Fundamentals of Time-of Flight

FlightSense™ Principle

**Measured
distance**

=

**Photon travel
time /2**

x

**Speed of
light**

1cm round-trip at 67ps!

- At t0, the VCSEL emits Multiple train pulses to generate a time-of-arrival histogram towards a target
- Photons are partially reflected by the target to the receiver SPAD array (t1)
- The SPAD generates a small pulse for each received photon
- Time between initial pulse and reconstructed received pulse is measured and added to time counters to create a photon event histogram.
- Time is converted in distance using dedicated algo
- Distance value ready to be read in sensor registers
