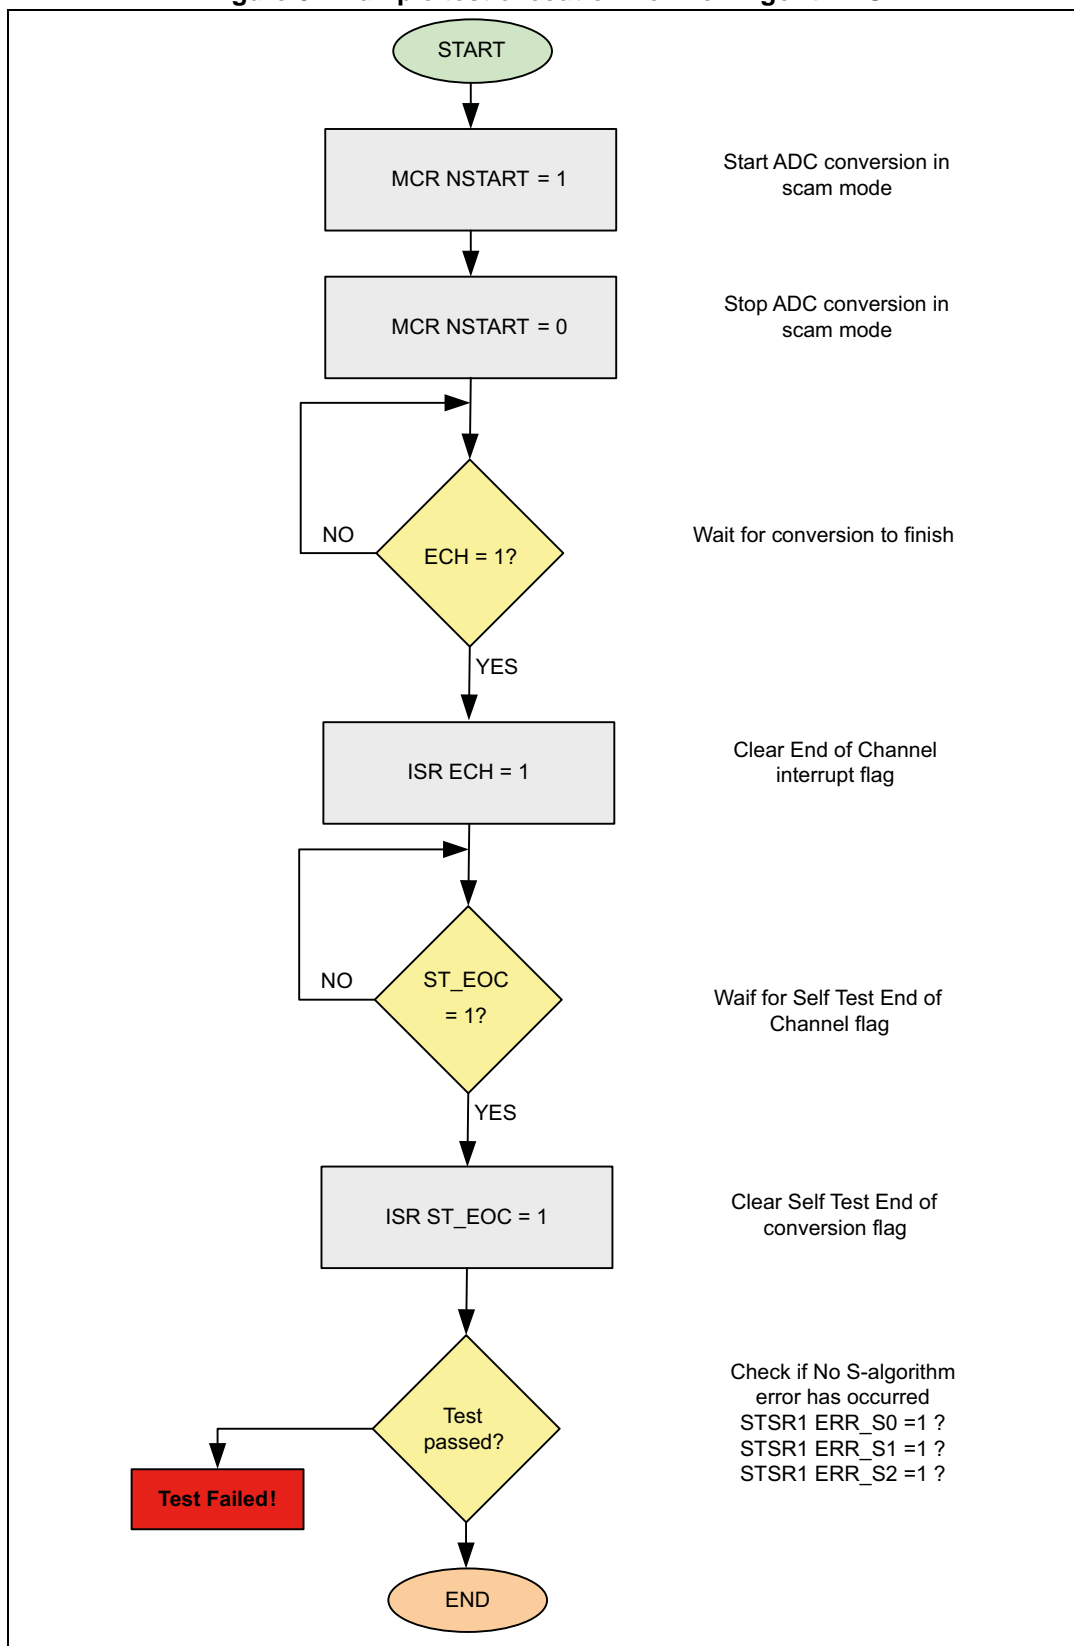

Figure 9. Test execution flow - Algorithm S

2.3 Resistive-Capacitive self-test - Algorithm RC

Algorithm RC includes a sequence of 19 test conversions (steps) by setting the ADC internal resistive digital-to-analog converter (DAC).

2.3.1 Resistive-Capacitive self-test in CPU mode

Resistive-Capacitive self-test can be executed either in one shot or scan mode. On [Figure 11](#) is demonstrated basic test flow. After execution of normal channel the single step of self-test is executed. This process continues for all Steps of RC algorithm. State Machine returns to IDLE state when MCR[NSTART] is cleared.

The demonstration example of RC algorithm in one-shot mode is shown on [Figure 10](#). It is necessary to check self-test result after every step of the conversion.

Figure 10. Self-test flow in one-shot mode- algorithm RC

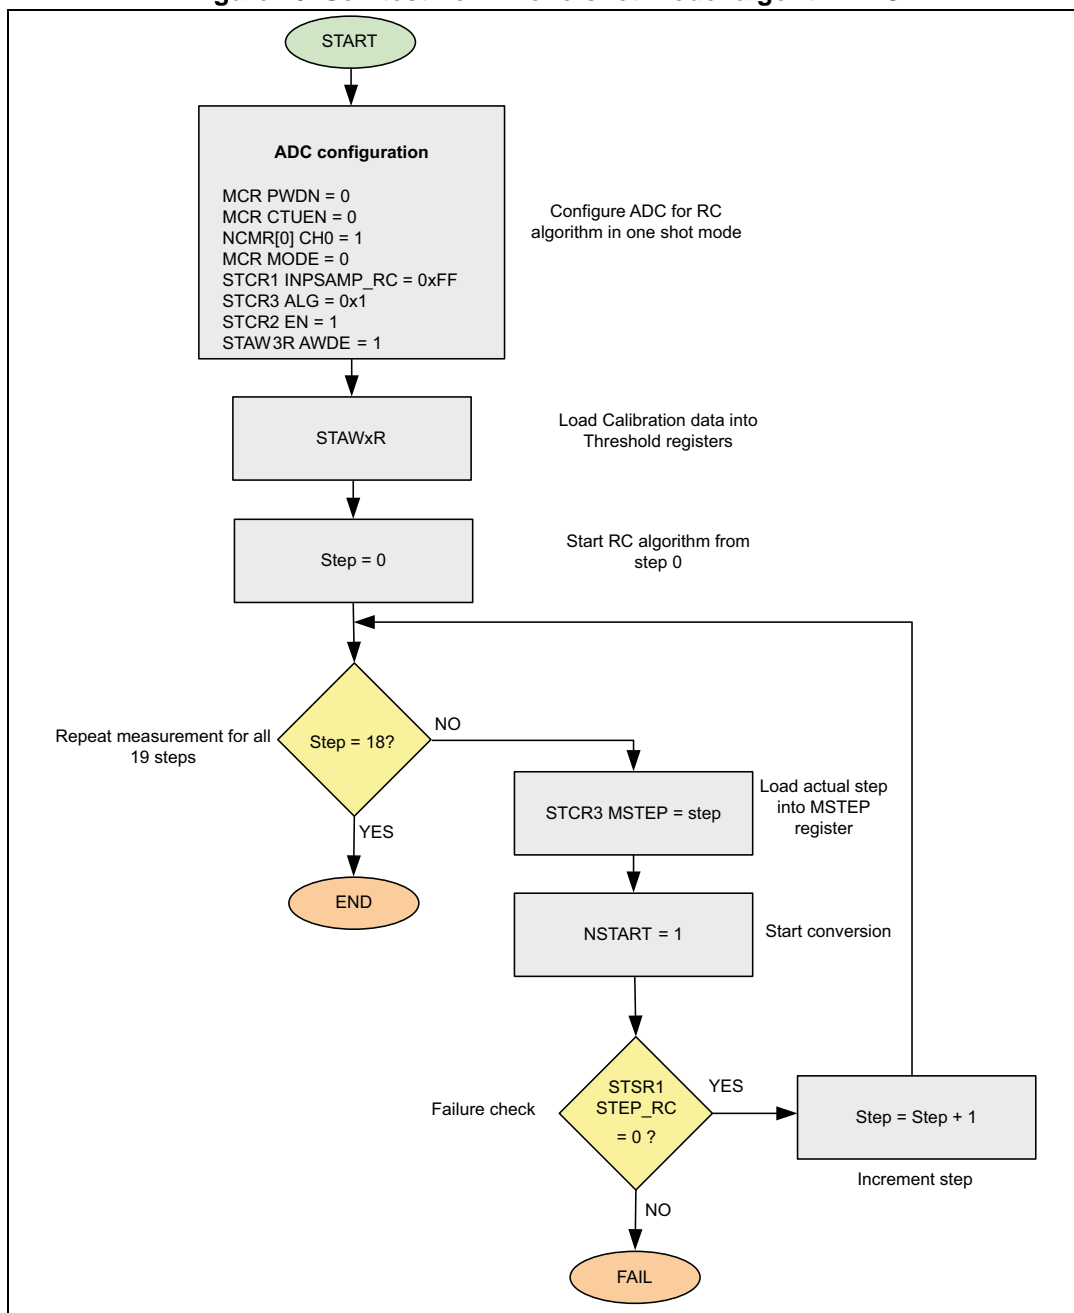

Figure 11. Test flow - Algorithm RC

2.4 Capacitive self-test - Algorithm C

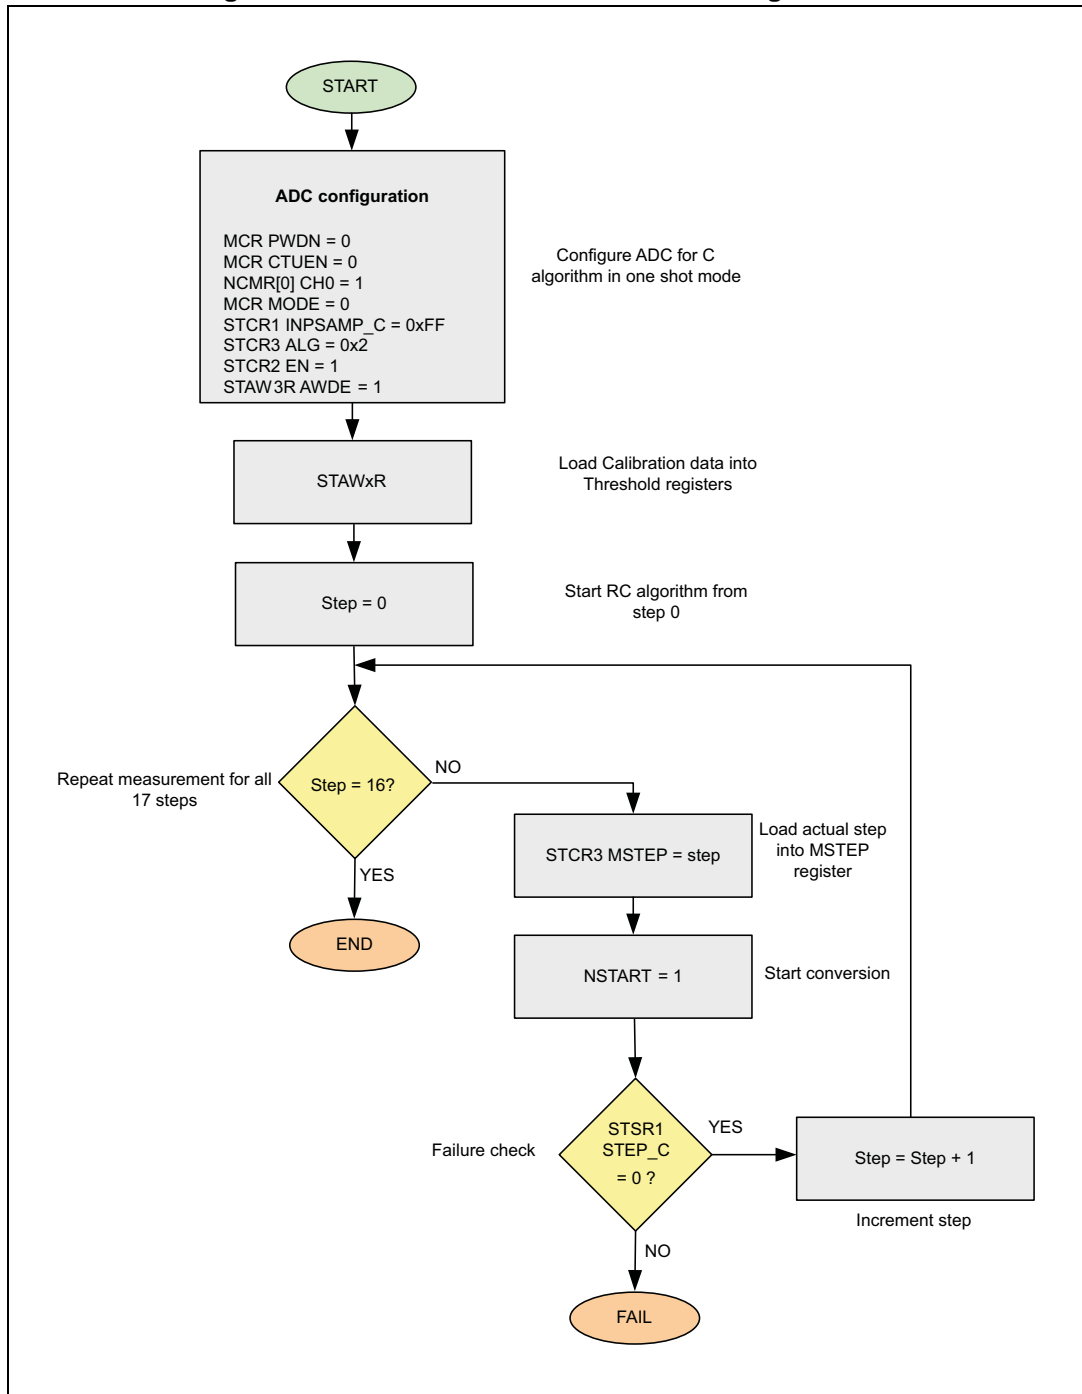

Capacitive Self-test Algorithm C includes a sequence of 17 test conversions (steps) by setting the capacitive elements comprising the sampling capacitor/ capacitive DAC. This algorithm is designed to highlight faults in the sampling capacitor matrix. Each step considers two elements of the sampling capacitor matrix. For each step a sequence of pre-sampling, sampling and evaluation phases are executed.

2.4.1 Capacitive self-test in CPU mode

Figure 12 demonstrating basic self-test flow for algorithm C in one-shot mode.

After executing each step of the self-test the error bit STSR1[STEP_C] is checked.

Figure 12. Self-test flow in one-shot mode- algorithm C

3 Appendix A

Example source code can be found in these appendixes.

3.1 Test Flash copy function example

Read_Self_Test_calibration_data function is necessary to be executed from RAM.

```
#pragma ghs section text=".ramcode"
void Read_Self_Test_calibration_data (void)
{
    uint32_t address = 0x0;
    uint32_t i = 0;

    /* map Test Flash sector into Flash memory stating 0x0 */
    SSCM.SCTR.B.TFE = 1;

    for (i=0;i<22;i++)
    {
        Raw_Test_Flash_Calibration_Data[i] = (*(volatile uint32_t *)address);
        address = address + 0x4;
    }
    SSCM.SCTR.B.TFE = 0;
}
#pragma ghs section
```

3.2 Algorithm S example in CPU scan mode

```
void ADC0_SUPPLY_SELF_TEST_ScanMode(void)
{
    // Algorithm S
    ADC0.MCR.B.PWDN = 0;        // Enable ADC0
    /* 1 */
    ADC0.MCR.B.CTUEN = 0;      // CPU mode
    /* 2 */
    ADC0.NCMR[0].B.CH0 = 1;    // ADC0 channel 0 is set. Program NCMR0 to
    select channels to be converted for normal conversion
    /* 3 */
    ADC0.MCR.B.MODE = 1;       // Program MCR[MODE] = 1 to select Scan Mode
    mode
    /* 4 */

    if (ADC0.STSR1.B.ERR_S0 == 1 || ADC0.STSR1.B.ERR_S1 == 1 ||
    ADC0.STSR1.B.ERR_S2 == 1)    // Check if No S-algorithm error has occurred
    {
        while(1); // Self test failed
    }

```

```

    }

    /* 8 */
    // On receiving end of conversion for test channel, the digital result
    is written in
    // STDR1.TCDATA and STDR1.VALID bit is set. Also, EOC and ECH bits are
    set in the
    // ISR and ST_EOC bit is set in STSR1.
    /* 9 */
    // State Machine returns to IDLE state.
}

```

3.3 Algorithm RC example in CPU one-shot mode

```

void ADC0_RESISTIVE_CAPACITIVE_SELF_TEST (void)
{
    uint8_t step = 0;

    // Algorithm RC
    ADC0.MCR.B.PWDN = 0;      // Enable ADC0
    /* 1 */
    ADC0.MCR.B.CTUEN = 0;    // CPU mode
    /* 2 */
    ADC0.NCMR[0].B.CH0 = 1;  // ADC0 channel 0 is set. Program NCMR0 to
    select channels to be converted for normal conversion
    /* 3 */
    ADC0.MCR.B.MODE = 0;     // Program MCR[MODE] = 0 to select one shot
    mode
    /* 4 */
    ADC0.STCR1.B.INPSAMP_RC = 0xFF; // Program sampling phase duration for
    the test conversions
    /* 5 */
    ADC0.STCR3.B.ALG = 0x1;  // Select the RC Self Testing algorithm in
    STCR3.ALG. Default is Algorithm S
    /* 6 */
    ADC0.STCR2.B.EN = 1;     // ADC0 Enable self testing channel by setting
    EN bit in the STCR2 register
    /* 7 */
    ADC0.STAW3R.B.AWDE = 1;  // Enable analog watchdog related to the
    algorithm RC
    /* 8 */
    ADC0.STAW3R.B.THRL = ADC0_Self_Test_Flash_Calibration_Data[0]; // ADC0
    Self-Test calibration - RC algo - Low Threshold Value
    ADC0.STAW3R.B.THRH = ADC0_Self_Test_Flash_Calibration_Data[1]; // ADC0
    Self-Test calibration - RC algo - High Threshold Value
    /* 9 */
}

```

```

    for(step=0;step<19;step++)
    {
        ADC0.STCR3.B.MSTEP = step;    // For one-shot mode, defines the current
step for algorithms S
        ADC0.MCR.B.NSTART = 1;    // Start ADC0 normal conversion by setting
NSTART bit in the MCR
        if (ADC1.STSR1.B.STEP_RC != 0)
        {
            ADC_Self_Test_Fail[step+6] = 1;    // Check if No RC-algorithm [step]
error has occurred
        }
    }
}

```

3.4 Algorithm RC example in CPU scan mode

```

void ADC0_RESISTIVE_CAPACITIVE_SELF_TEST_ScanMode (void)
{
    // Algorithm RC
    ADC0.MCR.B.PWDN = 0;    // Enable ADC0

        }

        ADC0.STSR1.B.ST_EOC = 0;
    }

```

3.5 Algorithm C example in CPU one-shot mode

```

void ADC1_CAPACITIVE_SELF_TEST (void)
{
    uint8_t step = 0;

    // Algorithm C
    ADC1.MCR.B.PWDN = 0;    // Enable ADC1
    /* 1 */
    ADC1.MCR.B.CTUEN = 0;    // CPU mode
    /* 2 */
    ADC1.NCMR[0].B.CH0 = 1;    // ADC_0 channel 0 is set. Program NCMR0 to
    select channels to be converted for normal conversion
    /* 3 */
    ADC1.MCR.B.MODE = 0;    // Program MCR[MODE] = 0 to select one shot
    mode
    /* 4 */
    ADC1.STCR1.B.INPSAMP_C = 0xFF;    // Program sampling phase duration for
    the test conversions
    /* 5 */
    ADC1.STCR3.B.ALG = 0x2;    // Select the Self Testing algorithm in
    STCR3.ALG. Default is Algorithm S
    /* 6 */
    ADC1.STCR2.B.EN = 1;    // ADC_0 Enable self testing channel by
    setting EN bit in the STCR2 register
    /* 7 */
    ADC1.MCR.B.NSTART = 1;    // Start ADC1 normal conversion by setting
    NSTART bit in the MCR
    /* 8 */
    ADC1.STAW4R.B.THRL = ADC1_Self_Test_Flash_Calibration_Data[2]; // ADC1
    Self-Test calibration - C algo S0 step) - Low Treshold Value

```

```

    ADC1.STAW4R.B.THRH = ADC1_Self_Test_Flash_Calibration_Data[3]; // ADC1
    Self-Test calibration - C algo S0 step) - High Treshold Value
    ADC1.STAW5R.B.THRL = ADC1_Self_Test_Flash_Calibration_Data[4]; // ADC1
    Self-Test calibration - C algo Sn step) - Low Treshold Value
    ADC1.STAW5R.B.THRH = ADC1_Self_Test_Flash_Calibration_Data[5]; // ADC1
    Self-Test calibration - C algo Sn step) - High Treshold Value
    for(step=0;step<17;step++)
    {
        ADC1.STCR3.B.MSTEP = step; // For one-shot mode, defines the current
    step for algorithms S
        ADC1.MCR.B.NSTART = 1; // Start ADC1 normal conversion by setting
    NSTART bit in the MCR
        if (ADC1.STSR1.B.STEP_C != 0)
        {
            ADC_Self_Test_Fail[step+60] = 1; // Check if No RC-algorithm
    [step] error has occurred
        }
    }
}

```

3.6 Algorithm C example in CPU scan mode

```

void ADC0_CAPACITIVE_SELF_TEST_ScanMod (void)
{
    // Algorithm C
    ADC0.MCR.B.PWDN = 0; // Enable ADC0
    /* 1 */
    ADC0.MCR.B.CTUEN = 0; // CPU mode
    /* 2 */
    ADC0.NCMR[0].B.CH0 = 1; // ADC_0 channel 0 is set. Program NCMR0 to
    select channels to be converted for normal conversion
    /* 3 */
    ADC0.MCR.B.MODE = 1; // Program MCR[MODE] = 0 to select one shot
    mode
    /* 4 */
    ADC0.STCR1.B.INPSAMP_C = 0xFF; // Program sampling phase duration for
    the test conversions
    /* 5 */
    ADC0.STCR3.B.ALG = 0x2; // Select the Self Testing algorithm in
    STCR3.ALG. Default is Algorithm S
    /* 6 */
    ADC0.STCR2.B.EN = 1; // ADC_0 Enable self testing channel by
    setting EN bit in the STCR2 register
    /* 7 */
    ADC0.STAW4R.B.THRL = ADC0_Self_Test_Flash_Calibration_Data[2]; // ADC0
    Self-Test calibration - C algo S0 step) - Low Treshold Value
    ADC0.STAW4R.B.THRH = ADC0_Self_Test_Flash_Calibration_Data[3]; // ADC0
    Self-Test calibration - C algo S0 step) - High Treshold Value
}

```

```
ADC0.STAW5R.B.THRL = ADC0_Self_Test_Flash_Calibration_Data[4]; // ADC0
Self-Test calibration - C algo Sn step) - Low Treshold Value
ADC0.STAW5R.B.THRH = ADC0_Self_Test_Flash_Calibration_Data[5]; // ADC0
Self-Test calibration - C algo Sn step) - High Treshold Value
/* 8 */
ADC0.MCR.B.NSTART = 1; // Start ADC0 normal conversion by setting
NSTART bit in the MCR
while (ADC0.STSR1.B.ST_EOC != 0);

ADC0.MCR.B.NSTART = 0; // Stop ADC0 normal conversion by setting
NSTART bit in the MCR

if (ADC0.STSR1.B.STEP_C != 0) // Check if No C-algorithm error has
occurred
{
while(1); // Self test failed
}
ADC0.STSR1.B.ST_EOC = 0;
}
```

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

ST PRODUCTS ARE NOT DESIGNED OR AUTHORIZED FOR USE IN: (A) SAFETY CRITICAL APPLICATIONS SUCH AS LIFE SUPPORTING, ACTIVE IMPLANTED DEVICES OR SYSTEMS WITH PRODUCT FUNCTIONAL SAFETY REQUIREMENTS; (B) AERONAUTIC APPLICATIONS; (C) AUTOMOTIVE APPLICATIONS OR ENVIRONMENTS, AND/OR (D) AEROSPACE APPLICATIONS OR ENVIRONMENTS. WHERE ST PRODUCTS ARE NOT DESIGNED FOR SUCH USE, THE PURCHASER SHALL USE PRODUCTS AT PURCHASER'S SOLE RISK, EVEN IF ST HAS BEEN INFORMED IN WRITING OF SUCH USAGE, UNLESS A PRODUCT IS EXPRESSLY DESIGNATED BY ST AS BEING INTENDED FOR "AUTOMOTIVE, AUTOMOTIVE SAFETY OR MEDICAL" INDUSTRY DOMAINS ACCORDING TO ST PRODUCT DESIGN SPECIFICATIONS. PRODUCTS FORMALLY ESCC, QML OR JAN QUALIFIED ARE DEEMED SUITABLE FOR USE IN AEROSPACE BY THE CORRESPONDING GOVERNMENTAL AGENCY.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.
