### TSV731, TSV732, TSV734

High accuracy (200 µV) micropower 60 µA, 900 kHz 5 V CMOS operational amplifiers

#### Features
- Low offset voltage: 200 µV max.
- Low power consumption: 60 µA at 5 V
- Low supply voltage: 1.5 V to 5.5 V
- Gain bandwidth product: 900 kHz typ.
- Low input bias current: 1 pA typ.
- Rail-to-rail input and output
- EMI hardened operational amplifiers
- High tolerance to ESD: 4 kV HBM
- Extended temperature range: -40 to +125 °C

#### Benefits
- Higher accuracy without calibration
- Energy saving
- Guaranteed operation on low-voltage battery

#### Related products
- See the TSV71 series (150 kHz for 14 µA) for more power savings

#### Applications
- Battery powered applications
- Portable devices
- Signal conditioning
- Active filtering
- Medical instrumentation

#### Description
The TSV73x series of single, dual, and quad operational amplifiers offer low-voltage operation, rail-to-rail input and output, and excellent accuracy ($V_{io}$ lower than 200 µV at 25 °C).

These devices benefit from STMicroelectronics® 5 V CMOS technology and offer an excellent speed/power consumption ratio (900 kHz typical gain bandwidth) while consuming 60 µA typical at 5 V. The TSV73x series also feature an ultra-low input bias current.

The single version (TSV731), the dual version (TSV732), and the quad version (TSV734) are housed in the smallest industrial packages.

These characteristics make the TSV73x family ideal for sensor interfaces, battery-powered and portable applications, and active filtering.

---

**Datasheet - preliminary data**

Single (TSV731)
- SC70-5

Dual (TSV732)
- DFN8 2x2
- MiniSO-8

Quad (TSV734)
- QFN16 3x3
- TSSOP14

1. All voltage values, except the differential voltage are with respect to the network ground terminal.
2. The differential voltage is a non-inverting input terminal with respect to the inverting input terminal. The TSV732 and TSV734 devices include an internal differential voltage limiter that clamps internal differential voltage at 0.5 V.
3. $V_{CC}$ - $V_{in}$ must not exceed 6 V, $V_{in}$ must not exceed 6 V.
4. Input current must be limited by a resistor in series with the inputs.
5. Short-circuits can cause excessive heating and destructive dissipation.
6. $R_{th}$ are typical values.
7. Human body model: 100 pF discharged through a 1.5 kΩ resistor between two pins of the device, done for all couples of pin combinations with other pins floating.
8. Machine model: a 200 pF cap is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5 Ω), done for all couples of pin combinations with other pins floating.
9. Charged device model: all pins plus package are charged together to the specified voltage and then discharged directly to ground.

1. See Section 4.4: Input offset voltage drift over temperature.
2. Typical value is based on the $V_{io}$ drift observed after 1000h at 125 °C extrapolated to 25 °C using the Arrhenius law and assuming an activation energy of 0.7 eV. The operational amplifier is aged in follower mode configuration. See Section 4.5: Long-term input offset voltage drift.
3. Guaranteed by characterization.
4. Tested on SC70-5 package.
5. Slew rate value is calculated as the average between positive and negative slew rates.
6. Initialization time is defined as the delay after power-up to guarantee operation within specified performances. Guaranteed by design. See Section 4.6: Initialization time.

4 Application information

4.1 Operating voltages

The TSV73x series of devices can operate from 1.5 V to 5.5 V. The parameters are fully specified for 1.8 V, 3.3 V, and 5 V power supplies. However, they are very stable in the full $V_{CC}$ range and several characterization curves show TSV73x device characteristics at 1.5 V. In addition, the main specifications are guaranteed in the extended temperature range from -40 °C to +125 °C.

4.2 Rail-to-rail input

The TSV731, TSV732, and TSV734 devices have a rail-to-rail input, and the input common mode range is extended from $V_{CC}- 0.1$ V to $V_{CC} + 0.1$ V.

4.3 Rail-to-rail output

The output levels of the TSV73x operational amplifiers can go close to the rails: to a maximum of 40 mV below the upper rail and to a maximum of 75 mV above the lower rail when a 10 kΩ resistive load is connected to $V_{CC}/2$.

4.4 Input offset voltage drift over temperature

The maximum input voltage drift over the temperature variation is defined as the offset variation related to offset value measured at 25 °C. The operational amplifier is one of the main circuits of the signal conditioning chain, and the amplifier input offset is a major contributor to the chain accuracy. The signal chain accuracy at 25 °C can be compensated during production at application level. The maximum input voltage drift over temperature enables the system designer to anticipate the effect of temperature variations.

The maximum input voltage drift over temperature is computed using Equation 1.

Equation 1

$$\frac{\Delta V_{io}}{\Delta T} = \max \left| \frac{V_{io}(T) - V_{io}(25^\circ C)}{T - 25^\circ C} \right|$$

with $T = -40$ °C and 125 °C.

The datasheet maximum value is guaranteed by a measurement on a representative sample size ensuring a $C_{pk}$ (process capability index) greater than 1.33.
4.5 Long-term input offset voltage drift

To evaluate product reliability, two types of stress acceleration are used:

- Voltage acceleration, by changing the applied voltage
- Temperature acceleration, by changing the die temperature (below the maximum junction temperature allowed by the technology) with the ambient temperature.

The voltage acceleration has been defined based on JEDEC results, and is defined using Equation 2.

**Equation 2**

\[ A_{VF} = e^{\beta (V_S - V_U)} \]

Where:
- \( A_{VF} \) is the voltage acceleration factor
- \( \beta \) is the voltage acceleration constant in 1/V, constant technology parameter (\( \beta = 1 \))
- \( V_S \) is the stress voltage used for the accelerated test
- \( V_U \) is the voltage used for the application

The temperature acceleration is driven by the Arrhenius model, and is defined in Equation 3.

**Equation 3**

\[ A_{FT} = e^{\frac{E_a}{k} \left( \frac{1}{T_U} - \frac{1}{T_S} \right)} \]

Where:
- \( A_{FT} \) is the temperature acceleration factor
- \( E_a \) is the activation energy of the technology based on the failure rate
- \( k \) is the Boltzmann constant (8.6173 x 10^{-5} eV.K^{-1})
- \( T_U \) is the temperature of the die when \( V_U \) is used (K)
- \( T_S \) is the temperature of the die under temperature stress (K)

The final acceleration factor, \( A_F \), is the multiplication of the voltage acceleration factor and the temperature acceleration factor (Equation 4).

**Equation 4**

\[ A_F = A_{FT} \times A_{VF} \]

\( A_F \) is calculated using the temperature and voltage defined in the mission profile of the product. The \( A_F \) value can then be used in Equation 5 to calculate the number of months of use equivalent to 1000 hours of reliable stress duration.
Equation 5

\[ \text{Months} = A_F \times 1000 \, \text{h} \times 12 \, \text{months} / (24 \, \text{h} \times 365.25 \, \text{days}) \]

To evaluate the op-amp reliability, a follower stress condition is used where \( V_{CC} \) is defined as a function of the maximum operating voltage and the absolute maximum rating (as recommended by JEDEC rules).

The \( V_{io} \) drift (in \( \mu \text{V} \)) of the product after 1000 h of stress is tracked with parameters at different measurement conditions (see Equation 6).

Equation 6

\[ V_{CC} = \max V_{op} \text{ with } V_{icm} = V_{CC}/2 \]

The long term drift parameter (\( \Delta V_{io} \)), estimating the reliability performance of the product, is obtained using the ratio of the \( V_{io} \) (input offset voltage value) drift over the square root of the calculated number of months (Equation 7).

Equation 7

\[ \Delta V_{io} = \frac{V_{io \text{ drift}}}{\sqrt{\text{months}}} \]

where \( V_{io} \) drift is the measured drift value in the specified test conditions after 1000 h stress duration.
4.6 Initialization time

The TSV73x series of devices use a proprietary trimming topology that is initiated at each device power-up and allows excellent \( V_{io} \) performance to be achieved. The initialization time is defined as the delay after power-up which guarantees operation within specified performances. During this period, the current consumption \( (I_{CC}) \) and the input offset voltage \( (V_{io}) \) can be different to the typical ones.

The initialization time is \( V_{CC} \) and temperature dependent. Table 6 sums up the measurement results for different supply voltages and for temperatures varying from \(-40 \, ^\circ C\) to \(125 \, ^\circ C\).

![Figure 22. Initialization phase](image)

### Table 6. Initialization time measurement results

| \( V_{CC} (V) \) | Temperature: -40 °C | | Temperature: 25 °C | | Temperature: 125 °C |
|---|---|---|---|---|
| \( V_{CC} (V) \) | | \( T_{init} (ms) \) | \( I_{CC} \) phase 1 (mA) | \( T_{init} (ms) \) | \( I_{CC} \) phase 1 (mA) | \( T_{init} (ms) \) | \( I_{CC} \) phase 1 (mA) |
| 1.8 | | 37 | 0.33 | 3.2 | 0.40 | 0.35 | 0.46 |
| 3.3 | | 2.9 | 1.4 | 0.95 | 1.3 | 0.34 | 1.2 |
| 5 | | 2.4 | 3.2 | 0.85 | 2.4 | 0.31 | 2.9 |

4.7 PCB layouts

For correct operation, it is advised to add a 10 nF decoupling capacitors as close as possible to the power supply pins.
4.8 Macromodel

Accurate macromodels of the TSV73x devices are available on the STMicroelectronics’ website at www.st.com. These models are a trade-off between accuracy and complexity (that is, time simulation) of the TSV73x operational amplifiers. They emulate the nominal performance of a typical device within the specified operating conditions mentioned in the datasheet. They also help to validate a design approach and to select the right operational amplifier, but they do not replace on-board measurements.
5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com. ECOPACK® is an ST trademark.
