Introduction

This document describes the functions of a single-phase energy meter based on the STPM10 metering IC and STM8L152C6 microcontroller. The demonstration board solution is a fully functional single-phase solution with parameter display, tamper management, maximum demand (MD) calculation, EEPROM data logging and low-power management. The meter specifications are:

- **Accuracy**: class 1 with dynamic range 200:1
- **Nominal voltage**: 240 V
- **Nominal current**: 10 A (ITYP)
- **Maximum current**: 80 A (IMAX)
- **Operating range**: 0.6 Vb to 1.2 Vb
- **Meter constant**: 1600 impulses/KWh
- **Power frequency range**: 45 Hz to 65 Hz
- **Sensor**: primary side CT and secondary side shunt
- **Communication interface**: IrDA

1 Features

- Low cost single-phase energy meter solution
- Supports IEC 61036:1996 + A1: 2000, static meter for active energy classes 1 for Ib = 10 A
- Less than 4 VA power consumption for voltage circuit at reference voltage
- Less than 1 VA power consumption for current circuit at reference basic current
- Multiple tamper detection: earth, neutral missing, reverse, case tamper, magnetic tamper detection.
- Case tamper detection in power-down also
- Detects, signals and continues to measure accurately under tamper condition
- Rechargeable battery is available on board for showing LCD parameters in case of power down mode
- Active energy pulse output 1600 impulses/kWh
- Software based auto-calibration without the need of a reference meter, only a reference source is required
- Microcontroller built-in RTC for date and time display
- Microcontroller STM8L152C6T6 is responsible for all the data management, display and power management
- STPM10 metering IC with 1st order sigma-delta ADC for energy measurements
- Single point and fast calibration of the STPM10 for class 1 meter
- External EEPROM used to store calibration parameters, tampering information, cumulative energy, MD and power factor (PF) data
- Active power, current, voltage, power factor and line frequency measurements
- Numeric display precision (except cumulative energy): 5+2 digits
- Numeric display precision for cumulative energy: 5+1 digits
- Energy EEPROM log precision: 0.01 kWh.
2 Overview

2.1 Safety rules

This board can be connected to mains voltage (240 V). In the case of improper use, wrong installation or malfunction, there is a danger of serious personal injury and damage to property. All operations such as transport, installation and commissioning, as well as maintenance, should be carried out only by skilled technical personnel (regional accident prevention rules must be observed).

---

Danger: Due to the risk of death when using this prototype on mains voltage (240 V), only skilled technical personnel who are familiar with the installation, mounting, commissioning and operation of power electronic systems and have the qualifications needed to perform these functions, may use this prototype.

---

2.2 Recommended reading

This document describes how to use the multi-tariff meter reference board. Additional information can be found in the following documents:

- STPM10 datasheet
- STM8L152C6T6 datasheet
- Component datasheets
- IEC 62056-21 IrDA protocol mode C.

2.3 Getting technical support

For technical assistance, documentation, information and updates about products and services, please refer to your local ST distributor/office.
3  Getting started

3.1  Package

The demonstration kit package includes the following items:

- **Hardware content**
  - STEVAL-IPE012V2 demonstration board
- **Software**
  - SerialIO GUI for IRDA communication testing
- **Documentation:**
  - User manual
  - Presentation
  - Schematic
  - BOM list.

3.2  Hardware installation

Connect the STEVAL-IPE012V2 demonstration board with the mains supply before load. Please refer to Figure 2 for connection with mains power and load.

Auto-scrolling LCD display indicates successful power-up of the board.

**Figure 2. Electricity meter connection diagram**
3.3 Software installation

The demonstration kit supports the SerialIO GUI for RS232 testing to check 62056-21 IRDA protocol mode C implementation.

3.3.1 System requirements for demonstration GUI

For demonstration board communication with the GUI, a recent version of Windows®, Windows XP, must be installed on the PC.

The SerialIO GUI does not require any driver installation.

The version of the Windows OS installed on the PC can be determined by clicking on the system icon in the control panel.
4 Hardware layout

The demonstration kit hardware is designed in a sectional approach to offer multiple functions to users.

Figure 3. Hardware layout: top view

Figure 4. Hardware layout: bottom view
5 Hardware details

5.1 Metering IC U1

The programmable single-phase energy metering IC STPM10BTR (Package: TSSOP20) is interfaced to the microcontroller using a 3-wire SPI interface. Active energy, apparent energy, instantaneous voltage, and instantaneous current values are obtained from the STPM10 metering IC. For calibration of the STPM10, auto-calibration is implemented.

5.1.1 Clocking Y1

A 4.194MHz crystal is used as the clock generator input for the metering IC. For more details about auto-calibration, please refer to Section 6.1: Auto-calibration mode.

5.2 Microcontroller U2

The microcontroller STM8l152C6T6 (Package: LQFP48, 32K Flash, 2KB RAM, 48-pin) is responsible for all the data management and power management tasks. MCU consumes very low power and has built-in RTC for date and time management.

5.2.1 LED D10

LED D10 is the pulse-out LED for cumulative energy. This is used for testing energy meter energy calculation accuracy.

5.2.2 Switch SW1, SW2

Switch SW1 is the reset switch for the microcontroller. Switch SW2 is the case tamper switch. This is used to detect case tampering of the energy meter solution. For more details, refer to Section 6.4: LCD display modes.

5.2.3 Jumper J2

Table 1. 3-pin jumper header

<table>
<thead>
<tr>
<th>Jumper</th>
<th>Close : 1-2</th>
<th>Close : 2-3</th>
<th>Default</th>

</thead>
<tbody>
<tr>
<td>J2</td>
<td>Microcontroller pin PA1 is connected to reset switch SW1.</td>
<td>Microcontroller pin PA1 is connected to LED D10.</td>
<td>Close : 2-3</td>
</tr>
</tbody>
</table>

5.2.4 Clocking Y2

A 32.768 kHz crystal is used as clock input for LSE (low speed external) for the microcontroller RTC block. The microcontroller core is clocked by a HSI (high speed internal) clock.
5.3 **Power supply section**

Capacitive power supply is used to build 3.6 V for the metering IC and microcontroller section.

5.3.1 **Programmable voltage reference U5**

U5 TL431AI (package TO-92) is used to regulate the 3.6 V supply.

5.3.2 **Current sensor CT1**

CT1 E4626-X002 (2500 turns, series resistance: 41.7 Ω) is the sensor for the primary current channel.

5.3.3 **Shunt RS1**

RS1 300 µΩ is the sensor for the secondary current channel.

5.4 **Neutral missing power supply section**

The neutral missing power supply section is operational in case of neutral missing tamper. In case of a neutral missing tamper condition, neutral is disconnected from the energy meter. Therefore, there is no voltage input and so no output would be generated by the main capacitive power supply. However, in the case of load present, there would be a valid input signal on the current channel so energy would be consumed. Since the voltage on the neutral channel is zero, so is the power (\( P = V \times I \)). In order to take account of energy consumed in this case, the neutral missing power supply section provides voltage supply to the STPM10 metering IC. A zero crossing signal of 50 Hz is provided to the VIP pin of the STPM10, so the STPM10 now calculates the energy consumption at a nominal voltage level of 230 V.

5.4.1 **Current sensor CT2**

CT2 is used to develop the power supply for the board using a diode full wave rectifier circuit in neutral missing condition.

5.5 **EEPROM U3 section**

EEPROM M24C32-RMN6TP (package: SO8, 32 Kbit) is interfaced to the microcontroller using an I²C bus. Cumulative energy, MD, average PF and tamper information for seven consecutive months are logged as months in EEPROM. For more details about EEPROM data logging, refer to Section 6.2: EEPROM data log.

5.6 **LCD section**

LCD J3 is the connector for external 18* 4 LCD glass.

LCD glass OPT6089A (operating voltage 3 V, duty 1/4, Bias 1/3) offers various energy meter specific symbols.

LCD glass is driven by the microcontroller internal LCD driver.
5.7 Battery management section
Two batteries are used in the circuit.

5.7.1 Coin cell BT1
BT1 CR2032 (3 V, 225 mAh) is the microcontroller power source in halt mode to keep RTC running.

5.7.2 Rechargeable battery BT2
BT2 VL2330 (3 V, 50 mAh) for pushbutton and IRDA operation when mains power is off.
- Rechargeable battery acts as power source for microcontroller section when pushbutton is pressed during mains power-off.
- Rechargeable battery is charged based on trickle charging mode during mains power on.

5.7.3 Small signal Schottky diode D11, D12, D13, D14, D5
Diodes (D11, D12, D13, D14, D5) BAT30KFB (SOD - 523) based circuit is used to select the power source for the microcontroller.

5.7.4 Switch SW3
Switch SW3 is the pushbutton switch. SW3 is used to control LCD display modes.
When mains power is on, on pressing the pushbutton, the LCD display is executed as per the pushbutton run mode.
When mains power is off, on pressing the pushbutton, the LCD display is executed as per the pushbutton low-power mode.

5.8 IRDA section

5.8.1 IRDA transceiver U6
The IRDA transceiver TFDU6300 is used for IRDA communication.

5.8.2 Jumper J6
Using jumper J6, IRDA transmit and receive pins allow the testing of the IRDA section using the SerialIO GUI.
For more details, refer to Section 6.6.2: SerialIO GUI.

5.9 Magnetic sensor U4

The magnetic sensor AH180 (SC59-3L) is used to detect magnetic interference in the energy meter solution. Magnetic sensor outputs low on magnetic interference on the board.

5.10 Connector section

The connector section comprises four test points for different signals.

6 Single-phase energy meter features

6.1 Auto-calibration mode

The STEVAL-IPE012V2 demonstration board supports auto-calibration using an ideal reference source for 10 A and 240 V. Calibration is performed to minimize measurement errors and to increase the accuracy of the meter.

Using auto-calibration mode, calibration parameters (CHV, CHS, and CHP) are calculated and programmed in metering IC registers. The procedure for meter calibration is explained below by firstly giving an overview of the hardware setup, and then by describing how to connect a calibration board.

6.1.1 Steps for auto-calibration

- Connect 240 V voltage source to phase and neutral of board
- Connect 10 A source to board
- Push button SW3 for more than 4 sec
- Board enters auto-calibration mode; “CALIB ON” is displayed on the board
- As calibration is complete, board returns to auto-scroll display mode.

For more details of calibration parameters, refer to the metering IC datasheet on www.st.com.

Figure 5. Auto-calibration mode connection diagram
6.2 EEPROM data log

Total EPROM data log size: 920 bytes.

Multiple parameters are stored in EEPROM, as below:

- The following metering parameters are logged in EEPROM memory for the current month and last six months:
  - Cumulative energy (CE) till last month
  - Maximum demand (MD)
  - Cumulative energy (CE) consumed in current month
  - Average PF and averaging count
  - Tamper entries

  Four types of tamper data storage are done: earth, reverse, neutral, case tamper. For each type of tamper, the number of tamper entries per month is four.

- Two duplicate entries of cumulative energy are stored with CRC-8 value for error detection.

- 10 bytes stored for calibration data @ start of EEPROM including 3 bytes of CHV, CHP, and CHS.

- Last power-down date and time log
- Overflow count for cumulative energy
  - Number of times cumulative energy overflows from 99999.9 (maximum display precision).

For more details, refer to Appendix A.

6.3 Power management

The STEVAL-IPE012V2 demonstration board is designed with board power consumption 4 VA.

The board supports two modes of operation:

- Meter run mode
- Meter low-power mode.

6.3.1 Meter run mode

When mains power is on, the board operates in run mode. The board components are powered using capacitive supply using the main power line as the source. In this mode, rechargeable battery is in charging mode based on trickle charging technique.

6.3.2 Meter low-power mode

When mains power goes down, the onboard microcontroller enters halt mode and metering IC is off. In this mode, the microcontroller RTC is running and other peripherals are off. In halt mode, the microcontroller is powered using BT1.

Therefore, pushbutton SW3 is pressed in low-power mode; BT2 supply connects to supply input of the microcontroller and IRDA section. Therefore, in a button pressed condition, BT2 is the main supply source.
Now, the meter low-power LCD display and IRDA communication are operational till pushbutton SW3 is operational.

6.4 LCD display modes

The STEVAL-IPE012V2 demonstration board offers the user different parameters.

The metering parameters display is configured in a specific manner based upon the power mode of the meter.

- Meter run mode LCD display
- Meter low-power LCD display.

6.4.1 Meter run mode display

During the main power-on condition, all the critical parameters with details of last month’s logs for metering parameters are available on the display.

Parameter display is classified in the manner below for mains-on condition:

- Auto-scroll mode
- Pushbutton display mode.

6.4.2 Auto-scroll mode

In auto-scroll mode, the following parameters are displayed on the LCD display one by one.

- Cumulative active energy (KWh)
- Max. demand (KW) of last month
- Average PF of last consumption month.

Note: Auto-scroll mode interval (8sec) is configurable in “autoscroll_display.h” in the firmware.

6.4.3 Pushbutton mode

- In pushbutton mode, the following parameters are displayed on the LCD on pressing pushbutton SW3. Each button push displays the next pushbutton parameter.
- If the pushbutton is in the pressed condition for 4sec, the board enters auto-calibration mode.

For more details on auto-calibration, refer to Section 6.1: Auto-calibration mode.

In pushbutton mode, the following parameters are displayed on the LCD.

- All LCD segments on
- Date and time
- Max. demand since last reset
- Cumulative energy for last six months
- Max. demand for last six months
- Instantaneous PF
- Instantaneous voltage
- Instantaneous current
- Instantaneous load in Watt.
When the pushbutton SW3 is released, the LCD display returns to auto-scroll mode after a pushbutton mode interval (10sec).

**Note:** A pushbutton mode interval (8sec) is configurable in “pushbutton_display.h” in the firmware.

### 6.4.4 Meter low-power mode display

In low-power mode, display is off till pushbutton SW3 is pressed. When pushbutton SW3 is pressed in low-power mode, display is on in auto-scroll display mode. The display is active till pushbutton SW3 is in the pressed condition.

### 6.5 Tamper detection

The STEVAL-IPE012V2 demonstration board supports multiple tamper detection and their logging in EEPROM.

#### 6.5.1 Tamper types

The five types of tamper detection are:

- Earth tamper
- Reverse tamper
- Neutral missing tamper
- Case tamper
- Magnetic interference.

#### 6.5.2 LCD symbol for tamper condition

- Earth tamper: Earth
- Reverse tamper: Rev
- Neutral missing tamper: ☹️
- Case tamper: BP
- Magnetic interference: BP

Three of the above tampers (earth, reverse and neutral missing) are detected using a software algorithm based on meter readings from the metering IC.

In the case of neutral missing tamper detection, the board starts recording energy when the load current is 2 A or higher.

Case tamper is detected using switch SW2 and magnetic interference is detected using magnetic sensor U4. Symbol ‘BP’ is shared for displaying case tamper as well as magnetic interference. It means if any of the tampers are detected, symbol ‘BP’ is displayed on the LCD.

For tamper definitions, refer to *Appendix B*.

**Note:** In the present solution, magnetic tamper is not logged in EEPROM. For logging, it can be easily done by modifying the EEPROM log structure.
6.6 62056-21 IRDA protocol mode C

The STEVAL-IPE012V2 demonstration board supports 62056-21 IRDA protocol mode C. IRDA is used as the communication channel for reading meter data. In such systems, a handheld unit (HHU) or a unit with equivalent functions is connected to a tariff device (energy meter). The protocol offers five alternative protocol modes, A, B, C, D and E. This user manual covers mode C use. In mode C, data exchange is bi-directional and is always initiated by the HHU with the transmission of a request message. In this mode, the HHU acts as a master and the tariff device acts as a slave. These protocol modes permit meter reading, manufacturer specific operation and programming mode. It is designed to be highly suitable for electricity metering environments, particularly with regards to electrical isolation and data security.

6.6.1 IRDA modes

- **Data readout mode**
  In data readout mode, the tariff device responds with all the data logged in EEPROM as per EEPROM data structure (refer to Appendix A). Each data block consists of a sequence of data lines separated by CR carriage return and LF linefeed.

- **Manufacturer specific mode**
  In manufacturer specific mode, RTC date and time setting is done.

- **Programming mode**
  In programming mode, as per the protocol, data read and write can be done at different locations of EEPROM.

6.6.2 SerialIO GUI

The SerialIO GUI can be used as test GUI for 62056-21 IRDA protocol mode C implementation. Here, the protocol is tested using serial communication. For this testing, a daughterboard with an RS232 converter is required to map PC serial data signals to 3.4 V data signals of the board.

Steps for serial communication based protocol testing:

- Demount R41, R42 from board
- Comment "#defines IRDA_MODE_ENABLE" in "emter_irda.h.
- Connect the RS232 daughterboard as shown in Figure 6
- Write data in serialIO GUI data box and send.
6.7 Pulse-out LED

LED D10 is used as pulse-out for cumulative energy. It works on a meter constant of 1600 impulses/kWh.

LED output can be used to test the accuracy of the meter.

Note: For more details about IRDA mode C, refer to 62056-21 IRDA protocol mode C document.
Appendix A  EEPROM log data structure

All the parameters below are stored in EEPROM:

- Calibration data (10 bytes)
  (3 bytes of CHV, CHP, CHS then 7 times 0x00)
- Total cumulative energy
  (at two locations - to keep duplicate entries)
- Total cumulative till last month
  (month-wise for the last six months and current month)
- Maximum demand
  (month-wise for the last six months and current month)
- Cumulative energy
  (month-wise for the last six months and current month)
- Average PF and averaging count
  (month-wise for the last six months and current month)
- Tamper information - earth, reverse, neutral missing, case tamper
  (month-wise for the last six months and current month and four entries per month with count for tamper and date and time details)
- Count of cumulative energy overflow
- Date and time of last power-down

Total size required: 920 bytes.

Data storage structure in EEPROM, as follows:

- Calibration data (CHV, CHP, CHS)
- CE main entry with CRC
- N month: CE till last month: MD: CE current month: average PF: tamper
- N-1 month: CE till last month: MD: CE current month: average PF: tamper
- N-2 month: CE till last month: MD: CE current month: average PF: tamper
- N-3 month: CE till last month: MD: CE current month: average PF: tamper
- N-4 month: CE till last month: MD: CE current month: average PF: tamper
- N-5 month: CE till last month: MD: CE current month: average PF: tamper
- N-6 month: CE till last month: MD: CE current month: average PF: tamper
- CE duplicate copy with CRC
- Count for cumulative energy overflow
- Power-down date and time.

Where N is the current month:

- All parameters are logged for a total of 7 months including one current and the last 6 months
- In current month log, data is updated at day end and on power-down
- Total cumulative energy log is updated half-hourly
- Month serial order is updated at 24:00 hrs of last date of each calendar month.

Note: EEPROM data structuring is done in a modular way to support future updates. Reconfigure parameters in header file “emeter_datamgmt.h” to modify log structure entry count.

6.9 Entry structure

- Calibration data log

CHV, CHP, CHS are calibration parameters for current and voltage channel for metering IC.

Table 6. Calibration data Log

<table>
<thead>
<tr>
<th>Calibration data</th>
<th>Start address</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>(CHV, CHP, CHS, 7 times 0x00)</td>
<td>0x00</td>
<td>10</td>
</tr>
</tbody>
</table>

For more details on calibration parameters, refer to the metering IC datasheet on www.st.com.

- Total cumulative energy log

Two duplicate entries are stored. One at the start of EEPROM and another at the end of EEPROM.

This is done to make sure that, if EEPROM is corrupted at one point, another entry with correct CRC is considered as the valid value.
● Cumulative energy till last month
Cumulative energy till last month states energy consumed till the last calendar month reset.

Table 7. Total cumulative energy log

| 7 bytes (4 bytes: kWh, 2byte: impulse count & 1byte: CRC) | Total cumulative energy entry |

Table 8. Cumulative energy till last month

| 6 bytes (4 bytes: kWh & 2byte: impulse count) | Cumulative energy entry till last month |

● Monthly maximum demand

Table 9. Monthly maximum demand

<table>
<thead>
<tr>
<th>3 bytes (1 byte: integer value &amp; 2byte: impulse count)</th>
<th>3 bytes</th>
<th>3 bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>MD Value</td>
<td>Date</td>
<td>Time</td>
</tr>
</tbody>
</table>

● Current monthly cumulative energy
Current monthly cumulative energy states energy consumed in that particular current month till the last calendar month reset.

Table 10. Current monthly cumulative energy

| 6 Bytes (4 bytes: kWh & 2byte: impulse count) | Current cumulative energy entry |

● Monthly average PF
PF average value is the sum of PF readings and PF averaging count is the number of PF readings.

Table 11. Monthly average PF

<table>
<thead>
<tr>
<th>4 bytes</th>
<th>2 bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>PF average value</td>
<td>PF averaging value</td>
</tr>
</tbody>
</table>
● Monthly tamper log

For the monthly tamper log, the following four types of tamper data are logged.

- Earth tamper
- Reverse tamper
- Neutral missing tamper
- Case tamper.

For each tamper, there are 4 entries per month.

So, for each type of tamper, the storage per month is:

- Tamper count: 1 byte
- Four entries of date: 3 bytes x 4 : 12 bytes
- Four entries of time: 3 bytes x 4 : 12 bytes.

Table 12. Monthly tamper log

<table>
<thead>
<tr>
<th>1 byte</th>
<th>3 bytes</th>
<th>3 bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tamper count</td>
<td>Date</td>
<td>Time</td>
</tr>
</tbody>
</table>

In one tamper entry log, tamper count: number of tampers in a month.
D: date and T: time each is of 3 bytes.
Appendix B  Tamper definitions

- Earth tamper
  - Using earth in place of neutral (load current is passed partially or fully through earth)
- Reverse connection
  - Reversal of phase and neutral at mains
- Neutral missing tamper
  - When neutral is disconnected, the board is not powered. During this condition (single-wire conditions), power supply is generated by a CT for powering up the board.
- Case tamper
  - If an attempt is made to open the meter body, the meter logs the date/time of meter opening tamper
- Magnetic tamper
  - When a magnet comes near to the board, it pulls magnetic sensor output IO low.
B.1 Schematics
