

# Getting started with MotionTL tilt measurement library in X-CUBE-MEMS1 expansion for STM32Cube

#### Introduction

The MotionTL middleware library is part of the X-CUBE-MEMS1 software and runs on STM32. It provides real-time information about the tilt angles of the user device, i.e. cell phone. The library is also able to perform accelerometer 6-position calibration.

This library is intended to work with ST MEMS only.

The algorithm is provided in static library format and is designed to be used on STM32 microcontrollers based on the ARM<sup>®</sup> Cortex<sup>®</sup>-M0+, ARM<sup>®</sup> Cortex<sup>®</sup>-M3, ARM<sup>®</sup> Cortex<sup>®</sup>-M3, ARM<sup>®</sup> Cortex<sup>®</sup>-M4 or ARM<sup>®</sup> Cortex<sup>®</sup>-M7 architecture.

It is built on top of STM32Cube software technology to ease portability across different STM32 microcontrollers.

The software comes with a sample implementation running on an X-NUCLEO-IKS01A3, X-NUCLEO-IKS02A1 or X-NUCLEO-IKS04A1 expansion board on a NUCLEO-F401RE, NUCLEO-L073RZ, NUCLEO-L152RE or NUCLEO-U575ZI-Q development board

## 1 Acronyms and abbreviations

# MotionTL middleware library in X-CUBE-MEMS1 software expansion for STM32Cube

#### 2.1 MotionTL overview

The MotionTL library expands the functionality of the X-CUBE-MEMS1 software.

The library acquires data from the accelerometer and provides real-time tilt information with multimode support for the 3-axis accelerometer. This library is suitable for static inclinometer where system acceleration is negligible, such as in industrial applications, leveling, satellite antennas, solar panels, and automotive.

The library is also able to perform accelerometer 6-position calibration.

The library is designed for ST MEMS only. Functionality and performance when using other MEMS sensors are not analyzed and can be significantly different from what described in the document.

A sample implementation is available for X-NUCLEO-IKS01A3, X-NUCLEO-IKS02A1 or X-NUCLEO-IKS4A1 expansion boards, mounted on a NUCLEO-F401RE, NUCLEO-L073RZ, NUCLEO-L152RE or NUCLEO-U575ZI-Q development board.

#### 2.2 MotionTL library

Technical information fully describing the functions and parameters of the MotionTL APIs can be found in the MotionTL Package.chm compiled HTML file located in the Documentation folder.

#### 2.2.1 MotionTL library description

The MotionTL pedometer library manages the data acquired from the accelerometer; it features:

- Calculation of pitch, roll, and gravity inclination angles (Pitch-Roll-Gravity-Inclination mode)
- Calculation of theta, psi, and phi tilt angles (Theta-Psi-Phi mode)
- Accelerometer 6-position calibration
- Measurement based on the accelerometer data only
- Configure knobs to mitigate vibration noise
- Output: tilt angles, validity flag, expected error
- Recommended sensor data sampling frequency of 100 Hz and support for all full-scale ranges
- Resources requirements:
  - Cortex®-M0+: 3.6 KB of code and 0.2 KB of data memory
  - Cortex®-M3: 3.4 KB of code and 0.2 KB of data memory
  - Cortex®-M33: 3 KB of code and 0.2 KB of data memory
  - Cortex®-M4: 3.1 KB of code and 0.2 KB of data memory
  - Cortex®-M7: 3.1 KB of code and 0.2 KB of data memory
- Available for Arm Cortex®-M0+, Arm Cortex®-M3, Arm Cortex®-M33, Arm Cortex®-M4 or Arm Cortex®-M7 architectures

#### 2.2.2 MotionTL APIs

The MotionTL library APIs are:

- void MotionTL\_Initialize(MTL\_mcu\_type\_t mcu\_type, const char \*acc\_orientation)
  - Performs MotionTL library initialization and setup of the internal mechanism
  - Sets the accelerometer orientation
  - The CRC module in STM32 microcontroller (in the RCC peripheral clock enable register) has to be enabled before using the library
- mcu\_type is the type of MCU:
  - MFX CMOP MCU STM32 is a standard STM32 MCU
  - MFX\_CM0P\_MCU\_BLUE\_NRG1 is BlueNRG-1
  - MFX CMOP MCU BLUE NRG2 is BlueNRG-2
  - MFX CMOP MCU BLUE NRG LP is BlueNRG-LP
- \*acc\_orientation is the reference system of the accelerometer raw data

UM2277 - Rev 10 page 3/20

Note: This function must be called before using the tilt library.

- void MotionTL SetKnobs (MTL knobs t \*knobs)
  - Sets the knobs
  - The parameters for the structure type MTL\_knobs\_t are:
    - fullscale is the full scale of an accelerometer (in g). It is recommended to set full scale >1 g
      for the sensor. A lower full scale can be selected if the tilt variation is limited and higher
      resolution is required for the application.
    - k is the filtering coefficient. The range of k is [0.1 to ODR]. The lower value of k increases the
      filtering and removes the noise. For systems with high vibration, it is recommended to reduce
      the value of k.
    - orn[3] is the accelerometer data orientation string of three characters indicating the direction of each positive orientation of the reference frame used for the accelerometer data output, in the sequence x, y, z. Valid values are: n (north) or s (south), w (west) or e (east), u (up) or d (down) (see Figure 1). The orn is defined to bring the sensor into the X-NUCLEO-IKS4A1 frame.
    - mode is the operational mode where:
      - MODE\_PITCH\_ROLL\_GRAVITY\_INCLINATION enables angle representation in Euler angles (Roll, Pitch, and Phi) form
      - MODE\_THETA\_PSI\_PHI enables angle computation of theta, psi, and phi angle which measure the angle individually on each axis

Note: The API can be called after <code>MotionTL\_Initialize()</code> but before <code>MotionTL\_Update()</code>

- void MotionTL GetKnobs (MTL knobs t \*knobs)
  - Gets the knobs setting
  - For the parameters for the structure type MTL\_knobs\_t refer to the MotionTL\_SetKnobs() function

UM2277 - Rev 10 page 4/20

- void MotionTL\_Update(MTL\_input\_t \*data\_in, uint64\_t timestamp\_ms, MTL\_output\_t \*data out)
  - Executes the tilt algorithm
  - \*data\_in parameter is a pointer to a structure with input data
  - timestamp ms is the time stamp in milliseconds
  - \*data out parameter is a pointer to a structure with output data
  - The parameters for the structure type MTL input t are:
    - acc x is the accelerometer value in X axis in the g
    - acc y is the accelerometer value in Y axis in the g
    - acc z is the accelerometer value in Z axis in the g
  - The parameters for the structure type MTL\_output\_t are:
    - theta\_3x in Theta-Psi-Phi mode—the angle between the X axis and the horizontal plane. The range of angle is [-90, 90] degrees.
    - $_{\circ}$  psi\_3x in Theta-Psi-Phi mode–the angle between the Y axis and the horizontal plane. The range of angle is [-90, 90] degrees.
    - $_{\circ}$  phi\_3xin both modes—the angle between the X-Y plane and the horizontal plane. The range of angle is [0, 90] degrees.
    - $\circ$  roll\_3x in Pitch-Roll-Gravity-Inclination mode—the roll angle. The range of angle is [-180, 180] degrees.
    - pitch\_3x in Pitch-Roll-Gravity-Inclination mode—the pitch angle. The range of angle is [-90, 90] degrees.
    - err\_deg in both modes—the predicted angle error. The range of error in angle is [0, 90] degrees. The output can be used to accept/reject the tilt angle.
    - valid in both modes, this flag is used to show if output is valid or not. If accelerometer reading
      is showing high vibration or saturation at full scale, library will output '0' in the valid field.

Note:

In Pitch-Roll-Gravity-Inclination mode, the phi\_3x value represents the gravity\_inclination\_3x value.

- uint8\_t MotionTL\_GetLibVersion(char \*version)
  - Retrieves the library version
  - \*version is a pointer to an array of 35 characters
  - Returns the number of characters in the version string
- void MotionTL\_CalibratePosition(float cal\_data[][3], uint32\_t num\_records, MTL\_cal\_position\_t cal\_position)
  - Calibrates accelerometer in a specific position
  - calData parameter is a 2D array with accelerometer data for calibration (3 axes per record)
  - num-records parameter is the number of records
  - calPosition parameter is an enumeration of the desired position
  - The values for the enumeration type MTL\_CalPosition\_t are:
    - ° X UP
    - ° X\_DOWN
    - Y UP
    - Y DOWN
    - ° Z\_UP
    - ° Z\_DOWN
- MTL cal result t
- MotionTL GetCalValues (MTL acc\_cal\_t \*acc\_cal)

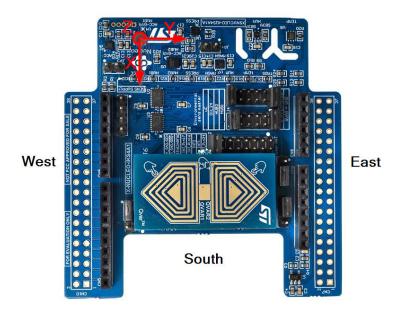

UM2277 - Rev 10 page 5/20

- Gets the calculated calibration values from the library to be used in the application
  - The return value is an enumeration of the calibration result
  - The values for the enumeration type MTL cal result t are:
    - CAL PASS: Calibration passed
    - CAL NONE: Calibration not finished or not performed at all
    - CAL FAIL: Calibration failed
  - acc\_cal parameter is a pointer to a structure with calibration parameters
  - The parameters for the structure type MTL\_acc\_cal\_t are:
    - offset parameter is an array with calculated offset for all 3 axes
    - $\circ$  gain parameter is an array with calculated gain for all 3 axes
- MTL\_cal-result\_t MotionTL\_SetCalValues(MTL\_acc\_cal\_t \*acc\_cal)
  - Validates and sets the calibration values passed in the parameter
  - The return value is an enumeration of the calibration result
  - For the values for the enumeration type MTL\_cal\_result\_t, see MotionTL\_GetCalValues() function
  - acc\_cal parameter is a pointer to a structure with calibration parameters
  - For the values for the enumeration type MTL\_acc\_cal\_t, see MotionTL\_GetCalValues() function
- void MotionTL SetOrientation Acc(const char \*acc orientation)
  - This function is used to set the accelerometer data orientation
  - Configuration is usually performed immediately after the MotionTL\_Initialize function call
  - \*acc\_orientation parameter is a pointer to a string of three characters indicating the direction of each of the positive orientations of the reference frame used for accelerometer data output, in the sequence x, y, z. Valid values are: n (north) or s (south), w (west) or e (east), u (up) or d (down). As shown in the figure below, the X-NUCLEO-IKS4A1 accelerometer has an SEU (x-South, y-East, z-Up) orientation, so the string is: "seu".

Figure 1. Example of sensor orientations

#### North

UM2277 - Rev 10 page 6/20

#### 2.2.3 Orientation

The MotionTL library works with the NWU orientation system, which means the device's X axis is pointing North, the Y axis is pointing West and the Z axis is pointing Up.

Any sensor orientation is internally transformed into device NWU orientation system. For this reason the sensor orientation must be defined by passing the acc orientation parameter to the

 ${\tt MotionTL\_Initialize} \\ \textbf{function or using } \\ \texttt{MotionTL\_SetOrientation\_Acc} \\ \textbf{function. All the outputs (angles)} \\ \textbf{are then calculated relative to the NWU orientation system.} \\$ 

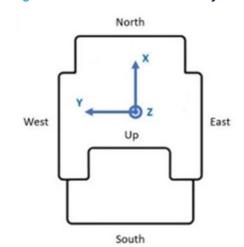

Figure 2. Device NWU orientation system

The MotionTL library has different types of output angles as detailed in the following tables.

Value **Pitch** Roll **Gravity inclination** Formula arctan2 (-Y/Z) arcsin (X) arccos (Z) -90°, +90° -180°, +180° 0, 180° Range Angle between X axis and horizontal Angle between Y axis and horizontal Angle between gravity vector Description plane. and Z axis. plane. South edge of the device going towards West edge of the device going towards Sign Always positive. the ground generates positive pitch. the ground generates positive roll.

Table 2. Pitch, Roll, and gravity inclination output angles

Table 3. Theta, psi and Phi output angles

Value	Theta	Psi	Phi
Formula	arctan (X/sqrt(Y <sup>2</sup> +Z <sup>2</sup> ))	arctan (Y/sqrt(X <sup>2</sup> +Z <sup>2</sup> ))	arctan (sqrt(X <sup>2</sup> +Y <sup>2</sup> )/Z)
Range	-90°, +90°	-90°, +90°	-90°, +90°
Description	Angle between X axis and horizontal plane.	Angle between Y axis and horizontal plane.	Angle between Z axis and gravity vector.
Sign	South edge of the device going towards the ground generates a positive theta angle.	East edge of the device going towards the ground generates a positive psi angle.	Positive if Z axis facing up, Negative if Z axis facing down.

Note: Calculation using tangent functions produces constant tilt sensitivity over measurement range.

#### 2.3 Sample application

The MotionTL middleware can be easily manipulated to build user applications; a sample application is provided in the Application folder.

It is designed to run on a NUCLEO-F401RE, NUCLEO-L073RZ, NUCLEO-L152RE or NUCLEO-U575ZI-Q development board connected to an X-NUCLEO-IKS01A3, X-NUCLEO-IKS02A1 or X-NUCLEO-IKS4A1 expansion board.

The tilt sensing algorithm only uses data from the accelerometer. It detects and provides real-time information about the tilt angles of the user device. The library is also able to perform accelerometer 6-position calibration if required. The data can be displayed through a GUI.

A USB cable connection is required to monitor real-time data. This allows the user to display in real-time calculated tilt angles, accelerometer data, time stamp and eventually other sensor data using the MEMS-Studio.

After pressing the **Tilt Calibrate** button in the Unicleo-GUI, the user is asked to hold the device still in each of the six positions while the calibration data is collected. Then the calibration parameters (offset and gain for all three axes) are calculated and sent to the Unicleo-GUI.

#### 2.4 MEMS-Studio application

The sample application uses the MEMS-Studio GUI application, which can be downloaded from www.st.com.

- Step 1. Ensure that the necessary drivers are installed and the STM32 Nucleo board with the appropriate expansion board is connected to the PC.
- Step 2. Launch the MEMS-Studio application to open the main application window.
  If an STM32 Nucleo board with supported firmware is connected to the PC, the appropriate COM port is automatically detected. Press the [Connect] button to open this port.

Figure 5. MEMS-studio connect

UM2277 - Rev 10 page 10/20

Step 3. When connected to a STM32 Nucleo board with supported firmware [Library Evaluation] tab is opened.

To start and stop data streaming, toggle the appropriate start / stop button on the outer vertical tool bar.

Figure 6. Start

Figure 7. Stop

The data coming from the connected sensor can be viewed selecting the [**Data Table**] tab on the inner vertical tool bar.

Figure 8. MEMS-Studio - library evaluation - data table

UM2277 - Rev 10 page 11/20

Step 4. Select the [Motion Tilt] tab on the inner vertical tool bar to open the dedicated application status window.

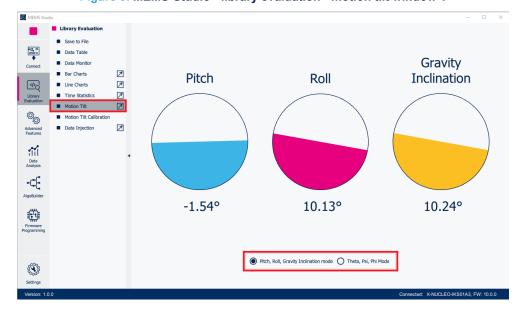

Figure 9. MEMS-Studio - library evaluation - motion tilt window 1

You can switch between two angle modes. In the first mode the Pitch, Roll and Gravity Inclination angles are displayed, in the second mode, the Theta, Psi, and Phi angles are displayed. The meaning of the angles in the second mode is displayed right above each indicator:

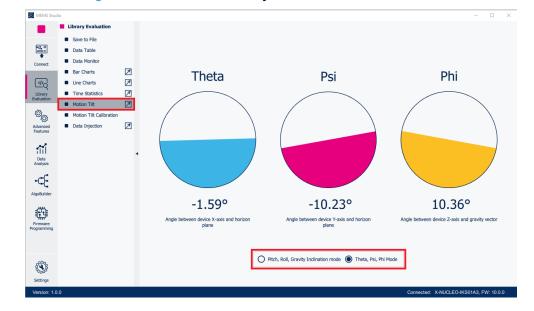

Figure 10. MEMS-Studio - library evaluation - motion tilt window 2

UM2277 - Rev 10 page 12/20

Step 5. Click on the [Motion Tilt Calibration] icon in the vertical tool bar to open the dedicated application window.

MEMS SI Library Evaluation ■ Data Table ■ Data Monito ■ Bar Charts √Q ■ Line Charts 7 Step 1 Step 2 Step 3 Step 4 Step 5 Step 6 7 ■ Time Statistic A (C) ■ Motion Tilt C Data Analysis Calibration Done -C{ Axis X: -0.00690 Axis Y: 0.00879 Axis Z: 0.00927 Axis X: 1.00267 Axis Y: 0.99838 Axis Z: 1.00026

Figure 11. MEMS-Studio - library evaluation - motion tilt calibration window 1

It will first show currently used calibration values calculated and stored during the previous calibration or default values if the calibration has never been performed.

You can start a new calibration by clicking the [Start calibration] button:

- Put the device in the first calibration position
- Press the [Next] button and hold the device still until the progress bar finishes and the [Hold still...] message disappears
- Repeat the same procedure for all calibration steps (step 2 through step 6)

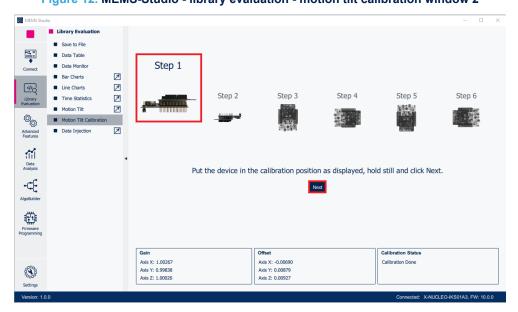

Figure 12. MEMS-Studio - library evaluation - motion tilt calibration window 2

Once the last position is calibrated, the new calibration parameters are calculated and updated in the bottom part of the window.

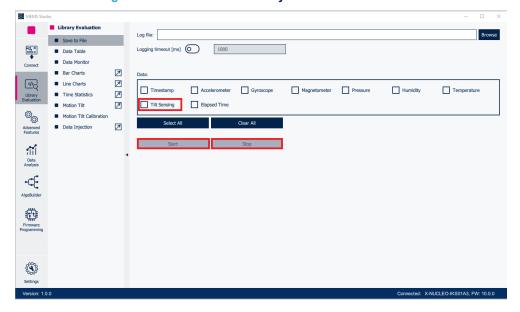

UM2277 - Rev 10 page 13/20

Step 6. Select the [Save to File] tab on the inner vertical tool bar to open the data logging configuration window. Select which sensor and [Tilt] data to save to the log file.

You can start or stop saving by clicking on the corresponding [Start/Stop] button.

Figure 13. MEMS-Studio - library evaluation - Save to file
