5: Full minus 3.5 Kbytes

Other values: reserved

The deassertion is effective only after flow control is asserted.

Note: The value must be programmed in such a way to make sure that the threshold is a positive number.

To have the flow control activated for a fill level of 3 Kbytes and deactivated when the fill level is 1 Kbyte, program:

RFA[2:0] = 0 (full – 1 Kbyte)

RFD[2:0] = 4 (full – 3 Kbytes)

Bits 13:11 Reserved, must be kept at reset value.

Bits 10:8 **RFA[2:0]**: Threshold for Activating Flow Control (in Half-duplex and Full-duplex)

These bits control the threshold (fill-level of Rx queue) at which the flow control is activated:
For more information on encoding for this field, see RFD[2:0].

Bit 7 **EHFC**: Enable Hardware Flow Control

When this bit is set, the flow control signal operation, based on the fill-level of Rx queue, is enabled. When reset, the flow control operation is disabled.

Bit 6 **DIS_TCP_EF**: Disable Dropping of TCP/IP Checksum Error Packets

When this bit is set, the MAC does not drop the packets which only have the errors detected by the Receive Checksum Offload engine. Such packets have errors only in the encapsulated payload. There are no errors (including FCS error) in the Ethernet packet received by the MAC.

When this bit is reset, all error packets are dropped if the FEP bit is reset.

Bit 5 **RSF**: Receive Queue Store and Forward

When this bit is set, the Ethernet peripheral reads a packet from the Rx queue only after the complete packet has been written to it, ignoring the RTC field of this register. When this bit is reset, the Rx queue operates in the Threshold (cut-through) mode, subject to the threshold specified by the RTC field of this register.

Bit 4 **FEP**: Forward Error Packets

When this bit is reset, the Rx queue drops packets with error status (CRC error, receive error, watchdog timeout, or overflow). However, if the start byte (write) pointer of a packet is already transferred to the read controller side (in Threshold mode), the packet is not dropped.

When this bit is set, all packets except the runt error packets are forwarded to the application or DMA. If the RSF bit is set and the Rx queue overflows when a partial packet is written, the packet is dropped irrespective of the setting of this bit. However, if the RSF bit is reset and the Rx queue overflows when a partial packet is written, a partial packet may be forwarded to the application or DMA.

Bit 3 **FUP**: Forward Undersized Good Packets

When this bit is set, the Rx queue forwards the undersized good packets (packets with no error and length less than 64 bytes), including pad-bytes and CRC. When this bit is reset, the Rx queue drops all packets of less than 64 bytes, unless a packet is already transferred because of the lower value of Rx Threshold, for example, RTC = 01.

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **RTC[1:0]**: Receive Queue Threshold Control

These bits control the threshold level of the MTL Rx queue (in bytes):

00: 64

01: 32

10: 96

11: 128

The received packet is transferred to the application or DMA when the packet size within the MTL Rx queue is larger than the threshold. In addition, full packets with length less than the threshold are automatically transferred.

This field is valid only when the RSF bit is zero. This field is ignored when the RSF bit is set to 1.

Rx queue x missed packet and overflow counter register (ETH_MTLRXQxMPOCR)

Address offset: 0x0D34 + 0x40 * x, (x = 0 to 1)

Reset value: 0x0000 0000

The Queue x missed packet and overflow counter registers contain the counter for packets missed because of Receive queue packet flush and packets discarded because of Receive queue overflow.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

				rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **MISCNTOVF**: Missed Packet Counter Overflow Bit

When set, this bit indicates that the Rx Queue Missed Packet Counter crossed the maximum limit.

Bits 26:16 **MISPKTCNT[10:0]**: Missed Packet Counter

This field indicates the number of packets missed by the Ethernet peripheral because the application requested to flush the packets for this queue. This counter is reset when this register is read.

This counter is incremented by 1 when the DMA discards the packet because of buffer unavailability.

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **OVFCNTOVF**: Overflow Counter Overflow Bit

When set, this bit indicates that the Rx Queue Overflow Packet Counter field crossed the maximum limit.

Bits 10:0 **OVFPKTCNT[10:0]**: Overflow Packet Counter

This field indicates the number of packets discarded by the Ethernet peripheral because of Receive queue overflow. This counter is incremented each time the Ethernet peripheral discards an incoming packet because of overflow. This counter is reset when this register is read.

Rx queue x debug register (ETH_MTLRXQxDR)

Address offset: 0x0D38 + 0x40 * x, (x = 0 to 1)

Reset value: 0x0000 0000

The Queue x Receive Debug register gives the debug status of various blocks related to the Receive queue.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

										r	r		r	r	r

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:16 **PRXQ[13:0]**: Number of Packets in Receive Queue

This field indicates the current number of packets in the Rx queue. The theoretical maximum value for this field is 256 Kbyte/16 bytes = 16K Packets, that is, Max_Queue_Size/Min_Packet_Size.

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:4 **RXQSTS[1:0]**: MTL Rx Queue Fill-Level Status

This field gives the status of the fill-level of the Rx queue:
00: Rx queue empty
01: Rx queue fill-level below flow-control deactivate threshold
10: Rx queue fill-level above flow-control activate threshold
11: Rx queue full

Bit 3 Reserved, must be kept at reset value.

Bits 2:1 **RRCSTS[1:0]**: MTL Rx Queue Read Controller State

This field gives the state of the Rx queue Read controller:
00: Idle state
01: Reading packet data
10: Reading packet status (or timestamp)
11: Flushing the packet data and status

Bit 0 **RWCSTS**: MTL Rx Queue Write Controller Active Status

When high, this bit indicates that the MTL Rx queue Write controller is active, and it is transferring a received packet to the Rx queue.

Rx queue x control register (ETH_MTLRXQxCR)

Address offset: 0x0D3C + 0x40 * x, (x = 0 to 1)

Reset value: 0x0000 0000

The Queue Receive Control register controls the receive arbitration and passing of received packets to the application.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RXQ_FRM_ARBIT	RXQ_WEGT[2:0]		
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **RXQ_FRM_ARBIT**: Receive Queue Packet Arbitration

When this bit is set, the Ethernet peripheral drives the packet data to the DMA such that the entire packet data of currently-selected queue is transmitted before switching to other queue.
When this bit is reset, the Ethernet peripheral drives the packet data to the DMA such that the following amount of data of currently-selected queue is transmitted before switching to other queue:

– PBL amount of data

or

– complete data of a packet

The status and the timestamp are not a part of the PBL data. Therefore, the Ethernet peripheral drives the complete status (including timestamp status) during first PBL request for the packet (in store-and-forward mode) or the last PBL request for the packet (in Threshold mode).

Bits 2:0 **RXQ_WEGT[2:0]**: Receive Queue Weight

This field indicates the weight assigned to the Rx queue x. The weight is used as the number of continuous PBL requests or contiguous packets (depending on the RXQ_FRM_ARBIT) allocated to the queue in one arbitration cycle.
This field needs to be programmed with one value less than the required weight, that is, reset value of 0 indicates weight of 1, value of 1 indicates weight of 2, and so on.

Note: The change in value of RXQ_WEGT takes effect only after the completion of current service round or when there is change from RAA=SP to RAA=WSP algorithm. This approach is taken so that there is smooth transition. For the RXQ_WEGT value to take effect at the start, the Rx queue x control register (ETH_MTLRXQxCR) must be programmed before the Rx queue x operating mode register (ETH_MTLRXQxOMR).

Tx queue x ETS control register (ETH_MTLTXQxECR)

Address offset: 0x0D10 + 0x40 * x, (x = 1 to 3)

Reset value: 0x0000 0000

The Queue ETS Control register controls the enhanced transmission selection operation.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SLC[2:0]			CC	AVALG	Res.	Res.
									rw	rw	rw	rw	rw		

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **SLC[2:0]**: Slot Count

If the credit-based shaper algorithm is enabled, the software can program the number of slots (of 125 us duration) over which the average transmitted bits per slot, provided in *Tx queue x ETS status register (ETH_MTLTXQxESR)*, need to be computed for Queue x. The encoding is as follows:
000: 1 Slot
001: 2 Slots
010: 4 Slots
011: 8 Slots
100: 16 Slots
101 to 111: Reserved, must not be used.

Bit 3 **CC**: Credit Control

When this bit is set, the accumulated credit parameter in the credit-based shaper algorithm logic is not reset to zero when there is positive credit and no packet to transmit in Channel x. The credit accumulates even when there is no packet waiting in Channel x and another channel is transmitting.
When this bit is reset, the accumulated credit parameter in the credit-based shaper algorithm logic is set to zero when there is positive credit and no packet to transmit in Channel x. When there is no packet waiting in Channel 1 and other channel is transmitting, no credit is accumulated.

Bit 2 **AVALG**: AV Algorithm

When Queue x is programmed for AV, this field configures the scheduling algorithm for this queue:
This bit when set, indicates credit based shaper algorithm (CBS) is selected for Queue x traffic. When reset, strict priority is selected.

Bits 1:0 Reserved, must be kept at reset value.

Tx queue x quantum weight register (ETH_MTLTXQxQWR)

Address offset: 0x0D18 + 0x40 * x, (x = 0 to 3)

Reset value: 0x0000 0000

This register contains the weights for the Weighted Round Robin (WRR) or IdleSlopeCredit for the queue.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	ISCQW[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:0 **ISCQW[13:0]**: IdleSlopeCredit or Weights

idleSlopeCredit

When AV feature is enabled, this field contains the idleSlopeCredit value required for the credit-based shaper algorithm for queue x (x = 1 to 3). This is the rate of change of credit in bits per cycle (40 ns for 100 Mbps; 8 ns for 1000 Mbps) when the credit is increasing. The software should program this field with computed credit in bits per cycle scaled by 1,024. The maximum value is portTransmitRate, that is, 0x2000 in 1000 Mbps mode and 0x1000 in 100 Mbps mode.

Weights

If WRR algorithm is enabled for queue x generic traffic (not AVB), this field contains the weight for queue x. The maximum value is 0x64. Bits [13:7] must be written to zero.

Note: In multiple Queue configuration this field must be programmed to some non-zero value when multiple queues are enabled, or a single queue other than Queue 0 is enabled. This field need not be programmed when only Q0 is enabled. In general, when WRR algorithm is selected a non-zero value must be programmed on both Receive and Transmit. In Receive, the register is Operating mode register (ETH_MTLOMR).

The weights programmed do not correspond to the number of packets but the fraction of bandwidth or time allocated for particular queue w.r.t. total BW or time.

Tx queue x send slope credit register (ETH_MTLTXQxSSCR)

Address offset: 0x0D1C + 0x40 * x, (x = 1 to 3)

Reset value: 0x0000 0000

The sendSlopeCredit register contains the sendSlope credit value required for the credit-based shaper algorithm for the Queue.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	SSC[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:0 **SSC[13:0]**: sendSlopeCredit Value

When AV operation is enabled, this field contains the sendSlopeCredit value required for credit-based shaper algorithm for queue x. This is the rate of change of credit in bits per cycle (40 ns and 8 ns for 100 Mbps and 1000 Mbps respectively) when the credit decreases. The software should program this field with computed credit in bits per cycle scaled by 1 024. The maximum value is portTransmitRate, that is 0x2000 in 1000 Mbps mode and 0x1000 in 100 Mbps mode. This field should be programmed with absolute sendSlopeCredit value. The credit-based shaper logic subtracts it from the accumulated credit when queue x is selected for transmission.

Tx Queue x hiCredit register (ETH_MTLTXQxHCR)

Address offset: 0x0D20 + 0x40 * x, (x = 1 to 3)

Reset value: 0x0000 0000

The hiCredit register contains the hiCredit value required for the credit-based shaper algorithm for the Queue.

HC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:0 **HC[28:0]**: hiCredit Value

This field contains the hiCredit value required for the credit-based shaper algorithm when the AV feature is enabled. This is the maximum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1 024.

The maximum value is maxInterferenceSize, that is, best-effort maximum packet size (16 384 bytes or 131 072 bits). The value to be specified is 131 072 ×1 024 = 134 217 728 or 0x0800 0000.

Tx queue x loCredit register (ETH_MTLTXQxLCR)

Address offset: 0x0D24 + 0x40 * x, (x = 1 to 3)

Reset value: 0x0000 0000

The loCredit register contains the loCredit value required for the credit-based shaper algorithm for the Queue.

LC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:0 **LC[28:0]**: loCredit Value

When AV operation is enabled, this field contains the loCredit value required for the credit-based shaper algorithm. This is the minimum value that can be accumulated in the credit parameter. This is specified in bits scaled by 1 024. The maximum value is maxFrameSize transmitted from this queue, that is, 16 384 × 8 × 1 024 = 134 217 728 or 0x0800 0000. Because it is a negative value, the programmed value is 2's complement of the value, that is, 0x1800 0000.

Refer to *Section 2.4 on page 228* for the register boundary addresses.

92.11.4 Ethernet MAC and MMC registers

Operating mode configuration register (ETH_MACCR)

Address offset: 0x0000

Reset value: 0x0000 0000

The MAC Configuration register establishes the operating mode of the MAC.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ARPEN		SARC[2:0]		IPC	IPG[2:0]			GPSLCE	S2KP	CST	ACS	WD	BE	JD	JE

PS	FES	DM	LM	ECRSFD	DO	DCRS	DR	Res.	BL[1:0]		DC	PRELEN[1:0]		TE	RE
rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw

Bit 31 **ARPEN**: ARP Offload Enable

When this bit is set, the MAC can recognize an incoming ARP request packet and schedules the ARP packet for transmission. It forwards the ARP packet to the application and also indicate the events in the RxStatus.

When this bit is reset, the MAC receiver does not recognize any ARP packet and indicates them as Type frame in the RxStatus.

Bits 30:28 **SARC[2:0]**: Source Address Insertion or Replacement Control

This field controls the source address insertion or replacement for all transmitted packets. Bit 30 specifies which MAC Address register (0 or 1) is used for source address insertion or replacement based on the values of Bits[29:28]:

010:the MAC inserts the content of the MAC Address 0 registers (*MAC Address 0 high register (ETH_MACA0HR)* and *MAC Address x low register (ETH_MACAxLR)*) in the SA field of all transmitted packets.

011: the MAC replaces the content of the MAC Address 0 registers (*MAC Address 0 high register (ETH_MACA0HR)* and *MAC Address x low register (ETH_MACAxLR)*) in the SA field of all transmitted packets.

110: the MAC inserts the content of the MAC Address 1 registers (*MAC Address x high register (ETH_MACAxHR)* and *MAC Address x low register (ETH_MACAxLR)*) in the SA field of all transmitted packets

111: the MAC replaces the content of the MAC Address 1 registers (*MAC Address x high register (ETH_MACAxHR)* and *MAC Address x low register (ETH_MACAxLR)*) in the SA field of all transmitted packets.

Others: Reserved, must not be used.

Note: Changes to this field take effect only on the start of a packet. If you write to this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value.

Bit 27 **IPC**: Checksum Offload

When set, this bit enables the IPv4 header checksum checking and IPv4 or IPv6 TCP, UDP, or ICMP payload checksum checking. When this bit is reset, the COE function in the receiver is disabled.

The Layer 3 and Layer 4 Packet Filter feature automatically selects the IPC Full Checksum Offload Engine on the Receive side. When this feature is enabled, you must set the IPC bit.

Bits 26:24 **IPG[2:0]**: Inter-Packet Gap

These bits control the minimum IPG between packets during transmission.

000: 96 bit times

001: 88 bit times

010: 80 bit times

...

111: 40 bit times

This range of minimum IPG is valid in Full-duplex mode.

In the Half-duplex mode, the minimum IPG can be configured only for 64-bit times (IPG = 100). Lower values are not considered.

When a JAM pattern is being transmitted because of backpressure activation, the MAC does not consider the minimum IPG.

The above function (IPG less than 96 bit times) is valid only when EIPGEN bit in ETH_MACECR register is reset. When EIPGEN is set, then the minimum IPG (greater than 96 bit times) is controlled as per the description given in EIPG field in ETH_MACECR register.

Bit 23 **GPSLCE**: Giant Packet Size Limit Control Enable

When this bit is set, the MAC considers the value in GPSL field in ETH_MACECR register to declare a received packet as Giant packet. This field must be programmed to more than 1,518 bytes. Otherwise, the MAC considers 1,518 bytes as giant packet limit.

When this bit is reset, the MAC considers a received packet as Giant packet when its size is greater than 1,518 bytes (1522 bytes for tagged packet).

The watchdog timeout limit, Jumbo Packet Enable and 2K Packet Enable have higher precedence over this bit, that is the MAC considers a received packet as Giant packet when its size is greater than 9,018 bytes (9,022 bytes for tagged packet) with Jumbo Packet Enabled and greater than 2,000 bytes with 2K Packet Enabled. The watchdog timeout, if enabled, terminates the received packet when watchdog limit is reached. Therefore, the programmed giant packet limit should be less than the watchdog limit to get the giant packet status.

Bit 22 **S2KP**: IEEE 802.3as Support for 2K Packets

When this bit is set, the MAC considers all packets with up to 2,000 bytes length as normal packets. When the JE bit is not set, the MAC considers all received packets of size more than 2K bytes as Giant packets.

When this bit is reset and the JE bit is not set, the MAC considers all received packets of size more than 1,518 bytes (1,522 bytes for tagged) as giant packets. For more information about how the setting of this bit and the JE bit impact the Giant packet status, see *Table 982: Giant Packet Status based on S2KP and JE Bits*.

Note: When the JE bit is set, setting this bit has no effect on the giant packet status.

Bit 21 **CST**: CRC stripping for Type packets

When this bit is set, the last four bytes (FCS) of all packets of Ether type (type field greater than 1,536) are stripped and dropped before forwarding the packet to the application. This function is not valid when the IP Checksum Engine (Type 1) is enabled in the MAC receiver. This function is valid when Type 2 Checksum Offload Engine is enabled.

Note: For information about how the settings of the ACS bit and this bit impact the packet length, see Table 983: Packet Length based on the CST and ACS bits.

Bit 20 **ACS**: Automatic Pad or CRC Stripping

When this bit is set, the MAC strips the Pad or FCS field on the incoming packets only if the value of the length field is less than 1,536 bytes. All received packets with length field greater than or equal to 1,536 bytes are passed to the application without stripping the Pad or FCS field.

When this bit is reset, the MAC passes all incoming packets to the application, without any modification.

Note: For information about how the settings of CST bit and this bit impact the packet length, see Table 983: Packet Length based on the CST and ACS bits.

Bit 19 **WD**: Watchdog Disable

When this bit is set, the MAC disables the watchdog timer on the receiver. The MAC can receive packets of up to 16,383 bytes.

When this bit is reset, the MAC does not allow more than 2,048 bytes (10,240 if JE is set high) of the packet being received. The MAC cuts off any bytes received after 2,048 bytes.

Bit 18 **BE**: Packet Burst Enable

When this bit is set, the MAC allows packet bursting during transmission in the GMII Half-duplex mode.

Bit 17 **JD**: Jabber Disable

When this bit is set, the MAC disables the jabber timer on the transmitter. The MAC can transfer packets of up to 16,383 bytes.

When this bit is reset, if the application sends more than 2,048 bytes of data (10,240 if JE is set high) during transmission, the MAC does not send rest of the bytes in that packet.

Bit 16 **JE**: Jumbo Packet Enable

When this bit is set, the MAC allows jumbo packets of 9,018 bytes (9,022 bytes for VLAN tagged packets) without reporting a giant packet error in the Rx packet status.

For more information about how the setting of this bit and the JE bit impact the Giant packet status, see *Table 982: Giant Packet Status based on S2KP and JE Bits*.

Bit 15 **PS**: Port Select

This bit selects the Ethernet line speed.

0: For 1000 Mbps operations

1: For 10 or 100 Mbps operations

In 10 or 100 Mbps operations, this bit, along with Bit FES, selects the exact line speed.

Bit 14 **FES**: MAC Speed

This bit selects the speed in the 10/100 Mbps mode:

0: 10 Mbps

1: 100 Mbps

Bit 13 **DM**: Duplex Mode

When this bit is set, the MAC operates in the Full-duplex mode in which it can transmit and receive simultaneously.

Bit 12 **LM**: Loopback Mode

When this bit is set, the MAC operates in the loopback mode at GMII or MII. The GMII Rx clock input (eth_rx_clk) is required for the loopback to work properly. This is because the Tx clock is not internally looped back.

Bit 11 **ECRSFD**: Enable Carrier Sense Before Transmission in Full-duplex mode

When this bit is set, the MAC transmitter checks the CRS signal before packet transmission in the Full-duplex mode. The MAC starts the transmission only when the CRS signal is low.

When this bit is reset, the MAC transmitter ignores the status of the CRS signal.

Bit 10 **DO**: Disable Receive Own

When this bit is set, the MAC disables the reception of packets when the ETH_TX_EN is asserted in the Half-duplex mode. When this bit is reset, the MAC receives all packets given by the PHY.

This bit is not applicable in the Full-duplex mode. This bit is reserved and read-only (RO) with default value in the Full-duplex-only configurations.

Bit 9 **DCRS**: Disable Carrier Sense During Transmission

When this bit is set, the MAC transmitter ignores the GMII CRS signal during packet transmission in the Half-duplex mode. As a result, no errors are generated because of Loss of Carrier or No Carrier during transmission.

When this bit is reset, the MAC transmitter generates errors because of Carrier Sense. The MAC can even abort the transmission.

Bit 8 **DR**: Disable Retry

When this bit is set, the MAC attempts only one transmission. When a collision occurs on the GMII or MII interface, the MAC ignores the current packet transmission and reports a Packet Abort with excessive collision error in the Tx packet status.

When this bit is reset, the MAC retries based on the settings of the BL field. This bit is applicable only in the Half-duplex mode.

Bit 7 Reserved, must be kept at reset value.

Bits 6:5 **BL[1:0]**: Back-Off Limit

The back-off limit determines the random integer number (r) of slot time delays (4,096 bit times for 1000 Mbps; 512 bit times for 10/100 Mbps) for which the MAC waits before rescheduling a transmission attempt during retries after a collision:

00: k= min (n, 10)

01: k = min (n, 8)

10: k = min (n, 4)

11: k = min (n, 1)

where n = retransmission attempt

The random integer r takes the value in the range $0 <= r < 2^k$.

This bit is applicable only in the Half-duplex mode.

Bit 4 **DC**: Deferral Check

When this bit is set, the deferral check function is enabled in the MAC. The MAC issues a Packet Abort status, along with the excessive deferral error bit set in the Tx packet status, when the Tx state machine is deferred for more than 24,288 bit times in 10 or 100 Mbps mode.

If the MAC is configured for 1000 Mbps operation, the threshold for deferral is 155,680 bits times. Deferral begins when the transmitter is ready to transmit, but it is prevented because of an active carrier sense signal (CRS) on GMII or MII.

The defer time is not cumulative. For example, if the transmitter defers for 10,000 bit times because the CRS signal is active and the CRS signal becomes inactive, the transmitter transmits and collision happens. Because of collision, the transmitter needs to back off and then defer again after back off completion. In such a scenario, the deferral timer is reset to 0, and it is restarted.

When this bit is reset, the deferral check function is disabled and the MAC defers until the CRS signal goes inactive.

This bit is applicable only in the Half-duplex mode.

Bits 3:2 **PRELEN[1:0]**: Preamble Length for Transmit packets

These bits control the number of preamble bytes that are added to the beginning of every Tx packet. The preamble reduction occurs only when the MAC is operating in the Full-duplex mode.

00: 7 bytes of preamble

01: 5 bytes of preamble

10: 3 bytes of preamble

11: Reserved, must not be used

Bit 1 **TE**: Transmitter Enable

When this bit is set, the Tx state machine of the MAC is enabled for transmission on the GMII or MII interface. When this bit is reset, the MAC Tx state machine is disabled after it completes the transmission of the current packet. The Tx state machine does not transmit any more packets.

Bit 0 **RE**: Receiver Enable

When this bit is set, the Rx state machine of the MAC is enabled for receiving packets from the GMII or MII interface. When this bit is reset, the MAC Rx state machine is disabled after it completes the reception of the current packet. The Rx state machine does not receive any more packets from the GMII or MII interface.

Table 982 shows how the settings of S2KP and JE bits of the ETH_MACCR register impact the giant packet status.

Table 982. Giant Packet Status based on S2KP and JE Bits(1)

Length/Type Field	Received Packet Length	S2KP	JE	Giant Packet Status
Untagged packet	> 1,518	0	0	1
	> 2,000	1	0	1
	> 9,018	x	1	1
VLAN tagged packet	> 1,522	0	0	1
	> 2,000	1	0	1
	> 9,022	x	1	1

1. For all other combinations, the Giant Packet status is 0.

Table 983 shows how the settings of the CST and ACS bits of the ETH_MACCR register impact whether CRC length is included in the packet length.

Table 983. Packet Length based on the CST and ACS bits

Received Packet Length	CST	ACS	FCS Stripping Done
< 1,536	x	0	No
	x	1	Yes (for Ethernet packets)
≥ 1,536	0	x	No
	1	x	Yes (for Type packets)

Extended operating mode configuration register (ETH_MACECR)

Address offset: 0x0004

Reset value: 0x0000 0000

The MAC Extended Configuration register establishes the operating mode of the MAC.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	APDIM	EIPG[4:0]					EIPGEN	Res.	Res.	Res.	Res.	Res.	USP	SPEN	DCRCC
	rw	rw	rw	rw	rw	rw	rw						rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	GPSL[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bit 30 **APDIM**: ARP Packet Drop if IP Address Mismatch

When this bit is set, Packet for which Target Protocol Address does not match IPv4 address is dropped in the MTL layer.
When this bit is reset, when target Protocol Address does not match, the packet is forwarded to MTL maintaining backward compatibility.

Bits 29:25 **EIPG[4:0]**: Extended Inter-Packet Gap

The value in this field is applicable when the EIPGEN bit is set. This field (as Most Significant bits) along with IPG field in *Operating mode configuration register (ETH_MACCR)*, gives the minimum IPG greater than 96 bit times in steps of 8 bit times. For example:

- EIPG = 0 and IPG = 0 give 104 bit times
- EIPG = 0 and IPG = 1 give 112 bit times
- EIPG = 0 and IPG = 2 give 120 bit times
- ..
- EIPG = 7 and IPG = 31 give 2144 bit times

Bit 24 **EIPGEN**: Extended Inter-Packet Gap Enable

When this bit is set, the MAC interprets EIPG field and IPG field in *Operating mode configuration register (ETH_MACCR)* together as minimum IPG greater than 96 bit times in steps of 8 bit times.
When this bit is reset, the MAC ignores EIPG field and interprets IPG field in *Operating mode configuration register (ETH_MACCR)* as minimum IPG less than or equal to 96 bit times in steps of 8 bit times.

Note: The extended Inter-Packet Gap feature must be enabled when operating in Full-duplex mode only. There may be undesirable effects on back-pressure function and frame transmission if it is enabled in Half-duplex mode.

Bits 23:19 Reserved, must be kept at reset value.

Bit 18 **USP**: Unicast Slow Protocol Packet Detect

When this bit is set, the MAC detects the Slow Protocol packets with unicast address of the station specified in the *MAC Address 0 high register (ETH_MACA0HR)* and MAC Address 0 low register *MAC Address x low register (ETH_MACAxLR)*. The MAC also detects the Slow Protocol packets with the Slow Protocols multicast address (01-80-C2-00-00-02).

When this bit is reset, the MAC detects only Slow Protocol packets with the Slow Protocol multicast address specified in the IEEE 802.3-2008, Section 5.

Bit 17 **SPEN**: Slow Protocol Detection Enable

When this bit is set, MAC processes the Slow Protocol packets (Ether Type 0x8809) and provides the Rx status. The MAC discards the Slow Protocol packets with invalid subtypes.

When this bit is reset, the MAC forwards all error-free Slow Protocol packets to the application. The MAC considers such packets as normal Type packets.

Bit 16 **DCRCC**: Disable CRC Checking for Received Packets

When this bit is set, the MAC receiver does not check the CRC field in the received packets.

When this bit is reset, the MAC receiver always checks the CRC field in the received packets.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **GPSL[13:0]**: Giant Packet Size Limit

If the received packet size is greater than the value programmed in this field in units of bytes, the MAC declares the received packet as Giant packet. The value programmed in this field must be greater than or equal to 1,518 bytes. Any other programmed value is considered as 1,518 bytes.

For VLAN tagged packets, the MAC adds 4 bytes to the programmed value. For double VLAN tagged packets, the MAC adds 8 bytes to the programmed value. The value in this field is applicable when the GPSLCE bit is set in ETH_MACCR register.

Packet filtering control register (ETH_MACPFR)

Address offset: 0x0008

Reset value: 0x0000 0000

The MAC Packet Filter register contains the filter controls for receiving packets. Some of the controls from this register go to the address check block of the MAC which performs the first level of address filtering. The second level of filtering is performed on the incoming packet based on other controls such as Pass Bad Packets and Pass Control Packets.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RA	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DNTU	IPFE	Res.	Res.	Res.	VTFE
rw										rw	rw				rw

Res.	Res.	Res.	Res.	Res.	HPF	SAF	SAIF	PCF[1:0]		DBF	PM	DAIF	HMC	HUC	PR
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **RA**: Receive All

When this bit is set, the MAC receiver module passes all received packets to the application, irrespective of whether they pass the address filter or not. The result of the SA or DA filtering is updated (pass or fail) in the corresponding bit in the Rx Status Word.

When this bit is reset, the receiver module passes only those packets to the application that pass the SA or DA address filter.

Bits 30:22 Reserved, must be kept at reset value.

Bit 21 **DNTU**: Drop Non-TCP/UDP over IP Packets

When this bit is set, the MAC drops the non-TCP or UDP over IP packets. The MAC forward only those packets that are processed by the Layer 4 filter. When this bit is reset, the MAC forwards all non-TCP or UDP over IP packets.

Bit 20 **IPFE**: Layer 3 and Layer 4 Filter Enable

When this bit is set, the MAC drops packets that do not match the enabled Layer 3 and Layer 4 filters. If Layer 3 or Layer 4 filters are not enabled for matching, this bit does not have any effect.

When this bit is reset, the MAC forwards all packets irrespective of the match status of the Layer 3 and Layer 4 fields.

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **VTFE**: VLAN Tag Filter Enable

When this bit is set, the MAC drops the VLAN tagged packets that do not match the VLAN Tag. When this bit is reset, the MAC forwards all packets irrespective of the match status of the VLAN Tag.

Bits 15:11 Reserved, must be kept at reset value.

Bit 10 **HPF**: Hash or Perfect Filter

When this bit is set, the address filter passes a packet if it matches either the perfect filtering or Hash filtering as set by the HMC or HUC bit.

When this bit is reset and the HUC or HMC bit is set, the packet is passed only if it matches the Hash filter.

Bit 9 **SAF**: Source Address Filter Enable

When this bit is set, the MAC compares the SA field of the received packets with the values programmed in the enabled SA registers. If the comparison fails, the MAC drops the packet.

When this bit is reset, the MAC forwards the received packet to the application with updated SAF bit of the Rx Status depending on the SA address comparison.

Note: According to the IEEE specification, Bit 47 of the SA is reserved. However, the MAC compares all 48 bits. The software driver should take this into consideration while programming the MAC address registers for SA.

Bit 8 **SAIF**: SA Inverse Filtering

When this bit is set, the Address Check block operates in the inverse filtering mode for SA address comparison. If the SA of a packet matches the values programmed in the SA registers, it is marked as failing the SA Address filter.

When this bit is reset, if the SA of a packet does not match the values programmed in the SA registers, it is marked as failing the SA Address filter.

Bits 7:6 **PCF[1:0]**: Pass Control Packets

These bits control the forwarding of all control packets (including unicast and multicast Pause packets).

00: The MAC filters all control packets from reaching the application.

01: The MAC forwards all control packets except Pause packets to the application even if they fail the Address filter.

10: The MAC forwards all control packets to the application even if they fail the Address filter.

11: The MAC forwards the control packets that pass the Address filter.

Bit 5 **DBF**: Disable Broadcast Packets

When this bit is set, the AFM module blocks all incoming broadcast packets. In addition, it overrides all other filter settings.

When this bit is reset, the AFM module passes all received broadcast packets.

Bit 4 **PM**: Pass All Multicast

When this bit is set, it indicates that all received packets with a multicast destination address (first bit in the destination address field is '1') are passed. When this bit is reset, filtering of multicast packet depends on HMC bit.

Bit 3 **DAIF**: DA Inverse Filtering

When this bit is set, the Address Check block operates in inverse filtering mode for the DA address comparison for both unicast and multicast packets. When this bit is reset, normal filtering of packets is performed.

Bit 2 **HMC**: Hash Multicast

When this bit is set, the MAC performs the destination address filtering of received multicast packets according to the Hash table.

When this bit is reset, the MAC performs the perfect destination address filtering for multicast packets, that is, it compares the DA field with the values programmed in DA registers.

Bit 1 **HUC**: Hash Unicast

When this bit is set, the MAC performs the destination address filtering of unicast packets according to the Hash table.

When this bit is reset, the MAC performs a perfect destination address filtering for unicast packets, that is, it compares the DA field with the values programmed in DA registers.

Bit 0 **PR**: Promiscuous Mode

When this bit is set, the Address Filtering module passes all incoming packets irrespective of the destination or source address. The SA or DA Filter Fails status bits of the Rx Status Word are always cleared when PR is set.

Watchdog and jabber timeout register (ETH_MACWJBTR)

Address offset: 0x000C

Reset value: 0x0000 0000

The watchdog and jabber timeout register controls the watchdog timeout for received packets and the jabber timeout limit for transmitted packets.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	PJE	Res.	Res.	Res.	Res.	JTO[3:0]			
							rw					rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	PWE	Res.	Res.	Res.	Res.	WTO[3:0]			
							rw					rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **PJE**: Programmable Jabber Enable

When this bit is set and the JD bit of the *Operating mode configuration register (ETH_MACCR)* is reset, the JTO[3:0] bitfield is used as jabber timeout limit for transmitted packets.

When this bit is cleared, the jabber timeout for a received packet is controlled by setting the JD and JE bits of the *Operating mode configuration register (ETH_MACCR)*.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **JTO[3:0]**: Jabber Timeout

When the PJE bit is set and the JD bit of the *Operating mode configuration register (ETH_MACCR)* is cleared, this bitfield is used as jabber timeout limit for transmitted packets. If the length of a transmitted packet exceeds the value of this bitfield, such packet is terminated and declared as an error packet.

Encoding is as follows:

0x0: 2 Kbytes

0x1: 3 Kbytes

0x2: 4 Kbytes

0x3: 5 Kbytes

..

0xC: 14 Kbytes

0xD: 15 Kbytes

0xE: 16383 Bytes

0xF: Reserved, must not be used

Note: When the PJE bit is set, the value in this bitfield must be more than 1,522 (0x05F2). Otherwise, the IEEE 802.3-specified valid tagged packets are declared as error packets and terminated.

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **PWE**: Programmable Watchdog Enable

When this bit is set and the WD bit of the *Operating mode configuration register (ETH_MACCR)* register is reset, the WTO field is used as watchdog timeout for a received packet. When this bit is cleared, the watchdog timeout for a received packet is controlled by setting of WD and JE bits in *Operating mode configuration register (ETH_MACCR)* register.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **WTO[3:0]**: Watchdog Timeout

When the PWE bit is set and the WD bit of the *Operating mode configuration register (ETH_MACCR)* register is reset, this field is used as watchdog timeout for a received packet. If the length of a received packet exceeds the value of this field, such packet is terminated and declared as an error packet.

Encoding is as follows:

0x0: 2 Kbytes
0x1: 3 Kbytes
0x2: 4 Kbytes
0x3: 5 Kbytes
..
0xC: 14 Kbytes
0xD: 15 Kbytes
0xE: 16383 Bytes
0xF: Reserved, must not be used

Note: When the PWE bit is set, the value in this bitfield should be more than 1,522 (0x05F2). Otherwise, the IEEE 802.3-specified valid tagged packets are declared as error packets and then dropped.

Hash Table 0 register (ETH_MACHT0R)

Address offset: 0x0010

Reset value: 0x0000 0000

The Hash Table Register 0 contains the first lower 32 bits of the Hash table (64 bits).

The Hash table is used for group address filtering.

For Hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register 0 or 1) and the least significant five bits determine the bit within the register. For example, a hash value of 0b100000 selects Bit 0 of the Hash Table Register 1.

The Hash value of the destination address is calculated in the following way:

1. Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32).
2. Perform bitwise reversal for the value obtained in Step 1.
3. Take the upper 7 or 8 bits from the value obtained in Step 2.

If the corresponding bit value of the register is 1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in ETH_MACPFR, all multicast packets are accepted regardless of the multicast Hash values.

Bits 31:0 **HT31T0[31:0]**: MAC Hash Table First 32 Bits
This field contains the first 32 Bits [31:0] of the Hash table.

Hash Table 1 register (ETH_MACHT1R)

Address offset: 0x0014

Reset value: 0x0000 0000

The Hash Table 1 register contains the upper 32 bits of the Hash table (64 bits).

The Hash table is used for group address filtering.

For Hash filtering, the content of the destination address in the incoming packet is passed through the CRC logic and the upper six bits of the CRC register are used to index the content of the Hash table. The most significant bits determines the register to be used (Hash Table Register 0 or 1) and the least significant five bits determine the bit within the register. For example, a hash value of 6'b100000 selects Bit 0 of the Hash Table Register 1.

The Hash value of the destination address is calculated in the following way:

1. Calculate the 32-bit CRC for the DA (See IEEE 802.3, Section 3.2.8 for the steps to calculate CRC32).
2. Perform bitwise reversal for the value obtained in Step 1.
3. Take the upper 7 or 8 bits from the value obtained in Step 2.

If the corresponding bit value of the register is 1, the packet is accepted. Otherwise, it is rejected. If the PM bit is set in ETH_MACPFR, all multicast packets are accepted regardless of the multicast Hash values.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **HT63T32[31:0]**: MAC Hash Table Second 32 Bits
This field contains the second 32 Bits [63:32] of the Hash table.

VLAN tag Control register (ETH_MACVTCR)

Address offset: 0x0050

Reset value: 0x0000 0000

This register is the redefined format of the MAC VLAN Tag Register. It is used for indirect addressing. It contains the address offset, command type and Busy Bit for CSR access of the Per VLAN Tag registers.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EIVLRXS	Res.	EIVLS[1:0]		ERIVLT	EDVLP	VTHM	EVLRXS	Res.	EVLS[1:0]		DOVLTC	ERSVLM	ESVL	VTIM	ETV
rw		rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OFS[1:0]		CT	OB
												rw	rw	rw	rw

Bit 31 **EIVLRXS**: Enable Inner VLAN Tag in Rx Status

When this bit is set, the MAC provides the inner VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the inner VLAN Tag in Rx status.

Bit 30 Reserved, must be kept at reset value.

Bits 29:28 **EIVLS[1:0]**: Enable Inner VLAN Tag Stripping on Receive

This field indicates the stripping operation on inner VLAN Tag in received packet:
00: Do not strip
01: Strip if VLAN filter passes
10: Strip if VLAN filter fails
11: Always strip

Bit 27 **ERIVLT**: Enable Inner VLAN Tag

When this bit and the EDVLP field are set, the MAC receiver enables operation on the inner VLAN Tag (if present). When this bit is reset, the MAC receiver enables operation on the outer VLAN Tag (if present). The ERSVLM bit determines which VLAN type is enabled for filtering or matching.The ERSVLM bit and DOVLTC bit determines which VLAN type is enabled for filtering.

Bit 26 **EDVLP**: Enable Double VLAN Processing

When this bit is set, the MAC enables processing of up to two VLAN Tags on Tx and Rx (if present). When this bit is reset, the MAC enables processing of up to one VLAN Tag on Tx and Rx (if present).

Bit 25 **VTHM**: VLAN Tag Hash Table Match Enable

When this bit is set, the most significant four bits of CRC of VLAN Tag are used to index the content of the ETH_MACVLANHTR register. A value of 1 in the VLAN Hash Table register, corresponding to the index, indicates that the packet matched the VLAN Hash table.
When the ETV bit is set, the CRC of the 12-bit VLAN Identifier (VID) is used for comparison.
When the ETV bit is reset, the CRC of the 16-bit VLAN tag is used for comparison.
When this bit is reset, the VLAN Hash Match operation is not performed.

Bit 24 **EVLRXS**: Enable VLAN Tag in Rx status

When this bit is set, MAC provides the outer VLAN Tag in the Rx status. When this bit is reset, the MAC does not provide the outer VLAN Tag in Rx status.

Bit 23 Reserved, must be kept at reset value.

Bits 22:21 **EVLS[1:0]**: Enable VLAN Tag Stripping on Receive

This field indicates the stripping operation on the outer VLAN Tag in received packet:
00: Do not strip
01: Strip if VLAN filter passes
10: Strip if VLAN filter fails
11: Always strip

Bit 20 **DOVLTC**: Disable VLAN Type Check

When this bit is set, the MAC does not check whether the VLAN Tag specified by the ERIVLT bit is of type S-VLAN or C-VLAN.
When this bit is reset, the MAC filters or matches the VLAN Tag specified by the ERIVLT bit only when VLAN Tag type is similar to the one specified by the ERSVLM bit.

Bit 19 **ERSVLM**: Enable Receive S-VLAN Match

When this bit is set, the MAC receiver enables filtering or matching for S-VLAN (Type = 0x88A8) packets. When this bit is reset, the MAC receiver enables filtering or matching for C-VLAN (Type = 0x8100) packets.
The ERIVLT bit determines the VLAN tag position considered for filtering or matching.

Bit 18 **ESVL**: Enable S-VLAN

When this bit is set, the MAC transmitter and receiver consider the S-VLAN packets (Type = 0x88A8) as valid VLAN tagged packets.

Bit 17 **VTIM**: VLAN Tag Inverse Match Enable

When this bit is set, this bit enables the VLAN Tag inverse matching. The packets without matching VLAN Tag are marked as matched. When reset, this bit enables the VLAN Tag perfect matching. The packets with matched VLAN Tag are marked as matched.

Bit 16 **ETV**: Enable 12-Bit VLAN Tag Comparison

When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits[11:0] of VLAN tag are compared with the corresponding field in the received VLAN-tagged packet. Similarly, when enabled, only 12 bits of the VLAN tag in the received packet are used for Hash-based VLAN filtering.
When this bit is reset, all 16 bits of the 15th and 16th bytes of the received VLAN packet are used for comparison and VLAN Hash filtering.

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:2 **OFS[1:0]**: Offset

This field holds the address offset of the MAC VLAN Tag Filter Register which the application is trying to access.
00:ETH_MACVTDR holds MAC VLAN Tag Filter0 content
01:ETH_MACVTDR holds MAC VLAN Tag Filter1 content
10:ETH_MACVTDR holds MAC VLAN Tag Filter2 content
11:ETH_MACVTDR holds MAC VLAN Tag Filter3 content

Bit 1 **CT**: Command Type

This bit indicates if the current register access is a read or a write.
When set, it indicate a read operation. When reset, it indicates a write operation.

Bit 0 **OB**: Operation Busy

This bit is set along with a read or write command for initiating the indirect access to per VLAN Tag Filter register. This bit is reset when the read or write command to per VLAN Tag Filter indirect access register is complete. The next indirect register access can be initiated only after this bit is reset.
During a write operation, the bit is reset only after the data has been written into the Per VLAN Tag register.
During a read operation, the data should be read from the MAC_VLAN_Tag_Data register only after this bit is reset.

VLAN tag data register (ETH_MACVTDR)

Address offset: 0x0054

Reset value: 0x0000 0000

This register contains VLAN Tag filter 0..3 control information, as per OFS[1:0] bitfield setting in ETH_MACVTCR register. This register holds the read/write data for Indirect Access of the Per VLAN Tag registers. During the read access, this field contains valid read data only after the OB bit is reset.
During the write access, this field should be valid prior to setting the OB bit in the MAC_VLAN_Tag_Ctrl Register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	DMACHN	DMACHEN	Res.	Res.	Res.	ERIVLT	ERSVLM	DOVLTC	ETV	VEN
						rw	rw				rw	rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VID[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **DMACHN**: DMA Channel Number

The DMA Channel number to which the VLAN Tagged Frame is to be routed if it passes this VLAN Tag Filter is programmed in this field.
If the Routing based on VLAN Tag Filter is not necessary, this field need not be programmed.

Bit 24 **DMACHEN**: DMA Channel Number Enable

This bit is the Enable for the DMA Channel Number value programmed in the DMACH field. When this bit is reset, the Routing does not occur based on VLAN Filter result. The frame is routed based on DA-based DMA Channel Routing.

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **ERIVLT**: Enable Inner VLAN Tag Comparison

This bit is valid only when Double VLAN Tag enable of the Filter is set.
When this bit and the EDVLP field are set, the MAC receiver enables operation on the inner VLAN Tag (if present).
When this bit is reset, the MAC receiver enables operation on the outer VLAN Tag (if present).

Bit 19 **ERSVLM**: Enable S-VLAN Match for received Frames

This bit is valid only when VLAN Tag Enable of the Filter is set.
When this bit is set, the MAC receiver enables filtering or matching for S-VLAN (Type = 0x88A8) packets.
When this bit is reset, the MAC receiver enables filtering or matching for C-VLAN (Type =0x8100) packets.

Bit 18 **DOVLTC**: Disable VLAN Type Comparison

This bit is valid only when VLAN Tag Enable of the Filter is set.
When this bit is set, the MAC does not check whether the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit is of type S-VLAN or C-VLAN.
When this bit is reset, the MAC filters or matches the VLAN Tag specified by the Enable Inner VLAN Tag Comparison bit only when the VLAN Tag type is similar to the one specified by the Enable S-VLAN Match for received frames bit.

Bit 17 **ETV**: 12-bit or 16-bit VLAN comparison

This bit is valid only when VEN of the Filter is set.
When this bit is set, a 12-bit VLAN identifier is used for comparing and filtering instead of the complete 16-bit VLAN tag. Bits[11:0] of VLAN tag are compared to the corresponding field in the received VLAN-tagged packet.
0: 16-bit VLAN
1: 12-bit VLAN

Bit 16 **VEN**: VLAN Tag Enable

This bit is used to enable or disable the VLAN Tag.
When this bit is set, the MAC compares the VLAN Tag of received packet with the VLAN Tag ID.
When this bit is reset, no comparison is performed irrespective of the programming of the other fields.

Bits 15:0 **VID[15:0]**: VLAN Tag ID

This field holds the VLAN Tag value which is used by the MAC for perfect comparison. It is valid when VLAN Tag Enable is set.

VLAN Hash table register (ETH_MACVHTR)

Address offset: 0x0058

Reset value: 0x0000 0000

When the VTHM bit of *VLAN tag Control register (ETH_MACVTCR)* register is set, the 16-bit VLAN Hash Table register is used for group address filtering based on the VLAN tag. For Hash filtering, the content of the 16-bit VLAN tag or 12-bit VLAN ID (based on the ETV bit of *VLAN tag Control register (ETH_MACVTCR)* register) in the incoming packet is passed through the CRC logic. The upper four bits of the calculated CRC are used to index the contents of the VLAN Hash table. For example, a Hash value of 1000 selects Bit 8 of the VLAN Hash table.

The Hash value of the destination address is calculated in the following way:

1. Calculate the 32-bit CRC for the VLAN tag or ID (For steps to calculate CRC32, see Section 3.2.8 of IEEE 802.3).
2. Perform bitwise reversal for the value obtained in step 1.
3. Take the upper four bits from the value obtained in step 2.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

VLHT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **VLHT[15:0]**: VLAN Hash Table
This field contains the 16-bit VLAN Hash Table.

VLAN inclusion register (ETH_MACVIR)

Address offset: 0x0060

Reset value: 0x0000 0000

The VLAN Tag Inclusion or Replacement register contains the VLAN tag for insertion or replacement in the Transmit packets. It also contains the VLAN tag insertion controls.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	rw					rw	rw			rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VLT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **BUSY**: Busy

This bit indicates the status of the read/write operation of indirect access to the queue/channel specific VLAN inclusion register.

For write operation write to a register is complete when this bit is reset. For read operation the read data is valid when the bit is reset.

No further writes are allowed to this register when this bit is set. This does not have any effect when CBTI is reset

Bit 30 **RDWR**: Read write control

This bit controls the read or write operation for indirectly accessing the queue/channel specific VLAN Inclusion register.

When set indicates write operation and when reset indicates read operation

This has no effect when CBTI is reset

Bits 29:26 Reserved, must be kept at reset value.

Bits 25:24 **ADDR[1:0]**: Address

This field selects one of the queue/channel specific VLAN Inclusion register for read/write access

This does not have any effect when CBTI is reset

00: VLAN tag for insertion in the Transmit packets from Tx Queue 0

01: VLAN tag for insertion in the Transmit packets from Tx Queue 1

10: VLAN tag for insertion in the Transmit packets from Tx Queue 2

11: VLAN tag for insertion in the Transmit packets from Tx Queue 3

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **CBTI**: Channel based tag insertion

When this bit is set, outer VLAN tag is inserted for every packets transmitted by the MAC. The tag value is taken from the queue/channel specific VLAN tag register. This overrides VLTI, VLP, VLC and VLT fields of this register

When this bit is set, a write operation to byte 3 of this register initiates the read/write access to the indirect register.

When reset outer VLAN operation is based on the setting of VLTI, VLP, VLC and VLT fields of this register

Bit 20 **VLTI**: VLAN Tag Input

When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from the Tx descriptor.

Bit 19 **CSVL**: C-VLAN or S-VLAN

When this bit is set, S-VLAN type (0x88A8) is inserted or replaced in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the 13th and 14th bytes of transmitted packets.

0: C-LAN

1: S-LAN

Bit 18 **VLP**: VLAN Priority Control

When this bit is set, the control bits[17:16] are used for VLAN deletion, insertion, or replacement. When this bit is reset, bits[17:16] are ignored.

Bits 17:16 **VLC[1:0]**: VLAN Tag Control in Transmit Packets

00: No VLAN tag deletion, insertion, or replacement

01: VLAN tag deletion. The MAC removes the VLAN type (bytes 13 and 14) and VLAN tag (bytes 15 and 16) of all transmitted packets with VLAN tags.

10: VLAN tag insertion. The MAC inserts VLT in bytes 15 and 16 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 13 and 14. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag.

11: VLAN tag replacement. The MAC replaces VLT in bytes 15 and 16 of all VLAN-type transmitted packets (Bytes 13 and 14 are 0x8100 or 0x88a8).

Note: Changes to this field take effect only on the start of a packet. If you write this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value.

Bits 15:0 **VLT[15:0]**: VLAN Tag for Transmit Packets

This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase.

The following list describes the bits of this field:

Bits[15:13]: User Priority

Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI)

Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

VLAN inclusion register [alternate] (ETH_MACVIR)

Address offset: 0x0060

Reset value: 0x0000 0000

The Tx Queue x VLAN Tag Inclusion register contains the VLAN tag for insertion in the Transmit packets from Tx Queue x. It also contains the VLAN tag insertion controls. This is an indirect register accessible when the CBTI bit is set in *VLAN inclusion register (ETH_MACVIR)*.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

VLT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **CSVL**: C-VLAN or S-VLAN

When this bit is set, S-VLAN type (0x88A8) is inserted or replaced in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the 13th and 14th bytes of transmitted packets.

0: C-LAN

1: S-LAN

Bits 18:16 Reserved, must be kept at reset value.

Bits 15:0 **VLT[15:0]**: VLAN Tag for Transmit Packets

This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase.

The following list describes the bits of this field:

Bits[15:13]: User Priority

Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI)

Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

Inner VLAN inclusion register (ETH_MACIVIR)

Address offset: 0x0064

Reset value: 0x0000 0000

The Inner VLAN Tag Inclusion or Replacement register contains the inner VLAN tag to be inserted or replaced in the Transmit packet. It also contains the inner VLAN tag insertion controls.

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **VLTI**: VLAN Tag Input

When this bit is set, it indicates that the VLAN tag to be inserted or replaced in Tx packet should be taken from the Tx descriptor

Bit 19 **CSVL**: C-VLAN or S-VLAN

When this bit is set, S-VLAN type (0x88A8) is inserted or replaced in the 13th and 14th bytes of transmitted packets. When this bit is reset, C-VLAN type (0x8100) is inserted or replaced in the 13th and 14th bytes of transmitted packets.

0: C-LAN

1: S-LAN

Bit 18 **VLP**: VLAN Priority Control

When this bit is set, the VLC field is used for VLAN deletion, insertion, or replacement. When this bit is reset, the VLC field is ignored.

Bits 17:16 **VLC[1:0]**: VLAN Tag Control in Transmit Packets

00: No VLAN tag deletion, insertion, or replacement

01: VLAN tag deletion

The MAC removes the VLAN type (bytes 17 and 18) and VLAN tag (bytes 19 and 20) of all transmitted packets with VLAN tags.

10: VLAN tag insertion

The MAC inserts VLT in bytes 19 and 20 of the packet after inserting the Type value (0x8100 or 0x88a8) in bytes 17 and 18. This operation is performed on all transmitted packets, irrespective of whether they already have a VLAN tag.

11: VLAN tag replacement

The MAC replaces VLT in bytes 19 and 20 of all VLAN-type transmitted packets (Bytes 17 and 18 are 0x8100 or 0x88a8).

Note: Changes to this field take effect only on the start of a packet. If you write to this register field when a packet is being transmitted, only the subsequent packet can use the updated value, that is, the current packet does not use the updated value.

Bits 15:0 **VLT[15:0]**: VLAN Tag for Transmit Packets

This field contains the value of the VLAN tag to be inserted or replaced. The value must only be changed when the transmit lines are inactive or during the initialization phase.
The following list describes the bits of this field:
Bits[15:13]: User Priority
Bit 12: Canonical Format Indicator (CFI) or Drop Eligible Indicator (DEI)
Bits[11:0]: VLAN Identifier (VID) field of VLAN tag

Tx Queue 0 flow control register (ETH_MACQ0TXFCR)

Address offset: 0x0070

Reset value: 0x0000 0000

The Flow Control register controls the generation and reception of the Control (Pause Command) packets by the Flow control module of the MAC. A Write to a register with the Busy bit set to 1 triggers the Flow Control block to generate a Pause packet. The fields of the control packet are selected as specified in the 802.3x specification, and the Pause Time value from this register is used in the Pause Time field of the control packet. The Busy bit remains set until the control packet is transferred onto the cable. The application must make sure that the Busy bit is cleared before writing to the register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DZPQ	PLT[2:0]			Res.	Res.	TFE	FCB_BPA
								rw	rw	rw	rw			rw	rw

Bits 31:16 **PT[15:0]**: Pause Time

This field holds the value to be used in the Pause Time field in the Tx control packet. I

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **DZPQ**: Disable Zero-Quanta Pause

When this bit is set, it disables the automatic generation of the zero-quanta Pause packets.
When this bit is reset, normal operation with automatic zero-quanta Pause packet generation is enabled.

Bits 6:4 **PLT[2:0]**: Pause Low Threshold

This field configures the threshold of the Pause timer at which the input flow is checked for automatic retransmission of the Pause packet.

The threshold values should be always less than the Pause Time configured in Bits[31:16]. For example, if PT = 100H (256 slot times), and PLT = 001, a second Pause packet is automatically transmitted at 228 (256-28) slot times after the first Pause packet is transmitted.

The following list provides the threshold values for different values:

000: Pause Time minus 4 Slot Times (PT -4 slot times)

001: Pause Time minus 28 Slot Times (PT -28 slot times)

010: Pause Time minus 36 Slot Times (PT -36 slot times)

011: Pause Time minus 144 Slot Times (PT -144 slot times)

100: Pause Time minus 256 Slot Times (PT -256 slot times)

101: Pause Time minus 512 Slot Times (PT -512 slot times)

110 to 111: Reserved, must not be used

The slot time is defined as the time taken to transmit 512 bits (64 bytes) on the GMII or MII interface.

This (approximate) computation is based on the packet size (64, 1518, 2000, 9018, 16384, or 32768) + 2 Pause Packet Size + IPG in Slot Times.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **TFE**: Transmit Flow Control Enable

Full-duplex mode: when this bit is set, the MAC enables the flow control operation to Tx Pause packets. When this bit is reset, the flow control operation in the MAC is disabled, and the MAC does not transmit any Pause packets.

Half-duplex mode: when this bit is set, the MAC enables the backpressure operation. When this bit is reset, the backpressure feature is disabled.

Bit 0 **FCB_BPA**: Flow Control Busy or Backpressure Activate

This bit initiates a Pause packet in the Full-duplex mode and activates the backpressure function in the Half-duplex mode if the TFE bit is set.

Full-Duplex mode: this bit should be read as 0 before writing to this register. To initiate a Pause packet, the application must set this bit to 1. During Control packet transfer, this bit continues to be set to indicate that a packet transmission is in progress. When Pause packet transmission is complete, the MAC resets this bit to 0. You should not write to this register until this bit is cleared.

Half-duplex mode: When this bit is set (and TFE bit is set) in the Half-duplex mode, the MAC asserts the backpressure. During backpressure, when the MAC receives a new packet, the transmitter starts sending a JAM pattern resulting in a collision. When the MAC is configured for the Full-duplex mode, the BPA is automatically disabled.

Rx flow control register (ETH_MACRXFCR)

Address offset: 0x0090

Reset value: 0x0000 0000

The Receive Flow Control register controls the pausing of MAC Transmit based on the received Pause packet.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UP	RFE
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **UP**: Unicast Pause Packet Detect

A pause packet is processed when it has the unique multicast address specified in the IEEE 802.3. When this bit is set, the MAC can also detect Pause packets with unicast address of the station. This unicast address should be as specified in *MAC Address 0 high register (ETH_MACA0HR)* and MAC Address 0 low register *MAC Address x low register (ETH_MACAxLR)*.

When this bit is reset, the MAC only detects Pause packets with unique multicast address.

Note: The MAC does not process a Pause packet if the multicast address is different from the unique multicast address. This is also applicable to the received PFC packet when the Priority Flow Control (PFC) is enabled. The unique multicast address (0x01 80 C2 00 00 01) is as specified in IEEE 802.1 Qbb-2011.

Bit 0 **RFE**: Receive Flow Control Enable

When this bit is set and the MAC is operating in Full-duplex mode, the MAC decodes the received Pause packet and disables its transmitter for a specified (Pause) time. When this bit is reset or the MAC is operating in Half-duplex mode, the decode function of the Pause packet is disabled.

When PFC is enabled, flow control is enabled for PFC packets. The MAC decodes the received PFC packet and disables the Transmit queue, with matching priorities, for a duration of received Pause time.

Rx Queue control register (ETH_MACRXQCR)

Address offset: 0x0094

Reset value: 0x0000 0000

The Receive Queue Control register controls the routing of unicast and multicast packets that fail the Destination or Source address filter to the Rx queues

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **VFFQ**: VLAN Tag Filter Fail Packets Queue

This field holds the Rx queue number to which the tagged packets failing the Destination or Source Address filter (and UFFQE/MFFQE not enabled) or failing the VLAN tag filter must be routed to. This field is valid only when the VFFQE bit is set.

0: Queue 0

1: Queue 1

Bit 16 **VFFQE**: VLAN Tag Filter Fail Packets Queuing Enable

When this bit is set, the tagged packets which fail the Destination or Source address filter or fail the VLAN tag filter are routed to the Rx Queue Number programmed in the VFFQ. When this bit is reset, the tagged packets which fail the Destination or Source Address filter or fail the VLAN tag filter are routed based on other routing options. This bit is valid only when the RA bit of the *Packet filtering control register (ETH_MACPFR)* is set.

0: Disabled

1: Enabled

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **MFFQ**: Multicast Address Filter Fail Packets Queue.

This field holds the Rx queue number to which the Multicast packets failing the Destination or Source Address filter are routed to. This field is valid only when the MFFQE bit is set.

0: Queue 0

1: Queue 1

Bit 8 **MFFQE**: Multicast Address Filter Fail Packets Queuing Enable.

When this bit is set, the Multicast packets which fail the Destination or Source address filter is routed to the Rx Queue Number programmed in the MFFQ.

When this bit is reset, the Multicast packets which fail the Destination or Source address filter is routed based on other routing options.

This bit is valid only when the RA bit of the *Packet filtering control register (ETH_MACPFR)* is set.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **UFFQ**: Unicast Address Filter Fail Packets Queue.

This field holds the Rx queue number to which the Unicast packets failing the Destination or Source Address filter are routed to. This field is valid only when the UFFQE bit is set.

0: Queue 0

1: Queue 1

Bit 0 **UFFQE**: Unicast Address Filter Fail Packets Queuing Enable.

When this bit is set, the Unicast packets which fail the Destination or Source address filter is routed to the Rx Queue Number programmed in the UFFQ.

When this bit is reset, the Unicast packets which fail the Destination or Source Address filter is routed based on other routing options.

This bit is valid only when the RA bit of the *Packet filtering control register (ETH_MACPFR)* is set.

Rx queue control 0 register (ETH_MACRXQC0R)

Address offset: 0x00A0

Reset value: 0x0000 0000

The Receive Queue Control 0 register controls the queue management in the MAC receiver.

Note: In multiple Rx queues configuration, all the queues are disabled by default. Enable the Rx queue by programming the corresponding field in this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:2 **RXQ1EN[1:0]**: Receive Queue 1 Enable

This field indicates whether Rx queue 1 is enabled for AV or Generic traffic.

00: Not enabled

01: Queue 1 enabled for AV

10: Queue 1 enabled for Generic traffic

11: Reserved, must not be used

Bits 1:0 **RXQ0EN[1:0]**: Receive Queue 0 Enable

This field indicates whether Rx queue 0 is enabled for AV or Generic traffic.

00: Not enabled

01: Queue 0 enabled for AV

10: Queue 0 enabled for Generic traffic

11: Reserved, must not be used

Rx queue control 1 register (ETH_MACRXQC1R)

Address offset: 0x00A4

Reset value: 0x0000 0000

The Receive Queue Control 1 register controls the routing of multicast, broadcast, AV and untagged packets to the Rx queues.

Res.	UPQ[2:0]			Res.	Res.	Res.	Res.	Res.	PTPQ[2:0]			Res.	AVCPQ2	AVCPQ1	AVCPQ0
	rw	rw	rw						rw	rw	rw		rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **TBRQE**: Type Field Based Rx Queuing Enable

When this bit is set, it enables Type field based Rx queuing where the Type field of received packet is compared with the programmed TYP field in ETH_MAC_TMRQR register and if a match occurs the packet is routed to the corresponding TMRQ field.

Bit 28 **OMCBCQ**: Overriding MC-BC queue priority select

1: Priority of MCBCQ is reduced and the received packet is first routed to PTPQ, AVCPQ, depending on packet type.
0: Received Multicast/Broadcast packet is routed to MCBCQ.

Bit 27 Reserved, must be kept at reset value.

Bits 26:24 **FPRQ[2:0]**: Frame Preemption Residue Queue

This field holds the Rx queue number to which the residual preemption frames must be forwarded. Preemption frames that are tagged and pass the SA/DA/VLAN filtering are routed based on PSRQ and all other frames are treated as residual frames and is routed to the queue number mentioned in this field. Queue 0 is used as a default queue for express frames, so this field cannot be programmed to a value 0.
000: Reserved, must not be used (Rx Queue 0)
001: Rx queue 1
Others: Reserved, must not be used

Bits 23:22 **TPQC[1:0]**: Tagged PTP over Ethernet Packets Queuing Control

This field controls the routing of the VLAN tagged PTPoE packets.
00: VLAN tagged PTPoE packets are routed as generic VLAN tagged packet (based on PSRQ for only non-AV enabled Rx queues).
01: VLAN tagged PTPoE packets are routed to Rx Queue specified by PTPQ field (this Rx Queue can be enabled for AV or non-AV traffic)
10: VLAN tagged PTPoE packets are routed to only AV enabled Rx queues based on PSRQ.
11: Reserved

Bit 21 **TACPQE**: Tagged AV Control Packets Queuing Enable
When set, the MAC routes the received Tagged AV control packets to the Rx queue specified by AVCPQ field.
When reset, the MAC routes the received Tagged AV control packets based on the tag priority matching the PSRQ fields in ETH_MACRXQC2R register.
This field is reserved if Rx queues are not selected for AV feature.

Bit 20 **MCBCQEN**: Multicast and Broadcast Queue Enable
This bit specifies that Multicast or Broadcast packets routing to the Rx queue is enabled and the Multicast or Broadcast packets must be routed to Rx queue specified in MCBCQ field.

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **MCBCQ[2:0]**: Multicast and Broadcast Queue
This field specifies the Rx queue onto which Multicast or Broadcast packets are routed. Any Rx queue enabled for Generic/AV traffic can be used to route the Multicast or Broadcast packets.
000: Rx queue 0
001: Rx queue 1
Others: Reserved, must not be used

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **UPQ[2:0]**: Untagged Packet Queue
This field indicates the Rx queue to which Untagged Packets are to be routed. Any Rx queue enabled for Generic/AV traffic can be used to route the Untagged Packets.
000: Rx queue 0
001: Rx queue 1
Others: Reserved, must not be used

Bits 11:7 Reserved, must be kept at reset value.

Bits 6:4 **PTPQ[2:0]**: PTP Packets Queue
This field specifies the Rx queue on which the PTP packets sent over the Ethernet payload (not over IPv4 or IPv6) are routed.
000: Rx queue 0
001: Rx queue 1
Others: Reserved, must not be used
When the AV8021ASMEN bit of *Timestamp control Register (ETH_MACTSCR)* is set, only untagged PTP over Ethernet packets are routed on an Rx queue. If the bit is not set, then based on programming of TPQC field, both tagged and untagged PTPoE packets can be routed to this Rx Queue.

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **AVCPQ[2:0]**: AV Untagged Control Packets Queue
This field specifies the Receive queue on which the received AV untagged control packets are routed:
000: Receive Queue 0
001: Receive Queue 1
Others: Reserved, must not be used
The AV tagged control and data packets are routed based on PSRQ field in the Transmit Flow Control Register of corresponding queue.
This field is reserved if Receive queues are not selected for AV feature.

Rx queue control 2 register (ETH_MACRXQC2R)

Address offset: 0x00A8

Reset value: 0x0000 0000

This register controls the routing of tagged packets based on the USP (user priority) field of the received packets to the Rx queue 0 and 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

PSRQ1[7:0]								PSRQ0[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **PSRQ1[7:0]**: Priorities Selected in the Receive Queue 1

This field defines the priorities assigned to Rx queue 1. All packets with priorities that match the values set in this field are routed to Rx queue 1.

For example, if PSRQ1[4] is set, packets with USP field equal to 4 are routed to Rx queue 1. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues.

Bits 7:0 **PSRQ0[7:0]**: Priorities Selected in the Receive Queue 0

This field defines the priorities assigned to Rx queue 0. All packets with priorities that match the values set in this field are routed to Rx queue 0.

For example, if PSRQ0[5] is set, packets with USP field equal to 5 are routed to Rx queue 0. The software must ensure that the content of this field is mutually exclusive to the PSRQ fields for other queues, that is, the same priority is not mapped to multiple Rx queues.

Interrupt status register (ETH_MACISR)

Address offset: 0x00B0

Reset value: 0x0000 0000

The Interrupt Status register contains the status of interrupts.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MFRIS	MFTIS	MDIOIS	FPEIS	Res.

	rc_r	rc_r	rc_r		r	r	r			r	r	r			r

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **MFRIS**: MMC FPE Receive Interrupt Status

This bit is set high when an interrupt is generated in the *MMC FPE Rx interrupt status register (ETH_MMC_FPE_RX_ISR)*. This bit is cleared when all bits in this interrupt register are cleared.

Bit 19 **MFTIS**: MMC FPE Transmit Interrupt Status

This bit is set high when an interrupt is generated in the *MMC FPE Tx interrupt status register (ETH_MMC_FPE_TX_ISR)*. This bit is cleared when all bits in this interrupt register are cleared.

Bit 18 **MDIOIS**: MDIO Interrupt Status

This bit indicates an interrupt event after the completion of MDIO operation. To reset this bit, the application has to read this bit (or write it to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* register is set) register is set.

Bit 17 **FPEIS**: Frame Preemption Interrupt Status

This bit indicates an interrupt event during the operation of Frame Preemption (Bits[19:16] of *FPE control and status register (ETH_MACFPECSR)* is set). To reset this bit, the application must clear the event in *FPE control and status register (ETH_MACFPECSR)* that has caused the Interrupt.

Bits 16:15 Reserved, must be kept at reset value.

Bit 14 **RXSTSIS**: Receive Status Interrupt

This bit indicates the status of received packets. This bit is set when the RWT bit is set in the *Rx Tx status register (ETH_MACRXTXSR)*. This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of *CSR software control register (ETH_MACCSRSWCR)* is set) in the ETH_MACISR register.

Bit 13 **TXSTSIS**: Transmit Status Interrupt

This bit indicates the status of transmitted packets. This bit is set when any of the following bits is set in the *Rx Tx status register (ETH_MACRXTXSR)*:

- Excessive Collision (EXCOL)
- Late Collision (LCOL)
- Excessive Deferral (EXDEF)
- Loss of Carrier (LCARR)
- No Carrier (NCARR)
- Jabber Timeout (TJT)

This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of *CSR software control register (ETH_MACCSRSWCR)* is set) in the ETH_MACISR register.

Bit 12 **TSIS**: Timestamp Interrupt Status

If the Timestamp feature is enabled, this bit is set when any of the following conditions is true:

- The system time value is equal to or exceeds the value specified in the Target Time High and Low registers.
- There is an overflow in the Seconds register.
- The Target Time Error occurred, that is, programmed target time already elapsed.

If the Auxiliary Snapshot feature is enabled, this bit is set when the auxiliary snapshot trigger is asserted.

When drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* and *Tx timestamp status seconds register (ETH_MACTXTSSSR)* registers.

When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* and *Tx timestamp status seconds register (ETH_MACTXTSSSR)* registers, for PTO generated Delay Request and Pdelay request packets.

This bit is cleared when the corresponding interrupt source bit is read (or corresponding interrupt source bit is written to 1 when RCWE bit of *CSR software control register (ETH_MACCSRSWCR)* is set) in the *Timestamp status register (ETH_MACTSSR)*.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **MMCTXIS**: MMC Transmit Interrupt Status

This bit is set high when an interrupt is generated in the *MMC Tx interrupt register (ETH_MMC_TX_INTERRUPT)*. This bit is cleared when all bits in this interrupt register are cleared.

Bit 9 **MMCRXIS**: MMC Receive Interrupt Status

This bit is set high when an interrupt is generated in the *MMC Rx interrupt register (ETH_MMC_RX_INTERRUPT)*. This bit is cleared when all bits in this interrupt register are cleared.

Bit 8 **MMCIS**: MMC Interrupt Status

This bit is set high when MMCTXIS or MMCRXIS is set high. This bit is cleared only when all these bits are low.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **LPIIS**: LPI Interrupt Status

This bit is set for any LPI state entry or exit in the MAC transmitter or receiver. This bit is cleared when the TLPIEN bit of *LPI control and status register (ETH_MACLCSR)* is read.

Bit 4 **PMTIS**: PMT Interrupt Status

This bit is set when a Magic packet or Wake-on-LAN packet is received in the power-down mode (RWKPRCVD and MGKPRCVD bits in ETH_MACPCSR register). This bit is cleared when Bits[6:5] are cleared because of a Read operation to the *PMT control status register (ETH_MACPCSR)*.

Bit 3 **PHYIS**: PHY Interrupt

This bit is set when rising edge is detected on the ETH_PHY_INTN input. This bit is cleared when this register is read.

Bits 2:1 Reserved, must be kept at reset value.

Bit 0 **RGSMIIIS**: RGMII Interrupt Status

This bit is set by any change in value of the Link Status of RGMII interface (LNKSTS bit in *PHYIF control status register (ETH_MACPHYCSR)* register). This bit is cleared when the ETH_MACPHYCSR register is read.

Interrupt enable register (ETH_MACIER)

Address offset: 0x00B4

Reset value: 0x0000 0000

The Interrupt Enable register contains the masks for generating the interrupts.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MDIOIE	FPEIE	Res.

	rw	rw	rw							rw	rw	rw			rw

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **MDIOIE**: MDIO Interrupt Enable

When this bit is set, it enables the assertion of the interrupt when MDIOIS field is set in the *Interrupt status register (ETH_MACISR)*.

Bit 17 **FPEIE**: Frame Preemption Interrupt Enable

When this bit is set, it enables the assertion of the interrupt when FPEIS field is set in the *Interrupt status register (ETH_MACISR)*.

Bits 16:15 Reserved, must be kept at reset value.

Bit 14 **RXSTSIE**: Receive Status Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of RXSTSIS bit in the *Interrupt status register (ETH_MACISR)*.

Bit 13 **TXSTSIE**: Transmit Status Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of TXSTSIS bit in the *Interrupt status register (ETH_MACISR)*.

Bit 12 **TSIE**: Timestamp Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of TSIS bit in *Interrupt status register (ETH_MACISR)*.

Bits 11:6 Reserved, must be kept at reset value.

Bit 5 **LPIIE**: LPI Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of LPIIS bit in *Interrupt status register (ETH_MACISR)*.

Bit 4 **PMTIE**: PMT Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of PMTIS bit in *Interrupt status register (ETH_MACISR)*.

Bit 3 **PHYIE**: PHY Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of PHYIS bit in *Interrupt status register (ETH_MACISR)*.

Bits 2:1 Reserved, must be kept at reset value.

Bit 0 **RGSMIIIE**: RGMII Interrupt Enable

When this bit is set, it enables the assertion of the interrupt signal because of the setting of RGSMIIIS bit in *Interrupt status register (ETH_MACISR)*.

Rx Tx status register (ETH_MACRXTXSR)

Address offset: 0x00B8

Reset value: 0x0000 0000

The Receive Transmit Status register contains the Receive and Transmit Error status.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	RWT	Res.	Res.	EXCOL	LCOL	EXDEF	LCARR	NCARR	TJT
							rc_r			rc_r	rc_r	rc_r	rc_r	rc_r	rc_r

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **RWT**: Receive Watchdog Timeout

This bit is set when a packet with length greater than 2,048 bytes is received (10, 240 bytes when Jumbo Packet mode is enabled) and the WD bit is reset in the *Operating mode configuration register (ETH_MACCR)*. This bit is set when a packet with length greater than 16,383 bytes is received and the WD bit is set in the *Operating mode configuration register (ETH_MACCR)*.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **EXCOL**: Excessive Collisions

When the DTXSTS bit is set in the *Operating mode register (ETH_MTLOMR)*, this bit indicates that the transmission aborted after 16 successive collisions while attempting to transmit the current packet. If the DR bit is set in the *Operating mode configuration register (ETH_MACCR)*, this bit is set after the first collision and the packet transmission is aborted.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bit 4 **LCOL**: Late Collision

When the DTXSTS bit is set in the *Operating mode register (ETH_MTLOMR)*, this bit indicates that the packet transmission aborted because a collision occurred after the collision window (64 bytes including Preamble in MII mode; 512 bytes including Preamble and Carrier Extension in GMII mode).

This bit is not valid if the Underflow error occurs.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bit 3 **EXDEF**: Excessive Deferral

When the DTXSTS bit is set in the *Operating mode register (ETH_MTLOMR)* and the DC bit is set in the *Operating mode configuration register (ETH_MACCR)*, this bit indicates that the transmission ended because of excessive deferral of over 24,288 bit times (155,680 in 1000 Mbps mode or when Jumbo packet is enabled).

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bit 2 **LCARR**: Loss of Carrier

When the DTXSTS bit is set in the *Operating mode register (ETH_MTLOMR)*, this bit indicates that the loss of carrier occurred during packet transmission, that is, the ETH_CRS signal was inactive for one or more transmission clock periods during packet transmission. This bit is valid only for packets transmitted without collision.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bit 1 **NCARR**: No Carrier

When the DTXSTS bit is set in the *Operating mode register (ETH_MTLOMR)*, this bit indicates that the carrier signal from the PHY is not present at the end of preamble transmission.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bit 0 **TJT**: Transmit Jabber Timeout

This bit indicates that the Transmit Jabber Timer expired which happens when the packet size exceeds 2,048 bytes (10,240 bytes when the Jumbo packet is enabled) and JD bit is reset in the *Operating mode configuration register (ETH_MACCR)*. This bit is set when the packet size exceeds 16,383 bytes and the JD bit is set in the *Operating mode configuration register (ETH_MACCR)*.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

PMT control status register (ETH_MACPCSR)

Address offset: 0x00C0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RWKFILTRST	Res.	Res.	RWKPTR[4:0]					Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw			r	r	r	r	r								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	RWKPFE	GLBLUCAST	Res.	Res.	RWKPRCVD	MGKPRCVD	Res.	Res.	RWKPKTEN	MGKPKTEN	PWRDWN
					rw	rw			r	rc_r			rw	rw	rw

Bit 31 **RWKFILTRST**: Remote Wake-up Packet Filter Register Pointer Reset
When this bit is set, the remote wake-up packet filter register pointer is reset to 0. It is automatically cleared after 1 clock cycle.

Bits 30:29 Reserved, must be kept at reset value.

Bits 28:24 **RWKPTR[4:0]**: Remote wake-up FIFO Pointer
This field gives the current value (0 to 7) of the Remote wake-up Packet Filter register pointer. When the value of this pointer is equal to 7, the contents of the Remote wake-up Packet Filter Register are transferred to the eth_rx_clk domain when a Write occurs to that register.

Bits 23:11 Reserved, must be kept at reset value.

Bit 10 **RWKPFE**: Remote wake-up Packet Forwarding Enable
When this bit is set along with RWKPKTEN, the MAC receiver drops all received frames until it receives the expected wake-up frame. All frames after that event including the received wake-up frame are forwarded to application. This bit is then self-cleared on receiving the wake-up packet.
The application can also clear this bit before the expected wake-up frame is received. In such cases, the MAC reverts to the default behavior where packets received are forwarded to the application. This bit must only be set when RWKPKTEN is set high and PWRDWN is set low. The setting of this bit has no effect when PWRDWN is set high.
Note: If Magic Packet Enable and wake-up Frame Enable are both set along with setting of this bit and Magic Packet is received prior to wake-up frame, this bit is self-cleared on receiving Magic Packet, the received Magic packet is dropped, and all frames after received Magic Packet are forwarded to application.

Bit 9 **GLBLUCAST**: Global Unicast
When this bit set, any unicast packet filtered by the MAC (DAF) address recognition is detected as a remote wake-up packet.

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 **RWKPRCVD**: Remote wake-up Packet Received
When this bit is set, it indicates that the power management event is generated because of the reception of a remote wake-up packet. This bit is cleared when this register is read.

Bit 5 **MGKPRCVD**: Magic Packet Received
When this bit is set, it indicates that the power management event is generated because of the reception of a magic packet. This bit is cleared when this register is read (or written to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **RWKPKTEN**: Remote wake-up Packet Enable

When this bit is set, a power management event is generated when the MAC receives a remote wake-up packet.

Bit 1 **MGKPKTEN**: Magic Packet Enable

When this bit is set, a power management event is generated when the MAC receives a magic packet.

Bit 0 **PWRDWN**: Power Down

When this bit is set, the MAC receiver drops all received packets until it receives the expected magic packet or remote wake-up packet. This bit is then self-cleared and the power-down mode is disabled. The software can clear this bit before the expected magic packet or remote wake-up packet is received. The packets received by the MAC after this bit is cleared are forwarded to the application. This bit must only be set when the Magic Packet Enable, Global Unicast, or Remote wake-up Packet Enable bit is set high.

Note: You can gate-off the CSR clock during the power-down mode. However, when the CSR clock is gated-off, you cannot perform any read or write operations on this register. Therefore, the Software cannot clear this bit.

Remote wake-up packet filter register (ETH_MACRWKPFR)

Address offset: 0x00C4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MACRWKPFR[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MACRWKPFR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MACRWKPFR[31:0]**: Remote wake-up packet filter

Refer to *Table 947*, *Table 948* and *Table 949* for details on register content and programming sequence.

The ETH_MACRWKPFR register at address 0x00C4 loads the wake-up Packet Filter register.

To load values in a wake-up Packet Filter register, the entire register (ETH_MACRWKPFR) must be written. The ETH_MACRWKPFR register is loaded by sequentially loading the eight, sixteen or thirty two register values in address (0x00C4) for ETH_MACRWKPFR value 0 to 7, respectively. The ETH_MACRWKPFR register is read in a similar way. The Ethernet peripheral updates the ETH_MACRWKPFR register current pointer value in Bits[26:24] of ETH_MACPCSR register.

LPI control and status register (ETH_MACLCSR)

Address offset: 0x00D0

Reset value: 0x0000 0000

The LPI Control and Status Register controls the LPI functions and provides the LPI interrupt status. The status bits are cleared when this register is read.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPITCSE	LPITE	LPITXA	PLSEN	PLS	LPIEN
										rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	RLPIST	TLPIST	Res.	Res.	Res.	Res.	RLPIEX	RLPIEN	TLPIEX	TLPIEN
						r	r					r	r	r	r

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **LPITCSE**: LPI Tx Clock Stop Enable

When this bit is set, the MAC asserts sbd_tx_clk_gating_ctrl_o signal high after it enters Tx LPI mode to indicate that the Tx clock to MAC can be stopped. When this bit is reset, the MAC does not assert sbd_tx_clk_gating_ctrl_o signal high after it enters Tx LPI mode.
If RGMII Interface is selected, the Tx clock is required for transmitting the LPI pattern. The Tx Clock cannot be gated and so the LPITCSE bit cannot be programmed.

Bit 20 **LPITE**: LPI Timer Enable

This bit controls the automatic entry of the MAC transmitter into and exit out of the LPI state. When LPITE, LPITXA and LPIEN bits are set, the MAC transmitter enters LPI state only when the complete MAC TX data path is IDLE for a period indicated by the ETH_MACLETR register.
After entering LPI state, if the data path becomes non-IDLE (due to a new packet being accepted for transmission), the transmitter exits LPI state but does not clear LPIEN bit. This enables the re-entry into LPI state when it is IDLE again.
When LPITE is 0, the LPI Auto timer is disabled and MAC transmitter enters LPI state based on the settings of LPITXA and LPIEN bit descriptions.

Bit 19 **LPITXA**: LPI Tx Automate

This bit controls the behavior of the MAC when it is entering or coming out of the LPI mode on the Transmit side.
If the LPITXA and LPIEN bits are set to 1, the MAC enters the LPI mode only after all outstanding packets (in the core) and pending packets (in the application interface) have been transmitted. The MAC comes out of the LPI mode when the application sends any packet for transmission or the application issues a Tx FIFO Flush command. In addition, the MAC automatically clears the LPIEN bit when it exits the LPI state. If Tx FIFO Flush is set in the FTQ bit of ETH_MTLTxQxOMR, when the MAC is in the LPI mode, it exits the LPI mode.
When this bit is 0, the LPIEN bit directly controls behavior of the MAC when it is entering or coming out of the LPI mode.

Bit 18 **PLSEN**: PHY Link Status Enable

This bit enables the link status received on the RGMII Receive paths to be used for activating the LPI LS TIMER.
When this bit is set, the MAC uses the link-status bits of the ETH_MACPHYCSR register and the PLS bit for the LPI LS Timer trigger. When this bit is reset, the MAC ignores the link-status bits of the ETH_MACPHYCSR register and takes only the PLS bit.

Bit 17 **PLS**: PHY Link Status

This bit indicates the link status of the PHY. The MAC transmitter asserts the LPI pattern only when the link status is up (OKAY) at least for the time indicated by the LPI LS TIMER.
When this bit is set, the link is considered to be okay (UP) and when this bit is reset, the link is considered to be down.

Bit 16 **LPIEN**: LPI Enable

When this bit is set, it instructs the MAC transmitter to enter the LPI state. When this bit is reset, it instructs the MAC to exit the LPI state and resume normal transmission.
This bit is cleared when the LPITXA bit is set and the MAC exits the LPI state because of the arrival of a new packet for transmission.

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **RLPIST**: Receive LPI State

When this bit is set, it indicates that the MAC is receiving the LPI pattern on the GMII or MII interface.

Bit 8 **TLPIST**: Transmit LPI State

When this bit is set, it indicates that the MAC is transmitting the LPI pattern on the GMII or MII interface.

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **RLPIEX**: Receive LPI Exit

When this bit is set, it indicates that the MAC receiver has stopped receiving the LPI pattern on the GMII or MII interface, exited the LPI state, and resumed the normal reception. This bit is cleared by a read into this register (or by writing it to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Note: This bit may not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock.

Bit 2 **RLPIEN**: Receive LPI Entry

When this bit is set, it indicates that the MAC receiver has received an LPI pattern and entered the LPI state. This bit is cleared by a read into this register (or by writing it to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Note: This bit may not be set if the MAC stops receiving the LPI pattern for a very short duration, such as, less than three clock cycles of CSR clock.

Bit 1 **TLPIEX**: Transmit LPI Exit

When this bit is set, it indicates that the MAC transmitter exited the LPI state after the application cleared the LPIEN bit and the LPI TW Timer has expired. This bit is cleared by a read into this register (or by writing it to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bit 0 **TLPIEN**: Transmit LPI Entry

When this bit is set, it indicates that the MAC transmitter has entered the LPI state because of the setting of the LPIEN bit. This bit is cleared by a read into this register (or by writing it to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

LPI timers control register (ETH_MACLTCR)

Address offset: 0x00D4

Reset value: 0x03E8 0000

The LPI Timers Control register controls the timeout values in the LPI states. It specifies the time for which the MAC transmits the LPI pattern and also the time for which the MAC waits before resuming the normal transmission.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

TWT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:16 **LST[9:0]**: LPI LS Timer

This field specifies the minimum time (in milliseconds) for which the link status from the PHY should be up (OKAY) before the LPI pattern can be transmitted to the PHY. The MAC does not transmit the LPI pattern even when the LPIEN bit is set unless the LPI LS Timer reaches the programmed terminal count. The default value of the LPI LS Timer is 1000 (1 sec) as defined in the IEEE standard.

Bits 15:0 **TWT[15:0]**: LPI TW Timer

This field specifies the minimum time (in microseconds) for which the MAC waits after it stops transmitting the LPI pattern to the PHY and before it resumes the normal transmission. The TLPIEX status bit is set after the expiry of this timer.

LPI entry timer register (ETH_MACLETR)

Address offset: 0x00D8

Reset value: 0x0000 0000

This register controls the Tx LPI entry timer. This counter is enabled only when LPITE bit of *LPI control and status register (ETH_MACLCSR)* register is set to 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

LPIET[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	r	r	r

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **LPIET[19:0]**: LPI Entry Timer

This field specifies the time in microseconds the MAC waits to enter LPI mode, after it has transmitted all the frames. This field is valid and used only when LPITE and LPITXA are set to 1.

Bits [2:0] are read-only so that the granularity of this timer is in steps of 8 micro-seconds.

One-microsecond-tick counter register (ETH_MAC1USTCR)

Address offset: 0x00DC

Reset value: 0x0000 0063

This register controls the generation of the Reference time (one-microsecond tick) for all the LPI timers. This timer has to be programmed by the software initially.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	TIC_1US_CNTR[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 TIC_1US_CNTR[11:0]: 1 µs tick Counter

The application must program this counter so that the number of clock cycles of CSR clock is 1 µs (subtract 1 from the value before programming).

For example if the CSR clock is 100 MHz then this field needs to be programmed to 100 - 1 = 99 (which is 0x63).

This is required to generate the 1 µs events that are used to update some of the EEE related counters.

PHYIF control status register (ETH_MACPHYCSR)

Address offset: 0x00F8

Reset value: 0x0000 0000

The PHY Interface Control and Status register indicates the status signals received by the RGMII interface from the PHY.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LUD	TC
														rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **LNKSTS**: Link Status

This bit indicates whether the link is up or down.

0: Link down

1: Link up

Bits 18:17 **LNKSPEED[1:0]**: Link Speed

This bit indicates the current speed of the link:

00: 2.5 MHz

01: 25 MHz

10: 125 MHz

11: Reserved, must not be used

Bit 16 **LNKMOD**: Link Mode

This bit indicates the current operating mode of the link:

0: Half-duplex mode

1: Full-duplex mode

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **LUD**: Link Up or Down

This bit indicates whether the link is up or down during transmission of configuration in the RGMII interface.
0: Link Down
1: Link Up

Bit 0 **TC**: Transmit Configuration in RGMII

When set, this bit enables the transmission of duplex mode, link speed, and link up or down information to the PHY in the RGMII port. When this bit is reset, no such information is driven to the PHY (see *Section 92.6.3: Reduced media independent interface (RMII)*).

Version register (ETH_MACVR)

Address offset: 0x0110

Reset value: 0x0000 1A53

The version register identifies the version of the Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

USERVER[7:0]								SNPSVER[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **USERVER[7:0]**: ST-defined version

Bits 7:0 **SNPSVER[7:0]**: IP version

Debug register (ETH_MACDR)

Address offset: 0x0114

Reset value: 0x0000 0000

The Debug register provides the debug status of various MAC blocks.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TFCSTS[1:0]		TPESTS

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RFCFCSTS[1:0]		RPESTS
													r	r	r

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:17 **TFCSTS[1:0]**: MAC Transmit Packet Controller Status

This field indicates the state of the MAC Transmit Packet Controller module:

00: Idle state

01: Waiting for one of the following:

– Status of the previous packet

– IPG or backoff period to be over

10: Generating and transmitting a Pause control packet (in Full-duplex mode)

11: Transferring input packet for transmission

Bit 16 **TPESTS**: MAC GMII or MII Transmit Protocol Engine Status

When this bit is set, it indicates that the MAC GMII or MII transmit protocol engine is actively transmitting data, and it is not in the Idle state.

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:1 **RFCFCSTS[1:0]**: MAC Receive Packet Controller FIFO Status

When this bit is set, this field indicates the active state of the small FIFO Read and Write controllers of the MAC Receive Packet Controller module.

Bit 0 **RPESTS**: MAC GMII or MII Receive Protocol Engine Status

When this bit is set, it indicates that the MAC GMII or MII receive protocol engine is actively receiving data, and it is not in the Idle state.

HW feature 0 register (ETH_MACHWF0R)

Address offset: 0x011C

Reset value: 0x0E0D 73F7

This register indicates the presence of first set of the optional features or functions of the Ethernet peripheral. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:28 **ACTPHYSEL[3:0]**: Active PHY selected
When you have multiple PHY interfaces in your configuration, this field indicates the sampled value of phy_intf_sel_i during reset de-assertion:
0x0: GMII or MII
0x1: RGMII
0x2: SGMII
0x3: TBI
0x4: RMII
0x5: RTBI
0x6: SMII
Others: Reserved, must not be used

Bit 27 **SAVLANINS**: Source Address or VLAN Insertion Enable
This bit is set to 1 when the Enable SA and VLAN Insertion on Tx option is selected

Bits 26:25 **TSSTSSEL[1:0]**: Timestamp System Time Source
This bit indicates the source of the Timestamp system time:
01: Internal
10: External
11: Both
00: Reserved, must not be used
This bit is set to 1 when the Enable IEEE 1588 Timestamp Support option is selected

Bit 24 **MACADR64SEL**: MAC Addresses 64-127 Selected
This bit is set to 1 when the Enable Additional 64 MAC Address Registers (64-127) option is selected

Bit 23 **MACADR32SEL**: MAC Addresses 32-63 Selected
This bit is set to 1 when the Enable Additional 32 MAC Address Registers (32-63) option is selected

Bits 22:18 **ADDMACADRSEL[4:0]**: MAC Addresses 1-31 Selected
This bit is set to 1 when the Enable Additional 1-31 MAC Address Registers option is selected

Bit 17 Reserved, must be kept at reset value.

Bit 16 **RXCOESEL**: Receive Checksum Offload Enabled
This bit is set to 1 when the Enable Receive TCP/IP Checksum Check option is selected

Bit 15 Reserved, must be kept at reset value.

Bit 14 **TXCOESEL**: Transmit Checksum Offload Enabled
This bit is set to 1 when the Enable Transmit TCP/IP Checksum Insertion option is selected

Bit 13 **EEESEL**: Energy Efficient Ethernet Enabled
This bit is set to 1 when the Enable Energy Efficient Ethernet (EEE) option is selected

Bit 12 **TSSEL**: IEEE 1588-2008 Timestamp Enabled
This bit is set to 1 when the Enable IEEE 1588 Timestamp Support option is selected

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **ARPOFFSEL**: ARP Offload Enabled
This bit is set to 1 when the Enable IPv4 ARP Offload option is selected

Bit 8 **MMCSEL**: RMON Module Enable
This bit is set to 1 when the Enable MAC management counters (MMC) option is selected

Bit 7 **MGKSEL**: PMT Magic Packet Enable
This bit is set to 1 when the Enable Magic Packet Detection option is selected

Bit 6 **RWKSEL**: PMT Remote Wake-up Packet Enable
This bit is set to 1 when the Enable Remote Wake-up Packet Detection option is selected

Bit 5 **SMASEL**: SMA (MDIO) Interface
This bit is set to 1 when the Enable Station Management (MDIO Interface) option is selected

Bit 4 **VLHASH**: VLAN Hash Filter Selected
This bit is set to 1 when the Enable VLAN Hash Table Based Filtering option is selected

Bit 3 **PCSSEL**: PCS Registers (TBI, SGMII, or RTBI PHY interface)
This bit is set to 1 when the TBI, SGMII, or RTBI PHY interface option is selected

Bit 2 **HDSEL**: Half-duplex Support
This bit is set to 1 when the Half-duplex mode is selected

Bit 1 **GMIISEL**: 1000 Mbps Support
This bit is set to 1 when 1000 Mbps is selected as operating mode.

Bit 0 **MIISEL**: 10 or 100 Mbps Support
This bit is set to 1 when 10/100 Mbps is selected as operating mode.

HW feature 1 register (ETH_MACHWF1R)

Address offset: 0x0120

Reset value: 0x1114 19A5

This register indicates the presence of second set of the optional features or functions of the Ethernet peripheral. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit 31 Reserved, must be kept at reset value.

Bits 30:27 **L3L4FNUM[3:0]**: Total number of L3 or L4 Filters
This field indicates the total number of L3 or L4 filters:
0000: No L3 or L4 Filter
0001: 1 L3 or L4 Filter
0010: 2 L3 or L4 Filters
..
1000: 8 L3 or L4

Bit 26 Reserved, must be kept at reset value.

Bits 25:24 **HASHTBLSZ[1:0]**: Hash Table Size
This field indicates the size of the Hash table:
00: No Hash table
01: 64
10: 128
11: 256

Bit 23 **POUOST**: One Step for PTP over UDP/IP Feature Enable
This bit is set to 1 when the Enable one step timestamp for PTP over UDP/IP feature is selected.

Bit 22 Reserved, must be kept at reset value.

Bit 21 **RAVSEL**: Rx Side Only AV Feature Enable
This bit is set to 1 when the Enable Audio video bridging option on Rx Side Only is selected.

Bit 20 **AVSEL**: AV Feature Enable
This bit is set to 1 when the Enable Audio video bridging option is selected.

Bit 19 **DBGMEMA**: DMA Debug Registers Enable
This bit is set to 1 when the Debug Mode Enable option is selected

Bit 18 **TSOEN**: TCP Segmentation Offload Enable
This bit is set to 1 when the Enable TCP Segmentation Offloading for TCP/IP Packets option is selected

Bit 17 **SPHEN**: Split Header Feature Enable
This bit is set to 1 when the Enable Split Header Structure option is selected

Bit 16 **DCBEN**: DCB Feature Enable
This bit is set to 1 when the Enable Data Center Bridging option is selected

Bits 15:14 **ADDR64[1:0]**: Address width
This field indicates the configured address width.
00: 32 bits
Others: Reserved, must not be used

Bit 13 **ADVTHWORD**: IEEE 1588 High Word Register Enable
This bit is set to 1 when the Add IEEE 1588 Higher Word Register option is selected

Bit 12 **PTOEN**: PTP Offload Enable
This bit is set to 1 when the Enable PTP Timestamp Offload Feature is selected.

Bit 11 **OSTEN**: One-Step Timestamping Enable
This bit is set to 1 when the Enable One-Step Timestamp Feature is selected.

Bits 10:6 **TXFIFOSIZE[4:0]**: MTL Transmit FIFO Size

This field contains the configured value of MTL Tx FIFO in bytes expressed as Log to base 2 minus 7, that is, Log2(TXFIFO_SIZE) -7:
00000: 128 bytes
00001: 256 bytes
00010: 512 bytes
00011: 1,024 bytes
00100: 2,048 bytes
00101: 4,096 bytes
00110: 8,192 bytes
00111: 16,384 bytes
01000: 32 Kbytes
01001: 64 Kbytes
01010: 128 Kbytes
01011 to 11111: Reserved, must not be used

Bit 5 **SPRAM**: Single Port RAM Enable

This bit is set to 1 when the Use single port RAM feature is selected.

Bits 4:0 **RXFIFOSIZE[4:0]**: MTL Receive FIFO Size

This field contains the configured value of MTL Rx FIFO in bytes expressed as Log to base 2 minus 7, that is, Log2(RXFIFO_SIZE) -7:
00000: 128 bytes
00001: 256 bytes
00010: 512 bytes
00011: 1,024 bytes
00100: 2,048 bytes
00101: 4,096 bytes
00110: 8,192 bytes
00111: 16,384 bytes
01000: 32 Kbytes
01001: 64 Kbytes
01010: 128 Kbytes
01011: 256 Kbytes
01100 to 11111: Reserved, must not be used

HW feature 2 register (ETH_MACHWF2R)

Address offset: 0x0124

Reset value: 0x420C 10C1

This register indicates the presence of third set of the optional features or functions of the Ethernet peripheral. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **AUXSNAPNUM[2:0]**: Number of Auxiliary Snapshot Inputs
This field indicates the number of auxiliary snapshot inputs:
000: No auxiliary input
001: 1 auxiliary input
010: 2 auxiliary inputs
011: 3 auxiliary inputs
100: 4 auxiliary inputs
101 to 111: Reserved, must not be used

Bit 27 Reserved, must be kept at reset value.

Bits 26:24 **PPSOUTNUM[2:0]**: Number of PPS Outputs
This field indicates the number of PPS outputs:
000: No PPS output
001: 1 PPS output
010: 2 PPS outputs
011: 3 PPS outputs
100: 4 PPS outputs
101 to 111: Reserved, must not be used

Bits 23:22 **TDCSZ[1:0]**: Tx DMA Descriptor Cache Size in terms of 16-byte descriptors
00: Cache not configured
01: Four 16-byte descriptors
10: Eight 16-byte descriptors
11: Sixteen 16-byte descriptors

Bits 21:18 **TXCHCNT[3:0]**: Number of DMA Transmit Channels
This field indicates the number of DMA Transmit channels:
0000: 1 DMA Tx Channel
0001: 2 DMA Tx Channels
..
0111: 8 DMA Tx

Bits 17:16 **RDCSZ[1:0]**: Rx DMA Descriptor Cache Size in terms of 16-byte descriptors
00: Cache not configured
01: Four 16-byte descriptors
10: Eight 16-byte descriptors
11: Sixteen 16-byte descriptors

Bits 15:12 **RXCHCNT[3:0]**: Number of DMA Receive Channels
This field indicates the number of DMA Receive channels:
0000: 1 DMA Rx Channel
0001: 2 DMA Rx Channels
..
0111: 8 DMA Rx

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:6 **TXQCNT[3:0]**: Number of MTL Transmit Queues
This field indicates the number of MTL Transmit queues:
0000: 1 MTL Tx queue
0001: 2 MTL Tx queues
..
0111: 8 MTL Tx

Bits 5:4 Reserved, must be kept at reset value.

Bits 3:0 **RXQCNT[3:0]**: Number of MTL Receive Queues
This field indicates the number of MTL Receive queues:
0000: 1 MTL Rx queue
0001: 2 MTL Rx queues
..
0111: 8 MTL Rx

HW feature 3 register (ETH_MACHWF3R)

Address offset: 0x0128

Reset value: 0x0C33 0031

This register indicates the presence of fourth set the optional features or functions of the Ethernet peripheral. The software driver can use this register to dynamically enable or disable the programs related to the optional blocks.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:28 **ASP[1:0]**: Automotive Safety Package
Following are the encoding for the different Safety features
00: None
01: ECC only
10: AS_NPPE
11: AS_PPE

Bit 27 **TBSSEL**: Time-based scheduling Enable
This bit is set to 1 when the time-based scheduling feature is selected.

Bit 26 **FPESEL**: Frame Preemption Enable
This bit is set to 1 when the Enable Frame preemption feature is selected.

Bits 25:22 Reserved, must be kept at reset value.

Bits 21:20 **ESTWID[1:0]**: Width of the Time Interval field in the Gate Control List
This field indicates the width of the Configured Time Interval Field
00: No width
01: 16
10: 20
11: 24

Bits 19:17 **ESTDEP[2:0]**: Depth of the Gate Control List
This field indicates the depth of Gate Control list
000: No depth
001: 64
010: 128
011: 256
100: 512
101: 1024
110: Reserved, must not be used

Bit 16 **ESTSEL**: Enhancements to Scheduled Traffic Enable
This bit is set to 1 when the enable enhancements to scheduling traffic feature is selected.

Bit 15 Reserved, must be kept at reset value.

Bits 14:13 **FRPES[1:0]**: Flexible Receive Parser Table Entries size
This field indicates the maximum number of parser entries supported by flexible receive parser.
00: 64 entries
01: 128 entries
10: 256 entries
11: Reserved, must not be used

Bits 12:11 **FRPBS[1:0]**: Flexible Receive Parser Buffer size
This field indicates the supported maximum number of bytes of the packet data to be parsed by flexible receive parser.
00: 64 bytes
01: 128 bytes
10: 256 bytes
11: Reserved, must not be used

Bit 10 **FRPSEL**: Flexible Receive Parser Selected
This bit is set to 1 when the Enable Flexible Programmable Receive Parser option is selected.

Bit 9 **PDUPSEL**: Broadcast/Multicast Packet Duplication
This bit is set to 1 when the Broadcast/Multicast Packet Duplication feature is selected.

Bits 8:6 Reserved, must be kept at reset value.

Bit 5 **DVLAN**: Double VLAN processing enable
This bit is set to 1 when Double VLAN processing is enabled.

Bit 4 **CBTISEL**: Queue/Channel based VLAN tag insertion on Tx enable
This bit is set to 1 when the Enable Queue/Channel based VLAN tag insertion on Tx feature is selected.

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **NRVF[2:0]**: Number of Extended VLAN Tag Filters Enabled
This field indicates the Number of Extended VLAN Tag Filters selected:
000: No Extended Rx VLAN Filters
001: 4 Extended Rx VLAN Filters
010: 8 Extended Rx VLAN Filters
011: 16 Extended Rx VLAN Filters
100: 24 Extended Rx VLAN Filters
101: 32 Extended Rx VLAN Filters
110 to 111: Reserved, must not be used

MDIO address register (ETH_MACMDIOAR)

Address offset: 0x0200

Reset value: 0x0000 0000

The MDIO Address register controls the management cycles to external PHY through a management interface.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	PSE	BTB	PA[4:0]					RDA[4:0]				
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	NTC[2:0]			CR[3:0]				Res.	Res.	Res.	SKAP	GOC[1:0]		C45E	GB
	rw	rw	rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **PSE**: Preamble Suppression Enable

When this bit is set, the SMA suppresses the 32-bit preamble and transmit MDIO frames with only 1 preamble bit.

When this bit is 0, the MDIO frame always has 32 bits of preamble as defined in the IEEE specifications.

Bit 26 **BTB**: Back to Back transactions

When this bit is set and the NTC has value greater than 0, then the MAC informs the completion of a read or write command at the end of frame transfer (before the trailing clocks are transmitted). The software can thus initiate the next command which is executed immediately irrespective of the number trailing clocks generated for the previous frame.

When this bit is reset, then the read/write command completion (GMII busy is cleared) only after the trailing clocks are generated. In this mode, it is ensured that the NTC is always generated after each frame.

This bit must not be set when NTC=0.

Bits 25:21 **PA[4:0]**: Physical Layer Address

This field indicates which Clause 22 PHY devices (out of 32 devices) the MAC is accessing.
This field indicates which Clause 45 capable PHYs (out of 32 PHYs) the MAC is accessing.

Bits 20:16 **RDA[4:0]**: Register/Device Address

These bits select the PHY register in selected Clause 22 PHY device. These bits select the Device (MMD) in selected Clause 45 capable PHY.

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **NTC[2:0]**: Number of Training Clocks

This field controls the number of trailing clock cycles generated on ETH_MDC after the end of transmission of MDIO frame. The valid values can be from 0 to 7. Programming the value to 011 indicates that there are additional three clock cycles on the MDC line after the end of MDIO frame transfer.

Bits 11:8 **CR[3:0]**: CSR Clock Range

The CSR Clock Range selection determines the frequency of the MDC clock according to the CSR clock frequency (eth_hclk):
0000: MDC clock = eth_hclk / 42
0001: MDC clock = eth_hclk / 62
0010: MDC clock = eth_hclk / 16
0011: MDC clock = eth_hclk / 26
0100: MDC clock = eth_hclk / 102
0101: MDC clock = eth_hclk / 124
0110: MDC clock = eth_hclk / 204
0111: MDC clock = eth_hclk / 324
The suggested range of CSR clock frequency applicable for each value (when Bit 11 = 0) ensures that the MDC clock is approximately between 1.0 MHz to 2.5 MHz frequency range.
When Bit 11 is set, you can achieve a higher frequency of the MDC clock than the frequency limit of 2.5 MHz (specified in the IEEE 802.3) and program a clock divider of lower value. For example, when CSR clock is of 100 MHz frequency and you program these bits to 1010, the resultant MDC clock is of 12.5 MHz which is above the range specified in IEEE 802.3. Program the following values only if the interfacing chips support faster MDC clocks:
1000: eth_hclk / 4
1001: eth_hclk / 6
1010: eth_hclk / 8
1011: eth_hclk / 10
1100: eth_hclk / 12
1101: eth_hclk / 14
1110: eth_hclk / 16
1111: eth_hclk / 18

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **SKAP**: Skip Address Packet

When this bit is set, the SMA does not send the address packets before read, write, or post-read increment address packets. This bit is valid only when C45E is set.

Bits 3:2 **GOC[1:0]**: GMII Operation Command

This bit indicates the operation command to the PHY.
00: Reserved, must not be used
01: Write
10: Post Read Increment Address for Clause 45 PHY
11: Read
When Clause 22 PHY is enabled, only Write and Read commands are valid.

Bit 1 **C45E**: Clause 45 PHY Enable

When this bit is set, Clause 45 capable PHY is connected to MDIO. When this bit is reset, Clause 22 capable PHY is connected to MDIO.

Bit 0 **GB**: GMII Busy

The application sets this bit to instruct the SMA to initiate a Read or Write access to the MDIOS. The MAC clears this bit after the MDIO frame transfer is completed. Hence the software must not write or change any of the fields in *MDIO address register (ETH_MACMDIOAR)* and *MDIO data register (ETH_MACMDIODR)* as long as this bit is set.

For write transfers, the application must first write 16-bit data in the GD field (and also RA field when C45E is set) in *MDIO data register (ETH_MACMDIODR)* register before setting this bit. When C45E is set, it should also write into the RA field of *MDIO data register (ETH_MACMDIODR)* before initiating a read transfer. When a read transfer is completed (GMII busy=0), the data read from the PHY register is valid in the GD field of the *MDIO data register (ETH_MACMDIODR)*.

Note: Even if the addressed PHY is not present, there is no change in the functionality of this bit.

MDIO data register (ETH_MACMDIODR)

Address offset: 0x0204

Reset value: 0x0000 0000

The MDIO Data register stores the Write data to be written to the PHY register located at the address specified in *MDIO address register (ETH_MACMDIOAR)* This register also stores the Read data from the PHY register located at the address specified by MDIO Address register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

GD[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **RA[15:0]**: Register Address

This field is valid only when C45E is set. It contains the Register Address in the PHY to which the MDIO frame is intended for.

Bits 15:0 **GD[15:0]**: GMII Data

This field contains the 16-bit data value read from the PHY after a Management Read operation or the 16-bit data value to be written to the PHY before a Management Write operation.

ARP address register (ETH_MACARPAR)

Address offset: 0x0210

Reset value: 0x0000 0000

The ARP Address register contains the IPv4 Destination Address of the MAC.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ARPPA[31:16]

ARPPA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ARPPA[31:0]**: ARP Protocol Address

This field contains the IPv4 Destination Address of the MAC. This address is used for perfect match with the Protocol Address of Target field in the received ARP packet.

CSR software control register (ETH_MACCSRSWCR)

Address offset: 0x0230

Reset value: 0x0000 0000

This register contains software-programmable controls for changing the CSR access response and status bits clearing.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RCWE
							rw								rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **SEEN**: Slave Error Response Enable

When this bit is set, the MAC responds with a Slave Error for accesses to reserved registers in CSR space.

When this bit is reset, the MAC responds with an Okay response to any register accessed from CSR space.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **RCWE**: Register Clear on Write 1 Enable

When this bit is set, the access mode to some register fields changes to rc_w1 (clear on write) meaning that the application needs to set that respective bit to 1 to clear it.

When this bit is reset, the access mode to these register fields remains rc_r (clear on read).

FPE control and status register (ETH_MACFPECSR)

Address offset: 0x0234

Reset value: 0x0000 0000

This register controls the operation of Frame Preemption.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRSP	TVER	RRSP	RVER

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ARV	SRSP	SVER	EFPE
												rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **TRSP**: Transmitted Respond Frame

Set when a Respond mPacket is transmitted (triggered by setting SRSP field). An interrupt can be generated for this event if FPEIE bit of *Interrupt enable register (ETH_MACIER)* is set.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bit 18 **TVER**: Transmitted Verify Frame

Set when a Verify mPacket is transmitted (triggered by setting SVER field). An interrupt can be generated for this event if FPEIE bit of *Interrupt enable register (ETH_MACIER)* is set.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bit 17 **RRSP**: Received Respond Frame

Set when a Respond mPacket is received. An interrupt can be generated for this event if FPEIE bit of *Interrupt enable register (ETH_MACIER)* is set.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bit 16 **RVER**: Received Verify Frame

Set when a Verify mPacket is received. An interrupt can be generated for this event if FPEIE bit of *Interrupt enable register (ETH_MACIER)* is set.

Cleared on read (or write of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **ARV**: Autogenerate Respond mPacket on receiving Verify mPacket

When set, this bit enables the function that autogenerates a Respond mPacket on receiving a Verify mPacket.

Bit 2 **SRSP**: Send Respond mPacket

When set, this bit indicates to the hardware that a Respond mPacket must be sent.
It is cleared by hardware after sending the Respond mPacket.
Setting 1 sets. Self-cleared.
Access restriction applies: this bit can be set by software or by hardware when the ARV bit is set and a verify mPacket is received. Setting it to 0 has no effect.

Bit 1 **SVER**: Send Verify mPacket

When set, this bit indicates to the hardware that a Verify mPacket must be sent. Reset by hardware after sending the Verify mPacket.
Setting 1 sets. Self-cleared.

Bit 0 **EFPE**: Enable Tx Frame Preemption

When set, Frame Preemption Tx functionality is enabled.

MAC presentation time register (ETH_MACPRSTIMR)

Address offset: 0x0240

Reset value: 0x0000 0000

This register contains the 32-bit binary rollover equivalent time of the PTP System Time expressed in ns.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MPTN[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MPTN[31:0]**: MAC 1722 Presentation Time in ns

These bits indicate the value of the 32-bit binary rollover equivalent time of the PTP System Time in ns.

MAC presentation time update register (ETH_MACPRSTIMUR)

Address offset: 0x0244

Reset value: 0x0000 0000

This register holds the 32-bit value of MAC 1722 Presentation Time in ns, that should be added to the current presentation time counter value. The initialization happens when TSINIT is set, and the update when the TSUPDT bit is set (TSINIT or TSUPDT bits in *Timestamp control Register (ETH_MACTSCR)*).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MPTU[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

MPTU[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MPTU[31:0]**: MAC 1722 Presentation Time Update

This field holds the initialization value or the update value for the presentation time. When used for update, this field holds the 32-bit value, in ns, that should be added to the current presentation time counter value. The initialization happens when TSINIT is set, and the update when the TSUPDT bit is set (TSINIT or TSUPDT bits in *Timestamp control Register (ETH_MACTSCR)*). When ADDSUB field of *System time nanoseconds update register (ETH_MACSTNUR)* is set, this value is directly used for subtraction.

MAC Address 0 high register (ETH_MACA0HR)

Address offset: 0x0300

Reset value: 0x8000 FFFF

The MAC Address0 High register holds the upper 16 bits of the first 6-byte MAC address of the station. The first DA byte that is received on the GMII interface corresponds to the LS byte (Bits [7:0]) of the MAC Address Low register. For example, if 0x11 22 33 44 55 66 is

received (0x11 in lane 0 of the first column) on the GMII as the destination address, then the MacAddress0 Register [47:0] is compared with 0x66 55 44 33 22 11.

If the MAC address registers are configured to be double-synchronized to the GMII clock domains, then the synchronization is triggered only when Bits[31:24] (in little-endian mode) or Bits[7:0] (in big-endian mode) of the MAC Address0 Low Register are written. For proper synchronization updates, the consecutive writes to this Address Low Register should be performed after at least four clock cycles in the destination clock domain.

ADDRHI[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **AE**: Address Enable

This bit is always set to 1.

Bits 30:17 Reserved, must be kept at reset value.

Bit 16 **DCS**: DMA Channel Select

This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address0 content is routed.
0: DMA Rx channel 0
1: DMA Rx channel 1

Bits 15:0 **ADDRHI[15:0]**: MAC Address0[47:32]

This field contains the upper 16 bits [47:32] of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

MAC Address x low register (ETH_MACAxLR)

Address offset: 0x0304 + 0x8 * x, (x = 0 to 3)

Reset value: 0xFFFF FFFF

The MAC Address x Low register holds the lower 32 bits of the 6-byte first MAC address of the station.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADDRLO[31:16]

ADDRLO[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ADDRLO[31:0]**: MAC Address x [31:0] (x = 0 to 3)

This field contains the lower 32 bits of the first 6-byte MAC address. The MAC uses this field for filtering the received packets and inserting the MAC address in the Transmit Flow Control (Pause) Packets.

MAC Address x high register (ETH_MACAxHR)

Address offset: 0x0308 + 0x8 * (x-1), (x = 1 to 3)

Reset value: 0x0000 FFFF

The MAC Address x High register holds the upper 16 bits of the second 6-byte MAC address of the station.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
AE	SA	MBC[5:0]						Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCS

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDRHI[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **AE**: Address Enable

When this bit is set, the address filter module uses the second MAC address for perfect filtering. When this bit is reset, the address filter module ignores the address for filtering.

Bit 30 **SA**: Source Address

When this bit is set, the MAC Addressx[47:0] is used to compare with the SA fields of the received packet. When this bit is reset, the MAC Address x[47:0] is used to compare with the DA fields of the received packet.

0: DA

1: SA

Bits 29:24 **MBC[5:0]**: Mask Byte Control

These bits are mask control bits for comparing each of the MAC Address bytes. When set high, the MAC does not compare the corresponding byte of received DA or SA with the contents of MAC Address1 registers. Each bit controls the masking of the bytes as follows:

Bit 29: ETH_MACAxHR[15:8]

Bit 28: ETH_MACAxHR[7:0]

Bit 27: ETH_MACAxLR[31:24]

Bit 26: ETH_MACAxLR[23:16]

Bit 25: ETH_MACAxLR[15:8]

Bit 24: ETH_MACAxLR[7:0]

You can filter a group of addresses (known as group address filtering) by masking one or more bytes of the address.

Bits 23:17 Reserved, must be kept at reset value.

Bit 16 **DCS**: DMA Channel Select

This field contains the binary representation of the DMA Channel number to which an Rx packet whose DA matches the MAC Address0 content is routed.

0: DMA Rx channel 0

1: DMA Rx channel 1

Bits 15:0 **ADDRHI[15:0]**: MAC Address1 [47:32]

This field contains the upper 16 bits[47:32] of the second 6-byte MAC address.

MMC control register (ETH_MMC_CONTROL)

Address offset: 0x0700

Reset value: 0x0000 0000

This register configures the MMC operating mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	UCDBC	Res.	Res.	CNTPRSTLVL	CNTPRST	CNTFREEZ	RSTONRD	CNTSTOPRO	CNTRST
							rw			rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **UCDBC**: Update MMC Counters for Dropped Broadcast Packets

The CNTRST bit has a higher priority than the CNTPRST bit. Therefore, when the software tries to set both bits in the same write cycle, all counters are cleared and the CNTPRST bit is not set.

When set, the MAC updates all related MMC Counters for Broadcast packets that are dropped because of the setting of the DBF bit of *Packet filtering control register (ETH_MACPFR)*.

When reset, the MMC Counters are not updated for dropped Broadcast packets.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **CNTPRSTLVL**: Full-Half Preset

When this bit is low and the CNTPRST bit is set, all MMC counters get preset to almost-half value. All octet counters get preset to 0x7FFF F800 (Half 2Kbytes) and all packet-counters get preset to 0x7FFF FFF0 (Half 16).

When this bit is high and the CNTPRST bit is set, all MMC counters get preset to almost-full value. All octet counters get preset to 0xFFFF F800 (Full 2Kbytes) and all packet-counters get preset to 0xFFFF FFF0 (Full 16).

For 16-bit counters, the almost-half preset values are 0x7800 and 0x7FF0 for the respective octet and packet counters. Similarly, the almost-full preset values for the 16-bit counters are 0xF800 and 0xFFF0.

Bit 4 **CNTPRST**: Counters Preset

When this bit is set, all counters are initialized or preset to almost full or almost half according to the CNTPRSTLVL bit. This bit is cleared automatically after 1 clock cycle.

This bit, along with the CNTPRSTLVL bit, is useful for debugging and testing the assertion of interrupts because of MMC counter becoming half-full or full.

Bit 3 **CNTFREEZ**: MMC Counter Freeze

When this bit is set, it freezes all MMC counters to their current value.

Until this bit is reset to 0, no MMC counter is updated because of any transmitted or received packet. If any MMC counter is read with the Reset on Read bit set, then that counter is also cleared in this mode.

Bit 2 **RSTONRD**: Reset on Read

When this bit is set, the MMC counters are reset to zero after Read (self-clearing after reset). The counters are cleared when the least significant byte lane (Bits[7:0]) is read.

Bit 1 **CNTSTOPRO**: Counter Stop Rollover

When this bit is set, the counter does not roll over to zero after reaching the maximum value.

Bit 0 **CNTRST**: Counters Reset

When this bit is set, all counters are reset. This bit is cleared automatically after 1 clock cycle.

MMC Rx interrupt register (ETH_MMC_RX_INTERRUPT)

Address offset: 0x0704

Reset value: 0x0000 0000

This register maintains the interrupts generated from all Receive statistics counters.

The MMC receive interrupt register maintains the interrupts that are generated when the following occur:

- Receive statistic counters reach half of their maximum values (0x8000 0000 for 32-bit counter and 0x8000 for 16-bit counter).
- Receive statistic counters cross their maximum values (0xFFFF FFFF for 32-bit counter and 0xFFFF for 16-bit counter).

When the CNTSTOPRO is set in *MMC control register (ETH_MMC_CONTROL)*, interrupts are set but the counter remains at all-ones. The MMC receive interrupt register is a 32-bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **RXLPITRCIS**: MMC Receive LPI transition counter interrupt status
This bit is set when the *Rx LPI transition counter register (ETH_RX_LPI_TRAN_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 26 **RXLPIUSCIS**: MMC Receive LPI microsecond counter interrupt status
This bit is set when the *Rx LPI microsecond counter register (ETH_RX_LPI_USEC_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 25 **RXCTRLPIS**: MMC Receive Control Packet Counter Interrupt Status
This bit is set when the *Rx control packets good register (ETH_RX_CONTROL_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 24 **RXRCVERRPIS**: MMC Receive Error Packet Counter Interrupt Status
This bit is set when the *Rx receive error register (ETH_RX_RECEIVE_ERROR)* counter reaches half of the maximum value or the maximum value.

Bit 23 **RXWDOGPIS**: MMC Receive Watchdog Error Packet Counter Interrupt Status
This bit is set when the *Rx watchdog error packets register (ETH_RX_WATCHDOG_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 22 **RXVLANGBPIS**: MMC Receive VLAN Good Bad Packet Counter Interrupt Status
This bit is set when the *Rx VLAN packets good bad register (ETH_RX_VLAN_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 21 **RXFOVPIS**: MMC Receive FIFO Overflow Packet Counter Interrupt Status
This bit is set when the *Rx FIFO overflow packets register (ETH_RX_FIFO_OVERFLOW_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 20 **RXPAUSPIS**: MMC Receive Pause Packet Counter Interrupt Status
This bit is set when the *Rx pause packets register (ETH_RX_PAUSE_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 19 **RXORANGEPIS**: MMC Receive Out Of Range Error Packet Counter Interrupt Status
This bit is set when the *Rx out of range type packets register (ETH_RX_OUT_OF_RANGE_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 18 **RXLENERPIS**: MMC Receive Length Error Packet Counter Interrupt Status
This bit is set when the *Rx length error packets register (ETH_RX_LENGTH_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 17 **RXUCGPIS**: MMC Receive Unicast Good Packet Counter Interrupt Status
This bit is set when the *Rx unicast packets good register (ETH_RX_UNICAST_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 16 **RX1024TMAXOCTGBPIS**: MMC Receive 1024 to Maximum Octet Good Bad Packet Counter Interrupt Status
This bit is set when the *Rx 1024 to max octets packets good bad register (ETH_RX_1024TOMAXOCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 15 **RX512T1023OCTGBPIS**: MMC Receive 512 to 1023 Octet Good Bad Packet Counter Interrupt Status

This bit is set when the *Rx 512 to 1023 octets packets good bad register (ETH_RX_512TO1023OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 14 **RX256T511OCTGBPIS**: MMC Receive 256 to 511 Octet Good Bad Packet Counter Interrupt Status

This bit is set when the *Rx 256 to 511 octets packets good bad register (ETH_RX_256TO511OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 13 **RX128T255OCTGBPIS**: MMC Receive 128 to 255 Octet Good Bad Packet Counter Interrupt Status

This bit is set when the *Rx 128 to 255 octets packets good bad register (ETH_RX_128TO255OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 12 **RX65T127OCTGBPIS**: MMC Receive 65 to 127 Octet Good Bad Packet Counter Interrupt Status

This bit is set when the *Rx 65 to 127 octets packets good bad register (ETH_RX_65TO127OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 11 **RX64OCTGBPIS**: MMC Receive 64 Octet Good Bad Packet Counter Interrupt Status

This bit is set when the *Rx unicast packets good register (ETH_RX_UNICAST_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 10 **RXOSIZEGPIS**: MMC Receive Oversize Good Packet Counter Interrupt Status

This bit is set when the *Rx oversize packets good register (ETH_RX_OVERSIZE_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 9 **RXUSIZEGPIS**: MMC Receive Undersize Good Packet Counter Interrupt Status

This bit is set when the *Rx undersize packets good register (ETH_RX_UNDERSIZE_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 8 **RXJABERPIS**: MMC Receive Jabber Error Packet Counter Interrupt Status

This bit is set when the *Rx jabber error packets register (ETH_RX_JABBER_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 7 **RXRUNTPIS**: MMC Receive Runt Packet Counter Interrupt Status

This bit is set when the *Rx runt error packets register (ETH_RX_RUNT_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 6 **RXALGNERPIS**: MMC Receive Alignment Error Packet Counter Interrupt Status

This bit is set when the *Rx alignment error packets register (ETH_RX_ALIGNMENT_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 5 **RXCRCERPIS**: MMC Receive CRC Error Packet Counter Interrupt Status

This bit is set when the *Rx CRC error packets register (ETH_RX_CRC_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 4 **RXMCGPIS**: MMC Receive Multicast Good Packet Counter Interrupt Status
This bit is set when the *Rx multicast packets good register (ETH_RX_MULTICAST_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 3 **RXBCGPIS**: MMC Receive Broadcast Good Packet Counter Interrupt Status
This bit is set when the *Rx broadcast packets good register (ETH_RX_BROADCAST_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 2 **RXGOCTIS**: MMC Receive Good Octet Counter Interrupt Status
This bit is set when the *Rx octet count good register (ETH_RX_OCTET_COUNT_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 1 **RXGBOCTIS**: MMC Receive Good Bad Octet Counter Interrupt Status
This bit is set when the *Rx octet count good bad register (ETH_RX_OCTET_COUNT_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 0 **RXGBPKTIS**: MMC Receive Good Bad Packet Counter Interrupt Status
This bit is set when the *Rx packets count good bad register (ETH_RX_PACKETS_COUNT_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

MMC Tx interrupt register (ETH_MMC_TX_INTERRUPT)

Address offset: 0x0708

Reset value: 0x0000 0000

This register maintains the interrupts generated from all Transmit statistics counters.

The MMC transmit interrupt register maintains the interrupts generated when transmit statistic counters reach half their maximum values (0x8000 0000 for 32-bit counter and 0x8000 for 16 bit counter), and when they cross their maximum values (0xFFFF FFFF for 32-bit counter and 0xFFFF for 16-bit counter).

When CNTSTOPRO is set in *MMC control register (ETH_MMC_CONTROL)*, the interrupts are set but the counter remains at all-ones.

The MMC transmit interrupt register is a 32-bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read.

The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **TXLPITRCIS**: MMC Transmit LPI transition counter interrupt status
This bit is set when the *Tx LPI transition counter register (ETH_TX_LPI_TRAN_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 26 **TXLPIUSCIS**: MMC Transmit LPI microsecond counter interrupt status
This bit is set when the *Tx LPI microsecond timer register (ETH_TX_LPI_USEC_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 25 **TXOSIZEGPIS**: MMC Transmit Oversize Good Packet Counter Interrupt Status
This bit is set when the *Tx OSsize packets good register (ETH_TX_OSIZE_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 24 **TXVLANGPIS**: MMC Transmit VLAN Good Packet Counter Interrupt Status
This bit is set when the *Tx VLAN packets good register (ETH_TX_VLAN_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 23 **TXPAUSPIS**: MMC Transmit Pause Packet Counter Interrupt Status
This bit is set when the *Tx pause packets register (ETH_TX_PAUSE_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 22 **TXEXDEFPIS**: MMC Transmit Excessive Deferral Packet Counter Interrupt Status
This bit is set when the *Tx excessive deferral error register (ETH_TX_EXCESSIVE_DEFERRAL_ERROR)* counter reaches half of the maximum value or the maximum value.

Bit 21 **TXGPKTIS**: MMC Transmit Good Packet Counter Interrupt Status
This bit is set when the *Tx packet count good register (ETH_TX_PACKET_COUNT_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 20 **TXGOCTIS**: MMC Transmit Good Octet Counter Interrupt Status
This bit is set when the *Tx octet count good register (ETH_TX_OCTET_COUNT_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 19 **TXCARERPIS**: MMC Transmit Carrier Error Packet Counter Interrupt Status
This bit is set when the *Tx carrier error packets register (ETH_TX_CARRIER_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 18 **TXEXCOLPIS**: MMC Transmit Excessive Collision Packet Counter Interrupt Status
This bit is set when the *Tx excessive collision packets register (ETH_TX_EXCESSIVE_COLLISION_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 17 **TXLATCOLPIS**: MMC Transmit Late Collision Packet Counter Interrupt Status
This bit is set when the *Tx late collision packets register (ETH_TX_LATE_COLLISION_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 16 **TXDEFPIS**: MMC Transmit Deferred Packet Counter Interrupt Status
This bit is set when the *Tx deferred packets register (ETH_TX_DEFERRED_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 15 **TXMCOLGPIS**: MMC Transmit Multiple Collision Good Packet Counter Interrupt Status
This bit is set when the *Tx multiple collision good packets register (ETH_TX_MULTIPLE_COLLISION_GOOD_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 14 **TXSCOLGPIS**: MMC Transmit Single Collision Good Packet Counter Interrupt Status
This bit is set when the *Tx single collision good packets register (ETH_TX_SINGLE_COLLISION_GOOD_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 13 **TXUFLOWERPIS**: MMC Transmit Underflow Error Packet Counter Interrupt Status
This bit is set when the *Tx underflow error packets register (ETH_TX_UNDERFLOW_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 12 **TXBCGBPIS**: MMC Transmit Broadcast Good Bad Packet Counter Interrupt Status
This bit is set when the *Tx broadcast packets good bad register (ETH_TX_BROADCAST_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 11 **TXMCGBPIS**: MMC Transmit Multicast Good Bad Packet Counter Interrupt Status
This bit is set when the *Tx multicast packets good bad register (ETH_TX_MULTICAST_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 10 **TXUCGBPIS**: MMC Transmit Unicast Good Bad Packet Counter Interrupt Status
This bit is set when the *Tx unicast packets good bad register (ETH_TX_UNICAST_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 9 **TX1024TMAXOCTGBPIS**: MMC Transmit 1024 to Maximum Octet Good Bad Packet Counter Interrupt Status
This bit is set when the *Tx 1024 to max octets packets good bad register (ETH_TX_1024TOMAXOCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 8 **TX512T1023OCTGBPIS**: MMC Transmit 512 to 1023 Octet Good Bad Packet Counter Interrupt Status
This bit is set when the *Tx 512 to 1023 octets packets good bad register (ETH_TX_512TO1023OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 7 **TX256T511OCTGBPIS**: MMC Transmit 256 to 511 Octet Good Bad Packet Counter Interrupt Status

This bit is set when the *Tx 256 to 511 octets packets good bad register (ETH_TX_256TO511OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 6 **TX128T255OCTGBPIS**: MMC Transmit 128 to 255 Octet Good Bad Packet Counter Interrupt Status

This bit is set when the *Tx 128 to 255 octets packets good bad register (ETH_TX_128TO255OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 5 **TX65T127OCTGBPIS**: MMC Transmit 65 to 127 Octet Good Bad Packet Counter Interrupt Status

This bit is set when the *Tx 65 to 127 octets packets good bad register (ETH_TX_64TO127OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 4 **TX64OCTGBPIS**: MMC Transmit 64 Octet Good Bad Packet Counter Interrupt Status

This bit is set when the *Tx 64 octets packets good bad register (ETH_TX_64OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 3 **TXMCGPIS**: MMC Transmit Multicast Good Packet Counter Interrupt Status

This bit is set when the *Tx multicast packets good register (ETH_TX_MULTICAST_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 2 **TXBCGPIS**: MMC Transmit Broadcast Good Packet Counter Interrupt Status

This bit is set when the *Tx single collision good packets register (ETH_TX_SINGLE_COLLISION_GOOD_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 1 **TXGBPKTIS**: MMC Transmit Good Bad Packet Counter Interrupt Status

This bit is set when the *Tx packet count good bad register (ETH_TX_PACKET_COUNT_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 0 **TXGBOCTIS**: MMC Transmit Good Bad Octet Counter Interrupt Status

This bit is set when the *Tx octet count good bad register (ETH_TX_OCTET_COUNT_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

MMC Rx interrupt mask register (ETH_MMC_RX_INTERRUPT_MASK)

Address offset: 0x070C

Reset value: 0x0000 0000

The MMC receive interrupt mask register maintains the masks for the interrupts generated when receive statistic counters reach half of their maximum value or the maximum values.

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **RXLPITRCIM**: MMC Receive LPI transition counter interrupt Mask

Setting this bit masks the interrupt when the *Rx LPI transition counter register (ETH_RX_LPI_TRAN_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 26 **RXLPIUSCIM**: MMC Receive LPI microsecond counter interrupt Mask

Setting this bit masks the interrupt when the *Rx LPI microsecond counter register (ETH_RX_LPI_USEC_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 25 **RXCTRLPIM**: MMC Receive Control Packet Counter Interrupt Mask

Setting this bit masks the interrupt when the *Rx control packets good register (ETH_RX_CONTROL_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 24 **RXRCVERRPIM**: MMC Receive Error Packet Counter Interrupt Mask

Setting this bit masks the interrupt when the *Rx receive error register (ETH_RX_RECEIVE_ERROR)* counter reaches half of the maximum value or the maximum value.

Bit 23 **RXWDOGPIM**: MMC Receive Watchdog Error Packet Counter Interrupt Mask

Setting this bit masks the interrupt when the *Rx watchdog error packets register (ETH_RX_WATCHDOG_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 22 **RXVLANGBPIM**: MMC Receive VLAN Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx VLAN packets good bad register (ETH_RX_VLAN_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 21 **RXFOVPIM**: MMC Receive FIFO Overflow Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx FIFO overflow packets register (ETH_RX_FIFO_OVERFLOW_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 20 **RXPAUSPIM**: MMC Receive Pause Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx pause packets register (ETH_RX_PAUSE_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 19 **RXORANGEPIM**: MMC Receive Out Of Range Error Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx out of range type packets register (ETH_RX_OUT_OF_RANGE_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 18 **RXLENERPIM**: MMC Receive Length Error Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx length error packets register (ETH_RX_LENGTH_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 17 **RXUCGPIM**: MMC Receive Unicast Good Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx unicast packets good register (ETH_RX_UNICAST_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 16 **RX1024TMAXOCTGBPIM**: MMC Receive 1024 to Maximum Octet Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx 1024 to max octets packets good bad register (ETH_RX_1024TOMAXOCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 15 **RX512T1023OCTGBPIM**: MMC Receive 512 to 1023 Octet Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx 512 to 1023 octets packets good bad register (ETH_RX_512TO1023OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 14 **RX256T511OCTGBPIM**: MMC Receive 256 to 511 Octet Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx 256 to 511 octets packets good bad register (ETH_RX_256TO511OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 13 **RX128T255OCTGBPIM**: MMC Receive 128 to 255 Octet Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx 128 to 255 octets packets good bad register (ETH_RX_128TO255OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 12 **RX65T127OCTGBPIM**: MMC Receive 65 to 127 Octet Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx 65 to 127 octets packets good bad register (ETH_RX_65TO127OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 11 **RX64OCTGBPIM**: MMC Receive 64 Octet Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx unicast packets good register (ETH_RX_UNICAST_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 10 **RXOSIZEGPIM**: MMC Receive Oversize Good Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx oversize packets good register (ETH_RX_OVERSIZE_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 9 **RXUSIZEGPIM**: MMC Receive Undersize Good Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx undersize packets good register (ETH_RX_UNDERSIZE_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 8 **RXJABERPIM**: MMC Receive Jabber Error Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx jabber error packets register (ETH_RX_JABBER_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 7 **RXRUNTPIM**: MMC Receive Runt Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx runt error packets register (ETH_RX_RUNT_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 6 **RXALGNERPIM**: MMC Receive Alignment Error Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx alignment error packets register (ETH_RX_ALIGNMENT_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 5 **RXCRCERPIM**: MMC Receive CRC Error Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx CRC error packets register (ETH_RX_CRC_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 4 **RXMCGPIM**: MMC Receive Multicast Good Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx multicast packets good register (ETH_RX_MULTICAST_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 3 **RXBCGPIM**: MMC Receive Broadcast Good Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx broadcast packets good register (ETH_RX_BROADCAST_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 2 **RXGOCTIM**: MMC Receive Good Octet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx octet count good register (ETH_RX_OCTET_COUNT_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 1 **RXGBOCTIM**: MMC Receive Good Bad Octet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx octet count good bad register (ETH_RX_OCTET_COUNT_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 0 **RXGBPKTIM**: MMC Receive Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Rx packets count good bad register (ETH_RX_PACKETS_COUNT_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

MMC Tx interrupt mask register (ETH_MMC_TX_INTERRUPT_MASK)

Address offset: 0x0710

Reset value: 0x0000 0000

The MMC transmit interrupt mask register maintains the masks for the interrupts generated when the transmit statistic counters reach half of their maximum value or the maximum values. This register is 32-bit wide.

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **TXLPITRCIM**: MMC Transmit LPI transition counter interrupt Mask

Setting this bit masks the interrupt when the *Tx LPI transition counter register (ETH_TX_LPI_TRAN_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 26 **TXLPIUSCIM**: MMC Transmit LPI microsecond counter interrupt Mask

Setting this bit masks the interrupt when the *Tx LPI microsecond timer register (ETH_TX_LPI_USEC_CNTR)* counter reaches half of the maximum value or the maximum value.

Bit 25 **TXOSIZEGPIM**: MMC Transmit Oversize Good Packet Counter Interrupt Mask

Setting this bit masks the interrupt when the *Tx OSsize packets good register (ETH_TX_OSIZE_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 24 **TXVLANGPIM**: MMC Transmit VLAN Good Packet Counter Interrupt Mask

Setting this bit masks the interrupt when the *Tx VLAN packets good register (ETH_TX_VLAN_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 23 **TXPAUSPIM**: MMC Transmit Pause Packet Counter Interrupt Mask

Setting this bit masks the interrupt when the *Tx pause packets register (ETH_TX_PAUSE_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 22 **TXEXDEFPIM**: MMC Transmit Excessive Deferral Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx excessive deferral error register (ETH_TX_EXCESSIVE_DEFERRAL_ERROR)* counter reaches half of the maximum value or the maximum value.

Bit 21 **TXGPKTIM**: MMC Transmit Good Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx packet count good register (ETH_TX_PACKET_COUNT_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 20 **TXGOCTIM**: MMC Transmit Good Octet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx octet count good register (ETH_TX_OCTET_COUNT_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 19 **TXCARERPIM**: MMC Transmit Carrier Error Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx carrier error packets register (ETH_TX_CARRIER_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 18 **TXEXCOLPIM**: MMC Transmit Excessive Collision Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx excessive collision packets register (ETH_TX_EXCESSIVE_COLLISION_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 17 **TXLATCOLPIM**: MMC Transmit Late Collision Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx late collision packets register (ETH_TX_LATE_COLLISION_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 16 **TXDEFPIM**: MMC Transmit Deferred Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx deferred packets register (ETH_TX_DEFERRED_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 15 **TXMCOLGPIM**: MMC Transmit Multiple Collision Good Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx multiple collision good packets register (ETH_TX_MULTIPLE_COLLISION_GOOD_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 14 **TXSCOLGPIM**: MMC Transmit Single Collision Good Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx single collision good packets register (ETH_TX_SINGLE_COLLISION_GOOD_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 13 **TXUFLOWERPIM**: MMC Transmit Underflow Error Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx underflow error packets register (ETH_TX_UNDERFLOW_ERROR_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 12 **TXBCGBPIM**: MMC Transmit Broadcast Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx broadcast packets good bad register (ETH_TX_BROADCAST_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 11 **TXMCGBPIM**: MMC Transmit Multicast Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx multicast packets good bad register (ETH_TX_MULTICAST_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 10 **TXUCGBPIM**: MMC Transmit Unicast Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx unicast packets good bad register (ETH_TX_UNICAST_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 9 **TX1024TMAXOCTGBPIM**: MMC Transmit 1024 to Maximum Octet Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx 1024 to max octets packets good bad register (ETH_TX_1024TOMAXOCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 8 **TX512T1023OCTGBPIM**: MMC Transmit 512 to 1023 Octet Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx 512 to 1023 octets packets good bad register (ETH_TX_512TO1023OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 7 **TX256T511OCTGBPIM**: MMC Transmit 256 to 511 Octet Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx 256 to 511 octets packets good bad register (ETH_TX_256TO511OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 6 **TX128T255OCTGBPIM**: MMC Transmit 128 to 255 Octet Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx 128 to 255 octets packets good bad register (ETH_TX_128TO255OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 5 **TX65T127OCTGBPIM**: MMC Transmit 65 to 127 Octet Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx 65 to 127 octets packets good bad register (ETH_TX_64TO127OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 4 **TX64OCTGBPIM**: MMC Transmit 64 Octet Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx 64 octets packets good bad register (ETH_TX_64OCTETS_PACKETS_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 3 **TXMCGPIM**: MMC Transmit Multicast Good Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx multicast packets good register (ETH_TX_MULTICAST_PACKETS_GOOD)* counter reaches half of the maximum value or the maximum value.

Bit 2 **TXBCGPIM**: MMC Transmit Broadcast Good Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx single collision good packets register (ETH_TX_SINGLE_COLLISION_GOOD_PACKETS)* counter reaches half of the maximum value or the maximum value.

Bit 1 **TXGBPKTIM**: MMC Transmit Good Bad Packet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx packet count good bad register (ETH_TX_PACKET_COUNT_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Bit 0 **TXGBOCTIM**: MMC Transmit Good Bad Octet Counter Interrupt Mask
Setting this bit masks the interrupt when the *Tx octet count good bad register (ETH_TX_OCTET_COUNT_GOOD_BAD)* counter reaches half of the maximum value or the maximum value.

Tx octet count good bad register (ETH_TX_OCTET_COUNT_GOOD_BAD)

Address offset: 0x0714

Reset value: 0x0000 0000

This register provides the number of bytes transmitted by the Ethernet peripheral, exclusive of preamble and retried bytes, in good and bad packets.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXOCTGB[31:16]

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXOCTGB[31:0]**: Tx Octet Count Good Bad
This field indicates the number of bytes transmitted, exclusive of preamble and retried bytes, in good and bad packets.

Tx packet count good bad register (ETH_TX_PACKET_COUNT_GOOD_BAD)

Address offset: 0x0718

Reset value: 0x0000 0000

This register provides the number of good and bad packets transmitted by the Ethernet peripheral, exclusive of retried packets.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

TX512_1023OCTGB[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TX512_1023OCTGB[31:0]**: Tx 512 to 1023 octets Packets Good Bad

This field indicates the number of good and bad packets transmitted with length between 512 and 1023 (inclusive) bytes, exclusive of preamble and retried packets.

Tx 1024 to max octets packets good bad register (ETH_TX_1024TOMAXOCTETS_PACKETS_GOOD_BAD)

Address offset: 0x0738

Reset value: 0x0000 0000

This register provides the number of good and bad packets transmitted by the Ethernet peripheral with a length 1024 to maxsize (inclusive) bytes, exclusive of preamble and retried packets.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

TX1024_MAXOCTGB[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TX1024_MAXOCTGB[31:0]**: Tx 1024 to Max octets Packets Good Bad

This field indicates the number of good and bad packets transmitted with length between 1024 and maxsize (inclusive) bytes, exclusive of preamble and retried packets.

Tx unicast packets good bad register (ETH_TX_UNICAST_PACKETS_GOOD_BAD)

Address offset: 0x073C

Reset value: 0x0000 0000

This register provides the number of good and bad unicast packets transmitted by the Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

TXMCASTGB[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXMCASTGB[31:0]**: Tx Multicast Packets Good Bad

This field indicates the number of good and bad multicast packets transmitted.

Tx broadcast packets good bad register (ETH_TX_BROADCAST_PACKETS_GOOD_BAD)

Address offset: 0x0744

Reset value: 0x0000 0000

This register provides the number of good and bad broadcast packets transmitted by the Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXBCASTGB[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

TXBCASTGB[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXBCASTGB[31:0]**: Tx Broadcast Packets Good Bad

This field indicates the number of good and bad broadcast packets transmitted.

Tx underflow error packets register (ETH_TX_UNDERFLOW_ERROR_PACKETS)

Address offset: 0x0748

Reset value: 0x0000 0000

This register provides the number of packets aborted by the Ethernet peripheral because of packet underflow error.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXUNDRFLW[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

TXUNDRFLW[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXUNDRFLW[31:0]**: Tx Underflow Error Packets

This field indicates the number of packets aborted because of packets underflow error.

Tx single collision good packets register (ETH_TX_SINGLE_COLLISION_GOOD_PACKETS)

Address offset: 0x074C

Reset value: 0x0000 0000

This register provides the number of successfully transmitted packets by Ethernet peripheral after a single collision in the Half-duplex mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXSNGLCOLG[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

TXSNGLCOLG[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXSNGLCOLG[31:0]**: Tx Single Collision Good Packets

This field indicates the number of successfully transmitted packets after a single collision in the Half-duplex mode.

Tx multiple collision good packets register (ETH_TX_MULTIPLE_COLLISION_GOOD_PACKETS)

Address offset: 0x0750

Reset value: 0x0000 0000

This register provides the number of successfully transmitted packets by Ethernet peripheral after multiple collisions in the Half-duplex mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXMULTCOLG[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

TXMULTCOLG[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXMULTCOLG[31:0]**: Tx Multiple Collision Good Packets

This field indicates the number of successfully transmitted packets after multiple collisions in the Half-duplex mode.

Tx deferred packets register (ETH_TX_DEFERRED_PACKETS)

Address offset: 0x0754

Reset value: 0x0000 0000

This register provides the number of packets successfully transmitted by the Ethernet peripheral after a deferral in Half-duplex mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

TXDEFRD[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXDEFRD[31:0]**: Tx Deferred Packets

This field indicates the number of packets successfully transmitted after a deferral in the half-duplex mode.

Tx late collision packets register (ETH_TX_LATE_COLLISION_PACKETS)

Address offset: 0x0758

Reset value: 0x0000 0000

This register provides the number of packets aborted by the Ethernet peripheral because of late collision error.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXLATECOL[31:16]

TXLATECOL[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXLATECOL[31:0]**: Tx Late Collision Packets

This field indicates the number of packets aborted because of late collision error.

Tx excessive collision packets register (ETH_TX_EXCESSIVE_COLLISION_PACKETS)

Address offset: 0x075C

Reset value: 0x0000 0000

This register provides the number of packets aborted by the Ethernet peripheral because of excessive (16) collision errors.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXEXSCOL[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

TXEXSCOL[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXEXSCOL[31:0]**: Tx Excessive Collision Packets

This field indicates the number of packets aborted because of excessive (16) collision errors.

Tx carrier error packets register (ETH_TX_CARRIER_ERROR_PACKETS)

Address offset: 0x0760

Reset value: 0x0000 0000

This register provides the number of packets aborted by the Ethernet peripheral because of carrier sense error (no carrier or loss of carrier).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXCARR[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

TXCARR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXCARR[31:0]**: Tx Carrier Error Packets

This field indicates the number of packets aborted because of carrier sense error (no carrier or loss of carrier).

Tx octet count good register (ETH_TX_OCTET_COUNT_GOOD)

Address offset: 0x0764

Reset value: 0x0000 0000

This register provides the number of bytes transmitted by the Ethernet peripheral, exclusive of preamble, only in good packets.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXOCTG[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TXOCTG[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXOCTG[31:0]**: Tx Octet Count Good

This field indicates the number of bytes transmitted, exclusive of preamble, only in good packets.

Tx packet count good register (ETH_TX_PACKET_COUNT_GOOD)

Address offset: 0x0768

Reset value: 0x0000 0000

This register provides the number of good packets transmitted by Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXPKTG[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

TXPKTG[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXPKTG[31:0]**: Tx Packet Count Good

This field indicates the number of good packets transmitted.

Tx excessive deferral error register (ETH_TX_EXCESSIVE_DEFERRAL_ERROR)

Address offset: 0x076C

Reset value: 0x0000 0000

This register provides the number of packets aborted by the Ethernet peripheral because of excessive deferral error (deferred for more than two max-sized packet times).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

TXPAUSE[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXPAUSE[31:0]**: Tx Pause Packets

This field indicates the number of good Pause packets transmitted.

Tx VLAN packets good register (ETH_TX_VLAN_PACKETS_GOOD)

Address offset: 0x0774

Reset value: 0x0000 0000

This register provides the number of good VLAN packets transmitted by the Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXVLANG[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

TXVLANG[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXVLANG[31:0]**: Tx VLAN Packets Good

This field provides the number of good VLAN packets transmitted.

Tx OSsize packets good register (ETH_TX_OSIZE_PACKETS_GOOD)

Address offset: 0x0778

Reset value: 0x0000 0000

This register provides the number of packets transmitted by the Ethernet peripheral without errors and with a length greater than the maxsize (1,518 or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in S2KP bit of the *Operating mode configuration register (ETH_MACCR)*.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

TXOSIZG[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXOSIZG[31:0]**: Tx OSize Packets Good

This field indicates the number of packets transmitted without errors and with length greater than the maxsize (1,518 or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in S2KP bit of the *Operating mode configuration register (ETH_MACCR)*).

Rx packets count good bad register (ETH_RX_PACKETS_COUNT_GOOD_BAD)

Address offset: 0x0780

Reset value: 0x0000 0000

This register provides the number of good and bad packets received by the Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

RXPKTGB[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXPKTGB[31:0]**: Rx Packets Count Good Bad

This field indicates the number of good and bad packets received.

Rx octet count good bad register (ETH_RX_OCTET_COUNT_GOOD_BAD)

Address offset: 0x0784

Reset value: 0x0000 0000

This register provides the number of bytes received by the Ethernet peripheral, exclusive of preamble, in good and bad packets.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

RXOCTGB[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXOCTGB[31:0]**: Rx Octet Count Good Bad

This field indicates the number of bytes received, exclusive of preamble, in good and bad packets.

Rx octet count good register (ETH_RX_OCTET_COUNT_GOOD)

Address offset: 0x0788

Reset value: 0x0000 0000

This register provides the number of bytes received by the Ethernet peripheral, exclusive of preamble, only in good packets.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

RXOCTG[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXOCTG[31:0]**: Rx Octet Count Good

This field indicates the number of bytes received, exclusive of preamble, only in good packets.

Rx broadcast packets good register (ETH_RX_BROADCAST_PACKETS_GOOD)

Address offset: 0x078C

Reset value: 0x0000 0000

This register provides the number of good broadcast packets received by the Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXBCASTG[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

RXBCASTG[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXBCASTG[31:0]**: Rx Broadcast Packets Good

This field indicates the number of good broadcast packets received.

Rx multicast packets good register (ETH_RX_MULTICAST_PACKETS_GOOD)

Address offset: 0x0790

Reset value: 0x0000 0000

This register provides the number of good multicast packets received by the Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXMCASTG[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

RXMCASTG[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXMCASTG[31:0]**: Rx Multicast Packets Good

This field indicates the number of good multicast packets received.

Rx CRC error packets register (ETH_RX_CRC_ERROR_PACKETS)

Address offset: 0x0794

Reset value: 0x0000 0000

This register provides the number of packets received by Ethernet peripheral with CRC error.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXCRCERR[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RXCRCERR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXCRCERR[31:0]**: Rx CRC Error Packets

This field indicates the number of packets received with CRC error.

Rx alignment error packets register (ETH_RX_ALIGNMENT_ERROR_PACKETS)

Address offset: 0x0798

Reset value: 0x0000 0000

This register provides the number of packets received by Ethernet peripheral with alignment (dribble) error. It is valid only in 10/100 mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXALGNERR[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RXALGNERR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXALGNERR[31:0]**: Rx Alignment Error Packets

This field indicates the number of packets received with alignment (dribble) error. It is valid only in 10/100 mode.

Rx runt error packets register (ETH_RX_RUNT_ERROR_PACKETS)

Address offset: 0x079C

Reset value: 0x0000 0000

This register provides the number of packets received by the Ethernet peripheral with runt error (length less than 64 bytes and CRC error).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXRUNTERR[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RXRUNTERR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXRUNTERR[31:0]**: Rx Runt Error Packets

This field indicates the number of packets received with runt error (length less than 64 bytes and CRC error).

Rx jabber error packets register (ETH_RX_JABBER_ERROR_PACKETS)

Address offset: 0x07A0

Reset value: 0x0000 0000

This register provides the number of giant packets received by the Ethernet peripheral with a length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN tagged), and with CRC error. If Jumbo Packet mode is enabled, the packets of length greater than 9,018 bytes (9,022 bytes for VLAN tagged) are considered as giant packets.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXJABERR[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

RXJABERR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXJABERR[31:0]**: Rx Jabber Error Packets

This field indicates the number of giant packets received with length (including CRC) greater than 1,518 bytes (1,522 bytes for VLAN tagged) and with CRC error. If Jumbo Packet mode is enabled, packets of length greater than 9,018 bytes (9,022 bytes for VLAN tagged) are considered as giant packets.

Rx undersize packets good register (ETH_RX_UNDERSIZE_PACKETS_GOOD)

Address offset: 0x07A4

Reset value: 0x0000 0000

This register provides the number of packets received by the Ethernet peripheral with a length less than 64 bytes, without any errors.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXUNDERSZG[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RXUNDERSZG[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXUNDERSZG[31:0]**: Rx Undersize Packets Good

This field indicates the number of packets received with length less than 64 bytes, without any errors.

Rx oversize packets good register (ETH_RX_OVERSIZE_PACKETS_GOOD)

Address offset: 0x07A8

Reset value: 0x0000 0000

This register provides the number of packets received by the Ethernet peripheral without errors, with a length greater than the maxsize (1,518 bytes or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in the S2KP bit of the *Operating mode configuration register (ETH_MACCR)*.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXOVERSZG[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RXOVERSZG[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXOVERSZG[31:0]**: Rx Oversize Packets Good

This field indicates the number of packets received without errors, with length greater than the maxsize (1,518 bytes or 1,522 bytes for VLAN tagged packets; 2000 bytes if enabled in the S2KP bit of the *Operating mode configuration register (ETH_MACCR)*).

Rx 64 octets packets good bad register (ETH_RX_64OCTETS_PACKETS_GOOD_BAD)

Address offset: 0x07AC

Reset value: 0x0000 0000

This register provides the number of good and bad packets received by the Ethernet peripheral with length 64 bytes, exclusive of the preamble.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

RX64OCTGB[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RX64OCTGB[31:0]**: Rx 64 Octets Packets Good Bad

This field indicates the number of good and bad packets received with length 64 bytes, exclusive of the preamble.

Rx 65 to 127 octets packets good bad register (ETH_RX_65TO127OCTETS_PACKETS_GOOD_BAD)

Address offset: 0x07B0

Reset value: 0x0000 0000

This register provides the number of good and bad packets received by the Ethernet peripheral with a length between 65 and 127 (inclusive) bytes, exclusive of the preamble.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

RX512_1023OCTGB[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RX512_1023OCTGB[31:0]**: Rx 512-1023 Octets Packets Good Bad

This field indicates the number of good and bad packets received with length between 512 and 1023 (inclusive) bytes, exclusive of the preamble.

Rx 1024 to max octets packets good bad register (ETH_RX_1024TOMAXOCTETS_PACKETS_GOOD_BAD)

Address offset: 0x07C0

Reset value: 0x0000 0000

This register provides the number of good and bad packets received by the Ethernet peripheral with a length between 1024 and maxsize (inclusive) bytes, exclusive of the preamble.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RX1024_MAXOCTGB[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RX1024_MAXOCTGB[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RX1024_MAXOCTGB[31:0]**: Rx 1024-Max Octets Good Bad

This field indicates the number of good and bad packets received with length between 1024 and maxsize (inclusive) bytes, exclusive of the preamble.

Rx unicast packets good register (ETH_RX_UNICAST_PACKETS_GOOD)

Address offset: 0x07C4

Reset value: 0x0000 0000

This register provides the number of good unicast packets received by Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXUCASTG[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

RXUCASTG[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXUCASTG[31:0]**: Rx Unicast Packets Good

This field indicates the number of good unicast packets received.

Rx length error packets register (ETH_RX_LENGTH_ERROR_PACKETS)

Address offset: 0x07C8

Reset value: 0x0000 0000

This register provides the number of packets received by the Ethernet peripheral with a length error (Length Type field not equal to packet size), for all packets with valid length field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXLENERR[31:16]

RXLENERR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXLENERR[31:0]**: Rx Length Error Packets

This field indicates the number of packets received with length error (Length Type field not equal to packet size), for all packets with valid length field.

Rx out of range type packets register (ETH_RX_OUT_OF_RANGE_PACKETS)

Address offset: 0x07CC

Reset value: 0x0000 0000

This register provides the number of packets received by the Ethernet peripheral with la ength field not equal to the valid packet size (greater than 1,500 but less than 1,536).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXOUTOFRNG[31:0]**: Rx Out of Range Type Packet

This field indicates the number of packets received with length field not equal to the valid packet size (greater than 1,500 but less than 1,536).

Rx pause packets register (ETH_RX_PAUSE_PACKETS)

Address offset: 0x07D0

Reset value: 0x0000 0000

This register provides the number of good and valid Pause packets received by the Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXPAUSEPKT[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RXPAUSEPKT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXPAUSEPKT[31:0]**: Rx Pause Packets
This field indicates the number of good and valid Pause packets received.

Rx FIFO overflow packets register (ETH_RX_FIFO_OVERFLOW_PACKETS)

Address offset: 0x07D4

Reset value: 0x0000 0000

This register provides the number of missed received packets because of FIFO overflow in the Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXFIFOOVFL[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

RXFIFOOVFL[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXFIFOOVFL[31:0]**: Rx FIFO Overflow Packets
This field indicates the number of missed received packetsbecause of FIFO overflow.

Rx VLAN packets good bad register (ETH_RX_VLAN_PACKETS_GOOD_BAD)

Address offset: 0x07D8

Reset value: 0x0000 0000

This register provides the number of good and bad VLAN packets received by the Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXVLANPKTGB[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

RXVLANPKTGB[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXVLANPKTGB[31:0]**: Rx VLAN Packets Good Bad

This field indicates the number of good and bad VLAN packets received.

Rx watchdog error packets register (ETH_RX_WATCHDOG_ERROR_PACKETS)

Address offset: 0x07DC

Reset value: 0x0000 0000

This register provides the number of packets received by the Ethernet peripheral with error because of watchdog timeout error (packets with a data load larger than 2,048 bytes (when JE and WD bits are reset in *Operating mode configuration register (ETH_MACCR)*), 10,240 bytes (when JE bit is set and WD bit is reset in *Operating mode configuration register (ETH_MACCR)*), 16,384 bytes (when WD bit is set in *Operating mode configuration register (ETH_MACCR)*) or the value programmed in the watchdog timeout register).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXWDGERR[31:16]

RXWDGERR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXWDGERR[31:0]**: Rx Watchdog Error Packets

This field indicates the number of packets received with error because of watchdog timeout error (packets with a data load larger than 2,048 bytes (when JE and WD bits are reset in *Operating mode configuration register (ETH_MACCR)*), 10,240 bytes (when JE bit is set and WD bit is reset in *Operating mode configuration register (ETH_MACCR)*), 16,384bytes (when WD bit is set in MAC_Configuration register) or the value programmed in the)*Watchdog and jabber timeout register (ETH_MACWJBTR)*.

Rx receive error register (ETH_RX_RECEIVE_ERROR)

Address offset: 0x07E0

Reset value: 0x0000 0000

This register provides the number of packets received by the Ethernet peripheral with Receive error or Packet Extension error on the GMII or MII interface.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXRCVERR[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RXRCVERR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXRCVERR[31:0]**: Rx Receive Error Packets

This field indicates the number of packets received with Receive error or Packet Extension error on the GMII or MII interface.

Rx control packets good register (ETH_RX_CONTROL_PACKETS_GOOD)

Address offset: 0x07E4

Reset value: 0x0000 0000

This register provides the number of good control packets received by the Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXCTRLG[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RXCTRLG[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXCTRLG[31:0]**: Rx Control Packets Good

This field indicates the number of good control packets received.

Tx LPI microsecond timer register (ETH_TX_LPI_USEC_CNTR)

Address offset: 0x07EC

Reset value: 0x0000 0000

This register provides the number of microseconds Tx LPI is asserted by Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXLPIUSC[31:16]

TXLPIUSC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXLPIUSC[31:0]**: Tx LPI Microseconds Counter

This field indicates the number of microseconds Tx LPI is asserted. For every Tx LPI Entry and Exit, the Timer value can have an error of +/- 1 microsecond.

Tx LPI transition counter register (ETH_TX_LPI_TRAN_CNTR)

Address offset: 0x07F0

Reset value: 0x0000 0000

This register provides the number of times Ethernet peripheral has entered Tx LPI.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXLPITRC[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TXLPITRC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXLPITRC[31:0]**: Tx LPI Transition counter

This field indicates the number of times Tx LPI Entry has occurred. Even if Tx LPI Entry occurs in Automate mode (because of LPITXA bit set in the *LPI control and status register (ETH_MACLCSR)*), the counter is incremented.

Rx LPI microsecond counter register (ETH_RX_LPI_USEC_CNTR)

Address offset: 0x07F4

Reset value: 0x0000 0000

This register provides the number of microseconds Rx LPI is sampled by Ethernet peripheral.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXLPIUSC[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RXLPIUSC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXLPIUSC[31:0]**: Rx LPI Microseconds Counter

This field indicates the number of microseconds Rx LPI is asserted. For every Rx LPI Entry and Exit, the Timer value can have an error of +/- 1 microsecond.

Rx LPI transition counter register (ETH_RX_LPI_TRAN_CNTR)

Address offset: 0x07F8

Reset value: 0x0000 0000

This register provides the number of times Ethernet peripheral has entered Rx LPI.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RXLPITRC[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RXLPITRC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RXLPITRC[31:0]**: Rx LPI Transition counter

This field indicates the number of times Rx LPI Entry has occurred.

MMC FPE Tx interrupt status register (ETH_MMC_FPE_TX_ISR)

Address offset: 0x08A0

Reset value: 0x0000 0000

This register maintains the interrupts generated from all FPE related Transmit statistics counters when transmit statistic counters reach half their maximum values (0x8000 0000 for 32-bit counter and 0x8000 for 16-bit counter), and when they cross their maximum values (0xFFFF FFFF for 32-bit counter and 0xFFFF for 16-bit counter). When CNTSTOPRO bit is set in *MMC control register (ETH_MMC_CONTROL)*, the interrupts are set but the counter remains at all-ones. The MMC FPE transmit interrupt register is a 32-bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read. The least significant byte lane (Bits[7:0]) of the respective counter must be read to clear the interrupt bit.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HRCIS	FCIS
														rc_r	rc_r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **HRCIS**: MMC Tx Hold Request Counter Interrupt Status
This bit is set when the *MMC Tx hold request counter register (ETH_MMC_TX_HRCR)* reaches half of the maximum value or the maximum value.

Bit 0 **FCIS**: MMC Tx FPE Fragment Counter Interrupt status
This bit is set when the *MMC FPE Tx fragment counter register (ETH_MMC_FPE_TX_FCR)* reaches half of the maximum value or the maximum value.

MMC FPE Tx interrupt mask register (ETH_MMC_FPE_TX_IMR)

Address offset: 0x08A4

Reset value: 0x0000 0000

This register maintains the masks for interrupts generated from all FPE related Transmit statistics counters when FPE related receive statistic counters reach half of their maximum value or the maximum values.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **HRCIM**: MMC transmit Hold Request Counter Interrupt Mask

Setting this bit masks the interrupt when the *MMC Tx hold request counter register (ETH_MMC_TX_HRCR)* reaches half of the maximum value or the maximum value.

Bit 0 **FCIM**: MMC Transmit Fragment Counter Interrupt Mask

Setting this bit masks the interrupt when the *MMC FPE Tx fragment counter register (ETH_MMC_FPE_TX_FCR)* reaches half of the maximum value or the maximum value.

MMC FPE Tx fragment counter register (ETH_MMC_FPE_TX_FCR)

Address offset: 0x08A8

Reset value: 0x0000 0000

This register provides the number of additional mPackets transmitted due to preemption.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TXFFC[31:16]

TXFFC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXFFC[31:0]**: Tx FPE Fragment counter

This field indicates the number of additional mPackets that has been transmitted due to preemption

MMC Tx hold request counter register (ETH_MMC_TX_HRCR)

Address offset: 0x08AC

Reset value: 0x0000 0000

This register provides the count of number of times a hold request is issue to the MAC.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TXHRC[31:0]**: Tx hold request counter

This field indicates count of number of a hold requests issued to the MAC.

MMC FPE Rx interrupt status register (ETH_MMC_FPE_RX_ISR)

Address offset: 0x08C0

Reset value: 0x0000 0000

This register maintains the interrupts generated from all FPE related Receive statistics counters when transmit statistic counters reach half their maximum values (0x8000 0000 for 32-bit counter and 0x8000 for 16-bit counter), and when they cross their maximum values (0xFFFF FFFF for 32-bit counter and 0xFFFF for 16-bit counter). When CNTSTOPRO bit is set in *MMC control register (ETH_MMC_CONTROL)*, the interrupts are set but the counter remains at all-ones. The MMC FPE receive interrupt register is a 32-bit register. An interrupt bit is cleared when the respective MMC counter that caused the interrupt is read.

												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **FCIS**: MMC Rx FPE Fragment Counter Interrupt Status

This bit is set when the *MMC Rx FPE fragments counter register (ETH_RX_FPE_FRAG_CR)* counter reaches half of the maximum value or the maximum value.

Bit 2 **PAOCIS**: MMC Rx Packet Assembly OK counter interrupt status
This bit is set when the *MMC Rx packet assembly OK register (ETH_RX_PACKET_ASM_OKR)* counter reaches half of the maximum value or the maximum value.

Bit 1 **PSECIS**: MMC Rx Packet SMD Error counter interrupt status
This bit is set when the *MMC Rx packet SMD error register (ETH_RX_PACKET_SMD_ERR)* counter reaches half of the maximum value or the maximum value.

Bit 0 **PAECIS**: MMC Rx Packet Assembly Error counter interrupt status
This bit is set when the *MMC Rx packet assembly error register (ETH_RX_PACKET_ASM_ERR)* counter reaches half of the maximum value or the maximum value.

MMC FPE Rx interrupt mask register (ETH_MMC_FPE_RX_IMR)

Address offset: 0x08C4

Reset value: 0x0000 0000

This register maintains the masks for interrupts generated from all FPE related Receive statistics counters when FPE related receive statistic counters reach half of their maximum value or the maximum values.

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **FCIM**: MMC Rx FPE Fragment Counter Interrupt Mask
Setting this bit masks the interrupt when the *MMC Rx FPE fragments counter register (ETH_RX_FPE_FRAG_CR)* counter reaches half of the maximum value or the maximum value.

Bit 2 **PAOCIM**: MMC Rx packet Assembly OK Counter Interrupt Mask
Setting this bit masks the interrupt when the *MMC Rx packet assembly OK register (ETH_RX_PACKET_ASM_OKR)* counter reaches half of the maximum value or the maximum value.

Bit 1 **PSECIM**: MMC Rx Packet SMD Error Counter Interrupt Mask
Setting this bit masks the interrupt when the *MMC Rx packet SMD error register (ETH_RX_PACKET_SMD_ERR)* counter reaches half of the maximum value or the maximum value.

Bit 0 **PAECIM**: MMC Rx Packet Assembly Error Counter Interrupt Mask
Setting this bit masks the interrupt when the *MMC Rx packet assembly error register (ETH_RX_PACKET_ASM_ERR)* counter reaches half of the maximum value or the maximum value.

MMC Rx packet assembly error register (ETH_RX_PACKET_ASM_ERR)

Address offset: 0x08C8

Reset value: 0x0000 0000

This register provides the number of MAC frames with reassembly errors on the receiver, due to mismatch in the Fragment Count value.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **PAEC[31:0]**: Rx Packet Assembly Error Counter

This field indicates the number of MAC frames with reassembly errors on the receiver, due to mismatch in the Fragment Count value.

MMC Rx packet SMD error register (ETH_RX_PACKET_SMD_ERR)

Address offset: 0x08CC

Reset value: 0x0000 0000

This register provides the number of received MAC frames rejected due to unknown SMD value and MAC frame fragments rejected due to arriving with an SMD-C when there was no preceding preempted frame.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:0 **PSEC[31:0]**: Rx Packet SMD Error Counter

This field indicates the number of MAC frames rejected due to unknown SMD value and MAC frame fragments rejected due to arriving with an SMD-C when there was no preceding preempted frame

MMC Rx packet assembly OK register (ETH_RX_PACKET_ASM_OKR)

Address offset: 0x08D0

Reset value: 0x0000 0000

This register provides the number of MAC frames that were successfully reassembled and delivered to MAC.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **PAOC[31:0]**: Rx Packet Assembly OK Counter

This field indicates the number of MAC frames that were successfully reassembled and delivered to MAC.

MMC Rx FPE fragments counter register (ETH_RX_FPE_FRAG_CR)

Address offset: 0x08D4

Reset value: 0x0000 0000

This register provides the number of additional mPackets received due to preemption.

Bits 31:0 **FFC[31:0]**: Rx FPE Fragment Counter

This field indicates the number of additional mPackets received due to preemption

L3 and L4 control 0 register (ETH_MACL3L4C0R)

Address offset: 0x0900

Reset value: 0x0000 0000

The Layer 3 and Layer 4 Control register controls the operations of filter 0 of Layer 3 and Layer 4.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **DMCHEN0**: DMA Channel Select Enable

When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. The DMA channel is indicated by the DMCHN bits. When this bit is reset, the DMA channel is not decided by this filter.

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **DMCHN0**: DMA Channel Number

When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. The width of this field depends on the number of the DMA channels present in your configuration.

0: DMA channel 0

1: DMA channel 1

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **L4DPIM0**: Layer 4 Destination Port Inverse Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching.

This bit is valid and applicable only when the L4DPM0 bit is set high.

Bit 20 **L4DPM0**: Layer 4 Destination Port Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching.

Bit 19 **L4SPIM0**: Layer 4 Source Port Inverse Match Enable

When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching.

This bit is valid and applicable only when the L4SPM0 bit is set high.

Bit 18 **L4SPM0**: Layer 4 Source Port Match Enable

When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching.

Bit 17 Reserved, must be kept at reset value.

Bit 16 **L4PEN0**: Layer 4 Protocol Enable

When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching.

The Layer 4 matching is done only when the L4SPM0 or L4DPM0 bit is set.

Bits 15:11 **L3HDBM0[4:0]**: Layer 3 IP DA higher bits match

Condition: IPv4 packets

This field contains the number of higher bits of IP Destination Address that are masked in the IPv4 packets:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

Condition: IPv6 packets

Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM0 which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. Number of bits masked is given by concatenated values of the L3HDBM0[1:0] and L3HSBM0 bits:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set.

Bits 10:6 **L3HSBM0[4:0]**: Layer 3 IP SA higher bits match

Condition: IPv4 packets

This field contains the number of lower bits of IP source address that are masked for matching in the IPv4 packets. The following list describes the values of this field:

0: No bits are masked.

1: LSb[0] is masked

2: Two LSbs [1:0] are masked

..

31: All bits except MSb are masked.

Condition: IPv6 packets:

This field contains Bits[4:0] of L3HSBM0. These bits indicate the number of higher bits of IP source or destination address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM0 or L3SAM0 bit is set high.

Bit 5 **L3DAIM0**: Layer 3 IP DA Inverse Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching.

This bit is valid and applicable only when the L3DAM0 bit is set high.

Bit 4 **L3DAM0**: Layer 3 IP DA Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching.

Note: When the L3PEN0 bit is set, you should set either this bit or the L3SAM0 bit because either IPv6 DA or SA can be checked for filtering.

Bit 3 **L3SAIM0**: Layer 3 IP SA Inverse Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching.

This bit is valid and applicable only when the L3SAM0 bit is set.

Bit 2 **L3SAM0**: Layer 3 IP SA Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching.

Note: When the L3PEN0 bit is set, you should set either this bit or the L3DAM0 bit because either IPv6 SA or DA can be checked for filtering.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **L3PEN0**: Layer 3 Protocol Enable

When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets.

The Layer 3 matching is done only when the L3SAM0 or L3DAM0 bit is set.

Layer4 Address filter 0 register (ETH_MACL4A0R)

Address offset: 0x0904

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **L4DP0[15:0]**: Layer 4 Destination Port Number Field

When the L4PEN0 bit is reset and the L4DPM0 bit is set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets.

When the L4PEN0 and L4DPM0 bits are set in *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 packets.

Bits 15:0 **L4SP0[15:0]**: Layer 4 Source Port Number Field

When the L4PEN0 bit is reset and the L4DPM0 bit is set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets.

When the L4PEN0 and L4DPM0 bits are set in *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 packets.

Layer3 Address 0 filter 0 register (ETH_MACL3A00R)

Address offset: 0x0910

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 0 filter 0 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **L3A00[31:0]**: Layer 3 Address 0 Field

When the L3PEN0 and L3SAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[31:0] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[31:0] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset and the L3SAM0 bit is set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with the IP Source Address field in the IPv4 packets.

Layer3 Address 1 filter 0 register (ETH_MACL3A10R)

Address offset: 0x0914

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 1 filter 0 register contains the 32-bit IP Destination Address field. For IPv6 packets, it contains Bits[63:32] of the 128-bit IP Source Address or Destination Address field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:0 **L3A10[31:0]**: Layer 3 Address 1 Field

When the L3PEN0 and L3SAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[63:32] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[63:32] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset and the L3SAM0 bit is set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with the IP Destination Address field in the IPv4 packets.

Layer3 Address 2 filter 0 register (ETH_MACL3A20R)

Address offset: 0x0918

Reset value: 0x0000 0000

The Layer 3 Address 2 filter 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[95:64] of 128-bit IP Source Address or Destination Address field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:0 **L3A20[31:0]**: Layer 3 Address 2 Field

When the L3PEN0 and L3SAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[95:64] of the IP Source Address field in the IPv6 packets.

When the L3PEN0 and L3DAM0 bits are set in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field contains the value to be matched with Bits[95:64] of the IP Destination Address field in the IPv6 packets.

When the L3PEN0 bit is reset in the *L3 and L4 control 0 register (ETH_MACL3L4C0R)*, this field is not used.

Layer3 Address 3 filter 0 register (ETH_MACL3A30R)

Address offset: 0x091C

Reset value: 0x0000 0000

The Layer 3 Address 3 filter 0 register is reserved for IPv4 packets. For IPv6 packets, it contains Bits[127:96] of 128-bit IP Source Address or Destination Address field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **DMCHEN1**: DMA Channel Select Enable

When set, this bit enables the selection of the DMA channel number for the packet that is passed by this L3_L4 filter. The DMA channel is indicated by the DMCHN bits. When this bit is reset, the DMA channel is not decided by this filter.

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **DMCHN1**: DMA Channel Number

When DMCHEN is set high, this field selects the DMA Channel number to which the packet passed by this filter is routed. The width of this field depends on the number of the DMA channels present in your configuration.

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **L4DPIM1**: Layer 4 Destination Port Inverse Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Destination Port number field is enabled for perfect matching.

This bit is valid and applicable only when the L4DPM1 bit is set high.

Bit 20 **L4DPM1**: Layer 4 Destination Port Match Enable

When this bit is set, the Layer 4 Destination Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Destination Port number field for matching.

Bit 19 **L4SPIM1**: Layer 4 Source Port Inverse Match Enable
When this bit is set, the Layer 4 Source Port number field is enabled for inverse matching. When this bit is reset, the Layer 4 Source Port number field is enabled for perfect matching.
This bit is valid and applicable only when the L4SPM1 bit is set high.

Bit 18 **L4SPM1**: Layer 4 Source Port Match Enable
When this bit is set, the Layer 4 Source Port number field is enabled for matching. When this bit is reset, the MAC ignores the Layer 4 Source Port number field for matching.

Bit 17 Reserved, must be kept at reset value.

Bit 16 **L4PEN1**: Layer 4 Protocol Enable
When this bit is set, the Source and Destination Port number fields of UDP packets are used for matching. When this bit is reset, the Source and Destination Port number fields of TCP packets are used for matching.
The Layer 4 matching is done only when the L4SPM1 or L4DPM1 bit is set.

Bits 15:11 **L3HDBM1[4:0]**: Layer 3 IP DA higher bits match
Condition: IPv4 packets
This field contains the number of lower bits of IP Destination Address that are masked for matching in the IPv4 packets. The following list describes the values of this field:
0: No bits are masked.
1: LSb[0] is masked
2: Two LSbs [1:0] are masked
..
31: All bits except MSb are masked.
Condition: IPv6 packets
Bits[12:11] of this field correspond to Bits[6:5] of L3HSBM1, which indicate the number of lower bits of IP Source or Destination Address that are masked in the IPv6 packets. The following list describes the concatenated values of the L3HDBM1[1:0] and L3HSBM1 bits:
0: No bits are masked
1: LSb[0] is masked
2: Two LSbs [1:0] are masked
..
127: All bits except MSb are masked
This field is valid and applicable only when the L3DAM1 or L3SAM1 bit is set.

Bits 10:6 **L3HSBM1[4:0]**: Layer 3 IP SA Higher Bits Match
Condition: IPv4 packets
This field contains the number of lower bits of IP Source Address that are masked for matching in the IPv4 packets. The following list describes the values of this field:
0: No bits are masked.
1: LSb[0] is masked
2: Two LSbs [1:0] are masked
..
31: All bits except MSb are masked.

Condition: IPv6 packets
This field contains Bits[4:0] of L3HSBM1. These bits indicate the number of higher bits of IP Source or Destination Address matched in the IPv6 packets. This field is valid and applicable only when the L3DAM1 or L3SAM1 bit is set high.

Bit 5 **L3DAIM1**: Layer 3 IP DA Inverse Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for inverse matching. When this bit is reset, the Layer 3 IP Destination Address field is enabled for perfect matching.

This bit is valid and applicable only when the L3DAM1 bit is set high.

Bit 4 **L3DAM1**: Layer 3 IP DA Match Enable

When this bit is set, the Layer 3 IP Destination Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Destination Address field for matching.

Note: When the L3PEN1 bit is set, you should set either this bit or the L3SAM1 bit because either IPv6 DA or SA can be checked for filtering.

Bit 3 **L3SAIM1**: Layer 3 IP SA Inverse Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for inverse matching. When this bit reset, the Layer 3 IP Source Address field is enabled for perfect matching.

This bit is valid and applicable only when the L3SAM1 bit is set.

Bit 2 **L3SAM1**: Layer 3 IP SA Match Enable

When this bit is set, the Layer 3 IP Source Address field is enabled for matching. When this bit is reset, the MAC ignores the Layer 3 IP Source Address field for matching.

Note: When the L3PEN01 bit is set, you should set either this bit or the L3DAM1 bit because either IPv6 SA or DA can be checked for filtering.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **L3PEN1**: Layer 3 Protocol Enable

When this bit is set, the Layer 3 IP Source or Destination Address matching is enabled for IPv6 packets. When this bit is reset, the Layer 3 IP Source or Destination Address matching is enabled for IPv4 packets.

The Layer 3 matching is done only when the L3SAM1 or L3DAM1 bit is set.

Layer 4 address filter 1 register (ETH_MACL4A1R)

Address offset: 0x0934

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **L4DP1[15:0]**: Layer 4 Destination Port Number Field

When the L4PEN1 bit is reset and the L4DPM1 bit is set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with the TCP Destination Port Number field in the IPv4 or IPv6 packets.

When the L4PEN1 and L4DPM1 bits are set in *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with the UDP Destination Port Number field in the IPv4 or IPv6 packets.

Bits 15:0 **L4SP1[15:0]**: Layer 4 Source Port Number Field

When the L4PEN1 bit is reset and the L4DPM1 bit is set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with the TCP Source Port Number field in the IPv4 or IPv6 packets.

When the L4PEN1 and L4DPM1 bits are set in *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with the UDP Source Port Number field in the IPv4 or IPv6 packets.

Layer3 address 0 filter 1 Register (ETH_MACL3A01R)

Address offset: 0x0940

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 0 filter 1 register contains the 32-bit IP Source Address field. For IPv6 packets, it contains Bits[31:0] of the 128-bit IP Source Address or Destination Address field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:0 **L3A01[31:0]**: Layer 3 Address 0 Field

When the L3PEN1 and L3SAM1bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[31:0] of the IP Source Address field in the IPv6 packets.

When the L3PEN1 and L3DAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[31:0] of the IP Destination Address field in the IPv6 packets.

When the L3PEN1 bit is reset and the L3SAM1 bit is set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with the IP Source Address field in the IPv4 packets.

Layer3 address 1 filter 1 register (ETH_MACL3A11R)

Address offset: 0x0944

Reset value: 0x0000 0000

For IPv4 packets, the Layer 3 Address 1 filter 1 register contains the 32-bit IP Destination Address field. For IPv6 packets, it contains Bits[63:32] of the 128-bit IP Source Address or Destination Address field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **L3A31[31:0]**: Layer 3 Address 3 Field

When the L3PEN1 and L3SAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[127:96] of the IP Source Address field in the IPv6 packets.

When the L3PEN1 and L3DAM1 bits are set in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field contains the value to be matched with Bits[127:96] of the IP Destination Address field in the IPv6 packets.

When the L3PEN1 bit is reset in the *L3 and L4 control 1 register (ETH_MACL3L4C1R)*, this field is not used.

MAC Indirect Access Control register (ETH_MAC_IACR)

Address offset: 0x0A70

Reset value: 0x0000 0000

This register provides the Indirect Access control and status for the *MAC type-based Rx Queue mapping register (ETH_MAC_TMRQR)*.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MSEL[3:0]			
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
AOFF[7:0]								Res.	Res.	AUTO	Res.	Res.	Res.	COM	OB
rw	rw	rw	rw	rw	rw	rw	rw			rw				rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **MSEL[3:0]**: Mode Select

This field is used for indirect accesses to the *MAC type-based Rx Queue mapping register (ETH_MAC_TMRQR)*. It must be set when initiating a read/write to the *MAC type-based Rx Queue mapping register (ETH_MAC_TMRQR)* and should not be changed until the OB bit is reset.

0000:Typ_RXQ_ (Type-based RXQ mapping)

0001-1111: Reserved for future use

Bits 15:8 **AOFF[7:0]**: Address Offset

This field is used for indirect accesses to the *MAC type-based Rx Queue mapping register (ETH_MAC_TMRQR)*. It must be set when initiating a read/write to the *MAC type-based Rx Queue mapping register (ETH_MAC_TMRQR)* and should not be changed until the OB bit is reset.

00000000: IndReg0 (Indirect register 0)

00000001: IndReg1 (Indirect register 1)

...

00000111: IndReg7 (Indirect register 7)

00001000-11111111: Reserved, must not be used

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **AUTO**: Auto-increment

1: AOFF is incremented by 1. The software should ensure not to cause a wrap condition. Byte-wise read/write is not supported when auto-increment is enabled.

0: AOFF is not automatically incremented. The software should program the correct address offset for each access.

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **COM**: Command type

This bit indicates the register access type:
1: Indicates a read operation.
0: Indicates a write operation.

Bit 0 **OB**: Operation Busy.

This bit is set along with a read or write command to initiate an indirect access to the *MAC type-based Rx Queue mapping register (ETH_MAC_TMRQR)*. This bit is reset when the read or write command to the *MAC type-based Rx Queue mapping register (ETH_MAC_TMRQR)* is complete. The next indirect register access can be initiated only after this bit is reset. During a write operation, the bit is reset only after the data has been written to the *MAC type-based Rx Queue mapping register (ETH_MAC_TMRQR)* register. During a read operation, the data should be read from the *MAC type-based Rx Queue mapping register (ETH_MAC_TMRQR)* only after this bit is reset.

MAC type-based Rx Queue mapping register (ETH_MAC_TMRQR)

Address offset: 0x0A74

Reset value: 0x0000 0000

This register contains the type, associated queue number and packet type (Preemption/Express) related to Type-based RXQ mappings. It holds the data for eight indirect registers, defined by the AOFF[7:0] bitfield in the *MAC Indirect Access Control register (ETH_MAC_IACR)*.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

TYP[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **PFEX**: Preemption or Express Packet

This bit indicates if it is a preemption packet or express packet.

0: Express packet

1: Preemption packet

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **TMRQ[2:0]**: Type Match Rx Queue Number

Indicates the receive queue number to which the packet needs to be forwarded on detecting a type match.

Bits 15:0 **TYP[15:0]**: Type field Value

Indicates the type value of packet that needs to be compared with the received Ethernet packet. This field is valid when programmed to a value greater than or equal to 0x0600.

Timestamp control Register (ETH_MACTSCR)

Address offset: 0x0B00

Reset value: 0x0000 2000

This register controls the operation of the System Time generator and processing of PTP packets for timestamping in the receiver.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw		rw	rw		rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **AV8021ASMEN**: AV 802.1AS Mode Enable

When this bit is set, the MAC processes only untagged PTP over Ethernet packets for providing PTP status and capturing timestamp snapshots, that is, IEEE 802.1AS operating mode.

When the PTP offload feature is enabled, for PTP offload, the transport-specific field in the PTP header is generated and checked based on the value of this bit.

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **TXTSSTSM**: Transmit Timestamp Status Mode

When this bit is set, the MAC overwrites the earlier transmit timestamp status even if it is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* register.

When this bit is reset, the MAC ignores the timestamp status of current packet if the timestamp status of previous packet is not read by the software. The MAC indicates this by setting the TXTSSMIS bit of the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)*.

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **ESTI**: External System Time Input

When this bit is set, the MAC uses the external 64-bit reference System Time input for the following:

- To take the timestamp provided as status
- To insert the timestamp in transmit PTP packets when One-step Timestamp or Timestamp Offload feature is enabled.

When this bit is reset, the MAC uses the internal reference System Time.

Bit 19 Reserved, must be kept at reset value.

Bit 18 **TSENMACADDR**: Enable MAC Address for PTP Packet Filtering

When this bit is set, the DA MAC address (that matches any MAC Address register) is used to filter the PTP packets when PTP is directly sent over Ethernet.

When this bit is set, received PTP packets with DA containing a special multicast or unicast address that matches the one programmed in MAC address registers are considered for processing as indicated below, when PTP is directly sent over Ethernet.

For normal timestamping operation, MAC address registers 0 to 31 is considered for unicast destination address matching.

For PTP offload, only MAC address register 0 is considered for unicast destination address matching.

Bits 17:16 **SNAPTYPSEL[1:0]**: Select PTP packets for Taking Snapshots

These bits, along with Bits 15 and 14, define the set of PTP packet types for which snapshot needs to be taken. The encoding is given in *Table 919: Timestamp Snapshot Dependency on ETH_MACTSCR bits*.

Bit 15 **TSMSTRENA**: Enable Snapshot for Messages Relevant to Master

When this bit is set, the snapshot is taken only for the messages that are relevant to the master node. Otherwise, the snapshot is taken for the messages relevant to the slave node.

Bit 14 **TSEVNTENA**: Enable Timestamp Snapshot for Event Messages

When this bit is set, the timestamp snapshot is taken only for event messages (SYNC, Delay_Req, Pdelay_Req, or Pdelay_Resp). When this bit is reset, the snapshot is taken for all messages except Announce, Management, and Signaling. For more information about the timestamp snapshots, see *Table 919: Timestamp Snapshot Dependency on ETH_MACTSCR bits*.

Bit 13 **TSIPV4ENA**: Enable Processing of PTP Packets Sent over IPv4-UDP

When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv4-UDP packets. When this bit is reset, the MAC ignores the PTP transported over IPv4-UDP packets. This bit is set by default.

Bit 12 **TSIPV6ENA**: Enable Processing of PTP Packets Sent over IPv6-UDP

When this bit is set, the MAC receiver processes the PTP packets encapsulated in IPv6-UDP packets. When this bit is clear, the MAC ignores the PTP transported over IPv6-UDP packets.

Bit 11 **TSIPENA**: Enable Processing of PTP over Ethernet Packets

When this bit is set, the MAC receiver processes the PTP packets encapsulated directly in the Ethernet packets. When this bit is reset, the MAC ignores the PTP over Ethernet packets.

Bit 10 **TSVER2ENA**: Enable PTP Packet Processing for Version 2 Format

When this bit is set, the IEEE 1588 version 2 format is used to process the PTP packets. When this bit is reset, the IEEE 1588 version 1 format is used to process the PTP packets. The IEEE 1588 formats are described in 'PTP Processing and Control'.

Bit 9 **TSCTRLSSR**: Timestamp Digital or Binary Rollover Control

When this bit is set, the Timestamp Low register rolls over after 0x3B9A C9FF value (that is, 1 nanosecond accuracy) and increments the timestamp (High) seconds. When this bit is reset, the rollover value of subsecond register is 0x7FFF FFFF. The subsecond increment must be programmed correctly depending on the PTP reference clock frequency and the value of this bit.

Bit 8 **TSENALL**: Enable Timestamp for All Packets

When this bit is set, the timestamp snapshot is enabled for all packets received by the MAC.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **PTGE**: Presentation Time Generation Enable

When this bit is set the Presentation Time generation is enabled.

Bit 5 **TSADDREG**: Update Addend Register

When this bit is set, the content of the Timestamp Addend register is updated in the PTP block for fine correction. This bit is cleared when the update is complete. This bit should be zero before it is set.

Bit 4 Reserved, must be kept at reset value.

Bit 3 **TSUPDT**: Update Timestamp

When this bit is set, the system time is updated (added or subtracted) with the value specified in *System time seconds update register (ETH_MACSTSUR)* and *System time nanoseconds update register (ETH_MACSTNUR)*.

When Media Clock Generation and Recovery is enabled, ETH_MACPRSTIMUR should also be updated before setting this field.

This bit should be zero before updating it. This bit is reset when the update is complete in hardware.

Bit 2 **TSINIT**: Initialize Timestamp

When this bit is set, the system time is initialized (overwritten) with the value specified in the *System time seconds update register (ETH_MACSTSUR)* and *System time nanoseconds update register (ETH_MACSTNUR)*.

When Media Clock Generation and Recovery is enabled, *MAC presentation time update register (ETH_MACPRSTIMUR)* should also be updated before setting this field.

This bit should be zero before it is updated. This bit is reset when the initialization is complete.

Bit 1 **TSCFUPDT**: Fine or Coarse Timestamp Update

When this bit is set, the Fine method is used to update system timestamp. When this bit is reset, Coarse method is used to update the system timestamp.

Bit 0 **TSENA**: Enable Timestamp

When this bit is set, the timestamp is added for Transmit and Receive packets. When disabled, timestamp is not added for transmit and receive packets and the Timestamp Generator is also suspended. You need to initialize the Timestamp (system time) after enabling this mode.

On the Receive side, the MAC processes the 1588 packets only if this bit is set.

Subsecond increment register (ETH_MACSSIR)

Address offset: 0x0B04

Reset value: 0x0000 0000

This register specifies the value to be added to the internal system time register every cycle of clk_ptp_ref_i clock.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **SSINC[7:0]**: Subsecond Increment Value

The value programmed in this field is accumulated every clock cycle (of clk_ptp_i) with the contents of the subsecond register. For example, when the PTP clock is 50 MHz (period is 20 ns), you should program 20 (0x14) when the System Time Nanoseconds register has an accuracy of 1 ns [TSCTRLSSR bit is set in *Timestamp control Register (ETH_MACTSCR)*]. When TSCTRLSSR is cleared, the Nanoseconds register has a resolution of ~0.465 ns. In this case, you should program a value of 43 (0x2B) which is derived by 20 ns/0.465.

Bits 15:0 Reserved, must be kept at reset value.

System time seconds register (ETH_MACSTSR)

Address offset: 0x0B08

Reset value: 0x0000 0000

The System Time Seconds register, along with System Time Nanoseconds register, indicates the current value of the system time maintained by the MAC. Though it is updated on a continuous basis, there is some delay from the actual time because of clock domain transfer latencies (from clk_ptp_ref_i to CSR clock).

TSS[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TSS[31:0]**: Timestamp Second

The value in this field indicates the current value in seconds of the System Time maintained by the MAC.

System time nanoseconds register (ETH_MACSTNR)

Address offset: 0x0B0C

Reset value: 0x0000 0000

The System Time Nanoseconds register, along with System Time Seconds register, indicates the current value of the system time maintained by the MAC.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

TSSS[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bit 31 Reserved, must be kept at reset value.

Bits 30:0 **TSSS[30:0]**: Timestamp subseconds

The value in this field has the subsecond representation of time, with an accuracy of 0.46 ns. When TSCTRLSSR is set in *Timestamp control Register (ETH_MACTSCR)*, each bit represents 1 ns. The maximum value is 0x3B9A C9FF after which it rolls-over to zero.

System time seconds update register (ETH_MACSTSUR)

Address offset: 0x0B10

Reset value: 0x0000 0000

The System Time Seconds Update register, along with the System Time Nanoseconds update register, initializes or updates the system time maintained by the MAC. You must write both registers before setting the TSINIT or TSUPDT bits in *Timestamp control Register (ETH_MACTSCR)*.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TSS[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

TSS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **TSS[31:0]**: Timestamp Seconds

The value in this field is the seconds part of the update.
When ADDSUB is reset, this field must be programmed with the seconds part of the update value.
When ADDSUB is set, this field must be programmed with the complement of the seconds part of the update value.
For example, to subtract 2.000000001 seconds from the system time, the TSS field in the ETH_MACSTSUR register must be 0xFFFF FFFE (that is, $2^{32} – 2$).

Caution: When the ADDSUB bit is set, TSSS[30:0] field cannot be set to 0 in *System time nanoseconds update register (ETH_MACSTNUR)*. The TSSS bitfield must be programmed to 0x7FFF FFFF (resulting in –0.46 ns) even if 0 ns must be subtracted.
For example, to subtract 2.000000000 seconds from the system time, the TSS field in the *System time seconds update register (ETH_MACSTSUR)* must be 0xFFFF FFFE (that is, $2^{32} – 1$) and the *System time nanoseconds update register (ETH_MACSTNUR)* must be 0xFFFF FFFF (ADDSUB = 1 and TSSS[30:0] field = 0x7FFF FFFF)

System time nanoseconds update register (ETH_MACSTNUR)

Address offset: 0x0B14

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADD SUB	TSSS[30:16]														
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TSSS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **ADDSUB**: Add or Subtract Time

When this bit is set, the time value is subtracted with the contents of the update register. When this bit is reset, the time value is added with the contents of the update register.

Bits 30:0 **TSSS[30:0]**: Timestamp subseconds

The value in this field is the subseconds part of the update.

– ADDSUB is 1: This field must be programmed with the complement of the subseconds part of the update value as described.

– ADDSUB is 0: This field must be programmed with the subseconds part of the update value, with an accuracy based on the TSCTRLSSR bit of the *Timestamp control Register (ETH_MACTSCR)*.

– TSCTRLSSR field in the *Timestamp control Register (ETH_MACTSCR)*is 1:
- The programmed value must be 10^9 – <subsecond value>.
- Each bit represents 1 ns and the programmed value should not exceed 0x3B9A C9FF.

– TSCTRLSSR field in the *Timestamp control Register (ETH_MACTSCR)* is 0:
- The programmed value must be 2^{31} - <subsecond_value>.
- Each bit represents an accuracy of 0.46 ns.

For example, to subtract 2.000000001 seconds from the system time, then the TSSS field in the ETH_MACSTNUR register must be 0x7FFF FFFF (that is, 2^{31} – 1), when TSCTRLSSR bit in *Timestamp control Register (ETH_MACTSCR)* is reset and 0x3B9A C9FF (that is, 10^9 –1), when TSCTRLSSR bit in *Timestamp control Register (ETH_MACTSCR)* is set.

Caution: When the ADDSUB bit is set, TSSS[30:0] field cannot be set to 0. The TSSS bitfield must be programmed to 0x7FFF FFFF (resulting in –0.46 ns) even if 0 ns must be subtracted.
For example, to subtract 2.000000000 seconds from the system time, *System time nanoseconds update register (ETH_MACSTNUR)* must be 0xFFFF FFFF (ADDSUB = 1 and TSSS[30:0] = 0) and the TSS field in the *System time seconds update register (ETH_MACSTSUR)* must be 0xFFFF FFFE (that is, 2^{32} – 1).

Timestamp addend register (ETH_MACTSAR)

Address offset: 0x0B18

Reset value: 0x0000 0000

This register value is used only when the system time is configured for Fine Update mode (TSCFUPDT bit in the *Timestamp control Register (ETH_MACTSCR)*). The content of this register is added to a 32-bit accumulator in every clock cycle of clk_ptp_ref_i and the system time is updated whenever the accumulator overflows.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TSAR[31:16]

TSAR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **TSAR[31:0]**: Timestamp Addend Register

This field indicates the 32-bit time value to be added to the Accumulator register to achieve time synchronization.

Timestamp status register (ETH_MACTSSR)

Address offset: 0x0B20

Reset value: 0x0000 0000

All bits except Bits[27:25] gets cleared when the application reads this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	ATSNS[4:0]					ATSSTM	Res.	Res.	Res.	Res.	ATSSTN[3:0]

rc_r										rc_r	rc_r	rc_r	rc_r	rc_r	rc_r

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:25 **ATSNS[4:0]**: Number of Auxiliary Timestamp Snapshots

This field indicates the number of Snapshots available in the FIFO. A value equal to the depth of FIFO (4) indicates that the Auxiliary Snapshot FIFO is full. These bits are cleared (to 00000) when the Auxiliary snapshot FIFO clear bit is set.

Bit 24 **ATSSTM**: Auxiliary Timestamp Snapshot Trigger Missed

This bit is set when the Auxiliary timestamp snapshot FIFO is full and external trigger was set. This indicates that the latest snapshot is not stored in the FIFO.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **ATSSTN[3:0]**: Auxiliary Timestamp Snapshot Trigger Identifier

These bits identify the Auxiliary trigger inputs for which the timestamp available in the Auxiliary Snapshot Register is applicable. When more than one bit is set at the same time, it means that corresponding auxiliary triggers were sampled at the same clock. These bits are applicable only if the number of Auxiliary snapshots is more than one. One bit is assigned for each trigger as shown in the following list:

Bit 16: Auxiliary trigger 0

Bit 17: Auxiliary trigger 1

Bit 18: Auxiliary trigger 2

Bit 19: Auxiliary trigger 3

The software can read this register to find the triggers that are set when the timestamp is taken.

Bit 15 **TXTSSIS**: Tx Timestamp Status Interrupt Status

When drop transmit status is enabled in MTL, this bit is set when the captured transmit timestamp is updated in the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* and *Tx timestamp status seconds register (ETH_MACTXTSSSR)*.

When PTP offload feature is enabled, this bit is set when the captured transmit timestamp is updated in the *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* and *Tx timestamp status seconds register (ETH_MACTXTSSSR)*, for PTO generated Delay Request and Pdelay request packets.

This bit is cleared when the *Tx timestamp status seconds register (ETH_MACTXTSSSR)* is read (or written to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bits 14:6 Reserved, must be kept at reset value.

Bit 5 **TSTRGTERR1**: Timestamp Target Time Error

This bit is set when the latest target time programmed in the ETH_MACPPSTTS1R and ETH_MACPPSTTSN1R registers elapses. It is cleared when the application reads this bit (or writes it to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bit 4 **TSTARGT1**: Timestamp Target Time Reached

When set, this bit indicates that the value of the system time is greater than or equal to the value specified in the ETH_MACPPSTTS1R and ETH_MACPPSTTSN1R registers.
This bit is cleared when the application reads this bit (or write it to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set)

Bit 3 **TSTRGTERR0**: Timestamp Target Time Error

This bit is set when the latest target time programmed in the ETH_MACPPSTTS0R and ETH_MACPPSTTSN0R elapses (see *PPS x target time seconds register (ETH_MACPPSTTSxR)* and *PPS x target time nanoseconds register (ETH_MACPPSTTNxR)*). This bit is cleared when the application reads this bit (or writes it to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bit 2 **AUXTSTRIG**: Auxiliary Timestamp Trigger Snapshot

This bit is set high when the auxiliary snapshot is written to the FIFO.
This bit is cleared when the application reads this bit (or writes it to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set).

Bit 1 **TSTARGT0**: Timestamp Target Time Reached

When set, this bit indicates that the value of system time is greater than or equal to the value specified in the ETH_MACPPSTTS0R and ETH_MACPPSTTSN0R registers (see *PPS x target time seconds register (ETH_MACPPSTTSxR)* and *PPS x target time nanoseconds register (ETH_MACPPSTTNxR)*).
This bit is cleared when the application reads this bit (or writes of 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set)

Bit 0 **TSSOVF**: Timestamp Seconds Overflow

When this bit is set, it indicates that the seconds value of the timestamp (when supporting version 2 format) has overflowed beyond 0xFFFF FFFF.
This bit is cleared when the application reads this bit (or writes it to 1 when RCWE bit in *CSR software control register (ETH_MACCSRSWCR)* is set)

Rx domain time increment register (ETH_MACRXDTI)

Address offset: 0x0B24

Reset value: 0x0000 0000

This register indicates the increment value of the PTP time maintained in the Receive clock domain that is used for timestamping.

Bits 31:16 **RXNS[15:0]**: Receive domain time increment value in nanoseconds

This bitfield indicates the nanosecond part of the increment value of the PTP time maintained in the Receive clock domain that is used for timestamping.

For example, when operating in 2.5G speed, the clock period is 3.2 ns, so in digital rollover mode, the RXNS[15:0] bitfield must be programmed to 3. In binary rollover mode, 3 / 0.466 = 6.44, so the RXNS[15:0] bitfield must be programmed to 6. When RXNS[15:0] is zero, the fixed value based on the operating speed is used for PTP time increment in Receive clock domain.

Bits 15:0 Reserved, must be kept at reset value.

Tx domain time increment register (ETH_MACTXDTI)

Address offset: 0x0B28

Reset value: 0x0000 0000

This register indicates the increment value of the PTP time maintained in the Transmit clock domain that is used for timestamping.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:16 **TXNS[15:0]**: Transmit domain time increment value in nanoseconds

This bitfield indicates the nanosecond part of the increment value of the PTP time maintained in the Transmit clock domain that is used for timestamping.

For example, when operating in 2.5G speed, the clock period is 3.2 ns, so in digital rollover mode, the TXNS[15:0] bitfield must be programmed to 3. In binary rollover mode, 3 / 0.466 = 6.44, so the TXNS[15:0] bitfield must be programmed to 6. When TXNS[15:0] is zero, the fixed value based on operating speed is used for PTP time increment in Transmit clock domain.

Bits 15:0 Reserved, must be kept at reset value.

Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)

Address offset: 0x0B30

Reset value: 0x0000 0000

This register contains the nanosecond part of timestamp captured for Transmit packets when Tx status is disabled.The *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* register, along with *Tx timestamp status seconds register (ETH_MACTXTSSSR)*, gives the 64-bit timestamp captured for the PTP packet successfully transmitted by the MAC. This value is considered to be read by the application when the last byte of *Tx timestamp status nanoseconds register (ETH_MACTXTSSNR)* is read

(bits[31:24]).
If the application does not read these registers and timestamp of another packet is captured, then either the current timestamp is lost (overwritten) or the new timestamp is lost (dropped), depending on the setting of the TXTSSTSM bit of the *Timestamp control Register (ETH_MACTSCR)*. The status bit TXTSSIS bit [15] in *Timestamp status register (ETH_MACTSSR)* register is set when the MAC transmitter captures the timestamp.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r	rc_r

Bit 31 **TXTSSMIS**: Transmit Timestamp Status Missed

When this bit is set, it indicates one of the following:

– The timestamp of the current packet is ignored if TXTSSTSM bit of the *Timestamp control Register (ETH_MACTSCR)* is reset

– The timestamp of the previous packet is overwritten with timestamp of the current packet if TXTSSTSM bit of the *Timestamp control Register (ETH_MACTSCR)* is set.

Bits 30:0 **TXTSSLO[30:0]**: Transmit Timestamp Status Low

This field contains the 31 bits of the Nanoseconds field of the Transmit packet's captured timestamp.

Tx timestamp status seconds register (ETH_MACTXTSSSR)

Address offset: 0x0B34

Reset value: 0x0000 0000

The register contains the higher 32 bits of the timestamp (in seconds) captured when a PTP packet is transmitted.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:0 **TXTSSHI[31:0]**: Transmit Timestamp Status High

This field contains the lower 32 bits of the Seconds field of Transmit packet's captured timestamp.

Auxiliary control register (ETH_MACACR)

Address offset: 0x0B40

Reset value: 0x0000 0000

The Auxiliary Timestamp Control register controls the Auxiliary Timestamp snapshot.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ATSEN3	ATSEN2	ATSEN1	ATSEN0	Res.	Res.	Res.	ATSFC
								rw	rw	rw	rw				rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **ATSEN3**: Auxiliary Snapshot 3 Enable

– This bit controls the capturing of Auxiliary Snapshot Trigger 3. When this bit is set, the auxiliary snapshot of the event on eth_ptp_trg3 input is enabled. When this bit is reset, the events on this input are ignored.

Bit 6 **ATSEN2**: Auxiliary Snapshot 2 Enable

– This bit controls the capturing of Auxiliary Snapshot Trigger 2. When this bit is set, the auxiliary snapshot of the event on eth_ptp_trg2 input is enabled. When this bit is reset, the events on this input are ignored.

Bit 5 **ATSEN1**: Auxiliary Snapshot 1 Enable

– This bit controls the capturing of Auxiliary Snapshot Trigger 1. When this bit is set, the auxiliary snapshot of the event on eth_ptp_trg1 input is enabled. When this bit is reset, the events on this input are ignored.

Bit 4 **ATSEN0**: Auxiliary Snapshot 0 Enable

This bit controls the capturing of Auxiliary Snapshot Trigger 0. When this bit is set, the auxiliary snapshot of the event on eth_ptp_trg0 input is enabled. When this bit is reset, the events on this input are ignored.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **ATSFC**: Auxiliary Snapshot FIFO Clear

When set, this bit resets the pointers of the Auxiliary Snapshot FIFO. This bit is cleared when the pointers are reset and the FIFO is empty. When this bit is high, the auxiliary snapshots are stored in the FIFO.

Auxiliary timestamp nanoseconds register (ETH_MACATSNR)

Address offset: 0x0B48

Reset value: 0x0000 0000

The *Auxiliary timestamp nanoseconds register (ETH_MACATSNR)*, along with *Auxiliary timestamp seconds register (ETH_MACATSSR)*, gives the 64-bit timestamp stored as auxiliary snapshot. These two registers form the read port of a 64-bit wide FIFO with a depth of 4 words.

You can store multiple snapshots in this FIFO. Bits[29:25] in *Timestamp status register (ETH_MACTSSR)* indicate the fill-level of the FIFO. The top of the FIFO is removed only when *Auxiliary timestamp seconds register (ETH_MACATSSR)* is read.

Bits 31:0 **AUXTSHI[31:0]**: Auxiliary Timestamp
Contains the lower 32 bits of the Seconds field of the auxiliary timestamp.

Timestamp ingress asymmetric correction register (ETH_MACTSIACR)

Address offset: 0x0B50

Reset value: 0x0000 0000

The MAC Timestamp Ingress Asymmetry Correction register contains the Ingress Asymmetry Correction value to be used while updating correction field in PDelay_Resp PTP messages.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

OSTIAC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **OSTIAC[31:0]**: One-Step Timestamp Ingress Asymmetry Correction

This field contains the ingress path asymmetry value to be added to correctionField of Pdelay_Resp PTP packet. The programmed value should be in units of nanoseconds and multiplied by 2^{16}. For example, 2.5 ns is represented as 0x00028000.

The value can also be negative, which is represented in 2's complement form with bit 31 representing the sign bit.

Timestamp egress asymmetric correction register (ETH_MACTSEACR)

Address offset: 0x0B54

Reset value: 0x0000 0000

The MAC Timestamp Egress Asymmetry Correction register contains the Egress Asymmetry Correction value to be used while updating the correction field in PDelay_Req PTP messages.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **OSTEAC[31:0]**: One-Step Timestamp Egress Asymmetry Correction

This field contains the egress path asymmetry value to be subtracted from correctionField of Pdelay_Resp PTP packet. The programmed value must be the negated value in units of nanoseconds multiplied by 2^{16}.

For example, if the required correction is +2.5 ns, the programmed value must be 0xFFFD 8000, which is the 2's complement of 0x0002 8000(2.5×2^{16}). Similarly, if the required correction is -3.3 ns, the programmed value is 0x0003 4CCC (3.3×2^{16}).

Timestamp Ingress correction nanosecond register (ETH_MACTSICNR)

Address offset: 0x0B58

Reset value: 0x0000 0000

This register contains the correction value in nanoseconds to be used with the captured timestamp value in the ingress path.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **TSEC[31:0]**: Timestamp Egress Correction

This field contains the nanoseconds part of the egress path correction value as defined by the Egress Correction expression.

Timestamp Ingress Latency register (ETH_MACTSILR)

Address offset: 0x0B68

Reset value: 0x0000 0000

This register holds the ingress MAC latency.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r								

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **ITLNS[11:0]**: Ingress Timestamp Latency, in nanoseconds

This register holds the average latency (in nanoseconds) between the MAC input ports and the actual point (GMII/MII) where the ingress timestamp is taken. Ingress correction value is computed as described in *Section : Ingress correction*.

Bits 15:8 **ITLSNS[7:0]**: Ingress Timestamp Latency, in subnanoseconds

This register holds the average latency (in subnanoseconds) between the MAC input ports and the actual point (GMII/MII) where the ingress timestamp is taken. ingress correction value is computed as described in *Section : Ingress correction*.

Bits 7:0 Reserved, must be kept at reset value.

Timestamp Egress Latency register (ETH_MACTSELR)

Address offset: 0x0B6C

Reset value: 0x0000 0000

This register holds the Egress MAC latency.

r	r	r	r	r	r	r	r								

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **ETLNS[11:0]**: Egress Timestamp Latency, in nanoseconds

This register holds the average latency in nanoseconds between the actual point (GMII/MII) where the egress timestamp is taken and the output ports of the MAC. Egress correction value is computed as described in *Section : Egress correction*.

Bits 15:8 **ETLSNS[7:0]**: Egress Timestamp Latency, in subnanoseconds

This register holds the average latency in subnanoseconds between the actual point (GMII/MII) where the egress timestamp is taken and the output ports of the MAC. Egress correction value is computed as described in *Section : Egress correction*.

Bits 7:0 Reserved, must be kept at reset value.

PPS control register (ETH_MACPPSCR)

Address offset: 0x0B70

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	TIMESEL	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
			rw												
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MCGREN0	TRGTMODSEL0[1:0]		PPSEN0	PPSCTRL[3:0]			
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **TIMESEL**: Time Select

When this bit is set, 64 bit PTP time is used to capture time at MCGR trigger[0] input
When this bit is reset, presentation time is used to capture time at trigger input, maintaining backward compatibility

Bits 27:8 Reserved, must be kept at reset value.

Bit 7 **MCGREN0**: MCGR Mode Enable for PPS0 Output

This field enables the 0th PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode.

0: PPS mode

1: MCGR mode

Bits 6:5 **TRGTMODSEL0[1:0]**: Target Time Register Mode for PPS Output

This field indicates the Target Time registers (*PPS x target time seconds register (ETH_MACPPSTTSxR)* and *PPS x target time nanoseconds register (ETH_MACPPSTTNxR)*) mode for PPS output signal:

00: Target Time registers are programmed only for generating the interrupt event.

01: Enables MCGR Interrupt whose status bit is indicated by TSTARGT0 bit in *Timestamp status register (ETH_MACTSSR)* register

10: Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS output signal generation.

11: Target Time registers are programmed only for starting or stopping the PPS output signal generation. No interrupt is asserted.

Bit 4 **PPSEN0**: Flexible PPS Output Mode Enable

When this bit is set, PPSCTRL[3:0] function as PPSCMD[3:0]. When this bit is reset, PPSCTRL[3:0] function as PPSCTRL (Fixed PPS mode).

Bits 3:0 **PPSCTRL[3:0]**: PPS Output Frequency Control

This field controls the frequency of the PPS output (eth_ptp_pps_out) signal. The default value of PPSCTRL is 0000, and the PPS output is 1 pulse (of width clk_ptp_i) every second. For other values of PPSCTRL, the PPS output becomes a generated clock of following frequencies:

0001: The binary rollover is 2 Hz, and the digital rollover is 1 Hz.

0010: The binary rollover is 4 Hz, and the digital rollover is 2 Hz.

0011: The binary rollover is 8 Hz, and the digital rollover is 4 Hz.

0100: The binary rollover is 16 Hz, and the digital rollover is 8 Hz.

..

1111: The binary rollover is 32.768 KHz and the digital rollover is 16.384 KHz.

Note: In the binary rollover mode, the PPS output (eth_ptp_pps_out) has a duty cycle of 50 percent with these frequencies. In the digital rollover mode, the PPS output frequency is an average number. The actual clock is of different frequency that gets synchronized every second. For example:

- *When PPSCTRL = 0001, the PPS (1 Hz) has a low period of 537 ms and a high period of 463 ms.*
- *When PPSCTRL = 0010, the PPS (2 Hz) is a sequence of*
  One clock of 50 percent duty cycle and 537 ms period
  Second clock of 463 ms period (268 ms low and 195 ms high).
- *When PPSCTRL = 0011, the PPS (4 Hz) is a sequence of*
  Three clocks of 50 percent duty cycle and 268 ms period
  Fourth clock of 195 ms period (134 ms low and 61 ms high)

This behavior is because of the non-linear toggling of bits in the digital rollover mode in the ETH_MACSTNR register.

PPS control register [alternate] (ETH_MACPPSCR)

Address offset: 0x0B70

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **TIMESEL**: Time Select

When this bit is set, 64 bit PTP time is used to capture time at MCGR trigger[0] input
When this bit is reset, presentation time is used to capture time at trigger input, maintaining backward compatibility

Bits 27:16 Reserved, must be kept at reset value.

Bit 15 **MCGREN1**: MCGR Mode Enable for PPS Output 1

This field enables the 0th PPS instance to operate in PPS or MCGR mode. When set, it operates in MCGR mode and when reset it operates in PPS mode.
0: PPS mode
1: MCGR mode

Bits 14:13 **TRGTMODSEL1[1:0]**: Target Time Register Mode for PPS Output 1

This field indicates the target time register (*PPS x target time seconds register (ETH_MACPPSTTSxR)* and *PPS x target time nanoseconds register (ETH_MACPPSTTNxR)*) mode for PPS output signal:
00: Target time registers are programmed only for generating the interrupt event.
01: Enabled MCGR Interrupt whose status bit is indicated by TSTARGT1 bit in *Timestamp status register (ETH_MACTSSR)* register
10: Target time registers are programmed for generating the interrupt event and starting or stopping the PPS output signal generation.
11: Target time registers are programmed only for starting or stopping the PPS output signal generation. No interrupt is asserted.

Bit 12 Reserved, must be kept at reset value.

Bits 11:8 **PPSCMD1[3:0]:** Flexible PPS Output 1 Control

This field controls the flexible PPS output 1 signal. This field is similar to the PPSCMD[3:0] bitfield.

– When MCGREN1 is set, PPSCMD1 indicated by the four bits [11:8] are taken as Presentation Time Control bits for media clock generation and recovery for comparator instance 1. This field is similar to the PPSCMD0 Presentation Time Control bits.
– When MCGREN1 is cleared, only the three bits [10:8] are used as PPSCMD1 and the 4th bit must be cleared.

Bit 7 **MCGREN0**: MCGR Mode Enable for PPS Output 0

This field enables the 0th PPS instance to operate in PPS or MCGR mode. When set it operates in MCGR mode and on reset it operates in PPS mode.

0: PPS mode

1: MCGR mode

Bits 6:5 **TRGTMODSEL0[1:0]**: Target Time Register Mode for PPS Output 0

This field indicates the Target Time registers (*PPS x target time seconds register (ETH_MACPPSTTSxR)* and *PPS x target time nanoseconds register (ETH_MACPPSTTNxR)*) mode for PPS output signal:

00: Target Time registers are programmed only for generating the interrupt event.

01: Enables MCGR Interrupt whose status bit is indicated by TSTARGT0 bit in *Timestamp status register (ETH_MACTSSR)* register

10: Target Time registers are programmed for generating the interrupt event and starting or stopping the PPS output 0 signal generation.

11: Target Time registers are programmed only for starting or stopping the PPS output 0 signal generation. No interrupt is asserted.

Bit 4 **PPSEN0**: Flexible PPS Output 0 Mode Enable

When this bit is set, Bits[3:0] function as PPSCMD[3:0]. When this bit is reset, Bits[3:0] function as PPSCTRL(Fixed PPS mode).

Bits 3:0 **PPSCMD[3:0]:** Flexible PPS Output 0 (eth_ptp_pps_out) Control

Programming these bits with a non-zero value instructs the MAC to initiate an event. When the command is transferred or synchronized to the PTP clock domain, these bits get cleared automatically. The software should ensure that these bits are programmed only when they are ‘all zero’. The following list describes the values of PPSCMD0:

0000: No Command

0001: START Single Pulse.

This command generates single pulse rising at the start point defined in Target Time Registers (register 455 and 456) and of a duration defined in the PPS Width Register.

0010: START Pulse Train.

This command generates the train of pulses rising at the start point defined in the Target Time Registers and of a duration defined in the PPS Width Register and repeated at interval defined in the PPS Interval Register. By default, the PPS pulse train is free-running unless stopped by the 'Stop Pulse train at time' or 'Stop Pulse Train immediately' commands.

0011: Cancel START.

This command cancels the START Single Pulse and START Pulse Train commands if the system time has not crossed the programmed start time.

0100: STOP Pulse Train at time.

This command stops the train of pulses initiated by the START Pulse Train command (PPSCMD[3:0] = 0010) after the time programmed in the Target Time registers elapses.

0101: STOP Pulse Train immediately.

This command immediately stops the train of pulses initiated by the START Pulse Train command (PPSCMD[3:0] = 0010).

0110: Cancel STOP Pulse train.

This command cancels the STOP pulse train at time command if the programmed stop time has not elapsed. The PPS pulse train becomes free-running on the successful execution of this command.

0111 to 1111: Reserved, must not be used

PPS x target time seconds register (ETH_MACPPSTTSxR)

Address offset: 0x0B80 + 0x10 *x, (x = 0 to 1)

Reset value: 0x0000 0000

The PPS output x Target Time Seconds register, along with *PPS x target time nanoseconds register (ETH_MACPPSTTNxR)*, is used to schedule an interrupt event (Bit TSSOVF of *Timestamp status register (ETH_MACTSSR)*) when the system time exceeds the value programmed in these registers.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TSTRH0[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TSTRH0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **TSTRH0[31:0]**: PPS Target Time Seconds Register

This field stores the time in seconds. When the timestamp value matches or exceeds both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on Target Time mode selected for the corresponding PPS output in the *PPS control register (ETH_MACPPSCR)*.

If the PTGE field of *Timestamp control Register (ETH_MACTSCR)* is set with Presentation time control set in Recovery mode, then these bits indicate the TPT being programmed by the application and in Generation mode it indicates the CPT generated at the sampled trigger.

PPS x target time nanoseconds register (ETH_MACPPSTTNxR)

Address offset: 0x0B84 + 0x10 *x, (x = 0 to 1)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TRGTBUSY0	TTSL0[30:16]														
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TTSL0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **TRGTBUSY0**: PPS Target Time Register Busy

The MAC sets this bit when the PPSCMD0 field in the *PPS control register (ETH_MACPPSCR)* is programmed to 010 or 011. Programming the PPSCMD0 field to 010 or 011 instructs the MAC to synchronize the Target Time Registers to the PTP clock domain. The MAC clears this bit after synchronizing the Target Time Registers with the PTP clock domain The application must not update the Target Time Registers when this bit is read as 1. Otherwise, the synchronization of the previous programmed time gets corrupted.

Bits 30:0 **TTSL0[30:0]**: Target Time Low for PPS Register

This register stores the time in (signed) nanoseconds. When the value of the timestamp matches the value in both Target Timestamp registers, the MAC starts or stops the PPS signal output and generates an interrupt (if enabled) based on the TRGTMODSEL0 field (Bits [6:5]) in *PPS control register (ETH_MACPPSCR)*.

When the TSCTRLSSR bit is reset in the *Timestamp control Register (ETH_MACTSCR)*, this value should be (time in ns / 0.465). The actual start or stop time of the PPS signal output might have an error margin up to one unit of subsecond increment value.

When the TSCTRLSSR bit is set in the *Timestamp control Register (ETH_MACTSCR)*, this value should not exceed 0x3B9A C9FF. The actual start or stop time of the PPS signal output may have an error margin up to one unit of subsecond increment value.

PPS x interval register (ETH_MACPPSIxR)

Address offset: 0x0B88 + 0x10 *x, (x = 0 to 1)

Reset value: 0x0000 0000

The PPS Interval register contains the number of units of subsecond increment value between the rising edges of PPS output x.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PPSINT0[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PPSINT0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PPSINT0[31:0]**: PPS Output Signal Interval

These bits store the interval between the rising edges of PPS signal output. The interval is stored in terms of number of units of subsecond increment value.

You need to program one value less than the required interval. For example, if the PTP reference clock is 50 MHz (period of 20 ns), and desired interval between the rising edges of PPS signal output is 100 ns (that is, 5 units of subsecond increment value), you should program value 4 (5-1) in this register.

PPS x width register (ETH_MACPPSWxR)

Address offset: 0x0B8C + 0x10 *x, (x = 0 to 1)

Reset value: 0x0000 0000

The PPS Width register contains the number of units of subsecond increment value between the rising and corresponding falling edges of PPS output x.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PPSWIDTH0[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PPSWIDTH0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PPSWIDTH0[31:0]**: PPS Output Signal Width

These bits store the width between the rising edge and corresponding falling edge of PPS signal output. The width is stored in terms of number of units of subsecond increment value. You need to program one value less than the required interval. For example, if PTP reference clock is 50 MHz (period of 20 ns), and width between the rising and corresponding falling edges of PPS signal output is 80 ns (that is, four units of subsecond increment value), you should program value 3 (4-1) in this register.

Note: The value programmed in this register must be lesser than the value programmed in PPS x interval register (ETH_MACPPSIxR).

PTP Offload control register (ETH_MACPOCR)

Address offset: 0x0BC0

Reset value: 0x0000 0000

This register controls the PTP Offload Engine operation.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DN[7:0]								PDRDIS	DRRDIS	APDREQTRIG	ASYNCTRIG	Res.	APDREQEN	ASYNCEN	PTOEN
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **DN[7:0]**: Domain Number

This field indicates the domain Number in which the PTP node is operating.

Bit 7 **PDRDIS**: Disable Peer Delay Response response generation

When this bit is set, the Peer Delay Response (Pdelay_Resp) response is not generated for received Peer Delay Request (Pdelay_Req) request packet, as required by the programmed mode.

Setting this bit to 1 affects the normal PTP Offload operation and the time synchronization. So, this bit must be set only if there is problem with Pdelay_Resp generation in hardware and/or Pdelay_Resp generation is handled by software.

Bit 6 **DRRDIS**: Disable PTO Delay Request/Response response generation
When this bit is set, the Delay Request and Delay response are not generated for received SYNC and Delay request packet respectively, as required by the programmed mode.

Bit 5 **APDREQTRIG**: Automatic PTP Pdelay_Req message Trigger
When this bit is set, one PTP Pdelay_Req message is transmitted. This bit is automatically cleared after the PTP Pdelay_Req message is transmitted. The application should set the APDREQEN bit for this operation.

Bit 4 **ASYNCTRIG**: Automatic PTP SYNC message Trigger
When this bit is set, one PTP SYNC message is transmitted. This bit is automatically cleared after the PTP SYNC message is transmitted. The application should set the ASYNCEN bit for this operation.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **APDREQEN**: Automatic PTP Pdelay_Req message Enable
When this bit is set, PTP Pdelay_Req message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Peer-to-Peer Transparent mode.

Bit 1 **ASYNCEN**: Automatic PTP SYNC message Enable
When this bit is set, PTP SYNC message is generated periodically based on interval programmed or trigger from application, when the MAC is programmed to be in Clock Master mode.

Bit 0 **PTOEN**: PTP Offload Enable
When this bit is set, the PTP Offload feature is enabled.

PTP Source Port Identity 0 Register (ETH_MACSPI0R)

Address offset: 0x0BC4

Reset value: 0x0000 0000

This register contains Bits[31:0] of the 80-bit Source Port Identity of the PTP node.

SPI0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SPI0[31:0]**: Source Port Identity 0
This field indicates bits [31:0] of sourcePortIdentity of PTP node.

PTP Source port identity 1 register (ETH_MACSPI1R)

Address offset: 0x0BC8

Reset value: 0x0000 0000

This register contains Bits[63:32] of the 80-bit Source Port Identity of the PTP node.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

SPI1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SPI1[31:0]**: Source Port Identity 1
This field indicates bits [63:32] of sourcePortIdentity of PTP node.

PTP Source port identity 2 register (ETH_MACSPI2R)

Address offset: 0x0BCC

Reset value: 0x0000 0000

This register contains Bits[79:64] of the 80-bit Source Port Identity of the PTP node.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

SPI2[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SPI2[15:0]**: Source Port Identity 2
This field indicates bits [79:64] of sourcePortIdentity of PTP node.

Log message interval register (ETH_MACLMIR)

Address offset: 0x0BD0

Reset value: 0x0000 0000

This register contains the periodic intervals for automatic PTP packet generation.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LMPDRI[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	DRSYNCR[2:0]			LSI[7:0]							
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **LMPDRI[7:0]**: Log Min Pdelay_Req Interval

This field indicates logMinPdelayReqInterval of PTP node. This is used to schedule the periodic Pdelay request packet transmission. Allowed values are -15 to 15.Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.

Bits 23:11 Reserved, must be kept at reset value.

Bits 10:8 **DRSYNCR[2:0]**:

Delay_Req to SYNC Ratio

In Slave mode, it is used for controlling frequency of Delay_Req messages transmitted.

0: DelayReq generated for every received SYNC

1: DelayReq generated every alternate reception of SYNC

2: for every 4 SYNC messages

3: for every 8 SYNC messages

4: for every 16 SYNC messages

5: for every 32 SYNC messages

Others: Reserved, must not be used

The master sends this information (logMinDelayReqInterval) in the DelayResp PTP messages to the slave. The reception processes this value from the received DelayResp messages and updates this field accordingly. In the Slave mode, the host must not write/update this register unless it has to override the received value. In Master mode, the sum of this field and logSyncInterval (LSI) field is provided in the logMinDelayReqInterval field of the generated multicast Delay_Resp PTP message.

Bits 7:0 **LSI[7:0]**:

Log Sync Interval

This field indicates the periodicity of the automatically generated SYNC message when the PTP node is Master. Allowed values are -15 to 15. Negative value must be represented in 2's-complement form. For example, if the required value is -1, the value programmed must be 0xFF.

93 Ethernet switch (ETHSW)

This section applies to STM32MP25xx devices only.

93.1 Introduction

Copyright TTTech Industrial Automation AG, 2021.

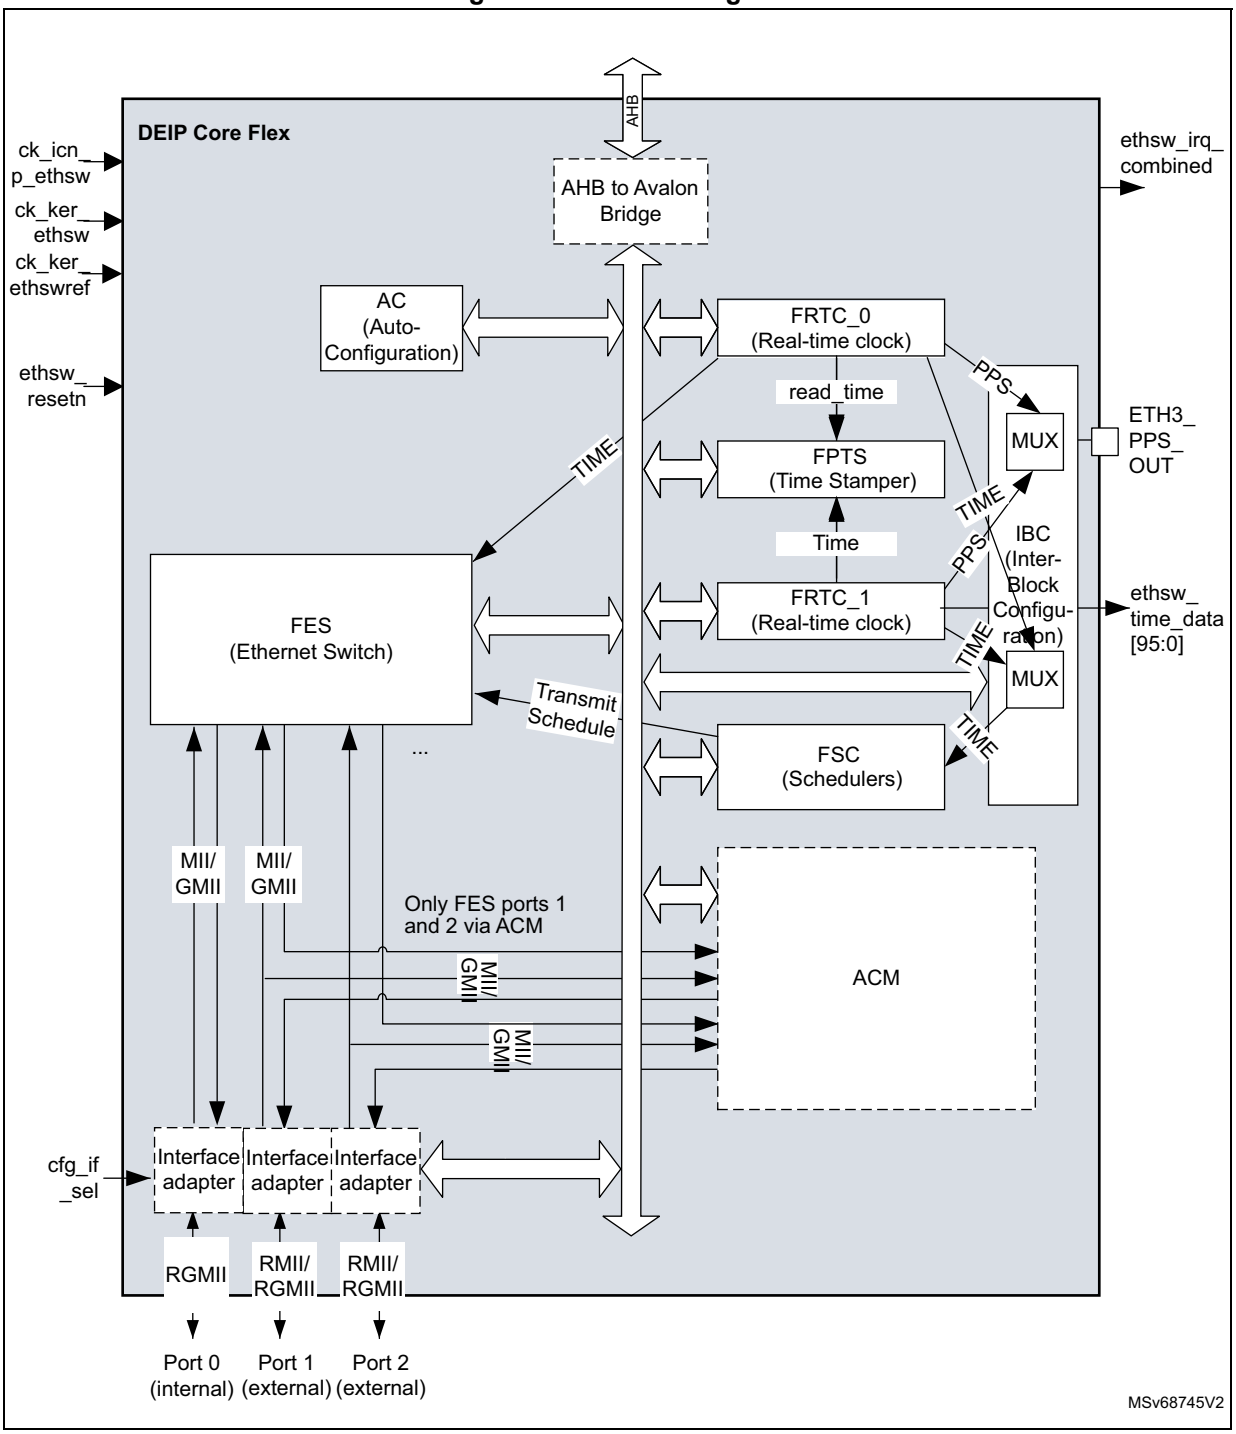
This section describes the three-port Gigabit Ethernet switch (ETHSW) with time sensitive networking (TSN) features.

93.2 ETHSW main features

- Three-port Gigabit Ethernet switch
  - two RMII/RGMII external ports
  - third port connected to the ETH1 Ethernet controller
- Two real-time clocks
- Timestamper
- Time synchronization (IEEE 802.1AS)
  - IEEE 1588v2 profile for the synchronization of clocks in the network.
  - Supports timing requirements for scheduled TSN networks
- Time-aware scheduler for scheduled traffic (IEEE802.1Qbv)
  - Provides guaranteed communication latency for time-critical traffic over standard Ethernet
- Frame preemption (IEEE 802.1Qbu)
  - Allows for optimal bandwidth utilization of non-scheduled background traffic sent in parallel with scheduled traffic
- Redundancy (frame replication and elimination for reliability) (IEEE 802.1 CB)
- Supplies the Ethernet controller external PTP buses for an Ethernet subsystem-wide time synchronization

Note: The ETHSW is a configurable peripheral and the figures hereafter may contain features not available in this version. The ETHSW does not include:

- *DMA ports*
- *MACSEC security*
- *PSFP (per stream filtering and policing)*
- *HSR/PRP functionalities*



93.3 ETHSW functional description

93.3.1 ETHSW block diagram

Figure 1126 here-below shows the ETHSW block diagram. Each of the individual building blocks are detailed in the functional description chapters.

Note: The ETHSW internal buses are using the Avalon protocol, as shown on Figure 1126. An AHB to Avalon bridge (see Section 93.3.10: AHB2Avalon) is implemented for the ETHSW register accesses.

Figure 1126. Block diagram

93.3.2 ETHSW pins and internal signals

Table 985 and *Table 986* show the Ethernet peripheral pins and ETHSW internal input/output signals, respectively.

Table 985. Ethernet peripheral pins

Port name	Digital port type	Description
ETH1_COL	Input	Collision detection signal, MII only.
ETH1_CRS	Input	Carrier sense signal, MII only
ETH1_REF_CLK	Input	RMII reference clock
ETH1_RX_CLK	Input	MII/RGMII timing reference for Rx data transfers
ETH1_RDX[4]	Input	Receive data. 4 pins for MII and RGMII, 2 for RMII.
ETH1_RX_DV	Input	Receive data valid
ETH1_CRS_DV	Input	Carrier Sense (CRS) and RX_Data Valid (RX_DV) multiplexed on alternate clock cycles
ETH1_RX_CTL	Input	After demultiplexing, this pin provides ETH_RX_DV on the rising edge of ETH_RX_CLK, and ETH_RX_ER (logical XOR between ETH_RX_CTL values on rising edge and falling edge of ETH_RX_CLK).
ETH1_RX_ER	Input	Receive error
ETH1_TX_CLK	Input	MII timing reference for Tx data transfers
ETH1_GTX_CLK	Output	RGMII timing reference for Tx data transfers
ETH1_TX[4]	Output	Transmit data. 4 pins for MII and RGMII, 2 for RMII.
ETH1_TX_EN	Output	Transmit data enable
ETH1_TX_CTL	Output	Multiplexing of ETH_TX_EN on the rising edge of ETH_TX_CLK, and a logical XOR between ETH_TX_EN and ETH_TX_ER values on falling edge of ETH_TX_CLK
ETH2_COL	Input	Collision detection signal, MII only.
ETH2_CRS	Input	Carrier sense signal, MII only
ETH2_REF_CLK	Input	RMII reference clock
ETH2_RX_CLK	Input	MII/RGMII timing reference for Rx data transfers
ETH2_RDX[4]	Input	Receive data. 4 pins for MII and RGMII, 2 for RMII.
ETH2_RX_DV	Input	Receive data valid
ETH2_CRS_DV	Input	Carrier Sense (CRS) and RX_Data Valid (RX_DV) multiplexed on alternate clock cycles
ETH2_RX_CTL	Input	After demultiplexing, this pin provides ETH_RX_DV on the rising edge of ETH_RX_CLK, and ETH_RX_ER (logical XOR between ETH_RX_CTL values on rising edge and falling edge of ETH_RX_CLK).
ETH2_RX_ER	Input	Receive error
ETH2_TX_CLK	Input	MII timing reference for Tx data transfers

Table 985. Ethernet peripheral pins (continued)

Port name	Digital port type	Description
ETH2_GTX_CLK	Output	RGMII timing reference for Tx data transfers
ETH2_TX[4]	Output	Transmit data. 4 pins for MII and RGMII, 2 for RMII.
ETH2_TX_EN	Output	Transmit data enable
ETH2_TX_CTL	Output	Multiplexing of ETH_TX_EN on the rising edge of ETH_TX_CLK, and a logical XOR between ETH_TX_EN and ETH_TX_ER values on falling edge of ETH_TX_CLK
ETH3_REF_CLK	Input	RMII reference clock
ETH3_RX_CLK	Input	MII/RGMII timing reference for Rx data transfers
ETH3_RDX[4]	Input	Receive data. 4 pins for MII and RGMII, 2 for RMII.
ETH3_CRS_DV	Input	Carrier Sense (CRS) and RX_Data Valid (RX_DV) multiplexed on alternate clock cycles
ETH3_RX_CTL	Input	After demultiplexing, this pin provides ETH_RX_DV on the rising edge of ETH_RX_CLK, and ETH_RX_ER (logical XOR between ETH_RX_CTL values on rising edge and falling edge of ETH_RX_CLK).
ETH3_TX_CLK	Input	MII timing reference for Tx data transfers
ETH3_GTX_CLK	Output	RGMII timing reference for Tx data transfers
ETH3_TX[4]	Output	Transmit data. 4 pins for MII and RGMII, 2 for RMII.
ETH3_TX_EN	Output	Transmit data enable
ETH3_TX_CTL	Output	Multiplexing of ETH_TX_EN on the rising edge of ETH_TX_CLK, and a logical XOR between ETH_TX_EN and ETH_TX_ER values on falling edge of ETH_TX_CLK
ETH3_PHY_IRQ	Input	PHY interrupt (directly connected to GIC)
ETH3_PPS_OUT	Output	PTP pulse-per-second output of the ETHSW. Pulse length is 20 µs.

Table 986. ETHSW internal input/output signals

Signal name	Signal type	Description
ck_icn_p_ethsw	Digital input	ETHSW Ethernet switch peripheral clocks: register access and PTP clock
ck_ker_ethsw	Digital input	ETHSW kernel clock
ck_ker_ethswref	Digital input	Internal RMII clock
ethsw_resetn	Digital input	ETHSW reset
ethsw_irq_combined	Digital output	ETHSW interrupt

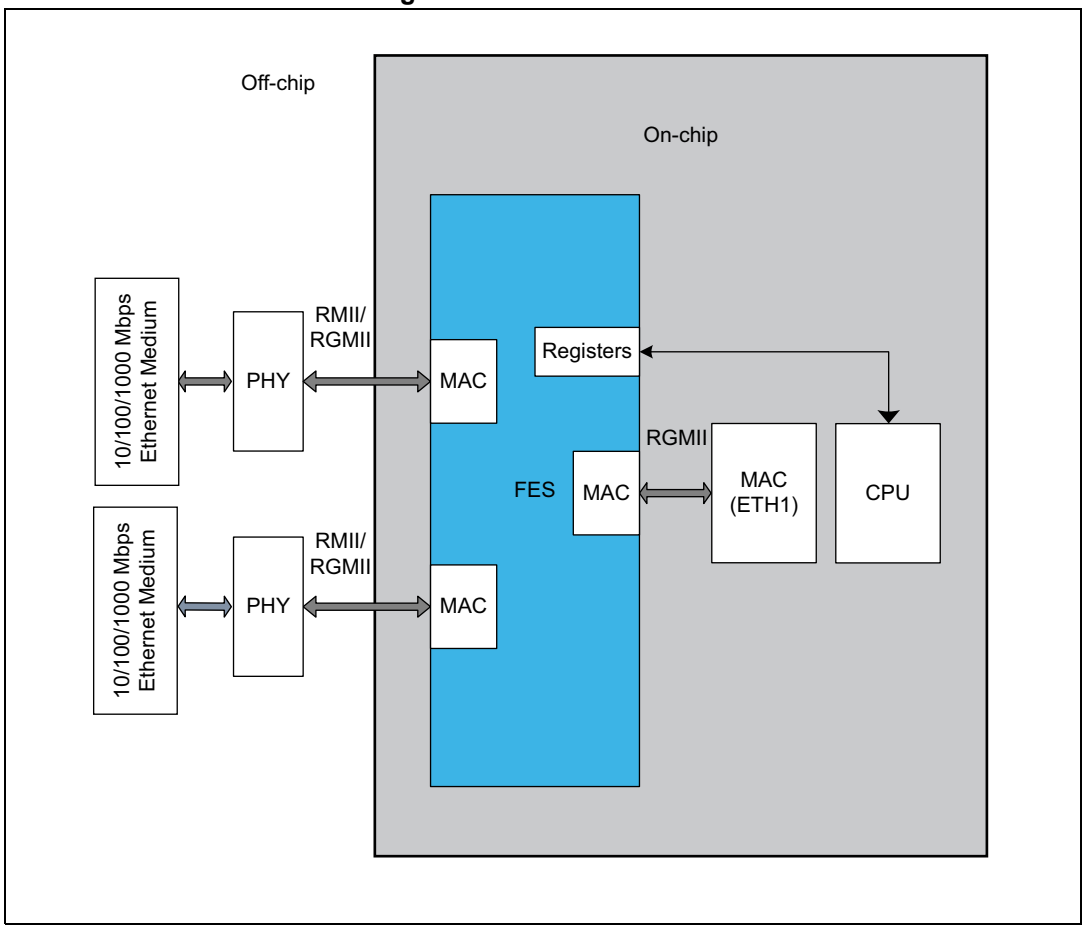
Table 986. ETHSW internal input/output signals (continued)

Signal name	Signal type	Description
cfg_if_sel	Digital input	PHY interface type selection for the RMII/RGMII adapters. This signal is controlled by the ETHSW_CFG_I_SEL bit in the RCC.
ethsw_time_data [95:0]	Digital output	ETHSW time data from FRTC0/1 (as per TIM_MUX0 bit in *ETHSW IBC time interface mux demux control register (ETHSW_IBC_TIME_MUX_CTRLR)*). Bits 15:0 subnanoseconds, bits (45:16) nanoseconds, bits (47:46) unused, bits (95 down to 48) seconds. Time data corresponds the time at time_ack signal edge. Synchronous to ck_icn_p_ethsw/2.

93.3.3 ETHSW reset and clocks

The ETHSW can be reset with the ETHSWRST bit in the RCC_ETHSWCFGR register.

It must be supplied with the following clocks:



- ck_icn_p_ethsw (200 MHz)
- ck_ker_ethsw (125 MHz)
- ck_ker_ethswref (50 MHz)

Refer to the RCC section for more details.

93.3.4 FES Ethernet switch

FES is an Ethernet switch that has multiple Ethernet Media Access Controller (MAC) functional entities. FES provides MII/GMII interfaces for Ethernet PHY devices and optionally for a host system CPU (see *Figure 1127*).

Figure 1127. FES overview

Features of FES

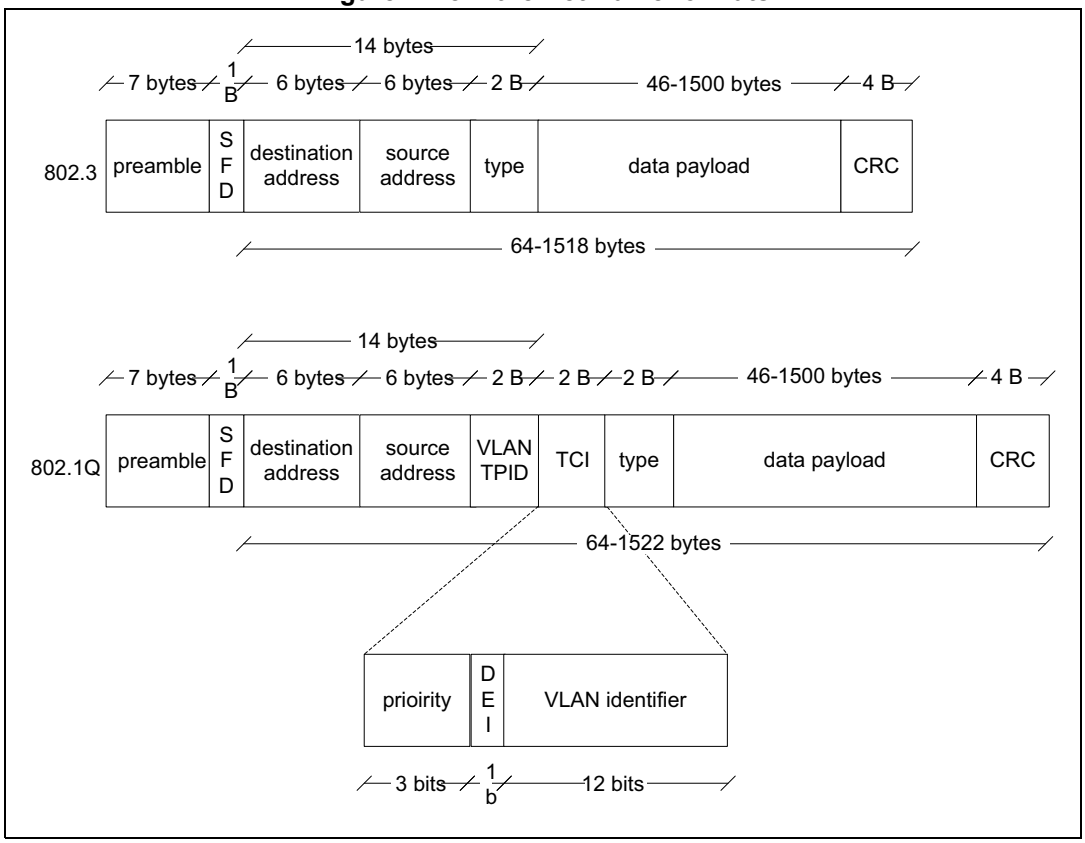
The standard and optional features of FES include:

- 10/100/1000 Mbit/s Full-Duplex Ethernet interfaces (IEEE 802.3x *[3]*)
- Compatible with IEEE standard 802.1D Media Access Control (MAC) Bridges *[5]*
- Ethernet packet forwarding at wire-speed, non-blocking
- PTPv2 end-to-end one-step transparent clock *[6]* processing at hardware
- PTPv2 peer-to-peer transparent clock *[6]* support functions
- PTPv2 boundary and ordinary clock *[6]* support functions
- Ethernet packet filtering and prioritization on each of the ports
- Virtual LAN tagging and priority tagging
- Traffic shaping and policing

Host system interface

FES has a special feature in its Ethernet interfaces that is helpful when the interface is connected to a host system CPU. This FES feature is called Management mode. By using the Management mode it is possible for the CPU to send/receive packets to/from any other port independent from the MAC address table and other configurations.

Introduction to Ethernet and switching



This chapter contains an introduction to Ethernet, Ethernet switching, Precision Time Protocol (IEEE 1588v2) and Time Sensitive Networking (TSN) technologies.

Ethernet Media Access Control (MAC)

The Media Access Control (MAC) protocol is used to provide the data link layer of Ethernet protocol. The MAC protocol encapsulates data by adding a 14-byte header before the payload and a 32-bit Cyclic Redundancy Check (CRC) checksum after the payload. In addition to this, there is a 7-byte preamble and a 1-byte Start Frame Delimiter (SFD) before the header, see *Figure 1128*.

In case of Virtual LAN (VLAN) tagging being used, the header is 4 bytes longer because of an additional type field and a VLAN tag. This also increases the Ethernet frame's maximum length from 1518 bytes to 1522 bytes (without preamble and SFD). This means that an Ethernet bridge should support forwarding of up to at least 1522-byte frames.

Figure 1128. Ethernet frame formats

Preamble and Start Frame Delimiter (SFD)

Between every frame, there is a small idle time called an Interframe Gap. The length of the Interframe Gap is 96 bits. After an Interframe Gap a node starts its transmission by sending a preamble sequence consisting of 56 alternating 1's and 0's. The purpose of the preamble sequence is to synchronize the receiver(s) before the actual data arrives. After the preamble comes a Start Frame Delimiter ("0x5D") that indicates the starting point of the actual frame (the header).

Header

MAC header consists of three parts:

- Destination Address field (6 bytes)

  The Destination Address specifies whether the recipient is a single node (unicast), a group of nodes (multicast), or all the nodes at the medium (broadcast). If the first bit is zero, then the recipient is a single node and this field contains the physical address of the receiver's interface.
- Source address field (6 bytes)

  The physical address of the interface that originated the frame.
- Type/Length field (2 bytes)

  The type field indicates the protocol being carried. In the case of IEEE 802.3 LLC, this field can also be used to indicate the length of the data. If the value of the field is less than or equal to 1500, then it is indicating the length of the frame.

Ethernet nodes are usually capable of choosing whether they want to receive only frames sent to their own Ethernet address and the broadcast address, or also frames sent to some, or all of the multicast addresses. The nodes may also choose to receive all the frames, including those destined for other nodes. This is called promiscuous mode.

CRC

The 32-bit cyclic redundancy check (CRC) checksum at the end of the frame provides an error detection mechanism. The CRC checksum is calculated and added to the frame when the frame is sent, and it is checked when the frame is received at the opposite end. Frames received with an invalid CRC checksum contain an error and should be discarded by the receiver.

Media Independent Interface (MII/GMII)

Media Independent Interface (MII) is a standardized interface between MAC and PHY. MII interface can exist in different forms, it can for example be a physical connector between two devices or it can be just signals between two devices on a circuit board. It is also possible that an MII interface exists inside a single chip, between two functional blocks. The idea of the MII interface is that it is independent of the physical medium. In practice this means that the same Ethernet MAC can be used with various kinds of Ethernet media. The MII interface standard supports both 10-Mbps and 100-Mbps transfer rates. For gigabit media there is GMII (Gigabit Medium Independent Interface).

Media Access Control (MAC) bridge

MAC bridges allow communications between end-stations attached to separate LANs (network segments). A bridge has an own separate MAC for each LAN it connects to and it is able to bridge traffic between the LANs transparent to logical link control (LLC) and network layer protocols, just as if the stations were attached to the same LAN. MAC bridges with more than two ports are commonly called switching hubs or Ethernet switches.

Functional entities of an Ethernet switch can be divided roughly into three parts: Forwarding Process, Address Learning Process and MAC address table (forwarding database). The Forwarding Process forwards Ethernet frames between the ports according to MAC address table updated by the Address Learning Process. The Address Learning Process observes all the received frames and learns which stations are in which network segments by storing their MAC addresses into the MAC address table.

Ethernet frames whose destination is known by the switch to be in the network segment behind another port are forwarded to that port. If the destination is known to be behind the same port where from the frame was received, the switch discards the frame. Ethernet frames whose destination is unknown (the address is not yet stored to the MAC address table, or the address information is deleted from the MAC address table because of being too old) are forwarded to every other port than the source port. In addition, frames with broadcast (and multicast) destination addresses are forwarded by switches to every other port that the source port as they are supposed to reach every station in the network.

MAC Address table

The operations on the MAC address table can be broken down to three different processes; a learning process, a lookup process and an aging process.

The learning process compares the source addresses of the received frames to the addresses in the MAC address table. If the entry is found to be already in the table, the port mapping information is updated if it has changed (the network topology has changed), and the entry is refreshed so that the aging process does not remove it prematurely. If the address entry cannot be found from the table, it is added there. If the table is already full, it may be necessary to remove some other entry from the table. Note that if the network topology changes and nodes are moved from a switch port to another, the switch does not have correct information on the whereabouts of the node until it transmits something, or the aging process removes the entry. Until then frames destined to the node is forwarded to wrong port and they do not reach their destination.

The lookup process compares the destination addresses of the received frames to the addresses in the MAC address table. According to this information the forwarding process either discards the frame or forwards it to another or to all other ports. Note that frames are never forwarded to the port from where they were received, as that would cause duplicate frames to the network.

The aging process removes entries from the MAC address table. The entries are removed when they have not been refreshed by the learning process for some time. In many switches this aging time is configurable, but not always, in which case the default value of five minutes is typically used. The aging process helps keeping the MAC address table small, which may in some cases affect the time taken by address lookup (depending on the search algorithm used). The other reason for the aging process to exist is to be able to react to network topology changes in case there are nodes that do not transmit too often or nodes that do not initiate any communication by themselves.

Shared Media versus Dedicated Media

“There are no shared-medium implementations of Ethernet at data rates above 10Mb/s.”*[10]*

Shared Ethernet, where technologies like Carrier Sense Multiple Access (CSMA) and Collision Detection (CD) are used for gaining access to the physical medium, is legacy technology. Today’s Ethernet is switched, which means that every end node has a dedicated port in an Ethernet switch. In switched Ethernet every network segment consists of an end-node, an Ethernet switch and a point-to-point link between them.

Switched Ethernet has many advantages over a shared media:

- Full-Duplex links offer double the capacity of a Half-Duplex link at the same nominal speed.
- Different nodes are able to operate with different data rates.
- Network capacity is used more efficiently, and latency minimized as all the frames are not forwarded to all the nodes and links.

- Full-Duplex operation allows links to be longer in distance because CSMA/CD protocol does not limit the maximum length. Today fiber optic Ethernet links can have range of over 100 kilometers.

Cut-through versus Store-and-Forward operation

According to the IEEE standard 802.1D “Media Access (MAC) Bridges” *[5]*, every port of the MAC bridge has an individual MAC entity examining all the frames transmitted to the medium by the other node(s). The CRC checksums of the received frames are checked by calculating the CRC of the received frames and comparing it to the CRC checksum at the end of the frame. Frames with erroneous CRC checksums should be silently discarded.

The so-called cut-through switches that start to forward the frame before it is fully received, do not conform with the standard in this respect because they are not able to discard the received frames if they have an erroneous CRC checksum. The opposite of cut-through operation is store-and-forward operation, in which case frames are fully received and their CRC checksums are checked before they are forwarded.

Spanning Tree Protocol

Spanning Tree Protocol (STP) is a protocol that automatically removes loops from a switched Ethernet network. A loop-free topology is achieved by disabling some of the network links, to form a tree topology from the mesh topology. Loop-free topology is needed because if there was a loop in the network, Ethernet frames would circulate in the loop for infinite time.

According to the standard (IEEE 802.1D) the Spanning Tree Protocol configures full, simple, and symmetric connectivity throughout a bridged Local Area Network that comprises individual LANs interconnected by bridges. The Spanning Tree Protocol (STP) configures the port state of each bridge port in the bridged Local Area Network. STP ensures that the stable connectivity provided by each bridge between its ports and by the individual LANs to which those ports attach is predictable, manageable, full, simple, and symmetric. STP further ensures that temporary loops in the active topology do not occur if the network has to reconfigure in response to the failure, removal, or addition of a network component, and that erroneous station location information are removed from the Filtering Database after reconfiguration. *[5]*

STP and its improved version Rapid Spanning Tree Protocol (RSTP) *[4]* use configuration messages sent to a specific multicast MAC address to create and maintain the network topology. In addition to the STP protocol stack, support for STP requires the bridge to support certain port states (Disabled, Learning and Forwarding) and capture the STP configuration messages for the STP protocol stack.

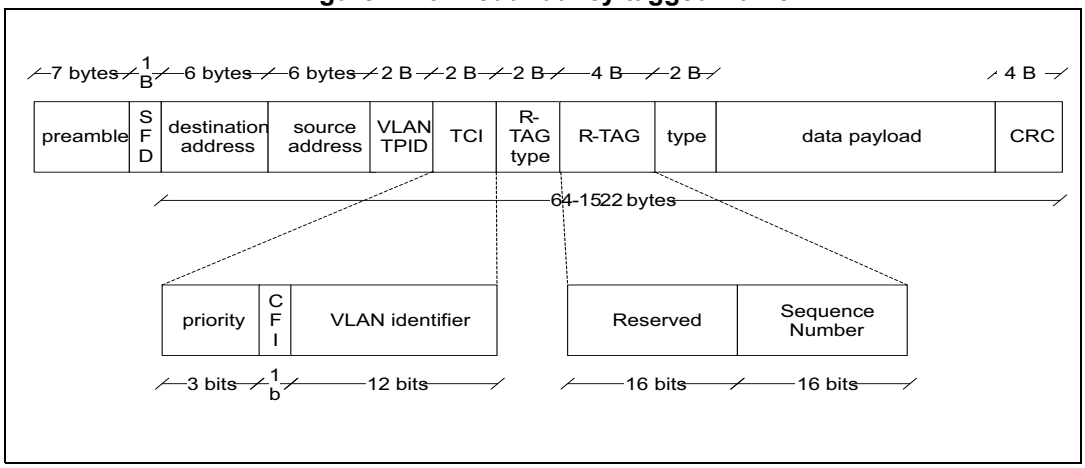
Precision Time Protocol

Precision Time Protocol (PTP), defined in IEEE standard 1588 *[6]*, is a protocol enabling precise synchronization of device clocks in packet-based networks, for example Ethernet. Devices running PTP are automatically synchronized to the most accurate clock in the network. The protocol supports system wide synchronization accuracy in submicrosecond range with minimal network and local clock computing resources. It is used for example by test and measurement, power-line management, industrial automation and telecom applications.

PTP accuracy is based on an assumption that the delay in Ethernet is approximately constant and symmetric. Because of the packet based traffic in Ethernet, Ethernet switches in the path of the packets cause variable delay for packet throughput, thus degrading PTP

synchronization accuracy. Transparent PTP clock functionality removes these problems and enables precise synchronization of clocks in switched Ethernet.

Transparent clock



Transparent clock timestamps PTP event frames in receive and in transmission ports and calculates the delay caused by the switch by subtracting the receive timestamp from the transmission timestamp. In PTP end-to-end transparent one step switch, the calculated delay is added to the correction field of the PTP event frame. A PTP slave that receives the PTP event message corrects the delay calculation by removing the effect of the PTP transparent clocks by subtracting the correction field value from the calculated total packet transmission delay. PTP peer-to-peer transparent clock measures the delay of the ingress path and includes that also in the correction field value.

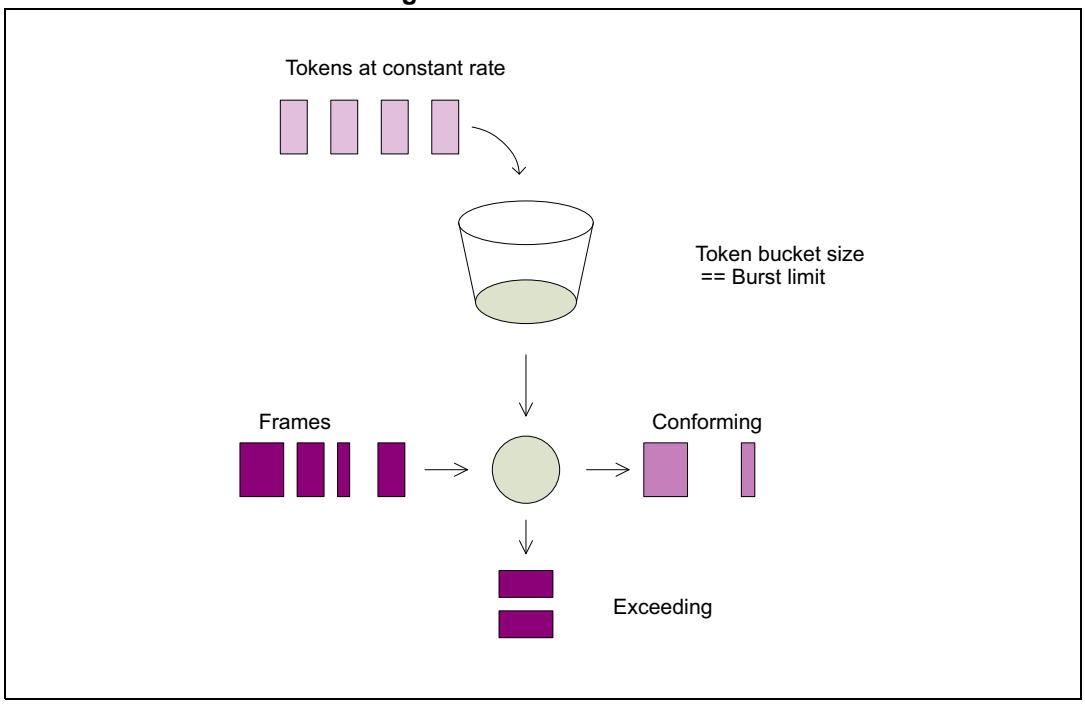
FRER (Frame Replication and Elimination for Reliability)

IEEE Standard 802.1CB (Frame Replication and Elimination for Reliability, FRER) *[9]* defines a method for frame replication and duplicate removal whose principles are quite similar to HSR and PRP. The standard even specifies some compatibility with HSR/PRP, and for compatibility reasons it uses, for example, the same sequence number space as HSR/PRP.

The main difference between HSR/PRP and FRER is that when HSR/PRP functionality is configured for ports, the FRER functionality is configured for streams. This means that in case of FRER a port can be simultaneously sending and receiving both FRER and non-FRER traffic. So, when in case of HSR/PRP the network topology is basically the same for all the traffic, with FRER different streams can experience totally different network topology. FRER uses Redundancy Tag (R-TAG) presented in *Figure 1129*. The EtherType of R-TAG is 0xF1C1. The Reserved bits in the R-TAG are transmitted as zero and ignored at receive.

Figure 1129. Redundancy tagged frame

Traffic shaping and policing



Traffic shaping and traffic policing are techniques for rate limiting. Traffic rate is measured and if the rate exceeds the configured rate, actions are taken to force the rate to comply with the configured profile.

The difference between shaping and policing is that a shaper is able to delay frames and a policer just drops the excess traffic. Shaping consumes more hardware resources than

policing as it requires buffering of the frames. As no buffer is infinite in size, shaping may also lead into dropping of frames if the traffic rate continuously exceeds the configured rate.

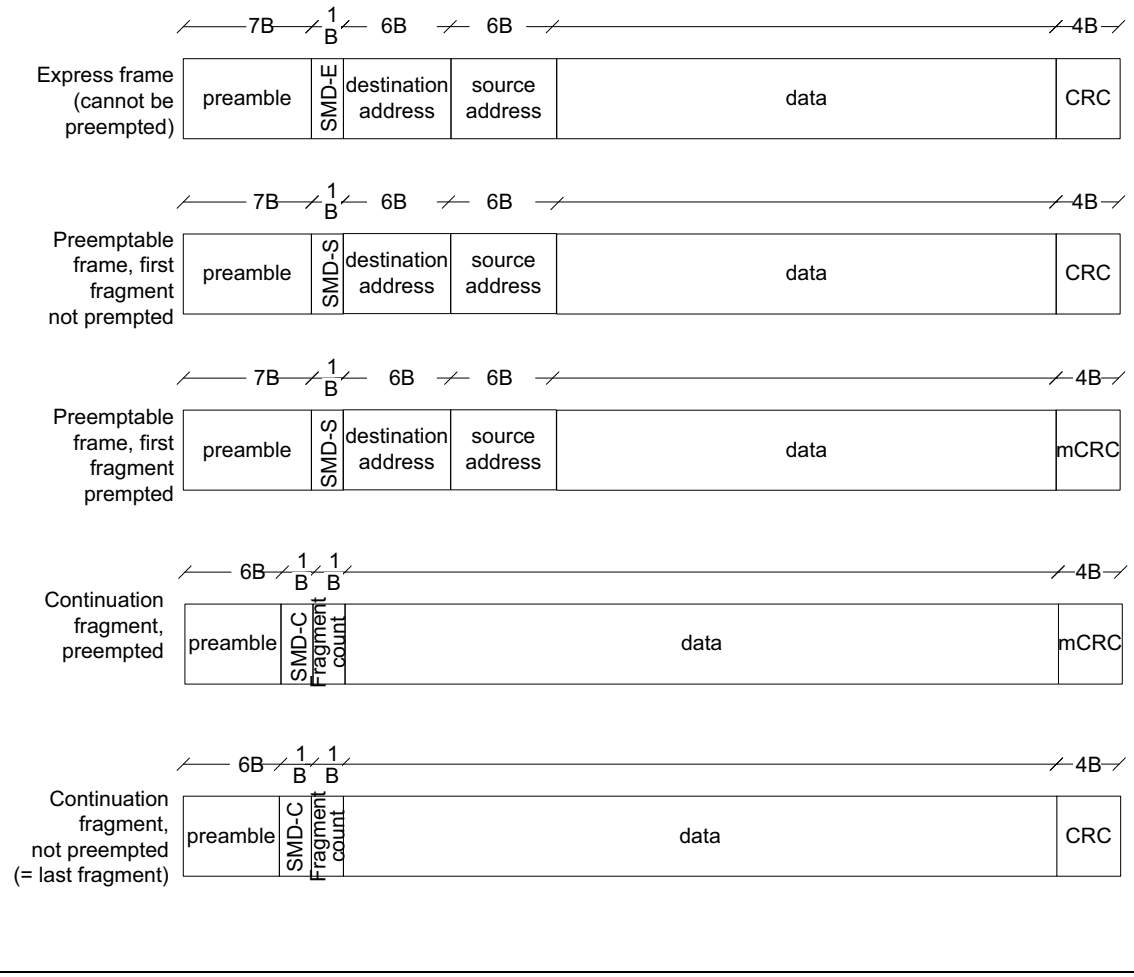
Policers typically employ so called Token bucket principle (see *Figure 1130*).

Figure 1130. Token bucket

Tokens arrive at the bucket with a constant rate that corresponds to the configured data rate. When a frame arrives, tokens are consumed for the frame. If the rate of the frames exceeds the rate of the tokens for a longer period, the bucket runs out of tokens. In that case the frames that are left without tokens are marked as exceeding the configured rate, and they may be treated in a different way than the other frames that conform to the configured rate.

Scheduled traffic

In critical control applications a very short and guaranteed maximum forwarding latency and end-to-end delay may be required. If the important traffic is periodic it is possible to arrange time slots for the important frames and to stop the less important traffic well before these time slots. In practice Scheduled traffic means that there is a schedule in the network nodes telling which TX queues of which ports are able to transmit at what time. For this to work the network nodes need to be well time synchronized with each other.



Preemptable traffic

Frame preemption means that transmission of a less time-critical frame whose transmission has already started can be interrupted so that a time-critical frame can be sent instead. After the time-critical frame has been sent, the transmission of the interrupted frame continues from the location where it was interrupted. A less time-critical (preemptable) frame may be interrupted (preempted) multiple times.

The SFD (Start Frame Delimiter) is replaced with an SMD (Start mPacket Delimiter) telling whether the frame is preemptable, non-preemptable (express), continuation fragment of a preempted frame, or a frame used for verifying whether the other end of the link supports

Frame preemption or not. When a frame is preempted, a special CRC called mCRC is added to the end of the frame for the receiving end to be able to distinguish it from frames that have not been preempted (see *Figure 1131*). The continuation fragments of the preempted frame then have one octet shorter (6 octets instead of the typical 7 octets) preamble, making room for an extra fragment count field located between the SMD and the data *[9]*.

Figure 1131. Ethernet frame with preemption

Notable is that the SMD for express frames (frames that cannot be preempted) is the same as the SFD (0xD5), so express frames are exactly like normal Ethernet frames. The full list of possible SMD values is presented in *Table 987*.

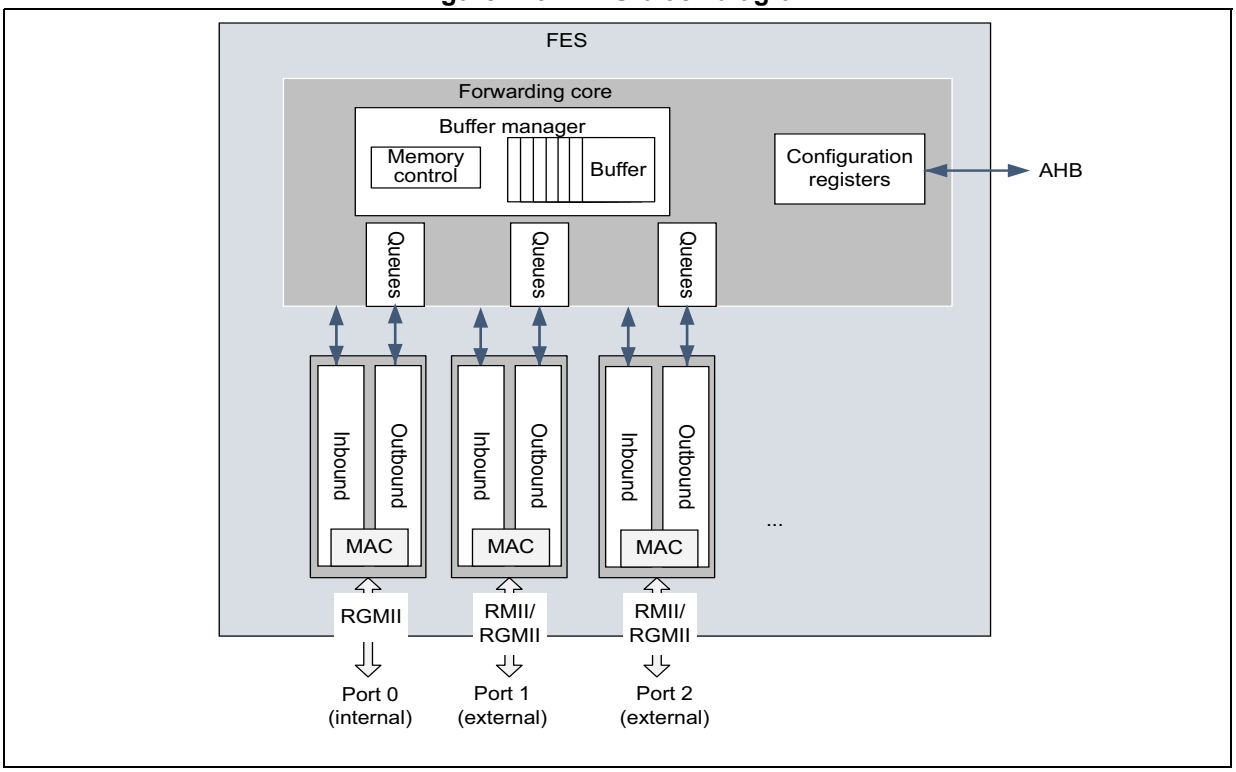


Table 987. SMD values

SMD	Notation	Meaning
0xD5	SMD-E	Express frame, non-preemptable.
0xE6, 0x4C, 0x7F, 0xB3	SMD-S	First fragment of a preemptable frame. It can be the only fragment too (CRC/mCRC indicates whether it is preempted or not). A 2-bit frame counter value is encoded into the SMD-S value as well.
0x61, 0x52, 0x9E, 0x2A	SMD-C	Continuation fragment of preempted frame. A 2-bit frame counter value is encoded into the SMD-C value as well.
0x07	SMD-V	A frame used for verifying preemption support of the other link partner.
0x19	SMD-R	A response to SMD-V.

Functional description

The functional blocks of FES are presented in *Figure 1132*. The functionality of FES can be controlled via configuration registers accessed using an AHB interface. The configuration registers are defined in *Section 93.5: ETHSW registers*.

Figure 1132. FES block diagram

FES consists of three main blocks: Forwarding core and Inbound and Outbound processing. The Inbound and Outbound processing blocks include either Ethernet Media Access Control (MAC) or DMA engine, depending on the port configuration.

The Forwarding core is responsible for managing the frames inside the switch. The Forwarding core is common to all the ports and it does the actual forwarding of frames between ports. As frames may need to spend time inside the switch, they are stored into a

buffer memory. The Forwarding core does the memory management for the buffer memory and it is also responsible for the queuing of the frames.

Every port has its own inbound and outbound processing. The inbound and outbound processing of a port is mostly independent from the other ports, exceptions to this are the MAC address tables, policers and stream recognition functionalities. Ports have GMII/MII interfaces to transfer Ethernet frames.

Figure 1133. FES forwarding path (GMII/MII port)

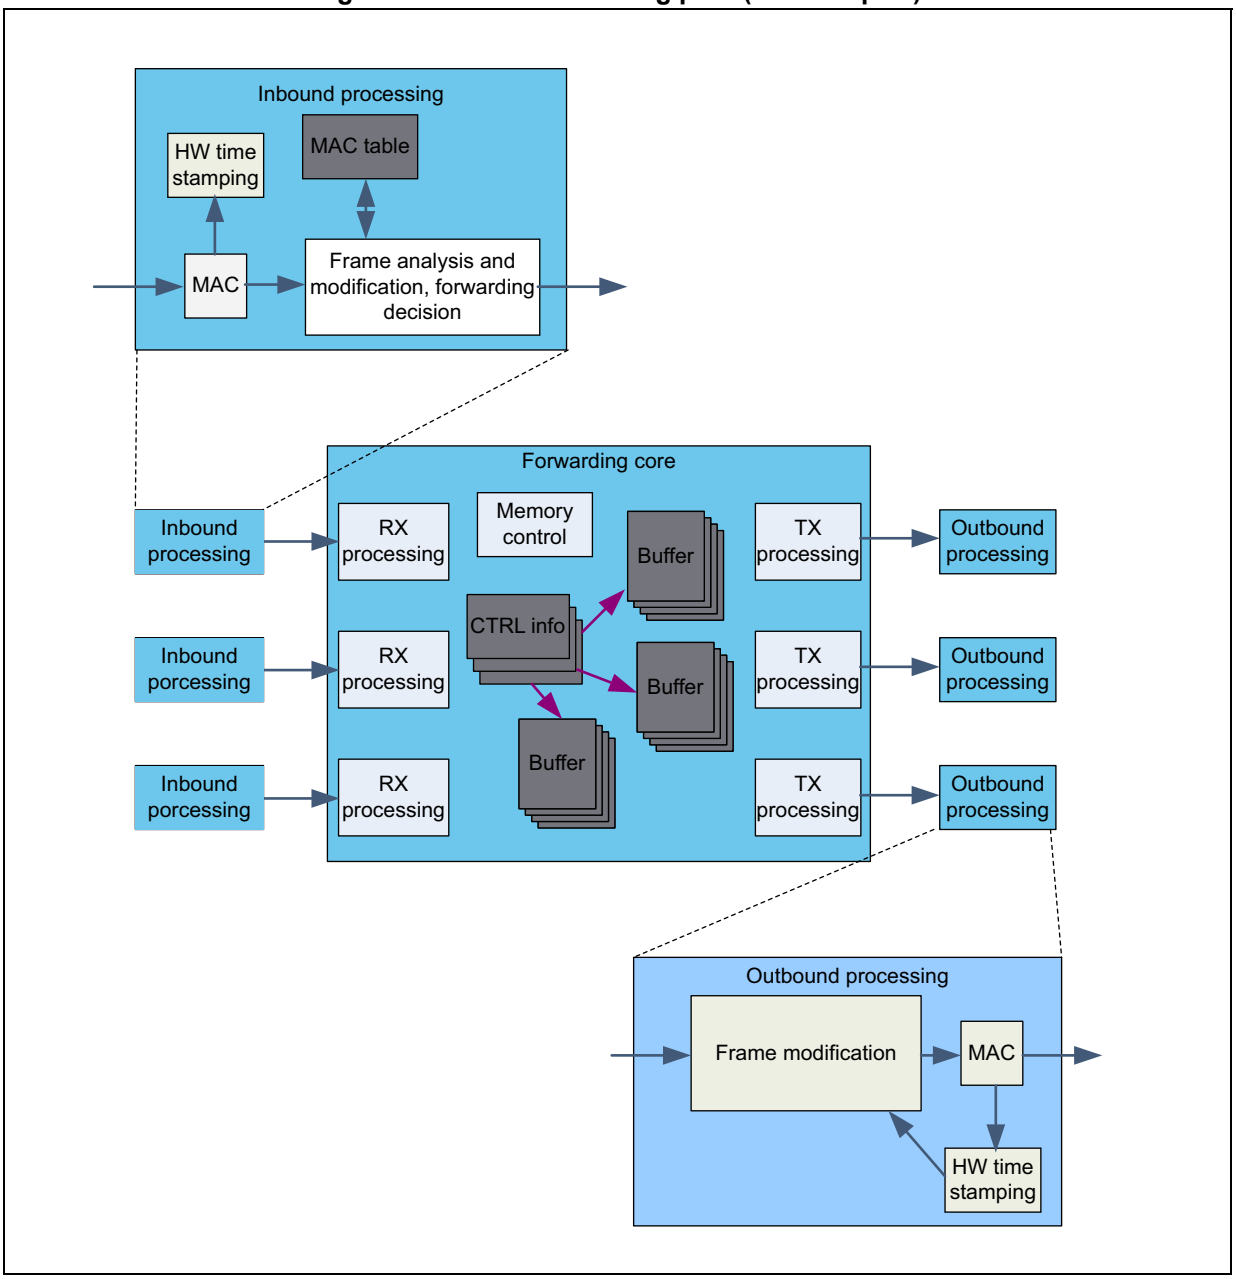

Figure 1133 presents the processing path of a forwarded frame inside FES. The path contains Inbound processing, Outbound processing and Forwarding core functions. Inbound processing contains Ethernet MAC and data processing blocks that are able to

analyze and modify the frame. Every port has its own Inbound processing functionality that uses a MAC address table common to all ports.

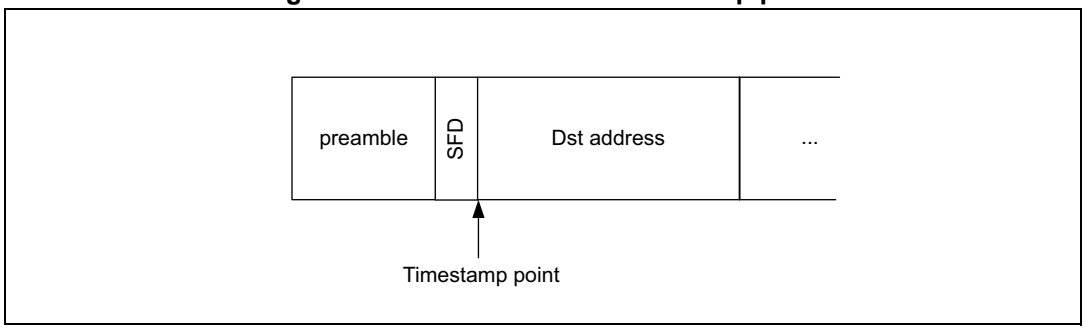
The Forwarding core contains RX and TX processing blocks for controlling Inbound and Outbound processing blocks. The memory controller block manages the memory used for storing frames and their control information. Storing of frames is needed because there can be more frames forwarded to an output port that what its capacity is. Frame data is stored into a buffer memory, and the state of the frame is managed via a CTRL info data structure. Every frame is associated with one CTRL info structure. CTRL info data structure contains all the needed information about the state of the frame, including the destination port and the whereabouts of the memory buffers where the frame data is stored. Frames are stored into the buffer memory in chunks of 512 bytes. This means that every stored frame consumes N* 512 bytes of buffer memory, where N equals 1 to 3. When frames are stored into the buffer memory waiting to be transmitted from an output port, they are in a TX queue of the output port. The TX queues contain pointers to the frames; no actual frame data is moved from a place to another when queuing the frames.

The main function of Outbound processing is to send frames from buffer memory to Ethernet (MII/GMII port). Outbound processing contains functionality for retrieving data from the buffer memory, timestamping functions for PTP use, and Ethernet MAC functionality for sending data to the medium (MII/GMII port). Each port has its own individual Outbound processing entity.

Inbound processing (GMII/MII ports)

Inbound processing receives frames from Ethernet and transfers them to the buffer memory. The functionality of Inbound processing blocks are described in subparagraphs in this chapter.

During reception, Inbound processing does the following:



- Detection of frame errors
- Timestamping of frames
- Filtering and recognition of frames
- Determination of the destination port(s) for every frame
- MAC address learning
- Modification of frames

RX MII

The RX MII receives frames from the Ethernet PHY. When RX MII is operational, and frames arrive from the network, it writes the frames received from the network to the RX preprocess block. While the frame is being received, RX MII calculates CRC over the frame. When the reception of the frame is complete, it indicates the status of the CRC calculation. Frames with invalid CRC are discarded by the Forwarding core (except when Cut-Through) and MAC RX error counter is incremented.

RX MII block indicates the start of the frame to the Timestamp block via the Time interface. The timestamp point for a frame is defined in *Figure 1134*.

Figure 1134. Ethernet frame timestamp point

There are four kinds of errors that can occur while RX MII is receiving a frame. These are: Size error, CRC error, Octet error and Line error.

Size error indicates that the received frame is over 1536-byte long (without preamble and SFD, with CRC). In that case the frame is truncated to 1536 bytes, and a Size error is generated incrementing MAC RX Error counter.

CRC error signals that the CRC checksum in the received frame was not the same as the one that was calculated while receiving the frame. This is the result of an error in the data of the received frame and an indication that the frame should be discarded. Size error, Octet error and Line error usually also cause a CRC error to the received frame.

Octet error occurs when the received frame contains an uneven number of half bytes (nibbles). This kind of frame is not valid.

Line error indicates that, while receiving the Frame, the PHY reported an error to RX MII.

All the frames received with an error are dropped by the Forwarding core (except when Cut-Through) and the corresponding error counters are incremented (see *ETHSW FES port x counter control register (ETHSW_FESx_CNT_CTRLR) (x = 0 to 2)*). In addition, frames whose size is less than 64 bytes are discarded.

Timestamp

The Timestamp block uses the start-of-frame indication from RX MII block to determine the exact value of the reception time. The reception time of the frame is then given to the RX preprocess block and to PTP Modify block (port 0 only).

The Timestamp block is external to FES. FES communicates with the Timestamp block using Time interface. Time interface uses time presentation that has an accuracy of 2^{-16} nanoseconds and a timestamp length of 96 bits. The actual accuracy depends on the system clock frequency used, and the type of clock.

Frame preemption

The frames with SMD-V or SMD-R are used for verifying preemption support. They are forwarded to the management ports for software handling of the verify protocol. The frames with SMD-S are either the first fragments or the only fragments of preemptable frames. The next fragments are marked with SMD-C. Frames with SMD-C include also an encoded fragment count. The last fragment is recognized by having a CRC instead of mCRC (CRC XOR 0x0000 FFFF). Both the frame count and fragment count are 2-bit counters.

The frame count is encoded into SMD-S as presented in *Table 988* and to SMD-C as presented in *Table 989*.

Table 988. Encoding of frame count in SMD-S

SMD-S[frame_count]	Value
SMD-S[0]	0xE6
SMD-S[1]	0x4C
SMD-S[2]	0x7F
SMD-S[3]	0xB3

Table 989. Encoding of frame count in SMD-C

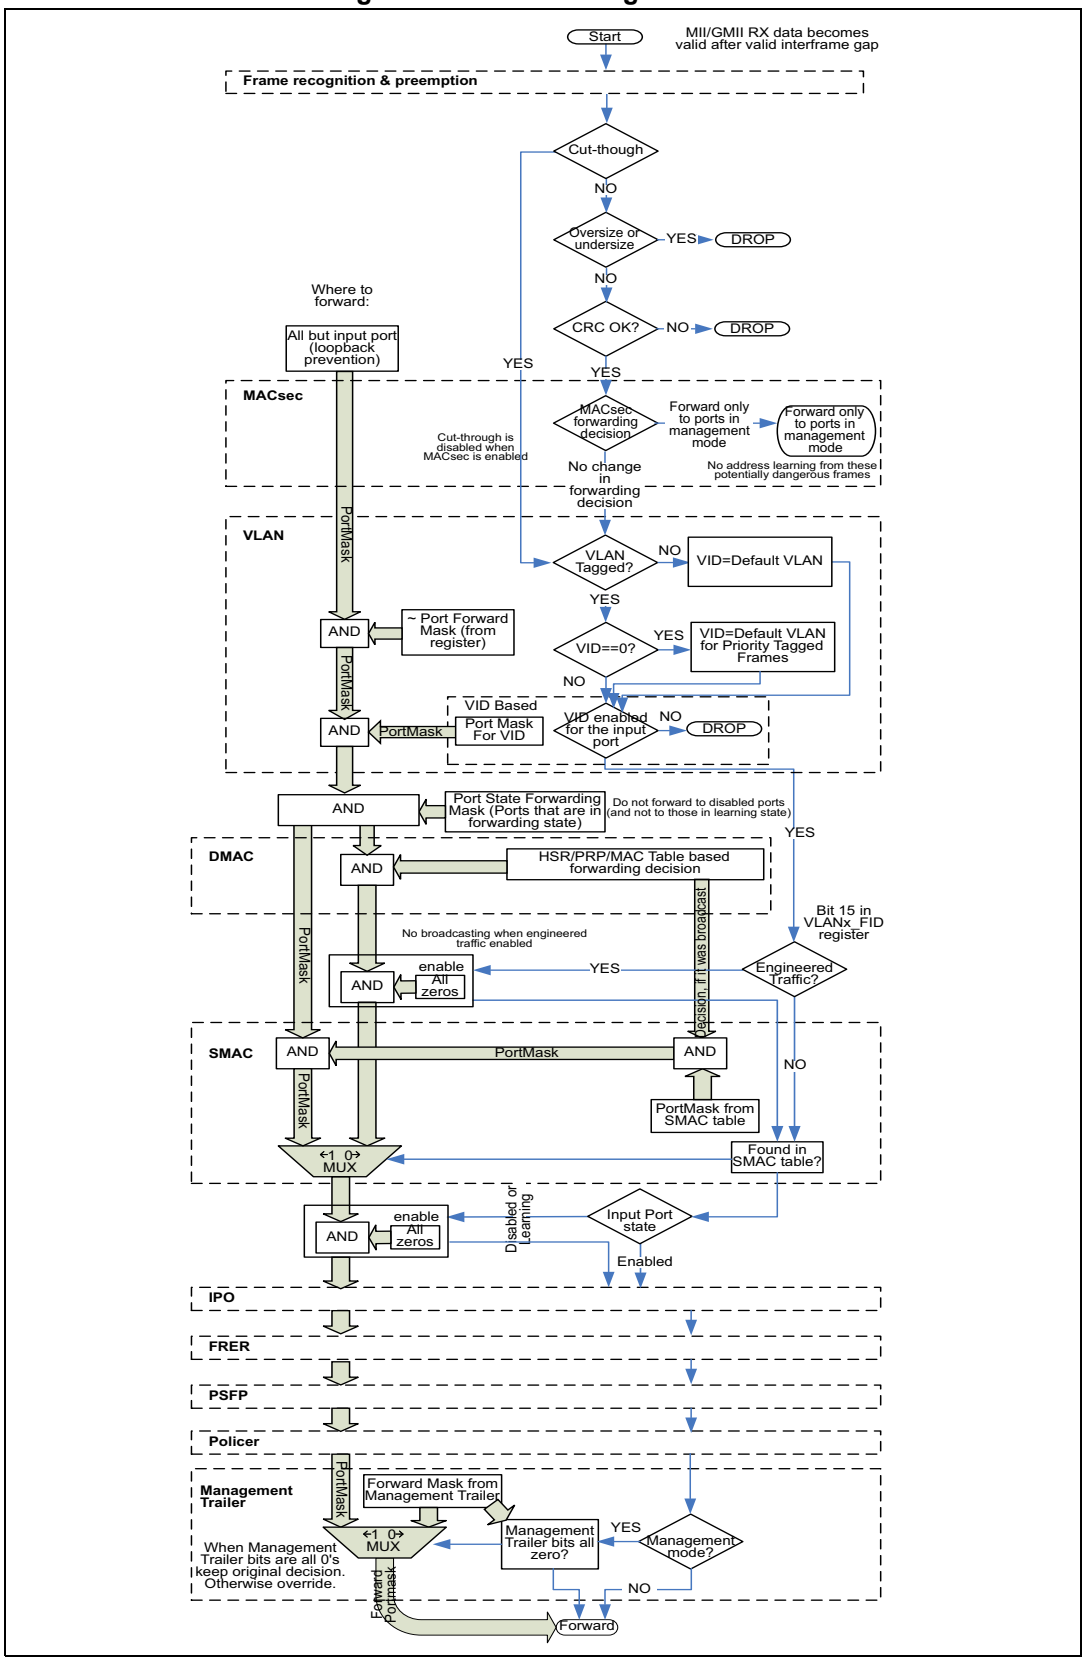
SMD-C[frame_count]	Value
SMD-C[0]	0x61
SMD-C[1]	0x52
SMD-C[2]	0x9E
SMD-C[3]	0x2A

Encoding of the Fragment Count in Continuation Fragments is presented in *Table 990*.

Table 990. Encoding of fragment count

FRAG_COUNT[frame_count]	Value
FRAG_COUNT[0]	0xE6
FRAG_COUNT[1]	0x4C
FRAG_COUNT[2]	0x7F
FRAG_COUNT[3]	0xB3

Forwarding decision



A Forwarding decision in FES is made based on information from the following sources:

- MAC address table
- Management Trailer (*Management Trailer*)
- IPO (*Inbound Port Ordinance*)
- VLAN configuration and VLAN ID (*Virtual LANs (VLANs)*)
- Port state (*ETHSW FES port x port State register (ETHSW_FESx_PORT_STATER) (x = 0 to 2)*) and FID_CFG Registers (*ETHSW FES port x filtering identifier configuration register 0 (ETHSW_FESx_FID_CFG0R) (x = 0 to 2)* to *ETHSW FES port x filtering identifier configuration register 7 (ETHSW_FESx_FID_CFG7R) (x = 0 to 2)*)
- Traffic Policer (*Traffic policing*)

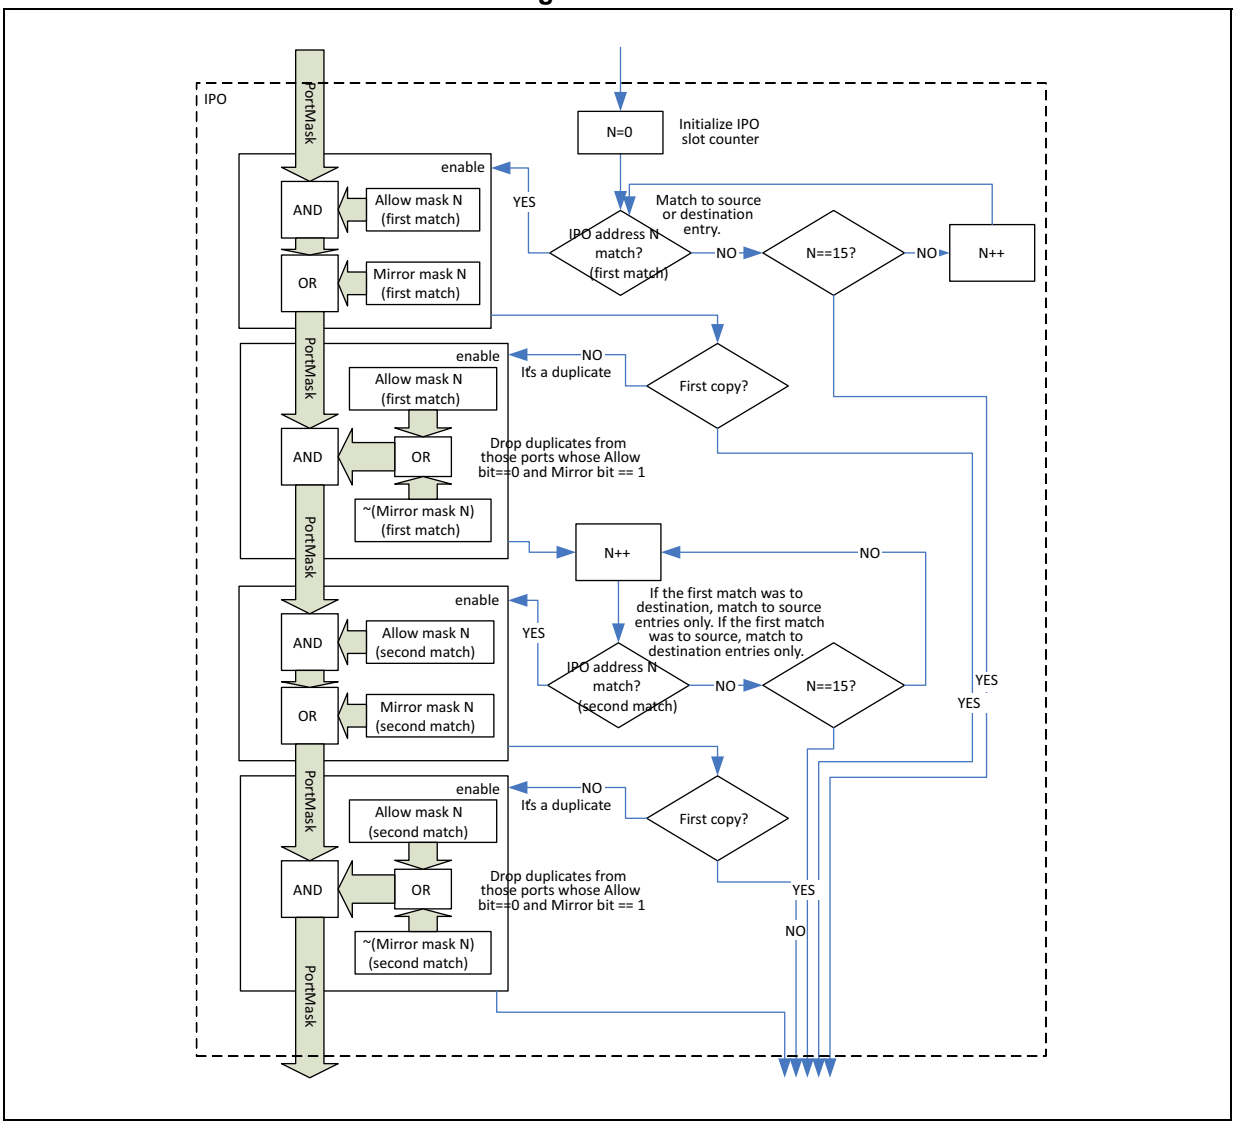
Regardless of a frame being dropped or not, it is always received to the buffer memory of the forwarding core, which means that it goes through the whole Inbound processing chain. If the frame is to be dropped, the memory resources allocated by the frame are freed right after the reception.

The forwarding decision is presented in *Figure 1135*. Note that frames coming into a disabled port are also received to the buffer memory, but because their forwarding decision is not to forward them to any port, they are dropped. However, this behavior can be changed and frames can be forwarded from disabled ports to other ports by using IPO (*Inbound Port Ordinance*).

Figure 1135. Forwarding decision

Inbound Port Ordinance

The Inbound Port Ordinance (IPO) functionality checks the source and the destination MAC addresses of all the received frames. The user can configure using the register interface what kind of a treatment should frames with certain source or destination MAC addresses then get. The alternatives for configured MAC addresses are the following:



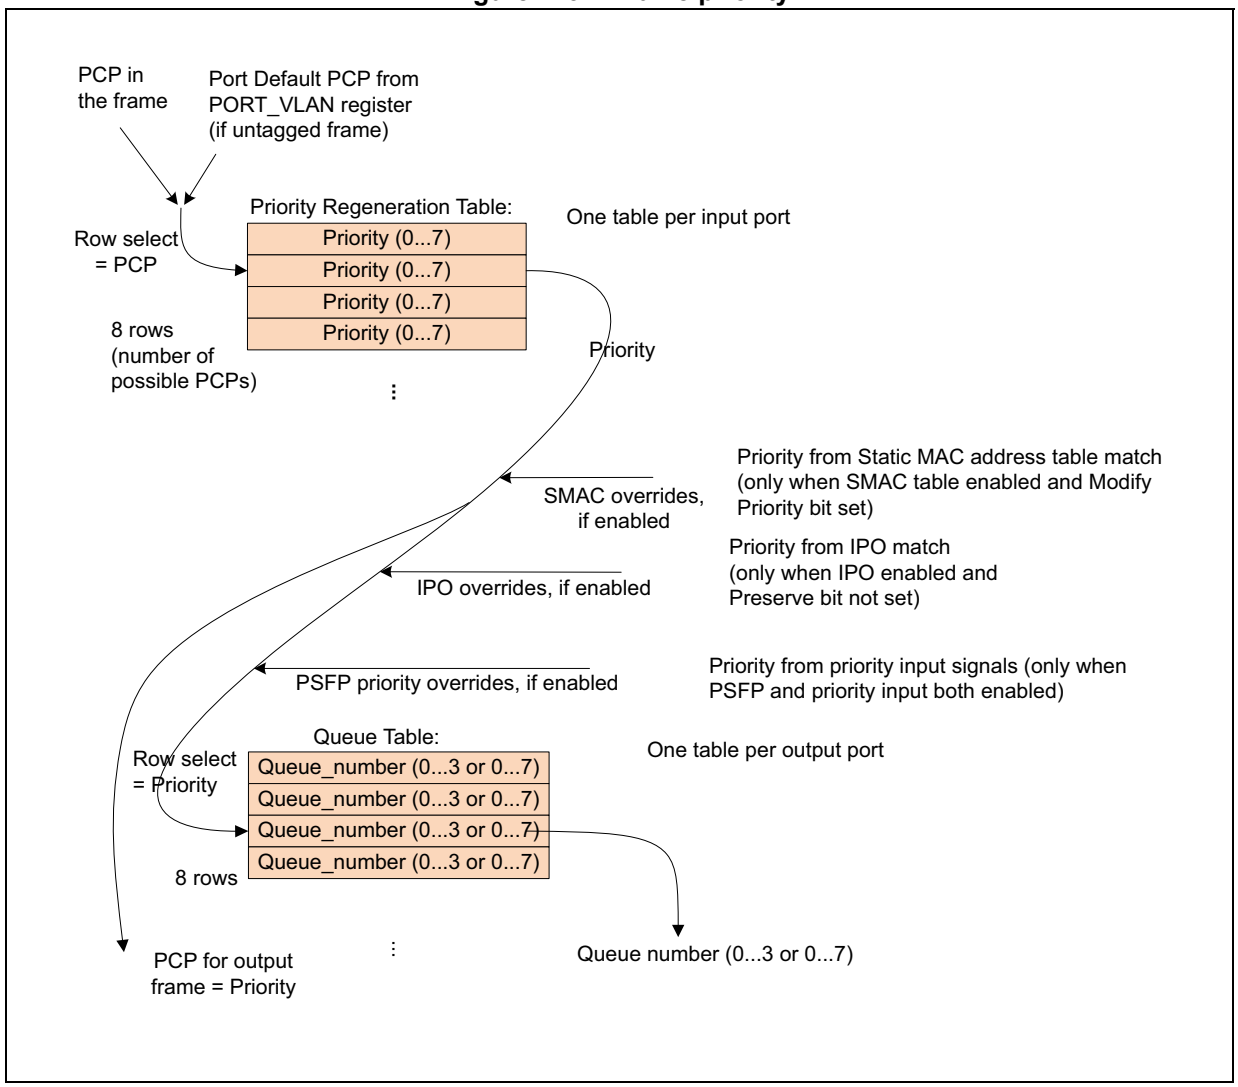
- Drop
- Allow forwarding only to certain ports
- Forced forwarding (mirroring) to certain ports

It is also possible to enable or disable:

- All unicast frames
- All multicast frames
- All broadcast frames

Figure 1136 shows how IPO affects the forwarding decision.

Figure 1136. IPO



The MAC addresses for the IPO are configured using IPO registers, from *ETHSW FES port x IPO command register (ETHSW_FESx_IPO_CMDR) (x = 0 to 2)* to *ETHSW FES port x ethernet address part 2 register (ETHSW_FESx_ETH_ADDR_2R) (x = 0 to 2)*.

The IPO goes through the MAC addresses configured in the IPO registers in ascending order for every incoming frame. It finds the first matching rule for both source and destination MAC addresses in the frame and applies both rules to the forwarding decision (in the order the matches were found). The effect of IPO matches to the forwarding decision can be seen in *Figure 1135*. The other settings for the matching frame (priority, whether to send without HSR/PRP tag) are taken from the latest match (if any).

Priority

When an incoming frame is VLAN tagged, its priority is defined by the PCP (Priority Code Point) bits in the VLAN tag and the priority configured in the Priority Regeneration Table for the PCP (see *ETHSW FES port x priority regeneration table low register (ETHSW_FESx_PRIO_REGENLR) (x = 0 to 2)* and *ETHSW FES port x priority regeneration table high register (ETHSW_FESx_PRIO_REGENHR) (x = 0 to 2)*). If the incoming frame had no VLAN tag, its priority is defined by the port default PCP (in PORT_VLAN register) and by the priority for the port default PCP configured in the Priority Regeneration Table, see *Figure 1137*. The priority then defines the PCP for the outgoing frame, and also via Queue Table into which the TX queue the frame is put.

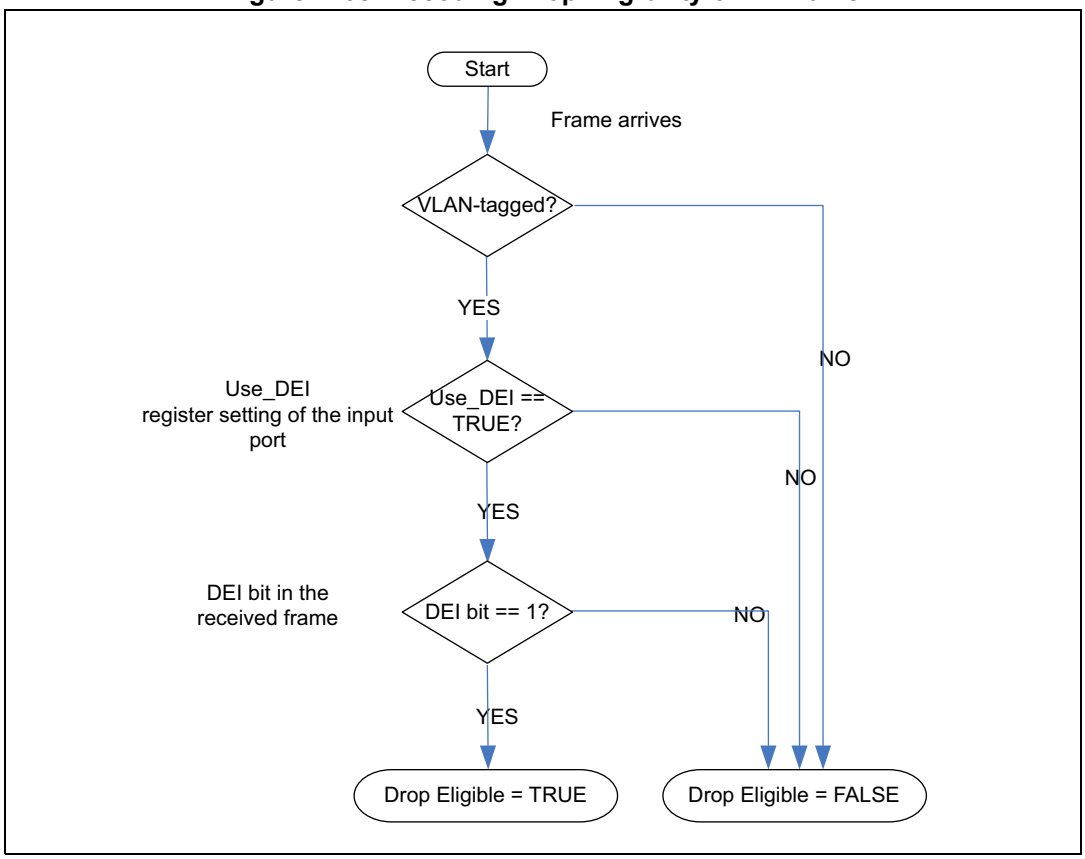
Figure 1137. Frame priority

IPO (*Inbound Port Ordinance*), SMAC table and PSFP schedule can be configured to override the priorities for selected frames as presented in *Figure 1137*. As can be seen in *Figure 1137*, priority from SMAC table affects the PCP of the outgoing frame, whereas priority from IPO and PSFP schedule can only affect the queue selection.

Drop Eligibility

The DEI (Drop Eligible Indicator) bit (see *Figure 1128*) in the VLAN tag can be used to indicate Drop Eligibility of Ethernet frames. Frames marked as Drop Eligible should be dropped before the frames not marked as Drop Eligible by the network nodes in case of network congestion. In FES the usage of DEI bit can be enabled/disabled per port by using the USE_DEI bit in register PORT_VLAN1 (*ETHSW FES port x port VLAN configuration register 1 (ETHSW_FESx_VLAN1R) (x = 0 to 2)*). Decoding and encoding of Drop Eligibility in the DEI bit of the VLAN tag is presented in *Figure 1138* and *Figure 1139*.

Figure 1138. Decoding Drop Eligibility of RX frame



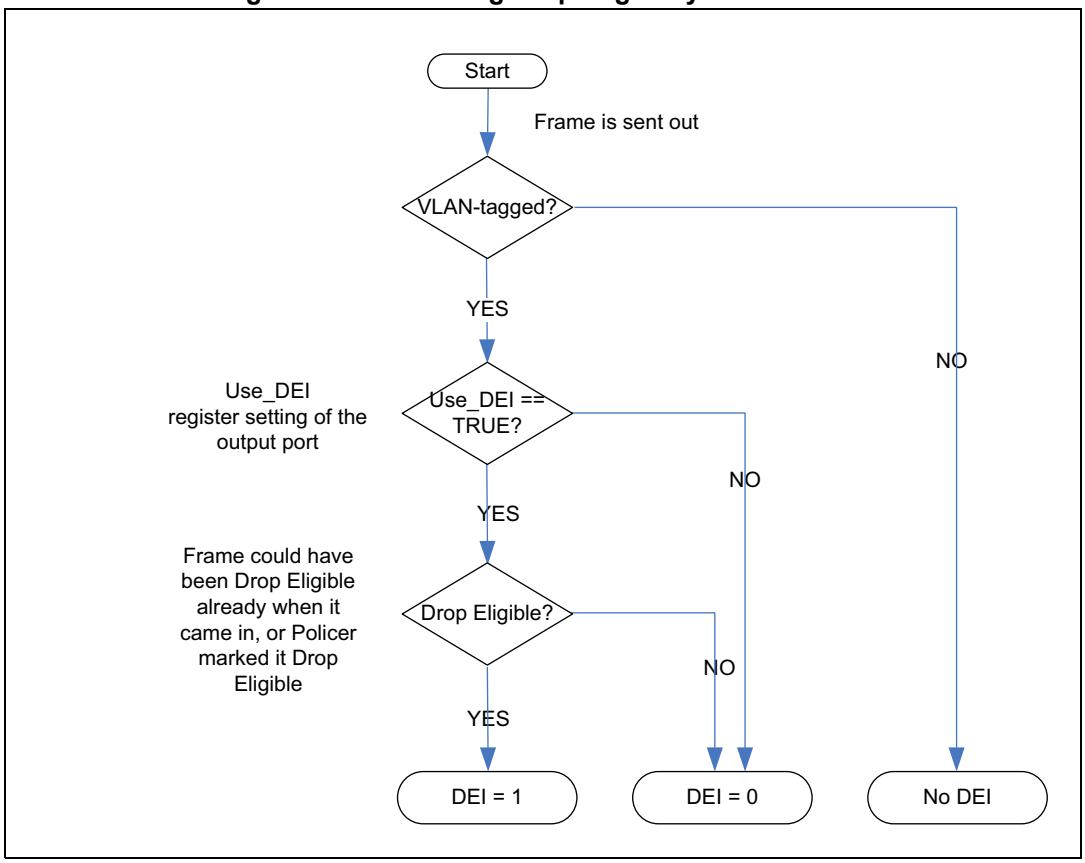


Figure 1139. Encoding Drop Eligibility for TX frame

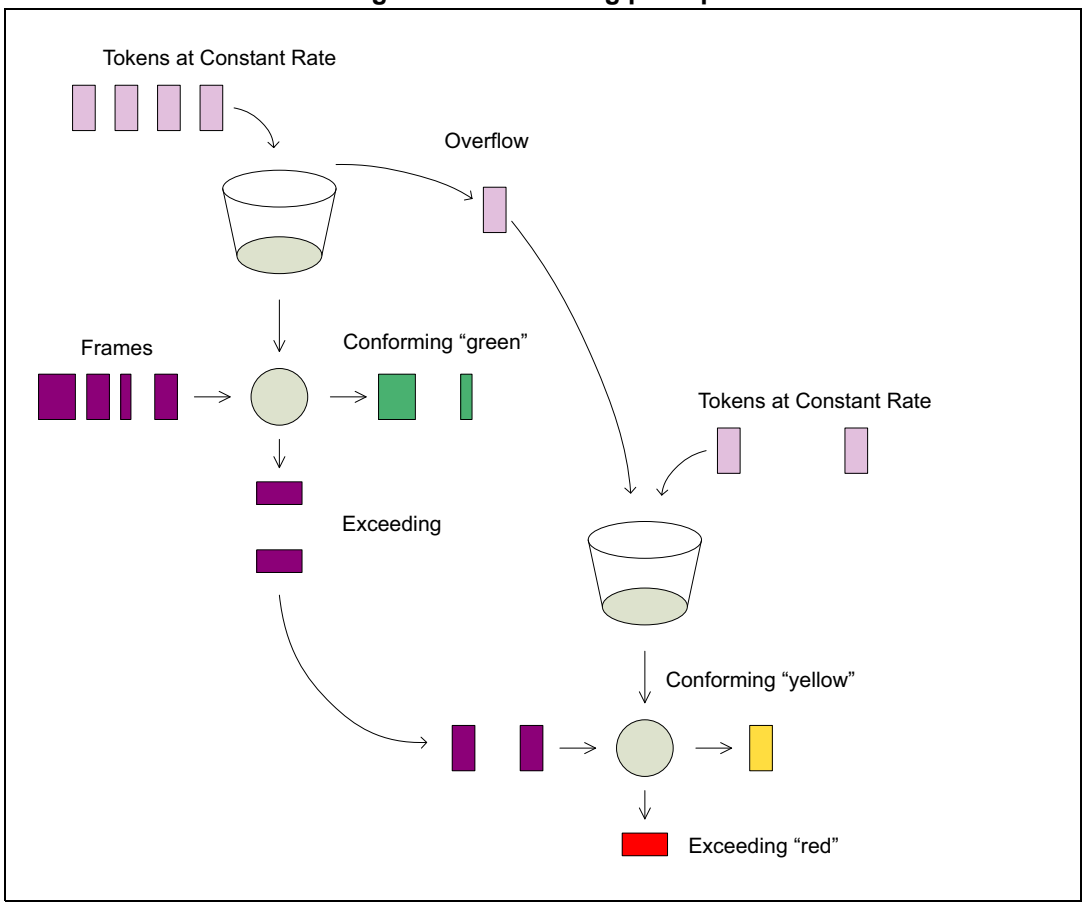
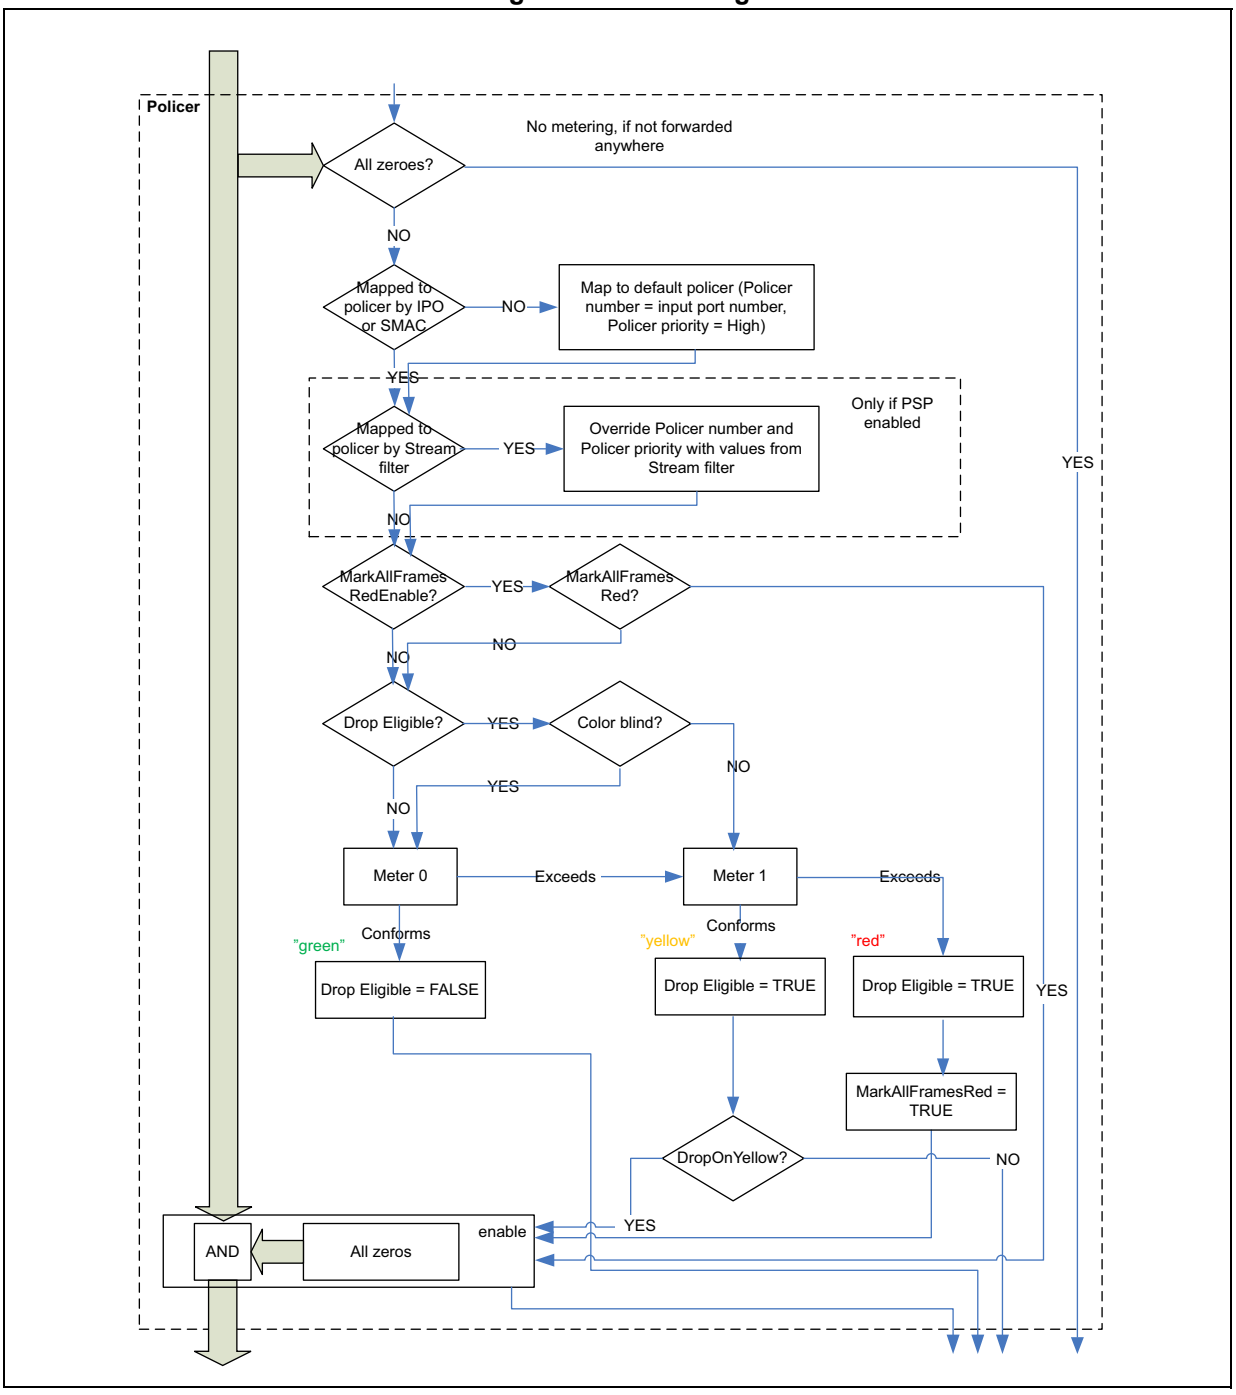


Traffic policing

Traffic policing provides means for limiting the rates of data flows by dropping the frames that exceed the configured rate.



FES has a 128 meters that can be used to measure and limit rates of data flows. Using the IPO (*Inbound Port Ordinance*) or the Static MAC Address Table (*MAC Address table*) the user can configure which frames are mapped to which meter.

Figure 1140. Metering principle

The principle of the metering system is presented in *Figure 1140*. There are two Token buckets in each meter (see *Figure 1130*), filled with tokens at configurable rate. In addition, the size of the buckets is user-configurable. The rate at which the first bucket is filled with tokens corresponds to Committed Information Rate (CIR) and the size of the bucket corresponds to Committed Burst Size (CBS). The rate at which the second bucket is filled with tokens corresponds to Excess Information Rate (EIR) and the size of the bucket corresponds to Excess Burst Size (EBS). The frames conforming to the CIR/CBS are marked “green” as they are considered well behaving. The frames not conforming to CIR/CBS but conforming to EIR/EBS are marked “yellow” and they are dropped more easily if the switch is running out of free buffer memory. The “yellow” frames that are sent out with VLAN tags can have their DEI (Drop Eligible Indicator) bits set if the network supports using DEI bit. The rest of the frames (the “red” frames) are dropped (refer to *Figure 1141* for the effect of the Policer on forwarding decision and compare it to the whole forwarding decision in *Figure 1135*). All the frames that have to be forwarded somewhere are mapped to some policer (see policer mapping in *Figure 1142*).

Figure 1141. Policing

In FES, each meter (bucket) is implemented as a 16-bit counter that counts tokens. The value in the counter is equivalent to number of bytes; for each accepted frame the counter value is decremented with the size of the frame. When calculating the length of a frame, preamble and SFD are not counted, while CRC is counted (refer to *Figure 1128*). The bucket size and token rate are separately configurable for each individual bucket. See *ETHSW FES policer read/write command register (ETHSW_FES_POLICER_CMDR)* for how to use indirect access to configure these values. The default values for token rate and bucket size are greater than the maximum line rate and frame size.

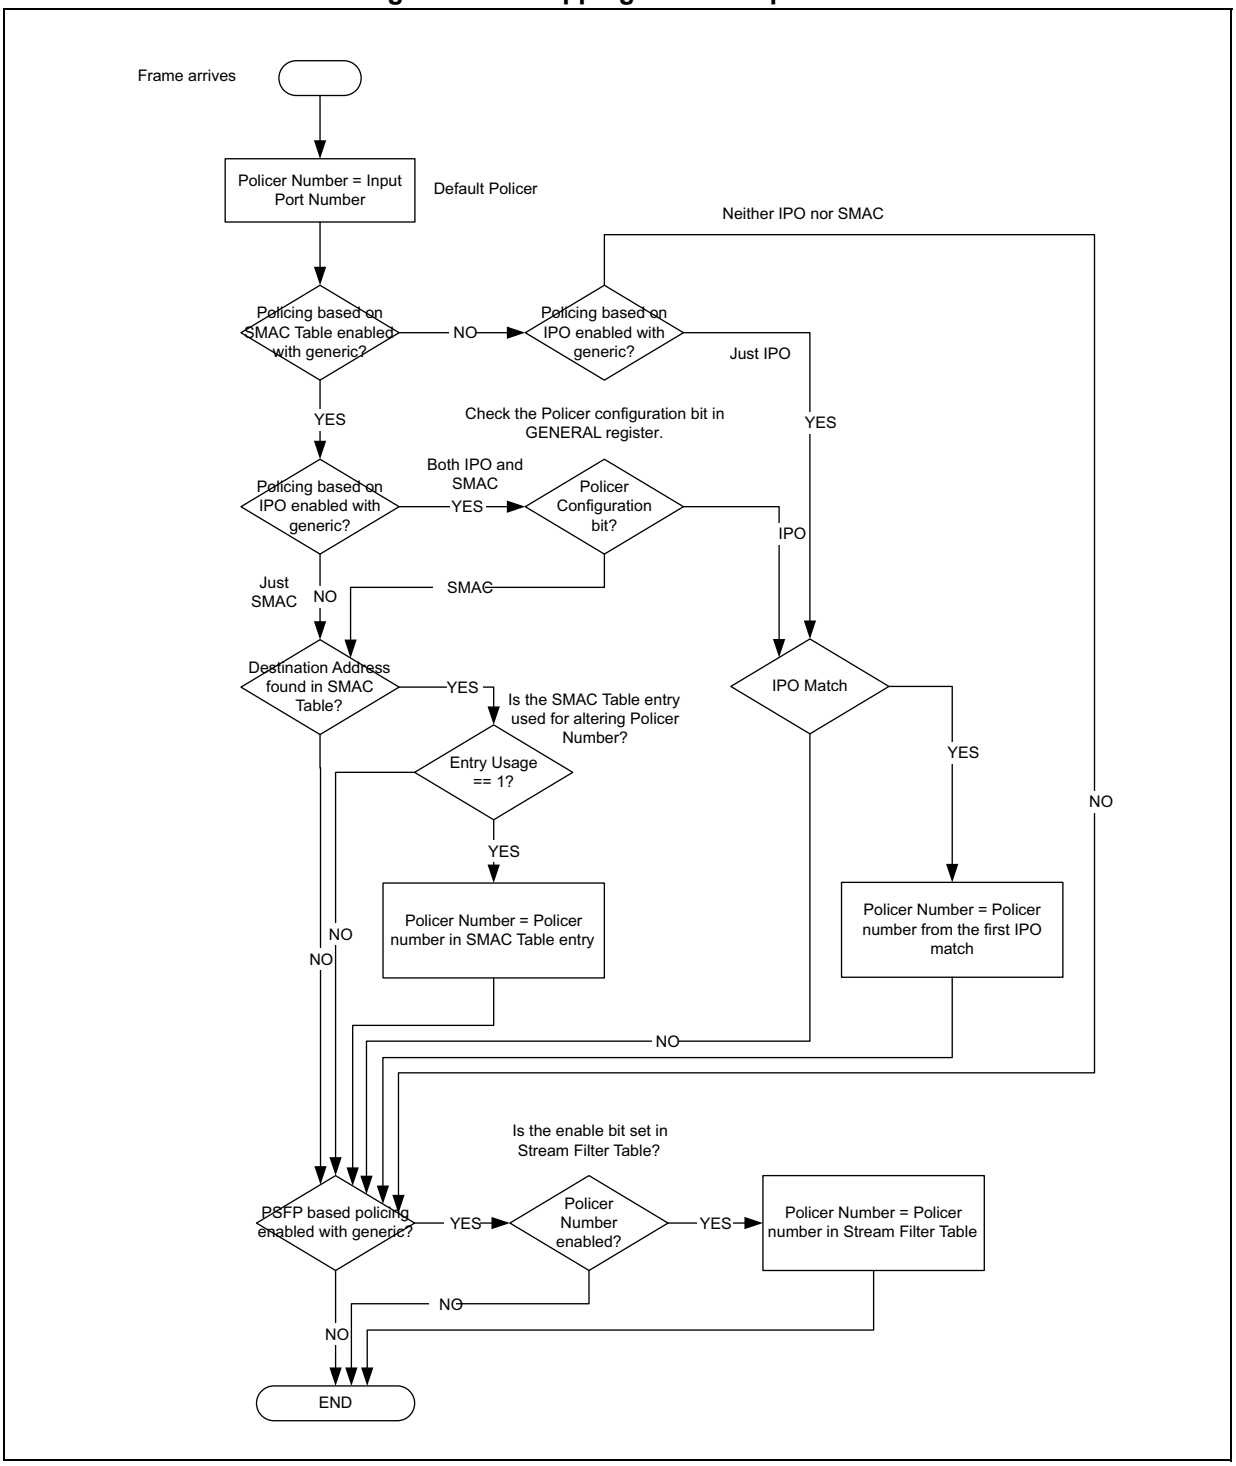
The token rate (the policed rate) is configured with the parameters Basic Rate and Rate Scale. The resulting rate can be calculated using the formula:

$$Rate(Bytes/s) = BasicRate \times \frac{clk}{16^{RateScale}}$$

where

clk = system clock speed (typically 125 MHz)

BasicRate = configured value for Basic Rate in the register



RateScale = configured value for Rate Scale in the register

RateScale values 0 and 7 are reserved. The maximum rate that can be configured is more than the maximum speed of gigabit Ethernet with all usable clk clock speeds.

Default policer

All the frames that are not mapped to any policer by Per-Stream Policing, Static MAC address table or IPO configuration, are mapped to the default policer of the port (see *Figure 1142* for how frames are mapped to policers). The default policer for a port is the same as the number of the port. If the user wants to drop all the frames that are not mapped to another policer by Per-Stream Policing (IPO) or by the Static MAC address table, the rate of the default policer must be set to zero. If the user does not want to drop any of these frames, the rate of the default policer can be set to the maximum value.

Figure 1142. Mapping frames to policers

Precision Time Protocol

FES supports PTP message transportation directly over Ethernet (IEEE 1588-2008 *[6]* Annex F) and over User Datagram Protocol (UDP) over Internet Protocol version 4 (IEEE 1588-2008 [14] Annex D). PTP_MOD[1:0] setting in *ETHSW FES general control register (ETHSW_FES_GEN_CTRLR)* selects which of the two modes is selected.

End-to-end transparent clock functionality

FES implements PTP version 2 End-to-end transparent clock functionality in one-step mode with pure hardware. Inbound processing chain recognizes IEEE 1588 PTP version 2 *[6]* event messages that need to have special processing inside Ethernet switches providing PTP transparent clock functionality. In practice what is done to the recognized frames is that FES adds the frame residence time inside the switch to the PTPv2 event message correctionField. The correctionField is modified in Outbound processing path. The modified message types include Sync, Delay_Req, Pdelay_Req and Pdelay_Resp messages.

Peer-to-peer transparent clock support

From FES point of view, Peer-to-peer transparent clock support differs from End-to-end transparent clock support by only a little: In Peer-to-peer transparent clock the line delay associated with the ingress path is also added to the correction field of Sync messages. For this purpose, there are dedicated registers (*ETHSW FES PTP RX sync delay subnanosecond register (ETHSW_FESx_PTP_RX_SYNCD_SNSR) (x = 0 to 2)*, *ETHSW FES PTP RX sync delay nanosecond low register (ETHSW_FESx_PTP_RX_SYNCD_NSLR) (x = 0 to 2)* and *ETHSW FES PTP RX sync delay nanosecond high register (ETHSW_FESx_PTP_RX_SYNCD_NSHR) (x = 0 to 2)*) for the delay for sync messages and dedicated registers (*ETHSW FES PTP RX event delay subnanosecond register (ETHSW_FESx_PTP_RX_EVENTD_SNSR) (x = 0 to 2)*, *ETHSW FES PTP RX event delay nanosecond register (ETHSW_FESx_PTP_RX_EVENTD_NSR) (x = 0 to 2)*) for the delay for the other event messages. For End-to-end transparent clock, the same values are written into the registers for sync messages and other event messages. For Peer-to-peer transparent clock, there has to be software that determines the link delay and writes it into these registers, after which FES is able to make the corrections automatically.

Ordinary and Boundary clock support

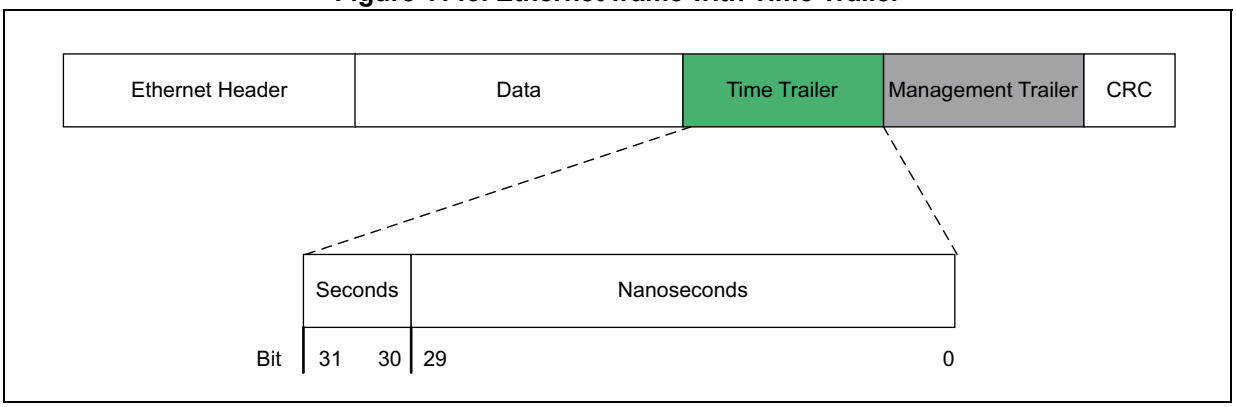
IEEE 1588 PTP Ordinary and Boundary clock implementations are able to achieve significantly better performance if there are hardware features to assist in timestamping and modifying of the PTP frames. Typically, such features are located in the Ethernet Controller or in the Ethernet PHY. FES port 0 has the features built-in.

Timestamp recording

At inbound and outbound of the ports, timestamps of PTP event message (Sync, Delay_Req, Pdelay_Req and Pdelay_Resp) frames are stored for the user to read. In addition to the timestamp, certain fields of the PTP message are also stored for the user to be able to recognize to which frame each stored timestamp corresponds.

FES is able to store timestamps for up to eight frames per port at a time; four frames in inbound direction and four frames in outbound direction. The software has to fetch the stored timestamps before FES is able to store more of them (TRANSFER bit in the *ETHSW FES timestamp command register (ETHSW_FES_TS_CMDR)*).

Frame modification



At inbound of port 0, the PTP Sync messages are modified when PTP frame modification feature is enabled (Modify Sync Frames MOD_SYNCF bit in *ETHSW FES*

general control register (ETHSW_FES_GEN_CTRLR)). The Sync messages are modified so that the exact receive time of the frame is written to the originTimestamp Field (offset of 34 octets from the start of PTP header).

Time Trailer

At outbound of port 0, timestamps of PTP event message (Sync, Delay_Req, Pdelay_Req and Pdelay_Resp) frames can be added to the frames themselves. When the feature is enabled (TIM_TRL bit in *ETHSW FES general control register (ETHSW_FES_GEN_CTRLR)*), a Time Trailer (see *Figure 1143*) is added between the Ethernet frame payload data and Management Trailer (*Management Trailer*). If Management Trailer is not enabled, the Time Trailer is added between the Ethernet frame payload data and the CRC. The Time Trailer contains the exact time the frame was sent out of port 0. The time presentation in the trailer includes 30 bits for nanoseconds and two bits for seconds (presenting two lowest bits of the seconds). A Time Trailer is never added to other frames than PTP event messages. Note that the nanoseconds value can, in some cases, be more than 999,999,999. The software using the timestamp in the trailer can handle the situation by subtracting 1,000,000,000 from the nanoseconds value and adding 1 to seconds.

Figure 1143. Ethernet frame with Time Trailer

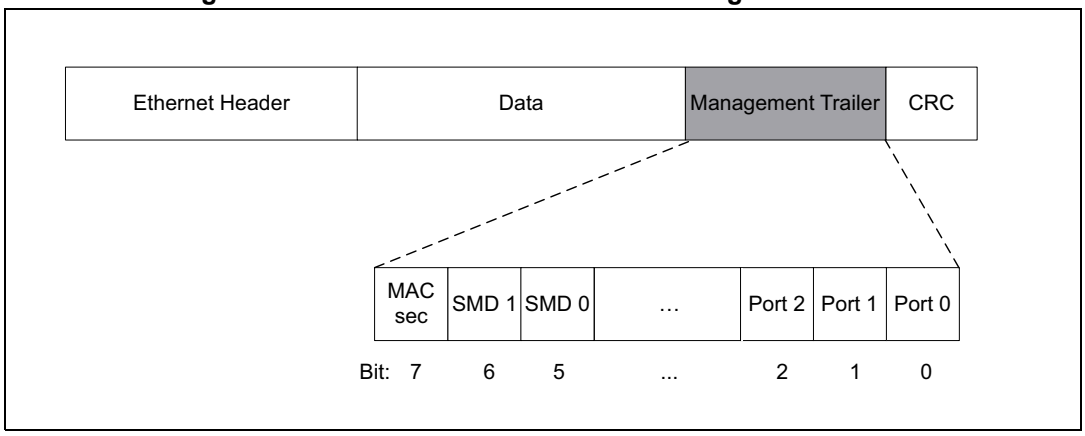
Management Trailer

The FES ports 0 can be configured to a special mode called Management mode. In Management mode the port is able to support the following features:

- Sending Ethernet frames to any other port of FES independent from other configurations (such as MAC table, Virtual LAN configuration, IPO and Disabled ports).
- Frames forwarded to management port by FES include the information on which port of FES they came in.
- Preemption special frame handling, if Frame preemption is enabled.

When in Management mode, every frame sent and received to/from the port is equipped with a Management Trailer. FES inserts a Management Trailer to every frame it sends out of the port and FES expects every frame received from the port to have a Management Trailer.

Figure 1144. Ethernet frame with 8-bit Management Trailer



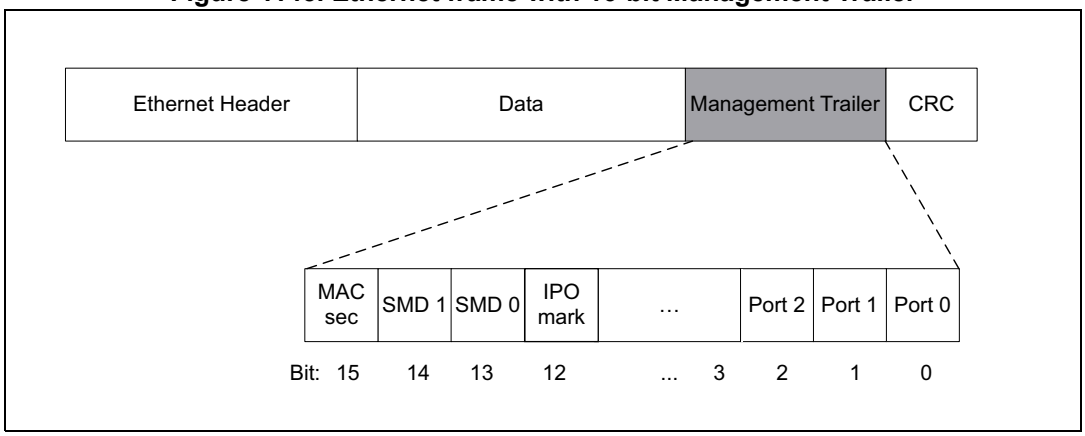


Figure 1145. Ethernet frame with 16-bit Management Trailer

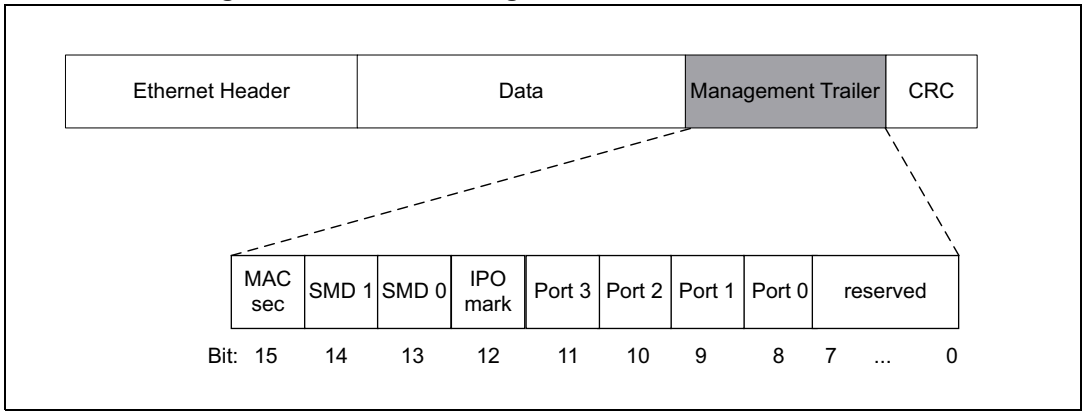
The length of the Management Trailer is one or two octets depending on the Management Trailer Length setting (MGMT_TRL_LGTH[1:0] bitfield in *ETHSW FES general control register (ETHSW_FES_GEN_CTRLR)*). The length of the Management Trailer can be 8 bits (one octet) or 16 bits (two octets). 8-bit Management Trailer is presented in *Figure 1144* and 16-bit Management Trailer in *Figure 1145*.



Port bits

There is a Port bit for each FES port in the Management Trailer, starting from Port 0 in bit 0, Port1 in bit 1, and so on.

When the host CPU wants to send a frame from port number 0 to port number 1 (CPU attached to Port0, Port0 in Management mode), it adds a Management Trailer to the frame with the bit corresponding to ‘Port 1’ set to one and the other bits in the Management Trailer set to zero. The host CPU can send a frame to multiple FES ports by setting multiple bits in the Management Trailer. By setting all management trailer bits (unused bits are ignored) to zero, the host CPU lets FES make the forwarding decision. Note that the host CPU sending to management port has to ensure that the frame minimum length requirement of 64 bytes is met also after the Management Trailer is removed by FES. When none of the ports are in HSR/PRP mode, source addresses are learned only from frames whose port bits in the Management Trailer are all zeros (for configured Management Trailer Offset).

When FES sends a frame to host CPU and the CPU port is in Management mode, FES adds a Management Trailer to the frame always with one of the Port bits set. The bit corresponds to the port from which the frame was received by FES. When FES forwards frames from a management port to another management port, it does not alter the unused (reserved) Management Trailer bits. There is also a special feature called Management Trailer Offset (MGMT_TRL_OFF[1:0] bitfield in *ETHSW FES general control register (ETHSW_FES_GEN_CTRLR)*) which allows different FES instances to use different port bits (8 bit offset) in the trailer (see example in *Figure 1146*). This feature makes it possible to send frames from a CPU to a certain port of an FES instance through another FES instance, which can be useful for example when two FES instances are used in a QuadBox design.

Figure 1146. 16-bit Management Trailer with 8-bit offset

Preemption bits

Preemptable traffic is enabled for Port1 and Port2. In this case, bit 5 and bit 6 in 8-bit Management Trailer (see *Figure 1144*) and bit 13 and bit 14 in 16-bit Management Trailer (see *Figure 1145*) become SMD bits. By using the SMD bits in the Management Trailer, the user can select the SMD (Start mPacket Delimiter) to be used in the frame when it is output from a port supporting Preemptable traffic.

Table 991 presents how the two SMD bits (SMD0 and SMD1) are used to indicate the SMD value by which the Ethernet frame SFD (value 0xD5) is replaced. The SFD is not replaced by SMD for frames that are output from port 0 (preemptable traffic is disabled on this port).

Table 991. Management Trailer SMD bit usage, frames from CPU to FES

SMD [1:0] in the Management Trailer	SMD in the forwarded frame	CRC/mCRC in the forwarded frame	Meaning, according to IEEE802.3br *[8]*
0,0	0xD5, 0xE6, 0x4C, 0x7F, 0xB3 (Not forced)	CRC if not preempted, mCRC if preempted	SMD-E, SMD-S
0,1 (value reserved, do not use)	-	-	-
1,0	Forced to 0x7	mCRC	SMD-V (verify packet)
1,1	Forced to 0x19	mCRC	SMD-R (verify packet)

By using the SMD bits in the Management trailer, it is possible to send IEEE 802.3br compatible verify (SMD-V) and respond (SMD-R) packets to external ports from the management port.

In the other direction, when FES sends a frame out of a port that is in Management mode, it sets the SMD bits according to *Table 991*.

Table 992. Management Trailer SMD bit usage, frames from FES to CPU

Input Port is preemptable	SMD in the received frame	SMD[1:0] in the Management Trailer	Meaning, according to IEEE802.3br *[8]*
yes	0x07	1,0	SMD-V (verify packet)
yes	0x19	1,1	SMD-R (respond packet)
yes	other than 0x7 or 0x19	0,0	-
no	0xD5	0,0	SFD
no	other than 0xD5	never forwarded	-

When Preemption is enabled, the maximum port count with 8-bit management trailer is 5. With bigger port counts, the Management Trailer has to be 16 bits in length.

IPO Mark bit

Bit 12 in the 16-bit Management Trailer (see *Figure 1145*) is the IPO Mark bit. This bit can be set by IPO (see *Inbound Port Ordinance*) rules. It can be used to signal the driver that certain frames matched certain IPO rule(s). Frames that did not match any IPO rule have always value 0 in this bit. Setting the bit by IPO rule has no other effect on the FES functionality.

The 8-bit Management Trailer does not have IPO Mark bit. In the frames sent to FES, the IPO Mark bit should always be set to 0.

MAC Address table

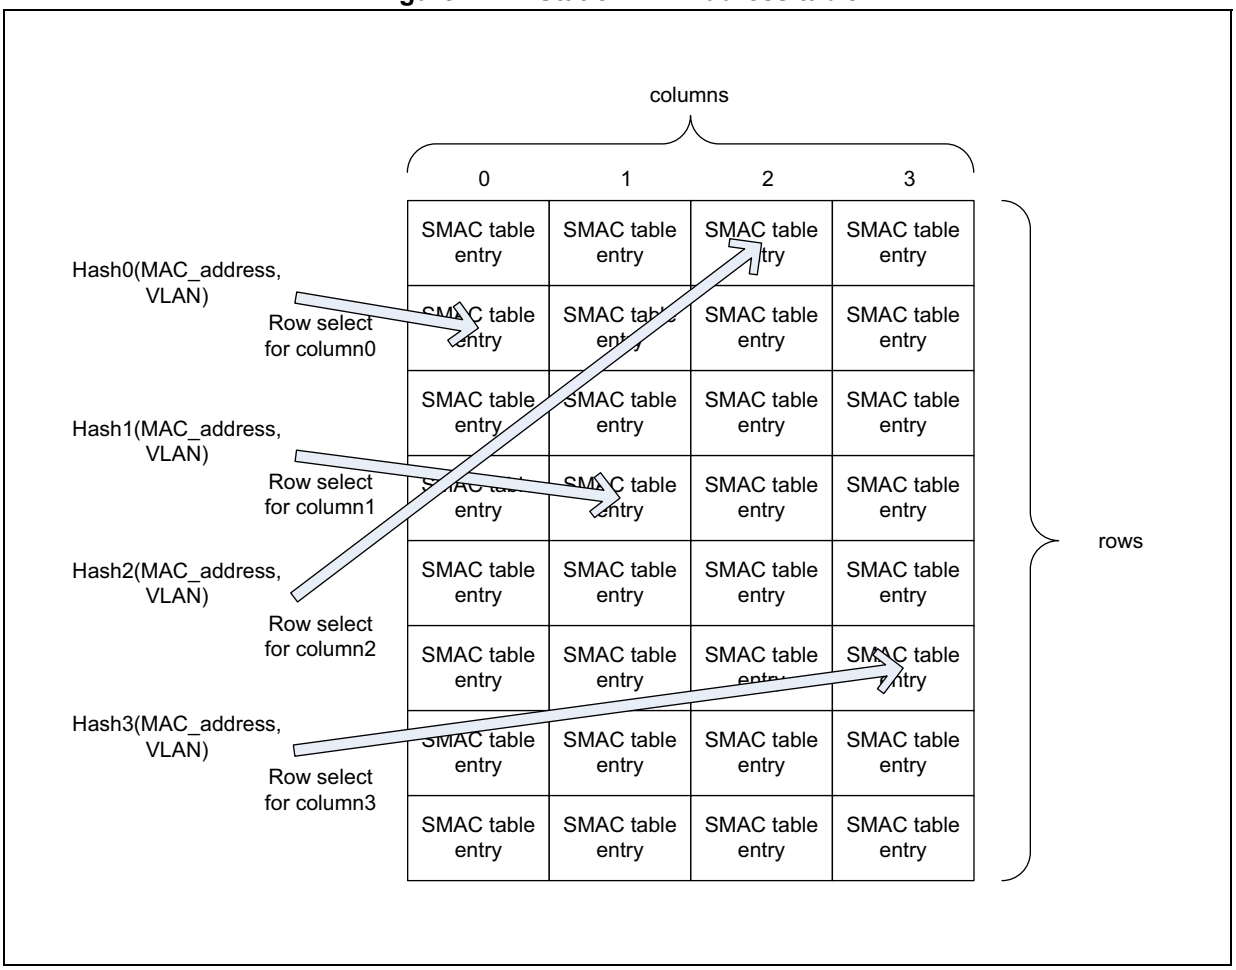
Forwarding decisions of FES are typically made by an address search to the MAC Address Table. Note that IPO, Management trailer or VLAN settings may override the decision made based on the contents of the MAC Address Table.

The MAC Address table of FES is divided into two parts, Static MAC Address table and Dynamic MAC Address table. The Static MAC Address table contains only user-configured MAC addresses. Typically these are multicast addresses, but unicast addresses can also be configured in the static MAC Address table. The Dynamic MAC Address table contains only automatically learned MAC addresses that are therefore all unicast addresses. If the same destination address can be found in both Static and Dynamic MAC Address tables, the user configured information in the Static MAC Address table is used.

Dynamic MAC Address table entry

The DMAC address entry contains the MAC Address, Filtering Identifier (FID), Aging value and a Port number. Aging value that differs from zero indicates that the entry is currently in use. The port where the latest frame with the MAC address and FID was received from is stored into the Port field.

The address lifetime is user configurable in the *ETHSW FES address aging configuration register (ETHSW_FES_ADDRESS_AGING_CFGR)*.



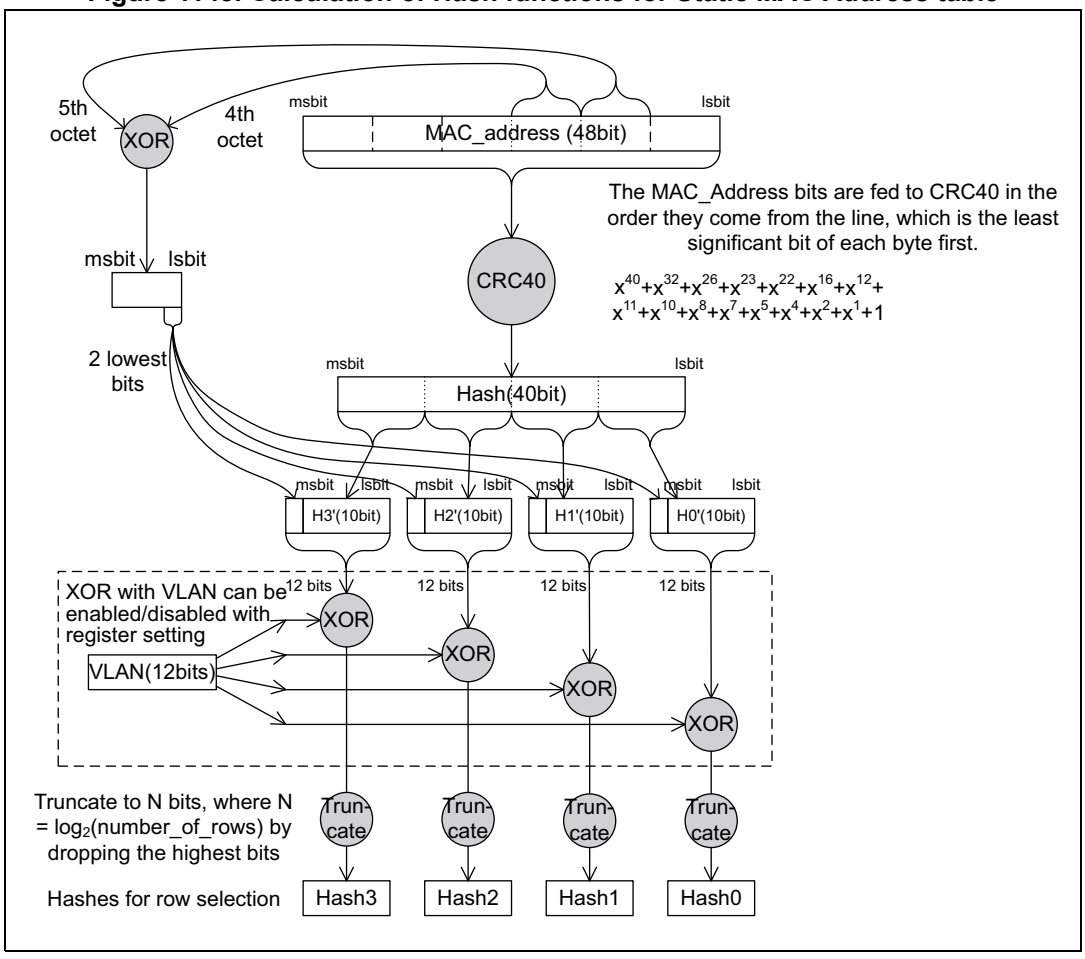
Static MAC Address table entry

The Static MAC Address table entry contains more parameters than the DMAC entry and the most important difference is the Forward Portmask. By using the Forward PortMask, the

user is able to configure more than one port where to frames with certain destination address are forwarded. It is also possible to map frames to certain policers and to change their priority. The VLAN field allows defining a Static MAC Address entry for certain Virtual LAN only.

The organization of the Static MAC Address table is presented in *Figure 1147*. Four hash functions are calculated from the MAC address, one for each column, so that these hashes point to four different entries in the Static MAC Address Table. The MAC address can be stored in any of these four entries.

Figure 1147. Static MAC Address table



The number of rows in the static MAC table is 1024. The number of columns is always 4.

Figure 1148 presents how the hash functions for SMAC table access are calculated. When storing a MAC address entry into the table, the software has to do the same calculation as FES does to be able to store the entry in the right location in the table. If an entry is stored in any other location in the table, FES is not able to find it, which makes the entry useless. By using the *ETHSW FES static MAC address table configuration register (ETHSW_FES_SMAC_CFGR)*, the user can select whether to take the VLAN of the frame

to the row pointer calculation or not. If VLAN is taken to the calculation, it is possible to store the same MAC address for really many different VLANs, because the hashes with different VLANs point to different rows. The downside of taking VLAN to the row pointer calculation is that then it is not possible to have a single SMAC table entry that is for all VLANs. Whether VLAN is taken to the calculation or not can be configured separately for each four SMAC table columns.

As presented in *Figure 1148*, the basis of the hash function calculated for the row access pointers is a 40-bit CRC with polynomial $x^{40} + x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$. The bits of the MAC address are fed to the CRC function in the order they come from the line, just like when calculating the FCS (Frame Check Sequence) for Ethernet frames with CRC-32. The initial (shift register) value for the CRC calculation is all ones.

Figure 1148. Calculation of Hash functions for Static MAC Address table

Note: The user should note the following feature of the SMAC table: when storing a new entry into the table, all the four pointers may point to an entry that is already in use. If the table is not very full, it is often possible to replace one of the old entries with the new one and find an unused entry for the old one.

Address learning

FES automatically updates the Dynamic MAC address table according to the source MAC address information in the received Ethernet frames. The Address learning process updates the Dynamic MAC Address table when the receive port of the frame is in Forwarding or Learning state (see FWD_ST[1:0] port state in *ETHSW FES port x port State register (ETHSW_FESx_PORT_STATER) (x = 0 to 2)* and FWD_STx[1:0] bitfields in FID_CFG registers *ETHSW FES port x filtering identifier configuration register 0 (ETHSW_FESx_FID_CFG0R) (x = 0 to 2)* to *ETHSW FES port x filtering identifier configuration register 7 (ETHSW_FESx_FID_CFG7R) (x = 0 to 2)*.

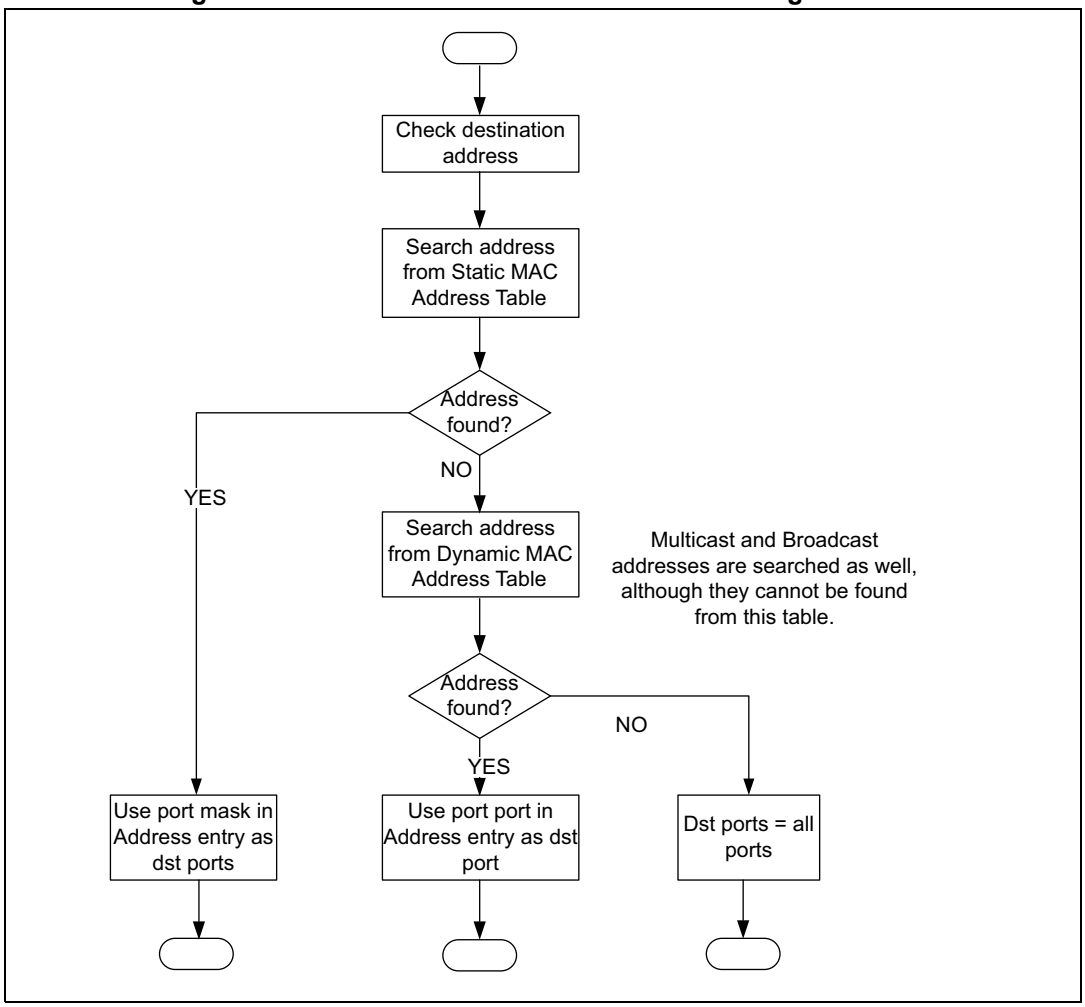
Address aging

Address aging minimum and maximum time depend on given parameters as follows:

$$\text{MAC_entry_aging_time(min)} = 14 \times (\text{AGING_BASE_TIME} \times T_{clk}) \times 300 \times (\text{ADDRESS_LIFETIME} + 1)$$

$$\text{MAC_entry_aging_time(max)} = 15 \times (\text{AGING_BASE_TIME} \times T_{clk}) \times 300 \times (\text{ADDRESS_LIFETIME} + 1)$$

where AGING_BASE_TIME is the Aging Base Time in *ETHSW FES aging base time low register (ETHSW_FES_AGING_BASE_TIMELR)* and *ETHSW FES aging base time high register (ETHSW_FES_AGING_BASE_TIMEHR)*, ADDRESS_LIFETIME is the value in Address Lifetime bits in *ETHSW FES address aging configuration register (ETHSW_FES_ADDRESS_AGING_CFGR)* and T_{clk} is the period of the Main Clock (clk).



The entries in the Static MAC Address table are user configured and they are not automatically aged.

MAC Address and Forward decision

The Address search process searches MAC addresses from the two MAC Address tables. Static MAC Address table and Dynamic MAC Address table. Destination MAC address is extracted from every frame received, and a search is made to the MAC address table on the address. If the address is found in a MAC Address table, it means that in case of a unicast address it is known behind which port the destination node is, and the frame can be forwarded to that port. Note that IPO, Management trailer or Virtual LAN settings may still override the forwarding decision made by the MAC Address table search algorithm.

The MAC Address based forwarding decision is depicted in *Figure 1149*. The whole forwarding decision process is presented in *Figure 1135*.

Figure 1149. MAC Address search and Forwarding decision

Virtual LANs (VLANs)

FES supports Virtual LANs (VLANs). By using VLANs the switch can be divided into two or more virtual switches; frames are not forwarded to ports that are not configured to be members of the same VLAN. VLANs for the ports can be configured using VLAN configuration registers (*ETHSW FES port x port VLAN configuration register 0 (ETHSW_FESx_VLAN0R) (x = 0 to 2)* and *ETHSW FES port x port VLAN configuration register 1 (ETHSW_FESx_VLAN1R) (x = 0 to 2)*). See *Figure 1135* on how VLAN configuration affects the forwarding decision.

Using the PORT_VLAN register (*ETHSW FES port x port VLAN configuration register 0 (ETHSW_FESx_VLAN0R) (x = 0 to 2)*) it is possible to configure the default VLAN to which untagged frames coming into a port are mapped. In input, FES removes the (first) VLAN tags in the frames, if any. In output, a VLAN tag can be added depending on the Tagged/untagged setting in PORT_VLAN register and the setting in corresponding VLAN_TAG register (*ETHSW FES port VLAN tagging register (ETHSW_FES_VLAN_TAGR)*).

Forward portmask

Forward portmask is another way to control how frames can be forwarded between ports. Forward portmask configuration is made via port configuration registers (*ETHSW FES port x port forward mask configuration register (ETHSW_FESx_FWDM_CFGR) (x = 0 to 2)*). With Forward portmask, the user defines to which ports it is possible to forward frames from a port. Note that the forwarding can be configured to be different in different directions. The Forward portmask can be useful for example in systems where one of the ports is connected to a CPU; Forward portmask can be used to force the forwarding of frames from other ports to the CPU port only.

See *Figure 1135* on how Forward Portmask affects the forwarding decision.

Outbound processing (GMII/MII ports)

Outbound processing block transfers frames from Forwarding core (buffer memory) to Ethernet medium. Every port has its own individual Outbound processing entity. During transmitting the Outbound processing does the following:

- Timestamping of frames
- Modification of frames

TX MII

TX MII block automatically calculates and inserts correct CRC checksums to transmitted frames. In addition, the preamble and the Start Frame Delimiter (SFD) are automatically inserted. TX MII block indicates the start of the frame to Timestamp block via Time interface. The timestamp point of a frame is defined in *Figure 1134*.

Timestamp

The Timestamp block uses the start-of-frame indication from TX MII block to determine the exact value of the transmit time. The transmit time is then given to the PTP overwrite block.

The Timestamp block is external to FES. FES communicates with the Timestamp block using Time interface. The timestamp block and Time interface at Outbound processing are similar to the Timestamp block and Time interface at Inbound processing. See more information in section *Timestamp*.

PTP overwrite

Outbound processing timestamps every Ethernet frame and the difference between the outbound and the inbound timestamps (the time the frame spent inside the switch) is added to the correctionField of the PTP event message headers. For Sync messages, the link delay of the ingress port is also added to the correctionField. Event messages are recognized already at Inbound processing as specified in section *Inbound processing (GMII/MII ports)*.

The time the frame spent inside the switch is calculated by subtracting the RX timestamp of the frame from the TX timestamp. The accuracy of the calculation is 2^{-16} nanoseconds. The maximum value for the correctionField is 0x7FFF FFFF FFFF FFFF. If the calculated correction is more than 0x7FFF FFFF FFFF FFFE, value 0x7FFF FFFF FFFF FFFF is written to the correctionField, indicating that the correction is too big to be represented. 0x7FFF FFFF FFFF FFFF is also written to the correctionField if the difference of the seconds part of the RX and TX timestamps is more than one.

The correctionField of a PTP event message is not modified when the frame is Cut-through. For this reason, there is a Cut-through disable bit CT_DIS in *ETHSW FES port x IPO filter configuration register 1 (ETHSW_FESx_ETH_ADDR_CFG1R) (x = 0 to 2)*.

Frame preemption

The preemption is triggered either by a frame coming into an express queue or by a Hold signal

Forwarding core

The Forwarding core is responsible for forwarding frames between ports, that is from the Inbound processing path of a port to the outbound processing path of another. The Forwarding core is common to all ports. The Forwarding core includes memory management, eight TX queues per port and management of the inbound and the outbound processing paths. The Forwarding core also drops frames during high load situations, when running out of buffer memory space.

Memory controller

The Memory controller block (see *Figure 1132*) is responsible for the memory management of the buffer memory used for buffering the frames. The buffer memory is common to all the ports and there is no fixed buffer space reserved per port. Instead, a port is able to buffer more frames when other ports have shorter queues.

The Ethernet frames to be forwarded are stored into the buffer memory in one to three fragments depending on the length of the frame. The size of each fragment is 512 bytes. This is also the size of the unit in which the Memory controller manages the buffer memory. Every output port has enough bandwidth to the buffer memory to achieve wire-speed operation.

The Memory controller provides an indication to the Frame Early Drop algorithm (see section *Frame Early Drop*) in situations where the buffer memory is so crowded that some of the already stored frames have to be dropped to make space for new ones.

Queuing

FES has eight queues for every output port. When a frame is received, the priority of the frame and the destination port(s) are determined during Inbound processing. When the Inbound processing passes the frame for the Forwarding core, the Forwarding core places the frame into the queue that matches its priority (priority to queue mapping in*ETHSW FES port x queue table configuration register (ETHSW_FESx_QUEUE_TBLR) (x = 1 to 2)*).

If Traffic shaping, Scheduled Traffic, and Preemptable Traffic (see *Preemptable traffic*) functionalities are not active, the queues are emptied in descending order so that frames from higher queues are sent before frames from any of the lower queues of the port. Traffic shaping may affect this behavior by not giving permission to transmit from certain queue(s) due to insufficient credit. If there is not enough credit to be able to transmit from a certain queue, a frame from lower queue is transmitted instead, or if no such frame exists, the transmitter is kept idle. Transmission schedule may also block transmission from certain queue(s), in which case a frame from a lower queue is selected. It should be also noted that the Express/Preemptable selection for transmit queues in *ETHSW FES port x TX preemptable traffic selection register 0 (ETHSW_FESx_TX_PREE0R) (x = 1 to 2)* changes the order of the queues so that the Express queues are selected for transmission before Preemptable queues.

All the queues have a fixed length of 32 frames. When a frame is dropped from a queue because it was full, and a new frame was coming to the queue, the corresponding error counter is incremented (see *Table 996: FES counters*).

Traffic shaping

Traffic shaping means limiting the transmit rate to meet certain preconfigured maximum allowed transmit rate; the frames that exceed the configured rate are delayed increasing the latency they experience. In FES shaping is done per queue basis which means that the rate at which frames can be transmitted from certain queue can be configured. If frames come into the queue faster than they can be sent out, the queue fill level increases. This means that when traffic shaping is active the frames have to wait longer in the queue than without shaping. On the other hand, the fill levels of the lower queues decrease when higher queues are shaped.

FES has a counter for each queue that can be used to control the transfer rate of the queue. Each counter forms a shaper whose functionality is equivalent to those known in the literature as Credit Based Shaper or Credit-based fair queuing. Credit (corresponding to tokens in Token bucket) is added into the counter (corresponding to the bucket in Token bucket) at a constant rate and credit is removed from the counter for every frame that is sent from the queue. A frame can be sent from the queue only when the credit is zero or above. If the credit is negative, the frame (queue) has to wait for the credit to increase.

The rate at which the credit increases defines the rate the output queue is shaped to. In a Credit Based Shaper the maximum amount of credit should never be reached, so the maximum value for credit is not configurable (unlike the bucket size in case of Token bucket). The Addend is the only configurable value for a shaper and it defines the rate at which credit increases which is also the rate the queue is shaped to.

The reset default is that the rate of all the shapers of all the ports and queues is above line speed; the user does not have to configure shapers if they are not used.

Configuring shapers

The only user configurable parameter in a shaper is the rate to which the shaper shapes the traffic of the queue. It can be configured by setting the Addend value in the *ETHSW FES port x shaper y configuration register (ETHSW_FESx_SHAPERyR) (x = 0 to 2)*. The Addend value defines the speed by defining how many credits are added to the internal credit counter at every time interval of 8 clock cycles. The Addend value is 16 bits, 12 of which are fractions of credit, so the maximum value for Addend is 15,9998 and the minimum is 0. The resolution of the adjustment is 1/4096 (about 0.00024).

The configured rate can be calculated using the formula:

$$\text{Rate} = \frac{\text{Addend}}{8 \times \frac{1}{\text{clk}}} = \text{Addend} \times \frac{\text{clk}}{8}$$

where Addend is the value written in the shaper internal register and clk is clk the clock speed.

The value for Addend can be calculated from the desired data rate by using the formula:

$$\text{Addend} = \frac{\text{Rate} \times 8}{\text{clk}}$$

where Rate is the desired data rate in Bytes per second and clk is the clock speed.

When calculating the rate, preamble and SFD are not counted to frame length, CRC is counted (refer to *Figure 1128*).

With the typical 125 MHz clock, the maximum configured rate is:

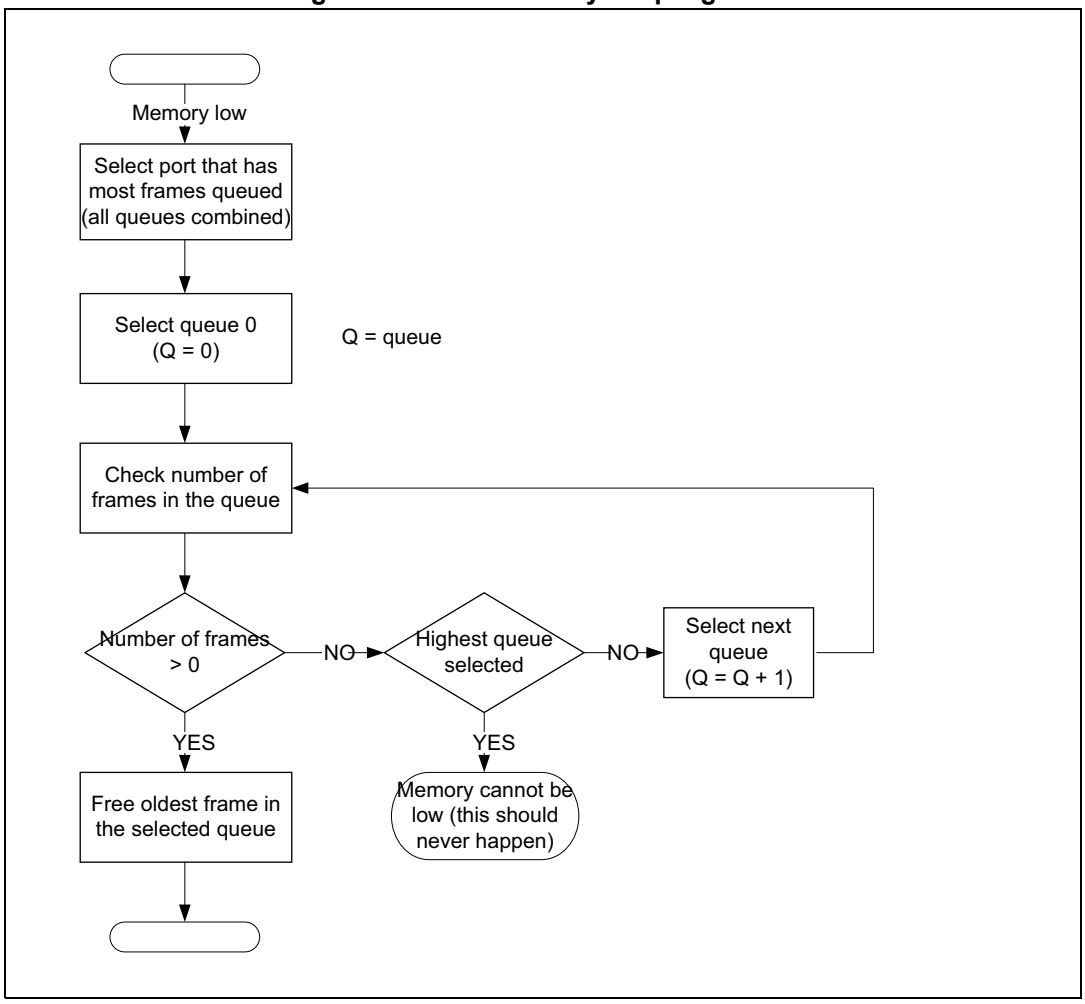
$$\text{Rate(max)} = 15998\ \text{bytes} \times \frac{125\ \text{MHz}}{8} = 250\ \text{Mbyte/ s}$$

which is well above the maximum line speed.

The resolution of the rate adjustment is:

$$\text{Rate(resolution)} = \frac{1}{4096}\ \text{bytes} \times \frac{125\ \text{MHz}}{8} = 3.8\ \text{kbyte/ s} = 30.5\ \text{kb/ s}$$

Scheduled Traffic



To support Enhancements for Scheduled Traffic as specified in IEEE standard 802.1Qbv *[7]*, FES works in cooperation with Scheduling functionality (FSC). With Scheduled traffic, it is possible to enable or disable transmitting from any queue independently from other queues. Information on how much time there is to transmit from certain queue before transmission is disabled comes also from the Scheduler: If there is not enough time to transmit the frame in a certain queue, a frame from a lower queue may be transmitted instead.

Frame Early Drop

Frame Early Drop (FED) algorithm deallocates buffer memory when FES encounters heavy load and buffer memory is about to cease. An indication that the memory is going to be fully used soon is got from Memory controller block.

One reason for using FED algorithm is to ensure that the frames buffered for some output ports do not block traffic for the other ports, as buffering too much frames for some ports would in worst case cause all the incoming frames to be dropped. So the Memory controller block triggers the Frame Early Drop algorithm early and frequently enough to ensure that there is free buffer memory to be able to receive incoming frames. The FED algorithm used guarantees that frames from lower queues of a port are dropped before the frames from higher queues. Frames are also dropped early enough to slow down TCP connections (selective dropping for oldest frames) to prevent total congestion.

Figure 1150. Frame Early Drop algorithm

The Frame Early Drop algorithm is presented in *Figure 1150*. The algorithm selects one frame to be dropped and drops it. The algorithm selects first the output port that has the most frames queued. Then it selects the lowest queue of the port that has frames in it and removes the oldest frame from the queue. After dropping the frame, the corresponding error counter is incremented.

Cut-through

In Cut-through operation an incoming frame is forwarded to output port(s) before the frame is fully received. This minimizes the latency the frame experiences; in FES the forwarding latency of Cut-through frames can be down to 1 µs in gigabit mode and down to 3.5 µs in 100 Mbit/s mode.

In Cut-through mode, if an incoming frame has a CRC error, the transmission cannot be canceled because it has already started. In this case the transmitted frame is given an erroneous CRC so that the destination node can drop it, if it is not in Cut-through mode.

Notable is that in a ring topology, if all the nodes are in Cut-through mode, a broken frame can circulate in the ring for an infinite time. Therefore, in order to remove broken frames from rings, FES changes its mode from Cut-through to Store-and-forward with certain probability (1/256) when it receives a broken frame. The probability is low to guarantee low impact to overall latency of the ring (If the probability was one, one single broken frame can change the mode of every node in the ring).

For Cut-through forwarding of a frame, all the following must be true:

- RX Cut-through is enabled for the input port in *ETHSW FES port x port State register (ETHSW_FESx_PORT_STATER) (x = 0 to 2)*.
- TX Cut-through is enabled for the output queue in *ETHSW FES port x TX cut-through enable register (ETHSW_FESx_TX_CTER) (x = 1 to 2)* of the output port.
- Input and output ports have the same speed.
- Output port is configured as VLAN tagged (see *ETHSW FES port x port VLAN configuration register 0 (ETHSW_FESx_VLAN0R) (x = 0 to 2)*) and the input port and the output port have the same default VLAN.
- Neither input nor output port is in Management mode.
- The input and output ports are both HSR redundant ports or they are both non-HSR/PRP ports.
- The frame is not preemptable (see *Preemptable traffic*).
- The schedule does not prevent transmitting the frame.
- The Shaper does not prevent transmitting the frame.
- Transmitter is idle, or frame preemption (see *Frame preemption*) is enabled and possible.
- The TX queue selected for the frame is empty.
- There are no frames in the higher queues that can be sent instead (if higher queues are blocked by Shaper or schedule, Cut-through is possible).

If any of the above is false, the (non-broken) frame is forwarded in Store-and-forward fashion.

FRER (Frame Replication and Elimination for Reliability)

FRER *[9]* specific features of FES include:

- Automatic insertion of R-TAG (*Figure 1129*)
- Automatic removal of R-TAG
- Automatic sequence generation
- Automatic duplicate detection and removal

Notable is that, unlike HSR/PRP, FRER functionality does not affect frame forwarding decision in any other way than removing duplicate frames. Otherwise the forwarding decisions are the same as without FRER.

At FRER enabled ports, R-TAGs are always removed from frames at inbound processing. R-TAGs are inserted at outbound processing depending on the configuration (see *ETHSW FES stream table read/write 1 register (ETHSW_FES_STREAM_TABLE1R)*). For unrecognized (unconfigured) streams, an R-TAG is added at the output if the input frame had an R-TAG, and R-TAG is not added if the input frame did not have one. So, the output frames look the same as the input frames when it comes to R-TAGging.

SMAC table extension for stream identification

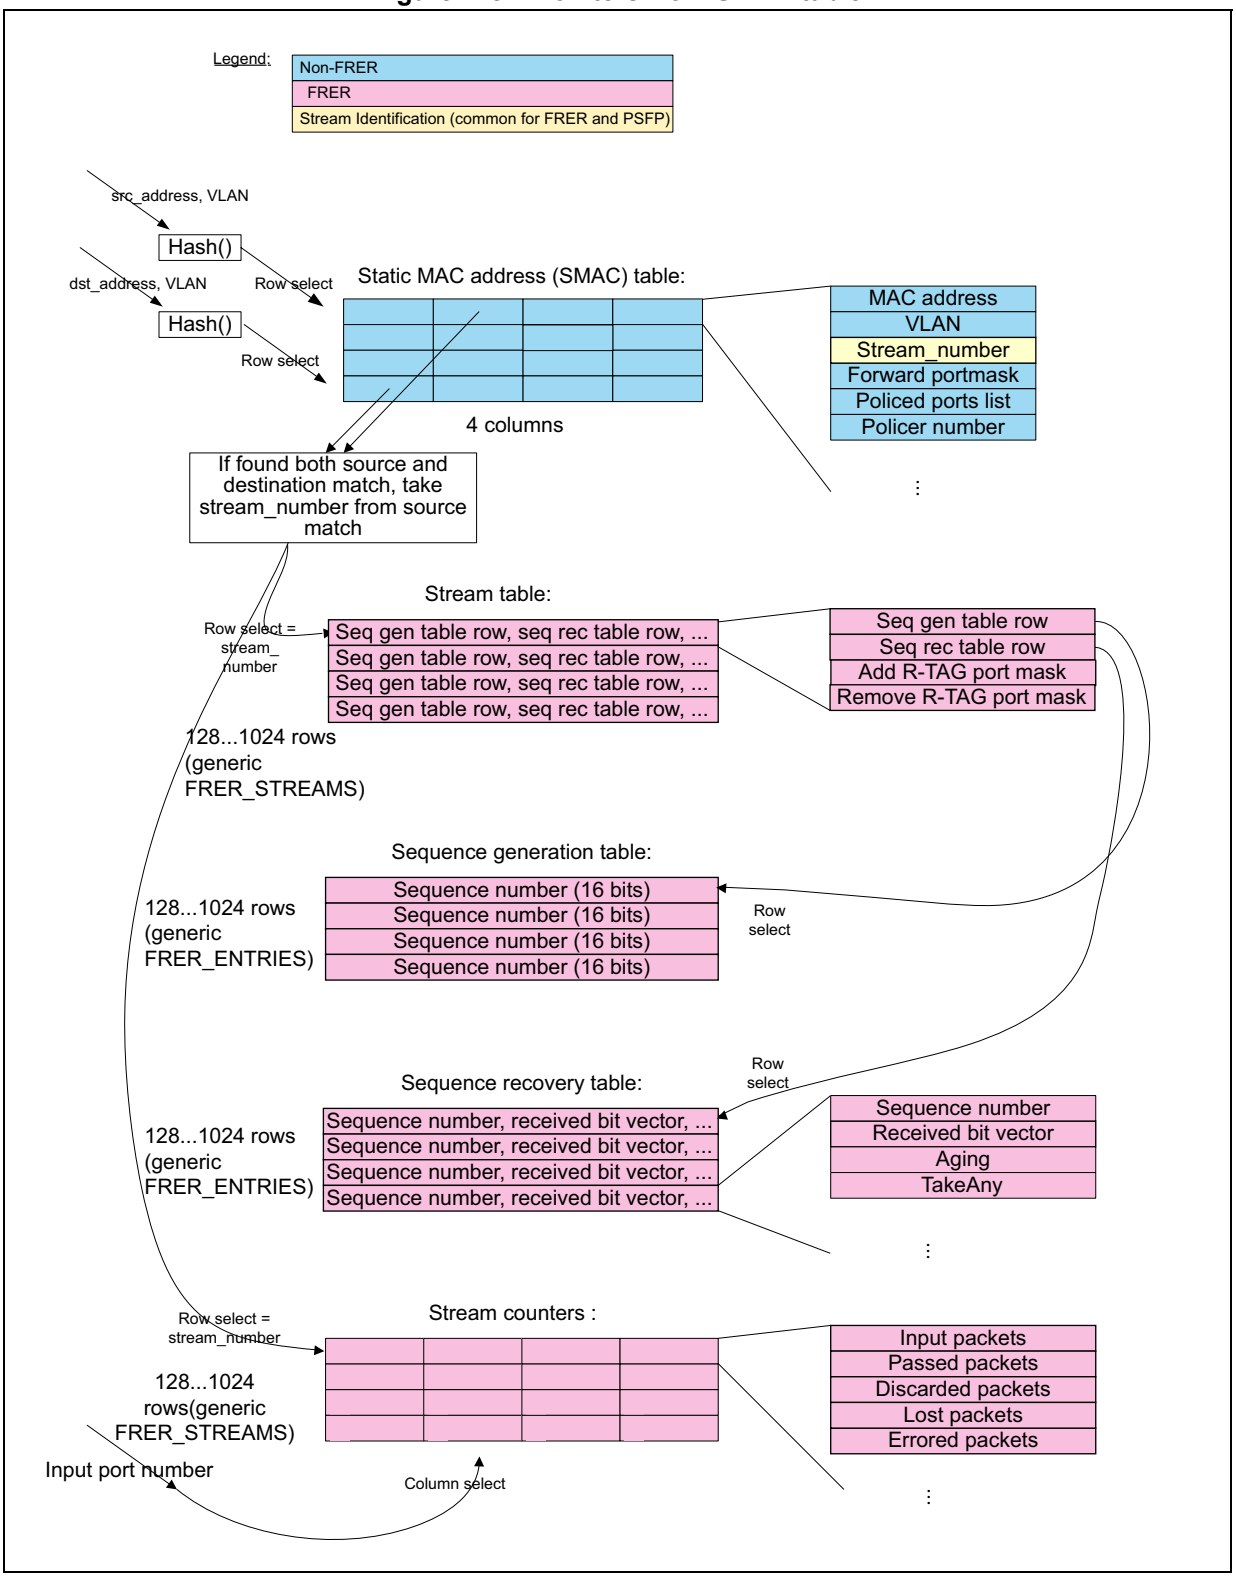
When FRER functionality is enabled the entries of the Static MAC Address (SMAC) table are enhanced from 128 to 144 bits.The FRER related information in the SMAC table consists of the following:

- stream_number for matching frames

  Pointer to stream table and to per-port per-stream counters (*ETHSW FES capture status 0 register (ETHSW_FES_CAPT0R)* to *ETHSW FES sequence recovery frames seen before high register (ETHSW_FES_SEQ_REC_SB_HR)*).

- stream_number Source/Destination Match bit

  Configuring whether stream_number related information in this entry is used only for matching source or matching destination addresses in the frames. The setting corresponds to different stream identification methods (Source MAC and VLAN stream identification or null stream identification). When a frame comes in, the source and destination MAC addresses in the frame are searched from the SMAC table. If a match is found for both source and destination address, and the entries for them both have a non-zero stream_number the stream_number in the entry with matching source address is used. If no matching entry is found in the SMAC table, the frame gets stream_number 0.



The process for defining the stream_number is presented in *Figure 1151*.

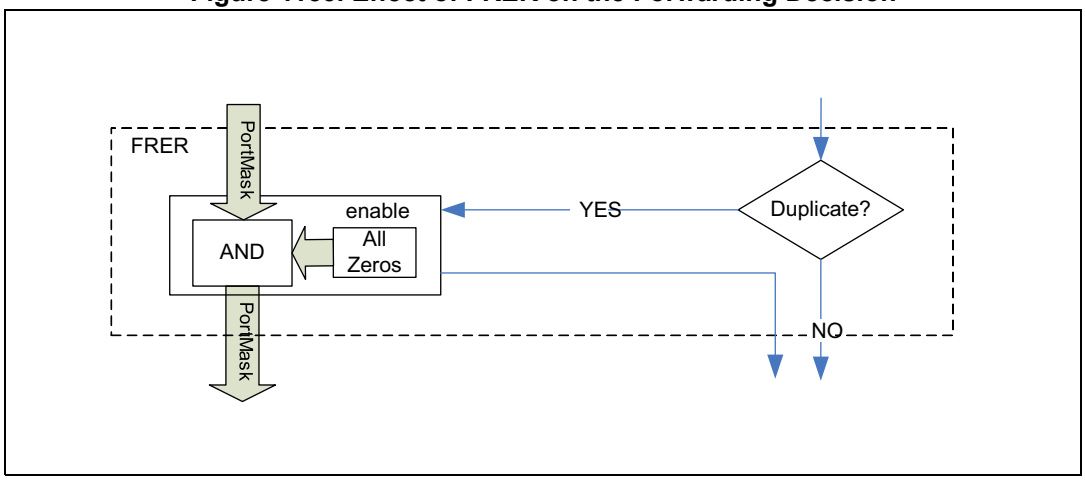
Figure 1151. Stream number

FRER specific pointers are presented in *Figure 1152*.

Figure 1152. Pointers from SMAC table

Sequence generation

Sequence number is generated based on information in SMAC table and Sequence Generation table.This Sequence number is then used in the R-TAG, HSR-tag or PRP-trailer (if any) when the frame is sent out. The Sequence number read from the Sequence Generation table is then incremented by one and written back to the table.



Sequence recovery

Sequence Recovery is based on a user configurable recovery algorithm, which is retrieved based on SMAC table and Sequence Recovery table information. There are two possible Sequence Recovery algorithms, Vector Recovery algorithm and Match Recovery.

Handling of duplicate frames

The result of the Sequence Recovery algorithm is that the frame is either a duplicate or not a duplicate. If the frame is a duplicate, its forwarding decision is changed as presented in *Figure 1153* (a comparison with the whole forwarding decision process is presented in *Figure 1135*).

Figure 1153. Effect of FRER on the Forwarding Decision

Aging

The aging speed can be configured separately for each sequence recovery entity by using the *ETHSW FES sequence recovery table read/write 4 register (ETHSW_FES_SEQ_REC_TABLE4R)*.

The aging time can be calculated using the following formula:

$$\text{aging_time} = (15.5 \mp 1.5) \times \left(\text{AGING_TIME_BASE} \times \frac{T_{CLK}}{8}\right) \times \left(\frac{8}{2^{\text{Aging_rate_scale}}}\right) \times \left(\frac{8}{5 + \text{Aging_basic_rate}}\right)$$

where:

- AGING_BASE_TIME is the Aging Base Time in registers *ETHSW FES aging base time low register (ETHSW_FES_AGING_BASE_TIMELR)* and *ETHSW FES aging base time high register (ETHSW_FES_AGING_BASE_TIMEHR)*
- T_{clk} is the period of the Main Clock (clk)
- Aging_rate_scale is the value for Aging rate scale in *ETHSW FES sequence recovery table read/write 4 register (ETHSW_FES_SEQ_REC_TABLE4R)*
- Aging_basic_rate is the value for Aging basic rate in *ETHSW FES sequence recovery table read/write 4 register (ETHSW_FES_SEQ_REC_TABLE4R)*

Stream encoding

The information in the Stream table indicate whether the frame should be sent out with or without an R-TAG (see *Table 993*). The Stream number of the frame is used as a row pointer to the Stream table. The Stream table includes the following information:

- Enable/Disable for Sequence Recovery per Stream number
- Pointer to Sequence Recovery table
- Pointer to Sequence Generation table
- Enable/Disable R-TAG per egress port per Stream number
- Remove/Remain R-TAG per ingress port per Stream number

Table 993. Keeping, adding or removing R-TAG

Input frame	Input port setting	Output port setting	Output frame	Note
R-TAGged	keep	keep	R-TAGged	-
not R-TAGged	keep	keep	not R-TAGged	-
R-TAGged	remove	keep	not R-TAGged	-
not R-TAGged	remove	keep	not R-TAGged	-
R-TAGged	keep	add	R-TAGged	Just one R-tag
not R-TAGged	keep	add	R-TAGged	-
R-TAGged	remove	add	R-TAGged	-
not R-TAGged	remove	add	R-TAGged	-

Configuration registers

Registers of FES are presented in *Section 93.5.7*.

FES register map consists of two sets of registers, detailed in *Table 995: Register maps summary*:

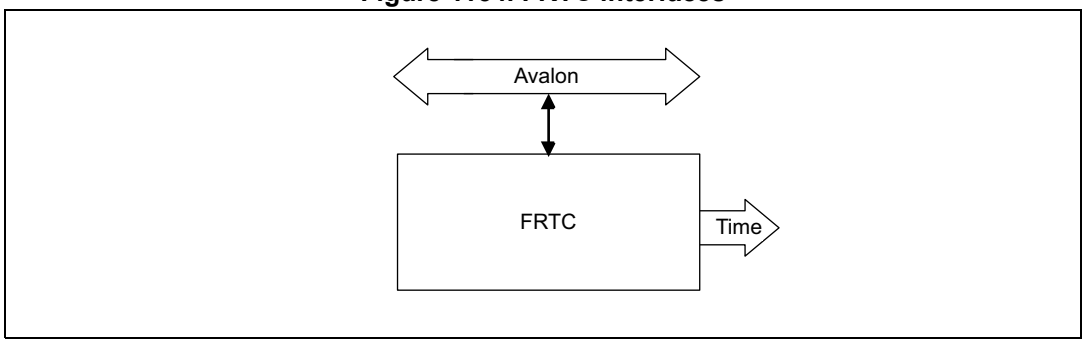
- FES switch configuration registers (starting from *ETHSW FES IP core identification register (ETHSW_FES_IPC_IDR)*) to configure the operation of the FES switch core
- FES port configuration registers (starting from *ETHSW FES port x port State register (ETHSW_FESx_PORT_STATER) (x = 0 to 2)*) to configure the operation of the input/output ports of FES. There is a separate set of FES port configuration registers for every Ethernet port.

FES switch configuration registers are split as follows:

- General switch configuration registers, starting from *ETHSW FES general control register (ETHSW_FES_GEN_CTRLR)*
- Frame timestamp registers, starting from *ETHSW FES timestamp command register (ETHSW_FES_TS_CMDR)*. FES is able to store up to four timestamps per port and per direction (RX/TX). The user can fetch the stored timestamps one by one by writing into *ETHSW FES timestamp command register (ETHSW_FES_TS_CMDR)*. After fetching the timestamp information to *ETHSW FES timestamp time low register (ETHSW_FES_TS_TIME_LOR)*, *ETHSW FES timestamp time high register (ETHSW_FES_TS_TIME_HIR)*, *ETHSW FES timestamp PTP message 0 register (ETHSW_FES_TS_MSG_0R)* and *ETHSW FES timestamp PTP message 1 register (ETHSW_FES_TS_MSG_1R)*, FES clears the Transfer bit in the *ETHSW FES timestamp command register (ETHSW_FES_TS_CMDR)*. If the queue of four timestamps gets full, the timestamp information of the next PTP event message is lost, but the frame itself is forwarded normally. A timestamp queue (for certain port and direction) getting full does not affect timestamping of the other ports or the other direction, so the user does not have to fetch the stored timestamps that are not needed.
- Virtual LAN configuration registers, starting from *ETHSW FES VLAN command register (ETHSW_FES_VLAN_CMDR)*. When a frame comes in from a port, its VLAN ID is checked against the VLAN configuration. The VLAN configuration can be modified by using the VLAN configuration registers. If the port is not a member of the VLAN the frame belongs to, the frame is dropped. Frames without a VLAN tag are mapped to the port's default VLAN (configured in *ETHSW FES port x port VLAN configuration register 0 (ETHSW_FESx_VLAN0R) (x = 0 to 2)*). Untagged frames can be dropped by setting the default VLAN to a VLAN the port is not a member of. A frame can be forwarded only to the ports that are members of the VLAN the frame belongs to. If the frame is a unicast frame and the destination port (according to the MAC address table) is not a member of the VLAN, the frame is forwarded to all the other ports that are members of the VLAN. Note that the reserved VLAN IDs 0x1, 0x2 and 0xFFF are handled in FES the same way as the other VLAN IDs. Frames with the reserved VLAN ID 0x0 (priority tagged frames) can be mapped to any other VLAN. For all the 4096 VLANs, it can be configured to which Filtering Identifier (FID) the VLAN belongs. The address learning is separate for each FID. The reset values for VLAN configuration are such that all ports are members of all VLANs, VLAN tagging is not disabled and all VLANs belong to FID 0 with Engineered traffic setting disabled.
- Feature registers, starting from *ETHSW FES FES_PORT_HIGH generic register (ETHSW_FES_PORT_HIGHR)*. These registers are all read-only, and they contain information about the peripheral and its configuration. The registers contain the values of the generics and generics-like signals (cfg_clk_freq, debug_in) and other information such as peripheral internal delays for software to read.

FES port configuration register groups are split as follows:

- General configuration and state registers, starting from *ETHSW FES port x port State register (ETHSW_FESx_PORT_STATER) (x = 0 to 2)*
- PTP registers, starting from *ETHSW FES PTP RX sync delay subnanosecond register (ETHSW_FESx_PTP_RX_SYNCD_SNSR) (x = 0 to 2)*
- Counter registers, starting from *ETHSW FES port x counter control register (ETHSW_FESx_CNT_CTRLR) (x = 0 to 2)*
- IPO registers, starting from *ETHSW FES port x IPO command register (ETHSW_FESx_IPO_CMDR) (x = 0 to 2)*



93.3.5 FRTC

Flexibilis Real-Time Clock (FRTC) block can be used to provide wall clock time for other IPs. The time format is compatible with the time format defined in IEEE1588 standard *[6]*, so it can be used for example to provide time for the on-chip Ethernet MAC controllers.

Functionality

FRTC has an Avalon Memory Mapped slave interface and one or more time interfaces. The Avalon interface is used by controlling entity (for example host CPU) to read and adjust the internal time or FRTC. The Time interface provide time information for other subblocks. See *Figure 1154*.

Figure 1154. FRTC interfaces

FRTC has two clock domains, one for Avalon interface and another for calculating time. In this way different clocks can be used in Avalon bus and to calculate the wall clock time.

In case of FRTC, time is presented in seconds and nanoseconds. Time interface supports a 96 bit time format compatible with IEEE1588, which defines 48 bits for seconds, 32 bits for nanoseconds and 16 bits for subnanoseconds.

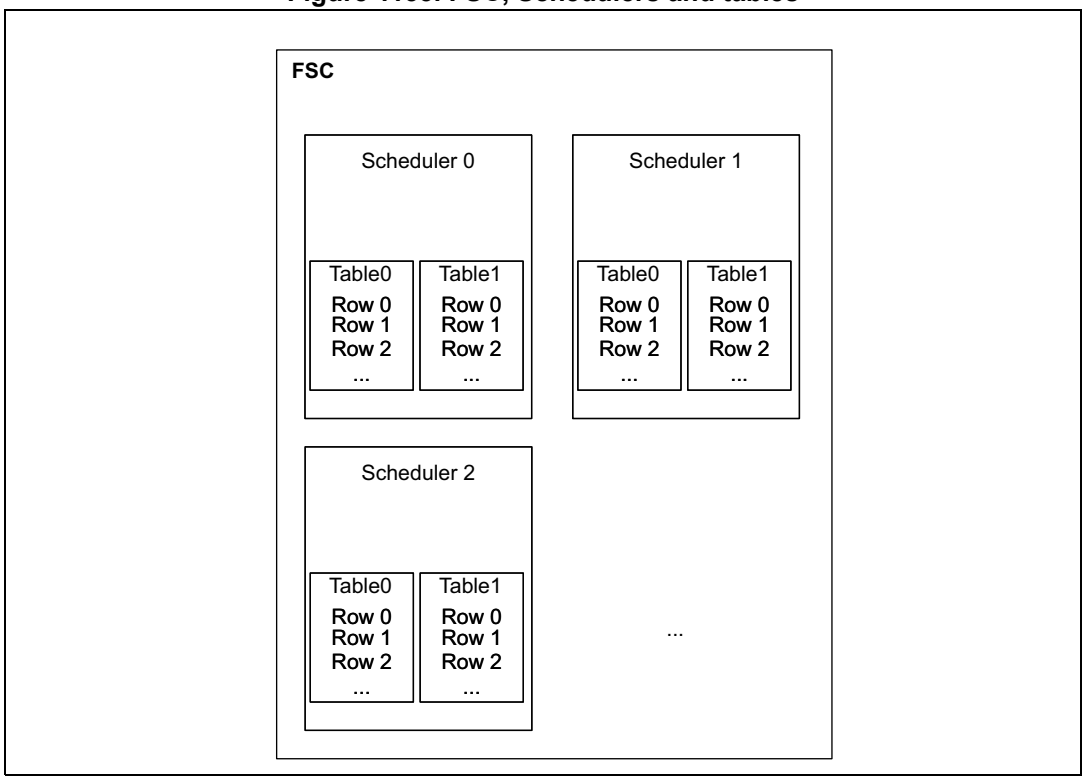
FRTC is implemented with an NCO (Numerically Controller Oscillator) that counts nanoseconds. Seconds value is updated and nanoseconds value wraps around always when nanoseconds value exceeds 1,000,000,000 (corresponds to one second). Because of this, the nanoseconds value can never be more than 30 bits.

NCO starts counting when step is configured. *ETHSW FRTCx time command register (ETHSW_FRTCx_TIME_CMDR) (x = 0 to 1)* must be used also for time adjustment and time read operations.

Configuration registers

FRTC registers are presented in *Section 93.5.5*.

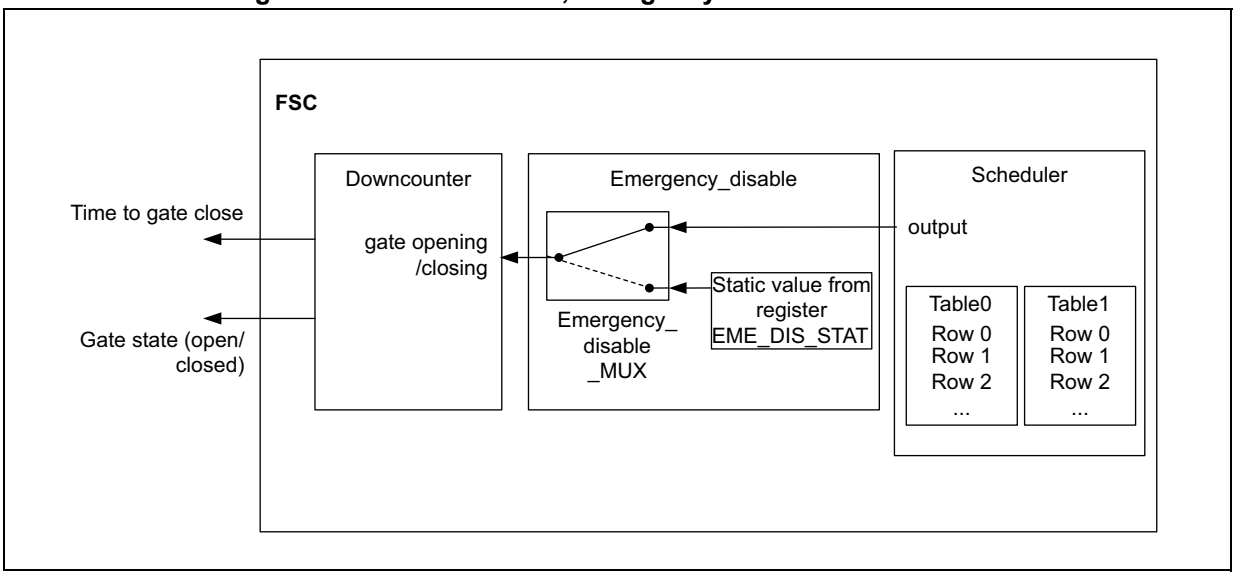
93.3.6 FSC



The main purpose of Flexibilis Scheduling Controller (FSC) is to control the queuing mechanism of the *FES Ethernet switch* in a time-aware fashion. The controller can be used to control other timed functionality as well. The idea is that this controller together with FES is able to implement the Enhancements for Scheduled Traffic as specified in IEEE standard 802.1Qbv *[7]*.

Section : Functionality defines the FSC functionality, *Section : Software driver* explains how to handle certain functionalities in the device driver and the registers of FSC are presented in *Section 93.5.6*.

Functionality



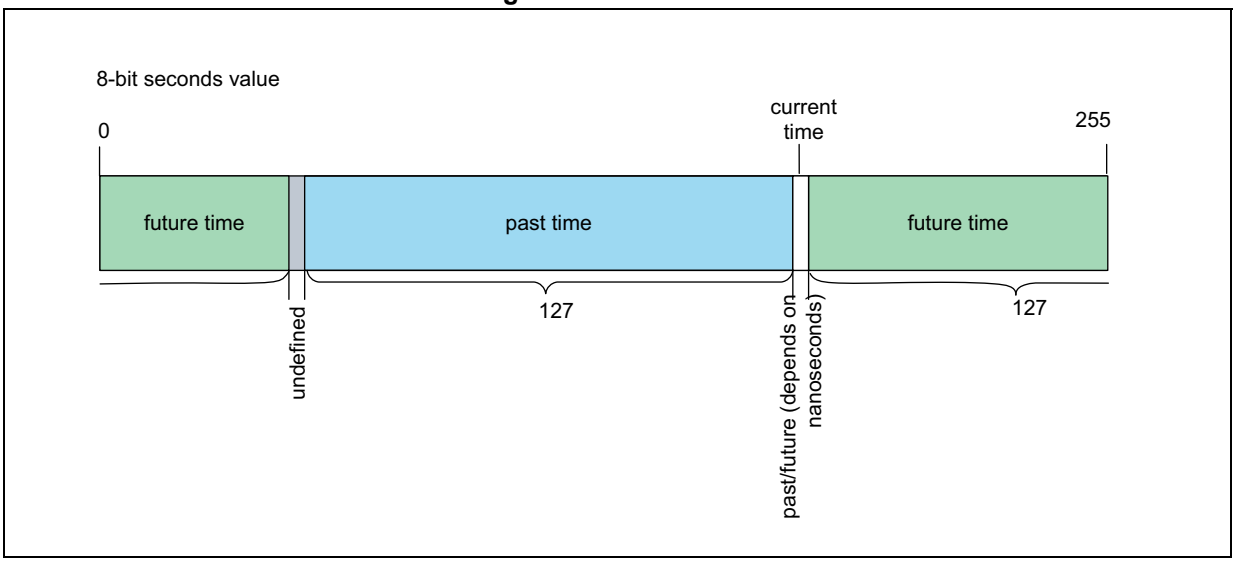
The Scheduling controller includes up to 16 schedulers that can be configured independently from each other (see *Figure 1155*). Schedulers have up to 64 outputs each. The Schedulers control the outputs time synchronized to an external clock time. The controlling is done according to a Schedule table. Each Scheduler features two of these tables, one is in use (active table) and the other one can be configured by the user during the operation. The active table the scheduler uses for controlling the outputs can then be changed seamlessly on-the-fly.

Figure 1155. FSC, Schedulers and tables

To support 802.1Qbv, FES needs to know beforehand the time when each gate closes. This is because it is not possible to stop transmitting a frame after transmission has started and the transmission cannot be ongoing when the gate closes. So for each transmitter queue, the information on how long a frame can be transmitted from that queue before the gate closes must be present, and the transmitter has to compare these values to the lengths of the frames in the queues. For this purpose FSC features downcounters (*Figure 1156*) that count down time (or bytes that can be sent) before each gate closes.

Figure 1156. Downcounter, emergency disable and scheduler

The countdown rate is configurable as it has to match, for example, the current Ethernet line speed. The scheduler has to be set ahead in time so that the downcounter has enough time to count down to zero before the gate closes.



Software driver

This section contains instructions on how to control FSC to perform certain specific things required for example in IEEE 802.1Qbv *[7]*. These instructions may be helpful for example for the operating system device driver writers.

Changing the Schedule table on-the-fly

The IEEE specification 802.1Qbv *[7]* specifies that CycleStartTime = (BaseTime + N*CycleTime). The software driver has to calculate a suitable time to be written to STARTTIME registers based on the BaseTime and CycleTime values and based on the current time (from FRTC block). When the FRTC time reaches the STARTTIME, the new schedule is taken into use. If the STARTTIME is in the past, FSC increments the STARTTIME by CycleTime until the STARTTIME is in the future. The STARTTIME in the register map (*ETHSW FSC scheduler x table y start time second register (ETHSW_FSCx_Ty_STRT_SR) (x = 0 to 2)*) has 8 bits for seconds. Half of the range is used for future times and the other half for past as presented in *Figure 1157*. The device driver software needs to recalculate the STARTTIME if it is (going to be) more than 127 seconds in the past (at the time when writing the register), and simply waits before writing the register if the starttime is more than 127 seconds in the future.

Figure 1157. Starttime

OperCycleTimeExtension

In the IEEE specification 802.1Qbv *[7]*, CycleTimeExtension is the time the previous cycle is allowed to be extended when the new schedule is taken into use. The idea is to make schedule change smooth by extending the previous cycle instead of starting a new cycle that has to be truncated when changing to the new schedule.

Cycle extension is implemented in FSC by providing configurable last cycle value (see *ETHSW FSC scheduler x table y last cycle register (ETHSW_FSCx_Ty_LST_CYCR) (x = 0 to 2)*). When the Cycle Number reaches the configured Last Cycle, the cycle is extended until the time for the next schedule change is reached.

Because delays in software are indefinite, it may be wise to configure the schedule change time first and the Last Cycle value after that (if there is still time before schedule change time). If the Last Cycle is configured first, and the software is unable to configure schedule change time in time, this leads to a very long extended cycle.

Rounding error in cycle time

According to the IEEE specification 802.1Qbv *[7]* the cycle time is a rational number represented by a numerator and denominator that are both unsigned 32-bit integers. The cycle time in FSC is configured with the CYCLETIME registers with great accuracy, but still there can be a tiny error in the cycle time caused by the finite resolution of the cycle time setting that then cumulates over time. Because of this, it may be necessary to change from Schedule table to another for example once in ten minutes to remove the cumulated time error. The time error can also be monitored by checking the cycle start timestamps in *ETHSW FSC scheduler x table y cycle timestamp second register (ETHSW_FSCx_Ty_CYCTS_SR) (x = 0 to 2)* and *ETHSW FSC scheduler x table y cycle timestamp nanosecond register (ETHSW_FSCx_Ty_CYCTS_NSR) (x = 0 to 2)*.

Time advance

The software driver needs to set the Scheduler timing so that it is ahead of the schedule at which gates need to be opened and closed. This is because of the time taken by the countdown of the downcounter. There is also an additional 10-clock cycle delay in the internal signal mapping that has to be compensated by the software. The countdown time is adjustable. When it is adjusted, the timing of the Scheduler has to be adjusted accordingly. The software driver also has to ensure that there is no more than one gate opening event during a countdown period, and no more than one gate closing event during a countdown period. In other words, the distance between two gate opening events and the distance between two gate closing events must be more than the downcounting period (Scheduler time advance).

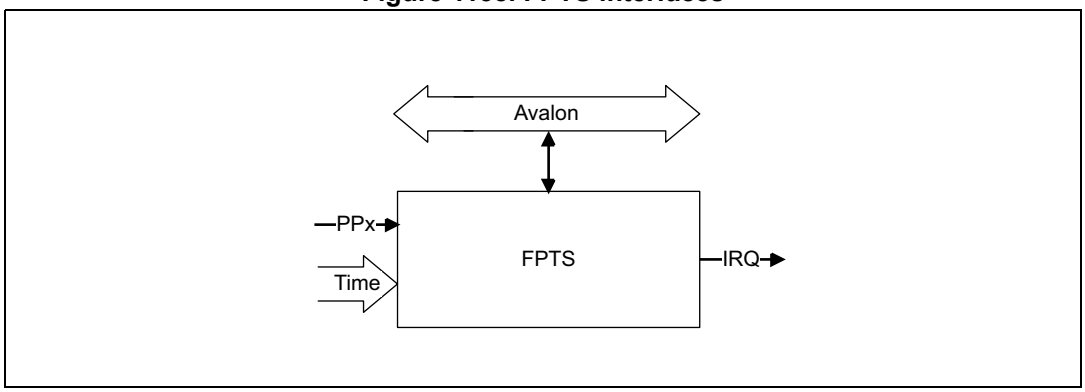
Adjusting the clock time

Adjusting the clock speed is allowed during operation. When adjusting the clock forwards or backwards in time, one cycle becomes shorter or longer in duration than normal. Adjusting the clock time more than two minutes backwards or forwards during operation should never be needed and may cause malfunction of the schedule. Configure a new schedule if the clock time is adjusted more than two minutes backwards or forwards.

Configuration registers

FSC register mapping is detailed in *Table 995: Register maps summary*, and FSC registers are presented in *Section 93.5.6*.

93.3.7 FPTS



The Flexibilis PPx Time Stamper (FPTS) timestamps rising edges of its input signal and stores the timestamps into its internal registers where the user can read them. Input signal frequencies up to 10 MHz are supported. Typical use of FPTS includes synchronizing to 1PPS and other PPx signals.

Section 93.5.2 contains the register description.

Functionality

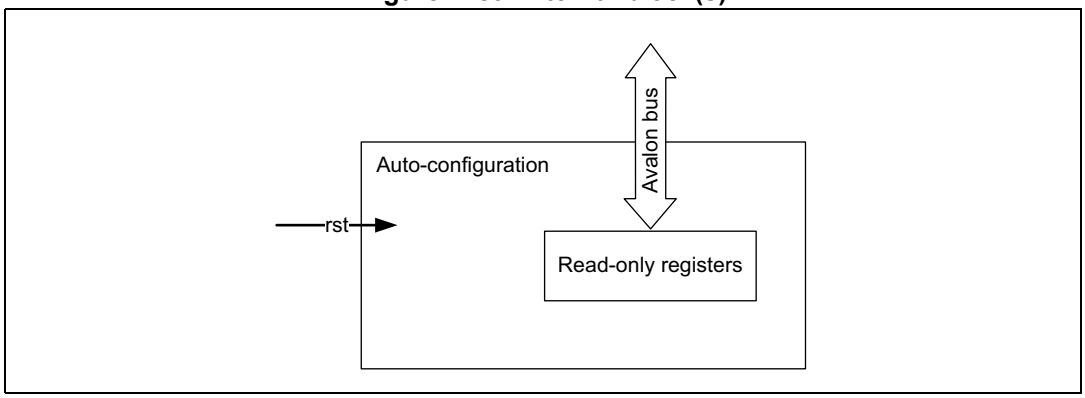
Figure 1158 presents the external interfaces of FPTS. FPTS timestamps the rising edges of the incoming PPx signal. By using the Avalon slave interface the user can read the timestamps from the registers of FPTS.

Figure 1158. FPTS interfaces

The Time interface (see *Figure 1158*) provides the current time information for FPTS as FPTS does not have internal timekeeping functionality. The Time interface is typically connected to FRTC (Flexibilis Real-Time Clock) (see *Section 93.3.5: FRTC*). The IRQ line is connected to the IRQ input of the CPU so that the CPU does not necessarily need to poll the registers of FPTS.

Configuration registers

FTPS registers are presented in *Section 93.5.4*.



93.3.8 AC

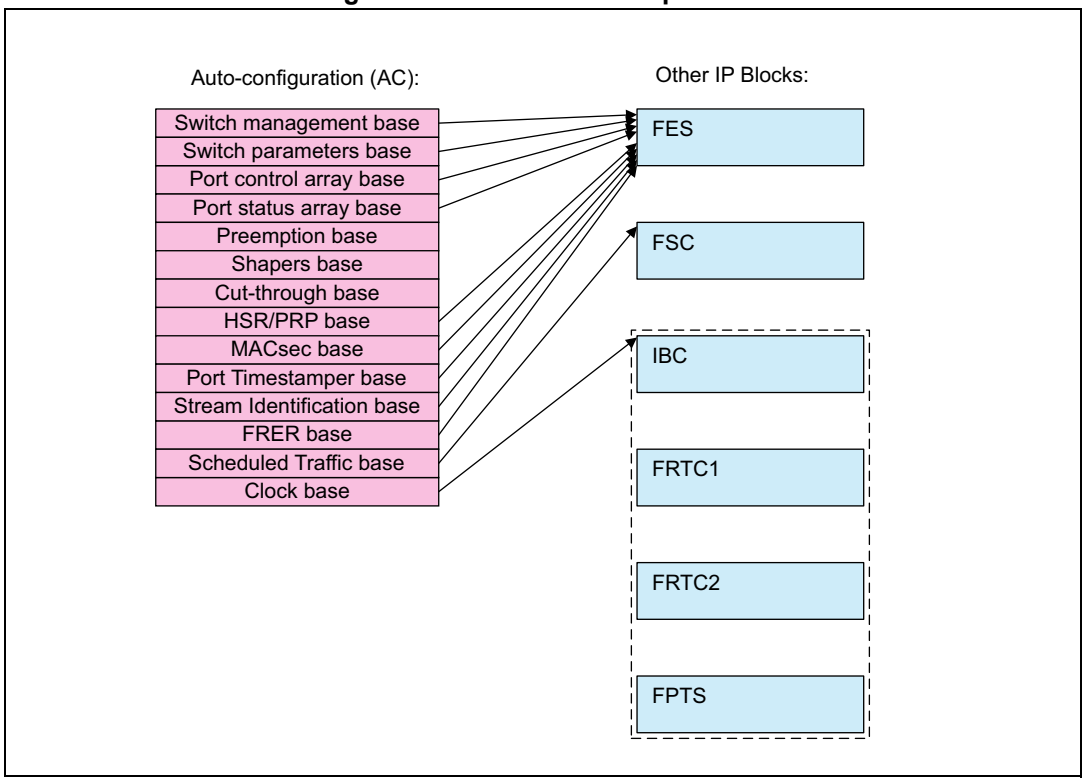
The idea is that this block resides at a known memory address and the software can then get information about the hardware by reading the address space of this block.

Functionality

The Auto-configuration block has an Avalon Memory Mapped slave interface using which its memory map can be read. This is the only Auto-configuration block functionality (see *Figure 1159*). The memory map consists of information for software about the hardware.

Figure 1159. Internal block(s)

Registers



AC register mapping is detailed in *Table 995: Register maps summary*, and AC registers are presented in *Section 93.5.2*.

Interface Map registers

The Interface Map registers are *ETHSW AC interface x ID register (ETHSW_AC_IFx_IDR)*. These registers list the interfaces provided by other blocks. All the registers are read-only. *Figure 1160* presents how base address pointers point to different functionalities.

The purpose of *ETHSW AC end of table register (ETHSW_AC_EOTR)* is to mark the end of Interface Map table for the driver. It is always positioned after the last existing line of the Interface Map and it is always equal to a static value 0x0.

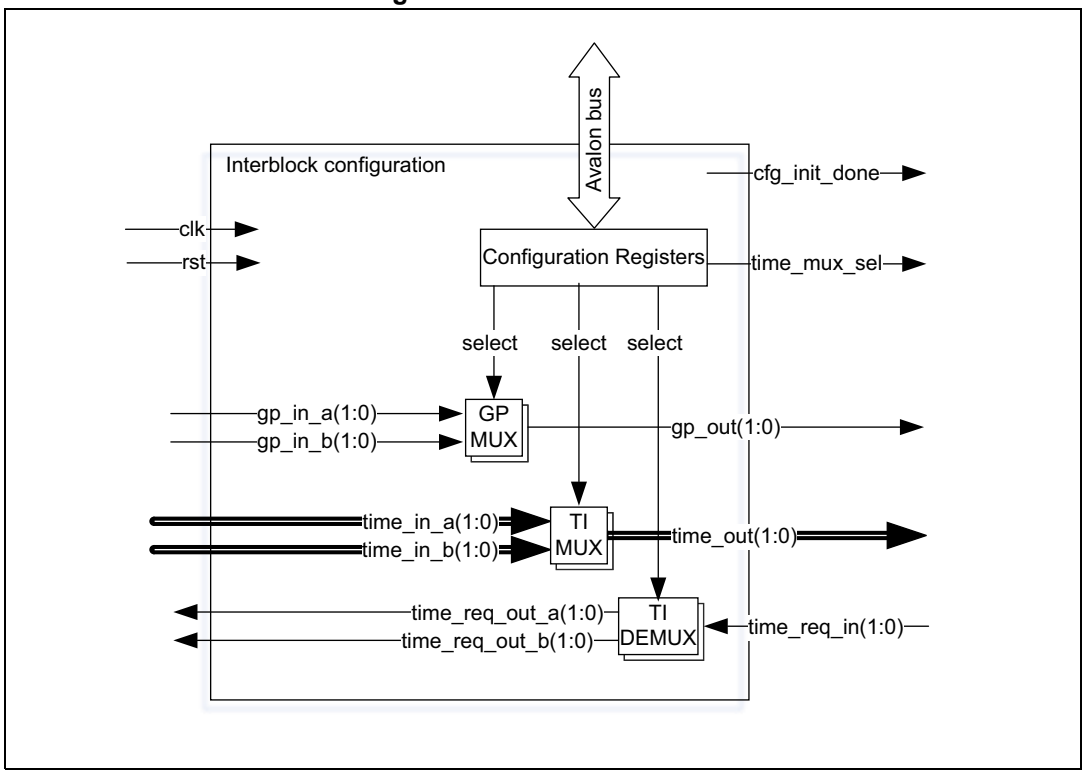


Figure 1160. Base address pointers

93.3.9 IBC

Inter-Block Configuration (IBC) block controls the communication between other subblocks. For that purpose, IBC has up to two Time Interfaces, 2-to-1 multiplexers(/demultiplexers), and up to two 2-to-1 general purpose multiplexers (see *Figure 1161*). The multiplexers are controlled by using the configuration registers through Avalon interface.

Figure 1161. Internal blocks

Registers

IBC register mapping is detailed in *Table 995: Register maps summary*, while IBC registers are presented in *Section 93.5.3*.

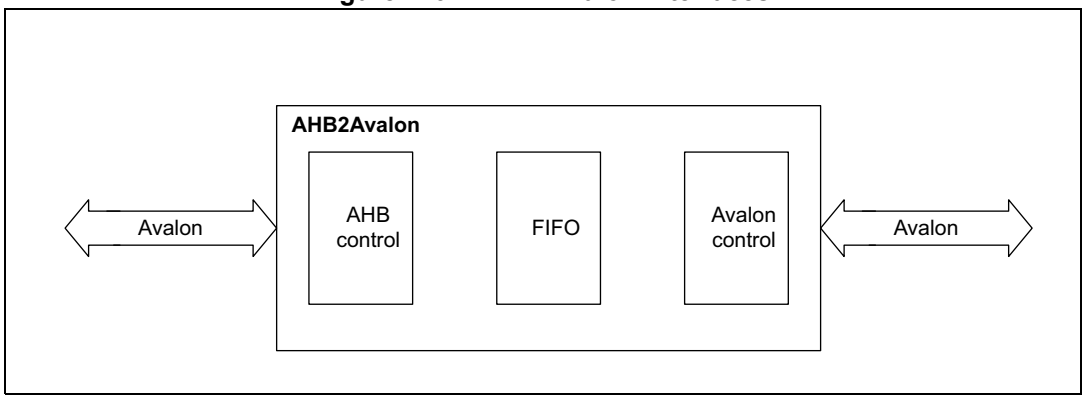
93.3.10 AHB2Avalon

AHB to Avalon Bridge (AHB2Avalon) subblock is used by an AHB master device to connect to Avalon slave devices. The AHB2Avalon translates AHB transfers to corresponding Avalon transfers.

The following AHB features are supported:

- AHB-Lite Interface with 32-bit data width
- 32-bit and 16-bit transfers only
- Single transfers
- Bursts (all lengths and burst termination supported)

The following features are not supported:



- Locked transfers
- Protection control
- 8-bit transfers (results in Bus Error)

AHB and Avalon buses operate in different clock domains, and the AHB2Avalon handles the clock domain crossing.

Functionality

AHB2Avalon has an AHB slave interface and an Avalon Memory Mapped master interface, which have their own clock domains. The external connections and functional blocks of the AHB2Avalon are presented in *Figure 1162*.

Figure 1162. AHB2Avalon interfaces

The AHB Control subblock handles the AHB interface signals. It sends new AHB transfers to FIFO and creates AHB responses when the transfer is complete. Write transfers are indicated complete when the transfer is written to the FIFO. Read transfers wait until the Avalon transfer is complete and the response data is available.

FIFO subblock is used to temporarily store the transfers, and to cross the clock domain from AHB clock to Avalon clock. The FIFO has a depth of 4 words and decreases the load on AHB, because some AHB transfers can be complete while the corresponding Avalon transfer is not yet complete.

Avalon Control subblock handles the Avalon interface signals. It reads new transfers from the FIFO and creates them on the Avalon bus.

Performance

The AHB2Avalon is designed to have good performance and to add as few wait states as possible on AHB. The number of wait states depends on several factors, including the following:

- Avalon slave performance
- AHB and Avalon clock frequencies
- FIFO state
- Transfer direction (read or write)

The exact number of wait states can be easily calculated only for single AHB transfers where all the previous transfers have already ended before the new transfer is started.

When the FIFO is empty, the equation to calculate the (maximum) number of read transfer wait states is the following:

$$WS_{AHB} = 3 + (3 + WS_{Avalon}) \times Clock_{AHB} / Clock_{Avalon}$$

As an example, if the AHB clock is 200 MHz, Avalon clock is 125 MHz and the Avalon slave has 1 wait state:

$$WS_{AHB} = 3 + (3 + 1) \times 200 / 125$$

The constants (3's) in the equation are the delays caused by the clock domain crossing.

The wait states values are the following:

- Write access: 1 AHB clock cycle
- Read access: 4 AHB clock cycles

When the FIFO is full, a new transfer must wait until the ongoing transfer is complete and there is free space in the FIFO. In addition to that, a new read transfer must wait until the FIFO is emptied of all the earlier write transfers. Waiting for the FIFO sums up to the total number of wait states, which are seen on the AHB. In general, a bigger FIFO improves the general performance, but it increases the maximum possible number of wait states of a single (read) transfer.

The AHB2Avalon writes the read transfers to the FIFO during the address phase as early as possible, which takes advantage of the pipeline characteristics of AHB and improves the performance of consecutive read transfers.

Optimizing the performance

When the general performance of AHB needs to be optimized, the AHB master can follow the next tips to improve the throughput of the AHB2Avalon and minimize the AHB wait states:

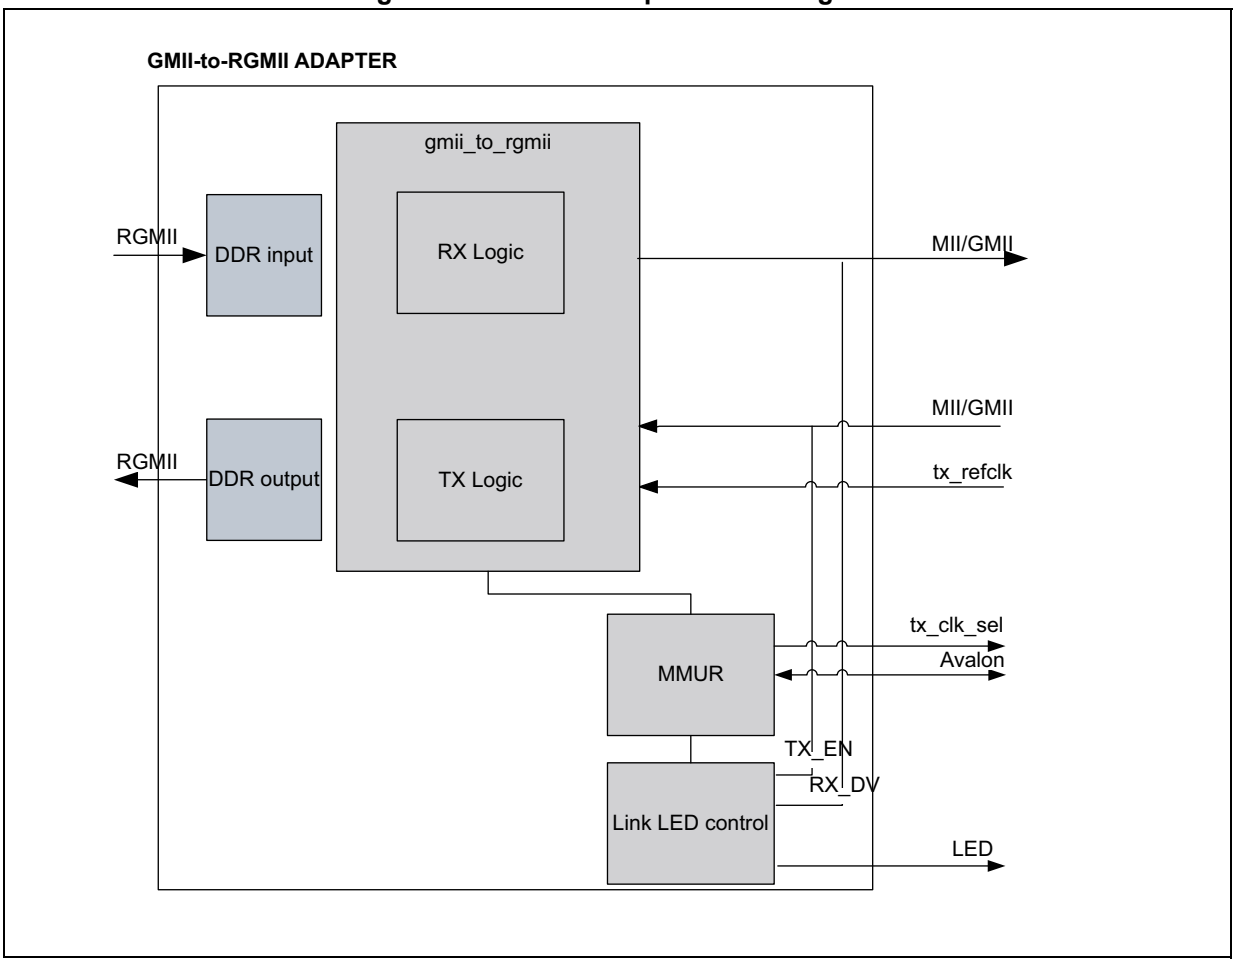
- Consecutive transfers on the same direction have greater performance than mixing reads and writes. Especially, an immediate read transfer after many write transfers can require many wait states, because the FIFO may be full of the write transfers and it is emptied before the read transfer can complete.
- If the accessed Avalon slave device is known to be slow, the AHB master can take it into account by not accessing it consecutively. Instead, it is better to make dispersed single transfers to the slow device. Especially, several consecutive write transfers to the slow device may slow down the following transfers.
- Burst write transfers, which have the same size as the FIFO depth, consume very few wait states because the whole transfer fits into the FIFO. After the burst, it is also recommended to keep a delay before accessing the AHB2Avalon again. The delay gives time for the FIFO to empty.

93.3.11 Ethernet interface adapters (EIA)

Ethernet interface adapters can be used to convert the native MII/GMII Ethernet interfaces of FES to other standard compliant interfaces (see *Figure 1126*). The available adapters for this are described in the following subparagraphs. The ETSW is configured as following:

- Port 0: RGMII adapter
- Port 1 and 2: Dual mode port adapter: RMII / RGMII adapter selection is done with the ethsw_ifsel signal.

RGMII



The main functionalities supported by the RGMII adapter are:

- Interface adaptation between GMII/MII and RGMII *[1]*
- Memory mapped user registers accessible via Avalon interface

The RGMII interface signal are Double Data Rate (DDR) signals, which means that data is sent and received on both clock edges.

RGMII adapter supports 10/100/1000 Mbps and the correct speed is selected based on the inband coding as defined in RGMII specification *[1]*. RGMII-ID mode on GMAC side, as specified in RGMII specification version 2.0 *[2]*, is supported thanks to GPIO advanced configuration settings. In addition to the actual GMII to RGMII adaptation, the adapter includes logic for Avalon slave register interface and traffic link LED generation (not supported in this product). RGMII adapter block diagram is described in *Figure 1163*.

Figure 1163. RGMII adapter block diagram

This adapter does not support internal RGMII data/clock delay compensation. In TX direction, the clock and data are aligned while in RX direction the clock is expected to be delayed by 2 ns. This delay must be provided by the PHY or with the PCB design.

This adapter supports all speeds and reports speed (speed_sel) according to inband status reported by the other end of RGMII interface. Note that the inband status is optional part of RGMII specification, so system designer must verify that the data is available from the other side before enabling automatic speed setting in FES.

In receive direction, the PHY status is decoded from inband signaling. The data can be read from LINK_STATUS register. If inband coding is detected to be invalid (rising edge data differs from falling edge, or if speed indication is ‘reserved’) link down with gigabit and full duplex is reported.

In transmit direction, full-duplex and link up are always reported. Speed reporting is according to speed_selected with gmii_tx_clk_sel.

RMII port adapter

The main functionalities supported by the RMII adapter are:

- Interface adaptation between GMII/MII and RMII *[1]*
- Memory mapper user registers accessible via Avalon interface

The RMII interface signals contain two transmit and receive bits, data valid for both directions and a reference clock input.

RMII adapter supports 10/100 Mbps Link status must be set by software by writing the link status register.

Most common use cases and configuration

The RMII adapter is most commonly used with 10/100 Mbps PHYs and do not need any configurations for basic operations. The link status is not known by the adapter.

Registers

Ethernet adapter register mapping is detailed in *Table 995: Register maps summary*, and registers are presented in *Section 93.5.8*.

93.5 ETHSW registers

93.5.1 ETHSW registers maps

This section provides the following register maps:

- AC registers (see *Section 93.5.2*)
- IBC registers (see *Section 93.5.3*)
- FTPS registers (see *Section 93.5.4*)
- FRTC registers (see *Section 93.5.5*)
- FSC registers (see *Section 93.5.6*)
- FES registers (see *Section 93.5.7*)
- EIA registers (see *Section 93.5.8*)

0: not mapped to corresponding port of FES
1: mapped to corresponding port of FES

Bits 15:8 **PORT_FES1[7:0]**: Port mapping to FES_1
Bit 0 corresponds to FES_1 port 0, bit 1 corresponds to FES_1 port 1, and so on.
0: not mapped to corresponding port of FES
1: mapped to corresponding port of FES

Bits 7:0 **PORT_FES0[7:0]**: Port mapping to FES_0
Bit 0 corresponds to FES_0 port 0, bit 1 corresponds to FES_0 port 1, and so on.
0: not mapped to corresponding port of FES
1: mapped to corresponding port of FES

ETHSW AC end of table register (ETHSW_AC_EOTR)

Address offset: 0x0010E0

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
END_OF_TABLE[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **END_OF_TABLE[15:0]**: Static value 0x0 indicating end of table.
Indicates end of the table in case the size of the table is full 16 lines.

93.5.3 ETHSW IBC registers

ETHSW IBC device ID register (ETHSW_IBC_DEV_IDR)

Address offset: 0x100000

Reset value: 0x0000 E000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DEVICE_ID[15:8]

Bits 15:2 Reserved, must be kept at reset value.

Bits 1:0 **TIM_MUXDEF[1:0]**: The value of Generic TIME_MUX_DEFAULT

ETHSW IBC generic AUTOCONFIG0 register (ETHSW_IBC_AUTOCONFIG0R)

Address offset: 0x102100

Reset value: 0x0006

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TS_NUM[1:0]		RTC_NUM[1:0]	
												r	r	r	r

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:2 **TS_NUM[1:0]**: Number of Timestamper blocks (for example FPTS) in the system

Bits 1:0 **RTC_NUM[1:0]**: Number of Real-Time Clock blocks (for example FRTC) in the system

ETHSW IBC generic AUTOCONFIG8 register (ETHSW_IBC_AUTOCONFIG8R)

Address offset: 0x102110

Reset value: 0x0008

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RTC_ADD[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **RTC_ADD[15:0]**: Bits (31:16) of the base address of the first Real-Time Clock block

Base address of the first Real-Time Clock block (for example FRTC) in the system relative to the base address of this IBC block (the value in this register is ((BASE_RTC0 >> 16) – (BASE_IBC >> 16)) mod 0x10000). The bits (15:0) of the base addresses are all zeroes.

ETHSW IBC generic AUTOCONFIG9 register (ETHSW_IBC_AUTOCONFIG9R)

Address offset: 0x102112

Reset value: 0x0009

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RTC_ADD[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **RTC_ADD[15:0]**: Bits (31:16) of the base address of the second real-time clock block

Base address of the second Real-Time Clock block (for example FRTC) in the system relative to the base address of this IBC block (the value in this register is ((BASE_RTC0 >> 16) – (BASE_IBC >> 16)) mod 0x10000). The bits (15:0) of the base addresses are all zeroes.

ETHSW IBC generic AUTOCONFIG10 register (ETHSW_IBC_AUTOCONFIG10R)

Address offset: 0x102114

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RTC_ADD[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **RTC_ADD[15:0]**: Bits (31:16) of the base address of the third real-time clock block

Base address of the third Real-Time Clock block (for example FRTC) in the system relative to the base address of this IBC block (the value in this register is ((BASE_RTC0 >> 16) – (BASE_IBC >> 16)) mod 0x10000). The bits (15:0) of the base addresses are all zeroes.

ETHSW IBC generic AUTOCONFIG12 register (ETHSW_IBC_AUTOCONFIG12R)

Address offset: 0x102118

Reset value: 0x0002

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TS_ADD[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **TS_ADD[15:0]**: Bits (31:16) of the base address of the first timestamper (TS) block

Base address of the first timestamper block (for example FPTS) in the system relative to the base address of this IBC block (the value in this register is ((BASE_TS0 >> 16) – (BASE_IBC >> 16)) mod 0x10000). The bits (15:0) of the base addresses are all zeroes.

ETHSW IBC generic AUTOCONFIG13 register (ETHSW_IBC_AUTOCONFIG13R)

Address offset: 0x10211A

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TS_ADD[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **TS_ADD[15:0]**: Bits (31:16) of the base address of the second timestamper (TS) block

Base address of the second timestamper block (for example FPTS) in the system relative to the base address of this IBC block (the value in this register is ((BASE_TS0 >> 16) – (BASE_IBC >> 16)) mod 0x10000). The bits (15:0) of the base addresses are all zeroes.

ETHSW IBC generic AUTOCONFIG14 register (ETHSW_IBC_AUTOCONFIG14R)

Address offset: 0x10211C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TS_ADD[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **TS_ADD[15:0]**: Bits (31:16) of the base address of the third timestamper (TS) block
Base address of the third timestamper block (for example FPTS) in the system relative to the base address of this IBC block (the value in this register is ((BASE_TS0 >> 16) – (BASE_IBC >> 16)) mod 0x10000). The bits (15:0) of the base addresses are all zeroes.

93.5.4 ETHSW FTPS registers

ETHSW FTPS general register 0 (ETHSW_FTPS_GL0R)

Address offset: 0x120000

Reset value: 0x0000 9100

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DEVICE_ID[15:8]

REV_ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **REV_ID[31:0]**: Revision ID

ETHSW FTPS timestamper control register (ETHSW_FTPS_TSCR)

Address offset: 0x121000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GET_TIMESTAMP
															rt_w1

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **GET_TIMESTAMP**: Get timestamp

Writing 1 to this bit enables the recording of timestamp of the next PPx event to registers:

– *ETHSW FTPS timestamp subnanosecond register (ETHSW_FTPS_TS_SNSR)*

– *ETHSW FTPS timestamp second low register (ETHSW_FTPS_TS_SLR)*

– *ETHSW FTPS timestamp second high register (ETHSW_FTPS_TS_SHR)*

– *ETHSW FTPS timestamp nanosecond register (ETHSW_FTPS_TS_NSR)*.

In addition, the amount of PPx pulses arrived so far is written into *ETHSW FTPS pulse counter register (ETHSW_FTPS_PCNTR)*. This bit is cleared when the timestamp and the counter value are available.

ETHSW FTPS timestamper interrupt mask register (ETHSW_FTPS_TSIMR)

Address offset: 0x121008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIMESTAMP_IE
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **TIMESTAMP_IE**: Timestamp interrupt enable

An external interrupt is activated when the TIMESTAMP_IS Interrupt Status bit is set and the TIMESTAMP_IE Mask bit is set.

ETHSW FTPS timestamper interrupt status register (ETHSW_FTPS_TSISR)

Address offset: 0x121010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIMESTAMP_IS
															rc_w0

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **TIMESTAMP_IS**: Timestamp interrupt status

Indicates that a PPx pulse has arrived and a timestamp and pulse counter value are recorded to the following registers:

- *ETHSW FTPS timestamp subnanosecond register (ETHSW_FTPS_TS_SNSR)*
- *ETHSW FTPS timestamp nanosecond register (ETHSW_FTPS_TS_NSR)*
- *ETHSW FTPS timestamp second low register (ETHSW_FTPS_TS_SLR)*
- *ETHSW FTPS timestamp second high register (ETHSW_FTPS_TS_SHR)*
- *ETHSW FTPS pulse counter register (ETHSW_FTPS_PCNTR)*

An external interrupt is activated when the TIMESTAMP_IS Interrupt Status bit is set and the TIMESTAMP_IE Mask bit is set. The interrupt status bit in this register is updated independently from the Interrupt Mask bit.

ETHSW FTPS timestamp subnanosecond register (ETHSW_FTPS_TS_SNSR)

Address offset: 0x121100

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SUBNANOSECONDS[31:16]

PCNT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **PCNT[31:0]**: Pulse counter
Value in the free running 32-bit counter that counts incoming PPx pulses. This counter can be used for finding out how many pulses there has been between two timestamp captures. Useful with fast input signals.

93.5.5 ETHSW FRTC registers

ETHSW FRTCx general register (ETHSW_FRTCx_GLR) (x = 0 to 1)

Address offset: FRTC 0: 0x180000

Address offset: FRTC 1: 0x190000

Reset value: 0x0000 9003

SUBNANOSECONDS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SUBNANOSECONDS[31:0]**: Subnanoseconds

Subnanoseconds step size for NCO. This value is added to the internal NCO at every clock cycle. Defines the speed of the clock time.

The new value is taken into use with Adjust Step command (see *ETHSW FRTCx time command register (ETHSW_FRTCx_TIME_CMDR) (x = 0 to 1)*).

ETHSW FRTCx step size nanosecond register (ETHSW_FRTCx_STEP_SIZE_NR) (x = 0 to 1)

Address offset: FRTC 0: 0x181024

Address offset: FRTC 1: 0x191024

Reset value: 0x0000 0005

NANOSECONDS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:0 **NANOSECONDS[29:0]**: Nanoseconds

Adjust time (nanoseconds part). This value is added to the nanoseconds part with Adjust Time command instead of STEP_SIZE nanoseconds in:

– *ETHSW FRTCx step size subnanosecond register (ETHSW_FRTCx_STEP_SIZE_SNR) (x = 0 to 1)*

– *ETHSW FRTCx step size nanosecond register (ETHSW_FRTCx_STEP_SIZE_NR) (x = 0 to 1)*).

For the change to take effect, *ETHSW FRTCx time command register (ETHSW_FRTCx_TIME_CMDR) (x = 0 to 1)* must also be written.

The nanosecond adjustment value is unsigned and therefore always positive.

To go backwards, use negative seconds adjustment in

– *ETHSW FRTCx adjust second low register (ETHSW_FRTCx_ADJUST_SECLR) (x = 0 to 1)*

– *ETHSW FRTCx adjust second high register (ETHSW_FRTCx_ADJUST_SECHR) (x = 0 to 1)*.

For example, to go 500 ns backwards, adjust 999,999,500 ns forwards and one second backwards. Allowed range for nanosecond adjustment is from 0 to 999,999,999.

ETHSW FRTCx adjust second low register (ETHSW_FRTCx_ADJUST_SECLR) (x = 0 to 1)

Address offset: FRTC 0: 0x181038

Address offset: FRTC 1: 0x191038

Reset value: 0x0000 0000

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ADJUST_TIME_MODE	READ_TIME	ADJUST_STEP	ADJUST_TIME
												rt_w1	rt_w1	rt_w1	rt_w1

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **ADJUST_TIME_MODE**:

Determines when ADJUST_TIME command is taken into use (does not affect to ADJUST_STEP command):
0: takes effect immediately (normal behavior)
1: takes effect on half second (2^{29} = ~536,9 ms on nanoseconds value)
Writing 1 to this bit triggers the adjustment on half-second. It is then automatically cleared by hardware.

Bit 2 **READ_TIME**:

Updates the following registers with the current values in the NCO:
– *ETHSW FRTCx current time nanosecond register (ETHSW_FRTCx_CUR_NSECR) (x = 0 to 1)*
– *ETHSW FRTCx current time second low register (ETHSW_FRTCx_CUR_SECLR) (x = 0 to 1)*
– *ETHSW FRTCx current time second high register (ETHSW_FRTCx_CUR_SECHR) (x = 0 to 1)*
– *ETHSW FRTCx time CC low register (ETHSW_FRTCx_TIME_CCLR) (x = 0 to 1)*
– *ETHSW FRTCx time CC high register (ETHSW_FRTCx_TIME_CCHR) (x = 0 to 1)*
Writing 1 to this bit triggers the update. It is then automatically cleared by hardware.

Bit 1 **ADJUST_STEP**:

Take the new values of the following registers into use:
– *ETHSW FRTCx step size subnanosecond register (ETHSW_FRTCx_STEP_SIZE_SNR) (x = 0 to 1)*
– *ETHSW FRTCx step size nanosecond register (ETHSW_FRTCx_STEP_SIZE_NR) (x = 0 to 1)*.
Writing 1 to this bit triggers the step adjustment. It is then automatically cleared by hardware.

Bit 0 **ADJUST_TIME**:

Adds (for one time only) the values in the following registers to internal time (NCO):
– *ETHSW FRTCx adjust nanosecond register (ETHSW_FRTCx_ADJUST_NSECR) (x = 0 to 1)*
– *ETHSW FRTCx adjust second low register (ETHSW_FRTCx_ADJUST_SECLR) (x = 0 to 1)*
– *ETHSW FRTCx adjust second high register (ETHSW_FRTCx_ADJUST_SECHR) (x = 0 to 1)*
Writing 1 to this bit triggers the time adjustment. It is then automatically cleared by hardware.

ETHSW FRTCx generics low register (ETHSW_FRTCx_GENERICS_LR) (x = 0 to 1)

Address offset: FRTC 0: 0x182000

Address offset: FRTC 1: 0x192000

Revision ID from version control system

ETHSW FSC schedule table row access command register 0 (ETHSW_FSC_ROW_ACCESS_CMD0R)

Address offset: 0x1C1000

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRANSFER	READ_WRITE	ACCESS_ERR	Res.	Res.	Res.	Res.	TABLE	Res.	Res.	Res.	Res.	SCHEDULER[3:0]			
rt_w1	rw	r					rw					rw	rw	rw	rw

Bit 15 **TRANSFER**: Triggers transfer between schedule table row and ROW_DATA registers

Write 1 to this bit to read data from Schedule Table row to ROW_DATA registers, or to write data from ROW_DATA registers to Schedule Table row, depending on Read/Write bit.

The ROW_DATA registers are:

– *ETHSW FSC schedule table row data 0 register (ETHSW_FSC_ROW_DATA0R)*

– *ETHSW FSC schedule table row data 4 register (ETHSW_FSC_ROW_DATA4R)*

Value 0 indicates that the read/write is complete.

Bit 14 **READ_WRITE**: Read/write

0: Read. Data is available on next read to ROW_DATA registers.

1: Write. Data in ROW_DATA registers is written to Schedule Table row.

Bit 13 **ACCESS_ERR**: Access error.

0: The previous read/write was successful

1: The previous write access was not successful because the table was in use by the scheduler (= active)

Bits 12:9 Reserved, must be kept at reset value.

Bit 8 **TABLE**: Schedule table.
The Schedule Table of the scheduler that is accessed (read or written). Note that the active table cannot be written, only read.
0: Table 0
1: Table 1

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **SCHEDULER[3:0]**: Scheduler
The number of the scheduler whose Schedule Table is read or written.
0: Scheduler 0
1: Scheduler 1
2: Scheduler 2
Others: Reserved, must not be used.

ETHSW FSC schedule table row access command register 1 (ETHSW_FSC_ROW_ACCESS_CMD1R)

Address offset: 0x1C1002

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:0 **ROW_NUM[9:0]**: Row number
The Schedule Table row that is accessed (indirect access).

ETHSW FSC schedule table row data 0 register (ETHSW_FSC_ROW_DATA0R)

Address offset: 0x1C1010

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	OUTPUT_STATE[8:0]								
							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:9 Reserved, must be kept at reset value.

Bits 8:0 **OUTPUT_STATE[8:0]**: Output state for outputs 8 to 0.
Data to be written to Schedule Table row, or data read from Schedule Table row.
For each output bit:
0: Gate state is Closed
1: Gate state is Open
Note: Schedule Table rows that have not been written by the user may contain random data.

ETHSW FSC schedule table row data 4 register (ETHSW_FSC_ROW_DATA4R)

Address offset: 0x1C1018

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TIME[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **TIME[15:0]**: Time in clock cycles

The time in clock cycles the row processor stays on this schedule table row. Allowed values are 0, 8 to 65535. Value 0 corresponds to an infinite amount of clock cycles.

Data to be written to Schedule Table row, or data read from Schedule Table row.

Note: Schedule table rows that have not been written by the user may contain random data.

ETHSW FSC interrupt mask register (ETHSW_FSC_IMR)

Address offset: 0x1C1100

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCHTBL_IE
															rw

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **SCHTBL_IE**: Schedule table interrupt enable

Enables interrupt indicating that a scheduler has taken a new schedule table into use.

An interrupt is activated when this bit is set and the SCHTBL_IS Interrupt Status bit is 1.

ETHSW FSC interrupt status register (ETHSW_FSC_ISR)

Address offset: 0x1C1102

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCHTBL_IS
															rc_w0

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **SCHTBL_IS**: Schedule table interrupt status

Indicates that a scheduler has taken a new schedule table into use.

An interrupt is activated when this bit is set and the SCHTBL_IE Interrupt enable bit is 1.

The interrupt status bit is updated independently from the Interrupt enable bit.

ETHSW FSC generic scheduler register (ETHSW_FSC_GEN_SCHR)

Address offset: 0x1C4000

Reset value: 0x0007

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SCHEDULERS[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **SCHEDULERS[15:0]**: The value of generic SCHEDULERS
Bit 0 corresponds to scheduler 0, bit 1 corresponds to scheduler 1, and so on.

ETHSW FSC generic outputs register (ETHSW_FSC_GEN_OUTR)

Address offset: 0x1C4002

Reset value: 0x0009

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OUTPUTS[6:0]						
									r	r	r	r	r	r	r

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:0 **OUTPUTS[6:0]**: The value of generic OUTPUTS
Number of outputs per scheduler:
1: 1 output
2: 2 outputs
3: 3 outputs
...

ETHSW FSC generic table rows register (ETHSW_FSC_GEN_TBL_RWR)

Address offset: 0x1C4004

Reset value: 0x000A

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

												r	r	r	r

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **TABLE_ROWS[3:0]**: The value of generic TABLE_ROWS
Number of rows (entries) in each schedule table (there are two schedule tables per scheduler). Presented in powers of two:
‘6’: 64 rows
‘7’: 128 rows
‘8’: 256 rows
‘9’: 512 rows
‘10’: 1024 rows

ETHSW FSC generic clock frequency register (ETHSW_FSC_GEN_CLK_FRQR)

Address offset: 0x1C4006

Reset value: 0x00C8

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLK_FREQ[7:0]							
								r	r	r	r	r	r	r	r

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **CLK_FREQ[7:0]**: The value of generic CLK_FREQ

This bitfield can be used to indicate the clk clock frequency for the device driver software.
0: Reserved
1: 1 MHz
2: 2 MHz
...
255: 255 MHz

ETHSW FSC scheduler x general register (ETHSW_FSCx_SCH_GENR) (x = 0 to 2)

Address offset: scheduler 0: 0x1D0000

Address offset: scheduler 1: 0x1D1000

Address offset: scheduler 2: 0x1D2000

Reset value: 0x7FF0

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	DWNCNT_STRT_VAL[10:0]											Res.	Res.	DWNCNT_SPD[1:0]	
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw			rw	rw

Bit 15 Reserved, must be kept at reset value.

Bits 14:4 **DWNCNT_STRT_VAL[10:0]**: Downcounter start value.

The value from which the downcounters count down to zero.
If the Addend in *ETHSW FSC scheduler x downcounter speed setting register (ETHSW_FSCx_DWNCNT_SPDR) (x = 0 to 2)* is 0b1000, the start value has to be divisible by 4.
If the Addend in *ETHSW FSC scheduler x downcounter speed setting register (ETHSW_FSCx_DWNCNT_SPDR) (x = 0 to 2)* is 0b1010 or 0b0101, the start value has to be divisible by 5.

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **DWNCNT_SPD[1:0]**: Downcounter speed, 10/100 divider
00: one addend in a clock cycle (see *ETHSW FSC scheduler x downcounter speed setting register (ETHSW_FSCx_DWNCNT_SPDR) (x = 0 to 2)*)
01: one addend in ten clock cycles
10: one addend in one hundred clock cycles
11: Reserved
When FSC is used with FES, this setting corresponds to 1 Gbit/s, 100 Mbit/s and 10 Mbit/s line speeds.

ETHSW FSC scheduler x downcounter speed setting register (ETHSW_FSCx_DWNCNT_SPDR) (x = 0 to 2)

Address offset: scheduler 0: 0x1D0002

Address offset: scheduler 1: 0x1D1002

Address offset: scheduler 2: 0x1D2002

Reset value: 0x0100

Res.	Res.	Res.	Res.	Res.	Res.	Res.	DWNCNTR_SPD[3:0]				Res.	Res.	Res.	Res.	Res.
							rw	rw	rw	rw					

Bits 15:9 Reserved, must be kept at reset value.

Bits 8:5 **DWNCNTR_SPD[3:0]**: Downcounter speed, addend
0101: 0.625 units in a clock cycle.
When FSC is used with FES this setting corresponds to 200 MHz clk clock.
1000: one unit in a clock cycle
When FSC is used with FES this setting corresponds to 125 MHz clk clock.
1010: 1.25 units in a clock cycle
When FSC is used with FES this setting corresponds to 100 MHz clk clock.
Others: Reserved, must not be used.

Bits 4:0 Reserved, must be kept at reset value.

ETHSW FSC scheduler x emergency disable control register (ETHSW_FSCx_EME_DIS_CR) (x = 0 to 2)

Address offset: scheduler 0: 0x1D0020

Address offset: scheduler 1: 0x1D1020

Address offset: scheduler 2: 0x1D2020

Reset value: 0x0003

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EME_DIS_MUX_STATE	EME_DIS_MUX_CTRL
														r	rw

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **EME_DIS_MUX_STATE**: Current state of emergency disable MUX

0: signals to downcounters / gate_state outputs are from scheduler

1: signals to downcounters / gate state outputs are from *ETHSW FSC scheduler x emergency disable port state register (ETHSW_FSCx_EME_DIS_STATR) (x = 0 to 2)*

Bit 0 **EME_DIS_MUX_CTRL**: Emergency disable MUX control

0: set MUX so that signals to downcounters/gate_state outputs are from scheduler

1: set MUX so that signals to downcounters/gate state outputs are from *ETHSW FSC scheduler x emergency disable port state register (ETHSW_FSCx_EME_DIS_STATR) (x = 0 to 2)*.

The MUX reacts to this setting with zero delay in 0 to 1 direction. 1 to 0 change happens only at the start of a cycle.

ETHSW FSC scheduler x emergency disable port state register (ETHSW_FSCx_EME_DIS_STATR) (x = 0 to 2)

Address offset: scheduler 0: 0x1D0030

Address offset: scheduler 1: 0x1D1030

Address offset: scheduler 2: 0x1D2030

Reset value: 0x00FF

Res.	Res.	Res.	Res.	Res.	Res.	Res.	EME_DIS_STAT[8:0]								
							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:9 Reserved, must be kept at reset value.

Bits 8:0 **EME_DIS_STAT[8:0]**: Gate state in Emergency disable mode

This register is used to set the gate_state outputs open/closed when Emergency disable MUX state (in *ETHSW FSC scheduler x emergency disable control register (ETHSW_FSCx_EME_DIS_CR) (x = 0 to 2)*) is 1.

Bit 0 corresponds to gate_state output 0, bit 1 corresponds to gate_state output 1, and so on

0: gate_state is closed

1: gate_state is open

ETHSW FSC scheduler x table y general control and status register (ETHSW_FSCx_Ty_TBL_GENR) (x = 0 to 2)

Address offset: scheduler 0: 0x1D0800 + 0x100 * y, (y = 0 to 1)

Address offset: scheduler 1: 0x1D1800 + 0x100 * y, (y = 0 to 1)

Address offset: scheduler 2: 0x1D2800 + 0x100 * y, (y = 0 to 1)

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
UPDATE	Res.	Res.	Res.	Res.	Res.	LST_CYC_RCHD	LST_CYC_EN	Res.	Res.	Res.	Res.	Res.	Res.	SCH_TBL_IN_USE	SCH_TBL_UPDATE
rt_w1						r	rw							r	rw

Bit 15 **UPDATE**: Update

Write 1 to update read-only information in the following registers:

– *ETHSW FSC scheduler x table y cycle timestamp nanosecond register (ETHSW_FSCx_Ty_CYCTS_NSR) (x = 0 to 2)*

– *ETHSW FSC scheduler x table y cycle timestamp second register (ETHSW_FSCx_Ty_CYCTS_SR) (x = 0 to 2)*

– *ETHSW FSC scheduler x table y cycle counter register (ETHSW_FSCx_Ty_CYC_CNTR) (x = 0 to 2)*

Bits 14:10 Reserved, must be kept at reset value.

Bit 9 **LST_CYC_RCHD**: Last cycle reached

0: Disabled, cycler process goes on forever

1: Enabled, cycler process stops when last cycle is reached

Bit 8 **LST_CYC_EN**: Last cycle number register enable/disable

0: Disabled, cycler process goes on forever

1: Enabled, cycler process stops when last cycle is reached.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **SCH_TBL_IN_USE**: Schedule table currently in use
0: This table is not currently in use
1: This table is in use

Bit 0 **SCH_TBL_UPDATE**: Schedule table can be taken into use
0: cannot be taken into use
1: can be taken into use
When the scheduler takes the table into use, it clears this bit

ETHSW FSC scheduler x table y start time nanosecond register (ETHSW_FSCx_Ty_STRT_NSR) (x = 0 to 2)

Address offset: scheduler 0: 0x1D0814 + 0x100 * y, (y = 0 to 1)

Address offset: scheduler 1: 0x1D1814 + 0x100 * y, (y = 0 to 1)

Address offset: scheduler 2: 0x1D2814 + 0x100 * y, (y = 0 to 1)

Reset value: 0x0000 0000

STARTTIME_NS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:0 **STARTTIME_NS[29:0]**: Time schedule table taken into use, nanoseconds part.
If this schedule table is in use, this is the time it was taken into use. If this schedule table is not in use and bit 0 in *ETHSW FSC scheduler x table y general control and status register (ETHSW_FSCx_Ty_TBL_GENR) (x = 0 to 2)* is 1, this is the time the new schedule is going to be taken into use. Writing into this register is allowed only when bits 0 and 1 in *ETHSW FSC scheduler x table y general control and status register (ETHSW_FSCx_Ty_TBL_GENR) (x = 0 to 2)* are both 0.
Allowed range for nanosecond values is 0 to 999,999,999.

ETHSW FSC scheduler x table y start time second register (ETHSW_FSCx_Ty_STRT_SR) (x = 0 to 2)

Address offset: scheduler 0: 0x1D0818 + 0x100 * y, (y = 0 to 1)

Address offset: scheduler 1: 0x1D1818 + 0x100 * y, (y = 0 to 1)

Address offset: scheduler 2: 0x1D2818 + 0x100 * y, (y = 0 to 1)

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STARTTIME_S[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **STARTTIME_S[7:0]**: Time schedule table taken into use, seconds part.

Values 1 to 127 greater than the seconds of the current time (including wraparound) are interpreted as future time. Values 1 to 127 smaller (= 129 to 255 bigger) than the seconds of the current time (including wraparound) are interpreted as past time. Seconds value 128 greater than the seconds of the current time (including wraparound) is undefined.

If this Schedule Table is in use, this is the time it was taken into use. If this Schedule Table is not in use and bit 0 in *ETHSW FSC scheduler x table y general control and status register (ETHSW_FSCx_Ty_TBL_GENR) (x = 0 to 2)* is 1, this is the time the new schedule is going to be taken into use. Writing into this register is allowed only when bits 0 and 1 in *ETHSW FSC scheduler x table y general control and status register (ETHSW_FSCx_Ty_TBL_GENR) (x = 0 to 2)* are both 0.

Allowed range for nanosecond values is 0 to 999,999,999.

ETHSW FSC scheduler x table y cycle time subnanosecond register (ETHSW_FSCx_Ty_CYC_SUBNSR) (x = 0 to 2)

Address offset: scheduler 0: 0x1D0820 + 0x100 * y, (y = 0 to 1)

Address offset: scheduler 1: 0x1D1820 + 0x100 * y, (y = 0 to 1)

Address offset: scheduler 2: 0x1D2820 + 0x100 * y, (y = 0 to 1)

Reset value: 0x0000 0000

RX_CT	FB_STF	Res.	Res.	Res.	Res.	SPEED_SEL[1:0]		Res.	Res.	HW_MODE[1:0]		MGMT_ST[1:0]		FWD_ST[1:0]	
rw	rw					rw	rw			rw	rw	rw	rw	rw	rw

Bit 15 **RX_CT**: RX Cut-through
0: Cut-through disabled for frames coming into this port. Only Store-and-Forward operation.
1: Cut-through enabled for frames coming into this port.
For preventing broken frames from looping indefinitely in the network, this bit self-clears with a probability of 1/256 in case of a receive error (RX_UNDERSIZE, RX_FRAGMENTS, RX_OVERSIZE, RX_JABBER, RX_ERR or RX_CRC), if the value of the bit 14 (Fallback to Store-and-Forward) in this register is 0.
It is not allowed to enable Cut-through if the port is in Management mode.
Note: This bit is reserved for port 0.

Bit 14 **FB_STF**: Fallback to Store-and-Forward
0: RX Cut-through bit (RX_CT) is cleared with a probability of 1/256 in case of a receive error.
1: RX Cut-through bit (RX_CT) is never automatically cleared.
Note: This bit is reserved for port 0.

Bits 13:10 Reserved, must be kept at reset value.

Bits 9:8 **SPEED_SEL[1:0]**: Speed select
00: Reserved
01: 1000 Mb/s
10: 100 Mb/s
11: 10 Mb/s

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **HW_MODE[1:0]**: Port HW mode
00: MII
10: GMII
Others: Reserved, must not be used

Bits 3:2 **MGMT_ST[1:0]**: Port management state
00: Normal mode
01: Management mode. All the frames sent to/received from the port have a management trailer. When in Management mode none of the queues is allowed to be preemptable (see *ETHSW FES port x TX preemptable traffic selection register 0 (ETHSW_FESx_TX_PREE0R) (x = 1 to 2)*).
Others: Reserved, must not be used

Bits 1:0 **FWD_ST[1:0]**: Port Forwarding state
00: Forwarding. The port learns MAC addresses and forwards data. This can be overridden using FID_CFG registers *ETHSW FES port x filtering identifier configuration register 0 (ETHSW_FESx_FID_CFG0R) (x = 0 to 2)* to *ETHSW FES port x filtering identifier configuration register 7 (ETHSW_FESx_FID_CFG7R) (x = 0 to 2)*.
01: Reserved
10: Disabled. The port neither learns MAC addresses nor forwards data.
11: Reserved

ETHSW FES port x port VLAN configuration register 0 (ETHSW_FESx_VLAN0R) (x = 0 to 2)

Address offset: port 0: 0x200010

Address offset: port 1: 0x210010

Address offset: port 2: 0x220010

Reset value: 0x8FFF

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TGD_UTGD	PD_PCP[2:0]			PD_VLAN[11:0]											
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 15 **TGD_UTGD**: Tagged/untagged
Defines whether frames are sent out with or without a VLAN tag. Does not affect the handling of incoming frames.
0: no VLAN tags is added to the frames at exit. Since one VLAN tag per frame is always removed in ingress, the number of VLAN tags in frames decreases by one when a frame goes through FES.
1: VLAN tags are added to frames at exit, except for frames whose VLAN is the default VLAN of the output port. Tagging can still be disabled per-port per-VLAN using *ETHSW FES port VLAN tagging register (ETHSW_FES_VLAN_TAGR)*.

Bits 14:12 **PD_PCP[2:0]**: Port default PCP

Priority Code Point (PCP) for the frames coming in from the port without a VLAN tag. This setting together with Priority Regeneration Table Register also defines the priority for the frames.

Bits 11:0 **PD_VLAN[11:0]**: Port default VLAN

Incoming untagged frames are mapped to this VLAN. Outgoing frames with this VLAN are sent untagged. Value 0x0 is reserved

ETHSW FES port x port VLAN configuration register 1 (ETHSW_FESx_VLAN1R) (x = 0 to 2)

Address offset: port 0: 0x200012

Address offset: port 1: 0x210012

Address offset: port 2: 0x220012

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
USE_DEI	Res.	Res.	Res.	VLAN_PRIF[11:0]											
rw				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 15 **USE_DEI**: Use_DEI

Defines whether to use the DEI (Drop Eligible Indicator)-bit in the VLAN tag or not.
0: DEI bit is not used for this port. None of the incoming frames is considered as Drop Eligible. DEI bit is always cleared for frames transmitted out from this port.
1: DEI bit is used for this port. Incoming frames are considered as Drop Eligible if their DEI bit is set. If their DEI bit is cleared, they are considered as non Drop Eligible. DEI bit is set for Drop Eligible frames sent out from this port and cleared for frames that are not Drop Eligible

Bits 14:12 Reserved, must be kept at reset value.

Bits 11:0 **VLAN_PRIF[11:0]**: Default VLAN for Priority Tagged Frames

Incoming frames with priority tag (VLAN ID 0) are mapped to this VLAN. This setting does not affect frames going out from this port.

ETHSW FES port x port forward mask configuration register (ETHSW_FESx_FWDM_CFGR) (x = 0 to 2)

Address offset: port 0: 0x200014

Address offset: port 1: 0x210014

Address offset: port 2: 0x220014

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PORT_FWDM[2:0]		
													rw	rw	rw

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:0 **PORT_FWDM[2:0]**: Port forward mask
Configures to which ports forwarding is allowed from this port.
Bit 0 corresponds to port 0, bit 1 corresponds to port 1, bit 2 corresponds to port 2.
0: Enable forwarding to the port
1: Disable forwarding to the port

ETHSW FES port x priority regeneration table low register (ETHSW_FESx_PRIO_REGENLR) (x = 0 to 2)

Address offset: port 0: 0x200016

Address offset: port 1: 0x210016

Address offset: port 2: 0x220016

Reset value: 0x3210

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	PCP3[2:0]			Res.	PCP2[2:0]			Res.	PCP1[2:0]			Res.	PCP0[2:0]		
	rw	rw	rw		rw	rw	rw		rw	rw	rw		rw	rw	rw

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **PCP3[2:0]**: Priority, PCP3
Frames with Priority Code Point 3 get this priority in FES.

Bit 11 Reserved, must be kept at reset value.

Bits 10:8 **PCP2[2:0]**: Priority, PCP2
Frames with Priority Code Point 2 get this priority in FES.

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **PCP1[2:0]**: Priority, PCP1
Frames with Priority Code Point 1 get this priority in FES.

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **PCP0[2:0]**: Priority, PCP0
Defines priorities for Priority Code Points (PCP) 0. The priority for each PCP is configured with three bits. The priority an incoming frame gets defines the Priority Code Point (PCP) for the frame when it is sent out. Together with Queue Table (*ETHSW FES port x queue table configuration register (ETHSW_FESx_QUEUE_TBLR) (x = 1 to 2)*) of the output port, the priority also defines the TX queue into which the frame is put.

ETHSW FES port x priority regeneration table high register (ETHSW_FESx_PRIO_REGENHR) (x = 0 to 2)

Address offset: port 0: 0x200018

Address offset: port 1: 0x210018

Address offset: port 2: 0x220018

Reset value: 0x7654

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	PCP7[2:0]			Res.	PCP6[2:0]			Res.	PCP5[2:0]			Res.	PCP4[2:0]		
	rw	rw	rw		rw	rw	rw		rw	rw	rw		rw	rw	rw

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **PCP7[2:0]**: Priority, PCP7
Frames with Priority Code Point 7 get this priority in FES.

Bit 11 Reserved, must be kept at reset value.

Bits 10:8 **PCP6[2:0]**: Priority, PCP6
Frames with Priority Code Point 6 get this priority in FES.

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **PCP5[2:0]**: Priority, PCP5
Frames with Priority Code Point 5 get this priority in FES.

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **PCP4[2:0]**: Priority, PCP4
Frames with Priority Code Point 4 get this priority in FES.

ETHSW FES port x TX cut-through enable register (ETHSW_FESx_TX_CTER) (x = 1 to 2)

Address offset: port 1: 0x21001A

Address offset: port 2: 0x22001A

Reset value: 0x0000

Note: This register does not exist for port 0.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CTE7	CTE6	CTE5	CTE4	CTE3	CTE2	CTE1	CTE0
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **CTE7**: Cut-through enable/disable for queue 7

Bit 6 **CTE6**: Cut-through enable/disable for queue 6

Bit 5 **CTE5**: Cut-through enable/disable for queue 5

Bit 4 **CTE4**: Cut-through enable/disable for queue 4

Bit 3 **CTE3**: Cut-through enable/disable for queue 3

Bit 2 **CTE2**: Cut-through enable/disable for queue 2

Bit 1 **CTE1**: Cut-through enable/disable for queue 1

Bit 0 **CTE0**: Cut-through enable/disable for queue 0

0: Cut-through disabled

1: Cut-through enabled

Cut-through is possible only for Express frames, not for Preemptable frames; it is not allowed to enable Cut-through for Preemptable queues (see *ETHSW FES port x TX preemptable traffic selection register 0 (ETHSW_FESx_TX_PREE0R) (x = 1 to 2)*) and to enable Cut-through for any queue if the port is in Management mode.

ETHSW FES port x TX preemptable traffic selection register 0 (ETHSW_FESx_TX_PREE0R) (x = 1 to 2)

Address offset: port 1: 0x21001C

Address offset: port 2: 0x22001C

Reset value: 0x0000

Note: This register does not exist for port 0.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PREE7	PREE6	PREE5	PREE4	PREE3	PREE2	PREE1	PREE0
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **PREE7**: Preemption setting for queue 7

Bit 6 **PREE6**: Preemption setting for queue 6

Bit 5 **PREE5**: Preemption setting for queue 5

Bit 4 **PREE4**: Preemption setting for queue 4

Bit 3 **PREE3**: Preemption setting for queue 3

Bit 2 **PREE2**: Preemption setting for queue 2

Bit 1 **PREE1**: Preemption setting for queue 1

Bit 0 **PREE0**: Preemption setting for queue 0

0: Express. Traffic from this queue cannot be preempted.

1: Preemptable. Traffic from this queue can be preempted by express traffic.

ETHSW FES port x TX preemptable traffic selection register 1 (ETHSW_FESx_TX_PREE1R) (x = 1 to 2)

Address offset: port 1: 0x21001E

Address offset: port 2: 0x22001E

Reset value: 0x0000

Note: This register does not exist for port 0.

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **QUEUE_PRI7[2:0]**: Queue for priority 7

Egress frames with priority 7 are put into this TX queue in this output port.

Bit 27 Reserved, must be kept at reset value.

Bits 26:24 **QUEUE_PRI6[2:0]**: Queue for priority 6

Egress frames with priority 6 are put into this TX queue in this output port.

Bit 23 Reserved, must be kept at reset value.

Bits 22:20 **QUEUE_PRI5[2:0]**: Queue for priority 5
Egress frames with priority 5 are put into this TX queue in this output port.

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **QUEUE_PRI4[2:0]**: Queue for priority 4
Egress frames with priority 4 are put into this TX queue in this output port.

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **QUEUE_PRI3[2:0]**: Queue for priority 3
Egress frames with priority 3 are put into this TX queue in this output port.

Bit 11 Reserved, must be kept at reset value.

Bits 10:8 **QUEUE_PRI2[2:0]**: Queue for priority 2
Egress frames with priority 2 are put into this TX queue in this output port.

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **QUEUE_PRI1[2:0]**: Queue for priority 1
Egress frames with priority 1 are put into this TX queue in this output port.

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **QUEUE_PRI0[2:0]**: Queue for priority 0
Egress frames with priority 0 are put into this TX queue in this output port.

ETHSW FES port x shaper y configuration register (ETHSW_FESx_SHAPERyR) (x = 0 to 2)

Address offset: port 0: 0x200030 + 0x2 * y, (y = 0 to 7)

Address offset: port 1: 0x210030 + 0x2 * y, (y = 0 to 7)

Address offset: port 2: 0x220030 + 0x2 * y, (y = 0 to 7)

Reset value: 0xFFFF

															rt_w1

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **CAPTURE**: Capture

Writing 1 to this bit captures the stored minimum and maximum queue fill levels and writes the values to the registers:

– *ETHSW FES port x minimum fill level queue y register (ETHSW_FESx_FL_Qy_MINR) (x = 0 to 2)*

– *ETHSW FES port x maximum fill level queue y register (ETHSW_FESx_FL_Qy_MAXR) (x = 0 to 2)*

– *ETHSW FES port x buffer fill level sample counter register (ETHSW_FESx_FL_SMPL_CNTR) (x = 0 to 2)*.

FES clears this bit when the captured values can be read from the registers.

ETHSW FES port x buffer fill level sample counter register (ETHSW_FESx_FL_SMPL_CNTR) (x = 0 to 2)

FL_SAMPLE_CNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **FL_SAMPLE_CNT[15:0]**: Sample counter

Number of scheduler cycles since the last capture.

This is the number of queue fill level samples whose minimum and maximum values are stored in *ETHSW FES port x minimum fill level queue y register (ETHSW_FESx_FL_Qy_MINR) (x = 0 to 2)* and *ETHSW FES port x maximum fill level queue y register (ETHSW_FESx_FL_Qy_MAXR) (x = 0 to 2)*.

This value saturates to 0xFFFF.

ETHSW FES port x minimum fill level queue y register (ETHSW_FESx_FL_Qy_MINR) (x = 0 to 2)

Address offset: port 0: 0x2000E0 + 0x2 * y, (y = 0 to 7)

											rw	rw	rw	rw	rw

Bits 15:5 Reserved, must be kept at reset value.

Bits 4:0 **FL_QY_MIN[4:0]**: Minimum fill level for queue y
The smallest value of the fill level samples since the last capture.
The fill level is measured only on scheduler cycle start. The value in this register is the minimum of those measurements since the last capture.
It is updated after writing 1 to CAPTURE bit in *ETHSW FES port x buffer fill level capture register (ETHSW_FESx_FL_CAPTR) (x = 0 to 2)*.

ETHSW FES port x maximum fill level queue y register (ETHSW_FESx_FL_Qy_MAXR) (x = 0 to 2)

Address offset: port 0: 0x2000F0 + 0x2 * y, (y = 0 to 7)

Bits 15:5 Reserved, must be kept at reset value.

Bits 4:0 **FL_QY_MAX[4:0]**: Maximum fill level for queue y
The biggest value of the fill level samples since the last capture.
The fill level is measured only on scheduler cycle start. The value in this register is the maximum of those measurements, since the last capture.
It is updated after writing 1 to CAPTURE bit in *ETHSW FES port x buffer fill level capture register (ETHSW_FESx_FL_CAPTR) (x = 0 to 2)*.

Bits 15:0 **PTP_RX_SYNC_DELAY_SUBNS[15:0]**: RX Sync delay, subnanoseconds

Subnanoseconds part of the Receive delay compensation for PTP Sync messages, presented in 2^{-16} parts of a nanosecond. This value is added to the correction field of every received Sync message in addition to residence time (the time the frame spent inside FES) and TX delay.

This compensation consists of the delay from device input to FES input (it includes for example the PHY delay and the delay caused by any interface adapters) and the link delay for peer-to-peer transparent clock. For end-to-end transparent clock, this register must be set to the same value as *ETHSW FES PTP RX event delay subnanosecond register (ETHSW_FESx_PTP_RX_EVENTD_SNSR) (x = 0 to 2)*.

The value in this register is taken into use after writing to *ETHSW FES PTP RX sync delay nanosecond low register (ETHSW_FESx_PTP_RX_SYNCD_NSLR) (x = 0 to 2)*.

			rw		rw		rw								rw

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **CPT_CNT_GRP5**: Capture counter group 5

0: Capture counter TX_OVERRUN. See *Table 996* for details.

1: Do not capture above mentioned counter.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **CPT_CNT_GRP3**: Capture counter group 3

0: Capture counters RX_PREEMPT_SMD_ERR, RX_PREEMPT_ASS_ERR, RX_PREEMPT_ASS_OK, RX_PREEMPT_FRAG_CNT, TX_PREEMPT_FRAG_CNT. See *Table 996* for details.

1: Do not capture above mentioned counters.

Bit 9 Reserved, must be kept at reset value.

Bit 8 **CPT_CNT_GRP1**: Capture counter group 1

0: Capture counters RX_GOOD_OCTETS, RX_BAD_OCTETS,RX_UNICAST, RX_BROADCAST, RX_MULTICAST, RX_UNDERSIZE,RX_FRAGMENTS, RX_OVERSIZE, RX_JABBER, RX_ERR, RX_CRC,RX_64, RX_65_127, RX_128_255, RX_256_511, RX_512_1023,RX_1024_1536, FULL_DROP, RX_POLICED, TX_OCTETS, TX_UNICAST, TX _BROADCAST, TX _MULTICAST, Q_DROP, EARLY_DROP.
See *Table 996* for details.
1: Do not capture above mentioned counters.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **CAPTURE**: Capture

Writing 1 to this bit captures the selected counters. After the capture, the counters are reset. The result is that the user can read the number of events that happened between two successive captures. Which registers are captured is selected using the bits (12:8) of this register. FES clears this bit when the counters can be read using the indirect access (*ETHSW FES port x counter command register (ETHSW_FESx_CNT_CMDR) (x = 0 to 2)*).

ETHSW FES port x counter command register (ETHSW_FESx_CNT_CMDR) (x = 0 to 2)

Address offset: port 0: 0x206002

Address offset: port 1: 0x216002

TRANSFER	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CNT_NUM[5:0]					
rt_w1										rw	rw	rw	rw	rw	rw

Bit 15 **TRANSFER**: Transfer

This bit controls the indirect access for reading the captured values of the counters.
Writing 1 to this bit makes FES write the captured counter value of the selected counter (in Counter number bits) to *ETHSW FES port x counter value low register (ETHSW_FESx_CNT_VAL_LOR) (x = 0 to 2)* and *ETHSW FES port x counter value high register (ETHSW_FESx_CNT_VAL_HIR) (x = 0 to 2)*.
FES clears this bit when the value can be read from the registers.

Bits 14:6 Reserved, must be kept at reset value.

Bits 5:0 **CNT_NUM[5:0]**: Counter number

This bitfield controls the indirect access for reading the captured values of the counters.
It contains the number of the counter whose captured value has to be written to *ETHSW FES port x counter value low register (ETHSW_FESx_CNT_VAL_LOR) (x = 0 to 2)* and *ETHSW FES port x counter value high register (ETHSW_FESx_CNT_VAL_HIR) (x = 0 to 2)*.
See *Table 996* for details.
It is not allowed to use reserved counter numbers.

ETHSW FES port x counter value low register (ETHSW_FESx_CNT_VAL_LOR) (x = 0 to 2)

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **CNT_VAL_HI[15:0]**: Counter value High

Bits[31:16] of the counter value.

The value in this register is updated after writing 1 to the TRANFER bit in *ETHSW FES port x counter command register (ETHSW_FESx_CNT_CMDR) (x = 0 to 2)*.

Table 996. FES counters

Counter number	Counter description
0	**RX_GOOD_OCTETS** Number of octets in good frames received. Preamble and SFD are not counted to the frame length. FCS (CRC) is counted. On preemptable ports (port 1 and port 2), SMD, Fragment count and mCRC are not counted. The mPackets with SMD-V or SMD-R are not counted at all. If frame preemption is disabled, mPackets with other SMDs than SMD-E are not recognized as Ethernet frames and therefore not counted. Frames are considered as good frames if they have valid CRC, there was no RX error during the receiving and their length is 64 to 1536 octets (70 to 1536 with HSR). If a frame is not considered as a good frame, it is considered as a bad frame. The counter saturates to 0x FFFF FFFF.

Table 996. FES counters (continued)

Counter number	Counter description
1	**RX_BAD_OCTETS** Number of received octets in bad Ethernet frames. Preamble and SFD are not counted to frame length. FCS (CRC) is counted. Frames are considered as bad frames if they do not have a valid CRC, an RX error happened during reception or their length is under 64 octets (under 70 with HSR/PRP) or over 1536 octets. If a frame is not considered as a good frame, it is considered as a bad frame. If frame preemption is enabled with the generic PREEMPTABLE_PORTS, SMD, Fragment count and mCRC are not counted. Fragments of preempted frames are not counted separately; the whole frame is bad if one fragment is bad. The mPackets with SMD-V or SMD-R are not counted at all. If frame preemption is disabled, mPackets with other SMDs than SMD-E are not recognized as Ethernet frames and therefore not counted. The counter saturates to 0xFFFF FFFF.
2	**RX_UNICAST** Number of received good unicast frames. Fragments caused by frame preemption are not counted as separate frames. mPackets with SMD-V or SMD-R are not counted. The counter saturates to 0xFFFF FFFF.
3	**RX_BROADCAST** Number of received good broadcast frames. Fragments caused by frame preemption are not counted as separate frames. The counter saturates to 0xFFFF FFFF.
4	**RX_MULTICAST** Number of received good multicast frames. Does not include broadcast frames counted in RX_BROADCAST_L/H. Fragments caused by frame preemption are not counted as separate frames. The counter saturates to 0xFFFF FFFF.
5	**RX_UNDERSIZE** Number of received frames with valid CRC and under 64 octets in length (under 70 octets with HSR/PRP). Undersized frames are considered as bad frames, and they are not forwarded. The counter saturates to 0xFFFF FFFF.
6	**RX_FRAGMENTS** Number of received frames with invalid CRC and length under 64 octets. Fragments are considered as bad frames, and they are not forwarded. The counter saturates to 0xFFFF FFFF.
7	**RX_OVERSIZE** Number of received frames with valid CRC and length over 1536 octets. Oversized frames are considered as bad frames, and they are not forwarded. The counter saturates to 0xFFFF FFFF.
8	**RX_JABBER** Number of received frames with invalid CRC and length over 1536 octets. Jabber frames are considered as bad frames, and they are not forwarded. The counter saturates to 0xFFFF FFFF.
9	**RX_ERR** Number of received frames with an error, with size from 64 to 1536 octets, with or without a valid CRC. Includes frames with non-integral number of bytes and those received with RX Error signal from the PHY. RX Erroneous frames are considered as bad frames, and they are not forwarded. The counter saturates to 0xFFFF FFFF.
10	**RX_CRC Error** Number of received frames with size from 64 to 1536 octets and without a valid CRC, but not counted in RX_ERR_L/H. CRC Erroneous frames are considered as bad frames, and they are not forwarded. The counter saturates to 0xFFFF FFFF.

Table 996. FES counters (continued)

Counter number	Counter description
11	**FULL_DROP**: Memory Full Drop Number of frames dropped during reception because there was no room for the incoming frame. Fragments caused by frame preemption are not counted as separate frames. The counter saturates to 0xFFFF FFFF.
12	**RX_POLICED** Number of frames received that were policed because the input rate limit was exceeded. The counter counts also frames that would have been dropped anyway, and frames still forwarded because of management trailer. Fragments caused by frame preemption are not counted as separate frames. The counter saturates to 0xFFFF FFFF.
13	**TX_OCTETS** Total number of octets in frames transmitted. Preamble and SFD (and SMD, Fragment count and mCRC of preemptable frame) are not counted to the frame length. FCS (CRC) is counted. mPackets with SMD-R or SMD-V are not counted. The counter saturates to 0xFFFF FFFF.
14	**TX_UNICAST** Number of transmitted unicast frames. Fragments caused by frame preemption are not counted as separate frames. mPackets with SMD-R or SMD-V are not counted. The counter saturates to 0xFFFF FFFF.
15	**TX _BROADCAST** Number of transmitted broadcast frames. Fragments caused by frame preemption are not counted as separate frames. The counter saturates to 0xFFFF FFFF.
16	**TX _MULTICAST** Number of transmitted multicast frames. Does not include broadcast frames counted in TX Broadcast counter. Fragments caused by frame preemption are not counted as separate frames. The counter saturates to 0xFFFF FFFF.
17	**Q_DROP**: Queue Drop Number of frames dropped by this output port because TX queue was full, or the frame was too big for the queue (see FRAMESIZE registers). Note that a frame can be forwarded to multiple ports, so one single incoming frame can increment the counter for more than one port. The counter saturates to 0xFFFF FFFF.
18	**EARLY_DROP**: Early Frame Drop Number of frames dropped by this output port because internal memory was becoming full. Note that a frame can be forwarded to multiple ports, so one single incoming frame can increment the counter for more than one port. The counter saturates to 0xFFFF FFFF.
19	**RX_64**: RX 64 Octets Number of received frames with size of exactly 64 octets, including frames with errors. Fragments caused by frame preemption are not counted as separate frames. mPackets with SMD-R or SMD-V are not counted. The counter saturates to 0xFFFF FFFF.
20	**RX_65_127**: RX 65 to 127 Octets Number of received frames with size of 65 to 127 octets, including frames with errors. Fragments caused by frame preemption are not counted as separate frames. The counter saturates to 0xFFFF FFFF.
21	**RX_128_255**: RX 128 to 255 Octets Number of received frames with size of 128 to 255 octets, including frames with errors. Fragments caused by frame preemption are not counted as separate frames. The counter saturates to 0xFFFF FFFF.

Table 996. FES counters (continued)

Counter number	Counter description
22	**RX_256_511**: RX 256 to 511 Octets Number of received frames with size of 256 to 511 octets, including frames with errors. Fragments caused by frame preemption are not counted as separate frames. The counter saturates to 0xFFFF FFFF.
23	**RX_512_1023**: RX 512 to 1023 Octets Number of received frames with size of 512 to 1023 octets, including frames with errors. Fragments caused by frame preemption are not counted as separate frames. The counter saturates to 0xFFFF FFFF.
24	**RX_1024_1536**: RX 1024 to 1536 Octets Number of received frames with size of 1024 to 1536 octets, including frames with errors. Fragments caused by frame preemption are not counted as separate frames. The counter saturates to 0xFFFF FFFF.
25 to 27	Reserved
28	**RX_PREEMPT_SMD_ERR**: RX SMD Error Number of fragments received with invalid SMD or with SMD-C when there was no preempted frame in progress. The counter saturates to 0xFFFF FFFF. *Note: This counter number is reserved for Port 0.*
29	**RX_PREEMPT_ASS_ERR**: RX Reassembly Error Number of preemptable frame reassembly errors. The counter saturates to 0xFFFF FFFF. *Note: This counter number is reserved for Port 0.*
30	**RX_PREEMPT_ASS_OK**: RX Reassembly OK Number of successfully reassembled preempted frames. The counter saturates to 0xFFFF FFFF. *Note: This counter number is reserved for Port 0.*
31	**RX_PREEMPT_FRAG_CNT**: RX Preemption Extra Fragments Number of extra fragments received that were caused by preemption. The counter saturates to 0xFFFF FFFF. *Note: This counter number is reserved for Port 0.*
32	**TX_PREEMPT_FRAG_CNT**: TX Preemption Fragment Count Number of extra fragments sent because of preemption. The counter saturates to 0xFFFF FFFF. *Note: This counter number is reserved for Port 0.*
33 to 47	Reserved
48	**TX_OVERRUN**: TX Overrun Number of gate close events that happened while there was ongoing transmission. The counter saturates to 0xFFFF FFFF.

Note: FES does not forward frames whose length is more than 1536 octets or under 64 octets. Frames which came in with a VLAN tag and whose length was under 68 octets are padded to 64 octets when sent out without the VLAN tag.

ETHSW FES port x IPO command register (ETHSW_FESx_IPO_CMDR) (x = 0 to 2)

Address offset: port 0: 0x208000

Address offset: port 1: 0x218000

Address offset: port 2: 0x228000

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRANSFER	RD_WR	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IPO_FIL_NUM[3:0]			
rt_w1	rw											rw	rw	rw	rw

Bit 15 **TRANSFER**: Transfer

Writing 1 to this bit makes FES read or write (depending on the RD_WR bit) the selected IPO filter. FES clears this bit when the transfer is complete.

Bit 14 **RD_WR**: Read/write

0: Read from IPO filter to registers:

- *ETHSW FES port x IPO filter configuration register 0 (ETHSW_FESx_ETH_ADDR_CFG0R) (x = 0 to 2)*
- *ETHSW FES port x forward allow register (ETHSW_FESx_ETH_ADDR_FWD_ALLOWR) (x = 0 to 2)*
- *ETHSW FES port x forward mirror register (ETHSW_FESx_ETH_ADDR_FWD_MIRRORR) (x = 0 to 2)*
- *ETHSW FES port x IPO filter configuration register 1 (ETHSW_FESx_ETH_ADDR_CFG1R) (x = 0 to 2)*
- *ETHSW FES port x ethernet address part 0 register (ETHSW_FESx_ETH_ADDR_0R) (x = 0 to 2)*
- *ETHSW FES port x ethernet address part 1 register (ETHSW_FESx_ETH_ADDR_1R) (x = 0 to 2)*
- *ETHSW FES port x ethernet address part 2 register (ETHSW_FESx_ETH_ADDR_2R) (x = 0 to 2)*.

1: Write from registers (see above) to IPO filter.

Bits 13:4 Reserved, must be kept at reset value.

Bits 3:0 **IPO_FIL_NUM[3:0]**: IPO Filter Number

The number of the IPO filter that is read or written.

ETHSW FES port x IPO filter configuration register 0 (ETHSW_FESx_ETH_ADDR_CFG0R) (x = 0 to 2)

Address offset: port 0: 0x208010

Address offset: port 1: 0x218010

Address offset: port 2: 0x228010

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NEW_PRI_LSB	PRES_PRI	NEW_PRI_MSB[1:0]		Res.	Res.	POL_PRIO	Res.	CMP_LENGTH[5:0]						SRC_DST_MATCH	ENABLE
rw	rw	rw	rw			rw		rw	rw	rw	rw	rw	rw	rw	rw

Bit 15 **NEW_PRI_LSB**: New priority, LSB

If Preserve Priority bit = 0, the frame priority is set to the value in New priority bits. It overrides the priority defined by PCP.

In case of two IPO matches (source address match and destination address match), the information is taken from the second match.

Bit 14 **PRES_PRI**: Preserve priority

0: Set the frame priority to the value in New priority bits.

1: Do not alter the frame priority

In case of two IPO matches (source address match and destination address match), the information is taken from the second match.

Bits 13:12 **NEW_PRI_MSB[1:0]**: New priority, MSBs

If Preserve Priority bit = 0, the frame priority is set to this value. It overrides the priority defined by PCP.

In case of two IPO matches (source address match and destination address match), the information is taken from the second match.

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **POL_PRIO**: Policer priority

0: Normal Policer priority

1: Low Policer priority, frames with lower policer priority use only the upper half of the token buckets

If Policer configuration bit = 1 in *ETHSW FES general control register (ETHSW_FES_GEN_CTRLR)* (Policing is not based on IPO), this bit has to be 0.

In case of two IPO matches (source address match and destination address match), the information is taken from the first match.

Bit 8 Reserved, must be kept at reset value.

Bits 7:2 **CMP_LENGTH[5:0]**: Compared Length

Defines how many bits from the start of the MAC addresses of the incoming frames are compared to the value in registers from *ETHSW FES port x ethernet address part 0 register (ETHSW_FESx_ETH_ADDR_0R) (x = 0 to 2)* to *ETHSW FES port x ethernet address part 2 register (ETHSW_FESx_ETH_ADDR_2R) (x = 0 to 2)*. If the value is 48, the whole MAC address is compared. With value 0, every frame matches. With value 1, only the unicast/multicast bit is compared if Compare Order (see *ETHSW FES port x IPO filter configuration register 1 (ETHSW_FESx_ETH_ADDR_CFG1R) (x = 0 to 2)*) = 0. Values over 48 are reserved.

Bit 1 **SRC_DST_MATCH**: Source/Destination Match

Defines whether to compare the address in registers from *ETHSW FES port x ethernet address part 0 register (ETHSW_FESx_ETH_ADDR_0R) (x = 0 to 2)* to *ETHSW FES port x ethernet address part 2 register (ETHSW_FESx_ETH_ADDR_2R) (x = 0 to 2)* to the source or to the destination MAC address of the incoming frame.

0: Match to destination address

1: Match to source address

Bit 0 **ENABLE**: Enable

0: Rule disabled. All the other settings for this rule have no effect.

1: Rule enabled

ETHSW FES port x forward allow register (ETHSW_FESx_ETH_ADDR_FWD_ALLOWR) (x = 0 to 2)

Address offset: port 0: 0x208012

Address offset: port 1: 0x218012

Address offset: port 2: 0x228012

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FWD_ALLOW_MSK[2:0]		
													rw	rw	rw

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:0 **FWD_ALLOW_MSK[2:0]**: Forward allow mask

Defines to which ports the matching frames are allowed to be forwarded.

Bit 0 corresponds to port 0, bit 1 corresponds to port 1, bit 2 corresponds to port 2.

0: Forwarding is not allowed to this port

1: Forwarding is allowed to this port.

ETHSW FES port x forward mirror register (ETHSW_FESx_ETH_ADDR_FWD_MIRRORR) (x = 0 to 2)

Address offset: port 0: 0x208014

Address offset: port 1: 0x218014

Address offset: port 2: 0x228014

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FWD_MIRROR_MSK[2:0]		
													rw	rw	rw

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:0 **FWD_MIRROR_MSK[2:0]**: Forward mirror mask

Defines to which ports the matching frames are mirrored.
Bit 0 corresponds to port 0, bit 1 corresponds to port 1, bit 2 corresponds to port 2.
0: Frame is not mirrored to this port
1: Frame is mirrored to this port.

ETHSW FES port x IPO filter configuration register 1 (ETHSW_FESx_ETH_ADDR_CFG1R) (x = 0 to 2)

Address offset: port 0: 0x208016

Address offset: port 1: 0x218016

Address offset: port 2: 0x228016

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CT_DIS	CMP_ORDER	Res.	IPO_MARK	Res.	Res.	Res.	Res.	Res.	POLICER[6:0]						
rw	rw		rw						rw	rw	rw	rw	rw	rw	rw

Bit 15 **CT_DIS**: Cut-Through disable

0: Cut-through is possible for the frame if all the other requirements for cut-through forwarding are met.

1: Cut-through is disabled for the matching frames.

In case of two IPO matches (source address match and destination address match), the information is taken from the second match.

Cut-through disable is typically used for PTP event message (Sync, Delay_Req, Pdelay_Req and Pdelay_Resp) because the correctionField is not modified when the frame is Cut-through.

Bit 14 **CMP_ORDER**: Compare Order

Defines the bit order of the Compared Length (see bits (7:2) in *ETHSW FES port x IPO filter configuration register 0 (ETHSW_FESx_ETH_ADDR_CFG0R) (x = 0 to 2)*).

0: The order is the order in which bits come from the line, that is the highest byte first, but the lowest bit of the byte first.

1: The order is the highest byte first and the highest bit of the byte first.

Note that this setting has no effect if the Compared Length is divisible by eight.

Bit 13 Reserved, must be kept at reset value.

Bit 12 **IPO_MARK**: IPO Mark

If this bit is set, bit 12 in the Management Trailer (and DMA RX Descriptor) is set for matching frames.

In case of two IPO matches (source address match and destination address match), the bit in the trailer is set if this bit is set in either of the matches

Bits 11:7 Reserved, must be kept at reset value.

Bits 6:0 **POLICER[6:0]**: Policer

The number of the policer that is used to measure and police matching frames. If Policer configuration bit = 1 in *ETHSW FES general control register (ETHSW_FES_GEN_CTRLR)* (Policing is not based on IPO), these bits have to be 0.

In case of two IPO matches (source address match and destination address match), the information is taken from the first match.

ETHSW FES port x ethernet address part 0 register (ETHSW_FESx_ETH_ADDR_0R) (x = 0 to 2)

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **REV_ID0[15:0]**: Configuration revision ID 0
Revision number from version control system

ETHSW FES revision ID register 1 (ETHSW_FES_REV_ID1R)

Address offset: 0x800008

Reset value: 0x71CA

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REV_ID1[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **REV_ID1[15:0]**: Body revision ID, bit (15:0)
Revision number from version control system (lowest bits).

ETHSW FES revision ID register 2 (ETHSW_FES_REV_ID2R)

Address offset: 0x80000A

Reset value: 0x057D

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REV_ID2[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **REV_ID2[15:0]**: Body revision ID, bit (31:16)
Revision number from version control system (highest bits).

ETHSW FES general control register (ETHSW_FES_GEN_CTRLR)

Address offset: 0x800010

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
INIT_REQ	CLR_MAC_TAB	CORR_DIS	PTP_MOD[1:0]		MOD_SYNCF	TIM_TRL	POL_CFG	Res.	Res.	MGMT_TRL_OFF[1:0]		MGMT_TRL_LGTH[1:0]		Res.	Res.
rw	rt_w1	rw	rw	rw	rw	rw	rw			rw	rw	rw	rw		

Bit 15 **INIT_REQ**: Init Request
Requests the ETHSW initialization (reset). This bit must be forced to zero for operation.
0: Initialization release
1: Initialization request

Bit 14 **CLR_MAC_TAB**: Clear Dynamic MAC address table
Writing 1 to this bit clears entries from the Dynamic MAC address table. The values in *ETHSW FES dynamic MAC table clear mask register (ETHSW_FES_MT_CLEAR_MSKR)* and *ETHSW FES dynamic MAC table clear FID register (ETHSW_FES_MT_CLEAR_FIDR)* define which entries are cleared. FES clears this bit when done.

Bit 13 **CORR_DIS**: Correction Disable
0: correctionFields of Store-and-forward PTPv2 event messages (Sync, Delay_Req, Pdelay_Req and Pdelay_Resp) are modified to include the time the frame spent inside the switch and for Sync frames optionally the link delay of the ingress port.
1: correctionFields of PTPv2 event messages are not modified by FES

Bits 12:11 **PTP_MOD[1:0]**: PTP Mode
00: PTP over UDP/IPv4
01: Reserved
10: PTP over Ethernet
11: Reserved

Bit 10 **MOD_SYNCF**: Modify Sync frames
When enabled, origin Timestamp field in the Sync messages in port 0 inbound are modified to contain the receive time of the frame.
0: Disabled
1: Enabled

Bit 9 **TIM_TRL**: Time trailer
When enabled, Time Trailer is added to PTP event message frames at outbound of port 0.
0: Disabled
1: Enabled

Bit 8 **POL_CFG**: Policer configuration

0: Policing based on IPO. No Static MAC Address Table based policing. Policer bits in Static MAC Address Table are reserved.

1: Policing based on Static MAC Address Table. No policing based on IPO.Policer bits in IPO registers are reserved.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **MGMT_TRL_OFF[1:0]**: Management Trailer Offset

00: normal operation

01: 8-bit offset. This causes bit 8 in the management trailer to relate to port 0 (instead of port 8), bit 9 to relate to port 1 (instead of port 9), and so on. Use only when Management Trailer Length is configured to 16 bits.

Others: Reserved, must not be used

Bits 3:2 **MGMT_TRL_LGTH[1:0]**: Management Trailer Length

Defines the length of the management trailer for the ports that are in Management mode.

00: 8 bits

01: 16 bits

Others: Reserved, must not be used

Bits 1:0 Reserved, must be kept at reset value.

ETHSW FES dynamic MAC table clear mask register (ETHSW_FES_MT_CLEAR_MSKR)

Address offset: 0x800012

Reset value: 0x0007

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

													rw	rw	rw

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:0 **MAC_TAB_CLRM[2:0]**: MAC Table Clear Mask

Bit 0 corresponds to port 0, bit 1 corresponds to port 1 and bit 2 corresponds to port 2.

0: Entries registered to this port are not cleared

1: Entries registered to this port are cleared

ETHSW FES dynamic MAC table clear FID register (ETHSW_FES_MT_CLEAR_FIDR)

Address offset: 0x800014

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FID[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:0 **FID[5:0]**: Filtering Identifier (FID)
Only entries with this FID are cleared.

ETHSW FES address aging configuration register (ETHSW_FES_ADDRESS_AGING_CFGR)

Address offset: 0x800020

Reset value: 0x0012

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LIFE_TIME[6:0]						
									rw	rw	rw	rw	rw	rw	rw

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:0 **LIFE_TIME[6:0]**: Address Lifetime
Lifetime of automatically learned addresses.
0: 16 s
1: 32 s
2: 48 s
...
127: 2048 s

ETHSW FES aging base time low register (ETHSW_FES_AGING_BASE_TIMELR)

Address offset: 0x800022

Reset value: 0xA11F

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BASE_TIMEL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **BASE_TIMEL[15:0]**: Aging base time value bits (15:0)
Defines Aging Base Time in number of system clock cycles. The value written into this register should result in an aging base time of 4 ms. The default value gives 4 ms with a 125 MHz system clock frequency.

ETHSW FES aging base time high register (ETHSW_FES_AGING_BASE_TIMEHR)

Address offset: 0x800024

Reset value: 0x0007

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BASE_TIMEH[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **BASE_TIMEH[7:0]**: Aging base time value bits (23:16)

Defines Aging Base Time in number of system clock cycles. The value written into this register should result in an aging base time of 4 ms. The default value gives 4 ms with a 125 MHz system clock frequency.

ETHSW FES interrupt mask clear register (ETHSW_FES_INT_MASK_CLR)

Address offset: 0x800030

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CONGESTED_IMC	RX_ERROR_IMC	RX_TIMESTAMP_IMC	TX_TIMESTAMP_IMC
												rc_w0	rc_w0	rc_w0	rc_w0

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **CONGESTED_IMC**: Congested interrupt mask clear
Setting this bit clears the CONGESTED_IE mask bit.

Bit 2 **RX_ERROR_IMC**: RX error interrupt mask clear
Setting this bit clears the RX_ERROR_IE mask bit.

Bit 1 **RX_TIMESTAMP_IMC**: RX timestamp interrupt mask clear
Setting this bit clears the RX_TIMESTAMP_IE mask bit.

Bit 0 **TX_TIMESTAMP_IMC**: TX timestamp interrupt mask clear
Setting this bit clears the TX_TIMESTAMP_IE mask bit.

ETHSW FES interrupt mask set register (ETHSW_FES_INT_MASK_SETR)

Address offset: 0x800034

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CONGESTED_IE	RX_ERROR_IE	RX_TIMESTAMP_IE	TX_TIMESTAMP_IE
												rs	rs	rs	rs

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **CONGESTED_IE**: Congested interrupt enable mask
The interrupt is activated when CONGESTED_IM and CONGESTED_IM bit are both set.

Bit 2 **RX_ERROR_IE**: RX error interrupt enable mask
The interrupt is activated when RX_ERROR_IM and RX_ERROR_IS bit are both set.

Bit 1 **RX_TIMESTAMP_IE**: RX timestamp interrupt enable mask
The interrupt is activated when RX_TIMESTAMP_IM and RX_TIMESTAMP_IS bit are both set.

Bit 0 **TX_TIMESTAMP_IE**: TX timestamp interrupt enable mask
The interrupt is activated when TX_TIMESTAMP_IM and TX_TIMESTAMP_IS bit are both set.

ETHSW FES interrupt status register (ETHSW_FES_INT_STATUSR)

Address offset: 0x800038

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CONGESTED_IS	RX_ERROR_IS	RX_TIMESTAMP_IS	TX_TIMESTAMP_IS
												rc_w0	rc_w0	rc_w0	rc_w0

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **CONGESTED_IS**: Congested interrupt status
Indicates that at least one frame was dropped due to congestion. The number of frames dropped can be read from registers Q_DROP, EARLY_DROP and FULL_DROP.
This bit is updated independently from the CONGESTED_IS interrupt mask bit. The interrupt is activated when CONGESTED_IS and CONGESTED_IM bits are both set.

Bit 2 **RX_ERROR_IS**: RX error interrupt status

Indicates that an RX error happened and that the corresponding counter has been incremented. The number of erroneous frames can be read from counter registers RX_UNDERSIZE, RX_FRAGMENTS, RX_OVERSIZE, RX_JABBER, RX_ERR and RX_CRC. RX_WRONGLAN does not cause an interrupt.

This bit is updated independently from the RX_ERROR_IS interrupt mask bit.

The interrupt is activated when RX_ERROR_IS and RX_ERROR_IM bits are both set.

Bit 1 **RX_TIMESTAMP_IS**: RX timestamp interrupt status

Indicates that information of a PTP event message has been stored into RX timestamp registers.The interrupt is not activated if there is no room for storing the RX timestamp of the PTP event frame.

This bit is updated independently from the RX_TIMESTAMP_IS interrupt mask bit. The interrupt is activated when RX_TIMESTAMP_IS and RX_TIMESTAMP_IM bits are both set.

Bit 0 **TX_TIMESTAMP_IS**: TX timestamp interrupt status

Indicates that information of a PTP event message has been stored into TX timestamp registers. The interrupt is not activated if there is no room for storing the TX timestamp of the PTP event frame.

This bit is updated independently from the TX_TIMESTAMP_IE interrupt mask bit. The interrupt is activated when TX_TIMESTAMP_IS and TX_TIMESTAMP_IM bits are both set.

ETHSW FES dynamic MAC table read 0 register (ETHSW_FES_MAC_TABLE0R)

Address offset: 0x800200

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRANSFER	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PORT_NUM[3:0]			
rt_w1												r	r	r	r

Bit 15 **TRANSFER**: Transfer

Write 1 to this bit to enable fetching of the next MAC address entry to *ETHSW FES dynamic MAC table read 0 register (ETHSW_FES_MAC_TABLE0R)* to *ETHSW FES dynamic MAC table read 3 register (ETHSW_FES_MAC_TABLE3R)*. Value 0 indicates that the fetch is completed.

The first entry fetched is the first entry in the table. Fetched MAC address value FF:FF:FF:FF:FF:FF indicates that the latest entry fetched was the last entry in the table and that the next entry to be fetched is the first entry in the table.

Bits 14:4 Reserved, must be kept at reset value.

Bits 3:0 **PORT_NUM[3:0]**: Port number

The port where to the address is registered.

ETHSW FES dynamic MAC table read 1 register (ETHSW_FES_MAC_TABLE1R)

Address offset: 0x800202

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OCTET_2[7:0]								OCTET_1[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:8 **OCTET_2[7:0]**: Dynamic MAC Address Table Read: 2nd octet
2nd octet (xx:XX:xx:xx:xx:xx) of the MAC address.
MAC address value FF:FF:FF:FF:FF:FF indicates the end of the table.

Bits 7:0 **OCTET_1[7:0]**: Dynamic MAC Address Table Read: 1st octet
1st octet (XX:xx:xx:xx:xx:xx) of the MAC address.
MAC address value FF:FF:FF:FF:FF:FF indicates the end of the table.

ETHSW FES dynamic MAC table read 2 register (ETHSW_FES_MAC_TABLE2R)

Address offset: 0x800204

Reset value: 0x0000

TRANSFER	RD_WR	COLUMN[1:0]		ROW[11:0]											
rt_w1	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 15 **TRANSFER**: Transfer
Write 1 to this bit to initiate read or write access to Static MAC Address Table.
Value 0 indicates that the access is complete.

Bit 14 **RD_WR**: Read / write
Read or write values between Static MAC Table Entry and registers from *ETHSW FES static MAC address table read/write 0 register (ETHSW_FES_SMAC_TABLE0R)* to *ETHSW FES static MAC address table read/write 7 register (ETHSW_FES_SMAC_TABLE7R)*.
0: Read values from Static MAC Table Entry to registers
1: Write values from registers into Static MAC Table Entry

Bits 13:12 **COLUMN[1:0]**: Column
The number of the column of the Static MAC Table Entry that is read or written

Bits 11:0 **ROW[11:0]**: Row
The number of the row of the Static MAC Table Entry that is read or written.
Trying to access rows that do not exist is not allowed (1024 rows are available).

ETHSW FES static MAC address table configuration register (ETHSW_FES_SMAC_CFGR)

Address offset: 0x800222

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

								rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:6 **ROW_COL3[1:0]**: Row selection setting for column 3
See ROW_COL0[1:0].

Bits 5:4 **ROW_COL2[1:0]**: Row selection setting for column 2
See ROW_COL0[1:0].

Bits 3:2 **ROW_COL1[1:0]**: Row selection setting for column1
See ROW_COL0[1:0].

Bits 1:0 **ROW_COL0[1:0]**: Row selection setting for column 0
00: XOR with VLAN disabled. MATCH_VLAN bit in *ETHSW FES static MAC address table read/write 0 register (ETHSW_FES_SMAC_TABLE0R)* can be enabled or disabled for entries in the column.
01: XOR with VLAN enabled. MATCH_VLAN bit in *ETHSW FES static MAC address table read/write 0 register (ETHSW_FES_SMAC_TABLE0R)* must be enabled for all entries in the column.
Others: Reserved, must not be used

ETHSW FES static MAC address table read/write 0 register (ETHSW_FES_SMAC_TABLE0R)

Address offset: 0x800230

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ENTRY_USAGE	Res.	POLICER_PRIO	MATCH_VLAN	MOD_PRIO	FRAME_PRIO[2:0]			STREAM_MATCH	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw		rw	rw	rw	rw	rw	rw	rw							

Bit 15 **ENTRY_USAGE**: Entry usage

0: The entry is not used for altering Forward PortMask, Priority and Policer number for frames.

1: The entry is used for altering Forward PortMask of frames. It can also be used for altering Priority and Policer number.

Bit 14 Reserved, must be kept at reset value.

Bit 13 **POLICER_PRIO**: Policer priority

0: Normal Policer priority

1: Low Policer priority, frames with lower policer priority use only the upper half of the token buckets

If POL_CFG bit = 0 in *ETHSW FES general control register (ETHSW_FES_GEN_CTRLR)* (Policing is not based on SMAC Table), this bit must also be set to 0.

Bit 12 **MATCH_VLAN**: Match VLAN

0: Do not care about the VLAN of the frame. The MAC Table entry is valid for all the VLANs. This can be used only for entries that are in a column for which "XOR with VLAN" is disabled (see *ETHSW FES static MAC address table configuration register (ETHSW_FES_SMAC_CFGR)*).

1: Check that the value in VLAN field (*ETHSW FES static MAC address table read/write 7 register (ETHSW_FES_SMAC_TABLE7R)*) matches to VLAN of the frame. The MAC Table entry is valid for one single VLAN. This can be used independently from the "XOR with VLAN" setting for the column (see *ETHSW FES static MAC address table configuration register (ETHSW_FES_SMAC_CFGR)*).

Bit 11 **MOD_PRIO**: Modify Priority

0: Do not change frame priority

1: Change the priority of the frame to the value in bits (10:8) of this register

Bits 10:8 **FRAME_PRIO[2:0]**: Frame Priority

New priority for frames with destination address match.

Bit 7 **STREAM_MATCH**: Stream_number source/destination match

0: stream_number in this entry is used only for frames whose source address matches to the address in registers from *ETHSW FES static MAC address table read/write 1 register (ETHSW_FES_SMAC_TABLE1R)* to *ETHSW FES static MAC address table read/write 3 register (ETHSW_FES_SMAC_TABLE3R)*.

1: stream_number in this entry is used only for frames whose destination address matches to the address in registers from *ETHSW FES static MAC address table read/write 1 register (ETHSW_FES_SMAC_TABLE1R)* to *ETHSW FES static MAC address table read/write 3 register (ETHSW_FES_SMAC_TABLE3R)*.

Bits 6:0 Reserved, must be kept at reset value.

ETHSW FES static MAC address table read/write 1 register (ETHSW_FES_SMAC_TABLE1R)

Address offset: 0x800232

Reset value: 0x0000

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:0 **POLICER_PORTS[2:0]**: Policed Ports
Bit 0 corresponds to input port 0, bit 1 to port 1, bit 2 to port 2.
0: Keep the default policer for this input port
1: Change policer mapping (to Policer Number in *ETHSW FES static MAC address table read/write 6 register (ETHSW_FES_SMAC_TABLE6R)*) for this input port.
If POL_CFG bit = 0 in *ETHSW FES general control register (ETHSW_FES_GEN_CTRLR)* (Policing is not based on SMAC Table), this bit must also be set to 0.

ETHSW FES static MAC address table read/write 6 register (ETHSW_FES_SMAC_TABLE6R)

Address offset: 0x80023C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	POLICER_NUM[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **POLICER_NUM[11:0]**: Policer Number
The number of the policer to which the matching frame is mapped. The policer mapping is not changed if Policed Port bit is set to 0 for the input port (in *ETHSW FES static MAC address table read/write 5 register (ETHSW_FES_SMAC_TABLE5R)*).
If POL_CFG bit = 0 in *ETHSW FES general control register (ETHSW_FES_GEN_CTRLR)* (Policing is not based on SMAC Table), this bit must also be set to 0.

ETHSW FES static MAC address table read/write 7 register (ETHSW_FES_SMAC_TABLE7R)

Address offset: 0x80023E

Reset value: 0x0000

rw	rw	rw	rw					rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:14 **AGING_SCALE[1:0]**: Aging rate scale
Rate scale for aging functionality of sequence recovery algorithm.

Bits 13:12 **AGING_BRATE[1:0]**: Aging basic rate
Basic rate for aging functionality of sequence recovery algorithm.

Bits 11:8 Reserved, must be kept at reset value.

Bit 7 **ACC_NVAL_SEQ**: Accept non valid sequence
0: Drop frames that have no valid sequence number
1: Accept frames that have no valid sequence number

Bit 6 **IND_REC**: Individual recovery
0: Frames discarded as duplicates do not cause the aging timer to be reset.
1: Frames discarded as duplicates cause the aging timer to be reset.

Bit 5 **ALGORITHM**: Algorithm
Sequence recovery algorithm used.
0: Vector Recovery Algorithm
1: Match Recovery Algorithm

Bits 4:0 **HIST_LENGTH[4:0]**: History Length - 1
The length of the sequence history of the sequence recovery algorithm is the value in these bits plus 1.

ETHSW FES sequence generation command register (ETHSW_FES_SEQ_GEN_CMDR)

Address offset: 0x800380

Reset value: 0x0000

Bit 13 **RESET**: Reset

0: Do nothing

1: Reset sequence number. Makes generated sequence to restart from zero.

Bits 12:10 Reserved, must be kept at reset value.

Bits 9:0 **ENTITY[9:0]**: Entity

The number of the Sequence Generation Entity that is controlled.

ETHSW FES stream table R/W command register (ETHSW_FES_STREAM_CMDR)

Address offset: 0x800400

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRANSFER	RD_WR	Res.	Res.	Res.	Res.	ROW[9:0]									
rt_w1	rw					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 15 **TRANSFER**: Transfer

Write 1 to this bit to initiate read or write access to Stream Table. Value 0 indicates that the access is completed.

Bit 14 **RD_WR**: Read / write

0: Read values from Stream Table row to registers from *ETHSW FES stream table read/write 0 register (ETHSW_FES_STREAM_TABLE0R)* to *ETHSW FES stream table read/write 3 register (ETHSW_FES_STREAM_TABLE3R)*.

1: Write values from registers *ETHSW FES stream table read/write 0 register (ETHSW_FES_STREAM_TABLE0R)* to *ETHSW FES stream table read/write 3 register (ETHSW_FES_STREAM_TABLE3R)* into Stream Table row.

Bits 13:10 Reserved, must be kept at reset value.

Bits 9:0 **ROW[9:0]**: Row

The number of the row of the Stream Table that is read or written. It is not allowed to try to access rows that do not exist (128 streams available)

ETHSW FES stream table read/write 0 register (ETHSW_FES_STREAM_TABLE0R)

Address offset: 0x800410

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRANSFER	RD_WR	Res.	Res.	POLICER_NUM[11:0]											
rt_w1	rw			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 15 **TRANSFER**: Transfer

Write 1 to this bit to enable read or write to policer internal registers. FES clears this bit when done.

Bit 14 **RD_WR**: Read / write

0: Read values from policer internal registers to registers *ETHSW FES policer read/write 0 register (ETHSW_FES_POLICER0R)* to *ETHSW FES policer read/write 4 register (ETHSW_FES_POLICER4R)*.

1: Write values from registers *ETHSW FES policer read/write 0 register (ETHSW_FES_POLICER0R)* to *ETHSW FES policer read/write 4 register (ETHSW_FES_POLICER4R)* to policer internal registers.

Bits 13:12 Reserved, must be kept at reset value.

Bits 11:0 **POLICER_NUM[11:0]**: Policer Number

The number of the policer whose registers are read or written when Transfer bit is set. Do not configure a policer that does not exist (128 policers are available).

ETHSW FES policer read/write 0 register (ETHSW_FES_POLICER0R)

Address offset: 0x800610

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LIMIT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **LIMIT[15:0]**: Limit

The maximum number of Tokens in the Bucket of Meter 0 (the meter for “green”).

ETHSW FES policer read/write 1 register (ETHSW_FES_POLICER1R)

Address offset: 0x800612

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	RATE_SCALE[2:0]			BASIC_RATE[7:0]							
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:11 Reserved, must be kept at reset value.

Bits 10:8 **RATE_SCALE[2:0]**: Rate Scale of Meter 0 (the meter for “green”)

Values 0 and 7 are reserved.

Bits 7:0 **BASIC_RATE[7:0]**: Basic Rate of Meter 0 (the meter for “green”)

Policed rate (bytes/s) = Basic_Rate * clk / 16^{Rate_Scale}.

ETHSW FES policer read/write 2 register (ETHSW_FES_POLICER2R)

Address offset: 0x800614

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LIMIT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **LIMIT[15:0]**: Limit

The maximum number of Tokens in the Bucket of Meter 1 (the meter for “yellow” / “red”).

ETHSW FES policer read/write 3 register (ETHSW_FES_POLICER3R)

Address offset: 0x800616

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	RATE_SCALE[2:0]			BASIC_RATE[7:0]							
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:11 Reserved, must be kept at reset value.

Bits 10:8 **RATE_SCALE[2:0]**: Rate Scale of Meter 1 (the meter for “yellow” / “red”)

Values 0 and 7 are reserved.

Bits 7:0 **BASIC_RATE[7:0]**: Basic Rate of Meter 1 (the meter for “yellow” / “red”)

Policed rate (bytes/s) = Basic_Rate * clk / 16^{Rate_Scale}.

ETHSW FES policer read/write 4 register (ETHSW_FES_POLICER4R)

Address offset: 0x800618

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DROP_YELLOW	MARK_ALL_RED	MARK_ALL_RED_EN	COUPLING_FLAG	COLOR_BLIND
											rw	rw	rw	rw	rw

Bits 15:5 Reserved, must be kept at reset value.

Bit 4 **DROP_YELLOW**: Drop on Yellow

0: Disabled. “yellow” frames are marked as Drop Eligible, but they are not dropped.

1: Enabled. “yellow” frames are dropped (if not saved by the management trailer).

Bit 3 **MARK_ALL_RED**: Mark all Frames Red

The peripheral always changes the value of this bit to 1 when a frame is marked “red”. Setting the MARK_ALL_RED_EN bit to 1 causes all the following frames to be marked “red” until either one of these bits is cleared by the user.

Bit 2 **MARK_ALL_RED_EN**: Mark all Frames Red Enable

0: Disabled.

1: Enabled.

If both this bit and the MARK_ALL_RED bit are set to 1, all the frames are marked “red”.

Bit 1 **COUPLING_FLAG**: Coupling Flag

0: No coupling between Meter 0 and Meter 1.

1: Tokens overflowing from the bucket of Meter 0 (“green”) are given to Meter 1 (“yellow” / “red”).

Bit 0 **COLOR_BLIND**: Color Blind

0: Color Aware. Drop Eligible frames cannot become “green”. They are either “yellow” or “red”. Drop Eligible frames stay Drop Eligible.

1: Color Blind. Frames that are Drop Eligible are treated the same way as not Drop Eligible frames. They can become also “green” and therefore not Drop Eligible.

ETHSW FES timestamp command register (ETHSW_FES_TS_CMDR)

Address offset: 0x802000

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	TRANSFER	ERROR	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TX_RX	PORT_NUM[3:0]			
	rt_w1	r									rw	rw	rw	rw	rw

Bit 15 Reserved, must be kept at reset value.

Bit 14 **TRANSFER**: Transfer

Write 1 to this bit to enable fetching the next stored timestamp information to registers:

– *ETHSW FES timestamp time low register (ETHSW_FES_TS_TIME_LOR)*

– *ETHSW FES timestamp time high register (ETHSW_FES_TS_TIME_HIR)*

– *ETHSW FES timestamp PTP message 0 register (ETHSW_FES_TS_MSG_0R)*

– *ETHSW FES timestamp PTP message 1 register (ETHSW_FES_TS_MSG_1R)*.

Value 0 indicates that the fetch is completed.

Bit 13 **ERROR**: Error

0: Previous transfer command, initiated by writing 1 to the Transfer bit, was successful.

1: Previous transfer command failed because there was no stored timestamp information to fetch.

Bits 12:5 Reserved, must be kept at reset value.

Bit 4 **TX_RX**: TX / RX

0: The next stored TX timestamp of the port is fetched when writing 1 to the transfer bit.

1: The next stored RX timestamp of the port is fetched when writing 1 to the transfer bit.

Bits 3:0 **PORT_NUM[3:0]**: Port Number

The number of the port whose next stored timestamp is fetched when 1 is written to the Transfer bit. Port 0 is not allowed (timestamping not enabled).

ETHSW FES timestamp time low register (ETHSW_FES_TS_TIME_LOR)

Address offset: 0x802008

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NANOSECONDS[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **NANOSECONDS[15:0]**: Nanoseconds, bits (15:0)

Nanoseconds of the timestamp of the frame (lowest bits).

ETHSW FES timestamp time high register (ETHSW_FES_TS_TIME_HIR)

Address offset: 0x80200A

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SECONDS[1:0]		NANOSECONDS[29:16]													
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:14 **SECONDS[1:0]**: Seconds, bits (0:1)

Seconds of the timestamp of the frame (lowest two bits).

Bits 13:0 **NANOSECONDS[29:16]**: Nanoseconds, bits (29:16)

Nanoseconds of the timestamp of the frame (highest bits). The nanoseconds value can, in some cases, be more than 999,999,999. The software using the timestamp can handle the situation by subtracting 1,000,000,000 from the nanoseconds value and adding 1 to seconds.

ETHSW FES timestamp PTP message 0 register (ETHSW_FES_TS_MSG_0R)

Address offset: 0x80200C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DOMAIN_NUM[7:0]								TRANSP_SPEC[3:0]				MSG_TYPE[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:8 **DOMAIN_NUM[7:0]**: Domain number
The value copied from the field domainNumber (offset = 4 bytes) from the PTP Message header of the frame for which the Timestamp was stored.

Bits 7:4 **TRANSP_SPEC[3:0]**: Transport specific
The value copied from the field transportSpecific (offset = 4 bits) from the PTP Message header of the frame for which the Timestamp was stored.

Bits 3:0 **MSG_TYPE[3:0]**: Message type
The value copied from the field messageType (offset = 0) from the PTP Message header of the frame for which the Timestamp was stored.

ETHSW FES timestamp PTP message 1 register (ETHSW_FES_TS_MSG_1R)

Address offset: 0x80200E

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SEQUENCE_ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **SEQUENCE_ID[15:0]**: Sequence ID
The value copied from the field sequenceID (offset = 30 bytes) from the PTP Message header of the frame for which the TimeStamp was stored.

ETHSW FES timestamp status port vector RX register (ETHSW_FES_TS_RX_STATUSR)

Address offset: 0x802010

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TS_STATUS_IN[1:0]		Res.
													r	r	

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:1 **TS_STATUS_IN[1:0]**: Timestamp status input port vector
Bit 1 corresponds to input port 1, bit 2 corresponds to input port 2.
0: There is no stored timestamp for this input port.
1: There is at least one stored timestamp for this input port.

Bit 0 Reserved, must be kept at reset value.

ETHSW FES timestamp status port vector TX register (ETHSW_FES_TS_TX_STATUSR)

Address offset: 0x802012

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TS_STATUS_OUT[1:0]		Res.
													r	r	

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:1 **TS_STATUS_OUT[1:0]**: Timestamp status output port vector
Bit 1 corresponds to output port 1, bit 2 corresponds to output port 2.
0: There is no stored timestamp for this output port.
1: There is at least one stored timestamp for this output port.

Bit 0 Reserved, must be kept at reset value.

ETHSW FES VLAN command register (ETHSW_FES_VLAN_CMDR)

Address offset: 0x808000

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRSFR_VLAN_FID	TRSFR_VLAN_TAG	TRSFR_VLAN_PORTS	RD_WR	VLAN_ID[11:0]											
rt_w1	rt_w1	rt_w1	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 15 **TRSFR_VLAN_FID**: Transfer VLAN_FID
0: Do not transfer data to/from VLAN_FID register.
1: Transfer data to/from (depending of read/write bit) VLAN_FID register.
This bit self-clears when the transfer is done. When the value of this bit is 1, it is not allowed to write into this register.

Bit 14 **TRSFR_VLAN_TAG**: Transfer VLAN_TAG
0: Do not transfer data to/from VLAN_TAG register.
1: Transfer data to/from (depending of read/write bit) VLAN_TAG register.
This bit self-clears when the transfer is done. When the value of this bit is 1, it is not allowed to write into this register.

Bit 13 **TRSFR_VLAN_PORTS**: Transfer VLAN_PORTS

0: Do not transfer data to/from VLAN_PORTS register.

1: Transfer data to/from (depending of read/write bit) VLAN_PORTS register.

This bit self-clears when the transfer is done. When the value of this bit is 1, it is not allowed to write into this register.

Bit 12 **RD_WR**: Read/Write

0: Read settings. Data are transferred from internal structure to VLAN_PORTS, VLAN_TAG and/or VLAN_FID registers (those that are enabled using bits 13 to 15 of this register):

– *ETHSW FES port VLAN membership register (ETHSW_FES_VLAN_PORTSR)*
– *ETHSW FES port VLAN tagging register (ETHSW_FES_VLAN_TAGR)*
– *ETHSW FES Filtering ID register (ETHSW_FES_VLAN_FIDR)*

1: Write settings. Data are transferred from VLAN_PORTS, VLAN_TAG and/or VLAN_FID registers (those that are enabled using bits 13 to 15 of this register) to internal structure.

Bits 11:0 **VLAN_ID[11:0]**: VLAN_ID

The VLAN ID for which data is copied to/from VLAN_PORTS, VLAN_TAG and/or VLAN_FID registers.

ETHSW FES port VLAN membership register (ETHSW_FES_VLAN_PORTSR)

Address offset: 0x808008

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VLAN_MEMBER[2:0]		
													rw	rw	rw

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:0 **VLAN_MEMBER[2:0]**: VLAN membership

Bit 0 corresponds to port 0, bit 1 corresponds to port 1, bit 2 corresponds to port 2.

0: The port is not a member of this VLAN.

1: The port is a member of this VLAN.

ETHSW FES port VLAN tagging register (ETHSW_FES_VLAN_TAGR)

Address offset: 0x80800A

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VLAN_TAG[2:0]		
													rw	rw	rw

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:0 **VLAN_TAG[2:0]**: VLAN tagging

Bit 0 corresponds to port 0, bit 1 corresponds to port 1, bit 2 corresponds to port 2.

0: Tagging enabled for the port, if enabled in *ETHSW FES port x port VLAN configuration register 1 (ETHSW_FESx_VLAN1R) (x = 0 to 2)*, bit TGD_UTGD.

1: Tagging disabled for the port.

ETHSW FES Filtering ID register (ETHSW_FES_VLAN_FIDR)

Address offset: 0x80800C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ENG_TRAFFIC	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FILTERING_ID[5:0]					
rw										rw	rw	rw	rw	rw	rw

Bit 15 **ENG_TRAFFIC**: Engineered Traffic

0: Engineered traffic disabled, address learning is enabled and the traffic destined to unlearned/unconfigured unicast or multicast/broadcast destinations is sent to all ports (if allowed)

1: Engineered traffic enabled, address learning is disabled and the traffic destined to unconfigured unicast or multicast/broadcast destinations is dropped.

After changing this bit from 0 to 1, it is recommended to clear the Dynamic MAC address table for the FID (*ETHSW FES dynamic MAC table clear FID register (ETHSW_FES_MT_CLEAR_FIDR)*).

Bits 14:6 Reserved, must be kept at reset value.

Bits 5:0 **FILTERING_ID[5:0]**: Filtering ID

0: FID 0

1: FID 1

2: FID 2

...

63: FID 63

ETHSW FES FES_PORT_HIGH generic register (ETHSW_FES_PORT_HIGHR)

Address offset: 0x80E000

Reset value: 0x0002

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FES_PORT_HIGH[3:0]			
												r	r	r	r

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **FES_PORT_HIGH[3:0]**: The value of generic FES_PORT_HIGH

Number of switch ports, given as highest port index. For example value 2 corresponds to a 3-port switch.

ETHSW FES COUNTERS generic register (ETHSW_FES_COUNTERSR)

Address offset: 0x80E002

Reset value: 0x0003

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	COUNTERS[2:0]		
													r	r	r

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:0 **COUNTERS[2:0]**: The value of generic COUNTERS
Bit 0: Basic Counter registers (CNT)
Bit 1: Stream Counter registers (SCNT)
Bit 2: Buffer fill levels (FL_*)

ETHSW FES CT_PORTS generic register (ETHSW_FES_CT_PORTSR)

Address offset: 0x80E004

Reset value: 0x0006

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CT_PORTS[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **CT_PORTS[11:0]**: The value of generic CT_PORTS
Cut-through port enable vector.
Bit index 0 corresponds port 0, Bit index 1 corresponds port 1, and so on.

ETHSW FES TS_PORTS generic register (ETHSW_FES_TS_PORTSR)

Address offset: 0x80E006

Reset value: 0x0006

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	TS_PORTS[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **TS_PORTS[11:0]**: The value of generic TS_PORTS
Timestamper port enable vector.
Bit index 0 corresponds port 0, Bit index 1 corresponds port 1, and so on.
Port 0 has always timestamping capability independent of this setting.

ETHSW FES SMAC_TABLE_ROWS generic register (ETHSW_FES_SMAC_TABLE_ROWSR)

Address offset: 0x80E008

Reset value: 0x000A

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SMAC_TABLE_ROWS[3:0]			
												r	r	r	r

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **SMAC_TABLE_ROWS[3:0]**: The value of generic SMAC_TABLE_ROWS
Static MAC table synthesis generic giving number of rows in table.
7: 128 rows
8: 256 rows
…
12: 4096 rows

ETHSW FES POLICING generic register (ETHSW_FES_POLICINGR)

Address offset: 0x80E00A

Reset value: 0x0003

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	POLICING[1:0]	
														r	r

Bits 15:2 Reserved, must be kept at reset value.

Bits 1:0 **POLICING[1:0]**: The value of generic POLICING
00: No policer function
01: Policer via IPO
10: Policer via SMAC
11: Policing via both IPO/SMAC selectable by software

ETHSW FES POLICERS generic register (ETHSW_FES_POLICERSR)

Address offset: 0x80E00C

Reset value: 0x0007

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	POLICERS[3:0]			
												r	r	r	r

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **POLICERS[3:0]**: The value of generic POLICERS
Value 7 ≥ 128 policers, value 8 ≥ 256 policers, and so on.

ETHSW FES QUEUES generic register (ETHSW_FES_QUEUESR)

Address offset: 0x80E00E

Reset value: 0x0008

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	QUEUES[3:0]			
												r	r	r	r

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **QUEUES[3:0]**: The value of generic QUEUES
Allowed values are 4 and 8.

ETHSW FES BUFFER_SIZE generic register (ETHSW_FES_BUFFER_SIZER)

Address offset: 0x80E010

Reset value: 0x0001

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BUFFER_SIZE
															r

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **BUFFER_SIZE**: The value of generic BUFFER_SIZE
0: Normal
1: Double

ETHSW FES SHAPERS generic register (ETHSW_FES_SHAPERSR)

Address offset: 0x80E012

Reset value: 0x0001

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SHAPERS
															r

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **SHAPERS**: The value of generic SHAPERS
0: Disabled
1: Enabled

ETHSW FES GIGABIT generic register (ETHSW_FES_GIGABITR)

Address offset: 0x80E014

Reset value: 0x0001

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GIGABIT
															r

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **GIGABIT**: The value of generic GIGABIT
0: all ports 10/100 Mbps only
1: all ports 10/100/1000 Mbps

ETHSW FES HSR_PORTS generic register (ETHSW_FES_HSR_PORTSR)

Address offset: 0x80E016

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HSR_PORTS[7:0]							
								r	r	r	r	r	r	r	r

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **HSR_PORTS[7:0]**: The value of generic HSR_PORTS
HSR (High-availability Seamless Redundancy).
Bit index 0 corresponds port 0, Bit index 1 corresponds port 1, and so on.
0: Disabled
1: Enabled

ETHSW FES PRP_PORTS generic register (ETHSW_FES_PRP_PORTSR)

Address offset: 0x80E018

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRP_PORTS[7:0]							
								r	r	r	r	r	r	r	r

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **PRP_PORTS[7:0]**: The value of generic PRP_PORTS
PRP (Parallel Redundancy Protocol).
Bit index 0 corresponds port 0, Bit index 1 corresponds port 1, and so on.
0: Disabled
1: Enabled

ETHSW FES SCHEDULED_PORTS generic register (ETHSW_FES_SCHEDULED_PORTSR)

Address offset: 0x80E01A

Reset value: 0x0007

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **SCHEDULED_PORTS[11:0]**: The value of generic SCHEDULED_PORTS
Bit index 0 corresponds port 0, Bit index 1 corresponds port 1, and so on.
0: Disabled
1: Enabled

ETHSW FES PREEMPTABLE_PORT generic register (ETHSW_PREEMPTABLE_PORTR)

Address offset: 0x80E01C

Reset value: 0x0006

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	PREEMPTABLE_PORT[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **PREEMPTABLE_PORT[11:0]**: The value of generic PREEMPTABLE_PORT
Bit index 0 corresponds port 0, Bit index 1 corresponds port 1, and so on.
0: Disabled
1: Enabled

ETHSW FES MACSEC generic register (ETHSW_FES_MACSECR)

Address offset: 0x80E01E

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	MACSEC[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **MACSEC[11:0]**: The value of generic MACSEC
Bit index 0 corresponds port 0, Bit index 1 corresponds port 1, and so on.
0: Disabled
1: Enabled

ETHSW FES MACSEC_CIPHER generic register (ETHSW_FES_MACSEC_CIPHERR)

Address offset: 0x80E020

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MACSEC_CIPHER[2:0]		
													r	r	r

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:0 **MACSEC_CIPHER[2:0]**: The value of generic MACSEC_CIPHER
1: AES-GCM-128. Effective when MACSEC generic has non-zero value.

ETHSW FES MGMT_PORTS generic register (ETHSW_FES_MGMT_PORTSR)

Address offset: 0x80E022

Reset value: 0x0001

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	MGMT_PORTS[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **MGMT_PORTS[11:0]**: The value of generic MGMT_PORTS
Bit index 0 corresponds port 0, Bit index 1 corresponds port 1, and so on.
0: Disabled
1: Enabled
Port 0 (Host) is the management port.

ETHSW FES FRER_PORTS generic register (ETHSW_FES_FRER_PORTSR)

Address offset: 0x80E024

Reset value: 0x0007

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FRER_PORTS[7:0]							
								r	r	r	r	r	r	r	r

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **FRER_PORTS[7:0]**: The value of generic FRER_PORTS
Bit index 0 corresponds port 0, Bit index 1 corresponds port 1, and so on.
0: Disabled
1: Enabled

ETHSW FES FRER_ENTRIES generic register (ETHSW_FES_FRER_ENTRIESR)

Address offset: 0x80E026

Reset value: 0x000A

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FRER_ENTRIES[3:0]			
												r	r	r	r

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **FRER_ENTRIES[3:0]**: The value of generic FRER_ENTRIES
Number of entries supported by FRER sequence generation and recovery functions.
Allowed values are 7 to 10.
7: 128 entries
8: 256 entries
...
10: 1024 entries

ETHSW FES FRER_STREAMS generic register (ETHSW_FES_FRER_STREAMSR)

Address offset: 0x80E028

Reset value: 0x0007

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FRER_STREAMS[3:0]			
												r	r	r	r

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **FRER_STREAMS[3:0]**: The value of generic FRER_STREAMS
Number of streams supported by FRER functionality.
Allowed values are 7 to 10.
7: 128 streams
8: 256 streams
...
10: 1024 streams

ETHSW FES FIDS generic register (ETHSW_FES_FIDSR)

Address offset: 0x80E02A

Reset value: 0x0006

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FIDS[5:0]					
										r	r	r	r	r	r

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:0 **FIDS[5:0]**: The value of generic FIDS
Number of filtering IDs
Allowed values are 0, 2 and 6.
0: Feature does not exist
2: 4 FIDs
6: 64 FIDs

ETHSW FES DMA_PORTS generic register (ETHSW_FES_DMA_PORTSR)

Address offset: 0x80E02C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	DMA_PORTS[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **DMA_PORTS[11:0]**: The value of generic DMA_PORTS
Bit index 0 corresponds port 0, Bit index 1 corresponds port 1, and so on.
0: Disabled
1: Enabled

ETHSW FES DMA_TX_DESC_RING generic register (ETHSW_FES_DMA_TX_DESC_RINGR)

Address offset: 0x80E02E

Reset value: 0x0001

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DMA_TX_DESC_RING[3:0]			
												r	r	r	r

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **DMA_TX_DESC_RING[3:0]**: The value of generic DMA_TX_DESC_RING
Number of DMA transmit descriptor rings.

ETHSW FES DMA_RX_DESC_RING generic register (ETHSW_FES_DMA_RX_DESC_RINGR)

Address offset: 0x80E030

Reset value: 0x0001

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DMA_RX_DESC_RING[3:0]			
												r	r	r	r

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **DMA_RX_DESC_RING[3:0]**: The value of generic DMA_RX_DESC_RING
Number of DMA receive descriptor rings.

ETHSW FES PSFP generic register (ETHSW_FES_PSFPR)

Address offset: 0x80E032

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PSFP
															r

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **PSFP**: The value of generic PSFP
Per stream filtering and policing.

ETHSW FES PSFP_STREAMS generic register (ETHSW_FES_PSFP_STREAMSR)

Address offset: 0x80E034

Reset value: 0x0007

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PSFP_STREAMS[3:0]			
												r	r	r	r

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **PSFP_STREAMS[3:0]**: The value of generic PSFP_STREAMS
Number of streams supported by PSFP functionality.
Presented in powers of two:
7: 128
8: 256
9: 512
10: 1024 streams

ETHSW FES CFG_CLK_FREQ register (ETHSW_FES_CFG_CLK_FREQR)

Address offset: 0x80E100

Reset value: 0x00C8

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CFG_CLK_FREQ[7:0]							
								r	r	r	r	r	r	r	r

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **CFG_CLK_FREQ[7:0]**: The value of generic CFG_CLK_FREQ
The current state of signal cfg_clk_freq(7:0).

ETHSW FES DEBUG_IN register (ETHSW_FES_DEBUG_INR)

Address offset: 0x80E110

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DEBUG_IN
															r

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **DEBUG_IN**: The value of generic DEBUG_IN
The current state of signal debug_in.

ETHSW FES hold advance 10M register (ETHSW_FES_H_ADV_10R)

Address offset: 0x80E200

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HOLD_ADV_MII[7:0]								HOLD_ADV_CLK[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:8 **HOLD_ADV_MII[7:0]**: holdadvance_mii_cycles value
Hold advance in mii cycles, 10 Mbit/s line speed.

Bits 7:0 **HOLD_ADV_CLK[7:0]**: holdadvance_clk_cycles value
Hold advance in clock cycles, 10 Mbit/s line speed.

The maximum possible time from rising edge of the hold signal to the point where the last nibble of the last byte of any ongoing or queued preemptable frame is present in the MII interface.
The formula for Hold Advance is:
hold_advance_ns = clk_cycle_ns * holdadvance_clk_cycles + mii_cycle_ns * (2 * (128 + addfragsize * 64) + holdadvance_mii_cycles)
where:
hold_advance_ns = Hold Advance in nanoseconds
clk_cycle_ns = length of the clk cycle in nanoseconds
mii_cycle_ns = length of the tx_clk cycle in nanoseconds (400 ns)
addfragsize = the configured value (from 0 to 3) for AddFragSize in *ETHSW FES port x TX preemptable traffic selection register 1 (ETHSW_FESx_TX_PREE1R) (x = 1 to 2)*
holdadvance_clk_cycles = the value configured in this register, bits (7:0)
holdadvance_mii_cycles = the value configured in this register, bits (15:8)

ETHSW FES hold advance 100M register (ETHSW_FES_H_ADV_100R)

Address offset: 0x80E202

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HOLD_ADV_MII[7:0]								HOLD_ADV_CLK[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:8 **HOLD_ADV_MII[7:0]**: holdadvance_mii_cycles value
Hold advance in mii cycles, 100 Mbit/s line speed.

Bits 7:0 **HOLD_ADV_CLK[7:0]**: holdadvance_clk_cycles value
Hold advance in clock cycles, 100 Mbit/s line speed.

The maximum possible time from rising edge of the hold signal to the point where the last nibble of the last byte of any ongoing or queued preemptable frame is present in the MII interface.
The formula for Hold Advance is:
hold_advance_ns = clk_cycle_ns * holdadvance_clk_cycles + mii_cycle_ns * (2 * (128 + addfragsize * 64) + holdadvance_mii_cycles)
where:
hold_advance_ns = Hold Advance in nanoseconds
clk_cycle_ns = length of the clk cycle in nanoseconds
mii_cycle_ns = length of the tx_clk cycle in nanoseconds (40 ns)
addfragsize = the configured value (from 0 to 3) for AddFragSize in *ETHSW FES port x TX preemptable traffic selection register 1 (ETHSW_FESx_TX_PREE1R) (x = 1 to 2)*
holdadvance_clk_cycles = the value configured in this register, bits (7:0)
holdadvance_mii_cycles = the value configured in this register, bits (15:8)

ETHSW FES hold advance 1000M register (ETHSW_FES_H_ADV_1000R)

Address offset: 0x80E204

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
HOLD_ADV_GMII[7:0]								HOLD_ADV_CLK[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:8 **HOLD_ADV_GMII[7:0]**: holdadvance_gmii_cycles value
Hold advance in gmii cycles, 1000 Mbit/s line speed.

Bits 7:0 **HOLD_ADV_CLK[7:0]**: holdadvance_clk_cycles value
Hold advance in clock cycles, 1000 Mbit/s line speed

The maximum possible time from rising edge of the hold signal to the point where the last byte of any ongoing or queued preemptable frame is present in the GMII interface.
The formula for Hold Advance is:
hold_advance_ns = clk_cycle_ns * holdadvance_clk_cycles + gmii_cycle_ns * (2 * (128 + addfragsize * 64) + holdadvance_gmii_cycles)
where:
hold_advance_ns = Hold Advance in nanoseconds
clk_cycle_ns = length of the clk cycle in nanoseconds
gmii_cycle_ns = length of the tx_clk cycle in nanoseconds (8 ns)
addfragsize = the configured value (from 0 to 3) for AddFragSize in *ETHSW FES port x TX preemptable traffic selection register 1 (ETHSW_FESx_TX_PREE1R) (x = 1 to 2)*
holdadvance_clk_cycles = the value configured in this register, bits (7:0)
holdadvance_gmii_cycles = the value configured in this register, bits (15:8)

ETHSW FES release advance 10M register (ETHSW_FES_R_ADV_10R)

Address offset: 0x80E208

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Maximum Input to Gate delay in mii cycles, 10 Mbit/s line speed.

Bits 7:0 **I_TO_G_MAX_CLK[7:0]**: inputtogate_clk_cycles value
Maximum Input to Gate delay in clock cycles, 10 Mbit/s line speed

The maximum possible time it takes for a frame to travel from input to gate. The time is measured from the point when the frame timestamp point is in the MII interface to the earliest point where gate_state signal may affect the frame.
The formula for input to gate maximum delay is:
inputtogate_ns = clk_cycle_ns * inputtogate_clk_cycles + mii_cycle_ns * (2 * framesize_bytes + inputtogate_mii_cycles)
where:
inputtogate_ns = Input to Gate delay in nanoseconds
clk_cycle_ns = length of the clk cycle in nanoseconds
mii_cycle_ns = length of the rx_clk cycle in nanoseconds (400 ns)
framesize_bytes = the length of the frame in bytes, not including preamble, not including SFD/SMD
inputtogate_clk_cycles = the value configured in this register, bits (7:0)
inputtogate_mii_cycles = the value configured in this register, bits (15:8)

ETHSW FES maximum input to gate delay 100M register (ETHSW_FES_I_TO_G_MAX_100R)

Address offset: 0x80E21A

Bits 15:8 **G_TO_O_MAX_GMII[7:0]**: gatetooutput_gmii_cycles value
Maximum Input to Gate delay in gmii cycles, 1000 Mbit/s line speed.

Bits 7:0 **G_TO_O_MAX_CLK[7:0]**: gatetooutput_clk_cycles value
Maximum Gate to Output delay, 1000 Mbit/s line speed

The maximum possible time it takes for a frame to travel from gate to output, when there is no other frame blocking the transmission. The time is measured from the rising edge of gate_state signal to the point when the frame timestamp point (*Figure 1134*) is in the MII interface. The formula is the same as for the minimum presented in *ETHSW FES minimum gate to output delay 1000M register (ETHSW_FES_G_TO_O_MIN_1000R)* description.

ETHSW FES capture status 0 register (ETHSW_FES_CAPT0R)

Address offset: 0x80F000

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CAPTURE_PPPS1	CAPTURE_PPPS0	Res.	Res.	Res.	CAPTURE_PE
										r	r				r

Bits 15:6 Reserved, must be kept at reset value.

Bit 5 **CAPTURE_PPPS1**: Capture PPPS1

Value 1 in this bit indicates ongoing capture for per-port per-stream counters for the port and stream that are configured in *ETHSW FES capture control 3 register (ETHSW_FES_CAPT3R)*.

When the capturing is finished, the counter values are written into the registers:

– *ETHSW FES vector recovery out of order frames low register (ETHSW_FES_SEQ_REC_OOO2_LR)*
– *ETHSW FES vector recovery out of order frames high register (ETHSW_FES_SEQ_REC_OOO2_HR)*
– *ETHSW FES vector recovery rogue frames low register (ETHSW_FES_VECT_ROG_LR)*
– *ETHSW FES vector recovery rogue frames high register (ETHSW_FES_VECT_ROG_HR)*
– *ETHSW FES sequence recovery tagless frames low register (ETHSW_FES_SEQ_REC_TAGLESS_LR)*
– *ETHSW FES sequence recovery tagless frames high register (ETHSW_FES_SEQ_REC_TAGLESS_HR)*
– *ETHSW FES sequence recovery frames seen before low register (ETHSW_FES_SEQ_REC_SB_LR)*
– *ETHSW FES sequence recovery frames seen before high register (ETHSW_FES_SEQ_REC_SB_HR)*.

FES clears this bit when the captured values can be read from the registers.

Bit 4 **CAPTURE_PPPS0**: Capture PPPS0

Value 1 in this bit indicates ongoing capture for per-port per-stream counters for the port and stream that are configured in CAPT2 register. When the capturing is finished, the counter values are written into the registers:

– *ETHSW FES input frames low register (ETHSW_FES_FRAMES_IN_LR)*
– *ETHSW FES input frames high register (ETHSW_FES_FRAMES_IN_HR)*
– *ETHSW FES output frames low register (ETHSW_FES_FRAMES_OUT_LR)*
– *ETHSW FES output frames high register (ETHSW_FES_FRAMES_OUT_HR)*.

FES clears this bit when the captured values can be read from the registers.

The counters do not saturate to their maximum values, they wrap around and start from zero again. The counters are not reset when captured.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **CAPTURE_PE**: Capture PE

Value 1 in this bit indicates ongoing capture for the per-entity counters for the sequence recovery function entity whose number is configured in CAPT1 register.

When the capturing is finished, the counter values are written into the registers:

– *ETHSW FES sequence recovery timeouts low register (ETHSW_FES_SEQ_REC_TOUT_LR)*
– *ETHSW FES sequence recovery timeouts high register (ETHSW_FES_SEQ_REC_TOUT_HR)*
– *ETHSW FES vector recovery jump ahead low register (ETHSW_FES_VECT_JUMP_LR)*
– *ETHSW FES vector recovery jump ahead high register (ETHSW_FES_VECT_JUMP_HR)*
– *ETHSW FES vector recovery out of order frames low register (ETHSW_FES_SEQ_REC_OOO_LR)*
– *ETHSW FES vector recovery out of order frames high register (ETHSW_FES_SEQ_REC_OOO_HR)*.

FES clears this bit when the captured values can be read from the registers.

The counters do not saturate to their maximum values, they wrap around and start from zero again. The counters are not reset when captured.

ETHSW FES capture control 1 register (ETHSW_FES_CAPT1R)

Address offset: 0x80F002

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	ENTITY[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **ENTITY[11:0]**: Entity

The number of the sequence recovery function entity whose counters are to be captured. Per-entity counter capture control register controls for which sequence recovery function entity the per-entity counters are captured and written to registers:

- *ETHSW FES sequence recovery timeouts low register (ETHSW_FES_SEQ_REC_TOUT_LR)*
- *ETHSW FES sequence recovery timeouts high register (ETHSW_FES_SEQ_REC_TOUT_HR)*
- *ETHSW FES vector recovery jump ahead low register (ETHSW_FES_VECT_JUMP_LR)*
- *ETHSW FES vector recovery jump ahead high register (ETHSW_FES_VECT_JUMP_HR)*
- *ETHSW FES vector recovery out of order frames low register (ETHSW_FES_SEQ_REC_OOO_LR)*
- *ETHSW FES vector recovery out of order frames high register (ETHSW_FES_SEQ_REC_OOO_HR).*

Writing to his register triggers the capture.

ETHSW FES capture control 2 register (ETHSW_FES_CAPT2R)

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **COUNTER[31:16]**: Counter value, bits (31:16)

Number of frames that were out of order (most significant part). The port is the output port. Frames forwarded to multiple output ports increase the counter for every output port. Frames not identified to belong to any stream are not counted at all.

ETHSW FES vector recovery rogue frames low register (ETHSW_FES_VECT_ROG_LR)

Address offset: 0x80F30C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
COUNTER[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **COUNTER[15:0]**: Counter value, bits (15:0)

Number of frames that were discarded because their sequence number was too far from the last accepted sequence number (least significant part). For each discarded frame, the counter is incremented for every port where to the frame would have been forwarded, if it was not discarded by the recovery algorithm. Frames not identified to belong to any stream are not counted at all.

ETHSW FES vector recovery rogue frames high register (ETHSW_FES_VECT_ROG_HR)

Address offset: 0x80F30E

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
COUNTER[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **COUNTER[31:16]**: Counter value, bits (31:16)

Number of frames that were discarded because their sequence number was too far from the last accepted sequence number (most significant part). For each discarded frame, the counter is incremented for every port where to the frame would have been forwarded, if it was not discarded by the recovery algorithm. Frames not identified to belong to any stream are not counted at all.

ETHSW FES sequence recovery tagless frames low register (ETHSW_FES_SEQ_REC_TAGLESS_LR)

Address offset: 0x80F310

Reset value: 0x0000

COUNTER[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **COUNTER[15:0]**: Counter value, bits (15:0)

Number of frames that had no valid sequence number (Sequence_number_valid = FALSE), least significant part. The port is the output port. If Accept_no_seq is true, the counter is incremented for every port where to the frame is forwarded. If Accept_no_seq is false, the counter is incremented for every port where to the frame would have been forwarded if Accept_no_seq was true (if the frame was not discarded by the recovery algorithm). Frames not identified to belong to any stream are not counted at all.

ETHSW FES sequence recovery tagless frames high register (ETHSW_FES_SEQ_REC_TAGLESS_HR)

Address offset: 0x80F312

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
COUNTER[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **COUNTER[31:16]**: Counter value, bits (31:16)

Number of frames that had no valid sequence number (Sequence_number_valid = FALSE), most significant part. The port is the output port. If Accept_no_seq is true, the counter is incremented for every port where to the frame is forwarded. If Accept_no_seq is false, the counter is incremented for every port where to the frame would have been forwarded if Accept_no_seq was true (if the frame was not discarded by the recovery algorithm). Frames not identified to belong to any stream are not counted at all.

ETHSW FES sequence recovery frames seen before low register (ETHSW_FES_SEQ_REC_SB_LR)

Address offset: 0x80F314

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
COUNTER[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **COUNTER[15:0]**: Counter value, bits (15:0)

Number of frames that were discarded because their sequence number was found to be already received (least significant part). For each discarded frame, the counter is incremented for every port where to the frame would have been forwarded, if it was not discarded by the recovery algorithm. Frames not identified to belong to any stream are not counted at all.

ETHSW FES sequence recovery frames seen before high register (ETHSW_FES_SEQ_REC_SB_HR)

Address offset: 0x80F316

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
COUNTER[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 15:0 **COUNTER[31:16]**: Counter value, bits (31:16)

Number of frames that were discarded because their sequence number was found to be already received (most significant part). For each discarded frame, the counter is incremented for every port where to the frame would have been forwarded, if it was not discarded by the recovery algorithm. Frames not identified to belong to any stream are not counted at all.

93.5.8 ETHSW EIA registers

ETHSW EIA port x RGMII adapter ID register (ETHSW_EIA_RGMII_Px_IDR) (x = 0 to 2)

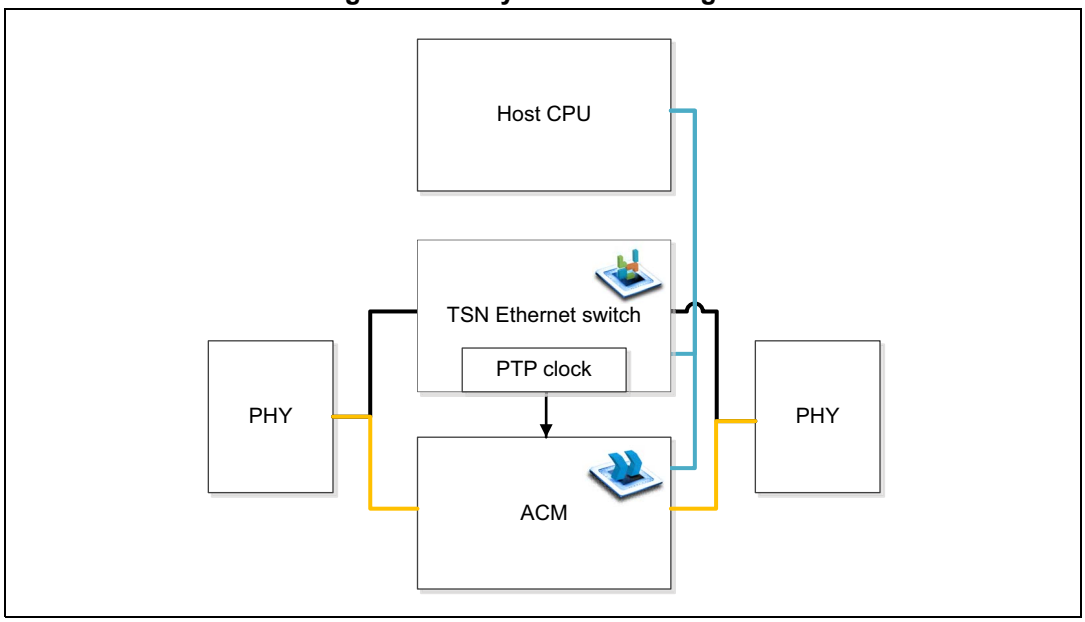
94 Ethernet switch acceleration module (ETHSW_ACM)



This section applies to STM32MP25xx devices only.

94.1 Introduction

Copyright TTTech Industrial Automation AG, 2021.

This section gives an overview of the Ethernet switch acceleration module (ETHSW_ACM). This peripheral works only when the ETHSW peripheral is enabled, and shares the same external pins. It provides ultra-low latency, cut-through forwarding between two external Ethernet ports, together with on-the-fly frame processing (extraction and insertion of data). It allows for multimaster distributed networks, based for example on OPC UA over TSN, whilst still meeting the performance requirements for high-speed motion control applications. The ACM is used in combination with a TSN Ethernet switch, a gPTP synchronized clock, and a host CPU as shown in *Figure 1164* below.

Figure 1164. System block diagram

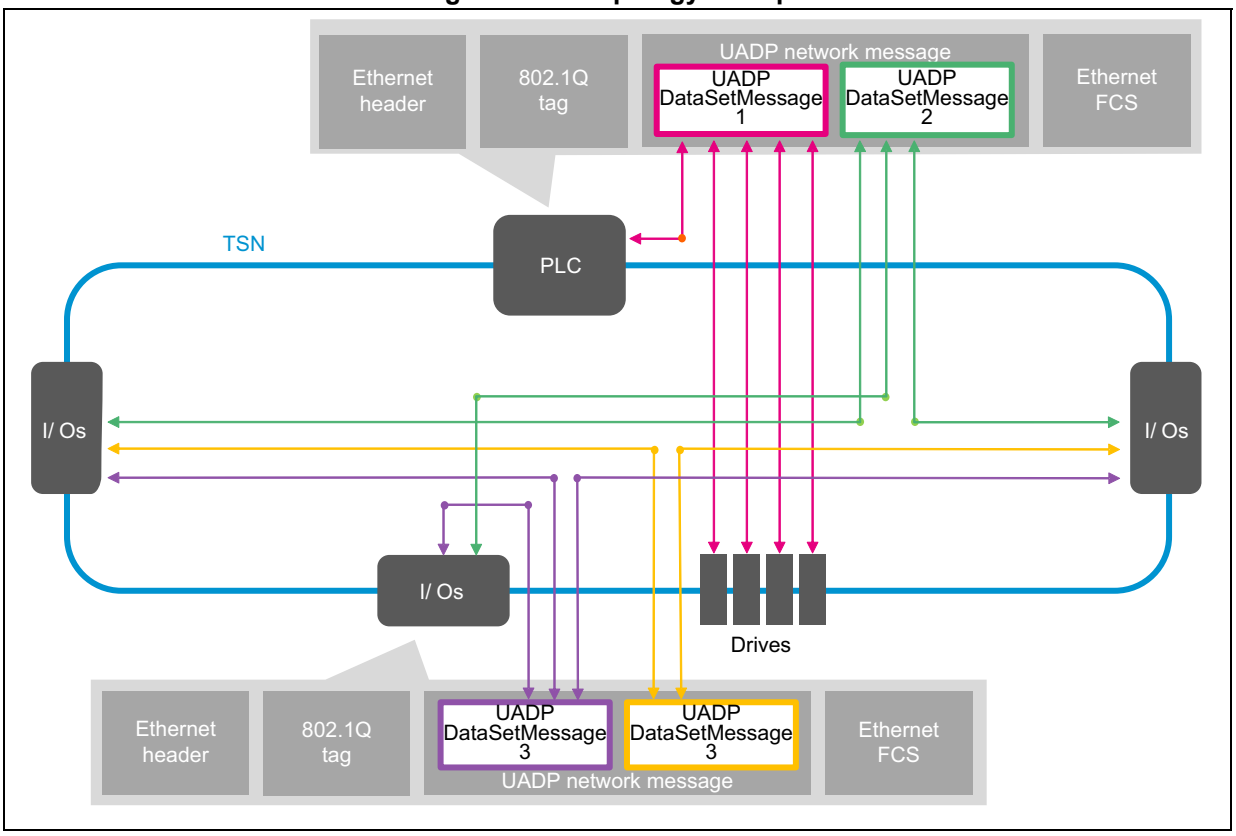
This section is an overview and does not include a detailed functional description nor the registers and message buffer description.
TTTech Industrial Automation AG or STMicroelectronics sales representative must be contacted for getting access to the full documentation (delivered under NDA).

94.2 ETHSW_ACM main features

- Ultra-low latency cut-through
  - ~400 ns including data manipulation (Gigabit)
- Scheduled cut-through and forwarding

  - Information can be sent with low latency alongside other traffic
  - Frames not subject to acceleration are fully IEEE 802.1Q compliant
- Scatter-gather engine
  - Information can be added and/or extracted dynamically without CPU
  - Frame is composed dynamically
  - Header and Trailer are statically configured
  - CPU does not need to process the entire frame
- Summation frame
  - Information can be added to one frame as it passes from node to node
  - Significantly enhances bandwidth efficiency for short messages in lines

94.3 ETHSW_ACM application example



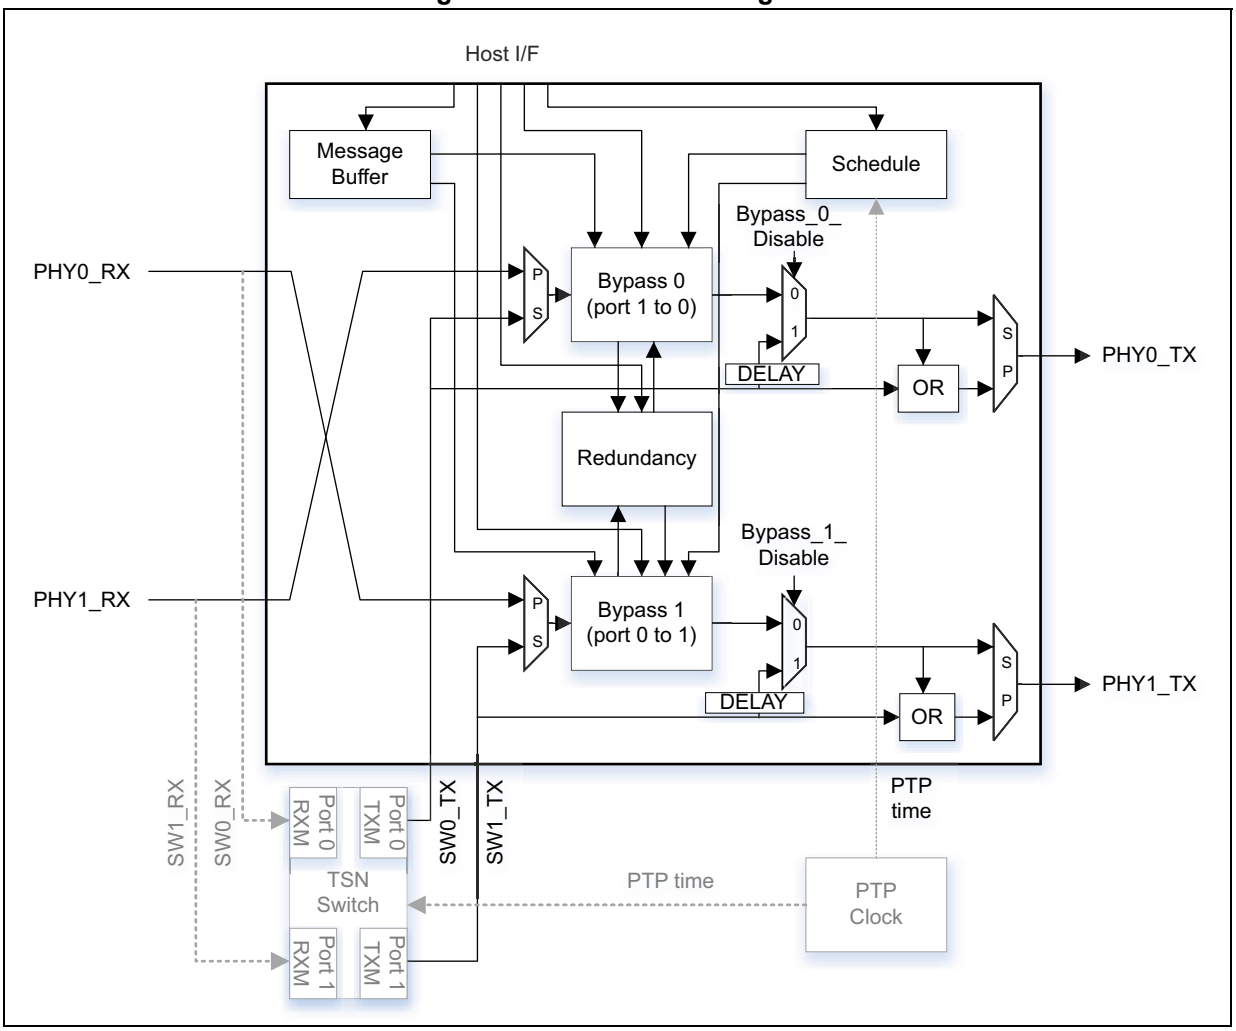
Typical application scenarios for ACM are industrial line or ring topologies as shown in *Figure 1165*. The example shows several use cases in a simple setup based on OPC UA over TSN, but this is also applicable for other protocols over TSN.

In such an example, the programmable logic controller (PLC) runs a control loop for some motion controllers (drives) and other input/output (I/O) devices. It also considers the input from some of the I/Os for controlling the drives. To do so the PLC generates a frame that can contain multiple submessages targeted at different nodes. The devices are configured so that the message travels around the ring until it reaches the last node that requires the data or the PLC again in case there is an immediate response. The *DataSetMessage 1* and *2* are generated by the PLC and are targeted at the drives and the left/right I/O module, respectively. To show the distributed / multimaster usage, the bottom I/O module generates the *DataSetMessage 3* that is consumed by the left and the right I/O without the PLC being involved. In addition, the left/right I/O communicates via a data exchange on *DataSetMessage 4*.

The fact that a single frame can be used for multiple submessages allows lower overhead for small process data updates and therefore significantly faster cycle times. To further increase the update rate, ACM allows data insertion (produce operation) and extraction (consume operation) during the forwarding process, without any CPU involvement. Data is taken from / provided to a triple buffer memory allowing the CPU to write/read only the parts of a frame that contain relevant process data for the same node. The remaining frame is automatically assembled/parsed by the ACM according to predefined rules during the forwarding process. The triple buffer towards the CPU guarantees permanent availability of the latest available data including a timestamp.

In a ring topology (as shown in *Figure 1165*), the module also supports seamless redundancy compatible with IEEE 802.1CB. This allows timely delivery of frames even in case of disruptions on one path within the network. Frames are sent in both directions and only one copy is used by the node in case both arrive. Overall, the design guarantees a constant delay per hop as low as 0.4 µs for Gigabit Ethernet or 3.8 µs for Fast Ethernet independent of CPU performance, number of frames and submessages.

Figure 1165. Topology example



94.4 ETHSW_ACM functional description

94.4.1 ETHSW_ACM block diagram

The ACM is composed of several submodules, namely: Bypass module (x2), Message buffer, Schedule and Redundancy (see *Figure 1166*). The main purpose of the Bypass module is to enable low-latency frame cut-through functionality between Ethernet ports. Moreover, the Bypass module supports advanced frame processing (that is extraction/insertion of data into/from the passing frames, recovery frame functionality, frame policing, data exchange with the CPU via Message buffer). The Bypass module and the TSN Ethernet switch are interconnected via GMII interfaces. The Schedule module consists of two Scheduler units to provide timing for the two Bypass modules.

Figure 1166. ACM block diagram

The two Bypass modules can be connected to the TSN Ethernet switch either in parallel or in series (see options P and S in *Figure 1166*). When connected in parallel, the Bypass modules enable a frame cut-through operation between the TSN Ethernet switch ports 0 and 1 (see the Bypass 1 module), and between the TSN Ethernet switch ports 1 and 0 (see the Bypass 0 module). The configuration in parallel is used when both adjacent nodes operate at the same GMII speed and are able to achieve sufficient PTP clock synchronization precision.

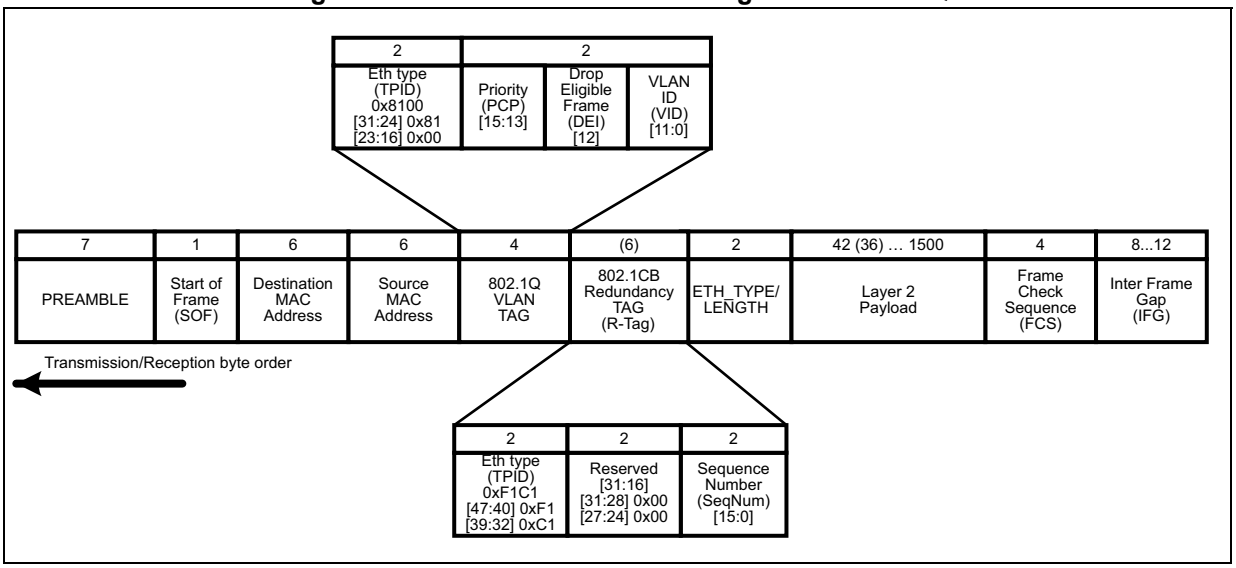
When connected in series, the ingress frame first passes through the TSN Ethernet switch and then through the Bypass module (without crossing), port 0 is connected to the Bypass 0 and port 1 is connected to the Bypass 1. The configuration in series is used when the two adjacent network nodes either operate at different line speeds (for example one operates at 1 Gbps and the other at 100 Mbps), or one of the two adjacent nodes has poor timing characteristics.

In serial mode, the data that come from the TSN Ethernet switch and do not pass the Bypass module (Bypass module is disabled), are delayed to match the data delay through the Bypass module. These delay blocks are shown in the TSN Ethernet switch data path in *Figure 1166*.

The ACM can also be completely isolated from the TSN Ethernet switch by disabling it. In this case the TSN Ethernet switch output is directly fed to the PHY interface without introducing additional delay, which is the default behavior at startup.

94.4.2 ETHSW_ACM pins

The ETHSW_ACM pins are shared with the ETHSW peripheral. It is not necessary to enable specific alternate functions for operating it.



94.4.3 ETHSW_ACM clocks

The ETHSW_ACM peripheral must be clocked at 200MHz. The RCC features 2 independent clock enable bits, for the ETHSW_ACM configuration registers and message buffer.

94.4.4 Frame format

The format of a frame that is processed by the Bypass module is depicted in *Figure 1167*. All the fields are shown in the transmission/reception order (bytes in the left side are transmitted/received first).

Figure 1167. Frame format according to IEEE 802.1Q

Frame fields that are processed by the ACM are discussed in the following paragraphs.

Destination MAC address

Destination MAC address is a unicast or a locally administered multicast address of the target node that should receive the frame.

IEEE 802.1Q VLAN tag structure

The VLAN tag is composed of four bytes *[1]*. The first two bytes contain the defined TPID = 0x8100 indicating an IEEE 802.1Q-tagged frame. If this value is not found in the frame, the Bypass module must drop the frame, because it belongs to the best effort traffic. Moreover, the Bypass module compares the VID field to decide whether to drop the frame or process it further. The TSN Ethernet switch VID filtering must be complementary to the Bypass modules VID filtering, meaning that the TSN Ethernet switch must process frames dropped by the Bypass modules and vice versa. Similar, the TSN Ethernet switch must run a mutual exclusive IEEE 802.1Qbv schedule *[2]* to prevent conflicts on the node egress ports.

Frames containing the VLAN tag are referred to as tagged and those not containing the VLAN tag are referred to as untagged.

IEEE 802.1CB Redundancy Tag structure

The Redundancy Tag (R-Tag) is composed of six bytes *[3]*. The first two bytes contain the defined TPID = 0xF1C1. If this value is found in the frame, the frame is considered as a redundant traffic and handled accordingly. The second two bytes are reserved and their content is ignored on reception and transmitted with 0x0000 value. The last two bytes of the R-Tag contain the 16-bit sequence number. Whenever a frame is transmitted as two replicas, both replicas are recognized by carrying the same sequence number.

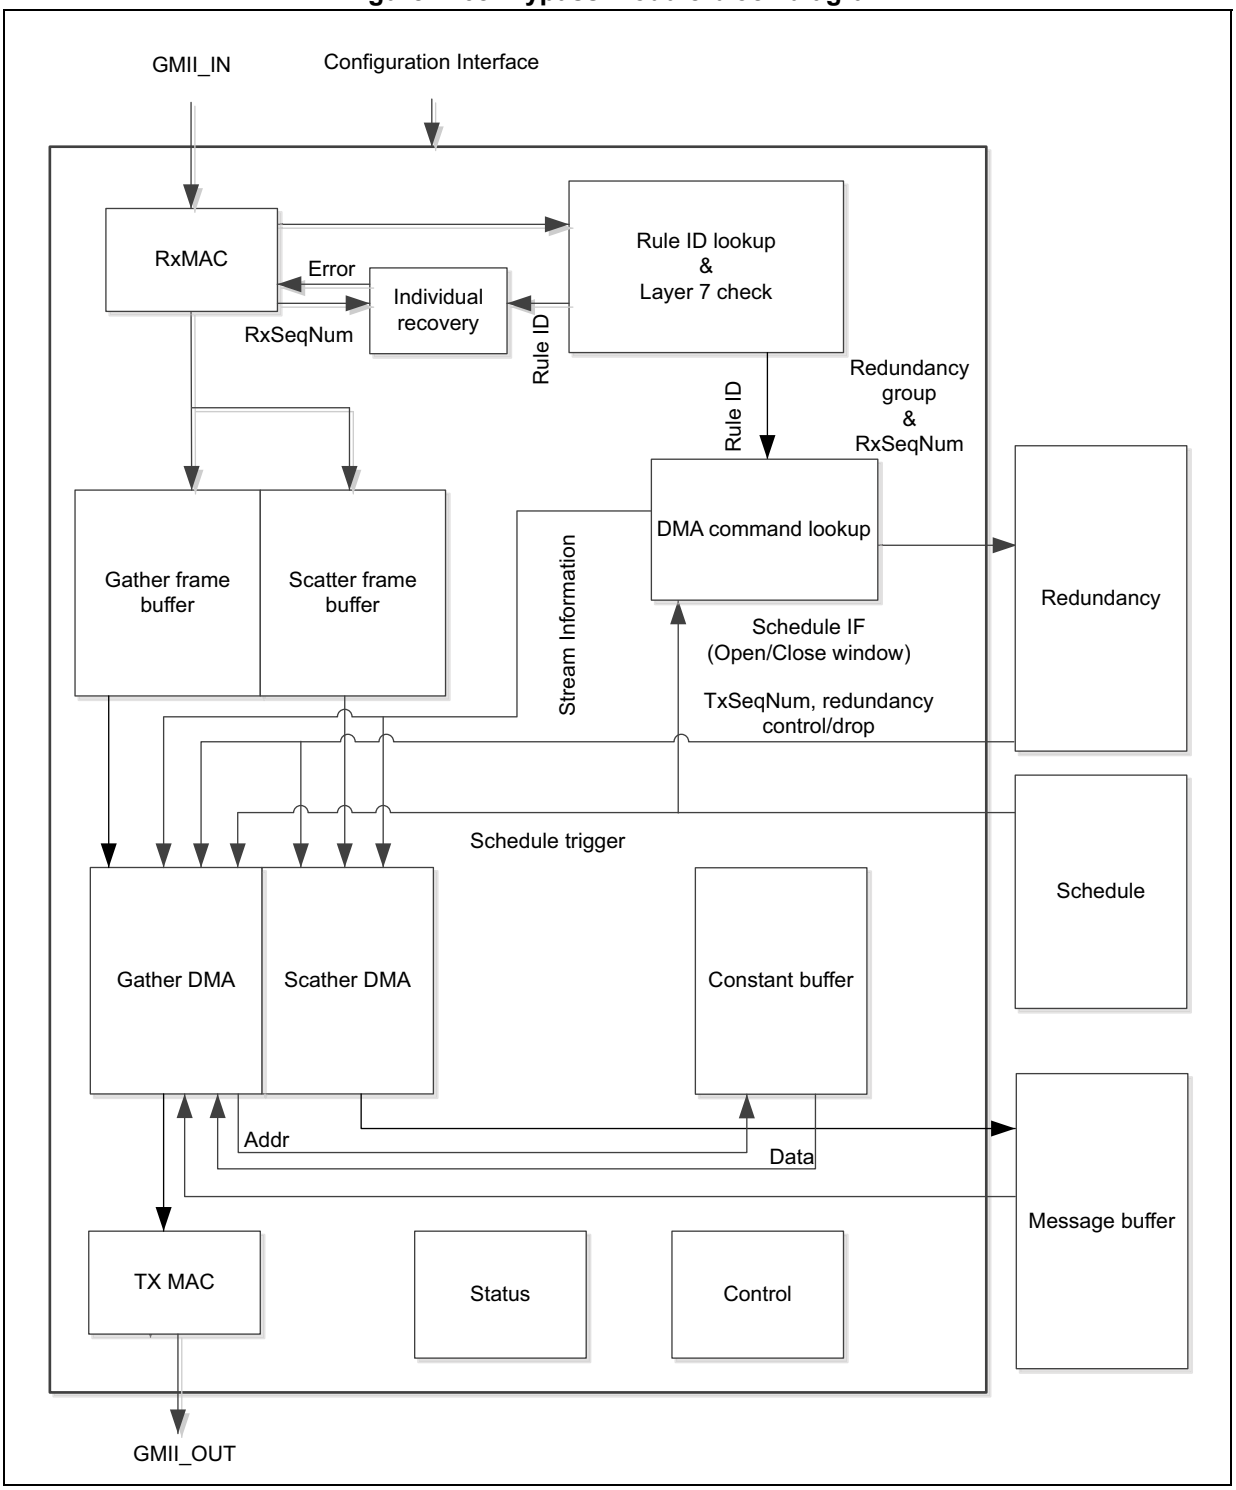
Layer 7 UADP protocol

Layer 2 payload contains data that can be interpreted as protocols operating on the higher layers of the OSI model. For certain protocols (namely UADP *[4]* protocol) operating on layer 7 all the lower layer protocols are defined (i.e. implement the IP protocol and the UDP protocol). Therefore, most of the data in these higher layer headers can be mapped one-to-one to a specific stream ID. Thus, Bypass modules can be configured to compare the layer 3 to layer 7 frame bytes against a preconfigured byte sequence. If a match is found, layer 7 check is considered successful and the frame is processed further. On the contrary, if the match is not found the frame is dropped.

Frames types

Frames are classified based on their destination MAC address and the VLAN ID (further referred to as VID), as it is the recommended method for stream identification described in the IEEE 802.1Q standard *[1]*. Frames that are processed by the Bypass module can be split into the following classes:

- **Best-effort frames**: these frames are not processed by the Bypass module but rather by the TSN Ethernet switch. Therefore, Bypass modules have to be configured in a way to drop these frames when connected in parallel, or forward them unchanged when connected in series. Best-effort frames either do not contain a VLAN tag, or their VID does not match any of the configured VIDs.
- **Isochronous frames**: all the frames that are processed by the Bypass module. These frames contain a VLAN tag and their VID must match to at least one of the configured VIDs. Moreover, these frames can be split into redundant copies and delivered to the destination using different paths. If both copies are received correctly at the destination, one of them is dropped and the other one provided to the host CPU. The isochronous frames can be further divided into the following subclasses:
  - **One-to-one frames**: One-to-one frames (further on referred to as Cross-traffic frames) are produced by one node (a producing node) and consumed by another



node (a consuming node). All the other nodes in the network only forward such frames to reach their destination node.

– **One-to-many summation frames**: A one-to-many summation frame is produced by the first node in the network (i.e. master node) and contains several submessages for a group of nodes. All the nodes outside the group only forward the frame. Each node in the group can consume (i.e. read the submessage) its submessage (but can also read more submessages) and can also remove the read message from the frame (i.e. by shortening the frame). The last node in the group consumes the last submessage in the frame and discards the received frame.
– **Many-to-one summation frames**: A many-to-one summation frame is produced by the last node of the group of nodes (i.e. slave node). The producing node also inserts its submessage into this frame. The frame is then transmitted in the direction towards the master node. All other nodes in the group then insert their submessage into the frame. After leaving the group, the frame is forwarded by other nodes until it reaches the master node. Optionally, the producing node can also pad the frame with zero bytes, so that the frame size is the same as the final size when the frame leaves the group. In such case, other nodes in the group not only insert their submessage to the frame, but also remove the same number of zero bytes from the frame. This way, the frame size remains constant while the frame is updated by the group nodes.
– **First-stage recovery frame**: The first-stage recovery frame is a frame that is produced by a node in the group in case the expected many-to-one frame did not arrive. The node that produces the first stage recovery frame also inserts its submessage into the frame and transmits the frame towards the master node.

94.4.5 Bypass module overview

Figure 1168 diagram presents the Bypass module block diagram.

Figure 1168. Bypass module block diagram

Each of the two Bypass blocks of the ETHSW_ACM consists of the following blocks:

- Rx MAC
- Frame buffer
- Rule ID lookup & layer 7 check
- Individual recovery
- DMA command lookup
- Scatter DMA
- Gather DMA
- Constant buffer
- Tx MAC

The Bypass module performs frame classification based on the destination MAC address (DMAC) and VID. Frames can be classified to one of the 17 stream classes and receive a Rule ID for which specific processing actions can be defined. The layer 7 check can optionally be performed (i. e. layer 2 payload data up a configured depth are compared against a configured byte sequence), so that it is possible to drop frames based on data content.

Based on the selected Rule ID a DMA command list is selected for the Scatter and the Gather DMA module separately. These two modules then perform the stored list of operations on the frame while the frame is being forwarded. For frame assembly the module provides prefetching operations to make data available in a local buffer. From this or the constants memory it is then possible to modify, forward, or assemble the frame while forwarding. Further, selectable operations include for ingress policing (policing arrival time of a frame) or recovery frame generation. The Scatter DMA allows to extract (multiple) parts of the received frame for further processing by the host CPU. That way the CPU can define upfront the parts of the frame it is interested in and can offload the frame processing.

94.4.6 Schedule module overview

This section presents the basic scheduling principles.

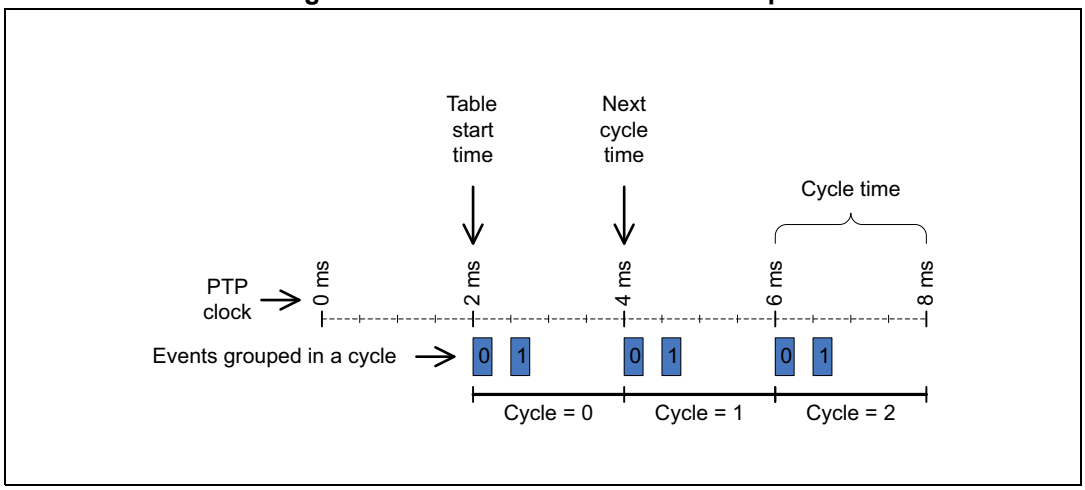
Purpose

The Schedule module is responsible for fetching and executing the schedule events at exact moments of time. The schedule module outputs the result of a schedule event in form of a schedule command that instructs a Bypass module to enable/disable Bypass modules, open/close ingress policing windows, or trigger a Gather DMA chain execution. The schedule module follows the principles of the IEEE 802.1Qbv *[2]* standard.

Scheduling principles

The schedule receives the global network time information from the external PTP Clock module (according to the IEEE 802.1AS standard *[5]*) and synchronizes its execution with this time. This way, schedule modules in all nodes in the network execute events based on the same time reference.

Figure 1169. Schedule execution example



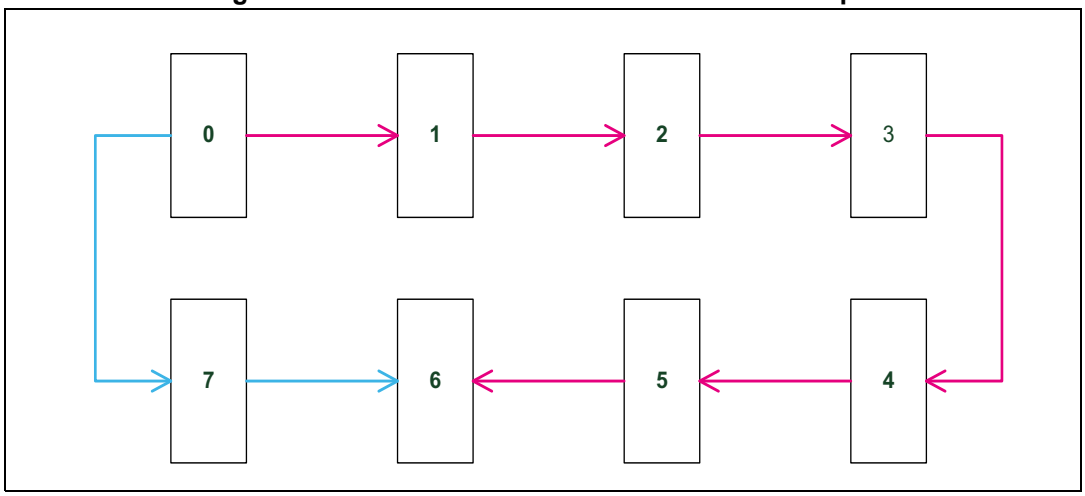


Figure 1169 gives an example of the schedule composed of two schedule events being repeated in cycles. When the schedule starts its operation at a specific table start time, the first cycle is executed.

The schedule block can be reconfigured during runtime (on-the-fly). In order to enable uninterrupted execution of the events, the schedule module uses two tables instead of one. While one of the tables is being processed (i.e. events are fetched and executed), the software can access the other table and store the new events into table rows. Tables can be swapped at a specific point in time in an atomic operation.

94.4.7 Redundancy functionality overview

The main objective of seamless redundancy is to ensure that a frame is delivered from the source node (node 0 in *Figure 1170*) to the destination node (node 6 in *Figure 1170*) even if the connection between two nodes is physically interrupted. In order to guarantee this, the frames are replicated at the source node, transported through the network on disjoint paths (see blue and pink paths in *Figure 1170*) and then received and evaluated by the destination node. If both frame replicas arrive and pass the frame check sequence (FCS) verification, only one is provided to the host and the other one is dropped. If one of the frame replicas gets corrupted or even lost on its way to the destination node, the other one is delivered via a different path.

Figure 1170. Redundant schedule execution example

In case if one of the paths delays the frames above a certain limit and the source node generates several replicated frame pairs with a short time distance between them, it may happen that the newer frame replica arrives faster to the destination node via a faster path than the older frame replica arriving via the slower path. For the sake of correct replica elimination on the destination node's side, each replicated frame pair contains a Redundancy Tag (R-Tag) with an identical sequence number (see *Figure 1167*). The ACM supports automated duplication of frames generated on the node, as well as transparent elimination of redundant copies before they are delivered to the host CPU. Thus, redundancy operation is fully transparent to the CPU and only requires one time configuration.

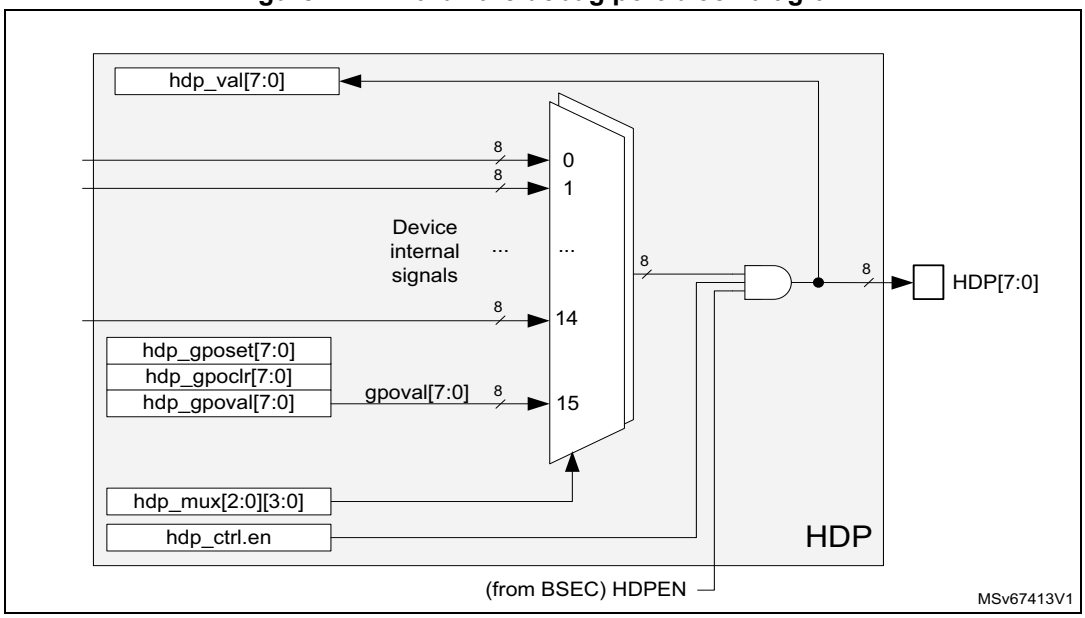
Message buffer	0x0008 0000	0x0004 0000

95 Hardware debug port (HDP)



The hardware debug port allows the observation of internal signals. By using multiplexers, up to 16 signals for each of 8-bit output can be observed.

95.1 HDP main features

- 8 output signals
- One of 15 internal signals with individual control
- 8 software programmable signals for pinout agnostic code debugging
- Output disabling by security signal

95.2 Functional description

Figure 1171. Hardware debug port block diagram

The control of the main multiplexer that allows the selection of the 8-signal debug set to be output is done through the HDP_CTRL register.

The HDP value at the output of the main multiplexer can be read by software through the HDP_VAL register.

During debug, it is often useful to output some signals that are controlled by the software. They can be used to observe precisely a code sequence, or to indicate the current executed task. The debug set #15 is reserved for this purpose: it provides on HDP outputs, HDP_GPOVAL value that is associated with HDP_GPOSET and HDP_GPOCLR, allowing the signals to be toggled without a read-modify-write sequence.

Some debug sets expose internal data that require to be protected: the HDPEN signal, when low, forces all the HDP block outputs low.

Note: The internal signals may toggle at a higher rate than the pins can support. Their observability may then be compromised. The user must be aware of this limitation when using the HDP port.

Refer to *Section 2.4* for the register boundary addresses.

96 Software error robustness collector (SERC)

96.1 Introduction

The SERF (software-error robustness framework) detects accesses to target peripherals that are either shutdown (computing clock off), or under reset. Upon detection of the access, the software-error robustness detector (SERD) answers the bus request instead of the shutdown target. It reports a bus illegal access (bus_ilac) to the software-error robustness collector (SERC). In this context, a bus illegal access is an access to peripherals either under reset, or with clock not enabled.

The SERC fires an interrupt, and is equipped with registers to identify the target generating the fault, and enabling/masking corresponding interrupt.

The primary use of the SERF is to prevent CPU hangs on accessing AXI shutdown targets.

The SERF works in collaboration with the RCC, which provides clocks and resets.

96.2 SERF main features

- Cover all targets, provided with either AXI or AHB interfaces
- Reply (with error) to requests directed to shut down AXI targets, preventing CPU hangs
- Notify through interrupts to the CPU that access to a shutdown/under-reset target has been attempted
- Identify the unavailable target registered

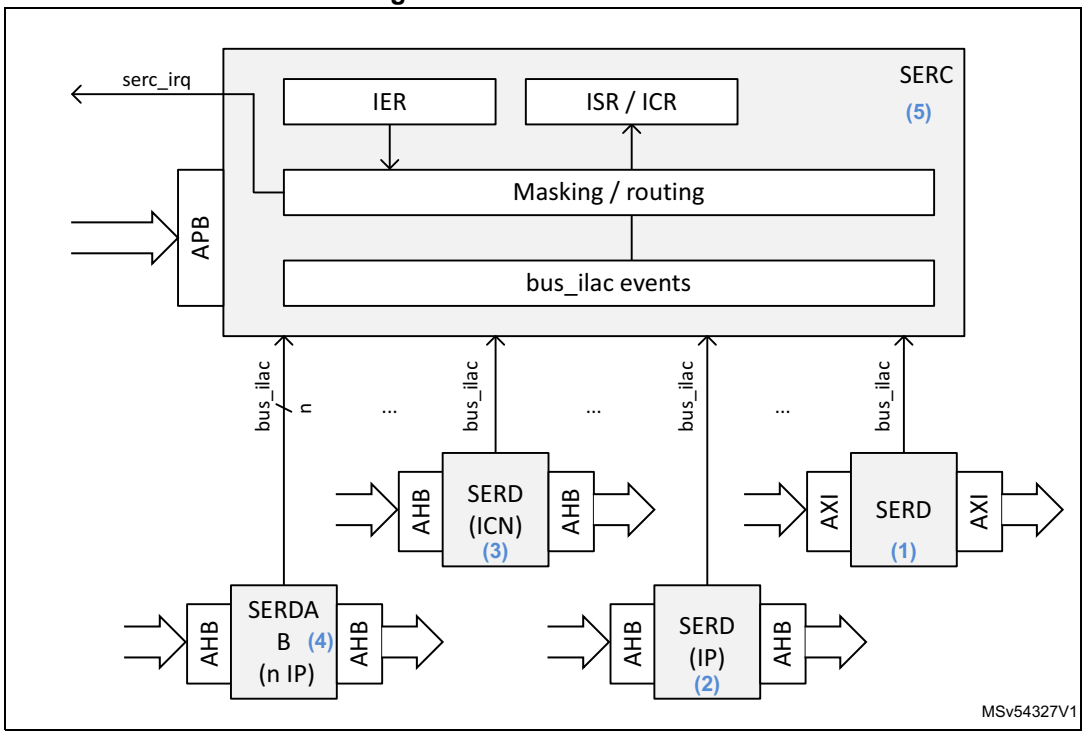
The SERF includes:

- a set of detectors (SERD)
- a collector (SERC), provided with an APB interface, which gathers all detected error sources, fires an interrupt (if needed), and logs the detector ID in a local register

The detectors have a zero-cycle pass through latency if the target is enabled.

96.3 SERF functional description

96.3.1 SERF block diagram



The SERF is made up of four building blocks, namely AXI SERD, AHB SERD, AHB SERDAB (SERD address based), and SERC.

AXI SERD, AHB SERD, and AHB SERDAB can be instantiated as many times as required, while usually there is a single SERC instance.

Figure 1172 shows a SERF example interconnect featuring:

- One SERD instance (1) with AXI interfaces, located in front of an AXI target peripheral
- One SERD instance (2) with AHB interfaces, located in front on an AHB target peripheral
- One SERD instance (3) with AHB interfaces, located in front of an AHB grape interconnect
- One SERDAB instance (4) with AHB interfaces, located in front of an AHB2APB grape interconnect
- One SERC instance (5) collecting the bus_ilac reported by the detectors, and generating interrupts. The SERC is provided with an APB interface to access its control registers.

Figure 1172. SERF overview

When a SERD gets a bus access to a target shutdown or under reset, it generates an error response on the data bus and a bus_ilac to the SERC. Each bus_ilac is recorded in SERC_ISRx registers, and a serc_irq is fired.

The interrupt handler can do the following:

- Read SERC_ISRx to understand which peripheral was accessed while under reset or shutdown.
- Clear this status (and as well the interrupt) through SERC_ICRx.
- Mask an interrupt generated by an illegal access from a specific peripheral through SERC_IECx.

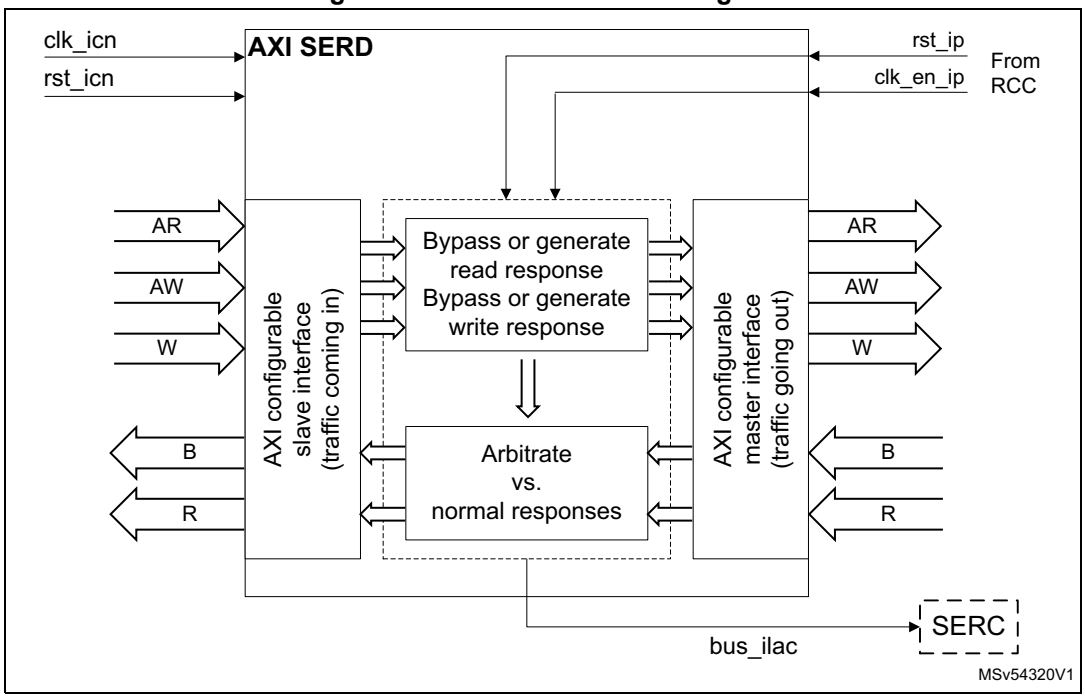
96.3.2 SERF key internal signals

Table 1001. Key internal signals

Module	Interfaces	Functionality
AXI SERD	One AXI slave and one AXI master	Receives the clk_en_ip and rstn_ip of the peripheral. It is connected to from the RCC. Reports a bus_ilac to the SERC.
AHB SERD	One AHB slave and one AHB master	Receives the clk_en_ip and rstn_ip of the peripheral. It is connected to from the RCC. If the SERD is connected to an AHB matrix, it receives the clk_en_ip and the rsnt_ip of all the IPs connected to the AHB matrix. Reports a bus_ilac to the SERC.
AHB SERDAB		Receives the clk_en_ip and rstn_ip of all the peripherals connected to the AHB2APB downstream from the RCC. Reports a bus_ilac to the SERC per address region it protects.
SERC	One slave APB	Receives all bus_ilac signals from the embedded SERD /SERDAB. Generates a SERC_irq when one or several bus_ilac are detected.

The SERC resource allocation is aligned to the one defined for the RIF (product dependent).

96.3.3 SERF resets and clocks



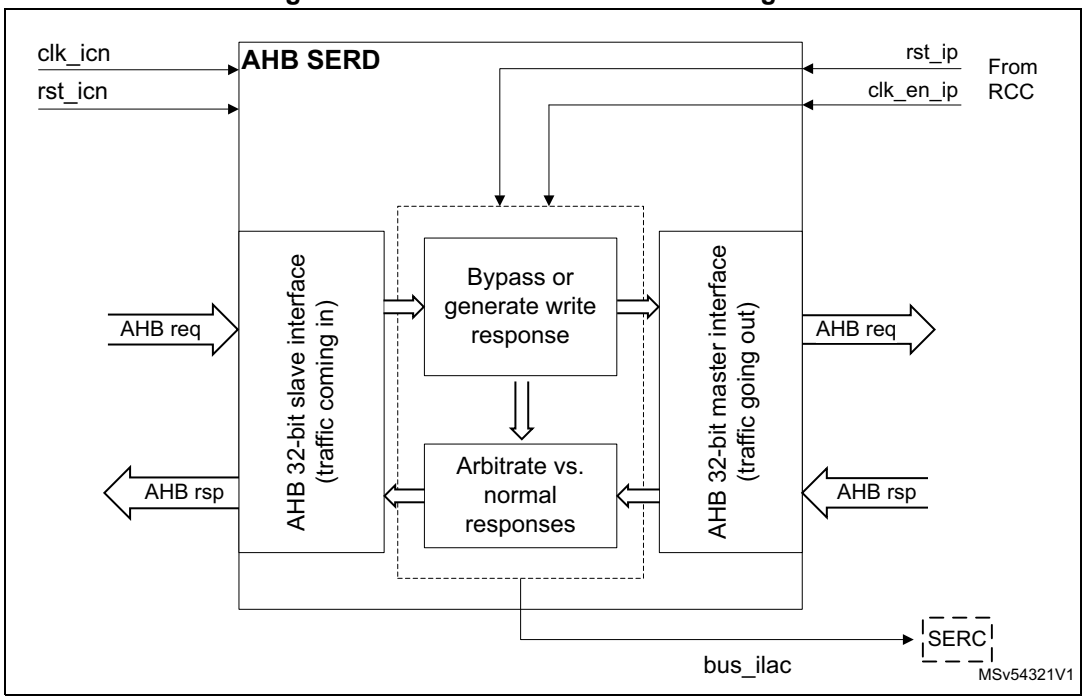
AXI SERD, AHB SERD, and AHB SERDAB receive the same clock and reset signals of the interconnect they are inserted in. SERC has a single clock and a single reset. All clocks and resets are provided by the RCC.

96.3.4 Functionality and programming model

AXI SERD

As shown in *Figure 1173*, AXI SERD is made up of one AXI slave interface, one AXI master interface, and an internal logic to detect access to non-available target peripheral, generating appropriate response, and reporting a bus_ilac to the SERC.

Figure 1173. AXI SERD block diagram



Note: The AXI SERD does not allow recover when a peripheral is wrongly shut down (when there are still outstanding responses expected from the peripheral). It only prevents that a peripheral under shutdown or reset is accessed.

AHB SERD

Figure 1174 shows a block diagram of the AHB SERD (for IP). The AHB SERD is made up of one AHB slave interface, one AHB master interface, and an internal logic for detecting access to non available target IP, generating an appropriate response, and reporting a bus_ilac to the SERC.

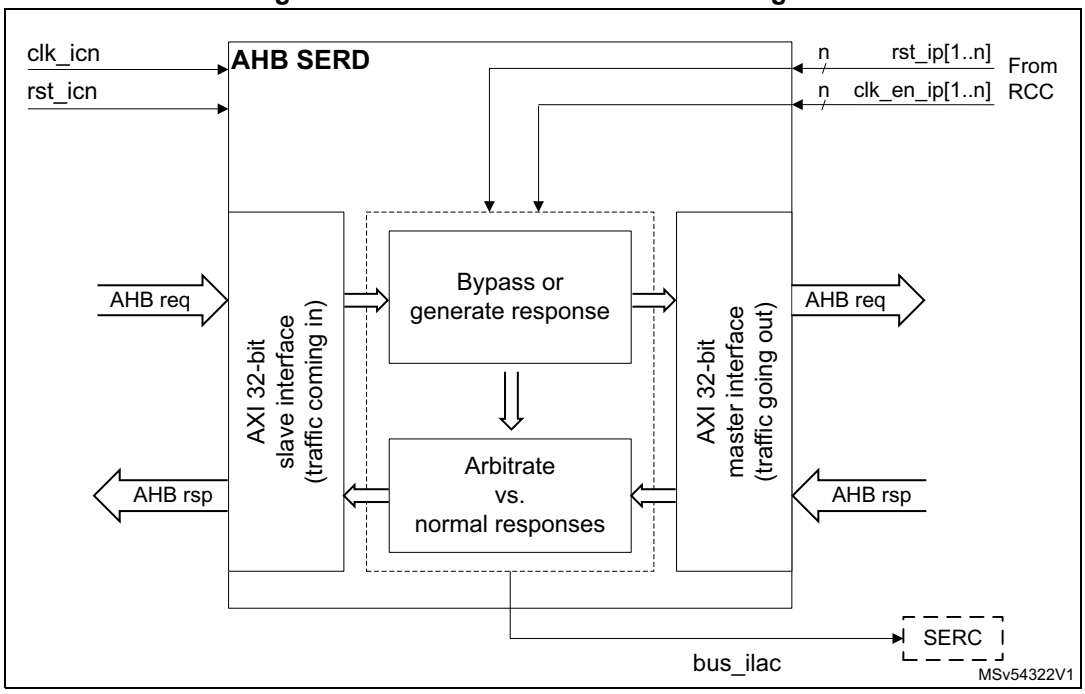


Figure 1174. AHB SERD for IP block diagram

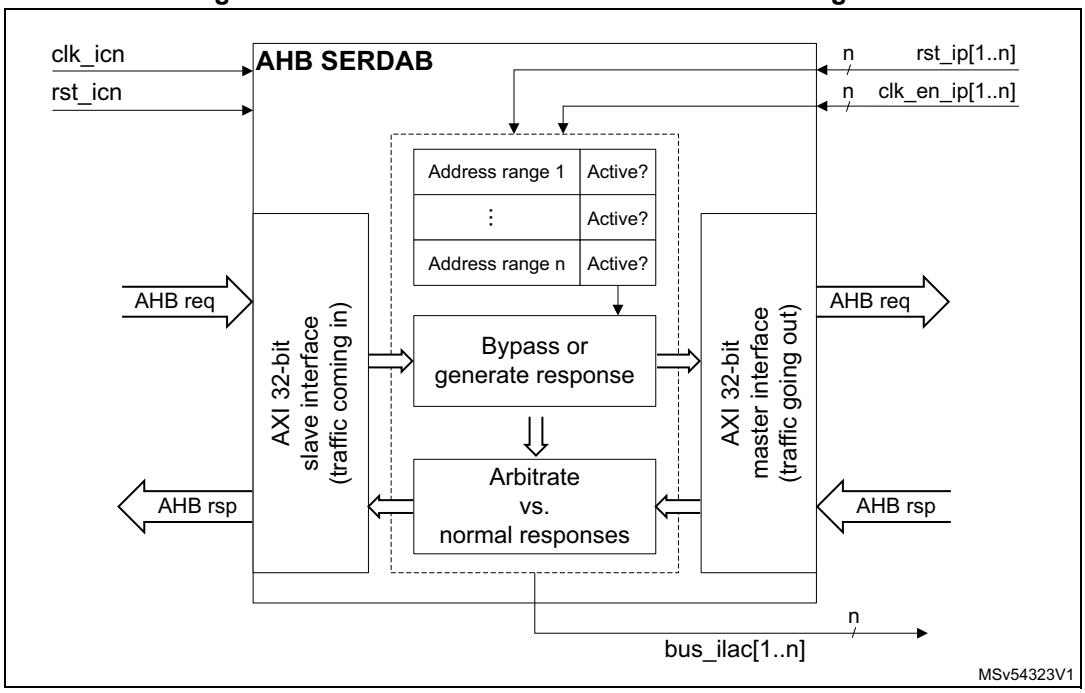
As shown in *Figure 1175*, the AHB SERD is made up of one AHB slave interface, one AHB master interface, and an internal logic for detecting access to non-available target peripherals, generating an appropriate response, and reporting a bus_ilac to the SERC.

The AHB SERD (for ICN) differs from the AHB SERD (for peripheral) because it is located in front of an AHB grape. If all targets connected to this grape are switched off, the grape is switched off as well. The AHB SERD for ICN must handle any access directed to it. For this purpose, it receives all ip_clk_en and ip_rst signals of the targets connected to the AHB grape it protects.

Figure 1175. AHB SERD for ICN block diagram



AHB SERDAB

Figure 1176 shows the block diagram of the AHB SERDAB for shielding an APB2AHB bridge. The AHB SERDAB is made up of one AHB slave interface, one AHB master interface, and an internal logic for detecting access to non-available target peripherals, generating appropriate response, and reporting a bus_ilac to the SERC. The AHB SERDAB differs from the AHB SERD (for peripheral) because it is located in front of an AHB2APB bridge. Each APB target connected to the AHB2APB bridge can drive its pready and pslverr signals or not. If the target does not drive pready and pslverr, these signals are tied, respectively, to 1 and 0. It is then not possible to discriminate if the response at the AHB master interface comes really from the APB target, or is a dummy response, from a target that may be in power down. To overcome this limitation, the AHB SERDAB can do the following:

- It receives from the RCC all the clk_en_ip and rst_ip of the targets connected to the AHB2APB bridge.
- It is provided with an internal address decoder, and each region is active or not depending on the corresponding clk_en_ip and rst_ip.
- When a transaction address is detected in an address range inactive, the corresponding bus_ilac signal is reported to the SERC.

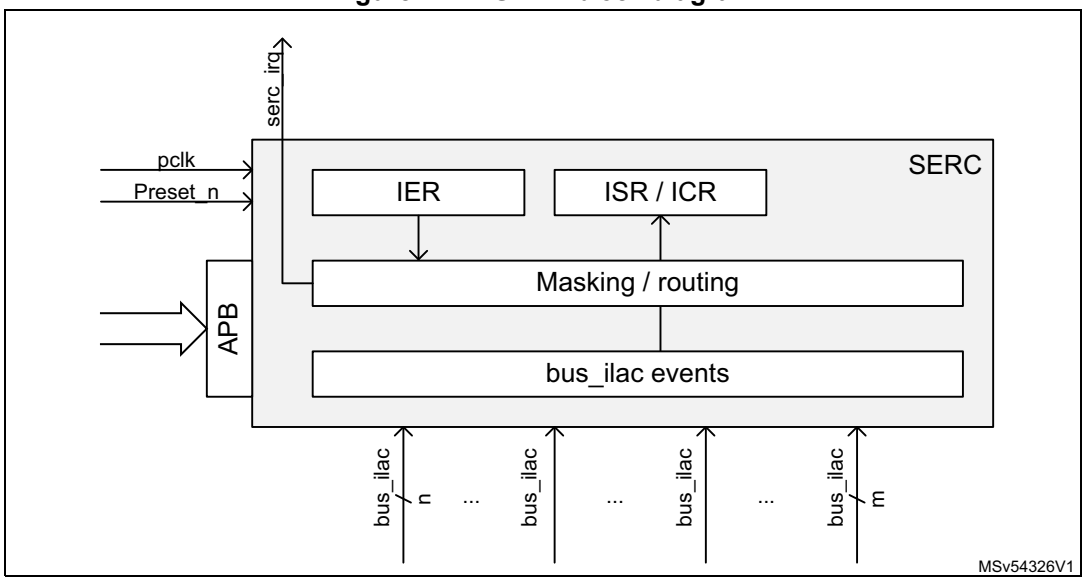


Figure 1176. AHB SERDAB for AHB2APB block diagram

SERC

The SERC gathers in a central place all the bus_ilac signals and registers to enable, mask, and clear the resulting serc_irq. The SERC maps each bus_ilac to one of its registers, accessible through an APB interface.

Figure 1177. SERC block diagram

The device embeds a RIF infrastructure, hence a RISUP is present in front of the APB interface. *Figure 1178* shows the SERF when connected to the RISUP block.

Figure 1178. SERF with an RISUP

96.4 SERF low-power modes

The SERF does not support low power modes.

96.5 SERC interrupts

The SERC fires an interrupt when a detector reports a bus_ilac to it. The interrupt is cleared by writing the SER_ICR register matching the SERC_ISR that generated the interrupt. The SERC_ICR auto resets itself when the corresponding SERC_ISR bit is reset.

The interrupt remains high as long as there is one bit set to 1 in the SERC_ISR register. This ensures that none of the reported bus_ilac cam be missed by the interrupt handler.

Interrupts can be masked individually for each bus_ilac source through register SERC_IER.

96.6 SERC registers

The AXI/AHB SERD/SERDAB are not provided with registers.

The SERC has a set of registers:

- to log the target peripheral that has generated an interrupt
- to enable or mask the generation of the interrupt for each single target peripheral
- to clear the interrupt and reset the status of the logged target peripheral

SERC is disabled at boot time, and must be enabled.

On top of these functional registers, the SERC is also provided with configuration registers:

- hardware configuration registers, embedding configured values of design generics
- version, size, and identification registers

All SERC registers are accessed by words (32-bit). Byte and 16-bit write accesses are ignored and have no effect, read accesses always return 0. In all cases, byte and 16-bit accesses do not generate a bus error.

Read accesses to unmapped addresses or write-only registers always report errors. Write accesses to unmapped accesses or read-only registers are ignored and have no effects.

- SERC_IERx registers are used to enable an interrupt when an access to non-available (either shutdown or under reset) target occurs. These registers are accessible in read or write.
- SERC_ISRx registers are used to read the status of all accesses to non-available (either shutdown or under reset) events. These registers are read only.

  The collector asserts the bit corresponding to a bus_ilac input and fires an interrupt. Upon reception of the interrupt, the interrupt handler can check this register to retrieve which peripheral generated the interrupt.
- SERC_ICRx registers are used to clear a pending illegal access interrupt. These registers are write only.

  When the interrupt handler has finished dealing with the power-down or reset illegal access interrupt, it writes in this register to clear the interrupt and reset the status in the corresponding peripheral SERC_ISRx register. This register is then auto-reset.

96.6.1 SERC interrupt enable register 0 (SERC_IER0)

Address offset: 0x0000

Reset value: 0x0000 0000

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SERFEN
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **SERFEN**: Enable the SERF framework.

When the SERF is enabled, an access to a target under reset or clocked off is detected; a functional error response is given back on the IP bus, an illegal access is reported to the SERC, and an interrupt is fired according to the SERC registers configuration. When the SERF is disabled, an access to a target under reset or clocked off is not detected.

96.6.20 SERC hardware configuration register (SERC_HWCFGR)

Address offset: 0x03F0

Reset value: 0x000X 00XX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

97 Debug support (DBG)

97.1 DBG introduction

In the whole document:

- The Cortex-A35 is also called CPU1 or MPU.
- The Cortex-M33 is also called CPU2 or MCU.
- The Cortex- M0+ is also called CPU3.

A comprehensive set of debug features is provided to support software development and system integration:

- Independent breakpoint debugging of each CPU core in the system
- Code execution tracing
- Software instrumentation
- Cross-triggering

The debug features can be controlled via a JTAG/serial-wire debug access port, using industry standard debugging tools.

A trace port allows data to be captured for logging and analysis.

The debug features are based on the following Arm CoreSight components:

- SWJ-DP: JTAG/serial-wire debug port
- AXI-AP: AXI access port
- AHB-AP: AHB access port
- APB-AP: APB access port
- ITM: instrumentation trace macrocell
- DWT: data watchpoint and trace
- ETM: embedded trace macrocell
- ETF: embedded trace FIFO
- ETR: embedded trace router
- TPIU: trace port interface unit
- SWO: serial wire output
- CTI: cross trigger interface
- CTM: cross trigger matrix
- Timestamp generator
- STM: system trace macrocell

These components are described in *Section 97.10*. More information can be found in the Arm documents referenced in *Section 97.14*.

97.2 DBG use cases

The trace and debug system are designed to support a variety of typical use cases:

- Low cost software trace (Cortex-M33 only)

  A limited trace capability is available over the single-wire debug output. This supports code instrumentation using “printf”, tracing of data and address watchpoints, interrupt detection and program counter sampling.
- External debugging of each core independently

  All processor cores can be simultaneously and independently debugged using equipment connected to the JTAG/SWD debug port. This allows breakpoint and watchpoint settings, code stepping, and memory access.
- Self-hosted debugging of each core independently

  All processor cores can be simultaneously and independently debugged by software running on one of the cores. This allows breakpoint and watchpoint settings, code stepping, and memory access.
- Synchronous debugging of cores

  When one core stops due to a breakpoint or a debugger stop command, other cores can be stopped as well. Similarly, the cores can be restarted at the same time. This allows debugging of loosely coupled applications which require the processors to remain synchronized.
- Tracing code execution from one or more cores via the trace port

  The trace information from all cores is combined into a single trace stream and output to a trace port analyzer in real time. An ID embedded in the trace allows the analyzer to identify the source of each information packet.
- Code and hardware instrumentation via the trace port

  The software data from the processors, memory content via DMA, and hardware event trace information can be generated using the STM. The information is combined with the processor trace stream and output to a trace port analyzer in real time.
- Capturing trace continuously into the ETF programmed as a circular buffer (ETB)

  The combined trace information can be stored on-chip in a private circular buffer. The trace storage can be started and stopped by a debugger command, a software command, an external trigger signal, or an internal event.
- Capturing trace continuously into a system memory

  Thanks to the ETR, the combined trace information can be sent to a system memory, either on-chip SRAM or off-chip DDR or PCIE. The trace storage can be started and stopped by a debugger command, a software command, an external trigger signal, an internal event.
- Reading the stored trace with the debugger

  The debugger can read the contents of the recorded trace data via the debug port. This is slower than the trace port, but allows basic trace functionality on the debugger without the cost of a trace port analyzer.
- Self-hosted trace analysis

  The recorded trace data can be read by any of the processor cores. This powerful feature allows built-in test software to monitor code execution in real time, analyze and identify faults, autonomously handle exceptions.

- Uploading stored trace

  The stored trace can also be uploaded to a host machine using one of the MPU communications interfaces (such as USB, USART, SPI, I2C, Ethernet, CAN). This is especially useful if the trace port is not accessible, for example remote monitoring and failure analysis of a deployed product.

97.3 DBG block diagram

Figure 1179. Block diagram of debug support infrastructure

97.4 DBG pins

Table 1004. JTAG/Serial-wire debug port pins

Pin name	JTAG debug port		SWD debug port		Pin assignment
	Type	Description	Type	Description	
JTMS/SWDIO	I	JTAG test mode select	I/O	Serial-wire data in/out	-
JTCK/SWCLK	I	JTAG test clock	I	Serial-wire clock	-
JTDI	I	JTAG test data input	-	-	-
JTDO	O	JTAG test data output	-	-	-
NJTRST	I	JTAG test reset	-	-	-

Table 1005. Trace port pins

Pin name	Type	Description	Pin assignment
TRACED[15:0]	O	Trace synchronous data out (can be 1, 2, 4, 8 or 16 pins)	Refer to Datasheet
TRACECLK	O	Trace clock	

Table 1006. Serial-wire trace port pins

Pin name	Type	Description	Pin assignment
TRACESWO	O	Trace asynchronous data out	(1)

1. TRACESWO is multiplexed with JTDO. This means that single-wire trace is only available when using the JTAG port in serial-wire debug interface mode, not when using JTAG.

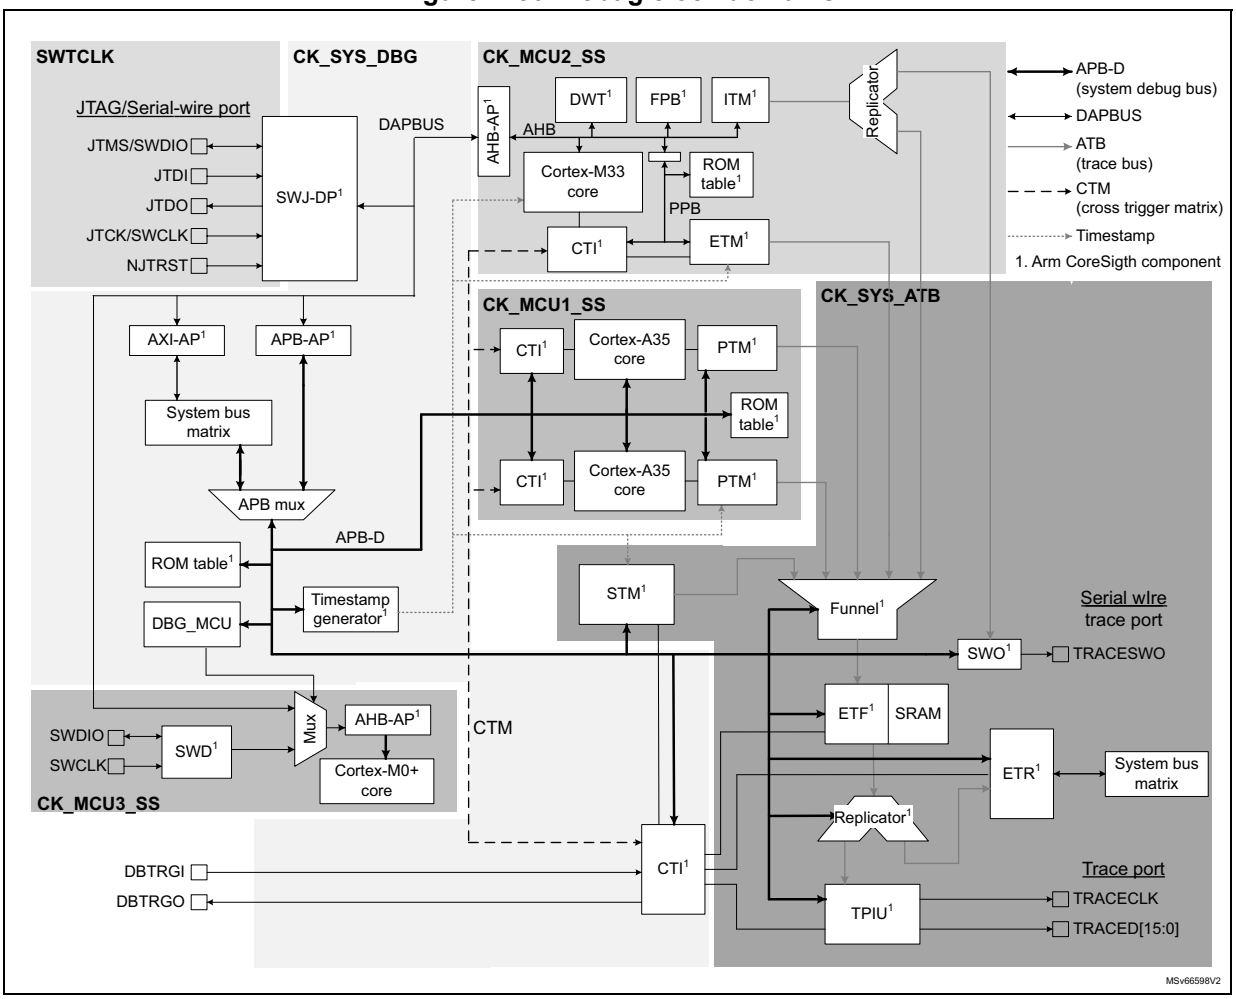
Table 1007. Trigger pins

Pin name	Type	Description	Pin assignment
DBTRGI	I	External trigger input to CTI	Refer to Datasheet
DBTRGO	O	External trigger output from CTI	

Table 1008. Cortex-M0+ serial wire debug port pins

Pin name	Type	Description	Pin assignment
SWCLK	I	Serial-wire clock	Refer to Datasheet
SWDIO	O	Serial-wire data in/out	

97.5 DBG power and clocking



97.5.1 DBG power domains

All debug components except the SWJ-DP are in the V_{DDCORE} power domain.

The SWJ-DP is located in the V_{DD} power domain, and as such is powered in all modes but the V_{BAT} one. This means that the debugger is able to wake the device up from Standby modes. the Cortex-M0+ and its dedicated SWD interface are located in the V_{BAT} power domain, and as such, can still be used in low-power mode where V_{DDCORE} is off.

97.5.2 DBG clocks

Figure 1180. Debug clock domains

The debugger supplies the clock for the debug port, SWTCLK, via the debug interface pin, JTCK/SWCLK. This clock is used to register the serial input data in both serial-wire and JTAG mode, as well as to operate the state machines and internal logic of the debug port. It must therefore continue to toggle for several cycles after the end of an access, to ensure that the debug port returns to the idle state.

The SWJ-DP contains an asynchronous interface to the system debug clock domain, CK_SYS_DBG. The debug APB bus in this domain.

The trace subsystem (that is all components on the ATB) is in the CK_SYS_ATB trace domain.

CK_SYS_DBG and the CK_SYS_ATB clocks are enabled by the debugger using CDBGPWRUPREQ in debug port CTRL/STAT register. They can also be enabled by software writing to a register in the RCC. The clocks must be enabled before the debugger or software can access any of the debug features on the device. They must be disabled when debug and trace are not used to avoid wasting energy.

The trace port (TPIU) output clock, TRACECLK, is generated by the flexible clock generator that can be programmed to match the capability of the IO ports. The same clock is used to drive the serial wire output (SWO).

Note: TRACECLK is enabled in the RCC. It must be activated whenever tracing is required, even if neither the TPIU nor the SWO are active (that is when using the embedded trace FIFO as a software buffer). This is to avoid filling up the SWO FIFO which would then block the trace output from the ITM in the Cortex-M33.

The debug and trace components included in the processors (such as PTM, ETM, ITM, DWG, FPB, CTI) are clocked with the corresponding core clock (CK_CPU1_SS for the Cortex-A35 subsystem, CK_CPU2_SS for the Cortex-M33 subsystem, and CK_CPU3_SS for the Cortex-M0+ subsystem).

97.5.3 Debug and low-power modes

The device includes power saving features which allow the various domain clocks and even the core power to be switched off when not required. If the core power is switched off (Standby mode), or the system debug domain is not clocked (Stop mode), all debug components are inaccessible to the debugger. To avoid this, power saving mode emulation is implemented. If emulation is enabled, the device still enters the programmed low-power mode, but its clock and power are maintained. In other words, the domain behaves as if it is in low-power mode, but the debugger does not lose the connection.

The Emulation mode is programmed in the MCU debug (DBGMCU) unit. For more information, refer to the *Section 97.10.11: Microcontroller debug unit (DBGMCU)*.

If the device is in Stop or Standby mode without emulation, and the debugger wishes to wake the system up, it can do so by asserting CDBGPWRUPREQ bit in debug port CTRL/STAT register. This restarts the clocks (and switches on the high power regulator if needed) but does not generate any interrupt or event to either processor core. When the wake-up has completed, CDBGPWRUPACK in the same register goes high. In this state the debugger can access the memories and peripheral registers, and trigger a wake-up of the CPU if required.

97.5.4 Debug reset

The debug components, except for the debug port, are reset by their respective clock domain resets. The debug port (SWJ-DP) is reset by a power-on reset of the always-on domain only. The access ports can be reset under debugger control, using CDBGRSTREQ/ACK in the CTRL/STAT register of the debug port.

The debugger sets CDBGRSTREQ bit to request a reset. It then polls CDBGRSTACK bit until it goes high, indicating that the reset has completed, following which it deasserts the CDBGRSTREQ bit.

97.6 Security

The trace and debug components allow a high degree of access to the processor and system during product development. In order to protect user code and ensure that the debug features can not be used to alter or compromise the normal operation of the finished product, these features can be disabled, or limited in scope. For example, secure software debug and trace can be disabled without preventing the debug of non-secure code.

97.6.1 Authentication signals

The following authentication signals are used by a CoreSight system to determine which features are enabled or disabled:

- DEVICEEN: Controls access to debug components via the external debug port.
  0: External debugger has no access to debug components or system interconnect.
  1: External debugger has access to debug components and system interconnect. External access to secure system interconnect depends on SPIDEN state.
- DBGEN: Global enable for all debug and trace features
  0: All debug features are disabled.
  1: Debug features in non-secure mode are enabled. Debug features in secure mode depend on SPIDEN state.
- SPIDEN: Enables debug in secure privileged mode when DBGEN = 1.
  0: Debug features are disabled in secure privileged mode. External access to secure system interconnect is disabled.
  1: Debug features are enabled in secure privileged mode. External access to secure system interconnect is enabled.
- NIDEN: Enables trace and performance monitoring (non-invasive debug).
  0: Trace generation is disabled.
  1: Trace generation in non-secure mode is enabled. Trace generation in non-secure mode depends on SPIDEN state.
- SPNIDEN: Enables trace and performance monitoring in secure privileged mode when NIDEN = 1.
  0: Trace generation is disabled in secure privileged mode.
  1: Trace generation is enabled in secure privileged mode.
- DBGSWEN: Enables self-hosted debug (by a software running on a processor).
  0: Software access to debug components on the APB-AP is disabled.
  1: Software access to debug components on the APB-AP is enabled.

The Cortex-A35 and Cortex-M33 have independent set of authentication signals to allow their debug capabilities to be set individually for each core. The Cortex-M33 authentication signals also apply to the Cortex-M0+.

The table below lists which signals apply to which debug and trace components.

Table 1009. Authentication signal connectivity

-	DEVICEEN	DBGEN	SPIDEN	NIDEN	SPNIDEN	DBGSWEN
Debug APB-AP	X	-	-	-	-	-
System bus AXI-AP	X	-	X	-	-	-

Table 1009. Authentication signal connectivity (continued)

-	DEVICEEN	DBGEN	SPIDEN	NIDEN	SPNIDEN	DBGSWEN
Cortex-M33 AHB-AP	X	-	X(1)	-	-	-
Cortex-M0+ AHB-AP	X	-	-	-	-	-
Cortex-M33 DWT/FPB/SCS/ITM	-	X(1)	X(1)	X(1)	X(1)	-
Cortex-M33 ETM	-	X(1)	X(1)	X(1)	X(1)	-

STM	-	X(1)(2)	X(1)(2)	X(1)(2)	X(1)(2)	X
ETF	-	-	-	-	-	X
ETR	-	X	X	-	-	X
TSGEN	-	-	-	-	-	X
TPIU	-	-	-	-	-	X

1. Cortex-M33/M0+ dedicated subset of authentication signals.
2. Cortex-A35 dedicated subset of authentication signals.

For detailed information on the behavior of each component according to the state of the authentication signals, refer to the relevant component section, or to the relevant Arm technical documentation.

The initial states of the signals are set at power-on reset, according to the table below. States of the signals can be modified in BSEC_DENR register after boot-up by a trusted software with secure and privilege access rights.

Refer to *Section 7: Boot and security control (BSEC)*, in the debug and trace control sections, for more details on the various combinations allowed for these signals.

Table 1010. Authentication signal initial states

Device state (set by OTP fuse)	Authentication signal default state	Description
Open device	All ones	All debug and trace is enabled at boot-up.
Closed device	All zeros	All debug and trace is disabled at boot-up. Secure software must enable debug as required after booting.

97.7 Chip-level TAP controller (CLTAPC)

The JTAG interface is connected to the internal scan chain of the device. It is used for testing as well as for debug. The first component in the scan chain is the chip-level TAP

controller which implements a TAP state machine based on IEEE Std 1149.1-1990. It allows access to the built-in manufacturing test features.

The CLTAPC must be bypassed in order to access the debug support functions provided by the SWJ-DP. This is done by prefixing the SWJ-DP instructions with the CLTAPC bypass instruction sequence (0b11111).

The CLTAPC also contains three 16-bit registers which can be accessed using the CTRL instruction sequence (0b01000) followed by 0b1111 to bypass the SWJ-DP.

Next, the register address is shifted into the DR (LSB first). Finally, the 16-bit register content is shifted into or out of the DR, according to whether the register is read or write.

The CLTAPC registers are listed in the table below.

Table 1011. CLTAPC registers

Name	Address	Description	read/write
SECSTS	0b001	Status of BSEC_DENR register	R
DBGCTL	0b010	Connected to BSEC_JTAGINR register	W
DBGSTS	0b011	Connected to BSEC_JTAGOUTR register	R

For details on BSEC register bits, refer to *Section 7.3.13: JTAG registers*.

97.8 Serial-wire and JTAG debug port (SWJ-DP)

The SWJ-DP is a CoreSight component that implements an external access port for connecting debugging equipment.

Two types of interface can be configured:

- 5-pin standard JTAG interface (JTAG-DP)
- 2-pin (clock + data) serial-wire debug port (SW-DP)

The two modes are mutually exclusive, since they share the same I/O pins.

By default, the JTAG-DP is selected after a system or power-on reset. The five I/O pins are configured by hardware in debug alternative function mode. The SWJ-DP incorporates pull-up resistors on JTDI, JTMS/SWDIO, and NJTRST, as well as a pull-down resistor on JTCK/SWCLK.

A debugger can select the SW-DP by transmitting the following serial data sequence on JTMS/SWDIO:

...(50 or more ones)...,0,1,1,1,1,0,0,1,1,1,1,0,0,1,1,1,...(50 or more ones)...

JTCK/SWCLK must be cycled for each data bit.

In SW-DP mode, the unused JTAG pins JTDI, JTDO and NJTRST can be used for other functions.

Note: All SWJ port I/Os can be reconfigured to other functions by software, but debugging is no longer possible.

97.8.1 JTAG debug port

The JTAG-DP implements a TAP state machine (TAPSM) based on IEEE Std 1149.1-1990.

For more details on the JTAG debug protocol, refer to the Arm debug interface Architecture specification *[1]*.

97.8.2 SWD debug port

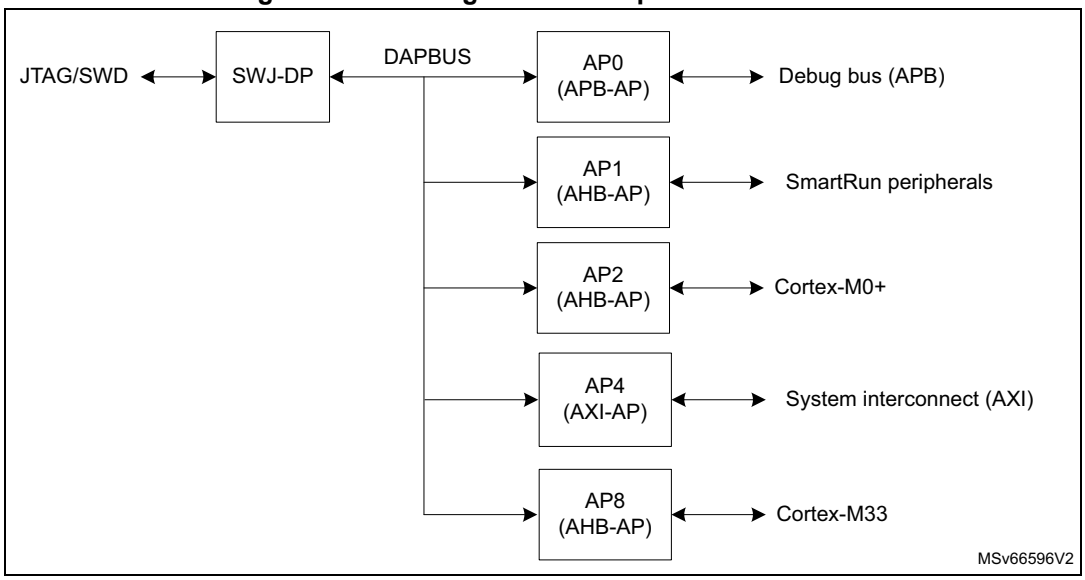
The serial-wire debug protocol uses the two following pins:

- SWCLK: clock from host to target
- SWDIO: bi-directional serial data (100 kΩ pull-up required)

Serial data is transferred LSB first, synchronously with the clock. A transfer comprises the following phases:

1. packet request (8 bits) transmitted by the host
2. acknowledge response (3 bits) transmitted by the target
3. data transfer (33 bits) transmitted by the host (for a write) or target (for a read)

For more details on the serial wire debug protocol, refer to the Arm debug interface Architecture Specification *[1]*.



Note: The SWJ-DP implements SWD protocol version 2.

In addition to the main SWJ-DP, a dedicated SWD-only interface is provisioned to be able to access the Cortex-M0+ for debug in low-power modes.

97.9 Access ports

There are five access ports (AP) attached to the DP.

Figure 1181. Debug and access port connections

- AP0: Debug access port (APB-AP). It allows access to CoreSight components on debug APB bus, including the Cortex-A35. The DBGMCU is also located on this bus.
- AP1: SmartRun peripherals access (AHB-AP) port. It allows access to peripherals located in the SmartRun power domain even though the Cortex-M0+ is switched off.

- AP2: Cortex-M0+ access port (AHB-AP). It allows access to debug features integrated in the Cortex-M0+ processor via its PPB bus. By default, the Cortex-M0+ debug is accessed through AP2, but this can be switched to a separate SWD port by clearing DBG_SWD_SEL_N in DBGMCU_CR (refer to *Table 1033*).
- AP4: System bus access port (AXI-AP). It allows access to the system bus matrix. This gives visibility of all memories and peripherals accessible via AXI and AHB interconnects, except the ones on system APB debug bus. No CoreSight components are accessible via this port.
- AP8: Cortex-M33 access port (AHB-AP). It allows access to debug and trace features integrated in the Cortex-M33 processor core via its PPB bus.

All five access ports are of type MEM-AP: debug and trace component registers are mapped in the address space of the associated debug bus. The AP is seen by the debugger as a set of 32-bit registers organized in banks of four registers each. Some of these registers are used to configure or monitor the AP itself, while others are used to perform a transfer on the bus.

For more detailed information on the MEM-AP, refer to the Arm debug interface architecture specification *[1]*.

97.9.1 Authentication

The effect of the authentication signals for each access port is shown in the tables below.

Table 1012. AP0 (Debug APB) authentication behavior

DEVICEEN	Other authentication signal	Behavior
0	X	All access blocked.
1		All access enabled. Note that access to certain components may return an error depending on the state of the other authentication signals.

Table 1013. AP1-2-4-8 authentication behavior

DEVICEEN	SPIDEN(1)	Others	Behavior
0	X	X	All transfers blocked. Any attempt to perform a transfer results in an error.
1	0		Secure transfers blocked. Any attempt to perform a secure transfer results in an error. Non-secure transfers are enabled.
1	1		Both non-secure and secure transfers are enabled.

1. AP1/2/8 are controlled from Cortex-M33/M0+ SPIDEN signal. AP4 is controlled from Cortex-A35 SPIDEN signal.

97.10 System debug features

The system debug features include the following CoreSight components:

- System ROM tables
- Global trace timestamp generator (TSGEN)
- System cross-trigger interface (CTI)
- Cross-trigger matrix (CTM)

- Trace port interface Unit (TPIU)
- Trace bus funnel (CSTF)
- Embedded trace FIFO (ETF)
- Embedded trace router (ETR)
- Replicator
- System trace macrocell (STM)
- Serial wire output (SWO)

These components are accessible by the debugger via the system APB-AP and its associated APB debug bus. They are also accessible from the Cortex-A35 and Cortex-M33 processors to the extent that self-hosted feature is enabled.

The MCU debug unit (DBGMCU) is also accessed via the debug APB. This non-CoreSight component contains registers for configuring the behavior of the device in debug mode.

97.10.1 System ROM tables

There is one main ROM table on the debug APB bus. The ROM table is a CoreSight component that contains the base addresses of CoreSight debug components on APB bus. This table allows a debugger to discover automatically the CoreSight system topology.

The ROM table points to the CoreSight components located in the debug subsystem, and to a secondary ROM table in the Cortex-A35 subsystem.

The table occupies a 4-Kbyte, 32-bit wide chunk of APB address space:

- from 0x8000 0000 to 0x8000 0FFC when accessed by the JTAG debugger through the debug APB-AP
- from 0x4A00 0000 to 0x4A00 0FFC when accessed from the system bus

Each component referenced in the ROM table occupies a 64-Kbyte range.

Table 1014. Debug subsystem ROM table

Address offset in ROM table	Component name	Component base address (system bus)	Component base address (debugger)	Component address offset	Data
0x000	DBGMCU	0x4A01 0000	0x8001 0000	0x1 0000	0x0001 0002
0x004	Funnel	0x4A02 0000	0x8002 0000	0x2 0000	0x0002 0003
0x008	ETF	0x4A03 0000	0x8003 0000	0x3 0000	0x0003 0003
0x00C	ETR	0x4A04 0000	0x8004 0000	0x4 0000	0x0004 0003
0x010	TPIU	0x4A05 0000	0x8005 0000	0x5 0000	0x0005 0003
0x014	Replicator	0x4A06 0000	0x8006 0000	0x6 0000	0x0006 0003
0x018	Timestamp generator	0x4A07 0000	0x8007 0000	0x7 0000	0x0007 0003
0x01C	STM	0x4A08 0000	0x8008 0000	0x8 0000	0x0008 0003
0x020	CTI0	0x4A09 0000	0x8009 0000	0x9 0000	0x0009 0003
0x024	CTI1	0x4A0A 0000	0x800A 0000	0xA 0000	0x000A 0003
0x028	SWO	0x4A0B 0000	0x800B 0000	0xB 0000	0x000B 0003

Table 1014. Debug subsystem ROM table (continued)

Address offset in ROM table	Component name	Component base address (system bus)	Component base address (debugger)	Component address offset	Data
0x02C	Cortex-A35 ROM table	0x4A20 0000	0x8020 0000	0x20 0000	0x0020 0003
0x030	Top of table	-	-	-	0x0000 0000
0x034 to 0xFC8	Reserved	-	-	-	0x0000 0000
0xFCC to 0xFFC	ROM table registers	-	-	-	-

The secondary ROM table below describes the debug components attached to the Cortex-A35 processors. It occupies a 4-Kbyte, 32-bit wide chunk of APB address space:

- from 0x8020 0000 to 0x8020 0FFC when accessed by the debugger
- from 0x4A21 0000 to 0x4A21 0FFC when accessed from the system bus

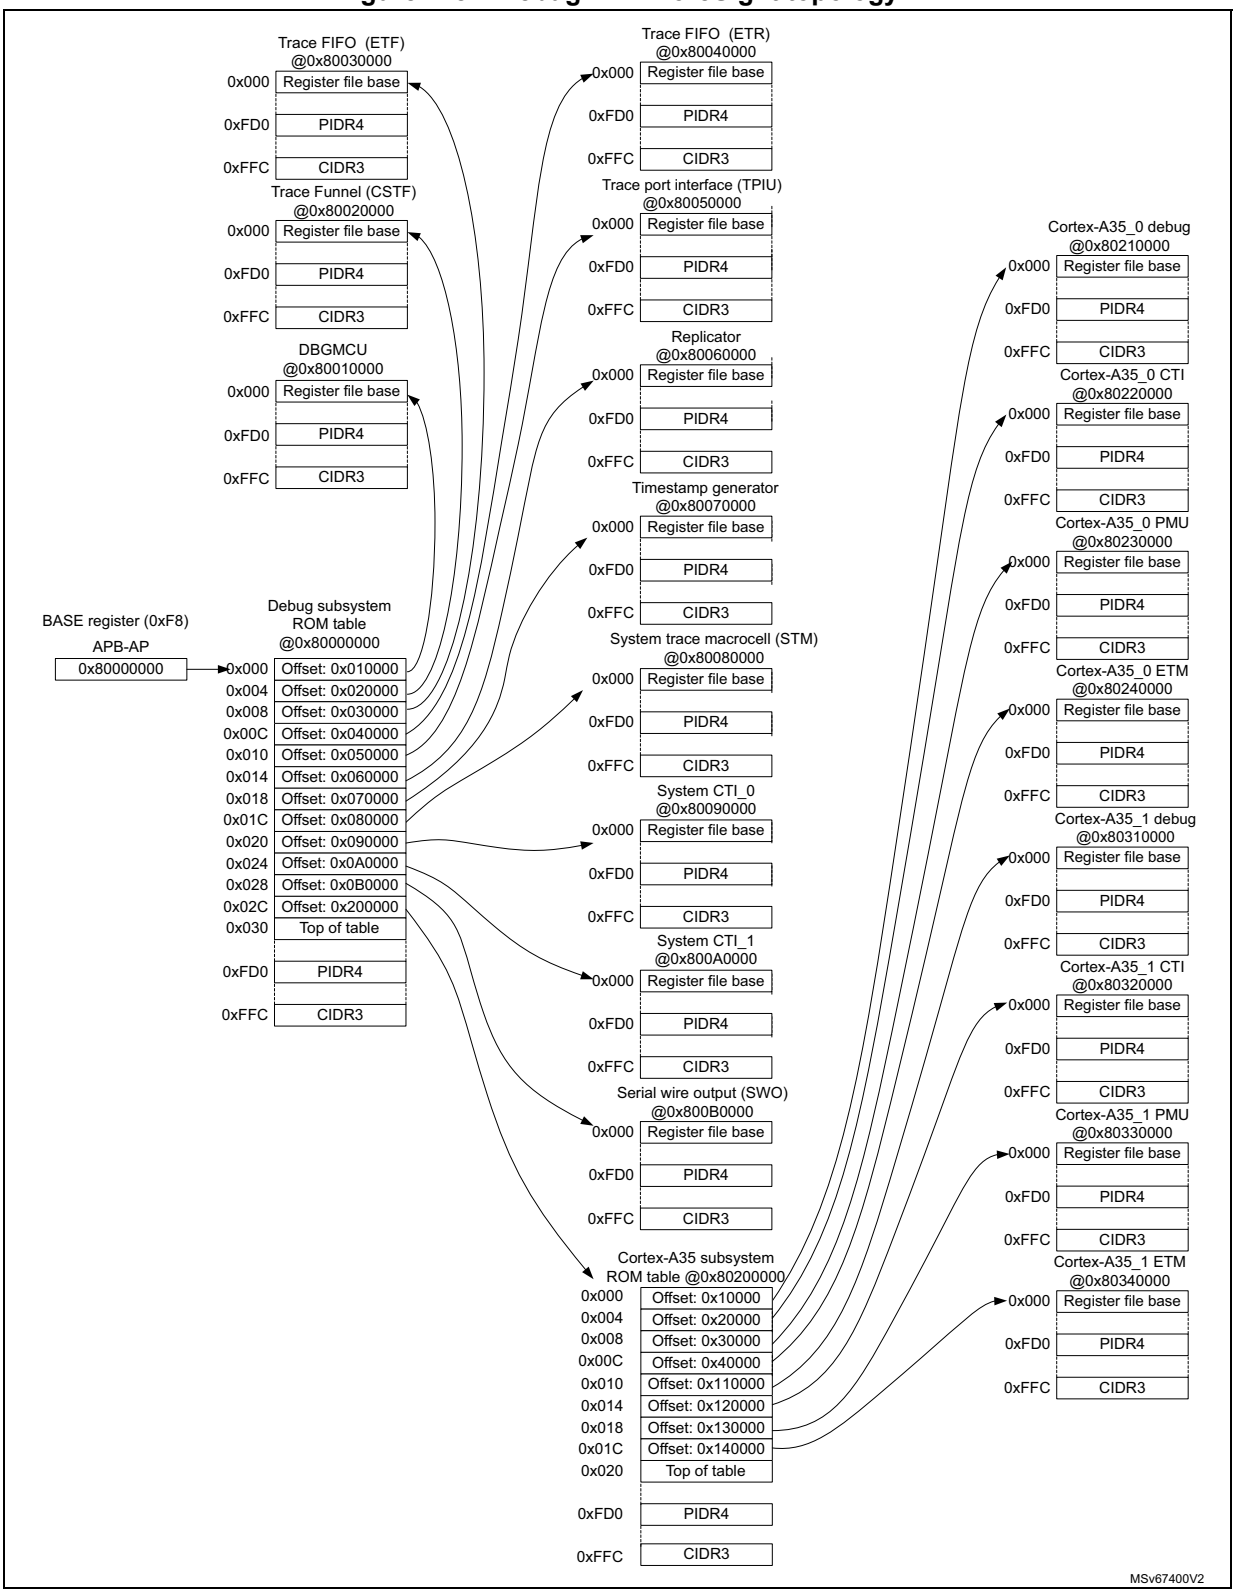


Table 1015. Cortex-A35 subsystem ROM table

Address offset in ROM table	Component name	Component base address (system bus)	Component base address (debugger)	Component address offset	Entry
0x000	CA35_0_DBG	0x4A21 0000	0x8021 0000	0x1 0000	0x0001 0003
0x004	CA35_0_CTI	0x4A22 0000	0x8022 0000	0x2 0000	0x0002 0003
0x008	CA35_0_PMU	0x4A23 0000	0x8023 0000	0x3 0000	0x0003 0003

0x01C	CA35_1_ETM	0x4A34 0000	0x8034 0000	0x14 0000	0x0014 0003
0x020	Top of table	-	-	-	0x0000 0000
0x024 to 0xFC8	Reserved	-	-	-	0x0000 0000
0xFCC to 0xFFC	ROM table registers	-	-	-	-

For more information on these ROM tables, refer to the Arm Debug Interface Architecture Specification *[1]*.

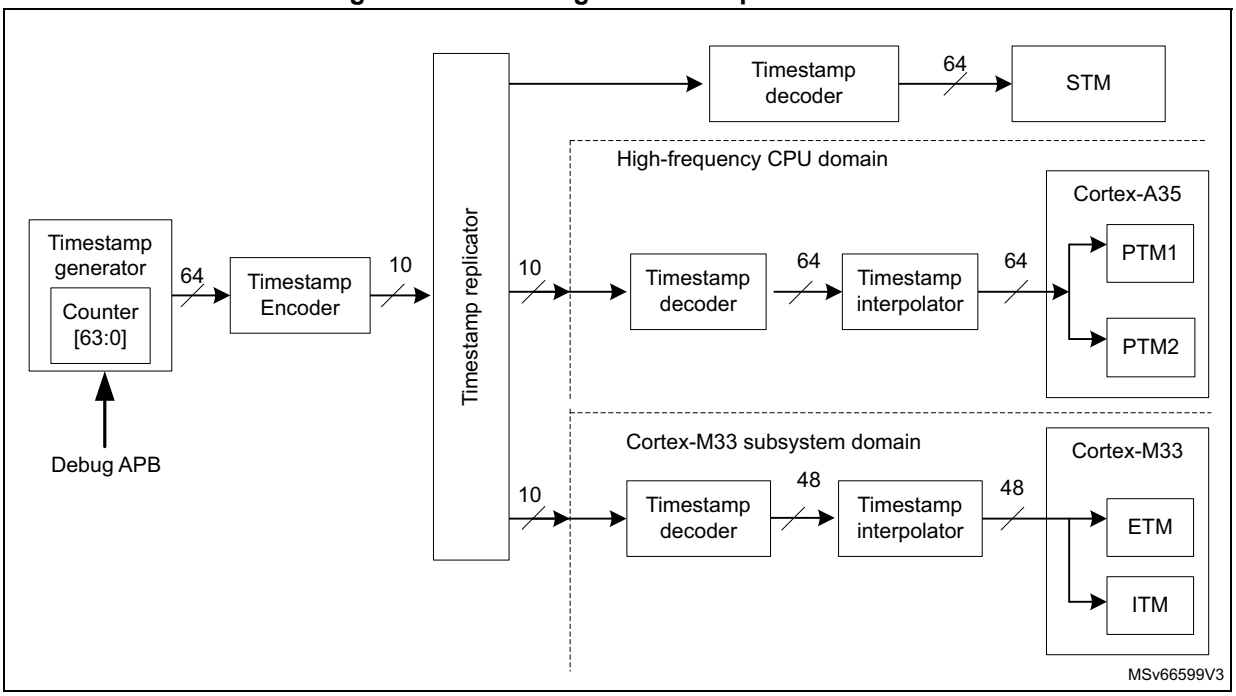
The topology for CoreSight components on debug APB is shown in the figure below.

Figure 1182. Debug APB CoreSight topology

97.10.2 CoreSight global timestamp generator (TSGEN)

The CoreSight global timestamp generator contains a 64-bit counter that provides a common timing reference for all trace sources in the system (PTM, ETM, ITM and STM). These components insert timestamps in the trace streams that allow the trace analyzer to recover the chronological order of trace packets, which can be lost when multiple trace sources are multiplexed into one stream at the funnel.

TSGEN registers are accessible over the debug APB. This allows the debugger or debug software to perform the following tasks:



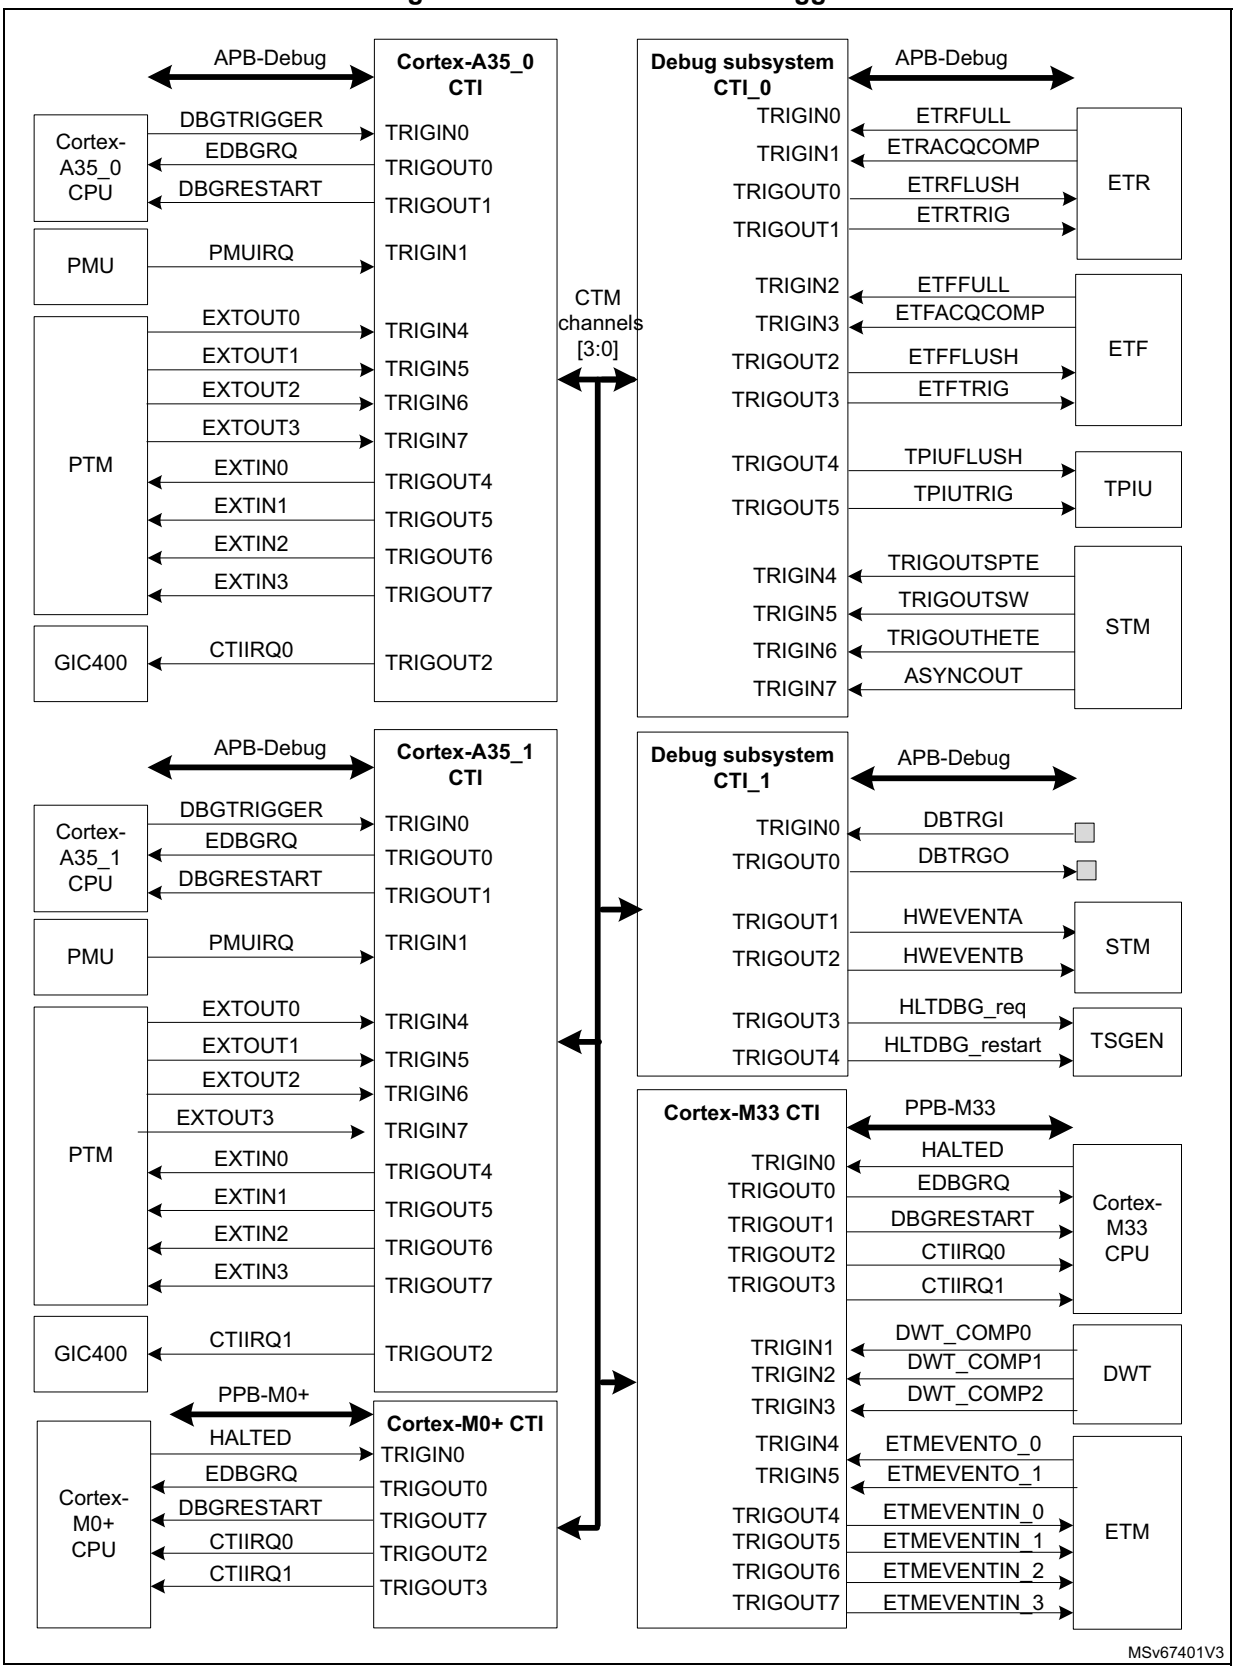
- Start and stop the timestamp incrementing.
- Cause the timestamp counter to stop when debug state is entered. To enable this feature, the debug subsystem CTI must be configured to signal to the timestamp generator when system-wide debug state has been entered (all CPU cores halted).
- Read the current timestamp value.
- Change the current timestamp value. The timestamp counter must be halted while it is changed. When the timestamp value is changed, the timestamp generator resynchronizes all trace sources.
- Change the reported timestamp increment.

For more information on the TSGEN CoreSight component, refer to the Arm CoreSight SoC-400 technical reference manual *[2]*.

The timestamp generator has its own clock domain CK_KER_TSGEN, and is distributed to the Cortex-A35 and Cortex-M33 to provide a time information for their respective trace macrocell, and to the STM to provide a time information for stamping its messages.
To simplify the distribution over clock domain boundaries, the 64-bit timestamp is encoded in 7 bits, then decoded in the destination power domain. The timestamp distribution is shown in *Figure 1183*.

Whenever the frequency of TSGEN or Cortex-M33 changes, the ETM of the Cortex-M33 processor receives a pulse on TSCLKCHANGE input.

Figure 1183. CoreSight timestamp distribution



97.10.3 Cross trigger interface (CTI) and matrix (CTM)

The cross trigger interfaces (CTI) and cross trigger matrix (CTM) together form the CoreSight embedded cross trigger feature. There are six CTI components, two in the debug subsystem, one for each Cortex-A35, one dedicated to the Cortex-M33 and one dedicated to the Cortex-M0+.

The CTIs are connected to each other via two CTMs. Debug subsystem and Cortex-A35 CTIs are accessible to the debugger via the debug APB. The Cortex-M33 CTI is accessible on its private peripheral bus (PPB) via the Cortex-M33 AHB access port.
The Cortex-M0+CTI is accessible on its private peripheral bus (PPB) via the Cortex-M0+ AHB access port.

Figure 1184. Embedded cross trigger

The CTIs allow events from various sources to trigger debug and/or trace activity. For example, a breakpoint reached in one of the processor cores can stop the other processors, or a transition detected on an external trigger input can start code trace.

Each CTI has up to eight trigger inputs and eight trigger outputs. Any input can be connected to any output, on the same CTI, or on another CTI via the CTM. The trigger input and output signals for each CTI are listed in tables below.

Table 1016. Trace subsystem CTI_0 inputs

-	Source signal	Source component	Comments
0	ETRACQCOMP	ETR	ETR capture finished. Allows a debug event to be generated when trace acquisition is complete.
1	ETRFULL	ETR	ETF full flag. Allows a debug event to be generated when the trace buffer is full.
2	ETFACQCOMP	ETF	ETF capture finished. Allows a debug event to be generated when the trace FIFO is empty.
3	ETFFULL	ETF	ETF full flag. Allows a debug event to be generated when the trace FIFO is full.
4	TRIGOUTSPTE	STM	The STM asserts this signal for one clock cycle when a trigger event is detected on a match using STMSPTER.
5	TRIGOUTSW	STM	The STM asserts this signal for one clock cycle when a trigger event is generated on writes to a TRIG location in the extended stimulus port registers.
6	TRIGOUTHETE	STM	The STM asserts this signal for one clock cycle when a trigger event is detected on a match using STMHETER.
7	ASYNCOUT	STM	Alignment synchronization signal. The STM asserts this signal for one clock cycle when an ASYNC-VERSION-FREQ sequence is output on the ATB interface, and the ASYNCOUT signal can be used for cross-triggering.

Table 1017. Trace subsystem CTI_0 outputs

-	Output signal	Destination component	Comments
0	ETRTRIG	ETR	ETR trigger. Causes various kinds of flush, stops the TMC, and causes additional trigger insertion.
1	ETRFLUSH	ETR	ETF flush trigger. Causes trace sources to be flushed into destination memory.
2	ETFTRIG	ETF	ETF enable trigger. Starts filling the trace FIFO.
3	ETFFLUSH	ETF	ETF flush trigger. Causes trace FIFO to be flushed.
4	TPIUFLUSH	TPIU	Trace port flush trigger. Causes TPIU FIFO to be flushed.
5	TPIUTRIG	TPIU	Trace port enable trigger. Starts trace output on the external trace port.

There are four event channels in a cross trigger matrix, which allows up to four, parallel, bidirectional connections between trigger inputs and outputs on different CTIs.

To connect input number *m* on CTI*x* to output number *n* on CTI*y*, the input must be connected to an event channel *p* using the CTIINEN*m* register of CTI*x*. The same channel *p* must be connected to the output using the CTIOUTEN*n* register of CTI*y*.

Note: This applies even if the input and the output belong to the same CTI.

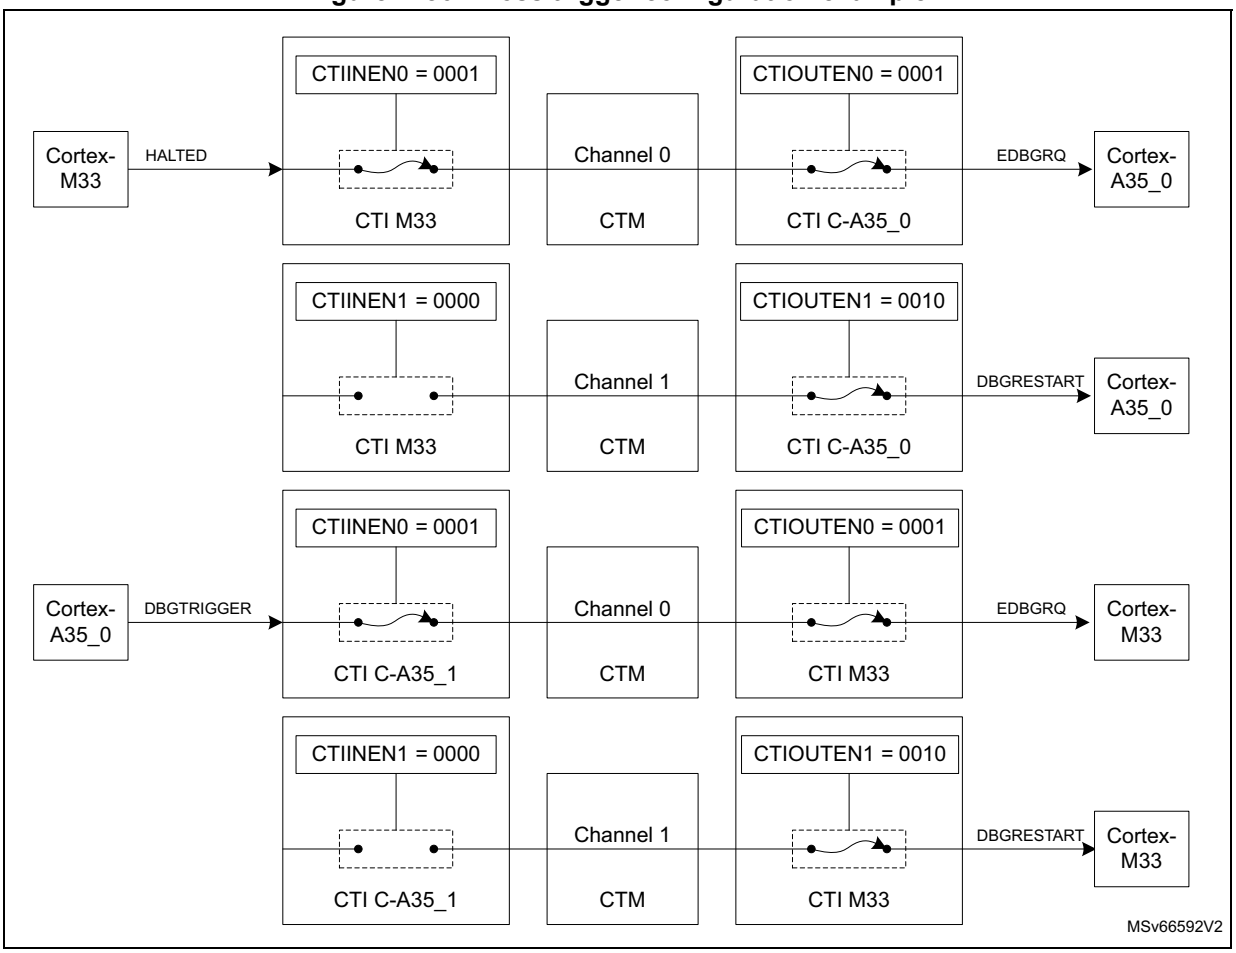
An input can be connected to more than one channel (up to four). An input can then be routed to several outputs. Similarly, an output can be connected to several inputs. Several inputs/outputs can also be connected to the same channel.

Figure 1185. Mapping trigger inputs to outputs

Example configuration: When either the MCU or the MPU hits a breakpoint, stop the other processor and restart the two processors synchronously.

To stop both cores, when either core stops requires the debug status output of each core (HALTED for Cortex-M33, DBGTRIGGER for Cortex-A35) to be connected to the EDBGRQ input of the opposite core.

As mentioned in *Table 1020* and *Table 1022*, the DBGTRIGGER signal from Cortex-A35_0 processor core0 is connected to input 0 of the Cortex-A35_0 CTI. The same signal from the Cortex-M33 core is connected to the same input on the Cortex-M33 CTI. The programming of the CTIIEN0 register on each CTI connects these inputs to a CTM channel (for example channel 0).



As mentioned in *Table 1021* and *Table 1023*, the EDBGRQ signals to the CPUs are connected to output 0 of their respective CTIs. The programming of the CTIIEN0 register on each CTI connects these outputs to the same CTM channel.

To restart both cores simultaneously the debugger must use the APPPULSE register in either of the CTIs. This allows the debugger to generate a pulse on any of the four CTM channels. The channel must be connected to the DBGRESTART signal of both cores.

As mentioned in *Table 1021* and *Table 1023*, the DBGRESTART signals to the CPUs are connected to output 1 of their respective CTIs. The programming of the CTIOUTEN1 register on each CTI connects these outputs to another CTM channel (for example, channel 1).

The above configuration is illustrated in the figure below.

Figure 1186. Cross trigger configuration example

To force the processors to restart simultaneously, the debugger must use the following procedure:

1. Clear debug request by writing 0x01, then 0x00, to CTIINTACK register in each CTI.
2. Cause a pulse on channel 1 by writing 0x02 to APPPULSE register in either CTI. This generates a restart request to both processors.

Note: The debugger can also force both cores to stop simultaneously by writing 0x01 to the APPPULSE register in either CTI, which generates a pulse on channel 0.

Cross trigger interface registers

The register base address for each CTI is defined by the ROM table for the bus to which it is connected. The registers are the same for each CTI.

For more information on the CTI CoreSight component, refer to the Arm CoreSight SoC-400 technical reference manual *[2]*.

97.10.4 Trace funnel (CSTF)

The trace funnel is a CoreSight component that combines the ATB buses from the five trace sources into one single ATB. The CSTF has five ATB slave ports, and one ATB master port. An arbiter selects the slave ports according to a programmable priority.

The slave ports are connected as follows:

- S0: Cortex-A35_0 PTM
- S1: Cortex-A35_1 PTM
- S2: STM
- S3: Cortex-M33 ETM
- S4: Cortex-M33 ITM

The CSTF registers allow the slave ports to be individually enabled, and their priority settings to be configured. The priorities can be modified only when trace is disabled.
The arbitration works as follows:

1. The arbiter selects the slave port with the highest assigned priority that has data valid.
2. Up to min_hold_time transfers are passed from the selected slave to the master port, where min_hold_time is programmable in the CONTROL register.
3. A new arbitration is then performed.

A high priority must be assigned to slave ports connected to sources with a small amount of buffering, or where data loss can not be tolerated. Low priority must be assigned to less critical sources or those with large buffers.

For more information on the CSTF CoreSight component, refer to the Arm CoreSight SoC-400 technical reference manual *[2]*.

97.10.5 Embedded trace FIFO (ETF)

The ETF is a 64-Kbyte memory which captures trace data from five trace sources:

- PTM/ETM of each Cortex-A35 core
- ITM of Cortex-M33
- STM

The ETF is a configuration of the CoreSight trace memory controller component. It can be used in the following modes (selected in the mode register):

- Hardware FIFO mode

  The trace memory is used as a FIFO that is drained through the ATB master interface. Trace data is captured into the trace RAM and when full, the incoming trace stream is stalled. When the trace buffer is not empty, trace data is drained out through the ATB master interface to the TPIU.

  In this mode, the role of the FIFO is to smooth the flow of trace information arriving at the trace port. Since the trace data can be very bursty in nature, the peak data rate can easily exceed the port capability, resulting in an overflow. The ETF allows a steady data rate at the trace port, which can then be sized according to the average rate rather than the peak. The trace is stored off-chip in real time by the trace port analyzer tool, and so the trace log can be very big.

- Software FIFO mode

  The trace memory is used as a FIFO that can be read through the RRD register while trace is being captured. Trace data is captured into the trace RAM and when full, the incoming trace stream is stalled.

  This mode allows the trace to be transferred by DMA into the system memory, or to a high-speed interface (such as SPI, USB), or even monitored by software running on one of the cores.

Note: Unlike the hardware FIFO mode, this mode is invasive, since it uses system resources which are shared by the processors.

- Circular buffer mode (embedded trace buffer)

  The trace memory is used as a circular buffer. Trace data is captured into the trace memory starting from the location pointed to by the write pointer register. Even when the trace memory is full, incoming trace data continues to be overwritten into the trace memory until a stop condition occurs.

  In this mode, the ETF stores the trace data on-chip, so the trace log size is limited to the ETF SRAM one (64 Kbytes in this case). Being a circular buffer, if the FIFO becomes full, incoming trace data overwrites the oldest stored data, which are lost. Therefore the contents of the trace buffer represent the most recent activity of the processor(s), up to the point when the buffer was stopped, rather than all the activity since the trace was started.

  The possible methods to read out the buffer contents once the trace has stopped are details below:

  – via the trace port: With the TPIU enabled, the contents of the buffer are output over the trace port. This can be done by setting the DrainBuffer bit in the ETF_FFCR register.
  – via the ETR: The buffer can be sent out to memory, either internal such as SRAM, or external such as DDR. With the ETR enabled, this can be done by setting the DrainBuffer bit in the ETF_FFCR register.
  – via the debug port: the debugger can read the buffer via the RRD register which is accessible over the debug APB.
  – by software: Either processor can read the buffer via the RRD register, since the debug APB is accessible from the system bus. This can also be performed by software triggered DMA transfers. No hardware DMA request is available so the FULL flag can be used to trigger an interrupt to the appropriate core via the cross trigger. The software can then read the ETF_CBUFLVL register to find out the number of data to be read.

For more information on the trace memory controller CoreSight component, refer to the Arm CoreSight Trace Memory Controller technical reference manual *[3]*.

97.10.6 Embedded trace router (ETR)

The ETR allows trace data from the Arm trace bus to be sent to external memory, using a DMA scatter/gather interface over an AXI bus.

The ETR also supports programmable burst options for an optimum efficiency of the system interconnect and memory controller. The trace capture can be intrusive to system performance, because less memory is available to the rest of the system, and because the bandwidth must be shared between the ETR and regular system functions. However, the depth of trace capture available is likely to be much larger than available when storing in the

ETF and a trace port is not required. Reading of the AXI based trace buffer can either be done directly over the AXI from a normal bus master or through the ETR as if it is an ETB.

The ETR is a configuration of the CoreSight trace memory controller component. It is configured at design time, and some registers accessible through the APB interface allows some parameters to be modified. In particular, the following:

- AXI control register: It contains a field indicating the maximum number of data transfers that can occur within each burst initiated by the TMC on the AXI master interface.
- data buffer address low and high registers: They contain the 32-bit address used to locate the trace buffer in the system memory.
- formatter and flush control register: It enables the trace data to be TWP formatted with only frames (no padding or syncs). When disabled, the data is raw data from the ATB input, without the ID.

A low-power interface is implemented in order to allow the debugger to reset the ETR without provoking protocol violation on the global AXI bus interconnect. The LPI interface is controlled from a configuration register located in the Cortex-A35 system configuration.

From a security perspective, the ETR is associated with a RIMU that controls its master access to the interconnect (see *Section 9: Resource isolation framework security controller (RIFSC)* for more details on the RIMU).

97.10.7 Trace port interface unit (TPIU)

The TPIU is a CoreSight component that formats the trace stream and outputs it on the external trace port signals. The TPIU has a single ATB slave port for incoming trace data. The trace port is a synchronous parallel port, comprising a clock output, TRACECLK, and sixteen data outputs, TRACED(15:0). The trace port width is programmable in the range 1 to 16. Using a smaller port width reduces the number of test points/connector pins needed, and frees up I/Os for other purposes. It also restricts the bandwidth of the trace port and the quantity of trace information that can be output in real time.

For more information on TPIU CoreSight component, refer to the Arm CoreSight SoC-400 technical reference manual *[2]*.

97.10.8 Replicator

This Arm CoreSight component replicates an Arm trace bus input to two identical Arm trace bus outputs. The replicator does not accept more data from the trace source until all trace sinks have accepted this data. This reduces the throughput of the replicator to match that of the slowest trace sink. To prevent this, the APB interface is implemented on this replicator, in order to disable paths. This gives also some filtering capabilities (for example some trace off-chip, some to the ETR).

Table 1026. Replicator allocation

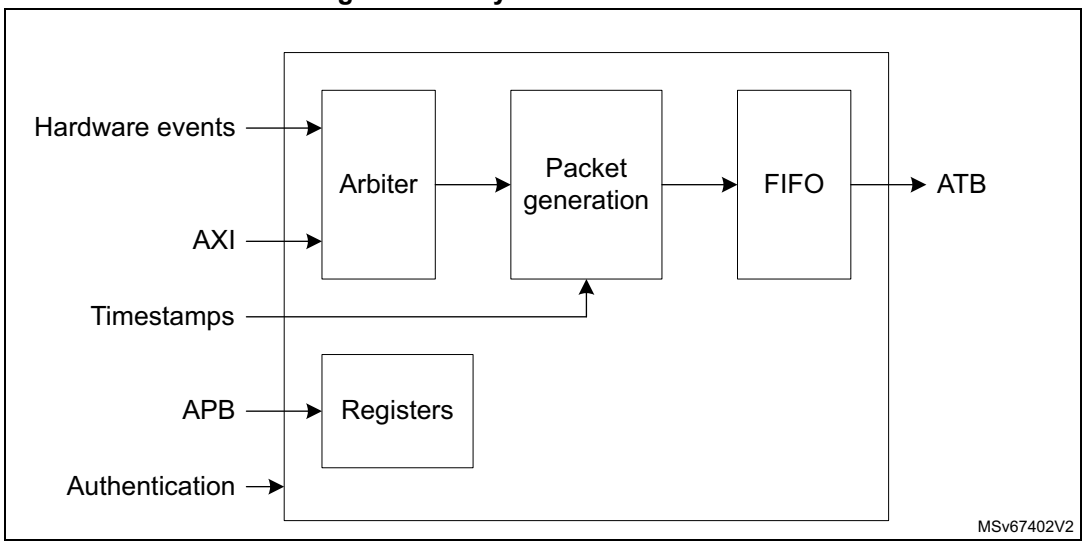
ATB port	Trace sink
#0	ETR
#1	TPIU

97.10.9 Serial-wire output (SWO)

The SWO is a CoreSight component that formats the trace stream from the Cortex-M33 processor ITM, and outputs it on the single wire TRACESWO output.

Compared to the TPIU, the SWO contains:

- no formatter
- no pattern generator
- an 8-bit ATB input
- no synchronous trace output (no TRACEDx or TRACECLK pin)
- no support for flush (because this is not required)
- no support for triggering



The SWO output supports Manchester encoded and UART NRZ formats.

For more information about the SWO CoreSight component, refer to the Arm CoreSight Components technical reference manual *[4]*.

97.10.10 System trace macrocell (STM)

The system trace macrocell is a CoreSight component which allows instrumentation data generated by software to be incorporated in the trace output. The software writes the instrumentation data to the STM via a memory-mapped port on the AXI system interconnect. The data is formatted and time-stamped for output on the ATB trace bus, where it is merged with the trace coming from other sources (ETM, ITM).

Figure 1187. System trace macrocell

The STM is configured with the following values:

- DATA_FIFO_DEPTH = 16
- CHN_FIFO_DEPTH = 8
- HW_EVOBIF_PRESENT = TRUE

The various AXI masters can generate trace by writing to the extended STM stimulus ports via its AXI slave port, which is mapped in a 4-Mbyte window of address space

(see *Section 2.4: Memory organization*). A 256-byte extended stimulus port comprises 16 x 64-bit locations or registers. Writes to different locations generate different types of trace packets, as shown in the table below.

The base address for stimulus port n is the STM base address + n x 256. A master can use any number of the 16384 available stimulus ports mapped in the 4-Mbyte window.

Table 1027. STM extended stimulus port memory map

Address offset	Name	Description
0x00	G_DMTS	Data, marked with timestamp, guaranteed
0x08	G_DM	Data, marked, guaranteed
0x10	G_DTS	Data, with timestamp, guaranteed
0x18	G_D	Data, guaranteed
0x20-0x58	-	Reserved
0x60	G_FLAGTS	Flag with timestamp, guaranteed
0x68	G_FLAG	Flag, guaranteed
0x70	G_TRIGTS	Trigger with timestamp, guaranteed
0x78	G_TRIG	Trigger, guaranteed
0x80	I_DMTS	Data, marked with timestamp, invariant timing
0x88	I_DM	Data, marked, invariant timing
0x90	I_DTS	Data, with timestamp, invariant timing
0x98	I_D	Data, invariant timing
0xA0-0xD8	-	Reserved
0xE0	I_FLAGTS	Flag with timestamp, invariant timing
0xE8	I_FLAG	Flag, invariant timing
0xF0	I_TRIGTS	Trigger with timestamp, invariant timing
0xF8	I_TRIG	Trigger, invariant timing

The trace packets contain the 8-bit identity of the master that triggered them. This identity is decoded from the non-secure master ID carried on the AWID wires of the AXI interconnect. The ID also includes the security status of the master at the time.

The ID is mapped as follows:

- Bit [7] = 0
- Bit [6] = secure/non-secure state
- Bit [5:0] = master ID

A list of valid IDs and how they map to the originating master is given in the table below.

Table 1028. STM trace packet ID mapping to AXI masters

Master	Secure access ID	Non-secure access ID
Cortex-A35 processor core0	0x00	0x40
Cortex-A35 processor core1	0x01	0x41

Table 1028. STM trace packet ID mapping to AXI masters (continued)

Master	Secure access ID	Non-secure access ID
Cortex-M33	0x02	0x42
HPDMA1	0x03	0x43
HPDMA2	0x04	0x44
HPDMA3	0x05	0x45
DAP-AXI-AP	0x06	0x46

The STM can also generate trace packets or triggers when certain hardware events are detected. A maximum of 64 events can be traced at any one time. An external multiplexer allows four sets of signals to be mapped onto these events. The mapping is given in *Table 1029* to *Table 1031*. All events are edge sensitive.

As shown in *Table 1009*, the STM is subject to the authentication signals for Cortex-A35 and Cortex-M33. This means that only a processor that has the rights to produce trace (established from BSEC_DENR) can use the STM.

For more information on the STM, refer to the Arm CoreSight STM technical reference manual *[9]*.

STM registers

The STM is configured and controlled by registers mapped on the debug APB accessible either from the debugger through JTAG or through the interconnect for self-hosted debug (see *Section 2.4: Memory organization*).

97.10.11 Microcontroller debug unit (DBGMCU)

The DBGMCU is a component containing a number of registers which control the power and clock behavior in debug mode. It allows the debugger or debug software for the following tasks:

- Maintain the clock and power to the processors when in low-power modes.
- Maintain the clock and power to the system debug and trace components when in low-power modes.
- Stop the clock to certain peripherals (CAN, SMBUS timeout, watchdogs, timers, RTC, DMAs) when a processor is stopped in debug mode.

Low-power mode emulation in debug

When entering a low-power mode, the clock to the processor, the system clock, or the core power supply (only in Standby), can be switched off. This prevents any debug accesses to the unclocked domains.

To simplify debugging of applications which use these power saving features, the clock and power can be maintained or not according to the setting of DBG_STANDBY, DBG_STOP, and DBG_SLEEP in DBGMCU_CR.

There are no restrictions from a security perspective to access these control bits as the overall system behavior is not modified, apart that the power and clocks remain on. The application software does not need to be modified.

If the system enters one of the power saving modes, and the corresponding register bit is set, the system state in the EXTI is not affected: the system enters and exits the low-power mode as usual. The clock and power remain active, allowing the debugger full access.

Note: If the TPIU is used, loss of trace data can occur if the system enters Standby and switches off the core power before the TPIU FIFO is empty. The software can check the FIFO state to avoid this. If DBG_STANDBY bit is set while using the trace port, the trace continues to flush during Standby, and no specific software action is required.

Peripheral clock “freeze” in debug

When one or more processors are halted in debug state, by default the peripherals continue to operate. The system state, at the moment the breakpoint was taken, is overwritten and can not be recovered. Some peripherals require software intervention on a regular basis, without which they may time out and generate a reset (watchdogs for example).

By setting the corresponding bits in DBGMCU peripheral freeze registers, some peripheral clocks can be stopped automatically as soon as one or more processors enter debug state. The clocks remain stopped until the processor is restarted.

The following peripherals support this feature:

- all DMA engines (HPDMAx and LPDMA1)
- all timers (TIMx, LPTIMx)
- all I2C peripherals (to prevent SMBus timeout)
- FDCAN
- all watchdog timers (WWDGx, IWDGx)
- RTC

There is one CPU specific register for each peripheral to control whether the peripheral is sensitive to Cortex-A35, Cortex-M33, or Cortex-M0+ debug states.

In STM32MP23/25xx, peripherals can be dedicated to one specific processor thanks to a RISU (resource isolation slave unit) for peripherals (see *Section 9: Resource isolation framework security controller (RIFSC)* for more details on the RISUP). DBGMCU register bits inherit from these RISUP. As a consequence, accesses to the register bits are filtered accordingly to the processor which has been associated to the peripheral.

As the DBGMCU can not be accessed from the Cortex-M0+, the Cortex-M33 has the delegation to program the freeze registers associated to the Cortex-M0+.

The access to the registers depends also on the secure state of the processor as follows:

- When SPIDEN = 1 (secure privilege debug enabled), all bits can be modified by a secure access (PPROT[1] = 0). Only bits corresponding to non-secure peripherals (or DMA channels) can be modified by a non-secure access (PPROT[1] = 1).
  All bits can be read by both non-secure or secure accesses.

- When SPIDEN = 0 (secure privilege debug disabled), both secure and non-secure accesses are possible. Only bits corresponding to non-secure peripherals (or DMA channels) can be modified. All bits can be read.

The status (secure or non-secure) and the allocation of a peripheral or a DMA channel, are signaled to the DBGMCU by the peripheral. To ensure that these settings are always taken into account, the debugger can only access registers through the DAP AXI-AP. The access then goes through the device interconnect, and must satisfy the same rules as a processor with respect to secure and allocation schemes.

Cortex-M33 and Cortex-M0+ debug states correspond to a high level on their respective HALTED signal. The Cortex-A35 is an OR of the DBGACK signal from each core. If either Cortex-A35 processor core enters debug, and the corresponding bit in the peripheral freeze register is set, the peripheral clock is then frozen.

The IWDG1 (secure watchdog for Cortex-A35) is an exception to the above. When secure debugging is disabled (SPIDEN = 0), any Cortex-A35 processor core which is in secure state does not stop in debug mode until it exits secure state. For security reasons, when SPIDEN = 0, the IWDG1 does not stop unless both Cortex-A35 processor core DBGACK signals are active: both processor cores have stopped, and are then in non-secure state.

When secure debugging is enabled (SPIDEN = 1), the behavior is determined by WDFZCTL in DBGMCU_CRA35 register. The IWDG1 behavior is summarized in the table below.

Table 1032. IWDG1 behavior in debug

Inputs					IWDG1 frozen?
IWDG1[1]	SPIDEN	WDFZCTL[2]	DEBUGACK (Cortex-A35 core0)	DEBUGACK (Cortex-A35 core1)	
0	X	X	X	X	No
1	0	X	0	X	No
1	0	X	X	0	No
1	0	X	1	1	Yes
1	1	0	0	0	No
1	1	0	1	X	Yes
1	1	0	X	1	Yes
1	1	1	0	X	No
1	1	1	X	0	No
1	1	1	1	1	Yes

1. Bit in DBGMCU_APB3FZ1 register.
2. Bit in DBGMCU_CRA35 register.

Processor debug unit registers

DBGMCU registers are not reset by a system reset, only by a power on reset. A few of them (DBGMCU_IDC and DBGMCU_CR) are accessible to the debugger via the debug APB bus at base address 0xE008 1000. The whole register set is accessible by processors and debugger (through DAP AXI-AP) at base address 0x5A01 0000 (to the extent they satisfy the secure/allocation conditions as explained earlier).

DBGMCU identity code register (DBGMCU_IDC)

Address offset: 0x000

Reset value: 0x2000 6505

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MAJOR_REV_ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	DEV_ID[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 **MAJOR_REV_ID[15:0]**: Revision
Example 0x2000 = revision 2

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **DEV_ID[11:0]**: Device identifier
0x0505: STM32MP23/25xx

DBGMCU configuration register (DBGMCU_CR)

Address offset: 0x004

Reset value: 0x0000 0010

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBG_SWD_SEL_N	Res.	DBG_STANDBY	DBG_STOP	DBG_SLEEP
											rw		rw	rw	rs

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **DBG_SWD_SEL_N**: Cortex-M0+ debug interface selection
See *Section 97.13.1: Single-wire debug interface*.
0: SWD used to access the Cortex-M0+
1: Main debug interface (SWJ-DP) used to access the Cortex-M0+

Bit 3 Reserved, must be kept at reset value.

Bit 2 **DBG_STANDBY**: Debug enable in Standby mode
0: Normal operation. All clocks are disabled and V_{DDCORE} (and V_{DDCPU} if selected) domains are powered down automatically in Standby mode.
1: Automatic clock stop/power down disabled. All active clocks and oscillators continue to run during Standby, and V_{DDCORE} as well as V_{DDCPU} domain supplies are maintained, allowing full debug capability.
Note: On exit from Standby mode, a system reset is performed.

Bit 1 **DBG_STOP**: Debug enable in Stop mode

0: Normal operation. All clocks are disabled automatically in Stop mode.

1: Automatic clock stop disabled. All active clocks and oscillators continue to run during Stop mode, allowing full debug capability.

Note: On exit from Stop mode, the clock settings are set to the Stop mode exit state.

Bit 0 **DBG_SLEEP**: Debug enable in Sleep mode

0: Normal operation. The processor clock is stopped automatically in Sleep mode.

1: Automatic clock stop disabled. The processor clock continues to run, allowing full debug capability.

DBGMCU configuration register CPU1 (DBGMCU_CRA35)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBG_STGEN_STOP	WDFZCTL
														rw	rs

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DBG_STGEN_STOP:** STGEN behavior when debug is enabled

This bit determines the behavior of the time generator used for the operating system timer in debug mode.

0: Normal operation. OS timer continues to run.

1: Freeze OS timer when either Cortex-A35 processor core halts in debug mode.

Bit 0 **WDFZCTL:** IWDG1 behavior when secure debug is enabled

This bit determines the behavior of the IWDG1 in debug mode when SPIDEN = 1 (see *Table 1032* for more details).

0: OR. Freeze IWDG1 when either Cortex-A35 processor core halts in debug mode.

1: AND. Freeze IWDG1 only when both Cortex-A35 processor cores halt in debug mode.

DBGMCU AHB2 - lowest part - peripheral freeze register CPU1 (DBGMCU_AHB2LFZ1)

Address offset: 0x010

Reset value: 0x0000 0000

Bit 29 **DBG_TIM11_STOP**: TIM11 stop in debug

0: Normal operation. TIM11 continues to operate while Cortex-A35 is in debug mode.

1: Stop in debug. TIM11 is frozen while Cortex-A35 is in debug mode.

Bit 28 **DBG_TIM10_STOP**: TIM10 stop in debug

0: Normal operation. TIM10 continues to operate while Cortex-A35 is in debug mode.

1: Stop in debug. TIM10 is frozen while Cortex-A35 is in debug mode.

Bit 27 **DBG_I3C3_STOP**: I3C3 SMBUS timeout stop in debug

0: Normal operation. I3C3 SMBUS timeout continues to operate while Cortex-A35 is in debug mode.

1: Stop in debug. I3C3 SMBUS timeout is frozen while Cortex-A35 is in debug mode.

Bit 26 **DBG_I3C2_STOP**: I3C2 SMBUS timeout stop in debug

0: Normal operation. I3C2 SMBUS timeout continues to operate while Cortex-A35 is in debug mode.

1: Stop in debug. I3C2 SMBUS timeout is frozen while Cortex-A35 is in debug mode.

Bit 25 **DBG_I3C1_STOP**: I3C1 SMBUS timeout stop in debug
0: Normal operation. I3C1 SMBUS timeout continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. I3C1 SMBUS timeout is frozen while Cortex-A35 is in debug mode.

Bit 24 **DBG_I2C7_STOP**: I2C7 SMBUS timeout stop in debug
0: Normal operation. I2C7 SMBUS timeout continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. I2C7 SMBUS timeout is frozen while Cortex-A35 is in debug mode.

Bit 23 **DBG_I2C6_STOP**: I2C6 SMBUS timeout stop in debug
0: Normal operation. I2C6 SMBUS timeout continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. I2C6 SMBUS timeout is frozen while Cortex-A35 is in debug mode.

Bit 22 **DBG_I2C5_STOP**: I2C5 SMBUS timeout stop in debug
0: Normal operation. I2C5 SMBUS timeout continues to operate while Cortex-A35 is in debug mod.e
1: Stop in debug. I2C5 SMBUS timeout is frozen while Cortex-A35 is in debug mode.

Bit 21 **DBG_I2C4_STOP**: I2C4 SMBUS timeout stop in debug
0: Normal operation. I2C4 SMBUS timeout continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. I2C4 SMBUS timeout is frozen while Cortex-A35 is in debug mode.

Bit 20 **DBG_I2C3_STOP**: I2C3 SMBUS timeout stop in debug
0: Normal operation. I2C3 SMBUS timeout continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. I2C3 SMBUS timeout is frozen while Cortex-A35 is in debug mode.

Bit 19 **DBG_I2C2_STOP**: I2C2 SMBUS timeout stop in debug
0: Normal operation. I2C2 SMBUS timeout continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. I2C2 SMBUS timeout is frozen while Cortex-A35 is in debug mode.

Bit 18 **DBG_I2C1_STOP**: I2C1 SMBUS timeout stop in debug
0: Normal operation. I2C1 SMBUS timeout continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. I2C1 SMBUS timeout is frozen while Cortex-A35 is in debug mode.

Bits 17:11 Reserved, must be kept at reset value.

Bit 10 **DBG_LPTIM2_STOP**: LPTIM2 stop in debug
0: Normal operation. LPTIM2 continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. LPTIM2 is frozen while Cortex-A35 is in debug mode.

Bit 9 **DBG_LPTIM1_STOP**: LPTIM1 stop in debug
0: Normal operation. LPTIM1 continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. LPTIM1 is frozen while Cortex-A35 is in debug mode.

Bit 8 **DBG_TIM14_STOP**: TIM14 stop in debug
0: Normal operation. TIM14 continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. TIM14 is frozen while Cortex-A35 is in debug mode.

Bit 7 **DBG_TIM13_STOP**: TIM13 stop in debug
0: Normal operation. TIM13 continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. TIM13 is frozen while Cortex-A35 is in debug mode.

Bit 6 **DBG_TIM12_STOP**: TIM12 stop in debug
0: Normal operation. TIM12 continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. TIM12 is frozen while Cortex-A35 is in debug mode.

Bit 5 **DBG_TIM7_STOP**: TIM7 stop in debug
0: Normal operation. TIM7 continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. TIM7 is frozen while Cortex-A35 is in debug mode.

Bit 4 **DBG_TIM6_STOP**: TIM6 stop in debug

0: Normal operation. TIM6 continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. TIM6 is frozen while Cortex-A35 is in debug mode.

Bit 3 **DBG_TIM5_STOP**: TIM5 stop in debug

0: Normal operation. TIM5 continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. TIM5 is frozen while Cortex-A35 is in debug mode.

Bit 2 **DBG_TIM4_STOP**: TIM4 stop in debug

0: Normal operation. TIM4 continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. TIM4 is frozen while Cortex-A35 is in debug mode.

Bit 1 **DBG_TIM3_STOP**: TIM3 stop in debug

0: Normal operation. TIM3 continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. TIM3 is frozen while Cortex-A35 is in debug mode.

Bit 0 **DBG_TIM2_STOP**: TIM2 stop in debug

0: Normal operation. TIM2 continues to operate while Cortex-A35 is in debug mode.
1: Stop in debug. TIM2 is frozen while Cortex-A35 is in debug mode.

Bit 29 **DBG_TIM11_STOP**: TIM11 stop in debug

0: Normal operation. TIM11 continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. TIM11 is frozen while Cortex-M33 is in debug mode.

Bit 28 **DBG_TIM10_STOP**: TIM10 stop in debug

0: Normal operation. TIM10 continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. TIM10 is frozen while Cortex-M33 is in debug mode.

Bit 27 **DBG_I3C3_STOP**: I3C3 SMBUS timeout stop in debug

0: Normal operation. I3C3 SMBUS timeout continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. I3C3 SMBUS timeout is frozen while Cortex-M33 is in debug mode.

Bit 26 **DBG_I3C2_STOP**: I3C2 SMBUS timeout stop in debug

0: Normal operation. I3C2 SMBUS timeout continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. I3C2 SMBUS timeout is frozen while Cortex-M33 is in debug mode.

Bit 25 **DBG_I3C1_STOP**: I3C1 SMBUS timeout stop in debug
0: Normal operation. I3C1 SMBUS timeout continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. I3C1 SMBUS timeout is frozen while Cortex-M33 is in debug mode.

Bit 24 **DBG_I2C7_STOP**: I2C7 SMBUS timeout stop in debug
0: Normal operation. I2C7 SMBUS timeout continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. I2C7 SMBUS timeout is frozen while Cortex-M33 is in debug mode.

Bit 23 **DBG_I2C6_STOP**: I2C6 SMBUS timeout stop in debug
0: Normal operation. I2C6 SMBUS timeout continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. I2C6 SMBUS timeout is frozen while Cortex-M33 is in debug mode.

Bit 22 **DBG_I2C5_STOP**: I2C5 SMBUS timeout stop in debug
0: Normal operation. I2C5 SMBUS timeout continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. I2C5 SMBUS timeout is frozen while Cortex-M33 is in debug mode.

Bit 21 **DBG_I2C4_STOP**: I2C4 SMBUS timeout stop in debug
0: Normal operation. I2C4 SMBUS timeout continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. I2C4 SMBUS timeout is frozen while Cortex-M33 is in debug mode.

Bit 20 **DBG_I2C3_STOP**: I2C3 SMBUS timeout stop in debug
0: Normal operation. I2C3 SMBUS timeout continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. I2C3 SMBUS timeout is frozen while Cortex-M33 is in debug mode.

Bit 19 **DBG_I2C2_STOP**: I2C2 SMBUS timeout stop in debug
0: Normal operation. I2C2 SMBUS timeout continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. I2C2 SMBUS timeout is frozen while Cortex-M33 is in debug mode.

Bit 18 **DBG_I2C1_STOP**: I2C1 SMBUS timeout stop in debug
0: Normal operation. I2C1 SMBUS timeout continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. I2C1 SMBUS timeout is frozen while Cortex-M33 is in debug mode.

Bits 17:11 Reserved, must be kept at reset value.

Bit 10 **DBG_LPTIM2_STOP**: LPTIM2 stop in debug
0: Normal operation. LPTIM2 continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. LPTIM2 is frozen while Cortex-M33 is in debug mode.

Bit 9 **DBG_LPTIM1_STOP**: LPTIM1 stop in debug
0: Normal operation. LPTIM1 continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. LPTIM1 is frozen while Cortex-M33 is in debug mode.

Bit 8 **DBG_TIM14_STOP**: TIM14 stop in debug
0: Normal operation. TIM14 continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. TIM14 is frozen while Cortex-M33 is in debug mode.

Bit 7 **DBG_TIM13_STOP**: TIM13 stop in debug
0: Normal operation. TIM13 continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. TIM13 is frozen while Cortex-M33 is in debug mode.

Bit 6 **DBG_TIM12_STOP**: TIM12 stop in debug
0: Normal operation. TIM12 continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. TIM12 is frozen while Cortex-M33 is in debug mode.

Bit 5 **DBG_TIM7_STOP**: TIM7 stop in debug
0: Normal operation. TIM7 continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. TIM7 is frozen while Cortex-M33 is in debug mode.

Bit 4 **DBG_TIM6_STOP**: TIM6 stop in debug

0: Normal operation. TIM6 continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. TIM6 is frozen while Cortex-M33 is in debug mode.

Bit 3 **DBG_TIM5_STOP**: TIM5 stop in debug

0: Normal operation. TIM5 continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. TIM5 is frozen while Cortex-M33 is in debug mode.

Bit 2 **DBG_TIM4_STOP**: TIM4 stop in debug

0: Normal operation. TIM4 continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. TIM4 is frozen while Cortex-M33 is in debug mode.

Bit 1 **DBG_TIM3_STOP**: TIM3 stop in debug

0: Normal operation. TIM3 continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. TIM3 is frozen while Cortex-M33 is in debug mode.

Bit 0 **DBG_TIM2_STOP**: TIM2 stop in debug

0: Normal operation. TIM2 continues to operate while Cortex-M33 is in debug mode.
1: Stop in debug. TIM2 is frozen while Cortex-M33 is in debug mode.

1: Stop in debug. I3C4 is frozen while Cortex-M0+ is in debug mode.

Bit 7 **DBG_LPTIM5_STOP**: LPTIM5 stop in debug
0: Normal operation. LPTIM5 continues to operate while Cortex-M0+ is in debug mode.
1: Stop in debug. LPTIM5 is frozen while Cortex-M0+ is in debug mode.

Bit 6 **DBG_LPTIM4_STOP**: LPTIM4 stop in debug

0: Normal operation. LPTIM4 continues to operate while Cortex-M0+ is in debug mode.

1: Stop in debug. LPTIM4 is frozen while Cortex-M0+ is in debug mode.

Bit 5 **DBG_LPTIM3_STOP**: LPTIM3 stop in debug

0: Normal operation. LPTIM3 continues to operate while Cortex-M0+ is in debug mode.

1: Stop in debug. LPTIM3 is frozen while Cortex-M0+ is in debug mode.

Bit 4 **DBG_I2C8_STOP**: I2C8 stop in debug

0: Normal operation. I2C8 continues to operate while Cortex-M0+ is in debug mode.

1: Stop in debug. I2C8 is frozen while Cortex-M0+ is in debug mode.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **DBG_RTC_STOP**: RTC clock is suspended in debug

0: Normal operation. RTC clock continues to operate while Cortex-M0+ is in debug mode

1: Stop in debug. RTC clock is suspended while Cortex-M0+ is in debug mode.

DBGMCU register map

97.11 Cortex-A35 debug features

The Cortex-A35 subsystem integrates the following CoreSight components (one of each per processor core):

- Debug unit (DBG)
- Performance monitoring unit (PMU)
- Embedded trace macrocell (ETM)
- Cross trigger interface (CTI)

These components are accessible by the debugger via the APB-AP and its associated debug APB bus. They are also accessible by both Cortex-A35 and Cortex-M33 via the system interconnect.

97.11.1 Cortex-A35 debug unit

The debug unit enables the debugger to access the debug features built into Cortex-A35. The debug features allow an external debugger to perform the following:

- Stop program execution.
- Examine and alter process and processor states.
- Examine and alter memory and input/output peripheral states.
- Restart the processor.

For detailed information on the debug unit, refer to the Cortex-A35 technical reference manual *[10]*.

97.11.2 Cortex-A35 performance monitoring unit (PMU)

The performance monitoring unit contains six 32-bit event counters, and one 64-bit processor clock-cycle counter. The event counters can be configured to increment every time a specified event occurs. Examples of events that can be counted include:

- cache hit/miss
- data load/store
- bus access

- interrupt exception
- ETM external trigger output
- snoop transaction
- software increment

When a counter wraps, it can generate an interrupt on PMUIRQ. This interrupt is connected to the CTI that can halt the processor cores, start or stop the trace.

Most of the events are connected to the ETM via the PMUEVENTS bus. This allows ETM resources to be used to filter the events. The filtered events are returned to the PMU via the four EXTOUT outputs of the ETM.

For a list of PMU events and the corresponding line of the PMUEVENTS bus, refer to the Cortex-A35 technical reference manual *[10]*.

PMU registers

PMU registers are accessed by the debugger via the debug APB at addresses:

- from 0x8021 0000 to 0x8021 0FFC for the CPU1 PMU
- from 0x8031 0000 to 0x8031 0FFC for the CPU2

The same registers are accessible by software at addresses 0x4A21 0000 to 0x4A21 0FFC, and 0x4A31 0000 to 0x4A31 0FFC respectively.

Each CPU can also access the registers of its own PMU via CP15 registers.

97.11.3 Embedded trace macrocell (ETM)

The Cortex-A35 ETM is a CoreSight component closely coupled to the CPU. There are two ETM units, one for each Cortex-A35 processor core. The ETM generates trace packets that allow the Cortex-A35 processor core execution to be traced. Only instruction execution can be traced.

The ETM receives information from the CPU over the processor trace interface, including:

- number of instructions executed in the same cycle
- changes in program flow
- current processor instruction state
- addresses of memory locations accessed by load and store instructions
- type, direction and size of a transfer
- condition code information
- exception information
- wait for interrupt (WFI) state information

For more information, refer to the Arm ETM v4 reference manual *[7]*.

97.11.4 Cross trigger interface (CTI)

See *Section 97.10.3: Cross trigger interface (CTI) and matrix (CTM)*.

97.12 Cortex-M33 debug features

The Cortex-M33 subsystem integrates the following CoreSight components:

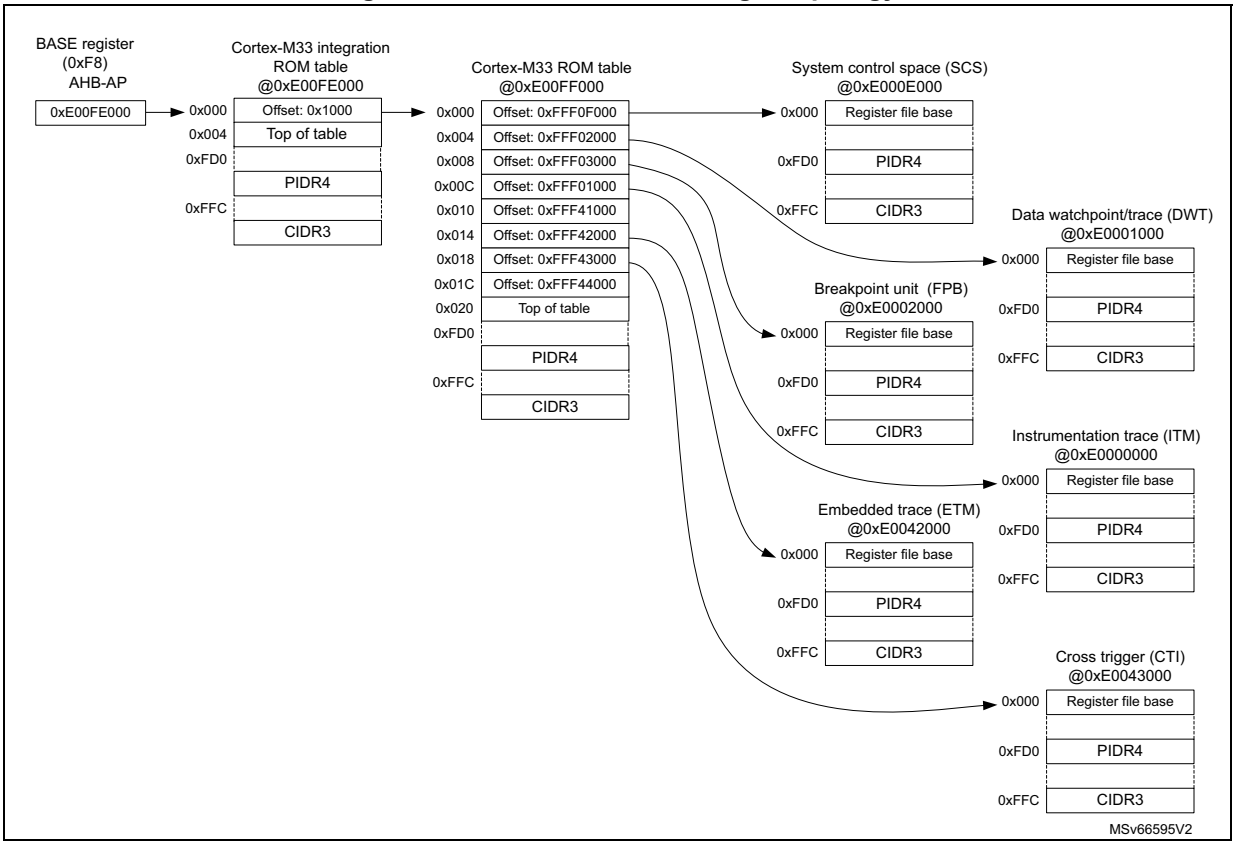
- Cortex-M33 ROM table
- Cortex-M33 system control space (SCS)
- Breakpoint Unit (FPB)
- Data watchpoint and trace unit (DWT)
- Instrumentation trace macrocell (ITM)
- Embedded trace macrocell (ETM)
- Cross trigger interface (CTI)

These components are accessible by the debugger via the Cortex-M33 AHB-AP.

97.12.1 ROM tables

The ROM table is a CoreSight component that contains the base addresses of all CoreSight debug components accessible via the AHB-AP. These tables allow a debugger to discover the topology of the CoreSight system automatically.

There is one integration ROM table in the Cortex-M33 subsystem. This table is pointed to by the BASE register in Cortex-M33 AHB-AP. It links to the processor ROM table that contains the base address pointer for the system control space registers, which allow the debugger to identify the CPU core, as well as for the FPB, DWT, ITM, ETM and CTI.



The Cortex-M33 CPU ROM table occupies a 4-Kbyte, 32-bit wide chunk of address space, from 0xE00F F000 to 0xE00F FFFC.

Table 1034. Cortex-M33 CPU ROM table

Address in ROM table	Component name	Component base address	Component address offset	Size (Kbytes)	Entry
0xE00F F000	SCS	0xE000 E000	0xFFF0 F000	4	0xFFF0 F003
0xE00F F004	DWT	0xE000 1000	0xFFF0 2000		0xFFF0 2003
0xE00F F008	FPB	0xE000 2000	0xFFF0 3000		0xFFF0 3003
0xE00F F00C	ITM	0xE000 0000	0xFFF0 1000		0xFFF0 1003
0xE00F F010	Reserved	0xE004 0000	0xFFF4 1000		0xFFF4 1002
0xE00F F014	ETM	0xE004 1000	0xFFF4 2000		0xFFF4 2003
0xE00F E018	CTI	0xE004 2000	0xFFF4 3000		0xFFF4 3003
0xE00F F01C	Reserved	0xE004 3000	0xFFF4 4000		0xFFF4 4002
0xE00F F020	Top of table	-	-	-	0x0000 0000
0xE00F F024 to 0xE00F FFC8	Reserved	-	-	-	0x0000 0000
0xE00F FFCC to 0xE00F FFFC	ROM table registers	-	-	-	-

The topology for the CoreSight components in the Cortex-M33 subsystem is shown in the figure below.

Figure 1188. Cortex-M33 CoreSight topology

97.12.2 Data watchpoint and trace unit (DWT)

The DWT provides four comparators that can be used as:

- watchpoint
- ETM trigger
- PC sampling trigger
- data address sampling trigger
- data comparator (COMP1 only)
- clock-cycle counter comparator (COMP0 only)

The DWT also contains counters for:

- clock cycles
- folded instructions
- load store unit (LSU) operations
- sleep cycles
- number of cycles per instruction
- interrupt overhead

A DWT comparator compares one of the following with the value in its DWT_COMP register:

- a data address
- an instruction address
- a data value
- the cycle-count value (for comparator 0 only)

For address matching, the comparator can use a mask, so it matches a range of addresses.

On a successful match, the comparator generates one of the following:

- one or more DWT data trace packets, containing one or more:
  - address of the instruction that caused a data access
  - address offset, bits[15:0] of the data access address
  - matched data value
- a watchpoint debug event, on either the PC value or the accessed data address
- a CMPMATCH[N] event that signals the match outside the DWT.

A watchpoint debug event either generates a DebugMonitor exception, or causes the processor to halt execution and enter debug state.

For more details on how to use the DWT, refer to the Arm Cortex-M33 processor technical reference manual *[5]*.

97.12.3 Instrumentation trace macrocell (ITM)

The ITM generates trace information as packets. There are four sources that can generate packets. If multiple sources generate packets at the same time, the ITM arbitrates the order in which packets are output. The four sources in decreasing order of priority are:

- Software trace

  The software can write directly to any of 32 x 32-bit ITM stimulus registers to generate packets. The permission level for each port can be programmed. When software writes to an enabled stimulus port, the ITM combines the identity of the port, the size of the write access, and the data written, into a packet that it writes to a FIFO. The ITM outputs packets from the FIFO onto the trace bus. Reading a stimulus port register returns the status of the stimulus register (empty or pending) in bit 0.
- Hardware trace

  The DWT generates trace packets in response to a data trace event, a PC sample, or a performance profiling counter wraparound. The ITM outputs these packets on the trace bus.
- Local timestamping

  The ITM contains a 21-bit counter clocked by the (pre-divided) processor clock. The counter value is output in a timestamp packet on the trace bus. The counter is reset to zero every time a timestamp packet is generated. The timestamps thus indicate the time elapsed since the previous timestamp packet.
- Global system timestamping

  Timestamps can also be generated using the system-wide 64-bit count value coming from the timestamp generator component.

For more details on how to use the ITM, refer to the Arm Cortex-M33 processor technical reference manual *[5]*.

97.12.4 Breakpoint unit (FPB)

The FPB allows hardware breakpoints to be set. It contains eight comparators which monitor the instruction fetch address. If a match occurs, the instruction comparators can be configured to generate a breakpoint instruction.

97.12.5 Embedded trace macrocell (ETM)

The Cortex-M33 ETM is a CoreSight component closely coupled to the CPU. The ETM generates trace packets that allow the execution of the Cortex-M33 core to be traced.

Note: Data accesses are not included in the trace information.

The ETM receives information from the CPU over the processor trace interface, including:

- number of instructions executed in the same cycle
- changes in program flow
- current processor instruction state
- addresses of memory locations accessed by load and store instructions
- type, direction and size of a transfer
- condition code information
- exception information
- wait for interrupt state information

For more information, refer to the Arm CoreSight ETM-Cortex-M33 technical reference manual *[8]*.

97.12.6 Cross trigger interface (CTI)

See *Section 97.10.3: Cross trigger interface (CTI) and matrix (CTM)*.

97.13 Cortex-M0+ debug features

The Cortex-M0+ subsystem integrates the following CoreSight components:

- Cortex-M0+ integration level ROM table
- Cortex-M0+ system control space (SCS)
- Breakpoint Unit (BPU)
- Data watchpoint and trace Unit (DWT)
- Cross trigger interface (CTI)

These components are accessible by the debugger via the Cortex-M0+ AHB-AP.

97.13.1 Single-wire debug interface

The Cortex-M0+ AHB-AP is located by default at reset exit behind the main JTAG port used for the debuggers to access the main processors. It can be switched behind a dedicated SWD interface (see *Table 1008*) after clearing DBGMCU_SWD_SELn in DBGMCU_CR. This allows the Cortex-M0+ to be debugged in V_{BAT} mode where other power domains are switched off.

This interface available on GPIO PZ0 and PZ1 can be used when the TAMPER output is not enabled in the RTC, and Cortex-M0+ debug is enabled.

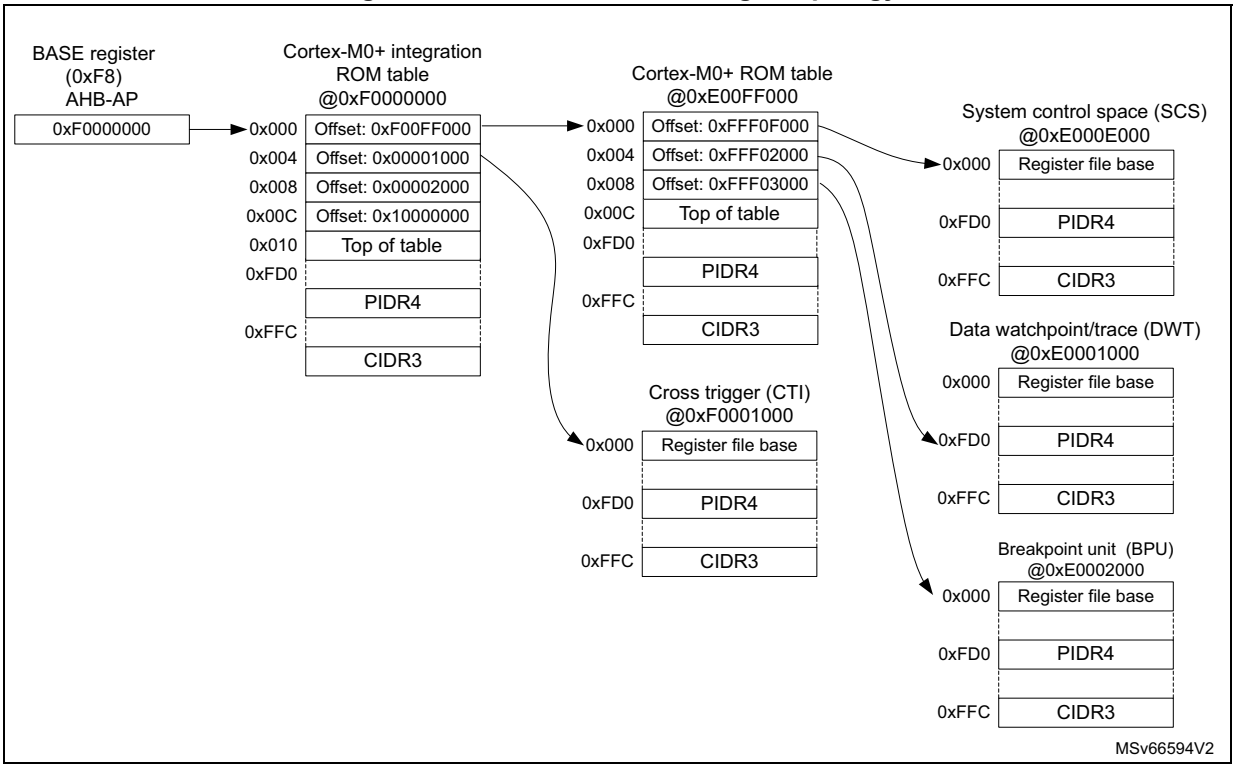
97.13.2 ROM tables

There is one integration level ROM table pointing to the Cortex-M0+ processor and to additional CoreSight components. This table is pointed to by the BASE register in Cortex-M0+ AHB-AP.

The integration level ROM table occupies a 4-Kbyte, 32-bit wide chunk of address space, from 0xF000 0000 to 0xF000 FFFC.

The Cortex-M0+ CPU ROM table occupies a 4-Kbyte, 32-bit wide chunk of address space, from 0xE00F F000 to 0xE00F FFFC.

Table 1035. Cortex-M0+ integration level ROM table



Address in ROM table	Component name	Component base address	Component address offset	Size (Kbytes)	Entry
0xF000 0000	CM0+ ROM table	0xE00F F000	0xF00F F000	4	0xF00F F003
0xF000 0004	CTI	0xF000 0000	0x0000 1000		0x0000 1003
0xF000 0008	Reserved	-	-		0x0000 2002
0xF000 000C	Reserved	-	-		0x1000 0002
0xF000 0010	Top of table	-	-	-	0x0000 0000
0xE00F F014 to 0xE00F FFC8	Reserved	-	-	-	0x0000 0000
0xE00F FFCC to 0xE00F FFFC	ROM table registers	-	-	-	-

Table 1036. Cortex-M0+ processor ROM table

Address in ROM table	Component name	Component base address	Component address offset	Size (Kbytes)	Entry
0xE00F F000	SCS	0xE000 E000	0xFFF0 F000	4	0xFFF0 F003
0xE00F F004	DWT	0xE000 1000	0xFFF0 2000		0xFFF0 2003
0xE00F F008	BPU	0xE000 2000	0xFFF0 3000		0xFFF0 3003
0xE00F F00C	Top of table	-	-	-	0x0000 0000
0xE00F F010 to 0xE00F FFC8	Reserved	-	-	-	0x0000 0000
0xE00F FFCC to 0xE00F FFFC	ROM table registers	-	-	-	-

The topology for the CoreSight components in the Cortex-M0+ subsystem is shown in the figure below.

Figure 1189. Cortex-M0+ CoreSight topology

97.13.3 Data watchpoint and trace unit (DWT)

The DWT allows external PC sampling using a PC sample register, and provides two comparators that support:

- watchpoints for data address matching
- PC watchpoints for instruction address matching

The PC sampling feature and watchpoint support operate independently of each other. The watchpoint events result in a processor halt and entry to debug state.

For more details on how to use the DWT, refer to the Arm Cortex-M0+ processor technical reference manual *[6]*.

97.13.4 Breakpoint unit (BPU)

The BPU provides support for breakpoint functionality on instruction fetches. It includes four breakpoint comparators that operate only on instruction read access, meaning there is no read or write data match capability.

97.13.5 Cross trigger interface (CTI)

See *Section 97.10.3: Cross trigger interface (CTI) and matrix (CTM)*.

98 Device electronic signature

The device electronic signature are either set in hardware or stored in the OTP (visible in BSEC registers) which can be read using the debug interface or by the CPU. It contains factory-programmed identification data that allow the user firmware or other external devices to automatically match the characteristics of the component.

98.1 Unique device ID register (96 bits) (UID)

The unique device identifier is ideally suited to be used:

- as serial number (USB string serial number, or other end applications)
- as part of the security keys, to increase the security of code in flash memory while using and combining this unique ID with software cryptographic primitives and protocols before programming the memory
- during processes such as secure boot

The 96-bit unique device identifier provides a reference number, unique for a given device and in any context. These bits cannot be altered by the user.

99 Important security notice

The STMicroelectronics group of companies (ST) places a high value on product security, which is why the ST product(s) identified in this documentation may be certified by various security certification bodies and/or may implement our own security measures as set forth herein. However, no level of security certification and/or built-in security measures can guarantee that ST products are resistant to all forms of attacks. As such, it is the responsibility of each of ST's customers to determine if the level of security provided in an ST product meets the customer needs both in relation to the ST product alone, as well as when combined with other components and/or software for the customer end product or application. In particular, take note that:

- ST products may have been certified by one or more security certification bodies, such as Platform Security Architecture (www.psacertified.org) and/or Security Evaluation standard for IoT Platforms (www.trustcb.com). For details concerning whether the ST product(s) referenced herein have received security certification along with the level and current status of such certification, either visit the relevant certification standards website or go to the relevant product page on *www.st.com* for the most up to date information. As the status and/or level of security certification for an ST product can change from time to time, customers should re-check security certification status/level as needed. If an ST product is not shown to be certified under a particular security standard, customers should not assume it is certified.
- Certification bodies have the right to evaluate, grant and revoke security certification in relation to ST products. These certification bodies are therefore independently responsible for granting or revoking security certification for an ST product, and ST does not take any responsibility for mistakes, evaluations, assessments, testing, or other activity carried out by the certification body with respect to any ST product.
- Industry-based cryptographic algorithms (such as AES, DES, or MD5) and other open standard technologies which may be used in conjunction with an ST product are based on standards which were not developed by ST. ST does not take responsibility for any flaws in such cryptographic algorithms or open technologies or for any methods which have been or may be developed to bypass, decrypt or crack such algorithms or technologies.
- While robust security testing may be done, no level of certification can absolutely guarantee protections against all attacks, including, for example, against advanced attacks which have not been tested for, against new or unidentified forms of attack, or against any form of attack when using an ST product outside of its specification or intended use, or in conjunction with other components or software which are used by customer to create their end product or application. ST is not responsible for resistance against such attacks. As such, regardless of the incorporated security features and/or any information or support that may be provided by ST, each customer is solely responsible for determining if the level of attacks tested for meets their needs, both in relation to the ST product alone and when incorporated into a customer end product or application.
- All security features of ST products (inclusive of any hardware, software, documentation, and the like), including but not limited to any enhanced security features added by ST, are provided on an "AS IS" BASIS. AS SUCH, TO THE EXTENT PERMITTED BY APPLICABLE LAW, ST DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, unless the applicable written and signed contract terms specifically provide otherwise.

IMPORTANT NOTICE – READ CAREFULLY

STMicroelectronics NV and its subsidiaries (“ST”) reserve the right to make changes, corrections, enhancements, modifications, and improvements to ST products and/or to this document at any time without notice. Purchasers should obtain the latest relevant information on ST products before placing orders. ST products are sold pursuant to ST’s terms and conditions of sale in place at the time of order acknowledgment.

Purchasers are solely responsible for the choice, selection, and use of ST products and ST assumes no liability for application assistance or the design of purchasers’ products.

No license, express or implied, to any intellectual property right is granted by ST herein.

Resale of ST products with provisions different from the information set forth herein shall void any warranty granted by ST for such product.

ST and the ST logo are trademarks of ST. For additional information about ST trademarks, refer to *www.st.com/trademarks*. All other product or service names are the property of their respective owners.

Information in this document supersedes and replaces information previously supplied in any prior versions of this document.
