Description

STMicroelectronics STM32 Audio Engine is a set of software libraries allowing customers to build audio applications with high-quality and professional results.

The popular MP3 format is part of the formats a professional application should support to ensure the best musical experience.

Therefore, the MP3 decoder library is a must. It removes the need for an external MP3 decoding component. Moreover, unlike many open-source solutions, it was written specifically for STM32, and is therefore highly optimized, leaving room for other application tasks to run concurrently with the audio decoding.

In addition, it comes with a set of impressive add-ons such as a channel mixer, a standalone 5-band parametric equalizer and loudness control to provide a complete plug-and-play solution for STM32 customers.

The MP3 decoder library is not available for all STM32 family members (see further).
1 Functional description

1.1 MP3 background

The popular MP3, short for MPEG-1/MPEG-2 Layer 3, is a format allowing to store digital audio using lossy compression algorithms. It was patented by Technicolor.

1.2 Royalties and part numbers

Some royalties are due to the patent owner. For the MP3 decoder, STMicroelectronics proposes to embed the royalties in the chip prices, in order to ease customers life, and to leverage royalty costs on high volumes.

In order to know the quantities of delivered ships, STMicroelectronics is therefore proposing specific part numbers. Please refer to the product datasheets for more information, or contact your local ST sales representative.

1.3 Operating principle

The delivered package contains four libraries, one per main feature:

- MP3 decoder
- Channel mixer
- Equalizer
- Loudness control

While the MP3 decoder is using a “Pull” mechanism, in which the decoding function calls a callback function to retrieve the data, the three other libraries use a “Push” mechanism, thus accepting one input buffer (or several) and generating an output buffer at the time of a call.

Figure 1. MP3 decoder flow, in “Pull” mode: callback way
The developer is then free to use PCM buffers as needed by his application - streaming them out to I2S, for instance.
