Introduction

The STEVAL-CCA036V1 demonstration board is designed to help characterize single operational amplifiers housed in SO8 packages.

This application note provides:
- a brief description of the STEVAL-CCA036V1 demonstration board
- a view of the top and bottom layers of the STEVAL-CCA036V1 demonstration board
- some examples of classic configurations that can be tested with the board

1 STEVAL-CCA036V1 description

The STEVAL-CCA036V1 demonstration board is designed with versatility in mind. In particular, its components allow it to be configured as:

- a low-pass Sallen-Key circuit
- a high-pass Sallen-Key circuit
- a differential amplifier
- an AC-coupled circuit
- an in-the-loop compensation circuit
- an out-of-loop compensation circuit
- numerous other possible configurations not described here

The STEVAL-CCA036V1 demonstration board is designed for surface-mounted components and can be used to perform on-board characterization prior to the integration of STMicroelectronics’ products in designs. Resistor and capacitor footprints are implemented for the 0805 series. A set of two decoupling capacitors have been implemented on both power supply pins of the op-amp so as to benefit from the maximum performance of ST products. In order to reject a wide range of frequencies, 10 nF and 4.7 μF are good values for these capacitors.

Figure 1. STEVAL-CCA036V1 demonstration board schematic
2 STEVAL-CCA036V1 layout

The STEVAL-CCA036V1 demonstration board has a triangular shape which looks like the op-amp symbol.

The board is a two-layer printed circuit board (PCB) with the following dimensions: 3040 mils x 2140 mils (77.2 mm x 54.4 mm)

For the $V_{out}$ connection, either a BNC connector or a 2 mm female connector can be implanted. $V_{in+}$ and $V_{in-}$ can be directly connected by BNC connectors to ease the design. You can also implant test points on these three voltages which will facilitate the visualization of the signals.

The STEVAL-CCA036V1 top and bottom layers are shown in Figure 2.

Figure 2. STEVAL-CCA036V1 top and bottom layers
3  STEVAL-CCA036V1 possible configurations

Section 3.1 through to Section 3.6 give some instruction on how to set up the STEVAL-CCA036V1 demonstration board to perform several classical configurations. The configurations are shown in the following figures:

- Figure 3: Low-pass Sallen-Key configuration
- Figure 4: High-pass Sallen-Key configuration
- Figure 5: Differential amplifier
- Figure 6: In-the-loop compensation configuration
- Figure 7: Out-of-loop compensation configuration
- Figure 8: AC coupled configuration

To obtain a more complex configuration, put several boards in cascade.
3.1 Low-pass Sallen-Key configuration

The low-pass Sallen-Key configuration \((\text{Figure 3})\) is a second order filter configuration. This circuit has 40 dB roll-off per decade.

\(Z4\) and \(Z9\) set the gain.

\textit{Equation 1} describes the filter cut-off frequency.

\textbf{Equation 1}

\[
f_c = \frac{1}{2\pi Z_1 Z_2 Z_5 Z_6}
\]

\(Z7, Z8, Z12,\) and \(Z14\) must not be connected.
\(Z3\) and \(Z13\) must be shorted.

\textbf{Figure 3. Low-pass Sallen-Key configuration}
3.2 High-pass Sallen-Key configuration

The high-pass Sallen-Key configuration (Figure 4) is also a second order filter configuration. It has a slope of 40 dB per decade.

Z4 and Z9 set the gain.

Equation 2 describes the filter cut-off frequency.

Equation 2

\[ f_c = \frac{1}{2\pi Z_1 Z_2 Z_5 Z_6} \]

Z7, Z8, Z12, and Z14 must not be connected.
Z3 and Z13 must be shorted.
3.3 Differential amplifier

The differential amplifier (Figure 5) allows two voltages to be subtracted. Equation 3 describes the output voltage of the op-amp.

Equation 3

\[ V_{\text{out}} = V_{\text{in+}} \left( \frac{Z_8 + Z_4}{Z_8 + Z_1 + Z_5} \right) - V_{\text{in-}} \frac{Z_4}{Z_8} \]

Choosing \( Z_8 = Z_1 \) and \( Z_4 = Z_5 \) gives Equation 4.

Equation 4

\[ V_{\text{out}} = (V_{\text{in+}} - V_{\text{in-}}) \frac{Z_4}{Z_8} \]

Z6, Z7, Z9, Z12, and Z14 must not be connected.
Z2, Z3, and Z13 must be shorted.

Figure 5. Differential amplifier
3.4 **In-the-loop compensation configuration**

The goal of in-the-loop compensation configuration (Figure 6) is to stabilize the amplifier configuration with a capacitive load. This compensation is called "in-the-loop" because the additional components (Z14 and Z4) used to improve the stability are inserted in the feedback loop.

Z5, Z6, and Z8 must not be connected.

Z1, Z2, and Z3 must be shorted.

![Figure 6. In-the-loop compensation configuration](image-url)
3.5 Out-of-loop compensation configuration

Out-of-loop compensation configuration (Figure 7) is a simple compensation method, using only one extra component. The component is a resistor (Z13) which is added in series between the output of the amplifier and its load. It is often referred to as the out-of-loop compensation method because the additional component is added outside of the feedback loop.

Z3, Z5, Z6, Z8, Z9, and Z14 must not be connected.
Z1, Z2, and Z4 must be shorted.

Figure 7. Out-of-loop compensation configuration
3.6 **AC coupled circuit configuration**

The AC coupled circuit configuration (*Figure 8*) allows the AC part of the input signal to be amplified.

Z2, Z6, Z7, Z9, Z12, and Z14 must not be connected.

No component is shorted.

*Figure 8. AC coupled configuration*
