Introduction

The MotionPE middleware library is part of the X-CUBE-MEMS1 software and runs on STM32. It provides real-time information about the user current pose based on data from a device.

It is able to distinguish the following poses: sitting, standing and lying down. The library is intended for wrist-worn devices.

This library is intended to work with ST MEMS only.

The algorithm is provided in static library format and is designed to be used on STM32 microcontrollers based on the ARM® Cortex®-M3 or ARM® Cortex®-M4 architecture.

It is built on top of STM32Cube software technology to ease portability across different STM32 microcontrollers.

The software comes with sample implementation running on X-NUCLEO-IKS01A2 or X-NUCLEO-IKS01A3 expansion board on a NUCLEO-F401RE, NUCLEO-L476RG or NUCLEO-L152RE development board.

Table 1: List of acronyms
2  MotionPE middleware library in X-CUBE-MEMS1 software expansion for STM32Cube

2.1  MotionPE overview

The MotionPE library expands the functionality of the X-CUBE-MEMS1 software. The library acquires data from the accelerometer and provides information about the user current pose based on data from a device. The library is designed for ST MEMS only. Functionality and performance when using other MEMS sensors are not analyzed and can be significantly different from what described in the document. A sample implementation is available for XX-NUCLEO-IKS01A2 and X-NUCLEO-IKS01A3 expansion boards, mounted on a NUCLEO-F401RE, NUCLEO-L476RG or NUCLEO-L152RE development board.

2.2  MotionPE library

Technical information fully describing the functions and parameters of the MotionPE APIs can be found in the MotionPE_Package.chm compiled HTML file located in the Documentation folder.

2.2.1  MotionPE library description

The MotionPE pose estimation library manages the data acquired from the accelerometer; it features:

- possibility to distinguish the following user poses: sitting, standing, lying down
- intended for wrist-worn devices
- recognition based on the accelerometer data only
- required accelerometer data sampling frequency of 16 Hz
- resources requirements:
  - Cortex-M3: 11.8 kB of code and 2.8 kB of data memory
  - Cortex-M4: 12.4 kB of code and 2.8 kB of data memory
- available for ARM® Cortex®-M3 and ARM Cortex-M4 architectures

2.2.2  MotionPE APIs

The MotionPE library APIs are:

- `uint8_t MotionPE_GetLibVersion(char *version)`
  - retrieves the library version
  - *version is a pointer to an array of 35 characters
  - returns the number of characters in the version string
- `void MotionPE_Initialize(void)`
  - performs MotionPE library initialization and setup of the internal mechanism
  - the CRC module in STM32 microcontroller (in RCC peripheral clock enable register) has to be enabled before using the library
  
  Note: This function must be called before using the pose estimation library
- `void MotionPE_ResetLib(void)`
  - reset the library
- `void MotionPE_Update(MPE_input_t *data_in, MPE_output_t *data_out)`
  - executes pose estimation algorithm
  - *data_in parameter is a pointer to a structure with input data
  - the parameters for the structure type MPE_input_t are:
    - AccX is the accelerometer sensor value in X axis in g
    - AccY is the accelerometer sensor value in Y axis in g
    - AccZ is the accelerometer sensor value in Z axis in g
  - *data_out parameter is a pointer to an enum with the following items:
- MPE_UNKNOWN = 0
- MPE_SITTING = 1
- MPE_STANDING = 2
- MPE LYING_DOWN = 3

void MotionPE_SetOrientation_Acc(const char *acc_orientation)
- this function is used to set the accelerometer data orientation
- configuration is usually performed immediately after the MotionPE_Initialize function call
- *acc_orientation parameter is a pointer to a string of three characters indicating the direction of each of the positive orientations of the reference frame used for accelerometer data output, in the sequence x, y, z. Valid values are: n (north) or s (south), w (west) or e (east), u (up) or d (down).
- As shown in the figure below, the X-NUCLEO-IKS01A2 accelerometer sensor has an NWU (x-North, y-West, z-Up), so the string is: “nwu”.

Figure 1. Example of sensor orientations

Figure 2. Orientation system for wrist-worn devices
2.2.3 API flow chart

Figure 3. MotionPE API logic sequence

- **Start**
- **Initialize**
- **GetLibVersion**
- **SetOrientation_Acc**
- **Wait Expiring Timer Data Read Interrupt**
- **Read Accelerometer Data**
- **Update**
- **Get Pose Estimation Code**

2.2.4 Demo code

The following demonstration code reads data from the accelerometer sensor and gets the estimated pose.

```c
#define VERSION_STR_LENG 35

/*** Initialization ***/
char lib_version[VERSION_STR_LENG];
```
char acc_orientation[3];

/* Pose Estimation API initialization function */
MotionPE_Initialize();

/* Optional: Get version */
MotionPE_GetLibVersion(lib_version);

/* Set accelerometer orientation */
acc_orientation[0] = 'n';
acc_orientation[1] = 'w';
acc_orientation[2] = 'u';
MotionPE_SetOrientation_Acc(acc_orientation);

[...]

/** Using Pose Estimation algorithm ***/
Timer_OR_DataRate_Interrupt_Handler()
{
  MPE_input_t data_in;
  MPE_output_t data_out;

  /* Get acceleration X/Y/Z in g */
  MEMS_Read_AccValue(&data_in.AccX, &data_in.AccY, &data_in.AccZ);

  /* Pose Estimation algorithm update */
  MotionPE_Update(&data_in, &data_out);
}

2.2.5 Algorithm performance

The pose estimation algorithm only uses data from the accelerometer and runs at a low frequency (16 Hz) to reduce power consumption.

The table below shows the performance of the pose estimation algorithm in terms of recognition success rates.

<table>
<thead>
<tr>
<th>Pose</th>
<th>Detection probability (typical)</th>
<th>Minimum latency</th>
<th>Typical latency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sitting</td>
<td>83.30%</td>
<td>15 s</td>

2.3 Sample application

The MotionPE middleware can be easily manipulated to build user applications.

A sample application is provided in the Application folder. It is designed to run on a NUCLEO-F401RE, NUCLEO-L476RG or NUCLEO-L152RE development board connected to an X-NUCLEO-IKS01A2 or X-NUCLEO-IKS01A3 expansion board.

The application recognizes the current user pose in real-time. The data can be displayed through a GUI or stored in the board for offline analysis.
Stand-alone mode

In stand-alone mode, the sample application allows the user to detect the current user pose and store it in the MCU flash memory.

The STM32 Nucleo board may be supplied by a portable battery pack (to make the user experience more comfortable, portable and free of any PC connections).

<table>
<thead>

Figure 4. STM32 Nucleo: LEDs, button, jumper

The above figure shows the user button B1 and the three LEDs of the NUCLEO-F401RE board. Once the board is powered, LED LD3 (PWR) turns ON and the tricolor LED LD1 (COM) begins blinking slowly due to the missing USB enumeration (refer to UM1724 on www.st.com for further details).

Note: After powering the board, LED LD2 blinks once indicating the application is ready.

When the user button B1 is pressed, the system starts acquiring data from the accelerometer sensor and detects the current user pose; during this acquisition mode, a fast LED LD2 blinking indicates that the algorithm is running. During this phase, the detected user pose is stored in the MCU internal flash memory. Data are automatically saved every 5 minutes to avoid excessive data loss in case of an unforeseen power fault.

Pressing button B1 a second time stops the algorithm and data storage and LED LD2 switches off.

Pressing the button again starts the algorithm and data storage once again.

The flash sector dedicated to data storage is 128 KB, allowing memorization of more than 16,000 data sets.

To retrieve these data, the board must be connected to a PC running Unicleo-GUI. When stored data is retrieved via the GUI, the MCU flash sector dedicated to this purpose is cleared.
If LED LD2 is ON after powering the board, it represents a warning message indicating the flash memory is full.

**Note:** Optionally, the MCU memory can be erased by holding the user push button down for at least 5 seconds. LED LD2 switches OFF and then blinks 3 times to indicate that the data stored in the MCU has been erased. This option is available only after power ON or reset of the board while LED LD2 is ON indicating the flash memory is full.

When the application runs in stand-alone mode and the flash memory is full, the application switches to PC GUI drive mode and LED LD2 switches OFF.

The flash memory must be erased by downloading data via the Unicleo-GUI or the user push button (see the above note).

**PC GUI drive mode**

In this mode, a USB cable connection is required to monitor real-time data. The board is powered by the PC via USB connection. This working mode allows the user to display real-time detected user pose, accelerometer data, time stamp and any other sensor data, using the Unicleo-GUI.

In this working mode, data are not stored in the MCU flash memory.

### 2.4 Unicleo-GUI application

The sample application uses the Windows Unicleo-GUI utility, which can be downloaded from www.st.com.

**Step 1.** Ensure that the necessary drivers are installed and the STM32 Nucleo board with appropriate expansion board is connected to the PC.

**Step 2.** Launch the Unicleo-GUI application to open the main application window.

If an STM32 Nucleo board with supported firmware is connected to the PC, it is automatically detected and the appropriate COM port is opened.

**Figure 5. Unicleo main window**

---

**Step 3.** Start and stop data streaming by using the appropriate buttons on the vertical tool bar. The data coming from the connected sensor can be viewed in the User Messages tab.
Step 4. Click on the Pose Estimation icon in the vertical tool bar to open the dedicated application window.

If the board has been working in standalone mode and the user wants to retrieve stored data, press Download Off-line Data button to upload the stored activities data to the application. This operation automatically deletes acquired data from microcontroller.

Press the Save Off-line Data to File button to save the uploaded data in a .tsv file.

Step 5. Click on the Datalog icon in the vertical tool bar to open the datalog configuration window: you can select which sensor and activity data to save in files. You can start or stop saving by clicking on the corresponding button.
All of the following resources are freely available on www.st.com.
