BlueMS application for Android and iOS

Features
- Sensor data reception and command transmission over Bluetooth Low Energy (BLE).
- Support for multiple STM32ODE function packs and boards.
- Available on Android and iOS app stores.
- Cross-platform user interface and functionality.
- Based on BlueST-SDK library.
- Data logging support.
- Data plotting support.
- Included serial console (stdout/stdin/stderr) over Bluetooth.
- Secure pairing (with pin) support.
- Data publishing on the cloud support.

Description
The ST BlueMS is the application available for Android and iOS that shows the data exported by a BLE device using the BlueST protocol (e.g. FP-SNS-ALLMEMS1 STM32ODE function pack).

The app shows different panels based on the data types exported by the firmware, including: environmental data, MEMS sensor fusion, plot, activity recognition, carry position, acceleration event, BlueVoice, pedometer, switch, motion intensity, compass, cloud logging, node status.

All the data received by the app can be logged in CVS files and exported by e-mail.

If the firmware supports the functionality, the application can also show a serial console to exchange string messages with the board. This functionality is also used to upgrade the board firmware.

Both Android and iOS applications support the Bluetooth secure pairing with pin.

For Android it is also possible to use an NFC tag to read the pin and trigger the connection with the node.
Detailed description

The available panels shown by the application are:

- Environmental data: displays the data from the environmental sensors (temperature, pressure, humidity, light).
- MEMS sensor fusion: moves a cube using the quaternions computed by the sensor fusion library (if supported by the firmware).
- Plot: plots the available features.
- Activity recognition: shows the result of the activity recognition algorithm library (if supported by the firmware).
- Carry position: shows the result of the carry position recognition algorithm library (if supported by the firmware).
- Acceleration event: displays events like single tap, double tap, orientation, pedometer detected by the accelerometer component.
- BlueVoice: receives the audio from a MEMS microphone (if available).
- Pedometer: shows the output of the pedometer algorithm (if supported by the firmware).
- Switch: changes the LED status
- Motion intensity: shows the output of the motion intensity detection library (if supported by the firmware).
- Compass: displays the board orientation with respect to the magnetic north (if supported by the firmware).
- Cloud: sends board data to a cloud provider using the MQTT protocol.
- Node status: shows the RSSI of a BLE signal and the battery level.
