ESDALC5-1BT2Y

Automotive single-line low capacitance Transil™,
transient surge voltage suppressor (TVS) for ESD protection

Datasheet — production data

Features
- Single-line bidirectional protection
- Breakdown voltage = 5.8 V min.
- Low capacitance = 26 pF at 0 V
- Lead-free packages
- ECOPACK®2 compliant component
- AEC-Q101 qualified

Benefits
- Low capacitance for optimized data integrity
- Low leakage current < 60 nA
- Low PCB space consumption: 0.6 mm²
- High reliability offered by monolithic integration

Complies with the following standards:
- IEC 61000-4-2 (exceeds level 4)
  - 30 kV (air discharge)
  - 30kV (contact discharge)
- ISO10605: C = 330 pF, R = 330 Ω
  - 30kV (air discharge)
  - 30kV (contact discharge)
- ISO 7637-3:
  - Pulse 3a: V₉ = -150 V
  - Pulse 3b: V₉ = +100 V

Applications
Where transient overvoltage protection in ESD sensitive equipment is required, such as:
- Automotive applications
- Computers
- Printers
- Communication systems
- Cellular phone handsets and accessories
- Video equipment

Description
The ESDALC5-1BT2Y is bidirectional single-line TVS diode designed to protect data lines or other I/O ports against ESD transients.
This device is ideal for applications where both printed circuit board space and power absorption capability are required.

3 Recommendation on PCB assembly

3.1 Stencil opening design

1. General recommendation on stencil opening design
   a) Stencil opening dimensions: L (Length), W (Width), T (Thickness).

   Figure 19. Stencil opening dimensions

   b) General design rule
      Stencil thickness (T) = 75 ~ 125 µm
      Aspect Ratio = \( \frac{W}{T} \geq 1,5 \)
      Aspect Area = \( \frac{L \times W}{2T(L+W)} \geq 0,66 \)

2. Reference design
   a) Stencil opening thickness: 100 µm
   b) Stencil opening for central exposed pad: Opening to footprint ratio is 50%.
   c) Stencil opening for leads: Opening to footprint ratio is 90%.

   Figure 20. Recommended stencil window position in mm (inches)
3.2 Solder paste
1. Halide-free flux qualification ROL0 according to ANSI/J-STD-004.
2. “No clean” solder paste is recommended.
3. Offers a high tack force to resist component movement during high speed.
4. Solder paste with fine particles: powder particle size is 20-45 µm.

3.3 Placement
1. Manual positioning is not recommended.
2. It is recommended to use the lead recognition capabilities of the placement system, not the outline centering.
3. Standard tolerance of ± 0.05 mm is recommended.
4. 3.5 N placement force is recommended. Too much placement force can lead to squeezed out solder paste and cause solder joints to short. Too low placement force can lead to insufficient contact between package and solder paste that could cause open solder joints or badly centered packages.
5. To improve the package placement accuracy, a bottom side optical control should be performed with a high resolution tool.
6. For assembly, a perfect supporting of the PCB (all the more on flexible PCB) is recommended during solder paste printing, pick and place and reflow soldering by using optimized tools.

3.4 PCB design preference
1. To control the solder paste amount, the closed via is recommended instead of open vias.
2. The position of tracks and open vias in the solder area should be well balanced. The symmetrical layout is recommended, in case any tilt phenomena caused by asymmetrical solder paste amount due to the solder flow away.
3.5 Reflow profile

Figure 21. ST ECOPACK® recommended soldering reflow profile for PCB mounting

Note: Minimize air convection currents in the reflow oven to avoid component movement.
