Table 183. RCC register allocation to RIF resource and access conditions (continued)

Register name	RCC RIF resource number	RIF resource configuration	Access type(1)	Description
RCC_PREDIVSR1	NA	NA	R	Flexclkgen pre divider status flag
RCC_PREDIVSR2				
RCC_FINDIVSR1				Flexclkgen final divider status flag
RCC_FINDIVSR2				
RCC_D3SR				D3 domain status flag
RCC_OCRDYR				Oscillator status clear
RCC_HSIFVALR				HSI clock cycle count
RCC_FCALCSR				Clock frequency calculator status
RCC_VERR				-
RCC_IDR				-
RCC_SIDR				-

1. RW = read or write, SR = set or read (noted RWS1 in the register description), CR = clear or read (noted rwc1 in the register description, R = read, and W = write.
2. DDR RIF configuration (resource number 104) is exported to the DDR subsystem to filter any DDR programming ports.

All RCC registers can be accessed in word, half-word and byte format, unless explicitly specified differently. All RCC registers are reset by the sys_rstn signal, unless explicitly specified differently.

Note: The burst access mode is not supported; and any opcode fetch transfer generates a bus error.

21.8.1 RCC secure configuration register 0 (RCC_SECCFGR0)

Address offset: 0x0000

Reset value: 0x0000 0000

This register is used to set the secure attribute that filters any write access to the RCC local resource number 0 to 31 (see *Table 183* for RCC local resource mapping). Non-secure or unprivileged writes to this register are ignored, and illegal access related events are generated. Any read is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SEC[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

SEC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SEC[31:0]**: Secure attribute reference for local resource number x (x = 31 to 0)

if compartment filtering for local resource number x is enabled (resp. disabled) using CFEN in RCC_RxCIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if access privilege and security are sufficient. Writes are ignored if RLOCKx = 1 in RCC_RCFGLOCKR0.

Authorized compartment is defined as SCID if SEM_EN = 0 in RCC_RxCIDCFGR.
If SEM_EN = 1, it is equal to SEMCID if SEM_MUTEX = 1 in RCC_RxSEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

0: Secure and non-secure data accesses are granted to local resource number x.

1: Only secure data access is granted to local resource number x.

21.8.2 RCC secure configuration register 1 (RCC_SECCFGR1)

Address offset: 0x0004

Reset value: 0x0000 0000

This register is used to set the secure attribute value used to filter any write access to the RCC local resources number 32 to 63 (see *Table 183* for RCC local resource mapping). Non-secure or unprivileged writes to this register are ignored, and illegal access related events are generated. Any read is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SEC[63:48]

SEC[47:32]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SEC[63:32]**: Secure attribute reference for the local resource number x (x = 63 to 32)

If compartment filtering for local resource number x is enabled (resp. disabled) using CFEN in RCC_RxCIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if access privilege and security are sufficient. Writes are ignored if RLOCK(x - 32) = 1 in RCC_RCFGLOCKR1.

Authorized compartment is defined as SCID if SEM_EN = 0 in RCC_RxCIDCFGR.
If SEM_EN = 1, it is equal to SEMCID if SEM_MUTEX = 1 in RCC_RxSEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

0: Secure and non-secure data accesses are granted to local resource number x

1: Only secure data access is granted to local resource number x

21.8.3 RCC secure configuration register 2 (RCC_SECCFGR2)

Address offset: 0x0008

Reset value: 0x0000 0000

This register is used to set the secure attribute value used to filter any write access to the RCC local resources number 64 to 95 (see *Table 183* for RCC local resource mapping). Non-secure or unprivileged writes to this register are ignored, and illegal access related events are generated. Any read is allowed.

SEC[79:64]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SEC[95:64]**: Secure attribute reference for the local resource number x (x = 95 to 64)

If compartment filtering for local resource number x is enabled (resp. disabled) using CFEN in RCC_RxCIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if access privilege and security are sufficient. Writes are ignored if RLOCK(x - 64) = 1 in RCC_RCFGLOCKR2.

Authorized compartment is defined as SCID if SEM_EN = 0 in RCC_RxCIDCFGR.
If SEM_EN = 1 it is equal to SEMCID if SEM_MUTEX = 1 in RCC_RxSEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

0: Non-secure write access is allowed.

1: Only secure write access is allowed.

21.8.4 RCC secure configuration register 3 (RCC_SECCFGR3)

Address offset: 0x000C

Reset value: 0x0000 0000

This register is used to set the secure attribute value used to filter any write access to the RCC local resources number 96 to 113 (see *Table 183* for RCC local resource mapping). Non-secure or unprivileged writes to this register are ignored, and illegal access related events are generated.Any read is allowed.

SEC[111:96]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:0 **SEC[113:96]**: Secure attribute reference for the local resource number x (x = 113 to 96)

If compartment filtering for local resource number x is enabled (resp. disabled) using CFEN in RCC_RxCIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if access privilege and security are sufficient. Writes are ignored if RLOCK(x - 96) = 1 in RCC_RCFGLOCKR3.

Authorized compartment is defined as SCID if SEM_EN = 0 in RCC_RxCIDCFGR.
If SEM_EN = 1, it is equal to SEMCID if SEM_MUTEX = 1 in RCC_RxSEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

0: Non-secure write access is allowed.

1: Secure write access is allowed.

21.8.5 RCC privileged configuration register 0 (RCC_PRIVCFGR0)

Address offset: 0x0010

Reset value: 0x0000 0000

This register is used to set the privileged attribute value used to filter any write access to the RCC local resource number 0 to 31 (see *Table 183* for RCC local resource mapping). Unprivileged writes to this register are ignored, and illegal access event is generated. Any read is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PRIV[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PRIV[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PRIV[31:0]**: Privileged attribute reference for local resource number x (x = 31 to 0)

If corresponding SECx is set in RCC_SECCFGR0, each bit can only be written by a secure privileged application.

If compartment filtering for local resource number x is enabled (resp. disabled) using CFEN in RCC_RxCIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if access privilege and security are sufficient. Writes are ignored if RLOCKx = 1 in RCC_RCFGLOCKR0.

Authorized compartment is defined as SCID if SEM_EN = 0 in RCC_RxCIDCFGR.
If SEM_EN = 1, it is equal to SEMCID if SEM_MUTEX = 1 in RCC_RxSEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

0: Privileged and unprivileged data accesses are granted to local resource number x.

1: Only privileged data access is granted to local resource number x.

21.8.6 RCC privileged configuration register 1 (RCC_PRIVCFGR1)

Address offset: 0x0014

Reset value: 0x0000 0000

This register is used to set the privileged attribute value used to filter any write access to the RCC local resources number 32 to 63 (see *Table 183* for RCC local resource mapping). Unprivileged writes to this register are ignored, and illegal access event is generated. Any read is allowed.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PRIV[63:32]**: Privileged attribute reference for the local resource number x (x = 63 to 32)
if corresponding SEC(x - 32) is set in RCC_SECCFGR1, this bit can only be written by a secure privileged application.
If compartment filtering for local resource number x is enabled (resp. disabled) using CFEN in RCC_RxCIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if access privilege and security are sufficient. Writes are ignored if RLOCK(x - 32) = 1 in RCC_RCFGLOCKR1.
Authorized compartment is defined as SCID if SEM_EN = 0 in RCC_RxCIDCFGR.
If SEM_EN = 1, it is equal to SEMCID if SEM_MUTEX = 1 in RCC_RxSEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.
0: Privileged and unprivileged data accesses are granted to local resource number x.
1: Only privileged data access is granted to local resource number x.

21.8.7 RCC privileged configuration register 2 (RCC_PRIVCFGR2)

Address offset: 0x0018

Reset value: 0x0000 0000

This register is used to set the privileged attribute value used to filter any write access to the RCC local resources number 64 to 95 (see *Table 183* for RCC local resource mapping. Unprivileged writes to this register are ignored, and illegal access event is generated. Any read is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

PRIV[79:64]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PRIV[95:64]**: Privileged attribute reference for the local resource number x (x = 95 to 64)
If corresponding SEC(x - 64) is set in RCC_SECCFGR2, each bit can only be written by a secure privileged application.
If compartment filtering for local resource number x is enabled (resp. disabled) using CFEN in RCC_RxCIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if access privilege and security are sufficient. Writes are ignored if RLOCK(x - 64) = 1 in RCC_RCFGLOCKR2.
Authorized compartment is defined as SCID if SEM_EN = 0 in RCC_RxCIDCFGR.
If SEM_EN = 1, it is equal to SEMCID if SEM_MUTEX = 1 in RCC_RxSEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.
0: Privileged and unprivileged data accesses are granted to local resource number x.
1: Only privileged data access is granted to local resource number x.

21.8.8 RCC privileged configuration register 3 (RCC_PRIVCFGR3)

Address offset: 0x001C

Reset value: 0x0000 0000

This register is used to set the privileged attribute value used to filter any write access to the RCC local resources number 96 to 113 (see *Table 183* for RCC local resource mapping). Unprivileged writes to this register are ignored, and illegal access event is generated. Any read is allowed.

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:0 **PRIV[113:96]**: Privileged attribute reference for the local resource number x (x = 113 to 96)
If corresponding SEC(x - 96) is set in RCC_SECCFGR3, each bit can only be written by a secure privileged application.
If compartment filtering for local resource number x is enabled (resp. disabled) using CFEN in RCC_RxCIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if access privilege and security are sufficient. Writes are ignored if RLOCK(x - 96) = 1 in RCC_RCFGLOCKR3.
Authorized compartment is defined as SCID if SEM_EN = 0 in RCC_RxCIDCFGR.
If SEM_EN = 1, it is equal to SEMCID if SEM_MUTEX = 1 in RCC_RxSEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.
0: Privileged and unprivileged data accesses are granted to local resource number x.
1: Only privileged data access is granted to local resource number x.

21.8.9 RCC resource configuration lock register 0 (RCC_RCFGLOCKR0)

Address offset: 0x0020

Reset value: 0x0000 0000

Secure privileged write access only. Write only by trusted domain. Debug domain can write this register if the feature is activated. Otherwise, illegal access events are generated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

RLOCK[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **RLOCK[31:0]**: RCC local resource number x lock (x = 31 to 0)

Each bit is set to lock the RCC local resource x. It is cleared by default, and once set. It cannot be reset until the RCC is reset.

0: SECx in RCC_SECCFGR0 and PRIVx in RCC_PRIVCFGR0 are writable. RCC_RxCIDCFGR is writable.

1: Writes to SECx in RCC_SECCFGR0 and PRIVx in RCC_PRIVCFGR0 are ignored. Writes to RCC_RxCIDCFGR are ignored.

21.8.10 RCC resource configuration lock register 1 (RCC_RCFGLOCKR1)

Address offset: 0x0024

Reset value: 0x0000 0000

Secure privileged write access only. Write only by trusted domain. Debug domain can write to this register if the feature is activated. Otherwise, illegal access events are generated. Any read access is allowed.

RLOCK[47:32]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **RLOCK[63:32]**: RCC local resource number x lock (x = 63 to 32)

Each bit is set to lock the RCC local resource x. It is cleared by default, and once set, it cannot be reset until RCC is reset.

0: SEC(x - 32) in RCC_SECCFGR1 and PRIV(x - 32) in RCC_PRIVCFGR1 are writable. RCC_RxCIDCFGR is writable.

1: Writes to SEC(x - 32) in RCC_SECCFGR1 and PRIV(x - 32) in RCC_PRIVCFGR1 are ignored. Writes to RCC_RxCIDCFGR are ignored.

21.8.11 RCC resource configuration lock register 2 (RCC_RCFGLOCKR2)

Address offset: 0x0028

Reset value: 0x0000 0000

Secure privileged write access only. Write only by trusted domain. Debug domain can write to this register if the feature is activated.Otherwise, illegal access events are generated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

RLOCK[79:64]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **RLOCK[95:64]**: RCC local resource number x lock (x = 95 to 64)

Each bit is set to lock the RCC local resource x. It is cleared by default, and once set. It cannot be reset until the RCC is reset.

0: SEC(x - 64) in RCC_SECCFGR2 and PRIV(x - 64) in RCC_PRIVCFGR2 are writable. RCC_RxCIDCFGR is writable.

1: Writes to SEC(x - 64) in RCC_SECCFGR2 and PRIV(x - 64) in RCC_PRIVCFGR2 are ignored. Writes to RCC_RxCIDCFGR are ignored.

21.8.12 RCC resource configuration lock register 3 (RCC_RCFGLOCKR3)

Address offset: 0x002C

Reset value: 0x0000 0000

Secure privileged write access only. Write only by trusted domain.Debug domain can write to this register if the feature is activated.Otherwise, illegal access events are generated. Any read access is allowed.

RLOCK[111:96]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:0 **RLOCK[113:96]**: RCC local resource number x lock (x = 113 to 96)

Each bit is set to lock the RCC local resource x. It is cleared by default, and once set. It cannot be reset until the RCC is reset.

0: SEC(x - 96) in RCC_SECCFGR3 and PRIV(x - 96) in RCC_PRIVCFGR3 are writable. RCC_RxCIDCFGR is writable.

1: Writes to SEC(x - 96) in RCC_SECCFGR3 and PRIV(x - 96) in RCC_PRIVCFGR3 are ignored. Writes to RCC_RxCIDCFGR are ignored.

21.8.13 RCC resource x CID configuration register (RCC_RxCIDCFGR)

Address offset: 0x0030 + 0x8 * x, (x = 0 to 113)

Reset value: 0x0000 0000

This register is used to configure the CID filtering policy for the RCC local resource x (see *Table 183* for RCC local resource mapping). Secure privileged write access only. Write only by trusted domain. Debug domain can write to this register if the feature is activated.

Any write is ignored if the local resource x is locked (RLOCK(x - 32 * z) = 1 in RCC_RCFGLOCKRz, with z = 0 to 3).Otherwise, illegal access events are generated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCID[2:0]			Res.	Res.	SEM_EN	CFEN
									rw	rw	rw			rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **SEMWLC[7:0]**: Semaphore white-list for compartment y (y = 7 to 0)

Set and cleared by software.

0: Application running in compartment y cannot get access to local resource x through semaphore SEM_MUTEX.

1: Application running in compartment y can get access to local resource x through semaphore SEM_MUTEX.

Note: This bit is ignored if SEM_EN = 0 or CFEN = 0

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:4 **SCID[2:0]**: Static compartment ID

Set by software. Trusted domain application uses this bitfield to statically define which compartment has access to local resource x when SEM_EN = 0.

Note: This bitfield is ignored if SEM_EN = 1 or CFEN = 0

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **SEM_EN**: Semaphore enable

Set and cleared by software.

0: Access to local resource x is granted only if CID of the access equals to SCID.

1: Access to local resource x is granted only if SEM_MUTEX = 1, and CID of the access equals to SEMCID.

Note: This bit is ignored if CFEN = 0. When this bit is cleared, SEM_MUTEX is cleared.

Bit 0 **CFEN**: Static CID filter enable

Set and cleared by software. Additional access controls to local resource x apply, as defined in RCC_PRIVCFGRz and RCC_SECCFGRz with z = 0 to 3.

0: Compartment-based filtering is defined in RCC_RxCIDCFGR, and optionally RCC_RxSEMCR is disabled for local resource x.

1: Compartment-based filtering is defined in RCC_RxCIDCFGR, and optionally RCC_RxSEMCR is enabled for local resource x.

Note: When this bit is cleared, SEM_MUTEX is cleared.

21.8.14 RCC resource x semaphore control register (RCC_RxSEMCR)

Address offset: 0x0034 + 0x8 * x, (x = 0 to 113)

Reset value: 0x0000 0000

This register is used to control the semaphore access for the RCC local resource x.
If compartment filtering is disabled (CFEN = 0 in RCC_RxCIDCFGR), or semaphore is disabled (SEM_EN = 0 in RCC_RxCIDCFGR), any write to this register is ignored. Illegal access event generation is disabled in this case.

Secure-only write access if SEC(x - 32 * z) is set in RCC_SECCFGRz (with z = 0 to 3).
Privileged-only write access if PRIV(x - 32 * z) is set in RCC_PRIVCFGRz (with z = 0 to 3).

If compartment filtering is enabled and semaphore is enabled (CFEN and SEM_EN set in RCC_RxCIDCFGR), only an authorized compartment can write this register. Authorized compartment is defined by SEMCID if SEM_MUTEX = 1. Otherwise, it is defined by the CID white list (SEMWLCy with y = 0 to 7) in RCC_RxCIDCFGR. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEMCID[2:0]			Res.	Res.	Res.	SEM_MUTEX
									r	r	r				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **SEMCID[2:0]**: Semaphore compartment ID

Set by hardware. When SEM_EN and CFEN are set in RCC_RxCIDCFGR, this bitfield is updated with the CID value of the latest successful acquisition of RCC_RxSEMCR semaphore (SEM_MUTEX = 1).

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **SEM_MUTEX**: Semaphore mutex

Set and cleared by software. White-listed application can set this bit to get exclusive access to local resource x, when SEM_EN = 1 in RCC_RxCIDCFGR (writes ignored otherwise).
When SEM_MUTEX = 0, only applications belonging to the white-listed compartments (defined by SEMWLCy in RCC_RxCIDCFGR) can acquire this semaphore.
When SEM_MUTEX = 1, only applications belonging to the SEMCID compartment can release this semaphore.
0: Reading 0 means that the semaphore is free. Writing 0 means that the semaphore is going to be released.
1: Reading 1 means that the semaphore is taken. Writing 1 means that the semaphore is going to be acquired.

Note: This bit is cleared when CFEN or SEM_EN are cleared in RCC_RxCIDCFGR.

21.8.15 RCC global reset control set register (RCC_GRSTCSETR)

Address offset: 0x400

Reset value: 0x0000 0000

This register is used to generate a system reset. Writing 0 has no effect, reading returns the effective values of the corresponding bits. Writing 1 activates a system reset. Write accesses are defined according to the RCC local resource number 66 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SYSRST
															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **SYSRST**: System reset

Set by software, cleared by hardware.

0: Writing 0 has no effect. Reading 0 means that the system reset is released.

1: Writing 1 generates a system reset (see *Figure 81*).

21.8.16 RCC CPU1 reset control set register (RCC_C1RSTCSETR)

Address offset: 0x404

Reset value: 0x0000 0000

This register is used to generate the CPU1 reset, and IWDG1/2 kernel resets. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 activates the bit. Write accesses are defined according to the RCC local resource number 66 configuration (see *Table 183* for details).Any read access is allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	C1RST
															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **C1RST**: CPU1 reset

Set by software, cleared by hardware when the reset command is completed. Resets the CPU1 subsystem, and IWDG1/2 kernel clocks.

0: Writing 0 has no effect. Reading 0 means that the CPU1 reset is released.

1: Writing 1 generates a CPU1 reset. Reading 1 means that the reset is asserted (see *Figure 81*).

21.8.17 RCC CPU1 processor core 1 reset control set register (RCC_C1P1RSTCSETR)

Address offset: 0x408

Reset value: 0x0000 0000

This register is used to generate the CPU1 processor core 1 resets. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 activates the bit. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 183* for details).Any read access is allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	C1P1RST	C1P1PORRST
														rs	rs

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **C1P1RST**: CPU1 processor core 1 reset

Set by software and cleared by hardware when the reset command is completed. Resets all registers in the processor core 1, excluding debug and ETM ones.

0: Writing 0 has no effect. Reading 0 means that the CPU1 processor core 1 reset is released.

1: Writing 1 generates a CPU1 processor core 1 reset. Reading 1 means that the reset is asserted.

Bit 0 **C1P1PORRST**: CPU1 processor core 1 power-on reset

Set by software and cleared by hardware when the reset command is completed. Resets all registers in the processor core 1 including debug and ETM ones.

0: Writing 0 has no effect. Reading 0 means that the CPU1 processor core 1 power-on reset is released.

1: Writing 1 generates a CPU1 processor core 1 power-on reset. Reading 1 means that the reset is asserted.

21.8.18 RCC CPU2 reset control set register (RCC_C2RSTCSETR)

Address offset: 0x40C

Reset value: 0x0000 0000

This register is used to generate a CPU2 reset, and IWDG3/4 kernel resets. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 activates the reset of the corresponding peripheral. Write accesses are defined according to the RCC local resource number 66 configuration (see *Table 183* for details).Any read access is allowed.

															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **C2RST**: CPU2 reset

Set by software and cleared by hardware when the reset command is completed. Resets the CPU2 subsystem, and IWDG3/4 kernel clocks.

0: Writing 0 has no effect. Reading 0 means that the CPU2 reset is released.

1: Writing 1 generates a CPU2 reset. Reading 1 means that the reset is asserted (see *Figure 81*).

21.8.19 RCC hardware reset status clear register (RCC_HWRSTSCLRR)

Address offset: 0x410

Reset value: 0x0000 0015

This register is used by the trusted application to check the reset source. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. This register is located in V_{DD} domain, and is reset by por_rstn reset. Write accesses are defined according to the RCC local resource number 66 configuration (see *Table 183* for details).Any read access is allowed.

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **RETECCFAILRESTRSTF**: RETRAM ECC failure reset flag during system restoration phase

Cleared by software and set by hardware when a reset due to an ECC failure on RETRAM during the system restoration phase occurs.

0: Writing 0 has no effect. Reading 0 means that no reset due to an ECC failure on RETRAM during the system restoration phase occurred (default after por_rstn reset).

1: Writing 1 clears the RETECCFAILRESTRSTF flag. Reading 1 means that a reset due to an ECC failure on RETRAM during the system restoration phase occurred.

Bit 13 **RETECCFAILCRCRSTF**: RETRAM ECC failure reset flag during the CRC computation phase

Cleared by software and set by hardware when a reset due to an ECC failure on RETRAM during CRC computation phase occurs.

0: Writing 0 has no effect. Reading 0 means that no reset due to an ECC failure on RETRAM during CRC computation phase occurred (default after por_rstn reset).

1: Writing 1 clears the RETECCFAILCRCRSTF flag. Reading 1 means that a reset due to an ECC failure on RETRAM during CRC computation phase occurred.

Bit 12 **RETCRCERRRSTF**: RETRAM CRC error reset flag

Cleared by software and set by hardware when a reset due to a CRC error on RETRAM content occurs.

0: Writing 0 has no effect. Reading 0 means that no reset due to a CRC error on RETRAM content occurred (default after por_rstn reset).

1: Writing 1 clears the RETCRCERRRSTF flag. Reading 1 means that a reset due to a CRC error on RETRAM content occurred.

Bit 11 **IWDG5SYSRSTF**: IWDG5 system reset flag

Cleared by software and set by hardware when an IWDG5 system reset occurs.

0: Writing 0 has no effect. Reading 0 means that no IWDG5 system reset occurred (default after por_rstn reset).

1: Writing 1 clears the IWDG5SYSRSTF flag. Reading 1 means that an IWDG5 system reset occurred.

Bit 10 **IWDG4SYSRSTF**: IWDG4 system reset flag

Cleared by software and set by hardware when an IWDG4 system reset occurs.

0: Writing 0 has no effect. Reading 0 means that no IWDG4 system reset occurred (default after por_rstn reset).

1: Writing 1 clears the IWDG4SYSRSTF flag. Reading 1 means that an IWDG4 system reset occurred.

Bit 9 **IWDG3SYSRSTF**: IWDG3 system reset flag

Cleared by software and set by hardware when an IWDG3 system reset occurs.

0: Writing 0 has no effect. Reading 0 means that no IWDG3 system reset occurred (default after por_rstn reset).

1: Writing 1 clears the IWDG3SYSRSTF flag. Reading 1 means that an IWDG3 system reset occurred.

Bit 8 **IWDG2SYSRSTF**: IWDG2 system reset flag

Cleared by software and set by hardware when an IWDG2 system reset occurs.

0: Writing 0 has no effect. Reading 0 means that no IWDG2 system reset occurred (default after por_rstn reset).

1: Writing 1 clears the IWDG2SYSRSTF flag. Reading 1 means that an IWDG2 system reset occurred.

Bit 7 **IWDG1SYSRSTF**: IWDG1 system reset flag

Cleared by software and set by hardware when an IWDG1 system reset occurs.

0: Writing 0 has no effect. Reading 0 means that no IWDG1 system reset occurred (default after por_rstn reset).

1: Writing 1 clears the IWDG1SYSRSTF flag. Reading 1 means that an IWDG1 system reset occurred.

Bit 6 **SYSC2RSTF**: CPU2 system reset flag

Cleared by software and set by hardware when a CPU2 system reset occurs.

0: Writing 0 has no effect. Reading 0 means that no system reset generated by the CPU2 occurred (default after por_rstn reset).

1: Writing 1 clears the SYSC2RSTF flag. Reading 1 means that a system reset generated by the CPU2 occurred.

Bit 5 **SYSC1RSTF**: CPU1 system reset flag

Cleared by software and set by hardware when a CPU1 system reset occurs.

0: Writing 0 has no effect. Reading 0 means that no system reset generated by the CPU1 occurred (default after por_rstn reset).

1: Writing 1 clears the SYSC1RSTF flag. Reading 1 means that a system reset generated by the CPU1occurred.

Bit 4 **VCORERSTF**: V_{DDCORE} reset flag

Cleared by software and set by hardware when a reset occurs because V_{DDCORE} is lower than the expected value.

0: Writing 0 has no effect. Reading 0 means that V_{DDCORE} is not the origin of the reset.

1: Writing 1 clears the VCORERSTF flag. Reading 1 means that V_{DDCORE} is the origin of the reset (default after por_rstn reset).

Bit 3 **HCSSRSTF**: HSE CSS reset flag

Cleared by software and set by hardware when a failure is detected on HSE.

0: Writing 0 has no effect. Reading 0 means that no HSE CSS reset occurred (default after por_rstn reset).

1: Writing 1 clears the HCSSRSTF flag. Reading 1 means that a HSE CSS reset occurred.

Bit 2 **PADRSTF**: NRST reset flag

Cleared by software and set by hardware when a PAD reset occurs.

0: Writing 0 has no effect. Reading 0 means that no PAD reset occurred.

1: Writing 1 clears the PADRSTF flag. Reading 1 means that a PAD reset occurred (default after por_rstn reset).

Bit 1 **BORRSTF**: BOR reset flag

Cleared by software and set by hardware when a BOR occurs.

0: Writing 0 has no effect. Reading 0 means that no BOR occurred
(default after por_rstn reset).

1: Writing 1 clears the BORRSTF flag. Reading 1 means that a BOR occurred.

Bit 0 **PORRSTF**: POR/PDR reset flag

Cleared by software and set by hardware when a POR/PDR occurs.

0: Writing 0 has no effect. Reading 0 means that no POR/PDR occurred.

1: Writing 1 clears the PORRSTF flag. Reading 1 means that a POR/PDR occurred (default after por_rstn reset).

21.8.20 RCC CPU1 hardware reset status clear register (RCC_C1HWRSTSCLRR)

Address offset: 0x414

Reset value: 0x0000 0003

This register is used by the CPU1 to check the reset source. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. This register is located in V_{DD} domain, and is reset by por_rstn reset except the C1P1RSTF flag. This flag is located in the V_{DDCORE} domain, and is reset by sys_rstn reset. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 183* for details). Any read access is allowed.

													rc_w1	rc_w1	rc_w1

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **C1P1RSTF**: CPU1 processor core 1 reset flag

Cleared by software and set by hardware when a CPU1 processor core 1 reset occurs.
0: Writing 0 has no effect. Reading 0 means that no CPU1 processor core 1 reset occurred (default after sys_rstn reset).
1: Writing 1 clears the C1P1RSTF flag. Reading 1 means that a CPU1 processor core 1 reset occurred.

Bit 1 **C1RSTF**: CPU1 reset flag

Cleared by software and set by hardware when a CPU1 reset occurs.
0: Writing 0 has no effect. Reading 0 means that no CPU1 reset occurred.
1: Writing 1 clears the C1RSTF flag. Reading 1 means that a CPU1 reset occurred (default after por_rstn reset).

Bit 0 **VCPURSTF**: V_{DDCPU} reset flag

Cleared by software and set by hardware when a reset occurs because V_{DDCPU} is lower than the expected value.
0: Writing 0 has no effect. Reading 0 means that V_{DDCPU} is not the origin of the reset.
1: Writing 1 clears the VCPURSTF flag. Reading 1 means that V_{DDCPU} is the origin of the reset (default after por_rstn reset).

21.8.21 RCC CPU2 hardware reset status clear register (RCC_C2HWRSTSCLRR)

Address offset: 0x418

Reset value: 0x0000 0001

This register is used by the CPU2 to check the reset source. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. This register is located in the V_{DD} domain, and is reset by por_rstn reset. Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 183* for details).Any read access is allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	C2RSTF
															rc_w1

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **C2RSTF**: CPU2 reset flag

Cleared by software and set by hardware when a CPU2 reset occurs.

0: Writing 0 has no effect. Reading 0 means that no CPU2 reset occurred.

1: Writing 1 clears the C2RSTF flag. Reading 1 means that a CPU2 reset occurred (default after por_rstn reset).

21.8.22 RCC CPU1 boot reset status set register (RCC_C1BOOTRSTSSETR)

Address offset: 0x41C

Reset value: 0x0000 0000

This register is used by the CPU1 to set the boot reset source. This register is updated by the boot ROM code after any reset source. Writing 0 to this register has no effect. Writing 1 sets the corresponding bits (see *Section 21.3.13* for details). The register is located in the V_{DDCORE} domain. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 183* for details).Any read access is allowed.

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **D2STBYRSTF**: D2 DStandby reset flag
Set by software. Indicates that the D2 domain has been in DStandby mode.
0: No effect
1: Set the D2STBYRSTF bit

Bit 22 **D1STBYRSTF**: D1 DStandby reset flag
Set by software. Indicates that the D1 domain has been in DStandby mode.
0: No effect
1: Set the D1STBYRSTF bit.

Bit 21 Reserved, must be kept at reset value.

Bit 20 **STBYC1RSTF**: CPU1 system Standby reset flag
Set by software. Indicates that the system has been in Standby mode for CPU1.
0: No effect
1: Set the STBYC1RSTF bit.

Bit 19 **RETECCFAILRESTRSTF**: RETRAM ECC failure reset flag during system restoration phase
Set by software. Indicates that a reset due to an ECC failure on RETRAM during the system restoration phase occurred.
0: No effect
1: Set the RETECCFAILRESTRSTF bit.

Bit 18 **RETECCFAILCRCRSTF**: RETRAM ECC failure reset flag during the CRC computation phase
Set by software. Indicates that a reset due to an ECC failure on RETRAM during CRC computation phase occurred.
0: No effect
1: Set the RETECCFAILCRCRSTF bit.

Bit 17 **RETCRCERRRSTF**: RETRAM CRC error reset flag
Set by software. Indicates that a reset due to a CRC error on RETRAM content occurred.
0: No effect
1: Set the RETCRCERRRSTF bit.

Bit 16 **C1P1RSTF**: CPU1 processor core 1 reset flag
Set by software. Indicates that a CPU1 processor core 1 reset occurred.
0: No effect
1: Set the C1P1RSTF bit.

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **C1RSTF**: CPU1 reset flag
Set by software. Indicates that a CPU1 reset occurred.
0: No effect
1: Set the C1RSTF bit.

Bit 12 **IWDG5SYSRSTF**: IWDG5 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG5 timeout.
0: No effect
1: Set the IWDG5SYSRSTF bit.

Bit 11 **IWDG4SYSRSTF**: IWDG4 system reset flag
Set by software.Indicates that a system reset occurred due to an IWDG4 timeout.
0: No effect
1: Set the IWDG4SYSRSTF bit.

Bit 10 **IWDG3SYSRSTF**: IWDG3 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG3 timeout.
0: No effect
1: Set the IWDG3SYSRSTF bit.

Bit 9 **IWDG2SYSRSTF**: IWDG2 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG2 timeout.
0: No effect
1: Set the IWDG2SYSRSTF bit.

Bit 8 **IWDG1SYSRSTF**: IWDG1 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG1 timeout.
0: No effect
1: Set the IWDG1SYSRSTF bit.

Bit 7 **SYSC2RSTF**: CPU2 system reset flag
Set by software. Indicates that a system reset generated by the CPU2 occurred.
0: No effect
1: Set the SYSC2RSTF bit.

Bit 6 **SYSC1RSTF**: CPU1 system reset flag
Set by software. Indicates that a system reset generated by the CPU1 occurred.
0: No effect
1: Set the SYSC1RSTF bit.

Bit 5 **VCPURSTF**: V_{DDCPU} reset flag
Set by software. Indicates that a reset occurred because V_{DDCPU} is lower than the expected value.
0: No effect
1: Set the VCPURSTF bit.

Bit 4 **VCORERSTF**: V_{DDCORE} reset flag
Set by software. Indicates that a reset occurred because V_{DDCORE} is lower than the expected value.
0: No effect
1: Set the VCORERSTF bit.

Bit 3 **HCSSRSTF**: HSE CSS reset flag
Set by software. Indicates that a reset occurred due to a failure detection on HSE.
0: No effect
1: Set the HCSSRSTF bit.

Bit 2 **PADRSTF**: NRST reset flag
Set by software. Indicates that a pad reset occurred.
0: No effect
1: Set the PADRSTF bit.

Bit 1 **BORRSTF**: BOR reset flag
Set by software. Indicates that a BOR reset occurred.
0: No effect
1: Set the BORRSTF bit.

Bit 0 **PORRSTF**: POR/PDR reset flag
Set by software. Indicates that a POR/PDR reset occurred.
0: No effect
1: Set the PORRSTF bit.

21.8.23 RCC CPU1 boot reset status clear register (RCC_C1BOOTRSTSCLRR)

Address offset: 0x420

Reset value: 0x0000 0000

This register is used by the CPU1 to check the boot reset source. This register is updated by the boot ROM code after any reset source. Writing 0 to this register has no effect. Writing 1 clears the corresponding bits (see *Section 21.3.13* for details). The register is located in the V_{DDCORE} domain. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 183* for details).Any read access is allowed.

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **D2STBYRSTF**: D2 DStandby reset flag
Cleared by software. Indicates that the D2 domain has been in DStandby mode.
0: No effect
1: Clear the D2STBYRSTF bit.

Bit 22 **D1STBYRSTF**: D1 DStandby reset flag
Cleared by software. Indicates that the D1 domain has been in DStandby mode.
0: No effect
1: Clear the D1STBYRSTF bit.

Bit 21 Reserved, must be kept at reset value.

Bit 20 **STBYC1RSTF**: CPU1 system Standby reset flag
Cleared by software. Indicates that the system has been in Standby mode for CPU1.
0: No effect
1: Clear the STBYC1RSTF bit.

Bit 19 **RETECCFAILRESTRSTF**: RETRAM ECC failure reset flag during system restoration phase
Cleared by software. Indicates that a reset due to an ECC failure on RETRAM during the system restoration phase occurred.
0: No effect
1: Clear the RETECCFAILRESTRSTF bit.

Bit 18 **RETECCFAILCRCRSTF**: RETRAM ECC failure reset flag during the CRC computation phase
Cleared by software. Indicates that a reset due to an ECC failure on RETRAM during CRC computation phase occurred.
0: No effect
1: Clear the RETECCFAILCRCRSTF bit.

Bit 17 **RETCRCERRRSTF**: RETRAM CRC error reset flag
Cleared by software. Indicates that a reset due to a CRC error on RETRAM content occurred.
0: No effect
1: Clear the RETCRCERRRSTF bit.

Bit 16 **C1P1RSTF**: CPU1 processor core 1 reset flag
Cleared by software. Indicates that a CPU1 processor core 1 reset occurred.
0: No effect
1: Clear the C1P1RSTF bit.

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **C1RSTF**: CPU1 reset flag
Cleared by software. Indicates that a CPU1 reset occurred.
0: No effect
1: Clear the C1RSTF bit.

Bit 12 **IWDG5SYSRSTF**: IWDG5 system reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG5 timeout.
0: No effect
1: Clear the IWDG5SYSRSTF bit.

Bit 11 **IWDG4SYSRSTF**: IWDG4 system reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG4 timeout.
0: No effect
1: Clear the IWDG4SYSRSTF bit.

Bit 10 **IWDG3SYSRSTF**: IWDG3 system reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG3 timeout.
0: No effect
1: Clear the IWDG3SYSRSTF bit.

Bit 9 **IWDG2SYSRSTF**: IWDG2 system reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG2 timeout.
0: No effect
1: Clear the IWDG2SYSRSTF bit.

Bit 8 **IWDG1SYSRSTF**: IWDG1 system reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG1 timeout.
0: No effect
1: Clear the IWDG1SYSRSTF bit.

Bit 7 **SYSC2RSTF**: CPU2 system reset flag
Cleared by software. Indicates that a system reset generated by the CPU2 occurred.
0: No effect
1: Clear the SYSC2RSTF bit.

Bit 6 **SYSC1RSTF**: CPU1 system reset flag
Cleared by software. Indicates that a system reset generated by the CPU1 occurred.
0: No effect
1: Clear the SYSC1RSTF bit.

Bit 5 **VCPURSTF**: V_{DDCPU} reset flag
Cleared by software. Indicates that a reset occurred because V_{DDCPU} is lower than the expected value.
0: No effect
1: Clear the VCPURSTF bit.

Bit 4 **VCORERSTF**: V_{DDCORE} reset flag
Cleared by software. Indicates that a reset occurred because V_{DDCORE} is lower than the expected value.
0: No effect
1: Clear the VCORERSTF bit.

Bit 3 **HCSSRSTF**: HSE CSS reset flag
Cleared by software. Indicates that a reset occurred due to a failure detection on HSE.
0: No effect
1: Clear the HCSSRSTF bit.

Bit 2 **PADRSTF**: NRST reset flag
Cleared by software. Indicates that a pad reset occurred.
0: No effect
1: Clear the PADRSTF bit.

Bit 1 **BORRSTF**: BOR reset flag
Cleared by software. Indicates that a BOR reset occurred.
0: No effect
1: Clear the BORRSTF bit.

Bit 0 **PORRSTF**: POR/PDR reset flag
Cleared by software. Indicates that a POR/PDR reset occurred.
0: No effect
1: Clear the PORRSTF bit.

21.8.24 RCC CPU2 boot reset status set register (RCC_C2BOOTRSTSSETR)

Address offset: 0x424

Reset value: 0x0000 0000

This register is used by the CPU2 to set the boot reset source. This register is updated by the CPU2 wake-up firmware after any reset source. Writing 0 to this register has no effect. Writing 1 sets the corresponding bits (see *Section 21.3.13* for details). The register is located in the V_{DDCORE} domain. Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 183* for details).Any read access is allowed.

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **D2STBYRSTF**: D2 DStandby reset flag
Set by software. Indicates that the D2 domain has been in DStandby mode.
0: No effect
1: Set the D2STBYRSTF bit.

Bit 22 Reserved, must be kept at reset value.

Bit 21 **STBYC2RSTF**: CPU2 system Standby reset flag
Set by software. Indicates that the system has been in Standby mode for CPU2.
0: No effect
1: Set the STBYC2RSTF bit.

Bit 20 Reserved, must be kept at reset value.

Bit 19 **RETECCFAILRESTRSTF**: RETRAM ECC failure reset flag during system restoration phase
Set by software. Indicates that a reset due to an ECC failure on RETRAM during the system restoration phase occurred.
0: No effect
1: Set the RETECCFAILRESTRSTF bit.

Bit 18 **RETECCFAILCRCRSTF**: RETRAM ECC failure reset flag during the CRC computation phase
Set by software. Indicates that a reset due to an ECC failure on RETRAM during CRC computation phase occurred.
0: No effect
1: Set the RETECCFAILCRCRSTF bit.

Bit 17 **RETCRCERRRSTF**: RETRAM CRC error reset flag
Set by software. Indicates that a reset due to a CRC error on RETRAM content occurred.
0: No effect
1: Set the RETCRCERRRSTF bit.

Bits 16:15 Reserved, must be kept at reset value.

Bit 14 **C2RSTF**: CPU2 reset flag
Set by software. Indicates that a CPU2 reset occurred.
0: No effect
1: Set the C2RSTF bit.

Bit 13 Reserved, must be kept at reset value.

Bit 12 **IWDG5SYSRSTF**: IWDG5 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG5 timeout.
0: No effect
1: Set the IWDG5SYSRSTF bit.

Bit 11 **IWDG4SYSRSTF**: IWDG4 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG4 timeout.
0: No effect
1: Set the IWDG4SYSRSTF bit.

Bit 10 **IWDG3SYSRSTF**: IWDG3 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG3 timeout.
0: No effect
1: Set the IWDG3SYSRSTF bit.

Bit 9 **IWDG2SYSRSTF**: IWDG2 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG2 timeout.
0: No effect
1: Set the IWDG2SYSRSTF bit.

Bit 8 **IWDG1SYSRSTF**: IWDG1 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG1 timeout.
0: No effect
1: Set the IWDG1SYSRSTF bit.

Bit 7 **SYSC2RSTF**: CPU2 system reset flag
Set by software. Indicates that a system reset generated by the CPU2 occurred.
0: No effect
1: Set the SYSC2RSTF bit.

Bit 6 **SYSC1RSTF**: CPU1 system reset flag
Set by software. Indicates that a system reset generated by the CPU1 occurred.
0: No effect
1: Set the SYSC1RSTF bit.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **VCORERSTF**: V_{DDCORE} reset flag
Set by software. Indicates that a reset occurred because V_{DDCORE} is lower than the expected value.
0: No effect
1: Set the VCORERSTF bit.

Bit 3 **HCSSRSTF**: HSE CSS reset flag
Set by software. Indicates that a reset occurred due to a failure detection on HSE.
0: No effect
1: Set the HCSSRSTF bit.

Bit 2 **PADRSTF**: NRST reset flag
Set by software. Indicates that a pad reset occurred.
0: No effect
1: Set the PADRSTF bit.

Bit 1 **BORRSTF**: BOR reset flag
Set by software. Indicates that a BOR reset occurred.
0: No effect
1: Set the BORRSTF bit.

Bit 0 **PORRSTF**: POR/PDR reset flag
Set by software. Indicates that a POR/PDR reset occurred.
0: No effect
1: Set the PORRSTF bit.

21.8.25 RCC CPU2 boot reset status clear register (RCC_C2BOOTRSTSCLRR)

Address offset: 0x428

Reset value: 0x0000 0000

This register is used by the CPU2 to check the boot reset source. This register is updated by the CPU2 wake-up firmware after any reset source. Writing 0 to this register has no effect. Writing 1 clears the corresponding bits (see *Section 21.3.13* for details). The register is located in the V_{DDCORE} domain. Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 183* for details). Any read access is allowed.

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **D2STBYRSTF**: D2 DStandby reset flag
Cleared by software. Indicates that the D2 domain has been in DStandby mode.
0: No effect
1: Clear the D2STBYRSTF bit.

Bit 22 Reserved, must be kept at reset value.

Bit 21 **STBYC2RSTF**: CPU2 system Standby reset flag
Cleared by software. Indicates that the system has been in Standby mode for CPU2.
0: No effect
1: Clear the STBYC2RSTF bit.

Bit 20 Reserved, must be kept at reset value.

Bit 19 **RETECCFAILRESTRSTF**: RETRAM ECC failure reset flag during system restoration phase
Cleared by software. Indicates that a reset due to an ECC failure on RETRAM during the system restoration phase occurred.
0: No effect
1: Clear the RETECCFAILRESTRSTF bit.

Bit 18 **RETECCFAILCRCRSTF**: RETRAM ECC failure reset flag during the CRC computation phase
Cleared by software. Indicates that a reset due to an ECC failure on RETRAM during CRC computation phase occurred.
0: No effect
1: Clear the RETECCFAILCRCRSTF bit.

Bit 17 **RETCRCERRRSTF**: RETRAM CRC error reset flag
Cleared by software. Indicates that a reset due to a CRC error on RETRAM content occurred.
0: No effect
1: Clear the RETCRCERRRSTF bit.

Bits 16:15 Reserved, must be kept at reset value.

Bit 14 **C2RSTF**: CPU2 reset flag
Cleared by software. Indicates that a CPU2 reset occurred.
0: No effect
1: Clear the C2RSTF bit.

Bit 13 Reserved, must be kept at reset value.

Bit 12 **IWDG5SYSRSTF**: IWDG5 reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG5 timeout.
0: No effect
1: Clear the IWDG5SYSRSTF bit.

Bit 11 **IWDG4SYSRSTF**: IWDG4 reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG4 timeout.
0: No effect
1: Clear the IWDG4SYSRSTF bit.

Bit 10 **IWDG3SYSRSTF**: IWDG3 reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG3 timeout.
0: No effect
1: Clear the IWDG3SYSRSTF bit.

Bit 9 **IWDG2SYSRSTF**: IWDG2 reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG2 timeout.
0: No effect
1: Clear the IWDG2SYSRSTF bit.

Bit 8 **IWDG1SYSRSTF**: IWDG1 system reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG1 timeout.
0: No effect
1: Clear the IWDG1SYSRSTF bit.

Bit 7 **SYSC2RSTF**: CPU2 system reset flag
Cleared by software. Indicates that a system reset generated by the CPU2 occurred.
0: No effect
1: Clear the SYSC2RSTF bit.

Bit 6 **SYSC1RSTF**: CPU1 system reset flag
Cleared by software. Indicates that a system reset generated by the CPU1 occurred.
0: No effect
1: Clear the SYSC1RSTF bit.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **VCORERSTF**: V_{DDCORE} reset flag
Cleared by software. Indicates that a reset occurred because V_{DDCORE} is lower than the expected value.
0: No effect
1: Clear the VCORERSTF bit.

Bit 3 **HCSSRSTF**: HSE CSS reset flag
Cleared by software. Indicates that a reset occurred due to a failure detection on HSE.
0: No effect
1: Clear the HCSSRSTF bit.

Bit 2 **PADRSTF**: NRST reset flag
Cleared by software. Indicates that a pad reset occurred.
0: No effect
1: Clear the PADRSTF bit.

Bit 1 **BORRSTF**: BOR reset flag
Cleared by software. Indicates that a BOR reset occurred.
0: No effect
1: Clear the BORRSTF bit.

Bit 0 **PORRSTF**: POR/PDR reset flag
Cleared by software. Indicates that a POR/PDR reset occurred.
0: No effect
1: Clear the PORRSTF bit.

21.8.26 RCC CPU1 stop request set register (RCC_C1SREQSETR)

Address offset: 0x42C

Reset value: 0x0000 0000

Writing 0 has no effect. Reading returns the values of the bits. Writing 1 sets the corresponding bit to 1. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ESLPREQ
															rs

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STPREQ_P1	STPREQ_P0
														rs	rs

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **ESLPREQ**: Enhanced CSleep request for CPU1 subsystem
Set by software. Allows the entry in enhanced CSleep for CPU1 sub-ystem, when the complete CPU1 is in WFI.
0: Writing 0 has no effect. Reading 0 means that enhanced CSleep for CPU1 subsystem is not requested.
1: Writing 1 sets the ESLPREQ bit. Reading 1 means that enhanced CSleep for CPU1 subsystem is requested.

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **STPREQ_P1**: Stop request for CPU1 processor core 1
Set by software. In Single-core CPU1, this bit is reserved. Indicates if the CPU1 processor core 1 allows the entry in Stop mode for CPU1 subsystem, when complete CPU1 is in WFI.
0: Writing 0 has no effect. Reading 0 means that the CPU1 processor 1 does not allow the CPU1 subsystem to go to CStop.
1: Writing 1 sets the STPREQ_P1 bit. Reading 1 means that the CPU1 processor core 1 allows the CPU1 subsystem to go to CStop.

Bit 0 **STPREQ_P0**: Stop request for CPU1 processor core 0

Set by software. Indicates if the CPU1 processor 0 allows the entry in Stop mode for CPU1 subsystem, when the complete CPU1 is in WFI.

0: Writing 0 has no effect. Reading 0 means that the CPU1 processor core 0 does not allow the CPU1 subsystem to go to CStop.

1: Writing 1 sets the STPREQ_P0 bit. Reading 1 means that the CPU1 processor core 0 allows the CPU1 subsystem to go to CStop.

21.8.27 RCC CPU1 stop request clear register (RCC_C1SREQCLRR)

Address offset: 0x430

Reset value: 0x0000 0000

Writing 0 has no effect. Reading returns the effective values of the bits. Writing 1 clears the corresponding bit to 0. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

														rc_w1	rc_w1

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **ESLPREQ**: Enhanced CSleep request for CPU1 subsystem

Cleared by software. Allows the entry in enhanced CSleep for CPU1 subsystem, when the complete CPU1 is in WFI.

0: Writing 0 has no effect. Reading 0 means that enhanced CSleep for CPU1 subsystem is not requested.

1: Writing 1 clears the ESLPREQ bit. Reading 1 means that enhanced CSleep for the CPU1 subsystem is requested.

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **STPREQ_P1**: Stop request for CPU1 processor core 1

Cleared by software. Indicates if the CPU1 processor core 1 allows the entry in Stop mode for the CPU1 subsystem, when the complete CPU1 is in WFI.

0: Writing 0 has no effect. Reading 0 means that the CPU1 processor core 1 does not allow the CPU1 subsystem to go to CStop.

1: Writing 1 clears the STPREQ_P1 bit. Reading 1 means that the CPU1 processor core 1 allows the CPU1 subsystem to go to CStop.

Bit 0 **STPREQ_P0**: Stop request for CPU1 processor core 0

Cleared by software. Indicates if the CPU1 processor core 0 allows the entry in Stop mode for CPU1 subsystem, when the complete CPU1 is in WFI.

0: Writing 0 has no effect. Reading 0 means that the CPU1 processor core 0 does not allow the CPU1 subsystem to go to CStop.

1: Writing 1 clears the STPREQ_P0 bit. Reading 1 means that the CPU1 processor core 0 allows the CPU1 subsystem to go to CStop.

21.8.28 RCC CPU boot control register (RCC_CPUBOOTCR)

Address offset: 0x434

Reset value: 0x0000 0000

The register is used to control the HOLD_BOOT state of the CPUs after reset (see *HOLD_BOOT CPUx state* for details). Write accesses are defined according to the RCC local resource number 67 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BOOT_CPU1	BOOT_CPU2
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **BOOT_CPU1**: CPU1 boot

Set and cleared by software to set the CPU1 in HOLD_BOOT after a reset of the CPU1. If the CPU1 was in HOLD_BOOT, it causes the CPU1 to boot.

0: The CPU1 is set in HOLD_BOOT when the next CPU1 reset occurs.

1: The CPU1 is not in HOLD_BOOT mode when the next CPU1 reset occurs.

Bit 0 **BOOT_CPU2**: CPU2 to boot

Set and cleared by software to set the CPU2 in HOLD_BOOT after a reset of the CPU2 core. If the CPU2 was in HOLD_BOOT, it causes the CPU2 to boot.

0: The CPU2 is set in HOLD_BOOT when the next CPU2 core reset occurs.

1: The CPU2 is not in HOLD_BOOT mode when the next CPU2 core reset occurs.

21.8.29 RCC standby boot control register (RCC_STBYBOOTCR)

Address offset: 0x438

Reset value: 0x0000 0000

This register is used to control the boot sequence when the system exits Standby (see *Section 21.3.14* for details). This register is reset when a system reset occurs (app_rstn), but not when the circuit exits from Standby. Wait states are inserted in case of successive write accesses to this register. The number of wait states can be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 67 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	RET_CRCERR_RSTEN	Res.	Res.	CPU1_HW_BEN	CPU2_HW_BEN	Res.	COLD_CPU2	CPU_BEN_SEL	Res.
							rw			r	r		rwo	rw	

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **RET_CRCERR_RSTEN**: RETRAM CRC error system reset enable

Set and cleared by software to select whether a RETRAM CRC error triggers a system reset or not.

0: RETRAM CRC error does not trigger a system reset (default after reset).

1: RETRAM CRC error triggers a system reset.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **CPU1_HW_BEN**: CPU1 hardware boot enable

Set and cleared by hardware to indicate whether the CPU1 is enabled to restart after the system exits Standby.

0: CPU1 remains in HOLD_BOOT state.

1: CPU1 is allowed to restart.

Bit 4 **CPU2_HW_BEN**: CPU2 hardware boot enable

Set and cleared by hardware to indicate whether the CPU2 is enabled to restart after the system exits Standby.

0: CPU2 remains in HOLD_BOOT state.

1: CPU2 is allowed to restart.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **COLD_CPU2**: CPU2 cold boot

Set by software to indicate that CPU2 started first after POR. This bit can be written only one time after system reset.

0: CPU1 is the cold boot CPU.

1: CPU2 is the cold boot CPU.

Bit 1 **CPU_BEN_SEL**: CPU boot select

Set and cleared by software to select the CPU to restart first after the system exits Standby, in wake-up event mode in case of simultaneous CPU events.

0: CPU1 restarts first (default after reset).

1: CPU2 restarts first.

Bit 0 Reserved, must be kept at reset value.

21.8.30 RCC legacy boot control register (RCC_LEGBOOTCR)

Address offset: 0x43C

Reset value: 0x0000 0000

This register is used to control the first CPUx to boot (see *Section 21.3.14* for details). This register is reset when a system reset (app_rstn) occurs but not when the circuit exits Standby. Wait states are inserted in case of successive write accesses to this register. The number of wait states can be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 67 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LEGACY_BEN
															rwo

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **LEGACY_BEN**: Enable of the legacy selection mode to choose the first CPU to boot
Set by software to indicate that the CPU1 boots first. This bit can be written only one time after system reset.
0: The legacy selection mode is disabled (default after reset).
1: The legacy selection mode is enabled.

21.8.31 RCC backup domain control register (RCC_BDCR)

Address offset: 0x440

Reset value: 0x0000 0020

This register is used to control LSE and LSI functions. Wait states are inserted in case of successive write accesses to this register. The number of wait states may be up to 7 cycles of the RCC clock. After a system reset, this register is write-protected. In order to modify this register, DBD3P in PWR_BDCR1 must be set to 1. This register is only reset after a backup domain reset (vsw_rstn, see *Section 21.3.6*). Any other internal or external reset does not have any effect on these bits. This register is located in the V_{SW} domain.
Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
VSWRST	Res.	Res.	Res.	Res.	Res.	C3SYSTICKSEL	MSIFREQSEL	Res.	Res.	Res.	RTCCKEN	Res.	Res.	RTCSRC[1:0]	
rw						rw	rw				rw			rwo	rwo
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	LSIRDY	LSION	LSECSSD	LSEGFON	LSECSSON	LSEDRV[1:0]		LSEDIGBYP	LSERDY	LSEBYP	LSEON
					r	rw	r	rw	rw	rw	rw	rw	r	rw	rw

Bit 31 **VSWRST**: V_{SW} domain software reset
Set and cleared by software.
0: Reset not activated (default after backup domain reset)
1: Resets the entire V_{SW} domain.

Bits 30:26 Reserved, must be kept at reset value.

Bit 25 **C3SYSTICKSEL**: CPU3 SysTick clock select
Set and cleared by software.
0: CPU3 SysTick clock is LSI (default after backup domain reset).
1: CPU3 SysTick clock is LSE.

Bit 24 **MSIFREQSEL**: MSI frequency selection
Set and cleared by software.
0: MSI frequency is 4 MHz (default after backup domain reset).
1: MSI frequency is 16 MHz.

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **RTCCKEN**: RTC clock enable
Set and cleared by software.
0: rtc_ck clock disabled (default after backup domain reset)
1: rtc_ck clock enabled

Bits 19:18 Reserved, must be kept at reset value.

Bits 17:16 **RTCSRC[1:0]**: RTC clock source selection
Set by software to select the clock source for the RTC. This field can be written only one time after backup domain reset. When an LSE failure occurs, this field is cleared to 0, and the software can write it again once. This field must be written before LSECSSON is enabled (see *CSS on LSE* for details).
0x0: No clock (default after backup domain reset)
0x1: LSE clock used as RTC clock
0x2: LSI clock used as RTC clock
0x3: HSE clock divided by RTCDIV value used as RTC clock

Bits 15:11 Reserved, must be kept at reset value.

Bit 10 **LSIRDY**: LSI oscillator ready
Set and cleared by hardware to indicate when the LSI is stable. This bit needs 3 cycles of lsi_ck to fall down after LSION has been cleared to 0.
0: LSI oscillator not ready (default after reset)
1: LSI oscillator ready

Bit 9 **LSION**: LSI oscillator enabled
Set and cleared by software.
0: LSI oscillator off (default after backup domain reset)
1: LSI oscillator on

Bit 8 **LSECSSD**: LSE CSS failure detection
Set by hardware to indicate when a failure has been detected by the CSS on the external 32 kHz oscillator.
0: No failure detected on 32 kHz oscillator (default after backup domain reset)
1: Failure detected on 32 kHz oscillator

Bit 7 **LSEGFON**: LSE clock glitch filter enable

Set and cleared by software to enable the LSE clock glitch filter. This bit can be written only when LSE is disabled (LSEON = 0).

0: LSE clock glitch filter disabled

1: LSE clock glitch filter enabled

Bit 6 **LSECSSON**: LSE CSS enable

Set by software to enable the CSS on 32 kHz oscillator (see *LSE oscillator* for details on the activation and deactivation sequences). Once this bit is set, it cannot be cleared, except after a LSE failure detection (LSECSSD = 1).

0: CSS on 32 kHz oscillator off (default after backup domain reset)

1: CSS on 32 kHz oscillator on

Bits 5:4 **LSEDRV[1:0]**: LSE oscillator driving capability

Set by software to select the driving capability of the LSE oscillator.

0x0: Lowest drive

0x1: Medium-high drive (recommended setting with most crystals)

0x2: Medium-low drive (default after backup domain reset)

0x3: Highest drive

Bit 3 **LSEDIGBYP**: LSE digital bypass

Set and cleared by software to select the analog or digital bypass mode

0: LSE in analog bypass mode (default after backup domain reset)

1: LSE in digital bypass mode

Bit 2 **LSERDY**: LSE oscillator ready

Set and cleared by hardware to indicate when the LSE is stable. This bit needs 6 cycles of lse_ck to fall down after LSEON has been cleared to 0.

0: LSE oscillator not ready (default after backup domain reset)

1: LSE oscillator ready

Bit 1 **LSEBYP**: LSE oscillator bypass

Set and cleared by software to bypass oscillator in debug mode. This bit must not be written when the LSE is enabled (LSEON = 1) (see *LSE oscillator* for details).

0: LSE oscillator not bypassed (default after backup domain reset)

1: LSE oscillator bypassed

Bit 0 **LSEON**: LSE oscillator enable

Set and cleared by software.

0: LSE oscillator off (default after backup domain reset)

1: LSE oscillator on

21.8.32 RCC D3 domain control register (RCC_D3DCR)

Address offset: 0x444

Reset value: 0x0000 0000

This register is used to control the D3 domain functions. Wait states are inserted in case of successive write accesses to this register. The number of wait states may be up to 7 cycles of the RCC clock. Write access to this register is not allowed during the clock restore sequence (see *Clock restore sequence* for details). This register is located i
n the D3 domain. Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	D3PERCKSEL[1:0]

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MSIRDY	MSIKERON	MSION
													r	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:16 **D3PERCKSEL[1:0]**: D3 peripheral local bus clock select
Set and cleared by software.
0x0: MSI kernel clock used as D3 peripheral bus clock interface (default after backup domain reset)
0x1: LSI clock used as D3 peripheral bus clock interface
0x2: LSE clock used as D3 peripheral bus clock interface
Others: Reserved

Bits 15:3 Reserved, must be kept at reset value.

Bit 2 **MSIRDY**: MSI clock ready flag
Set by hardware to indicate that the MSI oscillator is stable.
0: MSI clock is not ready (default after reset)
1: MSI clock is ready

Bit 1 **MSIKERON**:
Set by software to force the MSI on, even in Stop mode, in order to be quickly available as kernel clock for some peripherals. This bit has no effect on the MSION value.
0: No effect
1: Set the MSIKERON bit.

Bit 0 **MSION**: MSI oscillator enable
Set and cleared by software.
0: MSI oscillator off (default after reset)
1: MSI oscillator on

21.8.33 RCC D3 domain status register (RCC_D3DSR)

Address offset: 0x448

Reset value: 0x0000 0000

This is a read-only access register that contains the D3 domain status flags. Writing has no effect. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **D3STATE[1:0]**: D3 domain state

Set by hardware to indicate the D3 domain state.
0x0: D3 domain in reset state (default after reset)
0x1: D3 domain in system state (flexclkgen clocking)
0x2: D3 domain in clock switching state
0x3: D3 domain in local state (D3 local clocking)

21.8.34 RCC reset duration control register (RCC_RDCR)

Address offset: 0x44C

Reset value: 0x0600 0000

This register is used to control the minimum NRST active duration. Wait states are inserted in case of successive write accesses to this register. The number of wait states may be up to 7 cycles of the RCC clock. This register is reset by por_rstn reset, and it is located in the V_{DD} domain. Write accesses are defined according to the RCC local resource number 68 configuration (see *Table 183* for details). Any read access is allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **EADLY[3:0]**: External access delays
Set and cleared by software. Time to wait before boot ROM performs any external access (for peripherals like UART, USB, OCTOSPI, FMC, or SDMMC).
0x0: No extra delay added by boot ROM
0x1: 100 µs
0x2: 200 µs
0x3: 500 µs
0x4: 1 ms
0x5: 2 ms
0x6: 5 ms (default after reset)
0x7: 10 ms
0x8: 20 ms
0x9: 50 ms
0xA: 100 ms
0xB: 200 ms
0xC: 500 ms
0xD: 1 s
0xE: 2 s
0xF: 5 s

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **MRD[4:0]**: Minimum reset duration
Set and cleared by software. This field defines the minimum guaranteed duration of the NRST low pulse. The LSI oscillator is automatically enabled when needed by the RPCTL.
0x0: NRST low-pulse duration is guaranteed by the pulse stretcher of the pin. The RPCTL is bypassed (default after reset).
0x1: The guaranteed NRST low-pulse duration is about 1 ms (1 x 32 lsi_ck cycles).
0x2: The guaranteed NRST low-pulse duration is about 2 ms (2 x 32 lsi_ck cycles).
...
0x1F: The guaranteed NRST low-pulse duration is about 31 ms (31 x 32 lsi_ck cycles).

Bits 15:0 Reserved, must be kept at reset value.

21.8.35 RCC C1MS reset delay control register (RCC_C1MSRDCR)

Address offset: 0x450

Reset value: 0x0000 0000

This register is used to control the minimum NRSTC1MS active duration after any D1 Standby exit. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	C1MSRST	Res.	Res.	Res.	C1MSRD[4:0]				
							rs				rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **C1MSRST**: Trigger low-level pulse on NRSTC1MS pin
Set by software and cleared by hardware.
0: Reading 0 means that the NRSTC1MS level is high (inactive) (default after reset).
1: Writing 1 triggers a low-level pulse on NRSTC1MS according to C1MSRD value.
Reading 1 means that the NRSTC1MS level is low (active).

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **C1MSRD[4:0]**: Minimum Standby reset duration
Set and cleared by software. This filed defines the minimum duration of the low-level pulse on NRSTC1MS when C1MSRST is high. The LSI is automatically enabled after any D1 DStandby exit.
0x0: No pulse on NRSTC1MS (default after reset)
0x1: The guaranteed NRSTC1MS low-pulse duration is about 1 ms (1 x 32 lsi_ck cycles).
0x2: The guaranteed NRSTC1MS low-pulse duration is about 2 ms (2 x 32 lsi_ck cycles).
...
0x1F: The guaranteed NRSTC1MS low-pulse duration is about 31 ms (31 x 32 lsi_ck cycles).

21.8.36 RCC PWR_LP delay control register (RCC_PWRLPDLYCR)

Address offset: 0x454

Reset value: 0x0000 0000

This register is used to program the delay between the moment where the system exits Stop mode, and the moment where it is allowed to enable the PLLs and to provide a clock to bridges and CPUx. Write access to this register is not allowed during the clock restore sequence (see *Clock restore sequence* for details). Write accesses are defined according to the RCC local resource number 67 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	CPU2TMPSKP	Res.	Res.	PWRLP_DLY[21:16]					
							rw			rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PWRLP_DLY[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **CPU2TMPSKP**: Skip of PWR_LP delay for CPU2
Set and cleared by software. This bit is used by the clock restore sequence to skip the PWR_LP delay for the CPU2 clock restore when the system exits Stop mode.
0: The CPU2 clock restore sequence waits for the PWR_LP delay before activating power consuming elements (default after reset).
1: The CPU2 clock restore sequence runs the PWR_LP delay, but did not wait for the delay to elapse before activating power consuming elements

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:0 **PWRLP_DLY[21:0]**: PWR_LP delay value

Set and cleared by software. This register contains the delay value to be observed before activating the PLL and interconnect clocks, after one of the system Stop modes. The delay is counted with the HSI, or HSI/2 clock.

When LSMCU = 0 in RCC_LSMCUDIVR, the delay value is given by the formula: PWRLP_DLY[21:0] / f_{HSI} or PWRLP_DLY[21:0] / f_{HSI} / 2

0x0: PWR_LP delay bypassed (default after reset)

0x1: PWR_LP delay of one 64 MHz HSI period (LSMCU = 0) or two HSI periods (LSMCU = 1) is observed.

...

0x3FFFFF: PWR_LP delay of about 65.5 ms (LSMCU = 0) or 131 ms (LSMCU = 1) is observed.

21.8.37 RCC CPU1 clock source interrupt enable set register (RCC_C1CIESETR)

Address offset: 0x458

Reset value: 0x0000 0000

This register is used by the CPU1 to control the interrupt source enable (see *Section 21.5* for details). Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **WKUPIE**: CPU1 wake-up from CStop interrupt enable

Set and cleared by software to enable/disable the generation of the interrupt used to wake up the CPU1 from CStop.

0: Wake-up interrupt disabled (default after reset)

1: Wake-up interrupt enabled

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **LSECSSIE**: LSE clock security system interrupt enable

Set and cleared by software to enable/disable interrupt caused by the CSS on the external 32 kHz oscillator.

0:LSE CSS interrupt disabled (default after reset)

1: LSE CSS interrupt enabled

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **PLL8RDYIE**: PLL8 ready interrupt enable

Set and cleared by software to enable/disable interrupt caused by PLL8 lock.

0: PLL8 lock interrupt disabled (default after reset)

1: PLL8 lock interrupt enabled

Bit 11 **PLL7RDYIE**: PLL7 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL7 lock.
0: PLL7 lock interrupt disabled (default after reset)
1: PLL7 lock interrupt enabled

Bit 10 **PLL6RDYIE**: PLL6 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL6 lock.
0: PLL6 lock interrupt disabled (default after reset)
1: PLL6 lock interrupt enabled

Bit 9 **PLL5RDYIE**: PLL5 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL5 lock.
0: PLL5 lock interrupt disabled (default after reset)
1: PLL5 lock interrupt enabled

Bit 8 **PLL4RDYIE**: PLL4 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL4 lock.
0: PLL4 lock interrupt disabled (default after reset)
1: PLL4 lock interrupt enabled

Bit 7 **PLL3RDYIE**: PLL3 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL3 lock.
0: PLL3 lock interrupt disabled (default after reset)
1: PLL3 lock interrupt enabled

Bit 6 **PLL2RDYIE**: PLL2 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL2 lock.
0: PLL2 lock interrupt disabled (default after reset)
1: PLL2 lock interrupt enabled

Bit 5 **PLL1RDYIE**: PLL1 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL1 lock.
0: PLL1 lock interrupt disabled (default after reset)
1: PLL1 lock interrupt enabled

Bit 4 **MSIRDYIE**: MSI ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by the MSI oscillator stabilization.
0: MSI ready interrupt disabled (default after reset)
1: MSI ready interrupt enabled

Bit 3 **HSERDYIE**: HSE ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by the HSE oscillator stabilization.
0: HSE ready interrupt disabled (default after reset)
1: HSE ready interrupt enabled

Bit 2 **HSIRDYIE**: HSI ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by the HSI oscillator stabilization.
0: HSI ready interrupt disabled (default after reset)
1: HSI ready interrupt enabled

Bit 1 **LSERDYIE**: LSE ready interrupt enable

Set and cleared by software to enable/disable interrupt caused by the LSE oscillator stabilization.

0: LSE ready interrupt disabled (default after reset)

1: LSE ready interrupt enabled

Bit 0 **LSIRDYIE**: LSI ready interrupt enable

Set and cleared by software to enable/disable interrupt caused by the LSI oscillator stabilization.

0: LSI ready interrupt disabled (default after reset)

1: LSI ready interrupt enabled

21.8.38 RCC CPU1 clock source interrupt flag clear register (RCC_C1CIFCLRR)

Address offset: 0x45C

Reset value: 0x0000 0004

This register is used by the CPU1 to read and clear the interrupt flags. Writing 0 has no effect. Writing 1 clears the corresponding flag (see *Section 21.5* for details). Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 183* for details). Any read access is allowed.

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **WKUPF**: CPU1 wake-up from CStop interrupt flag

Reset by software by writing this flag to 1. Set by hardware when CPU1 needs to exit CStop.

0: No wake-up interrupt pending (default after reset)

1: Wake-up interrupt pending. Writing 1 clears this flag.

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **LSECSSF**: LSE CSS interrupt flag

Reset by software by writing this flag to 1. Set by hardware when a failure is detected on the external 32 kHz oscillator.

0: No failure detected on the external 32 kHz oscillator (default after reset)

1: A failure is detected on the external 32 kHz oscillator. Writing 1 clears this flag.

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **PLL8RDYF**: PLL8 ready interrupt flag

Reset by software by writing this flag to 1. Set by hardware when the PLL8 locks.

0: No clock ready interrupt caused by PLL8 lock (default after reset)

1: Clock ready interrupt caused by PLL8 lock. Writing 1 clears this flag.

Bit 11 **PLL7RDYF**: PLL7 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL7 locks.
0: No clock ready interrupt caused by PLL7 lock (default after reset)
1: Clock ready interrupt caused by PLL7 lock. Writing 1 clears this flag.

Bit 10 **PLL6RDYF**: PLL6 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL6 locks.
0: No clock ready interrupt caused by PLL6 lock (default after reset)
1: Clock ready interrupt caused by PLL6 lock. Writing 1 clears this flag.

Bit 9 **PLL5RDYF**: PLL5 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL5 locks.
0: No clock ready interrupt caused by PLL5 lock (default after reset)
1: Clock ready interrupt caused by PLL5 lock. Writing 1 clears this flag.

Bit 8 **PLL4RDYF**: PLL4 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL4 locks.
0: No clock ready interrupt caused by PLL4 lock (default after reset)
1: Clock ready interrupt caused by PLL4 lock. Writing 1 clears this flag.

Bit 7 **PLL3RDYF**: PLL3 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL3 locks.
0: No clock ready interrupt caused by PLL3 lock (default after reset)
1: Clock ready interrupt caused by PLL3 lock. Writing 1 clears this flag.

Bit 6 **PLL2RDYF**: PLL2 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL2 locks.
0: No clock ready interrupt caused by PLL2 lock (default after reset)
1: Clock ready interrupt caused by PLL2 lock. Writing 1 clears this flag.

Bit 5 **PLL1RDYF**: PLL1 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL1 locks.
0: No clock ready interrupt caused by PLL1 lock (default after reset)
1: Clock ready interrupt caused by PLL1 lock. Writing 1 clears this flag.

Bit 4 **MSIRDYF**: MSI ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when MSI clock becomes stable.
0: No clock ready interrupt caused by the MSI (default after reset)
1: Clock ready interrupt caused by the MSI. Writing 1 clears this flag.

Bit 3 **HSERDYF**: HSE ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when HSE clock becomes stable.
0: No clock ready interrupt caused by the HSE (default after reset)
1: Clock ready interrupt caused by the HSE. Writing 1 clears this flag.

Bit 2 **HSIRDYF**: HSI ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when HSI clock becomes stable.
0: No clock ready interrupt caused by the HSI (default after reset)
1: Clock ready interrupt caused by the HSI. Writing 1 clears this flag.

Bit 1 **LSERDYF**: LSE ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when LSE clock becomes stable.
0: No clock ready interrupt caused by the LSE (default after reset)
1: Clock ready interrupt caused by the LSE. Writing 1 clears this flag.

Bit 0 **LSIRDYF**: LSI ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when LSI clock becomes stable.
0: No clock ready interrupt caused by the LSI (default after reset)
1: Clock ready interrupt caused by the LSI. Writing 1 clears this flag.

21.8.39 RCC CPU2 clock source interrupt enable set register (RCC_C2CIESETR)

Address offset: 0x460

Reset value: 0x0000 0000

This register is used by the CPU2 to control the interrupt source enable (see *Section 21.5* for more details). Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 183* for details). Any read access is allowed.

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **WKUPIE**: CPU2 wake-up from CStop Interrupt Enable
Set and cleared by software to enable/disable the generation of the interrupt used to wake up the CPU2 from CStop.
0: Wake-up interrupt disabled (default after reset)
1: Wake-up interrupt enabled

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **LSECSSIE**: LSE CSS interrupt enable
Set and cleared by software to enable/disable interrupt caused by the CSS on external 32 kHz oscillator.
0: LSE CSS interrupt disabled (default after reset)
1: LSE CSS interrupt enabled

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **PLL8RDYIE**: PLL8 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL8 lock.
0: PLL8 lock interrupt disabled (default after reset)
1: PLL8 lock interrupt enabled

Bit 11 **PLL7RDYIE**: PLL7 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL7 lock.
0: PLL7 lock interrupt disabled (default after reset)
1: PLL7 lock interrupt enabled

Bit 10 **PLL6RDYIE**: PLL6 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL6 lock.
0: PLL6 lock interrupt disabled (default after reset)
1: PLL6 lock interrupt enabled

Bit 9 **PLL5RDYIE**: PLL5 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL5 lock.
0: PLL5 lock interrupt disabled (default after reset)
1: PLL5 lock interrupt enabled

Bit 8 **PLL4RDYIE**: PLL4 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL4 lock.
0: PLL4 lock interrupt disabled (default after reset)
1: PLL4 lock interrupt enabled

Bit 7 **PLL3RDYIE**: PLL3 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL3 lock.
0: PLL3 lock interrupt disabled (default after reset)
1: PLL3 lock interrupt enabled

Bit 6 **PLL2RDYIE**: PLL2 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL2 lock.
0: PLL2 lock interrupt disabled (default after reset)
1: PLL2 lock interrupt enabled

Bit 5 **PLL1RDYIE**: PLL1 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL1 lock.
0: PLL1 lock interrupt disabled (default after reset)
1: PLL1 lock interrupt enabled

Bit 4 **MSIRDYIE**: MSI ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by MSI stabilization.
0: MSI ready interrupt disabled (default after reset)
1: MSI ready interrupt enabled

Bit 3 **HSERDYIE**: HSE ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by HSE stabilization.
0: HSE ready interrupt disabled (default after reset)
1: HSE ready interrupt enabled

Bit 2 **HSIRDYIE**: HSI ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by HSI stabilization.
0: HSI ready interrupt disabled (default after reset)
1: HSI ready interrupt enabled

Bit 1 **LSERDYIE**: LSE ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by LSE stabilization.
0: LSE ready interrupt disabled (default after reset)
1: LSE ready interrupt enabled

Bit 0 **LSIRDYIE**: LSI ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by LSI stabilization.
0: LSI ready interrupt disabled (default after reset)
1: LSI ready interrupt enabled

21.8.40 RCC CPU2 clock source interrupt flag clear register (RCC_C2CIFCLRR)

Address offset: 0x464

Reset value: 0x0000 0004

This register is used by the CPU2 to read and clear the interrupt flags. Writing 0 has no effect. Writing 1 clears the corresponding flag (see *Section 21.5* for more details).
Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 183* for details). Any read access is allowed.

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **WKUPF**: CPU2 wake-up from CStop interrupt flag
Reset by software by writing this flag to 1. Set by hardware when CPU2 needs to exit CStop.
0: No wake-up interrupt pending (default after reset)
1: Wake-up interrupt pending. Writing 1 clears this flag.

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **LSECSSF**: LSE clock security system interrupt flag
Reset by software by writing this flag to 1. Set by hardware when a failure is detected on the external 32 kHz oscillator.
0: No failure detected on the external 32 kHz oscillator (default after reset)
1: A failure is detected on the external 32 kHz oscillator. Writing 1 clears this flag.

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **PLL8RDYF**: PLL8 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL8 locks.
0: No clock ready interrupt caused by PLL8 lock (default after reset)
1: Clock ready interrupt caused by PLL8 lock. Writing 1 clears this flag.

Bit 11 **PLL7RDYF**: PLL7 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL7 locks.
0: No clock ready interrupt caused by PLL7 lock (default after reset)
1: Clock ready interrupt caused by PLL7 lock. Writing 1 clears this flag.

Bit 10 **PLL6RDYF**: PLL6 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL6 locks.
0: No clock ready interrupt caused by PLL6 lock (default after reset)
1: Clock ready interrupt caused by PLL6 lock. Writing 1 clears this flag.

Bit 9 **PLL5RDYF**: PLL5 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL5 locks.
0: No clock ready interrupt caused by PLL5 lock (default after reset)
1: Clock ready interrupt caused by PLL5 lock. Writing 1 clears this flag.

Bit 8 **PLL4RDYF**: PLL4 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL4 locks.
0: No clock ready interrupt caused by PLL4 lock (default after reset)
1: Clock ready interrupt caused by PLL4 lock. Writing 1 clears this flag.

Bit 7 **PLL3RDYF**: PLL3 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL3 locks.
0: No clock ready interrupt caused by PLL3 lock (default after reset)
1: Clock ready interrupt caused by PLL3 lock. Writing 1 clears this flag.

Bit 6 **PLL2RDYF**: PLL2 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL2 locks.
0: No clock ready interrupt caused by PLL2 lock (default after reset)
1: Clock ready interrupt caused by PLL2 lock. Writing 1 clears this flag.

Bit 5 **PLL1RDYF**: PLL1 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL1 locks.
0: No clock ready interrupt caused by PLL1 lock (default after reset)
1: Clock ready interrupt caused by PLL1 lock. Writing 1 clears this flag.

Bit 4 **MSIRDYF**: MSI ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when MSI clock becomes stable.
0: No clock ready interrupt caused by the MSI (default after reset)
1: Clock ready interrupt caused by the MSI. Writing 1 clears this flag.

Bit 3 **HSERDYF**: HSE ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when HSE clock becomes stable.
0: No clock ready interrupt caused by the HSE (default after reset)
1: Clock ready interrupt caused by the HSE. Writing 1 clears this flag.

Bit 2 **HSIRDYF**: HSI ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when HSI clock becomes stable.
0: No clock ready interrupt caused by the HSI (default after reset)
1: Clock ready interrupt caused by the HSI. Writing 1 clears this flag.

Bit 1 **LSERDYF**: LSE ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when LSE clock becomes stable.
0: No clock ready interrupt caused by the LSE (default after reset)
1: Clock ready interrupt caused by the LSE. Writing 1 clears this flag.

Bit 0 **LSIRDYF**: LSI ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when LSI clock becomes stable.
0: No clock ready interrupt caused by the LSI (default after reset)
1: Clock ready interrupt caused by the LSI. Writing 1 clears this flag.

21.8.41 RCC IWDG CPU1 clock freeze set register (RCC_IWDGC1FZSETR)

Address offset: 0x468

Reset value: 0x0000 0000

This register is used by to freeze IWDG1 and IWDG2 clocks. After a system reset, a Standby reset (sys_rstn), or a D1 DStandby reset (vcpu_rstn), the CPU1 can write this register once. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 sets the corresponding bit to 1. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 183* for details). Any read access is allowed.

														rs	rs

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FZ_IWDG2**: Freeze of IWDG2 clock

Set once by software after a system, Standby, or D1 DStandby reset, to freeze IWDG2 clock.
0: Writing 0 has no effect. Reading 0 means IWDG2 clock is not frozen (default after reset).
1: Writing 1 freezes IWDG2 clock. Reading 1 means that the IWDG2 clock is frozen.

Bit 0 **FZ_IWDG1**: Freeze of IWDG1 clock

Set once by software after a system, Standby, or D1 DStandby reset, to freeze IWDG1 clock.
0: Writing 0 has no effect. Reading 0 means IWDG1 clock is not frozen (default after reset).
1: Writing 1 freezes IWDG1 clock. Reading 1 means that IWDG1 clock is frozen.

21.8.42 RCC IWDG CPU1 clock freeze clear register (RCC_IWDGC1FZCLRR)

Address offset: 0x46C

Reset value: 0x0000 0000

This register is used to unfreeze IWDG1 and IWDG2 clocks. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 183* for details). Any read access is allowed.

														rc_w1	rc_w1

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FZ_IWDG2**: Unfreeze IWDG2 clock
Cleared by software to unfreeze IWDG2 clock.
0: Writing 0 has no effect. Reading 0 means IWDG2 clock is not frozen (default after reset).
1: Writing 1 unfreezes IWDG2 clock. Reading 1 means that IWDG2 clock is frozen.

Bit 0 **FZ_IWDG1**: Unfreeze IWDG1 clock
Cleared by software to unfreeze the IWDG1 clock.
0: Writing 0 has no effect. Reading 0 means IWDG1 clock is not frozen (default after reset).
1: Writing 1 unfreezes IWDG1 clock. Reading 1 means that IWDG1 clock is frozen.

21.8.43 RCC IWDG CPU1 configuration set register (RCC_IWDGC1CFGSETR)

Address offset: 0x470

Reset value: 0x0000 0000

This register is used to enable IWDG1 and IWDG2 timeout event reset behavior, and to activate IWDG2 kernel reset. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 sets the corresponding bit to 1. Wait states are inserted in case of successive write accesses to IWDG1_SYSRSTEN and IWDG2_SYSRSTEN. The number of wait states may be up to 7 cycles of the RCC clock. IWDG1_SYSRSTEN and IWDG2_SYSRSTEN are reset by app_rstn reset, and are located in V_{DD} domain. IWDG2_KERRST is reset by sys_rstn reset. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 183* for details). Any read access is allowed.

													rs		rs

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **IWDG2_KERRST**: IWDG2 kernel reset
Set by software.
0: Writing 0 has no effect. Reading 0 means that the IWDG2 kernel reset is not active.
1: Writing 1 activates IWDG2 kernel reset Reading 1 means IWDG2 kernel reset is active.

Bits 17:3 Reserved, must be kept at reset value.

Bit 2 **IWDG2_SYSRSTEN**: Enable of IWDG2 timeout event to reset the application
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG2 timeout event cannot trigger an application reset.
1: Writing 1 enables IWDG2 timeout event to reset the application. Reading 1 means that IWDG2 timeout event triggers an application reset.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **IWDG1_SYSRSTEN**: Enable of IWDG1 timeout event to reset the application
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG1 timeout event does not trigger an application reset when CPU1 is not the trusted agent.
1: Writing 1 enables IWDG1 timeout event to reset the application when CPU1 is not the trusted agent. Reading 1 means that IWDG1 timeout event triggers an application reset when CPU1 is not the trusted agent.

21.8.44 RCC IWDG CPU1 configuration clear register (RCC_IWDGC1CFGCLRR)

Address offset: 0x474

Reset value: 0x0000 0000

This register is used to disable IWDG1 and IWDG2 timeout event reset behavior, and to deactivate IWDG2 kernel reset. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. Wait states are inserted in case of successive write accesses to IWDG1_SYSRSTEN and IWDG2_SYSRSTEN. The number of wait states may be up to 7 cycles of RCC clock. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 183* for details). Any read access is allowed.

													rc_w1		rc_w1

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **IWDG2_KERRST**: IWDG2 kernel reset
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG2 kernel reset is not active
1: Writing 1 deactivates IWDG2 kernel reset. Reading 1 means IWDG2 kernel reset is active.

Bits 17:3 Reserved, must be kept at reset value.

Bit 2 **IWDG2_SYSRSTEN**: Clear of IWDG2 timeout event to reset the application
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG2 timeout event cannot trigger an application reset.
1: Writing 1 clears IWDG2 timeout event to reset the application. Reading 1 means that IWDG2 timeout event is enabled.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **IWDG1_SYSRSTEN**: Clear of IWDG1 timeout event to reset the application
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG1 timeout event cannot trigger an application reset when CPU1 is not the trusted agent.
1: Writing 1 clears IWDG1 timeout event to reset the application when CPU1 is not the trusted agent. Reading 1 means that IWDG1 timeout event triggers an application reset when CPU1 is not the trusted agent.

21.8.45 RCC IWDG CPU2 clock freeze set register (RCC_IWDGC2FZSETR)

Address offset: 0x478

Reset value: 0x0000 0000

This register is used by to freeze IWDG3 and IWDG4 clocks. After a system reset, or a Standby reset (sys_rstn), the CPU2 can write this register once. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 sets the corresponding bit to 1. Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 183* for details). Any read access is allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FZ_IWDG4	FZ_IWDG3
														rs	rs

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FZ_IWDG4**: Freeze of IWDG4 clock
Set once by software after a system or Standby reset to freeze IWDG4 clock.
0: Writing 0 has no effect. Reading 0 means IWDG4 clock is not frozen (default after reset).
1: Writing 1 freezes IWDG4 clock. Reading 1 means that IWDG4 clock is frozen.

Bit 0 **FZ_IWDG3**: Freeze of IWDG3 clock
Set once by software after a system or Standby reset to freeze IWDG3 clock.
0: Writing 0 has no effect. Reading 0 means IWDG3 clock is not frozen (default after reset).
1: Writing 1 freezes IWDG3 clock. Reading 1 means that IWDG3 clock is frozen.

21.8.46 RCC IWDG CPU2 clock freeze clear register (RCC_IWDGC2FZCLRR)

Address offset: 0x47C

Reset value: 0x0000 0000

This register is used to unfreeze IWDG3 and IWDG4 clocks. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 183* for details). Any read access is allowed.

														rc_w1	rc_w1

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FZ_IWDG4**: Unfreeze of IWDG4 clock

Cleared by software to unfreeze IWDG4 clock.

0: Writing 0 has no effect. Reading 0 means that the IWDG4 clock is not frozen (default after reset).

1: Writing 1 unfreezes the IWDG4 clock. Reading 1 means that the IWDG4 clock is frozen.

Bit 0 **FZ_IWDG3**: Unfreeze of IWDG3 clock

Cleared by software to unfreeze IWDG3 clock.

0: Writing 0 has no effect. Reading 0 means IWDG3 clock is not frozen (default after reset).

1: Writing 1 unfreezes IWDG3 clock. Reading 1 means that IWDG3 clock is frozen.

21.8.47 RCC IWDG CPU2 configuration set register (RCC_IWDGC2CFGSETR)

Address offset: 0x480

Reset value: 0x0000 0000

This register is used to enable IWDG3 and IWDG4 timeout event reset behavior, and to activate IWDG4 kernel reset. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 sets the corresponding bit to 1. Wait states are inserted in case of successive write accesses to IWDG3_SYSRSTEN and IWDG4_SYSRSTEN. The number of wait states may be up to 7 cycles of the RCC clock. IWDG3_SYSRSTEN and IWDG4_SYSRSTEN are reset by app_rstn reset, and are located in the V_{DD} domain. IWDG4_KERRST is reset by sys_rstn reset. Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 183* for details). Any read access is allowed.

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **IWDG4_KERRST**: IWDG4 kernel reset
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG4 kernel reset is not active.
1: Writing 1 activates IWDG4 kernel reset. Reading 1 means IWDG4 kernel reset is active.

Bits 17:3 Reserved, must be kept at reset value.

Bit 2 **IWDG4_SYSRSTEN**: Enable of IWDG4 timeout event to reset the application
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG4 timeout event cannot trigger an application reset.
1: Writing 1 enables IWDG4 timeout event to reset the application. Reading 1 means that IWDG4 timeout event triggers an application reset.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **IWDG3_SYSRSTEN**: Enable of IWDG3 timeout event to reset the application
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG3 timeout event does not trigger an application reset when CPU1 is not the trusted agent.
1: Writing 1 enables IWDG3 timeout event to reset the application when CPU1 is not the trusted agent. Reading 1 means that IWDG3 timeout event triggers an application reset when CPU1 is not the trusted agent.

21.8.48 RCC IWDG CPU2 configuration clear register (RCC_IWDGC2CFGCLRR)

Address offset: 0x484

Reset value: 0x0000 0000

This register is used to disable IWDG3 and IWDG4 timeout event reset behavior, and to deactivate IWDG4 kernel reset. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. Wait states are inserted in case of successive write accesses to IWDG3_SYSRSTEN and IWDG4_SYSRSTEN. The number of wait states may be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 183* for details). Any read access is allowed.

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **IWDG4_KERRST**: IWDG4 kernel reset
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG4 kernel reset is not active.
1: Writing 1 deactivates IWDG4 kernel reset. Reading 1 means IWDG4 kernel reset is active.

Bits 17:3 Reserved, must be kept at reset value.

Bit 2 **IWDG4_SYSRSTEN**: Clear of IWDG4 timeout event to reset the application
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG4 timeout event cannot trigger an application reset.
1: Writing 1 clears IWDG4 timeout event to reset the application. Reading 1 means that IWDG4 timeout event is enabled.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **IWDG3_SYSRSTEN**: Clear of IWDG3 timeout event to reset the application
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG3 timeout event cannot trigger an application reset when CPU1 is not the trusted agent.
1: Writing 1 clears IWDG3 timeout event to reset the application when CPU1 is not the trusted agent. Reading 1 means that IWDG3 timeout event triggers an application reset when CPU1 is not the trusted agent.

21.8.49 RCC IWDG CPU3 configuration set register (RCC_IWDGC3CFGSETR)

Address offset: 0x488

Reset value: 0x0000 0000

This register is used to enable IWDG5 timeout event reset behavior. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 sets the corresponding bit to 1. Wait states are inserted in case of successive write accesses to this register. The number of wait states may be up to 7 cycles of the RCC clock. This register is reset by app_rstn reset, and it is located in the V_{DD} domain. Write accesses are defined according to the RCC local resource number 72 configuration (see *Table 183* for details). Any read access is allowed.

															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **IWDG5_SYSRSTEN**: Enable of IWDG5 timeout event to reset the application

Set by software.

0: Writing 0 has no effect. Reading 0 means that IWDG5 timeout event cannot trigger an application reset.

1: Writing 1 enables IWDG5 timeout event to reset the application. Reading 1 means that IWDG5 timeout event is enabled.

21.8.50 RCC IWDG CPU3 configuration clear register (RCC_IWDGC3CFGCLRR)

Address offset: 0x48C

Reset value: 0x0000 0000

This register is used to disable IWDG5 timeout event reset behavior. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. Wait states are inserted in case of successive write accesses to this register. The number of wait states may be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 72 configuration (see *Table 183* for details). Any read access is allowed.

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **IWDG5_SYSRSTEN**: Clear of IWDG5 timeout event to reset the application
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG5 timeout event cannot trigger an application reset.
1: Writing 1 clears IWDG5 timeout event to reset the application. Reading 1 means that IWDG5 timeout event is enabled.

21.8.51 RCC CPU3 configuration register (RCC_C3CFGR)

Address offset: 0x490

Reset value: 0x0000 0005

This register is used to control the reset, clock gating, low-power, and autonomous clock mode behavior of the CPU3. It is also used to control some D3 peripheral allocation to CPU3 (see *Section 21.4.14* for details). To apply software reset, the peripheral must be clocked (C3EN = 1). Wait states are inserted in case of successive write accesses to this register, except on C3RST. The number of wait states may be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 72 configuration (see *Table 183* for details). Any read access is allowed.

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **I3C4C3EN**: I3C4 allocation to CPU3 enable
Set and cleared by software. This bit is meaningful only when CPU3 is enabled (C3EN = 1).
0: Writing 0 disables I3C4 allocation to CPU3. Reading 0 means that I3C4 is not allocated to CPU3.
1: Writing 1 enables I3C4 allocation to CPU3. Reading 1 means that I3C4 is allocated to CPU3.

Bit 26 **RTCC3EN**: RTC allocation to CPU3 enable
Set and cleared by software. This bit is meaningful only when CPU3 is enabled (C3EN = 1).
0: Writing 0 disables RTC allocation to CPU3. Reading 0 means that RTC is not allocated to CPU3.
1: Writing 1 enables RTC allocation to CPU3. Reading 1 means that RTC is allocated to CPU3.

Bit 25 **LPDMAC3EN**: LPDMA1 allocation to CPU3 enable
Set and cleared by software. This bit is meaningful only when CPU3 is enabled (C3EN = 1).
0: Writing 0 disables LPDMA1 allocation to CPU3. Reading 0 means that LPDMA1 is not allocated to CPU3.
1: Writing 1 enables LPDMA1 allocation to CPU3. Reading 1 means that LPDMA1 is allocated to CPU3.

Bit 24 **GPIOZC3EN**: GPIOZ allocation to CPU3 enable
Set and cleared by software. This bit is meaningful only when CPU3 is enabled (C3EN = 1).
0: Writing 0 disables GPIOZ allocation to CPU3. Reading 0 means that GPIOZ is not allocated to CPU3.
1: Writing 1 enables GPIOZ allocation to CPU3. Reading 1 means that GPIOZ is allocated to CPU3.

Bit 23 **ADF1C3EN**: ADF1 allocation to CPU3 enable
Set and cleared by software. This bit is meaningful only when CPU3 is enabled (C3EN = 1).
0: Writing 0 disables ADF1 allocation to CPU3. Reading 0 means that ADF1 is not allocated to CPU3.
1: Writing 1 enables ADF1 allocation to CPU3. Reading 1 means that ADF1 is allocated to CPU3.

Bit 22 Reserved, must be kept at reset value.

Bit 21 **I2C8C3EN**: I2C8 allocation to CPU3 enable
Set and cleared by software. This bit is meaningful only when CPU3 is enabled (C3EN = 1).
0: Writing 0 disables I2C8 allocation to CPU3. Reading 0 means that I2C8 is not allocated to CPU3.
1: Writing 1 enables I2C8 allocation to CPU3. Reading 1 means that I2C8 is allocated to CPU3.

Bit 20 **LPUART1C3EN**: LPUART1 allocation to CPU3 enable
Set and cleared by software. This bit is meaningful only when CPU3 is enabled (C3EN = 1).
0: Writing 0 disables LPUART1 allocation to CPU3. Reading 0 means that LPUART1 is not allocated to CPU3.
1: Writing 1 enables LPUART1 allocation to CPU3. Reading 1 means that LPUART1 is allocated to CPU3.

Bit 19 **SPI8C3EN**: SPI8 allocation to CPU3 enable
Set and cleared by software. This bit is meaningful only when CPU3 is enabled (C3EN = 1).
0: Writing 0 disables SPI8 allocation to CPU3. Reading 0 means that SPI8 is not allocated to CPU3.
1: Writing 1 enables SPI8 allocation to CPU3. Reading 1 means that SPI8 is allocated to CPU3.

Bit 18 **LPTIM5C3EN**: LPTIM5 allocation to CPU3 enable
Set and cleared by software. This bit is meaningful only when CPU3 is enabled (C3EN = 1).
0: Writing 0 disables LPTIM5 allocation to CPU3. Reading 0 means that LPTIM5 is not allocated to CPU3.
1: Writing 1 enables LPTIM5 allocation to CPU3. Reading 1 means that LPTIM5 is allocated to CPU3.

Bit 17 **LPTIM4C3EN**: LPTIM4 allocation to CPU3 enable
Set and cleared by software. This bit is meaningful only when CPU3 is enabled (C3EN = 1).
0: Writing 0 disables LPTIM4 allocation to CPU3. Reading 0 means that LPTIM4 is not allocated to CPU3.
1: Writing 1 enables LPTIM4 allocation to CPU3. Reading 1 means that LPTIM4 is allocated to CPU3.

Bit 16 **LPTIM3C3EN**: LPTIM3 allocation to CPU3 enable
Set and cleared by software. This bit is meaningful only when CPU3 is enabled (C3EN = 1).
0: Writing 0 disables LPTIM3 allocation to CPU3. Reading 0 means that LPTIM3 is not allocated to CPU3.
1: Writing 1 enables LPTIM3 allocation to CPU3. Reading 1 means that LPTIM3 is allocated to CPU3.

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **C3AMEN**: CPU3 autonomous clock mode enable

Set and cleared by software.

0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.

1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **C3LPEN**: CPU3 peripheral clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables the peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables the peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **C3EN**: CPU3 peripheral clocks enable

Set and cleared by software.

0: Writing 0 disables the peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables the peripheral clocks. Reading 1 means that peripheral clocks are enabled

Bit 0 **C3RST**: CPU3 reset

Set and cleared by software.

0: Writing 0 releases the block reset. Reading 0 means that the block reset is released.

1: Writing 1 asserts the block reset. Reading 1 means that the block reset is asserted (default after reset).

21.8.52 RCC MCO1 configuration register (RCC_MCO1CFGR)

Address offset: 0x494

Reset value: 0x0000 0000

This register is used to select the clock generated on the MCO1 output. Write accesses are defined according to the RCC local resource number 108 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	MCO1 ON	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MCO1 SEL
							rw								rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **MCO1ON**: Control of MCO1 output

Set and cleared by software.

0: MCO1 output disabled (default after reset)

1: MCO1 output enabled

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **MCO1SEL**: MCO1 clock output selection

Set and cleared by the software. Clock source selection may generate glitches on MCO1. It is highly recommended to configure this bit only after reset, before enabling the external oscillators and the PLLs.

0: Channel 61 output of the flexclkgen engine (default after reset)

1: Clock observation 0 of the flexclkgen engine

21.8.53 RCC MCO2 configuration register (RCC_MCO2CFGR)

Address offset: 0x498

Reset value: 0x0000 0000

This register is used to select the clock generated on the MCO2 output. Write accesses are defined according to the RCC local resource number 109 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	MCO2 ON	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MCO2 SEL
							rw								rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **MCO2ON**: Control of the MCO2 output

Set and cleared by software.

0: MCO2 output disabled (default after reset)

1: MCO2 output enabled

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **MCO2SEL**: MCO2 clock output selection

Set and cleared by software. Clock source selection may generate glitches on MCO2. It is highly recommended to configure this bit only after reset, before enabling the external oscillators and the PLLs.

0: Channel 62 output of the flexclkgen engine (default after reset)

1: Clock observation 1 of the flexclkgen engine

21.8.54 RCC oscillator clock enable set register (RCC_OCENSETR)

Address offset: 0x49C

Reset value: 0x0000 0001

This register is used to control the oscillators. Writing 0 has no effect. Writing 1 sets the corresponding bits. Reading gives the effective values of each bit. Write access to this register is not allowed during the clock restore sequence (see *Clock restore sequence* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

				rs	rs	rs	rs	rs	rs	rs				rs	rs

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **HSECSSON**: HSECSSON bit set
Set CSS on HSE. This bit is set-only (disabled by system reset, or when the system enters Standby). When this bit is set, the clock detector is enabled by hardware when HSE is ready.
0: Reading 0 means that CSS on HSE is off (default after reset).
1: Writing 1 enables CSS on HSE. Reading 1 means that CSS on HSE is on.

Bit 10 **HSEBYP**: HSEBYP bit set
Set by software in order to enable the HSE bypass mode.
0: No effect
1: Set the HSEBYP bit.

Bit 9 **HSEKERON**: HSEKERON bit set
Set by software to force HSE on even in Stop mode, to be quickly available as kernel clock for some peripherals. This bit has no effect on HSEON value.
0: No effect
1: Set the HSEKERON bit.

Bit 8 **HSEON**: HSEON bit set
Set by software to enable HSE.
0: No effect
1: Set HSEON bit.

Bit 7 **HSEDIGBYP**: HSEDIGBYP bit set
Set by software when the external clock connected to OSC_IN is a full-swing digital signal.
0: No effect
1: Set HSEDIGBYP bit (digital bypass).

Bit 6 **HSEDIV2BYP**: HSEDIV2BYP bit set
Set by software to bypass the HSE divide-by-2 clock.
0: No effect
1: Set HSEDIV2BYP bit.

Bit 5 **HSEDIV2ON**: HSEDIV2ON bit set
Set by software to enable the HSE divide-by-2 clock.
0: No effect
1: Set HSEDIV2ON bit.

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **HSIKERON**: HSIKERON bit set
Set by software to force HSI on even in Stop mode, to be quickly available as kernel clock for peripherals. This bit has no effect on HSION value.
0: No effect
1: Set the HSIKERON bit.

Bit 0 **HSION**: HSION bit set
Set by software to enable HSI. This bit is also set by hardware to force HSI on when the product exits Standby or Stop, or in case of a failure of HSE which is used as the system clock source.
0: No effect
1: Set the HSION bit.

21.8.55 RCC oscillator clock enable clear register (RCC_OCENCLRR)

Address offset: 0x4A0

Reset value: 0x0000 0001

This register is used to control the oscillators. Writing 0 has no effect. Writing 1 clears the corresponding bits. Reading gives the effective values of the enable bits. Write access to this register is not allowed during the clock restore sequence (see *Clock restore sequence* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	HSEBYP	HSEKERON	HSEON	HSEDIGBYP	HSEDIV2BYP	HSEDIV2ON	Res.	Res.	Res.	HSIKERON	HSION
					rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1				rc_w1	rc_w1

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **HSEBYP**: HSEBYP bit clear
Cleared by software in order to disable the bypass mode.
0: No effect
1: Clear the HSEBYP bit.

Bit 9 **HSEKERON**: HSEKERON bit clear
Cleared by software to allow the HSE to be switched off in Stop mode.
0: No effect
1: Clear the HSEKERON bit.

Bit 8 **HSEON**: HSEON bit clear
Cleared by software to disable the HSE clock.
0: No effect
1: Clear the HSEON bit.

Bit 7 **HSEDIGBYP**: HSEDIGBYP bit clear
Cleared by software when the external clock connected to OSC_IN is a low-swing signal.
0: No effect
1: Clear the HSEDIGBYP bit (analog bypass).

Bit 6 **HSEDIV2BYP**: HSEDIV2BYP bit clear
Cleared by software to use the HSE divide-by-2 clock.
0: No effect
1: Clear the HSEDIV2BYP bit.

Bit 5 **HSEDIV2ON**: HSEDIV2ON bit clear
Cleared by software to disable the HSE divide-by-2 clock.
0: No effect
1: Clear HSEDIV2ON bit.

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **HSIKERON**: HSIKERON bit clear
Cleared by software to allow the HSI to be switched off in Stop mode. This bit has no effect on HSION value.
0: No effect
1: Clear the HSIKERON bit.

Bit 0 **HSION**: HSION bit clear
Cleared by software to disable the HSI clock.
0: No effect
1: Clear the HSION bit.

21.8.56 RCC oscillator clock ready register (RCC_OCRDYR)

Address offset: 0x4A4

Reset value: 0x0000 0001

This is a read-only access register that contains the status flags of the oscillators. Writing has no effect. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	CKRESRT	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
						r									

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	HSERDY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HSIRDY
							r								r

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **CKREST**: Clock restore state machine status
Set by hardware to indicate if the clock restore sequence is on-going.
0: Clock restore process not ongoing (default after reset)
1: Clock restore process ongoing

Bits 24:9 Reserved, must be kept at reset value.

Bit 8 **HSERDY**: HSE clock ready flag
Set by hardware to indicate that the HSE oscillator is stable.
0: HSE clock not ready (default after reset)
1: HSE clock ready

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **HSIRDY**: HSI clock ready flag
Set by hardware to indicate that the HSI oscillator is stable.
0: HSI clock not ready (default after reset)
1: HSI clock ready

21.8.57 RCC HSI configuration register (RCC_HSICFGR)

Address offset: 0x4A8

Reset value: 0x0000 0000

This register is used to configure the HSI. Write access is not allowed during the clock restore sequence (see *Clock restore sequence* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	HSICAL[8:0]

Res.	HSITRIM[6:0]							Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
	rw	rw	rw	rw	rw	rw	rw								

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:16 **HSICAL[8:0]**: HSI clock calibration
Set by hardware when option-byte loading during system reset. Adjusted by software through HSITRIM trimming bits.
This bitfield contains the sum of engineering option-byte calibration and HSITRIM values.

Bit 15 Reserved, must be kept at reset value.

Bits 14:8 **HSITRIM[6:0]**: HSI clock trimming
Set by software to adjust calibration. This bitfield represents a signed value. It is added to engineering option bytes loaded during reset phase (bsec_hsi_cal[8:0]) to form calibration trimming value: HSICAL[8:0] = HSITRIM[6:0] + bsec_hsi_cal[8:0].
0x40: bsec_hsi_cal[8:0] - 64
0x41: bsec_hsi_cal[8:0] - 63
...
0x0: bsec_hsi_cal[8:0] (default after reset)
...
0x3E: bsec_hsi_cal[8:0] + 62
0x3F: bsec_hsi_cal[8:0] + 63

Bits 7:0 Reserved, must be kept at reset value.

21.8.58 RCC MSI configuration register (RCC_MSICFGR)

Address offset: 0x4AC

Reset value: 0x0000 1000

This register is used to finetune the MSI frequency. Write access is not allowed during the clock restore sequence (see *Clock restore sequence* for details).

Wait states are inserted in case of successive write accesses to this register. The number of wait states may be up to 7 cycles of the RCC clock. This register is located into D3 domain. Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	MSITRIM[4:0]					Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
			rw	rw	rw	rw	rw								

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **MSICAL[7:0]**: MSI clock calibration
Set by hardware when option-byte loading during system reset. Adjusted by software through MSITRIM trimming bits.
This bitfield contains the sum of engineering option-byte calibration and MSITRIM values.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **MSITRIM[4:0]**: MSI clock trimming
Set by software to adjust calibration. This bitfield is added to engineering option bytes loaded during reset phase (bsec_msi_cal[7:0]) to form the calibration trimming value.
MSICAL[7:0] = MSITRIM[4:0] + bsec_msi_cal[7:0].

Bits 7:0 Reserved, must be kept at reset value.

21.8.59 RCC RTC clock divider register (RCC_RTCDIVR)

Address offset: 0x4B0

Reset value: 0x0000 0000

This register is used to divide the HSE clock for the RTC. Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RTCDIV[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **RTCDIV[5:0]**: HSE division factor for RTC clock

Set and cleared by software to divide the HSE clock for RTC.

Caution: The software must set these bits correctly to ensure that the clock supplied to the RTC is lower than 4 MHz. These bits must be configured if needed before selecting the RTC clock source.

Note: When RTCSRC ≠ 3, this divider is disabled (does not provide clock).

0x0: HSE (default after reset)
0x1: HSE/2
0x2: HSE/3
0x3: HSE/4
...
0x3E: HSE/63
0x3F: HSE/64

21.8.60 RCC APB1 clock divider register (RCC_APB1DIVR)

Address offset: 0x4B4

Reset value: 0x8000 0000

This register is used to control the APB1 clock prescaler (see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
APB1DIVRDY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	APB1DIV[2:0]		
													rw	rw	rw

Bit 31 **APB1DIVRDY**: APB1 clock prescaler status

Set and cleared by hardware to indicate if the new division factor is taken into account.

0: The new division factor is not yet taken into account.

1: The new division factor is taken into account (default after reset).

Bits 30:3 Reserved, must be kept at reset value.

Bits 2:0 **APB1DIV[2:0]**: APB1 clock divider

Set and cleared by software to control the APB1 clock division factor. Changing this division ratio impacts the APB1 clock domain frequency. Clocks are divided with the new prescaler factor, from 1 to 16 ck_icn_ls_mcu cycles after APB1DIV update. The application can check if the new division factor is taken into account by reading APB1DIVRDY.

0x0: ck_icn_ls_mcu (default after reset)

0x1: ck_icn_ls_mcu / 2

0x2: ck_icn_ls_mcu / 4

0x3: ck_icn_ls_mcu / 8

0x4: ck_icn_ls_mcu / 16

Others: Reserved

21.8.61 RCC APB2 clock divider register (RCC_APB2DIVR)

Address offset: 0x4B8

Reset value: 0x8000 0000

This register is used to control the APB2 clock prescaler (see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit 31 **APB2DIVRDY**: APB2 clock prescaler status

Set and cleared by hardware to indicate if the new division factor is taken into account.

0: The new division factor is not yet taken into account.

1: The new division factor is taken into account (default after reset).

Bits 30:3 Reserved, must be kept at reset value.

Bits 2:0 **APB2DIV[2:0]**: APB2 clock divider

Set and cleared by software to control APB2 clock division factor. Changing this division ratio impacts the APB2 clock domain frequency. Clocks are divided with the new prescaler factor, from 1 to 16 ck_icn_ls_mcu cycles after APB2DIV update. The application can check if the new division factor is taken into account by reading APB2DIVRDY.

0x0: ck_icn_ls_mcu (default after reset)
0x1: ck_icn_ls_mcu / 2
0x2: ck_icn_ls_mcu / 4
0x3: ck_icn_ls_mcu / 8
0x4: ck_icn_ls_mcu / 16
Others: Reserved

21.8.62 RCC APB3 clock divider register (RCC_APB3DIVR)

Address offset: 0x4BC

Reset value: 0x8000 0000

This register is used to control the APB3 clock prescaler (see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 183* for details). Any read access is allowed.

Bit 31 **APB3DIVRDY**: APB3 clock prescaler status

Set and cleared by hardware to indicate if the new division factor is taken into account.
0: The new division factor is not yet taken into account.
1: The new division factor is taken into account. (default after reset)

Bits 30:3 Reserved, must be kept at reset value.

Bits 2:0 **APB3DIV[2:0]**: APB3 clock divider

Set and cleared by software to control APB3 clock division factor.
Changing this division ratio has an impact on the frequency of the APB3 clock domain. Clocks are divided with the new prescaler factor, from 1 to 16 ck_icn_ls_mcu cycles after APB3DIV update. The application can check if the new division factor is taken into account by reading APB3DIVRDY.

0x0: ck_icn_ls_mcu (default after reset)
0x1: ck_icn_ls_mcu / 2
0x2: ck_icn_ls_mcu / 4
0x3: ck_icn_ls_mcu / 8
0x4: ck_icn_ls_mcu / 16
Others: Reserved

21.8.63 RCC APB4 clock divider register (RCC_APB4DIVR)

Address offset: 0x4C0

Reset value: 0x8000 0000

This register is used to control the APB4 clock divider (see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit 31 **APB4DIVRDY**: APB4 clock divider status

Set and cleared by hardware to indicate if the new division factor is taken into account.
0: The new division factor is not yet taken into account.
1: The new division factor is taken into account (default after reset).

Bits 30:3 Reserved, must be kept at reset value.

Bits 2:0 **APB4DIV[2:0]**: APB4 clock divider

Set and cleared by software to control APB4 clock division factor. This division ratio can be changed on-the-fly. It impacts only the APB4 clock frequency. Clocks are divided with the new prescaler factor, from 1 to 16 ck_icn_ls_mcu cycles after APB4DIV update.
The application can check if the new division factor is taken into account by reading APB4DIVRDY.
0x0: ck_icn_ls_mcu (default after reset)
0x1: ck_icn_ls_mcu / 2
0x2: ck_icn_ls_mcu / 4
0x3: ck_icn_ls_mcu / 8
0x4: ck_icn_ls_mcu / 16
Others: Reserved

21.8.64 RCC APBDBG clock divider register (RCC_APBDBGDIVR)

Address offset: 0x4C4

Reset value: 0x8000 0000

This register is used to control the APBDBG clock divider (see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

													rw	rw	rw

Bit 31 **APBDBGDIVRDY**: APBDBG clock divider status

Set and cleared by hardware to indicate if the new division factor is taken into account.

0: The new division factor is not yet taken into account.

1: The new division factor is taken into account (default after reset).

Bits 30:3 Reserved, must be kept at reset value.

Bits 2:0 **APBDBGDIV[2:0]**: APBDBG clock divider

Set and cleared by software to control APBDBG clock division factor. This division ratio can be changed on-the-fly. It impacts only the APBDBG clock frequency. Clocks are divided with the new prescaler factor, from 1 to 16 ck_icn_ls_mcu cycles after APBDBGDIV update. The application can check if the new division factor is taken into account by reading APBDBGDIVRDY.

0x0: ck_icn_ls_mcu (default after reset)

0x1: ck_icn_ls_mcu / 2

0x2: ck_icn_ls_mcu / 4

0x3: ck_icn_ls_mcu / 8

0x4: ck_icn_ls_mcu / 16

Others: Reserved

21.8.65 RCC TIM group 1 prescaler register (RCC_TIMG1PRER)

Address offset: 0x4C8

Reset value: 0x8000 0000

This register is used to control the prescaler value of timers located in the APB1 domain: TIM2 to TIM7, and TIM10 to TIM14 (see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TIMG1PRERDY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIMG1PRE
															rw

Bit 31 **TIMG1PRERDY**: Clock prescaler status for timers of group 1

Set and cleared by hardware to indicate if the new division factor is taken into account.

0: The new division factor is not yet taken into account.

1: The new division factor is taken into account (default after reset).

Bits 30:1 Reserved, must be kept at reset value.

Bit 0 **TIMG1PRE**: Clock prescaler selection for timers of group 1

This bit is set and cleared by software to control the clock frequency of all timers connected to APB1 domain (see *Table 134)*.

0: Timer kernel clock is equal to ck_icn_ls_mcu if APB1DIV corresponds to a division by 1 or 2. Otherwise it is equal to 2 x Fck_icn_apb1 (default after reset).

1: Timer kernel clock is equal to ck_icn_ls_mcu if APB1DIV corresponds to a division by 1, 2, or 4. Otherwise, it is equal to 4 x Fck_icn_apb1.

21.8.66 RCC TIM group 2 prescaler register (RCC_TIMG2PRER)

Address offset: 0x4CC

Reset value: 0x8000 0000

This register is used to control the prescaler value of timers located in the APB2 domain: TIM1, TIM8, TIM15, TIM16, TIM17, TIM20 (see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TIMG2PRERDY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIMG2PRE
															rw

Bit 31 **TIMG2PRERDY**: Clock prescaler status for timers of group 2

Set and cleared by hardware to indicate if the new division factor is taken into account.

0: The new division factor is not yet taken into account.

1: The new division factor is taken into account. (default after reset)

Bits 30:1 Reserved, must be kept at reset value.

Bit 0 **TIMG2PRE**: Clock prescaler selection for timers of group 2

This bit is set and cleared by software to control the clock frequency of all timers connected to APB2 domain (see *Table 134)*.

0: Timer kernel clock is equal to ck_icn_ls_mcu if APB2DIV corresponds to a division by 1 or 2. Otherwise it is equal to 2 x Fck_icn_apb2 (default after reset).

1: Timer kernel clock is equal to ck_icn_ls_mcu if APB2DIV corresponds to division by 1, 2, or 4.Otherwise it is equal to 4 x Fck_icn_apb2.

21.8.67 RCC LSMCU clock divider register (RCC_LSMCUDIVR)

Address offset: 0x4D0

Reset value: 0x8000 0000

This register is used to control the LSMU (low-speed MCU clock divider, see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see*Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LSMCUDIVRDY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LSMCUDIV
															rw

Bit 31 **LSMCUDIVRDY**: LSMCU clock divider status

Set and cleared by hardware to indicate if the new division factor is taken into account.

0: The new division factor is not yet taken into account.

1: The new division factor is taken into account (default after reset).

Bits 30:1 Reserved, must be kept at reset value.

Bit 0 **LSMCUDIV**: LSMCU clock divider

Set and cleared by software to control ck_icn_ls_mcu clock division factor. This division ratio can be changed on-the-fly. It impacts only the ck_icn_ls_mcu clock frequency. This clock is divided with the new prescaler factor, from 1 to 2 ck_icn_hs_mcu cycles after LSMCUDIV update. The application can check if the new division factor is taken into account by reading LSMCUDIVRDY.

0x0: ck_icn_hs_mcu (default after reset)

0x1: ck_icn_hs_mcu / 2

21.8.68 RCC DDRC AXI port configuration register (RCC_DDRCPCFGR)

Address offset: 0x4D4

Reset value: 0x0000 0005

This register is used to control reset, clock gating, and low-power behavior of the DDRC AXI ports. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRC PLPEN	DDRC PEN	DDRC PRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DDRCPLPEN**: DDRC AXI port clock enable during CSleep

Set and cleared by software. This bit controls ck_icn_s_ddr clock gating in CSleep.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **DDRCPEN**: DDRC AXI port clock enable

Set and cleared by software. This bit control sck_icn_s_ddr clock gating.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DDRCPRST**: DDRC AXI port reset

Set and cleared by software.

0: Writing 0 releases DDRC AXI port interface reset. Reading 0 means that DDRC AXI port interface is not under reset (default after reset).

1: Writing 1 sets DDRC AXI port interface under reset. Reading 1 means that DDRC AXI port interface is under reset.

21.8.69 RCC DDRC APB configuration register (RCC_DDRCAPBCFGR)

Address offset: 0x4D8

Reset value: 0x0000 0005

This register is used to control reset, clock gating, and low-power behavior of the DDRC APB. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRC APBLPEN	DDRC APBEN	DDRC APBRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DDRCAPBLPEN**: DDRC APB clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **DDRCAPBEN**: DDRC APB clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DDRCAPBRST**: DDRC APB reset

Set and cleared by software.

0: Writing 0 releases DDRC APB interface reset. Reading 0 means that DDRC APB interface is not under reset (default after reset).

1: Writing 1 sets DDRC APB interface under reset. Reading 1 means that DDRC APB interface is under reset.

21.8.70 RCC DDRPHYC APB configuration register (RCC_DDRPHYCAPBCFGR)

Address offset: 0x4DC

Reset value: 0x0000 0005

This register is used to control reset, clock gating, and low-power behavior of the DDRPHYC APB interface. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRPHYCAPBLPEN	DDRPHYCAPBEN	DDRPHYCAPBRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DDRPHYCAPBLPEN**: DDRPHYC APB clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **DDRPHYCAPBEN**: DDRPHYC APB clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DDRPHYCAPBRST**: DDRPHYC APB reset

Set and cleared by software.

0: Writing 0 releases DDRPHYC APB interface reset. Reading 0 means that DDRPHYC APB interface is not under reset (default after reset).

1: Writing 1 sets DDRPHYC APB interface under reset. Reading 1 means that DDRPHYC APB interface is under reset.

21.8.71 RCC DDRPHYC configuration register (RCC_DDRPHYCCFGR)

Address offset: 0x4E0

Reset value: 0x0000 0000

This register is used to control clock gating behavior of the DDRPHYC. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRP HYCEN	Res.
														rw	

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DDRPHYCEN**: DDRPHYC kernel clock enable
Set and cleared by software.
0: Writing 0 disables DDRPHYC kernel clock. Reading 0 means that DDRPHYC kernel clock is disabled.
1: Writing 1 enables DDRPHYC kernel clock. Reading 1 means that DDRPHYC kernel clock is enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.72 RCC DDR configuration register (RCC_DDRCFGR)

Address offset: 0x4E4

Reset value: 0x0000 0005

This register is used to control reset, clock gating, and low-power behavior of the DDR APB configuration. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRCF GLPEN	DDRCF GEN	DDRCF GRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DDRCFGLPEN**: DDR APB configuration clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **DDRCFGEN**: DDR APB configuration clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DDRCFGRST**: DDR APB configuration reset
Set and cleared by software.
0: Writing 0 releases DDR APB configuration interface reset. Reading 0 means that DDR APB configuration interface is not under reset (default after reset).
1: Writing 1 sets DDR APB configuration interface under reset. Reading 1 means that DDR APB configuration interface is under reset.

21.8.73 RCC DDR interface configuration register (RCC_DDRITFCFGR)

Address offset: 0x4E8

Reset value: 0x0000 0001

This register is used to control the DDR interface according to supported low-power modes. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRPHYDLP
															rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRSHR	Res.	Res.	DDRCKMOD[1:0]		Res.	Res.	Res.	DDRRST
							rw			rw	rw				rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **DDRPHYDLP**: DDRPHY deep low-power mode (LP2 or LP3)
Set and cleared by software.
0: DDRPHY not set in low-power mode (default after reset)
1: DDRPHY set in deep low-power mode

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **DDRSHR**: DDR peripheral mode
Set and cleared by software.
0: DDR defined as single peripheral (default after reset)
1: DDR defined as shared peripheral

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **DDRCKMOD[1:0]**: RCC mode for DDR clock control
Set and cleared by software.
0x0: Normal mode: dphy_ker_ck and dphy_ker_byp_ck gating depends on DDRPHYCEN, DDRSHR, DDRPHYDLP, and CPU1 or system mode. ddrc_ker_ck gating depends on DDRCPEN, DDRCPLPEN, DDRSHR, and CPU1 or system mode. This mode must be selected during DDRC and DDRPHYC initialization phase, and if the application uses SSR (software self-refresh) mode.
0x1: ASR (automatic self-refresh) mode: ddrc_ker_ck is gated automatically according to cactive_ddrc signal. dphy_ker_ck and dphy_ker_byp_ck must be kept running in this mode.
0x2: HSR (hardware self-refresh) mode: ddrc_ker_ck gating depends on DDRCPEN, DDRCLPEN, DDRSHR, and CPU1 or system mode. Te dphy_ker_ck and dphy_ker_byp_ck must be kept running in this mode.
Others: Reserved

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **DDRRST**: DDR core and PHY reset
Set and cleared by software.
0: DDR core and PHY are not reset.
1: DDR core and PHY are reset (default after reset).

21.8.74 RCC SYSRAM configuration register (RCC_SYSRAMCFGR)

Address offset: 0x4F0

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the SYSRAM. Write accesses are defined according to the RCC local resource number 74 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SYSRAMLPEN	SYSRAMEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SYSRAMLPEN**: SYSRAM clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SYSRAMEN**: SYSRAM clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.75 RCC VDERAM configuration register (RCC_VDERAMCFGR)

Address offset: 0x4F4

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the VDERAM. Write accesses are defined according to the RCC local resource number 75 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VDERAMLPEN	VDERAMEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **VDERAMLPEN**: VDERAM clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **VDERAMEN**: VDERAM clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.76 RCC SRAM1 configuration register (RCC_SRAM1CFGR)

Address offset: 0x4F8

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the SRAM1. Write accesses are defined according to the RCC local resource number 78 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SRAM1LPEN	SRAM1EN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SRAM1LPEN**: SRAM1 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SRAM1EN**: SRAM1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.77 RCC SRAM2 configuration register (RCC_SRAM2CFGR)

Address offset: 0x4FC

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the SRAM2. Write accesses are defined according to the RCC local resource number 79 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SRAM2 LPEN	SRAM2 EN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SRAM2LPEN**: SRAM2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SRAM2EN**: SRAM2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.78 RCC RETRAM configuration register (RCC_RETRAMCFGR)

Address offset: 0x500

Reset value: 0x0000 0006

This register is used to control clock gating and low-power behavior of the RETRAM. Write accesses are defined according to the RCC local resource number 76 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RETRAMLPEN	RETRAMEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **RETRAMLPEN**: RETRAM clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **RETRAMEN**: RETRAM clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.79 RCC BKPSRAM configuration register (RCC_BKPSRAMCFGR)

Address offset: 0x504

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the BKPSRAM. Write accesses are defined according to the RCC local resource number 77 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BKPSRAMLPEN	BKPSRAMEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **BKPSRAMLPEN**: BKPSRAM clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **BKPSRAMEN**: BKPSRAM clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.80 RCC LPSRAM1 configuration register (RCC_LPSRAM1CFGR)

Address offset: 0x508

Reset value: 0x0000 0004

This register is used to control clock gating, low-power, and autonomous clock mode behavior of the LPSRAM1. Wait states are inserted in case of successive write accesses to this register. The number of wait states may be up to 7 cycles of the RCC clock.
Write accesses are defined according to the RCC local resource number 80 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPSRAM1AMEN	LPSRAM1LPEN	LPSRAM1EN	Res.
												rw	rw	rw	

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **LPSRAM1AMEN**: LPSRAM1 autonomous clock mode enable

Set and cleared by software.

0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.

1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **LPSRAM1LPEN**: LPSRAM1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPSRAM1EN**: LPSRAM1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.81 RCC LPSRAM2 configuration register (RCC_LPSRAM2CFGR)

Address offset: 0x50C

Reset value: 0x0000 0004

This register is used to control clock gating, low-power, and autonomous clock mode behavior of the LPSRAM2. Wait states are inserted in case of successive write accesses to this register. The number of wait states may be up to 7 cycles of the RCC clock.
Write accesses are defined according to the RCC local resource number 81 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPSRAM2AMEN	LPSRAM2LPEN	LPSRAM2EN	Res.
												rw	rw	rw	

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **LPSRAM2AMEN**: LPSRAM2 autonomous clock mode enable
Set and cleared by software.
0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.
1: Writing 1 enables the autonomous clock mode. Reading 1 means that the autonomous clock mode is enabled

Bit 2 **LPSRAM2LPEN**: LPSRAM2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPSRAM2EN**: LPSRAM2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.82 RCC LPSRAM3 configuration register (RCC_LPSRAM3CFGR)

Address offset: 0x510

Reset value: 0x0000 0004

This register is used to control clock gating, low-power, and autonomous clock mode behavior of the LPSRAM3. Wait states are inserted in case of successive write accesses to this register. The number of wait states may be up to 7 cycles of the RCC clock.
Write accesses are defined according to the RCC local resource number 82 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPSRAM3AMEN	LPSRAM3LPEN	LPSRAM3EN	Res.
												rw	rw	rw	

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **LPSRAM3AMEN**: LPSRAM3 autonomous clock mode enable
Set and cleared by software.
0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.
1: Writing 1 enables the autonomous clock mode. Reading 1 means that the autonomous clock mode is enabled

Bit 2 **LPSRAM3LPEN**: LPSRAM3 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPSRAM3EN**: LPSRAM3 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.83 RCC OCTOSPI1 configuration register (RCC_OSPI1CFGR)

Address offset: 0x514

Reset value: 0x0000 0004

This register is used to control the reset, clock gating, and low-power behavior of the OCTOSPI1 and the OTFDEC1. Write accesses are defined according to the RCC local resource number 110 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OSPI1 DLLRST
															rw

							rw						rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **OSPI1DLLRST**: OCTOSPI1 DLL reset
Set and cleared by software.
0: Writing 0 releases OCTOSPI1 DLL reset. Reading 0 means that OCTOSPI1 DLL reset is released.
1: Writing 1 asserts OCTOSPI1 DLL reset. Reading 1 means that OCTOSPI1 DLL reset is asserted.

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **OTFDEC1RST**: OTFDEC1 reset
Set and cleared by software.
0: Writing 0 releases OTFDEC1 reset. Reading 0 means that OTFDEC1 reset is released.
1: Writing 1 asserts OTFDEC1 reset. Reading 1 means that OTFDEC1 reset is asserted.

Bits 7:3 Reserved, must be kept at reset value.

Bit 2 **OSPI1LPEN**: OCTOSPI1, OTFDEC1 and OCTOSPI1 delay (DLYBOSPI1) clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **OSPI1EN**: OCTOSPI1 and OTFDEC1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **OSPI1RST**: OCTOSPI1 reset
Set and cleared by software.
0: Writing 0 releases OCTOSPI1 reset. Reading 0 means that OCTOSPI1 reset is released.
1: Writing 1 asserts OCTOSPI1 reset. Reading 1 means that OCTOSPI1 reset is asserted.

21.8.84 RCC OCTOSPI2 configuration register (RCC_OSPI2CFGR)

Address offset: 0x518

Reset value: 0x0000 0004

This register is used to control the reset, clock gating, and low-power behavior of the OCTOSPI2 and the OTFDEC2. Write accesses are defined according to the RCC local resource number 111 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

							rw						rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **OSPI2DLLRST**: OCTOSPI2 DLL reset
Set and cleared by software.
0: Writing 0 releases OCTOSPI2 DLL reset. Reading 0 means that OCTOSPI2 DLL reset is released.
1: Writing 1 asserts OCTOSPI2 DLL reset. Reading 1 means that OCTOSPI2 DLL reset is asserted.

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **OTFDEC2RST**: OTFDEC2 reset
Set and cleared by software.
0: Writing 0 releases OTFDEC2 reset. Reading 0 means that OTFDEC2 reset is released.
1: Writing 1 asserts OTFDEC2 reset. Reading 1 means that OTFDEC2 reset is asserted.

Bits 7:3 Reserved, must be kept at reset value.

Bit 2 **OSPI2LPEN**: OCTOSPI2 and OTFDEC2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **OSPI2EN**: OCTOSPI2 and OTFDEC2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **OSPI2RST**: OCTOSPI2 reset
Set and cleared by software.
0: Writing 0 releases OCTOSPI2 reset. Reading 0 means that OCTOSPI2 reset is released.
1: Writing 1 asserts OCTOSPI2 reset. Reading 1 means that OCTOSPI2 reset is asserted.

21.8.85 RCC FMC configuration register (RCC_FMCCFGR)

Address offset: 0x51C

Reset value: 0x0000 0004

This register is used to control the reset, clock gating, and low-power behavior of the FMC. Write accesses are defined according to the RCC local resource number 112 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FMCLPEN	FMCEN	FMCRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **FMCLPEN**: FMC clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **FMCEN**: FMC clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **FMCRST**: FMC reset

Set and cleared by software.

0: Writing 0 releases FMC reset. Reading 0 means that FMC reset is released.

1: Writing 1 asserts FMC reset. Reading 1 means that FMC reset is asserted.

21.8.86 RCC debug configuration register (RCC_DBGCFGR)

Address offset: 0x520

Reset value: 0x0000 0000

This is register contains the enable control of debug and trace functions. Write accesses are defined according to the RCC local resource number 73 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DBGRST	Res.	Res.	TRACEEN	DBGEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
			rw			rw	rw								

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **DBGRST**: Debug function reset
Set and cleared by software to control the reset generation for trace and all debug.
0: Trace and debug parts are not reset (default after reset).
1: Trace and debug parts are under reset.

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **TRACEEN**: Clock enable for trace port interface
Set and cleared by software to control ck_ker_tpiu generation.
0: Clock for trace function disabled (default after reset)
1: Clock for trace function enabled

Bit 8 **DBGEN**: Debug function clock enable
Set and cleared by software to control ck_icn_apbdbg and ck_sys_atb generation.
0: Enabling of clocks for debug function is controlled by cdbgpwrupreq signal from DAP (default after reset).
1: Clocks for debug function are enabled.

Bits 7:0 Reserved, must be kept at reset value.

21.8.87 RCC STM configuration register (RCC_STMCFGR)

Address offset: 0x524

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the STM. Write accesses are defined according to the RCC local resource number 73 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STMLPEN	STMEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **STMLPEN**: STM clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **STMEN**: STM clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.88 RCC ETR configuration register (RCC_ETRCFGR)

Address offset: 0x528

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the Cortex-A35 ETR interface. Write accesses are defined according to the RCC local resource number 73 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ETRLPEN	ETREN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **ETRLPEN**: ETR clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **ETREN**: ETR clocks enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.89 RCC GPIOx configuration register (RCC_GPIOxCFGR) (x = A to K)

Address offset: Block A: 0x52C

Address offset: Block B: 0x530

Address offset: Block C: 0x534

Address offset: Block D: 0x538

Address offset: Block E: 0x53C

Address offset: Block F: 0x540

Address offset: Block G: 0x544

Address offset: Block H: 0x548

Address offset: Block I: 0x54C

Address offset: Block J: 0x550

Address offset: Block K: 0x554

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the GPIOx. Write accesses are defined according to the RCC local resource number 90 to 100 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GPIOx LPEN	GPIOx EN	GPIOx RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **GPIOxLPEN**: GPIO x clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **GPIOxEN**: GPIO x clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **GPIOxRST**: GPIO x reset
Set and cleared by software.
0: Writing 0 releases GPIOx reset. Reading 0 means that GPIOx reset is released.
1: Writing 1 asserts GPIOx reset. Reading 1 means that GPIOx reset is asserted.

21.8.90 RCC GPIOZ configuration register (RCC_GPIOZCFGR)

Address offset: 0x558

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-power, and autonomous clock mode behavior of the GPIOZ. Wait states are inserted in case of successive write accesses to this register, except on GPIOZRS. The number of wait states may be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 101 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GPIOZ AMEN	GPIOZ LPEN	GPIOZ EN	GPIOZ RST
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **GPIOZAMEN**: GPIOZ autonomous clock mode enable

Set and cleared by software.

0: Writing 0 disables the autonomous clock mode. Reading 0 means that the autonomous clock mode is disabled.

1: Writing 1 enables the autonomous clock mode. Reading 1 means that the autonomous clock mode is enabled.

Bit 2 **GPIOZLPEN**: GPIOZ clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **GPIOZEN**: GPIOZ clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **GPIOZRST**: GPIOZ reset

Set and cleared by software.

0: Writing 0 releases GPIOZ reset. Reading 0 means that GPIOZ reset is released.

1: Writing 1 asserts GPIOZ reset. Reading 1 means that GPIOZ reset is asserted.

21.8.91 RCC HPDMA1 configuration register (RCC_HPDMA1CFGR)

Address offset: 0x55C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the HPDMA1. Write accesses are defined according to the RCC local resource number 83 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **HPDMA1LPEN**: HPDMA1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **HPDMA1EN**: HPDMA1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **HPDMA1RST**: HPDMA1 reset

Set and cleared by software.

0: Writing 0 releases HPDMA1 reset. Reading 0 means that HPDMA1 reset is released.

1: Writing 1 asserts HPDMA1 reset. Reading 1 means that HPDMA1 reset is asserted.

21.8.92 RCC HPDMA2 configuration register (RCC_HPDMA2CFGR)

Address offset: 0x560

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the HPDMA2. Write accesses are defined according to the RCC local resource number 84 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **HPDMA2LPEN**: HPDMA2 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **HPDMA2EN**: HPDMA2 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **HPDMA2RST**: HPDMA2 reset

Set and cleared by software.

0: Writing 0 releases HPDMA2 reset. Reading 0 means that HPDMA2 reset is released.

1: Writing 1 asserts HPDMA2 reset. Reading 1 means that HPDMA2 reset is asserted.

21.8.93 RCC HPDMA3 configuration register (RCC_HPDMA3CFGR)

Address offset: 0x564

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the HPDMA3. Write accesses are defined according to the RCC local resource number 85 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **HPDMA3LPEN**: HPDMA3 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **HPDMA3EN**: HPDMA3 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **HPDMA3RST**: HPDMA3 reset

Set and cleared by software.

0: Writing 0 releases HPDMA3 reset. Reading 0 means that HPDMA3 reset is released.

1: Writing 1 asserts HPDMA3 reset. Reading 1 means that HPDMA3 reset is asserted.

21.8.94 RCC LPDMA1 configuration register (RCC_LPDMACFGR)

Address offset: 0x568

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-power, and autonomous clock mode behavior of the LPDMA1. Wait states are inserted in case of successive write accesses to this register except on LPDMARST. The number of wait states may be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 86 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPDMAAMEN	LPDMALPEN	LPDMAEN	LPDMARST
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **LPDMAAMEN**: LPDMA1 autonomous clock mode enable

Set and cleared by software.

0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.

1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **LPDMALPEN**: LPDMA1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPDMAEN**: LPDMA1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LPDMARST**: LPDMA1 reset

Set and cleared by software.

0: Writing 0 releases LPDMA1 reset. Reading 0 means that LPDMA1 reset is released.

1: Writing 1 asserts LPDMA1 reset. Reading 1 means that LPDMA1 reset is asserted.

21.8.95 RCC HSEM configuration register (RCC_HSEMCFGR)

Address offset: 0x56C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the HSEM. Wait states are inserted in case of successive write accesses to this register except on HSEMRST. The number of wait states may be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 89 configuration (see *Table 183* for details). Any read access is allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HSEMAMEN	HSEMLPEN	HSEMEN	HSEMRST
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **HSEMAMEN**: HSEM autonomous clock mode enable

Set and cleared by software.

0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.

1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **HSEMLPEN**: HSEM clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **HSEMEN**: HSEM clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **HSEMRST**: HSEM reset

Set and cleared by software.

0: Writing 0 releases HSEM reset. Reading 0 means that HSEM reset is released.

1: Writing 1 asserts HSEM reset. Reading 1 means that HSEM reset is asserted.

21.8.96 RCC IPCC1 configuration register (RCC_IPCC1CFGR)

Address offset: 0x570

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of IPCC1. Write accesses are defined according to the RCC local resource number 87 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IPCC1LPEN	IPCC1EN	IPCC1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IPCC1LPEN**: IPCC1 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **IPCC1EN**: IPCC1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **IPCC1RST**: IPCC1 reset
Set and cleared by software.
0: Writing 0 releases IPCC1 reset. Reading 0 means that IPCC1 reset is released.
1: Writing 1 asserts IPCC1 reset. Reading 1 means that IPCC1 reset is asserted.

21.8.97 RCC IPCC2 configuration register (RCC_IPCC2CFGR)

Address offset: 0x574

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-power, and autonomous clock mode behavior of the IPCC2. Wait states are inserted in case of successive write accesses to this register except on IPCC2RST. The number of wait states may be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 88 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **IPCC2AMEN**: IPCC2 autonomous clock mode enable

Set and cleared by software.

0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.

1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **IPCC2LPEN**: IPCC2 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **IPCC2EN**: IPCC2 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **IPCC2RST**: IPCC2 reset

Set and cleared by software.

0: Writing 0 releases IPCC2 reset. Reading 0 means that IPCC2 reset is released.

1: Writing 1 asserts IPCC2 reset. Reading 1 means that IPCC2 reset is asserted.

21.8.98 RCC RTC configuration register (RCC_RTCCFGR)

Address offset: 0x578

Reset value: 0x0000 0004

This register is used to control clock gating, low-power, and autonomous clock mode behavior of the RTC. Wait states are inserted in case of successive write accesses to this register. The number of wait states may be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 102 configuration (see *Table 183* for details). Any read access is allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RTCAMEN	RTCLPEN	RTCEN	Res.
												rw	rw	rw	

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **RTCAMEN**: RTC autonomous clock mode enable

Set and cleared by software.

0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.

1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **RTCLPEN**: RTC bus clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.

1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clocks is enabled in CSleep.

Bit 1 **RTCEN**: RTC bus clock enable

Set and cleared by software.

0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.

1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.99 RCC SYSCPU1 configuration register (RCC_SYSCPU1CFGR)

Address offset: 0x580

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the CPU1 system configuration. Write accesses are defined according to the RCC local resource number 106 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SYSCPU1LPEN	SYSCPU1EN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SYSCPU1LPEN**: CPU1 system configuration clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.
1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clocks is enabled in CSleep.

Bit 1 **SYSCPU1EN**: CPU1 system configuration clock enable
Set and cleared by software.
0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.
1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.100 RCC BSEC configuration register (RCC_BSECCFGR)

Address offset: 0x584

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the BSEC. Write accesses are defined according to the RCC local resource number 103 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BSECLPEN	BSECEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **BSECLPEN**: BSEC clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.
1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clocks is enabled in CSleep.

Bit 1 **BSECEN**: BSEC clock enable
Set and cleared by software.
0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.
1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.101 RCC PLLx configuration register 1 (RCC_PLLxCFGR1)

Address offset: 0x590 + 0x28 * (x - 2), (x = 2 to 3)

Reset value: 0x0000 0001

This register is used to configure PLLx in the device. Write accesses are defined according to the RCC local resource number 104 configuration for PLL2, and to the RCC local resource number 105 configuration for PLL3 (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	CKREFST	Res.	Res.	Res.	PLLRDY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
			rc_w				r

Res.	Res.	Res.	Res.	Res.	Res.	Res.	PLLEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SSMODRST
							rw								rw

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **CKREFST**: PLLx reference clock state
Set by hardware and cleared by software. Indicates if PLLx reference clock is running. After any reset, this bit is updated after 5 clock cycles of the selected PLL reference clock.
0: Reading 0 means that PLLx reference clock is not running. Writing 0 resets the reference clock running detector.
1: Reading 1 means that PLLx reference clock is running. Writing 1 resets the reference clock running detector.

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **PLLRDY**: PLLx clock ready flag
Set by hardware to indicate when the PLLx is locked
0: PLLx unlocked (default after reset)
1: PLLx locked

Bits 23:9 Reserved, must be kept at reset value.

Bit 8 **PLLEN**: PLLx enable
Set and cleared by software to enable PLLx.
0: PLLx off (default after reset)
1: PLLx on

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **SSMODRST**: PLLx spread-spectrum modulator reset
Set and cleared by software.
0: PLLx spread-spectrum modulator reset module is released.
1: PLLx spread-spectrum modulator reset module is asserted (default after reset).

21.8.102 RCC PLLx configuration register 2 (RCC_PLLxCFGR2)

Address offset: 0x594 + 0x28 * (x - 2), (x = 2 to 3)

Reset value: 0x0000 0000

This register is used to configure PLLx in the device. Write accesses are defined according to the RCC local resource number 104 configuration for PLL2 and to the RCC local resource number 105 configuration for PLL3 (see *Table 183* for details). Any read access is allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FREFDIV[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **FBDIV[11:0]**: PLLx VCO multiplication factor
Set and cleared by software to control the VCO multiplication factor.
In integer mode, this value must be set between 16 and 640.
In fractional mode, this value must be set between 20 and 320.

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:0 **FREFDIV[5:0]**: PLLx reference input clock divide frequency ratio
Set and cleared by software.
0x0: Not applicable when PLLx is enabled
0x1: FREF divided by 1 (min value)
0x2: FREF divided by 2
0x3: FREF divided by 3
...
0x3C: FREF divided by 60
0x3D: FREF divided by 61
0x3E: FREF divided by 62
0x3F: FREF divided by 63

21.8.103 RCC PLLx configuration register 3 (RCC_PLLxCFGR3)

Address offset: 0x598 + 0x28 * (x - 2), (x = 2 to 3)

Reset value: 0x0400 0000

This register is used to configure the PLLx in the device. Write accesses are defined according to the RCC local resource number 104 configuration for PLL2 and to the RCC local resource number 105 configuration for PLL3 (see *Table 183* for details). Any read access is allowed.

FRACIN[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **SSCGDIS**: PLLx spread-spectrum modulator enable
Set and cleared by software to enable the PLLx clock spreading generator.
0: PLLx spread-spectrum modulator enabled
1: PLLx spread-spectrum modulator disabled (default after reset)

Bit 25 **DACEN**: PLLx noise canceling DAC enable in fractional mode
Set and cleared by software to enable the noise cancellation in fractional mode.
0: DAC not active (default after reset)
1: DAC active

Bit 24 **DOWNSPREAD**: PLLx VCO frequency modulation mode
Set and cleared by software to select the PLLx clock spreading mode.
0: Center-spread modulation selected (default after reset)
1: Down-spread modulation selected

Bits 23:0 **FRACIN[23:0]**: Fractional part of PLLx VCO multiplication factor
Set and cleared by software to control the VCO fractional multiplication factor.
VCO output frequency = FREF * (FBDIV + FRAC / 2^{24}) / FREFDIV

21.8.104 RCC PLLx configuration register 4 (RCC_PLLxCFGR4)

Address offset: 0x59C + 0x28 * (x - 2), (x = 2 to 3)

Reset value: 0x0000 0000, 0x0000 0600

This register is used to configure PLLx in the device. Write accesses are defined according to the RCC local resource number 104 configuration for PLL2 and to the RCC local resource number 105 configuration for PLL3 (see *Table 183* for details). Any read access is allowed.

					rw	rw	rw								

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **BYPASS**: PLLx FOUTPOSTDIV bypass
Set and cleared by software to bypass FOUTPOSTDIV by FREF.
0: FOUTPOSTDIV driven by POSTDIV2
1: FOUTPOSTDIV driven by FREF

Bit 9 **FOUTPOSTDIVEN**: PLLx output and post divider enable
Set and cleared by software to enable PLLx output and post dividers.
0: FOUTPOSTDIV output, POSTDIV1, and POSTDIV2 are powered down.
1: FOUTPOSTDIV output, POSTDIV1, and POSTDIV2 dividers are active.

Bit 8 **DSMEN**: PLLx delta-sigma modulator enable
Set and cleared by software to enable the delta-sigma modulator (DSM).
0: DSM is powered down.
1: DSM is active.

Bits 7:0 Reserved, must be kept at reset value.

21.8.105 RCC PLLx configuration register 5 (RCC_PLLxCFGR5)

Address offset: 0x5A0 + 0x28 * (x - 2), (x = 2 to 3)

Reset value: 0x0000 0000

This register is used to configure PLLx in the device. Write accesses are defined according to the RCC local resource number 104 configuration for PLL2 and to the RCC local resource number 105 configuration for PLL3 (see *Table 183* for details). Any read access is allowed.

												rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **SPREAD[4:0]**: Modulation depth adjustment for PLLx
Set and cleared by software to adjust the modulation depth of clock spreading generator.

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **DIVVAL[3:0]**: Modulation frequency adjustment for PLLx
Set and cleared by software to adjust the modulation frequency of clock spreading generator.

21.8.106 RCC PLLx configuration register 6 (RCC_PLLxCFGR6)

Address offset: 0x5A8 + 0x28 * (x - 2), (x = 2 to 3)

Reset value: 0x0000 0000

This register is used to configure PLLx in the product. Write accesses are defined according to the RCC local resource number 104 configuration for PLL2 and to the RCC local resource number 105 configuration for PLL3 (see *Table 183* for details). Any read access is allowed.

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **POSTDIV1[2:0]**: PLLx VCO frequency divide level 1
Set and cleared by software to divide the VCO frequency output.
0x0: Not applicable
0x1: FOUTVCO divided by 1 (minimum value)
...
0x6: FOUTVCO divided by 6
0x7: FOUTVCO divided by 7

21.8.107 RCC PLLx configuration register 7 (RCC_PLLxCFGR7)

Address offset: 0x5AC + 0x28 * (x - 2), (x = 2 to 3)

Reset value: 0x0000 0000

This register is used to configure PLLx in the product. Write accesses are defined according to the RCC local resource number 104 configuration for PLL2 and to the RCC local resource number 105 configuration for PLL3 (see *Table 183* for details). Any read access is allowed.

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **POSTDIV2[2:0]**: PLLx VCO frequency divide level 2
Set and cleared by software to divide the VCO frequency output.
0x0: Not applicable
0x1: FOUTVCO/POSTDIV1 divided by 1 (minimum value)
...
0x6: FOUTVCO/POSTDIV1 divided by 6
0x7: FOUTVCO/POSTDIV1 divided by 7
*Note: FOUTPOSTDIV = FOUTVCO / POSTDIV1 * POSTDIV2*

21.8.108 RCC HSI frequency monitoring control register (RCC_HSIFMONCR)

Address offset: 0x5E0

Reset value: 0x001F 07A1

This register is used to control the HSI frequency monitoring module. Write accesses are defined according to the RCC local resource number 113 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HSIMONF	HSIMONIE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HSIDEV[5:0]					
rc_w1	rw									rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HSIMONEN	Res.	Res.	Res.	Res.	HSIREF[10:0]										
rw					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **HSIMONF**: HSI clock period monitor interrupt flag
Reset by software by writing 1 to this flag. Set by hardware when a deviation is detected on HSI clock period.
0: No deviation detected on HSI clock period (default after reset)
1: Deviation detected on HSI clock period. Writing 1 clears this flag.

Bit 30 **HSIMONIE**: HSI clock period monitor interrupt enable
Set and cleared by software to enable/disable interrupt caused by HSI clock period monitoring.
0: HSI clock period monitoring interrupt disabled (default after reset)
1: HSI clock period monitoring interrupt enabled

Bits 29:22 Reserved, must be kept at reset value.

Bits 21:16 **HSIDEV[5:0]**: HSI clock count deviation value
Set and cleared by software.

Bit 15 **HSIMONEN**: HSI clock period monitor enable
Set and cleared by software.
0: Writing 0 disables HSI clock period monitoring. Reading 0 means that HSI clock period monitoring is disabled.
1: Writing 1 enables HSI clock period monitoring. Reading 1 means that HSI clock period monitoring is enabled.

Bits 14:11 Reserved, must be kept at reset value.

Bits 10:0 **HSIREF[10:0]**: HSI clock count reference value
Set and cleared by software.

21.8.109 RCC HSI frequency value register (RCC_HSIFVALR)

Address offset: 0x5E4

Reset value: 0x0000 0000

This read-only access register contains the number of HSI clock cycles measured between consecutive edges of LSE. Writing has no effect. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	HSIVAL[10:0]										
					r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **HSIVAL[10:0]**: HSI clock-cycle counter value
Set by hardware.

21.8.110 RCC TIM1 configuration register (RCC_TIM1CFGR)

Address offset: 0x700

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM1LPEN	TIM1EN	TIM1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM1LPEN**: TIM1 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM1EN**: TIM1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM1RST**: TIM1 reset
Set and cleared by software.
0: Writing 0 releases TIM1 reset. Reading 0 means that TIM1 reset is released.
1: Writing 1 asserts TIM1 reset. Reading 1 means that TIM1 reset is asserted.

21.8.111 RCC TIM2 configuration register (RCC_TIM2CFGR)

Address offset: 0x704

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM2LPEN**: TIM2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM2EN**: TIM2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM2RST**: TIM2 reset
Set and cleared by software.
0: Writing 0 releases TIM2 reset. Reading 0 means that TIM2 reset is released.
1: Writing 1 asserts TIM2 reset. Reading 1 means that TIM2 reset is asserted.

21.8.112 RCC TIM3 configuration register (RCC_TIM3CFGR)

Address offset: 0x708

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM3LPEN	TIM3EN	TIM3RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM3LPEN**: TIM3 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM3EN**: TIM3 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM3RST**: TIM3 reset

Set and cleared by software.

0: Writing 0 releases TIM3 reset. Reading 0 means that TIM3 reset is released.

1: Writing 1 asserts TIM3 reset. Reading 1 means that TIM3 reset is asserted.

21.8.113 RCC TIM4 configuration register (RCC_TIM4CFGR)

Address offset: 0x70C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM4. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM4LPEN	TIM4EN	TIM4RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM4LPEN**: TIM4 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM4EN**: TIM4 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM4RST**: TIM4 reset
Set and cleared by software.
0: Writing 0 releases TIM4 reset. Reading 0 means that TIM4 reset is released.
1: Writing 1 asserts TIM4 reset. Reading 1 means that TIM4 reset is asserted.

21.8.114 RCC TIM5 configuration register (RCC_TIM5CFGR)

Address offset: 0x710

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM5. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM5LPEN	TIM5EN	TIM5RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM5LPEN**: TIM5 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM5EN**: TIM5 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM5RST**: TIM5 reset
Set and cleared by software.
0: Writing 0 releases TIM5 reset. Reading 0 means that TIM5 reset is released.
1: Writing 1 asserts TIM5 reset. Reading 1 means that TIM5 reset is asserted.

21.8.115 RCC TIM6 configuration register (RCC_TIM6CFGR)

Address offset: 0x714

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM6. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM6LPEN**: TIM6 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM6EN**: TIM6 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM6RST**: TIM6 reset

Set and cleared by software.

0: Writing 0 releases TIM6 reset. Reading 0 means that TIM6 reset is released.

1: Writing 1 asserts TIM6 reset. Reading 1 means that TIM6 reset is asserted.

21.8.116 RCC TIM7 configuration register (RCC_TIM7CFGR)

Address offset: 0x718

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM7. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM7LPEN**: TIM7 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM7EN**: TIM7 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM7RST**: TIM7 reset

Set and cleared by software.

0: Writing 0 releases TIM7 reset. Reading 0 means that TIM7 reset is released.

1: Writing 1 asserts TIM7 reset. Reading 1 means that TIM7 reset is asserted.

21.8.117 RCC TIM8 configuration register (RCC_TIM8CFGR)

Address offset: 0x71C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM8. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM8LPEN**: TIM8 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM8EN**: TIM8 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM8RST**: TIM8 reset

Set and cleared by software.

0: Writing 0 releases TIM8 reset. Reading 0 means that TIM8 reset is released.

1: Writing 1 asserts TIM8 reset. Reading 1 means that TIM8 reset is asserted.

21.8.118 RCC TIM10 configuration register (RCC_TIM10CFGR)

Address offset: 0x720

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM10. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM10LPEN**: TIM10 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM10EN**: TIM10 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM10RST**: TIM10 reset

Set and cleared by software.

0: Writing 0 releases TIM10 reset. Reading 0 means that TIM10 reset is released.

1: Writing 1 asserts TIM10 reset. Reading 1 means that TIM10 reset is asserted.

21.8.119 RCC TIM11 configuration register (RCC_TIM11CFGR)

Address offset: 0x724

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM11. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM11LPEN**: TIM11 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM11EN**: TIM11 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM11RST**: TIM11 reset

Set and cleared by software.

0: Writing 0 releases TIM11 reset. Reading 0 means that TIM11 reset is released.

1: Writing 1 asserts TIM11 reset. Reading 1 means that TIM11 reset is asserted.

21.8.120 RCC TIM12 configuration register (RCC_TIM12CFGR)

Address offset: 0x728

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM12. Any read access is allowed.

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM12LPEN**: TIM12 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM12EN**: TIM12 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM12RST**: TIM12 reset

Set and cleared by software.

0: Writing 0 releases TIM12 reset. Reading 0 means that TIM12 reset is released.

1: Writing 1 asserts TIM12 reset. Reading 1 means that TIM12 reset is asserted.

21.8.121 RCC TIM13 configuration register (RCC_TIM13CFGR)

Address offset: 0x72C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM13. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM13LPEN**: TIM13 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM13EN**: TIM13 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM13RST**: TIM13 reset

Set and cleared by software.

0: Writing 0 releases TIM13 reset. Reading 0 means that TIM13 reset is released.

1: Writing 1 asserts TIM13 reset. Reading 1 means that TIM13 reset is asserted.

21.8.122 RCC TIM14 configuration register (RCC_TIM14CFGR)

Address offset: 0x730

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM14. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM14LPEN	TIM14EN	TIM14RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM14LPEN**: TIM14 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM14EN**: TIM14 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM14RST**: TIM14 reset
Set and cleared by software.
0: Writing 0 releases TIM14 reset. Reading 0 means that TIM14 reset is released.
1: Writing 1 asserts TIM14 reset. Reading 1 means that TIM14 reset is asserted.

21.8.123 RCC TIM15 configuration register (RCC_TIM15CFGR)

Address offset: 0x734

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM15. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM15LPEN	TIM15EN	TIM15RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM15LPEN**: TIM15 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM15EN**: TIM15 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM15RST**: TIM15 reset
Set and cleared by software.
0: Writing 0 releases TIM15 reset. Reading 0 means that TIM15 reset is released.
1: Writing 1 asserts TIM15 reset. Reading 1 means that TIM15 reset is asserted.

21.8.124 RCC TIM16 configuration register (RCC_TIM16CFGR)

Address offset: 0x738

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM16. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM16LPEN	TIM16EN	TIM16RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM16LPEN**: TIM16 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM16EN**: TIM16 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM16RST**: TIM16 reset

Set and cleared by software.

0: Writing 0 releases TIM16 reset. Reading 0 means that TIM16 reset is released.

1: Writing 1 asserts TIM16 reset. Reading 1 means that TIM16 reset is asserted.

21.8.125 RCC TIM17 configuration register (RCC_TIM17CFGR)

Address offset: 0x73C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM17. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM17LPEN	TIM17EN	TIM17RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM17LPEN**: TIM17 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM17EN**: TIM17 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM17RST**: TIM17 reset
Set and cleared by software.
0: Writing 0 releases TIM17 reset. Reading 0 means that TIM17 reset is released.
1: Writing 1 asserts TIM17 reset. Reading 1 means that TIM17 reset is asserted.

21.8.126 RCC TIM20 configuration register (RCC_TIM20CFGR)

Address offset: 0x740

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM20. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM20LPEN	TIM20EN	TIM20RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM20LPEN**: TIM20 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM20EN**: TIM20 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM20RST**: TIM20 reset
Set and cleared by software.
0: Writing 0 releases TIM20 reset. Reading 0 means that TIM20 reset is released.
1: Writing 1 asserts TIM20 reset. Reading 1 means that TIM20 reset is asserted.

21.8.127 RCC LPTIM1 configuration register (RCC_LPTIM1CFGR)

Address offset: 0x744

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the LPTIM. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPTIM1 LPEN	LPTIM1 EN	LPTIM1 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LPTIM1LPEN**: LPTIM1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPTIM1EN**: LPTIM1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LPTIM1RST**: LPTIM1 reset

Set and cleared by software.

0: Writing 0 releases LPTIM1 reset. Reading 0 means that LPTIM1 reset is released.

1: Writing 1 asserts LPTIM1 reset. Reading 1 means that LPTIM1 reset is asserted.

21.8.128 RCC LPTIM2 configuration register (RCC_LPTIM2CFGR)

Address offset: 0x748

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the LPTIM2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPTIM2 LPEN	LPTIM2 EN	LPTIM2 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LPTIM2LPEN**: LPTIM2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPTIM2EN**: LPTIM2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LPTIM2RST**: LPTIM2 reset
Set and cleared by software.
0: Writing 0 releases LPTIM2 reset. Reading 0 means that LPTIM2 reset is released.
1: Writing 1 asserts LPTIM2 reset. Reading 1 means that LPTIM2 reset is asserted.

21.8.129 RCC LPTIM3 configuration register (RCC_LPTIM3CFGR)

Address offset: 0x74C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-power, and autonomous clock mode behavior of the LPTIM3. Wait states are inserted in case of successive write accesses to this register except on LPTIM3RST. The number of wait states may be up to 7 cycles of the RCC clock. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPTIM3 AMEN	LPTIM3 LPEN	LPTIM3 EN	LPTIM3 RST
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **LPTIM3AMEN**: LPTIM3 autonomous clock mode enable
Set and cleared by software.
0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.
1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **LPTIM3LPEN**: LPTIM3 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPTIM3EN**: LPTIM3 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LPTIM3RST**: LPTIM3 reset
Set and cleared by software.
0: Writing 0 releases LPTIM3 reset. Reading 0 means that LPTIM3 reset is released.
1: Writing 1 asserts LPTIM3 reset. Reading 1 means that LPTIM3 reset is asserted.

21.8.130 RCC LPTIM4 configuration register (RCC_LPTIM4CFGR)

Address offset: 0x750

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-powe, r and autonomous clock mode behavior of the LPTIM4. Wait states are inserted in case of successive write accesses to this register except on LPTIM4RST. The number of wait states may be up to 7 cycles of the RCC clock. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPTIM4 AMEN	LPTIM4 LPEN	LPTIM4 EN	LPTIM4 RST
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **LPTIM4AMEN**: LPTIM4 autonomous clock mode enable
Set and cleared by software.
0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.
1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **LPTIM4LPEN**: LPTIM4 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPTIM4EN**: LPTIM4 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LPTIM4RST**: LPTIM4 reset
Set and cleared by software.
0: Writing 0 releases LPTIM4 reset. Reading 0 means that LPTIM4 reset is released.
1: Writing 1 asserts LPTIM4 reset. Reading 1 means that LPTIM4 reset is asserted.

21.8.131 RCC LPTIM5 configuration register (RCC_LPTIM5CFGR)

Address offset: 0x754

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-power, and autonomous clock mode behavior of the LPTIM5. Wait states are inserted in case of successive write accesses to this register except on LPTIM5RST. The number of wait states may be up to 7 cycles of the RCC clock. Any read access is allowed.

												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **LPTIM5AMEN**: LPTIM5 autonomous clock mode enable

Set and cleared by software.

0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.

1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **LPTIM5LPEN**: LPTIM5 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPTIM5EN**: LPTIM5 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LPTIM5RST**: LPTIM5 reset

Set and cleared by software.

0: Writing 0 releases LPTIM5 reset. Reading 0 means that LPTIM5 reset is released.

1: Writing 1 asserts LPTIM5 reset. Reading 1 means that LPTIM5 reset is asserted.

21.8.132 RCC SPI1 configuration register (RCC_SPI1CFGR)

Address offset: 0x758

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPI1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPI1LPEN	SPI1EN	SPI1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPI1LPEN**: SPI1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPI1EN**: SPI1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPI1RST**: SPI1 reset

Set and cleared by software.

0: Writing 0 releases SPI1 reset. Reading 0 means that SPI1 reset is released.

1: Writing 1 asserts SPI1 reset. Reading 1 means that SPI1 reset is asserted.

21.8.133 RCC SPI2 configuration register (RCC_SPI2CFGR)

Address offset: 0x75C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPI2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPI2LPEN	SPI2EN	SPI2RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPI2LPEN**: SPI2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPI2EN**: SPI2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPI2RST**: SPI2 reset
Set and cleared by software.
0: Writing 0 releases SPI2 reset. Reading 0 means that SPI2 reset is released.
1: Writing 1 asserts SPI2 reset. Reading 1 means that SPI2 reset is asserted.

21.8.134 RCC SPI3 configuration register (RCC_SPI3CFGR)

Address offset: 0x760

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPI3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPI3LPEN	SPI3EN	SPI3RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPI3LPEN**: SPI3 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPI3EN**: SPI3 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPI3RST**: SPI3 reset
Set and cleared by software.
0: Writing 0 releases SPI3 reset. Reading 0 means that SPI3 reset is released.
1: Writing 1 asserts SPI3 reset. Reading 1 means that SPI3 reset is asserted.

21.8.135 RCC SPI4 configuration register (RCC_SPI4CFGR)

Address offset: 0x764

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPI4. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPI4LPEN	SPI4EN	SPI4RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPI4LPEN**: SPI4 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPI4EN**: SPI4 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPI4RST**: SPI4 reset

Set and cleared by software.

0: Writing 0 releases SPI4 reset. Reading 0 means that SPI4 reset is released.

1: Writing 1 asserts SPI4 reset. Reading 1 means that SPI4 reset is asserted.

21.8.136 RCC SPI5 configuration register (RCC_SPI5CFGR)

Address offset: 0x768

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPI5. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPI5LPEN**: SPI5 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPI5EN**: SPI5 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPI5RST**: SPI5 reset
Set and cleared by software.
0: Writing 0 releases SPI5 reset. Reading 0 means that SPI5 reset is released.
1: Writing 1 asserts SPI5 reset. Reading 1 means that SPI5 reset is asserted.

21.8.137 RCC SPI6 configuration register (RCC_SPI6CFGR)

Address offset: 0x76C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPI6. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPI6LPEN	SPI6EN	SPI6RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPI6LPEN**: SPI6 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPI6EN**: SPI6 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPI6RST**: SPI6 reset
Set and cleared by software.
0: Writing 0 releases SPI6 reset. Reading 0 means that SPI6 reset is released.
1: Writing 1 asserts SPI6 reset. Reading 1 means that SPI6 reset is asserted.

21.8.138 RCC SPI7 configuration register (RCC_SPI7CFGR)

Address offset: 0x770

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPI7. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPI7LPEN	SPI7EN	SPI7RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPI7LPEN**: SPI7 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPI7EN**: SPI7 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPI7RST**: SPI7 reset

Set and cleared by software.

0: Writing 0 releases SPI7 reset. Reading 0 means that SPI7 reset is released.

1: Writing 1 asserts SPI7 reset. Reading 1 means that SPI7 reset is asserted.

21.8.139 RCC SPI8 configuration register (RCC_SPI8CFGR)

Address offset: 0x774

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-power, and autonomous clock mode behavior of the SPI8. Wait states are inserted in case of successive write accesses to this register except on SPI8RST. The number of wait states may be up to 7 cycles of the RCC clock. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPI8AMEN	SPI8LPEN	SPI8EN	SPI8RST
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **SPI8AMEN**: SPI8 autonomous clock mode enable

Set and cleared by software.

0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.

1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **SPI8LPEN**: SPI8 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPI8EN**: SPI8 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPI8RST**: SPI8 reset

Set and cleared by software.

0: Writing 0 releases SPI8 reset. Reading 0 means that SPI8 reset is released.

1: Writing 1 asserts SPI8 reset. Reading 1 means that SPI8 reset is asserted.

21.8.140 RCC SPDIFRX configuration register (RCC_SPDIFRXCFGR)

Address offset: 0x778

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPDIFRX. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPDIFRXLPEN	SPDIFRXEN	SPDIFRXRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPDIFRXLPEN**: SPDIFRX clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPDIFRXEN**: SPDIFRX clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPDIFRXRST**: SPDIFRX reset

Set and cleared by software.

0: Writing 0 releases SPDIFRX reset. Reading 0 means that SPDIFRX reset is released.

1: Writing 1 asserts SPDIFRX reset. Reading 1 means that SPDIFRX reset is asserted.

21.8.141 RCC USART1 configuration register (RCC_USART1CFGR)

Address offset: 0x77C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USART1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	USART1LPEN	USART1EN	USART1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **USART1LPEN**: USART1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USART1EN**: USART1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USART1RST**: USART1 reset

Set and cleared by software.

0: Writing 0 releases USART1 reset. Reading 0 means that USART1 reset is released.

1: Writing 1 asserts USART1 reset. Reading 1 means that USART1 reset is asserted.

21.8.142 RCC USART2 configuration register (RCC_USART2CFGR)

Address offset: 0x780

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USART2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	USART 2LPEN	USART 2EN	USART 2RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **USART2LPEN**: USART2 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USART2EN**: USART2 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USART2RST**: USART2 reset

Set and cleared by software.

0: Writing 0 releases USART2 reset. Reading 0 means that USART2 reset is released.

1: Writing 1 asserts USART2 reset. Reading 1 means that USART2 reset is asserted.

21.8.143 RCC USART3 configuration register (RCC_USART3CFGR)

Address offset: 0x784

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USART3.Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	USART 3LPEN	USART 3EN	USART 3RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **USART3LPEN**: USART3 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USART3EN**: USART3 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USART3RST**: USART3 reset

Set and cleared by software.

0: Writing 0 releases USART3 reset. Reading 0 means that USART3 reset is released.

1: Writing 1 asserts USART3 reset. Reading 1 means that USART3 reset is asserted.

21.8.144 RCC UART4 configuration register (RCC_UART4CFGR)

Address offset: 0x788

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the UART4. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UART4 LPEN	UART4 EN	UART4 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **UART4LPEN**: UART4 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **UART4EN**: UART4 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **UART4RST**: UART4 reset
Set and cleared by software.
0: Writing 0 releases UART4 reset. Reading 0 means that UART4 reset is released.
1: Writing 1 asserts UART4 reset. Reading 1 means that UART4 reset is asserted.

21.8.145 RCC UART5 configuration register (RCC_UART5CFGR)

Address offset: 0x78C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the UART5. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UART5 LPEN	UART5 EN	UART5 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **UART5LPEN**: UART5 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **UART5EN**: UART5 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **UART5RST**: UART5 reset
Set and cleared by software.
0: Writing 0 releases UART5 reset. Reading 0 means that UART5 reset is released.
1: Writing 1 asserts UART5 reset. Reading 1 means that UART5 reset is asserted.

21.8.146 RCC USART6 configuration register (RCC_USART6CFGR)

Address offset: 0x790

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USART6. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	USART 6LPEN	USART 6EN	USART 6RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **USART6LPEN**: USART6 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USART6EN**: USART6 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USART6RST**: USART6 reset

Set and cleared by software.

0: Writing 0 releases USART6 reset. Reading 0 means that USART6 reset is released.

1: Writing 1 asserts USART6 reset. Reading 1 means that USART6 reset is asserted.

21.8.147 RCC UART7 configuration register (RCC_UART7CFGR)

Address offset: 0x794

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the UART7. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UART7 LPEN	UART7 EN	UART7 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **UART7LPEN**: UART7 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **UART7EN**: UART7 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **UART7RST**: UART7 reset
Set and cleared by software.
0: Writing 0 releases UART7 reset. Reading 0 means that UART7 reset is released.
1: Writing 1 asserts UART7 reset. Reading 1 means that UART7 reset is asserted.

21.8.148 RCC UART8 configuration register (RCC_UART8CFGR)

Address offset: 0x798

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the UART8. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UART8 LPEN	UART8 EN	UART8 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **UART8LPEN**: UART8 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **UART8EN**: UART8 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **UART8RST**: UART8 reset
Set and cleared by software.
0: Writing 0 releases UART8 reset. Reading 0 means that UART8 reset is released.
1: Writing 1 asserts UART8 reset. Reading 1 means that UART8 reset is asserted.

21.8.149 RCC UART9 configuration register (RCC_UART9CFGR)

Address offset: 0x79C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the UART9. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UART9LPEN	UART9EN	UART9RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **UART9LPEN**: UART9 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **UART9EN**: UART9 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **UART9RST**: UART9 reset

Set and cleared by software.

0: Writing 0 releases UART9 reset. Reading 0 means that UART9 reset is released.

1: Writing 1 asserts UART9 reset. Reading 1 means that UART9 reset is asserted.

21.8.150 RCC LPUART1 configuration register (RCC_LPUART1CFGR)

Address offset: 0x7A0

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-power, and autonomous clock mode behavior of the LPUART1. Wait states are inserted in case of successive write accesses to this register except on LPUART1RST. The number of wait states may be up to 7 cycles of the RCC clock. Any read access is allowed.

												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **LPUART1AMEN**: LPUART1 autonomous clock mode enable

Set and cleared by software.

0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.

1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **LPUART1LPEN**: LPUART1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPUART1EN**: LPUART1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LPUART1RST**: LPUART1 reset

Set and cleared by software.

0: Writing 0 releases LPUART1 reset. Reading 0 means that LPUART1 reset is released.

1: Writing 1 asserts LPUART1 reset. Reading 1 means that LPUART1 reset is asserted.

21.8.151 RCC I2C1 configuration register (RCC_I2C1CFGR)

Address offset: 0x7A4

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the I2C1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I2C1LPEN**: I2C1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I2C1EN**: I2C1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I2C1RST**: I2C1 reset
Set and cleared by software.
0: Writing 0 releases I2C1 reset. Reading 0 means that I2C1 reset is released.
1: Writing 1 asserts I2C1 reset. Reading 1 means that I2C1 reset is asserted.

21.8.152 RCC I2C2 configuration register (RCC_I2C2CFGR)

Address offset: 0x7A8

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the I2C2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	I2C2LPEN	I2C2EN	I2C2RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I2C2LPEN**: I2C2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I2C2EN**: I2C2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I2C2RST**: I2C2 reset
Set and cleared by software.
0: Writing 0 releases I2C2 reset. Reading 0 means that I2C2 reset is released.
1: Writing 1 asserts I2C2 reset. Reading 1 means that I2C2 reset is asserted.

21.8.153 RCC I2C3 configuration register (RCC_I2C3CFGR)

Address offset: 0x7AC

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the I2C3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	I2C3LPEN	I2C3EN	I2C3RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I2C3LPEN**: I2C3 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I2C3EN**: I2C3 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I2C3RST**: I2C3 reset

Set and cleared by software.

0: Writing 0 releases I2C3 reset. Reading 0 means that I2C3 reset is released.

1: Writing 1 asserts I2C3 reset. Reading 1 means that I2C3 reset is asserted.

21.8.154 RCC I2C4 configuration register (RCC_I2C4CFGR)

Address offset: 0x7B0

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the I2C4. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	I2C4LPEN	I2C4EN	I2C4RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I2C4LPEN**: I2C4 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I2C4EN**: I2C4 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I2C4RST**: I2C4 reset
Set and cleared by software.
0: Writing 0 releases I2C4 reset. Reading 0 means that I2C4 reset is released.
1: Writing 1 asserts I2C4 reset. Reading 1 means that I2C4 reset is asserted.

21.8.155 RCC I2C5 configuration register (RCC_I2C5CFGR)

Address offset: 0x7B4

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of I2C5. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I2C5LPEN**: I2C5 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I2C5EN**: I2C5 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I2C5RST**: I2C5 reset
Set and cleared by software.
0: Writing 0 releases I2C5 reset. Reading 0 means that I2C5 reset is released.
1: Writing 1 asserts I2C5 reset. Reading 1 means that I2C5 reset is asserted.

21.8.156 RCC I2C6 configuration register (RCC_I2C6CFGR)

Address offset: 0x7B8

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the I2C6. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	I2C6LPEN	I2C6EN	I2C6RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I2C6LPEN**: I2C6 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I2C6EN**: I2C6 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I2C6RST**: I2C6 reset

Set and cleared by software.

0: Writing 0 releases I2C6 reset. Reading 0 means that I2C6 reset is released.

1: Writing 1 asserts I2C6 reset. Reading 1 means that I2C6 reset is asserted.

21.8.157 RCC I2C7 configuration register (RCC_I2C7CFGR)

Address offset: 0x7BC

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the I2C7. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	I2C7LPEN	I2C7EN	I2C7RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I2C7LPEN**: I2C7 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I2C7EN**: I2C7 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I2C7RST**: I2C7 reset

Set and cleared by software.

0: Writing 0 releases I2C7 reset. Reading 0 means that I2C7 reset is released.

1: Writing 1 asserts I2C7 reset. Reading 1 means that I2C7 reset is asserted.

21.8.158 RCC I2C8 configuration register (RCC_I2C8CFGR)

Address offset: 0x7C0

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-power, and autonomous clock mode behavior of the I2C8. Wait states are inserted in case of successive write accesses to this register except on I2C8RST. The number of wait states may be up to 7 cycles of the RCC clock. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	I2C8AMEN	I2C8LPEN	I2C8EN	I2C8RST
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **I2C8AMEN**: I2C8 autonomous clock mode enable

Set and cleared by software.

0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.

1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **I2C8LPEN**: I2C8 peripheral clocks enable during CSleep mode

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I2C8EN**: I2C8 peripheral clocks enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I2C8RST**: I2C8 reset
Set and cleared by software.
0: Writing 0 releases I2C8 reset. Reading 0 means that I2C8 reset is released.
1: Writing 1 asserts I2C8 reset. Reading 1 means that I2C8 reset is asserted.

21.8.159 RCC SAI1 configuration register (RCC_SAI1CFGR)

Address offset: 0x7C4

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SAI1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SAI1LPEN	SAI1EN	SAI1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SAI1LPEN**: SAI1 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SAI1EN**: SAI1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SAI1RST**: SAI1 reset
Set and cleared by software.
0: Writing 0 releases SAI1 reset. Reading 0 means that SAI1 reset is released.
1: Writing 1 asserts SAI1 reset. Reading 1 means that SAI1 reset is asserted.

21.8.160 RCC SAI2 configuration register (RCC_SAI2CFGR)

Address offset: 0x7C8

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SAI2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SAI2LPEN	SAI2EN	SAI2RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SAI2LPEN**: SAI2 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SAI2EN**: SAI2 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SAI2RST**: SAI2 reset

Set and cleared by software.

0: Writing 0 releases SAI2 reset. Reading 0 means that SAI2 reset is released.

1: Writing 1 asserts SAI2 reset. Reading 1 means that SAI2 reset is asserted.

21.8.161 RCC SAI3 configuration register (RCC_SAI3CFGR)

Address offset: 0x7CC

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SAI3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SAI3LPEN	SAI3EN	SAI3RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SAI3LPEN**: SAI3 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SAI3EN**: SAI3 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SAI3RST**: SAI3 reset
Set and cleared by software.
0: Writing 0 releases SAI3 reset. Reading 0 means that SAI3 reset is released.
1: Writing 1 asserts SAI3 reset. Reading 1 means that SAI3 reset is asserted.

21.8.162 RCC SAI4 configuration register (RCC_SAI4CFGR)

Address offset: 0x7D0

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SAI4. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SAI4LPEN	SAI4EN	SAI4RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SAI4LPEN**: SAI4 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SAI4EN**: SAI4 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SAI4RST**: SAI4 reset
Set and cleared by software.
0: Writing 0 releases SAI4 reset. Reading 0 means that SAI4 reset is released.
1: Writing 1 asserts SAI4 reset. Reading 1 means that SAI4 reset is asserted.

21.8.163 RCC MDF1 configuration register (RCC_MDF1CFGR)

Address offset: 0x7D8

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the MDF1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MDF1LPEN	MDF1EN	MDF1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **MDF1LPEN**: MDF1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **MDF1EN**: MDF1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **MDF1RST**: MDF1 reset

Set and cleared by software.

0: Writing 0 releases MDF1 reset. Reading 0 means that MDF1 reset is released.

1: Writing 1 asserts MDF1 reset. Reading 1 means that MDF1 reset is asserted.

21.8.164 RCC ADF1 configuration register (RCC_ADF1CFGR)

Address offset: 0x7DC

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-power, and autonomous clock mode behavior of the ADF1. Wait states are inserted in case of successive write accesses to this register except on ADF1RST bitfield. The number of wait states may be up to 7 cycles of the RCC clock. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ADF1AMEN	ADF1LPEN	ADF1EN	ADF1RST
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **ADF1AMEN**: ADF1 autonomous clock mode enable

Set and cleared by software.

0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.

1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **ADF1LPEN**: ADF1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **ADF1EN**: ADF1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **ADF1RST**: ADF1 reset

Set and cleared by software.

0: Writing 0 releases ADF1 reset. Reading 0 means that ADF1 reset is released.

1: Writing 1 asserts ADF1 reset. Reading 1 means that ADF1 reset is asserted.

21.8.165 RCC FDCAN configuration register (RCC_FDCANCFGR)

Address offset: 0x7E0

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the FDCAN and CANRAM. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FDCAN LPEN	FDCAN EN	FDCAN RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **FDCANLPEN**: FDCAN clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **FDCANEN**: FDCAN clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **FDCANRST**: FDCAN reset
Set and cleared by software.
0: Writing 0 releases FDCAN reset. Reading 0 means that FDCAN reset is released.
1: Writing 1 asserts FDCAN reset. Reading 1 means that FDCAN reset is asserted.

21.8.166 RCC HDP configuration register (RCC_HDPCFGR)

Address offset: 0x7E4

Reset value: 0x0000 0000

This register is used to control reset and clock gating behavior of the HDP. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HDPEN	HDPRST
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **HDPEN**: HDP clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **HDPRST**: HDP reset
Set and cleared by software.
0: Writing 0 releases HDP reset. Reading 0 means that HDP reset is released.
1: Writing 1 asserts HDP reset. Reading 1 means that HDP reset is asserted.

21.8.167 RCC ADC12 configuration register (RCC_ADC12CFGR)

Address offset: 0x7E8

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the ADC12. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	ADC12 KERSEL	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ADC12 LPEN	ADC12 EN	ADC12 RST
			rw										rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **ADC12KERSEL**: ADC12 kernel clock source selection
Set and cleared by software.
0: Kernel clock source is ck_ker_adc12.
1: Kernel clock source is ck_icn_ls_mcu.

Bits 11:3 Reserved, must be kept at reset value.

Bit 2 **ADC12LPEN**: ADC12 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **ADC12EN**: ADC12 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **ADC12RST**: ADC12 reset
Set and cleared by software.
0: Writing 0 releases ADC12 reset. Reading 0 means that ADC12 reset is released.
1: Writing 1 asserts ADC12 reset. Reading 1 means that ADC12 reset is asserted.

21.8.168 RCC ADC3 configuration register (RCC_ADC3CFGR)

Address offset: 0x7EC

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the ADC3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

		rw	rw										rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:12 **ADC3KERSEL[1:0]**: ADC3 kernel clock source select
Set and cleared by software.
0x0: Kernel source clock is ck_ker_adc3.
0x1: Kernel source clock is ck_icn_ls_mcu.
0x2: Kernel source clock is ck_ker_adc12.
0x3: Reserved

Bits 11:3 Reserved, must be kept at reset value.

Bit 2 **ADC3LPEN**: ADC3 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **ADC3EN**: ADC3 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **ADC3RST**: ADC3 reset
Set and cleared by software.
0: Writing 0 releases ADC3 reset. Reading 0 means that ADC3 reset is released.
1: Writing 1 asserts ADC3 reset. Reading 1 means that ADC3 reset is asserted.

21.8.169 RCC Ethernet 1 configuration register (RCC_ETH1CFGR)

Address offset: 0x7F0

Reset value: 0x0000 0A44

This register is used to control reset, clock gating, and low-power behavior of the Ethernet 1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

				rw	rw	rw	rw		rw	rw	rw		rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **ETH1RXLPEN**: Ethernet 1 reception clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables reception clock in CSleep. Reading 0 means that reception clock is disabled in CSleep.

1: Writing 1 enables reception clock in CSleep. Reading 1 means that reception clock is enabled in CSleep.

Bit 10 **ETH1RXEN**: Ethernet 1 reception clock enable

Set and cleared by software.

0: Writing 0 disables reception clock. Reading 0 means that reception clock is disabled.

1: Writing 1 enables reception clock. Reading 1 means that reception clock is enabled.

Bit 9 **ETH1TXLPEN**: Ethernet 1 transmission clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables transmission clock in CSleep. Reading 0 means that transmission clock is disabled in CSleep.

1: Writing 1 enables transmission clock in CSleep. Reading 1 means that transmission clock is enabled in CSleep.

Bit 8 **ETH1TXEN**: Ethernet 1 transmission clock enable

Set and cleared by software.

0: Writing 0 disables transmission clock. Reading 0 means that transmission clock is disabled.

1: Writing 1 enables transmission clock. Reading 1 means that transmission clock is enabled.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **ETH1LPEN**: Ethernet 1 kernel clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables kernel clocks in CSleep. Reading 0 means that kernel clocks are disabled in CSleep.

1: Writing 1 enables kernel clocks in CSleep. Reading 1 means that kernel clocks are enabled in CSleep.

Bit 5 **ETH1EN**: Ethernet 1 kernel clock enable

Set and cleared by software.

0: Writing 0 disables kernel clocks. Reading 0 means that kernel clocks are disabled.

1: Writing 1 enables kernel clocks. Reading 1 means that kernel clocks are enabled.

Bit 4 **ETH1STPEN**: Ethernet 1 kernel clocks enable during CStop

Set and cleared by software. This bits allows ETH1 to receive clocks coming from ETH1_TX_CLK and ETH1_RX_CLK pins during CStop.

0: Writing 0 disables ETH1 TX and RX kernel clocks in CStop. Reading 0 means that ETH1 TX and RX kernel clocks are disabled in CStop.

1: Writing 1 enables ETH1 TX and RX kernel clocks in CStop. Reading 1 means that ETH1 TX and RX kernel clocks are enabled in CStop.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **ETH1MACLPEN**: Ethernet 1 bus clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables bus clocks in CSleep. Reading 0 means that bus clocks are disabled in CSleep.

1: Writing 1 enables bus clocks in CSleep. Reading 1 means that bus clocks are enabled in CSleep.

Bit 1 **ETH1MACEN**: Ethernet 1 bus clock enable

Set and cleared by software.

0: Writing 0 disables bus clocks. Reading 0 means that bus clocks are disabled.

1: Writing 1 enables bus clocks. Reading 1 means that bus clocks are enabled.

Bit 0 **ETH1RST**: Ethernet 1 reset

Set and cleared by software.

0: Writing 0 releases ETH1 reset. Reading 0 means that ETH1 reset is released.

1: Writing 1 asserts ETH1 reset. Reading 1 means that ETH1 reset is asserted.

21.8.170 RCC Ethernet 2 configuration register (RCC_ETH2CFGR)

Address offset: 0x7F4

Reset value: 0x0000 0A44

This register is used to control reset, clock gating, and low-power behavior of the Ethernet 2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	ETH2RXLPEN	ETH2RXEN	ETH2TXLPEN	ETH2TXEN	Res.	ETH2LPEN	ETH2EN	ETH2STPEN	Res.	ETH2MACLPEN	ETH2MACEN	ETH2RST
				rw	rw	rw	rw		rw	rw	rw		rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **ETH2RXLPEN**: Ethernet 2 reception clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables reception clock in CSleep. Reading 0 means that reception clock is disabled in CSleep.

1: Writing 1 enables reception clock in CSleep. Reading 1 means that reception clock is enabled in CSleep.

Bit 10 **ETH2RXEN**: Ethernet 2 reception clock enable
Set and cleared by software.
0: Writing 0 disables reception clock. Reading 0 means that reception clock is disabled.
1: Writing 1 enables reception clock. Reading 1 means that reception clock is enabled.

Bit 9 **ETH2TXLPEN**: Ethernet 2 transmission clock enable during CSleep mode
Set and cleared by software.
0: Writing 0 disables transmission clock in CSleep. Reading 0 means that transmission clock is disabled in CSleep.
1: Writing 1 enables transmission clock in CSleep. Reading 1 means that transmission clock is enabled in CSleep.

Bit 8 **ETH2TXEN**: Ethernet 2 transmission clock enable
Set and cleared by software.
0: Writing 0 disables transmission clock. Reading 0 means that transmission clock is disabled.
1: Writing 1 enables transmission clock. Reading 1 means that transmission clock is enabled

Bit 7 Reserved, must be kept at reset value.

Bit 6 **ETH2LPEN**: Ethernet 2 kernel clocks enable during CSleep
Set and cleared by software.
0: Writing 0 disables kernel clocks in CSleep. Reading 0 means that kernel clocks are disabled in CSleep.
1: Writing 1 enables kernel clocks in CSleep. Reading 1 means that kernel clocks are enabled in CSleep.

Bit 5 **ETH2EN**: Ethernet 2 kernel clocks enable
Set and cleared by software.
0: Writing 0 disables kernel clocks. Reading 0 means that kernel clocks are disabled.
1: Writing 1 enables kernel clocks. Reading 1 means that kernel clocks are enabled.

Bit 4 **ETH2STPEN**: Ethernet 2 kernel clocks enable during CStop
Set and cleared by software. This bits allows ETH2 to receive clocks coming from ETH2_TX_CLK and ETH2_RX_CLK pins during CStop.
0: Writing 0 disables ETH2 TX and RX kernel clocks in CStop. Reading 0 means that ETH2 TX and RX kernel clocks are disabled in CStop.
1: Writing 1 enables ETH2 TX and RX kernel clocks in CStop. Reading 1 means that ETH2 TX and RX kernel clocks are enabled in CStop.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **ETH2MACLPEN**: Ethernet 2 bus clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables bus clocks in CSleep. Reading 0 means that bus clocks are disabled in CSleep.
1: Writing 1 enables bus clocks in CSleep. Reading 1 means that bus clocks are enabled in CSleep.

Bit 1 **ETH2MACEN**: Ethernet 2 bus clock enable
Set and cleared by software.
0: Writing 0 disables bus clocks. Reading 0 means that bus clocks are disabled.
1: Writing 1 enables bus clocks. Reading 1 means that bus clocks are enabled.

Bit 0 **ETH2RST**: Ethernet 2 reset
Set and cleared by software.
0: Writing 0 releases ETH2 reset. Reading 0 means that ETH2 reset is released.
1: Writing 1 asserts ETH2 reset. Reading 1 means that ETH2 reset is asserted.

21.8.171 RCC USBH configuration register (RCC_USBHCFGR)

Address offset: 0x7FC

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USBH. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	USBHSTPEN	Res.	USBHLPEN	USBHEN	USBHRST
											rw		rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **USBHSTPEN**: USBH clock enable during CStop

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CStop. Reading 0 means that peripheral clocks are disabled in CStop.

1: Writing 1 enables peripheral clocks in CStop. Reading 1 means that peripheral clocks are enabled in CStop.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **USBHLPEN**: USBH clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USBHEN**: USBH peripheral clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USBHRST**: USBH reset

Set and cleared by software.

0: Writing 0 releases USBH reset. Reading 0 means that USBH reset is released.

1: Writing 1 asserts USBH reset. Reading 1 means that USBH reset is asserted.

21.8.172 RCC USB2PHY1 configuration register (RCC_USB2PHY1CFGR)

Address offset: 0x800

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USB2PHY1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw											rw		rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **USB2PHY1CKREFSEL**: USB2PHY1 reference clock selection
Set and cleared by software.
0: USB2PHY1 reference clock is channel 57 (ck_ker_usb2phy1) of the flexclkgen (default after reset).
1: USB2PHY1 reference clock is the HSE oscillator (hse_ker_ck).

Bits 14:5 Reserved, must be kept at reset value.

Bit 4 **USB2PHY1STPEN**: USB2PHY1 reference clock enable during CStop
Set and cleared by software.
0: Writing 0 disables reference clock in CStop. Reading 0 means that reference clock is disabled in CStop.
1: Writing 1 enables reference clock in CStop. Reading 1 means that reference clock is enabled in CStop.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **USB2PHY1LPEN**: USB2PHY1 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USB2PHY1EN**: USB2PHY1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USB2PHY1RST**: USB2PHY1 reset
Set and cleared by software.
0: Writing 0 releases USB2PHY1 reset. Reading 0 means that USB2PHY1 reset is released.
1: Writing 1 asserts USB2PHY1 reset. Reading 1 means that USB2PHY1 reset is asserted.

21.8.173 RCC USB2PHY2 configuration register (RCC_USB2PHY2CFGR)

Address offset: 0x804

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USB2PHY2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw											rw		rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **USB2PHY2CKREFSEL**: USB2PHY2 reference clock select

Set and cleared by software.

0: USB2PHY2 reference clock is channel 58 (ck_ker_usb2phy2) of the flexclkgen (default after reset).

1: USB2PHY2 reference clock is the HSE oscillator (hse_ker_ck).

Bits 14:5 Reserved, must be kept at reset value.

Bit 4 **USB2PHY2STPEN**: USB2PHY2 reference clock enable during CStop

Set and cleared by software.

0: Writing 0 disables reference clock in CStop. Reading 0 means that reference clock is disabled in CStop.

1: Writing 1 enables reference clock in CStop. Reading 1 means that reference clock is enabled in CStop.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **USB2PHY2LPEN**: USB2PHY2 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USB2PHY2EN**: USB2PHY2 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USB2PHY2RST**: USB2PHY2 reset

Set and cleared by software.

0: Writing 0 releases USB2PHY2 reset. Reading 0 means that USB2PHY2 reset is released.

1: Writing 1 asserts USB2PHY2 reset. Reading 1 means that USB2PHY2 reset is asserted.

21.8.174 RCC USB3DR configuration register (RCC_USB3DRCFGR)

Address offset: 0x808

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USB3DR. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

											rw		rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **USB3DRSTPEN**: USB3DR clock enable during CStop

Set and cleared by software.

0: Writing 0 disables reference clock in CStop. Reading 0 means that reference clock is disabled in CStop.

1: Writing 1 enables reference clock in CStop. Reading 1 means that reference clock is enabled in CStop.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **USB3DRLPEN**: USB3DR clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USB3DREN**: USB3DR peripheral clocks enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USB3DRRST**: USB3DR reset

Set and cleared by software.

0: Writing 0 releases USB3DR reset. Reading 0 means that USB3DR reset is released.

1: Writing 1 asserts USB3DR reset. Reading 1 means that USB3DR reset is asserted.

21.8.175 RCC USB3PCIEPHY configuration register (RCC_USB3PCIEPHYCFGR)

Address offset: 0x80C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USB3PCIEPHY. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw											rw		rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **USB3PCIEPHYCKREFSEL**: USB3PCIEPHY reference clock selection
Set and cleared by software.
0: USB3PCIEPHY reference clock is channel 34 (ck_ker_usb3pciephy) of the flexclkgen (default after reset).
1: USB3PCIEPHY reference clock is the HSE oscillator (hse_ker_ck).

Bits 14:5 Reserved, must be kept at reset value.

Bit 4 **USB3PCIEPHYSTPEN**: USB3PCIEPHY reference clock enable during CStop
Set and cleared by software.
0: Writing 0 disables reference clock in CStop. Reading 0 means that reference clock is disabled in CStop.
1: Writing 1 enables reference clock in CStop. Reading 1 means that reference clock is enabled in CStop.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **USB3PCIEPHYLPEN**: USB3PCIEPHY clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USB3PCIEPHYEN**: USB3PCIEPHY clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USB3PCIEPHYRST**: USB3PCIEPHY reset
Set and cleared by software.
0: Writing 0 releases USB3PCIEPHY reset. Reading 0 means that USB3PCIEPHY reset is released.
1: Writing 1 asserts USB3PCIEPHY reset. Reading 1 means that USB3PCIEPHY reset is asserted.

21.8.176 RCC PCIE configuration register (RCC_PCIECFGR)

Address offset: 0x810

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the PCIE. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PCIESTPEN	Res.	PCIELPEN	PCIEEN	PCIERST
											rw		rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **PCIESTPEN**: PCIE clock enable during CStop

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CStop. Reading 0 means that peripheral clocks are disabled in CStop.

1: Writing 1 enables peripheral clocks in CStop. Reading 1 means that peripheral clocks are enabled in CStop.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **PCIELPEN**: PCIE clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **PCIEEN**: PCIE clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **PCIERST**: PCIE reset

Set and cleared by software.

0: Writing 0 releases PCIE reset. Reading 0 means that PCIE reset is released.

1: Writing 1 asserts PCIE reset. Reading 1 means that PCIE reset is asserted.

21.8.177 RCC UCPD configuration register (RCC_UCPDCFGR)

Address offset: 0x814

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the UCPD. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **UCPDLPEN**: UCPD clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **UCPDEN**: UCPD clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **UCPDRST**: UCPD reset

Set and cleared by software.

0: Writing 0 releases UCPD reset. Reading 0 means that UCPD reset is released.

1: Writing 1 asserts UCPD reset. Reading 1 means that UCPD reset is asserted.

21.8.178 RCC Ethernet switch configuration register (RCC_ETHSWCFGR)

Address offset: 0x818

Reset value: 0x0040 0044

This register is used to control reset, clock gating, and low-power behavior of the ETHSW. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ETHSWREFLPEN	ETHSWREFEN	Res.	Res.	Res.	Res.	Res.

									rw	rw			rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **ETHSWREFLPEN**: ETHSW ck_ker_ethswref kernel clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables ck_ker_ethswref in CSleep. Reading 0 means that ck_ker_ethswref is disabled in CSleep.
1: Writing 1 enables ck_ker_ethswref in CSleep. Reading 1 means that ck_ker_ethswref is enabled in CSleep.

Bit 21 **ETHSWREFEN**:ETHSW ck_ker_ethswref kernel clock enable
Set and cleared by software.
0: Writing 0 disables ck_ker_ethswref. Reading 0 means that ck_ker_ethswref is disabled.
1: Writing 1 enables ck_ker_ethswref. Reading 1 means that ck_ker_ethswref is enabled.

Bits 20:7 Reserved, must be kept at reset value.

Bit 6 **ETHSWLPEN**: ETHSW ck_ker_ethsw kernel clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables ck_ker_ethsw in CSleep. Reading 0 means that ck_ker_ethsw is disabled in CSleep.
1: Writing 1 enables ck_ker_ethsw in CSleep. Reading 1 means that ck_ker_ethsw is enabled in CSleep.

Bit 5 **ETHSWEN**: ETHSW ck_ker_ethsw kernel clock enable
Set and cleared by software.
0: Writing 0 disables ck_ker_ethsw. Reading 0 means that ck_ker_ethsw is disabled.
1: Writing 1 enables ck_ker_ethsw. Reading 1 means that ck_ker_ethsw is enabled.

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **ETHSWMACLPEN**: ETHSW clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **ETHSWMACEN**: ETHSW clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **ETHSWRST**: ETHSW reset
Set and cleared by software.
0: Writing 0 releases ETHSW reset. Reading 0 means that ETHSW reset is released.
1: Writing 1 asserts ETHSW reset. Reading 1 means that ETHSW reset is asserted.

21.8.179 RCC Ethernet switch ACM configuration register (RCC_ETHSWACMCFGR)

Address offset: 0x81C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the ETHSW_ACM. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ETHSWACMLPEN	ETHSWACMEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **ETHSWACMLPEN**:ETHSW_ACM clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **ETHSWACMEN**: ETHSW_ACM clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.180 RCC Ethernet switch ACM message configuration register (RCC_ETHSWACMMSGCFGR)

Address offset: 0x820

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the ETHSW_ACM message buffer in the Ethernet switch. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ETHSWACMMSGLPEN	ETHSWACMMSGEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **ETHSWACMMSGLPEN**: ETHSW_ACM message buffer clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **ETHSWACMMSGEN**: ETHSW_ACM message buffer clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.181 RCC STGEN configuration register (RCC_STGENCFGR)

Address offset: 0x824

Reset value: 0x0000 0004

This register is used to control clock gating and low-power clock mode behavior of the STGENC and STGENR. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STGEN STPEN	Res.	STGEN LPEN	STGEN EN	Res.
											rw		rw	rw	

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **STGENSTPEN**: STGENRW and STGENRO kernel clock enable during CStop
Set and cleared by software.
0: Writing 0 disables kernel clocks in CStop. Reading 0 means that kernel clocks are disabled in CStop.
1: Writing 1 enables kernel clocks in CStop. Reading 1 means that kernel clocks are enabled in CStop.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **STGENLPEN**: STGENRW and STGENRO clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **STGENEN**: STGENRW and STGENRO clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.182 RCC SDMMC1 configuration register (RCC_SDMMC1CFGR)

Address offset: 0x830

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SDMMC1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDMMC1DLLRST

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDMMC1LPEN	SDMMC1EN	SDMMC1RST
													rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **SDMMC1DLLRST**: SDMMC1 DLL reset

Set and cleared by software.

0: Writing 0 releases DLL reset. Reading 0 means that DLL reset is released.

1: Writing 1 asserts DLL reset. Reading 1 means that DLL reset is asserted.

Bits 15:3 Reserved, must be kept at reset value.

Bit 2 **SDMMC1LPEN**: SDMMC1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SDMMC1EN**: SDMMC1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SDMMC1RST**: SDMMC1 reset

Set and cleared by software.

0: Writing 0 releases SDMMC1 reset. Reading 0 means that SDMMC1 reset is released.

1: Writing 1 asserts SDMMC1 reset. Reading 1 means that SDMMC1 reset is asserted.

21.8.183 RCC SDMMC2 configuration register (RCC_SDMMC2CFGR)

Address offset: 0x834

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SDMMC2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDMMC2DLLRST

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDMMC2LPEN	SDMMC2EN	SDMMC2RST
													rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **SDMMC2DLLRST**: SDMMC2 DLL reset

Set and cleared by software.

0: Writing 0 releases DLL reset. Reading 0 means that DLL reset is released.

1: Writing 1 asserts DLL reset. Reading 1 means that DLL reset is asserted.

Bits 15:3 Reserved, must be kept at reset value.

Bit 2 **SDMMC2LPEN**: SDMMC2 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SDMMC2EN**: SDMMC2 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SDMMC2RST**: SDMMC2 reset

Set and cleared by software.

0: Writing 0 releases SDMMC2 reset. Reading 0 means that SDMMC2 reset is released.

1: Writing 1 asserts SDMMC2 reset. Reading 1 means that SDMMC2 reset is asserted.

21.8.184 RCC SDMMC3 configuration register (RCC_SDMMC3CFGR)

Address offset: 0x838

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SDMMC3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDMMC3LPEN	SDMMC3EN	SDMMC3RST
													rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **SDMMC3DLLRST**: SDMMC3 DLL reset

Set and cleared by software.

0: Writing 0 releases DLL reset. Reading 0 means that DLL reset is released.

1: Writing 1 asserts DLL reset. Reading 1 means that DLL reset is asserted.

Bits 15:3 Reserved, must be kept at reset value.

Bit 2 **SDMMC3LPEN**: SDMMC3 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SDMMC3EN**: SDMMC3 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SDMMC3RST**: SDMMC3 block reset

Set and cleared by software.

0: Writing 0 releases SDMMC3 reset. Reading 0 means that SDMMC3 reset is released.

1: Writing 1 asserts SDMMC3 reset. Reading 1 means that SDMMC3 reset is asserted.

21.8.185 RCC GPU configuration register (RCC_GPUCFGR)

Address offset: 0x83C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the GPU.Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GPULPEN	GPUEN	GPURST
													rw	rw	rs

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **GPULPEN**: GPU clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **GPUEN**: GPU clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **GPURST**: GPU reset

Set and cleared by software. In order to reset the GPU, the user has to write this bit to 1, and read until it is read to 0.GPU

0: Writing 0 has no effect. Reading 0 means that GPU reset is released.

1: Writing 1 asserts GPU reset. Reading 1 means that GPU reset is ongoing.

21.8.186 RCC LTDC configuration register (RCC_LTDCCFGR)

Address offset: 0x840

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of LTDC. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LTDCLPEN	LTDCEN	LTDCRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LTDCLPEN**: LTDC clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LTDCEN**: LTDC peripheral clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LTDCRST**: LTDC reset

Set and cleared by software.

0: Writing 0 releases LTDC reset. Reading 0 means that LTDC reset is released.

1: Writing 1 asserts LTDC reset. Reading 1 means that LTDC reset is asserted.

21.8.187 RCC DSI configuration register (RCC_DSICFGR)

Address offset: 0x844

Reset value: 0x0000 0004

This register is used to control te reset, clock gating, and low-power behavior of the DSI and DSIPHY. Any read access is allowed.

Note: Changing the DSI byte lane clock source on-the-fly is allowed, and does not generate any timing violation. However the user has to ensure that both previous and new clock sources are present during the switching, and for the whole transition time.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DSIPHYCKREFSEL	Res.	Res.	DSIBLSEL	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DSILPEN	DSIEN	DSIRST
rw			rw										rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **DSIPHYCKREFSEL**: DSIPHY reference clock selection

Set and cleared by software.

0: DSIPHY reference clock is channel 28 (ck_ker_dsiphy) of the flexclkgen (default after reset).

1: DSIPHY reference clock is the HSE oscillator (hse_ck).

Bits 14:13 Reserved, must be kept at reset value.

Bit 12 **DSIBLSEL**: DSI byte lane clock source selection

Set and cleared by software.

0: DSIPHY clock is selected as DSI byte lane clock source (default after reset).

1: Clock channel 27 (ck_ker_ltdc) of flexclkgen is selected as DSI byte lane clock source.

Bits 11:3 Reserved, must be kept at reset value.

Bit 2 **DSILPEN**: DSI clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **DSIEN**: DSI clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DSIRST**: DSI reset
Set and cleared by software.
0: Writing 0 releases LTDC reset. Reading 0 means that LTDC reset is released.
1: Writing 1 asserts LTDC reset. Reading 1 means that LTDC reset is asserted.

21.8.188 RCC LVDS configuration register (RCC_LVDSCFGR)

Address offset: 0x850

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the LVDS and LVDSPHY. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LVDSPHYCKREFSEL	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LVDSLPEN	LVDSEN	LVDSRST
rw													rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **LVDSPHYCKREFSEL**: LVDSPHY reference clock select
Set and cleared by software.
0: LVDSPHY reference clock is channel 32 (ck_ker_lvdsphy) of the flexclkgen (default after reset).
1: LVDSPHY reference clock is the HSE oscillator (hse_ker_ck).

Bits 14:3 Reserved, must be kept at reset value.

Bit 2 **LVDSLPEN**: LVDSPHY clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LVDSEN**: LVDSPHY clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LVDSRST**: LVDS reset

Set and cleared by software.

0: Writing 0 releases LVDS reset. Reading 0 means that LVDS reset is released.

1: Writing 1 asserts LVDS reset. Reading 1 means that LVDS reset is asserted.

21.8.189 RCC CSI configuration register (RCC_CSICFGR)

Address offset: 0x858

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the CSI. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CSILPEN	CSIEN	CSIRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CSILPEN**: CSI clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **CSIEN**: CSI clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **CSIRST**: CSI reset

Set and cleared by software.

0: Writing 0 releases CSI reset. Reading 0 means that CSI reset is released.

1: Writing 1 asserts CSI reset. Reading 1 means that CSI reset is asserted.

21.8.190 RCC DCMIPP configuration register (RCC_DCMIPPCFGR)

Address offset: 0x85C

Reset value: 0x0000 0004

This register is used to control the reset, clock gating and low-power behavior of DCMIPP. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCMIPPLPEN	DCMIPPEN	DCMIPPRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DCMIPPLPEN**: DCMIPP clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **DCMIPPEN**: DCMIPP clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DCMIPPRST**: DCMIPP reset

Set and cleared by software.

0: Writing 0 releases DCMIPP reset. Reading 0 means that DCMIPP reset is released.

1: Writing 1 asserts DCMIPP reset. Reading 1 means that DCMIPP reset is asserted.

21.8.191 RCC CCI configuration register (RCC_CCICFGR)

Address offset: 0x860

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of CCI (DCMI and PSSI). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCILPEN	CCIEN	CCIRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CCILPEN**: CCI clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **CCIEN**: CCI clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **CCIRST**: CCI reset

Set and cleared by software.

0: Writing 0 releases CCI reset. Reading 0 means that CCI reset is released.

1: Writing 1 asserts CCI reset. Reading 1 means that CCI reset is asserted.

21.8.192 RCC VDEC configuration register (RCC_VDECCFGR)

Address offset: 0x864

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of VDEC. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VDECLPEN	VDECEN	VDECRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **VDECLPEN**: VDEC clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **VDECEN**: VDEC clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **VDECRST**: VDEC reset

Set and cleared by software.

0: Writing 0 releases VDEC reset. Reading 0 means that VDEC reset is released.

1: Writing 1 asserts VDEC reset. Reading 1 means that VDEC reset is asserted.

21.8.193 RCC VENC configuration register (RCC_VENCCFGR)

Address offset: 0x868

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of VENC. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VENCLPEN	VENCEN	VENCRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **VENCLPEN**: VENC clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **VENCEN**: VENC clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **VENCRST**: VENC reset

Set and cleared by software.

0: Writing 0 releases VENC reset. Reading 0 means that VENC reset is released.

1: Writing 1 asserts VENC reset. Reading 1 means that VENC reset is asserted.

21.8.194 RCC RNG configuration register (RCC_RNGCFGR)

Address offset: 0x870

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of RNG. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RNGLPEN	RNGEN	RNGRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **RNGLPEN**: RNG clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **RNGEN**: RNG clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **RNGRST**: RNG reset
Set and cleared by software.
0: Writing 0 releases RNG reset. Reading 0 means that RNG reset is released.
1: Writing 1 asserts RNG reset. Reading 1 means that RNG reset is asserted.

21.8.195 RCC PKA configuration register (RCC_PKACFGR)

Address offset: 0x874

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of PKA. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PKALPEN	PKAEN	PKARST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **PKALPEN**: PKA clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **PKAEN**: PKA clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **PKARST**: PKA reset
Set and cleared by software.
0: Writing 0 releases PKA reset. Reading 0 means that PKA reset is released.
1: Writing 1 asserts PKA reset. Reading 1 means that PKA reset is asserted.

21.8.196 RCC SAES configuration register (RCC_SAESCFGR)

Address offset: 0x878

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of SAES. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SAESLPEN	SAESEN	SAESRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SAESLPEN**: SAES clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SAESEN**: SAES clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SAESRST**: SAES reset

Set and cleared by software.

0: Writing 0 releases SAES reset. Reading 0 means that SAES reset is released.

1: Writing 1 asserts SAES reset. Reading 1 means that SAES reset is asserted.

21.8.197 RCC HASH configuration register (RCC_HASHCFGR)

Address offset: 0x87C

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of HASH. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HASHLPEN	HASHEN	HASHRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **HASHLPEN**: HASH clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **HASHEN**: HASH clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **HASHRST**: HASH reset
Set and cleared by software.
0: Writing 0 releases HASH reset. Reading 0 means that HASH reset is released.
1: Writing 1 asserts HASH reset. Reading 1 means that HASH reset is asserted.

21.8.198 RCC CRYP1 configuration register (RCC_CRYP1CFGR)

Address offset: 0x880

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of CRYP1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CRYP1 LPEN	CRYP1 EN	CRYP1 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CRYP1LPEN**: CRYP1 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **CRYP1EN**: CRYP1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **CRYP1RST**: CRYP1 reset
Set and cleared by software.
0: Writing 0 releases CRYP1 reset. Reading 0 means that CRYP1 reset is released.
1: Writing 1 asserts CRYP1 reset. Reading 1 means that CRYP1 reset is asserted.

21.8.199 RCC CRYP2 configuration register (RCC_CRYP2CFGR)

Address offset: 0x884

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of CRYP2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CRYP2 LPEN	CRYP2 EN	CRYP2 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CRYP2LPEN**: CRYP2 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **CRYP2EN**: CRYP2 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **CRYP2RST**: CRYP2 reset

Set and cleared by software.

0: Writing 0 releases CRYP2 reset. Reading 0 means that CRYP2 reset is released.

1: Writing 1 asserts CRYP2 reset. Reading 1 means that CRYP2 reset is asserted.

21.8.200 RCC IWDG1 configuration register (RCC_IWDG1CFGR)

Address offset: 0x888

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of IWDG1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IWDG1 LPEN	IWDG1 EN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IWDG1LPEN**: IWDG1 bus clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.
1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clock is enabled in CSleep.

Bit 1 **IWDG1EN**: IWDG1 bus clock enable
Set and cleared by software.
0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.
1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.201 RCC IWDG2 configuration register (RCC_IWDG2CFGR)

Address offset: 0x88C

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of IWDG2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IWDG2 LPEN	IWDG2 EN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IWDG2LPEN**: IWDG2 bus clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.
1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clock is enabled in CSleep.

Bit 1 **IWDG2EN**: IWDG2 bus clock enable
Set and cleared by software.
0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.
1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.202 RCC IWDG3 configuration register (RCC_IWDG3CFGR)

Address offset: 0x890

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of IWDG3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IWDG3 LPEN	IWDG3 EN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IWDG3LPEN**: IWDG3 bus clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.

1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clock is enabled in CSleep.

Bit 1 **IWDG3EN**: IWDG3 bus clock enable

Set and cleared by software.

0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.

1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.203 RCC IWDG4 configuration register (RCC_IWDG4CFGR)

Address offset: 0x894

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of IWDG4. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IWDG4 LPEN	IWDG4 EN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IWDG4LPEN**: IWDG4 bus clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.
1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clock is enabled in CSleep.

Bit 1 **IWDG4EN**: IWDG4 bus clock enable
Set and cleared by software.
0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.
1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.204 RCC IWDG5 configuration register (RCC_IWDG5CFGR)

Address offset: 0x898

Reset value: 0x0000 0004

This register is used to control clock gating, low-power and autonomous clock mode behavior of IWDG5. Wait states are inserted in case of successive write accesses to this register. The number of wait states may be up to 7 cycles of the RCC clock.

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IWDG5 AMEN	IWDG5 LPEN	IWDG5 EN	Res.
												rw	rw	rw	

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **IWDG5AMEN**: IWDG5 autonomous clock mode enable
Set and cleared by software.
0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.
1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **IWDG5LPEN**: IWDG5 bus clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.
1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clock is enabled in CSleep.

Bit 1 **IWDG5EN**: IWDG5 bus clock enable
Set and cleared by software.
0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.
1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.205 RCC WWDG1 configuration register (RCC_WWDG1CFGR)

Address offset: 0x89C

Reset value: 0x0000 0004

This register is used to control th clock gating and low-power behavior of WWDG1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WWDG 1LPEN	WWDG 1EN	WWDG 1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **WWDG1LPEN**: WWDG1 bus clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.

1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clock is enabled in CSleep.

Bit 1 **WWDG1EN**: WWDG1 bus clock enable

Set and cleared by software.

0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.

1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 **WWDG1RST**: WWDG1 reset

Set and cleared by software.

0: Writing 0 releases WWDG1 reset. Reading 0 means that WWDG1 reset is released.

1: Writing 1 asserts WWDG1 reset. Reading 1 means that WWDG1 reset is asserted.

21.8.206 RCC WWDG2 configuration register (RCC_WWDG2CFGR)

Address offset: 0x8A0

Reset value: 0x0000 0004

This register is used to control clock gating, low-power and autonomous clock mode behavior of WWDG2. Wait states are inserted in case of successive write accesses to this register except on WWDG2RST bitfield. The number of wait states may be up to 7 cycles of the RCC clock. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WWDG 2AMEN	WWDG 2LPEN	WWDG 2EN	WWDG 2RST
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **WWDG2AMEN**: WWDG2 autonomous clock mode enable

Set and cleared by software.

0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.

1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **WWDG2LPEN**: WWDG2 bus clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.

1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clock is enabled in CSleep.

Bit 1 **WWDG2EN**: WWDG2 bus clock enable

Set and cleared by software.

0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.

1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 **WWDG2RST**: WWDG2 block reset

Set and cleared by software.

0: Writing 0 releases WWDG2 reset. Reading 0 means that WWDG2 reset is released.

1: Writing 1 asserts WWDG2 reset. Reading 1 means that WWDG2 reset is asserted.

21.8.207 RCC VREFBUF configuration register (RCC_VREFBUFCFGR)

Address offset: 0x8A8

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of VREFBUF. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VREFBUFLPEN	VREFBUFEN	VREFBUFRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **VREFBUFLPEN**: VREFBUF clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **VREFBUFEN**: VREFBUF clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **VREFBUFRST**: VREFBUF reset

Set and cleared by software.

0: Writing 0 releases VREFBUF reset. Reading 0 means that VREFBUF reset is released.

1: Writing 1 asserts VREFBUF reset. Reading 1 means that VREFBUF reset is asserted

21.8.208 RCC DTS configuration register (RCC_DTSCFGR)

Address offset: 0x8AC

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of DTS. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

		rw	rw										rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:12 **DTSKERSEL[1:0]**: DTS kernel clock selection
Set and cleared by software.
0x0: hsi_ker_ck selected
0x1: hse_ker_ck selected
0x2: msi_ker_ck selected
0x3: Reserved

Bits 11:3 Reserved, must be kept at reset value.

Bit 2 **DTSLPEN**: DTS clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **DTSEN**: DTS clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DTSRST**: DTS reset
Set and cleared by software.
0: Writing 0 releases DTS reset. Reading 0 means that DTS reset is released.
1: Writing 1 asserts DTS reset. Reading 1 means that DTS reset is asserted

21.8.209 RCC CRC configuration register (RCC_CRCCFGR)

Address offset: 0x8B4

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of CRC. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CRCLPEN	CRCEN	CRCRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CRCLPEN**: CRC clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **CRCEN**: CRC clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **CRCRST**: CRC reset
Set and cleared by software.
0: Writing 0 releases CRC reset. Reading 0 means that CRC reset is released.
1: Writing 1 asserts CRC reset. Reading 1 means that CRC reset is asserted

21.8.210 RCC SERC configuration register (RCC_SERCCFGR)

Address offset: 0x8B8

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of SERC. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SERCLPEN	SERCEN	SERCRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SERCLPEN**: SERC clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SERCEN**: SERC clocks enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SERCRST**: SERC reset
Set and cleared by software.
0: Writing 0 releases SERC reset. Reading 0 means that SERC reset is released.
1: Writing 1 asserts SERC reset. Reading 1 means that SERC reset is asserted

21.8.211 RCC OCTOSPI I/O manager configuration register (RCC_OSPIIOMCFGR)

Address offset: 0x8BC

Reset value: 0x0000 0004

This is register contains the enable control of OCTOSPIM. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OSPIIOMLPEN	OSPIIOMEN	OSPIIOMRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **OSPIIOMLPEN**: OCTOSPIM clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **OSPIIOMEN**: OCTOSPIM clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **OSPIIOMRST**: OCTOSPIM reset
Set and cleared by software.
0: Writing 0 releases OCTOSPIM reset. Reading 0 means that OCTOSPIM reset is released.
1: Writing 1 asserts OCTOSPIM reset. Reading 1 means that OCTOSPIM reset is asserted.

21.8.212 RCC GICV2M configuration register (RCC_GICV2MCFGR)

Address offset: 0x8C0

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of GICv2M. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GICV2MLPEN	GICV2MEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **GICV2MLPEN**: GICV2M clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **GICV2MEN**: GICV2M clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

21.8.213 RCC I3C1 configuration register (RCC_I3C1CFGR)

Address offset: 0x8C8

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of I3C1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	I3C1LPEN	I3C1EN	I3C1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I3C1LPEN**: I3C1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I3C1EN**: I3C1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I3C1RST**: I3C1 reset

Set and cleared by software.

0: Writing 0 releases I3C1 reset. Reading 0 means that I3C1 reset is released.

1: Writing 1 asserts I3C1 reset. Reading 1 means that I3C1 reset is asserted.

21.8.214 RCC I3C2 configuration register (RCC_I3C2CFGR)

Address offset: 0x8CC

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of I3C2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I3C2LPEN**: I3C2 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I3C2EN**: I3C2 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I3C2RST**: I3C2 reset

Set and cleared by software.

0: Writing 0 releases I3C2 reset. Reading 0 means that I3C2 reset is released.

1: Writing 1 asserts I3C2 reset. Reading 1 means that I3C2 reset is asserted.

21.8.215 RCC I3C3 configuration register (RCC_I3C3CFGR)

Address offset: 0x8D0

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of I3C3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I3C3LPEN**: I3C3 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I3C3EN**: I3C3 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I3C3RST**: I3C3 reset
Set and cleared by software.
0: Writing 0 releases I3C3 reset. Reading 0 means that I3C3 reset is released.
1: Writing 1 asserts I3C3 reset. Reading 1 means that I3C3 reset i asserted.

21.8.216 RCC I3C4 configuration register (RCC_I3C4CFGR)

Address offset: 0x8D4

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of I3C4. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **I3C4AMEN**: I3C4 autonomous clock mode enable
Set and cleared by software.
0: Writing 0 disables autonomous clock mode. Reading 0 means that autonomous clock mode is disabled.
1: Writing 1 enables autonomous clock mode. Reading 1 means that autonomous clock mode is enabled.

Bit 2 **I3C4LPEN**: I3C4 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I3C4EN**: I3C4 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I3C4RST**: I3C4 reset
Set and cleared by software.
0: Writing 0 releases I3C4 reset. Reading 0 means that I3C4 reset is released.
1: Writing 1 asserts I3C4 reset. Reading 1 means that I3C4 reset is asserted.

21.8.217 RCC MUXSEL configuration register (RCC_MUXSELCFGR)

Address offset: 0x1000

Reset value: 0x0000 0000

This register is used to select reference clock for each channel in MUXSEL of flexclkgen. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Others: Reserved

21.8.218 RCC cross bar x configuration register (RCC_XBARxCFGR)

Address offset: 0x1018 + 0x4 * x, (x = 0 to 63)

Reset value: 0x0000 0045

This register is used to configure channel x output of cross bar (XBAR) in flexclkgen. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number x configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **XBARxSTS**: Cross bar channel x output status

Set and cleared by hardware to indicate channel x output status versus setting changes.

0: Channel x is aligned to given settings.

1: Indicates change ongoing.

Bit 6 **XBARxEN**: Cross bar channel x clock output enable

Set and cleared by software. It is recommended to keep the channel x enabled at cross bar stage, and to use the final divider enable bit to disable the channel x output.

0: Channel x output disabled

1: Channel x output enabled

Bits 5:4 Reserved, must be kept at reset value.

Bits 3:0 **XBARxSEL[3:0]**: Cross bar channel x input clock selection

Set and cleared by software to select the input clock for the channel x.

0x0: PLL4 FOUTPOSTDIV clock selected

0x1: PLL5 FOUTPOSTDIV clock selected

0x2: PLL6 FOUTPOSTDIV clock selected

0x3: PLL7 FOUTPOSTDIV clock selected

21.8.219 RCC pre divider x configuration register (RCC_PREDIVxCFGR)

Address offset: 0x1118 + 0x4 * x, (x = 0 to 63)

Reset value: 0x0000 0000

This register is used to configure the channel x pre divider (PREDIV) stage in flexclkgen. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number x configuration (see *Table 183* for details). Any read access is allowed.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **PREDIVSTS[31:0]**: Predivider channel[31:0] output status

Set by hardware to indicate the status of channel output versus divide ratio changes.

0: Channel is aligned with divide ratio change.

1: Indicates that the divider is in the process of changing.

21.8.221 RCC pre divider status register 2 (RCC_PREDIVSR2)

Address offset: 0x121C

Reset value: 0x0000 0000

This register is used to get status of last 32 channel outputs of PREDIV in flexclkgen. Word format data access only supported on this register. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PREDIVSTS[63:48]

PREDIVSTS[47:32]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **PREDIVSTS[63:32]**: Predivider channel[63:32] output status

Set by hardware to indicate the status of channel output versus divide ratio changes.

0: Channel is aligned with divide ratio change.

1: Indicates that the divider is in the process of changing.

21.8.222 RCC final divider x configuration register (RCC_FINDIVxCFGR)

Address offset: 0x1224 + 0x4 * x, (x = 0 to 63)

Reset value: 0x0000 0040

This register is used to configure channel x final divider (FINDIV) in flexclkgen. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number x configuration (see *Table 183* for details). Any read access is allowed.

									rw	rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **FINDIVxEN**: Final divider channel x output enable

Set and cleared by software.

0: Channel x output disabled

1: Channel x output enabled

Bits 5:0 **FINDIVx[5:0]**: Channel x divider ratio

Set and cleared by software to select one div1 up to div64 step.

21.8.223 RCC final divider status register 1 (RCC_FINDIVSR1)

Address offset: 0x1324

Reset value: 0x0000 0000

This register is used to get status of first 32 channel outputs of FINDIV in flexclkgen. Word format access only supported on this register. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

FINDIVSTS[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **FINDIVSTS[31:0]**: Final divider channel[31:0] output status

Set by hardware to indicate the status of the channel output vs divide ratio changes.

0: Channel is aligned with divide ratio change.

1: Indicates that the divider is in the process of changing.

21.8.224 RCC final divider status register 2 (RCC_FINDIVSR2)

Address offset: 0x1328

Reset value: 0x0000 0000

This register is used to get status of last 32 channel outputs of FINDIV in flexclkgen. Word format access only supported on this register. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

FINDIVSTS[47:32]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **FINDIVSTS[63:32]**: Final divider channel[63:32] output status

Set by hardware to indicate the status of the channel output versus divide ratio changes.

0: Channel is aligned with divide ratio change.

1: Indicates that the divider is in the process of changing.

21.8.225 RCC clock frequency calculator and observation 0 clock configuration register (RCC_FCALCOBS0CFGR)

Address offset: 0x1340

Reset value: 0x1600 0087

This register is used to configure clock frequency calculator and observation clock 0 in flexclkgen. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 65 configuration (see *Table 183* for details). Any read access is allowed.

rw					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **CKOBSEN**: Observation clock 0 output enable
Set and cleared by software to enable the observation clock 0 output in front of the divider.
0: Observation clock 0 output disabled
1: Observation clock 0 output enabled (default after reset)

Bit 25 **FCALCCKEN**: Clock frequency calculator input clock enable
Set and cleared by software to enable the clock frequency calculator input clock.
0: Input clock disabled
1: Input clock enabled (default after reset)

Bits 24:22 **CKOBSDIV[2:0]**: Observation clock 0 divide ratio
Set and cleared by software to select the divide ratio for the observation clock 0.
000: div1 (default after reset)
001: div2
010: div4
011: div8
100: div16
101: div32
110: div64
111: div128

Bits 21:19 Reserved, must be kept at reset value.

Bit 18 **CKOBSINV**: Observation clock 0 inverter
Set and cleared by software to invert the observation clock 0 in front of the divider.
0: Observation clock 0 not inverted (default after reset)
1: Observation clock 0 inverted

Bit 17 **FCALCCKINV**: Clock frequency calculator input clock inverter

Set and cleared by software to invert THE clock frequency calculator input clock (in front of the divider).

0: Input clock not inverted (default after reset)

1: Input clock inverted

Bit 16 **CKOBSEXTSEL**: External clock source for observation clock 0

Set and cleared by software to select internal or external clocks for observation clock 0.

0: Internal clock selected for observation clock 0 (default after reset)

1: External clock selected for observation clock 0

Bit 15 **FCALCCKEXTSEL**: External clock source for clock frequency calculator input clock

Set and cleared by software to select an internal or external clock source for the clock frequency calculator input clock.

0: Internal clock selected for the clock frequency calculator input clock (default after reset)

1: External clock selected for the clock frequency calculator input clock

Bits 14:11 Reserved, must be kept at reset value.

Bits 10:8 **CKEXTSEL[2:0]**: External clock selector for clock frequency calculator and observation clock 0

Set and cleared by software to select the external clock to be calculated or observed.

000: pll1 clock divided by 42

001: pll2 clock divided by 4

010: pll3 clock divided by 2

011: usb2phy1 PLL clock

100: usb2phy2 PLL clock

101: usb3pciephy PLL clock

110: lvdsphy PLL clock

111: dsiphy PLL clock

Bits 7:0 **CKINTSEL[7:0]**: Internal clock selector for clock frequency calculator and observation clock 0
Set and cleared by software to select the internal clock to be calculated or observed.

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **FCALCRSTN**: Clock frequency calculator reset

Set and cleared by software.
0: Clock frequency calculator reset module asserted (default after reset)
1: Clock frequency calculator reset module released

Bit 26 **CKOBSEN**: Observation clock 1 output enable

Set and cleared by software to enable observation clock 1 output in front of the divider.
0: Observation clock 1 output disabled
1: Observation clock 1 output enabled (default after reset)

Bit 25 Reserved, must be kept at reset value.

Bits 24:22 **CKOBSDIV[2:0]**: Observation clock 1 divide ratio

Set and cleared by software to select the divide ratio for observation clock 1.
000: div1 (default after reset)
001: div2
010: div4
011: div8
100: div16
101: div32

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **FCALCREFCKSEL[2:0]**: Reference clock selection used by clock frequency calculator
Set and cleared by software to select clock frequency calculator reference clock used for definition of clock frequency calculation time window (see RCC_FCALCCR2).
000: PLL4 reference input clock
001: PLL5 reference input clock
010: PLL6 reference input clock
011: PLL7 reference input clock
100: PLL8 reference input clock
Others: Reserved

21.8.228 RCC clock frequency calculator control register 1 (RCC_FCALCCR1)

Address offset: 0x134C

Reset value: 0x0000 0000

This register is used to control clock frequency calculator in flexclkgen block. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 65 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **FCALCRUN**: Clock frequency calculator run
Set and cleared by software to run the measure.
0: Clock frequency calculator off (default after reset)
1: Clock frequency calculator on

21.8.229 RCC clock frequency calculator control register 2 (RCC_FCALCCR2)

Address offset: 0x1354

Reset value: 0x0000 0000

This register is used to control the clock frequency calculator in flexclkgen. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 65 configuration (see *Table 183* for details). Any read access is allowed.

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:17 **FCALCTYP[4:0]**: Clock frequency calculation type selection
Set and cleared by software to select the clock frequency calculation type.
0x0C: Frequency value type
Other: Reserved

Bits 16:15 Reserved, must be kept at reset value.

Bits 14:11 **FCALCTWC[3:0]**: Time window code for clock frequency calculation
Set and cleared by software to set the number of reference clock cycles used for the clock frequency calculation in application mode (see FCALCMD).
0x0: 63 cycles
0x1: 3 cycles
0x2: 7 cycles
0x3: 15 cycles
0x4: 31 cycles
0x5: 63 cycles
0x6: 127 cycles

0xB: 4095 cycles
0xC: 8191 cycles
0xD: 16383 cycles
0xE: 32767 cycles
0xF: 65535 cycles

Bits 10:5 Reserved, must be kept at reset value.

Bits 4:3 **FCALCMD[1:0]**: Clock frequency calculation method
Set and cleared by software to set the clock frequency calculation method.
11: Application method
Other: Reserved

Bits 2:0 Reserved, must be kept at reset value.

21.8.230 RCC clock frequency calculator status register (RCC_FCALCSR)

Address offset: 0x1358

Reset value: 0x0000 0000

This register is used to get status of clock frequency calculator in flexclkgen. Word format data access only supported on this register. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

FVAL[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **FCALCSTS**: Clock frequency calculation status
Set by hardware to indicate the status of the clock frequency calculation.
– When FCALCRUN = 0, FCALCSTS = FVAL[16] (overflow of the register).
– When FCALCRUN = 1, FCALCSTS = 1 when the clock frequency calculation is ended.

Bits 18:17 Reserved, must be kept at reset value.

Bits 16:0 **FVAL[16:0]**: Clock frequency calculation value
Set by hardware to indicate the clock frequency calculation value.
– When FCALCTYP ≠ 0x0C, FVAL[16] = overflow flag of the frequency counter.
– When FCALCTYP = 0x0C, FVAL[15:0] = frequency counter value.

21.8.231 RCC PLLy configuration register 1 (RCC_PLLyCFGR1)

Address offset: 0x1360 + 0x28 * (y - 4), (y = 4 to 8)

Reset value: 0x1000 0001

This register is used to configure flexclkgen PLLy. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	PLLEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SSMODRST
							rw								rw

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **CKREFST**: PLLy reference clock state

Set by hardware and cleared by software. Indicates if PLLy reference clock is running. After any reset, this bit is updated after 5 clock cycles of the selected PLL reference clock.
0: Reading 0 means that PLLy reference clock does not run. Writing 0 resets the reference clock running detector.
1: Reading 1 means that PLLy reference clock is running. Writing 1 resets the reference clock running detector.

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **PLLRDY**: PLLy clock ready flag

Set by hardware to indicate when PLLy is locked.
0: PLLy unlocked (default after reset)
1: PLLy locked

Bits 23:9 Reserved, must be kept at reset value.

Bit 8 **PLLEN**: PLLy enable

Set and cleared by software to enable PLLy.
0: PLLy off (default after reset)
1: PLLy on

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **SSMODRST**: PLLy spread-spectrum modulator reset

Set and cleared by software.
0: PLLy spread-spectrum modulator reset module released
1: PLLy spread-spectrum modulator reset module asserted (default after reset)

21.8.232 RCC PLLy configuration register 2 (RCC_PLLyCFGR2)

Address offset: 0x1364 + 0x28 * (y - 4), (y = 4 to 8)

Reset value: 0x0000 0000

This register is used to configure flexclkgen PLLy. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

										rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **FBDIV[11:0]**: PLLy VCO multiplication factor
Set and cleared by software to control VCO multiplication factor.
In integer mode, this value must be set between 16 and 640.
In fractional mode, this value must be set between 20 and 320.

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:0 **FREFDIV[5:0]**: PLLy reference input clock divide frequency ratio
Set and cleared by software.
0x0: Not applicable
0x1: FREF divided by 1 (min value)
0x2: FREF divided by 2
0x3: FREF divided by 3
...
0x3C: FREF divided by 60
0x3D: FREF divided by 61
0x3E: FREF divided by 62
0x3F: FREF divided by 63

21.8.233 RCC PLLy configuration register 3 (RCC_PLLyCFGR3)

Address offset: 0x1368 + 0x28 * (y - 4), (y = 4 to 8)

Reset value: 0x0400 0000

This register is used to configure flexclkgen PLLy. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	SSCGDIS	DACEN	DOWNSPREAD	FRACIN[23:16]							
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FRACIN[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **SSCGDIS**: PLLy spread-spectrum modulator disable
Set and cleared by software to enable the PLLy clock spreading generator.
0: PLLy spread-spectrum modulator enabled
1: PLLy spread-spectrum modulator disabled (default after reset)

Bit 25 **DACEN**: PLLy noise canceling DAC enable in fractional mode.
Set and cleared by software to enable the noise cancellation in fractional mode.
0: DAC not active (default after reset)
1: DAC active

Bit 24 **DOWNSPREAD**: PLLy VCO frequency modulation mode
Set and cleared by software to select the PLLy clock spreading mode.
0: Center-spread modulation selected (default after reset)
1: Down-spread modulation selected

Bits 23:0 **FRACIN[23:0]**: Fractional part of PLLy VCO multiplication factor
Set and cleared by software to control the VCO fractional multiplication factor.
VCO output frequency = FREF * (FBDIV + FRAC / 2^{24}) / FREFDIV

21.8.234 RCC PLLy configuration register 4 (RCC_PLLyCFGR4)

Address offset: 0x136C + 0x28 * (y - 4), (y = 4 to 8)

Reset value: 0x0000 0000

This register is used to configure flexclkgen PLLy. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	BYPASS	FOUTPOSTDIVEN	DSMEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
					rw	rw	rw								

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **BYPASS**: PLLy FOUTPOSTDIV bypass
Set and cleared by software to bypass the FOUTPOSTDIV by FREF.
0: FOUTPOSTDIV driven by POSTDIV2
1: FOUTPOSTDIV driven by FREF

Bit 9 **FOUTPOSTDIVEN**: PLLy output and post dividers enable
Set and cleared by software to enable the PLLy output and post dividers.
0: FOUTPOSTDIV output, POSTDIV1, and POSTDIV2 are powered down.
1: FOUTPOSTDIV output, POSTDIV1, and POSTDIV2 dividers are active.

Bit 8 **DSMEN**: PLLy delta-sigma modulator enable
Set and cleared by software to enable the delta-sigma modulator (DSM).
0: DSM powered down
1: DSM active

Bits 7:0 Reserved, must be kept at reset value.

21.8.235 RCC PLLy configuration register 5 (RCC_PLLyCFGR5)

Address offset: 0x1370 + 0x28 * (y - 4), (y = 4 to 8)

Reset value: 0x0000 0000

This register is used to configure flexclkgen PLLy. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPREAD[4:0]				
											rw	rw	rw	rw	rw

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DIVVAL[3:0]			
												rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **SPREAD[4:0]**: Modulation depth adjustment for PLLy
Set and cleared by software to adjust modulation depth of the clock spreading generator.

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **DIVVAL[3:0]**: Modulation frequency adjustment for PLLy
Set and cleared by software to adjust modulation frequency of the clock spreading generator.

21.8.236 RCC PLLy configuration register 6 (RCC_PLLyCFGR6)

Address offset: 0x1378 + 0x28 * (y - 4), (y = 4 to 8)

Reset value: 0x0000 0000

This register is used to configure flexclkgen PLLy. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	POSTDIV1[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **POSTDIV1[2:0]**: PLLy VCO frequency divide level 1
Set and cleared by software to divide the VCO frequency output.
0x0: Not applicable
0x1: FOUTVCO divided by 1 (minimum value)
...
0x6: FOUTVCO divided by 6
0x7: FOUTVCO divided by 7

21.8.237 RCC PLLy configuration register 7 (RCC_PLLyCFGR7)

Address offset: 0x137C + 0x28 * (y - 4), (y = 4 to 8)

Reset value: 0x0000 0000

This register is used to configure flexclkgen PLLy. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 183* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	POSTDIV2[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **POSTDIV2[2:0]**: PLLy VCO frequency divide level 2
Set and cleared by software to divide the VCO frequency output.
0x0: Not applicable
0x1: FOUTVCO/POSTDIV1 divided by 1 (minimum value)
...
0x6: FOUTVCO/POSTDIV1 divided by 6
0x7: FOUTVCO/POSTDIV1 divided by 7
Note: FOUTPOSTDIV = FOUTVCO / POSTDIV1 × POSTDIV2.

21.8.238 RCC version register (RCC_VERR)

Address offset: 0xFFF4

Reset value: 0x0000 0011

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJREV[3:0]				MINREV[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major RCC revision

Bits 3:0 **MINREV[3:0]**: Minor RCC revision

21.8.239 RCC identifier register (RCC_IDR)

Address offset: 0xFFF8

Reset value: 0x0000 0003

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ID[31:0]**: RCC identifier

21.8.240 RCC size identification register (RCC_SIDR)

Address offset: 0xFFFC

Reset value: 0xA3C5 DD40

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **SID[31:0]**: RCC decoding space (64 Kbytes)

21.8.241 RCC register map

Table 184. RCC register map and reset values

Refer to *Section 2.4* for the register boundary addresses.

22 Hardware semaphore (HSEM)

22.1 Introduction

The hardware semaphore block provides 16 (32-bit) register based semaphores.

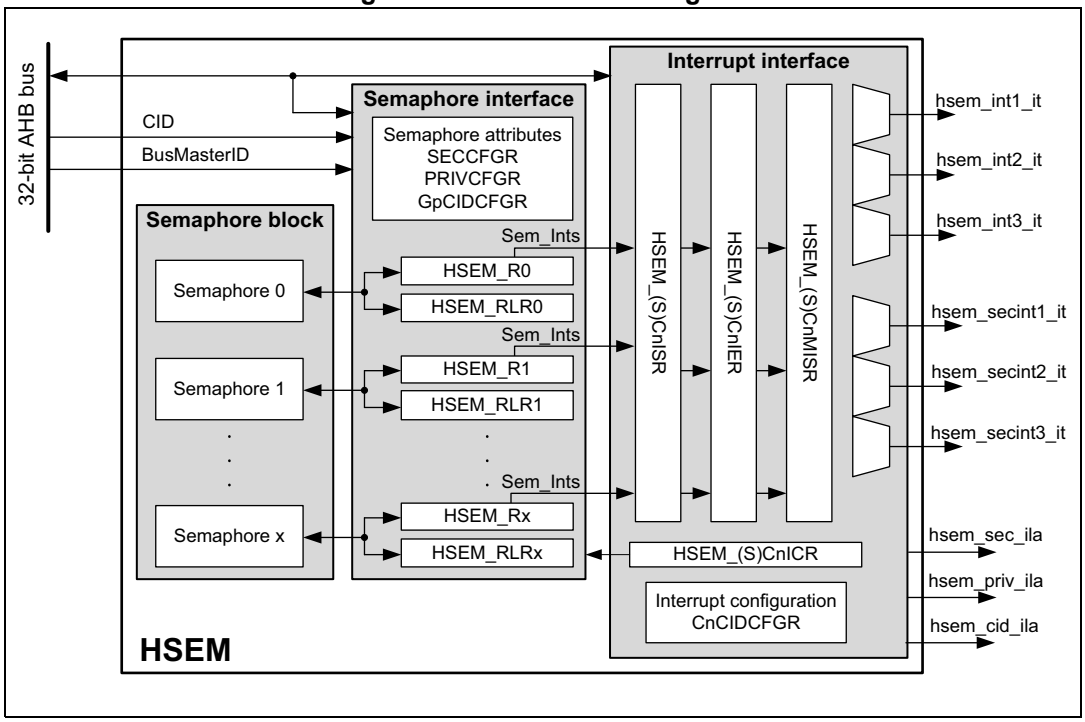
The semaphores can be used to ensure synchronization between different processes running between different cores. The HSEM provides a non-blocking mechanism to lock semaphores in an atomic way. The following functions are provided:

- Semaphore lock, in two ways:
  - 2-step lock: by writing LOCKID and PROCID, SEC and PRIV to the semaphore, followed by a read check
  - 1-step lock: by reading the LOCKID, SEC and PRIV from the semaphore
- Interrupt generation when a semaphore is unlocked
  - Each semaphore may generate an interrupt (secure and non-secure) on one of the interrupt lines
- Semaphore clear protection
  - A semaphore is only unlocked when LOCKID and PROCID, SEC, and PRIV match
- Global semaphore clear per LOCKID
- Secure semaphore lock support
- Privileged / unprivileged semaphore lock support
- Semaphore lock protection via semaphore attribute
- Processor CID white list filtering per group of four semaphores.

22.2 Main features

The HSEM includes the following features:

- 16 (32-bit) semaphores with security, privilege, and CID filtering attributes
- 8-bit PROCID
- 4-bit LOCKID
- 1-bit secure domain indication
- 1-bit privileged domain indication
- 1-bit CID filtering indication
- One non-secure and one secure interrupt lines per processor
- Lock indication



22.3 Functional description

22.3.1 HSEM block diagram

As shown in *Figure 137*, the HSEM is based on three sub-blocks:

- the semaphore block containing the semaphore status and IDs
- the semaphore interface block providing AHB access to the semaphore via the HSEM_Rx and HSEM_RLRx registers, and the semaphore security, privilege and CID filtering attributes
- the interrupt interface block providing control for the interrupts via HSEM_CnISR, HSEM_(S)CnIER, HSEM_(S)CnMISR, and HSEM_(S)CnICR registers.CID filtering for the processor dedicated interrupt control registers is provided through HSEM_CnCIDCFGR.

Figure 137. HSEM block diagram

22.3.2 HSEM internal signals

Table 185. HSEM internal input/output signals

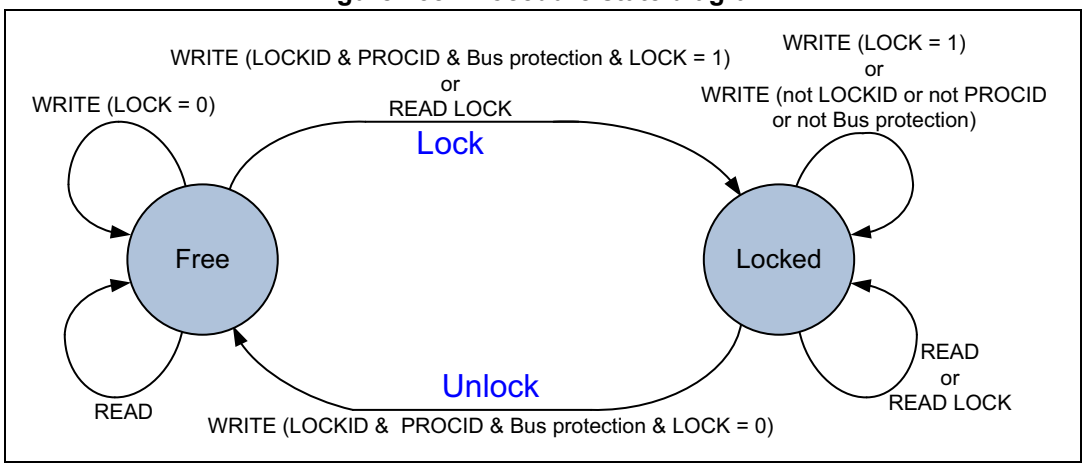
Signal name	Signal type	Description
AHB bus	Digital input/output	AHB register access bus
BusMasterID	Digital input	AHB bus master ID
CID	Digital input	Compartment isolation ID
hsem_intn_it	Digital output	Non-secure Interrupt n line (n = 1 to 3)
hsem_secintn_it	Digital output	Secure interrupt n line (n = 1 to 3)

Table 185. HSEM internal input/output signals (continued)

Signal name	Signal type	Description
hsem_sec_ila	Digital output	illegal secure access event
hsem_priv_ila	Digital output	Illegal privilege access event
hsem_cid_ila	Digital output	Illegal CID access event

22.3.3 HSEM lock procedures

There are two lock procedures, namely 2-step (write) lock and 1-step (read) lock. The two procedures can be used concurrently.



The semaphore is free when its LOCK bit is 0. In this case, the LOCKID, SEC, PRIV, and PROCID are also 0. When the LOCK bit is 1, the semaphore is locked and the LOCKID indicates which AHB bus master ID or CID has locked it. The PROCID indicates which process of that AHB bus master ID or CID has locked the semaphore. The semaphore CFEN indicates if the semaphore is CID filtered or not. The SEC and PRIV indicated the lock protection, if the AHB bus master that locked the semaphore was running in secure and or privileged mode.

When write locking a semaphore, the written LOCKID, SEC and PRIV must match the AHB bus master ID or CID, SEC and PRIV, and the PROCID is written by the AHB bus master software process taking the lock.

When read locking the semaphore, the LOCKID is taken from the AHB bus master ID when CID filtering for the semaphore is disabled or AHB bus master CID when CID filtering for the semaphore is enabled, SEC and PRIV are taken from the bus protection, and the PROCID is forced to 0 by hardware. There is no PROCID available with read lock.

Semaphores can be locked only by a processor complying with the attribute settings.

Figure 138. Procedure state diagram

2-step (write) lock procedure

The 2-step lock procedure consists in a write to lock the semaphore, followed by a read to check if the lock has been successful, carried out from the HSEM_Rx register.

- Write semaphore with PROCID, SEC, PRIV and LOCKID, and LOCK = 1. The SEC, PRIV and LOCKID data written by software must match the AHB bus master

information, that is, when the semaphore CID filtering is enabled, a secure, privileged, AHB bus master CID = 1 writes data SEC = 1, PRIV = 1 and LOCKID = 1 (the semaphore CFEN indication is provided from the semaphore group CID filtering information in HSEM_GpCIDCFGR).

Lock is put in place when the semaphore is free at write time.

- Read-back the semaphore

  The software checks the lock status, if PROCID, SEC, PRIV and LOCKID match the written data and CFEN indication match the CID or AHB bus master ID locking mode, then the lock is confirmed.
- Else retry (the semaphore has been locked by another process, AHB bus master ID or CID, or protection level).

A semaphore can only be locked when it is free.

A semaphore can be locked when the PROCID = 0.

Consecutive write attempts with LOCK = 1 to a locked semaphore are ignored.

1-step (read) lock procedure

The 1-step procedure consists in a read to lock and check the semaphore in a single step, carried out from the HSEM_RLRx register.

- Read lock semaphore with the AHB bus master LOCKID, SEC, PRIV.
- If read LOCKID, SEC, PRIV and CFEN indication matches and PROCID = 0, then lock is put in place. The semaphore CFEN indication is provided from the semaphore group CID filtering information in HSEM_GpCIDCFGR. If LOCKID, SEC, PRIV and CFEN indication matches and PROCID is not 0, this means that another process from the same LOCKID and protection level, has locked the semaphore with a 2-step (write) procedure.
- Else retry (the semaphore has been locked by another process, AHB bus master ID or CID, or protection level).

A semaphore can only be locked when it is free. When read locking a free semaphore, PROCID is 0. Read locking a locked semaphore returns the LOCKID, SEC, PRIV and PROCID that locked it. All read locks, including the first one that locks the semaphore, return the LOCKID, SEC, PRIV that locks or locked the semaphore.

Note: The 1-step procedure must not be used when running multiple processes of the same AHB bus master ID or CID and protection level. All processes with the same bus protection level using the same semaphore read the same status. When only one process locks the semaphore, each process of that AHB bus master ID or CID and protection level reads the semaphore as locked by itself with the LOCKID, SEC, PRIV, and CFEN.

22.3.4 HSEM write/read/read lock register address

For each semaphore, two AHB register addresses are provided, separated in two banks of 32-bit semaphore registers, spaced by a 0x80 address offset.

In the first register address bank the semaphore can be written (locked/unlocked) and read through the HSEM_Rx registers.

In the second register address bank the semaphore can be read (locked) through the HSEM_RLRx registers.

22.3.5 HSEM unlock procedures

Unlocking a semaphore is a protected process, to prevent accidental clearing by a AHB bus master ID or CID, SEC, PRIV or by a process not having the semaphore lock right. The procedure consists in writing to the semaphore HSEM_Rx register with the corresponding LOCKID, SEC, PRIV and PROCID and LOCK = 0. A semaphore can always be unlocked by the LOCKID, SEC, PRIV and PROCID that locked it, it is unlocked regardless of the semaphore attribute settings. When unlocked the semaphore, the LOCKID, SEC, PRIV, and the PROCID are all 0.

Note: When the attributes of a locked semaphore are changed, it can always be unlocked by the AHB bus master ID or CID, SEC, PRIV and process that locked it. To unlock the semaphore the PROCID must match.

When unlocked, an interrupt may be generated to signal the event. To this end, the semaphore non-secure interrupt and or secure interrupt must be enabled.

The unlock procedure consists in a write to the semaphore HSEM_Rx register with matching LOCKID, SEC, and PRIV, regardless on how the semaphore has been locked (1- or 2-step) and how it is protected by the semaphore attributes.

- Write semaphore with PROCID, SEC, PRIV, LOCKID, and LOCK = 0
- If the written data matches the semaphore PROCID, SEC, PRIV and LOCKID and the AHB bus master ID or CID, SEC, PRIV, the semaphore is unlocked and an interrupt may be generated when enabled, else write is ignored, semaphore remains locked and no interrupt is generated (the semaphore is locked by another process, AHB bus master ID or CID, and bus protection level or the written data does not match the AHB bus master signaling).

Note: Different processes of the same AHB bus master ID or CID and bus protection can write any PROCID value. Preventing other processes of the same AHB bus master ID or CID and bus protection from unlocking a semaphore must be ensured by software, handling the PROCID correctly.

22.3.6 HSEM LOCKID semaphore clear

All semaphores locked by a LOCKID and bus protection can be unlocked at once by using the HSEM_CR register. Write LOCKID, SEC, PRIV, CFEN and correct KEY value in HSEM_CR. All locked semaphores with a matching LOCKID, SEC, PRIV, CFEN are unlocked, and may generate an interrupt when enabled.

Note: This procedure may be used in case of an incorrect functioning AHB bus master ID or CID, where the trusted domain CID can unlock the locked semaphores by writing the LOCKID, SEC, PRIV, CFEN of the incorrect functioning processor into the HSEM_CR register with the correct KEY value. This unlocks all locked semaphores with a matching LOCKID, SEC, PRIV, CFEN.

An interrupt may be generated for the unlocked semaphore(s). To this end, the semaphore interrupt must be enabled in the HSEM_(S)CnIER registers.

22.3.7 HSEM interrupts

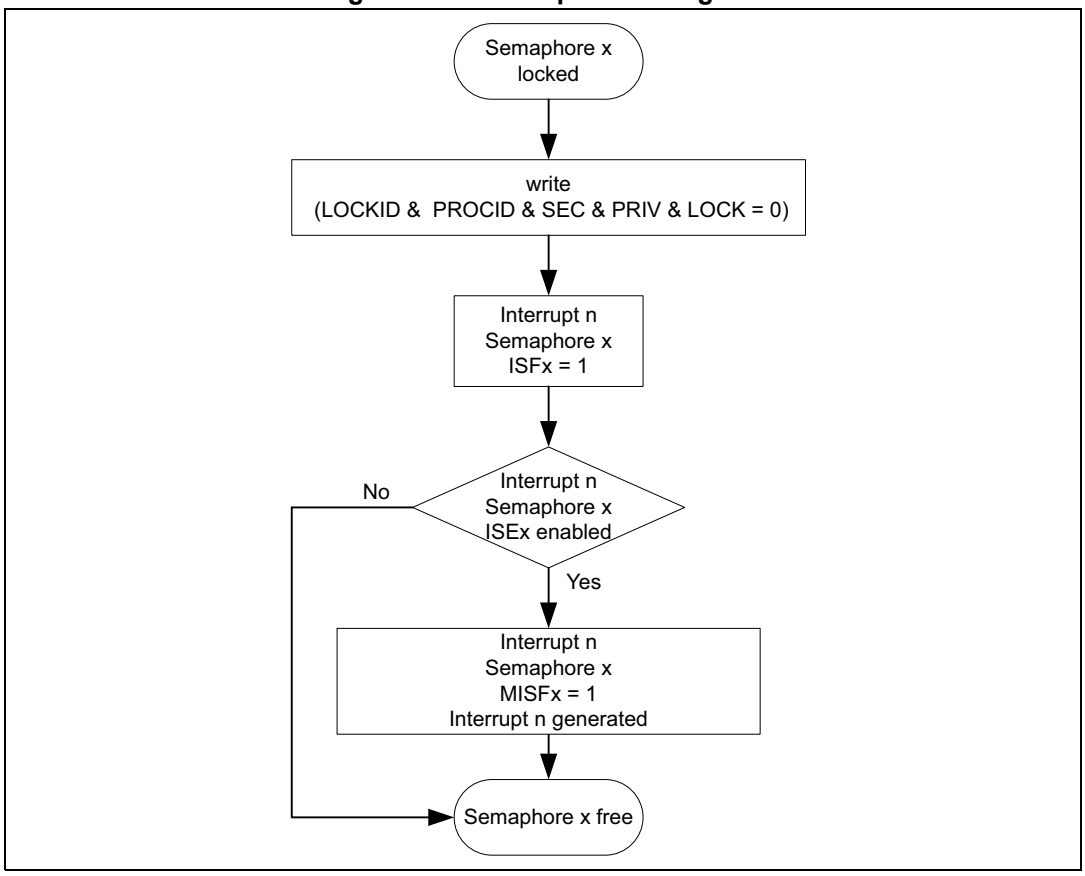
An interrupt line hsem_intn_it (non-secure) and hsem_secint_it (secure) per processor allows each semaphore to generate an interrupt.

An interrupt line provides the following features per semaphore:

- interrupt enable
- interrupt clear
- interrupt status
- masked interrupt status
- interrupt generation based on semaphore security attribute settings
- interrupt generation based on CID filtering in HSEM_CnCIDCFGR and HSEM_GpCIDCFGR

With the interrupt enable (HSEM_(S)CnIER) the semaphores affecting the interrupt line can be enabled. Disabled (masked) semaphore interrupts do not set the masked interrupt status MISF for that semaphore, and do not generate an interrupt on the interrupt line.

The interrupt clear (HSEM_(S)CnICR) clears the interrupt status ISF and masked interrupt status MISF of the associated semaphore for the interrupt line.



The interrupt status (HSEM_(S)CnISR) mirrors the semaphore interrupt status ISF before the enable.

The masked interrupt status (HSEM_(S)CnMISR) only mirrors the semaphore enabled interrupt status MISF on the interrupt line. All masked interrupt status MISF of the enabled semaphores need to be cleared to clear the interrupt line.

A semaphore with its security attribute set to secure generates only a secure interrupt, non-secure interrupts are omitted. On the other hand, a non-secure semaphore may generate non-secure and secure interrupts.

A semaphore with its CID white list filtering attribute enabled generates only an interrupt to the CIDs for which it is enabled in the HSEM_GpCIDCFGR white list and by the interrupt CID filtering in the HSEM_CnCIDCFGR. On the other hand semaphores for which CID filtering is disabled may generate an interrupt to all CIDs.

Figure 139. Interrupt state diagram

The procedure to get an interrupt when a semaphore becomes free is described hereafter.

Try to lock semaphore x

- If the semaphore lock is obtained, no interrupt is needed.
- If the semaphore lock fails:
- Clear pending semaphore x interrupt status for the (non-secure) interrupt line or secure interrupt line in HSEM_(S)CnICR.
  Re-try to lock the semaphore x again:
  - If the semaphore lock is obtained, no interrupt is needed (semaphore has been freed between first try to lock and clear semaphore interrupt status).
  - If the semaphore lock fails, enable the semaphore x (non-secure) interrupt or secure interrupt line in HSEM_(S)CnIER.

On semaphore x free interrupt, try to lock semaphore x

- If the semaphore lock is obtained:
  Disable the semaphore x (non-secure) interrupt or secure interrupt in HSEM_(S)CnIER.
  Clear pending semaphore x interrupt status in HSEM_(S)CnICR.

- If the semaphore x lock fails:
  Clear pending semaphore x interrupt status in HSEM_(S)CnICR.
  Try again to lock the semaphore x:
  - If the semaphore lock is obtained (semaphore has been freed between first try to lock and semaphore interrupt status clear), disable the semaphore (non-secure) interrupt or secure interrupt in HSEM_(S)CnIER.
  - If the semaphore lock fails, wait for semaphore free interrupt.

Note: An interrupt does not lock the semaphore. After an interrupt, either the AHB bus master or the process must still perform the lock procedure to lock the semaphore.

It is possible to have multiple AHB bus masters informed by the semaphore free interrupts. Each AHB bus master gets its interrupt, and the first one to react locks the semaphore.

22.3.8 Semaphore attributes

The HSEM allows semaphores to be protected by the following attributes:

- security as defined in HSEM_SECCFGR
- privilege as defined in HSEM_PRIVCFGR
- CID filtering as defined in HSEM_GpCIDCFGR (per semaphore group)

Semaphores with security attribute set to secure can be locked only by a secure access, and generate only a secure interrupt.

Semaphores with privilege attribute set to privilege can be locked only by a privileged access.

Semaphore group CID filtering is controlled according to *Table 186*.

Table 186. Semaphore CID filtering

HSEM_GpCIDCFGR.C	HSEM_GpCIDCFGR			C3CIDCFGR.CFEN	C2CIDCFGR.CFEN	C1CIDCFGR.CFEN	Description(1)
	SEM[WLIST[3]	SEM[WLIST[2]	SEM[WLIST[1]				
0	x	x	x	x	x	x	Semaphore group CID filtering disabled, semaphore group can be locked by MASTERID.
1	x	x	x	0	0	0	Semaphore CID filtering disabled, semaphores can be locked by MASTERID.
1	0	x	x	1	0	0	Semaphore group CID filtering enabled, but no enabled CID in the group white list. Semaphore group cannot be locked.
1	x	0	x	0	1	0	
1	x	x	0	0	0	1	
1	1	0	0	0	1	1	
1	0	1	0	1	0	1	
1	0	0	1	1	1	0	

Table 186. Semaphore CID filtering (continued)

HSEM_GpCIDCFGR.C	HSEM_ GpCIDCFGR			C3CIDCFGR.CFEN	C2CIDCFGR.CFEN	C1CIDCFGR.CFEN	Description(1)
	SEM[WLIST[3]	SEM[WLIST[2]	SEM[WLIST[1]				
1	1	0	0	1	1	1	Semaphore group CID filtering enabled with only enabled C3 CID in the white list. Semaphore group can be accessed only by C3 CID.
1	1	0	1	1	1	1	Semaphore group CID filtering enabled with enabled C3 and C1 CID in the white list. Semaphore group can be accessed by C3 and C1 CID.
1	1	1	1	1	1	1	Semaphore group CID filtering enabled with enabled C3, 2 and 1 CID in the white list. Semaphore group can be accessed by C3, C2 and C1 CID.

1. It is not possible to share semaphores between CID and bus MASTERID. A semaphore group is either filtered by CID (and only accessible by white listed enabled CIDs) or bus MASTERID protected (and only accessible by valid bus MASTERIDs).

Semaphores with CID white list filtering enabled in HSEM_GpCIDCFGR.CFEN can only be locked by CIDs in the white list and generate only an interrupt to the CIDs in the white list.

Table 187. Semaphore attributes

Attributes				Interrupt(s)		Description(1)
Security	Privileged	CFEN	CID white list	Secure	Non-secure	
0	0	0	N.A.	Yes	Yes	No protection. All locks allowed, any interrupt generated.
0	1	x	x	Yes	Yes	Privilege protection. Only privileged lock allowed, any interrupt generated.
1	0	x	x	Yes	no	Security protection. Only secure lock allowed and secure interrupt generated.
1	1	x	x	Yes	No	Security and privilege protection. Only secure privileged lock allowed and secure interrupt generated.
x	x	1	1	Yes(2)	Yes(3)	CID protection. Only white listed CIDs lock allowed and white listed CIDs interrupt generated.

1. Illegal accesses generate illegal access events.
2. A secure interrupt is generated only for the CIDs in the white list.
3. A non-secure interrupt is generated only when the semaphore security attribute is set to non-secure, and for the CIDs in the white list.

The HSEM allows only authorized AHB bus master IDs or CIDs to lock and unlock semaphores.

- The AHB bus master 2-step lock write access to the semaphore HSEM_Rx register is checked against the valid bus master IDs or CID in the semaphore CID white list.
  - Accesses from unauthorized AHB bus master IDs or CIDs are discarded and do not lock the semaphore. On unauthorized CID accesses a CID illegal access event is generated.
- The AHB bus master 1-step lock read access from the semaphore HSEM_RLRx register is checked against the valid bus master IDs or CIDs in the semaphore CID white list.
  - An unauthorized AHB bus master ID or CID not in the white list read from HSEM_RLRx returns all 0. On unauthorized CID accesses a CID illegal access event is generated.
- The semaphore unlock write access to the HSEM_CR register is checked against the trusted domain CID. Only the trusted domain CID can write to the HSEM_CR register and unlock any of the LOCKID semaphores.
  - Accesses from unauthorized CIDs are discarded and do not clear the LOCKID semaphores. On unauthorized CID accesses a CID illegal access event is generated.

Table 188 details the relation between bus master/processor and LOCKID.

Table 188. Authorized bus master IDs

Bus master 0 (processor1)	Bus master 1 (processor2)	Bus master 2 (processor3)	DD bus master
MASTERID = 1	MASTERID = 2	MASTERID = 3	MASTERID = 0

Note: Accesses from unauthorized AHB bus master IDs to other registers are granted.

22.3.9 HSEM debug with DDCID

The DDCID and DDEN allow the user to debug hardware semaphores via the debug access.

- Registers can be accessed only with the right protection
  - Privilege protected registers can be accessed only with a DDCID privileged debug access.
  - Secure protected registers can be accessed only with a DDCID secure debug access.
- All CID protected registers can be accessed with the DDCID when DDEN = 1.
  - DDCID debug can unlock semaphores locked by a CID.
  - DDCID debug can lock a semaphore with the DDCID, even when DDCID is not part of the white list.
  - HSEM_(S)CnIER, HSEM_(S)CnICR, HSEM_(S)CnISR, and HSEM_(S)CnMISR can be accessed with the debug DDCID, even when CID filtering for processor[n] is enabled.
  - HSEM_SECCFGR and HSEM_PRIVCFGR bits can be accessed with the debug DDCID, even when semaphore x CID white list filtering is enabled.

- Semaphores without CID protection can be access by the DDCID.
  - DDCID debug can unlock semaphores locked by any AHB bus master ID.
  - DDCID debug can lock a semaphore with the DD AHB bus master ID or the DDCID. When locked with DD AHB bus master ID semaphore status CFEN = 0, when locked with DDCID semaphore status CFEN = 1.
- All TDCID protected registers can be accessed also with the DDCID when DDEN = 1.
  - HSEM_CR, HSEM_KEYR, HSEM_CnCIDCFGR, and HSEM_GpCIDCFGR can be accessed with the debug DDCID.

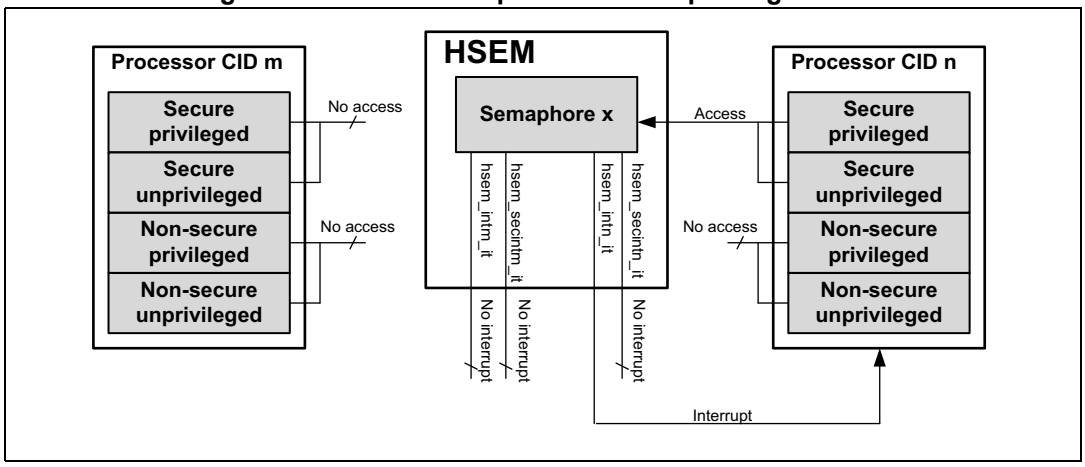
22.4 HSEM examples

22.4.1 Secure unprivileged CID n

HSEM_SECCFGR.SECx = 1

HSEM_PRIVCFGR.PRIVx = 0

HSEM_GpCIDCFGR.CFEN = 1 and HSEM_GpCIDCFGR.SEM_WLIST_Cn = 1



This allows to share the semaphore x between the secure privileged and secure unprivileged domains of processor with CID n.

Only secure privileged and secure unprivileged processor CID n can lock the semaphore, and only the processor CID n secure interrupt can report an unlock event.

The non-secure processor CID n and all other processor CIDs have no access to the semaphore x and the associated interrupt bits.

Non-secure accesses generate a secure illegal access event and all other processor CIDs accesses generate a CID illegal access event.

Figure 140. HSEM example - Secure unprivileged CID n

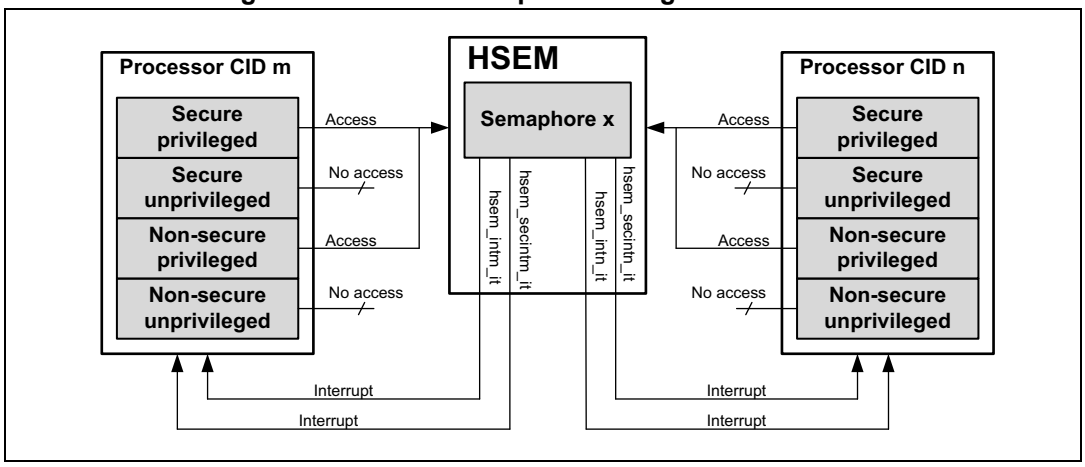
22.4.2 Privilege CID m and n

HSEM_SECCFGR.SECx = 0

HSEM_PRIVCFGR.PRIVx = 1

HSEM_GpCIDCFGR.CFEN = 1 & HSEM_GpCIDCFGR.SEM_WLIST_Cm = 1 and HSEM_GpCIDCFGR.SEM_WLIST_Cn = 1

This makes it possible to share the semaphore x between the secure privileged and non-secure privilege domains of processors with CID m and CID n.



Only secure privileged and non-secure privilege processors CID m and CID n can lock the semaphore, and only the processor CID m and n, secure and non-secure interrupts report an unlock event.

The secure unprivileged and non-secure unprivileged processor CID m and CID n and all other processor CIDs have no access to the semaphore n.

Secure unprivileged and non-secure unprivileged accesses generate a privileged illegal access event.

All other processor CIDs accesses generate a CID illegal access event.

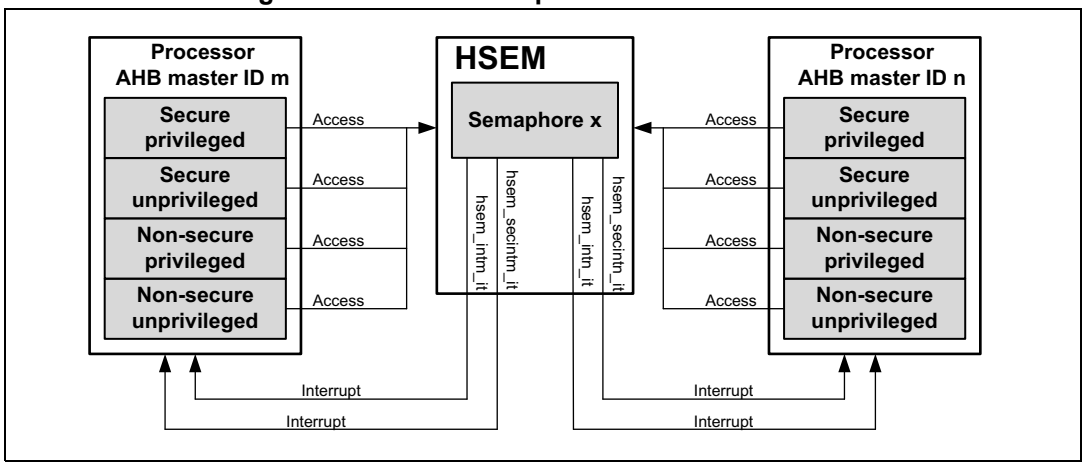
Figure 141. HSEM example - Privileged CID m and n

22.4.3 MASTERIDs

HSEM_SECCFGR.SECx = 0

HSEM_PRIVCFGR.PRIVx = 0

HSEM_GpCIDCFGR.CFEN = 0



This makes it possible to share the semaphore x between all authorized AHB bus master IDs as shown in *Table 188* and all protection non-secure, secure, privilege and unprivileged domains.

All secure privileged, secure unprivileged, non-secure privilege and non-secure unprivileged of all authorized processors AHB bus master IDs can lock the semaphore, and the secure and non-secure interrupts for all processors report an unlock event.

The processor CIDs are don’t care.

There is no protection so no illegal access events are generated.

Figure 142. HSEM example - AHB bus master IDs

22.5 HSEM registers

Registers must be accessed using word format. Byte and half-word accesses are ignored and have no effect on the semaphores, they generate a bus error.

For any DDCID access to registers and register bits, security and privileged policies apply. When DDEN = 0 accesses from DDCID to CID filtered registers is ignored. When DDEN = 1 the DDCID has access to all registers regardless of any CID filtering policy.

22.5.1 HSEM register semaphore x (HSEM_Rx)

Address offset: 0x000 + 0x4 * x (x = 0 to 15)

Reset value: 0x0000 0000

The HSEM_Rx must be used to perform a 2-step write lock, read back, and for unlocking a semaphore. Only write accesses with authorized AHB bus master IDs or CIDs are granted. Write accesses with unauthorized AHB bus master IDs and CIDs are discarded. An unauthorized AHB bus master CID access generates an illegal access event.

When the semaphore x security attribute SECx is enabled the semaphore can only be locked by a secure access. A non-secure write access generates a secure illegal access event. When the semaphore x security attribute SECx is disabled both secure and non-secure accesses may lock the semaphore.

When the semaphore x privileged attribute PRIVx is enabled the semaphore can only be locked by a privileged access. An unprivileged write access generates a privileged illegal access event. When the semaphore x privileged attribute PRIVx is disabled both privileged and unprivileged accesses may lock the semaphore.

When the semaphore x CID white list filtering is enabled in HSEM_GpCIDCFGR.CFEN and HSEM_CnCIDCFGR.CFEN, the semaphore can only be locked by CIDs from the white list. A write access from CIDs not in the white list generates a CID illegal access event. When the semaphore x CID white list attribute filtering is disabled in HSEM_GpCIDCFGR.CFEN or HSEM_CnCIDCFGR.CFEN the semaphore can be locked by any valid MASTERID.

A locked semaphore can always be unlocked with the semaphore PRIV, SEC and LOCKID that locked the semaphore, regardless of the semaphore attribute settings. To unlock the semaphore the PROCID must match.

When reading the semaphore x with a non-secure access, the semaphore data are returned only if:

- the semaphore security attribute SECx is disabled (non-secure semaphore)
- the semaphore has been locked with semaphore SEC = 0 (before security attribute SECx has been enabled) and the semaphore PRIV and LOCKID matches.

Else a 0 is returned, and a secure illegal access event is generated.

When reading the semaphore x with an unprivileged access, the semaphore data are returned only when:

- The semaphore privileged attribute PRIVx is disabled (unprivileged semaphore)
- The semaphore has been locked with semaphore PRIV = 0 (before security attribute PRIVx has been enabled) and the semaphore SEC and LOCKID matches.

Else a 0 is returned, and an privileged illegal access event is generated.

Semaphore data can only be read when the read access protection (SEC, PRIV and LOCKID) complies with the semaphore attribute protection rules or by a read access from the AHB bus master with the SEC, PRIV and LOCKID that locked the semaphore.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LOCK	CFEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	PRIV	SEC	LOCKID[3:0]				PROCID[7:0]							
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **LOCK:** Lock indication

This bit can be written and read by software.

0: On write free semaphore (only when LOCKID and PROCID match), on read semaphore is free.

1: On write try to lock semaphore, on read semaphore is locked.

Bit 30 **CFEN:** Semaphore CID filter indication

This bit is updated, with the CID filtering information in HSEM_GpCIDCFGR.CFEN and HSEM_CnCIDCFGR.CFEN, by HW when semaphore is locked. This bit is set only when CID filtering is enabled for at least one CID in both HSEM_GpCIDCFGR.CFEN and HSEM_CnCIDCFGR.CFEN. Read only by software.

0: Semaphore is not CID filtered, LOCKID field indicated MASTERID or semaphore is free.

1: Semaphore is CID filtered, LOCKID field indicates CID.

Bits 29:14 Reserved, must be kept at reset value.

Bit 13 **PRIV:** Semaphore privilege

Written by software

- When the semaphore is free and the LOCK bit is at the same time written to 1, and the LOCKID matches the AHB bus master ID or CID, SEC and PRIV matches the AHB bus master definition.
- When the semaphore is unlocked (LOCK written to 0 and AHB bus master ID or CID matched LOCKID, SEC and PRIV matches the AHB bus master definition, the PRIV is cleared to 0.
- When the semaphore is unlocked (LOCK bit written to 0 and AHB bus master ID or CID does not match LOCKID and/or SEC or PRIV do not match AHB bus master definition, the PRIV is not affected.
- Write when LOCK bit is already 1 (semaphore locked), the PRIV is not affected.
- An authorized read returns the stored PRIV value.

0: Semaphore free or locked by unprivileged compartment.

1: Semaphore locked by privilege compartment.

Bit 12 **SEC:** Semaphore secure

Written by software

- When the semaphore is free and the LOCK bit is at the same time written to 1, and the LOCKID matches the AHB bus master ID or CID, SEC and PRIV matches the AHB bus master definition.
- When the semaphore is unlocked (LOCK written to 0 and AHB bus master ID or CID matched LOCKID, SEC and PRIV matches the AHB bus master definition, the SEC is cleared to 0.
- When the semaphore is unlocked (LOCK bit written to 0 and AHB bus master ID or CID does not match LOCKID and/or SEC or PRIV do not match AHB bus master definition, the SEC is not affected.
- Write when LOCK bit is already 1 (semaphore locked), the SEC is not affected.
- An authorized read returns the stored SEC value.

0: Semaphore free or locked by non-secure compartment.

1: Semaphore locked by secure compartment.

Bits 11:8 **LOCKID[3:0]:** Semaphore LOCKID

Written by software

- When the semaphore is free and the LOCK bit is at the same time written to 1 and the LOCKID matches the AHB bus master ID or CID, SEC and PRIV matches the AHB bus master protection.
- When the semaphore is unlocked (LOCK written to 0 and AHB bus master ID or CID matched LOCKID, SEC and PRIV matches the AHB bus master protection, the LOCKID is cleared to 0.
- When the semaphore is unlocked (LOCK bit written to 0 or AHB bus master ID or CID does not match LOCKID and/or SEC or PRIV do not match AHB bus master protection, the LOCKID is not affected.
- Write when LOCK bit is already 1 (semaphore locked), the LOCKID is not affected.
- An authorized read returns the stored LOCKID value.

Bits 7:0 **PROCID[7:0]:** Semaphore PROCID

Written by software

-When the semaphore is free and the LOCK is written to 1, and the LOCKID matches the AHB bus master ID or CID, SEC and PRIV matches the AHB bus master definition, PROCID is set to the written data.
- When the semaphore is unlocked, LOCK written to 0 and AHB bus master ID or CID matched LOCKID, SEC and PRIV matches the AHB bus master protection, the PROCID is cleared to 0.
- When the semaphore is unlocked, LOCK bit written to 0 and AHB bus master ID or CID does not match LOCKID and/or SEC or PRIV do not match the AHB bus master definition, the PROCID is not affected.
- Write when LOCK bit is already 1 (semaphore locked), the PROCID is not affected.
- An authorized read returns the stored PROCID value.

22.5.2 HSEM read lock register semaphore x (HSEM_RLRx)

Address offset: 0x080 + 0x4 * x (x = 0 to 15)

Reset value: 0x0000 0000

Accesses the same physical bits as HSEM_Rx. The HSEM_RLRx must be used to perform a 1-step read lock. Only read accesses with authorized AHB bus master IDs or CIDs are

granted. Read accesses with unauthorized AHB bus master IDs or CIDs are discarded and return 0. An unauthorized AHB bus master CID access generates an illegal access event.

When the semaphore x security attribute SECx is enabled the semaphore can only be locked by a secure access. A non-secure read access returns 0 and generates a secure illegal access event. When the semaphore x security attribute SECx is disabled both secure and non-secure accesses may lock the semaphore.

When the semaphore x privileged attribute PRIVx is enabled the semaphore can be locked only by a privileged access. An unprivileged read access reads 0 and generates a privileged illegal access event. When the semaphore x privileged attribute PRIVx is disabled both privileged and unprivileged accesses may lock the semaphore.

When the semaphore x CID white list filtering is enabled in HSEM_GpCIDCFGR.CFEN and HSEM_CnCIDCFGR.CFEN, the semaphore can only be locked by CIDs from the white list. A read access from CIDs not in the white list generates a CID illegal access event. When the semaphore x CID white list attribute filtering is disabled in HSEM_GpCIDCFGR.CFEN or HSEM_CnCIDCFGR.CFEN the semaphore can be locked by any valid MASTERID.

		r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bit 31 **LOCK:** Lock indication

This bit is read only by software at this address.

- When the semaphore is free:

A read with a valid AHB bus master ID or CID and SEC and PRIV locks the semaphore and returns 1.

- When the semaphore is locked:

A read with a valid AHB bus master ID or CID and SEC and PRIV returns 1 (the LOCKID and SEC and PRIV and PROCID reflect the already locked semaphore information).

Bit 30 **CFEN:** Semaphore CID filter indication

This bit is updated by hardware when semaphore is locked with the CID filtering information in HSEM_GpCIDCFGR.CFEN and HSEM_CnCIDCFGR.CFEN. This bit is set only when CID filtering is enabled for at least one CID in both HSEM_GpCIDCFGR.CFEN and HSEM_CnCIDCFGR.CFEN.

0: Semaphore is free or locked and not CID filtered, LOCKID field indicates AHB bus master ID.

1: Semaphore is locked and CID filtered, LOCKID field indicated AHB bus master CID.

Bits 29:14 Reserved, must be kept at reset value.

Bit 13 **PRIV:** Semaphore privilege

This field is read only by software at this address.

- When the semaphore is free:

A read with a valid AHB bus master ID or CID and SEC and PRIV locks the semaphore and hardware sets the PRIV to the valid AHB bus master privileged definition.

- When the semaphore is locked:

A read with a valid AHB bus master ID or CID and SEC and PRIV returns the PRIV of the AHB bus master that has locked the semaphore.

0: Semaphore free or locked by unprivileged compartment.

1: Semaphore locked by privileged compartment.

Bit 12 **SEC:** Semaphore secure.

This field is read only by software at this address.

- When the semaphore is free:

A read with a valid AHB bus master ID or CID and SEC and PRIV locks the semaphore and hardware sets the SEC to the valid AHB bus master security definition.

- When the semaphore is locked:

A read with a valid AHB bus master ID or CID and SEC and PRIV returns the SEC of the AHB bus master that has locked the semaphore.

0: Semaphore free or locked by non-secure compartment.

1: Semaphore locked by secure compartment.

Bits 11:8 **LOCKID[3:0]:** Semaphore LOCKID

This field is read only by software at this address.

On a read, when the semaphore is free, the hardware sets the LOCKID to the AHB bus master ID reading the semaphore. The LOCKID of the AHB bus master locking the semaphore is read.

On a read when the semaphore is locked, this field returns the LOCKID of the AHB bus master that has locked the semaphore.

Bits 7:0 **PROCID[7:0]:** Semaphore processor ID

This field is read only by software at this address.

- On a read when the semaphore is free:

A read with a valid AHB bus master ID or CID and SEC and PRIV locks the semaphore and hardware sets the PROCID to 0.

- When the semaphore is locked:

A read with a valid AHB bus master ID or CID and SEC and PRIV returns the PROCID of the AHB bus master that has locked the semaphore.

22.5.3 HSEM non-secure interrupt enable register (HSEM_CnIER)

Address offset: 0x100 + 0x010 * (n - 1), (n = 1 to 3)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ISE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **ISE[15:0]:** Non-secure Interrupt(n) semaphore x enable bit (x = 0 to 15)

This bit is read and written by software.

When semaphore x SECx is disabled, bit x can be accessed with secure and non-secure access.

When semaphore x SECx is enabled, bit x is forced to 0 and cannot be accessed, write to this bit is discarded and a read returns 0.

When semaphore x PRIVx is disabled, bit x can be accessed with privilege and unprivileged access.

When semaphore x PRIVx is enabled, bit x can be accessed only with privileged access. Unprivileged write to this bit is discarded, unprivileged read returns 0.

When semaphore x CID white list is disabled by HSEM_GpCIDCFGR.CFEN, bit x can be accessed according the register global access definition shown above.

When semaphore x CID white list is enabled by HSEM_GpCIDCFGR.CFEN, bit x can only be accessed by the processor(s) as defined in the HSEM_CnCIDCFGR when the processor CID is part of the HSEM_GpCIDCFGR CID white list. When its CID is not in the white list bit x is reset to zero and can't be accessed, writing to this bit is discarded and read return 0 value.

0: Non-secure Interrupt(n) generation for semaphore x disabled (masked)

1: Non-secure Interrupt(n) generation for semaphore x enabled (not masked)

22.5.4 HSEM non-secure interrupt clear register (HSEM_CnICR)

Address offset: 0x104 + 0x010 * (n - 1), (n = 1 to 3)

Reset value: 0x0000 0000

Register global access: When CID filtering for processor[n] is enabled in HSEM_CnCIDCFGR, this register can be accessed only by the processor CID. An illegal CID access to this register generates a CID illegal access event. When CID filtering for processor[n] is disabled this register can be accessed by any bus master.

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **ISC[15:0]:** Non-secure Interrupt(n) semaphore x clear bit (x = 0 to 15)

This bit is written by software, and is always read 0.

When semaphore x SECx is disabled, bit x can be accessed with secure and non-secure access.

When semaphore x SECx is enabled, bit x cannot be accessed, write to this bit is discarded.

When semaphore x PRIVx is disabled, bit x can be accessed with privileged and unprivileged access.

When semaphore x PRIVx is enabled, bit x can only be accessed with privileged access. Unprivileged write to this bit is discarded.

When semaphore x CID white list is disabled by HSEM_GpCIDCFGR.CFEN, bit x can be accessed according to the register global access definition shown above.

When semaphore x CID white list is enabled by HSEM_GpCIDCFGR.CFEN, bit x can be accessed only by the processor(s) as defined in the HSEM_CnCIDCFGR when the processor CID is part of the HSEM_GpCIDCFGR CID white list. When its CID is not in the white list bit x is reset to 0 and cannot be accessed, writing to this bit is discarded and read returns 0.

0: non-secure Interrupt(n) semaphore x status ISFx and masked status MISFx not affected.

1: non-secure Interrupt(n) semaphore x status ISFx and masked status MISFx cleared.

22.5.5 HSEM non-secure interrupt status register (HSEM_CnISR)

Address offset: 0x108 + 0x010 * (n - 1), (n = 1 to 3)

Reset value: 0x0000 0000

Register global access: when CID filtering for processor[n] is enabled in HSEM_CnCIDCFGR, this register can be accessed only by the processor CID. An illegal CID access generates a CID illegal access event. When CID filtering for processor[n] is disabled this register can be read by any bus master.

ISF[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **ISF[15:0]:** Interrupt semaphore x status bit before enable (mask) (x = 0 to 15)

This bit is set by hardware, and reset only by software. This bit is cleared by software writing the corresponding HSEM_CnICR bit.

0: Interrupt semaphore x status, no interrupt pending

1: Interrupt semaphore x status, interrupt pending

22.5.6 HSEM non-secure interrupt status register (HSEM_CnMISR)

Address offset: 0x10C + 0x010 * (n - 1), (n = 1 to 3)

Reset value: 0x0000 0000

Register global access: when CID filtering for processor[n] is enabled in HSEM_CnCIDCFGR, this register can be accessed only by the processor CID. An illegal

CID access generates a CID illegal access event. When CID filtering for processor[n] is disabled this register can be read by any bus master.

MISF[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MISF[15:0]:** Masked non-secure interrupt(n) semaphore x status bit after enable (mask) (x = 0 to 15)

This bit is set by hardware and read only by software. This bit is cleared by software writing the corresponding HSEM_CnICR bit. This bit is read as 0 when semaphore x status is masked in HSEM_CnIER bit x.

When semaphore x SECx is disabled, bit x can be accessed with secure and non-secure access.

When semaphore x SECx is enabled, bit x cannot be accessed, read returns 0.

When semaphore x PRIVx is disabled, bit x can be accessed with privileged and unprivileged access.

When semaphore x PRIVx is enabled, bit x can be accessed only with privileged access. Unprivileged read returns 0.

When semaphore x CID white list is disabled by HSEM_GpCIDCFGR.CFEN, bit x can be accessed according the register global access definition shown above.

When semaphore x CID white list is enabled by HSEM_GpCIDCFGR.CFEN, bit x can be accessed only by the processor(s) as defined in the HSEM_CnCIDCFGR when the processor CID is part of the HSEM_GpCIDCFGR CID white list. When its CID is not in the white list bit x is reset to 0 and cannot be accessed, read returns 0.

0: non-secure interrupt(n) semaphore x status after masking not pending

1: non-secure interrupt(n) semaphore x status after masking pending

22.5.7 HSEM secure interrupt enable register (HSEM_SCnIER)

Address offset: 0x180 + 0x010 * (n - 1), (n = 1 to 3)

Reset value: 0x0000 0000

Register global access: when CID filtering for processor[n] is enabled in HSEM_CnCIDCFGR, this register can be accessed only by the processor CID. An illegal

CID access to this register generates a CID illegal access event. When CID filtering for processor[n] is disabled this register can be accessed by any bus master.

This register provides access security, a non-secure write access is discarded and a non-secure read returns all 0. Both non-secure read and write generate a secure illegal access event.

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SISE[15:0]:** Secure interrupt(n) semaphore x enable bit (x = 0 to 15)

This bit is read and written by software.

When semaphore x PRIVx is disabled, bit x can be accessed with secure privilege and secure unprivileged access.

When semaphore x PRIVx is enabled, bit x can be accessed only with secure privilege access. secure unprivileged write to this bit is discarded, secure unprivileged read return 0 value.

When semaphore x CID white list is disabled by HSEM_GpCIDCFGR.CFEN, bit x can be accessed according the register global access definition shown above.

When semaphore x CID white list is enabled by HSEM_GpCIDCFGR.CFEN, bit x can be accessed only by the secure processor(s) as defined in the HSEM_CnCIDCFGR when the processor CID is part of the HSEM_GpCIDCFGR CID white list. When its CID is not in the white list bit x is reset to 0 and cannot be accessed, writing to this bit is discarded and read returns 0.

0: Secure interrupt(n) generation for semaphore x is disabled (masked).

1: Secure interrupt(n) generation for semaphore x is enabled (not masked).

22.5.8 HSEM secure interrupt clear register (HSEM_SCnICR)

Address offset: 0x184 + 0x010 * (n - 1), (n = 1 to 3)

Reset value: 0x0000 0000

Register global access: when CID filtering for processor[n] is enabled in HSEM_CnCIDCFGR, this register can be accessed only by the processor CID. An illegal CID access to this register generates a CID illegal access event. When CID filtering for processor[n] is disabled this register can be accessed by any bus master.

This register provides access security, a non-secure write access is discarded and a non-secure read returns all 0. Both non-secure read and write generate a secure illegal access event.

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SISC[15:0]:** Secure interrupt(n) semaphore x clear bit (x = 0 to 15)

This bit is written by software, and is always read 0.

When semaphore x PRIVx is disabled, bit x can be accessed with secure privilege and secure unprivileged access.

When semaphore x PRIVx is enabled, bit x can be accessed only with secure privilege access. Secure unprivileged write to this bit is discarded.

When semaphore x CID white list is disabled by HSEM_GpCIDCFGR.CFEN, bit x can be accessed according the register global access definition shown above.

When semaphore x CID white list is enabled by HSEM_GpCIDCFGR.CFEN, bit x can be accessed only by the secure processor(s) as defined in the HSEM_CnCIDCFGR when the processor CID is part of the HSEM_GpCIDCFGR CID white list. When its CID is not in the white list bit x is reset to 0 and cannot be accessed, writing to this bit is discarded and read returns 0.

0: Secure interrupt(n) semaphore x status ISFx and masked status MISFx not affected.

1: Secure interrupt(n) semaphore x status ISFx and masked status MISFx cleared.

22.5.9 HSEM secure interrupt status register (HSEM_SCnISR)

Address offset: 0x188 + 0x010 * (n - 1), (n = 1 to 3)

Reset value: 0x0000 0000

Register global access: When CID filtering for processor[n] is enabled in HSEM_CnCIDCFGR, this register can be accessed only by the processor CID. An illegal CID access to this register generates a CID illegal access event. When CID filtering for processor[n] is disabled this register can be read by any bus master.

This register provides access security, a non-secure read returns all 0. Both non-secure read and write generate a secure illegal access event.

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SISF[15:0]:** Secure interrupt(n) semaphore x status bit before enable (mask) (x = 0 to 15)
This bit is set by hardware and read only by software.
Bit is cleared by software writing the corresponding HSEM_SCnICR bit x.
When semaphore x PRIVx is disabled, bit x can be accessed with secure privilege and secure unprivileged access.
When semaphore x PRIVx is enabled, bit x can be accessed only with secure privilege access. Secure unprivileged read return 0 value.
When semaphore x CID white list is disabled by HSEM_GpCIDCFGR.CFEN, bit x can be accessed according the register global access definition shown above.
When semaphore x CID white list is enabled by HSEM_GpCIDCFGR.CFEN, bit x can be accessed only by the secure processor(s) as defined in the HSEM_CnCIDCFGR when the processor CID is part of the HSEM_GpCIDCFGR CID white list. When its CID is not in the white list bit x is reset to 0 and cannot be accessed, read return 0 value.
0: Secure interrupt(n) semaphore x status, no interrupt pending.
1: Secure interrupt(n) semaphore x status, interrupt pending.

22.5.10 HSEM secure masked interrupt status register (HSEM_SCnMISR)

Address offset: 0x18C + 0x010 * (n - 1), (n = 1 to 3)

Reset value: 0x0000 0000

Register global access: when CID filtering for processor[n] is enabled in HSEM_CnCIDCFGR, this register can be accessed only by the processor CID. An illegal CID access to this register generates a CID illegal access event. When CID filtering for processor[n] is disabled this register can be read by any bus master.

This register provides access security, a non-secure read returns all 0. Both non-secure read and write generate a secure illegal access event.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SMISF[15:0]:** Secure masked interrupt(n) semaphore x status bit after enable (mask) (x = 0 to 15)

This bit is set by hardware and read only by software.

Bit is cleared by software writing the corresponding HSEM_SCnICR bit x.

Bit is read as 0 when semaphore x status is masked in HSEM_SCnIER bit x.

When semaphore x PRIVx is disabled, bit x can be accessed with secure privilege and secure unprivileged access.

When semaphore x PRIVx is enabled, bit x can be accessed only with secure privilege access. Secure unprivileged read return 0 value.

When semaphore x CID white list is disabled by HSEM_GpCIDCFGR.CFEN, bit x can be accessed according the register global access definition shown above.

When semaphore x CID white list is enabled by HSEM_GpCIDCFGR.CFEN, bit x can be accessed only by the secure processor(s) as defined in the HSEM_CnCIDCFGR when the processor CID is part of the HSEM_GpCIDCFGR CID white list. When its CID is not in the white list bit x is reset to 0 and cannot be accessed, read return 0 value.

0: Secure interrupt(n) semaphore x status after masking not pending.

1: Secure interrupt(n) semaphore x status after masking pending.

22.5.11 HSEM security configuration register (HSEM_SECCFGR)

Address offset: 0x200

Reset value: 0x0000 0000

This register provides write access security and privileged, a non-secure or unprivileged write access is discarded and generates an illegal access event. There is no read protection and the register data can be read by any accesses.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

SEC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SEC[15:0]:** Semaphore x security attribute (x = 0 to 15)

This bit is set and cleared by software.

When semaphore x CID white list is disabled by HSEM_GpCIDCFGR.CFEN, bit x can be written by any secure processor.

When semaphore x CID white list is enabled by HSEM_GpCIDCFGR.CFEN, bit x can only be written by secure processor CIDs, which are part of the CID white list.

All CIDs have read accesses to the register bit x value.

0: Semaphore x non-security, can be accessed by both secure and non-secure processors. When unlocking semaphore x both a secure and non-secure interrupt can be generated.

1: Semaphore x security, can be accessed only by secure processors. When unlocking semaphore x only a secure interrupt can be generated.

22.5.12 HSEM privilege configuration register (HSEM_PRIVCFGR)

Address offset: 0x210

Reset value: 0x0000 0000

This register provides write access privilege protection, an unprivileged write access is discarded and generate a privilege illegal access event. There is no read protection and the register data can be read by both privilege and unprivileged accesses.

There is no read protection and the register data can be read by both secure and non-secure accesses.

PRIV[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PRIV[15:0]:** Semaphore x privilege attribute (x = 0 to 15)
This bit is set and cleared by software.
When semaphore x SECx is disabled, bit x can be write accessed with secure privileged and non-secure privileged access.
When semaphore x SECx is enabled, bit x can only be write accessed with secure privilege access. Non-secure privileged write access is discarded. Both secure and non-secure read return the register bit x value
When semaphore x CID white list is disabled by HSEM_GpCIDCFGR.CFEN, bit x can be written by any privilege processor.
When semaphore x CID white list is enabled by HSEM_GpCIDCFGR.CFEN, bit x can only be written by privileged processor CIDs, which are part of the CID white list.
All CIDs have read accesses to the register bit x value.
0: Semaphore x unprivileged, can be accessed by both privileged and unprivileged processors.
1: Semaphore x privileged, can be accessed only by privileged processors.

22.5.13 HSEM processor n CID configuration register (HSEM_CnCIDCFGR)

Address offset: 0x220 + 0x004 * (n - 1), (n = 1 to 3)

Reset value: 0x0000 0000

This register can be written only by the secure, privileged, trusted domain CID. An illegal write access generates a secure, privilege and or CID illegal access event.

This registers has no read access limitations, and can be read by any domain CID, and any access protection.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CID[2:0]			Res.	Res.	Res.	CFEN
									rw	rw	rw				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **CID[2:0]:** processor[n] CID domain identification
If CFEN = 0 these bits are ignored and there is no processor[n] CID filtering. Else: processor[n] CID domain identification number.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **CFEN:** processor[n] CID filtering enabled for HSEM_(S)CnIER, HSEM_(S)CnICR, HSEM_(S)CnISR, and HSEM_(S)CnMISR registers and for white list filter usage in HSEM_GpCIDCFGR.SEM_WLIST_Cn
0: disable the CID filtering for processor[n]
1: enable the CID filtering for processor[n]

22.5.14 HSEM clear register (HSEM_CR)

Address offset: 0x230

Reset value: 0x0000 0000

This register can be written only by the secure, privileged, trusted domain CID. A write access from any other protection level or domain CID is discarded and any read returns 0. Both illegal write and read access generate a secure, privileged and or CID illegal access event.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
KEY[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	PRIV	SEC	LOCKID[3:0]				Res.	Res.	Res.	Res.	Res.	Res.	Res.	CFEN
		w	w	w	w	w	w								w

Bits 31:16 **KEY[15:0]:** Semaphore clear key
This field can be written by software and is always read 0.
If this key value does not match HSEM_KEYR.KEY, semaphores are not affected.
If this key value matches HSEM_KEYR.KEY, all semaphores matching the LOCKID are cleared to the free state.

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **PRIV:** PRIV value of semaphores to be cleared.
This field can be written by software, is always read 0.
Indicates the PRIV for which the semaphores are cleared when writing the HSEM_CR.

Bit 12 **SEC:** SEC value of semaphores to be cleared.
This field can be written by software, is always read 0.
Indicates the SEC for which the semaphores are cleared when writing the HSEM_CR

Bits 11:8 **LOCKID[3:0]:** LOCKID of semaphores to be cleared
This field can be written by software and is always read 0.
This field indicates the LOCKID for which the semaphores are cleared when writing the HSEM_CR.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **CFEN:** Semaphore CID filtered.
This field can be written by software, is always read 0.
0: Semaphore not CID filtered, LOCKID field represents MASTERID
1: Semaphore CID filtered, LOCKID field represents CID

22.5.15 HSEM clear semaphore key register (HSEM_KEYR)

Address offset: 0x234

Reset value: 0x0000 0000

This register can only be accessed by the secure, privileged, trusted domain CID. A write access from any other protection level or domain CID is discarded and any read returns 0. Both illegal write and read access generate a secure, privileged and or CID illegal access event.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
KEY[15:0]

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:16 **KEY[15:0]:** Semaphore clear key
This field can be written and read by software.
Key value to match when clearing semaphores.

Bits 15:0 Reserved, must be kept at reset value.

22.5.16 HSEM CID configuration register (HSEM_GpCIDCFGR)

Address offset: 0x240 + 0x004 * p, (p = 0 to 3)

- p = 0 Group HSEM3:0
- p = 1 Group HSEM4:7
- p = 2 Group HSEM8:11
- p = 3 Group HSEM12:15

Reset value: 0x0000 0000

This register can be written only by the secure, privileged, trusted domain CID. A write access from any other protection level or domain CID is discarded and any read returns 0. Both illegal write and read accesses generate a secure, privileged and or CID illegal access event.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CFEN
															rw

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:16 **SEM_WLIST_C[3:1]:** Semaphore group p CID filtering enable for processor n CID (n = 1 to 3).
This bit is set and cleared by software.
If CID filtering is disabled in HSEM_GpCIDCFGR.CFEN, these bits are ignored, else:
If CID filtering is disabled in HSEM_CnCIDCFGR.CFEN, bit n is ignored, (n = 1 to 3) and HSEM_CnCIDCFGR.CID is black listed, else:
0: Processor n CID as defined in HSEM_CnCIDCFGR.CID is black listed for Semaphore group p.
1: Processor n CID as defined in HSEM_CnCIDCFGR.CID is white listed for Semaphore group p.

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **CFEN:** Semaphore group p global CID filtering enable.
This bit is set and cleared by software.
0: Semaphore group p CID filtering disabled. (Group p semaphores can be accessed by all authorized MASTERIDs)
1: Semaphore group p CID filtering enabled. (Group p semaphores can only be accessed by white listed CIDs)

22.5.17 HSEM hardware configuration register 2 (HSEM_HWCFGR2)

Address offset: 0x3EC

Reset value: 0x0000 0321

23 Inter-processor communication controller (IPCC)

23.1 Introduction

The inter-processor communication controller (IPCC) is used for communicating data between two processors.

The IPCC block provides a nonblocking signaling mechanism to post and retrieve communication data in an atomic way. It provides the signaling for 32 channels:

- 16 channels in the direction from processor 1 to processor 2
- 16 channels in the opposite direction

It is then possible to have two different communication types in each direction.

The IPCC communication data must be located in a common memory, which is not part of the IPCC block.

23.2 IPCC main features

- Status signaling for the 32 channels
  - Channel occupied/free flag, also used as lock
- Four interrupt lines per processor
  - One non-secure and one secure for RX channel occupied (communication data posted by sending processor)
  - One non-secure and one secure for TX channel free (communication data retrieved by receiving processor)
- Interrupt masking per channel
  - Channel occupied mask
  - Channel free mask
- Two channel operation modes
  - Simplex (each channel has its own communication data memory location)
  - Half duplex (a single channel associated to a bidirectional communication data information memory location)
- Security support
  - Support for AHB independent secure and non-secure IPCC channels. Protecting any secure resource (register field) from a non-secure access
  - Generation of separate secure and non-secure interrupt per CPU
- Privileged/unprivileged support
  - Support for AHB independent privilege and unprivileged IPCC channels. Protecting any privilege resource (register field) from an unprivileged access
- Resource isolation support
- CID-aware register access. Protecting any CID domain (register) from access by another CID domain.
  - Dedicated processor interrupt lines per CID domain and interrupt routing.

23.3 IPCC implementation

Table 190 describes IPCC implementation.

Table 190. IPCC features implementation

IPCC feature(1)	IPCC1	IPCC2
Processor 1(2)	Cortex-A35, Cortex-M33	Any(3)
Processor 2(2)		
Number of channels	16	4
Security	X	X
Privilege	X	X
Resource isolation support	X	X

1. X = supported.
2. Processor 1 and Processor 2 are defined by interrupt routing and CID filtering policy.
3. Cortex-A35, Cortex-M33, Cortex-M0+.

23.4 IPCC functional description

The IPCC communication data is located in a common memory, which is not part of the IPCC block. The address location of the communication data must be known or located in a known common area that, as already stated, is not part of the IPCC block.

For each communication, the IPCC block provides a channel status flag CHnF.

- When 0, the channel status flag CHnF indicates that the associated IPCC channel is free (the receiving processor has retrieved communication data), and can be accessed by the sending processor.
- When 1, the channel status flag CHnF indicates that the associated IPCC channel is occupied (the sending processor has posted communication data) and can be accessed by the receiving processor.

The channel operation mode must be known to both processors. A common parameter can be used to indicate the channel transfer mode and must also be located in a known common area. This parameter is not available from the IPCC.

23.4.1 IPCC block diagram

The IPCC (see *Figure 143*) consists of the following subblocks:

- Status block, containing the channel status
- IPCC interface block, providing AHB access to the channel status registers
- Interrupt interface block, providing control for the interrupts

Figure 143. IPCC block diagram

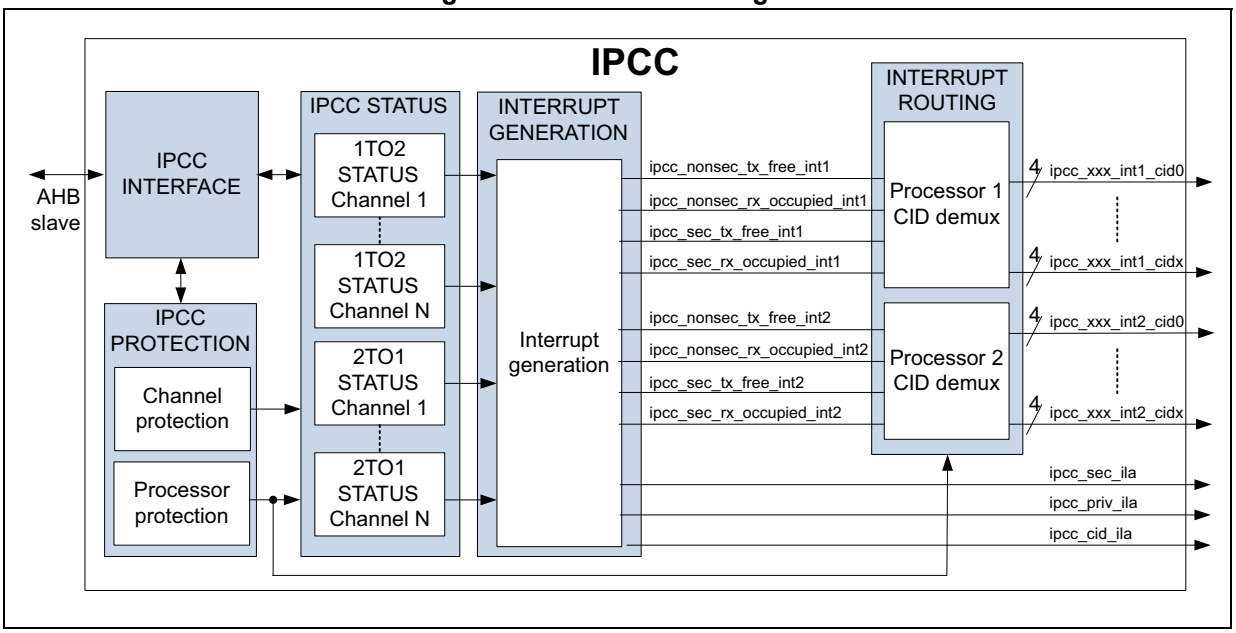

Table 191. IPCC interface signals

Signal		Description
Name	Type	
AHB slave	I/O	AHB register access bus
ipcc_nonsec_tx_free_int1_cidx	O	Non secure TX free interrupt to processor 1 per CID
ipcc_nonsec_rx_occupied_int1_cidx	O	Non secure RX occupied interrupt to processor 1 per CID
ipcc_sec_tx_free_int1_cidx	O	Secure TX free interrupt to processor 1 per CID
ipcc_sec_rx_occupied_int1_cidx	O	Secure RX occupied interrupt to processor 1 per CID
ipcc_nonsec_tx_free_int2_cidx	O	Non secure TX free interrupt to processor 2 per CID
ipcc_nonsec_rx_occupied_int2_cidx	O	Non secure RX occupied interrupt to processor 2 per CID
ipcc_sec_tx_free_int2_cidx	O	Secure TX free interrupt to processor 2 per CID
ipcc_sec_rx_occupied_int2_cidx	O	Secure RX occupied interrupt to processor 2 per CID
ipcc_sec_ila	O	Illegal secure access event
ipcc_priv_ila	O	Illegal privilege access event
ipcc_cid_ila	O	Illegal CID access event

23.4.2 IPCC Simplex channel mode

In Simplex channel mode, a dedicated memory location (used to transfer data in a single direction) is assigned to the communication data. The associated channel N control bits (see *Table 192*) are used to manage the transfer from the sending to the receiving processor.

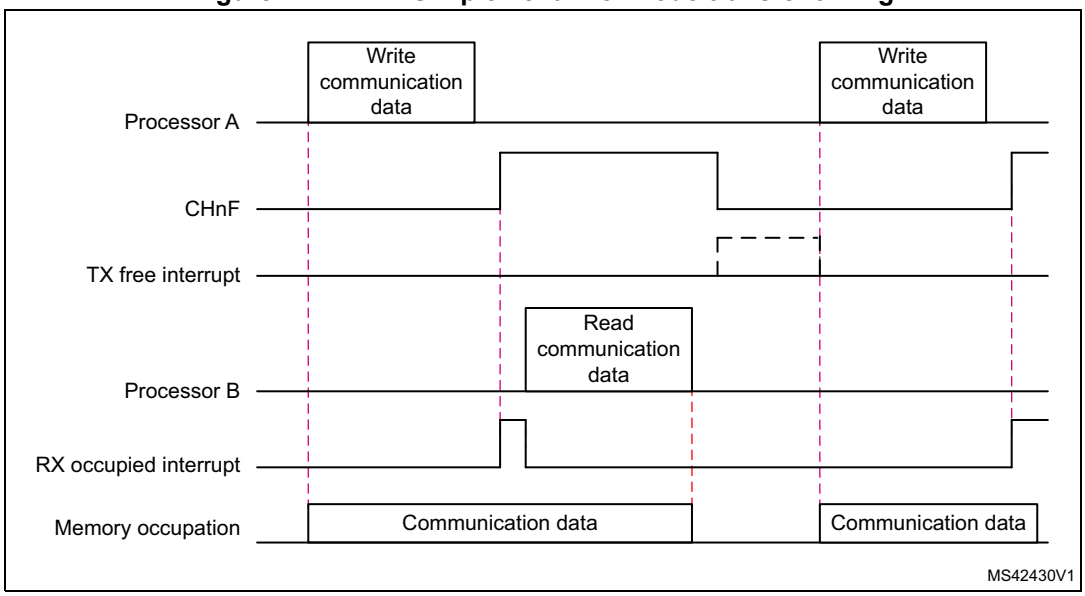
Table 192. Bits used for the communication

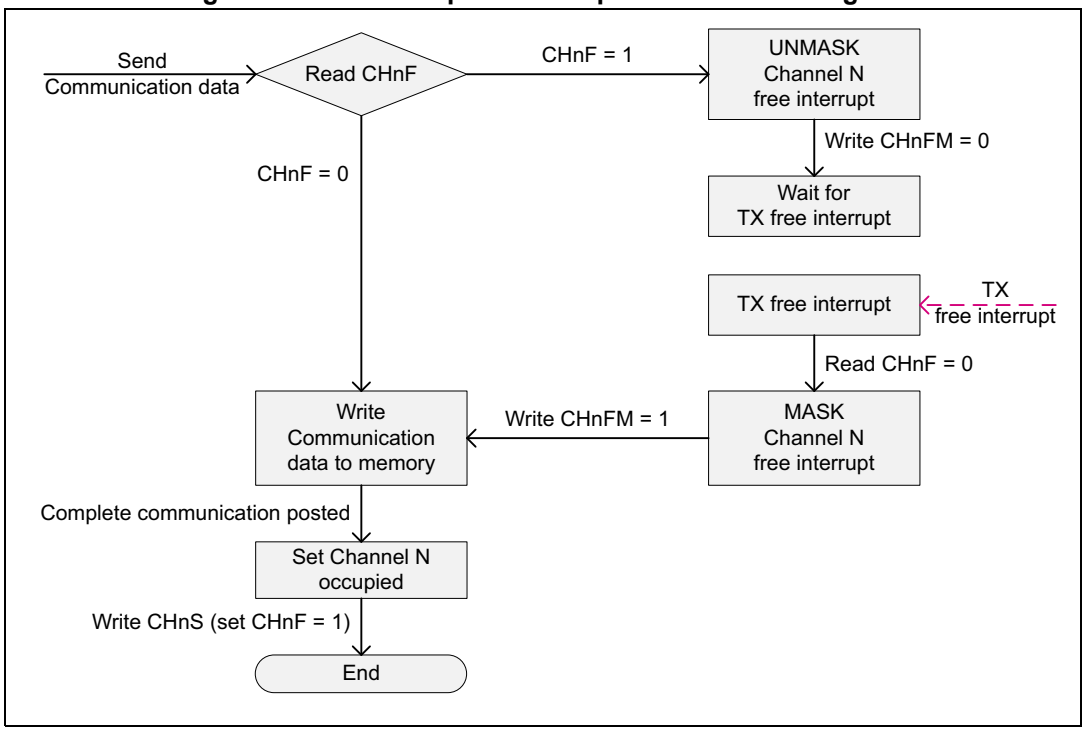
Processor	A	B
SEND A = 1 RECEIVE B = 2	IPCC_C1CR.TXFIE IPCC_C1MR.CHnFM IPCC_C1SCR.CHnS IPCC_C1TOC2SR.CHnF	IPCC_C2CR.RXOIE IPCC_C2MR.CHnOM IPCC_C2SCR.CHnC
SEND A = 2 RECEIVE B = 1	IPCC_C2CR.TXFIE IPCC_C2MR.CHnFM IPCC_C2SCR.CHnS IPCC_C2TOC1SR.CHnF	IPCC_C1CR.RXOIE IPCC_C1MR.CHnOM IPCC_C1SCR.CHnC

Once the sending processor has posted the communication data in the memory, it sets the channel status flag CHnF to occupied with CHnS.

Once the receiving processor has retrieved the communication data from the memory, it clears the channel status flag CHnF back to free with CHnC.

Figure 144. IPCC Simplex channel mode transfer timing





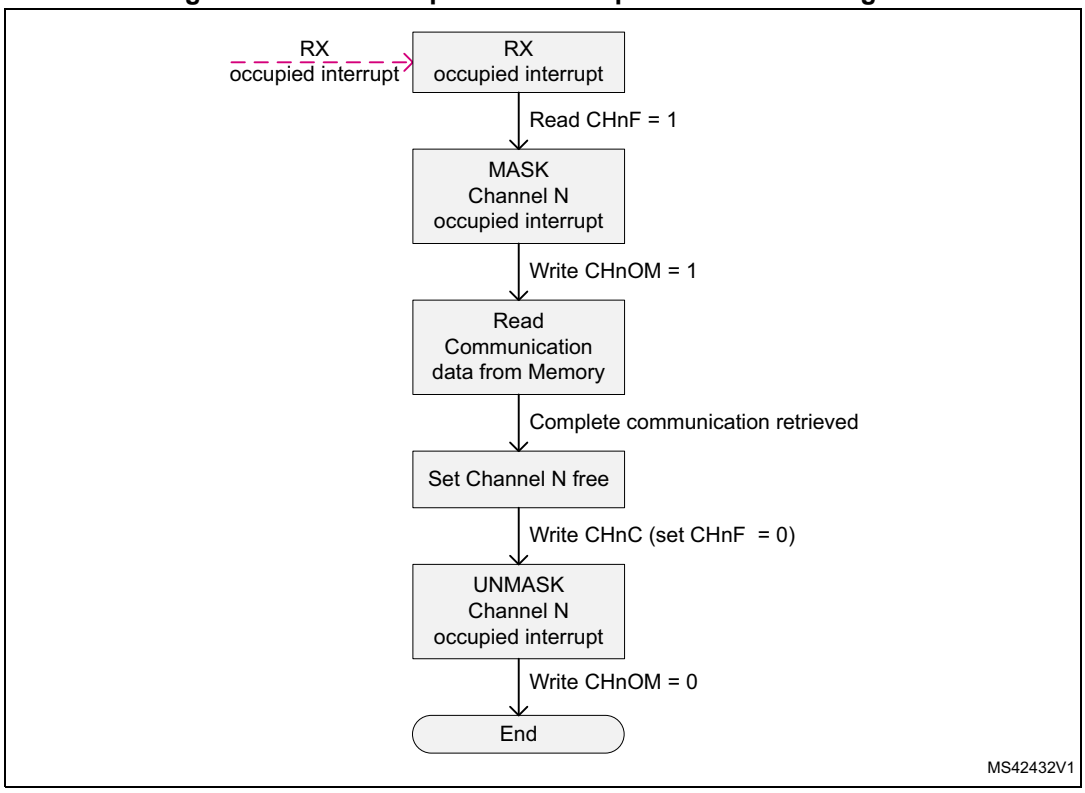


Figure 145. IPCC Simplex - Send procedure state diagram

To send communication data:

- The sending processor checks the channel status flag CHnF:
  - When CHnF = 0, the channel is free (last communication data retrieved by the receiving processor), and the new communication data can be written.
  - When CHnF = 1, the channel is occupied (last communication data not retrieved by the receiving processor), and the sending processor unmasks the channel free interrupt (CHnFM = 0).
  - On a TX free interrupt, the sending processor checks which channel became free and masks the channel free interrupt (CHnFM = 1). Then the new communication can take place.
- Once the complete communication data is posted, the channel status is set to occupied with CHnS. This gives memory access to the receiving processor and generates the RX occupied interrupt.

Figure 146. IPCC Simplex - Receive procedure state diagram

To receive a communication, the channel occupied interrupt is unmasked (CHnOM = 0):

- On an RX occupied interrupt, the receiving processor checks which channel became occupied, masks the associated channel occupied interrupt (CHnOM) and reads the communication data from memory.
- Once the complete communication data is retrieved, the channel status is cleared to free with CHnC. This gives memory access back to the sending processor and may generate the TX free interrupt.
- Once the channel status is cleared, the channel occupied interrupt is unmasked (CHnOM = 0).

23.4.3 IPCC Half-duplex channel mode

The Half-duplex channel mode is used when one processor sends a communication and the other processor sends a response to each communication (ping-pong).

In Half-duplex channel mode, a single dedicated memory location is assigned to communication data and response, and is used to transfer data in both directions. The sending processor channel status flag CHnF is assigned to the channel and used by both processors (see *Table 192*).

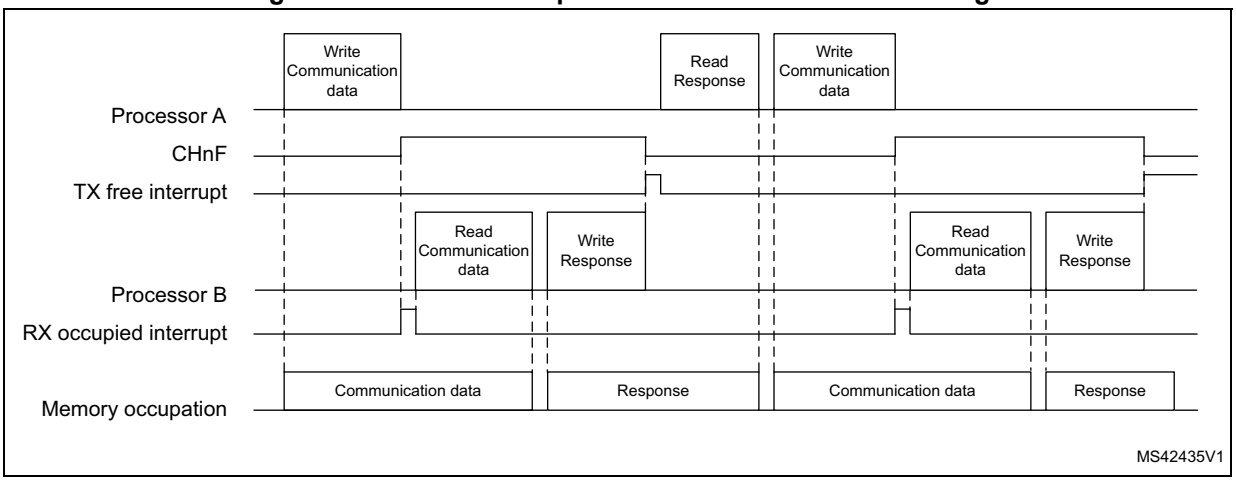
Once the processor A posts communication data into memory, it sets the processor A channel status flag CHnF to occupied with CHnS (giving memory access to processor B).

Once the processor B retrieves communication data from memory, it does not change the channel status flags. The memory access is kept by processor B for the response.

Once the processor B posts the response into memory, it clears the channel status flag CHnF to free with CHnC (giving memory access back to processor A).

Once the processor A retrieves the response from the memory, it does not change the channel status flags. The memory location access is kept by processor A for the next communication data.

Figure 147. IPCC Half-duplex channel mode transfer timing



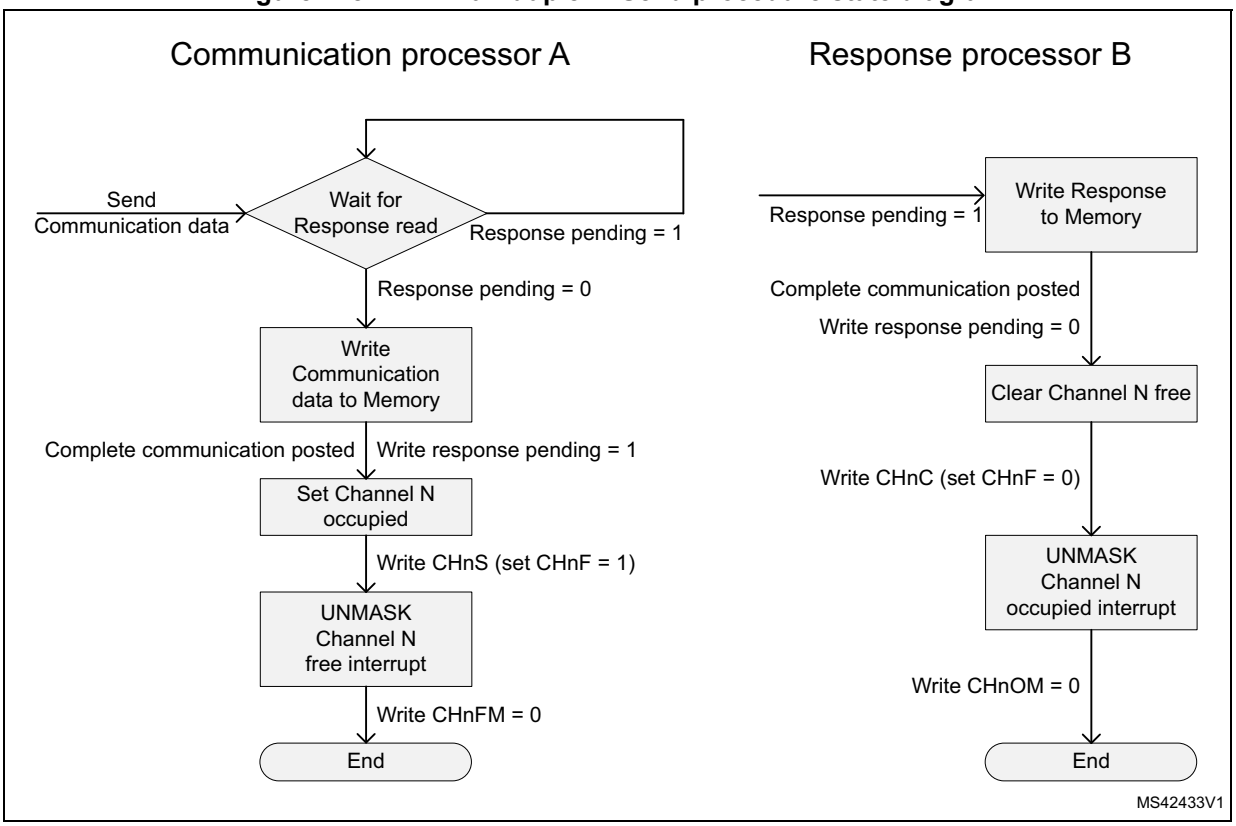


Figure 148. IPCC Half-duplex - Send procedure state diagram

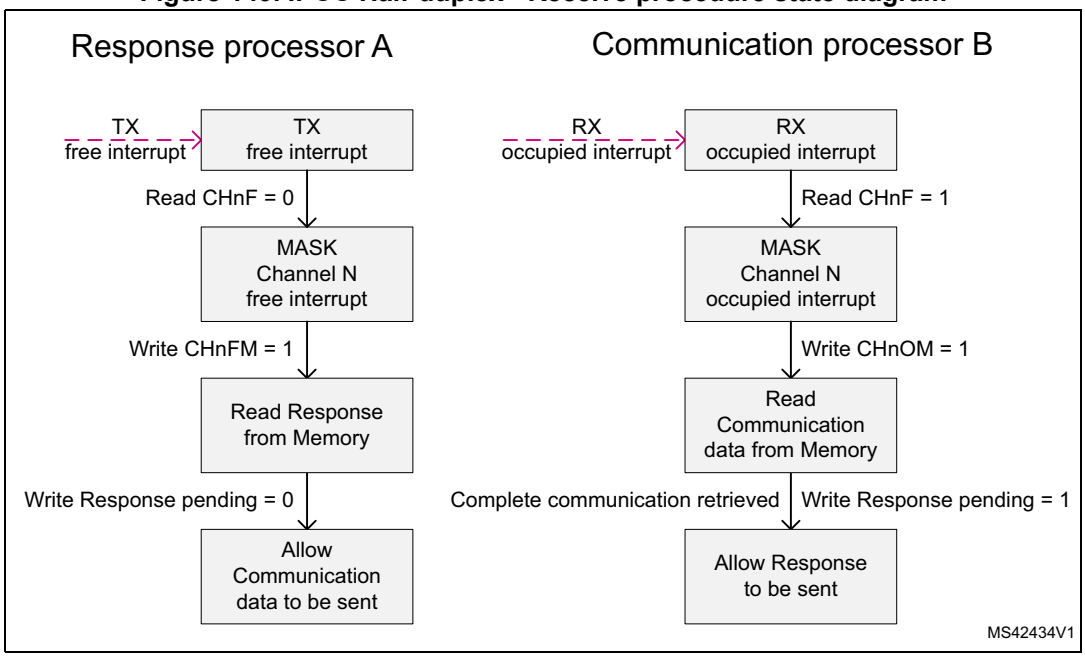

To send communication data:

- The sending processor waits for its response pending software variable to get 0.
  - Once the response pending software variable is 0 the communication data is posted.
- Once the complete communication data has been posted, the channel status flag CHnF is set to occupied with CHnS, and the response pending software variable is set to 1 (this gives memory access and generates the RX occupied interrupt to the receiving processor).
- Once the channel status flag CHnF is set, the channel free interrupt is unmasked (CHnFM = 0).

To send a response:

- The receiving processor waits for its response pending software variable to get 1.
  - Once the response pending software variable is 1, the response is posted.
- Once the complete response is posted, the channel status flag CHnF is cleared to free with CHnC, and the response pending software variable is set to 0 (this gives memory access and generates the TX free interrupt to the sending processor).
- Once the channel status flag CHnF is cleared, the channel occupied interrupt is unmasked (CHnOM = 0).

Figure 149. IPCC Half-duplex - Receive procedure state diagram

To receive communication data the channel occupied interrupt is unmasked (CHnOM = 0):

- On an RX occupied interrupt, the receiving processor checks which channel became occupied, masks the associated channel occupied interrupt (CHnOM) and reads the communication data from the memory.
- Once the complete communication data is retrieved, the response pending software variable is set. The channel status is not changed, access to the memory is kept to post the subsequent response.

To receive the response the channel free interrupt is unmasked (CHnFM = 0):

- On a TX free interrupt, the sending processor checks which channel became free, masks the associated channel free interrupt (CHnFM) and reads the response from the memory.
- Once the complete response is retrieved, the response pending software variable is cleared. The channel status is not changed, access to the memory is kept to post the subsequent communication data.

23.4.4 IPCC interrupts and events

There are eight interrupt lines per CID and security events:

- four RX channel occupied interrupts, one non-secure and one secure for each processor: CID compartment
  - Interrupt enable RXOIE, SECRXOIE per processor
  - Individual mask CHnOM per channel
  - Interrupt routing based on processor CID in IPCC_CxCIDCFGR
- four TX channel free interrupts, one non-secure and one secure for each processor CID compartment
  - Interrupt enable TXFIE, SECTXFIE per processor
  - Individual mask CHnFM per channel
  - Interrupt routing based on processor CID in IPCC_CxCIDCFGR
- illegal access events, for security, privilege, and CID

The RX occupied interrupt is used by the receiving processor and indicates when an unmasked channel status indicates occupied (CHnF = 1).

The TX free interrupt is used by the sending processor, and indicates when an unmasked channel status indicates free (CHnF = 0).

A secure channel only generates a secure interrupt, and only in the case when the channel is secure unmasked and global secure enabled.

A non-secure channel only generates a non-secure interrupt, and only in the case when the channel is non-secure unmasked and global non-secure enabled.

Interrupt routing

When CID filtering is enabled in IPCC_CxCIDCFGR.CFEN, the associated processor x interrupt is only routed to the enabled CID.

When CID filtering is disabled in IPCC_CxCIDCFGR.CFEN, the associated processor x interrupt is broadcast to all supported CIDs. To prevent a compartment to receive unwanted IPCC interrupts, it must be masked at the processor compartment level (in the CPU NVIC).

23.4.5 IPCC security

The IPCC provides per processor and per channel security, in the IPCC_C1SECCFGR, IPCC_C1PRIVCFGR, IPCC_C2SECCFGR and IPCC_C2PRIVCFGR. This allows any channel to be configured in one of the modes detailed in *Table 193*.

Table 193. IPCC security modes

Processor 1	Processor 2	Description
Non-secure	Non-secure	Non-secure / unprivileged
Non-secure	Secure	TX secure - RX non-secure / unprivileged
Secure	Non-secure	TX non-secure - RX secure / unprivileged
Secure	Secure	Full secure / unprivileged
Non-secure privilege	Non-secure	Non-secure TX privilege
Non-secure	Non-secure privilege	Non-secure RX privilege
Non-secure privilege	Non-secure privilege	Non-secure Full privilege
Non-secure privilege	Secure	TX secure privilege - RX non-secure
Non-secure	Secure privilege	TX secure - RX non-secure privilege
Non-secure privilege	Secure privilege	TX secure - RX non-secure / Full privilege
Secure privilege	Non-secure	TX non-secure privilege - RX secure
Secure	Non-secure privilege	TX non-secure - RX secure privilege
Secure privilege	Non-secure privilege	TX non-secure -RX secure/ Full privilege
Secure privilege	Secure	TX privileged - RX unprivilege / Full secure
Secure	Secure privilege	TX unprivileged - RX privilege / Full secure
Secure privilege	Secure privilege	Full secure privilege

All processor non-secure channels generate a processor non-secure interrupt. All processor secure channels generate an associated processor secure interrupt. Illegal accesses to the security control register and privileged control registers are signaled on the illegal access events.

Additionally, the resource isolation allows the processor 1 registers to be protected from the processor 2 accesses and vice versa, and from any other AHB bus master access. Illegal CID processor accesses are signaled on the CID illegal access event.

The channel status in IPCC_CxTOCySR registers are readable by both processors and by all secure and privileged protection levels of these processors. For this the access protection on these registers is only provided on the compartment filtering when enabled for both processor 1 and processor 2. The following table summarizes the protection on IPCC_CxTOCySR. Not having security and privileged protection allows channels to be shared between secure and non-secure, privileged, and unprivileged compartments.

Table 194. Access to channels

IPCC_C1CIDCFGR	IPCC_C2CIDCFGR	IPCC_CxTOCySR access
CFEN = 0	CFEN = 0	No protection, access by secure, non-secure, privileged, unprivileged and any CID.
CFEN = 1	CFEN = 0	
CFEN = 0	CFEN = 1	
CFEN = 1	CFEN = 1	Compartment isolation protected, only access by processor 1 and processor 2 CIDs with secure, non-secure, privileged, and unprivileged. Other CID accesses are illegal.

23.5 IPCC registers

The peripheral registers must be accessed by words (32-bit). Byte (8-bit) and half-word (16-bit) accesses are not permitted and do not generate a bus error.

For any DDCID access to registers and register bits, security and privileged policy applies. When DDEN = 0 accesses from the DDCID to CID filtered registers is ignored. When DDEN = 1 the DDCID has access to all registers regardless of any CID filtering policy.

23.5.1 IPCC processor 1 control register (IPCC_C1CR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEC RXOIE	RXOIE
														rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **SECTXFIE**: Processor 1 transmit channel free secure interrupt enable.
Associated with IPCC_C1TOC2SR.
This bit can only be accessed with a secure access. Non-secure write to this bit is discarded, non-secure read returns 0 value.
1: Enable an unmasked processor 1 transmit channel free to generate a TX free secure interrupt.
0: Processor 1 TX free secure interrupt disabled.

Bit 16 **TXFIE**: Processor 1 transmit channel free non-secure interrupt enable
Associated with IPCC_C1TOC2SR.
1: Enable an unmasked processor 1 transmit channel free to generate a non-secure TX free interrupt.
0: Processor 1 non-secure TX free interrupt disabled

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **SECRXOIE**: Processor 1 receive channel occupied secure interrupt enable.
Associated with IPCC_C2TOC1SR
This bit can only be accessed with a secure access. Non-secure write to this bit is discarded, non-secure read returns 0 value.
1: Enable an unmasked processor 1 receive channel occupied to generate an RX occupied secure interrupt.
0: Processor 1 RX occupied secure interrupt disabled.

Bit 0 **RXOIE**: Processor 1 receive channel occupied interrupt enable
Associated with IPCC_C2TOC1SR.
1: Enable an unmasked processor 1 receive channel occupied to generate an RX occupied interrupt.
0: Processor 1 RX occupied interrupt disabled

23.5.2 IPCC processor 1 mask register (IPCC_C1MR)

Address offset: 0x004

Reset value: 0xFFFF FFFF

This register is CID-filtered depending on the CID configuration in the processor 1 IPCC_C1CIDCFGR. An illegal CID write access is discarded and a read access returns zero data, also on both illegal accesses a CID illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CH16 FM	CH15 FM	CH14 FM	CH13 FM	CH12 FM	CH11 FM	CH10 FM	CH9 FM	CH8 FM	CH7 FM	CH6 FM	CH5 FM	CH4 FM	CH3 FM	CH2 FM	CH1 FM

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **CHnFM:** Processor 1 transmit channel n status set, (n = 16 to 1).

Associated with IPCC_C1TOC2SR.CHnF

When processor 1 CHnSEC is disabled, bit n can be accessed with secure and non-secure access.

When processor 1 CHnSEC is enabled, bit n can only be accessed with secure access. Non-secure write to this bit is discarded, non-secure read returns 0 value.

When processor 1 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.

When processor 1 CHnPRIV is enabled, bit n can only be accessed with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.

1: Transmit channel n free interrupt masked.

0: Transmit channel n free interrupt not masked.

Bits 15:0 **CHnOM**: Processor 1 receive channel n status clear (n = 16 to 1).

Associated with IPCC_C2TOC1SR.CHnF

When processor 1 CHnSEC is disabled, bit n can be accessed with secure and non-secure access.

When processor 1 CHnSEC is enabled, bit n can only be accessed with secure access. Non-secure write to this bit is discarded, non-secure read returns 0 value.

When processor 1 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.

When processor 1 CHnPRIV is enabled, bit n can only be accessed with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.

1: Receive channel n occupied interrupt masked.

0: Receive channel n occupied interrupt not masked.

23.5.3 IPCC processor 1 status set clear register (IPCC_C1SCR)

Address offset: 0x008

Reset value: 0x0000 0000

Reading this register always returns 0x0000 0000.

This register is CID-filtered depending on the CID configuration in the processor 1 IPCC_C1CIDCFGR. An illegal CID write access is discarded and a read access returns zero data, also on both illegal accesses a CID illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:16 **CHnS:** Processor 1 transmit channel n status set (n = 16 to 1).
Associated with IPCC_C1TOC2SR.CHnF
When processor 1 CHnSEC is disabled, bit n can be accessed with secure and non-secure access.
When processor 1 CHnSEC is enabled, bit n can only be accessed with secure access. Non-secure write to this bit is discarded, non-secure read returns 0 value.
When processor 1 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.
When processor 1 CHnPRIV is enabled, bit n can only be accessed with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.
1: Processor 1 transmit channel n status bit set.
0: No action.

Bits 15:0 **CHnC**: Processor 1 receive channel n status clear (n = 16 to 1).
Associated with IPCC_C2TOC1SR.CHnF
When processor 1 CHnSEC is disabled, bit n can be accessed with secure and non-secure access.
When processor 1 CHnSEC is enabled, bit n can only be accessed with secure access. Non-secure write to this bit is discarded, non-secure read returns 0 value.
When processor 1 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.
When processor 1 CHnPRIV is enabled, bit n can only be accessed with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.
1: Processor 1 receive channel n status bit clear.
0: No action.

23.5.4 IPCC processor 1 to processor 2 status register (IPCC_C1TOC2SR)

Address offset: 0x00C

Reset value: 0x0000 0000

When processor 1 or processor 2 CID filtering is disabled, this register has no access limitations, and can be accessed by any domain CID, and any combination of secure, non-secure, privilege, and unprivileged access.

When both processor 1 and processor 2 CID filtering is enabled. Access restriction applies and only both processors CIDs have access, other CID accesses are discarded. In this case, an illegal CID read access returns zero data. A CID illegal access event is generated also on illegal accesses.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CHnF:** Processor 1 transmit to processor 2 receive channel n status flag before masking (n = 16 to 1).

1: Channel occupied, data can be read by the receiving processor 2.
When channel is non-secure in C2SECCFGR, generates a non-secure RX occupied interrupt to processor 2, when unmasked and global non-secure enabled for processor 2.
When channel is secure in C2SECCFGR, generates a secure RX occupied interrupt to processor 2, when unmasked and global secure enabled for processor 2.
0: Channel free, data can be written by the sending processor 1.
When channel is non-secure in C1SECCFGR, generates a non-secure TX free interrupt to processor 1, when unmasked and global non-secure enabled for processor 1.
When channel is secure in C1SECCFGR, generates a secure TX free interrupt to processor 1, when unmasked and global secure enabled for processor 1.

23.5.5 IPCC processor 2 control register (IPCC_C2CR)

Address offset: 0x010

Reset value: 0x0000 0000

This register is CID-filtered depending on the CID configuration in the processor 2 IPCC_C2CIDCFGR. An illegal CID write access is discarded and a read access returns zero data, also on both illegal accesses a CID illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

														rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **SECTXFIE:** Processor 2 secure transmit channel free interrupt enable.
Associated with IPCC_C2TOC1SR.
This bit can only be accessed with a secure access. Non-secure write to this bit is discarded, non-secure read returns 0 value.
1: Enable an unmasked processor 2 transmit channel free to generate a secure TX free interrupt.
0: Processor 2 secure TX free interrupt disabled.

Bit 16 **TXFIE:** Processor 2 transmit channel free interrupt enable
Associated with IPCC_C2TOC1SR.
1: Enable an unmasked processor 2 transmit channel free to generate a TX free interrupt.
0: Processor 2 TX free interrupt disabled

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **SECRXOIE:** Processor 2 secure Receive channel occupied interrupt enable.
Associated with IPCC_C1TOC2SR.
This bit can only be accessed with a secure access. Non-secure write to this bit is discarded, non-secure read returns 0 value.
1: Enable an unmasked processor 2 receive channel occupied to generate an secure RX occupied interrupt.
0: Processor 2 secure RX occupied interrupt disabled.

Bit 0 **RXOIE:** Processor 2 receive channel occupied interrupt enable
Associated with IPCC_C1TOC2SR.
1: Enable an unmasked processor 2 receive channel occupied to generate an RX occupied interrupt.
0: Processor 2 RX occupied interrupt disabled

23.5.6 IPCC processor 2 mask register (IPCC_C2MR)

Address offset: 0x014

Reset value: 0xFFFF FFFF

This register is CID-filtered depending on the CID configuration in the processor 2 IPCC_C2CIDCFGR. An illegal CID write access is discarded and a read access returns zero data, also on both illegal accesses a CID illegal access event is generated.

Bits 31:16 **CHnFM:** Processor 2 transmit channel n free interrupt mask (n = 16 to 1).
Associated with IPCC_C2TOC1SR.CHnF
When processor 2 CHnSEC is disabled, bit n can be accessed with secure and non-secure access.
When processor 2 CHnSEC is enabled, bit n can only be accessed with secure access. Non-secure write to this bit is discarded, non-secure read returns 0 value.
When processor 2 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.
When processor 2 CHnPRIV is enabled, bit n can only be accessed with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.
1: Transmit channel n free interrupt masked.
0: Transmit channel n free interrupt not masked.

Bits 15:0 **CHnOM**: Processor 2 receive channel n occupied interrupt mask (n = 16 to 1).
Associated with IPCC_C1TOC2SR.CHnF
When processor 2 CHnSEC is disabled, bit n can be accessed with secure and non-secure access.
When processor 2 CHnSEC is enabled, bit n can only be accessed with secure access. Non-secure write to this bit is discarded, non-secure read returns 0 value.
When processor 2 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.
When processor 2 CHnPRIV is enabled, bit n can only be accessed with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.
1: Receive channel n occupied interrupt masked.
0: Receive channel n occupied interrupt not masked.

23.5.7 IPCC processor 2 status set clear register (IPCC_C2SCR)

Address offset: 0x018

Reset value: 0x0000 0000

Reading this register always returns 0x0000 0000.

This register is CID-filtered depending on the CID configuration in the processor 2 IPCC_C2CIDCFGR. An illegal CID write access is discarded and a read access returns zero data, also on both illegal accesses a CID illegal access event is generated.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **CHnS:** Processor 2 transmit channel n status set (n = 16 to 1).
Associated with IPCC_C2TOC1SR.CHnF
When processor 2 CHnSEC is disabled, bit n can be accessed with secure and non-secure access.
When processor 2 CHnSEC is enabled, bit n can only be accessed with secure access. Non-secure write to this bit is discarded, non-secure read returns 0 value.
When processor 2 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.
When processor 2 CHnPRIV is enabled, bit n can only be accessed with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.
1: Processor 2 transmit channel n status bit set.
0: No action.

Bits 15:0 **CHnC**: Processor 2 receive channel n status clear (n = 16 to 1).
Associated with IPCC_C1TOC2SR.CHnF
When processor 2 CHnSEC is disabled, bit n can be accessed with secure and non-secure access.
When processor 2 CHnSEC is enabled, bit n can only be accessed with secure access. Non-secure write to this bit is discarded, non-secure read returns 0 value.
When processor 2 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.
When processor 2 CHnPRIV is enabled, bit n can only be accessed with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.
1: Processor 2 receive channel n status bit clear.
0: No action.

23.5.8 IPCC processor 2 to processor 1 status register (IPCC_C2TOC1SR)

Address offset: 0x01C

Reset value: 0x0000 0000

When processor 1 or processor 2 CID filtering is disabled, this register has no access limitations, and can be accessed by any domain CID, and by any combination of secure, non-secure, privileged, and unprivileged access.

When both processor 1 and processor 2 CID filtering is enabled, access restriction applies and only CIDs of both processors have access, other CID accesses are discarded. In this case, an illegal CID read access returns zero data. A CID illegal access event is generated also on illegal accesses.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CHnF:** Processor 2 transmit to processor 1 receive channel n status flag before masking (n = 16 to 1)

1: Channel occupied, data can be read by the receiving processor 1.
When channel is non-secure in C1SECCFGR, generates a non-secure RX occupied interrupt to processor 1, when unmasked and global non-secure enabled for processor 1.
When channel is secure in C1SECCFGR, generates a secure RX occupied interrupt to processor 1, when unmasked and global secure enabled for processor 1.
0: Channel free, data can be written by the sending processor 2.
When channel is non-secure in C2SECCFGR, generates a non-secure TX free interrupt to processor 2, when unmasked and global non-secure enabled for processor 2.
When channel is secure in C2SECCFGR, generates a secure TX free interrupt to processor 2, when unmasked and global secure enabled for processor 2.

23.5.9 IPCC processor 1 security configuration register (IPCC_C1SECCFGR)

Address offset: 0x080

Reset value: 0x0000 0000

This register is CID-filtered depending on the CID configuration in the processor 1 IPCC_C1CIDCFGR. When CID filtering is enabled this register can only be accessed by the enabled CID. An illegal CID write access is discarded and a read access returns zero data, on illegal accesses a CID illegal access event is generated.

This register can only be write accessed by a secure privileged access. A non-secure or unprivileged write access is discarded and causes the generation of an illegal access event. All CID filtered read accesses return the register data.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CHnSEC:** Processor 1 channel n security enable (n = 16 to 1).

1: Channel n processor 1 security enabled (secure)
0: Channel n processor 1 security disabled (non-secure).

23.5.10 IPCC processor 1 privilege configuration register (IPCC_C1PRIVCFGR)

Address offset: 0x084

Reset value: 0x0000 0000

This register is CID-filtered depending on the CID configuration in the processor 1 IPCC_C1CIDCFGR. When CID filtering is enabled, this register can only be accessed by

the enabled CID. An illegal CID write access is discarded, and a read access returns zero data. A CID illegal access event is generated on illegal accesses.

This register can only be write accessed by a privilege access. An unprivileged write access is discarded and causes the generation of a privilege illegal access event. All CID filtered read accesses return the register data.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CHnPRIV:** Processor 1 channel n privilege enable (n = 16 to 1).
When processor 1 CHnSEC is disabled, bit n can be accessed with secure and non-secure access.
When processor 1 CHnSEC is enabled, bit n can only be accessed with secure access. Non-secure write to this bit is discarded.
1: Channel n processor 1 privilege enabled (privileged)
0: Channel n processor 1 privilege disabled (unprivileged).

23.5.11 IPCC processor 1 CID configuration register (IPCC_C1CIDCFGR)

Address offset: 0x088

Reset value: 0x0000 0000

This register can only be written by the secure, privilege, trusted domain CID. An illegal write access to this register generates a CID illegal access event.

This register has no read access limitations, and can be read by any domain CID, and any access protection.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CID[3:0]				Res.	Res.	Res.	CFEN
								rw	rw	rw	rw				rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **CID[3:0]:** Processor 1 CID domain identification
Processor 1 CID domain identification number:
- 0x0: Processor CID 0
- ...
- 0x7: Processor CID 7
- Others: Reserved

If CFEN = 1 these bits are used for processor 1 CID filtering and interrupt routing.
If CFEN = 0 these bits are ignored and there is no processor 1 CID filtering nor interrupt routing.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **CFEN:** CID filtering enabled for processor 1
0: disable the processor 1 CID filtering and interrupt routing, Processor 1 interrupts are broadcast to all CIDs.
1: enable the processor 1 CID filtering and interrupt routing

23.5.12 IPCC processor 2 security configuration register (IPCC_C2SECCFGR)

Address offset: 0x090

Reset value: 0x0000 0000

This register is CID-filtered depending on the CID configuration in the processor 2 IPCC_C2CIDCFGR. When CID filtering is enabled this register can only be accessed by the enabled CID. An illegal CID write access is discarded and a read access returns zero data, on illegal accesses a CID illegal access event is generated.

This register can only be write accessed by a secure privileged access. A non-secure or unprivileged write access is discarded and causes the generation of an illegal access event. All CID filtered read accesses return the register data.

Refer to *Section 2.4 on page 228* for the register boundary addresses.

24 General-purpose I/Os (GPIO)

24.1 GPIO introduction

Each general-purpose I/O port has four 32-bit configuration registers (GPIOx_MODER, GPIOx_OTYPER, GPIOx_OSPEEDR, and GPIOx_PUPDR), two 32-bit data registers (GPIOx_IDR and GPIOx_ODR), one 16-bit reset register (GPIOx_BRR), and one 32-bit set/reset register (GPIOx_BSRR).

All GPIOs have one 32-bit locking register (GPIOx_LCKR), two couple of 32-bit advanced configuration registers (GPIOx_DELAYRL/H, GPIOx_ADVCFGRL/H), and two 32-bit alternate function selection registers (GPIOx_AFRH and GPIOx_AFRL).

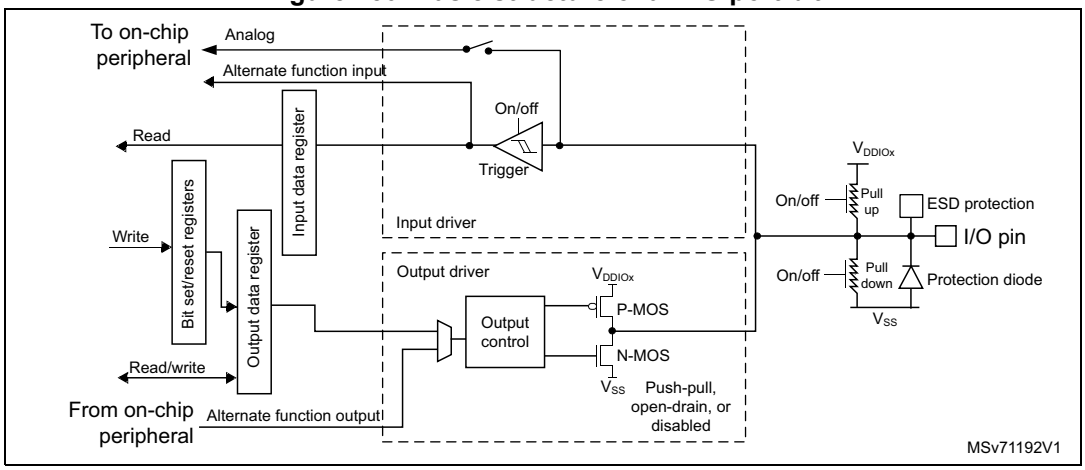
The access can be restricted to each GPIO configuration bit to secure-only and/or privileged-only. These configuration bits can also be allocated to a specific CPU.

24.2 GPIO main features

- Multiple choice of configurations per I/O port:
  - Input configuration in floating, pull-up/down, or analog state
  - Analog configuration (output buffer and Schmitt trigger inputs disabled)
  - Output configuration, or alternate function configuration, in push-pull or open-drain state, with pull-up or pull-down activated
- Data present on the I/O pin sampled to GPIOx_IDR register (input configuration), or to the peripheral (alternate-function configuration)
- Output buffer on the I/O pin driven by GPIOx_ODR register (output configuration) or by the peripheral (alternate-function configuration)
- I/O data output atomic read/modify through GPIOx_ BSRR and GPIOx_BRR registers
- Speed selection for each I/O (GPIOx_OSPEEDR)
- Lock mechanism (GPIOx_LCKR) to selectively freeze the I/O port configurations
- Highly-flexible pin multiplexing allowing the use of I/O pins as GPIOs, or as one of several possible peripheral function
- Programmable delay to either the input path or the output path (GPIOx_DELAYR)
- Double-edge selection, clock inversion, and optional retime (GPIOx_ADVCFGR)
- Possibility to restrict each I/O control to secure-only, privileged-only, or to a specific CPU (using its compartment information)

24.3 GPIO functional description

Subject to the specific hardware characteristics of each I/O port listed in the datasheet, each port bit of the GPIO ports can be individually configured by software in several modes:



- input floating
- input pull-up
- input-pull-down
- analog
- output-open-drain with pull-up or pull-down capability

- output-push-pull with pull-up or pull-down capability
- alternate-function push-pull with pull-up or pull-down capability
- alternate-function open-drain with pull-up or pull-down capability

Each I/O port bit is freely programmable. GPIO registers must be accessed as 32-bit words, half-words, or bytes. GPIOx_BSRR and GPIOx_BRR allow atomic read/modify accesses to any of GPIOx_ODR. There is then no risk of an IRQ occurring between the read and the modify access.

The figure below shows the basic structure of a standard I/O port bit. *Table 196* gives the possible port bit configurations.

Figure 150. Basic structure of an I/O port bit

I/Os can be used at 1.8 V typ. or 3.3 V typ. (default), by selecting the VDDIOxRSEL range in PWR_CR1.

A 1.8 V I/O supply voltage and 1.8 V IO levels, with a 3.3 V I/O range setting is allowed, but results in degraded I/O performances.

A 3.3V I/O supply voltage or 3.3 V I/O levels, with a 1.8 V I/O range setting is not allowed, and may permanently damage the I/O.

Table 196. Port x bit configurations

Port x configuration bits					I/O configuration(1)	
MODEx[1:0]	OTx	OSPEEDx[1:0]	PUPDx[1:0]			
01	0	SPEED[1:0]	0	0	GP output	PP
			0	1		PP + PU
			1	0		PP + PD
			1	1	Reserved (GP output PP)	
	1		0	0	GP output (open-drain)	OD
			0	1		OD + PU
			1	0		OD + PD
			1	1	Reserved (GP output OD)	

Table 196. Port x bit configurations (continued)

Port x configuration bits					I/O configuration(1)	
MODEx[1:0]	OTx	OSPEEDx[1:0]	PUPDx[1:0]			
10	0	SPEED[1:0]	0	0	AF	PP
			0	1		PP + PU
			1	0		PP + PD
			1	1	Reserved (AF PP)	
	1		0	0	AF (open-drain)	OD
			0	1		OD + PU
			1	0		OD + PD
			1	1	Reserved (AF OD)	
00	x	x	0	0	GP input	Floating
	x	x	0	1		PU
	x	x	1	0		PD
	x	x	1	1	Reserved (input floating)	
11	x	x	0	0	Input/output	Analog
	x	x	0	1		Analog
	x	x	1	0		Analog + PD
	x	x	1	1		Analog

1. GP = general-purpose, PP = push-pull, PU = pull-up, PD = pull-down, OD = open-drain, AF = alternate function.

24.3.1 General-purpose I/O (GPIO)

During and just after a reset, alternate functions are not active, and all I/O ports are configured in analog mode, as defined through GPIOx_MODER.

When the pin is configured as output, the value written to GPIOx_ODR is output on the I/O pin. The output driver can be used in push-pull or open-drain mode (only the low level is driven, the high level is Hi-Z).

GPIOx_IDR captures the data present on the I/O pin at every AHB clock cycle.

All GPIO pins have weak internal pull-up and pull-down resistors, that can be activated or not depending on GPIOx_PUPDR value.

24.3.2 I/O pin alternate-function multiplexer and mapping

The I/O pins are connected to on-board peripherals/modules through a multiplexer that allows only one peripheral alternate function (AF) connected to an I/O pin at a time. This avoids any conflict between peripherals available on the same I/O pin.

Each I/O pin has a multiplexer with up to 16 alternate function inputs (AF0 to AF15), that can be configured through GPIOx_AFRL (for pin 0 to 7) and GPIOx_AFRH (for pin 8 to 15):

- During and just after reset, AFs are not active, and all I/O ports are configured in analog mode (through GPIOx_MODER). When active, AF0 is selected by default.

- Specific AF assignments for each I/O pin are detailed in the device datasheet.

This flexible I/O multiplexing architecture is used to optimize the number of peripherals available in smaller packages.

To use an I/O in a given configuration, the user must proceed as follows:

- GPIO modes: configure the desired I/O as output, input, or analog in GPIOx_MODER.
- Peripheral alternate function:
  - For a given peripheral function, use the device datasheet “Alternate functions” table to identify the AF to use with a given I/O. One of GPIOx_AFRL or GPIOx_AFRH must be used.
  - Configure the desired I/O as an AF in GPIOx_MODER. Select also the type, pull-up/pull-down, and output speed via GPIOx_OTYPER, GPIOx_PUPDR, and GPIOx_OSPEEDR respectively.
- Additional functions:
  - In the device datasheet, the “Additional functions” table lists peripheral functions that directly select/enable its allocated I/O port(s). Typical peripherals are RTC, TAMP, PWR (WKUPx pins), or RCC (oscillator pins). These functions have priority over the configuration in standard GPIO registers.
  - For ADC peripherals, configure the desired I/O in analog mode in GPIOx_MODER and configure the required function in ADC registers.
  - As described in the device datasheet “Additional functions”, some pins/balls are directly connected to ANA0 and ANA1 ADC analog inputs.

24.3.3 I/O port control registers

Each GPIO port x has four 32-bit memory-mapped control registers to configure up to 16 I/Os:

- GPIOx_MODER is used to select the I/O mode (input, output, AF, analog).
- GPIOx_OTYPER and GPIOx_OSPEEDR are respectively used to select the output type (push-pull or open-drain) and the speed.
- GPIOx_PUPDR is used to select the pull-up/pull-down whatever the I/O direction.

24.3.4 I/O port data registers

Each GPIO port x has two 16-bit memory-mapped data registers:

- GPIOx_ODR read/writable register stores the data to be output per I/O.
- GPIOx_IDR read-only register stores the data input through each I/O.

24.3.5 I/O data bitwise handling

GPIOx_BSRR allows the application to set and reset each individual bit in GPIOx_ODR. GPIOx_BSRR has twice the size of GPIOx_ODR.

To each bit in GPIOx_ODR, correspond two control bits in GPIOx_BSRR: BS(i) and BR(i). When written to 1, BS(i) sets the corresponding ODR(i) bit. When written to 1, BR(i) resets the ODR(i) corresponding bit.

Writing any bit to 0 in GPIOx_BSRR does not have any effect on the corresponding bit in GPIOx_ODR. If there is an attempt to both set and reset a bit in GPIOx_BSRR, the set action takes priority.

Using GPIOx_BSRR to change the values of individual bits in GPIOx_ODR is a “one-shot” effect that does not lock GPIOx_ODR bits (they can always be accessed directly). GPIOx_BSRR provides a way of performing atomic-bitwise handling.

The software does not need to disable interrupts when programming GPIOx_ODR at bit level: one or more bits can be modified in a single-atomic AHB write access.

24.3.6 GPIO locking mechanism

GPIO control registers can be frozen by applying a specific write sequence to GPIOx_LCKR: each GPIOx_LCKR bit freezes the corresponding bit in GPIOx_MODER, GPIOx_OTYPER, GPIOx_OSPEEDR, GPIOx_PUPDR, GPIOx_DELAYRL/H, GPIOx_ADVCFGRL/H, and GPIOx_AFRL/H.

To write GPIOx_LCKR, a specific write/read sequence must be applied. When the right lock sequence is applied to the bit 16 in this register, LCKR[15:0] value is used to lock the I/O configuration (during the write sequence, LCKR[15:0] value must be the same). When the lock sequence is applied to a port bit, the port bit value can no longer be modified until next device or peripheral reset. Each GPIOx_LCKR bit freezes the corresponding bit in control registers (GPIOx_MODER, GPIOx_OTYPER, GPIOx_OSPEEDR, GPIOx_PUPDR, GPIOx_DELAYRL/H, GPIOx_ADVCFGRL/H, and GPIOx_AFRL/H).

The lock sequence can only be performed using a 32-bit word access to GPIOx_LCKR, due to the fact that GPIOx_LCKR bit 16 must be set at the same time as the [15:0] bits.

Note: The lock sequence aborts in the event of an AHB bus error (see Section 24.4 introduction), or insufficient access rights (see Section 24.3.15 to Section 24.3.17).

The lock sequence automatically suspends when accessing a different register from GPIOx_LCKR. It resumes with the next access to GPIOx_LCKR.

24.3.7 I/O alternate-function input/output

GPIOx_AFRL and GPIOx_AFRH registers are used to select one of the AF inputs/outputs available for each I/O. With these registers, the user can connect an AF to some other pin as required by the application.

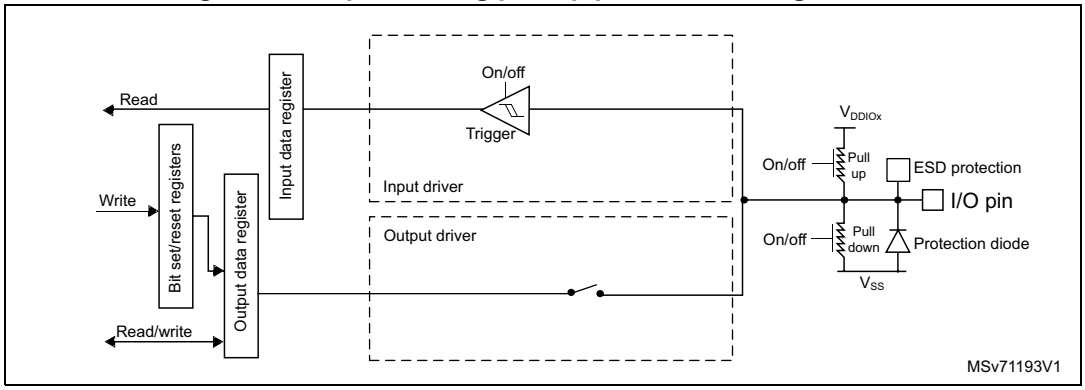
This means that a number of possible peripheral functions are multiplexed on each GPIO using the GPIOx_AFRL and GPIOx_AFRH. The application can thus select any one of the possible functions for each I/O. The AF-selection signal being common to the AF input and AF output, a single channel is selected for the AF input/output of a given I/O.

To know which functions are multiplexed on each GPIO pin, refer to the device datasheet.

24.3.8 External interrupt/wake-up lines

All ports have an external interrupt capability. To use external interrupt lines, the port can be configured in input, output, or alternate-function mode (the port must not be configured in analog mode). Refer to *Section 34: Extended interrupts and event controller (EXTI)* for more details.

24.3.9 Input configuration



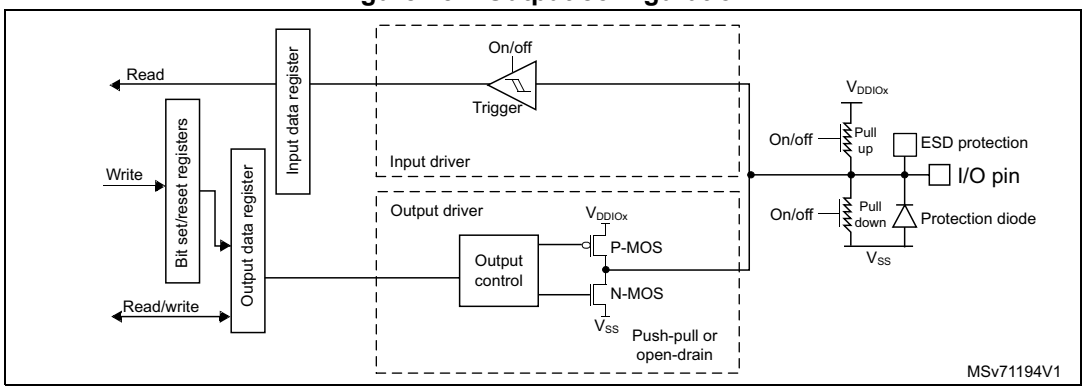
When the I/O port is programmed as input, the following happens:

- The output buffer is disabled.
- The Schmitt trigger input is activated.

- Pull-up and pull-down resistors are activated depending on GPIOx_PUPDR value.
- Data present on the I/O pin are sampled into the input data register every AHB clock cycle.
- A read access to the input data register provides the I/O state.

The figure below shows the input configuration of the I/O port bit.

Figure 151. Input floating/pull-up/pull-down configurations



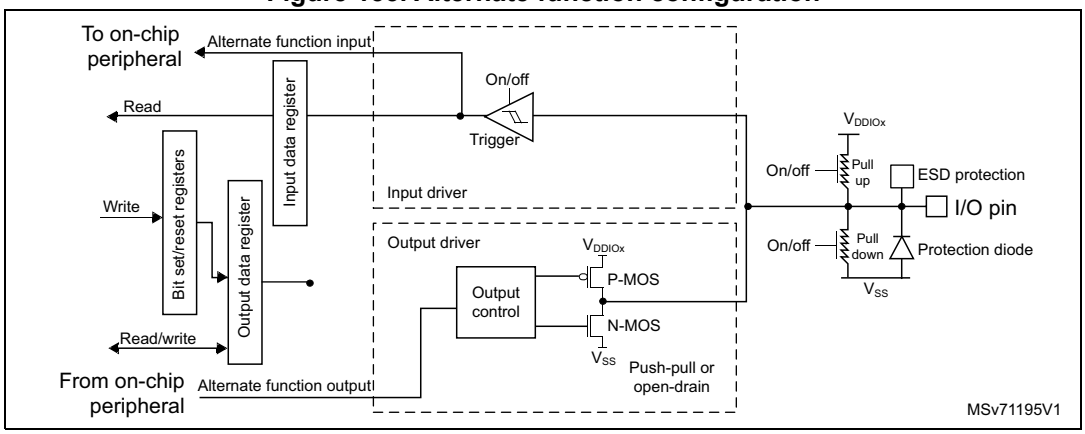
24.3.10 Output configuration

When the I/O port is programmed as output, the following happens:

- The output buffer is enabled:
  - Open-drain mode: a zero in the output register activates the N-MOS. A one in the output register leaves the port in Hi-Z (the P-MOS is never activated).
  - Push-pull mode: a zero in the output register activates the N-MOS. A one in the output register activates the P-MOS.
- The Schmitt trigger input is activated.
- Pull-up and pull-down resistors are activated depending on GPIOx_PUPDR value.
- Data present on the I/O pin are sampled into the input data register every AHB clock cycle.
- A read access to the input data register gets the I/O state.
- A read access to the output data register gets the last written value.

The figure below shows the output configuration of the I/O port bit.

Figure 152. Output configuration



24.3.11 Alternate-function configuration

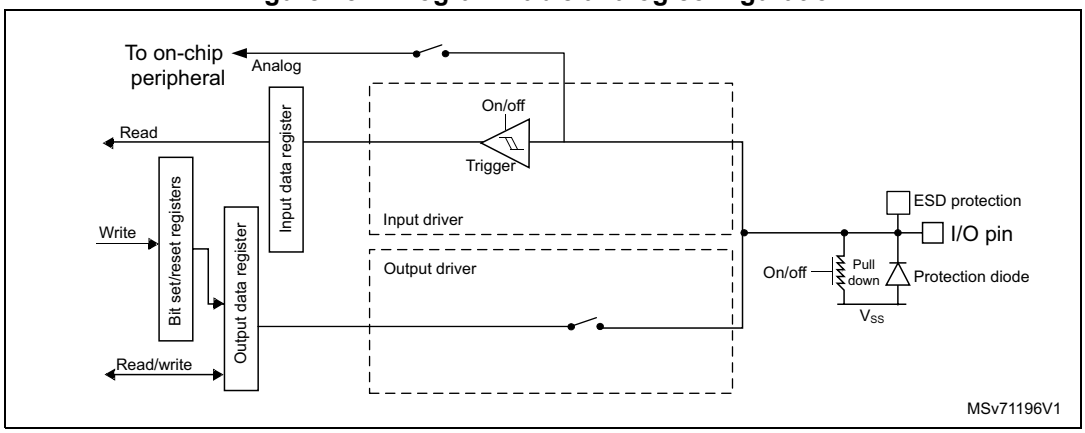
When the I/O port is programmed as alternate function, the following happens:

- The output buffer can be configured in open-drain or push-pull mode.
- The output buffer is driven by signals coming from the peripheral (transmitter enable and data).
- The Schmitt trigger input is activated.
- Weak pull-up and pull-down resistors are activated or not depending on GPIOx_PUPDR value.
- Data present on the I/O pin are sampled into the input data register every AHB clock cycle.
- A read access to the input data register gets the I/O state.

The figure below shows the alternate function configuration of the I/O port bit.

Figure 153. Alternate function configuration

24.3.12 Analog configuration



When the I/O port is programmed as analog, the following happens:

- The output buffer is disabled.
- The Schmitt trigger input is deactivated, providing zero consumption for every analog value of the I/O pin. The output of the Schmitt trigger is forced to a constant value (0).
- The weak pull-up resistor is disabled by hardware. The weak pull-down resistor is activated or not depending on GPIOx_PUPDR value.
- Read access to the input data register gets the value 0.
- The analog switch to the analog peripheral must be closed by control from the analog peripheral.

Caution: The ADC is 1.8 V only. Check the datasheet for allowed voltage on ADC input pins to avoid permanent damage to the ADC.

The figure below shows the programmable, analog-input configuration of the I/O port bits.

Figure 154. Programmable analog configuration

24.3.13 GPIO pins used in V_{SW} domain

The GPIO functionality is lost when the core supply domain is powered off. The pins are then set in analog input mode, unless one of the following conditions is met:

- The GPIO configuration is bypassed by an additional function which stays powered: for example debug (CPU3_SWD only), PWR (WKUP only), RTC, TAMP, or RCC (LSE only). For more information, refer to the relevant sections in this reference manual and datasheet.
- The GPIO bank stays powered (for example GPIOZ). Refer to the power supply list of GPIO table in the datasheet for the list of GPIO pins in V_{SW} domain.

24.3.14 Advanced I/O configurations

I/O compensation cell

The I/O commutation slew rate (t_{fall}/t_{rise}) can be adapted by software depending on PVT (process, voltage, and temperature) conditions, in order to reduce the I/O noise on power supply. Refer to *Section 25: System configuration controller (SYSCFG)* for more details.

I/O path configurable delay

A delay programmed in GPIOx_DELAYRL/H can be applied to either input or output path, based on DLYPATHy in GPIOx_ADVCFGRL/R.

I/O data double-edge selection

Input and output data can be managed as single- or double-edge, according to DEy in GPIOx_ADVCFGRL/R.

I/O data retiming

When RETy is set in GPIOx_ADVCFGRL/R, input and output data are retimed to either rising or falling clock edge, depending on INVCLKy value.

24.3.15 I/O pin isolation using TrustZone

As TrustZone-aware peripheral, each I/O pin of GPIO port x can be individually configured as secure through GPIOx_SECCFGR. After reset, all GPIO ports are secure.

I/Os connected to peripheral functions can be conditioned by the peripheral security configuration (see *Section 6.2: Resource isolation framework (RIF)* for more details):

- peripherals for which the I/O pin selection is done through GPIOx_AFRL/H

  If the peripheral is configured as secure, it cannot be connected to a non-secure I/O pin. If this is not respected, the input data to the secure peripheral is forced to zero (I/O input pin value ignored), and the output pin value is forced to zero. Any secure information leak through non-secure I/Os is then avoided. TrustZone-aware logic around GPIO ports is summarized in *Table 197*.
- peripherals (like ADC) that embed AFs that directly select/enable its allocated I/O ports using analog switches

  if the I/O is secure, this analog switch cannot be controlled by a non-secure peripheral. If the peripheral is configured as non-secure and the I/O is secure, the switch remains open. This prevents the redirection of secure data to a non-secure peripheral or I/O through analog path. Refer to *Section 6: System security* for the list of peripherals using this security.
- I/Os that do not have an hardware protection linked to TrustZone (see *Section 6: System security*)

  The listed signals (input and/or outputs) are not blocked when the I/O is set as secure. The associated peripheral is non secure. For each of these I/Os, the secure application must decide if a potential effect on data integrity or confidentiality is critical or not.

Refer to the ‘pin definition’ table in the device datasheet for more information about peripheral AFs (first above bullet) and additional-function mapping (last two bullets).

Table 197. Secure AF between peripherals and allocated I/Os

Security configuration		Alternate-function logic		Comment
Peripheral	**Allocated I/O pin**	**Input**	**Output**	
Secure	Secure	I/O data	Peripheral data	-
Non-secure				Out of reset configuration
Secure	Non-secure	Zero	Zero	-
Non-secure		I/O data	Peripheral data	

Table 198 lists the I/O port y secured bits, following the SECy setting in GPIOx_SECCFGR. For each register in the table:

- When a bit is secure, read and write operations are only allowed by a secure access. Non-secure read or write accesses on secure bits are RAZ/WI, with no illegal access event generated.
- When a bit is non-secure, there is no TrustZone restriction. Read and write operations are allowed by both secure and non-secure accesses.

Table 198. GPIO protected bits

Protected bit	Register name	Illegal access to protected bit
MODEy[1:0]	GPIOx_MODER	RAZ/WI
OTy	GPIOx_OTYPER	
OSPEEDy[1:0]	GPIOx_OSPEEDR	
PUPDy[1:0]	GPIOx_PUPDR	
IDy	GPIOx_IDR	
ODy	GPIOx_ODR	
BSy and BRy	GPIOx_BSRR	
BRy	GPIOx_BRR	
LCKy	GPIOx_LCKR	
AFSELy[3:0]	GPIOx_AFRH	
	GPIOx_AFRL	
DLYy[3:0]	GPIOx_DELAYRL	RAZ/WI
	GPIOx_DELAYRH	
RETy, INVCLKy, DEy, DELYPATHy	GPIOx_ADVCFGRL	
	GPIOx_ADVCFGRH	

Note: GPIOx_SECCFGR is readable by any application, and writable by only secure privileged applications.

Each bit in GPIOx_SECCFGR is write locked until the next device reset when setting the corresponding bit in GPIOx_RCFGLOCKR.

24.3.16 I/O pin isolation using privilege

As RIF-aware peripheral, each I/O pin of GPIO port x can be individually configured as privileged through GPIOx_PRIVCFGR . After reset, all GPIO registers can be read and written by privileged and unprivileged accesses, if the security is enough and the CPU is allowed.

Table 198 in the previous section lists the I/O port y protected bits, following PRIVy setting in GPIOx_PRIVCFGR. For each register in the table:

- When a bit is privileged, read and write operations are only allowed by a privileged access. Unprivileged read or write accesses on privileged bits are RAZ/WI, with no illegal access event generated.
- When a bit is unprivileged, there is no privilege restriction. Read and write operations are allowed by both privileged and unprivileged accesses.

Note: GPIOx_PRIVCFGR is readable by any application, writable by only privileged applications.

Each bit in GPIOx_PRIVCFGR is write locked until the next device reset, when setting the corresponding bit in GPIOx_RCFGLOCKR.

24.3.17 I/O pin isolation using compartments

As RIF-aware peripheral, when the compartment-based filtering is active (CFEN = 1), each I/O pin y of GPIO port x can be individually configured as controlled by a unique CPU using one of the following techniques:

- A trusted-domain application keeps SEM_EN cleared, and sets the authorized compartment with SCID[1:0] in GPIOx_CIDCFGRy.
- A trusted-domain application sets SEM_EN, and sets compartments that are authorized to take the I/O pin y, by setting the corresponding SEMWLCm bits in GPIOx_CIDCFGRy. Each CPU, white-listed this way, is authorized to take SEM_MUTEX in GPIOx_SEMCRy to have the exclusive ownership on the I/O pin until this CPU clears SEM_MUTEX.

Table 198 in *Section 24.3.15* details the I/O port y protected bits following the isolation to a compartment using GPIOx_CIDCFGRy and GPIOx_SEMCRy. For each register in the table:

- For bits with compartment filtering activated: read and write operations are only allowed to the CPU with the correct compartment ID (CID), if secure and privilege of the access are enough. Other CPUs read configuration bits as zero, and writes are ignored. There is no illegal access event generated.
- For bits with compartment filtering deactivated: no restriction. Read and write operations are allowed by any CPU, if secure and privilege of the access are enough.

Note: GPIOx_CIDCFGR and GPIOx_SEMCR are readable by any application. GPIOx_CIDCFGR is writable only by the trusted-domain CPU.

GPIOx_CIDCFGRy is write locked until the next device reset, when setting RLOCKy in GPIOx_RCFGLOCKR.

For more information on RIF, compartment ID (CID) and trusted domain application, refer to *Section 6.2: Resource isolation framework (RIF)*.

24.4 GPIO registers

These registers are accessible through 32-bit word, half-word, or byte single access. Double-word and instruction-fetch accesses trigger an AHB bus error. Byte or half-word writes to GPIOx_LCKR are silently ignored (no bus error).

For any DDCID access to registers, the security and privileged policy applies like any other CIDs. Compartment filtering policy also applies to DDCID access if the debug domain is deactivated (DDEN = 0). When the debug domain is activated (DDEN = 1), the DDCID access goes through regardless of any CID filtering policy.

24.4.1 GPIO port x mode register (GPIOx_MODER) (x = A to K, Z)

Address offset: 0x000

Reset value: 0x0FFF FFFF (H port)

Reset value: 0x0000 FFFF (K port)

Reset value: 0x000F FFFF (Z port)

Reset value: 0xFFFF FFFF (all other ports)

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MODEy[1:0]:** Port x configuration I/O pin y (y = 15 to 0)

These bits are written by software to configure the I/O mode.

00: General-purpose input mode

01: General-purpose output mode

10: Alternate-function mode (refer to device datasheet for available options)

11: Analog mode (reset state)

Successful read or write to MODEy must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.

If SEM_EN = 1, it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

24.4.2 GPIO port x output type register (GPIOx_OTYPER) (x = A to K, Z)

Address offset: 0x004

Reset value: 0x0000 0000

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **OTy:** Port x configuration I/O pin y (y = 15 to 0)

These bits are written by software to configure the I/O output type.

0: Output push-pull (reset state)

1: Output open-drain

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bit, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.

If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

24.4.3 GPIO port x output speed register (GPIOx_OSPEEDR) (x = A to K, Z)

Address offset: 0x008

Reset value: 0x0000 0000

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **OSPEEDy[1:0]**: Port x configuration I/O pin y (y = 15 to 0)

These bits are written by software to configure the I/O output speed.

00: Low speed

01: Medium speed

10: High speed

11: Very-high speed

Note: Refer to the device datasheet for frequency specifications, power supply, and load conditions for each speed.

Successful read or write to the bitfield OSPEEDy must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

24.4.4 GPIO port pull-up/pull-down register (GPIOx_PUPDR) (x = A to K, Z)

Address offset: 0x00C

Reset value: 0x0000 0000

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PUPDy[1:0]:** Port x configuration I/O pin y (y = 15 to 0)

These bits are written by software to configure the I/O pull-up or pull-down

00: No pull-up, pull-down

01: Pull-up

10: Pull-down

11: Reserved

Successful read or write to the bitfield PUPDy must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

24.4.5 GPIO port x input data register (GPIOx_IDR) (x = A to K, Z)

Address offset: 0x010

Reset value: 0x0000 XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **IDy:** Port x input data I/O pin y (y = 15 to 0)

These bits are read-only. They contain the input value of the corresponding I/O port.
Successful read to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.
If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read, if privilege and security of the access is sufficient. Illegal read returns zero.
Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

24.4.6 GPIO port x output data register (GPIOx_ODR) (x = A to K, Z)

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **ODy:** Port x output data I/O pin y (y = 15 to 0)

These bits can be read and written by software.

Note: For atomic bit set/reset, the OD bits can be individually set and/or reset by writing to GPIOx_BSRR or GPIOx_BRR.

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bit, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

24.4.7 GPIO port x bit set/reset register (GPIOx_BSRR) (x = A to K, Z)

Address offset: 0x018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:16 **BRy:** Port x reset I/O pin y (y = 15 to 0)

These bits are write-only. A read to these bits returns the value 0x0000.

0: No action on the corresponding ODx bit

1: Resets the corresponding ODx bit

Note: If both BSx and BRx are set, BSx has priority.

Successful write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can write to this bit, if privilege and security of the access is sufficient. Illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

Bits 15:0 **BS[15:0]:** Port x set I/O pin y (y = 15 to 0)

These bits are write-only. A read to these bits returns the value 0x0000.

0: No action on the corresponding ODx bit

1: Sets the corresponding ODx bit

Successful write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can write to this bit, if privilege and security of the access is sufficient. Illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

24.4.8 GPIO port x configuration lock register (GPIOx_LCKR) (x = A to K, Z)

Address offset: 0x01C

Reset value: 0x0000 0000

This register is used to lock the configuration of the port bits when a correct write sequence is applied to bit 16 (LCKK). The value of bits [15:0] is used to lock the GPIO configuration. During the lock sequence, LCKR[15:0] value can change, but only stable bits are set (for example: if LCKR[15:0] = 0x3 during the first two writes but LCKR[15:0] = 0x2 for the third write, then only LCK1 is set).

Note: Only word access (32-bit long) is allowed during this locking sequence. Byte or half-word writes are silently ignored (no bus error, no abort to lock sequence).

When the lock sequence has been applied on a port bit, this port bit value can no longer be modified until the next device or peripheral reset. Each lock bit freezes a specific configuration register (control and alternate-function registers).
See *Section 24.3.6* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LCKK
															rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LCK15	LCK14	LCK13	LCK12	LCK11	LCK10	LCK9	LCK8	LCK7	LCK6	LCK5	LCK4	LCK3	LCK2	LCK1	LCK0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **LCKK:** Lock key

This bit can be read any time. It can only be modified using the lock key write sequence.
0: Port configuration lock key not active
1: Port configuration lock key active. This register is locked until the next device or peripheral reset.
LOCK key write sequence:
WR LCKR[16] = 1 + LCKR[15:0]
WR LCKR[16] = 0 + LCKR[15:0]
WR LCKR[16] = 1 + LCKR[15:0]
RD LCKR
RD LCKR[16] = 1 (this read operation is optional but it confirms that the lock is active.)

Note: During the lock key write sequence, LCK[15:0] value must not change.
Any error in the lock sequence aborts the lock.
After the first lock sequence on any bit of the port, any read access on LCKK returns one until the next device or peripheral reset.

Bits 15:0 **LCKy:** Port x lock I/O pin y (y = 15 to 0)

These bits are read/write but can only be written when LCKK = 0.

0: Port configuration not locked

1: Port configuration locked

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bit, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

24.4.9 GPIO port x alternate function low register (GPIOx_AFRL) (x = A to K, Z)

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **AFSELy[3:0]:** Alternate function selection for port x I/O pin y (y = 15 to 8)

These bits are written by software to configure alternate function I/Os. See GPIOx_AFRL register for details.

Successful read or write to the bitfield AFSELy must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

24.4.11 GPIO port x bit reset register (GPIOx_BRR) (x = A to K, Z)

Address offset: 0x028

Reset value: 0x0000 0000

w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **BRy:** Port x reset I/O pin y (y = 15 to 0)

These bits are write-only. A read to these bits returns the value 0x0000.

0: No action on the corresponding ODx bit

1: Reset the corresponding ODx bit

Successful write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can write to this bit, if privilege and security of the access is sufficient. Illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

24.4.12 GPIO port x secure configuration register (GPIOx_SECCFGR) (x = A to K, Z)

Address offset: 0x030

Reset value: 0x0000 FFFF

This register is used to configure a selected I/O as secure. Non-secure or unprivileged writes to this register are ignored, while any read is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SECy**: I/O pin y of Port x security configuration (y = 15 to 0)
0: The I/O pin y is non-secure. Secure access is also possible.
1: The I/O pin y is secure. Refer to *Table 198* for all corresponding secured bits.
If compartment filtering for this I/O pin is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (resp any compartment) can write this bit, if privilege and security of the access is sufficient.
Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGR.
If SEM_EN = 1 it is equal to SEMCID if SEM_MUTEX = 1 in GIPOx_SEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.
If RLOCKy bit is set in GPIOx_RCFGLOCKR write to this bit is ignored.

24.4.13 GPIO port x privileged configuration register (GPIOx_PRIVCFGR) (x = A to K, Z)

Address offset: 0x034

Reset value: 0x0000 0000

Unprivileged writes to this register are ignored, while any read is allowed.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PRIVy**: I/O pin y of port x privilege configuration (y = 15 to 0)

0: The I/O pin y is unprivileged. Privileged access is also possible.

1: The I/O pin y is privileged only. Refer to *Table 198* for all corresponding protected bits.

If corresponding SECy is set in GPIOx_SECCFGR, this bit can only be written by a secure privileged application.

If compartment filtering for this I/O pin is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (resp any compartment) can write this bit, if privilege and security of the access is sufficient.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGR.

If SEM_EN = 1 it is equal to SEMCID if SEM_MUTEX = 1 in GIPOx_SEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

If RLOCKy bit is set in GPIOx_RCFGLOCKR write to this bit is ignored.

24.4.14 GPIO port x resource configuration lock register (GPIOx_RCFGLOCKR) (x = A to K, Z)

Address offset: 0x038

Reset value: 0x0000 0000

Secure privileged write access only. Write only by trusted domain CID.

Any read access is allowed on this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **RLOCKy**: I/O pin y of port x resource lock (y = 15 to 0)

This bit is set to lock this I/O resource. It is cleared by default and once set it cannot be cleared until GPIOx peripheral is reset.

0: Bits SECy in GPIOx_SECCFGR and PRIVy in GPIOx_PRIVCFGR are writable. GPIOx_CIDCFGRy is also writable.

1: Writes to bits SECy in GPIOx_SECCFGR and PRIVy in GPIOx_PRIVCFGR are ignored. Writes to GPIOx_CIDCFGRy are also ignored.

24.4.15 GPIO port x delay low register (GPIOx_DELAYRL) (x = A to K, Z)

Address offset: 0x040

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DLY7[3:0]				DLY6[3:0]				DLY5[3:0]				DLY4[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DLY3[3:0]				DLY2[3:0]				DLY1[3:0]				DLY0[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DLYy[3:0]:** Port x IO pin y delay setup (y = 7 to 0)

Configure delay applied to either the input path (data IN from pad) or the output path (data OUT to pad), depending on the value of the corresponding DLYPATHy in GPIOx_ADVCFGRL.

0000: no delay
0001: delay 0.3 ns
0010: delay 0.5 ns
0011: delay 0.75 ns
0100: delay 1.0 ns
0101: delay 1.25 ns
0110: delay 1.5 ns
0111: delay 1.75 ns
1000: delay 2.0 ns
1001: delay 2.25 ns
1010: delay 2.5 ns
1011: delay 2.75 ns
1100: delay 3.0 ns
1101: delay 3.25 ns
1110 to 1111: delay 3.25 ns (maximum)

Successful read or write to the bitfield DLYy must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

24.4.16 GPIO port x delay high register (GPIOx_DELAYRH) (x = A to K, Z)

Address offset: 0x044

Reset value: 0x0000 0000

Bits 31, 27, 23, 19, 15, 11, 7, 3 **RETy**: Data retime selection y (y = 7 to 0)

0: Input and output data are not synchronized or retimed on clock edges.

1: Input and output data are retimed to either rising or falling clock edge depending on value of INVCLKy.

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.

If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

Bits 30, 26, 22, 18, 14, 10, 6, 2 **INVCLKy**: Clock inversion selection y (y = 7 to 0)

0: I/O clocks are not inverted. Input and output data are retimed to rising clock edge.

1: I/O clocks are inverted. Input and output data are retimed to falling clock edge.

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.

If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

Bits 29, 25, 21, 17, 13, 9, 5, 1 **DEy**: Input/Output data double edge selection y (y = 7 to 0)

0: Input and output data is single-edge (changing on rising or falling clock edge, but not both)

1: Input and output data is double-edge (changing on both rising and falling clock edges)

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.

If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

Bits 28, 24, 20, 16, 12, 8, 4, 0 **DLYPATHy**: Controls which path contains the configurable delay, input or output y (y = 7 to 0)
0: Delay is switched into the output path, while the input path is set as pass through.
1: Delay is switched into the input path, while the output path is set as pass through.
Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.
If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.
Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

24.4.18 GPIO port x advanced configuration high register (GPIOx_ADVCFGRH) (x = A to K, Z)

Illegal read returns zero and illegal write is ignored.
Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

Bits 30, 26, 22, 18, 14, 10, 6, 2 **INVCLKy**: Clock inversion selection y (y = 15 to 8)

0: I/O clocks are not inverted. Input and output data are retimed to rising clock edge.

1: I/O clocks are inverted. Input and output data are retimed to falling clock edge.

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.

If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

Bits 29, 25, 21, 17, 13, 9, 5, 1 **DEy**: Input/Output data double edge selection y (y = 15 to 8)

0: Input and output data is single-edge (changing on rising or falling clock edge, but not both)

1: Input and output data is double-edge (changing on both rising and falling clock edges)

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.

If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

Bits 28, 24, 20, 16, 12, 8, 4, 0 **DLYPATHy**: Controls which path contains the configurable delay, input or output y (y = 15 to 8)

0: Delay is switched into the output path, while the input path is set as pass through.

1: Delay is switched into the input path, while the output path is set as pass through.

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.

If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

24.4.19 GPIO port x CID configuration register for I/O pin y (GPIOx_CIDCFGRy) (x = A to K, Z)

Address offset: 0x050 + 0x8 * y (y = 0 to 15)

Reset value: 0x0000 0000

Secure privileged write access only. Write only by trusted domain CID.

Any read access is allowed on this register. Any write is ignored if RLOCKy is set in GPIOx_RCFGLOCKR register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEMWLC3	SEMWLC2	SEMWLC1	SEMWLC0
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCID[1:0]		Res.	Res.	SEM_EN	CFEN
										rw	rw			rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **SEMWLCz**: Semaphore white list for compartment z (z = 3 to 0)

0: Application running in compartment z cannot get access to the I/O pin y through semaphore SEM_MUTEX.

1: Application running in compartment z can get access to the I/O pin y through semaphore SEM_MUTEX.

Each bit is not taken into account by GPIOx when semaphore is disabled (SEM_EN = 0), or compartment filtering is off (CFEN = 0) for this I/O pin.

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:4 **SCID[1:0]**: Static CID

Trusted domain application uses this bitfield to statically define which compartment has access to the I/O pin y when SEM_EN = 0.

This CID is not taken into account by GPIOx when semaphore is enabled (SEM_EN = 1) or compartment filtering is off (CFEN=0) for this I/O pin.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **SEM_EN**: Semaphore enable

0: Access to I/O pin y is granted only if CID of the access equals to SCID.

1: Access to I/O pin y is granted only if SEM_MUTEX = 1 and CID of the access equals to SEMCID in GPIOx_SEMCR.

This bit is not taken into account by GPIOx if compartment filtering is off (CFEN = 0) for this I/O pin. When this bit is cleared from 1 by trusted domain application SEM_MUTEX is cleared to zero by GPIOx.

Bit 0 **CFEN**: CID filtering enable

0: Compartment-based filtering defined in GPIOx_CIDCFGR, and optionally GPIOx_SEMCR is disabled for I/O pin y.

1: Compartment-based filtering defined in GPIOx_CIDCFGR, and optionally GPIOx_SEMCR is enabled for I/O pin y.

For any CFEN value access controls to I/O pin y defined in GPIOx_PRIVCFGR and GPIOx_SECCFGR always apply. When this bit is cleared from 1 by trusted domain application SEM_MUTEX is cleared to zero by GPIOx.

24.4.20 GPIO port x semaphore control register for I/O pin y (GPIOx_SEMCRy) (x = A to K, Z)

Address offset: 0x054 + 0x8 * y (y = 0 to 15)

Reset value: 0x0000 0000

If compartment filtering is disabled (CFEN = 0) or semaphore is disabled (SEM_EN = 0) in GPIOx_CIDCFGRy, any write to this register is ignored.

Privileged-only write if PRIVy is set in GPIOx_PRIVCFGR. Secure-only write if SECy is set in GPIOx_SECCFGR.

If compartment filtering is enabled and semaphore is enabled (CFEN and SEM_EN set in GPIOx_CIDCFGRy), only an authorized compartment can write to this register. For this register, the authorized compartment is equal to SEMCID if SEM_MUTEX = 1, else it is defined by the CID white list (SEMWLCm) in GPIOx_CIDCFGRy. There is no authorized compartment if semaphore is disabled (SEM_EN = 0).

Any read access is allowed to this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEMCID[1:0]		Res.	Res.	Res.	SEM_ MUTEX
										r	r				rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:4 **SEMCID[1:0]**: Semaphore current CID

When SEM_EN and CFEN are set in GPIOx_CIDCFGRy, this read-only bitfield is updated with the CID value of the latest successful acquisition of GPIOx_SEMCRy semaphore (SEM_MUTEX = 1). In all other cases SEMCID stays unchanged.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **SEM_MUTEX**: Semaphore mutex

White listed application can set semaphore bit to get exclusive access to the I/O pin y configuration when SEM_EN is set in GPIOx_CIDCFGRy (writes are ignored otherwise).

Read 0: Semaphore is free to take

Read 1: Semaphore is taken

Write 0: Release semaphore

Write 1: Acquire semaphore

When SEM_MUTEX = 0, only applications belonging to white-listed compartments (defined with SEMWLCm bits in GPIOx_CIDCFGRy) can acquire this semaphore.

When SEM_MUTEX = 1, only applications belonging to compartment SEMCID can release this semaphore.

This bit is cleared when CFEN or SEM_EN are cleared from 1 by trusted domain application in GPIOx_CIDCFGRy.

24.4.21 GPIO port x hardware configuration register 11 (GPIOx_HWCFGR11) (x = A to K, Z)

Refer to *Section 2.4* for the register boundary addresses.

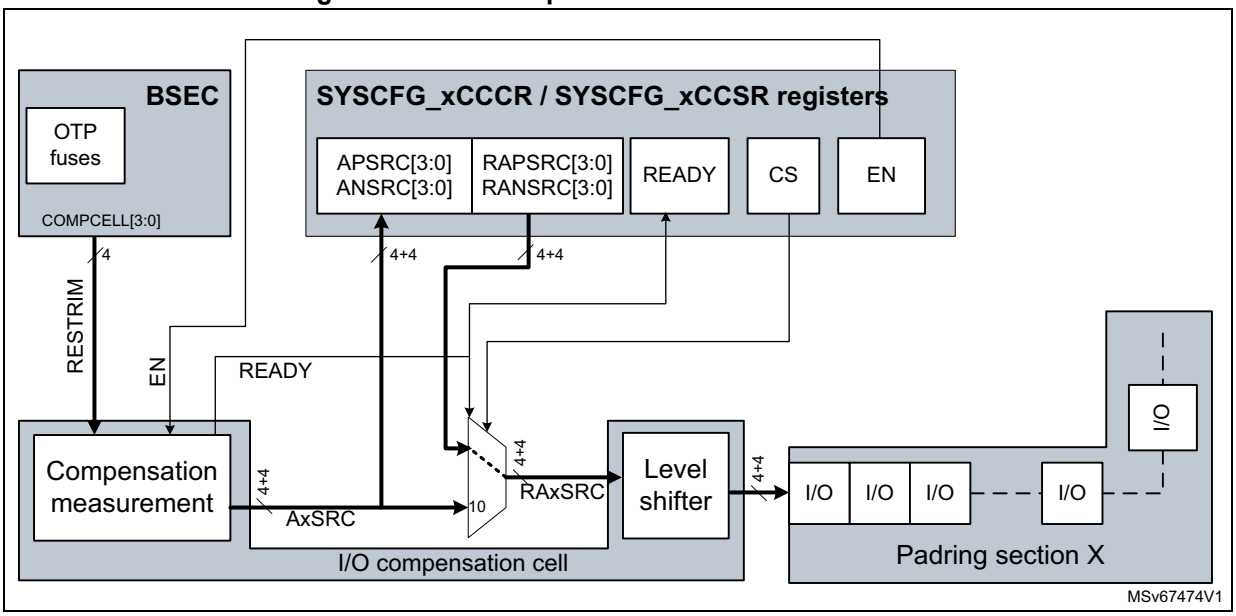
25 System configuration controller (SYSCFG)

STM32MP23/25xx devices feature a set of configuration registers. The main purposes of the system configuration controller are the following:

- Managing OCTOSPI1, OCTOSPI2, SDMMC1, SDMMC2, and SDMMC3 delay block
- Managing system related settings
- Managing I/O compensation cells
- Managing ETH1, ETH2 and ETHSW clock source selection
- Managing the selection of reference clock frequency, the control of the battery charging procedure, and the trimming of USB2PHY1 electrical parameters
- Managing the selection between USB3DR and PCIE mode, the selection of reference clock frequency, the control of the battery charging procedure and the trimming of USB2PHY2 and COMBOPHY electrical parameters
- Configuring PCIE interrupts and the selection of USB3 and PCIE observation points

25.1 SYSCFG functional description

25.1.1 I/O compensation cell



The I/O compensation cell generates an 8-bit value for the I/O buffer (4 bits for N-MOS and 4 bits for P-MOS), that depends on PVT operating conditions (process, voltage, temperature). These bits are used to control the current slew-rate and output impedance in the I/O buffer. Five compensation cells are embedded: one for the I/Os supplied by V_{DD} and four for the I/Os supplied by V_{DDIO1},V_{DDIO2},V_{DDIO3}, and V_{DDIO4}.

By default, the compensation cells are disabled, and a fixed code is applied to all the I/Os. When enabled, the compensation cell tracks the PVT, and the 8-bit code APSRC and ANSRC are available in SYSCFG_xCCSR (with x = V_{DD}, V_{DDIO1}, V_{DDIO2}, V_{DDIO3}, or V_{DDIO4}) once the corresponding READY bit is set. If CS is cleared in SYSCFG_xCCCR and READY is set in SYSCFG_xCCSR, the I/Os receive the code APSRC and ANSRC from SYSCFG_xCCSR, resulting from the compensation cell.

To optimize the trimming, the code can be adjusted using RAPSRC and RANSRC fields in SYSCFG_xCCCR. They can be selected through CS in SYSCFG_xCCCR (see *Figure 155*).

To reduce the power consumption, it is recommended to copy the code from SYSCFG_xCCSR to SYSCFG_xCCCR. After the result is ready, set CS and disable the compensation cell.

Figure 155. I/O compensation cell control overview

25.2 SYSCFG registers

25.2.1 SYSCFG boot pin status register (SYSCFG_BOOTSR)

Address offset: 0x000

Reset value: 0x0000 000X

This register is used to know the state of BOOT pins. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BOOT3	BOOT2	BOOT1	BOOT0
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **BOOT3**: BOOT3 pin value
0: (low) BOOT3 pin connected to VSS (or left open if BOOT3_PD = 0)
1: (high) BOOT3 pin connected to VDD

Bit 2 **BOOT2**: BOOT2 pin value
0: (low) BOOT2 pin connected to VSS (or left open if BOOT2_PD = 0)
1: (high) BOOT2 pin connected to VDD

Bit 1 **BOOT1**: BOOT1 pin value
0: (low) BOOT1 pin connected to VSS (or left open if BOOT1_PD = 0)
1: (high) BOOT1 pin connected to VDD

Bit 0 **BOOT0**: BOOT0 pin value
0: (low) BOOT0 pin connected to VSS (or left open if BOOT0_PD = 0)
1: (high) BOOT0 pin connected to VDD

25.2.2 SYSCFG boot pin control register (SYSCFG_BOOTCR)

Address offset: 0x004

Reset value: 0x0000 0000

Reset by any system reset.
This register is used to control pull-up to reduce the static power consumption on the pin set to high level.
Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BOOT3_PD	BOOT2_PD	BOOT1_PD	BOOT0_PD
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **BOOT3_PD**: BOOT3 pin pull-down disable
This bit is used to save power in case the BOOT3 pin is connected to VDD.
0: (enabled) pull-down enabled. BOOT3 pin can be left open and takes a value of 0 if open.
1: (disabled) pull-down disabled. BOOT3 pin must not be left open.

Bit 2 **BOOT2_PD**: BOOT2 pin pull-down disable
This bit is used to save power in case the BOOT2 pin is connected to VDD.
0: (enabled) pull-down enabled. BOOT2 pin can be left open and takes a value of 0 if open.
1: (disabled) pull-down disabled. BOOT2 pin must not be left open.

Bit 1 **BOOT1_PD**: BOOT1 pin pull-down disable
This bit is used to save power in case the BOOT1 pin is connected to VDD.
0: (enabled) pull-down enabled. BOOT1 pin can be left open and takes a value of 0 if open.
1: (disabled) pull-down disabled. BOOT1 pin must not be left open.

Bit 0 **BOOT0_PD**: BOOT0 pin pull-down disable
This bit is used to save power in case the BOOT0 pin is connected to VDD.
0: (enabled) pull-down enabled. BOOT0 pin can be left open and takes a value of 0 if open.
1: (disabled) pull-down disabled. BOOT0 pin must not be left open.

25.2.3 SYSCFG DLYBSD1 control register (SYSCFG_DLYBSD1CR)

Address offset: 0x400

Reset value: 0x0040 0000

Reset by system reset and SDMMC1 DLL software reset.

Write access according to SDMMC1 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ANTIGLITCH_EN	BYP_CMD[4:0]					BYP_EN
									rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RX_TAP_SEL[5:0]						EN
									rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **ANTIGLITCH_EN**:
1: The anti-glitch logic is enabled. This ensures that there is no glitch on the clock line when the tap value is modified.

Bits 21:17 **BYP_CMD[4:0]**: Delay unit when in DLL bypass mode
00000: Reserved
00001: 1 delay element enabled
00010: 2 delay elements enabled
...
11000: all 24 delay elements enabled
11001: all 24 delay elements enabled
...
11111: all 24 delay elements enabled

Bit 16 **BYP_EN**: DLL bypass mode enable
1: DLL bypass mode is enabled. In bypass mode the DLL is used in pure delay mode and there is no VT compensation. The command applied to every delay unit is set by DLL_BYP_CMD[4:0], and a tap value must be selected with RX_TAP_SEL[5:0]. In bypass mode, the total delay is given by (delay unit) × tap number selected.
0: DLL lock mode is selected.

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:1 **RX_TAP_SEL[5:0]**: TAP number for RX clock selection
000000: 0 tap selected
000001: 1 tap is selected
....
000010: 2 taps selected
....
011111: 31 taps selected
100000: 32 taps selected

Bit 0 **EN**:
When 1, the DLL is enabled when configured in lock mode (BYP_EN = 0).

25.2.4 SYSCFG DLYBSD1 status register (SYSCFG_DLYBSD1SR)

Address offset: 0x404

Reset value: 0x0000 0002

Reset by system reset and SDMMC1 DLL software reset.

Write access according to SDMMC1 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RX_TAP_SEL_ACK	LOCK
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **RX_TAP_SEL_ACK**:
1: The RX delay switched to the tap value specified in RX_TAP_SEL[5:0].

Bit 0 **LOCK**:
1: The DLL is locked.

25.2.5 SYSCFG SDMMC1 control register (SYSCFG_SDMMC1CR)

Address offset: 0x408

Reset value: 0x0000 0000

Reset by system reset and SDMMC1 software reset.

Write access according to SDMMC1 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDMMC1_VSEL
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **SDMMC1_VSEL**: Voltage selection

Change the value of the SDVSEL1 pin output to control the voltage on pins for external card. Need AFMUX selection.

1: Change the voltage to low-voltage range (1.8 V typ.).

0: Change the voltage to high-voltage range (3.3 V typ.).

Note: There must be a control circuit out of SDMMC1 to change the voltage on pins.

25.2.6 SYSCFG DLYBSD2 control register (SYSCFG_DLYBSD2CR)

Address offset: 0x800

Reset value: 0x0040 0000

Reset by system reset and SDMMC2 DLL software reset.

Write access according to SDMMC2 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ANTIGLITCH_EN	BYP_CMD[4:0]					BYP_EN
									rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RX_TAP_SEL[5:0]						EN
									rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **ANTIGLITCH_EN**: Anti-glitch logic enable

1: The anti-glitch logic is enabled. This ensures that there is no glitch on the clock line when the tap value is modified.

Bits 21:17 **BYP_CMD[4:0]**: Delay unit when in DLL bypass mode

00000: Reserved
00001: 1 delay element enabled
00010: 2 delay elements enabled
...
11000: all 24 delay elements enabled
11001: all 24 delay elements enabled
...
11111: all 24 delay elements enabled

Bit 16 **BYP_EN**: DLL bypass mode enable

1: DLL bypass mode is enabled. In bypass mode, the DLL is used in pure delay mode and there is no VT compensation. The command applied to every delay unit is set by DLL_BYP_CMD[4:0], and a tap value must be selected with RX_TAP_SEL[5:0]. In bypass mode, the total delay is given by (delay unit) x tap number selected.
0: DLL lock mode is selected.

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:1 **RX_TAP_SEL[5:0]**: TAP delay for RX clock selection

000000: 0 tap selected
000001: 1 tap selected
....
000010: 2 taps selected
....
011111: 31 taps selected
100000: 32 taps selected

Bit 0 **EN**:

1: The DLL is enabled when configured in lock mode (BYP_EN = 0).

25.2.7 SYSCFG DLYBSD2 status register (SYSCFG_DLYBSD2SR)

Address offset: 0x804

Reset value: 0x0000 0002

Reset by system reset and SDMMC2 DLL software reset.

Write access according to SDMMC1 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RX_TAP_SEL_ACK	LOCK
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **RX_TAP_SEL_ACK**:
1: The RX delay switched to the tap value specified in RX_TAP_SEL[5:0].

Bit 0 **LOCK**:
1: The DLL is locked.

25.2.8 SYSCFG SDMMC2 control register (SYSCFG_SDMMC2CR)

Address offset: 0x808

Reset value: 0x0000 0000

Reset by system reset and SDMMC2 software reset.

Write access according to SDMMC2 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDMMC2_VSEL
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **SDMMC2_VSEL**: Voltage selection

Change the value of the SDVSEL2 pin output to control the voltage on pins for external card. Need AFMUX selection.

1: Change the voltage to low-voltage range (1.8 V typ.).

0: Change the voltage to high-voltage range (3.3 V typ.).

Note: There must be a control circuit out of SDMMC2 to change the voltage on pins.

25.2.9 SYSCFG DLYBSD3 control register (SYSCFG_DLYBSD3CR)

Address offset: 0xC00

Reset value: 0x0040 0000

Reset by system reset and SDMMC3 DLL software reset.

Write access according to SDMMC3 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ANTIGLITCH_EN	BYP_CMD[4:0]					BYP_EN
									rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RX_TAP_SEL[5:0]						EN
									rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **ANTIGLITCH_EN**: Anti-glitch logic enable

1: The anti-glitch logic is enabled. This ensures that there is no glitch on the clock line when the tap value is modified.

Bits 21:17 **BYP_CMD[4:0]**: Delay unit when in DLL bypass mode

00000: Reserved
00001: 1 delay element enabled
00010: 2 delay elements enabled
...
11000: all 24 delay elements enabled
11001: all 24 delay elements enabled
...
11111: all 24 delay elements enabled

Bit 16 **BYP_EN**: DLL bypass mode enable

1: DLL bypass mode is enabled. In bypass mode the DLL is used in pure delay mode and there is no VT compensation. The command applied to every delay unit is set by DLL_BYP_CMD[4:0] and a tap value must be selected with RX_TAP_SEL[5:0]. In bypass mode, the total delay is given by (delay unit) x tap number selected.
0: DLL lock mode is selected.

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:1 **RX_TAP_SEL[5:0]**: TAP delay for RX clock selection

000000: 0 tap selected
000001: 1 tap selected
....
000010: 2 taps selected
....
011111: 31 taps selected
100000: 32 taps selected

Bit 0 **EN**:

1: The DLL is enabled when configured in lock mode (BYP_EN = 0).

25.2.10 SYSCFG DLYBSD3 status register (SYSCFG_DLYBSD3SR)

Address offset: 0xC04

Reset value: 0x0000 0002

Reset by system reset and SDMMC3 DLL software reset.

Write access according to SDMMC3 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RX_TAP_SEL_ACK	LOCK
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **RX_TAP_SEL_ACK**:
1: The RX delay has switched to the tap value specified in RX_TAP_SEL[5:0].

Bit 0 **LOCK**:
1: The DLL is locked.

25.2.11 SYSCFG DLYBOS1 control register (SYSCFG_DLYBOS1CR)

Address offset: 0x1000

Reset value: 0x0000 0000

Reset by system reset and OCTOSPI1 DLL software reset.

Write access according to OCTOSPI1 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BYP_CMD[4:0]					BYP_EN
										rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	TX_TAP_SEL[5:0]						RX_TAP_SEL[5:0]						EN
			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:17 **BYP_CMD[4:0]**: Delay unit when in DLL bypass mode
00000: Reserved
00001: 1 delay element enabled
00010: 2 delay elements enabled
...
11000: all 24 delay elements enabled
11001: all 24 delay elements enabled
...
11111: all 24 delay elements enabled

Bit 16 **BYP_EN**: DLL bypass mode enable
1: DLL bypass mode is enabled. In bypass mode the DLL is used in pure delay mode and there is no VT compensation. The command applied to every delay unit is set by DLL_BYP_CMD[4:0] and a tap value must be selected with RX_TAP_SEL[5:0]. In bypass mode, the total delay is given by (delay unit) x tap number selected.
0: DLL lock mode is selected.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:7 **TX_TAP_SEL[5:0]**: TAP delay for TX clock selection
000000: 0 tap selected
000001: 1 tap selected
....
000010: 2 taps selected
....
011111: 31 taps selected
100000: 32 taps selected

Bits 6:1 **RX_TAP_SEL[5:0]**: TAP delay for RX clock selection
000000: 0 tap selected
000001: 1 tap selected
....
000010: 2 taps selected
....
011111: 31 taps selected
100000: 32 taps selected

Bit 0 **EN**:
1: The DLL is enabled when configured in lock mode (BYP_EN = 0).

25.2.12 SYSCFG DLYBOS1 status register (SYSCFG_DLYBOS1SR)

Address offset: 0x1004

Reset value: 0x0000 0006

Reset by system reset and OCTOSPI1 DLL software reset.

Write access according to OCTOSPI1 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TX_TAP_SEL_ACK	RX_TAP_SEL_ACK	LOCK
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TX_TAP_SEL_ACK**:
1: The TX delay has switched to the tap value specified in TX_TAP_SEL[5:0].

Bit 1 **RX_TAP_SEL_ACK**:
1: The RX delay has switched to the tap value specified in RX_TAP_SEL[5:0].

Bit 0 **LOCK**:
1: The DLL is locked.

25.2.13 SYSCFG DLYBOS2 control register (SYSCFG_DLYBOS2CR)

Address offset: 0x1400

Reset value: 0x0000 0000

Reset by system reset and OCTOSPI2 DLL software reset.
Write access according to OCTOSPI2 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	TX_TAP_SEL[5:0]						RX_TAP_SEL[5:0]						EN
			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:17 **BYP_CMD[4:0]**: Delay unit when in DLL bypass mode
00000: Reserved
00001: 1 delay element enabled
00010: 2 delay elements enabled
...
11000: all 24 delay elements enabled
11001: all 24 delay elements enabled
...
11111: all 24 delay elements enabled

Bit 16 **BYP_EN**: DLL bypass mode enable
1: DLL bypass mode is enabled. In bypass mode the DLL is used in pure delay mode and there is no VT compensation. The command applied to every delay unit is set by DLL_BYP_CMD[4:0] and a tap value must be selected with RX_TAP_SEL[5:0]. In bypass mode, the total delay is given by (delay unit) x tap number selected.
0: DLL lock mode is selected.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:7 **TX_TAP_SEL[5:0]**: TAP delay for TX clock selection
000000: 0 tap selected
000001: 1 tap selected
....
000010: 2 taps selected
....
011111: 31 taps selected
100000: 32 taps selected

Bits 6:1 **RX_TAP_SEL[5:0]**: TAP delay for RX clock selection
000000: 0 tap selected
000001: 1 tap selected
....
000010: 2 taps selected
....
011111: 31 taps are selected
100000: 32 taps are selected

Bit 0 **EN**: e
1: The DLL is enabled when configured in lock mode (BYP_EN = 0).

25.2.14 SYSCFG DLYBOS2 status register (SYSCFG_DLYBOS2SR)

Address offset: 0x1404

Reset value: 0x0000 0006

Reset by system reset and OCTOSPI2 DLL software reset.

Write access according to OCTOSPI2 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TX_TAP_SEL_ACK	RX_TAP_SEL_ACK	LOCK
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TX_TAP_SEL_ACK**:
1: The TX delay has switched to the tap value specified in TX_TAP_SEL[5:0].

Bit 1 **RX_TAP_SEL_ACK**:
1: The RX delay has switched to the tap value specified in RX_TAP_SEL[5:0].

Bit 0 **LOCK**:
1: The DLL is locked.

25.2.15 SYSCFG video decoder encoder RAM control register (SYSCFG_VDERAMCR)

Address offset: 0x1800

Reset value: 0x0000 0000

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VDERAM_EN
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **VDERAM_EN**: VDEC/VENC RAM enable

This bit is used to allocate the shared RAMs embedded in VDEC and VENC to the system. It must be only set when VDEC and VENC are inactive.

0: VDERAM not allocated to the system

1: VDERAM allocated to the system

25.2.16 SYSCFG potential tamper reset control register (SYSCFG_POTTAMPRSTCR)

Address offset: 0x1804

Reset value: 0x0000 0000

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	POTTAMPRESETMASK
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **POTTAMPRESETMASK**:

This bit can be set by software to mask PKA, SAES, CRYP1/2, and HASH reset in case of potential tamper.

0: PKA, SAES, CRYP1/2, and HASH reset in case of potential tamper

1: PKA, SAES, CRYP1/2, and HASH not reset in case of potential tamper

25.2.17 SYSCFG M33SS control register (SYSCFG_M33SSCR)

Address offset: 0x1C00

Reset value: 0x0000 0000

Reset by system reset.

Write access according to ICACHE_DCACHE RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCKSAU	LOCKNSMPU	LOCKSMPU	LOCKNSVTOR	LOCKSVTAIRCR
											rw	rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FPU_IT_EN[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **LOCKSAU**:
Prevent changes to secure SAU memory regions already programmed.

Bit 19 **LOCKNSMPU**:
Prevent changes to non-secure MPU memory regions already programmed.

Bit 18 **LOCKSMPU**:
Prevent changes to programmed secure MPU memory regions.

Bit 17 **LOCKNSVTOR**:
Prevent changes to non-secure vector table base address.

Bit 16 **LOCKSVTAIRCR**:
Prevent changes to:
– secure vector table base address
– secure interrupt priority handling
– BusFault, HardFault, and NMI security target settings in the processor

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:0 **FPU_IT_EN[5:0]**: Floating point unit interrupt enable
FPU_IT_EN[5]: Input abnormal interrupt enable
FPU_IT_EN[4]: Inexact interrupt enable
FPU_IT_EN[3]: Underflow interrupt enable
FPU_IT_EN[2]: Overflow interrupt enable
FPU_IT_EN[1]: Divide-by-zero interrupt enable
FPU_IT_EN[0]: Invalid operation Interrupt enable

25.2.18 SYSCFG ICN QOS priority control register 1 (SYSCFG_ICNQPCR1)

Address offset: 0x2000

Reset value: 0xCCCB BB3E

Reset by system reset.
Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 11:8 **PCIE_QOS[3:0]**: PCIE read/write channel QoS setting
0x0: Lowest priority
0xF: Highest priority

Bits 7:4 **USB3DR_QOS[3:0]**: USB3DR read/write channel QoS setting
0x0: Lowest priority
0xF: Highest priority

Bits 3:0 **USBH_QOS[3:0]**: USBH read/write channel QoS setting
0x0: Lowest priority
0xF: Highest priority

25.2.20 SYSCFG ICN early write response control register (SYSCFG_ICNEWRCR)

Address offset: 0x2008

Reset value: 0x0000 0000

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LTDCR_DCMIPP_EARLY_WR_RSP_ENABLE	SDMMC3_EARLY_WR_RSP_ENABLE	SDMMC2_EARLY_WR_RSP_ENABLE	SDMMC1_EARLY_WR_RSP_ENABLE	USBH_EARLY_WR_RSP_ENABLE
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **LTDCR_DCMIPP_EARLY_WR_RSP_ENABLE**: LTDC Rotation and DCMIPP early write response enable
0: Early write response disabled.The AXI write response is given from the final destination.
1: Early write response enabled. An automatic OKAY write response is answered early by the NoC.

Bit 3 **SDMMC3_EARLY_WR_RSP_ENABLE**: SDMMC3 early write response enable
0: Early write response disabled. The last AHB write data beat receives the AXI buffered response for the complete AHB transaction.
1: Early write response enabled. AHB-Lite write data beats receive an automatic OKAY response from the AHB-to-AXI bridge irrespective of the B-channel AXI response.

Bit 2 **SDMMC2_EARLY_WR_RSP_ENABLE**: SDMMC2 early write response enable
0: Early write response disabled. The last AHB write data beat receives the AXI buffered response for the complete AHB transaction.
1: Early write response enabled. AHB-Lite write data beats receive an automatic OKAY response from the AHB-to-AXI bridge irrespective of the B-channel AXI response.

Bit 1 **SDMMC1_EARLY_WR_RSP_ENABLE**: SDMMC1 early write response enable
0: Early write response disabled. The last AHB write data beat receives the AXI buffered response for the complete AHB transaction.
1: Early write response enabled. AHB-Lite write data beats receive an automatic OKAY response from the AHB-to-AXI bridge irrespective of the B-channel AXI response.

Bit 0 **USBH_EARLY_WR_RSP_ENABLE**: USBH (OHCI and EHCI) early write response enable
0: Early write response disabled. The last AHB write data beat receives the AXI buffered response for the complete AHB transaction.
1: Early write response enabled. AHB-Lite write data beats receive an automatic OKAY response from the AHB-to-AXI bridge irrespective of the B-channel AXI response.

25.2.21 SYSCFG ICN clock gating control register (SYSCFG_ICNCGCR)

Address offset: 0x200C

Reset value: 0x0000 0000

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

								rw		rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **ALWAYS_ON_CLK_ICN_VID**:
When set to 1, ICN automatic clock gating on clk_icn_vid domain is off.

Bit 6 Reserved, must be kept at reset value.

Bit 5 **ALWAYS_ON_CLK_ICN_SDMMC**:
When set to 1, ICN automatic clock gating on clk_icn_sdmmc domain is off.

Bit 4 **ALWAYS_ON_CLK_ICN_SYSATB**:
When set to 1, ICN automatic clock gating on clk_icn_sysatb domain is off.

Bit 3 **ALWAYS_ON_CLK_ICN_MCU**:
When set to 1, ICN automatic clock gating on clk_icn_mcu domain is off.

Bit 2 **ALWAYS_ON_CLK_ICN_HSL**:
When set to 1, ICN automatic clock gating on clk_icn_hsl domain is off.

Bit 1 **ALWAYS_ON_CLK_ICN_DISPLAY**:
When set to 1, ICN automatic clock gating on clk_icn_display domain is off.

Bit 0 **ALWAYS_ON_CLK_ICN_DDR**:
When set to 1, ICN automatic clock gating on clk_icn_ddr domain is off.

25.2.22 SYSCFG ICN GPU bandwidth limiter control register (SYSCFG_ICNGPUBWLCR)

Address offset: 0x2010

Reset value: 0x0000 400B

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MAXABW[7:0]								Res.	Res.	Res.	Res.	PMRSTDLY[1:0]		BWLEN	PMEN
rw	rw	rw	rw	rw	rw	rw	rw					rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **MAXABW[7:0]**: Maximum allowed Bandwidth
Configures the maximum allowed bandwidth for the GPU (Read and Write traffic) in proportion of the link throughput in one direction, 9.6 GB/s with a default clock configuration.
0: Reserved
1: Bandwidth limited at 1/128 of 9.6GB/s.
2: Bandwidth limited at 2/128 of 9.6GB/s
255: Bandwidth limited at 255/128 of 9.6GB/s

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:2 **PMRSTDLY[1:0]**: Panic Mode Restart Delay
Configures the delay applied before restarting a GPU transaction after they have been blocked by a DDR saturation.
00: No delay (immediate restart of flow)
01: 16-cycle delay at DDR-CTRL frequency
10: 32-cycle delay at DDR-CTRL frequency
11: 64-cycle delay at DDR-CTRL frequency

Bit 1 **BWLEN**: Bandwidth limiter enable
Activates the GPU bandwidth limiter.
0: Bandwidth limiter disabled
1: Bandwidth limiter enabled

Bit 0 **PMEN**: Panic Mode Enable

Activates the regulation part that allows a DDR saturation to temporarily block the GPU transactions.

0: DDR-to-GPU regulation disabled

1: DDR-to-GPU regulation enabled

25.2.23 SYSCFG ICN end-to-end bandwidth regulation control register (SYSCFG_ICNE2EBWRCR)

Address offset: 0x2014

Reset value: 0x0000 0052

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	CFG_HPDMA_BW	CFG_CPU1_BW	Res.	CFG_ALL_TGT[2:0]			Res.	CFG_MODEL[1:0]		CFG_ENABLE
						rw	rw		rw	rw	rw		rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **CFG_HPDMA_BW**:

Triple the bandwidth (BW) allowed to HPDMA1/2/3 by the regulation.

0: Normal bandwidth allocated to HPDMA1/2/3

1: Increased bandwidth allocated to HPDMA1/2/3

Note: This additional bandwidth is preempted from other peripherals, that may thus face real-time issues. Keep default setting unless ST recommendation.

Bit 8 **CFG_CPU1_BW**:

Triple the bandwidth allowed to the CPU1 by the regulation.

0: Normal bandwidth allocated to HPDMA1/2/3

1: Increased bandwidth allocated to HPDMA1/2/3

Note: This additional bandwidth is preempted from other peripherals, that may thus face real-time issues. Keep default setting unless ST recommendation.

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **CFG_ALL_TGT[2:0]**: Amount of empty CAM slots in DDR-CTRL that the regulation targets

000: 9 empty slots targeted

001: 11 empty slots targeted

010: 13 empty slots targeted

011: 15 empty slots targeted

100: 17 empty slots targeted

101: 20 empty slots targeted (default)

110: 24 empty slots targeted

111: 28 empty slots targeted

Bit 3 Reserved, must be kept at reset value.

Bits 2:1 **CFG_MODEL[1:0]**:
Defines the reactivity of the regulation feedback.
00: Slow reaction (risk of congestion if the regulation reacts too slow)
11: Fast reaction (risk of oscillation if the regulation reacts too fast)

Bit 0 **CFG_ENABLE**:
Activates the end-to-end bandwidth regulation.
0: Regulation disabled. Peripheral bus masters access without constrain into the STNoC AXI network-on-chip.
1: Regulation enabled. The regulation favors the high QoS, and limits some bandwidths.

25.2.24 SYSCFG safe reset control register (SYSCFG_SAFERSTCR)

Address offset: 0x2018

Reset value: 0x0000 0000

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

MAXABW[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	BWLEN	Res.
rw	rw	rw	rw	rw	rw	rw	rw							rw	

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **MAXABW[7:0]**: Maximum allowed Bandwidth

Configures the maximum allowed bandwidth for the PCIe (only Read traffic) in proportion of the link throughput in one direction, 2.4 GB/s with a default clock configuration.

0: Reserved

1: Bandwidth limited at 1/128 of 2.4 GB/s

2: Bandwidth limited at 2/128 of 2.4 GB/s

255: Bandwidth limited at 255/128 of 2.4 GB/s

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **BWLEN**: Bandwidth limiter enable

Activates the PCIe bandwidth limiter.

0: Bandwidth limiter disabled

1: Bandwidth limiter enabled

Bit 0 Reserved, must be kept at reset value.

25.2.26 SYSCFG ICN ETH bandwidth limiter control register (SYSCFG_ICNETHBWLCR)

Address offset: 0x2020

Reset value: 0x0000 1002

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

rw	rw	rw	rw	rw	rw	rw	rw							rw	

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **MAXABW[7:0]**: Maximum allowed Bandwidth

Configures the maximum allowed bandwidth for each ETH (read and write traffic) in proportion of the link throughput in one direction, 2.4 GB/s with a default clock configuration.

0: Reserved

1: Bandwidth limited at 1/128 of 2.4 GB/s

2: Bandwidth limited at 2/128 of 2.4 GB/s

255: Bandwidth limited at 255/128 of 2.4 GB/s

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **BWLEN**: Bandwidth limiter enable

Activates the ETHs bandwidth limiter.

0: Bandwidth limiter disabled

1: Bandwidth limiter enabled

Bit 0 Reserved, must be kept at reset value.

25.2.27 SYSCFG ICN USB3 bandwidth limiter control register (SYSCFG_ICNUSB3BWLCR)

Address offset: 0x2024

Reset value: 0x0000 4002

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw							rw	

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **MAXABW[7:0]**: Maximum allowed Bandwidth

Configures the maximum allowed bandwidth for the USB3 (read and write traffic) in proportion of the link throughput in one direction, 2.4 GB/s with a default clock configuration.

0: Reserved

1: Bandwidth limited at 1/128 of 2.4 GB/s

2: Bandwidth limited at 2/128 of 2.4 GB/s

255: Bandwidth limited at 255/128 of 2.4 GB/s

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **BWLEN**: Bandwidth limiter enable

Activates the USB3 bandwidth limiter.

0: Bandwidth limiter disabled

1: Bandwidth limiter enabled

Bit 0 Reserved, must be kept at reset value.

25.2.28 SYSCFG ICN CPU1 bandwidth limiter control register (SYSCFG_ICNCPU1BWLCR)

Address offset: 0x2028

Reset value: 0x0000 2002

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw	rw	rw	rw	rw	rw	rw	rw							rw	

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **MAXABW[7:0]**: Maximum allowed Bandwidth

Configures the maximum allowed bandwidth for the CPU1 (read and write traffic) in proportion of the link throughput in one direction, 9.6 GB/s with a default clock configuration.

0: Reserved

1: Bandwidth limited at 1/128 of 9.6 GB/s

2: Bandwidth limited at 2/128 of 9.6 GB/s

255: Bandwidth limited at 255/128 of 9.6 GB/s

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **BWLEN**: Bandwidth limiter enable

Activates the CPU1 bandwidth limiter.

0: Bandwidth limiter disabled

1: Bandwidth limiter enabled

Bit 0 Reserved, must be kept at reset value.

25.2.29 SYSCFG ICN LTDC bandwidth limiter control register (SYSCFG_ICNLTDCBWLCR)

Address offset: 0x202C

Reset value: 0x0000 8002

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw	rw	rw	rw	rw	rw	rw	rw							rw	

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **MAXABW[7:0]**: Maximum allowed Bandwidth

Configures the maximum allowed bandwidth for the LTDC (read and write traffic) in proportion of the link throughput in one direction, 3.2 GB/s with a default clock configuration.

0: Reserved

1: Bandwidth limited at 1/128 of 3.2 GB/s

2: Bandwidth limited at 2/128 of 3.2 GB/s

255: Bandwidth limited at 255/128 of 3.2 GB/s

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **BWLEN**: Bandwidth limiter enable

Activates the LTDC bandwidth limiter.

0: Bandwidth limiter disabled

1: Bandwidth limiter enabled

Bit 0 Reserved, must be kept at reset value.

25.2.30 SYSCFG ICN DCMIPP bandwidth limiter control register (SYSCFG_ICNDCMIPPBWLCR)

Address offset: 0x2030

Reset value: 0x0000 5002

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

MAXABW[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	BWLEN	Res.
rw	rw	rw	rw	rw	rw	rw	rw							rw	

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **MAXABW[7:0]**: Maximum allowed Bandwidth

Configures the maximum allowed bandwidth for the DCMIPP (read and write traffic) in proportion of the link throughput in one direction, 3.2 GB/s with a default clock configuration.

0: Reserved

1: Bandwidth limited at 1/128 of 3.2 GB/s

2: Bandwidth limited at 2/128 of 3.2 GB/s

255: Bandwidth limited at 255/128 of 3.2 GB/s

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **BWLEN**: Bandwidth limiter enable

Activates the DCMIPP bandwidth limiter.

0: Bandwidth limiter disabled

1: Bandwidth limiter enabled

Bit 0 Reserved, must be kept at reset value.

25.2.31 SYSCFG ICN Video Decoder Encoder bandwidth limiter control register (SYSCFG_ICNVDEBWLCR)

Address offset: 0x2034

Reset value: 0x0000 3502

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

rw	rw	rw	rw	rw	rw	rw	rw							rw	

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **MAXABW[7:0]**: Maximum allowed Bandwidth

Configures the maximum allowed bandwidth for the VDEC (read and write traffic) in proportion of the link throughput in one direction, 4.8 GB/s with a default clock configuration.

0: Reserved

1: Bandwidth limited at 1/128 of 4.8 GB/s

2: Bandwidth limited at 2/128 of 4.8 GB/s

255: Bandwidth limited at 255/128 of 4.8 GB/s

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **BWLEN**: Bandwidth limiter enable

Activates the VDEC bandwidth limiter.

0: Bandwidth limiter disabled

1: Bandwidth limiter enabled

Bit 0 Reserved, must be kept at reset value.

25.2.32 SYSCFG USB2PHY1 control register (SYSCFG_USB2PHY1CR)

Address offset: 0x2400

Reset value: 0x0000 0015

Reset by system reset.

Write access according to USBH RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	USB2PHY1SEL[2:0]			Res.	USB2PHY1CMN	AUTORSMENB1	RETENABLEN1
									rw	rw	rw		rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **USB2PHY1SEL[2:0]**: PHY reference clock speed setting
000: 19.2 MHz
001: 20 MHz (default)
010: 24 MHz
Others: Reserved

Bit 3 Reserved, must be kept at reset value.

Bit 2 **USB2PHY1CMN**:
Controls power down of analog blocks during Suspend and Sleep.
0: PHY clocks are kept active during Suspend and Sleep (with the exception of PHYCLK). The PLL is on. Requires to keep the PHY reference clock on.
1: PHY clocks are off during Suspend and Sleep. PLL is off (default).

Bit 1 **AUTORSMENB1**: Auto-resume mode enable
Enables auto-resume logic in USB2PHY. The PHY automatically responds to a remote wake-up without initial involvement of the Host controller.
0: Auto-resume disabled (default
1: A pulse on this bit prior to enabling the retention mode, enables the auto-resume mode.

Bit 0 **RETENABLEN1**: Retention mode enable (active low)
0: Retention mode enabled
1: Retention mode disabled (default)

25.2.33 SYSCFG USB2PHY1 battery charging control register (SYSCFG_USB2PHY1BCCR)

Address offset: 0x2404

Reset value: 0x0000 0000

Reset by system reset.

Write access according to USBH RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **H_FORCEBCMODE**:
Forces USB2PHY1 in non-driving suspend mode. This is the recommended mode to perform battery charging procedure.
0: Normal mode. SUSPENDM0 and OPMODE0 inputs of USB2PHY1 are managed by the USB2 Host controller (default).
1: OPMODE0[1:0] is forced to non-driving, and SUSPENDM0 is forced to active.

Bit 2 **H_VDMSRCEN**: Voltage source on DM for CDP port enable
0: Voltage source disabled (default)
1: Voltage source enabled

Bit 1 **H_CDPDETEN**: Voltage detector on DP for CDP port enable
0: voltage detector on DP disabled (default)
1: voltage detector on DP enabled

Bit 0 **H_CDPEN**: CDP behavior for Host port enable
0: CDP behavior disabled (Host port behaves as an SDP) (default)
1: CDP behavior enabled

25.2.34 SYSCFG USB2PHY1 battery charging status register (SYSCFG_USB2PHY1BCSR)

Address offset: 0x2408

Reset value: 0x0000 0000

Reset by system reset.

Write access according to USBH RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FSVMINUS	FSVPLUS	CHGDET
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **FSVMINUS**: Voltage level on DM (also output of the comparison with VLGC threshold, as defined in BC v1.2 standard)
0: VDM < VLGC
1: VDM > VLGC

Bit 1 **FSVPLUS**: Voltage level on DP (also output of the comparison with VLGC threshold, as defined in BC v1.2 standard)
0: VDP < VLGC
1: VDP > VLGC

Bit 0 **CHGDET**: Comparison of voltage on DP with VDAT_REF threshold as defined in BC v1.2 standard
0: VDP < VDAT_REF
1: VDP > VDAT_REF

25.2.35 SYSCFG USB2PHY1 trimming 1 control register (SYSCFG_USB2PHY1TRIM1CR)

Address offset: 0x240C

Reset value: 0x299E D6F0

Reset by system reset.

Write access according to USBH RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	USB2PHY1TXRESTUNE[1:0]		USB2PHY1TXRISETUNE[1:0]		USB2PHY1TXVREFTUNE[3:0]				USB2PHY1TXFSLSTUNE[3:0]				USB2PHY1TXHSXVTUNE[1:0]		USB2PHY1OTGTUNE[2]

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:29 **USB2PHY1TXRESTUNE[1:0]**: USB source impedance adjustment

In some applications, there is significant series resistance on DP and DM paths between the transceiver and the cable. This bitfield adjusts the driver source impedance to compensate for added series resistance on the USB. Any setting other than the default one can result in source impedance variation across process, voltage and temperature that does not meet USB2.0 specifications limits.

11: Source impedance decreased by approximately 5.6 Ω

10: Source impedance decreased by approximately 3.6 Ω

01: Nominal

00: Source impedance increased by approximately 1.3 Ω

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 28:27 **USB2PHY1TXRISETUNE[1:0]**: High-speed transmitter rise/fall time adjustment

This bitfield is used to adjust rise/fall times of the high-speed waveform.

11: -8.1%

10: -7.2%

01: Nominal

00: +5.4%

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 26:23 **USB2PHY1TXVREFTUNE[3:0]**: HS DC voltage level adjustment

This bitfield is used to adjust the high-speed (HS) DC level voltage. When the PHY is in a Host role, any adjustment of the HS transmit voltage level tune bits (TXVREFTUNE) may also request a change to the HS disconnect detection threshold (COMPDISTUNE).

1111: +24%
1110: +22%
1101: +20%
1100: +18%
1011: +16%

0010: -2%
0001: -4%
0000: -6%

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 22:19 **USB2PHY1TXFSLSTUNE[3:0]**: Full-speed (FS)/low-speed (LS) source impedance adjustment

This bit field is used to adjust FS and LS single-ended source impedance while driving high. The following adjustment values are based on nominal process, voltage and temperature.

1111: -10.7%
0111: -5.6%
0011: Nominal
0001: +6.5%
0000: +14%
Other: reserved

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 18:17 **USB2PHY1TXHSXVTUNE[1:0]**: Transmitter high-speed crossover adjustment

This bitfield is used to adjust the voltage at which DP and DM signals cross while transmitting in high-speed mode.

11: Nominal
10: +15 mV
01: -15 mV
00: reserved

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 16:14 **USB2PHY1OTGTUNE[2:0]**: V_{BUS} valid threshold adjustment

This bitfield is used to adjust the voltage level for the V_{BUS} valid threshold.

111: +12%
110: +9%
101: +6%
100: +3%
011: Nominal
010: -3%
001: -6%
000: -9%

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 13:12 **USB2PHY1VDATREFTUNE[1:0]**: Data detect voltage adjustment

This bitfield is used to adjust the threshold voltage level (Vdat_ref) used to detect data during charger type detection.

11: -20%
10: -10%
01: Nominal
00: +10%

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 11:9 **USB2PHY1SQRXTUNE[2:0]**: Squelch threshold adjustment

This bitfield is used to adjust the voltage level for the threshold used to detect valid HS data.

111: -20%
110: -15%
101: -10%
100: -5%
011: Nominal

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **USB2PHY1TXPREEMPPULSETUNE**: HS transmitter preemphasis duration control

This bit controls the duration for which the HS preemphasis current is sourced onto DM or DP. The HS transmitter preemphasis duration is defined in terms of unit amounts. One unit of preemphasis duration is approximately 580 ps, and is defined as 1x preemphasis duration. This bit is valid only if TXPREEMPAMPTUNE[0] or TXPREEMPAMPTUNE[1] is set to 1.

1: 1x, short pre-emphasis current duration

0: 2x, long pre-emphasis current duration

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 1:0 **USB2PHY1TXPREEMPAMPTUNE[1:0]**: HS transmitter preemphasis current control

This bitfield controls the amount of current sourced to DP and DM after a J-to-K or K-to-J transition. The HS transmitter preemphasis current is defined in terms of unit amounts. One unit amount is approximately 600 µA, and is defined as 1x pre-emphasis current.

11: HS transmitter preemphasis circuit sources 3x preemphasis current

10: HS transmitter preemphasis circuit sources 2x preemphasis current

01: HS transmitter preemphasis circuit sources 1x preemphasis current

00: HS transmitter preemphasis disabled

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

25.2.37 SYSCFG USBH control register (SYSCFG_USBHCR)

Address offset: 0x2420

Reset value: 0x0000 0000

Reset by system reset.

Write access according to USBH RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw		rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **DRVVBUS0**: Control bit for VBUS valid comparator in USB2PHY2
0: VBUS valid comparator is off in Suspend and Sleep modes (default).
1: VBUS valid comparator is on in Suspend and Sleep modes.

Bit 16 **OTGDISABLE0**: Disable control bit for VBUS valid comparator in USB2PHY2
0: VBUS valid comparator is on in normal mode. The VBUS valid comparator state in Suspend and Sleep depends on DRVVBUS0 setting. The session valid comparator is on.
1: VBUS valid comparator is powered down. The session valid comparator is on(default).

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **USB2PHY2SEL[2:0]**: PHY reference clock speed setting
000: 19.2 MHz
001: 20 MHz (default)
010: 24 MHz
Others: Reserved

Bit 11 Reserved, must be kept at reset value.

Bits 10:7 **FILTER_BYPASS[3:0]**: Internal debounce logic enable (default)
Bit[0] applies to utmiotg_vbusvalid. Bit[1] applies to pipe3_PowerPresent. Bit[2] applies to utmisrp_bvalid. Bit[3] applies to utmiotg_iddig (default).
1: internal debounce logic disabled

Bit 6 **VBUSVLDEXT**: Voltage comparison result when an external voltage comparator is used
0: VBUS not valid (default)
1: VBUS above valid threshold

Bit 5 **VBUSVLDEXTSEL**: VBUS valid comparator used when USB3DR controller is in device mode
0: Session valid comparator inside USB2PHY2 is used (default).
1: An external voltage comparator is used. Outcome of voltage comparison must be written in VBUSVLDEXT bit.

Bit 4 **VBUSVALID**: Control of VBUS valid input of USB3DR controller when in Host mode
0: VBUS not valid (default)
1: VBUS above valid threshold

Bit 3 Reserved, must be kept at reset value.

Bit 2 **USB2PHY2CMN**: Control of power down of analog blocks during Suspend and Sleep
0: PHY clocks are kept active during Suspend and Sleep (with the exception of PHYCLK). The PLL is on. Requires to keep the PHY reference clock on.
1: PHY clocks are off during Suspend and Sleep. PLL is off (default)

Bit 1 **AUTORSMENB2**: Auto-resume mode enable
This bit enables auto-resume logic in USB2PHY. The PHY automatically responds to a remote wake-up without initial involvement of the Host controller.
0: Auto-resume is disabled (default).
1: A pulse on this bit prior to enabling the retention mode, enables the auto-resume mode.

Bit 0 **RETENABLEN2**: Retention mode enable (active low)
0: Retention mode enabled
1: Retention mode disabled (default)

25.2.39 SYSCFG USB2PHY2 trimming 1 control register (SYSCFG_USB2PHY2TRIM1CR)

Address offset: 0x2808

Reset value: 0x299E D6F0

Reset by system reset.

Write access according to USB3DR RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:29 **USB2PHY2TXRESTUNE[1:0]**: USB source impedance adjustment

In some applications there is significant series resistance on DP and DM paths between the transceiver and the cable. This bitfield is used to adjust the driver source impedance to compensate for added series resistance on the USB. Any setting other than the default one can result in source impedance variation across process, voltage and temperature that does not meet USB2.0 specifications limits.

11: Source impedance decreased by approximately 5.6 Ω

10: Source impedance decreased by approximately 3.6 Ω

01: Nominal

00: Source impedance increased by approximately 1.3 Ω

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 28:27 **USB2PHY2TXRISETUNE[1:0]**: HS transmitter rise/fall time adjustment

This bitfield is used to adjust the rise/fall times of the high-speed waveform.

11: -8.1%

10: -7.2%

01: Nominal

00: +5.4%

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 26:23 **USB2PHY2TXVREFTUNE[3:0]**: HS DC voltage level adjustment

This bitfield is used to adjust the HS DC level voltage. When the PHY is in a Host role, any adjustment of the HS transmit voltage level tune bits (TXVREFTUNE) may also request a change to the HS disconnect detection threshold (COMPDISTUNE).

1111: +24%

Bit 1 **ETHSW_CFG_IF_SEL**: PHY interface type selection for external ports
0: RMII
1: RGMII

Bit 0 **ETH1_DIRECT**: Ethernet switch bypass
0: Connect ETH1 to host port of ETHSW.
1: Connect ETH1 directly to PHY (bypass ETHSW).

25.2.47 SYSCFG VDDIO3 compensation cell control register (SYSCFG_VDDIO3CCCR)

Address offset: 0x4000

Reset value: 0x0000 0078

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	LPMDIS	CS	EN	RAPSRC[3:0]				RANSRC[3:0]			
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **LPMDIS**: I/Os supplied by V_{DDIO3} compensation cell low power mode disable
0: V_{DDIO3} I/O compensation is disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes
1: V_{DDIO3} I/O compensation is not disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes

Bit 9 **CS**: I/Os supplied by V_{DDIO3} code selection
This bit selects the code to be applied for the compensation cell of I/Os supplied by V_{DDIO3}.
0: V_{DDIO3} I/O code from the cell (available in SYSCFG_VDDIO3CCSR)
1: V_{DDIO3} I/O code from RANSRC[3:0] and RAPSRC[3:0] register values
Note: CS = 0 is not taken into account until READY = 1. This means that, whenever CS, RANSRC[3:0] and RAPSRC[3:0] are used for I/O compensation when the compensation cell is not enabled (EN = 0, which is the case after a reset).

Bit 8 **EN**: I/Os supplied by V_{DDIO3} compensation cell enable
This bit enables the compensation cell of the I/Os supplied by V_{DDIO3}.
0: V_{DDIO3} I/Os compensation cell disabled
1: V_{DDIO3} I/Os compensation cell enabled
Note: The HSI oscillator must be enabled and ready (controlled in RCC) before EN can be set to 1. Similarly, the HSI oscillator can be disabled only if EN is set to 0.

Bits 7:4 **RAPSRC[3:0]**: PMOS compensation code of the I/Os supplied by V_{DDIO3}
These bits are written by software to define an I/O compensation code for PMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.
Value 0b1111 must never be used.

Bits 3:0 **RANSRC[3:0]**: NMOS compensation code of the I/Os supplied by V_{DDIO3}
These bits are written by software to define an I/O compensation code for NMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.
Value 0b0000 must never be used.

25.2.48 SYSCFG VDDIO3 compensation cell status register (SYSCFG_VDDIO3CCSR)

Address offset: 0x4004

Reset value: 0x0000 0000

Reset by system reset.

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	READY	APSRC[3:0]				ANSRC[3:0]			
							r	r	r	r	r	r	r	r	r

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **READY**: V_{DDIO3} I/O compensation cell ready flag
This bit provides the compensation cell status of the I/Os supplied by V_{DDIO3}
0: V_{DDIO3} I/O compensation cell not ready
1: V_{DDIO3} I/O compensation cell ready
Note: The HSI clock is required for the compensation cell to work properly. The compensation cell READY bit is not set if the HSI clock is not enabled.

Bits 7:4 **APSRC[3:0]**: PMOS compensation value of the I/Os supplied by V_{DDIO3}
This value is provided by the cell and can be used by the CPU to compute an I/O compensation cell code for PMOS transistors. This code is applied to the I/O compensation cell when CS in SYSCFG_VDDIO3CCCR is reset, and READY is set.

Bits 3:0 **ANSRC[3:0]**: NMOS compensation value of the I/Os supplied by V_{DDIO3}
This value is provided by the cell and can be used by the CPU to compute an I/O compensation cell code for NMOS transistors. This code is applied to the I/O compensation cell when CS in SYSCFG_VDDIO3CCCR is reset, and READY is set.

25.2.49 SYSCFG VDDIO4 compensation cell control register (SYSCFG_VDDIO4CCCR)

Address offset: 0x4008

Reset value: 0x0000 0078

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **LPMDIS**: I/Os supplied by V_{DDIO4} compensation cell low power mode disable

0: V_{DDIO4} I/O compensation is disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes

1: V_{DDIO4} I/O compensation is not disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes

Bit 9 **CS**: V_{DDIO4} I/O code selection

This bit selects the code to be applied for the compensation cell of the I/Os supplied by V_{DDIO4}.

0: V_{DDIO4} I/O code from the cell (available in SYSCFG_VDDIO4CCSR)

1: V_{DDIO4} I/O code from RANSRC[3:0] and RAPSRC[3:0] values

Note: CS = 0 is not taken into account until READY = 1.This means that, whenever CS, RANSRC[3:0] and RAPSRC[3:0] are used for I/O compensation when the compensation cell is not enabled (EN = 0, which is the case after a reset).

Bit 8 **EN**: V_{DDIO4} I/O compensation cell enable

This bit enables the compensation cell of the I/Os supplied by V_{DDIO4}.

0: V_{DDIO4} I/O compensation cell disabled

1: V_{DDIO4} I/O compensation cell enabled

Note: The HSI oscillator must be enabled and ready (controlled in RCC) before EN can be set to 1. Similarly, the HSI oscillator can be disabled only if EN is set to 0.

Bits 7:4 **RAPSRC[3:0]**: PMOS compensation code of the I/Os supplied by V_{DDIO4}

These bits are written by software to define an I/O compensation code for PMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.

Value 0b1111 must never be used.

Bits 3:0 **RANSRC[3:0]**: NMOS compensation code of the I/Os supplied by V_{DDIO4}

These bits are written by software to define an I/O compensation code for NMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.

Value 0b0000 must never be used.

25.2.50 SYSCFG VDDIO4 compensation cell status register (SYSCFG_VDDIO4CCSR)

Address offset: 0x400C

Reset value: 0x0000 0000

Reset by system reset.

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

							r	r	r	r	r	r	r	r	r

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **READY**: V_{DDIO4} I/O compensation cell ready flag

This bit provides the compensation cell status of the I/Os supplied by V_{DDIO4}.

0: V_{DDIO4} I/O compensation cell not ready

1: V_{DDIO4} I/O compensation cell ready

Note: The HSI clock is required for the compensation cell to work properly. The compensation cell READY bit is not set if the HSI clock is not enabled.

Bits 7:4 **APSRC[3:0]**: PMOS compensation value of the I/Os supplied by V_{DDIO4}

This value is provided by the cell and can be used by the CPU to compute an I/O compensation cell code for PMOS transistors. This code is applied to the I/O compensation cell when CS in SYSCFG_VDDIO4CCCR is reset, and the READY bit is set.

Bits 3:0 **ANSRC[3:0]**: NMOS compensation value of the I/Os supplied by V_{DDIO4}

This value is provided by the cell and can be used by the CPU to compute an I/O compensation cell code for NMOS transistors. This code is applied to the I/O compensation cell when CS in SYSCFG_VDDIO4CCCR is reset, and the READY bit is set.

25.2.51 SYSCFG VDD compensation cell control register (SYSCFG_VDDCCCR)

Address offset: 0x4010

Reset value: 0x0000 0078

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **LPMDIS**: I/Os supplied by V_{DD} compensation cell low power mode disable

0: V_{DD} I/O compensation is disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes

1: V_{DD} I/O compensation is not disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes

Bit 9 **CS**: V_{DD} I/O code selection

This bit selects the code to be applied for the compensation cell of the I/Os supplied by V_{DD}.

0: V_{DD} I/O code from the cell (available in SYSCFG_VDDCCSR)

1: V_{DD} I/O code from RANSRC[3:0] and RAPSRC[3:0] values

Note: CS = 0 is not taken into account until READY = 1. This means that whenever CS, RANSRC[3:0] and RAPSRC[3:0] are used for IO compensation when the compensation cell is not enabled (EN = 0, which is the case after a reset).

Bit 8 **EN**: V_{DD} I/O compensation cell enable

This bit enables the compensation cell of the I/Os supplied by V_{DD}.

0: V_{DD} I/Os compensation cell disabled

1: V_{DD} I/Os compensation cell enabled

Note: The HSI oscillator must be enabled and ready (controlled in RCC) before EN can be set to 1. Similarly, the HSI oscillator can be disabled only if EN is set to 0.

Bits 7:4 **RAPSRC[3:0]**: PMOS compensation code of the I/Os supplied by V_{DD}

These bits are written by software to define an I/O compensation code for PMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.

Value 0b1111 must never be used.

Bits 3:0 **RANSRC[3:0]**: NMOS compensation code of the I/Os supplied by V_{DD}

These bits are written by software to define an I/O compensation code for NMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.

Value 0b0000 must never be used.

25.2.52 SYSCFG VDD compensation cell status register (SYSCFG_VDDCCSR)

Address offset: 0x4014

Reset value: 0x0000 0000

Reset by system reset.

Any read access is allowed.

Bit 8 **READY**: V_{DD} I/O compensation cell ready flag
This bit provides the compensation cell status of the I/Os supplied by V_{DD}.
0: V_{DD} I/O compensation cell not ready
1: V_{DD} I/O compensation cell ready
Note: The HSI clock is required for the compensation cell to work properly. The compensation cell READY bit is not set if the HSI clock is not enabled.

Bits 7:4 **APSRC[3:0]**: PMOS compensation value of the I/Os supplied by V_{DD}
This value is provided by the cell and can be used by the CPU to compute an I/O compensation cell code for PMOS transistors. This code is applied to the I/O compensation cell when CS in SYSCFG_VDDCCCR is reset, and the READY bit is set.

Bits 3:0 **ANSRC[3:0]**: NMOS compensation value of the I/Os supplied by V_{DD}
This value is provided by the cell and can be used by the CPU to compute an I/O compensation cell code for NMOS transistors. This code is applied to the I/O compensation cell when CS in SYSCFG_VDDCCCR is reset, and the READY bit is set.

25.2.53 SYSCFG VDDIO2 compensation cell control register (SYSCFG_VDDIO2CCCR)

Address offset: 0x4018

Reset value: 0x0000 0078

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed on this register.

Bit 10 **LPMDIS**: I/Os supplied by V_{DDIO2} compensation cell low power mode disable
0: V_{DDIO2} I/O compensation is disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes
1: V_{DDIO2} I/O compensation is not disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes

Bit 9 **CS**: V_{DDIO2} I/O code selection
This bit selects the code to be applied for the compensation cell of I/Os supplied by V_{DDIO2}.
0: V_{DDIO2} I/O code from the cell (available in the SYSCFG_VDDIO2CCSR)
1: V_{DDIO2} I/O code from RANSRC[3:0] and RAPSRC[3:0] register values
Note: CS = 0 is not taken into account until READY = 1. This means that whenever CS, RANSRC[3:0] and RAPSRC[3:0] are used for I/O compensation when the compensation cell is not enabled (EN = 0, which is the case after a reset).

Bit 8 **EN**: V_{DDIO2} I/O compensation cell enable
This bit enables the compensation cell of the I/Os supplied by V_{DDIO2}.
0: V_{DDIO2} I/O compensation cell disabled
1: V_{DDIO2} I/O compensation cell enabled
Note: The HSI oscillator must be enabled and ready (controlled in RCC) before EN can be set to 1. Similarly, the HSI oscillator can be disabled only if EN is set to 0.

Bits 7:4 **RAPSRC[3:0]**: PMOS compensation code of the I/Os supplied by V_{DDIO2}
These bits are written by software to define an I/O compensation code for PMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.
Value 0b1111 must never be used.

Bits 3:0 **RANSRC[3:0]**: NMOS compensation code of the I/Os supplied by V_{DDIO2}
These bits are written by software to define an I/O compensation code for NMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.
Value 0b0000 must never be used.

25.2.54 SYSCFG VDDIO2 compensation cell status register (SYSCFG_VDDIO2CCSR)

Address offset: 0x401C

Reset value: 0x0000 0000

Reset by system reset.

Bit 10 **LPMDIS**: I/Os supplied by V_{DDIO1} compensation cell low power mode disable

0: V_{DDIO1} I/O compensation is disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes

1: V_{DDIO1} I/O compensation is not disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes

Bit 9 **CS**: V_{DDIO1} I/O code selection

This bit selects the code to be applied for the compensation cell of I/Os supplied by V_{DDIO1}.

0: V_{DDIO1} I/O code from the cell (available in SYSCFG_VDDIO1CCSR)

1: V_{DDIO1} I/O code from RANSRC[3:0] and RAPSRC[3:0] values

Note: CS = 0 is not taken into account until READY = 1.This means that whenever CS, RANSRC[3:0] and RAPSRC[3:0] are used for I/O compensation when the compensation cell is not enabled (EN = 0, which is the case after a reset).

Bit 8 **EN**: V_{DDIO1} I/O compensation cell enable

This bit enables the compensation cell of the I/Os supplied by V_{DDIO1}.

0: V_{DDIO1} I/O compensation cell disabled

1: V_{DDIO1} I/O compensation cell enabled

Note: The HSI oscillator must be enabled and ready (controlled in RCC) before EN can be set to 1. Similarly, the HSI oscillator can be disabled only if EN is set to 0.

Bits 7:4 **RAPSRC[3:0]**: PMOS compensation code of the I/Os supplied by V_{DDIO1}

These bits are written by software to define an I/O compensation code for PMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.

Value 0b1111 must never be used.

Bits 3:0 **RANSRC[3:0]**: NMOS compensation code of the I/Os supplied by V_{DDIO1}

These bits are written by software to define an I/O compensation code for NMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.

Value 0b0000 must never be used.

25.2.56 SYSCFG VDDIO1 compensation cell status register (SYSCFG_VDDIO1CCSR)

Address offset: 0x4024

Reset value: 0x0000 0000

Reset by system reset.

											rwo	rwo	rwo		rwo

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **RETRAML**: RETRAM double ECC error lock

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the RETRAM double ECC error signal connection to TIM1/8/15/16/17/20 break inputs.

0: RETRAM double ECC error signal disconnected from TIM1/8/15/16/17/20 break inputs

1: RETRAM double ECC error signal connected to TIM1/8/15/16/17/20 break inputs

Bit 3 **BKRAML**: BKPSRAM double ECC error lock

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the BKPSRAM double ECC error signal connection to TIM1/8/15/16/17/20 break inputs.

0: BKPSRAM double ECC error signal disconnected from TIM1/8/15/16/17/20 break inputs

1: BKPSRAM double ECC error signal connected to TIM1/8/15/16/17/20 break inputs

Bit 2 **PVDL**: PVD lock enable

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the PVD connection to TIM1/8/15/16/17/20 break input, as well as th PVDEN in PWR_CR3.

0: PVD interrupt disconnected from TIM1/8/15/16/17/20 break input. PVDEN bits can be programmed by the application.

1: PVD interrupt connected to TIM1/8/15/16/17/20 break input. PVDEN bits are read only.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **CLL**: Cortex-M33 LOCKUP (HardFault) output enable

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the connection of Cortex-M33 LOCKUP (HardFault) output to TIM1/8/15/16/17/20 break input.

0: Cortex-M33 LOCKUP output disconnected from TIM1/8/15/16/17/20 break inputs

1: Cortex-M33 LOCKUP output connected to TIM1/8/15/16/17/20 break inputs

25.2.58 SYSCFG USB3DR control register (SYSCFG_USB3DRCR)

Address offset: 0x4800

Reset value: 0x0000 0000

Reset by system reset.

Write access according to USB3DR RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

				rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **USB3DR_NOTPCIE_DEBUG_BUS**: Selection of USB3DR or PCIE debug signals
0: PCIE debug signals are selected.
1: USB3DR debug signals are selected.

Bits 10:8 **USB3DR_DEBUG_BUS_SEL[2:0]**: Selection of USB3DR/USBH debug signals
000: usb3dr_logic_analyzer[15:0]
001: usb3dr_logic_analyzer[31:16]
010: usb3dr_logic_analyzer[47:32]
011: usb3dr_logic_analyzer[63:48]
1xx: 00 and usb3dr_hub_port_overcurrent[1:0] and usbh_app_prt_ovrcur and combophy_pipe0_rx_elecidle and usb2phy2_host_disconnect0 and usb2phy2_linestate[1:0] and usb2phy2_sleepm0 and usb2phy2_suspendm0 and usb2phy1_hostdisconnect0 and usb2phy1_linestate[1:0] and usb2phy1_sleepm0 and usb2phy1_suspendm0

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **USB3DR_USB2ONLYD**:
0: USB3DR controller used in USB3 mode
1: USB3DR controller used in USB2-only Device mode

Bit 3 **USB3DR_USB2ONLYH**:
0: USB3DR controller used in USB3 mode
1: USB3DR controller used in USB2-only Host mode

Bit 2 **USB3DR_VBUSEN_POLARITY**: Polarity of USB3DR_VBUSEN alternate function
0: USB3DR_VBUSEN active high (a 1 logic level means the VBUS must be enabled) (default)
1: USB3DR_VBUSEN active low (a 0 logic level means the VBUS must be enabled)

Bit 1 **USB3DR_OVRCUR_POLARITY**: Polarity of USB3DR_OVRCUR alternate function
0: USB3DR_OVRCUR active high (a 1 logic level means there is an over-current situation) (default)
1: USB3DR_OVRCUR active low (a 0 logic level means there is an over-current situation)

Bit 0 **USB3DR_HOST_PORT_POWER_CONTROL_PRESENT**:
This port defines the bit[3] of capability parameters (HCCPARAMS). This indicates whether the host controller implementation includes port power control.
0: Indicates that the port does not have port power switches.
1: Indicates that the port has port power switches.

25.2.59 SYSCFG USB3DR status register (SYSCFG_USB3DRSR)

Address offset: 0x4804

Reset value: 0x0000 0000

Reset by system reset.

Any read access is allowed.

													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **USB3DR_CLK_GATE_CTRL[2:0]**: USB3DR debug register - Clock gating control
Indicates the status of internal clock gating for RAM and bus clocks.
Bit[0] gates control for bus_clk. Bit[1] is for ram_clk. Bit[2] is for ram_clk_u3_l2.

25.2.60 SYSCFG COMBOPHY control register 1 (SYSCFG_COMBOPHYCR1)

Address offset: 0x4C00

Reset value: 0x0000 00C8

Reset by system reset.

Write access according to COMBOPHY RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	COMBOPHY_SSCRANGE[2:0]			COMBOPHY_SSCEN	COMBOPHY_REFSSPEN	COMBOPHY_REFCLKDIV2	COMBOPHY_SSCREFCLKSEL[8]

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:20 **COMBOPHY_SSCRANGE[2:0]**: Selection of the range of spread-spectrum modulation
000: -4980 ppm
001: -4492 ppm
010: -4003 ppm
011: -2000 ppm
100: 4980 ppm
101: 4492 ppm
110: 4003 ppm
111: 2000 ppm

Bit 19 **COMBOPHY_SSCEN**: Spread-spectrum enable
0: Spread-spectrum disabled
1: Spread-spectrum enabled (modulation at approximately 31.5 kHz, range is defined by COMBOPHY_SSCRANGE). If the reference clock already has spread-spectrum applied, this bit must be deasserted.

Bit 18 **COMBOPHY_REFSSPEN**: Reference clock enable
0: Reference clock buffer disabled
1: Reference clock buffer enabled

Bit 17 **COMBOPHY_REFCLKDIV2**: Parameter for the frequency selection of the reference clock
0: 19.2, 20, 24, 25, 26, 38.4, 48, 50, 52, or 100 MHz
1: 40 or 200 MHz

Bits 16:8 **COMBOPHY_SSCREFCLKSEL[8:0]**: Parameter for reference clock frequency selection
000000000: 20, 25, 40, 50, 100, or 200 MHz
100001000: 19.2, 24, 26, 38.4, 48, or 52 MHz

Bits 7:1 **COMBOPHY_MPLLMULTIPLIER[6:0]**: Parameter for reference clock frequency selection
0000010: 19.2 MHz
0011001: 100 or 200 MHz
0110000: 52 MHz
0110010: 50 MHz
0110100: 48 MHz
1000001: 38.4 MHz
1100000: 26 MHz
1100100: 25 MHz
1101000: 24 MHz
1111101: 20 or 40 MHz

Bit 0 **COMBOPHY_REFUSEPAD**: Selection of COMBOPHY reference clock source
0: Reference clock sourced either from RCC or directly from HSE (depending on USB3PCIEPHYCKREFSEL in RCC_USB3PCIEPHYCFGR)
1: Reference clock sourced from PCIE_CLKIN_P/N pins

25.2.61 SYSCFG COMBOPHY control register 2 (SYSCFG_COMBOPHYCR2)

Address offset: 0x4C04

Reset value: 0x0000 0000

Reset by system reset.

Write access according to COMBOPHY RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw														rw	rw

Bit 31 **COMBOPHY_TEST_POWERDOWN**:
Forces the entire PHY into its lowest power state by turning everything off.

Bits 30:16 Reserved, must be kept at reset value.

Bit 15 **COMBOPHY_ISO_DIS**: COMBOPHY isolation cells disable
0: Electrical isolation for signals between V_{DDCORE} and $V_{DDCOMBOPHY}$ is enabled.
1: Electrical isolation for signals between V_{DDCORE} and $V_{DDCOMBOPHY}$ is disabled.

Bits 14:2 Reserved, must be kept at reset value.

Bits 1:0 **COMBOPHY_MODESEL[1:0]**: COMBOPHY mode selection
00: PCIE
11: USB3

25.2.62 SYSCFG COMBOPHY control register 3 (SYSCFG_COMBOPHYCR3)

Address offset: 0x4C08

Reset value: 0x1E21 5800

Reset by system reset.

Write access according to SERDES RIFSC configuration. Debug domain can also access if

the feature is activated. Any read access is allowed on this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	COMBOPHY_RTUNE_REQ	COMBOPHY_RXLOSLFPSEN	COMBOPHY_PCSTXSWINGFULL[6:0]							COMBOPHY_PCSTXDEEMPH6DB[5:0]					
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bit 30 **COMBOPHY_RTUNE_REQ**:
Instructs COMBOPHY to perform a termination calibration. The calibration has completed when COMBOPHY_RTUNE_ACK is set. This bit must be cleared after the calibration has completed.
0: Idle
1: A termination calibration must be performed by the COMBOPHY.

Bit 29 **COMBOPHY_RXLOSLFPSEN**: Enables the RX LOS LFPS mode.

Bits 28:22 **COMBOPHY_PCSTXSWINGFULL[6:0]**: TX amplitude (full swing mode)
(USB3 and PCIE use cases)

Bits 21:16 **COMBOPHY_PCSTXDEEMPH6DB[5:0]**: TX deemphasis at 6 dB (USB3 use case)

Bits 15:10 **COMBOPHY_PCSTXDEEMPH3P5DB[5:0]**: TX deemphasis at 3.5 dB (USB3 use case)

Bits 9:0 **COMBOPHY_PCSRXLOSMASKVAL[9:0]**:
Masks the incoming LFPS for the number of reference clock cycles equal to the value of this bitfield. This control filters out short, non-compliant, LFPS glitches sent by a non-compliant partner. Clearing this bitfield to 0 disables the masking.

25.2.63 SYSCFG COMBOPHY control register 4 (SYSCFG_COMBOPHYCR4)

Address offset: 0x4C0C

Reset value: 0x80F0 B24A

Reset by system reset.

Write access according to SERDES RIFSC configuration. Debug domain can also access if

the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 **COMBOPHY_TX_VBOOST_LEVEL[2:0]**: TX voltage boost level
011: Launch amplitude of 0.844 V.
100: Launch amplitude of 1 V.
101: Launch amplitude of 1.156 V.
Others: Reserved

Bits 28:24 **COMBOPHY_TX_TERM_OFFSET[4:0]**: Transmitter termination offset
Enables adjustment of the transmitter termination value from the default value of 50 Ω. This is a signed offset from -16 to +15.

Bits 23:17 **COMBOPHY_PCS_TX_SWING_LOW[6:0]**: TX amplitude (low swing mode) (PCIE use case)

Bits 16:11 **COMBOPHY_PCS_TX_DEEMPH_GEN1[5:0]**: TX deemphasis at 3.5 dB (PCIE gen1 use case)

Bits 10:8 **COMBOPHY_LOS_BIAS[2:0]**: Loss-of-signal detector threshold level control

Bits 7:3 **COMBOPHY_LOS_LEVEL[4:0]**: Loss-of-signal detector sensitivity level control

Bits 2:0 **COMBOPHY_RX0_EQ[2:0]**: RX equalizer setting

25.2.64 SYSCFG COMBOPHY control register 5 (SYSCFG_COMBOPHYCR5)

Address offset: 0x4C10

Reset value: 0x0000 0856

Reset by system reset.

Write access according to COMBOPHY RIFSC configuration. Debug domain can also

access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

COMBOPHY_PIPE0_TX2RX_LOOPBK	COMBOPHY_LANE0_TX2RX_LOOPBK	COMBOPHY_LANE0_EXT_PCLK_REQ	COMBOPHY_PCS_COMMON_CLOCKS	COMBOPHY_PCS_TX_DEEMPH_GEN2_6DB[5:0]						COMBOPHY_PCS_TX_DEEMPH_GEN2_3P5DB[5:0]					
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **COMBOPHY_PIPE0_TX2RX_LOOPBK**: PCIE use case

When this bit is equal to 1, data from the transmit predriver is looped back to the receive slicers. This is for debug only. Must be equal to 0 in functional mode.

Bit 14 **COMBOPHY_LANE0_TX2RX_LOOPBK**: USB3 use case

When this bit is equal to 1, data from the transmit predriver is looped back to the receive slicers. This is for debug only. Must be equal to 0 in functional mode.

Bit 13 **COMBOPHY_LANE0_EXT_PCLK_REQ**: USB3 use case

External PIPE clock enable request. When this bit is equal to 1, it enables the pipeX_pclk output regardless of power state.

Bit 12 **COMBOPHY_PCS_COMMON_CLOCKS**: Common clock mode selection for PCIE receive data path

When both ends of a PCIE link share a common reference clock, the latency through the receiver elasticity buffer can be shorter, because no frequency offset exists between the two ends of the link.

0: Reference clock not common

1: Common reference clock

Bits 11:6 **COMBOPHY_PCS_TX_DEEMPH_GEN2_6DB[5:0]**: TX deemphasis at 6 dB (PCIE gen2 use case)

Bits 5:0 **COMBOPHY_PCS_TX_DEEMPH_GEN2_3P5DB[5:0]**: TX deemphasis at 3.5 dB (PCIE gen2 use case)

25.2.65 SYSCFG COMBOPHY status register (SYSCFG_COMBOPHYSR)

Address offset: 0x4C14

Reset value: 0x0000 0002

Reset by system reset.

Any read access is allowed on this register.

														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **COMBOPHY_PIPE0_PHYSTATUS**:

Communicates completion of several PHY functions. pipe0_pclk is up and stable, power management state transitions, rate change, receiver detection

0: When COMBOPHY reset is deasserted, and the COMBOPHY PLL and PIPE clock runs

1: While the COMBOPHY reset is asserted

Bit 0 **COMBOPHY_RTUNE_ACK**: End of the termination calibration step

0: Idle

1: Termination calibration has completed.

25.2.66 SYSCFG display clock control register (SYSCFG_DISPLAYCLKCR)

Address offset: 0x5000

Reset value: 0x0000 0001

Reset by system reset.

Write access according to LTDC_CMN RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **APP_DBI_RO_WR_DISABLE**: DBI read-only write disable
0: DBI_RO_WR_EN in PCIE_PORT_LOGIC_MISC_CONTROL_1_OFF is read-write and can be used to enable write access to some read-only registers.
1: DBI_RO_WR_EN is forced to 0 and is read-only.

Bits 24:17 **APP_BUS_NUM[7:0]**: Bus number in the requester ID for RC port

Bits 16:12 **APP_DEV_NUM[4:0]**: Device number in the requester ID for an RC port

Bits 11:8 **DEVICE_TYPE[3:0]**: Device/port type
0000: PCI express endpoint
0001: Legacy PCI express endpoint
0100: Root port of PCI express root complex
Others: Reserved

Bit 7 **APP_CLK_REQ_N**:
Clear this bit to 0 if the application does not want to remove the reference clock.
Only modify this bit during configuration: it must not be changed dynamically during L1.

Bits 6:5 **DEBUG_BUS_SEL[1:0]**: Selection of PCIE observation points

Bit 4 **SYS_INT**:
When pcie_sys_int goes from low to high, the PCIE controller generates an Assert_INTx message.
When pcie_sys_int goes from high to low, the PCIE controller generates a Deassert_INTx message.

Bit 3 **APP_REQ_RETRY_EN**:

Provides a capability to defer incoming configuration requests until initialization is complete (only for endpoint).

Bit 2 **APP_LTSSM_ENABLE**:

After application has finished initializing the core configuration registers, it must assert this bit to allow the LTSSM to continue link establishment.

Bit 1 **APP_INIT_RST**:

Requests from the application to send a hot reset to the downstream device (only for RootComplex).

Bit 0 Reserved, must be kept at reset value.

25.2.68 SYSCFG PCIE CFG_PME_MSI control register (SYSCFG_PCIEPMEMSICR)

Address offset: 0x6004

Reset value: 0x0000 0000

Reset by system reset.

Write access according to PCIE RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

25.2.71 SYSCFG PCIE PTM interrupt control register (SYSCFG_PCIEPTMIRQCR)

Address offset: 0x6010

Reset value: 0x0000 0000

Reset by system reset.

Write access according to PCIE RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **RST_PTM_REQ_REPLAY_TX**: Reset ptm_req_replay_rx interrupt logic
0: Reset inactive
1: Reset active

Bit 2 **RST_PTM_REQ_DUP_RX**: Reset ptm_req_dup_rx interrupt logic
0: Reset inactive
1: Reset active

Bit 1 **RST_PTM_REQ_RESPONSE_TIMEOUT**: Reset ptm_req_response_timeout interrupt logic
0: Reset inactive
1: Reset active

Bit 0 **RST_PTM_CLOCK_UPDATED**: Reset ptm_clock_updated interrupt logic
0: Reset inactive
1: Reset active

25.2.72 SYSCFG PCIE PRG control register (SYSCFG_PCIEPRGCR)

Address offset: 0x6080

Reset value: 0x0000 0006

Reset by system reset.

Write access according to PCIE RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRG_IMP_CTRL[4:0]					PRG_EN
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:1 **PRG_IMP_CTRL[4:0]**: Control of the impedance of the 100 MHz differential output buffer
Bits [4:3] set the single-ended voltage swing, from 100% (0b11) to 70% (0b00) of VDDPCIECLK. Default is 100%.
Bits [2:0] set the single-ended output impedance, from 40 Ω (0b111) to 60 Ω (0b000). Default is 50 Ω (0b011).

Bit 0 **PRG_EN**:
0: The internal 100 MHz clock PCIe Reference Generator is disabled.
1: The internal 100 MHz clock PCIe Reference Generator is enabled.

25.2.73 SYSCFG PCIE status register 1 (SYSCFG_PCIESR1)

Address offset: 0x6100

Reset value: 0x0000 0004

Reset by system reset.

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PTM_RESPONDER_RDY_TO_VALIDATE	PTM_UPDATING	PTM_CLOCK_UPDATED	PTM_REQ_RESPONSE_TIMEOUT	PTM_REQ_DUP_RX	PTM_REQ_REPLAY_TX
										r	r	r	r	r	r

r	r	r	r	r	r	r	r		r	r	r	r	r	r	r

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **PTM_RESPONDER_RDY_TO_VALIDATE**:
Application software can re-validate the context, because it was invalidated.

Bit 20 **PTM_UPDATING**: PTM update in progress

Bit 19 **PTM_CLOCK_UPDATED**: Controller updated the local clock.

Bit 18 **PTM_REQ_RESPONSE_TIMEOUT**: PTM requester response timeout
The 100 µs timeout occurred while waiting for a PTM response or responseD message.

Bit 17 **PTM_REQ_DUP_RX**: PTM requester duplicate TLP received
When PTM requester is in the process of updating PTM local clock, or following calculation of the update, when the PTM context is valid.

Bit 16 **PTM_REQ_REPLAY_TX**:
PTM requester detected a TLP replay being sent when responseD message in use, and one of the following:
– PTM requester in the process of updating PTM local clock
– following calculation of update when PTM context valid

Bit 15 **RADM_QOVERFLOW**:
Level high indicates that one or more of the P/NP/CPL receive queues has overflowed.
Status cleared using RST_RADM_QOVERFLOW in SYSCFG_PCIESYSRCCR.

Bit 14 **RADM_Q_NOT_EMPTY**:
Level high indicates that the receive queues contain TLP header/data.

Bit 13 **CFG_AER_RC_ERR_INT**: pcie_1_cfg_aer_rc_err interrupt

Bit 12 **CFG_PME_INT**: pcie_1_cfg_pme interrupt

Bit 11 **INTA_INTERRUPT**: pcie_1_inta interrupt

Bit 10 **INTB_INTERRUPT**: pcie_1_intb interrupt

Bit 9 **INTC_INTERRUPT**: pcie_1_intc interrupt

Bit 8 **INTD_INTERRUPT**: pcie_1_intd interrupt

Bit 7 Reserved, must be kept at reset value.

Bit 6 **MSI_CTRL_INT**: pcie_1_msi_ctrl_int interrupt

Bit 5 **RDLH_LINK_UP**: Data link layer up, status for RC application

Bit 4 **CFG_HW_AUTO_SP_DIS**: Hardware autonomous speed disable
Used in downstream ports only.

Bit 3 **SMLH_LINK_UP**: PHY link up, status for RC application

Bits 2:0 **PM_DSTATE[2:0]**: Power management D-state

25.2.74 SYSCFG PCIE interrupt status register 2 (SYSCFG_PCIESR2)

Address offset: 0x6104

Reset value: 0x0000 0000

Reset by system reset.

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CFG_SYS_ERR_RC_INT_STS**: Status of PCIE cfg_sys_err_rc interrupt

Bit 1 **CFG_AER_RC_ERR_MSI_INT_STS**: Status of PCIE cfg_aer_rc_err_msi interrupt

Bit 0 **CFG_PME_MSI_INT_STS**: Status of PCIE cfg_pme_msi interrupt

25.2.75 SYSCFG device ID register (SYSCFG_IDC)

Address offset: 0x6400

Reset value: 0x2000 6505

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MAJOR_REV_ID[15:0]

Res.	Res.	Res.	Res.	DEV_ID[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 **MAJOR_REV_ID[15:0]**: Device revision
0x2000 = Revision 2

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **DEV_ID[11:0]**: Device ID
0x505: STM32MP23/25xx

25.2.76 SYSCFG version register (SYSCFG_VERR)

Address offset: 0x7FF4

Reset value: 0x0000 0011

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJREV[3:0]				MINREV[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: SYSCFG major revision
The major revision is 1.

Bits 3:0 **MINREV[3:0]**: SYSCFG minor revision
The minor revision is 1.

25.2.77 SYSCFG identification register (SYSCFG_IPIDR)

Address offset: 0x7FF8

Reset value: 0x0003 0003

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ID[31:0]**: SYSCFG identifier

25.2.78 SYSCFG size identification register (SYSCFG_SIDR)

Address offset: 0x7FFC

Reset value: 0xA3C5 DD40

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Refer to *Section 2.4* for the register boundary addresses.

26 Peripheral interconnects

26.1 Introduction

Several peripherals have direct interconnections between them. This allows autonomous communication and synchronization between peripherals, saving processor resources and reducing power supply consumption.

In addition, these hardware connections remove software latency and allow the design of a predictable system.

This also saves pins and GPIOs.

Depending on the peripheral, these interconnections can operate in Run, CSleep or Stop modes.

26.2 Connection overview

There are several types of connections, as listed below.

26.2.1 Asynchronous connections (A)

The source output signal is sampled by the destination clock, leading to the possible introduction of jitter in the latency between the source output event and the destination event detection.

26.2.2 Synchronous connections (S)

Both source and destination are synchronous (they run on the same clock), and the latency from the source to the destination is deterministic. No jitter is introduced.

26.2.3 Break/fault connection for TIM outputs (B)

The source output signal disables the timer outputs through a pure combinatorial logic path, without any latency.

26.2.4 Peripherals interconnect matrix

27 High-performance direct memory access controller (HPDMA)

27.1 HPDMA introduction

The high-performance direct memory access (HPDMA) controller is a bus master and system peripheral.

The HPDMA is used to perform programmable data transfers between memory-mapped peripherals, and/or memories via linked-lists, upon the control of an off-loaded CPU.

27.2 HPDMA main features

- Single bidirectional AXI master and single bidirectional AHB master
- Memory-mapped data transfers from a source to a destination:
  - Peripheral-to-memory
  - Memory-to-peripheral
  - Memory-to-memory
  - Peripheral-to-peripheral
- Autonomous data transfers during Stop mode (*Section 27.3.3*)

  Transfer arbitration based on a 4-grade programmed priority at channel level:
  - One high-priority traffic class, for time-sensitive channels (queue 3)
  - Three low-priority traffic classes, with a weighted round-robin allocation for non time-sensitive channels (queues 0, 1, 2)
- Per channel event generation, on any of the following events: transfer complete, half transfer complete, data transfer error, user setting error, link transfer error, completed suspension, and trigger overrun
- Per channel interrupt generation, with separately programmed interrupt enable per event
- 16 concurrent HPDMA channels:
  - Per channel FIFO for queuing source and destination transfers (see *Section 27.3.1*)
  - Intra-channel HPDMA transfers chaining via programmable linked-list into memory, supporting two execution modes: run-to-completion and link step mode
  - Intra-channel and inter-channel HPDMA transfers chaining via programmable HPDMA input triggers connection to HPDMA task completion events
- Per linked-list item within a channel:
  - Separately programmed source and destination transfers
  - Programmable data handling between source and destination: byte-based reordering, packing or unpacking, padding or truncation, sign extension and left/right realignment
  - Programmable number of data bytes to be transferred from the source, defining the block level

  - Linear source and destination addressing: either fixed or contiguously incremented addressing, programmed at block level, between successive burst transfers
  - 2D source and destination addressing: programmable signed address offsets between successive burst transfers (non-contiguous addressing within a block, combined with programmable signed address offsets between successive blocks, at a second 2D/repeated block level, for a reduced set of channels (see *Section 27.3.1*)
  - Support for scatter-gather (multi-buffer transfers), data interleaving and deinterleaving via 2D addressing
  - Selection of programmable HPDMA request and trigger
  - Generation of programmable HPDMA half-transfer and transfer-complete event
  - Pointer to the next linked-list item and its data structure in memory, with automatic update of the HPDMA linked-list control registers
  - Channel abort and restart
- Debug:
  - Channel suspend and resume support
  - Channel status reporting, including FIFO level, and event flags
- TrustZone support:
  - Support for secure and nonsecure HPDMA transfers, independently at a first channel level, and independently at a source/destination and link sublevels
  - Secure and nonsecure interrupts reporting, resulting from any of the respectively secure and nonsecure channels
  - TrustZone-aware AHB slave port, protecting any HPDMA secure resource (register, bitfield) from a nonsecure access
- Privileged/unprivileged support:
  - Support for privileged and unprivileged HPDMA transfers, independently at channel level
  - Privileged-aware AHB slave port
- Channel isolation support:
  - Support for compartmented DMA transfers, independently at channel level, via compartment IDs (named CIDs)
  - CID-aware interrupts reporting
  - CID-aware AHB slave port, with integrated semaphores for a concurrent control, from any of the CPUs
- Identification registers, with associated peripheral revision and hardware configuration

27.3 HPDMA implementation

27.3.1 HPDMA channels

A given HPDMA channel x is implemented with the following features and intended use.

To make the best use of the HPDMA performance, the following table lists some general recommendations, allowing the user to select and allocate a channel, given its implemented FIFO size and the requested HPDMA transfer.

Table 203. Implementation of HPDMA1/2/3 channels

Channel x	Hardware parameters		Features
	dma_fifo_size[x]	dma_addressing[x]	
x = 0 to 7	2	0	Channel x (x = 0 to 7) is implemented with: – a FIFO of 8 bytes, 2 words, 1 double-word – fixed/contiguously incremented addressing These channels are typically allocated for HPDMA transfers between an APB or AHB peripheral, and SRAM.
x = 8 to 11	4	0	Channel x (x = 8 to 11) is implemented with: – a FIFO of 32 bytes, 8 words, 4 double-words – fixed/contiguously incremented addressing These channels can be used for HPDMA transfers between a demanding AHB peripheral and SRAM, or with external memories transfers.
x = 12 to 15	6	2	Channel x (x = 12 to 15) is implemented with: – a FIFO of 128 bytes, 16 double-words – 2D addressing with extended offsets These channels can also be used for data demanding memory-to-memory HPDMA transfers including DDR-SDRAM.

27.3.2 HPDMA allowed AXI maximum burst length

For a data transfer, the user has to program:

– the source (and destination) burst length that a given channel x ideally performs, via SBL_1[5:0] (and respectively DBL_1[5:0]) field in HPDMA_CxTR1.

– the allocated master port, AXI or AHB, on which this source (or destination) data transfer must be performed, via SAP (or respectively DAP) field in HPDMA_CxTR1.

Caution: The maximum allowed AXI burst length is restricted to 16:

1. if SAP = 0 (AXI allocated port): the maximum allowed value of SBL_1[5:0] is 15.
2. if DAP = 0 (AXI allocated port): the maximum allowed value of DBL_1[5:0] is 15.

27.3.3 HPDMA autonomous mode in low-power modes

The HPDMA autonomous mode and wake-up features are implemented in the device low-power modes as per the table below.

Table 204. HPDMA1/2/3 autonomous mode and wake-up in low-power modes

Feature	Low-power modes
Autonomous mode and wake-up	HPDMA1/2/3 in Sleep and Stop 1 modes

27.3.4 HPDMA requests

An HPDMA request from a peripheral can be assigned to a HPDMA channel x, via REQSEL[7:0] in HPDMA_CxTR2, provided that SWREQ = 0.

The HPDMA requests mapping is specified in the table below.

Table 205. Programmed HPDMA1/2/3 request

27.3.5 HPDMA block requests

Some HPDMA requests must be programmed as a block request, and not as a burst request. Then BREQ in HPDMA_CxTR2 must be set for a correct HPDMA execution of the requested peripheral transfer at the hardware level.

Table 206. Programmed HPDMA1/2/3 request as a block request

HPDMA block requests
lptim1/2_ue_dma

27.3.6 HPDMA channels with peripheral early termination

An HPDMA channel, if implemented with this feature, can support the early termination of the data transfer from the peripheral which does also support this feature.

Table 207. HPDMA channel with peripheral early termination

HPDMA channel x with peripheral early termination
x = 0 to 15

This HPDMA support is activated when the channel x is programmed with HPDMA_CxTR2.PFREQ = 1. Then, the peripheral itself can initiate and request a data transfer completion, before that the HPDMA has transferred the whole block (see *Section 27.4.14* for more details).

Table 208. Programmed HPDMA1/2/3 request with peripheral early termination

Programmed HPDMA channel x request with peripheral early termination
i3c1_rx_dma
i3c2_rx_dma
i3c3_rx_dma

27.3.7 HPDMA triggers

An HPDMA trigger can be assigned to an HPDMA channel x, via TRIGSEL[6:0] in HPDMA_CXTR2, provided that TRIGPOL[1:0] defines a rising or a falling edge of the selected trigger (TRIGPOL[1:0] = 01 or TRIGPOL[1:0] = 10).

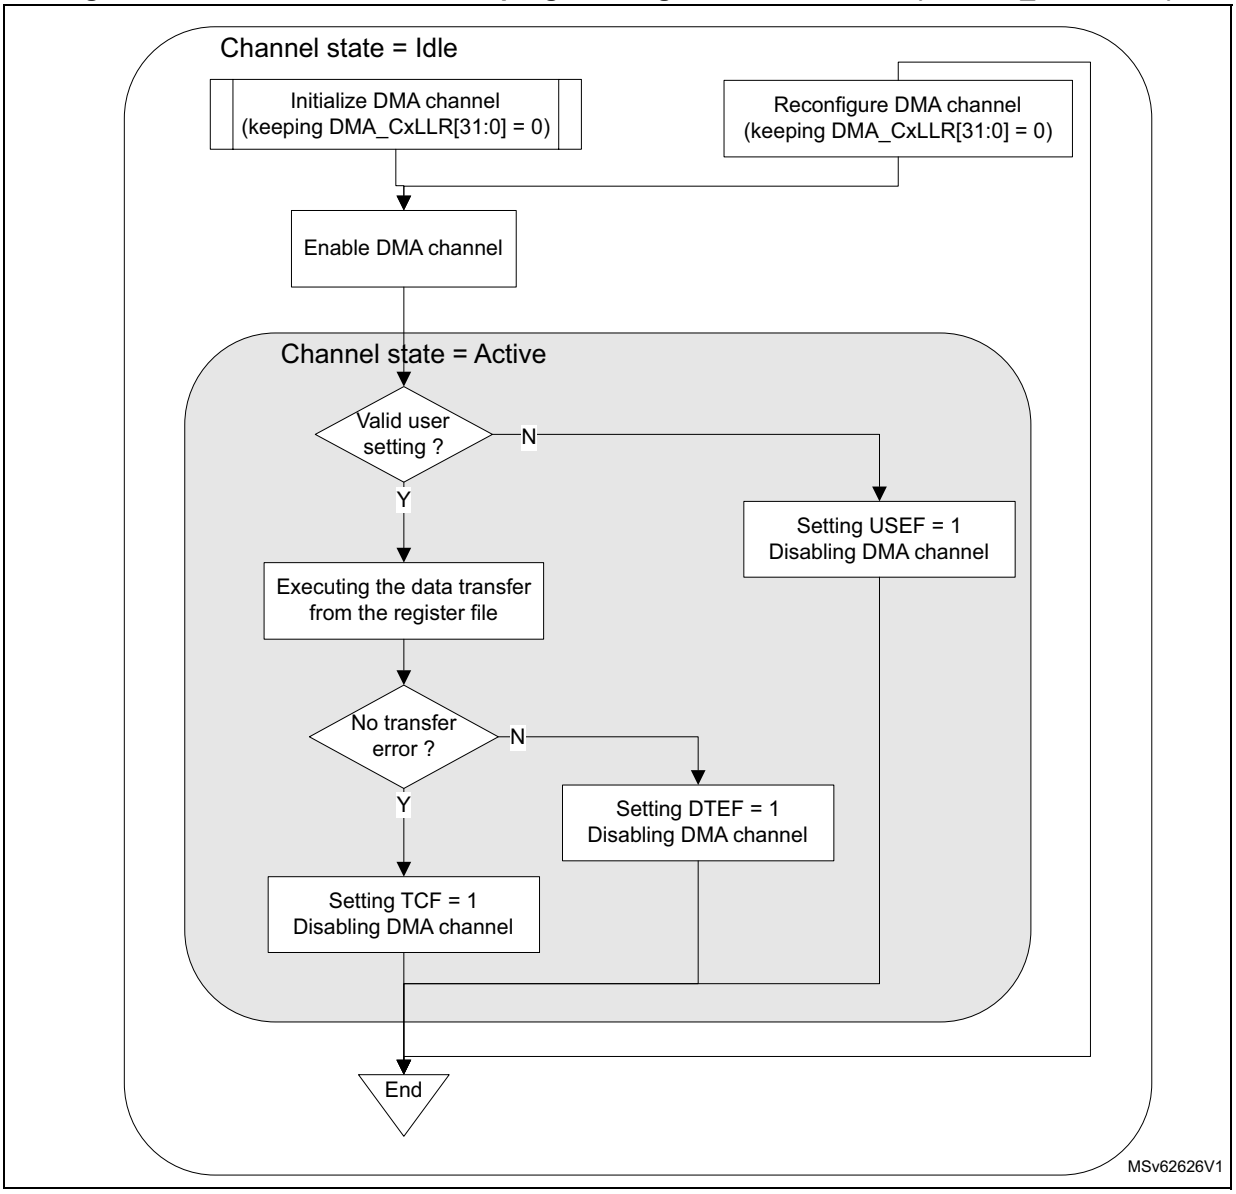
27.4 HPDMA functional description

27.4.1 HPDMA block diagram

Figure 156. HPDMA block diagram



27.4.2 HPDMA channel state and direct programming without any linked-list

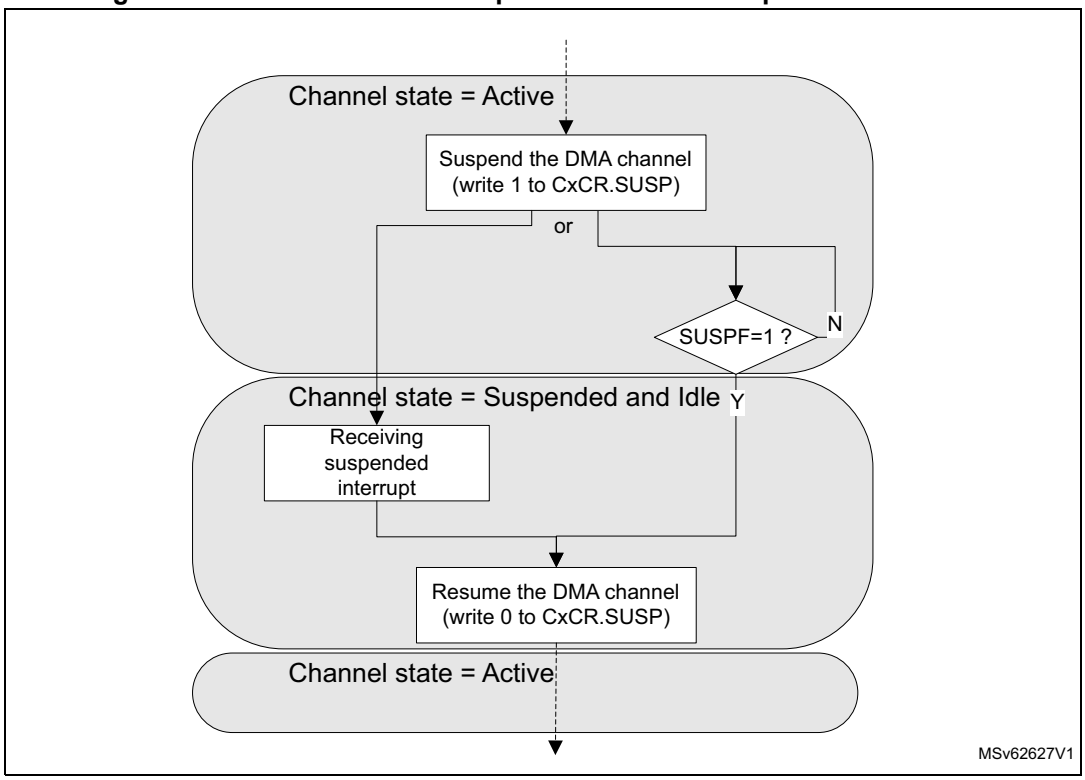
After an HPDMA reset, an HPDMA channel x is in idle state. When the software writes 1 into the HPDMA_CxCR.EN enable control bit, the channel takes into account the value of the different channel configuration registers (HPDMA_CxXXX), switches to the active/non-idle state, and starts to execute the corresponding requested data transfers.

After enabling/starting an HPDMA channel transfer by writing 1 into HPDMA_CxCR.EN, an HPDMA channel interrupt on a complete transfer notifies the software that the HPDMA channel is back in idle state (EN is then deasserted by hardware), and that the channel is ready to be reconfigured then enabled again.

The figure below illustrates this HPDMA direct programming without any linked-list (HPDMA_CxLLR = 0).

Figure 157. HPDMA channel direct programming without linked-list (HPDMA_CxLLR = 0)

27.4.3 HPDMA channel suspend and resume



The software can suspend on its own a channel still active, with the following sequence:

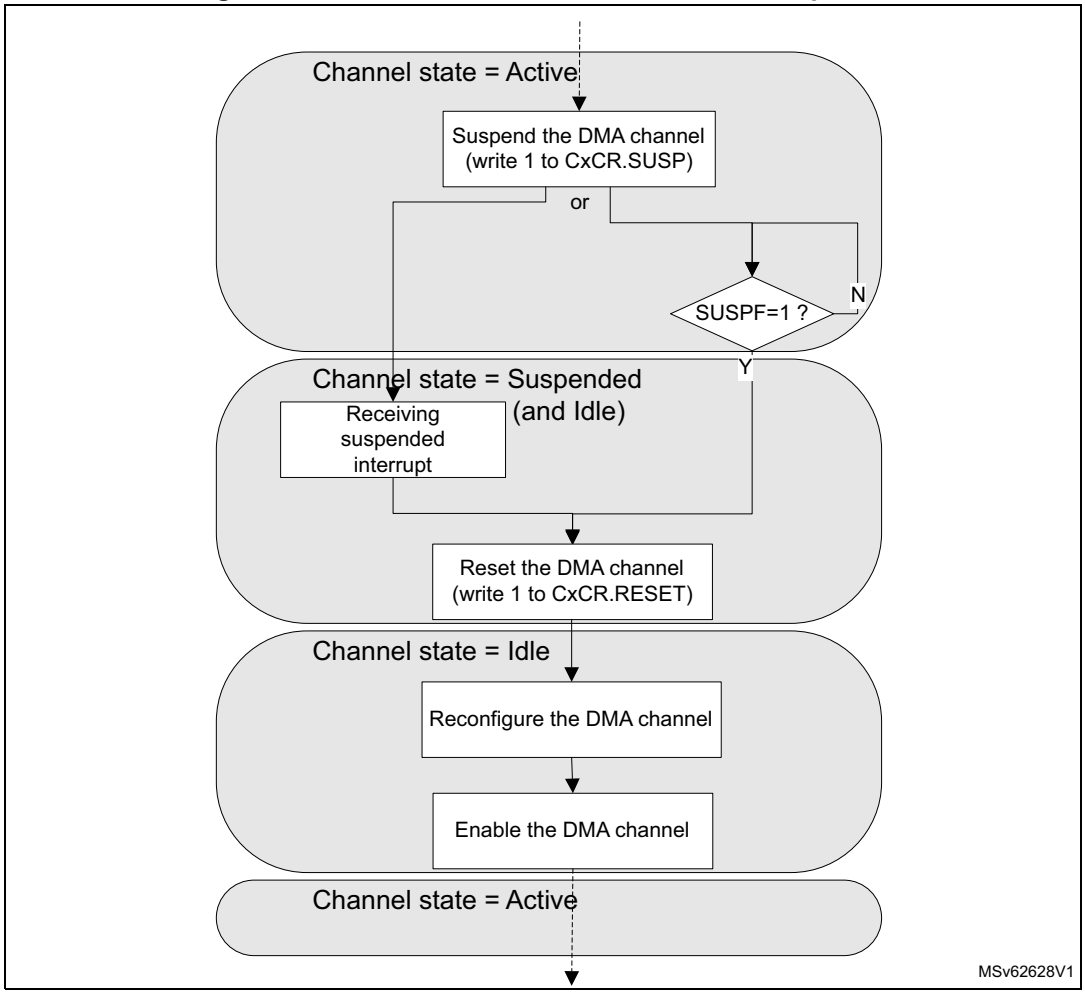
1. The software writes 1 into the HPDMA_CxCR.SUSP bit.
2. The software polls the suspended flag HPDMA_CxSR.SUSPF until SUSPF = 1, or waits for an interrupt previously enabled by writing 1 to HPDMA_CxCR.SUSPIE. Wait for the channel to be effectively in suspended state means wait for the completion of any ongoing HPDMA transfer over its master ports. Then the software can observe, in a steady state, any read register or bitfield that is hardware modifiable.

Note: An ongoing HPDMA transfer can be a data transfer (a source/destination burst transfer,) or a link transfer for the internal update of the linked-list register file from the next linked-list item.

3. The software safely resumes the suspended channel by writing 0 to HPDMACxCR.SUSP.

Figure 158. HPDMA channel suspend and resume sequence

Note: A suspend and resume sequence does not impact the HPDMA_*CxCR.EN bit. Suspending a channel (transfer) does not suspend a started trigger detection.*



27.4.4 HPDMA channel abort and restart

Alternatively, like for aborting a continuous HPDMA transfer with a circular buffering or a double buffering, the software can abort, on its own, a still active channel with the following sequence:

1. The software writes 1 into the HPDMA_CxCR.SUSP bit.
2. The software polls suspended flag HPDMA_CxSR.SUSPF until SUSPF = 1, or waits for an interrupt previously enabled by writing 1 to HPDMA_CxCR.SUSPIE. Wait for the channel to be effectively in suspended state means wait for the completion of any ongoing HPDMA transfer over its master port.
3. The software resets the channel by writing 1 to HPDMA_CxCR.RESET. This causes the reset of the FIFO, the reset of the channel internal state, the reset of the HPDMA_CxCR.EN bit, and the reset of the HPDMA_CxCR.SUSP bit.
4. The software safely reconfigures the channel. The software must reprogram hardware-modified HPDMA_CxBR1, HPDMA_CxSAR, and HPDMA_CxDAR.

5. In order to restart the aborted then reprogrammed channel, the software enables it again by writing 1 to the HPDMA_CxCR.EN bit.

Figure 159. HPDMA channel abort and restart sequence

27.4.5 HPDMA linked-list data structure

Alternatively to the direct programming mode, a channel can be programmed by a list of transfers, known as a list of linked-list items (LLI). Each LLI is defined by its data structure.

For a channel x, the base address in memory of the data structure of a next LLI_{n+1} is the sum of the following:

- the link base address of the channel x (in HPDMA_CxLBAR)
- the link address offset LA[15:2] bitfield in HPDMA_CxLLR, that is the updated result from the data structure of the previous LLIn of the channel x

The data structure for each LLI can be specific.

A linked-list data structure is addressed following the value of UT1, UT2, UB1, USA, UDA, and ULL bits, plus UB2 and UT3 when present, in HPDMA_CxLLR.

In linked-list mode, each HPDMA linked-list register (HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR, HPDMA_CxDAR or HPDMA_CxLLR,

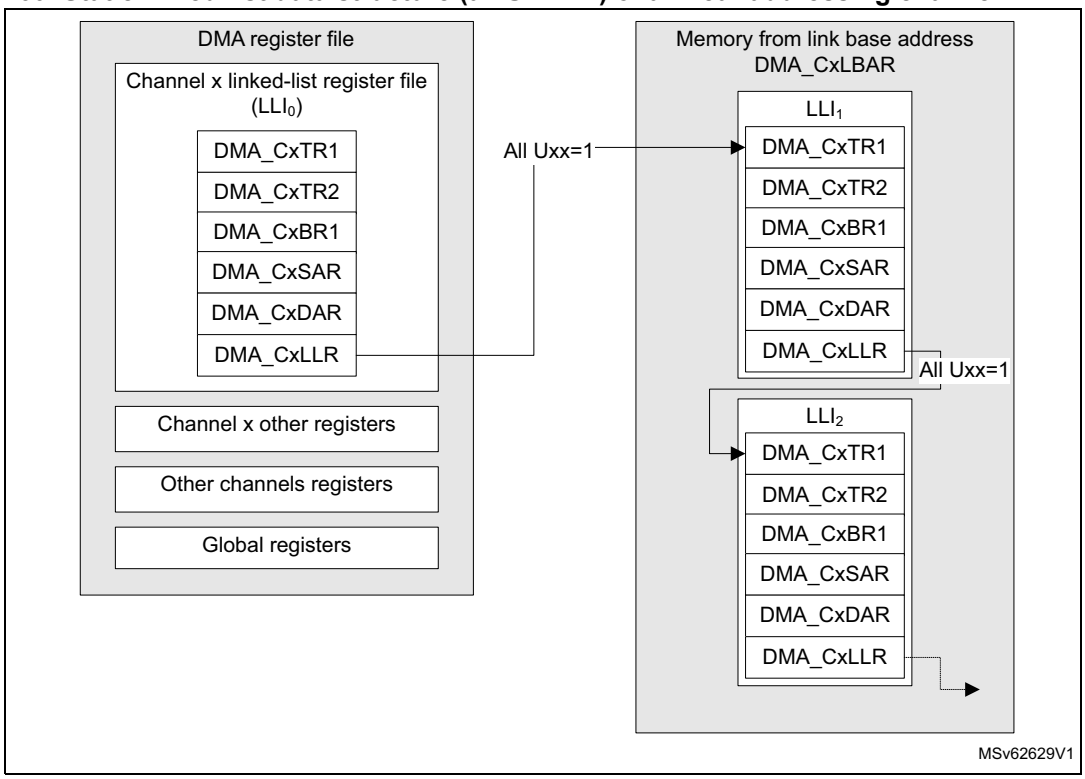
plus HPDMA_CxTR3 or HPDMA_CxBR2 when present) is conditionally and automatically updated from the next linked-list data structure in the memory, following the current value of HPDMA_CxLLR that was conditionally updated from the linked-list data structure of the previous LLI.

Static linked-list data structure

For example, when the update bits (UT1, UT2, UB1, USA, UDA, and ULL, plus UB2 and UT3 when present) in HPDMA_CxLLR are all asserted, the linked-list data structure in the memory is maximal with:

- channel x, x = 0 to 11, six contiguous 32-bit locations, including HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR, HPDMA_CxDAR, and HPDMA_CxLLR (see *Figure 160*) and including the first linked-list register file (LLI_0), and the next LLIs (LLI_1, LLI_2,...) in the memory
- channel x, x = 12 to 15, eight contiguous 32-bit locations, including HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR, HPDMA_CxDAR, and HPDMA_CxLLR, plus HPDMA_CxTR3 and HPDMA_CxBR2 (see *Figure 161*), including the first linked-list register file (LLI_0), and the next LLIs (LLI_1, LLI_2,...) in the memory

Figure 160. Static linked-list data structure (all Uxx = 1) of a linear addressing channel x



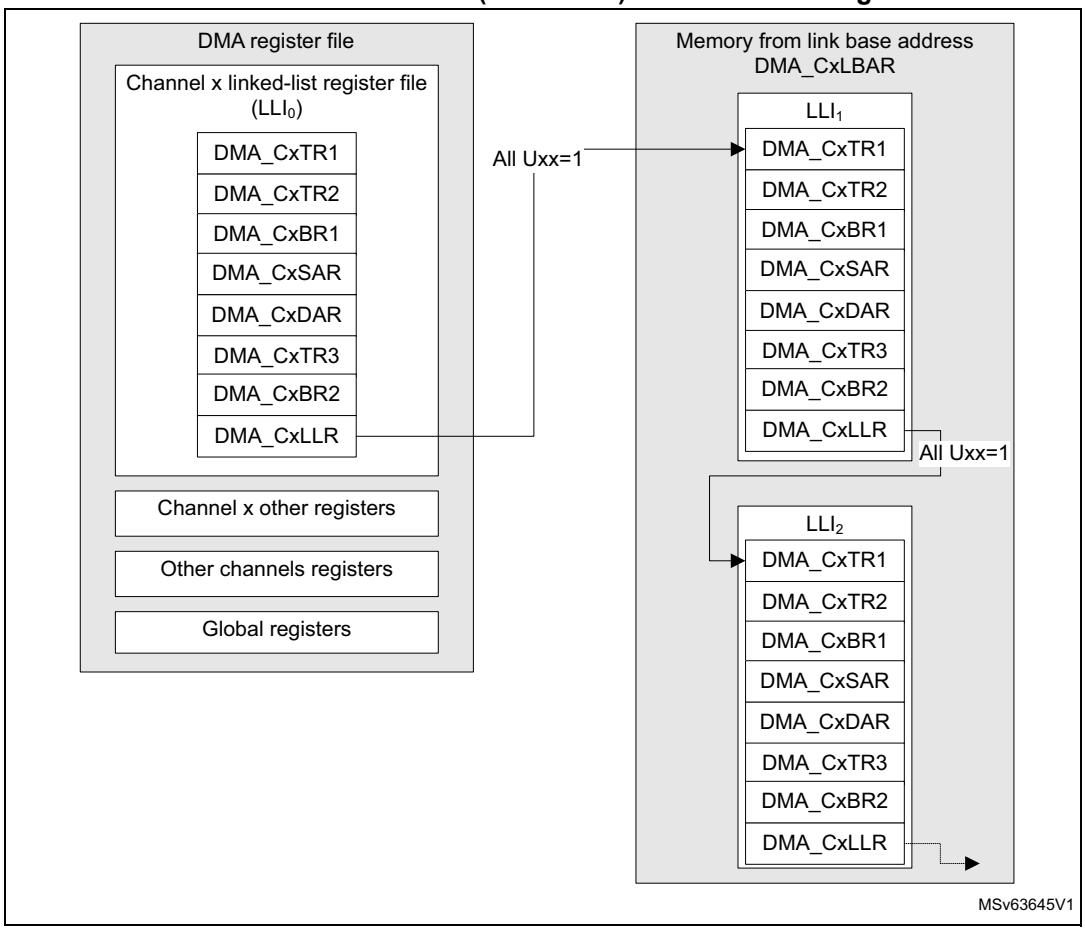


Figure 161. Static linked-list data structure (all Uxx = 1) of a 2D addressing channel x

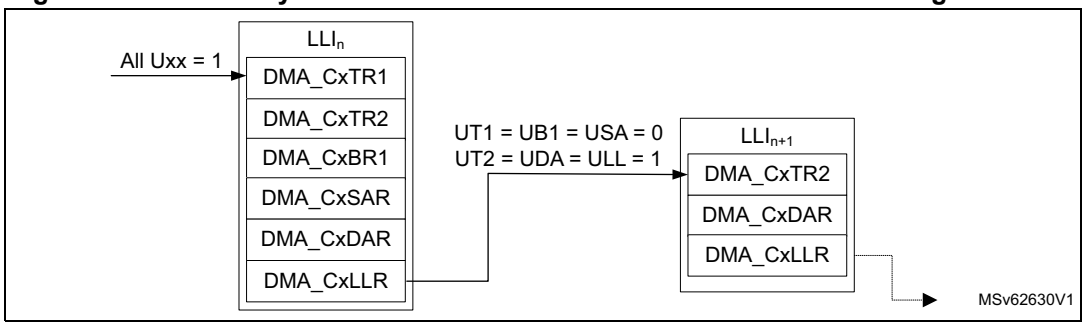
Dynamic linked-list data structure

Alternatively, the memory organization for the full list of LLIs can be compacted with specific data structure for each LLI.

If UT1 = 0 and UT2 = 1, the link address offset of HPDMA_CxLLR points to the updated value of HPDMA_CxTR2, instead of HPDMA_CxTR1 which is not to be modified (see *Figure 162*).

Example: if UT1 = UB1 = USA = 0, and if UT3 = UB2 = 0 when channel x is with 2D addressing, and if UT2 = UDA = ULL = 1, the next LLI does not contain an (updated) value for HPDMA_CxTR1, nor HPDMA_CxBR1, nor HPDMA_CxSAR, nor HPDMA_CxTR3, nor HPDMA_CxBR2 when channel x is with 2D addressing. The next LLI contains an updated value for HPDMA_CxTR2, HPDMA_CxDAR, and HPDMA_CxLLR, as shown in *Figure 163*.

Figure 162. HPDMA dynamic linked-list data structure of linear addressing channel x



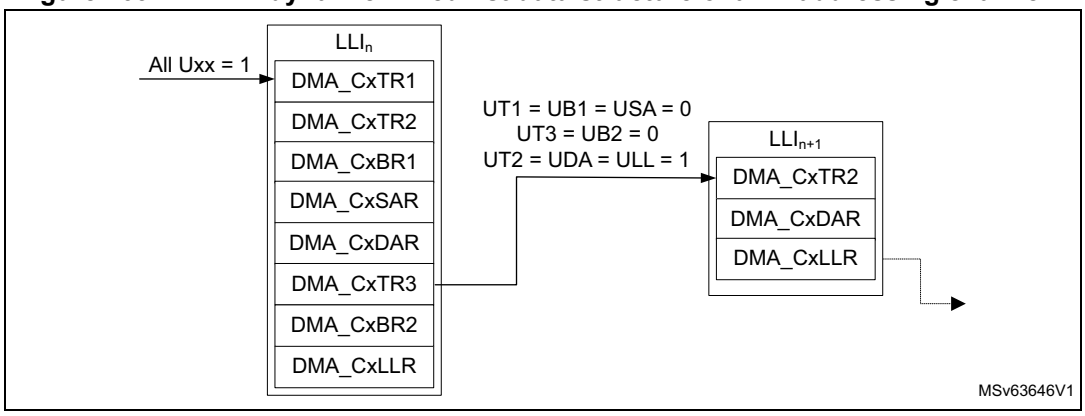


Figure 163. HPDMA dynamic linked-list data structure of a 2D addressing channel x

The user must program HPDMA_CxLLR for each LLI_n to be 32-bit aligned, and not to exceed the 64-Kbyte addressable space pointed by HPDMA_CxLBAR.

27.4.6 Linked-list item transfer execution

An LLI_n transfer is the sequence of:

1. a data transfer: the HPDMA executes the data transfer as described by the HPDMA internal register file (this data transfer can be void/null for LLI_0).
2. a conditional link transfer: the HPDMA automatically and conditionally updates its internal register file by the data structure of the next LLI_{n+1}, as defined by the HPDMA_CxLLR value of the LLI_n.

Note: The initial data transfer, as defined by the internal register file (LLI_0), can be null (HPDMA_CxBR1.BNDT[15:0] = 0 and HPDMA_CxTR2.PFREQ = 0), provided that UB1 is set in HPDMA_CxLLR (meaning there is a non-null data transfer described by the next LLI_1 in the memory to be executed).

Depending on the intended HPDMA use, an HPDMA channel x can be executed as described by the full linked-list (run-to-completion mode, HPDMA_CxCR.LSM = 0), or can be programmed for a single execution of a LLI (link step mode, HPDMA_CxCR.LSM = 1), as described in the next sections.

27.4.7 HPDMA channel state and linked-list programming in run-to-completion mode

When HPDMA_CxCR.LSM = 0 (in full-list execution mode, execution of the full sequence of LLIs, named run-to-completion mode), an HPDMA channel x is initially programmed, started by writing 1 to HPDMA_CxCR.EN, and after completed at channel level.
The channel transfer is:

- configured with at least the following:
  - the first LLI_0, internal linked-list register file: HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR, HPDMA_CxDAR, and HPDMA_CxLLR, plus HPDMA_CxTR3 and HPDMA_CxBR2 when present
  - the last LLI_N described by the linked-list data structure in memory, as defined by HPDMA_CxLLR reflecting the before last LLI_{N-1}
- completed when HPDMA_CxLLR[31:0] = 0 and HPDMA_CxBR1.BRC[10:0] = 0, if BRC[10:0] is present and HPDMA_CxBR1.BNDT[15:0] = 0, at the end of the last LLI_{N-1} transfer

HPDMA_CxLLR[31:0] = 0 is the condition of a linked-list based channel completion, and means the following:

- The 16 low significant bits HPDMA_CxLLR.LA[15:0] of the next link address are null.
- All bits HPDMA_CxLLR.Uxx are null (UT1, UT2, UB1, USA, UDA, and ULL, plus UB2 and UT3 when present).

The channel may never be completed when HPDMA_CxLLR.LSM = 0:

- If the last LLI_N is recursive, pointing to itself as a next LLI, in one of the following:
  - HPDMA_CxLLR.ULL = 1 and HPDMA_CxLLR.LA[15:2] is updated by the same value.
  - HPDMA_CxLLR.ULL = 0
- If LLI_N points to a previous LLI

In the regular data transfer completion at a block level, HPDMA_CxBR1.BNDT[15:0] = 0 and HPDMA_CxBR1.BRC[10:0] = 0 (if present). Alternatively, a block transfer may be early completed by a peripheral (such as an I3C in Rx mode), and then BNDT[15:0] is not null (see *Section 27.4.14* for more details).

In the typical run-to-completion mode, the allocation of an HPDMA channel, including its fine programming, is done once during the HPDMA initialization. In order to have a reserved data communication link and HPDMA service during run-time, for continuously repeated transfers (from/to a peripheral respectively to/from memory or for memory-to-memory transfers). This reserved data communication link can consist of a channel, or the channel can be shared and a repeated transfer consists of a sequence of LLIs.

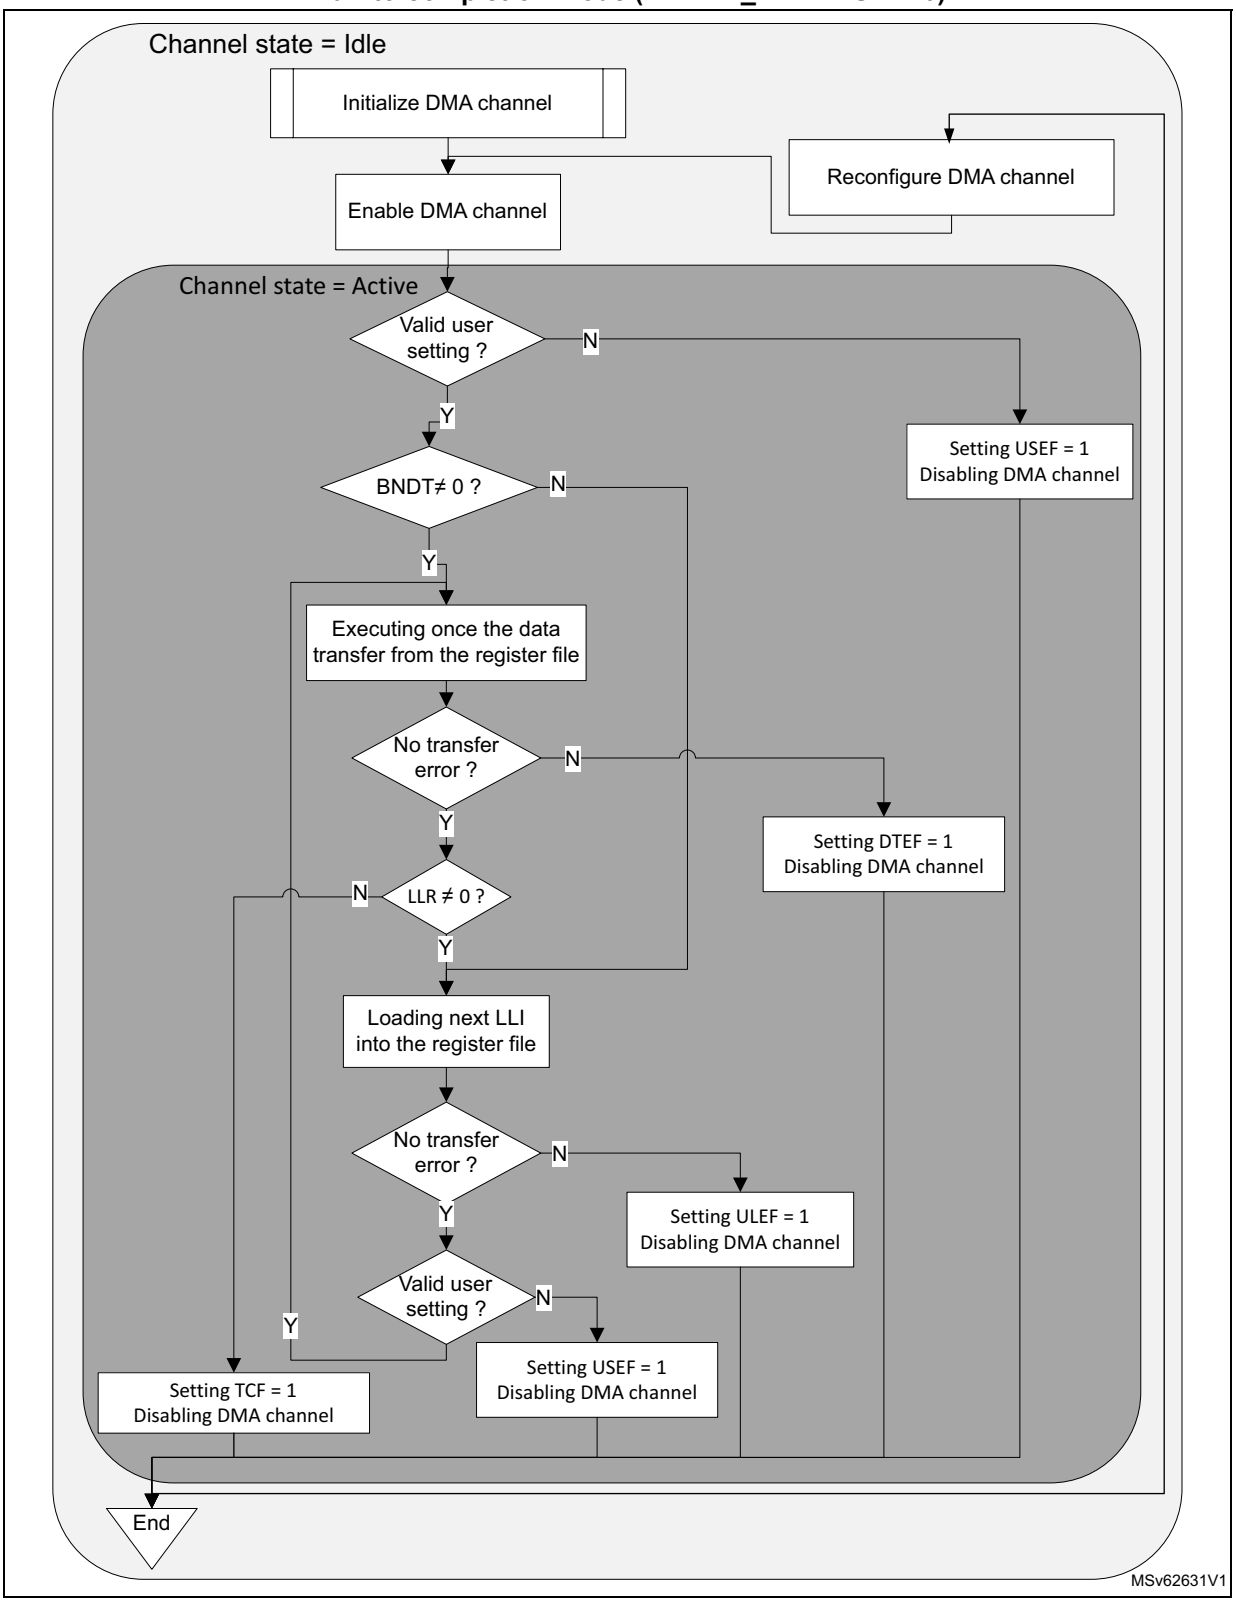

Figure 164 depicts the HPDMA channel execution and its registers programming in run-to-completion mode.

Note: Figure 164 is not intended to illustrate how often a TCEF can be raised, depending on the programmed value of TCEM[1:0] in HPDMA_CxTR2. It can be raised at (each) block completion, at (each) 2D block completion, at (each) LLI completion, or only at channel

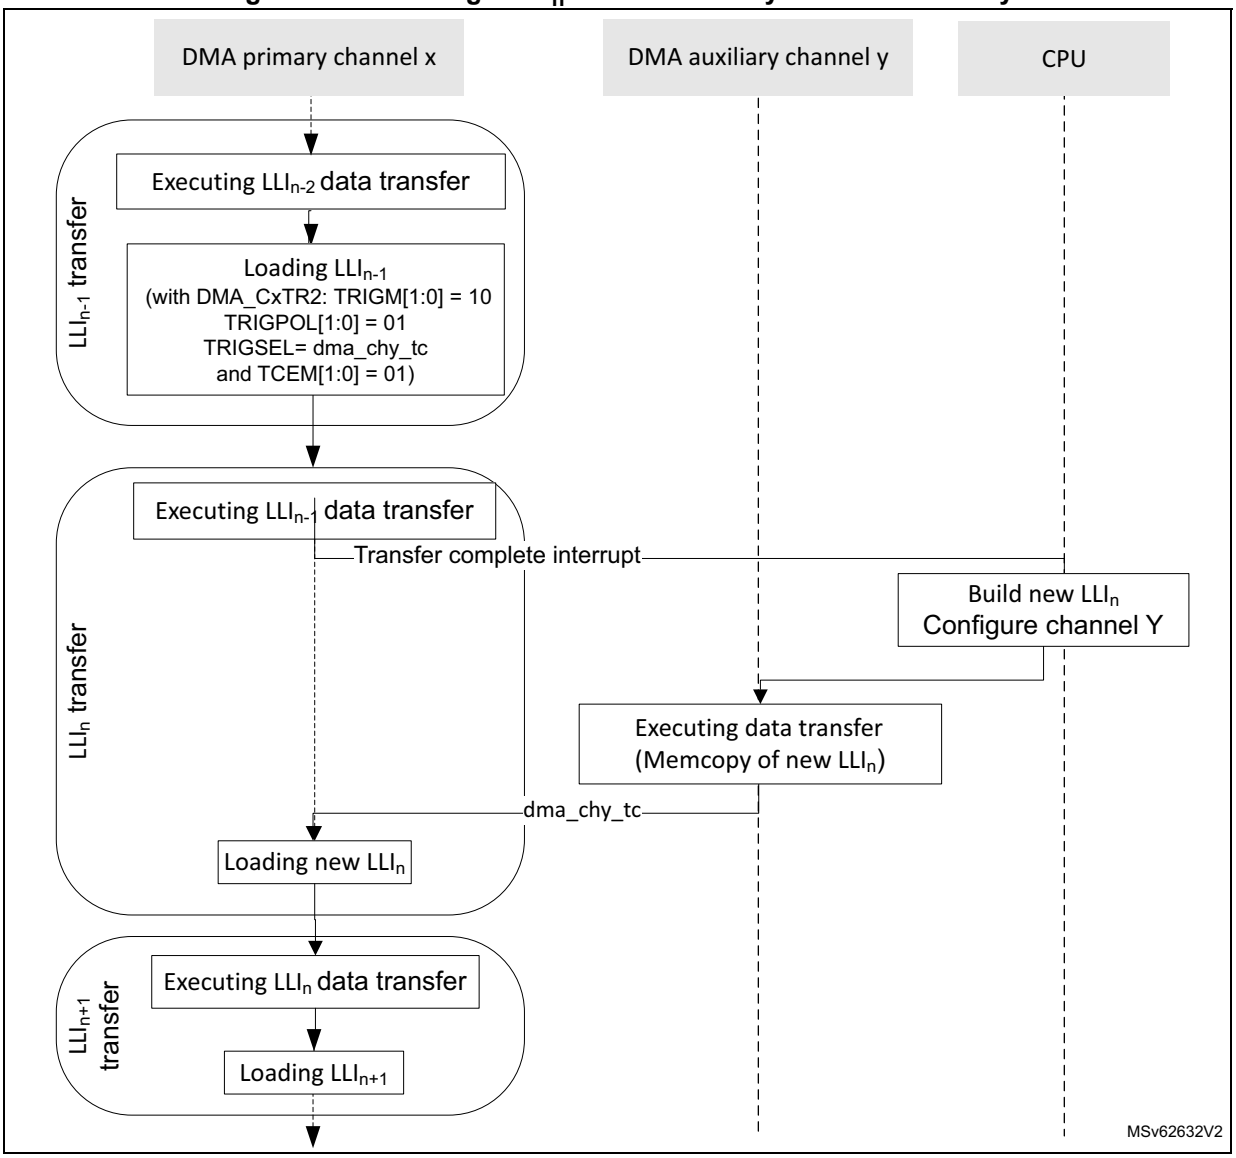
completion. In run-to-completion mode, whatever is the value of TCEM[1:0], at the channel completion, the hardware always set TCEF = 1 and disables the channel.

In Figure 164, BNDT ≠ 0 is the typical condition for starting the first data transfer. This condition becomes (BNDT ≠ 0 and PFREQ = 1) if the peripheral requests a data transfer with early termination (see Section 27.3.6).

Figure 164. HPDMA channel execution and linked-list programming in run-to-completion mode (HPDMA_CxCR.LSM = 0)

Run-time inserting a LLI_n via an auxiliary channel, in run-to-completion mode

The start of the link transfer of the LLI_{n-1} (start of the LLI_n loading) can be conditioned by the occurrence of a trigger, when programming the following bitfields of HPDMA_CxTR2 in the data structure of the LLI_{n-1}:



- TRIGM[1:0] = 10 (link transfer triggering mode)
- TRIGPOL[1:0] = 01 or 10 (rising or falling edge)
- TRIGSEL[6:0] (see *Section 27.3.7* for the trigger selection details)

Another auxiliary channel y can be used to store the channel x LLI_n in the memory, and to generate a transfer complete event hpdma_chy_tc. By selecting this event as the input trigger of the link transfer of the LLI_{n-1} of the channel x, the software can pause the primary channel x after its LLI_{n-1} data transfer, until it is indeed written the LLI_n.

Figure 165 depicts such a dynamic elaboration of a linked-list of a primary channel x, via another auxiliary channel y.

Caution: This use case is restricted to an application with an LLI_{n-1} data transfer that does not need a trigger. The triggering mode of this LLI_{n-1} is used to load the next LLI_n.

Figure 165. Inserting a LLI_n with an auxiliary HPDMA channel y

27.4.8 HPDMA channel state and linked-list programming in link step mode

When HPDMA_CxCR.LSM = 1 (in link step execution mode, single execution of one LLI), a channel transfer is executed and completed after each single execution of a LLI, including its (conditional) data transfer and its (conditional) link transfer.

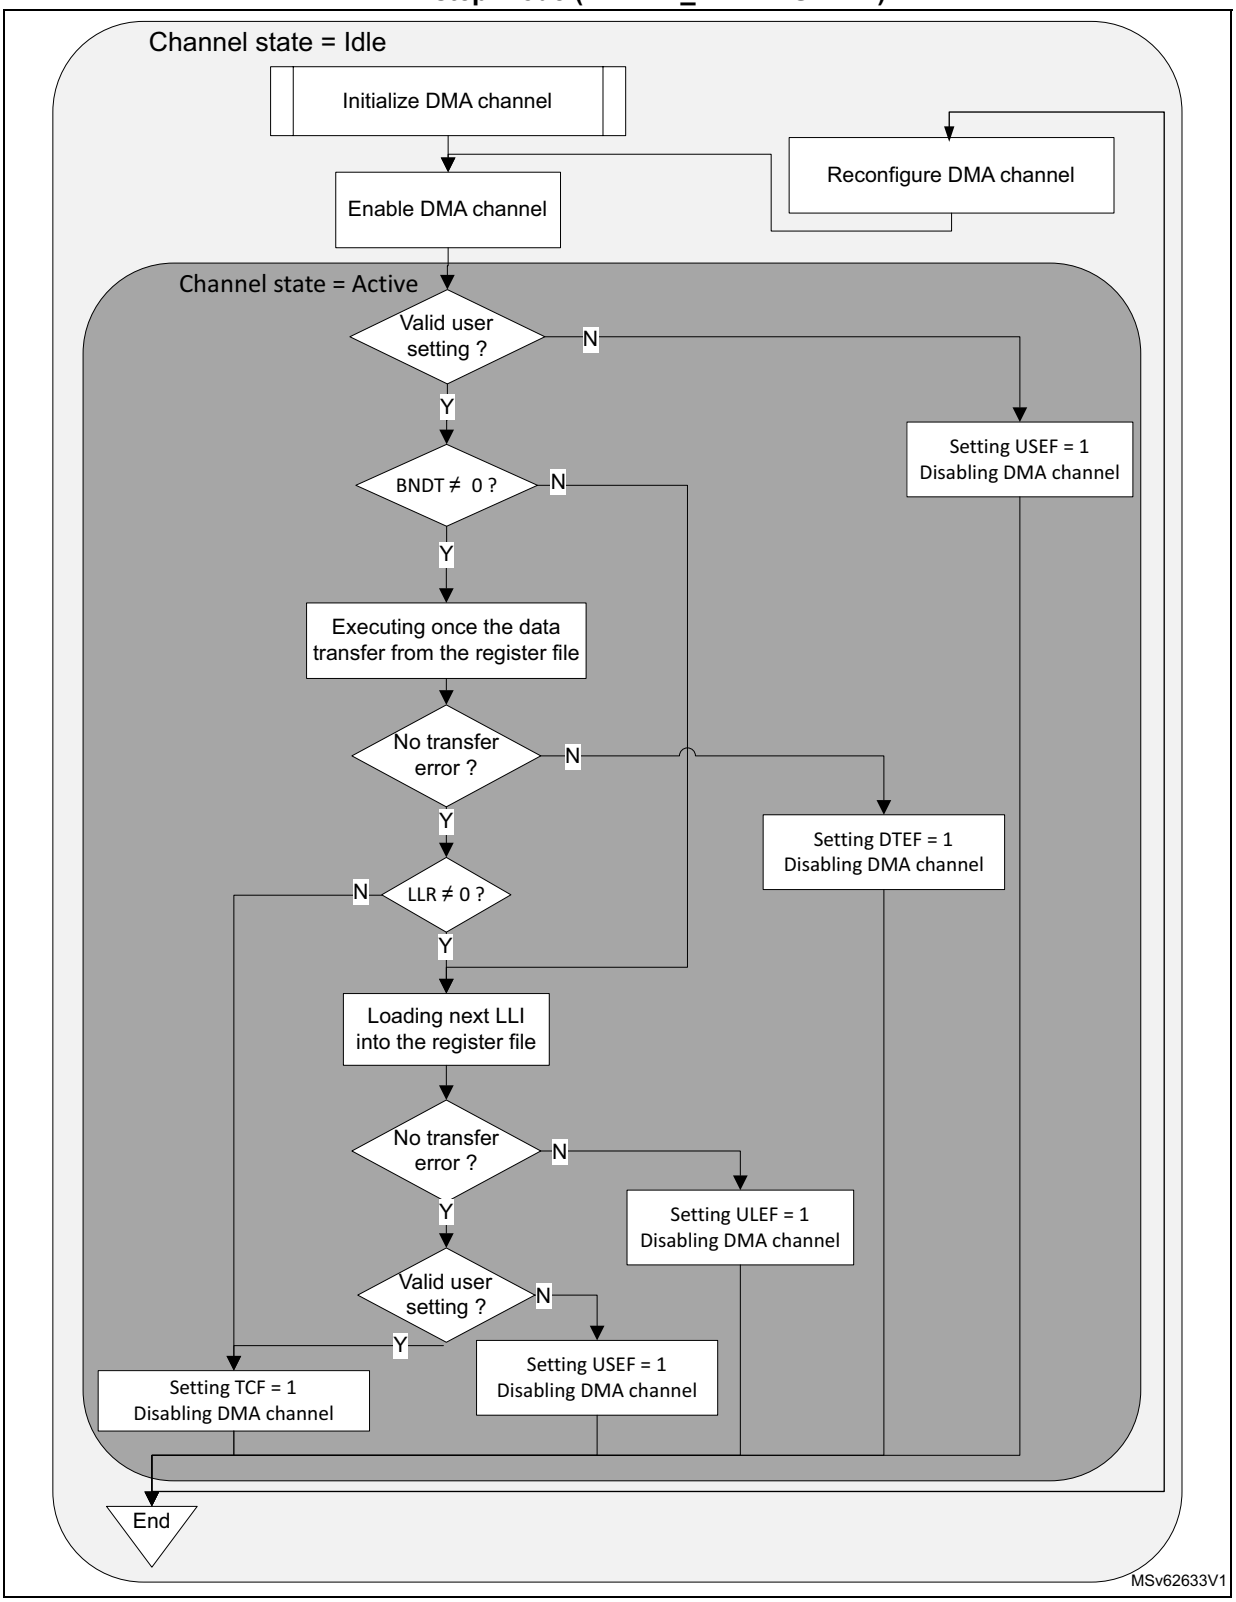
An HPDMA channel transfer can be programmed at an LLI level, started by writing 1 into HPDMA_CxCR.EN, and after completed at LLI level:

- The current LLI_n transfer is described with the following:
  - HPDMA_CxTR1 defines the source/destination elementary single/burst transfers.
  - HPDMA_CxBR1 defines the number of bytes at a block level (BNDT[15:0]), for channel x = 12 to 15, the number of blocks at a 2D/repeated block level (BRC[10:0]+1), and the incrementing/decrementing mode for address offsets.

  - HPDMA_CxTR2 defines the input control (request, trigger), and the output control (transfer-complete event) of the transfer.
  - HPDMA_CxSAR and HPDMA_CxDAR define the source/destination transfer start address.
  - HPDMA_CxTR3 (for channel x = 12 to 15) defines the source/destination additional address offset between burst transfers.
  - HPDMA_CxBR2 (for channel x = 12 to 15) defines the source/destination additional address offset between blocks at a 2D/repeated block level.
  - HPDMA_CxLLR defines the data structure, and the address offset of the next LLI_{n+1} in the memory.
- The current LLI_n transfer is completed after the single execution of the current LLI_n:
  - after the (conditional) data transfer completion (when HPDMA_CxBR1.BRC[10:0] = 0 if BRC[10:0] is present, and HPDMA_CxBR1.BNDT[15:0] = 0)
  - after the (conditional) update of the HPDMA link register file from the data structure of the next LLI_{n+1} in memory

Note: If an LLI is recursive (pointing to itself as a next LLI, either HPDMA_CxLLR.ULL = 1 and HPDMA_CxLLR.LA[15:2] is updated by the same value, or HPDMA_CxLLR.ULL = 0), a channel in link step mode is completed after each repeated single execution of this LLI.

In the regular data transfer completion at a block level, HPDMA_CxBR1.BNDT[15:0] = 0 and HPDMA_CxBR1.BRC[10:0] = 0 (if present). Alternatively, a block transfer can be early completed by a peripheral (such as an I3C in Rx mode), and then BNDT[15:0] is not null (see *Section 27.4.14* for more details).



The link step mode can be used to elaborate dynamically LLIs in memory during run-time. The software can be facilitated by using a static data structure for any LLI_n (all update bits of HPDMA_CxLLR have a static value, LLI_n.LLR.LA = LLI_{n-1}.LLR.LA + constant).

Figure 166 depicts the HPDMA channel execution mode, and its programming in link step mode.

Note: Figure 166 is not intended to illustrate how often a TCEF can be raised, depending on the programmed value of TCEM[1:0] in HPDMA_CxTR2. It can be raised at (each) block completion, at (each) 2D block completion, at (each) LLI completion, or only at the last LLI data transfer completion. In link step mode, the channel is disabled after each single execution of a LLI, and depending on the value of TCEM[1:0] a TCEF is raised or not.

In Figure 166, BNDT ≠ 0 is the typical condition for starting the first data transfer. This condition becomes BNDT ≠ 0 and PFREQ = 1 if the peripheral requests a data transfer with early termination (see Section 27.3.6).

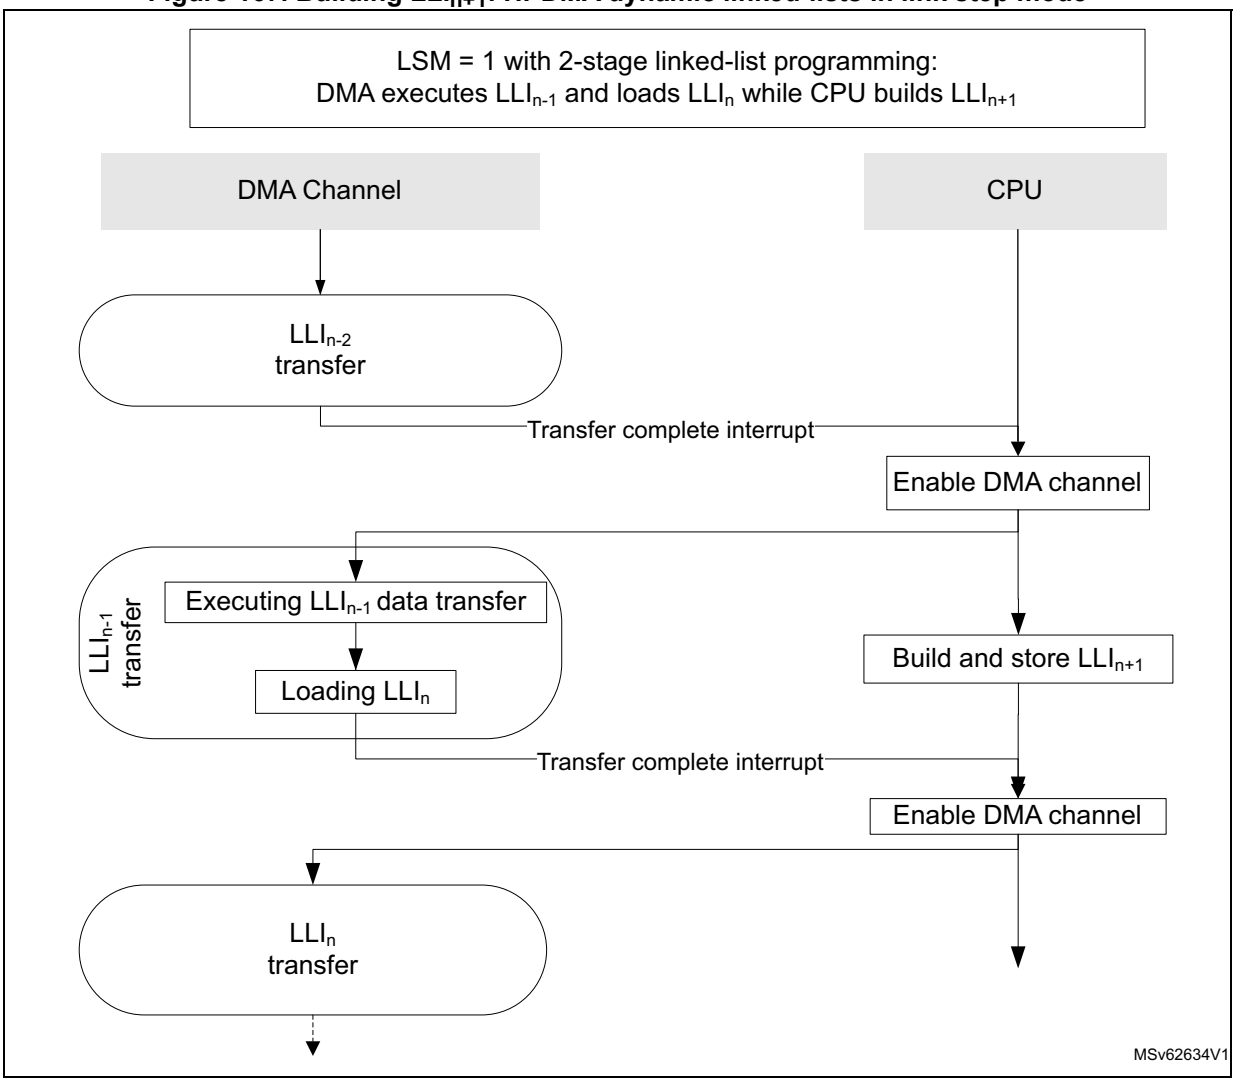


Figure 166. HPDMA channel execution and linked-list programming in link step mode (HPDMA_CxCR.LSM = 1)

Run-time adding a LLI_{n+1} in link step mode

During run-time, the software can defer the elaboration of the LLI_{n+1} (and next LLIs), until/after the HPDMA executed the transfer from the LLI_{n-1} and loaded the LLI_n from the memory, as shown in the figure below.

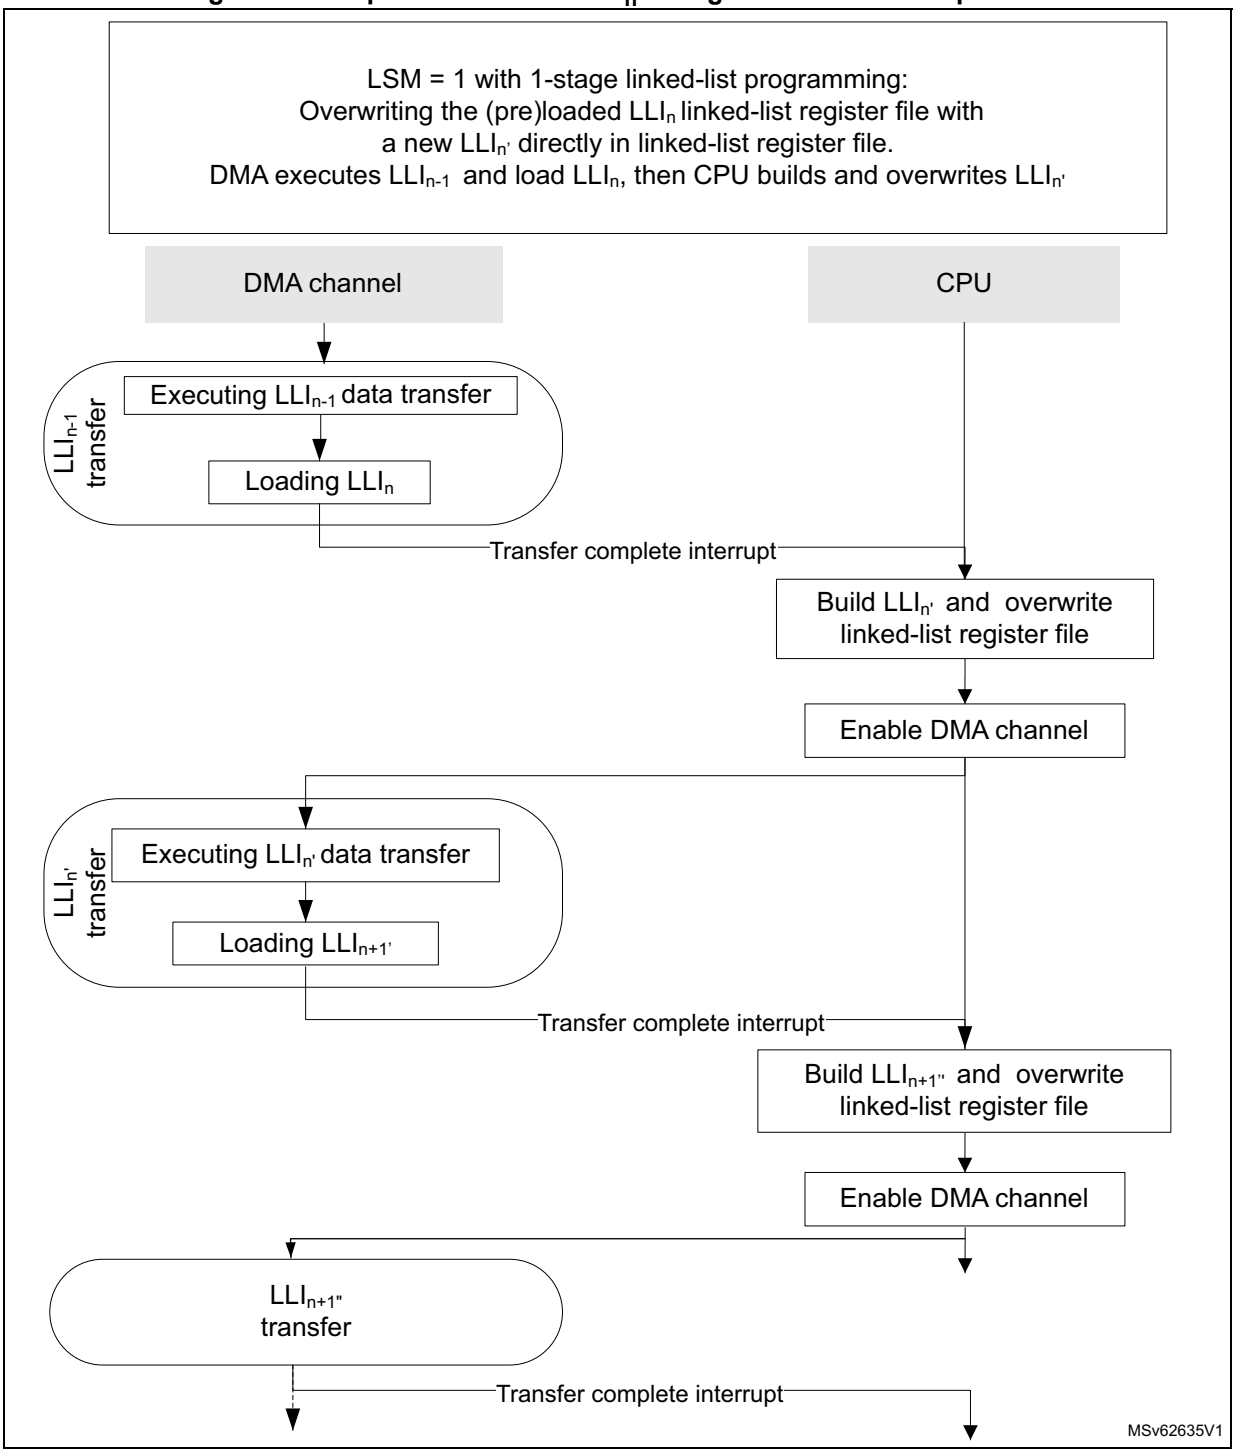

Figure 167. Building LLI_{n+1}: HPDMA dynamic linked-lists in link step mode

Run-time replacing an LLI_n with a new LLI_n', in link step mode (in linked-list register file)

In this link step mode, during run-time, the software can build and insert a new LLI_n', after the HPDMA executed the transfer from the LLI_{n-1}, and loaded a formerly elaborated LLI_n from the memory by overwriting directly the linked-list register file with the new LLI_n', as shown in *Figure 168*.

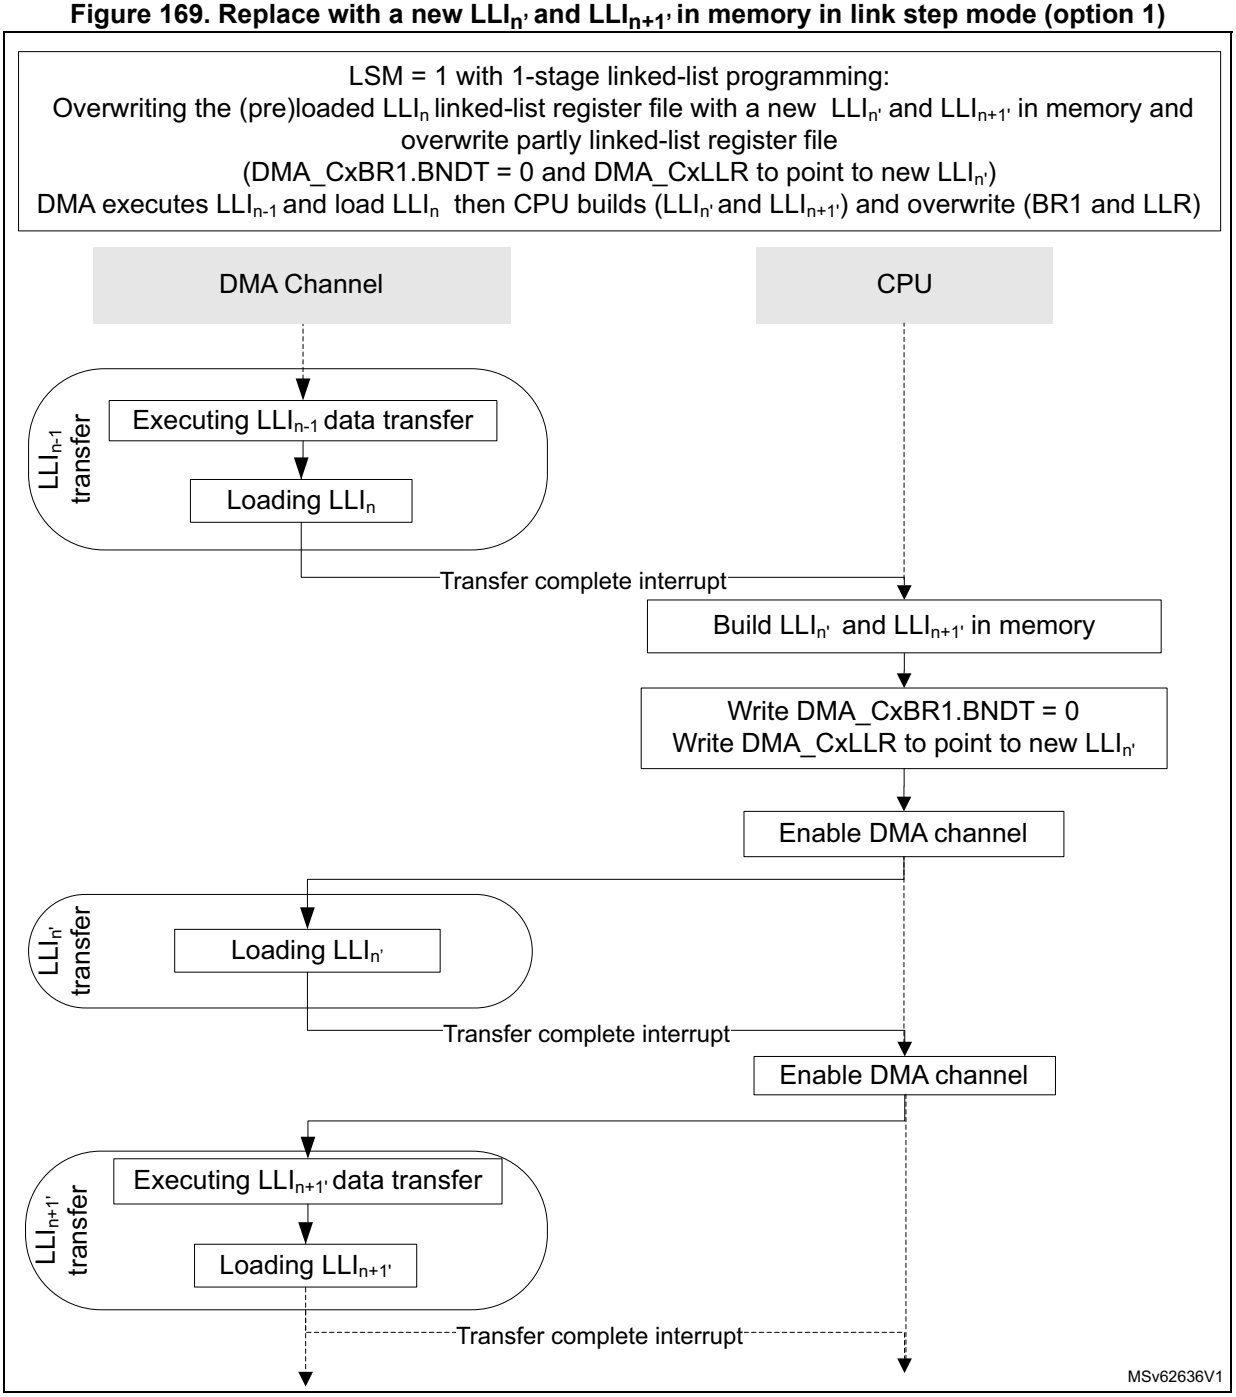

Figure 168. Replace with a new $LLI_{n'}$ in register file in link step mode

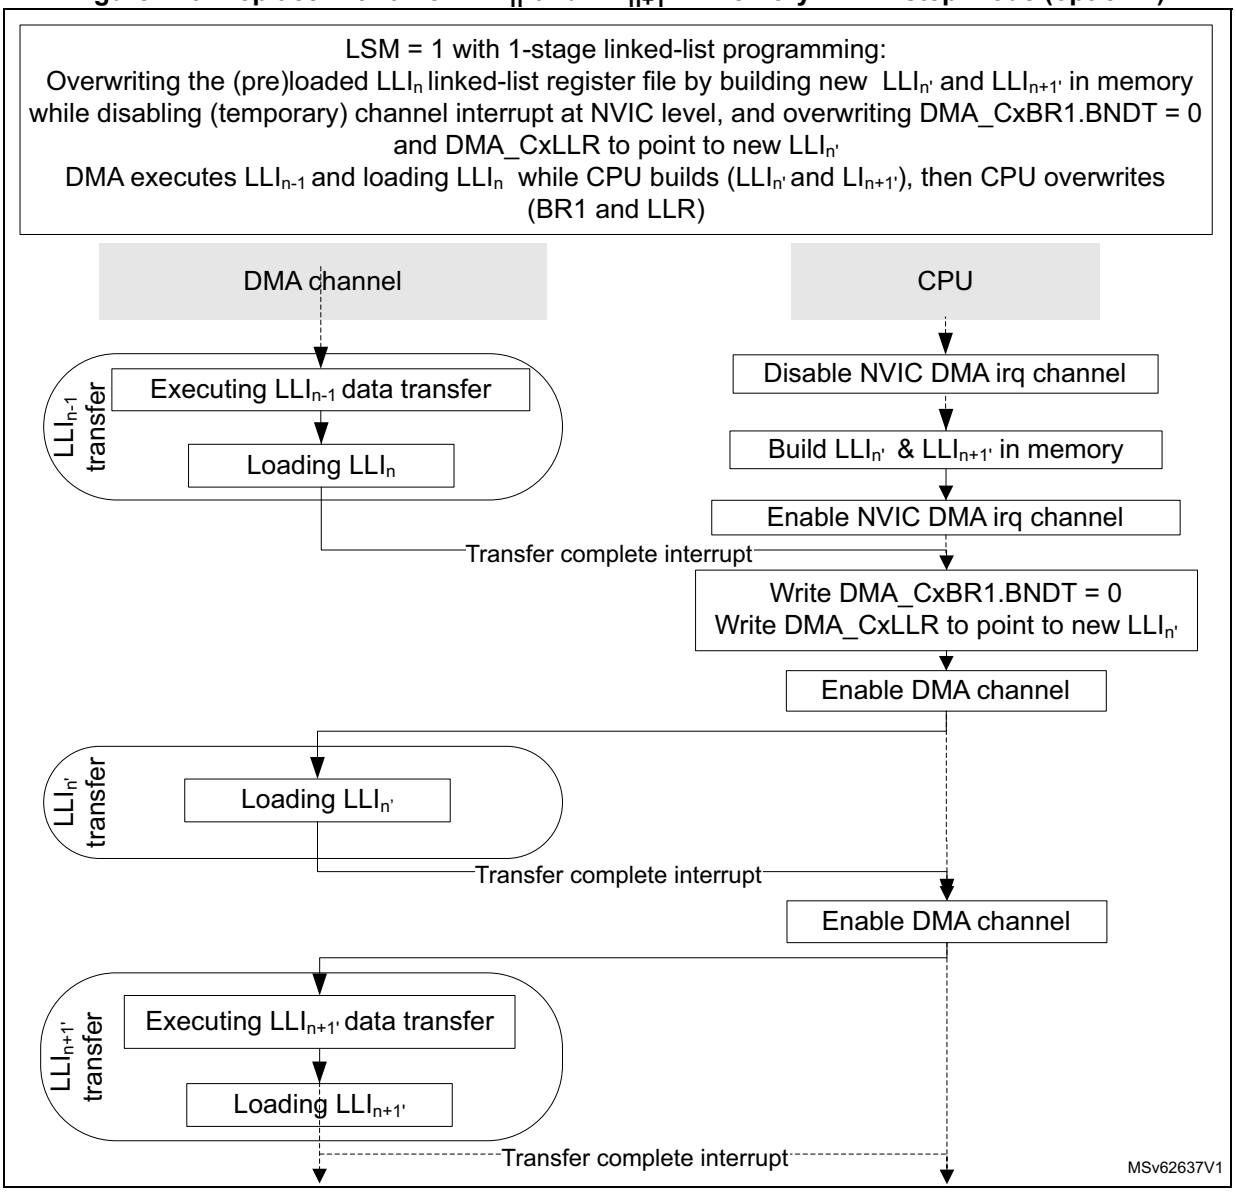
Run-time replacing an LLI_n with a new $LLI_{n'}$ in link step mode (in the memory)

The software can build and insert a new $LLI_{n'}$ and $LLI_{n+1'}$ in the memory, after HPDMA executed the transfer from the LLI_{n-1}, and loaded a formerly elaborated LLI_n from the memory, by overwriting partly the linked-list register file (HPDMA_CxBR1.BNDT[15:0] to be null, and HPDMA_CxLLR to point to new LLI_n) as shown in *Figure 169*.

Figure 169. Replace with a new $LLI_{n'}$ and $LLI_{n+1'}$ in memory in link step mode (option 1)



Run-time replacing a LLI_n with a new $LLI_{n'}$ in link step mode

Other software implementations exist. Meanwhile the HPDMA executes the transfer from the LLI_{n-1} and loads a formerly elaborated LLI_n from the memory (or even earlier), the software can do the following:

1. Disable the NVIC for not being interrupted by the interrupt handling.
2. Build a new $LLI_{n'}$ and a new $LLI_{n+1'}$.
3. Enable again the NVIC for the channel interrupt (transfer complete) notification.

The software in the interrupt handler for LLI_{n-1} is then restricted to overwrite HPDMA_CxBR1.BNDT[15:0] to be null and HPDMA_CxLLR to point to new $LLI_{n'}$, as shown in the figure below.

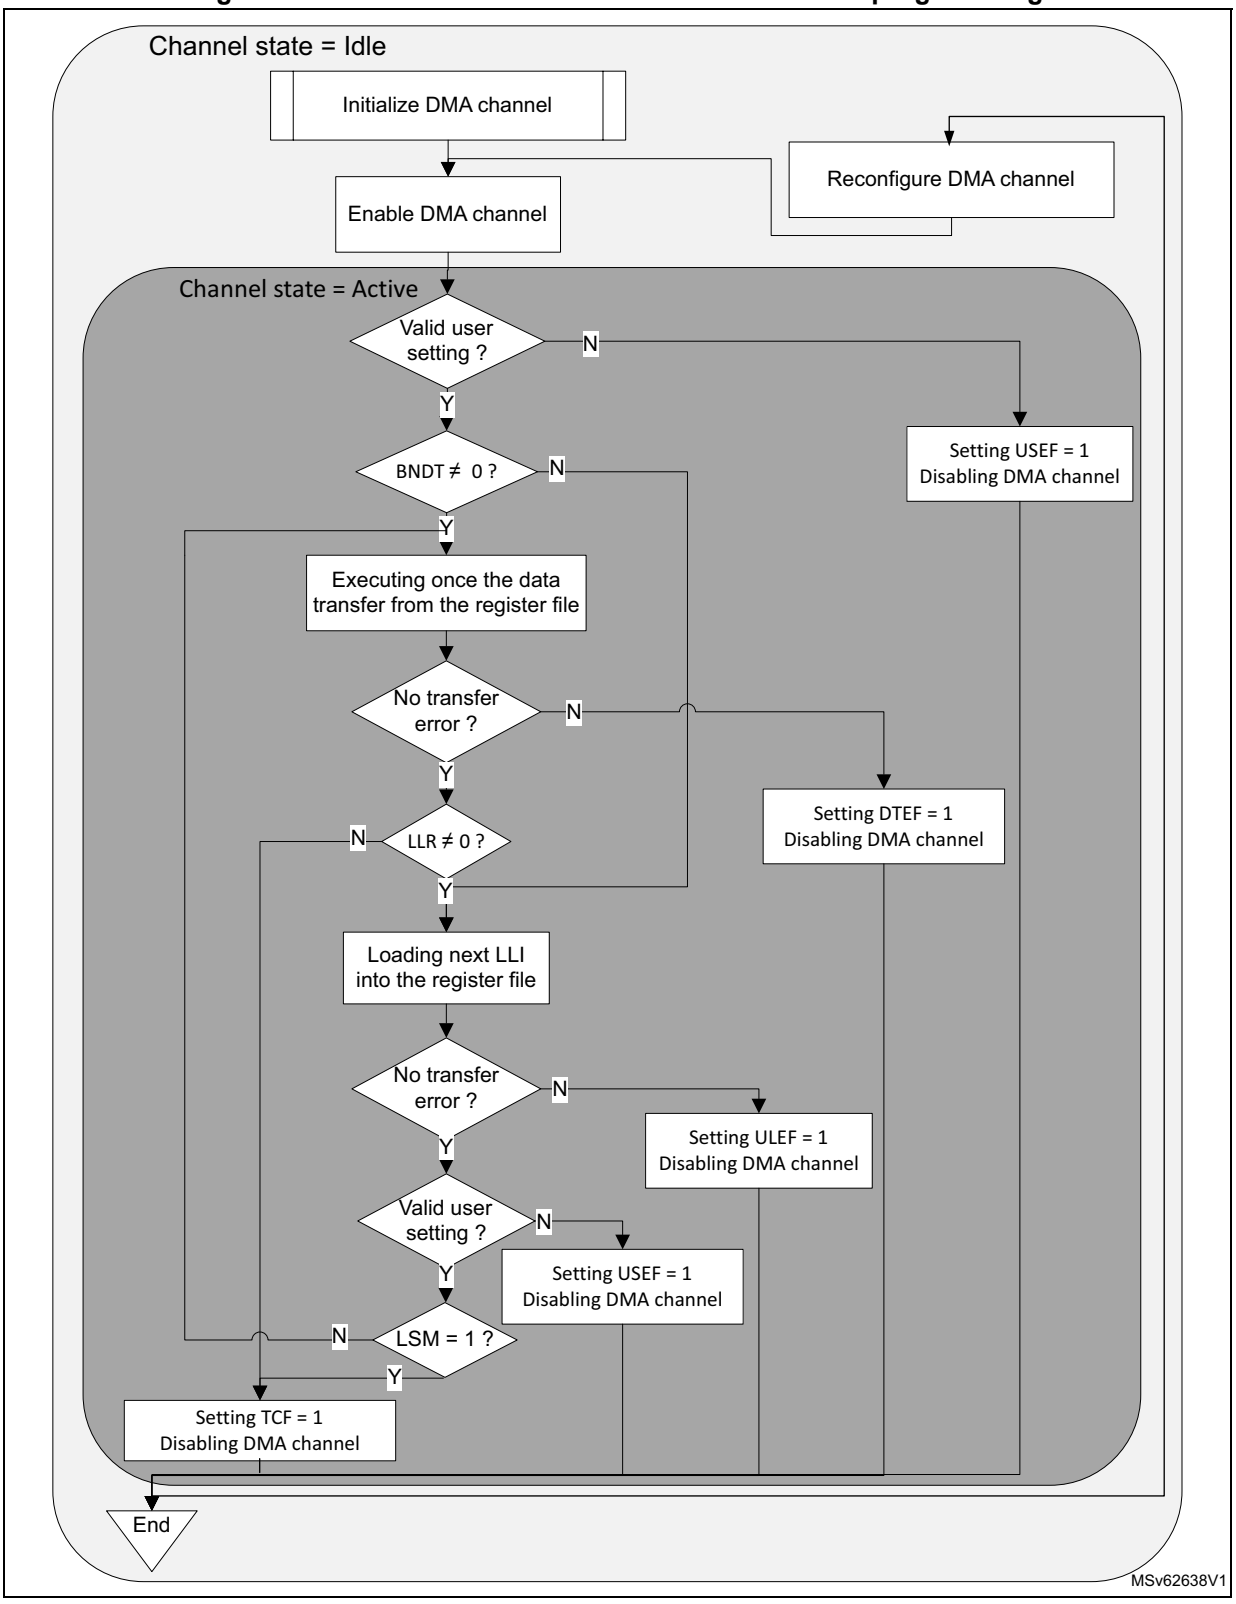
Figure 170. Replace with a new $LLI_{n'}$ and $LLI_{n+1'}$ in memory in link step mode (option 2)

27.4.9 HPDMA channel state and linked-list programming

The software can reconfigure a channel when the channel is disabled (HPDMA_CxCR.EN = 0), and update the execution mode (HPDMA_CxCR.LSM) to change from/to run-to-completion mode to/from link step mode.

In any execution mode, the software can:

- reprogram LLI_{n+1} in the memory to finally complete the channel by this LLI_{n+1} (clear the HPDMA_CxLLR of this LLI_{n+1}), before this LLI_{n+1} is loaded/used by the HPDMA channel
- abort and reconfigure the channel with an LSM update (see *Section 27.4.4*.)



In link step mode, the software can clear LSM after each a single execution of any LLI, during LLI_{n-1}.

Figure 171 shows the overall and unified HPDMA linked-list programming, whatever is the execution mode.

Note: Figure 171 is not intended to illustrate how often a TCEF can be raised, depending on the programmed value of TCEM[1:0] in HPDMA_CxTR2. It can be raised at (each) block completion, at (each) 2D block completion, at (each) LLI completion, or only at the last LLI data transfer completion. In run-to-completion mode, whatever is the value of TCEM[1:0], at the channel completion the hardware always set TCEF = 1 and disables the channel. In link step mode, the channel is disabled after each single execution of a LLI, and depending on the value of TCEM[1:0] a TCEF is raised or not.

In Figure 171, BNDT ≠ 0 is the typical condition for starting the first data transfer. This condition becomes BNDT ≠ 0 and PFREQ = 1 if the peripheral requests a data transfer with early termination (see Section 27.3.6).

Figure 171. HPDMA channel execution and linked-list programming

27.4.10 HPDMA FIFO-based transfers

There is a single transfer operation mode: the FIFO mode. There are FIFO-based transfers. Any channel x is implemented with a dedicated FIFO whose size is defined by dma_fifo_size[x] (see *Section 27.3.1* for more details).

HPDMA burst

A programmed transfer at the lowest level is an HPDMA burst.

An HPDMA burst is a burst of data received from the source, or a burst of data sent to the destination. A source (and destination) burst is programmed with a burst length by SBL_1[5:0] (respectively DBL_1[5:0]), and with a data width defined by SDW_LOG2[1:0] (respectively DDW_LOG2[1:0]) in HPDMA_CxTR1.

The addressing mode after each data (named beat) of an HPDMA burst is defined by SINC and DINC in HPDMA_CxTR1, for source and destination respectively: either a fixed addressing or an incremented addressing with contiguous data.

The start and next addresses of an HPDMA source/destination burst (defined by HPDMA_CxSAR and HPDMA_CxDAR) must be aligned with the respective data width.

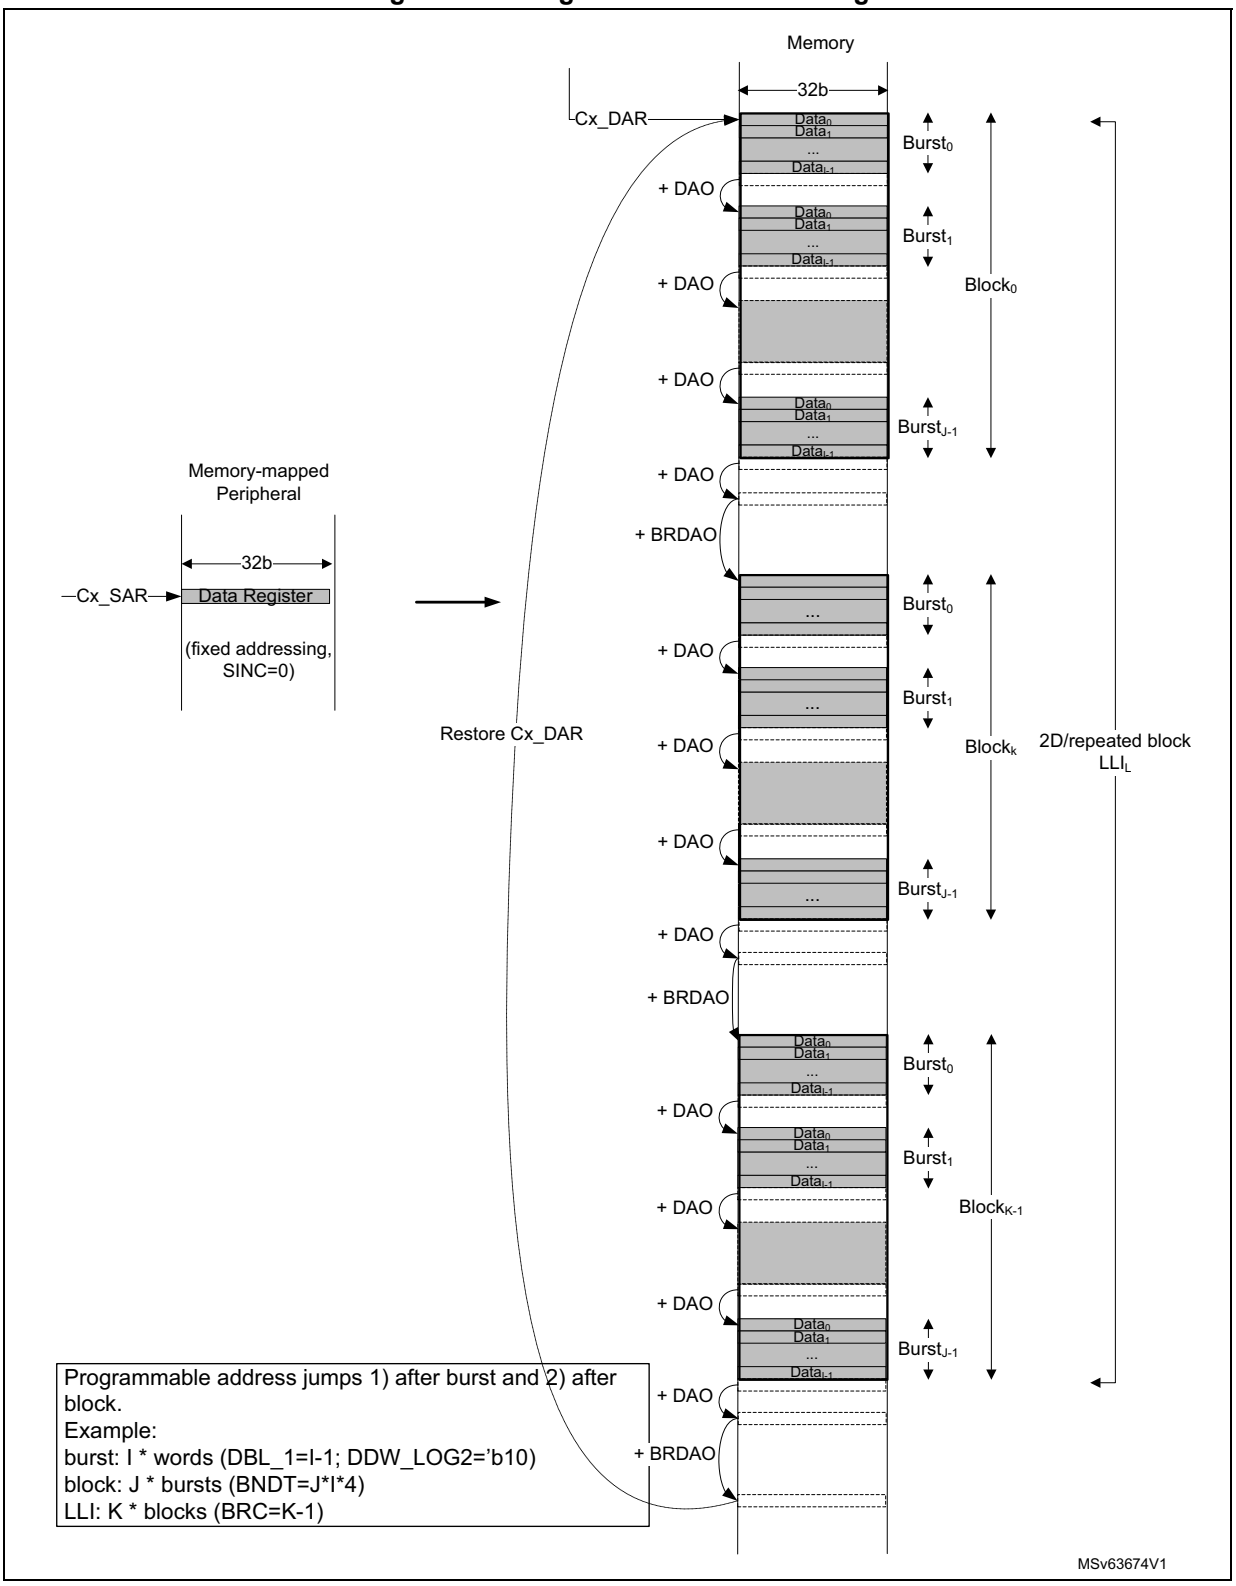
The table below lists the main characteristics of an HPDMA burst.

Table 210. Programmed HPDMA source/destination burst

<table>
<tr><th>SAP/DAP (allocated port)</th><th>SDW_LOG2[1:0] DDW_LOG2[1:0]</th><th>Data width (bytes)</th><th>SINC/DINC</th><th>SBL_1[5:0] DBL_1[5:0]</th><th>Burst length (data/ beats)</th><th>Next data/ beat address</th><th>Next burst address</th><th>Burst address alignment</th></tr>
<tr><td rowspan="3">0: AXI
1: AHB</td><td>00</td><td>1</td><td rowspan="4">0 (fixed)</td><td rowspan="6">n = 0 to 63(1)(2)</td><td rowspan="6">n+1</td><td rowspan="4">+ 0</td><td rowspan="4">+ 0</td><td>1</td></tr>
<tr><td>01</td><td>2</td><td>2</td></tr>
<tr><td>10</td><td>4</td><td>4</td></tr>
<tr><td>0: AXI</td><td>11</td><td>8</td><td>8</td></tr>
<tr><td rowspan="3">0: AXI
1: AHB</td><td>00</td><td>1</td><td rowspan="3">1
(contiguously incremented)</td><td>+ 1</td><td>+ (n + 1)</td><td>1</td></tr>
<tr><td>01</td><td>2</td><td>+ 2</td><td>+ 2 * (n + 1)</td><td>2</td></tr>
<tr><td>10</td><td>4</td><td>+ 4</td><td>+ 4 * (n + 1)</td><td>4</td></tr>
<tr><td>0: AXI</td><td>11</td><td>8</td><td>+ 8</td><td>+ 8 * (n + 1)</td><td>8</td></tr>
<tr><td>0: AHB</td><td>11</td><td colspan="7">forbidden user setting, causing USEF generation and none burst to be issued.</td></tr>
</table>

1. When S/DBL_1[5:0] = 0, burst is of length 1. Then burst can be also named as single.
2. As highlighted in *Section 27.3.2*, the maximum allowed AXI burst length is 16. The user must set SBL_1[5:0] lower or equal to 15 if the source allocated port is AXI (if SAP = 0). The user must set DBL_1[5:0] lower or equal to 15 if the destination allocated port is AXI (if DAP = 0).

The next burst address in the above table is the next source/destination default address pointed by HPDMA_CxSAR or HPDMA_CxDAR, once the programmed source/destination burst is completed. This default value refers to the fixed/contiguously incremented address.



HPDMA burst with 2D addressing (channel x = 12 to 15)

When the channel has additional 2D addressing feature, this default value refers to the value without taking into account the two programmed incremented or decremented offsets. These two additional offsets (with a null default value) are applied:

- after each completed source/destination burst, as defined respectively by HPDMA_CxTR2.SAO[12:0]/DAO[12:0] and HPDMA_CxBR1.SDEC/DDEC
- after each completed block, as defined respectively by HPDMA_CxBR2.BRSAO[15:0]/BRDAO[15:0] and HPDMA_CxBR1.BRSDEC/BRDDEC)

Then, a 2D/repeated block can be addressed with a first programmed address jump after each completed burst, and with a second programmed address jump after each block, as depicted by *Figure 172* with a 2D destination buffer.

Figure 172. Programmed 2D addressing

HPDMA FIFO-based burst

In FIFO-mode, a transfer generally consists of two pipelined and separated burst transfers:

- one burst from the source to the FIFO over the allocated source master port, as defined by HPDMA_CxTR1.SAP
- one burst from the FIFO to the destination over the allocated destination master port, as defined by HPDMA_CxTR1.DAP

HPDMA source burst

The requested source burst transfer to the FIFO can be scheduled as early as possible over the allocated port, depending on the current FIFO level versus the programmed burst size (when the FIFO is ready to get one new burst from the source):

when FIFO level ≤ $2^{dma_fifo_size[x]}$ - (SBL_1[5:0]+1) * $2^{SDW_LOG2[1:0]}$

where:

- FIFO level is the current filling level of the FIFO, in bytes.
- $2^{dma_fifo_size[x]}$ is the channel x FIFO size, in bytes (see *Section 27.3.1* for the implementation details and dma_fifo_size[x] value).
- (SBL_1[5:0]+1) * $2^{SDW_LOG2[1:0]}$ is the size of the programmed source burst transfer, in bytes.

Based on the channel priority (HPDMA_CxCR.PRIO[1:0]), this ready FIFO-based source transfer is internally arbitrated versus the other requested and active channels.

HPDMA destination burst

The requested destination burst transfer from the FIFO can be scheduled as early as possible over the allocated port, depending on the current FIFO level versus the programmed burst size (when the FIFO is ready to push one new burst to the destination):

when FIFO level ≥ (DBL_1[5:0]+1) * $2^{DDW_LOG2[1:0]}$

where:

- FIFO level is the current filling level of the FIFO, in bytes.
- (DBL_1[5:0]+1) * $2^{DDW_LOG2[1:0]}$ is the size of the programmed destination burst transfer, in bytes.

Based on the channel priority, this ready FIFO-based destination transfer is internally arbitrated versus the other requested and active channels.

HPDMA burst versus source block size, 1- or 4-Kbyte address boundary and FIFO size

The programmed source/destination HPDMA burst is implemented with an AHB/AXI burst as is, unless one of the following conditions is met:

- When half of the FIFO size of the channel x is lower than the programmed source/destination burst size, the programmed source/destination HPDMA burst is implemented with a series of singles or bursts of a lower size, each transfer being of a size that is lower or equal than half of the FIFO size, without any user constraint.
- if the source block size (HPDMA_CxBR1.BNDT[15:0]) is not a multiple of the source burst size but is a multiple of the data width of the source burst (HPDMA_CxTR1.SDW_LOG2[1:0]), the HPDMA modifies and shortens bursts into

singles or bursts of lower length, in order to transfer exactly the source block size, without any user constraint.

- if the source/destination burst transfer have crossed the 1- or 4-Kbyte address boundary on, respectively, an AHB or AXI transfer, the HPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the AHB/AXI protocol, without any user constraint.
- If the source/destination burst length exceeds 16 on a AHB transfer, or if the source/destination burst on an AXI transfer is both with fixed addressing and with a burst length which exceeds 16, the HPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the AHB/AXI protocol, without any user constraint.

In any case, the HPDMA keeps ensuring source/destination data (and address) integrity without any user constraint. The current FIFO level (software readable in HPDMA_CxSR) is compared to and updated with the effective transfer size, and the HPDMA re-arbitrates between each AHB/AXI single or burst transfer, possibly modified.

Based on the channel priority, each single or burst of a lower burst size versus the programmed burst, is internally arbitrated versus the other requested and active channels.

Note: In linked-list mode, the HPDMA read transfers related to the update of the linked-list parameters from the memory to the internal HPDMA registers, are scheduled over the link allocated port, as programmed by HPDMA_CxCR.LAP.

HPDMA data handling: byte-based reordering, packing/unpacking, padding/truncation, sign extension, and left/right alignment

The data handling is controlled by HPDMA_CxTR1. The source/destination data width of the programmed burst is byte, half-word, word, or double-word, as per SDW_LOG2[1:0] and DDW_LOG2[1:0] (see *Table 211*).

The user can configure the data handling between transferred data from the source and transfer to the destination. More specifically, programmed data handling is orderly performed with:

1. Byte-based source reordering
   - If SBX = 1 and if the source data width is a word or a double-word (for AXI source bus, SAP = 0), the two bytes of the unaligned half-word at the middle of each source data word are exchanged.
2. Data-width conversion by packing, unpacking, padding, or truncation, if destination data width is different than the source data width, depending on PAM[1:0]:
   - If destination data width > source data width, the post SBX source data is either right-aligned and padded with 0s, or sign extended up to the destination data width, or is FIFO queued and packed up to the destination data width.
   - If destination data width < source data width, the post SBX data is either right-aligned and left-truncated down to the destination data width, or is FIFO queued and unpacked and streamed down to the destination data width.

3. Byte-based destination re-ordering:
   - If DBX = 1 and if the destination data width is not a byte, the two bytes are exchanged within the aligned post PAM[1:0] half-words.
   - If DHX = 1 and if the destination data width is neither a byte nor a half-word, the two aligned half-words are exchanged within the aligned post PAM[1:0] words.
   - If DWX = 1and if the destination data width is a double-word and the destination bus is AXI (DAP = 0), the two aligned words are exchanged within aligned (post PAM[1:0]) double-words).

Note: Left-alignment with 0s-padding can be achieved by programming both a right-alignment with a 0s-padding, and a destination byte-based re-ordering.

The table below lists the possible data handling from the source to the destination.

Table 211. Programmed data handling

SDW_LOG2 [1:0]	Source data	Source data stream(1)	SBX	DDW_LOG2 [1:0]	Destination data	PAM[1:0](2)	DBX	DHX	DWX	Destination data stream(1)
00	Byte	$B_7,B_6,B_5,B_4,B_3,B_2,B_1,B_0$	x	00	Byte	xx	x	x	x	$B_7,B_6,B_5,B_4,B_3,B_2,B_1,B_0$

1. Data stream is timely ordered starting from the byte with the lowest index (B_0).
2. RA= right aligned, LA = left aligned, RT = right truncated, LT = left truncated, 0P = zero bit padding up to the destination data width, SE = sign bit extended up to the destination data width.
3. RA= right aligned. LA = left aligned. RT = right truncated. LT = left truncated.
4. 0P= zero-bit padding up to the destination data width. SE = sign bit extended up to the destination data width.
5. if DDW_LOG2[1:0] = 11 and if DAP = 0 (destination allocated port is AXI). Else if DDW_LOG2[1:0] = 11 and DAP = $\overline{1}$ (AHB), a user setting error (USEF) is reported.
6. if SDW_LOG2[1:0] = 11 and if SAP = 0 (source allocated source port is AXI). Else if SDW_LOG2[1:0] = 11 and SAP = $\overline{1}$ (AHB), a user setting error (USEF) is reported.

27.4.11 HPDMA transfer request and arbitration

HPDMA transfer request

As defined by HPDMA_CxTR2, a programmed HPDMA data transfer is requested with one of the following:

- a software request if the control bit SWREQ = 1: This is used typically by the CPU for a data transfer from a memory-mapped address to another memory mapped address (memory-to-memory, GPIO to/from memory)
- an input hardware request coming from a peripheral if SWREQ = 0: The selection of the HPDMA hardware peripheral request is driven by REQSEL[7:0] (see *Section 27.3.5*). The selected hardware request can be one of the following:
  - an hardware request from a peripheral configured in HPDMA mode (for a transfer from/to the peripheral data register respectively to/from the memory)
  - an hardware request from a peripheral for its control register update from the memory
  - an hardware request from a peripheral for a read of its status registers transferred to the memory

Caution: The user must not assign the same input hardware peripheral HPDMA request via HPDMA_CxTR.REQSEL[7:0] to two different channels, if at a given time this request is asserted by the peripheral, and each channel is ready to execute this requested data transfer. There is no user setting error reporting.

HPDMA transfer request for arbitration

A ready FIFO-based HPDMA source single/burst transfer (from the source address to the FIFO) to be scheduled over the allocated master port (HPDMA_CxTR1.SAP) is arbitrated based on the channel priority (HPDMA_CxCR.PRIO[1:0]) versus the other simultaneous requested HPDMA transfers to the same master port.

A ready FIFO-based HPDMA destination single/burst transfer (from the FIFO to the destination address) to be scheduled over the allocated master port (HPDMA_CxTR1.DAP) is arbitrated based on the channel priority (HPDMA_CxCR.PRIO[1:0]) versus the other simultaneous requested HPDMA transfers to the same master port.

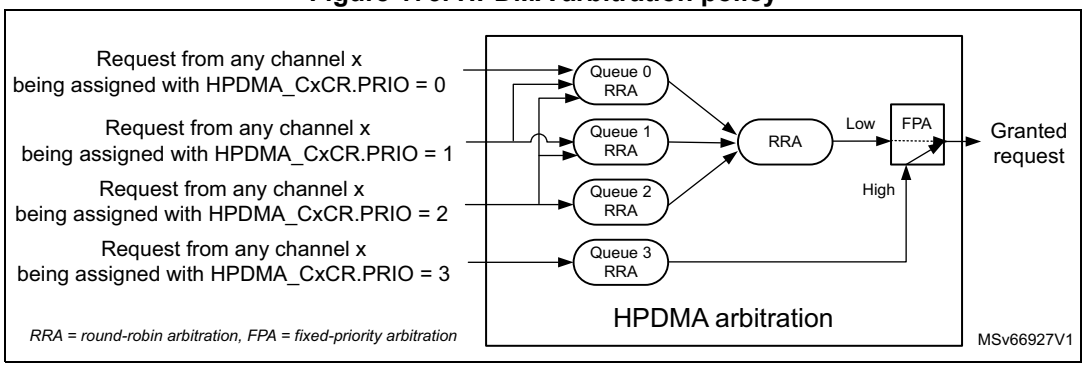
An arbitrated HPDMA requested link transfer consists of one 32-bit read from the linked-list data structure in the memory to one of the linked-list registers (HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR, HPDMA_CxDAR, HPDMA_CxTR3, HPDMA_CxBR2 or HPDMA_CxLLR). Each 32-bit read from the memory is arbitrated with the same channel priority as for data transfers, in order to be scheduled over the allocated master port (HPDMA_CxCR.LAP).

Whatever the requested data transfer is programmed with a software request for a memory-to- memory transfer (HPDMA_CxTR2.SWREQ = 1), or with a hardware request (HPDMA_CxTR2.SWREQ = 0) for a memory-to-peripheral transfer or a peripheral-to-memory transfer and whatever is the hardware request type, re-arbitration occurs after each granted single/burst transfer.

When an hardware request is programmed from a destination peripheral (HPDMA_CxTR2.SWREQ = 0 and HPDMA_CxTR2.DREQ = 1), the first memory read of a (possibly 2D/repeated) block (the first ready FIFO-based source burst request), is gated by the occurrence of the corresponding and selected hardware request. This first read request

to memory is not taken into account earlier by the arbiter (not as soon as the block transfer is enabled and executable).

HPDMA arbitration



The HPDMA arbitration is directed from the 4-grade assigned channel priority (HPDMA_CxCR.PRIO[1:0]). The arbitration policy, as illustrated in *Figure 173*, is defined by:

- one high-priority traffic class (queue 3), dedicated to the assigned channels with priority 3, for time-sensitive channels

  This traffic class is granted via a fixed-priority arbitration against any other low-priority traffic class. Within this class, requested single/burst transfers are round-robin arbitrated.
- three low-priority traffic classes (queues 0, 1 or 2) for non time-sensitive channels with priority 0, 1 or 2

  Each requested single/burst transfer within this class is round-robin arbitrated, with a weight that is monotonically driven from the programmed priority:
  - Requests with priority 0 are allocated to the queue 0.
  - Requests with priority 1 are allocated and replicated to the queue 0 and queue 1.
  - Requests with priority 2 are allocated and replicated to the queue 0, queue 1, and queue 2.
  - Any queue 0, 1 or 2 equally grants any of its active input requests in a round-robin manner, provided there are simultaneous requests.
  - Additionally, there is a second stage for the low-traffic with a round-robin arbiter that fairly alternates between simultaneous selected requests from queue 0, queue 1 and queue 2.

Figure 173. HPDMA arbitration policy

HPDMA arbitration and bandwidth

With this arbitration policy, the following is guaranteed:

- equal maximum bandwidth between requests with same priority
- reserved bandwidth (noted as B_{Q3}) to the time-sensitive requests (with priority 3)
- residual weighted bandwidth between different low-priority requests (priority 0 versus priority 1 versus priority 2).

The two following examples highlight that the weighted round-robin arbitration is driven by the programmed priorities:

- **Example 1**: basic application with two non time-sensitive HPDMA requests: req0 and req1. There are the following programming possibilities:
  - If they are assigned with same priority, the allocated bandwidth by the arbiter to req0 (B_{req0}) is **equal** to the allocated bandwidth to req1(B_{req1}).

    $B_{req0} = B_{req1} = 1/2 * (1 - B_{Q3})$
  - If req0 is assigned to priority 0 and req1 to priority 1, the allocated bandwidth to req0 (B_{P0}) is **3 times less** than the allocated bandwidth to req1 (B_{P1}).

    $B_{req0} = B_{P0} = 1/2 * 1/2 * (1 - B_{Q3}) = 1/4 * (1 - B_{Q3})$

    $B_{req1} = B_{P1} = (1/2 + 1) * 1/2 * (1 - B_{Q3}) = 3/4 * (1 - B_{Q3})$
  - If req0 is assigned to priority 0 and req1 to priority 2, the allocated bandwidth to req0 (B_{P0}) is **5 times less** than the allocated bandwidth to req1 (B_{P2}).

    $B_{req0} = B_{P0} = 1/2 * 1/3 * (1 - B_{Q3}) = 1/6 * (1 - B_{Q3})$

    $B_{req1} = B_{P2} = (1/2 + 1 + 1) * 1/3 * (1 - B_{Q3}) = 5/6 * (1 - B_{Q3})$

  The above computed bandwidth calculation is based on a theoretical input request, always active for any HPDMA clock cycle. This computed bandwidth from the arbiter must be weighted by the frequency of the request given by the application, that cannot be always active and may be quite much variable from one HPDMA client (example I2C at 400 kHz) to another one (PWM at 1 kHz) than the above x3 and x5 ratios.
- **Example 2**: application where the user distributes a same non-null N number of HPDMA requests to every non time-sensitive priority 0, 1 and 2. The bandwidth calculation is then the following:
  - The allocated bandwidth to the set of requests of priority 0 (B_{P0}) is

    $B_{P0} = 1/3 * 1/3 * (1 - B_{Q3}) = 1/9 * (1 - B_{Q3})$
  - The allocated bandwidth to the set of requests of priority 1(B_{P1}) is

    $B_{P1} = (1/3 + 1/2) * 1/3 * (1 - B_{Q3}) = 5/18 * (1 - B_{Q3})$
  - The allocated bandwidth to the set of requests of priority 2(B_{P2}) is

    $B_{P2} = (1/3 + 1/2 + 1) * 1/3 * (1 - B_{Q3}) = 11/18 * (1 - B_{Q3})$
  - The allocated bandwidth to any request n ($B_{n)}$ among the N requests of that priority Pi (i = 0 to 2) is $B_n = 1/N * B_{Pi}$
  - The allocated bandwidth to any request n of priority 0i ($B_{n, Pi}$) is

    $B_{n, P0} = 1/N * 1/9 * (1 - B_{Q3})$

    $B_{n, P1} = 1/N * 5/18 * (1 - B_{Q3})$

    $B_{n, P2} = 1/N * 11/18 * (1 - B_{Q3})$

  In this example, when the master port bus bandwidth is not totally consumed by the time-sensitive queue 3, the residual bandwidth is such that 2.5 times less bandwidth is allocated to any request of priority 0 versus priority 1, and 5.5 times less bandwidth is allocated to any request of priority 0 versus priority 2.

More generally, assume that the following requests are present:

- I requests (I ≥ 0) assigned to priority 0
  If I > 0, these requests are noted from i = 0 to I-1.
- J requests (J ≥ 0) assigned to priority 1
  If J > 0, these requests are noted from j = 0 to J-1.
- K requests (K > 0) assigned to priority 2
  These requests are noted from k = 0 to K-1
- L requests (L ≥ 0) assigned to priority 3
  If L > 0, these requests are noted from l = 0 to L-1.

As B_{Q3} is the reserved bandwidth to time-sensitive requests, the bandwidth for each request L with priority 3 is:

- $B_l = B_{Q3} / L$ for L > 0 (else: $B_l = 0$)

The bandwidth for each non-time sensitive queue is:

- $B_{Q0} = 1/3 * (1 - B_{Q3})$
- $B_{Q1} = 1/3 * (1 - B_{Q3})$
- $B_{Q2} = 1/3 * (1 - B_{Q3})$

The bandwidth for the set of requests with priority 0 is:

- $B_{P0} = I / (I + J + K) * B_{Q0}$

The bandwidth for each request i with priority 0 is:

- $B_i = B_{P0} / I$ for L > 0 (else $B_{P0} = 0$)

The bandwidth for the set of requests with priority 1 and routed to queue 0 is:

- $B_{P1,Q0} = J / (I + J + K) * B_{Q0}$

The bandwidth for the set of requests with priority 1 and routed to queue 1 is:

- $B_{P1,Q1} = J / (J + K) * B_{Q1}$

The total bandwidth for the set of requests with priority 1 is:

- $B_{P1} = B_{P1,Q0} + B_{P1,Q1}$

The bandwidth for each request j with priority 1 is:

- $B_j = B_{P1} / J$ for J > 0 (else $B_j = 0$)

The bandwidth for the set of requests with priority 2 and routed to queue 0 is:

- $B_{P2,Q0} = K / (I + J + K) * B_{Q0}$

The bandwidth for the set of requests with priority 2 and routed to queue 1 is:

- $B_{P2,Q1} = K / (J + K) * B_{Q1}$

The bandwidth for the set of requests with priority 2 and routed to queue 2 is:

- $B_{P2,Q2} = B_{Q2}$

The total bandwidth for the set of requests with priority 2 is:

- $B_{P2} = B_{P2,Q0} + B_{P2,Q1} + B_{P2,Q2}$

The bandwidth for each request k with priority 2 is:

- $B_k = B_{P2} / K$ (K>0 in the general case)

Thus finally the maximum allocated residual bandwidths for any i, j, k non-time sensitive request are:

- in the general case (when there is at least one request k with a priority 2 (K > 0)):
  - $B_i = 1/I * 1/3 * I/(I + J + K) * (1 - B_{Q3})$
  - $B_j = 1/J * 1/3 *[J/(I + J + K) + J/(J + K)] * (1 - B_{Q3})$
  - $B_k = 1/K * 1/3 *[K/(I + J + K) + K/(J + K) + 1] * (1 - B_{Q3})$
- in the specific case (when there is no request k with a priority 2 (K = 0)):
  - $B_i = 1/I * 1/2 * I/(I + J) * (1 - B_{Q3})$
  - $B_j = 1/J * 1/2 *[J/(I + J) + 1] * (1 - B_{Q3})$

Consequently, the HPDMA arbiter can be used as a programmable weighted bandwidth limiter, for each queue and more generally for each request/channel. The different weights are monotonically resulting from the programmed channel priorities.

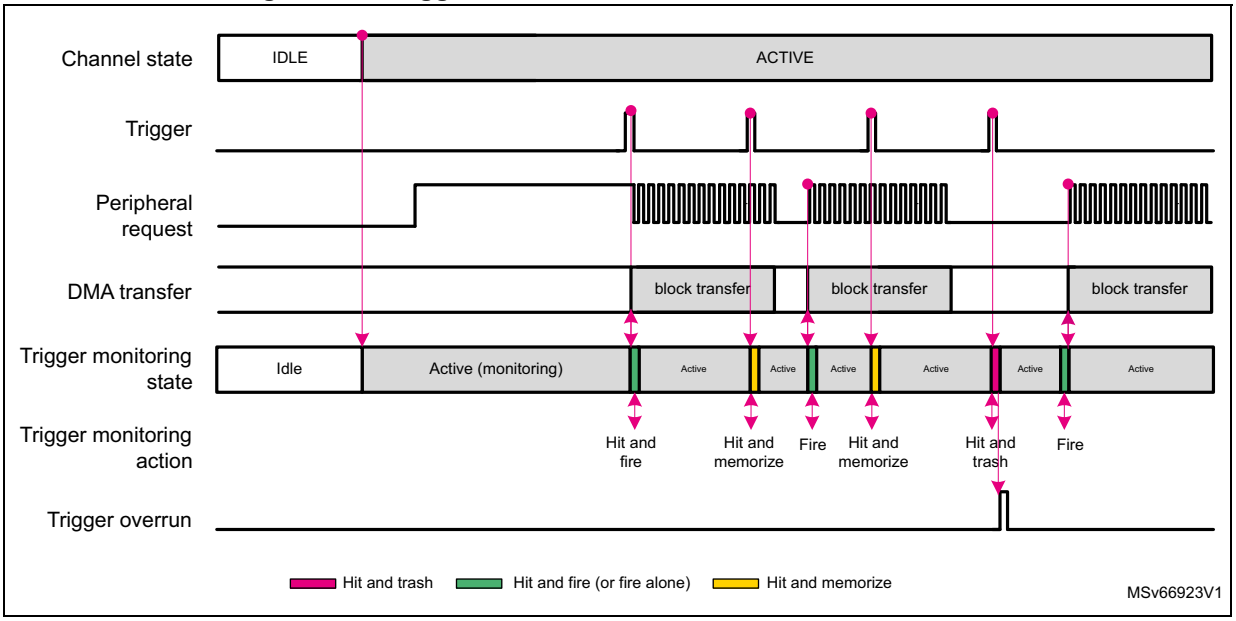
27.4.12 HPDMA triggered transfer

A programmed HPDMA transfer can be triggered by a rising/falling edge of a selected input trigger event, as defined by HPDMA_CxTR2.TRIGPOL[1:0] and HPDMA_CxTR2.TRIGSEL[6:0] (see *Section 27.3.7* for the trigger selection).

The triggered transfer, as defined by the trigger mode in HPDMA_CxTR2.TRIGM[1:0], can be at LLI data transfer level, to condition the first burst read of a block, the first burst read of a 2D/repeated block (for channel x = 12 to 15), or each programmed burst read/write. The trigger mode can also be programmed to condition the LLI link transfer (see TRIGM[1:0] in *HPDMA channel x transfer register 2 (HPDMA_CxTR2)* for more details).

Trigger hit memorization and trigger overrun flag generation

The HPDMA monitoring of a trigger for a channel x is started when the channel is enabled/loaded with a new active trigger configuration: rising or falling edge on a selected trigger (respectively TRIGPOL[1:0] = 01 or TRIGPOL[1:0] = 10).



The monitoring of this trigger is kept active during the triggered and uncompleted (data or link) transfer. If a new trigger is detected, this hit is internally memorized to grant the next transfer, as long as the defined rising/falling edge and TRIGSEL[6:0] are not modified, and the channel is enabled.

Transferring a next $LLI_{n+1,}$ that updates HPDMA_CxTR2 with a new value for any of TRIGSEL[6:0] or TRIGPOL[1:0], resets the monitoring, trashing the possible memorized hit of the formerly defined LLI_n trigger.

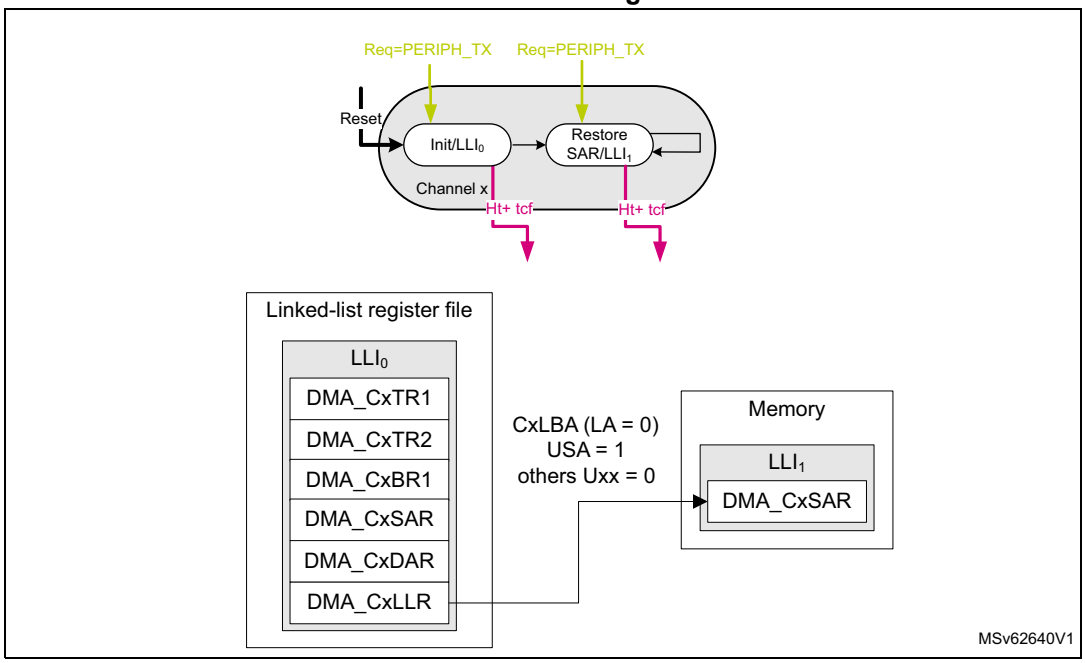
Caution: After a first new trigger, hit_{n+1} is memorized. If another trigger hit_{n+2} is detected, and if the hit_n triggered transfer is still not completed, hit_{n+2} is lost and not memorized. A trigger overrun flag is reported (HPDMA_CxSR.TOF = 1) and an interrupt is generated if enabled (if HPDMA_CxCR.TOIE = 1). The channel is not automatically disabled by hardware due to a trigger overrun.

The figure below illustrates the trigger hit, memorization, and overrun in the configuration example with a block-level trigger mode and a rising edge trigger polarity.

Figure 174. Trigger hit, memorization and overrun waveform

Note: The user can assign the same input trigger event to different channels. This can be used to trigger different channels on a broadcast trigger event.

27.4.13 HPDMA circular buffering with linked-list programming



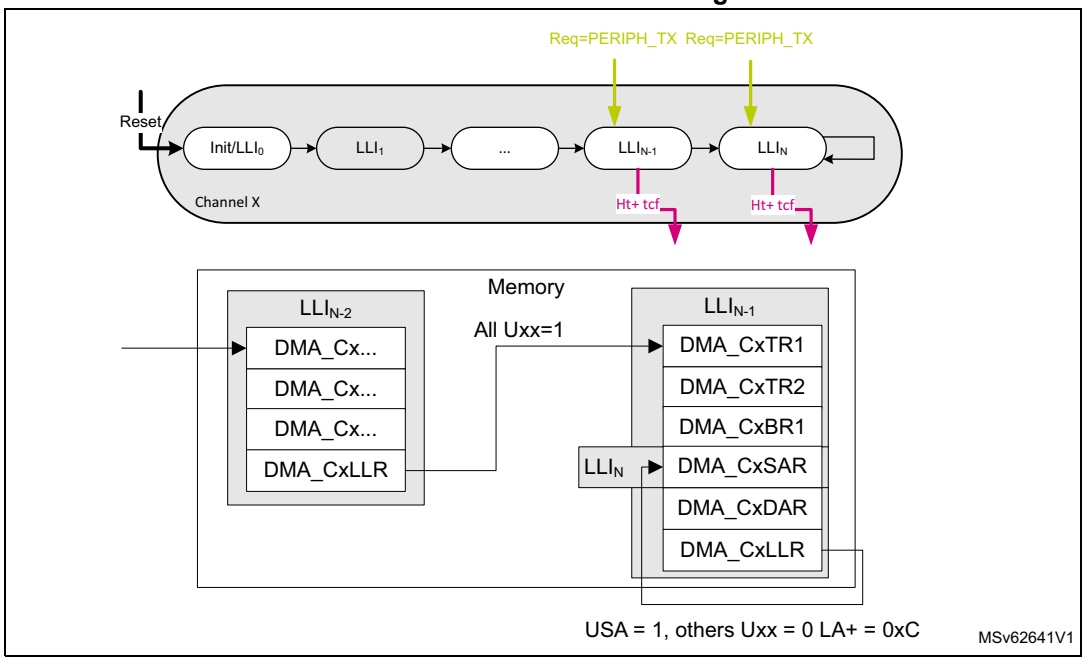
HPDMA circular buffering for memory-to-peripheral and peripheral-to-memory transfers, with a linear addressing channel

For a circular buffering, with a continuous memory-to-peripheral (or peripheral-to-memory) transfer, the software must set up a channel with half-transfer and complete-transfer event/interrupt generation (HPDMA_CxCR.HTIE = 1 and HPDMA_CxCR.TCIE = 1), in order to enable a concurrent buffer software processing.

LLI_0 is configured for the first block transfer with the linear addressing channel.
A continuously-executed LLI_1 is needed to restore the memory source (or destination) start address for the memory-to-peripheral transfer (respectively the peripheral-to-memory).
The HPDMA automatically reloads the initially programmed HPDMA_CxBR1.BNDT[15:0] when a block transfer is completed, and there is no need to restore HPDMA_CxBR1.

The figure below illustrates this programming with a linear addressing HPDMA channel and a source circular buffer.

Figure 175. HPDMA circular buffer programming: update of the memory start address with a linear addressing channel



Note: With a 2D addressing channel, a single LLI can be used with HPDMA_CxBR1.BRC[10:0] = 1. The user can program a negative memory block address offset with HDMA_CxBR2 and HDMA_CxBR1, in order to jump back to the memory source or destination start address.

If the circular buffering must be executed after some other transfers over the shared HPDMA channel x, the before-last LLI_{N-1} in the memory is needed to configure the first block transfer. The last LLI_N restores the memory source (or destination) start address in memory-to-peripheral transfer (respectively in peripheral-to-memory).

The figure below illustrates this programming with a linear addressing shared HPDMA channel, and a source circular buffer.

Figure 176. Shared HPDMA channel with circular buffering: update of the memory start address with a linear addressing channel

27.4.14 HPDMA transfer in peripheral flow-control mode

A peripheral with the peripheral flow-control mode feature can decide to early terminate an HPDMA block transfer, provided that the allocated channel is implemented with this feature (see *Section 27.3.6*).

If the related HPDMA channel x is also programmed in peripheral flow-control mode (HPDMA_CxTR2.PFREQ = 1):

- The HPDMA block transfer starts as follows:
  - If HPDMA_CxBR1.BNDT[15:0] ≠ 0, the programmed value is internally taken into account by the HPDMA hardware.
  - If HPDMA_CxBR1.BNDT[15:0] = 0, the HPDMA hardware internally considers a 64-Kbyte value for the maximum source block size to be transferred.
- The HPDMA block transfer is completed as soon as the first occurrence of any of the following condition occurs:
  - when HPDMA_CxBR1.BNDT[15:0] = 0
  - when the peripheral early terminates the block. The complete transfer event is generated if programmed, depending on HPDMA_CxTR2. Then the software can read the current number of transferred bytes from the source (HPDMA_CxBR1.BNDT[15:0]), and/or read the current source or destination address of the buffer in memory (HPDMA_CxSAR[31:0] or HPDMA_CxDAR[31:0]).

In peripheral flow-control mode:

- a destination peripheral with an hardware requested transfer is not supported: memory-to-peripheral transfer is not supported.
- Data packing from a source peripheral is not supported.
- 2D/repeated block is not supported.
- HPDMA_CxBR1.BNDT[15:0] must be programmed as a multiple of the source (peripheral) burst size.

27.4.15 HPDMA secure/nonsecure channel

The HPDMA controller is compliant with the TrustZone hardware architecture at channel level, partitioning all its resources so that they exist in one of the secure and nonsecure worlds at any given time.

Any channel x is a secure or nonsecure hardware resource, as configured by HPDMA_SECCFGR.SECx.

When a channel x is configured in secure state by a secure and privileged agent, the following access control rules are applied:

- A nonsecure read access to a bitfield of this channel is forced to return 0, except for HPDMA_SECCFGR, HPDMA_PRIVCFGR, HPDMA_RCFGLOCKR, and HPDMA_CxSEMCR that are readable by a nonsecure agent.
- A nonsecure write access to a bitfield of this channel has no impact.

When a channel x is configured in secure state, a secure agent can configure separately as secure or nonsecure the HPDMA data transfer from the source (HPDMA_CxTR1.SSEC), and to the destination (HPDMA_CxTR1.DSEC).

When a channel x is configured in secure state and in linked-list mode, the loading of the next linked-list data structure from the HPDMA memory into its register file, is automatically performed with secure transfers via the HPDMA_CxCR.LAP allocated master port.

The HPDMA generates a secure bus that reflects HPDMA_SECCFGR, to keep the other peripherals informed of the secure/nonsecure state of each HPDMA channel x.

The HPDMA also generates a security illegal access pulse signal on an illegal nonsecure access to a secure HPDMA register. This signal is routed to the TrustZone interrupt controller.

When the secure software must switch a channel from a secure state to a nonsecure state, the secure software must abort the channel or wait until the secure channel is completed before switching. This is needed to dynamically re-allocate a channel to a next nonsecure transfer as a nonsecure software is not allowed to do so, and must have HPDMA_CxCR.EN = 0 before the nonsecure software can reprogram HPDMA_CxCR for a next transfer. The secure software can reset not only the channel x (HPDMA_CxCR.RESET = 1), but also the full channel x register file to its reset value.

27.4.16 HPDMA privileged/unprivileged channel

Any channel x is a privileged or unprivileged hardware resource, as configured by a privileged agent via HPDMA_PRIVCFGR.PRIVx.

When a channel x is configured in a privileged state by a privileged agent, the following access control rules are applied:

- An unprivileged read access to a bitfield of this channel is forced to return 0, except for HPDMA_PRIVCFGR, HPDMA_SECCFGR, HPDMA_CxCIDCFGR and HPDMA_CxSEMCR that are readable by an unprivileged agent.
- An unprivileged write access to a bitfield of this channel has no impact.

When a channel is configured in a privileged (or unprivileged) state, the source and destination data transfers are privileged (respectively unprivileged) transfers over the AHB/AXI master port.

When a channel is configured in a privileged (or unprivileged) state and in linked-list mode, the loading of the next linked-list data structure from the HPDMA memory into its register file, is automatically performed with privileged (respectively unprivileged) transfers, via the HPDMA_CxCR.LAP allocated master port.

The HPDMA generates a privileged bus that reflects HPDMA_PRIVCFGR, to keep the other peripherals informed of the privileged/unprivileged state of each HPDMA channel x.

Additionally, the HPDMA generates a privileged illegal access pulse signal on an illegal unprivileged access to a privileged HPDMA register. This signal can be used or not, depending on the product (see the system security section for more details).

When the privileged software must switch a channel from a privileged state to an unprivileged state, the privileged software must abort the channel, or wait until the privileged channel is completed before switching. This is needed to dynamically re-allocate a channel to a next unprivileged transfer, as an unprivileged software is not allowed to do so, and must have HPDMA_CxCR.EN = 0 before the unprivileged software can reprogram the HPDMA_CxCR for a next transfer. The privileged software can reset not only the channel x (HPDMA_CxCR.RESET = 1), but also the full channel x register file to its reset value.

HPDMA compartmented channel

The HPDMA controller performs bus transfers over its master port, under the control of a resource isolation domain identification named compartment identification (CID), at a channel level. For more details about resource isolation and CID, refer to the RIF section in the product reference manual.

27.4.17 HPDMA error management

The HPDMA can manage and report to the user a transfer error, as follows, depending on the root cause.

Data transfer error

On a bus access (as an AHB/AXI single or a burst) to the source or the destination

- The source or destination target reports an AHB/AXI error.
- The programmed channel transfer is stopped (HPDMA_CxCR.EN cleared by the HPDMA hardware). The channel status register reports an idle state (HPDMA_CxSR.IDLEF = 1) and the data error (HPDMA_CxSR.DTEF = 1).

- After an HPDMA data transfer error, the user must perform a debug session, taking care of the product-defined memory mapping of the source and destination, including the protection attributes.
- After an HPDMA data transfer error, the user must issue a channel reset (set HPDMA_CxCR.RESET) to reset the hardware HPDMA channel data path and the FIFO content, before the user enables again the same channel for a next transfer.

Link transfer error

On a tentative update of a HPDMA channel register from the programmed LLI in the memory:

- The linked-list memory reports an AHB/AXI error.
- The programmed channel transfer is stopped (HPDMA_CxCR.EN cleared by the HPDMA hardware), the channel status register reports an idle state HPDMA_CxSR.IDLEF = 1), and the link error (HPDMA_CxSR.ULEF = 1).
- After an HPDMA link error, the user must perform a debug session, taking care of the product-defined memory mapping of the linked-list data structure (HPDMA_CxLBAR and HPDMA_CxLLR), including the protection attributes.
- After an HPDMA link error, the user must explicitly write the linked-list register file (HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR, HPDMA_CxDAR, and HPDMA_CxLLR, plus HPDMA_CxTR3 and HPDMA_CxBR2 when present), before the user enables again the same channel for a next transfer.

User setting error

On a tentative execution of an HPDMA transfer with an unauthorized user setting:

- The programmed channel transfer is disabled (HPDMA_CxCR.EN forced and cleared by the HPDMA hardware), preventing the next unauthorized programmed data transfer from being executed. The channel status register reports an idle state (HPDMA_CxSR.IDLEF = 1), and a user setting error (HPDMA_CxSR.USEF = 1).
- After an HPDMA user setting error, the user must perform a debug session, taking care of the HPDMA channel programming. A user setting error can be caused by one of the following:
  - a programmed null source block size without a programmed update of this value from the next LLI_1 (HPDMA_CxBR1.BNDT[15:0] = 0 and HPDMA_CxLLR.UB1 = 0)
  - a programmed non-null source block size being not a multiple of the programmed data width of a source burst transfer (HPDMA_CxBR1.BNDT[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0])
  - when in packing/unpacking mode (if PAM[1] = 1), a programmed non-null source block size being not a multiple of the programmed data width of a destination burst transfer (HPDMA_CxBR1.BNDT[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0])
  - when in packing/unpacking mode (if PAM[1] = 1), a programmed non-null source block size being not a multiple of the programmed data width of a destination burst transfer (HPDMA_CxBR1.BNDT[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0])
  - a programmed unaligned source start address being not a multiple of the programmed data width of a source burst transfer (HPDMA_CxSAR[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0])

- for channel x =12 to 15, a programmed unaligned source address offset being not a multiple of the programmed data width of a source burst transfer (HPDMA_CxTR3.SAO[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0])
- for channel x =12 to 15, a programmed unaligned block repeated source address offset being not a multiple of the programmed data width of a source burst transfer (HPDMA_CxBR2.BRSAO[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0])
- a programmed unaligned destination start address, being not a multiple of the programmed data width of a destination burst transfer (HPDMA_CxDAR[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0])
- for channel x =12 to 15, a programmed unaligned destination address offset being not a multiple of the programmed data width of a destination burst transfer (HPDMA_CxTR3.DAO[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0])
- for channel x =12 to 15, a programmed unaligned block repeated destination address offset being not a multiple of the programmed data width of a destination burst transfer (HPDMA_CxBR2.BRDAO[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0])
- a programmed double-word source data width and a programmed AHB source allocated port (HPDMA_CxTR1.SDW_LOG2[1:0] = 11 and HPDMA_CxTR1.SAP = 1)
- a programmed double-word destination data width and a programmed AHB destination allocated port (HPDMA_CxTR1.DDW_LOG2[1:0] = 11 and HPDMA_CxTR1.DAP = 1)
- a programmed linked-list item LLI_{n+1} with a null data transfer (HPDMA_CxLLR.UB1 = 1 and HPDMA_CxBR1. BNDT = 0)

27.4.18 HPDMA autonomous mode

To save dynamic power consumption while the HPDMA executes the programmed linked-list transfers, the HPDMA hardware automatically manages its own clock gating, and generates a clock request output signal to the RCC, whenever the device is in Run, Sleep, or Stop mode, provided that the RCC is programmed with the corresponding HPDMA enable control bits.

For more details about the RCC programming, refer to the RCC section of the reference manual.

For mode details about the availability of the HPDMA autonomous feature versus the device low-power modes, see *Section 27.3.3*.

The user can program and schedule the execution of a given HPDMA transfer at a LLI_n level of an HPDMA channel x, with HPDMA_CxTR2 as follows:

- The software controls and conditions the input of a transfer with TRIGM[1:0], TRIGPOL[1:0], TRIGSEL[y[(a)]:0], SWREQ, and REQSEL[z[(a)]:0] for the input trigger and request.
- The software controls and signals the output of a transfer with TCEM[1:0] for generating or not a transfer-complete event, and generating or not an associated half-transfer event).

See *HPDMA channel x transfer register 2 (HPDMA_CxTR2)* for more details.

a. Refer to *HPDMA channel x transfer register 2 (HPDMA_CxTR2)* for y and z values.

When used in low-power modes, this functionality enables a CPU wake-up on a specific transfer completion by the enabled the HPDMA transfer complete interrupt (HPDMA_CxCR.TCIE = 1), or/and enables to continue with the autonomous HPDMA for operating another LLI_{n+1} transfer over the same channel.

The output channel x transfer complete event, hpdma_chx_tc, can be programmed as a selected input trigger for a channel if this event is looped-back and connected at HPDMA level (see *Section 27.3.7*), allowing autonomous and fine HPDMA inter-channel transfer scheduling, without needing a cleared transfer complete flag (TCF).

A given HPDMA channel x asserts its clock request in one of the following conditions:

- if the next transfer to be executed is programmed as conditioned by a trigger (HPDMA_CxTR2.TRIGPOL[1:0] and HPDMA_CxTR2.TRIGM[1:0]), only when the trigger hit occurs
- if the next transfer to be executed is not conditioned by a trigger:
  - if HPDMA_CxTR2.SWREQ = 0, only when the hardware request is asserted by the selected peripheral
  - if HPDMA_CxTR2.SWREQ = 1 (memory-to-memory, GPIO to/from memory), as soon as the HPDMA is enabled

The HPDMA channel x releases its clock request as soon as all the following conditions are met:

- The transfer to be executed is completed.
- The HPDMA channel x is not immediately ready and requested to execute the next transfer.
- If a channel x interrupt was raised, all the flags of the status register that can cause this interrupt, are cleared by a software agent.

When one channel asserts its clock request, the HPDMA asserts its clock request to the RCC. When none channel asserts its clock request, the HPDMA releases its clock request to the RCC.

27.5 HPDMA in debug mode

When the device enters debug mode (core halted), any channel x can be individually either continued (default) or suspended, depending on the programmable control bit in the DBGMCU module.

Note: In debug mode, HPDMA_CxSR.SUSPF is not altered by a suspension from the programmable control bit in the DBGMCU module. In this case, HPDMA_CxSR.IDLEF can be checked to know the completion status of the channel suspension.

27.6 HPDMA in low-power modes

Table 212. Effect of low-power modes on HPDMA

Mode	Description
Sleep	No effect. HPDMA interrupts cause the device to exit Sleep mode.
Stop(1)	The content of HPDMA registers is kept when entering Stop mode. The content of HPDMA registers can be autonomously updated by a next linked-list item from the memory, to perform autonomous data transfers. HPDMA interrupts can cause the device to exit Stop mode.
Standby	The HPDMA is powered down, and must be reinitialized after exiting Standby mode.

1. Refer to *Section 27.3.3* to know which Stop mode is supported.

27.7 HPDMA interrupts

There is one HPDMA interrupt line for each channel, and separately for each CPU (if several ones in the devices).

Table 213. HPDMA interrupt requests

Interrupt acronym	Interrupt event	Interrupt enable	Event flag	Event clear method
HPDMA_CHx	Transfer complete	HPDMA_CxCR.TCIE	HPDMA_CxSR.TCF	Writes 1 to HPDMA_CxFCR.TCF
	Half transfer	HPDMA_CxCR.HTIE	HPDMA_CxSR.HTF	Writes 1 to HPDMA_CxFCR.HTF
	Data transfer error	HPDMA_CxCR.DTEIE	HPDMA_CxSR.DTEF	Writes 1 to HPDMA_CxFCR.DTEF
	Update link error	HPDMA_CxCR.ULEIE	HPDMA_CxSR.ULEF	Writes 1 to HPDMA_CxFCR.ULEF
	User setting error	HPDMA_CxCR.USEIE	HPDMA_CxSR.USEF	Writes 1 to HPDMA_CxFCR.USEF
	Suspended	HPDMA_CxCR.SUSPIE	HPDMA_CxSR.SUSPF	Writes 1 to HPDMA_CxFCR.SUSPF
	Trigger overrun	HPDMA_CxCR.TOFIE	HPDMA_CxSR.TOF	Writes 1 to HPDMA_CxFCR.TOF

An HPDMA channel x event can be:

- a transfer complete
- an half-transfer complete
- a transfer error, due to either:
  - a data transfer error
  - an update link error
  - a user setting error completed suspension
- a trigger overrun

Note: When a channel x transfer complete event occurs, the output signal hpdma_chx_tc is generated as a high pulse of one clock cycle.

An interrupt is generated following any xx event, provided that both:

- the corresponding interrupt event xx is enabled (HPDMA_CxCR.xxIE = 1)
- the corresponding event flag is cleared (HPDMA_CxSR.xxF = 0). This means that, after a previous same xx event occurrence, a software agent must have written 1 into the corresponding xx flag clear control bit (write 1 into HPDMA_CxFCR.xxF).

TCF (transfer complete) and HTF (half transfer) events generation is controlled by HPDMA_CxTR2.TCEM[1:0] as follows:

- A transfer-complete event is a block transfer complete, a 2D/repeated block transfer complete, or a LLI transfer complete including the upload of the next LLI if any, or the full linked-list completion, depending on the transfer complete event mode HPDMA_CxTR2.TCEM[1:0].
- A half-transfer event is an half-block transfer, or a half 2D/repeated block transfer, depending on the transfer complete event mode HPDMA_CxTR2.TCEM[1:0].

  An half-block transfer occurs when half of the source block size bytes (rounded-up integer of HPDMA_CxBR1.BNDT[15:0] / 2) is transferred to the destination.

  An half 2D/repeated block transfer occurs when half of the repeated blocks (rounded-up integer of (HPDMA_CxBR1.BRC[10:0] + 1) / 2) is transferred to the destination.

See *HPDMA channel x transfer register 2 (HPDMA_CxTR2)* for more details.

Note: The interrupt mode must be used (not the polling mode) to be notified on an half transfer when the write data transaction has been completed over the AXI destination allocated port (written at the destination memory-mapped address), and not just before when has been issued, at HPDMA level, this AXI burst transaction.

A transfer error rises in one of the following situations:

- during a single/burst data transfer from the source or to the destination (DTEF)
- during an update of an HPDMA channel register from the programmed LLI in memory (ULEF)
- during a tentative execution of an HPDMA channel with an unauthorized setting (USEF)

  The user must perform a debug session to correct the HPDMA channel programming versus the USEF root causes list (see *Section 27.4.17*).

A trigger overrun is described in *Trigger hit memorization and trigger overrun flag generation*.

27.8 HPDMA registers

The HPDMA registers must be accessed with an aligned 32-bit word data access.

27.8.1 HPDMA secure configuration register (HPDMA_SECCFGR)

Address offset: 0x000

Reset value: 0x0000 0000

A write access to this register must be secure and privileged. A read access is secure or nonsecure, privileged, or unprivileged, and with any CID.

A write access is ignored at bit level if the corresponding channel x is locked (HPDMA_RCFGLOCKR.LOCKx = 1).

This register can mix information from different CIDs. If a channel x is configured as CID filtered (HPDMA_CxCIDCFGR.CFEN = 1), the SECx bit can be written only by an authorized CID (and secure and privileged) agent. If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be programmed at a bit level, at the initialization/closure of an HPDMA channel (when HPDMA_CxCR.EN = 0), to securely allocate individually any channel x to the secure or nonsecure world.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SECx**: Secure state of channel x (x = 15 to 0)

0: Nonsecure

1: Secure

27.8.2 HPDMA privileged configuration register (HPDMA_PRIVCFGR)

Address offset: 0x004

Reset value: 0x0000 0000

A write access to this register must be privileged. A read access can be privileged or unprivileged, secure or nonsecure, and with any CID.

This register can mix secure and nonsecure information. If a channel x is configured as secure (HPDMA_SECCFGR.SECx = 1), the PRIVx bit can be written only by a secure (and privileged) agent.

This register can mix information from different CIDs. If a channel x is configured as CID filtered (HPDMA_CxCIDCFGR.CFEN = 1), the PRIVx bit can be written only by an authorized CID (and privileged) agent. If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

A write access is ignored at bit level if the corresponding channel x is locked (HPDMA_RCFGLOCKR.LOCKx = 1).

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be programmed at a bit level, at the initialization/closure of a HPDMA channel (HPDMA_CxCR.EN = 0), to individually allocate any channel x to the privileged or unprivileged world.

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PRIVx**: Privileged state of channel x (x = 15 to 0)
0: Unprivileged
1: Privileged

27.8.3 HPDMA configuration lock register (HPDMA_RCFGLOCKR)

Address offset: 0x008

Reset value: 0x0000 0000

This register can be written by a software agent with secure privileged and trusted domain CID attributes in order to individually lock, for example at boot time, the secure privileged and CID attributes of any HPDMA channel/resource (to lock the setting of HPDMA_SECCFGR, HPDMA_PRIVCFGR, and HPDMA_CxCIDCFGR for any channel x at, for example at boot time).

A read access may be privileged or unprivileged, secure or nonsecure, and with any CID.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **LOCKx**: Lock of the configuration of HPDMA_SECCFGR.SECx, HPDMA_PRIVCFGR.PRIVx, and HPDMA_CxCIDCFGR until a global HPDMA reset (x = 15 to 0)

This bit is cleared after reset and, once set, it cannot be reset until a global HPDMA reset.

0: Secure privilege and CID configuration of the channel x is writable.

1: Secure privilege and CID configuration of the channel x is not writable.

27.8.4 HPDMA nonsecure masked interrupt status register (HPDMA_MISR)

Address offset: 0x00C

Reset value: 0x0000 0000

This register is a read register.

This is a nonsecure register, containing the masked interrupt status bit MISx for each non-secure channel x (channel x configured with HPDMA_SECCFGR.SECx = 0). It is a logical OR of all the flags of HPDMA_CxSR, each source flag being enabled by the corresponding interrupt enable bit of HPDMA_CxCR.

Every bit is deasserted by hardware when writing 1 to the corresponding flag clear bit in HPDMA_CxFCR.

If a channel x is in secure state (HPDMA_SECCFGR.SECx = 1), a read access to the masked interrupt status bit MISx of this channel x returns zero.

This register can mix privileged and unprivileged information, depending on the privileged state of each channel HPDMA_PRIVCFGR.PRIVx. A privileged software can read the full nonsecure interrupt status. An unprivileged software is restricted to read the status of unprivileged (and nonsecure) channels, other privileged bitfields returning zero.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MISx**: Masked interrupt status of channel x (x = 15 to 0)

0: No interrupt occurred on channel x.

1: An interrupt occurred on channel x.

27.8.5 HPDMA secure masked interrupt status register (HPDMA_SMISR)

Address offset: 0x010

Reset value: 0x0000 0000

This is a secure read register, containing the masked interrupt status bit MISx for each secure channel x (HPDMA_SECCFGR.SECx = 1). It is a logical OR of all the HPDMA_CxSR flags, each source flag being enabled by the corresponding HPDMA_CxCR interrupt enable bit.

Every bit is deasserted by hardware when securely writing 1 to the corresponding HPDMA_CxFCR flag clear bit.

This register does not contain any information about a nonsecure channel.

This register can mix privileged and unprivileged information, depending on the privileged state of each channel HPDMA_PRIVCFGR.PRIVx. A privileged software can read the full secure interrupt status. An unprivileged software is restricted to read the status of unprivileged and secure channels, other privileged bitfields returning zero.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MISx**: Masked interrupt status of the secure channel x (x = 15 to 0)
0: No interrupt occurred on the secure channel x.
1: An interrupt occurred on the secure channel x.

27.8.6 HPDMA channel x linked-list base address register (HPDMA_CxLBAR)

Address offset: 0x050 + 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This register must be written by a privileged software. It is either privileged readable or not, depending on the privileged state of the channel x HPDMA_PRIVCFGR.PRIVx.

This register is either secure or nonsecure depending on the secure state of the channel x (HPDMA_SECCFGR.SECx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This channel-based register is the linked-list base address of the memory region, for a given channel x, from which the LLIs describing the programmed sequence of the HPDMA transfers, are conditionally and automatically updated.

This 64-Kbyte aligned channel x linked-list base address is offset by the 16-bit HPDMA_CxLLR register that defines the word-aligned address offset for each LLI.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LBA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:16 **LBA[31:16]**: Linked-list base address of HPDMA channel x

Bits 15:0 Reserved, must be kept at reset value.

27.8.7 HPDMA channel x CID register (HPDMA_CxCIDCFGR)

Address offset: 0x054+ 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This channel-based register can be written by the secure, privileged, and trusted domain CID, in order to individually configure the CID allocation of any HPDMA channel x. If the debug domain feature is activated, a read/write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register must be written when the resource configuration of the channel x is unlocked (HPDMA_RCFGLOCKR.LOCKx = 0) and when the channel is disabled (HPDMA_CxCR.EN = 0).

A read access may be privileged or unprivileged, secure or nonsecure, and with any CID.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEM_WLIST_CID2	SEM_WLIST_CID1	SEM_WLIST_CID0
													rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCID[1:0]		Res.	Res.	SEM_EN	CFEN
										rw	rw			rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **SEM_WLIST_CID2**: White-listed CID2 in the CID allocation pool (for when the channel x in semaphore mode)
0: CID2 black-listed in the semaphore-based CID allocation pool
1: CID2 white-listed in the semaphore-based CID allocation pool

Bit 17 **SEM_WLIST_CID1**: White-listed CID1 in the CID allocation pool (for when the channel x in semaphore mode)
0: CID1 black-listed in the semaphore-based CID allocation pool
1: CID1 white-listed in the semaphore-based CID allocation pool

Bit 16 **SEM_WLIST_CID0**: White-listed CID0 in the CID allocation pool (for when the channel x in semaphore mode)
0: CID0 black-listed in the semaphore-based CID allocation pool
1: CID0 white-listed in the semaphore-based CID allocation pool

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:4 **SCID[1:0]**: Allocation of a static/single CID to the channel x (for when the channel x CID configuration is not in semaphore mode)
00: CID0 allocated to the channel x
01: CID1 allocated to the channel x
10: CID2 allocated to the channel x
11: Reserved (write ignored)

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **SEM_EN**: Semaphore mode enable (for the CID allocation policy to the channel x)
0: Semaphore mode disabled. CID allocation policy to the channel x is defined by SCID[1:0].
1: Semaphore mode enabled. CID allocation policy to the channel x is defined by the white-listed allocation pool SEM_WLIST_CIDx and HPDMA_CxSEMCR.SEM_MUTEX.
Note: If SEM_EN = 1 and if a trusted domain or debug domain CID agent clears this bit, then the HPDMA hardware automatically clears the HPDMA_CxSEMCR.SEM_MUTEX.

Bit 0 **CFEN**: CID filtering enable of the channel x
0: CID filtering disabled for when accessing a channel x register/bitfield
1: CID filtering enabled for when accessing a channel x register/bitfield
Note: If CFEN = 1 and if a trusted domain or debug domain CID agent clears this bit, then the HPDMA hardware automatically clears the HPDMA_CxSEMCR.SEM_MUTEX.

27.8.8 HPDMA channel x semaphore control register (HPDMA_CxSEMCR)

Address offset: 0x058+ 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

When the secure, privileged and trusted domain has set up the channel x in semaphore mode (HPDMA_CxCIDCFGR.SEM_EN = 1), this register is used during run-time by an authorized white-listed CID agent, in order to take and after possibly release the control of the channel x.

A read access may be privileged or unprivileged, secure or nonsecure, and with any CID.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEM_CCID[1:0]		Res.	Res.	Res.	SEM_MUTEX
										r	r				rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:4 **SEM_CCID[1:0]**: Current CID allocated to the channel x (in semaphore mode)

This read-only bitfield is internally updated when a white-listed CID took the control of the channel x, in semaphore mode. If SEM_MUTEX = 0, this same CID also released it.

00: CID0 is the last white-listed CID that took the control of the channel x.

01: CID1 is the last white-listed CID that took the control of the channel x.

10: CID2 is the last white-listed CID that took the control of the channel x.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **SEM_MUTEX**: Mutual exclusion semaphore for the CID allocation of the channel x (in semaphore mode)

If the channel x is in secure state (HPDMA_SECCFGR.SECx = 1), this bit can only be written by a secure agent. If the channel x is in privileged state (HPDMA_PRIVCFGR.PRIVx = 1), this bit can only be written by a privileged agent.

If the channel x is CID-filtered (HPDMA_CxCIDCFGR.CFEN = 1) and in semaphore mode (HPDMA_CIDCFGR.SEM_EN = 1), this bit can only be written either by an authorized (white-listed) CID agent to take the control, or by the same (white-listed) CID agent to release the control.

Condition: write

0: Release the control of the channel x (in semaphore mode) to any white-listed CID.

1: Take the control of the channel x (in semaphore mode), from one of the white-listed CID pool.

Condition: read

0: Channel x CID-free (not currently under the control of any white-listed CID)

1: Channel x CID-allocated (currently taken and under the control of one white-listed CID)

Note: This bit must be written when HPDMA_CxCR.EN = 0. This bit is read-only when HPDMA_CxCR.EN = 1.

When SEM_EN or CFEN bit is cleared in HPDMA_CxSEMCR, the HPDMA hardware automatically clears this SEM_MUTEX bit.

27.8.9 HPDMA channel x flag clear register (HPDMA_CxFCR)

Address offset: 0x05C+ 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This is a write register, secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx) and privileged or unprivileged, depending on the privileged state of the channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **TOF**: Trigger overrun flag clear
0: No effect
1: Corresponding TOF flag cleared

Bit 13 **SUSPF**: Completed suspension flag clear
0: No effect
1: Corresponding SUSPF flag cleared

Bit 12 **USEF**: User setting error flag clear
0: No effect
1: Corresponding USEF flag cleared

Bit 11 **ULEF**: Update link transfer error flag clear
0: No effect
1: Corresponding ULEF flag cleared

Bit 10 **DTEF**: Data transfer error flag clear
0: No effect
1: Corresponding DTEF flag cleared

Bit 9 **HTF**: Half transfer flag clear
0: No effect
1: Corresponding HTF flag cleared

Bit 8 **TCF**: Transfer complete flag clear
0: No effect
1: Corresponding TCF flag cleared

Bits 7:0 Reserved, must be kept at reset value.

27.8.10 HPDMA channel x status register (HPDMA_CxSR)

Address offset: 0x060 + 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0001

This is a read register, reporting the channel status.

This register is secure or nonsecure, depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of the channel (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	r	r	r	r	r	r	r								r

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:16 **FIFOL[8:0]**: Monitored FIFO level

Number of available write beats in the FIFO, in units of the programmed destination data width (see *Section 27.8.12: HPDMA channel x transfer register 1 (HPDMA_CxTR1)* DDW_LOG2[1:0], in units of bytes, half-words, words or double-words).

Note: After having suspended an active transfer, the user may need to read FIFOL[8:0], additionally to HPDMA_CxBR1.BDNT[15:0] and HPDMA_CxBR1.BRC[10:0], to know how many data have been transferred to the destination. Before reading, the user may wait for the transfer to be suspended (HPDMA_CxSR.SUSPF = 1).

Bit 15 Reserved, must be kept at reset value.

Bit 14 **TOF**: Trigger overrun flag

0: No trigger overrun event

1: A trigger overrun event occurred.

Bit 13 **SUSPF**: Completed suspension flag

0: No completed suspension event

1: A completed suspension event occurred.

Bit 12 **USEF**: User setting error flag

0: No user setting error event

1: A user setting error event occurred.

Bit 11 **ULEF**: Update link transfer error flag

0: No update link transfer error event

1: A master bus error event occurred while updating a linked-list register from memory.

Bit 10 **DTEF**: Data transfer error flag

0: No data transfer error event

1: A master bus error event occurred on a data transfer.

Bit 9 **HTF**: Half transfer flag

0: No half transfer event

1: An half transfer event occurred.

An half transfer event is either an half block transfer or an half 2D/repeated block transfer, depending on the transfer complete event mode (HPDMA_CxTR2.TCEM[1:0]).

An half block transfer occurs when half of the bytes of the source block size (rounded up integer of HPDMA_CxBR1.BNDT[15:0]/2) has been transferred to the destination.

An half 2D/repeated block transfer occurs when half of the repeated blocks (rounded up integer of (HPDMA_CxBR1.BRC[10:0]+1)/2)) has been transferred to the destination.

Bit 8 **TCF**: Transfer complete flag

0: No transfer complete event

1: A transfer complete event occurred.

A transfer complete event is either a block transfer complete, a 2D/repeated block transfer complete, a LLI transfer complete including the upload of the next LLI if any, or the full linked-list completion, depending on the transfer complete event mode (HPDMA_CxTR2.TCEM[1:0]).

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **IDLEF**: Idle flag

0: Channel not in idle state

1: Channel in idle state

This idle flag is deasserted by hardware when the channel is enabled (HPDMA_CxCR.EN = 1) with a valid channel configuration (no USEF to be immediately reported).

This idle flag is asserted after hard reset or by hardware when the channel is back in idle state (in suspended or disabled state).

27.8.11 HPDMA channel x control register (HPDMA_CxCR)

Address offset: 0x064 + 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of the channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register is used to control a channel (activate, suspend, abort or disable it).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIO[1:0]		Res.	Res.	Res.	Res.	LAP	LSM

	rw	rw	rw	rw	rw	rw	rw						rw	w	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:22 **PRIO[1:0]:** Priority level of the channel x HPDMA transfer versus others
00: Low priority, low weight
01: Low priority, mid weight
10: Low priority, high weight
11: High priority
Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bits 21:18 Reserved, must be kept at reset value.

Bit 17 **LAP**: lLnked-list allocated port
This bit is used to allocate the master port for the update of the HPDMA linked-list registers from the memory.
0: Port 0 (AXI) allocated
1: Port 1 (AHB) allocated
Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bit 16 **LSM**: Link step mode
0: Channel executed for the full linked-list and completed at the end of the last LLI (HPDMA_CxLLR = 0). The 16 low-significant bits of the link address are null (LA[15:0] = 0) and all the update bits are null (UT1 = UB1 = UT2 = USA = UDA = ULL = 0 and UT3 = UB2 = 0 if present). Then HPDMA_CxBR1.BNDT[15:0] = 0 and HPDMA_CxBR1.BRC[10:0] = 0 if present.
1: Channel executed once for the current LLI
First the (possible 1D/repeated) block transfer is executed as defined by the current internal register file until HPDMA_CxBR1.BNDT[15:0] = 0 and HPDMA_CxBR1.BRC[10:0] = 0, if present. Secondly the next linked-list data structure is conditionally uploaded from memory as defined by HPDMA_CxLLR. Then channel execution is completed.
Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bit 15 Reserved, must be kept at reset value.

Bit 14 **TOIE**: Trigger overrun interrupt enable
0: Interrupt disabled
1: Interrupt enabled

Bit 13 **SUSPIE**: cCmpleted suspension interrupt enable
0: Interrupt disabled
1: Interrupt enabled

Bit 12 **USEIE**: User setting error interrupt enable
0: Interrupt disabled
1: Interrupt enabled

Bit 11 **ULEIE**: Update link transfer error interrupt enable
0: Interrupt disabled
1: Interrupt enabled

Bit 10 **DTEIE**: Data transfer error interrupt enable
0: Interrupt disabled
1: Interrupt enabled

Bit 9 **HTIE**: Half transfer complete interrupt enable
0: Interrupt disabled
1: Interrupt enabled

Bit 8 **TCIE**: Transfer complete interrupt enable
0: Interrupt disabled
1: Interrupt enabled

Bits 7:3 Reserved, must be kept at reset value.

Bit 2 **SUSP:** Suspend

Writing 1 to RESET in this register causes the hardware to deassert this SUSP bit, whatever is written into this SUSP. Else:

Software must write 1 in order to suspend an active channel (a channel with an ongoing HPDMA transfer over its master ports).

The software must write 0 in order to resume a suspended channel, following the programming sequence detailed in *Figure 158*.

0: Write: resume channel, read: channel not suspended

1: Write: suspend channel, read: channel suspended

Bit 1 **RESET:** Reset

This bit is write only. Writing 0 has no impact. Writing 1 implies the reset of the following: the FIFO, the channel internal state, SUSP and EN bits (whatever is written receptively in bit 2 and bit 0).

The reset is effective when the channel is in steady state, meaning one of the following:

- active channel in suspended state (HPDMA_CxSR.SUSPF = 1 and HPDMA_CxSR.IDLEF = HPDMA_CxCR.EN = 1)
- channel in disabled state (HPDMA_CxSR.IDLEF = 1 and HPDMA_CxCR.EN = 0).

After writing a RESET, to continue using this channel, the user must explicitly reconfigure the channel including the hardware-modified configuration registers (HPDMA_CxBR1, HPDMA_CxSAR and HPDMA_CxDAR) before enabling again the channel (see the programming sequence in *Figure 159*).

0: No channel reset

1: Channel reset

Bit 0 **EN:** Enable

Writing 1 to RESET in this register causes the hardware to deassert this EN bit, whatever is written into this bit 0. Else:

This bit is deasserted by hardware when there is a transfer error (master bus error or user setting error) or when there is a channel transfer complete (channel ready to be configured, for example if LSM = 1 at the end of a single execution of the LLI).

Else, this bit can be asserted by software.

Writing 0 into this EN bit is ignored.

0: Write: ignored, read: channel disabled

1: Write: enable channel, read: channel enabled

27.8.12 HPDMA channel x transfer register 1 (HPDMA_CxTR1)

Address offset: 0x090 + 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx) except for secure DSEC and SSEC, privileged or unprivileged, depending on the privileged state of the channel x in HPDMA_PRIVCFGR.PRIVx.

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when the channel is completed. Then the hardware has de-asserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by HPDMA from the memory if HPDMA_CxLLR.UT1 = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DSEC	DAP	Res.	DWX	DHX	DBX	DBL_1[5:0]						DINC	Res.	DDW_LOG2[1:0]	
rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SSEC	SAP	SBX	PAM[1:0]		Res.	SBL_1[5:0]						SINC	Res.	SDW_LOG2[1:0]	
rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw		rw	rw

Bit 31 **DSEC**: Security attribute of the HPDMA transfer to the destination

If HPDMA_SECCFGR.SECx = 1 and the access is secure:

0: HPDMA transfer nonsecure

1: HPDMA transfer secure

This is a secure register bit. This bit can only be read by a secure software. This bit must be written by a secure software when HPDMA_SECCFGR.SECx = 1. A secure write is ignored when HPDMA_SECCFGR.SECx = 0.

When HPDMA_SECCFGR.SECx is deasserted, this DSEC bit is also deasserted by hardware (on a secure reconfiguration of the channel as nonsecure), and the HPDMA transfer to the destination is nonsecure.

Bit 30 **DAP**: Destination allocated port

This bit is used to allocate the master port for the destination transfer

0: Port 0 (AXI) allocated

1: Port 1 (AHB) allocated

Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bit 29 Reserved, must be kept at reset value.

Bit 28 **DWX**: Destination word exchange

If the destination data size is not a double-word, this bit is ignored.

If the destination data size is a double-word and if destination bus is AXI (DAP = 0):

0: No word-based exchanged within double-word

1: The two consecutive (post PAM) words are exchanged in each destination double-word.

Bit 27 **DHX**: Destination half-word exchange

If the destination data size is shorter than a word, this bit is ignored.

If the destination data size is a word or double-word and if destination bus is AXI (DAP = 0):

0: No half-word-based exchanged within word

1: The two consecutive (post PAM) half-words are exchanged in each destination word.

Bit 26 **DBX**: Destination byte exchange

If the destination data size is a byte, this bit is ignored.

If the destination data size is not a byte:

0: No byte-based exchange within half-word

1: The two consecutive (post PAM) bytes are exchanged in each destination half-word.

Bits 25:20 **DBL_1[5:0]**: Destination burst length minus 1, between 0 and 63

The burst length unit is one data named beat within a burst. If DBL_1[5:0] = 0, the burst can be named as single. Each data/beat has a width defined by the destination data width DDW_LOG2[1:0].

Caution: As highlighted in *Section 27.3.2*, the maximum allowed AXI burst length is 16. The user must set DBL_1[5:0] lower or equal to 15 if the destination allocated port is AXI (if DAP = 0).

Note: If a burst transfer crossed a 1- or 4-Kbyte address boundary on respectively an AHB or AXI transfer, the HPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the AHB/AXI protocol.

If the burst length exceeds 16 on an AHB transfer, or if the burst on an AXI transfer is both with fixed addressing (DINC = 0) and with a burst length which exceeds 16, the HPDMA modifies and shortens the programmed burst into bursts of lower length, to be compliant with the AHB or AXI protocol.

If a burst transfer is of length greater than the FIFO size of the channel x, the HPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the FIFO size. Transfer performance is lower, with HPDMA re-arbitration between effective and lower singles/bursts, but the data integrity is guaranteed.

Bit 19 **DINC**: Destination incrementing burst

0: Fixed burst

1: Contiguously incremented burst

The destination address, pointed by HPDMA_CxDAR, is kept constant after a burst beat/single transfer, or is incremented by the offset value corresponding to a contiguous data after a burst beat/single transfer.

Bit 18 Reserved, must be kept at reset value.

Bits 17:16 **DDW_LOG2[1:0]**: Binary logarithm of the destination data width of a burst, in bytes
00: Byte
01: Half-word (2 bytes)
10: Word (4 bytes)
11: If DAP = 0 (AXI), double-word (8 bytes)
if DAP = 1, user setting error reported and no transfer issued

Note: A destination burst transfer must have an aligned address with its data width (start address HPDMA_CxDAR[2:0] and if present address offset HPDMA_CxTR3.DAO[2:0], versus DDW_LOG2[1:0]). Otherwise a user setting error is reported and no transfer is issued.

When configured in packing mode (PAM[1] = 1 and destination data width different from source data width), a source block size must be a multiple of the destination data width (see HPDMA_CxBR1.BNDT[2:0] versus DDW_LOG2[1:0]). Else a user setting error is reported and none transfer is issued.

A burst with a double-word data width must be allocated to the AXI master port, else a user setting error is reported and none transfer is issued.

Bit 15 **SSEC**: Security attribute of the HPDMA transfer from the source
If HPDMA_SECCFGR.SECx = 1 and the access is secure:
0: HPDMA transfer nonsecure
1: HPDMA transfer secure
This is a secure register bit. This bit can only be read by a secure software. This bit must be written by a secure software when HPDMA_SECCFGR.SECx = 1. A secure write is ignored when HPDMA_SECCFGR.SECx = 0.
When HPDMA_SECCFGR.SECx is deasserted, this SSEC bit is also deasserted by hardware (on a secure reconfiguration of the channel as nonsecure), and the HPDMA transfer from the source is nonsecure.

Bit 14 **SAP**: Source allocated port
This bit is used to allocate the master port for the source transfer
0: Port 0 (AXI) allocated
1: Port 1 (AHB) allocated

Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bit 13 **SBX**: Source byte exchange within the unaligned half-word of each source word
If the source data width is shorter than a word, this bit is ignored.
If the source data width is a word or a double-word, and if source bus is AXI (SAP = 0):
0: No byte-based exchange within the unaligned half-word of each source word
1: The two consecutive bytes within the unaligned half-word of each source word are exchanged.

Bits 12:11 **PAM[1:0]**: Padding/alignment mode

If DDW_LOG2[1:0] = SDW_LOG2[1:0]: if the data width of a burst destination transfer is equal to the data width of a burst source transfer, these bits are ignored.

Else, in the following enumerated values, the condition PAM_1 is when destination data width is higher than source data width, and the condition PAM_2 is when source data width is higher than destination data width.

Condition: PAM_1

00: Source data is transferred as right aligned, padded with 0s up to the destination data width

01: Source data is transferred as right aligned, sign extended up to the destination data width

10-11: Successive source data are FIFO queued and packed at the destination data width, in a left (LSB) to right (MSB) order (named little endian), before a destination transfer

Condition: PAM_2

00: Source data is transferred as right aligned, left-truncated down to the destination data width

01: Source data is transferred as left-aligned, right-truncated down to the destination data width

10-11: Source data is FIFO queued and unpacked at the destination data width, to be transferred in a left (LSB) to right (MSB) order (named little endian) to the destination

Note: If the transfer from the source peripheral is configured with peripheral flow-control mode (SWREQ = 0 and PFREQ = 1 and DREQ = 0), and if the destination data width > the source data width, packing is not supported.

Bit 10 Reserved, must be kept at reset value.

Bits 9:4 **SBL_1[5:0]**: Source burst length minus 1, between 0 and 63

The burst length unit is one data named beat within a burst. If SBL_1[5:0] = 0, the burst can be named as single. Each data/beat has a width defined by the destination data width SDW_LOG2[1:0].

Caution: As highlighted in *Section 27.3.2*, the maximum allowed AXI burst length is 16. The user must set SBL_1[5:0] lower or equal to 15 if the source allocated port is AXI (if SAP = 0).

Note: If a burst transfer crossed a 1- or 4-Kbyte address boundary on respectively an AHB or an AXI transfer, the HPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the AHB protocol.

If the burst length exceeds 16 on a AHB transfer, or if the burst on a AXI transfer is both with fixed addressing (SINC = 0) and with a burst length which exceeds 16, the HPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the FIFO size. Transfer performance is lower, with HPDMA re-arbitration between effective and lower singles/bursts, but the data integrity is guaranteed.

Bit 3 **SINC**: Source incrementing burst

0: Fixed burst

1: Contiguously incremented burst

The source address, pointed by HPDMA_CxSAR, is kept constant after a burst beat/single transfer or is incremented by the offset value corresponding to a contiguous data after a burst beat/single transfer.

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **SDW_LOG2[1:0]**: Binary logarithm of the source data width of a burst in bytes
00: Byte
01: Half-word (2 bytes)
10: Word (4 bytes)
11: If SAP = 0 (AXI), double-word (8 bytes)
if SAP = 1, user setting error reported and no transfer issued

Note: A source block size must be a multiple of the source data width (HPDMA_CxBR1.BNDT[2:0] versus SDW_LOG2[1:0]). Otherwise, a user setting error is reported and no transfer is issued.

A source burst transfer must have an aligned address with its data width (start address HPDMA_CxSAR[2:0] versus SDW_LOG2[1:0]). Otherwise, a user setting error is reported and none transfer is issued.

A burst with a double-word data width must be allocated to the AXI master port, else a user setting error is reported and none transfer is issued.

27.8.13 HPDMA channel x transfer register 2 (HPDMA_CxTR2)

Address offset: 0x094 + 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, a write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (the hardware deasserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by HPDMA from the memory, if HPDMA_CxLLR.UT2 = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TCEM[1:0]		Res.	Res.	Res.	Res.	TRIGPOL[1:0]		Res.	TRIGSEL[6:0]

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRIGM[1:0]		Res.	PFREQ	BREQ	DREQ	SWREQ	Res.	REQSEL[7:0]							
rw	rw		rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 **TCEM[1:0]**: Transfer complete event mode

These bits define the transfer granularity for the transfer complete and half transfer complete events generation.

00: At block level (when HPDMA_CxBR1.BNDT[15:0] = 0): The complete (and the half) transfer event is generated at the (respectively half of the) end of a block.

Note: If the initial LLI_0 data transfer is null/void (directly programmed by the internal register file with HPDMA_CxBR1.BNDT[15:0] = 0), then neither the complete transfer event nor the half transfer event is generated.

01: Channel x = 0 to 11, same as 00; channel x = 12 to 15, at 2D/repeated block level (when HPDMA_CxBR1.BRC[10:0] = 0 and HPDMA_CxBR1.BNDT[15:0] = 0), the complete (and the half) transfer event is generated at the end (respectively half of the end) of the 2D/repeated block.

Note: If the initial LLI_0 data transfer is null/void (directly programmed by the internal register file with HPDMA_CxBR1.BNDT[15:0] = 0), then neither the complete transfer event nor the half transfer event is generated.

10: At LLI level: The complete transfer event is generated at the end of the LLI transfer, including the update of the LLI if any. The half transfer event is generated at the half of the LLI data transfer (the LLI data transfer being a block transfer or a 2D/repeated block transfer for channel x = 12 to 15), if any data transfer.

Note: If the initial LLI_0 data transfer is null/void (directly programmed by the internal register file with HPDMA_CxBR1.BNDT[15:0] = 0), then the half transfer event is not generated, and the transfer complete event is generated when is completed the loading of the LLI_1.

11: At channel level: The complete transfer event is generated at the end of the last LLI transfer. The half transfer event is generated at the half of the data transfer of the last LLI. The last LLI updates the link address HPDMA_CxLLR.LA[15:2] to zero and clears all the HPDMA_CxLLR update bits (UT1, UT2, UB1, USA, UDA and ULL, plus UT3 and UB2 if present). If the channel transfer is continuous/infinite, no event is generated.

Bits 29:26 Reserved, must be kept at reset value.

Bits 25:24 **TRIGPOL[1:0]**: Trigger event polarity

These bits define the polarity of the selected trigger event input defined by TRIGSEL[6:0].

00: No trigger (masked trigger event)

01: Trigger on the rising edge

10: Trigger on the falling edge

11: Same as 00

Bit 23 Reserved, must be kept at reset value.

Bits 22:16 **TRIGSEL[6:0]**: Trigger event input selection

These bits select the trigger event input of the HPDMA transfer (as per *Section 27.3.7*), with an active trigger event if TRIGPOL[1:0] ≠ 00.

Bits 15:14 **TRIGM[1:0]**: Trigger mode

These bits define the transfer granularity for its conditioning by the trigger.

If the channel x is enabled (HPDMA_CxCR.EN asserted) with TRIGPOL[1:0] = 00 or 11, these TRIGM[1:0] bits are ignored.

Else, an HPDMA transfer is conditioned by at least one trigger hit:

00: at block level: the first burst read of each block transfer is conditioned by one hit trigger (channel x = 12 to 15, for each block if a 2D/repeated block is configured with HPDMA_CxBR1.BRC[10:0] ≠ 0).

01: channel x = 0 to 11, same as 00; channel x = 12 to 15, at 2D/repeated block level, the first burst read of a 2D/repeated block transfer is conditioned by one hit trigger.

10: at link level: a LLI link transfer is conditioned by one hit trigger. The LLI data transfer (if any) is not conditioned.

11: at programmed burst level: If SWREQ = 1, each programmed burst read is conditioned by one hit trigger. If SWREQ = 0, each programmed burst that is requested by the selected peripheral, is conditioned by one hit trigger.

– If the peripheral is programmed as a source (DREQ = 0) of the LLI data transfer, each programmed burst read is conditioned.

– If the peripheral is programmed as a destination (DREQ = 1) of the LLI data transfer, each programmed burst write is conditioned. The first memory burst read of a (possibly 2D/repeated) block, also named as the first ready FIFO-based source burst, is gated by the occurrence of both the hardware request and the first trigger hit.

The HPDMA monitoring of a trigger for channel x is started when the channel is enabled/loaded with a new active trigger configuration: rising or falling edge on a selected trigger (TRIGPOL[1:0] = 01 or respectively TRIGPOL[1:0] = 10).

The monitoring of this trigger is kept active during the triggered and uncompleted (data or link) transfer; and if a new trigger is detected then, this hit is internally memorized to grant the next transfer, as long as the defined rising or falling edge is not modified, and the TRIGSEL[5:0] is not modified, and the channel is enabled.

Transferring a next LLI_{n+1} that updates the HPDMA_CxTR2 with a new value for any of TRIGSEL[6:0] or TRIGPOL[1:0], resets the monitoring, trashing the memorized hit of the formerly defined LLI_n trigger.

After a first new trigger hit_{n+1} is memorized, if another second trigger hit_{n+2} is detected and if the hit_n triggered transfer is still not completed, hit_{n+2} is lost and not memorized.memorized. A trigger overrun flag is reported (HPDMA_CxSR.TOF = 1), and an interrupt is generated if enabled (HPDMA_CxCR.TOIE = 1). The channel is not automatically disabled by hardware due to a trigger overrun.

Note: When the source block size is not a multiple of the source burst size and is a multiple of the source data width, then the last programmed source burst is not completed and is internally shorten to match the block size. In this case, if TRIGM[1:0] = 11 and (SWREQ = 1 or (SWREQ = 0 and DREQ = 0)), the shortened burst transfer (by singles or/and by bursts of lower length) is conditioned once by the trigger.

When the programmed destination burst is internally shortened by singles or/and by bursts of lower length (versus FIFO size, versus block size, 1/4-Kbyte boundary address crossing maximum burst length versus AHB/AXI protocol): if the trigger is conditioning the programmed destination burst (if TRIGM[1:0] = 11 and SWREQ = 0 and DREQ = 1), this shortened destination burst transfer is conditioned once by the trigger.

Bit 13 Reserved, must be kept at reset value.

Bit 12 **PFREQ**: Hardware request in peripheral flow control mode

Important: If a given channel x is not implemented with this feature, this bit is reserved and PFREQ is not present (see Section 27.3.6 for the list of the implemented channels with this feature.

If the channel x is activated (HPDMA_CxCR.EN asserted) with SWREQ = 1 (software request for a memory-to-memory transfer), this bit is ignored. Else:

0: The selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol in HPDMA control mode. The HPDMA is programmed with HPDMA_CxCBR1.BNDT[15:0] and this is internally used by the hardware for the block transfer completion.

1: The selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol in peripheral control mode. The HPDMA block transfer can be early completed by the peripheral itself (see *Section 27.3.6* for more details).

Note: In peripheral flow control mode, there are the following restrictions:

- no 2D/repeated block support (HPDMA_CxBR1.BRC[10:0] must be set to 0 if present)

- the peripheral must be set as the source of the transfer (DREQ = 0).

- data packing to a wider destination width is not supported (if destination width > source data width, HPDMA_CxTR1.PAM[1] must be set to 0).

- HPDMA_CxBR1.BNDT[15:0] must be set as a multiple of the source (peripheral) burst size.

Bit 11 **BREQ**: Block hardware request

If the channel x is activated (HPDMA_CxCR.EN asserted) with SWREQ = 1 (software request for a memory-to-memory transfer), this bit is ignored. Else:

0: The selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol at a burst level.

1: The selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol at a block level (see *Section 27.3.5*).

Bit 10 **DREQ**: Destination hardware request

This bit is ignored if channel x is activated (HPDMA_CxCR.EN asserted) with SWREQ = 1 (software request for a memory-to-memory transfer). Else:

0: Selected hardware request driven by a source peripheral (request signal taken into account by the HPDMA transfer scheduler over the source/read port)

1: Selected hardware request driven by a destination peripheral (request signal taken into account by the HPDMA transfer scheduler over the destination/write port)

Note: If the channel x is activated (HPDMA_CxCR.EN is asserted) with SWREQ = 0 and PFREQ = 1 (peripheral hardware request with peripheral flow-control mode), any software assertion to this DREQ bit is ignored: in peripheral flow-control mode, only a peripheral-to-memory transfer is supported.

Bit 9 **SWREQ**: Software request

This bit is internally taken into account when HPDMA_CxCR.EN is asserted.

0: No software request. The selected hardware request REQSEL[7:0] is taken into account.

1: Software request for a memory-to-memory transfer. The default selected hardware request as per REQSEL[7:0] is ignored.

Bit 8 Reserved, must be kept at reset value.

Bits 7:0 **REQSEL[7:0]**: Hardware request selection

These bits are ignored if channel x is activated (HPDMA_CxCR.EN asserted) with SWREQ = 1 (software request for a memory-to-memory transfer). Else, the selected hardware request is internally taken into account as per *Section 27.3.4*.

Caution: The user must not assign a same input hardware request (same REQSEL[7:0] value) to different active HPDMA channels (HPDMA_CxCR.EN = 1 and HPDMA_CxTR2.SWREQ = 0 for these channels). The HPDMA is not intended to hardware support the case of simultaneous enabled channels incorrectly configured with a same hardware peripheral request signal, and there is no user setting error reporting.

27.8.14 HPDMA channel x block register 1 (HPDMA_CxBR1)

Address offset: 0x098 + 0x80 * x (x = 0 to 11)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, a write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x at a block level.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when channel x is completed (then the hardware has de-asserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer:

- if HPDMA_CxLLR.UB1 = 1, this register is automatically updated by the HPDMA from the next LLI in memory.
- If HPDMA_CxLLR.UB1 = 0 and if there is at least one linked-list register to be updated from the next LLI in memory, this register is automatically and internally restored with the programmed value for the bitfield BNDT[15:0].
- If all the update bits HPDMA_CxLLR.Uxx are null and if HPDMA_CxLLR.LA[15:0] ≠ 0, the current LLI is the last one and is continuously executed: this register is automatically and internally restored with the programmed value for BNDT[15:0] after each execution of this final LLI
- If HPDMA_CxLLR = 0, this register and BNDT[15:0] are kept as null, channel x is completed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BNDT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **BNDT[15:0]**: Block number of data bytes to transfer from the source

Block size transferred from the source. When the channel is enabled, this bitfield becomes read-only and is decremented, indicating the remaining number of data items in the current source block to be transferred. BNDT[15:0] is programmed in number of bytes, maximum source block size is 64 Kbytes -1.

Once the last data transfer is completed (BNDT[15:0] = 0):

- if HPDMA_CxLLR.UB1 = 1, this bitfield is updated by the LLI in the memory.
- if HPDMA_CxLLR.UB1 = 0 and if there is at least one non null Uxx update bit, this bitfield is internally restored to the programmed value.
- if all HPDMA_CxLLR.Uxx = 0 and if HPDMA_CxLLR.LA[15:0] = 0, this bitfield is internally restored to the programmed value (infinite/continuous last LLI).
- if HPDMA_CxLLR = 0, this bitfield is kept as zero following the last LLI data transfer.

Note: A non-null source block size must be a multiple of the source data width (BNDT[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0]). Else a user setting error is reported and no transfer is issued.

When configured in packing mode (HPDMA_CxTR1.PAM[1] = 1 and destination data width different from source data width), a non-null source block size must be a multiple of the destination data width (BNDT[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0]). Else a user setting error is reported and no transfer is issued.

27.8.15 HPDMA channel x alternate block register 1 (HPDMA_CxBR1)

Address offset: 0x098 + 0x80 * x (x = 12 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, a write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x at a block level.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when channel x is completed (then the hardware has de-asserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer:

- if HPDMA_CxLLR.UB1 = 1, this register is automatically updated by the HPDMA from the next LLI in memory.
- If HPDMA_CxLLR.UB1 = 0 and if there is at least one linked-list register to be updated from the next LLI in memory, this register is automatically and internally restored with the programmed value for the bitfields BNDT[15:0] and BRC[10:0].
- If all the update bits HPDMA_CxLLR.Uxx are null and if HPDMA_CxLLR.LA[15:0] ≠ 0, the current LLI is the last one and is continuously executed: this register is automatically and internally restored with the programmed value for the bitfields BNDT[15:0] and BRC[10:0] after each execution of this final LLI

- If HPDMA_CxLLR = 0, BNDT[15:0] and BRC[10:0] are kept as null, channel x is completed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BRDDEC	BRSDEC	DDEC	SDEC	Res.	BRC[10:0]										
rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BNDT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **BRDDEC**: Block repeat destination address decrement

0: At the end of a block transfer, the HPDMA_CxDAR register is updated by adding the programmed offset HPDMA_CxBR2.BRDAO to the current HPDMA_CxDAR value (current destination address)

1: At the end of a block transfer, the HPDMA_CxDAR register is updated by subtracting the programmed offset HPDMA_CxBR2.BRDAO from the current HPDMA_CxDAR value (current destination address)

Note: On top of this increment/decrement (depending on BRDDEC), HPDMA_CxDAR is in the same time also updated by the increment/decrement (depending on DDEC) of the HPDMA_CxTR3.DAO value, as it is usually done at the end of each programmed burst transfer.

Bit 30 **BRSDEC**: Block repeat source address decrement

0: At the end of a block transfer, the HPDMA_CxSAR register is updated by adding the programmed offset HPDMA_CxBR2.BRSAO to the current HPDMA_CxSAR value (current source address)

1: At the end of a block transfer, the HPDMA_CxSAR register is updated by subtracting the programmed offset HPDMA_CxBR2.BRSAO from the current HPDMA_CxSAR value (current source address)

Note: On top of this increment/decrement (depending on BRSDEC), HPDMA_CxSAR is in the same time also updated by the increment/decrement (depending on SDEC) of the HPDMA_CxTR3.SAO value, as it is done after any programmed burst transfer.

Bit 29 **DDEC**: destination address decrement

0: At the end of a programmed burst transfer to the destination, the HPDMA_CxDAR register is updated by adding the programmed offset HPDMA_CxTR3.DAO to the current HPDMA_CxDAR value (current destination address)

1: At the end of a programmed burst transfer to the destination, the HPDMA_CxDAR register is updated by subtracting the programmed offset HPDMA_CxTR3.DAO to the current HPDMA_CxDAR value (current destination address)

Bit 28 **SDEC**: source address decrement

0: At the end of a programmed burst transfer from the source, the HPDMA_CxSAR register is updated by adding the programmed offset HPDMA_CxTR3.SAO to the current HPDMA_CxSAR value (current source address)

1: At the end of a programmed burst transfer from the source, the HPDMA_CxSAR register is updated by subtracting the programmed offset HPDMA_CxTR3.SAO to the current HPDMA_CxSAR value (current source address)

Bit 27 Reserved, must be kept at reset value.

Bits 26:16 **BRC[10:0]**: Block repeat counter

This bitfield contains the number of repetitions of the current block (0 to 2047).

When the channel is enabled, this bitfield becomes read-only. After decrements, this bitfield indicates the remaining number of blocks, excluding the current one. This counter is hardware decremented for each completed block transfer.

Once the last block transfer is completed (BRC[10:0] = BNDT[15:0] = 0):

– If HPDMA_CxLLR.UB1 = 1, all HPDMA_CxBR1 bitfields are updated by the next LLI in the memory.

– If HPDMA_CxLLR.UB1 = 0 and if there is at least one not null Uxx update bit, this bitfield is internally restored to the programmed value.

– if all HPDMA_CxLLR.Uxx = 0 and if HPDMA_CxLLR.LA[15:0] ≠ 0, this bitfield is internally restored to the programmed value (infinite/continuous last LLI).

– if HPDMA_CxLLR = 0, this bitfield is kept as zero following the last LLI and data transfer.

Bits 15:0 **BNDT[15:0]**: Block number of data bytes to transfer from the source

Block size transferred from the source. When the channel is enabled, this bitfield becomes read-only and is decremented, indicating the remaining number of data items in the current source block to be transferred.

l If DMA_CxTR3.BAM[1:0] = 00, BNDT[15:0] is programmed in number of bytes. The maximum source block size is 64 Kbytes - 1.

l If DMA_CxTR3.BAM[1:0] =01, BNDT[15:0] is programmed as multiple of 16 bytes. The maximum source block size is 1 Mbyte - 16.

l If DMA_CxTR3.BAM[1:0] = 10, BNDT[15:0] is programmed as multiple of 256 bytes. The maximum source block size is 16 Mbytes - 256.

Once the last data transfer is completed (BNDT[15:0] = 0):

- if HPDMA_CxLLR.UB1 = 1, this bitfield is updated by the LLI in the memory.

- if HPDMA_CxLLR.UB1 = 0 and if there is at least one not null Uxx update bit, this bitfield is internally restored to the programmed value.

- if all HPDMA_CxLLR.Uxx = 0 and if HPDMA_CxLLR.LA[15:0] ≠ 0, this bitfield is internally restored to the programmed value (infinite/continuous last LLI).

- if HPDMA_CxLLR = 0, this bitfield is kept as zero following the last LLI data transfer.

Note: A non-null source block size must be a multiple of the source data width (BNDT[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0]). Else a user setting error is reported and no transfer is issued.

When configured in packing mode (HPDMA_CxTR1.PAM[1] = 1 and destination data width different from source data width), a non-null source block size must be a multiple of the destination data width (BNDT[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0]). Else a user setting error is reported and no transfer is issued.

27.8.16 HPDMA channel x source address register (HPDMA_CxSAR)

Address offset: 0x09C + 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register configures the source start address of a transfer.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1, and continuously updated by hardware, in order to reflect the address of the next burst transfer from the source.

This register must be written when the channel is completed (then the hardware has deasserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the HPDMA from the memory if HPDMA_CxLLR.USA = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SA[31:0]**: Source address

This bitfield is the pointer to the address from which the next data is read.

During the channel activity, depending on the source addressing mode (HPDMA_CxTR1.SINC), this bitfield is kept fixed or incremented by the data width (HPDMA_CxTR1.SDW_LOG2[1:0]) after each burst source data, reflecting the next address from which data is read.

During the channel activity, this address is updated after each completed source burst, consequently to:

– the programmed source burst; either in fixed addressing mode or in contiguous-data incremented mode. If contiguously incremented (HPDMA_CxTR1.SINC = 1), then the additional address offset value is the programmed burst size, as defined by HPDMA_CxTR1.SBL_1[5:0] and HPDMA_CxTR1.SDW_LOG2[1:0]

– the additional source incremented/decremented offset value as programmed by HPDMA_CxBR1.SDEC and HPDMA_CxTR3.SAO[12:0]

– once/if completed source block transfer, for a channel x with 2D addressing capability (x = 12 to 15). additional block repeat source incremented/decremented offset value as programmed by HPDMA_CxBR1.BRSDEC and HPDMA_CxBR2.BRSAO[15:0]

In linked-list mode, after a LLI data transfer is completed, this register is automatically updated by HPDMA from the memory, provided the LLI is set with HPDMA_CxLLR.USA = 1.

Note: A source address must be aligned with the programmed data width of a source burst (SA[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0]). Else, a user setting error is reported and no transfer is issued.

When the source block size is not a multiple of the source burst size and is a multiple of the source data width, the last programmed source burst is not completed and is internally shorten to match the block size. In this case, the additional HPDMA_CxTR3.SAO[12:0] is not applied.

27.8.17 HPDMA channel x destination address register (HPDMA_CxDAR)

Address offset: 0x0A0 + 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register configures the destination start address of a transfer.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1, and continuously updated by hardware, in order to reflect the address of the next burst transfer to the destination.

This register must be written when the channel is completed (then the hardware has deasserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by HPDMA from the memory if HPDMA_CxLLR.UDA = 1.

DA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DA[31:0]**: destination address

This bitfield is the pointer to the address from which the next data is written.

During the channel activity, depending on the destination addressing mode (HPDMA_CxTR1.DINC), this bitfield is kept fixed or incremented by the data width (HPDMA_CxTR1.DDW_LOG2[1:0]) after each burst destination data, reflecting the next address from which data is written.

During the channel activity, this address is updated after each completed destination burst, consequently to:

– the programmed destination burst; either in fixed addressing mode or in contiguous-data incremented mode. If contiguously incremented (HPDMA_CxTR1.DINC = 1), then the additional address offset value is the programmed burst size, as defined by HPDMA_CxTR1.DBL_1[5:0] and HPDMA_CxTR1.DDW_LOG2[1:0]

– the additional destination incremented/decremented offset value as programmed by HPDMA_CxBR1.DDEC and HPDMA_CxTR3.DAO[12:0]

– once/if completed destination block transfer, for a channel x with 2D addressing capability (x = 12 to 15), the additional block repeat destination incremented/decremented offset value as programmed by HPDMA_CxBR1.BRDDEC and HPDMA_CxBR2.BRDAO[15:0]

In linked-list mode, after a LLI data transfer is completed, this register is automatically updated by the HPDMA from the memory, provided the LLI is set with HPDMA_CxLLR.UDA = 1.

Note: A destination address must be aligned with the programmed data width of a destination burst (DA[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0]). Else, a user setting error is reported and no transfer is issued.

27.8.18 HPDMA channel x transfer register 3 (HPDMA_CxTR3)

Address offset: 0x0A4 + 0x80 * x (x = 12 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, a write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (then the hardware has deasserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the HPDMA from the memory if HPDMA_CxLLR.UT3 = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BRAM[1:0]		Res.	DAO[12:0]												
rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BAM[1:0]		Res.	SAO[12:0]												
rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 **BRAM[1:0]**: Block repeated alignment mode

00: Repeated block address offset (HPDMA_CxBR2.BRSAO/BRDAO[15:0]) programmed in number of bytes. The absolute maximum repeated block address offset is 64 Kbytes - 1.

01: Repeated block address offset (HPDMA_CxBR2.BRSAO/BRDAO[15:0]) programmed in number of 16 bytes. A repeated block address offset is a multiple of 16 bytes. Absolute maximum repeated block address offset is 1 Mbytes - 16.

10-11: Repeated block address offset (HPDMA_CxBR2.BRSAO/BRDAO[15:0]) programmed in number of 256 bytes. A repeated block address offset is a multiple of 256 bytes. Absolute maximum repeated block address offset is 16 Mbytes - 256.

Bit 29 Reserved, must be kept at reset value.

Bits 28:16 **DAO[12:0]**: Destination address offset increment

The destination address, pointed by HPDMA_CxDAR, is incremented or decremented (depending on HPDMA_CxBR1.DDEC) by this offset DAO[12:0] for each programmed destination burst. This offset is not including and is added to the programmed burst size when the completed burst is addressed in incremented mode (HPDMA_CxTR1.DINC = 1).

Note: A destination address offset must be aligned with the programmed data width of a destination burst (DAO[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0]). Else, a user setting error is reported and no transfer is issued.

Bits 15:14 **BAM[1:0]**: Block alignment mode

00: Block address offset (HPDMA_CxTR3.SAO/DAO[12:0]) and block size transferred from the source (HPDMA_CxBR1.BNDT[15:0] programmed in number of bytes). Absolute maximum block address offset is 8 Kbytes - 1. Maximum source block size is 64 Kbytes - 1.

01: block address offset (HPDMA_CxTR3.SAO/DAO[12:0]) and block size transferred from the source (HPDMA_CxBR1.BNDT[15:0] programmed as a multiple of 16 bytes). Absolute maximum block address offset is 128 Kbytes - 16. Maximum source block size is 1 Mbytes - 16.

10-11: Block address offset (HPDMA_CxTR3.SAO/DAO[12:0]) and block size transferred from the source (HPDMA_CxBR1.BNDT[15:0] programmed as a multiple of 256 bytes). Absolute maximum block address offset is 2 Mbytes - 256. Maximum source block size is 16 Mbytes - 256.

Bit 13 Reserved, must be kept at reset value.

Bits 12:0 **SAO[12:0]**: Source address offset increment

The source address, pointed by HPDMA_CxSAR, is incremented or decremented (depending on HPDMA_CxBR1.SDEC) by this offset SAO[12:0] for each programmed source burst. This offset is not including and is added to the programmed burst size when the completed burst is addressed in incremented mode (HPDMA_CxTR1.SINC = 1).

Note: A source address offset must be aligned with the programmed data width of a source burst (SAO[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0]). Else a user setting error is reported and none transfer is issued.

When the source block size is not a multiple of the destination burst size and is a multiple of the source data width, then the last programmed source burst is not completed and is internally shorten to match the block size. In this case, the additional HPDMA_CxTR3.SAO[12:0] is not applied.

27.8.19 HPDMA channel x block register 2 (HPDMA_CxBR2)

Address offset: 0x0A8 + 0x80 * x (x = 12 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, a write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x at a 2D/repeated block level.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (then the hardware has deasserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the HPDMA from the memory if HPDMA_CxLLR.UB2 = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BRDAO[15:0]

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BRSAO[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **BRDAO[15:0]**: Block repeated destination address offset

For a channel with 2D addressing capability, this bitfield is used to update (by addition or subtraction depending on HPDMA_CxBR1.BRDDEC) the current destination address (HPDMA_CxDAR) at the end of a block transfer.

Note: A block repeated destination address offset must be aligned with the programmed data width of a destination burst (BRDAO[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0]). Else a user setting error is reported and no transfer is issued.
BRDAO[15:0] must be set to 0 in peripheral flow-control mode (if HPDMA_CxTR2.PFREQ = 1).

Bits 15:0 **BRSAO[15:0]**: Block repeated source address offset

For a channel with 2D addressing capability, this bitfield is used to update (by addition or subtraction depending on HPDMA_CxBR1.BRSDEC) the current source address (HPDMA_CxSAR) at the end of a block transfer.

Note: A block repeated source address offset must be aligned with the programmed data width of a source burst (BRSAO[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0]). Else a user setting error is reported and no transfer is issued.
BRSAO[15:0] must be set to 0 in peripheral flow-control mode (if HPDMA_CxTR2.PFREQ = 1).

27.8.20 HPDMA channel x linked-list address register (HPDMA_CxLLR)

Address offset: 0x0CC + 0x80 * x (x = 0 to 11)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, a write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register configures the data structure of the next LLI in the memory and its address pointer. A channel transfer is completed when this register is null.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (then the hardware has deasserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the HPDMA from the memory if HPDMA_CxLLR.ULL = 1.

LA[15:2]														Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		

Bit 31 **UT1**: Update HPDMA_CxTR1 from memory

This bit controls the update of HPDMA_CxTR1 from the memory during the link transfer.
0: No HPDMA_CxTR1 update
1: HPDMA_CxTR1 update

Bit 30 **UT2**: Update HPDMA_CxTR2 from memory

This bit controls the update of HPDMA_CxTR2 from the memory during the link transfer.
0: No HPDMA_CxTR2 update
1: HPDMA_CxTR2 update

Bit 29 **UB1**: Update HPDMA_CxBR1 from memory

This bit controls the update of HPDMA_CxBR1 from the memory during the link transfer.
If UB1 = 0 and if HPDMA_CxLLR ≠ 0, the linked-list is not completed.
HPDMA_CxBR1.BNDT[15:0] is then restored to the programmed value after data transfer is completed and before the link transfer.
0: No HPDMA_CxBR1 update from memory (HPDMA_CxBR1.BNDT[15:0] restored if any link transfer)
1: HPDMA_CxBR1 update

Bit 28 **USA**: Update HPDMA_CxSAR from memory
This bit controls the update of HPDMA_CxSAR from the memory during the link transfer.
0: No HPDMA_CxSAR update
1: HPDMA_CxSAR update

Bit 27 **UDA**: Update HPDMA_CxDAR register from memory
This bit is used to control the update of HPDMA_CxDAR from the memory during the link transfer.
0: No HPDMA_CxDAR update
1: HPDMA_CxDAR update

Bits 26:17 Reserved, must be kept at reset value.

Bit 16 **ULL**: Update HPDMA_CxLLR register from memory
This bit is used to control the update of HPDMA_CxLLR from the memory during the link transfer.
0: No HPDMA_CxLLR update
1: HPDMA_CxLLR update

Bits 15:2 **LA[15:2]**: Pointer (16-bit low-significant address) to the next linked-list data structure
If UT1 = UT2 = UB1 = USA = UDA = ULL = 0 and if LA[15:2] = 0, the current LLI is the last one. The channel transfer is completed without any update of the linked-list HPDMA register file.
Else, this bitfield is the pointer to the memory address offset from which the next linked-list data structure is automatically fetched from, once the data transfer is completed, in order to conditionally update the linked-list HPDMA internal register file (HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR, HPDMA_CxDAR, and HPDMA_CxLLR).

Note: The user must program the pointer to be 32-bit aligned. The two low-significant bits are write ignored.

Bits 1:0 Reserved, must be kept at reset value.

27.8.21 HPDMA channel x alternate linked-list address register (HPDMA_CxLLR)

Address offset: 0x0CC + 0x80 * x (x = 12 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register configures the data structure of the next LLI in the memory and its address pointer. A channel transfer is completed when this register is null.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (then the hardware has deasserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the HPDMA from the memory if HPDMA_CxLLR.ULL = 1.

Refer to *Section 2.4* for the register boundary addresses.

28 Low-power direct memory access controller (LPDMA)

28.1 LPDMA introduction

The low-power direct memory access (LPDMA) controller is a bus master and system peripheral.

The LPDMA is used to perform programmable data transfers between memory-mapped peripherals and/or memories via linked-lists, upon the control of an off-loaded CPU.

28.2 LPDMA main features

- Single bidirectional AHB master
- Memory-mapped data transfers from a source to a destination:
  - Peripheral-to-memory
  - Memory-to-peripheral
  - Memory-to-memory
  - Peripheral-to-peripheral
- Autonomous data transfers during Stop mode (see *Section 28.4.18*)
- Transfers arbitration based on a 4-grade programmed priority at channel level:
  - One high-priority traffic class, for time-sensitive channels (queue 3)
  - Three low-priority traffic classes, with a weighted round-robin allocation for non time-sensitive channels (queues 0, 1, 2)
- Per channel event generation, on any of the following events: transfer complete, half transfer complete, data transfer error, user setting error, link transfer error, completed suspension and trigger overrun
- Per channel interrupt generation, with separately programmed interrupt enable per event
- 4 concurrent LPDMA channels:
  - Intra-channel LPDMA transfers chaining via programmable linked-list into memory, supporting two execution modes: run-to-completion and link step mode
  - Intra-channel and inter-channel LPDMA transfers chaining via programmable LPDMA input triggers connection to LPDMA task completion events
- Per linked-list item within a channel:
  - Separately programmed source and destination transfers
  - Programmable data handling between source and destination: byte-based padding or truncation, sign extension and left/right realignment
  - Programmable number of data bytes to be transferred from the source, defining the block level
  - Linear source and destination addressing: either fixed or contiguously incremented addressing, programmed at a block level, between successive single transfers
  - Programmable LPDMA request and trigger selection
  - Programmable LPDMA half-transfer and transfer-complete events generation

  - Pointer to the next linked-list item and its data structure in memory, with automatic update of the LPDMA linked-list control registers
- Debug:
  - Channel suspend and resume support
  - Channel status reporting and event flags
- TrustZone support
  - Support for secure and nonsecure LPDMA transfers, independently at a first channel level, and independently at a source/destination and link sub-levels
  - Secure and nonsecure interrupts reporting, resulting from any of the respectively secure and nonsecure channels
  - TrustZone-aware AHB slave port, protecting any LPDMA secure resource (register, register field) from a nonsecure access
- Privileged/unprivileged support:
  - Support for privileged and unprivileged LPDMA transfers, independently at a channel level
  - Privileged-aware AHB slave port
- Channel isolation support:
  - Support for compartmented DMA transfers, independently at a channel level, via compartment IDs (named CIDs)
  - CID-aware interrupts reporting
  - CID-aware AHB slave port, with integrated semaphores for a concurrent control, from any of the CPUs
- Identification registers, with associated peripheral revision and hardware configuration

28.3 LPDMA implementation

28.3.1 LPDMA channels

A given LPDMA channel x is implemented with the hardware parameters as per the table below.

Table 215.LPDMA1 channels implementation

Channel x	Hardware parameters		Features
	dma_fifo_ size[x]	dma_ addressing[x]	
x = 0 to 3	0	0	Channel x (x = 0 to 3) is implemented with: – no FIFO. Only a single source transfer cell is internally registered. – fixed/contiguously incremented addressing

28.3.2 LPDMA autonomous mode in low-power modes

The LPDMA autonomous mode and wake-up features are implemented in the device low-power modes as per the table below.

Table 216. LPDMA1 autonomous mode and wake-up in low-power modes

Feature	Low-power modes
Autonomous mode and wake-up	LPDMA1 in Sleep, Stop 0, Stop 1and Stop 2 modes

28.3.3 LPDMA requests

A LPDMA request from a peripheral can be assigned to a LPDMA channel x, via the REQSEL[4:0] field in the *LPDMA channel x transfer register 2 (LPDMA_CxTR2)*, provided that SWREQ = 0.

The LPDMA requests mapping is specified in the table below.

Table 217. Programmed LPDMA1 request

LPDMA_CxTR2.REQSEL[4:0]	Selected LPDMA request
0	lpuart1_rx_dma
1	lpuart1_tx_dma
2	i2c8_rx_dma
3	i2c8_tx_dma
4	i2c8_evc_dma
5	spi8_rx_dma
6	spi8_tx_dma
7	adf1_flt0_dma
8	lptim3_ic1_dma
9	lptim3_ic2_dma
10	lptim3_ue_dma
11	lptim4_ic1_dma
12	lptim4_ic2_dma
13	lptim4_ue_dma
14	Reserved
15	i3c4_rx_dma
16	i3c4_tx_dma
17	i3c4_tc_dma
18	i3c4_rs_dma

28.3.4 LPDMA block requests

Some LPDMA requests must be programmed as a block request, and not as a single request. Then the BREQ bit in *LPDMA channel x transfer register 2 (LPDMA_CxTR2)* must be set for a correct LPDMA execution of the requested peripheral transfer at the hardware level.

The LPDMA block requests are listed in the table below.

Table 218. Programmed LPDMA1 request as a block request

LPDMA block requests
lptim3_ue_dma
lptim4_ue_dma

28.3.5 LPDMA channels with peripheral early termination

A LPDMA channel, if implemented with this feature, can support the early termination of the data transfer from the peripheral which does also support this feature.

Table 219. LPDMA channel with peripheral early termination

LPDMA channel x with peripheral early termination
x = 0 to 3

This LPDMA support is activated when the channel x is programmed with LPDMA_CxTR2.PFREQ = 1. Then, the peripheral itself can initiate and request a data transfer completion, before that the LPDMA has transferred the whole block (see *Section 28.4.14* for more details).

Table 220. Programmed LPDMA request with peripheral early termination

Programmed LPDMA channel x request with peripheral early termination
i3c4_rx_dma

28.3.6 LPDMA triggers

A LPDMA trigger can be assigned to a LPDMA channel x, via the TRIGSEL[4:0] field in the *LPDMA channel x transfer register 2 (LPDMA_CxTR2)*, provided that TRIGPOL[1:0] defines a rising or a falling edge of the selected trigger (TRIGPOL[1:0] = 01 or TRIGPOL[1:0] = 10).

The LPDMA triggers mapping is specified in the table below.

Table 221. Programmed LPDMA1 trigger

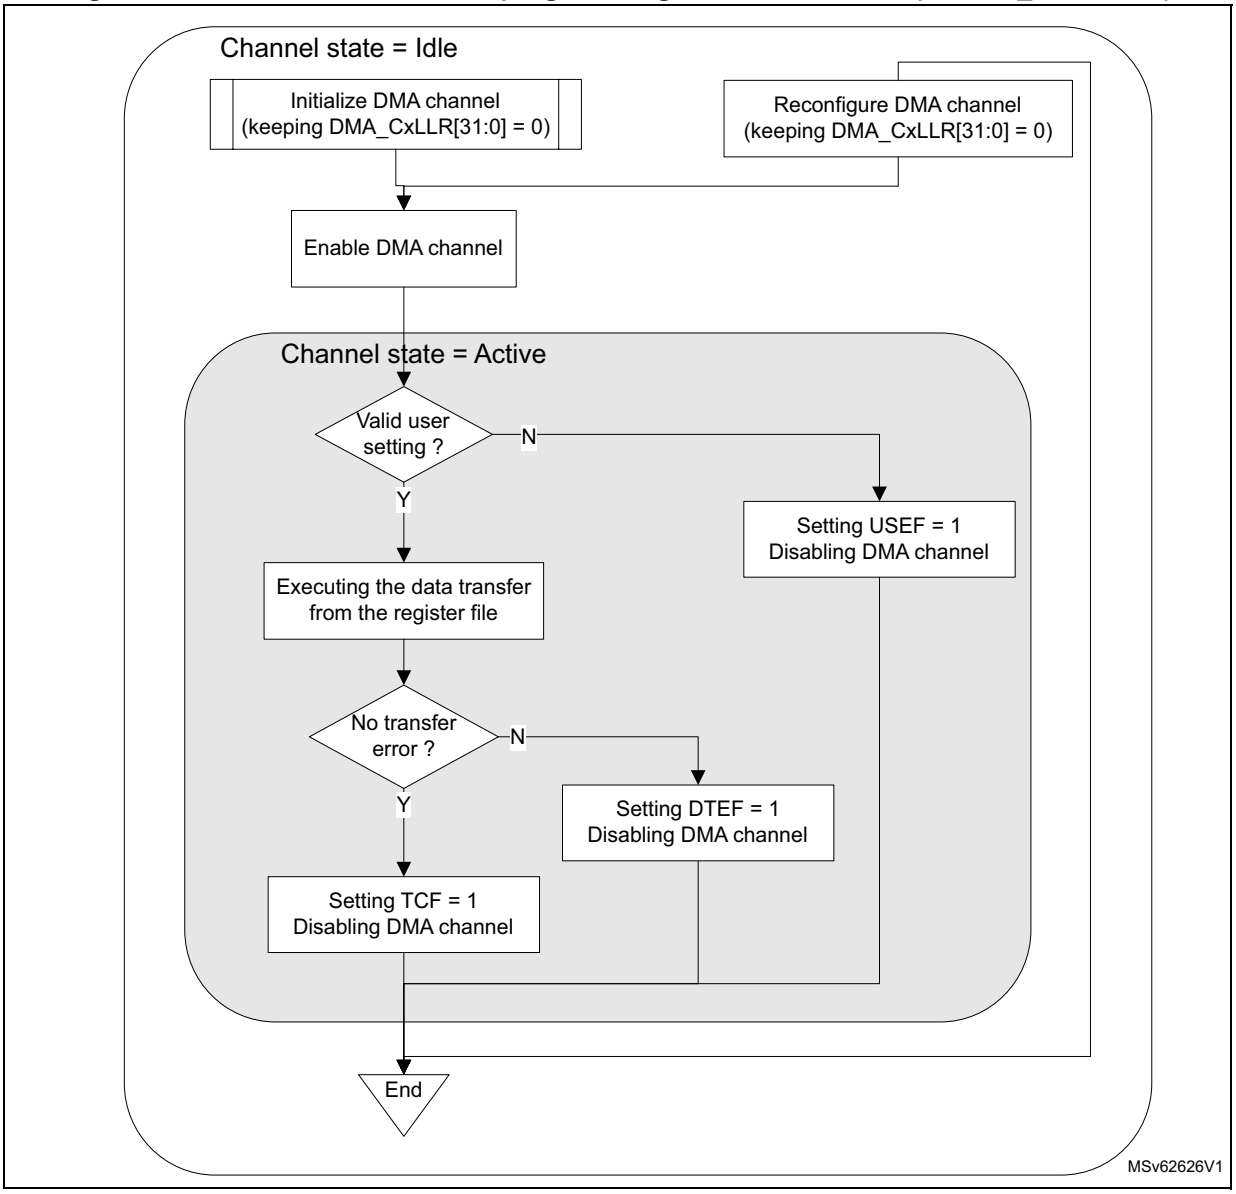
28.4 LPDMA functional description

28.4.1 LPDMA block diagram

The LPDMA block diagram is illustrated in the figure below.

Figure 177. LPDMA block diagram



28.4.2 LPDMA channel state and direct programming without any linked-list

After a LPDMA reset, a LPDMA channel x is in idle state. When the software writes 1 into the in LPDMA_CxCR.EN enable control bit, the channel takes into account the value of the different channel configuration registers (LPDMA_CxXXX), switches to the active/non-idle state and starts to execute the corresponding requested data transfers.

After enabling/starting a LPDMA channel transfer by writing 1 into the LPDMA_CxCR.EN bit, a LPDMA channel interrupt on a complete transfer notifies the software that the LPDMA channel is back in idle state (EN is then de-asserted by hardware) and that the channel is ready to be reconfigured then enabled again.

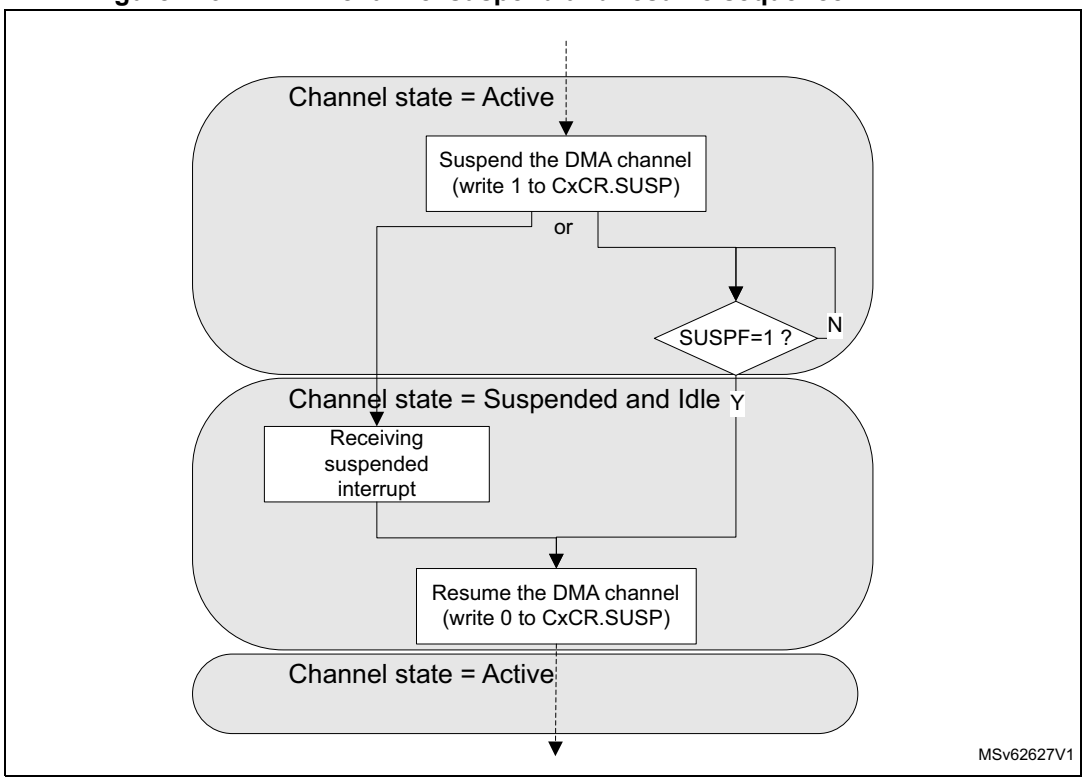
The figure below illustrates this LPDMA direct programming without any linked-list (LPDMA_CxLLR = 0).

Figure 178. LPDMA channel direct programming without linked-list (LPDMA_CxLLR = 0)

28.4.3 LPDMA channel suspend and resume

The software can suspend on its own a channel still active, with the following sequence:

1. The software writes 1 into the LPDMA_CxCR.SUSP bit.
2. The software polls the suspended flag LPDMA_CxSR.SUSPF until SUSPF = 1, or waits for an interrupt previously enabled by writing 1 to LPDMA_CxCR.SUSPIE. Wait for the channel to be effectively in suspended state means wait for the completion of



any ongoing LPDMA transfer over its master port. Then the software can observe, in a steady state, any read register or register field that is hardware modifiable.

Note that an ongoing LPDMA transfer can be a data transfer (a read-followed-by-write single transfer) or a link transfer for the internal update of the linked-list register file from the next linked-list item.

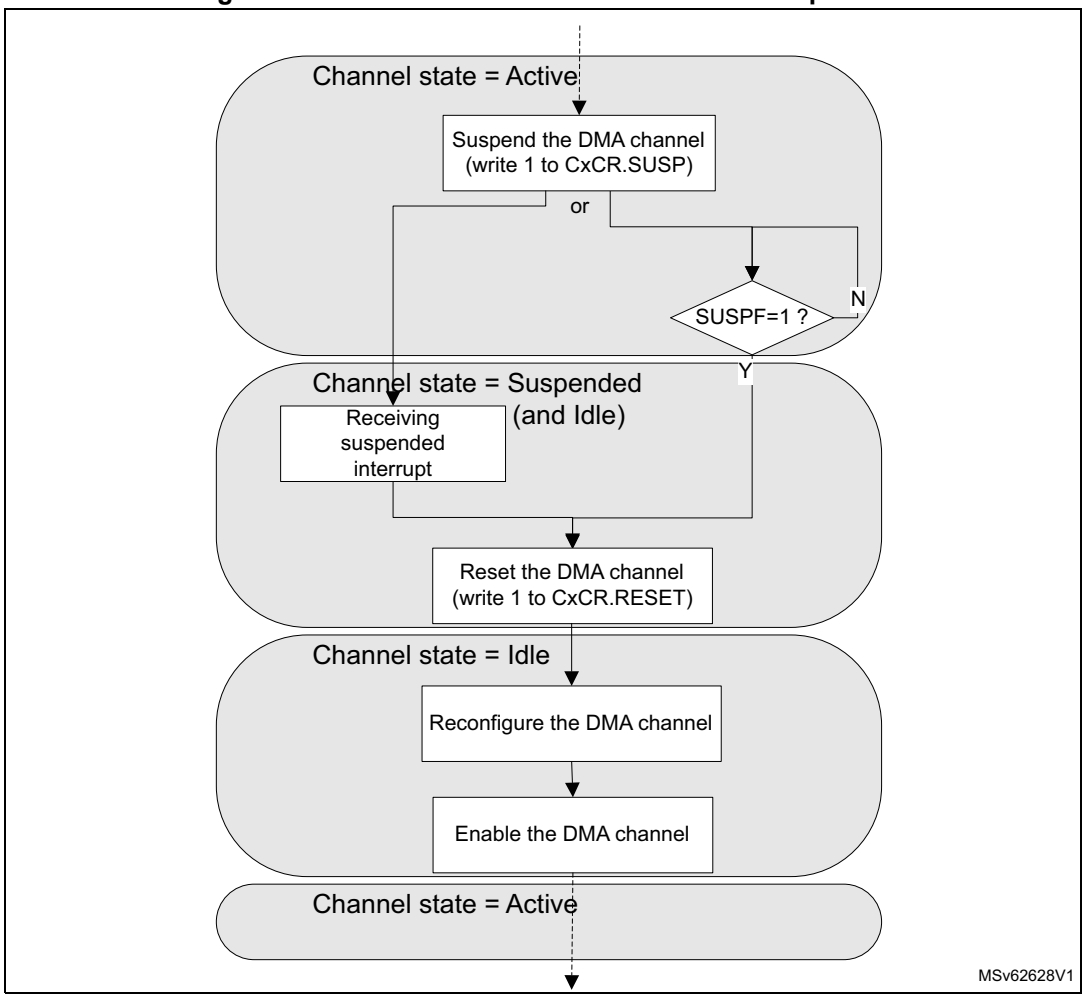
3. The software safely resumes the suspended channel by writing 0 to LPDMA_CxCR.SUSP.

The suspend and resume sequence is illustrated in the figure below.

Figure 179. LPDMA channel suspend and resume sequence

Note: A suspend and resume sequence does not impact the LPDMA_CxCR.EN bit. Suspending a channel (transfer) does not suspend a started trigger detection.

28.4.4 LPDMA channel abort and restart



Alternatively, like for aborting a continuous LPDMA transfer with a circular buffering or a double buffering, the software can abort, on its own, a still active channel with the following sequence:

1. The software writes 1 into the LPDMA_CxCR.SUSP bit.
2. The software polls suspended flag LPDMA_CxSR.SUSPF until SUSPF = 1, or waits for an interrupt previously enabled by writing 1 to LPDMA_CxCR.SUSPIE. Wait for the channel to be effectively in suspended state means wait for the completion of any ongoing LPDMA transfer over its master port.
3. The software resets the channel by writing 1 to LPDMA_CxCR.RESET. This causes the reset of the channel internal state, the reset of the LPDMA_CxCR.EN bit, and the reset of the LPDMA_CxCR.SUSP bit.

4. The software safely reconfigures the channel. The software must reprogram the hardware-modified LPDMA_CxBR1, LPDMA_CxSAR, and LPDMA_CxDAR registers.
5. In order to restart the aborted then reprogrammed channel, the software enables it again by writing 1 to the LPDMA_CxCR.EN bit.

The abort and restart sequence is illustrated in the figure below.

Figure 180. LPDMA channel abort and restart sequence

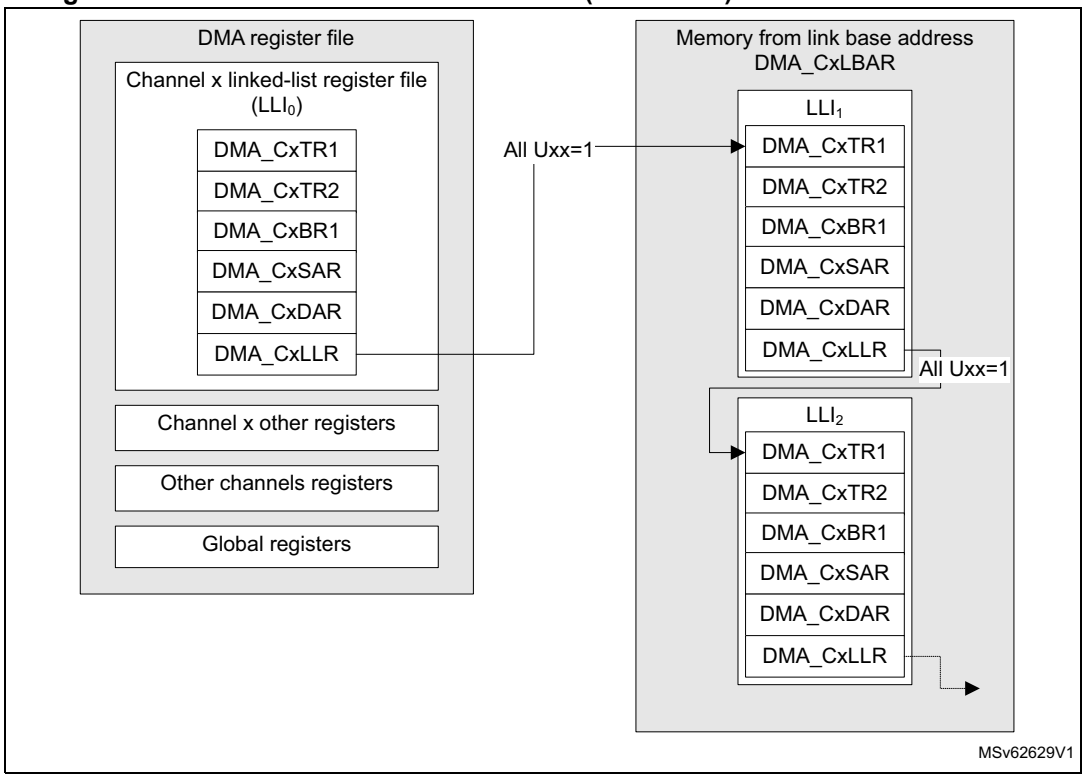
28.4.5 LPDMA linked-list data structure

Alternatively to the direct programming mode, a channel can be programmed by a list of transfers, known as a list of linked-list items (LLI). Each LLI is defined by its data structure.

The base address in memory of the data structure of a next LLI_{n+1} of a channel x is the sum of the following:

- the link base address of the channel x (in LPDMA_CxLBAR)
- the link address offset (LA[15:2] field in LPDMA_CxLLR)

The data structure for each LLI may be specific.



A linked-list data structure is addressed following the value of the UT1, UT2, UB1, USA, UDA and ULL bits of the LPDMA_CxLLR register.

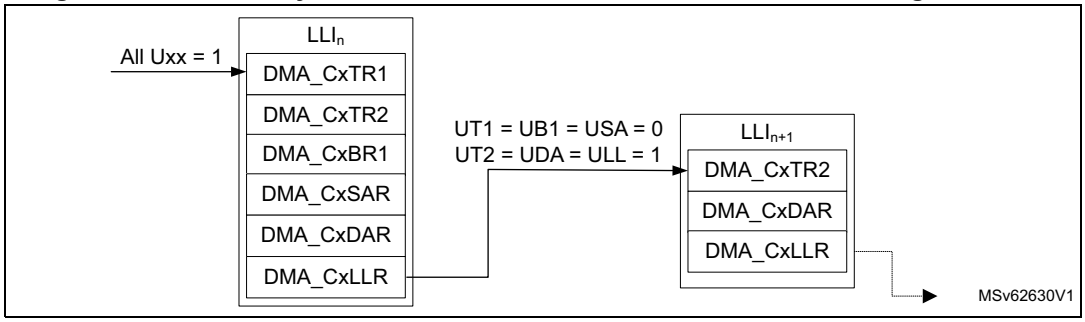
In linked-list mode, each LPDMA linked-list register (LPDMA_CxTR1, LPDMA_CxTR2, LPDMA_CxBR1, LPDMA_CxSAR, LPDMA_CxDAR or LPDMA_CxLLR) is conditionally and automatically updated from the next linked-list data structure in the memory, following the current value of the LPDMA_CxLLR register that was conditionally updated from the linked-list data structure of the previous LLI.

Static linked-list data structure

For example, when the update bits (UT1, UT2, UB1, USA, UDA and ULL) of the LPDMA_CxLLR register are all asserted, the linked-list data structure in memory is maximal with six contiguous 32-bit locations, including LPDMA_CxTR1, LPDMA_CxTR2, LPDMA_CxBR1, LPDMA_CxSAR, LPDMA_CxDAR and LPDMA_CxLLR (see the figure below) and including the first linked-list register file (LLI_0) and the next LLIs (LLI_1, LLI_2,...) in the memory.

Figure 181. Static linked-list data structure (all Uxx = 1) of channel x

Dynamic linked-list data structure



Alternatively, the memory organization for the full list of LLIs can be compacted with specific data structure for each LLI.

If UT1 = 0 and UT2 = 1, the link address offset of the register LPDMA_CxLLR is pointing to the updated value of the LPDMA_CxTR2 instead of the LPDMA_CxTR1 which is not to be modified.

Example: if UT1 = UB1 = USA = 0, and if UT2 = UDA = ULL = 1, the next LLI does not contain an updated value for LPDMA_CxTR1, nor LPDMA_CxBR1, nor LPDMA_CxSAR.

The next LLI contains an updated value for LPDMA_CxTR2, LPDMA_CxDAR, and LPDMA_CxLLR, as shown in the figure below.

Figure 182. LPDMA dynamic linked-list data structure of an addressing channel x

The user must program LPDMA_CxLLR for each LLI_n to be 32-bit aligned and not to exceed the 64-Kbyte addressable space pointed by LPDMA_CxLBAR.

28.4.6 Linked-list item transfer execution

A LLI_n transfer is the sequence of:

1. a data transfer: LPDMA executes the data transfer as described by the LPDMA internal register file (this data transfer can be void/null for LLI_0)
2. a conditional link transfer: LPDMA automatically and conditionally updates its internal register file by the data structure of the next LLI_{n+1}, as defined by the LPDMA_CxLLR value of the LLI_n.

Note: The initial data transfer as defined by the internal register file (LLI_0) can be null (LPDMA_CxBR1.BNDT[15:0] = 0 and LPDMA_CxTR2.PFREQ = 0) provided that the conditional update bit UB1 in LPDMA_CxLLR is set (meaning there is a non-null data transfer described by the next LLI_1 in the memory to be executed).

Depending on the intended LPDMA usage, a LPDMA channel x can be executed as described by the full linked-list (run-to-completion mode, LPDMA_CxCR.LSM = 0) or a LPDMA channel x can be programmed for a single execution of a LLI (link step mode, LPDMA_CxCR.LSM = 1), as described in the next paragraphs.

28.4.7 LPDMA channel state and linked-list programming in run-to-completion mode

When LPDMA_CxCR.LSM = 0, a LPDMA channel x is initially programmed, started by writing 1 to LPDMA_CxCR.EN, and after (possibly) completed at channel level. The channel transfer is:

- configured with at least the following:
  - the first LLI_0, internal linked-list register file: LPDMA_CxTR1, LPDMA_CxTR2, LPDMA_CxBR1, LPDMA_CxSAR, LPDMA_CxDAR and LPDMA_CxLLR
  - the last LLI_N, described by the linked-list data structure in memory, as defined by the LPDMA_CxLLR reflecting the before last LLI_{N-1}
- completed when LPDMA_CxLLR[31:0] = 0 and LPDMA_CxBR1.BNDT[15:0] = 0, at the end of the last LLI_{N-1} transfer

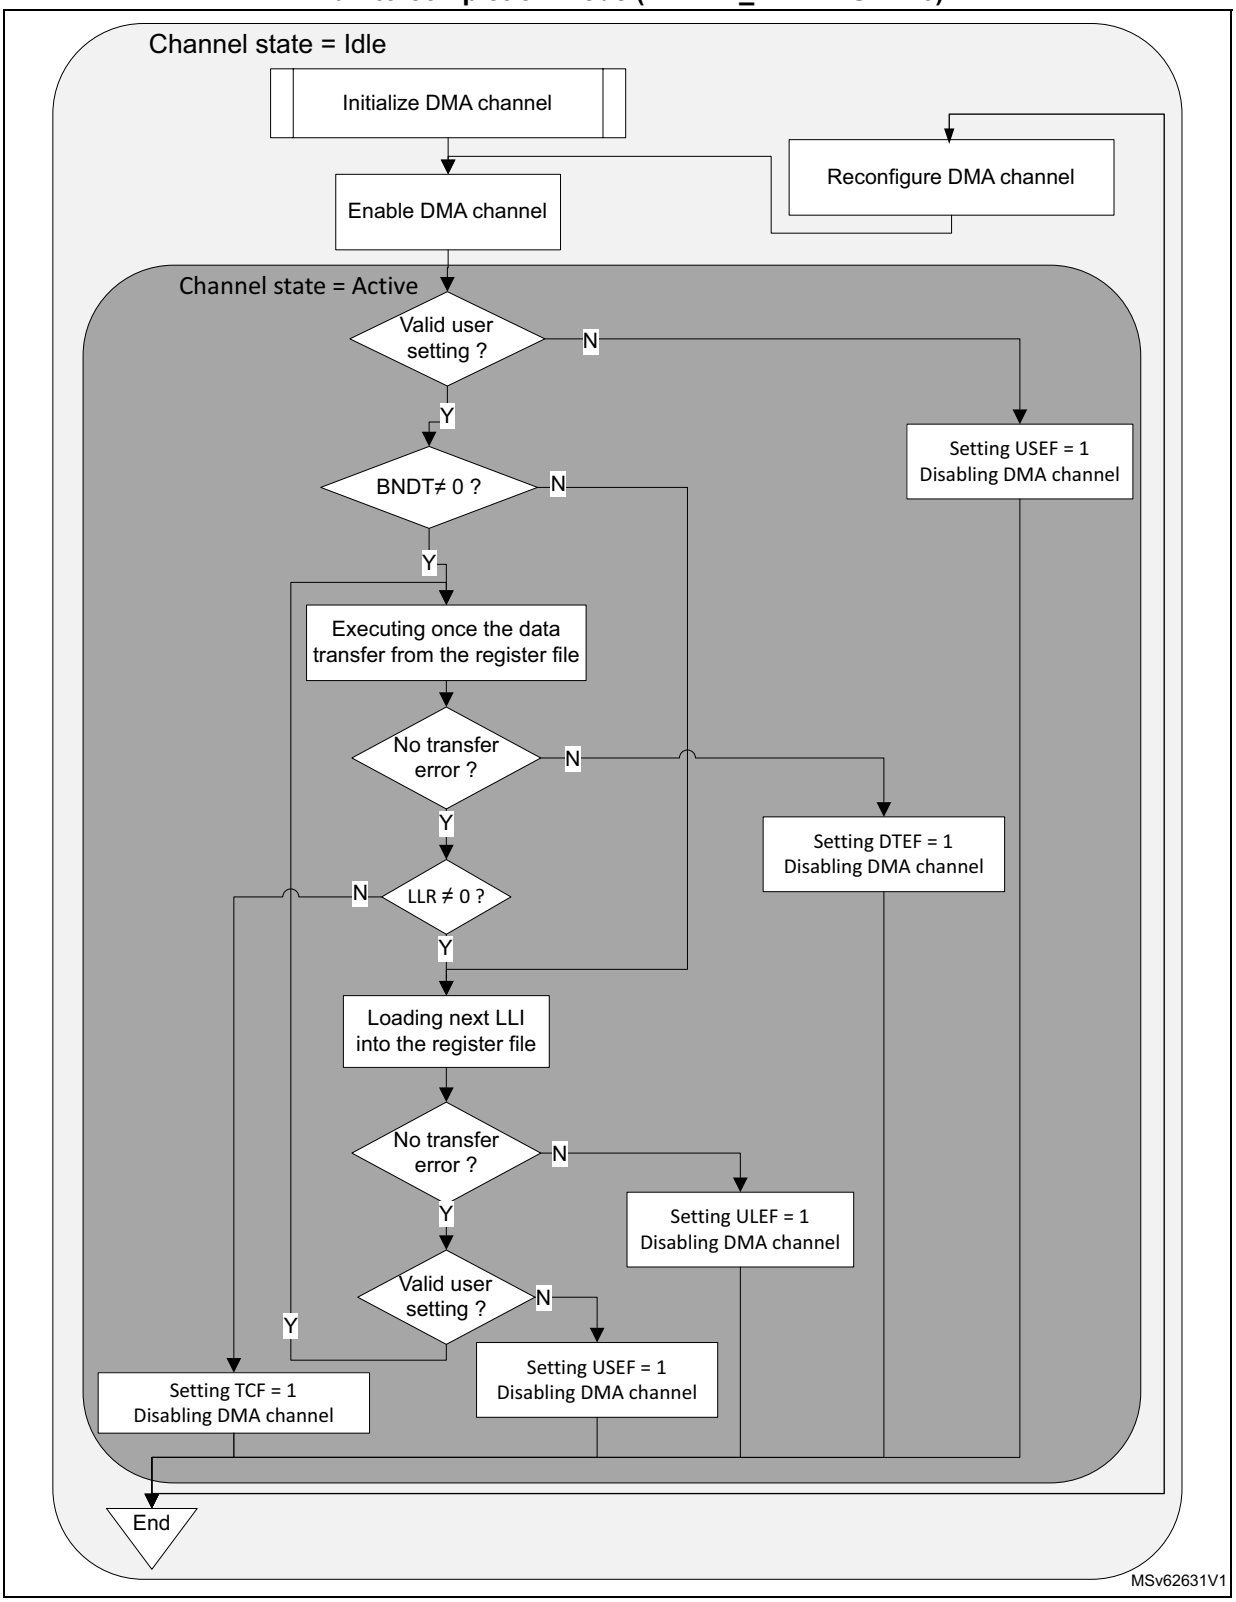
LPDMA_CxLLR[31:0] = 0 is the condition of a linked-list based channel completion and means the following:

- The 16 low significant bits LPDMA_CxLLR.LA[15:0] of the next link address are null.
- All the update bits Uxx of LPDMA_CxLLR are null (UT1, UT2, UB1, USA, UDA, ULL).

The channel may never be completed when LPDMA_CxLLR.LSM = 0:

- If the last LLI_N is recursive, pointing to itself as a next LLI:
  - either LPDMA_CxLLR.ULL = 1 and LPDMA_CxLLR.LA[15:2] is updated by the same value
  - or LPDMA_CxLLR.ULL = 0
- If LLI_N is pointing to a previous LLI.

In the regular data transfer completion at a block level, LPDMA_CxBR1.BNDT[15:0] = 0. Alternatively, a block transfer may be early completed by a peripheral (such as an I3C in Rx mode), and then BNDT[15:0] is not null (see *Section 28.4.14* for more details).



In the typical run-to-completion mode, the allocation of a LPDMA channel, including its fine programming, is done once during the LPDMA initialization. In order to have a reserved data communication link and LPDMA service during run-time, for continuously repeated transfers (from/to a peripheral respectively to/from memory or for memory-to-memory transfers). This reserved data communication link can consist of a channel, or the channel can be shared and a repeated transfer consists of a sequence of LLIs.

Figure 183 depicts the LPDMA channel execution and its registers programming in run-to-completion mode.

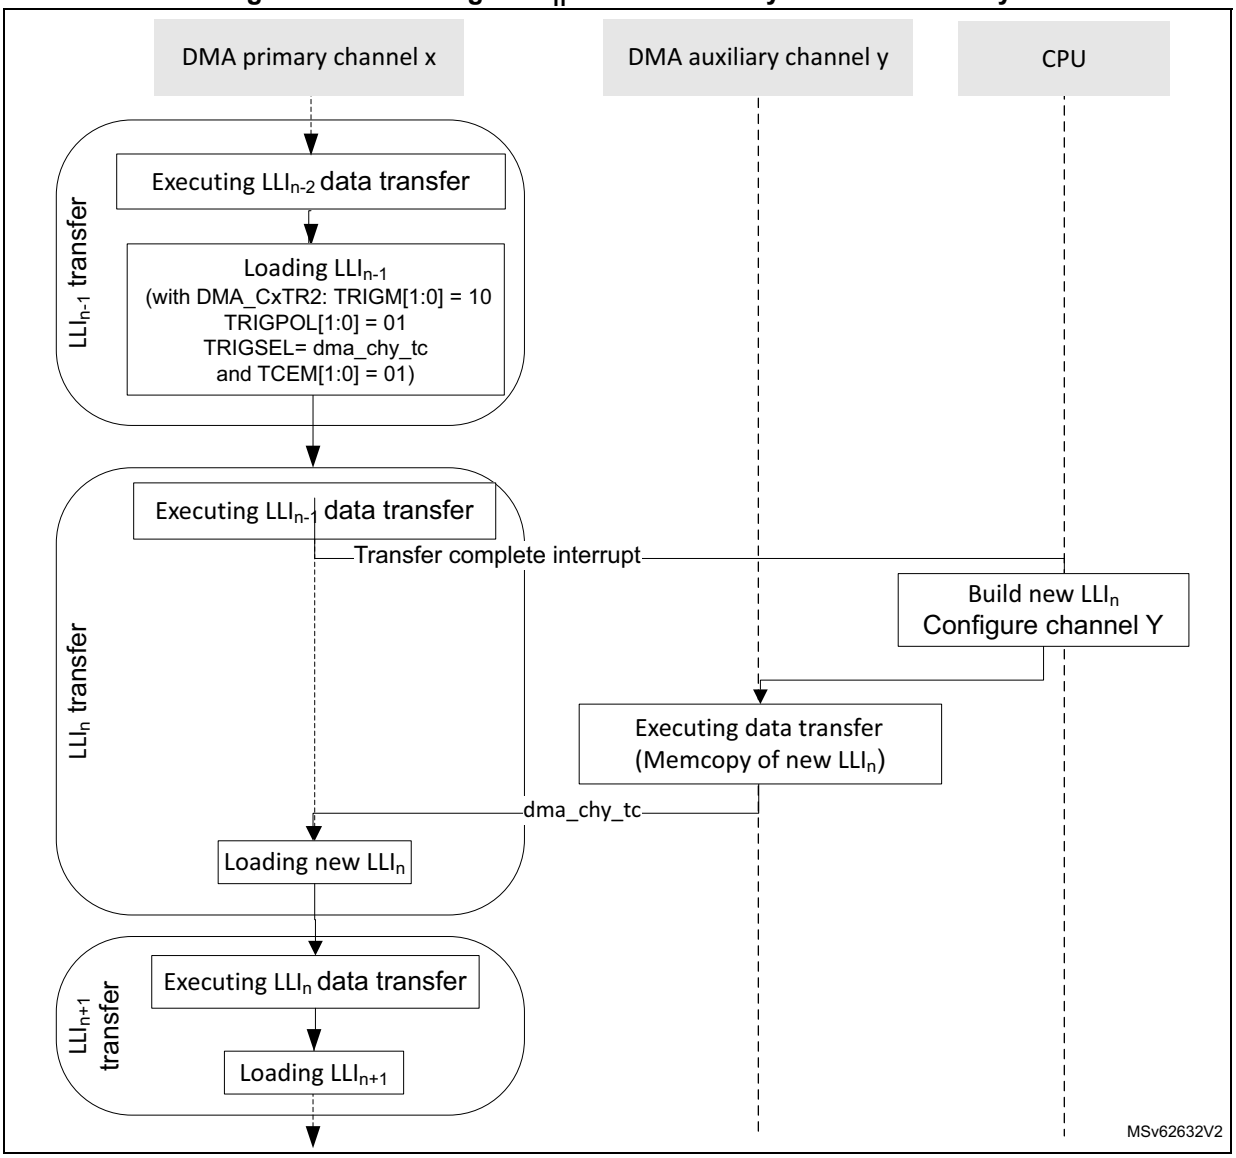
Note: Figure 183 is not intended to illustrate how often a TCEF can be raised, depending on the programmed value of TCEM[1:0] in LPDMA_CxTR2. It can be raised at (each) block completion, at (each) 2D block completion, at (each) LLI completion, or only at channel completion. In run-to-completion mode, whatever is the value of TCEM[1:0], at the channel completion, the hardware always set TCEF = 1 and disables the channel.

In Figure 183, BNDT ≠ 0 is the typical condition for starting the first data transfer. This condition becomes (BNDT ≠ 0 and PFREQ = 1) if the peripheral requests a data transfer with early termination (see Section 28.3.5).

Figure 183. LPDMA channel execution and linked-list programming in run-to-completion mode (LPDMA_CxCR.LSM = 0)

Run-time inserting a LLI_n via an auxiliary channel, in run-to-completion mode

The start of the link transfer of the LLI_{n-1} (start of the LLI_n loading) can be conditioned by the occurrence of a trigger, when programming the following fields of the LPDMA_CxTR2 in the data structure of the LLI_{n-1}:



- TRIGM[1:0] = 10 (link transfer triggering mode)
- TRIGPOL[1:0] = 01 or 10 (rising or falling edge)
- TRIGSEL[4:0] (see *Section 28.3.6* for the trigger selection details)

Another auxiliary channel y can be used to store the channel x LLI_n in the memory and to generate a transfer complete event lpdma_chy_tc. By selecting this event as the input trigger of the link transfer of the LLI_{n-1} of the channel x, the software can pause the primary channel x after its LLI_{n-1} data transfer, until it is indeed written the LLI_n.

Figure 184 depicts such a dynamic elaboration of a linked-list of a primary channel x, via another auxiliary channel y.

Caution: This use case is restricted to an application with a LLI_{n-1} data transfer that does not need a trigger. The triggering mode of this LLI_{n-1} is used to load the next LLI_n.

Figure 184. Inserting a LLI_n with an auxiliary LPDMA channel y

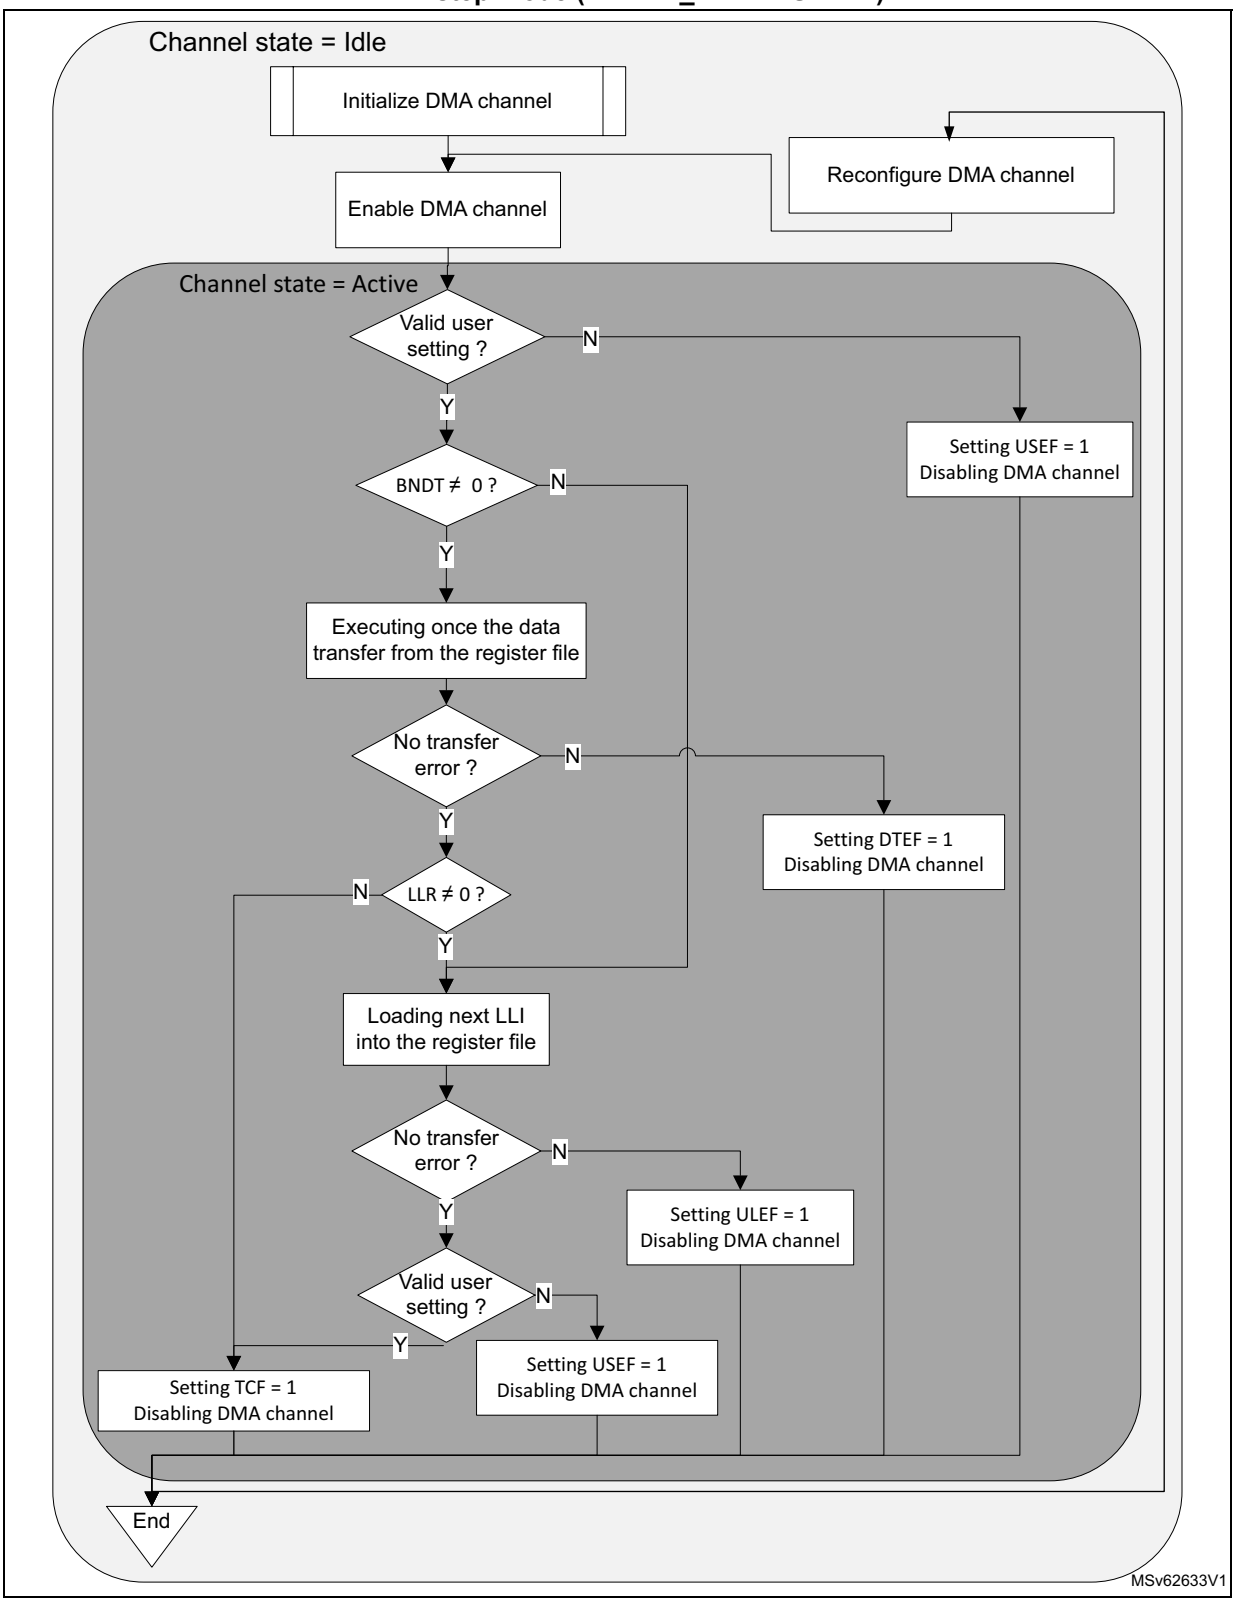
28.4.8 LPDMA channel state and linked-list programming in link step mode

When LPDMA_CxCR.LSM = 1, a channel transfer is executed and completed after each single execution of a LLI, including its (conditional) data transfer and its (conditional) link transfer.

A LPDMA channel transfer can be programmed at LLI level, started by writing 1 into LPDMA_CxCR.EN, and after completed at LLI level:

- The current LLI_n transfer is described with:
  - LPDMA_CxTR1 defines the source/destination elementary single transfers.
  - LPDMA_CxBR1 defines the number of bytes at a block level (BNDT[15:0]).
  - LPDMA_CxTR2 defines the input control (request, trigger) and the output control (transfer complete event) of the transfer.
  - LPDMA_CxSAR/LPDMA_CxDAR defines the source/destination transfer start address.
  - LPDMA_CxLLR defines the data structure and the address offset of the next LLI_{n+1} in the memory.
- The current LLI_n transfer is completed after the single execution of the current LLI_n:
  - after the (conditional) data transfer completion (when LPDMA_CxBR1.BNDT[15:0] = 0)
  - after the (conditional) update of the LPDMA link register file from the data structure of the next LLI_{n+1} in memory

Note: If a LLI is recursive (pointing to itself as a next LLI, either LPDMA_CxLLR.ULL = 1 and LPDMA_CxLLR.LA[15:2] is updated by the same value, or LPDMA_CxLLR.ULL = 0), a channel in link step mode is completed after each repeated single execution of this LLI.



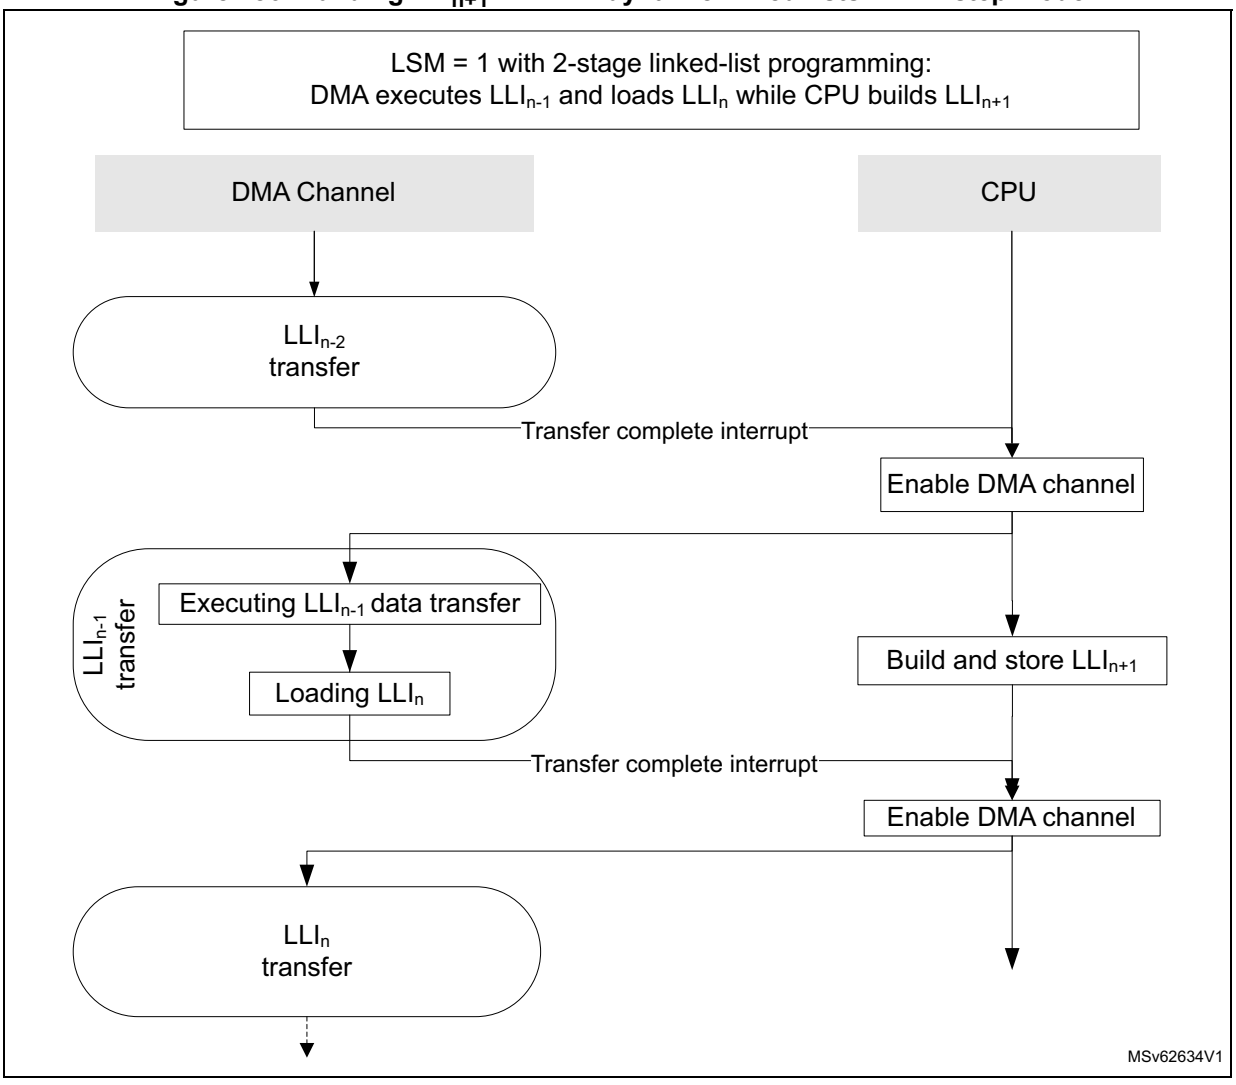
In the regular data transfer completion at a block level, LPDMA_CxBR1.BNDT[15:0] = 0. Alternatively, a block transfer may be early completed by a peripheral (such as an I3C in Rx mode), and then BNDT[15:0] is not null (see *Section 28.4.14* for more details).

Figure 185 depicts the LPDMA channel execution mode, and its programming in link step mode.

Note: Figure 185 is not intended to illustrate how often a TCEF can be raised, depending on the programmed value of TCEM[1:0] in LPDMA_CxTR2. It can be raised at (each) block completion, at (each) 2D block completion, at (each) LLI completion, or only at the last LLI data transfer completion. In link step mode, the channel is disabled after each single execution of a LLI, and depending on the value of TCEM[1:0] a TCEF is raised or not.

In Figure 185, BNDT ≠ 0 is the typical condition for starting the first data transfer. This condition becomes (BNDT ≠ 0 and PFREQ = 1) if the peripheral requests a data transfer with early termination (see Section 28.3.5).

Figure 185. LPDMA channel execution and linked-list programming in link step mode (LPDMA_CxCR.LSM = 1)



The link step mode can be used to elaborate dynamically LLIs in memory during run-time. The software can be facilitated by using a static data structure for any LLI_n (all update bits of LPDMA_CxLLR have a static value, LLI_n.LLR.LA = LLI_{n-1}.LLR.LA + constant).

Run-time adding a LLI_{n+1} in link step mode

During run-time, the software can defer the elaboration of the LLI_{n+1} (and next LLIs), until/after LPDMA executed the transfer from the LLI_{n-1} and loaded the LLI_n from the memory, as shown in the figure below.

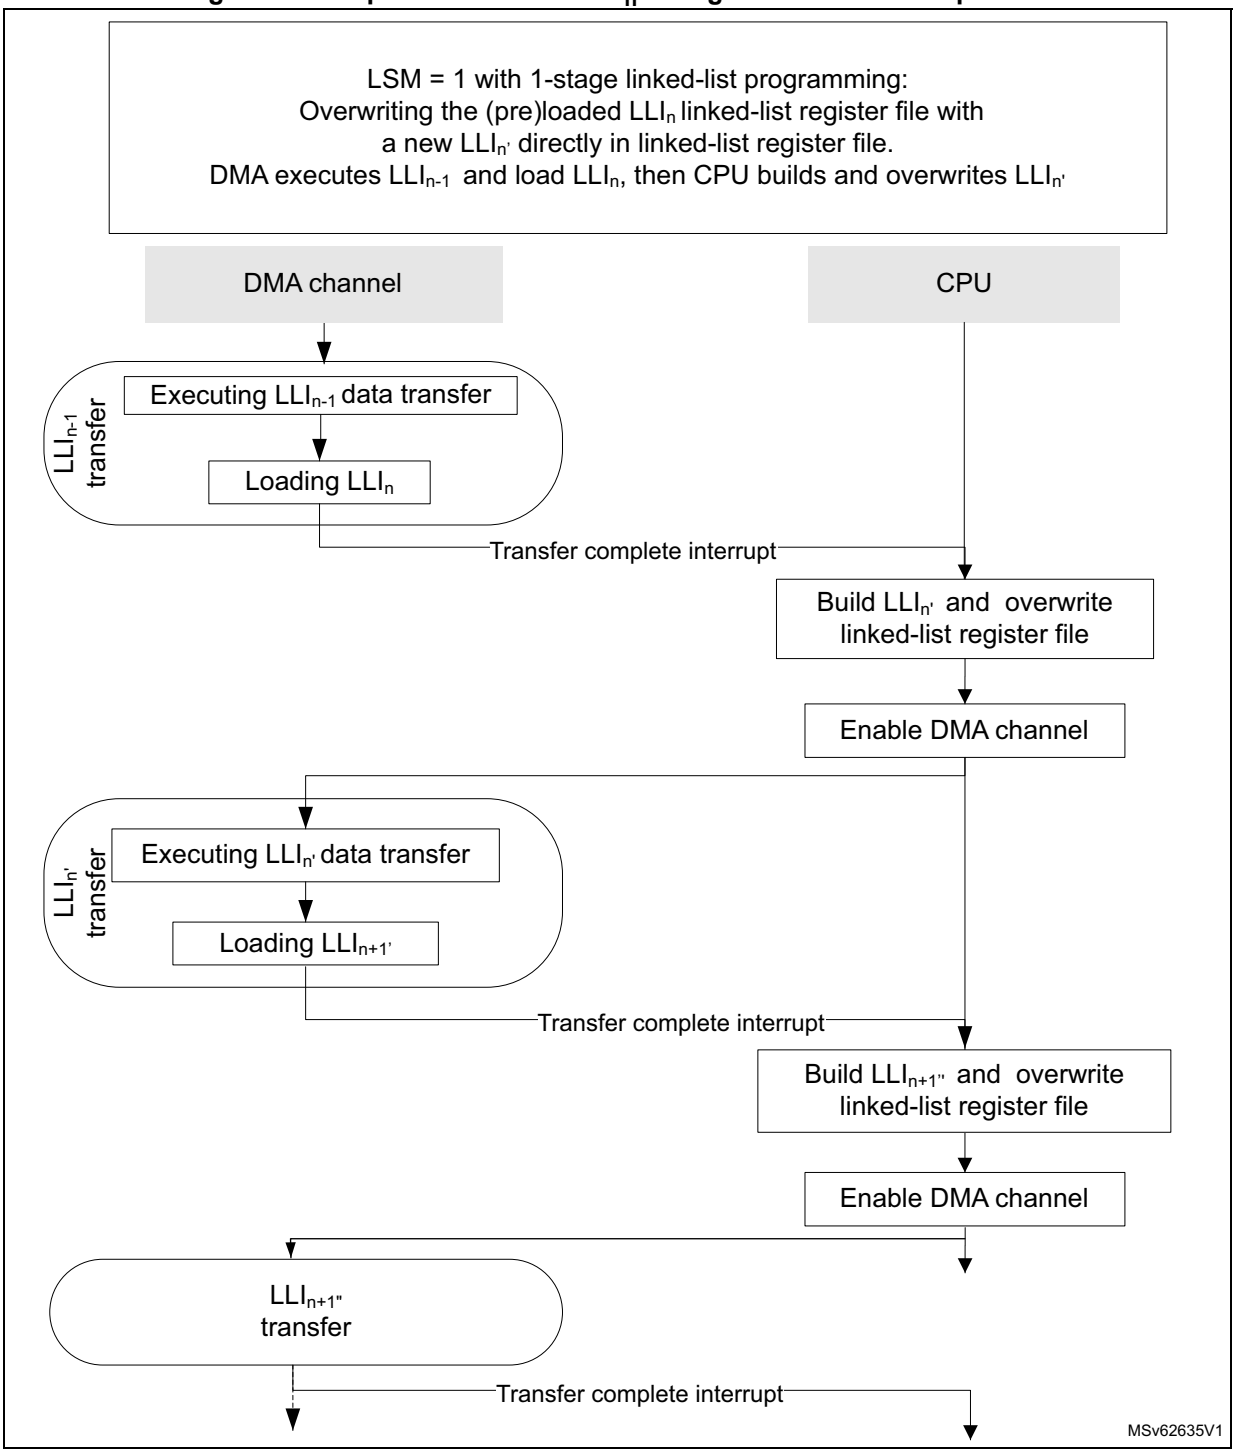


Figure 186. Building LLI_{n+1}: LPDMA dynamic linked-lists in link step mode

Run-time replacing a LLI_n with a new $LLI_{n'}$ in link step mode (in linked-list register file)

In this link step mode, during run-time, the software can build and insert a new $LLI_{n'}$, after LPDMA executed the transfer from the LLI_{n-1} and loaded a formerly elaborated LLI_n from the memory by overwriting directly the linked-list register file with the new $LLI_{n'}$, as shown in *Figure 187*.

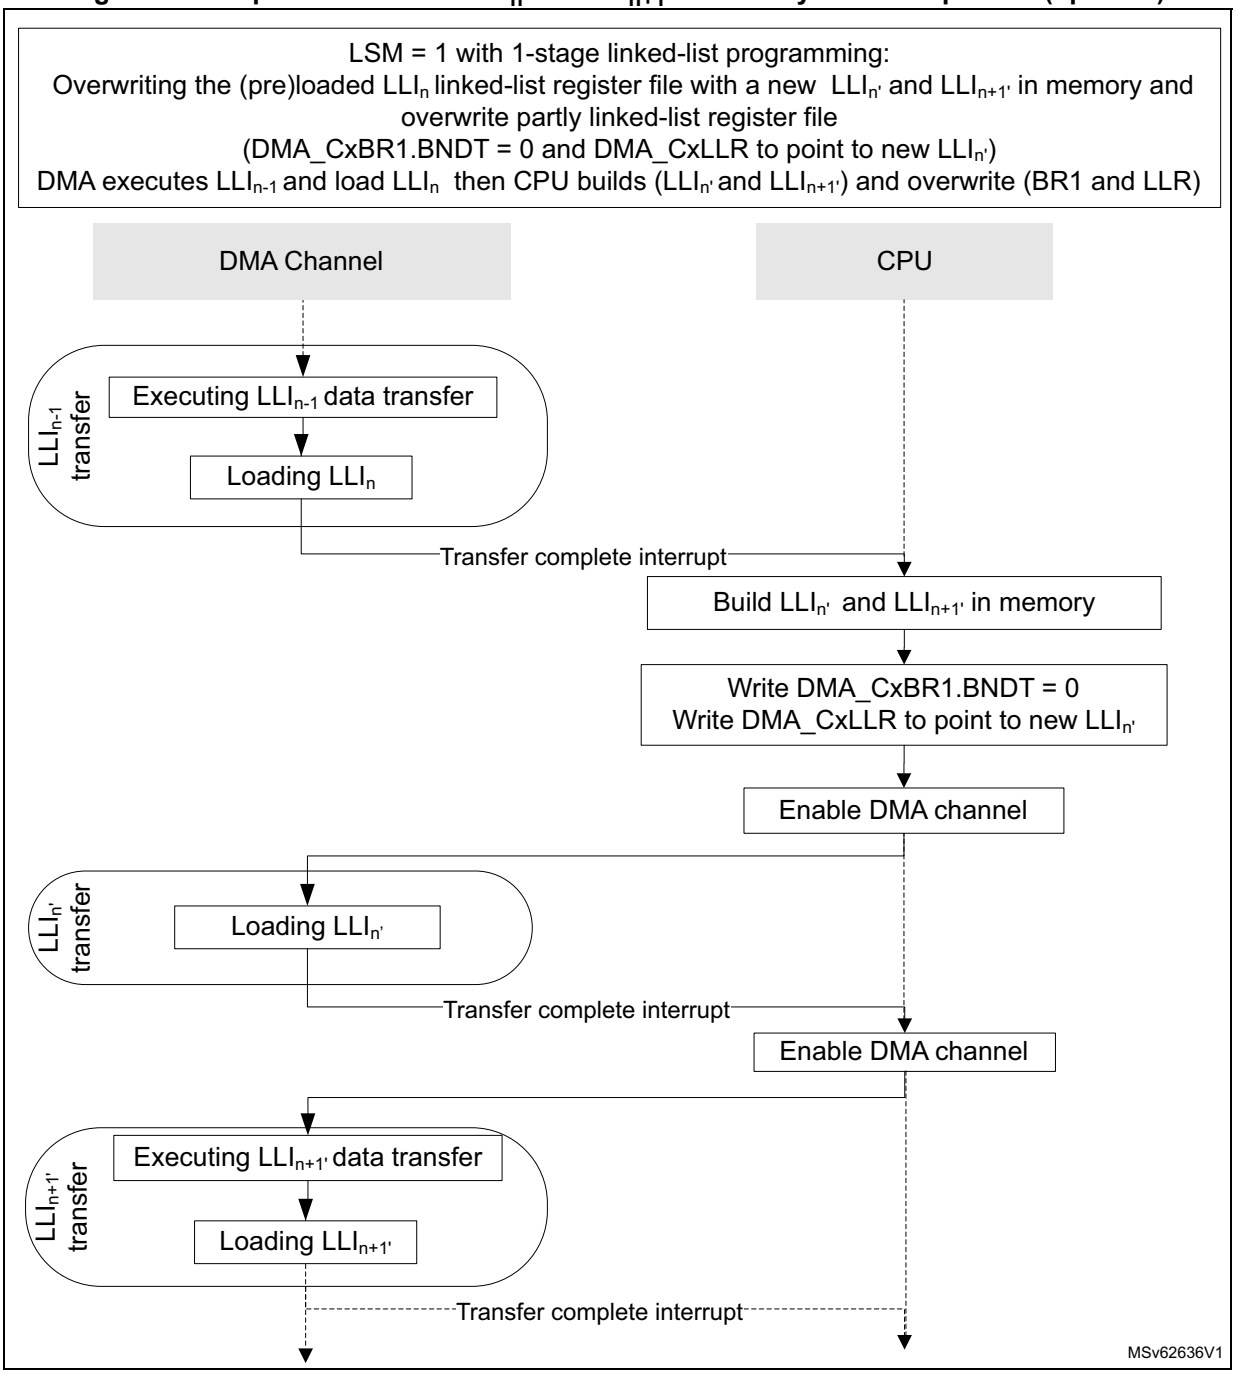

Figure 187. Replace with a new $LLI_{n'}$ in register file in link step mode

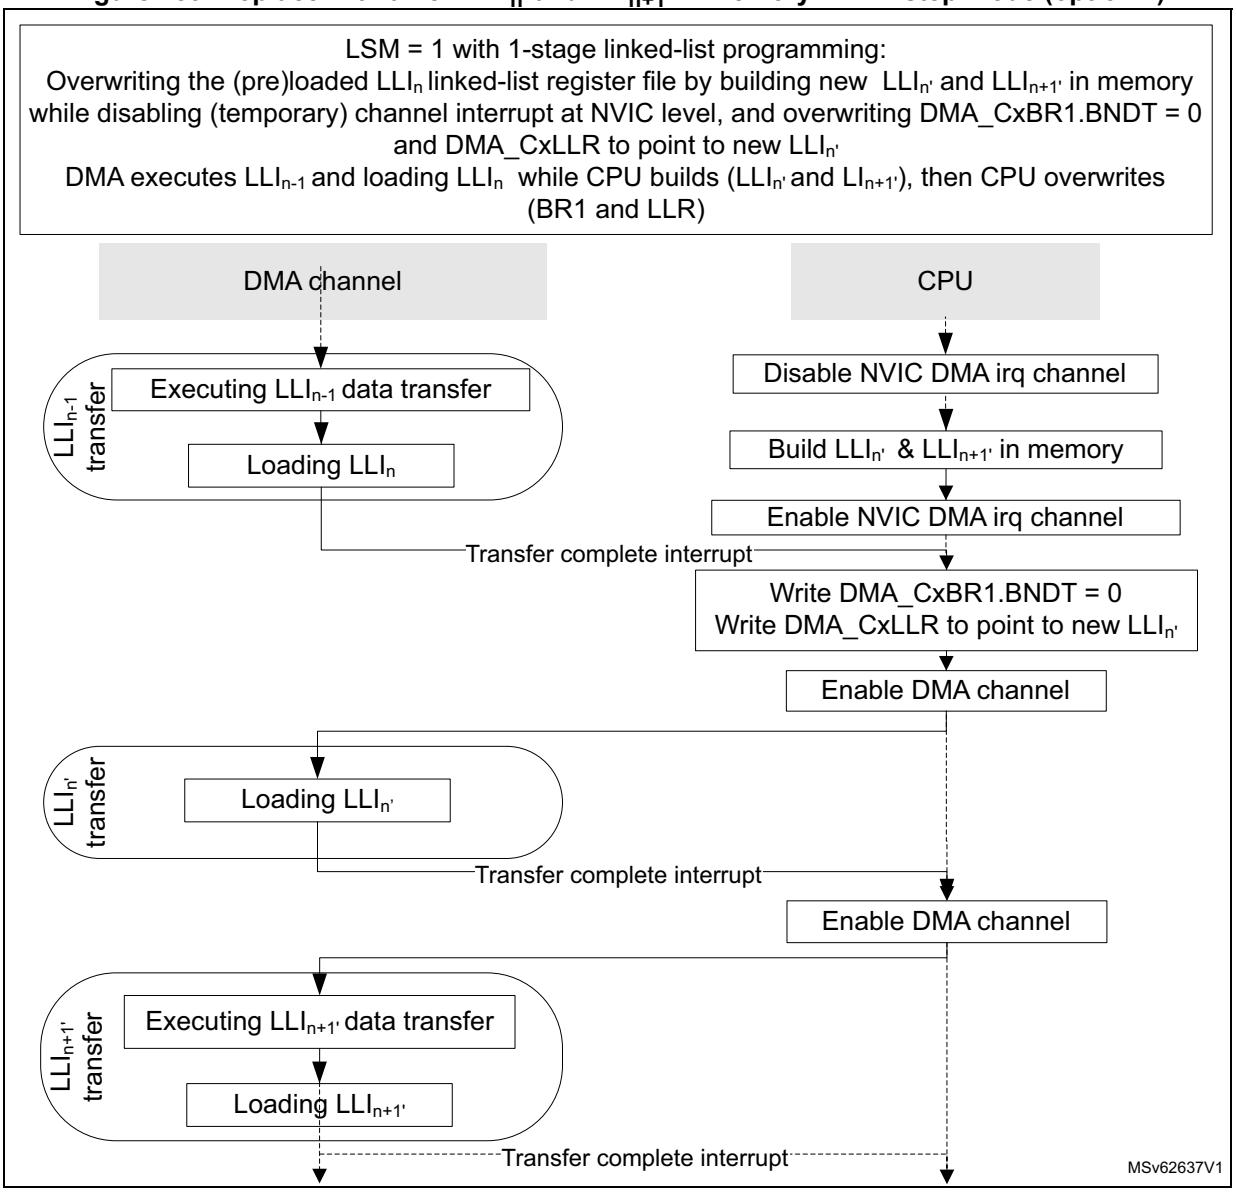
Run-time replacing a LLI_n with a new $LLI_{n'}$ in link step mode (in the memory)

The software can build and insert a new $LLI_{n'}$ and $LLI_{n+1'}$ in the memory, after LPDMA executed the transfer from the LLI_{n-1} and loaded a formerly elaborated LLI_n from the memory, by overwriting partly the linked-list register file (LPDMA_CxBR1.BNDT[15:0] to be null and LPDMA_CxLLR to point to new $LLI_{n'}$) as shown in *Figure 188*.

Figure 188. Replace with a new $LLI_{n'}$ and $LLI_{n+1'}$ in memory in link step mode (option 1)



Run-time replacing a LLI_n with a new $LLI_{n'}$ in link step mode

Other software implementations exist. Meanwhile LPDMA executes the transfer from the LLI_{n-1} and loads a formerly elaborated LLI_n from the memory (or even earlier), the software can do the following:

1. Disable the NVIC for not being interrupted by the interrupt handling.
2. Build a new $LLI_{n'}$ and a new $LLI_{n+1'}$.
3. Enable again the NVIC for the channel interrupt (transfer complete) notification.

The software in the interrupt handler for LLI_{n-1} is then restricted to overwrite LPDMA_CxBR1.BNDT[15:0] to be null and LPDMA_CxLLR to point to new $LLI_{n'}$, as shown in *Figure 189*.

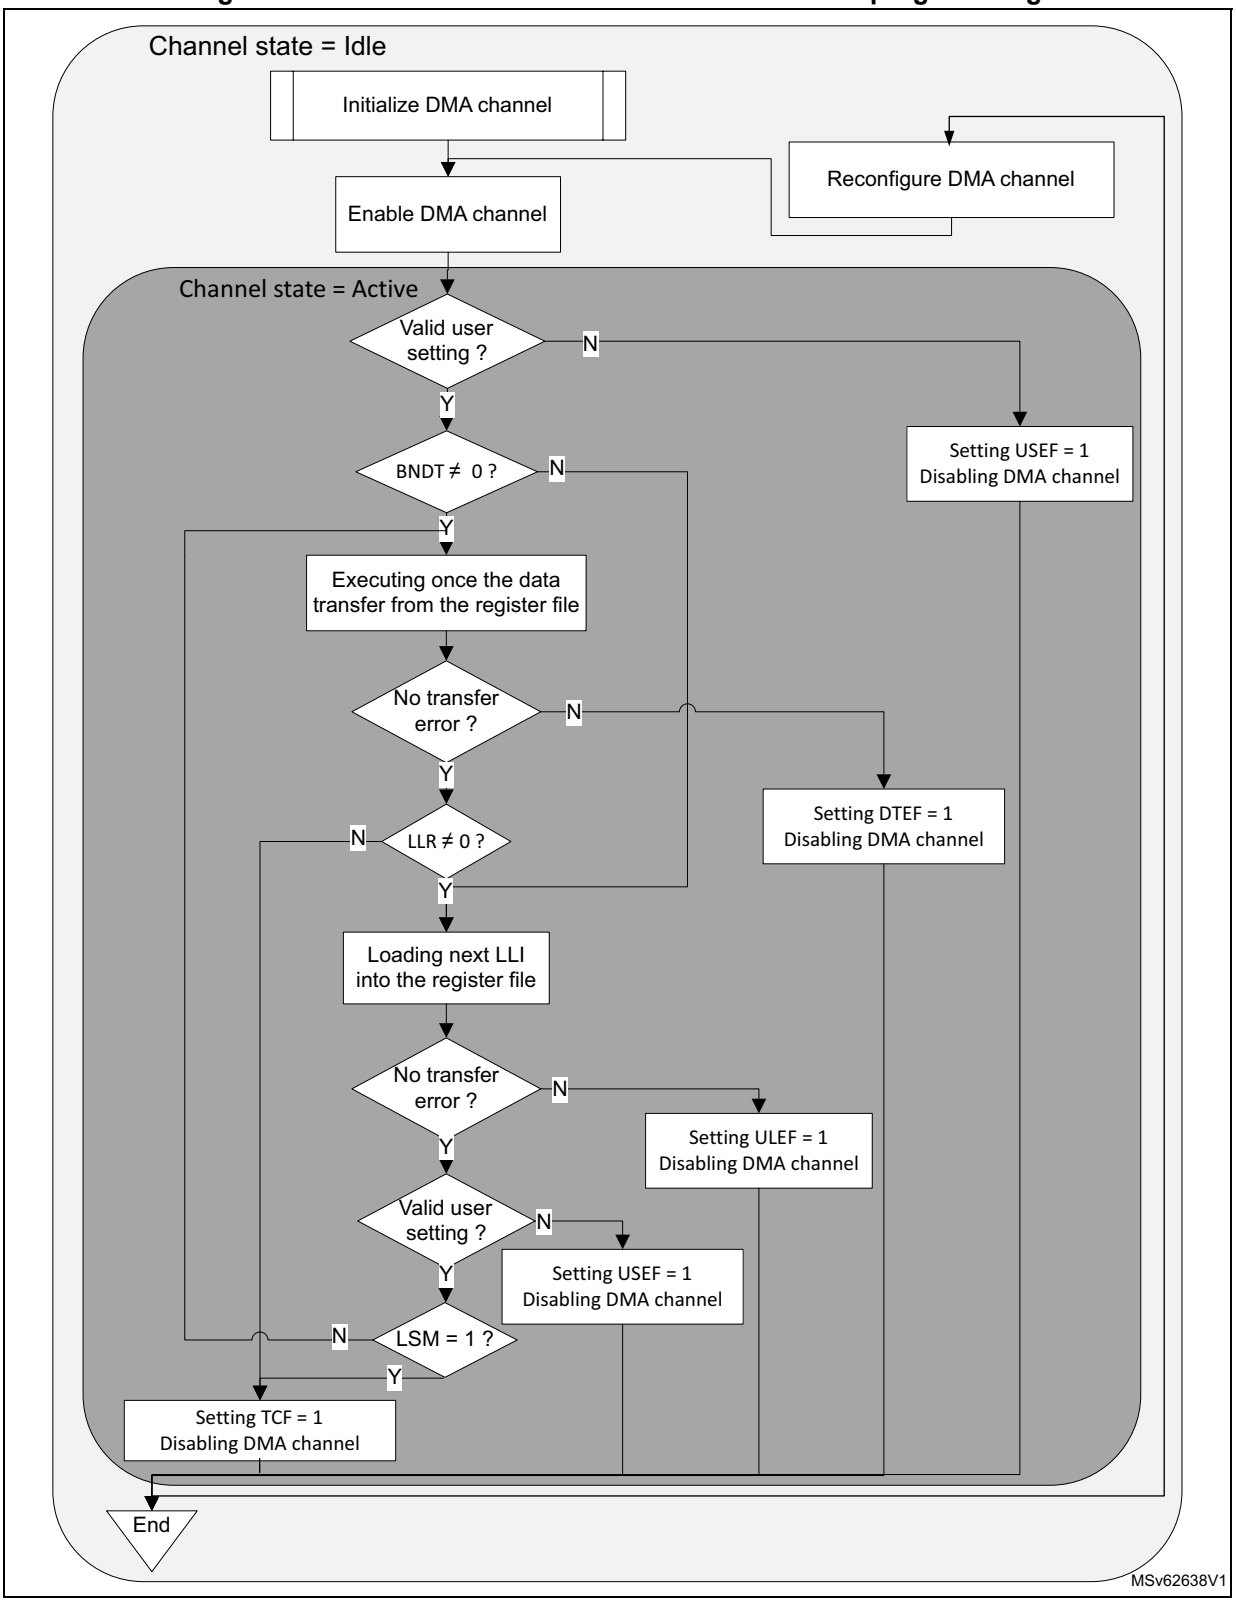
Figure 189. Replace with a new $LLI_{n'}$ and $LLI_{n+1'}$ in memory in link step mode (option 2)

28.4.9 LPDMA channel state and linked-list programming

The software can reconfigure a channel when the channel is disabled (LPDMA_CxCR.EN = 0) and update the execution mode (LPDMA_CxCR.LSM) to change from/to run-to-completion mode to/from link step mode.

In any execution mode, the software can:

- reprogram LLI_{n+1} in the memory to finally complete the channel by this LLI_{n+1} (clear the LPDMA_CxLLR of this LLI_{n+1}), before that this LLI_{n+1} is loaded/used by the LPDMA channel
- abort and reconfigure the channel with a LSM update (see *Section 28.4.4*)



In link step mode, the software can clear LSM after each a single execution of any LLI, during LLI_{n-1}.

Figure 190 shows the overall and unified LPDMA linked-list programming, whatever is the execution mode.

Note: Figure 190 is not intended to illustrate how often a TCEF can be raised, depending on the programmed value of TCEM[1:0] in LPDMA_CxTR2. It can be raised at (each) block completion, at (each) 2D block completion, at (each) LLI completion, or only at the last LLI data transfer completion. In run-to-completion mode, whatever is the value of TCEM[1:0], at the channel completion the hardware always set TCEF = 1 and disables the channel. In link step mode, the channel is disabled after each single execution of a LLI, and depending on the value of TCEM[1:0] a TCEF is raised or not.

In Figure 190, BNDT ≠ 0 is the typical condition for starting the first data transfer. This condition becomes (BNDT ≠ 0 and PFREQ = 1) if the peripheral requests a data transfer with early termination (see Section 28.3.5).

Figure 190. LPDMA channel execution and linked-list programming

28.4.10 LPDMA direct transfers

There is a single transfer operation mode called the direct mode. Any LPDMA channel is used in direct mode. Any channel is implemented without any FIFO (for every channel x, dma_fifo_size[x] = 0).

LPDMA single

A programmed transfer at the lowest level is called a LPDMA single.

A LPDMA single data width is 1, 2 or 4 bytes, as defined by the SDW_LOG2[1:0] and DDW_LOG2[1:0] fields of LPDMA_CxTR1(respectively for source and destination).

Note: The user must not assign a 8-byte data width (SDW_LOG2[1:0] = 0b11 or DDW_LOG2[1:0] = 0b11) else a user setting is reported and no transfer is issued.

The addressing mode after each data of a LPDMA single is defined by the SINC and DINC bits of LPDMA_CxTR1(respectively for source and destination): either a fixed addressing or an incremented addressing with contiguous data.

The start and next addresses of a LPDMA source/destination single (defined by LPDMA_CxSAR and LPDMA_CxDAR) must be aligned with the respective data width.

The table below lists the main characteristics of a LPDMA single.

The next single address in the table is the next source/destination address, pointed by LPDMA_CxSAR and LPDMA_CxDAR, once the programmed source/destination single is completed.

Table 222. Programmed LPDMA source/destination single

Programmed LPDMA source/destination single	SDW_LOG2[1:0] DDW_LOG2[1:0]	Data width (bytes)	SINC/ DINC	Addressing mode	SAR/DAR next single address	Address alignment
Fixed byte single	00	1	0	Fixed	+0	1
Fixed half-word single	01	2				2
Fixed word single	10	4				4
Incremented byte single	00	1	1	Incremented	+1	1
Incremented half-word single	01	2			+2	2
Incremented word single	10	4			+4	4
Forbidden	11	Causes USEF generation and none single to be issued.				

In direct mode, a LPDMA single is an AHB single transfer.

LPDMA data handling: byte-based padding/truncation, sign extension and left/right alignment

The user can configure some data manipulation between a transferred data from the source and its transfer to the destination. Data handling is controlled by the LPDMA_CxTR1 register:

- If destination data width = source data width (DDW_LOG2[1:0] = SDW_LOG2[1:0]), the source data is copied as is and transferred to the destination.
- Else, depending on PAM:
  - If destination data width > source data width, the source data can be either right-aligned and padded with 0 s, or sign extended up to the destination data width.
  - If destination data width < source data width, the source data can be either right-aligned and left-truncated down to the destination data width, or left-aligned and right-truncated down to the destination data width.

There is no data manipulation between two distinct transferred data from the source, before the generation of the destination transfer.

The table below lists possible data handling from the source to the destination.

Table 223. Programmed data handling

SDW_ LOG2[1:0]	Source data	Source data stream(1)	DDW_ LOG2[1:0]	Destination data	PAM[0]	Destination data stream(1)
00	Byte	$B_7,B_6,B_5,B_4,B_3,B_2,B_1,B_0$	00	Byte	x	$B_7,B_6,B_5,B_4,B_3,B_2,B_1,B_0$
			01	Half-word	0 (RA, 0P)(2)(3)	$0B_3,0B_2,0B_1,0B_0$
					1 (RA, SE)(2)(4)	SB_3,SB_2,SB_1,SB_0
			10	Word	0 (RA, 0P)	$000B_1,000B_0$
					1 (RA, SE)	$SSSB_1,SSSB_0$
01	Half-word	$B_7B_6,B_5B_4,B_3B_2,B_1B_0$	00	Byte	0 (RA, LT)(2)	B_6,B_4,B_2,B_0
					1 (LA, RT)(2)	B_7,B_5,B_3,B_1
			01	Half-word	xx	$B_7B_6,B_5B_4,B_3B_2,B_1B_0$
			10	Word	0 (RA, 0P)	$00B_3B_2,00B_1B_0$
					1 (RA, SE)	SSB_3B_2,SSB_1B_0
10	Word	$B_7B_6B_5B_4,B_3B_2B_1B_0$	00	Byte	0 (RA, LT)	B_{12},B_8,B_4,B_0
					1 (LA, RT)	B_{15},B_{11},B_7,B_3
			01	Half-word	0 (RA, LT)	B_5B_4,B_1B_0
				Word	1 (LA, RT)	B_7B_6,B_3B_2
			10		xx	$B_7B_6B_5B_4,B_3B_2B_1B_0$

1. Data stream is timely ordered starting from the byte with the lowest index a.k.a B_0.
2. RA = right aligned. LA = left aligned. RT= right truncated. LT = left truncated.
3. 0P = zero bit padding up to the destination data width.
4. SE = sign bit extended up to the destination data width.

28.4.11 LPDMA transfer request and arbitration

LPDMA transfer request

As defined by LPDMA_CxTR2, a programmed LPDMA data transfer is requested with one of the following:

- a software request if the control bit SWREQ = 1: This is used typically by the CPU for a data transfer from a memory-mapped address to another memory mapped address (memory-to-memory, GPIO to/from memory)
- an input hardware request coming from a peripheral if SWREQ = 0: The selection of the LPDMA hardware peripheral request is driven by the REQSEL[4:0] field (see *Section 28.3.4*). The selected hardware request can be one of the following:
  - a hardware request from a peripheral configured in LPDMA mode (for a transfer from/to the peripheral data register respectively to/from the memory)
  - a hardware request from a peripheral for its control registers update from the memory
  - a hardware request from a peripheral for a read of its status registers transferred to the memory

Caution: The user must not assign a same input hardware peripheral LPDMA request via LPDMA_CxTR.REQSEL[4:0] to two different channel if at a given time this request is asserted by the peripheral and each channel is ready to execute this requested data transfer. There is no user setting error reporting.

LPDMA transfer request for arbitration

For a given channel, a LPDMA requested data transfer from the source address to the destination address is arbitrated versus simultaneous requested LPDMA transfers from other channels, in order to be scheduled over the AHB master port. A LPDMA data transfer is atomic to the LPDMA arbitration: it consists of an AHB read single, immediately followed by an AHB write single. It is granted by the arbiter once for both AHB transfers, based on the channel priority defined by LPDMA_CxCR.PRIO[1:0].

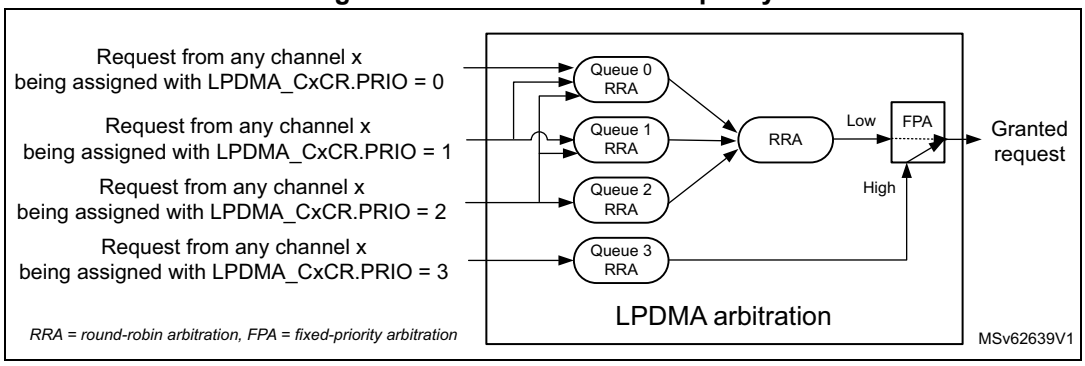
An arbitrated LPDMA requested link transfer consists of one 32-bit read from the linked-list data structure in the memory to one of the linked-list registers (LPDMA_CxTR1, LPDMA_CxTR2, LPDMA_CxBR1, LPDMA_CxSAR, LPDMA_CxDAR or LPDMA_CxLLR). Each 32-bit read from the memory is arbitrated with the same channel priority as for data transfers, in order to be scheduled over the master port.

The re arbitration occurs after each granted single transfer:

- whatever how the requested data transfer is programmed:
  - with a software request for a memory-to-memory transfer (LPDMA_CxTR2.SWREQ = 1)
  - with a hardware request (LPDMA_CxTR2.SWREQ = 0) for a memory-to-peripheral transfer or a peripheral-to-memory transfer
- whatever the hardware request type

When the requested data transfer is programmed with a hardware request from a peripheral (LPDMA_CxTR2.SWREQ = 0), the first memory read of a block is gated by the occurrence of the corresponding and selected hardware request, whatever the peripheral is source or destination of the transfer. This first read request to the memory is not taken into account earlier by the arbiter (not as soon as the block transfer is enabled and executable).

LPDMA arbitration



The LPDMA arbitration is directed from the 4-grade assigned channel priority (LPDMA_CxCR.PRIO[1:0]). The arbitration policy, as illustrated in *Figure 191*, is defined by:

- one high-priority traffic class (queue 3), dedicated to the assigned channels with priority 3, for time-sensitive channels

  This traffic class is granted via a fixed-priority arbitration against any other low-priority traffic class. Within this class, requested single transfers are round-robin arbitrated.
- three low-priority traffic classes (queues 0, 1 or 2) for non time-sensitive channels with priority 0, 1 or 2

  Each requested single transfer within this class is round-robin arbitrated, with a weight that is monotonically driven from the programmed priority:
  - Requests with priority 0 are allocated to the queue 0.
  - Requests with priority 1 are allocated and replicated to the queue 0 and queue 1.
  - Requests with priority 2 are allocated and replicated to the queue 0, queue 1, and queue 2.
  - Any queue 0, 1 or 2 equally grants any of its active input requests in a round-robin manner, provided there are simultaneous requests.
  - Additionally, there is a second stage for the low-traffic with a round-robin arbiter that fairly alternates between simultaneous selected requests from queue 0, queue 1 and queue 2.

Figure 191. LPDMA arbitration policy

1. RRA: round-robin arbitration
2. FPA: fixed-priority arbitration

LPDMA arbitration and bandwidth

With this arbitration policy, the following is guaranteed:

- Equal maximum bandwidth between requests with same priority
- Reserved bandwidth (noted as B_{Q3}) to the time-sensitive requests (with priority 3)
- Residual weighted bandwidth between different low-priority requests (priority 0 versus priority 1 versus priority 2).

The two following examples highlight that the weighted round-robin arbitration is driven by the programmed priorities:

- **Example 1**: basic application with two non time-sensitive LPDMA requests: req0 and req1. There are the following programming possibilities:
  - If they are assigned with same priority, the allocated bandwidth by the arbiter to req0 (B_{req0}) is **equal** to the allocated bandwidth to req1(B_{req1}).

    $B_{req0} = B_{req1} = 1/2 * (1 - B_{Q3})$
  - If req0 is assigned to priority 0 and req1 to priority 1, the allocated bandwidth to req0 (B_{P0}) is **3 times less** than the allocated bandwidth to req1 (B_{P1}).

    $B_{req0} = B_{P0} = 1/2 * 1/2 * (1 - B_{Q3}) = 1/4 * (1 - B_{Q3})$

    $B_{req1} = B_{P1} = (1/2 + 1) * 1/2 * (1 - B_{Q3}) = 3/4 * (1 - B_{Q3})$
  - If req0 is assigned to priority 0 and req1 to priority 2, the allocated bandwidth to req0 (B_{P0}) is **5 times less** than the allocated bandwidth to req1 (B_{P2}).

    $B_{req0} = B_{P0} = 1/2 * 1/3 * (1 - B_{Q3}) = 1/6 * (1 - B_{Q3})$

    $B_{req1} = B_{P2} = (1/2 + 1 + 1) * 1/3 * (1 - B_{Q3}) = 5/6 * (1 - B_{Q3})$

  The above computed bandwidth calculation is based on a theoretical input request, always active for any LPDMA clock cycle. This computed bandwidth from the arbiter must be weighted by the frequency of the request given by the application, that cannot be always active and may be quite much variable from one LPDMA client (example I2C at 400 kHz) to another one (PWM at 1 kHz) than the above x3 and x5 ratios.
- **Example 2**: application where the user distributes a same non-null N number of LPDMA requests to every non time-sensitive priority 0, 1 and 2. The bandwidth calculation is then the following:
  - The allocated bandwidth to the set of requests of priority 0 (B_{P0}) is

    $B_{P0} = 1/3 * 1/3 * (1 - B_{Q3}) = 1/9 * (1 - B_{Q3})$
  - The allocated bandwidth to the set of requests of priority 1(B_{P1}) is

    $B_{P1} = (1/3 + 1/2) * 1/3 * (1 - B_{Q3}) = 5/18 * (1 - B_{Q3})$
  - The allocated bandwidth to the set of requests of priority 2(B_{P2}) is

    $B_{P2} = (1/3 + 1/2 + 1) * 1/3 * (1 - B_{Q3}) = 11/18 * (1 - B_{Q3})$
  - The allocated bandwidth to any request n ($B_{n)}$ among the N requests of that priority Pi (i = 0 to 2) is $B_n = 1/N * B_{Pi}$
  - The allocated bandwidth to any request n of priority 0i ($B_{n, Pi}$) is

    $B_{n, P0} = 1/N * 1/9 * (1 - B_{Q3})$

    $B_{n, P1} = 1/N * 5/18 * (1 - B_{Q3})$

    $B_{n, P2} = 1/N * 11/18 * (1 - B_{Q3})$

  In this example, when the master port bus bandwidth is not totally consumed by the time-sensitive queue 3, the residual bandwidth is such that 2.5 times less bandwidth is allocated to any request of priority 0 versus priority 1, and 5.5 times less bandwidth is allocated to any request of priority 0 versus priority 2.

More generally, assume that the following requests are present:

- I requests (I ≥ 0) assigned to priority 0
  If I > 0, these requests are noted from i = 0 to I-1.
- J requests (J ≥ 0) assigned to priority 1
  If J > 0, these requests are noted from j = 0 to J-1.
- K requests (K > 0) assigned to priority 2
  These requests are noted from k = 0 to K-1
- L requests (L ≥ 0) assigned to priority 3
  If L > 0, these requests are noted from l = 0 to L-1.

As B_{Q3} is the reserved bandwidth to time-sensitive requests, the bandwidth for each request L with priority 3 is:

- $B_l = B_{Q3} / L$ for L > 0 (else: $B_l = 0$)

The bandwidth for each non-time sensitive queue is:

- $B_{Q0} = 1/3 * (1 - B_{Q3})$
- $B_{Q1} = 1/3 * (1 - B_{Q3})$
- $B_{Q2} = 1/3 * (1 - B_{Q3})$

The bandwidth for the set of requests with priority 0 is:

- $B_{P0} = I / (I + J + K) * B_{Q0}$

The bandwidth for each request i with priority 0 is:

- $B_i = B_{P0} / I$ for L > 0 (else $B_{P0} = 0$)

The bandwidth for the set of requests with priority 1 and routed to queue 0 is:

- $B_{P1,Q0} = J / (I + J + K) * B_{Q0}$

The bandwidth for the set of requests with priority 1 and routed to queue 1 is:

- $B_{P1,Q1} = J / (J + K) * B_{Q1}$

The total bandwidth for the set of requests with priority 1 is:

- $B_{P1} = B_{P1,Q0} + B_{P1,Q1}$

The bandwidth for each request j with priority 1 is:

- $B_j = B_{P1} / J$ for J > 0 (else $B_j = 0$)

The bandwidth for the set of requests with priority 2 and routed to queue 0 is:

- $B_{P2,Q0} = K / (I + J + K) * B_{Q0}$

The bandwidth for the set of requests with priority 2 and routed to queue 1 is:

- $B_{P2,Q1} = K / (J + K) * B_{Q1}$

The bandwidth for the set of requests with priority 2 and routed to queue 2 is:

- $B_{P2,Q2} = B_{Q2}$

The total bandwidth for the set of requests with priority 2 is:

- $B_{P2} = B_{P2,Q0} + B_{P2,Q1} + B_{P2,Q2}$

The bandwidth for each request k with priority 2 is:

- $B_k = B_{P2} / K$ (K>0 in the general case)

Thus finally the maximum allocated residual bandwidths for any i, j, k non-time sensitive request are:

- in the general case (when there is at least one request k with a priority 2 (K > 0)):
  - $B_i = 1/I * 1/3 * I/(I + J + K) * (1 - B_{Q3})$
  - $B_j = 1/J * 1/3 *[J/(I + J + K) + J/(J + K)] * (1 - B_{Q3})$
  - $B_k = 1/K * 1/3 *[K/(I + J + K) + K/(J + K) + 1] * (1 - B_{Q3})$
- in the specific case (when there is no request k with a priority 2 (K = 0)):
  - $B_i = 1/I * 1/2 * I/(I + J) * (1 - B_{Q3})$
  - $B_j = 1/J * 1/2 *[J/(I + J) + 1] * (1 - B_{Q3})$

Consequently, the LPDMA arbiter can be used as a programmable weighted bandwidth limiter, for each queue and more generally for each request/channel. The different weights are monotonically resulting from the programmed channel priorities.

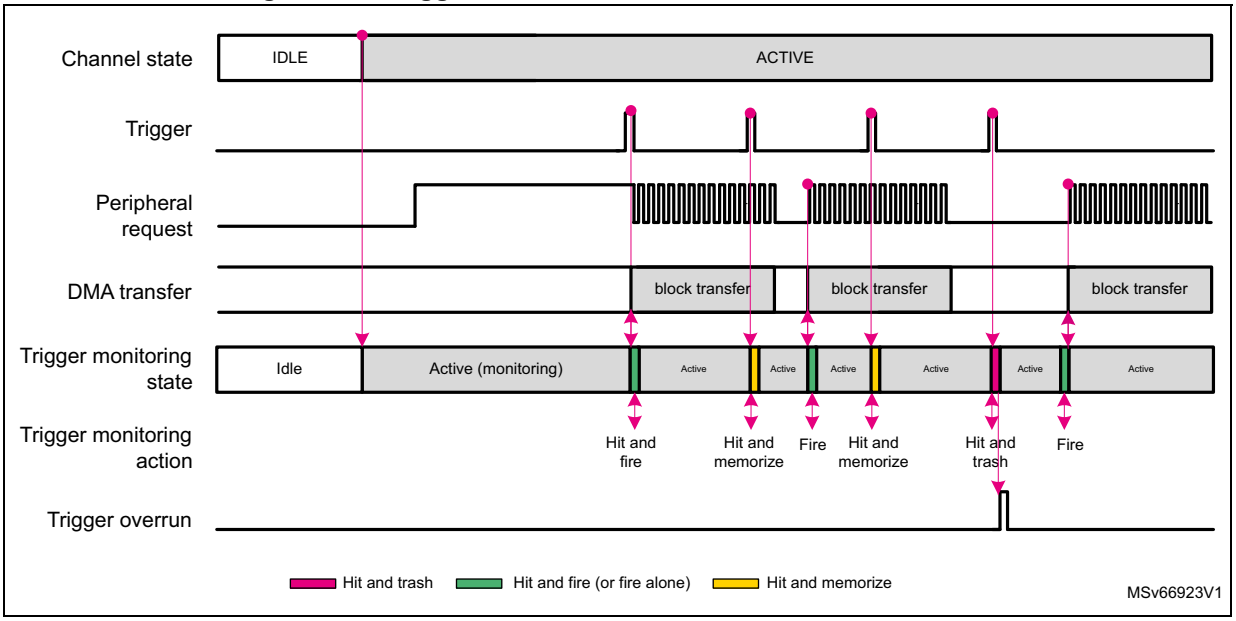
28.4.12 LPDMA triggered transfer

A programmed LPDMA transfer can be triggered by a rising/falling edge of a selected input trigger event, as defined by LPDMA_CxTR2.TRIGPOL[1:0] and LPDMA_CxTR2.TRIGSEL[4:0] (see *Section 28.3.6* for the trigger selection).

The triggered transfer, as defined by the trigger mode in LPDMA_CxTR2.TRIGM[1:0], can be at LLI data transfer level, to condition the first single read of a block, or each programmed single read. The trigger mode can also be programmed to condition the LLI link transfer (see the TRIGM[1:0] description in *LPDMA channel x transfer register 2 (LPDMA_CxTR2)* for more details).

Trigger hit memorization and trigger overrun flag generation

The LPDMA monitoring of a trigger for a channel x is started when the channel is enabled/loaded with a new active trigger configuration: rising or falling edge on a selected trigger (respectively TRIGPOL[1:0] = 01 or TRIGPOL[1:0] = 10).



The monitoring of this trigger is kept active during the triggered and uncompleted (data or link) transfer. If a new trigger is detected, this hit is internally memorized to grant the next transfer, as long as the defined rising/falling edge and TRIGSEL[4:0] are not modified, and the channel is enabled.

Transferring a next LLI_{n+1}, that updates the LPDMA_CxTR2 with a new value for any of TRIGSEL[4:0] or TRIGPOL[1:0], resets the monitoring, trashing the possible memorized hit of the formerly defined LLI_n trigger.

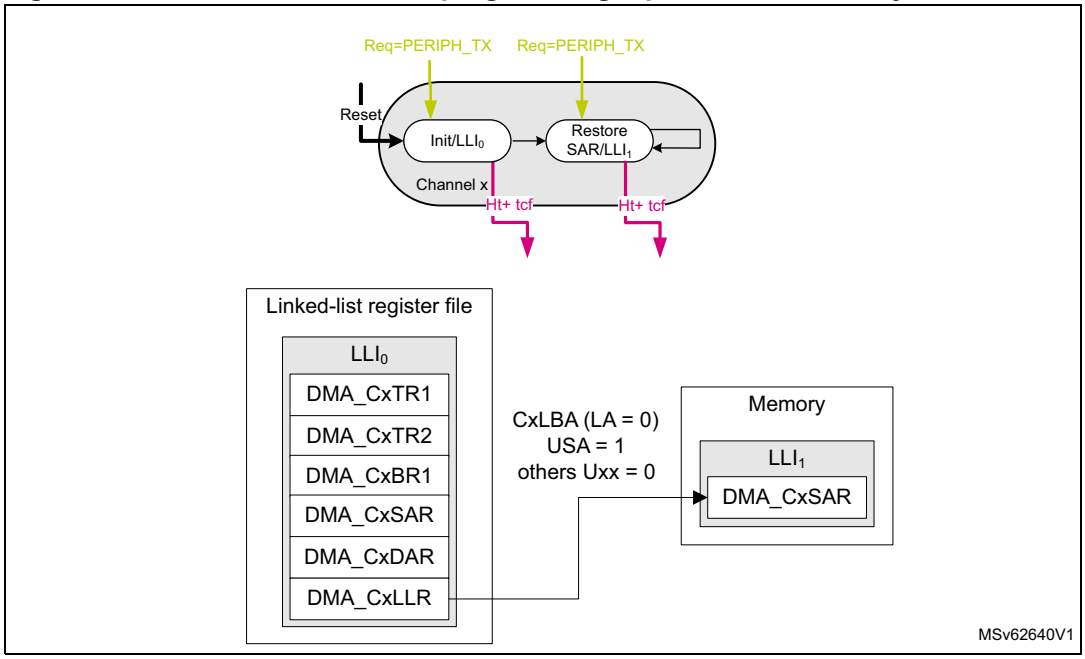
Caution: After a first new trigger hit_{n+1} is memorized, if another trigger hit_{n+2} is detected and if the hit_n triggered transfer is still not completed, hit_{n+2} is lost and not memorized. A trigger overrun flag is reported (LPDMA_CxSR.TOF = 1) and an interrupt is generated if enabled (if LPDMA_CxCR.TOIE = 1). The channel is not automatically disabled by hardware due to a trigger overrun.

The figure below illustrates the trigger hit, memorization and overrun in the configuration example with a block-level trigger mode and a rising edge trigger polarity.

Figure 192. Trigger hit, memorization and overrun waveform

Note: The user can assign the same input trigger event to different channels. This can be used to trigger different channels on a broadcast trigger event.

28.4.13 LPDMA circular buffering with linked-list programming



LPDMA circular buffering for memory-to-peripheral and peripheral-to-memory transfers

For a circular buffering, with a continuous memory-to-peripheral (or peripheral-to-memory) transfer, the software must set up a channel with half transfer and complete transfer events/interrupts generation (LPDMA_CxCR.HTIE = 1 and LPDMA_CxCR.TCIE = 1), in order to enable a concurrent buffer software processing.

LLI_0 is configured for the first block transfer. A continuously-executed LLI_1 is needed to restore the memory source (or destination) start address, for the memory-to-peripheral transfer (respectively the peripheral-to-memory transfer). LPDMA automatically reloads the initially programmed LPDMA_CxBR1.BNDT[15:0] when a block transfer is completed, and there is no need to restore LPDMA_CxBR1.

The figure below illustrates this programming with a LPDMA channel and a source circular buffer.

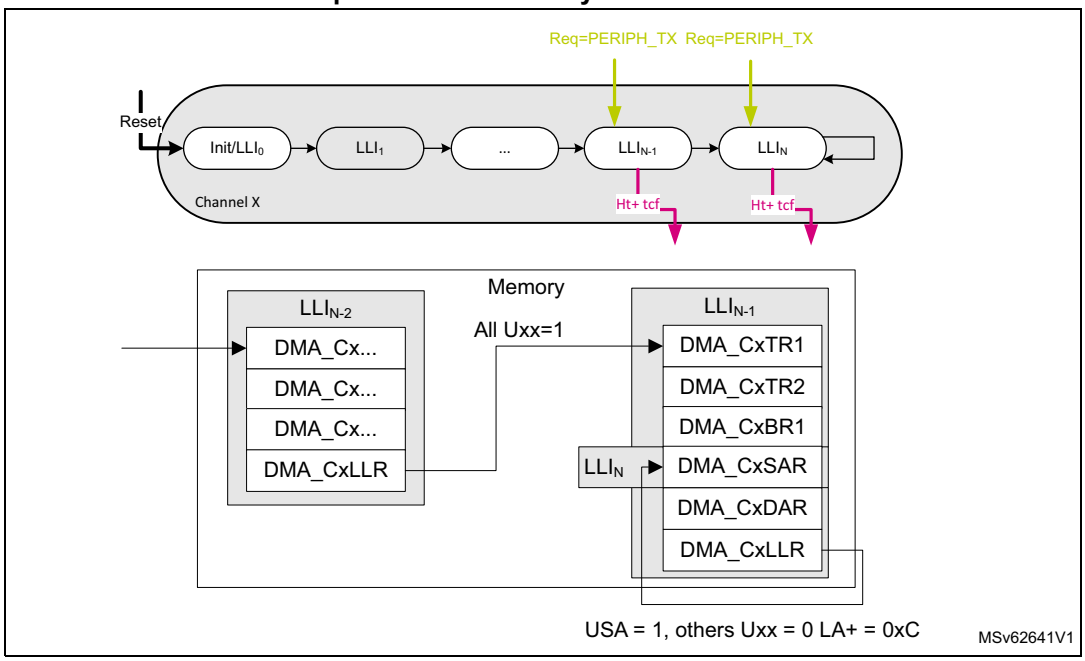


Figure 193. LPDMA circular buffer programming: update of the memory start address

If circular buffering must be executed after some other transfers over the shared LPDMA channel x, the before-last LLI_{N-1} in memory is needed to configure the first block transfer. And the last LLI_N restores the memory source (or destination) start address in memory-to-peripheral transfer (respectively in peripheral-to-memory transfer).

The figure below illustrates this programming with a shared LPDMA channel, and a source circular buffer.

Figure 194. Shared LPDMA channel with circular buffering: update of the memory start address

28.4.14 LPDMA transfer in peripheral flow-control mode

A peripheral with the peripheral flow-control mode feature can decide to early terminate an LPDMA block transfer, provided that the allocated channel is implemented with this feature (see *Section 28.3.5*).

If the related LPDMA channel x is also programmed in peripheral flow-control mode (LPDMA_CxTR2.PFREQ = 1):

- The LPDMA block transfer starts as follows:
  - If LPDMA_CxBR1.BNDT[15:0] ≠ 0, the programmed value is internally taken into account by the LPDMA hardware.
  - If LPDMA_CxBR1.BNDT[15:0] = 0, the LPDMA hardware internally considers a 64-Kbyte value for the maximum source block size to be transferred.
- The LPDMA block transfer is completed as soon as the first occurrence of one of the following condition occurs:
  - when LPDMA_CxBR1.BNDT[15:0] = 0
  - when the peripheral early terminates the block. The complete transfer event is generated if programmed, depending on LPDMA_CxTR2 (see *LPDMA channel x transfer register 2 (LPDMA_CxTR2)*). Then the software can read the current number of transferred bytes from the source (LPDMA_CxBR1.BNDT[15:0]), and/or read the current source or destination address of the buffer in memory (LPDMA_CxSAR[31:0] or LPDMA_CxDAR[31:0]).

28.4.15 LPDMA secure/nonsecure channel

The LPDMA controller is compliant with the TrustZone hardware architecture at channel level, partitioning all its resources so that they exist in one of the secure and nonsecure worlds at any given time.

Any channel x is a secure or a nonsecure hardware resource, as configured by LPDMA_SECCFGR.SECx.

When a channel x is configured in secure state by a secure and privileged agent, the following access control rules are applied:

- A nonsecure read access to a register field of this channel is forced to return 0, except for LPDMA_SECCFGR, LPDMA_PRIVCFGR, LPDMA_RCFGLOCKR and LPDMA_CxSEMCR that are readable by a nonsecure agent.
- A nonsecure write access to a register field of this channel has no impact.

When a channel x is configured in secure state, a secure agent can configure separately as secure or nonsecure the LPDMA data transfer from the source (LPDMA_CxTR1.SSEC) and the LPDMA data transfer to the destination (LPDMA_CxTR1.DSEC).

When a channel x is configured in secure state and in linked-list mode, the loading of the next linked-list data structure from the LPDMA memory into its register file, is automatically performed with secure transfers via the master port.

LPDMA generates the DMA channel state versus security, reflecting LPDMA_SECCFGR, to keep the other peripherals informed of the secure/nonsecure state of each LPDMA channel x.

LPDMA also generates a security illegal access pulse signal on an illegal nonsecure access to a secure LPDMA register. This signal is routed to the TrustZone interrupt controller.

When the secure software must switch a channel from a secure state to a nonsecure state, the secure software must abort the channel or wait until the secure channel is completed before switching. This is needed to dynamically re-allocate a channel to a next nonsecure transfer as a nonsecure software is not allowed to do so and must have LPDMA_CxCR.EN = 0 before the nonsecure software can reprogram the LPDMA_CxCR for a next transfer. The secure software may reset not only the channel x (LPDMA_CxCR.RESET = 1) but also the full channel x register file to its reset value.

28.4.16 LPDMA privileged/unprivileged channel

Any channel x is a privileged or unprivileged hardware resource, as configured by a privileged agent via LPDMA_PRIVCFGR.PRIVx.

When a channel x is configured in a privileged state by a privileged agent, the following access control rules are applied:

- An unprivileged read access to a register field of this channel is forced to return 0, except for LPDMA_PRIVCFGR, LPDMA_SECCFGR, LPDMA_CxCIDCFGR and LPDMA_CxSEMCR that are readable by an unprivileged agent.
- An unprivileged write access to a register field of this channel has no impact.

When a channel is configured in a privileged (or unprivileged) state, the source and destination data transfers are privileged (respectively unprivileged) transfers over the AHB master port.

When a channel is configured in a privileged (or unprivileged) state and in linked-list mode, the loading of the next linked-list data structure from the LPDMA memory into its register file,

is automatically performed with privileged (respectively unprivileged) transfers, via the master port.

LPDMA generates a DMA channel state versus privilege, reflecting LPDMA_PRIVCFGR, to keep the other peripherals informed of the privileged/unprivileged state of each DMA channel x.

Additionally, the LPDMA generates the privileged illegal access pulse signal on an illegal unprivileged access to a privileged LPDMA register. This signal may be used or not, depending on the product (see the system security section for more details).

When the privileged software must switch a channel from a privileged state to an unprivileged state, the privileged software must abort the channel or wait until that the privileged channel is completed before switching. This is needed to dynamically re-allocate a channel to a next unprivileged transfer as an unprivileged software is not allowed to do so, and must have LPDMA_CxCR.EN = 0 before the unprivileged software can reprogram the LPDMA_CxCR for a next transfer. The privileged software may reset not only the channel x (LPDMA_CxCR.RESET = 1) but also the full channel x register file to its reset value.

LPDMA compartmented channel

The LPDMA controller performs bus transfers over its master port, under the control of a resource isolation domain identification, named compartment identification (CID), at a channel level. For more details about resource isolation and CID, refer to RIF section in the product reference manual.

28.4.17 LPDMA error management

LPDMA is able to manage and report to the user a transfer error, as follows, depending on the root cause.

Data transfer error

On a bus access (as a AHB single) to the source or the destination:

- The source or destination target reports an AHB error.
- The programmed channel transfer is stopped (LPDMA_CxCR.EN cleared by the LPDMA hardware). The channel status register reports an idle state (LPDMA_CxSR.IDLEF = 1) and the data error (LPDMA_CxSR.DTEF = 1).
- After a LPDMA data transfer error, the user must perform a debug session, taking care of the product-defined memory mapping of the source and destination, including the protection attributes.
- After a LPDMA data transfer error, the user must issue a channel reset (set LPDMA_CxCR.RESET) to reset the hardware LPDMA channel data path before the user enables again the same channel for a next transfer.

Link transfer error

On a tentative update of a LPDMA channel register from the programmed LLI in the memory:

- The linked-list memory reports an AHB error.
- The programmed channel transfer is stopped (LPDMA_CxCR.EN cleared by the LPDMA hardware), the channel status register reports an idle state (LPDMA_CxSR.IDLEF = 1) and the link error (LPDMA_CxSR.ULEF = 1).
- After a LPDMA link error, the user must perform a debug session, taking care of the product-defined memory mapping of the linked-list data structure (LPDMA_CxLBAR and LPDMA_CxLLR), including the protection attributes.
- After a LPDMA link error, the user must explicitly write the linked-list register file (LPDMA_CxTR1, LPDMA_CxTR2, LPDMA_CxBR1, LPDMA_CxSAR, LPDMA_CxDAR and LPDMA_CxLLR), before the user enables again the same channel for a next transfer.

User setting error

On a tentative execution of a LPDMA transfer with an unauthorized user setting:

- The programmed channel transfer is disabled (LPDMA_CxCR.EN forced and cleared by the LPDMA hardware) preventing the next unauthorized programmed data transfer from being executed. The channel status register reports an idle state (LPDMA_CxSR.IDLEF = 1) and a user setting error (LPDMA_CxSR.USEF = 1).
- After a LPDMA user setting error, the user must perform a debug session, taking care of the LPDMA channel programming. A user setting error can be caused by one of the following:
  - a programmed null source block size without a programmed update of this value from the next LLI_1 (LPDMA_CxBR1.BNDT[15:0] = 0 and LPDMA_CxLLR.UB1 = 0)
  - a programmed non-null source block size being not a multiple of the programmed data width of a source single transfer (LPDMA_CxBR1.BNDT[2:0] versus LPDMA_CxTR1.SDW_LOG2[1:0])
  - a programmed unaligned source start address, being not a multiple of the programmed data width of a source single transfer (LPDMA_CxSAR[2:0] versus LPDMA_CxTR1.SDW_LOG2[1:0])
  - a programmed unaligned destination start address, being not a multiple of the programmed data width of a destination single transfer (LPDMA_CxDAR[2:0] versus LPDMA_CxTR1.DDW_LOG2[1:0])
  - a programmed double-word source data width (LPDMA_CxTR1.SDW_LOG2[1:0] = 0b11)
  - a programmed double-word destination data width (LPDMA_CxTR1.DDW_LOG2[1:0] = 0b11
  - a programmed linked-list item LLI_{n+1} with a null data transfer (LPDMA_CxLLR.UB1 = 1 and LPDMA_CxBR1. BNDT = 0)

28.4.18 LPDMA autonomous mode

To save dynamic power consumption while LPDMA executes the programmed linked-list transfers, LPDMA hardware automatically manages its own clock gating and generates a

clock request output signal to the RCC, whenever the device is in Run, Sleep or Stop mode, provided that the RCC is programmed with the corresponding LPDMA enable control bits.

For more details about the RCC programming, refer to the RCC section of the reference manual.

For mode details about the availability of the LPDMA autonomous feature vs the device low-power modes, refer to *Section 28.3.2*.

Note: design/firmware: In low power modes, DMA clock request is asserted upon a DMA request/trigger from an autonomous peripheral or upon a DMA trigger from an EXTI line.

The user can program and schedule the execution of a given LPDMA transfer at a LLI_n level of a LPDMA channel x, with LPDMA_CxTR2 as follows:

- The software controls and conditions the input of a transfer with TRIGM[1:0], TRIGPOL[1:0], TRIGSEL[y[(a)]:0], SWREQ, and REQSEL[z[(a)]:0] for the input trigger and request.
- The software controls and signals the output of a transfer with TCEM[1:0] for generating or not a transfer complete event, and generating or not an associated half data transfer event).

See *LPDMA channel x transfer register 2 (LPDMA_CxTR2)* for more details.

The output channel x transfer complete event, lpdma_chx_tc, can be programmed as a selected input trigger for a channel if this event is looped-back and connected at the LPDMA level (see *Section 28.3.6*), allowing autonomous and fine DMA inter-channel transfer scheduling, without needing a cleared transfer complete flag (TCF).

A given LPDMA channel x asserts its clock request in one of the following conditions:

- if the next transfer to be executed is programmed as conditioned by a trigger (LPDMA_CxTR2.TRIGPOL[1:0] and LPDMA_CxTR2.TRIGM[1:0]), only when the trigger hit occurs.
- if the next transfer to be executed is not conditioned by a trigger:
  - if LPDMA_CxTR2.SWREQ = 0, only when the hardware request is asserted by the selected peripheral
  - if LPDMA_CxTR2.SWREQ = 1 (memory-to-memory, GPIO to/from memory), as soon as the GPDMA is enabled

The LPDMA channel x releases its clock request as soon as all the following conditions are met:

- The transfer to be executed is completed.
- The LPDMA channel x is not immediately ready and requested to execute the next transfer.
- If a channel x interrupt was raised, all the flags of the status register that can cause this interrupt, are cleared by a software agent.

When one channel asserts its clock request, the LPDMA asserts its clock request to the RCC. When none channel asserts its clock request, the LPDMA releases its clock request to the RCC.

a. Refer to *LPDMA channel x transfer register 2 (LPDMA_CxTR2)* for y and z values.

28.5 LPDMA in debug mode

When the microcontroller enters debug mode (core halted), any channel x can be individually either continued (default) or suspended, depending on the programmable control bit in the DBGMCU module.

Note: In debug mode, LPDMA_CxSR.SUSPF is not altered by a suspension from the programmable control bit in the DBGMCU module. In this case, LPDMA_CxSR.IDLEF can be checked to know the completion status of the channel suspension.

28.6 LPDMA in low-power modes

Table 224. Effect of low-power modes on LPDMA

Mode	Description
Sleep	No effect. LPDMA interrupts cause the device to exit Sleep mode.
Stop(1)	The content of the LPDMA registers is kept when entering Stop mode. The content of the LPDMA registers can be autonomously updated by a next linked-list item from memory, to perform autonomous data transfers. LPDMA interrupts can cause the device to exit Stop mode.
Standby	The LPDMA is powered down and must be reinitialized after exiting Standby mode.

1. Refer to *Section 28.3.2* to know which Stop mode is supported.

28.7 LPDMA interrupts

There is one LPDMA interrupt line for each channel, and separately for each CPU (if several ones in the devices).

Table 225. LPDMA interrupt requests

Interrupt acronym	Interrupt event	Interrupt enable	Event flag	Event clear method
LPDMA_CHx	Transfer complete	LPDMA_CxCR.TCIE	LPDMA_CxSR.TCF	Write 1 to LPDMA_CxFCR.TCF
	Half transfer	LPDMA_CxCR.HTIE	LPDMA_CxSR.HTF	Write 1 to LPDMA_CxFCR.HTF
	Data transfer error	LPDMA_CxCR.DTEIE	LPDMA_CxSR.DTEF	Write 1 to LPDMA_CxFCR.DTEF
	Update link error	LPDMA_CxCR.ULEIE	LPDMA_CxSR.ULEF	Write 1 to LPDMA_CxFCR.ULEF
	User setting error	LPDMA_CxCR.USEIE	LPDMA_CxSR.USEF	Write 1 to LPDMA_CxFCR.USEF
	Suspended	LPDMA_CxCR.SUSPIE	LPDMA_CxSR.SUSPF	Write 1 to LPDMA_CxFCR.SUSPF
	Trigger overrun	LPDMA_CxCR.TOFIE	LPDMA_CxSR.TOF	Write 1 to LPDMA_CxFCR.TOF

A LPDMA channel x event may be:

- a transfer complete
- a half-transfer complete
- a transfer error, due to either:
  - a data transfer error
  - an update link error
  - a user setting error completed suspension
- a trigger overrun

Note: When a channel x transfer complete event occurs, the output signal lpdma_chx_tc is generated as a high pulse of one clock cycle.

An interrupt is generated following any xx event, provided that both:

- the corresponding interrupt event xx is enabled (LPDMA_CxCR.xxIE = 1)
- the corresponding event flag is cleared (LPDMA_CxSR.xxF = 0). This means that, after a previous same xx event occurrence, a software agent must have written 1 into the corresponding xx flag clear control bit (write 1 into LPDMA_CxFCR.xxF).

TCF (transfer complete) and HTF (half transfer) events generation is controlled by LPDMA_CxTR2.TCEM[1:0] as follows:

- A transfer complete event is a block transfer complete or a LLI transfer complete including the upload of the next LLI if any, or the full linked-list completion, depending on the transfer complete event mode LPDMA_CxTR2.TCEM[1:0].
- A half transfer event is a half block transfer. A half-block transfer occurs when half of the source block size bytes (rounded-up integer of LPDMA_CxBR1.BNDT[15:0] / 2) is transferred to the destination.

See *LPDMA channel x transfer register 2 (LPDMA_CxTR2)* for more details.

A transfer error rises in one of the following situations:

- during a single data transfer from the source or to the destination (DTEF)
- during an update of a LPDMA channel register from the programmed LLI in memory (ULEF)
- during a tentative execution of a LPDMA channel with an unauthorized setting (USEF)

  The user must perform a debug session to correct the LPDMA channel programming versus the USEF root causes list (see *Section 28.4.17*).

A trigger overrun is described in *Trigger hit memorization and trigger overrun flag generation*.

28.8 LPDMA registers

The LPDMA registers must be accessed with an aligned 32-bit word data access.

28.8.1 LPDMA secure configuration register (LPDMA_SECCFGR)

Address offset: 0x000

Reset value: 0x0000 0000

A write access is ignored at bit level if the corresponding channel x is locked (LPDMA_RCFGLOCKR.LOCKx = 1).

A write access to this register must be secure and privileged. A read access is secure or nonsecure, privileged or unprivileged, and with any CID.

This register can mix information from different CIDs. If a channel x is configured as CID filtered (LPDMA_CxCIDCFGR.CFEN = 1), the SECx bit can be written only by an authorized CID (and secure and privileged) agent. If the debug domain feature is activated, a write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register must be written when LPDMA_CxCR.EN = 0.

This register is read-only when LPDMA_CxCR.EN = 1.

This register must be programmed at a bit level, at the initialization/closure of a LPDMA channel (when LPDMA_CxCR.EN = 0), to securely allocate individually any channel x to the secure or nonsecure world.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEC3	SEC2	SEC1	SEC0
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **SECx**: secure state of channel x (x = 3 to 0)

0: nonsecure

1: secure

28.8.2 LPDMA privileged configuration register (LPDMA_PRIVCFGR)

Address offset: 0x004

Reset value: 0x0000 0000

A write access to this register must be privileged. A read access can be privileged or unprivileged, secure or nonsecure, and with any CID.

A write access is ignored at bit level if the corresponding channel x is locked (GPDMA_RCFGLOCKR.LOCKx = 1).

This register can mix secure and nonsecure information. If a channel x is configured as secure (LPDMA_SECCFGR.SECx = 1), the PRIVx bit can be written only by a secure (and privileged) agent.

This register can mix information from different CIDs. If a channel x is configured as CID filtered (LPDMA_CxCIDCFGR.CFEN = 1), the SECx bit can be written only by an authorized CID (and secure and privileged) agent. If the debug domain feature is activated, a write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register must be written when LPDMA_CxCR.EN = 0.

This register is read-only when LPDMA_CxCR.EN = 1.

This register must be programmed at a bit level, at the initialization/closure of a LPDMA channel (LPDMA_CxCR.EN = 0), to individually allocate any channel x to the privileged or unprivileged world.

												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **PRIVx**: privileged state of channel x (x = 3 to 0)
0: unprivileged
1: privileged

28.8.3 LPDMA configuration lock register (LPDMA_RCFGLOCKR)

Address offset: 0x008

Reset value: 0x0000 0000

This register can be written by a software agent with secure privileged and trusted domain CID attributes in order to individually lock, for example at boot time, the secure privileged and CID attributes of any DMA channel/resource (to lock the setting of LPDMA_SECCFGR, LPDMA_PRIVCFGR, and LPDMA_CxCIDCFGR for any channel x, for example at boot time).

A read access may be privileged or unprivileged, secure or nonsecure, and with any CID.

Note: If TZEN = 0, this register cannot be written.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCK3	LOCK2	LOCK1	LOCK0
												rs	rs	rs	rs

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **LOCKx**: lock the configuration of LPDMA_SECCFGR.SECx, LPDMA_PRIVCFGR.PRIVx, and LPDMA_CxCIDCFGR until a global DMA reset (x = 3 to 0)

This bit is cleared after reset and, once set, it cannot be reset until a global DMA reset.

0: secure privilege and CID configuration of the channel x is writable.

1: secure privilege and CID configuration of the channel x is not writable.

28.8.4 LPDMA nonsecure masked interrupt status register (LPDMA_MISR)

Address offset: 0x00C

Reset value: 0x0000 0000

This register is a read register.

This is a nonsecure register, containing the masked interrupt status bit MISx for each nonsecure channel x (channel x configured with LPDMA_SECCFGR.SECx = 0). It is a logical OR of all the flags of LPDMA_CxSR, each source flag being enabled by the corresponding interrupt enable bit of LPDMA_CxCR.

Every bit is de-asserted by hardware when writing 1 to the corresponding flag clear bit in LPDMA_CxFCR.

If a channel x is in secure state (LPDMA_SECCFGR.SECx = 1), a read access to the masked interrupt status bit MISx of this channel x returns zero.

This register may mix privileged and unprivileged information, depending on the privileged state of each channel LPDMA_PRIVCFGR.PRIVx. A privileged software can read the full nonsecure interrupt status. An unprivileged software is restricted to read the status of unprivileged (and nonsecure) channel(s), other privileged bit fields returning zero.

This register can mix information of different CID values, depending on the CID of each channel (LPDMA_CxCIDCFGR register). A given CIDy software is unable to read the

masked interrupt status bit MISx of a channel x, if this channel is CID-filtered (LPDMA_CxCIDCFGR.CFEN=1) and is under the control of a software with a different CID value than the CIDy (then read as zero). If debug domain feature is activated, a read access to this register is granted to the debug domain CID, regardless of any CID filtering.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MIS3	MIS2	MIS1	MIS0
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **MISx**: masked interrupt status of channel x (x = 3 to 0)
0: no interrupt occurred on nonsecure channel x
1: an interrupt occurred on nonsecure channel x

28.8.5 LPDMA secure masked interrupt status register (LPDMA_SMISR)

Address offset: 0x010

Reset value: 0x0000 0000

This is a secure read register, containing the masked interrupt status bit MISx for each secure channel x (LPDMA_SECCFGR.SECx = 1). It is a logical OR of all the LPDMA_CxSR flags, each source flag being enabled by the corresponding LPDMA_CxCR interrupt enable bit.

Every bit is de-asserted by hardware when securely writing 1 to the corresponding LPDMA_CxFCR flag clear bit.

This register does not contain any information about a nonsecure channel.

This register can mix privileged and unprivileged information, depending on the privileged state of each channel LPDMA_PRIVCFGR.PRIVx. A privileged software can read the full secure interrupt status. An unprivileged software is restricted to read the status of unprivileged and secure channels, other privileged bit fields returning zero.

This register can mix information of different CID values, depending on the CID of each channel (LPDMA_CxCIDCFGR register). A given CIDy software is unable to read the masked interrupt status bit MISx of a channel x, if this channel is CID-filtered (LPDMA_CxCIDCFGR.CFEN=1) and is under the control of a software with a different CID value than the CIDy (then read as zero). If debug domain feature is activated, a read access to this register is granted to the debug domain CID, regardless of any CID filtering.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MIS3	MIS2	MIS1	MIS0
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **MISx**: masked interrupt status of the secure channel x (x = 3 to 0)
0: no interrupt occurred on the secure channel x
1: an interrupt occurred on the secure channel x

28.8.6 LPDMA channel x linked-list base address register (LPDMA_CxLBAR)

Address offset: 0x050 + 0x80 * x (x = 0 to 3)

Reset value: 0x0000 0000

This register must be written by a privileged software. It is either privileged readable or not, depending on the privileged state of the channel x LPDMA_PRIVCFGR.PRIVx.

This register is either secure or nonsecure depending on the secure state of the channel x (LPDMA_SECCFGR.SECx).

This register is CID-filtered depending on the CID configuration of the channel x (LPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register must be written when LPDMA_CxCR.EN = 0.

This register is read-only when LPDMA_CxCR.EN = 1.

This channel-based register is the linked-list base address of the memory region, for a given channel x, from which the LLIs describing the programmed sequence of the LPDMA transfers, are conditionally and automatically updated.

This 64-Kbyte aligned channel x linked-list base address is offset by the 16-bit LPDMA_CxLLR register that defines the word-aligned address offset for each LLI.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:16 **LBA[31:16]**: linked-list base address of LPDMA channel x

Bits 15:0 Reserved, must be kept at reset value.

28.8.7 LPDMA channel x CID register (LPDMA_CxCIDCFGR)

Address offset: 0x054 + 0x80 * x (x = 0 to 3)

Reset value: 0x0000 0000

This channel-based register can be written by the secure, privileged, trusted domain CID, in order to individually configure the CID allocation of any LPDMA channel x.

This register must be written when the CID configuration of channel x is unlocked (LPDMA_RCFGLOCKR.LOCKx = 0) and when channel x is disabled (LPDMA_CxCR.EN = 0).

This register is read-only when LPDMA_RCFGLOCKR.LOCKx = 1 or LPDMA_CxCR.EN = 1.

A read access may be privileged or unprivileged, secure or nonsecure, and with any CID.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEM_WLIST_CID3	SEM_WLIST_CID2	SEM_WLIST_CID1	SEM_WLIST_CID0

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCID[1:0]		Res.	Res.	SEM_EN	CFEN
										rw	rw			rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **SEM_WLIST_CID3**: white-listed CID3 in the CID allocation pool (of channel x in semaphore mode)
- 0: CID3 black-listed in the CID allocation pool (of channel x in semaphore mode)
- 1: CID3 white-listed in the CID allocation pool (of channel x in semaphore mode)

Bit 18 **SEM_WLIST_CID2**: white-listed CID2 in the CID allocation pool (of channel x in semaphore mode)
- 0: CID2 black-listed in the CID allocation pool (of channel x in semaphore mode)
- 1: CID2 white-listed in the CID allocation pool (of channel x in semaphore mode)

Bit 17 **SEM_WLIST_CID1**: white-listed CID1 in the CID allocation pool (of channel x in semaphore mode)
- 0: CID1 black-listed in the CID allocation pool (of the channel x in semaphore mode)
- 1: CID1 white-listed in the CID allocation pool (of the channel x in semaphore mode)

Bit 16 **SEM_WLIST_CID0**: white-listed CID0 in the CID allocation pool (of channel x in semaphore mode)
- 0: CID0 black-listed in the CID allocation pool (of channel x in semaphore mode)
- 1: CID0 white-listed in the CID allocation pool (of channel x in semaphore mode)

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:4 **SCID[1:0]**: static CID selection to channel x
- 00: CID0 allocated to channel x
- 01: CID1 allocated to channel x
- 10: CID2 statically allocated to channel x
- 11: CID3 allocated to channel x

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **SEM_EN**: semaphore mode enable (for the CID allocation policy to the channel x)
0: semaphore mode disabled. CID allocation policy to the channel x is defined by SCID[1:0].
1: semaphore mode enabled. CID allocation policy to the channel x is defined by the white-listed allocation pool SEM_WLIST_CIDx and LPDMA_CxSEMCR.SEM_MUTEX.
Note: If SEM_EN = 1 and if a trusted domain or debug domain CID agent clears this bit, then the LPDMA hardware automatically clears the LPDMA_CxSEMCR.SEM_MUTEX.

Bit 0 **CFEN**: CID filtering enable of the channel x
0: CID filtering disabled for when accessing a channel x register/field
1: CID filtering enabled for when accessing a channel x register/field
Note: If SCFEN = 1 and if a trusted domain or debug domain CID agent clears this bit, then the LPDMA hardware automatically clears the LPDMA_CxSEMCR.SEM_MUTEX.

28.8.8 LPDMA channel x semaphore control register (LPDMA_CxSEMCR)

Address offset: 0x058 + 0x80 * x (x = 0 to 3)

Reset value: 0x0000 0000

When the secure, privileged and trusted domain has set up the channel x in semaphore mode (LPDMA_CxCIDCFGR.SEM_EN = 1), this register is used during run-time by an authorized white-listed CID agent in order to take and after possibly release the control of the channel x.

A read access may be privileged or unprivileged, secure or nonsecure, and with any CID.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEM_CCID[1:0]		Res.	Res.	Res.	SEM_MUTEX
										r	r				rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:4 **SEM_CCID[1:0]**: current CID allocated to channel x in semaphore mode
This read-only field is internally updated when a white-listed CID takes the control of channel x, in semaphore mode. If SEM_MUTEX = 0, this same CID also released it.
00: CID0 is the last white-listed CID that took the control of channel x
01: CID1 is the last white-listed CID that took the control of channel x
10: CID2 is the last white-listed CID that took the control of channel x
11: CID3 is the last white-listed CID that took the control of the channel x

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **SEM_MUTEX**: mutex exclusion semaphore for the CID allocation of channel x (in semaphore mode)

If the channel x is in secure state (LPDMA_SECCFGR.SECx = 1), this bit can only be written by a secure agent. If the channel x is in privileged state (LPDMA_PRIVCFGR.PRIVx = 1), this bit can only be written by a privileged agent.

If the channel x is CID-filtered (LPDMA_CxCIDCFGR.CFEN = 1) and in semaphore mode (LPDMA_CIDCFGR.SEM_EN = 1), this bit can only be written either by an authorized (white-listed) CID agent to take the control, or by the same (white-listed) CID agent to release the control.

– Condition ‘On write’:

0: release the control of the channel x (in semaphore mode) to any white-listed CID

1: take the control of the channel x (in semaphore mode), from one of the white-listed CID pool

– Condition ‘On read’:

0: channel x CID-free (not currently under the control of any white-listed CID)

1: channel x CID-allocated (currently taken and under the control of one white-listed CID)

Note: This bit must be written when LPDMA_CxCR.EN = 0. This bit is read-only when LPDMA_CxCR.EN = 1.

When EN of CFEN bit is cleared in LPDMA_CxSEMCR, the LPDMA hardware automatically clears this SEM_MUTEX bit.

28.8.9 LPDMA channel x flag clear register (LPDMA_CxFCR)

Address offset: 0x05C+ 0x80 * x (x = 0 to 3)

Reset value: 0x0000 0000

This is a write register, secure or nonsecure depending on the secure state of channel x (LPDMA_SECCFGR.SECx) and privileged or non-privileged, depending on the privileged state of the channel x (LPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (LPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **TOF**: trigger overrun flag clear

0: no effect

1: clears the corresponding TOF flag

Bit 13 **SUSPF**: completed suspension flag clear

0: no effect

1: corresponding SUSPF flag cleared

Bit 12 **USEF**: user setting error flag clear
0: no effect
1: corresponding USEF flag cleared

Bit 11 **ULEF**: update link transfer error flag clear
0: no effect
1: corresponding ULEF flag cleared

Bit 10 **DTEF**: data transfer error flag clear
0: no effect
1: corresponding DTEF flag cleared

Bit 9 **HTF**: half transfer flag clear
0: no effect
1: corresponding HTF flag cleared

Bit 8 **TCF**: transfer complete flag clear
0: no effect
1: corresponding TCF flag cleared

Bits 7:0 Reserved, must be kept at reset value.

28.8.10 LPDMA channel x status register (LPDMA_CxSR)

Address offset: 0x060 + 0x80 * x (x = 0 to 3)

Reset value: 0x0000 0001

This is a read register, reporting the channel status.

This register is secure or nonsecure, depending on the secure state of channel x (LPDMA_SECCFGR.SECx), and privileged or non-privileged, depending on the privileged state of the channel (LPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (LPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	TOF	SUSPF	USEF	ULEF	DTEF	HTF	TCF	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IDLEF
	r	r	r	r	r	r	r								r

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **TOF**: trigger overrun flag clear
0: no effect
1: clears the corresponding TOF flag

Bit 13 **SUSPF**: completed suspension flag
0: no completed suspension event
1: a completed suspension event occurred

Bit 12 **USEF**: user setting error flag
0: no user setting error event
1: a user setting error event occurred

Bit 11 **ULEF**: update link transfer error flag
0: no update link transfer error event
1: a master bus error event occurred while updating a linked-list register from memory

Bit 10 **DTEF**: data transfer error flag
0: no data transfer error event
1: a master bus error event occurred on a data transfer

Bit 9 **HTF**: half transfer flag
0: no half transfer event
1: a half transfer event occurred
A half transfer event is a half block transfer that occurs when half of the bytes of the source block size (rounded-up integer of LPDMA_CxBR1.BNDT[15:0] / 2) has been transferred to the destination.

Bit 8 **TCF**: transfer complete flag
0: no transfer complete event
1: a transfer complete event occurred
A transfer complete event is a block transfer complete or a LLI transfer complete including the upload of the next LLI if any, or the full linked-list completion, depending on the transfer complete event mode LPDMA_CxTR2.TCEM[1:0].

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **IDLEF**: idle flag
0: channel not in idle state
1: channel in idle state
This idle flag is de-asserted by hardware when the channel is enabled (LPDMA_CxCR.EN = 1) with a valid channel configuration (no USEF to be immediately reported).
This idle flag is asserted after hard reset or by hardware when the channel is back in idle state (in suspended or disabled state).

28.8.11 LPDMA channel x control register (LPDMA_CxCR)

Address offset: 0x64 + 0x80 * x (x = 0 to 3)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (LPDMA_SECCFGR.SECx), and privileged or non-privileged, depending on the privileged state of the channel x (LPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (LPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register is used to control a channel (activate, suspend, abort or disable it).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIO[1:0]		Res.	Res.	Res.	Res.	Res.	LSM

	rw	rw	rw	rw	rw	rw	rw						rw	w	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:22 **PRIO[1:0]:** priority level of the channel x LPDMA transfer versus others
00: low priority, low weight
01: low priority, mid weight
10: low priority, high weight
11: high priority
Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bits 21:17 Reserved, must be kept at reset value.

Bit 16 **LSM**: Link step mode
0: channel executed for the full linked-list and completed at the end of the last LLI (LPDMA_CxLLR = 0). The 16 low-significant bits of the link address are null (LA[15:0] = 0) and all the update bits are null (UT1 = UB1 = UT2 = USA = UDA = ULL = 0). Then LPDMA_CxBR1.BNDT[15:0] = 0.
1: channel executed **once** for the current LLI
First the block transfer is executed as defined by the current internal register file until LPDMA_CxBR1.BNDT[15:0] = 0). Secondly the next linked-list data structure is conditionally uploaded from memory as defined by LPDMA_CxLLR. Then channel execution is completed.
Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bit 15 Reserved, must be kept at reset value.

Bit 14 **TOIE**: trigger overrun interrupt enable
0: interrupt disabled
1: interrupt enabled

Bit 13 **SUSPIE**: completed suspension interrupt enable
0: interrupt disabled
1: interrupt enabled

Bit 12 **USEIE**: user setting error interrupt enable
0: interrupt disabled
1: interrupt enabled

Bit 11 **ULEIE**: update link transfer error interrupt enable
0: interrupt disabled
1: interrupt enabled

Bit 10 **DTEIE**: data transfer error interrupt enable
0: interrupt disabled
1: interrupt enabled

Bit 9 **HTIE**: half transfer complete interrupt enable
0: interrupt disabled
1: interrupt enabled

Bit 8 **TCIE**: transfer complete interrupt enable
0: interrupt disabled
1: interrupt enabled

Bits 7:3 Reserved, must be kept at reset value.

Bit 2 **SUSP:** suspend
Writing 1 into the field RESET (bit 1) causes the hardware to de-assert this bit, whatever is written into this bit 2. Else:
Software must write 1 in order to suspend an active channel (with an ongoing DMA transfer over its master ports).
The software must write 0 in order to resume a suspended channel, following the programming sequence detailed in *Figure 179*.
0: write: resume channel, read: channel not suspended
1: write: suspend channel, read: channel suspended.

Bit 1 **RESET:** reset
This bit is write only. Writing 0 has no impact. Writing 1 implies the reset of the following: the channel internal state, SUSP and EN bits (whatever is written receptively in bit 2 and bit 0).
The reset is effective when the channel is in steady state, meaning one of the following:
- active channel in suspended state (LPDMA_CxSR.SUSPF = 1 and LPDMA_CxSR.IDLEF = LPDMA_CxCR.EN = 1)
- channel in disabled state (LPDMA_CxSR.IDLEF = 1 and LPDMA_CxCR.EN = 0).
After writing a RESET, to continue using this channel, the user must explicitly reconfigure the channel including the hardware-modified configuration registers (LPDMA_CxBR1, LPDMA_CxSAR and LPDMA_CxDAR) before enabling again the channel (see the programming sequence in *Figure 180*).
0: no channel reset
1: channel reset

Bit 0 **EN:** enable
Writing 1 into the field RESET (bit 1) causes the hardware to de-assert this bit, whatever is written into this bit 0. Else:
this bit is de-asserted by hardware when there is a transfer error (master bus error or user setting error) or when there is a channel transfer complete (channel ready to be configured, for example: if LSM = 1 at the end of a single execution of the LLI).
Else, this bit can be asserted by software.
Writing 0 into this EN bit is ignored.
0: write: ignored, read: channel disabled
1: write: enable channel, read: channel enabled

28.8.12 LPDMA channel x transfer register 1 (LPDMA_CxTR1)

Address offset: 0x090 + 0x80 * x (x = 0 to 3)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (LPDMA_SECCFGR.SECx) except for secure DSEC and SSEC, privileged or non-privileged, depending on the privileged state of the channel x in LPDMA_PRIVCFGR.PRIVx.

This register is CID-filtered depending on the CID configuration of the channel x (LPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x.

This register must be written when LPDMA_CxCR.EN = 0.

This register is read-only when LPDMA_CxCR.EN = 1.

This register must be written when the channel is completed. Then the hardware has deasserted LPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block or LLI or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by LPDMA from the memory if LPDMA_CxLLR.UT1 = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DSEC	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DINC	Res.	DDW_LOG2[1:0]	
rw												rw		rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SSEC	Res.	Res.	Res.	PAM	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SINC	Res.	SDW_LOG2[1:0]	
rw				rw								rw		rw	rw

Bit 31 **DSEC**: security attribute of the LPDMA transfer to the destination

If LPDMA_SECCFGR.SECx = 1 and the access is secure:

0: LPDMA transfer nonsecure

1: LPDMA transfer secure

This is a secure register bit. This bit can only be read by a secure software. This bit must be written by a secure software when LPDMA_SECCFGR.SECx = 1. A secure write is ignored when LPDMA_SECCFGR.SECx = 0.

When LPDMA_SECCFGR.SECx is de-asserted, this DSEC bit is also de-asserted by hardware (on a secure reconfiguration of the channel as nonsecure), and the LPDMA transfer to the destination is nonsecure.

Bits 30:20 Reserved, must be kept at reset value.

Bit 19 **DINC**: destination incrementing single

0: fixed single

1: contiguously incremented single

The destination address, pointed by LPDMA_CxDAR, is kept constant after a single transfer, or is incremented by the offset value corresponding to a contiguous data after a single transfer.

Bit 18 Reserved, must be kept at reset value.

Bits 17:16 **DDW_LOG2[1:0]**: binary logarithm of the destination data width of a single in bytes
00: byte
01: half-word (2 bytes)
10: word (4 bytes)
11: user setting error reported and no transfer issued

Note: Setting a 8-byte data width causes a user setting error to be reported and none transfer is issued.
A destination single transfer must have an aligned address with its data width (start address LPDMA_CxDAR[2:0] versus DDW_LOG2[1:0]). Otherwise a user setting error is reported and none transfer is issued.

Bit 15 **SSEC**: security attribute of the LPDMA transfer from the source
If LPDMA_SECCFGR.SECx = 1 and the access is secure:
0: LPDMA transfer nonsecure
1: LPDMA transfer secure
This is a secure register bit. This bit can only be read by a secure software. This bit must be written by a secure software when LPDMA_SECCFGR.SECx =1 . A secure write is ignored when LPDMA_SECCFGR.SECx = 0.
When LPDMA_SECCFGR.SECx is de-asserted, this SSEC bit is also de-asserted by hardware (on a secure reconfiguration of the channel as nonsecure), and the LPDMA transfer from the source is nonsecure.

Bits 14:12 Reserved, must be kept at reset value.

Bit 11 **PAM**: padding/alignment mode
If DDW_LOG2[1:0] = SDW_LOG2[1:0]: if the data width of a single destination transfer is equal to the data width of a single source transfer, this bit is ignored.
Else, in the following enumerated values, the condition PAM_1 is when destination data width is higher that source data width, and the condition PAM_2 is when destination data width is higher than source data width.
Condition: PAM_1
0: source data is transferred as right aligned, padded with 0s up to the destination data width
1: source data is transferred as right aligned, sign extended up to the destination data width
Condition: PAM_2
0: source data is transferred as right aligned, left-truncated down to the destination data width
1: source data is transferred as left-aligned, right-truncated down to the destination data width

Bits 10:4 Reserved, must be kept at reset value.

Bit 3 **SINC**: source incrementing single
0: fixed single
1: contiguously incremented single
The source address, pointed by LPDMA_CxSAR, is kept constant after a single transfer or is incremented by the offset value corresponding to a contiguous data after a single transfer.

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **SDW_LOG2[1:0]**: binary logarithm of the source data width of a single in bytes
00: byte
01: half-word (2 bytes)
10: word (4 bytes)
11: user setting error reported and no transfer issued

Note: Setting a 8-byte data width causes a user setting error to be reported and none transfer is issued.
a source block size must be a multiple of the source data width (LPDMA_CxBR1.BNDT[2:0] versus SDW_LOG2[1:0]). Otherwise, a user setting error is reported and no transfer is issued.
A source single transfer must have an aligned address with its data width (start address LPDMA_CxSAR[2:0] versus SDW_LOG2[1:0]). Otherwise, a user setting error is reported and none transfer is issued.

28.8.13 LPDMA channel x transfer register 2 (LPDMA_CxTR2)

Address offset: 0x094 + 0x80 * x (x = 0 to 3)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (LPDMA_SECCFGR.SECx), and privileged or non-privileged, depending on the privileged state of channel x (LPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (LPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x.

This register must be written when LPDMA_CxCR.EN = 0.

This register is read-only when LPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (the hardware de-asserted LPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block or LLI or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by LPDMA from the memory, if LPDMA_CxLLR.UT2 = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TCEM[1:0]		Res.	Res.	Res.	Res.	TRIGPOL[1:0]		Res.	Res.	Res.	TRIGSEL[4:0]				
rw	rw					rw	rw				rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRIGM[1:0]		Res.	PFREQ	BREQ	Res.	SWREQ	Res.	Res.	Res.	Res.	REQSEL[4:0]				
rw	rw		rw	rw		rw					rw	rw	rw	rw	rw

Bits 31:30 **TCEM[1:0]**: transfer complete event mode

These bits define the transfer granularity for the transfer complete and half transfer complete events generation.

00: at block level (when LPDMA_CxBR1.BNDT[15:0] = 0): the complete (and the half) transfer event is generated at the (respectively half of the) end of a block.

Note: If the initial LLI_0 data transfer is null/void (directly programmed by the internal register file with LPDMA_CxBR1.BNDT[15:0] = 0), then neither the complete transfer event nor the half transfer event is generated.

01: same as 00

10: at LLI level: the complete transfer event is generated at the end of the LLI transfer, including the update of the LLI if any. The half transfer event is generated at the half of the LLI data transfer (the LLI data transfer being a block transfer), if any data transfer.

Note: If the initial LLI_0 data transfer is null/void (i.e. directly programmed by the internal register file with LPDMA_CxBR1.BNDT[15:0] = 0), then the half transfer event is not generated, and the transfer complete event is generated when is completed the loading of the LLI_1.

11: at channel level: the complete transfer event is generated at the end of the last LLI transfer. The half transfer event is generated at the half of the data transfer of the last LLI. The last LLI updates the link address LPDMA_CxLLR.LA[15:2] to zero and clears all the LPDMA_CxLLR update bits (UT1, UT2, UB1, USA, UDA and ULL). If the channel transfer is continuous/infinite, no event is generated.

Bits 29:26 Reserved, must be kept at reset value.

Bits 25:24 **TRIGPOL[1:0]**: trigger event polarity

These bits define the polarity of the selected trigger event input defined by TRIGSEL[4:0].

00: no trigger (masked trigger event)

01: trigger on the rising edge

10: trigger on the falling edge

11: same as 00

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **TRIGSEL[4:0]**: trigger event input selection

These bits select the trigger event input of the LPDMA transfer (as per *Section 28.3.6*), with an active trigger event if TRIGPOL[1:0] = 00.

Bits 15:14 **TRIGM[1:0]**: trigger mode

These bits define the transfer granularity for its conditioning by the trigger.

If the channel x is enabled (LPDMA_CxCR.EN asserted) with TRIGPOL[1:0] = 0b00 or 0b11, these TRIGM[1:0] bits are ignored.

Else, a DMA transfer is conditioned by at least one trigger hit:

00: at block level: the first single read of each block transfer is conditioned by one hit trigger.

01: same as 00

10: at link level: a LLI link transfer is conditioned by one hit trigger. The LLI data transfer (if any) is not conditioned.

11: at programmed single level: each programmed single read is conditioned by one hit trigger.

The LPDMA monitoring of a trigger for channel x is started when the channel is enabled/loaded with a new active trigger configuration: rising or falling edge on a selected trigger (TRIGPOL[1:0] = 0b01 or respectively TRIGPOL[1:0] = 0b10).

The monitoring of this trigger is kept active during the triggered and uncompleted (data or link) transfer; and if a new trigger is detected then, this hit is internally memorized to grant the next transfer, as long as the defined rising or falling edge is not modified, and the TRIGSEL[4:0] is not modified, and the channel is enabled.

Transferring a next LLI_{n+1} that updates the LPDMA_CxTR2 with a new value for any of TRIGSEL[4:0] or TRIGPOL[1:0], resets the monitoring, trashing the memorized hit of the formerly defined LLI_n trigger.

After a first new trigger hit_{n+1} is memorized, if another second trigger hit_{n+2} is detected and if the hit_n triggered transfer is still not completed, hit_{n+2} is lost and not memorized, and a trigger overrun flag is reported (LPDMA_CxSR.TOF = 1), an interrupt is generated if enabled (LPDMA_CxCR.TOIE = 1). The channel is not automatically disabled by hardware due to a trigger overrun.

Bit 13 Reserved, must be kept at reset value.

Bit 12 **PFREQ**: Hardware request in peripheral flow control mode

Important: If a given channel x is not implemented with this feature, this bit is reserved and PFREQ is not present (see Section 28.3.5 for the list of the implemented channels with this feature.

If the channel x is activated (LPDMA_CxCR.EN asserted) with SWREQ = 1 (software request for a memory-to-memory transfer), this bit is ignored. Else:

0: the selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol in LPDMA control mode. The LPDMA is programmed with LPDMA_CxCBR1.BNDT[15:0] and this is internally used by the hardware for the block transfer completion.

1: the selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol in peripheral control mode. The LPDMA block transfer can be early completed by the peripheral itself (see *Section 28.3.5* for more details).

Bit 11 **BREQ**: block hardware request

If the channel x is activated (LPDMA_CxCR.EN asserted) with SWREQ = 1 (software request for a memory-to-memory transfer), this bit is ignored. Else:

0: the selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol at a single level.

1: the selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol at a block level (see *Section 28.3.4*).

Bit 10 Reserved, must be kept at reset value.

Bit 9 **SWREQ**: software request

This bit is internally taken into account when LPDMA_CxCR.EN is asserted.

0: no software request. The selected hardware request REQSEL[4:0] is taken into account.

1: software request for a memory-to-memory transfer. The default selected hardware request as per REQSEL[4:0] is ignored.

Bits 8:5 Reserved, must be kept at reset value.

Bits 4:0 **REQSEL[4:0]**: DMA hardware request selection

These bits are ignored if channel x is activated (LPDMA_CxCR.EN asserted) with SWREQ = 1 (software request for a memory-to-memory transfer). Else, the selected hardware request is internally taken into account as per *Section 28.3.3*.

Caution: The user must not assign a same input hardware request (same REQSEL[4:0] value) to different active DMA channels (LPDMA_CxCR.EN = 1 and LPDMA_CxTR2.SWREQ = 0 for these channels). DMA is not intended to hardware support the case of simultaneous enabled channels incorrectly configured with a same hardware peripheral request signal, and there is no user setting error reporting.

28.8.14 LPDMA channel x block register 1 (LPDMA_CxBR1)

Address offset: 0x098 + 0x80 * x (x = 0 to 3)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (LPDMA_SECCFGR.SECx), and privileged or non-privileged, depending on the privileged state of channel x (LPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (LPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x at a block level.

This register must be written when LPDMA_CxCR.EN = 0.

This register is read-only when LPDMA_CxCR.EN = 1.

This register must be written when channel x is completed (then the hardware has de-asserted LPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, or LLI or full linked-list.

In linked-list mode, during the link transfer:

- if LPDMA_CxLLR.UB1 = 1, this register is automatically updated by DMA from the next LLI in memory.
- If LPDMA_CxLLR.UB1 = 0 and if there is at least one linked-list register to be updated from the next LLI in memory, this register is automatically and internally restored with the programmed values for the field BNDT[15:0].
- If all the update bits LPDMA_CxLLR.Uxx are null and if LPDMA_CxLLR.LA[15:0] # 0, the current LLI is the last one and is continuously executed: this register is

automatically and internally restored with the programmed value for BNDT[15:0] after each execution of this final LLI

- If LPDMA_CxLLR = 0, this register and BNDT[15:0] are kept as null, channel x is completed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BNDT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **BNDT[15:0]**: block number of data bytes to transfer from the source

Block size transferred from the source. When the channel is enabled, this field becomes read-only and is decremented, indicating the remaining number of data items in the current source block to be transferred. BNDT[15:0] is programmed in number of bytes, maximum source block size is 64 Kbytes -1.

Once the last data transfer is completed (BNDT[15:0] = 0):

- if LPDMA_CxLLR.UB1 = 1, this field is updated by the LLI in the memory.
- if LPDMA_CxLLR.UB1 = 0 and if there is at least one non null Uxx update bit, this field is internally restored to the programmed value.
- if all LPDMA_CxLLR.Uxx = 0 and if LPDMA_CxLLR.LA[15:0] = 0, this field is internally restored to the programmed value (infinite/continuous last LLI).
- if LPDMA_CxLLR = 0, this field is kept as zero following the last LLI data transfer.

Note: A non-null source block size must be a multiple of the source data width (BNDT[2:0] versus LPDMA_CxTR1.SDW_LOG2[1:0]). Else a user setting error is reported and none transfer is issued.

28.8.15 LPDMA channel x source address register (LPDMA_CxSAR)

Address offset: 0x09C + 0x80 * x (x = 0 to 3)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (LPDMA_SECCFGR.SECx), and privileged or non-privileged, depending on the privileged state of channel x (LPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (LPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register configures the source start address of a transfer.

This register must be written when LPDMA_CxCR.EN = 0.

This register is read-only when LPDMA_CxCR.EN = 1, and continuously updated by hardware, in order to reflect the address of the next single transfer from the source.

This register must be written when the channel is completed (then the hardware has deasserted LPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block or LLI or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by LPDMA from the memory if LPDMA_CxLLR.USA = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SA[31:0]**: source address

This field is the pointer to the address from which the next data is read.

During the channel activity, depending on the source addressing mode (LPDMA_CxTR1.SINC), this field is either kept fixed or incremented by the data width (LPDMA_CxTR1.SDW_LOG2[1:0]) after each single source data, reflecting the next address from which data is read.

In linked-list mode, after a LLI data transfer is completed, this register is automatically updated by LPDMA from the memory, provided the LLI is set with LPDMA_CxLLR.USA = 1.

Note: A source address must be aligned with the programmed data width of a source single (SA[32:0] versus LPDMA_CxTR1.SDW_LOG2[1:0]). Else, a user setting error is reported and no transfer is issued.

28.8.16 LPDMA channel x destination address register (LPDMA_CxDAR)

Address offset: 0x0A0 + 0x80 * x (x = 0 to 3)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (LPDMA_SECCFGR.SECx), and privileged or non-privileged, depending on the privileged state of channel x (LPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (LPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register configures the destination start address of a transfer.

This register must be written when LPDMA_CxCR.EN = 0.

This register is read-only when LPDMA_CxCR.EN = 1, and continuously updated by hardware, in order to reflect the address of the next single transfer to the destination.

This register must be written when the channel is completed (then the hardware has deasserted LPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block or LLI or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by LPDMA from the memory if LPDMA_CxLLR.UDA = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

DA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DA[31:0]**: destination address

This field is the pointer to the address from which the next data is written.

During the channel activity, depending on the destination addressing mode (LPDMA_CxTR1.DINC), this field is kept fixed or incremented by the data width (LPDMA_CxTR1.DDW_LOG2[1:0]) after each single destination data, reflecting the next address from which data is written.

In linked-list mode, after a LLI data transfer is completed, this register is automatically updated by DMA from the memory, provided the LLI is set with LPDMA_CxLLR.UDA = 1.

Note: A destination address must be aligned with the programmed data width of a destination single (DA[2:0] versus LPDMA_CxTR1.DDW_LOG2[1:0]). Else, a user setting error is reported and no transfer is issued.

28.8.17 LPDMA channel x linked-list address register (LPDMA_CxLLR)

Address offset: 0x0CC + 0x80 * x (x = 0 to 3)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (LPDMA_SECCFGR.SECx), and privileged or non-privileged, depending on the privileged state of channel x (LPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (LPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register configures the data structure of the next LLI in the memory and its address pointer. A channel transfer is completed when this register is null.

This register must be written when LPDMA_CxCR.EN = 0.

This register is read-only when LPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (then the hardware has deasserted LPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block or LLI or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by LPDMA from the memory if LPDMA_CxLLR.ULL = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UT1	UT2	UB1	USA	UDA	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ULL

LA[15:2]														Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		

Bit 31 **UT1**: Update LPDMA_CxTR1 from memory

This bit controls the update of the LPDMA_CxTR1 register from the memory during the link transfer.

0: no LPDMA_CxTR1 update

1: LPDMA_CxTR1 update

Bit 30 **UT2**: Update LPDMA_CxTR2 from memory

This bit controls the update of the LPDMA_CxTR2 register from the memory during the link transfer.

0: no LPDMA_CxTR2 update

1: LPDMA_CxTR2 update

Bit 29 **UB1**: Update LPDMA_CxBR1 from memory

This bit controls the update of the LPDMA_CxBR1 register from the memory during the link transfer.

0: no LPDMA_CxBR1 update from memory and internally restored to the previous programmed value

1: LPDMA_CxBR1 update

Bit 28 **USA**: update LPDMA_CxSAR from memory

This bit controls the update of the LPDMA_CxSAR register from the memory during the link transfer.

0: no LPDMA_CxSAR update

1: LPDMA_CxSAR update

Bit 27 **UDA**: Update LPDMA_CxDAR register from memory
This bit is used to control the update of the LPDMA_CxDAR register from the memory during the link transfer.
0: no LPDMA_CxDAR update
1: LPDMA_CxDAR update

Bits 26:17 Reserved, must be kept at reset value.

Bit 16 **ULL**: Update LPDMA_CxLLR register from memory
This bit is used to control the update of the LPDMA_CxLLR register from the memory during the link transfer.
0: no LPDMA_CxLLR update
1: LPDMA_CxLLR update

Bits 15:2 **LA[15:2]**: pointer (16-bit low-significant address) to the next linked-list data structure
If UT1 = UT2 = UB1 = USA = UDA = ULL = 0 and if LA[15:2] = 0, the current LLI is the last one. The channel transfer is completed without any update of the linked-list DMA register file.
Else, this field is the pointer to the memory address offset from which the next linked-list data structure is automatically fetched from, once the data transfer is completed, in order to conditionally update the linked-list DMA internal register file (LPDMA_CxTR1, LPDMA_CxTR2, LPDMA_CxBR1, LPDMA_CxSAR, LPDMA_CxDAR and LPDMA_CxLLR).

Note: The user must program the pointer to be 32-bit aligned. The two low-significant bits are write ignored.

Bits 1:0 Reserved, must be kept at reset value.

28.8.18 LPDMA hardware configuration 13 register (LPDMA_HWCFGR13)

Address offset: 0xFC0

Reset value: 0x0000 0000

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:28 **G_M1_DATA_WIDTH_ENC[1:0]**: master port 1 data bus width
0: 32-bit
1: 64-bit
2: 128-bit

Bits 27:26 Reserved, must be kept at reset value.

Bits 25:24 **G_M0_DATA_WIDTH_ENC[1:0]**: master port 0 data bus width
0: 32-bit
1: 64-bit
2: 128-bit

Bits 23:20 **G_MAX_CID[3:0]**: maximum compartment ID (CID)
0: no CID support, DMA not CID-aware
1 to 15: DMA CID-aware. Any channel is a separate CID-aware resource. Support of n+1 CIDs (from CID0 up to CIDn).

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **G_TRUSTZONE**:TrustZone
0: no TrustZone
1: TrustZone support

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **G_NUM_CHANNELS[4:0]**: Number of DMA channels

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **G_PRIVILEGE**:
0: no privilege
1: privilege support

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **G_MASTER_PORTS[2:0]**: master ports type
0: one AXI (AXI4)
1: one AHB: port 0 (AHB5)
2: two AHB: port 0 and port 1 (AHB5)
3: one AXI port 0 (AXI4) + one AHB port 1 (AHB5)
4: two AXI: port 0 and port 1 (AXI4)

28.8.31 LPDMA version register (LPDMA_VERR)

Address offset: 0xFF4

Reset value: 0x0000 0013

29 Graphic processing unit (GPU)

29.1 Introduction

The graphic processing unit (GPU) provides a powerful hardware acceleration means for all modern Graphic, but also Neural, and general parallel computing applications.

On the graphic side, the GPU accelerates all typical embedded API, from the older OpenGL/ES family to the most modern API, Vulkan. This wide support guarantees to be able to accelerate any application up to the most recent ones, with graphic performances reaching 25.6 GFlops.

On the neural side, the GPU, by means of its additional specific neural extensions, can accelerate the most widespread frameworks, such as TensorFlowLite, Caffe2, Theano, Darknet, and many others. It guarantees that any recent neural-based application is accelerated efficiently.

On the computing side, the GPU accelerates parallel computing (GPGPU), via the typical OpenCL or Vulkan API, or more image-based APIs such as OpenVX or OpenCV.

The GPU is built in a separate power domain, which allows to switch the GPU off when not used in the long-term, or even to play with dynamic voltage frequency scaling (DVFS).

29.2 GPU main features

The GPU allows simultaneous running of graphic, neural, and computing tasks, each providing the following features.

29.2.1 Graphic Main Features

The GPU graphic hardware acceleration is exposed through the following API:

- OpenVG 1.3 for 2D or Curve drawing.
- OpenGL/ES 3.1 for 3D apps (backward compatible: OES2.1 & OES1.1)
- Vulkan 1.3 for modern 3D apps.

The GPU provides the following graphic theoretical performance, at 800 MHz:

- Vertex: 200 MVtx/s
- Triangle: 133 MTrg/s
- Texel: 800 MTex/s
- Pixel: 800 MPix/s
- Float 16bit: 25.6 GFlops
- Float 32bit: 12.8 GFlops

The GPU benefits from a high bandwidth access to the memory, which, coupled with the above theoretical performance, allows to provide the following benchmarks capabilities:

- Egypt (Game) 48 Fps (1080p, no AntiAliasing, working in DDR with 0.4µs latency)

29.2.2 Computing main features

The GPU computing hardware acceleration is exposed with the following APIs:

- OpenCL 3.0
- Vulkan 1.3
- OpenVX 1.3
- OpenCV non-exhaustive support

Theoretical performance at 800 MHz:

- Float 16bit: 25.6 GFlops
- Float 32bit: 12.8 GFlops

29.2.3 Neural networkmain features

The Neural Features are accelerated by the GPU hardware, though the OpenVX API.

See the NPU chapter for more details about the supported Neural features.

29.2.4 Simultaneous processing of Gfx versus Neural versus computing tasks

The GPU architecture allows different types of task to be run in parallel (simultaneously, but sequentially at frame level), graphic versus neural versus computing.

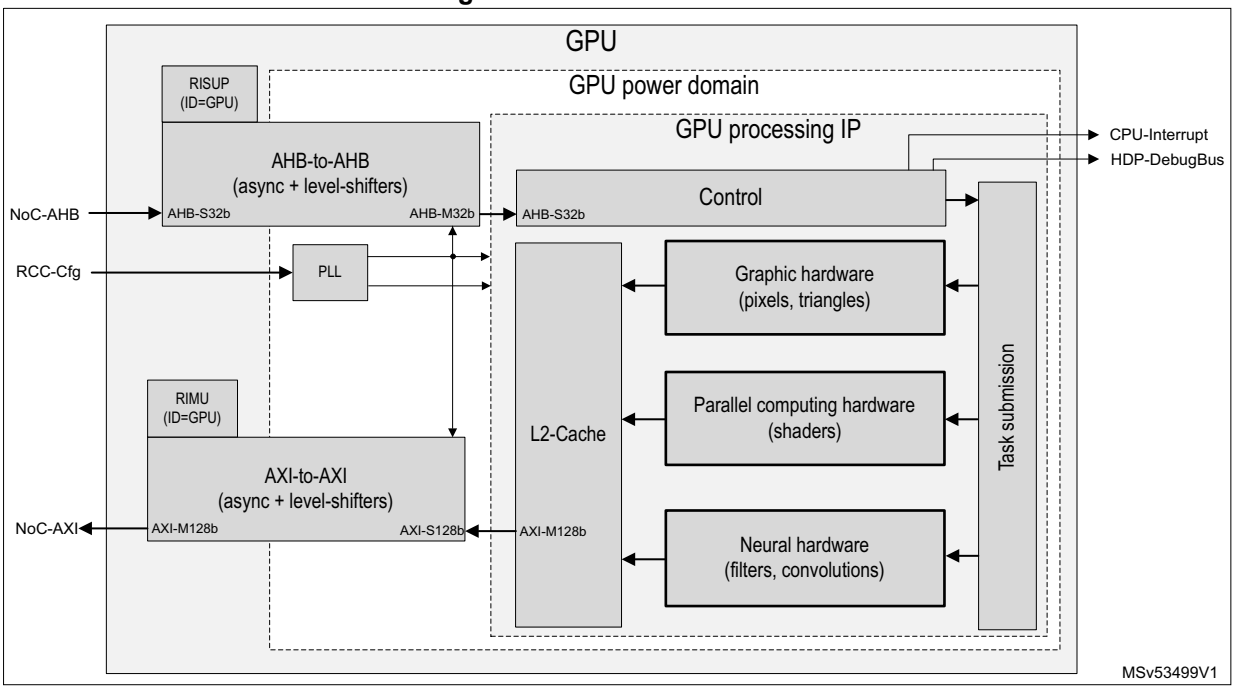
29.3 GPU implementation

The GPU by VeriSilicon provides the following hardware low-level specific features:

- GC8000UL Core, with a 2x Shader/Core, and with 2x Float/Shader.
- OpenGL/ES Extension,
- Vulkan + OpenCL Extension,
- VIP neural network extension (NPU), with a VIP2 operator.

The GPU benefits from the following ancillary co-located items:

- Voltage Domain: switchable, and potentially different voltage versus the SoC.
- Dedicated PLL: allows an independent GPU frequency
- Temperature Probe: located close to the GPU Core
- Voltage Probe: to tune the GPU voltage



Note: The GPU and/or NPU is not available on all products.

29.4 GPU functional description

29.4.1 GPU block diagram

The following block diagram shows the GPU, its internal specific power domain, its PLL and its internal computing blocks.

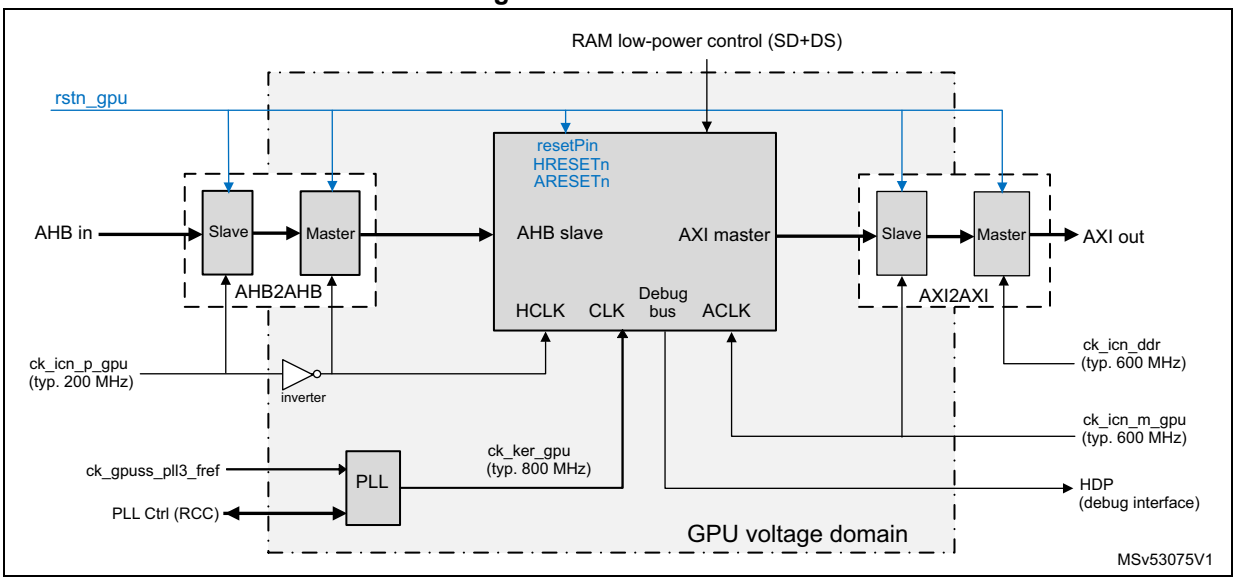
Figure 195. GPU main blocks

29.4.2 GPU pins and internal signals

The GPU implements the following group of pins:

- RCC PLL Bus to have the RCC configure the local PLL.
  It includes the RCC HSE clock as reference and a system reset.
- AHB Slave Bus: 32 bits, to configure the GPU and start its tasks.
- AXI Master Bus: 128 bits to have the GPU fetch and store its needed data.
  It allows a bandwidth up to 9.6 Gbyte/s in read and write.
- Interrupts returned to the CPU Interrupt handler.
- Debug Interface: HDP debug bus allows scanning of 8 internal signals of the GPU, using the HDP_MUX=7.

29.4.3 GPU reset and clocks



The GPU receives the following external signals:

- rstn_gpu: to reset the whole GPU except its PLL
- sys_rstn: to reset the PLL only
- ck_icn_p_gpu: to clock the part of the AHB bus in and out of the GPU power domain
- ck_icn_m_gpu: to clock the part of the AXI-Master in the GPU power domain.
- ck_icn_ddr: to clock the part of the AXI Master out of the GPU power domain.

The GPU integrates one PLL in its power domain: the PLL is configured centrally by the RCC (and provided a reference and reset), and generates the clock used inside the GPU power domain for the GPU core, inducing all GPU theoretical performance aspects (pixels, TOPs, and so on).

Figure 196 describes the GPU clocks.

Figure 196. GPU clocks

29.4.4 GPU security

The security of the GPU is based on the RIF, with a protection of:

- its register map (AHB slave) with a RISUP: see RIF with RIF Periph Name = GPU.
- its access to memory (AXI master) with a RISUP.

The GPU RIMU by default inherits from its RISUP settings.

More information can be found in the RIF chapter.

The security configuration is by default non-protected:

- It allows the default OS drivers to handle the GPU.
- AXI transactions are not protected, although they can be tagged with CID=DISP.

29.4.5 GPU power-on sequence

The Power-On procedure to get the GPU run is the following:

- Power activation: Activate the power supply on the VDDGPU external pin
- Voltage sensor reset: PWR chapter: set: PWR_CR12.GPUVMEN=1
- Wait power activated: PWR chapter: wait: PWR_CR12.GPURDY=1
- Remove Isolation: PWR chapter: set: PWR_CR12.GPUSV=1
- GPU reset-off: RCC chapter, auto: Reset automatically performed after power-up.
- PLL reset-off: RCC chapter: auto: Reset automatically stops after power-up.
- PLL activation: RCC chapter, register: RCC_PLL3CFGR to reach typ. 800 MHz.
- AHB clock activation: RCC chapter, set: ck_icn_p_gpu to activate
- AXI internal clock: act.: RCC chapter, clock: RCC_GPUCFGR.GPUEN activates ck_icn_m_gpu.
- AXI external clock act.: RCC chapter, set: ck_icn_m_ddr clock to activate

The GPU IP can now start to run, with its registers accessed by its driver, and the GPU performing its task accessing the memory.

Note: The RCC automatically handles the wait-cycles needed to perform the GPU reset and to let it stabilize afterwards.

To detect a voltage drop in the GPU, the PWR_CR12.GPURDY is connected to the EXTI1, where a rising/falling edge can be monitored to trigger an interrupt.

29.5 GPU low power modes

The GPU is implemented inside a specific power domain, that may be powered with a different voltage and may be switched off when not used..

29.6 GPU interrupts

The GPU has a global interrupt that is sent to both the CPU1 and CPU2, under the tag GPU.

The security (see RIF) filters the arrival of the global interrupt to the CPUs, depending on the security setting of the GPU.

29.7 GPU registers

29.7.1 GPU AQ Hi clock control register (GPU_AQHICLOCKCONTROL)

Address offset: 0x0

Reset value: 0x0007 0900

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	SOFT_RESET_L2	Res.	Res.	Res.	Res.	MULTI_PIPE_REG_SELECT[3:0]				ISOLATE_GPU	Res.	Res.	IDLE3_D
			rw					rw	rw	rw	rw	rw			r

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	DISABLE_RAM_POWER_OPTIMIZATION	Res.	Res.	DISABLE_RAM_CLOCK_GATING	FSCALE_CMD_LOAD	FSCALE_VAL[6:0]							CLK2D_DIS	CLK3D_DIS
		rw			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **SOFT_RESET_L2**: Soft resets the L2.

Bits 27:24 Reserved, must be kept at reset value.

Bits 23:20 **MULTI_PIPE_REG_SELECT[3:0]**: Determines which HI/MC to use while reading registers

Bit 19 **ISOLATE_GPU**: Isolate GPU bit

Bits 18:17 Reserved, must be kept at reset value.

Bit 16 **IDLE3_D**: 3D pipe is idle

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **DISABLE_RAM_POWER_OPTIMIZATION**: Disables ram power optimization

Bits 12:11 Reserved, must be kept at reset value.

Bit 10 **DISABLE_RAM_CLOCK_GATING**: Disables clock gating for rams

Bit 9 **FSCALE_CMD_LOAD**: Core clock frequency scale value enable.
Writing a 1 to this bit updates the frequency scale factor with the value FSCALE_VAL[6:0]. The bit must be set back to 0 after that. If this bit is set and FSCALE_VAL=0 (an invalid combination), the HREADYOUT output signal gets stuck to 0.

Bits 8:2 **FSCALE_VAL[6:0]**: Core clock frequency scale value

Bit 1 **CLK2D_DIS**: Clock 2D Disable. The AXI interface clock is the only block not stalled.
0: clock is enabled
1: clock is disabled.

Bit 0 **CLK3D_DIS**: Clock 2D Disable. The AXI interface clock is the only block not stalled.
0: clock is enabled
1: clock is disabled.

29.7.2 GPU AQ Hi Idle Register (GPU_AQHIIDLE)

Address offset: 0x4

Reset value: 0x7FFF FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
AXI_LP	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
r															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	IDLE_MC	IDLE_FE_BLT	IDLE_BLT	Res.	Res.	Res.	Res.	IDLE_TX	IDLE_RA	IDLE_SE	Res.	IDLE_SH	IDLE_PE	Res.	IDLE_FE
	r	r	r					r	r	r		r	r		r

Bit 31 **AXI_LP**: AXI is in low power mode

Bits 30:15 Reserved, must be kept at reset value.

Bit 14 **IDLE_MC**: MC is idle

Bit 13 **IDLE_FE_BLT**: FE BLT Parser is idle

Bit 12 **IDLE_BLT**: BLT is idle

Bits 11:8 Reserved, must be kept at reset value.

Bit 7 **IDLE_TX**: TX is idle

Bit 6 **IDLE_RA**: RA is idle

Bit 5 **IDLE_SE**: SE is idle

Bit 4 Reserved, must be kept at reset value.

Bit 3 **IDLE_SH**: SH is idle

Bit 2 **IDLE_PE**: PE is idle

Bit 1 Reserved, must be kept at reset value.

Bit 0 **IDLE_FE**: FE is idle

29.7.3 GPU AQ AXI status register (GPU_AQAXISTATUS)

Address offset: 0xC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	DET_RD_ERR	DET_WR_ERR	RD_ERR_ID[3:0]				WR_ERR_ID[3:0]			
						r	r	r	r	r	r	r	r	r	r

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **DET_RD_ERR**: 1: Detect read error

Bit 8 **DET_WR_ERR**: 1: Detect write error

Bits 7:4 **RD_ERR_ID[3:0]**: Read error ID

Bits 3:0 **WR_ERR_ID[3:0]**: Write error ID

29.7.4 GPU AQ interrupt acknowledge register (GPU_AQINTRACKNOWLEDGE)

Address offset: 0x10

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
INTR_VEC[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
INTR_VEC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **INTR_VEC[31:0]**: Interrupt read-reset Vector.
Bit 31 is for AXI_BUS_ERROR. For each interrupt bit:
0: no interrupt occurred
1: interrupt occurred

29.7.5 GPU AQ interrupt enable register (GPU_AQINTRENBL)

Address offset: 0x14

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
INTR_ENBL_VEC[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
INTR_ENBL_VEC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **INTR_ENBL_VEC[31:0]**: Interrupt Enable Vector.
Bit 31 is for AXI_BUS_ERROR. For each interrupt bit:
0: interrupt is masked,
1: interrupt is visible.

29.7.6 GPU GC chip revision register (GPU_GCCHIPREV)

Address offset: 0x24

Reset value: 0x0000 6205

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REV[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REV[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **REV[31:0]**: IP Revision number in BCD.

29.7.7 GPU GC chip date register (GPU_GCCHIPDATE)

Address offset: 0x28

Reset value: 0x2020 0106

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATE[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATE[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **DATE[31:0]**: IP Date in BCD as YYYYMMDD.

29.7.8 GPU GC total cycles register (GPU_GCTOTALCYCLES)

Address offset: 0x78

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CYCLES[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CYCLES[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CYCLES[31:0]**: Total Cycles.
This register is a free running counter at GPU frequency.
It can be reset by writing 0 to it.

29.7.9 GPU GC registration Hi chip patch revision register (GPU_GCREGHICHIPPATCHREV)

Address offset: 0x98

Reset value: 0x0000 0012

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PATCH_REV[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PATCH_REV[7:0]**: Patch revision level for the chip.

29.7.10 GPU GC product identification register (GPU_GCPRODUCTID)

Address offset: 0xA8

Reset value: 0x0008 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	TYPE[3:0]				NUM[19:12]							
				r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NUM[11:0]												GRADE_LEVEL[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **TYPE[3:0]**: 0:GC (2D or 3D Graphic Cores)

Bits 23:4 **NUM[19:0]**: Product Number: 0x8000 for this core.

Bits 3:0 **GRADE_LEVEL[3:0]**:

0: None
3: NanoUltra3.1 + Vulkan
5: NanoUltra
7: NanoUltra3
9: NanoUltra2

29.7.11 GPU GC ECO identification register (GPU_GCECOID)

Address offset: 0xE8

Reset value: 0x0400 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CONV_COUNT[23:8]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

CONV_COUNT[7:0]								ID[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:8 **CONV_COUNT[23:0]**: Convolution Cores Count:

0: No convolution cores,
1: 1 convolution core (= 5NN)
2: 2 convolution core, S variant (Single = 1NN)
3: 3 convolution core, S+ variant (= 1.5 NN)
4: 4 convolution core, D variant (Dual = 2NN)
6: 6 convolution core, D+ variant (= 3 NN)
8: 8 convolution core, Q variant (Quad = 4 NN)
16: 16 convolution core, O variant (Octo = 8 NN)
32: 32 convolution core, H variant (Hex = 16 NN)

Bits 7:0 **ID[7:0]**: ECO ID.

29.7.12 GPU GC module power control register (GPU_GCMODULEPOWERCONTROLS)

Address offset: 0x100

Reset value: 0x0014 0020

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TURN_OFF_COUNTER[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TURN_ON_COUNTER[3:0]				Res.	DISABLE_STARVE_MODULE_CLOCK_GATING	DISABLE_STALL_MODULE_CLOCK_GATING	ENABLE_MODULE_CLOCK_GATING
								rw	rw	rw	rw		rw	rw	rw

Bits 31:16 **TURN_OFF_COUNTER[15:0]**: Counter value for clock gating the module if the module is idle for this amount of clock cycles.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:4 **TURN_ON_COUNTER[3:0]**: Number of clock cycles to wait after turning on the clock

Bit 3 Reserved, must be kept at reset value.

Bit 2 **DISABLE_STARVE_MODULE_CLOCK_GATING**: Disables module level clock gating

Bit 1 **DISABLE_STALL_MODULE_CLOCK_GATING**: Disables module level clock gating for stall condition.

Bit 0 **ENABLE_MODULE_CLOCK_GATING**: Enables module level clock gating

29.7.13 GPU GC MMU AHB control register (GPU_GCREGMMUAHBCONTROL)

Address offset: 0x388

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MMU
															w

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **MMU**: Enable the MMU. For security reasons, once the MMU is enabled it cannot be disabled anymore:

0: MMU is disabled.

1: MMU is enabled.

29.7.14 GPU GC MMU AHB table array base address low register (GPU_GCREGMMUAHBTABLEARRAYBASEADDRESSLOW)

Address offset: 0x38C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADDRESS[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDRESS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ADDRESS[31:0]**: 32 bit Address for MMU Table Array Base Low.

29.7.15 GPU GC MMU AHB table array base address high register (GPU_GCREGMMUAHBTABLEARRAYBASEADDRESSHIGH)

Address offset: 0x390

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **MASTER_TLB_SHAREABLE**: Bit that defines whether the master TLB address is shareable or not.

Bit 8 **MASTER_TLB_SECURE**: Bit that defines whether the master TLB address is secure or not

Bits 7:0 **MASTER_TLB[7:0]**: Upper 8-bits of the master TLB address to form a true 40-bit address

29.7.16 GPU GC MMU AHB table array size register (GPU_GCREGMMUAHBTABLEARRAYSIZE)

Address offset: 0x394

Reset value: 0x0000 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

SIZE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SIZE[15:0]**: Size of MMU Table

29.7.17 GPU GC MMU AHB safe non-secure address register (GPU_GCREGMMUAHBSAFENONSECUREADDRESS)

Address offset: 0x398

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADDRESS[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDRESS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ADDRESS[31:0]**: A 64-byte address that acts as a 'safe' zone. Any address that would cause an exception is routed to this safe zone. Reads happen and writes go to this address, but with a write-enable of 0. This register can only be programmed once after a reset. Any attempt to write to this register after the initial write-after-reset is ignored. This is in non-secure memory.

29.7.18 GPU GC MMU AHB safe secure address register (GPU_GCREGMMUAHBSAFESECUREADDRESS)

Address offset: 0x39C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADDRESS[31:16]

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDRESS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ADDRESS[31:0]**: A 64-byte address that acts as a 'safe' zone. Any address that causes an exception is routed to this safe zone. Reads happen and writes go to this address, but with a write-enable of 0. This register can only be programmed once after a reset - any attempt to write to this register after the initial write-after-reset is ignored. This is in secure memory.

29.7.19 GPU GC command buffer AHB control register (GPU_GCREGCMDBUFFERAHBCTRL)

Address offset: 0x3A4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ENABLE

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PREFETCH[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **ENABLE**: Enable the command parser:
0: command parser is disabled
1: command parser is enabled

Bits 15:0 **PREFETCH[15:0]**: Number of 64-bit words to fetch from the command buffer.

29.7.20 GPU GC Hi AHB control register (GPU_GCREGHIAHBCONTROL)

Address offset: 0x3A8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DEBUG_MODE	SOFT_RESET
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DEBUG_MODE**: Enable debug mode if disabled debug registers return 0xFFFF FFFF.
0: debug mode is disabled
1: debug mode is enabled

Bit 0 **SOFT_RESET**: Soft resets the IP:
0: soft reset mode is inactive
1: soft reset is active

29.7.21 GPU GC AXI AHB configuration register (GPU_GCREGAXIAHBCONFIG)

Address offset: 0x3AC

Reset value: 0x0022 2200

									rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FOR_RF2P[7:0]								FOR_RF1P[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **LIGHT_SLEEP**: Light sleep

Bit 21 **DEEP_SLEEP**: Deep sleep

Bit 20 **POWER_DOWN**: Power-down memory

Bits 19:18 **FAST_WTC[1:0]**: WTC for fast rams

Bits 17:16 **FAST_RTC[1:0]**: RTC for fast rams

Bits 15:8 **FOR_RF2P[7:0]**: for 2 port RAM

Bits 7:0 **FOR_RF1P[7:0]**: for 4 port RAM

29.7.24 GPU AQ command buffer address register (GPU_AQCMDBUFFERADDR)

Address offset: 0x654

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TYPE	ADDRESS[30:16]														
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDRESS[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bit 31 **TYPE**:
0: system
1: virtual system

Bits 30:0 **ADDRESS[30:0]**: Base address for the command buffer.
The address must be 64-bit aligned and it is always physical.
To use addresses above 0x8000_0000, program GPU_AQMemoryFE with the appropriate offset.
As this register cannot be read, to check the value of the current fetch address, use GPU_AQFEDebugCurCmdAdr.

29.7.25 GPU AQ FE debug current command address register (GPU_AQFEDEBUGCURCMDADR)

Address offset: 0x664

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CUR_CMD_ADR[28:13]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CUR_CMD_ADR[12:0]													Res.	Res.	Res.
r	r	r	r	r	r	r	r	r	r	r	r	r			

Bits 31:3 **CUR_CMD_ADR[28:0]**: This is the command decoder address.
The address is always physical so the MSB should always be 0. It has no reset value. Note that with the current MMU all 32 bits are valid.

Bits 2:0 Reserved, must be kept at reset value.

29.7.26 GPU register map

Table 227. GPU register map and reset values

30 Neural processing unit (NPU)

30.1 Introduction

The neural processing unit (NPU) provides powerful hardware acceleration for neural network, to allow efficient artificial intelligence (AI) applications.

30.2 NPU main features

The NPU neural hardware acceleration is exposed through the following API:

- TensorFlowLite-API
- Linux NN-API-Adapter

The NPU flexibility allows to optimally accelerate the following frameworks (It is a non-exhaustive list):

- TensorFlow: non-exhaustive hardware support
- TensorFlowLite: full hardware support (including its SoftMax subset)
- Caffe, Caffe2
- CNTK, Torch, Theano, Darknet

The NPU provides the following neural theoretical performance, values for 800 MHz:

- Integer Operations: 1.2 TOPS (integer 8 bit)

The NPU integration allows to reach the following neural benchmarked performances:

- Inception_V1: 110 Inference/s
- Inception_V3: 30 Inference/s
- ResNetV1-50: 70 Inference/s
- SqueezeNetV1.1: 480 Inference/s
- VGG16: 48 Inference/s

To reduce the required DDR bandwidth during neural computations, the NPU embeds natively 128 Kbytes of memory. It is recommended to allocate some additional embedded memory (SRAM) to the neural acceleration: typically one or two additional 128-Kbyte buffers, if available (for instance from the disabled video encode/decode operator, VENC/VDEC).

30.3 NPU implementation

The NPU acceleration is implemented in the hardware through the neural operator inserted into the GPU. It benefits from both the efficiency of an optimized hardware (the neural operator) and the flexibility of the GPU shaders.

Refer to *Section 29: Graphic processing unit (GPU)* for any details on the hardware implementation.

30.4 NPU functional description

The NPU acceleration is based on the GPU hardware, refer to *Section 29: Graphic processing unit (GPU)* for more details about the functional descriptions of the following common items:

- GPU / NPU block diagram
- GPU / NPU pins and internal signals
- GPU / NPU reset and clocks
- GPU / NPU security
- GPU / NPU power-on sequence

30.5 NPU low-power modes

The NPU benefits of the same low-power modes as the GPU. Refer to *Section 29: Graphic processing unit (GPU)* for more details.

30.6 NPU interrupts

The NPU shares its interrupts with the GPU. Refer to *Section 29: Graphic processing unit (GPU)* for more details.

30.7 NPU registers

The NPU shares its registers with the GPU. Refer to *Section 29: Graphic processing unit (GPU)* for more details.

31 Interrupt list

31.1 NVIC interrupts

Table 228. interrupt mapping for Cortex-M33

Position	Priority(1)	Acronym	Description	Address (hexadec. values)	EXTI1 event(2)	EXTI2 event(2)

Table 228. interrupt mapping for Cortex-M33 (continued)

Position	Priority(1)	Acronym	Description	Address (hexadec. values)	EXTI1 event(2)	EXTI2 event(2)
41	49	HPDMA1_Channel8	HPDMA1 channel 8 interrupt	0000 00E4	-	-
42	50	HPDMA1_Channel9	HPDMA1 channel 9 interrupt	0000 00E8	-	-
43	51	HPDMA1_Channel10	HPDMA1 channel 10 interrupt	0000 00EC	-	-
44	52	HPDMA1_Channel11	HPDMA1 channel 11 interrupt	0000 00F0	-	-
45	53	HPDMA1_Channel12	HPDMA1 channel 12 interrupt	0000 00F4	-	-
46	54	HPDMA1_Channel13	HPDMA1 channel 13 interrupt	0000 00F8	-	-
47	55	HPDMA1_Channel14	HPDMA1 channel 14 interrupt	0000 00FC	-	-
48	56	HPDMA1_Channel15	HPDMA1 channel 15 interrupt	0000 0100	-	-
49	57	HPDMA2_Channel0	HPDMA2 channel 0 interrupt	0000 0104	-	-
50	58	HPDMA2_Channel1	HPDMA2 channel 1 interrupt	0000 0108	-	-
51	59	HPDMA2_Channel2	HPDMA2 channel 2 interrupt	0000 010C	-	-
52	60	HPDMA2_Channel3	HPDMA2 channel 3 interrupt	0000 0110	-	-
53	61	HPDMA2_Channel4	HPDMA2 channel 4 interrupt	0000 0114	-	-
54	62	HPDMA2_Channel5	HPDMA2 channel 5 interrupt	0000 0118	-	-
55	63	HPDMA2_Channel6	HPDMA2 channel 6 interrupt	0000 011C	-	-
56	64	HPDMA2_Channel7	HPDMA2 channel 7 interrupt	0000 0120	-	-
57	65	HPDMA2_Channel8	HPDMA2 channel 8 interrupt	0000 0124	-	-
58	66	HPDMA2_Channel9	HPDMA2 channel 9 interrupt	0000 0128	-	-
59	67	HPDMA2_Channel10	HPDMA2 channel 10 interrupt	0000 012C	-	-
60	68	HPDMA2_Channel11	HPDMA2 channel 11 interrupt	0000 0130	-	-
61	69	HPDMA2_Channel12	HPDMA2 channel 12 interrupt	0000 0134	-	-
62	70	HPDMA2_Channel13	HPDMA2 channel 13 interrupt	0000 0138	-	-
63	71	HPDMA2_Channel14	HPDMA2 channel 14 interrupt	0000 013C	-	-
64	72	HPDMA2_Channel15	HPDMA2 channel 15 interrupt	0000 0140	-	-
65	73	HPDMA3_Channel0	HPDMA3 channel 0 interrupt	0000 0144	-	-
66	74	HPDMA3_Channel1	HPDMA3 channel 1 interrupt	0000 0148	-	-
67	75	HPDMA3_Channel2	HPDMA3 channel 2 interrupt	0000 014C	-	-
68	76	HPDMA3_Channel3	HPDMA3 channel 3 interrupt	0000 0150	-	-
69	77	HPDMA3_Channel4	HPDMA3 channel 4 interrupt	0000 0154	-	-
70	78	HPDMA3_Channel5	HPDMA3 channel 5 interrupt	0000 0158	-	-
71	79	HPDMA3_Channel6	HPDMA3 channel 6 interrupt	0000 015C	-	-
72	80	HPDMA3_Channel7	HPDMA3 channel 7 interrupt	0000 0160	-	-

Table 228. interrupt mapping for Cortex-M33 (continued)

Position	Priority(1)	Acronym	Description	Address (hexadec. values)	EXTI1 event(2)	EXTI2 event(2)
73	81	HPDMA3_Channel8	HPDMA3 channel 8 interrupt	0000 0164	-	-
74	82	HPDMA3_Channel9	HPDMA3 channel 9 interrupt	0000 0168	-	-
75	83	HPDMA3_Channel10	HPDMA3 channel 10 interrupt	0000 016C	-	-
76	84	HPDMA3_Channel11	HPDMA3 channel 11 interrupt	0000 0170	-	-
77	85	HPDMA3_Channel12	HPDMA3 channel 12 interrupt	0000 0174	-	-
78	86	HPDMA3_Channel13	HPDMA3 channel 13 interrupt	0000 0178	-	-
79	87	HPDMA3_Channel14	HPDMA3 channel 14 interrupt	0000 017C	-	-
80	88	HPDMA3_Channel15	HPDMA3 channel 15 interrupt	0000 0180	-	-
81	89	LPDMA1_Channel0	LPDMA1 channel 0 interrupt	0000 0184	-	-
82	90	LPDMA1_Channel1	LPDMA1 channel 1 interrupt	0000 0188	-	-
83	91	LPDMA1_Channel2	LPDMA1 channel 2 interrupt	0000 018C	-	-
84	92	LPDMA1_Channel3	LPDMA1 channel 3 interrupt	0000 0190	-	-
85	93	ICACHE	ICACHE interrupt	0000 0194	-	-
86	94	DCACHE	DCACHE interrupt	0000 0198	-	-
87	95	ADC1	ADC1 interrupt	0000 019C	-	-
88	96	ADC2	ADC2 interrupt	0000 01A0	-	-
89	97	ADC3	ADC3 interrupt	0000 01A4	-	-
90	98	FDCAN_CAL	FDCAN CCU interrupt	0000 01A8	-	-
91	99	FDCAN1_IT0	FDCAN1 interrupt 0	0000 01AC	-	-
92	100	FDCAN2_IT0	FDCAN2 interrupt 0	0000 01B0	-	-
93	101	FDCAN3_IT0	FDCAN3 interrupt 0	0000 01B4	-	-
94	102	FDCAN1_IT1	FDCAN1 interrupt 1	0000 01B8	-	-
95	103	FDCAN2_IT1	FDCAN2 interrupt 1	0000 01BC	-	-
96	104	FDCAN3_IT1	FDCAN3 interrupt 1	0000 01C0	-	-
97	105	TIM1_BRK	TIM1 break interrupt	0000 01C4	-	-
98	106	TIM1_UP	TIM1 update interrupt	0000 01C8	-	-
99	107	TIM1_TRG_COM	TIM1 trigger and commutation interrupts	0000 01CC	-	-
100	108	TIM1_CC	TIM1 capture compare interrupt	0000 01D0	-	-
101	109	TIM20_BRK	TIM20 break interrupt	0000 01D4	-	-
102	110	TIM20_UP	TIM20 update interrupt	0000 01D8	-	-
103	111	TIM20_TRG_COM	TIM20 trigger and commutation interrupts	0000 01DC	-	-
104	112	TIM20_CC	TIM20 capture compare interrupt	0000 01E0	-	-

Table 228. interrupt mapping for Cortex-M33 (continued)

Position	Priority(1)	Acronym	Description	Address (hexadec. values)	EXTI1 event(2)	EXTI2 event(2)
105	113	TIM2	TIM2 global interrupt	0000 01E4	-	-
106	114	TIM3	TIM3 global interrupt	0000 01E8	-	-
107	115	TIM4	TIM4 global interrupt	0000 01EC	-	-
108	116	I2C1	I2C1 global interrupt	0000 01F0	(21)	-
109	117	I3C1	I3C1 global interrupt	0000 01F4	(74)	-
110	118	I2C2	I2C2 global interrupt	0000 01F8	(22)	-
111	119	I3C2	I3C2 global interrupt	0000 01FC	(75)	-
112	120	SPI1	SPI1 global interrupt	0000 0200	(36)	-
113	121	SPI2	SPI2 global interrupt	0000 0204	(37)	-
114	122	USART1	USART1 global interrupt	0000 0208	(26)	-
115	123	USART2	USART2 global interrupt	0000 020C	(27)	-
116	124	USART3	USART3 global interrupt	0000 0210	(28)	-
117	125	VDEC	VDEC global interrupt	0000 0214	-	-
118	126	TIM8_BRK	TIM8 break interrupt	0000 0218	-	-
119	127	TIM8_UP	TIM8 update interrupt	0000 021C	-	-
120	128	TIM8_TRG_COM	TIM8 trigger and commutation interrupt	0000 0220	-	-
121	129	TIM8_CC	TIM8 capture compare interrupt	0000 0224	-	-
122	130	FMC	FMC global interrupt	0000 0228	-	-
123	131	SDMMC1	SDMMC1 global interrupt	0000 022C	-	-
124	132	TIM5	TIM5 global interrupt	0000 0230	-	-
125	133	SPI3	SPI3 global interrupt	0000 0234	(38)	-
126	134	UART4	UART4 global interrupt	0000 0238	(30)	-
127	135	UART5	UART5 global interrupt	0000 023C	(31)	-
128	136	TIM6	TIM6 global interrupt	0000 0240	-	-
129	137	TIM7	TIM7 global interrupt	0000 0244	-	-
130	138	ETH1_SBD	ETH1 global interrupt	0000 0248	(69)	-
131	139	ETH1_PMT	ETH1 wake-up interrupt (PMT)	0000 024C	(68)	-
132	140	ETH1_LPI	ETH1 LPI interrupt	0000 0250	-	
133	141	ETH2_SBD	ETH2 global interrupt	0000 0254	(71)	-
134	142	ETH2_PMT	ETH2 wake-up interrupt (PMT)	0000 0258	(70)	-
135	143	ETH2_LPI	ETH2 LPI interrupt	0000 025C	(71)	-
136	144	USART6	USART6 global interrupt	0000 0260	(29)	-

Table 228. interrupt mapping for Cortex-M33 (continued)

Position	Priority(1)	Acronym	Description	Address (hexadec. values)	EXTI1 event(2)	EXTI2 event(2)
137	145	I2C3	I2C3 global interrupt	0000 0264	(23)	-
138	146	I3C3	I3C3 global interrupt	0000 0268	(76)	-
139	147	USBH_EHCI	USB Host EHCI interrupt	0000 026C		-
140	148	USBH_OHCI	USB Host OHCI interrupt	0000 0270		-
141	149	DCMI_PSSI	DCMI and PSSI global interrupt	0000 0274	-	-
142	150	CSI	CSI2 Host controller interrupt	0000 0278	-	-
143	151	DSI	DSI Host controller global interrupt	0000 027C	-	-
144	152	CRYP1	Crypto1 interrupt	0000 0280	-	-
145	153	HASH	Hash interrupt	0000 0284	-	-
146	154	PKA	PKA interrupt	0000 0288	-	-
147	155	FPU	FPU global interrupt	0000 028C	-	-
148	156	UART7	UART7 global interrupt	0000 0290	(32)	-
149	157	UART8	UART8 global interrupt	0000 0294	(33)	-
150	158	UART9	UART9 global interrupt	0000 0298	(34)	-
151	159	LPUART1	LPUART1 global interrupt	0000 029C	-	(26)
152	160	SPI4	SPI4 global interrupt	0000 02A0	(39)	-
153	161	SPI5	SPI5 global interrupt	0000 02A4	(40)	-
154	162	SPI6	SPI6 global interrupt	0000 02A8	(41)	-
155	163	SPI7	SPI7 global interrupt	0000 02AC	(42)	-
156	164	SPI8	SPI8 global interrupt	0000 02B0	-	(27)
157	165	SAI1	SAI1 global interrupt	0000 02B4	-	-
158	166	LTDC	LTDC global interrupt	0000 02B8	-	-
159	167	LTDC_ER	LTDC global error interrupt	0000 02BC	-	-
160	168	LTDC_SEC	LTDC security global interrupt	0000 02C0	-	-
161	169	LTDC_SEC_ER	LTDC security global error interrupt	0000 02C4	-	-
162	170	SAI2	SAI2 global interrupt	0000 02C8	-	-
163	171	OCTOSPI1	OCTOSPI1 global interrupt	0000 02CC	-	-
164	172	OCTOSPI2	OCTOSPI2 global interrupt	0000 02D0	-	-
165	173	OTFDEC1	OTFDEC1 interrupt	0000 02D4	-	-
166	174	LPTIM1	LPTIMER1 global interrupt	0000 02D8	(47)	-
167	175	VENC	VENC global interrupt	0000 02DC	-	-
168	176	I2C4	I2C4 global interrupt	0000 02E0	(24)	-

Table 228. interrupt mapping for Cortex-M33 (continued)

Position	Priority(1)	Acronym	Description	Address (hexadec. values)	EXTI1 event(2)	EXTI2 event(2)
169	177	USBH_WAKEUP	USBH remote wake-up from USB2PHY1	0000 02E4	43	-
170	178	SPDIFRX	SPDIFRX global interrupt	0000 02E8	-	-
171	179	IPCC1_RX	Mailbox 1 RX occupied interrupt	0000 02EC	(60)	-
172	180	IPCC1_TX	Mailbox 1 TX free interrupt	0000 02F0	(60)	-
173	181	IPCC1_RX_S	Mailbox 1 RX occupied secure interrupt	0000 02F4	(62)	-
174	182	IPCC1_TX_S	Mailbox 1 TX Free secure interrupt	0000 02F8	(62)	-
175	183	IPCC2_RX	Mailbox 2 RX occupied interrupt	0000 02FC	-	(35)
176	184	IPCC2_TX	Mailbox 2 TX free interrupt	0000 0300	-	(35)
177	185	IPCC2_RX_S	Mailbox 2 RX occupied secure interrupt	0000 0304	-	(38)
178	186	IPCC2_TX_S	Mailbox 2 TX free secure interrupt	0000 0308	-	(38)
179	187	SAES	Secure AES	0000 030C	-	-
180	188	CRYP2	Crypto2 interrupt	0000 0310	-	-
181	189	I2C5	I2C5 global interrupt	0000 0314	(25)	-
182	190	USB3DR_WAKEUP	USB3DR remote wake-up from USB2PHY2	0000 0318	44	-
183	191	GPU	GPU global interrupt	0000 031C	-	-
184	192	MDF1_FLT0	MDF1 filter0 interrupt	0000 0320	-	-
185	193	MDF1_FLT1	MDF1 filter1 interrupt	0000 0324	-	-
186	194	MDF1_FLT2	MDF1 filter2 interrupt	0000 0328	-	-
187	195	MDF1_FLT3	MDF1 filter3 interrupt	0000 032C	-	-
188	196	MDF1_FLT4	MDF1 filter4 interrupt	0000 0330	-	-
189	197	MDF1_FLT5	MDF1 filter5 interrupt	0000 0334	-	-
190	198	MDF1_FLT6	MDF1 filter6 interrupt	0000 0338	-	-
191	199	MDF1_FLT7	MDF1 filter7 interrupt	0000 033C	-	-
192	200	SAI3	SAI3 global interrupt	0000 0340	-	-
193	201	TIM15	TIM15 global interrupt	0000 0344	-	-
194	202	TIM16	TIM16 global interrupt	0000 0348	-	-
195	203	TIM17	TIM17 global interrupt	0000 034C	-	-
196	204	TIM12	TIM12 global interrupt	0000 0350	-	-
197	205	SDMMC2	SDMMC2 global interrupt	0000 0354	-	-
198	206	DCMIPP	DCMIPP global interrupt	0000 0358	-	-
199	207	HSEM_IT1	HSEM semaphore non-secure interrupt 1	0000 035C	-	(41)
200	208	HSEM_S_IT1	HSEM semaphore secure interrupt 1	0000 0360	-	(44)

Table 228. interrupt mapping for Cortex-M33 (continued)

Position	Priority(1)	Acronym	Description	Address (hexadec. values)	EXTI1 event(2)	EXTI2 event(2)
201	209	nCTIIRQ1	Cortex-M33 CTI interrupt 1	0000 0364	-	-
202	210	nCTIIRQ2	Cortex-M33 CTI interrupt 2	0000 0368	-	-
203	211	TIM13	TIM13 global interrupt	0000 036C	-	-
204	212	TIM14	TIM14 global interrupt	0000 0370	-	-
205	213	TIM10	TIM10 global interrupt	0000 0374	-	-
206	214	RNG	RNG interrupt	0000 0378	-	-
207	215	ADF1_FLT	ADF1 filter interrupt	0000 037C	-	(33)
208	216	I2C6	I2C6 global interrupt	0000 0380	(49)	-
209	217	COMBOPHY_WAKEUP	COMBOPHY LFPS start request	0000 0384	45	-
210	218	I2C7	I2C7 global interrupt	0000 0388	(50)	-
211	219	-	Reserved	0000 038C	-	-
212	220	I2C8	I2C8 global interrupt	0000 0390	-	(25)
213	221	I3C4	I3C4 global interrupt	0000 0394	-	(70)
214	222	SDMMC3	SDMMC3 global interrupt	0000 0398	-	-
215	223	LPTIM2	LPTIMER2 global interrupt	0000 039C	(48)	-
216	224	LPTIM3	LPTIMER3 global interrupt	0000 03A0	-	(29)
217	225	LPTIM4	LPTIMER4 global interrupt	0000 03A4	-	(30)
218	226	LPTIM5	LPTIMER5 global interrupt	0000 03A8	-	(31)
219	227	OTFDEC2	OTFDEC2 interrupt	0000 03AC		-
220	228	CPU1_SEV	Cortex-A35 send event through EXTI	0000 03B0	65	-
221	229	CPU3_SEV	Cortex-M0+ send event through EXTI	0000 03B4	-	61
222	230	RCC_WAKEUP	RCC CPU2 wake-up interrupt	0000 03B8	-	-
223	231	SAI4	SAI4 global interrupt	0000 03BC	-	-
224	232	DTS	Temperature sensor interrupt	0000 03C0	(72)	-
225	233	TIM11	TIM11 global interrupt	0000 03C4	-	-
226	234	CPU2_WAKEUP_PIN	interrupt for all six wakeups enabled by CPU2	0000 03C8	(52, 53, 54, 55, 56, 57)	-
227	235	USB3DR_BC	USB3 BC interrupt	0000 03CC	-	-
228	236	USB3DR	USB3 interrupt	0000 03D0	-	-
229	237	UCPD	USB PD interrupt	0000 03D4	46	-

Table 228. interrupt mapping for Cortex-M33 (continued)

Position	Priority(1)	Acronym	Description	Address (hexadec. values)	EXTI1 event(2)	EXTI2 event(2)
230 to 239	238 to 247	-	Reserved	0000 03D8-0000 03FC	-	-
240	248	SERC	SERC global interrupt	0000 0400	-	-
241	249	-	Reserved	0000 0404	-	-
242	250	RAMCFG	RAM configuration global interrupt	0000 0408	-	-
243	251	DDRCTRL	DDRCTRL interrupt	0000 040C	-	-
244	252	DDRPHYC	DDRPHY interrupt (active low)	0000 0410	-	-
245	253	DDRPHYC	DFI error interrupt	0000 0414	-	-
246	254	IAC	RIF illegal access controller interrupt	0000 0418	-	(63)
247	255	VDDCPU_VD	V_{DDCPU} voltage detector	0000 041C	-	64
248	256	VDDCORE_VD	V_{DDCORE} voltage detector	0000 0420	-	65
249	257	-	Reserved	0000 0424	-	-
250	258	ETHSW	Ethernet switch global interrupt	0000 0428	-	-
251	259	ETHSW_MSGBUF	Ethernet ACM message buffer interrupt	0000 042C	-	-
252	260	ETHSW_FSC	Ethernet ACM scheduler interrupt	0000 0430	-	-
253	261	HPDMA1_WKUP	HPDMA1 channel 0 to 15 wake-up	0000 0434	(80)	-
254	262	HPDMA2_WKUP	HPDMA2 channel 0 to 15 wake-up	0000 0438	(81)	-
255	263	HPDMA3_WKUP	HPDMA3 channel 0 to 15 wake-up	0000 043C	(82)	-
256	264	LPDMA1_WKUP	LPDMA1 channel 0 to 3 wake-up	0000 0440	-	(68)
257	265	UCPD_VBUS_VALID	USB Type C VBUS valid	0000 0444	83	-

1. Priority values below 0 are fixed. Priority values 0 and more are settable.
2. Absence of parenthesis around EXTI event numbers indicates that the EXTI output is connected to the NVIC. The EXTI configuration may impact the interrupt line state (EXTI may mask the interrupt).
Presence of parenthesis around EXTI event numbers indicates that the EXTI output is not connected to the NVIC. The EXTI configuration cannot impact the interrupt line state (see *Section 34* for details).

Table 229. interrupt mapping for Cortex-M0+

Position	Priority(1)	Acronym	Description	Address (hexadec. values)	EXTI2 event(2)
-	-3	Reset	Reset	0000 0004	-
-	-2	NMI	Reserved	0000 0008	-

1. Absence of parenthesis around EXTI event numbers indicates that the EXTI output is connected to the NVIC. The EXTI configuration may impact the interrupt line state (EXTI may mask the interrupt).
Presence of parenthesis around EXTI event numbers indicates that the EXTI output is not connected to the NVIC. The EXTI configuration cannot impact the interrupt line state (see *Section 34* for details).

32 Nested vectored interrupt controllers (NVIC)

32.1 NVIC features

The NVIC for Cortex-M33 (CPU2) includes the following features:

- 320 maskable interrupt channels (not including the 16 Cortex-M33 with FPU interrupt lines)
- 16 programmable priority levels (4 bits of interrupt priority are used)
- Low-latency exception and interrupt handling
- Power management control
- Implementation of system control registers

The NVIC and the Cortex-M33 core are closely coupled, which enables low-latency interrupt processing, and efficient processing of late arriving interrupts.

The NVIC registers are banked across secure and non-secure states.

All the interrupts including Cortex-M33 core exceptions are managed by the NVIC.

For more information on exceptions and NVIC programming, refer to *STM32 Cortex-M33 MCUs programming manual* (PM0264).

The NVIC for Cortex M0+ (CPU3) includes the following features:

- 32 maskable interrupt channels
- 4 programmable priority levels (2 bits of interrupt priority are used)
- Low-latency exception and interrupt handling
- Power management control
- Implementation of system control registers

All the interrupts including Cortex-M0+ core exceptions are managed by the NVIC.

For more information on exceptions and NVIC programming, refer to *STM32 Cortex-M0+ programming manual* (PM0223).

32.2 SysTick calibration value register

The Cortex-M33 with TrustZone mainline security extension embeds two SysTick timers, that are available when TrustZone is activated:

- SysTick secure instance
- SysTick non-secure instance

When TrustZone is disabled, only one SysTick timer is available.

As SysTick for Cortex-M33 does not run on a fixed frequency, there is no SysTick calibration value available.

The SysTick reload counter must be set according to the required time base, and the ck_cpu2 frequency value must be set in the RCC.

The Cortex-M0+ embeds one SysTick timer, that runs from a reference clock (LSI or LSE) as set by the RCC.

32.3 Interrupt and exception vectors

See Cortex-M33 and Cortex-M0+ interrupt tables in *Section 31: Interrupt list*.

33 Global interrupt controller (GIC)

33.1 GIC introduction

The following Arm specifications provide additional details on the GIC:

- Arm generic interrupt controller - Architecture specification v2.0
- Cortex-A35 technical reference manual revision r0p1

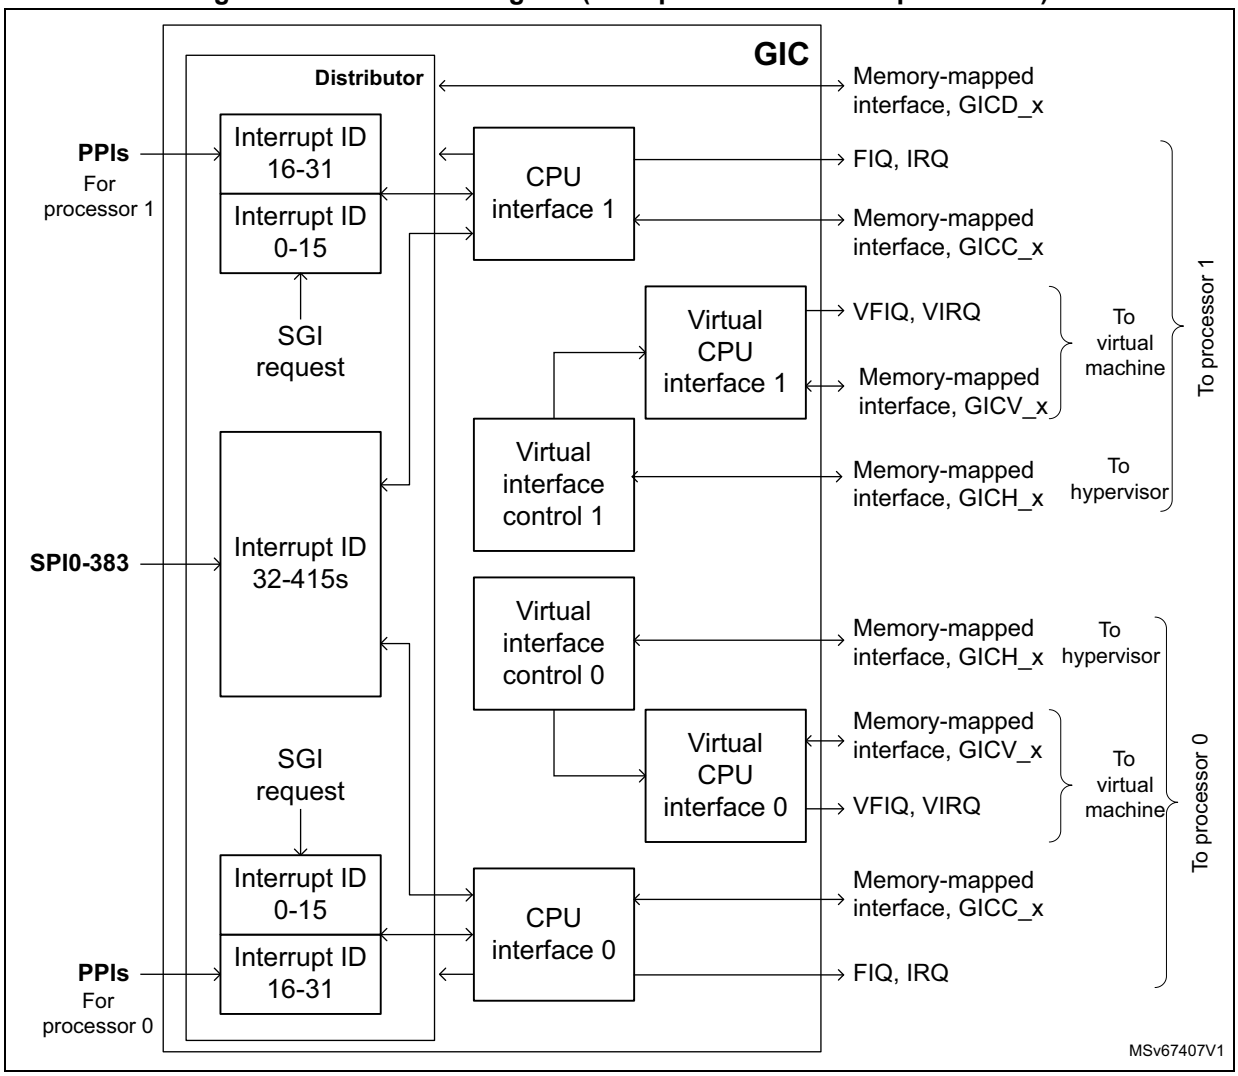
33.2 GIC main features

The integrated GIC collates and arbitrates from a large number of interrupt sources. It provides:

- Masking of interrupts
- Prioritization of interrupts
- Distribution of the interrupts to the target processors
- Tracking of the status of interrupts
- Generation of interrupts by software
- Support for security extensions
- Support for virtualization extensions

33.3 GIC functional description

The GIC is a single functional unit located in the Cortex-A35. It consists of a shared distributor block, and several CPU interfaces. Each Cortex-A35 processor core embeds:



- a CPU interface
- a virtual interface control
- a virtual CPU interface

The GIC registers are memory-mapped, and the base address is visible into the configuration base address (CBAR) for each processor core in the cluster.

Memory regions used for these registers must be marked as device, or strongly-ordered in the translation tables.

Memory regions marked as normal memory cannot access any of the GIC registers: access caches or external memory as required.

Figure 197. GIC block diagram (example with two cores/processors)

33.4 GIC interrupt sources

All interrupt sources are identified by a unique ID. The Cortex-A35 processor interrupt sources are detailed below.

33.4.1 Software generated interrupts (SGI)

The SGIs are generated by writing to the software generated interrupt register (GICD_SGIR). Each processor interface can generate a maximum of 16 SGIs (ID0-ID15). An SGI has edge-triggered properties. The software triggering of the interrupt is equivalent to the edge transition of the interrupt signal on a peripheral input.

Note: Arm recommends to use SGI ID0-ID7 for non-secure interrupts, and SGI ID8-ID15 for secure interrupts.

33.4.2 Private peripheral interrupts (PPI)

A PPI is an interrupt generated by a peripheral that is specific to a single processor. There are six PPIs for each CPU interface:

- legacy nFIQ signal (PPI0) - not used

  When the GIC interrupt bypass is in effect (such as after reset), the external nFIQ signal bypasses the interrupt distributor logic, and directly drives the interrupt request to the corresponding processor.

  When a processor uses the GIC rather than the external nFIQ signal (by enabling its own CPU interface), the nFIQ signal is treated like other interrupt lines, and uses ID28. The interrupt is active-low-level sensitive.
- secure physical timer event (PPI1)

  This event is generated from the secure physical timer, and uses ID29. The interrupt is level sensitive.
- non-secure physical timer event (PPI2)

  This event is generated from the non-secure physical timer, and uses ID30. The interrupt is level sensitive.
- legacy nIRQ signal (PPI3) - not used

  When the GIC interrupt bypass is in effect (such as after reset), the external nIRQ signal bypasses the interrupt distributor logic, and directly drives the interrupt request to the corresponding processor.

  When a processor uses the GIC rather than the external nIRQ signal (by enabling its own CPU interface), the nIRQ signal is treated like other interrupt lines and uses ID31. The interrupt is active-low-level sensitive.
- virtual timer event (PPI4)

  This event is generated from the virtual timer, and uses ID27. The interrupt is level sensitive.
- hypervisor timer event (PPI5)

  This event is generated from the physical timer in hypervisor mode, and uses ID26. The interrupt is level-sensitive.

33.4.3 Shared peripheral interrupts (SPI)

The SPIs are triggered by events generated on associated interrupt input lines. The GIC supports up to 384 SPIs corresponding to the external IRQS signal.

The SPIs start at ID32, and can be configured to be edge-triggered or active-high-level sensitive.

33.4.4 Interrupt priority formats

The Cortex-A35 implements a 5-bit version of the interrupt priority field for 32 interrupt priority levels.

33.5 GIC distributor (GICD)

The GICD centralizes all interrupt sources, determines the priority of each interrupt, and, for each CPU interface, forwards the interrupt with the highest priority to the interface for priority masking and preemption handling.

The GICD provides a programming interface for the following actions:

- Enable globally the forwarding of interrupts to the CPU interfaces.
- Enable/disable each interrupt.
- Set the priority level of each interrupt.
- Set the target processor list of each interrupt.
- Set each peripheral interrupt to be level sensitive or edge triggered.
- Set each interrupt as either group 0 or group 1.
- Send an SGI to one or more target processor cores.
- Give visibility of the state of each interrupt.
- Provide a mechanism for software to set/clear pending state of a peripheral interrupt.

The GICD_IPRIORITYRx, GICD_ITARGETSRx, GICD_CPENDSGIRx, and GICD_SPENDSGIRx registers are byte-accessible and halfword-accessible.

All other registers are word-accessible.

33.5.1 GICD control register (GICD_CTLR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ENABLEGRP1	ENABLEGRP0
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **ENABLEGRP1:** Enable group 1 interrupts
Global enable for forwarding pending group 1 interrupts from the GICD to the CPU interfaces

Bit 0 **ENABLEGRP0**: Enable group 0 interrupts
Global enable for forwarding pending group 0 interrupts from the GICD to the CPU interfaces

33.5.2 GICD control non-secure access register (GICD_CTLRNS)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ENABLE
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **ENABLE**:
Global enable for forwarding pending group 1 interrupts from the GICD to the CPU interfaces

33.5.3 GICD interrupt controller type register (GICD_TYPER)

Address offset: 0x004

Reset value: 0x0000 FC2C

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LSPI[4:0]					SECURITYEXTN	Res.	Res.	CPUNUMBER[2:0]			ITLINESNUMBER[4:0]				
r	r	r	r	r	r			r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:11 **LSPI[4:0]**: Lockable shared peripheral interrupt
This bitfield returns the number of LSPIs that the interrupt controller contains. (0b1111 = 31 LSPIs, IDs 32-62).

Bit 10 **SECURITYEXTN**: Security extension
This bit indicates whether the GIC implements the security extensions. This bit always returns a value of 1, indicating that the security extensions are implemented.

Bits 9:8 Reserved, must be kept at reset value.

Bits 7:5 **CPUNUMBER[2:0]**: Number of processor interfaces
This bitfield indicates the number of implemented processor interfaces in the GIC.
0b001: 2 processor interfaces

Bits 4:0 **ITLINESNUMBER[4:0]**: Number of interrupt lines
This bitfield indicates the number of interrupts that the GIC supports. (0b01100= up to 416 interrupts, up to 384 SPI interrupts)

33.5.4 GICD implementer identification register (GICD_IIDR)

Address offset: 0x008

Reset value: 0x0202 143B

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PRODUCTID[7:0]								Res.	Res.	Res.	Res.	VARIANT[3:0]

NSATT	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SGIINTID[3:0]			
w												w	w	w	w

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **TARGETLISTFILTER[1:0]**: Target list filter

This bitfield determines how the distributor must process the requested SGI.

0: Forward the interrupt to the CPU interfaces specified in the CPUTARGETLIST bitfield.

1: Forward the interrupt to all CPU interfaces except the processor which requested the interrupt.

2: Forward the interrupt only to the CPU interface of the processor which requested the interrupt.

3: Reserved

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **CPUTARGETLIST[3:0]**: CPU target list

When TARGETLISTFILTER = 0b00, this CPUTARGETLIST bitfield defines the CPU interfaces to which the GICD must forward the interrupt. Each bit refers to the corresponding CPU interface. If this bitfield is 0 when TARGETLISTFILTER = 0b00, the GICD does not forward the interrupt to any CPU interface.

Bit 15 **NSATT**: Non-secure attribute

this bit specifies the required security value of the SGI.

0: Forward the SGI specified in the SGIINTID bitfield to a specified CPU interface, only if the SGI is configured as group 0 on this interface.

1: Forward the SGI specified in the SGIINTID bitfield to a specified CPU interface, only if the SGI is configured as group 1 on this interface.

Note: This bit is writable only by a secure access. Any non-secure write to this register generates an SGI, only if the specified SGI is programmed as group 1.

Bits 14:4 Reserved, must be kept at reset value.

Bits 3:0 **SGIINTID[3:0]**: SGI interrupt ID

The value of this bitfield is the interrupt ID of the SGI to forward to the specified CPU interfaces, in the range 0-15 (for example: a value of 0b0011 specifies interrupt ID 3).

33.5.23 GICD SGI clear-pending register x (GICD_CPENDSGIRx)

Address offset: 0xF10 + 0x4 * x, (x = 0 to 3)

Reset value: 0x0000 0000

For SGI = x * 4 to SGI = x * 4 + 3.

Res.	Res.	Res.	Res.	SGI_CLEAR_PENDING1[3:0]				Res.	Res.	Res.	Res.	SGI_CLEAR_PENDING0[3:0]			
				rw	rw	rw	rw					rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **SGI_CLEAR_PENDING3[3:0]**: Clear-pending state for SGI = x * 4 + 3

Writing a 1 clears the pending state of the SGI for the corresponding source processor, and no longer targets the processor performing the write.
Writing a 0 has no effect.
Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **SGI_CLEAR_PENDING2[3:0]**: Clear-pending state for SGI = x * 4 + 2

Writing a 1 clears the pending state of the SGI for the corresponding source processor, and no longer targets the processor performing the write.
Writing a 0 has no effect.
Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **SGI_CLEAR_PENDING1[3:0]**:Clear-pending state for SGI = x * 4 + 1

Writing a 1 clears the pending state of the SGI for the corresponding source processor, and no longer targets the processor performing the write.
Writing a 0 has no effect.
Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **SGI_CLEAR_PENDING0[3:0]**: Clear-pending state for SGI = x * 4

Writing a 1 clears the pending state of the SGI for the corresponding source processor, and no longer targets the processor performing the write.
Writing a 0 has no effect.
Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

33.5.24 GICD SGI set-pending register x (GICD_SPENDSGIRx)

Address offset: 0xF20 + 0x4 * x, (x = 0 to 3)

Reset value: 0x0000 0000

For SGI = x * 4 to SGI = x * 4 + 3.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

				rw	rw	rw	rw					rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **SGI_SET_PENDING3[3:0]**: Set-pending state for SGI = x * 4 + 3

Writing a 1 sets the pending state of the SGI for the corresponding source processor. Writing a 0 has no effect.

Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **SGI_SET_PENDING2[3:0]**: Set-pending state for SGI= x * 4 + 2

Writing a 1 sets the pending state of the SGI for the corresponding source processor. Writing a 0 has no effect.

Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **SGI_SET_PENDING1[3:0]**: Set-pending state for SGI = x * 4 + 1

Writing a 1 sets the pending state of the SGI for the corresponding source processor. Writing a 0 has no effect.

Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **SGI_SET_PENDING0[3:0]**: Set-pending state for SGI = x * 4

Writing a 1 sets the pending state of the SGI for the corresponding source processor.
Writing a 0 has no effect.

Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

Refer to *Section 2.4* for the register boundary addresses.

33.6 GIC CPU interface (GICC)

Each CPU interface provides a programming interface for the following actions:

- Enable the signaling of interrupt requests by the CPU interface.
- Acknowledge an interrupt.
- Indicate completion of the processing of an interrupt.
- Set an interrupt priority mask for the processor.
- Define the preemption policy for the processor.
- Determine the highest priority pending interrupt for the processor

All the registers are word-accessible.

33.6.1 GICC control register (GICC_CTLR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	EOIMODENS	EOIMODES	IRQBYPDISGRP1	FIQBYPDISGRP1	IRQBYPDISGRP0	FIQBYPDISGRP0	CBPR	FIQEN	ACKCTL	ENABLEGRP1	ENABLEGRP0
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **EOIMODENS**: Alias of EOIMODENS from the non-secure copy of this register.

Bit 9 **EOIMODES**:EOI mode for secure accesses

This bit controls the behavior of accesses to GICC_EOIR and GICC_DIR registers.
This control applies only to secure accesses.

Bit 8 **IRQBYPDISGRP1**: Alias of IRQBYPDISGRP1 from the non-secure copy of this register.

Bit 7 **FIQBYPDISGRP1**: Alias of FIQBYPDISGRP1 from the non-secure copy of this register.

Bit 6 **IRQBYPDISGRP0**: IRQ bypass disable for group 0 interrupts

When the signaling of IRQs by the CPU interface is disabled, this bit partly controls whether the bypass IRQ signal is signaled to the processor.

Bit 5 **FIQBYPDISGRP0**: FIQ bypass disable for group 0 interrupts

When the signaling of FIQs by the CPU interface is disabled, this bit partly controls whether the bypass FIQ signal is signaled to the processor.

Bit 4 **CBPR**: BPR control

Controls whether GICC_BPR provides common control to group 0 and group 1 interrupts.

Bit 3 **FIQEN**: FIQ enable for group 0 interrupts

Controls whether the CPU interface signals group 0 interrupts to a target processor using the FIQ or the IRQ signal. The GIC always signals group 1 interrupts using the IRQ signal.

Bit 2 **ACKCTL**: Acknowledge control

When the highest priority pending interrupt is a group 1 interrupt, this bit determines both:
- whether a read of GICC_IAR acknowledges the interrupt, or returns a spurious interrupt ID
- whether a read of GICC_HPPIR returns the ID of the highest priority pending interrupt, or returns a spurious interrupt ID

Note: Arm deprecates use of this bit and strongly recommends using a software model where this bit is set to 0.

Bit 1 **ENABLEGRP1**: Enable group 1 interrupts

This bit enables the signaling of group 1 interrupts by the CPU interface to the connected processor.

Bit 0 **ENABLEGRP0**: Enable group 0 interrupts

This bit enables the signaling of group 0interrupts by the CPU interface to the connected processor.

33.6.2 GICC control non-secure access register (GICC_CTLRNS)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	EOIMODENS	Res.	Res.	IRQBYPDISGRP1	FIQBYPDISGRP1	Res.	Res.	Res.	Res.	ENABLEGRP1
						rw			rw	rw					rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **EOIMODENS**: EOI mode for non- secure accesses

This bit controls the behavior of accesses to GICC_EOIR and GICC_DIR registers.

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 **IRQBYPDISGRP1**: IRQ bypass for group 1 interrupts

When the signaling of IRQs by the CPU interface is disabled, this bit partly controls whether the bypass IRQ signal is signaled to the processor.

Bit 5 **FIQBYPDISGRP1**: FIQ bypass disable for group 1 interrupts
When the signaling of FIQs by the CPU interface is disabled, this bit partly controls whether the bypass FIQ signal is signaled to the processor.

Bits 4:1 Reserved, must be kept at reset value.

Bit 0 **ENABLEGRP1**: Enable group1 interrupts
This bit enables the signaling of group 1 interrupts by the CPU interface to the connected processor.

33.6.3 GICC input priority mask register (GICC_PMR)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIORITY[4:0]					Res.	Res.	Res.
								rw	rw	rw	rw	rw			

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:3 **PRIORITY[4:0]**: Priority mask level for the CPU interface
If the priority of an interrupt is higher than the value indicated by this bitfield, the interface signals the interrupt to the processor.

Bits 2:0 Reserved, must be kept at reset value.

33.6.4 GICC binary point register (GICC_BPR)

Address offset: 0x008

Reset value: 0x0000 0002

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BINARY_POINT[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **BINARY_POINT[2:0]**:
This bitfield value controls how the 8-bit interrupt priority field is split into a group priority field. It is used to determine interrupt preemption and a subpriority field. Minimum value is 2.

33.6.5 GICC binary point non-secure access register (GICC_BPRNS)

Address offset: 0x008

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BINARY_POINT[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **BINARY_POINT[2:0]**:

This bitfield value controls how the 8-bit interrupt priority field is split into a group priority field. It is used to determine interrupt preemption and a subpriority field. Minimum value is 3.

33.6.6 GICC interrupt acknowledge register (GICC_IAR)

Address offset: 0x00C

Reset value: 0x0000 03FF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CPUID[1:0]		INTERRUPT_ID[9:0]									
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:10 **CPUID[1:0]**: CPU requesting the interrupt

For SGIs in a multiprocessor implementation, this field identifies the processor that requested the interrupt. It returns the number of the CPU interface that made the request.

For example, a value of 1 means the request was generated by a write to the GICD_SGIR on CPU interface 1.

Bits 9:0 **INTERRUPT_ID[9:0]**: interrupt ID

33.6.7 GICC end of interrupt register (GICC_EOIR)

Address offset: 0x010

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CPUID[1:0]		EOIINTID[9:0]									
				w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:10 **CPUID[1:0]**:

On a multiprocessor implementation, if the write refers to an SGI, this field contains the CPUID value from the corresponding GICC_IAR access.

Bits 9:0 **EOIINTID[9:0]**: Interrupt ID value from the corresponding GICC_IAR access

33.6.8 GICC running priority register (GICC_RPR)

Address offset: 0x014

Reset value: 0x0000 00FF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIORITY[4:0]					Res.	Res.	Res.
								r	r	r	r	r			

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:3 **PRIORITY[4:0]**: Current running priority on the CPU interface

Bits 2:0 Reserved, must be kept at reset value.

33.6.9 GICC highest priority pending interrupt register (GICC_HPPIR)

Address offset: 0x018

Reset value: 0x0000 03FF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CPUID[1:0]		PENDINTID[9:0]									
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:10 **CPUID**[1:0]:

On a multiprocessor implementation, if the PENDINTID bitfield returns the ID of an SGI, this field contains the CPUID value for this interrupt. This identifies the processor that generated the interrupt.

Bits 9:0 **PENDINTID[9:0]**: Interrupt ID of the highest-priority pending interrupt

33.6.10 GICC aliased binary point register (GICC_ABPR)

Address offset: 0x01C

Reset value: 0x0000 0003

GICC_ABPR is an alias of the non-secure GICC_BPR. When CBPR is cleared to 0 in GICC_CTLR, a secure access to this register is equivalent to a non-secure access to GICC_BPR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BINARY_POINT[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **BINARY_POINT[2:0]**:

The value of this bitfield controls how the 8-bit interrupt priority field is split into a group priority field. It is used to determine interrupt preemption, and a subpriority field. Minimum value is 3.

33.6.11 GICC aliased interrupt acknowledge register (GICC_AIAR)

Address offset: 0x020

Reset value: 0x0000 03FF

GICC_AIAR is an alias of the non-secure view of GICC_IAR. A secure access to this register is identical to a non-secure access to GICC_IAR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CPUID[1:0]		INTERRUPT_ID[9:0]									
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:10 **CPUID[1:0]**:

For SGIs in a multiprocessor implementation, this field identifies the processor that requested the interrupt. It returns the number of the CPU interface that made the request.

For example, a value of 1 means the request was generated by a write to the GICD_SGIR on CPU interface 1.

Bits 9:0 **INTERRUPT_ID[9:0]**: Interrupt ID

33.6.12 GICC aliased end of interrupt register (GICC_AEOIR)

Address offset: 0x024

Reset value: 0xXXXX XXXX

GICC_AEOIR is an alias of the non-secure GICC_EOIR. A secure access to this register is similar to a non-secure access to GICC_EOIR, except that EOIMODES in GICC_CTLR is used.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CPUID[1:0]		EOIINTID[9:0]									
				w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:10 **CPUID[1:0]**:

On a multiprocessor implementation, when processing an SGI, this field must contain the CPUID value from the corresponding GICC_AIAR, or non-secure GICC_IAR, access.

Bits 9:0 **EOIINTID[9:0]**:

This bitfield contains the interrupt ID value from the corresponding GICC_AIAR, or non-secure GICC_IAR, access.

33.6.13 GICC aliased highest priority pending interrupt register (GICC_AHPPIR)

Address offset: 0x028

Reset value: 0x0000 03FF

This register is an alias of the non-secure GICC_HPPIR. A secure access to this register is equivalent to a non-secure access to GICC_HPPIR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CPUID[1:0]		PENDINTID[9:0]									
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:10 **CPUID[1:0]**:

On a multiprocessor implementation, if the PENDINTID bitfield returns the ID of an SGI, this field contains the CPUID value for that interrupt. This identifies the processor that generated the interrupt.

Bits 9:0 **PENDINTID[9:0]**: Interrupt ID of the highest-priority pending interrupt
This bitfield contains the interrupt ID of the highest-priority pending interrupt If that interrupt is a group 1 interrupt. Otherwise, its value is the spurious interrupt ID, 1023.

33.6.14 GICC active priority register (GICC_APR0)

Address offset: 0x0D0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
APR0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **APR0[31:0]:** Active priority

33.6.15 GICC non-secure active priority register (GICC_NSAPR0)

Address offset: 0x0E0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
NSAPR0[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NSAPR0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **NSAPR0[31:0]**: Non-secure active priority

33.6.16 GICC interface identification register (GICC_IIDR)

Address offset: 0x0FC

Reset value: 0x0202 143B

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PRODUCTID[11:0]												ARCH[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REVISION[3:0]				IMPLEMENTER[11:0]											
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:20 **PRODUCTID[11:0]**: product ID

Bits 19:16 **ARCH[3:0]**: GIC architecture version

Bits 15:12 **REVISION[3:0]**: revision number for the CPU interface

Bits 11:0 **IMPLEMENTER[11:0]**: GIC implementer (0x43B Arm implementation)

33.6.17 GICC deactivate interrupt register (GICC_DIR)

Address offset: 0x1000

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Refer to *Section 2.4* for the register boundary addresses.

33.7 GIC virtual interface control, common (GICH)

The GICH registers are management ones. Configuration software on the Cortex-A35 must ensure they are accessible only by a hypervisor or similar software.

All the registers are word-accessible.

33.7.1 GICH hypervisor control register (GICH_HCR)

Address offset: 0x000

Reset value: 0b0000 0XXX XXXX XXXX XXXX XXXX 0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EOICOUNT[4:0]					Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw	rw	rw	rw	rw											
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VGRP1 DIE	VGRP1 EIE	VGRP0 DIE	VGRP0 EIE	NPIE	LRENP IE	UIE	EN
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 **EOICOUNT[4:0]**: End-of-interrupt counter

This bitfield counts the number of EOIs received that do not have a corresponding entry in the list registers. The virtual CPU interface increments this bitfield automatically when a matching EOI is received. When EOIs do not clear a bit in the active priorities register, GICH_APR does not cause an increment.

Although not possible under correct operation, if an EOI occurs when the value of this bitfield is 31, this bitfield wraps to 0.

The maintenance interrupt is asserted whenever this bitfield is non-zero, and LRENPIE = 1.

Bits 26:8 Reserved, must be kept at reset value.

Bit 7 **VGRP1DIE**: Virtual machine disable group 1 interrupt enable

This bit enables the signaling of a maintenance interrupt while signaling of group 1 interrupts from the virtual CPU interface to the connected virtual machine, is disabled.

Bit 6 **VGRP1EIE**: Virtual machine enable group 1 interrupt enable

This bit enables the signaling of a maintenance interrupt while signaling of group 1 interrupts from the virtual CPU interface to the connected virtual machine, is enabled.

Bit 5 **VGRP0DIE**: Virtual machine disable group 0 interrupt enable

This bit enables the signaling of a maintenance interrupt while signaling of group 0 interrupts from the virtual CPU interface to the connected virtual machine, is disabled.

Bit 4 **VGRP0EIE**: Virtual machine enable group 0interrupt enable

This bit enables the signaling of a maintenance interrupt while signaling of group 0 interrupts from the virtual CPU interface to the connected virtual machine, is enabled.

Bit 3 **NPIE**: No pending interrupt enable

This bit enables the signaling of a maintenance interrupt while no pending interrupts are present in the list registers.

Bit 2 **LRENPIE**: List register entry not present interrupt enable

This bit enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid list register entry for an EOI request.

Bit 1 **UIE**: Underflow interrupt enable.
This bit enables the signaling of a maintenance interrupt when the list registers are empty, or hold only one valid entry.

Bit 0 **EN**: Global enable bit for the virtual CPU interface

33.7.2 GICH VGIC type register (GICH_VTR)

Address offset: 0x004

Reset value: 0x9000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PRIBITS[2:0]			PREBITS[2:0]			Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
r	r	r	r	r	r										
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LISTREGS[4:0]				
											r	r	r	r	r

Bits 31:29 **PRIBITS[2:0]**: Priority bits
This bitfield indicates the number of priority bits implemented, minus one.
For example, 0x4 means 5 bits of priority, and 32 priority levels.

Bits 28:26 **PREBITS[2:0]**: Preemption bits
This bitfield indicates the number of preemption bits implemented, minus one.
For example, 0x4 means 5 bits of preemption, and 32 preemption levels

Bits 25:5 Reserved, must be kept at reset value.

Bits 4:0 **LISTREGS[4:0]**: List registers
This bitfield indicates the number of implemented list registers, minus one.
For example, 0x3 means 4 list registers.

33.7.3 GICH virtual machine control register (GICH_VMCR)

Address offset: 0x008

Reset value: 0b0000 0XXX 0100 11XX XXXX XX0X XXX0 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

						rw					rw	rw	rw	rw	rw

Bits 31:27 **VMPRIMASK[4:0]**: Alias of GICV_PMR.PRIORITY

Bits 26:24 Reserved, must be kept at reset value.

Bits 23:21 **VMBP[2:0]**: Alias of GICV_BPR.BINARY_POINT

Bits 20:18 **VMABP[2:0]**: Alias of GICV_ABPR.BINARY_POINT.

Bits 17:10 Reserved, must be kept at reset value.

Bit 9 **VEM**: Alias of GICV_CTLR.EOIMODE

Bits 8:5 Reserved, must be kept at reset value.

Bit 4 **VMCBPR**: Alias of GICV_CTLR.CBPR

Bit 3 **VMFIQEN**: Alias of GICV_CTLR.FIQEN

Bit 2 **VMACKCTL**: Alias of GICV_CTLR.ACKCTL

Bit 1 **VMGRP1EN**: Alias of GICV_CTLR.ENABLEGRP1

Bit 0 **VMGRP0EN**: Alias of GICV_CTLR.ENABLEGRP0

33.7.4 GICH maintenance interrupt status register (GICH_MISR)

Address offset: 0x010

Reset value: 0bXXXX XXXX XXXX XXXX XXXX XXXX 0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **VGRP1D**: Disabled group 1 maintenance interrupt
Asserted whenever GICH_HCR.VGRP1DIE is set and GICH_VMCR.VMGRP1EN = 0.

Bit 6 **VGRP1E**: Enabled group 1 maintenance interrupt
Asserted whenever GICH_HCR.VGRP1EIE is set and GICH_VMCR.VMGRP1EN = 1.

Bit 5 **VGRP0D**: Disabled group 0 maintenance interrupt
Asserted whenever GICH_HCR.VGRP0DIE is set and GICH_VMCR.VMGRP0EN = 0.

Bit 4 **VGRP0E**: Enabled group 0 maintenance interrupt
Asserted whenever GICH_HCR.VGRP0EIE is set and GICH_VMCR.VMGRP0EN = 1.

Bit 3 **NP**: No pending maintenance interrupt
Asserted whenever GICH_HCR.NPIE = 1 and no list register is in pending state.

Bit 2 **LRENP**: List register entry not present maintenance interrupt
Asserted whenever GICH_HCR.LRENPIE = 1 and GICH_HCR.EOICOUNT is non-zero.

Bit 1 **U**: Underflow maintenance interrupt
Asserted whenever GICH_HCR.UIE is set and if none, or only one, of the list register entries are marked as a valid interrupt (if the corresponding GICH_LRx.STATE bits do not equal 0x0).

Bit 0 **EOI**: End of interrupt maintenance interrupt
Asserted whenever at least one list register asserts an EOI Interrupt, which means at least one bit at 1 in GICH_EISRx.

33.7.5 GICH end of interrupt status register (GICH_EISR0)

Address offset: 0x020

Reset value: 0bXXXX XXXX XXXX XXXX XXXX XXXX XXXX 0000

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ELSR0[31:0]**: Empty list status

33.7.7 GICH active priority register (GICH_APR0)

Address offset: 0x0F0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
APR0[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
APR0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **APR0[31:0]**: Active priority

33.7.8 GICH list register x (GICH_LRx)

Address offset: 0x100 + 0x4 * x, (x = 0 to 3)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HW	GRP1	STATE[1:0]		PRIORITY[4:0]					Res.	Res.	Res.	PHYSICALID[9:6]			
rw	rw	rw	rw	rw	rw	rw	rw	rw				rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PHYSICALID[5:0]						VIRTUALID[9:0]									
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **HW**: Hardware interrupt

This bit indicates whether this virtual interrupt is an hardware interrupt (corresponding to a physical interrupt). Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the ID that the PHYSICALID bitfield indicates.

Bit 30 **GRP1**:

This bit indicates whether this virtual interrupt is a group 1 virtual interrupt.

Bits 29:28 **STATE[1:0]**: State of the interrupt

Bits 27:23 **PRIORITY[4:0]**: Priority of the interrupt

Bits 22:20 Reserved, must be kept at reset value.

Bits 19:10 **PHYSICALID[9:0]**: Physical ID

This bitfield function depends on the value of the GICH_LR.HW bit, as follows.

1) When GICH_LR.HW = 0, bits [9:0] have the following meanings:

- [19] EOI when this interrupt triggers an EOI maintenance interrupt
- [12:10] CPUID If the interrupt has the virtual ID for an SGI, that is, 0-15. This bitfield shows the requesting CPU ID. This appears in the relevant field of the virtual machine interrupt acknowledge register, GICV_IAR or GICV_AIAR. Otherwise, this bitfield must be set to 0.

2) When GICH_LR.HW = 1, PHYSICALID[9:0] indicates the physical interrupt ID that the hypervisor forwards to the GICD.

If this bitfield value is 0-15, or 1020-1023, behavior is unpredictable.

If this bitfield value is 16-31, it applies to the PPI associated with the same physical CPUID as the virtual CPU interface requesting the deactivation.

Bits 9:0 **VIRTUALID[9:0]**: virtual ID

This ID is returned to the guest OS when the interrupt is acknowledged through GICV_IAR. Each valid interrupt stored in the list registers must have a unique virtual ID for that virtual CPU interface.

If this bitfield value is 1020-1023, behavior is unpredictable.

33.7.9 GICH register map

Table 233. GICH register map and reset values

Refer to *Section 2.4* for the register boundary addresses.

33.8 GIC virtual CPU interface (GICV)

The GICV forwards virtual interrupts to a connected Cortex-A35 processor core, subject to the normal GIC handling and prioritization rules. The virtual interface control registers control GICV operation. The GICV uses the contents of the list registers to determine when to signal virtual interrupts. When a processor core accesses the GICV, the list registers are updated.

All the registers are word-accessible.

33.8.1 GICV virtual machine control register (GICV_CTLR)

						rw					rw	rw	rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **EOIMODE**: End of interrupt mode

This bit controls the behavior associated with GICV_EOIR, GICV_AEOIR, and GICV_DIR.

Bits 8:5 Reserved, must be kept at reset value.

Bit 4 **CBPR**: BPR control

This bit controls whether GICV_BPR controls both group 0 and group 1 virtual interrupts.

Bit 3 **FIQEN**: FIQ enable for group 0 interrupts

This bit controls whether interrupts marked as group 0 are presented as virtual FIQs.

Bit 2 **ACKCTL**: Acknowledge control

This bit controls whether a read of GICV_IAR, when the highest priority pending interrupt is a group 1 interrupt, causes the CPU interface to acknowledge the interrupt.

Note: Arm deprecates use of this bit, and strongly recommends that software is written to operate with this bit always set to 0.

Bit 1 **ENABLEGRP1**:

This bit enables the signaling of group 1 virtual interrupts by the GICV to the virtual machine.

Bit 0 **ENABLEGRP0**:

This bit enables the signaling of group 0 virtual interrupts by the GICV to the virtual machine.

33.8.2 GICV VM priority mask register (GICV_PMR)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIORITY[4:0]					Res.	Res.	Res.
								rw	rw	rw	rw	rw			

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:3 **PRIORITY[4:0]**: Priority mask level for the virtual CPU interface
Only virtual interrupts with higher priority than this bitfield value can be signaled to the processor core.

Bits 2:0 Reserved, must be kept at reset value.

33.8.3 GICV VM binary point register (GICV_BPR)

Address offset: 0x008

Reset value: 0x0000 0002

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BINARY_POINT[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **BINARY_POINT[2:0]**:
This bitfield value controls how the 8-bit virtual interrupt priority field is split into a group priority field, used to determine virtual interrupt preemption, and a subpriority field. Minimum value is 2.

33.8.4 GICV VM interrupt acknowledge register (GICV_IAR)

Address offset: 0x00C

Reset value: 0x0000 03FF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CPUID[1:0]		INTERRUPT_ID[9:0]									
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:10 **CPUID[1:0]**:
If HW is cleared to 0 in GICH_LRx (indicating that the interrupt is triggered in software), the value of CPUID in GICH_LRx, that indicates the CPU ID, is returned in this field.
Otherwise this bit is read as zero.

Bits 9:0 **INTERRUPT_ID[9:0]**: Interrupt ID

33.8.5 GICV VM end of interrupt register (GICV_EOIR)

Address offset: 0x010

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CPUID[1:0]		EOIINTID[9:0]									
				w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:10 **CPUID[1:0]**:

On a multiprocessor implementation, if the write refers to an SGI, this field contains the CPUID value from the corresponding GICV_IAR access.

Bits 9:0 **EOIINTID[9:0]**:

If HW is set to 1 in GICH_LRx (indicating a hardware interrupt), a deactivate request is sent to the physical distributor, identifying the physical ID from the corresponding bitfield in the list register.

33.8.6 GICV VM running priority register (GICV_RPR)

Address offset: 0x014

Reset value: 0x0000 00FF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIORITY[4:0]					Res.	Res.	Res.
								r	r	r	r	r			

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:3 **PRIORITY[4:0]**: Current running priority on the virtual CPU interface

Bits 2:0 Reserved, must be kept at reset value.

33.8.7 GICV VM highest priority pending interrupt register (GICV_HPPIR)

Address offset: 0x018

Reset value: 0x0000 03FF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CPUID[1:0]		PENDINTID[9:0]									
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:10 **CPUID[1:0]**:

On a multiprocessor implementation, if GICH_LRx.HW = 0, this field contains the CPUID value for this virtual interrupt. This identifies the virtual processor that generated the virtual interrupt.

Bits 9:0 **PENDINTID[9:0]**:

The virtual interrupt ID of the highest-priority pending virtual interrupt

33.8.8 GICV VM aliased binary point register (GICV_ABPR)

Address offset: 0x01C

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BINARY_POINT[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **BINARY_POINT[2:0]**:

This bitfield value controls how the 8-bit virtual interrupt priority field is split into a group priority field, used to determine virtual interrupt preemption, and a subpriority field. Minimum value is 3.

33.8.9 GICV VM aliased interrupt register (GICV_AIAR)

Address offset: 0x020

Reset value: 0x0000 03FF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CPUID[1:0]		INTERRUPT_ID[9:0]									
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:10 **CPUID[1:0]**:

If HW is cleared to 0 in GICH_LRx (indicating that the interrupt is triggered in software), the CPUID value in GICH_LRx, that indicates the CPU ID, is returned in this field. Otherwise, this bit is read as zero.

Bits 9:0 **INTERRUPT_ID[9:0]**: interrupt ID

If GRP1 = 0 in GICH_LRx, the interrupt is group 0. The spurious interrupt ID 1023 is returned, and the interrupt is not acknowledged.

33.8.10 GICV VM aliased end of interrupt register (GICV_AEOIR)

Address offset: 0x024

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CPUID[1:0]		EOIINTID[9:0]									
				w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:10 **CPUID[1:0]**:

On a multiprocessor implementation, if the write refers to an SGI, this field contains the CPUID value from the corresponding GICV_IAR access.

Bits 9:0 **EOIINTID[9:0]**:

If HW is set to 1 in GICH_LRx (indicating an hardware interrupt), a deactivate request is sent to the physical distributor, identifying the physical ID from the corresponding field in the list register.

33.8.11 GICV VM aliased highest priority pending interrupt register (GICV_AHPPIR)

Address offset: 0x028

Reset value: 0x0000 03FF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CPUID[1:0]		PENDINTID[9:0]									
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:10 **CPUID[1:0]**:

If HW is set to 1 in GICH_LRx (indicating an hardware interrupt), a deactivate request is sent to the physical distributor, identifying the physical ID from the corresponding field in the list register.

Bits 9:0 **PENDINTID[9:0]**:

This bitfield contains the virtual interrupt ID of the highest-priority pending virtual interrupt, if that virtual interrupt is a group 1 virtual interrupt.

Otherwise, it contains the spurious virtual interrupt ID (1023).

33.8.12 GICV VM active priority register (GICV_APR0)

Address offset: 0x0D0

Reset value: 0x0000 0000

This register is an alias of GICH_APR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
APR0[31:16]

Refer to *Section 2.4* for the register boundary addresses.

34 Extended interrupts and event controller (EXTI)

The extended interrupts and event controller (EXTI) manages the individual CPU and system wake-up through configurable and direct event inputs. It provides wake-up requests to the power control, and generates a combined secure/non-secure interrupt request to the CPUs NVIC and events to the CPUs event input. For each CPU, an additional event generation block (EVG) is needed to generate the CPU event signal.

The EXTI wake-up requests allow the system to be woken up from Stop modes, and the CPU to be woken up from CStop and CStandby modes.

The interrupt request and event request generation can also be used in Run modes.

EXTI1: CPU1 = Cortex-A35 and CPU2 = Cortex-M33

EXTI2: CPU1 = Cortex-A35, CPU2 = Cortex-M33, CPU3 = Cortex-M0+

34.1 EXTI main features

The EXTI main features are the following:

- EXTI1 85, and EXTI2 77 input events supported
- EXTI1 two CPUs, and EXTI2 three CPUs supported
- Most event inputs allow to wake up the system.
- Some events can only be used to generate a CPU wake-up.
- Events which do not have an associated wake-up flag in the peripheral, have a flag in the EXTI, and generate a combined secure/non-secure interrupt to the CPUs from the EXTI.
- Events can be used to generate a CPU wake-up event.

The asynchronous event inputs are classified in two groups:

- configurable events (signals from I/Os or peripherals able to generate a pulse)

  These events have the following features:
  - Selectable active trigger edge
  - Interrupt pending status register bits independent for the rising and falling edge
  - Individual interrupt and event generation mask, used to condition the CPU wake-up, interrupt and event generation
  - Individual interrupt lines per CPU
  - Software trigger possibility
- direct events (interrupt and wake-up sources from peripherals having an associated flag which requires to be cleared in the peripheral)

  These events have the following features:
  - Fixed rising edge active trigger
  - No interrupt pending status register bit in the EXTI (the interrupt pending status flag is provided by the peripheral generating the event)
  - Individual interrupt and event generation mask, used to condition the CPU wake-up and event generation
  - No software trigger possibility

- Secure events
  - The access to control and configuration bits of secure input events can be made secure and or privilege.
- Resource isolation support
  - Support for CID resource identification per CPU, protecting any resource (register) from access by an other resource
- EXTI I/O port selection

34.2 EXTI implementation

Table 235. EXTI implementation

EXTI features(1)	EXTI1	EXTI2
EXTI I/O port selection	X	X
EXTI I/O port to interconnect other peripherals	-	X
Number of events	85	77
Number of CPUs	2	3
Security	X	X

1. X = supported.

34.3 EXTI block diagram

The EXTI consists of the following blocks (see *Figure 198*):

- register block accessed via an AHB interface, which contains all the EXTI registers
- event input trigger block which provides event input edge trigger logic
- masking block which provides the event input distribution to the different wake-up, interrupts, and event outputs, plus the masking of these
- EXTI mux which provides the I/O port selection on to the EXTI event signal

Figure 198. EXTI block diagram

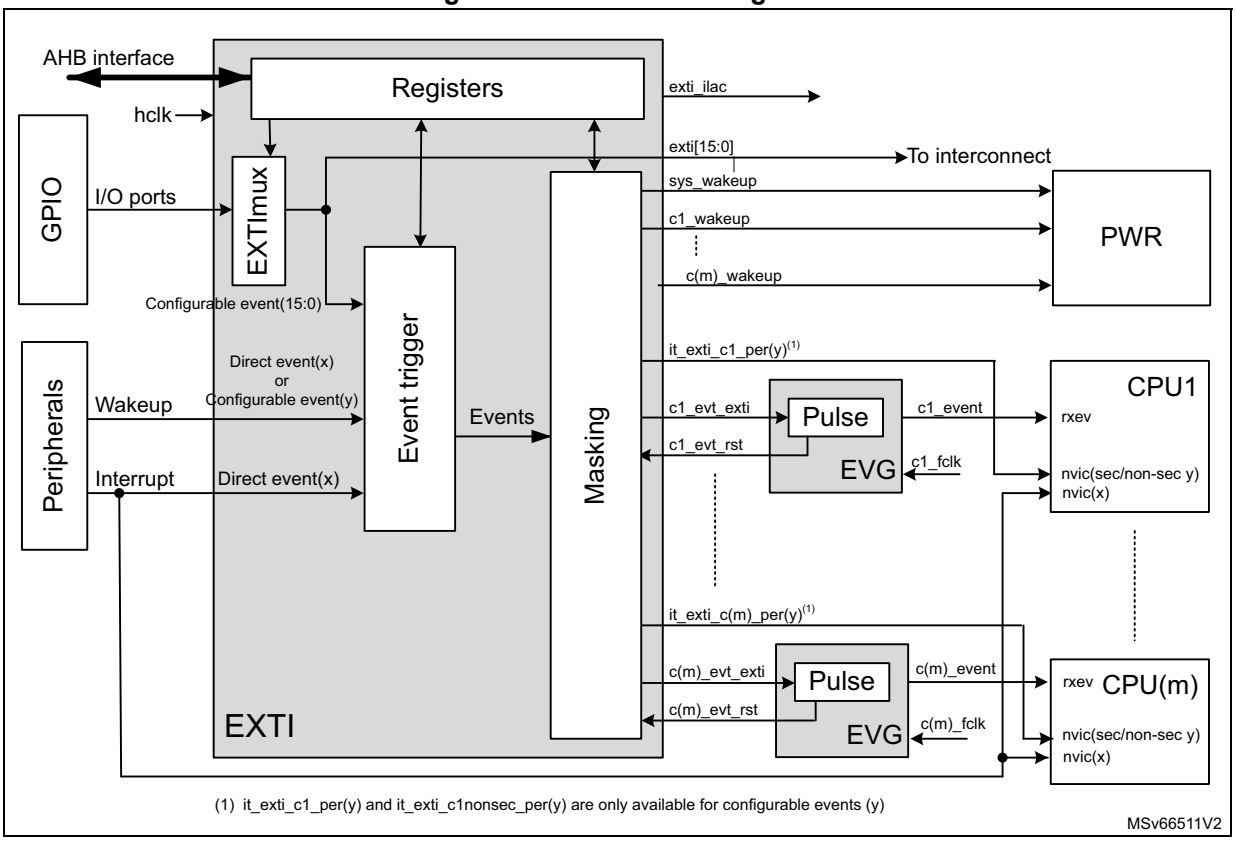

Table 236. EXTI signals

Name	I/O	Description
AHB interface	I/O	EXTI register bus interface. When one event is configured to allow security, the AHB interface support secure accesses.
hclk	I	AHB bus clock and EXTI system clock.
exti_ilac	O	Illegal access event
Configurable event(y)	I	Asynchronous wake-up events from peripherals which do not have an associated interrupt and flag in the peripheral.
Direct event(x)	I	Synchronous and Asynchronous wake-up events from peripherals which have an associated interrupt and flag in the peripheral.
I/O ports	I	GPIO I/O ports[15:0]
exti[15:0]	O	EXTI GPIO output port to trigger other peripherals (only available for EXTI2)
it_exti_c(m)_per(y)	O	Combined secure/non-secure Interrupts to the CPU1 and CPU(m) associated with Configurable event (y)
c(m)_evt_exti	O	High-level sensitive event output for CPU(m) synchronous to hclk (EXTI1: m = 2, EXTI2: m = 2 to 3)
c(m)_evt_rst	I	Asynchronous reset input to clear c(m)_evt_exti (EXTI1: m = 2, EXTI2: m = 2 to 3)

Table 236. EXTI signals (continued)

Name	I/O	Description
sys_wakeup	O	Asynchronous system wake-up request to PWR for ck_sys and hclk
c(m)_wakeup	O	Wake-up request to PWR for CPU(m), synchronous to hclk (EXTI1: m = 1 to 2, EXTI2: m = 1 to 3)

Table 237. EVG signals

Name	I/O	Description
c_fclk	I	CPU free running clock.
c_evt_in	I	High-level sensitive events input from EXTI, asynchronous to CPU clock.
c_event	O	Event pulse, synchronous to CPU clock.
c_evt_rst	O	Event reset signal, synchronous to CPU clock.

34.3.1 EXTI connections between peripherals and CPU

Peripherals able to generate wake-up or interrupt events when the system is in Stop mode or a CPU is in CStop mode, are connected to the EXTI.

Peripheral wake-up signals that generate a pulse, or which do not have an interrupt status bits in the peripheral, are connected to an EXTI configurable event input. For these events, the EXTI provides a status pending bit which requires to be cleared. It is the EXTI interrupt associated with the status bit that interrupts the CPU.

Peripheral interrupt and wake-up signals that have a status bit in the peripheral which requires to be cleared in the peripheral, are connected to an EXTI direct event input. There is no status pending bit within the EXTI. The interrupt or wake-up is cleared by the CPU in the peripheral. It is the peripheral interrupt that interrupts the CPU directly.

All GPIO ports are inputs for the EXTI multiplexer and used to select a port pin to wake up the system via a configurable event.

EXTI configurable event interrupts are connected to the respective NVIC of each CPU. A secure CPU receives both its secure and non-secure interrupts on the combined secure/non-secure it_exti_c(m)_per(y) interrupt signal. A non-secure CPU only receives its non-secure interrupts on the it_exti_c(m)_per(y) interrupt signal. Each CPU has its dedicated individual interrupt signal, which allows interrupt masking per CPU based on the EXTI_CmIMR settings.

The dedicated EXTI/EVG CPU event is connected to the respective CPU rxev input.

EXTI CPU wake-up signals are connected to the PWR, and are used to wake up the system and CPU subsystem bus clocks.

34.3.2 EXTI1 wake-up interrupt list

The wake-up sources are listed in the table below.

Some wake-up sources are able to generate an event to the CPU (see event column). The wake-up source capability to wake up a CPU is noted in wake-up column.

For CPU interrupt handling, see *Section 32: Nested vectored interrupt controllers (NVIC)*.

Table 238. EXTI1 wake-up interrupts

EXTI n°	Acronym	Description	EXTI type	Event(1)	Security	Wake-up

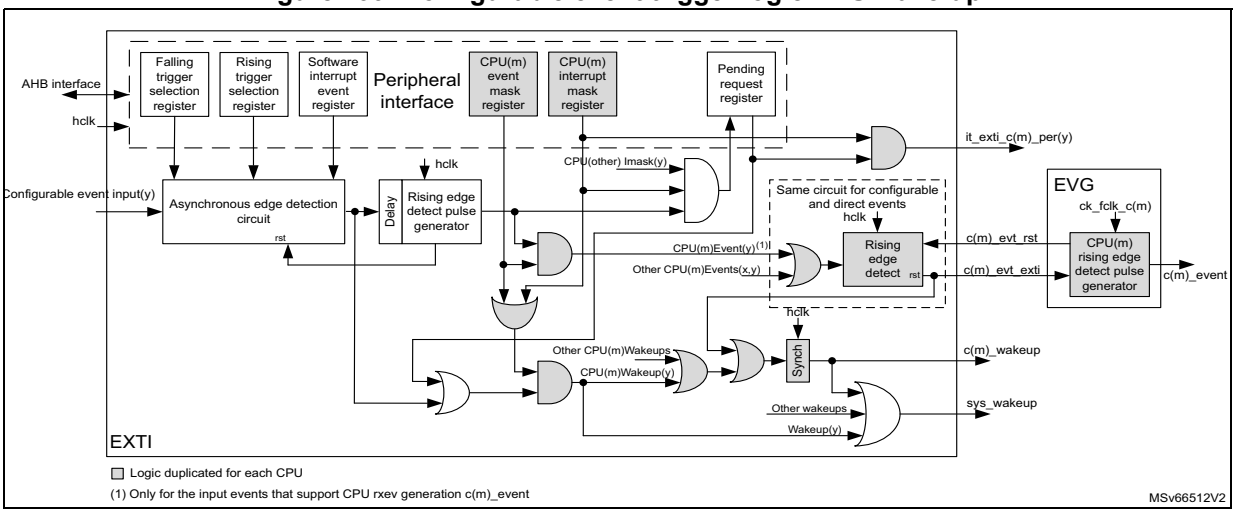
1. Events are only generated for CPU2 and CPU3
2. For correct operation, the EXTI2 event EXTI2_C2IMRm.IM and EXTI2_C3IMRm.IMbit must be set to 0 before CPU1 uses this event.
3. For correct operation, the EXTI2 event EXTI2_C1IMRm.IM and EXTI2_C3IMRm.IM bit must be set to 0 before CPU2 uses this event.
4. For correct operation, the EXTI2 event EXTI2_C1IMRm.IM and EXTI2_C2IMRm.IM bit must be set to 0 before CPU3 uses this event.
5. For correct operation, the EXTI2 event, EXTI2_C3IMRm.IM and EXTI2_C3EMRm.EM bits must be set to 0 before CPU1 or CPU2 uses this event.

34.4 EXTI functional description

Depending on the EXTI event input type and wake-up targets, different logic implementations are used. The applicable features are controlled from register bits:

Table 240. EXTI event input configurations and register control



Event input type	Logic implementation	EXTI_RTSR	EXTI_FTSR	EXTI_SWIER	EXTI_RPR	EXTI_FPR	EXTI_SECCFGR	EXTI_PRIVCFGR	EXTI_CmIMR	EXTI_CmEMR(1)
Configurable	Configurable event input wake-up logic	x	x	x	x	x	x	x	x	x
Direct	Direct event input wake-up logic	-	-	-	-	-	x	x	x	x

1. Only for input events with configuration “rxev generation” enabled.

34.4.1 EXTI configurable event input wake-up

The figure below is a detailed representation of the logic associated with configurable event inputs which wake up the CPU(m) sub-system bus clocks and generate an EXTI pending flag and combined secure/non-secure interrupt to the CPU(m) and or a CPU(m) wake-up event.

Figure 199. Configurable event trigger logic CPU wake-up

The software interrupt event register is used to trigger configurable events by software, writing the corresponding register bit, irrespective of the edge selection setting.

The rising edge and falling edge selection registers are used to enable and to select the configurable event active trigger edge or both edges.

Each CPU has its dedicated wake-up (interrupt) mask register and a dedicated event mask register. The enabled event is used to generate an event on the CPU. All events for a CPU are ORed together into a single CPU event signal. The event pending registers (EXTI_RPR and EXTI_FPR) are not set for an unmasked CPU event.

The configurable events have unique interrupt pending request register bits, shared by the CPUs. The pending register is only set for an unmasked interrupt. Each configurable event provides dedicated combined secure/non-secure interrupts to all CPUs. The configurable event interrupts need to be acknowledged by software in EXTI_RPR and/or EXTI_FPR.

When a CPU(m) wake-up (interrupt) or CPU(m) event is enabled, the asynchronous edge detection circuit is reset by the clocked delay and rising edge detect pulse generator. This guarantees that the EXTI hclk clock is woken up before the asynchronous edge detection circuit is reset.

Note: A detected configurable event interrupt pending request can be cleared by any CPU with the correct access permission. The system is not able to enter into low-power modes as long as an interrupt pending request is active.

34.4.2 EXTI direct event input wake-up

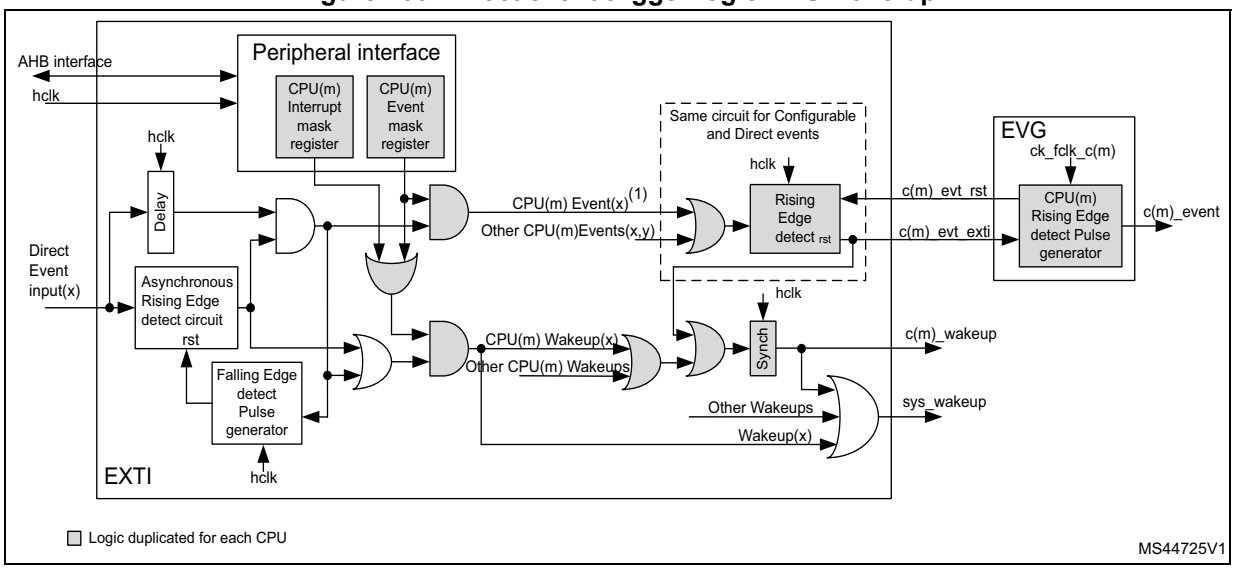


Figure 200 is a detailed representation of the logic associated with direct event inputs that wake up the system.

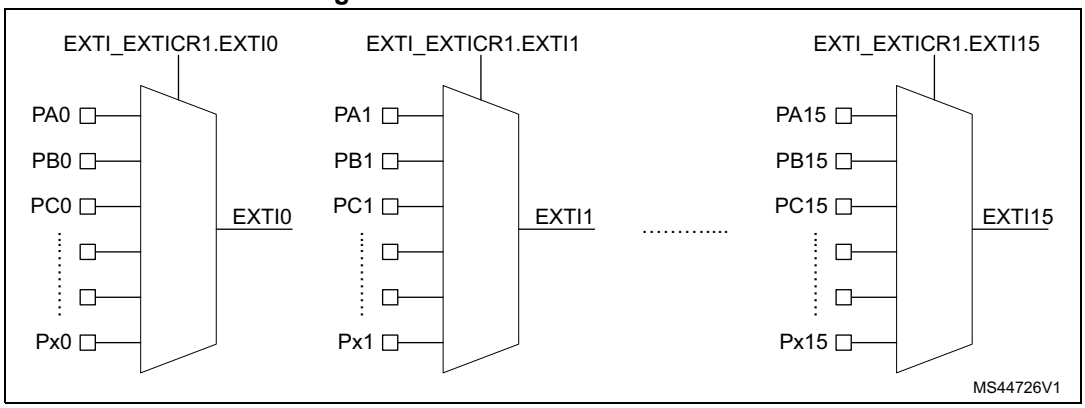
The direct events do not have an associated EXTI interrupt. The EXTI only wakes up the system and CPU subsystem clocks, and can generate a CPU wake-up event. The peripheral synchronous interrupt, associated with the direct wake-up event, wakes up the CPU.

The EXTI direct event is able to generate a CPU event that wakes up the CPU. The CPU event may occur before the associated peripheral interrupt flag is set.

Note: The direct events are cleared in the peripheral generating the event. When a direct event input enabled by CPU(m) is cleared by an other CPU before the CPU(m) clock is running, the CPU(m) no longer receives a CPU(m) interrupt nor CPU(m) event. The CPU(m) does not wake up. The system stays in Run mode, and generates the CPU(m) clock. For this reason, CPU(m) direct events must NOT be cleared by an other CPU.

Figure 200. Direct event trigger logic CPU wake-up



1. Only for the input events that support CPU rxev generation c(m)_event.

34.4.3 EXTI multiplexer selection

The EXTI multiplexer selection is available on EXTI1 and EXTI2. It is used to select GPIOs as interrupts and wake-up. The GPIOs are connected via 16 EXTI multiplexers to the first 16 EXTI events as configurable event. The selection of GPIO port as EXTI multiplexer output, is controlled by EXTIn_EXTICRx (x = 1 to 4).

Figure 201. EXTI mux GPIO selection

Only the EXTI mux outputs from EXTI2 are available as output signals to trigger other peripherals. The EXTI mux outputs are available independently from any masking in EXTI2_CmIMR1 and EXTI2_CmEMR1.

34.5 EXTI functional behavior

The direct event inputs are enabled in the respective peripheral generating the wake-up event. The configurable events are enabled by enabling at least one of the trigger edges.

Once an event input is enabled, the generation of a CPU(m) wake-up is conditioned by the CPU(m) interrupt mask and CPU(m) event mask.

Table 241. Masking functionality

CPU interrupt enable EXTI_CmIMR.IMn	CPU event enable EXTI_CmEMR.EMn	Configurable event inputs EXTI_RPR.RPIFn EXTI_FPR.FPIFn	exti(n) interrupt(1)	CPU(m) event	CPU(m) wake-up
0 for all CPUs	0	No	Masked	Masked	Masked
	1	No	Masked	Yes	Yes
1 for any CPU	0	Status latched	Yes	Masked	Yes(2)
	1	Status latched	Yes	Yes	Yes

1. The CPU dedicated exti(n), combined secure/non-secure interrupts, goes to each CPUs. If no interrupt is required for CPU(m), the exti(n) interrupt must be masked in EXTI_CmIMR.
2. Only if CPU(m) interrupt is enabled in EXTI_CmIMR.IMn.

For configurable event inputs, when the enabled edges occur on the event input, an event request is generated. When the associated CPU(m) interrupt is unmasked, the corresponding pending bit(s) EXTI_RPR.RPIFn and/or EXTI_FPR.FPIFn is/are set and

the CPU(m) subsystem is woken up, and the CPU combined secure/non-secure interrupt signal is activated. EXTI_RPR.RPIFn and/or EXTI_FPR.FPIFn pending bit(s) must be cleared by software (writing them to 1). This clears the CPU interrupt. An interrupt is only generated, on the CPU dedicated interrupt line, when it is enabled in the CPU associated EXTI_CmIMR register.

For direct event inputs, when enabled in the associated peripheral, an event request is generated on the rising edge only. There is no corresponding CPU pending bit in the EXTI. When the associated CPU(m) interrupt is unmasked, the corresponding CPU subsystem is woken up. The CPU is woken up (interrupted) by the peripheral synchronous interrupt.

The CPU(m) event must be unmasked to generate an event. When the enabled edge(s) occur(s) on the event input, a CPU(m) event pulse is generated. There is no event pending bit.

For the configurable event inputs, an event request can be generated by software when writing 1 in EXTI_SWIER. This generates a rising edge on the event. The rising edge event pending bit is set in EXTI_RPR, whatever the setting in EXTI_RTSR.

34.6 EXTI event protection

The EXTI is able to protect event register bits from being modified by non-secure and unprivileged accesses. The protection can individually be activated per input event, via EXTI_SECCFGRx and EXTI_PRIVCFGRx. At EXTI level, the protection consists in preventing unauthorized write access to do the foollowing:

- Change settings of secure configurable events.
- Change masking of secure input events.
- Clear pending status of secure input events.

Note: The EXTI does not differentiate protected accesses from individual CPUs. When there is no CID resource isolation, then any CPU secure access can modify the protected register bits.

Table 242. Register protection overview

Register name	Access type	Security(1)(2)(3)(4)
EXTI_RTSRx	RW	Secure and privileged can be enabled bit-wise in EXTI_SECCFGRx and EXTI_PRIVCFGRx, and CID filtering in EXTI_EnCIDCFGR.
EXTI_FTSRx	RW	
EXTI_SWIERx	RW	
EXTI_RPRx	RW	
EXTI_FPRx	RW	
EXTI_SECCFGRx	RW	Always secure and privileged, and CID filtering can bit wise be enabled in EXTI_EnCIDCFGR.
EXTI_PRIVCFGRx	RW	Always privileged, and secure can be enabled bit-wise in EXTI_SECCFGRx, and CID filtering in EXTI_EnCIDCFGR
EXTI_EXTICRx	RW	Secure and privileged can be enabled bit-wise in EXTI_SECCFGRx and EXTI_PRIVCFGRx, and CID filtering in EXTI_EnCIDCFGR.
EXTI_LOCKR	RW	Always secure and privileged trusted domain CID

Table 242. Register protection overview (continued)

Register name	Access type	Security[1][2][3][4]
EXTI_CmIMRx	RW	Secure and privilege can be enabled bit-wise in EXTI_SECCFGRx and EXTI_PRIVCFGRx, and CID filtering in EXTI_EnCIDCFGR. CPU(m) CID filtering is enabled on a register basis in EXTI_CmCIDCFGR.
EXTI_CmEMRx	RW	
EXTI_EnCIDCFGR	RW	Always secure and privileged trusted domain CID
EXTI_CmCIDCFGR	RW	Always secure and privileged trusted domain CID
EXTI_HWCFGRx	R	Non-secure unprivileged, no CID filtering.
EXTI_VER	R	
EXTI_ID	R	
EXTI_SID	R	

1. Security is enabled with EXTI_SECCFGRx registers.
2. Privilege is enabled with EXTI_PRIVCFGRx registers.
3. Resource compartment filtering is enabled with EXTI_EnCIDCFGR registers.
4. CPU(m) compartment filtering is enabled with EXTI_CmCIDCFGR registers.

34.6.1 EXTI register security protection

When security is enabled for an input event, the associated input event configuration and the control bits can only be modified and read by a secure access, a non-secure write access is discarded and a read returns 0.

When input events are non-secure, the security is disabled. The associated input event configuration and control bits can be modified and read by a secure access and non-secure access.

The security configuration in registers EXTI_SECCFGRx can be globally locked after reset by EXTI_LOCKR.GLOCK.

34.6.2 EXTI register privilege protection

When the privilege is enabled for an input event, the associated input event configuration and control bits can only be modified and read by a privilege access, an unprivileged write access is discarded and a read returns 0.

When input events are unprivileged, the privilege is disabled. The associated input event configuration and control bits can be modified and read by a privilege access and unprivileged access.

The privilege configuration in EXTI_PRIVCFGRx can be globally locked after reset by GLOCK in EXTI_LOCKR.

34.6.3 EXTI register CID protection

When the CID resource isolation is enabled for an input event, the associated input event configuration and control bits can only be modified and read by the assigned CID resource. Other CID resource write access is discarded, and a read returns 0.

When input events have no CID resource isolation, the CID filtering is disabled. Associated input event configuration and control bits can be modified and read by any access.

When the CPU CID resource isolation is enabled for a CPU, the associated CPU registers can only be modified and read by the assigned CID resource. Other CID resource write access is discarded, and a read returns 0.

When a CPU has no CID resource isolation, the CID filtering is disabled. The associated CPU registers can be modified and read by any access.

Table 243. Register protection hierarchy overview

TDCID filtered	CPU(m) CID filtered
EXTI_CmCIDCFGR = CPU(m) CID	EXTI_CmIMRn global register access
	EXTI_CmEMRn global register access
EXTI_EnCIDCFGR = CPU(m) CID	EXTI_RTSRn bit wise access filtering
	EXTI_FTSRn bit wise access filtering
	EXTI_SWIERn bit wise access filtering
	EXTI_RPRn bit wise access filtering
	EXTI_FPRn bit wise access filtering
	EXTI_SECCFGRn bit wise access filtering
	EXTI_PRIVCFGRn bit wise access filtering
	EXTI_CmIMRn bit wise access filtering
	EXTI_CmEMRn bit wise access filtering
	EXTI_EXTICRx bit filed wise access filtering

The security configuration in EXTI_EnCIDCFGRx and EXTI_CmCIDCFGR can be globally locked after reset by GLOCK in EXTI_LOCKR.

34.7 EXTIx registers

The EXTIx register map is divided in sections listed in the table below.

Table 244. EXTIx register map sections

Address offset	Description
0x000 - 0x01C	General configurable event [31:0] configuration
0x020 - 0x03C	General configurable event [63:32] configuration
0x040 - 0x05C	General configurable event [95:64] configuration
0x060 - 0x06C	EXTI I/O port mux selection
0x070	EXTI protection lock configuration
0x080 - 0x0BC	CPU1 input event configuration
0x0C0 - 0x0FC	CPU2 input event configuration
0x100 - 0x13C	CPU3 input event configuration (only available on EXTI2)
0x180 - 0x2FC	Event input CID filtering configuration
0x300 - 0x30C	CPU CID filtering configuration

All registers can be accessed with word (32-bit), half-word (16-bit), and byte (8-bit) access.

For any DDCID access to registers, security and privileged policy applies. When DDEN = 0, accesses from the DDCID to CID filtered registers are ignored. When DDEN = 1, the DDCID has access to all registers regardless of any CID filtering policy.

34.7.1 EXTI1 rising trigger selection register (EXTI1_RTSR1)

Address offset: 0x000

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RT18	RT17	RT16
													rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RT15	RT14	RT13	RT12	RT11	RT10	RT9	RT8	RT7	RT6	RT5	RT4	RT3	RT2	RT1	RT0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:0 **RTx:** Rising trigger event configuration bit of configurable event input x (x = 18 to 0)

0: Rising trigger disabled (for event and interrupt) for input line

1: Rising trigger enabled (for event and interrupt) for input line

When SECx is disabled in EXTI1_SECCFGR1, RTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR1, RTx can only be accessed with secure access. Non-secure write to RTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR1, RTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR1, RTx can only be accessed with privileged access. Unprivileged write to RTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, RTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, RTx can only be accessed by the allowed processor CID. Illegal CID write to RTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a rising edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

34.7.2 EXTI1 falling trigger selection register (EXTI1_FTSR1)

Address offset: 0x004

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FT18	FT17	FT16
													rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FT15	FT14	FT13	FT12	FT11	FT10	FT9	FT8	FT7	FT6	FT5	FT4	FT3	FT2	FT1	FT0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:0 **FTx:** Falling trigger event configuration bit of configurable event input x (x = 18 to 0)

0: Falling trigger disabled (for event and interrupt) for input line

1: Falling trigger enabled (for event and interrupt) for input line.

When SECx is disabled in EXTI1_SECCFGR1, FTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR1, FTx can only be accessed with secure access. Non-secure write to FTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR1, FTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR1, FTx can only be accessed with privileged access. Unprivileged write to FTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, FTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, FTx can only be accessed by the allowed processor CID. Dis allowed CID CID write to FTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a falling edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

34.7.3 EXTI1 software interrupt event register (EXTI1_SWIER1)

Address offset: 0x008

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWI18	SWI17	SWI16
													rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SWI15	SWI14	SWI13	SWI12	SWI11	SWI10	SWI9	SWI8	SWI7	SWI6	SWI5	SWI4	SWI3	SWI2	SWI1	SWI0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:0 **SWIx:** Software interrupt on event x (x = 18 to 0)

0: Writing 0 has no effect.

1: Writing 1 to this bit triggers a rising edge event on event x (bit auto cleared by hardware).

When SECx is disabled in EXTI1_SECCFGR1, SWIx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR1, SWIx can only be accessed with secure access. Non-secure write to SWIx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR1,SWIx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR1,SWIx can only be accessed with privileged access. Unprivileged write to SWIx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, SWIx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, SWIx can only be accessed by the allowed processor CID. Dis allowed CID write to SWIx is discarded and read returns 0.

A software interrupt is generated whatever the setting in EXTI1_RTSR and EXTI1_FTSR. It always returns 0 when read.

34.7.4 EXTI1 rising edge pending register (EXTI1_RPR1)

Address offset: 0x00C

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RPIF18	RPIF17	RPIF16
													rc_w1	rc_w1	rc_w1
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RPIF15	RPIF14	RPIF13	RPIF12	RPIF11	RPIF10	RPIF9	RPIF8	RPIF7	RPIF6	RPIF5	RPIF4	RPIF3	RPIF2	RPIF1	RPIF0
rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:0 **RPIFx:** Configurable event input x rising edge pending bit (x = 18 to 0)

This bit is set when the selected rising edge event or an EXTI1_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No rising edge trigger request occurred

1: Rising edge trigger request occurred

When SECx is disabled in EXTI1_SECCFGR1, RPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR1, RPIFx can only be accessed with secure access. Non-secure write to RPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR1, RPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR1, RPIFx can only be accessed with privileged access. Unprivileged write to RPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, RPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, RPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to RPIFx is discarded, and read returns 0.

34.7.5 EXTI1 falling edge pending register (EXTI1_FPR1)

Address offset: 0x010

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FPIF18	FPIF17	FPIF16
													rc_w1	rc_w1	rc_w1
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FPIF15	FPIF14	FPIF13	FPIF12	FPIF11	FPIF10	FPIF9	FPIF8	FPIF7	FPIF6	FPIF5	FPIF4	FPIF3	FPIF2	FPIF1	FPIF0
rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:0 **FPIFx:** configurable event input x falling edge pending bit (x = 18 to 0)

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into this bit.

0: No falling edge trigger request occurred

1: Falling edge trigger request occurred

When SECx is disabled in EXTI1_SECCFGR1, FPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR1, FPIFx can only be accessed with secure access. Non-secure write to FPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR1, FPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR1, FPIFx can only be accessed with privileged access. Unprivileged write to FPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, FPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, FPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to FPIFx is discarded, and read returns 0.

34.7.6 EXTI1 security configuration register (EXTI1_SECCFGR1)

Address offset: 0x014

Reset value: 0x0000 0000

This register provides write access security and privilege. A non-secure or unprivileged write access is ignored, and causes the generation of an secure illegal access event. All read return the register data.

Write to this register is ignored if GLOCK is enabled in EXTI1_LOCKR.

This register contains only bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SEC31	SEC30	SEC29	SEC28	SEC27	SEC26	SEC25	SEC24	SEC23	SEC22	SEC21	Res.	SEC19	SEC18	SEC17	SEC16
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SEC15	SEC14	SEC13	SEC12	SEC11	SEC10	SEC9	SEC8	SEC7	SEC6	SEC5	SEC4	SEC3	SEC2	SEC1	SEC0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:21 **SECx:** Security enable on event input x (x = 31 to 21)
0: Event security disabled (non-secure)
1: Event security enabled (secure)
When CID filtering is disabled in EXTI1_ExCIDCFGR, SECx can be accessed by any processor CID.
When CID filtering is enabled in EXTI1_ExCIDCFGR, SECx can only be accessed by the allowed processor CID. Dis allowed CID write to SECx is discarded and read returns 0.

Bit 20 Reserved, must be kept at reset value.

Bits 19:0 **SECx:** Security enable on event input x (x = 19 to 0)

34.7.7 EXTI1 privilege configuration register (EXTI1_PRIVCFGR1)

Address offset: 0x018

Reset value: 0x0000 0000

This register provides privileged write access protection. An unprivileged write access is discarded, and causes the generation of a privilege illegal access event. An unprivileged read returns the register data.

Write to this register are ignored if GLOCK is enabled in EXTI1_LOCKR.

This register contains only bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PRIV31	PRIV30	PRIV29	PRIV28	PRIV27	PRIV26	PRIV25	PRIV24	PRIV23	PRIV22	PRIV21	Res.	PRIV19	PRIV18	PRIV17	PRIV16
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PRIV15	PRIV14	PRIV13	PRIV12	PRIV11	PRIV10	PRIV9	PRIV8	PRIV7	PRIV6	PRIV5	PRIV4	PRIV3	PRIV2	PRIV1	PRIV0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:21 **PRIVx:** Privilege enable on event input x (x = 31 to 21)
0: Event privilege disabled (unprivileged)
1: Event privilege enabled (privileged)
When SECx is disabled in EXTI1_SECCFGR1, PRIVx can be accessed with secure and non-secure access.
When SECx is enabled in EXTI1_SECCFGR1, PRIVx can only be written with secure access. Non-secure write to PRIVx is discarded.
When CID filtering is disabled in EXTI1_ExCIDCFGR, PRIVx can be accessed by any processor CID.
When CID filtering is enabled in EXTI1_ExCIDCFGR, PRIVx can only be accessed by the allowed processor CID. Dis allowed CID write to PRIVx is discarded and read returns 0.

Bit 20 Reserved, must be kept at reset value.

Bits 19:0 **PRIVx:** Privilege enable on event input x (x = 19 to 0)

34.7.8 EXTI1 rising trigger selection register (EXTI1_RTSR2)

Address offset: 0x020

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	RT45	RT44	RT43	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
		rw	rw	rw											

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:11 **RTx:** Rising trigger event configuration bit of configurable event input x (x = 45 to 43)

0: Rising trigger disabled (for event and Interrupt) for input line x

1: Rising trigger enabled (for event and Interrupt) for input line x

When SECx is disabled in EXTI1_SECCFGR2, RTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR2, RTx can only be accessed with secure access. Non-secure write to RTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR2, RTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR2, RTx can only be accessed with privileged access. Unprivileged write to RTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, RTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, RTx can only be accessed by the allowed processor CID. Illegal CID write to RTx is discarded and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a rising edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

Bits 10:0 Reserved, must be kept at reset value.

34.7.9 EXTI1 falling trigger selection register (EXTI1_FTSR2)

Address offset: 0x024

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	FT45	FT44	FT43	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
		rw	rw	rw											

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:11 **FTx:** Falling trigger event configuration bit of configurable event input x (x = 45 to 43)

0: Falling trigger disabled (for event and Interrupt) for input line

1: Falling trigger enabled (for event and Interrupt) for input line.

When SECx is disabled in EXTI1_SECCFGR2, FTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR2, FTx can only be accessed with secure access. Non-secure write to FTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR2, FTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR2, FTx can only be accessed with privileged access. Unprivileged write to FTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, FTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, FTx can only be accessed by the allowed processor CID. Dis allowed CID write to FTx is discarded and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a falling edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

Bits 10:0 Reserved, must be kept at reset value.

34.7.10 EXTI1 software interrupt event register (EXTI1_SWIER2)

Address offset: 0x028

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	SWI45	SWI44	SWI43	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
		rw	rw	rw											

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:11 **SWIx:** Software interrupt on event x (x = 45 to 43)

0: Writing 0 has no effect.

1: Writing 1 to this bit triggers a rising edge event on event x (bit auto cleared by hardware).

When SECx is disabled in EXTI1_SECCFGR2, SWIx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR2, SWIx can only be accessed with secure access. Non-secure write to SWIx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR2, SWIx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR2, SWIx can only be accessed with privileged access. Unprivileged write to SWIx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, SWIx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, SWIx can only be accessed by the allowed processor CID. Dis allowed CID write to SWIx is discarded and read returns 0.

A software interrupt is generated whatever the setting in EXTI1_RTSR and EXTI1_FTSR. It always returns 0 when read.

Bits 10:0 Reserved, must be kept at reset value.

34.7.11 EXTI1 rising edge pending register (EXTI1_RPR2)

Address offset: 0x02C

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	RPIF45	RPIF44	RPIF43	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
		rc_w1	rc_w1	rc_w1											

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:11 **RPIFx:** Configurable event input x rising edge pending bit (x = 45 to 43)

This bit is set when the selected rising edge event or an EXTI1_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No rising edge trigger request occurred

1: Rising edge trigger request occurred

When SECx is disabled in EXTI1_SECCFGR2, RPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR2, RPIFx can only be accessed with secure access. Non-secure write to RPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR2, RPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR2, this bit can only be accessed with privileged access. Unprivileged write to RPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, RPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, this bit can only be accessed by the allowed processor CID. Dis allowed CID write to RPIFx is discarded and read returns 0.

Bits 10:0 Reserved, must be kept at reset value.

34.7.12 EXTI1 falling edge pending register (EXTI1_FPR2)

Address offset: 0x030

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

		rc_w1	rc_w1	rc_w1											

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:11 **FPIFx:** Configurable event input x falling edge pending bit (x = 45 to 43)

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No falling edge trigger request occurred

1: Falling edge trigger request occurred

When SECx is disabled in EXTI1_SECCFGR2, FPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR2, FPIFx can only be accessed with secure access. Non-secure write to this FPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR2d, FPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR2, FPIFx can only be accessed with privileged access. Unprivileged write to FPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, FPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, this bit can only be accessed by the allowed processor CID. Dis allowed CID write to FPIFx is discarded and read returns 0.

Bits 10:0 Reserved, must be kept at reset value.

34.7.13 EXTI1 security enable register (EXTI1_SECCFGR2)

Address offset: 0x034

Reset value: 0x0000 0000

This register provides write access security and privilege. A non-secure or unprivileged write access is ignored, and causes the generation of an secure illegal access event. All read return the register data.

Write to this register is ignored if GLOCK is enabled in EXTI1_LOCKR.

This register contains only bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:27 **SECx:** Security enable on event input x (x = 62 to 59)
0: Event security disabled (non-secure)
1: Event security enabled (secure)
When CID filtering is disabled in EXTI1_ExCIDCFGR, SECx can be accessed by any processor CID.
When CID filtering is enabled in EXTI1_ExCIDCFGR, SECx can only be accessed by the allowed processor CID. Dis allowed CID write to SECx is discarded and read returns 0.

Bit 26 Reserved, must be kept at reset value.

Bits 25:20 **SECx:** Security enable on event input x (x = 57 to 52)

Bit 19 Reserved, must be kept at reset value.

Bits 18:4 **SECx:** Security enable on event input x (x = 50 to 36)

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **SECx:** Security enable on event input x (x = 34 to 32)

34.7.14 EXTI1 privilege enable register (EXTI1_PRIVCFGR2)

Address offset: 0x038

Reset value: 0x0000 0000

This register provides privilege write access protection. An unprivileged write access is discarded, and causes the generation of a privilege illegal access event. An unprivileged read returns the register data.

Write to this register is ignored if GLOCK is enabled in EXTI1_LOCKR.

This register contains only bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:27 **PRIVx:** Privilege enable on event input x (x = 62 to 59)

0: Event privilege disabled (unprivileged)

1: Event privilege enabled (privileged)

When SECx is disabled in EXTI1_SECCFGR2, PRIVx can be accessed with secure and non-secure access.

When SECx is enabled in EXTI1_SECCFGR2, PRIVx can only be accessed with secure access. Non-secure write to PRIVx is discarded.

When CID filtering is disabled in EXTI1_ExCIDCFGR, PRIVx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, PRIVx can only be accessed by the allowed processor CID. Dis allowed CID write to PRIVx is discarded, and read returns 0.

Bit 26 Reserved, must be kept at reset value.

Bits 25:20 **PRIVx:** Privilege enable on event input x (x = 57 to 52)

Bit 19 Reserved, must be kept at reset value.

Bits 18:4 **PRIVx:** Privilege enable on event input x (x = 50 to 36)

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **PRIVx:** Privilege enable on event input x (x = 34 to 32)

34.7.15 EXTI1 rising trigger selection register (EXTI1_RTSR3)

Address offset: 0x040

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RT84	RT83	Res.	Res.	Res.
											rw	rw			
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	RT73	Res.	Res.	Res.	Res.	Res.	RT67	Res.	RT65	RT64
						rw						rw		rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:19 **RTx:** Rising trigger event configuration bit of configurable event input x (x = 84 to 83)

0: Rising trigger disabled (for event and interrupt) for input line

1: Rising trigger enabled (for event and interrupt) for input line

When SECx is disabled in EXTI1_SECCFGR3, RTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR3, RTx can only be accessed with secure access. Non-secure write to RTx is discarded. Non-secure read returns 0.

When PRIVx i disabled in EXTI1_PRIVCFGR3, RTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR3, RTx can only be accessed with privileged access. Unprivileged write to RTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, RTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, RTx can only be accessed by the allowed processor CID. Dis allowed CID write to RTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a rising edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

Bits 18:10 Reserved, must be kept at reset value.

Bit 9 **RT73:** Rising trigger event configuration bit of configurable event input 73

Bits 8:4 Reserved, must be kept at reset value.

Bit 3 **RT67:** Rising trigger event configuration bit of configurable event input 67

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **RTx:** Rising trigger event configuration bit of configurable event input x (x = 65 to 64)

34.7.16 EXTI1 falling trigger selection register (EXTI1_FTSR3)

Address offset: 0x044

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FT84	FT83	Res.	Res.	Res.
											rw	rw			
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	FT73	Res.	Res.	Res.	Res.	Res.	FT67	Res.	FT65	FT64
						rw						rw		rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:19 **FTx:** Falling trigger event configuration bit of configurable event input x (x = 84 to 83)

0: Falling trigger disabled (for event and interrupt) for input line

1: Falling trigger enabled (for event and interrupt) for input line

When SECx is disabled in EXTI1_SECCFGR3, FTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR3, FTx can only be accessed with secure access. Non-secure write to FTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR3, FTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR3, FTx can only be accessed with privileged access. Unprivileged write to FTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, FTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, FTx can only be accessed by the allowed processor CID. Dis allowed CID write to FTx is discarded and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a falling edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

Bits 18:10 Reserved, must be kept at reset value.

Bit 9 **FT73:** Falling trigger event configuration bit of configurable event input 73

Bits 8:4 Reserved, must be kept at reset value.

Bit 3 **FT67:** Falling trigger event configuration bit of configurable event input 67

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **FTx:** Falling trigger event configuration bit of configurable event input x (x = 65 to 64)

34.7.17 EXTI1 software interrupt event register (EXTI1_SWIER3)

Address offset: 0x048

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWI84	SWI83	Res.	Res.	Res.
											rw	rw			
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	SWI73	Res.	Res.	Res.	Res.	Res.	SWI67	Res.	SWI65	SWI64
						rw						rw		rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:19 **SWIx:** Software interrupt on event x (x = 84 to 83)

0: Writing 0 has no effect.

1: Writing 1 to this bit triggers a rising edge event on event x (bit auto cleared by hardware).

When SECx is disabled in EXTI1_SECCFGR3, SWIx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR3, SWIx can only be accessed with secure access. Non-secure write to SWIx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR3, SWIx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR3, SWIx can only be accessed with privileged access. Unprivileged write to SWIx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, SWIx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, SWIx can only be accessed by the allowed processor CID. Dis allowed CID write to SWIx is discarded and read returns 0.

A software interrupt is generated whatever the setting in EXTI1_RTSR and EXTI1_FTSR. It always returns 0 when read.

Bits 18:10 Reserved, must be kept at reset value.

Bit 9 **SWI73:** Software interrupt on event 73

Bits 8:4 Reserved, must be kept at reset value.

Bit 3 **SWI67:** Software interrupt on event 67.

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **SWIx:** Software interrupt on event x (x = 65 to 64)

34.7.18 EXTI1 rising edge pending register (EXTI1_RPR3)

Address offset: 0x04C

Reset value: 0x0000 0000

This register contains only bits for configurable events.

						rc_w1						rc_w1		rc_w1	rc_w1

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:19 **RPIFx:** configurable event input x rising edge pending bit (x = 84 to 83)

This bit is set when the selected rising edge event or an EXTI1_SWIER Software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No rising edge trigger request occurred

1: Rising edge trigger request occurred

When SECx is disabled in EXTI1_SECCFGR3, RPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR3, RPIFx can only be accessed with secure access. Non-secure write to this RPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR3, RPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR3, RPIFx can only be accessed with privileged access. Unprivileged write to RPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, RPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, RPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to RPIFx is discarded and read returns 0.

Bits 18:10 Reserved, must be kept at reset value.

Bit 9 **RPIF73:** configurable event input 73 rising edge pending bit

Bits 8:4 Reserved, must be kept at reset value.

Bit 3 **RPIF67:** configurable event input 67 rising edge pending bit

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **RPIFx:** configurable event input x rising edge pending bit (x = 65 to 64)

34.7.19 EXTI1 falling edge pending register (EXTI1_FPR3)

Address offset: 0x050

Reset value: 0x0000 0000

This register contains only bits for configurable events.

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:19 **FPIFx:** configurable event input x falling edge pending bit (x = 84 to 83)

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No falling edge trigger request occurred

1: Falling edge trigger request occurred

When SECx is disabled in EXTI1_SECCFGR3, FPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR3, FPIFx can only be accessed with secure access. Non-secure write to FPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR3, FPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR3, FPIFx can only be accessed with privileged access. Unprivileged write to FPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, FPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, FPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to FPIFx is discarded and read returns 0.

Bits 18:10 Reserved, must be kept at reset value.

Bit 9 **FPIF73:** configurable event input 73 falling edge pending bit

Bits 8:4 Reserved, must be kept at reset value.

Bit 3 **FPIF67:** configurable 67 falling edge pending bit

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **FPIFx:** configurable event input x falling edge pending bit (x = 65 to 64)

34.7.20 EXTI1 security enable register (EXTI1_SECCFGR3)

Address offset: 0x054

Reset value: 0x0000 0000

This register provides write access security and privilege. A non-secure or unprivileged write access is ignored and causes the generation of an secure illegal access event. All reads return the register data.

Write to this register are ignored if GLOCK is enabled in EXTI1_LOCKR.

This register contains only bits for security capable input events.

When SEC3 is enabled in EXTI1_SECCFGR1, this field can only be accessed with secure access. Non-secure write is discarded. Non-secure read returns 0.
When PRIV3 is disabled in EXTI1_PRIVCFGR1, this field can be accessed with privileged and unprivileged access.
When PRIV3 is enabled in EXTI1_PRIVCFGR1, this field can only be accessed with privileged access. Unprivileged write to this field is discarded, and read returns 0.
When CID filtering in EXTI1_E3CIDCFGR is disabled, this field can be accessed by any processor CID.
When CID filtering in EXTI1_E3CIDCFGR is enabled, this field can only be accessed by the allowed processor CID. Dis allowed CID write to this field is discarded, and read returns 0.

Bits 23:16 **EXTI2[7:0]:** EXTI2 GPIO port selection

These bits are written by software to select the source input for EXTI2 external interrupt.
0x00: PA2 pin
0x01: PB2 pin
0x02: PC2 pin
0x03: PD2 pin
0x04: PE2 pin
0x05: PF2 pin
0x06: PG2 pin
0x07: PH2 pin
0x08: PI2 pin
0x09: PJ2 pin
0x0A: PK2 pin
0x0B: PZ2 pin
Others: reserved

When SEC2 is disabled in EXTI1_SECCFGR1, this field can be accessed with non-secure and secure access.
When SEC2 is enabled in EXTI1_SECCFGR1, this field can only be accessed with secure access. Non-secure write is discarded, non-secure read returns 0.
When PRIV2 is disabled in EXTI1_PRIVCFGR1, this field can be accessed with privileged and unprivileged access.
When PRIV2 is enabled in EXTI1_PRIVCFGR1, this field can only be accessed with privileged access. Unprivileged write to this field is discarded and read returns 0.
When CID filtering in EXTI1_E2CIDCFGR is disabled, this field can be accessed by any processor CID.
When CID filtering in EXTI1_E2CIDCFGR is enabled, this field can only be accessed by the allowed processor CID. Dis allowed CID write to this field is discarded and read returns 0.

Bits 15:8 **EXTI1[7:0]:** EXTI1 GPIO port selection

These bits are written by software to select the source input for EXTI1 external interrupt.
0x00: PA1 pin
0x01: PB1 pin
0x02: PC1 pin
0x03: PD1 pin
0x04: PE1 pin
0x05: PF1 pin
0x06: PG1 pin
0x07: PH1 pin
0x08: PI1 pin
0x09: PJ1 pin
0x0A: PK1 pin
0x0B: PZ1 pin
Others: reserved

When SEC1 is disabled in EXTI1_SECCFGR1, this field can be accessed with non-secure and secure access.
When SEC1 is enabled in EXTI1_SECCFGR1, this field can only be accessed with secure access. Non-secure write is discarded, non-secure read returns 0.
When PRIV1 is disabled in EXTI1_PRIVCFGR1, this field can be accessed with privileged and unprivileged access.
When PRIV1 is enabled in EXTI1_PRIVCFGR1, this field can only be accessed with privileged access. Unprivileged write to this field is discarded and read returns 0.
When CID filtering in EXTI1_E1CIDCFGR is disabled, this field can be accessed by any processor CID.
When CID filtering in EXTI1_E1CIDCFGR is enabled, this field can only be accessed by the allowed processor CID. Dis allowed CID write to this field is discarded and read returns 0.

Bits 7:0 **EXTI0[7:0]:** EXTI0 GPIO port selection.

These bits are written by software to select the source input for EXTI0 external interrupt.
0x00: PA0 pin
0x01: PB0 pin
0x02: PC0 pin
0x03: PD0 pin
0x04: PE0 pin
0x05: PF0 pin
0x06: PG0 pin

Others: reserved

When SEC12 is disabled in EXTI1_SECCFGR1 this field can be accessed with non-secure and secure access.
When SEC12 is enabled in EXTI1_SECCFGR1, this field can only be accessed with secure access. Non-secure write is discarded, non-secure read returns 0.
When PRIV12 is disabled in EXTI1_PRIVCFGR1, this field can be accessed with privileged and unprivileged access.
When PRIV12 is enabled in EXTI1_PRIVCFGR1, this field can only be accessed with privileged access. Unprivileged write to this field is discarded and read returns 0.
When CID filtering in EXTI1_E12CIDCFGR is disabled, this field can be accessed by any processor CID.
When CID filtering in EXTI1_E12CIDCFGR is enabled, this field can only be accessed by the allowed processor CID. Dis allowed CID write to this field is discarded and read returns 0.

34.7.26 EXTI1 lock register (EXTI1_LOCKR)

Address offset: 0x070

Reset value: 0x0000 0000

This register can only be written by the secure, privileged, trusted domain CID. A write access from any other protection level or domain CID is discarded and any read returns zero value. Both illegal write and read access generate an illegal access event.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GLOCK
															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **GLOCK:** Global security privilege and CID configuration registers EXTI1_SECCFGRx, EXTI1_PRIVCFGRx,EXTI1_EnCIDCFGR and EXTI1_CmCIDCFGR lock.

This bit is written once after reset.
0: Security, privilege, and CID configuration open can be modified.
1: Security, privilege, and CID configuration locked can no longer be modified.

34.7.27 EXTI1 CPUm wake-up with interrupt mask register (EXTI1_CmIMR1) (m = 1 to 2)

Address offset: Block 1: 0x080

Address offset: Block 2: 0x0C0

Reset value: 0x0000 0000

This register contains only bits for configurable events and direct events.

This register has CID resource protection, and can only be accessed by the allowed CID as defined in EXTI1_CmCIDCFGR. An illegal CID write access is discarded, and a read access return zero data, also on both illegal accesses an CID illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IM31	IM30	IM29	IM28	IM27	IM26	IM25	IM24	IM23	IM22	IM21	Res.	IM19	IM18	IM17	IM16
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IM15	IM14	IM13	IM12	IM11	IM10	IM9	IM8	IM7	IM6	IM5	IM4	IM3	IM2	IM1	IM0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:21 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 31 to 21)

0: Wake-up and interrupt CPU(m) from input event x is masked.

1: Wake-up and interrupt CPU(m) from input event x is unmasked. CPU(m) wake-up event and configurable event interrupt generated.

When SECx is disabled in EXTI1_SECCFGR1, IMx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR1, IMx can only be accessed with secure access. Non-secure write to IMx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR1, IMx can be accessed with privileged and unprivileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR1, IMx can only be accessed with privileged access. Unprivileged write to IMx is discarded, and read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR IMx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR IMx can only be accessed by the allowed processor CID. Dis allowed CID write to IMx is discarded and read returns 0.

Bit 20 Reserved, must be kept at reset value.

Bits 19:0 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 19 to 0)

34.7.28 EXTI1 CPU2 wake-up with event mask register (EXTI1_C2EMR1)

Address offset: 0x0C4

Reset value: 0x0000 0000

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI1_C2CIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **EMx:** CPU2 wake-up with event on event input x (x = 15 to 0)

0: Wake-up with event request from line x is masked.

1: Wake-up with event request from line x is unmasked.

When SECx is disabled in EXTI1_SECCFGR1, EMx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR1, EMx can only be accessed with secure access. Non-secure write to EMx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR1, EMx can be accessed with privileged and unprivileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR1, EMx can only be accessed with privileged access. Unprivileged write to EMx is discarded, and read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, EMx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, EMx can only be accessed by the allowed processor CID. Disallowed CID write to EMx is discarded, and read returns 0.

34.7.29 EXTI1 CPUm wake-up with interrupt mask register (EXTI1_CmIMR2) (m = 1 to 2)

Address offset: Block 1: 0x090

Address offset: Block 2: 0x0D0

Reset value: 0x0000 0000

This register contains only bits for configurable events and direct events.

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI1_CmCIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:27 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 62 to 59)
0: Wake-up and interrupt CPU(m) from input event x is masked.
1: Wake-up and interrupt CPU(m) from input event x is unmasked. CPU(m) wake-up event and configurable event interrupt generated.
When SECx is disabled in EXTI1_SECCFGR2, IMx can be accessed with non-secure and secure access.
When SECx is enabled in EXTI1_SECCFGR2, IMx can only be accessed with secure access. Non-secure write to IMx is discarded. Non-secure read returns 0.
When PRIVx is disabled in EXTI1_PRIVCFGR2, IMx can be accessed with privileged and unprivileged access.
When PRIVx is enabled in EXTI1_PRIVCFGR2, IMx can only be accessed with privileged access. Unprivileged write to IMx is discarded, and read returns 0.
When CID filtering is disabled in EXTI1_ExCIDCFGR IMx can be accessed by any processor CID.
When CID filtering is enabled in EXTI1_ExCIDCFGR IMx can only be accessed by the allowed processor CID. Dis allowed CID write to IMx is discarded, and read returns 0.

Bit 26 Reserved, must be kept at reset value.

Bits 25:20 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 57 to 52)

Bit 19 Reserved, must be kept at reset value.

Bits 18:4 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 50 to 36)

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 34 to 32)

34.7.30 EXTI1 CPUm wake-up with interrupt mask register (EXTI1_CmIMR3) (m = 1 to 2)

Address offset: Block 1: 0x0A0

Address offset: Block 2: 0x0E0

Reset value: 0x0000 0000

This register contains only bits for configurable events and direct events.

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI1_CmCIDCFGR. An illegal CID write access is discarded and a read access returns zero data, also on both illegal accesses an illegal access event is generated.

rw	rw	rw	rw	rw	rw	rw	rw		rw		rw	rw		rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:8 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 84 to 72)
0: Wake-up and interrupt CPU(m) from input event x is masked
1: Wake-up and interrupt CPU(m) from input event x is unmasked. CPU(m) wake-up event and configurable event interrupt generated.
When SECx is disabled in EXTI1_SECCFGR3, IMx can be accessed with non-secure and secure access.
When SECx is enabled in EXTI1_SECCFGR3, IMx can only be accessed with secure access. Non-secure write to IMx is discarded. Non-secure read returns 0.
When PRIVx is disabled in EXTI1_PRIVCFGR3, IMx can be accessed with privileged and unprivileged access.
When PRIVx is enabled EXTI1_PRIVCFGR3, IMx can only be accessed with privileged access. Unprivileged write to IMx is discarded and read returns 0.
When CID filtering is disabled in EXTI1_ExCIDCFGR, IMx can be accessed by any processor CID.
When CID filtering is enabled in EXTI1_ExCIDCFGR, IMx can only be accessed by the allowed processor CID. Dis allowed CID write to IMx is discarded, and read returns 0.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **IM70:** CPUm wake-up with interrupt mask on event input 70.

Bit 5 Reserved, must be kept at reset value.

Bits 4:3 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 68 to 67)

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 65 to 64)

34.7.31 EXTI1 CPU2 wake-up with event mask register (EXTI1_C2EMR3)

Address offset: 0x0E4

Reset value: 0x0000 0000

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI1_C2CIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EM65	Res.
														rw	

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **EM65:** CPU2 wake-up with event mask on event input 65

0: Wake-up with event request from line 65 is masked.

1: Wake-up with event request from line 65 is unmasked.

When SEC65 is disabled in EXTI1_SECCFGR3, EM65 can be accessed with non-secure and secure access.

When SEC65 is enabled in EXTI1_SECCFGR3, EM65 can only be accessed with secure access. Non-secure write to EM65 is discarded. Non-secure read returns 0.

When PRIV65 is disabled in EXTI1_PRIVCFGR3, EM65 can be accessed with privileged and unprivileged access.

When PRIV65 is enabled in EXTI1_PRIVCFGR3, EM65 can only be accessed with privileged access. Unprivileged write to EM65 is discarded and read returns 0.

When CID filtering is disabled in EXTI1_E65CIDCFGR, EM65 can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_E65CIDCFGR, EM65 can only be accessed by the allowed processor CID. Disallowed CID write to EM65 is discarded and read returns 0.

Bit 0 Reserved, must be kept at reset value.

34.7.32 EXTI1 event CID configuration register (EXTI1_EnCIDCFGR)

Valid range: n = 0 to 19, 21 to 34, 36 to 50, 52 to 57, 59 to 62, 64 to 65, 67 to 68, 70, 72 to 84

Address offset: 0x180 + 0x04 * n (n = 0 to 84)

Reset value: 0x0000 0000

This register can only be written by the secure, privileged, trusted domain CID. A write access from any other protection level or domain CID is discarded and any read returns zero value. Both illegal write and read access generate an illegal access event.

Write to these registers are ignored if GLOCK is enabled in EXTI1_LOCKR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CID[2:0]			Res.	Res.	Res.	CFEN
									rw	rw	rw				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **CID[2:0]:** EXTI event n allowed CID value

If CID filtering is disabled in CFEN, these bits are ignored, else EXTI event n allowed processor CID number.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **CFEN:** EXTI event n CID filtering enable

0: Disable EXTI event n filtering (EXTI event n can be accessed by any CIDs).

1: Enable EXTI event n filtering (EXTI event n can only be accessed by the processor with CID = CPUm CID).

34.7.33 EXTI1 processor m CID configuration register (EXTI1_CmCIDCFGR)

Address offset: 0x300 + 0x04 * (m - 1) (m = 1 to 2)

Reset value: 0x0000 0000

This register can only be written by the secure, privilege, trusted domain CID. An illegal write access to this register generates an illegal access event.

Write to these registers are ignored if GLOCK is enabled in EXTI1_LOCKR.

This registers have no read access limitations, and can be read by any domain CID, and any access protection.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CID[2:0]			Res.	Res.	Res.	CFEN
									rw	rw	rw				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **CID[2:0]:** CPUm CID domain identification
If CFEN = 0, these bits are ignored, and there is no CPUm CID filtering, else CPUm CID domain identification number.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **CFEN:** CID filtering enabled for CPUm EXTI1_CmIMRx and EXTI1_CmEMRx registers
0: Disable the CID filtering for CPUm.
1: Enable the CID filtering for CPUm.

Address offset: 0x000

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RT15	RT14	RT13	RT12	RT11	RT10	RT9	RT8	RT7	RT6	RT5	RT4	RT3	RT2	RT1	RT0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **RTx:** Rising trigger event configuration bit of configurable event input x (x = 15 to 0)

0: Rising trigger disabled (for event and interrupt) for input line x

1: Rising trigger enabled (for event and interrupt) for input line x

When SECx is disabled in EXTI2_SECCFGR1, RTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR1, RTx can only be accessed with secure access. Non-secure write to RTx x is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR1, RTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR1, RTx can only be accessed with privileged access. Unprivileged write to RTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, RTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, RTx can only be accessed by the allowed processor CID. Illegal CID write to RTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a rising edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

34.7.48 EXTI2 falling trigger selection register (EXTI2_FTSR1)

Address offset: 0x004

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FT15	FT14	FT13	FT12	FT11	FT10	FT9	FT8	FT7	FT6	FT5	FT4	FT3	FT2	FT1	FT0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **FTx:** Falling trigger event configuration bit of configurable event input x (x = 15 to 0)

0: Falling trigger disabled (for event and Interrupt) for input line x

1: Falling trigger enabled (for event and Interrupt) for input line x

When SECx is disabled in EXTI2_SECCFGR1, FTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR1, FTx can only be accessed with secure access. Non-secure write to FTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR1, FTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR1, FTx can only be accessed with privileged access. Unprivileged write to FTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, FTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, FTx can only be accessed by the allowed processor CID. Dis allowed CID write to FTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a falling edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

34.7.49 EXTI2 software interrupt event register (EXTI2_SWIER1)

Address offset: 0x008

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SWI15	SWI14	SWI13	SWI12	SWI11	SWI10	SWI9	SWI8	SWI7	SWI6	SWI5	SWI4	SWI3	SWI2	SWI1	SWI0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SWIx:** Software interrupt on event x (x = 15 to 0)

0: Writing 0 has no effect.

1: Writing 1 to this bit triggers a rising edge event on event x (bit auto cleared by hardware).

When SECx is disabled in EXTI2_SECCFGR1, SWIx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR1, SWIx can only be accessed with secure access. Non-secure write to SWIx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR1, SWIx can be accessed with unprivileged and privileged access.

When PRIVx is disabled in EXTI2_PRIVCFGR1, SWIx can only be accessed with privileged access. Unprivileged write to SWIx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, SWIx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, SWIx can only be accessed by the allowed processor CID. Dis allowed CID write to SWIx is discarded, and read returns 0.

A software interrupt is generated independent from the setting in EXTI2_RTSR and EXTI2_FTSR. It always returns 0 when read.

34.7.50 EXTI2 rising edge pending register (EXTI2_RPR1)

Address offset: 0x00C

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RPIF15	RPIF14	RPIF13	RPIF12	RPIF11	RPIF10	RPIF9	RPIF8	RPIF7	RPIF6	RPIF5	RPIF4	RPIF3	RPIF2	RPIF1	RPIF0
rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **RPIFx:** Configurable event input x rising edge pending bit (x = 15 to 0)

This bit is set when the selected rising edge event, or an EXTI2_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No rising edge trigger request occurred

1: Rising edge trigger request occurred

When SECx is disabled in EXTI2_SECCFGR1, RPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR1, RPIFx can only be accessed with secure access. Non-secure write to RPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR1, RPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR1, RPIFx can only be accessed with privileged access. Unprivileged write to RPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, RPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, RPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to RPIFx is discarded, and read returns 0.

34.7.51 EXTI2 falling edge pending register (EXTI2_FPR1)

Address offset: 0x010

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FPIF15	FPIF14	FPIF13	FPIF12	FPIF11	FPIF10	FPIF9	FPIF8	FPIF7	FPIF6	FPIF5	FPIF4	FPIF3	FPIF2	FPIF1	FPIF0
rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **FPIFx:** Configurable event input x falling edge pending bit (x = 15 to 0)

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No falling edge trigger request occurred

1: Falling edge trigger request occurred

When SECx is disabled in EXTI2_SECCFGR1, FPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR1, FPIFx can only be accessed with secure access. Non-secure write to FPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR1, FPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR1, FPIFx can only be accessed with privileged access. Unprivileged write to FPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, FPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, FPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to FPIFx is discarded and read returns 0.

34.7.52 EXTI2 security configuration register (EXTI2_SECCFGR1)

Address offset: 0x014

Reset value: 0x0000 0000

This register provides write access security and privilege.A non-secure or unprivileged write access is ignored and causes the generation of an illegal access event. All read return the register data.

Write to this register are ignored if GLOCK is enabled in EXTI2_LOCKR.

This register contains only bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SEC31	SEC30	SEC29	Res.	SEC27	SEC26	SEC25	SEC24	SEC23	SEC22	SEC21	SEC20	SEC19	SEC18	SEC17	SEC16
rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SEC15	SEC14	SEC13	SEC12	SEC11	SEC10	SEC9	SEC8	SEC7	SEC6	SEC5	SEC4	SEC3	SEC2	SEC1	SEC0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 **SECx:** Security enable on event input x (x = 31 to 29)
0: Event security disabled (non-secure)
1: Event security enabled (secure)
When CID filtering is disabled in EXTI2_ExCIDCFGR, SECx can be accessed by any processor CID.
When CID filtering is enabled in EXTI2_ExCIDCFGR, SECx can only be accessed by the allowed processor CID. Dis allowed CID write to SECx is discarded and read returns 0.

Bit 28 Reserved, must be kept at reset value.

Bits 27:0 **SECx:** Security enable on event input x (x = 27 to 0)

34.7.53 EXTI2 privilege configuration register (EXTI2_PRIVCFGR1)

Address offset: 0x018

Reset value: 0x0000 0000

This register provides privilege write access protection. An unprivileged write access is discarded and causes the generation of an illegal access event. A unprivileged read returns the register data.

Write to this register are ignored if GLOCK is enabled in EXTI2_LOCKR.

This register contains only bits for security capable Input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PRIV31	PRIV30	PRIV29	Res.	PRIV27	PRIV26	PRIV25	PRIV24	PRIV23	PRIV22	PRIV21	PRIV20	PRIV19	PRIV18	PRIV17	PRIV16
rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PRIV15	PRIV14	PRIV13	PRIV12	PRIV11	PRIV10	PRIV9	PRIV8	PRIV7	PRIV6	PRIV5	PRIV4	PRIV3	PRIV2	PRIV1	PRIV0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 **PRIVx:** Privilege enable on event input x (x = 31 to 29)
0: Event privilege disabled (unprivileged)
1: Event privilege enabled (privileged)
When SECx is disabled in EXTI2_SECCFGR1, PRIVx can be accessed with secure and non-secure access.
When SECx is enabled in EXTI2_SECCFGR1, PRIVx can only be written with secure access. Non-secure write to PRIVx is discarded.
When CID filtering is disabled in EXTI2_ExCIDCFGR, PRIVx can be accessed by any processor CID.
When CID filtering is enabled in EXTI2_ExCIDCFGR, PRIVx can only be accessed by the allowed processor CID. Dis allowed CID write to PRIVx is discarded, and read returns 0.

Bit 28 Reserved, must be kept at reset value.

Bits 27:0 **PRIVx:** Privilege enable on event input x (x = 27 to 0)

34.7.54 EXTI2 rising trigger selection register (EXTI2_RTSR2)

Address offset: 0x020

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	RT61	RT60	RT59	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RT51	RT50	RT49	RT48
		rw	rw	rw								rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RT47	RT46	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw	rw														

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:27 **RTx:** Rising trigger event configuration bit of configurable event input x (x = 61 to 59)

0: Rising trigger disabled (for event and interrupt) for input line x

1: Rising trigger enabled (for event and interrupt) for input line x

When SECx is disabled in EXTI2_SECCFGR2, RTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR2, RTx can only be accessed with secure access. Non-secure write to RTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR2, RTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR2, RTx can only be accessed with privileged access. Unprivileged write to RTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, RTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, RTx can only be accessed by the allowed processor CID. Dis allowed CID write to RTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a rising edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

Bits 26:20 Reserved, must be kept at reset value.

Bits 19:14 **RTx:** Rising trigger event configuration bit of configurable event input x (x = 51 to 46)

Bits 13:0 Reserved, must be kept at reset value.

34.7.55 EXTI2 falling trigger selection register (EXTI2_FTSR2)

Address offset: 0x024

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	FT61	FT60	FT59	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FT51	FT50	FT49	FT48
		rw	rw	rw								rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FT47	FT46	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw	rw														

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:27 **FTx:** Falling trigger event configuration bit of configurable event input x (x = 61 to 59)

0: Falling trigger disabled (for event and interrupt) for input line x

1: Falling trigger enabled (for event and interrupt) for input line x

When SECx is disabled in EXTI2_SECCFGR2, FTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR2, FTx can only be accessed with secure access. Non-secure write to FTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR2, FTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR2, FTx can only be accessed with privileged access. Unprivileged write to FTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, FTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, FTx can only be accessed by the allowed processor CID. Dis allowed CID write to FTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a rising edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

Bits 26:20 Reserved, must be kept at reset value.

Bits 19:14 **FTx:** Falling trigger event configuration bit of configurable event input x (x = 51 to 46)

Bits 13:0 Reserved, must be kept at reset value.

34.7.56 EXTI2 software interrupt event register (EXTI2_SWIER2)

Address offset: 0x028

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	SWI61	SWI60	SWI59	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWI51	SWI50	SWI49	SWI48
		rw	rw	rw								rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SWI47	SWI46	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw	rw														

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:27 **SWIx:** Software interrupt on event x (x = 61 to 59)

0: Writing 0 has no effect.

1: Writing 1 to this bit triggers a rising edge event on event x (bit auto cleared by hardware).

When SECx is disabled in EXTI2_SECCFGR2, SWIx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR2, SWIx can only be accessed with secure access. Non-secure write to SWIx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR2, SWIx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR2, SWIx can only be accessed with privileged access. Unprivileged write to SWIx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, SWIx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, SWIx can only be accessed by the allowed processor CID. Dis allowed CID write to SWIx is discarded, and read returns 0.

A software interrupt is generated independent from the setting in EXTI2_RTSR and EXTI2_FTSR. It always returns 0 when read.

Bits 26:20 Reserved, must be kept at reset value.

Bits 19:14 **SWIx:** Software interrupt on event x (x = 51 to 46)

Bits 13:0 Reserved, must be kept at reset value.

34.7.57 EXTI2 rising edge pending register (EXTI2_RPR2)

Address offset: 0x02C

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	RPIF61	RPIF60	RPIF59	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RPIF51	RPIF50	RPIF49	RPIF48

RPIF47	RPIF46	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rc_w1	rc_w1														

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:27 **RPIFx:** Configurable event input x rising edge pending bit (x = 61 to 59)

This bit is set when the selected rising edge event or an EXTI2_SWIER Software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No rising edge trigger request occurred

1: Rising edge trigger request occurred

When SECx is disabled in EXTI2_SECCFGR2, RPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR2, RPIFx can only be accessed with secure access. Non-secure write to RPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR2, RPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR2, RPIFx can only be accessed with privileged access. Unprivileged write to RPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, RPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, RPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to RPIFx is discarded, and read returns 0.

Bits 26:20 Reserved, must be kept at reset value.

Bits 19:14 **RPIFx:** Configurable event input x rising edge pending bit (x = 51 to 46)

Bits 13:0 Reserved, must be kept at reset value.

34.7.58 EXTI2 falling edge pending register (EXTI2_FPR2)

Address offset: 0x030

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	FPIF61	FPIF60	FPIF59	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FPIF51	FPIF50	FPIF49	FPIF48

FPIF47	FPIF46	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rc_w1	rc_w1														

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:27 **FPIFx:** Configurable event input x pending bit (x = 61 to 59)

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No falling edge trigger request occurred

1: Falling edge trigger request occurred

When SECx is disabled in EXTI2_SECCFGR2, FPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR2, FPIFx can only be accessed with secure access. Non-secure write to FPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR2, FPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR2, FPIFx can only be accessed with privileged access. Unprivileged write to FPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, FPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, FPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to FPIFx is discarded, and read returns 0.

Bits 26:20 Reserved, must be kept at reset value.

Bits 19:14 **FPIFx:** Configurable event input x pending bit (x = 51 to 46)

Bits 13:0 Reserved, must be kept at reset value.

34.7.59 EXTI2 security enable register (EXTI2_SECCFGR2)

Address offset: 0x034

Reset value: 0x0000 0000

This register provides write access security and privilege. A non-secure or unprivileged write access is ignored and causes the generation of an illegal access event. All read return the register data.

Write to this register are ignored if GLOCK is enabled in EXTI2_LOCKR.

This register contains only bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SEC 63	SEC 62	SEC 61	SEC 60	SEC 59	Res.	Res.	SEC 56	SEC 55	SEC 54	SEC 53	SEC 52	SEC 51	SEC 50	SEC 49	SEC 48

SEC 47	SEC 46	Res.	SEC 44	SEC 43	SEC 42	SEC 41	SEC 40	Res.	SEC 38	SEC 37	SEC 36	SEC 35	SEC 34	SEC 33	Res.
rw	rw		rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	

Bits 31:27 **SECx:** Security enable on event input x (x = 63 to 59)

0: Event security disabled (non-secure)

1: Event security enabled (secure)

When CID filtering is disabled in EXTI2_ExCIDCFGR, SECx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, SECx can only be accessed by the allowed processor CID. Dis allowed CID write to SECx is discarded, and read returns 0.

Bits 26:25 Reserved, must be kept at reset value.

Bits 24:14 **SECx:** Security enable on event input x (x = 56 to 46)

Bit 13 Reserved, must be kept at reset value.

Bits 12:8 **SECx:** Security enable on event input x (x = 44 to 40)

Bit 7 Reserved, must be kept at reset value.

Bits 6:1 **SECx:** Security enable on event input x (x = 38 to 33)

Bit 0 Reserved, must be kept at reset value.

34.7.60 EXTI2 privilege enable register (EXTI2_PRIVCFGR2)

Address offset: 0x038

Reset value: 0x0000 0000

This register provides privilege write access protection. An unprivileged write access is discarded and causes the generation of an illegal access event. A unprivileged read returns the register data.

Write to this register are ignored if GLOCK is enabled in EXTI2_LOCKR.

This register contains only bits for security capable Input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

PRIV47	PRIV46	Res.	PRIV44	PRIV43	PRIV42	PRIV41	PRIV40	Res.	PRIV38	PRIV37	PRIV36	PRIV35	PRIV34	PRIV33	Res.
rw	rw		rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	

Bits 31:27 **PRIVx:** Privilege enable on event input x (x = 63 to 59)

0: Event privilege disabled (unprivileged)

1: Event privilege enabled (privileged)

When SECx is disabled in EXTI2_SECCFGR2, PRIVx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR2, PRIVx can only be accessed with secure access. Non-secure write to PRIVx is discarded. Non-secure read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, PRIVx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, PRIVx can only be accessed by the allowed processor CID. Dis allowed CID write to PRIVx is discarded, and read returns 0.

Bits 26:25 Reserved, must be kept at reset value.

Bits 24:14 **PRIVx:** Privilege enable on event input x (x = 56 to 46)

Bit 13 Reserved, must be kept at reset value.

Bits 12:8 **PRIVx:** Privilege enable on event input x (x = 44 to 40)

Bit 7 Reserved, must be kept at reset value.

Bits 6:1 **PRIVx:** Privilege enable on event input x (x = 38 to 33)

Bit 0 Reserved, must be kept at reset value.

34.7.61 EXTI2 rising trigger selection register (EXTI2_RTSR3)

Address offset: 0x040

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RT66	RT65	RT64
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **RTx:** Rising trigger event configuration bit of configurable event input x (x = 66 to 64)

0: Rising trigger disabled (for event and interrupt) for input line x

1: Rising trigger enabled (for event and interrupt) for input line x

When SECx is disabled in EXTI2_SECCFGR3, RTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR3, RTx can only be accessed with secure access. Non-secure write to RTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR3, RTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR3, RTx can only be accessed with privileged access. Unprivileged write to RTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, RTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, RTx can only be accessed by the allowed processor CID. Dis allowed CID write to RTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a rising edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

34.7.62 EXTI2 falling trigger selection register (EXTI2_FTSR3)

Address offset: 0x044

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FT66	FT65	FT64
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **FTx:** Falling trigger event configuration bit of configurable event input x (x = 66 to 64)

0: Falling trigger disabled (for event and interrupt) for input line x

1: Falling trigger enabled (for event and interrupt) for input line x

When SECx is disabled in EXTI2_SECCFGR3, FTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR3, FTx can only be accessed with secure access. Non-secure write to FTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR3, FTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR3, FTx can only be accessed with privileged access. Unprivileged write to FTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, FTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, FTx can only be accessed by the allowed processor CID. Dis allowed CID write to FTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a rising edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

34.7.63 EXTI2 software interrupt event register (EXTI2_SWIER3)

Address offset: 0x048

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWI66	SWI65	SWI64
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **SWIx:** Software interrupt on event x (x = 66 to 64)

0: Writing 0 has no effect.

1: Writing 1 to this bit triggers a rising edge event on event x (bit auto cleared by hardware).

When SECx is disabled in EXTI2_SECCFGR3, SWIx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR3, SWIx can only be accessed with secure access. Non-secure write to SWIx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR3, SWIx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR3, SWIx can only be accessed with privileged access. Unprivileged write to SWIx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, SWIx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, SWIx can only be accessed by the allowed processor CID. Dis allowed CID write to SWIx is discarded, and read returns 0.

A software interrupt is generated independent from the setting in EXTI2_RTSR and EXTI2_FTSR. It always returns 0 when read.

34.7.64 EXTI2 rising edge pending register (EXTI2_RPR3)

Address offset: 0x04C

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RPIF66	RPIF65	RPIF64
													rc_w1	rc_w1	rc_w1

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **RPIFx:** configurable event input x rising edge pending bit (x = 66 to 64)

This bit is set when the selected rising edge event or an EXTI2_SWIER Software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No rising edge trigger request occurred

1: Rising edge trigger request occurred

When SECx is disabled in EXTI2_SECCFGR3, RPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR3, RPIFx can only be accessed with secure access. Non-secure write to RPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR3, RPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR3, RPIFx can only be accessed with privileged access. Unprivileged write to RPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, RPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, RPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to RPIFx is discarded, and read returns 0.

34.7.65 EXTI2 falling edge pending register (EXTI2_FPR3)

Address offset: 0x050

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FPIF66	FPIF65	FPIF64
													rc_w1	rc_w1	rc_w1

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **FPIFx:** Configurable event input x falling edge pending bit (x = 66 to 64)

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No falling edge trigger request occurred

1: Falling edge trigger request occurred

When SECx is disabled in EXTI2_SECCFGR3, FPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR3, FPIFx can only be accessed with secure access. Non-secure write to FPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR3, FPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR3, FPIFx can only be accessed with privileged access. Unprivileged write to FPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, FPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, FPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to FPIFx is discarded, and read returns 0.

34.7.66 EXTI2 security enable register (EXTI2_SECCFGR3)

Address offset: 0x054

Reset value: 0x0000 0000

This register provides write access security and privilege. A non-secure or unprivileged write access is ignored and causes the generation of an illegal access event. All read return the register data.

Write to this register are ignored if GLOCK is enabled in EXTI2_LOCKR.

This register contains only bits for security capable Input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	SEC76	Res.	Res.	Res.	Res.	Res.	SEC70	SEC69	SEC68	SEC67	SEC66	SEC65	SEC64
			rw						rw	rw	rw	rw	rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **SEC76:** Security enable on event input 76

Bits 11:7 Reserved, must be kept at reset value.

Bits 6:0 **SECx:** Security enable on event input x (x = 70 to 64)

0: Event security disabled (non-secure)

1: Event security enabled (secure)

When CID filtering is disabled in EXTI2_ExCIDCFGR, SECx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, SECx can only be accessed by the allowed processor CID. Dis allowed CID write to SECx is discarded and read returns 0.

34.7.67 EXTI2 privilege enable register (EXTI2_PRIVCFGR3)

Address offset: 0x058

Reset value: 0x0000 0000

This register provides privilege write access protection. An unprivileged write access is discarded and causes the generation of an illegal access event. A unprivileged read returns the register data.

Write to this register are ignored if GLOCK is enabled in EXTI2_LOCKR.

This register contains only bits for security capable Input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	PRIV76	Res.	Res.	Res.	Res.	Res.	PRIV70	PRIV69	PRIV68	PRIV67	PRIV66	PRIV65	PRIV64
			rw						rw	rw	rw	rw	rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **PRIV76:** Privilege enable on event input 76

Bits 11:7 Reserved, must be kept at reset value.

Bits 6:0 **PRIVx:** Privilege enable on event input x (x = 70 to 64)

0: Event privilege disabled (unprivileged)

1: Event privilege enabled (privileged)

When SECx is disabled in EXTI2_SECCFGR3, PRIVx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR3, PRIVx can only be accessed with secure access. Non-secure write to PRIVx is discarded. Non-secure read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, PRIVx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, PRIVx can only be accessed by the allowed processor CID. Dis allowed CID write to PRIVx is discarded, and read returns 0.

34.7.68 EXTI2 external interrupt selection register 1 (EXTI2_EXTICR1)

Address offset: 0x060

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Others: reserved

When SECx is disabled in EXTI2_SECCFGR1, this field can be accessed with non-secure and secure access.
When SECx is enabled in EXTI2_SECCFG1, this field can only be accessed with secure access. Non-secure write to this field is discarded. Non-secure read returns 0.
When PRIVx is disabled in EXTI2_PRIVCFGR1, this field can be accessed with unprivileged and privileged access.
When PRIVx is enabled in EXTI2_PRIVCFGR1, this field can only be accessed with privileged access. Unprivileged write to this field is discarded. Unprivileged read returns 0.
When CID filtering is disabled in EXTI2_ExCIDCFGR, this field can be accessed by any processor CID.
When CID filtering is enabled in EXTI2_ExCIDCFGR, this field can only be accessed by the allowed processor CID. Dis allowed CID write to this field is discarded, and read returns 0.

Bits 23:16 **EXTI6[7:0]:** EXTI6 GPIO port selection

These bits are written by software to select the source input for EXTI6 external interrupt.
0x00: PA6 pin
0x01: PB6 pin
0x02: PC6 pin
0x03: PD6 pin
0x04: PE6 pin
0x05: PF6 pin
0x06: PG6 pin
0x07: PH6 pin
0x08: PI6 pin
0x09: PJ6 pin
0x0A: PK6 pin
0x0B: PZ6 pin
Others: reserved

When SECx is disabled in EXTI2_SECCFGR1, this field can be accessed with non-secure and secure access.
When SECx is enabled in EXTI2_SECCFG1, this field can only be accessed with secure access. Non-secure write to this field is discarded. Non-secure read returns 0.
When PRIVx is disabled in EXTI2_PRIVCFGR1, this field can be accessed with unprivileged and privileged access.
When PRIVx is enabled in EXTI2_PRIVCFGR1, this field can only be accessed with privileged access. Unprivileged write to this field is discarded. Unprivileged read returns 0.
When CID filtering is disabled in EXTI2_ExCIDCFGR, this field can be accessed by any processor CID.
When CID filtering is enabled in EXTI2_ExCIDCFGR, this field can only be accessed by the allowed processor CID. Dis allowed CID write to this field is discarded, and read returns 0.

Bits 15:8 **EXTI5[7:0]:** EXTI5 GPIO port selection

These bits are written by software to select the source input for EXTI5 external interrupt.
0x00: PA5 pin
0x01: PB5 pin
0x02: PC5 pin
0x03: PD5 pin
0x04: PE5 pin
0x05: PF5 pin

When SECx is disabled in EXTI2_SECCFGR1, this field can be accessed with non-secure and secure access.
When SECx is enabled in EXTI2_SECCFG1, this field can only be accessed with secure access. Non-secure write to this field is discarded. Non-secure read returns 0.
When PRIVx is disabled in EXTI2_PRIVCFGR1, this field can be accessed with unprivileged and privileged access.
When PRIVx is enabled in EXTI2_PRIVCFGR1, this field can only be accessed with privileged access. Unprivileged write to this field is discarded. Unprivileged read returns 0.
When CID filtering is disabled in EXTI2_ExCIDCFGR, this field can be accessed by any processor CID.
When CID filtering is enabled in EXTI2_ExCIDCFGR, this field can only be accessed by the allowed processor CID. Dis allowed CID write to this field is discarded, and read returns 0.

34.7.72 EXTI2 lock register (EXTI2_LOCKR)

Address offset: 0x070

Reset value: 0x0000 0000

This register can only be written by the secure, privileged, trusted domain CID. A write access from any other protection level or domain CID is discarded and any read returns zero value. Both illegal write and read access generate an illegal access event.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GLOCK
															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **GLOCK:** Global security, privilege and CID configuration registers EXTI2_SECCFGRx, EXTI2_PRIVCFGRx, EXTI2_EnCIDCFGR and EXTI2_CmCIDCFGR lock

This bit is write once after reset.
0: Security and privilege configuration open, can be modified
1: Security and privilege configuration locked, can no longer be modified

34.7.73 EXTI2 CPUm wake-up with interrupt mask register (EXTI2_CmIMR1) (m = 1 to 3)

Address offset: Block 1: 0x080

Address offset: Block 2: 0x0C0

Address offset: Block 3: 0x100

Reset value: 0x0000 0000

Contains register bits for configurable events and direct events.

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI2_CmCIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IM31	IM30	IM29	Res.	IM27	IM26	IM25	IM24	IM23	IM22	IM21	IM20	IM19	IM18	IM17	IM16
rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

IM15	IM14	IM13	IM12	IM11	IM10	IM9	IM8	IM7	IM6	IM5	IM4	IM3	IM2	IM1	IM0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 31 to 29)

0: Wake-up and interrupt CPU(m) from input event x is masked.

1: Wake-up and interrupt CPU(m) from input event x is unmasked. CPU(m) wake-up event and configurable event interrupt generated.

When SECx is disabled in EXTI2_SECCFGR1, IMx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR1, IMx can only be accessed with secure access. Non-secure write to IMx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR1, IMx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR1, IMx can only be accessed with privileged access. Unprivileged write to IMx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, IMx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, IMx can only be accessed by the allowed processor CID. Dis allowed CID write to IMx is discarded, and read returns 0.

Bit 28 Reserved, must be kept at reset value.

Bits 27:0 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 27 to 0)

34.7.74 EXTI2 CPUm wake-up with event mask register (EXTI2_CmEMR1) (m = 2 to 3)

Address offset: Block 2: 0x0C4

Address offset: Block 3: 0x104

Reset value: 0x0000 0000

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI2_CmCIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **EMx:** CPU(m) wake-up with event generation mask on event input x (x = 15 to 0)

0: Wake-up with event generation from line x is masked.

1: Wake-up with event generation from line x is unmasked.

When SECx is disabled in EXTI2_SECCFGR1, EMx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR1, EMx can only be accessed with secure access. Non-secure write to EMx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR1, EMx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR1, EMx can only be accessed with privileged access. Unprivileged write to EMx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, EMx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, EMx can only be accessed by the allowed processor CID. Dis allowed CID write to EMx is discarded, and read returns 0.

34.7.75 EXTI2 CPUm wake-up with interrupt mask register (EXTI2_CmIMR2) (m = 1 to 3)

Address offset: Block 1: 0x090

Address offset: Block 2: 0x0D0

Address offset: Block 3: 0x110

Reset value: 0x0000 0000

This register contains only bits for configurable events and direct events.

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI2_CmCIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

rw	rw		rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	

Bits 31:27 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 63 to 59)
0: Wake-up and interrupt CPU(m) from input event x is masked.
1: Wake-up and interrupt CPU(m) from input event x is unmasked. CPU(m) wake-up event and configurable event interrupt generated.
When SECx is disabled in EXTI2_SECCFGR2, IMx can be accessed with non-secure and secure access.
When SECx is enabled in EXTI2_SECCFGR2, IMx can only be accessed with secure access. Non-secure write to IMx is discarded. Non-secure read returns 0.
When PRIVx is disabled in EXTI2_PRIVCFGR2, IMx can be accessed with unprivileged and privileged access.
When PRIVx is enabled in EXTI2_PRIVCFGR2, IMx can only be accessed with privileged access. Unprivileged write to IMx is discarded. Unprivileged read returns 0.
When CID filtering is disabled in EXTI2_ExCIDCFGR, IMx can be accessed by any processor CID.
When CID filtering is enabled in EXTI2_ExCIDCFGR, IMx can only be accessed by the allowed processor CID. Dis allowed CID write to IMx is discarded, and read returns 0.

Bits 26:25 Reserved, must be kept at reset value.

Bits 24:14 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 56 to 46)

Bit 13 Reserved, must be kept at reset value.

Bits 12:8 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 44 to 40)

Bit 7 Reserved, must be kept at reset value.

Bits 6:1 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 38 to 33)

Bit 0 Reserved, must be kept at reset value.

34.7.76 EXTI2 CPUm wake-up with event mask register (EXTI2_CmEMR2) (m = 2 to 3)

Address offset: Block 2: 0x0D4

Address offset: Block 3: 0x114

Reset value: 0x0000 0000

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI2_CmCIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:27 **EMx:** CPU(m) wake-up with event generation mask on event input x (x = 61 to 59)

0: Wake-up with event generation from line x is masked.

1: Wake-up with event generation from line x is unmasked.

When SECx is disabled in EXTI2_SECCFGR2, EMX can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR2, EMX can only be accessed with secure access. Non-secure write to EMX is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR2, EMX can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR2, EMX can only be accessed with privileged access. Unprivileged write to EMX is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, EMX can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, EMX can only be accessed by the allowed processor CID. Dis allowed CID write to EMX is discarded, and read returns 0.

Bits 26:0 Reserved, must be kept at reset value.

34.7.77 EXTI2 CPUm wake-up with interrupt mask register (EXTI2_CmIMR3) (m = 1 to 3)

Address offset: Block 1: 0x0A0

Address offset: Block 2: 0x0E0

Address offset: Block 3: 0x120

Reset value: 0x0000 0000

This register contains only bits for configurable events and direct events.

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI2_CmCIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	IM76	Res.	Res.	Res.	Res.	Res.	IM70	IM69	IM68	IM67	IM66	IM65	IM64
			rw						rw	rw	rw	rw	rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **IM76:** CPUm wake-up with interrupt mask on event input 76.

Bits 11:7 Reserved, must be kept at reset value.

Bits 6:0 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 70 to 64)

0: Wake-up and interrupt CPU(m) from input event x is masked.

1: Wake-up and interrupt CPU(m) from input event x is unmasked. CPU(m) wake-up event and configurable event interrupt generated.

When SECx is disabled in EXTI2_SECCFGR3, IMx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR3, IMx can only be accessed with secure access. Non-secure write to IMx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR3, IMx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR3, IMx can only be accessed with privileged access. Unprivileged write to IMx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, IMx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, IMx can only be accessed by the allowed processor CID. Dis allowed CID write to IMx is discarded, and read returns 0.

34.7.78 EXTI2 event CID config register (EXTI2_EnCIDCFGR)

Valid range: n = 0 to 27, 29 to 31, 33 to 38, 40 to 44, 46 to 56, 59 to 70, 76

Address offset: 0x180 + 0x04 * n (n = 0 to 76)

Reset value: 0x0000 0000

This register can only be written by the secure, privileged, trusted domain CID. A write access from any other protection level or domain CID is discarded and any read returns zero value. Both illegal write and read access generate an illegal access event.

Write to these registers are ignored if GLOCK is enabled in EXTI2_LOCKR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CID[2:0]			Res.	Res.	Res.	CFEN
									rw	rw	rw				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **CID[2:0]:** EXTI event n allowed CID value

If CID filtering is disabled in CFEN, these bits are ignored, else EXITI event n allowed processor CID number.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **CFEN:** EXTI event n CID filtering enable

0: Disable EXTI event x filtering (EXTI event x can be accessed by all CIDs).

1: Enable EXTI event x filtering (EXTI event x can only be accessed by the processor with CID = CPUm CID).

34.7.79 EXTI2 processor m CID configuration register (EXTI2_CmCIDCFGR)

Address offset: 0x300 + 0x04 * (m - 1) (m = 1 to 3)

Reset value: 0x0000 0000

This register can only be written by the secure, privilege, trusted domain CID. An illegal write access to this register generates an illegal access event.

Write to these registers are ignored if GLOCK is enabled in EXTI2_LOCKR.

This registers has no read access limitations, and can be read by any domain CID, and any access protection.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CID[2:0]			Res.	Res.	Res.	CFEN
									rw	rw	rw				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **CID[2:0]:** CPUm CID domain identification
If CFEN = 0, these bits are ignored, and there is no CPUm CID filtering, else CPUm CID domain identification number.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **CFEN:** CID filtering enabled for CPUm EXTI2_CmIMRn and EXTI2_CmEMRn registers
0: Disable the CID filtering for CPUm.
1: Enable the CID filtering for CPUm.

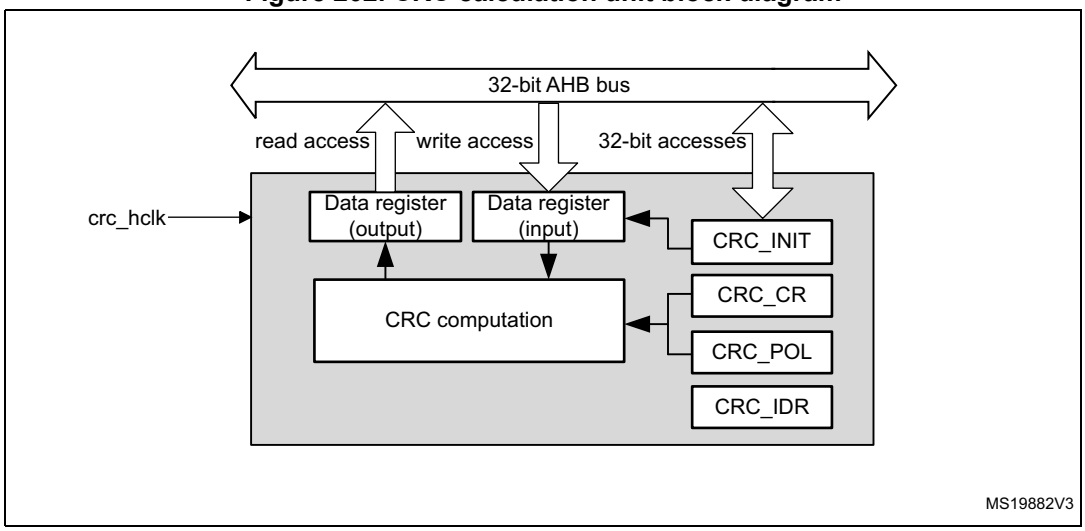
35 Cyclic redundancy check calculation unit (CRC)

35.1 Introduction

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code from 8-, 16- or 32-bit data word and a generator polynomial.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the functional safety standards, they offer a means of verifying the flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link time and stored at a given memory location.



35.2 CRC main features

- Uses CRC-32 (Ethernet) polynomial: 0x4C11DB7
  $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$
- Alternatively, uses fully programmable polynomial with programmable size (7, 8, 16, 32 bits)
- Handles 8-,16-, 32-bit data size
- Programmable CRC initial value
- Single input/output 32-bit data register
- Input buffer to avoid bus stall during calculation
- CRC computation done in 4 AHB clock cycles (HCLK) for the 32-bit data size
- General-purpose 8-bit register (can be used for temporary storage)
- Reversibility option on I/O data
- Accessed through AHB slave peripheral by 32-bit words only, with the exception of CRC_DR register that can be accessed by words, right-aligned half-words and right-aligned bytes

35.3 CRC functional description

35.3.1 CRC block diagram

Figure 202. CRC calculation unit block diagram

35.3.2 CRC internal signals

Table 247. CRC internal input/output signals

Signal name	Signal type	Description
crc_hclk	Digital input	AHB clock

35.3.3 CRC operation

The CRC calculation unit has a single 32-bit read/write data register (CRC_DR). It is used to input new data (write access), and holds the result of the previous CRC calculation (read access).

Each write operation to the data register creates a combination of the previous CRC value (stored in CRC_DR) and the new one. CRC computation is done on the whole 32-bit data word or byte by byte depending on the format of the data being written.

The CRC_DR register can be accessed by word, right-aligned half-word and right-aligned byte. For the other registers only 32-bit accesses are allowed.

The duration of the computation depends on data width:

- 4 AHB clock cycles for 32 bits
- 2 AHB clock cycles for 16 bits
- 1 AHB clock cycles for 8 bits

An input buffer allows a second data to be immediately written without waiting for any wait-states due to the previous CRC calculation.

The data size can be dynamically adjusted to minimize the number of write accesses for a given number of bytes. For instance, a CRC for 5 bytes can be computed with a word write followed by a byte write.

The input data can be reversed to manage the various endianness schemes. The reversing operation can be performed on 8 bits, 16 bits and 32 bits depending on the REV_IN[1:0] bits in the CRC_CR register.

For example, 0x1A2B3C4D input data are used for CRC calculation as:

- 0x58D43CB2 with bit-reversal done by byte
- 0xD458B23C with bit-reversal done by half-word
- 0xB23CD458 with bit-reversal done on the full word

The output data can also be reversed by setting the REV_OUT bit in the CRC_CR register.

The operation is done at bit level. For example, 0x11223344 output data are converted to 0x22CC4488.

The CRC calculator can be initialized to a programmable value using the RESET control bit in the CRC_CR register (the default value is 0xFFFFFFFF).

The initial CRC value can be programmed with the CRC_INIT register. The CRC_DR register is automatically initialized upon CRC_INIT register write access.

The CRC_IDR register can be used to hold a temporary value related to CRC calculation. It is not affected by the RESET bit in the CRC_CR register.

Polynomial programmability

The polynomial coefficients are fully programmable through the CRC_POL register, and the polynomial size can be configured to be 7, 8, 16 or 32 bits by programming the POLYSIZE[1:0] bits in the CRC_CR register. Even polynomials are not supported.

Note: The type of an even polynomial is $X+X^2+..+X^n$, while the type of an odd polynomial is $1+X+X^2+..+X^n$.

If the CRC data is less than 32-bit, its value can be read from the least significant bits of the CRC_DR register.

To obtain a reliable CRC calculation, the change on-fly of the polynomial value or size can not be performed during a CRC calculation. As a result, if a CRC calculation is ongoing, the application must either reset it or perform a CRC_DR read before changing the polynomial.

The default polynomial value is the CRC-32 (Ethernet) polynomial: 0x4C11DB7.

35.4 CRC registers

The CRC_DR register can be accessed by words, right-aligned half-words and right-aligned bytes. For the other registers only 32-bit accesses are allowed.

35.4.1 CRC data register (CRC_DR)

Address offset: 0x00

Reset value: 0xFFFF FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DR[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DR[31:0]:** Data register bits

This register is used to write new data to the CRC calculator.

It holds the previous CRC calculation result when it is read.

If the data size is less than 32 bits, the least significant bits are used to write/read the correct value.

35.4.2 CRC independent data register (CRC_IDR)

Address offset: 0x04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IDR[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **IDR[31:0]**: General-purpose 32-bit data register bits

These bits can be used as a temporary storage location for four bytes.

This register is not affected by CRC resets generated by the RESET bit in the CRC_CR register

35.4.3 CRC control register (CRC_CR)

Address offset: 0x08

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	REV_OUT	REV_IN[1:0]		POLYSIZE[1:0]		Res.	Res.	RESET
								rw	rw	rw	rw	rw			rs

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **REV_OUT**: Reverse output data

This bit controls the reversal of the bit order of the output data.

0: Bit order not affected

1: Bit-reversed output format

Bits 6:5 **REV_IN[1:0]**: Reverse input data

This bitfield controls the reversal of the bit order of the input data

00: Bit order not affected

01: Bit reversal done by byte

10: Bit reversal done by half-word

11: Bit reversal done by word

Bits 4:3 **POLYSIZE[1:0]**: Polynomial size

These bits control the size of the polynomial.

00: 32 bit polynomial

01: 16 bit polynomial

10: 8 bit polynomial

11: 7 bit polynomial

Bits 2:1 Reserved, must be kept at reset value.

Bit 0 **RESET**: RESET bit

This bit is set by software to reset the CRC calculation unit and set the data register to the value stored in the CRC_INIT register. This bit can only be set, it is automatically cleared by hardware

35.4.4 CRC initial value (CRC_INIT)

Address offset: 0x10

Reset value: 0xFFFF FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CRC_INIT[31:16]

CRC_INIT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CRC_INIT[31:0]**: Programmable initial CRC value
This register is used to write the CRC initial value.

35.4.5 CRC polynomial (CRC_POL)

Address offset: 0x14

Reset value: 0x04C1 1DB7

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
POL[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
POL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **POL[31:0]**: Programmable polynomial
This register is used to write the coefficients of the polynomial to be used for CRC calculation.
If the polynomial size is less than 32 bits, the least significant bits have to be used to program the correct value.

35.4.6 CRC hardware configuration register (CRC_HWCFGR)

Address offset: 0x3F0

Reset value: 0x0000 00XX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FULL_POLY[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **FULL_POLY[7:0]**: Polynomial type
00000000: Fixed polynomial 0x4C11DB7
00000001: Programmable polynomial coefficients and size (7,8,16,32)
Others: Reserved, must not be used.

35.4.7 CRC version register (CRC_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0023

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJREV[3:0]				MINREV[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision
These bits return the CRC major revision.

Bits 3:0 **MINREV[3:0]**: Minor revision
These bits return the CRC minor revision.

35.4.8 CRC identification register (CRC_IPIDR)

Address offset: 0x3F8

Reset value: 0x0017 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ID[31:16]

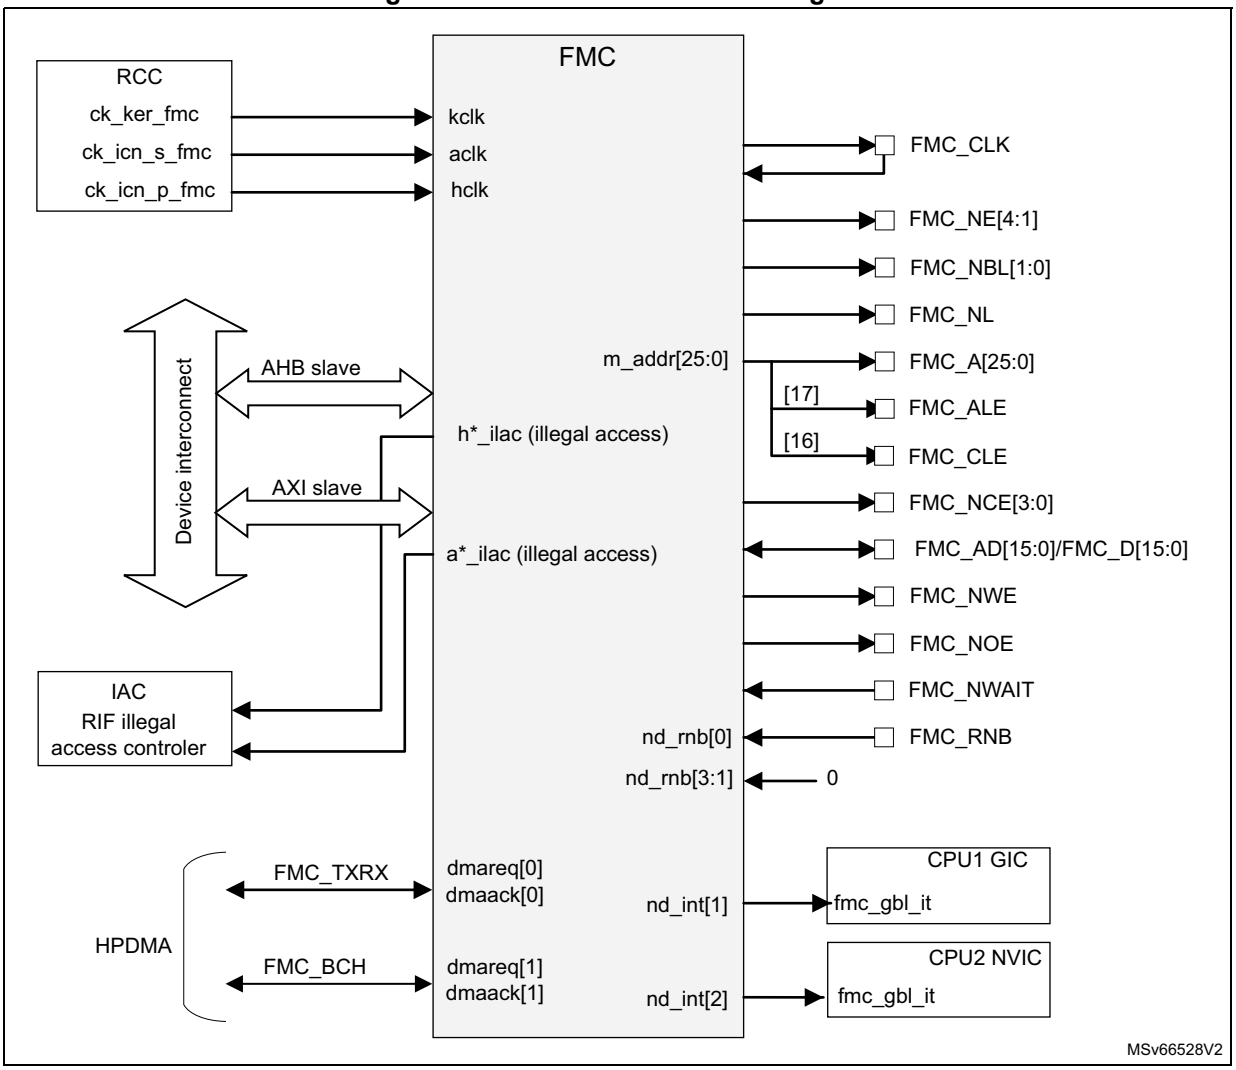
36 Mass storage interfaces

36.1 Overview

STM32MP23/25xx devices embed three types of mass storage interfaces:

- FMC interface: manages access to external parallel NOR, parallel NAND, or parallel static RAM devices.
- Octo-SPI interface: manages access to external serial NOR or serial NAND devices.
- SD/*e*.MMC interface: manages access to external SD or *e*.MMC or SDIO devices.

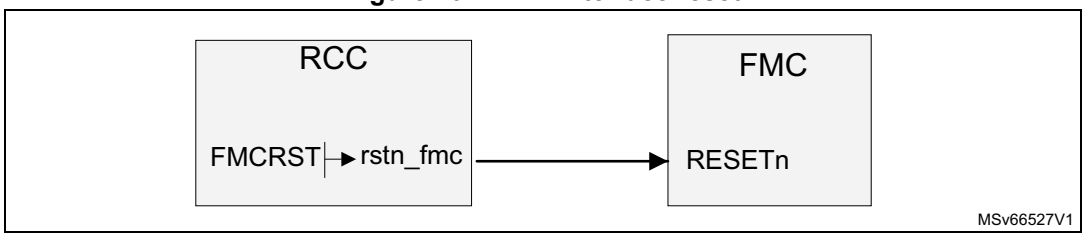
36.2 FMC interface



The FMC is compliant with the RIF (resource isolation framework). See *Section 37: Flexible memory controller (FMC)*.

36.2.1 Main features of the FMC interface

- NOR/PSRAM:
  - ‘Generic interface’ to parallel NOR/PSRAM or external device 8080 display or external FPGA
  - Parallel NOR flash memory not supported as BOOT device
  - Up to 4 regions (4 CS, 64 Mbytes each), independent memory and RIF configuration for each region
  - 8- or 16-bit data modes
  - Separate or multiplexed address and data buses
  - A clock divided from the kernel clock provided for synchronous devices
- NAND:
  - SLC NAND
  - Hamming and BCH ECC controllers
  - Supported as BOOT device
  - 4 CS + 1 RnB signals
  - 8- or 16-bit data modes
  - Hardware sequencer which can be used jointly with DMA channels to free the CPU of sequencing tasks
  - RIF compliant



36.2.2 FMC interface block diagram

Figure 203. FMC interface block diagram

36.2.3 FMC interface reset

Figure 204. FMC interface reset

There is only one reset for the FMC interface (rstn_fmc) which is controlled by FMCRST in RCC_FMCCFGR register.

36.2.4 FMC interface interrupt

The FMC generates two interrupts, one for each CID that can be attached to the NAND controller:

- nd_int[1] generated if the CID attached to the NAND controller corresponds to CPU1
- nd_int[2] generated if the CID attached to the NAND controller corresponds to CPU2

Table 249. FMC interface interrupts

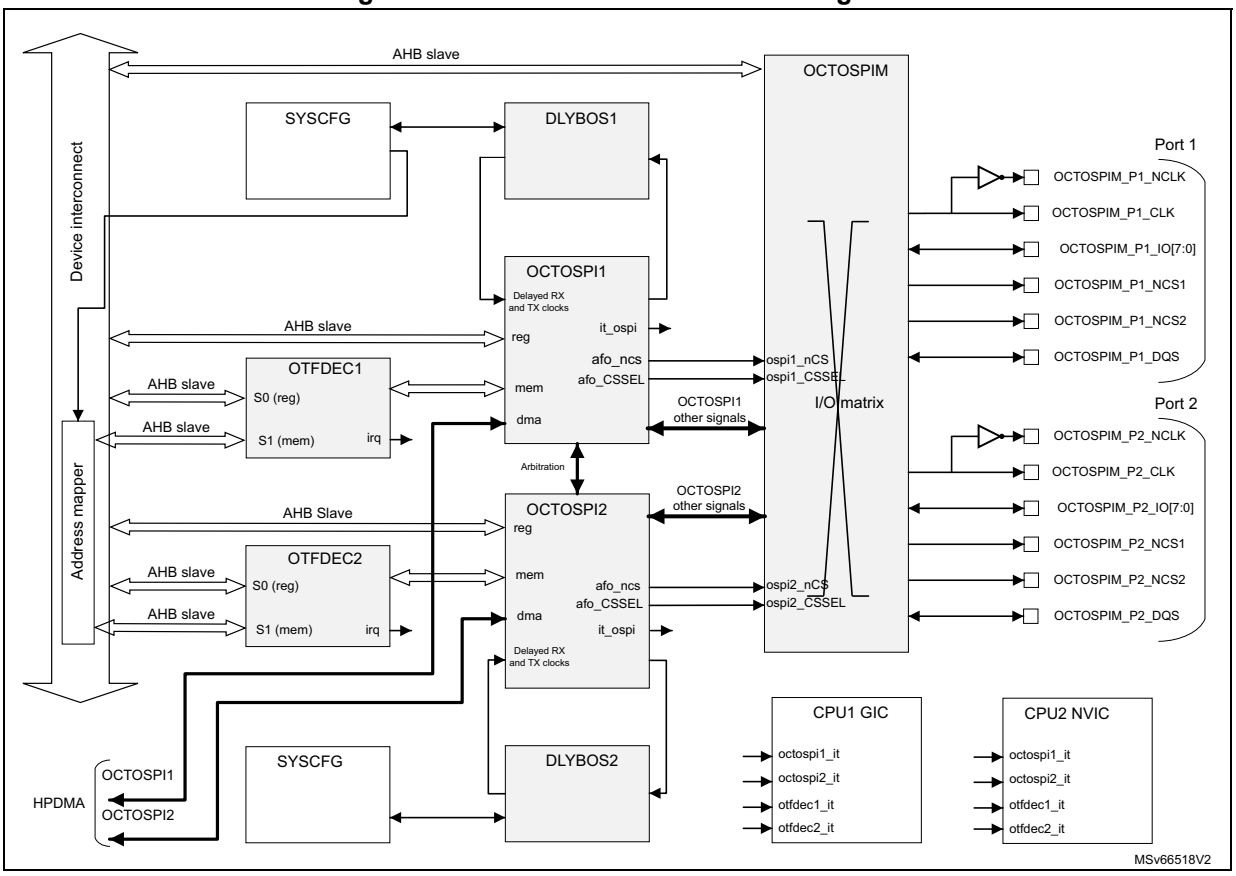
FMC signal name	CPU1 interrupt	CPU2 interrupt
nd_int[1]	fmc_gbl_it	-
nd_int[2]	-	fmc_gbl_it

36.3 Octo-SPI interface

The Octo-SPI interface offers two OCTOSPI physical ports. Accesses to the OCTOSPI controllers are protected by RISUP components.

36.3.1 Main features of the Octo-SPI interface

- Support sNOR and sNAND devices from different families: HyperBus™ compliant devices (HyperRAM™ and HyperFlash™ devices from Spansion, Cypress, including MCP devices which integrate both HyperRAM™ and HyperFlash™), Micron devices (Xcella family), Macronix™ devices.
- Three functional modes: indirect, automatic-status polling, memory-mapped
- Up to 4 Gbytes of external memory can be addressed in indirect mode (per physical port and per CS), and up to 256 Mbytes in memory-mapped mode (combined for both physical ports and per CS).
- Single-, dual-, quad-, and octal-SPI communication
- Dual-quad communication
- Single data rate (SDR) and double transfer rate (DTR)
- Maximum target frequency is 133 MHz for SDR and 133 MHz for DTR
- Data strobe support
- DMA channel for indirect mode
- Support for on-the-fly decryption of data read from an external flash memory:
  - Up to four regions can be defined with independent decryption attributes (execute-only and execute-never) and keys.
  - The decryption applies when the OCTOSPI controller is used in read memory-mapped mode.
- Encryption support
- Double CS mapping that allows two external flash devices to be addressed with a single OCTOSPI controller mapped on a single OCTOSPI port.
- I/O manager (OCTOSPIM):
  - It allows the access to two external flash devices attached to a single OCTOSPI physical port and controlled independently by the OCTOSPI1 and OCTOSPI2 controllers (multiplexed mode).



– It also allows the swap of the OCTOSPI controllers mapping on the physical ports (OCTOSPI1 controller mapped on OCTOSPI port2, and OCTOSPI2 controller mapped on OCTOSPI port1).

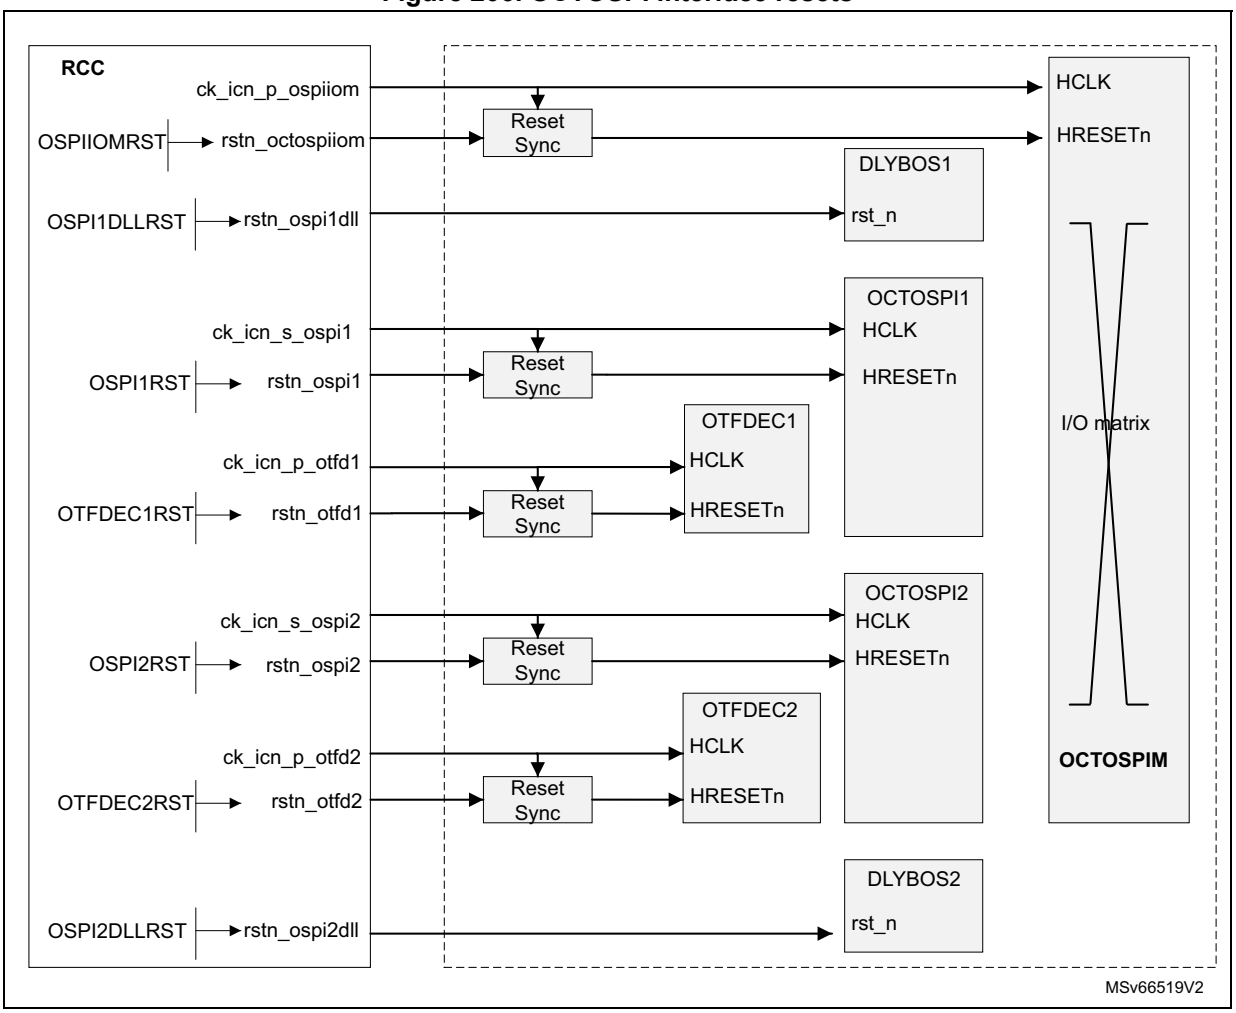
For a complete list of features, refer to:

- *Section 38: Octo-SPI interface (OCTOSPI)*
- *Section 62: On-the-fly decryption engine (OTFDEC)*
- *Section 39: Octo-SPI I/O manager (OCTOSPIM)*.

36.3.2 Octo-SPI interface block diagram

Figure 205. Octo-SPI interface block diagram

The OCTOSPI1 and OCTOSPI2 are the memory controllers. They are symmetric and can be accessed by either CPU1 or CPU2.



The OCTOSPIM manages the mapping of OCTOSPI1 and OCTOSPI2 controllers on the two OCTOSPI physical ports. By default, the OCTOSPI1 is mapped on port 1, and the OCTOSPI2 is mapped on port 2, but this can be swapped by software. The OCTOSPIM enables a multiplexed mode where OCTOSPI1 and OCTOSPI2 controllers share dynamically a single physical port. This is useful for instance to support one SPI_NOR and one SPI_NAND devices attached to the same port, and controlled by independent OCTOSPI controllers.

The OTFDEC1 and OTFDEC2 are in charge of on-the-fly decryption of data read from the external memory devices.

The DLYBOS1 and DLYBOS2 are DLL-based programmable delays which are used to tune the phase of RX sampling clocks and TX launch clocks.

36.3.3 Octo-SPI interface resets

Figure 206. OCTOSPI interface resets

There are seven independent resets for the Octo-SPI interface:

- rstn_octospiiom: controlled by OSPIIOMRST in RCC_OSPIIOMCFGR register
- rstn_ospi1dll: controlled by OSPI1DLLRST in RCC_OSPI1CFGR register
- rstn_ospi1: controlled by OSPI1RST in RCC_OSPI1CFGR register
- rstn_otfd1: controlled by OTFDEC1RST in RCC_OSPI1CFGR register
- rstn_ospi2dll: controlled by OSPI2DLLRST in RCC_OSPI2CFGR register
- rstn_ospi2: controlled by OSPI2RST in RCC_OSPI2CFGR register
- rstn_otfd2: controlled by OTFDEC2RST in RCC_OSPI2CFGR register

When configuring the Octo-SPI interface, the reset sequence to be applied is the following:

1. At device reset, OSPIIOMRST, OSPI1DLLRST (respectively OSPI2DLLRST), OSPI1RST (respectively OSPI2RST), OTFDEC1RST (respectively OTFDEC2RST) are all 0. OSPIIOM, DLYBOS1 (respectively DLYBOS2), OCTOSPI1 (respectively OCTOSPI2), OTFDEC1 (respectively OTFDEC2) are under reset because their clocks are disabled.
2. Set OSPI1EN (respectively OSPI2EN) to 1. This activates the peripheral clock of OCTOSPI1 and OTFDEC1 (respectively OCTOSPI2 and OTFDEC2) and releases their resets.
3. Configure the OCTOSPI1 (respectively OCTOSPI2) and the OTFDEC1 (respectively OTFDEC2) engine.
4. Set OSPIIOMEN to 1. This activates the peripheral clock of OCTOSPIM and releases its reset.
5. Configure the OCTOSPIM.
6. For configurations where the programmable delays must be used:
   a) Wait for the DLL to be locked. This is indicated by LOCK bit in SYSCFG_DLYBOS1SR (respectively SYSCFG_DLYBOS2SR).
   b) Perform a training sequence to determine which delay values correspond to the middle of the valid window for RX sampling (and possibly Tx launching).

   For configurations where the programmable delay is not needed, DLYBOS1 (respectively DLYBOS2) can be maintained under reset by setting OSPI1DLLRST (respectively OSPI2DLLRST) to 1.

36.3.4 Octo-SPI interface memory

256 Mbytes are allocated in the STM32MP23/25xx memory map for OCTOSPI1 and OCTOSPI2. This area is used when OCTOSPI1 and/or OCTOSPI2 operate in memory-mapped mode. These 256-Mbyte allocation between OCTOSPI1 and OCTOSPI2 is static and controlled by OCTOSPI_ADDRESS_MAPPING[2:0] in SYSCFG_OCTOSPIAMCR register.

Table 250. 256-Mbyte allocation between OCTOSPI1 and OCTOSPI2

OCTOSPI_ADDRESS_MAPPING[2:0]	OCTOSPI1 area	OCTOSPI2 area
000	256 Mbytes 0x6000_0000 -> 0x6FFF_FFFF	0 Mbyte
001	192 Mbytes 0x6000_0000 -> 0x6BFF_FFFF	64 Mbytes 0x6C00_0000 -> 0x6FFF_FFFF
010	128 Mbytes 0x6000_0000 -> 0x67FF_FFFF	128 Mbytes 0x6800_0000 -> 0x6FFF_FFFF
011	64 Mbytes 0x6000_0000 -> 0x63FF_FFFF	192 Mbytes 0x6400_0000 -> 0x6FFF_FFFF
1xx	0 Mbyte	256 Mbytes 0x6000_0000 -> 0x6FFF_FFFF

36.3.5 OCTOSPI1/2 description

Refer to *Section 38: Octo-SPI interface (OCTOSPI)*.

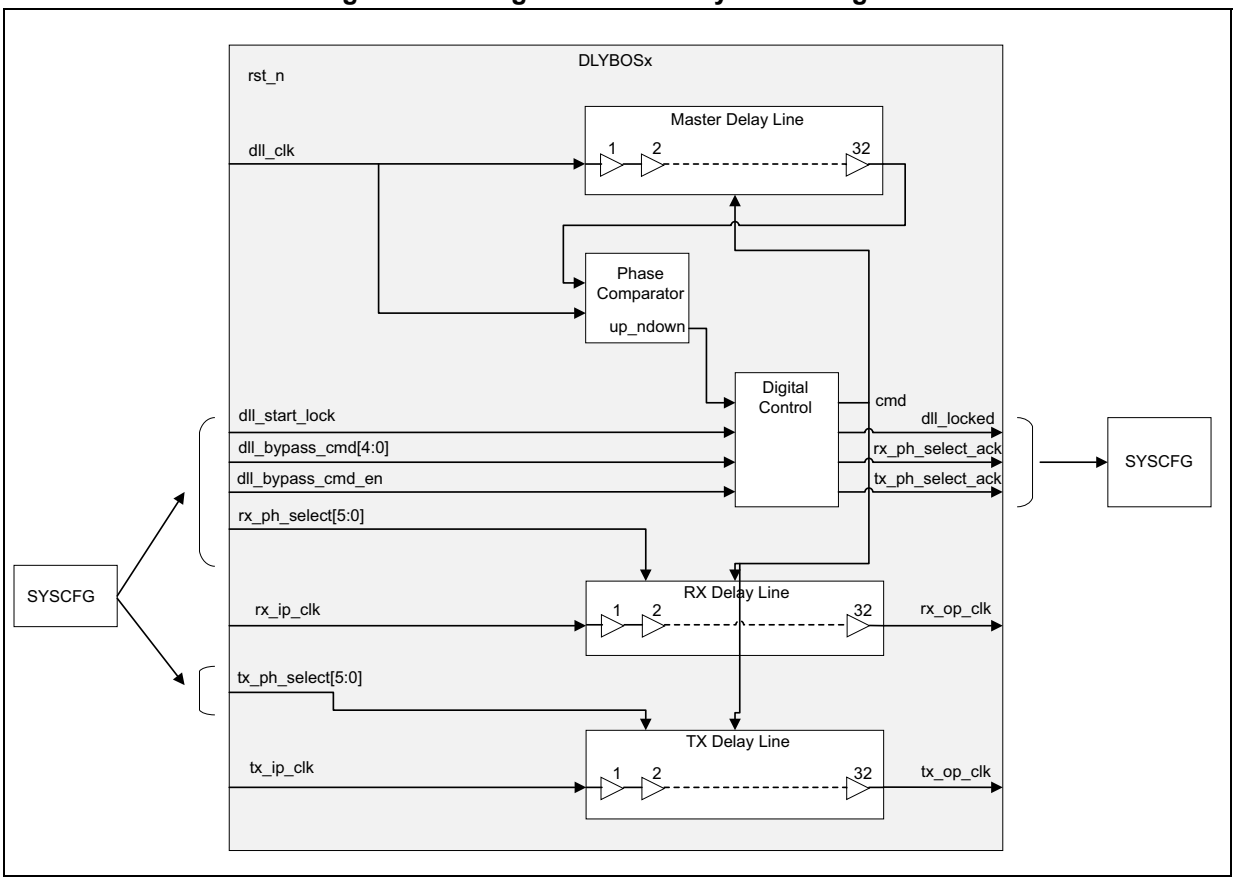
36.3.6 OCTOSPIM description

Refer to *Section 39: Octo-SPI I/O manager (OCTOSPIM)*.

36.3.7 OTFDEC1/2 description

Refer to *Section 62: On-the-fly decryption engine (OTFDEC)*.

36.3.8 DLYBOS1/2 description



Refer to *Section 41: Delay block (DLYB)*

One programmable delay is used for each OCTOSPI. These programmable delays are used to tune the phase of:

- the RX sampling clock (or DQS) in order to sample the data in their valid window
- the TX launch clock in order to meet setup and hold constraints of TX signals versus the memory clock

The programmable delay block is based on a DLL that compensates for voltage and temperature variations. The DLL features 32 taps and covers the [50 MHz, 208 MHz] frequency range. The clock on which the DLL locks is a free running clock provided by the OCTOSPI. This clock is at the same frequency as the clock sent to the memory. When an Octo-SPI interface operates below 50 MHz, either the programmable delay is not used (standard case), or it must be used in bypass mode (case of OCTOSPI devices with DQS strobe).

Figure 207. Programmable delay block diagram

The DLL architecture is based on one master delay line, and two slave delay lines (RX and TX). There are two operating modes:

- Lock mode (dll_bypass_cmd_en = 0)
  - This mode can only be used when the dll_clk frequency is in the range [50 MHz, 208 MHz].
  - The DLL is enabled by setting dll_start_lock to 1.
  - The DLL locks on the frequency of the dll_clk input clock, and compensates for voltage and temperature variations. This process determines the command to be applied to each of the 32 delay units (named tap) of the master delay line for the total master delay to represent one period of dll_clk. This command is copied to each delay unit of the RX and TX delay lines. The command varies with voltage and temperature for the DLL to remain locked. This guarantees that each delay unit of the RX and TX delay lines represents $1/32^{th}$ of the input clock period.
  - Independent delay values can be selected for the RX and TX delay lines by controlling rx_ph_select[5:0] and tx_ph_select[5:0] parameters independently. The granularity of the delay is 1/32th of the input clock period.

Table 251. RX and TX delays in lock mode

rx_ph_select[5:0] (respectively tx_ph_select[5:0])	RX delay (respectively TX delay)
000000	0
000001	1/32 x T(dll_clk)
...	...
011111	31/32 x T(dll_clk)
100000	32/32 x T(dll_clk)

  - When selecting a new delay value with rx_ph_select[5:0] (respectively tx_ph_select[5:0]), an acknowledge is returned when the change takes place with rx_ph_select_ack (respectively tx_ph_select_ack).

- Bypass mode (dll_bypass_cmd_en = 1)
  - In this mode, delays in RX and TX delay lines are used as “pure” delays: without trying to lock on the frequency of the dll_clk input clock. There is therefore no voltage nor temperature compensation in this mode, and RX and TX delay values vary with the voltage and the temperature. The command applied to each delay unit of the RX and TX delay lines is controlled by dll_bypass_cmd[4:0]. Each delay unit includes 24 delay elements. The number of delay elements which are enabled in each delay unit depends on the value of dll_bypass_cmd[4:0].

Table 252. Number of delay elements enabled in each delay unit

dll_bypass_cmd[4:0]	Number of delay elements enabled
00000	reserved
00001	1 delay element is enabled
00010	2 delay elements are enabled
...	...
11000 to 11111	All 24 delay elements are enabled

  - Independent delay values can be selected for the RX and TX delay lines by controlling rx_ph_select[5:0] and tx_ph_select[5:0] parameters independently. Rx_ph_select[5:0] and tx_ph_select[5:0] control the number of delay units that are enabled in the RX and TX delay lines: a value of n corresponds to n delay units enabled. The total delay inserted by the RX (respectively TX) delay line depends on rx_ph_select[5:0] (respectively tx_ph_select[5:0]) and dll_bypass_cmd[4:0] values.
  - This mode is required to be able to insert a delay between the rx_ip_clk (respectively tx_ip_clk) input clock and the rx_op_clk (respectively tx_op_clk) output clock when the operating frequency is lower than the minimum frequency supported by the DLL (f <50 MHz). This is necessary to support OCTOSPI devices in DTR mode at low frequency for which DQS must be delayed to sample data.

36.3.9 Octo-SPI interface interrupts

Each OCTOSPI and each OTFDEC instance generate one interrupt.

Table 253. Octo-SPI interface interrupts

Peripheral	Signal name	CPU1 interrupt	CPU2 interrupt
OCTOSPI1	it_ospi	octospi1_it	octospi1_it
OCTOSPI2	it_ospi	octospi2_it	octospi2_it
OTFDEC1	irq	otfdec1_it	otfdec1_it
OTFDEC2	irq	otfdec2_it	otfdec2_it

36.3.10 OCTOSPI mapping on OCTOSPI physical ports

The OCTOSPIM enables several mapping configuration depending on MUXEN and MODE in OCTOSPIM_CR register.

- **MUXEN = 0 and MODE = 0 (non multiplexed, non swapped mode):**

  The OCTOSPI1 is mapped on port1, and the OCTOSPI2 is mapped on port2.
  The CS mapping depends on the value of CSSEL in OCTOSPI_CR registers, as well as CSSEL_OVR_01, CSSEL_OVR_02, CSSEL_OVR_EN bits in OCTOSPIM_CR.

Table 254. OCTOSPI1 CS mapping when MUXEN = 0 and MODE = 0

OCTOSPI1 CSSEL	CSSEL_OVR_EN	CSSEL_OVR_01	OCTOSPI1 CS mapped on
0	0	x	OCTOSPIM_P1_NCS1
1	0	x	OCTOSPIM_P1_NCS2
x	1	0	OCTOSPIM_P1_NCS1
x	1	1	OCTOSPIM_P1_NCS2

Table 255. OCTOSPI2 CS mapping when MUXEN = 0 and MODE = 0

OCTOSPI2 CSSEL	CSSEL_OVR_EN	CSSEL_OVR_02	OCTOSPI2 CS mapped on
0	0	x	OCTOSPIM_P2_NCS1
1	0	x	OCTOSPIM_P2_NCS2
x	1	0	OCTOSPIM_P2_NCS1
x	1	1	OCTOSPIM_P2_NCS2

- **MUXEN = 0 and MODE = 1 (non multiplexed, swapped mode):**

  The OCTOSPI1 is mapped on port2, and the OCTOSPI2 is mapped on port1.
  The CS mapping depends on the value of CSSEL in OCTOSPI_CR registers, as well as CSSEL_OVR_01, CSSEL_OVR_02, CSSEL_OVR_EN bits in OCTOSPIM_CR.

Table 256. OCTOSPI1 CS mapping when MUXEN = 0 and MODE = 1

OCTOSPI1 CSSEL	CSSEL_OVR_EN	CSSEL_OVR_01	OCTOSPI1 CS mapped on
0	0	x	OCTOSPIM_P2_NCS1
1	0	x	OCTOSPIM_P2_NCS2
x	1	0	OCTOSPIM_P2_NCS1
x	1	1	OCTOSPIM_P2_NCS2

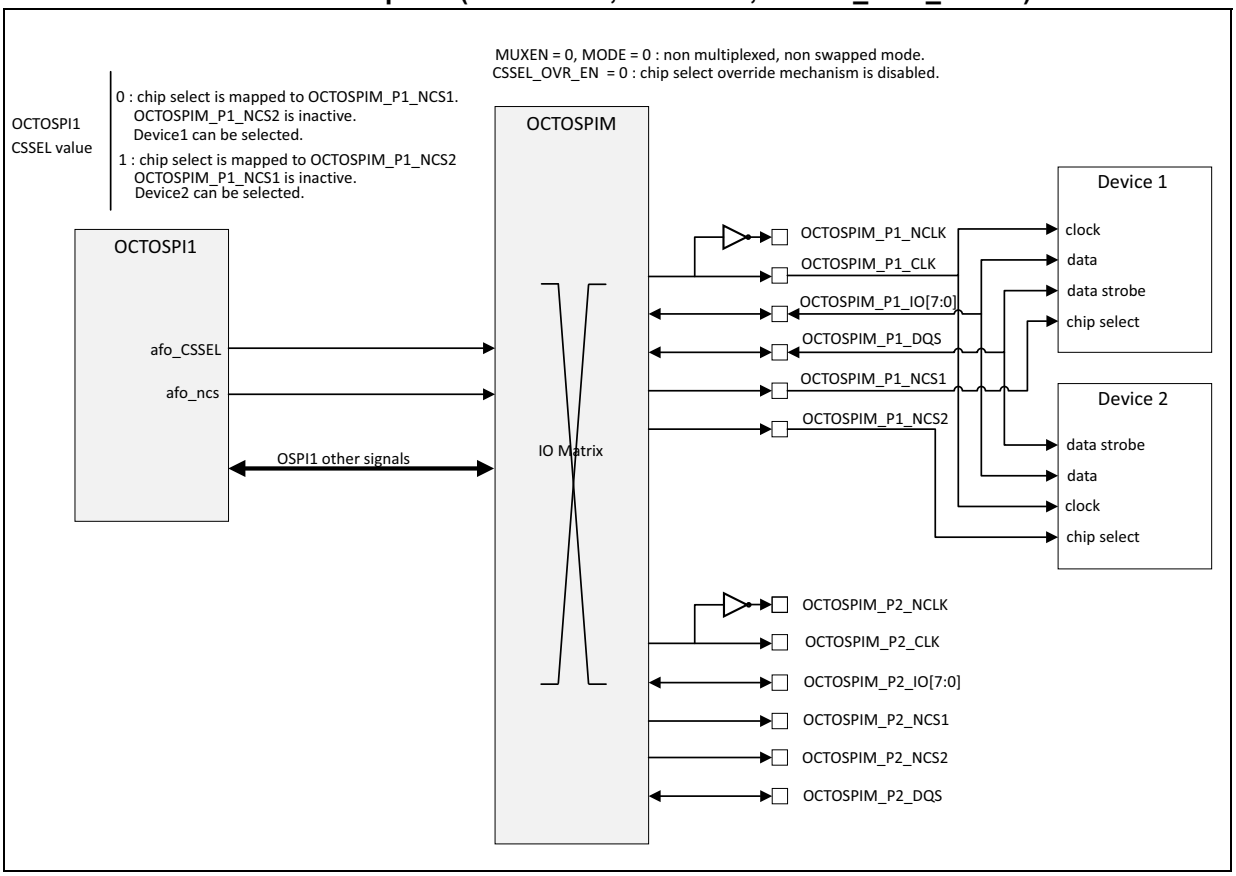


Table 257. OCTOSPI2 CS mapping when MUXEN = 0 and MODE = 1

OCTOSPI2 CSSEL	CSSEL_OVR_EN	CSSEL_OVR_02	OCTOSPI2 CS mapped on
0	0	x	OCTOSPIM_P1_NCS1
1	0	x	OCTOSPIM_P1_NCS2
x	1	0	OCTOSPIM_P1_NCS1
x	1	1	OCTOSPIM_P1_NCS2

Note: In non multiplexed mode (MUXEN = 0), two flash devices can be connected to the same port and can be controlled by the same OCTOSPI controller. Both flash devices cannot be used simultaneously. Switching from one device to the other requires the following:
- to re-program OCTOSPI(1 or 2) CSSEL (or reprogram CSSEL_OVR bits) to remap CS.
- to re-program the OCTOSPI(1or2) controller.

The figure below gives an example of this possibility where two 8-bit devices are controlled by OCTOSPI1 on port1.

Figure 208. Flash configuration example: 2x 8-bit flash devices controlled by OCTOSPI1 on port1 (MUXEN = 0, MODE = 0, CSSEL_OVR_EN = 0)

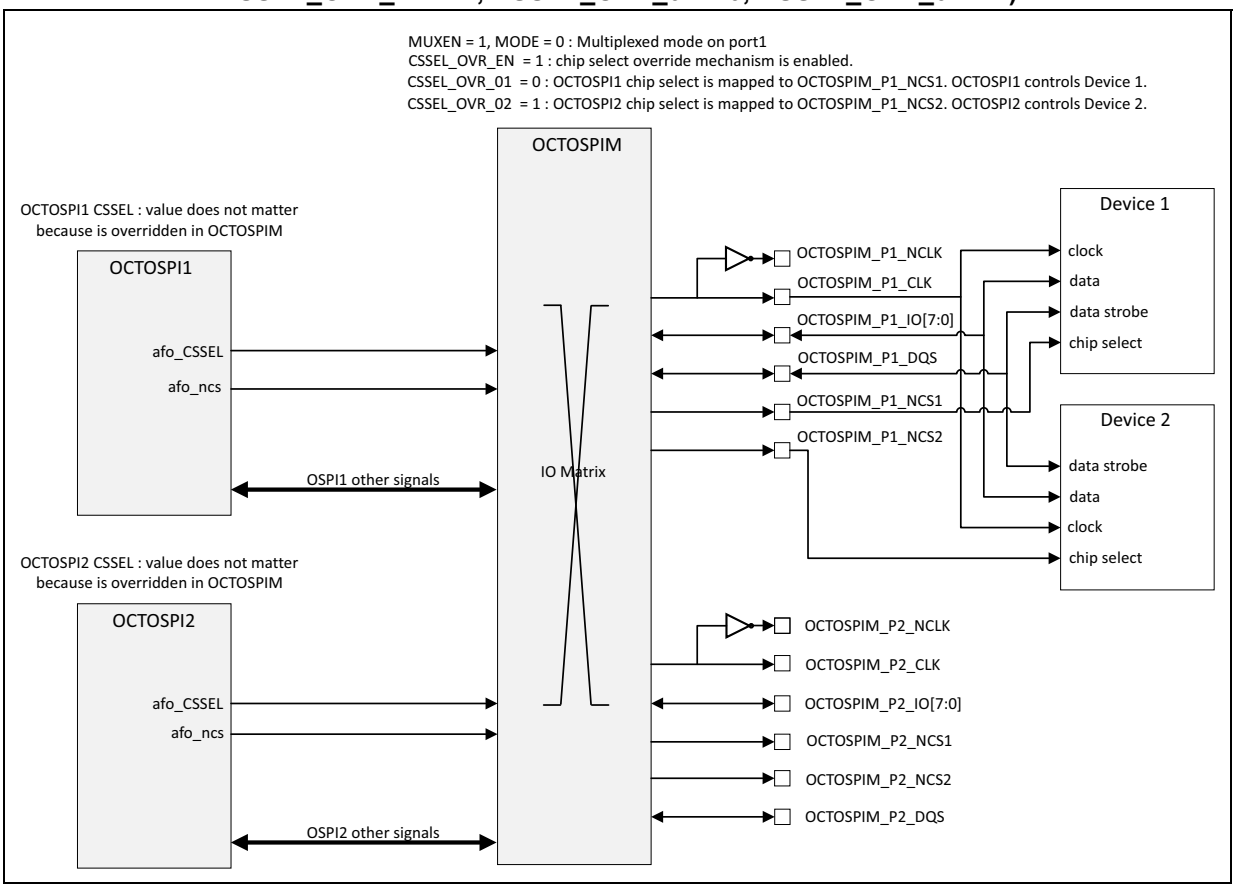
- **MUXEN = 1 and MODE = 0 (multiplexed, non swapped mode):**

The OCTOSPI1 and OCTOSPI2 are both mapped on port1. All OCTOSPI signals are multiplexed, including CS. OCTOSPI1 and OCTOSPI2 must not use the same CS line: either CSSEL bits in OCTOSPI1 and OCTOSPI2 must be consistently programmed, or this can be ensured by using the CS override mechanism in OCTOSPIM (CSSEL_OVR_EN = 1) which defines the OCTOSPI CS mapping in a unique cell. The table below shows example programming for this mode.

Table 258. OCTOSPI CS mapping when MUXEN = 1 and MODE = 0

OCTOSPI1 CSSEL	OCTOSPI2 CSSEL	CSSEL_ OVR_EN	CSSEL_ OVR_01	CSSEL_ OVR_02	OCTOSPI1 CS mapped on	OCTOSPI2 CS mapped on
0	1	0	x	x	OCTOSPIM_P1_NCS1	OCTOSPIM_P1_NCS2
1	0	0	x	x	OCTOSPIM_P1_NCS2	OCTOSPIM_P1_NCS1
x	x	1	0	1	OCTOSPIM_P1_NCS1	OCTOSPIM_P1_NCS2
x	x	1	1	0	OCTOSPIM_P1_NCS2	OCTOSPIM_P1_NCS1

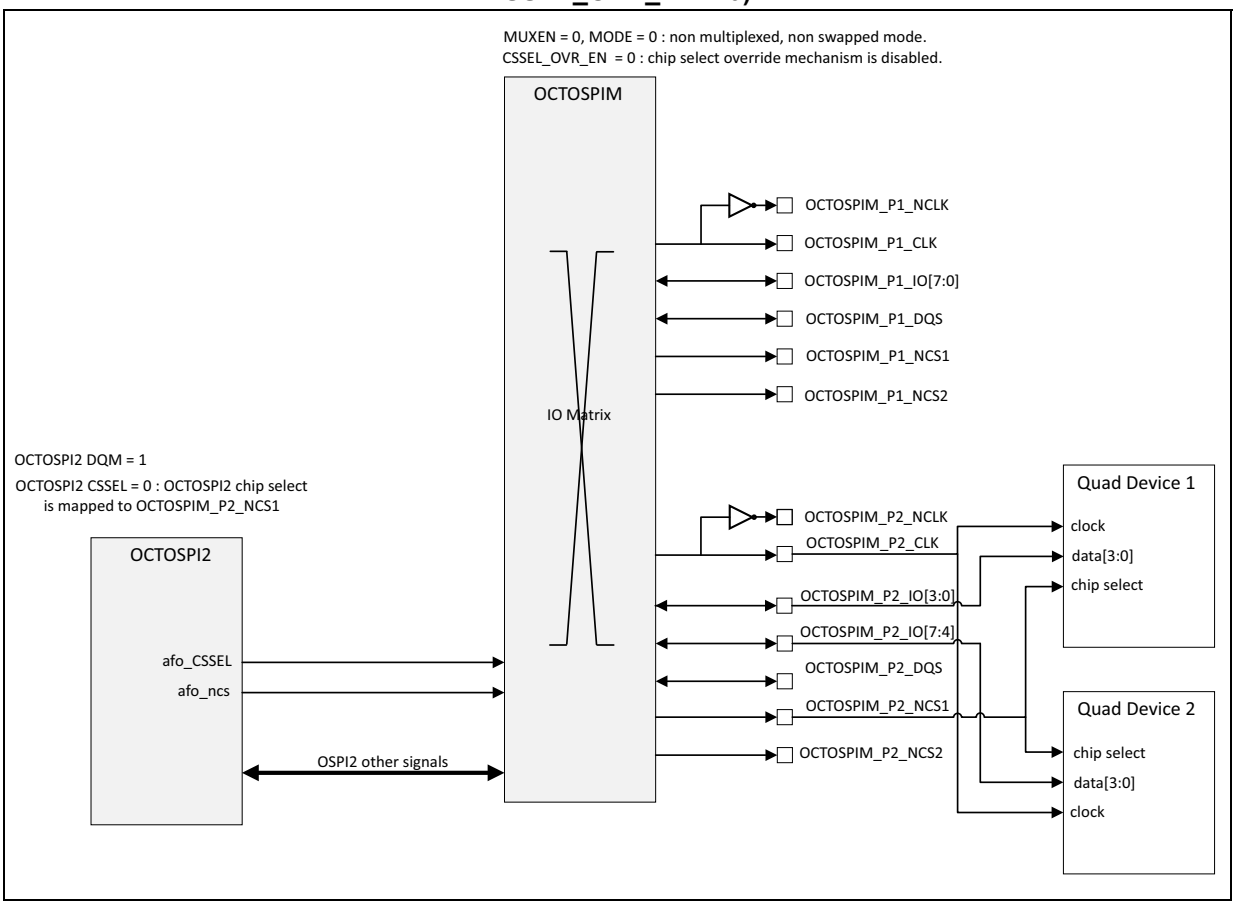
- **MUXEN = 1 and MODE = 1 (multiplexed, swapped mode):**



OCTOSPI1 and OCTOSPI2 are both mapped on port2. All OCTOSPI signals are multiplexed, including the Chip Selects. Care must be taken that OCTOSPI1 and OCTOSPI2 do not use the same Chip Select line: either CSSEL bits in OCTOSPI1 and OCTOSPI2 must be consistently programmed or this can be ensured by using the chip select override mechanism in OCTOSPIM (CSSEL_OVR_EN = 1) which allows to define OCTOSPI chip select mapping in a unique cell. The table below shows example programming for this mode.

Table 259. OCTOSPI CS mapping when MUXEN = 1 and MODE = 1

OCTOSPI1 CSSEL	OCTOSPI2 CSSEL	CSSEL_ OVR_EN	CSSEL_ OVR_01	CSSEL_ OVR_02	OCTOSPI1 CS mapped on	OCTOSPI2 CS mapped on
0	1	0	x	x	OCTOSPIM_P2_NCS1	OCTOSPIM_P2_NCS2
1	0	0	x	x	OCTOSPIM_P2_NCS2	OCTOSPIM_P2_NCS1
x	x	1	0	1	OCTOSPIM_P2_NCS1	OCTOSPIM_P2_NCS2
x	x	1	1	0	OCTOSPIM_P2_NCS2	OCTOSPIM_P2_NCS1



An example of flash configuration in multiplexed mode (MUXEN = 1) is depicted in *Figure 209* where the CS override mechanism in OCTOSPIM is used (CSSEL_OVR_EN = 1). In this example, device1 and 2 are both connected to port 1 (MODE = 0). The device1 is controlled by the OCTOSPI1. The device2 is controlled by the OCTOSPI2.

Figure 209. Flash configuration example: 2x 8-bit flash devices connected to port1 and controlled by independent OCTOSPI controllers (MUXEN = 1, MODE = 0, CSSEL_OVR_EN = 1, CSSEL_OVR_01 = 0, CSSEL_OVR_02 = 1)

In multiplexed or non-multiplexed mode, the OCTOSPI interface also supports dual-quad mode. In dual quad mode, two 4-bit devices are connected to the same port and the same Chip Select and are controlled by a unique OCTOSPI controller in order to provide a throughput similar to an 8-bit device. This mode is configured by the bit DQM in OCTOSPI_CR register. An example is shown in the figure below.

Figure 210. Flash configuration example: dual quad mode. Two 4-bit devices are connected to port 2 and controlled by OCTOSPI2 (MUXEN = 0, MODE = 0, CSSEL_OVR_EN = 0)

36.3.11 Octo-SPI interface programmable parameters

Octo-SPI memory area allocation in memory-mapped mode

Refer to *Section 36.3.4: Octo-SPI interface memory*.

DLYBOS1 control

The DLYBOS1 programmable delay is controlled by bits in SYSCFG_DLYBOS1CR and SYSCFG_DLYBOS1SR registers. The table below gives the correspondence between SYSCFG bitfields and the control parameters described in *Section 36.3.8*.

Table 260. DLYBOS1 SYSCFG bits

DLYBOS1 SYSCFG bits	Control input or status output in the OCTOSPI	Comment
BYP_EN	dll_bypass_cmd_en	Selection of lock or pure-delay mode
EN	dll_start_lock	Enable of DLL when configured in Lock mode
RX_TAP_SEL[5:0]	rx_ph_select[5:0]	Selection of delay in RX delay line
TX_TAP_SEL[5:0]	tx_ph_select[5:0]	Selection of delay in TX delay line

Table 260. DLYBOS1 SYSCFG bits (continued)

DLYBOS1 SYSCFG bits	Control input or status output in the OCTOSPI	Comment
BYP_CMD[4:0]	dll_bypass_cmd[4:0]	Command applied to every delay units in RX and TX delay lines when the DLL is configured in pure-delay mode
LOCK	dll_locked	When in lock mode, indicates that the DLL has locked on the input clock frequency
RX_TAP_SEL_ACK	rx_ph_select_ack	Indicates that the RX delay line has switched to the delay selected by RX_TAP_SEL[5:0]
TX_TAP_SEL_ACK	tx_ph_select_ack	Indicates that the TX delay line has switched to the delay selected by TX_TAP_SEL[5:0]

DLYBOS2 control

DLYBOS2 programmable delay is controlled by bits in SYSCFG_DLYBOS2CR and SYSCFG_DLYBOS2SR registers. The table below gives the correspondence between the SYSCFG bitfields and the control parameters described in *Section 36.3.8*.

Table 261. DLYBOS2 SYSCFG bits

DLYBOS2 SYSCFG bits	Control input or status output in the OCTOSPI	Comment
BYP_EN	dll_bypass_cmd_en	Selection of lock or pure-delay mode
EN	dll_start_lock	Enable of DLL when configured in Lock mode
RX_TAP_SEL[5:0]	rx_ph_select[5:0]	Selection of delay in RX delay line
TX_TAP_SEL[5:0]	tx_ph_select[5:0]	Selection of delay in TX delay line
BYP_CMD[4:0]	dll_bypass_cmd[4:0]	Command applied to every delay units in RX and TX delay lines when the DLL is configured in pure-delay mode
LOCK	dll_locked	When in lock mode, indicates that the DLL has locked on the input clock frequency
RX_TAP_SEL_ACK	rx_ph_select_ack	Indicates that the RX delay line has switched to the delay selected by RX_TAP_SEL[5:0]
TX_TAP_SEL_ACK	tx_ph_select_ack	Indicates that the TX delay line has switched to the delay selected by TX_TAP_SEL[5:0]

36.3.12 Select the RX sampling strobe and configure the TX clock

The table below lists the various OCTOSPI modes, and gives guidelines to select the RX sampling strobe and configure the TX clock. Some information is also given on how to enable the DLL.

Table 262. OCTOSPI modes and recommended clock configuration

OCTOSPI Mode	STR or DTR	DQS used in read ?	Max frequency	Setup/Hold constraints on memory device	Data valid Window at output of memory Device	TX clock configuration	RX sampling strobe selection
HyperBus(Cypress, Spansion)	DTR	yes	200 166 133 100 50	0.40 / 0.40 ns 0.60 / 0.60 ns 0.80 / 0.80 ns 1 / 1 ns wrt memory clock edges	1.45 ns 1.70 ns 2.37 ns 3.30 ns	if kernel clock is a multiple of memory clock, set DHQC = 1 (this automatically bypasses the TX delay). If kernel clock is equal to memory clock, set DQHC = 0. The DLL must be used for TX delay.	DQS delayed (DQSE = 1, DLYBYP = 0). The DLL must be used for RX delay.
Macronix [For instr. READ, FASTREAD, OCTAREAD-STR]	STR	no	133 100 66	2 / 2 ns 2 / 2 ns 2 / 2 ns wrt memory clock rising edge	2 ns@10pF 4 ns@15pF 7 ns@30pF	Set DQHC = 0 and configure the TX delay to minimum value.	Feedback clock delayed @133 MHz and 100 MHz (DQSE=0, DLYBYP=0). The DLL must be used for RX delay. Feedback clock @66 MHz (DQSE=0, DLYBYP=1). The DLL is not used for RX delay.
Macronix [For instr. OCTAREAD - DTR]	DTR	yes	133 100 66	0.8 / 0.8 ns 1 / 1 ns 1 / 1 ns	1.5ns@10pF 2.8ns @15pF 4.9ns @30pF	if kernel clock is a multiple of memory clock, set DHQC = 1 (this automatically bypasses the TX delay). If kernel clock is equal to memory clock, set DQHC = 0. The DLL must be used for TX delay.	DQS delayed (DQSE = 1, DLYBYP = 0). The DLL must be used for RX delay.
Micron Xcella (MT35XL01 GBBA ds)	STR	no	133	1.8 / 1.8 ns Wrt memory clock rising edge	2.8ns @12pF	Set DQHC = 0 and configure the TX delay to minimum value.	Feedback clock delayed @133 MHz and 100 MHz (DQSE=0, DLYBYP=0). The DLL must be used for RX delay. Feedback clock @66 MHz (DQSE=0, DLYBYP=1). The DLL is not used for RX delay.
Micron Xcella (MT35XL01 GBBA ds)	DTR	yes	133	0.8 / 0.8 ns Wrt memory clock edges	2 ns	if kernel clock is a multiple of memory clock, set DHQC = 1 (this automatically bypasses the TX delay). If kernel clock is equal to memory clock, set DQHC = 0. The DLL must be used for TX delay.	DQS delayed (DQSE = 1, DLYBYP = 0). The DLL must be used for RX delay.

DHQC is bit #28 in OCTOSPI_TCR register. DQSE is bit #29 in OCTOSPI_CCR register. DLYBYP is bit #3 in OCTOSPI_DCR1 register.

Enabling the DLL for frequencies greater or equal to 50 MHz (lock mode)

The DLL is enabled by setting EN = 1. The DLL lock state is reached when LOCK = 1. Once the DLL is locked, an RX delay value can be selected by programming RX_TAP_SEL[5:0], and a TX delay value can be selected by programming TX_TAP_SEL[5:0]. Each tap corresponds to 1/32th of the memory device clock period. The selected delays are applied

to RX sampling strobe and TX launch clock once RX_TAP_SEL_ACK and TX_TAP_SEL_ACK are set to 1.

Enabling the DLL for frequencies lower than 50 MHz (bypass mode)

The DLL is enabled by setting BYP_EN = 1. The command applied to every DLL delay unit is defined by BYP_CMD[4:0] bits (the value 0 is reserved and must not be used). RX_TAP_SEL[5:0] and TX_TAP_SEL[5:0] define the number of elementary delays inserted on RX sampling clock and TX launch clock. For minimum delay, RX_TAP_SEL[5:0] (respectively TX_TAP_SEL[5:0]) must be set to 0.

EN, RX_TAP_SEL[5:0], TX_TAP_SEL[5:0], BYP_EN, BYP_CMD[4:0] bits are located in SYSCFG_DLYBOSnCR (n=1,2) registers. LOCK, RX_TAP_SEL_ACK, TX_TAP_SEL_ACK bits are located in SYSCFG_DLYBOSnSR (n=1,2) registers.

36.4 SD/*e*•MMC interface

The SD/*e*•MMC interface offers three SD/*e*•MMC physical ports. The accesses to the SDMMC controllers are protected by RISUP components.

36.4.1 SD/*e*•MMC interface main features

- SDMMC1 interface:
  - supports SD cards, *e*•MMC memories, and SDIO devices. Alternate multiplexing is optimized for SD.
  - 1-bit, 4-bit, 8-bit modes.
  - SD: supports SD 3.01 up to UHS-1 modes (SDR104, DDR50, SDR50, DDR25) and all backward compatible modes.
  - *e*•MMC: supports *e*•MMC 5.1 up to HS200 (HS400 not supported)
  - SDIO: supports SDIO 4.0 and all backward compatible modes.
  - SD or *e*•MMC devices are supported as Boot device.
  - DLL to tune the RX sampling clock.
  - SDMMC1 IO segment is in a dedicated V_{DDIO1} supply domain. Both 1V8 and 3V3 devices are supported. 1V2 is not supported.
  - 3V3 to 1V8 voltage transition for UHS-1 modes of SD card can be supported in two different ways:

    . An SDMMC1_VSEL function is mapped on a GPIO and controls an external voltage regulator to switch from 3V3 to 1V8. This voltage regulator supplies the SDMMC1 IO segment.

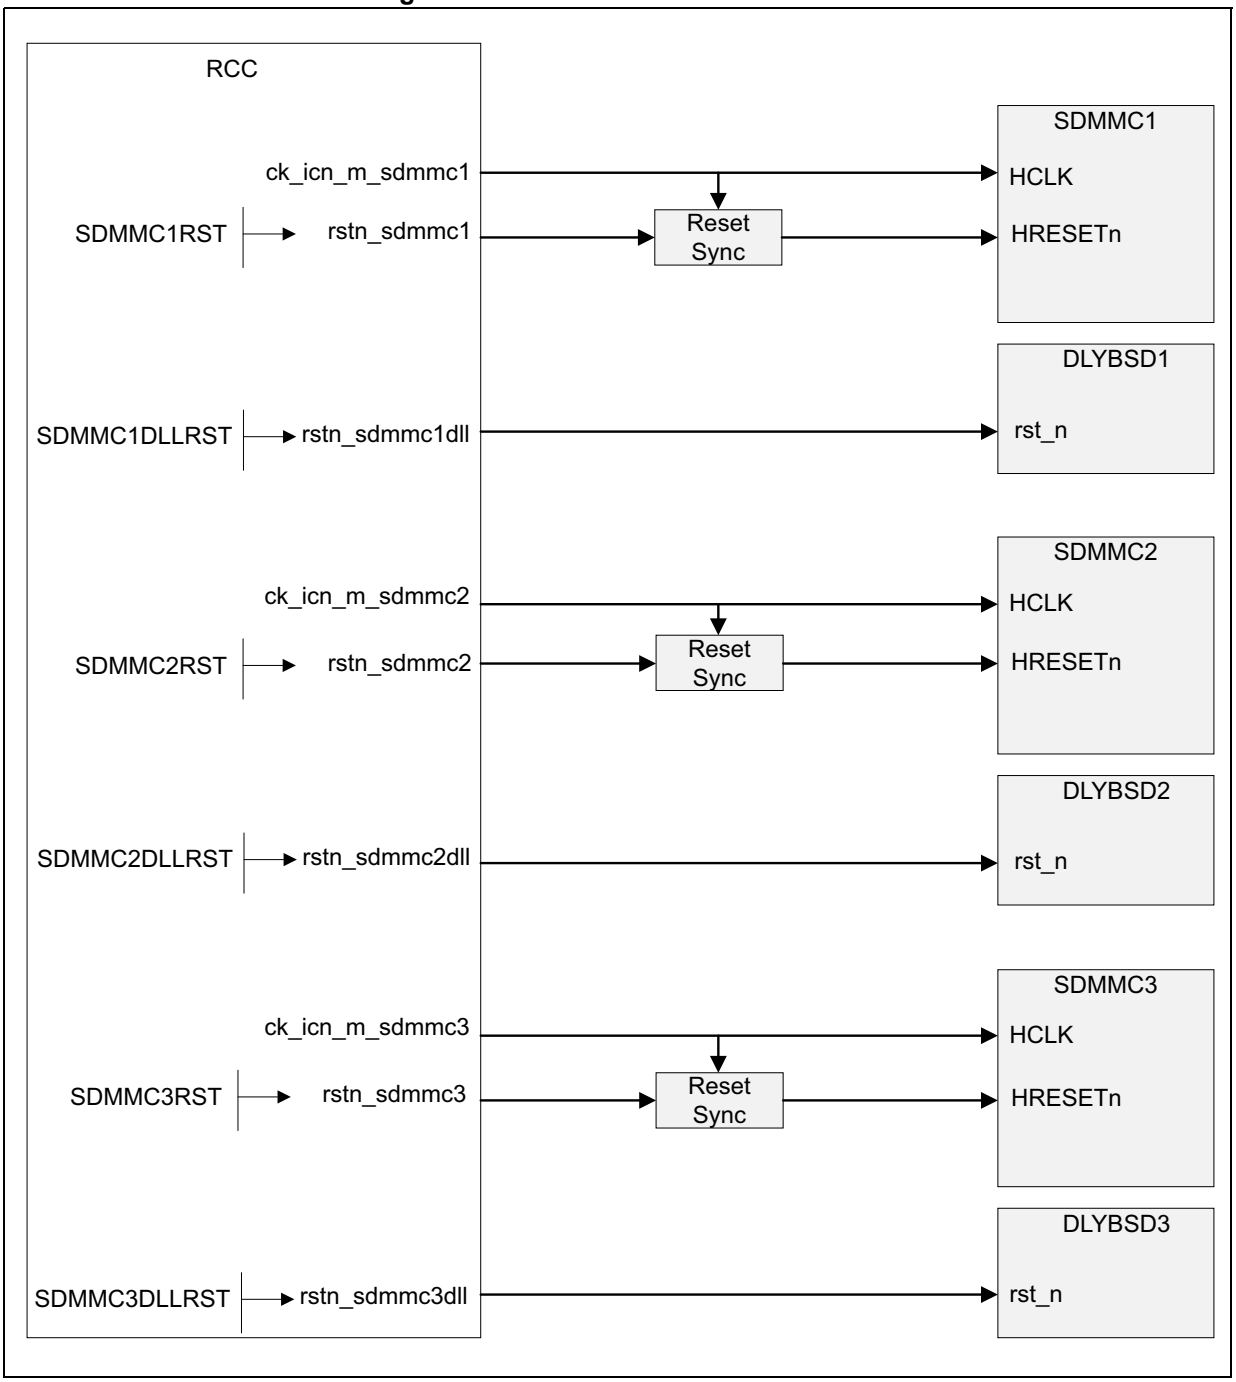
    . External Level Shifters are used. The enable of these Level Shifters is controlled by a GPIO and their direction is controlled by SDMMC1_CDIR, SDMMC1_D0DIR and SDMMC1_D123DIR alternate functions.
- SDMMC2 interface:
  - supports SD cards, *e*•MMC memories and SDIO devices. Alternate multiplexing is optimized for *e*•MMC.
  - 1-bit, 4-bit, 8-bit modes.
  - SD: supports SD 3.01 up to UHS-1 modes (SDR104, DDR50, SDR50, DDR25) and all backward compatible modes.
  - *e*•MMC: supports *e*•MMC 5.1 up to HS200 (HS400 not supported).
  - SDIO: supports SDIO 4.0 and all backward compatible modes.
  - SD or *e*•MMC devices are supported as Boot device.
  - DLL to tune the RX sampling clock.
  - SDMMC2 IO segment is in a dedicated VDDEMMC supply domain. Both 1V8 and 3V3 devices are supported. 1V2 is not supported.
  - 3V3 to 1V8 voltage transition for UHS-1 modes of SD card can be supported in two different ways:

    . An SDMMC2_VSEL function is mapped on a GPIO and controls an external voltage regulator to switch from 3V3 to 1V8. This voltage regulator supplies the SDMMC2 IO segment.

    . External Level Shifters are used. The enable of these Level Shifters is controlled by a GPIO and their direction is controlled by SDMMC2_CDIR, SDMMC2_D0DIR and SDMMC2_D123DIR alternate functions.

- SDMMC3 interface:
  - supports SD cards, *e*•MMC memories (limited to 4-bit) and SDIO devices.
  - 1-bit, 4-bit modes.
  - SD: supports SD 3.01 up to UHS-1 modes (SDR104, DDR50, SDR50, DDR25) and all backward compatible modes.
  - *e*•MMC: supports *e*•MMC 5.1 up to HS200 (HS400 not supported).
  - SDIO: supports up to SDIO 4.0 and all backward compatible modes.
  - DLL to tune the RX sampling clock.
  - SDMMC3 IOs do not have a dedicated supply. They are in VDD IO domain. The external device must also be in VDD IO domain or external Level Shifters must be used.
  - 3V3 to 1V8 voltage transition for UHS-1 modes of SD card can only be supported with external Level Shifters. Like for the other SDMMC interfaces, the enable of these Level Shifters is controlled by a GPIO and their direction is controlled by SDMMC3_CDIR, SDMMC3_D0DIR and SDMMC3_D123DIR alternate functions.

For a complete list of features refer to *Section 40: Secure digital input/output MultiMediaCard interface (SDMMC)*.



36.4.2 SD/e•MMC interface block diagram

Figure 211. SD/e•MMC interface block diagram

36.4.3 SD/e•MMC interface reset

Figure 212. SD/e•MMC interface resets

36.4.4 SDMMC1/2 description

Refer to *Section 40: Secure digital input/output MultiMediaCard interface (SDMMC)*.

36.4.5 DLYBSD1/2 description

One programmable delay is used for each SDMMC interface. The programmable delay can be used to tune the phase of the RX sampling clock in order to sample the data in their valid window. The programmable delay has no effect on the TX path.

These programmable delays are identical to the ones used in the OCTOSPI interfaces. The clock on which the DLL locks is a free running clock provided by the SDMMC controller which is at the same frequency as the clock sent to the memory. When an SDMMC interface operates below 50 MHz, the programmable delay cannot be used. Refer to *Section 36.3.8* for a detailed description.

36.4.6 SD/e•MMC interface interrupts

Each SDMMC instance generates one interrupt.

Table 263. SD/e•MMC interface interrupts

Peripheral	pin name	CPU1 interrupt	CPU2 interrupt
SDMMC1	IRQ	sdmmc1_gbl_it	sdmmc1_gbl_it
SDMMC2	IRQ	sdmmc2_gbl_it	sdmmc2_gbl_it
SDMMC3	IRQ	sdmmc3_gbl_it	sdmmc3_gbl_it

36.4.7 SD/e•MMC interface programmable parameters

Control of external voltage regulator

For SDMMC1 and SDMMC2 interfaces, an external voltage regulator can be used to manage the 3V3 to 1V8 voltage transition for UHS-1 modes of SD card. This external voltage regulator can be controlled by the SDVSEL1 (respectively SDVSEL2) alternate function. These alternate functions are controlled by the following SYSCFG bits:

- SDMMC1 interface: SDMMC1_VSEL bit in SYSCFG_SDMMC1CR register.
- SDMMC2 interface: SDMMC2_VSEL bit in SYSCFG_SDMMC2CR register.

PWR_CR8.VDDIO1VRSEL (respectively PWR_CR7.VDDIO2VRSEL) must be controlled according to external voltage regulator transition.

DLYBSD1 control

DLYBSD1 programmable delay is controlled by bits in SYSCFG_DLYBSD1CR and SYSCFG_DLYBSD1SR registers. The table below gives the correspondence between the SYSCFG bitfields and the control parameters described in *Section 36.3.8*.

Table 264. DLYBSD1 SYSCFG bits

DLYBSD1 SYSCFG bits	Control input or status output in the SDMMC	Comment
BYP_EN	dll_bypass_cmd_en	Selection of lock or pure-delay mode
EN	dll_start_lock	Enable of DLL when configured in Lock mode
RX_TAP_SEL[5:0]	rx_ph_select[5:0]	Selection of delay in RX delay line

Table 264. DLYBSD1 SYSCFG bits (continued)

DLYBSD1 SYSCFG bits	Control input or status output in the SDMMC	Comment
BYP_CMD[4:0]	dll_bypass_cmd[4:0]	Command applied to every delay units in RX and TX delay lines when the DLL is configured in pure-delay mode
LOCK	dll_locked	When in lock mode, indicates that the DLL has locked on the input clock frequency
RX_TAP_SEL_ACK	rx_ph_select_ack	Indicates that the RX delay line has switched to the delay selected by RX_TAP_SEL[5:0]

DLYBSD2 control

DLYBSD2 programmable delay is controlled by bits in SYSCFG_DLYBSD2CR and SYSCFG_DLYBSD2SR registers. The table below gives the correspondence between the SYSCFG bitfields and the control parameters described in *Section 36.3.8*.

Table 265. DLYBSD2 SYSCFG bits

DLYBSD2 SYSCFG bits	Control input or status output in the SDMMC	Comment
BYP_EN	dll_bypass_cmd_en	Selection of lock or pure-delay mode
EN	dll_start_lock	Enable of DLL when configured in Lock mode
RX_TAP_SEL[5:0]	rx_ph_select[5:0]	Selection of delay in RX delay line
BYP_CMD[4:0]	dll_bypass_cmd[4:0]	Command applied to every delay units in RX and TX delay lines when the DLL is configured in pure-delay mode
LOCK	dll_locked	When in lock mode, indicates that the DLL has locked on the input clock frequency
RX_TAP_SEL_ACK	rx_ph_select_ack	Indicates that the RX delay line has switched to the delay selected by RX_TAP_SEL[5:0]

DLYBSD3 control

DLYBSD3 programmable delay is controlled by bits in SYSCFG_DLYBSD3CR and SYSCFG_DLYBSD3SR registers. The table below gives the correspondence between the SYSCFG bitfields and the control parameters described in *Section 36.3.8*.

Table 266. DLYBSD3 SYSCFG bits

DLYBSD3 SYSCFG bits	Control input or status output in SDMMC	Comment
BYP_EN	dll_bypass_cmd_en	Selection of lock or pure-delay mode
EN	dll_start_lock	Enable of DLL when configured in Lock mode
RX_TAP_SEL[5:0]	rx_ph_select[5:0]	Selection of delay in RX delay line
BYP_CMD[4:0]	dll_bypass_cmd[4:0]	Command applied to every delay units in RX and TX delay lines when the DLL is configured in pure-delay mode
LOCK	dll_locked	When in lock mode, indicates that the DLL has locked on the input clock frequency
RX_TAP_SEL_ACK	rx_ph_select_ack	Indicates that the RX delay line has switched to the delay selected by RX_TAP_SEL[5:0]

36.4.8 Guidelines for selecting the RX sampling clock

The tables below list the various SD/*e*•MMC speed modes and gives guidelines to select the RX sampling clock and configure the clock control bits in the SDMMC cell. It is assumed here that no external level shifters are used. Some information is also given on how to enable the DLL.

Table 267. SD speed modes and recommended clock configuration

Speed Mode	Max card clock freq. SDMMCn_CK	IO Voltage	Setup/hold constraints on SD device	Data valid Window at output of SD Device	Kernel clock freq (SCLK)	DDR	NEGEDGE	CLKDIV	Selection of RX sampling clock (SELCLKRX)
DS (default speed)(1)	25 MHz	3V3	5ns/5ns	26ns	25 MHz	0	NA	0 (div by 1)	SDMMC_CLKio
HS (high speed)(1)	50 MHz	3V3	6ns/2ns	8.5ns	50 MHz	0	NA	0 (div by 1)	SDMMC_CLKio
SDR12(1)	25 MHz	1V8	3ns/0.8ns	27.5ns	25 MHz	0	NA	0 (div by 1)	SDMMC_CLKio
SDR25(1)	50 MHz	1V8	3ns/0.8ns	7.5ns	50 MHz	0	NA	0 (div by 1)	SDMMC_CLKio
DDR50 (2)	50 MHz	1V8	3ns/0.8ns	4.5ns	50 MHz	1	(3)	1 (div by 2)	SDMMC_CLKio
SDR50(2)	100 MHz	1V8	3ns/0.8ns	4ns	100 MHz	0	NA	0 (div by 1)	SDMMC_CLKio
SDR104	208 MHz	1V8	1.4ns/0.8ns	2,88ns	208 MHz	0	NA	0 (div by 1)	SDMMC_FB_CLK

1. For these modes, other clock configurations exist where the kernel clock frequency is a multiple of the card clock. However, considering that all three SDMMC controllers have dedicated kernel clocks, it seems more straightforward to align the kernel clock frequency with the card clock frequency.
2. For these modes, it is also possible to enable the programmable delay and select the delayed loopback clock (SDMMC_FB_CLK) as RX sampling clock if it is needed to adjust the sampling edge.
3. Value to be programmed depend on timings of the interface. For functional simulation, either value works.

Table 268. *e*•MMC Speed modes and recommended clock configuration

Speed Mode	Max card clock freq. SDMMCn_CK	IO Voltage(1)	Setup/Hold constraints on SD device	Data valid Window at output of *e*•MMC Device	Kernel clock freq (SCLK)	DDR	NEGEDGE	CLKDIV	Selection of RX sampling clock (SELCLKRX)
Legacy compatible(2)	26 MHz	3V3, 1V8, 1V2	3ns/3ns	20ns	26 MHz	0	NA	0 (div by 1)	SDMMC_CLKio
High speed SDR(2)	52 MHz	3V3, 1V8, 1V2	3ns/3ns	8ns	52 MHz	0	NA	0 (div by 1)	SDMMC_CLKio
High Speed DDR(3)	52 MHz	3V3, 1V8, 1V2	CMD: 3ns/3ns DATA: 2.5ns/2.5ns	CMD: 8ns DATA: 4.1ns	104 MHz	1	(4)	1 (div by 2)	SDMMC_CLKio
High speed HS200	200 MHz	1V8, 1V2	1.4ns/0.8ns	0.575 UI (2.88ns at 200 MHz)	200 MHz	0	NA	0 (div by 1)	SDMMC_FB_CLK

1. 1V2 is not supported in STM32MP23/25xx.
2. For these modes, other clock configurations exist where the kernel clock frequency is a multiple of the card clock. However, considering that all three SDMMC controllers have dedicated kernel clocks, it seems more straightforward to align the kernel clock frequency with the card clock frequency.
3. For this mode, it is also possible to enable the programmable delay and select the delayed loopback clock (SDMMC_FB_CLK) as RX sampling clock if it is needed to adjust the sampling edge.
4. Value to be programmed depend on timings of the interface. For functional simulation, either value works.

DDR, NEGEDGE, CLKDIV and SELCLKRX are bitfields in SDMMC_CLKCR register.

The DLL is enabled by writing BYP_EN to 0 and setting EN to 1. The DLL lock state is reached when the status bit LOCK is equal to 1. Once the DLL is locked, a delay value can be selected by programming RX_TAP_SEL[5:0]. The selected delay is applied to the RX sampling clock when the status bit RX_TAP_SEL_ACK is equal to 1. Theses control and status bits are located in the SYSCFG_DLYBSDnCR and SYSCFG_DLYBSDnSR registers (n=1,2,3).

Sequencing between SDMMC and DLL programming when the DLL is used

1. Enable in SDMMC the generation of the free running clock towards the DLL. This is done as soon as PWRCTRL is set to 0b11.
2. Once the memory frequency is increased to high speed (i.e. after the initialization sequence), reset and enable the DLL. The reset of the DLL is controlled by SDMMCnDLLRST (n=1,2,3) bit in the RCC. The enable of the DLL is controlled by EN bit in SYSCFG_DLYBSDnCR (n=1,2,3) register.
3. Once the DLL is locked (as indicated by LOCK = 1 in SYSCFG_DLYBSDnSR register), select the delayed feedback clock as the RX sampling clock by writing SELCLKRX to 0b10.
4. Select the RX delay value by programming RX_TAP_SEL[5:0] in SYSCFG_DLYBSDnCR .
5. Wait for RX_TAP_SEL_ACK bit to be set to 1 in SYSCFG_DLYBSDnSR register before reading data from memory.

At startup a tuning phase is required where steps 4 and 5 are repeated for every RX_TAP_SEL[5:0] values. This enables to determine a range of delays where data are read successfully. The delay value corresponding to the middle of this valid range must be selected for further operation.

37 Flexible memory controller (FMC)

The flexible memory controller (FMC) includes two memory controllers:

- the NOR/PSRAM memory controller
- the NAND memory controller

37.1 FMC main features

The FMC functional block makes the interface with: synchronous and asynchronous static memories, and NAND flash memory. Its main purposes are:

- to translate AXI transactions into the appropriate external device protocol
- to meet the access time requirements of the external memory devices

All external memories share the addresses, data and control signals with the controller. Each external device is accessed by means of a unique Chip Select. The FMC performs only one access at a time to an external device.

The main features of the FMC are the following:

- Interface with static-memory mapped devices including:
  - Static random access memory (SRAM)
  - NOR flash memory/OneNAND flash memory
  - PSRAM (4 memory subregions)
  - Ferroelectric RAM (FRAM)
  - NAND flash memory with ECC hardware to check up to 8 Kbytes of data
- Burst mode support for faster access to synchronous devices such as NOR flash memory, PSRAM)
- Programmable continuous clock output for asynchronous and synchronous accesses
- 8-,16-bit wide data bus
- Independent chip-select control for each memory region
- Independent configuration for each memory region
- Write enable and byte lane select outputs for use with PSRAM, SRAM devices
- External asynchronous wait control
- Security and Isolation compliant with the Resource Isolation Framework (RIF)

At startup the FMC pins must be configured by the user application. The FMC input/output pins which are not used by the application can be used for other purposes.

After reset, the FMC is disabled. Once all the used memory controllers are configured, the FMC must be enabled by setting the FMCEN bit.

The FMC registers that define the external device type and associated characteristics are set at boot time and do not change until the next reset or power-up. If some registers have to be re-configured, the FMC must be disabled (FMCEN bit set to 0x0). However, only few bits can be changed on the fly:

- FMCEN bit
- ECCEN and PBEN bits in FMC_PCR register
- FMC_CSQICR and FMC_CSQIER register bits

- FMC command sequencer registers and FMC BCH registers
- WEN bit in the FMC_PCR register

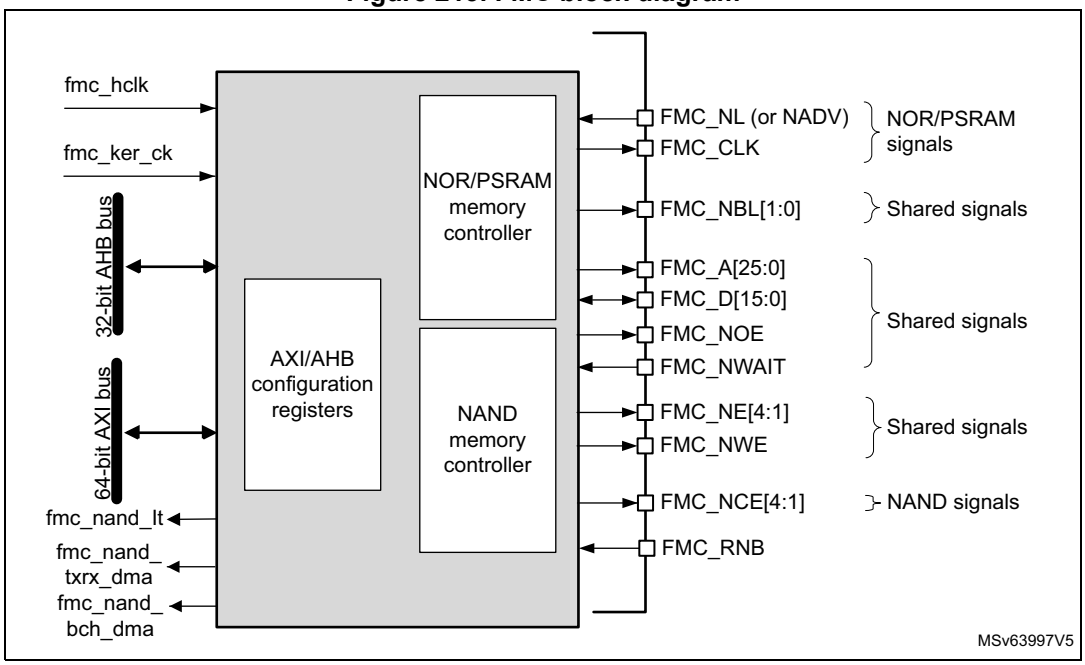
If some parameters have to be modified while the FMC is enabled, the FMC must be first disabled so that no further access is allowed to any memory controller during register modification. Once all needed configurations are updated, enable the FMC as follows:

1. Disable FMC by resetting the FMCEN bit.
2. Wait ISOST[1:0] bits in FMC_SR register to be set to 0b11.
3. Wait until PEF flag is set in the FMC_SR register.
4. Program the registers with new values.
5. Enable the FMC by setting the FMCEN bit.

37.2 FMC implementation

Table 269. FMC features

Modes/features	FMC
NAND flash chip-select outputs	4
NAND flash RNBx inputs	1
NAND/NOR flash with common WAIT pin	No



37.3 FMC block diagram

The FMC consists of the following main blocks:

- The NOR flash/PSRAM/SRAM controller
- The NAND controller
- The AXI interface
- The AHB interface (including the FMC configuration registers)

The block diagram is shown in the below figure.

Figure 213. FMC block diagram

1. The FMC features four NCEx chip select outputs.

37.4 FMC internal signals

Table 270 gives the list of FMC internal signals. FMC pins (or external signals) are described in *Section 37.10.1: External memory interface signals*.

Table 270. FMC internal signals

Names	Signal type	Description
fmc_nand_it	Digital output	FMC NAND flash interrupt
fmc_ker_ck	Digital input	FMC kernel clock
fmc_hclk	Digital input	FMC interface clock
fmc_nand_txrx_dma	Digital output	DMA request for reading or writing data from/to NAND flash memory
fmc_nand_bch_dma	Digital output	DMA request for BCH results

37.5 AHB interface

The AHB slave interface allows internal CPUs to configure the FMC registers.

The AHB clock (HCLK) is the reference clock for the FMC register accesses.

The FMC registers must be accessed by words (32 bits). For non 32-bit AHB accesses, FMC does not return an AHB bus error and the register value can be corrupted.

37.6 AXI interface

The AXI slave interface allows internal CPUs and other bus master peripherals to access the external memories.

AXI transactions are translated into the external device protocol. As the AXI data bus is 64-bit wide, the AXI transactions might be split into several consecutive 32- or 16- or 8-bit accesses according to data size accesses.

The FMC generates an AXI slave error when one of the following conditions is met:

- When reading or writing to an FMC memory region (memory region 1 to 4) which is not enabled
- When reading or writing to any FMC memory region while the FMC is disabled (FMCEN bit is reset)
- When reading or writing by the command sequencer to NAND memory region while it is disabled
- When reading or writing to the NOR flash memory region while the MBKEN bit is reset in the FMC_BCRx register

The kernel clock for the FMC is the asynchronous fmc_ker_ck clock (refer the Reset and Clock control (RCC) section for details on fmc_ker_ck clock source selection).

37.6.1 Supported memories and transactions

General transaction rules

The requested AXI transaction data size can be 8-, 16-, 32- or 64-bit wide whereas the accessed external device has a fixed data width. This may lead to inconsistent transfers.

Therefore, some simple transaction rules must be followed:

- AXI transaction size and memory data size must be equal to prevent issues from occurring.
- AXI transaction size is greater than the memory size:

  In this case, the FMC splits the AXI transaction into smaller consecutive memory accesses to meet the external data width.
- AXI transaction size is smaller than the memory size:

  The transfer may or not be consistent depending on the type of external device:
  - Accesses to devices that have the byte select feature (SRAM, ROM, PSRAM)

    In this case, the FMC allows read/write transactions and accesses the right data through its byte lanes NBL[1:0].

    Bytes to be written are addressed by NBL[1:0].

    All memory bytes are read (NBL[1:0] are driven low during read transaction) and the useless ones are discarded.
  - Accesses to devices that do not have the byte select feature (NOR and NAND flash memories)

    This situation occurs when a byte access is requested to a 16-bit wide flash memory. Since the device cannot be accessed in Byte mode (only 16-bit words can be read/written from/to the flash memory), write transactions are not allowed while read transactions are allowed (the controller reads the entire 16-bit memory word and uses only the required byte).

Wrap support for NOR flash/PSRAM

Synchronous memories must be configured in Linear burst mode of undefined length as not all masters can issue wrap transactions.

If a master generates a wrap transaction:

- The read operation is split into two linear burst transactions.
- The write operation is split into two linear burst transactions.

Configuration registers

The FMC can be configured through a set of registers. Refer to *Section 37.10.6*, for a detailed description of the NOR flash/PSRAM controller registers. Refer to *Section 37.11.9*, for a detailed description of the NAND flash registers.

37.7 External device address mapping

From the FMC point of view, the external memory is divided into fixed-size memory regions of 256 Mbytes each (see *Table 271*):

- Memory region 1 is used to address up to 4 NOR flash memories or PSRAM devices. This region is split into four NOR/PSRAM subregions with four dedicated Chip Selects, as follows:
  - Subregion 1 - NOR/PSRAM 1
  - Subregion 2 - NOR/PSRAM 2
  - Subregion 3- NOR/PSRAM 3
  - Subregion 4 - NOR/PSRAM 4

Note: The Memory region 1 type attribute must be declared as 'device'.

For each memory region, the type of memory to be used can be configured by the user application through the Configuration register.

Table 271. FMC memory regions (default mapping)

Address	Memory region	Supported memory type
0x6000 0000 - 0x6FFF FFFF	Memory region 1	NOR flash memory/PSRAM/SRAM

37.7.1 NOR/PSRAM address mapping

ADDR[27:26] bits are used to select one of the four memory subregions as shown in *Table 272*.

Table 272. NOR/PSRAM subregion selection

ADDR[27:26](1)	Selected subregion
00	Subregion 1 - NOR/PSRAM 1
01	Subregion 2 - NOR/PSRAM 2
10	Subregion 3- NOR/PSRAM 3
11	Subregion 4- NOR/PSRAM 4

1. ADDR are internal address lines that are translated to external memory.

The ADDR[25:0] bits contain the external memory address. Since ADDR is a byte address whereas the memory is addressed at word level, the address actually issued to the memory varies according to the memory data width, as shown in the following table.

Table 273. NOR/PSRAM External memory address

Memory width(1)	Data address issued to the memory	Maximum memory capacity (bits)
8-bit	ADDR[25:0]	64 Mbytes * 8 = 512 Mbit
16-bit	ADDR[25:1] >> 1	64 Mbytes/2 * 16 = 512 Mbit

1. In case of a 16-bit external memory width, the FMC internally uses ADDR[25:1] to generate the address for external memory FMC_A[24:0].
Whatever the external memory width, FMC_A[0] must be connected to external memory address A[0].

37.7.2 NAND flash memory address mapping

The 4 Kbyte NAND flash address bits are mapped according to *Table 274*.

Table 274. NAND access memory map

Address field	FMC signal name	Function	Detailed description
ADDR[11:10]	NCEx	NAND chip enable selection	00: NCE1 01: NCE2 10: NCE3 11: NCE4
ADDR[9:8]	-	Reserved	-
ADDR[7]	-	Timing selection	0: Common space, timing defined by FMC_PMEM 1: Attribute space, timing defined by FMC_PATT
ADDR[6]	-	Reserved	-
ADDR[5]	A[17]	Address (ALE)	00: Data section 01: Command section 10: Address section 11: reserved
ADDR[4](1)	A[16]	Command (CLE)	

1. Four address LSBs are don't care: each section has 16 bytes mapped to the alias region.

The application software uses the 3 sections to access the NAND flash memory:

- **To send a command to NAND flash memory**, the software must write the command value to any memory location in the command section.
- **To specify the NAND flash address that must be read or written**, the software must write the address value to any memory location in the address section. Since an address can be 4 or 5 bytes long (depending on the actual memory size), several consecutive write operations to the address section are required to specify the full address.
- **To read or write data,** the software reads or writes the data from/to any memory location in the data section.

Since the NAND flash memory automatically increments addresses, there is no need to increment the address of the data section to access consecutive memory locations.

Note: The NAND region has to be accessed as a device and not as memory. Write accesses to command and address sections must be done in Byte mode and aligned with the section base address (offset = 0).

Read and Write accesses to NAND data section must be in Byte mode for 8-bit NAND flash memories and Byte or Half-word mode for 16-bit NAND flash memories.

Read and Write bursts must start at section base address (offset = 0) and must not cross the 16-byte section boundary.

37.8 FMC security and isolation

The FMC supports security and isolation compliant with the Resource Isolation Framework (RIF). Refer to Section *Resource Isolation Framework* (RIF).

From RIF view point, the FMC is composed of several independent resources, listed below, which can be assigned to different security and compartment domains. They are referenced by an index in the RIF programming model:

- 0: Common FMC_CFGR register
- 1: NOR/PSRAM controller for Chip Select NE1, including registers and associated memory map subregion (64 Mbytes)
- 2: NOR/PSRAM controller for Chip Select NE2, including registers and associated memory map subregion (64 Mbytes)
- 3: NOR/PSRAM controller for Chip Select NE3, including registers and associated memory map subregion (64 Mbytes)
- 4: NOR/PSRAM controller for Chip Select NE4, including registers and associated memory map subregion (64 Mbytes)
- 5: NAND controller, including registers and associated memory map subregion (4 Kbytes)

Note: Only the current NAND controller owner is notified by an interrupt and able to clear it. This owner can be any CID if no filtering is used (CFEN = 0 in FMC_CIDCFGRx), SCID if filtering is used (CFEN = 1) or SEMCID if both filtering and semaphore are used (CFEN = 1 and SEMEN =1) and if SEM_MUTEX = 1. No interrupt is issued when SEM_MUTEX = 0 as there is no owner. In case of sharing with MUTEX, it is mandatory that the owner releases the NAND flash memory resource in a clean state, that is after all pending interrupts have been cleared and masked.

The FMC RIF-compliant security and isolation supports:

- Filtering of secure/non-secure accesses for each resource according to its domain definition.
- Filtering of privileged/unprivileged accesses for each resource according to its domain definition.
- Filtering of compartment identifier (CID) for each resource according to its domain definition
- CID domain definition using dedicated semaphore (optional)
- Locking of security, privilege and CID domain settings for each resource.

Resource access definition is set through dedicated registers:

- FMC_SECCFGR configures the security of local resources.
- FMC_PRIVCFGR configures the privilege of local resources.
- FMC_CIDCFGRx configures compartment access for local resources.
- FMC_SEMCRx is used to configure local semaphore (when used).

By default, all FMC resources are non-secure, unprivileged, they can be accessed in read/write mode by any master, and CID based filtering is disabled.

Trusted domain (TDCID secure, privileged) can configure compartment IDs for FMC resources through FMC_CIDCFRx registers.

RIF-compliant FMC security and Isolation also supports the following features:

- Interrupt gating: a NAND controller interrupt is sent only to the interrupt controller attached to the NAND controller compartment.
- Failed accesses are reported by the illegal access controller (IAC) without bus errors. They are silently ignored. No bus errors are generated by the FMC: failed write operations are ignored, and read operations return zero value on any bus.
- FMC kernel clock gating by RCC is not conditioned by hardware according to FMC resource state. The kernel clock can only be gated after all resources are idle, under application software responsibility.For this purpose local status register bits are read accessible by all domains.

Register accesses are defined in *Table 275*, where:

TD: written only by the trusted domain according to its TDCID

C: bitwise filtering is conditioned to the corresponding register (FMC_SECCFGR,FMC_PRIVCFGR, or FMC_CIDCFGR), all filters must pass.

Y: filtering according to security and privilege

N: no filtering is applied

Table 275. FMC RIF register properties and definitions

Registers	Security	Privilege	CID	Registers used for access definition
FMC_CFGR	C	C	C(1)	FMC_SECCFGR.SEC0, FMC_SECCFGR.PRIV0, FMC_RCFGLOCKR.LOCK0, FMC_CIDCFGR0, FMC_SEMCR0
FMC_BRCR1, FMC_BRTR1, FMC_BWTR1	C	C	C	FMC_SECCFGR.SEC1, FMC_SECCFGR.PRIV1, FMC_RCFGLOCKR.LOCK1, FMC_CIDCFGR1, FMC_SEMCR1
FMC_BRCR2, FMC_BRTR2, FMC_BWTR2	C	C	C	FMC_SECCFGR.SEC2, FMC_SECCFGR.PRIV2, FMC_RCFGLOCKR.LOCK2, FMC_CIDCFGR2, FMC_SEMCR2
FMC_BRCR3, FMC_BRTR3, FMC_BWTR3	C	C	C	FMC_SECCFGR.SEC3, FMC_SECCFGR.PRIV3, FMC_RCFGLOCKR.LOCK3, FMC_CIDCFGR3, FMC_SEMCR3

Table 275. FMC RIF register properties and definitions (continued)

Registers	Security	Privilege	CID	Registers used for access definition
FMC_BRCR4, FMC_BRTR4, FMC_BWTR4	C	C	C	FMC_SECCFGR.SEC4, FMC_SECCFGR.PRIV4, FMC_RCFGLOCKR.LOCK4, FMC_CIDCFGR4, FMC_SEMCR4

FMC_SR, FMC_HWCFGR1, FMC_HWCFGR2, FMC_HWCFGR3, FMC_VERR, FMC_IPIDR, FMC_SIDR	N	N	N	Read -only, read by all
FMC_SECCFGR	Y	Y	C	Bit write only by assigned CID according to FMC_CIDCFGR, FMC_SEMCR and by DDCID according to DDEN. Read by all.
FMC_PRIVCFGR	C	Y	C	Bit write only by assigned CID according to FMC_CIDCFGR, FMC_SEMCR and by DDCID according to DDEN and security configuration. Read by all.
FMC_RCFGLOCKR	Y	Y	TD(1)	Read by all.
FMC_CIDCFGRx	Y	Y	TD(1)	Read by all.
FMC_SEMCRx	C	C	C	Read by all.

1. The debug domain (according to DDCID and RIF DDEN signal) can access all registers when passing secure and privilege filtering.

37.9 FMC RIF registers

37.9.1 FMC security configuration register (FMC_SECCFGR)

Address offset: 0x300

Reset value: 0x0000 0000

Non-secure or unprivileged write accesses to this register are ignored. Read accesses are allowed.

If compartment filtering is enabled (respectively disabled), only trusted domain, secure debug domain (CID) or an allowed secure privileged compartment (respectively any secure privileged compartment) can write to this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

										rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 Reserved, must be kept at reset value.

Bit 5 **SEC5:** Security configuration for NAND controller
0: non-secure
1: secure

Bit 4 **SEC4:** Security state for NOR/PSRAM controller for Chip Select NE4
0: non-secure
1: secure

Bit 3 **SEC3:** Security state for NOR/PSRAM controller for Chip Select NE3
0: non-secure
1: secure

Bit 2 **SEC2:** Security state for NOR/PSRAM controller for Chip Select NE2
0: non-secure
1: secure

Bit 1 **SEC1:** Security state for NOR/PSRAM controller for Chip Select NE1
0: non-secure
1: secure

Bit 0 **SEC0:** Security state for FMC_CFGR common control register
0: non-secure
1: secure

37.9.2 FMC security configuration register (FMC_PRIVCFGR)

Address offset: 0x304

Reset value: 0x0000 0000

Non-secure or unprivileged write accesses to this register are ignored. Read accesses are allowed.

If compartment filtering is enabled (respectively disabled), only trusted domain, secure debug domain (CID) or an allowed secure privileged compartment (respectively any secure privileged compartment) can write to this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

37.9.3 FMC CID configuration lock register (FMC_RCFGLOCKR)

Address offset: 0x308

Reset value: 0x0000 0000

Only secure privileged write accesses to this register are allowed. This register can be written only by trusted domain and debug domain (CID). Read accesses are allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

										rs	rs	rs	rs	rs	rs

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 Reserved, must be kept at reset value.

Bit 5 **LOCK5:** Lock NAND controller until a global FMC reset
0: no effect
1: FMC_CIDCFGR5, SEC[5] of FMC_SECCFGR and FMC_PRIVCFGR[5] are write locked

Bit 4 **LOCK4:** Lock NOR/PSRAM controller for Chip Select NE4 until a global FMC reset
0: no effect
1: FMC_CIDCFGR4, SEC[4] of FMC_SECCFGR and FMC_PRIVCFGR[4] are write locked

Bit 3 **LOCK3:** Lock NOR/PSRAM controller for Chip Select NE3 until a global FMC reset
0: no effect
1: FMC_CIDCFGR3, SEC[3] of FMC_SECCFGR and FMC_PRIVCFGR[3] are write locked

Bit 2 **LOCK2:** Lock NOR/PSRAM controller for Chip Select NE2 until a global FMC reset
0: no effect
1: FMC_CIDCFGR2, SEC[2] of FMC_SECCFGR and FMC_PRIVCFGR[2] are write locked

Bit 1 **LOCK1:** Lock NOR/PSRAM controller for Chip Select NE1 until a global FMC reset
0: no effect
1: FMC_CIDCFGR1, SEC[1] of FMC_SECCFGR and FMC_PRIVCFGR[1] are write locked

Bit 0 **LOCK0:** Lock FMC_CFGR until a global FMC reset
0: no effect
1: FMC_CIDCFGR0, SEC[0] of FMC_SECCFGR and FMC_PRIVCFGR[0] are write locked

37.9.4 FMC resource x CID register (FMC_CIDCFGRx)

Address offset: 0x30C + 0x8 * x (x = 0 to 5)

Reset value: 0x0000 0000

x designates an FMC resource with associated registers:

x = 0: FMC common control, FMC_CFGR

x = 1: NOR/PSRAM controller for Chip Select NE1 and its memory map address space

x = 2:NOR/PSRAM controller for Chip Select NE2 and its memory map address space

x = 3: NOR/PSRAM controller for Chip Select NE3 and its memory map address space

x = 4: NOR/PSRAM controller for Chip Select NE4 and its memory map address space

x = 5: NAND controller and its memory map address space

Only secure privileged write accesses to this register are allowed. This register can be written only by trusted domain and debug domain (CID) provided LOCKx is cleared in FMC_RCFGLOCKR register.

Read accesses from this register are allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEMWLC7	SEMWLC6	SEMWLC5	SEMWLC4	SEMWLC3	SEMWLC2	SEMWLC1	SEMWLC0

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCID[2:0]			Res.	Res.	SEMEN	CFEN
									rw	rw	rw			rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **SEMWLC7:** White-listed CID in the CID allocation pool for resource x in semaphore mode
0: CID7 is black-listed in CID allocation pool
1: CID7 is white-listed in CID allocation pool

Bit 22 **SEMWLC6:** White-listed CID0 in the CID allocation pool for resource x in semaphore mode
0: CID6 is black-listed in CID allocation pool
1: CID6 is white-listed in CID allocation pool

Bit 21 **SEMWLC5:** White-listed CID0 in the CID allocation pool of resource x in semaphore mode
0: CID5 is black-listed in CID allocation pool
1: CID5 is white-listed in CID allocation pool

Bit 20 **SEMWLC4:** White-listed CID0 in the CID allocation pool of resource x in semaphore mode
0: CID4 is black-listed in CID allocation pool
1: CID4 is white-listed in CID allocation pool

Bit 19 **SEMWLC3:** White-listed CID in the CID allocation pool of resource x in semaphore mode
0: CID3 is black-listed in CID allocation pool
1: CID3 is white-listed in CID allocation pool

Bit 18 **SEMWLC2:** White-listed CID in the CID allocation pool of resource x in semaphore mode
0: CID2 is black-listed in CID allocation pool
1: CID2 is white-listed in CID allocation pool

Bit 17 **SEMWLC1:** White-listed CID0 in the CID allocation pool of resource x in semaphore mode
0: CID1 is black-listed in CID allocation pool
1: CID1 is white-listed in CID allocation pool

Bit 16 **SEMWLC0:** White-listed CID0 in the CID allocation pool of resource x in semaphore mode
0: CID0 is black-listed in CID allocation pool
1: CID0 is white-listed in CID allocation pool

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:4 **SCID[2:0]:** Static CID for resource x
Trusted domain applications use this bit to statically define which compartment has access to the resource x when SEMEN=0.
This bit is ignored if SEMEN=1 or CFEN=0.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **SEMEN:** Semaphore enable for resource x
0: disable the semaphore mode
1: enable the semaphore mode

Bit 0 **CFEN:** CID filtering enable for resource x
0: disable CID filtering
1: enable CID filtering

37.9.5 FMC resource x semaphore control register (FMC_SEMCRx)

Address offset: 0x310+ x * 0x8 (x = 0 to 5)

Reset value: 0x0000 0000

x designates an FMC resource with associated registers:

x = 0: FMC common control, FMC_SEMCR

x = 1: NOR/PSRAM controller for Chip Select NE1 and its memory map address space

x = 2:NOR/PSRAM controller for Chip Select NE2 and its memory map address space

x = 3: NOR/PSRAM controller for Chip Select NE3 and its memory map address space

x = 4: NOR/PSRAM controller for Chip Select NE4 and its memory map address space

x = 5: NAND controller and its memory map address space

When the secure, privileged and trusted domain has set up resource x in semaphore mode (SEMEN=1 in FMC_CIDCFGRx), the FMC_SEMCRx register can be used during runtime by any authorized white-listed CID agent to take and release the control of resource x.

Read accesses can be privileged or unprivileged, secure or non-secure, and with any CID.

Write accesses are ignored if CFEN = 0 or SEMEN = 0 in FMC_CIDCFGRx.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEMCID[2:0]			Res.	Res.	Res.	SEM_MUTEX
									r	r	r				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **SEMCID[2:0]:** Current CID allocated to resource x in semaphore mode

The field is read-only. It is internally updated when a white-listed CID has taken the control of resource x, in semaphore mode. If SEM_MUTEX=0, this CID also released it.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **SEM_MUTEX:** Mutex for the CID allocation of resource x in semaphore mode

Write access:

Write 0: Control of resource x (in semaphore mode) released to any white-listed CID

Write 1: Control of resource x (in semaphore mode) acquired by a white-listed CID

Read access:

Read 0: Resource x is CID-free, meaning that it is not (currently) under the control of any white-listed CID

Read 1: Resource x is CID-allocated, meaning that it is (currently) under the control of one white-listed CID

If resource x is in secure state (SECx=1 in FMC_SECCFGR), this bit can be written only by a secure agent.

If resource x is in privileged state (FMC_PRIVCFGR.PRIVx=1), this bit can be written only by a privileged agent.

If resource x is CID-filtered (CFEN=1 in FMC_CIDCFGRx) and in semaphore mode (FMC_CIDCFGR.SEMEN=1), this bit can be written either by an authorized (white-listed) CID agent to acquire the control or by the same (white-listed) CID agent to release the control.

37.10 NOR flash/PSRAM controller

The FMC generates the appropriate signal timings to drive the following types of memories:

- Asynchronous SRAM, FRAM and ROM
  - 8 bits
  - 16 bits
- PSRAM (CellularRAM™)
  - Asynchronous mode
  - Burst mode for synchronous accesses with configurable option to split burst access when crossing boundary page for CRAM 1.5.
  - Multiplexed or non-multiplexed
- NOR flash memory
  - Asynchronous mode
  - Burst mode for synchronous accesses
  - Multiplexed or non-multiplexed

The FMC outputs a unique Chip Select signal, NE[4:1], per memory region. All the other signals (addresses, data and control) are shared.

The FMC supports a wide range of devices through a programmable timings among which:

- Programmable wait-states (up to 15)
- Programmable bus turnaround cycles (up to 15)
- Programmable output enable and write enable delays (up to 15)
- Independent read and write timings and protocol to support the widest variety of memories and timings
- Programmable continuous clock (FMC_CLK) output.

The FMC output Clock (FMC_CLK) is a submultiple of the fmc_ker_ck clock. It can be delivered to the selected external device either during synchronous accesses only or during asynchronous and synchronous accesses depending on the CCKEN bit configuration in the FMC_BCR1 register:

- If the CCLKEN bit is reset, the FMC generates the clock (FMC_CLK) only during synchronous accesses (Read/write transactions).
- If the CCLKEN bit is set, the FMC generates a continuous clock during asynchronous and synchronous accesses. To generate the FMC_CLK continuous clock, memory region 1 must be configured in synchronous mode (see *Section 37.10.6: NOR/PSRAM controller registers*). Since the same clock is used for all synchronous memories, when a continuous output clock is generated and synchronous accesses are performed, the AXI data size has to be the same as the memory data width (MWID[1:0]) otherwise the FMC_CLK frequency is changed depending on AXI data transaction (refer to *Section 37.10.5: Synchronous transactions* for FMC_CLK divider ratio formula).

The size of each memory region is fixed and equal to 64 Mbytes. Each memory region is configured through dedicated registers (see *Section 37.10.6: NOR/PSRAM controller registers*).

The programmable memory parameters include access times (see *Table 276*) and support for wait management (for PSRAM and NOR flash accessed in burst mode).

Table 276. Programmable NOR/PSRAM access parameters

Parameter	Function	Access mode	Unit	Min.	Max.
Address setup	Duration of the address setup phase	Asynchronous	FMC clock cycle (fmc_ker_ck)	0	15
Address hold	Duration of the address hold phase	Asynchronous, muxed I/Os	FMC clock cycle (fmc_ker_ck)	1	15
NBL setup	Duration of the Byte lanes setup phase	Asynchronous	FMC clock cycle (fmc_ker_ck)	0	3
Data setup	Duration of the data setup phase	Asynchronous	FMC clock cycle (fmc_ker_ck)	1	256
Data hold	Duration of the data hold phase	Asynchronous	FMC clock cycle (fmc_ker_ck)	0	3
Bust turn	Duration of the bus turnaround phase	Asynchronous and synchronous read	FMC clock cycle (fmc_ker_ck)	0	15
Clock divide ratio	Number of FMC clock cycles (fmc_ker_ck) to build one memory clock cycle (CLK)	Synchronous	FMC clock cycle (fmc_ker_ck)	2	16
Data latency	Number of clock cycles to issue to the memory before the first data of the burst	Synchronous	Memory clock cycle (fmc_ker_ck)	2	17

37.10.1 External memory interface signals

Table 277, *Table 278* and *Table 279* list the signals that are typically used to interface with NOR flash memory, SRAM and PSRAM.

Note: The prefix “N” identifies the signals which are active low.

NOR flash memory, non-multiplexed I/Os

Table 277. Non-multiplexed I/O NOR flash memory

FMC signal name	I/O	Function
CLK	O	Clock (for synchronous access)
A[25:0]	O	Address bus
D[15:0]	I/O	Bidirectional data bus
NE[x]	O	Chip Select, x = 1 to 4
NOE	O	Output enable
NWE	O	Write enable
NL(=NADV)	O	Latch enable (this signal is called address valid, NADV, by some NOR flash devices)
NWAIT	I	NOR flash wait input signal to the FMC

The maximum capacity is 512 Mbits (26 address lines).

NOR flash memory, 16-bit multiplexed I/Os

Table 278. 16-bit multiplexed I/O NOR flash memory

FMC signal name	I/O	Function
CLK	O	Clock (for synchronous access)
A[25:16]	O	Address bus
AD[15:0]	I/O	16-bit multiplexed, bidirectional address/data bus (the 16-bit address A[15:0] and data D[15:0] are multiplexed on the databus)
NE[x]	O	Chip Select, x = 1 to 4
NOE	O	Output enable
NWE	O	Write enable
NL(=NADV)	O	Latch enable (this signal is called address valid, NADV, by some NOR flash devices)
NWAIT	I	NOR flash wait input signal to the FMC

The maximum capacity is 512 Mbits.

PSRAM/SRAM/FRAM, non-multiplexed I/Os

Table 279. Non-multiplexed I/Os PSRAM/SRAM

FMC signal name	I/O	Function
CLK	O	Clock (only for PSRAM synchronous access)
A[25:0]	O	Address bus
D[15:0]	I/O	Data bidirectional bus
NE[x]	O	Chip Select, x = 1 to 4 (called NCE by PSRAM (CellularRAM™, CRAM))
NOE	O	Output enable
NWE	O	Write enable
NL(= NADV)	O	Address valid only for PSRAM input (memory signal name: NADV)
NWAIT	I	PSRAM wait input signal to the FMC
NBL[1:0]	O	Byte lane output (upper and lower byte enable)

The maximum capacity is 512 Mbits.

PSRAM, 16-bit multiplexed I/Os

Table 280. 16-bit multiplexed I/O PSRAM

FMC signal name	I/O	Function
CLK	O	Clock (for synchronous access)
A[25:16]	O	Address bus

Table 280. 16-bit multiplexed I/O PSRAM (continued)

FMC signal name	I/O	Function
AD[15:0]	I/O	16-bit multiplexed, bidirectional address/data bus (the 16-bit address A[15:0] and data D[15:0] are multiplexed on the databus)
NE[x]	O	Chip Select, x = 1 to 4 (called NCE by PSRAM (CellularRAM™, CRAM))
NOE	O	Output enable
NWE	O	Write enable
NL(= NADV)	O	Address valid PSRAM input (memory signal name: NADV)
NWAIT	I	PSRAM wait input signal to the FMC
NBL[1:0]	O	Byte lane output (upper and lower byte enable)

The maximum capacity is 512 Mbits (26 address lines).

37.10.2 Supported memories and transactions

Table 281 below shows an example of the supported devices, access modes and transactions when the memory data bus is 16-bit wide for NOR flash memory, PSRAM and SRAM. The transactions not allowed (or not supported) by the FMC are shown in gray in this example.

Table 281. NOR flash/PSRAM: Example of supported memories and transactions

Device	Mode	R/W	AXI data size	Memory data size	Allowed/ not allowed	Comments
NOR flash (muxed I/Os and non-muxed I/Os)	Asynchronous	R	8	16	Y	-
	Asynchronous	W	8	16	N	-
	Asynchronous	R	16	16	Y	-
	Asynchronous	W	16	16	Y	-
	Asynchronous	R	32	16	Y	Split into 2 FMC accesses
	Asynchronous	W	32	16	Y	Split into 2 FMC accesses
	Asynchronous	R	64	16	Y	Split into 4 FMC accesses
	Asynchronous	W	64	16	Y	Split into 4 FMC accesses
	Asynchronous page	R	-	16	N	Mode is not supported
	Synchronous	R	8	16	N	-
	Synchronous	R	16	16	Y	-
	Synchronous	R	32	16	Y	-
	Synchronous	R	64	16	Y	Split into 4 FMC accesses

Table 281. NOR flash/PSRAM: Example of supported memories and transactions

Device	Mode	R/W	AXI data size	Memory data size	Allowed/ not allowed	Comments
PSRAM (multiplexed I/Os and non-multiplexed I/Os)	Asynchronous	R	8	16	Y	-
	Asynchronous	W	8	16	Y	Use of byte lanes NBL[1:0]
	Asynchronous	R	16	16	Y	-
	Asynchronous	W	16	16	Y	-
	Asynchronous	R	32	16	Y	Split into 2 FMC accesses
	Asynchronous	W	32	16	Y	Split into 2 FMC accesses
	Asynchronous	R	64	16	Y	Split into 4 FMC accesses
	Asynchronous	W	64	16	Y	Split into 4 FMC accesses
	Asynchronous page	R	-	16	N	Mode is not supported
	Synchronous	R	8	16	N	-
	Synchronous	R	16	16	Y	-
	Synchronous	R	32/64	16	Y	-
	Synchronous	W	8	16	Y	Use of byte lanes NBL[1:0]
	Synchronous	W	16/32/64	16	Y	-
SRAM and ROM	Asynchronous	R	8 / 16	16	Y	-
	Asynchronous	W	8 / 16	16	Y	Use of byte lanes NBL[1:0]
	Asynchronous	R	32	16	Y	Split into 2 FMC accesses
	Asynchronous	W	32	16	Y	Split into 2 FMC accesses
	Asynchronous	R	64	16	Y	Split into 4 FMC accesses
	Asynchronous	W	64	16	Y	Split into 4 FMC accesses

37.10.3 General timing rules

Signals synchronization

- All controller output signals change on the rising edge of the fmc_ker_ck clock
- In synchronous mode (read or write), all output signals change on the rising edge of fmc_ker_ck clock.
- NBL signals

  They are applicable to memories which support byte enable.
  - The NBL signals are driven low:

    from the start of a read memory transfer and optionally earlier according to NBLSET, when the device requires some setup time from NBL to NCE,

    for bytes to be written during data transfer and according to the first data bytes during the address transfer.
  - The NBL signals are driven high two FMC_CLK clock cycles after the completion of the read or write transfer.

37.10.4 NOR flash/PSRAM controller asynchronous transactions

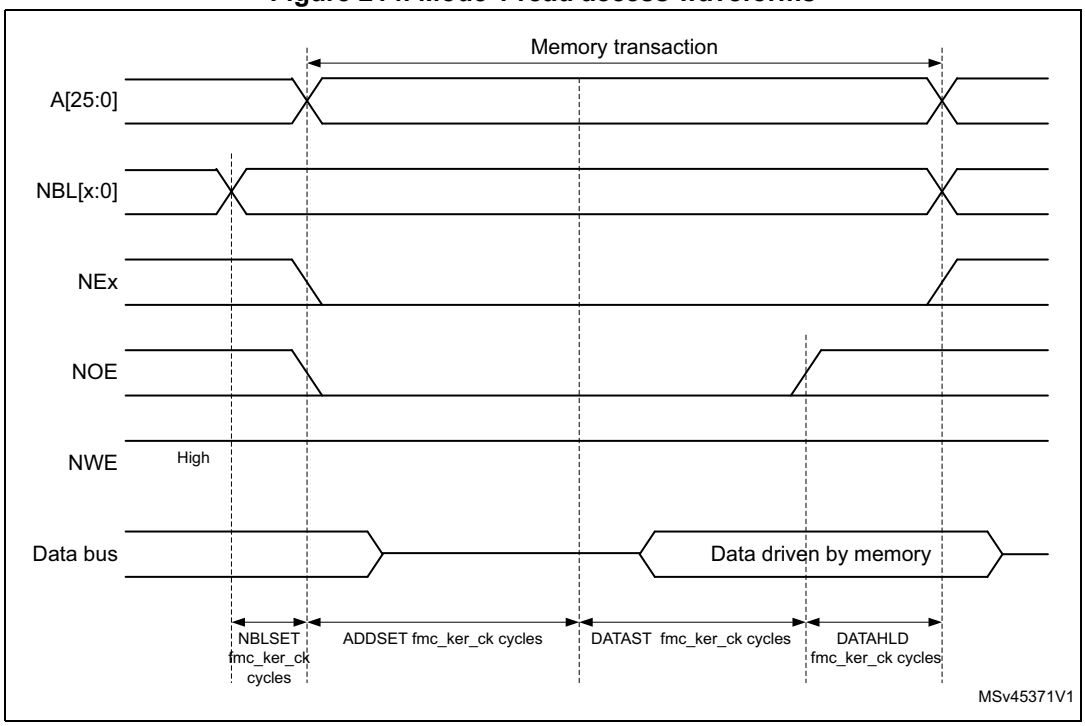
Asynchronous static memories (NOR flash, PSRAM, SRAM, FRAM)

- Signals are synchronized by the internal clock fmc_ker_ck. This clock is not issued to the memory.
- The FMC always samples the data before deasserting the Chip Select signal NE. This guarantees that the memory data hold timing constraint is met (minimum chip enable high to data transition is usually 0 ns).
- If the extended mode is enabled (EXTMOD bit is set in the FMC_BCRx register), up to four extended modes (A, B, C and D) are available. It is possible to mix A, B, C and D modes for read and write operations. For example, read operation can be performed in mode A and write in mode B. The extended mode is not compatible with the muxed mode (EXTMOD bit must be kept cleared in muxed mode).
- If the extended mode is disabled (EXTMOD bit is reset in the FMC_BCRx register), the FMC can operate in mode 1 or mode 2 as follows:
  - Mode 1 is the default mode when SRAM/PSRAM memory type is selected (MTYP[1:0] = 0x0 or 0x01 in the FMC_BCRx register)
  - Mode 2 is the default mode when NOR memory type is selected (MTYP[1:0] = 0x10 in the FMC_BCRx register).

Mode 1 - SRAM/FRAM/PSRAM (CRAM)

The next figures show the read and write transactions for the supported modes followed by the required configuration of FMC_BCRx, and FMC_BTRx/FMC_BWTRx registers.

Figure 214. Mode 1 read access waveforms



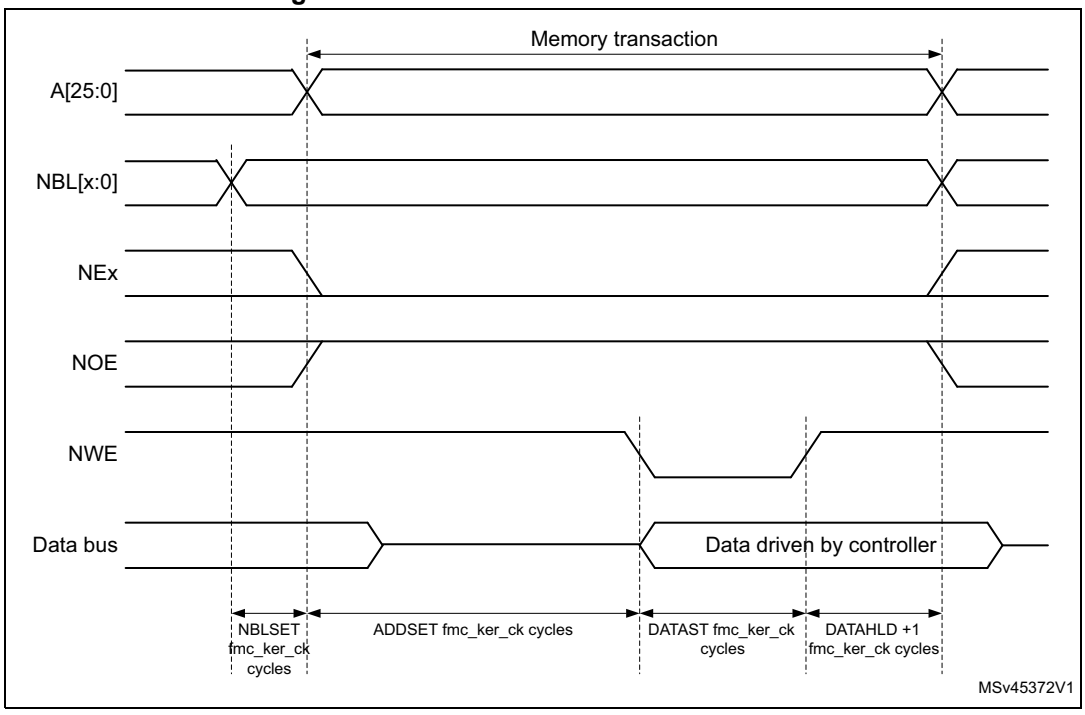


Figure 215. Mode 1 write access waveforms

The DATAHLD time at the end of the read and write transaction guarantee the address and data hold time after the NOE/NWE rising edge. For write, the DATAST value must be greater than zero (DATAST > 0).

Table 282. FMC_BCRx bitfields (mode 1)

Bit number	Bit name	Value to set
31	Reserved	0x0
30-24	Reserved	0x000
23:22	NBLSET[1:0]	As needed
21:20	CSCOUNT	As needed

7-4	ADDHLD	Duration of the middle phase of the access (ADDHLD fmc_ker_ck cycles).
3-0	ADDSET	Duration of the first access phase (ADDSET fmc_ker_ck cycles). Minimum value for ADDSET is 1.

WAIT management for asynchronous accesses

If the asynchronous memory asserts the WAIT signal to indicate that it is not yet ready to accept or to provide data, the ASYNCWAIT bit has to be set in FMC_BCRx register.

If the WAIT signal is active (high or low depending on the WAITPOL bit), the second access phase (Data setup phase), programmed by the DATAST bits, is extended until WAIT becomes inactive. Unlike the data setup phase, the first access phases (Address setup and Address hold phases), programmed by the ADDSET and ADDHLD bits, are not WAIT sensitive and so they are not prolonged.

The data setup phase must be programmed so that WAIT can be detected 4 fmc_ker_ck cycles before the end of the memory transaction. The following cases must be considered:

1. The memory asserts the WAIT signal aligned to NOE/NWE which toggles:

$$DATAST \geq (4 \times FMCCLK) + max_wait_assertion_time$$

2. The memory asserts the WAIT signal aligned to NEx (or NOE/NWE not toggling):
   if

$$max_wait_assertion_time > address_phase + hold_phase$$

   then:

$$DATAST \geq (4 \times FMCCLK) + (max_wait_assertion_time - address_phase - hold_phase$$

   otherwise

$$DATAST \geq 4 \times FMCCLK$$

   where max_wait_assertion_time is the maximum time taken by the memory to assert the WAIT signal once NEx/NOE/NWE is low.

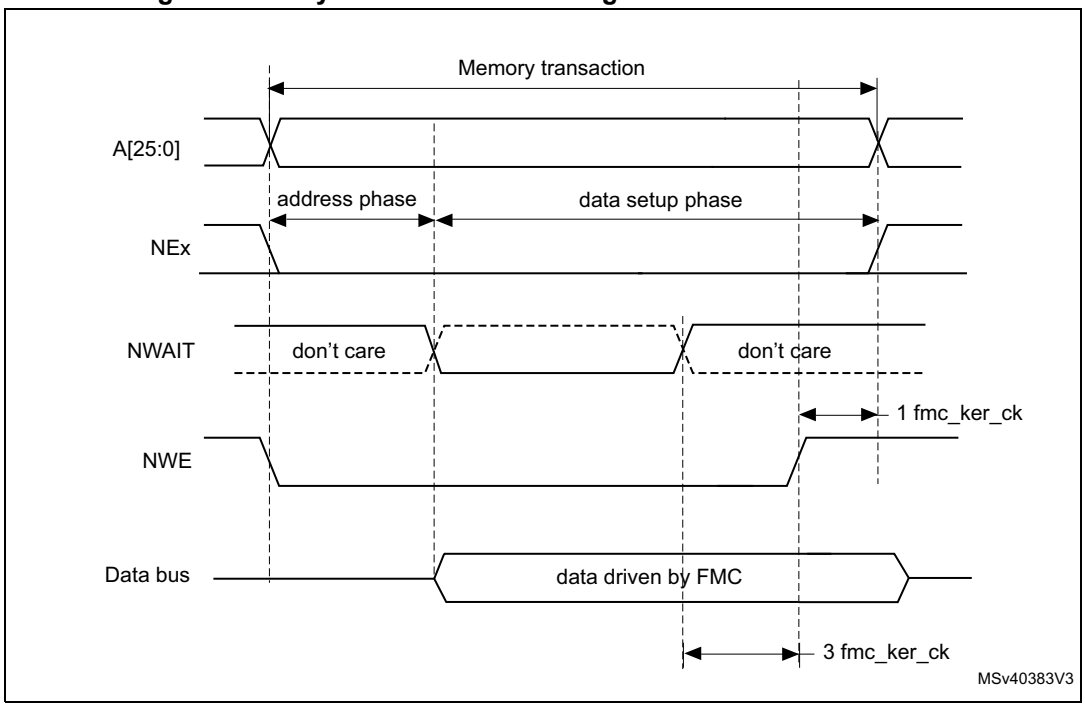

Figure 227 and *Figure 228* show the number of fmc_ker_ck clock cycles that are added to the memory access phase after WAIT is released by the asynchronous memory (independently of the above cases).

Figure 227. Asynchronous wait during a read access waveforms

1. NWAIT polarity depends on WAITPOL bit setting in FMC_BCRx register.

Figure 228. Asynchronous wait during a write access waveforms

1. NWAIT polarity depends on WAITPOL bit setting in FMC_BCRx register.

CellularRAM™ (PSRAM) refresh management

The CellularRAM™ does not allow maintaining the chip select signal (NE) low for longer than the t_{CEM} timing specified in memory device. This timing can be programmed in the FMC_CFGR register. It defines the maximum duration of the NE low pulse (expressed in fmc_ker_ck cycles) in synchronous mode for PSRAM read or write accesses.

37.10.5 Synchronous transactions

The memory clock, FMC_CLK, is a submultiple of fmc_ker_ck. It depends on the value of CLKDIV.

NOR flash memories specify a minimum time from NADV assertion to FMC_CLK high. To meet this constraint, the FMC does not issue the clock to the memory during the first internal clock cycle of the synchronous access (before NADV assertion). This guarantees that the rising edge of the memory clock occurs in the middle of the NADV low pulse.

Data latency versus NOR memory latency

The data latency is the number of cycles to wait before sampling the data. The DATLAT value must be consistent with the latency value specified in the NOR flash configuration register. The FMC does not include the clock cycle when NADV is low in the data latency count.

Caution: Some NOR flash memories include the NADV Low cycle in the data latency count, so that the exact relation between the NOR flash latency and the FMC DATLAT parameter can be either:

- NOR flash latency = (DATLAT + 2) CLK clock cycles
- or NOR flash latency = (DATLAT + 3) CLK clock cycles

Some recent memories assert NWAIT during the latency phase. In such cases DATLAT can be set to its minimum value. As a result, the FMC samples the data and waits long enough to evaluate if the data are valid. Thus the FMC detects when the memory exits latency and real data are processed.

Other memories do not assert NWAIT during latency. In this case the latency must be set correctly for both the FMC and the memory, otherwise invalid data are mistaken for good data, or valid data are lost in the initial phase of the memory access.

Single-burst transfer

When the selected memory region is configured in burst mode for synchronous accesses, if for example a single-burst transaction is requested on 16-bit memories, the FMC performs a burst transaction of length 1 (if the AXI transfer is 16 bits), or length 2 (if the AXI transfer is 32 bits) and deassert the Chip Select signal when the last data is strobed.

Such transfers are not the most efficient in terms of cycles compared to asynchronous read operations. Nevertheless, a random asynchronous access would first require to re-program the memory access mode, which would altogether last longer.

Cross boundary page for CellularRAM™ 1.5

CellularRAM™ 1.5 does not allow burst access to cross the page boundary. The FMC allows to split automatically the burst access when the memory page size is reached by configuring the CPSIZE bits in the FMC_BCR1 register following the memory page size.

Wait management

For synchronous NOR flash memories, NWAIT is evaluated after the programmed latency period, which corresponds to (DATLAT+2) FMC_CLK clock cycles.

If NWAIT is active (low level when WAITPOL = 0, high level when WAITPOL = 1), wait-states are inserted until NWAIT is inactive (high level when WAITPOL = 0, low level when WAITPOL = 1).

When NWAIT is inactive, the data is considered valid either immediately (bit WAITCFG = 1) or on the next clock edge (bit WAITCFG = 0).

During wait-state insertion via the NWAIT signal, the controller continues to send clock pulses to the memory, keeping the Chip Select and output enable signals valid. It does not consider the data as valid.

In burst mode, there are two timing configurations for the NOR flash NWAIT signal:

- The flash memory asserts the NWAIT signal one data cycle before the wait-state (default after reset).
- The flash memory asserts the NWAIT signal during the wait-state

The FMC supports both NOR flash wait-state configurations, for each Chip Select, thanks to the WAITCFG bit in the FMC_BCRx registers (x = 0 to 3).

37.10.6 NOR/PSRAM controller registers

The peripheral registers have to be accessed by words (32-bit)

SRAM/NOR flash chip-select control register for memory region x (FMC_BCRx)

Address offset: 0x00 + 0x08 * (x - 1), (x = 1 to 4)

Reset value: 0x0000 30DB, 0x0000 30D2, 0x0000 30D2, 0x0000 30D2

This register contains the control information of each memory region, used for SRAMs, PSRAM, FRAM and NOR flash memories.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NBLSET[1:0]		CSCOUNT1	CSCOUNT0	CBURSTRW	CPSIZE[2:0]		
								rw	rw	rw	rw	rw	rw	rw	rw

rw	rw	rw	rw	rw		rw	rw			rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:24 Reserved, must be kept at reset value.

Bits 23:22 **NBLSET[1:0]**: Byte lane (NBL) setup

These bits configure the NBL setup timing from NBLx low to Chip select NEx low.
00: NBL setup time is 0 fmc_ker_ck clock cycle.
01: NBL setup time is 1 fmc_ker_ck clock cycle.
10: NBL setup time is 2 fmc_ker_ck clock cycles.
11: NBL setup time is 3 fmc_ker_ck clock cycles.

Bits 21:20 **CSCOUNT[1:0]:** Chip Select (CS) counter

These bits define the maximum duration of Chip Select low for PSRAM synchronous mode and for each memory region.

The Chip Select counter is loaded into a timer which is decremented using the KCK_FMC while the NE is maintained low during PSRAM read or write access.

When the timer reaches 0, the PSRAM controller splits the current access and toggles NE to allow PSRAM device refresh.

The programmed counter value guarantees a maximum NE pulse width (t_{CEM}) as specified for PSRAM devices.

The counter is reloaded and starts decrementing each time a new access is triggered by a transition of NE from high to low.

0b00: Counter disabled

0b01: NEx deasserted after fmc_ker_ck clock cycle

0b10: NEx deasserted after 64 fmc_ker_ck clock cycles

0b11: NEx deasserted after 256 fmc_ker_ck clock cycles

Note: Most PSRAMs manage refresh transparently and do not require access split. CSCOUNT[1:0] must consequently be left at its default value (counter disabled), otherwise CSCOUNT[1:0] value and access split impact must be checked according to PSRAM timing parameters.

Bit 19 **CBURSTRW:** Write burst enable

For PSRAM (CRAM) operating in burst mode, the bit enables synchronous accesses during write operations. The enable bit for synchronous read accesses is the BURSTEN bit in the FMC_BCRx register.

0: Write operations are always performed in asynchronous mode

1: Write operations are performed in synchronous mode.

Bits 18:16 **CPSIZE[2:0]:** CRAM page size

These bits are used for CellularRAM™ 1.5 which does not allow burst accesses to cross the address boundaries between pages. When these bits are configured, the FMC automatically splits the burst access when the memory page size is reached (refer to memory datasheet for page size).

000: No burst split when crossing page boundary. (default after reset).

001: 128 bytes

010: 256 bytes

011: 512 bytes

100: 1024 bytes

Others: Reserved.

Bit 15 **ASYNCWAIT**: Wait signal during asynchronous transfers

This bit enables/disables wait signal usage by the FMC even during asynchronous transfers.

0: NWAIT signal not taken in to account during asynchronous transfers (default after reset)

1: NWAIT signal taken in to account during asynchronous transfers

Bit 14 **EXTMOD:** Extended mode enable

This bit enables write timing programming for asynchronous accesses inside the FMC_BWTR register, thus resulting in different timings for read and write operations.

0: Values inside FMC_BWTR register not taken into account (default after reset)

1: Values inside FMC_BWTR register taken into account

Note: When the extended mode is disabled, the FMC can operate in mode 1 or mode 2 as follows:

- *Mode 1 is the default mode when the SRAM/PSRAM memory type is selected (MTYP[1:0] =0x0 or 0x01)*
- *Mode 2 is the default mode when the NOR memory type is selected (MTYP[1:0] = 0x10).*

Bit 13 **WAITEN:** Wait enable bit

This bit enables/disables wait-state insertion via the NWAIT signal when accessing the memory in synchronous mode.

0: NWAIT signal disabled (its level not taken into account, no wait-state inserted after the programmed flash latency period)

1: NWAIT signal enabled (its level is taken into account after the programmed latency period to insert wait-states if asserted) (default after reset)

Bit 12 **WREN:** Write enable bit

This bit indicates whether write operations to the memory region by the FMC are enabled/disabled:

0: Write operations to the memory region by the FMC disabled. An AXI slave error is reported,

1: Write operations to the memory region by the FMC enabled (default after reset).

Bit 11 **WAITCFG:** Wait timing configuration

The NWAIT signal indicates whether the data from the memory are valid or if a wait-state must be inserted when accessing the memory in synchronous mode. This configuration bit determines if NWAIT is asserted by the memory one clock cycle before the wait-state or during the wait-state:

0: NWAIT signal active one data cycle before wait-state (default after reset),

1: NWAIT signal active during wait-state (not used for PSRAM).

Bit 10 Reserved, must be kept at reset value.

Bit 9 **WAITPOL:** Wait signal polarity bit

This bit defines the polarity of the wait signal from memory used for either in synchronous or asynchronous mode:

0: NWAIT active low (default after reset),

1: NWAIT active high.

Bit 8 **BURSTEN:** Burst enable bit

This bit enables/disables synchronous accesses during read operations. It is valid only for synchronous memories operating in burst mode:

0: Burst mode disabled (default after reset). Read accesses are performed in asynchronous mode.

1: Burst mode enable. Read accesses are performed in synchronous mode.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **MWID[1:0]:** Memory data bus width

This bit defines the external memory device width, valid for all type of memories.

00: 8 bits

01: 16 bits (default after reset)

10: Reserved.

11: Reserved.

Bits 3:2 **MTYP[1:0]:** Memory type

This bit defines the type of external memory attached to the corresponding memory region:
00: SRAM/ FRAM (default after reset for memory region 2...4)
01: PSRAM (CRAM)/FRAM
10: NOR flash/OneNAND flash (default after reset for memory region 1)
11: Reserved.

Bit 1 **MUXEN:** Address/data multiplexing enable bit

When this bit is set, the address and data values are multiplexed on the data bus, valid only with NOR and PSRAM memories:
0: Address/Data non-multiplexed
1: Address/Data multiplexed on databus (default after reset)

Bit 0 **MBKEN:** Memory region enable bit

This bit enables the memory region. After reset memory region 1 is enabled, all others are disabled. Accessing a disabled memory region causes an ERROR on AXI bus.
0: Corresponding memory region is disabled
1: Corresponding memory region is enabled

SRAM/NOR flash chip-select timing registers for memory region x (FMC_BTRx)

Address offset: 0x04 + 0x8 * (x - 1), (x = 1 to 4)

Reset value: 0x0FFF FFFF

This register contains the control information of each memory region, used for SRAMs, PSRAM and NOR flash memories.If the EXTMOD bit is set in the FMC_BCRx register, then this register is partitioned for write and read access, that is, two registers are available: one to configure read accesses (this register) and one to configure write accesses (FMC_BWTRx registers).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATAHLD[1:0]		ACCMOD[1:0]		DATLAT[3:0]				CLKDIV[3:0]				BUSTURN[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATAST[7:0]								ADDHLD[3:0]				ADDSET[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 **DATAHLD[1:0]:** Data Hold phase duration

These bits are written by software to define the duration of the *data hold* phase in fmc_ker_ck cycles (refer to *Figure 227* to *Figure 228*), used in asynchronous accesses:
For read/write accesses:
00: DATAHLD phase duration = fmc_ker_ck clock cycle * 0 (default, read)/1 (default, write)
01: DATAHLD phase duration = fmc_ker_ck clock cycle * 1 (read)/2 (write)
10: DATAHLD phase duration = fmc_ker_ck clock cycle * 2 (read)/3 (write)
11: DATAHLD phase duration = fmc_ker_ck clock cycle * 3 (read)/4 (write)

Bits 29:28 **ACCMOD[1:0]:** Access mode

These bits specify the asynchronous access modes as shown in the timing diagrams. These bits are taken into account only when the EXTMOD bit in the FMC_BCRx register is 1.
00: Access mode A
01: Access mode B
10: Access mode C
11: Access mode D

Bits 27:24 **DATLAT[3:0]:** Data latency for synchronous memory (see note below bit descriptions)

For synchronous access with read/write burst mode enabled (BURSTEN / CBURSTRW bits set), these bits define the number of memory clock cycles (+2) to issue to the memory before reading/writing the first data.
This timing parameter is not expressed in fmc_ker_ck periods, but in FMC_CLK periods.
For asynchronous access, this value is don't care.
0000: Data latency of 2 FMC_CLK clock cycles for first burst access
1111: Data latency of 17 FMC_CLK clock cycles for first burst access (default value after reset)

Bits 23:20 **CLKDIV[3:0]:** Clock divide ratio (for FMC_CLK signal)

These bits define FMC_CLK clock output signal period, expressed in fmc_ker_ck cycles:
0000: Reserved.
0001: FMC_CLK period = 2 × fmc_ker_ck periods
0010: FMC_CLK period = 3 × fmc_ker_ck periods
1111: FMC_CLK period = 16 × fmc_ker_ck periods (default value after reset)
This value is don't care when accessing NOR flash memories, SRAM and PSRAM in asynchronous mode.

Note: Refer to Section 37.10.5: Synchronous transactions for FMC_CLK *divider ratio formula).*

Note: CLKDIV[3:0] bits are don't care when CCLKEN bit of FMC_CFGR is set. In this case FMC_CLK clock output is controlled by CLKDIV of FMC_CFGR.

Bits 19:16 **BUSTURN[3:0]:** Bus turnaround phase duration

These bits are written by software to add a delay between the end of current read or write transaction and the next transaction on the same memory region.

This delay allows matching the minimum time between consecutive transactions (t_{EHEL} from NEx high to NEx low) and the maximum time required by the memory to free the data bus after a read access ($t_{EHQZ\ f}$from chip enable high to output Hi-Z). This delay is recommended for mode D and muxed mode. For non-muxed memory, the bus turnaround delay can be set to a minimum value that respects the following condition:

(BUSTRUN + 1)fmc_ker_ck period ≥ $t_{EHELmin}$ max ($t_{EHELmin}$, $t_{EHQZmax)}$

For FRAMs, the bus turnaround delay must be configured to match the minimum precharge time (t_{PC}). This delay is inserted between all consecutive transactions on the same memory region (read/read, write/write, read/write and write/read) to match the t_{PC} memory timing, and the Chip select toggles between consecutive accesses.

(BUSTRUN + 1) fmc_ker_ck period >= t_{PCmin}

0000: BUSTURN phase duration = 1 * fmc_ker_ck clock cycle added

...

1111: BUSTURN phase duration = 16 * fmc_ker_ck clock cycles added (default value after reset)

Bits 15:8 **DATAST[7:0]:** Data-phase duration

These bits are written by software to define the duration of the data phase (refer to *Figure 227* to *Figure 228*) used in asynchronous accesses:
0000 0000: Reserved.
0000 0001: DATAST phase duration = 1 * fmc_ker_ck clock cycles
0000 0010: DATAST phase duration = 2 * fmc_ker_ck clock cycles
...
1111 1111: DATAST phase duration = 255 * fmc_ker_ck clock cycles (default value after reset)
For each memory type and access mode data-phase duration, refer to the respective figure (*Figure 227* to *Figure 228*).
Example of mode 1, write access, DATAST=1:
Data-phase duration= DATAST+1 = 2 *fmc_ker_ck clock cycles.

Note: This value is don't care in synchronous accesses.

Bits 7:4 **ADDHLD[3:0]:** Address-hold phase duration

These bits are written by software to define the duration of the *address hold* phase (refer to *Figure 223* to *Figure 226*) used in mode D or multiplexed accesses:
0000: Reserved.
0001: ADDHLD phase duration =1 * fmc_ker_ck clock cycle
0010: ADDHLD phase duration = 2 * fmc_ker_ck clock cycle
...
1111: ADDHLD phase duration = 15 * fmc_ker_ck clock cycles (default value after reset)
For each access mode address-hold phase duration, refer to the respective figure (*Figure 223* to *Figure 226*).

Note: This value is not used in synchronous accesses, and the address hold phase lasts always 1 memory clock period.

Bits 3:0 **ADDSET[3:0]:** Address setup phase duration

These bits are written by software to define the duration of the *address setup* phase (refer to *Figure 227* to *Figure 228*), used in SRAMs, ROMs and asynchronous NOR flash memories:
0000: ADDSET phase duration = 0 * fmc_ker_ck clock cycle
...
1111: ADDSET phase duration = 15 * fmc_ker_ck clock cycles (default value after reset)
For each access mode address setup phase duration, refer to the respective figure (refer to *Figure 227* to *Figure 228*).

Note: This value is don't care in synchronous accesses.
In muxed mode or mode D, the minimum value for ADDSET is 1.

Note: PSRAMs (CRAMs) have a variable latency due to internal refresh. Therefore these memories issue the NWAIT signal during the whole latency phase to extend the latency as needed.

On PSRAMs (CRAMs), DATLAT must be configured to 0 so that the FMC quickly exits its latency phase, starts sampling NWAIT from memory, and starts read or write operations when the memory is ready.

This method can be used also with the latest generation of synchronous flash memories, which, unlike older flash memories, issue the NWAIT signal (check the corresponding flash memory datasheet).

SRAM/NOR-flash write timing registers for memory region x (FMC_BWTRx)

Address offset: 0x104 + 0x8 * (x - 1), (x = 1 to 4)

Reset value: 0x000F FFFF

This register contains the control information of each memory region. It is used for SRAMs, FRAMs, PSRAMs and NOR flash memories. When the EXTMOD bit is set in the FMC_BCRx register, then this register is active for write access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATAHLD[1:0]		ACCMOD[1:0]		Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BUSTURN[3:0]			
rw	rw	rw	rw									rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATAST[7:0]								ADDHLD[3:0]				ADDSET[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 **DATAHLD[1:0]:** Data Hold phase duration

These bits are written by software to define the duration of the *data hold* phase in fmc_ker_ck cycles (refer to *Figure 228*), used in asynchronous write accesses:

00: DATAHLD phase duration = 1 * fmc_ker_ck clock cycle (default)

01: DATAHLD phase duration = 2 * fmc_ker_ck clock cycle

10: DATAHLD phase duration = 3 * fmc_ker_ck clock cycle

11: DATAHLD phase duration = 4 * fmc_ker_ck clock cycle

Bits 29:28 **ACCMOD[1:0]:** Access mode.

These bits specify the asynchronous access modes as shown in the next timing diagrams.These bits are taken into account only when the EXTMOD bit in the FMC_BCRx register is 1.

00: Access mode A

01: Access mode B

10: Access mode C

11: Access mode D

Bits 27:20 Reserved, must be kept at reset value.

Bits 19:16 **BUSTURN[3:0]**: Bus turnaround phase duration

These bits are written by software to add a delay between the end of current write transaction and the next transaction on the same memory region.

For FRAMs, the bus turnaround delay must be configured to match the minimum precharge time (t_{PC}). The bus turnaround delay is inserted between all consecutive transactions on the same memory region (read/read, write/write, read/write and write/read), and the Chip select toggles between consecutive accesses.

(BUSTRUN + 1) fmc_ker_ck period >= t_{PCmin}

0000: BUSTURN phase duration = 1 * fmc_ker_ck clock cycle added

...

1111: BUSTURN phase duration = 16 * fmc_ker_ck clock cycles added (default value after reset)

Bits 15:8 **DATAST[7:0]:** Data-phase duration.

These bits are written by software to define the data phase duration (refer to *Figure 227* to *Figure 228*) used in asynchronous SRAM, PSRAM and NOR flash memory accesses:
0000 0000: Reserved.
0000 0001: DATAST phase duration = 1 * fmc_ker_ck clock cycles
0000 0010: DATAST phase duration = 2 * fmc_ker_ck clock cycles
...
1111 1111: DATAST phase duration = 255 * fmc_ker_ck clock cycles (default value after reset)

Bits 7:4 **ADDHLD[3:0]:** Address-hold phase duration.

These bits are written by software to define the duration of the address hold phase (refer to *Figure 225* to *Figure 226*) used in asynchronous multiplexed accesses:
0000: Reserved.
0001: ADDHLD phase duration = 1 * fmc_ker_ck clock cycle
0010: ADDHLD phase duration = 2 * fmc_ker_ck clock cycle
...
1111: ADDHLD phase duration = 15 * fmc_ker_ck clock cycles (default value after reset)

Note: In synchronous NOR flash accesses, this value is not used, and the address hold phase always lasts 1 flash clock period.

Bits 3:0 **ADDSET[3:0]:** Address setup phase duration.

These bits are written by software to define the duration of the address setup phase in fmc_ker_ck cycles (refer to *Figure 227* to *Figure 228*) used in asynchronous accesses:
0000: ADDSET phase duration = 0 * fmc_ker_ck clock cycle
...
1111: ADDSET phase duration = 15 * fmc_ker_ck clock cycles (default value after reset)

Note: In synchronous accesses, this value is not used, and the address setup phase always lasts 1 flash clock period. In muxed mode, the minimum ADDSET value is 1.

FMC common configuration register (FMC_CFGR)

Address offset: 0x020

Reset value: 0x0000 0000

This register is user to set configuration common to all controllers

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FMCEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCLKEN	CLKDIV[3:0]

Bit 31 **FMCEN:** FMC enable

This bit enables/disables the FMC.

0: FMC disabled

1: FMC enabled

Bits 30:24 Reserved, must be kept at reset value.

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **CCLKEN:** Continuous clock enable

This bit enables the FMC_CLK clock output to external memory devices.

0: The FMC_CLK is only generated during the synchronous memory access (read/write transaction). The FMC_CLK clock ratio is defined by the programmed CLKDIV value in the FMC_BCRx register (default after reset).

1: The FMC_CLK is generated continuously during asynchronous and synchronous access.

If continuous clock mode is enabled, the synchronous memories connected to all memory regions are clocked by the same clock with the clock ratio defined by CLKDIV in FMC_CFGR. The CLKDIV value in FMC_BWTRx are don't care.

Bits 19:16 **CLKDIV[3:0]:** Clock divide ratio (for FMC_CLK signal)

These bits define the FMC_CLK clock output signal period, expressed in number of fmc_ker_ck cycles:

0000: Reserved.

0001: FMC_CLK period = 2 × fmc_ker_ck periods

0010: FMC_CLK period = 3 × fmc_ker_ck periods

1111: FMC_CLK period = 16 × fmc_ker_ck periods (default value after reset)

This value is don't care when accessing NOR flash memories, SRAM and PSRAM in asynchronous mode.

Note: Refer to Section 37.10.5: Synchronous transactions for FMC_CLK divider ratio formula.

Bits 15:0 Reserved, must be kept at reset value.

FMC size identification register (FMC_SIDR)

Bits 31:28 **RA_LN2DPTH[3:0]:** AXI read address FIFO depth
These bits return the AXI read address FIFO depth. depth is $2^{RA_LN2DPTH}$.

Bits 27:24 **WR_LN2DPTH[3:0]:** AXI write response FIFO depth
These bits return the AXI write response FIFO depth. depth is $2^{WR_LN2DPTH}$.

Bits 23:20 **WD_LN2DPTH[3:0]:** AXI write data FIFO depth
These bits return the AXI write data FIFO depth. depth is $2^{WD_LN2DPTH}$.

Bits 19:16 **WA_LN2DPTH[3:0]:** AXI write address FIFO depth
These bits return the AXI write address FIFO depth. depth is $2^{WA_LN2DPTH}$.

Bits 15:12 **ID_SIZE[3:0]:** AXI ID width
These bits return the AXI ID width.

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **SDRAM_SEL:** SDRAM controller selection
0x0: SDRAM controller not supported
0x1: SDRAM controller supported

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **NAND_ECC:** NAND ECC
0x0: Hamming code (supported only in Legacy mode without sequencer)
0x1: Hamming and BCH code

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **NAND_SEL:** NAND Controller Selection
0x0: NAND Controller not supported
0x1: NAND Controller supported

FMC hardware configuration register 2 (FMC_HWCFGR2)

Address offset: 0x3EC

Reset value: 0x11DC 4772

The base addresses are relevant only when the FMC includes the corresponding memory controller.

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **SECURE**: Support for Arm® TrustZone®

0: no TrustZone

1: Support for TrustZone

Note: Arm and TrustZone are registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **PRIVILEGE**: Support for Privileged mode

0: Privileged mode not supported

1: Privileged mode supported

Bits 23:20 **SDRAM2_BASE[3:0]:** SDRAM bank 2 base address

It returns bits [31:28] of SDRAM bank 2 base address space when the SDRAM controller is supported. It is ignored otherwise.

Bits 19:16 **SDRAM1_BASE[3:0]:** SDRAM bank 1 base address

It returns bits [31:28] of SDRAM bank 1 base address space when the SDRAM controller is supported. It is ignored otherwise.

Bits 15:12 **NAND_BASE[3:0]:** NAND base address

It returns bits [31:28] of NAND base address space

Bits 11:8 **SDRAM_RBASE[3:0]:** SDRAM remap base address

it returns bits [31:28] of SDRAM remap base address space when the SDRAM controller is supported. It is ignored otherwise.

Bits 7:4 **NOR_BASE[3:0]:** NOR base address

It returns bits [31:28] of NOR base address space

Bits 3:0 **RD_LN2DPTH[3:0]:** AXI read data FIFO depth

These bits return the AXI read data FIFO depth. depth is $2^{RD_LN2DPTH}$

FMC hardware configuration register 3 (FMC_HWCFGR3)

Address offset: 0x3E8

Reset value: 0x0000 0037

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CID_WIDTH[3:0]				MAX_CID[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **CID_WIDTH[3:0]**: CID bus width
This bitfield is relevant only when MAX_CID is not null in FMC_HWCFGR2.
0000: Width = 1
0001: Width = 2
0010: Width = 3
0011: Width = 4
Others: Reserved, must not be used.

Bits 3:0 **MAX_CID[3:0]**: Maximum compartment ID (or CID)
MAX_CID ranges from 0 to 15:
0000: no CID supported, DMA is not CID-aware
0001 to 1111: FMC is CID-aware and each channel is a separate CID-aware resource. n+1 CIDs, from CID0 up to CIDn, are supported.

37.11 NAND flash controller

The FMC generates the appropriate signal timings to drive 8- and 16-bit NAND flash memories

The NAND memory region is configured through dedicated registers (*Section 37.11.9*). The programmable memory parameters include access timings (shown in *Table 302*) and ECC configuration.

The NAND controller supports the following features:

- Programmable page size of 256, 512, 1024, 2048, 4096 or 8192 bytes
- Programmable memory timings
- Programmable Error Correction Capability using BCH code or Hamming code
- Command sequencer: a hardware accelerator for read/write accesses within a page or within a block of configurable size.
  This feature is useful when ECC computation is performed.
- Programmable address offset for ECC bytes programming using the command sequencer
- Interrupt generation on ECC error detection and page or sector transfer complete
- Support of multiple dice per package. Only one die can be selected at a time.

Table 302. Programmable NAND flash access parameters

Parameter	Function	Access mode	Unit	Min.	Max.
Memory setup time	Number of clock cycles (fmc_ker_ck) required to set up the address before the command assertion	Read/Write	FMC clock cycle (fmc_ker_ck)	1	256
Memory wait	Minimum duration (in fmc_ker_ck clock cycles) of the command assertion	Read/Write	FMC clock cycle (fmc_ker_ck)	1	256

Table 302. Programmable NAND flash access parameters (continued)

Parameter	Function	Access mode	Unit	Min.	Max.
Memory hold	Number of clock cycles (fmc_ker_ck) during which the address must be held (as well as the data if a write access is performed) after the command deassertion	Read/Write	FMC clock cycle (fmc_ker_ck)	1	256
Memory databus high-Z	Number of clock cycles (fmc_ker_ck) during which the data bus is kept in high-Z state after a write access has started	Write	FMC clock cycle (fmc_ker_ck)	1	256

37.11.1 External memory interface signals

The following tables list the typical signals that are used to interface NAND flash memory.

Note: The "N" prefix identifies the signals which are active low.

8-bit NAND flash memory

Table 303. 8-bit NAND flash memory

FMC signal name	I/O	Function
A[17]	O	NAND flash address latch enable (ALE) signal
A[16]	O	NAND flash command latch enable (CLE) signal
D[7:0]	I/O	8-bit multiplexed, bidirectional address/data bus
NCEx	O	Chip Select (x=1, 2, 3, 4)
NOE(= NRE)	O	Output enable (memory signal name: read enable, NRE)
NWE	O	Write enable
RNB	I	NAND flash Ready/Busy (RNB) input signal to the FMC

Note: Theoretically, there is no capacity limitation as the FMC can manage as many address cycles as needed.

16-bit NAND flash memory

Table 304. 16-bit NAND flash memory

FMC signal name	I/O	Function
A[17]	O	NAND flash address latch enable (ALE) signal
A[16]	O	NAND flash command latch enable (CLE) signal
D[15:0]	I/O	16-bit multiplexed, bidirectional address/data bus
NCEx	O	Chip Select (x=1, 2, 3, 4)
NOE(= NRE)	O	Output enable (memory signal name: read enable, NRE)

Table 304. 16-bit NAND flash memory (continued)

FMC signal name	I/O	Function
NWE	O	Write enable
RNB	I	NAND flash Ready/Busy (RNB) input signal to the FMC

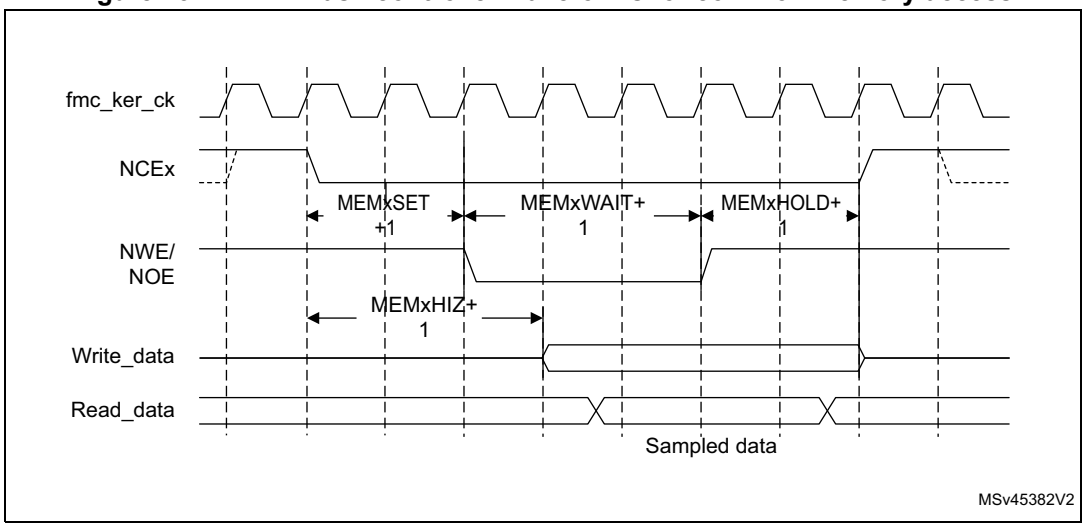
Note: Theoretically, there is no capacity limitation as the FMC can manage as many address cycles as needed.

37.11.2 NAND flash supported memories and transactions

Table 305 shows the supported devices, access modes and transactions. Transactions not allowed (or not supported) by the NAND flash controller are shown in gray.

Table 305. Supported memories and transactions

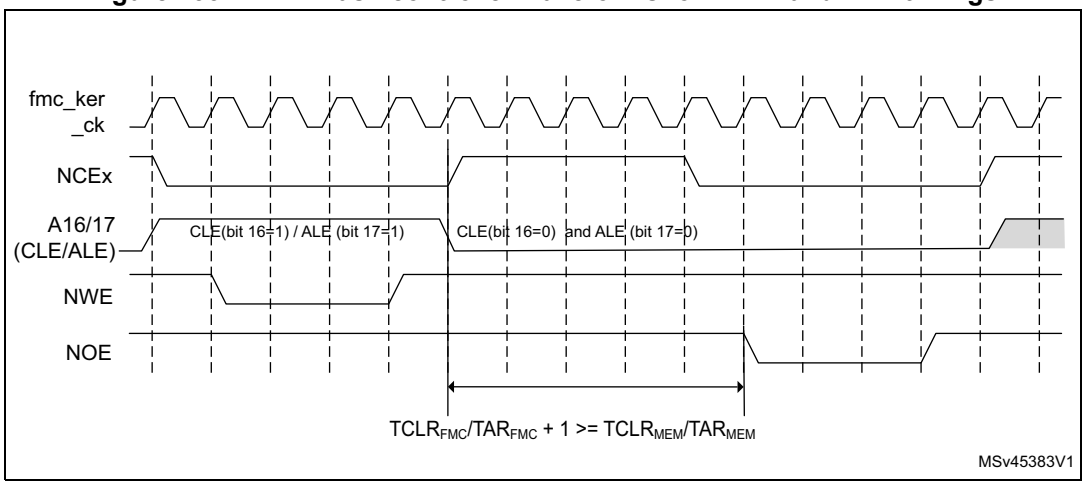
Device	Mode	R/W	AXI data size	Memory data size	Allowed/ not allowed	Comments
NAND 8-bit	Asynchronous	R	8	8	Y	
	Asynchronous	W	8	8	Y	
	Asynchronous	R	16	8	Y	Split into 2 FMC accesses
	Asynchronous	W	16	8	Y	Split into 2 FMC accesses
	Asynchronous	R	32	8	Y	Split into 4 FMC accesses
	Asynchronous	W	32	8	Y	Split into 4 FMC accesses
	Asynchronous	R	64	8	Y	Split into 8 FMC accesses
	Asynchronous	W	64	8	Y	Split into 8 FMC accesses
NAND 16-bit	Asynchronous	R	8	16	Y	
	Asynchronous	W	8	16	N	
	Asynchronous	R	16	16	Y	
	Asynchronous	W	16	16	Y	
	Asynchronous	R	32	16	Y	Split into 2 FMC accesses
	Asynchronous	W	32	16	Y	Split into 2 FMC accesses
	Asynchronous	R	64	16	Y	Split into 4 FMC accesses
	Asynchronous	W	64	16	Y	Split into 4 FMC accesses



37.11.3 Timing diagrams for NAND flash memory

The NAND flash memory region is managed through a set of registers:

- Control register: FMC_PCR
- Interrupt status register: FMC_SR
- ECC register: FMC_HECCR
- Timing register for Common memory space: FMC_PMEM
- Timing register for Attribute memory space: FMC_PATT



Each timing configuration register contains three parameters used to define the number of fmc_ker_ck cycles for the different phases of any NAND flash access, plus one parameter that defines the timing to start driving the data bus when a write access is performed. *Figure 232* shows the timing parameter definitions for common memory accesses, knowing that Attribute memory space access timings are similar.

Figure 232. NAND flash controller waveforms for common memory access

1. NOE remains high (inactive) during write accesses. NWE remains high (inactive) during read accesses.
2. The programmed values of MEMxSET + MEMxHOLD must be >1.

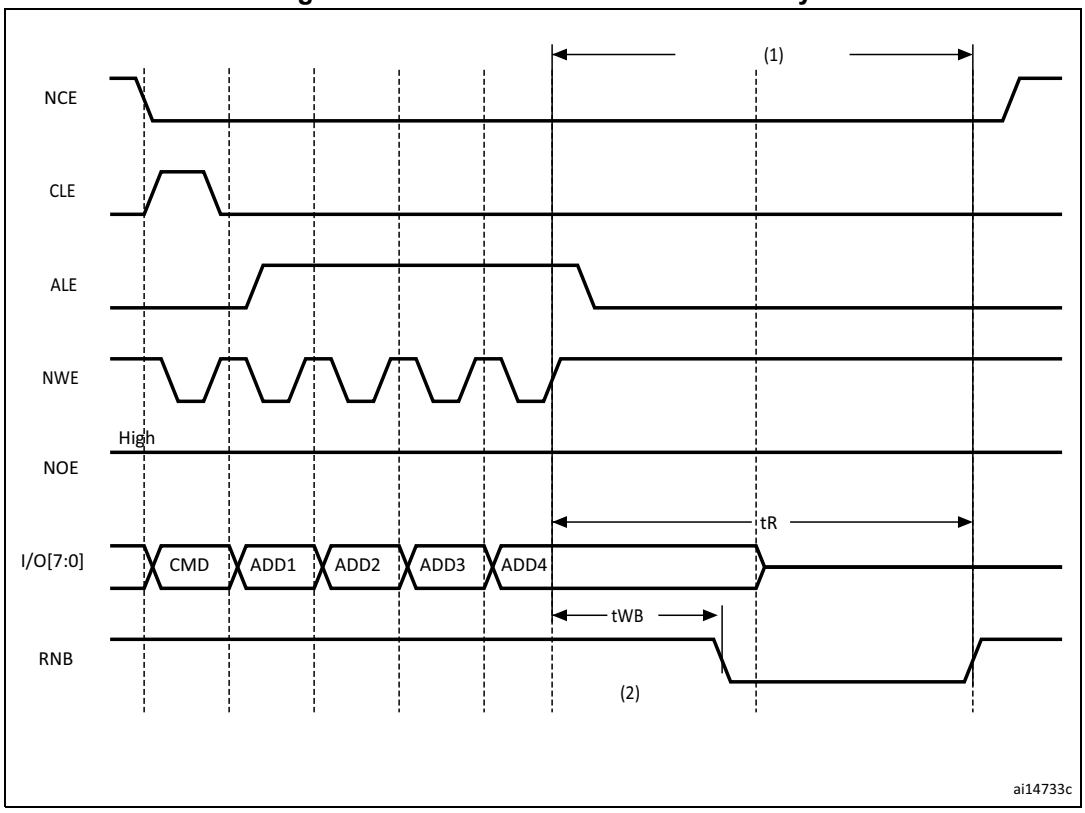
Figure 233. NAND flash controller waveforms for TCLR and TAR timings

1. NOE remains high (inactive) during write accesses. NWE remains high (inactive) during read accesses.

37.11.4 NAND flash operations

The command latch enable (CLE) and address latch enable (ALE) signals of the NAND flash memory device are driven by address signals from the FMC. This means that to send a command or an address to the NAND flash memory, the CPU has to perform a write to a specific address in its memory space.

A typical page read operation from the NAND flash device requires the following steps:



1. Program and enable the NAND memory region by configuring the FMC_PCR and FMC_PMEM (and for some devices, FMC_PATT, see *Section 37.11.5: NAND flash prewait function*) registers according to the characteristics of the NAND flash memory (PWID bits to configure NAND flash data bus width, PWAITEN set or cleared as needed, see *Section 37.7.2: NAND flash memory address mapping* for timing configuration).
2. The CPU performs a byte write to the common memory space, with a data byte value equal to one flash command byte (for example 0x00 for Samsung NAND flash devices). The NAND flash CLE input is active during the write strobe (low pulse on NWE), so that the written byte is interpreted as a command by the NAND flash memory. Once the command is latched by the memory device, it does not need to be written again for the following page read operations.
3. The CPU can send the start address for a read operation by writing a five-byte address to the common memory or the attribute space followed by the second read command. The NAND flash ALE input is active during the write strobe (low pulse on NWE), so that the written bytes are interpreted as the start address for read operations. Using the attribute memory space allows to use a different FMC timing configuration, which can be used to implement the prewait function required for some NAND flash memories (see details in *Section 37.11.5: NAND flash prewait function*).
4. The controller waits till the NAND flash memory is ready (RNB signal high), before starting a new access to the same memory region or to another memory region.
5. The CPU can then perform byte read operations from the common memory space to read the NAND flash page (data field + Spare field) byte by byte.
6. No CPU command or address write operation is required to read the next NAND flash page. This can be done in three different ways:
   - by simply performing the operation described in step 5,
   - a new random address can be accessed by restarting the operation at step 3,
   - a new command can be sent to the NAND flash device by restarting at step 2.

Note: Non-'CE don't care' NAND flash memories are not supported.

37.11.5 NAND flash prewait function

The NAND controller must wait for RNB to be asserted low before sending its next command (see *Figure 234*). This timing constraint is set according to t_{WB} using MEMHOLD[7:0] bitfield in FMC_PMEM or ATTHOLD[7:0] in FMC_PATT.

Figure 234. Access to NAND flash memory

1. NCE can be deasserted for NAND flash memories since CE is don't care except for very old NAND flash devices that are not considered in this example.
2. RNB sampling can be delayed after t_{WB} by using ATTHOLD[7:0] bit of FMC_PATT. As an example, if fmc_ker_clk = 14 ns and ATTHOLD[7:0] = 7, the delay is 8*14 = 112 ns. The usual t_{WB} maximum value is 100 ns and the programmed delay must be higher than t_{WB} + 2*fmc_ker_clk.

Any CPU read or write access to the NAND flash memory has a delay of (MEMHOLD[7:0] + 1) * fmc_ker_ck cycles after the NWE signal is asserted.

The ATTHOLD[7:0] bitfield in FMC_PATT register must be determined to satisfy t_{WB} timing constraints and selectively apply larger timing constraints to the last command or address byte in CPU mode. When setting ATTHOLD[7:0], the 2 * fmc_ker_ck delay required for the sampling of RNB by NAND sequencer must also taken into account.

37.11.6 NAND ECC controller

NAND flash memories include a spare memory area (or OOB) at the end of each page. This area is typically used to store some metadata (such as Bad Block Marker information to invalidate the whole page) or for error management functions.

The FMC supports on-the-fly error correction code (ECC) computation during data read/program from/to NAND flash memory. This mechanism reduces the host CPU workload when processing the ECC by software.

The user application can select one out of two algorithms:

- Hamming code algorithm for 1-bit error code correction and 2-bit error detection per 256, 512, 1024, 2048, 4096 or 8192 bytes.
- BCH (Bose, Chaudhuri and Hocquenghem) code for 4-bit error code correction and 8-bit error detection or 8-bit error code correction and 16-bit error detection per 512 bytes.

The principle of both ECC controllers is similar: the ECC modules monitor the NAND flash data bus and read/write signals (NCE and NWE) each time the NAND flash memory region is active. The ECC controllers operate as follows:

- When accessing a NAND flash memory region, the data present on the D[7:0] or D[15:0] bus are latched and used for ECC computation.
- When accessing any other address in NAND flash memory, the ECC logic is idle, and does not perform any operation. As a result, write operations to define commands or addresses to the NAND flash memory are not taken into account for ECC computation.

Once the desired number of bytes has been read/written from/to the NAND flash memory by the host CPU or DMA, the ECC result registers are updated.

Hamming code

The Hamming code implemented can perform 1-bit error correction and 2-bit error detection per 256, 512, 1024, 2048, 4 096 or 8192 bytes read or written from/to the NAND flash memory. It consists in calculating the row and column parity. This algorithm is supported by 8-bit and 16-bit NAND flash memories.

Page write and read sequences with Hamming code are described below.

To perform a page program with Hamming ECC computation:

1. Enable the ECCEN bit in the FMC_PCR register.
2. Write data to the NAND flash memory page. While the NAND page is written, the ECC controller computes the ECC value.
3. Wait until the ECC code is ready (NWRF is set in the FMC_SR register).
4. Read the ECC value available in the FMC_HECCR register and store it in NAND flash spare area.
5. Clear the ECCEN bit and launch the page programming.

To perform a page read with Hamming ECC computation:

1. Enable the ECCEN bit in the FMC_PCR register before reading the NAND page. While the NAND page is read, the ECC block computes the ECC value.
2. Wait until the ECC code is ready (NWRF set in the FMC_SR register).
3. Read the ECC value available in the spare area as well also the ECC value, processed by Hamming controller, available in FMC_HECCR register.
4. If the two ECC values are identical, no correction is required. Otherwise an ECC error occurred, the software correction routine returns information on whether the error can be corrected or not, and corrects it when possible.

Depending on the spare area size, the page can be split into several sectors of identical size. This allows increasing the error correction capability for each page since 1 error can be corrected and 2 errors can be detected for each sector.

Example

For a NAND flash memory with 2 Kbytes + 64 bytes pages, each page can be split into 8 sectors of 256 bytes each. 3 bytes (22 bits) of ECC are required for each sector, which makes 24 bytes (8 * 3 bytes) to be stored in the spare area for the whole page. For the whole 2 Kbyte page, up to 8 errors can be corrected, respectively up to 16 errors detected, provided there is less than 1 error, respectively 2 errors, per sector.

BCH (Bose, Chaudhuri and Hocquenghem) code

To increase the error correction capability, the FMC embeds a BCH (Bose, Chaudhuri and Hocquenghem) encoder and decoder.

It supports 4-bit error code correction and 8-bit error detection or 8-bit error code correction, and 16-bit error detection per sector. BCH encoder/decoder module handles sectors of fixed size, equal to 512 bytes. Each page must consequently be split into 512-byte sectors. The number of parity bytes generated for each sector is given in *Table 306*. For 16-bit NAND flash memories, a padding is added to align parity bytes to an even number (8 bytes and 14 bytes for 4-bit and 8-bit BCH code, respectively).

Table 306. Number of ECC parity bytes per sector

Function	BCH code	
Error correction	4-bit	8-bit
Number of parity bytes	7 bytes	13 bytes

The BCH module detects errors and returns the bit position for each sector. To correct the errors, the software needs to flip the error bits at the provided bit position stored in the FMC_BCHPBRx register.

The BCH ECC controller supports 8-bit and 16-bit NAND flash memories.

During a page program operation, the BCH encoder generates the ECC bytes (7 or 13 bytes) for each sector of 512 bytes that must be written in the NAND flash spare area with a programmable offset. It must take into account some metadata at the beginning of the spare area. This operation must be executed for each sector. The BCH encoder does not process the spare area: metadata must have their own error protection mechanism.

The total number of ECC bytes (N) is given by the below equation:

$$N = \text{Number of ECC bytes /sector} \times \text{Number of sector/page}$$

Example

For an 8-bit NAND flash with 4096-byte pages and an error correction capability of 4-bit per 512 bytes, the number of sector per page is 8 (4096 / 512). The total number of ECC bytes is consequently:

$$N = 7 \times 8 = 56 \text{ bytes}$$

The user application has to make sure that the spare area is large enough to store the metadata and parity bytes.

Page program and read sequences with BCH code are described below.

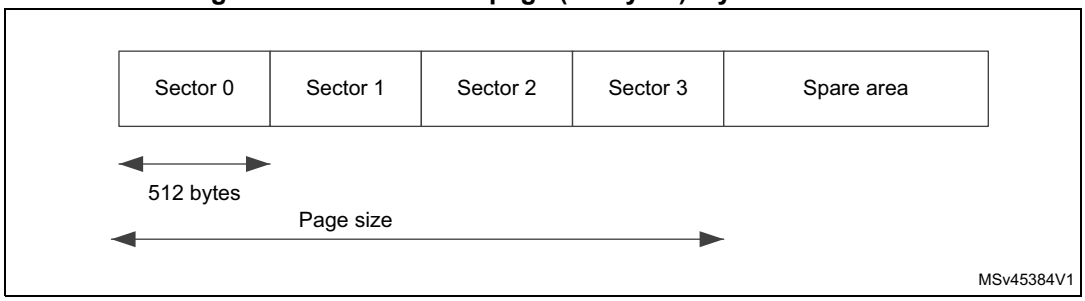
To perform a page program:

1. Enable write access by setting the WEN bit in the FMC_PCR register.
2. Enable the ECC by setting the ECCEN bit in FMC_PCR register.
3. Write 512 data bytes to the sector in the NAND flash memory page. While the sector is written, the BCH encoder computes the ECC value.
4. Wait until the BCH encoder parity bits are available by monitoring EPBRF bit of FMC_BCHISR register.
5. Read the ECC value available in the FMC_BCHPBRx registers and store it in the NAND flash spare area.
6. Disable ECC by resetting the ECCEN bit in FMC_PCR register.
7. Execute again step 2 to 6 for all sectors to be written in NAND flash memory.
8. Launch the page programming.

To perform a page read:

1. Enable read access by resetting the WEN bit in the FMC_PCR register.
2. Enable the ECC by stetting the ECCEN bit in FMC_PCR register.
3. Read the NAND page sector (512 bytes).
4. Read the corresponding ECC bytes (7 or 13 bytes) from the NAND flash spare area.
5. During the read of data and parity bits, the syndrome is calculated. Then the error location search is launched.
6. Wait until the decoding error is ready (DERF bit set in the FMC_BCHISR register), then read the decoding results (errors detected if any, correctable or not, number of errors, bit position) in FMC_BCHDSR0 and FMC_BCHDSRx registers.
7. Thanks to the decoding results, the software can correct the errors in the sector (when possible).
8. Disable ECC by resetting the ECCEN bit in FMC_PCR register.
9. Execute again step 2 to 7 for all relevant sectors of the page.

37.11.7 FMC command sequencer



NAND flash page programming and reading can be performed by the CPU as described in the above sections.
Data sector programming/reading as well as ECC byte programming/reading can also be managed automatically by the FMC command sequencer for command and address transfers, and by DMA for data transfers.

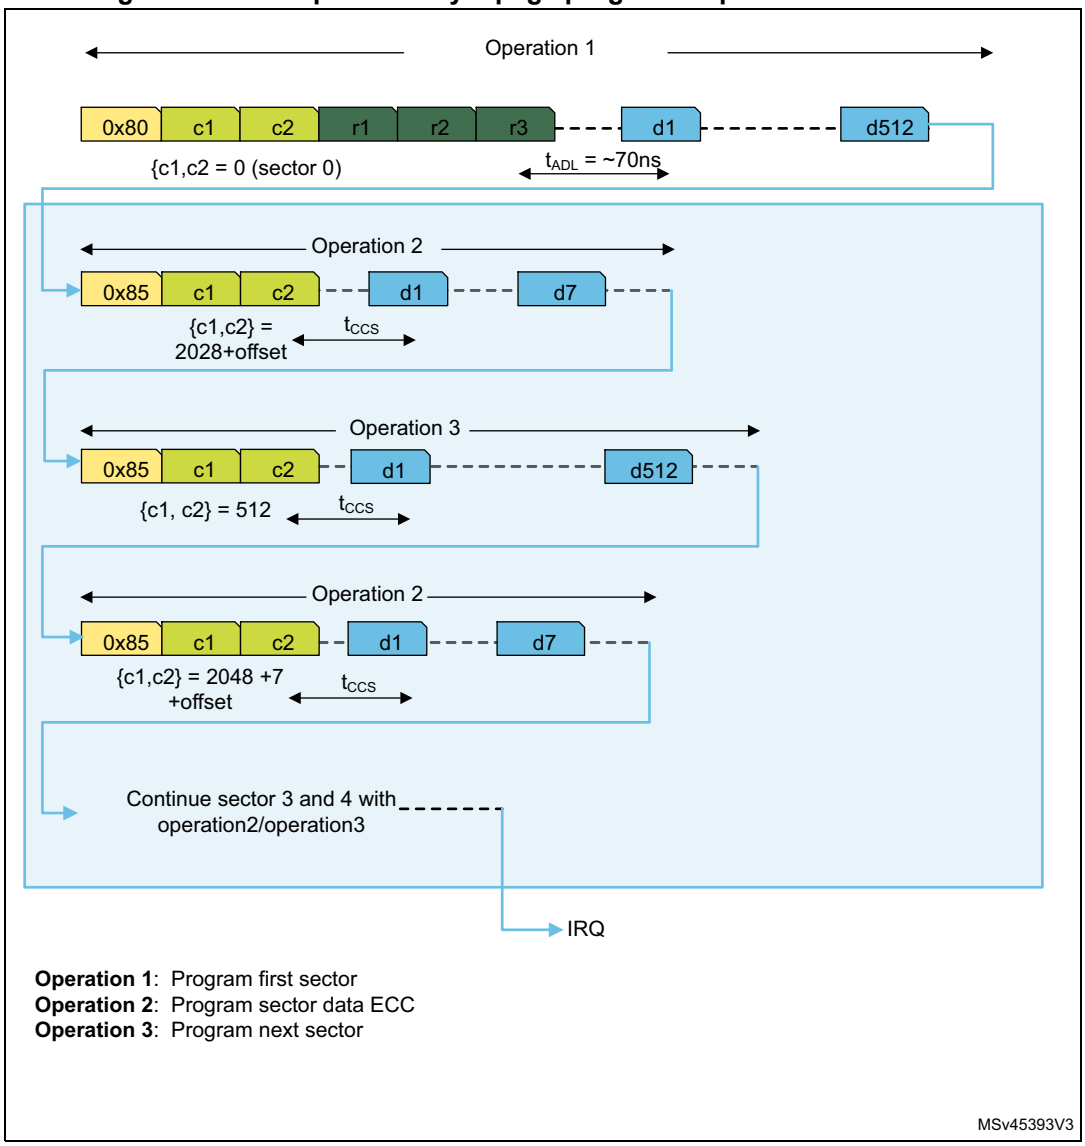
The purpose of the command sequencer is to ease the programming/reading of NAND flash pages with ECC computation as well as free the CPU of sequencing tasks. The command sequencer enables the software to work on full NAND flash pages instead of sectors, which is more efficient and essential to achieve high throughput. The sequencer handles all the sectors in the page. It does not support sub-page read or program operations.

One DMA channel is required for write operations and two DMA channels for read operations.

A specific NAND flash page layout must be respected when using the BCH algorithm. See *Figure 235* for an example of 2Kbyte page BCH layout.

Figure 235. NAND flash page (2 Kbytes) layout with BCH

Page program sequence



1. A data buffer located in SRAM has to be initialized with the data to be written to the NAND flash page.
2. The CPU configures the FMC command sequencer registers: page program command (0x80), address bytes, change write column command (0x85), ECC address offset, page size, sector size and sector number. It also selects the chip enable.

   It also selects the ECC algorithm (Hamming or BCH) and configures one DMA channel to transfer data from the buffer to the NAND flash page.
3. The CPU then launches the sequencer by setting the CSQSTART bit in the FMC_CSQCR register.
4. The command sequencer automatically generates the control and address cycles to the NAND flash memory, following the programmed timings configured either in FMC_PMEM or FMC_PATT register.
5. A DMA request is issued to start data transfer from the data buffer to NAND flash memory.
6. When the full sector is programmed, go to step 7 if ECC is enabled. Otherwise, jump to step 9.
7. The FMC command sequencer automatically issues a change write column command (0x85) followed by two address cycles. The command to be issued and the number of address cycles are programmed in FMC_CSQCFGR2 register. The address is automatically generated from the programmed ECC address offset.
8. Once the parity bytes are available in ECC encoder (Hamming or BCH) module, they are automatically transferred to the NAND flash spare area. The FMC command sequencer can generate a sector transfer complete interrupt if it has been previously enabled.
9. The sequencer then repeats step 4 (except that it performs only a change write column command instead of a page program command) to step 8 to program the following sectors and their corresponding ECC parity bytes. The ECC address offset is automatically incremented for each sector transfer. When ECC is disabled, the sequencer repeats step 5.
10. The FMC command sequencer can generate a transfer complete interrupt or a transfer complete error interrupt by sector or when all sectors are written.
11. The CPU can program any further metadata in the NAND flash area, taking care not to overwrite parity bytes.
12. The program command (0x10) can then be written to the command section to program the NAND flash memory.

13. An interrupt, if enabled, is generated on the rising edge of the Ready/Busy (RNB) signal to indicate that the page program operation is complete.

Refer to *Figure 236* for an overview of the page program sequence with BCH.

Figure 236. Example of 2 Kbyte page program sequence with 4-bit BCH

Page read sequence

1. A data buffer is allocated in SRAM to store the NAND flash page data. A decoding status buffer is also allocated to store result of ECC decoding.
2. The CPU programs the command sequencer registers: the page read first cycle command (0x00), address bytes, the page read second cycle command (0x30), change read column command (0x05), spare area offset, page size, sector size and sector number. It also selects the chip enable.

   It configures the ECC algorithm if required (Hamming or BCH), one DMA channel to handle data transfers from the NAND flash page to the data buffer, and a second DMA

channel to transfer ECC decoding results from ECC status registers to the RAM decoding status buffer.

3. The CPU then launches the FMC sequencer by setting the CSQSTART bit in the FMC_CSQCR register.
4. The FMC command sequencer issues the command and address cycles to the NAND flash memory.
5. The command sequencer waits for a Ready/Busy (RNB) rising edge to start data transfer.
6. It sends a DMA request to launch the data transfer from the NAND flash page to the data buffer.
7. When all sector data are read, go to step 8 if ECC is enabled, otherwise go to step 9. The FMC command sequencer can generate a sector transfer complete interrupt if it has been previously enabled.
8. When ECC status registers are empty (because the Hamming error code or the BCH error position bits of previous sector have already been read), the ECC command sequencer automatically issues a change read column command (0xE0) followed by two address cycles and by the 0xE0 command, to read ECC bytes from NAND flash memory and store them in ECC registers. These commands as well as the number of address cycles are programmed in the FMC_CSQCFGR2 register (see *Figure 237*).

   The address in spare area is extracted from the programmed ECC address offset.

   When the Hamming algorithm is used, a DMA request to the second DMA channel is send to transfer ECC codes (FMC_HPR and FMC_HECCR registers) to the decoding status buffer.

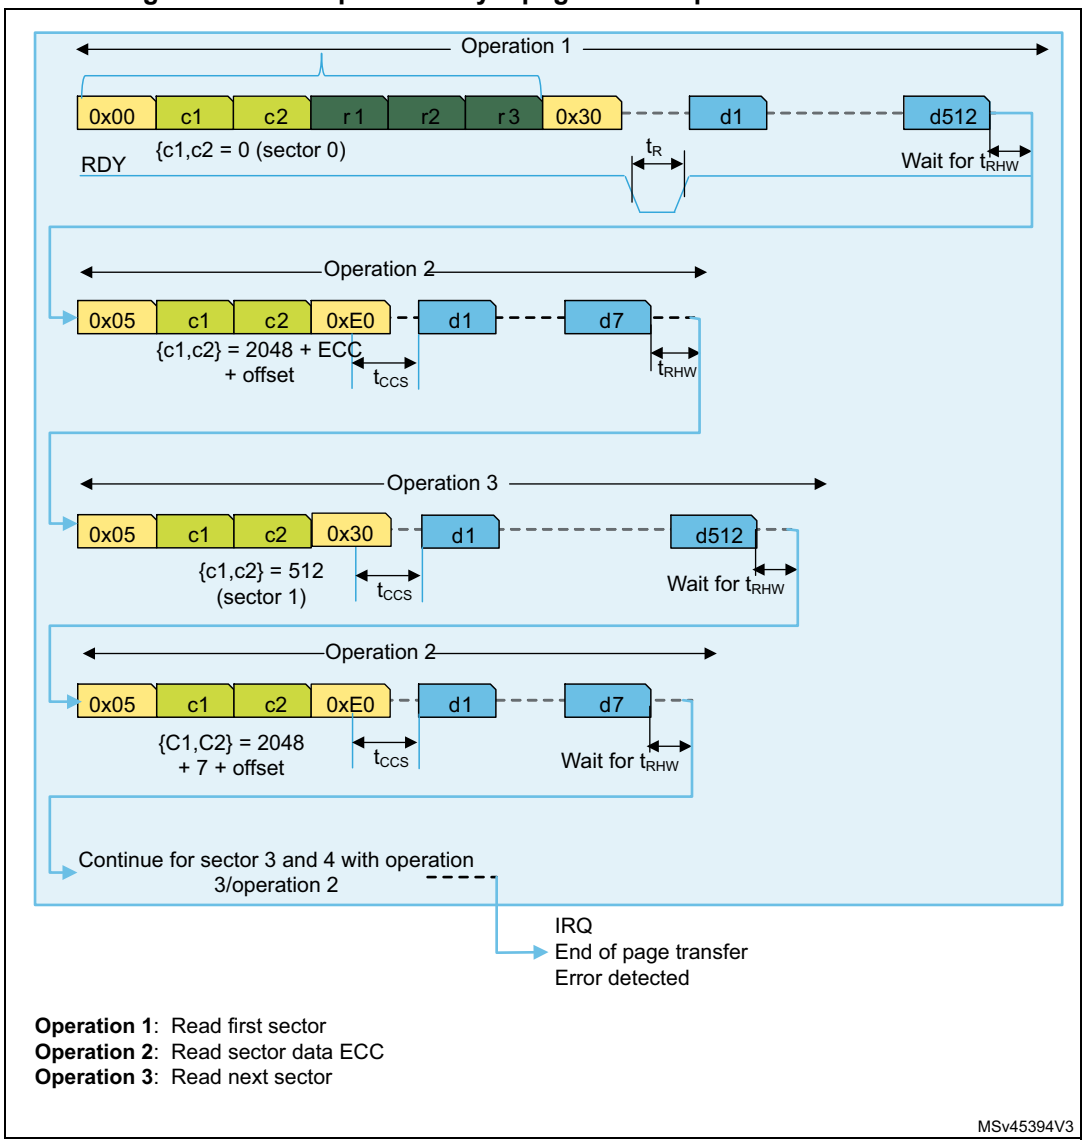
   When BCH algorithm is used, once all the parity bytes have been read, the BCH decoder first processes the syndrome to detect errors and then searches for error positions if any.

   As the BCH decoder is pipelined, it is possible to start reading a sector even if the decoding of the previous sector is not complete.

   In parallel of the following steps, when BCH sector decoding is complete, the new error status is stored in the ECC status registers (FMC_BCHDSR0) and a DMA request to the second DMA channel is sent to transfer data from the status registers to the decoding status buffer located in RAM.
9. The FMC command sequencer then repeats step 4 (except that a change read column command is issued instead of the page read first cycle command) to step 8 to read the other sectors and their corresponding ECC bytes. The addresses are issued and incremented following the page size, number of sectors, spare area address offset address and BCH code selection. When the read sequence is complete, the command sequencer waits for t_{RHWL} before issuing a new command sequence (refer to *Figure 236*). When ECC is disabled, the sequencer repeats step 6.
10. Once all sectors within a page and the status registers (FMC_BCHDSRx) are transferred by the command sequencer, the ECC controller can generate the transfer complete interrupt or transfer complete error (when enabled).
11. By reading the decoding status buffer, the CPU can start processing the errors corresponding to each sector. If no error has been detected, the page stored in RAM is validated. Otherwise the CPU corrects the error(s) before validating the page buffer in RAM. If there are too many errors, the CPU can detect the page cannot be corrected and invalidate the data buffer.

Following the selected BCH code, if the number of detected errors exceeds the number of correctable errors, this bit is not significant and the DUE bit is set. If the number of errors the detected by the BCH decoder exceeds the maximum number of detectable errors, DEN and DUE bits are not significant.

The DMA channels can also send interrupts each time a data transfer is complete. This allows the CPU to process error(s) in a sector as soon as it is available.



Note: When using the sequencer and DMA channels, the CPU must not read the FMC_BCHPBRx and FMC_BCHDSRx registers before data of all sectors are transferred, that is when TCF flag is set in the FMC_CSQISR register.

Figure 237. Chained-page read command timings

An example of 2 Kbyte page read sequence with BCH is described in *Figure 238*. This example corresponds to four 512-byte sectors and 7 ECC bytes per data 512 bytes.

Figure 238. Example of 2-Kbyte page read sequence with 4-bit BCH

The BCH controller resets the ECC computation whenever a page read (0x00), a page program (0x80), a random read (0x05) or a random program command ((0x85) is issued.

When only part of a page is written/read using the BCH, the command sequencer issues a random read/write command sequence only for the number of sectors to be read/written. This is done by programming the number of sector to be processed.

FMC command sequencer configuration

1. Configure the FMC_CSQCFGR1 register: program the command1 and the command 2 (in case of read access), the number of address cycles to be issued, configure the read or write sequence, and select the timings to be used.
2. Configure the address bytes in FMC_CSQAR1 and FMC_CSQAR2 register.
3. In the FMC_CSQCFGR2 register, configure the change write or change read column commands and the timings to be used for ECC. Program the address offset for the random columns in the FMC_CSQAR2 register. Enable the DMA if it is needed for ECC status register transfer.
4. Configure the number of sectors and the address cycle timings in the FMC_CSQCFGR3 register.
5. Configure the ECC sector size, and select read or write access in the FMC_PCR register.
6. Enable the SQSDTEN bit in the FMC_CSQFCGR2 register. The ECCEN bit in the FMC_PCR register kept at 0.
7. Transfer complete, and transfer error complete or sector transfer complete can be enabled through the FMC_CSQIER register.

37.11.8 NAND flash controller interrupt

An interrupt can be generated on the following events:

- RNB rising edge: an interrupt is generated when a rising edge is detected on RNB NAND flash signal
- RNB falling edge: an interrupt is generated when a falling edge is detected on RNB NAND flash signal
- RNB high-level: an interrupt is generated when a high-level is detected on RNB NAND flash signal.
- Transfer complete: an interrupt is generated when the FMC command sequencer has completed all data transfers for all sectors or when the command sequencer was aborted.
- Sector complete interrupt: an interrupt is generated when the FMC command sequencer has completed all data transfers for one sector.
- Sector error interrupt: an interrupt is generated when the FMC command sequencer has completed a sector transfer with at least one error detected.
- Sector uncorrectable error interrupt: an interrupt is generated when the FMC command sequencer has completed a sector transfer and detected an uncorrectable error.
- Command transfer complete: the command sequencer has completed the transfer of programmed commands and addresses.
- BCH encoder parity bits ready: an interrupt is generated when the BCH encoder has finished processing parity bits.
- BCH decoder syndrome ready: an interrupt is generated when the BCH decoder has finished processing the syndrome and knows if errors have been detected or not.
- BCH decoder error found: an interrupt is generated when the BCH decoder has detected an error.
- BCH decoder error ready: an interrupt is generated when the BCH decoder has finished processing errors, has identified error locations and can then correct them.
- BCH decoder uncorrectable error: an interrupt is generated when the BCH decoder has detected that the errors cannot be corrected (more than four or eight errors according to BCH error correction capability configuration).

The interrupt source can be enabled or disabled separately through the FMC_ IER, FMC_CSQIER and FMC_BCHIER registers.

Table 307. FMC NAND controller Interrupt request

Interrupt event	Event Flag	Enable control bit
Transfer complete	TCF in FMC_CSQISR	TCIE in FMC_CSQIER
Sector complete	SCF in FMC_CSQISR	SCIE in FMC_CSQIER
Sector error	SEF in FMC_CSQISR	SEIE in FMC_CSQIER
Sector uncorrectable error	SUEF in FMC_CSQISR	SUEIE in FMC_CSQIER
Command transfer complete	CMDTCF in FMC_CSQISR	CMDTCIE in FMC_CSQIER
BCH encoder parity bits ready	EPBRF in FMC_BCHISR	EPBRIE in FMC_BCHIER
BCH decoder syndrome ready	DSRF in FMC_BCHISR	DSRIE in FMC_BCHIER
BCH decoder error found	DEFF in FMC_BCHISR	DEFIE in FMC_BCHIER

Table 307. FMC NAND controller Interrupt request (continued)

Interrupt event	Event Flag	Enable control bit
BCH decoder error ready	DERF in FMC_BCHISR	DERIE in FMC_BCHIER
BCH decoder uncorrectable error	DUEF in FMC_BCHISR	DUEIE in FMC_BCHIER

37.11.9 NAND flash controller registers

NAND flash programmable control register (FMC_PCR)

Address offset: 0x80

Reset value: 0x0007 FE08

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	WEN	BCHECC	Res.	Res.	Res.	Res.	ECCSS[2:0]			TAR [3]
						rw	rw					rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TAR[2:0]			TCLR[3:0]				ECCALG	Res.	ECCEN	PWID[1:0]		Res.	PBKEN	PWAITEN	Res.
rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw		rw	rw	

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **WEN:** Write enable

This bit enables read or write access. It must be configured when using the FMC sequencer or when the ECC with BCH code is enabled. It can only be modified when ECCEN bit is reset.

0: Read access enabled

1: Write access enabled

Bit 24 **BCHECC:** BCH error correction capability

0: 4-bit BCH (4-bit error correction and 8-bit error detection per 512 bytes)

1: 8-bit BCH (8-bit error correction and 16-bit error detection per 512 bytes)

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:17 **ECCSS[2:0]:** ECC sector size (used to access spare area)

These bits define the sector size used for the ECC:

000: 256 bytes

001: 512 bytes

010: 1024 bytes

011: 2048 bytes (default)

100: 4096 bytes

101: Reserved.

11X: Reserved.

When the ECC is enabled with BCH code, the sector size must be programmed to 512 bytes.

Bits 16:13 **TAR[3:0]:** ALE to RE delay.

These bits define the time from ALE low to RE low in number of fmc_ker_ck clock cycles:
t_ar ≤ (TAR +1) × $t_{fmc_ker_ck}$
where $t_{fmc_ker_ck}$ is the FMC clock period and *t*_ar is the ALE to RE timing of NAND flash memories.
0000: 1 * fmc_ker_ck cycle
1111: 16 * fmc_ker_ck cycles (default)

Bits 12:9 **TCLR[3:0]:** CLE to RE delay.

These bits define the time from CLE low to RE low in number of fmc_ker_ck clock cycles:
t_clr ≤ (TCLR +1) × $t_{fmc_ker_ck}$
where $t_{fmc_ker_ck}$ is the FMC clock period and *t*_clr is the CLE to RE timing of NAND flash memories.
0000: 1 * fmc_ker_ck cycle
1111: 16 * fmc_ker_ck cycles (default)

Bit 8 **ECCALG:** ECC algorithm

0: Hamming code is selected (default).
1: BCH code is selected.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **ECCEN:** ECC computation logic enable bit

0: ECC logic is disabled and reset (default after reset),
1: ECC logic is enabled.
This bit must be kept reset when using the FMC sequencer

Bits 5:4 **PWID[1:0]:** Data bus width

These bits define the external memory device width.
00: 8 bits (default after reset).
01: 16 bits
1X: Reserved.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **PBKEN:** NAND flash memory region enable bit

This bit enables the memory region. Accessing a disabled memory region causes an AXI bus error.
0: Corresponding memory region is disabled (default after reset)
1: Corresponding memory region is enabled.

Note: The NAND flash memory region must be disabled only when all NAND flash controller commands are complete.

Bit 1 **PWAITEN:** Wait feature enable bit

This bit enables the Wait feature for the NAND flash memory region:
0: disabled (default)
1: enabled

Bit 0 Reserved, must be kept at reset value.

FMC status register (FMC_SR)

Address offset: 0x84

Reset value: 0x0000 0053

This register contains information about the AXI interface isolation status and the NAND write requests status. The FMC has to be disabled before modifying some registers. As requests might be pending, it is necessary to wait till the AXI interface is stable and the core of the block is totally isolated from its AXI interface before reconfiguring the registers.

The PEF and NWEF bits indicate the status of the pipe. If Hamming algorithm is used, the ECC is calculated while data are written to the memory. To read the correct ECC, the software must consequently wait until no write request to the NAND controller are pending, by polling PEF and NWRF bits.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NWRF	Res.	PEF	Res.	Res.	ISOST[1:0]	
									r		r			r	r

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **NWRF:** NAND write request flag

This bit provides the status of the write request issued to the NAND flash memory. When this bit is set, all write requests to the NAND controller are served.

0: NAND flash write requests are pending

1: No NAND flash write requests pending

Bit 5 Reserved, must be kept at reset value.

Bit 4 **PEF:** Pipe Empty Flag

This bit indicates if the pipe contains requests.

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **ISOST[1:0]:** FMC isolation state with respect to the AXI interface

00: FMC is not isolated; AXI transactions are treated by the FMC and its controllers.

01: FMC has been enabled (FMCEN = 1) and waits for the end of pending AXI transactions (which leads to error responses) before going to “non-isolated” state.

10: FMC has been disabled (FMCEN = 0) and waits for the end of pending AXI transactions before going to isolation state.

11: FMC is isolated from its AXI interface. All AXI requests lead to error responses.

FMC common memory space timing register (FMC_PMEM)

Address offset: 0x88

Reset value: 0x0A0A 0A0A

The FMC_PMEM read/write register contains NAND flash memory region timing information. This information is used to access the NAND flash common memory space for command, address write accesses or data read/write accesses.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MEMHIZ[7:0]								MEMHOLD[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MEMWAIT[7:0]								MEMSET[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **MEMHIZ[7:0]:** Common memory data bus Hi-Z time

These bits define the number of fmc_ker_ck clock cycles (+1) during which the data bus is kept Hi-Z after starting a NAND flash write access to the common memory space. This is only valid for write transactions:

0000 0000: 1 * fmc_ker_ck cycle

0000 0001: 2 * fmc_ker_ck cycles

.....

1111 1111: 256 * fmc_ker_ck cycles

Bits 23:16 **MEMHOLD[7:0]:** Common memory hold time

These bits define the number of fmc_ker_ck clock cycles (+1) during which the address is held (and data for write accesses) after the command is deasserted (NWE, NOE), during NAND flash read or write accesses to the common memory space:

0000 0000: 1 * fmc_ker_ck cycle

0000 0001: 2 * fmc_ker_ck cycles

.....

1111 1111: 256 * fmc_ker_ck cycles

Bits 15:8 **MEMWAIT[7:0]:** Common memory wait time

These bits define the minimum number of fmc_ker_ck clock cycles (+1) to assert the command (NWE, NOE), during NAND flash read or write accesses to the common memory space. The duration of command assertion is extended if the wait signal (NWAIT) is active (low) at the end of the programmed value of fmc_ker_ck:

0000 0000: 1 * fmc_ker_ck cycles (+ wait cycle introduced by deasserting NWAIT)

0000 0001: 2 * fmc_ker_ck cycles (+ wait cycle introduced by deasserting NWAIT)

.....

1111 1111: 256 * fmc_ker_ck cycles (+ wait cycle introduced by deasserting NWAIT)

Bits 7:0 **MEMSET[7:0]:** Common memory setup time

These bits define the number of fmc_ker_ck clock cycles (+1) to set up the address before the command assertion (NWE, NOE), during NAND flash read or write accesses to the common memory space:

0000 0000: 1 * fmc_ker_ck cycles

0000 0001: 2 * fmc_ker_ck cycles

.....

1111 1111: 256 * fmc_ker_ck cycles

FMC attribute memory space timing registers (FMC_PATT)

Address offset: 0x8C

Reset value: 0x0A0A 0A0A

The FMC_PATT read/write register contains NAND flash memory region timing information. It is used for 8-bit accesses to the NAND flash attribute memory space during the last address write access when the timing differs from previous accesses (for Ready/Busy management, refer to *Section 37.11.5: NAND flash prewait function*).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ATTHIZ[7:0]								ATTHOLD[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ATTWAIT[7:0]								ATTSET[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **ATTHIZ[7:0]:** Attribute memory data bus Hi-Z time

These bits define the number of fmc_ker_ck clock cycles (+1) during which the data bus is kept in Hi-Z after starting a NAND flash write access to the attribute memory space. These bits are only valid for write transactions:
0000 0000: 1 * fmc_ker_ck cycle
0000 0001: 2 * fmc_ker_ck cycle
.....
1111 1111:256 * fmc_ker_ck cycles

Bits 23:16 **ATTHOLD[7:0]:** Attribute memory hold time

These bits define the number of fmc_ker_ck clock cycles (+1) during which the address is held (and data for write access) after the command deassertion (NWE, NOE), during NAND flash read or write accesses to the attribute memory space:
0000 0000: 1 * fmc_ker_ck cycle
0000 0001: 2 * fmc_ker_ck cycle
.....
1111 1111:256 * fmc_ker_ck cycles.

Bits 15:8 **ATTWAIT[7:0]:** Attribute memory wait time

These bits define the minimum number of x fmc_ker_ck (+1) clock cycles to assert the command (NWE, NOE), during NAND flash read or write accesses to the attribute memory space. The duration of command assertion is extended if the wait signal (NWAIT) is active (low) at the end of the programmed value of fmc_ker_ck:
0000 0000: 1 * fmc_ker_ck cycle (+ wait cycle introduced by deassertion of NWAIT)
0000 0001: 2 * fmc_ker_ck cycles (+ wait cycle introduced by deassertion of NWAIT)
.....
1111 1111: 256 * fmc_ker_ck cycles (+ wait cycle introduced by deasserting NWAIT)

Bits 7:0 **ATTSET[7:0]:** Attribute memory setup time

These bits define the number of fmc_ker_ck clock cycles (+1) for address set up before the command assertion (NWE, NOE), during NAND flash read or write accesses to the attribute memory space:
0000 0000: 1 * fmc_ker_ck cycle
0000 0001: 2 * fmc_ker_ck cycle
.....
1111 1111:256 * fmc_ker_ck cycles.

FMC Hamming parity result registers (FMC_HPR)

Address offset: 0x90

Reset value: 0x0000 0000

This register is used during read accesses in conjunction with the FMC sequencer. It contains the current error correction code value computed by the FMC NAND controller Hamming module. When the FMC sequencer reads data from a NAND flash memory page at the correct address, the data read are automatically processed by the Hamming computation module. When X bytes have been read (according to the sector size ECCSS field in the FMC_PCR register), the CPU must read the computed ECC value from the FMC_HECCR register. It then verifies if these computed parity data are the same as the parity value recorded in the spare area and stored in the and the FMC_HPR, to determine whether a page is valid, and to correct it otherwise. The FMC_HPR register must be cleared after being read by setting the ECCEN bit to 0. To compute a new data block, the ECCEN bit must be set.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

HPR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **HPR[31:0]:** Hamming parity result

This field contains the parity value computed by the Hamming ECC computation module. *Table 308* describes the contents of these bitfields.

Table 308. HPR relevant bits

ECCSS[2:0]	Sector size in bytes	HPR bits
000	256	HPR[21:0]
001	512	HPR[23:0]
010	1024	HPR[25:0]
011	2048	HPR[27:0]
100	4096	HPR[29:0]
101	8192	HPR[31:0]

FMC Hamming code ECC result register (FMC_HECCR)

Address offset: 0x94

Reset value: 0x0000 0000

This register contain the current error correction code value computed by the FMC NAND controller Hamming module.When the CPU reads/writes data from/to a NAND flash memory page at the correct address (refer to *Section 37.11.6: NAND ECC controller*), the data read/written from/to the NAND flash memory are automatically processed by the Hamming computation module. When X bytes have been read (according to the sector size ECCSS

field in the FMC_PCR register), the CPU must read the computed ECC value from the FMC_HECCR register. It then verifies if these computed parity data are the same as the parity value recorded in the spare area, to determine whether a page is valid, and to correct it otherwise. The FMC_HECCR register must be cleared after being read by setting the ECCEN bit to 0. To compute a new data block, the ECCEN bit must be set.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **HECC[31:0]:** ECC result

This field contains the value computed by the Hamming ECC computation logic. *Table 309* describes the contents of these bitfields.

Table 309. ECC result relevant bits(1)

ECCSS[2:0]	Sector size in bytes	HECC bits
000	256	HECC[21:0]
001	512	HECC[23:0]
010	1024	HECC[25:0]
011	2048	HECC[27:0]
100	4096	HECC[29:0]
101	8192	HECC[31:0]

1. Only the relevant bits according to the sector size are valid.

FMC NAND interrupt enable register (FMC_IER)

Address offset: 0x180

Reset value: 0x0000 0000

This register configures the interrupt capability generation when the RNB signal is connected on FMC interrupt pin. An interrupt can be generated on the rising edge, falling edge or high level detected on the RNB signal.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IFEE	IHLE	IREE
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IFEE:** Interrupt falling edge detection enable bit
0: Interrupt falling edge detection request disabled
1: Interrupt falling edge detection request enabled

Bit 1 **IHLE:** Interrupt high-level detection enable bit
0: Interrupt high-level detection request disabled
1: Interrupt high-level detection request enabled

Bit 0 **IREE:** Interrupt rising edge detection enable bit
0: Interrupt rising edge detection request disabled
1: Interrupt rising edge detection request enabled

FMC interrupt status register (FMC_ISR)

Address offset: 0x184

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IFEF	IHLF	IREF
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IFEF:** Interrupt falling edge flag
The flag is set by hardware and cleared by setting the CFEIF bit.
0: No interrupt falling edge occurred
1: Interrupt falling edge occurred

Bit 1 **IHLF:** Interrupt high-level flag
The flag is set by hardware and cleared by setting the CHLIF bit.
0: No Interrupt high-level occurred
1: Interrupt high-level occurred

Bit 0 **IREF:** Interrupt rising edge flag
The flag is set by hardware and cleared by setting the CREIF bit.
0: No interrupt rising edge occurred
1: Interrupt rising edge occurred

FMC NAND controller interrupt clear register (FMC_ICR)

Address offset: 0x188

Reset value: 0x0000 0000

Writing 1 in one of these bits clears the corresponding flag in the interrupt status register (FMC_ISR).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CIFEF	CIHLF	CIREF
													w	w	w

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CIFEF:** Clear Interrupt falling edge flag
0: No effect
1: Clears the IFEF flag in the FMC_ISR register

Bit 1 **CIHLF:** Clear Interrupt high-level flag
0: No effect
1: Clears the IHLF flag in the FMC_ISR register

Bit 0 **CIREF:** Clear Interrupt rising edge flag
0: No effect
1:Clear the IREF flag in the FMC_ISR register

FMC NAND command sequencer control register (FMC_CSQCR)

Address offset: 0x200

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CSQSTART
															w

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **CSQSTART**: Command Sequencer Enable
Writing 1 starts the Command sequencer.
Writing 0 has no effect.

Note: Write this bit to 1 to start the sequencer only when the FMC is enabled by setting FMCEN bit of FMC_CFGR to 1 and the NAND flash controller is activated by setting PBKEN bit of FMC_PCR to 1.

FMC NAND command sequencer configuration register 1 (FMC_CSQCFGR1)

Address offset: 0x204

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	CMD2T	CMD1T	CMD2[7:0]							
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CMD1[7:0]								Res.	ACYNBR[2:0]			Res.	DMADEN	CMD2EN	Res.
rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw		rw	rw	

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **CMD2T:** Command 2 Sequencer timings

This bit specifies if the Command 2 (CMD2) is issued to the NAND flash memory with the timings defined in FMC_PMEM or FMC_PATT register.

0: CMD2 issued with the timings programmed in FMC_PMEM

1: CMD2 issued with the timings programmed in FMC_PATT

Bit 24 **CMD1T:** Command 1 Sequencer timings

This bit specifies if the Command 1 (CMD1) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or FMC_PATT register.

0: CMD1 issued with the timings programmed in FMC_PMEM

1: CMD1 issued with the timings programmed in FMC_PATT

Bits 23:16 **CMD2[7:0]:** Command 2 sequencer

These bits specify if the Command 2 is issued by the command sequencer for the command second cycle during read operations.This command is only issued when the CMD2EN bit is set.

Example: CMD2[7:0] bits must be programmed to 0x30 to issue the read column command.

Bits 15:8 **CMD1[7:0]:** Command 1 sequencer

These bits specify if the Command 1 is issued by the command sequencer for the first cycle during read or write operations.

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **ACYNBR[2:0]:** Address Cycle number

These bits define the number of address cycles to be generated by the command sequencer when issuing the command programmed in the registers.

000: No address cycle.

001: 1 address cycle

010: 2 address cycles

011: 3 address cycles

100: 4 address cycles

101: 5 address cycles

Others: Reserved.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **DMADEN:** Command sequencer DMA request data enable

When this bit is set, the command sequencer generates a DMA request to the first DMA channel, to transfer data from/to NAND flash memory.

0: No DMA request transfer

1: A DMA request transfer

Bit 1 **CMD2EN:** Command cycle 2 Enable

This bit specifies that the command cycle 2 has to be generated by the command sequencer.

0: Command cycle 2 not issued.

1: Command cycle 2 (programmed CMD2[7:0]) sent by the command sequencer to the NAND flash memory after the address cycles.

Bit 0 Reserved, must be kept at reset value.

FMC NAND command sequencer configuration register 2 (FMC_CSQCFGR2)

Address offset:0x208

Reset value: 0x0000 0000

This register is used to configure the command sequencer to issue random read/ write commands to read/ write data by sector and automatically read/write data from NAND flash memory at a programmable address offset. This is useful when performing a sector read/write operation followed by an ECC read/write operation in the NAND flash spare area.The command sequencer generates the random commands until all the sectors are read/written.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	RCMD2T	RCMD1T	RCMD2[7:0]							
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RCMD1[7:0]								Res.	Res.	Res.	Res.	Res.	DMASEN	RCMD2EN	SQSDTEN
rw	rw	rw	rw	rw	rw	rw	rw						rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **RCMD2T:** Command 1 sequencer timings

This bit specifies if the CMD1 is issued to the NAND flash memory with the timings programmed in FMC_PMEM or FMC_PATT register.

0: CMD1 issued with the timings programmed in FMC_PMEM

1: CMD1 issued with the timings programmed in FMC_PATT

Bit 24 **RCMD1T:** Command 1 sequencer timings

This bit specifies if the CMD1 is issued to the NAND flash memory with the timings flash memory in FMC_PMEM or FMC_PATT register.

0: CMD1 issued with the timings programmed in FMC_PMEM

1: CMD1 issued with the timings programmed in FMC_PATT

Bits 23:16 **RCMD2[7:0]:** Random Command 2 sequencer

These bits specify that the command 2 is issued by the command sequencer for the second cycle during read operations.This command is only issued when the RCMD2EN bit is set.
Example: the RCMD2 (0xE0) is required to issue the random read column command.

Bits 15:8 **RCMD1[7:0]:** Random Command 1 sequencer

These bits specify that the command 1 value is issued by the command sequencer for the first cycle during read or write accesses.

Bits 7:3 Reserved, must be kept at reset value.

Bit 2 **DMASEN:** Command sequencer DMA request decoding status enable

When this bit is set, the command sequencer generates a DMA request to the second DMA channel when valid bits are available in the ECC status register at the end of ECC processing (decoding).
0: No DMA request used for ECC status registers transfer
1: A DMA request used for ECC status registers transfer

Note: This bit must be set only during a page read sequence to offload the saving of the ECC results between sectors by using a second DMA channel.

Bit 1 **RCMD2EN:** Random Command 2 sequencer enable

This bit enables the command 2 to be issued by the command sequencer during read accesses. This command is issued only when the CMD2SQEN bit is set.
0: Command 2 not issued.
1: Command 2 (CMD2SQ[7:0]) issued by the command sequencer to NAND flash memory after the address cycle.

Bit 0 **SQSDTEN:** Sequencer spare data transfer enable

This bit enables the sequencer to access the spare data area after each sector transfer. It also enables the ECC when using the sequencer. ECCEN bit in FMC_PCR register must be reset.
0: ECC disabled and spare data area not accessed by the sequencer
1: ECC enabled and spare data area read or programmed by the sequencer after each sector transfer

FMC NAND sequencer configuration register 3 (FMC_CSQCFGR3)

Address offset: 0x20C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	SNBR[5:0]						Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
		rw	rw	rw	rw	rw	rw								

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **RAC2T:** Random Address cycle 2 sequencer timings

This bit specifies if the random Address cycle 2 (ADDC2) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or in FMC_PATT register.

0: Random ADDC2 issued with the timings programmed in FMC_PMEM

1: Random ADDC2 issued with the timings programmed in FMC_PATT

Bit 22 **RAC1T:** Random Address cycle 1 sequencer timings

This bit specifies if the random Address cycle 1 (ADDC1) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or in FMC_PATT register.

0: Random ADDC1 issued with the timings programmed in FMC_PMEM

1: Random ADDC1 issued with the timings programmed in FMC_PATT

Bit 21 **SDT:** Spare data transfer sequencer timings

This bit specifies if the spare data transfer for read and write operations from/to the NAND flash memory are performed with the timings programmed in FMC_PMEM or FMC_PATT register.

0: Spare data transfer issued with the timings programmed in FMC_PMEM

1: Spare data transfer issued with the timings programmed in FMC_PATT

Bit 20 **AC5T:** Address cycle 5 sequencer timings

This bit defines if the Address cycle 5(ADDC1) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or FMC_PATT register.

0: ADDC5 issued with the timings programmed in FMC_PMEM

1: ADDC5 issued with the timings programmed in FMC_PATT

Bit 19 **AC4T:** Address cycle 4sequencer timings

This bit defines if the Address cycle 4 (ADDC4) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or FMC_PATT register.

0: ADDC4 issued with the timings programmed in FMC_PMEM

1: ADDC4 issued with the timings programmed in FMC_PATT

Bit 18 **AC3T:** Address cycle 3 sequencer timings

This bit defines if the Address cycle 3 (ADDC3) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or FMC_PATT register.

0: ADDC3 issued with the timings programmed in FMC_PMEM

1: ADDC3 issued with the timings programmed in FMC_PATT

Bit 17 **AC2T:** Address cycle 2 sequencer timings

This bit defines if the Address cycle 2 (ADDC2) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or FMC_PATT register.

0: ADDC2 issued with the timings programmed in FMC_PMEM

1: ADDC2 issued with the timings programmed in FMC_PATT

Bit 16 **AC1T:** Address cycle 1 sequencer timings

This bit defines if the Address cycle 1 (ADDC1) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or FMC_PATT register.

0: ADDC1 issued with the timings programmed in FMC_PMEM

1: ADDC1 issued with the timings programmed in FMC_PATT

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **SNBR[5:0]:** Number of sectors to be read/written

These bits define the number of sectors that are processed by the sequencer.
They are used to read/write part of a page or to use the ECC (in particular with the BCH code which requires 512-byte sectors):
000000: 1 sector
000001: 2 sectors
...
111111: 16 sectors
Others: Reserved.

Bits 7:0 Reserved, must be kept at reset value.

FMC NAND command sequencer address register 1 (FMC_CSQAR1)

Address offset: 0x210

Reset value: 0x0000 0000

This register is used to define the value of address cycles 1 to 4 to be issued by the command sequencer.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADDC4[7:0]								ADDC3[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDC2[7:0]								ADDC1[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **ADDC4[7:0]:** Address Cycle 4

These bits define the value of address cycle 4 to be issued by the command sequencer during read or write accesses.

Bits 23:16 **ADDC3[7:0]:** Address Cycle 3

These bits define the value of address cycle 2 to be issued by the command sequencer during read or write accesses.

Bits 15:8 **ADDC2[7:0]:** Address Cycle 2

These bits define the value of address cycle 2 to be issued by the command sequencer during read or write accesses.

Bits 7:0 **ADDC1[7:0]:** Address Cycle 1

These bits define the value of address cycle 1 to be issued by the command sequencer during read or write accesses.

FMC NAND command sequencer address register 2 (FMC_CSQAR2)

Address offset: 0x214

Reset value: 0x0000 0000

This register is used to program the fifth address cycle and the address offset in spare area. It also selects the chip enable.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SAO[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Res.	Res.	Res.	Res.	NAND CEN1	NAND CEN0	Res.	Res.	ADDC5[7:0]							
				rw	rw			rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **SAO[15:0]:** Spare Area Address Offset

These bits define the offset of the first ECC byte in the spare area for the program sequence.

Note: The minimum SAQ value is 2 since the first two bytes of the spare area are reserved for Bad block marking and metadata.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:10 **NANDCEN[1:0]:** NAND flash chip enable number

These bits define the chip enable to be selected by the NAND flash command sequencer.

00: NCE1 chip enable selected

01: NCE2 chip enable selected

10: NCE3 chip enable selected

11: NCE4 chip enable selected

Bits 9:8 Reserved, must be kept at reset value.

Bits 7:0 **ADDC5[7:0]:** Address Cycle 5

These bits define the value of address cycle 5 to be issued by the command sequencer during read or write accesses.

FMC NAND command sequencer interrupt enable register (FMC_CSQIER)

Address offset: 0x220

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bit 4 **CMDTCIE:** Command Transfer Complete interrupt enable
0: Command Transfer Complete Interrupt disable
1: Command Transfer Complete Interrupt enable

Bit 3 **SUEIE:** Sector Uncorrectable Error interrupt enable
0: Command Transfer Complete Interrupt disable
1: Command Transfer Complete Interrupt enable

Bit 2 **SEIE:** Sector Error interrupt enable
0: Sector Error Interrupt disable
1: Sector Error Interrupt enable

Bit 1 **SCIE:** Sector Complete interrupt enable
0: Sector Complete Interrupt disable
1: Sector Complete Interrupt enable

Bit 0 **TCIE:** Transfer Complete Interrupt enable
0: Transfer Complete Interrupt disable
1: Transfer Complete Interrupt enable

FMC NAND command sequencer interrupt status register (FMC_CSQISR)

Address offset: 0x224

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CMDTCF	SUEF	SEF	SCF	TCF
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CMDTCF:** Command Transfer Complete flag
This bit is set when the command sequencer has completed the transfer of programmed commands and addresses.
This bit is cleared by setting CCMDTCF bit. An interrupt can be generated if the CMDTCIE bit is set in the FMC_CSQICR register.
Note: The Sector Transfer Complete interrupt is not needed in sequencer mode.

Bit 3 **SUEF:** Sector Uncorrectable Error flag
This bit is set by hardware and cleared by writing 1 to the CSUEF bit in FMC_CSQICR.
When this bit is set, it indicates that the command sequencer detected an uncorrectable error when decoding a sector. An interrupt can be generated if the SUEIE bit is set in the FMC_CSQICR register.
Note: The SUEF bit is relevant only for BCH code to indicate uncorrectable errors. It must be ignored for Hamming code.

Bit 2 **SEF:** Sector Error flag

This bit is set by hardware and cleared by writing 1 to the CSEF bit in FMC_CSQICR.

This bit is set when the command sequencer has completed the sector data transfer with at least one error detection. An interrupt can be generated if the SEIE bit is set in the FMC_CSQICR register.

Note: The SEF bit is relevant only for BCH code to indicate that errors are present. It must be ignored for Hamming code.

Bit 1 **SCF:** Sector Complete flag

This bit is set by hardware and cleared by writing 1 to the CSCF bit in FMC_CSQICR.

This bit is set when the command sequencer has completed the sector data transfer. An interrupt can be generated if the SCIE bit is set in the FMC_CSQICR register.

Bit 0 **TCF:** Transfer Complete flag

This bit is set by hardware and cleared by writing 1 to the CTCF bit in FMC_CSQICR.

This bit is set when the command sequencer has transferred all the data for all sectors or when the command sequencer was aborted. An interrupt can be generated if the TCIE bit is set in the FMC_CSQICR register.

FMC NAND command sequencer interrupt clear register (FMC_CSQICR)

Address offset: 0x228

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCMDTCF	CSUEF	CSEF	CSCF	CTCF
											w	w	w	w	w

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CCMDTCF:** Clear Command Transfer Complete flag

Writing one clears the CMTCF flag in the FMC_CSQISR register

Bit 3 **CSUEF:** Clear Sector uncorrectable Error flag

Writing one clears the SUEF flag in the FMC_CSQISR register

Bit 2 **CSEF:** Clear Sector Error flag

Writing one clears the SEF flag in the FMC_CSQISR register

Bit 1 **CSCF:** Clear Sector Complete flag

Writing one clears the SCF flag in the FMC_CSQISR register

Bit 0 **CTCF**: Clear Transfer Complete flag

Writing one clears the TCF flag in the FMC_CSQISR register

FMC command sequencer error mapping status register (FMC_CSQEMSR)

Address offset: 0x230

Reset value: 0x0000 0000

This register holds a sector error mapping status when the whole transfer is complete.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

SEM[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SEM[15:0]:** Sector Error mapping

When SEM[i] bit (0 ≤ i ≤ 15) is set, at least one error has been detected on sector i+1.
As an example, SEM[2] and SEM[1] bits are set when errors are detected in sector 3 and 2.

FMC BCH interrupt enable register (FMC_BCHIER)

Address offset: 0x250

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **EPBRIE:** Decoder Parity Bits Ready Interrupt enable

0: Decoder Parity Bits Ready Interrupt disable
1: Decoder Parity Bits Ready Interrupt enable

Bit 3 **DSRIE:** Decoder Syndrome Ready Interrupt enable

0: Decoder Syndrome Ready Interrupt disable
1: Decoder Syndrome Ready Interrupt enable

Bit 2 **DEFIE:** Decoder Error Found Interrupt enable
0: Decoder Error Found Interrupt disable
1: Decoder Error Found Interrupt enable

Bit 1 **DERIE:** Decoder Error Ready Interrupt enable
0: Decoder Error Ready Interrupt disable
1: Decoder Error Ready Interrupt enable

Bit 0 **DUEIE:** Decoder Uncorrectable Errors Interrupt enable
0: Decoder Uncorrectable Errors Interrupt disable
1: Decoder Uncorrectable Errors Interrupt enable

FMC BCH interrupt and status register (FMC_BCHISR)

Address offset: 0x254

Reset value: 0x0000 0000

This register holds the status of BCH encoder/decoder after processing each sector. When the sequencer is used, this register is automatically cleared and the corresponding interrupt must not be enabled through FMC_BCHIER register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EPBRF	DSRF	DEFF	DERF	DUEF
											r	r	r	r	r

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **EPBRF:** Encoder Parity Bits Ready flag
This bit is set when the BCH encoder parity bits are available in FMC_BCHPBR1 to 4.

Bit 3 **DSRF:** Decoder Syndrome Ready flag
This bit is set when the syndrome is ready and DEFF is a valid field.

Bit 2 **DEFF:** Decoder Error Found flag
This bit is set by hardware and cleared by writing 1 to CDEFF.
This bit indicates that at least one error has been detected in the sector.

Bit 1 **DERF:** Decoder Error Ready flag
This bit indicates that the decoder has finished searching errors and identifying their location. The number of errors and their location are available in FMC_BCHDSR0 and FMC_BCHDSR1 to 4, respectively.

Bit 0 **DUEF:** Decoder Uncorrectable Errors flag
This field indicates that too many errors have been detected in the sector during the BCH decoding and that the sector is uncorrectable.

FMC BCH interrupt clear register (FMC_BCHICR)

Address offset: 0x258

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CEPBRF	CDSRF	CDEFF	CDERF	CDUEF
											w	w	w	w	w

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CEPBRF:** Clear Encoder Parity Bits Ready flag
Writing 1 clears the EPBRF flag in FMC_BCHISR.

Bit 3 **CDSRF:** Clear Decoder Syndrome Ready flag
Writing 1 clears the DSRF flag in FMC_BCHISR.

Bit 2 **CDEFF:** Clear Decoder Error Found flag
Writing 1 clears the DEFF flag in FMC_BCHISR.

Bit 1 **CDERF:** Clear Decoder Error ready flag
Writing 1 clears the DERF flag in FMC_BCHISR.

Bit 0 **CDUEF:** Clear Decoder Uncorrectable Error flag
Writing 1 clears the DUEF flag in FMC_BCHISR.

FMC BCH parity bits register 1 (FMC_BCHPBR1)

Address offset: 0x260

Reset value: 0x0000 0000

These registers contain the BCH parity bits (BCHPB). For the BCH 4-bit, only BCHPB[51:0] are significant and for the BCH 8-bit BCHPB[103:0] are significant.

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **BCHPB[103:96]:** BCH parity bits

FMC BCH decoder status register 0 (FMC_BCHDSR0)

Address offset: 0x27C

Reset value: 0x0000 0000

This register contains some fields already available in other registers but that require to be saved when error correction is performed on several sectors at a time (for example a whole NAND flash page). This allows a DMA channel to transfer the content of FMC_BCHDSR0 to 4 to a decoding status buffer.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DEN[3:0]				Res.	Res.	DEF	DUE
								r	r	r	r			r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **DEN[3:0]:** Decoder error number

When DEF bit is set, this field indicates the number of errors detected by the BCH decoder.
Following the selected BCH code, if the number of detected errors exceeds the number of correctable errors, this bit is not significant and DUE bit is set.
If the BCH decoder detects a number of errors that exceeds the maximum number of detectable errors, DEN is not significant.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **DEF:** Decoder error found

This field indicates that the decoder has finished searching errors and identifying their location.
The number of errors and their location are available in FMC_BCHDSR0 and FMC_BCHDSR1 to 4, respectively.

Bit 0 **DUE:** Decoder uncorrectable error

This field indicates that too many errors have been detected in the sector during the BCH decoding and that the sector is uncorrectable.
If the BCH decoder detects a number of errors that exceeds the maximum number of detectable errors, DUE is not significant.

FMC BCH decoder status register for memory region 1 (FMC_BCHDSR1)

Address offset: 0x280

Reset value: 0x0000 0000

The maximum error correction capability of the BCH block embedded in the FMC is 8 errors. This register contains the positions of the 1st and 2nd error bits in EBP1 and EPB2 fields, respectively. If less than 8 errors are detected, the useless EPBx fields (x = 1 to 8) are “don’t care”.

Refer to *Section 2.4* for the register boundary addresses.

38 Octo-SPI interface (OCTOSPI)

38.1 Introduction

The OCTOSPI supports most external serial memories such as serial PSRAMs, serial NAND and serial NOR flash memories, HyperRAM™ and HyperFlash™ memories, with the following functional modes:

- indirect mode: all the operations are performed using the OCTOSPI registers to preset commands, addresses, data, and transfer parameters.
- automatic status-polling mode: the external memory status register is periodically read and an interrupt can be generated in case of flag setting. This feature is only available in regular-command protocol.
- memory-mapped mode: the external memory is memory mapped and it is seen by the system as if it was an internal memory, supporting both read and write operations.

The OCTOSPI supports the following protocols with associated frame formats:

- the regular-command frame format with the command, address, alternate byte, dummy cycles, and data phase
- the HyperBus™ frame format

38.2 OCTOSPI main features

- Functional modes: indirect, automatic status-polling, and memory-mapped
- Read and write support in memory-mapped mode
- External (P)SRAM memory support
- Support for single, dual, quad, and octal communication
- Dual memory configuration, where eight bits can be sent/received simultaneously by accessing two quad memories in parallel
- SDR (single-data rate) and DTR (double-transfer rate) support
- Data strobe support
- Fully programmable opcode
- Fully programmable frame format
- Support wrapped-type access to memory in read direction
- HyperBus support
- Integrated FIFO for reception and transmission
- Asynchronous bus clock versus kernel clock support
- 8-, 16-, and 32-bit data accesses allowed
- DMA protocol support
- DMA channel for indirect mode operations
- Interrupt generation on FIFO threshold, timeout, operation complete, and access error
- AHB interface with transaction acceptance limited to one: the interface accepts the next transfer on AHB bus only once the previous is completed on memory side.
- Dual chip select support

38.3 OCTOSPI implementation

Table 311. OCTOSPI implementation

OCTOSPI feature	OCTOSPI1/2
HyperBus standard compliant	X
Xccela standard compliant	X
XSPI (JESD251C) standard compliant	X
AMBA® AHB compliant data interface	X
Asynchronous AHB clock versus kernel clock	X
Dual AHB interface	X
Functional modes: indirect, automatic status-polling, and memory-mapped	X
Read and write support in memory-mapped mode	X
Dual-quad configuration	X

8, 16, and 32-bit data accesses	X
Interrupt on FIFO threshold, timeout, operation complete, and access error	X
Compliant with dual-OCTOSPI arbiter (communication regulation)	X
Extended CSHT timeout	X
Memory-mapped write	X
Refresh counter	X
High-speed interface	-
LP/HPDMA interface	X
Dual chip select	X
Extended external memory	-
Prefetch disable	-
Prefetch hardware software	-

38.4 OCTOSPI functional description

38.4.1 OCTOSPI block diagram

Figure 239. OCTOSPI block diagram in octal configuration

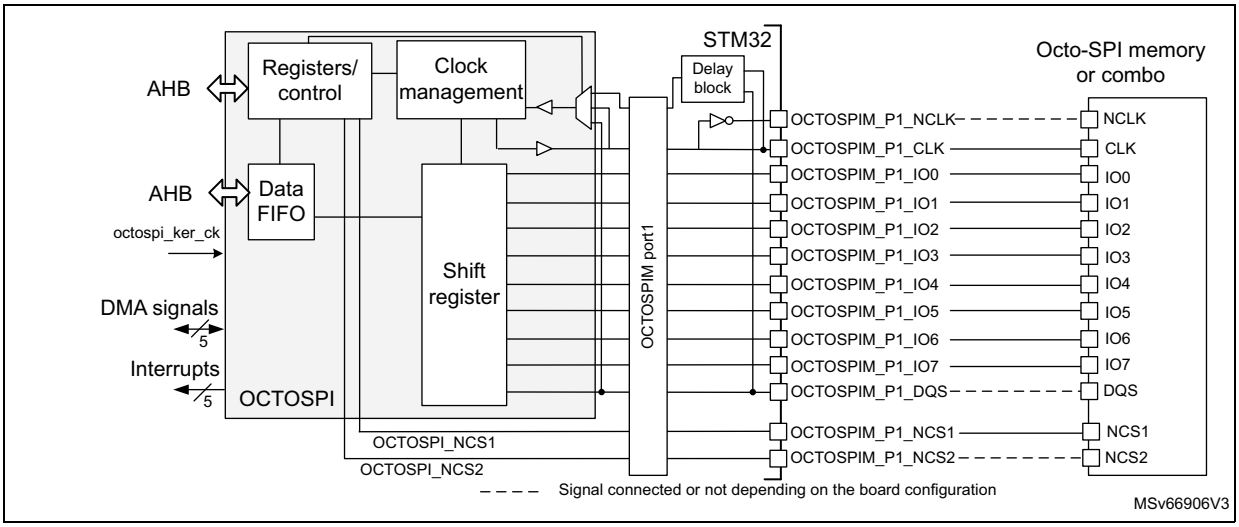

Figure 240. OCTOSPI block diagram in quad configuration

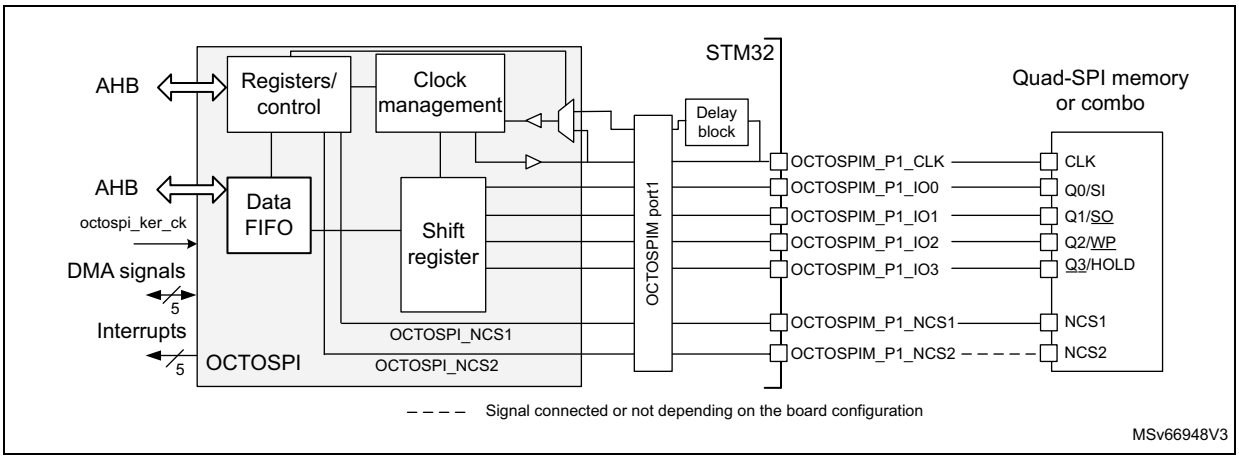

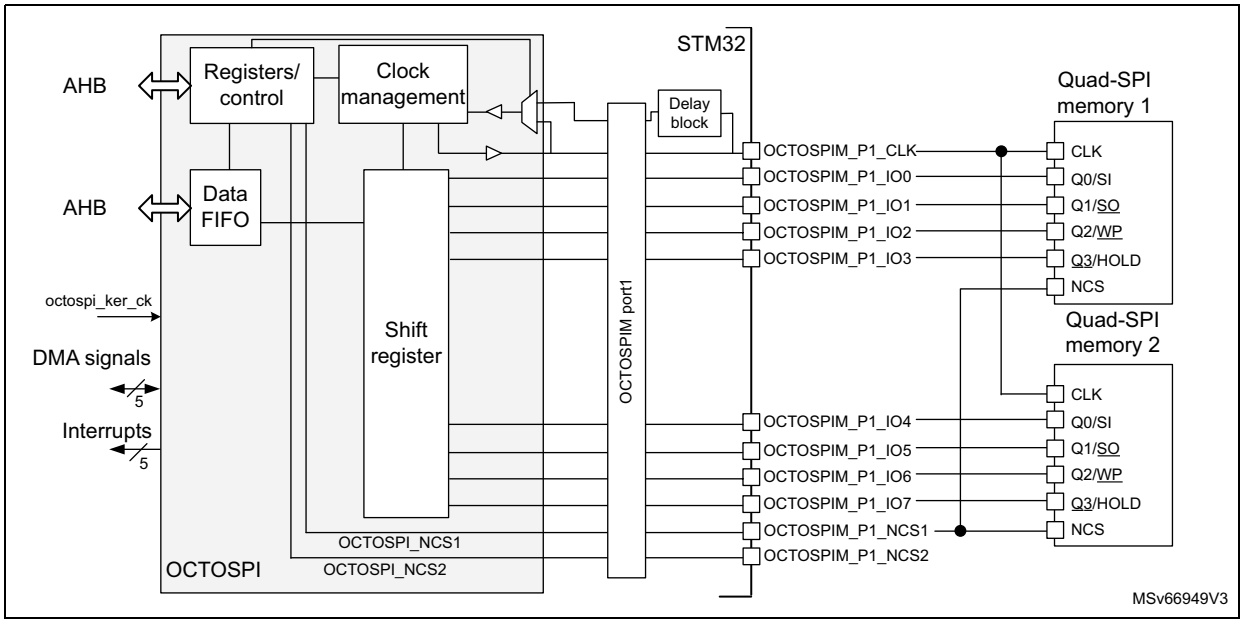

Figure 241. OCTOSPI block diagram in dual-quad configuration

38.4.2 OCTOSPI pins and internal signals

Table 312. OCTOSPI input/output pins(1)

Pin name	Type	Description
OCTOSPIM_Px_NCLK	Output	OCTOSPI inverted clock to support 1.8 V HyperBus protocol. The inversion must be activated only in this case, by setting the INVCLK bit in *Section 24.3.14: Advanced I/O configurations*.
OCTOSPIM_Px_CLK		OCTOSPI clock
OCTOSPIM_Px_IOn (n = 0 to 7)	Input/output	OCTOSPI data pins
OCTOSPIM_Px_NCS1,2	Output	Chip select for the memory
OCTOSPIM_Px_DQS	Input/output	Data strobe/write mask signal from/to the memory

1. x = 1 to 2.

Caution: Use the same configuration (output speed, HSLV(a)) for all OCTOSPI input/output pins to avoid any data corruption.

Table 313. OCTOSPI internal signals

Signal name	Type	Description
octospi_hclk	Input	OCTOSPI AHB clock
octospi_ker_ck	Input	OCTOSPI kernel clock

a. When applicable.

Table 313. OCTOSPI internal signals

Signal name	Type	Description
octospi_dma	N/A	DMA request signal
octospi_it	Output	Global interrupt line (see *Table 317* for the multiple sources of interrupt)

38.4.3 OCTOSPI interface to memory modes

The OCTOSPI supports the following protocols:

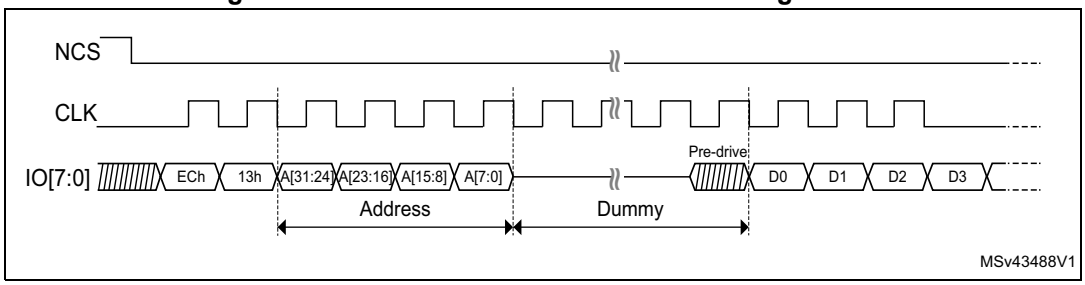
- regular-command protocol
- HyperBus protocol

The OCTOSPI uses from 6 to 12 signals to interface with a memory, depending on the functional mode:

- NCS: chip-select (in the following sections, unless otherwise specified, NCS applies for NCS1 or NCS2. Only one of these two signals is active at a given moment in time)
- CLK: communication clock
- NCLK: inverted clock used only in the 1.8 V HyperBus protocol
- DQS: data strobe used only in regular-command protocol as input only
- IO[3:0]: data bus LSB
- IO[7:4]:
  - data bus MSB used in dual-quad and octal configurations
  - data bus can be used as possible remap for quad-SPI mode

38.4.4 OCTOSPI regular-command protocol

When in regular-command protocol, the OCTOSPI communicates with the external device using commands. Each command can include the following phases:



- Instruction phase
- Address phase
- Alternate-byte phase
- Dummy-cycle phase
- Data phase

Any of these phases can be configured to be skipped but, in case of single-phase command, the only use case supported is instruction-phase-only.

The NCS falls before the start of each command and rises again after each command finishes.

In memory-mapped mode, both read and write operations are supported: as a consequence, some of the configuration registers are duplicated to specify write operations (read operations are configured using regular registers).

Figure 242. SDR read command in octal configuration

The specific regular-command protocol features are configured through the registers in the 0x0100-0x01FC offset range.

Instruction phase

During this phase, a 1- to 4-byte instruction is sent to the external device specifying the type of operation to be performed. The size of the instruction to be sent is configured by ISIZE[1:0] in OCTOSPI_CCR and the instruction is programmed in INSTRUCTION[31:0] of OCTOSPI_IR.

The instruction phase can optionally send:

- 1 bit at a time (over IO0, SO single in single-SPI mode)
- 2 bits at a time (over IO0/IO1 in dual-SPI mode)
- 4 bits at a time (over IO0 to IO3 in quad-SPI mode)
- 8 bits at a time (over IO0 to IO7 in octal-SPI mode)

This can be configured using IMODE[2:0] of OCTOSPI_CCR.

The instruction can be sent in DTR mode on each rising and falling edge of the clock, by setting IDTR in OCTOSPI_CCR.

When IMODE[2:0] = 000 in OCTOSPI_CCR, the instruction phase is skipped, and the command sequence starts with the address phase, if present.

In memory-mapped mode, the instruction used for the write operation is specified in OCTOSPI_WIR, and the instruction format is specified in OCTOSPI_WCCR. The instruction used for the read operation and the instruction format are specified in OCTOSPI_IR and OCTOSPI_CCR.

Address phase

In the address phase, 1 to 4 bytes are sent to the external device, to indicate the address of the operation. The number of address bytes to be sent is configured by ADSIZE[1:0] in OCTOSPI_CCR.

In indirect and automatic status-polling modes, the address bytes to be sent are specified by ADDRESS[31:0] in OCTOSPI_AR. In memory-mapped mode, the address is given directly via the AHB (from any master in the system).

The address phase can send:

- 1 bit at a time (over IO0, SO single in single-SPI mode)
- 2 bits at a time (over IO0/IO1 in dual-SPI mode)
- 4 bits at a time (over IO0 to IO3 in quad-SPI mode)
- 8 bits at a time (over IO0 to IO7 in octal-SPI mode)

This can be configured using ADMODE[2:0] in OCTOSPI_CCR.

The address can be sent in DTR mode (on each rising and falling edge of the clock) setting ADDTR in OCTOSPI_CCR.

When ADMODE[2:0] = 000, the address phase is skipped and the command sequence proceeds directly to the next phase, if any.

In memory-mapped mode, the address format for the write operation is specified in OCTOSPI_WCCR. The address format for the read operation is specified in OCTOSPI_CCR.

Alternate-byte phase

In the alternate-byte phase, 1 to 4 bytes are sent to the external device, generally to control the mode of operation. The number of alternate bytes to be sent is configured by ABSIZE[1:0] in OCTOSPI_CCR. The bytes to be sent are specified in OCTOSPI_ABR.

The alternate-byte phase can send:

- 1 bit at a time (over IO0, SO single in single-SPI mode)
- 2 bits at a time (over IO0/IO1 in dual-SPI mode)
- 4 bits at a time (over IO0 to IO3 in quad-SPI mode)
- 8 bits at a time (over IO0 to IO7 in octal-SPI mode)

This can be configured using ABMODE[2:0] in OCTOSPI_CCR.

The alternate bytes can be sent in DTR mode (on each rising and falling edge of the clock) setting ABDTR in OCTOSPI_CCR.

When ABMODE[2:0] = 000, the alternate-byte phase is skipped and the command sequence proceeds directly to the next phase, if any.

There may be times when only a single nibble needs to be sent during the alternate-byte phase rather than a full byte, such as when the dual-SPI mode is used and only two cycles are used for the alternate bytes.

In this case, the firmware can use the quad-SPI mode (ABMODE[2:0] = 011) and send a byte with bits 7 and 3 of ALTERNATE[31:0] set to 1 (keeping the IO3 line high), and bits 6 and 2 set to 0 (keeping the IO2 line low), in OCTOSPI_IR.

The upper two bits of the nibble to be sent are then placed in bits 5:4 of ALTERNATE[31:0] while the lower two bits are placed in bits 1:0. For example, if the nibble 2 (0010) is to be sent over IO0/IO1, then ALTERNATE[31:0] must be set to 0x8A (1000_1010).

In memory-mapped mode, the alternate bytes used for the write operation are specified in OCTOSPI_WABR, and the alternate byte format is specified in OCTOSPI_WCCR. The alternate bytes used for read operation and the alternate byte format are specified in OCTOSPI_ABR and OCTOSPI_CCR.

Dummy-cycle phase (memory latency)

In the dummy-cycle phase, 1 to 31 cycles are given without any data being sent or received, in order to give the external device, the time to prepare for the data phase when the higher clock frequencies are used. The number of cycles given during this phase is specified by DCYC[4:0] in OCTOSPI_TCR. In both SDR and DTR modes, the duration is specified as a number of full CLK cycles.

When DCYC[4:0] = 00000, the dummy-cycle phase is skipped, and the command sequence proceeds directly to the data phase, if present.

In order to assure enough “turn-around” time for changing the data signals from the output mode to the input mode, there must be at least one dummy cycle when using the dual-SPI, the quad-SPI, or the octal-SPI mode, to receive data from the external device.

In memory-mapped mode, the dummy cycles for the write operations are specified in OCTOSPI_WTCR. The dummy cycles for the read operation are specified in OCTOSPI_TCR.

Data phase

During the data phase, any number of bytes can be sent to or received from the external device.

In indirect mode, the number of bytes to be sent/received is specified in OCTOSPI_DLR. In this mode, the data to be sent to the external device must be written to OCTOSPI_DR, while in indirect-read mode the data received from the external device is obtained by reading OCTOSPI_DR.

In automatic status-polling mode, the number of bytes to be received is specified in OCTOSPI_DLR, and the data received from the external device can be obtained by reading OCTOSPI_DR.

In memory-mapped mode, the data read or written, is sent or received directly over the AHB to the Cortex core or to a DMA.

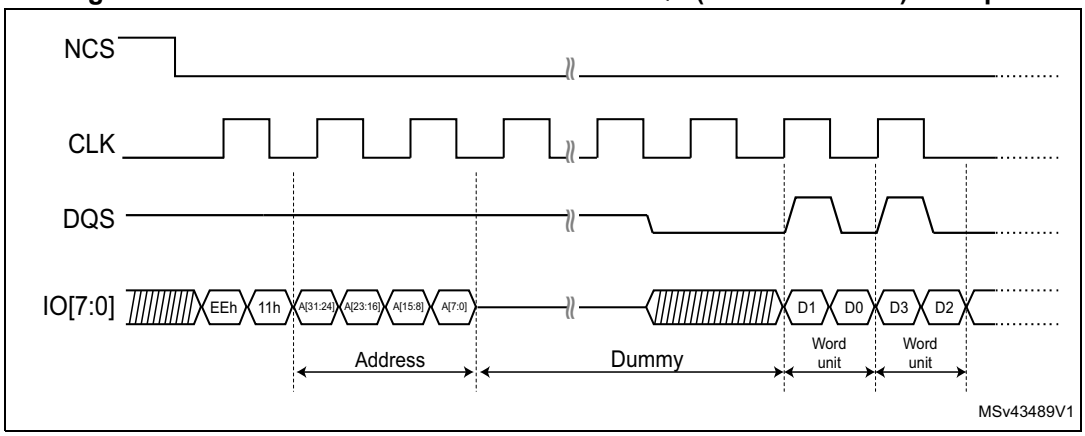
The data phase can send/receive:

- 1 bit at a time (over IO0/IO1 (SO/SI respectively) in single-SPI mode)
- 2 bits at a time (over IO0/IO1 in dual-SPI mode)
- 4 bits at a time (over IO0 to IO3 in quad-SPI mode)
- 8 bits at a time (over IO0 to IO7 in octal-SPI mode)

This can be configured using DMODE[2:0] in OCTOSPI_CCR.

The data can be sent or received in DTR mode (on each rising and falling edge of the clock) setting DDTR in OCTOSPI_CCR.

When DMODE[2:0] = 000, the data phase is skipped, and the command sequence finishes immediately by raising the NCS. This configuration must be used only in indirect-write mode.



In memory-mapped mode, the data format for the write operation is specified in OCTOSPI_WCCR. The data format for the read operation is specified in OCTOSPI_CCR.

DQS use

The DQS signal can be used for data strobing during the read transactions when the device toggles the DQS aligned with the data.

The DQS management can be enabled by setting DQSE in OCTOSPI_CCR.

Figure 243. DTR read in octal-SPI mode with DQS (Macronix mode) example

38.4.5 OCTOSPI regular-command protocol signal interface

Single-SPI mode

The legacy SPI mode allows just a single bit to be sent/received serially. In this mode, the data is sent to the external device over the SO signal (Single-SPI Output) (whose I/Os are shared with IO0). The data received from the external device arrives via SI (Single-SPI Input) (whose I/Os are shared with IO1).

Compared to the SPI legacy mode, I0/SO and I1/SI are respectively equivalent to MOSI and MISO, having the OCTOSPI generating the clock.

The different phases can each be configured separately to use this single-SPI mode by setting to 001 the IMODE, ADMODE, ABMODE, and DMODE fields in OCTOSPI_CCR and OCTOSPI_WCCR.

In each phase configured in single-SPI mode:

- IO0 (SO) is in output mode.
- IO1 (SI) is in input mode (high impedance).
- IO2 is in output mode and forced to 0 (to deactivate the “write protect” function).
- IO3 is in output mode and forced to 1 (to deactivate the “hold” function).
- IO4 to IO7 are in output mode and forced to 0.

This is the case even for the dummy phase if DMODE[2:0] = 001.

Dual-SPI mode

In dual-SPI mode, two bits are sent/received simultaneously over the IO0/IO1 signals.

The different phases can each be configured separately to use dual-SPI mode by setting to 010 the IMODE, ADMODE, ABMODE, and DMODE fields in OCTOSPI_CCR and OCTOSPI_WCCR.

In each phase configured in dual-SPI mode:

- IO0/IO1 are at high-impedance (input) during the data phase for the read operations, and outputs in all other cases.
- IO2 is in output mode and forced to 0.
- IO3 is in output mode and forced to 1.
- IO4 to IO7 are in output mode and forced to 0.

In the dummy phase when DMODE[2:0] = 010, IO0/IO1 are always high-impedance.

Quad-SPI mode

In quad-SPI mode, four bits are sent/received simultaneously over the IO0/IO1/IO2/IO3 signals.

The different phases can each be configured separately to use the quad-SPI mode by setting to 011 the IMODE, ADMODE, ABMODE, and DMODE fields in OCTOSPI_CCR and OCTOSPI_WCCR.

In each phase configured in quad-SPI mode:

- IO0 to IO3 are all at high-impedance (inputs) during the data phase for the read operations, and outputs in all other cases.
- IO4 to IO7 are in output mode and forced to 0.

In the dummy phase when DMODE[2:0] = 011, IO0 to IO3 are all high-impedance.

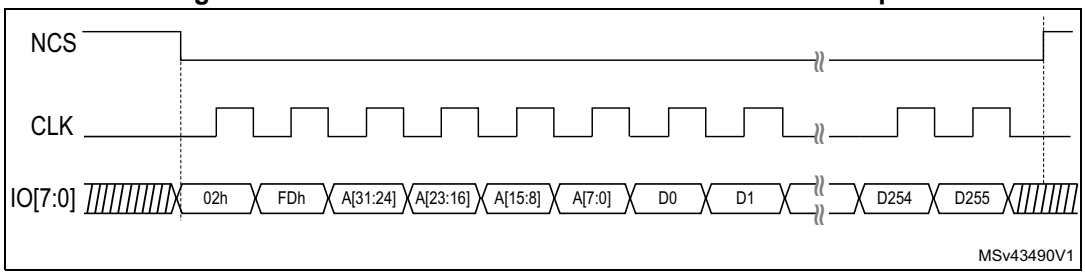
Octal-SPI mode

In regular octal-SPI mode, the eight bits are sent/received simultaneously over the IO[0:7] signals.

The different phases can each be configured separately to use the octal-SPI mode by setting to 100 the IMODE, ADMODE, ABMODE, and DMODE fields in OCTOSPI_CCR and OCTOSPI_WCCR.

In each phase that is configured in octal-SPI mode, IO[0:7] are all at high-impedance (input) during the data phase for read operations, and outputs in all other cases.

In the dummy phase when DMODE[2:0] = 100, IO[0:7] are all high-impedance.



Single-data rate (SDR) mode

By default, all the phases operate in SDR mode.

In this mode, when the OCTOSPI drives the IO0/SO, IO1 to IO7 signals, these signals transition only with the falling edge of CLK.

When receiving data in SDR mode, the OCTOSPI assumes that the external devices also send the data using CLK falling edge. By default (when SSHIFT = 0 in OCTOSPI_TCR), the signals are sampled using the following (rising) edge of CLK.

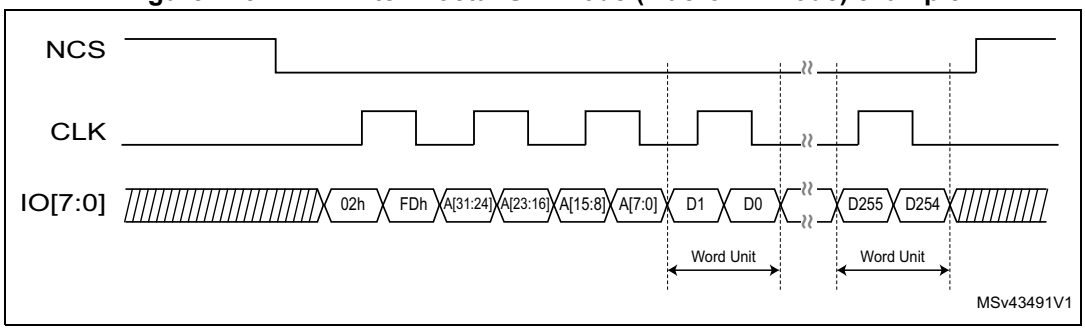
Figure 244. SDR write command in octo-SPI mode example

Note: Due to internal synchronization, up to six extra dummy clock cycles may be generated by the Octo-SPI interface after the last data is read.

Double-transfer rate (DTR) mode

Each of the instruction, address, alternate-byte, and data phases can be configured to operate in DTR mode setting IDTR, ADDTR, ABDTR, and DDTR in OCTOSPI_CCR.

In memory-mapped mode, the DTR mode for each phase of the write operations is specified in OCTOSPI_WCCR. The DTR mode for each phase of the read operations is specified in OCTOSPI_CCR.



In DTR mode, when the OCTOSPI drives the IO0/SO and IO1 to IO7 signals in the instruction, address, and alternate-byte phases, a bit is sent or received on each of the falling and rising edges of CLK.

When receiving data in DTR mode, the OCTOSPI assumes that the external devices also send the data using both CLK rising and falling edges. When DDTR = 1 in OCTOSPI_CCR, the software must clear SSHIFT in OCTOSPI_TCR. Thus, the signals are sampled one half of a CLK cycle later (on the following, opposite edge).

In DTR mode, it is recommended to set DHQC of OCTOSPI_TCR, to shift the outputs by a quarter of cycle and avoid holding issues on the memory side.

Note: DHQC must not be set when the prescaler value is 0, as this action leads to unpredictable behavior.

Figure 245. DTR write in octal-SPI mode (Macronix mode) example

Note: Due to internal synchronization, up to six extra dummy clock cycles may be generated by the Octo-SPI interface after the last data is read.

Dual-quad configuration

When DMM = 1 in OCTOSPI_CR, the OCTOSPI is in dual-memory configuration: if DMODE = 011, two external Quad-SPI devices (device A and device B) are used in order to

send/receive eight bits (or 16 bits in DTR mode) every cycle, effectively doubling the throughput.

Each device (A or B) uses the same CLK and NCS signals, but each has separate IO0 to IO3 signals.

The dual-quad configuration can be used in conjunction with the single-SPI, dual-SPI, and quad-SPI modes, as well as with either the SDR or DTR mode.

The device size, as specified by DEVSIZE[4:0] in OCTOSPI_DCR1, must reflect the total external device capacity that is the double of the size of one individual component.

If address X is even, then the byte that the OCTOSPI gives for address X is the byte at the address X/2 of device A, and the byte that the OCTOSPI gives for address X + 1 is the byte at the address X/2 of device B. In other words, the bytes at even addresses are all stored in device A and the bytes at odd addresses are all stored in device B.

When reading the status registers of the devices in dual-quad configuration, twice as many bytes must be read compared to the same read in regular-command protocol: if each device gives eight valid bits after the instruction for fetching the status register, then the OCTOSPI must be configured with a data length of 2 bytes (16 bits), and the OCTOSPI receives one byte from each device.

If each device gives a status of 16 bits, then the OCTOSPI must be configured to read 4 bytes to get all the status bits of both devices in dual-quad configuration. The least-significant byte of the result (in the data register) is the least-significant byte of device A status register. The next byte is the least-significant byte of device B status register. Then, the third byte of the data register is the device A second byte. The fourth byte is the device B second byte (if devices have 16-bit status registers).

An even number of bytes must always be accessed in dual-quad configuration. For this reason, bit 0 of DL[31:0] in OCTOSPI_DLR is stuck at 1 when DMM = 1.

In dual-quad configuration, the behavior of device A interface signals is basically the same as in normal mode. Device B interface signals have exactly the same waveforms as device A ones during the instruction, address, alternate-byte, and dummy-cycle phases. In other words, each device always receives the same instruction and the same address.

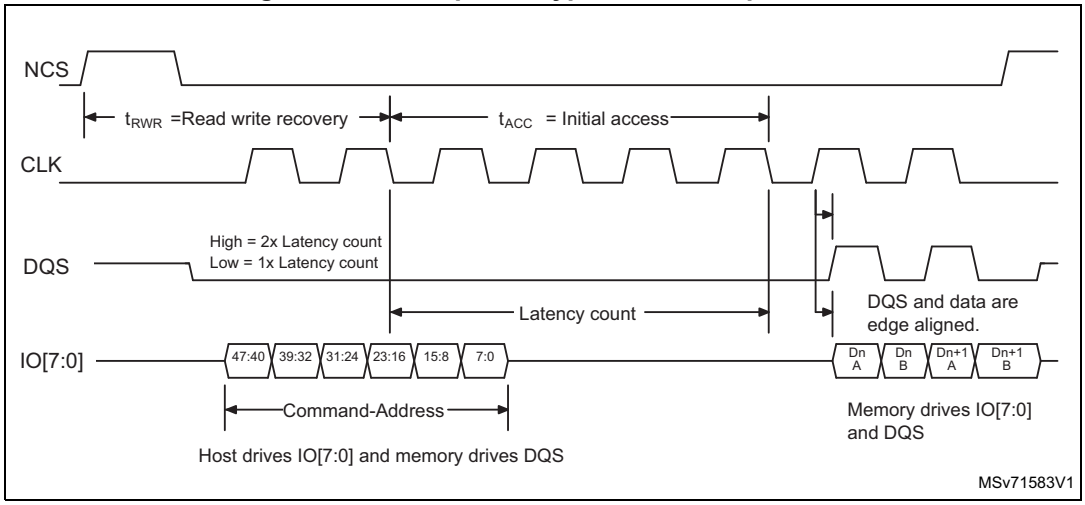
Then, during the data phase, the AIOx and the BIOx buses both transfer data in parallel, but the data that is sent to (or received from) device A is distinct than the one from device B.

38.4.6 HyperBus protocol

The OCTOSPI can communicate with the external device using the HyperBus protocol.

The HyperBus uses 11 to 12 pins depending on the operating voltage:

- IO[7:0] as bidirectional data bus
- DQS for read and write data strobe and latency insertion
- NCS
- CLK
- NCLK for 1.8 V operations (to support this mode, the device must be powered with 1.8 V)



The HyperBus does not require any command specification nor any alternate bytes. As a consequence, a separate register set is used to define the timing of the transaction.

The HyperBus frame is composed of the following phases:

- Command/address phase
- Data phase

The NCS falls before the start of a transaction and rises again after each transaction finishes.

Figure 246. Example of HyperBus read operation

Note: Due to internal synchronization, up to six extra dummy clock cycles may be generated by the Octo-SPI interface after the last data is read.

The specific HyperBus features are configured through the registers in the 0x0200-0x02FC offset range.

Command/address phase

During this initial phase, the OCTOSPI sends 48 bits over IO[7:0] to specify the operations to be performed with the external device.

Table 314. Command/address phase description

CA bit	Bit name	Description
47	R/W#	Identifies the transaction as a read or a write.
46	Address space	Indicates if the transaction accesses the memory or the register space.
45	Burst type	Indicates if the burst is linear or wrapped.
44-16	Row and upper column address	Selects the row and the upper column addresses.
15-3	Reserved	-
2-0	Lower column address	Selects the starting 16-bit word within the half page.

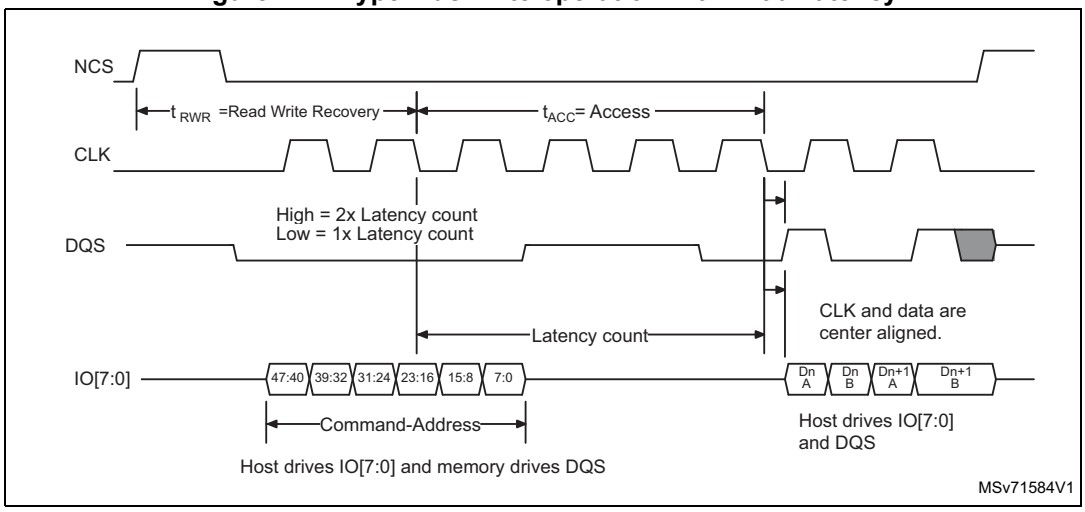
The address space is configured through the memory type MTYP[2:0] in OCTOSPI_DCR1.

The total size of the device must be configured through DEVSIZE[4:0] of OCTOSPI_DCR1. In case of multi-chip product (MCP), the device size is the sum of all the sizes of all the MCP dies.

Read/write operation with initial latency

The HyperBus read and write operations need to respect two timings:

- t_{RWR}: minimal read/write recovery time for the device (defined by TRWR[7:0] in OCTOSPI_HLCR)
- t_{ACC}: access time for the device (defined by TACC[7:0] in OCTOSPI_HLCR) according to the memory latency



During the read operation, the DQS is used by the device, in two ways (see *Figure 246*):

- during the command/address phase, to request an additional latency
- during the data phase, for data strobing

During the write operation, the DQS is used:

- by the device, during the command/address phase, to request an additional latency.
- by the OCTOSPI, during the data phase, for write data masking.

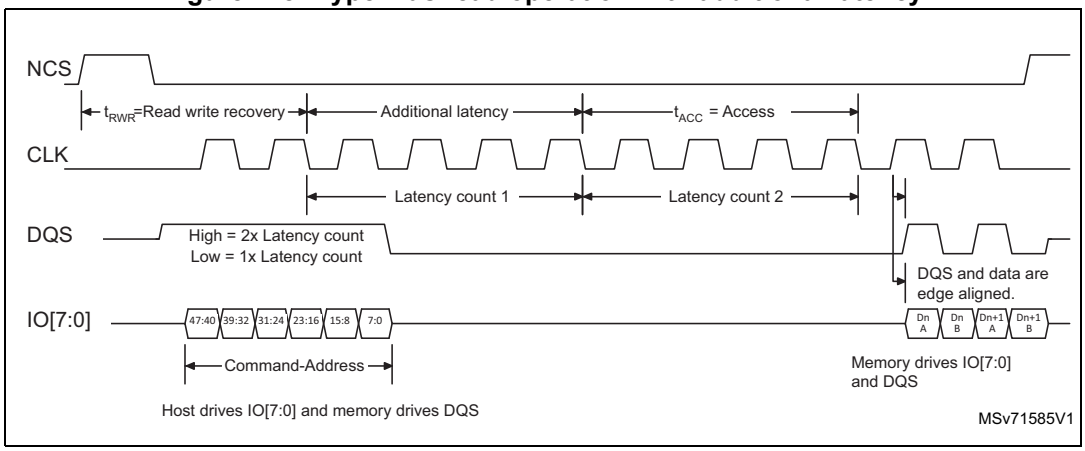
Figure 247. HyperBus write operation with initial latency

Read/write operation with additional latency

If the device needs an additional latency (during refresh period of an SDRAM for example), DQS must be tied to one during one of the DQS signals, during the command/address phase.

An additional t_{ACC} duration is added by the OCTOSPI to meet the device request.

Figure 248. HyperBus read operation with additional latency



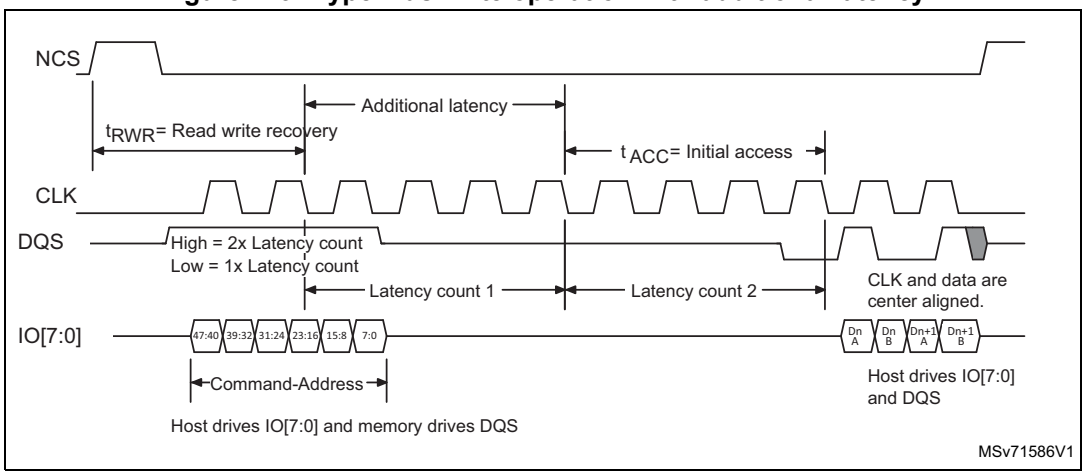


Figure 249. HyperBus write operation with additional latency

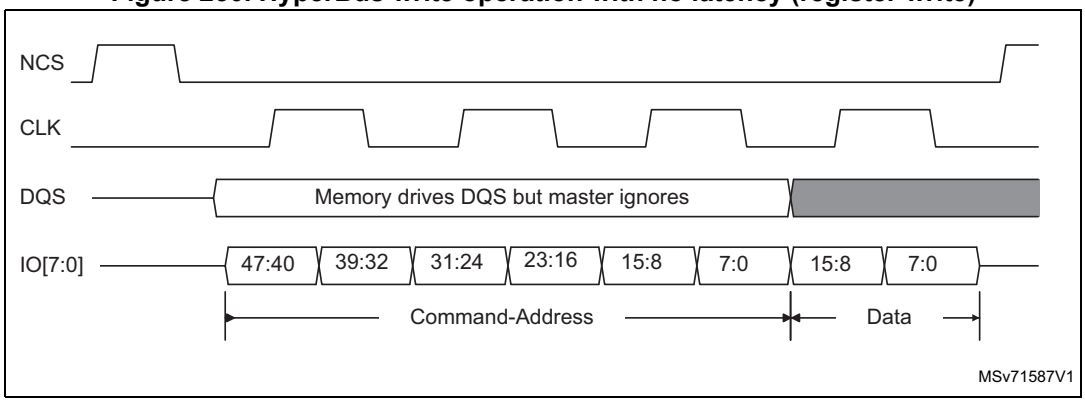
Fixed-latency mode

Some devices or some applications may not want to operate with a variable latency time as described above.



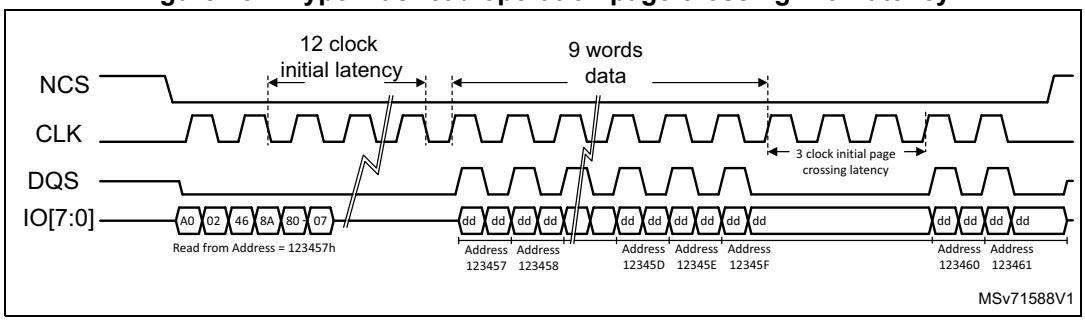
The latency can be forced to 2 x t_{ACC} by setting LM in OCTOSPI_HLCR.

In this OCTOSPI latency mode, the state of the DQS signal is not taken into account by the OCTOSPI, and an additional latency is always added, leading to a fixed 2 x t_{ACC} latency time.

Write operation with no latency

Some devices can also require a zero latency for the write operations. This write-zero latency can be forced by setting WZL in OCTOSPI_HLCR.

Figure 250. HyperBus write operation with no latency (register write)



Latency on page-crossing during the read operations

An additional latency can be needed by some devices for the read operation when crossing pages.

The initial latency must be respected for any page access, as a consequence, when the first access is close to the page boundary, a latency is automatically added at the page crossing to respect the t_{ACC} time.

Figure 251. HyperBus read operation page crossing with latency

38.4.7 Specific features

The OCTOSPI supports some specific features, such as:

- Wrap support
- NCS boundary and refresh
- Communication regulation

Wrap support

The OCTOSPI supports a hybrid wrap as defined by the HyperBus protocol. A hybrid wrap is also supported in the regular-command protocol.

In hybrid wrap, the transaction can continue after the initial wrap with an incremental access.

The wrap size supported by the target memory is configured by WRAPSIZE in OCTOSPI_DCR2.

Wrap is supported only in memory-read direction and only for data size = 4 bytes. Wrapped reads are supported for both HyperBus and regular-command protocols. To enable wrapped-read accesses, the dedicated OCTOSPI_WPxxx registers must be programmed according to the wrapped-read access characteristics. These registers apply for both HyperBus and regular-command protocols.

If the target memory is not supporting the hybrid wrap, WRAPSIZE must be set to 0.

Note: Hybrid wrap requires that the nonwrapped registers (OCTOSPI_CCR, OCTOSPI_TCR, OCTOSPI_IR) are set according to the memory configuration to satisfy its correct data prefetch (initiated after the wrap command).

The wrap operation cannot be interrupted by a refresh. The refresh event is only considered after the wrap completion.

NCS boundary and refresh

Two processes can be activated to regulate the OCTOSPI transactions:

- NCS boundary
- Refresh

The NCS boundary feature limits a transaction to a boundary of aligned addresses. The size of the address to be aligned with, is configured by CSBOUND[4:0] in OCTOSPI_DCR3: it is equal to $2^{CSBOUND}$.

As an example, if CSBOUND(4:0] = 0x4, the boundary is set to 2^4 = 16 bytes. The NCS is then released each time the LSB address is equal to 0xF, and each time a new transaction is issued to address the next data.

If CSBOUND[4:0] = 0, the feature is disabled. A minimum value of three is recommended.

The NCS boundary feature cannot be used for flash memory devices in write mode since a command is necessary to program another page of the flash memory.

The refresh feature limits the duration of the transactions to the value programmed by REFRESH[31:0] in OCTOSPI_DCR4. The duration is expressed in number of cycles. This allows an external RAM to perform its internal refresh operation regularly.

The refresh value must be greater than the minimal transaction size in terms of number of cycles including the command/address/alternate/dummy phases.

If NCS boundary and refresh are enabled at the same time, the NCS is released on the first condition met.

Communication regulation

The communication regulation feature limits the maximum length of a transaction to the value programmed by MAXTRAN[7:0] in OCTOSPI_DCR3.

If the number of clock cycles reaches the MAXTRAN + 1 value, and if the second OCTOSPI requests access, the NCS is released and a new transaction is issued to address the next data. If the second OCTOSPI does not request an access, the transaction is not stopped and the NCS is not released.

If MAXTRAN[7:0] = 0, no limitation occurs.

The MAXTRAN[7:0] value must be greater than the minimal transaction size in terms of number of cycles including the command, address, alternate, and dummy phases.

Note: The communication regulation feature cannot be used in write mode for the flash memory devices that require extra command to reenable the write operation after the NCS is active again.

If NCS boundary, refresh, and communication regulation are enabled at the same time, the NCS is released on the first condition met.

Restarting after an interrupted transfer

When a read or write operation is interrupted by a timeout or communication regulation feature, the Octo-SPI interface, as soon as possible after getting back the port ownership, reissues the initial command sequence together with the address following the last address actually accessed before interruption. The transfer initially set goes on and ends seamlessly.

38.4.8 OCTOSPI operating mode introduction

The OCTOSPI has the following operating modes regardless of the low-level protocol used (either regular-command or HyperBus):

- indirect mode (read or write)
- automatic status-polling mode (only in regular-command protocol)
- memory-mapped mode

38.4.9 OCTOSPI indirect mode

In indirect mode, the commands are started by writing to the OCTOSPI registers, and data are transferred by writing or reading the data register, in a similar way to other communication peripherals.

When FMODE[1:0] = 00 in OCTOSPI_CR, the OCTOSPI is in indirect-write mode: bytes are sent to the external device during the data phase. Data are provided by writing to OCTOSPI_DR.

When FMODE[1:0] = 01, the OCTOSPI is in indirect-read mode: bytes are received from the external device during the data phase. Data are recovered by reading OCTOSPI_DR.

In indirect mode, when the OCTOSPI is configured in DTR mode over eight lanes with DQS disabled, the given starting address and the data length must be even.

Note: The OCTOSPI_AR register must be updated even if the start address is the same as the start address of the previous indirect access.

The number of bytes to be read/written is specified in OCTOSPI_DLR:

- If DL[31:0] = 0xFFFF FFFF, the data length is considered undefined and the OCTOSPI simply continues to transfer data until it reaches the end of the external device (as defined by DEVSIZE). If no bytes are to be transferred, DMODE[2:0] must be set to 0 in OCTOSPI_CCR.
- If DL[31:0] = 0xFFFF FFFFF and DEVSIZE[4:0] = 0x1F (its maximum value indicating at 4-Gbyte device), the transfers continue indefinitely, stopping only after an abort request or after the OCTOSPI is disabled. After the last memory address is read (at address 0xFFFF FFFF), reading continues with address = 0x0000 0000.

When the programmed number of bytes to be transmitted or received is reached, the TCF bit is set in OCTOSPI_SR, and an interrupt is generated if TCIE = 1 in OCTOSPI_CR. In the case of an undefined number of data, TCF is set when the limit of the external SPI memory is reached, according to the device size defined in OCTOSPI_DCR1.

Triggering the start of a transfer in regular-command protocol

Depending on the OCTOSPI configuration, there are three different ways to trigger the start of a transfer in indirect mode when using the regular-command protocol. In general, the start of transfer is triggered as soon as the software gives the last information that is necessary for the command. More specifically in indirect mode, a transfer starts when one of the following sequence of events occurs:

- if no address is necessary (ADMODE[2:0] = 000) and if no data need to be provided by the software (FMODE[1:0] = 01 or DMODE[2:0] = 000), and at the moment when a write is performed to INSTRUCTION[31:0] in OCTOSPI_IR
- if an address is necessary (when ADMODE[2:0] ≠ 000) and if no data need to be provided by the software (when FMODE[1:0] = 01 or DMODE[2:0] = 000), and at the moment when a write is performed to ADDRESS[31:0] in OCTOSPI_AR
- if data need to be provided by the software (when FMODE[1:0] = 00 and DMODE[2:0] ≠ 000), and at the moment when a write is performed to DATA[31:0] in OCTOSPI_DR

A write to OCTOSPI_ABR never triggers the communication start. If alternate bytes are required, they must have been programmed before.

As soon as a command is started, the BUSY bit is automatically set in OCTOSPI_SR.

Triggering the start of a transfer in HyperBus protocol

Depending on the OCTOSPI configuration, there are different ways to trigger the start of a command in indirect mode. In general, it is triggered as soon as the firmware gives the last information that is necessary for the transfer to start, and more specifically, a communication in indirect mode is triggered by one of the following register settings, when it is the last one to be executed:

- when a write is performed to ADDRESS[31:0] (OCTOSPI_AR) with ADMODE[2:0] ≠ 000 in indirect read mode (FMODE[1:0] = 01).
- when a write is performed to DATA[31:0] (OCTOSPI_DR) in indirect-write mode (when FMODE = 00).
- when a (dummy) write is performed to INSTRUCTION[31:0] (OCTOSPI_IR) for indirect read mode (with ADMODE[2:0] = 000 and FMODE = 01).

As soon as a transfer is started, the BUSY bit (OCTOSPI_SR[5]) is automatically set.

FIFO and data management

Data in indirect mode passes through a 64-byte FIFO that is internal to the OCTOSPI. FLEVEL in OCTOSPI_SR indicates how many bytes are currently being held in the FIFO.

AHB burst transactions are supported. Data of the burst are successively written in OCTOSPI_DR, and immediately transferred in the internal FIFO.

In indirect-write mode (FMODE[1:0] = 00), the software adds data to the FIFO when it writes in OCTOSPI_DR. A word write adds 4 bytes to the FIFO, a half-word write adds 2 bytes, and a byte write adds only 1 byte. If the software adds too many bytes to the FIFO (more

than indicated in DL[31:0]), the extra bytes are flushed from the FIFO at the end of the write operation (when TCF is set).

The byte/half-word accesses to OCTOSPI_DR must be done only to the least significant byte/halfword of the 32-bit register.

FTHRES is used to define a FIFO threshold after which point the FIFO threshold flag, FTF, gets set. In indirect-read mode, FTF is set when the number of valid bytes to be read from the FIFO is above the threshold. FTF is also set if there is any data left in the FIFO after the last byte is read from the external device, regardless of FTHRES setting. In indirect-write mode, the FTF is set when the number of empty bytes in the FIFO is above the threshold.

If FTIE = 1, there is an interrupt when the FTF is set. If DMAEN = 1, a DMA transfer is initiated when the FTF is set. The FTF is cleared by hardware as soon as the threshold condition is no longer true (after enough data has been transferred by the CPU or DMA).

The last data read in RX FIFO remains valid as long as there is no request for the next line. This means that, when the application reads several times in a row at the same location, the data is provided from the RX FIFO and not read again from the distant memory.

38.4.10 OCTOSPI automatic status-polling mode

In automatic status-polling mode, the OCTOSPI periodically starts a command to read a defined number of status bytes (up to four). The received bytes can be masked to isolate some status bits and an interrupt can be generated when the selected bits have a defined value. The automatic status-polling mode must be used only in regular-command protocol. For HyperBus protocol, it is not exploitable since the read status register into the HyperFlash memory must be performed in two steps (a write operation followed by a read operation).

The access to the device begins in the same manner as in indirect-read mode. BUSY in OCTOSPI_SR goes high at this point and stays high even between the periodic accesses.

The content of MASK[31:0] in OCTOSPI_PSMAR is used to mask the data from the external device in automatic status-polling mode:

- If the MASK[n] = 0, then bit n of the result is masked and not considered.
- If MASK[n] = 1, and the content of bit[n] is the same as MATCH[n] in OCTOSPI_PSMAR, then there is a match for bit n.

If PMM = 0 in OCTOSPI_CR, the AND-match mode is activated: SMF is set in OCTOSPI_SR only when there is a match on all of the unmasked bits.

If PMM = 1 in OCTOSPI_CR, the OR-match mode is activated: SMF gets set if there is a match on any of the unmasked bits.

An interrupt is called when SMF = 1 if SMIE = 1.

If APMS is set in OCTOSPI_CR, the operation stops and BUSY goes to 0 as soon as a match is detected. Otherwise, BUSY stays at 1 and the periodic accesses continue until there is an abort or until the OCTOSPI is disabled (EN = 0).

OCTOSPI_DR contains the latest received status bytes (FIFO deactivated). The content of this register is not affected by the masking used in the matching logic. FTF in OCTOSPI_SR is set as soon as a new reading of the status is complete. FTF is cleared as soon as the data is read.

In automatic status-polling mode, variable latency is not supported. The memory must then be configured in fixed latency.

38.4.11 OCTOSPI memory-mapped mode

When configured in memory-mapped mode, the external SPI device is seen as an internal memory.

Note: No more than 256 Mbytes can be addressed even if the external device capacity is larger.

If an access is made to an address outside of the range defined by DEVSIZE[4:0] but still within the 256 Mbytes range, then an AHB error is given. The effect of this error depends on the AHB master that attempted the access:

- If it is the Cortex CPU, a hard-fault interrupt is generated.
- If it is a DMA, a DMA transfer error is generated, and the corresponding DMA channel is automatically disabled.

Byte, half-word, and word access types are all supported.

A support for execute in place (XIP) operation is implemented, where the OCTOSPI continues to load the bytes to the addresses following the most recent access. If subsequent accesses are continuous to the bytes that follow, then these operations end up quickly since their results were prefetched.

By default, the OCTOSPI never stops its prefetch operation. It either keeps the previous read operation active with the NCS maintained low or it relaunches a new transfer, even if no access to the external device occurs for a long time.

Since external devices tend to consume more when the NCS is held low, the application may want to activate the timeout counter (TCEN = 1 in OCTOSPI_CR): the NCS is released after a period defined by TIMEOUT[15:0] in OCTOSPI_LPTR, when x cycles have elapsed without access since the clock is inactive.

BUSY goes high as soon as the first memory-mapped access occurs. Because of the prefetch operations, BUSY does not fall until there is an abort, or the peripheral is disabled.

It is not recommended to program the flash memory using the memory-mapped writes: the indirect-write mode fulfills this operation.

38.4.12 OCTOSPI configuration introduction

The OCTOSPI configuration is done in three steps:

1. OCTOSPI system configuration
2. OCTOSPI device configuration
3. OCTOSPI mode configuration

38.4.13 OCTOSPI system configuration

The OCTOSPI is configured using OCTOSPI_CR. The user must program:

- the functional mode with FMODE[1:0]
- the automatic status-polling mode behavior if needed with PMM and APMS
- the FIFO level with FTHRES
- the DMA use with DMAEN
- the timeout counter use with TCEN
- the dual-memory configuration, if needed, with DMM

In case of an interrupt use, the respective enable bit can also be set during this phase.

If the timeout counter is used, the timeout value is programmed in OCTOSPI_LPTR.

The DMA channel must not be enabled during the OCTOSPI configuration: it must be enabled only when the operation is fully configured, to avoid any unexpected request generation.

The DMA and OCTOSPI must be configured in a coherent manner regarding data length: FTHRES value must reflect the DMA burst size.

38.4.14 OCTOSPI device configuration

The parameters related to the external device targeted are configured through OCTOSPI_DCR1 and OCTOSPI_DCR2.The user must program:

- the device size with DEVSIZE[4:0]
- the chip-select minimum high time with CSHT[5:0]
- the clock mode with FRCK and CKMODE
- the device frequency with PRESCALER[7:0]

DEVSIZE[4:0] defines the size of external memory using the following formula:

$$\text{Number of bytes in the device} = 2^{\text{DEVSIZE+1}}$$

where DEVSIZE+1 is the number of address bits required to address the external device. The external device capacity can go up to 4 Gbytes (addressed using 32 bits) in indirect mode, but the addressable space in memory-mapped mode is limited to 256 Mbytes.

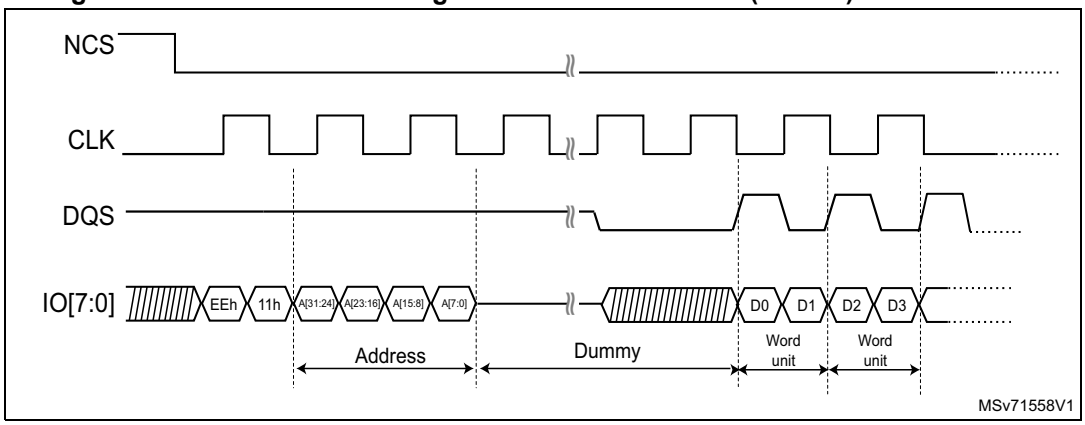
If DMM = 1, DEVSIZE[4:0] must reflect the total capacity of the two devices together considering the above formula (DEVSIZE[4:0] value is so equal to one of the two memory capacities).

When the OCTOSPI executes two commands, one immediately after the other, it raises the chip-select signal (NCS) high between the two commands for only one CLK cycle by default.

If the external device requires more time between commands, the chip-select high time CSHT[5:0] can be used to specify the minimum number of CLK cycles for which the NCS must remain high.

CKMODE indicates the level that the CLK takes between commands (when NCS = 1).

In HyperBus protocol, the device timing (t_{ACC} and t_{RWR}) and the latency mode must be configured in OCTOSPI_HLCR.



Memory types

External memory providers may present some architecture and slight data formatting differences between them. The bitfield MTYP[2:0] into the OCTOSPI_CR register allows targeting the right controller configuration depending on the associated memory type selected in the application. This is the responsibility of the software developer to align the controller configuration to fit with the targeted memory type.

The memory types are grouped in a such way:

- D0/D1 data ordering in octal-SPI data mode (DMODE[2:0] = 100) in DTR mode by configuring MTYP[2:0] = 000. For instance, Micron is using such data ordering. In this configuration, the DQS is sent with a polarity inverted respect to the clock polarity.

Figure 252. D0/D1 data ordering in octal-SPI DTR mode (Micron) - Read access

- D1/D0 data ordering in octal-SPI data mode (DMODE[2:0] = 100) in DTR mode by configuring MTYP[2:0] = 001. For instance, Macronix is using this reverse data ordering in its Octaflash portfolio (this configuration is not adapted to its OctaRAM™ memories). DQS is keeping the same polarity as the clock when reading data from the memory. Refer to *Figure 243: DTR read in octal-SPI mode with DQS (Macronix mode) example*.
- D1/D0 data ordering in octal-SPI data mode (DMODE[2:0] = 100) in DTR mode by configuring MTYP[2:0] = 011 with specific address phase built with row and column to fit with Macronix OctaRAM™ memories requirement (refer to *Table 315: OctaRAM command address bit assignment (based on 64-Mbyte OctaRAM)*. This is the controller which translates internally the targeted address provided by the software in row/column address formatting to sent to the memory. DQS is keeping the same polarity as the clock one when reading data from the memory.

Figure 253. OctaRAM read operation with reverse data ordering D1/D0

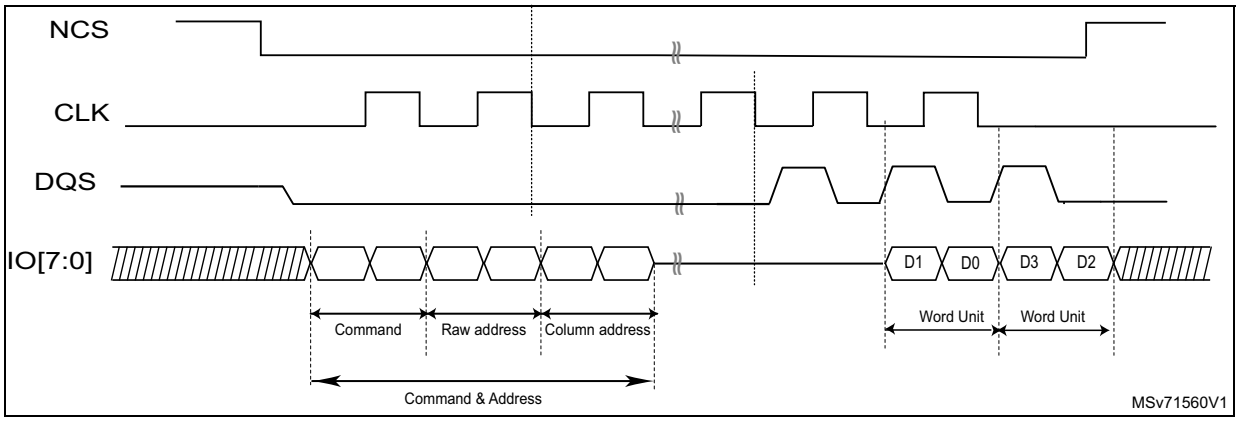


Table 315. OctaRAM command address bit assignment (based on 64-Mbyte(1) OctaRAM)

Clock	1st clock	2nd clock		3rd clock	
Function	Command	Row address		Column address	
SIO[7]	Command	Reserved	RA7	CA9	Reserved
SIO[6]		Reserved	RA6	CA8	Reserved
SIO[5]		Reserved	RA5	CA7	Reserved
SIO[4]		RA12	RA4	CA6	Reserved
SIO[3]		RA11	RA3	CA5	CA3
SIO[2]		RA10	RA2	CA4	CA2
SIO[1]		RA9	RA1	Reserved	CA1
SIO[0]		RA8	RA0	Reserved	CA0(2)

1. Example of 64-Mbyte OctaRAM address assignment:
Row Address [RA12:RA0]: 8K. Column address [CA9:CA0]: 1K. 64-Mbyte density = 8K x 1K x 8 bits
2. Column address A0 must be always 0.

- HyperBus memories need to be selected when targeted by the application. The configuration to set depends on the access type:
  - HyperBus memory mode: The protocol follows the HyperBus specification. MTYP[2:0] = 100 is the configuration to use to access the memory space.
  - HyperBus register mode (addressing register space): the memory-mapped accesses in this mode must be noncacheable, or the indirect read/write modes must be used. The configuration to be set for this particular register space access is MTYP[2:0] = 101.
- Standard mode. It is the mode to use whenever the targeted memory is not corresponding to any others configurations described in this section. MTYP[2:0] = 010 for this standard mode.

38.4.15 OCTOSPI regular-command mode configuration

Indirect mode configuration

When FMODE[1:0] = 00, the indirect-write mode is selected and data can be sent to the external device. When FMODE[1:0] = 01, the indirect-read mode is selected, and data can be read from the external device.

When the OCTOSPI is used in indirect mode, the frames are constructed in the following way:

1. Specify a number of data bytes to read or write in OCTOSPI_DLR.
2. Specify the frame timing in OCTOSPI_TCR.
3. Specify the frame format in OCTOSPI_CCR.
4. Specify the instruction in OCTOSPI_IR.
5. Specify the optional alternate byte to be sent right after the address phase in OCTOSPI_ABR.
6. Specify the targeted address in OCTOSPI_AR.

7. Enable the DMA channel if needed.
8. Read/write the data from/to the FIFO through OCTOSPI_DR (if no DMA usage).

If neither the address register (OCTOSPI_AR) nor the data register (OCTOSPI_DR) need to be updated for a particular command, then the command sequence starts as soon as OCTOSPI_IR is written. This is the case when both ADMODE[2:0] and DMODE[2:0] equal 000, or if just ADMODE[2:0] = 000 when in indirect-read mode (FMODE[1:0] = 01).

When an address is required (ADMODE[2:0] ≠ 000) and the data register does not need to be written (FMODE[1:0] = 01 or DMODE[2:0] = 000), the command sequence starts as soon as the address is updated with a write to OCTOSPI_AR.

In case of data transmission (FMODE[1:0] = 00 and DMODE[2:0] ≠ 000), the communication start is triggered by a write in the FIFO through OCTOSPI_DR.

Automatic status-polling mode configuration

The automatic status-polling mode is enabled by setting FMODE[1:0] = 10. In this mode, the programmed frame is sent and data are retrieved periodically.

The maximum amount of data read in each frame is 4 bytes. If more data is requested in OCTOSPI_DLR, it is ignored, and only 4 bytes are read. The periodicity is specified in OCTOSPI_PIR.

Once the status data has been retrieved, the following can be processed:

- Set SMF (an interrupt is generated if enabled).
- Stop automatically the periodic retrieving of the status bytes.

The received value can be masked with the value stored in OCTOSPI_PSMKR, and can be ORed or ANDed with the value stored in OCTOSPI_PSMAR.

In case of a match, SMF is set and an interrupt is generated if enabled. The OCTOSPI can be automatically stopped if AMPS is set. In any case, the latest retrieved value is available in OCTOSPI_DR.

When the OCTOSPI is used in automatic status-polling mode, the frames are constructed in the following way:

1. Specify the input mask in OCTOSPI_PSMKR.
2. Specify the comparison value in OCTOSPI_PSMAR.
3. Specify the read period in OCTOSPI_PIR.
4. Specify a number of data bytes to read in OCTOSPI_DLR.
5. Specify the frame timing in OCTOSPI_TCR.
6. Specify the frame format in OCTOSPI_CCR.
7. Specify the instruction in OCTOSPI_IR.
8. Specify the optional alternate byte to be sent right after the address phase in OCTOSPI_ABR.
9. Specify the optional targeted address in OCTOSPI_AR.

If the address register (OCTOSPI_AR) does not need to be updated for a particular command, then the command sequence starts as soon as OCTOSPI_CCR is written. This is the case when ADMODE[2:0] = 000.

When an address is required (ADMODE[2:0] ≠ 000), the command sequence starts as soon as the address is updated with a write to OCTOSPI_AR.

Memory-mapped mode configuration

In memory-mapped mode, the external device is seen as an internal memory but with some latency during accesses. Read and write operations are allowed to the external device in this mode.

It is not recommended to program the flash memory using memory-mapped writes, as the internal flags for erase or programming status have to be polled. The indirect-write mode fulfills this operation, possibly in conjunction with the automatic status-polling mode.

The memory-mapped mode is entered by setting FMODE[1:0] = 11 in OCTOSPI_CR.

The programmed instruction and frame are sent when an AHB master accesses the memory-mapped space.

The FIFO is used as a prefetch buffer to anticipate any linear reads. Any access to OCTOSPI_DR in this mode returns zero.

The data length register (OCTOSPI_DLR) has no meaning in memory-mapped mode.

When the OCTOSPI is used in memory-mapped mode, the frames are constructed in the following way:

1. Specify the frame timing in OCTOSPI_TCR for read operation.
2. Specify the frame format in OCTOSPI_CCR for read operation.
3. Specify the instruction in OCTOSPI_IR.
4. Specify the optional alternate byte to be sent right after the address phase in OCTOSPI_ABR for read operation.
5. Specify the frame timing in OCTOSPI_WTCR for write operation.
6. Specify the frame format in OCTOSPI_WCCR for write operation.
7. Specify the instruction in OCTOSPI_WIR.
8. Specify the optional alternate byte to be sent right after the address phase in OCTOSPI_WABR for write operation.

All configuration operations must be completed (ensured by checking BUSY = 0) before the first access to the memory area: any register write operation when BUSY = 1 has no effect and is not signaled with an error response. On the first access, the OCTOSPI becomes busy, and no further configuration is allowed. Then, the only way to get BUSY low is to clear the ENABLE bit or to abort by setting the ABORT bit.

OCTOSPI delayed data sampling when no DQS is used

By default, when no DQS is used, the OCTOSPI samples the data driven by the external device one half of a CLK cycle after the external device drives the signal.

In case of any external signal delays, it may be useful to sample the data later. Using SSHIFT in OCTOSPI_TCR, the sampling of the data can be shifted by half of a CLK cycle.

The firmware must clear SSHIFT when the data phase is configured in DTR mode (DDTR = 1).

OCTOSPI delayed data sampling when DQS is used

When external DQS is used as a sampling clock, it can be shifted in time to compensate the data propagation delay. This shift is performed by an external delay block located outside the OCTOSPI. The control of this feature depends on the device implementation (see the product reference manual for more details).

In configurations where delay does not need to be compensated, the external delay block can be bypassed by setting DLYBYP in OCTOSPI_DCR1.

38.4.16 OCTOSPI HyperBus protocol configuration

Indirect mode configuration (HyperBus)

When FMODE[1:0] = 00, the indirect-write mode is selected and data can be sent to the external device. When FMODE[1:0] = 01, the indirect-read mode is selected where data can be read from the external device. ADMODE must be configured with a value different from 000 (for instance ADMODE = 100).

When the OCTOSPI is used in indirect mode, the frames are constructed in the following way:

1. Specify a number of data bytes to read or write in OCTOSPI_DLR.
2. Specify the targeted address in OCTOSPI_AR.
3. Enable the DMA channel if needed.
4. Read/write the data from/to the FIFO through OCTOSPI_DR (if no DMA usage).

In indirect-read mode, the command sequence starts as soon as the address is updated with a write to OCTOSPI_AR.

In indirect-write mode, the communication start is triggered by a write in the FIFO through OCTOSPI_DR.

Memory-mapped mode configuration (HyperBus)

In memory-mapped mode, the external device is seen as an internal memory but with some latency during the accesses. Read and write operations are allowed to the external device in this mode.

It is not recommended to program the flash memory using the memory-mapped writes: the indirect-write mode fulfills this operation.

The memory-mapped mode is entered by setting FMODE[1:0] = 11. The programmed instruction and frame is sent when an AHB master accesses the memory-mapped space.

The FIFO is used as a prefetch buffer to anticipate any linear reads. Any access to OCTOSPI_DR in this mode returns zero.

The data length register (OCTOSPI_DLR) has no meaning in memory-mapped mode.

All the configuration operation must be completed before the first access to the memory area. On the first access, the OCTOSPI becomes busy, and no configuration is allowed. Then, the only way to get BUSY low is to clear the ENABLE bit, or to abort by setting the ABORT bit.

38.4.17 OCTOSPI error management

The following errors set the TEF flag in OCTOSPI_SR and generates an interrupt if enabled (TEIE = 1 in OCTOSPI_CR):

- in indirect or automatic status-polling mode, when a wrong address has been programmed in OCTOSPI_AR (according to the device size defined by DEVSIZE[4:0]).
- in indirect mode, if the address plus the data length exceed the device size: TEF is set as soon as the access is triggered.

In memory-mapped mode, the OCTOSPI generates an AHB slave error in the following situations:

- The memory-mapped mode is disabled and an AHB read or write request occurs.
- A read or write address exceeds the size of the external memory.
- An abort is received while a read or write burst is ongoing.
- The OCTOSPI is disabled while a read or write burst is requested.
- A write wrap burst is received.
- A write request is received while DQSE = 0 in OCTOSPI_WCCR in octal DTR mode, in dual-memory configuration, in HyperBus mode.
- A read or write request is received while DMODE[2:0] = 000 (no data phase), except when MTYP[2:0] is HyperBus.
- Illegal access size when wrap read burst. This means that the AHB bus transfer size (HSIZE) is different from 4 bytes (only for memory-mapped mode).
- Bit DMM is set in OCTOSPI_CR (dual-memory configuration) and octal mode is set.

38.4.18 OCTOSPI BUSY and ABORT

Once the OCTOSPI starts an operation with the external device, BUSY is automatically set in OCTOSPI_SR.

In indirect mode, BUSY is reset once the OCTOSPI has completed the requested command sequence and the FIFO is empty.

In automatic status-polling mode, BUSY goes low only after the last periodic access is complete, due to a match when APMS = 1 or due to an abort.

After the first access in memory-mapped mode, BUSY goes low only on an abort.

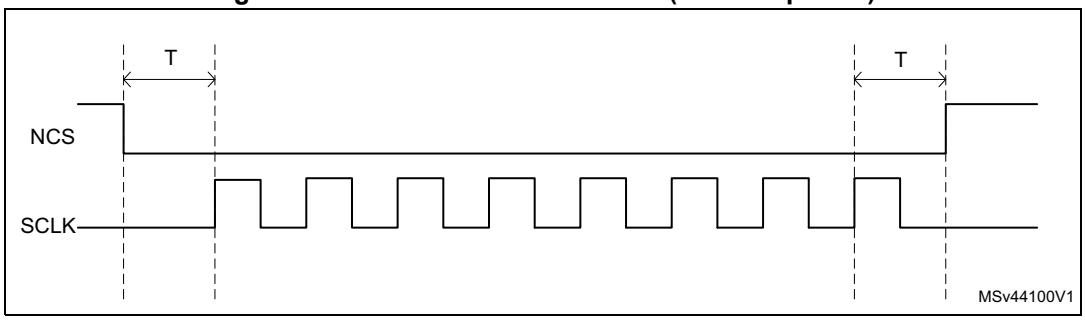
Any operation can be aborted by setting ABORT in OCTOSPI_CR. Once the abort is completed, BUSY and ABORT are automatically reset, and the FIFO is flushed.

Before setting ABORT, the software must ensure that all the current transactions are finished using the synchronization barriers. When DMA is enabled to handle the data read or write operations in OCTOSPI_DR, it is recommended to disable the DMA channel before aborting the OCTOSPI.

Note: Some devices may misbehave if a write operation to a status register is aborted.

38.4.19 OCTOSPI reconfiguration or deactivation

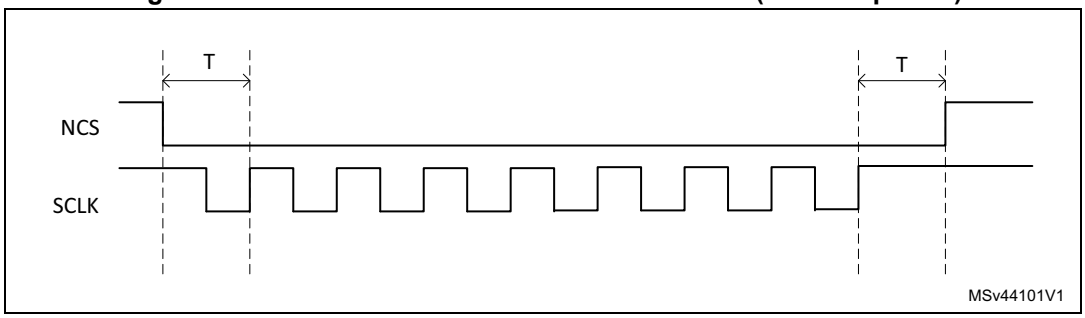
Before any OCTOSPI reconfiguration, the software must ensure that all the transactions are completed:



- After a memory-mapped write, the software must perform a dummy read followed by a synchronization barrier, then an abort.
- After a memory-mapped read, the software must perform a synchronization barrier than an abort.

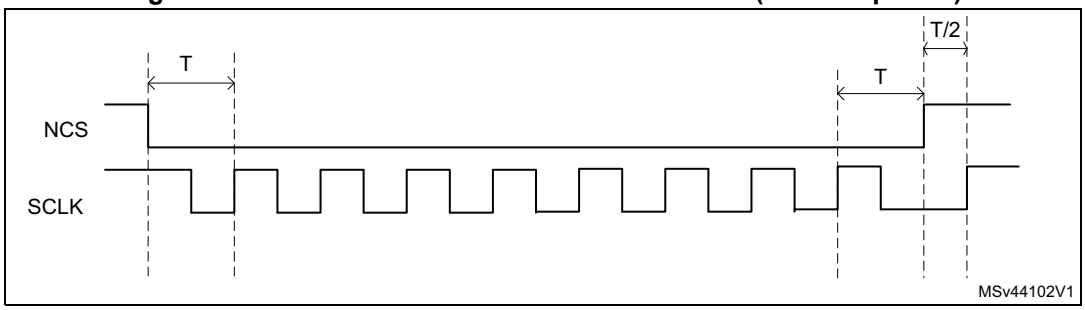
38.4.20 NCS behavior

By default, NCS is high, deselecting the external device. NCS falls before an operation begins and rises as soon as it finishes.



When CKMODE = 0 (clock mode 0: CLK stays low when no operation is in progress), NCS falls one CLK cycle before an operation first rising CLK edge, and NCS rises one CLK cycle after the operation final rising CLK edge (see the figure below).

Figure 254. NCS when CKMODE = 0 (T = CLK period)



When CKMODE = 1 (clock mode 3: CLK goes high when no operation is in progress) and when in SDR mode, NCS falls one CLK cycle before an operation first rising CLK edge, and NCS rises one CLK cycle after the operation final rising CLK edge (see the figure below).

Figure 255. NCS when CKMODE = 1 in SDR mode (T = CLK period)

When the CKMODE = 1 (clock mode 3) and DDTR = 1 (data DTR mode), NCS falls one CLK cycle before an operation first rising CLK edge, and NCS rises one CLK cycle after the operation final active rising CLK edge (see the figure below). Because the DTR operations must finish with a falling edge, CLK is low when NCS rises, and CLK rises back up one half of a CLK cycle afterwards.

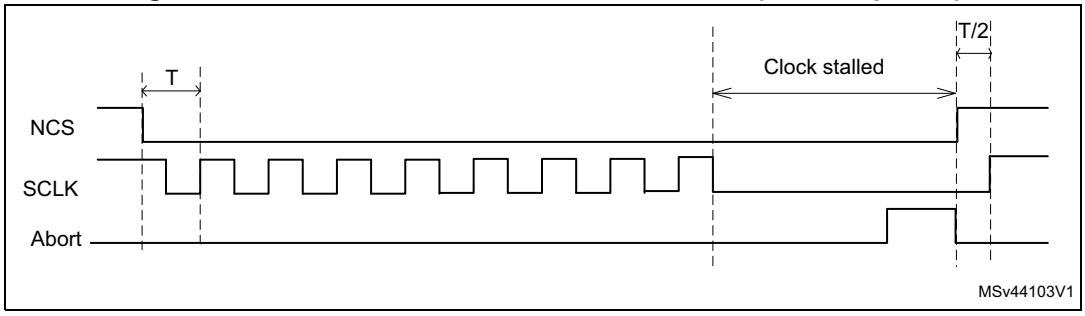


Figure 256. NCS when CKMODE = 1 in DTR mode (T = CLK period)

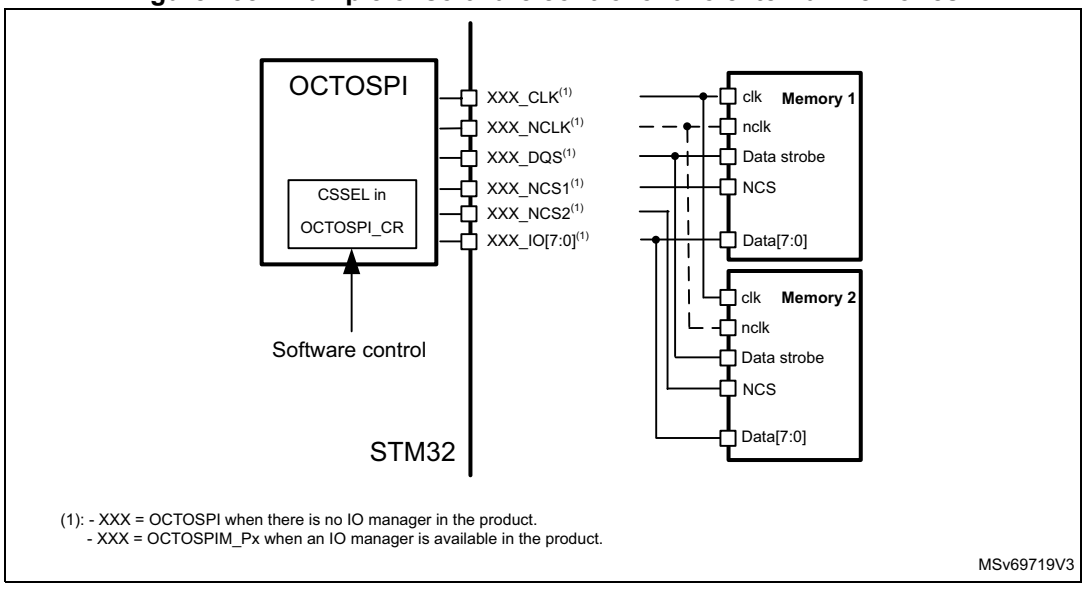
When the FIFO stays full during a read operation, or if the FIFO stays empty during a write operation, the operation stalls and CLK stays low until the software services the FIFO. If an

abort occurs when an operation is stalled, NCS rises just after the abort is requested and then CLK rises one half of a CLK cycle later (see the figure below).

Figure 257. NCS when CKMODE = 1 with an abort (T = CLK period)



In dual memory configuration, the NCS2 behaves exactly the same as the NCS1.
The quad-SPI/octal-SPI memory 2 can then use the NCS1, and the NCS2 pin can be used for other functions.

38.4.21 Software control of two external memories

One OCTOSPI instance is able to control the generation of the two chip-select signals (NCS1 and NCS2). This allows two external memories to be connected to the same I/O port driven by the OCTOSPI. The OCTOSPI generates one NCS signal and the user defines how the NCS is directed to NCS1 or NCS2, by setting the CSSEL bit in OCTOSPI_CR. Intended operation is semistatic commutation, such as starting an application reading an external flash memory and then, for the rest of the application, use an external SRAM connected to the same I/O bus. From a memory-map point of view, these two memories are located in the same address.

Figure 258. Example of software control of two external memories

38.5 Address alignment and data number

The table below summarizes the effect of the address alignment and programmed data number depending on the use case.

Table 316. Address alignment cases

Memory type	Transaction type	Constraint on address(1)	Impact if constraint on address not respected	Constraint on number of bytes(1)	Impact if constraint on bytes not respected
Single, dual, quad flash or SRAM (DMM = 0)	IND(2) read	None	None	None	None
	MM(3) read				
	IND write				
	MM write				
Single, dual, quad flash or SRAM (DMM = 1)	IND read	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM read	None	None	None	None
	IND write	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM write	Even	Slave error	Even	Last byte is lost.
Octal flash in SDR mode	IND read	None	None	None	None
	MM read				
	IND write				
	MM write				
Octal memory in DTR mode without WDM(6)	IND read	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM read	None	None	None	None
	IND write	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM write	Even	Slave error	Even	Last byte is lost.
Octal flash or RAM in DTR mode with WDM	IND read	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM read	None	None	None	None
	IND write(7)				
	MM write				
HyperBus	IND read	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM read	None	None	None	None
	IND write(7)				
	MM write				

1. To be respected by the software.
2. IND = indirect mode.
3. MM = memory-mapped mode
4. Extra data at transfer start.
5. Extra data at transfer end.
6. WDM = write data mask.

7. If the FTHRES bitfield is set to the maximum value with DLR value greater than the data burst length, and if the DMA is enabled or the interrupt based on FIFO THRESHOLD Flag is enabled (FTF), the address must be modulo 2 aligned in DTR mode when the initiator (DMA, CPU, ...) is writing the data with a burst length equal to the FIFO size.

38.6 OCTOSPI interrupts

An interrupt can be produced on the following events:

- Timeout
- Status match
- FIFO threshold
- Transfer complete
- Transfer error

Separate interrupt enable bits are available to provide more flexibility.

Table 317. OCTOSPI interrupt requests

Interrupt event	Event flag	Enable control bit
Timeout	TOF	TOIE
Status match	SMF	SMIE
FIFO threshold	FTF	FTIE
Transfer complete	TCF	TCIE
Transfer error	TEF	TEIE

38.7 OCTOSPI registers

38.7.1 OCTOSPI control register (OCTOSPI_CR)

Address offset: 0x0000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	MSEL	FMODE[1:0]		Res.	Res.	Res.	CSSEL	PMM	APMS	Res.	TOIE	SMIE	FTIE	TCIE	TEIE
	rw	rw	rw				rw	rw	rw		rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	FTHRES[5:0]						Res.	DMM	Res.	Res.	TCEN	DMAEN	ABORT	EN
		rw	rw	rw	rw	rw	rw		rw			rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bit 30 **MSEL**: External memory select

This bit selects the external memory to be addressed in single-, dual-, quad-SPI mode in single-memory configuration (when DMM = 0).

0: External memory 1 selected (data exchanged over IO[3:0])

1: External memory 2 selected (data exchanged over IO[7:4])

This bit is ignored when DMM = 1 or when octal-SPI mode is selected.

Note: This bit is mirrored in bit 7. This bit can be modified only when BUSY = 0.

Bits 29:28 **FMODE[1:0]**: Functional mode

This bitfield defines the OCTOSPI functional mode of operation.

00: Indirect-write mode

01: Indirect-read mode

10: Automatic status-polling mode (relevant in regular-command protocol only)

11: Memory-mapped mode

If DMAEN = 1 already, then the DMA controller for the corresponding channel must be disabled before changing the FMODE[1:0] value.

Note: This bitfield can be modified only when BUSY = 0.

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **CSSEL**: Chip-select selection

This bit indicates to OCTOSPI I/O manager if it must copy NCS to NCS1 or NCS2.

0: NCS I/O manager input is copied to NCS1 I/O manager output.

1: NCS I/O manager input is copied to NCS2 I/O manager output.

Note: This bit can be modified only when BUSY = 0.

Bit 23 **PMM**: Polling match mode

This bit indicates which method must be used to determine a match during the automatic status-polling mode.

0: AND-match mode, SMF is set if all the unmasked bits received from the device match the corresponding bits in the match register.

1: OR-match mode, SMF is set if any of the unmasked bits received from the device matches its corresponding bit in the match register.

Note: This bit can be modified only when BUSY = 0.

Bit 22 **APMS**: Automatic status-polling mode stop

This bit determines if the automatic status-polling mode is stopped after a match.

0: Automatic status-polling mode is stopped only by abort or by disabling the OCTOSPI.

1: Automatic status-polling mode stops as soon as there is a match.

Note: This bit can be modified only when BUSY = 0.

Bit 21 Reserved, must be kept at reset value.

Bit 20 **TOIE**: Timeout interrupt enable

This bit enables the timeout interrupt.

0: Interrupt disabled

1: Interrupt enabled

Bit 19 **SMIE**: Status-match interrupt enable

This bit enables the status-match interrupt.

0: Interrupt disabled

1: Interrupt enabled

Bit 18 **FTIE**: FIFO threshold interrupt enable
This bit enables the FIFO threshold interrupt.
0: Interrupt disabled
1: Interrupt enabled

Bit 17 **TCIE**: Transfer complete interrupt enable
This bit enables the transfer complete interrupt.
0: Interrupt disabled
1: Interrupt enabled

Bit 16 **TEIE**: Transfer error interrupt enable
This bit enables the transfer error interrupt.
0: Interrupt disabled
1: Interrupt enabled

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **FTHRES[5:0]**: FIFO threshold level
This field defines, in indirect mode, the threshold number of bytes in the FIFO that causes the FIFO threshold flag FTF in OCTOSPI_SR, to be set.
000000: FTF is set if there are one or more free bytes available to be written to in the FIFO in indirect-write mode, or if there are one or more valid bytes can be read from the FIFO in indirect-read mode.
000001: FTF is set if there are two or more free bytes available to be written to in the FIFO in indirect-write mode, or if there are two or more valid bytes can be read from the FIFO in indirect-read mode.
...
111111: FTF is set if there are 64 free bytes available to be written to in the FIFO in indirect-write mode, or if there are 64 valid bytes can be read from the FIFO in indirect-read mode.
Note: If DMAEN = 1, the DMA controller for the corresponding channel must be disabled before changing the FTHRES[5:0] value.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **DMM**: Dual-memory configuration
This bit activates the dual-memory configuration, where two external devices are used simultaneously to double the throughput and the capacity
0: Dual-memory configuration disabled
1: Dual-memory configuration enabled
Note: This bit can be modified only when BUSY = 0.

Bits 5:4 Reserved, must be kept at reset value.

Bit 3 **TCEN**: Timeout counter enable
This bit is valid only when the memory-mapped mode (FMODE[1:0] = 11) is selected. This bit enables the timeout counter.
0: The timeout counter is disabled, and thus the chip-select (NCS) remains active indefinitely after an access in memory-mapped mode.
1: The timeout counter is enabled, and thus the chip-select is released in the memory-mapped mode after TIMEOUT[15:0] cycles of external device inactivity.
Note: This bit can be modified only when BUSY = 0.

Bit 2 **DMAEN**: DMA enable

In indirect mode, the DMA can be used to input or output data via OCTOSPI_DR. DMA transfers are initiated when FTF is set.

0: DMA disabled for indirect mode

1: DMA enabled for indirect mode

Note: Resetting the DMAEN bit while a DMA transfer is ongoing, breaks the handshake with the DMA. Do not write this bit during DMA operation.

Bit 1 **ABORT**: Abort request

This bit aborts the ongoing command sequence. It is automatically reset once the abort is completed. This bit stops the current transfer.

0: No abort requested

1: Abort requested

Note: This bit is always read as 0.

Bit 0 **EN**: Enable

This bit enables the OCTOSPI.

0: OCTOSPI disabled

1: OCTOSPI enabled

Note: The DMA request can be aborted without having received the ACK in case this EN bit is cleared during the operation.
In case this bit is set to 0 during a DMA transfer, the REQ signal to DMA returns to inactive state without waiting for the ACK signal from DMA to be active.

38.7.2 OCTOSPI device configuration register 1 (OCTOSPI_DCR1)

Address offset: 0x0008

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	MTYP[2:0]			Res.	Res.	Res.	DEVSIZE[4:0]				
					rw	rw	rw				rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	CSHT[5:0]						Res.	Res.	Res.	Res.	DLY BYP	Res.	FRCK	CKMO DE
		rw	rw	rw	rw	rw	rw					rw		rw	rw

Bits 31:27 Reserved, must be kept at reset value.

Bits 26:24 **MTYP[2:0]**: Memory type

This bitfield indicates the type of memory to be supported.

000: Micron mode, D0/D1 ordering in DTR 8-data-bit mode. regular-command protocol in single-, dual-, quad- and octal-SPI modes.

Note: In this mode, DQS signal polarity is inverted with respect to the memory clock signal. This is the default value and care must be taken to change MTYP[2:0] for memories different from Micron.

001: Macronix mode, D1/D0 ordering in DTR 8-data-bit mode. Regular-command protocol in single-, dual-, quad-, and octal-SPI modes.

010: Standard mode

011: Macronix RAM mode, D1/D0 ordering in DTR 8-data-bit mode. Regular-command protocol in single-, dual-, quad-, and octal-SPI modes with dedicated address mapping (address is built with row and column to fit with Macronix requirements).

100: HyperBus memory mode, the protocol follows the HyperBus specification.

101: HyperBus register mode, addressing register space. The memory-mapped accesses in this mode must be noncacheable, or indirect-read/write modes must be used.

Others: Reserved

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **DEVSIZE[4:0]**: Device size

This bitfield defines the size of the external device using the following formula:

Number of bytes in device = $2^{[DEVSIZE+1]}$.

DEVSIZE + 1 is effectively the number of address bits required to address the external device. The device capacity can be up to 4 Gbytes (addressed using 32-bits) in indirect mode, but the addressable space in memory-mapped mode is limited to 256 Mbytes.

In regular-command protocol, if DMM = 1, DEVSIZE[4:0] must reflect the total capacity of the two devices together considering the above formula (DEVSIZE[4:0] value is so equal to one of the two memory capacities).

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **CSHT[5:0]**: Chip-select high time

CSHT + 1 defines the minimum number of CLK cycles where the chip-select (NCS) must remain high between commands issued to the external device.

0x0: NCS stays high for at least 1 cycle between external device commands.

0x1: NCS stays high for at least 2 cycles between external device commands.

...

0x3F: NCS stays high for at least 64 cycles between external device commands.

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **DLYBYP**: Delay block bypass

0: The internal sampling clock (called feedback clock) or the DQS data strobe external signal is delayed by the delay block (for more details on this block, refer to the dedicated section of the reference manual as it is not part of the OCTOSPI peripheral).

1: The delay block is bypassed, so the internal sampling clock or the DQS data strobe external signal is not affected by the delay block. The delay is shorter than when the delay block is not bypassed, even with the delay value set to minimum value in delay block.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **FRCK**: Free running clock

This bit configures the free running clock.

0: CLK is not free running.

1: CLK is free running (always provided).

Note: Free running clock mode is intended for delay calibration only. No memory or other device access is possible when FRCK is set.

Bit 0 **CKMODE**: Clock mode 0/mode 3

This bit indicates the level taken by the CLK between commands (when NCS = 1).

0: CLK must stay low while NCS is high (chip-select released). This is referred to as clock mode 0.

1: CLK must stay high while NCS is high (chip-select released). This is referred to as clock mode 3.

38.7.3 OCTOSPI device configuration register 2 (OCTOSPI_DCR2)

Address offset: 0x000C

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WRAPSIZE[2:0]		
													rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRESCALER[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:16 **WRAPSIZE[2:0]**: Wrap size

This bitfield indicates the wrap size to which the memory is configured. For memories which have a separate command for wrapped instructions, this bitfield indicates the wrap-size associated with the command held in the OCTOSPI1_WPIR register.

000: Wrapped reads are not supported by the memory.

010: External memory supports wrap size of 16 bytes.

011: External memory supports wrap size of 32 bytes.

100: External memory supports wrap size of 64 bytes.

101: External memory supports wrap size of 128 bytes.

Others: Reserved

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **PRESCALER[7:0]**: Clock prescaler

This bitfield defines the scaler factor for generating the CLK based on the kernel clock (value + 1).

0: $F_{CLK} = F_{KERNEL}$, kernel clock used directly as OCTOSPI CLK (prescaler bypassed). In this case, if the DTR mode is used, it is mandatory to provide to the OCTOSPI a kernel clock that has 50% duty-cycle.

1: $F_{CLK} = F_{KERNEL}/2$

2: $F_{CLK} = F_{KERNEL}/3$

...

255: $F_{CLK} = F_{KERNEL}/256$

For odd clock division factors, the CLK duty cycle is not 50 %. The clock signal remains low one cycle longer than it stays high.

38.7.4 OCTOSPI device configuration register 3 (OCTOSPI_DCR3)

Address offset: 0x0010

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CSBOUND[4:0]				
											rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAXTRAN[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **CSBOUND[4:0]**: NCS boundary

This bitfield enables the transaction boundary feature. When active, a minimum value of 3 is recommended. The NCS is released on each boundary of $2^{CSBOUND}$ bytes.

0: NCS boundary disabled

Others: NCS boundary set to $2^{CSBOUND}$ bytes

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **MAXTRAN[7:0]**: Maximum transfer

This bitfield enables the communication regulation feature. The NCS is released every MAXTRAN+1 clock cycles when the other OCTOSPI request the access to the bus.

0: Maximum communication disabled

Others: Maximum communication is set to MAXTRAN + 1 bytes.

38.7.5 OCTOSPI device configuration register 4 (OCTOSPI_DCR4)

Address offset: 0x0014

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REFRESH[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REFRESH[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **REFRESH[31:0]**: Refresh rate

This bitfield enables the refresh rate feature. The NCS is released every REFRESH + 1 clock cycles for writes, and REFRESH + 4 clock cycles for reads. These two values can be extended with few clock cycles when refresh occurs during a byte transmission in single-, dual- or quad-SPI mode, because the byte transmission must be completed.

0: Refresh disabled

Others: Maximum communication length is set to REFRESH + 1 clock cycles.

Note: REFRESH count is based on the divided clock period: if OCTOSPI_DCR2 PRESCALER bitfield is changed, the REFRESH field must be updated accordingly.

38.7.6 OCTOSPI status register (OCTOSPI_SR)

Address offset: 0x0020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	FLEVEL[6:0]							Res.	Res.	BUSY	TOF	SMF	FTF	TCF	TEF
	r	r	r	r	r	r	r			r	r	r	r	r	r

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:8 **FLEVEL[6:0]**: FIFO level

This bitfield gives the number of valid bytes that are being held in the FIFO. FLEVEL = 0 when the FIFO is empty, and 64 when it is full.

In automatic status-polling mode, FLEVEL is zero.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **BUSY**: Busy

This bit is set when an operation is ongoing. It is cleared automatically when the operation with the external device is finished and the FIFO is empty.

Bit 4 **TOF**: Timeout flag

This bit is set when timeout occurs. It is cleared by writing 1 to CTOF.

Bit 3 **SMF**: Status match flag

This bit is set in automatic status-polling mode when the unmasked received data matches the corresponding bits in the match register (OCTOSPI_PSMAR).
It is cleared by writing 1 to CSMF.

Bit 2 **FTF**: FIFO threshold flag

In indirect mode, this bit is set when the FIFO threshold has been reached, or if there is any data left in the FIFO after the reads from the external device are complete.
It is cleared automatically as soon as the threshold condition is no longer true.
In automatic status-polling mode, this bit is set every time the status register is read, and the bit is cleared when the data register is read.

Bit 1 **TCF**: Transfer complete flag

This bit is set in indirect mode when the programmed number of data has been transferred or in any mode when the transfer has been aborted.It is cleared by writing 1 to CTCF.

Bit 0 **TEF**: Transfer error flag

This bit is set in indirect mode when an invalid address is being accessed in indirect mode.
It is cleared by writing 1 to CTEF.

38.7.7 OCTOSPI flag clear register (OCTOSPI_FCR)

Address offset: 0x0024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CTOF	CSMF	Res.	CTCF	CTEF
											w	w		w	w

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CTOF**: Clear timeout flag

Writing 1 clears the TOF flag in the OCTOSPI_SR register.

Bit 3 **CSMF**: Clear status match flag

Writing 1 clears the SMF flag in the OCTOSPI_SR register.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CTCF**: Clear transfer complete flag

Writing 1 clears the TCF flag in the OCTOSPI_SR register.

Bit 0 **CTEF**: Clear transfer error flag

Writing 1 clears the TEF flag in the OCTOSPI_SR register.

38.7.8 OCTOSPI data length register (OCTOSPI_DLR)

Address offset: 0x0040

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DL[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DL[31:0]**: Data length

Number of data to be retrieved (value+1) in indirect and automatic status-polling modes. A value not greater than three (indicating 4 bytes) must be used for automatic status-polling mode.

All 1's in indirect mode means undefined length, where OCTOSPI continues until the end of the memory, as defined by DEVSIZE.

0x0000_0000: 1 byte is to be transferred.

0x0000_0001: 2 bytes are to be transferred.

0x0000_0002: 3 bytes are to be transferred.

0x0000_0003: 4 bytes are to be transferred.

...

0xFFFF_FFFD: 4,294,967,294 (4G-2) bytes are to be transferred.

0xFFFF_FFFE: 4,294,967,295 (4G-1) bytes are to be transferred.

0xFFFF_FFFF: undefined length; all bytes, until the end of the external device, (as defined by DEVSIZE) are to be transferred. Continue reading indefinitely if DEVSIZE = 0x1F.

DL[0] is stuck at 1 in dual-memory configuration (DMM = 1) even when 0 is written to this bit, thus assuring that each access transfers an even number of bytes.

This bitfield has no effect in memory-mapped mode.

38.7.9 OCTOSPI address register (OCTOSPI_AR)

Address offset: 0x0048

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0 and FMODE ≠ 11.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADDRESS[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDRESS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ADDRESS[31:0]**: Address

Address to be sent to the external device. In HyperBus protocol, this field must be even as this protocol is 16-bit word oriented. In dual-memory configuration, AR[0] is forced to 0.

38.7.10 OCTOSPI data register (OCTOSPI_DR)

Address offset: 0x0050

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DATA[31:0]**: Data

Data to be sent/received to/from the external SPI device

In indirect-write mode, data written to this register is stored on the FIFO before it is sent to the external device during the data phase. If the FIFO is too full, a write operation is stalled until the FIFO has enough space to accept the amount of data being written.

In indirect-read mode, reading this register gives (via the FIFO) the data that was received from the external device. If the FIFO does not have as many bytes as requested by the read operation and if BUSY = 1, the read operation is stalled until enough data is present or until the transfer is complete, whichever happens first.

In automatic status-polling mode, this register contains the last data read from the external device (without masking).

Word, half-word, and byte accesses to this register are supported. In indirect-write mode, a byte write adds 1 byte to the FIFO, a half-word write 2 bytes, and a word write 4 bytes.

Similarly, in indirect-read mode, a byte read removes 1 byte from the FIFO, a halfword read 2 bytes, and a word read 4 bytes. Accesses in indirect mode must be aligned to the bottom of this register: A byte read must read DATA[7:0] and a half-word read must read DATA[15:0].

38.7.11 OCTOSPI polling status mask register (OCTOSPI_PSMKR)

Address offset: 0x0080

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MASK[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MASK[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MASK[31:0]**: Status mask

Mask to be applied to the status bytes received in automatic status-polling mode

For bit n:

0: Bit n of the data received in automatic status-polling mode is masked and its value is not considered in the matching logic.

1: Bit n of the data received in automatic status-polling mode is unmasked and its value is considered in the matching logic.

38.7.12 OCTOSPI polling status match register (OCTOSPI_PSMAR)

Address offset: 0x0088

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MATCH[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MATCH[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MATCH[31:0]**: Status match
Value to be compared with the masked status register to get a match

38.7.13 OCTOSPI polling interval register (OCTOSPI_PIR)

Address offset: 0x0090

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

INTERVAL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **INTERVAL[15:0]**: Polling interval
Number of CLK cycles between a read during the automatic status-polling phases

38.7.14 OCTOSPI communication configuration register (OCTOSPI_CCR)

Address offset: 0x0100

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **DQSE**: DQS enable
This bit enables the data strobe management.
0: DQS disabled
1: DQS enabled

Bit 28 Reserved, must be kept at reset value.

Bit 27 **DDTR**: Data double transfer rate
This bit sets the DTR mode for the data phase.
0: DTR mode disabled for data phase
1: DTR mode enabled for data phase

Bits 26:24 **DMODE[2:0]**: Data mode
This bitfield defines the data phase mode of operation.
000: No data
001: Data on a single line
010: Data on two lines
011: Data on four lines
100: Data on eight lines
Others: Reserved

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:20 **ABSIZE[1:0]**: Alternate-byte size
This bitfield defines the alternate-byte size.
00: 8-bit alternate bytes
01: 16-bit alternate bytes
10: 24-bit alternate bytes
11: 32-bit alternate bytes

Bit 19 **ABDTR**: Alternate- byte double transfer rate
This bit sets the DTR mode for the alternate-byte phase.
0: DTR mode disabled for the alternate-byte phase
1: DTR mode enabled for the alternate-byte phase

Bits 18:16 **ABMODE[2:0]**: Alternate-byte mode
This bitfield defines the alternate-byte phase mode of operation.
000: No alternate bytes
001: Alternate bytes on a single line
010: Alternate bytes on two lines
011: Alternate bytes on four lines
100: Alternate bytes on eight lines
Others: Reserved

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:12 **ADSIZE[1:0]**: Address size
This bitfield defines the address size.
00: 8-bit address
01: 16-bit address
10: 24-bit address
11: 32-bit address

Bit 11 **ADDTR**: Address double transfer rate
This bit sets the DTR mode for the address phase.
0: DTR mode disabled for the address phase
1: DTR mode enabled for the address phase

Bits 10:8 **ADMODE[2:0]**: Address mode
This bitfield defines the address phase mode of operation.
000: No address
001: Address on a single line
010: Address on two lines
011: Address on four lines
100: Address on eight lines
Others: Reserved

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **ISIZE[1:0]**: Instruction size
This bitfield defines instruction size.
00: 8-bit instruction
01: 16-bit instruction
10: 24-bit instruction
11: 32-bit instruction

Bit 3 **IDTR**: Instruction double transfer rate
This bit sets the DTR mode for the instruction phase.
0: DTR mode disabled for the instruction phase
1: DTR mode enabled for the instruction phase

Bits 2:0 **IMODE[2:0]**: Instruction mode
This bitfield defines the instruction phase mode of operation.
000: No instruction
001: Instruction on a single line
010: Instruction on two lines
011: Instruction on four lines
100: Instruction on eight lines
Others: Reserved

38.7.15 OCTOSPI timing configuration register (OCTOSPI_TCR)

Address offset: 0x0108

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

											rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bit 30 **SSHIFT**: Sample shift
By default, the OCTOSPI samples data 1/2 of a CLK cycle after the data is driven by the external device.
This bit allows the data to be sampled later in order to consider the external signal delays.
0: No shift
1: 1/2 cycle shift
The software must ensure that SSHIFT = 0 when the data phase is configured in DTR mode (when DDTR = 1.)

Bit 29 Reserved, must be kept at reset value.

Bit 28 **DHQC**: Delay hold quarter cycle
0: No delay hold
1: 1/4 cycle hold

Bits 27:5 Reserved, must be kept at reset value.

Bits 4:0 **DCYC[4:0]**: Number of dummy cycles
This bitfield defines the duration of the dummy phase according to the memory latency.
In both SDR and DTR modes, it specifies a number of CLK cycles (0-31).

38.7.16 OCTOSPI instruction register (OCTOSPI_IR)

Address offset: 0x0110

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
INSTRUCTION[31:16]

ALTERNATE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ALTERNATE[31:0]**: Alternate bytes

Optional data to be sent to the external SPI device right after the address.

38.7.18 OCTOSPI low-power timeout register (OCTOSPI_LPTR)

Address offset: 0x00130

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

TIMEOUT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **TIMEOUT[15:0]**: Timeout period

After each access in memory-mapped mode, the OCTOSPI prefetches the subsequent bytes and hold them in the FIFO.

This bitfield indicates how many CLK cycles the OCTOSPI waits after the clock becomes inactive and until it raises the NCS, putting the external device in a lower-consumption state.

38.7.19 OCTOSPI wrap communication configuration register (OCTOSPI_WPCCR)

Address offset: 0x0140

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

11: 32-bit alternate bytes

Bit 19 **ABDTR**: Alternate-byte double transfer rate
This bit sets the DTR mode for the alternate-byte phase.
0: DTR mode disabled for the alternate-byte phase
1: DTR mode enabled for the alternate-byte phase

Bits 18:16 **ABMODE[2:0]**: Alternate-byte mode
This bitfield defines the alternate-byte phase mode of operation.
000: no alternate bytes
001: alternate bytes on a single line
010: alternate bytes on two lines
011: alternate bytes on four lines
100: alternate bytes on eight lines
Others: reserved

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:12 **ADSIZE[1:0]**: Address size
This bitfield defines the address size.
00: 8-bit address
01: 16-bit address
10: 24-bit address
11: 32-bit address

Bit 11 **ADDTR**: Address double transfer rate
This bit sets the DTR mode for the address phase.
0: DTR mode disabled for address phase
1: DTR mode enabled for address phase

Bits 10:8 **ADMODE[2:0]**: Address mode
This bitfield defines the address phase mode of operation.
000: No address
001: Address on a single line
010: Address on two lines
011: Address on four lines
100: Address on eight lines
Others: Reserved

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **ISIZE[1:0]**: Instruction size
This bitfield defines the instruction size.
00: 8-bit instruction
01: 16-bit instruction
10: 24-bit instruction
11: 32-bit instruction

Bit 3 **IDTR**: Instruction double transfer rate
This bit sets the DTR mode for the instruction phase.
0: DTR mode disabled for the instruction phase
1: DTR mode enabled for the instruction phase

Bits 2:0 **IMODE[2:0]**: Instruction mode
This bitfield defines the instruction phase mode of operation.
000: No instruction
001: Instruction on a single line
010: Instruction on two lines

100: Instruction on eight lines
Others: Reserved

38.7.20 OCTOSPI wrap timing configuration register (OCTOSPI_WPTCR)

Address offset: 0x0148

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	SSHIFT	Res.	DHQC	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
	rw		rw												

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCYC[4:0]				
											rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bit 30 **SSHIFT**: Sample shift
By default, the OCTOSPI samples data 1/2 of a CLK cycle after the data is driven by the external device.
This bit allows the data to be sampled later in order to consider the external signal delays.
0: No shift
1: 1/2 cycle shift
The firmware must assure that SSHIFT=0 when the data phase is configured in DTR mode (when DDTR = 1).

Bit 29 Reserved, must be kept at reset value.

Bit 28 **DHQC**: Delay hold quarter cycle
Add a quarter cycle delay on the outputs in DTR communication to match hold requirement.
0: No quarter cycle delay
1: 1/4 cycle delay inserted

Bits 27:5 Reserved, must be kept at reset value.

Bits 4:0 **DCYC[4:0]**: Number of dummy cycles
This bitfield defines the duration of the dummy phase according to the memory latency.
In both SDR and DTR modes, it specifies a number of CLK cycles (0-31).

38.7.21 OCTOSPI wrap instruction register (OCTOSPI_WPIR)

Address offset: 0x0150

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
INSTRUCTION[31:16]

INSTRUCTION[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **INSTRUCTION[31:0]**: Instruction
Instruction to be sent to the external SPI device

38.7.22 OCTOSPI wrap alternate bytes register (OCTOSPI_WPABR)

Address offset: 0x0160

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ALTERNATE[31:16]

ALTERNATE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ALTERNATE[31:0]**: Alternate bytes
Optional data to be sent to the external SPI device right after the address

38.7.23 OCTOSPI write communication configuration register (OCTOSPI_WCCR)

Address offset: 0x0180

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0. Its content has a meaning only when requesting write operations in memory-mapped mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	DQSE	Res.	DDTR	DMODE[2:0]			Res.	Res.	ABSIZE[1:0]		ABDTR	ABMODE[2:0]

		rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **DQSE**: DQS enable
This bit enables the data strobe management.
0: DQS disabled
1: DQS enabled

Bit 28 Reserved, must be kept at reset value.

Bit 27 **DDTR**: data double transfer rate
This bit sets the DTR mode for the data phase.
0: DTR mode disabled for the data phase
1: DTR mode enabled for the data phase

Bits 26:24 **DMODE[2:0]**: Data mode
This bitfield defines the data phase mode of operation.
000: No data
001: Data on a single line
010: Data on two lines
011: Data on four lines
100: Data on eight lines
Others: Reserved

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:20 **ABSIZE[1:0]**: Alternate-byte size
This bitfield defines the alternate-byte size.
00: 8-bit alternate bytes
01: 16-bit alternate bytes
10: 24-bit alternate bytes
11: 32-bit alternate bytes

Bit 19 **ABDTR**: Alternate bytes double transfer rate
This bit sets the DTR mode for the alternate-bytes phase.
0: DTR mode disabled for alternate-bytes phase
1: DTR mode enabled for alternate-bytes phase

Bits 18:16 **ABMODE[2:0]**: Alternate-byte mode
This bitfield defines the alternate-byte phase mode of operation.
000: No alternate bytes
001: Alternate bytes on a single line
010: Alternate bytes on two lines
011: Alternate bytes on four lines
100: Alternate bytes on eight lines
Others: Reserved

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:12 **ADSIZE[1:0]**: Address size
This bitfield defines the address size.
00: 8-bit address
01: 16-bit address
10: 24-bit address
11: 32-bit address

Bit 11 **ADDTR**: Address double transfer rate
This bit sets the DTR mode for the address phase.
0: DTR mode disabled for the address phase
1: DTR mode enabled for the address phase

Bits 10:8 **ADMODE[2:0]**: Address mode
This bitfield defines the address phase mode of operation.
000: No address
001: Address on a single line
010: Address on two lines
011: Address on four lines
100: Address on eight lines
Others: Reserved

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **ISIZE[1:0]**: Instruction size
This bitfield defines the instruction size.
00: 8-bit instruction
01: 16-bit instruction
10: 24-bit instruction
11: 32-bit instruction

Bit 3 **IDTR**: Instruction double transfer rate
This bit sets the DTR mode for the instruction phase.
0: DTR mode disabled for instruction phase
1: DTR mode enabled for instruction phase

Bits 2:0 **IMODE[2:0]**: Instruction mode
This bitfield defines the instruction phase mode of operation.
000: No instruction
001: Instruction on a single line
010: Instruction on two lines
011: Instruction on four lines
100: Instruction on eight lines
Others: Reserved

38.7.24 OCTOSPI write timing configuration register (OCTOSPI_WTCR)

Address offset: 0x0188

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0. Its content has a meaning only when requesting write operations in memory-mapped mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCYC[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **DCYC[4:0]**: Number of dummy cycles
This bitfield defines the duration of the dummy phase according to the memory latency.
In both SDR and DTR modes, it specifies a number of CLK cycles (0-31).

38.7.25 OCTOSPI write instruction register (OCTOSPI_WIR)

Address offset: 0x0190

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0. Its content has a meaning only when requesting write operations in memory-mapped mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

INSTRUCTION[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **INSTRUCTION[31:0]**: Instruction
Instruction to be sent to the external SPI device

38.7.26 OCTOSPI write alternate bytes register (OCTOSPI_WABR)

Address offset: 0x01A0

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0. Its content has a meaning only when requesting write operations in memory-mapped mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ALTERNATE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ALTERNATE[31:0]**: Alternate bytes

Optional data to be sent to the external SPI device right after the address

38.7.27 OCTOSPI HyperBus latency configuration register (OCTOSPI_HLCR)

Address offset: 0x0200

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRWR[7:0]

TACC[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	WZL	LM
rw	rw	rw	rw	rw	rw	rw	rw							rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **TRWR[7:0]:** Read-write minimum recovery time

Device read-to-write/write-to-read minimum recovery time expressed in number of communication clock cycles

Bits 15:8 **TACC[7:0]**: Access time

Device access time according to the memory latency, expressed in number of communication clock cycles

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **WZL:** Write zero latency

This bit enables zero latency on write operations.

0: Latency on write accesses

1: No latency on write accesses

Bit 0 **LM:** Latency mode
This bit selects the latency mode.
0: Variable initial latency
1: Fixed latency

38.7.28 OCTOSPI hardware configuration register 2 (OCTOSPI_HWCFGR2)

Address offset: 0x03EC

Reset value: 0x0000 0X01

39 Octo-SPI I/O manager (OCTOSPIM)

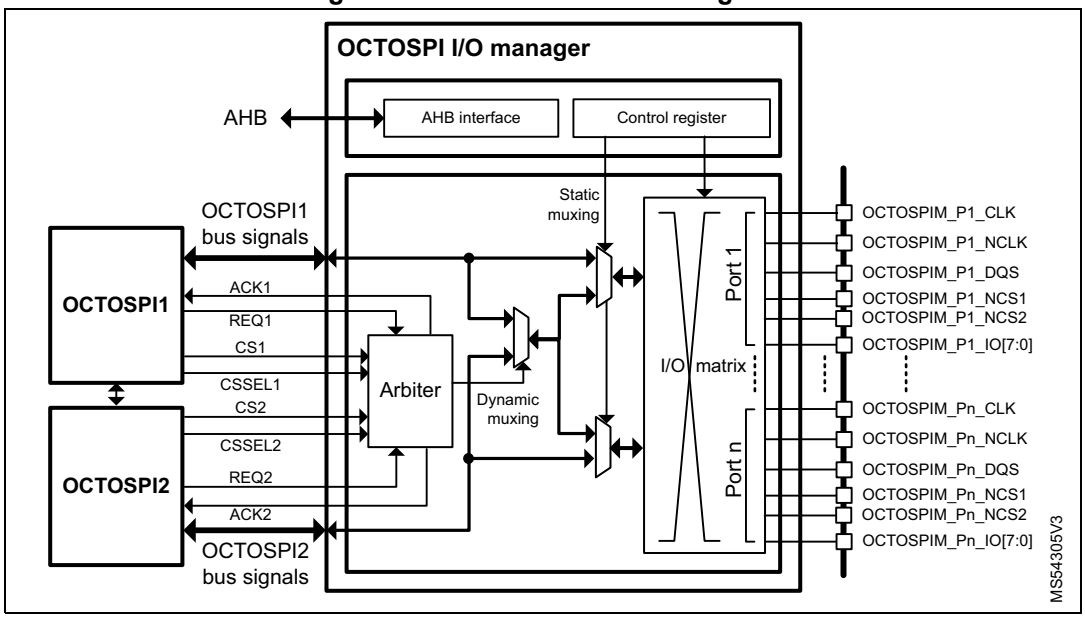
39.1 Introduction

The Octo-SPI I/O manager is a low-level interface that enables an efficient OCTOSPI pin assignment with a full I/O matrix (before alternate function map), and multiplex of single/dual/quad/octal SPI interfaces over the same bus.

39.2 OCTOSPIM main features

- Supports up to two single/dual/quad/octal SPI interfaces
- Supports up to two ports for pin assignment

Table 319. OCTOSPIM implementation



OCTOSPI feature	Available on the devices
Supports up to two single/dual/quad interfaces	X
Fully I/O multiplexing capability	X
Supports time-multiplexed mode	X
Supports high-speed interface	-
Chip select selection if OCTOSPI provides dual chip select	X
Supports 16-bit data interface and dual-octal mode	-

39.3 OCTOSPIM functional description

39.3.1 OCTOSPIM block diagram

The block diagram of the OCTOSPI I/O manager is shown in *Figure 259*.

Figure 259. OCTOSPIM block diagram

1. The number of ports (n) is 2.

39.3.2 OCTOSPIM input/output pins

Table 320. OCTOSPIM input/output pins

Pin name(1)	Signal type	Description
OCTOSPIM_Px_NCLK	Output	OCTOSPI inverted clock to support 1.8 V HyperBus protocol
OCTOSPIM_Px_CLK		OCTOSPI clock
OCTOSPIM_Px_IOn (n = 0 to 7)	Input/output	OCTOSPI data pins
OCTOSPIM_Px_NCS1,2	Output	Chip select for the memories
OCTOSPIM_Px_DQS	Input/output	Data strobe/write mask signal from/to the memory

1. x = 1 to 2.

39.3.3 OCTOSPIM matrix

The OCTOSPI I/O manager matrix allows the user to set a premapping of functions:

- OCTOSPI1 mapped to Port 1, with OCTOSPI2 mapped to Port 2 (direct mode)
- OCTOSPI1 mapped to Port 2, with OCTOSPI2 mapped to Port 1 (swapped mode)
- OCTOSPI1 and OCTOSPI2 both mapped to Port 1, with arbitration (multiplexed mode)
- OCTOSPI1 and OCTOSPI2 both mapped to Port 2, with arbitration (multiplexed mode)

Note: There is no possibility to use mixed combinations of signals (like NCS of OCTOSPI1 with data of OCTOSPI2).

When several I/O pins have the same configuration and are enabled at the same time, the result can be unpredictable.

In the default out-of-reset configuration, the OCTOSPI1 and OCTOSPI2 signals are mapped, respectively, on Port 1 and on Port 2.

The OCTOSPIM configuration can be changed only when all OCTOSPIs are disabled.

39.3.4 OCTOSPIM multiplexed mode

When this mode is set, the OCTOSPIs are time-multiplexed over the same bus. They get the ownership of the bus (in turn) through a request/acknowledge protocol with REQ/ACK signals.

The time-multiplexing is enabled by setting the MUXEN bit of the configuration register OCTOSPIM_CR.

The fairness counter (MAXTRAN) of each OCTOSPI can be used to manage accurately the maximum duration for which a given OCTOSPI takes the bus: this feature ensures a maximum bus access latency for the other OCTOSPI(s). When the bus is released by one OCTOSPI, an arbitration phase occurs, which is round-robin: when another OCTOSPI requests the bus, it gets it.

When the multiplexed mode is enabled, either the fairness counter or the refresh timeout counter of both OCTOSPI interfaces must be activated.

Each OCTOSPI delivers one NCS signal together with a CSSEL control signal. The CSSEL signal selects which of the two outputs (NCS1, NCS2) is active. In multiplexed modes, the active CCSEL signal is the one of the OCTOSPI owning the bus. The default value of OCTOSPI_CR.CSSEL is 0 for OCTOSPI1 and 1 for OCTOSPI2. Only OCTOSPIn_IOs, OCTOSPIn_DQS and OCTOSPIn_CLK / OCTOSPIn_NCLK are multiplexed.

When the multiplexed mode is used, only clock mode 0 is supported on the OCTOSPIs.

Due to arbitration and bus sharing, the auto polling interval time of the OCTOSPI, when used, may increase.

Minimum switching duration

The minimum number of cycles needed to switch from an OCTOSPI to another can be configured.

This internal timer guarantees a latency between the falling edge of the REQ signal of the active OCTOSPI (the active one releases the bus), and the rising edge of the ACK signal to the requesting OCTOSPI (the bus is granted to the requesting one).

The REQ2ACK_TIME field of the configuration register OCTOSPIM_CR defines the duration.

39.4 Use cases description

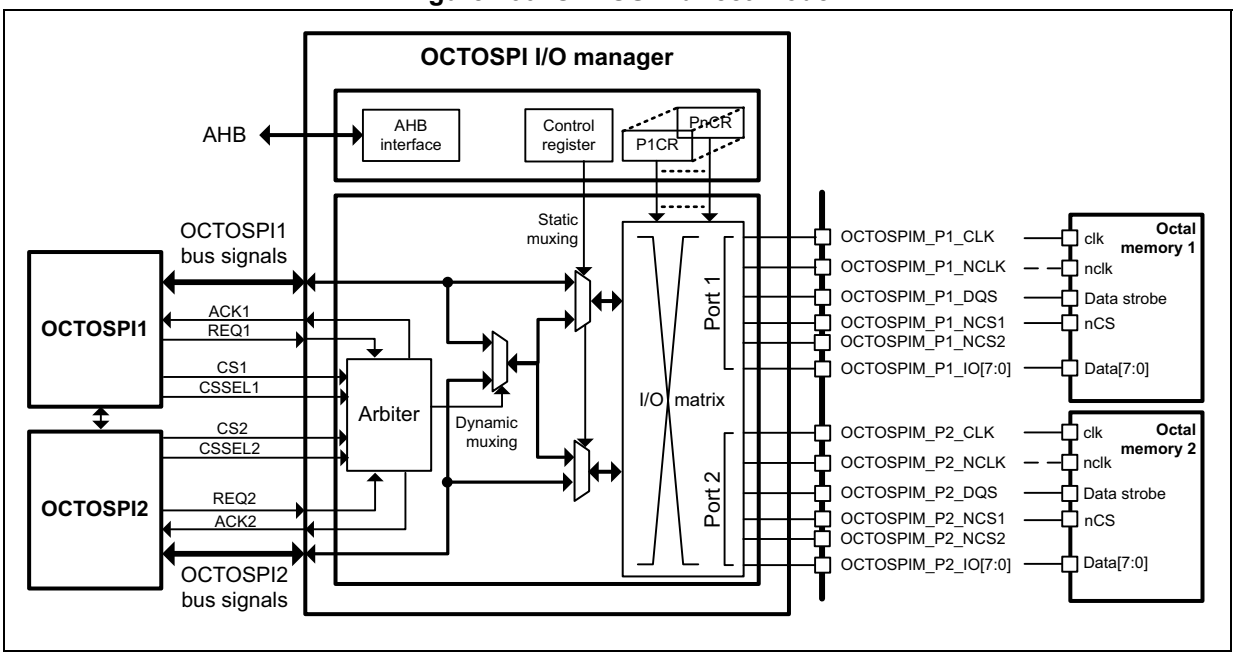
Table 321 summarizes the use cases corresponding to IO manager modes.

Table 321. Use cases

IO manager mode	MUXEN	Mode	Reference
Direct	0	0	*Section 39.4.1*
Swapped	0	1	*Section 39.4.2*

Table 321. Use cases (continued)

IO manager mode	MUXEN	Mode	Reference
Multiplexed to Port1	1	0	*Section 39.4.3*
Multiplexed to Port2	1	1	*Section 39.4.4*
Two OCTOSPIs drive one external memory	1	0 or 1, depending upon the port connected to the memory	*Section 39.4.5*
One OCTOSPI drives two external memories	0	0 with CS selection command from OCTOSPI1 or 2.	*Section 39.4.6*



39.4.1 Two OCTOSPIs direct mode

This is the baseline mode: each OCTOSPI drives independently the corresponding port. There is no multiplexing.

Alternate function signals can be routed on NCS2 pins (these signals are not used for the OCTOSPI bus), nclk clocks are requested in case of 1.8 V HyperBus memory type.

This mode is selected by default through bits OCTOSPIM_CR[1:0].

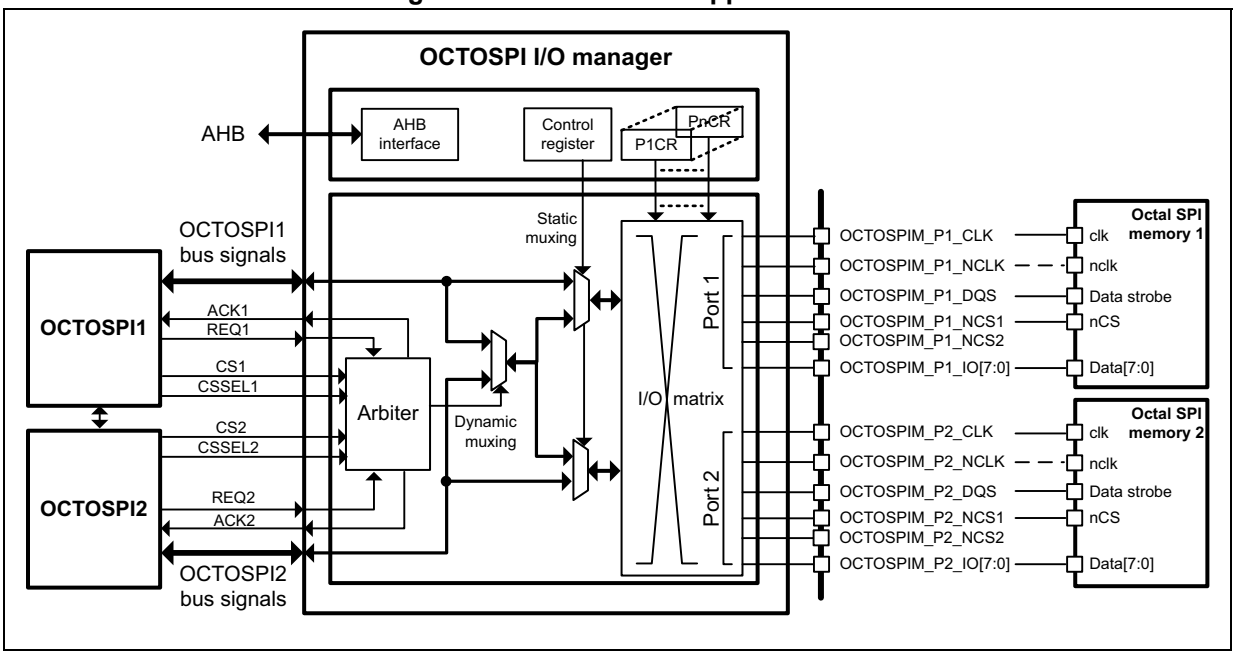


Figure 260. OCTOSPI direct mode

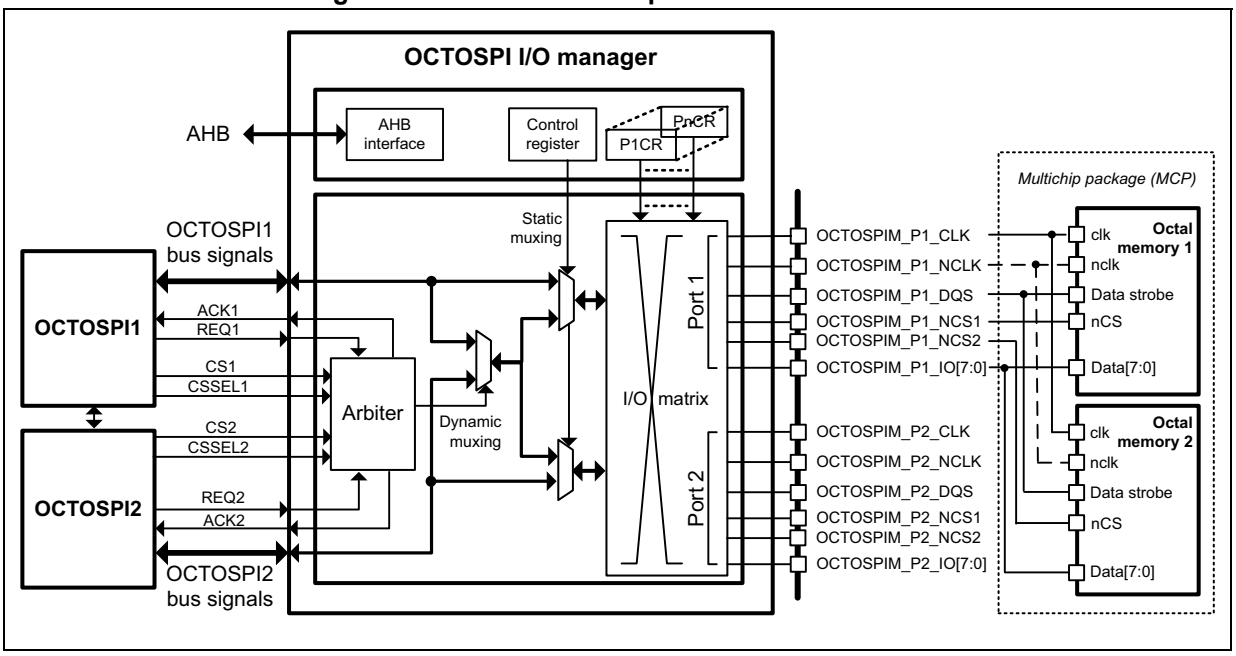
39.4.2 OCTOSPI swapped mode

This mode is similar to OCTOSPI direct mode but the ports are swapped, for example to help I/O mapping. The mode is selected by bits OCTOSPIM_CR[1:0].

Figure 261. OCTOSPI swapped mode



39.4.3 Two OCTOSPIs multiplexed mode to Port 1 accessing two external memories

If only one output port is used to access two memories, alternate function signals can be routed to pins corresponding to the other port. This mode is selected by bits OCTOSPIM_CR[1:0].

The arbiter in IO manager selects OCTOSPI1 or OCTOSPI2 to own the Octal-SPI bus according to existing transfer requests and status of the two MAXTRAN fairness counters.

The external memories can be two separate chips or embedded in a single multichip package. In this case each memory requests a dedicated Chip select, selected according to the CSSEL control of the OCTOSPI currently owning the bus.

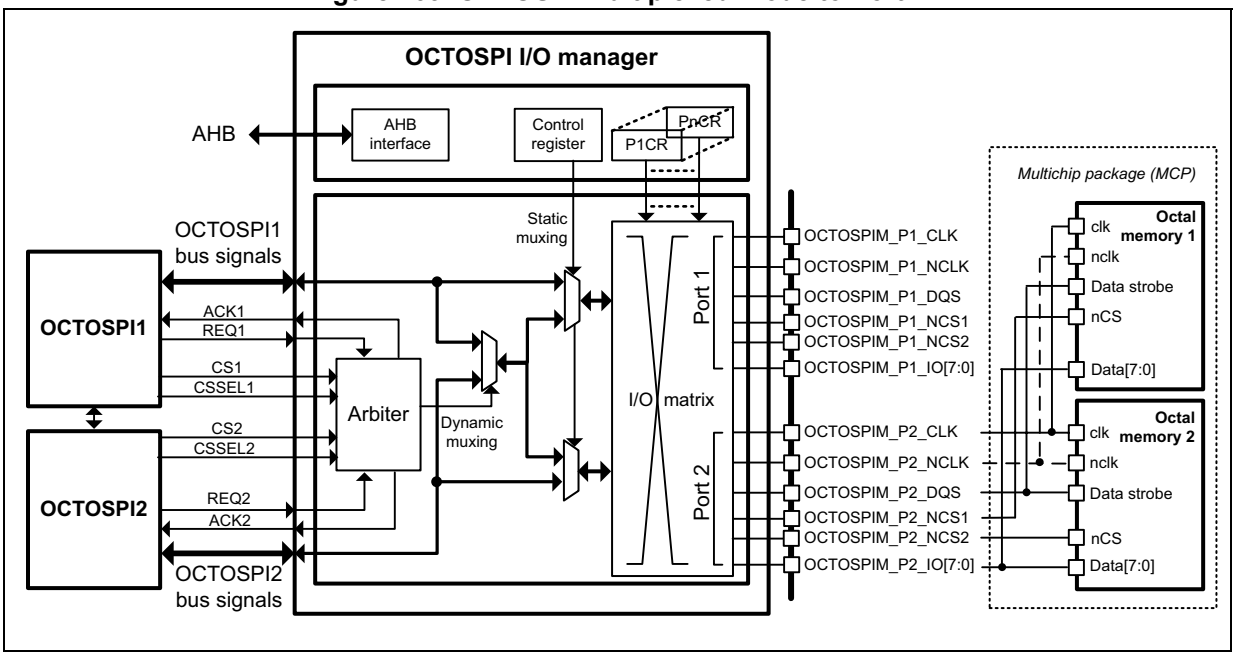


Figure 262. OCTOSPI multiplexed mode to Port 1

39.4.4 Two OCTOSPIs multiplexed mode to Port 2 accessing two external memories

This is similar to OCTOSPI multiplexed mode to Port 1, but target is Port 2. This mode is selected by bits OCTOSPIM_CR[2:1].

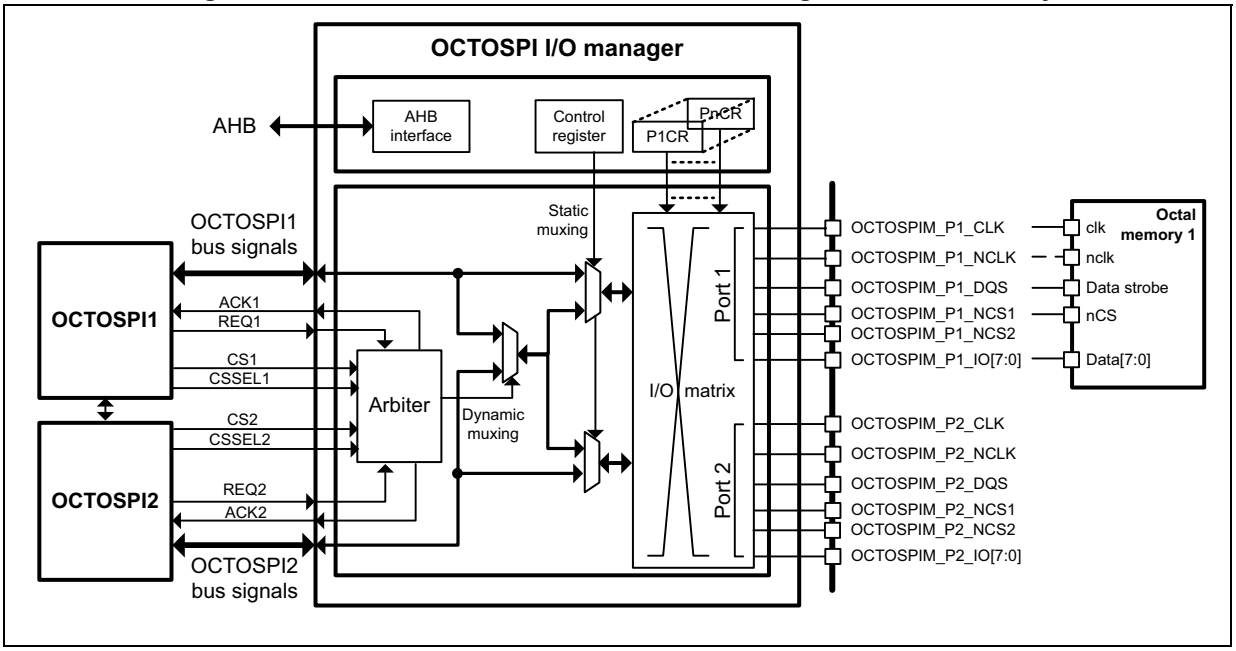

Figure 263. OCTOSPI multiplexed mode to Port 2

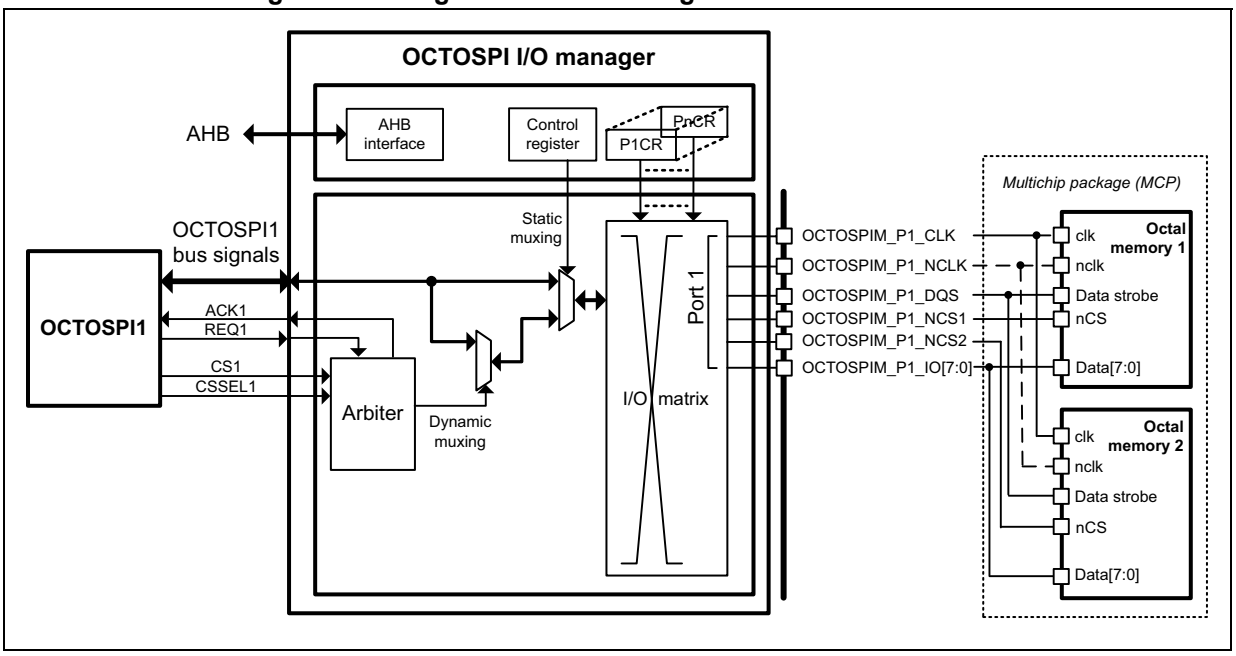
39.4.5 OCTOSPI1 and OCTOSPI2 drive a single external memory

This is similar to OCTOSPIs multiplexed mode to Port 1, but in this case only one external memory is present. Both CSSEL controls must target the same NCS (NCS1 in *Figure 264*).

Figure 264. OCTOSPI1 and OCTOSPI2 drive a single external memory



This use case is valid even when Port 2 is used instead of Port 1.

39.4.6 A single OCTOSPI drives two external memories

This is a subset of direct mode and corresponds to semi-dynamic switching. There are two target memories but the arbiter is not used. The software has to set the OCTOSPI1 chip select selector (bit 24 of OCTOSPI_CR register) each time the target memory changes.

Baseline use case boots on flash (memory1) and then switches to SRAM (memory2) for the rest of the application.

Figure 265. Single OCTOSPI driving two external memories

This use case is valid even when OCTOSPI2 is used instead of OCTOSPI1.

39.5 OCTOSPIM registers

39.5.1 OCTOSPIM control register (OCTOSPIM_CR)

Address offset: 0x0000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	REQ2ACK_TIME[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CSSEL_OVR_O2	CSSEL_OVR_O1	CSSEL_OVR_EN	Res.	Res.	MODE	MUXEN
									rw	rw	rw			rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **REQ2ACK_TIME[7:0]**: REQ to ACK time
In multiplexed mode (MUXEN = 1), this field defines the time between two transactions.
The value is the number of OCTOSPI clock cycles - 1

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **CSSEL_OVR_O2**: Chip select selector override setting for OCTOSPI2
0: the chip select signal from OCTOSPI2 is sent to NCS1
1: the chip select signal from OCTOSPI2 is sent to NCS2

Bit 5 **CSSEL_OVR_O1**: Chip select selector override setting for OCTOSPI1
0: the chip select signal from OCTOSPI1 is sent to NCS1
1: the chip select signal from OCTOSPI1 is sent to NCS2

Bit 4 **CSSEL_OVR_EN**: Chip select selector override enable
0: override not enabled
1: CSSEL_OVR_O1 and CSSEL_OVR_O2 bit values overwrite the CSSEL signal values coming from OCTOSPI1 and OCTOSPI2

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **MODE**: OCTOSPIM multiplexing mode
0: if MUXEN = 0 direct mode, if MUXEN = 1 arbitration mode to output Port 1
1: if MUXEN = 0 swapped mode, if MUXEN = 1 arbitration mode to output Port 2

Bit 0 **MUXEN**: Multiplexed mode enable
This bit enables the multiplexing of the two OCTOSPIs.
0: No multiplexing, hence no arbitration
1: OCTOSPI1 and OCTOSPI2 are multiplexed over the same bus.

39.5.2 OCTOSPIM hardware configuration register (OCTOSPIM_HWCFGR)

Address offset: 0x03F0

Reset value: 0x0000 0002

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NUM_PORT[3:0]			
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **NUM_PORT[3:0]**: Number of ports

This field returns the number of ports in the OCTOSPI I/O manager implementation

39.5.3 OCTOSPIM version register (OCTOSPIM_VERR)

Address offset: 0x03F4

Reset value: 0x0000 00XX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJVER[3:0]				MINVER[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJVER[3:0]**: OCTOSPIM major version

Bits 3:0 **MINVER[3:0]**: OCTOSPIM minor version

39.5.4 OCTOSPIM identification (OCTOSPIM_IDR)

Address offset: 0x03F8

Reset value: 0x0014 1041

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ID[31:0]**: OCTOSPIM identification

39.5.5 OCTOSPIM size identification register (OCTOSPIM_SIDR)

Address offset: 0x03FC

Reset value: 0xA3C5 DD01

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **SID[31:0]**: Size identifier

This field returns the size of the memory region allocated to registers. The address decoding range is 1 Kbyte.

39.5.6 OCTOSPIM register map

Table 322. OCTOSPIM register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Refer to *Section 2.4 on page 228* for the register boundary addresses.

40 Secure digital input/output MultiMediaCard interface (SDMMC)

40.1 SDMMC main features

The SD/SDIO, embedded MultiMediaCard (*e*•MMC) host interface (SDMMC) provides an interface between the AHB bus and SD memory cards, SDIO cards and *e*•MMC devices.

The MultiMediaCard system specifications are available through the MultiMediaCard Association website at www.jedec.org, published by the MMCA technical committee.

SD memory card and SD I/O card system specifications are available through the SD card Association website at www.sdcard.org.

The SDMMC features include the following:

- Compliance with *Embedded MultiMediaCard System Specification Version 5.1*. Card support for three different databus modes: 1-bit (default), 4-bit and 8-bit. (HS200 SDMMC_CK speed limited to maximum allowed I/O speed)(HS400 is not supported).
- Full compatibility with previous versions of MultiMediaCards (backward compatibility).
- Full compliance with *SD memory card specifications version 6.0*. (SDR104 SDMMC_CK speed limited to maximum allowed I/O speed, SPI mode and UHS-II mode not supported).
- Full compliance with *SDIO card specification version 4.0.* Card support for two different databus modes: 1-bit (default) and 4-bit. (SDR104 SDMMC_CK speed limited to maximum allowed I/O speed, SPI mode and UHS-II mode not supported).
- Data transfer up to 208 Mbyte/s for the 8-bit mode. (depending maximum allowed I/O speed).
- Data and command output enable signals to control external bidirectional drivers.
- IDMA linked list support

The MultiMediaCard/SD bus connects cards to the host.

The current version of the SDMMC supports only one SD/SDIO/*e*•MMC card at any one time and a stack of *e*•MMC.

40.2 SDMMC implementation

Table 323. SDMMC features

SDMMC modes/features(1)	SDMMC1	SDMMC2
Variable delay	X	X
SDMMC_CKIN	X	X
SDMMC_CDIR, SDMMC_D0DIR	X	X
SDMMC_D123DIR	X	X

1. X = supported.

40.3 SDMMC bus topology

Communication over the bus is based on command/response and data transfers.

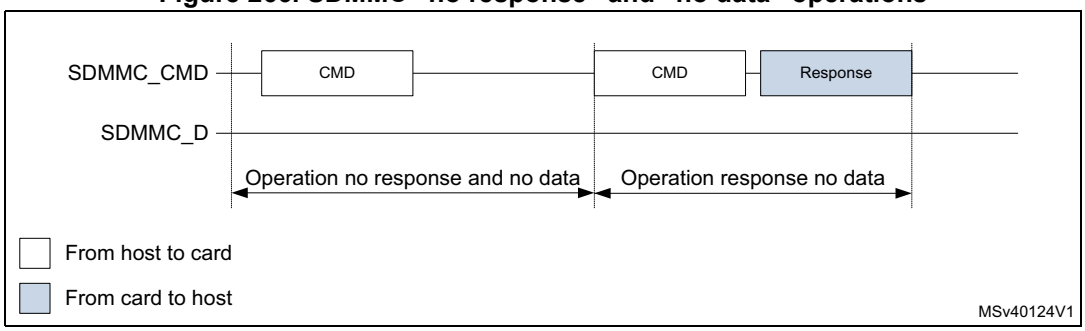
The basic transaction on the SD/SDIO/*e*•MMC bus is the command/response transaction. These types of bus transaction transfer their information directly within the command or response structure. In addition, some operations have a data token.

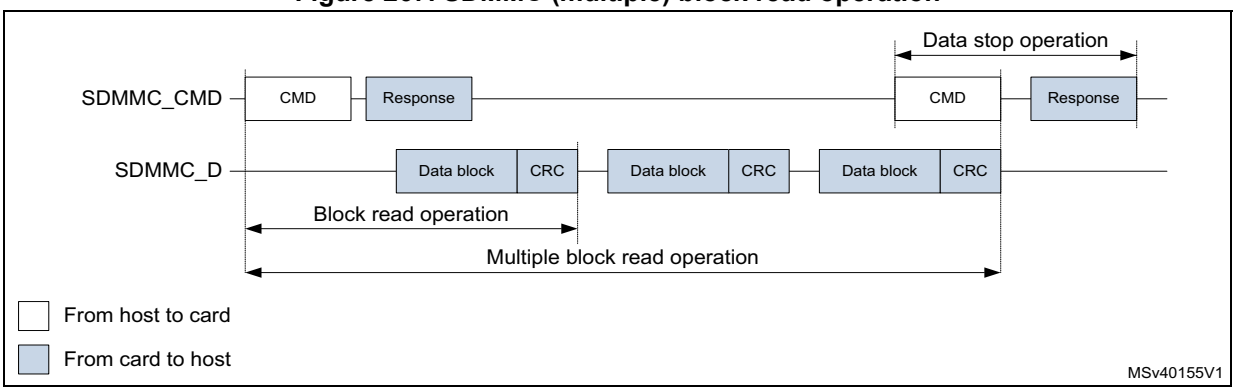
Data transfers are done in the following ways:

- Block mode: data block(s) with block size 2^N bytes with N in the range 0-14
- SDIO multibyte mode: single data block with block size range 1-512 bytes
- *e*•MMC Stream mode: continuous data stream

Data transfers to/from *e*•MMC cards are done in data blocks or streams.

Figure 266. SDMMC "no response" and "no data" operations





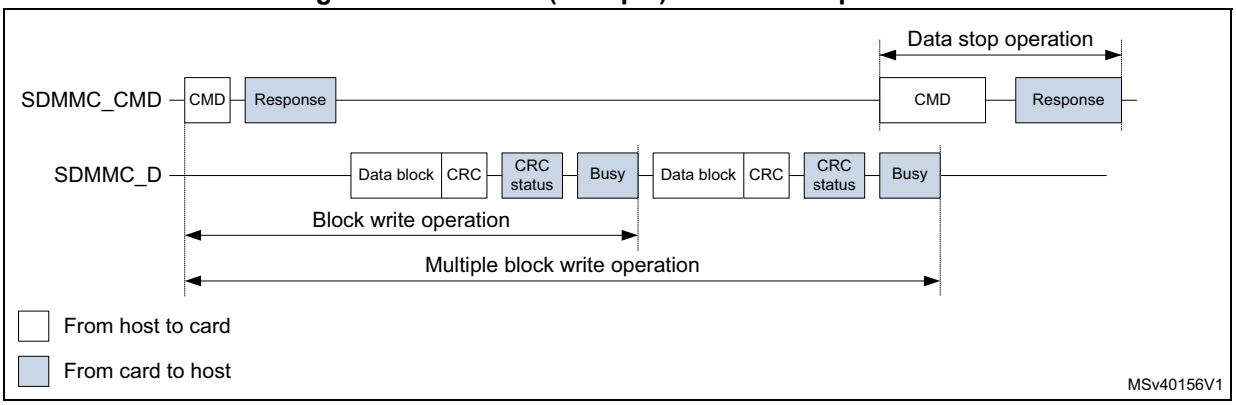


Figure 267. SDMMC (multiple) block read operation

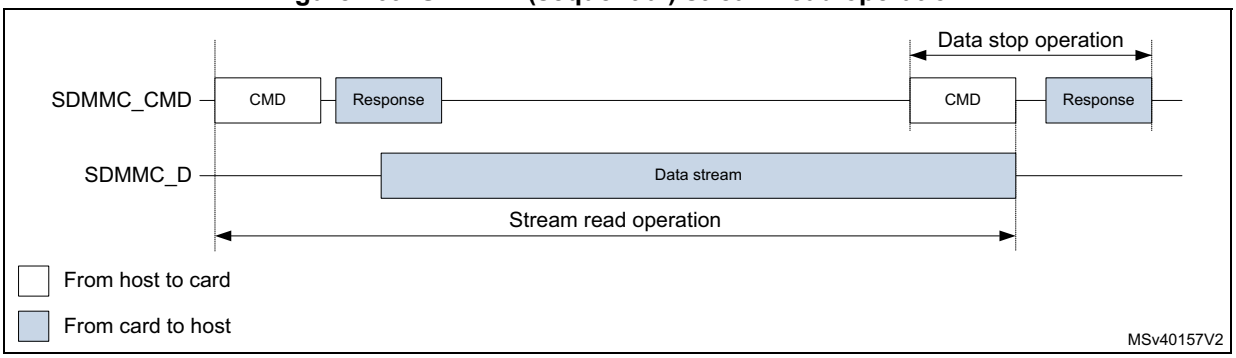
Note: The Stop Transmission command is not required at the end of a e•MMC multiple block read with predefined block count.

Figure 268. SDMMC (multiple) block write operation

Note: The Stop Transmission command is not required at the end of an e•MMC multiple block write with predefined block count.

The SDMMC does not send any data as long as the Busy signal is asserted (SDMMC_D0 pulled low).

Figure 269. SDMMC (sequential) stream read operation



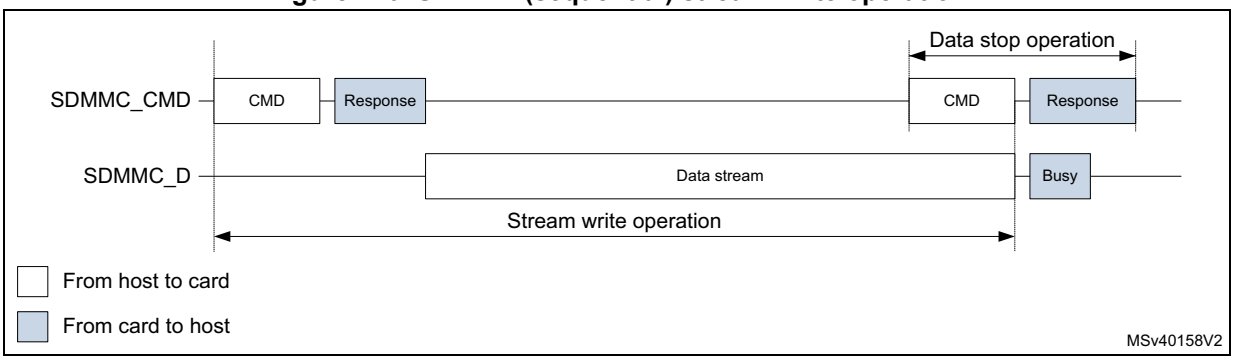


Figure 270. SDMMC (sequential) stream write operation

Stream data transfer operates only in a 1-bit wide bit bus configuration on SDMMC_D0 in single data rate modes (DS, HS, and SDR).

40.4 SDMMC operation modes

Table 324. SDMMC operation modes SD and SDIO

SDIO bus speed modes(1)(2)	Max bus speed (3) [Mbyte/s]	Max clock frequency [MHz](4)	Signal voltage [V]
DS (default speed)	12.5	25	3.3
HS (high speed)	25	50	3.3
SDR12	12.5	25	1.8
SDR25	25	50	1.8
DDR50	50	50	1.8
SDR50	50	100	1.8
SDR104	104	208	1.8

1. SDR single data rate signaling.
2. DDR double data rate signaling (data is sampled on both SDMMC_CK clock edges).
3. SDIO bus speed with 4-bit bus width.
4. Maximum frequency depending on maximum allowed I/O speed.

SDR104 mode requires variable delay support using sampling point tuning. The use of variable delay is optional for SDR50 mode.

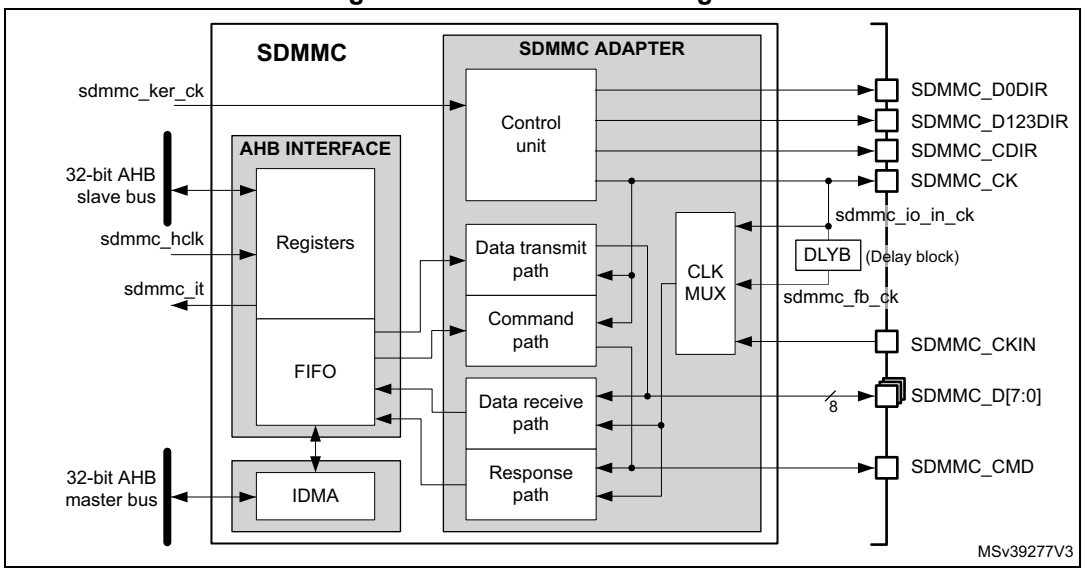
Table 325. SDMMC operation modes *e*•MMC

e•MMC bus speed modes (1)(2)	Max bus speed (3) [Mbyte/s]	Max clock frequency [MHz](4)	Signal voltage [V](5)
Legacy compatible	26	26	3/1.8/1.2V
High speed SDR	52	52	3/1.8/1.2V
High speed DDR	104	52	3/1.8/1.2V
High speed HS200	200	200	1.8/1.2V

1. SDR single data rate signaling.
2. DDR double data rate signaling. (data is sampled on both SDMMC_CK clock edges).
3. *e*•MMC bus speed with 8-bit bus width.
4. Maximum frequency depending on maximum allowed I/O speed.
5. Supported signal voltage level depends on I/O port characteristics, refer to device datasheet.

HS200 mode requires variable delay support using sampling point tuning.

40.5 SDMMC functional description



The SDMMC consists of four parts:

- The AHB slave interface accesses the SDMMC adapter registers, and generates interrupt signals and IDMA control signals.
- The SDMMC adapter block provides all functions specific to the *e*•MMC/SD/SD I/O card such as the clock generation unit, command and data transfer.
- The internal DMA (IDMA) block with its AHB master interface.
- A delay block (DLYB) taking care of the receive data sample clock alignment. The delay block is NOT part of the SDMMC. A delay block is mandatory when supporting SDR104 or HS200.

40.5.1 SDMMC block diagram

Figure 271 shows the SDMMC block diagram.

Figure 271. SDMMC block diagram

40.5.2 SDMMC pins and internal signals

Table 326 lists the SDMMC internal input/output signals, *Table 327* the SDMMC pins (alternate functions).

Table 326. SDMMC internal input/output signals

Signal name	Signal type	Description
sdmmc_ker_ck	Digital input	SDMMC kernel clock
sdmmc_hclk	Digital input	AHB clock
sdmmc_it	Digital output	SDMMC global interrupt

Table 326. SDMMC internal input/output signals (continued)

Signal name	Signal type	Description
sdmmc_io_in_ck	Digital input	SD/SDIO/*e*•MMC card feedback clock. This signal is internally connected to the SDMMC_CK pin (for DS and HS modes).
sdmmc_fb_ck	Digital input	SD/SDIO/*e*•MMC card tuned feedback clock after DLYB delay block (for SDR50, DDR50, SDR104, HS200)

Table 327. SDMMC pins

Pin name	Pin type	Description
SDMMC_CK	Digital output	Clock to SD/SDIO/*e*•MMC card
SDMMC_CKIN	Digital input	Clock feedback from an external driver for SD/SDIO/*e*•MMC card. (for SDR12, SDR25, SDR50, DDR50)
SDMMC_CMD	Digital input/output	SD/SDIO/*e*•MMC card bidirectional command/response signal.
SDMMC_CDIR	Digital output	SD/SDIO/*e*•MMC card I/O direction indication for the SDMMC_CMD signal.
SDMMC_D[7:0]	Digital input/output	SD/SDIO/*e*•MMC card bidirectional data lines.
SDMMC_D0DIR	Digital output	SD/SDIO/*e*•MMC card I/O direction indication for the SDMMC_D0 data line.
SDMMC_D123DIR	Digital output	SD/SDIO/*e*•MMC card I/O direction indication for the data lines SDMMC_D[3:1].

40.5.3 General description

The **SDMMC_D[7:0]** lines have different operating modes:

- By default, SDMMC_D0 line is used for data transfer. After initialization, the host can change the databus width.
- For an *e*•MMC, 1-bit (SDMMC_D0), 4-bit (SDMMC_D[3:0]) or 8-bit (SDMMC_D[7:0]) data bus widths can be used.
- For an SD or an SDIO card, 1-bit (SDMMC_D0) or 4-bit (SDMMC_D[3:0]) can be used. All data lines operate in push-pull mode.

To allow the connection of an external driver (a voltage switch transceiver), the direction of data flow on the data lines is indicated with I/O direction signals. The **SDMMC_D0DIR** signal indicates the I/O direction for the SDMMC_D0 data line, the **SDMMC_D123DIR** for the SDMMC_D[3:1] data lines.

SDMMC_CMD only operates in push-pull mode:

To allow the connection of an external driver (a voltage switch transceiver), the direction of data flow on the SDMMC_CMD line is indicated with the I/O direction signal **SDMMC_CDIR**.

SDMMC_CK clock to the card originates from **sdmmc_ker_ck**:

- When the sdmmc_ker_ck clock has 50 % duty cycle, it can be used even in bypass mode (CLKDIV = 0).
- When the sdmmc_ker_ck duty cycle is not 50 %, the CLKDIV must be used to divide it by 2 or more (CLKDIV > 0).
- The phase relation between the SDMMC_CMD / SDMMC_D[7:0] outputs and the SDMMC_CK can be selected through the NEGEDGE bit. The phase relation depends on the CLKDIV, NEGEDGE, and DDR settings. See *Figure 272*.

Figure 272. SDMMC Command and data phase relation

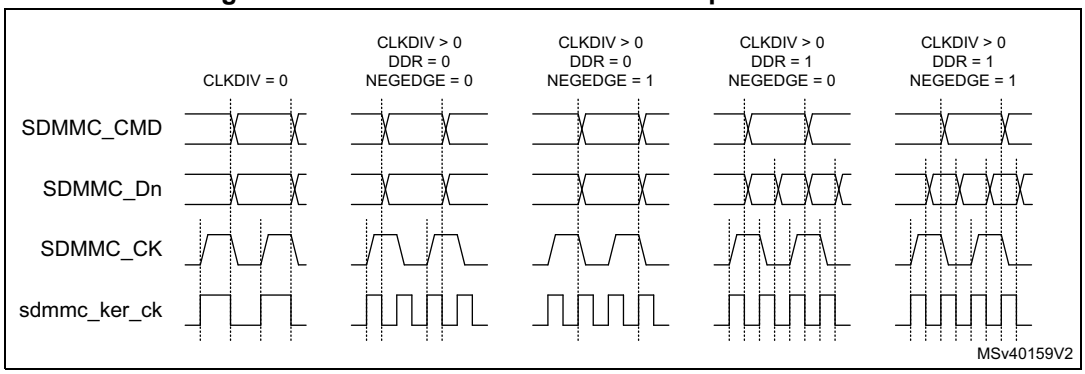


Table 328. SDMMC Command and data phase selection

CLKDIV	DDR	NEGEDGE	SDMMC_CK	Command out	Data out
0	x	x	= sdmmc_ker_ck	Generated on sdmmc_ker_ck falling edge	
>0	0	0	Generated on sdmmc_ker_ck rising edge	Generated on sdmmc_ker_ck falling edge succeeding the SDMMC_CK rising edge.	
		1		Generated on the same sdmmc_ker_ck rising edge that generates the SDMMC_CK falling edge.	
	1	0		Generated on sdmmc_ker_ck falling edge succeeding the SDMMC_CK rising edge.	Generated on sdmmc_ker_ck falling edge succeeding a SDMMC_CK edge.
		1		Generated on the same sdmmc_ker_ck rising edge that generates the SDMMC_CK falling edge.	

By default, the **sdmmc_io_in_ck** feedback clock input is selected for sampling incoming data in the SDMMC receive path. It is derived from the SDMMC_CK pin.

For tuning the phase of the sampling clock to accommodate the receive data timing, the DLYB delay block available on the device can be connected between **sdmmc_io_in_ck** signal (DLYB input dlyb_in_ck) and **sdmmc_fb_ck** clock input of SDMMC (DLYB output dlyb_out_ck). Selecting the **sdmmc_fb_ck** clock input in the receive path then enables using the phase-tuned sampling clock for the incoming data. This is required for SDMMC to support the SDR104 and HS200 operating mode and optional for SDR50 and DDR50 modes.

When using an external driver (a voltage switch transceiver), the SDMMC_CKIN feedback clock input can be selected to sample the receive data.

For an SD/SDIO/*e*•MMC card, the clock frequency can vary between 0 and 208 MHz (limited by maximum I/O speed).

Depending on the selected bus mode (SDR or DDR), one bit or two bits are transferred on SDMMC_D[7:0] lines with each clock cycle. The SDMMC_CMD line transfers only one bit per clock cycle.

40.5.4 SDMMC adapter

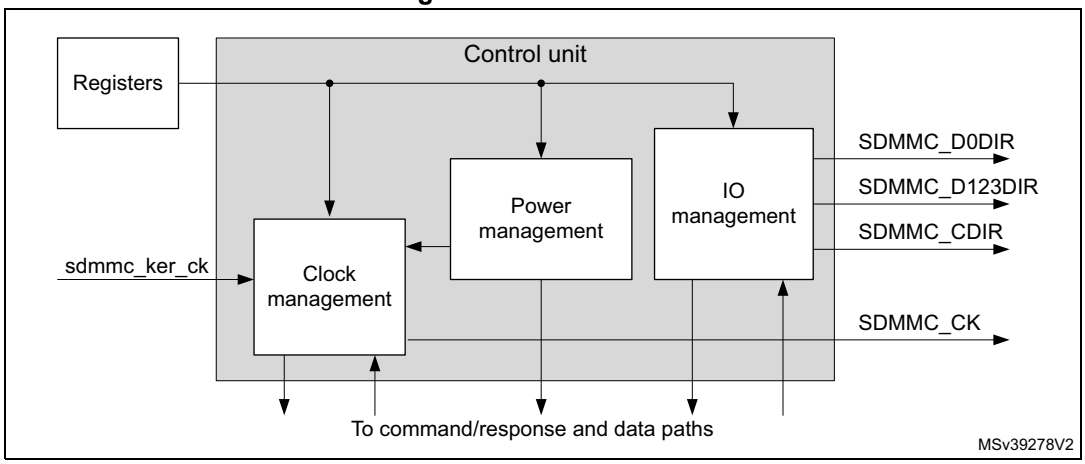
The SDMMC adapter (see *Figure 271: SDMMC block diagram*) is a multimedia/secure digital memory card bus master that provides an interface to a MultiMediaCard stack or to a secure digital memory card. It consists of the following subunits:

- Control unit
- Data transmit path
- Command path
- Data receive path
- Response path
- Receive data path clock multiplexer
- Delay block (DLYB), external to the SDMMC
- Adapter register block
- Data FIFO
- Internal DMA (IDMA)

Note: The adapter registers and FIFO use the AHB clock domain (sdmmc_hclk). The control unit, command path and data transmit path use the SDMMC adapter clock domain (sdmmc_ker_ck). The response path and data receive path use the SDMMC adapter feedback clock domain from the sdmmc_io_in_ck, or SDMMC_CKIN, or from the sdmmc_fb_ck generated by DLYB.

The DLYB delay block on the device can be used in conjunction with the SDMMC adapter, to tune the phase of the sampling clock for incoming data in SDMMC receive mode. It is required for the SDMMC to support the SDR104 and HS200 operating mode and optional for SDR50 and DDR50 modes.

Adapter register block



The adapter register block contains all system control registers, the SDMMC command and response registers and the data FIFO.

This block also generates the signals from the corresponding bit location in the SDMMC Clear register that clear the static flags in the SDMMC adapter.

Control unit

The control unit illustrated in *Figure 273*, contains the power management functions, the SDMMC_CK clock management with divider, and the I/O direction management.

Figure 273. Control unit

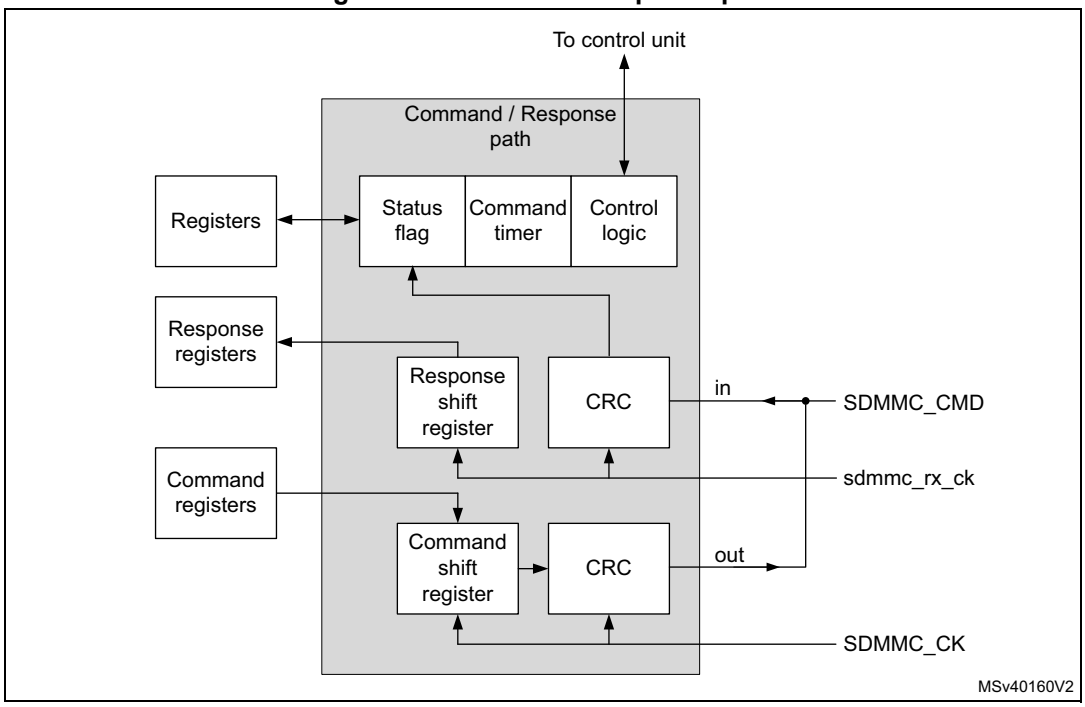
The power management subunit disables the card bus output signals during the power-off and power-up phases.

There are three power phases:

- power-off
- power-up
- power-on

The clock management subunit uses the sdmmc_ker_ck to generate the SDMMC_CK and provides the division control. It also takes care of stopping the SDMMC_CK for flow control, for example.

The clock outputs are inactive:



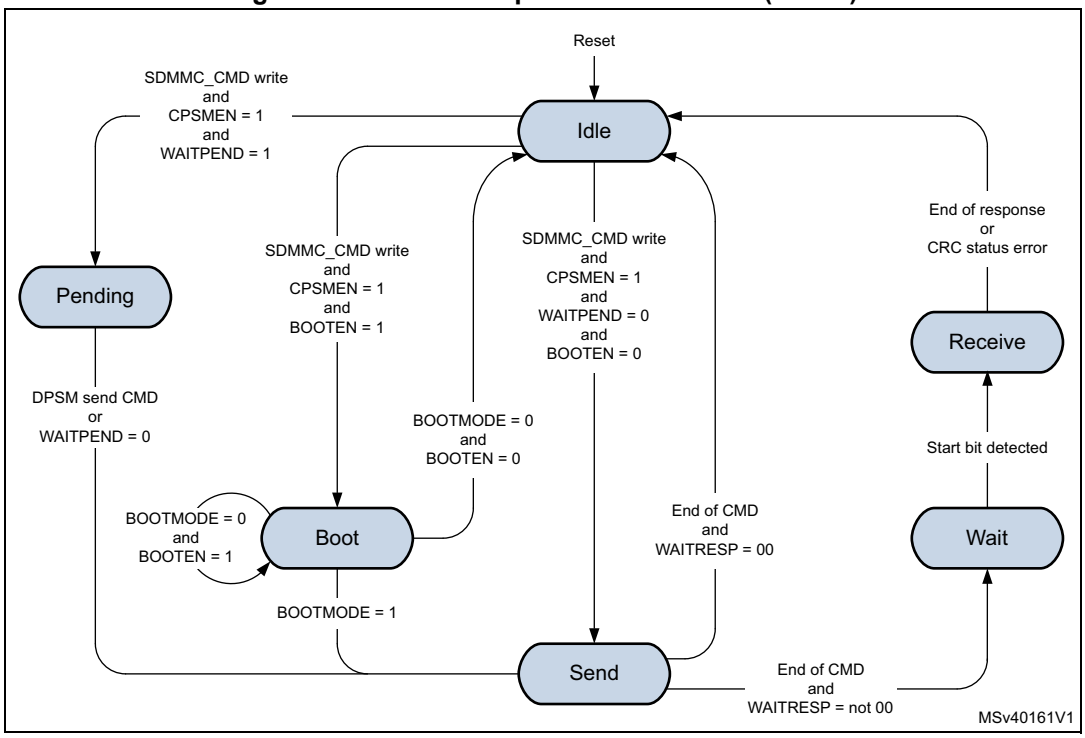
- after reset
- during the power-off or power-up phases
- if the power saving mode (register bit PWRSAV) is enabled and the card bus is in the Idle state for eight clock periods. The clock is stopped eight cycles after both the command/response CPSM and data path DPSM subunits have enter the Idle phase. The clock is restarted when the command/response CPSM or data path DPSM is activated (enabled).

The I/O management subunit takes care of the SDMMC_Dn and SDMMC_CMD I/O direction signals, which controls the external voltage transceiver.

Command/response path

The command/response path subunit transfers commands and responses on the SDMMC_CMD line. The command path is clocked on the SDMMC_CK and sends commands to the card,. The response path is clocked on the sdmmc_rx_ck and receives responses from the card.

Figure 274. Command/response path



Command/response path state machine (CPSM):

- When the command register is written to and the enable bit is set, command transfer starts. When the command has been sent the CRC is appended and the command path state machine (CPSM) sets the status flags and:
  - if a response is not required enters the Idle state.
  - If a response is required, it waits for the response.
- When the response is received,
  - for a response with CRC, the received CRC code and the internally generated code are compared, and the appropriate status flag is set according the result.
  - for a response without CRC, no CRC is checked, and the appropriate status flag is not set.

When ever the CPSM is active (not in the Idle state), the CPSMACT bit is set.

Figure 275. Command path state machine (CPSM)

- **Idle**: The command path is inactive. When the command control register is written and the enable bit (CPSMEN) is set, the CPSM activates the SDMMC_CK clock (when stopped due to power save PWRSAV bit) and moves
  - to the Send state when WAITPEND = 0 and BOOTEN = 0.
  - to the Pending state when WAITPEND = 1.
  - to the Boot state when BOOTEN = 1.
- **Send**: The command is sent and the CRC is appended.
  - When CMDTRANS bit is set or when BOOTEN bit is set and BOOTMODE is alternative boot, and the DTDIR = receive, the CPSM DataEnable signal is issued to the DPSM at the end of the command.
  - When the CMDTRANS bit is set and the CMDSUSPEND bit is 0 the interrupt period is terminated at the end of the command.
  - When CMDSTOP bit is set the CPSM Abort signal is issued to the DPSM at the end of the command.
  - If no response is expected (WAITRESP = 00) the CPSM moves to the Idle state and the CMDSENT flag is set. When BOOTMODE = 1 and BOOTEN = 0 the CMDSENT flag is delayed 56 cycles after the command end bit, otherwise the

CMDSENT flag is generated immediately after the command end bit.
The RESPCMDR and RESPxR registers are not modified.

– If a command response is expected (WAITRESP = not 00) the CPSM moves to the Wait state and start the response timeout.

- **Wait**: The command path waits for a response.
  – When WAITINT bit is 0 the command timer starts running and the CPSM waits for a start bit.
  a) If a start bit is detected before the timeout the CPSM moves to the Receive state.
  b) If the timeout is reached before the CPSM detect a response start bit, the timeout flag (CTIMEOUT) is set and the CPSM moves to the Idle state.
  The RESPCMDR and RESPxR registers are not modified.
  – When WAITINT bit is 1, the timer is disabled and the CPSM waits for an interrupt request (response start bit) from one of the cards.
  a) When a start bit is detected the CPSM moves to the Receive state.
  b) When writing WAITINT to 0 (interrupt mode abort), the host sends a response by its self and on detecting the start bit the CPSM move to the Receive state.
- **Receive**: The command response is received. Depending the response mode bits WAITRESP in the command control register, the response can be either short or long, with CRC or without CRC. The received CRC code when present is verified against the internally generated CRC code.
  – When the CMDSUSPEND bit is set and the SDIO Response bit BS = 0 (response bit [39]), the interrupt period is started after the response.
  When the CMDSUSPEND bit is cleared, or the CMDSUSPEND bit is 1 and the SDIO Response bit BS = 1 (response bit [39]), there is no interrupt period started.
  – When the CMDTRANS bit is set and the CMDSUSPEND bit is set and the SDIO Response bit DF= 1 (response bit [32]) the interrupt period is terminated after the response.
  – When the CRC status passes or no CRC is present the CMDREND flag is set, the CPSM moves to the Idle state.
  The RESPCMDR and RESPxR registers are updated with received response.
  - When BOOTMODE = 1 and BOOTEN = 0 the CMDREND flag is delayed 56 cycles after the response end bit, otherwise the CMDREND flag is generated immediately after the response end bit.
  - When CMDTRANS bit is set and the DTDIR = transmit, the CPSM DataEnable signal is issued to the DPSM at the end of the command response.
  – When the CRC status fails the CCRCFAIL flag is set and the CPSM moves to the Idle state.
  The RESPCMDR and RESPxR registers are updated with received response.
- **Pending**: According the pending WAITPEND bit in the command register, the CPSM enters the pending state.
  – When DATALENGTH ≤ 5 bytes the CPSM moves to the Sent state and generates the DataEnable signal to start the data transfer aligned with the CMD12 Stop Transmission command.
  – When DATALENGTH > 5 bytes, the CPSM DataEnable signal is issued to the DPSM to start the data transfer. The CPSM waits for a send CMD signal from the

DPSM before moving to the Send state. This enables, for example, the CMD12 Stop Transmission command to be sent aligned with the data.

– When writing WAITPEND to 0, the CPSM moves to the Send state.

- **Boot**: If the BOOTEN bit is set in the command register, the CPSM enters the Boot state, and when:
  – BOOTMODE = 0 the SDMMC_CMD line is driven low and when CMDTRANS bit is set and the DTDIR = receive, the CPSM DataEnable signal is issued to the DPSM. This enables normal boot operation. This state is left at the end of the boot procedure by clearing the register bit BOOTEN, which cause the SDMMC_CMD line to be driven high and the CPSM Abort signal is issued to the DPSM, before moving to the Idle state. The CMDSENT flag is generated 56 cycles after SDMMC_CMD line is high.
  – BOOTMODE = 1, move to the Send state. This enables sending of the CMD0 (boot). Clearing BOOTEN has no effect.

Note: The CPSM remains in the Idle state for at least eight SDMMC_CK periods to meet the N_{CC} and N_{RC} timing constraints. N_{CC} is the minimum delay between two host commands, and N_{RC} is the minimum delay between the host command and the card response.

The response timeout has a fixed value of 64 SDMMC_CK clock periods.

A command is a token that starts an operation. Commands are sent from the host to either a single card (addressed command) or all connected cards (broadcast command are available for *e*•MMC V3.31 or previous). Commands are transferred serially on the SDMMC_CMD line. All commands have a fixed length of 48 bits. The general format for a command token for SD-Memory cards, SDIO cards, and *e*•MMC cards is shown in *Table 329.*

The command token data is taken from two registers, one containing a 32-bit argument and the other containing the 6-bit command index (six bits sent to a card).

Table 329. Command token format

Bit position	Width	Value	Description
47	1	0	Start bit
46	1	1	Transmission bit
[45:40]	6	x	Command index
[39:8]	32	x	Argument
[7:1]	7	x	CRC7
0	1	1	End bit

Next to the command data there are command type (WAITRESP) bits controlling the command path state machine (CPSM). These bits also determine whether the command requires a response, and whether the response is short (48 bit) or long (136 bits) long, and if a CRC is present or not.

A response is a token that is sent from an addressed card or synchronously from all connected cards to the host as an answer to a previous received command. All responses are sent via the command line SDMMC_CMD. The response transmission always starts with the left bit of the bit string corresponding to the response code word. The code length depends on the response type. Response tokens R1, R2, R3, R4, R5, and R6 have various

coding schemes, depending on their content. The general formats for the response tokens for SD-Memory cards, SDIO cards, and *e*•MMC cards are shown in *Table 330*, *Table 331* and *Table 332*.

A response always starts with a start bit (always 0), followed by the bit indicating the direction of transmission (card = 0). A value denoted by x in the tables below indicates a variable entry. Most responses, except some, are protected by a CRC. Every command code word is terminated by the end bit (always 1).

The response token data is stored in five registers, four containing the 32-bits card status, OCR register, argument or 127-bits CID or CSD register including internal CRC, and one register containing the 6-bits command index.

Table 330. Short response with CRC token format

Bit position	Width	Value	Description
47	1	0	Start bit
46	1	0	Transmission bit
[45:40]	6	x	Command index (or reserved 111111)
[39:8]	32	x	Argument
[7:1]	7	x	CRC7
0	1	1	End bit

Table 331. Short response without CRC token format

Bit position	Width	Value	Description
47	1	0	Start bit
46	1	0	Transmission bit
[45:40]	6	x	Command index (or reserved 111111)
[39:8]	32	x	Argument
[7:1]	7	1111111	(reserved 1111111)
0	1	1	End bit

Table 332. Long response with CRC token format

Bit position	Width	Value	Description
135	1	0	Start bit
134	1	0	Transmission bit
[133:128]	6	111111	Reserved
[127:1]	127:8	x	CID or CSD slices
	7:1	x	CRC7 (included in CID or CSD)
0	1	1	End bit

The command/response path operates in a half-duplex mode, so that either commands can be sent or responses can be received. If the CPSM is not in the Send state, the

SDMMC_CMD output is in the Hi-Z state. Data sent on SDMMC_CMD are synchronous with the SDMMC_CK according the NEGEDGE register bit see *Figure 272*.

The command and short response with CRC, the CRC generator calculates the CRC checksum for all 40 bits before the CRC code. This includes the start bit, transmission bit, command index, and command argument (or card status).

For the long response the CRC checksum is calculated only over the 120 bits of R2 CID or CSD. Note that the start bit, transmission bit and the six reserved bits are not used in the CRC calculation.

The CRC checksum is a 7-bit value:

CRC[6:0] = remainder $[(M(x) * x^7) / G(x)]$

$G(x) = x^7 + x^3 + 1$

$M(x) = (\text{first bit}) * x^n + (\text{second bit}) * x^{n-1} + \ldots + (\text{last bit before CRC}) * x^0$

Where n = 39 or 119.

The CPSM can send a number of specific commands to handle various operating modes when CPSMEN is set, see *Table 333*.

Table 333. Specific Commands overview

VSWITCH	BOOTEN	BOOTMOD	CMDTRAN	WAITPEND	CMDSTOP	WAITINT	Description
1	x	x	x	x	x	x	Start voltage switch sequence
0	1	x	x	x	x	x	Start normal boot
0	1	1	x	x	x	x	Start alternative boot
0	0	1	x	x	x	x	Stop alternative boot.
0	0	0	1	x	x	x	Send command with associated data transfer.
0	0	0	0	1	1	x	*e*•MMC stream data transfer, command (STOP_TRANSMISSION) pending until end of data transfer.
0	0	0	0	1	0	x	*e*•MMC stream data transfer, command different from (STOP_TRANSMISSION) pending until end of data transfer.
0	0	0	0	0	1	x	Send command (STOP_TRANSMISSION), stopping any ongoing data transmission.
0	0	0	0	0	0	1	Enter *e*•MMC wait interrupt (Wait-IRQ) mode.
0	0	0	0	0	0	0	Any other none specific command

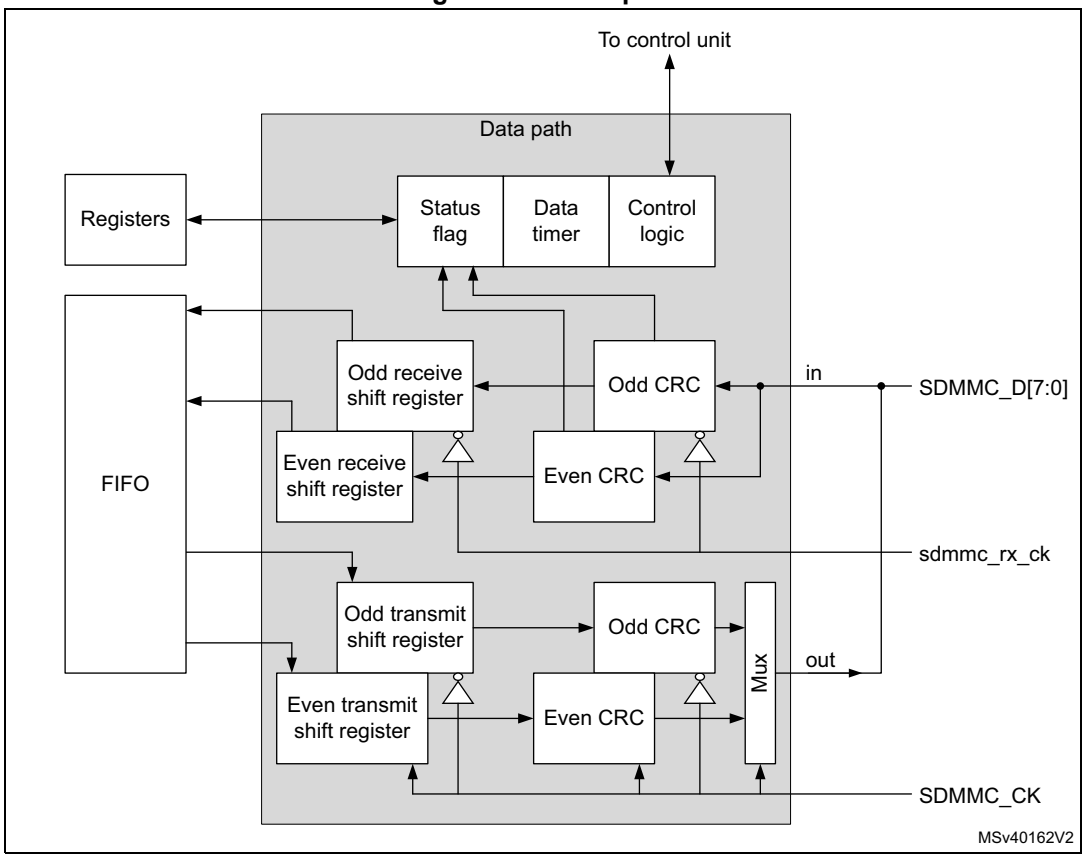
The command/response path implements the status flags and associated clear bits shown in *Table 334*:

Table 334. Command path status flags

Flag	Description
CMDSENT	Set at the end of the command without response (CPSM moves from Send to Idle).
CMDREND	Set at the end of the command response when the CRC is OK (CPSM moves from Receive to Idle).
CCRCFAIL	Set at the end of the command response when the CRC is FAIL (CPSM moves from Receive to Idle).
CTIMEOUT	Set after the command when no response start bit received before the timeout (CPSM moves from Wait to Idle).
CKSTOP	Set after the voltage switch (VSWITCHEN = 1) command response when the CRC is OK and the SDMMC_CK is stopped (no impact on CPSM).
VSWEND	Set after the voltage switch (VSWITCH = 1) timeout of 5 ms + 1 ms (no impact on CPSM).
CPSMACT	Command transfer in progress (CPSM not in Idle state).

The command path error handling is shown in *Table 335*:

Table 335. Command path error handling



Error	CPSM state	Cause	Card action	Host action	CPSM action
Timeout	Wait	No start bit in time	Unknown	Reset or cycle power card(1)	Move to Idle
CRC status	Receive	Negative status	Command ignored	Resend command(1)	Move to Idle
		Transmission error	Command accepted	Resend command(1)	

1. When CMDTRANS is set, also a stop_transmission command must be send to move the DPSM to Idle.

Data path

The data path subunit transfers data on the SDMMC_D[7:0] lines to and from cards. The data transmit path is clocked on the SDMMC_CK and sends data to the card. The data receive path is clocked on the sdmmc_rx_ck and receives data from the card. *Figure 276* shows the data path block diagram.

Figure 276. Data path

The card data bus width can be programmed in the clock control register bits WIDBUS. The supported data bus width modes are:

- If the wide bus mode is not enabled, only one bit is transferred over SDMMC_D0.
- If the 4-bit wide bus mode is enabled, data is transferred at four bits over SDMMC_D[3:0].
- If the 8-bit wide bus mode is enabled, data is transferred at eight bits over SDMMC_D[7:0].

Next to the data bus width the data sampling mode can be programmed in the clock control register bit DDR. The supported data sampling modes are:

- Single data rate signaling (SDR), data is clocked on the rising edge of the clock.
- Double data rate signaling (DDR), data is clocked on the both edges of the clock. DDR mode is only supported in wide bus mode (4-bit wide and 8-bit wide).

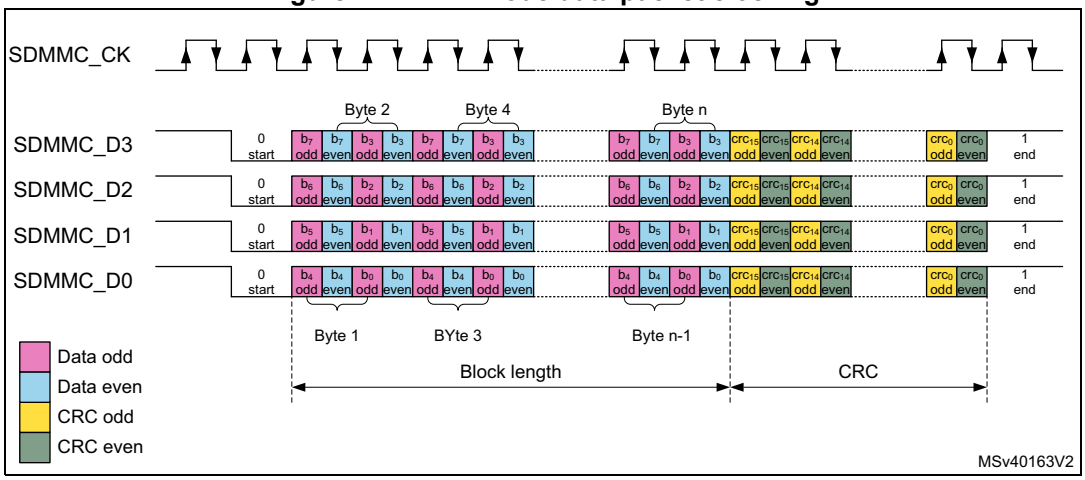
Note: The data sampling mode only applies to the SDMMC_D[7:0] lines. (not applicable to the SDMMC_CMD line.)

In DDR mode, data is sampled on both edges of the SDMMC_CK according the following rules, see also *Figure 277* and *Figure 278*:

- On the rising edge of the clock odd bytes are sampled.
- On the falling edge of the clock even bytes are sampled.
- Data payload size is always a multiple of 2 bytes.
- Two CRC16 are computed per data line
  - Odd bits CRC16 clocked on the falling edge of the clock.
  - Even bits CRC16 clocked on the rising edge of the clock.
- Start, end bits and idle conditions are full cycle.
- CRC status / boot acknowledgment and busy signaling are full cycle and are only sampled on the rising edge of the clock.

In DDR mode, the SDMMC_CK clock division must be ≥ 2.

Figure 277. DDR mode data packet clocking



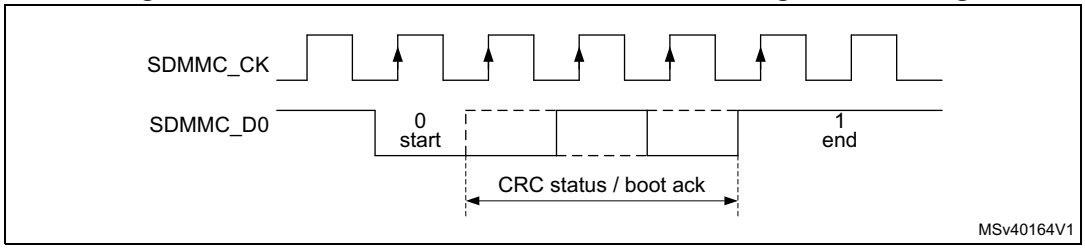


Figure 278. DDR mode CRC status / boot acknowledgment clocking

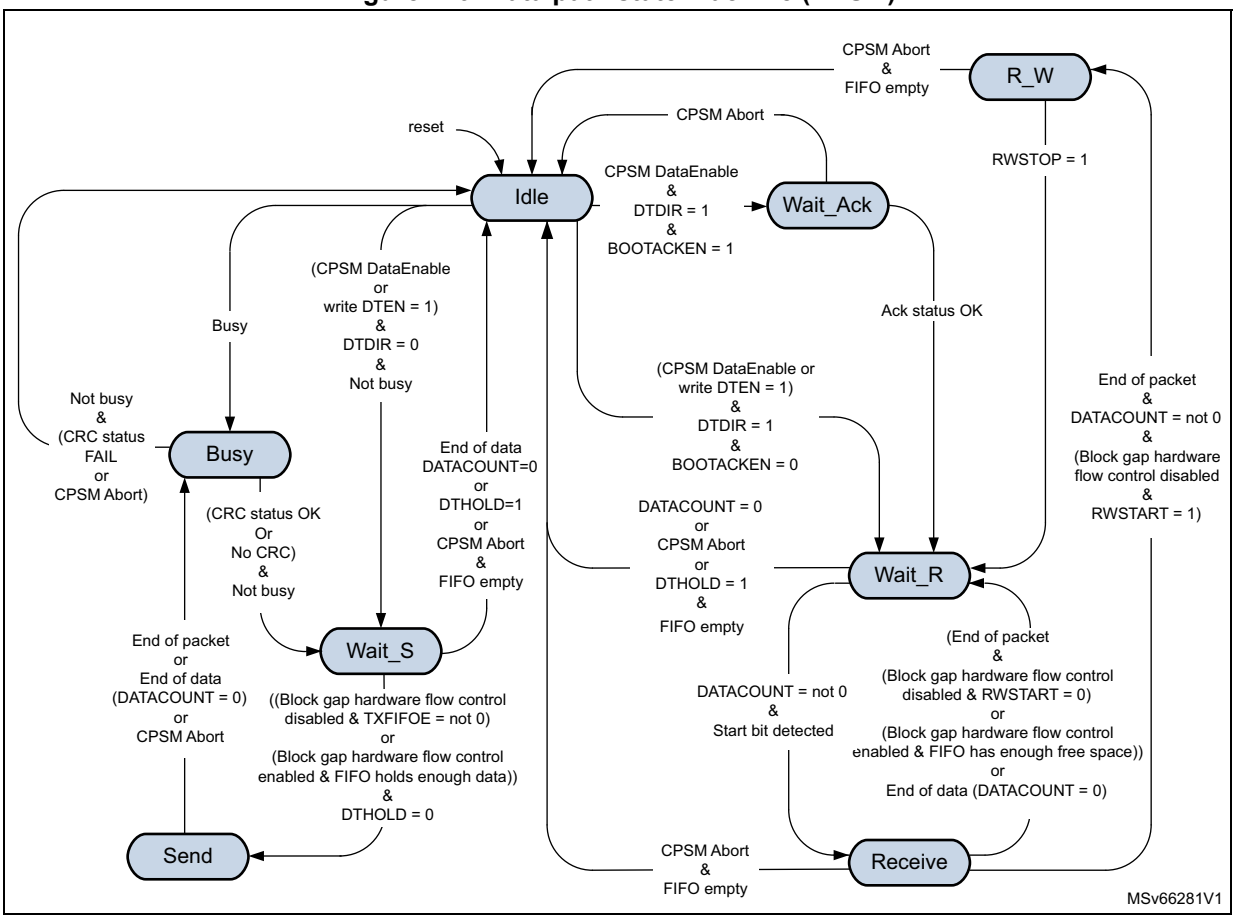
Data path state machine (DPSM)



Depending on the transfer direction (send or receive), the data path state machine (DPSM) moves to the Wait_S or Wait_R state when it is enabled:

- Send: the DPSM moves to the Wait_S state. If there is data in the transmit FIFO, the DPSM moves to the Send state, and the data path subunit starts sending data to a card.
- Receive: the DPSM moves to the Wait_R state and waits for a start bit. When it receives a start bit, the DPSM moves to the Receive state, and the data path subunit starts receiving data from a card.

For boot operation with acknowledgment the DPSM moves to the Wait_Ack state and waits for the boot acknowledgment before moving to the Wait_R state.

The DPSM operates at SDMMC_CK. The DPSM has the following states, as shown in *Figure 279*. When ever the DPSM is active (not in the Idle state), the DPSMACT bit is set.

Figure 279. Data path state machine (DPSM)

- **Idle** state: the data path is inactive, and the SDMMC_D[7:0] outputs are according the PWRCTRL setting. The DPSM is activated either by sending a command with CMDTRANS bit set or by setting the DTEN bit, or by detecting Busy on SDMMC_D0 (that is, after a command with R1b response).

  When not busy, the DPSM activates the SDMMC_CK clock (when stopped due to power save PWRSAV bit), loads the data counter with a new (DATALENGTH) value and:

  – When the data direction bit (DTDIR) indicates send, moves to the Wait_S.

  – When the data direction bit (DTDIR) indicates receive, moves to the
  - Wait_R when BOOTACKEN register bit is clear.
  - Wait_Ack when BOOTACKEN register bit is set and start the acknowledgment timeout.

  When busy the DPSM keeps the SDMMC_CK clock active and move to the Busy state.

Note: DTEN must not be used to start data transfer with SD, SDIO and e•MMC cards.

- **Wait_Ack** state: the data path waits for the boot acknowledgment token.
  - The DPSM moves to the Wait_R state if it receives an error free acknowledgment before a timeout.
  - When a pattern different from the acknowledgment is received an acknowledgment status error is generated, and the ack fail status flag (ACKFAIL) is set. The DPSM stays in Wait_Ack.
  - If it reaches a timeout (ACKTIME) before it detects a start bit, it sets the timeout status flag (ACKTIMEOUT). The DPSM stays in Wait_Ack.
  - When the CPSM Abort signal is set it moves to the Idle state and sets the DABORT flag.
- **Wait_R** state: the data path, if the data counter is not zero and data is not hold, waits for a start bit on SDMMC_D[n:0]. If the data counter is zero or data is hold, wait for the FIFO to be empty.
  - In block mode, if a start bit is received before a timeout the DPSM moves to the Receive state and loads the data block counter with DBLOCKSIZE.
  - In SDIO multibyte mode, if a start bit is received before a timeout the DPSM moves to the Receive state and loads the data block counter with DATALENGTH.
  - In stream mode, if a start bit is received before a timeout the DPSM moves to the Receive state and loads the data counter with DATALENGTH.
  - if the data counter (DATACOUNT) equals zero (end of data) the DPSM moves to the Idle state when the receive FIFO is empty and the DATAEND flag is set.
  - If it reaches a timeout (DATATIME) before it detects a start bit, it sets the timeout status flag (DTIMEOUT) and the DPSM stays in the Wait_R state.
  - If the CPSM Abort signal is set:
    If DATACOUNT > 0, the DPSM moves to the Idle state when the FIFO is empty and when IDMAEN = 0 reset with FIFORST, and sets the DABORT flag.
    If DATACOUNT is zero normal operation is continued, there is no DABORT flag since the transfer has completed normally.
  - if the DTHOLD bit is set:
    - When DATACOUNT > 0, the DPSM moves to the Idle state when the receive FIFO is empty and when IDMAEN = 0 reset with FIFORST, and issues the DHOLD flag. When holding the timeout is disabled. When an CPSM Abort signal is received during holding, the transfer is aborted.

- When DATACOUNT = 0, the transfer is completed normally and there is no DHOLD flag.

– When DPSM has been started with DTEN, after an error (DTIMEOUT) the DPSM moves to the Idle state when the FIFO is empty and when IDMAEN = 0 reset with FIFORST.

- **R_W** state: the data path Read Wait the bus.
  – The DPSM moves to the Wait_R state when the Read Wait stop bit (RWSTOP) is set, and start the receive timeout.
  – If the CPSM Abort signal is set, wait for the FIFO to be empty and when IDMAEN = 0 reset with FIFORST, then moves to the Idle state and sets the DABORT flag.
- **Receive** state: the data path receives serial data from a card. Pack the data in bytes and written it to the data FIFO. Depending on the transfer mode selected in the data control register (DTMODE), the data transfer mode can be either block or stream:
  – In block mode, when the data block size (DBLOCKSIZE) number of data bytes are received, the DPSM waits until it receives the CRC code.
  – In SDIO multibyte mode, when the data block size (DATALENGTH) number of data bytes are received, the DPSM waits until it receives the CRC code.
  a) If the received CRC code matches the internally generated CRC code, the DPSM moves to the
  - R_W state when RWSTART = 1 and DATACOUNT > zero, the DBCKEND flag is set.
  - Wait_R state otherwise, either immediately when block gap hardware flow control is disabled, or after enough free area is available in the FIFO when block gap hardware flow control is enabled.
  b) If the received CRC code fails the internally generated CRC code any further data reception is prevented.
  - When not all data has been received (DATACOUNT > 0), the CRC fail status flag (DCRCFAIL) is set and the DPSM stays in the Receive state.
  - When all data has been received (DATACOUNT = 0), wait for the FIFO to be empty after which the CRC fail status flag (DCRCFAIL) is set and the DPSM moves to the Idle state.
  – In stream mode, the DPSM receives data while the data counter DATACOUNT > 0. When the counter is zero, the remaining data in the shift register is written to the data FIFO, and the DPSM moves to the Wait_R state.
  – When a FIFO overrun error occurs, the DPSM sets the FIFO overrun error flag (RXOVERR) and any further data reception is prevented. The DPSM stays in the Receive state.
  – When an CPSM Abort signal is received:
  - If the CPSM Abort signal is received before the 2 last bits of the data with DATACOUNT = 0, the transfer is aborted. The remaining data in the shift register is written to the data FIFO, wait for the FIFO to be empty and when IDMAEN = 0 reset with FIFORST, then the DPSM moves to the Idle state and the DABORT flag is set.
  - If the CPSM Abort signal is received during or after the 2 last bits of the transfer with DATACOUNT = 0, the transfer is completed normally. The DPSM stays in the Receive state no DABORT flag is generated.

  - When DPSM has been started with DTEN, after an error (DCRCFAIL when DATACOUNT > 0, or RXOVERR) the DPSM moves to the Idle state when the FIFO is empty and when IDMAEN = 0 reset with FIFORST.

- **Wait_S** state: the data path waits for data to be available from the FIFO.
  - If the data counter DATACOUNT > 0,
    - When block gap hardware flow control is disabled, waits until the data FIFO empty flag (TXFIFOE) is de-asserted and DTHOLD is not set, and moves to the Send state.
    - When block gap hardware flow control is enabled, waits until the data FIFO hold enough data and DTHOLD is not set, and moves to the Send state.
  - If the data counter (DATACOUNT) = 0 the DPSM moves to the Idle state.
    - When DTHOLD is disabled, the DATAEND flag is set.
    - When DTHOLD is enabled, the DHOLD flag is set.
  - When DTHOLD is set and the DATACOUNT > 0
    - When IDMA is enabled, the DBCKEND flag is set and subsequently the FIFO is flushed, furthermore the DPSM moves to the Idle state and the DHOLD flag is set.
    - When IDMA is disabled the DBCKEND flag is set. Wait for the FIFO to be reset by software with FIFORST, then DPSM moves to the Idle state and issues the DHOLD flag.
  - When DTHOLD is set and DATACOUNT = 0 the transfer is completed normally.
  - When receiving the CPSM Abort signal
    - If the CPSM Abort signal is received before the 2 last bits of the data with DATACOUNT = 0, the transfer is aborted, wait for the FIFO to be empty and when IDMAEN = 0 reset with FIFORST, then the DPSM moves to the Idle state and sets the DABORT flag.
    - If the CPSM Abort signal is received during or after the 2 last bits of the transfer with DATACOUNT = 0, normal operation is continued, there is no DABORT flag since the transfer has completed normally.

Note: The DPSM remains in the Wait_S state for at least two clock periods to meet the N_{WR} timing requirements, where N_{WR} is the number of clock cycles between the reception of the card response and the start of the data transfer from the host.

- **Send** state: the DPSM starts sending data to a card. Depending on the transfer mode bit in the data control register, the data transfer mode can be either block, SDIO multibyte or stream:
  - In block mode, when the data block size (DBLOCKSIZE) number of data bytes are send, the DPSM sends an internally generated CRC code and end bit, and moves to the Busy state and start the transmit timeout.
  - In SDIO multibyte mode, when the data block size (DATALENGTH) number of data bytes are send, the DPSM sends an internally generated CRC code and end bit, and moves to the Busy state and start the transmit timeout.
  - In stream mode, the DPSM sends data to a card while the data counter DATACOUNT > 0. When the data counter reaches zero moves to the Busy state and start the transmit timeout.
    Before sending the last stream byte according to DATACOUNT, the DPSM issues

a trigger on the send CMD signal. This signal is used by the CPSM to sent any pending command (CMD12 Stop Transmission command).

– If a FIFO underrun error occurs, the DPSM sets the FIFO underrun error flag (TXUNDERR). The DPSM stays in the Send state.

– When receiving the CPSM Abort signal
- If the CPSM Abort signal is received before the 2 last bits of the transfer with DATACOUNT = 0, the transfer is aborted. The DPSM sends a last data bit followed by an end bit. The FIFO is disabled/flushed, and the DPSM moves to the Busy state to wait for not busy before setting the DABORT flag.
- If the CPSM Abort signal is received during or after the 2 last bits of the transfer with DATACOUNT = 0, the transfer is completed normally, there is no DABORT flag.

- **Busy** state: the DPSM waits for the CRC status token when expected, and wait for a not busy signal:

– If a CRC status token is expected and indicate “non-erroneous transmission” or when there is no CRC expected:
- it moves to the Wait_S state when SDMMC_D0 is not low (the card is not busy).
- When the card is busy SDMMC_D0 is low it remains in the Busy state.

– If a CRC status token is expected and indicates “erroneous transmission”.
- When not all data has been send (DATACOUNT > 0). The DPSM waits for not busy after which the CRC fail status flag (DCRCFAIL) is set. The FIFO is disabled/flushed and the DPSM stays in the Busy state.
- When all data has been send (DATACOUNT = 0). The DPSM waits for not busy after which the CRC fail status flag (DCRCFAIL) is set and the DPSM moves to the Idle state.

– If a CRC status (Ncrc) timeout occurs while the DPSM is in the Busy state, it sets the data timeout flag (DTIMEOUT) and stays in the Busy state.

– If a busy timeout occurs while the DPSM is in the Busy state, it sets the data timeout flag (DTIMEOUT) and stays in the Busy state.

– When receiving the CPSM Abort signal in the Busy state:
- If the CPSM Abort signal is received before the 2 last bits of the CRC response with DATACOUNT > 0, the data transfer is aborted. The DPSM waits for not busy and the FIFO to be disabled/flushed before moving to the Idle state and the DABORT flag is set.
- If the CPSM Abort signal is received during or after the 2 last bits of the CRC response when DATACOUNT = 0 or when no CRC is expected and DATACOUNT = 0 and there has been no DTIMEOUT error, the DPSM stays in the Busy state no DABORT flag is generated, since the transfer may completed normally.
- If the CPSM Abort signal is received when a DTIMEOUT error has occurred the DPSM waits for not busy and the FIFO to be disabled/flushed before moving to the Idle state and the DABORT flag is set.

– When entering the Busy state due to an abort in the Send state, the DPSM waits for not busy before moving to the Idle state and the DABORT flag is set.

– When DPSM has been started with DTEN, after an error (DCRCFAIL when DATACOUNT > 0, or DTIMEOUT) the DPSM moves to the Idle state when the FIFO is reset.

– When the DPSM has been started due to Busy on SDMMC_D0, waits for not busy after which the Busy end status flag (BUSYD0END) is set and the DPSM moves to the Idle state.

The data timer (DATATIME) is enabled when the DPSM is in the Wait_R or Busy state 2 cycles after the data block end bit, or data read command end bit, or R1b response, and generates the data timeout error (DTIMEOUT):

- When transmitting data, the timeout occurs
  - when a CRC status is expected and no start bit is received withing 8 SDMMC_CK cycles, the DTIMEOUT flag is set.
  - when the Busy state takes longer than the programmed timeout period., the DTIMEOUT flag is set.
- When receiving data, the timeout occurs
  - when there is still data to be received DATACOUNT > 0 and no start bit is received before the programmed timeout period, the DTIMEOUT flag is set.
- After a R1b response, the timeout occurs
  - when the Busy state takes longer than the programmed timeout period., the DTIMEOUT flag is set.

When DATATIME = 0:

- In receive the start bit must be present 2 cycles after the data block end bit or data read command end bit.
- In transmit busy is timed out 2 cycles after the CRC token end bit or stream data end bit.
- After a R1b response busy is timed out 2 cycles after the response end bit.

Data can be transferred from the card to the host (transmit, send) or vice versa (receive). Data are transferred via the SDMMC_Dn data lines, they are stored in a FIFO.

Table 336. Data token format

Description	Start bit	Data(1)	CRC16	End bit	DTMODE
Block data	0	(DBLOCKSIZE, DATALENGTH)	Yes	1	00
SDIO multibyte	0	(DATALENGTH)	Yes	1	01
e•MMC stream	0	(DATALENGTH)	No	1	10

1. The total amount of data to transfer is given by DATALENGTH. Where for Block data the amount of data in each block is given by DBLOCKSIZE.

The data token format is selected with register bits DTMODE according.

The data path implements the status flags and associated clear bits shown in *Table 337*:

Table 337. Data path status flags and clear bits

Flag		Description
DATAEND	TX	Set at the end of the complete data transfer when the CRC is OK and busy has finished and both DTHOLD = 0 and DATACOUNT = 0. (DPSM moves from Wait_S to Idle)
	RX	Set at the end of the complete data transfer when the CRC is OK and all data has been read, (DATACOUNT = 0 and FIFO is empty). (DPSM moves from Wait_R to Idle)
	Boot	

Table 337. Data path status flags and clear bits (continued)

Flag		Description
DCRCFAIL	TX	Set at the end of the CRC when FAIL and busy has finished. (DPSM stay in Busy when there is still data to send and wait for CPSM Abort) (DPSM moves from Busy to Idle when all data has been sent) or DPSM has been started with DTEN
	RX	Set at the end of the CRC when FAIL and FIFO is empty. (DPSM stays in Receive when there is still data to be received and wait for CPSM Abort) (DPSM moves from Receive to Idle when all data has been received or DPSM has been started with DTEN)
	Boot	
ACKFAIL	Boot	Set at the end of the boot acknowledgment when fail. (DPSM stays in Wait_Ack and wait for CPSM Abort)
DTIMEOUT	CMD R1b	Set after the command response no end of busy received before the timeout. (DPSM stays in Busy and wait for CPSM Abort)
	TX	Set when no CRC token start bit received within Ncrc, or no end of busy received before the timeout. (DPSM stays in Busy and wait for CPSM Abort) (When DPSM has been started with DTEN move to Idle) Note: The DCRCFAIL flag may also be set when CRC failed before the busy timeout.
	RX	Set when no start bit received before the timeout. (DPSM stays in Wait_R and wait for CPSM Abort) (When DPSM has been started with DTEN move to Idle)
	Boot	
ACKTIMEOUT	Boot	Set when no start bit received before the timeout. (DPSM stays in Wait_Ack and wait for CPSM Abort)
DBCKEND	TX	When DTHOLD = 1 and IDMAEN = 0: Set at the end of data block transfer when the CRC is OK and busy has finished, when data transfer is not complete (DATACOUNT >0). (DPSM moves from Busy to Wait_S)
	RX	When RWSTART = 1: Set at the end of data block transfer when the CRC is OK, when data transfer is not complete (DATACOUNT > 0). (DPSM moves from Receive to R_W)
	Boot	
DHOLD	TX	When DTHOLD = 1: Set at the end of data block transfer when the CRC is OK and busy has finished. (DPSM moves from Wait_S to Idle)
	RX	When DTHOLD = 1: Set at the end of data block transfer when the CRC is OK and all data has been read (FIFO is empty), when data transfer is not complete (DATACOUNT >0). (DPSM moves from Wait_R to Idle)
DABORT	CMD R1b	When CPSM Abort event has been sent by the CPSM and busy has finished. (DPSM moves from Busy to Idle)
	TX	When CPSM Abort event has been sent by the CPSM before the 2 last bits of the transfer. (DPSM moves from any state to Idle)
	RX	
	Boot	
BUSYD0END	CMD R1b	Set after the command response when end of busy before the timeout. (DPSM moves from Busy to Idle)
DPSMACT		Data transfer in progress. (DPSM not in Idle state)

The data path error handling is shown in *Table 338*:

Table 338. Data path error handling

Error	DPSM state	Cause	Card action	Host action	DPSM action
Timeout	Wait_Ack	No Ack in time	unknown	Card cycle power	Stay in Wait_Ack (reset the SDMMC with the RCC.SDMMCxRST register bit)
	Wait_R	No start bit in time	unknown	Stop data reception Send stop transmission command	On CPSM Abort move to Idle
			unknown	Stop boot procedure	
	Busy	Busy too long (due to data transfer)	unknown	Stop data reception Send stop transmission command	
		Busy too long (due to R1b)	unknown	Send reset command	
CRC	Receive	transmission error	Send further data	Stop data reception Send stop transmission command	On CPSM Abort move to Idle
CRC status	Busy	Negative status	Ignore further data	Stop data transmission Send stop transmission command	On CPSM Abort move to Idle
		transmission error	wait for further data		
Ack status	Wait_Ack	transmission error	Send boot data	Stop boot procedure	On CPSM Abort move to Idle
Overrun	Receive	FIFO full	Send further data	Stop data reception Send stop transmission command	On CPSM Abort move to Idle
Underrun	Send	FIFO empty	Receive further data	Stop data transmission Send stop transmission command	On CPSM Abort move to Idle

Data FIFO

The data FIFO (first-in-first-out) subunit contains the transmit and receive data buffer. A single FIFO is used for either transmit or receive as selected by the DTDIR bit. The FIFO contain a 32-bit wide, 256-word deep data buffer and control logic. Because the data FIFO operates in the AHB clock domain (sdmmc_hclk), all signals from the subunits in the SDMMC clock domain (SDMMC_CK/sdmmc_rx_ck) are resynchronized.

The FIFO can be in one of the following states:

- The transmit FIFO refers to the transmit logic and data buffer when sending data out to the card. (DTDIR = 0)
- The receive FIFO refers to the receive logic and data buffer when receiving data in from the card. (DTDIR = 1)

The end of a correctly completed SDMMC data transfer from the FIFO is indicated by the DATAEND flags driven by the data path subunit. Any incorrect (aborted) SDMMC data transfer from the FIFO is indicated by one of the error flags (DCRCFAIL, DTIMEOUT, DABORT) driven by the data path subunit, or one of the FIFO error flags (TXUNDERR, RXOVERR) driven by the FIFO control.

The data FIFO can be accessed in the following ways, see *Table 339*.

Table 339. Data FIFO access

Data FIFO access	IDMAEN
From firmware via AHB slave interface	0
From IDMA via AHB master interface	1

Transmit FIFO:

Data can be written to the transmit FIFO when the DPSM has been activated (DPSMACT = 1).

When IDMAEN = 1 the FIFO is fully handled by the IDMA.

When IDMAEN = 0 the FIFO is controlled by firmware via the AHB slave interface. The transmit FIFO is accessible via sequential addresses. The transmit FIFO contains a data output register that holds the data word pointed to by the read pointer. When the data path subunit has loaded its shift register, it increments the read pointer and drives new data out. The transmit FIFO is handled in the following way:

1. Write the data length into DATALENGTH and the block length in DBLOCKSIZE.
   – For block data transfer (DTMODE = 0), DATALENGTH must be an integer multiple of DBLOCKSIZE.
2. Enable hardware flow control HWFC_EN.
   If bus speed SDR50, SDR104, HS200 or DDR50 is used FIFO threshold can be used to provide flow control at the receive block gap.
3. Set the SDMMC in transmit mode (DTDIR = 0).
   – Configures the FIFO in transmit mode.
4. Enable the data transfer
   – either by sending a command from the CPSM with the CMDTRANS bit set
   – or by setting DTEN bit
5. When (DPSMACT = 1) write data to the FIFO.
   – When BUSSPEED = 0: The DPSM stays in the Wait_S state until FIFO is full (TXFIFOF = 1), or the number indicated by DATALENGTH.
   - The SDMMC keeps sending data as long as FIFO is not empty, hardware flow control during data transfer is used to prevent FIFO underrun.
   – When BUSSPEED = 1 and the FIFO threshold is zero: The DPSM reads the transmit data from the FIFO.

- The SDMMC keeps transmitting data as long as FIFO is not empty, hardware flow control during the data transfer is used to prevent FIFO underrun.

– When BUSSPEED = 1 and the FIFO threshold is not zero: The DPSM reads the transmit data from the FIFO.
- The SDMMC only starts sending a new block when there is enough data in the FIFO according the threshold. Block gap hardware flow control is used to prevent FIFO underrun.

6. Write data to the FIFO.
   – When the FIFO is handled by software, wait until the FIFO is half empty (TXFIFOHE flag), write data to the FIFO until FIFO is full (TXFIFOF = 1), or last data has been written.
   – When the FIFO is handled by the IDMA, the IDMA transfers the FIFO date.
7. When last data has been written wait for end of data (DATAEND flag)
   – SDMMC has completely sent all data and the DPSM is disabled (DPSMACT = 0).

In case of a data transfer error or transfer hold when IDMAEN = 0, firmware must stop writing to the FIFO and flush and reset the FIFO with the FIFORST register bit.

The transmit FIFO status flags are listed in *Table 340*.

Table 340. Transmit FIFO status flags

Flag	Description
TXFIFOF	Set to high when all transmit FIFO words contain valid data.
TXFIFOE	Set to high when the transmit FIFO does not contain valid data.
TXFIFOHE	Set to high when half or more transmit FIFO words are empty.
TXUNDERR	Set to high when an underrun error occurs. This flag is cleared by writing to the SDMMC Clear register.

Receive FIFO:

Data can be read from the receive FIFO when the DPSM is activated (DPSMACT = 1).

When IDMAEN = 1 the FIFO is fully handled by the IDMA.

When IDMAEN = 0 the FIFO is controlled by firmware via the AHB slave interface.When the data path subunit receives a word of data, it drives the data on the write databus. The write pointer is incremented after the write operation completes. On the read side, the contents of the FIFO word pointed to by the current value of the read pointer is driven onto the read databus. The receive FIFO is accessible via sequential addresses.

The receive FIFO is handled in the following way:

1. Write the data length into DATALENGTH and the block length in DBLOCKSIZE.
   – For block data transfer (DTMODE = 0), DATALENGTH must be an integer multiple of DBLOCKSIZE.
2. Enable hardware flow control HWFC_EN.
   – If bus speed SDR50, SDR104, HS200 or DDR50 is used FIFO threshold can be used to provide flow control at the receive block gap.
3. Set the SDMMC in receive mode (DTDIR = 1).
   – Configures the FIFO in receive mode.
4. Enable the DPSM transfer
   – either by sending a command from the CPSM with the CMDTRANS bit set
   – or by setting DTEN bit.
5. When (DPSMACT = 1) the FIFO is ready to receive data.
   – When BUSSPEED = 0: The DPSM writes the received data to the FIFO.
   - The SDMMC keeps receiving data as long as FIFO is not full, hardware flow control during the data transfer is used to prevent FIFO overrun.
   – When BUSSPEED = 1 and the FIFO threshold is zero: The DPSM writes the received data to the FIFO.
   - The SDMMC keeps receiving data as long as FIFO is not full, hardware flow control during the data transfer is used to prevent FIFO overrun.
   – When BUSSPEED = 1 and the FIFO threshold is not zero: The DPSM writes the received data to the FIFO.
   - The SDMMC only starts receiving a new block when there is enough free space in the FIFO according the threshold. Block gap hardware flow control is used to prevent FIFO overrun.
6. Read data from the FIFO.
   – When the FIFO is handled by software, wait until the FIFO is half full (RXFIFOHF flag), read data from the FIFO until FIFO is empty (RXFIFOE = 1).
   - When last data has been received, read data from the FIFO until FIFO is empty (DATAEND = 1).
   – When the FIFO is handled by the IDMA, the IDMA transfers the FIFO date.
7. SDMMC has completely received all data and the DPSM is disabled (DPSMACT = 0).

In case of a data transfer hold when IDMAEN = 0, the firmware must read the remaining data until the FIFO is empty and reset the FIFO with the FIFORST register bit. This causes the DPSM to go to the Idle state (DPSMACT = 0).

In case of a data transfer error when IDMAEN = 0, the firmware must stop reading the FIFO and flush and reset the FIFO with the FIFORST register bit. This causes the DPSM to go to the Idle state (DPSMACT = 0).

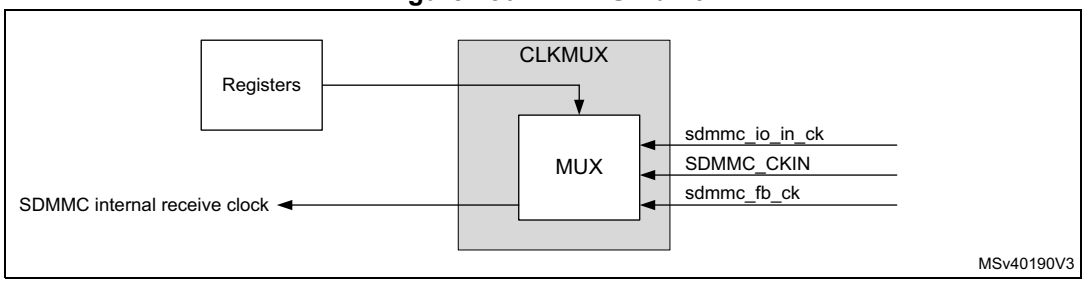
The receive FIFO status flags are listed in *Table 341*.

Table 341. Receive FIFO status flags

Flag	Description
RXFIFOF	Set to high when all receive FIFO words contain valid data
RXFIFOE	Set to high when the receive FIFO does not contain valid data.
RXFIFOHF	Set to high when half or more receive FIFO words contain valid data.
RXOVERR	Set to high when an overrun error occurs. This flag is cleared by writing to the SDMMC Clear register.

CLKMUX unit

The CLKMUX selects the source for clock sdmmc_rx_ck to be used with the received data and command response. The receive data clock source can be selected by the clock control register bit SELCLKRX, between:



- sdmmc_io_in_ck bus master main feedback clock.
- SDMMC_CKIN external bus feedback clock.
- sdmmc_fb_ck bus tuned feedback clock.

The sdmmc_io_in_ck is selected when there is no external driver, with DS and HS.

The SDMMC_CKIN is selected when there is an external driver with SDR12, SDR25, SDR50 and DDR50.

The sdmmc_fb_ck clock input must be selected when the DLYB block on the device is used with SDR104, HS200 and optionally with SDR50 and DDR50 modes.

Figure 280. CLKMUX unit

The sdmmc_rx_ck source must be changed when the CPSM and DPSM are in the Idle state.

40.5.5 SDMMC AHB slave interface

The AHB slave interface generates the interrupt requests, and accesses the SDMMC adapter registers and the data FIFO. It consists of a data path, register decoder, and interrupt logic.

SDMMC FIFO

The FIFO access is restricted to word access only:

- In transmit FIFO mode
  - Data are written to the FIFO in words (32-bits) until all data according DATALENGTH has been transfered. When the DATALENGTH is not an integer

multiple of 4, the last remaining data (1, 2 or 3 bytes) are written with a word transfer.

- In receive FIFO mode
  - Data are read from the FIFO in words (32-bits) until all data according DATALENGTH has been transfered. When the DATALENGTH is not an integer multiple of 4, the last remaining data (1, 2 or 3 bytes) are read with a word transfer padded with 0 value bytes.

When accessing the FIFO with half word or byte accesses an AHB bus fault is generated.

SDMMC interrupts

The interrupt logic generates an interrupt request signal that is asserted when at least one of the unmasked status flags is active. A mask register is provided to allow selection of the conditions that generate an interrupt. A status flag generates the interrupt request if a corresponding mask flag is set. Some status flags require an implicit clear in the clear register.

40.5.6 SDMMC AHB master interface

The AHB master interface is used to transfer the data between a memory and the FIFO using the SDMMC IDMA.

SDMMC IDMA

Direct memory access (DMA) is used to provide high-speed transfer between the SDMMC FIFO and the memory. The AHB master optimizes the bandwidth of the system bus. The SDMMC internal DMA (IDMA) provides one channel to be used either for transmit or receive.

The IDMA is enabled by the IDMAEN bit and supports burst transfers of 16 beats.

- In transmit burst transfer mode:
  - Data are fetched in burst from memory whenever the FIFO is empty for the number of burst transfers, until all data according DATALENGTH has been transfered. When the DATALENGTH is not an integer multiple of the burst size the remaining, smaller then burst size data is transfered using single transfer mode. When the DATALENGTH is not an integer multiple of 4, the last remaining data (1, 2 or 3 bytes) are fetched with a word transfer.
- In receive burst transfer mode:
  - Data are stored in burst in to memory whenever the FIFO contains the number of burst transfers, until all data according DATALENGTH has been transfered. When the DATALENGTH is not an integer multiple of the burst transfer the remaining, smaller then burst size data, is transfered using single transfer mode. When the DATALENGTH is not an integer multiple of 4, the last remaining data (1, 2 or 3 bytes) are stored with halfword and or byte transfers.

In addition the IDMA provides the following channel configurations selected by bit IDMABMODE:

- single buffered channel
- linked list channel

Single buffered channel

In single buffer configuration the data at the memory side is accessed in a linear matter starting from the base address IDMABASE. When the IDMA has finished transferring all data the and the DPSM has completed the transfer the DATAEND flag is set.

Linked list channel

In linked list configuration, IDMAMODE = 1, the data at the memory side is subsequently accessed from linked buffers, located at base address IDMABASE. The size of the memory buffers is defined by IDMABSIZE. The buffer size must be an integer multiple of the burst size. The bit ULA is used to indicate if a new linked list buffer configuration has to be loaded from the linked list table. A new linked list configuration is loaded when the ULA bit for the current linked list item is set.

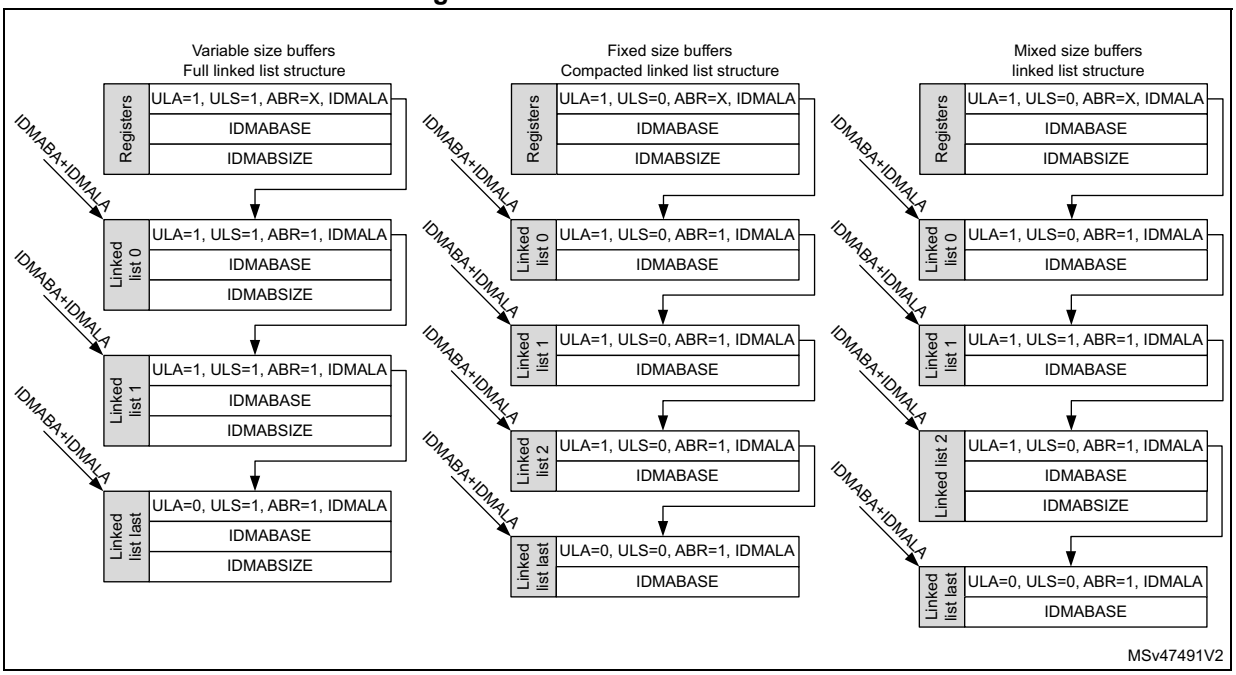
The first linked list item configuration is programmed by firmware directly in the SDMMC registers.

When the IDMA has finished transferring all the data of one linked list buffer, according IDMABSIZE, and when the linked list item ULA bit is set, the IDMA loads the new linked list item from the linked list table, and continues transferring data from the next linked list buffer. When the IDMA has finished transferring all data, according IDMABSIZE and ULA, and the DPSM has completed the transfer, according DATALENGHT, the DATAEND flag is set.

In the following cases, the linked list provides more buffer space than the data to transfer which means the current linked list buffer data has not completely be transfered:

- the ULA bit is set, and all SDMMC data according DATALENGTH has been transfered (DATAEND flag)
- a transfer error (DCRCFAIL when DATACOUNT > 0, RXOVERR, TXUNDERR) occurs
- a transfer is hold (DTHOLD)

In all above cases, the IDMA linked list is stopped and the FIFO is flushed/reset. Before starting or restarting a new SDMMC transfer, the software must initialize a new linked list with correct IDMABASE and IDMABSIZE.



When a IDMA transfer error occurs (see *Section : IDMA transfer error management*) or when the linked list does not provide sufficient buffer space:

- the linked list ends with ULA = 0 and all last linked list buffer data has been transfered, and not all SDMMC data according DATALENGTH has been transfered. The SDMMC transfer is stopped and an IDMA transfer error is generated (see *Section : IDMA transfer error management*).

For a given linked list item, the base address is given by the linked list base IDMABA register value plus the linked list offset IDMALA register value.

The content of each linked list item can be specified by the ULS bit, which makes possible to optionally load the IDMABSIZE, resulting in a 3-word linked list structure. When the IDMABSIZE is not to be loaded (fixed size buffers) a compacted reduced 2-word linked list structure can be used containing only the IDMABASER and the IDMALAR values.

Figure 281. Linked list structures

There is no restriction on mixing both linked list item structures in a single list, this enables the IDMABSIZE to be updated only when needed.

Whenever a linked list buffer has been transfered and the current buffer ULA = 1, an end-of-linked-list-buffer-transfer-complete interrupt (IDMABTC) may be generated (if interrupt is enabled).

Linked list acknowledgment

In the case where software dynamically updates the linked list, during the SDMMC transfer, the availability of a new linked list buffer can be acknowledged by the acknowledge buffer ready (ABR) bit.

When ABR acknowledges that the new linked list buffer is ready, the IDMA continues transferring data from the new linked list buffer.

When ABR indicates that the new linked list buffer is not ready, an IDMA transfer error is generated (see *Section : IDMA transfer error management*). Depending when the IDMA transfer error occurs, it normally causes the generation of an TXUNDERR or RXOVERR error. When a linked list buffer is not acknowledged in time the SDMMC transfer is stopped.

The ABR information is “don't care” when starting the linked list from software programmed register information. The first linked list buffer must be ready to be used before starting the SDMMC transfer.

IDMA transfer error management

An IDMA transfer error can occur:

- When reading or writing a reserved address space (for data or linked list information).
- When there is no more linked list buffer space to store received SDMMC data.
- When all linked list buffer data has been transfered and still more SDMMC data needs to be sent.
- When the availability of a linked list buffer is not acknowledged.

On an IDMA transfer error subsequent IDMA transfers are disabled and an IDMATE flag is set and hardware flow control is disabled. Depending when the IDMA transfer error occurs, it normally causes the generation of a TXUNDERR or RXOVERR error.

The behavior of the IDMATE flag depend on when the IDMA transfer error occurs during the SDMMC transfer:

- An IDMA transfer error is detected before any SDMMC transfer error (TXUNDERR, RXOVERR, DCRCFAIL, or DTIMEOUT):
  - The IDMATE flag is set at the same time as the SDMMC transfer error flag.
  - The TXUNDERR, RXOVERR, DCRCFAIL, or DTIMEOUT interrupt is generated.
- An IDMA transfer error is detected during a STOP_TRANSNMISSION command:
  - The IDMATE flag is set at the same time as the DABORT flag.
  - The DABORT interrupt is generated.
- An IDMA transfer error is detected at the end of the SDMMC transfer (DHOLD, or DATAEND).
  - The IDMATE flag is set at the end of the SDMMC transfer.
  - A SDMMC transfer end interrupt is generated and a DHOLD or DATAEND flag is set.

The IDMATE is generated on an other SDMMC transfer interrupt (TXUNDERR. RXOVERR, DCRCFAIL, DTIMEOUT, DABORT, DHOLD, or DATAEND).

40.5.7 AHB and SDMMC_CK clock relation

The AHB must at least have between 1.72x and 3x more bandwidth than the SDMMC bus bandwidth i.e. for SDR50 4-bit mode (50 Mbyte/s) the minimum sdmmc_hclk frequency is 21.43 MHz (85.72 Mbyte/s).

Table 342. AHB and SDMMC_CK clock frequency relation

SDMMC bus mode	SDMMC bus width	Maximum SDMMC_CK [MHz]	Minimum AHB clock [MHz]
e•MMC DS	8	26	13
e•MMC HS	8	52	26
e•MMC DDR52	8	52	78
e•MMC HS200	8	200	100
SD DS / SDR12	4	25	5.36
SD HS / SDR25	4	50	10.72
SD DDR50	4	50	25

Table 342. AHB and SDMMC_CK clock frequency relation (continued)

SDMMC bus mode	SDMMC bus width	Maximum SDMMC_CK [MHz]	Minimum AHB clock [MHz]
SD SDR50	4	100	21.43
SD SDR104	4	208	44.58

Warning: When minimum HCLK frequency is not respected, overrun or underrun errors may occur even when hardware flow control is enabled.

40.6 Card functional description

40.6.1 SD I/O mode

The following features are SDMMC specific operations:

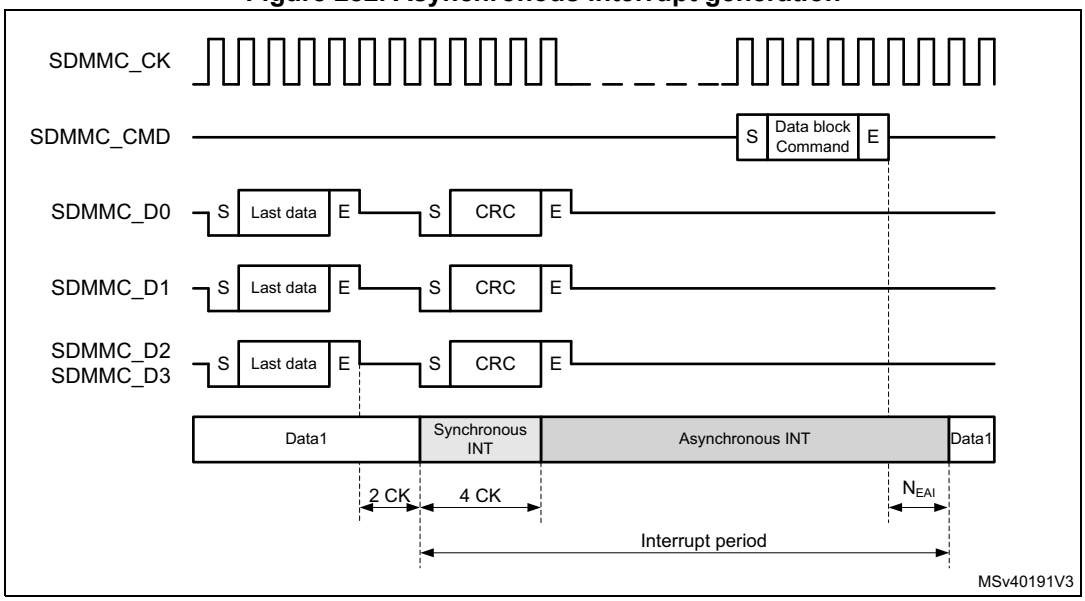
- SDIO interrupts
- SDIO suspend/resume operation (write and read suspend)
- SDIO Read Wait operation by stopping the clock
- SDIO Read Wait operation by SDMMC_D2 signaling

Table 343. SDIO special operation control

Operation mode	SDIOEN	RWMOD	RWSTOP	RWSTART	DTDIR
Interrupt detection	1	X	X	X	X
Suspend/Resume operation	X	X	X	X	X
Read Wait SDMMC_CK clock stop (START)	X	1	0	1	1
Read Wait SDMMC_CK clock stop (STOP)	X	1	1	1	1
Read Wait SDMMC_D2 signaling (START)	X	0	0	1	1
Read Wait SDMMC_D2 signaling (STOP)	X	0	1	1	1

SD I/O interrupts

To allow the SD I/O card to interrupt the host, an interrupt function is available on pin 8 (shared with SDMMC_D1 in 4-bit mode) on the SD interface. The use of the interrupt is optional for each card or function within a card. The SD I/O interrupt is level-sensitive, which means that the interrupt line must be held active (low) until it is either recognized and acted upon by the host or deasserted due to the end of the interrupt period. After the host has serviced the interrupt, the interrupt status bit is cleared via an I/O write to the appropriate bit in the SD I/O card internal registers. The interrupt output of all SD I/O cards is active low and the application must provide external pull-up resistors on all data lines (SDMMC_D[3:0]).



In SD 1-bit mode pin 8 is dedicated to the interrupt function (IRQ), and there are no timing constraints on interrupts.

In SD 4-bit mode the host samples the level of pin 8 (SDMMC_D1/IRQ) into the interrupt detector only during the interrupt period. At all other times, the host interrupt ignores this value. The interrupt period begins when interrupts are enabled at the card and SDIOEN bit is set see register settings in *Table 343*.

In 4-bit mode the card can generate a synchronous or asynchronous interrupt as indicated by the card CCCR register SAI and EAI bits.

- Synchronous interrupt, require the SDMMC_CK to be active.
- Asynchronous interrupt, can be generated when the SDMMC_CK is stopped, 4 cycles after the start of the card interrupt period following the last data block.

Figure 282. Asynchronous interrupt generation

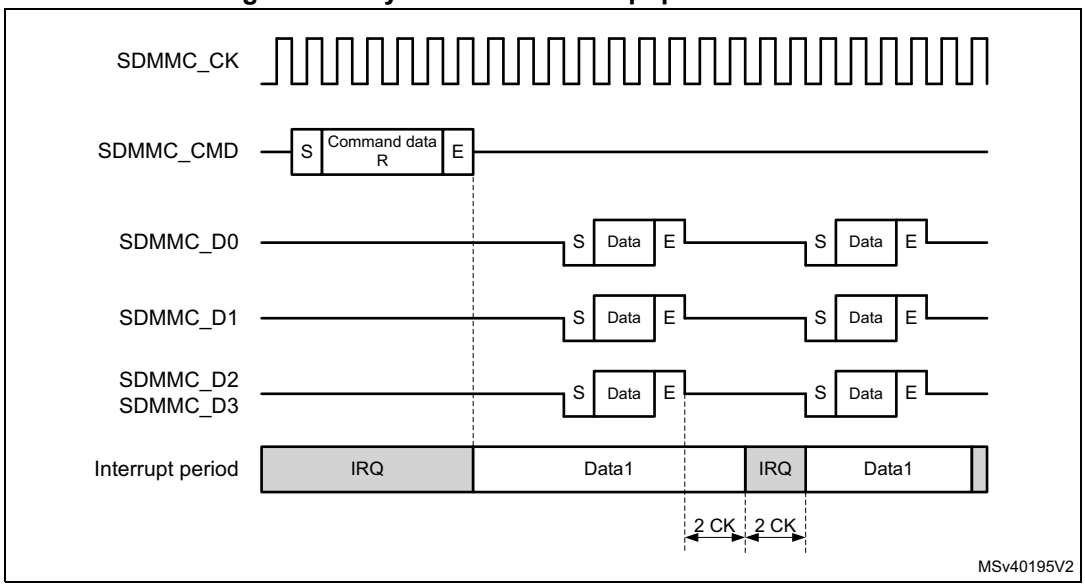
The timing of the interrupt period is depending on the bus speed mode.

In DS, HS, SDR12, and SDR25 mode, selected by register bit BUSSPEED, the interrupt period is synchronous to the SD clock.

- The interrupt period ends at the next clock from the end bit of a command that transfers data block(s) (Command sent with the CMDTRANS bit is set), or when the DTEN bit is set.
- The interrupt period resumes 2 SDMMC_CK after the completion of the data block.
- At the data block gap the interrupt period is limited to 2 SDMMC_CK cycles.

Note: DTEN must not be used to start data transfer with SD and e•MMC cards.

Figure 283. Synchronous interrupt period data read



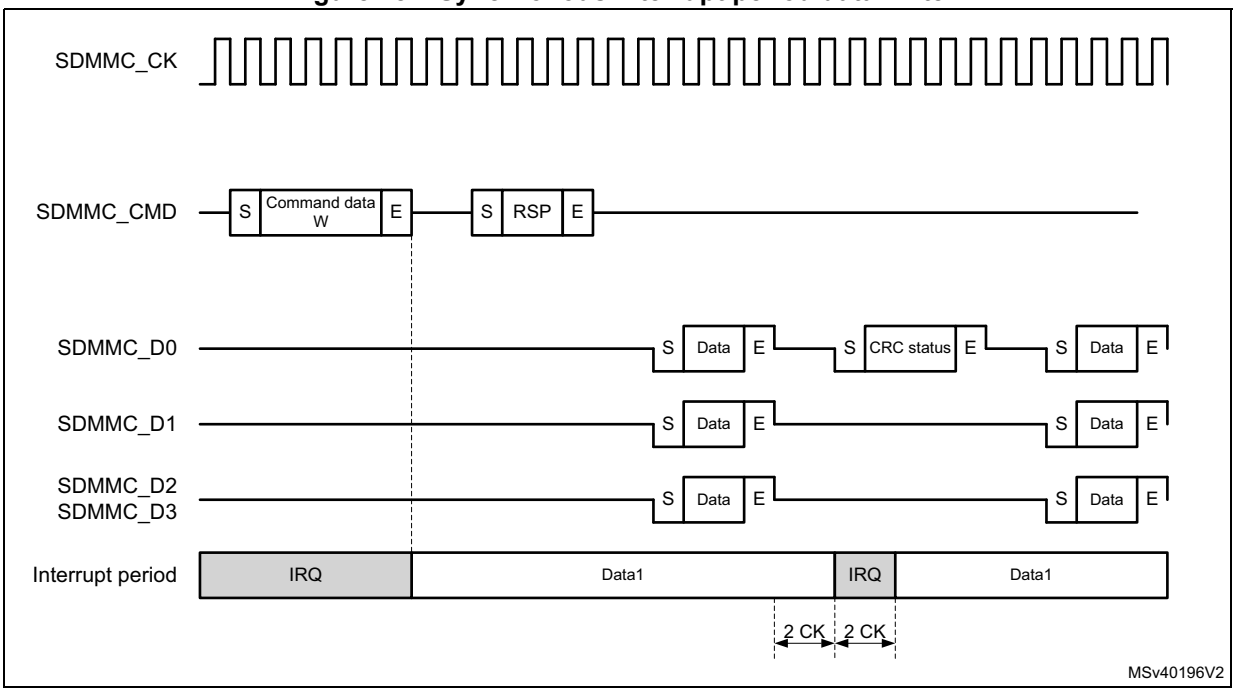


Figure 284. Synchronous interrupt period data write

In SDR50, SDR104, and DDR50, selected by register bit BUSSPEED, due to propagation delay from the card to host, the interrupt period is asynchronous.

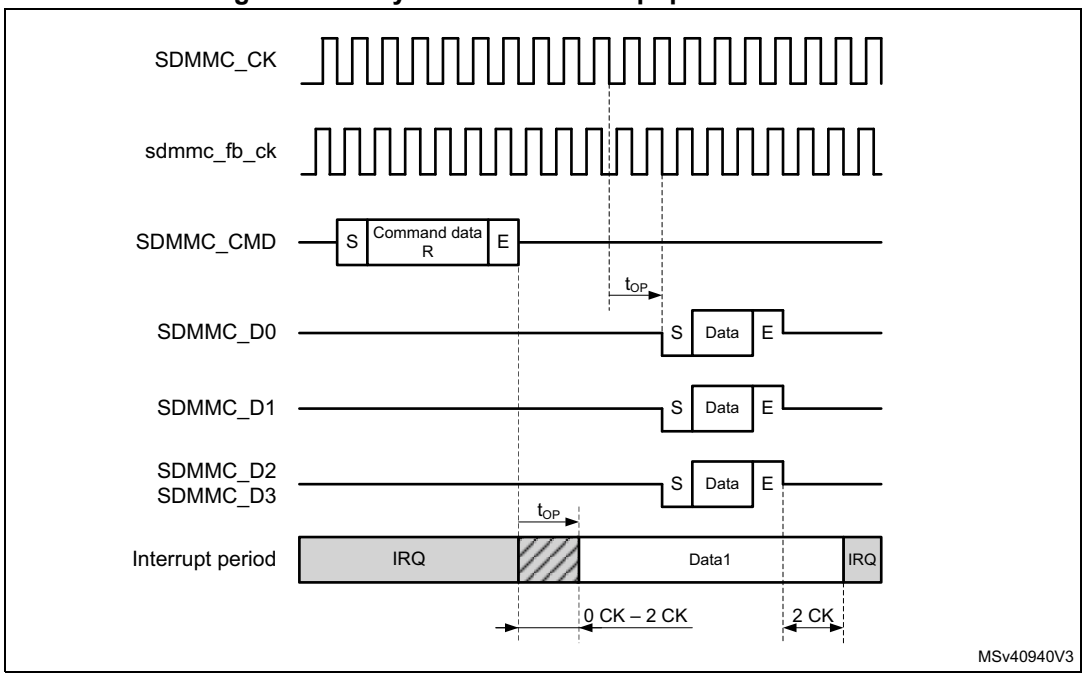
- The card interrupt period ends after 0 to 2 SDMMC_CK cycles after the end bit of a command that transfers data block(s) (Command sent with the CMDTRANS bit is set), or when the DTEN bit is set. At the host the interrupt period ends after the end bit of a

command that transfers data block(s). A card interrupt issued in the 1 to 2 cycles after the command end bit are not detected by the host during this interrupt period.

- The card interrupt period resumes 2 to 4 SDMMC_CK after the completion of the last data block. The host resumes the interrupt period always 2 cycles after the last data block.
- There is NO interrupt period at the data block gap.

Note: DTEN must not be used to start data transfer with SD and e•MMC cards.

Figure 285. Asynchronous interrupt period data read



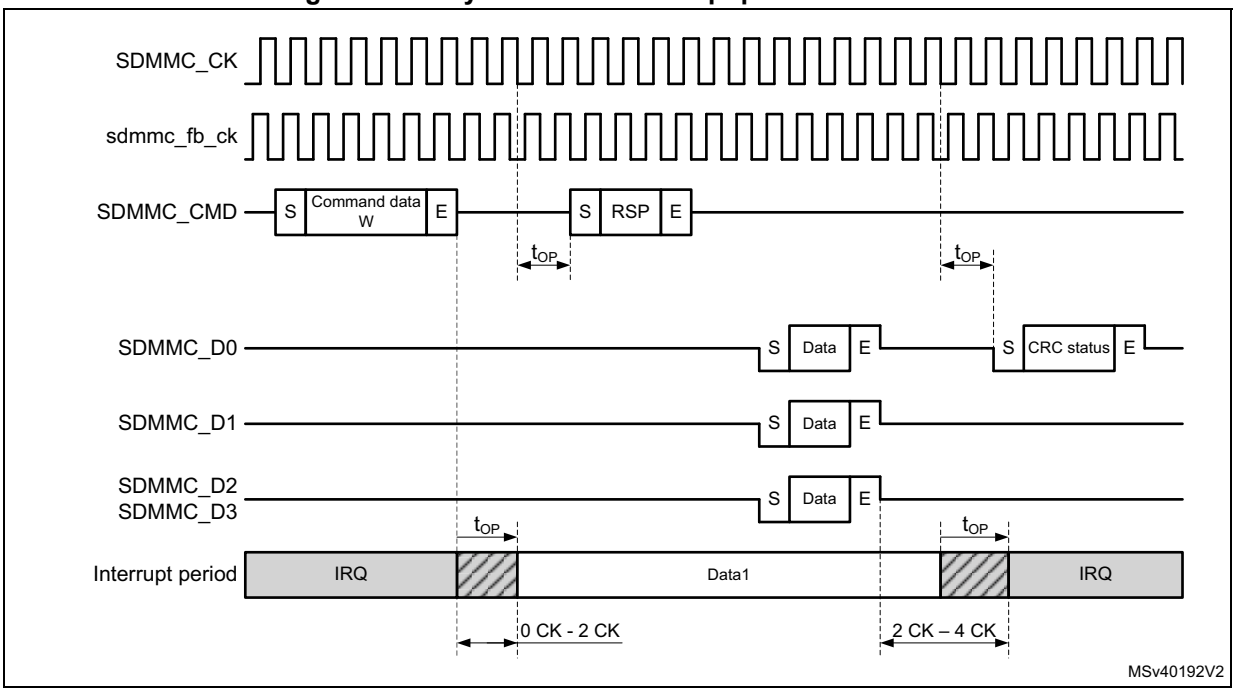


Figure 286. Asynchronous interrupt period data write

When transferring Open-ended multiple block data and using DTMODE “block data transfer ending with STOP_TRANSMISSION command”, the SDMMC masks the interrupt period after the last data block until the end of the CMD12 STOP_TRANSMISSION command.

The interrupt period is applicable for both memory and I/O operations.

In 4-bit mode interrupts can be differentiated from other signaling according *Table 344*.

Table 344. 4-bit mode Start, interrupt, and CRC-status Signaling detection

SDMMC data line	Start	Interrupt	CRC-status
SDMMC_D0	0	1 or CRC-status	0
SDMMC_D1	0	0	X
SDMMC_D2	0	1 or Read Wait	X
SDMMC_D3	0	1	X

SD I/O suspend and resume

This function is NOT supported in SDIO version 4.00 or later.

Within a multifunction SD I/O or a card with both I/O and memory functions, there are multiple devices (I/O and memory) that share access to the *e*•MMC/SD bus. To share access to the host among multiple devices, SD I/O and combo cards optionally implement the concept of suspend/resume. When a card supports suspend/resume, the host can temporarily halt (suspend) a data transfer operation to one function or memory to free the bus for a higher-priority transfer to a different function or memory. After this higher-priority transfer is complete, the original transfer is restarted (resume) where it left off.

To perform the suspend/resume operation on the bus, the host performs the following steps:

1. Determines the function currently using the SDMMC_D[3:0] line(s).
2. Requests the lower-priority or slower transaction to suspend.
3. Waits for the transaction suspension to complete.
4. Begins the higher-priority transaction.
5. Waits for the completion of the higher priority transaction.
6. Restores the suspended transaction.

The card receiving a suspend command responds with its current bus status. Only when the bus has been suspended by the card the bus status indicates suspension completed.

There are different suspend cases conditions:

- Suspend request accepted prior to the start of data transfer.
- Suspend request not accepted, (due to data being transfered at the same time), the host keeps checking the request until it is accepted (data transfer has suspended).
- Suspend request during write busy.
- Suspend request with write multiple.
- Suspend request during Read Wait.

For the host to know if the bus has been released it must check the status of the suspend request, suspension completed.

When the bus status of the suspend request response indicates suspension completed, the card has released the bus. At this time the state of the suspended operation must be saved where after an other operation can start.

The suspend command must be sent with the CMDSUSPEND bit set. This makes possible to start the interrupt period after the suspend command response when the bus is suspended (response bit BS = 0).

The hardware does not save the number of remaining data to be transfered when resuming the suspended operation. It is up to firmware to determine the data that has been transferred and resume with the correct remaining number of data bytes.

While receiving data from the card, the SDMMC can suspend the read operation after the read data block end (DPSM in Wait_R). After receiving the suspend acknowledgment response from the card the following steps must be taken by firmware:

1. The normal receive process must be stopped by setting DTHOLD bit.
   a) The remaining number of data bytes in the FIFO must be read until the receive FIFO is empty (RXFIFOE flag is set), and when IDMAEN = 0 the FIFO must be reset with FIFORST.
2. The confirmation that all data has been read from the FIFO, and that the suspend is completed is indicated by the DHOLD flag.
   a) The remaining number of data bytes (multiple of data blocks) still to be read when resuming the operation must be determined from the remaining number of bytes indicated by the DATACOUNT.

Note: When a DTIMEOUT flag occurs during the suspend procedure, this must be ignored.

To resume receiving data from the card, the following steps must be taken by firmware:

1. The remaining number of data bytes (multiple of data blocks) must be programmed in DATALENGTH.
2. The DPSM must be configured to receive data in the DTDIR bit.
3. The resume command must be sent from the CPSM, with the CMDTRANS bit set and the CMDSUSPEND bit set, which ends the interrupt period when data transfer is resumed (response bit DF = 1) and enabled the DPSM, after which the card resumes sending data.

While sending data to the card, the SDMMC can suspend the write operation after the write data block CRC status end (DPSM in Busy). Before sending the suspend command to the card the following steps must be taken by firmware:

1. Enable DHOLD flag (and DBCKEND flag when IDMAEN = 0)
2. The DPSM must be prevented from start sending a new data block by setting DTHOLD.
3. When IDMAEN = 0: When receiving the DBCKEND flag the data transfer is stopped. Firmware can stop filling the FIFO, after which the FIFO must be reset with FIFORST. Any bytes still in the FIFO need to be rewritten when resuming the operation.
4. When receiving the DHOLD flag the data transfer is stopped. The remaining number of data bytes still to be written when resuming must be determined from the remaining number of bytes indicated by the DATACOUNT.
5. To suspend the card the suspend command must be sent by the CPSM with the CMDSUSPEND bit set. This makes possible to start the interrupt period after the suspend command response when the bus is suspended (response bit BS = 0).

To resume sending data to the card, the following steps must be taken by firmware:

1. The remaining number of data bytes must be programmed in DATALENGTH.
2. The DPSM must be configured for transmission with DTDIR set and enabled by having the CPSM send the resume command with the CMDTRANS bit set and the CMDSUSPEND bit set. This ends the interrupt period and start the data transfer. The DPSM either goes to the Wait_S state when SDMMC_D0 does not signal busy, or goes to the Busy state when busy is signaled.
3. When IDMAEN = 1: The IDMA needs to be reprogrammed for the remaining bytes to be transfered.
4. When IDMAEN = 0: Firmware must start filling the FIFO with the remaining data.

SD I/O Read Wait

There are two methods to pause the data transfer during the block gap:

1. Stopping the SDMMC_CK.
2. Using Read Wait signaling on SDMMC_D2.
