

FUNCTIONAL SAFETY SOLUTIONS

For Safer and Smarter Factories

Meet stringent SIL requirements and benefit from reduced installation time, less downtime and ease of maintenance

A key differentiator in the smart industry era, safety infrastructures for operators are critical, in particular when it concerns electrical equipment, robots and heavy loads.

To facilitate and accelerate development and certification processes for safety-critical services and functions, ST offers a range of high-performance STM32 microcontrollers as well as fully protected current limited termination (CLT) ICs, intelligent power switches (IPS) and protection devices – many of which come with a 10-year longevity commitment.

KEY PRODUCTS

- Functional Safety Design Package for STM32 MCUs
- Voltage regulators for Safe Automation
- Safe digital current limiters
- Intelligent power switches for SIL-compliant systems
- Integrated galvanic isolated switches with SPI and parallel interfaces

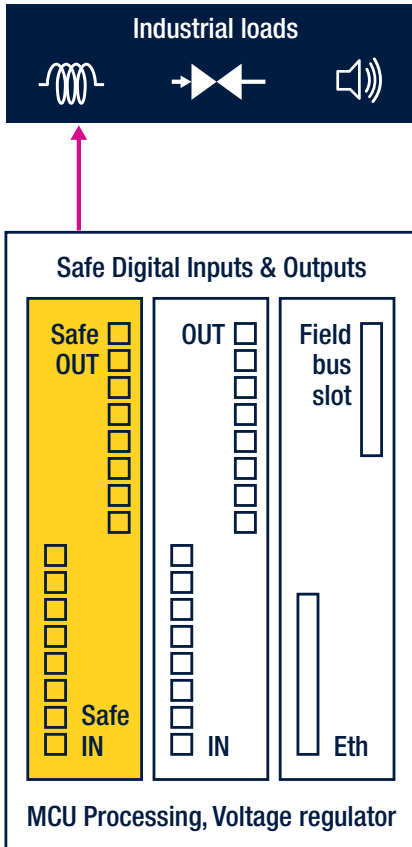

With ST, developers benefit from a large ecosystem of hardware and software evaluation and development tools and – together with partners – support services to help meet the reliability, safety and security challenges of Industry 4.0.

Functional safety solutions to meet the challenges of safety-critical designs

Industrial inputs
Safety button or industrial sensors like proximity, optical, touch ultrasonic...

Yellow PLC

VOLTAGE REGULATORS FOR SAFE AUTOMATION

The first brick in building a safe-ready application, our power management ICs include L7987 61 V rated asynchronous step-down switching regulators with adjustable current limitation to match fail-safe requirements.

SAFE DIGITAL INPUTS & OUTPUTS

The CLT03-2Q3 digital input current limiter doesn't require any external power supply and includes a glitch filter for EMC robustness.

IPS160HF and IPS161HF are the latest high-side intelligent power switches designed to fit safe applications.

To improve flexibility and safety, our ISO8200AQ, ISO8200B and ISO8200BQ galvanic isolated switches come with an SPI or parallel communication interface.

FUNCTIONAL SAFETY DESIGN PACKAGE FOR STM32 MCUs

ST provides a comprehensive set of certified software libraries and documentation for manufacturers to achieve functional safety standard certifications.

Achieving SIL2/3 with STM32

X-CUBE-STL is the design package conceived to achieve the IEC 61508 Safety Integrity Level (SIL2 / SIL3) certification with STM32.

EVALUATION BOARDS AND TOOLS

ST proposes a wide range of evaluation boards that may be used to perform a comprehensive evaluation of ST's safety products and solutions while reducing your development time.

This includes boards for:

- Isolated and non-isolated digital inputs
- 61V asynchronous step-down switching regulator
- High-side driver
- Low-side driver
- STM32 Nucleo development and expansion boards.
