INTRODUCTION
The purpose of this document is to explain the behaviour of LCP 150S/1511/1512 devices during the coupling between a telecommunication line and a mains line.

TEST DIAGRAM
Figure 1 shows the test diagram. The mains 220 V 50 Hz is applied to the test assembly through an isolation transformer. A relay driven by a mono-pulse generator allows the conducting time to be adjusted. The current through the device is adjusted by a series resistor.

Figure 1. Test Diagram

MEASUREMENTS
During the tests three kinds of behaviour occur:
a) As shown in Figure 2 the device acts as a clamping device (non-firing) due to the small value of the current which never exceeds the latching current of the structure.
Figure 2. Voltage and current for a non-firing device

b) In the second operating region the LCPxxx fires and the piece under test is still functional after 15 minutes.
- Figure 3.1 shows the start of the firing (the peak of the current wave through the device is just over the latching limit).
- Figure 3.2 the amplitude of the current wave through the device is greater than in the precedent case, so the device is well fired after a few hundred microseconds.

c) In the third operating region the device has been destroyed in a time depending on the current through the LCPxxx.

Figure 3. Equivalent circuit of both driver and receiver adjacent lines

3.1 With I slightly higher than I_{latch}.
3.2 With I considerably higher than I_{latch}.
ANALYSIS

Table 1. Operating Region Definition

<table>
<thead>
<tr>
<th>OPERATING REGION</th>
<th>LCP 150</th>
<th>LCP 1512</th>
<th>LCP 1511</th>
</tr>
</thead>
<tbody>
<tr>
<td>A/clamping</td>
<td>0 to 70 mA*</td>
<td>0 to 70 mA*</td>
<td>0 to 70 mA*</td>
</tr>
<tr>
<td>B/non destructive region</td>
<td>0.07 to 2 A*</td>
<td>0.07 to 1.2 A*</td>
<td>0.07 to 0.8 A*</td>
</tr>
<tr>
<td>C/destructive region</td>
<td>Over 2 A*</td>
<td>Over 1.2 A*</td>
<td>Over 0.8 A*</td>
</tr>
</tbody>
</table>

* RMS current

Table 1 shows the range of the three operating regions, while Figure 4, which illustrates region C, allows us to determine the destruction time limit of each device versus the current through the structure (RMS current at 25°C).

Figure 4: Characteristics of Region C (With Vgate = -48 V)

CONCLUSION

Figure 4: The devices in the LCPxxx family have common characteristics, divided into three regions:

a) Clamping mode, still functional after 15 minutes
b) Crowbar mode (firing) still functional after 15 minutes of test at 25°C
c) Crowbar mode, with a destruction time defined by Figure 4.

The given curves enable the appropriate series elements to be chosen, for example a PTC device.
### REVISION HISTORY
