Reference manual

STM32H523/533xx, STM32H543/553xx, STM32H562xx, and STM32H563/573xx Arm®-based 32-bit MCUs

Introduction

This document is addressed to application developers. It provides complete information on how to use the STM32H523xx, STM32H533xx, STM32H543xx, STM32H553xx, STM32H562xx, STM32H563xx, and STM32H573xx microcontrollers memory and peripherals.

For ordering information, mechanical and electrical device characteristics, refer to the corresponding datasheets.

For information on the Arm® Cortex®-M33 core, refer to the corresponding Arm® Technical Reference Manuals available on http://infocenter.arm.com.

1 Documentation conventions 119

1.1 General information 119

1.2 List of abbreviations for registers 119

1.3 Register reset value 120

1.4 Glossary 120

2 Memory and bus architecture 121

2.1 System architecture 121

2.1.1 Fast C-bus 122

2.1.2 Slow C-bus 123

2.1.3 S-bus 123

2.1.4 DCache S-bus 123

2.1.5 GPDMA1 and GPDMA2 buses 123

2.1.6 SDMMC1 and SDMMC2 controllers DMA buses 123

2.1.7 BusMatrix 123

2.1.8 AHB/APB bridges 124

2.1.9 Ethernet MAC 124

2.2 TrustZone security architecture 124

2.2.1 Default TrustZone security state 124

2.2.2 TrustZone peripheral classification 125

2.3 Memory organization 130

2.3.1 Introduction 130

2.3.2 Memory map and register boundary addresses 131

2.3.3 Embedded SRAMs 147

2.3.4 Flash memory overview 147

2.3.5 Boot modes 147

3 System security 149

3.1 Key security features 149

3.2 Secure install 150

3.3 Secure boot 151

3.3.1 Unique boot entry 151

3.3.2 Immutable root of trust in system flash memory 152

3.4 Secure update . . . 152
3.5 Resource isolation using hide protection levels . . . 153
3.6 Resource isolation using TrustZone . . . 153
3.6.1 TrustZone security architecture . . . 154
3.6.2 Armv8-M security extension of Cortex-M33 . . . 154
3.6.3 Memory and peripheral allocation using IDAU/SAU . . . 154
3.6.4 Memory and peripheral allocation using GTZC . . . 156
3.6.5 Managing security in TrustZone-aware peripherals . . . 160
3.6.6 Activating TrustZone security . . . 166
3.6.7 Deactivating TrustZone security . . . 167
3.7 Other resources isolation . . . 168
3.7.1 Temporal isolation using secure hide protection (HDP) . . . 168
3.7.2 Resource isolation using Cortex privileged mode . . . 168
3.8 Secure execution . . . 172
3.8.1 Memory protection unit (MPU) . . . 172
3.8.2 Embedded flash memory write protection . . . 173
3.8.3 Tamper detection and response . . . 173
3.9 Secure storage . . . 175
3.9.1 Hardware secret key management . . . 176
3.9.2 Unique ID . . . 177
3.10 Crypto engines . . . 177
3.10.1 Crypto engines features . . . 177
3.10.2 Secure AES co-processor (SAES) . . . 178
3.10.3 On-the-fly decryption engine (OTFDEC) . . . 179
3.11 Product life cycle . . . 179
3.11.1 Product configurations and security services . . . 181
3.11.2 Life cycle management . . . 181
3.11.3 Recommended product settings . . . 184
3.12 Software intellectual property protection and collaborative development 184
3.12.1 Software intellectual property protection . . . 186
3.12.2 Software intellectual property protection with OTFDEC . . . 186
3.12.3 Other software intellectual property protections . . . 188

4 Boot modes . . . 189

4.2 STM32H533/53/73xx boot modes . . . 191

5 Global TrustZone® controller (GTZC) 192

5.1 GTZC introduction 192

5.2 GTZC main features 192

5.3 GTZC implementation 194

5.4 GTZC functional description 196

5.4.1 GTZC block diagram 196

5.4.2 Illegal access definition 197

5.4.3 TrustZone security controller (TZSC) 198

5.4.4 Memory protection controller - block based (MPCBB) 199

5.4.5 TrustZone illegal access controller (TZIC) 200

5.4.6 Power-on/reset state 200

5.5 GTZC interrupts 200

5.6 GTZC1 TZSC registers 201

5.6.1 GTZC1 TZSC control register (GTZC1_TZSC_CR) 201

5.6.2 GTZC1 TZSC secure configuration register 1 (GTZC1_TZSC_SECCFGR1) 201

5.6.3 GTZC1 TZSC secure configuration register 2 (GTZC1_TZSC_SECCFGR2) 204

5.6.4 GTZC1 TZSC secure configuration register 3 (GTZC1_TZSC_SECCFGR3) 206

5.6.5 GTZC1 TZSC privilege configuration register 1 (GTZC1_TZSC_PRIVCFGR1) 209

5.6.6 GTZC1 TZSC privilege configuration register 2 (GTZC1_TZSC_PRIVCFGR2) 211

5.6.7 GTZC1 TZSC privilege configuration register 3 (GTZC1_TZSC_PRIVCFGR3) 213

5.6.8 GTZC1 TZSC memory x subregion A watermark configuration register (GTZC1_TZSC_MPCWMxACFGR) 216

5.6.9 GTZC1 TZSC memory x subregion A watermark register (GTZC1_TZSC_MPCWMxAR) 217

5.6.10 GTZC1 TZSC memory x subregion B watermark configuration register (GTZC1_TZSC_MPCWMxBCFGR) 217

5.6.11 GTZC1 TZSC memory x subregion B watermark register (GTZC1_TZSC_MPCWMxBR) 218

5.6.12 GTZC1 TZSC register map 220

5.7 GTZC1 TZIC registers 222

5.7.1 GTZC1 TZIC interrupt enable register 1 (GTZC1_TZIC_IER1) 222

5.7.2 GTZC1 TZIC interrupt enable register 2 (GTZC1_TZIC_IER2) 224

5.7.3 GTZC1 TZIC interrupt enable register 3 (GTZC1_TZIC_IER3) 226

5.7.4 GTZC1 TZIC interrupt enable register 4 (GTZC1_TZIC_IER4) 229
5.7.5 GTZC1 TZIC status register 1 (GTZC1_TZIC_SR1) 231
5.7.6 GTZC1 TZIC status register 2 (GTZC1_TZIC_SR2) 233
5.7.7 GTZC1 TZIC status register 3 (GTZC1_TZIC_SR3) 236
5.7.8 GTZC1 TZIC status register 4 (GTZC1_TZIC_SR4) 238
5.7.9 GTZC1 TZIC flag clear register 1 (GTZC1_TZIC_FCR1) 240
5.7.10 GTZC1 TZIC flag clear register 2 (GTZC1_TZIC_FCR2) 242
5.7.11 GTZC1 TZIC flag clear register 3 (GTZC1_TZIC_FCR3) 244
5.7.12 GTZC1 TZIC flag clear register 4 (GTZC1_TZIC_FCR4) 246
5.7.13 GTZC1 TZIC register map 249
5.8 GTZC1 MPCBBz registers (z = 1 to 3) 251
5.8.1 GTZC1 SRAMz MPCBB control register (GTZC1_MPCBBz_CR) (z = 1 to 3) 251
5.8.2 GTZC1 SRAMz MPCBB configuration lock register 1 (GTZC1_MPCBBz_CFGLOCK1) (z = 1 to 3) 251
5.8.3 GTZC1 SRAMz MPCBB security configuration for super-block x register (GTZC1_MPCBBz_SECCFGRx) (z = 1 to 3) 252
5.8.4 GTZC1 SRAMz MPCBB privileged configuration for super-block x register (GTZC1_MPCBBz_PRIVCFGRx) (z = 1 to 3) 252
5.8.5 GTZC1 MPCBBz register map (z = 1 to 3) 253

6 RAMs configuration controller (RAMCFG) 254
6.1 RAMCFG introduction 254
6.2 RAMCFG main features 254
6.3 RAMCFG functional description 254
6.3.1 Internal SRAMs features 254
6.3.2 Error code correction (SRAM2, SRAM3, BKPSRAM) 255
6.3.3 Write protection (SRAM2) 258
6.3.4 Software erase 259
6.4 RAMCFG low-power modes 259
6.5 RAMCFG interrupts 259
6.6 RAMCFG registers 260
6.6.1 RAMCFG memory x control register (RAMCFG_MxCR) 260
6.6.2 RAMCFG memory x interrupt enable register (RAMCFG_MxIER) . . . 260
6.6.3 RAMCFG memory interrupt status register (RAMCFG_MxISR) 261
6.6.4 RAMCFG memory x ECC single error address register (RAMCFG_MxSEAR) 262

6.6.5 RAMCFG memory x ECC double error address register (RAMCFG_MxDEAR) . . . 262
6.6.6 RAMCFG memory x interrupt clear register x (RAMCFG_MxICR) . . . 262
6.6.7 RAMCFG memory 2 write protection register 1 (RAMCFG_M2WPR1) . . . 263
6.6.8 RAMCFG memory 2 write protection register 2 (RAMCFG_M2WPR2) . . . 263
6.6.9 RAMCFG memory 2 write protection register 3 (RAMCFG_M2WPR3) . . . 264
6.6.10 RAMCFG memory x ECC key register (RAMCFG_MxECCKEYR) . . . 264
6.6.11 RAMCFG memory x erase key register (RAMCFG_MxERKEYR) . . . 265
6.6.12 RAMCFG register map . . . 266

7 Embedded flash memory (FLASH) . . . 269

7.1 FLASH introduction . . . 269
7.2 FLASH main features . . . 269
7.3 FLASH functional description . . . 270
7.3.1 FLASH block diagram . . . 270
7.3.2 FLASH signals . . . 271
7.3.3 Flash memory architecture and usage . . . 272
7.3.4 FLASH read operations . . . 274
7.3.5 FLASH program operations . . . 276
7.3.6 FLASH erase operations . . . 279
7.3.7 FLASH parallel operations . . . 282
7.3.8 FLASH error protections . . . 283
7.3.9 OTP and RO memory access . . . 283
7.3.10 Flash high-cycle data . . . 285
7.3.11 Flash bank swapping . . . 287
7.3.12 FLASH reset and clocks . . . 291
7.4 FLASH option bytes . . . 292
7.4.1 About option bytes . . . 292
7.4.2 Option bytes loading . . . 292
7.4.3 Option bytes modification . . . 293
7.4.4 Description of user and system option bytes . . . 296
7.4.5 Description of data protection option bytes . . . 297
7.4.6 Description of boot address option bytes . . . 297
7.4.7 Specific rules for modifying option bytes . . . 298
7.5 Option bytes key (OBK) management . . . 300

7.5.1 OBK loading . . . 300
7.5.2 OBK access per HDPL level . . . 300
7.5.3 OBK programming sequence . . . 301
7.5.4 OBK programming finite state machine . . . 302
7.5.5 OBK swap sector . . . 303
7.5.6 OBK alternate sector erase . . . 305
7.6 FLASH security and protections . . . 305
7.6.1 TrustZone security protection . . . 306
7.6.2 Hide protection (HDP) . . . 308
7.6.3 Block-based secure flash memory area protection . . . 310
7.6.4 Block-based privileged flash memory area protection . . . 311
7.6.5 Flash memory register privileged and unprivileged modes . . . 312
7.6.6 Flash memory banks attributes in case of bank swap . . . 313
7.6.7 Flash memory configuration protection . . . 314
7.6.8 Write protection . . . 315
7.6.9 Flash high-cycle data protections . . . 315
7.6.10 Life cycle management . . . 317
7.6.11 Product state transitions . . . 318
7.6.12 OBK protection . . . 320
7.6.13 One-time-programmable and read-only memory protections . . . 321
7.7 System memory . . . 322
7.7.1 Introduction . . . 322
7.7.2 RSS user functions . . . 322
7.8 FLASH low-power modes . . . 329
7.9 FLASH error management . . . 330
7.9.1 Introduction . . . 330
7.9.2 Nonsecure write protection error (WRPERR) . . . 330
7.9.3 Secure write protection error (WRPERR) . . . 331
7.9.4 Non secure programming sequence error (PGSERR) . . . 332
7.9.5 Secure programming sequence error (PGSERR) . . . 333
7.9.6 Nonsecure strobe error (STRBERR) . . . 334
7.9.7 Secure strobe error (STRBERR) . . . 334
7.9.8 Nonsecure inconsistency error (INCERR) . . . 334
7.9.9 Secure inconsistency error (INCERR) . . . 335
7.9.10 Error correction code error (ECCC, ECCD) . . . 336
7.9.11 Illegal access (ILAFM/ILAP) . . . 337
7.9.12 Option byte change error (OPTCHANGEERR) . . . 337

7.9.13 Miscellaneous HardFault errors . . . 338
7.9.14 OBK error cases (OBKERR, OBKWERR) . . . 338
7.10 FLASH interrupts . . . 339
7.11 FLASH registers . . . 341
7.11.1 FLASH access control register (FLASH_ACR) . . . 341
7.11.2 FLASH nonsecure key register (FLASH_NSKEYR) . . . 342
7.11.3 FLASH secure key register (FLASH_SECKEYR) . . . 342
7.11.4 FLASH option key register (FLASH_OPTKEYR) . . . 343
7.11.5 FLASH nonsecure OBK key register (FLASH_NSOBKKEYR) . . . 343
7.11.6 FLASH secure OBK key register (FLASH_SECOBKKEYR) . . . 343
7.11.7 FLASH operation status register (FLASH_OPSR) . . . 344
7.11.8 FLASH option control register (FLASH_OPTCR) . . . 345
7.11.9 FLASH nonsecure status register (FLASH_NSSR) . . . 346
7.11.10 FLASH secure status register (FLASH_SECSR) . . . 348
7.11.11 FLASH nonsecure control register (FLASH_NSCR) . . . 350
7.11.12 FLASH secure control register (FLASH_SECCR) . . . 352
7.11.13 FLASH nonsecure clear control register (FLASH_NSCCR) . . . 355
7.11.14 FLASH secure clear control register (FLASH_SECCCR) . . . 356
7.11.15 FLASH privilege configuration register (FLASH_PRIVCFGR) . . . 357
7.11.16 FLASH nonsecure OBK configuration register (FLASH_NSOBKCFGR) . . . 357
7.11.17 FLASH secure OBK configuration register (FLASH_SECOBKCFGR) 358
7.11.18 FLASH HDP extension register (FLASH_HDPEXTR) . . . 359
7.11.19 FLASH option status register (FLASH_OPTSR_CUR) . . . 360
7.11.20 FLASH option status register (FLASH_OPTSR_PRG) . . . 362
7.11.21 FLASH nonsecure EPOCH register (FLASH_NSEPOCHR_CUR) . . . 363
7.11.22 FLASH secure EPOCH register (FLASH_SECEPOCHR_CUR) . . . 364
7.11.23 FLASH option status register 2 (FLASH_OPTSR2_CUR) . . . 364
7.11.24 FLASH option status register 2 (FLASH_OPTSR2_PRG) . . . 365
7.11.25 FLASH nonsecure boot register (FLASH_NSBOOTR_CUR) . . . 367
7.11.26 FLASH nonsecure boot register (FLASH_NSBOOTR_PRG) . . . 367
7.11.27 FLASH secure boot register (FLASH_SECBOOTR_CUR) . . . 368
7.11.28 FLASH secure boot register (FLASH_BOOTR_PRG) . . . 368
7.11.29 FLASH nonsecure OTP block lock (FLASH_OTPBLR_CUR) . . . 369
7.11.30 FLASH nonsecure OTP block lock (FLASH_OTPBLR_PRG) . . . 369
7.11.31 FLASH secure block based register for Bank1 (FLASH_SECBB1Rx) 370

7.11.32 FLASH privilege block based register for Bank1 (FLASH_PRIVBB1Rx) . . . 370
7.11.33 FLASH security watermark for Bank1 (FLASH_SECWM1R_CUR) . . 371
7.11.34 FLASH security watermark for Bank1 (FLASH_SECWM1R_PRG) . . 371
7.11.35 FLASH write sector group protection for Bank1 (FLASH_WRP1R_CUR) . . . 372
7.11.36 FLASH write sector group protection for Bank1 (FLASH_WRP1R_PRG) . . . 373
7.11.37 FLASH data sector configuration Bank1 (FLASH_EDATA1R_CUR) . . 373
7.11.38 FLASH data sector configuration Bank1 (FLASH_EDATA1R_PRG) . . 374
7.11.39 FLASH HDP Bank1 configuration (FLASH_HDP1R_CUR) . . . 375
7.11.40 FLASH HDP Bank1 configuration (FLASH_HDP1R_PRG) . . . 375
7.11.41 FLASH ECC correction register (FLASH_ECCCORR) . . . 376
7.11.42 FLASH ECC detection register (FLASH_ECCDETR) . . . 377
7.11.43 FLASH ECC data (FLASH_ECCDR) . . . 378
7.11.44 FLASH secure block-based register for Bank2 (FLASH_SECBB2Rx) 378
7.11.45 FLASH privilege block-based register for Bank2 (FLASH_PRIVBB2Rx) . . . 379
7.11.46 FLASH security watermark for Bank2 (FLASH_SECWM2R_CUR) . . 379
7.11.47 FLASH security watermark for Bank2 (FLASH_SECWM2R_PRG) . . 380
7.11.48 FLASH write sector group protection for Bank2 (FLASH_WRP2R_CUR) . . . 380
7.11.49 FLASH write sector group protection for Bank2 (FLASH_WRP2R_PRG) . . . 381
7.11.50 FLASH data sectors configuration Bank2 (FLASH_EDATA2R_CUR) . 382
7.11.51 FLASH data sector configuration Bank2 (FLASH_EDATA2R_PRG) . . 382
7.11.52 FLASH HDP Bank2 configuration (FLASH_HDP2R_CUR) . . . 383
7.11.53 FLASH HDP Bank2 configuration (FLASH_HDP2R_PRG) . . . 383
7.12 FLASH register map and reset values . . . 385

8 Instruction cache (ICACHE) . . . 390

8.1 ICACHE introduction . . . 390
8.2 ICACHE main features . . . 390
8.3 ICACHE implementation . . . 391
8.4 ICACHE functional description . . . 391
8.4.1 ICACHE block diagram . . . 392
8.4.2 ICACHE reset and clocks . . . 392
8.4.3 ICACHE TAG memory . . . 393

8.4.4 Direct-mapped ICACHE (1-way cache) . . . 394
8.4.5 ICACHE enable . . . 395
8.4.6 Cacheable and noncacheable traffic . . . 395
8.4.7 Address remapping . . . 396
8.4.8 Cacheable accesses . . . 398
8.4.9 Dual-master cache . . . 399
8.4.10 ICACHE security . . . 399
8.4.11 ICACHE maintenance . . . 399
8.4.12 ICACHE performance monitoring . . . 400
8.4.13 ICACHE boot . . . 400
8.5 ICACHE low-power modes . . . 400
8.6 ICACHE error management and interrupts . . . 401
8.7 ICACHE registers . . . 401
8.7.1 ICACHE control register (ICACHE_CR) . . . 401
8.7.2 ICACHE status register (ICACHE_SR) . . . 402
8.7.3 ICACHE interrupt enable register (ICACHE_IER) . . . 403
8.7.4 ICACHE flag clear register (ICACHE_FCR) . . . 403
8.7.5 ICACHE hit monitor register (ICACHE_HMONR) . . . 404
8.7.6 ICACHE miss monitor register (ICACHE_MMONR) . . . 404
8.7.7 ICACHE region x configuration register (ICACHE_CRRx) . . . 404
8.7.8 ICACHE register map . . . 405

9 Data cache (DCACHE) . . . 407
9.1 DCACHE introduction . . . 407
9.2 DCACHE main features . . . 407
9.3 DCACHE implementation . . . 408
9.4 DCACHE functional description . . . 408
9.4.1 DCACHE block diagram . . . 409
9.4.2 DCACHE reset and clocks . . . 409
9.4.3 DCACHE TAG memory . . . 410
9.4.4 DCACHE enable . . . 412
9.4.5 Cacheable and noncacheable traffic . . . 412
9.4.6 Cacheable accesses . . . 413
9.4.7 DCACHE security . . . 415
9.4.8 DCACHE maintenance . . . 415
9.4.9 DCACHE performance monitoring . . . 417

9.4.10 DCACHE boot 417
9.5 DCACHE low-power modes 418
9.6 DCACHE error management and interrupts 418
9.7 DCACHE registers 419
9.7.1 DCACHE control register (DCACHE_CR) 419
9.7.2 DCACHE status register (DCACHE_SR) 420
9.7.3 DCACHE interrupt enable register (DCACHE_IER) 421
9.7.4 DCACHE flag clear register (DCACHE_FCR) 422
9.7.5 DCACHE read-hit monitor register (DCACHE_RHMONR) 422
9.7.6 DCACHE read-miss monitor register (DCACHE_RMMONR) 423
9.7.7 DCACHE write-hit monitor register (DCACHE_WHMONR) 423
9.7.8 DCACHE write-miss monitor register (DCACHE_WMMONR) 423
9.7.9 DCACHE command range start address register (DCACHE_CMDRSADDRR) 424
9.7.10 DCACHE command range end address register (DCACHE_CMDREADDRR) 424
9.7.11 DCACHE register map 424

10 Power control (PWR) 426
10.1 PWR introduction 426
10.2 PWR main features 426
10.3 PWR pins and internal signals 427
10.4 PWR power supplies and supply domains 428
10.4.1 External power supplies 430
10.4.2 Internal regulators 431
10.4.3 Power-up and power-down power sequences 433
10.4.4 Independent analog peripherals supply 433
10.4.5 Independent I/O supply rail 434
10.4.6 Independent USB transceivers supply 434
10.4.7 Backup domain 435
10.5 PWR system supply voltage regulation 436
10.5.1 SMPS and LDO embedded regulators 436
10.5.2 V_{CORE} supply versus reset, voltage scaling, and low-power modes . . 437
10.5.3 Embedded voltage regulator operating modes 437
10.6 PWR power supply and temperature supervision 437
10.6.1 Power-on reset (POR)/power-down reset (PDR) 438
10.6.2 Brownout reset (BOR) 438

10.6.3 Programmable voltage detector (PVD) . . . 439
10.6.4 Analog voltage detector (AVD) . . . 440
10.6.5 VDDIO2 voltage monitor (IO2VM) . . . 441
10.6.6 Backup domain voltage monitoring . . . 441
10.6.7 Temperature monitoring . . . 442
10.7 PWR management . . . 443
10.7.1 Voltage scaling . . . 443
10.7.2 Power management examples . . . 444
10.8 Power modes . . . 445
10.8.1 Slowing down system clocks . . . 449
10.8.2 Peripheral clock gating . . . 449
10.8.3 Low-power modes . . . 449
10.8.4 Sleep mode . . . 450
10.8.5 Stop mode . . . 451
10.8.6 Standby mode . . . 453
10.8.7 Power modes output pins . . . 456

12.4.3 Synchronization input 605
12.4.4 Frequency error measurement 605
12.4.5 Frequency error evaluation and automatic trimming 606
12.4.6 CRS initialization and configuration 607
12.5 CRS in low-power modes 608
12.6 CRS interrupts 608
12.7 CRS registers 608
12.7.1 CRS control register (CRS_CR) 608
12.7.2 CRS configuration register (CRS_CFGR) 610
12.7.3 CRS interrupt and status register (CRS_ISR) 611
12.7.4 CRS interrupt flag clear register (CRS_ICR) 613
12.7.5 CRS register map 613

13 General-purpose I/Os (GPIO) 615

13.1 GPIO introduction . . . 615
13.2 GPIO main features . . . 615
13.3 GPIO functional description . . . 615
13.3.1 General-purpose I/O (GPIO) . . . 617
13.3.2 I/O pin alternate function multiplexer and mapping . . . 618
13.3.3 I/O port control registers . . . 619
13.3.4 I/O data bitwise handling . . . 619
13.3.5 GPIO locking mechanism . . . 619
13.3.6 I/O alternate function input/output . . . 620
13.3.7 External interrupt/wake-up lines . . . 620
13.3.8 Input configuration . . . 620
13.3.9 Output configuration . . . 621
13.3.10 Alternate function configuration . . . 621
13.3.11 Analog configuration . . . 622
13.3.12 Using the HSE or LSE oscillator pins as GPIOs . . . 622
13.3.13 Using the GPIO pins in the RTC supply domain . . . 623
13.3.14 I/Os state retention during standby mode . . . 623
13.3.15 TrustZone security . . . 623
13.3.16 Privileged and unprivileged modes . . . 624
13.3.17 High-speed low-voltage mode (HSLV) . . . 624
13.3.18 I/O compensation cell . . . 625
13.4 GPIO registers . . . 626
13.4.1 GPIO port mode register (GPIOx_MODER) (x = A to I) . . . 626
13.4.2 GPIO port output type register (GPIOx_OTYPER) (x = A to I) . . . 626
13.4.3 GPIO port output speed register (GPIOx_OSPEEDR) (x = A to I) . . . 627
13.4.4 GPIO port pull-up/pull-down register (GPIOx_PUPDR) (x = A to I) . . . 627
13.4.5 GPIO port input data register (GPIOx_IDR) (x = A to I) . . . 628
13.4.6 GPIO port output data register (GPIOx_ODR) (x = A to I) . . . 628
13.4.7 GPIO port bit set/reset register (GPIOx_BSRR) (x = A to I) . . . 629
13.4.8 GPIO port configuration lock register (GPIOx_LCKR) (x = A to I) . . . 629
13.4.9 GPIO alternate function low register (GPIOx_AFRL) (x = A to I) . . . 630
13.4.10 GPIO alternate function high register (GPIOx_AFRH) (x = A to H) . . . 631
13.4.11 GPIO port bit reset register (GPIOx_BRR) (x = A to I) . . . 632
13.4.12 GPIO high-speed low-voltage register (GPIOx_HSLVR) (x = A to I) . . . 632
13.4.13 GPIO secure configuration register (GPIOx_SECCFGR) (x = A to I) . . . 633
13.4.14 GPIO register map . . . 634

14 System configuration, boot, and security (SBS) 636

14.1 SBS introduction 636

14.2 SBS main features 636

14.3 SBS functional description 637

14.3.1 SBS block diagram 637

14.3.2 SBS signals 638

14.3.3 SBS reset and clocks 638

14.3.4 SBS system configuration 639

14.3.5 SBS boot control 640

14.3.6 SBS debug control 643

14.3.7 SBS hardware secure storage control 645

14.4 SBS interrupts 647

14.5 SBS registers 647

14.5.1 SBS temporal isolation control register (SBS_HDPLCR) 647

14.5.2 SBS temporal isolation status register (SBS_HDPLSR) 647

14.5.3 SBS next HDPL control register (SBS_NEXTHDPLCR) 648

14.5.4 SBS debug control register (SBS_DBGCR) 648

14.5.5 SBS debug lock register (SBS_DBGLOCKR) 649

14.5.6 SBS RSS command register (SBS_RSSCMDR) 650

14.5.7 SBS EPOCH selection control register (SBS_EPOCHSELCR) 650

14.5.8 SBS security mode configuration control register (SBS_SECCFGR) . 651

14.5.9 SBS product mode and configuration register (SBS_PMCR) 651

14.5.10 SBS product mode and configuration register [alternate] (SBS_PMCR) 653

14.5.11 SBS FPU interrupt mask register (SBS_FPUIMR) 654

14.5.12 SBS memory erase status register (SBS_MESR) 655

14.5.13 SBS compensation cell for I/Os control and status register (SBS_CCCSR) 656

14.5.14 SBS compensation cell for I/Os value register (SBS_CCVALR) 657

14.5.15 SBS compensation cell for I/Os software code register (SBS_CCSWCR) 657

14.5.16 SBS Class B register (SBS_CFGR2) 658

14.5.17 SBS CPU nonsecure lock register (SBS_CNSLCKR) 659

14.5.18 SBS CPU secure lock register (SBS_CSLCKR) 660

14.5.19 SBS flitf ECC NMI mask register (SBS_ECCNMIR) 661

14.5.20 SBS register map 662

15 Peripherals interconnect matrix 664
15.1 Interconnect matrix introduction 664
15.2 Connection summary 664
15.3 Interconnection details 666
15.3.1 Master to slave interconnection for timers 666
15.3.2 Triggers to ADCs 666
15.3.3 ADC analog watchdogs as triggers to timers and PLAY 667
15.3.4 Triggers to DAC 668
15.3.5 Clock sources to timers 668
15.3.6 Triggers to low-power timers 669
15.3.7 RTC wake-up as inputs to timers 670
15.3.8 System errors as break signals to timers 670
15.3.9 Triggers for communication peripherals 671
15.3.10 Triggers to GPDMA1/2 671
15.3.11 Internal analog signals to analog peripherals 672
15.3.12 Clock source for the DAC sample and hold mode 672
15.3.13 Internal tamper sources 672
15.3.14 Output from tamper to RTC 672
15.3.15 Encryption keys to AES/SAES 673
15.3.16 Comparators as inputs, trigger, or break signals to timers1 673
15.3.17 Blanking sources to comparators 674
15.3.18 Play as input to timers 675
15.3.19 Clock source to PLAY 675
15.3.20 Inputs to PLAY 675
15.3.21 Triggers to DTS 676

16 General purpose direct memory access controller (GPDMA) 677
16.1 GPDMA introduction 677
16.2 GPDMA main features 677
16.3 GPDMA implementation 678
16.3.1 GPDMA instances 678
16.3.2 GPDMA channels 678
16.3.3 GPDMA in low-power modes 679
16.3.4 GPDMA requests 679
16.3.5 GPDMA block requests 684
16.3.6 GPDMA channels with peripheral early termination 684

16.3.7 GPDMA triggers . . . 685
16.4 GPDMA functional description . . . 687
16.4.1 GPDMA block diagram . . . 687
16.4.2 GPDMA channel state and direct programming without any linked-list . . . 688
16.4.3 GPDMA channel suspend and resume . . . 689
16.4.4 GPDMA channel abort and restart . . . 690
16.4.5 GPDMA linked-list data structure . . . 691
16.4.6 Linked-list item transfer execution . . . 694
16.4.7 GPDMA channel state and linked-list programming in run-to-completion mode . . . 694
16.4.8 GPDMA channel state and linked-list programming in link step mode . . . 698
16.4.9 GPDMA channel state and linked-list programming . . . 705
16.4.10 GPDMA FIFO-based transfers . . . 707
16.4.11 GPDMA transfer request and arbitration . . . 714
16.4.12 GPDMA triggered transfer . . . 718
16.4.13 GPDMA circular buffering with linked-list programming . . . 719
16.4.14 GPDMA transfer in peripheral flow-control mode . . . 721
16.4.15 GPDMA secure/nonsecure channel . . . 722
16.4.16 GPDMA privileged/unprivileged channel . . . 723
16.4.17 GPDMA error management . . . 723
16.5 GPDMA in debug mode . . . 725
16.6 GPDMA in low-power modes . . . 725
16.7 GPDMA interrupts . . . 726
16.8 GPDMA registers . . . 727
16.8.1 GPDMA secure configuration register (GPDMA_SECCFGR) . . . 727
16.8.2 GPDMA privileged configuration register (GPDMA_PRIVCFGR) . . . 728
16.8.3 GPDMA configuration lock register (GPDMA_RCFGLOCKR) . . . 728
16.8.4 GPDMA nonsecure masked interrupt status register (GPDMA_MISR) . . . 729
16.8.5 GPDMA secure masked interrupt status register (GPDMA_SMISR) . . . 730
16.8.6 GPDMA channel x linked-list base address register (GPDMA_CxLBAR) . . . 730
16.8.7 GPDMA channel x flag clear register (GPDMA_CxFCR) . . . 731
16.8.8 GPDMA channel x status register (GPDMA_CxSR) . . . 732
16.8.9 GPDMA channel x control register (GPDMA_CxCR) . . . 733
16.8.10 GPDMA channel x transfer register 1 (GPDMA_CxTR1) . . . 735

16.8.11 GPDMA channel x transfer register 2 (GPDMA_CxTR2) 739
16.8.12 GPDMA channel x block register 1 (GPDMA_CxBR1) 743
16.8.13 GPDMA channel x alternate block register 1 (GPDMA_CxBR1) 744
16.8.14 GPDMA channel x source address register (GPDMA_CxSAR) 747
16.8.15 GPDMA channel x destination address register (GPDMA_CxDAR) . . 749
16.8.16 GPDMA channel x transfer register 3 (GPDMA_CxTR3) 750
16.8.17 GPDMA channel x block register 2 (GPDMA_CxBR2) 751
16.8.18 GPDMA channel x linked-list address register (GPDMA_CxLLR) 752
16.8.19 GPDMA channel x alternate linked-list address register (GPDMA_CxLLR) 754
16.8.20 GPDMA register map 755

17 Nested vectored interrupt controller (NVIC) 758

20.3.8 Interrupt mode . . . 845
20.3.9 DMA mode . . . 845
20.4 CORDIC registers . . . 846
20.4.1 CORDIC control/status register (CORDIC_CSR) . . . 846
20.4.2 CORDIC argument register (CORDIC_WDATA) . . . 848
20.4.3 CORDIC result register (CORDIC_RDATA) . . . 849
20.4.4 CORDIC register map . . . 849

21 Filter math accelerator (FMAC) . . . 850
21.1 FMAC introduction . . . 850
21.2 FMAC main features . . . 850
21.3 FMAC functional description . . . 851
21.3.1 General description . . . 851
21.3.2 Local memory and buffers . . . 852
21.3.3 Input buffers . . . 852
21.3.4 Output buffer . . . 855

21.3.5 Initialization functions . . . 857
21.3.6 Filter functions . . . 858
21.3.7 Fixed point representation . . . 862
21.3.8 Implementing FIR filters with the FMAC . . . 862
21.3.9 Implementing IIR filters with the FMAC . . . 864
21.3.10 Examples of filter initialization . . . 866
21.3.11 Examples of filter operation . . . 867
21.3.12 Filter design tips . . . 869
21.4 FMAC registers . . . 870
21.4.1 FMAC X1 buffer configuration register (FMAC_X1BUFCFG) . . . 870
21.4.2 FMAC X2 buffer configuration register (FMAC_X2BUFCFG) . . . 870
21.4.3 FMAC Y buffer configuration register (FMAC_YBUFCFG) . . . 871
21.4.4 FMAC parameter register (FMAC_PARAM) . . . 872
21.4.5 FMAC control register (FMAC_CR) . . . 873
21.4.6 FMAC status register (FMAC_SR) . . . 874
21.4.7 FMAC write data register (FMAC_WDATA) . . . 875
21.4.8 FMAC read data register (FMAC_RDATA) . . . 876
21.4.9 FMAC register map . . . 876

22 Programmable logic array (PLAY) . . . 878
22.1 PLAY introduction . . . 878
22.2 PLAY main features . . . 878
22.3 PLAY functional description . . . 879
22.3.1 PLAY block diagram . . . 879
22.3.2 PLAY pins and internal signals . . . 879
22.3.3 PLAY reset and clocks . . . 882
22.3.4 Input selection . . . 882
22.3.5 Input filtering and edge detection . . . 883
22.3.6 Software programmable inputs . . . 885
22.3.7 Logic elements . . . 886
22.3.8 Input interconnect . . . 889
22.3.9 Output interconnect . . . 894
22.3.10 Flags . . . 895
22.3.11 Miscellaneous status bits . . . 896
22.4 PLAY in low-power modes . . . 896
22.5 PLAY interrupts . . . 896

22.6 PLAY registers 897
22.6.1 PLAY configuration control register (PLAY_CFGCR) 898
22.6.2 PLAY security attributes configuration register (PLAY_SECCFGR) . . 898
22.6.3 PLAY privilege attributes configuration register (PLAY_PRIVCFGR) . 899
22.6.4 PLAY filter x configuration register (PLAY_FILTxCFG) 900
22.6.5 PLAY logic element x configuration register 1 (PLAY_LExCFG1) 901
22.6.6 PLAY logic element x configuration register 2 (PLAY_LExCFG2) 901
22.6.7 PLAY output x configuration register (PLAY_OUTxCFG) 902
22.6.8 PLAY software input status register (PLAY_SWIN) 903
22.6.9 PLAY software input set register (PLAY_SWINSET) 903
22.6.10 PLAY software input clear register (PLAY_SWINCLR) 904
22.6.11 PLAY output status register (PLAY_OSR) 905
22.6.12 PLAY flag status register (PLAY_FLSTAT) 905
22.6.13 PLAY flag set register (PLAY_FLSET) 906
22.6.14 PLAY flag clear register (PLAY_FLCLR) 907
22.6.15 PLAY flag interrupt enable register (PLAY_FLIER) 907
22.6.16 PLAY flag control register (PLAY_FLCTL) 908
22.6.17 PLAY miscellaneous status register (PLAY_MSR) 909
22.6.18 PLAY interrupt status register (PLAY_ISR) 909
22.6.19 PLAY interrupt clear register (PLAY_ICR) 910
22.6.20 PLAY interrupt enable register (PLAY_IER) 911
22.7 PLAY register map 911

23 Flexible memory controller (FMC) 914
23.1 FMC introduction 914
23.2 FMC main features 914
23.3 FMC block diagram 915
23.4 AHB interface 916
23.4.1 Supported memories and transactions 917
23.5 External device address mapping 918
23.5.1 NOR/PSRAM address mapping 919
23.5.2 NAND flash memory address mapping 919
23.5.3 SDRAM address mapping 920
23.6 NOR flash/PSRAM controller 922
23.6.1 External memory interface signals 924
23.6.2 Supported memories and transactions 926

23.6.3 General timing rules . . . 927
23.6.4 NOR flash/PSRAM controller asynchronous transactions . . . 927
23.6.5 Synchronous transactions . . . 945
23.6.6 NOR/PSRAM controller registers . . . 952
23.7 NAND flash controller . . . 960
23.7.1 External memory interface signals . . . 960
23.7.2 NAND flash supported memories and transactions . . . 961
23.7.3 Timing diagrams for NAND flash memory . . . 962
23.7.4 NAND flash operations . . . 963
23.7.5 NAND flash prewait functionality . . . 963
23.7.6 Computation of the error correction code (ECC) in NAND flash memory . . . 964
23.7.7 NAND flash controller registers . . . 965
23.8 SDRAM controller . . . 971
23.8.1 SDRAM controller main features . . . 971
23.8.2 SDRAM External memory interface signals . . . 971
23.8.3 SDRAM controller functional description . . . 972
23.8.4 Low-power modes . . . 978
23.8.5 SDRAM controller registers . . . 981
23.8.6 FMC register map . . . 987

24 Octo-SPI interface (OCTOSPI) . . . 990
24.1 OCTOSPI introduction . . . 990
24.2 OCTOSPI main features . . . 990
24.3 OCTOSPI implementation . . . 991
24.4 OCTOSPI functional description . . . 992
24.4.1 OCTOSPI block diagram . . . 992
24.4.2 OCTOSPI pins and internal signals . . . 993
24.4.3 OCTOSPI interface to memory modes . . . 994
24.4.4 OCTOSPI regular-command protocol . . . 994
24.4.5 OCTOSPI regular-command protocol signal interface . . . 998
24.4.6 HyperBus protocol . . . 1001
24.4.7 Specific features . . . 1005
24.4.8 OCTOSPI operating mode introduction . . . 1006
24.4.9 OCTOSPI indirect mode . . . 1006
24.4.10 OCTOSPI automatic status-polling mode . . . 1008
24.4.11 OCTOSPI memory-mapped mode . . . 1009

24.4.12 OCTOSPI configuration introduction 1010
24.4.13 OCTOSPI system configuration 1010
24.4.14 OCTOSPI device configuration 1011
24.4.15 OCTOSPI regular-command mode configuration 1014
24.4.16 OCTOSPI HyperBus protocol configuration 1016
24.4.17 OCTOSPI error management 1017
24.4.18 OCTOSPI BUSY and ABORT 1017
24.4.19 OCTOSPI reconfiguration or deactivation 1018
24.4.20 NCS behavior 1018
24.5 Address alignment and data number 1020
24.6 OCTOSPI interrupts 1021
24.7 OCTOSPI registers 1021
24.7.1 OCTOSPI control register (OCTOSPI_CR) 1021
24.7.2 OCTOSPI device configuration register 1 (OCTOSPI_DCR1) 1024
24.7.3 OCTOSPI device configuration register 2 (OCTOSPI_DCR2) 1026
24.7.4 OCTOSPI device configuration register 3 (OCTOSPI_DCR3) 1027
24.7.5 OCTOSPI device configuration register 4 (OCTOSPI_DCR4) 1027
24.7.6 OCTOSPI status register (OCTOSPI_SR) 1028
24.7.7 OCTOSPI flag clear register (OCTOSPI_FCR) 1029
24.7.8 OCTOSPI data length register (OCTOSPI_DLR) 1030
24.7.9 OCTOSPI address register (OCTOSPI_AR) 1030
24.7.10 OCTOSPI data register (OCTOSPI_DR) 1031
24.7.11 OCTOSPI polling status mask register (OCTOSPI_PSMKR) 1031
24.7.12 OCTOSPI polling status match register (OCTOSPI_PSMAR) 1032
24.7.13 OCTOSPI polling interval register (OCTOSPI_PIR) 1032
24.7.14 OCTOSPI communication configuration register (OCTOSPI_CCR) . 1032
24.7.15 OCTOSPI timing configuration register (OCTOSPI_TCR) 1034
24.7.16 OCTOSPI instruction register (OCTOSPI_IR) 1035
24.7.17 OCTOSPI alternate bytes register (OCTOSPI_ABR) 1035
24.7.18 OCTOSPI low-power timeout register (OCTOSPI_LPTR) 1036
24.7.19 OCTOSPI wrap communication configuration register (OCTOSPI_WPCCR) 1036
24.7.20 OCTOSPI wrap timing configuration register (OCTOSPI_WPTCR) . 1038
24.7.21 OCTOSPI wrap instruction register (OCTOSPI_WPIR) 1039
24.7.22 OCTOSPI wrap alternate bytes register (OCTOSPI_WPABR) 1039
24.7.23 OCTOSPI write communication configuration register (OCTOSPI_WCCR) 1040

24.7.24 OCTOSPI write timing configuration register (OCTOSPI_WTCR) . . . 1042
24.7.25 OCTOSPI write instruction register (OCTOSPI_WIR) 1042
24.7.26 OCTOSPI write alternate bytes register (OCTOSPI_WABR) 1043
24.7.27 OCTOSPI HyperBus latency configuration register (OCTOSPI_HLCR) 1043
24.7.28 OCTOSPI register map 1044

25 Octo-SPI interface (OCTOSPI) 1047

25.1 OCTOSPI introduction 1047
25.2 OCTOSPI main features 1047
25.3 OCTOSPI implementation 1048
25.4 OCTOSPI functional description 1049
25.4.1 OCTOSPI block diagram 1049
25.4.2 OCTOSPI pins and internal signals 1050
25.4.3 OCTOSPI interface to memory modes 1051
25.4.4 OCTOSPI regular-command protocol 1051
25.4.5 OCTOSPI regular-command protocol signal interface 1055
25.4.6 HyperBus protocol 1058
25.4.7 Specific features 1062
25.4.8 OCTOSPI operating mode introduction 1063
25.4.9 OCTOSPI indirect mode 1063
25.4.10 OCTOSPI automatic status-polling mode 1065
25.4.11 OCTOSPI memory-mapped mode 1066
25.4.12 OCTOSPI configuration introduction 1067
25.4.13 OCTOSPI system configuration 1067
25.4.14 OCTOSPI device configuration 1068
25.4.15 OCTOSPI regular-command mode configuration 1071
25.4.16 OCTOSPI HyperBus protocol configuration 1073
25.4.17 OCTOSPI error management 1074
25.4.18 OCTOSPI BUSY and ABORT 1074
25.4.19 OCTOSPI reconfiguration or deactivation 1075
25.4.20 NCS behavior 1075
25.4.21 Software control of two external memories 1077
25.4.22 Hardware-controlled extended memory support 1077
25.5 Address alignment and data number 1078
25.6 OCTOSPI interrupts 1079
25.7 OCTOSPI registers 1080

25.7.1 OCTOSPI control register (OCTOSPI_CR) 1080
25.7.2 OCTOSPI device configuration register 1 (OCTOSPI_DCR1) 1083
25.7.3 OCTOSPI device configuration register 2 (OCTOSPI_DCR2) 1085
25.7.4 OCTOSPI device configuration register 3 (OCTOSPI_DCR3) 1086
25.7.5 OCTOSPI device configuration register 4 (OCTOSPI_DCR4) 1087
25.7.6 OCTOSPI status register (OCTOSPI_SR) 1087
25.7.7 OCTOSPI flag clear register (OCTOSPI_FCR) 1088
25.7.8 OCTOSPI data length register (OCTOSPI_DLR) 1089
25.7.9 OCTOSPI address register (OCTOSPI_AR) 1089
25.7.10 OCTOSPI data register (OCTOSPI_DR) 1090
25.7.11 OCTOSPI polling status mask register (OCTOSPI_PSMKR) 1090
25.7.12 OCTOSPI polling status match register (OCTOSPI_PSMAR) 1091
25.7.13 OCTOSPI polling interval register (OCTOSPI_PIR) 1091
25.7.14 OCTOSPI communication configuration register (OCTOSPI_CCR) . 1092
25.7.15 OCTOSPI timing configuration register (OCTOSPI_TCR) 1094
25.7.16 OCTOSPI instruction register (OCTOSPI_IR) 1094
25.7.17 OCTOSPI alternate bytes register (OCTOSPI_ABR) 1095
25.7.18 OCTOSPI low-power timeout register (OCTOSPI_LPTR) 1095
25.7.19 OCTOSPI wrap communication configuration register (OCTOSPI_WPCCR) 1096
25.7.20 OCTOSPI wrap timing configuration register (OCTOSPI_WPTCR) . 1098
25.7.21 OCTOSPI wrap instruction register (OCTOSPI_WPIR) 1098
25.7.22 OCTOSPI wrap alternate bytes register (OCTOSPI_WPABR) 1099
25.7.23 OCTOSPI write communication configuration register (OCTOSPI_WCCR) 1099
25.7.24 OCTOSPI write timing configuration register (OCTOSPI_WTCR) . . . 1101
25.7.25 OCTOSPI write instruction register (OCTOSPI_WIR) 1102
25.7.26 OCTOSPI write alternate bytes register (OCTOSPI_WABR) 1102
25.7.27 OCTOSPI HyperBus latency configuration register (OCTOSPI_HLCR) 1103
25.7.28 OCTOSPI register map 1103

26 Secure digital input/output MultiMediaCard interface (SDMMC) . . 1107

26.1 SDMMC main features 1107
26.2 SDMMC implementation 1107
26.3 SDMMC bus topology 1108
26.4 SDMMC operation modes 1110

26.5 SDMMC functional description 1111
26.5.1 SDMMC block diagram 1111
26.5.2 SDMMC pins and internal signals 1111
26.5.3 General description 1112
26.5.4 SDMMC adapter 1114
26.5.5 SDMMC AHB slave interface 1136
26.5.6 SDMMC AHB master interface 1137
26.5.7 AHB and SDMMC_CK clock relation 1140
26.6 Card functional description 1140
26.6.1 SD I/O mode 1140
26.6.2 CMD12 send timing 1148
26.6.3 Sleep (CMD5) 1152
26.6.4 Interrupt mode (Wait-IRQ) 1153
26.6.5 Boot operation 1154
26.6.6 Response R1b handling 1157
26.6.7 Reset and card cycle power 1158
26.7 Hardware flow control 1159
26.8 Ultra-high-speed phase I (UHS-I) voltage switch 1159
26.9 SDMMC interrupts 1163
26.10 SDMMC registers 1164
26.10.1 SDMMC power control register (SDMMC_POWER) 1164
26.10.2 SDMMC clock control register (SDMMC_CLKCR) 1165
26.10.3 SDMMC argument register (SDMMC_ARGR) 1167
26.10.4 SDMMC command register (SDMMC_CMDR) 1167
26.10.5 SDMMC command response register (SDMMC_RESPCMDR) 1169
26.10.6 SDMMC response x register (SDMMC_RESPxR) 1170
26.10.7 SDMMC data timer register (SDMMC_DTIMER) 1170
26.10.8 SDMMC data length register (SDMMC_DLENR) 1171
26.10.9 SDMMC data control register (SDMMC_DCTRL) 1172
26.10.10 SDMMC data counter register (SDMMC_DCNTR) 1173
26.10.11 SDMMC status register (SDMMC_STAR) 1174
26.10.12 SDMMC interrupt clear register (SDMMC_ICR) 1177
26.10.13 SDMMC mask register (SDMMC_MASKR) 1179
26.10.14 SDMMC acknowledgment timer register (SDMMC_ACKTIMER) . . . 1182
26.10.15 SDMMC DMA control register (SDMMC_IDMACTRLR) 1182
26.10.16 SDMMC IDMA buffer size register (SDMMC_IDMABSIZER) 1183

26.10.17 SDMMC IDMA buffer base address register (SDMMC_IDMABASER) 1184
26.10.18 SDMMC IDMA linked list address register (SDMMC_IDMALAR) . . . 1184
26.10.19 SDMMC IDMA linked list memory base register (SDMMC_IDMABAR) 1185
26.10.20 SDMMC data FIFO registers x (SDMMC_FIFORx) 1186
26.10.21 SDMMC register map 1186

27 Delay block (DLYB) 1189
27.1 DLYB introduction 1189
27.2 DLYB main features 1189
27.3 DLYB implementation 1189
27.4 DLYB functional description 1189
27.4.1 DLYB diagram 1189
27.4.2 DLYB pins and internal signals 1190
27.4.3 General description 1190
27.4.4 Delay line length configuration procedure 1191
27.4.5 Output clock phase configuration procedure 1192
27.5 DLYB registers 1192
27.5.1 DLYB control register (DLYB_CR) 1192
27.5.2 DLYB configuration register (DLYB_CFGR) 1193
27.5.3 DLYB register map 1194

28 Analog-to-digital converters (ADC1/2/3) 1195
28.1 ADC introduction 1195
28.2 ADC main features 1195
28.3 ADC implementation 1197
28.4 ADC functional description 1198
28.4.1 ADC block diagram 1198
28.4.2 ADC pins and internal signals 1199
28.4.3 ADC clocks 1202
28.4.4 ADC connectivity 1204
28.4.5 Slave AHB interface 1207
28.4.6 ADC Deep-power-down mode (DEEPPWD) and ADC voltage regulator (ADVREGEN) 1207
28.4.7 Single-ended and differential input channels 1208
28.4.8 Calibration (ADCAL, ADCALDIF, ADC_CALFACT) 1208

28.4.9 ADC on-off control (ADEN, ADDIS, ADRDY) 1211
28.4.10 Constraints when writing the ADC control bits 1212
28.4.11 Channel selection (ADC_SQRy, ADC_JSQR) 1213
28.4.12 Channel-wise programmable sampling time (SMPR1, SMPR2) 1214
28.4.13 Single conversion mode (CONT = 0) 1216
28.4.14 Continuous conversion mode (CONT = 1) 1216
28.4.15 Starting conversions (ADSTART, JADSTART) 1217
28.4.16 ADC timing 1218
28.4.17 Stopping an ongoing conversion (ADSTP, JADSTP) 1219
28.4.18 Conversion on external trigger and trigger polarity (EXTSEL, EXTEN,JEXTSEL, JEXTEN) 1220
28.4.19 Injected channel management 1222
28.4.20 Discontinuous mode (DISCEN, DISCNUM, JDISCEN) 1223
28.4.21 Queue of context for injected conversions 1224
28.4.22 Programmable resolution (RES) - fast conversion mode 1232
28.4.23 End of conversion, end of sampling phase (EOC, JEOC, EOSMP) . 1233
28.4.24 End of conversion sequence (EOS, JEOS) 1233
28.4.25 Timing diagrams example (single/continuous modes, hardware/software triggers) 1234
28.4.26 Data management 1236
28.4.27 Dynamic low-power features 1242
28.4.28 Analog window watchdog (AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWD2CH, AWD3CH, AWD_HTx, AWD_LTx, AWDx) 1247
28.4.29 Oversampler 1251
28.4.30 Dual ADC modes 1258
28.4.31 Temperature sensor 1271
28.4.32 VBAT supply monitoring 1273
28.4.33 Monitoring the internal voltage reference 1274
28.4.34 Monitoring the supply voltage 1275
28.5 ADC interrupts 1276
28.6 ADC registers (for each ADC) 1277
28.6.1 ADC interrupt and status register (ADC_ISR) 1277
28.6.2 ADC interrupt enable register (ADC_IER) 1279
28.6.3 ADC control register (ADC_CR) 1281
28.6.4 ADC configuration register (ADC_CFGR) 1284
28.6.5 ADC configuration register 2 (ADC_CFGR2) 1289
28.6.6 ADC sample time register 1 (ADC_SMPR1) 1291
28.6.7 ADC sample time register 2 (ADC_SMPR2) 1292

28.6.8 ADC watchdog threshold register 1 (ADC_TR1) 1293
28.6.9 ADC watchdog threshold register 2 (ADC_TR2) 1294
28.6.10 ADC watchdog threshold register 3 (ADC_TR3) 1295
28.6.11 ADC regular sequence register 1 (ADC_SQR1) 1295
28.6.12 ADC regular sequence register 2 (ADC_SQR2) 1296
28.6.13 ADC regular sequence register 3 (ADC_SQR3) 1297
28.6.14 ADC regular sequence register 4 (ADC_SQR4) 1298
28.6.15 ADC regular data register (ADC_DR) 1299
28.6.16 ADC injected sequence register (ADC_JSQR) 1299
28.6.17 ADC offset y register (ADC_OFRy) 1302
28.6.18 ADC injected channel y data register (ADC_JDRy) 1303
28.6.19 ADC analog watchdog 2 configuration register (ADC_AWD2CR) . . . 1304
28.6.20 ADC analog watchdog 3 configuration register (ADC_AWD3CR) . . . 1304
28.6.21 ADC Differential mode selection register (ADC_DIFSEL) 1305
28.6.22 ADC calibration factors (ADC_CALFACT) 1306
28.6.23 ADC option register (ADC_OR) 1306
28.7 ADC common registers 1307
28.7.1 ADC common status register (ADC_CSR) 1307
28.7.2 ADC common control register (ADC_CCR) 1309
28.7.3 ADC common regular data register for dual mode (ADC_CDR) 1312
28.8 ADC register map 1313

29 Digital temperature sensor (DTS) 1317
29.1 DTS introduction 1317
29.2 DTS main features 1317
29.3 DTS functional description 1318
29.3.1 DTS block diagram 1318
29.3.2 DTS internal signals 1318
29.3.3 DTS block operation 1319
29.3.4 Operating modes 1319
29.3.5 Calibration 1319
29.3.6 Prescaler 1319
29.3.7 Temperature measurement principles 1320
29.3.8 Sampling time 1321
29.3.9 Quick measurement mode 1321
29.3.10 Trigger input 1322
29.3.11 On-off control and ready flag 1322

29.3.12 Temperature measurement sequence 1323
29.4 DTS low-power modes 1324
29.5 DTS interrupts 1324
29.5.1 Temperature window comparator 1324
29.5.2 Synchronous interrupt 1324
29.5.3 Asynchronous wake-up 1324
29.6 DTS registers 1325
29.6.1 Temperature sensor configuration register 1 (DTS_CFGR1) 1325
29.6.2 Temperature sensor T0 value register 1 (DTS_T0VALR1) 1327
29.6.3 Temperature sensor ramp value register (DTS_RAMPVALR) 1327
29.6.4 Temperature sensor interrupt threshold register 1 (DTS_ITR1) 1328
29.6.5 Temperature sensor data register (DTS_DR) 1328
29.6.6 Temperature sensor status register (DTS_SR) 1329
29.6.7 Temperature sensor interrupt enable register (DTS_ITENR) 1330
29.6.8 Temperature sensor clear interrupt flag register (DTS_ICIFR) 1331
29.6.9 Temperature sensor option register (DTS_OR) 1332
29.6.10 DTS register map 1333

30 Digital-to-analog converter (DAC) 1335
30.1 DAC introduction 1335
30.2 DAC main features 1335
30.3 DAC implementation 1336
30.4 DAC functional description 1337
30.4.1 DAC block diagram 1337
30.4.2 DAC pins and internal signals 1338
30.4.3 DAC clocks 1339
30.4.4 DAC channel enable 1339
30.4.5 DAC data format 1339
30.4.6 DAC conversion 1341
30.4.7 DAC output voltage 1342
30.4.8 DAC trigger selection 1342
30.4.9 DMA requests 1343
30.4.10 Noise generation 1344
30.4.11 Triangle-wave generation 1345
30.4.12 DAC channel modes 1346
30.4.13 DAC channel buffer calibration 1349

30.4.14 DAC channel conversion modes 1350
30.4.15 Dual DAC channel conversion modes (if dual channels are available) 1351
30.5 DAC in low-power modes 1355
30.6 DAC interrupts 1355
30.7 DAC registers 1356
30.7.1 DAC control register (DAC_CR) 1356
30.7.2 DAC software trigger register (DAC_SWTRGR) 1359
30.7.3 DAC channel1 12-bit right-aligned data holding register (DAC_DHR12R1) 1360
30.7.4 DAC channel1 12-bit left aligned data holding register (DAC_DHR12L1) 1361
30.7.5 DAC channel1 8-bit right aligned data holding register (DAC_DHR8R1) 1361
30.7.6 DAC channel2 12-bit right aligned data holding register (DAC_DHR12R2) 1362
30.7.7 DAC channel2 12-bit left aligned data holding register (DAC_DHR12L2) 1362
30.7.8 DAC channel2 8-bit right-aligned data holding register (DAC_DHR8R2) 1363
30.7.9 Dual DAC 12-bit right-aligned data holding register (DAC_DHR12RD) 1363
30.7.10 Dual DAC 12-bit left aligned data holding register (DAC_DHR12LD) 1364
30.7.11 Dual DAC 8-bit right aligned data holding register (DAC_DHR8RD) 1364
30.7.12 DAC channel1 data output register (DAC_DOR1) 1365
30.7.13 DAC channel2 data output register (DAC_DOR2) 1365
30.7.14 DAC status register (DAC_SR) 1366
30.7.15 DAC calibration control register (DAC_CCR) 1367
30.7.16 DAC mode control register (DAC_MCR) 1368
30.7.17 DAC channel1 sample and hold sample time register (DAC_SHSR1) 1369
30.7.18 DAC channel2 sample and hold sample time register (DAC_SHSR2) 1370
30.7.19 DAC sample and hold time register (DAC_SHHR) 1370
30.7.20 DAC sample and hold refresh time register (DAC_SHRR) 1371
30.7.21 DAC register map 1372

31 Voltage reference buffer (VREFBUF) 1374

31.1 VREFBUF introduction . . . 1374
31.2 VREFBUF implementation . . . 1374
31.3 VREFBUF functional description . . . 1374
31.4 VREFBUF trimming . . . 1375
31.5 VREFBUF registers . . . 1376
31.5.1 VREFBUF control and status register (VREFBUF_CSR) . . . 1376
31.5.2 VREFBUF calibration control register (VREFBUF_CCR) . . . 1377
31.5.3 VREFBUF register map . . . 1378

32 Comparator (COMP) . . . 1379
32.1 COMP introduction . . . 1379
32.2 COMP main features . . . 1379
32.3 COMP functional description . . . 1380
32.3.1 COMP block diagram . . . 1380
32.3.2 COMP pins and internal signals . . . 1380
32.3.3 COMP reset and clocks . . . 1382
32.3.4 Comparator LOCK mechanism . . . 1383
32.3.5 Window comparator . . . 1383
32.3.6 Hysteresis . . . 1383
32.3.7 Comparator output blanking function . . . 1384
32.3.8 COMP startup stabilization time . . . 1385
32.3.9 COMP power and speed modes . . . 1385
32.4 COMP low-power modes . . . 1385
32.5 COMP interrupts . . . 1386
32.5.1 Wake-up interrupt through EXTI . . . 1386
32.5.2 Interrupt through EXTI . . . 1386
32.5.3 Interrupt through the NVIC of the CPU . . . 1387
32.6 SCALER function . . . 1387
32.7 COMP registers . . . 1388
32.7.1 Comparator status register (COMP_SR) . . . 1388
32.7.2 Comparator interrupt clear flag register (COMP_ICFR) . . . 1389
32.7.3 Comparator configuration register 1 (COMP_CFGR1) . . . 1389
32.7.4 Comparator configuration register 2 (COMP_CFGR2) . . . 1391
32.7.5 COMP register map . . . 1393

33 Digital camera interface (DCMI) . . . 1394

33.1 DCMI introduction 1394
33.2 DCMI main features 1394
33.3 DCMI functional description 1394
33.3.1 DCMI block diagram 1395
33.3.2 DCMI pins and internal signals 1395
33.3.3 DCMI clocks 1396
33.3.4 DCMI DMA interface 1396
33.3.5 DCMI physical interface 1396
33.3.6 DCMI synchronization 1398
33.3.7 DCMI capture modes 1400
33.3.8 DCMI crop feature 1401
33.3.9 DCMI JPEG format 1402
33.3.10 DCMI FIFO 1402
33.3.11 DCMI data format description 1403
33.4 DCMI interrupts 1405
33.5 DCMI registers 1405
33.5.1 DCMI control register (DCMI_CR) 1405
33.5.2 DCMI status register (DCMI_SR) 1408
33.5.3 DCMI raw interrupt status register (DCMI_RIS) 1408
33.5.4 DCMI interrupt enable register (DCMI_IER) 1409
33.5.5 DCMI masked interrupt status register (DCMI_MIS) 1410
33.5.6 DCMI interrupt clear register (DCMI_ICR) 1411
33.5.7 DCMI embedded synchronization code register (DCMI_ESCR) 1412
33.5.8 DCMI embedded synchronization unmask register (DCMI_ESUR) . 1412
33.5.9 DCMI crop window start (DCMI_CWSTRT) 1413
33.5.10 DCMI crop window size (DCMI_CWSIZE) 1414
33.5.11 DCMI data register (DCMI_DR) 1414
33.5.12 DCMI register map 1415

34 Parallel synchronous slave interface (PSSI) 1416

34.1 PSSI introduction 1416
34.2 PSSI main features 1416
34.3 PSSI functional description 1416
34.3.1 PSSI block diagram 1417
34.3.2 PSSI pins and internal signals 1417
34.3.3 PSSI clock 1418

34.3.4 PSSI data management . . . 1418
34.3.5 PSSI optional control signals . . . 1420
34.4 PSSI interrupts . . . 1423
34.5 PSSI registers . . . 1424
34.5.1 PSSI control register (PSSI_CR) . . . 1424
34.5.2 PSSI status register (PSSI_SR) . . . 1425
34.5.3 PSSI raw interrupt status register (PSSI_RIS) . . . 1426
34.5.4 PSSI interrupt enable register (PSSI_IER) . . . 1427
34.5.5 PSSI masked interrupt status register (PSSI_MIS) . . . 1427
34.5.6 PSSI interrupt clear register (PSSI_ICR) . . . 1428
34.5.7 PSSI data register (PSSI_DR) . . . 1428
34.5.8 PSSI register map . . . 1429

35 Coupling and chaining bridge (CCB) . . . 1430
35.1 CCB introduction . . . 1430
35.2 CCB main features . . . 1430
35.3 CCB implementation . . . 1431
35.4 CCB functional description . . . 1431
35.4.1 CCB block diagram . . . 1431
35.4.2 CCB internal signals . . . 1432
35.4.3 CCB reset and clocks . . . 1432
35.4.4 CCB coupling and chaining . . . 1432
35.4.5 CCB error management . . . 1435
35.5 CCB coupling and chaining operations . . . 1435
35.5.1 Preliminary steps before any protected operation . . . 1437
35.5.2 ECDSA signature . . . 1438
35.5.3 ECC scalar multiplication . . . 1445
35.5.4 RSA modular exponentiation . . . 1448
35.6 CCB interrupts . . . 1450
35.7 CCB registers . . . 1451
35.7.1 CCB control register (CCB_CR) . . . 1451
35.7.2 CCB status register (CCB_SR) . . . 1452
35.7.3 CCB reference tag register (CCB_REFTAGRx) . . . 1454
35.7.4 CCB register map . . . 1455

36 True random number generator (RNG) . . . 1456

36.1 RNG introduction . . . 1456
36.2 RNG main features . . . 1456
36.3 RNG functional description . . . 1457
36.3.1 RNG block diagram . . . 1457
36.3.2 RNG internal signals . . . 1457
36.3.3 Random number generation . . . 1457
36.3.4 RNG initialization . . . 1460
36.3.5 RNG operation . . . 1461
36.3.6 RNG clocking . . . 1463
36.3.7 Error management . . . 1463
36.3.8 RNG low-power use . . . 1464
36.4 RNG interrupts . . . 1465
36.5 RNG processing time . . . 1465
36.6 RNG entropy source validation . . . 1466
36.6.1 Introduction . . . 1466
36.6.2 Validation conditions . . . 1466
36.7 RNG registers . . . 1467
36.7.1 RNG control register (RNG_CR) . . . 1467
36.7.2 RNG status register (RNG_SR) . . . 1469
36.7.3 RNG data register (RNG_DR) . . . 1470
36.7.4 RNG noise source control register (RNG_NSCR) . . . 1471
36.7.5 RNG health test control register (RNG_HTCR) . . . 1472
36.7.6 RNG register map . . . 1472

37 True random number generator (RNG) . . . 1473
37.1 RNG introduction . . . 1473
37.2 RNG main features . . . 1473
37.3 RNG functional description . . . 1474
37.3.1 RNG block diagram . . . 1474
37.3.2 RNG internal signals . . . 1474
37.3.3 Random number generation . . . 1475
37.3.4 RNG initialization . . . 1477
37.3.5 RNG operation . . . 1478
37.3.6 RNG clocking . . . 1480
37.3.7 Error management . . . 1480
37.3.8 RNG low-power use . . . 1482

37.4 RNG interrupts . . . 1482
37.5 RNG processing time . . . 1483
37.6 RNG entropy source validation . . . 1483
37.6.1 Introduction . . . 1483
37.6.2 Validation conditions . . . 1483
37.7 RNG registers . . . 1485
37.7.1 RNG control register (RNG_CR) . . . 1485
37.7.2 RNG status register (RNG_SR) . . . 1487
37.7.3 RNG data register (RNG_DR) . . . 1488
37.7.4 RNG noise source control register (RNG_NSCR) . . . 1489
37.7.5 RNG health test control register x (RNG_HTCRx) . . . 1489
37.7.6 RNG health test status register 0 (RNG_HTSR0) . . . 1490
37.7.7 RNG health test status register 1 (RNG_HTSR1) . . . 1490
37.7.8 RNG noise source mask register (RNG_NSMR) . . . 1491
37.7.9 RNG register map . . . 1492

38 Secure AES coprocessor (SAES) . . . 1493
38.1 SAES introduction . . . 1493
38.2 SAES main features . . . 1493
38.3 SAES implementation . . . 1494
38.4 SAES functional description . . . 1494
38.4.1 SAES block diagram . . . 1494
38.4.2 SAES internal signals . . . 1495
38.4.3 SAES reset and clocks . . . 1496
38.4.4 SAES symmetric cipher implementation . . . 1496
38.4.5 SAES encryption or decryption typical usage . . . 1497
38.4.6 SAES authenticated encryption, decryption, and cipher-based message authentication . . . 1499
38.4.7 SAES ciphertext stealing and data padding . . . 1500
38.4.8 SAES suspend and resume operations . . . 1500
38.4.9 SAES basic chaining modes (ECB, CBC) . . . 1501
38.4.10 SAES counter (CTR) mode . . . 1505
38.4.11 SAES Galois/counter mode (GCM) . . . 1507
38.4.12 SAES Galois message authentication code (GMAC) . . . 1511
38.4.13 SAES counter with CBC-MAC (CCM) . . . 1513
38.4.14 SAES operation with wrapped keys . . . 1518
38.4.15 SAES operation with shared keys . . . 1522

38.4.16 SAES data registers and data swapping 1523
38.4.17 SAES key registers 1526
38.4.18 SAES initialization vector registers 1527
38.4.19 SAES error management 1528
38.5 SAES interrupts 1530
38.6 SAES DMA requests 1530
38.7 SAES processing latency 1531
38.8 SAES registers 1533
38.8.1 SAES control register (SAES_CR) 1533
38.8.2 SAES status register (SAES_SR) 1536
38.8.3 SAES data input register (SAES_DINR) 1537
38.8.4 SAES data output register (SAES_DOUTR) 1538
38.8.5 SAES key register 0 (SAES_KEYR0) 1538
38.8.6 SAES key register 1 (SAES_KEYR1) 1539
38.8.7 SAES key register 2 (SAES_KEYR2) 1539
38.8.8 SAES key register 3 (SAES_KEYR3) 1539
38.8.9 SAES initialization vector register 0 (SAES_IVR0) 1540
38.8.10 SAES initialization vector register 1 (SAES_IVR1) 1540
38.8.11 SAES initialization vector register 2 (SAES_IVR2) 1540
38.8.12 SAES initialization vector register 3 (SAES_IVR3) 1541
38.8.13 SAES key register 4 (SAES_KEYR4) 1541
38.8.14 SAES key register 5 (SAES_KEYR5) 1541
38.8.15 SAES key register 6 (SAES_KEYR6) 1542
38.8.16 SAES key register 7 (SAES_KEYR7) 1542
38.8.17 SAES suspend registers (SAES_SUSPRx) 1542
38.8.18 SAES interrupt enable register (SAES_IER) 1543
38.8.19 SAES interrupt status register (SAES_ISR) 1544
38.8.20 SAES interrupt clear register (SAES_ICR) 1545
38.8.21 SAES register map 1546

39 AES hardware accelerator (AES) 1548

39.1 AES introduction 1548
39.2 AES main features 1548
39.3 AES implementation 1549
39.4 AES functional description 1549
39.4.1 AES block diagram 1549

39.4.2 AES internal signals . . . 1550
39.4.3 AES reset and clocks . . . 1550
39.4.4 AES symmetric cipher implementation . . . 1550
39.4.5 AES encryption or decryption typical usage . . . 1551
39.4.6 AES authenticated encryption, decryption, and cipher-based message authentication . . . 1553
39.4.7 AES ciphertext stealing and data padding . . . 1553
39.4.8 AES suspend and resume operations . . . 1554
39.4.9 AES basic chaining modes (ECB, CBC) . . . 1555
39.4.10 AES counter (CTR) mode . . . 1558
39.4.11 AES Galois/counter mode (GCM) . . . 1561
39.4.12 AES Galois message authentication code (GMAC) . . . 1565
39.4.13 AES counter with CBC-MAC (CCM) . . . 1566
39.4.14 AES key sharing with secure AES co-processor . . . 1571
39.4.15 AES data registers and data swapping . . . 1572
39.4.16 AES key registers . . . 1574
39.4.17 AES initialization vector registers . . . 1574
39.4.18 AES error management . . . 1575
39.5 AES interrupts . . . 1576
39.6 AES DMA requests . . . 1576
39.7 AES processing latency . . . 1577
39.8 AES registers . . . 1579
39.8.1 AES control register (AES_CR) . . . 1579
39.8.2 AES status register (AES_SR) . . . 1581
39.8.3 AES data input register (AES_DINR) . . . 1582
39.8.4 AES data output register (AES_DOUTR) . . . 1583
39.8.5 AES key register 0 (AES_KEYR0) . . . 1583
39.8.6 AES key register 1 (AES_KEYR1) . . . 1584
39.8.7 AES key register 2 (AES_KEYR2) . . . 1584
39.8.8 AES key register 3 (AES_KEYR3) . . . 1584
39.8.9 AES initialization vector register 0 (AES_IVR0) . . . 1585
39.8.10 AES initialization vector register 1 (AES_IVR1) . . . 1585
39.8.11 AES initialization vector register 2 (AES_IVR2) . . . 1585
39.8.12 AES initialization vector register 3 (AES_IVR3) . . . 1586
39.8.13 AES key register 4 (AES_KEYR4) . . . 1586
39.8.14 AES key register 5 (AES_KEYR5) . . . 1586
39.8.15 AES key register 6 (AES_KEYR6) . . . 1587

39.8.16 AES key register 7 (AES_KEYR7) . . . 1587
39.8.17 AES suspend registers (AES_SUSPRx) . . . 1587
39.8.18 AES interrupt enable register (AES_IER) . . . 1588
39.8.19 AES interrupt status register (AES_ISR) . . . 1589
39.8.20 AES interrupt clear register (AES_ICR) . . . 1590
39.8.21 AES register map . . . 1590

40 Hash processor (HASH) . . . 1593
40.1 HASH introduction . . . 1593
40.2 HASH main features . . . 1593
40.3 HASH implementation . . . 1594
40.4 HASH functional description . . . 1594
40.4.1 HASH block diagram . . . 1594
40.4.2 HASH internal signals . . . 1595
40.4.3 About secure hash algorithms . . . 1595
40.4.4 Message data feeding . . . 1596
40.4.5 Message digest computing . . . 1597
40.4.6 Message padding . . . 1600
40.4.7 HMAC operation . . . 1601
40.4.8 HASH suspend/resume operations . . . 1603
40.4.9 HASH DMA interface . . . 1605
40.4.10 HASH error management . . . 1606
40.4.11 HASH processing time . . . 1606
40.5 HASH interrupts . . . 1606
40.6 HASH registers . . . 1607
40.6.1 HASH control register (HASH_CR) . . . 1607
40.6.2 HASH data input register (HASH_DIN) . . . 1609
40.6.3 HASH start register (HASH_STR) . . . 1610
40.6.4 HASH digest registers . . . 1611
40.6.5 HASH interrupt enable register (HASH_IMR) . . . 1613
40.6.6 HASH status register (HASH_SR) . . . 1613
40.6.7 HASH context swap registers . . . 1615
40.6.8 HASH register map . . . 1615

41 Public key accelerator (PKA) . . . 1617
41.1 PKA introduction . . . 1617

41.2 PKA main features . . . 1617
41.3 PKA implementation . . . 1617
41.4 PKA functional description . . . 1618
41.4.1 PKA block diagram . . . 1618
41.4.2 PKA internal signals . . . 1618
41.4.3 PKA reset and clocks . . . 1619
41.4.4 PKA public key acceleration . . . 1619
41.4.5 Typical applications for PKA . . . 1621
41.4.6 PKA procedure to perform an operation . . . 1623
41.4.7 Private keys protection using CCB . . . 1624
41.4.8 PKA error management . . . 1628
41.5 PKA operating modes . . . 1628
41.5.1 Introduction . . . 1628
41.5.2 Montgomery parameter computation . . . 1630
41.5.3 Modular addition . . . 1630
41.5.4 Modular subtraction . . . 1631
41.5.5 Modular and Montgomery multiplication . . . 1631
41.5.6 Modular exponentiation . . . 1632
41.5.7 Modular inversion . . . 1634
41.5.8 Modular reduction . . . 1634
41.5.9 Arithmetic addition . . . 1635
41.5.10 Arithmetic subtraction . . . 1635
41.5.11 Arithmetic multiplication . . . 1636
41.5.12 Arithmetic comparison . . . 1636
41.5.13 RSA CRT exponentiation . . . 1636
41.5.14 Point on elliptic curve Fp check . . . 1637

51.6.24 RTC option register (RTC_OR) . . . 2254
51.6.25 RTC alarm A binary mode register (RTC_ALRABINR) . . . 2254
51.6.26 RTC alarm B binary mode register (RTC_ALRBBINR) . . . 2255

51.6.27 RTC register map 2256

52 Tamper and backup registers (TAMP) 2259

52.1 TAMP introduction 2259
52.2 TAMP main features 2260
52.3 TAMP implementation 2260
52.4 TAMP functional description 2261
52.4.1 TAMP block diagram 2261
52.4.2 TAMP pins and internal signals 2262
52.4.3 GPIOs controlled by the RTC and TAMP 2265
52.4.4 TAMP register write protection 2265
52.4.5 TAMP secure protection modes 2265
52.4.6 Backup registers protection zones 2266
52.4.7 TAMP privilege protection modes 2266
52.4.8 Boot hardware key (BHK) 2267
52.4.9 Tamper detection 2267
52.4.10 TAMP backup registers and other device secrets erase 2267
52.4.11 Tamper detection configuration and initialization 2269
52.5 TAMP low-power modes 2276
52.6 TAMP interrupts 2277
52.7 TAMP registers 2277
52.7.1 TAMP control register 1 (TAMP_CR1) 2277
52.7.2 TAMP control register 2 (TAMP_CR2) 2279
52.7.3 TAMP control register 3 (TAMP_CR3) 2282
52.7.4 TAMP filter control register (TAMP_FLTCR) 2283
52.7.5 TAMP active tamper control register 1 (TAMP_ATCR1) 2284
52.7.6 TAMP active tamper seed register (TAMP_ATSEEDR) 2287
52.7.7 TAMP active tamper output register (TAMP_ATOR) 2287
52.7.8 TAMP active tamper control register 2 (TAMP_ATCR2) 2288
52.7.9 TAMP secure configuration register (TAMP_SECCFGR) 2291
52.7.10 TAMP privilege configuration register (TAMP_PRIVCFGR) 2293
52.7.11 TAMP interrupt enable register (TAMP_IER) 2294
52.7.12 TAMP status register (TAMP_SR) 2296
52.7.13 TAMP nonsecure masked interrupt status register (TAMP_MISR) . . 2298
52.7.14 TAMP secure masked interrupt status register (TAMP_SMISR) 2299
52.7.15 TAMP status clear register (TAMP_SCR) 2301

52.7.16 TAMP monotonic counter 1 register (TAMP_COUNT1R) 2303
52.7.17 TAMP option register (TAMP_OR) 2303
52.7.18 TAMP resources protection configuration register (TAMP_RPCFGR) 2304
52.7.19 TAMP backup x register (TAMP_BKPxR) 2305
52.7.20 TAMP register map 2306

53 Inter-integrated circuit interface (I2C) 2308

53.1 I2C introduction 2308
53.2 I2C main features 2308
53.3 I2C implementation 2309
53.4 I2C functional description 2309
53.4.1 I2C block diagram 2310
53.4.2 I2C pins and internal signals 2310
53.4.3 I2C clock requirements 2311
53.4.4 I2C mode selection 2311
53.4.5 I2C initialization 2312
53.4.6 I2C reset 2316
53.4.7 I2C data transfer 2317
53.4.8 I2C target mode 2319
53.4.9 I2C controller mode 2328
53.4.10 I2C_TIMINGR register configuration examples 2339
53.4.11 SMBus specific features 2341
53.4.12 SMBus initialization 2343
53.4.13 SMBus I2C_TIMEOUTR register configuration examples 2345
53.4.14 SMBus target mode 2346
53.4.15 SMBus controller mode 2349
53.4.16 Wake-up from Stop mode on address match 2352
53.4.17 Error conditions 2353
53.5 I2C in low-power modes 2355
53.6 I2C interrupts 2355
53.7 I2C DMA requests 2356
53.7.1 Transmission using DMA 2356
53.7.2 Reception using DMA 2356
53.8 I2C debug modes 2356
53.9 I2C registers 2357
53.9.1 I2C control register 1 (I2C_CR1) 2357

53.9.2 I2C control register 2 (I2C_CR2) . . . 2360
53.9.3 I2C own address 1 register (I2C_OAR1) . . . 2362
53.9.4 I2C own address 2 register (I2C_OAR2) . . . 2362
53.9.5 I2C timing register (I2C_TIMINGR) . . . 2363
53.9.6 I2C timeout register (I2C_TIMEOUTR) . . . 2364
53.9.7 I2C interrupt and status register (I2C_ISR) . . . 2365
53.9.8 I2C interrupt clear register (I2C_ICR) . . . 2368
53.9.9 I2C PEC register (I2C_PECR) . . . 2369
53.9.10 I2C receive data register (I2C_RXDR) . . . 2369
53.9.11 I2C transmit data register (I2C_TXDR) . . . 2370
53.9.12 I2C register map . . . 2371

54 Improved inter-integrated circuit (I3C) . . . 2372

54.1 I3C introduction . . . 2372
54.2 I3C main features . . . 2372
54.3 I3C implementation . . . 2374
54.3.1 I3C instantiation . . . 2374
54.3.2 I3C wake-up from low-power mode(s) . . . 2374
54.3.3 I3C FIFOs . . . 2374
54.3.4 I3C triggers . . . 2374
54.3.5 I3C interrupt(s) . . . 2374
54.3.6 I3C MIPI® support . . . 2375
54.4 I3C block diagram . . . 2376
54.5 I3C pins and internal signals . . . 2376
54.6 I3C reset and clocks . . . 2377
54.6.1 I3C reset . . . 2377
54.6.2 I3C clocks and requirements . . . 2377
54.7 I3C peripheral state and programming . . . 2379
54.7.1 I3C peripheral state . . . 2379
54.7.2 I3C controller state and programming sequence . . . 2380
54.7.3 I3C target state and programming sequence . . . 2385
54.8 I3C registers and programming . . . 2392
54.8.1 I3C register set, as controller/target . . . 2392
54.8.2 I3C registers and fields use versus peripheral state, as controller . . . 2393
54.8.3 I3C registers and fields usage versus peripheral state, as target . . . 2395
54.9 I3C bus transfers and programming . . . 2397

54.9.1 I3C command set (CCCs), as controller/target 2397
54.9.2 I3C broadcast/direct CCC transfer (except ENTDAA, RSTACT), as controller 2401
54.9.3 I3C broadcast ENTDAA CCC transfer, as controller 2403
54.9.4 I3C broadcast/direct RSTACT CCC transfer, as controller 2403
54.9.5 I3C broadcast/direct CCC transfer (except ENTDAA, DEFTGTS, DEFGRPA), as target 2405
54.9.6 I3C broadcast ENTDAA CCC transfer, as target 2407
54.9.7 I3C broadcast DEFTGTS CCC transfer, as target 2408
54.9.8 I3C broadcast DEFGRPA CCC transfer, as target 2409
54.9.9 I3C direct GETSTATUS CCC response, as target 2410
54.9.10 I3C private read/write transfer, as controller 2411
54.9.11 I3C private read/write transfer, as target 2412
54.9.12 Legacy I2C read/write transfer, as controller 2413
54.9.13 Legacy I2C read/write transfer, as target 2414
54.9.14 I3C IBI transfer, as controller/target 2414
54.9.15 I3C hot-join request transfer, as controller/target 2416
54.9.16 I3C controller-role request transfer, as controller/target 2417
54.10 I3C FIFOs management, as controller 2418
54.10.1 C-FIFO management, as controller 2418
54.10.2 TX-FIFO management, as controller 2419
54.10.3 RX-FIFO management, as controller 2422
54.10.4 S-FIFO management, as controller 2424
54.11 I3C FIFOs management, as target 2426
54.11.1 RX-FIFO management, as target 2426
54.11.2 TX-FIFO management, as target 2429
54.12 I3C error management 2433
54.12.1 Controller error management 2433
54.12.2 Target error management 2435
54.13 I3C in low-power modes 2436
54.14 I3C interrupts 2438
54.15 I3C registers 2438
54.15.1 I3C message control register (I3C_CR) 2438
54.15.2 I3C message control register [alternate] (I3C_CR) 2440
54.15.3 I3C configuration register (I3C_CFGR) 2442
54.15.4 I3C receive data byte register (I3C_RDR) 2447
54.15.5 I3C receive data word register (I3C_RDWR) 2448

54.15.6 I3C transmit data byte register (I3C_TDR) 2449
54.15.7 I3C transmit data word register (I3C_TDWR) 2450
54.15.8 I3C IBI payload data register (I3C_IBIDR) 2451
54.15.9 I3C target transmit configuration register (I3C_TGTTDR) 2452
54.15.10 I3C status register (I3C_SR) 2453
54.15.11 I3C status error register (I3C_SER) 2454
54.15.12 I3C received message register (I3C_RMR) 2456
54.15.13 I3C event register (I3C_EVR) 2457
54.15.14 I3C interrupt enable register (I3C_IER) 2461
54.15.15 I3C clear event register (I3C_CEVR) 2463
54.15.16 I3C masked interrupt status register (I3C_MISR) 2465
54.15.17 I3C own device characteristics register (I3C_DEVR0) 2466
54.15.18 I3C device x characteristics register (I3C_DEVRx) 2468
54.15.19 I3C maximum read length register (I3C_MAXRLR) 2470
54.15.20 I3C maximum write length register (I3C_MAXWLR) 2471
54.15.21 I3C I2C target configuration register (I3C_I2CCFGR) 2472
54.15.22 I3C timing register 0 (I3C_TIMINGR0) 2473
54.15.23 I3C timing register 1 (I3C_TIMINGR1) 2474
54.15.24 I3C timing register 2 (I3C_TIMINGR2) 2476
54.15.25 I3C bus characteristics register (I3C_BCR) 2478
54.15.26 I3C device characteristics register (I3C_DCR) 2479
54.15.27 I3C get capability register (I3C_GETCAPR) 2480
54.15.28 I3C controller-role capability register (I3C_CRCAPR) 2481
54.15.29 I3C get max data speed register (I3C_GETMXDSR) 2482
54.15.30 I3C extended provisioned ID register (I3C_EPIDR) 2484
54.15.31 I3C register map 2485

55 Improved inter-integrated circuit (I3C) 2488

55.1 I3C introduction 2488
55.2 I3C main features 2488
55.3 I3C implementation 2490
55.3.1 I3C instantiation 2490
55.3.2 I3C wake-up from low-power mode(s) 2490
55.3.3 I3C autonomous mode with DMA in Stop mode(s) 2490
55.3.4 I3C FIFOs 2490
55.3.5 I3C triggers 2490
55.3.6 I3C interrupt(s) 2490

55.3.7 I3C MIPI® support . . . 2491
55.4 I3C block diagram . . . 2492

56 Universal synchronous/asynchronous receiver transmitter (USART/UART) 2596

56.1 USART introduction 2596
56.2 USART main features 2596
56.3 USART extended features 2597
56.4 USART implementation 2597
56.5 USART functional description 2599
56.5.1 USART block diagram 2599
56.5.2 USART pins and internal signals 2599
56.5.3 USART clocks 2601
56.5.4 USART character description 2601
56.5.5 USART FIFOs and thresholds 2604
56.5.6 USART transmitter 2604
56.5.7 USART receiver 2607
56.5.8 USART baud rate generation 2614
56.5.9 Tolerance of the USART receiver to clock deviation 2616
56.5.10 USART auto baud rate detection 2617
56.5.11 USART multiprocessor communication 2619
56.5.12 USART Modbus communication 2621
56.5.13 USART parity control 2622
56.5.14 USART LIN (local interconnection network) mode 2623
56.5.15 USART synchronous mode 2625
56.5.16 USART single-wire half-duplex communication 2629
56.5.17 USART receiver timeout 2629
56.5.18 USART smartcard mode 2630
56.5.19 USART IrDA SIR ENDEC block 2634
56.5.20 Continuous communication using USART and DMA 2637
56.5.21 RS232 hardware flow control and RS485 driver enable 2639
56.5.22 USART low-power management 2642
56.6 USART in low-power modes 2645
56.7 USART interrupts 2645
56.8 USART registers 2648

56.8.1 USART control register 1 (USART_CR1) 2648
56.8.2 USART control register 1 [alternate] (USART_CR1) 2652
56.8.3 USART control register 2 (USART_CR2) 2655
56.8.4 USART control register 3 (USART_CR3) 2659
56.8.5 USART control register 3 [alternate] (USART_CR3) 2663
56.8.6 USART baud rate register (USART_BRR) 2666
56.8.7 USART guard time and prescaler register (USART_GTPR) 2667
56.8.8 USART receiver timeout register (USART_RTOR) 2668
56.8.9 USART request register (USART_RQR) 2669
56.8.10 USART interrupt and status register (USART_ISR) 2670
56.8.11 USART interrupt and status register [alternate] (USART_ISR) 2676
56.8.12 USART interrupt flag clear register (USART_ICR) 2681
56.8.13 USART receive data register (USART_RDR) 2682
56.8.14 USART transmit data register (USART_TDR) 2683
56.8.15 USART prescaler register (USART_PRESC) 2683
56.8.16 USART register map 2684

57 Low-power universal asynchronous receiver transmitter (LPUART) 2686

57.1 LPUART introduction 2686
57.2 LPUART main features 2686
57.3 LPUART implementation 2687
57.4 LPUART functional description 2689
57.4.1 LPUART block diagram 2689
57.4.2 LPUART pins and internal signals 2690
57.4.3 LPUART clocks 2691
57.4.4 LPUART character description 2691
57.4.5 LPUART FIFOs and thresholds 2693
57.4.6 LPUART transmitter 2693
57.4.7 LPUART receiver 2697
57.4.8 LPUART baud rate generation 2701
57.4.9 Tolerance of the LPUART receiver to clock deviation 2702
57.4.10 LPUART multiprocessor communication 2703
57.4.11 LPUART parity control 2705
57.4.12 LPUART single-wire half-duplex communication 2706
57.4.13 Continuous communication using DMA and LPUART 2706
57.4.14 RS232 hardware flow control and RS485 driver enable 2709

57.4.15 LPUART low-power management 2711
57.5 LPUART in low-power modes 2714
57.6 LPUART interrupts 2715
57.7 LPUART registers 2716
57.7.1 LPUART control register 1 (LPUART_CR1) 2716
57.7.2 LPUART control register 1 [alternate] (LPUART_CR1) 2719
57.7.3 LPUART control register 2 (LPUART_CR2) 2722
57.7.4 LPUART control register 3 (LPUART_CR3) 2724
57.7.5 LPUART control register 3 [alternate] (LPUART_CR3) 2727
57.7.6 LPUART baud rate register (LPUART_BRR) 2729
57.7.7 LPUART request register (LPUART_RQR) 2729
57.7.8 LPUART interrupt and status register (LPUART_ISR) 2730
57.7.9 LPUART interrupt and status register [alternate] (LPUART_ISR) . . . 2735
57.7.10 LPUART interrupt flag clear register (LPUART_ICR) 2738
57.7.11 LPUART receive data register (LPUART_RDR) 2739
57.7.12 LPUART transmit data register (LPUART_TDR) 2739
57.7.13 LPUART prescaler register (LPUART_PRESC) 2740
57.7.14 LPUART register map 2741

58 Serial peripheral interface (SPI) 2743
58.1 SPI introduction 2743
58.2 SPI main features 2743
58.3 SPI implementation 2744
58.4 SPI functional description 2745

61 Universal serial bus full-speed host/device interface (USB) 2953

61.1 USB introduction 2953
61.2 USB main features 2953
61.3 USB implementation 2953
61.4 USB functional description 2954
61.4.1 USB block diagram 2954
61.4.2 USB pins and internal signals 2954
61.4.3 USB reset and clocks 2955
61.4.4 General description and Device mode functionality 2955
61.4.5 Description of USB blocks used in both Device and Host modes . . . 2956
61.4.6 Description of host frame scheduler (HFS) specific to Host mode . . 2957
61.5 Programming considerations for Device and Host modes 2958
61.5.1 Generic USB Device programming 2958
61.5.2 System and power-on reset 2958
61.5.3 Double-buffered endpoints and usage in Device mode 2965
61.5.4 Double buffered channels: usage in Host mode 2967
61.5.5 Isochronous transfers in Device mode 2968
61.5.6 Isochronous transfers in Host mode 2969
61.5.7 Suspend/resume events 2970
61.6 USB registers 2973
61.6.1 USB control register (USB_CNTR) 2974
61.6.2 USB interrupt status register (USB_ISTR) 2977
61.6.3 USB frame number register (USB_FNR) 2981
61.6.4 USB Device address (USB_DADDR) 2981
61.6.5 USB LPM control and status register (USB_LPMCSR) 2982
61.6.6 USB battery charging detector (USB_BCDR) 2983
61.6.7 USB endpoint/channel n register (USB_CHEPnR) 2984
61.7 USBSRAM registers 2993
61.7.1 Channel/endpoint transmit buffer descriptor n (USB_CHEP_TXRXBD_n) 2994
61.7.2 Channel/endpoint receive buffer descriptor n [alternate] (USB_CHEP_TXRXBD_n) 2994
61.7.3 Channel/endpoint receive buffer descriptor n (USB_CHEP_RXTXBD_n) 2996
61.7.4 Channel/endpoint transmit buffer descriptor n [alternate] (USB_CHEP_RXTXBD_n) 2997
61.7.5 USBSRAM register map 2998

62 USB Type-C®/USB Power Delivery interface (UCPD) 2999

62.1 UCPD introduction 2999
62.2 UCPD main features 2999
62.3 UCPD implementation 3000
62.4 UCPD functional description 3000
62.4.1 UCPD block diagram 3001
62.4.2 UCPD reset and clocks 3002
62.4.3 Physical layer protocol 3003
62.4.4 UCPD BMC transmitter 3010
62.4.5 UCPD BMC receiver 3011
62.4.6 UCPD Type-C pull-ups (Rp) and pull-downs (Rd) 3013
62.4.7 UCPD Type-C voltage monitoring and de-bouncing 3013
62.4.8 UCPD fast role swap (FRS) 3014
62.4.9 UCPD DMA Interface 3014
62.4.10 Wake-up from Stop mode 3014
62.5 UCPD programming sequences 3014
62.5.1 Initialization phase 3015
62.5.2 Type-C state machine handling 3015
62.5.3 USB PD transmit 3017
62.5.4 USB PD receive 3018
62.5.5 UCPD software trimming 3019
62.6 UCPD low-power modes 3019
62.7 UCPD interrupts 3020
62.8 UCPD registers 3021
62.8.1 UCPD configuration register 1 (UCPD_CFGR1) 3021
62.8.2 UCPD configuration register 2 (UCPD_CFGR2) 3023
62.8.3 UCPD configuration register 3 (UCPD_CFGR3) 3023
62.8.4 UCPD control register (UCPD_CR) 3024
62.8.5 UCPD interrupt mask register (UCPD_IMR) 3026
62.8.6 UCPD status register (UCPD_SR) 3028
62.8.7 UCPD interrupt clear register (UCPD_ICR) 3031
62.8.8 UCPD Tx ordered set type register (UCPD_TX_ORDSETR) 3032
62.8.9 UCPD Tx payload size register (UCPD_TX_PAYSZR) 3032
62.8.10 UCPD Tx data register (UCPD_TXDR) 3033
62.8.11 UCPD Rx ordered set register (UCPD_RX_ORDSETR) 3033
62.8.12 UCPD Rx payload size register (UCPD_RX_PAYSZR) 3034
62.8.13 UCPD receive data register (UCPD_RXDR) 3035

62.8.14 UCPD Rx ordered set extension register 1 (UCPD_RX_ORDEXTR1) . . . 3035
62.8.15 UCPD Rx ordered set extension register 2 (UCPD_RX_ORDEXTR2) . . . 3036

1 Documentation conventions

1.1 General information

The STM32H5 devices have an Arm® Cortex®-M33 core.

arm

Note: Arm and Cortex are registered trademarks of Arm Limited (or its subsidiaries or affiliates) in the US and/or elsewhere.

The Arm word and logo are trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere. All rights reserved.

1.2 List of abbreviations for registers

The following abbreviations[a] are used in register descriptions:

read/write (rw)	Software can read and write to this bit.
read-only (r)	Software can only read this bit.
write-only (w)	Software can only write to this bit. Reading this bit returns the reset value.
read/clear write0 (rc_w0)	Software can read as well as clear this bit by writing 0. Writing 1 has no effect on the bit value.
read/clear write1 (rc_w1)	Software can read as well as clear this bit by writing 1. Writing 0 has no effect on the bit value.
read/clear write (rc_w)	Software can read as well as clear this bit by writing to the register. The value written to this bit is not important.
read/clear by read (rc_r)	Software can read this bit. Reading this bit automatically clears it to 0. Writing this bit has no effect on the bit value.
read/set by read (rs_r)	Software can read this bit. Reading this bit automatically sets it to 1. Writing this bit has no effect on the bit value.
read/set (rs)	Software can read as well as set this bit. Writing 0 has no effect on the bit value.
read/write once (rwo)	Software can only write once to this bit and can also read it at any time. Only a reset can return the bit to its reset value.
toggle (t)	The software can toggle this bit by writing 1. Writing 0 has no effect.
read-only write trigger (rt_w1)	Software can read this bit. Writing 1 triggers an event but has no effect on the bit value.
Reserved (Res.)	Reserved bit, must be kept at reset value.

a. This is an exhaustive list of all abbreviations applicable to STMicroelectronics microcontrollers, some of them may not be used in the current document.

1.3 Register reset value

Bits (binary notation) or bits nibbles (hexadecimal notation) of which the reset value is undefined are marked as X.

Bits (binary notation) or bits nibbles (hexadecimal notation) of which the reset value is unmodified are marked as U.

1.4 Glossary

This section gives a brief definition of acronyms and abbreviations used in this document:

- **Word**: data of 32-bit length.
- **Half-word**: data of 16-bit length.
- **Byte**: data of 8-bit length.
- **AHB**: advanced high-performance bus.

2 Memory and bus architecture

2.1 System architecture

The architecture relies on a Arm Cortex-M33 core optimized for execution thanks to an instruction cache having a direct access to the embedded flash memory.

This architecture also features a 32-bit multilayer AHB bus matrix with the interconnections detailed in *Table 1* and *Table 2*.

Table 1. Implementation of masters

Master	Comments	STM32H523/ 533xx	STM32H562/563/ 573xx	STM32H543/ 553xx
Cortex-M33 Fast C-bus	Connecting Cortex-M33 (with Arm TrustZone® mainline and FPU) to the internal SRAMs and flash memory through ICACHE	X	X	X
Cortex-M33 Slow C-bus	Connecting Cortex-M33 (with Arm TrustZone mainline and FPU) to the external memories through ICACHE	X	X	X
Cortex-M33 S-bus	Connecting the Cortex-M33 (with Arm TrustZone mainline and FPU) to internal SRAMs without latency	3 masters		
	Connecting Cortex-M33 (with Arm TrustZone mainline and FPU) to the external memories through DCACHE	X	X	X
GPDMA1	-	2 masters		
GPDMA2	-	2 masters		
SDMMC1	-	X	X	X
SDMMC2	-	-	X	-
Ethernet MAC	-	-	X(1)	X

1. Not available on STM32H562xx devices.

Table 2. Implementation of slaves

Slave	Comments	STM32H523/ 533xx	STM32H562/563/ 573xx	STM32H543/ 553xx
Flash memory	-	X	X	X
SRAM1	-	X	X	X
SRAM2	-	X	X	X
SRAM3	-	X	X	X

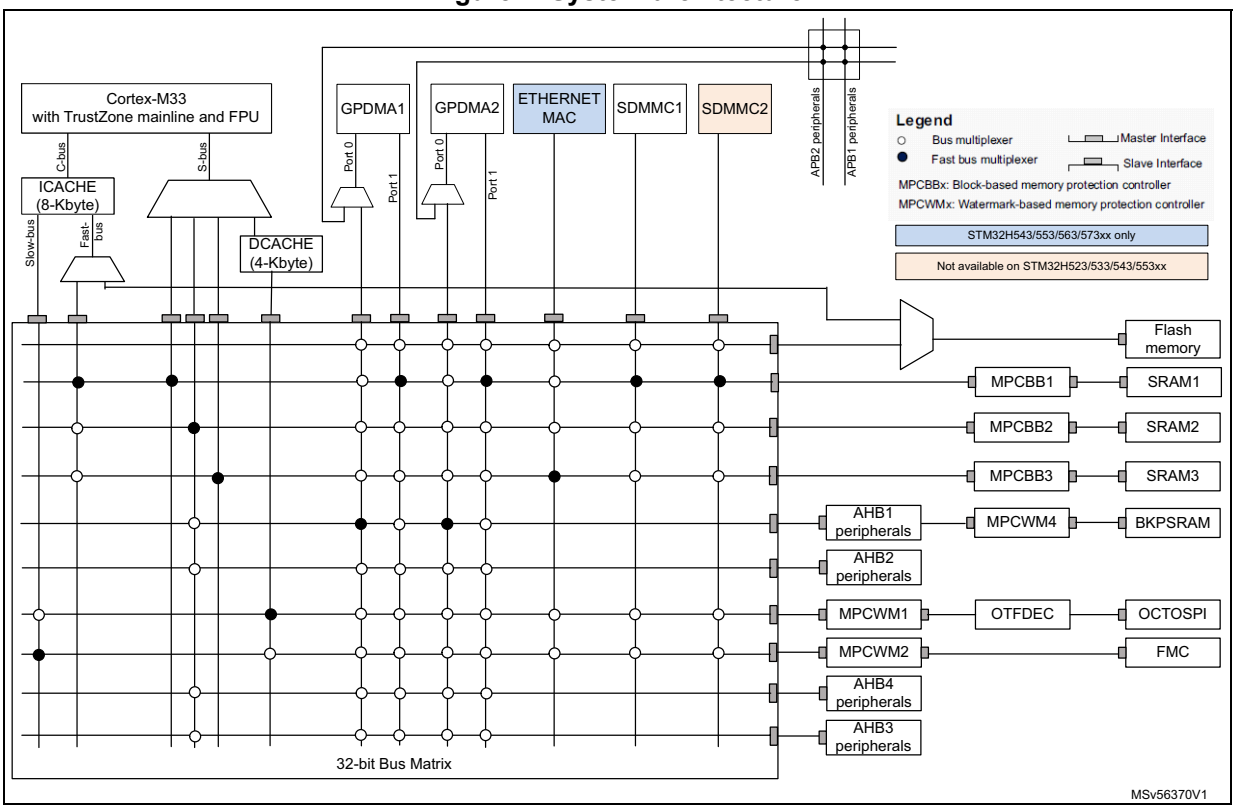

Table 2. Implementation of slaves (continued)

Slave	Comments	STM32H523/533xx	STM32H562/563/573xx	STM32H543/553xx
AHB1	Peripherals and BKPSRAM including AHB to APB bridge, and APB peripherals (connected to APB1 and APB2)	X	X	X
AHB2	Peripherals	X	X	X
FMC	-	X(1)	X	X
OCTOSPI1	-	X	X	X
AHB3	Including AHB to APB bridge, and APB peripherals (connected to APB3)	X	X	X
AHB4	Peripherals	X	X	X

1. STM32H523/533xx devices do not support SDRAM.

The bus matrix provides access from a master to a slave, enabling concurrent accesses and efficient operation even when several high-speed peripherals work simultaneously. This architecture is shown in *Figure 1*.

Figure 1. System architecture

2.1.1 Fast C-bus

This bus connects the C-bus of the Cortex-M33 core to the internal flash memory and to the BusMatrix via the instruction cache. This bus is used for instruction fetch and data access to

the internal memories mapped in code region. This bus targets the internal flash memory and the internal SRAMs (SRAM1, SRAM2 and SRAM3).

SRAM1, SRAM2 and SRAM3 are accessible on this bus with a continuous mapping.

2.1.2 Slow C-bus

This bus connects the C-bus of the Cortex-M33 core to the BusMatrix via the instruction cache. This bus is used for instruction fetch and data access to the external memories mapped in code region. This bus targets the external memories (FMC and OCTOSPI).

2.1.3 S-bus

This bus connects the system bus of the Cortex-M33 core to the BusMatrix. This bus is used by the core to access data located in a peripheral or SRAM area. This bus targets the internal SRAMs (SRAM1, SRAM2, SRAM3, and BKPSRAM), the AHB1 peripherals including the APB1, APB2, AHB2, AHB3 and AHB4 peripherals.

SRAM1, SRAM2 and SRAM3 are accessible on this bus with a continuous mapping.

Note: The Bus Matrix has a zero latency when accessing SRAM1, SRAM2 and SRAM3.

2.1.4 DCache S-bus

This bus connects the system bus of the Cortex-M33 core to the BusMatrix via the data cache. This bus is used for instruction fetch and data access to the external memories mapped in data region. This bus targets the external memories (FMC and OCTOSPI).

Note: Fetching instructions through this bus is less efficient than fetching instructions through the slow C-bus.

2.1.5 GPDMA1 and GPDMA2 buses

These buses connect the four AHB master interfaces of the GPDMA1 and GPDMA2 to the BusMatrix. These buses target the internal flash memory, the internal SRAMs (SRAM1, SRAM2, SRAM3, and BKPSRAM), the AHB1 peripherals including the APB1 and APB2 peripherals, the AHB2 peripherals, the AHB3 peripherals, AHB4 peripherals and the external memories through FMC or OCTOSPI.

2.1.6 SDMMC1 and SDMMC2[(a)] controllers DMA buses

These buses connect the SDMMC1 and SDMMC2 DMA master interfaces to the BusMatrix. They are used only by the SDMMC1 and SDMMC2 DMA to load/store data from/to the memory. These buses target the data memories: internal flash memory, internal SRAMs (SRAM1, SRAM2 and SRAM3), and external memories through FMC or OCTOSPI.

2.1.7 BusMatrix

The BusMatrix manages the access arbitration between masters. The arbitration uses a round-robin algorithm. This BusMatrix features a fast bus multiplexer used to connect each

a. SDMMC2 is not available on STM32H523/533xx and STM32H543/553xx devices.

master to a given slave without latency (see *Figure 1*). For the same master, other slaves undergo a latency of at least one cycle at each new access.

2.1.8 AHB/APB bridges

The three AHB/APB bridges provide full synchronous connections between the AHB and the APB buses, allowing flexible selection of the peripheral frequency.

Refer to *Section 2.3.2: Memory map and register boundary addresses* for the address mapping of the peripherals connected to these bridges.

After each device reset, all peripheral clocks are disabled (except for the internal SRAMs and flash memory interfaces). Before using a peripheral, its clock must be enabled in the RCC_AHBxENR and RCC_APBxENR registers.

Note: When a 8- or 16-bit access is performed on an APB register, the access is transformed into a 32-bit access: the bridge duplicates the 8- or 16-bit data to feed the 32-bit vector.

2.1.9 Ethernet MAC[(a)]

The Ethernet MAC uses a 32-bit bus, connected to the AHB bus matrix. Through the system bus matrix, it can access the internal flash memory, the internal memories, and the external memories through the OCTOSPI and the FMC.

2.2 TrustZone security architecture

The security architecture is based on Arm TrustZone with the Armv8-M mainline extension.

The TrustZone security is activated by the TZEN option bit in the FLASH_OPTR register.

When the TrustZone is enabled, the SAU (security-attribution unit) and IDAU (implementation-defined-attribution unit) defines the access permissions based on secure and nonsecure states.

- SAU: Up to eight SAU configurable regions are available for security attribution.
- IDAU: provides a first memory partition as nonsecure or nonsecure callable attributes. The IDAU memory map partition is not configurable, it is fixed by hardware implementation (refer to *Figure 2: Memory map based on IDAU mapping (STM32H562/563/573xx devices)*, *Figure 3: Memory map based on IDAU mapping (STM32H523/533xx devices)*, and *Figure 4: Memory map based on IDAU mapping (STM32H543/553xx devices)*). It is then combined with the results from the SAU security attribution, and the higher security state is selected.

Based on IDAU security attribution, the flash memory, system SRAMs and peripherals memory spaces are aliased twice for secure and nonsecure states. However, the external memories space is not aliased.

2.2.1 Default TrustZone security state

When the TrustZone security is activated by the TZEN option bit in the FLASH_OPTR, the default system security state is detailed below:

a. Not available on STM32H523/533xx and STM32H562xx devices.

- CPU:
  - Cortex-M33 is in secure state after reset. The boot address must be at a secure address.
- Memory map:
  - SAU is fully secure after reset. Consequently, all memory map is fully secure. Up to eight SAU configurable regions are available for security attribution.
- Flash memory:
  - The flash memory security area is defined by watermark user options.
  - Block-based security attributions are nonsecure after reset.
- SRAMs:
  - All SRAMs are secure after reset. MPCBBx (block-based memory protection controller) are secure.
- External memories:
  - FMC and OCTOSPI banks are secure after reset. MPCWMx (watermark-based memory protection controller) are secure.
- Peripherals (see *Table 3* and *Table 4* *for a list of securable and TrustZone-aware peripherals)*
  - Securable peripherals are nonsecure after reset.
  - TrustZone-aware peripherals are nonsecure after reset. Their secure configuration registers are secure.
- All GPIO are secure after reset.
- Interrupts:
  - NVIC: All interrupts are secure after reset. NVIC is banked for secure and nonsecure state.
  - TZIC: All illegal access interrupts are disabled after reset (see *GTZC TrustZone system architecture*).

2.2.2 TrustZone peripheral classification

When the TrustZone security is active, a peripheral can be either securable or TrustZone-aware type as follows:

- Securable: peripheral protected by an AHB/APB firewall gate that is controlled from TZSC controller to define security properties
- TrustZone-aware: peripheral connected directly to AHB or APB bus and implementing a specific TrustZone behavior such as a subset of registers being secure.

Refer to *GTZC TrustZone system architecture* for more details.

The following tables list the securable and TrustZone-aware peripherals within the system.

Table 3. Securable peripherals by TZSC

2.3 Memory organization

2.3.1 Introduction

Program memory, data memory, registers and I/O ports are organized within the same linear address space.

The bytes are coded in memory in Little Endian format. The lowest numbered byte in a word is considered the word's least significant byte and the highest numbered byte the most significant.

2.3.2 Memory map and register boundary addresses

Figure 2. Memory map based on IDAU mapping (STM32H562/563/573xx devices)

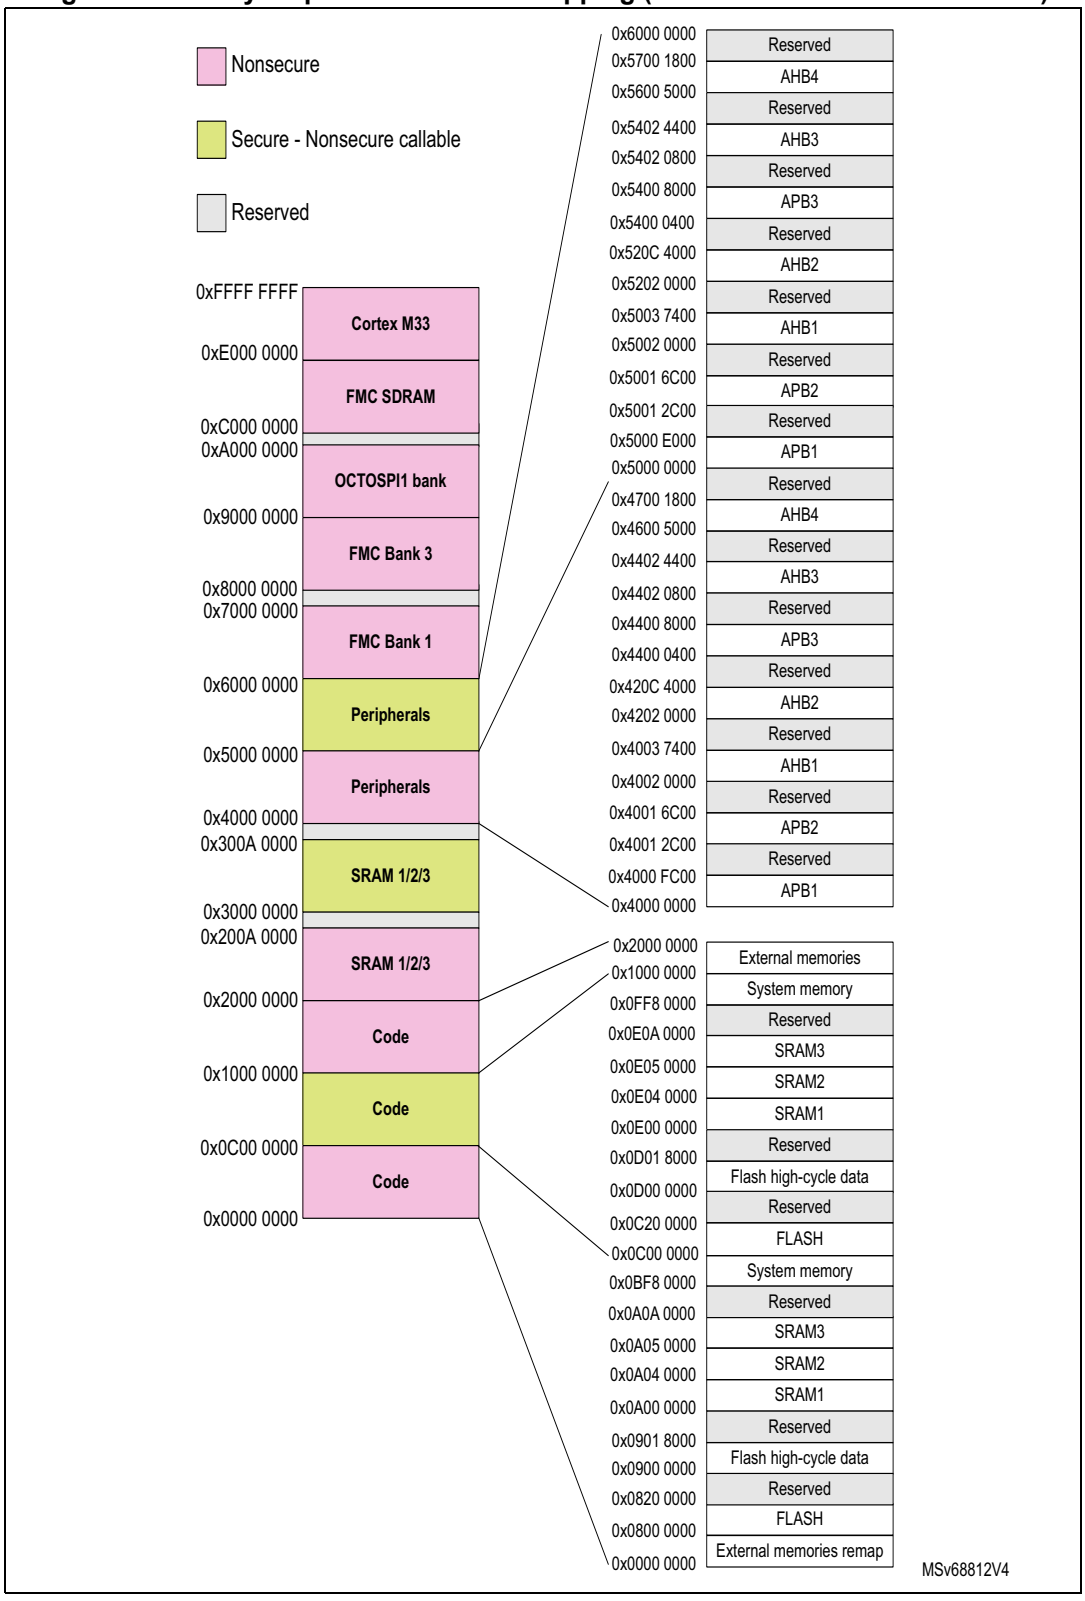

Figure 3. Memory map based on IDAU mapping (STM32H523/533xx devices)

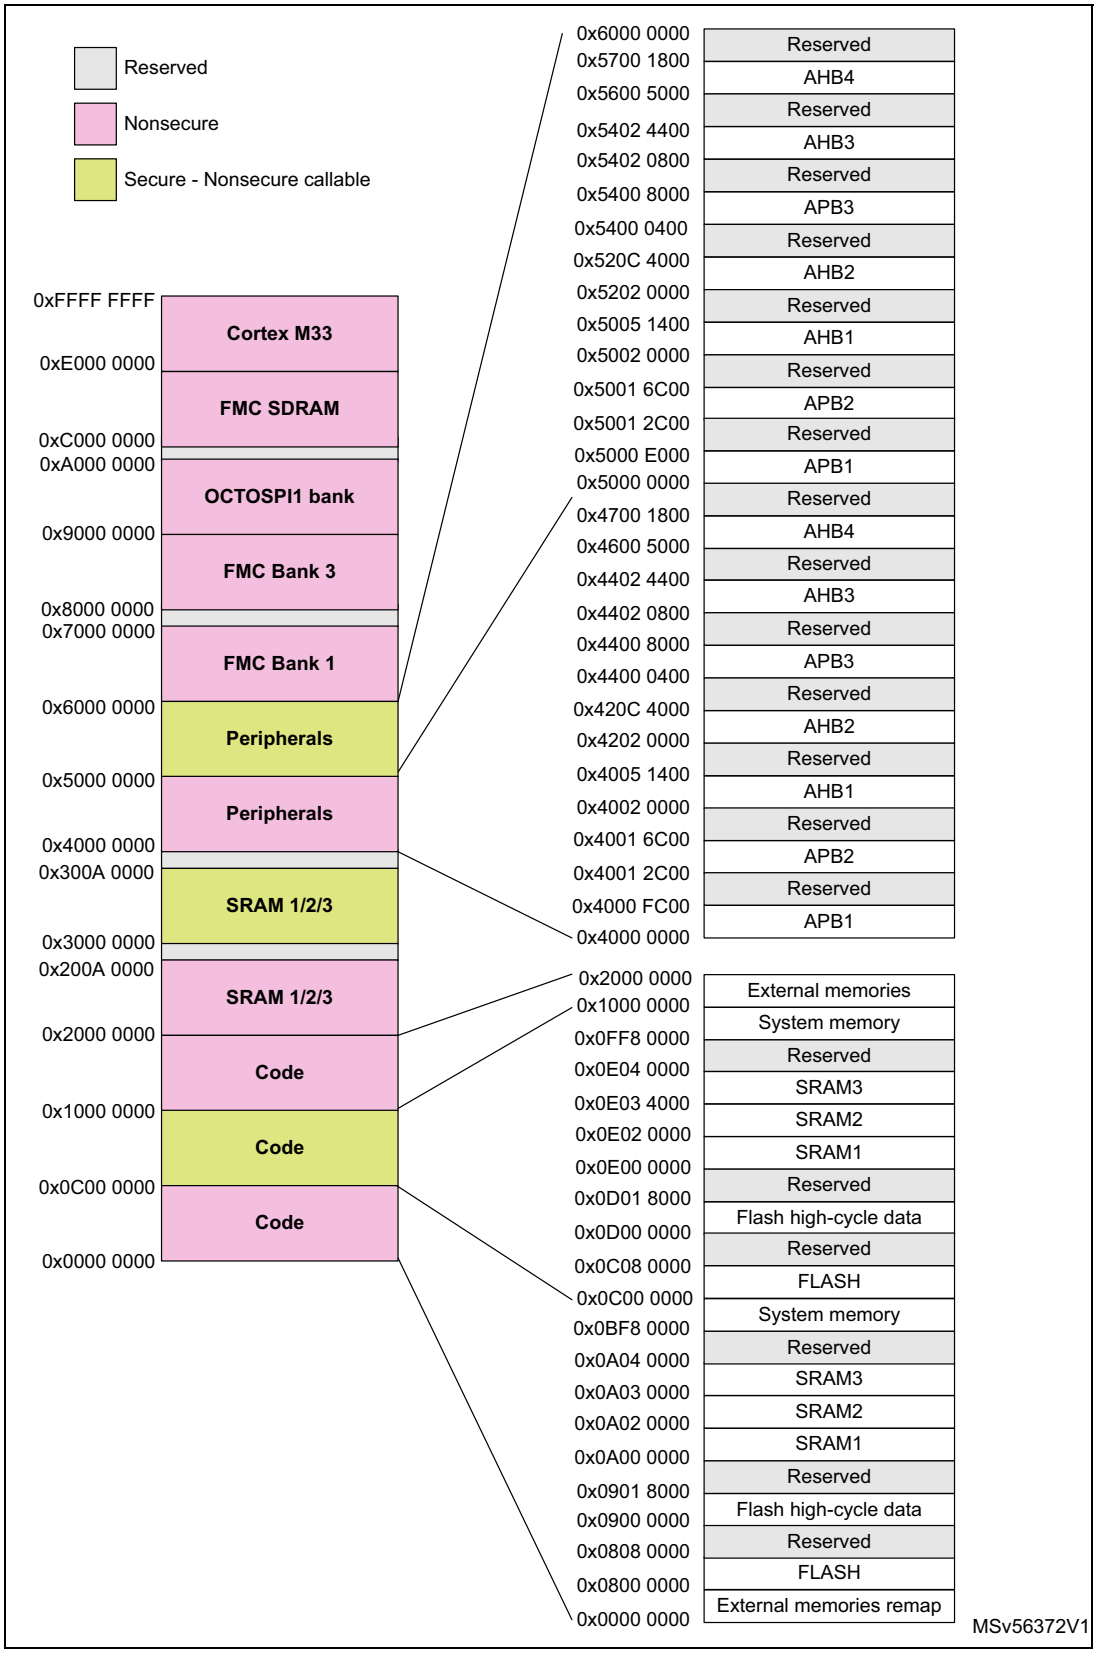

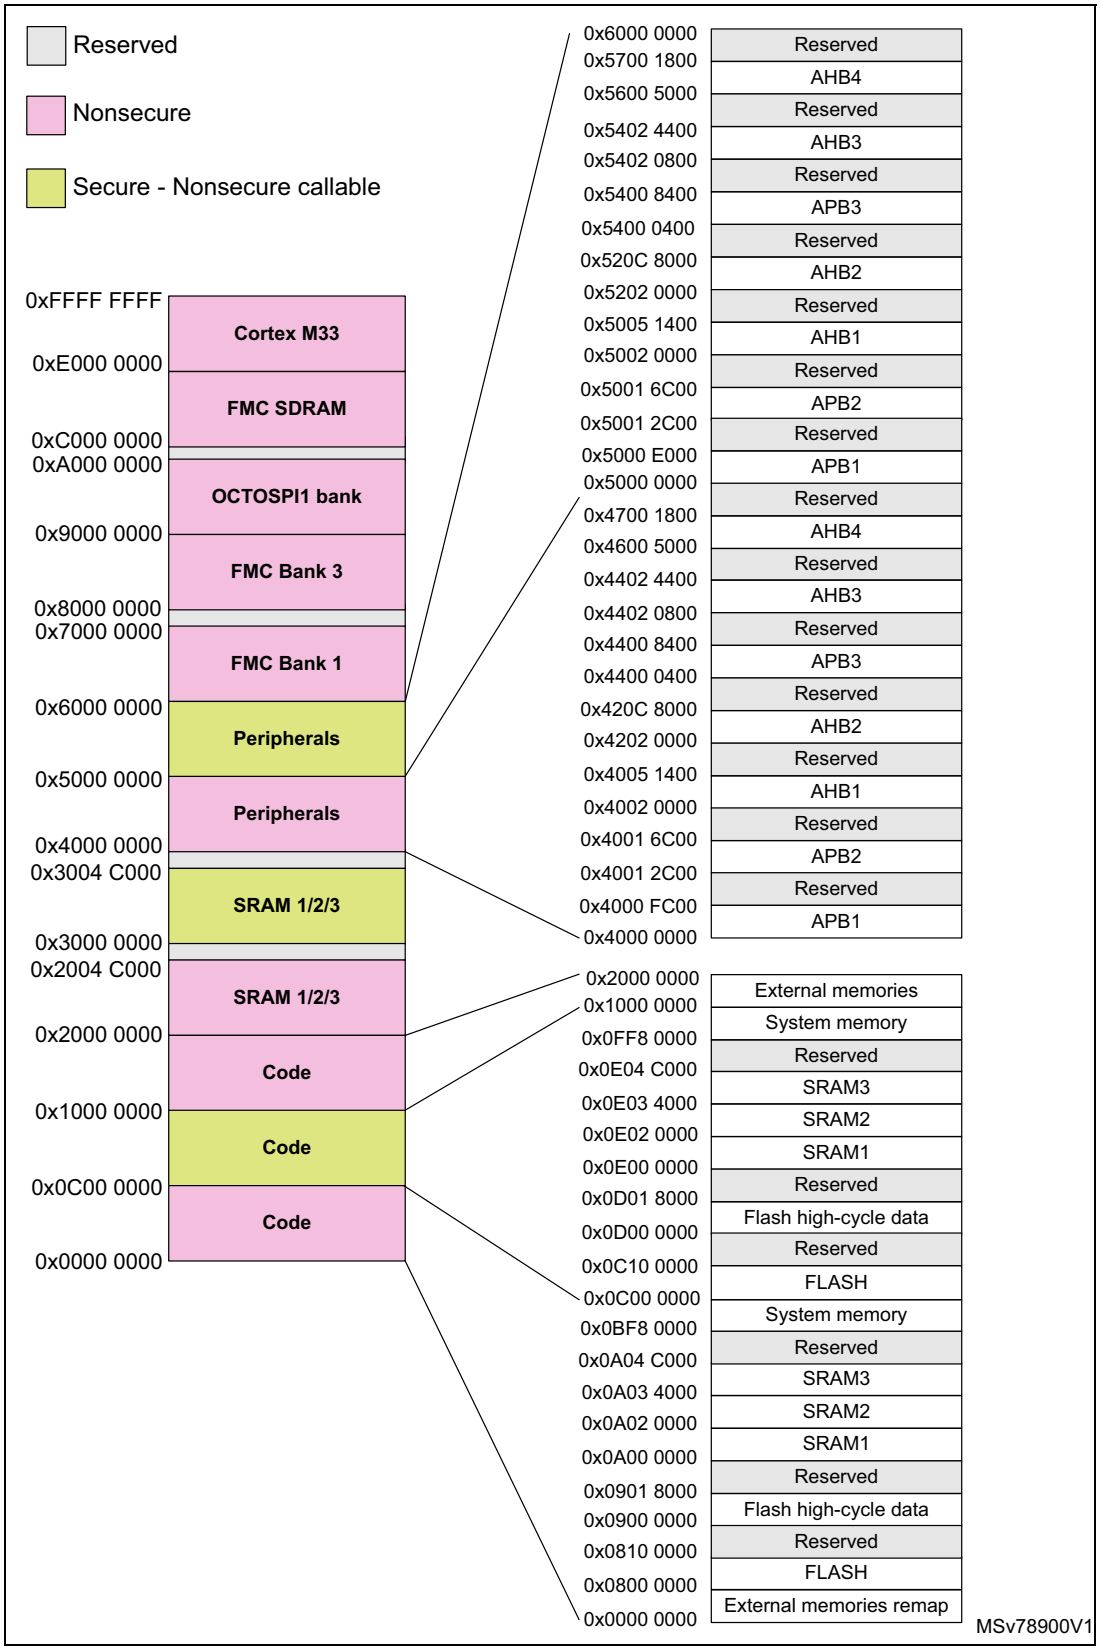

Figure 4. Memory map based on IDAU mapping (STM32H543/553xx devices)

All the memory map areas not allocated to on-chip memories and peripherals are reserved. *Table 5* and *Table 6* give the boundary addresses of the available peripherals.

Table 5. Memory map and peripheral register addresses (STM32H562/563/573xx)

Bus	Secure boundary address	Nonsecure boundary address	Peripheral	Register map
AHB4	0x5700 1800 - 0x57FF FFFF	0x4700 1800 - 0x47FF FFFF	Reserved	-
	0x5700 1400 - 0x5700 17FF	0x4700 1400 - 0x4700 17FF	OCTOSPI1	OCTOSPI
	0x5700 0800 - 0x5700 13FF	0x4700 0800 - 0x4700 13FF	Reserved	-
	0x5700 0400 - 0x5700 07FF	0x4700 0400 - 0x4700 07FF	FMC	FMC

2.3.3 Embedded SRAMs

The STM32H562/563/573xx devices feature up to 644-Kbyte SRAMs:

- 256-Kbyte SRAM1
- 64-Kbyte SRAM2 with ECC
- 320-Kbyte SRAM3 with optional ECC
- 4-Kbyte BKPSRAM with ECC

The STM32H543/553xx devices feature up to 306-Kbyte SRAMs:

- 128-Kbyte SRAM1
- 80-Kbyte SRAM2 with ECC
- 96-Kbyte SRAM3 with optional ECC
- 2-Kbyte BKPSRAM with ECC

The STM32H523/533xx devices feature up to 274-Kbyte SRAMs:

- 128-Kbyte SRAM1
- 80-Kbyte SRAM2 with ECC
- 64-Kbyte SRAM3
- 2-Kbyte BKPSRAM with ECC

The SRAMs can be accessed by byte, half-word (16 bits), or full word (32 bits).

The memories can be addressed both by CPU and DMAs. The CPU can access the SRAM1, SRAM2, and SRAM3 through the system bus or through the C-bus, depending on the selected address. The CPU can access the BKPSRAM only through the system bus.

When the TrustZone security is enabled, all SRAMs are secure after reset. The SRAMs can be programmed as nonsecure with a block granularity. For more details, refer to *Section 5: Global TrustZone® controller (GTZC)*.

SRAM features are detailed in *Section 6.3.1: Internal SRAMs features*.

2.3.4 Flash memory overview

The flash memory is composed of two distinct physical areas:

- The main memory block, which contains the application program and user data.
- The information block, composed of the following parts:
  - option bytes for hardware and memory protection user configuration
  - system memory, with the ST proprietary code
  - OTP (one-time programmable) area

The flash interface implements instruction and data access based on the AHB protocol. It also implements the logic necessary to carry out the program/erase operations controlled through the FLASH registers plus security access control features. Refer to *Section 7: Embedded flash memory (FLASH)* for more details.

2.3.5 Boot modes

At startup, the core jumps to the boot address configured through the BOOT0 pin, the BOOT_ADDR option bytes, the TZEN option bit, debug request and the product state.

If BOOT_ADDR is not yet configured, dedicated libraries (programmed during ST production), can be used for secure boot. They are located in system flash memory:

- ST libraries in system flash memory assist the application software boot with special features such as secure boot and secure firmware install (SFI-RSS).
- STiRoT (immutable root of trust) secure software in user flash memory are used for secure firmware update and provisioning (SFU).

If a debugger is attached to the product, the entry point is a debug authentication policy, used to unlock the device when attached to debugger. Digital signature must be provided to perform a regression to product state, where debug is allowed.

Embedded bootloader

The embedded bootloader is located in the system memory, programmed by ST during production. Refer to AN2606 “*Introduction to system memory boot mode on STM32 MCUs”*.

3 System security

The STM32H5 devices are designed with a comprehensive set of security features, some of them based on the standard Arm TrustZone® technology.

These security features simplify the process of evaluating IoT devices against security standards. They also significantly reduce the cost and complexity of software development for OEM and third-party developers, by facilitating the reuse, improving the interoperability, and minimizing the API fragmentation.

This section explains the different security features available on the devices.

3.1 Key security features

- Resource isolation using privilege mode and Armv8-M mainline security extension of Cortex-M33, extended to securable I/Os, memories, and peripherals
- Secure firmware installation (SFI) with device unique cryptographic key pair
  - Leveraging the on-chip immutable bootloader that supports the image download through USART, USB, I^2C, I^3C, SPI, FDCAN, and JTAG
- Boot entry: the platform makes it possible to select between native immutable root of trust or proprietary boot entry (in user flash memory).
- Security services (in system flash): the platform comes with native security services, embedded in the system memory to manage the root of trust services. Native root of trust services takes care of: platform security, including secure boot, secure updates of next boot level (uROT: updatable root of trust), secure debug control (debug reopening, regression control). The services can be personalized for each OEM, using the provisioning tools.
- Temporal isolation: boot levels are isolated thanks to HDPL (hide protect level) monotonic counter.
- Secure storage, featuring:
  - Five nonvolatile areas dedicated to secure storage, protected with HDPL and TrustZone.
  - Battery-powered volatile secure storage, automatically erased in case of tamper
  - Write-only key registers in the AES engines
  - Device 96-bit unique ID and JTAG 32-bit device-specific ID
  - Secure storage can rely upon the SAES engine to encrypt the stored data, to the benefit of DHUK properties. All data encrypted with the DHUK benefit of temporal and runtime isolation (HDPL and TrustZone), RHUK, EPOCH (version counter) properties.

  a) Data are isolated: all data encrypted/decrypted relying upon SAES+DHUK benefit of the variation of the DHUK for each different isolated area (HDPL0, HDPL1, HDPL2, HDPL3S, HDPL3NS).

  b) RHUK: hardware secret nonvolatile, unique per device keys (copy protection).

  c) EPOCH: counter incremented each time a regression is done (antirollback).
- General purpose cryptographic acceleration
  - AES 256-bit engine, supporting ECB, CBC, CTR, GCM, and CCM chaining modes

  - Secure AES 256-bit security coprocessor, supporting ECB, CBC, CTR, GCM, and CCM chaining modes with side-channel countermeasures and mitigations
  - HASH processor, supporting SHA-1 checksums and SHA-2 secure hash (SHA2, SHA2-384, SHA2-512, and SHA-3[a])
  - Public key accelerator (PKA) for RSA/DH (up to 4096 bits) and ECC (up to 640 bits), implementing side-channel counter measures, and mitigations when manipulating secrets
  - True random number generator (RNG), NIST SP800-90B precertified
  - Coupling and chaining bridge (CCB)[a] for special coupling and chaining operations (involving PKA, SAES, RNG peripherals) to protect private keys used in PKA protected operations
- On-the-fly decryption of encrypted image stored on external flash memory connected through the OCTOSPI
  - Almost-zero latency with standard NOR flash memories
  - Can be used to encrypt the image using the device unique secret keys
  - Automatic key-erase in case of tamper
- New flexible life cycle scheme
  - Allows product maintenance in-the-field (debug reopening or regressions)
  - Allows protected firmware distribution in up to three steps: immutable root of trust, secure and nonsecure application
- Active tamper and protection against temperature, voltage, and frequency attacks
  - Up to eight active inputs, eight active output tamper pins, available in different power modes (refer to TAMP low-power modes)

3.2 Secure install

The secure firmware install (SFI) is an STMicroelectronics secure service authenticated and decrypted by the immutable RSS code stored in the device. The SFI allows secure and counted installation of OEM firmware in an untrusted production environment (such as OEM contract manufacturer).

The confidentiality of the installed images written in the internal flash memory or encrypted in an external flash memory, is also protected, using the AES.

The SFI native service leverages the following hardware security features:

- secure boot (see *Section 3.3*)
- resource isolation using TrustZone (see *Section 3.6*)
- temporal isolation using hide protection (see *Section 3.7.1*)
- secure execution (see *Section 3.8*)
- secure storage, with associated cryptographic engines (see *Section 3.9* and *Section 3.10*) and flash memory dedicated areas

Further information can be found in AN4992 "*Introduction to secure firmware install (SFI) for STM32 MCUs".*

a. Available only on STM32H543/553xx devices.

3.3 Secure boot

Secure boot is an immutable code that is always executed after a system reset. As a root of trust, this code checks the device static protections and activates available device runtime protections, reducing the risk of invalid or malicious code running on the platform. As root of trust, the secure boot also checks the integrity and authenticity of the next level firmware before executing it.

The STM32H533/553/573xx offer two options (using BOOT_UBE) to execute the immutable code after a reset:

- Security services when STiRoT (code natively present in the system memory) is selected managing the secure boot of the next boot level. STiRoT takes care of the next level integrity, authenticity using configuration done by OEMs. The next stage can be an ST updatable service (STuRoT), or a proprietary one (uRoT)
- Proprietary boot entry when the OEM manages the full chain (OEMiRoT), to be installed in user flash memory with proper security activation.

The actual functions of the secure boot depend on the availability of TrustZone features, and on the firmware stored in the device. The secure boot typically initializes the secure storage, and installs on-the-fly decryption keys in the OTFDEC, to be able to use encrypted firmware stored in an external flash memory.

TrustZone application, supported by the STM32 ecosystem, provides a root of trust solution, including secure boot functions.For more information, refer to the user manual UM3065 "*Getting started with STM32CubeH5 for STM32H5 series*".

In the devices, the secure boot benefits of hardware security features:

- resource isolation using TrustZone (see *Section 3.6*)
- temporal isolation using hide protection levels (HDPL) (see *Section 3.7.1*)
- secure execution (see *Section 3.8*)
- secure install and update (see *Section 3.2* and *Section 3.4*)
- per domain secure storage, with associated cryptographic engines if available (see *Section 3.9* and *Section 3.10*)

This section describes the features specifically designed for secure boot.

3.3.1 Unique boot entry

Thanks to the unique boot entry (BOOT_UBE), it is possible to select the boot entry point between security services in system flash (STiRoT) and proprietary boot entry (OEMiRoT). This selection is possible only for products embedding cryptographic acceleration (STM32H533/553/573xx), when TrustZone is enabled (TZEN = 0xB4).

When TrustZone is enabled and SECBOOT_LOCK secure option bit is cleared, the application selects a boot entry point located either in the system flash memory (see the next section), or in the secure user flash memory, at the address defined by SECBOOTADD option bytes.

When TrustZone is enabled and SECBOOT_LOCK secure option bit is set, the device unique boot entry is the unmodifiable secure address defined by SECBOOTADD option bytes. The application cannot modify these option bytes when SECBOOT_LOCK is set.

When TrustZone is disabled (TZEN = 0xC3) and NSBOOT_LOCK option bit is cleared, the application selects a boot entry point located in the nonsecure user flash memory, at the address defined by NSBOOTADD option bytes.

When TrustZone is disabled and NSBOOT_LOCK option bit is set, the device unique boot entry is the unmodifiable nonsecure address defined by NSBOOTADD option bytes. The application cannot modify these option bytes when NSBOOT_LOCK is set.

Note: SECBOOT_LOCK and NSBOOT_LOCK can be changed only when PRODUCT_STATE = Open, Provisioning, or Regression.

For more information on the boot mechanisms, refer to *Section 4: Boot modes*.

3.3.2 Immutable root of trust in system flash memory

The immutable root-of-trust code stored in the system flash memory is first used to perform SFI, allowing secure and counted installation of OEM firmware in untrusted production environments (such as OEM contract manufacturer).

The immutable code also includes secure runtime services that can be called at runtime, when a secure application sets the SBS_RSSCMDR register to a non-null value, before triggering a system reset. This runtime feature is deactivated when the BOOT_LOCK secure option bit is set or when the PRODUCT_STATE is different from “Open”.

The STM32H5 products feature ST-DA (debug authentication), to manage the debug authentication control feature, allowing to control the debug reopening and regressions of the product for after sales (field return) of the product.

The products embedding cryptographic acceleration feature STiRoT (immutable root of trust), to handle the secure provisioning, secure boot, secure updates of the first updatable level of the platform.

For more information, refer to AN6007 “*Getting started with STiRoT (ST immutable Root of Trust) for STM32H5 MCUs*”.

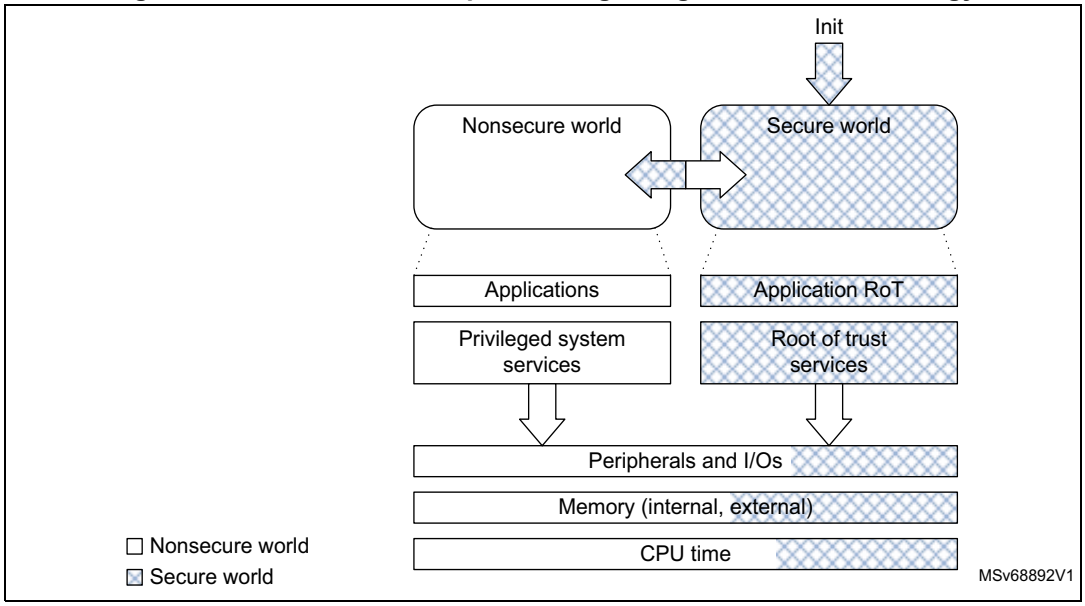
3.4 Secure update

The secure firmware update is a secure service that runs after a secure boot. Its actual functions depend on the availability of the TrustZone features, and on the firmware stored in the device.

Cortex-M based application processors is commonly used to run trusted boot and a trusted OS to create a Trusted Execution Environment (TEE). The trusted boot and TEE application, supported by the STM32 ecosystem, allow the update of the microcontroller built-in program with new firmware versions, adding new features and correcting potential issues. The update process is performed in a secure way, to prevent unauthorized updates and access to confidential on-device data.

A firmware update can be done either on a single firmware image including both secure and nonsecure parts, or on the secure (respectively nonsecure) part of the firmware image, independently.

In the devices, the secure update application leverages the same hardware security as the firmware install described in *Section 3.2*. For more information, refer to the user manual UM3065 “*Getting started with STM32CubeH5 for STM32H5 series*”.



3.5 Resource isolation using hide protection levels

The hardware and software resources used to boot can be isolated. This is called temporal isolation, based on a monotonic counter, taking care of incrementing the levels. When the counter is incremented, the resources (code and data) of the previous levels are hidden.

3.6 Resource isolation using TrustZone

The hardware and software resources can be partitioned so that they exist in the secure or in the nonsecure world, as shown in *Figure 5*.

Figure 5. Secure/nonsecure partitioning using TrustZone technology

Note: The initial partitioning of the platform is under the responsibility of the secure firmware executed after device reset.

Thanks to this resource isolation technology, the secure world can be used to protect critical code against intentional or unintentional tampering from the more exposed code running in the nonsecure world.

Note: The secure code is typically small and rarely modified, while the nonsecure code is more exposed, and prone to firmware updates.

3.6.1 TrustZone security architecture

The Armv8-M TrustZone technology is a comprehensive hardware architecture that proposes to developers a comprehensive, holistic protection across the entire processor and system. The device TrustZone hardware features include:

- The Armv8-M mainline security extension of Cortex-M33, enabling a new processor secure state, with its associated secure interrupts
- The dynamic allocation of memory and peripherals to TrustZone using eight security attribution unit (SAU) regions of Cortex-M33
- A global TrustZone framework (GTZC), extending the TrustZone protection against transactions coming from masters in the system different from Cortex-M33
- TrustZone-aware embedded flash memory and peripherals

Note: The TZEN option bit in the FLASH_OPTSR2_PRG register activates TrustZone security.

3.6.2 Armv8-M security extension of Cortex-M33

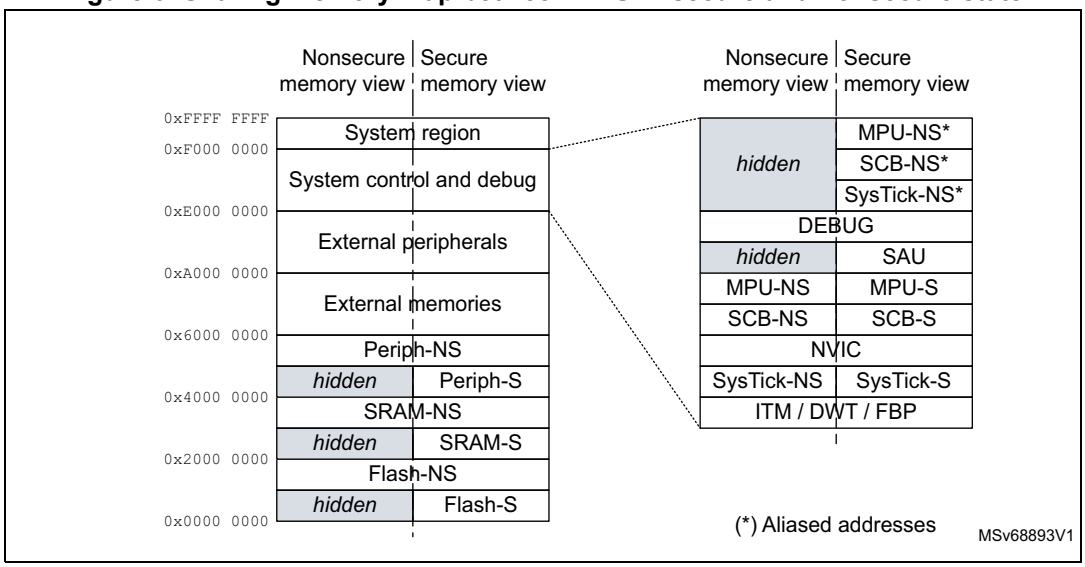
The Arm security extension of the Cortex-M33 is an evolution, not a revolution. It uses the programmer model from earlier Cortex-M subfamilies like Cortex-M4. Indeed, Armv8-M is architecturally similar to Armv7-M, using the same 32-bit architecture, the same memory mapped resources protected with an MPU. Armv8-M also uses the nested vectored interrupt controller (NVIC).

The implementation on STM32H5 devices is composed of the following features:

- A new processor state, with almost no additional code/cycle overhead (as opposed to Armv8-A TrustZone) that uses a dedicated exception routine to trigger a secure/nonsecure world change
- Two memory map views of a shared 4-Gbyte address space
- A low interrupt latency for both secure and nonsecure domains, and a new interrupt configuration for security grouping and priority setting
- Separated exception vector tables for the secure and nonsecure exceptions
- Micro-coded context preservation
- Banking of specific registers across secure/nonsecure states, including stack pointers with stack-limit checkers
- Banking of the following Cortex-M33 programmable components (two separate units for secure and nonsecure):
  - SysTick timer
  - MPU configuration registers (12 MPU regions in secure, eight in nonsecure)
  - some of the system control block (SCB) registers
- New system exception (SecureFault) for handling of security violations
- Configurable debug support, as defined in *Section 3.12*

For more information, refer to the Cortex-M33 programming manual (PM0264).

3.6.3 Memory and peripheral allocation using IDAU/SAU



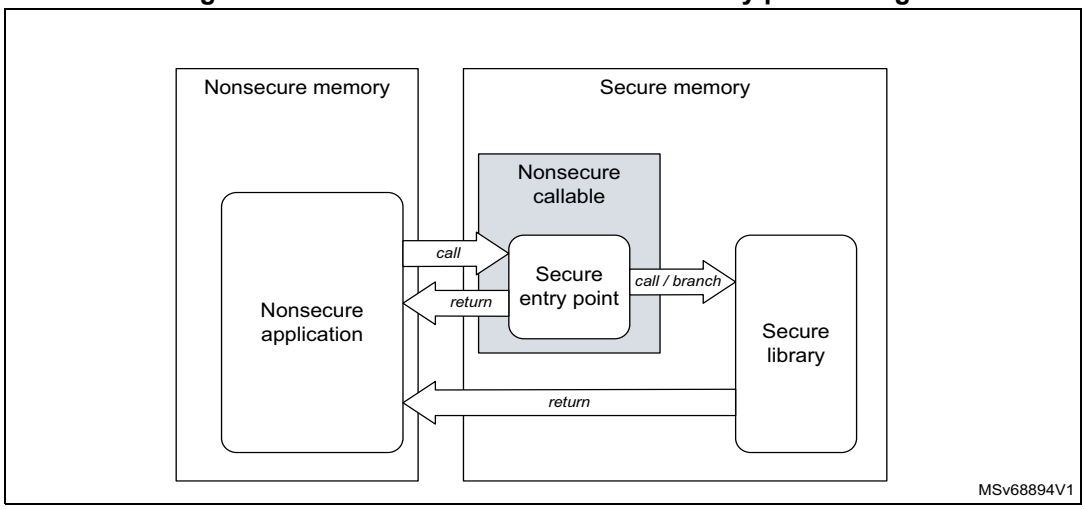
Security attributes

As illustrated in *Figure 6*, the Armv8-M nonsecure memory view is similar to Armv7-M (found in Cortex-M4), with the difference that the secure memory is hidden. The secure

memory view shows the flash memory, SRAM and peripherals that are accessible only while the Cortex processor executes in Secure state.

Note: Figure 6 shows the 32-bit address space after SAU configuration, as viewed by the secure code.

Figure 6. Sharing memory map between CPU in secure and nonsecure state



The Cortex processor state (and the associated rights) depends upon the security attribute assigned to the memory region where it is executed:

- A processor in a nonsecure/secure state executes only from nonsecure (NS)/secure (S) program memory.
- When running in secure state, the processor can access data from both S and NS memories. When running in nonsecure state, the CPU is limited to nonsecure memories.

To manage transitions to the secure world, developers must create nonsecure callable (NSC) regions containing valid entry points to the secure libraries. The first instruction in these entry points must be the new secure gate (SG) instruction, used by the nonsecure code to call a secure function (see *Figure 7*).

Figure 7. Secure world transition and memory partitioning

Programming security attributes

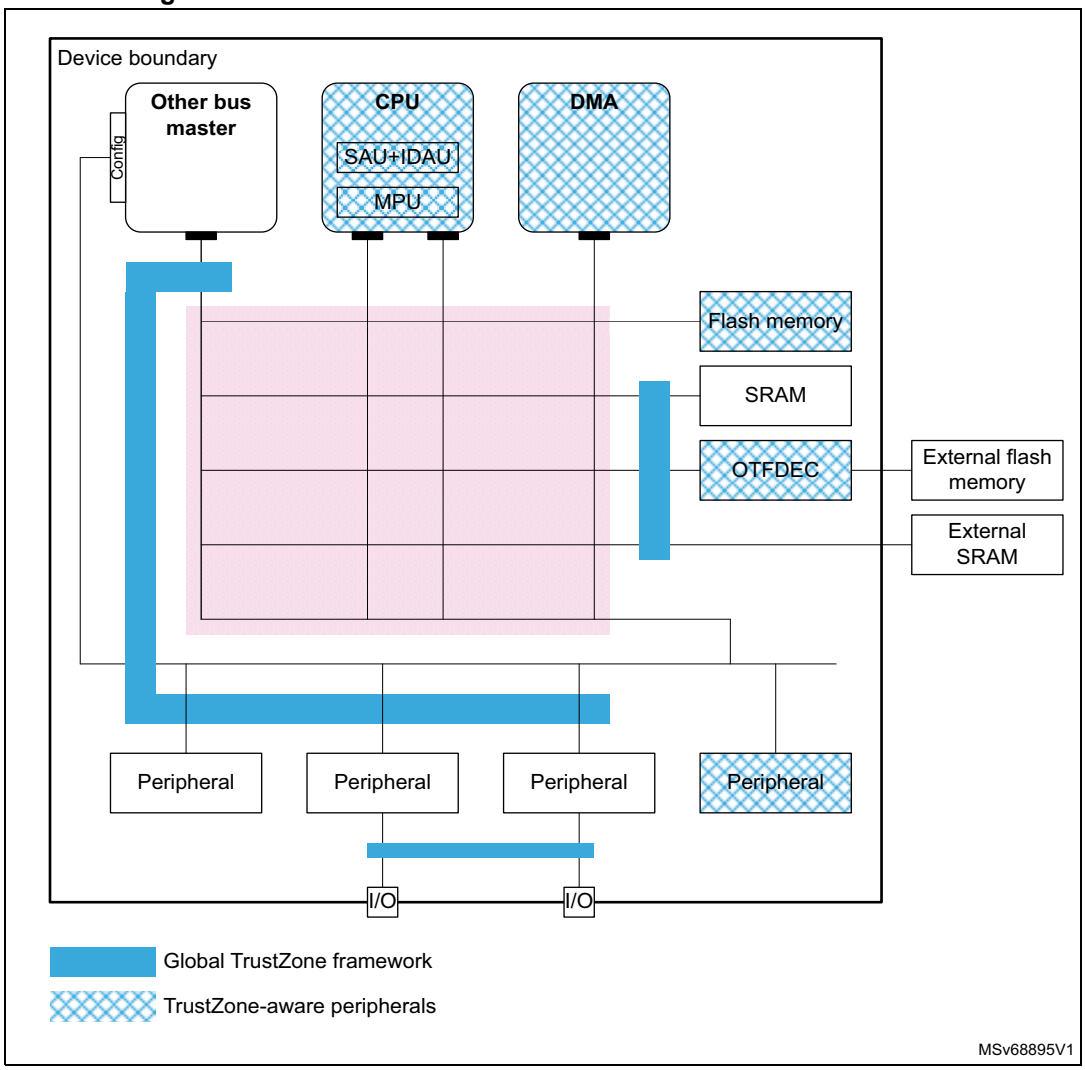
In Cortex-M33, the static implementation defined attribution unit (IDAU) works with the programmable security attribution unit (SAU) to assign a specific security attribute (S, NS, or NSC) to a specific address, as shown in *Table 8*.

Table 8. Configuring security attributes with IDAU and SAU

IDAU security attribution	SAU security attribution(1)	Final security attribution
Nonsecure	Secure	Secure
	Secure-NSC	Secure-NSC
	Nonsecure	Nonsecure
Secure-NSC	Secure	Secure
	Nonsecure	Secure-NSC

1. Defined regions are aligned to 32-byte boundaries.

The the Cortex-M33 can configure the SAU only in the secure-privilege state. When the TrustZone is enabled, the SAU defaults all addresses as secure (S). A secure boot application can then program the SAU to create NSC or NS regions, as shown in *Table 8*.



Note: The SAU/IDAU settings are applicable only to the Cortex-M33*. The other masters, like DMA, are not affected by these policies.*

3.6.4 Memory and peripheral allocation using GTZC

Global TrustZone framework architecture

On top of the Armv8-M TrustZone security extension in Cortex-M33, the devices embed complementary security features that reinforce, in a flexible way, the isolation between secure and nonsecure worlds. Unlike the SAU/IDAU, the GTZC can protect legacy memories and peripherals against nonsecure transactions coming from other masters than the Cortex-M33.

Figure 8. Global TrustZone framework and TrustZone awareness

Securing peripherals with TZSC

When the TrustZone security is active, a peripheral is either securable through the GTZC, or is natively TrustZone-aware, as shown in the previous figure:

- A securable peripheral or memory is protected by an AHB/APB firewall gate, controlled by the TrustZone security controller (TZSC).
- A TrustZone-aware peripheral or memory is connected directly to AHB or APB interconnect, implementing a specific TrustZone behavior, such as a subset of secure registers or a secure memory area.

When a securable peripheral is made secure-only with the GTZC, if this peripheral is master on the interconnect, it automatically issues secure transactions. The SDMMC is an example of securable master. TrustZone-aware AHB masters like Cortex-M33 or DMAs, drive a secure signal in the AHB interconnect, according to their security mode, independently to the GTZC.

Note: Like with TrustZone, a peripheral can be made privileged-only with TZSC (see Section 3.7.2). In this case, if this peripheral is master on the interconnect, it automatically issues privileged transactions.

Securing memories with TZSC and MPCBB

The TZSC block in GTZC provides the capability to manage the security and privilege for all securable external memories, programming the MPCWM resources as defined in *Table 9*.

Table 9. MPCWMx resources

Memory	MPC resource	Type of filtering	Number of regions	Default security	On-the-fly decryption(1)
OCTOSPI1	MPCWM1	Nonsecure privileged or unprivileged region (watermarks)	2	Secure privileged(2)	Yes
FMC_NOR bank	MPCWM2		2		No
FMC_NAND / FMC_SDRAM(3) bank	MPCWM3		1		
Backup SRAM (BKPSRAM)/FMC_SDRAM(3)	MPCWM4		1		

1. Using the OTFDEC.
2. Assuming TrustZone is activated on the device, nonsecure unprivileged otherwise.
3. FMC_SDRAM is not available on STM32H523/533xx devices.

The MPCBB resources in GTZC provide the capability to configure the security and privilege of embedded SRAM blocks, as defined in *Table 10*, *Table 11*, and *Table 12*.

Table 10. MPCBBx resources (STM32H562/563/573xx devices)

Memory	MPC resource	Type of filtering	Memory size	Block size	Number of super-blocks	Default security
SRAM1	GTZC1_MPCBB1	Block based, managing security and privilege	256 KB	512(1) bytes	16	Secure privileged(2)
SRAM2	GTZC1_MPCBB2		64 KB		4	
SRAM3	GTZC1_MPCBB3		320 KB		20	

1. Blocks are grouped in super-blocks of 32 consecutive blocks, to manage the configuration locking.
2. Assuming TrustZone is activated on the device, nonsecure unprivileged otherwise.

Table 11. MPCBBx resources (STM32H523/533xx devices)

Memory	MPC resource	Type of filtering	Memory size	Block size	Number of super-blocks	Default security
SRAM1	GTZC1_MPCBB1	Block based, managing security and privilege	128 KB	512(1) bytes	8	Secure privileged(2)
SRAM2	GTZC1_MPCBB2		80 KB		5	
SRAM3	GTZC1_MPCBB3		64 KB		4	

1. Blocks are grouped in super-blocks of 32 consecutive blocks, to manage the configuration locking.
2. Assuming TrustZone is activated on the device, nonsecure unprivileged otherwise.

Table 12. MPCBBx resources (STM32H543/553xx devices)

Memory	MPC resource	Type of filtering	Memory size	Block size	Number of super-blocks	Default security
SRAM1	GTZC1_MPCBB1	Block based, managing security and privilege	128 KB	512 bytes(1)	8	Secure privileged(2)
SRAM2	GTZC1_MPCBB2		80 KB		5	-
SRAM3	GTZC1_MPCBB3		96 KB		6	-

1. Blocks are grouped in super-blocks of 32 consecutive blocks, to manage the configuration locking.
2. Assuming TrustZone is activated on the device, nonsecure unprivileged otherwise.

Applying GTZC configurations

The TZSC and MPCBB blocks can be used in one of the following ways:

- statically programmed during the secure boot, locked and not changed afterwards
- dynamically reprogrammed using a specific application code or real-time kernel

When the dynamic option is selected and the configuration is not locked:

- MPCBB secure blocks or MPCWM nonsecure region size can be changed by a secure software. This software must be privileged for MPCWM, can be unprivileged if the particular block is not privileged-only.
- The secure (respectively privilege) state of each peripheral can be changed writing to GTZC_TZSC_SECCFRGx (respectively GTZC_TZSC_PRIVCFGRx) registers.

Securing peripherals with TZSC

The TZSC block in GTZC provides the capability to manage the security and the privilege for all securable peripherals. The list of these peripherals can be found in *Section 5: Global TrustZone® controller (GTZC)*.

Note: When the TrustZone is deactivated, the resource isolation hardware GTZC can still be used to isolate peripherals to privileged code only (see Section 3.7.2).

When the TrustZone is activated, peripherals are set as nonsecure and unprivileged after reset.

TrustZone-aware peripherals

The devices include the following TrustZone-aware peripherals:

- GPIOA to GPIOI
- GTZCx_MPCBB, GTZCx_TZIC and GTZCx_TZSC (GTZC blocks)
- OTFDEC1, writable only in secure if TZEN is enabled
- EXTI
- Flash memory
- RCC and PWR
- GPDMA1 and GPDMA2
- SBS registers
- RTC and TAMP
- MCU debug unit DBGMCU
- PLAY1(a)

The way illegal accesses to those peripherals are monitored through the TZIC registers is described in *Section 5: Global TrustZone® controller (GTZC)*.

For more details, refer to *Section 3.6.5*.

TrustZone illegal access controller (TZIC)

The TZIC block in GTZC gathers all illegal access events originated from sources either protected by GTZC or TrustZone-aware, generating one global secure interrupt towards the NVIC.

TZIC is available only when the system is TrustZone enabled (TZEN = 0xB4). All accesses to TZIC registers must be secured.

For each illegal event source, a status flag and a clear bit exist. Each illegal event can be masked, not generating an interrupt toward the NVIC.

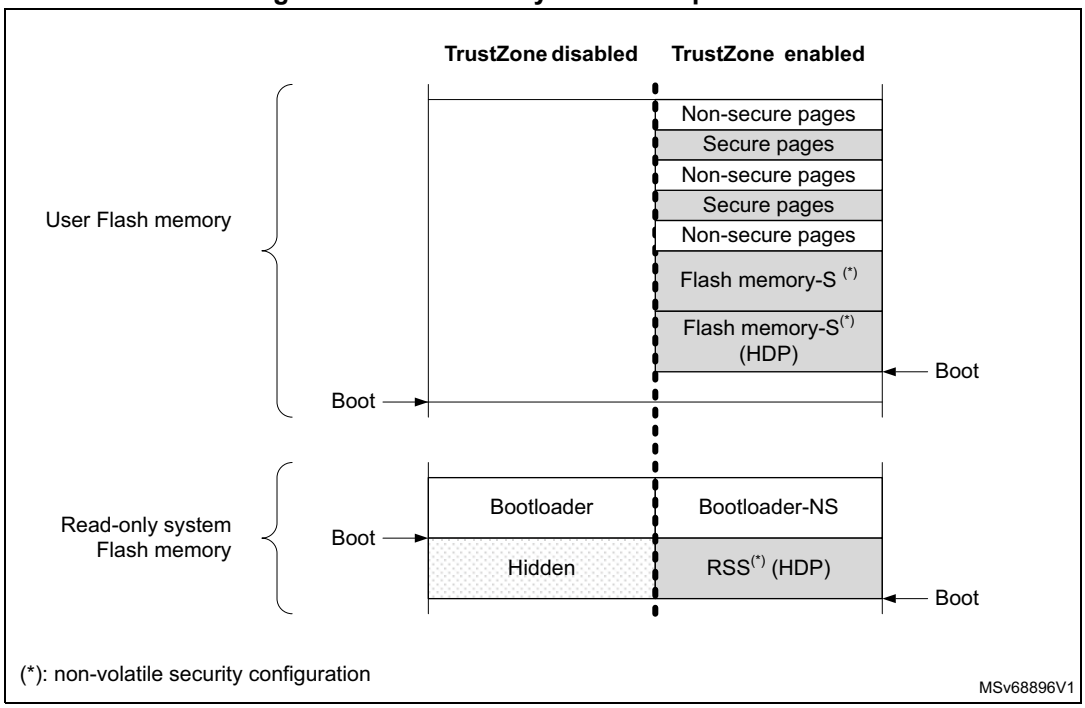
Note: By default, all events are masked.

3.6.5 Managing security in TrustZone-aware peripherals

This section gives more details on how the security is implemented in the TrustZone-aware peripherals listed in the previous section.

Embedded flash memory

When the TrustZone security is enabled through option bytes (TZEN = 0xB4), the whole memory is secure after reset. The following protections, shown in *Figure 9*, are available to the application:



- nonvolatile user secure areas, defined with nonvolatile secure user option bytes
  - watermark-based secure only area (x2)
  - secure hide protection (HDP) area, stickily hidden after boot (x2)
- volatile user secure pages, defined with volatile secure registers (lost after reset)
  - Any page set as nonsecure (example: outside watermark-based secure only area), can be set as secure on-the-fly using the block-based configuration registers.

Note: All areas are aligned on the page granularity of the flash memory, which can be configured as secure while it is tagged as nonsecure in Cortex-M33 IDAU/SAU. In this case, nonsecure accesses by the CPU to the flash memory are denied.

Erase or program operations can be available to secure/nonsecure code only for secure/nonsecure pages or memory. A flash memory is considered secure if at least one page is secure.

a. Available only on STM32H543/553xx devices.

Figure 9. Flash memory TrustZone protections

As shown above, when TrustZone is enabled (TZEN = 0xB4), the application code can use the HDP area that is part of the flash memory watermark-based secure area. Indeed, when the application sets the HDPx_ACCDIS bit, data read, write, and instruction fetch on this HDP area is denied until the next system reset.

For example, the software code in the secure flash memory HDP area can be executed only once, with any further access to this area denied until the next system reset. Additionally, any flash memory page belonging to an active HDP area cannot be erased anymore.

When the TrustZone is disabled (TZEN = 0xC3), the volatile/nonvolatile secure area features are deactivated and all secure registers are RAZ/WI.

See *Section 7: Embedded flash memory (FLASH)* for more details.

On-the-fly encryption/decryption (OTFDEC)

When the TrustZone security is enabled (TZEN = 0xB4), the OTFDEC can be initialized only by secure applications. Each of the four encrypted regions, once the configuration is confirmed, can be write-locked until the next power-on-reset.

Note: Any application (secure or nonsecure) can verify the initialization context of each OTFDEC region (including CRC of the keys), by reading the peripheral registers.

Key registers in each OTFDEC are write-only.

See *Section 3.10.3* for more details on this cryptographic engine.

Direct memory access controllers (GPDMAx)

When a DMA channel x is defined as secure (SECx = 1 in GPDMA_SECCFGR), the source and destination transfers can be independently set as secure or nonsecure by a secure application using SSEC and DSEC bits in GPDMA_CxTR1. *Table 13* summarizes these security options available in each DMA channel.

Table 13. DMA channel use (security)(1)

Destination type	Secure DMA channel x (SECx = 1)		Nonsecure DMA channel y (SECy = 0)	
	Secure source	Nonsecure source	Secure source	Nonsecure source
Secure destination	OK	OK(2)	Transfer blocked	
Nonsecure destination	OK(3)	OK(4)	Transfer blocked	OK

1. When a transfer is blocked, the transfer completes but the corresponding writes are ignored, and reads return 0s. An illegal access event to TZIC is automatically triggered by the memory/peripheral used as source or destination.
2. If the source is a memory, the transfer is possible only if SSEC = 0, otherwise the transfer is blocked.
3. If the destination is a memory, the transfer is possible only if DSEC = 0, otherwise the transfer is blocked.
4. If the transfer is memory-to-memory, it is possible only if SSEC = 0 and DSEC = 0, otherwise it is blocked.

When a channel is configured as secure:

- Registers allocated to this channel (excluding GPDMA_SECCFGR, GPDMA_PRIVCFGR and GPDMA_RCFGLOCKR) are read as 0. Writes are ignored for nonsecure accesses. A secure illegal access event may also be triggered towards the TZIC peripheral.
  - Writes to GPDMA_SECCFGR and GPDMA_RCFGLOCKR must be secure. For each bit in GPDMA_PRIVCFGR, write must be secure if the corresponding bit in GPDMA_SECCFGR is set.
- In linked-list mode, the loading of the next linked-list data structure from memory is performed with secure transfers.
- When switching to a nonsecure state, the secure application must abort the channel or wait until the secure channel is completed before doing the switch.

Note: DMA secure channels are not available when TrustZone is deactivated. When a channel is configured as nonsecure, in linked-list mode, the loading of the next linked-list data structure from memory is performed with nonsecure transfers.

See *Section 16: General purpose direct memory access controller (GPDMA)* for more details.

Power control (PWR)

When the TrustZone security is enabled (TZEN = 0xB4), the selected PWR registers can be secured through PWR_SECCFGR, protecting the following PWR features:

- low power mode setup
- wake-up (WKUP) pins definition
- voltage detection and monitoring
- backup domain control

Other PWR configuration bits become secure:

- when the system clock selection is secure in the RCC: the voltage scaling (VOS) becomes secure.
- when a GPIO is configured as secure: its corresponding bit for pull-up/pull-down configuration in Standby mode becomes secure.
- when the USB Type-C/USB power delivery interface (UCPD) is configured as secure in TZSC: PWR_UCPDR register becomes secure.

See *Section 10: Power control (PWR)* for details.

Secure clock and reset (RCC)

When the TrustZone security is enabled (TZEN = 0xB4) and security is enabled in the RCC, the bits controlling the peripheral clocks and resets become TrustZone-aware:

- If the peripheral is securable and programmed as secure in the TZSC, the peripheral clock and reset bits become secure.
- If the peripheral is TrustZone-aware, the peripheral clock and reset bits become secure when at least one function is configured as secure inside the peripheral.

Note: Refer to Section 3.6.4 for the list of securable and TrustZone-aware peripherals.

Additionally, the following configurations can be made secure-only using RCC_SECCFGR:

- external clock (such as HSE or LSE), internal oscillator (such as HSI, CSI, or LSI)
- main PLL and AHB prescaler
- system clock source selection
- MCO clock output
- reset flag
- automatic internal oscillator waking up configuration

See *Section 11: Reset and clock control (RCC)* for details.

Real-time clock (RTC)

Like all TrustZone-aware peripherals, a nonsecure read/write access to a secured RTC register is RAZ/WI. It also generates an illegal access event that triggers a secure illegal access interrupt if the RTC illegal access event is enabled in the TZIC.

After a backup domain power-on reset, all RTC registers can be read or written in both secure and nonsecure modes. The secure boot code can then change the security setup, making registers Alarm A, Alarm B, wakeup timer, and timestamp secure or not, using RTC_SECCFGR.

When the SEC bit is set in secure-only RTC_SECCFGR:

- Writing the RTC registers is possible only in secure mode.
- Reading RTC_SECCFGR, RTC_PRIVCFGR, RTC_MISR, RTC_TR, RTC_DR, RTC_SSR, RTC_PRER, and RTC_CALR is always possible in secure and nonsecure modes. All the other RTC registers can be read only in secure mode.

When SEC is cleared in secure-only RTC_SECCFGR, it is still possible to restrict access in secure mode to some RTC registers by setting dedicated control bits: INITSEC, CALSEC, TSSEC, WUTSEC, ALRASEC, and ALRBSEC.

Note: The RTC security configuration is not affected by a system reset.

See *Section 51: Real-time clock (RTC)* for more details.

Tamper and backup registers (TAMP)

Like all TrustZone-aware peripherals, a nonsecure read/write access to a secured TAMP register is RAZ/WI. It also generates an illegal access event that triggers a secure illegal access interrupt if the TAMP illegal access event is enabled in the TZIC.

After a backup domain power-on reset, all TAMP registers can be read or written in both secure and nonsecure modes. The secure boot code can change this security setup, making some registers secure or not as needed, using TAMP_SECCFGR register.

When TAMPSEC is set in TAMP_SECCFGR:

- Writing the TAMP registers is possible only in secure mode. Backup registers have their own write protection (see below).
- Reading the TAMP registers (exception TAMP_SECCFGR, TAMP_PRIVCFGR, and TAMP_MISR) returns 0 if the access is nonsecure. Backup registers have their own read protection (see below).

The application can also:

- make TAMP_COUNTR register read and write secure-only by setting the CNT1SEC bit in TAMP_SECCFGR secure register
- increase security in backup registers for two of the three protection zones configured using BKPRWSEC[7:0] and BKPWSEC[7:0] bitfields in TAMP_SECCFGR:
  - protection zone 1 is read nonsecure, write nonsecure
  - protection zone 2 is read nonsecure, write secure
  - protection zone 3 is read secure, write secure

Note: The TAMP security configuration is not affected by a system reset.

See *Section 52: Tamper and backup registers (TAMP)* for more details.

General-purpose I/Os (GPIO)

When the TrustZone security is enabled (TZEN = 0xB4), each I/O pin of the GPIO ports can be individually configured as secure through the GPIOx_SECCFGR registers. Only a secure application can write to GPIOx_SECCFGR registers. After boot, each I/O pin is set as secure.

When an I/O pin is configured as secure, its corresponding configuration bits for alternate function (AF), mode selection (MODE), and I/O data are RAZ/WI in case of nonsecure access.

When a digital alternate function is used (input/output mode) to protect data transiting from/to the I/O managed by a secure peripheral, the devices add a secure alternate function gate on the path between the peripheral and its allocated I/Os:

- if the peripheral is secure, the I/O pin must also be secure to allow input/output of data
- if the peripheral is not secure, the connection is allowed regardless of the I/O pin state.

The TrustZone-aware logic around GPIO ports, used as alternate functions, is summarized in *Table 14*.

Table 14. Secure alternate function between peripherals and allocated I/Os

Security configuration		Alternate function logic		Comment
Peripheral	**Allocated I/O pin**	**Input**	**Output**	
Secure	Secure	I/O data	Peripheral data	-
Nonsecure				Out of reset configuration
Secure	Nonsecure	0	0	-
Nonsecure		I/O data	Peripheral data	

When an analog function with an analog switch is used, the connection to the peripherals listed in *Table 15* is blocked by hardware when the peripheral is nonsecure and the I/O is secure.

Table 15. Nonsecure peripheral functions that cannot be connected to secure I/Os

Peripheral	Analog function(1)	Input	Output
ADC12	ADC12_INy (y = 1 to 17)	X	-
ADC3(2)	ADC3_INP	X	-
COMP1/2(2)	COMP1/2_INP/INM	X	-

1. Used to find the I/O corresponding to the signal/function on the package (refer to the product datasheet).
2. Available only on STM32H543/553xx devices.

Finally, regarding GPIO and security, *Table 16* summarizes the list of I/Os without any hardware protection linked to TrustZone. The listed signals (input and/or outputs) are not blocked when the I/O is set as secure, and the associated peripheral is non secure.

For example, when a secure application sets PA4 as secure to be used as LPTIM2_CH1, if the DAC is nonsecure, it can be programmed to output data to PA4, potentially causing malfunction to the secure application.

Similarly, when a secure application sets PA0 as secure to be used as UART4_TX, if TAMP is nonsecure, it can be programmed to capture the USART input traffic through the TAMP_IN signal.

It is important that, for each case described in *Table 16*, the secure application decides if a potential effect on data integrity or confidentiality is critical or not. For example, if the USART situation described above is not acceptable (data transiting on secure USART is confidential), then the secure application must configure the TAMP as secure even if not used by the secure application.

Table 16. Nonsecure peripheral functions that can be connected to secure I/Os

Peripheral	Signal(1)	Input	Output	How to set the peripheral or function as secure
DAC	DAC1_OUTx (x = 1, 2)	-	X	Set DAC1SEC in GTZC1_TZSC_SECCFGR1.
UCPD	UCPD1_CCx (x = 1, 2)	X	X	Set UCPD1SEC in GTZC1_TZSC_ SECCFGR1.
	UCPD1_DBx (x = 1, 2)	X	-	
TAMP	TAMP_INx (x = 1 to 8)	X	-	Set TAMPSEC in TAMP_SECCFGR
	TAMP_OUTx (x = 1 to 8)	-	X	
RTC	RTC_OUTx (x = 1, 2)	-	X	Set SEC in RTC_SECCFGR.
	RTC_TS	X	-	Set TSSEC in RTC_SECCFGR.
PWR	WKUPx (x = 1 to 8)	X	-	Set WUPxSEC in PWR_SECCFGR.
RCC	LSCO	-	X	Set LSESEC in RCC_SECCFGR.
EXTI	EXTIx (x = 0 to 66)	X	-	Set SECx bit in EXTI_SECCFGR.

1. To find the I/O corresponding to the signal/function on the package, refer to the product datasheet.

Refer to *Section 13: General-purpose I/Os (GPIO)* for more details.

Extended interrupts and event controller (EXTI)

When the TrustZone security is enabled, the EXTI is able to protect event register bits from being modified by nonsecure accesses. The protection can individually be activated per input event via the register bits in EXTI_SECCFGRx. When an input event is configured as secure, only a secure application can change the configuration (including security), change the masking or clear the status of this input event.

The security configuration in EXTI_SECCFGR1 and EXTI_SECCFGR2 can be globally locked after reset in EXTI_LOCKR.

See *Section 18: Extended interrupts and event controller (EXTI)* for more details.

System configuration, boot, and security (SBS)

Like all TrustZone-aware peripherals, when the TrustZone security is enabled, a nonsecure read/write access to a secured SBS register is RAZ/WI. Such access also generates an illegal access event that triggers a secure illegal access interrupt if the SBS illegal access event is not masked in the TZIC.

See *Section 14: System configuration, boot, and security (SBS)* for more details.

Microcontroller debug unit (DBGMCU)

The MCU debug component (DBGMCU) helps the debugger, providing support for:

- low-power modes behavior during debug
- peripheral freeze during debug, applicable to I2Cs, I3Cs, IWDG, WWDG, timers, low-power timers, and GPDMA channels

The DBGCMU is a TrustZone-aware peripheral, managing accesses to its control registers as described in *Table 17*.

Table 17. TrustZone-aware DBGMCU nonsecure accesses management

Debug profile	Peripheral status(1)	DBG_xx_STOP control bits	
		Write access	Read access
Nonsecure invasive (SPIDEN = 0)	NS	Yes (S(2) or NS)	Yes (S or NS)
	S	None (S or NS)	
Secure invasive (SPIDEN =1)	NS	Yes (S or NS)	
	S	Yes (S only)	

1. As reported by the GTZC, the TrustZone-aware peripheral or the DMA channel.
2. Secure access from debugger is converted to nonsecure access in the device.

Refer to *Section 66.12: Microcontroller debug unit (DBGMCU)* for more details.

3.6.6 Activating TrustZone security

The TrustZone is deactivated by default in all devices. It can be activated by setting the TZEN option bit in FLASH_OPTSR2_PRG when PRODUCT_STATE is Open. Once TZEN

has changed from disabled to enabled (0xC3 to 0xB4), the default security state, after reset, is always the following:

- CPU subsystem
  - Cortex-M33 exits reset in secure state, hence the boot address must point toward a secure memory area.
  - All interrupt sources are secure (in NVIC).
  - The memory mapped viewed by the CPU through IDAU/SAU is fully secure.
- Embedded flash memory
  - Flash memory nonvolatile secure areas (with their HDP zone), are defined with nonvolatile registers FLASH_SECWMxR (x = 1, 2). Default secure option bytes setup is all user flash secure, without HDP area defined.
  - Volatile block-based security attributions of the flash memory are nonsecure.
- Embedded SRAMs
  - All SRAMs are secure, as defined in GTZC/MPCBB (see *Section 3.6.4*). The secure boot code can change this security setup, making blocks secure or not.
- External memories
  - All memory devices connected to the FMC and OCTOSPI are secure, as defined in GTZC/MPCWM (see *Section 3.6.4*). The secure-boot code can change this security setup, making components secure or not.
- All GPIOs are secure.
- All GPDMA channels are nonsecure.
- Backup registers are nonsecure.
- Peripherals and GTZC:
  - Securable peripherals are nonsecure and unprivileged.
  - TrustZone-aware peripherals are nonsecure, with their secure configuration registers being secure.
  - All illegal access interrupts in GTZC/TZIC are disabled.

Note: Refer to Section 3.6.4 for the list of securable and TrustZone-aware peripherals.

3.6.7 Deactivating TrustZone security

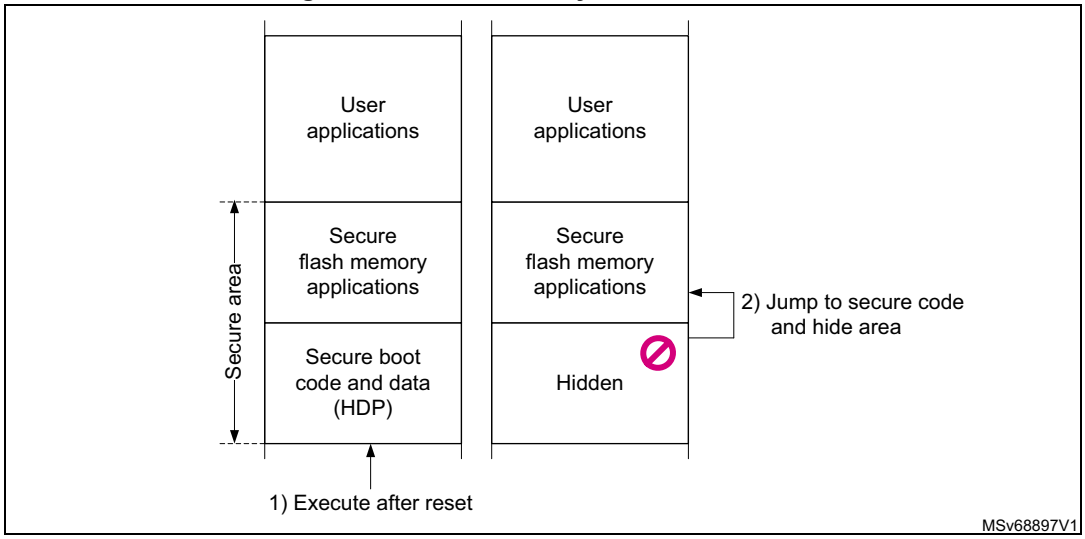
Once TrustZone is activated, it can only be deactivated during a PRODUCT_STATE regression to Open.

Note: Such PRODUCT_STATE regression triggers the erasing of embedded memories (SRAM2, flash), and the reset of all peripherals, including the OTFDEC and all crypto engines.

After the TrustZone deactivation, most of the features mentioned in *Section 3.6* are no longer available:

- The nonvolatile secure area of the embedded flash memory is deactivated, including the HDP area.
- Only the NVIC manages nonsecure interrupts.
- All secure registers in TrustZone-aware peripherals are RAZ/WI.

Note: When the TrustZone is deactivated, the resource isolation using privilege remains available (see Section 3.7.2 for details).



3.7 Other resources isolation

These are hardware mechanisms offering an additional level of isolation on top of the TrustZone technology.

3.7.1 Temporal isolation using secure hide protection (HDP)

When the TrustZone security is enabled, the embedded flash memory allows to define an HDP area per watermarked-secure area of each bank (8-Kbyte page granularity). The code executed in this HDP area, with its related data and keys, can be hidden after boot, until the next system reset. The hide protection principle is shown in *Figure 10*.

Figure 10. Flash memory secure HDP area

Activation of HDP area in user flash memory is related to HDPL1: as soon as HDPL ≥ 2, data read, write, and instruction fetch (on the area defined by HDPx_PSTRT and HDPx_PEND in FLASH_HDPxR_PRG option bytes), are denied until the next device reset.

The END of the HDPx areas can be extended (dynamically by the application) thanks to FLASH_HDPEXTR flash memory register.

Note: Bank erase aborts when it contains a write-protected area (WRP or HDP area).

3.7.2 Resource isolation using Cortex privileged mode

In parallel to the TrustZone isolation described in *Section 3.6*, the hardware and software resources can be partitioned so that they are restricted to software running in Cortex privileged mode.

Thanks to this hardware isolation technology, available even if TrustZone is disabled, critical code or data can be protected against intentional or unintentional tampering from the more exposed unprivileged code.

Memory and peripheral privileged allocation using MPU

The Cortex-M33 MPU divides the unified memory into eight regions in nonsecure and twelve in TrustZone, each aligned to a multiple of 32 bytes. Each memory region can be programmed to generate faults when accessed inappropriately by unprivileged software.

Memory and peripheral privileged allocation using GTZC

For the Cortex-M33 master, to complement the coarse isolation provided by the MPU, the GTZC reinforces, in a flexible way, the isolation between privileged and unprivileged tasks, for peripherals and selected memories.

For masters other than the Cortex-M33, the GTZC can assign them as unprivileged initiators, automatically protecting resources defined as privileged against this master.

- Securing peripherals with TZSC (privileged-only)

  In the devices, a peripheral is either securable privileged-only through GTZC, or is natively privileged-aware:

  – A securable privileged-only peripheral or memory is protected by an AHB/APB firewall gate controlled by the TZSC.

  – A privileged-aware peripheral or memory is connected directly to AHB or APB interconnect, implementing a specific behavior (for example, a subset of registers or a memory area is privilege-only).

    When such a peripheral is made privileged-only with GTZC, if it is master on the interconnect (SDMMC), it automatically issues privileged transactions. Privilege-aware masters like GPDMA1 and GPDMA2, drive privileged signal in the AHB interconnect according to their internal privileged mode, independently to the GTZC.

    The list of securable peripherals can be found in *Section 5: Global TrustZone® controller (GTZC)*.

- Securing memories with TZSC and MPCBB (privileged-only)

  The TZSC logic in GTZC provides the capability to manage the privilege level for all securable external memories, programming the MPCWM resources defined in *Section 3.6.4*.

  Similarly, the TZSC logic in GTZC provides the capability to configure the privilege level of embedded SRAM blocks, programming the MPCBB resources defined in *Section 3.6.4*.

- Error management (privileged-only)

  – Any unprivileged transaction trying to access a privileged resource is considered as illegal. There is no illegal access event generated for illegal unprivileged read and write accesses.

  – The addressed resource follows a silent-fail behavior, returning all-0 data for read and ignoring any write.

  – When an illegal unprivileged access occurs, no bus error is generated, except when this is an instruction fetch, accessing a privileged memory or a peripheral register.

Managing security in privileged-aware peripherals

TrustZone-aware peripherals also implement privileged-only access mode. The privileged protection is valid even if TrustZone is disabled (TZEN = 0xC3):

- *Embedded flash memory*

  By default, all registers can be read or programmed in both privileged and unprivileged modes.

  When secure privileged bit SPRIV is set in FLASH_PRIVCFGR, reading and writing the secure registers is possible only in privileged mode. Write access to this bit is ignored if TrustZone is disabled (TZEN = 0xC3).

  When nonsecure privileged bit NSPRIV is set in FLASH_PRIVCFGR, reading and writing the flash memory nonsecure registers is possible only in privileged mode.

  Regarding privileged protection, the devices offer the following features:

  – The system flash memory can be accessed in both privileged and unprivileged modes.
  – Each watermark-based secure area, including its secure HDP area, is accessible in secure-privileged and secure-unprivileged mode, if applicable.
  – Each 8-Kbyte page of the embedded flash memory can be programmed on-the-fly as privileged only, using the block-based privileged configuration registers FLASH_PRIV1BBRx and FLASH_PRIV2BBRx. An unprivileged page is accessible by privileged or unprivileged access.

Note: Switching a page from privileged to unprivileged does not erase its content.

When applicable, an erase or program operation is always available to privileged code, and is available to unprivileged code only for unprivileged pages or unprivileged memory.

- *On-the-fly encryption/decryption (OTFDEC)*

  When privileged bit PRIV is set in OTFDEC_PRIVCFGR, only a privileged application can initialize the OTFDEC.

Note: OTFDEC_PRIVCFGR can be read by both privileged and unprivileged code.

- *Direct memory access controllers (GPDMAx)*

  When a DMA channel x is defined as privileged (PRIVx = 1 in GPDMA_PRIVCFGR), special rules (see *Table 18*) apply when accessing privileged/unprivileged source or destination.

Table 18. DMA channel use (privilege)

Destination	Privileged DMA channel x (PRIVx = 1)		Unprivileged DMA channel y (PRIVy = 0)	
	Privileged source	Unprivileged source	Privileged source	Unprivileged source
Privileged	OK		Transfer blocked[1]	
Unprivileged			Transfer blocked	OK

1. When a transfer is blocked, the transfer completes but the corresponding writes are ignored, and reads return 0s.

- *Power control (PWR)*

  By default, after a power-on or a system reset, all PWR registers except PWR_PRIVCFGR, can be read or written in both privileged and unprivileged modes.

  When secure privileged bit SPRIV is set in PWR_PRIVCFGR, reading and writing the PWR securable registers are possible only in privileged mode. Write access to this bit is ignored if TrustZone is disabled (TZEN = 0xC3).

  When nonsecure privileged bit NSPRIV is set in PWR_PRIVCFGR, reading and writing the PWR nonsecure registers are possible only in privileged mode.

  See *Section 10: Power control (PWR)* for details.

- *Secure clock and reset (RCC)*

  By default, after a power-on or a system reset, all RCC registers except RCC_PRIVCFGR can be read or written in both privileged and unprivileged modes.

  When secure privileged bit SPRIV is set in RCC_PRIVCFGR, reading and writing the RCC securable bits are possible only in privileged mode. Write access to this bit is ignored if TrustZone is disabled (TZEN = 0xC3).

  When nonsecure privileged bit NSPRIV is set in RCC_PRIVCFGR, reading and writing the RCC nonsecure bits are possible only in privileged mode.

  See *Section 11: Reset and clock control (RCC)* for details.

- *Real time clock (RTC)*

  By default after any backup domain reset, all RTC registers except RTC_PRIVCFGR, can be read or written in both privileged and unprivileged modes.

  When PRIV bit is set in privileged-only RTC_PRIVCFGR:

  – Writing the RTC registers is possible only in privileged mode.

  – Reading the RTC_SECCFGR, RTC_PRIVCFGR, RTC_TR, RTC_DR, RTC_SSR, RTC_PRER and RTC_CALR is always possible in privileged and unprivileged modes.

  All the other RTC registers can be read only in privileged mode.

  When PRIV bit is cleared in privileged-only RTC_PRIVCFGR register, it is still possible to restrict access to privileged mode to some RTC registers by setting dedicated control bits: INITPRIV, CALPRIV, TSPRIV, WUTPRIV, ALRAPRV, or ALRBPRIV.

  See *Section 51: Real-time clock (RTC)* for details.

- *Tamper and backup registers (TAMP)*

  By default after any backup domain reset, all TAMP registers except TAMP_PRIVCFGR can be read or written in both privileged and unprivileged modes.

  When PRIV bit is set in privileged-only TAMP_PRIVCFGR:

  – Writing the TAMP registers is possible only in privileged mode, except for the backup registers and the monotonic counters that have their own protection setting.

  – Reading the TAMP_SECCFGR or TAMP_PRIVCFGR is always possible in privilege and unprivilege modes. All the other TAMP registers can be read only in privilege mode, except for the backup registers and the monotonic counters that have their own protection setting.

The application can also:

- make TAMP_COUNT1R register read and write privileged-only by setting the CNTPRIV bit in TAMP_PRIVCFGR
- increase security for two of the three protection zones in backup registers, using BKPRWPRIV and BKPWPRIV bits in TAMP_PRIVCFGR:
  - Make protection zone 1 read privileged, write privileged.
  - Make protection zone 2 read privileged or unprivileged, write privileged.
  - Protection zone 3 is always read and write privileged or unprivileged.

- *General-purpose I/Os (GPIO)*

  All GPIO registers can be read and written by privileged and unprivileged accesses, whatever the security state (secure or nonsecure).

- *Extended interrupts and event controller (EXTI)*

  The EXTI peripheral is able to protect event register bits from being modified by unprivileged accesses. The protection is individually activated per input event via the register bits in the privileged-only EXTI_PRIVCFGRx registers. When an input event is configured as privileged, only a privileged application can change the configuration (including security if applicable), change the masking or clear the status of this input event.

  The security configuration in EXTI_PRIVCFGR1 and EXTI_PRIVCFGR2 can be globally locked after reset in EXTI_LOCKR.

  See *Section 18: Extended interrupts and event controller (EXTI)* for more details.

- *System configuration boot and security (SBS)*

  All SBS registers can be read and written in both privileged and unprivileged modes, except:

  - FPUSEC bit in SBS_SECCFGR registers (privileged only)
  - SBS registers for CPU configuration: SBS _CSLOCKR, SBS _FPUIMR, and SBS _CNSLCKR

  See *Section 14: System configuration, boot, and security (SBS)* for more details.

3.8 Secure execution

Through a mix of special software and hardware features, the devices ensure the correct operation of their functions against abnormal situations caused by programmer errors, software attacks through network access or local attempt for tampering code execution.

This section describes the hardware features specifically designed for secure execution.

3.8.1 Memory protection unit (MPU)

The Cortex-M33 includes a memory protection unit (MPU) that can restrict the read and write accesses to Each memory region (including those mapped to peripherals), based on one or more of the following parameters

- Cortex-M33 operating mode (privileged, unprivileged)
- data/instruction fetch

The memory map and the programming of the nonsecure and secure MPUs split memory into regions (up to eight for the nonsecure, and up to twelve for the TrustZone). Secure MPU is only available when TrustZone is activated.

3.8.2 Embedded flash memory write protection

The embedded flash memory write protection (WRP) prevents illegal or unwanted write/erase to special sections of the embedded flash memory user area (system area is permanently write protected).

Write protected area is defined through the option bytes, writing the start and end addresses: two write-protected areas can be defined in each bank, with the granularity of a 32-Kbyte page.

WRP areas can be modified through option byte changes unless the corresponding FLASH_WRPSGNxR has its UNLOCK option bit cleared (meaning ROM emulation). UNLOCK can be set only when regressing to PRODUCT_STATE = Open.

Note: Bank erase aborts when it contains a write-protected area (WRP or HDP area).

3.8.3 Tamper detection and response

Principle

The devices include active protection of critical security assets against temperature, voltage and frequency attacks, with the following features:

- erasure of device secrets upon tamper detection
- improved guarantee of safe execution for the CPU and its associated security peripherals, including:
  - out-of-range voltage (example: V_{BAT}, V_{DDA}), temperature and clocking (LSE) detection
  - security watchdog IWDG clocked by the internal oscillator LSI
  - possible selection of internal oscillator HSI as system clock
- power supply protection
  - RTC/TAMP domain powered automatically with V_{DD} or V_{BAT}

See *Section 52: Tamper and backup registers (TAMP)* for more details.

Tamper detection sources

The devices support eight active input/output pins, allowing four independent active-tamper meshes, or up to seven meshes if the same output pin is shared by several input pins (for a total of eight active-tamper I/Os). The active-tamper balls are mapped in the center of packages that can be used in the POS market (such as WLCSP80).

The active pins are clocked by the LSE, and are functional in different system operating modes (Run, Sleep, Stop, or Standby), and in VBAT mode. Refer to TAMP pins functionality over modes for list of tamper pins and their availability across power modes

Detection time is programmable, and a digital filtering is available (tamper triggered after two false comparisons in four consecutive comparison samples).

Note: Timestamps are automatically generated when a tamper event occurs.

The internal tamper sources are listed in *Table 19*.

Table 19. Internal tampers in TAMP

Tamper input	NOER bit number in TAMP_CR3	Tamper source
itamp1	0	Backup domain voltage continuous monitoring, functional in VBAT mode
itamp2	1	Temperature monitoring, functional in VBAT mode
itamp3	2	LSE monitoring(1), functional in VBAT mode
itamp4	3	HSE monitoring
itamp5	4	RTC calendar overflow (rtc_calovf)
itamp6	5	JTAG/SWD access
itamp7, 12, 13	6, 11, 12	Voltage monitoring (V_{CORE}, V_{REF+}), through ADC analog watchdog
itamp8	7	Monotonic counter overflow (generated internally)
itamp9	8	Fault generation for cryptographic peripherals (SAES, PKA, AES, RNG)
itamp11	10	IWDG timeout and potential tamper (IWDG reset when at least one enabled tamper flag is set)
itamp15	14	System fault detection

1. LSE missing or over frequency detection (> 2 MHz), Glitch filter (> 2 MHz).

Response to tampers

Each source of tamper in the device can be configured to trigger the following events:

- Generate an interrupt, capable of waking up the device from Stop and Standby modes (see TAMPxMSK bits in TAMP_CR2 register).
- Generate a hardware trigger for the low-power timers.
- Erase device secrets if the corresponding TAMPxNOER bit is cleared in TAMP_CR2 (for tamper pins) or TAMP_CR3 (for internal tamper). These erasable secrets are:
  - symmetric keys stored in backup registers (x32), in SAES, AES, HASH, CCB(a), and OTFDEC (encrypted flash memory regions are read as 0)
  - asymmetric keys stored in PKA SRAM, erased when V_{DD} is present
  - other secrets stored in SRAM2 and CPU instruction cache memory (SRAM2 erased when V_{DD} is present)
  - nonvolatile information used to derive the DHUK in SAES is 0-ed until complete SRAM2 erase
  - Backup SRAM (depending on configuration bit), erased when V_{DD} is present

Read/write accesses by software to all these secrets can be blocked, by setting the BKBLOCK bit in TAMP_CR2. The device secrets access is possible only when BKBLOCK is cleared, and no tamper flag is set for any enabled tamper source.

If V_{DD} is not present, the secrets that are erased when V_{DD} is present are erased only at the next V_{DD} power on.

a. Available only on STM32H543/553xx devices.

Note: Device secret erase is also triggered by setting the BKERASE bit in TAMP_CR2, or by performing a PRODUCT_STATE regression as defined in Section 3.11.2.

Device secrets are not reset by a system reset or when the device wakes up from Standby mode.

Software filtering mechanism

Each tamper source can be configured not to launch an immediate erase, by setting the corresponding TAMPxNOER bit in TAMP_CR2 (for external tamper pin) or TAMP_CR3 (for internal tamper).

In such situation, when the tamper flag is raised, access to below secrets is blocked until all tamper flags are cleared:

- DHUK in SAES: fixed to a dummy value
- Backup registers, backup SRAM, SRAM2: read as 0, write-ignored
- AES, SAES, CCB[a], and HASH peripherals: automatically reset by RCC
- PKA peripheral: reset, with memory use blocked (meaning PKA not usable)

Once the application, notified by the tamper event, analyzes the situation, there are two possible cases:

- The application launches secrets erase with a software command (confirmed tamper).
- The application clears the flags to release secrets blocking (false tamper).

Note: If the tamper software fails to react to such a tamper flag, an IWDG reset triggers an automatic erasing of secrets.

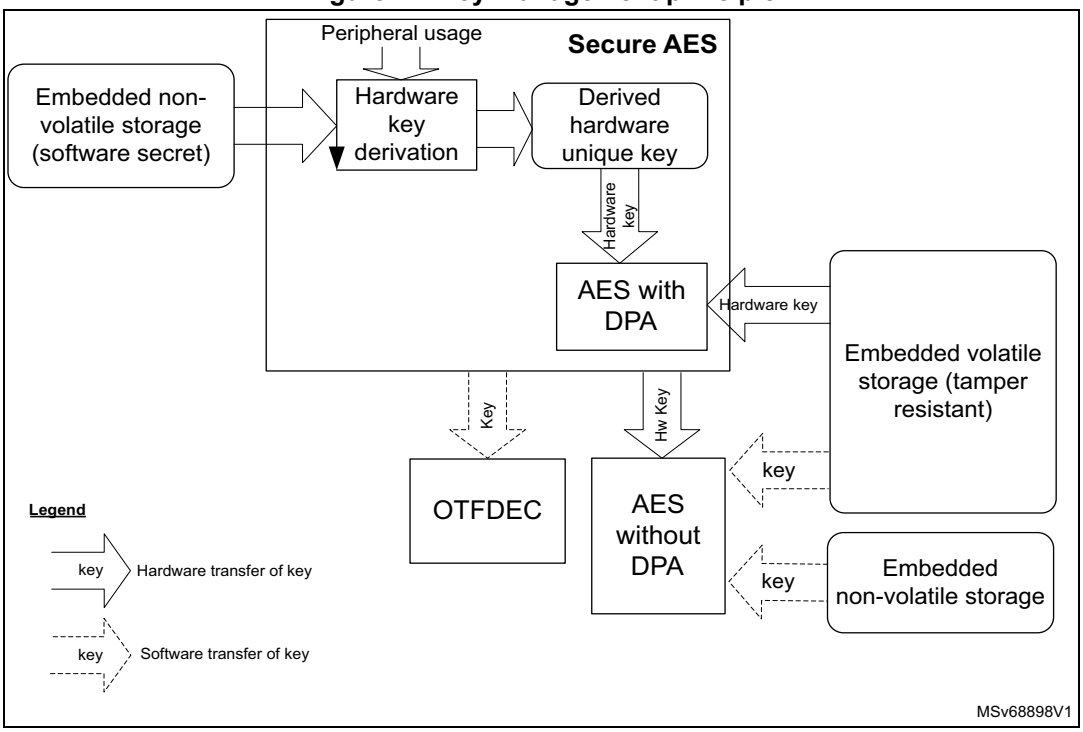
Tamper detection and low-power modes

The effect of low-power modes on a tamper detection are summarized in *Table 20*.

Table 20. Effect of low-power modes on TAMP

Mode	Description
Sleep	No effect on tamper detection features. TAMP interrupts cause the device to exit the Sleep mode.
Stop	No effect on tamper detection features, except for level detection with filtering and active tamper modes that remain active only when the clock source is LSE or LSI. Tamper events cause the device to exit the Stop mode.
Standby	No effect on tamper detection features, except for level detection with filtering and active tamper modes which remain active only when the clock source is LSE or LSI. Tamper events cause the device to exit the Standby mode.

3.9 Secure storage



A critical feature of security systems is how long-term keys are stored, protected, and provisioned. Such keys are typically used for loading a boot image, or handling of critical user data.

a. Available only on STM32H543/553xx devices.

Figure 11 shows how key management service application can use the AES engine, for example, to compute external image decryption keys. Nonvolatile keys are stored in the flash memory in a dedicated area including access control (see *Section 3.7.1*), while volatile key storage consists in the battery-powered, tamper-protected SRAM or registers in TrustZone-aware TAMP.

Figure 11 also shows keys that are manipulated by software (like OTFDEC keys), or keys that are managed only by hardware (like DHUK). More information on those hardware keys can be found in *Section 3.9.1*.

Figure 11. Key management principle

Details on tamper protection can be found in *Section 3.8.3*, while TAMP TrustZone features are briefly described in *Section 3.6.5*.

3.9.1 Hardware secret key management

As shown in the previous figure, the devices propose a better protection for application keys, using hardware secret keys. These AES keys can be made usable to the application, without exposing them in clear-text (unencrypted). Such keys also become immediately unusable in case of tamper.

There are three different sources of hardware secret keys:

- DHUK: derived keys based on 256-bit nonvolatile device unique secret in flash memory. The flash memory provides value provisioned during product manufacturing (called RHUK). The generation of DHUK key takes into account the TrustZone state,

the OBK-HDPLx (temporal isolation counter), the EPOCH (regression counter allowing antireplay protection) and key use state (KMOD).

- BHK: 256-bit application key stored in tamper-resistant volatile storage in TAMP

  This key is written at boot time, then read/write locked to the application until the next reset.
- XORK: result of an XOR of BHK and DHUK

Those keys can be used in the following modes:

- as a normal key, loading in write-only key registers (software key mode)
- as an encryption/decryption key for another key, to be used in the DPA-resistant SAES (wrapped key mode)
- as an encryption/decryption key for another key, to be used in a faster AES engine (shared key mode)

3.9.2 Unique ID

The devices store a 96-bit ID that is unique to each device (see *Section 67.1: Unique device ID register (96 bits)*).

Application services can use this unique identity key to identify the product in the cloud network, or make it difficult for counterfeit devices or clones to inject untrusted data into the network.

Alternatively, the 256-bit device unique key (DHUK) can be used (see *Section 3.9.1*).

3.10 Crypto engines

The devices implement state-of-the-art cryptographic algorithms featuring key sizes and computing protection as recommended by national security agencies such as NIST for the U.S.A, BSI for Germany or ANSSI for France. Those algorithms are used to support privacy, authentication, integrity, entropy and identity attestation.

The embedded crypto engines reduce weaknesses on the implementation of critical cryptographic functions, preventing, for example, the use of weak cryptographic algorithms and key sizes. They also enable lower processing times and lower power consumption when performing cryptographic operations, offloading those computations from Cortex-M33. This is especially true for asymmetric cryptography.

For product certification purposes, ST can provide certified device information on how these security functions are implemented and validated.

For more information on crypto engine processing times, refer to their respective sections in the reference manual.

3.10.1 Crypto engines features

Table 21 lists the accelerated cryptographic operations available in the devices. Two AES accelerators are available (both can be reserved to secure application only).

Note: Additional operations can be added using firmware. The PKA can accelerate asymmetric crypto operations (like key pair generation, ECC scalar multiplication, point on curve check). See Section 41: Public key accelerator (PKA) for more details.

Table 21. Accelerated cryptographic operations

Operations	Algorithm	Specification	Length of keys (in bit)	Modes
Get entropy	RNG	NIST SP800-90B(1)	N/A	Software and hardware(2) modes running in parallel
Encryption, decryption	AES	FIPS PUB 197 NIST SP800-38A	128, 256	ECB, CBC, CTR(3)
Authenticated encryption or decryption		NIST SP800-38C NIST SP800-38D	128, 256	GCM, CCM
Cipher-based message authentication code		NIST SP800-38D	128, 256	GMAC
Checksum	SHA-1	FIPS PUB 180-4	N/A	Digest 160-bit
Cryptographic hash	SHA-2		-	SHA-224, SHA-256 SHA2-384, SHA2-512
	SHA-3(4)			SHA3-224, SHA3-256 SHA3-384, SHA3-512
Keyed-hashing for message authentication	HMAC	FIPS PUB 198-1 IETF RFC 2104	Short, long (>64 bytes)	-
Encryption/decryption key-pair generation(5)	RSA	IETF RFC 8017 NIST SP800-56B	Up to 4160	RSAES-OAEP
Signature(5) with hashing	RSA	IETF RFC 8017 FIPS PUB 186-4	Up to 4160	PKCS1-v1_5, PSS
Signature verification	ECDSA	ANSI X9.62 IETF RFC 7027 FIPS PUB 186-4	Up to 640	Refer to table 'Family of supported curves for ECC operations' in PKA section for details
Key agreement	ECDH	ANSI X9.42		

1. Certifiable using STMicroelectronics reviewed documents.
2. Random numbers distribution to SAES and PKA using a dedicated hardware bus.
3. ECB and CBC chaining modes protected against side-channel and timing attacks in SAES (see *Section 3.10.2*).
4. Available only on STM32H543/553xx devices.
5. Private key cryptography protected against side-channel and timing attacks.

Note: Binary curves, Edwards curves and Curve25519 are not supported by the PKA.

3.10.2 Secure AES co-processor (SAES)

The devices provide an additional on-chip hardware AES encryption and decryption engine, implementing countermeasures and mitigations against power and electromagnetic side-channel attacks.

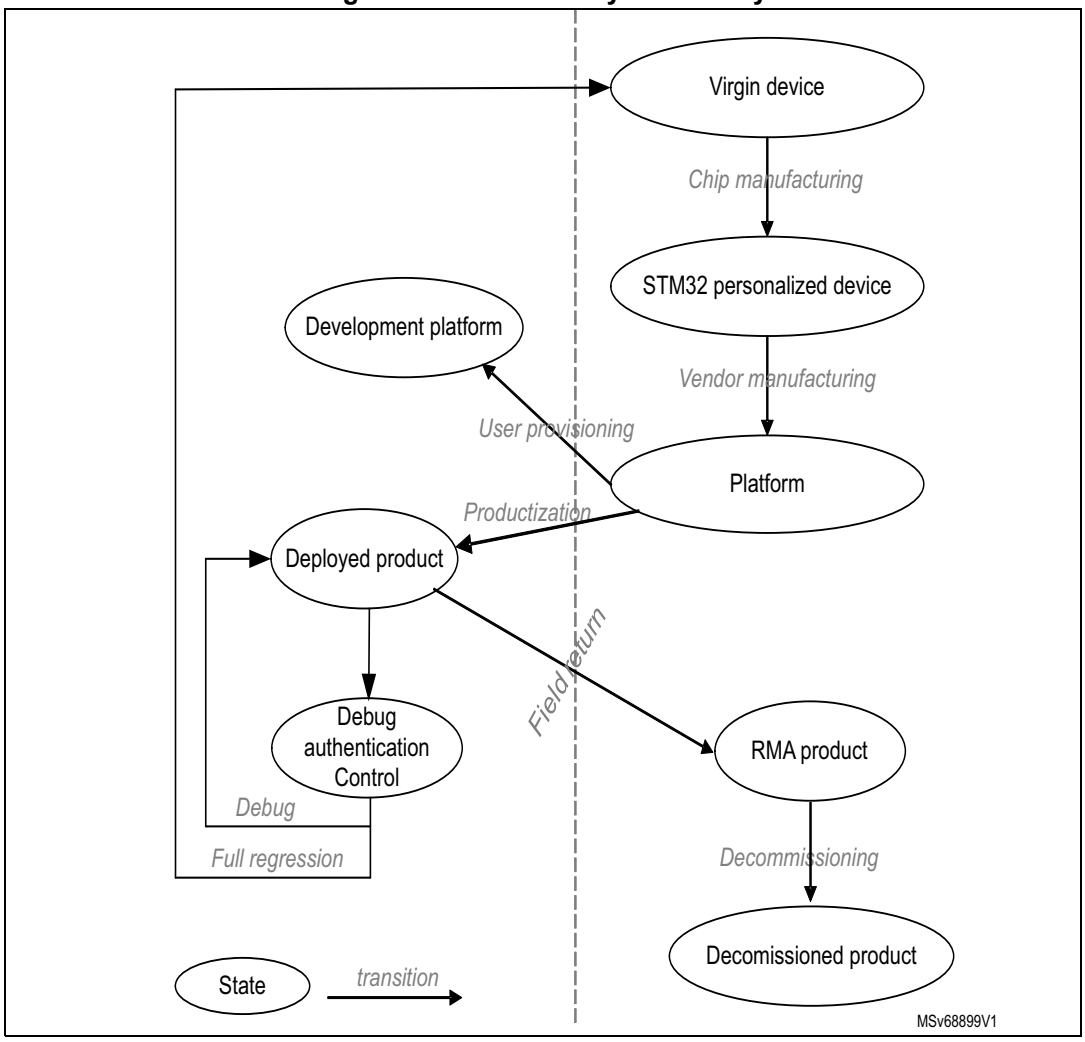
Clocked by the system clock the SAES results in very good performance for a dpa resistant hardware accelerator. The SAES engine supports 128-bit or 256-bit key in electronic code book (ECB), cipher block chaining (CBC), (CTR), (GCM), (CCM), (GMAC) modes.

As shown in *Section 3.9*, the SAES can be used for extra-secure on-chip storage for sensitive information. It can also be made secure-only.

For more information, refer to *Section 38: Secure AES coprocessor (SAES)*.

3.10.3 On-the-fly decryption engine (OTFDEC)

The OTFDEC TrustZone-aware peripheral proposes on-the-fly decryption of encrypted images stored on external flash memory, connected through the OCTOSPI. This decryption process introduces almost no additional cycle overhead when the standard NOR flash memory is used. The OTFDEC can also be used to encrypt flash memory images on the device (for example to encrypt with a device unique secret key).



When a tamper event is confirmed in TAMP, all OTFDEC keys are erased and encrypted regions are read as 0 until the OTFDEC is properly initialized again.

An OTFDEC typical use is detailed in *Section 3.12.2*. For more details on the peripheral programming, refer to *Section 42: On-the-fly decryption engine (OTFDEC)*.

3.11 Product life cycle

A typical IoT device life cycle is summarized in *Figure 12*. For each step, the devices propose secure life cycle management mechanisms embedded in the hardware.

Figure 12. Device life cycle security

Additional details on the various phases and associated transitions, found either at the vendor or end-user premises, are summarized in *Table 22*.

Table 22. Main product life cycle transitions

Transitions	Description
Device manufacturing	ST creates new STM32 devices, always checking for manufacturing defects. During this process, the device is provisioned with ROM firmware, secure firmware install (SFI) unique key pair, and a public ID.
Vendor manufacturing	One (or more) vendor is responsible for the platform assembly, initialization, and provisioning before delivery to the end user. This end user can use the final product (“productization” transition) or he/she can use the platform for software development (“user provisioning” transition).
Productization	The end user gets a product ready for use. All security functions of the platform are enabled, the debugging/testing features are restricted/disabled, and unique boot entry to immutable code is enforced.
User provisioning	Platform vendor prepares an individual platform for development, not to be connected to a production cloud network.

Table 22. Main product life cycle transitions (continued)

Transitions	Description
Full progression	The product is returned for analysis to field return centers. Analysis is possible by opening it partially, or by launching a partial or a full regression. Such accesses require provisioning, including certificates provided by the vendor.
Field return	These are one-way transitions, with devices kept in user premises or returned to the manufacturer. In both cases, all data including user data is destroyed, therefore the devices lose the ability to operate securely (like connecting to a managed IoT network). This Field return is valid including when PRODUCT_STATE is Locked.

The features described hereafter contribute to secure the device life cycle.

3.11.1 Product configurations and security services

The product is provisioned with ST security services in system flash, but can be configured to let the full control of the boot chain to OEMs. This is done thanks to the unique boot entry (FLASH_OPTSR: BOOT_UBE) option byte, allowing to select between the security services (STiRoT: ST immutable root of trust), or OEM boot implementation (OEMiRoT: OEM immutable root of trust) to be installed in the user part of the flash memory.

Security services are provisioned by ST in system flash (immutable). They provide the root of trust of the platform managing the verification and the update of the first updatable code (uRoT).

3.11.2 Life cycle management

The product life cycle allows to control access to different assets (code and data) of the product, including during development, manufacturing, and after sales. It allows to provision the product with different distribution models, taking care of the code and data provisioned.

Table 23. Typical product life cycle phases

PRODUCT_STATE + DebugState		Debug (default configuration)	Comments
Open	Device open	Secure(1) and nonsecure	Allows to develop the product, as it provides the debug of the code. Boot address must target a secure area when TrustZone is enabled. Using the boot pin allows to launch the bootloader. Using boot pin and BOOT_UBE allows to launch user flash code through STiRoT.
Provisioning	Debug partially opened (only nonsecure)	HDPL3 + Nonsecure only	Allows to manage the provisioning of the product (partial or full). It allows to launch secure firmware Install, or bootloader to provision the product. Boot address must target a secure area when TrustZone is enabled. Boot on SRAM is not permitted.
iRoT-Provisioned	Debug partially opened (only nonsecure)	HDPL3 + Nonsecure only	Assumes that immutable root of trust is installed, including its configuration (code, option bytes, secure storage). Boot address must target a secure area when TrustZone is enabled. Boot on SRAM is not permitted.

Table 23. Typical product life cycle (continued)phases (continued)

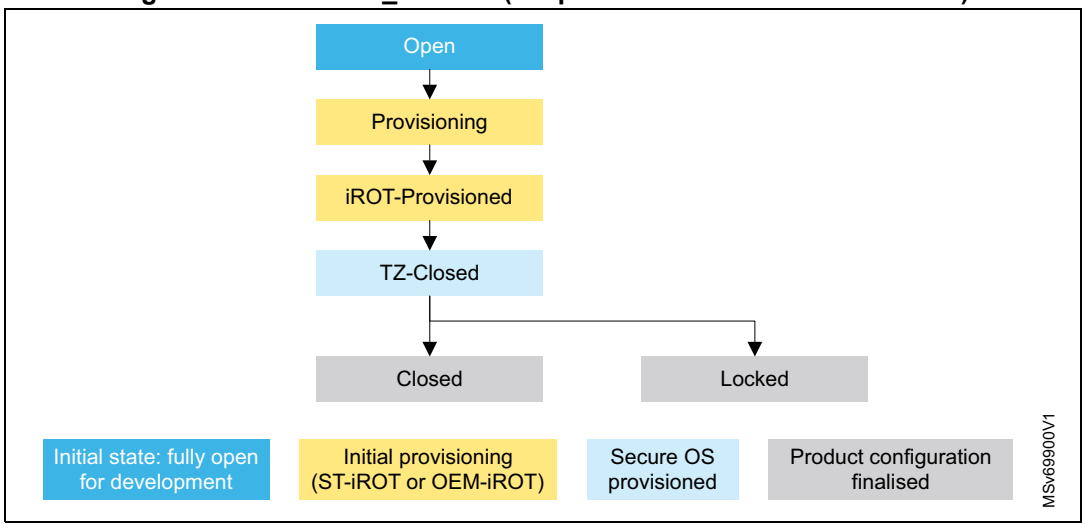
PRODUCT_STATE + DebugState		Debug (default configuration)	Comments
TZ-Closed	Debug partially opened (only nonsecure)	HDPL3 + Nonsecure only	Assumes that the Secure OS is installed in TrustZone (this state exist only if TZEN = 0xB4). Debug is opened for nonsecure applications
Closed	Debug closed	NoDebug + debug authentication control	Assumes the product configuration as finalized. It allows supporting debug authentication for in-the-field repair (read the dedicated application note).
Locked	Debug locked	None	Assumes the product configuration as finalized. Debug authentication is not permitted. The product is definitively in this state. Nevertheless, the field return procedure allows launching RMA state.
NS-Regression	Debug closed	NoDebug	This is a temporal (but nonvolatile) state to manage the partial regression to the TZ-Closed, removing all nonsecure code and data including in secure storage.
Regression	Debug closed	NoDebug	This is a temporal state (but nonvolatile) to manage the full regression to Open state, removing all user flash code and data including in secure storage (HDPL1 to HDPL3).
Debug Constrained	Debug opened following debug authentication permissions	Depends upon permissions	This is a temporal state (until power-on-reset) to manage debug based on the permissions acquired by the debug authentication protocol.

1. Debug is not available when executing RSS code.

STMicroelectronics does not perform analysis on defective parts in closed or locked states.

The supported transitions, summarized in *Figure 13*, can be requested (when available) through the debug interface or via the system bootloader.

Figure 13. PRODUCT_STATEs (simplified TrustZone activated view)



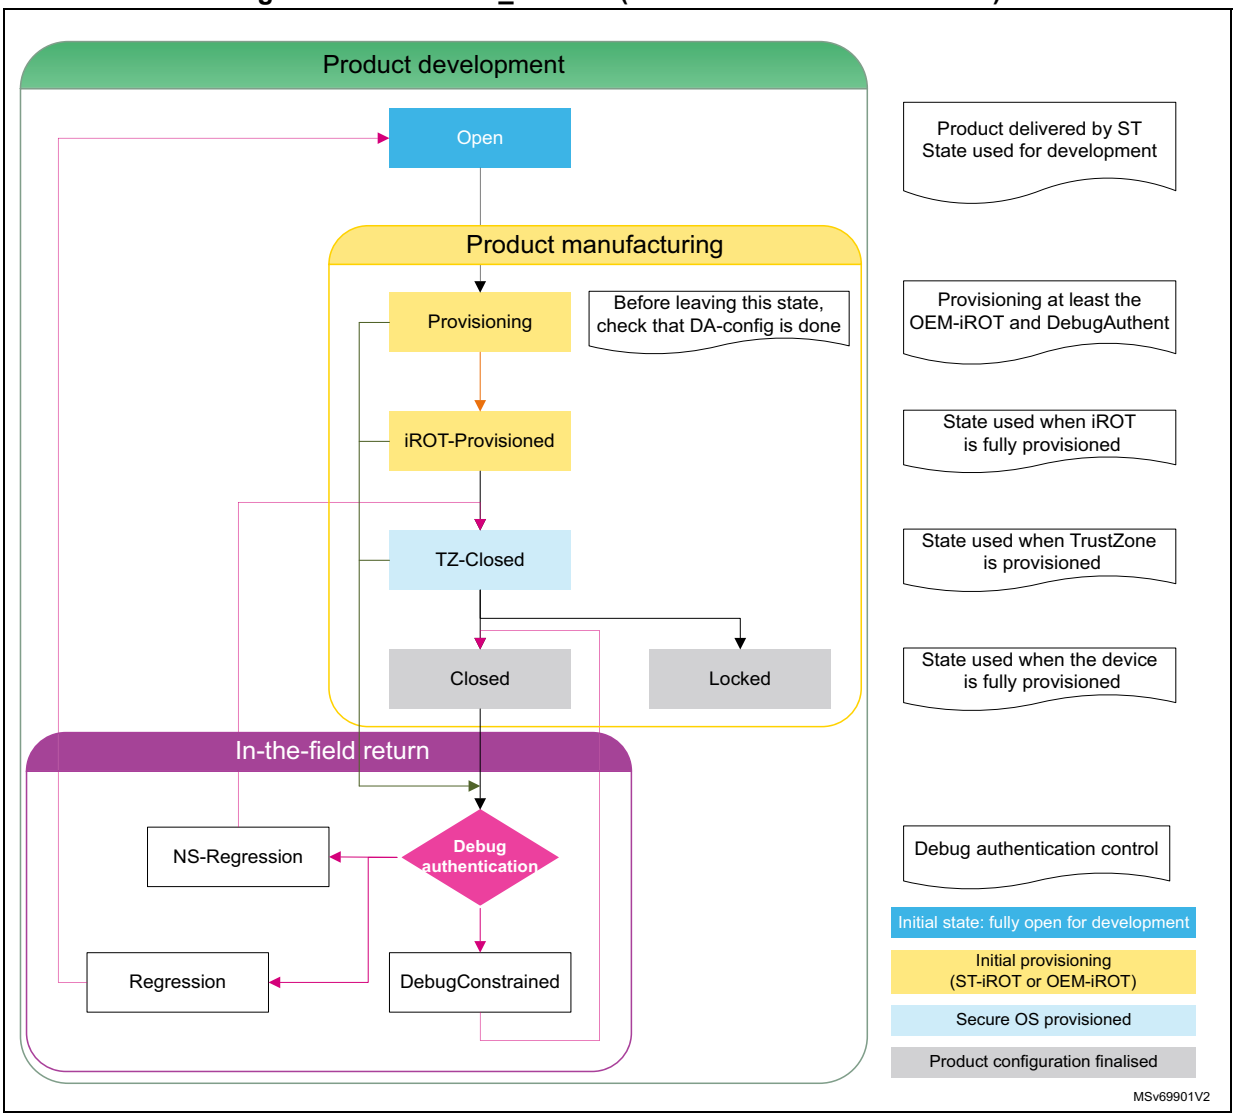


Figure 14. PRODUCT_STATEs (full TrustZone activated view)

The full view of the life cycle includes the debug authentication part, to help product maintenance to manage field returns (in-the-field centers). The debug authentication control is ensured thanks to a protocol based on Arm PSA ADAC specification. It allows controlling that the host has a trusted certificate with permissions. Permissions definition allows a lot of flexibility, in our default model we consider: Full or Partial regression, or to open the debug for nonsecure.

When TrustZone is disabled, the state TZ-Closed does not exist, and the debug authentication is based on a password authentication method. For details on the debug authentication feature, refer to the corresponding application note.

The procotol includes a “DISCOVER” command allowing to get basic informations of the target: manufacturer, product name, device identifier, protocol version supported and crypto scheme for authentication (this help selecting between certificates and password).

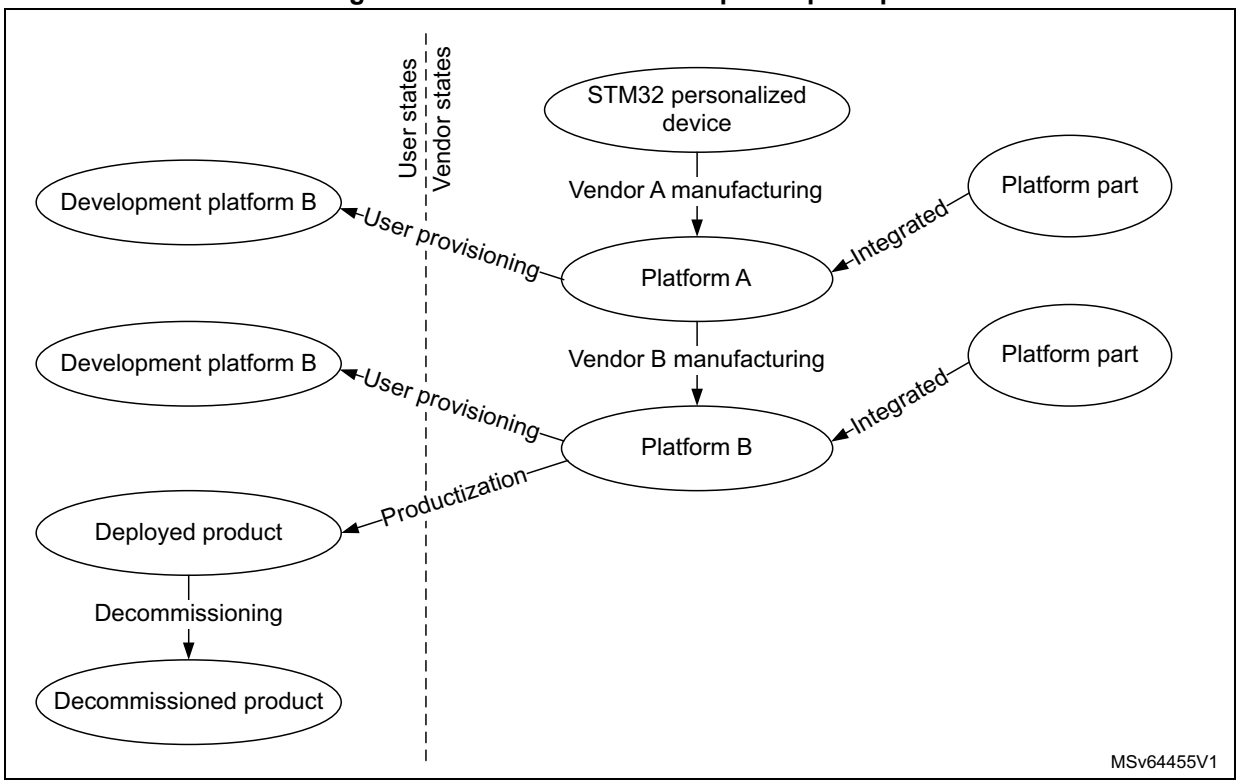
3.11.3 Recommended product settings

To ease the product maintenance (in-the-field), we recommend to take benefit of the feature called debug authentication control. This enables the maintenance of product activating the debug and makes possible to manage regressions while considering the security of the sensible information.

This implies the following actions:

- set the PRODUCT_STATE in Closed state when the product has been configured
- When debug authentication control is based on certificates (when TrustZone enabled), **provision the OEM-PublicKey and the SOC-Mask**. Setting the SOC-Mask to propose only the nonsecure-debug and partial and full regression guaranty to be compliant with the Arm PSA security model.
- When debug authentication control is based on password (when TrustZone is disabled), only the HASH of the password must be provisioned.

A dedicated application note is available to help configuring the platform, the host tools and to generate certificates.



3.12 Software intellectual property protection and collaborative development

Thanks to software intellectual property protection and collaborative model, the devices allow the design of solutions integrating innovative third-party libraries.

Collaborative development is summarized in *Figure 15*. Starting from a personalized device sold by STMicroelectronics, a vendor A can integrate a portion of hardware and software on a platform A, which can then be used by a vendor B, who does the same before deploying a final product to the end users.

Note: Each platform vendor can provision individual platforms for development not to be connected to a production cloud network (“Development Platform X”).

Figure 15. Collaborative development principle

The features described hereafter contribute to securing the software intellectual property within such a collaborative development.

3.12.1 Software intellectual property protection

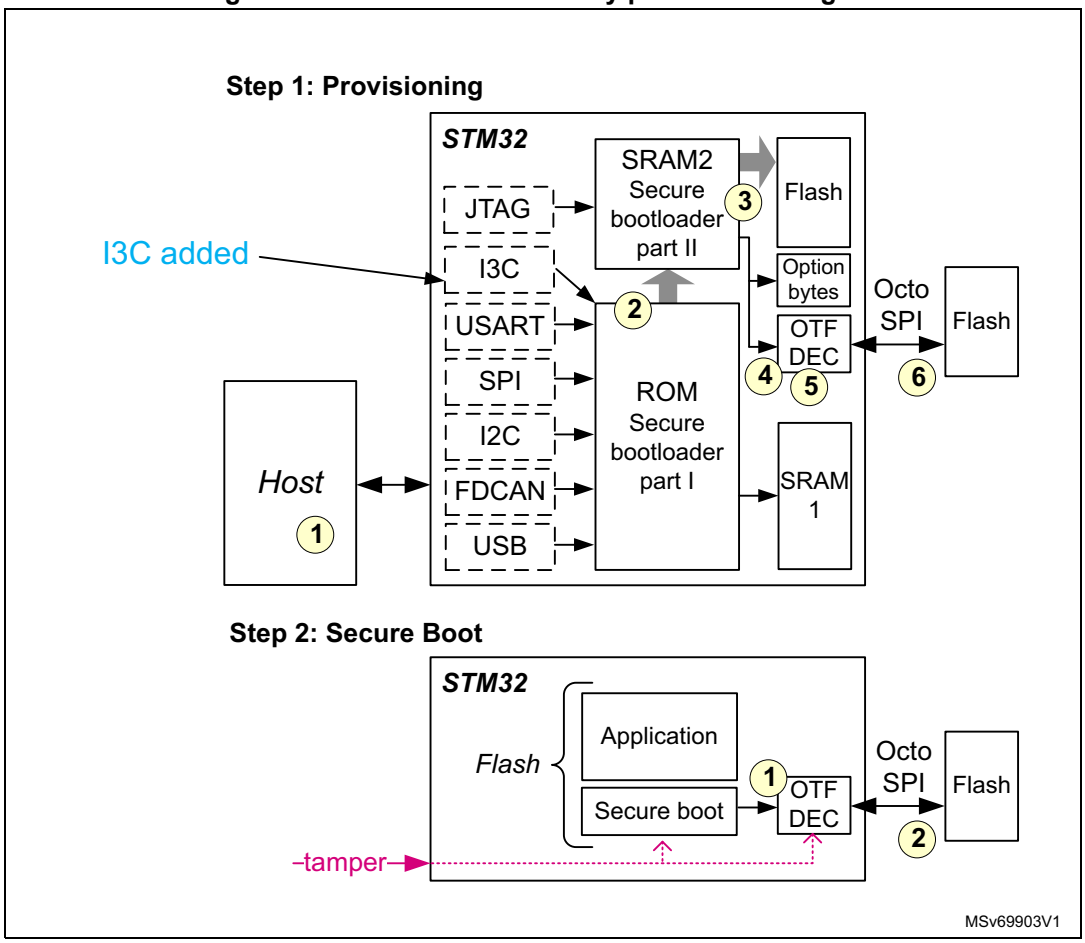
As described in *Section 3.11.2,* the hardware PRODUCT_STATE mechanism automatically controls the accesses to secrets provisioned in the device. The protection of these secrets are defined in *Table 24*.

Table 24. Software intellectual property protection with PRODUCT_STAT

PRODUCT_STATE protection level		Secrets protection
Open	Device open	No special protections.
Provisioning	Debug partially opened (only nonsecure)	All areas protected with HDPL1 cannot be dumped, debugged or traced. The iRoT can setup a higher level of protection.
iRoT-Provisioned	Debug partially opened (only nonsecure)	All areas protected with HDPL1 cannot be dumped, debugged or traced. The iRoT can setup a higher level of protection.
TZ-Closed	Debug partially opened (only nonsecure)	All peripherals and memories mapped as secure during secure boot cannot be dumped, debugged or traced
Closed	No debug	No debug possible except through debug authentication.
Locked	No debug	All data and code stored in the device or encrypted in external flash memory cannot be dumped clear-text, debugged or traced.

3.12.2 Software intellectual property protection with OTFDEC

As described in *Section 3.10.3,* the OTFDEC associated with the OCTOSPI is able to decrypt on the fly, the encrypted images stored in external SPI flash memories.



Thanks to this feature, the devices allow the installation of intellectual properties, in one of the following ways:

- over the air, with the image already encrypted with a key provisioned in the device
- through a provisioning host located in a trusted or a non-trusted environment/facility

Figure 16 illustrates this last case, with the provisioning, in a non-trusted environment, of software intellectual properties both in the embedded flash memory and in an external SPI flash memory (encrypted).

Note: Since the OTFDEC uses the AES in counter mode (CTR) to achieve the lowest possible latency, each time the content of one encrypted region is changed, the corresponding cryptographic context (key or initialization vector) must be changed. This constraint makes OTFDEC suitable to decrypt read-only data or code, stored in external NOR flash memory.

Figure 16. External flash memory protection using SFI

Provisioning

Assuming the device is virgin, the first step is to provision both flash memories, as detailed below:

1. The user creates a SFI image, composed of:
   - encrypted internal firmware and data (including external flash memory drivers)
   - encrypted external firmware and data AES key (up to 4)
   - encrypted external firmware and data image
2. The secure bootloader stored in the system memory, loads the second part of the secure bootloader in SRAM2, through the supported communication ports (USART, SPI, I2C, FDCAN, USB, I3C, and JTAG). This second part runs in the secure SRAM2 and is responsible for executing the SFI process, applying the SFI protocol thanks to the commands received through the above mentioned supported communication ports.
3. The internal flash memory is programmed with decrypted option bytes, internal firmware and data, and external firmware and data AES keys. Alternatively, device unique external firmware AES keys can be used instead of such global keys.
4. The OTFDEC is properly initialized with encrypted region information, including the corresponding external firmware and data AES key.
5. Running the SFI process, chunks of encrypted external firmware and data image are decrypted in the device, then re-encrypted in the OTFDEC.

6. After a chunk OTFDEC re-encryption, the user external flash memory programmer is responsible for programming the last encrypted chunks to the external SPI flash memories through the OCTOSPI.

Secure boot

After provisioning, each time the device initializes on a trusted firmware, the following actions are required:

1. Secure-boot firmware executes, programming the external firmware and data AES keys to the OTFDEC write-only key registers, along with the other needed information.
2. The application reads or executes the encrypted external firmware and data through the OCTOSPI in memory mapped mode, unless a tamper event is detected. In this case, all OTFDEC keys are erased and encrypted regions are read as 0 until the OTFDEC is properly initialized.

For more information on SFI solutions for the devices, refer to the AN4992 "*STM32 MCUs secure firmware install (SFI) overview".*

3.12.3 Other software intellectual property protections

The device additional protections to software intellectual property are:

- Invasive attacks such as physical tampering or perturbation are countered by detection then decommissioning of the device before the detected attack succeeds.
- Noninvasive attacks, such as side channel attacks, are countered by not leaking secret information via side channels (such as timing, power, and EM emissions).

4 Boot modes

At startup, a BOOT0 pin and NSBOOTADD[31:8]/SECBOOTADD[31:8] option bytes are used to select the boot memory address that includes:

- Boot from any address in user flash memory
- Boot from system memory:
  - Bootloader
  - ST immutable root of trust (STiRoT)
  - Root security service (RSS)
  - Debug authentication library (RSS-DA)

Embedded bootloader

The embedded bootloader is located in the system memory, programmed by ST during production. It is used to reprogram the flash memory by using USART, I2C, I3C, SPI, FDCAN, or USB_FS in device mode through the DFU (device firmware upgrade).

Refer to AN2606 "*Introduction to system memory boot mode on STM32 MCUs"*.

Embedded root security services (RSS)

The embedded RSS is located in the secure information block, programmed by ST during production.

Refer to AN4992 "*Introduction to secure firmware install (SFI) for STM32 MCUs"*.

Embedded immutable root of trust (STiRoT)

The embedded STiRoT in the system memory, is programmed by ST during production. STiRoT is the immutable root of trust managing the secure boot and secure install of the first updatable level to execute in a boot sequence.

Refer to AN6007 "*Getting started with STiRoT (ST immutable Root of Trust) for STM32H5 MCUs"*.

Embedded debug authentication (ST-DA)

The embedded ST-DA in the system memory, is programmed by ST during production. ST-DA is the library that manages the debug authentication protocol by allowing to securely reopen the debug or to launch regressions on secured products in the field.

Refer to AN6008 "*Getting started with debug authentication (DA) for STM32 MCUs"*.

4.1 STM32H523/43/62/63xx boot modes

Table 25 and *Table 26* provide the detail of the boot mode when the TrustZone is, respectively, disabled (TZEN = 0xC3) and enabled (TZEN = 0xB4).

Table 25. Boot mode when TrustZone is disabled (TZEN = 0xC3) - STM32H523/43/62/63xx devices

PRODUCT_STATE	BOOT0 pin	Boot address option-byte selection	Boot area	ST programmed default value
Open	0	NSBOOTADD[31:8]	Boot address defined by user option byte NSBOOTADD[31:8]	Flash: 0x0800 0000
	1	NA	Bootloader	Bootloader
Provisioning	x	NA	RSS	RSS
Provisioned, Closed, Locked	x	NSBOOTADD[31:8]	Boot address defined by user option byte NSBOOTADD[31:8]	Flash: 0x0800 0000

Table 26. Boot mode when TrustZone is enabled (TZEN = 0xB4) - STM32H523/43/62/63xx devices

PRODUCT_STATE	BOOT0 pin	Boot address option-byte selection	Boot area	ST programmed default value
Open	0	SECBOOTADD[31:8]	Boot address defined by user option byte SECBOOTADD[31:8]	Flash: 0x0C00 0000
	1	NA	Bootloader	Bootloader
Provisioning	x	NA	RSS	RSS
Provisioned, TZ_Closed, Closed, Locked	x	SECBOOTADD[31:8]	Boot address defined by user option byte SECBOOTADD[31:8]	Flash: 0x0C00 0000

Note: The BOOT_UBE is available only on STM32H533/53/73xx devices. Refer to Section 4.2.

When TrustZone is enabled (TZEN = 0xB4), the boot space must be in secure area. The SECBOOTADD0[24:0] option bytes are used to select the boot secure memory address. A unique boot entry option can be selected by setting the SECBOOT_LOCK option bit.

4.2 STM32H533/53/73xx boot modes

Table 27 and *Table 28* provide the detail of the boot mode products when the TrustZone is, respectively, disabled (TZEN = 0xC3) and enabled (TZEN = 0xB4).

Table 27. Boot mode when TrustZone is disabled (TZEN = 0xC3) - STM32H533/53/73xx devices

PRODUCT_STATE	BOOT0 pin	BOOT_UBE FLASH_OPTSR [29:22]	Boot address option-byte selection	Boot area	ST programmed default value
Open	0	NA	NSBOOTADD[31:8]	Boot address defined by user option byte NSBOOTADD[31:8]	Flash: 0x0800 0000
	1	NA	NA	Bootloader	Bootloader
Provisioning	x	NA	NA	RSS	RSS
Provisioned, Closed, Locked	x	NA	NSBOOTADD[31:8]	Boot address defined by user option byte NSBOOTADD[31:8]	Flash: 0x0800 0000

Table 28. Boot mode when TrustZone is enabled (TZEN = 0xB4) - STM32H533/53/73xx devices

PRODUCT_STATE	BOOT0 pin	BOOT_UBE FLASH_OPTSR [29:22]	Boot address option-byte selection	Boot area	ST programmed default value
Open	0	x	SECBOOTADD [31:8]	Boot address defined by user option byte SECBOOTADD[31:8]	Flash: 0x0C00 0000
	1	0xB4	NA	Bootloader	Bootloader
	1	0xC3	NA	STiRoT	STiRoT
Provisioning	x	NA	NA	RSS	RSS
Provisioned, TZ_Closed, Closed, Locked	x	0xC3	STiRoT	STiRoT	STiRoT
		0xB4	SECBOOTADD [31:8]	Boot address defined by user option byte SECBOOTADD[31:8]	Flash: 0x0C00 0000

When TrustZone is enabled (TZEN = 0xB4), the boot space must be in a secure area. The SECBOOTADD[24:0] option bytes are used to select the boot secure memory address. A unique boot entry option can be selected by setting the SECBOOT_LOCK option bit.

5 Global TrustZone® controller (GTZC)

5.1 GTZC introduction

The global TrustZone controller (GTZC) block contains the following subblocks:

- **TZSC**: TrustZone security controller

  Defines the secure/privileged state of slave peripherals, and controls the subregion area size and properties for the watermark memory peripheral controller (MPCWM). The TZSC informs some peripherals (such as RCC or GPIOs) about the secure status of each securable peripheral, by sharing with RCC and I/O logic.
- **MPCBB**: memory protection controller - block based

  Configures the internal RAM in a TrustZone-system product having segmented SRAM (pages of 512 bytes) with programmable-security and privileged attributes.
- **TZIC**: TrustZone illegal access controller

  Gathers all illegal access events in the system, and generates secure interrupts towards NVIC.

These subblocks are used to configure TrustZone system security in a product having bus agents with programmable-security and privileged attributes such as:

- on-chip RAM with programmable secure and/or privileged blocks (pages)
- AHB and APB peripherals with programmable security and/or privileged access
- off-chip memories with secure and/or privileged areas

5.2 GTZC main features

- Three independent 32-bit AHB interfaces for TZSC, TZIC, and MPCBB
- TZIC accessible only with secure transactions
- Secure and nonsecure access supported for privileged and unprivileged parts of TZSC and MPCBB
- Set of registers to define product security settings:
  - Secure/privileged blocks for internal SRAMs
  - Secure/privileged regions for external memories and internal backup SRAM
  - Secure/privileged access mode for securable peripherals
  - Secure/privileged access mode for securable masters

GTZC TrustZone system architecture

The Armv8-M supports security per TrustZone-M model with isolation between:

- a secure world, where usually security sensitive applications are run and critical resources are located
- a nonsecure or public world (such as the usual non secure operating system and user space)

The TrustZone architecture is extended beyond AHB and Armv8-M with:

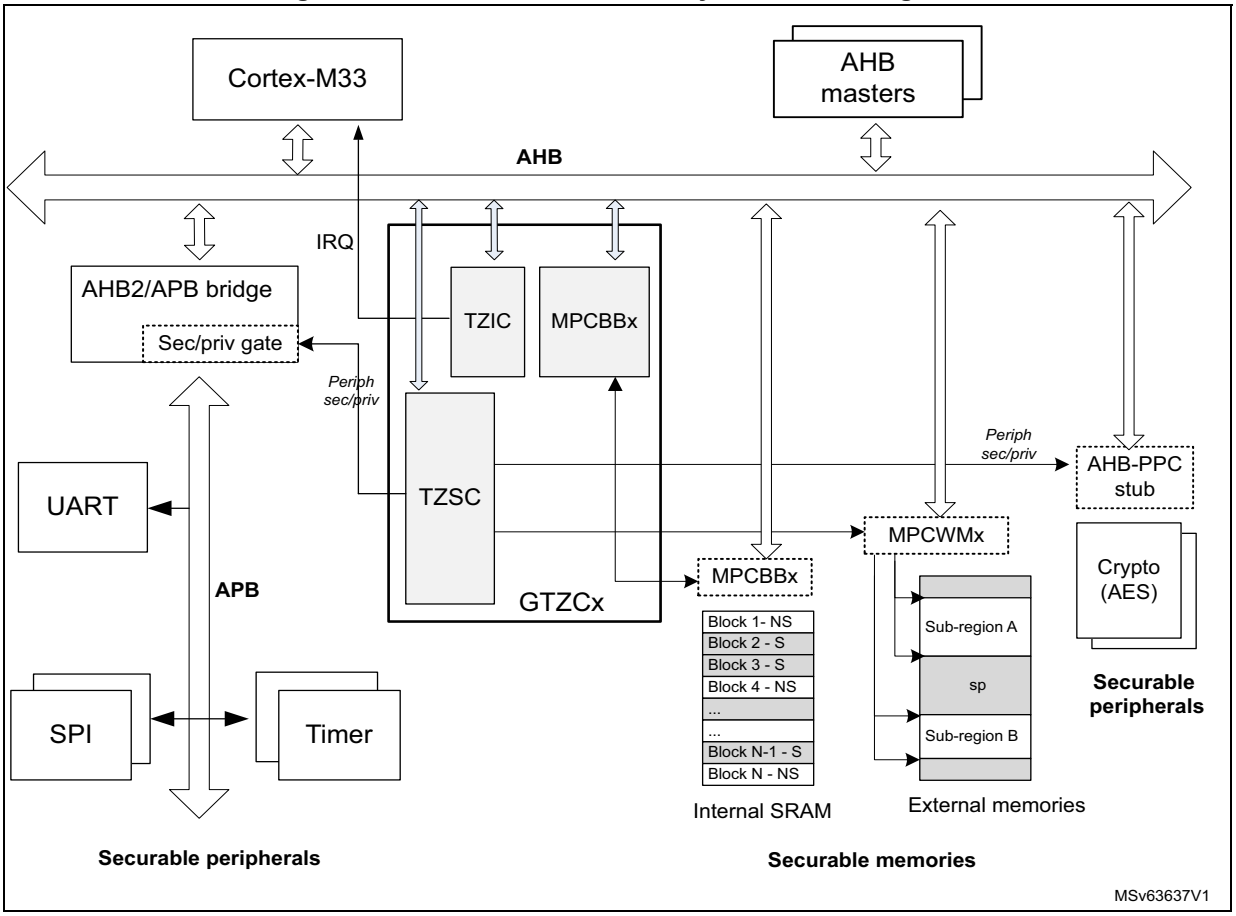
- AHB/APB bridge used as secure gate to block or propagate secure/nonsecure and privileged/unprivileged transaction towards APB agents

- PPC (peripheral protection controller) used as secure gate to block or propagate secure/nonsecure and privileged/unprivileged transaction towards AHB agents
- TrustZone block-based MPC firewalls used as secure gate to filter secure/nonsecure, privileged/unprivileged access towards internal SRAMs
- TrustZone watermark MPC firewalls used as secure gate to filter secure/nonsecure, privileged/unprivileged access towards external memories

AHB and APB peripherals can be categorized as:

- **privileged**: peripherals protected by an AHB/APB firewall stub controlled from TZSC to define privilege properties
- **secure**: peripherals always protected by an AHB/APB firewall stub, always secure (such as TZIC)
- **securable**: peripherals protected by an AHB/APB firewall stub that is controlled from TZSC to define security properties (optional)
- **nonsecure and unprivileged:** peripherals connected directly to AHB/APB interconnect without any secure gate
- **TrustZone-aware**: peripherals connected directly to the AHB or APB bus and implementing a specific TrustZone behavior (such as a subset of registers being secure). TrustZone-aware AHB masters always drive HNONSEC signal according to their security mode (such as Armv8-M core or DMA)

AHB securable masters can be configured in the TZSC to be secure/nonsecure and/or privileged/unprivileged.



Application information

The TZSC, MPCBB, and TZIC can be used in one of the following ways:

- programmed only during secure boot, locked and not changed afterwards
- dynamically re-programmed when using specific application code or secure kernel (microvisor). When not locked, MPC secure blocks or region size can be changed by secure software executing from the secure FLASH region or secure SRAM. The same applies to the GTZC1_TZSC_SECCFGRx/PRIVCFGRx registers that define the secure/privileged state of each peripheral.

The Armv8-M security architecture with secure, securable, and TrustZone-aware peripherals is shown in *Figure 17*.

Figure 17. GTZC in Armv8-M subsystem block diagram

5.3 GTZC implementation

The STM32H5 devices embed one instance of GTZC.

Table 29. GTZC features

GTZC subblocks	GTZC1
TZSC	X
TZIC	X
MPCBB subblock (number of MPCBBs)	X (3)

Table 30 shows the address offset of GTZC subblocks versus GTZC base address (refer to *Section 2.3* for GTZC1 base address).

Table 30. GTZC1 subblock address offset

GTZC1 subblock	Address offset

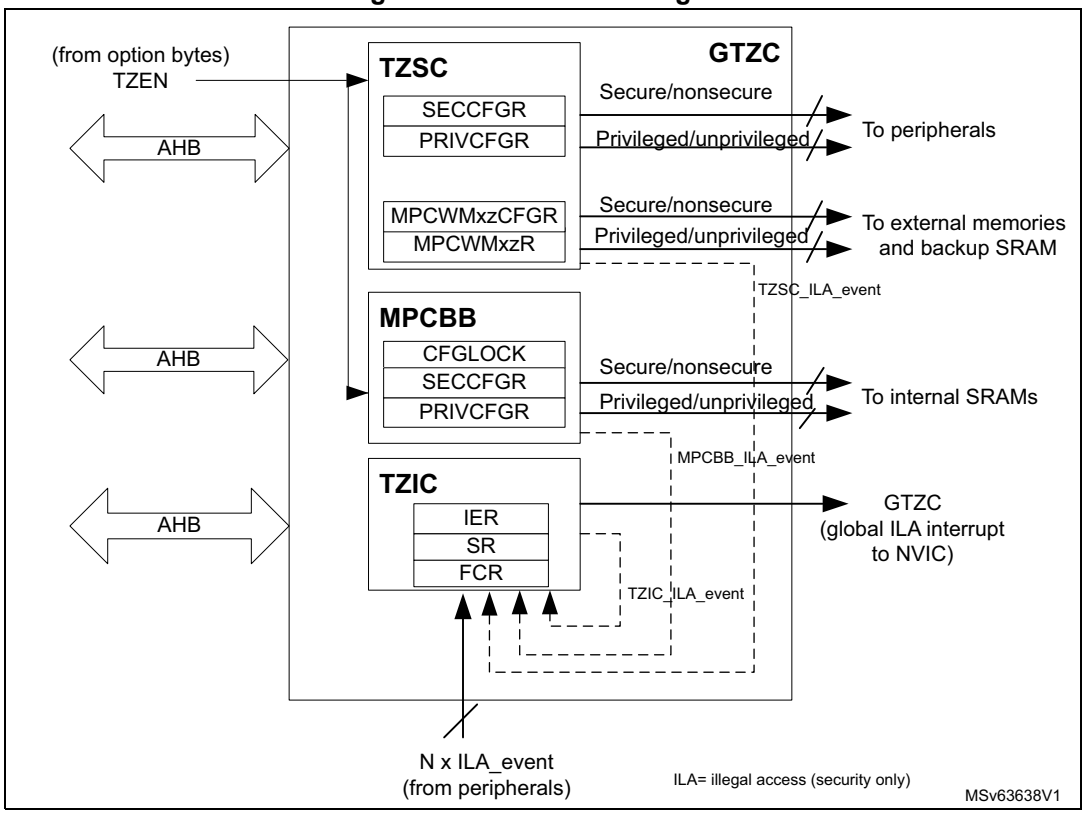
	MPCBB3	SRAM3	64		128	4

5.4 GTZC functional description

5.4.1 GTZC block diagram

Figure 18 describes the combined feature of TZSC, MPCBB, and TZIC. Each subblock is controlled by its own AHB configuration port.



The TZSC defines which peripheral is secure and/or privileged. The privileged configuration bit of a peripheral can be modified by a secure privileged transaction when the peripheral is configured as secure. Otherwise, a privileged transaction (nonsecure) is sufficient.

On the opposite, the secure configuration bit of a peripheral can be modified only with a secure privileged transaction if the peripheral is configured as privileged. Otherwise, a secure transaction (unprivileged) is sufficient.

The secure configuration bit of a given RAM block can be modified only with a secure privileged transaction if the same block is configured as privileged. Otherwise, a secure transaction (unprivileged) is sufficient.

The TZIC gathers illegal events generated within the system when an illegal access is detected. TZIC can then generate a secure interrupt towards the CPU if needed.

Figure 18. GTZC block diagram

5.4.2 Illegal access definition

Three different types of illegal access exist:

- Illegal nonsecure access

  Any nonsecure transaction trying to write a secure resource is considered as illegal, hence the addressed resource generates an illegal access interrupt for illegal write access and a bus error for illegal fetch access. There are some exceptions on secure and privileged configuration registers: the latter ones authorize non secure read access to secure registers (see GTZC1_TZSC_SECCFGRx/GTZC1_TZSC_PRIVCFGRx).

- Illegal secure access

  Any secure transaction trying to access nonsecure block in internal block-based SRAM or watermarked memory is considered as illegal.

  A correct TZIC setting allows the capture of the associated event and then generates the GTZC_IRQn interrupt to the NVIC. This applies for read, write, and execute access.

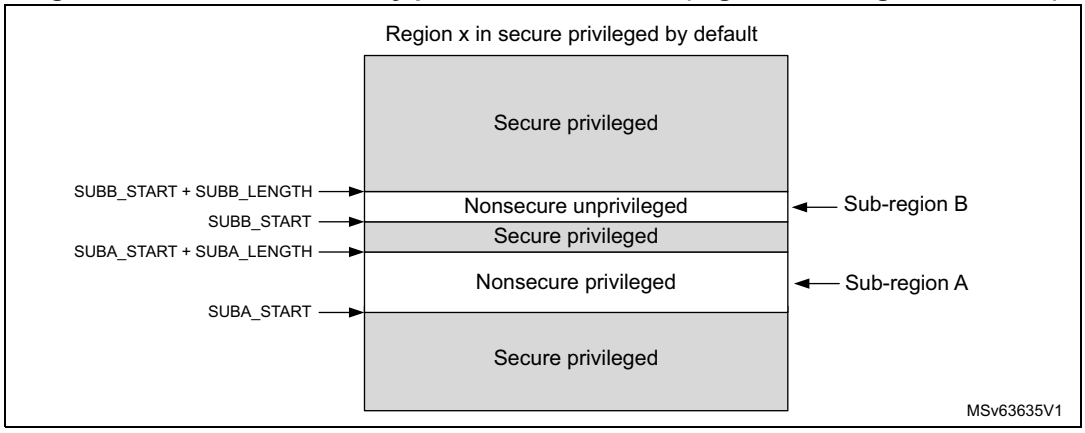
  Concerning the MPCBB controller, there is an option to ignore secure data read/write access on nonsecure SRAM blocks, by setting the SRWILADIS bit in the GTZC1_MPCBBz_CR register. Secure read and write data transactions are then

allowed on nonsecure SRAM blocks, while secure execution access remains not allowed.

Any secure execute transaction trying to access a nonsecure peripheral register is considered as illegal and generates a bus error.

- Illegal unprivileged access

  Any unprivileged transaction trying to access a privileged resource is considered as illegal. There is no illegal access event generated for illegal read and write accesses. The addressed resource follows a silent-fail behavior, returning all 0 data for read and ignoring any write. No bus error is generated. A bus error is generated when an unprivileged execute transaction tries to access a privileged memory.



5.4.3 TrustZone security controller (TZSC)

The TZSC is composed of a configurable set of registers, providing the following features:

- Control of secure and privileged state for all peripherals, done through:
  - GTZC1_TZSC_SECCFGRx registers to control AHB/APB firewall stubs for the securable peripherals
  - GTZC1_TZSC_PRIVCFGRx registers to control AHB/APB firewall stubs for the privileged peripherals
- For watermark memory protection controller (external memories and backup SRAM), two independent regions can be defined and the following fields are used to program:
  - the start of the first protected subregion on the external memory/backup SRAM: SUBA_START[10:0]
  - the length of the first protected subregion on the external memory/backup SRAM: SUBA_LENGTH[11:0]
  - the start of the second protected subregion on the external memory/backup SRAM: SUBB_START[10:0]
  - the length of the second protected subregion on the external memory/backup SRAM: SUBB_LENGTH[11:0]

A control register for each subregion can be used to enable/disable the watermark memory protection controller, and to define the right attributes of each subregion.

Figure 19. Watermark memory protection controller (region x/subregions A and B)

In *Figure 19*, region x represents the external memory or backup SRAM region (such as FMC bank, OCTOSPI1, or BKPSRAM). Secure and privileged attributes of subregions A

and B are independently configurable. When no subregions are defined or enabled on the region x, the default attribute of the region x is set as secure-privileged.

The following tables describe the secure/privileged properties of the common area of subregions A and B, when an overlap exists.

Table 36. Secure properties of subregions A and B

Subregion A	Subregion B	Properties of overlapped region A and B
Nonsecure	Nonsecure	Nonsecure
Nonsecure	Secure	Nonsecure
Secure	Nonsecure	Nonsecure
Secure	Secure	Secure

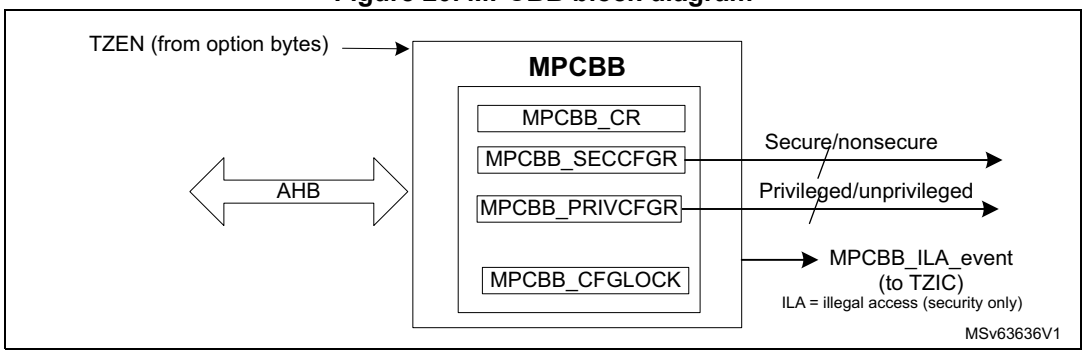


Table 37. Privileged properties of subregions A and B

Subregion A	Subregion B	Properties of overlapped region A and B
Unprivileged	Unprivileged	Unprivileged
Unprivileged	Privileged	Unprivileged
Privileged	Unprivileged	Unprivileged
Privileged	Privileged	Privileged

5.4.4 Memory protection controller - block based (MPCBB)

The MPCBB is composed of a configurable set of registers allowing to define security and privileged policy for internal SRAMs. The security and privileged policy can be individually configured per each 512-byte block.

Figure 20. MPCBB block diagram

To set up the MPCBB, the following actions are needed (for example at boot time):

- Secure firmware must define which memory blocks are secure by setting the correct bits in GTZC1_MPCBBz_SECCFGRx.
- Privileged firmware must define which memory blocks are privileged by setting the correct bits in GTZC1_MPCBBz_PRIVCFGRx.

An MPCBB super-block is made of 32 consecutive blocks. For each super-block, secure application can lock all related security/privileged bits using the correct bits in GTZC1_MPCBBz_CFGLOCK. This lock remains active until the next system reset.

*Note: The block size is 512 bytes. The super-block size is 512 * 32 = 16 Kbytes.*

5.4.5 TrustZone illegal access controller (TZIC)

The TZIC concentrates all illegal access source events. It is used only when the system is TrustZone enabled (TZEN = 0xB4).

TZIC allows to trace (flag) the event that triggered the secure illegal access interrupt. Register masks (GTZC1_TZIC_IERx) are available to filter unwanted event. On an unmasked illegal event, TZIC generates the GTZC_IRQn interrupt to the NVIC.

For each illegal event source, a status flag and a clear bit exist (respectively within GTZC1_TZIC_SRx and GTZC1_TZIC_FCRx). The reset value of mask registers (GTZC1_TZIC_IERx) is such that all events are masked.

5.4.6 Power-on/reset state

The power-on and reset state of the TZSC clear to 0 all bits of GTZC1_TZSC_SECCFGRx and GTZC1_TZSC_PRIVCFGRx, meaning that all securable peripherals are respectively set to nonsecure and unprivileged.

For internal SRAMx (x = 1 to 3), all GTZC1_MPCBBz_SECCFGRx and GTZC1_MPCBBz_PRIVCFGRx are set:

- to 0xFFFF FFFF, making these internal memories block secure and privileged by default when TrustZone security is enabled at system level (TZEN = 0xB4)
- to 0x0000 0000, making these internal memories block nonsecure and unprivileged by default when TrustZone security is disabled at system level (TZEN = 0xC3)

For external memories and backup SRAM, GTZC1_TZSC_MPCWMxzR registers are set:

- to 0x0000 0000, making these memories secure and privileged by default when TrustZone security is enabled a system level (TZEN = 0xB4).
- to 0x0800 0000, making these memories nonsecure and unprivileged by default when TrustZone security is disabled at system level (TZEN = 0xC3)

Secure boot code can then program the security settings, making components secure or not as needed.

5.5 GTZC interrupts

TZIC is a secure peripheral, thus it systematically generates an illegal access event when accessed by a nonsecure access. The MPCBB and TZSC are TrustZone-aware peripherals, meaning that secure and nonsecure registers coexist within the peripheral.

Table 38. GTZC interrupt request

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit Sleep mode	Exit Stop mode	Exit Standby mode
GTZC	Illegal access	All flags in GTZC1_TZIC_SRx	All bits in GTZC1_TZIC_IERx	Write 1 in the bit GTZC1_TZIC_FCRx	Yes	Yes	No

5.6 GTZC1 TZSC registers

All registers are accessed only by words (32-bit).

5.6.1 GTZC1 TZSC control register (GTZC1_TZSC_CR)

Address offset: 0x000

Reset value: 0x0000 0000

Secure privileged access only.

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **LCK**: lock the configuration of GTZC1_TZSC_SECCFGRx and GTZC1_TZSC_PRIVCFGRx until next reset

This bit is cleared by default, and once set, it cannot be reset until system reset.

0: configuration of all GTZC1_TZSC_SECCFGRx and GTZC1_TZSC_PRIVCFGRx not locked

1: configuration of all GTZC1_TZSC_SECCFGRx and GTZC1_TZSC_PRIVCFGRx locked

5.6.2 GTZC1 TZSC secure configuration register 1 (GTZC1_TZSC_SECCFGR1)

Address offset: 0x010

Reset value: 0x0000 0000

Write-secure access only.

This register can be written only by a secure privileged transaction when the corresponding GTZC1_TZSC_PRIVCFGR signal is set to 1. If a given PRIV bit is not set, the equivalent SEC bit can be written by secure unprivileged transaction.

Read accesses are authorized for any type of transactions, secure or not, privileged or not.

Refer to the device datasheet for the peripheral availability. If not present, consider the associated bit as reserved, and keep it at reset value.

5.6.3 GTZC1 TZSC secure configuration register 2 (GTZC1_TZSC_SECCFGR2)

Address offset: 0x014

Reset value: 0x0000 0000

Write-secure access only.

This register can be written only by a secure privileged transaction when the corresponding GTZC1_TZSC_PRIVCFGR signal is set to 1. If a given PRIV is not set, the equivalent SEC bit can be written by a secure unprivileged transaction.

Read accesses are authorized for any type of transactions, secure or not, privileged or not.

Refer to the device datasheet for the peripheral availability. If not present, consider the associated bit as reserved, and keep it at reset value.

1: privileged

5.6.8 GTZC1 TZSC memory x subregion A watermark configuration register (GTZC1_TZSC_MPCWMxACFGR)

Address offset: 0x40 + 0x10 *(x - 1) (x = 1 to 4)

Reset value: 0x0000 0000

Secure privilege access only.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	PRIV	SEC	Res.	Res.	Res.	Res.	Res.	Res.	SRLOCK	SREN
						rw	rw							rs	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **PRIV**: Privileged subregion A of base region x
This bit is taken into account only if SREN is set.
0: Privileged and unprivileged accesses are granted in subregion A.
1: Only privileged accesses are granted in subregion A of region x.

Bit 8 **SEC**: Secure subregion A of base region x
This bit is taken into account only if SREN is set.
0: Only nonsecure data accesses are granted to subregion A of region x.
1: Only secure data accesses are granted to subregion A of region x.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **SRLOCK**: Subregion A lock
This bit, once set, can be cleared only by a system reset.
0: GTZC1_TZSC_MPCWMxCFGR, GTZC1_TZSC_MPCWMxAR and GTZC1_TZSC_MPCWMxBR can be written.
1: Writes to GTZC1_TZSC_MPCWMxCFGR, GTZC1_TZSC_MPCWMxAR and GTZC1_TZSC_MPCWMxBR are ignored.

Bit 0 **SREN**: Subregion A enable

0: subregion A is disabled. Access control of base region x applies to any access between this subregion start- and end-addresses.

1: subregion A of region x is enabled. Access control defined in GTZC1_TZSC_MPCWMx_CFGR applies to any access between this subregion start- and end-addresses, defined in GTZC1_TZSC_MPCWMxAR and GTZC1_TZSC_MPCWMxBR.

Note: Watermark controlled external memories start fully nonsecure/unprivileged at reset when TZEN = 0xC3. When TZEN = 0xB4, they start fully secure/fully privileged (inverted reset-value).

5.6.9 GTZC1 TZSC memory x subregion A watermark register (GTZC1_TZSC_MPCWMxAR)

Address offset: 0x44 + 0x10 *(x - 1) (x = 1 to 4)

Reset value: 0x0000 0000

The given reset value is valid when TZEN = 0xB4. The reset value is 0x0800 0000 when TZEN = 0xC3.

Secure privilege access only.

When SUBA_START + SUBA_LENGTH is higher than the maximum size allowed for the memory, a saturation of SUBA_LENGTH is applied automatically.

When an overlap of subregion A and B exists, secure/privileged attributes of both subregions apply on the common section (see *Section 5.4.3*)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	SUBA_LENGTH[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	SUBA_START[10:0]										
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **SUBA_LENGTH[11:0]**: Length of subregion A in region x

This field defines the length of the subregion A, to be multiplied by the granularity defined in *Table 31*.

When SUBA_START + SUBA_LENGTH is higher than the maximum size allowed for the memory, a saturation of SUBA_LENGTH is applied automatically. If SUBA_LENGTH = 0, subregion A is disabled (SREN bit in GTZC1_TZSC_MPCMWxACFGR is cleared).

Bits 15:11 Reserved, must be kept at reset value.

Bits 10:0 **SUBA_START[10:0]**: Start of subregion A in region x

This field defines the address offset of the subregion A, to be multiplied by the granularity defined in *Table 31*, versus the start of the region x.

Watermark controlled external memories start fully nonsecure at reset when TZEN = 0xC3. When TZEN = 0xB4, they start fully secure (inverted reset value).

5.6.10 GTZC1 TZSC memory x subregion B watermark configuration register (GTZC1_TZSC_MPCWMxBCFGR)

Address offset: 0x48 + 0x10 *(x - 1) (x = 1 to 4)

Reset value: 0x0000 0000

Secure privilege access only.

						rw	rw							rs	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **PRIV**: Privileged subregion B of base region x

This bit is taken into account only if SREN is set.

0: Privileged and unprivileged accesses are granted in subregion A.

1: Only privileged accesses are granted in subregion A of region x.

Bit 8 **SEC**: Secure subregion B of base region x

This bit is taken into account only if SREN is set.

0: Only nonsecure data accesses are granted to subregion A of region x.

1: Only secure data accesses are granted to subregion A of region x.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **SRLOCK**: Subregion B lock

This bit, once set, can be cleared only by a system reset.

0: GTZC1_TZSC_MPCWMxCFGR, GTZC1_TZSC_MPCWMxAR and GTZC1_TZSC_MPCWMxBR can be written.

1: Writes to GTZC1_TZSC_MPCWMxCFGR, GTZC1_TZSC_MPCWMxAR and GTZC1_TZSC_MPCWMxBR are ignored.

Bit 0 **SREN**: Subregion B enable

0: subregion B is disabled. Access control of base region x applies to any access between this subregion start- and end-addresses.

1: subregion B of region x is enabled. Access control defined in GTZC1_TZSC_MPCWMx_CFGR applies to any access between this subregion start- and end-addresses, defined in GTZC1_TZSC_MPCWMxAR and GTZC1_TZSC_MPCWMxBR.

Note: Watermark controlled external memories start fully nonsecure/unprivileged at reset when TZEN = 0xC3. When TZEN = 0xB4, they start fully secure/fully privileged (inverted reset-value).

5.6.11 GTZC1 TZSC memory x subregion B watermark register (GTZC1_TZSC_MPCWMxBR)

Address offset: 0x4C + 0x10 *(x - 1) (x = 1 to 4)

Reset value: 0x0000 0000

The given reset value is valid when TZEN = 0xB4. The reset value is 0x0800 0000 when TZEN = 0xC3.

Secure privilege access only.

When SUBB_START + SUBB_LENGTH is higher than the maximum size allowed for the memory, a saturation of SUBB_LENGTH is applied automatically.

When an overlap of subregion A and B exists, secure/privileged attributes of both subregions apply on the common section (see *Section 5.4.3*)

Refer to *Table 30: GTZC1 subblock address offset*.

5.7 GTZC1 TZIC registers

All registers are accessed only by words (32-bit).

5.7.1 GTZC1 TZIC interrupt enable register 1 (GTZC1_TZIC_IER1)

Address offset: 0x000

Reset value: 0x0000 0000

Secure privileged access only.

This register is used to enable interrupt of illegal access.

Refer to the device datasheet for the peripheral availability. If not present, consider the associated bit as reserved, and keep it at reset value.

5.7.2 GTZC1 TZIC interrupt enable register 2 (GTZC1_TZIC_IER2)

Address offset: 0x004

Reset value: 0x0000 0000

Secure privileged access only.

This register is used to enable interrupt of illegal access.

Refer to the device datasheet for the peripheral availability. If not present, consider the associated bit as reserved, and keep it at reset value.

5.7.3 GTZC1 TZIC interrupt enable register 3 (GTZC1_TZIC_IER3)

Address offset: 0x008

Reset value: 0x0000 0000

Secure privileged access only.

This register is used to enable interrupt of illegal access.

Refer to the device datasheet for the peripheral availability. If not present, consider the associated bit as reserved, and keep it at reset value.

Bit 24 **SRAM1F**: illegal access flag for SRAM1
0: no illegal access event
1: illegal access event

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **BKPSRAMF**: illegal access flag for MPCWM4 (BKPSRAM) memory bank
0: no illegal access event
1: illegal access event

Bit 19 **FMC_MEMF**: illegal access flag for MPCWM2 (FMC_NOR bank), MPCWM3 (FMC_NAND bank and FMC_SDRAM bank 1), and MPCWM4 (FMC_SDRAM bank 2)
0: no illegal access event
1: illegal access event

Bit 18 **OCTOSPI1_MEMF**: illegal access flag for MPCWM1 (OCTOSPI1) memory bank
0: no illegal access event
1: illegal access event

Bit 17 **TZIC1F**: illegal access flag for GTZC1 TZIC registers
0: no illegal access event
1: illegal access event

Bit 16 **TZSC1F**: illegal access flag for GTZC1 TZSC registers
0: no illegal access event
1: illegal access event

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **PLAY1F**: illegal access flag for PLAY1
0: no illegal access event
1: illegal access event

Bit 11 **EXTIF**: illegal access flag for EXTI
0: no illegal access event
1: illegal access event

Bit 10 **RCCF**: illegal access flag for RCC
0: no illegal access event
1: illegal access event

Bit 9 **PWRF**: illegal access flag for PWR
0: no illegal access event
1: illegal access event

Bit 8 **TAMPF**: illegal access flag for TAMP
0: no illegal access event
1: illegal access event

Bit 7 **RTCF**: illegal access flag for RTC
0: no illegal access event
1: illegal access event

Bit 6 **SBSF**: illegal access flag for SBS
0: no illegal access event
1: illegal access event

Bit 5 Reserved, must be kept at reset value.

Bit 4 **OTFDEC1F**: illegal access flag for OTFDEC1
0: no illegal access event
1: illegal access event

Bit 3 **FLASHF**: illegal access flag for FLASH memory
0: no illegal access event
1: illegal access event

Bit 2 **FLASH_REGF**: illegal access flag for FLASH registers
0: no illegal access event
1: illegal access event

Bit 1 **GPDMA2F**: illegal access flag for GPDMA2
0: no illegal access event
1: illegal access event

Bit 0 **GPDMA1F**: illegal access flag for GPDMA1
0: no illegal access event
1: illegal access event

5.7.9 GTZC1 TZIC flag clear register 1 (GTZC1_TZIC_FCR1)

Address offset: 0x020

Reset value: 0x0000 0000

Secure privileged access only.

Refer to the device datasheet for the peripheral availability. If not present, consider the associated bit as reserved, and keep it at reset value.

Refer to *Table 30: GTZC1 subblock address offset*.

5.8 GTZC1 MPCBBz registers (z = 1 to 3)

All registers are accessed only by words (32-bit).

5.8.1 GTZC1 SRAMz MPCBB control register (GTZC1_MPCBBz_CR) (z = 1 to 3)

Address offset: 0x000

Reset value: 0x0000 0000

Secure privileged access only.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

															rs

Bit 31 **SRWILADIS**: secure read/write illegal access disable

This bit disables the detection of an illegal access when a secure read/write transaction access a nonsecure blocks of the block-based SRAM (secure fetch on nonsecure block is always considered illegal).

0: enabled, secure read/write access not allowed on nonsecure SRAM block

1: disabled, secure read/write access allowed on nonsecure SRAM block

Bit 30 **INVSECSTATE**: SRAMx clocks security state

This bit is used to define the internal SRAMs clocks control in RCC as secure or not.

0: SRAMs clocks are secure if a secure area exists in the MPCBB. It is non secure if there is no secure area.

1: SRAMs clocks are nonsecure even if a secure area exists in the MPCBB, and secure even if no secure block is set in the MPCBB.

Bits 29:1 Reserved, must be kept at reset value.

Bit 0 **GLOCK**: lock the control register of the MPCBB until next reset

This bit is cleared by default, and once set, it cannot be reset until system reset.

0: control register not locked

1: control register locked

5.8.2 GTZC1 SRAMz MPCBB configuration lock register 1 (GTZC1_MPCBBz_CFGLOCK1) (z = 1 to 3)

Address offset: 0x010

Reset value: 0x0000 0000

Secure privileged access only.

rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:0 **SPLCKy**: Security/privilege configuration lock for super-block (y = 31 to 0)
This bit is set by software and can be cleared only by system reset.
0: GTZC1_MPCBBz_SECCFGRy and GTZC1_MPCBBz_PRIVCFGRy can be written.
1: Writes to GTZC1_MPCBBz_SECCFGRy and GTZC1_MPCBBz_PRIVCFGRy are ignored

5.8.3 GTZC1 SRAMz MPCBB security configuration for super-block x register (GTZC1_MPCBBz_SECCFGRx) (z = 1 to 3)

Address offset: 0x100 + 0x4 * x, (x = 0 to 31)

Reset value: 0xFFFF FFFF

The given reset value is valid when TZEN = 0xB4. The reset value is 0x0000 0000 when TZEN = 0xC3.

Write access to this register is secure only. Any read is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SECy**: Security configuration for block y (y = 31 to 0)
0: Nonsecure access only to block y, belonging to super-block x. Secure access is also allowed if the SRWILADIS bit is set in GTZC1_MPCBBz_CR.
1: Secure access only to block y, belonging to super-block x.
Unprivileged write to this bit is ignored if PRIVy bit is set in GTZC1_MPCBBz_PRIVCFGRx.
Writes are ignored if SPLCKx bit is set in GTZC1_MPCBBz_CFGLOCK.

5.8.4 GTZC1 SRAMz MPCBB privileged configuration for super-block x register (GTZC1_MPCBBz_PRIVCFGRx) (z = 1 to 3)

Address offset: 0x200 + 0x4 * x, (x = 0 to 31)

Reset value: 0xFFFF FFFF

The given reset value is valid when TZEN = 0xB4. The reset value is 0x0000 0000 when TZEN = 0xC3. Write access to this register is privileged only. Any read is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PRIVy**: Privileged configuration for block y, belonging to super-block x (y = 31 to 0).
0: Privileged and unprivileged access to block y, belonging to super-block x
1: Only privileged access to block y, belonging to super-block x
Nonsecure write to this bit is ignored if SECy bit is set in GTZC1_MPCBBz_SECCFGRx.
Writes are ignored if SPLCKx bit is set in GTZC1_MPCBBz_CFGLOCK.

5.8.5 GTZC1 MPCBBz register map (z = 1 to 3)

Table 41. GTZC1 MPCBBz register map and reset values (z = 1 to 3)

Refer to *Table 30: GTZC1 subblock address offset*.

6 RAMs configuration controller (RAMCFG)

6.1 RAMCFG introduction

The RAMCFG configures the features of the internal SRAMs (SRAM1, SRAM2, SRAM3, and BKPSRAM).

6.2 RAMCFG main features

The internal SRAMs support the features listed hereafter, configured in RAMCFG:

- Error code correction (ECC):
  - Single error detection and correction with interrupt generation
  - Double error detection with interrupt or NMI generation
  - Status with failing address
- Write protection (1-Kbyte granularity)
- SRAM software erase

6.3 RAMCFG functional description

6.3.1 Internal SRAMs features

Four SRAMs are embedded in the devices, each with specific features:

- SRAM1, SRAM2, SRAM3 are the main SRAMs (see *Table 42*), made of several blocks that can be powered down in Stop mode to reduce consumption.
- The backup SRAM (BKPSRAM) can be retained in all low-power modes and when V_{DD} is off in VBAT mode. Refer to *Section 10: Power control (PWR)* for more details.
- SRAM2 is erased when a system reset occurs if the SRAM2_RST option bit is selected in the flash memory user option bytes. SRAM1 and SRAM3 are erased when a system reset occurs if the SRAM13_RST option bit is selected in the flash memory user option bytes. Refer to *Section 7: Embedded flash memory (FLASH)* for more details.
- SRAM2 and (optionally) backup SRAM are protected by the tamper detection circuit, and are erased by hardware in case of tamper detection. Refer to *Section 52: Tamper and backup registers (TAMP)* for more details.
- The RAMCFG embeds the registers related to the internal SRAMs ECC, write protection and software erase.

Table 42. SRAMs density (Kbytes)

Products	SRAM1	SRAM2	SRAM3
STM32H562/63/73xx	256	64	320
STM32H523/33xx	128	80	64
STM32H543/53xx	128	80	96

Table 43 summarizes the features supported by each internal SRAM.

Table 43. Internal SRAMs features

SRAM feature	SRAM1	SRAM2	SRAM3	BKPSRAM
Optional retention in Standby mode	-	-	-	X
Optional retention in VBAT mode	-	-	-	X
Optional retention in Stop mode	X	X	X	X
Erased with product state regression	X	X	X	X
Erased with tamper detection	-	X	-	X(1)
Erased with Backup domain reset	-	-	-	X
Optionally erased with system reset	X	X	X	-
Software erase	X	X	X	X
ECC	-	X	X(2)	X
Write protection	-	X	-	-

1. Optional: BKPSRAM can be configured to be erased or not on tamper detection.
2. Not available on STM32H523/33xx devices.

6.3.2 Error code correction (SRAM2, SRAM3, BKPSRAM)

The ECC is supported by SRAM2, SRAM3[a] and BKPSRAM when enabled with the SRAM2_ECC, SRAM3_ECC[b] and BKPRAM_ECC user option bits. Refer to *Section 7: Embedded flash memory (FLASH)* for more details.

Seven ECC bits are added per 32 bits of SRAM, allowing two bits error detection and one bit error correction on memory read access.

As the ECC is calculated and checked for a 32-bit word, the byte and half-word write accesses are managed by the SRAM interface by first reading the whole word, then write the word again with the new byte/half-word value. ECC double errors are also detected during these byte or half-word AHB write accesses (read/modify/write done by interface). The byte or half-word write access latency is two AHB clock cycles.

Caution: In case of a byte or half-word write on SRAM with ECC, the read/modify/write operation is done in a buffer. The buffer content is written into the SRAM two AHB clock cycles after the SRAM AHB is released (when SRAM is no more accessed).

Single and double ECC errors

When a single error is detected, it is automatically corrected. SEDC and CSEDC bits are set, respectively, in the *RAMCFG memory interrupt status register (RAMCFG_MxISR)* and *RAMCFG memory x interrupt clear register x (RAMCFG_MxICR)*. The associated ECC single error address is updated only if the single error interrupt is enabled (SEIE bit of *RAMCFG memory x interrupt enable register (RAMCFG_MxIER)* is set). An interrupt is

a. Not available on STM32H523/33xx devices.

b. Refer to the device datasheet for the actual availability. If not present, consider this bit as reserved, and keep it at reset value.

generated if enabled by the SEIE bit. The failing address is stored in the *RAMCFG memory x ECC single error address register (RAMCFG_MxSEAR)* if the ALE bit is set in the *RAMCFG memory x control register (RAMCFG_MxCR)*.

Caution: Single errors cannot be detected when the SEDC bit is set.

When a double error is detected, the DED and CDED bits are set in the *RAMCFG memory interrupt status register (RAMCFG_MxISR)* and *RAMCFG memory x interrupt clear register x (RAMCFG_MxICR)*, respectively. The associated ECC double error address is updated only if double error interrupt or NMI is enabled (DEIE bit or ECCNMI bit of *RAMCFG memory x interrupt enable register (RAMCFG_MxIER)* is set). An interrupt or NMI is generated if enabled by the DEIE or ECCNMI bit in the *RAMCFG memory x interrupt enable register (RAMCFG_MxIER)*. The failing address is stored in the *RAMCFG memory x ECC double error address register (RAMCFG_MxDEAR)* if the ALE bit is set in the *RAMCFG memory x control register (RAMCFG_MxCR)*.

Caution: Double errors cannot be detected when the DED bit is set.

SRAM3 ECC specific management

On STM32H562/563/573xx devices, when the ECC is enabled for SRAM3, only the first 256 Kbytes of SRAM3 are with ECC. The next 64 Kbytes are without ECC, and the last block is used to store the ECC, hence it cannot be used by the application.

On STM32H543/553xx devices, when the ECC is enabled for SRAM3, only the first 64 Kbytes of SRAM3 are with ECC. The next 16 Kbytes are without ECC, and the last block is used to store the ECC, hence it cannot be used by the application.

Figure 21 shows the SRAM areas, when SRAM2 and SRAM3 ECC are enabled. *Figure 22* shows the SRAM areas, when SRAM2 ECC and SRAM3 are enabled. *Figure 23* shows the SRAM areas, when SRAM2 and SRAM3 ECC are enabled.

Figure 21. Memory map: SRAM1, SRAM2/3 with ECC (STM32H562/63/73xx devices)

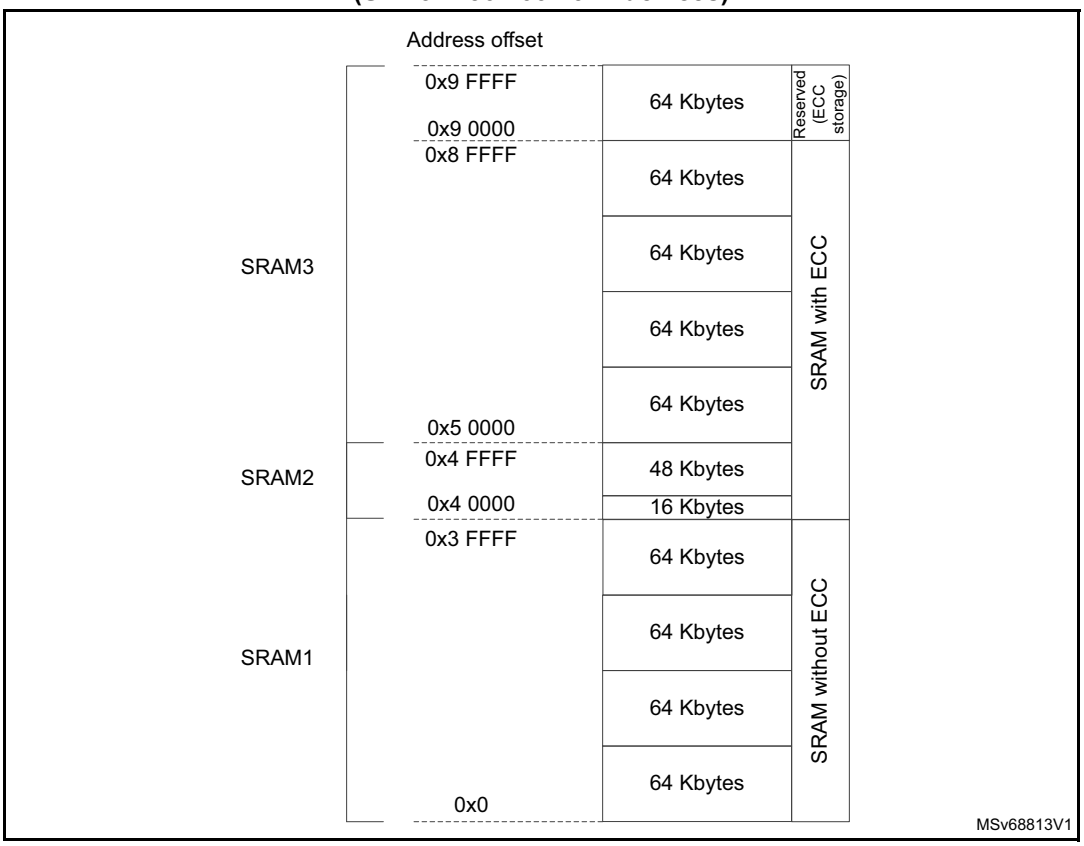

Figure 22. Memory map: SRAM1/3, SRAM2 with ECC (STM32H523/33xx devices)

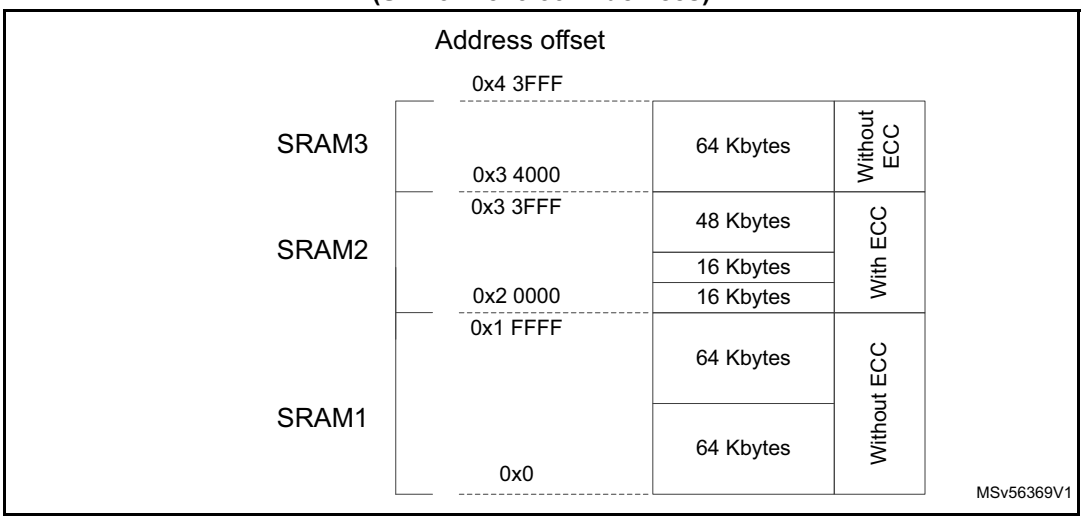

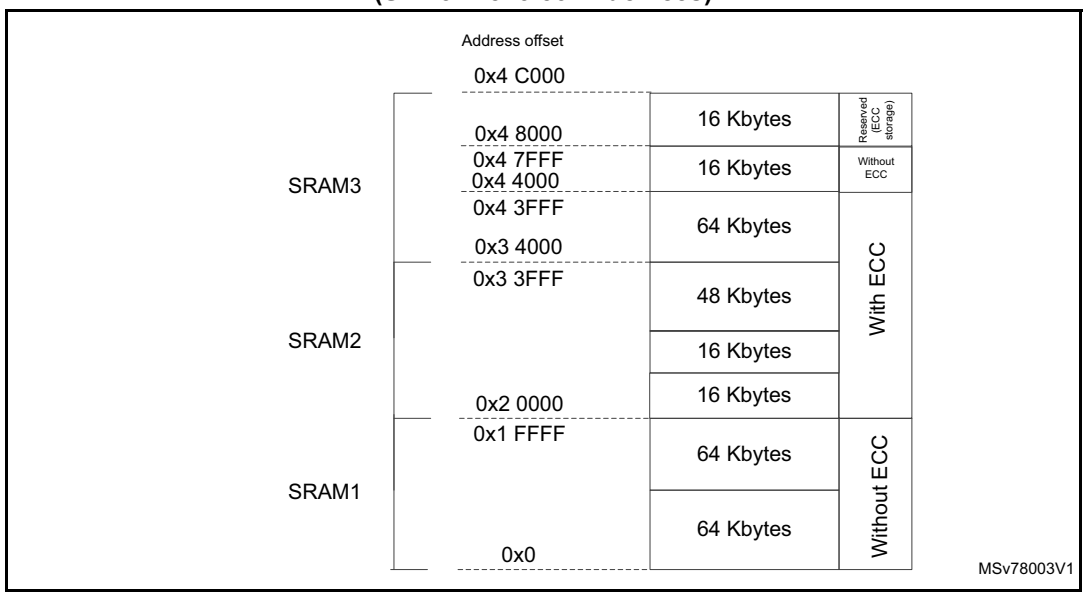

Figure 23. Memory map: SRAM1, SRAM2/3 with ECC (STM32H543/53xx devices)

When ECC is enabled by user option bits, the ECCE bit is automatically set after system reset in the related *RAMCFG memory x control register (RAMCFG_MxCR)*.

The ECC can be deactivated by executing the following software sequence:

1. Write 0xAE in the *RAMCFG memory x ECC key register (RAMCFG_MxECCKEYR)*.
2. Write 0x75 in the *RAMCFG memory x ECC key register (RAMCFG_MxECCKEYR)*.
3. Write 0 in the ECCE bit of the *RAMCFG memory x control register (RAMCFG_MxCR)*.

When ECC is deactivated (ECCE = 0), the SRAM3 ECC storage area can be read and written for ECC user test purpose. When the ECC is activated (ECCE = 1), this area is reserved for ECC storage purpose and cannot be neither read, nor written.

6.3.3 Write protection (SRAM2)

The SRAM2 is made of 1-Kbyte pages, each of them can be write-protected by setting its corresponding PxWP bit in the *RAMCFG memory 2 write protection register 1 (RAMCFG_M2WPR1)*, *RAMCFG memory 2 write protection register 2 (RAMCFG_M2WPR2)*, and *RAMCFG memory 2 write protection register 3 (RAMCFG_M2WPR3)*[a].

Table 44. SRAM2 features

Products	Page size	Number of pages	PxWP bits
STM32H562/63/73xx	1 Kbyte	64	0 to 63

a. This register is available only on STM32H523/533/543/553xx devices. If not present, consider this register as reserved, and keep its bits at reset value.

Table 44. SRAM2 features (continued)

Products	Page size	Number of pages	PxWP bits
STM32H523/33xx	1 Kbyte	80	0 to 79
STM32H543/53xx			

6.3.4 Software erase

SRAM erase can be requested by executing this software sequence:

1. Write 0xCA in the *RAMCFG memory x erase key register (RAMCFG_MxERKEYR)*.
2. Write 0x53 in the *RAMCFG memory x erase key register (RAMCFG_MxERKEYR)*.
3. Write 1 in the SRAMER bit of the *RAMCFG memory x control register (RAMCFG_MxCR)*.

SRAMBUSY flag is set in the related SRAM interrupt status register as long as the erase is ongoing.

The total duration of each SRAM erase is N AHB clock cycles, where N is the size of the SRAM in 32-bit words.

If the SRAM is read or written while an erase is ongoing, wait states are inserted on the AHB bus until the end of the operation.

6.4 RAMCFG low-power modes

Table 45. Effect of low-power modes on RAMCFG

Mode	Description
Sleep	No effect. RAMCFG interrupts cause the device to exit the Sleep mode
Stop	The content of RAMCFG registers is kept
Standby	The RAMCFG peripheral is powered down and must be reinitialized after exiting Standby

6.5 RAMCFG interrupts

Table 46. RAMCFG interrupt requests

Interrupt acronym	Interrupt event	Event flag	Enable control bit(s)	Interrupt clear method	Exit Sleep mode	Exit Stop mode	Exit Standby modes
RAMCFG	ECC single error detection and correction	SEDC	SEIE	Write 1 in CSEDC	Yes	No	No
	ECC double error detection	DED	DEIE = 1 and ECCNMI = 0	Write 1 in CDED	Yes	No	No
NMI	ECC double error detection	DED	ECCNMI	Write 1 in CDED	Yes	No	No

6.6 RAMCFG registers

In the registers described below, x refers to:

- SRAM1/2/3 when x = 1/2/3, respectively
- BKPSRAM when x = 5

6.6.1 RAMCFG memory x control register (RAMCFG_MxCR)

Address offset: 0x000 + 0x040 * (x - 1), (x = 1, 2, 3, 5)

Reset value: 0x0000 000X

ECCE reset value depends on ECC enable user option bit.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	SRAMER	Res.	Res.	Res.	ALE	Res.	Res.	Res.	ECCE
							rs				rw				rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **SRAMER**: SRAM erase

This bit can be set by software only after writing the unlock sequence in the ERASEKEY field of the RAMCFG_MxERKEYR register. Setting this bit starts the SRAM erase. This bit is automatically cleared by hardware at the end of the erase operation.

0: No erase operation on going

1: Erase operation on going

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **ALE**: Address latch enable

0: Failing address not stored in the SRAMx ECC single/double error address registers

1: Failing address stored in the SRAMx ECC single/double error address registers

Note: For SRAM1 and SRAM3 (when ECC is not available) this bit is reserved and must be kept at reset value in control registers.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **ECCE**: ECC enable.

This bit reset value is defined by the user option bit configuration. When set, it can be cleared by software only after writing the unlock sequence in the RAMCFG_MxECCKEYR register.

0: ECC disabled

1: ECC enabled

Note: For SRAM1 and SRAM3 (when ECC is not available) this bit is reserved and must be kept at reset value in control registers.

6.6.2 RAMCFG memory x interrupt enable register (RAMCFG_MxIER)

Address offset: 0x004 + 0x040 * (x - 1), (x = 2, 3, 5)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ECCNMI	Res.	DEIE	SEIE
												rs		rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **ECCNMI**: Double error NMI

This bit is set by software and cleared only by a global RAMCFG reset.

0: NMI not generated in case of ECC double error

1: NMI generated in case of ECC double error

Note: if ECCNMI is set, the RAMCFG maskable interrupt is not generated whatever DEIE bit value.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **DEIE**: ECC double error interrupt enable

0: Double error interrupt disabled

1: Double error interrupt enabled

Bit 0 **SEIE**: ECC single error interrupt enable

0: Single error interrupt disabled

1: Single error interrupt enabled

6.6.3 RAMCFG memory interrupt status register (RAMCFG_MxISR)

Address offset: 0x008 + 0x040 * (x - 1), (x = 1, 2, 3, 5)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	SRAM BUSY	Res.	Res.	Res.	Res.	Res.	Res.	DED	SEDC
							r							r	r

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **SRAMBUSY**: SRAM busy with erase operation

0: No erase operation on going

1: Erase operation on going

Note: Depending on the SRAM, the erase operation can be performed due to software request, system reset if the option bit is enabled, tamper detection or readout protection regression. Refer to Table 43.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **DED**: ECC double error detected

0: No double error

1: Double error detected

Note: For SRAM1 and SRAM3 (when ECC is not available) this bit is reserved and must be kept at reset value in control registers.

Bit 0 **SEDC**: ECC single error detected and corrected

0: No single error

1: Single error detected and corrected

Note: For SRAM1 and SRAM3 (when ECC is not available) this bit is reserved and must be kept at reset value in control registers.

6.6.4 RAMCFG memory x ECC single error address register (RAMCFG_MxSEAR)

Address offset: 0x00C + 0x040 * (x - 1), (x = 2, 3, 5)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ESEA[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ESEA[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ESEA[31:0]**: ECC single error address

When the ALE bit is set in the RAMCFG_MxCR register, this field is updated with the address corresponding to the ECC single error.

6.6.5 RAMCFG memory x ECC double error address register (RAMCFG_MxDEAR)

Address offset: 0x010 + 0x040 * (x - 1), (x = 2, 3, 5)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EDEA[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EDEA[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **EDEA[31:0]**: ECC double error address

When the ALE bit is set in the RAMCFG_MxCR register, this field is updated with the address corresponding to the ECC double error.

6.6.6 RAMCFG memory x interrupt clear register x (RAMCFG_MxICR)

Address offset: 0x014 + 0x040 * (x - 1), (x = 2, 3, 5)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CDED	CSEDC
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **CDED**: Clear ECC double error detected

Writing 1 to this flag clears the DED bit in the RAMCFG_MxISR register. Reading this flag returns the DED value.

Bit 0 **CSEDC**: Clear ECC single error detected and corrected

Writing 1 to this flag clears the SEDC bit in the RAMCFG_MxISR register. Reading this flag returns the SEDC value.

6.6.7 RAMCFG memory 2 write protection register 1 (RAMCFG_M2WPR1)

Address offset: 0x058

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:0 **PyWP**: SRAM2 1-Kbyte page y write protection (y = 31 to 0)

These bits are set by software and cleared only by a global RAMCFG reset.

0: Write protection of SRAM2 1-Kbyte page y is disabled.

1: Write protection of SRAM2 1-Kbyte page y is enabled.

6.6.8 RAMCFG memory 2 write protection register 2 (RAMCFG_M2WPR2)

Address offset: 0x05C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:0 **PyWP**: SRAM2 1-Kbyte page y write protection (y = 63 to 32)
These bits are set by software and cleared only by a global RAMCFG reset.
0: Write protection of SRAM2 1-Kbyte page y is disabled.
1: Write protection of SRAM2 1-Kbyte page y is enabled.

6.6.9 RAMCFG memory 2 write protection register 3 (RAMCFG_M2WPR3)

Address offset: 0x060

Reset value: 0x0000 0000

This register is available only for STM32H523/33/43/53xx devices.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PyWP**: SRAM2 1-Kbyte page y write protection (y = 79 to 64)
These bits are set by software and cleared only by a global RAMCFG reset.
0: Write protection of SRAM2 1-Kbyte page y is disabled.
1: Write protection of SRAM2 1-Kbyte page y is enabled.

6.6.10 RAMCFG memory x ECC key register (RAMCFG_MxECCKEYR)

Address offset: 0x024 + 0x040 * (x - 1), (x = 2, 3, 5)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ECCKEY[7:0]							
								w	w	w	w	w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **ECCKEY[7:0]**: ECC write protection key
The following steps are required to unlock the write protection of the ECCE bit in the RAMCFG_MxCR register.
1) Write 0xAE into ECCKEY[7:0].
2) Write 0x75 into ECCKEY[7:0].
Note: Writing a wrong key reactivates the write protection.

6.6.11 RAMCFG memory x erase key register (RAMCFG_MxERKEYR)

Address offset: 0x028 + 0x040 * (x - 1), (x = 1 to 5)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ERASEKEY[7:0]							
								w	w	w	w	w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **ERASEKEY[7:0]**: Erase write protection key

The following steps are required to unlock the write protection of the SRAMER bit in the RAMCFG_MxCR register.

1) Write 0xCA into ERASEKEY[7:0].

2) Write 0x53 into ERASEKEY[7:0].

Note: Writing a wrong key reactivates the write protection.

1. Available only on STM32H523/33/43/53xx devices.

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

7 Embedded flash memory (FLASH)

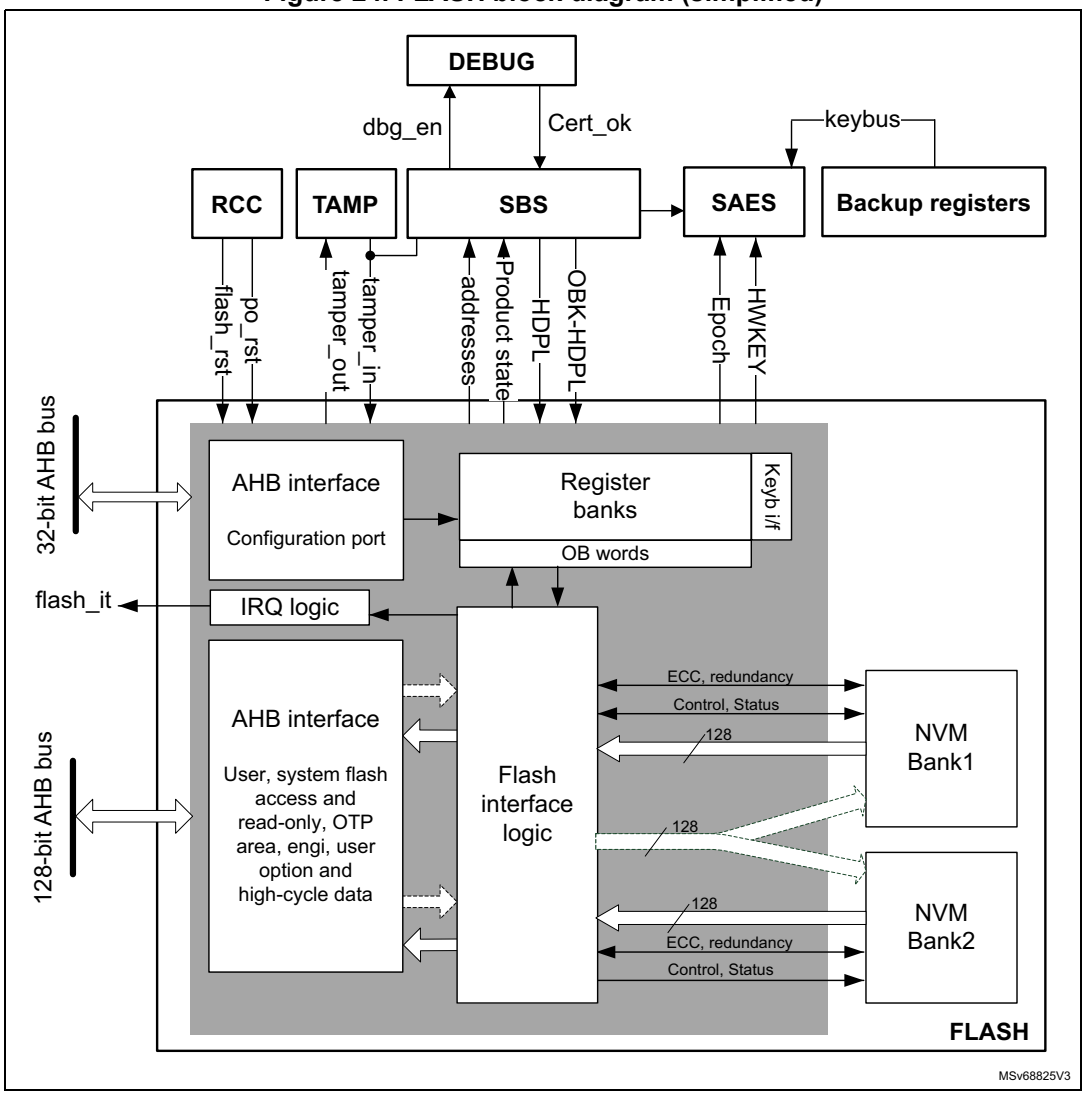
7.1 FLASH introduction

The embedded flash memory (FLASH) manages the accesses of any master to the up to 2 Mbytes of embedded nonvolatile memory. It implements read, program, and erase operations, error corrections, as well as various integrity and confidentiality protection mechanisms.

FLASH manages the automatic loading of nonvolatile user option bytes at power-on reset, and implements the dynamic update of these options. It also features a high-cycle data area, a one-time-programmable (OTP) area, a secure key storage area (OBKeys), and a read-only area configured by STMicroelectronics during manufacturing.

7.2 FLASH main features

- Up to 2 Mbytes of nonvolatile memory, divided into two 1-Mbyte banks
- Flash memory read operations supporting multiple lengths: 128 bits, 64 bits, 32 bits, 16 bits, or one byte
- Flash memory programming by 128 (user area, OBKeys) and by 16 bits (OTP and flash high-cycle data area)
- 8-Kbyte sector erase, bank erase and dual-bank mass erase
- Dual-bank organization supporting:
  - Simultaneous operations: read-while-write (program and erase) is supported, including flash high-cycle data area. The two banks share the same interface, hence write and erase cannot be performed in parallel (write-while-write is not supported).
  - Bank swapping: the address mapping of the user memory of each bank can be swapped, along with the corresponding registers. Security flags remain valid for the physical bank, so the data are not reveled by swapping to a bank with lower security configuration.
- Error code correction (ECC): one error detection/correction, or two errors detection per 128-bit flash word using nine ECC bits, on 16-bit words with six bits within configurable flash high-cycle data area.
- User configurable nonvolatile option bytes
- Flash memory enhanced protections, activated by option bytes
  - different product states for protecting memory content from debug access
  - sector group write-protection (WRPSG), protecting up to 32 groups of four sectors (32 Kbytes) per bank
  - two secure-only areas (one per user flash bank): when enabled, these areas are accessible only if the microcontroller operates in Secure access mode
  - HDP protection, providing temporal isolation for startup code
- 2-Kbyte one-time programmable (OTP) area
- Read-only area configured by STMicroelectronics
- Prefetch reads the next sequential instruction from flash memory



- Up to 48 Kbytes per bank supporting high-cycling capability (100 kcycles), to be used for data (EEPROM emulation)

7.3 FLASH functional description

7.3.1 FLASH block diagram

Figure 24 shows the embedded flash memory block diagram.

Figure 24. FLASH block diagram (simplified)

7.3.2 FLASH signals

The flash memory has two AHB connections, namely the flash AHB register interface and the main AHB interface.

Flash AHB register interface

- Data size is 32 bits
- Except for some registers (FLASH_NS/SECKEYR, FLASH_NS/SECOBKKEYR and FLASH_OPTKEYR, used to insert unlock sequences for control, and option registers that can be written by 32 bits), it is possible to read and write all registers by 8, 16 and 32 bits.
- When unlock sequence for control and option registers is wrong, a bus error is raised, otherwise no read or write errors are generated on the bus.

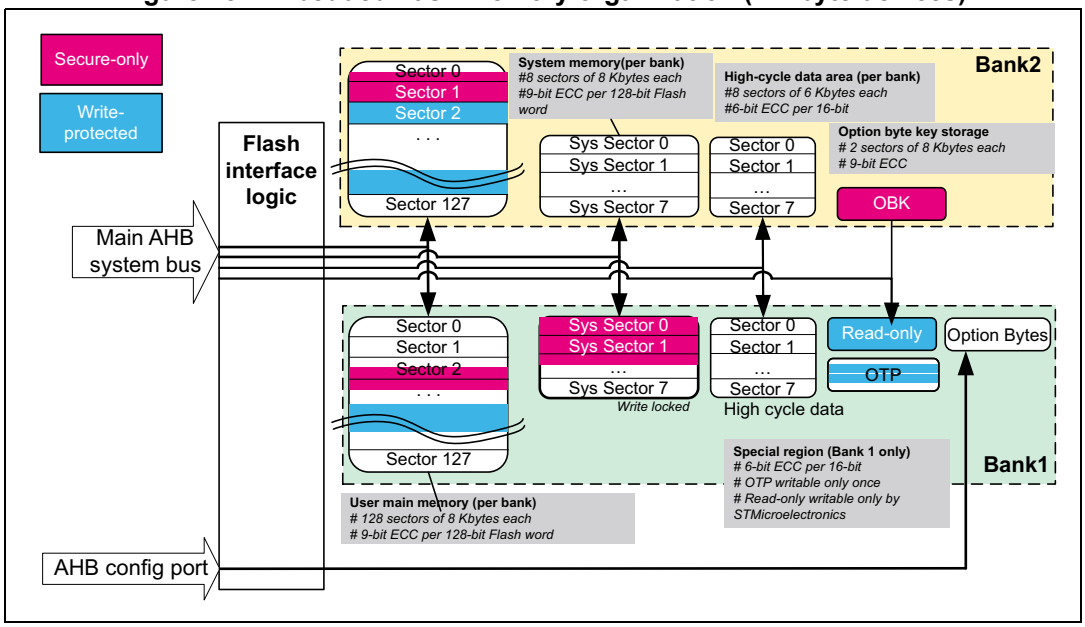
Main AHB interface

The AHB data bus size is 128 bits. This interface is used to handle three different targets:

- Code placed in user and system memory, protected by 9 bits of ECC.
- Secure keys placed in OBKey sectors, protected by 9 bits of ECC.
- OTP, read-only and flash memory high-cycle data area. protected by 6 bits of ECC.

The main AHB interface is implemented as follows:

- User and system memory, OBKeys storage:
  - Supports multiple length: 128-, 64-, 32-, 16- and 8-bit data width.
  - There is a read buffer of 128 bits for each bank where the last data read is stored. If data are available in the read buffer, no read access is given to the flash memory. Buffer is flushed when write access, OTP access, OBK swap, OBK alternate sector erase, high-cycle data area access, user option change request or erase operation occur.
  - There is a prefetch of the same size as the read buffer.
  - A 9-bit ECC is associated to each 128-bit data flash memory word.
- OTP, read-only and flash high-cycle data
  - Two dedicated data buffer of 137 bits are used to manage 16-bit data with 6-bit ECC
  - Reading two times the same address triggers two flash read accesses.
  - During a read access, two wait states are added in addition to the memory wait states. These wait states are necessary to parse the data buffer.
  - Each write access triggers a write in the flash memory.
  - 6-bit ECC is associated to each 16-bit data.



By default, all the AHB memory range is cacheable. For regions where caching is not practical (OTP, RO, data area), MPU must be used to disable local cacheability.

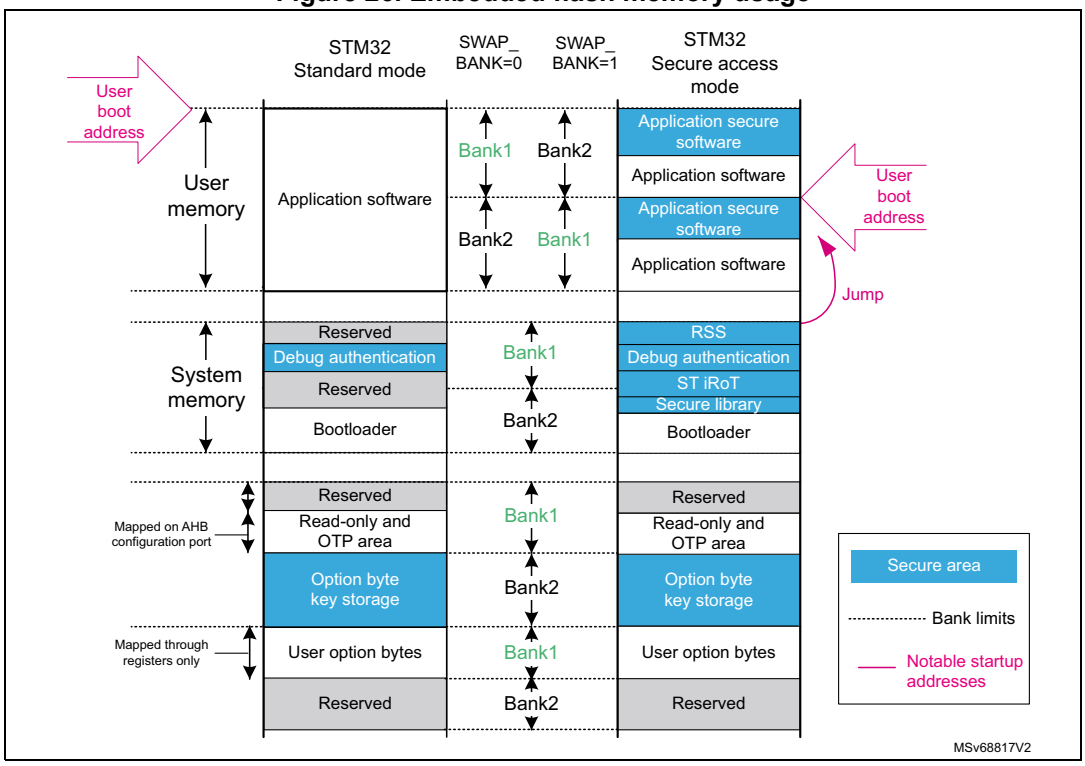
7.3.3 Flash memory architecture and usage

Flash memory architecture

Figure 25 shows the organization supported by the embedded flash memory. By default, all the AHB memory range is cacheable.For regions where caching is unpratical (OTP, read-only, data) use MPU to disable local cacheability.

Figure 25. Embedded flash memory organization (2-Mbyte devices)

The embedded flash nonvolatile memory is composed of:



- A main memory block, organized in two banks. Each bank is divided in sectors of 8 Kbytes each, and features flash-word rows of 128 bits + 9 bits of ECC per word (see *Table 51*).
- A system memory block of 128 Kbytes, divided into two 64-Kbyte banks. Each bank is divided in eight 8-Kbyte sectors. The system flash memory is ECC protected (9-bit ECC per 128-bit word).
- A set of nonvolatile option bytes loaded at reset by the embedded flash memory and accessible by the application software only through the AHB configuration register interface.
- A 2-Kbyte one-time-programmable (OTP) area that can be written only once by the application software.
- A 2-Kbyte read-only area. It contains a unique device ID and product information.
- Two memory sectors (2 x 8 Kbytes) of secure key storage, OBKeys.
- Up to 16 sectors of user flash memory with high cycling capability (100 K cycles) for data, 8 sectors per bank.

The overall flash memory architecture and its corresponding access interface is summarized in *Table 51*.

Partition usage

Figure 26 shows how the embedded flash memory is used by STMicroelectronics and by the application software.

Figure 26. Embedded flash memory usage

User and system memories are used differently, according to product state and other option bytes settings:

- The user memory contains the application code and data, while the system memory is used with root secure services (RSS), the debug authentication code, and the STM32 bootloader. When a reset occurs, the core jumps to the boot address configured through the BOOT pin, the (SEC/NS)BOOTADD option bytes, and the product state.
- The unique boot entry (BOOT_UBE) is set to either STiRoT located in the system flash memory, or iRoT in the user flash memory. This feature is available only on cryptography enabled devices.
- Secure service library in system flash memory is available in secure mode.
- If the debugger is attached to the product, the entry point is the debug authentication policy, used to unlock the device via the SBS when attached to debugger. A digital signature must be provided to perform a regression to product state, where debug is allowed.
- If (SEC/NS)BOOTADD is not yet configured, dedicated libraries can be used for secure boot. They are located in the system flash memory:
  - ST libraries in system flash memory assist the application software boot with special features, such as secure boot and secure firmware install (SFI-RSS)
  - STiRoT (immutable root of trust) secure software in user flash memory is used for secure firmware update and provisioning (SFU)

Note: For more information on option byte setup for boot, refer to Section 7.4.6.

7.3.4 FLASH read operations

Read operation overview

Read access to main and system flash memory operates as follows:

- There is a 128-bit read data buffer associated to each bank, which stores the last data read. If several consecutive read accesses request data belonging to the same flash data word (128 bits), data are read directly from the current data read buffer, without triggering additional flash read operations. This mechanism occurs each time a read access is granted. When a read access is rejected for security reasons, the corresponding read error response is issued by the embedded flash memory and no read operation to flash memory is triggered.
- The read data buffer is disabled when write access or OTP access, user option change request, OBK swap, OBK erase or other erase operation occur.

Read access to OTP, RO and flash high-cycle data operates as follows:

1. Flash data word of 137 bits is read and stored in a temporary buffer.
2. The interface parses the 137-bit data word, and selects the 16- or 32-bit data requested.
3. While parsing the 137-bit data word, (two) wait states are added, and the AHB bus is stalled.
4. If the application reads an OTP data or flash high-cycle data not previously written, **a double ECC error** is reported and **only a word full of set bits is returned** (see *Section 7.3.9* for details). The read data (in 16 bits) is stored in FLASH_ECCDR register, so that the user can identify if the double ECC error is due to a virgin data or a real ECC error.
5. Reading two times the same address triggers two reads in the flash memory.
6. For 8-bit accesses, an AHB bus error is generated.

Note: The embedded flash memory can perform single-error correction and double-error detection while read operations are being executed (see Section 7.3.8).

Instruction prefetch

The Cortex-M33 fetches instructions and literal pools (constants/data) over the C-Bus and through the instruction cache, if it is enabled. The prefetch block aims at increasing the efficiency of C-Bus accesses when the instruction cache is enabled, by reducing the cache refill latency.

Prefetch is efficient in case of sequential code; prefetch in the flash memory allows the next sequential instruction line to be read from the memory, while the current instruction line is being filled in instruction cache and executed by the CPU.

Prefetch is enabled by setting the PRFTEN bit in the FLASH access control register (FLASH_ACR). PRFTEN must be set only if at least one wait state is needed to access the flash memory.

Adjusting read timing constraints

The embedded clock must be enabled and running before reading data from a nonvolatile memory.

To correctly read data from the memory, the number of wait states (LATENCY) must be correctly programmed in the access control register (FLASH_ACR), according to the main AHB interface clock frequency, and the internal voltage range of the device (V_{core}).

Table 48 shows the correspondence between the number of wait states (LATENCY), the programming delay parameter (WRHIGHFREQ), the embedded flash memory clock frequency, and the supply voltage range.

Table 48. Recommended number of wait states and programming delay

Number of wait states (LATENCY)	Programming delay (WRHIGHFREQ)	Interface clock frequency vs. V_{CORE} range(1)			
		VOS3 range 0.95 to 1.05 V	VOS2 range 1.05 to 1.15 V	VOS1 range 1.15 to 1.26 V	VOS0 range 1.30 to 1.40 V
0 WS (1 FLASH clock cycle)	00	0 to 20 MHz	0 to 30 MHz	0 to 34 MHz	0 to 42 MHz
1 WS (2 FLASH clock cycles)		20 to 40 MHz	30 to 60 MHz	34 to 68 MHz	42 to 84 MHz
2 WS (3 FLASH clock cycles)	01	40 to 60 MHz	60 to 90 MHz	68 to 102 MHz	84 to 126 MHz
3 WS (4 FLASH clock cycles)		60 to 80 MHz	90 to 120 MHz	102 to 136 MHz	126 to 168 MHz
4 WS (5 FLASH clock cycles)	10	80 to 100 MHz	120 to 150 MHz	136 to 170 MHz	168 to 210 MHz
5 WS (6 FLASH clock cycles)		N/A	N/A	170 to 200 MHz	210 to 250 MHz

1. Voltage range from 1.26 to 1.30 V is not supported.

Adjusting system frequency

After power-on, the embedded flash memory is clocked by the 64 MHz high-speed internal oscillator (HSI), with a voltage range set at a scaled value of VOS3: a conservative 3 wait-state latency is specified in FLASH_ACR register (see *Table 48*).

When changing the bus frequency, the application software must follow the sequence described below, to tune the number of wait states required to access the memory.

To increase the CPU frequency:

1. If necessary, program the LATENCY and WRHIGHFREQ bits to the right value in the FLASH_ACR register, as described in *Table 48.*
2. Check that the new number of wait states is taken into account by reading back the FLASH_ACR register.
3. Modify the embedded flash memory clock source and/or the clock prescaler in the RCC_CFGR register of the reset and clock controller (RCC).
4. Check that the new embedded flash memory clock source and/or the new AHB clock prescaler value are taken in account by reading back the embedded flash memory clock source status and/or the prescaler value in the RCC_CFGR register of the reset and clock controller (RCC).

To decrease the CPU frequency:

1. Modify the embedded flash memory clock source and/or the clock prescaler in the RCC_CFGR register of reset and clock controller (RCC).
2. Check that the embedded flash memory new clock source and/or the new clock prescaler value are taken into account by reading back the embedded flash memory clock source status and/or the AHB interface prescaler value in the RCC_CFGR register of reset and clock controller (RCC).
3. If necessary, program the LATENCY and WRHIGHFREQ bits to the right value in FLASH_ACR register, as described in *Table 48.*
4. Check that the new number of wait states has been taken into account by reading back the FLASH_ACR register.

Error code correction (ECC)

The memory embeds an error correction mechanism. Single-error correction and double-error detection are performed for each read operation. For more details, refer to *Section 7.3.8*.

Read errors

When the ECC mechanism is unable to correct the read operation, the memory reports read errors, as described in *Section 7.9.10*.

Read interrupts

See *Section 7.10* for details.

7.3.5 FLASH program operations

Program operation overview

Program operation consists in issuing write commands. The memory supports the execution of only one write-command at a time. Write-while-write is not supported. Nothing prevents overwriting a non-virgin flash word, but this is not recommended. The result may lead to invalid data and inconsistent ECC code.

User flash, OBK storage and system flash memories sectors

For the user and system flash memories, 9-bit ECC is associated to each 128-bit data flash word. In this case, the embedded flash memory must always perform write operations to nonvolatile memory with a 128-bit word granularity. Once the write buffer is full (128 bits), the Busy flag is set, and a programming operation is triggered.

There is a write buffer common to Bank1 and 2, which supports multiple write-access types (128, 64, 32, 16 or 8 bits). The application can decide to write from 8 bits to 128 words. In this case, a force-write mechanism to the 128 bits + ECC is used (see FW bit of FLASH_NS/SECCR register).

When the write request is issued to the memory, any new write request stalls the main AHB bus. Moreover, while a write operation is ongoing, any new read request to the same bank stalls the main AHB bus.

OTP, RO, flash high-cycle data

When the target memory is OTP, RO and flash high-cycle data sectors, 6-bits ECC code is associated to each 16-bit data flash word. The embedded flash memory supports 16- or 32-bit write operations (8-bit write operations are not supported).For 8-bit accesses, write accesses are ignored. There is no write data buffer. Each write access triggers a write in the flash memory.

Note: The OTP area is typically write-protected on the final product, as described in Section 7.3.9.

The write protection check is performed at the reception of the write request (during address phase).Write protection is not checked anymore at the output of the write buffer. If a write protection violation is detected, the write operation is canceled, and write protection error (WRPERR) is raised in FLASH_NS/SECSR register.

Note: For write protections of main flash, ICP, and OTP see Section 7.6.

Monitoring ongoing write operations

The application software can use a status flag located in FLASH_NS/SECSR to monitor ongoing write operations. Since only one operation is possible at a time, this flag indicates if any operation (write, erase, option change) is ongoing, whatever the bank.

- **BSY**: indicates that an effective write, erase, option byte change, OBK swap, OBK alt sector erase is ongoing in the nonvolatile memory. This flag is not dedicated to a specific bank. It is set when an operation is starting on the memory, whatever the bank. An operation is triggered by:
  - An erase (FLASH_NS/SECCR.STRT)
  - A write (FLASH_NS/SECCR.PG + AHB write)
  - An option modification (FLASH_OPTCR.OPTSTRT)
  - OBKeys sector swap and OBKeys sector erase (FLASH_NS/SECOBKCFGR.SWAP_SECT_REQ and FLASH_NS/SECOBKCFGR.ALT_SECT_ERASE)

They are cleared when the current operation ends, or in case of error.

- **WBNE**: this bit indicates that the embedded flash memory is waiting for new data to complete the 128-bit write buffer. In this state the write buffer is not empty. It is reset as soon as the application software fills the write buffer, or forces the writes by using FW bit in FLASH_NS/SECCR, or an error is detected. When WBNE is high, it is not possible to launch an erase, an option modification, an OBK swap or OBK alternate sector erase operation on flash memory.
- **DBNE**: this bit indicates that the data buffer for parsing 16-bits data is not empty:
  - 16-bit data write access is received, and the data buffer is being filled. It is set at the receipt of a valid write access, and reset as soon as the write request preparation has been processed.

Note: If the memory is busy at the receipt of the AHB write request, the CPU execution is stalled.

Enabling write operations

Before programming the user flash memory in Bank1 or in Bank2, the application software must ensure that the PG bit is set to 1 in FLASH_NS/SECCR. If not, an unlock sequence must be used (see *Section 7.6.7*), and the PG bit must be set.

When an option byte or an option byte key must be modified, or a mass erase must be started, the application software must ensure that FLASH_OPTCR is unlocked. If this is not the case, an unlock sequence must be used (see *Section 7.6.7*).

A separate mechanism with similar use exists for FLASH_NS/SECOBKCFGR. The control register must be unlocked prior to the start of any OBKeys storage modification. Writing the correct sequence to the FLASH_NSOBKKEYR unlocks FLASH_NSOBKCFGR. FLASH_SECOBKKEYR is linked to FLASH_SECOBKCFGR, as described in *Section 7.6.7*.

Note: The application software must not unlock an already unlocked register, otherwise this register remains locked until the next system reset.

If needed, the application software can update the programming delay, as described in *Adjusting programming timing constraints*.

Writing to the FLASH control register FLASH_NS/SECCR and FLASH_OPTCR

The FLASH_NS/SECCR, FLASH_OPTCR and FLASH_NS/SECOBKCFGR registers are not accessible in write mode when the BSY bit is set. Any attempt to write these registers while the BSY bits is set causes the AHB bus to stall until SEC/NSBSY bit is cleared.

Single-write sequence

The recommended single-write sequence is the following:

1. Make sure protection mechanism does not prevent programming
2. Check that no memory operations are ongoing by checking the BSY bit in the FLASH_NS/SECSR register and CDBNE bits in the FLASH_NS/SECSR register. Check that the write buffer is empty by checking the WBNE bit in the FLASH_NS/SECSR register
3. Check and clear all the error flags due to previous programming/erase operation
4. Unlock the FLASH_NS/SECCR register, as described in *Section 7.6.7* (only if this register is not already unlocked)
5. Enable write operations by setting PG bit in the FLASH_NS/SECCR register
6. Write one flash-word at aligned address

Note: NS/SECWBNE flag indicates if the 128-bit write buffer is waiting for new data.

Note: No erase request, options change request, OBK operation is allowed between the first write and the completion of the write operation.

7. Wait for the BSY bit to be cleared in the corresponding FLASH_NS/SECSR register
8. Clear PG bit in FLASH_NS/SECCR register if there are not any more programming requests

If step *6* is executed incrementally (for example byte per byte), the write buffer can become partially filled. In this case the application software can decide to force-write what is stored in the write buffer by using FW bit in FLASH_NS/SECCR register. In this particular case, the unwritten bits are automatically set to 1. If no bit in the write buffer is cleared to 0, the FW bit has no effect.

Note: The usage of a force-write operation prevents the application from updating, in a later stage, the missing bits with a value different from 1. This can lead to unexpected or inconsistent data, or ECC.

Adjusting programming timing constraints

Program operation timing constraints depend of the memory clock frequency, which directly impacts the performance. If timing constraints are too tight, the nonvolatile memory does not operate correctly, if they are too lax, the programming speed is not optimal.

The user must therefore trim the optimal programming delay through the WRHIGHFREQ parameter in the FLASH_ACR register. Refer to *Table 48* for the recommended programming delay, depending upon the memory clock frequency.

FLASH_ACR configuration register is common to both banks.

The application software must check that no program/erase operation is ongoing before modifying WRHIGHFREQ.

Caution: Modifying WRHIGHFREQ while programming/erasing the memory can corrupt its content.

Programming errors

When a program operation fails, an error is reported, as described in *Section 7.9*.

Programming interrupts

See *Section 7.10: FLASH interrupts* for details.

7.3.6 FLASH erase operations

Erase operation overview

The memory can perform erase operations on 8-Kbyte user sectors, on one user flash memory bank, or on two user flash memory banks (for example mass erase). For more details in user flash memory, ICP, user options and OTP erase protection, see *Section 7.6*.

Erase commands are issued through the AHB configuration interface. The memory supports one operation at a time, if it receives simultaneously a write and an erase request an error flag is raised, and both operations are canceled. See *Section 7.9* for details.

After successful completion of erase, all the bytes in the erased flash sectors are set to the flash default 0xFF value.

Erase and WRP

If the application software attempts to erase a write-protected user sector, the sector erase operation is aborted, and the WRPERR flag is raised in the FLASH_NS/SECSR register, as described in *Section 7.9.2*.

Flash busy

Busy signals is described in *Monitoring ongoing write operations*.

Writing to the FLASH control register FLASH_NS/SECCR and FLASH_OPTCR

Refer to *Writing to the FLASH control register FLASH_NS/SECCR and FLASH_OPTCR*.

Enabling erase operations

Before erasing a sector, the application software must make sure that FLASH_NS/SECCR is unlocked. If this is not the case, an unlock sequence must be used (see *Section 7.6.7*).

Note: The application software must not unlock a register that is already unlocked, otherwise this register remains locked until next system reset. This can be used to deliberately lock-out a register from further accesses.

Similar constraints apply to bank erase requests.

Standard flash sector erase sequence

To erase an 8- or 6-Kbyte data user sector without security protections, proceed as follows:

1. Make sure protection mechanism does not prevent sector erase (WRP, secure flag, HDP).
2. Check that no memory operations are ongoing by checking the BSY and DBNE bits in the FLASH_NSSR register, and that the write buffer is empty by checking the WBNE bit in the FLASH_NSSR register.
3. Check and clear all the nonsecure error flags due to previous programming/erase operation. Refer to *Section 7.9* for details.
4. Unlock the FLASH_NSCR register, as described in *Section 7.6.7* (only if this register is not already unlocked).
5. Set the BKSEL bit, the SER bit and SNB bitfield in the FLASH_NSCR register. BKSEL indicates in which physical bank sector must be erased, then SER indicates a sector erase operation, while SNB contains the target sector number. In case of data sector, use the number of the corresponding regular sector.
6. Set the STRT bit in the FLASH_NSCR register.
7. Wait for the BSY bit to be cleared in the FLASH_NSSR register.
8. STRT bit is automatically cleared at the end of the sector erase, or in case of error.
9. Clear SER in FLASH_NSCR register if there are not anymore sector erase request to be issued.

Note: If another erase flag is requested simultaneously to the sector erase, a PGSERR error is generated.

Secure flash memory sector erase sequence

To erase an 8- or 6-Kbyte data secure configured user sector, proceed as follows:

1. Make sure write protection or HDP mechanism does not prevent sector erase.
2. Ensure that no memory operations are ongoing (by checking the BSY and DBNE bits in the FLASH_SECSR register), and that the write buffer is empty (by checking the WBNE bit in the FLASH_SECSR register).
3. Check and clear all the secure error flags due to previous programming/erase operations. Refer to *Section 7.9* for details.
4. Unlock the FLASH_SECCR register, as described in *Section 7.6.7* (only if this register is not already unlocked).
5. Set the BKSEL bit, the SER bit and SNB bitfield in the FLASH_SECCR register. BKSEL indicates in which physical bank sector must be erased, then SER indicates a sector erase operation, while SNB contains the target secure sector number. In case of data sector, use the number of the corresponding regular sector.

6. Set the STRT bit in the FLASH_SECCR register.
7. Wait for the BSY bit to be cleared in the FLASH_SECSR register.
8. STRT bit is automatically cleared at the end of the sector erase or in case of error.
9. Clear SER in FLASH_SECCR register if there are not any secure sector erase request to be issued.

Note: If another erase flag is requested simultaneously to the sector erase, a PGSERR error is generated.

Standard flash memory bank erase sequence

To erase bank where no sector is configured as secure:

1. Make sure protection mechanism does not prevent sector erase.
2. Check that no memory operations are ongoing by checking the BSY and DBNE bits in the FLASH_NSSR register and that the write buffer is empty by checking the WBNE bit in the same register.
3. Check and clear all the nonsecure error flags due to previous programming/erase operation. Refer to *Section 7.9* for details.
4. Unlock the FLASH_NSCR register, as described in *Section 7.6.7* (only if this register is not already unlocked).
5. Set the BKSEL bit and the BER bit in the FLASH_NSCR register to the targeted physical bank (swap setting is ignored).
6. Set the STRT bit in the FLASH_NSCR register to start the bank erase operation. Then wait until the BSY bit is cleared in the FLASH_NSSR register.
7. STRT bit is automatically cleared at the end of erase sequence or in case of error.
8. Clear BER in FLASH_NSCR register if there is not other bank erase request to be issued.

Secure flash memory bank erase sequence

To erase bank where all sectors are configured with secure flag:

1. Make sure protection mechanism does not prevent sector erase (for mass erase the HDP is also considered, it cannot be fully executed from HDPL= 2, 3 if HDP is defined).
2. Check that no memory operations are ongoing by checking the BSY and DBNE bits in the FLASH_SECSR register and that the write buffer is empty by checking the WBNE bit in the same register.
3. Check and clear all the secure error flags due to previous programming/erase operation. Refer to *Section 7.9* for details.
4. Unlock the FLASH_SECCR register, as described in *Section 7.6.7* (only if this register is not already unlocked).
5. Set the BKSEL bit and the BER bit in the FLASH_SECCR register to the targeted physical bank (swap setting is ignored).
6. Set the STRT bit in the FLASH_SECCR register to start the bank erase operation. Then wait until the BSY bit is cleared in the FLASH_SECSR register.
7. STRT bit is automatically cleared at the end of erase sequence or in case of error.
8. Clear BER in FLASH_SECCR register if there is not other bank erase request to be issued.

Flash mass erase sequence

To erase all sectors of both banks, using nonsecure access, all sectors must be configured as nonsecure. The application software can set the MER bit to 1 in FLASH_NSCR register, as described below:

1. Make sure protection mechanisms do not prevent mass erase (*Section 7.6*).
2. Check that no memory operations are ongoing by checking the BSY and DBNE bits in the FLASH_NSSR register and that the write buffer is empty by checking the WBNE bit in the FLASH_NSSR register.
3. Check and clear all the nonsecure error flags due to previous programming/erase operation. Refer to *Section 7.9* for details.
4. Unlock the FLASH_NSCR register as described in *Section 7.6.7* (only if the registers are not already unlocked).
5. Set the MER bit to 1 in FLASH_NSCR register.
6. Set the STRT bit in the FLASH_NSCR register. Then wait until BSY bit is cleared in the FLASH_NSSR register.
7. STRT bit is cleared automatically at the end of the erase sequence, or in case of error.
8. Clear MER in FLASH_NSCR register.

Secure flash memory mass erase sequence

To erase all sectors of both banks simultaneously, using secure access, all sectors must be configured as secure. The application software can set the MER bit to 1 in FLASH_SECCR register, as described below:

1. Make sure protection mechanisms do not prevent mass erase (*Section 7.6*).
2. Check that no memory operations are ongoing by checking the BSY and DBNE bits in the FLASH_SECSR register and that the write buffer is empty by checking the WBNE bit in the FLASH_SECSR register.
3. Check and clear all the secure error flags due to previous programming/erase operation. Refer to *Section 7.9* for details.
4. Unlock the FLASH_SECCR register as described in *Section 7.6.7* (only if the registers are not already unlocked).
5. Set the MER bit to 1 in FLASH_SECCR register.
6. Set the STRT bit in the FLASH_SECCR register. Then wait until BSY bit is cleared in the FLASH_SECSR register.
7. STRT bit is cleared automatically at the end of the erase sequence, or in case of error.
8. Clear MER in FLASH_SECCR register.

Note: Mass and bank erase also erase high-cycle data sectors aliased from the erased bank.

7.3.7 FLASH parallel operations

As the memory is divided into two independent banks, the embedded flash memory interface supports a read in one bank while a write (RWW. read while write) or an erase is executed in the other bank. It does not support write-while-write, nor read-while-read. Same is valid for the high-cycle data area, system flash libraries, or the OBK (located on Bank2).

In all cases, the sequences described in *Section 7.3.4*, *Section 7.3.5* and *Section 7.3.6* apply.

7.3.8 FLASH error protections

Error correction codes (ECC)

The embedded flash memory supports an error correction code (ECC) mechanism, based on the SECDED algorithm, to correct single errors and detect double errors.

This mechanism uses nine ECC bits per 128-bit flash word, and applies to user and system memory.For read-only, OTP, flash high-cycle data, a stronger six ECC bits per 16-bit word is used. A double ECC error is generated for an OTP or flash high-cycle data virgin word (for example a word with 22 bits at 1). When this OTP or flash high-cycle data word is no more virgin, the ECC error disappears.

More specifically, during each read operation from a 128-bit flash word, the embedded flash memory retrieves the 9-bit ECC information, computes the ECC of the flash word, and compares the result with the reference value. If they do not match, the corresponding ECC error is raised, as described in *Section 7.9.10*.

During each program operation, a 9-bit ECC code is associated to each 128-bit data flash word, and the resulting 137-bit flash word information is written in nonvolatile memory.

A similar mechanism applies to read-only and OTP areas, but with 6-bit ECC for 16-bit data.

7.3.9 OTP and RO memory access

OTP and RO memory are accessed through main AHB interface. The OTP is accessible at addresses 0x08FF_F000 to 0x08FF F7FF, and the read-only section is accessible from 0x08FF F800 to 0x08FF_FFFF.

FLASH one-time programmable area

The embedded flash memory offers a 2048-byte memory area dedicated to application non-confidential, one-time programmable data (OTP). This area is composed by 1024 words of 16 bits (plus 6 bits of ECC). It cannot be erased, and can be written only once. The OTP area can be accessed through the main AHB interface from address 0x08FF F000 to 0x08FF F7FE.

OTP data can be programmed by the application software by 16-bit chunks. Overwriting an already programmed16-bit half-word can lead to data and ECC errors, and is therefore not supported.

Note: The OTP area is virgin when the device is delivered by STMicroelectronics.

When reading OTP data with a single error corrected or a double error detected, the embedded flash memory reports read errors, as described in *Section 7.9.10*.

When reading OTP data not written by the application software (such as virgin OTP), the ECC correction reports a double-error detection (ECCD), and the data are to be found in the FLASH_ECCDR register. ECCD implies an NMI raised.

OTP write protection

OTP data are organized as 32 blocks of 32 OTP words, as shown in *Table 49*. An entire OTP block can be protected (locked) from write accesses by setting the LOCKBLi bit (i = 0 to 31) corresponding to each OTP block in the FLASH_OTPBLR register. A block can be write-protected, if it has been programmed (even partially) or not.

The OTP block locking operation is irreversible, and independent from the product life state.

Note: The OTP area can be accessed only in read mode.

Table 49. Flash memory OTP organization

OTP block	AHB address	AHB word		Lock bit
		[31:16]	[15:0]	
Block 0	0x08FF F000	OTP001	OTP000	LOCKBL0
	0x08FF F004	OTP003	OTP002	
	...			
	0x08FF F03C	OTP031	OTP030	
Block 1	0x08FF F040	OTP033	OTP032	LOCKBL1
	0x08FF F044	OTP035	OTP034	
	...			
	0x08FF F07C	OTP063	OTP062	
Block 2	0x08FF F080	OTP065	OTP064	LOCKBL2
	0x08FF F084	OTP067	OTP066	
	...			
	0x08FF F0BC	OTP95	OTP94	
...				
Block 31	0x08FF F7C0	OTP993	OTP992	LOCKBL31
	0x08FF F7C4	OTP995	OTP994	
	...			
	0x08FF F7FC	OTP1023	OTP1022	

OTP write sequence

Follow the sequence below to write an OTP word:

1. Check that no memory operations are ongoing by checking the BSY bit in the FLASH_NSSR register and that the data buffer is empty by checking the DBNE bit in the FLASH_NSSR register.
2. Check and clear all the error flags due to previous programming/erase operation.
3. Set PG bit in the FLASH_NSCR register.
4. Check the protection status of the target OTP word (see *Table 49*). The corresponding LOCKBLi bit must not be set to 1.
5. Write two OTP words (32 bits) corresponding to the 4-byte aligned address shown in *Table 49*. Alternatively, the application software can program separately the 16-bit MSB or 16-bit LSB. In this case the first 16-bit write operation starts immediately, without waiting for the second one.
6. Wait for the BSY bit to be cleared in the FLASH_NSSR register.
7. Clear PG bit in FLASH_NSCR register if there is not any programming request anymore in the bank.
8. Optionally, lock the OTP block using LOCKBLi to prevent further data changes.

Note: Do not write twice an OTP 16-bit word, otherwise an ECC error is generated.

Writing OTP data at byte level is not supported, and generates a bus error.

To avoid data corruption, it is important to complete the OTP write process (for example by reading back the OTP value), before starting an option change.

Flash read-only area

The embedded flash memory offers a 2-Kbyte area to store read-only data. This area can be accessed through the AHB main port, and is protected by a robust ECC scheme, as detailed in *Section 7.3.8*.

The read-only information (programmed by STMicroelectronics) that can be used by the application software is detailed in *Table 50*.

Table 50. Read-only public data organization

Read-only data name	Address	Comment
Unique device ID	0x08FF F800	U_ID[31:0]
	0x08FF F804	U_ID[63:32]
	0x08FF F808	U_ID[96:64]
Flash memory size/ package	0x08FF F80C	Flash memory size[15:0] / Package code[15:0]
Reserved	0x08FF F810 to 0x08FF FFFF	Reserved information

7.3.10 Flash high-cycle data

The embedded flash memory offers up to 96 Kbytes (maximum) memory area with high-cycling capability (100 kcycles) to store data and emulate EEPROM. It can be accessed through the AHB system port from address 0x0900_0000 to 0x0901_7FFF (see *Figure 27*). It is mapped in the 8 (or 4) last sectors of Bank 1 and 2. This area is protected by a robust 6-bit ECC, enabling a 16-bit read and write granularity, at the expense of having sector size shrunk to 6 Kbytes.

A threshold per bank (EDATA(1/2)_STRT) is programmable to determine the beginning of the data flash area. By default, the whole memory is used for code.

For example, if 48 Kbytes of data are needed in Bank 1, set EDATA1_EN to 1, and EDATA1_STRT to 7. If no data are needed in Bank2, set EDATA2_EN to 0. In this case the data are accessible from address 0x0900_0000 to 0x0900_BFFF for Bank 1.

For greater efficiency, it is recommended to use sector on the other bank for flash high-cycle data, so that the application benefits from RWW capability of the dual-bank arrangement.

When SWAP_BANK feature is enabled, the banks are swapped: the flash high-cycle data in Bank 2 are accessible from 0x0900_000 to 0x0900_BFFF, and the data in Bank 1 are accessible from 0x0900_C000 to 0x0901_7FFF.

A bus error is generated on:

- Attempt to access an address between 0x0900_0000 to 0x0901_7FFF and this address is not valid (EDATA(1/2)_EN not enabled or EDATA(1/2)_STRT not correct).
- Attempt to fetch instructions from flash high-cycle data area.

Erasing the data area sector is possible by normal erase request for the corresponding user flash sector (120-127 for the STM32H562/563/573xx devices, 24-31 for the STM32H523/33xx devices).

Protections and security of high-cycle area are detailed in *Section 7.6.9*.

Figure 27. Flash high-cycle data memory map on 2-Mbyte devices

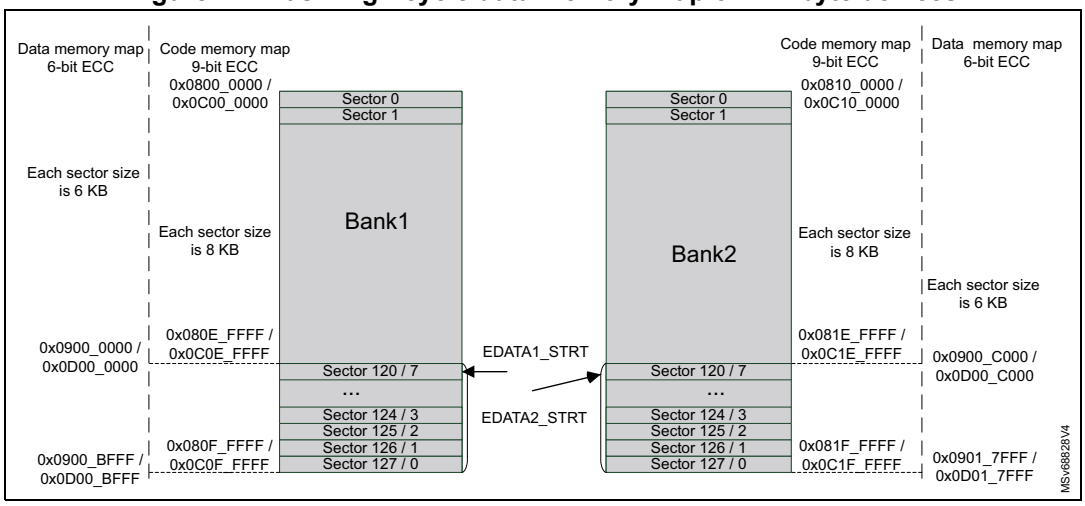


Figure 28. Flash high-cycle data memory map on 1-Mbyte devices

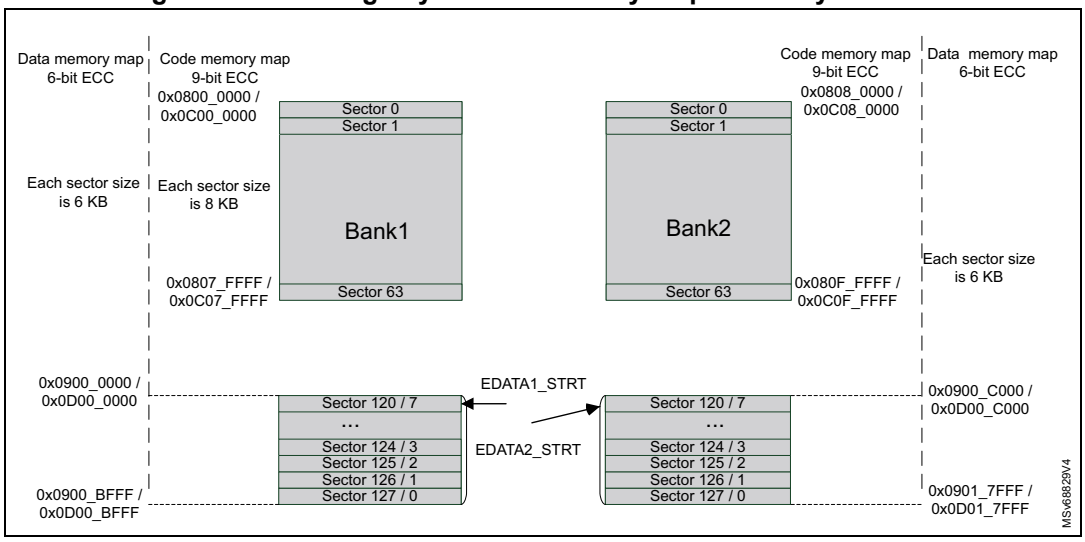

Figure 29. Flash high-cycle data memory map on 512-Kbyte devices

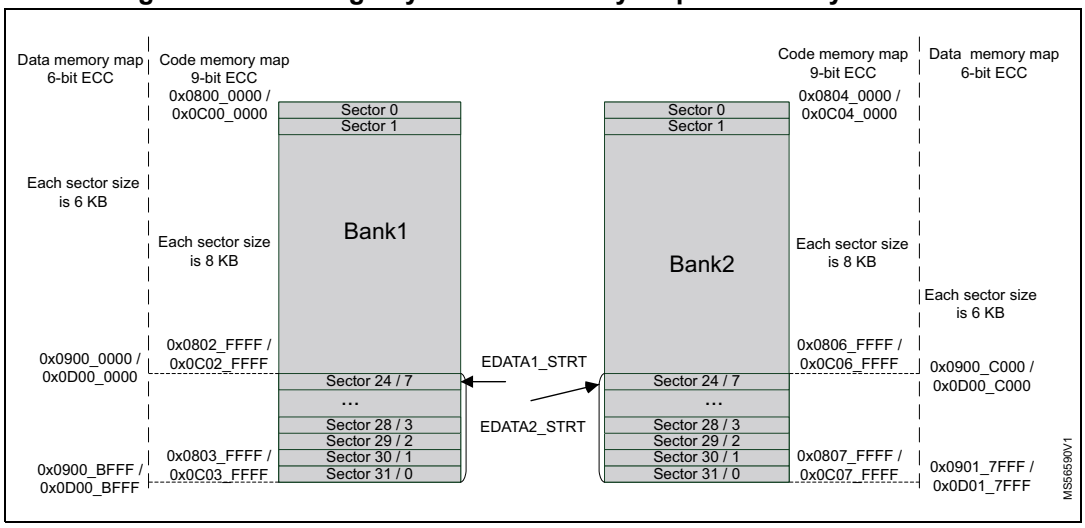

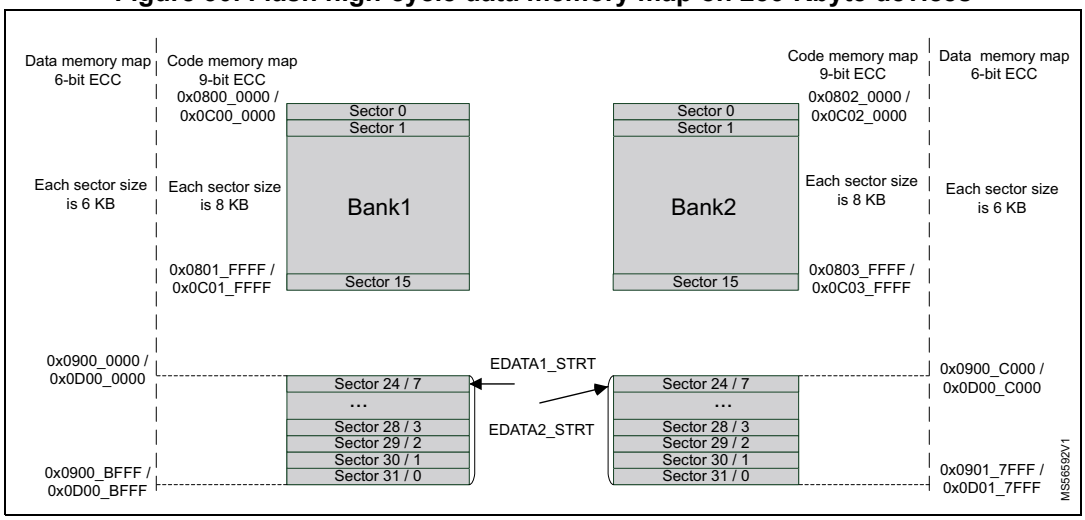

Figure 30. Flash high-cycle data memory map on 256-Kbyte devices

Note: When flash high-cycle data area on Bank1 is enabled, the code memory map is not continuous from Bank1 to Bank2 on 2M- and 512K-byte devices.

7.3.11 Flash bank swapping

Bank1 and Bank2 can be swapped for the user flash. This feature can be used after a firmware upgrade to restart the device on the new firmware. Bank swapping is an user option byte flag controlled by the SWAP_BANK bit of the FLASH_OPTCR register.

Bank specific settings for data area and security attributes follow the original bank and its contents. Control bit BKSEL always refers to physical bank, not the SWAP_BANK setting.

Table 51 shows the accessible memory, depending upon the SWAP_BANK bit value.

Table 51. Memory map and swapping options (STM32H562/563/573xx devices)

Area	Corresponding bank		Start address	End address	Size (bytes)	Region name

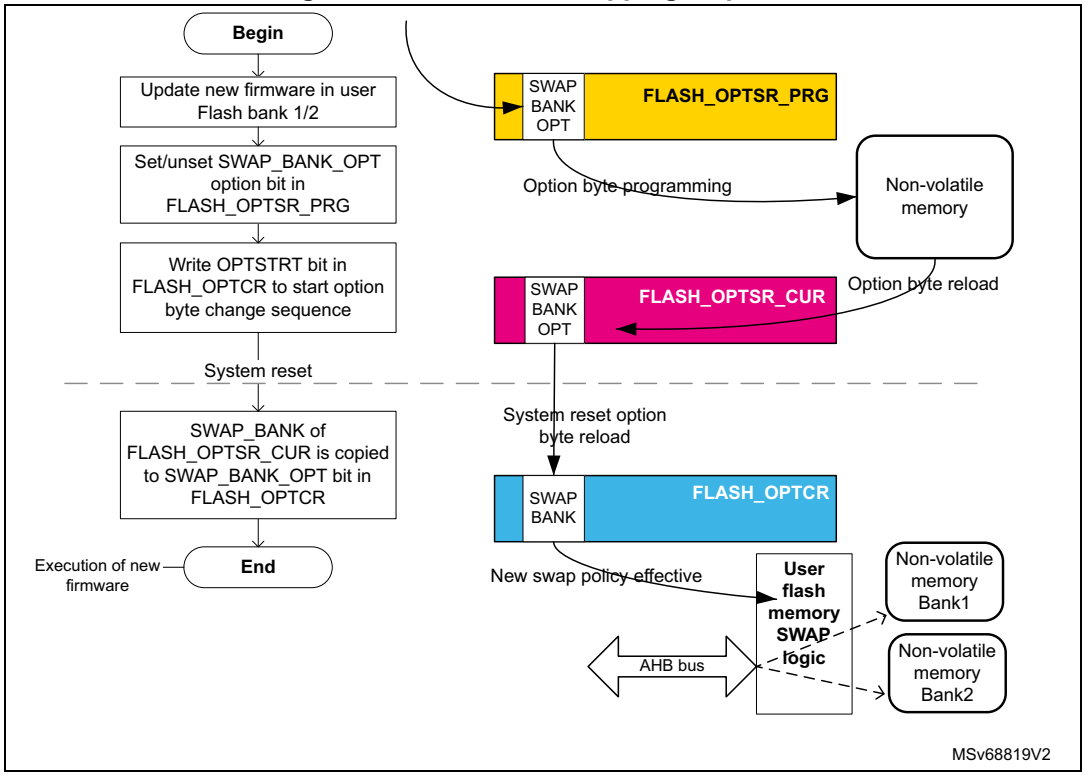
The SWAP_BANK bit in FLASH_OPTCR register is loaded from the SWAP_BANK option bit only after system reset or POR.

To change the SWAP_BANK bit (for example to apply a new firmware update), follow the sequence below:



1. Check that no memory operations are ongoing by checking the BSY and DBNE bits in the FLASH_NS/SECSR register and that the write buffer is empty by checking the WBNE bit in the FLASH_NS/SECSR register.
2. Clear all error flags due to a previous operation.
3. Unlock OPTLOCK bit, if not already unlocked.
4. Set the new desired SWAP_BANK value in the FLASH_OPTSR_PRG register.
5. Start the option byte change sequence by setting the OPTSTRT bit in the FLASH_OPTCR register.
6. Once the option byte change has completed, FLASH_OPTSR_CUR contains the expected SWAP_BANK value, but SWAP_BANK bit in FLASH_OPTCR has not yet been modified and the bank swapping is not yet effective.
7. Force a system reset or a POR. When the reset rises up, the bank swapping is effective (SWAP_BANK value updated in FLASH_OPTCR) and the new firmware shall be executed.

Note: The SWAP_BANK bit in FLASH_OPTCR is read-only, and cannot be modified by the application software.

The SWAP_BANK option bit in FLASH_OPTSR_PRG can be modified whatever the product state. Instead of being locked by PRODUCT_STATE, it is locked by (NS/SEC)BOOT_LOCK User OB.

Figure 31 gives an overview of the bank swapping sequence.

Figure 31. Flash bank swapping sequence

7.3.12 FLASH reset and clocks

Reset management

The embedded flash memory can be reset by a core domain reset, driven by the reset and clock control (RCC). The main effects of this reset are the following:

- All registers, except for option byte registers, are cleared, including read and write latencies. If the bank swapping option is changed, it is applied.
- Most control registers are automatically protected against write operations. To unprotect them, new unlock sequences must be used as described in *Section 7.6.7*.

The memory can be reset by a power-on core domain reset, driven by the reset and clock control (RCC). When the reset falls, all option byte registers are reset. When the reset rises up, the option bytes are loaded, potentially applying new features. During this loading sequence, the device remains under reset, and the memory is not accessible.

The reset signal can have a critical impact on the memory: the content is not guaranteed if a device reset occurs during a write or erase operation.

Reset occurring during flash operation

If a reset occurs during a flash operation (programing, erase or option change), the content of the memory is not guaranteed. It is mandatory for integrity to restart the operation. The status register FLASH_OPSR gives information about operations interrupted by a reset.

FLASH_OPSR.CODE_OP gives opcode of operation. *Table 54* indicates how to use FLASH_OPSR, and which operation is required.

Table 54. Recommended reactions to FLASH_OPSR contents

CODE_OP	Operation interrupted	OTP_OP	SYSF_OP	BK_OP	DATA_OP	Flash area	ADDR_OP min	ADDR_OP max	Recommended action
0x000	No operation ongoing while reset	0	0	0	0	-(1)	-	-	No extra action
0x001	Write operation	0	0	0/1	0	User flash	0x0000	0xFFFF	Erase sector and rewrite
		0	1	0/1	0	System flash	0x0000	0x0FFF	
		1	0	0	0	OTP	0x0600	0x07FF	
		1	0	1	0	OBKeys(2)	0x0000	0x03FF	
		0	0	0/1	1	Data area(3)	0xF000	0xFFFF	
0x010	OBK alternate sector erase	0	0	1	0	OBKeys	0	0	Relaunch the alternate sector erase
0x011	Sector erase(4)	0	0	0/1	0	User flash	0x0000	0xFFFF	Relaunch sector erase
		0	1	0/1	0	System flash	0x0000	0x0FFF	
0x100	Bank erase	0	0	0/1	0	User flash	-	-	Relaunch bank erase
0x101	Mass erase	0	0	0	0		-	-	Relaunch mass erase

Table 54. Recommended reactions to FLASH_OPSR contents (continued)

CODE_OP	Operation interrupted	OTP_OP	SYSF_OP	BK_OP	DATA_OP	Flash area	ADDR_OP min	ADDR_OP max	Recommended action
0x110	Option change	0	0	0	0	User configuration	-	-	New attempt on option change
0x111	OBK swap sector	0	0	1	0	OBKeys	-	-	Erase alternate sector, reprogram new OBKeys and relaunch swap

1. Dash represents “does not matter”.
2. Depends on current OBK sector.
3. Depends on EDATA setting in the OB.
4. Addresses indicated are aligned to sector start, data area sectors are erased by erase request to corresponding user flash memory sector.

Clock management

The memory uses the microcontroller system clock (sys_ck), here the AHB interface clock.

7.4 FLASH option bytes

7.4.1 About option bytes

The memory includes a set of nonvolatile option bytes. They are loaded at power-on reset and can be read and modified only through configuration registers.This section details:

- when option bytes are loaded
- how application software can modify them
- their detailed list, together with their initial values (before the first option byte change, user default configuration).

7.4.2 Option bytes loading

There are multiple ways of loading the option bytes:

- **Power-on wake-up**

  When the device is first powered, the embedded flash memory automatically loads all the option bytes. During the option byte loading sequence, the device remains under reset and the embedded flash memory cannot be accessed.

- **Wake-up from system Standby**

  When the core power domain, which contains the embedded flash memory, is switched from Standby mode to Run mode, the embedded flash memory behaves as during a

power-on sequence. **During loading time the device is not under reset, unlike power-on sequence.**

- **Dedicated option byte reloading by the application**

  When the user application successfully modifies the option byte content through the memory registers, the nonvolatile option bytes are programmed and the memory automatically reloads all option bytes to update the option registers.

Note: The option byte read sequence is protected by error correction code.In case of error, the option bytes are loaded with default values (see Section 7.4.3), different from the initial values (user default configuration), and more restrictive.

7.4.3 Option bytes modification

Changing user option bytes

A user option byte change operation can be used to modify the configuration and the protection settings saved in the nonvolatile option byte area.

There are several rules enforced when attempting to change a user option byte, they are summarized in *Section 7.4.7*. Failing to stick to those rules usually results in errors, described in *Section 7.9.12*.

The embedded flash memory features two sets of option byte registers:

- The first register set contains the current values of the option bytes. Their names have the _CUR extension. All these registers are read-only. Their values are automatically loaded from the nonvolatile memory after power-on reset, wake-up from system standby or after an option byte change operation.
- The second register set allows the modification of the option bytes. Their names contain the _PRG extension. All “_PRG” registers can be accessed in read/write mode.

When the OPTLOCK bit in FLASH_OPTCR register is set, it is not possible to modify the FLASH_XXX_PRG registers.

When OPTSTRT bit is set to 1, the memory checks the programming sequence (PGSERR) and the conditions described in *Section 7.4.7* (OPTCHANGEERR). If no error has been detected (PGSERR/OPTCHANGEERR), the flash interface launches the option byte modification, and updates the option byte registers with _CUR extension.

If one of the condition described in *Section 7.4.7*, *Section 7.9.12* or *Section 7.9.5*, alternatively *Section 7.9.4* is not respected, the memory aborts the option byte change operation. In this case, the FLASH_XXX_PRG registers are not overwritten by the current option value. The user application can check what was wrong in their configuration.

Unlocking the option byte modification

After reset, the OPTLOCK bit is set to 1 and the FLASH_OPTCR is locked. As a result, the application software must unlock the option configuration register before attempting to change the option bytes. The FLASH_OPTCR unlock sequence is described in *Section 7.6.7*.

Option bytes modification sequence

To modify user option bytes, follow the sequence below:

1. Check that no memory operations are ongoing by checking the BSY bit in the FLASH_NS/SECSR register and that the write buffer is empty by checking the WBNE bit in the FLASH_NS/SECSR register.
2. Check the data buffer is empty (DBNE = 0) in FLASH_NS/SECSR register.
3. Clear all error flags due to a previous operation.
4. Unlock FLASH_OPTCR register as described in *Section 7.6.7*, unless the register is already unlocked.
5. Write the desired new option byte values in the corresponding option registers (FLASH_XXX_PRG).
6. Set the option byte start change OPTSTRT bit to 1 in the FLASH_OPTCR register.
7. Wait until BSY bit is cleared in FLASH_NS/SECSR register.
8. OPTSTRT bit is cleared automatically at the end of the sequence (or in case of error).
9. Reset the device. This step is always recommended, becomes mandatory when one of the following option bytes is impacted:
   a) SECBOOTADDR
   b) NSBOOTADDR
   c) TZEN
   d) BOOT_UBE

Note: If a reset or a power-down occurs while the option byte modification is ongoing, the original option byte value is kept. A new option byte modification sequence is required to program it.

Option bytes overview

Table 55 lists all the user option bytes managed through the memory registers, as well as the initial values before the first option byte change (user default configuration).

7.4.4 Description of user and system option bytes

The general-purpose option bytes that can be used by the application are listed below:

- Watchdog management
  - IWDG_STOP: independent watchdog IWDG (also known as WDGLS_CD) counter active in Stop mode if 1 (stop counting or freeze if 0)
  - IWDG_STDBY: independent watchdog IWDG (also known as WDGLS_CD) counter active in Standby mode if 1 (stop counting or freeze if 0)
  - IWDG_SW: hardware (0) or software (1) IWDG (also known as WDGLS_CD) watchdog control selection

Note: If the hardware watchdog "control selection" feature is enabled (set to 0), the watchdog is automatically enabled at power-on, thus generating a reset unless the watchdog key register is written to or the down-counter is reloaded before the end-of-count is reached.

Depending on the configuration of IWDG_STOP and IWDG_STDBY options, the IWDG can continue counting (1) or not (0) when the device is, respectively, in Stop or Standby mode. When the IWDG is kept running during Stop or Standby mode, it can wake up the device from these modes.

- Reset management
  - BOR_LEV: Brownout level option, indicating the supply level threshold that activates/releases the reset
  - BORH_EN: enabling a high BOR level
  - NRST_STDBY: generates a reset when entering Standby mode if cleared to 0
  - NRST_STOP: generates a reset when entering Stop mode if cleared to 0.

Note: Whenever a Standby (Stop) mode entry sequence is successfully executed, the device is reset instead of entering Standby (Stop) mode if NRST_STDBY (NRST_STOP) is cleared to 0.

- Device options
  - IO_VDDIO2_HSLV: enables the configuration of pads below 2.7 V for VDDIO2 power rail if set to 1
  - IO_VDD_HSLV: enables the configuration of pads below 2.7 V for VDD power rail if set to 1
  - USBPD_DIS: USB Type-C® dead battery pull-down behavior on UCPDx_CC1

At delivery, the values programmed in the user option bytes are the following:

- Watchdog management
  - IWDG (also known as WDGLS_CD) active in Standby and Stop modes: 0x1
  - IWDG (also known as WDGLS_CD) not automatically enabled at power-on: 0x1
- Reset management
  - BOR: brownout level option (reset level = 2.1 V): 0x0. A reset is not generated when the device enters Standby, Stop low-power mode (value = 0x1)
- Device working in the full voltage range with I/O speed optimization at low-voltage disabled (IO_VDDIO2_HSLV = 0 and IO_VDD_HSLV = 0)

Refer to *Section 7.11* for details.

7.4.5 Description of data protection option bytes

The option bytes that can be used to enhance data protection are listed below:

- PRODUCT_STATE[7:0]: A product life cycle state (see *Section 7.6.11* for details).
- WRPSGn1/2: write protection option of the corresponding group of four consecutive sectors in Bank1 (respectively Bank2). It is active low. Refer to *Section 7.6.8* for details.
  - Bit N: Group embedding sectors 4 x N to 4 x N + 3
- SECWMx: TrustZone® secure only watermark area definition (refer to *Section 7.6.1* for details).
  - SECWM1_STRT (respectively SECWM1_END) contains the first (respectively last) sector of the secure access only zone in Bank1
  - SECWM2_STRT (respectively SECWM2_END) contains the first (respectively last) sector of the secure access only zone in Bank2.
- TZEN: this nonvolatile option can be used by the application to activate the secure access mode, as described in *Section 7.6*. For security reasons the TZEN is stored with redundancy on 8 bits. While the TZEN OB value is set immediately after programming, to actually use TZ features, reset is required to set the TZ_STATE in SBS.

  When TZEN is activated, secure watermark settings and secure boot address can be reset to default to prevent a deadlock in case the previous values were not correct.
- HDPx: Secure hide protection - HDPL exclusive area control in the user flash memory.

When factory programmed values of the data protection option bytes are the following:

- Flash bank erase operations do not impact watermarked secure data areas
- Secure watermark areas protections disabled (start addresses higher than end addresses)
- Write protection disabled (all option byte bits set to 1)
- TrustZone Secure access mode disabled (TZEN option byte value = 0xC3)

Refer to *Section 7.11* for details.

7.4.6 Description of boot address option bytes

Below the list of option bytes that can be used to configure the appropriate boot address for an application:

- PRODUCT_STATE

- BOOT_UBE: Selects either STiRoT or User flash as default boot address. Also used by RSS(SFI) to choose either Bootloader or STiRoT as next stage. Available only on products embedding cryptographic acceleration (STM32H533/573xx).
- NSBOOTADD: Selects default boot address when TZ is disabled.
- SECBOOTADD: Selects default boot address when TZ is enabled.
- (NS/SEC)BOOT_LOCK: Protects the boot configuration from further modification attempts.
- SWAP_BANK: bank swapping option, set to 1 to swap user flash banks after boot (see *Section 7.3.11*). If BOOT_LOCK corresponding to TZEN state (SEC/NS) is active, the value in SWAP_BANK is fixed, read-only.

When STMicroelectronics delivers the device, the PRODUCT_STATE is Open, BOOT_LOCK is not set (0xC3) and the BOOT_UBE is set to user flash (0xB4). Addresses are SECBOOTADD = 0x0C00 0000, NSBOOTADD = 0x0800 0000.

Refer to *Section 7.11* for details.

7.4.7 Specific rules for modifying option bytes

On top of OPTLOCK bit and register access rules, there are other protections for selected security-sensitive option byte fields.

Different option bytes can be modified simultaneously, but if they rely on each other for protection, both states are checked. For example, when trying to modify PRODUCT_STATE and TZEN simultaneously, resulting state must be coherent with the rules. With few exceptions, listed in this section, failing to uphold the rules results in raising OPTCHANGEERR flag (*Section 7.9.12* for additional details).

Table 56. Specific modifying rules

Option byte	HDPL	TZ secure	Value	Product state
PRODUCT_STATE	1(1)	Some values only when TZ is enabled	Set of possible transitions	Set of possible transitions (*Table 48*)
HDP	1(2)	(3)	-	Refer to *Table 57*
TZEN	-	-	-	Regression, Open or Provisioning
EPOCH	-	-	PRG > CUR	Regression
EPOCH_NS	-	-	PRG > CUR	NS-Regression, Regression
SECWM	-	Secure mode only(2)	-	Refer to *Table 57*
BOOT_UBE	-	-	-	Open or Provisioning, SECBOOT_LOCK disabled
SECBOOTADD	-	Secure mode only(2)	-	
NSBOOTADD	-	-	-	Open or Provisioning, NSBOOT_LOCK disabled
LOCKBL	-	-	One way switch(2)	-
SWAP_BANK	-	Fixed if BOOT_LOCK corresponding to TZEN is set	-	-
SECBOOT_LOCK	-	Secure mode only(2)	-	Open, Regression or Provisioning to unlock
NSBOOT_LOCK	-	-	-	

1. Most transitions are possible regardless of HDPL, only a few require specific HDPL, see text below.
2. No OPTCHANGEERR raised in violation of this.
3. Dash means there is no limitation from this side.

Even in the closed PRODUCT_STATE progression, some OBs can still be modified, if all the other constraints are satisfied. An overview is presented in *Table 57*.

Table 57. OB modifiable in closed product

PRODUCT_STATE	OBs that can be modified
TZ-Closed	SWAP_BANK, LOCKBL, PRODUCT_STATE, SECWM, HDP
Closed	SWAP_BANK, LOCKBL, PRODUCT_STATE
Locked	SWAP_BANK, LOCKBL

Specific rules must be respected to update the following OB:

- **PRODUCT_STATE**

  PRODUCT_STATE transitions follow a state machine with two types of transitions. Locking down the product is allowed without restriction. Opening the product is possible only using a debug interface and following a digital signature verification. The regression to a less secure state results in the erase of the protected content. More details are given in *Section 7.6.11*.

  Summary: Selected changes are possible only in HDPL1. Some states are accessible only when TZEN is enabled.
- **HDP**

  Can be modified only in HDPL1. Do not set it to overlap with flash high-cycle data area.
- **TrustZone access mode (TZEN)**

  Can be changed only in Open, Regression and Provisioning.
- **SEC_EPOCH and NS_EPOCH**

  The value programmed must be greater than current value.The increment is done in specific product states: Regression and NS-Regression.
- **Secure watermark area (SECWM1/2_STRT and SECWM1/2_END)**

  Can be changed only in secure mode (TZ_state = 0xB4). Automatically reset to default value when TZEN is enabled. Do not set it to to overlap with flash high-cycle data area.
- **BOOT_UBE**

  Available only on cryptography enabled devices. Can be changed only in product states open for debug like Open and also in Provisioning. SECBOOT_LOCK must be disabled to change.

- **SECBOOTADD**

  Can be changed only in Open and Provisioning. Locked by SECBOOT_LOCK. Automatically reset to default value when TZEN is enabled.
- **NSBOOTADD**

  Can be changed only in Open and Provisioning. Locked by NSBOOT_LOCK.
- **LOCKBL**

  Can be changed freely only in one direction. A permanent irreversible switch.
- **SWAP_BANK**

  Not modifiable when both TZEN and SECBOOT_LOCK are 0xB4 (set) or when TZEN = 0xC3 (disabled) and NSBOOT_LOCK is active (0xB4).
- **SECBOOT_LOCK**

  Can be changed only freely in locking direction. Unlock is possible in Open, Provisioning and Regression.
- **NSBOOT_LOCK**

  Can be changed only freely in locking direction. Unlock is possible in Open, Provisioning and Regression.

Note: For all user option bytes above: default values are loaded and Tamper is signaled when a double ECC error occurs during OBL.

7.5 Option bytes key (OBK) management

This section describes the key storage tied with SAES and OBK-HDPL value set by the SBS (refer to *Section 14.3.7: SBS hardware secure storage control*). The OBKs are stored in 128 bits and protected by 9-bit ECC (SEC/DED). They are written alternatively in two sectors.

7.5.1 OBK loading

OBKs are memory mapped, and accessible through the main AHB bus (C-Bus), starting from address 0x0FFD 0000. A 9-bit ECC is associated to each 128-bit data flash word.

Note: Read access is allowed in the current and alternate sector, except for the last address of the current and alternate sector. In case of read access, no error is reported but the read data is always 0x0 (see Section 7.6.12).

7.5.2 OBK access per HDPL level

Table 58 describes the option byte key areas. The key storage is not dedicated to a particular key, and the usage is defined by the application.

An option byte key can be accessed only if the OBK-HDPL (set in SBS) matches the HDPL associated to the storage offset, indicated below (refer to *Section 14.3.7: SBS hardware secure storage control*). If this is not the case, an OBKERR error is raised.

Table 58. Option bytes key area

OBK-HDPL	Address offset start	Address offset end	Comment
-	0x0000	0x00FF	Reserved
1	0x0100	0x08FF	OEMiRoT keys

Table 58. Option bytes key area (continued)

OBK-HDPL	Address offset start	Address offset end	Comment
2	0x0900	0x0BFF	uRoT, OS or secure application
3	0x0C00	0x17FF	HDPL 3 secure keys
3	0x1800	0x1FEF	HDPL 3 nonsecure keys

7.5.3 OBK programming sequence

The sequence to write OBK is the same as a write to main flash except that the “alternate sector” (ALT_SECT) bit must be set to write in the alternate OBK sector. The ALT_SECT bit is checked each time a write access is received. If it does not match the one stored in the write buffer, an error is raised.

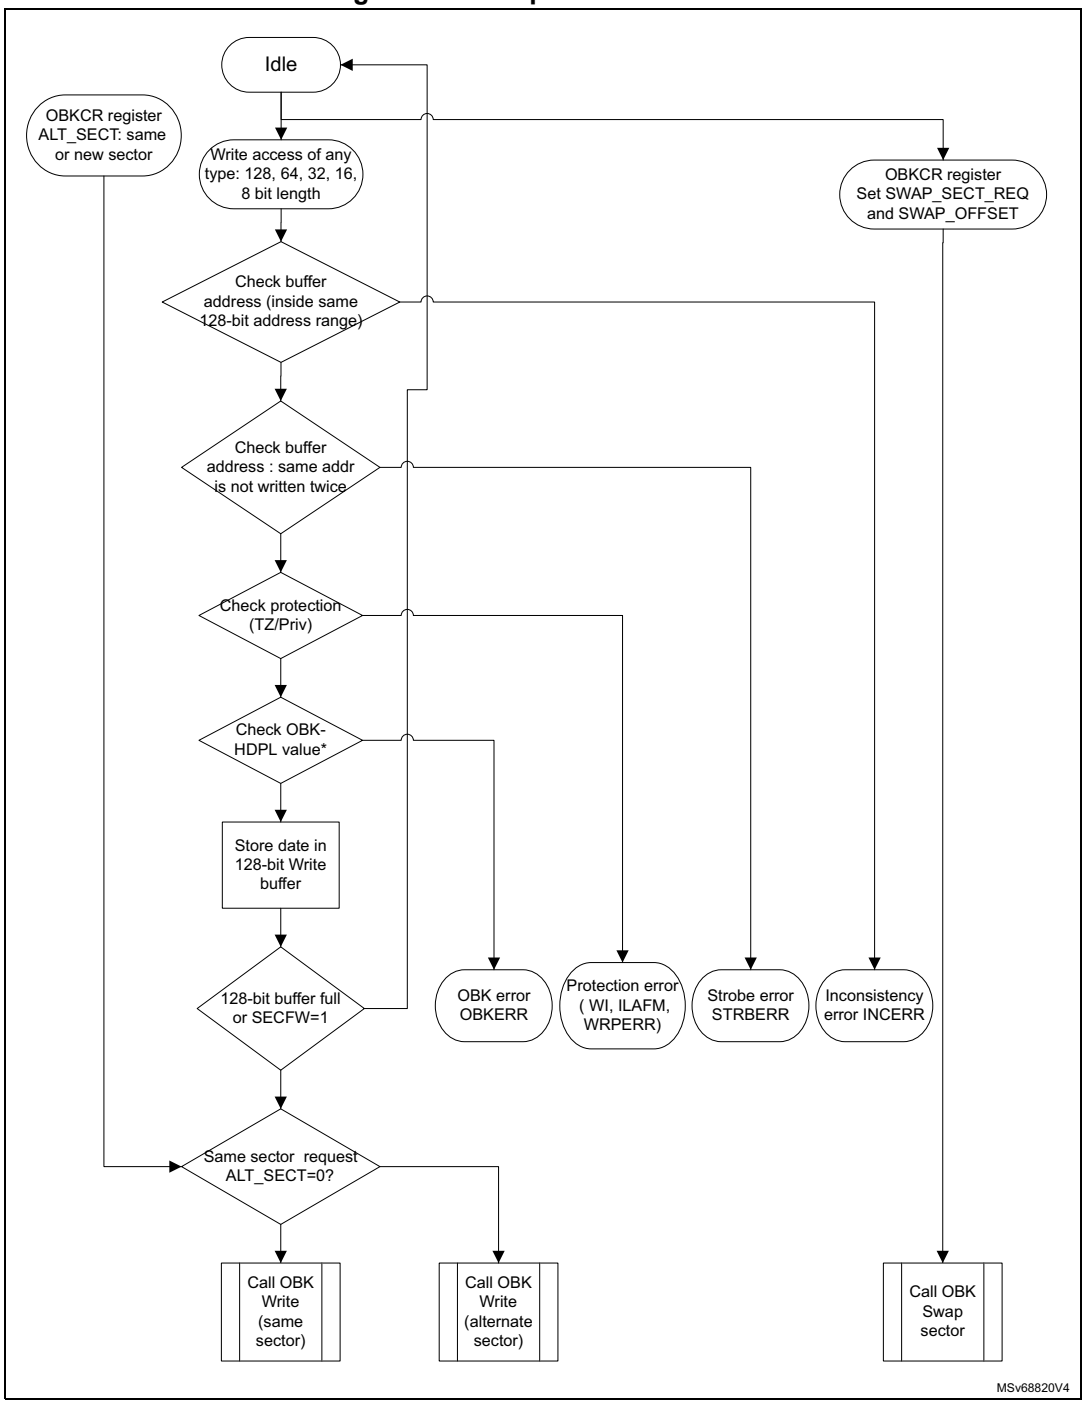
Note: Before writing in the alternate OBK sector the user must ensure that the whole key space (128, 256, or 512 bits) is free, by reading the alternate OBK sector.

If the alternate sector is not free, erase the sector using the command ALT_SECT_ERASE.

Secure programming method

Using the secure register if TrustZone is active (TZ_STATE = 0xB4):

1. Program the ALT_SECT bit.
2. Make sure protection mechanism does not prevent programming (TZ, PRIV and OBK-HDPL).
3. Check that no memory operations are ongoing by checking the BSY and DBNE bits in the FLASH_SECSR register and that the write buffer is empty by checking the WBNE bit in the FLASH_SECSR register.
4. Check and clear all the secure error flags due to previous operation.
5. Unlock the FLASH_SECCR register only if this register is not already unlocked, as described in *Section 7.6.7*.
6. Enable write operations by setting the SECPG bit in the FLASH_SECCR register.
7. Write one flash-word corresponding to 16-byte data starting at 16-byte aligned address.



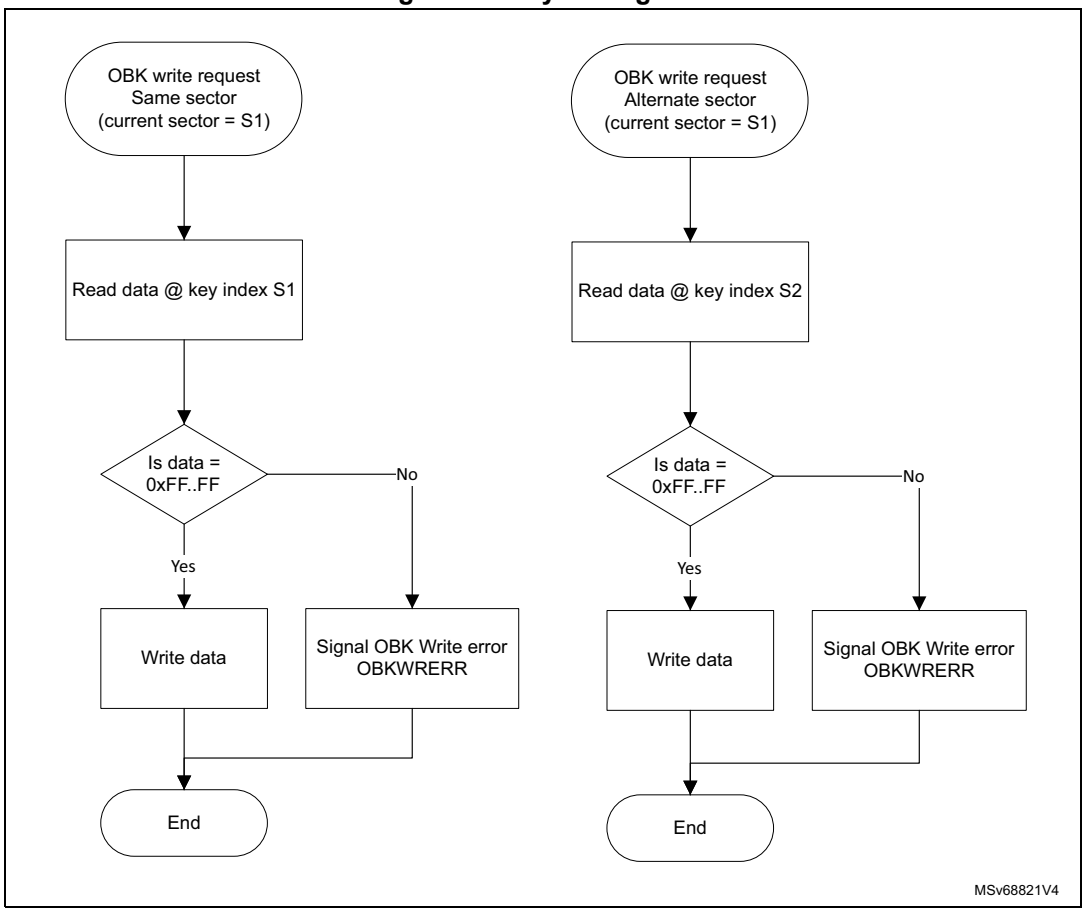
Note: WBNE flag indicates if the 128-bit write buffer is waiting for new data.

Note: No erase request, options change request, OBK swap sector or OBK alternate sector erase is allowed between first write and the completion of flash write operation.

8. Wait for the BSY bit to be cleared in the corresponding FLASH_SECSR register.
9. Clear PG bit in FLASH_SECCR register if there is not any programming request anymore in the bank.

If step 7 is executed incrementally (byte per byte), the write buffer can become partially filled. In this case the application software can decide to force-write what is stored in the write buffer by using FW bit in FLASH_SECCR register. In this particular case, the unwritten bits are automatically set to 1. If no bit in the write buffer is cleared to 0, the FW bit has no effect.

Figure 32. OBK protection checks



7.5.4 OBK programming finite state machine

When the OBK write buffer is filled, the OBK programing is launched automatically in the current OBK sector or in the alternate OBK sector, depending upon the ALT_SECT bit.

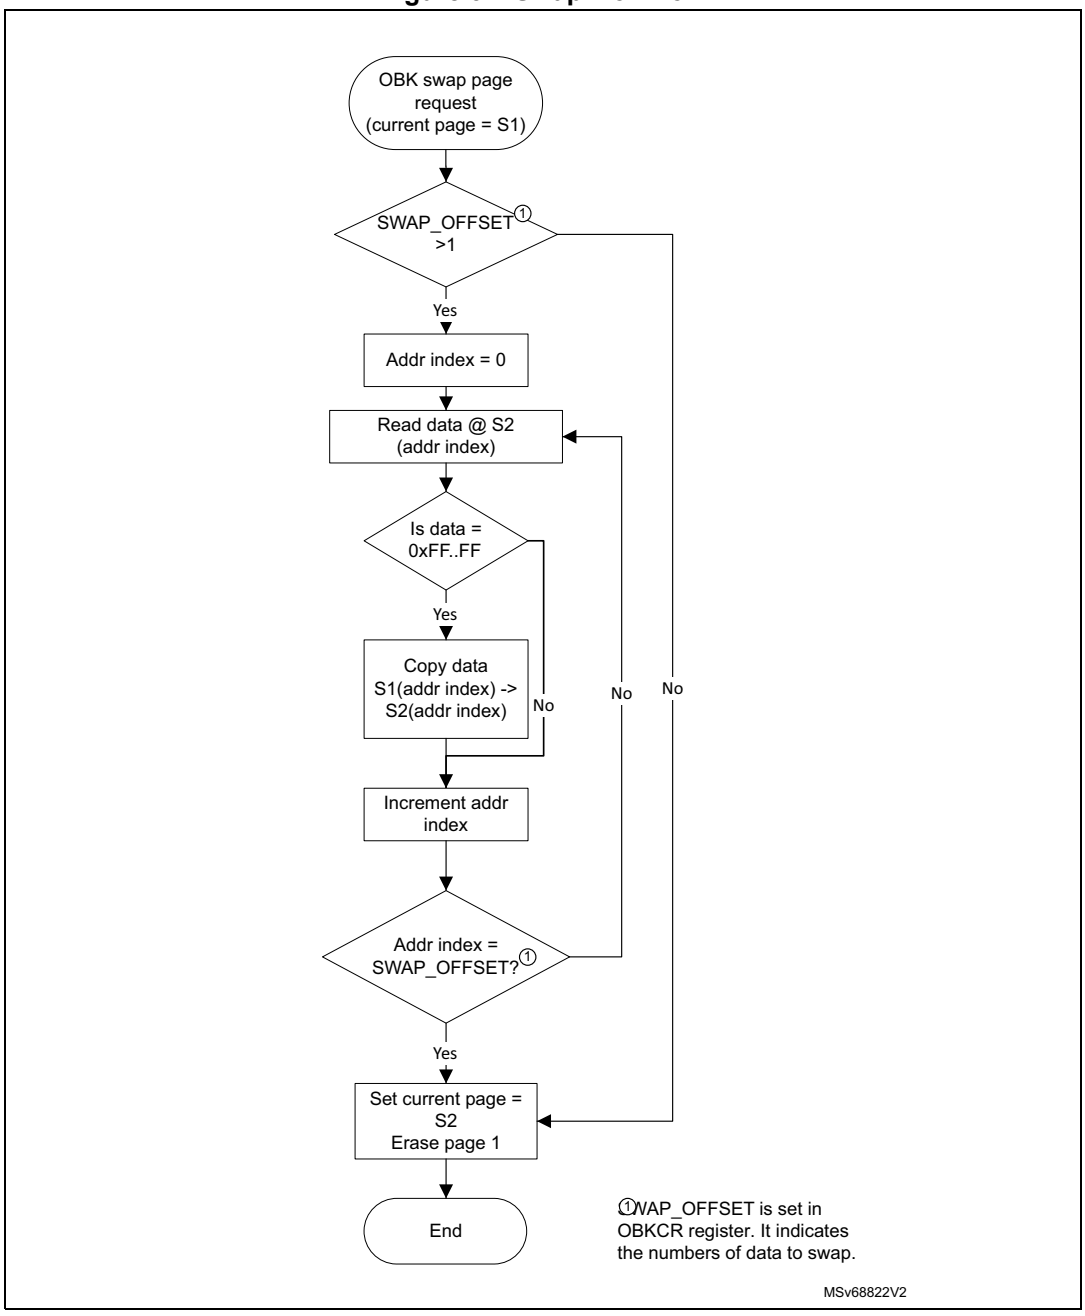
If the address is not virgin, the OBKWRERR is raised.

Figure 33. Key writing flow

7.5.5 OBK swap sector

The user can request a swap of the option byte keys by setting the bit SWAP_SECT_REQ in the NS/SECOBKCFGR register. The number of keys swapped is defined by the SWAP_OFFSET in NS/SECOBKCFGR register.

Swap is limited by OBK-HDPL value, the following SWAP_OFFSET values are permitted:



- OBK_HDPL1_OFFSET = 144
- OBK_HDPL2_OFFSET = 192
- OBK_HDPL3SEC_OFFSET = 384
- OBK_HDPL3NS_OFFSET = 511

The programming sequence is the following:

1. Check that no memory operations are ongoing by checking the BSY and DBNE bit in the FLASH_SEC/NSSR register and that the write buffer is empty by checking the WBNE bit in the FLASH_SEC/NSSR register.
2. Check and clear all the secure/nonsecure error flags due to previous operation.
3. Unlock NS/SECOBKCFGR register if not unlocked already thanks to FLASH_NS/SECOBKKEYR.

4. Define the numbers of keys to be swapped thanks to SWAP_OFFSET field in NS/SECOBKCFGR. SWAP_OFFSET must be equal to or greater than OBK_HDPL<N-1>_OFFSET.
5. Set bit SWAP_SECT_REQ in NS/SECOBKCFGR.
6. Wait for BSY bit to be cleared. In case of error OBKERR flag is set.
7. SWAP_SECT_REQ is cleared automatically at the end of the operation or in case of error.

Figure 34. Swap workflow

While the OBK SWAP operation is ongoing, the BSY flag is set and no other operation (write, erase, user opt change) can be launched in parallel.

7.5.6 OBK alternate sector erase

The user can request the erase of the alternate OBK sector by setting the bit ALT_SECT_ERASE in the FLASH_NS/SECOBKCFGR register.

The programming sequence must be:

1. Check that no memory operations are ongoing by checking the BSY and DBNE bits in the FLASH_SEC/NSSR register and that the write buffer is empty by checking the WBNE bit in the FLASH_SEC/NSSR register.
2. Check and clear all the secure/nonsecure error flags due to previous operation.
3. Set bit ALT_SECT_ERASE in NS/SECOBKCFGR.
4. Wait for BSY bit to be cleared.
5. ALT_SECT_ERASE is cleared automatically at the end of the operation or in case of error.

7.6 FLASH security and protections

To protect sensitive information against unwanted operations (such as reading confidential areas, illegal programming of immutable sectors, or malicious flash memory erasing), the FLASH implements the following protection mechanisms:

- TrustZone backed watermark and block security protection
- Temporal isolation protection (HDP)
- Configuration protection
- User flash write protection
- Device nonvolatile security life cycle and application boot state management
- OTP locking

The microcontroller can have TrustZone active (TZ_STATE = 0xB4) or not (TZ_STATE = 0xC3).

While TrustZone is active the flash memory can be accessed in four basic modes:

- nonsecure and unprivileged
- nonsecure and privileged
- secure and privileged
- secure and unprivileged

While TrustZone is disabled, only two modes are possible:

- nonsecure and unprivileged
- nonsecure and privileged

The flash interface evaluates the access restrictions in the following order:

1. TrustZone security
2. Write protection (for write access)
3. HDP
4. Privilege

7.6.1 TrustZone security protection

The global TrustZone system security is activated by setting the TZEN option in the FLASH_OPTSR2_PRG register. The actual state of TZ is however determined by the SBS and the setting of TZ_STATE (refer to *Section 14.3.5: SBS boot control*).

When TrustZone is active (TZ_STATE = 0xB4), additional security features are available:

- Secure watermark-based user options bytes defining secure areas
- Secure or nonsecure block-based areas can be configured on-the-fly after reset. This is a volatile secure area
- Additional product states associated with **closed_secure** provide protection of secure domain against external access (debug or bootloader)
- Erase or program operation can be performed in secure or nonsecure mode with associated configuration bit. When the TrustZone is disabled (TZ_STATE = 0xC3), the above features are deactivated and all secure registers are RAZ/WI.

Activating TrustZone security

When the TrustZone is activated (TZ_STATE = 0xB4), the SECBOOTADD and the secure watermark areas are set to a secure default value. Default settings are also used in case of corrupted configuration. In this default state, user flash memory is secure (see *Table 59*).

Table 59. Default secure watermark

Secure watermark in case of configuration error	Security attribute
SECWMx_STRT = 0 SECWMx_END = 0x7F(1)	All flash memory is secure

1. Default and maximum values depend upon the total number of sectors in the user flash memory.

Illegal access generation

A nonsecure access to a secure flash memory area is RAZ/WI, it generates an illegal access event. An illegal access interrupt is generated if the FLASHIE illegal access interrupt is enabled in the TZIC_IER2 register.

A nonsecure access to a secure flash register generates an illegal access event. An illegal access interrupt is generated if the FLASH_REGIE illegal access interrupt is enabled in the TZIC_IER2 register.

Table 60. Flash memory TZ protection summary

TZ protection (TZ_STATE = 0xB4)		Main flash	
		Nonsecure sector	Secure sector
Secure	Fetch	BUS ERROR	OK
	Read	RAZ, ILAFM	
	Write	WI, WRPERR, ILAFM	If not WRP: OK else: WI, WRPERR
	Erase		

Table 60. Flash memory TZ protection summary (continued)

TZ protection (TZ_STATE = 0xB4)		Main flash	
		Nonsecure sector	Secure sector
Nonsecure	Fetch	OK	BUS ERROR
	Read		RAZ, ILAFM
	Write	If not WRP: OK else: WI, WRPERR	WI, WRPERR, ILAFM
	Erase		

Table 61. TZ protection and bank or mass erase summary

TZ protection (TZ_STATE = 0xB4)	Main flash		
	Nonsecure flash	Secure flash	Mix of secure and nonsecure
MES	WI, WRPERR, ILAFM	OK	WI, WRPERR, ILAFM
MENS	OK	WI, WRPERR, ILAFM	WI, WRPERR, ILAFM

Deactivate TrustZone security

Reversing of the TZ setting in OB (TZEN) is possible when the product state is ST-RoT-Ready or Provisioning. Deactivating TZEN from other states requires full regression (Regression state).

When the TrustZone is deactivated (TZ_STATE = 0xC3) after option bytes loading, the following security features are deactivated:

- Watermark-based secure area (refer to *Watermark-based secure flash area protection*)
- block-based secure area (refer to *Section 7.6.3*)
- Secure interrupts (refer to *Section 7.9.11*)
- All secure registers are RAZ/WI.

Watermark-based secure flash area protection

When TrustZone security is active (TZ_STATE = 0xB4), a part of the flash memory can be protected against nonsecure read and write accesses. Up to two different nonvolatile secure areas can be defined by option bytes and can be read or written by a secure access only: one area per bank can be selected with a sector granularity.

The secure areas are defined by a start sector offset and end sector offset using the SECWMx_STRT and SECWMx_END option bytes. These offsets are defined in the secure watermark registers address registers *FLASH security watermark for Bank1 (FLASH_SECWM1R_CUR)*, *FLASH security watermark for Bank2 (FLASH_SECWM2R_CUR)* and modified by corresponding FLASH_XXX_PRG registers.

The SECWMx_STRT and SECWMx_END option bytes can be modified only by secure firmware.

Table 62. Secure watermark-based area

Secure watermark option bytes values (x = 1, 2)	Secure watermark protection area
SECWMx_STRT > SECWMx_END	Nonsecure area
SECWMx_STRT = SECWMx_END	One sector defined by SECWMx_STRT is secure watermark-based protected
SECWMx_STRT < SECWMx_END	The area between SECWMx_STRT and SECWMx_END is secure watermark-based protected

Caution: Switching a memory area from secure to nonsecure does not erase its content. The user secure software must perform the needed operation to erase the secure area before switching an area to nonsecure attribute whenever is needed. It is also recommended to flush the instruction cache.

7.6.2 Hide protection (HDP)

The HDP area is independent of the flash watermark-based secure area. One nonvolatile secure hide protection (HDP) area per bank can be defined with a sector granularity. Access to the hide protection area can be denied by progressing the HDPL level in the SBS.

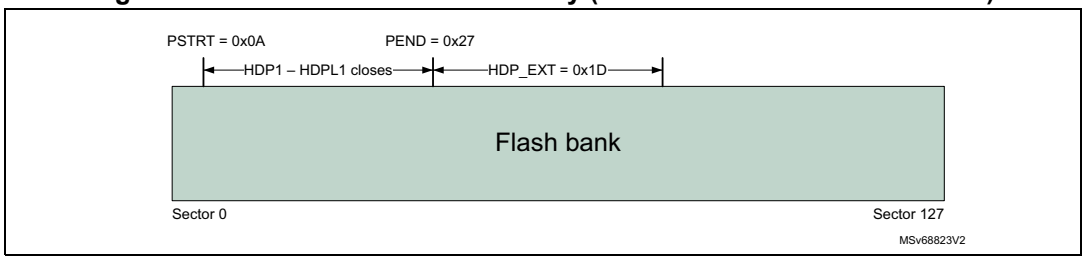
When the HDPL = 1, no user flash is protected by the HDP. With HDPL ≥ 2 the user OB defined HDP area in each bank is closed. No read, write, fetch or erase is allowed in the HDP area.

The HDP area can be extended, the extension setting is only a register value, not stored in OB. With HDPL = 3 the HDP area remains activated and the extension is added. If extension is added while the base user OB defined area is not active, the extension covers one more sector, because HDPx_END sector is also protected.

The HDPL level can be only cleared by a system reset, there is no means to deactivate the HDP area.

The protected HDP area is defined by setting its size using start and end sectors in a similar way as the secure watermark.

The size of the inaccessible area can be extended using register FLASH_HDPEXTR values HDPx_EXT, representing the number of sectors added to the HDP area (past the HDPx_END sector). The volatile HDPx_EXT value can be increased, but cannot decrement.



If HDPx_STRT > HDPx_END the extension covers (HDPx_EXT + 1) size area between sectors marked by HDPx_END and HDPx_END + HDPx_EXT.

By default HDPx_END is set to 0 and HDPx_STRT is set to 1. This means that the HDP area in user flash has a 0 size, and extends from the flash start address (first sector).

For example, to protect area by HDP from the address 0x0801 4000 (included) to the address 0x0804 FFFF (included):

- For physical Bank1, the option byte registers must be programmed with:
  - HDP1_STRT = 0x0A
  - HDP1_END = 0x27

Figure 35. HDP[a] in user flash memory (STM32H562/563/573xx devices)

- Once the HDPL is incremented to 2, the marked area becomes inaccessible. The HDPL = 2 code then sets the extension size to 29. Once the HDPL is incremented to 3, even the extension area becomes inaccessible.
- Alternatively, if:
  - HDP1_END = 0, HDP1_START = 1, HDPx_EXT = 1:
    Sector 0 and Sector 1 are HDP protected.
  - HDP1_END = 2, HDP1_START = 7, HDPx_EXT = 3 (a rather unusual example):
    Sectors 2 to 5 are HDP protected.
- If the two banks are swapped, the protection defined to physical Bank1 remains on the physical Bank1, unaffected by swapping. Separate protection applies to physical Bank2 and the option bytes registers must also be programmed with:
  - HDP2_STRT = 0x0A
  - HDP2_END = 0x27

Note: For more details on the bank swapping mechanism, refer to Section 7.6.6. The values have an upper limit, 127 for STM32H562/63/73xx devices, 31 for STM32H523/33xx devices.

Table 63. Secure hide protection

HDPx watermark option byte values (x = 1, 2)		Hide protection area
HDPL ≤ 1	-	No inaccessible HDP area in user flash memory
HDPL = 2	HDPx_END < HDPx_STRT	No inaccessible HDP area in user flash memory
	HDPx_END = HDPx_STRT	Exactly one sector is protected by HDP
	HDPx_END > HDPx_STRT	The area between HDPx_STRT and HDPx_END is HDP protected.
HDPL = 3	HDPx_END < HDPx_STRT and HDPx_EXT = 0	No inaccessible HDP area in user flash memory
	HDPx_END ≥ HDPx_STRT or HDPx_EXT > 0	The area between min (HDPx_STRT, HDPx_END) and (HDPx_END + HDPx_EXT) is HDP protected

a. The HDP works analogically, the number of sectors is the only differentiator.

Table 64. HDP protections summary

HDP protection	User flash			
	Access to OB HDP area		Access to EXT HDP area	
	HDPL 2 or 3	HDPL1	HDPL3	HDPL1 or HDPL 2
Fetch	BUS ERROR	OK	BUS ERROR	OK
Read	RAZ		RAZ	
Write	WI, WRPERR	If not WRP: OK Else: WI, WRPERR	WI, WRPERR	If not WRP: OK Else: WI, WRPERR
Erase (mass erase)				

7.6.3 Block-based secure flash memory area protection

Any sector can be programmed on-the-fly as secure or nonsecure using the block-based configuration registers. FLASH_SECBB1x/FLASH_SECBB2x registers are used to configure the security attribute for, respectively, sectors in Bank1/Bank2.

When the sector security attribute bit SECBByx[i] is set, the security attribute is the same as the secure watermark-based area. The secure sector is accessible only by a secure access.

If the SECBBy[i] bit is set or reset for a sector already included in a secure watermark-based area, the sector keeps the watermark-based protection security attributes.

To modify a block-based sector security attribute, it is recommended to:

- Check that no flash operation is ongoing on the related sector.
- Add an ISB instruction after modifying the sector security attribute SECBByx[i].

Caution: Switching a sector from secure to nonsecure does not erase the content of the associated sector. User secure software must perform the needed operations before switching to non-secure attribute:

- Erase sector content.
- Invalidate the instruction cache.

Note: For SECBByx[i] access control, refer to Table 65.

Execute protection for S-Bus (AHB register bus) is done in AHB decoder, not in flash memory interface itself.

Table 65. Secure configuration block-based registers access conditions

Access			Corresponding sector privilege status	Sector setting in SECBBxy
Fetch	Secure/ nonsecure	Privilege/ unprivilege	-	BUS ERROR
Read			-	OK
Write	Secure	Privilege	-	OK
		Unprivilege	0	OK
			1	WI
	Nonsecure	Privilege/ unprivilege	-	WI, ILAP

7.6.4 Block-based privileged flash memory area protection

Any sector can be programmed on-the-fly as privileged or unprivileged using the block-based configuration registers. FLASH_PRIVBB1x and FLASH_PRIVBB2x registers are used to configure the privilege attribute for, respectively, sectors in Bank1 and Bank2.

When the sector privilege attribute PRIVBByx[i] bit is set, the sector is accessible only by a privileged access. An unprivileged sector is accessible by a privileged or unprivileged access.

To modify a block-based privilege attribution, it is recommended to:

- Check that no flash operation is ongoing on the related sector.
- Add an ISB instruction after modifying the sector security attribute PRIVBByx[i].

Caution: Switching a sector from privileged to unprivileged does not erase the content of the associated sector.

Table 66. Privilege protection summary

Access (TZ not relevant)		Main flash	
		Unprivileged sector	Privileged sector
Privilege	Fetch	OK	
	Read		
	Write		
	Erase		
Unprivilege	Fetch	OK	RAZ
	Read		
	Write		WI, WRPERR
	Erase		

Table 67. Privilege and mass or bank erase

Access (TZ state not relevant)	Main flash		
	Unprivileged FLASH	Privileged FLASH	Mix unprivileged and privileged FLASH
MEP	OK		
MENP	OK	WI, WRPERR	

Note: For PRIVBByx[i] access control, refer to Table 68 and Table 69.

Table 68. Privilege configuration register access conditions (TZ enabled)

Access			Corresponding sector secure status(1)	Sector setting access in PRIVBBxy
Fetch	Privileged/ unprivileged	Secure/ nonsecure	-	BUS ERROR
Read			-	OK (all sectors)

Table 68. Privilege configuration register access conditions (TZ enabled) (continued)

Access			Corresponding sector secure status(1)	Sector setting access in PRIVBBxy
Write	Privileged	Secure	-	OK (all sectors)
		Nonsecure	NS	OK (only the sector corresponding to the bit)
			S	WI (only the sector corresponding to the bit)
	Unprivileged	Secure/ nonsecure	-	WI

1. Either watermark or block-based.

Table 69. Privilege configuration register access conditions (TZ disabled)

Access		Sector setting access in PRIVBBRxy
Fetch	Privileged/ unprivileged	BUS ERROR
Read		OK
Write	Privileged	OK
	Unprivileged	WI

7.6.5 Flash memory register privileged and unprivileged modes

The flash registers can be read and written by privileged and unprivileged accesses depending on the SPRIV and NSPRIV bits in *FLASH privilege configuration register (FLASH_PRIVCFGR)*:

- When the SPRIV (respectively NSPRIV) bit is reset, all secure (respectively non-secure) flash registers can be read and written by both privileged or unprivileged access.
- When the SPRIV (respectively NSPRIV) bit is set, all secure (respectively nonsecure) flash registers can be read and written by privileged access only. Unprivileged access to a privileged registers is RAZ/WI.

The registers related to key storage (FLASH_NSOBKCFGR, FLASH_SECOBKCFGR, FLASH_NSOBKKEYR, FLASH_SECOBKEYR) are exceptions to this rule and can be only accessed in privilege, regardless of other settings.

The next table summarizes flash registers access control.

Table 70. Flash register accesses(1)

Access			Nonsecure register		Secure register	
			NSPRIV = 1	NSPRIV = 0	SPRIV = 1	SPRIV = 0
X	Secure/ nonsecure	Privileged/ unprivileged	Bus error			
R/W	Secure	Privileged	OK			
R/W		Unprivileged	RAZ, WI	OK	RAZ, WI	OK

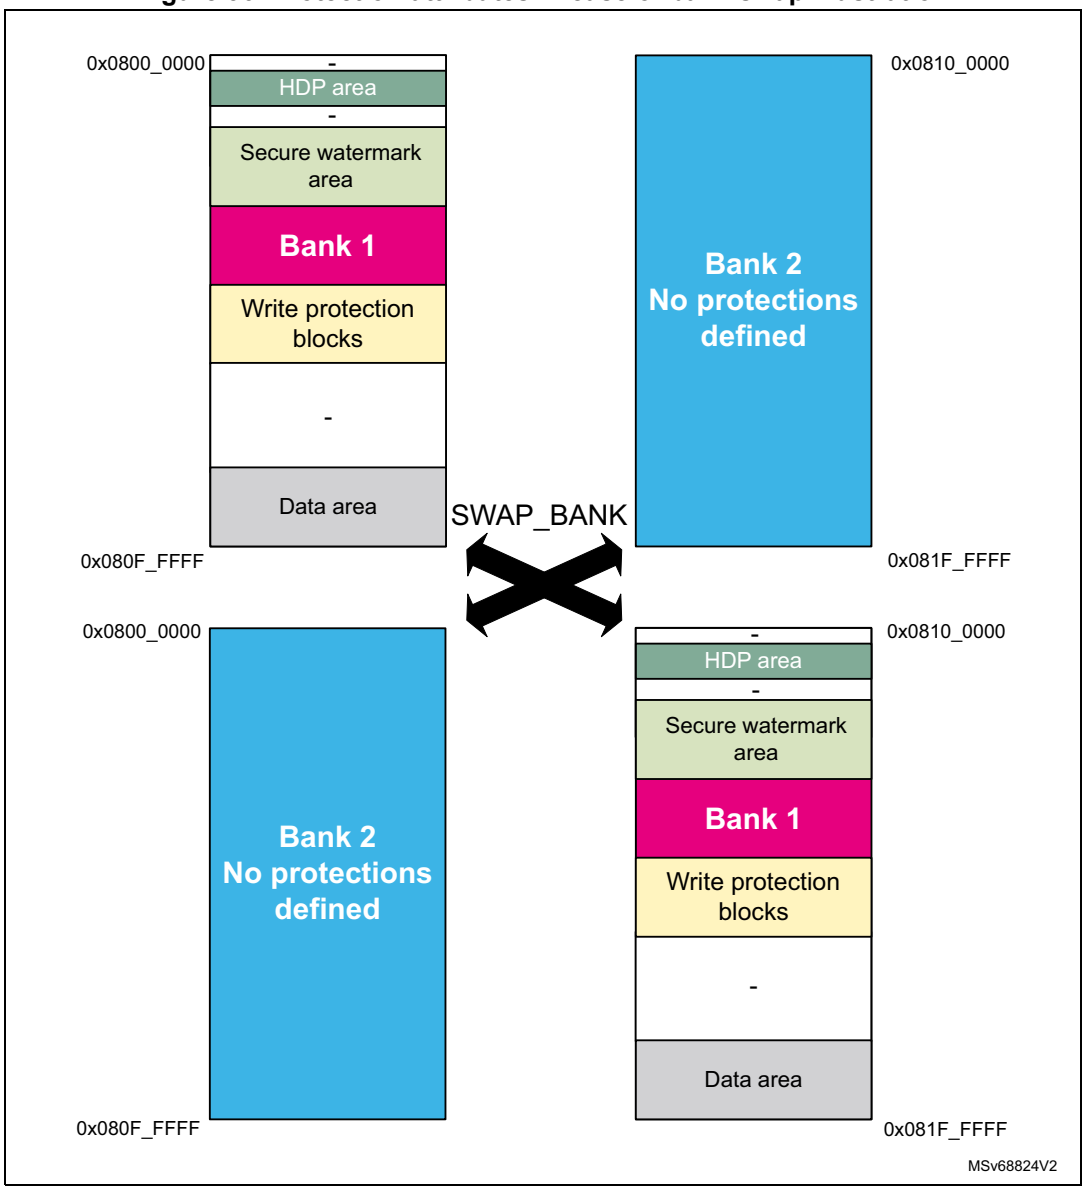
Table 70. Flash register accesses(1) (continued)

Access			Nonsecure register		Secure register	
			NSPRIV = 1	NSPRIV = 0	SPRIV = 1	SPRIV = 0
R/W	Nonsecure	Privileged	OK		RAZ, WI, ILAP	
R/W		Unprivileged	RAZ, WI	OK		

1. Some registers are privilege only, not configurable.

7.6.6 Flash memory banks attributes in case of bank swap

The SWAP_BANK option bit modifies the address of each bank in the memory map. When SWAP_BANK is reset, flash Bank1 is mapped at the lower address range. When SWAP_BANK is set, flash Bank1 is mapped at the higher address range. flash bank attributes follow their bank contents so there is no need to modify their setting registers when swapping banks:



- Flash secure watermark x FLASH_SECWMx
- Flash write protection sector group FLASH_WRPSG (refer to *Section 7.6.8*)
- Hide protection in FLASH_HDPx registers
- Flash secure block based bank x register y FLASH_SECBBxy
- Flash privilege block based bank x register y FLASH_PRIVBBxy
- The data area configuration FLASH_EDATA

The SWAP_BANK is rendered immutable by setting BOOT_LOCK in the user OB. If TZEN is enabled, then SECBOOT_LOCK locks the option. If TZEN is disabled, then NSBOOT_LOCK locks the SWAP_BANK option.

Note: The BK_ECC bit in the FLASH ECC detection register (FLASH_ECCDETR) and FLASH ECC correction register (FLASH_ECCCORR), BKSEL bit in FLASH nonsecure control register (FLASH_NSCR) and BKSEL bit in FLASH secure control register (FLASH_SECCR) always refers to Bank1 (respectively Bank2) when it is low (respectively high), regardless of the SWAP_BANK value.

Figure 36 shows how security attributes and protections behave in case of bank swap.

Figure 36. Protection attributes in case of bank swap illustration

7.6.7 Flash memory configuration protection

The memory uses hardware mechanisms to protect the following assets against unwanted or spurious modifications (such as software bugs):

- Option bytes change
- Write operations
- Erase commands
- Interrupt masking

The memory configuration registers protection is summarized in *Table 71*. Registers not present in this table are not protected by a key.

Table 71. Flash interface register protection summary

Register name	Unlocking register	Protected asset
FLASH_NSCR	FLASH_NSKEYR	Write/erase control
FLASH_SECCR	FLASH_SECKEYR	Secure write/erase control
FLASH_OPTCR + all _PRG registers	FLASH_OPTKEYR	Flash bank option byte words change
FLASH_NSOBKCFGR	FLASH_NSOBKKEYR	Flash OBKey storage manipulation
FLASH_SECOBKCFGR	FLASH_SECOBKKEYR	

7.6.8 Write protection

The purpose of the write protection is to prevent unwanted modifications to code and/or data.

Any group of four consecutive 8-Kbyte sectors can be independently write-protected or unprotected by clearing/setting the corresponding WRPSGn1/2 bit in the FLASH_WRPSG1/2 register (see *FLASH write sector group protection for Bank1 (FLASH_WRP1R_CUR)* and *FLASH write sector group protection for Bank2 (FLASH_WRP2R_CUR)*).

A write-protected group of sectors cannot be erased nor programmed. As a result, a bank erase cannot be performed if one group of sectors is write-protected, unless a PRODUCT_STATE transition to OPEN is triggered (erasing the whole user flash memory).

Note: Write protection errors are documented in Section 7.9.

7.6.9 Flash high-cycle data protections

The memory can be configured to have 96-Kbyte memory area with high-cycling capability (100 kcycles) to store data and emulate EEPROM, see *Section 7.3.10*.

Option byte controlled security features for user flash memory prevent sectors from being used as high-cycle data area. No OPTCHANGEERR is raised in case of setting conflict, it only makes the sectors unusable. Details are listed in *Table 72*.

Volatile settings using FLASH_SECBBxx and FLASH_PRIVBBxx can be applied. In this case the security setting of user flash sector 127 applies to flash high-cycle data sector 0 and so on, as indicated in *Figure 27*, *Figure 28*, and *Figure 31*.

Volatile settings of HDP extension that extends into sectors of data area cause the data area to be inaccessible.

Table 72. High-cycle area protection summary: access to data area address range

<table>
<tr><th colspan="2" rowspan="3">TZ protection (when TZ_STATE = 0xB4)(1)</th><th colspan="6">Data sector enabled</th><th rowspan="3">Data sector not enabled</th></tr>
<tr><th rowspan="2">HDP protected</th><th rowspan="2">OB secure area</th><th colspan="2">SecBB protected</th><th colspan="2">NS sector</th></tr>

</table>

7.6.10 Life cycle management

Nonvolatile or debug states are determined by the product state set by user option bytes. Debug possibility and possibility to change selected security settings are related to it. While the state is stored in the OB, it is the SBS that controls the debug policy.

OBK storage access conditions are unaffected by the PRODUCT_STATE, but keys can be evicted in regression transitions.

HDP works regardless of the debug state. Even in debug the HDP area is hidden when HDPL increments.

The following states are defined:

Table 75. Product states, debug states and debug policy

PRODUCT_STATE	Code in OB	Description
Open	0xED	User flash open (TZ secure and nonsecure open). External access (debug) N and NS enabled (~RDP0).
Provisioning	0x17	Provisioning - Immutable root of trust is being installed. Open if TZEN = 0xC3. The debug is opened in HDPL3-NS.
iRoT-Provisioned	0x2E	The immutable root of trust is installed (~RDP 0.5).
TZ-Closed	0xC6	State for debugging the NS application. Debug is restrained to nonsecure areas.
Closed	0x72	State for running a secure application. Debug disabled, regression is possible.
Locked	0x5C	Transition to other state, policy change or debug not permitted(1).
Regression	0x9A	The temporary state initiated by the debug authentication system in transition to Open.
NS-Regression	0xA3	The temporary state initiated by the debug authentication system in transition to TZ-Closed.

1. The same situation is Closed state with incorrect or not defined debug certificates.

1. No debug protection

Read, program and erase operations into the flash main memory area are possible. Least restriction on the option bytes.

2. Nonsecure debug only

All read and write operations (if no write protection is set) from/to the nonsecure flash memory are possible. The debug access to secure area is prohibited. Debug access to nonsecure area remains possible.

The following rules are enforced:

- User mode: code executing in user mode (boot flash) can access flash main memory and option bytes with all operations (read, erase, program).
- Nonsecure debug mode: The secure flash memory areas are inaccessible; the nonsecure flash memory areas remain accessible for debug purpose.
- Boot RAM mode: boot from SRAM is not possible.
- Transition to Open state is possible with the consequence of flash mass erase and key slots revocation. Depends on debug unlock policy (see below).

3. Full product protection

All debug features are disabled and following rules enforced:

- User mode: code executing in user mode (boot flash) can access flash main memory and selected option bytes with all operations (read, erase, program).
- Boot RAM mode: boot from SRAM is not possible.
- Transition to TZ-Closed or Open state is possible with the consequence of flash mass erase and key slots revocation. Depends on debug unlock policy (see below).

7.6.11 Product state transitions

Progressing towards a more closed state is the normal product life cycle, that does not require security measures. Transition towards Open state is a regression, controlled by the debug authentication control. If debug unlock policy is set to “locked”, no regression is accepted. Locked state can be reinforced by invalidating the debug authentication certificates.

All transitions not listed in this chapter are invalid.

There is no restriction on reading the current product state.

Transitions in progress direction

Transition from Open to any of the closed states is matter of correct product configuration and provisioning. The transitions must be done in correct order.

The normal progression is:

- Open to Provisioning or iRoT-Provisioned
- Provisioning to iRoT-Provisioned
- Provisioning or iRoT-Provisioned to TZ-Closed, Locked or Closed
- TZ-Closed to Locked or Closed

Transition is managed either by a software running on the device, or directly, using a debug interface. Transitions from Closed are only possible by software running on the device. By software it is assumed that transitions are triggered by bootloader, or root-of-trust services, but generally any software running on the device can do a progress transition.

Transition to Open state

This transition is a full regression. The starting state is any except Open and Locked. The debug tools are used to authenticate debug regression access rights with the debug authentication library, running on the device in HDPL1 (refer to *Section 14.3.6: SBS debug control*). After verifying the credentials, it puts the device into intermediate state Regression. From this state the device regresses securely in HDPL0 to Open.

The transition has the following consequence:

- Epoch secure counter is incremented
- Key slots revocation
- Product state updated
- User options updated (security settings reset, TZEN reset)
- Flash memory mass erase
- Backup RAM erase is requested

Transition from closed to closed-secure debug state

This transition opens the device to authorize the debug of the nonsecure application software without compromising the security of the ROT functions.

The starting state is Closed. The debug tools are used to authenticate debug regression access rights with the debug authentication library, running on the device in the HDPL1 (refer to *Section 14.3.6: SBS debug control*). After verifying the credentials, it puts the device into intermediate state NS-Regression. From this state, the device regresses securely in HDPL0 to Closed.

The transition has the following consequence:

- Epoch nonsecure counter is incremented
- Nonsecure slots revocation
- Product state updated
- Flash memory sectors not covered by the secure watermark are erased
- Backup RAM erase is requested

Table 76. PRODUCT_STATE transitions

From	To(1)							
	Open	Provisioning	iRoT-Provisioned	TZ-Closed(2)	Closed	Locked	Regression	NS-Regression(2)
Open	-	OK	OK	X	X	X	X	X
Provisioning	X	-	OK	OK	OK	OK	OK (HDPL1)	X
iRoT-Provisioned	X	X	-	OK	OK	OK	OK (HDPL1)	X
TZ-Closed	X	X	X	-	OK	OK	OK (HDPL1)	X
Closed	X	X	X	X	-	X	OK (HDPL1)	OK (HDPL1)
Locked	X	X	X	X	X	-	X	X

Table 76. PRODUCT_STATE transitions (continued)

From	To[1]							
	Open	Provisioning	iRoT-Provisioned	TZ-Closed[2]	Closed	Locked	Regression	NS-Regression[2]
Regression	OK (HDPL0)	X	X	X	X	X	-	X
NS-Regression	X	X	X	OK (HDPL0)	X	X	X	-

1. X = transitions not permitted (OPTCHANGEERR raised), - = no change, OK = valid transitions.
2. To transition into this state, both the current and programmed values of TZEN must be enabled (TZEN = 0xB4), otherwise the change is ignored with OPTCHANGEERR.

In *Table 76*, X indicates transitions that are not permitted, a dash indicates no change, OK indicates valid transitions. Some transitions are possible only in correct HDPL provided in parenthesis. Attempts to do an illegal transition result in OPTCHANGEERR.

Incorrect PRODUCT_STATE (no OBL) is interpreted as Locked.

7.6.12 OBK protection

At the receipt of an OBK access (read/write/execute), secure and privilege attributes are first checked, followed by OBK-HDPL. The OBK-HDPL value must exactly match the HDPL assigned to the key location, otherwise OBKERROR flag is raised. Flash interface response is described in *Table 77*.

Table 77. TZ OBK protection summary

TZ protection (when TZ_STATE = 0xB4)	OBK access		
	No tamper		Tamper
	HDPL0/1/2/3	OBK selector	
XS	BUS ERROR	BUS ERROR	RAZ, WI
RS	OK if privilege, otherwise RAZ	RAZ	
WS	OK if privilege, otherwise WI, WRPERR	WI, if not privilege also WRPERR	
XNS	BUS ERROR	BUS ERROR	
RNS	RAZ, ILAFM	RAZ, ILAFM	
WNS	WI, WRPERR, ILAFM	WI, WRPERR, ILAFM	
Erase	NA	NA	NA

Table 78. OBK protection summary with TZ disabled

TZ protection (when TZ_STATE = 0xC3)	OBK access		
	No tamper		Tamper
	HDPL1/2/3	OBK selector	
XNS	BUS ERROR	BUS ERROR	RAZ, WI
RNS	OK if privileged, otherwise RAZ	RAZ	
WNS	OK if privilege, otherwise WI, WRPERR	WI if privileged, otherwise WI, WRPERR	
Erase	NA	NA	NA

Note: Cacheable access is managed at system level and not in the flash interface. The MPU must be configured to disable cache where it is not desirable.

In case of tamper, all keys are read as 0x00s.

There are also rules for accessing the OBKFGCR and OBKKEYR registers.

Table 79. Access conditions to secure control register

-	S/NS	P/NP	TZ state	SECOBKCFGR and SECOBKKEYR access
X	-	-	-	Bus error
R/W	S	P	Active	OK
R/W	S	NP	Active	RAZ, WI
R/W	NS	P	Active	RAZ, WI, ILAP
R/W	NS	NP	Active	RAZ, WI, ILAP
R/W	-	-	Deactivated	RAZ, WI

Table 80. Access conditions to nonsecure control register

	S/NS	P/NP	TZ state	NSOBKCFGR and NSOBKKEYR access
X	-	-	-	Bus error
R/W	-	-	Active	RAZ, WI
R/W	-	P	Deactivated	OK
R/W	-	NP	Deactivated	RAZ, WI

7.6.13 One-time-programmable and read-only memory protections

Sections of OTP/RO in the flash memory are described in details in *Section 7.3.9*. There is no protection provided by the flash memory interface other than the dedicated write protection.

No write is possible to the RO area, once it was established in manufacturing. The *OTP write protection* describes a method of locking out the OTP area.

The access conditions are summarized in *Table 81*.

Table 81. OTP/RO access constraints

-	8 Kbytes sector dedicated to RO/OTP			
	0x08FF_E000 - E7FF	**0x08FF_E800 - EFFF Reserved**	**0x08FF_F000 - F7FF OTP**	**0x08FF_F800 - FFFF RO**
XS	BUS ERROR	BUS ERROR		
RS		RAZ, ILAC		
WS		WI, WRPERR, ILAFM		
XNS	BUS ERROR	BUS ERROR		
RNS		If correct size(1) RAZ, else BUS ERROR	If correct size OK, else BUS ERROR	
WNS		If correct size WI, else BUS ERROR	BUS ERROR if incorrect size. WRPERR if block is protected by LOCKBL, else OK.	If correct size WI, else BUS ERROR
Erase	WI			

1. Word size is 16 bits. 32-bit access is possible. Other access attempt leads to bus error.

7.7 System memory

7.7.1 Introduction

System memory stores RSS (root secure services) firmware programmed by ST during production. The RSS provides runtime services to user firmware.

When TrustZone is enabled (user sets TZEN bitfield to 0xB4) then RSS provides secure services to secure user firmware only; when TrustZone is disabled (user sets TZEN bitfield to 0xC3), RSS provides services to user firmware.

7.7.2 RSS user functions

The RSS provides runtime services thanks to RSS library, whose functions are exposed to user within the CMSIS device header file provided by the STM32CubeH5 firmware package (see UM3065 "*Getting started with STM32CubeH5 for STM32H5 series*" for more details).

RSS provides services through two different libraries, RSSLIB and NSSLIB.

Table 82. RSSLIB/NSSLIB accesses

TZEN configuration	User FW Nonsecure	User FW Secure	Bootloader/JTAG/SWD(1)
Enabled (0xB4)	N/A	RSSLIB	RSSLIB
Disabled (0xC3)	NSSLIB	N/A	

1. When the devices boot in bootloader, that is, in product state OPEN (with BOOT pin set to 1 and UBE set to 0xB4), or PROVISIONING.

For portability, security, and safety reasons, avoid calling library functions directly in your code. Instead, always use the official ST header files and libraries.

Table 83. RSSLIB/NSSLIB entry point access

C defined macro	Location in flash memory
RSSLIB_PFUNC	0xBF9FB68
NSSLIB_PFUNC	0xBF9FB6C

RSSLIB

The secure user firmware calls RSSLIB functions using RSSLIB_PFUNC C defined macro, which points to a location within nonsecure system memory.Before calling RSSLIB functions, the secure user firmware must define a nonsecure region above this location within SAU of the Cortex®-M33, starting from RSSLIB_SYS_FLASH_NS_PFUNC_START (0xBF9FB78), up to RSSLIB_SYS_FLASH_NS_PFUNC_END (0xBF9FB84). These last addresses are provided within the CMSIS device header file.

The user can set this nonsecure region either by using the CMSIS system partition header file, or by implementing its own code for SAU setup. The CMSIS system partition header file is part of the STM32CubeH5 firmware package.

Table 84. RSS lib interface functions

Library	Location in flash memory	Function	Function address offset	Attributes
RSSLIB_PFUNC	0xBF9FB68	JumpHDPLvl2	0x10	Secure callable function
		JumpHDPLvl3	0x14	
		JumpHDPLvl3NS	0x18	
		DataProvisioning	0x00	Nonsecure callable function

DataProvisioning

Secure attribute: Nonsecure callable function, no substitute is available if TrustZone is disabled. In such case, OBK has to be managed by using register access.

Prototype:

```
uint32_t_ DataProvisioning (RSSLIB_DataProvisioningConf_t *pConfig)
```

User code function call example:

```
RSSLIB_PFUNC→NSC.DataProvisioning(&pConfig)
```

Arguments:

pConfig: input parameter. **RSSLIB_DataProvisioningConf_t**

C structure definition is described below:

```
typedef struct
{
  uint32_t *pSource;
  uint32_t *pDestination;
  uint32_t Size;
  uint32_t DoEncryption;
  uint32_t Crc;
```

```
} RSSLIB_DataProvisioningConf_t;
```

Structure elements

pSource Provides the address of data to be provisioned. Must be within SRAM3 address range (nonsecure aliases).

pDestination Provides the address where to store data to be provisioned. Must be within OBKeys address range. To be aligned on 16 bytes.

Size Provides the size of data to be provisioned (the number of bytes, must be a multiple of 16).

DoEncryption Notifies RSSLIB_DataProvisioning function if it must encrypt or not data within OBKeys.

DoEncrypt can be either 0xF5F5A0AAU or 0xCACA0AA0U (the only one allowed on STM32H563xx devices)

– 0xF5F5A0AAU: notifies RSSLIB_DataProvisioning to encrypt data with relevant DHUK before programming it within OBKeys. DHUK is selected according to **pDestination** value.

– 0xCACA0AA0U: notifies RSSLIB_DataProvisioning to program in clear data within OBKeys.

Crc CRC over full source data buffer, **pConfig->pDestination** value, **pConfig->Size** value and finally **pConfig->DoEncryption** value.

CRC computation uses CRC-32 (Ethernet):

– CRC polynomial: 0x04C11DB7U

– Initial value: 0xFFFFFFFFU

Returned values

0xEAEAEAEAU	Success
0xF5F5E0E0U	Error: – **pConfig** or **pSource** are not in SRAM3 – **pDestination** is not aligned on 16 bytes – **pDestination + Size** does not fit within an OBKey section
0xF5F50E0EU	Error: **Size** is not a multiple of 16
0xF5F58080U	Error: computed CRC is not the expected one provided within **pConfig->CRC**
0xF5F58008U	Error: cannot program data within OBKeys destination section
0xF5F5E00EU	Error: wrong **DoEncryption** parameter value
0xF5F50880U	Error: encryption requested, butw platform does not support it
0xF5F50EE0U	Error: encryption error
0xF5F50808U.	Error: OBKeys programming error

RSSLIB_DataProvisioning receives in input a data buffer and programs it within OBKeys. A CRC prevents any data and parameters tampering issue.

The destination address (**pDestination**) added to the size (**Size**) of the data to be provisioned must not cross the OBKeys section boundaries, listed below.

Table 85. OBKeys section boundaries

OBKeys Level	Address
OBKeys Level1	Start address: 0x0FFD0100UL
	End address: 0x0FFD08FFUL
OBKeys Level2	Start address: 0x0FFD0900UL
	End address: 0x0FFD0BFFUL
OBKeys Level3 secure	Start address: 0x0FFD0C00UL
	End address: 0x0FFD17FFUL
OBKeys Level3 nonsecure	Start address: 0x0FFD1800UL
	End address: 0x0FFD1FEFUL

When requested through **`pConfig->DoEncryption`** parameter, RSSLIB_DataProvisioning encrypts data before programming them within OBKeys.

RSSLIB_DataProvisioning uses AES CBC 128 bits with:

- IV: defined as (using C definition format)

  ```
  uint32_t IV = {0x8001D1CEU, 0xD1CED1CEU, 0xD1CE8001U, 0xCED1CED1U};
  ```

- Key: DHUK corresponding to the targeted OBKeys section defined by **`pConfig->pDestination`** parameter.

Note: Data encryption within OBkeys is supported only by STM32H533/573xx devices.

JumpHDPLvl2

Secure attribute: Secure callable function.

Prototype:

```
uint32_t JumpHDPLvl2(uint32_t VectorTableAddr, uint32_t MPUIndex)
```

User code function call example:

```
RSSLIB_PFUNC->S.JumpHDPLvl2((uint32_t)NextVectorTableAddr, 1U );
```

Arguments:

- VectorTableAddr:
  - Input parameter, address of the next vector table to apply.
  - The vector table format is the one used by the Cortex-M33 core.
- MPUIndex:
  - Input parameter, MPU region index. Caller function must define (but keep disabled) the corresponding MPU region before calling JumpHDPLvl2. The function enables the MPU region before jumping to the reset handler of the vector table. The vector table reset handler function belongs to the MPU region.

User calls JumpHDPLvl2 to close user Flash HDPL1 area by incrementing HDPL to 2, then jump to the reset handler embedded within the vector table, whose address is passed as input parameter.

After closing HDPL1, JumpHDPLvl2 enables the MPU region provided as input parameter. Once the MPU is enabled, the function sets the SP to the address provided by the passed vector table, and jumps to the reset handler function supported by it. JumpHDPLvl2 does not set the new vector table.

On successful execution, the function does not return and does not push LR onto the stack.

In case of failure (bad input parameter value), RSSLIB_Sec_JumpHDPLvl2 returns 0xF5F5F5F5.

JumpHDPLvl3

Secure attribute: Secure callable function.

Prototype:

```
uint32_t JumpHDPLvl3(uint32_t VectorTableAddr, uint32_t MPUIndex)
```

User code function call example:

```
RSSLIB_PFUNC->S.JumpHDPLvl3((uint32_t)NextVectorTableAddr, 1U );
```

Arguments:

- VectorTableAddr:
  - Input parameter, address of the next vector table to apply.
  - The vector table format is the one used by the Cortex-M33 core.
- MPUIndex:
  - Input parameter, MPU region index. Caller function must define but keep disabled the corresponding MPU region before calling JumpHDPLvl3. The function enables the MPU region before jumping to the reset handler of the vector table, whose function belongs to the MPU region.

User calls JumpHDPLvl3 to close user Flash HDPL1 and HDPL2 areas by incrementing HDPL up to 3, then jump to the reset handler embedded within the vector table, whose address is passed as input parameter.

After closing HDPL1/2, JumpHDPLvl3 enables the MPU region provided as input parameter. Once the MPU is enabled, the function sets the SP to the address provided by the passed vector table, and jumps to the reset handler function supported by the vector table. JumpHDPLvl3 does not set the new vector table.

On successful execution, the function does not return and does not push LR onto the stack.

In case of failure (bad input parameter value), JumpHDPLvl3 returns 0xF5F5F5F5.

JumpHDPLvl3NS

Secure attribute: Secure callable function.

Prototype:

```
uint32_t JumpHDPLvl3NS(uint32_t VectorTableAddr)
```

User code function call example:

```
RSSLIB_PFUNC->S.JumpHDPLvl3NS((uint32_t)NextVectorTableAddr, 1U );
```

Arguments:

- VectorTableAddr:
  - Input parameter, address of the next vector table to apply.
  - The vector table format is the one used by the Cortex-M33 core.

User calls JumpHDPLvl3NS to close user flash HDPL1 and HDPL2 areas by incrementing HDPL up to 3, to move from secure to nonsecure domain, then jump to the nonsecure reset handler embedded within the vector table, whose address is passed as input parameter.

After closing HDPL1/2, JumpHDPLvl3 jumps to the nonsecure reset handler function supported by the vector table. JumpHDPLvl3NS does not set the new vector table.

On successful execution, the function does not return and does not push LR onto the stack.

In case of failure (bad input parameter value), JumpHDPLvl3NS returns 0xF5F5F5F5.

NSSLIB

The user firmware calls only the NSSLIB function when TrustZone is disabled (TZEN bitfield is set to 0xC3).

The user firmware calls NSSLIB functions using NSSLIB_PFUNC C defined macro, which points to a location within system memory.

Table 86. NSS lib interface functions

Library	Location in flash memory	Function	Function address offset	Attributes
NSSLIB_PFUNC	0xBF9FB6C	JumpHDPLvl2	0x00	Nonsecure function
		JumpHDPLvl3	0x04	

JumpHDPLvl2

Prototype:

```
uint32_t JumpHDPLvl2(uint32_t VectorTableAddr, uint32_t MPUIndex)
```

User code function call example:

```
NSSLIB_PFUNC->JumpHDPLvl2((uint32_t)NextVectorTableAddr, 1U );
```

Arguments:

- VectorTableAddr:
  - Input parameter, address of the next vector table to apply.
  - The vector table format is the one used by the Cortex-M33 core.
- MPUIndex:
  - Input parameter, MPU region index. Caller function shall define but keep disable the corresponding MPU region before calling JumpHDPLvl2. The function enables the MPU region before jumping to the reset handler of the vector table. The vector table reset handler function belongs to the MPU region.

User calls JumpHDPLvl2 to close user Flash HDPL1 area by incrementing HDPL to 2, and to jump to the reset handler embedded within the vector table which address is passed as input parameter

After closing HDPL1, JumpHDPLvl2 enables the MPU region provided as input parameter. Once the MPU is enabled, the function sets the SP to the address provided by the passed vector table and jumps to the reset handler function supported by the vector table too. JumpHDPLvl2 does not set the new vector table.

On successful execution, the function does not return and does not push LR onto the stack.

In case of failure (bad input parameter value), RSSLIB_Sec_JumpHDPLvl2 returns 0xF5F5F5F5.

JumpHDPLvl3

Prototype:

```
uint32_t JumpHDPLvl3(uint32_t VectorTableAddr, uint32_t MPUIndex)
```

User code function call example:

```
NSSLIB_PFUNC->JumpHDPLvl3((uint32_t)NextVectorTableAddr, 1U );
```

Arguments:

- VectorTableAddr:
  - Input parameter, address of the next vector table to apply.
  - The vector table format is the one used by the Cortex-M33 core.
- MPUIndex:
  - Input parameter, MPU region index. Caller function shall define but keep disable the corresponding MPU region before calling JumpHDPLvl3. The function enables the MPU region before jumping to the reset handler of the vector table. The vector table reset handler function belongs to the MPU region.

User calls JumpHDPLvl3 to close user Flash HDPL1 and HDPL2 areas by incrementing HDPL up to 3, and then jump to the reset handler embedded within the vector table, whose address is passed as input parameter

After closing HDPL1/2, JumpHDPLvl3 enables the MPU region provided as input parameter. Once the MPU is enabled, the function sets the SP to the address provided by the passed vector table, and jumps to the reset handler function supported by it. JumpHDPLvl3 does not set the new vector table.

On successful execution, the function does not return and does not push LR onto the stack.

In case of failure (bad input parameter value), JumpHDPLvl3 returns 0xF5F5F5F5.

7.8 FLASH low-power modes

Table 87 summarizes the memory behavior in STM32 low-power modes. Embedded flash memory belongs to the core domain.

Table 87. Effect of low-power modes on the embedded flash memory

Power mode	Core domain voltage range	Allowed if FLASH busy	FLASH power mode
Run	VOS0/1/2/3	Yes	Run
Stop1 (clock stopped)	SVOS3/4/5	No	Clock gated or stopped in case of SVOS5
Standby	Off	No	Off

When the system state changes or within a given system state, the memory can operate with a different voltage supply range (VOS), according to the application. The procedure to switch the memory into power modes (run, clock gated, stopped, off) is described hereafter.

Note: For more information on the microcontroller power states, refer to Section 10: Power control (PWR).

Managing the FLASH domain switching to Stop or Standby

As explained in *Table 87*, if the memory informs the reset and clock controller (RCC) that it is busy (BSY, DBNE, WBNE is set), the microcontroller cannot switch the core domain to Stop or Standby mode.

There are two ways to release the memory:

- Reset the WBNE busy flag in FLASH_NS/SECSR register by any of the following actions:
  - Complete the write buffer with missing data.
  - Force the write operation without filling the missing data by activating the FW bit in FLASH_NS/SECCR register. This forces all missing data “high”.
- Poll BSY busy bits in FLASH_NS/SECSR register until they are cleared. This indicates that all recorded write, erase and option change operations are complete.

The microcontroller can then switch the domain to Stop or Standby mode.

7.9 FLASH error management

7.9.1 Introduction

The memory automatically reports when an error occurs during a read, program or erase operation. A wide range of errors are reported:

- *Nonsecure write protection error (WRPERR)*
- *Secure write protection error (WRPERR)*
- *Non secure programming sequence error (PGSERR)*
- *Secure programming sequence error (PGSERR)*
- *Secure strobe error (STRBERR)*
- *Error correction code error (ECCC, ECCD)*
- *Illegal access (ILAFM/ILAP)*
- *Option byte change error (OPTCHANGEERR)*
- OBK nonsecure general error (OBKERR)
- OBK secure general error (OBKERR)
- OBK nonsecure write error (OBKWERR)
- OBK secure write error (OBKWERR)

The application software can individually enable the interrupt for each error, as detailed in *Section 7.10*.

The flash memory interface uses different interrupt lines to trigger the event. There are two direct lines to NVIC, one for secure interrupts, other for non secure. Third line leads to TZIC, for the ILAFM interrupt.

Note: For all errors, the application software must clear the error flag before attempting a new modify operation.

Since there is just one write buffer and only one operation is allowed at a time, the write control bits and status bits are shared by both banks:

- Write control bits (PG, FW, EOPIE, WRPERRIE, PGSERRIE, STRBERRIE, INCERRIE, CLR_EOP, CLR_WRPERR, CLR_STRBERR, CLR_INCERR, CLR_PGSERR) controls Bank1 and 2 at the same time.
- Write status flag reports (WBNE, DBNE, EOP, WRPERR, PGSERR, STRBERR, INCERR, BSY) error for Bank1 and 2 at the same time.

7.9.2 Nonsecure write protection error (WRPERR)

When an illegal nonsecure erase/program operation is attempted to the nonvolatile memory, the flash interface sets the write protection error flag WRPERR in FLASH_NSSR register.

An erase operation is rejected and flagged as illegal if it targets one of the following memory areas:

- A sector write-protected with WRPSGn
- An HDP area while the HDPL has made it inaccessible
- Secure (TZ) state not matching the erased memory attribute
- Attempt to erase privilege sector within unprivileged mode

A program operation is ignored and flagged as illegal if it targets one of the following memory areas:

- System flash memory
- A user sector write-protected with WRPSGn
- An OTP block, locked with LOCKBL
- A read-only section
- A reserved area
- Secure area
- Privileged area from within unprivileged mode
- OBK access conditions check error

When WRPERR flag is raised, the operation is rejected and nothing is changed in the corresponding bank. If this error is detected, the write buffer is invalidated.

Note: WRPERR flag must be cleared before any erase/program operation.

WRPERR flag is cleared by setting CLR_WRPERR bit to 1 in FLASH_NSCCR register.

If WRPERRIE bit in FLASH_NSCR register is set to 1, an interrupt is generated when WRPERR flag is raised (see *Section 7.10* for details).

7.9.3 Secure write protection error (WRPERR)

When an illegal secure erase/program operation is attempted to the nonvolatile memory, the flash interface sets the write protection error flag WRPERR in FLASH_SECSR register.

An erase operation is rejected and flagged as illegal if it targets one of the following memory areas:

- A sector write-protected with WRPSGn
- An HDP area while the HDPL has made it inaccessible
- Secure (TZ) state not matching the erased memory attribute
- Attempt to erase privilege sector within unprivileged mode

A program operation is ignored and flagged as illegal if it targets one of the following memory areas:

- System flash memory
- A user sector write-protected with WRPSGn
- An OTP block, locked with LOCKBL
- A read-only section
- A reserved area
- Nonsecure area
- Privileged area from within unprivileged mode
- OBK access condition check error

When WRPERR flag is raised, the operation is rejected and nothing is changed in the corresponding bank.

If this error is detected the write buffer is invalidated.

Note: WRPERR flag must be cleared before any erase/program operation.

WRPERR flag is cleared by setting CLR_WRPERR bit to 1 in FLASH_SECCCR register.

If WRPERRIE bit in FLASH_SECCR register is set to 1, an interrupt is generated when WRPERR flag is raised (see *Section 7.10* for details).

7.9.4 Non secure programming sequence error (PGSERR)

When the nonsecure programming sequence is incorrect, the flash interface sets the programming sequence error flag PGSERR in FLASH_NSSR register.

More specifically, PGSERR flag is set when one of below conditions is met:

- An error like INCERR, WRPERR, PGSERR, STRBERR, OPTCHANGEERR, OBKERR or OBKWERR have not been cleared before requesting a new write or erase operation, OBK operation or options change.
- For erase, PGSERR is set if:
  - missing erase operation (FLASH_NSCR): STRT = 1 with (MER = 0, SER = 0 and BER = 0)
  - sector and bank erase requested at the same time (NSSTRT and more than one of MER, SER and BER)
  - PG set during erase operation (it ensures that no erase req and write req happen at the same time): (STRT = 1) with (PG = 1)
  - Erase operation is started while write buffer is waiting for next data: (STRT = 1) with WBNE = 1.
  - STRT = 1 set by secure access.
  - Erase operation is started while DBNE = 1.
- For programming, PGSERR is set if:
  - missing write flag: A write operation is requested but the program enable bit PG has not been set in FLASH_NSCR register prior to the request.
  - write operation to flash high-cycle data is requested but PG = 0.
  - AHB write request is received and (SER = 1, BER = 1 or MER = 1)
  - 16 bit data access requested while WBNE = 1
- For options change, PGSERR is set if:
  - option change is started while write buffer is waiting for next data: OPTSTRT = 1 with WBNE = 1
  - OPTSTRT set with nonsecure DBNE = 1.
- For options byte key storage access, PGSERR is set if:
  - error flags from previous operation not cleared
  - ALT_SECT_ERASE and SWAP_SECT_REQ in FLASH_NSOBKCFGR are set at the same time
  - SWAP_OFFSET value is wrong: when SWAP_SECT_REQ is set to 1, the SWAP_OFFSET should be equal or greater than OBK_HDPL< N - 1 > _SWAP_OFFSET
  - ALT_SECT_ERASE or OBK_SWAP set while DBNE = 1
  - OBK-HDPL is incorrect and nonsecure OBK_SWAP is requested
  - If OBKSWAP or OBK alternate erase is started while write buffer is waiting for new data (WBNE = 1).

When PGSERR flag is raised as consequence of failed write attempt (flash programming), the current program operation is aborted and nothing is changed in the corresponding bank. The write data buffer is also invalidated.

Note: When PGSERR flag is raised, there is a risk that the last write operation performed by the application has been lost because of the above protection mechanism. It is recommended to generate interrupts on PGSERR and verify in the interrupt handler if the last write operation has been successful, by reading back the value in the flash memory.

The PGSERR flag also blocks any new program operation. This means that PGSERR must be cleared before starting a new program operation.

PGSERR flag is cleared by setting CLR_PGSERR bit to 1 in FLASH_NSCCR register.

If PGSERRIE bit in FLASH_NSCR register is set to 1, an interrupt is generated when PGSERR flag is raised. See *Section 7.10* for details.

7.9.5 Secure programming sequence error (PGSERR)

When the secure programming sequence is incorrect, the flash interface sets the programming sequence error flag PGSERR in FLASH_SECSR register.

More specifically, PGSERR flag is set when one of below conditions is met:

- An error like INCERR, WRPERR, PGSERR, STRBERR, OBKERR, or OBKWERR has not been cleared before requesting a new write or erase operation, OBK operation or options change.
- For erase, PGSERR is set if:
  - missing erase operation (FLASH_SECCR): STRT = 1 with (SER = 0 and BER = 0, MER = 0)
  - sector and bank erase requested at the same time (SECSTRT and more than one of MER, SER, and BER)
  - PG set during erase operation (it ensures that no erase request and write request happen at the same time): (STRT = 1) with (PG = 1)
  - erase operation is started while write buffer is waiting for next data: (STRT = 1) with WBNE = 1.
  - operation started while secure DBNE = 1.
- For programming, PGSERR is set if:
  - missing write flag: a write operation is requested but the program enable bit PG has not been set in FLASH_SECCR register prior to the request
  - write operation to flash high-cycle data is requested but PG = 0
  - AHB write request is received and (SER = 1, SBER = 1, or MER = 1)
  - 16 bit data access requested while WBNE = 1
- For options change, PGSERR is set if:
  - Option change is started while write buffer is waiting for next data: OPTSTRT = 1 with WBNE = 1
  - OPTSTRT set with secure DBNE = 1
- For options byte key storage access, SECPGSERR is set if:
  - error flags from previous operation not cleared
  - ALT_SECT_ERASE and SWAP_SECT_REQ are set at the same time
  - SWAP_OFFSET value is wrong: when SWAP_SECT_REQ = 1, SWAP_OFFSET must be equal or greater than OBK_HDPL<N-1>_SWAP_OFFSET.
  - SWAP_SECT_REQ or OBK_SWAP set while DBNE = 1
  - OBK-HDPL is incorrect and secure OBK_SWAP is requested

– If OBKSWAP or OBK alternate erase is started while write buffer is waiting for new data (WBNE = 1)

When PGSERR flag is raised as consequence of failed write attempt (flash programming), the current program operation is aborted and nothing is changed in the corresponding bank. The write data buffer is also invalidated.

Note: When PGSERR flag is raised, there is a risk that the last write operation performed by the application has been lost because of the above protection mechanism. It is recommended to generate interrupts on PGSERR and verify in the interrupt handler if the last write operation has been successful by reading back the value in the flash memory.

The PGSERR flag also blocks any new program operation. This means that PGSERR must be cleared before starting a new program operation.

PGSERR flag is cleared by setting CLR_SECPGSERR bit to 1 in FLASH_SECCCR register.

If PGSERRIE bit in FLASH_SECCR register is set to 1, an interrupt is generated when PGSERR flag is raised. See *Section 7.10* for details.

7.9.6 Nonsecure strobe error (STRBERR)

When the nonsecure application software writes several times to the same byte in the write buffer, the flash interface sets the strobe error flag STRBERR (FLASH_NSSR) whatever the target bank of the write access.

When STRBERR flag is raised, the current program operation is aborted and the write buffer is invalidated.

STRBERR flag is cleared by setting CLR_STRBERR bit to 1 in FLASH_NSCCR register.

If STRBERRIE bit in FLASH_NSCR register is set to 1, an interrupt is generated when STRBERR flag is raised. See *Section 7.10* for details.

7.9.7 Secure strobe error (STRBERR)

When the secure application software writes several times to the same byte in the write buffer, the memory sets the strobe error flag STRBERR (FLASH_SECSR) whatever the target bank of the write access.

When STRBERR flag is raised, the current program operation is aborted and the write buffer is invalidated.

STRBERR flag is cleared by setting CLR_STRBERR bit to 1 in FLASH_SECCCR register.

If STRBERRIE bit in FLASH_SECCR register is set to 1, an interrupt is generated when STRBERR flag is raised. See *Section 7.10* for details.

7.9.8 Nonsecure inconsistency error (INCERR)

When a programming inconsistency in nonsecure access is detected, the flash interface sets the inconsistency error flag INCERR in register FLASH_NSSR.

More specifically, INCERR flag is set when one of the following conditions is met:

- A write operation is attempted before completion of the previous write operation, for example:
  - The application software starts a write operation to fill the 128-bit write buffer, but sends a new write burst request to a different flash memory address before the buffer is full.
  - One master starts a write operation, but before the buffer is full, another master starts a new write operation to the same address or to a different address.
  - ALT_SECT in FLASH_NSOBKCFGR changed while filling the write buffer.

Note: INCERR flag must be cleared before starting a new write operation, otherwise a sequence error (PGSERR) is raised.

It is recommended to follow the following sequence to avoid losing data when an inconsistency error occurs:

1. Execute a handler routine when INCERR flag is raised.
2. Stop all write requests to the memory.
3. Clear INCERR bit.
4. Restart the write operations from where they have been interrupted.

INCERR flag is cleared by setting CLR_INCERR bit to 1 in FLASH_NSCCR register.

If INCERRIE bit in FLASH_NSCR register is set to 1, an interrupt is generated when INCERR flag is raised (see *Section 7.10* for details).

7.9.9 Secure inconsistency error (INCERR)

When a programming inconsistency is detected, the flash interface sets the inconsistency error flag INCERR in register FLASH_SECSR.

More specifically, INCERR flag is set when one of the following conditions is met:

- A write operation is attempted before completion of the previous write operation, for example:
  - The application software starts a write operation to fill the 128-bit write buffer, but sends a new write burst request to a different flash memory address before the buffer is full.
  - One master starts a write operation, but before the buffer is full, another master starts a new write operation to the same address or to a different address.

Note: INCERR flag must be cleared before starting a new write operation, otherwise a sequence error (PGSERR) is raised.

It is recommended to follow the sequence below to avoid losing data when an inconsistency error occurs:

1. Execute a handler routine when INCERR flag is raised.
2. Stop all write requests to the flash memory.
3. Clear INCERR bit.
4. Restart the write operations from where they have been interrupted.

INCERR flag is cleared by setting CLR_INCERR bit to 1 in FLASH_SECCCR register.

If INCERRIE bit in FLASH_SECCR register is set to 1, an interrupt is generated when INCERR flag is raised (see *Section 7.10* for details).

7.9.10 Error correction code error (ECCC, ECCD)

When a single-error correction is detected during a read, the flash interface sets the single-error correction flag ECCC in FLASH_ECCCORR register.

When two ECC errors are detected during a read, the flash interface sets the double error detection flag ECCD in FLASH_ECCDETR register.

When the ECCC flag is raised, the corrected read data are returned. The application can ignore the error, and request new read operations. When the ECCD the flag is raised, an NMI is generated, it can be masked in SBS registers (*SBS flitf ECC NMI mask register (SBS_ECCNMIR)*) for data access (OTP, data area, RO data). Software must invalidate the instruction cache (CACHEINV = 1) in the NMI interrupt service routine when the ECCD flag is set.

When ECCC or ECCD flag is raised, the address of the flash word that generated the error is saved in the FLASH_ECCCORR (FLASH_ECCDETR) register. If the address corresponds to a read-only area or to an OTP area or flash high-cycle data, the OTP_ECC bit is also set to 1 in the FLASH_ECCCORRR (FLASH_ECCDETR) register. This register is automatically cleared when the associated flag that generated the error is reset.

A BK_ECC flag indicates in which flash bank the error occurred.

A SYSF_ECC flag indicates an error detected in the system flash area.

Table 88. Locating ECC failure

OTP_ECC	SYSF_ECC	BK_ECC	EDATA_ECC	OBK_ECC	Flash area	ADDR_ECC min	ADDR_ECC max
0	0	0/1	0	0	User flash	0x0000	0xFFFF
0	1	0/1	0	0	System flash	0x0000	0x0FFF
1	0	0	0	0	OTP	0x0600	0x07FF
0	0	1	0	1	OBKeys	0x0000	0x03FF
0	0	0/1	1	0	Data area sector 7	0xF000	0xF1FF
0	0	0/1	1	0	Data area sector 6	0xF200	0xF3FF
0	0	0/1	1	0	Data area sector 5	0xF400	0xF5FF
0	0	0/1	1	0	Data area sector 4	0xF600	0xF7FF
0	0	0/1	1	0	Data area sector 3	0xF800	0xF9FF
0	0	0/1	1	0	Data area sector 2	0xFA00	0xFBFF
0	0	0/1	1	0	Data area sector 1	0xFC00	0xFDFF
0	0	0/1	1	0	Data area sector 0	0xFE00	0xFFFF

Note: In case of successive single correction or double detection errors, only the address corresponding to the first error is stored in FLASH_ECCCORR (FLASH_ECCDETR) *register.*

It is mandatory to clear ECCC or ECCD flags before starting a new read operation.

As the ECC interface is shared by the two banks, if the same error is registered simultaneously, a physical Bank1 error is registered. Both errors are registered if one bank reports ECCD and the other bank ECCC.

ECCC (respectively ECCD) flag is cleared by setting to 1 ECCC bit (respectively ECCD bit) in FLASH_ECCCORR (FLASH_ECCDETR) register.

If ECCC bit in FLASH_ECCCORR register is set to 1, an interrupt is generated when ECCC flag is raised. Only NMI is generated for the ECCD. See *Section 7.10* for details.

7.9.11 Illegal access (ILAFM/ILAP)

Illegal access is a signal to the TZIC, triggering a secure interrupt in there. It is complementary to the other interrupts and only generated when the TZ is enabled (TZ_STATE = 0xB4).

It can be masked only on GTZC level.

ILAFM is generated when rules on secure flash memory access are violated:

- Attempt to access secure memory location in nonsecure mode.
- Attempt to access nonsecure memory location in secure mode.

ILAP is generated on:

- Attempt to access secure register in nonsecure mode.

If ILAFM is detected during write, the write buffer is invalidated.

Note: ILAFM *and ILAP has no flag within the flash memory controller to clear to resume operation. It is dealt within the TZIC.*

7.9.12 Option byte change error (OPTCHANGEERR)

When the flash interface finds an error during an option change operation, it aborts the operation and sets the option byte change error flag OPTCHANGEERR in FLASH_NSSR register.

The error is raised after OPTSTRT bit set if:

- TZEN is not set and transition to TZ-Closed or NS-Regression state is requested. Also any other forbidden PRODUCT_STATE transition (*Table 76*).
- SWAP_BANK is locked out by combination of TZEN and BOOT_LOCK.
- OB modification is attempted in wrong HDPL (selected PRODUCT_STATE transitions)
- Attempt to modify OB with invalid value
  - New EPOCH value not greater than current
  - Value not recognized by the specification (enumerated magic numbers only)
- Attempt to modify OB in product state where it is not allowed (usually a state open for debug is required for change).

Note: Exceptions and details provided in the OB description (see Section 7.4.7 and Table 56).

OPTCHANGEERR flag is cleared by setting CLR_OPTCHANGEERR bit to 1 in FLASH_NSCCR register.

If OPTCHANGEERRIE bit in FLASH_NSCR register is set to 1, an interrupt is generated when OPTCHANGEERR flag is raised (see *Section 7.10* for details).

It is mandatory to clean the OPTCHANGEERR flag before starting a new operation (option change, erase or write).

7.9.13 Miscellaneous HardFault errors

The following events generate a bus error on the corresponding bus interface:

- On main AHB system bus for access targeting code and data with 9 bits ECC.
  - Fetching from secure user flash memory in nonsecure mode.
  - Fetching from nonsecure user flash memory in secure mode.
  - Access to invalid address (including data addresses forbidden for code use).
  - Fetching from HDP area with incorrect HDPL value.
  - Fetching from privilege area in unprivilege mode.
- On AHB configuration or system bus for accesses targeting OTP/RO (all addresses using 6bits ECC):
  - wrong key input to FLASH_NS/SECKEYR or FLASH_OPTKEYR.
  - 8-bit accesses to system AHB interface.
  - Wrong unlock sequence on a register.

7.9.14 OBK error cases (OBKERR, OBKWERR)

Four error types can be detected while filling the OBK write buffer: STRBERR, INCERR, WRPERR or OBKERR. The OBKERR is specific to the OBK access and cannot be raised by access to any other flash memory asset.

Note: For STRBERR, INCERR and WRPERR, nonsecure or secure flags are used depending on the AHB access type (sec or nonsecure). If a nonsecure access is received, the nonsecure error flags are used. If a secure access is received, the secure error flags are used.

For OBKERR and OBKWERR, nonsecure or secure flags are used depending on the value of the secure state. If the SOC is in secure state (TZ_STATE active), the secure error flags (OBKERR and OBKWERR) are used. Otherwise the nonsecure error flags (OBKERR and OBKWERR) are used.

OBKERR is raised when:

- the OBK-HDPL (input signal from SBS) does not match the HDPL associated to the key during a read or write access, and the TZ and PRIV attributes are correct (See *Section 7.5.2* for more details).

If OBKERR is raised during write access, the write buffer is flushed. If the OBKERR is raised on read access, the write buffer is intact. In both cases the flag must be cleared to enable write/erase access to flash memory.

OBKWERR is detected after filling the write buffer and raised if:

- the address is not virgin during a write access.
- OBK selector in the alternate sector is not virgin during a SWAP operation.

If OBKWERR is raised, the write buffer is flushed. The flag must be cleared to enable write/erase access to flash memory.

7.10 FLASH interrupts

The flash interface can generate a maskable interrupt to signal the following events on a given bank:

- Read and write errors (see *Section 7.9*)
  - Single ECC error correction during read operation
  - Write inconsistency error
  - Bad programming sequence
  - Strobe error during write operations
  - option change operation error
- Security errors (see *Section 7.9*)
  - Write protection error
  - Illegal access error - signal to TZIC
- Miscellaneous events (described below)
  - End of programming

A NMI is raised on double ECC error detection during read operation.

Two interrupt lines gather all the error sources, one for errors in nonsecure access and second for errors that happen in secure access.

The user can individually enable or disable flash interface interrupt sources by changing the mask bits in the FLASH_NS/SECCR, FLASH_ECCCORR and FLASH_ECCDETR register. Setting the appropriate mask bit to 1 enables the interrupt.

Note: Prior to writing, FLASH_NS/SECCR register must be unlocked as explained in Section 7.6.7.

Table 89 gives a summary of the available flash interface interrupt features. As mentioned in the table below, some flags need to be cleared before a new operation is triggered.

Table 89. Flash interrupt request

Interrupt event Event flag	Error flag label in register	Enable control bit	Clear flag to resume operation
End of operation event	EOP	EOPIE	N/A
Write protection error	WRPERR	WRPERRIE	Yes
Programming sequence error	PGSERR	PGSERRIE	Yes
Strobe error	STRBERR	STRBERRIE	Yes
OBK write error	OBKWERR	OBKWERRIE	Yes
OBK general error	OBKERR	OBKERRIE	Yes
Inconsistency error	INCERR	INCERRIE	Yes
Illegal access error	ILAFM	TZEN	No
Option byte error	OPTCHANGEERR	-	Yes

Table 89. Flash interrupt request (continued)

Interrupt event Event flag	Error flag label in register	Enable control bit	Clear flag to resume operation
ECC single error correction event	ECCC	ECCCIE	No
ECC double error detection event(1)	ECCD	Disabled	No

1. NMI.

The status of the individual maskable interrupt sources described in *Table 89* (except for option byte error and ECC) can be read from the FLASH_NS/SECSR register. They can be cleared by setting to 1 the adequate bit in FLASH_NS/SECCCR register.

Note: No unlocking mechanism is required to clear an interrupt.

End of operation event

Setting the end of operation interrupt enable bit (EOPIE) in the FLASH_NS/SECCR register enables the generation of an interrupt at the end of an erase operation, a program operation, or an option byte change.

When managing the OBKey storage area, the EOP is associated also with the OBK swap operation and the alternate area erase operation. EOP bit in the FLASH_NS/SECSR register is also set when one of these events occurs.

Setting CLR_EOP bit to 1 in FLASH_NS/SECCCR register clears EOP flag.

7.11 FLASH registers

Each register has an offset address and a reset value. In case of registers representing option bytes, the reset value is determined by the OBL process. In case of success the reset value is loaded from OB, in case of failure, a highly restrictive default value is set.

7.11.1 FLASH access control register (FLASH_ACR)

This register is nonsecure. It can be read and written by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

For more details, refer to *Section 7.3.4* and *Section 7.3.5*.

Address offset: 0x000

Reset value: 0x0000 0013

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRFTEN	Res.	Res.	WRHIGHFREQ[1:0]		LATENCY[3:0]			
							rw			rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **PRFTEN**: Prefetch enable. When bit value is modified, user must read back ACR register to be sure PRFTEN has been taken into account.
Bits used to control the prefetch.
0: prefetch disabled.
1: prefetch enabled when latency is at least one wait state.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **WRHIGHFREQ[1:0]**: Flash signal delay
These bits are used to control the delay between nonvolatile memory signals during programming operations. Application software has to program them to the correct value depending on the memory interface frequency. Please refer to *Table 48* for details.
Note: No check is performed to verify that the configuration is correct.
Two WRHIGHFREQ values can be selected for some frequencies.

Bits 3:0 **LATENCY[3:0]**: Read latency
These bits are used to control the number of wait states used during read operations on both nonvolatile memory banks. The application software has to program them to the correct value depending on the memory interface frequency and voltage conditions.
0000: no wait states used to read a word from nonvolatile memory
0001: one wait state used to read a word from nonvolatile memory
0010: two wait states used to read a word from nonvolatile memory
...
0111: seven wait states used to read a word from nonvolatile memory
1111: 15 wait states used to read a word from nonvolatile memory
Note: No check is performed by hardware to verify that the configuration is correct.

7.11.2 FLASH nonsecure key register (FLASH_NSKEYR)

This register is nonsecure. It can written by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

FLASH_NSKEYR is a write-only register. The following values must be programmed consecutively to unlock FLASH_NSCR register and allow programming/erasing it.

- First key = 0x4567 0123
- Second key = 0xCDEF 89AB

A wrong sequence locks the FLASH_NSCR register until next system reset.

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

NSKEY[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **NSKEY[31:0]**: Nonvolatile memory nonsecure configuration access unlock key

7.11.3 FLASH secure key register (FLASH_SECKEYR)

This register is secure. It can be written only by secure access. A nonsecure read/write access is RAZ/WI. This register can be protected against unprivileged access when SPRIV = 1 in the FLASH_PRIVCFGR register.

FLASH_SECKEYR is a write-only register. The following values must be programmed consecutively to unlock FLASH_SECCR register and allow programming/erasing it. A wrong sequence locks the FLASH_SECCR register until next system reset.

First key = 0x4567 0123

Second key = 0xCDEF 89AB

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

SECKEY[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **SECKEY[31:0]**: Nonvolatile memory secure configuration access unlock key

7.11.4 FLASH option key register (FLASH_OPTKEYR)

This write-only register is nonsecure. It can be written by both secure and nonsecure accesses, and can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

The following values must be programmed consecutively to unlock FLASH_OPTCR register

- First key = 0x0819 2A3B
- Second key = 0x4C5D 6E7F

A wrong sequence locks FLASH_OPTCR register until next system reset.

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

OPTKEY[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **OPTKEY[31:0]**: FLASH option bytes control access unlock key

7.11.5 FLASH nonsecure OBK key register (FLASH_NSOBKKEYR)

This is a write-only register. The following values must be programmed consecutively to unlock it register (a wrong sequence locks the register until next system reset).

- First key = 0x192A 083B
- Second key = 0x6E7F 4C5D

This register is nonsecure. This register can be written only by privileged access.

Address offset: 0x0010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

NSOBKKEY[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **NSOBKKEY[31:0]**: FLASH nonsecure option bytes keys control access unlock key

7.11.6 FLASH secure OBK key register (FLASH_SECOBKKEYR)

This is a write-only register. The following values must be programmed consecutively to unlock it (a wrong sequence locks the register until the next system reset)

- First key = 0x192A 083B
- Second key = 0x6E7F 4C5D

This register is secure, it can be written only by privileged access.

Address offset: 0x0014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

SECOBKKEY[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **SECOBKKEY[31:0]**: FLASH secure option bytes keys control access unlock key

7.11.7 FLASH operation status register (FLASH_OPSR)

This register is nonsecure. This register can be read by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

Address offset: 0x0018

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ADDR_OP[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:29 **CODE_OP[2:0]**: Flash memory operation code
- 000: No flash operation on going during previous reset
- 001: Single write operation interrupted
- 010: OBK alternate sector erase
- 011: Sector erase operation interrupted
- 100: Bank erase operation interrupted
- 101: Mass erase operation interrupted
- 110: Option change operation interrupted
- 111: OBK swap sector request

Bits 28:25 Reserved, must be kept at reset value.

Bit 24 **OTP_OP**: OTP operation interrupted
Indicates that reset interrupted an ongoing operation in OTP area (or OBKeys area).

Bit 23 **SYSF_OP**: Operation in system flash memory interrupted
Indicates that reset interrupted an ongoing operation in system flash.

Bit 22 **BK_OP**: Interrupted operation bank
It indicates which bank was concerned by operation.

Bit 21 **DATA_OP**: Flash high-cycle data area operation interrupted
It indicates if flash high-cycle data area is concerned by operation.

Bit 20 Reserved, must be kept at reset value.

Bits 19:0 **ADDR_OP[19:0]**: Interrupted operation address

7.11.8 FLASH option control register (FLASH_OPTCR)

This register is nonsecure. It can be read and written by both secure and nonsecure access, and protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

Access: No wait states when no memory operations are ongoing. The FLASH_OPTCR register is not accessible in write mode when the BSY bit is set. Any attempt to write to it while the BSY bit set causes the AHB bus to stall until the BSY bit is cleared.

Address offset: 0x01C

Reset value: 0xX000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SWAP_BANK	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
r															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OPTSTRT	OPTLOCK
														rw	rs

Bit 31 **SWAP_BANK**: Bank swapping option configuration bit
SWAP_BANK controls whether Bank1 and Bank2 are swapped or not. This bit is loaded with the SWAP_BANK bit of FLASH_OPTSR_CUR register only after reset or POR.
0: Bank1 and Bank2 not swapped
1: Bank1 and Bank2 swapped

Bits 30:2 Reserved, must be kept at reset value.

Bit 1 **OPTSTRT**: Option byte start change option configuration bit
OPTSTRT triggers an option byte change operation. The user can set OPTSTRT only when the OPTLOCK bit is cleared to 0. It is set only by Software and cleared when the option byte change is completed or an error occurs (PGSERR or OPTCHANGEERR). It is reset at the same time as BSY bit.
The user application cannot modify any FLASH_XXX_PRG flash interface register until the option change operation has been completed.
Before setting this bit, the user has to write the required values in the FLASH_XXX_PRG registers. The FLASH_XXX_PRG registers are locked until the option byte change operation has been executed in nonvolatile memory.

Bit 0 **OPTLOCK**: FLASH_OPTCR lock option configuration bit

The OPTLOCK bit locks the FLASH_OPTCR register as well as all _PRG registers. The correct write sequence to FLASH_OPTKEYR register unlocks this bit. If a wrong sequence is executed, or the unlock sequence to FLASH_OPTKEYR is performed twice, this bit remains locked until next system reset.

It is possible to set OPTLOCK by programming it to 1. When set to 1, a new unlock sequence is mandatory to unlock it. When OPTLOCK changes from 0 to 1, the others bits of FLASH_OPTCR register do not change.

0: FLASH_OPTCR register unlocked

1: FLASH_OPTCR register locked.

7.11.9 FLASH nonsecure status register (FLASH_NSSR)

This register is nonsecure, can be read by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

Address offset: 0x020

Reset value: 0x0000 000X

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBNE	Res.	WBNE	BSY
												r		r	r

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **OPTCHANGEERR**: Option byte change error flag

OPTCHANGEERR flag indicates that an error occurred during an option byte change operation. When OPTCHANGEERR is set to 1, the option byte change operation did not successfully complete. An interrupt is generated when this flag is raised if the OPTCHANGEERRIE bit of FLASH_NSCR register is set to 1.

Writing 1 to CLR_OPTCHANGEERR of register FLASH_NSCCR clears OPTCHANGEERR.

0: no option byte change errors occurred

1: one or more errors occurred during an option byte change operation.

Note: The OPTSTRT bit in FLASH_OPTCR cannot be set while OPTCHANGEERR is set.

Bit 22 **OBKWERR**: OBK write error flag

OBKWERR flag is raised when the address is not virgin on a write access to the OBK storage. Alternatively also when the OBK selector in the alternate sector is not virgin during a swap operation.

0: no OBK write error occurred

1: an OBK write error occurred

Bit 21 **OBKERR**: OBK general error flag

OBKERR flag is raised when the OBK-HDPL signal from the SBS does not match the HDPL value associated with the key slot during access to the key location. Alternatively also when the ALT_SECT is unexpectedly changed while the write buffer is being filled.

0: no OBK general error occurred

1: an OBK general error occurred

Bit 20 **INCERR:** inconsistency error flag

NSINCERR flag is raised when a inconsistency error occurs. An interrupt is generated if INCERRIE is set to 1. Writing 1 to CLR_INCERR bit in the FLASH_NSCCR register clears NSINCERR.

0: no inconsistency error occurs

1: a inconsistency error occurs

Bit 19 **STRBERR:** strobe error flag

STRBERR flag is raised when a strobe error occurs (when the master attempts to write several times the same byte in the write buffer). An interrupt is generated if the STRBERRIE bit is set to 1. Writing 1 to CLR_STRBERR bit in FLASH_NSCCR register clears STRBERR.

0: no strobe error occurred

1: a strobe error occurred

Bit 18 **PGSERR:** programming sequence error flag

PGSERR flag is raised when a sequence error occurs. An interrupt is generated if the PGSERRIE bit is set to 1. Writing 1 to CLR_PGSERR bit in FLASH_NSCCR register clears PGSERR.

0: no sequence error occurred

1: a sequence error occurred

Bit 17 **WRPERR**: write protection error flag

WRPERR flag is raised when a protection error occurs during a program operation. An interrupt is also generated if the WRPERRIE is set to 1. Writing 1 to CLR_WRPERR bit in FLASH_NSCCR register clears WRPERR.

0: no write protection error occurred

1: a write protection error occurred

Bit 16 **EOP**: end of operation flag

EOP flag is set when a operation (program/erase) completes. An interrupt is generated if the EOPIE is set to 1. It is not necessary to reset EOP before starting a new operation. EOP bit is cleared by writing 1 to CLR_EOP bit in FLASH_NSCCR register.

0: no operation completed

1: a operation completed

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **DBNE**: data buffer not empty flag

DBNE flag is set when the flash interface is processing 6-bits ECC data in dedicated buffer. This bit cannot be set to 0 by software. The hardware resets it once the buffer is free.

0: data buffer not used

1: data buffer used, wait

Bit 2 Reserved, must be kept at reset value.

Bit 1 **WBNE**: write buffer not empty flag

WBNE flag is set when the flash interface is waiting for new data to complete the write buffer. In this state, the write buffer is not empty. WBNE is reset by hardware each time the write buffer is complete or the write buffer is emptied following one of the events below:

– the application software forces the write operation using FW bit in FLASH_NSCR
– the memory detects an error that involves data loss

This bit cannot be reset by software writing 0 directly. To reset it, clear the write buffer by performing any of the above listed actions, or send the missing data.

0: write buffer empty or full

1: write buffer waiting data to complete

Bit 0 **BSY**: busy flag

BSY flag indicates that a flash memory is busy by an operation (write, erase, option byte change, OBK operation). It is set at the beginning of a flash memory operation and cleared when the operation finishes, or an error occurs.

0: no programming, erase or option byte change operation being executed

1: programming, erase or option byte change operation being executed

7.11.10 FLASH secure status register (FLASH_SECSR)

This register is secure. It can be read only by secure access. A nonsecure read/write access is RAZ/WI. This register can be protected against unprivileged access when SPRIV = 1 in the FLASH_PRIVCFGR register.

Address offset: 0x024

Reset value: 0x0000 000X

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

												r		r	r

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **OBKWERR**: OBK write error flag

OBKWERR flag is raised when the address is not virgin on a write access to the OBK storage. Alternatively also when the OBK selector in the alternate sector is not virgin during a swap operation.

0: no OBK write error occurred

1: an OBK write error occurred

Bit 21 **OBKERR**: OBK general error flag

OBKERR flag is raised when the OBK-HDPL signal from the SBS does not match the HDPL value associated with the key slot during access to the key location. Alternatively also when the ALT_SECT is unexpectedly changed while the write buffer is being filled.

0: no OBK general error occurred

1: an OBK general error occurred

Bit 20 **INCERR:** inconsistency error flag

INCERR flag is raised when a inconsistency error occurs. An interrupt is generated if INCERRIE is set to 1. Writing 1 to CLR_INCERR bit in the FLASH_SECCCR register clears INCERR.

0: no inconsistency error occurred

1: a inconsistency error occurred

Bit 19 **STRBERR:** strobe error flag

STRBERR flag is raised when a strobe error occurs (when the master attempts to write several times the same byte in the write buffer). An interrupt is generated if the STRBERRIE bit is set to 1. Writing 1 to CLR_STRBERR bit in FLASH_SECCCR register clears STRBERR.

0: no strobe error occurred

1: a strobe error occurred

Bit 18 **PGSERR:** programming sequence error flag

PGSERR flag is raised when a sequence error occurs. An interrupt is generated if the PGSERRIE bit is set to 1. Writing 1 to CLR_PGSERR bit in FLASH_SECCCR register clears PGSERR.

0: no sequence error occurred

1: a sequence error occurred

Bit 17 **WRPERR**: write protection error flag

WRPERR flag is raised when a protection error occurs during a program operation. An interrupt is also generated if the WRPERRIE is set to 1. Writing 1 to CLR_WRPERR bit in FLASH_SECCCR register clears WRPERR.

0: no write protection error occurred

1: a write protection error occurred

Bit 16 **EOP**: end of operation flag

EOP flag is set when a operation (program/erase) completes. An interrupt is generated if the EOPIE is set to. It is not necessary to reset EOP before starting a new operation. EOP bit is cleared by writing 1 to CLR_EOP bit in FLASH_SECCCR register.

0: no operation completed

1: a operation completed

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **DBNE**: data buffer not empty flag

DBNE flag is set when the memory interface is processing 6-bits ECC data in dedicated buffer. This bit cannot be set to 0 by software. The hardware resets it once the buffer is free.

0: data buffer not used

1: data buffer used, wait

Bit 2 Reserved, must be kept at reset value.

Bit 1 **WBNE**: write buffer not empty flag

WBNE flag is set when the flash interface is waiting for new data to complete the write buffer. In this state, the write buffer is not empty. WBNE is reset by hardware each time the write buffer is complete or the write buffer is emptied following one of the events below:

- the application software forces the write operation using FW bit in FLASH_SECCR
- the flash interface detects an error that involves data loss

This bit cannot be reset by writing 0 directly by software. To reset it, clear the write buffer by performing any of the above listed actions, or send the missing data.

0: write buffer empty or full

1: write buffer waiting data to complete

Bit 0 **BSY**: busy flag

BSY flag indicates that a FLASH memory is busy (write, erase, option byte change, OBK operations). It is set at the beginning of a flash memory operation and cleared when the operation finishes or an error occurs.

0: no programming, erase or option byte change operation being executed

1: programming, erase or option byte change operation being executed

7.11.11 FLASH nonsecure control register (FLASH_NSCR)

This register is nonsecure. It can be read and written by both secure and nonsecure accesses, and can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

Access: No wait states when no memory operations are ongoing. The FLASH_NSCR register is not accessible in write mode when the BSY bit is set. Any attempt to write to it with the BSY bit set causes the AHB bus to stall until the BSY bit is cleared.

Address offset: 0x028

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MER	Res.	Res.	SNB[6:0]							STRT	FW	BER	SER	PG	LOCK
rw			rw	rw	rw	rw	rw	rw	rw	rs	rw	rw	rw	rw	rs

Bit 31 **BKSEL**: Bank selector bit

Can be programmed only when LOCK is cleared to 0. The bit selects physical bank, SWAP_BANK setting is ignored.

0: Bank1 is selected for Bank erase / sector erase / interrupt enable

1: Bank2 is selected for BER / SER

Bits 30:24 Reserved, must be kept at reset value.

Bit 23 **OPTCHANGEERRIE**: Option byte change error interrupt enable bit

This bit controls if an interrupt must be generated when an error occurs during an option byte change. It can be programmed only when LOCK bit is cleared to 0.

0: no interrupt is generated when an error occurs during an option byte change

1: an interrupt is generated when and error occurs during an option byte change.

Bit 22 **OBKWERRIE**: OBK write error interrupt enable bit

OBKWERRIE enables generation of interrupt in case of OBK specific write error. This bit can be programmed only when LOCK bit is cleared to 0.

0: no interrupt is generated on OBK write error

1: an interrupt is generated on OBK write error

Bit 21 **OBKERRIE**: OBK general error interrupt enable bit

OBKERRIE enables generating an interrupt in case of OBK specific access error. This bit can be programmed only when LOCK bit is cleared to 0.

0: no interrupt is generated on OBK general access error

1: an interrupt is generated on OBK general access error

Bit 20 **INCERRIE**: inconsistency error interrupt enable bit

When INCERRIE bit is set to 1, an interrupt is generated when an inconsistency error occurs during a write operation. INCERRIE can be programmed only when LOCK is cleared to 0.

0: no interrupt generated when a inconsistency error occurs

1: interrupt generated when a inconsistency error occurs.

Bit 19 **STRBERRIE**: strobe error interrupt enable bit

When STRBERRIE bit is set to 1, an interrupt is generated when a strobe error occurs (the master programs several times the same byte in the write buffer) during a write operation. STRBERRIE can be programmed only when LOCK is cleared to 0.

0: no interrupt generated when a strobe error occurs

1: interrupt generated when strobe error occurs.

Bit 18 **PGSERRIE**: programming sequence error interrupt enable bit

When this bit is set to 1, an interrupt is generated when a sequence error occurs during a program operation. PGSERRIE can be programmed only when LOCK is cleared to 0.

0: no interrupt generated when a sequence error occurs

1: interrupt generated when sequence error occurs

Bit 17 **WRPERRIE**: write protection error interrupt enable bit

When this bit is set to 1, an interrupt is generated when a protection error occurs during a program operation. WRPERRIE can be programmed only when LOCK is cleared to 0.

0: no interrupt generated when a protection error occurs

1: interrupt generated when a protection error occurs

Bit 16 **EOPIE**: end of operation interrupt control bit

Setting EOPIE bit to 1 enables the generation of an interrupt at the end of a program or erase operation. EOPIE can be programmed only when LOCK is cleared to 0.

0: no interrupt generated at the end of operation.

1: interrupt enabled when at the end of operation

Bit 15 **MER**: mass erase request

Setting MER bit to 1 requests a mass erase operation (user flash memory only). MER can be programmed only when LOCK is cleared to 0.

If BER or SER are both set, a PGSERR is raised.

0: mass erase not requested

1: mass erase requested

Note: An error is triggered when a mass erase is required and some sectors are protected.

Bits 14:13 Reserved, must be kept at reset value.

Bits 12:6 **SNB[6:0]**: sector erase selection number

These bits are used to select the target sector for an erase operation, otherwise they are not used. They can be programmed only when LOCK is cleared to 0.

0x00: Sector 0 selected

0x01: Sector 1 selected

..

0x7F: Sector 127 selected

Note: For STM32H523/33xx devices the maximum value is 0x1F, consider bits [6:5] as reserved, and keep them at reset value.

Bit 5 **STRT**: erase start control bit

STRT bit is used to start a sector erase or a bank erase operation. STRT can be programmed only when LOCK is cleared to 0.

STRT is reset at the end of the operation or when an error occurs. It cannot be reset by software.

Bit 4 **FW:** write forcing control bit

FW forces a write operation even if the write buffer is not full. In this case all bits not written are set to 1 by hardware. FW can be programmed only when LOCK is cleared to 0.

The memory resets FW when the corresponding operation has been acknowledged.

Note: Using a force-write operation prevents the application from updating later the missing bits with something else than 1, because it is likely that it leads to permanent ECC error.

Write forcing is effective only if the write buffer is not empty and was filled by nonsecure access (in particular, FW does not start several write operations when the force-write operations are performed consecutively).

Since there is just one write buffer, FW can force a write in Bank1 or Bank2.

Bit 3 **BER**: erase request

Setting BER bit to 1 requests a bank erase operation (user flash memory only). BER can be programmed only when LOCK is cleared to 0.

If MER and SER are also set, a PGSERR is raised.

0: bank erase not requested

1: bank erase requested

Note: Write protection error is triggered when a bank erase is required and some sectors are protected.

Bit 2 **SER**: sector erase request

Setting SER bit to 1 requests a sector erase. SER can be programmed only when LOCK is cleared to 0.

If MER and SER are also set, a PGSERR is raised.

0: sector erase not requested

1: sector erase requested

Bit 1 **PG**: programming control bit

PG can be programmed only when LOCK is cleared to 0.

PG allows programming in Bank1 and Bank2.

0: programming disabled

1: programming enabled

Bit 0 **LOCK**: configuration lock bit

This bit locks the FLASH_NSCR register. The correct write sequence to FLASH_NSKEYR register unlocks this bit. If a wrong sequence is executed, or if the unlock sequence to FLASH_NSKEYR is performed twice, this bit remains locked until the next system reset.

LOCK can be set by programming it to 1. When set to 1, a new unlock sequence is mandatory to unlock it. When LOCK changes from 0 to 1, the other bits of FLASH_NSCR register do not change.

0: FLASH_NSCR register unlocked

1: FLASH_NSCR register locked

7.11.12 FLASH secure control register (FLASH_SECCR)

This register is secure, can be read and written only by secure access. A nonsecure read/write access is RAZ/WI. This register can be protected against unprivileged access when SPRIV = 1 in the FLASH_PRIVCFGR register.

Access: No wait states when no memory operations are ongoing. The FLASH_SECCR register is not accessible in write mode when the BSY bit is set. Any attempt to write to it with the BSY bit set causes the AHB bus to stall until the BSY bit is cleared.

Address offset: 0x02C

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BKSEL	Res.	INV	Res.	Res.	Res.	Res.	Res.	Res.	OBKW ERRIE	OBK ERRIE	INC ERRIE	STRB ERRIE	PGS ERRIE	WRP ERRIE	EOPIE
rw		rw							rw	rw	rw	rw	rw	rw	rw

MER	Res.	Res.	SNB[6:0]							STRT	FW	BER	SER	PG	LOCK
rw			rw	rw	rw	rw	rw	rw	rw	rs	rw	rw	rw	rw	rs

Bit 31 **BKSEL**: Bank selector bit

BKSEL can only be programmed when LOCK is cleared to 0. The bit selects physical bank, SWAP_BANK setting is ignored.

0: Bank1 is selected for Bank erase / sector erase / interrupt enable

1: Bank2 is selected for BER / SER

Bit 30 Reserved, must be kept at reset value.

Bit 29 **INV**: Flash memory security state invert.

This bit inverts the flash memory security state.

Bits 28:23 Reserved, must be kept at reset value.

Bit 22 **OBKWERRIE**: OBK write error interrupt enable bit

OBKWERRIE enables generation of interrupt in case of OBK specific write error. OBKWERRIE can be programmed only when LOCK is cleared to 0.

0: no interrupt is generated on OBK write error

1: an interrupt is generated on OBK write error

Bit 21 **OBKERRIE**: OBK general error interrupt enable bit

OBKERRIE enables generating an interrupt in case of OBK specific access error. OBKERRIE can be programmed only when LOCK is cleared to 0.

0: no interrupt is generated on OBK general access error

1: an interrupt is generated on OBK general access error

Bit 20 **INCERRIE**: inconsistency error interrupt enable bit

When INCERRIE bit is set to 1, an interrupt is generated when an inconsistency error occurs during a write operation. INCERRIE can be programmed only when LOCK is cleared to 0.

0: no interrupt generated when a inconsistency error occurs

1: interrupt generated when a inconsistency error occurs.

Bit 19 **STRBERRIE**: strobe error interrupt enable bit

When STRBERRIE bit is set to 1, an interrupt is generated when a strobe error occurs (the master programs several times the same byte in the write buffer) during a write operation. STRBERRIE can be programmed only when LOCK is cleared to 0.

0: no interrupt generated when a strobe error occurs

1: interrupt generated when strobe error occurs.

Bit 18 **PGSERRIE**: programming sequence error interrupt enable bit

When PGSERRIE is set to 1, an interrupt is generated when a sequence error occurs during a program operation. PGSERRIE can be programmed only when LOCK is cleared to 0.

0: no interrupt generated when a sequence error occurs

1: interrupt generated when sequence error occurs

Bit 17 **WRPERRIE**: write protection error interrupt enable bit

When WRPERRIE bit is set to 1, an interrupt is generated when a protection error occurs during a program operation. WRPERRIE can be programmed only when LOCK is cleared to 0.

0: no interrupt generated when a protection error occurs

1: interrupt generated when a protection error occurs

Bit 16 **EOPIE**: end of operation interrupt control bit

Setting EOPIE bit to 1 enables the generation of an interrupt at the end of a program/erase operation. EOPIE can be programmed only when LOCK is cleared to 0.

0: no interrupt generated at the end of operation.

1: interrupt enabled when at the end of operation

Bit 15 **MER**: mass erase request

Setting MER bit to 1 requests a mass erase operation (user flash memory only). MER can be programmed only when LOCK is cleared to 0.

If BER or SER are also set, a PGSERR is raised.

0: mass erase not requested

1: mass erase requested

Note: An error is triggered when a mass erase is required and some sectors are protected.

Bits 14:13 Reserved, must be kept at reset value.

Bits 12:6 **SNB[6:0]**: sector erase selection number

These bits are used to select the target sector for an erase operation, otherwise they are unused. SNB can be programmed only when LOCK is cleared to 0.

0x00: Sector 0 selected

0x01: Sector 1 selected

..

0x7F: Sector 127 selected

Note: For STM32H523/33xx devices the maximum value is 0x1F, consider bits [6:5] as reserved, and keep them at reset value.

Bit 5 **STRT**: erase start control bit

STRT bit is used to start a sector erase or a bank erase operation. STRT can be programmed only when LOCK is cleared to 0.

STRT is reset at the end of the operation or when an error occurs. It cannot be reset by software.

Bit 4 **FW:** write forcing control bit

FW forces a write operation even if the write buffer is not full. In this case all bits not written are set to 1 by hardware. FW can be programmed only when LOCK is cleared to 0.

The memory resets FW when the corresponding operation has been acknowledged.

Note: Using a force-write operation prevents the application from updating later the missing bits with something else than 1, because it is likely that it leads to permanent ECC error.

Write forcing is effective only if the write buffer is not empty and was filled by secure access (in particular, FW does not start several write operations when the force-write operations are performed consecutively).

Since there is just one write buffer, FW can force a write in Bank1 or Bank2.

Bit 3 **BER**: erase request

Setting BER bit to 1 requests a bank erase operation (user flash memory only). BER can be programmed only when LOCK is cleared to 0.

If MER and SER are also set, a PGSERR is raised.

0: bank erase not requested

1: bank erase requested

Note: A write protection error is triggered when a bank erase is required and some sectors are protected.

Bit 2 **SER**: sector erase request

Setting SER bit to 1 requests a sector erase. SER can be programmed only when LOCK is cleared to 0.

If BER and MER are also set, a PGSERR is raised.

0: sector erase not requested

1: sector erase requested

Bit 1 **PG**: programming control bit

PG can be programmed only when LOCK is cleared to 0.

PG allows programming in Bank1 and Bank2.

0: programming disabled

1: programming enabled

Bit 0 **LOCK**: configuration lock bit

This bit locks the FLASH_SECCR register. The correct write sequence to FLASH_SECKEYR register unlocks this bit. If a wrong sequence is executed, or if the unlock sequence to FLASH_NSKEYR is performed twice, this bit remains locked until the next system reset.

LOCK can be set by programming it to 1. When set to 1, a new unlock sequence is mandatory to unlock it. When LOCK changes from 0 to 1, the other bits of FLASH_SECCR register do not change.

0: FLASH_SECCR register unlocked

1: FLASH_SECCR register locked

7.11.13 FLASH nonsecure clear control register (FLASH_NSCCR)

This register is nonsecure. It can be written by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

Address offset: 0x030

Reset value: 0x0000 0000

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **CLR_OPTCHANGEERR:** Clear the flag corresponding flag in FLASH_NSSR by writing this bit.

Bit 22 **CLR_OBKWERR**: OBKWERR flag clear bit.
Setting this bit to 1 resets to 0 OBKWERR flag in FLASH_NSSR register.

Bit 21 **CLR_OBKERR**: OBKERR flag clear bit.
Setting this bit to 1 resets to 0 OBKERR flag in FLASH_NSSR register.

Bit 20 **CLR_INCERR**: INCERR flag clear bit
Setting this bit to 1 resets to 0 INCERR flag in FLASH_NSSR register.

Bit 19 **CLR_STRBERR**: STRBERR flag clear bit
Setting this bit to 1 resets to 0 STRBERR flag in FLASH_NSSR register.

Bit 18 **CLR_PGSERR**: PGSERR flag clear bit
Setting this bit to 1 resets to 0 PGSERR flag in FLASH_NSSR register.

Bit 17 **CLR_WRPERR**: WRPERR flag clear bit
Setting this bit to 1 resets to 0 WRPERR flag in FLASH_NSSR register.

Bit 16 **CLR_EOP**: EOP flag clear bit
Setting this bit to 1 resets to 0 EOP flag in FLASH_NSSR register.

Bits 15:0 Reserved, must be kept at reset value.

7.11.14 FLASH secure clear control register (FLASH_SECCCR)

This register is secure. It can be written only by secure access. A nonsecure read/write access is RAZ/WI. This register can be protected against unprivileged access when SPRIV = 1 in the FLASH_PRIVCFGR register.

Address offset: 0x034

Reset value: 0x0000 0000

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **CLR_OBKWERR**: OBKWERR flag clear bit
Setting this bit to 1 resets to 0 OBKWERR flag in FLASH_SECSR register.

Bit 21 **CLR_OBKERR**: OBKWERR flag clear bit
Setting this bit to 1 resets to 0 OBKWERR flag in FLASH_SECSR register.

Bit 20 **CLR_INCERR**: INCERR flag clear bit
Setting this bit to 1 resets to 0 INCERR flag in FLASH_SECSR register.

Bit 19 **CLR_STRBERR**: STRBERR flag clear bit
Setting this bit to 1 resets to 0 STRBERR flag in FLASH_SECSR register.

Bit 18 **CLR_PGSERR**: PGSERR flag clear bit
Setting this bit to 1 resets to 0 PGSERR flag in FLASH_SECSR register.

Bit 17 **CLR_WRPERR**: WRPERR flag clear bit
Setting this bit to 1 resets to 0 WRPERR flag in FLASH_SECSR register.

Bit 16 **CLR_EOP**: EOP flag clear bit
Setting this bit to 1 resets to 0 EOP flag in FLASH_SECSR register.

Bits 15:0 Reserved, must be kept at reset value.

7.11.15 FLASH privilege configuration register (FLASH_PRIVCFGR)

Address offset: 0x03C

Reset value: 0x0000 0000

This register can be read by both privileged and unprivileged access. NSPRIV is a nonsecure bit. SPRIV is a secure bit. It can be written only by privileged mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NSPRIV	SPRIV
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **NSPRIV**: privilege attribute for non secure registers
0: access to non secure registers is always granted
1: access to non secure registers is denied in case of unprivileged access.

Bit 0 **SPRIV**: privilege attribute for secure registers
0: access to secure registers is always granted
1: access to secure registers is denied in case of unprivileged access.

7.11.16 FLASH nonsecure OBK configuration register (FLASH_NSOBKCFGR)

Register is only available when TZ_STATE = 0xC3. This register is nonsecure. It can be read and written by both secure and nonsecure accesses. This register can only be accessed by privilege code. This register is not accessible in write mode when the BSY bit is set. Any attempt to write to it with the BSY bit set causes the AHB bus to stall until the BSY bit is cleared.

Address offset: 0x040

Reset value: 0x01FF 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWAP_OFFSET[8:0]

												rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:16 **SWAP_OFFSET[8:0]**: Key index (offset /16 bits) pointing for next swap.
0x00: means that no OBK is copied from current to alternate OBK sector during SWAP operation.
0x01 means that only the first OBK data (128 bits) are copied from current to alternate OBK sector
0x02 means that the two first OBK data are copied
…
0x1FF: means that all OBK data (511) are copied

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **ALT_SECT_ERASE**: alternate sector erase bit
0: do not touch OBK sector
1: erase the alternate OBK sector
When ALT_SECT bit is set, use this bit to generate an erase command for the OBK alternate sector. It is set only by Software and cleared when the OBK swap operation is completed or an error occurs (PGSERR). It is reset at the same time as BUSY bit.

Bit 2 **ALT_SECT**: alternate sector bit
0: current OBK sector is mapped to OBK address range for access
1: alternate OBK sector is mapped to OBK address range for access
This bit must not change while filling the write buffer, otherwise an error (OBKERR) is generated

Bit 1 **SWAP_SECT_REQ**: OBK swap sector request bit
0: no swap requested
1: launch the sector swap
When set, all the OBKs not updated in the alternate sector are copied from current sector to alternate one.
The SWAP_OFFSET must have a minimum value to launched the swap. The minimum value is 16 for OBK-HDPL = 1, 144 for OBK-HDPL = 2, and 192 for OBK-HDPL = 3.

Bit 0 **LOCK**: OBKCFGR lock option configuration bit
This bit locks the register, the correct write sequence unlocks it. If a wrong sequence is executed, or if the unlock sequence is performed twice, this bit remains locked until the next system reset. LOCK can be set by programming it to 1. When set to 1, a new unlock sequence is mandatory to unlock it. When LOCK changes from 0 to 1, the other bits of FLASH_NSCR register do not change.
0: FLASH_NSOBKCFGR register unlocked
1: FLASH_NSOBKCFGR register locked

7.11.17 FLASH secure OBK configuration register (FLASH_SECOBKCFGR)

This register can be accessed only in secure privileged mode. The FLASH_SECOBKCFGR register is not accessible in write mode when the BSY bit is set. Any attempt to write to it with the BSY bit set causes the AHB bus to stall until the BSY bit is cleared.

Address offset: 0x044

Reset value: 0x01FF 0000

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ALT_SECT_ERASE	ALT_SECT	SWAP_SECT_REQ	LOCK
												rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:16 **SWAP_OFFSET[8:0]**: key index (offset /16 bits) pointing for next swap.

0x0: no OBK is copied from current to alternate OBK sector during SWAP operation.
0x1: only the first OBK data (128 bits) are copied from current to alternate OBK sector
0x2: the two first OBK data are copied
…
0x1FF: the 511 first OBK data are copied

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **ALT_SECT_ERASE**: alternate sector erase bit

0: do not touch OBK sector
1: erase the alternate OBK sector
When ALT_SECT bit is set, use this bit to generate an erase command for the OBK alternate sector. It is set only by Software and cleared when the OBK swap operation is completed or an error occurs (PGSERR). It is reset at the same time as the BUSY bit.

Bit 2 **ALT_SECT**: alternate sector bit

0: current OBK sector is mapped to OBK address range for access
1: alternate OBK sector is mapped to OBK address range for access
This bit must not change while filling the write buffer, otherwise an error is generated

Bit 1 **SWAP_SECT_REQ**: OBK swap sector request bit

0: no swap requested
1: launch the sector swap
When set, all the OBKs not updated in the alternate sector are copied from current sector to alternate one.
SWAP_OFFSET must have a minimum value to launch the swap. The minimum value is 16 for OBK-HDPL = 1, 144 for OBK-HDPL = 2, and 192 for OBK-HDPL = 3.

Bit 0 **LOCK**: OBKCFGR lock option configuration bit

This bit locks the FLASH_OBKCFGR register. The correct write sequence to FLASH_SECOBKKEYR register unlocks this bit. If a wrong sequence is executed, or if the unlock sequence to FLASH_SECOBKKEYR is performed twice, this bit remains locked until the next system reset. LOCK can be set by programming it to 1. When set to 1, a new unlock sequence is mandatory to unlock it. When LOCK changes from 0 to 1, the other bits of FLASH_NSCR register do not change.
0: FLASH_OBKCFGR register unlocked
1: FLASH_OBKCFGR register locked

7.11.18 FLASH HDP extension register (FLASH_HDPEXTR)

All bits in this register are nonsecure. It can be read and written by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

The register can be modified only in HDPL ≤ 2.

The values in this register cannot be decremented. Attempts to write a value lower than the current one are ignored.

Address offset: 0x048

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HDP2_EXT[6:0]

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HDP1_EXT[6:0]						
									rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:16 **HDP2_EXT[6:0]**: HDP area extension in 8 Kbytes sectors in Bank2. Extension is added after the HDP2_END sector (included).

Note: For STM32H523/33xx devices the maximum value is 0x1F, consider bits [6:5] as reserved, and keep them at reset value.

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:0 **HDP1_EXT[6:0]**: HDP area extension in 8 Kbytes sectors in Bank1. Extension is added after the HDP1_END sector (included).

Note: For STM32H523/33xx devices the maximum value is 0x1F, consider bits [6:5] as reserved, and keep them at reset value.

7.11.19 FLASH option status register (FLASH_OPTSR_CUR)

This register is nonsecure, can be read by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

Default value: 0x0030 5CD8 (value in case of double ECC issue during OBL).

This read-only register reflects the current values of the corresponding option bits.

Address offset: 0x050

Reset value: 0xXXXX XXXX

Bits 0 to 31 are loaded with values from the flash memory at OBL.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SWAP_BANK	Res.	BOOT_UBE[7:0]								IWDG_STDBY	IWDG_STOP	Res.	Res.	IO_VDDIO2_HSLV	IO_VDD_HSLV

r	r	r	r	r	r	r	r	r	r		r	r	r	r	r

Bit 31 **SWAP_BANK**: Bank swapping option status bit
SWAP_BANK reflects whether Bank1 and Bank2 are swapped or not.
SWAP_BANK is loaded to SWAP_BANK of FLASH_OPTCR after a reset.
0: Bank1 and Bank2 not swapped
1: Bank1 and Bank2 swapped

Bit 30 Reserved, must be kept at reset value.

Bits 29:22 **BOOT_UBE[7:0]:** Available only on cryptography enabled devices.
Unique boot entry control, selects either ST or OEMiRoT for secure boot.
0xC3: STiRoT (system flash) selected
0xB4: OEMiRoT (user flash) selected. In Open PRODUCT_STATE this value selects bootloader. Default value.

Bit 21 **IWDG_STDBY**: IWDG Standby mode freeze option status bit
When set the independent watchdog IWDG is frozen in system Standby mode.
0: Independent watchdog frozen in Standby mode
1: Independent watchdog keep running in Standby mode.

Bit 20 **IWDG_STOP**: IWDG Stop mode freeze option status bit
When set the independent watchdog IWDG is in system Stop mode.
0: Independent watchdog frozen in system Stop mode
1: Independent watchdog keep running in system Stop mode.

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **IO_VDDIO2_HSLV**: High-speed IO at low V_{DDIO2} voltage configuration bit.
This bit can be set only with V_{DDIO2} below 2.7 V.
0: High-speed IO at low V_{DDIO2} voltage feature disabled (V_{DDIO2} can exceed 2.7 V)
1: High-speed IO at low V_{DDIO2} voltage feature enabled (V_{DDIO2} remains below 2.7 V)

Bit 16 **IO_VDD_HSLV**: High-speed IO at low V_{DD} voltage configuration bit.
This bit can be set only with V_{DD} below 2.7 V.
0: High-speed IO at low V_{DD} voltage feature disabled (V_{DD} can exceed 2.7 V)
1: High-speed IO at low V_{DD} voltage feature enabled (V_{DD} remains below 2.7 V)

Bits 15:8 **PRODUCT_STATE[7:0]**: Life state code (based on Hamming 8,4). See *Section 7.6.11*.

Bit 7 **NRST_STDBY**: Core domain Standby entry reset option status bit
0: a reset is generated when entering Standby mode on core domain
1: no reset generated when entering Standby mode on core domain.

Bit 6 **NRST_STOP**: Core domain Stop entry reset option status bit
0: a reset is generated when entering Stop mode on core domain
1: no reset generated when entering Stop mode on core domain.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **WWDG_SW**: WWDG control mode option status bit
0: WWDG watchdog is controlled by hardware
1: WWDG watchdog is controlled by software

Bit 3 **IWDG_SW**: IWDG control mode option status bit
0: IWDG watchdog is controlled by hardware
1: IWDG watchdog is controlled by software

Bit 2 **BORH_EN**: Brownout high enable
0: disable
1: enable

Bits 1:0 **BOR_LEV[1:0]**: Brownout level option status bit
These bits reflects the power level that generates a system reset.
00 or 11: BOR Level 1, the threshold level is low (~ 2.1 V)
01: BOR Level 2, the threshold level is medium (~ 2.4 V)
10: BOR Level 3, the threshold level is high (~ 2.7 V)

7.11.20 FLASH option status register (FLASH_OPTSR_PRG)

This register is nonsecure. It can be read and written by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

This register is used to program values in corresponding option bits. Values after reset reflects the current values of the corresponding option bits.

Address offset: 0x054

Reset value: 0xXXXX XXXX

Bits 0 to 31 are loaded with values from the flash memory at OBL.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SWAP_BANK	Res.	BOOT_UBE[7:0]								IWDG_STDBY	IWDG_STOP	Res.	Res.	IO_VDDIO2_HSLV	IO_VDD_HSLV
rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw			rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PRODUCT_STATE[7:0]								NRST_STDBY	NRST_STOP	Res.	WWDG_SW	IWDG_SW	BORH_EN	BOR_LEV[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw

Bit 31 **SWAP_BANK**: Bank swapping option configuration bit
SWAP_BANK option bit is used to configure whether the Bank1 and Bank2 are swapped or not. This bit is loaded with the SWAP_BANK bit of FLASH_OPTSR_CUR register after a reset.
0: Bank1 and Bank2 not swapped
1: Bank1 and Bank2 swapped

Bit 30 Reserved, must be kept at reset value.

Bits 29:22 **BOOT_UBE[7:0]:** Available only on cryptography enabled devices.
Unique boot entry control, selects either ST or OEMiRoT for secure boot.
0xC3: STiRoT (system flash) selected
0xB4: OEMiRoT (user flash) selected.
In Open PRODUCT_STATE this value selects bootloader. Default value.

Bit 21 **IWDG_STDBY**: IWDG Standby mode freeze option status bit
When set the independent watchdog IWDG is frozen in system Standby mode.
0: Independent watchdog frozen in Standby mode
1: Independent watchdog keep running in Standby mode.

Bit 20 **IWDG_STOP**: IWDG Stop mode freeze option status bit
When set the independent watchdog IWDG is in system Stop mode.
0: Independent watchdog frozen in system Stop mode
1: Independent watchdog keep running in system Stop mode.

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **IO_VDDIO2_HSLV**: High-speed IO at low V_{DDIO2} voltage configuration bit.
This bit can be set only with V_{DDIO2} below 2.7 V.
0: High-speed IO at low V_{DDIO2} voltage feature disabled (V_{DDIO2} can exceed 2.7 V)
1: High-speed IO at low V_{DDIO2} voltage feature enabled (V_{DDIO2} remains below 2.7 V)

Bit 16 **IO_VDD_HSLV**: High-speed IO at low VDD voltage configuration bit.
This bit can be set only with V_{DD} below 2.7 V.
0: High-speed IO at low V_{DD} voltage feature disabled (V_{DD} can exceed 2.7 V)
1: High-speed IO at low V_{DD} voltage feature enabled (V_{DD} remains below 2.7 V)

Bits 15:8 **PRODUCT_STATE[7:0]**: Life state code (based on Hamming 8,4). See *Section 7.6.11*.

Bit 7 **NRST_STDBY**: Core domain Standby entry reset option configuration bit
0: a reset is generated when entering Standby mode on core domain
1: no reset generated when entering Standby mode on core domain.

Bit 6 **NRST_STOP**: Core domain Stop entry reset option configuration bit
0: a reset is generated when entering Stop mode on core domain
1: no reset generated when entering Stop mode on core domain.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **WWDG_SW**: WWDG control mode option configuration bit
0: WWDG watchdog is controlled by hardware
1: WWDG watchdog is controlled by software

Bit 3 **IWDG_SW**: IWDG control mode option configuration bit
0: IWDG watchdog is controlled by hardware
1: IWDG watchdog is controlled by software

Bit 2 **BORH_EN**: Brownout high enable configuration bit
0: disabled
1: enabled

Bits 1:0 **BOR_LEV[1:0]**: Brownout level option configuration bit
These bits reflects the power level that generates a system reset.
00 or 11: BOR Level 1, the threshold level is low (~ 2.1 V)
01: BOR Level 2, the threshold level is medium (~ 2.4 V)
10: BOR Level 3, the threshold level is high (~ 2.7 V)

7.11.21 FLASH nonsecure EPOCH register (FLASH_NSEPOCHR_CUR)

This register is nonsecure, can be read by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

This read-only register reflects the current values of the corresponding option bits.

Address offset: 0x060

Reset value: 0xXXXX XXXX

Bits 0 to 31 are loaded with values from the flash memory at OBL

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:0 **NS_EPOCH[23:0]:** Nonvolatile nonsecure EPOCH counter

7.11.22 FLASH secure EPOCH register (FLASH_SECEPOCHR_CUR)

This register is nonsecure, can be read by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

This read-only register reflects the current values of the corresponding option bits.

Address offset: 0x068

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:0 **SEC_EPOCH[23:0]:** Nonvolatile secure EPOCH counter

7.11.23 FLASH option status register 2 (FLASH_OPTSR2_CUR)

This register is nonsecure, can be read by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

Default value: 0xB400 0170

This read-only register reflects the current values of the corresponding option bits.

Address offset: 0x070

Reset value: 0xXXXX XXXX

Bits 0 to 31 are loaded with values from the flash memory at OBL.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TZEN[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

							r		r	r	r	r	r		

Bits 31:24 **TZEN[7:0]**: TrustZone enable configuration bits
This bit enables the device is in TrustZone mode during an option byte change.
0xC3: TrustZone disabled
0xB4: TrustZone enabled.

Bits 23:15 Reserved, must be kept at reset value.

Bits 14:9 Reserved, must be kept at reset value.

Bit 8 **USBPD_DIS**: USB power delivery configuration option bit for UCPDx_CC1 pin only
This bit enables USB Type-C dead battery pull-down behavior on UCPDx_CC1 pin.
0: Enabled. For USB Type-C® and Power Delivery applications: enables correct dead-battery behavior of UCPDx_CC1 pin.
1: Disabled: Stops the dead battery pull-down behavior on the UCPDx_CC1 pin after power-up.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **SRAM2_ECC**: SRAM2 ECC detection and correction disable
0: SRAM2 ECC check enabled
1: SRAM2 ECC check disabled

Bit 5 **SRAM3_ECC**: SRAM3 ECC detection and correction disable
0: SRAM3 ECC check enabled
1: SRAM3 ECC check disabled

Bit 4 **BKPRAM_ECC**: Backup RAM ECC detection and correction disable
0: BKPRAM ECC check enabled
1: BKPRAM ECC check disabled

Bit 3 **SRAM2_RST**: SRAM2 erase when system reset
0: SRAM2 erased when a system reset occurs
1: SRAM2 not erased when a system reset occurs.

Bit 2 **SRAM13_RST**: SRAM1 and SRAM3 erase upon system reset
0: SRAM1 and SRAM3 erased when a system reset occurs
1: SRAM1 and SRAM3 not erased when a system reset occurs

Bits 1:0 Reserved, must be kept at reset value.

7.11.24 FLASH option status register 2 (FLASH_OPTSR2_PRG)

This register is nonsecure. It can be read and written by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

This register is used to program values in corresponding option bits. Values after reset reflects the current values of the corresponding option bits.

Address offset: 0x074

Reset value: 0xXXXX XXXX

Bits 0 to 31 are loaded with values from the flash memory at OBL.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TZEN[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

							rw		rw	rw	rw	rw	rw		

Bits 31:24 **TZEN[7:0]**: TrustZone enable configuration bits
This bit enables the device is in TrustZone mode during an option byte change.
0xC3: TrustZone disabled
0xB4: TrustZone enabled

Bits 23:15 Reserved, must be kept at reset value.

Bits 14:9 Reserved, must be kept at reset value.

Bit 8 **USBPD_DIS**: USB power delivery configuration option bit for UCPDx_CC1 pin only
This bit enables USB Type-C dead battery pull-down behavior on UCPDx_CC1 pin.
0: Enabled. For USB Type-C® and Power Delivery applications: enables correct dead-battery behavior of UCPDx_CC1 pin.
1: Disabled: Stops the dead battery pull-down behavior on the UCPDx_CC1 pin after power-up.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **SRAM2_ECC**: SRAM2 ECC detection and correction disable
0: SRAM2 ECC check enabled
1: SRAM2 ECC check disabled

Bit 5 **SRAM3_ECC**: SRAM3 ECC detection and correction disable
0: SRAM3 ECC check enabled
1: SRAM3 ECC check disabled

Bit 4 **BKPRAM_ECC**: Backup RAM ECC detection and correction disable
0: BKPRAM ECC check enabled
1: BKPRAM ECC check disabled

Bit 3 **SRAM2_RST**: SRAM2 erase when system reset
0: SRAM2 erased when a system reset occurs
1: SRAM2 not erased when a system reset occurs.
Note: SRAM erase is triggered by option byte change operation, when enabling this feature.

Bit 2 **SRAM1_3_RST**: SRAM1 and SRAM3 erase upon system reset
0: SRAM1 and SRAM3 erased when a system reset occurs
1: SRAM1 and SRAM3 not erased when a system reset occurs
Note: SRAM erase is triggered by option byte change operation, when enabling this feature.

Bits 1:0 Reserved, must be kept at reset value.

7.11.25 FLASH nonsecure boot register (FLASH_NSBOOTR_CUR)

This register is nonsecure, can be read by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

This register reflects the current values of the corresponding option bits.

Address offset: 0x080

Reset value: 0xXXXX XXXX

Bits 0 to 31 are loaded with values from the flash memory at OBL.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
NSBOOTADD[23:8]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NSBOOTADD[7:0]								NSBOOT_LOCK[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:8 **NSBOOTADD[23:0]**: Non secure unique boot entry address
These bits reflect the Non secure UBE address

Bits 7:0 **NSBOOT_LOCK[7:0]:** Field locking the values of SWAP_BANK, and NSBOOTADD settings.
0xC3: SWAP_BANK and NSBOOTADD can still be modified following their individual rules.
0xB4: NSBOOTADD is frozen. SWAP_ BANK can be modified only with TZEN set to 0xB4 (enabled).

7.11.26 FLASH nonsecure boot register (FLASH_NSBOOTR_PRG)

This register is nonsecure. It can be read and written by both secure and nonsecure accesses, and protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

This register is used to program values in corresponding option bits.

Address offset: 0x084

Reset value: 0xXXXX XXXX

Bits 0 to 31 are loaded with values from the flash memory at OBL.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
NSBOOTADD[23:8]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NSBOOTADD[7:0]								NSBOOT_LOCK[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 **NSBOOTADD[23:0]**: Non secure unique boot entry address
These bits allow configuring the Non secure BOOT address

Bits 7:0 **NSBOOT_LOCK[7:0]:** Field locking the values of SWAP_ BANK, and NSBOOTADD settings.
0xC3: SWAP_ BANK and NSBOOTADD can still be modified following their individual rules.
0xB4: NSBOOTADD is frozen. SWAP_ BANK can be modified only with TZEN set to 0xB4 (enabled).

7.11.27 FLASH secure boot register (FLASH_SECBOOTR_CUR)

This register is secure. It can be read only by secure access. A nonsecure read/write access is RAZ/WI. This register can be protected against unprivileged access when SPRIV = 1 in the FLASH_PRIVCFGR register.

This register reflects the current values of the corresponding option bits.

Address offset: 0x088

Reset value: 0xXXXX XXXX

Bits 0 to 31 are loaded with values from the flash memory at OBL.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SECBOOTADD[23:8]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SECBOOTADD[7:0]								SECBOOT_LOCK[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:8 **SECBOOTADD[23:0]**: Unique boot entry secure address
These bits reflect the Secure UBE address

Bits 7:0 **SECBOOT_LOCK[7:0]:** Field locking the values of UBE, SWAP_BANK, and SECBOOTADD settings.
0xC3: BOOT_UBE, SWAP_BANK and SECBOOTADD can still be modified following their individual rules.
0xB4: BOOT_UBE and SECBOOTADD are frozen. SWAP_ BANK can be modified only with TZEN set to 0xC3 (disabled).

7.11.28 FLASH secure boot register (FLASH_BOOTR_PRG)

This register is secure, can be read and written only by secure access. A nonsecure read/write access is RAZ/WI. This register can be protected against unprivileged access when SPRIV = 1 in the FLASH_PRIVCFGR register.

This register is used to program values in corresponding option bits.

Address offset: 0x08C

Reset value: 0xXXXX XXXX

Bits 0 to 31 are loaded with values from the flash memory at OBL.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SECBOOTADD[23:8]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SECBOOTADD[7:0]								SECBOOT_LOCK[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 **SECBOOTADD[23:0]**: Secure unique boot entry address.
These bits allow configuring the secure UBE address.

Bits 7:0 **SECBOOT_LOCK[7:0]:** Field locking the values of UBE, SWAP_ BANK, and SECBOOTADD setting.
0xC3: BOOT_UBE, SWAP_ BANK and SECBOOTADD can still be modified following their individual rules.
0xB4: BOOT_UBE and SECBOOTADD are frozen. SWAP_BANK can be modified only with TZEN set to 0xC3 (disabled).

7.11.29 FLASH nonsecure OTP block lock (FLASH_OTPBLR_CUR)

This register is nonsecure, can be read by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

This register reflects the current values of the corresponding option bits.

Address offset: 0x090

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LOCKBL[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LOCKBL[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **LOCKBL[31:0]**: OTP block lock
Block *n* corresponds to OTP 16-bit word 32 x *n* to 32 x *n* + 31.
LOCKBL[n] = 1 indicates that all OTP 16-bit words in OTP Block *n* are locked and attempt to program them results in WRPERR.
LOCKBL[n] = 0 indicates that all OTP 16-bit words in OTP Block *n* are not locked.
When one block is locked, it is not possible to remove the write protection.
Also if not locked, it is not possible to erase OTP words.

7.11.30 FLASH nonsecure OTP block lock (FLASH_OTPBLR_PRG)

This register is nonsecure. It can be read and written by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

This register is used to program values in corresponding option bits.

Address offset: 0x094

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LOCKBL[31:16]															
rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LOCKBL[15:0]															
rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:0 **LOCKBL[31:0]**: OTP block lock

Block *n* corresponds to OTP 16-bit word 32 x *n* to 32 x *n* + 31.
LOCKBL[n] = 1 indicates that all OTP 16-bit words in OTP Block *n* are locked and attempt to program them results in WRPERR.
LOCKBL[n] = 0 indicates that all OTP 16-bit words in OTP Block *n* are not locked.
When one block is locked, it is not possible to remove the write protection.
LOCKBL bits can be set if the corresponding bit in FLASH_OTPBLR_CUR is cleared.

7.11.31 FLASH secure block based register for Bank1 (FLASH_SECBB1Rx)

These registers (only one for STM32H523/33xx devices, as x = 1) are secure. They can be read and written only by secure access. A nonsecure read/write access is RAZ/WI.

Address offset: 0x0A0 + 0x004 * (x-1), (x = 1 to 4)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SECBB1[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SECBB1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SECBB1[31:0]**: Secure/nonsecure 8 Kbytes flash Bank1 sector attributes (y = 0 to 31)

0: sector (32 * (x-1) + y) in Bank1 is non secure.
1: sector (32 * (x-1) + y) in Bank1 is secure.

7.11.32 FLASH privilege block based register for Bank1 (FLASH_PRIVBB1Rx)

These registers (only one for STM32H523/33xx devices, as x = 1) are privileged. They can be read and written only by a privileged access. This register can be protected against nonsecure write access.

Address offset: 0x0C0 + 0x004 * (x-1), (x = 1 to 4)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PRIVBB1[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PRIVBB1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PRIVBB1[31:0]**: Privileged/unprivileged 8-Kbyte flash Bank1 sector attribute (y = 0 to 31)
0: sectors (32 * (x-1) + y) in Bank1 is unprivileged.
1: sector (32 * (x-1) + y) in Bank1 is privileged.

7.11.33 FLASH security watermark for Bank1 (FLASH_SECWM1R_CUR)

This read-only register is nonsecure, it can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register. It reflects the current values of the corresponding option bits.

Address offset: 0x0E0

Reset value: 0x00XX 00XX

Bits 0 to 31 are loaded with values from the flash memory at OBL.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SECWM1_END[6:0]						
									r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SECWM1_STRT[6:0]						
									r	r	r	r	r	r	r

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:16 **SECWM1_END[6:0]**: Bank1 security WM area 1 end sector

Note: For STM32H523/33xx devices the maximum value is 0x1F, consider bits [6:5] as reserved, and keep them at reset value.

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:0 **SECWM1_STRT[6:0]**: Bank1 security WM area 1 start sector

Note: For STM32H523/33xx devices the maximum value is 0x1F, consider bits [6:5] as reserved, and keep them at reset value.

7.11.34 FLASH security watermark for Bank1 (FLASH_SECWM1R_PRG)

This register is secure, can be read and written only by secure access. A nonsecure read/write access is RAZ/WI. This register can be protected against unprivileged access when SPRIV = 1 in the FLASH_PRIVCFGR register. This register is used to program values in corresponding option bits.

Address offset: 0x0E4

Reset value: 0x00XX 00XX

Bits 0 to 31 are loaded with values from the flash memory at OBL.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

									rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:16 **SECWM1_END[6:0]**: Bank1 security WM area 1 end sector

Note: For STM32H523/33xx devices the maximum value is 0x1F, consider bits [6:5] as reserved, and keep them at reset value.

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:0 **SECWM1_STRT[6:0]**: Bank1 security WM area 1 start sector

Note: For STM32H523/33xx devices the maximum value is 0x1F, consider bits [6:5] as reserved, and keep them at reset value.

7.11.35 FLASH write sector group protection for Bank1 (FLASH_WRP1R_CUR)

This register is nonsecure. It can be read by both secure and nonsecure accesses, and can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

This read-only register reflects the current values of the corresponding option bits.

Address offset: 0x0E8

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
WRPSG1[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

WRPSG1[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **WRPSG1[31:0]**: Bank1 sector group protection option status byte

Each FLASH_WRP1R_CUR bit reflects the write protection status of the corresponding group of four consecutive sectors in Bank1 (0: the group is write-protected; 1: the group is not write-protected)

Bit 0: Group embedding sectors 0 to 3

Bit 1: Group embedding sectors 4 to 7

Bit N: Group embedding sectors 4 x N to 4 x N + 3

Bit 31: Group embedding sectors 124 to 127

Note: In STM32H523/33xx devices only bits [7:0] are used. Consider bits [31:8] as reserved, and keep them at reset value.

7.11.36 FLASH write sector group protection for Bank1 (FLASH_WRP1R_PRG)

This register is nonsecure. It can be read and written by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

This register is used to program values in corresponding option bits.

Address offset: 0x0EC

Reset value: 0xXXXX XXXX

Bits 22:16 **HDP1_END[6:0]:** HDPL barrier end set in number of 8-Kbyte sectors

Note: For STM32H523/33xx devices the maximum value is 0x1F, consider bits [6:5] as reserved, and keep them at reset value.

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:0 **HDP1_STRT[6:0]:** HDPL barrier start set in number of 8-Kbyte sectors

Note: For STM32H523/33xx devices the maximum value is 0x1F, consider bits [6:5] as reserved, and keep them at reset value.

7.11.41 FLASH ECC correction register (FLASH_ECCCORR)

This register is nonsecure. It can be read and written by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

Address offset: 0x100

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	ECCC	Res.	Res.	Res.	Res.	ECCCIE	OTP_ECC	SYSF_ECC	BK_ECC	EDATA_ECC	OBK_ECC	Res.	Res.	Res.	Res.
	rw					rw	r	r	r	r	r				

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDR_ECC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bit 31 Reserved, must be kept at reset value.

Bit 30 **ECCC:** ECC correction set by hardware when single ECC error has been detected and corrected.

Cleared by writing 1.

Bits 29:26 Reserved, must be kept at reset value.

Bit 25 **ECCCIE**: ECC single correction error interrupt enable bit

When ECCCIE bit is set to 1, an interrupt is generated when an ECC single correction error occurs during a read operation.

0: no interrupt generated when an ECC single correction error occurs

1: nonsecure interrupt generated when an ECC single correction error occurs

Bit 24 **OTP_ECC**: OTP ECC error bit

This bit is set to 1 when one single ECC correction occurred during the last successful read operation from the read-only/ OTP area. The address of the ECC error is available in ADDR_ECC bitfield.

Bit 23 **SYSF_ECC**: ECC fail for corrected ECC error in system flash memory

It indicates if system flash memory is concerned by ECC error.

Bit 22 **BK_ECC**: ECC fail bank for corrected ECC error

It indicates which bank is concerned by ECC error

Bit 21 **EDATA_ECC**: ECC fail for corrected ECC error in flash high-cycle data area

It indicates if flash high-cycle data area is concerned by ECC error.

Bit 20 **OBK_ECC**: Single ECC error corrected in flash OB Keys storage area. It indicates the OBK storage concerned by ECC error.

Bits 19:16 Reserved, must be kept at reset value.

Bits 15:0 **ADDR_ECC[15:0]**: ECC error address

When an ECC error occurs (for single correction) during a read operation, ADDR_ECC contains the address that generated the error. It is reset when the flag error is reset.

The flash interface programs the address in this register only when no ECC error flags are set. This means that only the first address that generated an ECC error is saved.

The address in ADDR_ECC is relative to the flash memory area where the error occurred (user flash memory, system flash memory, data area, read-only/OTP area).

7.11.42 FLASH ECC detection register (FLASH_ECCDETR)

This register is nonsecure. It can be read and written by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

Address offset: 0x104

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ECCD	Res.	Res.	Res.	Res.	Res.	Res.	OTP_ECC	SYSF_ECC	BK_ECC	EDATA_ECC	OBK_ECC	Res.	Res.	Res.	Res.
rw							r	r	r	r	r				
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDR_ECC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bit 31 **ECCD:** ECC detection

Set by hardware when two ECC error has been detected.

When this bit is set, a NMI is generated.

Cleared by writing 1. Needs to be cleared in order to detect subsequent double ECC errors.

Bits 30:25 Reserved, must be kept at reset value.

Bit 24 **OTP_ECC**: OTP ECC error bit

This bit is set to 1 when double ECC detection occurred during the last read operation from the read-only/ OTP area. The address of the ECC error is available in ADDR_ECC bitfield.

Bit 23 **SYSF_ECC**: ECC fail for double ECC error in system flash memory

It indicates if system flash memory is concerned by ECC error.

Bit 22 **BK_ECC**: ECC fail bank for double ECC error

It indicates which bank is concerned by ECC error

Bit 21 **EDATA_ECC**: ECC fail double ECC error in flash high-cycle data area

It indicates if flash high-cycle data area is concerned by ECC error.

Bit 20 **OBK_ECC**: ECC fail double ECC error in flash OB Keys storage area. It indicates the OBK storage concerned by ECC error.

Bits 19:16 Reserved, must be kept at reset value.

Bits 15:0 **ADDR_ECC[15:0]**: ECC error address

When an ECC error occurs (double detection) during a read operation, the ADDR_ECC contains the address that generated the error. It is reset when the flag error is reset.
The flash interface programs the address in this register only when no ECC error flags are set. This means that only the first address that generated an double ECC error is saved.
The address in ADDR_ECC is relative to the flash memory area where the error occurred (user flash memory, system flash memory, data area, read-only/OTP area).

7.11.43 FLASH ECC data (FLASH_ECCDR)

This register is nonsecure. It can be read and written by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

Address offset: 0x108

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

DATA_ECC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **DATA_ECC[15:0]**: ECC error data

When an double detection ECC error occurs on special areas with 6-bit ECC on 16-bit data (data, read-only/OTP), the failing data is read to this register.
By checking if it is possible to determine whether the failure was on a real data, or due to access to uninitialized memory.

7.11.44 FLASH secure block-based register for Bank2 (FLASH_SECBB2Rx)

These registers (only one for STM32H523/33xx devices, as x = 1) are secure, they can be read and written only by secure access. A nonsecure read/write access is RAZ/WI. The registers can be protected against unprivileged access when SPRIV = 1 in the FLASH_PRIVCFGR register.

Address offset: 0x1A0 + 0x004 * (x-1), (x = 1 to 4)

Reset value: 0x0000 0000

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **WRPSG2[31:0]**: Bank2 sector group protection option status byte

Each bit reflects the write protection status of the corresponding group of four consecutive sectors in Bank2 (0: group is write-protected; 1: group is not write-protected)

Bit 0: Group embedding sectors 0 to 3

Bit 1: Group embedding sectors 4 to 7

Bit N: Group embedding sectors 4 x N to 4 x N + 3

Bit 31: Group embedding sectors 124 to 127

Note: In STM32H523/33xx devices only bits [7:0] are used. Consider bits [31:8] as reserved, and keep them at reset value.

7.11.49 FLASH write sector group protection for Bank2 (FLASH_WRP2R_PRG)

This register is nonsecure. It can be read and written by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

This register is used to program values in corresponding option bits.

Address offset: 0x1EC

WRPSG2[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **WRPSG2[31:0]**: Bank2 sector group protection option status byte

Setting WRPSGn2 bits to 0 write protects the corresponding group of four consecutive sectors in Bank2 (0: group is write-protected; 1: group is not write-protected)

Bit 0: Group embedding sectors 0 to 3

Bit 1: Group embedding sectors 4 to 7

Bit N: Group embedding sectors 4 x N to 4 x N + 3

Bit 31: Group embedding sectors 124 to 127

Note: In STM32H523/33xx devices only bits [7:0] are used. Consider bits [31:8] as reserved, and keep them at reset value.

7.11.50 FLASH data sectors configuration Bank2 (FLASH_EDATA2R_CUR)

This register is nonsecure, can be read by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

This read-only register reflects the current values of the corresponding options bits.

Address offset: 0x1F0

Reset value: 0xXXXX XXXX

r													r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **EDATA2_EN:** Bank2 flash high-cycle data enable
0: No flash high-cycle data area
1: Flash high-cycle data is used

Bits 14:3 Reserved, must be kept at reset value.

Bits 2:0 **EDATA2_STRT[2:0]:**
EDATA2_STRT contains the start sectors of the flash high-cycle data area in Bank2 There is no hardware effect to those bits. They shall be managed by ST tools in Flasher.
000: The last sector of Bank2 is reserved for flash high-cycle data
001: The two last sectors of Bank2 are reserved for flash high-cycle data
010: The three last sectors of Bank2 are reserved for flash high-cycle data
...
111: The eight last sectors of Bank2 are reserved for flash high-cycle data

7.11.51 FLASH data sector configuration Bank2 (FLASH_EDATA2R_PRG)

This register is nonsecure. It can be read and written by both secure and nonsecure accesses, and protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register. It is used to program values in corresponding options bits.

Address offset: 0x1F4

Reset value: 0xXXXX XXXX

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:16 **HDP2_END[6:0]:** HDPL barrier end set in number of 8-Kbyte sectors
Note: For STM32H523/33xx devices the maximum value is 0x1F, consider bits [6:5] as reserved, and keep them at reset value.

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:0 **HDP2_STRT[6:0]:** HDPL barrier start set in number of 8-Kbyte sectors
Note: For STM32H523/33xx devices the maximum value is 0x1F, consider bits [6:5] as reserved, and keep them at reset value.

7.11.53 FLASH HDP Bank2 configuration (FLASH_HDP2R_PRG)

This register is nonsecure. It can be read and written only by both secure and nonsecure accesses. This register can be protected against unprivileged access when NSPRIV = 1 in the FLASH_PRIVCFGR register.

Register is accessible only in HDPL1. In HDPL2 or HDPL3 it is WI, RAZ.

This register is used to program values in corresponding option bits.

Address offset: 0x1FC

Reset value: 0xXXXX XXXX

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

8 Instruction cache (ICACHE)

8.1 ICACHE introduction

The instruction cache (ICACHE) is implemented on the C-AHB code bus of the Cortex®-M33 processor to improve performance when fetching instructions and data from internal and external memories.

Some specific features, like dual master ports, hit-under-miss, and critical-word-first refill policy, result in close to zero-wait-state performance in most use cases.

8.2 ICACHE main features

The main features of ICACHE are listed below:

- Bus interface
  - One 32-bit AHB slave port, the execution port (input from Cortex®-M33 C-AHB code interface)
  - Two AHB master ports: master1 and master2 ports, with outputs to Fast and Slow buses of main AHB bus matrix, respectively
  - One 32-bit AHB slave port for control (input from AHB peripherals interconnect, for ICACHE registers access)
- Cache access
  - 0 wait-state on hits
  - Hit-under-miss capability: ability to serve processor requests (access to cached data) during an ongoing line refill due to a previous cache miss
  - Dual master access: feature used to decouple the traffic according to targeted memory. For example, the ICACHE assigns fast traffic (addressing flash memories and SRAMs) to the AHB master1 port, and slow traffic (addressing external memories) to the AHB master2 port, thus preventing processor stalls on line refills from external memories. This allows ISR (interrupt service routine) fetching on internal flash memory to take place in parallel with a cache line refill from external memories.
  - Minimal impact on interrupt latency, thanks to dual master
  - Optimal cache line refill thanks to WRAPw bursts of the size of the cache line (32-bit word size, **w**, aligned on cache line size)
  - n-way set-associative default configuration with possibility to configure as 1-way, means direct mapped cache, for applications needing very-low-power consumption profile
- Memory address remap
  - Possibility to remap input address falling into up to four memory regions (used to remap aliased code in external memories to the code region, for execution from the C-AHB code interface)
- Replacement and refill
  - pLRU-t (pseudo-least-recently-used, based on binary tree) replacement policy, algorithm with best complexity/performance balance
  - Critical-word-first refill policy, minimizing processor stalls

  - Possibility to configure burst type of AHB memory transaction for remapped regions: INCRw or WRAPw (size w aligned on cache line size)
- Performance counters

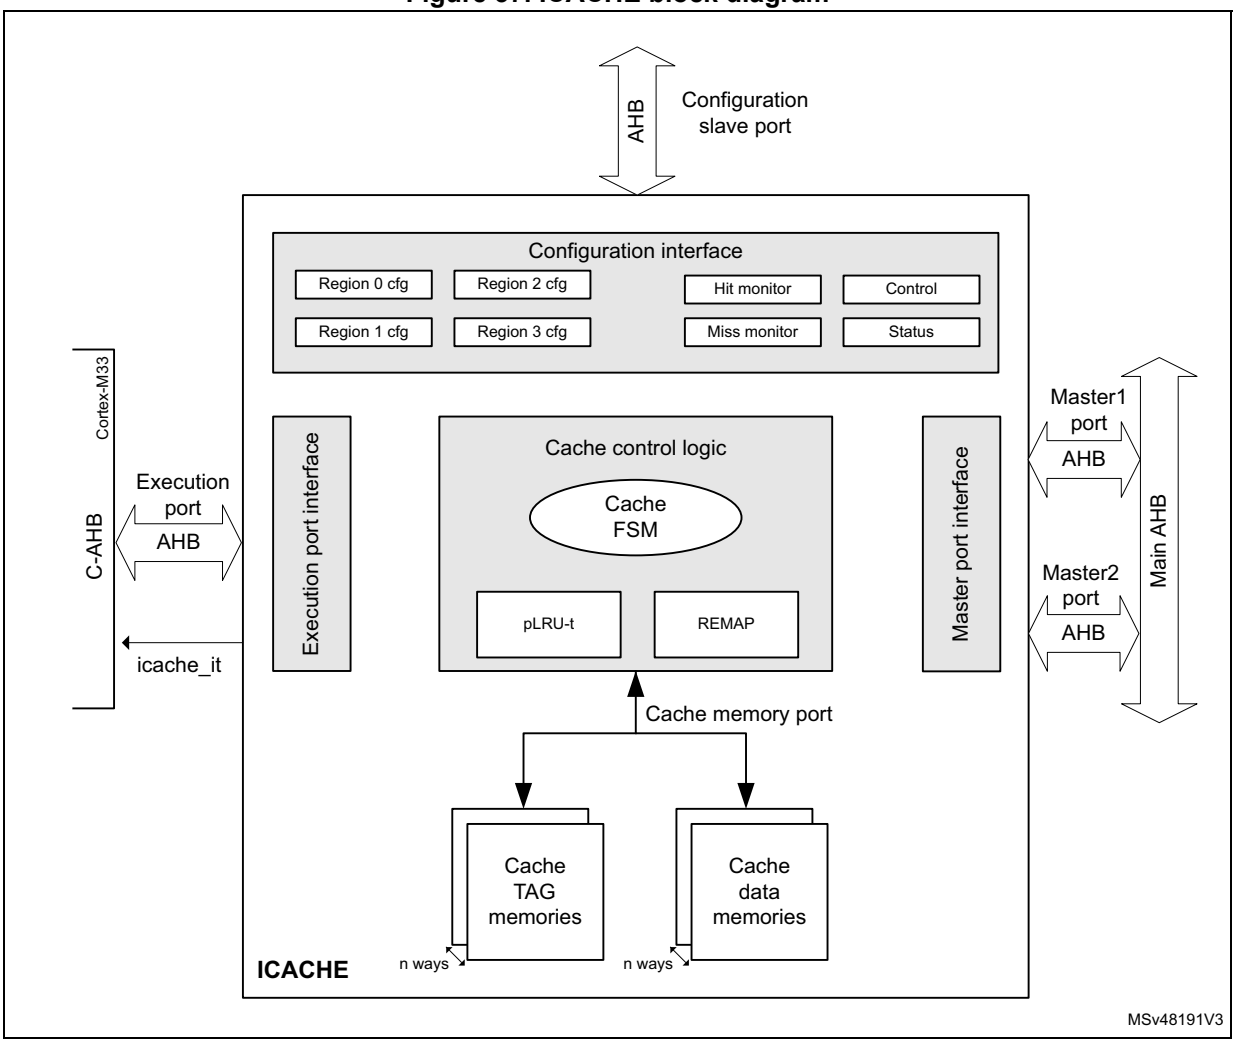
  The ICACHE implements two performance counters:
  - Hit monitor counter (32-bit)
  - Miss monitor counter (16-bit)
- Error management
  - Possibility to detect an unexpected cacheable write access, to flag an error, and optionally, to raise an interrupt
- TrustZone® security support
- Maintenance operation
  - Cache invalidate: full cache invalidation, fast command, noninterruptible

8.3 ICACHE implementation

Table 91. ICACHE features

Feature	ICACHE
Number of ways	2
Cache size	8 Kbytes
Cache line width	16 bytes
Range granularity of memory regions to be remapped	2 Mbytes
Number of regions to remap	4
Data size of AHB slave interface	32 bits
Data size of AHB fast master1 interface	128 bits
Data size of AHB slow master2 interface	32 bits

8.4 ICACHE functional description



The purpose of this block is to cache instruction fetches or instruction memories loads, coming from the processor. As such, the ICACHE manages only cacheable read transactions, and does not manage cacheable write transactions.

The noncacheable transactions (both read and write) bypass the ICACHE.

For the error management purpose, if a write cacheable transaction is presented (this happens only in case of bad software programming), the ICACHE sets an error flag and, if enabled, raises an interrupt to the processor.

8.4.1 ICACHE block diagram

Figure 37. ICACHE block diagram

8.4.2 ICACHE reset and clocks

The ICACHE is clocked on the Cortex®-M33 C-AHB bus clock.

When the ICACHE reset signal is released, a cache invalidate procedure is automatically launched, making the ICACHE busy (ICACHE_SR = 0x0000 0001).

When this procedure is finished:

- the ICACHE is invalidated: “cold cache”, with all cache line valid bits = 0 (ICACHE must be filled up)
- ICACHE_SR = 0x0000 0002 (reflecting the cache is no longer busy)
- the ICACHE is disabled: the EN bit in ICACHE_CR holds its reset state (= 0).

Note: When disabled, the ICACHE is bypassed, except the remapping mechanism that is still functional: slave input requests (remapped or not) are forwarded to the master port(s).

8.4.3 ICACHE TAG memory

The ICACHE TAG memory contains:

- address tags indicating which data are contained in the cache data memories
- validity bits

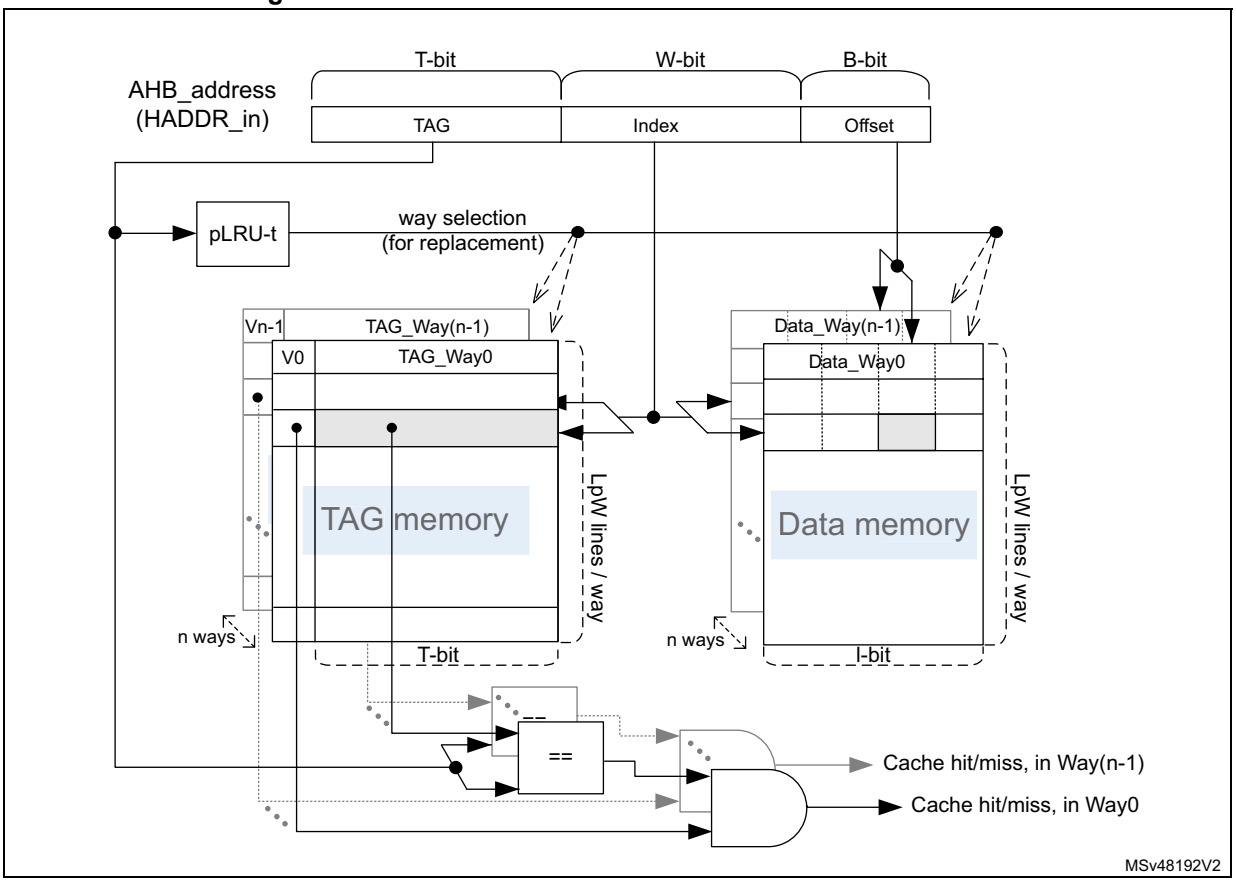
There is one valid bit per cache line (per way).

The valid bit is set when a cache line is refilled (after a miss).

Valid bits are reset in any of the below cases:

- after the ICACHE reset is released
- when the cache is disabled, by setting EN = 0 in ICACHE_CR (by software)
- when executing an ICACHE invalidate command, by setting CACHEINV = 1 in ICACHE_CR (by software)

When a cacheable transaction is received at the execution input port, its AHB address (HADDR_in) is split into the following fields (see *Table 92* for B and W definitions):



- HADDR_in[B-1:0]: address byte offset, indicates which byte to select inside a cache line.
- HADDR_in[B+W-1:B]: address way index, indicates which cache line to select inside each way.
- HADDR_in[31:B+W]: tag address, to be compared to the TAG memory address to check if the requested data is already available (meaning valid) inside the ICACHE.

The following table gives a summary of the ICACHE main parameters for TAG memory dimensioning. *Figure 38* shows the functional view of TAG and data memories, for an n-way set associative ICACHE.

Table 92. TAG memory dimensioning parameters for n-way set associative operating mode (default)

Parameter	Value	Example
Cache size	S Kbytes = s bytes (s = 1024 x S)	8 Kbytes = 8192 bytes
Cache number of ways	n	2
Cache line size	L-byte = l-bit (l = 8 x L)	16-byte = 128-bit
Number of cache lines	LpW = s / (n x L) lines / way	256 lines / way
Address byte offset size	B = $\log_2$(L) bit	4-bit
Address way index size	W = $\log_2$(LpW) bit	8-bit
TAG address size	T = (32 - W - B) bit	20-bit

Figure 38. ICACHE TAG and data memories functional view

8.4.4 Direct-mapped ICACHE (1-way cache)

The default configuration (at reset) is an n-way set associative cache (WAYSEL = 1 in ICACHE_CR), but the user can configure the ICACHE as direct mapped by writing WAYSEL = 0 (only possible when the cache is disabled, EN = 0 in ICACHE_CR).

The following table gives a summary of ICACHE main parameters for TAG memory when the direct-mapped cache operating mode is selected.

Table 93. TAG memory dimensioning parameters for direct-mapped cache mode

Parameter	Value	Example
Cache size	S Kbytes = s bytes (s = 1024 x S)	8 Kbytes = 8192 bytes
Cache number of ways	1	1
Cache line size	L-byte = l-bit (l = 8 x L)	16-byte = 128-bit
Number of cache lines	LpW = s / L lines	512 lines
Address byte offset size	B = $\log_2$(L) bit	4-bit
Address way index size	W = $\log_2$(LpW) bit	9-bit
TAG address size	T = (32 - W - B) bit	19-bit

All cache operations (such as read, refill, remapping, invalidation) remain the same in the direct-mapped configuration. The only difference is the absence of a replacement algorithm in case of line eviction (as explained in *Section 8.4.8*): only one way (the unique one) is possible for any data refill.

8.4.5 ICACHE enable

To activate the ICACHE, the EN bit in ICACHE_CR must be set to 1.

When the ICACHE is disabled, it is bypassed and all transactions are copied from the slave to the master ports in the same clock cycle.

It is recommended to initialize or modify the main memory content (region to be later cached) with the ICACHE disabled, and to enable the ICACHE only when this region remains unchanged (an enabled ICACHE detects cacheable write transactions as errors).

To ensure performance determinism, it is recommended to wait for the end of a potential cache invalidate procedure before enabling the ICACHE. This procedure occurs when the hardware reset signal is released, when CACHEINV is set, or when EN is cleared in ICACHE_CR. During the procedure, BUSYF is set in ICACHE_SR, and once finished, BUSYF is cleared and BSYENDF is set in the same register (raising the ICACHE interrupt if enabled on such a busy end condition).

The software must test BUSYF and/or BSYENDF values before enabling the ICACHE. Else, if the ICACHE is enabled before the end of an invalidate procedure, any cache access (while BUSYF = 1) is treated as noncacheable, and its performance depends on the main memory access time.

The address remapping is performed, whether the ICACHE is enabled or not, if the input transaction address falls into the memory regions defined and enabled in ICACHE_CRRx (see *Figure 39*).

The ICACHE is, by default, disabled at boot.

8.4.6 Cacheable and noncacheable traffic

The ICACHE is developed for the Cortex®-M33 core. It is placed on the C-AHB bus, and thus caches the code memory region, ranging from address 0x0000 0000 to 0x1FFF FFFF of the memory map.

To make other memory regions cacheable, the ICACHE supports a memory region remapping feature, used to define up to four external memory regions, whose addresses have an alias in the code region. Addressing these memory regions through their code alias address allows the memory request to be routed to the C-AHB bus, and to be managed by the ICACHE.

Any external memory space physically mapped at an address in the range [0x6000 0000:0xAFFF FFFF] or [0xC000 0000:0xDFFF FFFF] can be aliased with an address in the range [0x0000 0000:0x07FF FFFF] or [0x1000 0000:0x1FFF FFFF].

For a given memory request in the code region, the ICACHE implements the address remapping functionality first. If aliased, it is the remapped address, which is then cached, and, if needed, provided to the master port to address the main AHB bus matrix.
The destination physical address does not need further manipulation on the AHB bus.

The remapping functionality is available also for noncacheable traffic, and when the cache is disabled.

Additional details on address remapping are provided in *Section 8.4.7*.

An incoming memory request to the ICACHE is defined as cacheable according to its AHB transaction memory lookup attribute, as shown in *Table 94*. This AHB attribute depends on the MPU (memory protection unit) programming for the addressed region.

Table 94. ICACHE cacheability for AHB transaction

AHB lookup attribute	Cacheability
1	Cacheable
0	Noncacheable

In the case of a noncacheable access (read or write), the ICACHE is bypassed. The AHB transaction is propagated unchanged to the master output port, except the transaction address, which may be modified due to the address remapping feature (see *Section 8.4.7*).

The bypass, and eventual remap logic, does not increase the latency of the access to the targeted memory.

In the case of a cacheable access, the ICACHE behaves as explained in *Section 8.4.8*.

Cacheable memory regions are defined and programmed by the user in the MPU responsible for the generation of the AHB attribute signals (HPROT[6:0]) for any transaction addressing a given region.

Table 95 summarizes programmable configurations of various memories.

Table 95. Memory configurations

Memory	Cacheable (MPU programming)	Remapped in the ICACHE (ICACHE_CRRx programming)
Flash	Yes or no	Not required
SRAM	Not recommended	Not required
External memories	Yes	Required
	No	Required if the user wants code in external memories fetched on C-AHB bus (else on S-AHB bus)

8.4.7 Address remapping

The ICACHE allows an alias address to be defined in the code region for up to four external memory regions.

The address remapping is applied on the code alias address, transforming it into the destination external physical address.

The remapping operation is fully software configurable by programming ICACHE_CRRx (x = 0 to 3, number of remapped regions). This programming can be done only when the ICACHE is disabled.

Each region x can be individually enabled with REN in ICACHE_CRRx. Once enabled, the remap operation occurs even if the ICACHE is disabled, or if the transaction is noncacheable.

Remap regions can have different size: each can be programmed in RSIZE of its ICACHE_CRRx. The size of each region is a power of two multiple of range granularity (2 Mbytes), with a minimum of 2 Mbytes, and a maximum of 128 Mbytes.

The address remapping mechanism is based on the matching of an incoming AHB address (HADDR_in) with a given code subregion base-address, and the modification of this address into its (remapped) physical address, as follows:

- HADDR_in belongs to region x if HADDR_in[31:RI] = 000:BASEADDR[28:RI], where:
  - 000:BASEADDR is the code subregion base-address programmed in BASEADDR of ICACHE_CRRx.
  - RI defines the number of significant bits to consider. RI = $\log_2$ (region size) with a minimum value of 21 (for a 2-Mbyte region) and a maximum value of 27 (for a 128-Mbyte region).
- If the region x is enabled, the master port output AHB address (HADDR_out) is composed by concatenating the two below parts:
  - REMAPADDR[31:RI] field of ICACHE_CRRx as MSBs
  - HADDR_in[RI-1:0] as LSBs

Figure 39 describes the matching and the output address generation.

Figure 39. ICACHE remapping address mechanism

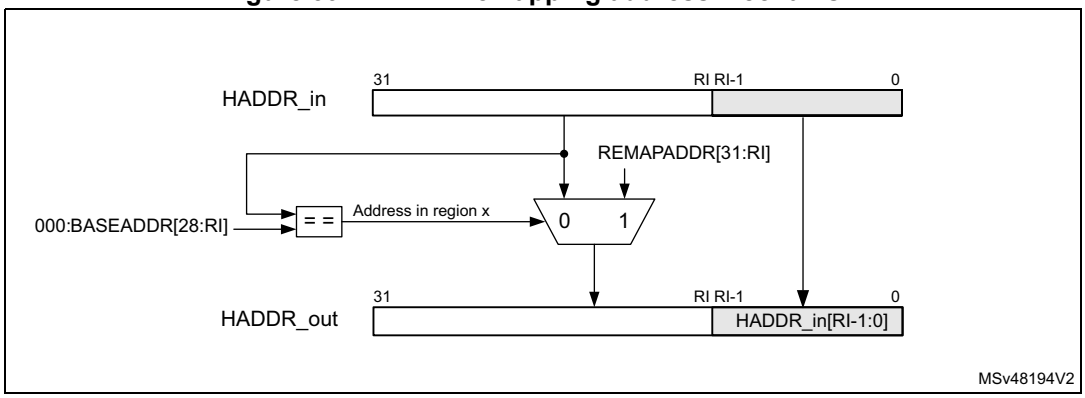


Table 96 summarizes all possible configurations of BASEADDR and REMAPADDR sizes (number of significant MSBs) in ICACHE_CRRx, depending upon RSIZE.

Table 96. ICACHE remap region size, base address, and remap address

Region size (Mbytes)	Base address size (MSBs)	Remap address (MSBs)
2	8	11
4	7	10
8	6	9
16	5	8
32	4	7
64	3	6
128	2	5

Care must be taken while programming BASEADDR and REMAPADDR in ICACHE_CRRx: if the programmed value is bigger than expected (number of MSBs, see *Table 96*), the unneeded extra LSBs are ignored.

Typical remapping example: a 128-Mbyte external RAM region physically located in the external address range [0x9000 0000:0x97FF FFFF], remapped in the code section range [0x1800 0000:0x1FFF FFFF]:

- REMAPADDR[31:21] = 0x480
- BASEADDR[28:21] = 0xC0
- HADDR_in[31:27] is compared to 000:BASEADDR[28:27], while HADDR_in and BASEADDR[26:21] are ignored.

If the comparison matches:

- HADDR_out[31:27] gets REMAPADDR[31:27] (in place of HADDR_in[31:27])
- HADDR_out[26:0] gets HADDR_in[26:0]

The software can program the kind of AHB burst generated by the ICACHE master ports on the bus matrix (for cache line refill), by setting HBURST in ICACHE_CRRx with:

- WRAP for remapped external memories accessed through interfaces that can support WRAP burst mode, providing the benefit of the critical-word-first feature performance:
  - WRAP burst size = cache line size
  - WRAP burst start address = word address of the first data requested by the core
- INCR: INCR burst mode for external memories accessed through the interfaces that do not support WRAP burst mode (losing the benefit of critical-word-first feature):
  - INCR burst size = cache line size
  - INCR burst start address = address aligned on the boundary of the cache line containing the requested word.

Note: Coherency is needed when programming the SAU (secure attribution unit) and the MPU (memory protection unit) attributes for both the external regions and their aliased code subregions.

8.4.8 Cacheable accesses

When the ICACHE receives a cacheable transaction from the Cortex®-M33, it checks if the address requested is present in its TAG memory, and if the corresponding cache line is valid.

There are then three alternatives:

- The address is present inside the TAG memory, the cache line is valid: **cache hit**, the data is read from the cache and provided to the processor in the same cycle.
- The address is not present in the TAG memory: **cache miss**, the data is read from the main memory and provided to the processor, and a cache line refill is performed.

  The critical-word-first policy ensures minimum wait cycles for the processor, since read data can be provided while the cache still performs a cache line refill (associated latency is the latency of fetching one word from the main memory).

  The burst generated on the ICACHE master bus is WRAPw (w being the cache line width, in words) if no address remap occurs. If an address remap occurs, the kind of burst depends upon the HBURST programmed in corresponding ICACHE_CRRx.

  The AHB transaction attributes are also propagated to the main AHB bus matrix on the master port selected for the line refill.

- The address is not present in TAG memory, but belongs to the refill burst from the main memory currently ongoing: **cache hit** (hit-under-miss feature).

  This happens during cache-line refill. The ICACHE can provide the requested data as soon as data are available at its master interface, thus avoiding a miss (fetching data from the main memory).

In the case of cache refill (due to cache miss), the ICACHE selects which cache line is written with the refill data:

- In direct map (1-way) mode, only one line can be used to store the refill data: the line pointed by the index of the input address.
- In n-way set associative mode, one line among n can be used (the line pointed by the address index, in each of the n ways). The way selection is based on a pLRU-t replacement algorithm that points, for each index, on the way candidate for the next refill.

If the cache line where the refill data must be written is already valid, the targeted cache line must be invalidated first. This is true whatever the direct map or n-way set associative cache mode.

8.4.9 Dual-master cache

The ICACHE implements a dual-port AHB master on the main AHB bus matrix: master1 and master2 ports. This is used to split the traffic going to different destination memories.

The nonremapped traffic goes systematically to master1 port. The remapped traffic can be routed on the master2 port by programming MSTSEL in ICACHE_CRRx (on a region basis).

The code can typically be fetched as follows:

- internal flash memory and internal SRAM on master1 port (Fast bus)
- external flash memory/RAM on master2 port (Slow bus)

For systems not implementing external memories, the traffic to the internal flash memory can be decoupled from the traffic to the internal SRAM (when remapped by the ICACHE). This feature is used to prevent further processor stalls on misses.

Alongside with hit-under-miss, this dual-master feature allows the processor to have an alternative path in case of fetching from different memories.

8.4.10 ICACHE security

The ICACHE implements an Armv8-M TrustZone.

ICACHE configuration registers are protected at system level.

8.4.11 ICACHE maintenance

The software can invalidate the whole content of the ICACHE by programming CACHEINV in the ICACHE_CR register.

When CACHEINV = 1, the ICACHE control logic sets the BUSYF flag in ICACHE_SR and launches the invalidate cache operation, resetting each TAG valid bit to 0 (one valid bit per cache line). CACHEINV is automatically cleared.

Once the invalidate operation is finished (all valid bits reset to 0), the ICACHE automatically clears BUSYF, and sets BSYENDF in the ICACHE_SR register.

If enabled on this flag condition (BSYENDIE = 1 in ICACHE_IER), the ICACHE interrupt is raised. Then, the (empty) cache is available again.

8.4.12 ICACHE performance monitoring

The ICACHE provides the following monitors for performance analysis:

- The 32-bit hit monitor counts the cacheable AHB-transactions on the slave cache port that hits the ICACHE content.

  It also takes into account all accesses whose address is present in the TAG memory or in the refill buffer (due to a previous miss, and whose data is coming, or is soon to come, from the cache master port) (see *Section 8.4.8*).
- The 16-bit miss monitor counts the cacheable AHB-transactions on the slave cache port that misses the ICACHE content.

  It also takes into account all accesses whose address is not present neither in the TAG memory nor in the refill buffer.

Upon reaching their maximum values, these monitors do not wrap over.

Hit and miss monitors can be enabled and reset by software allowing the analysis of specific pieces of code.

The software can perform the following tasks:

- Enable/stop the hit monitor through HITMEN in ICACHE_CR.
- Reset the hit monitor by setting HITMRST in ICACHE_CR.
- Enable/stop the miss monitor through MISSMEN in ICACHE_CR.
- Reset the miss monitor by setting MISSMRST in ICACHE_CR.

To reduce power consumption, these monitors are disabled (stopped) by default.

8.4.13 ICACHE boot

The ICACHE is disabled (EN = 0 in ICACHE_CR) at boot.

The code remapping at boot is not needed for a Cortex®-M33 as it implements the VTOR (vector tables) that allows a boot start address definition different than 0x0.

Once the boot is finished, the ICACHE can be enabled (software setting EN = 1 in CACHE_CR).

8.5 ICACHE low-power modes

At device level, using the ICACHE reduces the power consumption by fetching instructions from the internal ICACHE most of the time, rather than from the bigger and then more power consuming main memories. This reduction is even higher if the cached main memories are external.

Applications with lower performance profile (in terms of hit ratio) and stringent power consumption constraints may benefit from the lower power consumption of an ICACHE configured as direct mapped. This single-way cache configuration is obtained by programming WAYSEL = 0 in ICACHE_CR (see *Figure 38*). The power consumption is reduced by accessing, for each request, only the necessary cut of TAG and data memories. The cache effect still improves fetch performance, even if for most code execution, it is less efficient than with an n-way set associative cache mode.

8.6 ICACHE error management and interrupts

If an unsupported cacheable write request is detected (functional error), the ICACHE generates an error by setting the ERRF flag in ICACHE_SR. An interrupt is generated if the corresponding interrupt enable bit is set (ERRIE = 1 in ICACHE_IER).

The other possible interrupt generation is at the end of a cache invalidation operation. When the cache-busy state is finished, the ICACHE sets the BSYENDF flag in ICACHE_SR. An interrupt is generated if the corresponding interrupt enable bit is set (BSYENDIE = 1 in ICACHE_IER).

All ICACHE interrupt sources raise the same and unique interrupt signal, icache_it, and then use the same interrupt vector.

Table 97. ICACHE interrupts

Interrupt vector	Interrupt event	Event flag	Enable control bit	Interrupt clear method
ICACHE	Functional error	ERRF in ICACHE_SR	ERRIE in ICACHE_IER	Set CERRF to 1 in ICACHE_FCR
	End of busy state (invalidate finished)	BSYENDF in ICACHE_SR	BSYENDIE in ICACHE_IER	Set CBSYENDF to 1 in ICACHE_FCR

The ICACHE also propagates all AHB bus errors (such as security issues, address decoding issues) from the master1 or master2 port back to the execution port.

8.7 ICACHE registers

8.7.1 ICACHE control register (ICACHE_CR)

Address offset: 0x000

Reset value: 0x0000 0004

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WAYSEL	CACHEINV	EN
													rw	w	rw

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **MISSMRST**: miss monitor reset
0: release the cache miss monitor reset (needed to enable the counting)
1: reset cache miss monitor

Bit 18 **HITMRST**: hit monitor reset
0: release the cache miss monitor reset (needed to enable the counting)
1: reset cache hit monitor

Bit 17 **MISSMEN**: miss monitor enable
0: cache miss monitor switched off. Stopping the monitor does not reset it.
1: cache miss monitor enabled

Bit 16 **HITMEN**: hit monitor enable
0: cache hit monitor switched off. Stopping the monitor does not reset it.
1: cache hit monitor enabled

Bits 15:3 Reserved, must be kept at reset value.

Bit 2 **WAYSEL**: cache associativity mode selection
This bit allows user to choose ICACHE set-associativity. It can be written by software only when cache is disabled (EN = 0).
0: direct mapped cache (1-way cache)
1: n-way set associative cache (reset value)

Bit 1 **CACHEINV**: cache invalidation
Set by software and cleared by hardware when the BUSYF flag is set (during cache maintenance operation). Writing 0 has no effect.
0: no effect
1: invalidate entire cache (all cache lines valid bit = 0)

Bit 0 **EN**: enable
0: cache disabled
1: cache enabled

8.7.2 ICACHE status register (ICACHE_SR)

Address offset: 0x004

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **ERRF**: cache error flag
0: no error
1: an error occurred during the operation (cacheable write)

Bit 1 **BSYENDF**: busy end flag
0: cache busy
1: full invalidate CACHEINV operation finished

Bit 0 **BUSYF**: busy flag
0: cache not busy on a CACHEINV operation
1: cache executing a full invalidate CACHEINV operation

8.7.3 ICACHE interrupt enable register (ICACHE_IER)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ERRIE	BSYENDIE	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **ERRIE**: interrupt enable on cache error

Set by software to enable an interrupt generation in case of cache functional error (cacheable write access)

0: interrupt disabled on error

1: interrupt enabled on error

Bit 1 **BSYENDIE**: interrupt enable on busy end

Set by software to enable an interrupt generation at the end of a cache invalidate operation.

0: interrupt disabled on busy end

1: interrupt enabled on busy end

Bit 0 Reserved, must be kept at reset value.

8.7.4 ICACHE flag clear register (ICACHE_FCR)

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CERRF	CBSYENDF	Res.
													w	w	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CERRF**: clear cache error flag

Set by software.

0: no effect

1: clears ERRF flag in ICACHE_SR

Bit 1 **CBSYENDF**: clear busy end flag

Set by software.

0: no effect

1: clears BSYENDF flag in ICACHE_SR.

Bit 0 Reserved, must be kept at reset value.

8.7.5 ICACHE hit monitor register (ICACHE_HMONR)

Address offset: 0x010

Reset value: 0x0000 0000

MISSMON[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MISSMON[15:0]**: cache miss monitor counter

8.7.7 ICACHE region x configuration register (ICACHE_CRRx)

Address offset: 0x020 + 0x4 * x, (x = 0 to 3)

Reset value: 0x0000 0200

Define an alias address in the code region for other regions, making them cacheable.

BASEDADDR and REMAPADDR fields are write locked (read only) when EN = 1 in ICACHE_CR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HBURST	Res.	Res.	MSTSEL	Res.	REMAPADDR[31:21]										
rw			rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REN	Res.	Res.	Res.	RSIZE[2:0]			Res.	BASEADDR[28:21]							
rw				rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **HBURST**: output burst type for region x
0: WRAP
1: INCR

Bits 30:29 Reserved, must be kept at reset value.

Bit 28 **MSTSEL**: AHB cache master selection for region x
0: no action (master1 selected by default)
1: master2 selected

Bit 27 Reserved, must be kept at reset value.

Bits 26:16 **REMAPADDR[31:21]**: remapped address for region x
This field replaces the alias address defined by BASEADDR field.
The only useful bits are [31:RI], where 21 ≤ RI ≤ 27 is the number of bits of RSIZE (see *Section 8.4.7*). If the programmed value has more LSBs, the useless bits are ignored.

Bit 15 **REN**: enable for region x
0: disabled
1: enabled

Bits 14:12 Reserved, must be kept at reset value.

Bits 11:9 **RSIZE[2:0]**: size for region x
000: reserved
001: 2 Mbytes
010: 4 Mbytes
011: 8 Mbytes
100: 16 Mbytes
101: 32 Mbytes
110: 64 Mbytes
111: 128 Mbytes

Bit 8 Reserved, must be kept at reset value.

Bits 7:0 **BASEADDR[28:21]**: base address for region x
This alias address is replaced by REMAPADDR field.
The only useful bits are [28:RI], where 21 ≤ RI ≤ 27 is the number of bits of RSIZE (see *Section 8.4.7*). If the programmed value has more LSBs, the useless bits are ignored.

8.7.8 ICACHE register map

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

9 Data cache (DCACHE)

9.1 DCACHE introduction

The data cache (DCACHE) is introduced on S-AHB system bus of the Cortex®-M33 processor to improve the performance of data traffic to/from external memories.

Some specific features, like hit-under-miss and critical-word-first refill policy, optimize performance on external memories data accesses.

9.2 DCACHE main features

The main features of DCACHE are described below:

- Bus interface
  - One 32-bit AHB slave port, the system port (input from Cortex®-M33 S-AHB system interface)
  - One 32-bit AHB master port (output to main AHB bus matrix)
  - One 32-bit AHB slave port for control (input from AHB peripherals interconnect, for access to DCACHE registers)
- Cache access
  - 0 wait-state on hits
  - Hit-under-miss capability: ability to serve processor requests (access to cached data) during an ongoing line refill due to a previous cache miss
  - Optimized cache line refill thanks to WRAP bursts of the size of the cache line (such as WRAP4 for 128-bit cache line)
  - 2-way set-associative
  - Supports both write-back and write-through policies (selectable with AHB bufferable attribute)
  - Read and write-back always allocate
  - Write-through always non-allocate (write-around)
  - Supports byte, half-word, and word writes
- Replacement and refill
  - pLRU-t replacement policy (pseudo-least-recently-used, based on binary tree), algorithm with best complexity/performance balance
  - Critical-word-first refill policy for read transactions, minimizing processor stalls
  - Possibility to configure burst type of all AHB memory transactions: INCRw or WRAPw (size w aligned on cache line size)
- Performance counters

  The DCACHE implements four performance counters:
  - Two hit-monitor counters (32-bit): number of read hits, number of write hits
  - Two miss-monitor counters (16-bit): number of read misses, number of write misses

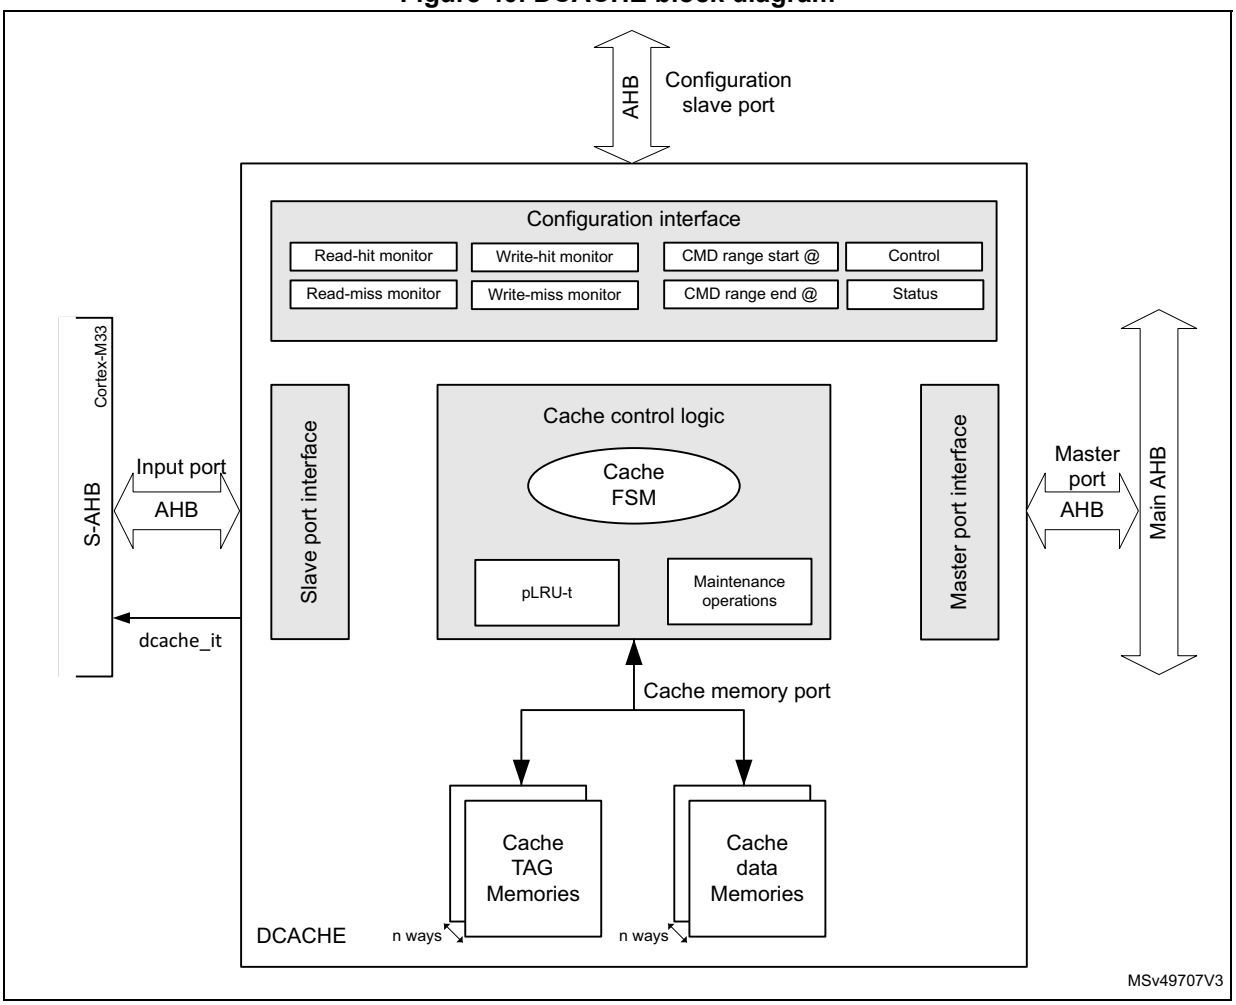
- Error management
  - Possibility to detect error for master port request initiated by DCACHE itself (a cache line written back into main memory, because of an eviction or a clean operation), to flag this error, and optionally to raise an interrupt
- TrustZone security support
- Maintenance operations
  - Cache invalidate: full cache invalidation, fast command, non-interruptible
  - Cache invalidate range: invalidates cache lines whose address belongs to defined range, background task, interruptible
  - Cache clean range: cleans cache lines (if dirty bit = 1, write back line, then clear dirty bit) whose address belongs to defined range, background task, interruptible
  - Cache clean and invalidate range: cleans and invalidates cache lines (if dirty bit = 1, write back line, then invalidate it) whose address belongs to defined range, background task, interruptible

9.3 DCACHE implementation

The DCACHE1 is placed on Cortex®-M33 S-AHB bus, and caches only the external RAM memory region (OCTOSPI and FMC), in the address range [0x6000 0000:0x9FFF FFFF] and [0xC000 0000:0xDFFF FFFF] of the memory map.

Indeed, by placing a bus matrix demultiplexing node in front of the DCACHE1, S-AHB bus memory requests addressing SRAM region or peripherals region (respectively in ranges [0x2000 0000:0x3FFF FFFF] and [0x4000 0000:0x5FFF FFFF]) are routed directly to the main AHB bus matrix, and the DCACHE1 is bypassed.

Table 99. DCACHE features



Features	DCACHE1
Number of ways	2
Cache size	4 Kbytes
Cache line width	16 bytes
Data size of AHB Master interface	32 bits

9.4 DCACHE functional description

The purpose of the data cache is to cache external memory data loads and stores, coming from the processor. These accesses include the instruction fetches that may occur at an external memory address. The DCACHE manages both read and write transactions.

9.4.1 DCACHE block diagram

Figure 40. DCACHE block diagram

9.4.2 DCACHE reset and clocks

The DCACHE is clocked on the Cortex®-M33 S-AHB bus clock.

When the DCACHE reset signal is released, a cache invalidate procedure is automatically launched, making the DCACHE busy (DCACHE_SR = 0x0000 0001).

When this procedure is finished:

- The DCACHE is invalidated: cold cache, with all cache line valid, dirty, and privilege bits = 0 (DCACHE must be filled up)
- DCACHE_SR = 0x0000 0002 (reflecting the cache is no longer busy)
- The DCACHE is disabled: the EN bit in DCACHE_CR holds its reset state (= 0).

Note: When disabled, the DCACHE is bypassed: slave input requests are just forwarded to the master port.

9.4.3 DCACHE TAG memory

The DCACHE TAG memory contains:

- address tags that indicate which data are contained in the cache data memories
- validity bits
- dirty bits
- privilege bits

There is one valid bit, one dirty bit, and one privilege bit per cache line (per way).

The valid bit enables/disables access to the data cache line: if the line is not valid, the data access (read or write) is performed in the main memory.

The valid bit is set when the cache line is written (refilled by either a read miss or a write-back miss).

Valid bits are reset in any of the below cases:

- after the DCACHE reset is released
- when the cache is disabled, by setting EN = 0 in DCACHE_CR (by software)
- when executing one of the DCACHE invalidate commands, setting by software CACHEINV = 0, or CACHECMD = 0b010 or 0b011 in DCACHE_CR (see *Section 9.4.8*).

The dirty bit indicates that the cache line has up-to-date values with respect to the main memory content (the cache has last right value, the main memory is not up to date).

The dirty bit is set when the cache line is written by a slave port write transaction (only in case of an access with write-back attribute).

Dirty bits are reset in any of the below cases:

- after the DCACHE reset is released
- when a line refill is performed on a read miss (on a write-back miss, the refilled cache line is modified by the written data, and dirty bit = 1)
- when the cache invalidation is performed
- when executing one of the DCACHE clean operations (cache line written back to the main memory), setting by software CACHECMD = 0b001 or 0b011 in DCACHE_CR (see *Section 9.4.8*).

The privilege bit indicates if the data is managed by a privileged entity. It is assigned according to the value of AHB privileged attribute at the input slave port, for the first access to this line (it is written only during the line refill, on read miss or write-back miss).

The privilege bit holds the same polarity as the privileged attribute: 1 for privileged access, 0 for unprivileged access.

Privilege bits are reset when the cache is invalidated, and after the DCACHE reset is released.

When a cacheable transaction is received at input slave port, its AHB address (HADDR_in) is split into the following fields (see the table below for B and W values):

- HADDR_in[B-1:0]: address byte offset, indicates which byte to select within a cache line.
- HADDR_in[B+W-1:B]: address way index, indicates which cache line to select inside each way.
- HADDR_in[31:B+W]: tag address, to be compared to TAG memory address to check if the requested data is already available (meaning valid) within the DCACHE

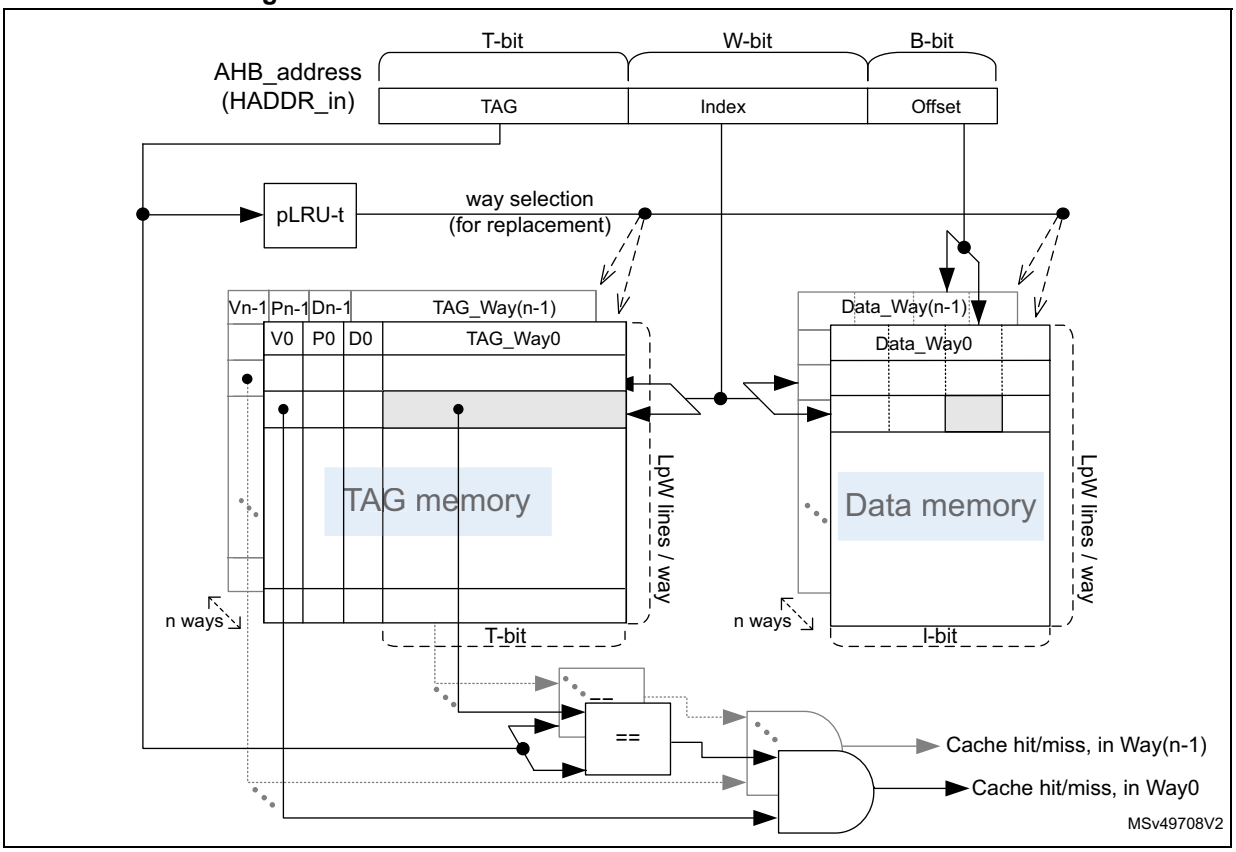


Table 100 gives DCACHE main parameters for TAG memory dimensioning.

Figure 41 shows the functional view of TAG and data memories, for an n-way set associative DCACHE.

Table 100. TAG memory dimensioning parameters

Parameter	Value	Example
Cache size	S Kbytes = s bytes (s = 1024 x S)	4 Kbytes = 4096 bytes
Cache number of ways	n	2
Cache line size	L-byte = l-bit (l = 8 x L)	16-byte = 128-bit
Number of cache lines (per way)	LpW = s / (n x L) lines/way	128 lines/way
Address byte offset size	B = $\log_2$(L) bit	4-bit
Address way index size	W = $\log_2$(LpW) bit	7-bit
TAG address size	T = (32 - W - B) bit	21-bit

Figure 41. DCACHE TAG and data memories functional view

9.4.4 DCACHE enable

To activate the DCACHE functioning, the EN bit must be set in DCACHE_CR control register.

When DCACHE is disabled, it is bypassed and all transactions are copied from slave port to master port in the same clock cycle, and no comparison is performed with TAG address.

DCACHE is by default disabled at boot.

9.4.5 Cacheable and noncacheable traffic

DCACHE is developed for a Cortex®-M33 core and caches the memory regions addressed by the AHB bus connected to it.

In addition, the AHB bus traffic to the memory regions can be cacheable or noncacheable. An incoming memory request to DCACHE is defined as cacheable according to its AHB transaction memory lookup attribute.

In case of write transaction, the DCACHE write policy is defined as write-through or write-back according to its AHB transaction memory bufferable attribute (see *Table 101*).

These AHB attributes depend on the memory protection unit (MPU) programming for the addressed region.

Table 101. DCACHE cacheability for AHB transaction

AHB lookup attribute	AHB bufferable attribute	Cacheability
0	x	Read and write: non cacheable
1	0	Read: cacheable Write: (cacheable) write-through
1	1	Read: cacheable Write: (cacheable) write-back

In case of noncacheable access, the DCACHE is bypassed, meaning that the AHB transaction is propagated unchanged to the master output port.

The bypass does not increase the latency of the access to the targeted memory.

In case of cacheable access, the DCACHE behaves as explained in *Section 9.4.6*.

Cacheable memory regions are defined and programmed by the user in the MPU, responsible for the generation of the AHB attribute signals for any transaction addressing a given region.

9.4.6 Cacheable accesses

When the DCACHE receives a cacheable transaction from Cortex®-M33 on its slave port, the DCACHE checks if the address requested is present in its TAG memory and if the corresponding cache line is valid.

For **read** transaction, there are three alternatives:

- The address is present inside the TAG memory, the cache line is valid: **cache read hit**, the data is read from cache and provided to the processor in the same cycle.
- The address is not present in the TAG memory: **cache read miss**, the data is read from the main memory and provided to the processor, and a cache line refill is performed.

  The critical-word-first refill policy insures minimum wait cycles for the processor, since read data can be provided while cache is still performing cache line refill (associated latency is the latency of fetching one word from main memory).

  The kind of burst generated on the DCACHE master bus depends on HBURST bit in DCACHE_CR: either INCRw or WRAPw (w being the cache line width, in words).

  The AHB transaction attributes are also propagated from the slave input (missing) request to the master output refill request.
- The address is not present in the TAG memory but belongs to the refill burst from main memory that is currently ongoing: **cache read hit** as well (hit-under-miss feature).

  Whatever the line refill is due to a read or write (missing) transaction, the DCACHE can provide the requested read data as soon as the data is available at its master interface, thus avoiding a miss (with data fetch from main memory).

For **write-back** transaction (write transaction, with write-back bufferable attribute), there are three alternatives as well:

- The address is present inside the TAG memory, cache line is valid: **cache write-back hit**, the data is written in cache.
- The address is not present in the TAG memory (or the cache line is not valid): **cache write-back miss**.

  First, a line allocation is performed by reading the entire cache line data from main memory. The kind of burst generated on the DCACHE master bus for this line refill depends on HBURST bit in DCACHE_CR: either INCRw or WRAPw (w being the cache line width, in words), and the AHB transaction attributes are propagated from the slave port initial request.

  Once the refilled line is written in the DCACHE, the initial data provided on the slave port is written in this DCACHE line (it overwrites the data part of the cache line that was refilled just before).
- The address is not present in the TAG memory but belongs to the refill burst from main memory that is currently ongoing: **cache write-back hit** as well (hit-under-miss feature).

  Whatever the line refill is due to a read or write (missing) transaction, the DCACHE can write incoming data directly inside the refilled line, thus avoiding a miss (with refill from main memory).

For **write-through** transaction (write transaction, with write-through bufferable attribute), only two alternatives exist:

- The address is present inside the TAG memory, cache line is valid: **cache write-through hit**, the data is written both in cache and in main memory (through master port).
- The address is not present in the TAG memory (or the cache line is not valid): **cache write-through miss**, the data incoming at slave port is written only in main memory (unlike the write-back miss, there is no line allocation and data written in cache).

In case of cache refill (due to cache miss), the DCACHE selects which cache line is written with the refill data: as a 2-way set associative cache, one line among two can be used (line pointed by the address index, in each of the two ways). The way selection is based on a pLRU-t replacement algorithm that points, for each index, on the way candidate for the next refill.

If the cache line where the refill data must be written is already valid, the targeted cache line must be evicted first:

- If the dirty tag of this line equals 0 (clean data), the line is simply invalidated.
- If it equals 1 (dirty data), the line must be written back in the main memory.

  The DCACHE generates a burst write transaction on its master port, with burst type set to INCRw (w being the cache line width, in words), and with AHB memory transaction attribute signals set as below:
  - data (not instruction)
  - privileged = TAG privilege bit
  - write-back (even if it does not care)
  - normal memory
  - cacheable
  - allocate (even if it does not care)

– nonshareable

These AHB attributes cannot be propagated from the slave port (as it is the case for all other transactions emitted by the DCACHE) because the evicting transaction has no relation with the initial missing transaction. Setting of the AHB attributes is fixed, except for the privileged bit that is copied from the TAG privilege bit of the evicted line.

9.4.7 DCACHE security

The DCACHE implements an Armv8-M TrustZone.

DCACHE configuration registers are protected at system level.

9.4.8 DCACHE maintenance

The DCACHE features several maintenance operations that the software can programmed in DCACHE_CR control register:

- **Full invalidate**: invalidates the whole cache, non interruptible task.

  The software can invalidate the whole DCACHE content by programming CACHEINV in DCACHE_CR.

  When CACHEINV = 1, the DCACHE control logic sets BUSYF flag in DCACHE_SR status register, and performs the operation of cache invalidation, resetting each TAG valid bit to 0 (one valid bit per cache line). Each dirty and privilege bits are also reset to 0 during cache invalidation to prevent unknown values at next cache line validation. CACHEINV is automatically cleared.

  Once the full invalidate operation is finished, the DCACHE automatically clears BUSYF flag, and sets BSYENDF in DCACHE_SR.

  If enabled on this flag condition (BSYENDIE = 1 in DCACHE_IER), the DCACHE interrupt is raised. Then, the (empty) cache is available again.

  This full invalidate operation is not interruptible, meaning that the cache does not treat any cacheable request while BUSYF = 1. However, non-cacheable traffic is treated (since the request address is not compared to TAG ones), the DCACHE being bypassed in the same clock cycle (same behavior as when the DCACHE is disabled).

- **Invalidate range**: invalidates a certain range of addresses in the cache, background task (interruptible).

  The software can invalidate a given data region in the DCACHE by programming STARTCMD = 1 and CACHECMD = 0b010 in DCACHE_CR, after the address range was programmed into DCACHE_CMDRSADDRR (range start address) and DCACHE_CMDREADDRR (range end address).

  The DCACHE control logic then parses the whole TAG memory. If the read line address (TAG address + line index) falls in the programmed address range (DCACHE_CMDRSADDRR ≤ Line Addr ≤ DCACHE_CMDREADDRR), the

corresponding cache line is invalidated (line TAG bits cleared, valid bit = dirty bit = privilege bit = 0).

When STARTCMD is set, the DCACHE control logic sets BUSYCMDF in DCACHE_SR and launches the invalidate range operation. STARTCMD is also automatically cleared.

Once the operation is finished (all TAG memory parsed), the DCACHE automatically clears BUSYCMDF and sets CMDENDF in DCACHE_SR.

If enabled on this flag condition (CMDENDIE = 1 in DCACHE_IER), the DCACHE interrupt is raised.

During this invalidate range operation, the DCACHE is interruptible, meaning it can accept new incoming requests that take higher priority than the invalidation process. The TAG memory is accessed for invalidate range operation only if not already accessed by an external cache request. This implies that invalidate range execution is usually not performed in one go, but can be interrupted.

- **Clean range**: cleans a certain range of addresses in the cache, background task (interruptible).

  Cleaning a cache line means making sure that the main memory content is up-to-date with the data, which may have been modified in the cache. The clean operation consists in performing the write-back in the main memory of the cache lines that are tagged as “dirty” (the ones with TAG dirty bit set).

  The software can clean a given data region in DCACHE by programming STARTCMD = 1, and CACHECMD = 0b001 in DCACHE_CR, after the address range was programmed into DCACHE_CMDRSADDRR (range start address) and DCACHE_CMDREADDRR (range end address).

  The DCACHE control logic then parses the whole TAG memory. If the read line address (TAG address + line index) falls in the programmed address range (DCACHE_CMDRSADDRR ≤ Line Addr ≤ DCACHE_CMDREADDRR), and the corresponding line is dirty, this line is cleaned, meaning the whole cache line is written-back in the memory through the DCACHE master port, and its TAG dirty bit is cleared.

  When STARTCMD is set, the DCACHE control logic sets BUSYCMDF in DCACHE_SR and launches the clean range operation. STARTCMD is also automatically cleared.

  Once the operation is finished (all TAG memory parsed), the DCACHE automatically clears BUSYCMDF and sets CMDENDF in DCACHE_SR.

  If enabled on this flag condition (CMDENDIE = 1 in DCACHE_IER), the DCACHE interrupt is raised.

  During this clean range operation, the DCACHE is interruptible, meaning it can accept new incoming requests that take higher priority than the cleaning process. The TAG memory is accessed for clean range operation only if not already accessed by an external cache request. This implies that clean range execution is usually not performed in one go, but can be interrupted.

  It is under the software responsibility that no bus initiator attempts to change the content of the region being cleaned until clean range is completed. For that, the software can take advantage of BUSYCMDF flag in DCACHE_SR, and can poll this flag to prevent any spurious access to the area being cleaned.

Alternatively it can also rely on the command end flag (CMDENDF) or on the DCACHE interrupt to detect the end of the clean range execution.

- **Clean and invalidate range**: cleans and invalidates a certain range of addresses in the cache, background task (interruptible).

  This operation cleans the “dirty” cache lines that belong to the operation address range (the same as the clean range operation), and also invalidates all the (valid) cache lines that belong to this address range (whether they are dirty or not).

  The software can launch this clean and invalidate range operation, by programming STARTCMD = 1, and CACHECMD = 0b011 in DCACHE_CR, after the address range was programmed into DCACHE_CMDRSADDRR (range start address) and DCACHE_CMDREADDRR (range end address).

  This sets and clears the same flags, and potentially the same interrupt as invalidate range or clean range operations.

9.4.9 DCACHE performance monitoring

The DCACHE provides the following monitors for performance analysis:

- The two 32-bit read-hit and write-hit monitors count the AHB transactions at the DCACHE input (slave port) that do not generate a transaction on the DCACHE output (master port).

  These monitors also take into account all accesses whose address is present in the TAG memory, or in the refill buffer (due to a previous miss, and whose data is coming, or is soon to come, from the cache master port) (see *Section 9.4.6*).
- The two 16-bit read-miss and write-miss monitors count the AHB transactions at the DCACHE input (slave port) that generate a transaction on the DCACHE output (master port).

  These monitors also take into account all accesses whose address is not present neither in the TAG memory, nor in the refill buffer.

Upon reaching their maximum values, the monitors do not wrap over.

The software can perform the following tasks:

- Enable/stop the read (write) hit monitor, through R(W)HITMEN in DCACHE_CR.
- Reset the read (write) hit monitor, by setting R(W)HITMRST in DCACHE_CR.
- Enable/stop the read (write) miss monitor, through R(W)MISSMEN in DCACHE_CR.
- Reset the read (write) miss monitor, by setting R(W)MISSMRST in DCACHE_CR.

To reduce power consumption, these monitors are disabled (stopped) by default.

9.4.10 DCACHE boot

The DCACHE is disabled (EN = 0 in DCACHE_CR) at boot.

Once the boot is finished, the DCACHE can be enabled (software setting EN = 1 in DCACHE_CR).

9.5 DCACHE low-power modes

At product level, the DCACHE reduces the power consumption by loading/storing data from/to the internal DCACHE most of the time, rather than from the bigger and then more power consuming main memories. This reduction is even much higher, since the cached main memories are external.

9.6 DCACHE error management and interrupts

A transaction initiated on the DCACHE master port may return an error (a write attempt into a read-only memory, for instance). If the master port request was propagated from a slave port request, the error is propagated back to the slave port. If ever the master port request is initiated by the DCACHE itself (a cache line is written back into the main memory because of an eviction or a clean operation), the DCACHE receives this functional error and flags it internally by setting the ERRF flag in DCACHE_SR.

In such a case, an interrupt is generated if the corresponding interrupt enable bit is set (ERRIE = 1 in DCACHE_IER).

Another case of potential interrupt generation is at the end of a full invalidate operation: when the cache busy state is finished, the DCACHE sets BSYENDF flag in DCACHE_SR.

An interrupt is then generated if the corresponding interrupt enable bit is set (BSYENDIE = 1 in DCACHE_IER).

Last case is at the end of invalidate and/or clean range operations: when the command busy state is finished, the DCACHE sets CMDENDF flag in DCACHE_SR.

An interrupt is also generated if the corresponding interrupt enable bit is set (CMDENDIE = 1 in DCACHE_IER).

All DCACHE interrupt sources raise the same and unique interrupt signal, dcache_it, and then use the same interrupt vector.

Table 102. DCACHE interrupts

Interrupt vector	Interrupt event	Event flag	Enable control bit	Interrupt clear method
DCACHE	Functional error	ERRF in DCACHE_SR	ERRIE in DCACHE_IER	Set CERRF to 1 in DCACHE_FCR
	End of busy state (full invalidate finished)	BSYENDF in DCACHE_SR	BSYENDIE in DCACHE_IER	Set CBSYENDF to 1 in DCACHE_FCR
	End of cache operations (address range based)	CMDENDF in DCACHE_SR	CMDENDIE in DCACHE_IER	Set CCMDENDF to 1 in DCACHE_FCR

The DCACHE also propagates all AHB bus errors (such as security issues, address decoding issues) from master port back to the S-AHB slave port.

9.7 DCACHE registers

9.7.1 DCACHE control register (DCACHE_CR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HBURST	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WMISSMRST	WHITMRST	WMISSMEN	WHITMEN	RMISSMRST	RHITMRST	RMISSMEN	RHITMEN
rw								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	STARTCMD	CACHECMD[2:0]			Res.	Res.	Res.	Res.	Res.	Res.	CACHEINV	EN
				w	rw	rw	rw							w	rw

Bit 31 **HBURST:** output burst type for cache master port read accesses
Can be set by software, only when EN = 0.
Master port write accesses are always done in INCR burst type.
0: WRAP
1: INCR

Bits 30:24 Reserved, must be kept at reset value.

Bit 23 **WMISSMRST:** write-miss monitor reset
0: release the cache miss monitor reset (needed to enable the counting)
1: reset cache write-miss monitor

Bit 22 **WHITMRST:** write-hit monitor reset
0: release the cache miss monitor reset (needed to enable the counting)
1: reset cache write-hit monitor

Bit 21 **WMISSMEN:** write-miss monitor enable
0: cache write-miss monitor switched off. Stopping the monitor does not reset it.
1: cache write-miss monitor enabled

Bit 20 **WHITMEN:** write-hit monitor enable
0: cache write-hit monitor switched off. Stopping the monitor does not reset it.
1: cache write-hit monitor enabled

Bit 19 **RMISSMRST:** read-miss monitor reset
0: release the cache miss monitor reset (needed to enable the counting)
1: reset cache read-miss monitor

Bit 18 **RHITMRST:** read-hit monitor reset
0: release the cache miss monitor reset (needed to enable the counting)
1: reset cache read-hit monitor

Bit 17 **RMISSMEN:** read-miss monitor enable
0: cache read-miss monitor switched off. Stopping the monitor does not reset it.
1: cache read-miss monitor enabled

Bit 16 **RHITMEN:** read-hit monitor enable
0: cache read-hit monitor switched off. Stopping the monitor does not reset it.
1: cache read-hit monitor enabled

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **STARTCMD:** starts maintenance command (maintenance operation defined in CACHECMD).
Can be set by software, only when EN = 1, BUSYCMDF = 0, BUSYF = 0 and CACHECMD = 0b001, 0b010 or 0b011.
Cleared by hardware when the BUSYCMDF flag is set (during cache maintenance operation). Writing 0 has no effect.
0: command operation (cache maintenance) finished
1: start maintenance command (cache maintenance)

Bits 10:8 **CACHECMD[2:0]:** cache command maintenance operation (cleans and/or invalidates an address range)
Can be set and cleared by software, only when no maintenance command is ongoing (BUSYCMDF = 0).
000: no operation
001: clean range
010: invalidate range
011: clean and invalidate range
others: reserved

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **CACHEINV:** full cache invalidation
Can be set by software, only when EN = 1.
Cleared by hardware when the BUSYF flag is set (during full cache invalidation operation). Writing 0 has no effect.
0: no effect
1: invalidate entire cache (all cache lines valid bit = 0)

Bit 0 **EN:** enable
0: cache disabled
1: cache enabled

9.7.2 DCACHE status register (DCACHE_SR)

Address offset: 0x004

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CMDENDF	BUSYCMDF	ERRF	BSYENDF	BUSYF
											r	r	r	r	r

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CMDENDF:** command end flag
Cleared by writing DCACHE_FCR.CCMDENDF = 1.
0: cache busy or in idle
1: CACHECMD command finished

Bit 3 **BUSYCMDF:** command busy flag
0: cache not busy on a CACHECMD command
1: cache busy on a CACHECMD command (clean and/or invalidate an address range)

Bit 2 **ERRF:** cache error flag
Cleared by writing DCACHE_FCR.CERRF = 1.
0: no error
1: an error occurred during the operation (eviction or clean operation write-back error).

Bit 1 **BSYENDF:** full invalidate busy end flag
Cleared by writing DCACHE_FCR.CBSYENDF = 1.
0: cache busy or in idle
1: full invalidate CACHEINV operation finished

Bit 0 **BUSYF:** full invalidate busy flag
0: cache not busy on a CACHEINV operation
1: cache executing a full invalidate CACHEINV operation

9.7.3 DCACHE interrupt enable register (DCACHE_IER)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CMDENDIE	Res.	ERRIE	BSYENDIE	Res.
											rw		rw	rw	

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CMDENDIE**: interrupt enable on command end
Set by software to enable an interrupt generation at the end of a cache command (clean and/or invalidate an address range)
0: interrupt disabled on command end
1: interrupt enabled on command end

Bit 3 Reserved, must be kept at reset value.

Bit 2 **ERRIE:** interrupt enable on cache error
Set by software to enable an interrupt generation in case of cache functional error (eviction or clean operation write-back error)
0: interrupt disabled on error
1: interrupt enabled on error

Bit 1 **BSYENDIE:** interrupt enable on busy end
Set by SW to enable an interrupt generation at the end of a cache full invalidate operation.
0: Interrupt disabled on busy end
1: Interrupt enabled on busy end

Bit 0 Reserved, must be kept at reset value.

9.7.4 DCACHE flag clear register (DCACHE_FCR)

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCMDENDF	Res.	CERRF	CBSYENDF	Res.
											w		w	w	

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CCMDENDF:** clear command end flag
Set by software.
0: no effect
1: clears CMDENDF flag in DCACHE_SR

Bit 3 Reserved, must be kept at reset value.

Bit 2 **CERRF:** clear cache error flag
Set by software.
0: no effect
1: clears ERRF flag in DCACHE_SR

Bit 1 **CBSYENDF:** clear full invalidate busy end flag
Set by software.
0: no effect
1: clears BSYENDF flag in DCACHE_SR

Bit 0 Reserved, must be kept at reset value.

9.7.5 DCACHE read-hit monitor register (DCACHE_RHMONR)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

10 Power control (PWR)

10.1 PWR introduction

The power controller manages the device power supplies and power modes transitions.

10.2 PWR main features

The power controller (PWR) main features are:

- Power supplies and supply domains
  - Core domain (V_{CORE})
  - V_{DD} domain
  - Backup domain (V_{SW})
  - Analog domain (V_{DDA})
  - Supply for the SMPS power stage (available on SMPS packages)[a]
  - V_{DDIO2} supply for ten I/Os (PD6, PD7, PG9:14, PB8, PB9)
  - V_{DDUSB} for USB transceiver
- System supply voltage regulation
  - SMPS step-down converter (STM32H563/573xx devices only)
  - Linear voltage regulator (LDO)
- Power supply supervision
  - POR/PDR monitor
  - BOR monitor
  - PVD monitor
  - AVD monitor
  - Out of functional range temperature monitor
  - Out of functional range Backup domain voltage monitor
- Power management
  - Operating modes
  - Voltage scaling control
  - Low-power modes
- V_{BAT} battery charging
- TrustZone security and privileged protection

a. STM32H563/573xxx devices only.

10.3 PWR pins and internal signals

Table 104. PWR input/output pins

Pin name	Signal type	Description
VDD	Supply	Main supply
GND	Supply	Main ground
VDDA	Supply	Analog peripherals supply
VSSA	Supply	Analog peripherals ground
VDDIO2	Supply	Independent I/O supply
VDDUSB	Supply	USB supply
VCAP	Supply	Logic supply (V_{CORE})
VBAT	Supply	Backup domain supply
VDDSMPS(1)	Supply	SMPS supply
VSSSMPS(1)	Supply	SMPS ground
VLXSMPS(1)	Supply	SMPS output
VREF+	Supply	ADC/DAC high reference voltage
VREF-	Supply	ADC/DAC low reference voltage
WKUPx (x = 1 to 8)	Input	Wake-up pins
CSLEEP	Output	MCU in Sleep mode
CDSTOP	Output	CPU in Stop modes

1. STM32H563/573xx devices only.

Table 105. PWR internal input/output signals

Internal signal name	Signal type	Description
WKUPx (x = 1 to 8)	Input	Wake-up event source

10.4 PWR power supplies and supply domains

Figure 42. Power supply with SMPS (STM32H563/573xx devices only)

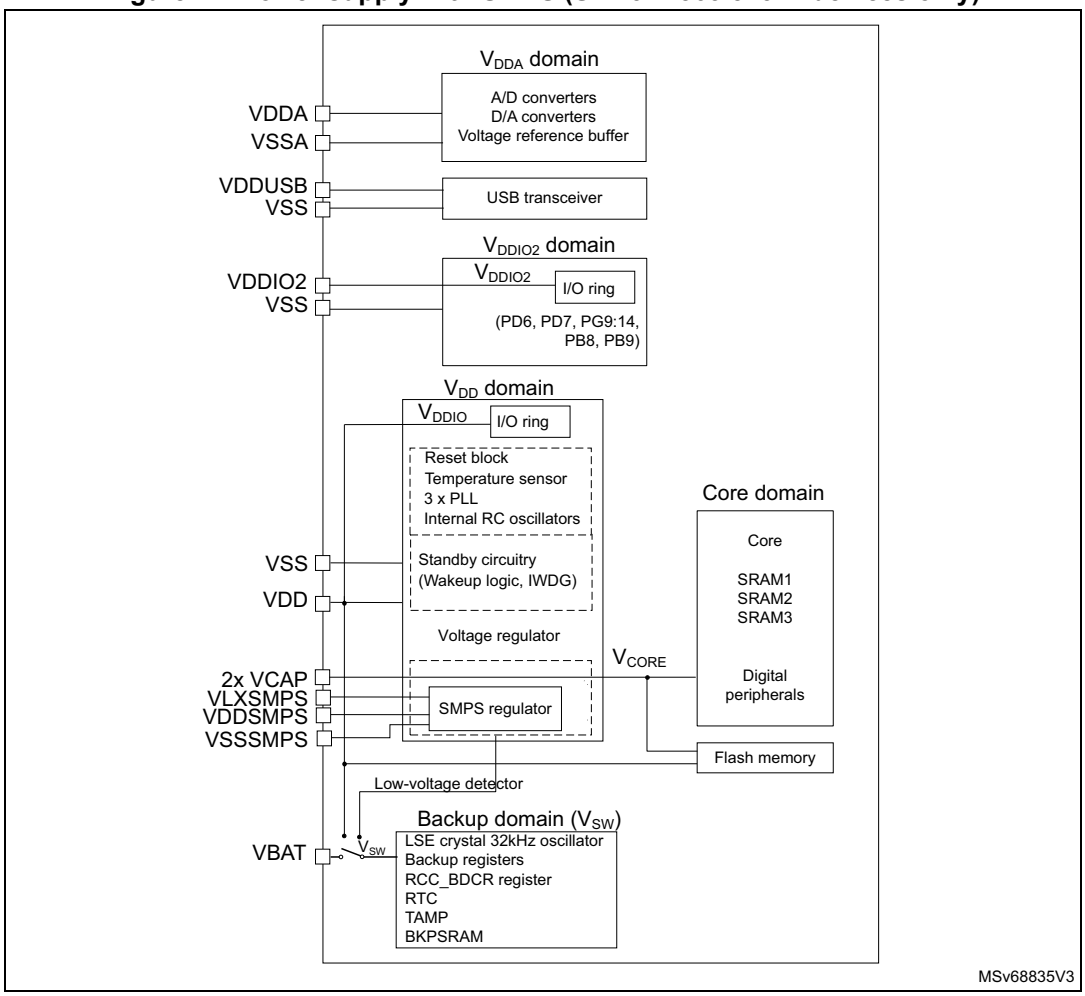

Figure 43. Power supply with LDO

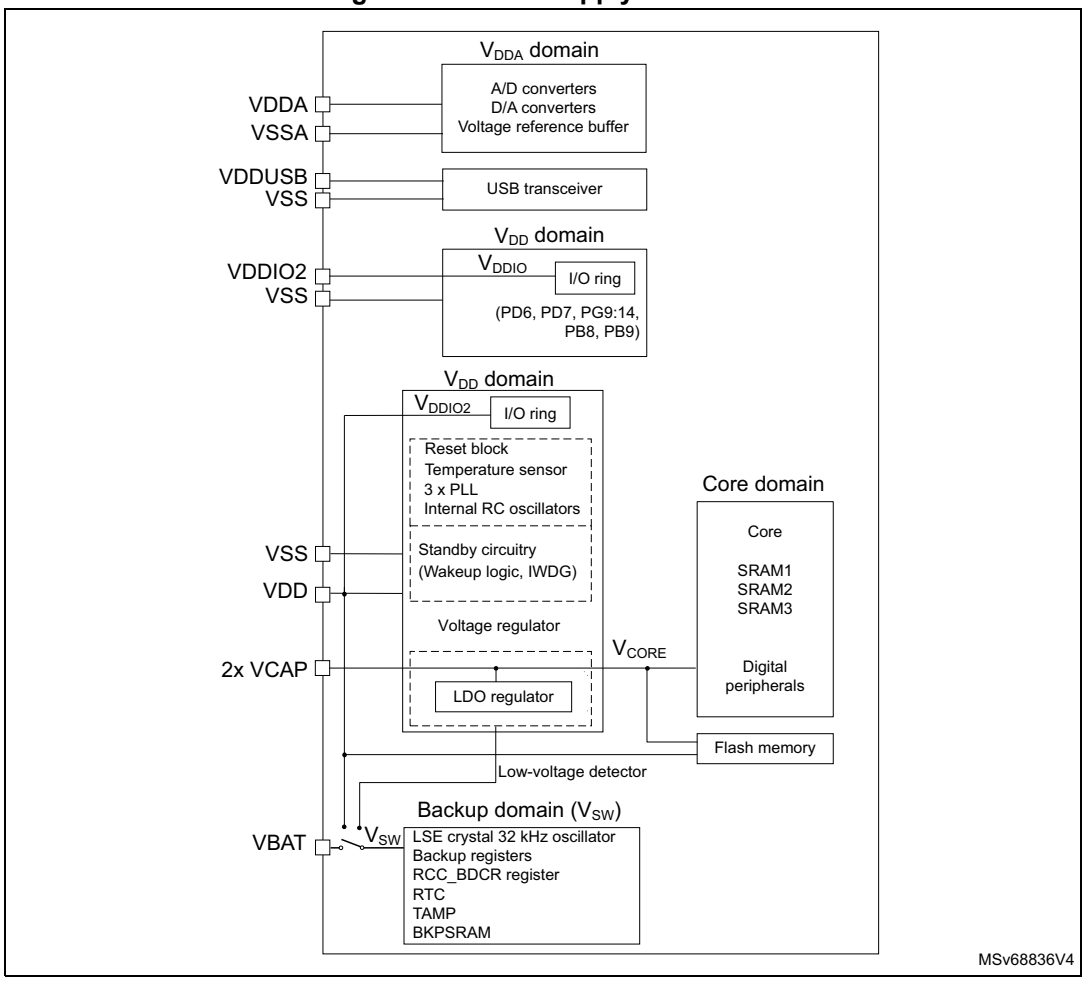

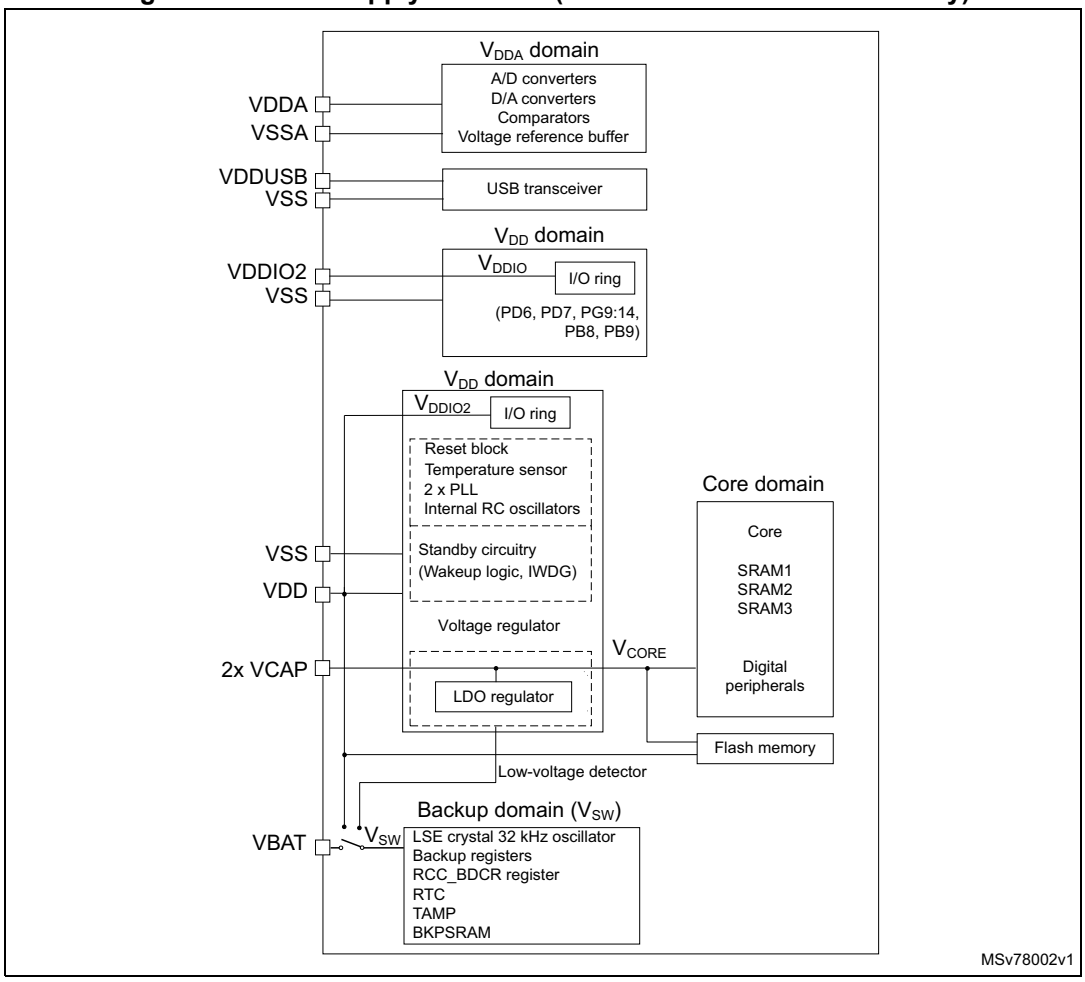

Figure 44. Power supply with LDO (STM32H543/553xx devices only)

10.4.1 External power supplies

The devices require a 1.71 to 3.6 V V_{DD} operating voltage supply. Several independent supplies can be provided for specific peripherals, but must not be provided without a valid operating supply on the VDD pin:

- V_{DD} = 1.71 to 3.6 V

  V_{DD} is the external power supply for the I/Os, the internal regulator, and the system analog (such as reset, power management, and internal clocks). It is provided externally through the VDD pins.

- V_{DDA} = 1.62 V (ADCs, COMP[a]) or 1.8 V (DAC) / 2.1 (VREFBUF) to 3.6 V

  V_{DDA} is the external analog power supply for A/D converters, D/A converters, and voltage reference buffer. The V_{DDA} voltage level is independent from the V_{DD} voltage, and must preferably be connected to V_{DD} when these peripherals are not used.

- V_{DDSMPS} = 1.71 to 3.6 V

  V_{DDSMPS} is the external power supply for the SMPS step-down converter. It is provided

a. Available on STM32H543/553xx devices only.

externally through the VDDSMPS supply pin, and must be connected to the same supply as the VDD pin.

- V_{LXSMPS} is the switched SMPS step-down converter output.

Note: The SMPS power supply pins are available only on specific packages, with SMPS step-down converter option.

- V_{DDUSB} = 3.0 to 3.6 V

  V_{DDUSB} is the external independent power supply for USB transceivers. The V_{DDUSB} voltage level is independent from the V_{DD} voltage and must preferably be connected to V_{DD} when the USB is not used.

- V_{DDIO2} = 1.08 to 3.6 V

  V_{DDIO2} is the external power supply for ten I/Os (PD6, PD7, PG9:14, PB8, PB9). The V_{DDIO2} voltage level is independent from the V_{DD} voltage and must preferably be connected to V_{DD} when those pins are not used.

- V_{CAP} = 1.0 to 1.35 V: digital core domain supply

  This power supply is independent from all the other power supplies:

  – When the voltage regulator is enabled, V_{CORE} is delivered by the internal voltage regulator.

  – When the voltage regulator is disabled, V_{CORE} is delivered by an external power supply through VCAP pin, or by the SMPS

- V_{BAT} = 1.2 to 3.6 V

  V_{BAT} is the power supply when V_{DD} is not present (through power switch) for RTC, external clock 32 kHz oscillator, backup registers, and, optionally, backup SRAM.

- V_{REF-}, V_{REF+}

  V_{REF+} is the input reference voltage for ADCs and DACs. It is also the output of the internal voltage reference buffer when enabled.

  V_{REF+} can be grounded when ADC and DAC are not active.

  The internal voltage reference buffer supports four output voltages, configured with VRS bit in the VREFBUF_CSR register:

  – V_{REF+} ~ 1.8 V. (requires $V_{DDA} \geq 2.1$ V)

  – V_{REF+} ~ 2.048 V (requires $V_{DDA} \geq 2.4$ V)

  – V_{REF+} ~ 2.5 V (requires $V_{DDA} \geq 2.8$ V)

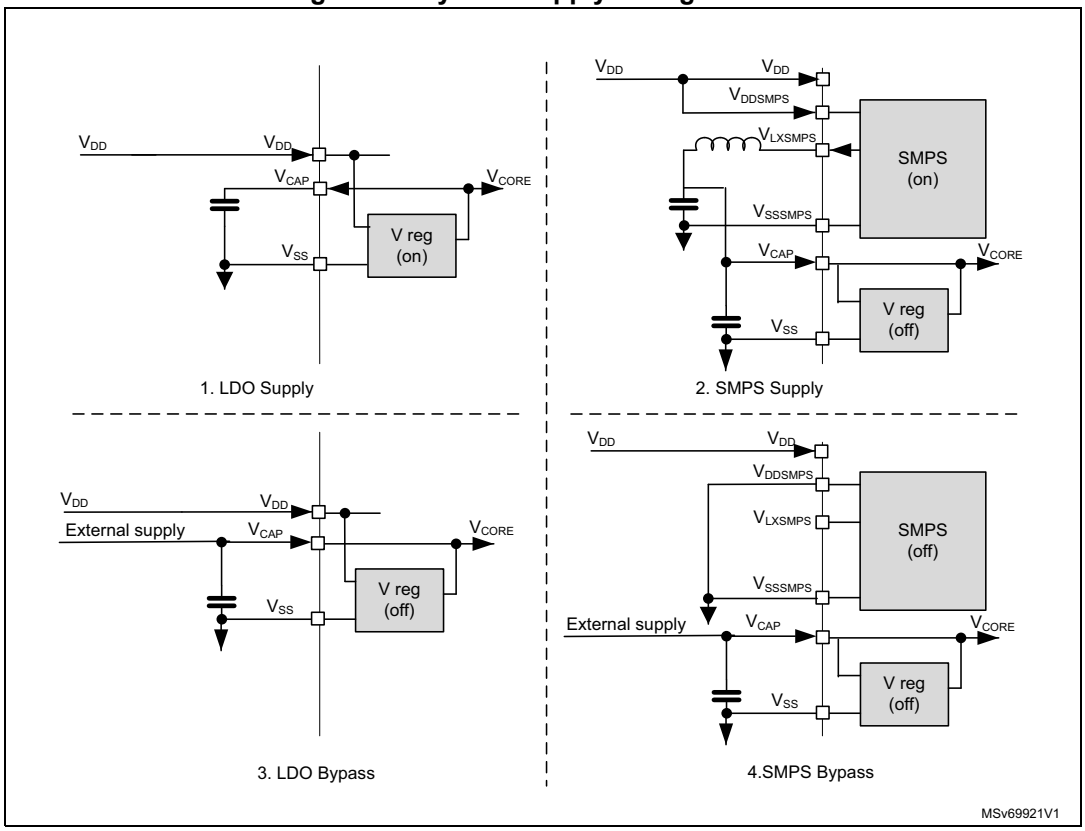
  VREF- and VREF+ pins are not available on all packages. When not available, they are bonded to VSSA and VDDA, respectively.

  When the VREF+ is double-bonded with VDDA in a package, the internal voltage reference buffer is not available and must be kept disabled.

  V_{REF-} must always be equal to V_{SSA}.

10.4.2 Internal regulators

The devices embed two regulators: one LDO and one SMPS[a] to provide the V_{CORE} supply for digital peripherals, SRAMs (except BKPSRAM), and embedded flash memory.



a. STM32H563/573xx devices only.

The SMPS generates this voltage on VCAP (two pins), with a total external capacitor of 10 µF (typical), and requires an external coil of 2.2 µH (typical). The LDO generates this voltage on VCAP, with a total external capacitance of 4.7 µF (typical).

Both regulators can provide four different voltages (voltage scaling), and can operate in Stop modes.

Depending on the package configuration (SMPS or LDO), the regulator is selected by hardware. SMPS and LDO regulator are exclusively selected. The supply configurations shown in *Figure 45* are supported for the V_{CORE} domain supply. Both regulators can also be bypassed to allow an external power supply to V_{CORE}.

Figure 45. System supply configurations

Startup with V_{CORE} provided from an external supply (Bypass)

- LDO configuration
  For devices in LDO packages, when operating in Bypass mode, the supply must first settle at its default level (≥ 1.1 V), before reaching the POR threshold.
  Since the LDO is enabled by default after power-up, the external voltage must remain above 1.1 V until the LDO is disabled by software.
- SMPS configuration
  For devices in SMPS packages, when operating in Bypass mode, the external supply ramp slope must be higher than 3.5 mV/µs.

Note: Once the internal regulator, either the LDO or the SMPS, is disabled, the external voltage can be adjusted according to the application requirements. See the General operating

conditions section of the datasheet for details about the VCORE level and the maximum operating frequency.

The application must also configure PWR_VOSCR according to the externally provided core voltage level and the related performance.

To adjust the VOS level, the software must select sequentially the intermediate levels.

- When increasing the performance:
  - First, voltage scaling must be incremented (for example when changing from VOS3 to VOS0, lower levels must be selected in the VOS[1:0] bits: VOS2, VOS1, and then VOS0).
  - The external voltage can be increased
  - The system frequency can be increased
- When decreasing the performance:
  - The system frequency must be decreased
  - The external voltage must be decreased
  - The voltage scaling can be decremented (for example when changing from VOS1 to VOS3, lower levels must be selected in the VOS[1:0] bits: VOS2, and then VOS3)

10.4.3 Power-up and power-down power sequences

During power-up and power-down phases, the following power sequence requirements must be respected:

- When V_{DD} is below 1 V, other power supplies (V_{DDA}, V_{DDIO2}, V_{DDUSB}) must remain below V_{DD} + 300 mV.
- When V_{DD} is above 1 V, all power supplies are independent.

During the power-down phase, V_{DD} can temporarily become lower than other supplies only if the energy provided to the MCU remains below 1 mJ. This allows external decoupling capacitors to be discharged with different time constants during the power-down transient phase.

10.4.4 Independent analog peripherals supply

To improve ADC and DAC conversion accuracy and to extend the supply flexibility, the analog peripherals have an independent power supply that can be separately filtered and shielded from noise on the PCB:

- The voltage supply input of the analog peripherals is available on a separate VDDA pin.
- An isolated supply ground connection is provided on the VSSA pin.

The V_{DDA} supply voltage can be different from V_{DD}. The presence of V_{DDA} must be checked before enabling any of the analog peripherals supplied by V_{DDA} (A/D converter, D/A converter, voltage reference buffer).

Power supply level monitoring is available on VDDA via AVDO bit in PWR_VMSR register.

When a single supply is used, V_{DDA} can be externally connected to V_{DD} through the external filtering circuit to ensure a noise-free V_{DDA} reference voltage.

Analog switch voltage booster

By setting the BOOSTE and AVD_READY bits in the PWR_PMCR register, the application can reduce the total harmonic distortion (THD) of the I/O analog switches when the supply voltage is below 2.7 V, ensuring the same performance as with the full voltage range.

To avoid unnecessary current consumption caused by booster activation when V_{DDA} < 2.7 V and V_{DD} > 2.7 V, V_{DD} can be selected as the supply voltage for the analog switches by keeping the AVD_READY bit cleared to 0 in the PWR_PMCR register.

Table 106. Analog switched recommended configuration

VDDA	VDD	BOOSTE	AVD_READY	Analog switch supply voltage
≤ 2.7 V	≤ 2.7 V	1	1	Booster
	> 2.7 V	0	0	VDD
> 2.7 V	Not applicable	0	1	VDDA

ADC and DAC reference voltage

To ensure a better accuracy on low-voltage inputs and outputs, the user can connect to VREF+ pin, a separate reference voltage lower than V_{DDA}. V_{REF+} is the highest voltage, represented by the full scale value, for an analog input (ADC) or output (DAC) signal.

V_{REF+} can be provided either by an external reference of by an internal buffered voltage reference (VREFBUF). The internal voltage reference can output a configurable voltage, namely 1.8, 2.048 or 2.4 V. The internal voltage reference can also provide the voltage to external components through VREF+ pin. Refer to the device datasheet and to *Section 31: Voltage reference buffer (VREFBUF)* for further information.

Note: The VREF+ and VREF- pins are not available on all packages (internally connected, respectively, to VDDA and VSSA). Do not enable the internal voltage reference buffer when an external power supply is applied to the VREF+ pin.

10.4.5 Independent I/O supply rail

Some I/Os (PD6, PD7, PG9:14, PB8, PB9) are supplied from a separate supply rail. The power supply for this rail can range from 1.08 to 3.6 V, and is provided externally through the VDDIO2 pin. The V_{DDIO2} voltage level is completely independent from V_{DD} or V_{DDA}. The VDDIO2 pin is available only for some packages. Refer to the pinout diagrams or tables in the related device datasheet(s) for the I/O list(s).

Power supply level monitoring is available on VDDIO2 via VDDIO2RDY bit in PWR_VMSR register.

10.4.6 Independent USB transceivers supply

The USB transceivers are supplied from a separate VDDUSB power supply pin. V_{DDUSB} range is from 3.0 to 3.6 V, and is completely independent from V_{DD} or V_{DDA}.

Power supply level monitoring is available on VDDUSB via the USB33RDY bit in PWR_VMSR register.

Before setting USB33SV bit in PWR USB supply control register (PWR_USBSCR), check that V_{DDUSB} is available by monitoring USB33RDY bit in PWR voltage monitor status

register (PWR_VMSR). The $V_{DD33USB}$ supply level detector must be enabled through USB33DEN bit in PWR USB supply control register (PWR_USBSCR).

Setting USB33SV bit is mandatory to use the USB peripheral. It is used to validate the V_{DDUSB} supply for electrical and logical isolation purposes.

10.4.7 Backup domain

To retain the content of the backup registers and to supply the RTC function when V_{DD} is turned off, the VBAT pin can be connected to an optional backup voltage supplied by a battery or by another source.

The VBAT pin powers the RTC unit, the LSE oscillator, PI8[a], and PC13 to PC15 I/Os, allowing the RTC to operate even when the main power supply is turned off. The backup SRAM is optionally powered by VBAT pin when the BREN bit is set in the *PWR Backup domain control register (PWR_BDCR)*. The switch to the V_{BAT} supply is controlled by the power-down reset embedded in the Reset block.

Warning: **During $t_{RSTTEMPO}$ (temporization at V_{DD} startup) or after a PDR has been detected, the power switch between V_{BAT} and V_{DD} remains connected to V_{BAT}.**
During the startup phase, if V_{DD} is established in less than $t_{RSTTEMPO}$ (refer to the datasheet for its value) and $V_{DD} > V_{BAT} + 0.6$ V, a current may be injected into V_{BAT} through an internal diode connected between V_{DD} and the power switch (V_{BAT}).
If the power supply/battery connected to the VBAT pin cannot support this current injection, it is strongly recommended to connect an external low-drop diode between this power supply and the VBAT pin.

If no external battery is used in the application, it is recommended to connect V_{BAT} externally to V_{DD} with a 100 nF external ceramic decoupling capacitor.

When the Backup domain is supplied by V_{BAT} (analog switch connected to V_{BAT}), the following pins are available:

- PC13, PI8[b], PC14, and PC15, which can be configured by RTC or LSE (refer to *Section 51.3: RTC functional description*)
- PC13, PI8[b], PA0, PA1, and PA2 when they are configured by TAMP peripheral as tamper pins.

Note: The analog switch can transfer only a limited amount of current, hence the use of GPIOs PC13 to PC15 and PI8[b] in output mode is restricted: the frequency must be limited (check the datasheet) with a maximum load of 30 pF, and these I/Os cannot be used as a current source (for example to drive a LED).

a. Not available on all devices, check the datasheet.

b. Not available on all devices, check the datasheet.

Backup domain access

After a system reset, the Backup domain (RCC Backup domain control register RCC_BDCR, RTC registers, TAMP registers, backup registers, and backup SRAM) is protected against possible unwanted write accesses. To enable access to the Backup domain, set the DBP bit in the *PWR Backup domain control register (PWR_BDCR)* to enable access to the Backup domain.

Backup RAM

The Backup domain includes up to 4 Kbytes of backup RAM accessible in 32-, 16-, or 8-bit data mode. The backup RAM is supplied from the backup regulator in the Backup domain. When the backup regulator is enabled through BREN bit in the PWR_BDCR, the backup RAM content is retained in Standby and/or VBAT mode (it can be considered as an internal EEPROM if VBAT is always present).

The backup regulator can be ON or OFF, depending on if the application needs the backup RAM function in Standby or VBAT modes.

The backup RAM is read protected and mass erased when a tamper event occurs, this is to prevent confidential data (such as a cryptographic private key) from being accessed.

The backup RAM can be erased in the following ways:

- through the flash interface after a full product state regression
- after a tamper event
- after a Backup domain reset

V_{BAT} battery charging

When V_{DD} is present, it is possible to charge the external battery on VBAT through an internal resistance.

The V_{BAT} charging is done either through a 5 or a 1.5 kΩ resistor, depending upon the VBRS bit value in the PWR_BDCR register.

The battery charging is enabled by setting VBE bit in the PWR_BDCR register. It is automatically disabled in V_{BAT} mode.

10.5 PWR system supply voltage regulation

10.5.1 SMPS and LDO embedded regulators

The devices embed two internal regulators[a], exclusively enabled by hardware on power-on reset, depending upon package configuration. To supply the V_{CORE} from an external source, it is possible to disable the regulator by setting the BYPASS bit in the PWR_SCCR register.

The BYPASS bit is written once after power-on reset. Written-once mechanism locks the register and any further write access is ignored. The system must be power cycled before writing a new value.

a. STM32H563/573xx devices only.

When V_{CORE} is supplied from an external source the externally applied voltage level must be reflected in the VOSx bits in the PWR_VOSCR register refer to *Startup with VCORE provided from an external supply (Bypass)*.

Both regulators can provide four different voltages (voltage scaling) and can operate in Stop modes.

10.5.2 V_{CORE} supply versus reset, voltage scaling, and low-power modes

After reset, the V_{CORE} is in VOS3.

When exiting the Stop or Standby mode, the voltage range is the VOS3.

10.5.3 Embedded voltage regulator operating modes

There are three different power modes: Run, Stop, and Standby modes.

Run mode

The voltage regulator provides full power to the V_{CORE} domain (core, memories, and digital peripherals). The regulator output voltage can be scaled by software to different voltage levels (VOS0, VOS1, VOS2, and VOS3) that are configured through the VOS bits in the PWR voltage scaling control register (PWR_VOSCR).

The VOS voltage scaling allows optimization of the power consumption when the system is clocked below the maximum frequency. By default, VOS3 is selected after system reset.

VOSx bits can be changed on-the-fly to adapt to the required system performance.

Stop mode

The voltage regulator supplies the V_{CORE} domain to retain the content of registers and internal memories. The regulator mode is selected through the SVOS bits in the PWR power mode control register (PWR_PMCR).

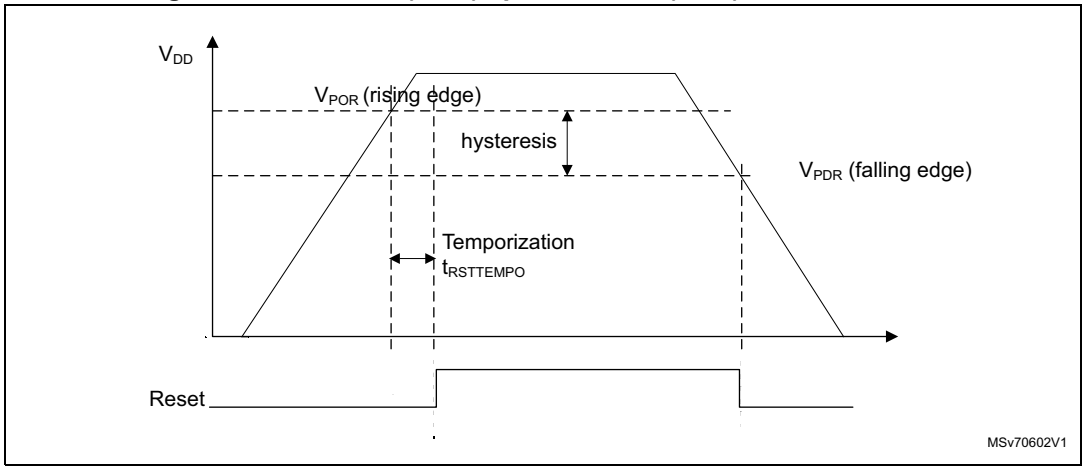
Stop mode power consumption can be further reduced using SVO4 (lower voltage level than VOS3) and even further with SVOS5.

Standby mode

The regulator is OFF and the V_{CORE} domains are powered down. The content of the registers and memories is lost except for the Standby circuitry and the Backup domain.

10.6 PWR power supply and temperature supervision

Power supply level monitoring is available on the following supplies:



- V_{DD} via POR/PDR (see *Section 10.6.1*), BOR (see *Section 10.6.2*), and PVD monitor (see *Section 10.6.3*)
- V_{DDA} via AVD monitor see (*Section 10.6.4*)
- V_{BAT} via V_{BAT} threshold (see *Section 10.6.6*)
- V_{DDIO2} via VDDIO2RDY bit (see *Section 10.11.14*)
- Temperature monitoring (see *Section 10.6.7*)

10.6.1 Power-on reset (POR)/power-down reset (PDR)

The system has an integrated POR/PDR circuitry that ensures proper startup operation.

The system remains in reset mode when V_{DD} is below a specified VPOR threshold, without the need for an external reset circuit. Once the supply level is above the VPOR threshold, the system is taken out of reset (see *Figure 46*). For more details concerning the reset thresholds refer to the electrical characteristics section of the datasheets.

Figure 46. Power-on (POR) / power-down (PDR) reset waveform

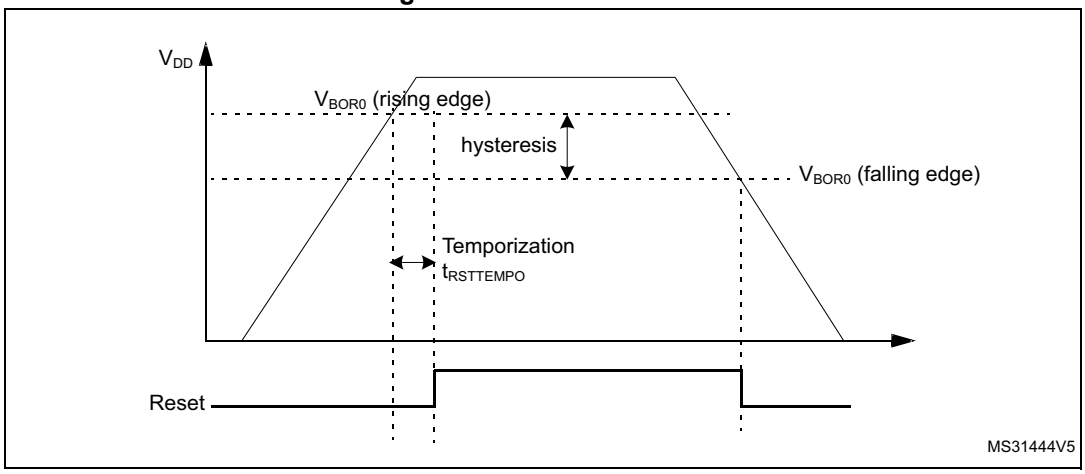
1. For thresholds and hysteresis values refer to the datasheets.

10.6.2 Brownout reset (BOR)

During power-on, the brownout reset (BOR) keeps the system under reset until the V_{DD} supply voltage reaches the specified V_{BOR} threshold.

The V_{BOR} threshold is configured through system option bytes:

- BOR OFF (BORH_EN = 0)
- BOR level 1 (V_{BOR1})
- BOR level 2 (V_{BOR2})
- BOR level 3 (V_{BOR3})



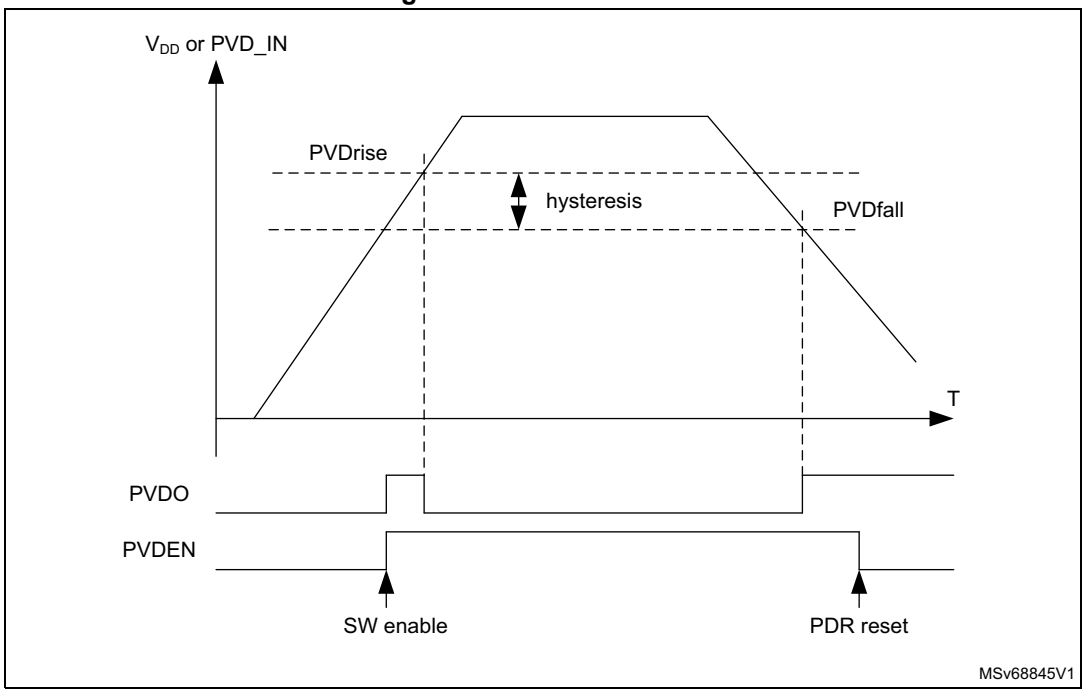
By default, BOR is OFF, it can be enabled by setting BORH_EN option bit.

For more details on the brownout reset thresholds, refer to the section "*Electrical characteristics*" of the product datasheets.

A system reset is generated when the BOR is enabled and V_{DD} supply voltage drops below the selected V_{BOR} threshold.

BOR can be disabled by programming the BORH_EN option bit to 0. To disable the BOR function, V_{DD} must have been higher than the POR threshold to start the system option byte programming sequence. Once BOR is disabled, the power-down is monitored by the PDR.

Figure 47. BOR thresholds



10.6.3 Programmable voltage detector (PVD)

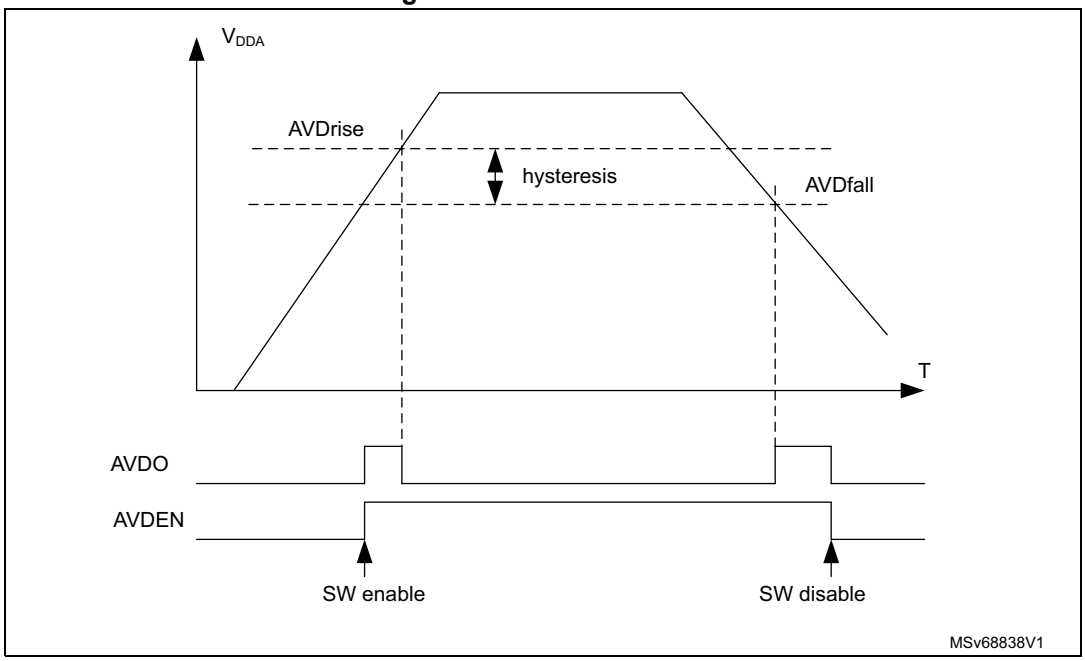
The PVD can be used to monitor the V_{DD} power supply by comparing it to a threshold selected by the PLS[2:0] bits in the *PWR voltage monitor control register (PWR_VMCR)*. The PVD can also be used to monitor a voltage level on the PVD_IN pin. In this case PVD_IN voltage is compared to the internal VREFINT level.

The PVD is enabled by setting the PVDE bit in *PWR voltage monitor control register (PWR_VMCR)*.

A PVDO flag is available in the *PWR voltage monitor status register (PWR_VMSR)* to indicate if V_{DD} or PVD_IN voltage is higher or lower than the PVD threshold. This event is internally connected to the EXTI and can generate an interrupt, provided it has been enabled through the EXTI registers. The rising/falling edge sensitivity of the EXTI line must be configured according to PVD output behavior. As an example, if the EXTI line is configured to rising edge sensitivity, the interrupt is generated when V_{DD} or PVD_IN voltage drops below the PVD threshold. The service routine can then start an emergency shutdown.

Figure 48. PVD thresholds

1. For thresholds and hysteresis values, refer to the datasheets.



10.6.4 Analog voltage detector (AVD)

The AVD can be used to monitor the V_{DDA} supply by comparing it to a threshold selected by the ALS[1:0] bits in the *PWR voltage monitor control register (PWR_VMCR)*.

The AVD is enabled by setting the AVDEN bit in *PWR voltage monitor control register (PWR_VMCR)*.

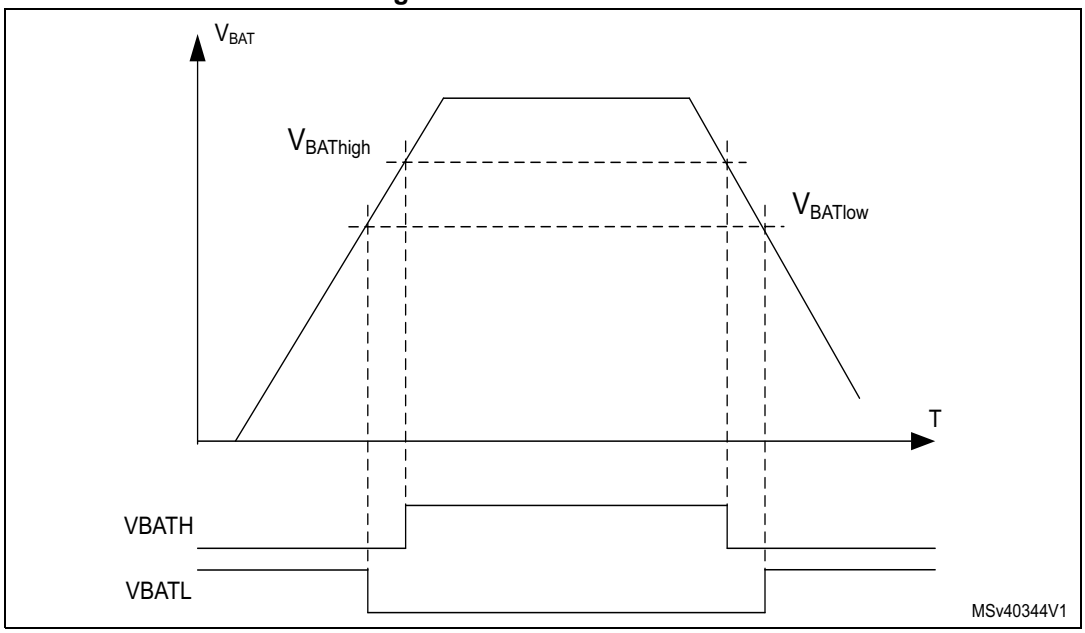
An AVDO flag is available in the *PWR voltage monitor status register (PWR_VMSR)* to indicate whether V_{DDA} is higher or lower than the AVD threshold. This event is internally connected to the EXTI and can generate an interrupt if enabled through the EXTI registers. The AVDO interrupt can be generated when V_{DDA} drops below the AVD threshold and/or when V_{DDA} rises above the AVD threshold, depending on EXTI rising/falling edge configuration. As an example, the service routine can indicate when the V_{DDA} supply drops below a minimum level.

Figure 49. AVD thresholds

1. For thresholds and hysteresis values, refer to the datasheets.

10.6.5 V_{DDIO2} voltage monitor (IO2VM)

The IO2VM monitors the independent supply voltage V_{DDIO2} to ensure that the peripheral is in its functional supply range. The VDDIO2RDY flag (see *PWR voltage monitor control register (PWR_VMCR)*) indicates whether a valid supply is present or not.



10.6.6 Backup domain voltage monitoring

In VBAT mode, the battery voltage supply (backup domain) can be monitored by comparing it with two threshold levels: $V_{BAThigh}$ and V_{BATlow}. The VBAT supply monitoring can be enabled/disabled via MONEN bit in *PWR Backup domain control register (PWR_BDCR)*. When it is enabled, the battery voltage thresholds increase power consumption.

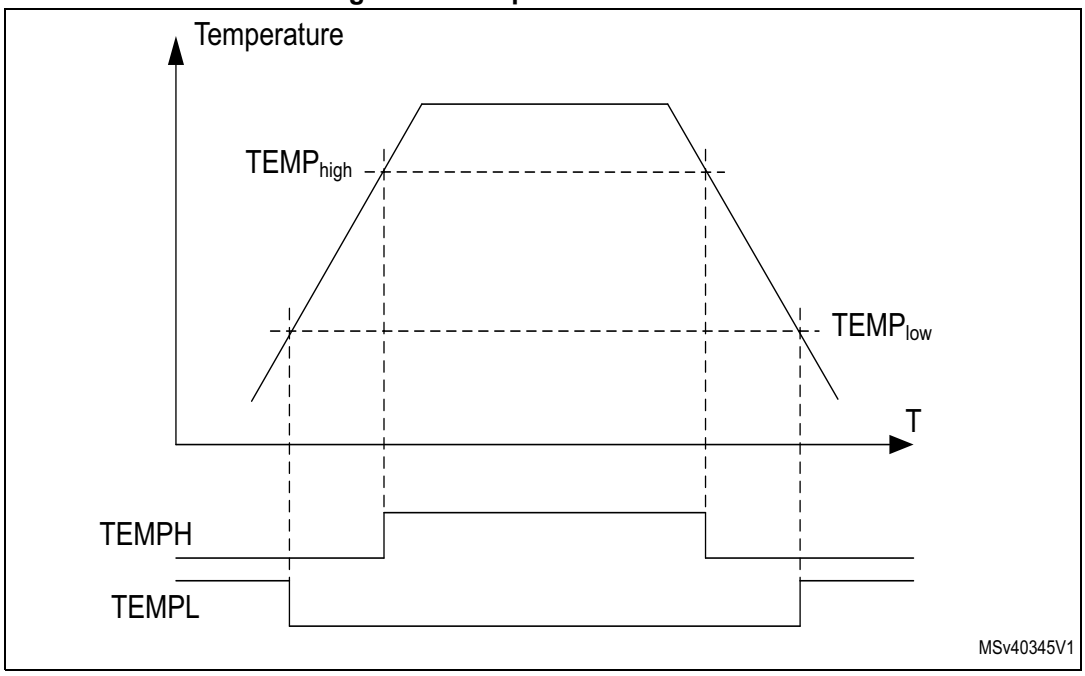
If the Backup domain voltage monitoring internal tamper is enabled in the TAMP peripheral (ITAMP1E = 1 in the TAMP_CR1 register), a tamper event is generated when the battery voltage is above the functional range.

Note: The Backup domain voltage is V_{DD} when present, V_{BAT} otherwise.

Figure 50. VBAT thresholds

1. For thresholds and hysteresis values, refer to the datasheets.

10.6.7 Temperature monitoring



A dedicated temperature sensor cell is embedded in the power control. The junction temperature can be monitored by comparing it with two threshold levels, $TEMP_{HIGH}$ and $TEMP_{LOW}$. TEMPH and TEMPL flags in the *PWR Backup domain status register (PWR_BDSR)*, which indicates whether the device temperature is higher or lower than the threshold. The temperature monitoring can be enabled/disabled via MONEN bit in *PWR Backup domain control register (PWR_BDCR)*.

When enabled, the temperature thresholds increase power consumption. As an example the levels may be used to trigger a routine to perform temperature control tasks.

If the temperature monitoring internal tamper is enabled in the TAMP peripheral (ITAMP2E = 1 in the TAMP_CR1 register), a tamper event is generated when the temperature is above or below the functional range.

TEMPH and TEMPL wake-up interrupts are available on the RTC tamper signals (see *Section 52: Tamper and backup registers (TAMP)*).

Figure 51. Temperature thresholds

1. For thresholds and hysteresis values, refer to the datasheets.

10.7 PWR management

10.7.1 Voltage scaling

The voltage regulator supporting voltage scaling with the following features:

- Run mode voltage scaling
  - VOS0: scale 0
  - VOS1: scale 1
  - VOS2: scale 2
  - VOS3: scale 3
- Stop mode voltage scaling
  - SVOS3: scale 3
  - SVOS4: scale 4
  - SVOS5: scale 5

For more details on voltage scaling values, refer to the product datasheets.

After reset, the system starts on the lowest Run mode voltage scaling (VOS3). The voltage scaling can be changed on-the-fly by software by programming VOS bits in PWR_VOSCR register, according to the required system performance. When exiting from the Stop mode or Standby mode, the Run mode voltage scaling is reset to the default VOS3 value.

Before entering Stop mode, the software must preselect the SVOS level in the PWR_PMCR registers. The Stop mode voltage scaling for SVOS4 and SVOS5 also sets the voltage regulator in Low-power mode, to further reduce power consumption.

10.7.2 Power management examples

Figure 52. Dynamic voltage scaling in Run mode

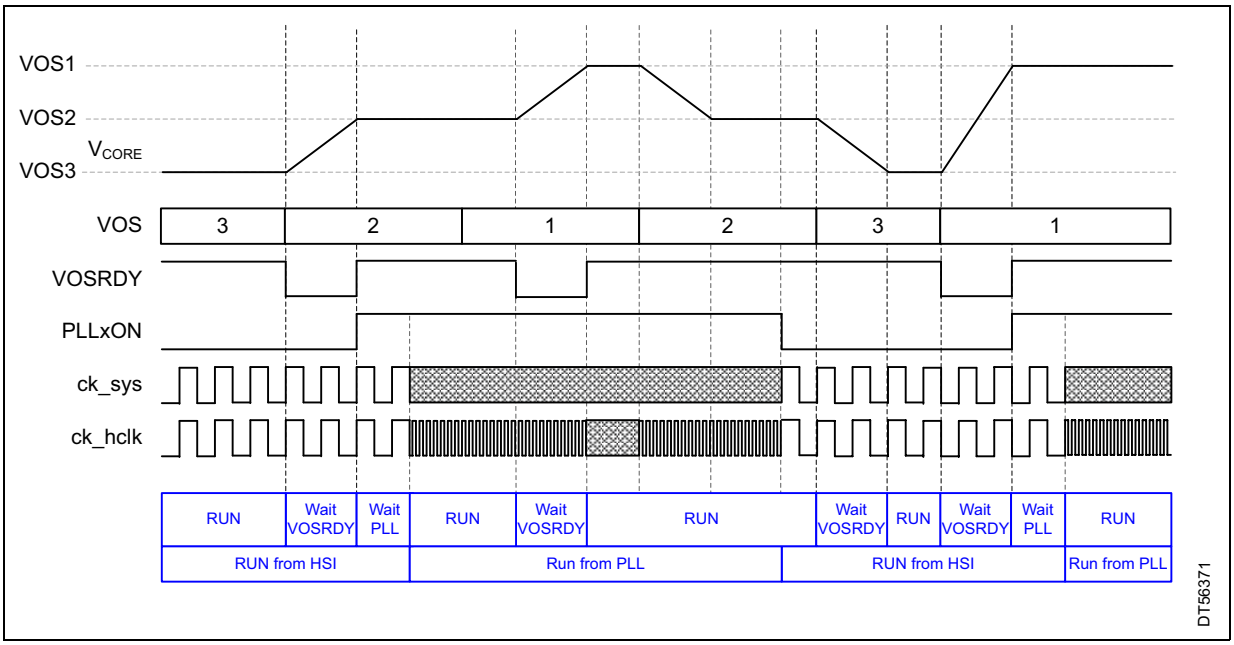


Figure 52 illustrates the following system operation sequence example:

1. After reset, the system starts from HSI with VOS3.
2. The system performance is increased to a medium-speed clock from the PLL with voltage scaling VOS2. To do this:
   a) Program the voltage scaling to VOS2.
   b) Once the V_{CORE} supply has reached the required level indicated by VOSRDY, increase the clock frequency by enabling the PLL.
   c) Once the PLL is locked, switch the system clock.
3. The system performance is increased to high-speed clock from the PLL with voltage scaling VOS1. To do this:
   a) Program the voltage scaling to VOS1.
   b) Once the VCORE supply has reached the required level indicated by VOSRDY, increase the clock frequency.
4. The system performance is reduced to a medium-speed clock with voltage scaling VOS2. To do this:
   a) First decrease the system frequency.
   b) Then decrease the voltage scaling to VOS2.
5. The next step is to reduce the system performance to the HSI clock with voltage scaling VOS3. To do this:
   a) Switch the clock to HSI.
   b) Disable the PLL.
   c) Decrease the voltage scaling to VOS3.

6. The system performance can then be increased to high-speed clock from the PLL. To do this:
   a) Program the voltage scaling to VOS1.
   b) Once the V_{CORE} supply has reached the required level indicated by VOSRDY, increase the clock frequency by enabling the PLL.
   c) Once the PLL is locked, switch the system clock.

When the system performance (clock frequency) is changed, VOS must be set accordingly, otherwise the system can be unreliable.

10.8 Power modes

By default, the microcontroller is in Run mode after a system or a power reset. Several low-power modes are available to reduce consumption when there is no need to keep the CPU running, for example when waiting for an external event. The user can select the mode that gives the best compromise between low-power consumption, short startup time, and wake-up sources.

The device features the following low-power modes:

- Sleep mode

  CPU clock off, peripherals such as NVIC and SysTick can run and wake-up the CPU when an interrupt or an event occurs. Refer to *Section 10.8.4*.

- Stop mode

  Achieves the lowest power consumption, while retaining the content of SRAM and registers. All clocks in the core domain are stopped. The PLL, the HSE crystal oscillators, HSI (except if HSIKERON is set), HSI48 and CSI RC (except if CSIKERON is set) are disabled. The LSE or LSI is still running.

  The RTC can remain active (Stop mode with RTC, Stop mode without RTC).

  The system clock when exiting from Stop mode can be either HSI up to 64 MHz or CSI, depending on software configuration.

  Refer to *Section 10.8.5*.

- Standby mode

  This mode achieves the lowest power consumption with BOR. The internal regulator is switched off so that the core domain is powered off. The PLL, the HSI RC, HSI48, the CSI RC, and the HSE crystal oscillators are also switched off.

  The RTC can remain active (Standby mode with RTC, Standby mode without RTC).

  The brownout reset (BOR) remains active.

  The state of the I/O (except I/Os used by standby mode) during Standby mode can be retained.

  After entering Standby mode, SRAMs and register contents are lost except for registers and backup SRAM in the Backup domain and Standby circuitry.

  The device exits Standby mode when an external reset (NRST pin), an IWDG reset, WKUP pin event (configurable rising or falling edge), an RTC event occurs (alarm, periodic wake-up, timestamp), or a tamper detection. The tamper detection can be

raised either due to external pins or due to an internal failure detection.

The system clock after wake-up is HSI at 32 MHz.

Refer to *Section 10.8.6*.

Table 107 shows the power modes overview.

Table 107. Low-power mode summary

Mode name	Entry	Wake-up source(1)	Wake-up system clock	Effect on clocks	Voltage regulators
Sleep (Sleep-now or Sleep-on-exit)	WFI or Return from ISR	Any interrupt	Same as before entering Sleep mode	– CPU clock OFF – No effect on other clocks or analog clock sources	VOS3, VOS2, VOS1, or VOS0
	WFE	Wake-up event			
Stop	LPMS = 0 + SLEEPDEEP bit + WFI or Return from ISR or WFE	– Any EXTI line (configured in the EXTI registers) – Specific peripherals events(2)	– CSI when STOPWUCK = 1 in RCC_CFGR – HSI with the frequency before entering Stop mode, up to 64 MHz, when STOPWUCK = 0	– All clocks OFF except LSI and LSE – HSI or CSI can be enabled temporarily when requested by software	SVOS3, SVOS4, or SVOS5
Standby	LPMS = 1 + SLEEPDEEP bit + WFI or Return from ISR or WFE	WKUP pin edge, RTC event, IWDG reset, external reset in NRST pin	HSI clock at 32 MHz	All clocks OFF except LSI and LSE	OFF

1. Refer to *Table 108*.
2. Peripherals able to wake-up the system from Stop mode (possible only when SVOS3 is selected before entering Stop mode).

1. Y = yes (enabled). O = optional (disabled by default, can be enabled by software). - = not available. HSI or CSI are available as kernel clock for peripherals only in SVOS3.
2. The memory can be configured in Low-power mode. By default, it is not in Low-power mode during Stop (SVOS3, SVOS4).
3. The SRAM clock can be gated on or off independently. By default clock is enabled in Run and Sleep modes.
4. The SRAMs can be powered on or off independently. By default, they are not in Power-off mode during Stop.
5. Wake-up with internal tamper.
6. GPIOs state can be retained during Standby mode. By default GPIOs states are not retained.
7. 8 pins are capable of wake-up from Standby mode: PA0, PA2, PB7, PC1, PC13, PD2, PD3 and PI8 (not available on all devices, check the datasheet).

In addition, the power consumption in Run mode can be reduced by slowing down the system clocks, configuring voltage scaling to lower power ranges, and by gating the clocks to the APB and AHB peripherals when they are not used.

Debug mode

By default, the debug connection is lost if the application puts the MCU in Stop or Standby mode while the debug features are used. This is due to the fact that the Cortex-M33 core is no longer clocked.

However, by setting some configuration bits in the DBGMCU control registers, the software can be debugged even when using the low-power modes extensively. For more details, refer to *Section 66.2.5: Debug and low-power modes*.

10.8.1 Slowing down system clocks

In Run mode, the speed of the system clocks (SYSCLK, HCLK, PCLK) can be reduced by programming the prescaler registers. These prescalers can also be used to slow down the peripherals before entering the Sleep mode.

For more details, refer to *Section 11: Reset and clock control (RCC)*.

10.8.2 Peripheral clock gating

In Run mode, the HCLK and PCLK for individual peripherals and memories can be stopped at any time to reduce the power consumption.

To further reduce the power consumption in Sleep mode, the peripheral clocks can be disabled before executing the WFI or WFE instructions.

The peripheral clock gating is controlled by the RCC_AHBxENR and RCC_APBxENR registers.

Disabling the peripherals clocks in Sleep mode can be performed automatically by resetting the corresponding bit in the RCC_AHBxLPENR and RCC_APBxLPENR registers.

10.8.3 Low-power modes

Entering a low-power mode

The MCU enters in low-power modes by executing the WFI (wait for interrupt), or WFE (wait for event) instructions, or when the SLEEPONEXIT bit in the Cortex-M33 system control register is set on Return from ISR.

Entering into a low-power mode through WFI or WFE is executed only if no interrupt is pending or no event is pending.

Exiting a low-power mode

The MCU exits the Sleep or Stop mode according to how the low-power mode was entered:

- If the WFI instruction or Return from ISR was used to enter the low-power mode, any peripheral interrupt acknowledged by the NVIC can wake up the device.
- If the WFE instruction is used to enter the low-power mode, the MCU exits the low-power mode as soon as an event occurs. The wake-up event can be generated either by:
  - an NVIC IRQ interrupt:
    - When SEVONPEND = 0 in the Cortex-M33 system control register
      By enabling an interrupt in the peripheral control register and in the NVIC. When the MCU resumes from WFE, the peripheral interrupt pending bit and. the NVIC peripheral IRQ channel pending bit (in the NVIC interrupt clear pending register) must be cleared. Only NVIC interrupts with high enough priority can wake up and interrupt the MCU.
    - When SEVONPEND = 1 in the Cortex-M33 system control register
      By enabling an interrupt in the peripheral control register and optionally in the

NVIC. When the MCU resumes from WFE, the peripheral interrupt pending bit and when enabled the NVIC peripheral IRQ channel pending bit (in the NVIC interrupt clear pending register) must be cleared. All NVIC interrupts wake up the MCU, even the disabled ones. Only enabled NVIC interrupts with high enough priority can wake up and interrupt the MCU.

– an event:
  > Configuring an EXTI line in event mode. When the CPU resumes from WFE, it is not necessary to clear the EXTI peripheral interrupt pending bit or the NVIC IRQ channel pending bit, as the pending bits corresponding to the event line are not set. It may be necessary to clear the interrupt flag in the peripheral.

The MCU exits Standby mode through an external reset (NRST pin), an IWDG reset, a rising edge on one of the enabled WKUPx pins or a RTC/TAMP event (see *Figure 685: RTC block diagram*).

After waking up from Standby mode, the program execution restarts in the same way as after a reset (boot pin sampling, option bytes loading, reset vector is fetched).

Caution: When the device is in Stop mode, a peripheral interrupt powers on an internal oscillator. The corresponding NVIC interrupt channel must be enabled to allow the interrupt to exit the device from Stop mode. It is not allowed to disable a peripheral interrupt by disabling only the NVIC channel while keeping the peripheral interrupt enable, as the device could remain in Stop mode with clock ON.

10.8.4 Sleep mode

I/O states in Sleep mode

In Sleep mode, all I/O pins keep the same state as in Run mode.

Entering the Sleep mode

The MCU enters the Sleep mode as described in *Entering a low-power mode*, when the SLEEPDEEP bit in the Cortex-M33 system control register is cleared (see the table below for details on how to enter the Sleep mode).

Exiting the Sleep mode

The MCU exits the Sleep mode as described in *Exiting a low-power mode* (see the table below for details on how to exit the Sleep mode).

Table 109. Sleep mode

Sleep mode	Description
Mode entry	WFI (wait for interrupt) or WFE (wait for event) while: – SLEEPDEEP = 0 – No interrupt (for WFI) or event (for WFE) pending Refer to the Cortex-M33 system control register.
	On return from ISR while: – SLEEPDEEP = 0 and – SLEEPONEXIT = 1 – No interrupt pending Refer to the Cortex-M33 system control register.
Mode exit	If WFI or Return from ISR was used for entry Interrupt (see *Table 152: STM32H562/563/573xx vector table*) If WFE was used for entry and SEVONPEND = 0: Wake-up event (see *Section 18.4: EXTI functional description*) If WFE was used for entry and SEVONPEND = 1: Interrupt even when disabled in NVIC (see *Table 152: STM32H562/563/573xx vector table*) or wake-up event (see *Section 18.4: EXTI functional description*)
Wake-up latency	None

10.8.5 Stop mode

The Stop mode is based on the Cortex-M33 Deepsleep mode combined with the peripheral clock gating. The voltage regulator is configured by SVOSx bits (the selected SVOS4 and SVOS5 levels add an additional startup delay when exiting from system Stop mode). In Stop mode, all clocks in the core domain are stopped. The PLL, HSI, HSI48, CSI and HSE oscillators are disabled.

It is possible to keep the HSI or CSI clock enabled during Stop mode, to be quickly available as kernel clock for peripherals.

All SRAMs and register contents are preserved, but the SRAMs can be totally or partially switched off to further reduced consumption. The user can select which memory is discarded during Stop mode by means of xxSO bits in PWR_PMCR registers.

Table 110. Memory shut-off block selection

Selection bit	Shut-off block in Stop mode	STM32H523/533xx	STM32H562/563/573xx	STM32H543/553xx
SRAM1SO	AHB SRAM1	X	X	X
SRAM2_48SO	AHB SRAM2 48-Kbyte	X	X	X
SRAM2_16SO	AHB SRAM2 16-Kbyte	-	X	-
SRAM2_16HSO	AHB SRAM2 16-Kbyte	X	-	X
SRAM2_16LSO	AHB SRAM2 16-Kbyte	X	-	X
SRAM3SO	AHB SRAM3	X	-	X
ETHERNETSO	ETHERNET RAM	-	X	X

The BOR is always available in Stop mode.

I/O states in Stop mode

In the Stop mode, all I/O pins keep the same state as in the Run mode.

Entering the Stop mode

The MCU enters the Stop mode as described in *Entering a low-power mode*, when the SLEEPDEEP bit in the Cortex-M33 system control register is set (see *Table 111* for details on how to enter the Stop mode).

If the flash memory programming is ongoing, the Stop mode entry is delayed until the memory access is finished.

If an access to the APB domain is ongoing, the Stop mode entry is delayed until the APB access is finished.

In Stop mode, the following features can be selected by programming the individual control bits:

- The independent watchdog (IWDG) is started by writing to its key register or by hardware option. Once started, it can be stopped only by a reset (see *Section 49.4: IWDG functional description*).
- The real-time clock (RTC) is configured by the RTCEN bit in the *RCC Backup domain control register (RCC_BDCR)*.
- The internal RC oscillator LSI clock is configured by the LSION bit in RCC_BDCR.
- The external 32.768 kHz oscillator (LSE) is configured by the LSEON bit in RCC_BDCR.

The AVD and the PVD can be used in Stop mode. If they are not needed, they must be disabled by software to save their power consumptions.

The ADCx (x = 1, 2, 3[a]), the DAC1 (two channels), the temperature sensor, and the VREFBUF can consume power during the Stop mode, unless they are disabled before entering this mode.

Exiting the Stop mode

The MCU exits Stop mode by enabling an EXTI interrupt or event depending on how the low-power mode was entered. Some peripherals are able to wake up the system (refer to *Table 157: EXTI line connections*) from Stop mode, this is only possible when SVOS3 is selected before entering Stop mode.

Note: When wake-up from Stop with peripherals is needed, SVOS3 must be selected.

When exiting Stop mode by issuing an interrupt or a wake-up event, CSI is selected as system clock if bit STOPWUCK is set in RCC clock configuration register 1 (RCC_CFGR). The HSI oscillator is selected as system clock if STOPWUCK is cleared. The wake-up time is shorter when CSI is selected as wake-up system clock. The HSI selection allows a wake-up at higher frequency (up to 64 MHz).

The MCU exits Stop mode by enabling an EXTI interrupt or event depending on how the low-power mode was entered.

a. Only available on STM32H543/553xx devices.

When exiting the Stop mode, the MCU is in Run mode, VOS3.

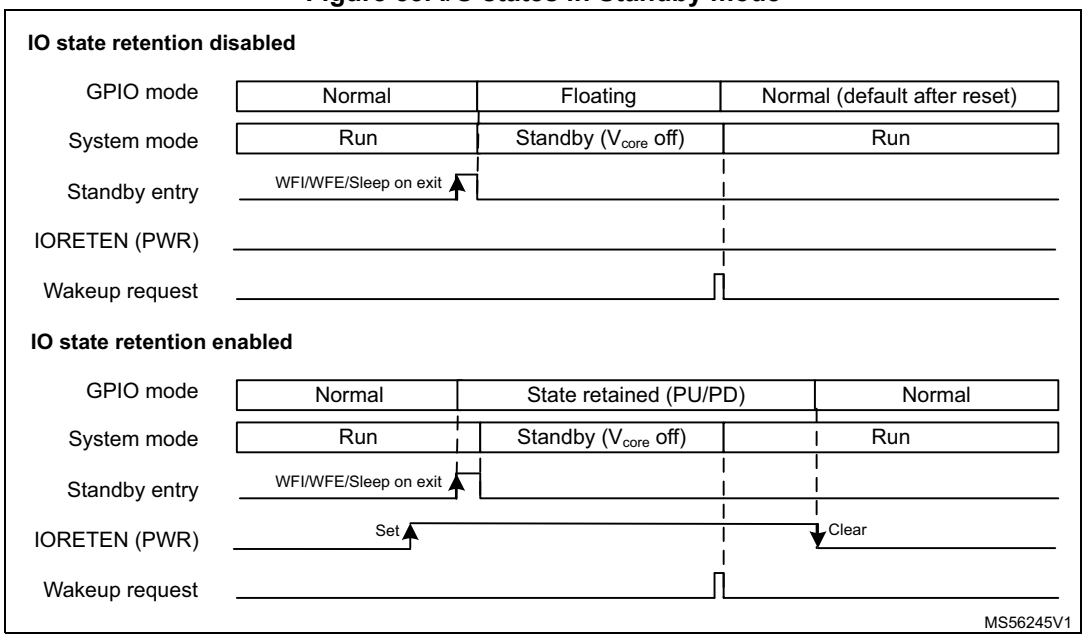
Table 111. Stop mode

Stop mode	Description
Mode entry	WFI (wait for interrupt) or WFE (wait for event) while: – SLEEPDEEP bit is set in Cortex-M33 system control register – No interrupt (for WFI) or event (for WFE) pending – LPMS = 0 in PWR_PMCR
	On Return from ISR while: – SLEEPDEEP bit is set in Cortex-M33 system control register – SLEEPONEXIT = 1 – No interrupt pending – LPMS = 0 in PWR_PMCR
	Note: To enter Stop mode, all EXTI line pending bits (in the EXTI rising edge pending register 2 (EXTI_RPR2)), and the peripheral flags generating wake-up interrupts must be cleared. Otherwise, the Stop mode entry procedure is ignored and the program execution continues.
Mode exit	If WFI or Return from ISR was used for entry: - any EXTI line configured in interrupt mode (the corresponding EXTI interrupt vector must be enabled in the NVIC). The interrupt source can be external interrupts or peripherals with wake-up capability (see *Table 152: STM32H562/563/573xx vector table*). - any peripheral interrupt occurring when the AHB/APB clocks are present due to an autonomous peripheral clock request (the peripheral vector must be enabled in the NVIC) If WFE was used for entry and SEVONPEND = 0: - any EXTI line configured in event mode (see *Section 18.4: EXTI functional description*). If WFE was used for entry and SEVONPEND = 1: - any EXTI line configured in interrupt mode (even if the corresponding EXTI interrupt vector is disabled in the NVIC). The interrupt source can be external interrupts or peripherals with wake-up capability (see *Table 152: STM32H562/563/573xx vector table*). - any EXTI line is configured in event mode (see *Section 18.4: EXTI functional description*)
	Note: All peripheral clocks must be enabled to allow this peripheral to generate a wake-up from Stop interrupt ([PERIPH]EN and [PERIPH]LPEN bits must be set in the RCC, and a functional independent clock must be selected).
Wake-up latency	Longest wake-up time between: HSI or CSI wake-up time and flash memory wake-up time from Stop mode.

10.8.6 Standby mode

The lowest power mode in which the BOR is active is the Standby mode. It is based on the Cortex-M33 Deepsleep mode, with the voltage regulators disabled. The PLL, HSI, HSI48, CSI, and HSE oscillators are also switched off.

The SRAMs and register contents are lost except for registers in the Backup domain and Standby circuitry (see *Figure 42* and *Figure 43*).



The BOR is always available in Standby mode.

I/O states in Standby mode

In the Standby mode, the I/Os are by default in floating state. If the IORETEN bit in the PWR_IORETR register is set, the I/Os output state is retained. I/O retention mode is enabled for all I/Os except those supporting the standby functionality and JTAG I/Os (PA13, PA14, PA15, and PB4). When entering into Standby mode, the state of the output is sampled, and pull-up or pull-down resistor are set to maintain the I/O output during Standby mode.

If the JTAGIORETEN bit in the PWR_IORETR register is set, the I/Os output state is retained. I/O retention mode is enabled for PA13, PA14, PA15, and PB4 (default JTAG pull-up/pull-down after wake-up is not enabled).

Figure 53. I/O states in Standby mode

After wake-up from Standby mode, as long as IORETEN (or JTAGIORETEN for JTAG I/Os) is set, the retained stated (pull-up/pull-down) remains applied.

The GPIO pin state before standby can be identified with GPIO_IDR register (when both GPIO port clock and input buffer are enabled).

The application can release the I/O state (clear the retained Pull-up/Pull-down) by clearing the IORETEN (or JTAGIORETEN for JTAG IOs) bit, before or after reconfiguring the GPIOs and related peripherals. The GPIOs can then be configured in a known state before releasing the retained state.

The RTC outputs on PC13 and PI8[(a)] are functional in Standby mode. PC14 and PC15 used for LSE are also functional. Eight wake-up (WKUPx, x = 1 to 8) and four RTC tamper pins are available.

a. Not available on all devices, check the datasheet.

Entering Standby mode

The MCU enters the Standby mode as described in *Entering a low-power mode*, when the SLEEPDEEP bit in the Cortex-M33 system control register is set (see *Table 112* for details on how to enter Standby mode).

In Standby mode, the following features can be selected by programming individual control bits:

- The independent watchdog (IWDG) is started by writing to its Key register or by hardware option. Once started, it can be stopped only by a reset (see *Section 49.4: IWDG functional description*).
- The real-time clock (RTC) is configured by the RTCEN bit in *RCC Backup domain control register (RCC_BDCR)*.
- The internal RC oscillator LSI clock, is configured by the LSION bit in RCC_BDCR.
- The external 32.768 kHz oscillator (LSE) is configured by the LSEON bit in RCC_BDCR.
- The I/Os retention is configured by the IORETEN bit in the PWR_IORETR register.

Exiting Standby mode

The MCU exits the Standby mode as described in *Exiting a low-power mode*. The SBF status flag in the *PWR status register (PWR_PMSR)* indicates that the MCU was in Standby mode. All registers are reset after wake-up from Standby except for *PWR Backup domain control register (PWR_BDCR)* and *PWR I/O retention register (PWR_IORETR)* *(see Table 112* for more details on how to exit Standby mode).

When exiting Standby mode, I/Os output state that were retained during Standby through IORETEN bit, keep this configuration upon exiting Standby mode until the IORETEN bit in PWR_IORETR register is cleared. Once IORETEN is cleared, the I/Os are configured to their reset values, or to the pull-up/pull-down state according to the GPIOx_PUPDR registers.

For I/Os, with a pull-up or pull-down predefined after reset (some JTAG/SWD I/Os), in case those pull-up or pull-down are different from the retained values during Standby, both a pull-down and pull-up are applied until IORETEN is cleared, releasing the retained value.

Also in case the GPIOx_PUPDR values programed after exiting from Standby are different from the retained values during Standby, both a pull-down and pull-up are applied until IORETEN is cleared, releasing the retained value.

Table 112. Standby mode

Standby mode	Description
Mode entry	WFI (wait for interrupt) or WFE (wait for event) while: – SLEEPDEEP bit is set in Cortex-M33 system control register – No interrupt (for WFI) or event (for WFE) pending – LPMS = 1 in PWR_PMCR – WUFx bits cleared in PWR_WUSR
	On Return from ISR while: – SLEEPDEEP bit is set in Cortex-M33 system control register – SLEEPONEXIT = 1 – No interrupt pending – LPMS = 1 in PWR_PMCR – WUFx bits cleared in PWR_WUSR – RTC/TAMP flags corresponding to the chosen wake-up source, cleared
Mode exit	WKUPx pin edge, RTC event, external Reset in NRST pin, IWDG Reset, BOR reset
Wake-up latency	Reset phase

10.8.7 Power modes output pins

In order to help the debug, three signals are available as device pins alternate functions:

- **CSLEEP**

  When set, CSLEEP indicates that the system is in Sleep mode: WFI or WFE has been executed.

  When cleared, CSLEEP indicates that the system is in Run mode.

- **CDSTOP**

  When set, CDSTOP indicates that the system is in CStop mode, meaning that the following conditions are fulfilled:

  – WFI or WFE has been executed with CPU SLEEPDEEP = 1.

  – No AHB/APB clock is running.

  When cleared, CDSTOP indicates that the system is not in CStop mode: AHB/APB clocks are running.

The table below explains the MCU power mode depending on these signals states.

Table 113. Power modes output states versus MCU power modes

CSLEEP	CSTOP	MCU power modes(1)
0	0	Run mode
1	0	Sleep mode or Stop mode, with AHB/APB clocks running
1	1	Stop mode

1. CSLEEP and CDSTOP are generated in core domain, consequently they are not driven in Standby mode.

10.9 PWR security and privileged protection

10.9.1 PWR security protection

When the TrustZone security is activated by the TZEN option byte in the flash memory option byte configuration register, some PWR register fields can be secured against nonsecure access.

The PWR TrustZone security allows the following features to be secured through the PWR_SECCFGR register:

- Low-power mode
- Wake-up (WKUP) pins
- Voltage detection and monitoring
- VBAT mode
- I/Os retention configuration

Other PWR configuration bits are secure when:

- The system clock selection is secure in RCC: the voltage scaling (VOS) configuration is secure.
- The UCPD1 is secure in the GTZC: the PWR_UCPDR register is secure.

Table 114 gives a summary of the PWR secured bits following the security configuration bit in PWR_SECCFGR.

A nonsecure access to a secure-protected register bit is denied:

- The secured bits are not written (WI) with a nonsecure write access.
- The secured bits are read as 0 (RAZ) with a nonsecure read access.

A nonsecure write access to PWR_SECCFGR is WI and generates an illegal access event and an interrupt if enabled in the GTZC. It can be read with a nonsecure read access.

When the TrustZone security is disabled (TZEN = 0xC3), PWR_SECCFGR is RAZ/WI and all other registers are nonsecure.

Table 114. PWR security configuration summary

Secure configuration register	Security configuration bit	Register name	Secured bits	Nonsecure access on secure bits
PWR_SECCFGR	Not applicable(1)	PWR_SECCFGR	All bits	Read OK. WI and illegal access event
PWR_SECCFGR	At least one bit is set	PWR_PRIVCFGR	SPRIV	Read OK. WI
PWR_SECCFGR	LPMSEC	PWR_PMCR	All bits	WI
PWR_SECCFGR	VUSBSEC	PWR_USBSCR	All bits	WI
PWR_SECCFGR	VBSEC	PWR_BDCR	All bits	WI
		PWR_DBPCR	All bits	WI
PWR_SECCFGR	RETSEC	PWR_IORETR	All bits	WI

Table 114. PWR security configuration summary (continued)

Secure configuration register	Security configuration bit	Register name	Secured bits	Nonsecure access on secure bits
PWR_SECCFGR	WUPxSEC (x = 1 to 8)	PWR_WUCR	WUPENx	RAZ/WI
			WUPPx	RAZ/WI
			WUPPUPD	RAZ/WI
		PWR_WUSCR	CWUFx	WI
GTZC_TZSC_SECCFGR	UCPD1SEC	PWR_UCPDR	All bits	RAZ/WI
RCC_SECCFGR	SYSCLKSEC	PWR_VOSCR	VOS[1:0]	RAZ/WI
RCC_SECCFGR	SCMSEC	PWR_SCCR	All bits	WI
RCC_SECCFGR	SCMSEC	PWR_VMCR	All bits	WI

1. PWR_SECCFGR is always secure.

10.9.2 PWR privileged protection

By default, after a reset, all registers can be read or written with both privileged and unprivileged accesses, except PWR_PRIVCFGR, which can be written only with privileged access. PWR_PRIVCFGR can be read by secure and non secure, privileged and unprivileged accesses.

The SPRIV bit in PWR_PRIVCFGR can be written only with secure privileged access. This bit configures the privileged access of all PWR secure functions (defined by PWR_SECCFGR, GTZC, RCC, or GPIO, as shown in *Table 114*).

When the SPRIV bit is set in PWR_PRIVCFGR:

- The PWR secure bits can be written only with privileged access, including PWR_SECCFGR.
- The PWR secure bits can be read only with privileged access except PWR_SECCFGR and PWR_PRIVCFGR that can be read by privileged or unprivileged access.
- An unprivileged access to a privileged PWR bit or register is discarded: the bits are read as 0 and the write to these bits is ignored (RAZ/WI).

The NSPRIV bit of PWR_PRIVCFGR can be written only with privileged access, secure or nonsecure. It configures the privileged access of all PWR securable functions configured as nonsecure (defined by PWR_SECCFGR, GTZC, RCC, or GPIO, see *Table 114*).

When the NSPRIV bit is set in PWR_PRIVCFGR:

- The PWR securable bits configured as nonsecure can be written only with privileged access.
- The PWR securable bits configured as nonsecure can be read only with privileged access except PWR_PRIVCFGR, which can be read by privileged or unprivileged accesses.
- The VOSRDY and BOOSTRDY bits in PWR_VOSR, PWR_SR, PWR_SVMSR, PWR_BDSR and PWR_WUSR can be read with privileged or unprivileged accesses.
- An unprivileged access to a privileged PWR bit or register is discarded: the bits are read as 0, and the write to these bits is ignored (RAZ/WI).

10.10 PWR interrupts

Table 115 gives a summary of the interrupt sources and the way to control them.

Table 115. PWR interrupt requests

Interrupt vector	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit Sleep, Stop modes	Exit Standby modes
PVD/AVD output	Programmable voltage detector through EXTI line 16	PVDO/AVDO	EXTI line 16 enabled	Write EXTI PIF16 = 1	Yes	No

10.11 PWR registers

The PWR registers can be accessed in word, half-word and byte format, unless otherwise specified.

10.11.1 PWR power mode control register (PWR_PMCR)

This register is protected against nonsecure access when LPMSEC = 1 in the PWR_SECCFGR register, and against unprivileged access when LPMSEC = 1 and SPRIV = 1 in the PWR_PRIVCFGR register, or when LPMSEC = 0 and NSPRIV = 1.

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **SRAM1SO**: AHB SRAM1 shut-off in Stop mode
0: AHB RAM1 content is kept in Stop mode.
1: AHB RAM1 content is lost in Stop mode.

Bit 25 **SRAM2_48SO**: AHB SRAM2 48-Kbyte shut-off in Stop mode.
0: AHB RAM2 48-Kbyte content is kept in Stop mode.
1: AHB RAM2 48-Kbyte content is lost in Stop mode.

Bit 24 **SRAM2_16SO**: AHB SRAM2 16-Kbyte shut-off in Stop mode.
0: AHB RAM2 16-Kbyte content is kept in Stop mode.
1: AHB RAM2 16-Kbyte content is lost in Stop mode.

Bit 23 **SRAM3SO**: AHB SRAM3 shut-off in Stop mode.
0: AHB RAM3 content is kept in Stop mode.
1: AHB RAM3 content is lost in Stop mode.

Bits 22:17 Reserved, must be kept at reset value.

Bit 16 **ETHERNETSO**: ETHERNET RAM shut-off in Stop mode.
0: ETHERNET RAM content is kept in Stop mode.
1: ETHERNET RAM content is lost in Stop mode.

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **AVD_READY**: analog voltage ready

This bit is used only when the analog switch boost must be enabled (see BOOSTE bit).
It must be set by software when the expected V_{DDA} analog supply level is available.
The correct analog supply level is indicated by the AVDO bit (PWR_VMSR register) after setting the AVDEN bit (PWR_VMCR register) and selecting the supply level to be monitored (ALS bits).
0: peripheral analog voltage V_{DDA} not ready (default)
1: peripheral analog voltage V_{DDA} ready.

Bit 12 **BOOSTE**: analog switch V_{BOOST} control

This bit enables the booster to guarantee the analog switch AC performance when the V_{DD} supply voltage is below 2.7 V (reduction of the total harmonic distortion to have the same switch performance over the full supply voltage range) The V_{DD} supply voltage can be monitored through the PVD and the PLS bits.
0: booster disabled (default)
1: booster enabled if analog voltage ready (AVD_READY = 1)

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **FLPS**: flash memory low-power mode in Stop mode

This bit is used to obtain the best trade-off between low-power consumption and restart time when exiting from Stop mode.
When it is set, the flash memory enters low-power mode when the system is in Stop mode.
0: flash memory remains in normal mode when the system enters Stop mode (quick restart time).
1: flash memory enters low-power mode when the system enters Stop mode (low-power consumption).

Note: When system enters Stop mode with SVOS5 enabled, flash memory is automatically forced in low-power mode.

Bit 8 Reserved, must be kept at reset value.

Bit 7 **CSSF**: clear Standby and Stop flags (always read as 0)

This bit is cleared to 0 by hardware.
0: no effect
1: STOPF and SBF flags cleared

Bits 6:4 Reserved, must be kept at reset value.

Bits 3:2 **SVOS[1:0]**: system Stop mode voltage scaling selection

These bits control the V_{CORE} voltage level in system Stop mode, to obtain the best trade-off between power consumption and performance.
00: reserved
01: SVOS5 scale 5
10: SVOS4 scale 4
11: SVOS3 scale 3 (default)

Bit 1 Reserved, must be kept at reset value.

Bit 0 **LPMS**: low-power mode selection

This bit defines the Deepsleep mode.
0: keeps Stop mode when entering DeepSleep.
1: allows Standby mode when entering DeepSleep.

10.11.2 PWR power mode control register [alternate] (PWR_PMCR)

This register is protected against nonsecure access when LPMSEC = 1 in the PWR_SECCFGR register, and against unprivileged access when LPMSEC = 1 and SPRIV = 1 in the PWR_PRIVCFGR register, or when LPMSEC = 0 and NSPRIV = 1.

0: AHB RA.M1 content is kept in Stop mode.
1: AHB RAM1 content is lost in Stop mode.

Bit 26 **SRAM2_48SO**: AHB SRAM2 48-Kbyte shut-off in Stop mode.
0: AHB RAM2 48-Kbyte content is kept in Stop mode.
1: AHB RAM2 48-Kbyte content is lost in Stop mode.

Bit 25 **SRAM2_16HSO**: AHB SRAM2 high 16-Kbyte shut-off in Stop mode.
0: AHB RAM2 high 16-Kbyte content is kept in Stop mode.
1: AHB RAM2]high16-Kbyte content is lost in Stop mode.

Bit 24 **SRAM2_16LSO**: AHB SRAM2 low 16-Kbyte shut-off in Stop mode.
0: AHB RAM2 low 16-Kbyte content is kept in Stop mode.
1: AHB RAM2 low 16-Kbyte content is lost in Stop mode.

Bit 23 **SRAM3SO**: AHB SRAM3 shut-off in Stop mode.
0: AHB RAM3 content is kept in Stop mode.
1: AHB RAM3 content is lost in Stop mode.

Bits 22:14 Reserved, must be kept at reset value.

Bit 13 **AVD_READY**: analog voltage ready
This bit is used only when the analog switch boost must be enabled (see BOOSTE bit).
It must be set by software when the expected V_{DDA} analog supply level is available.
The correct analog supply level is indicated by the AVDO bit (PWR_VMSR register) after setting the AVDEN bit (PWR_VMCR register) and selecting the supply level to be monitored (ALS bits).
0: peripheral analog voltage V_{DDA} not ready (default)
1: peripheral analog voltage V_{DDA} ready.

Bit 12 **BOOSTE**: analog switch V_{BOOST} control

This bit enables the booster to guarantee the analog switch AC performance when the V_{DD} supply voltage is below 2.7 V (reduction of the total harmonic distortion to have the same switch performance over the full supply voltage range) The V_{DD} supply voltage can be monitored through the PVD and the PLS bits.

0: booster disabled (default)

1: booster enabled if analog voltage ready (AVD_READY = 1)

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **FLPS**: flash memory low-power mode in Stop mode

This bit is used to obtain the best trade-off between low-power consumption and restart time when exiting from Stop mode.

When it is set, the flash memory enters low-power mode when the system is in Stop mode.

0: flash memory remains in normal mode when the system enters Stop mode (quick restart time).

1: flash memory enters low-power mode when the system enters Stop mode (low-power consumption).

Note: When system enters Stop mode with SVOS5 enabled, flash memory is automatically forced in low-power mode.

Bit 8 Reserved, must be kept at reset value.

Bit 7 **CSSF**: clear Standby and Stop flags (always read as 0)

This bit is cleared to 0 by hardware.

0: no effect

1: STOPF and SBF flags cleared

Bits 6:4 Reserved, must be kept at reset value.

Bits 3:2 **SVOS[1:0]**: system Stop mode voltage scaling selection

These bits control the V_{CORE} voltage level in system Stop mode, to obtain the best trade-off between power consumption and performance.

00: reserved

01: SVOS5 scale 5

10: SVOS4 scale 4

11: SVOS3 scale 3 (default)

Bit 1 Reserved, must be kept at reset value.

Bit 0 **LPMS**: low-power mode selection

This bit defines the Deepsleep mode.

0: keeps Stop mode when entering DeepSleep.

1: allows Standby mode when entering DeepSleep.

10.11.3 PWR power mode control register [alternate] (PWR_PMCR)

This register is protected against nonsecure access when LPMSEC = 1 in the PWR_SECCFGR register, and against unprivileged access when LPMSEC = 1 and SPRIV = 1 in the PWR_PRIVCFGR register, or when LPMSEC = 0 and NSPRIV = 1.

0: ETHERNET RAM content is kept in Stop mode.
1: ETHERNET RAM content is lost in Stop mode.

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **AVD_READY**: analog voltage ready

This bit is used only when the analog switch boost must be enabled (see BOOSTE bit).
It must be set by software when the expected V_{DDA} analog supply level is available.
The correct analog supply level is indicated by the AVDO bit (PWR_VMSR register) after setting the AVDEN bit (PWR_VMCR register) and selecting the supply level to be monitored (ALS bits).
0: peripheral analog voltage V_{DDA} not ready (default)
1: peripheral analog voltage V_{DDA} ready.

Bit 12 **BOOSTE**: analog switch V_{BOOST} control

This bit enables the booster to guarantee the analog switch AC performance when the V_{DD} supply voltage is below 2.7 V (reduction of the total harmonic distortion to have the same switch performance over the full supply voltage range) The V_{DD} supply voltage can be monitored through the PVD and the PLS bits.
0: booster disabled (default)
1: booster enabled if analog voltage ready (AVD_READY = 1)

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **FLPS**: flash memory low-power mode in Stop mode

This bit is used to obtain the best trade-off between low-power consumption and restart time when exiting from Stop mode.
When it is set, the flash memory enters low-power mode when the system is in Stop mode.
0: flash memory remains in normal mode when the system enters Stop mode (quick restart time).
1: flash memory enters low-power mode when the system enters Stop mode (low-power consumption).

Note: When system enters Stop mode with SVOS5 enabled, flash memory is automatically forced in low-power mode.

Bit 8 Reserved, must be kept at reset value.

Bit 7 **CSSF**: clear Standby and Stop flags (always read as 0)

This bit is cleared to 0 by hardware.
0: no effect
1: STOPF and SBF flags cleared

Bits 6:4 Reserved, must be kept at reset value.

Bits 3:2 **SVOS[1:0]**: system Stop mode voltage scaling selection

These bits control the V_{CORE} voltage level in system Stop mode, to obtain the best trade-off between power consumption and performance.
00: reserved
01: SVOS5 scale 5
10: SVOS4 scale 4
11: SVOS3 scale 3 (default)

Bit 1 Reserved, must be kept at reset value.

Bit 0 **LPMS**: low-power mode selection

This bit defines the Deepsleep mode.
0: keeps Stop mode when entering DeepSleep.
1: allows Standby mode when entering DeepSleep.

10.11.4 PWR status register (PWR_PMSR)

Address offset: 0x004

Reset value: 0x0000 0000

									r	r					

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **SBF**: System standby flag

This bit is set by hardware and cleared only by a POR or by setting the CSSF bit.

0: system has not been in Standby mode.

1: system has been in Standby mode.

Bit 5 **STOPF**: Stop flag

This bit is set by hardware and cleared only by any reset or by setting the CSSF bit.

0: system has not been in Stop mode.

1: system has been in Stop mode.

Bits 4:0 Reserved, must be kept at reset value.

10.11.5 PWR voltage scaling control register (PWR_VOSCR)

Some register fields are protected against nonsecure access, depending on RCC_SECCFGR register. These fields can be protected against unprivileged access, depending on PWR_PRIVCFGR register configuration.

Address offset: 0x0010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VOS[1:0]		Res.	Res.	Res.	Res.
										rw	rw				

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:4 **VOS[1:0]**: voltage scaling selection according to performance

These bits control the V_{CORE} voltage level and allow to obtain the best trade-off between power consumption and performance:

- In bypass mode, these bits must also be set according to the external provided core voltage level and related performance.
- When increasing the performance, the voltage scaling must be changed before increasing the system frequency.
- When decreasing performance, the system frequency must first be decreased before changing the voltage scaling.

00: scale 3 (default)

01: scale 2

10: scale 1

11: scale 0

Bits 3:0 Reserved, must be kept at reset value.

10.11.6 PWR voltage scaling status register (PWR_VOSSR)

Address offset: 0x0014

Reset value: 0x0000 2008

r	r	r										r			

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:14 **ACTVOS[1:0]**: voltage output scaling currently applied to V_{CORE}

This bit provides the last VOS value.

00: VOS3 (lowest power)

01: VOS2

10: VOS1

11: VOS0 (highest frequency)

Bit 13 **ACTVOSRDY**: Voltage level ready for currently used VOS

0: V_{CORE} is above or below the current voltage scaling provided by ACTVOS[1:0]

1: V_{CORE} is equal to the current voltage scaling provided by ACTVOS[1:0]

Bits 12:4 Reserved, must be kept at reset value.

Bit 3 **VOSRDY**: Ready bit for V_{CORE} voltage scaling output selection.

0: Not ready, voltage level below VOS selected level

1: Ready, voltage level at or above VOS selected level

Note: The VOSRDY flag must be used only when switching from low to high-voltage scale (like switching from VOS3 to VOS0).

Bits 2:0 Reserved, must be kept at reset value.

10.11.7 PWR Backup domain control register (PWR_BDCR)

This register is protected against nonsecure access when VBSEC = 1 in the PWR_SECCFGR register, and against unprivileged access when VBSEC = 1 and SPRIV = 1 in the PWR_PRIVCFGR register, or when VBSEC = 0 and NSPRIV = 1.

This register is not reset by wake-up from Standby mode, RESET signal and VDD POR. It is reset only by V_{SW} POR and VSWRST reset. This register must not be accessed when VSWRST bit in RCC_BDCR register resets the V_{SW} domain.

MONEN and BREN bits must not be accessed when VSWRST bit in RCC_BDCR register resets the V_{SW} domain. After reset, MONEN and BREN of this register are write-protected. Prior to modifying their content, the DBP bit in PWR_DBPCR register must be set to disable the write protection.

Address offset:0x20

Power-on reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	VBRS	VBE	Res.	Res.	Res.	Res.	Res.	Res.	MONEN	BREN
						rw	rw							rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **VBRS**: V_{BAT} charging resistor selection
0: Charge V_{BAT} through a 5 kΩ resistor.
1: Charge V_{BAT} through a 1.5 kΩ resistor.

Bit 8 **VBE**: V_{BAT} charging enable
0: V_{BAT} battery charging disabled.
1: V_{BAT} battery charging enabled.
Note: Reset only by POR.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **MONEN**: Backup domain voltage and temperature monitoring enable
0: Backup domain voltage and temperature monitoring disabled
1: Backup domain voltage and temperature monitoring enabled

Bit 0 **BREN**: Backup RAM retention in Standby and V_{BAT} modes
When this bit set, the backup regulator (used to maintain the backup RAM content in Standby and V_{BAT} modes) is enabled.
If BREN is cleared, the backup regulator is switched off. The backup RAM can still be used in Run and Stop modes. However its content is lost in Standby and V_{BAT} modes.
If BREN is set, the application must wait till the backup regulator ready flag (BRRDY) is set to indicate that the data written into the SRAM is maintained in Standby and V_{BAT} modes.
0: Backup RAM content lost in Standby and V_{BAT} modes.
1: Backup RAM content preserved in Standby and V_{BAT} modes

10.11.8 PWR Backup domain control register (PWR_DBPCR)

This register is protected against nonsecure access when VBSEC = 1 in the PWR_SECCFGR register, and against unprivileged access when VBSEC = 1 and SPRIV = 1 in the PWR_PRIVCFGR register, or when VBSEC = 0 and NSPRIV = 1.

Address offset: 0x24

Reset value: 0x0000 0000

															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **DBP**: Disable Backup domain write protection

In reset state, all registers and SRAM in Backup domain are protected against parasitic write access. This bit must be set to enable write access to these registers.

0: Write access to Backup domain disabled

1: Write access to Backup domain enabled

10.11.9 PWR Backup domain status register (PWR_BDSR)

This register is not reset by wake-up from Standby mode, RESET signal and VDD POR. It is reset only by V_{SW} POR and VSWRST reset.

Address offset: 0x028

Reset value: 0x0000 0000

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **TEMPH**: temperature level monitoring versus high threshold

0: temperature below high threshold level

1: temperature equal or above high threshold level

Bit 22 **TEMPL**: temperature level monitoring versus low threshold

0: temperature above low threshold level

1: temperature equal or below low threshold level

Bit 21 **VBATH**: V_{BAT} level monitoring versus high threshold

0: V_{BAT} level below high threshold level

1: V_{BAT} level equal or above high threshold level

Bit 20 **VBATL**: V_{BAT} level monitoring versus low threshold
0: V_{BAT} level above low threshold level
1: V_{BAT} level equal or below low threshold level

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **BRRDY**: backup regulator ready
This bit is set by hardware to indicate that the backup regulator is ready.
0: backup regulator not ready
1: backup regulator ready

Bits 15:0 Reserved, must be kept at reset value.

10.11.10 PWR USB Type-C power delivery register (PWR_UCPDR)

This register is protected against nonsecure access when UCPD1SEC = 1 in the TZSC_SECCFGR register, and against unprivileged access when UCPD1SEC = 1 and SPRIV = 1 in the PWR_PRIVCFGR register, or when UCPD1SEC = 0 and NSPRIV = 1.

Address offset: 0x02C

Reset value: 0x0000 0000

Not affected by exit Standby mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UCPD_STBY	UCPD_DBDIS
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **UCPD_STBY**: USB Type-c and Power delivery Standby mode
When set, this bit is used to memorize the UCPD configuration in Standby mode. This bit must be written to 1 just before entering Standby mode when using UCPD, and it must be written to 0 after exiting the standby mode and before writing any UCPD register.

Bit 0 **UCPD_DBDIS**: USB Type-C and power delivery dead battery disable
After exiting reset, the USB Type-C “dead battery” behavior is enabled, which may have a pull-down effect on CC1 and CC2 pins. It is recommended to disable it in all case, either to stop this pull-down or to hand over control to the UCPD (which should therefore be initialized before doing the disable).
0: Enable USB Type-C dead battery pull-down behavior on UCPDx_CC1 and UCPDx_CC2 pins.
1: Disable USB Type-C dead battery pull-down behavior on UCPDx_CC1 and UCPDx_CC2 pins.

10.11.11 PWR supply configuration control register (PWR_SCCR)

This register is protected against nonsecure access when SCMSEC = 1 in the PWR_SECCFGR register, and against unprivileged access when SCMSEC = 1 and SPRIV = 1 in the PWR_PRIVCFGR register, or when SCMSEC = 0 and NSPRIV = 1.

Address offset: 0x030

Reset value: 0x0000 0X00 (STM32H562/563/573xx devices)

Reset value: 0x0000 0100 (STM32H523/533/543/553xx devices)

The reset value of this register changes according to the package. Bits 9 and 8 indicate the power configuration. Their values are exclusive.

Reset by POR only, not reset by wake-up from Standby mode and RESET pad. The BYPASS bit of this register is written once after POR. Written-once mechanism locks the register and any further write access is ignored. The system must be power cycled before writing a new value.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	SMPS EN	LDO EN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BYPASS
						r	r								rwo

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **SMPSEN**: SMPS enable

The value is set by hardware when the package uses the SMPS regulator.

Note: Check the actual availability of this bit on the datasheet. If not available, consider it as reserved, and keep it at reset value.

Bit 8 **LDOEN**: LDO enable

The value is set by hardware when the package uses the LDO regulator.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **BYPASS**: power management unit bypass

0: Power management unit normal operation. Use the internal regulator.

1: Power management unit bypassed. Use the external power (voltage monitoring still active)

10.11.12 PWR voltage monitor control register (PWR_VMCR)

This register is protected against nonsecure access when SCMSEC = 1 in the PWR_SECCFGR register, and against unprivileged access when SCMSEC = 1 and SPRIV = 1 in the PWR_PRIVCFGR register, or when SCMSEC = 0 and NSPRIV = 1.

The PVDE and PLS bits are protected by lock mechanism. The lock control is in the SBS module controlled by PVDL bit in SBS_CFGR2 register. By default, the PVDE and PLS are unlocked.

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

					rw	rw	rw					rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:9 **ALS[1:0]**: analog voltage detector (AVD) level selection
These bits select the analog voltage detector (AVD) thresholds.
00: AVD level0 (V_{AVD0} ~ 1.7 V)
01: AVD level1 (V_{AVD1} ~ 2.1 V)
10: AVD level2 (V_{AVD2} ~ 2.5 V)
11: AVD level3 (V_{AVD3} ~ 2.8 V)

Bit 8 **AVDEN**: peripheral voltage monitor on V_{DDA} enable
0: peripheral voltage monitor on V_{DDA} disabled
1: peripheral voltage monitor on V_{DDA} enabled

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:1 **PLS[2:0]**: programmable voltage detector (PVD) level selection
These bits select the programmable voltage detector (PVD) thresholds.
000: PVD level0 (VPVD0 ~ 1.95 V)
001: PVD level1 (VPVD1 ~ 2.10 V)
010: PVD level2 (VPVD2 ~ 2.25 V)
011: PVD level3 (VPVD3 ~ 2.40 V)
100: PVD level4 (VPVD4 ~ 2.55 V)
101: PVD level5 (VPVD5 ~ 2.70 V)
110: PVD level6 (VPVD6 ~ 2.85 V)
111: PVD_IN pin

Bit 0 **PVDE**: PVD enable
0: PVD disabled
1: PVD enabled

10.11.13 PWR USB supply control register (PWR_USBSCR)

This register is protected against nonsecure access when VUSBSEC = 1 in the PWR_SECCFGR register, and against unprivileged access when VUSBSEC = 1 and SPRIV = 1 in the PWR_PRIVCFGR register, or when VUSBSEC = 0 and NSPRIV = 1.

Address offset: 0x038

Reset value: 0x0000 0000

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **USB33SV:** independent USB supply valid

This bit is used to validate the V_{DDUSB} supply for electrical and logical isolation purpose. Setting this bit is mandatory to use the USBFS peripheral. If V_{DDUSB} is not always present in the application, the V_{DDUSB} voltage monitor can be used to determine whether this supply is ready or not.

0: V_{DDUSB} is not present. Logical and electrical isolation is applied to ignore this supply.

1: V_{DDUSB} is valid.

Bit 24 **USB33DEN**: V_{DDUSB} voltage level detector enable

0: V_{DDUSB} voltage level detector disabled

1: V_{DDUSB} voltage level detector enabled

Bits 23:0 Reserved, must be kept at reset value.

10.11.14 PWR voltage monitor status register (PWR_VMSR)

Address offset: 0x03C

Reset value: 0x00X0 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **USB33RDY**: V_{DDUSB} ready

0: V_{DDUSB} is below the threshold of the V_{DDUSB} voltage monitor.

1: V_{DDUSB} is equal or above the threshold of the V_{DDUSB} voltage monitor.

Bit 23 Reserved, must be kept at reset value.

Bit 22 **PVDO**: programmable voltage detect output

This bit is set and cleared by hardware. It is valid only if the PVD has been enabled by the PVDE bit.

0: V_{DD} is equal or higher than the PVD threshold selected through the PLS[2:0] bits.

1: V_{DD} is lower than the PVD threshold selected through the PLS[2:0] bits.

Note: Since the PVD is disabled in Standby mode, this bit is equal to 0 after Standby or reset until the PVDE bit is set.

Bit 21 Reserved, must be kept at reset value.

Bit 20 **VDDIO2RDY**: voltage detector output on V_{DDIO2}

This bit is set and cleared by hardware.

0: V_{DDIO2} is below 1.2 V.

1: V_{DDIO2} is above or equal to 1.2 V.

Bit 19 **AVDO**: analog voltage detector output on V_{DDA}

This bit is set and cleared by hardware. It is valid only if AVD on VDDA is enabled by the AVDEN bit.

0: V_{DDA} is equal or higher than the AVD threshold selected with the ALS[2:0] bits.

1: V_{DDA} is lower than the AVD threshold selected with the ALS[2:0] bits.

Note: Since the AVD is disabled in Standby mode, this bit is equal to 0 after standby or reset until the AVDEN bit is set.

Bits 18:0 Reserved, must be kept at reset value.

10.11.15 PWR wake-up status clear register (PWR_WUSCR)

Each register bit CWUFx (x = 1 to 8) is protected against nonsecure access when WUPxSEC = 1 in the PWR_SECCFGR register, and against unprivileged access when WUPxSEC = 1 in PWR_SECCFGR and SPRIV = 1 in PWR_PRIVCFGR, or when WUPxSEC = 0 and NSPRIV = 1.

Address offset: 0x040

Reset value: 0x0000 0000

								w	w	w	w	w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **CWUFx**: clear wake-up pin flag for WUFx (x = 8 to 1)

These bits are always read as 0.

0: no effect

1: writing 1 clears the WUFx wake-up pin flag (bit is cleared to 0 by hardware).

10.11.16 PWR wake-up status register (PWR_WUSR)

Address offset: 0x044

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **WUFx**: wake-up pin WUFx flag (x = 8 to 1)

This bit is set by hardware and cleared only by a RESET pin or by setting the CWUFx bit in PWR_WUSCR register.

0: no wake-up event occurred.

1: wake-up event received from WUFx pin.

10.11.17 PWR wake-up configuration register (PWR_WUCR)

Each WUPPUPDx (x = 1 to 8), WUPPx (x = 1 to 8), and WUPENx (x = 1 to 8) bit is protected against nonsecure access when WUPxSEC = 1 (x = 1 to 8) in the PWR_SECCFGR register. Each WUPENx bit is protected against unprivileged access when WUPxSEC = 1 in PWR_SECCFGR and SPRIV = 1 in PWR_PRIVCFGR, or when WUPxSEC = 0 and NSPRIV = 1.

Address offset: 0x048

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
WUPPUPD8[1:0]		WUPPUPD7[1:0]		WUPPUPD6[1:0]		WUPPUPD5[1:0]		WUPPUPD4[1:0]		WUPPUPD3[1:0]		WUPPUPD2[1:0]		WUPPUPD1[1:0]	
rw	rw	rw	rw	rw	rw	rw	w	rw	rw	rw	rw	rw	rw	rw	rw

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **WUPPUPDx[1:0]**: wake-up pin pull configuration for WKUPx (x = 8 to 1)

These bits define the I/O pad pull configuration used when WUPENx = 1. The associated GPIO port pull configuration must be set to the same value or to 00. The wake-up pin pull configuration is kept in Standby mode.

00: no pull-up

01: pull-up

10: pull-down

11: reserved

Bits 15:8 **WUPPx**: wake-up pin polarity bit for WUPx (x = 8 to 1)

These bits define the polarity used for event detection on WUPx external wake-up pin.

0: detection on high level (rising edge)

1: detection on low level (falling edge)

Bits 7:0 **WUPENx**: enable wake-up pin WUPx (x = 8 to 1)

These bits are set and cleared by software.

0: an event on WUPx pin does not wake-up the system from Standby mode.

1: a rising or falling edge on WUPx pin wakes up the system from Standby mode.

Note: An additional wake-up event is detected if WUPx pin is enabled (by setting the WUPENx bit) when WUPx pin level is already high when WUPPx selects rising edge, or low when WUPPx selects falling edge.

10.11.18 PWR I/O retention register (PWR_IORETR)

This register is protected against nonsecure access when RETSEC = 1 in the PWR_SECCFGR register, and against unprivileged access when RETBSEC = 1 and SPRIV = 1 in the PWR_PRIVCFGR register, or when RETSEC = 0 and NSPRIV = 1.

Address offset: 0x050

Reset value: 0x0000 0000

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IORETEN
															rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **JTAGIORETEN**: IO retention enable for JTAG IOs

0: IO Retention mode is disabled.

1: IO Retention mode is enabling for PA13, PA14, PA15, and PB4.

when entering into standby mode, the output is sampled, and apply to the output IO during the standby power mode

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **IORETEN**: IO retention enable

0: IO Retention mode is disabled.

1: IO Retention mode is enabling for all IO except the IO support the standby functionality and PA13, PA14, PA15, and PB4.

When entering into standby mode, the output is sampled, and apply to the output IO during the standby power mode.

Note: The IO state is not retained if the DBG_STANDBY bit is set in DBGMCU_CR register.

10.11.19 PWR security configuration register (PWR_SECCFGR)

This register can be written only when the access is secure. It can be read by secure or nonsecure access. The register is write-protected against unprivileged write access when SPRIV = 1 in the PWR_PRIVCFGR.

Address offset: 0x100

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw				rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **VUSBSEC**: voltage USB secure protection

0: PWR_USBSCR can be read and written with secure or nonsecure access.

1: PWR_USBSCR can be read and written only with secure access..

Bit 14 **VBSEC**: Backup domain secure protection
0: PWR_BDCR, PWR_DBPCR can be read and written with secure or nonsecure access.
1: PWR_BDCR, PWR_DBPCR can be read and written only with secure access.

Bit 13 **SCMSEC**: supply configuration and monitoring secure protection.
0: PWR_SCCR and PWR_VMCR can be read and written with secure or nonsecure access.
1: PWR_SCCR and PWR_VMCR can be read and written only with secure access.

Bit 12 **LPMSEC**: low-power modes secure protection
0: PWR_PMCR can be read and written with secure or nonsecure access.
1: PWR_PMCR can be read and written only with secure access.

Bit 11 **RETSEC**: retention secure protection
0: PWR_IORETR can be read and written with secure or nonsecure access.
1: PWR_IORETR can be read and written only with secure access.

Bits 10:8 Reserved, must be kept at reset value.

Bits 7:0 **WUPxSEC**: WUPx secure protection (x = 8 to 1)
0: The bits related to the WKUPx wake-up pin in PWR_WUSCR and PWR_WUCR can be read and written with secure or nonsecure access.
1: The bits related to the WKUPx wake-up pin in PWR_WUSCR and PWR_WUCR can be read and written only with secure access.

10.11.20 PWR privilege configuration register (PWR_PRIVCFGR)

This register can be written only when the access is privileged. It can be read by privileged or unprivileged access.

Address offset: 0x104

Reset value: 0x0000 0000

														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **NSPRIV**: PWR nonsecure functions privilege configuration
Set and reset by software. This bit can be written only by privileged access, secure or nonsecure.
0: Read and write to PWR nonsecure functions can be done by privileged or unprivileged access.
1: Read and write to PWR nonsecure functions can be done by privileged access only.

Bit 0 **SPRIV**: PWR secure functions privilege configuration
Set and reset by software. This bit can be written only by a secure privileged access.
0: Read and write to PWR secure functions can be done by privileged or unprivileged access.
1: Read and write to PWR secure functions can be done by privileged access only.

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

11 Reset and clock control (RCC)

11.1 RCC introduction

The reset and clock control (RCC) manages the different resets, and generates the clocks for the bus and peripherals.

11.2 RCC pins and internal signals

Table 117 lists the RCC inputs and output signals connected to package pins or balls.

Table 117. RCC input/output signals connected to package pins or balls

Signal name	Signal type	Description
NRST	I/O	System reset, can be used to provide reset to external devices
OSC32_IN	I	32 kHz oscillator input
OSC32_OUT	O	32 kHz oscillator output
OSC_IN	I	System oscillator input
OSC_OUT	O	System oscillator output
MCO	O	Output clock for external devices
LSCO	O	Low-speed output clock for external devices
AUDIOCLK	I	External kernel clock input for SAI1, SAI2, I2S1, I2S2, and I2S3

11.3 RCC reset functional description

There are three types of reset:

- a system reset
- a power reset
- a Backup domain reset

11.3.1 Power reset

A power reset is generated when one of the following events occurs:

- a brownout reset (BOR)
- when exiting Standby mode

A brownout reset, including power-on or power-down reset (POR/PDR), sets all registers to their reset values except the ones in the Backup domain.

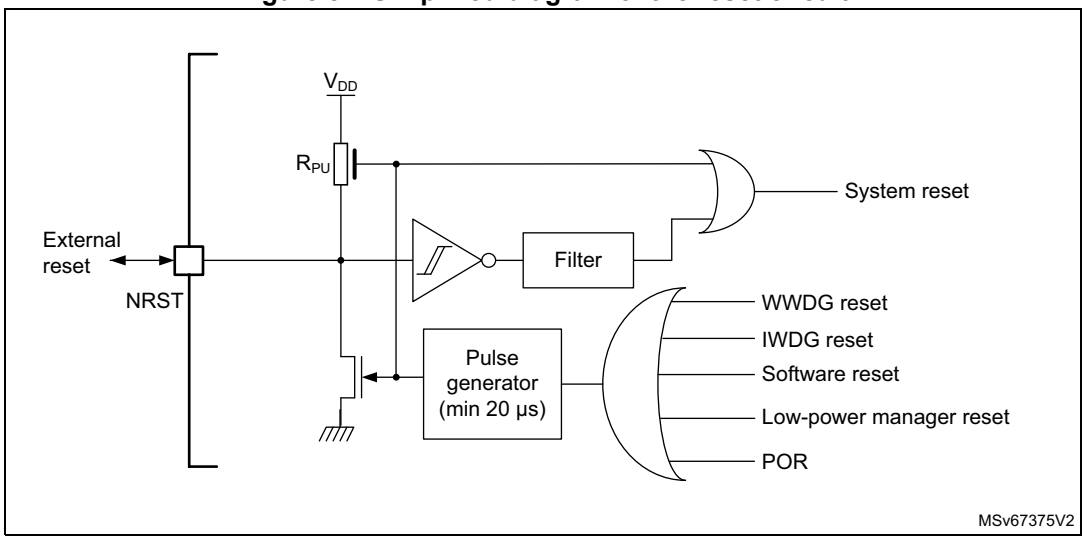
When exiting Standby mode, all registers in the core domain are set to their reset value. Registers outside the core domain (RTC, WKUP, IWDG, and GPIO pullup/pulldown configuration during Standby and Standby mode exit) are not impacted.

11.3.2 System reset

A system reset sets all registers to their reset values except the reset flags in *RCC reset status register (RCC_RSR)* and the registers in the Backup domain.

A system reset is generated when one of the following events occurs:

- a low level on the NRST pin (external reset)
- a window watchdog event (WWDG reset)
- an independent watchdog event (IWDG reset)
- a software reset (SW reset) (see *Software reset*)
- a low-power mode security reset (see *Low-power mode security reset*)
- a brownout reset



The reset source can be identified by checking the reset flags in *RCC reset status register (RCC_RSR)*.

These sources act on the NRST pin and this pin is always kept low during the delay phase. The reset service routine vector is selected depending on product state, on Boot option bytes or on both.

The system reset signal provided to the device is output on the NRST pin. The pulse generator guarantees a minimum reset pulse duration of 20 µs for each internal reset source. In case of an external reset, the reset pulse is generated while the NRST pin is asserted low.

In case on an internal reset, the internal pull-up R_{PU} is deactivated to save the power consumption through the pull-up resistor.

Figure 54. Simplified diagram of the reset circuit

Software reset

The SYSRESETREQ bit in Cortex-M33 application interrupt and reset control register must be set to force a software reset on the device.

Low-power mode security reset

To avoid that critical applications mistakenly enter a low-power mode, the following low-power mode security resets are available. If enabled in option bytes, the resets are generated in any of the following conditions:

- Entering Standby mode: this type of reset is enabled by resetting nRST_STDBY bit in user option bytes. In this case, whenever a Standby mode entry sequence is successfully executed, the device is reset instead of entering Standby mode.
- Entering Stop mode: this type of reset is enabled by resetting nRST_STOP bit in user option bytes. In this case, whenever a Stop mode entry sequence is successfully executed, the device is reset instead of entering Stop mode.

For further information on the user option bytes, refer to *Section 7.4.1: Option bytes description*.

11.3.3 Backup domain reset

The Backup domain has two specific resets, generated after one of the following events:

- a software reset, triggered by setting the VSWRST bit in the *RCC Backup domain control register (RCC_BDCR)*. Write access to this domain must be enabled before setting VSWRST bit to perform the reset.
- a V_{DD} or V_{BAT} power on, if both supplies have previously been powered off

A Backup domain reset affects the LSE oscillator, the RTC, the backup registers, the backup SRAM, and the RCC_BDCR register.

11.3.4 Reset source identification

The application can identify the reset source by checking the reset flags in the RCC_RSR register. The software can reset the flags by setting the RMVF bit.

Table 118 shows how the status bits of the RCC_RSR register behave according to the situation that generated the reset. For example, when an IWDG timeout occurs, if the CPU is reading the RCC_RSR register during the boot phase, both PINRSTF and IWDGRSTF bits are set, indicating that the IWDG also generated a pin reset.

Table 118. Reset source identification (RCC_RSR)(1)

	Reset	LPWRRSTF	WWDGRSTF	IWDGRSTF	SFTRSTF	BORRSTF	PINRSTF
1	Power-on reset	0	0	0	0	1	1
2	Pin/pad reset	0	0	0	0	0	1
3	Brownout (low or high) reset	0	0	0	0	1	1
4	System reset generated by CPU	0	0	0	1	0	1
5	WWDG reset	0	1	0	0	0	1
6	IWDG reset	0	0	1	0	0	1
7	Illegal stop entry reset	1	0	0	0	0	1

1. Gray cells highlight the register bits that are set.

11.4 RCC clocks functional description

Four different clock sources can be used to drive the system clock (SYSCLK):

- HSI: high-speed internal up to 64 MHz RC oscillator clock
- CSI: low power internal RC oscillator clock
- HSE: high-speed external crystal or clock, from 4 to 50 MHz
- PLL1 clock

The HSI is used as system clock source after startup from reset, configured at 32 MHz.

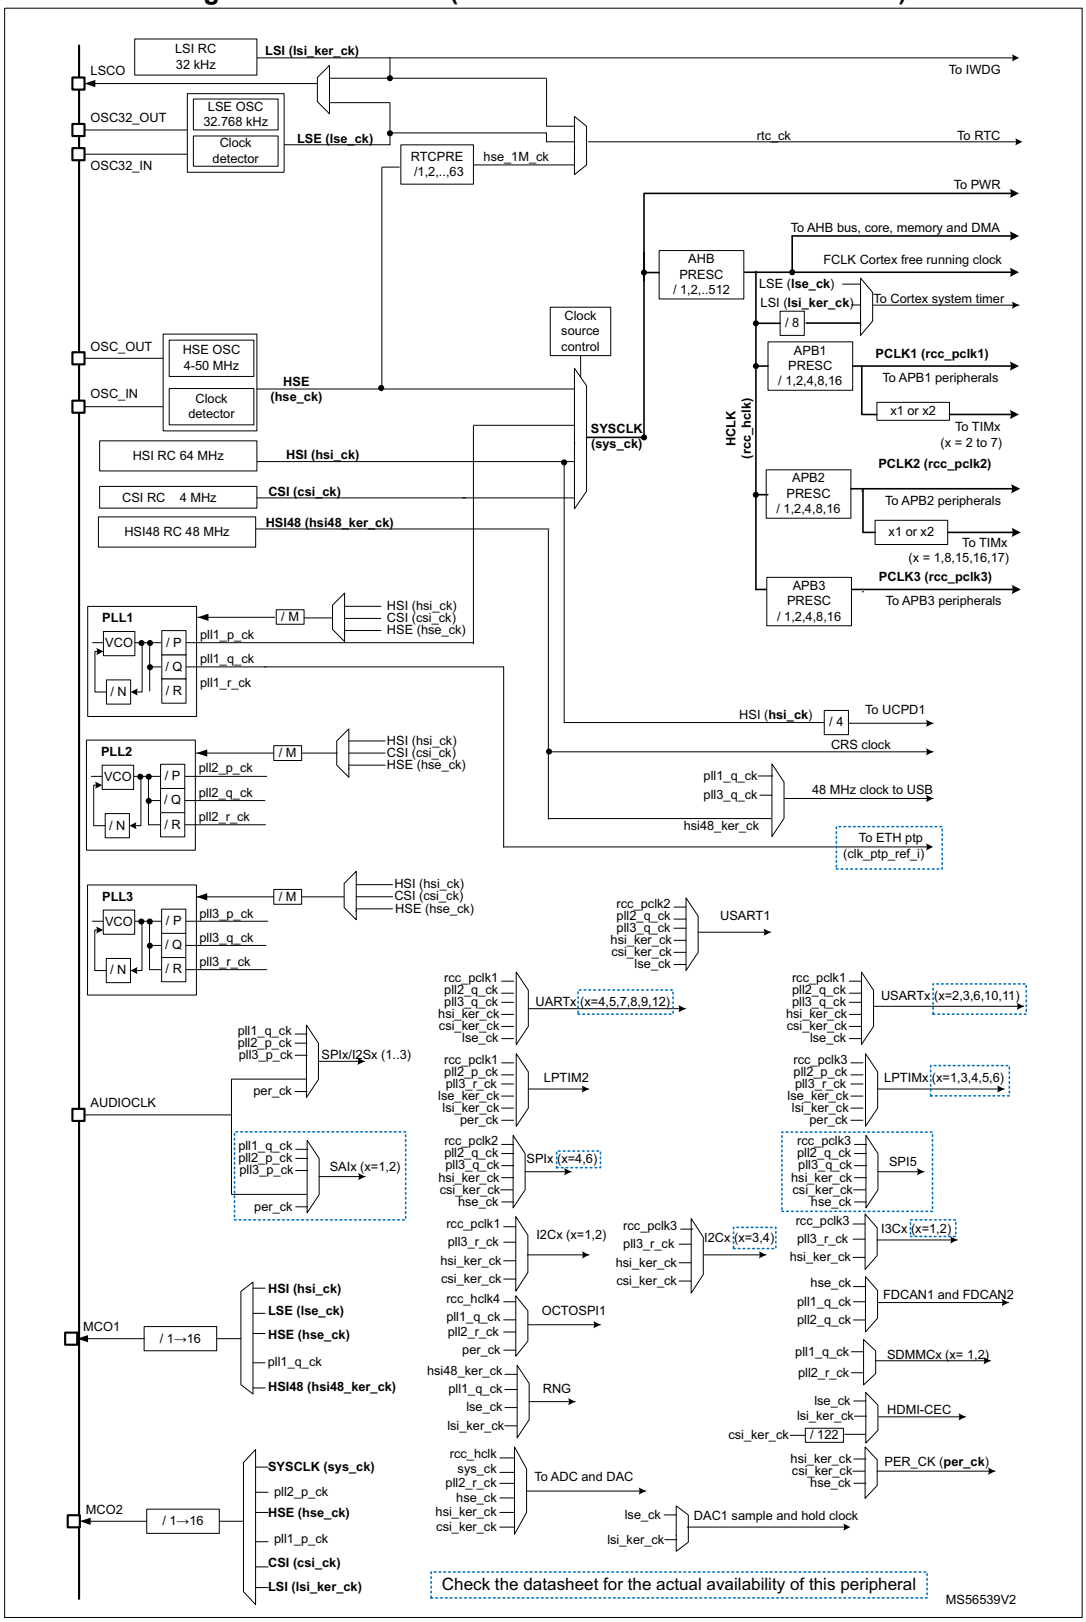
The device has the following additional clock sources:

- LSI: 32 kHz low-speed internal RC that drives the independent watchdog and optionally the RTC used for auto-wake-up from Stop and Standby modes
- LSE: 32.768 kHz low-speed external crystal or clock that optionally drives the real-time clock (rtc_ck)
- HSI48: internal 48 MHz RC that potentially drives the USB FS and the RNG
- PLL2 and PLL3[(a)] clocks

Each clock source can be switched on or off independently when it is not used, to optimize power consumption.

Several prescalers can be used to configure the AHB frequency, the APB1 and APB2 domains. The maximum frequency of the AHB and APB domains is 250 MHz.

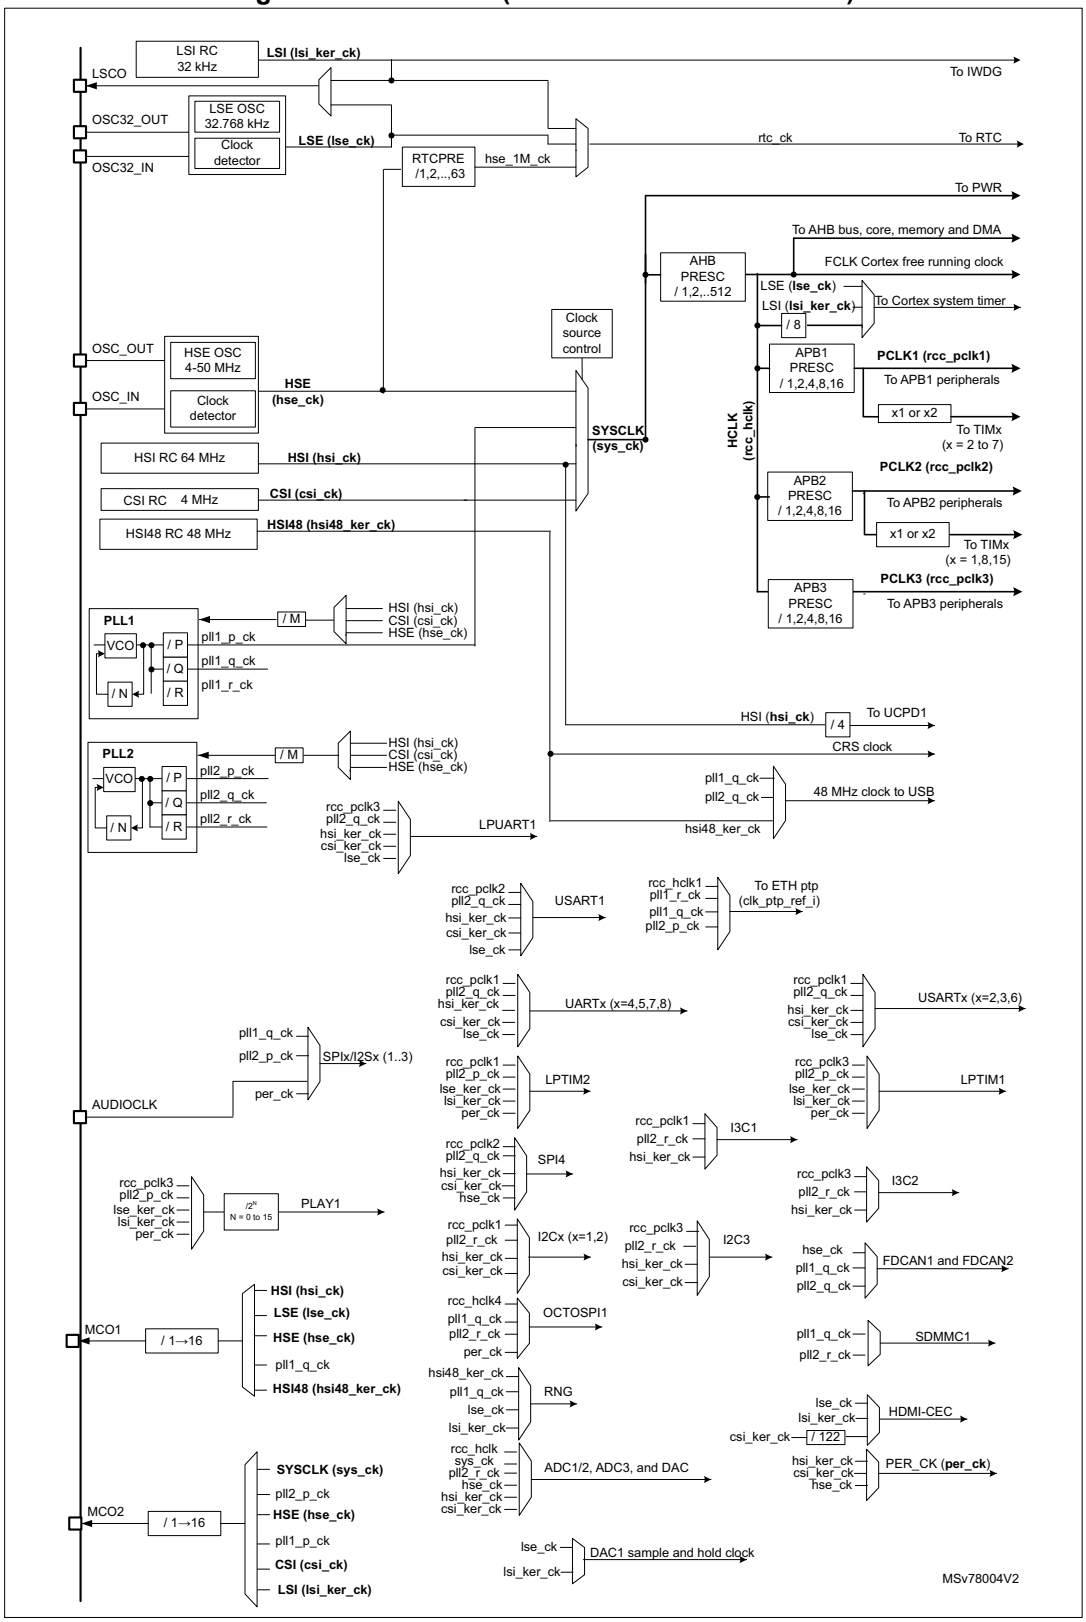
The peripheral clocks are derived from their bus clock (HCLK, PCLK1, PCLK2 or PCLK3), except those that receive an independent kernel clock. This kernel clock can be selected by software between several sources thanks to RCC_CCIPRx registers (x = 1,2,3,4,5).



In addition, the RTC kernel clock is selected by software in RCC_BDCR. The IWDG clock is always the LSI 32 kHz clock.

The RCC feeds the Cortex system timer (SysTick) external clock with the AHB clock (HCLK) divided by eight, or LSE or LSI. The SysTick can work either with this clock or directly with the Cortex clock (HCLK), configurable in the SysTick control and status register.

FCLK acts as Cortex-M33 free-running clock.

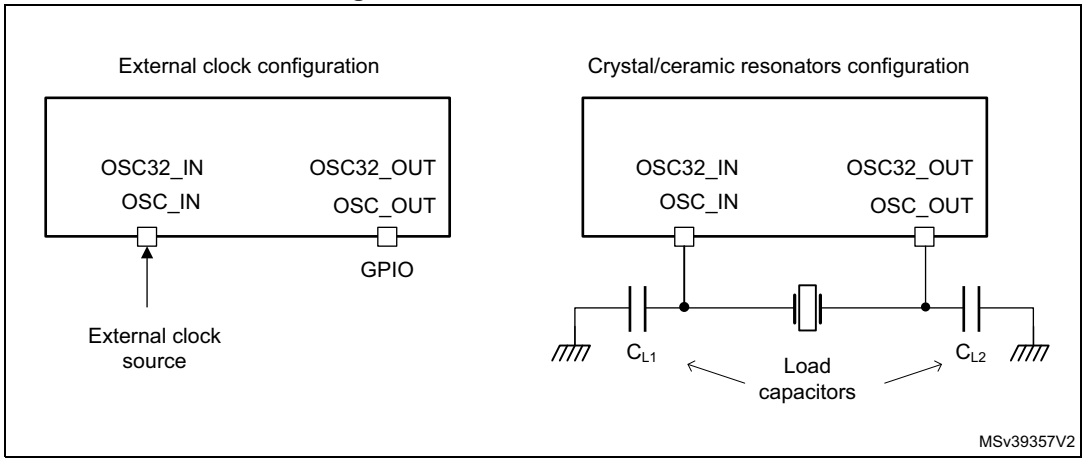


a. Not available on STM32H543/553xx devices.

Figure 55. Clock tree (STM32H523/533/56x/573xx devices)

1. For details on the internal/external clock source, refer to the electrical characteristics in the datasheet.

Figure 56. Clock tree (STM32H543/553xx devices)



1. For details on the internal/external clock source, refer to the electrical characteristics in the datasheet.

11.4.1 HSE clock

The HSE block can generate a clock from an external crystal/ceramic resonator, or from an external clock source.

Figure 57. HSE/LSE clock sources

External clock source (HSE bypass)

In this mode, an external clock source must be provided to OSC_IN pin. The external clock can be low swing (analog) or digital. If this clock is directly used by a peripheral, the duty cycle requirement is defined by the peripheral and the application (refer to datasheet for more details).

In case of an analog clock (low swing) the HSEBYP and HSEON bits must be set to 1 in the *RCC clock control register (RCC_CR)*.

In case of a digital clock, the HSEBYP and the HSEEXT bits must be set to 1 followed by setting the HSEON bit to 1 in the *RCC clock control register (RCC_CR)*.

External crystal/ceramic resonator

The oscillator is enabled by setting the HSEBYP bit to 0 and HSEON bit to 1.

The HSE can be used when the product requires a very accurate high-speed clock.

The associated hardware configuration is shown in *Figure 57*. The resonator and the load capacitors must be placed as close as possible to the oscillator pins to minimize output distortion and startup stabilization time. The loading capacitance values must be adjusted according to the selected crystal or ceramic resonator. Refer to the electrical characteristics section of the datasheet for more details.

The HSERDY flag of the *RCC clock control register (RCC_CR)* indicates whether the HSE oscillator is stable or not. At startup, the **hse_ck** clock is not released until this bit is set by hardware. An interrupt can be generated if enabled in the *RCC clock source interrupt enable register (RCC_CIER)*.

The HSE can be switched ON and OFF through the HSEON bit. Note that the HSE cannot be switched OFF if one of the following two conditions is met:

- the HSE is used directly (via software mux) as system clock
- the HSE is selected as reference clock for PLL1, with PLL1 enabled and selected to provide the system clock (via software mux).

In that case the hardware does not allow programming the HSEON bit to 0.

The HSE is automatically disabled by hardware, when the system enters Stop or Standby mode.

In addition, the HSE clock can be driven to the MCO1 and MCO2 outputs and used as clock source for other application components.

11.4.2 HSI clock

The HSI block provides the default clock to the product.

The HSI is a high-speed internal RC oscillator that can be used directly as system clock, peripheral clock, or as PLL input. A predivider allows the application to select an HSI output frequency of 8, 16, 32 or 64 MHz. This predivider is controlled by the HSIDIV.

The HSI advantages are the following:

- low-cost clock source, as no external crystal is required
- faster startup time than HSE (a few microseconds)

The HSI frequency, even with frequency calibration, is less accurate than an external crystal oscillator or ceramic resonator.

The HSI can be switched ON and OFF using the HSION bit. Note that the HSI cannot be switched OFF if one of the two conditions is met:

- the HSI is used directly (via software mux) as system clock
- the HSI is selected as reference clock for PLL1, with PLL1 enabled and selected to provide the system clock (via software mux).

In that case the hardware does not allow programming the HSION bit to 0. Note that the HSIDIV cannot be changed if the HSI is selected as reference clock for at least one enabled PLL (PLLxON bit set to 1). In that case the hardware does not update the HSIDIV with the new value. However it is possible to change the HSIDIV if the HSI is used directly as system clock.

The HSIRDY flag indicates if the HSI is stable or not. At startup, the HSI output clock is not released until this bit is set by hardware.

The HSI clock can also be used as a backup source (auxiliary clock) if the HSE fails (refer to *Section 11.4.10: Clock security system (CSS)*). The HSI can be disabled or not when the system enters Stop mode.

In addition, the HSI clock can be driven to the MCO1 output and used as clock source for other application components.

Care must be taken when the HSI is used as kernel clock for communication peripherals, the application must take into account the following parameters:

- the time interval between the moment where the peripheral generates a kernel clock request and the moment where the clock is really available
- the frequency accuracy.

Note: The HSI can remain enabled when the system is in Stop mode.

HSI calibration

RC oscillator frequencies can vary from one chip to another due to manufacturing process variations. That is why each device is factory calibrated by STMicroelectronics to achieve an accuracy of ACCHSI (refer to the product datasheet for more information).

After a power-on reset, the factory calibration value is loaded in the HSICAL[11:0] bits. If the application is subject to voltage or temperature variations, this may affect the RC oscillator frequency. The user application can trim the HSI frequency using the HSITRIM[6:0] bits.

Note: HSICAL[11:0] and HSITRIM[6:0] are located in the RCC CSI calibration register (RCC_CSICFGR).

11.4.3 CSI oscillator

The CSI is a low-power RC oscillator that can be used directly as system clock, peripheral clock, or PLL input.

The CSI advantages are the following:

- low-cost clock source since no external crystal is required
- faster startup time than HSE (a few microseconds)
- very low-power consumption,

The CSI provides a clock frequency of about 4 MHz, while the HSI is able to provide a clock up to 64 MHz.

CSI frequency, even with frequency calibration, is less accurate than an external crystal oscillator or ceramic resonator.

The CSI can be switched ON and OFF through the CSION bit. The CSIRDY flag indicates whether the CSI is stable or not. At startup, the CSI output clock is not released until this bit is set by hardware.

The CSI cannot be switched OFF if one of the two conditions is met:

- The CSI is used directly (via software mux) as system clock.
- The CSI is selected as reference clock for PLL1, with PLL1 enabled and selected to provide the system clock (via software mux).

In that case the hardware does not allow programming the CSION bit to 0.

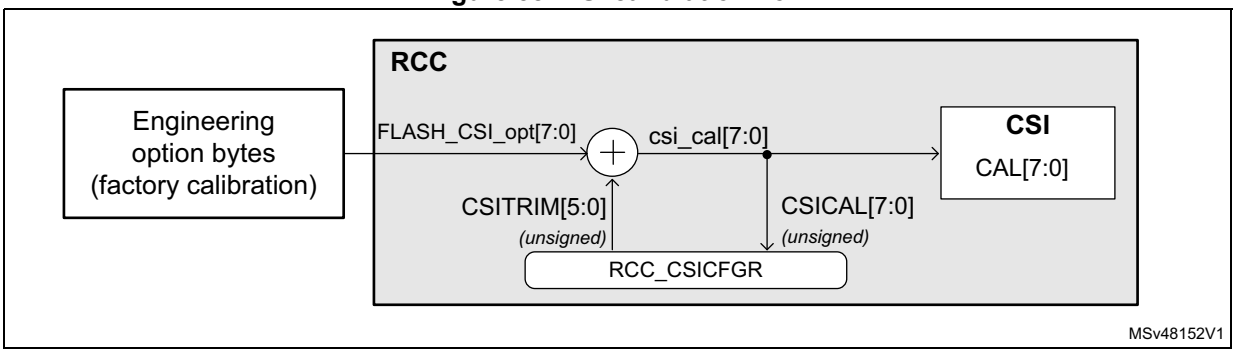
The CSI can be disabled or not when the system enters Stop mode.

In addition, the CSI clock can be driven to the MCO2 output and used as clock source for other application components.

Even if the CSI settling time is faster than the HSI, care must be taken when the CSI is used as kernel clock for communication peripherals: the application must take into account the following parameters:

- the time interval between the moment where the peripheral generates a kernel clock request and the moment where the clock is really available,
- the frequency precision.

Note: CSION and CSIRDY bits are located in the RCC clock control register (RCC_CR).



CSI calibration

RC oscillator frequencies can vary from one chip to another due to manufacturing process variations, this is why each device is factory calibrated to achieve ACC_{CSI} accuracy (refer to the product datasheet for more information). After reset, the factory calibration value is loaded in the CSICAL[7:0] bits.

Voltage and/or temperature variations affect the RC oscillator frequency. The user application can trim the CSI frequency using the CSITRIM[5:0] bits.

Note: Bits CSICAL[7:0] and CSITRIM[5:0] are located into the RCC CSI calibration register (RCC_CSICFGR).

Figure 58. CSI calibration flow

11.4.4 HSI48 clock

The HSI48 clock signal is generated from an internal 48 MHz RC oscillator, and can be used directly for USB and for random number generator (RNG).

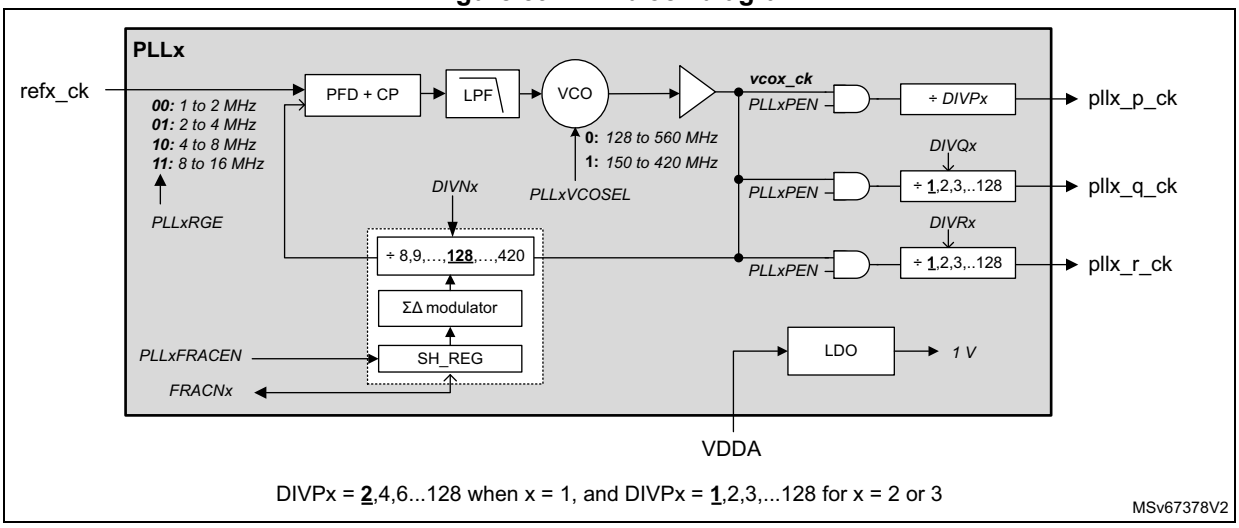
The internal 48 MHz RC oscillator is mainly dedicated to provide a high-precision clock to the USB peripheral by means of a special clock recovery system (CRS) circuitry. The CRS can use the USB SOF signal, the LSE, or an external signal to automatically and quickly adjust the oscillator frequency on-the-fly. It is disabled as soon as the system enters Stop or Standby mode. When the CRS is not used, the HSI48 RC oscillator runs on its default frequency, subject to manufacturing process variations.

For more details on how to configure and use the CRS peripheral, refer to *Section 12: Clock recovery system (CRS)*.

The HSI48RDY flag in the RCC_CR register indicates whether the HSI48 RC oscillator is stable or not. At startup, the HSI48 RC oscillator output clock is not released until this bit is set by hardware.

The HSI48 can be switched on and off using the HSI48ON bit in the RCC_CR register.

11.4.5 PLL description



The RCC features three PLLs:

- a main PLL (PLL1), generally used to provide clocks to the CPU and some peripherals
- two dedicated PLLs (PLL2 and PLL3[(a)]), used to generate the kernel clock for peripherals

The PLLs integrated into the RCC are completely independent. They offer the following features:

- A VCO supporting two modes:
  - a wide-range
  - a low-range used, for instance, in audio applications
- Input frequency range:
  - 2 to 16 MHz for the VCO in wide-range mode
  - 1 to 2 MHz for the VCO in low-range mode
- Capability to work either in integer or fractional mode
- 13-bit sigma-delta modulator, to fine-tune the VCO frequency by 11 to 0.3 ppm steps
- The sigma-delta modulator can be updated on-the-fly without generating frequency overshoots on PLLs outputs
- Each PLL offers three outputs with post-dividers

Figure 59. PLL block diagram

The PLLs are controlled via RCC_PLLxDIVR, RCC_PLLxFRACR, RCC_PLLCFGR, and RCC_CR registers.

The frequency of the reference clock provided to the PLLs (**refx_ck**) must range from 1 to 16 MHz. The PLLxM dividers of the RCC PLLx clock source selection register (RCC_PLLxCFGR) must be properly programmed to match this condition. In addition, the PLLxRGE[1:0] field of the RCC PLLx clock source selection register (RCC_PLLxCFGR) must be set according to the reference input frequency to optimize performance.

The user application can then configure the VCO. The smaller range (150 to 420 MHz) must be chosen when the reference clock frequency is lower than 2 MHz.

To reduce the power consumption, it is recommended to configure the VCO output to the smaller range.

DIVNx loop divider must be programmed to achieve the expected frequency at VCO output. In addition, the VCO output range must be respected.

a. PLL3 is not available on STM32H543/553xx devices.

The PLLs operate in integer mode when the value of SH_REG bit of the FRACNx shadow register is set to 0. The SH_REG bit is updated with the FRACNx value when PLLxFRACEN bit goes from 0 to 1. The sigma-delta modulator is designed to minimize the jitter impact, while allowing very small frequency steps.

The PLLs can be enabled by setting PLLxON to 1. The PLLxRDY bits indicate that the PLL is ready (locked).

*Note: Before enabling the PLLs, make sure that the reference frequency (**refx_ck**) provided to it is stable, so the hardware does not allow changing PLLxM when the PLLx is ON, and it is also not possible to change PLLSRC when one of the PLLs is ON.*

The hardware prevents writing PLL1ON to 0 if the PLL1 is currently used to deliver the system clock. There are other hardware protections on the clock generators (refer to HSE clock, HSI clock, and CSI oscillator).

The following PLL parameters cannot be changed once the PLL is enabled: DIVNx, PLLxRGE, PLLxVCOSEL, PLLxP (DIVP), PLLxQ (DIVQ), and PLLxR (DIVR).

To save power, when a PLLx output (pllx_p_ck, pllx_q_ck, or pllx_r_ck) is not used, disable it by clearing the corresponding enable bit (PLLxPEN, PLLxQEN, or PLLxREN) in the PLLxCFGR register.

If the above rules are not respected, the PLL output frequency is not guaranteed.

Output frequency computation

When the PLL is configured in integer mode (SH_REG = 0), the VCO frequency (F_{VCO}) is given by the following expression:

$$F_{VCO} = F_{REF_CK} \times DIVN$$

$$F_{PLL_y_CK} = (F_{VCO} / (DIVy + 1)) \text{ with y = P, Q, or R}$$

When the PLL is configured in fractional mode (SH_REG different from 0), the DIVN divider must be initialized before enabling the PLLs. However, it is possible to change the value of FRACNx on-the-fly without disturbing the PLL output.

This feature can be used either to generate a specific frequency from any crystal value with a good accuracy, or to fine-tune the frequency on-the-fly.

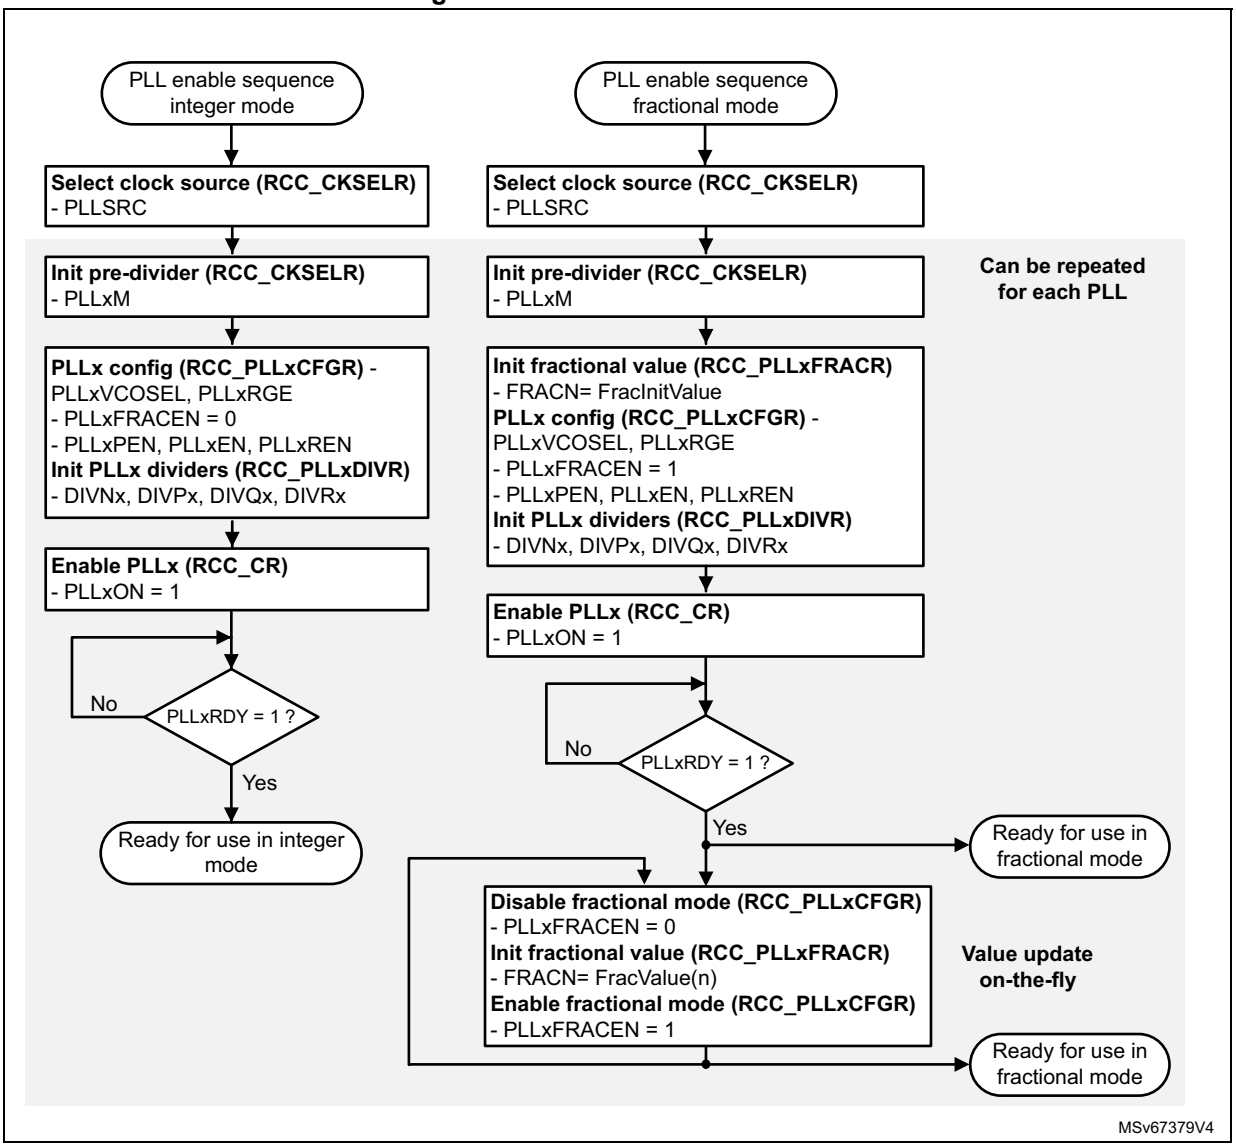
For each PLL, the VCO frequency is given by the following formula:

$$F_{VCO} = F_{ref_ck} \times \left(DIVN + \frac{FRACN}{2^{(13)}} \right)$$

Note: For PLL1, DIVP can only take odd values.

The PLLs are disabled by hardware when:

- the system enters Stop or Standby mode
- an HSE failure occurs when HSE or PLL (clocked by HSE) are used as system clock



PLL initialization phase

Figure 60 shows the recommended PLL initialization sequence in integer and fractional mode. The PLLx are supposed to be disabled at the start of the initialization sequence:

1. Initialize the PLLs registers according to the required frequency.
   – Set PLLxFRACEN of RCC PLLx clock source selection register (RCC_PLLxCFGR) to 0 for integer mode.
   – For fractional mode, set FRACN to the required initial value (FracInitValue) and then set PLLxFRACEN to 1.
2. Once the PLLxON bit is set to 1, the user application must wait until PLLxRDY bit is set to 1. If the PLLx is in fractional mode, the PLLxFRACEN bit must not be set back to 0 as long as PLLxRDY = 0.
3. Once the PLLxRDY bit is set to 1, the PLLx is ready to be used.
4. If the application intends to tune the PLLx frequency on-the-fly (possible only in fractional mode), then:
   a) PLLxFRACEN must be set to 0. When PLLxFRACEN = 0, the sigma-delta modulator is still operating with the value latched into SH_REG. The application must wait for three clock periods of refx_ck (PLLxFRACEN bit propagation delay).
   b) A new value must be uploaded into PLLxFRACR (FracValue(n)).
   c) PLLxFRACEN must be set to 1, to latch the content of PLLxFRACR into its shadow register.The new value is considered after three clock periods of refx_ck (PLLxFRACEN bit propagation delay).

Note: When the PLLxRDY goes to 1 the difference between the PLLx output frequency and the target value is lower than ±2%.

Figure 60. PLLs initialization flow

11.4.6 LSE clock

The LSE can generate a clock from an external crystal/ceramic resonator, or from an external user clock.

External clock source (LSE bypass)

In this mode, an external clock source must be provided to OSC32_IN pin (see *Figure 57*). The input clock can have a frequency up to 1 MHz, and be low swing (analog) or digital. A duty cycle close to 50% is recommended.

In case of an analog clock (low swing), the LSEBYP and LSEON bits must be set to 1 (*RCC Backup domain control register (RCC_BDCR)*).

In case of a digital clock, the LSEBYP and the LSEEXT bits must be set to 1 followed by setting the LSEON bit to 1 (*RCC Backup domain control register (RCC_BDCR)*). If the RTC

is used, the LSE bypass must not be configured in digital mode, but in low swing analog mode (default value after reset).

External crystal/ceramic resonator (LSE crystal)

The LSE clock is generated from a 32.768 kHz crystal or ceramic resonator. It has the advantage to provide a low-power, highly accurate clock source to the real-time clock (RTC) for clock/calendar or other timing functions.

The LSERDY flag of the *RCC Backup domain control register (RCC_BDCR)*) indicates whether the LSE crystal is stable or not. At startup, the LSE crystal output clock signal is not released until this bit is set by hardware. An interrupt can be generated if enabled in the *RCC clock source interrupt enable register (RCC_CIER)*.

The LSE oscillator is switched ON and OFF using the LSEON bit. The LSE remains enabled when the system enters Stop or Standby mode.

In addition, the LSE clock can be driven to the MCO1 output and used as clock source for other application components.

The LSE also offers a programmable driving capability (LSEDRV[1:0]), which can be used to modulate the amplifier driving capability. This driving capability is chosen according to the external crystal/ceramic component requirement to ensure a stable oscillation.

The driving capability must be set before enabling the LSE oscillator.

11.4.7 LSI clock

The LSI acts as a low-power clock source that can be kept running when the system is in Stop or Standby mode for the independent watchdog (IWDG) and auto-wake-up unit (AWU).

The clock frequency is around 32 kHz. For more details, refer to the electrical characteristics section of the datasheet.

The LSI can be switched ON and OFF using the LSION bit. The LSIRDY flag indicates whether the LSI oscillator is stable or not. If an independent watchdog is started either by hardware or software, the LSI is forced ON and cannot be disabled.

The LSI remains enabled when the system enters Stop or Standby mode.

At LSI startup, the clock is not provided until the hardware sets the LSIRDY bit. An interrupt can be generated if enabled in the *RCC clock source interrupt enable register (RCC_CIER)*.

In addition, the LSI clock can be driven to the MCO2 output, and used as a clock source for other application components.

Note: Bits LSION and LSIRDY are located in the RCC Backup domain control register (RCC_BDCR).

11.4.8 System clock (SYSCLK) selection

Four different clock sources can be used to drive the system clock (SYSCLK):

- HSI oscillator
- CSI oscillator
- HSE oscillator
- PLL

The system clock maximum frequency is 250 MHz. After a system reset (or after leaving Standby mode), the HSI oscillator, at 32 MHz, is selected as system clock. When a clock source is used directly or through the PLL as a system clock, it is not possible to stop it.

A switch from one clock source to another occurs only if the target clock source is ready (clock stable after startup delay or PLL locked). If a clock source not yet ready is selected, the switch occurs when the clock source becomes ready. Status bits in the *RCC clock control register (RCC_CR)* indicate which clocks are ready ,and which clock is currently used as a system clock.

11.4.9 Handling clock generators in stop and standby modes

When the whole system enters Stop mode, all the clocks (system and kernel clocks) are stopped, as well as the following clock sources:

- CSI, HSI (depending on HSIKERON and CSIKERON bits)
- HSE
- PLL1, PLL2, and PLL3[(a)]
- HSI48

The content of the RCC registers is not altered except for PLL1ON, PLL2ON, PLL3ON[(a)], HSEON, and HSI48ON, set to 0.

Exiting Stop mode

When the system exits this mode via a wake-up event, the application can select which oscillator (HSI and/or CSI) is used to restart. The STOPWUCK bit selects the oscillator used as system clock. The STOPKERWUCK bit selects the oscillator used as kernel clock for peripherals. The STOPKERWUCK bit is useful if after a system Stop, a peripheral needs a kernel clock generated by an oscillator different from the one used for the system clock.

These bits belong to the *RCC clock configuration register1 (RCC_CFGR1)*

Table 119. STOPWUCK and STOPKERWUCK description

STOPWUCK	STOPKERWUCK	Activated oscillator(s) when the system exits Stop mode	Distributed clocks when the system exits Stop mode	
			System clock	Kernel clock
0	0	HSI	HSI	HSI
	1	HSI and CSI		HSI and/or CSI
1	0		CSI	
	1	CSI		CSI

a. PLL3 is not available on STM32H543/553xx devices.

During Stop mode

There are two specific cases where the HSI or CSI can be enabled during this mode.

- When a dedicated peripheral requests the kernel clock the peripheral receives the HSI or CSI according to the kernel clock source selected for this peripheral (via CKPERSEL[1:0]).
- When the HSIKERON or CSIKERON bits of the *RCC clock control register (RCC_CR)* are set, the HSI and CSI are kept running, but the outputs are gated. The clock is then available immediately when the system exits Stop mode, or when a peripheral requests the kernel clock (see *Table 117* for details).

Table 120. HSIKERON and CSIKERON behavior

HSIKERON (CSIKERON)	HSI (CSI) state during Stop mode	HSI (CSI) state setting time
0	OFF	$t_{su(HSI)}$ $t_{su(CSI)}$ (1)
1	Running and gated	Immediate

1. $t_{su(HSI)}$ and $t_{su(CSI)}$ are the startup times of, respectively, the HSI and CSI oscillators (refer to the product datasheet for the values of these parameters).

When the microcontroller exists system standby mode, the HSI is selected as system and kernel clock. The RCC registers are reset to their initial values except for the RCC_RSR and RCC_BDCR registers.

Note: The HSI and CSI outputs provide two clock paths:

- one path for the system clock (hsi_ck or csi_ck)
- one path for the peripheral kernel clock (hsi_ker_ck or csi_ker_ck).

When a peripheral requests the kernel clock in system stop mode, only the path providing the hsi_ker_ck or csi_ker_ck is activated.

11.4.10 Clock security system (CSS)

Clock security system on HSE

The clock security system can be enabled by software via the HSECSSON bit, which can be enabled even when the HSEON is set to 0.

The CSS on HSE is enabled by the hardware when the HSE is enabled and ready, and HSECSSON set to 1.

The CSS on HSE is disabled when the HSE is disabled. As a result, this function does not work when the system is in Stop mode.

It is not possible to clear directly the HSECSSON bit by software.

The HSECSSON bit is cleared by hardware when a system reset occurs or when the system enters Standby mode.

If a failure is detected on the HSE clock, the system automatically switches to the HSI or CSI, depending on STOPWUCK bit configuration in *RCC clock configuration register1 (RCC_CFGR1)*, to provide a safe clock. The HSE is then automatically disabled, a clock failure event is sent to the break inputs of the advanced-control timers (TIM1, TIM8), and an NMI is automatically generated to inform the application about the failure, allowing the MCU

to perform rescue operations. If the HSE output was used as clock source for PLLs when the failure occurred, the PLLs are also disabled.

If an HSE clock failure occurs when the CSS is enabled, the CSS generates an interrupt that causes the automatic generation of an NMI. The HSECSSF flag in *RCC clock source interrupt flag register (RCC_CIFR)* is set to 1 to allow the application to identify the failure source. The NMI routine is executed indefinitely until the HSECSSF bit is cleared. As a consequence, the application must clear the HSECSSF flag in the NMI ISR by setting the HSECSSC bit in the *RCC clock source interrupt clear register (RCC_CICR)*.

Clock security system on LSE

A clock security system on LSE can be activated by software writing the LSECSSON bit in the *RCC Backup domain control register (RCC_BDCR)*. This bit can be disabled only by a hardware or RTC software reset, or after a failure detection on LSE. LSECSSON must be written after LSE is enabled (LSEON enabled) and ready (LSERDY set by hardware), and after the RTC clock has been selected by RTCSEL.

The CSS operates in all modes, including VBAT. It works also under system reset (excluding power-on reset). The system detects when the LSE disappears, or if it is over frequency.

If a failure is detected on the external 32 kHz oscillator, the LSE clock is no longer supplied to the RTC, but no hardware action is made to the registers.

The CSS on LSE detection event is connected to the internal tamper 3 of the TAMP peripheral. The internal tamper 3 must be enabled (ITAMP3E = 1 in TAMP_CR1 register) and the associated interrupt enabled (ITAMP3IE in TAMP_IER) to wake up from the low-power modes. This erases also the TAMP backup registers and backup SRAM unless the ITAMP3NOER = 1 in the TAMP_CR3 (see *Section 52: Tamper and backup registers (TAMP)* for more details).

In case of CSS on LSE detection event (LSECSSD = 1 in the RCC_BDCR), the software must disable the LSECSSON bit, stop the defective 32 kHz oscillator (disabling LSEON), and change the RTC clock source (no clock or LSI or HSE, with RTCSEL), or take actions to secure the application.

11.4.11 Clock output generation (MCO1/MCO2)

Two microcontroller clock output pins (MCO1 and MCO2) are available. A clock source can be selected for each output.The selected clock can be divided thanks to configurable prescaler (refer to *Figure 55* for additional information on signal selection).

MCO1 and MCO2 outputs are controlled via MCO1PRE[3:0], MCO1[2:0], MCO2PRE[3:0], and MCO2[2:0], located in the *RCC clock configuration register1 (RCC_CFGR1)*.

The GPIO port corresponding to each MCO pin must be programmed in alternate function mode.

The clock provided to the MCOs outputs must not exceed the maximum pin speed (refer to the product datasheet for information on the supported speed).

Another output (LSCO) allows one of the low-speed clocks (LSI, LSE) to be output onto the external LSCO pin. This output is available in Stop mode, not available in Standby and VBAT modes. The selection is controlled by the LSCOSEL bit, and enabled by the LSCOEN bit in the *RCC Backup domain control register (RCC_BDCR)*.

The MCO clock output requires the corresponding alternate function selected on the MCO pin. The LSCO pin must be left in default POR state.

11.4.12 Kernel clock selection

Some peripherals are designed to work with two different clock domains that operate asynchronously:

- a clock domain synchronous with the register and bus interface (**ckg_bus_perx** clock)
- a clock domain generally synchronous with the peripheral (kernel clock)

The benefit of having peripherals supporting these two clock domains is that the user application has more freedom to choose optimized clock frequency for the CPU, bus matrix and for the kernel part of the peripheral. The user application can thus change the bus frequency without reprogramming the peripherals. As an example, an ongoing transfer with UART is not disturbed if its APB clock is changed on-the-fly.

Table 121 shows the kernel clock that the RCC can deliver to the peripherals. Each row represents a multiplexer and the peripherals connected to its output.

Table 121. Kernel clock distribution overview

Peripherals(1)	Clock multiplexer control bits	pll1_q_ck	pll1_r_ck(2)	pll2_p_ck	pll2_q_ck	pll2_r_ck	pll3_p_ck(3)	pll3_q_ck(3)	pll3_r_ck(3)	sys_ck	bus clocks(4)	hse_ck	hsi_ker_ck	csi_ker_ck	hsi48_ck	lse_ck	lsi_ck	per_ck(5)	AUDIOCLK	Disabled

1. For the actual availability of the peripheral refer to the device datasheet.
2. Available only on STM32H543/553xx devices.
3. Not available on STM32H543/553xx devices.
4. The bus (APB or AHB) clocks are the bus interface clocks to whom the peripherals are connected.
5. The per_ck clock can be hse_ck, hsi_ker_ck, or csi_ker_ck, according to CKPERSEL selection.
6. With a duty cycle close to 50%, meaning that DIV[P/Q/R]x, values must be even. For SDMMCx the duty cycle must be 50% when supporting DDR.
7. Clock CSI divided by 122.
8. With a duty cycle close to 50%, meaning that DIV[P/Q/R]x, values must be even. For ADC the duty cycle must be 50% when supporting DDR.
9. Clock HSI divided by 4.
10. Clock HSE divided by RTCPRE.

To reduce the number of switches, some peripherals share the same kernel clock source, but all have their dedicated enable signal.

Peripherals dedicated to audio applications[a]

The audio peripherals generally need specific accurate frequencies, the kernel clock of the SAI or SPI/I2S can be generated by:

- PLL1 when the amount of active PLLs must be reduced (for SAIs and SPI1 to 3)
- APB2 peripheral clock (for SPI4 and 5)
- APB3 peripheral clock (for SPI6)
- PLL2 or PLL3[b] for optimal flexibility in frequency generation
- HSE, HSI, or CSI when the current consumption is critical
- AUDIOCLK when an external clock reference must be used

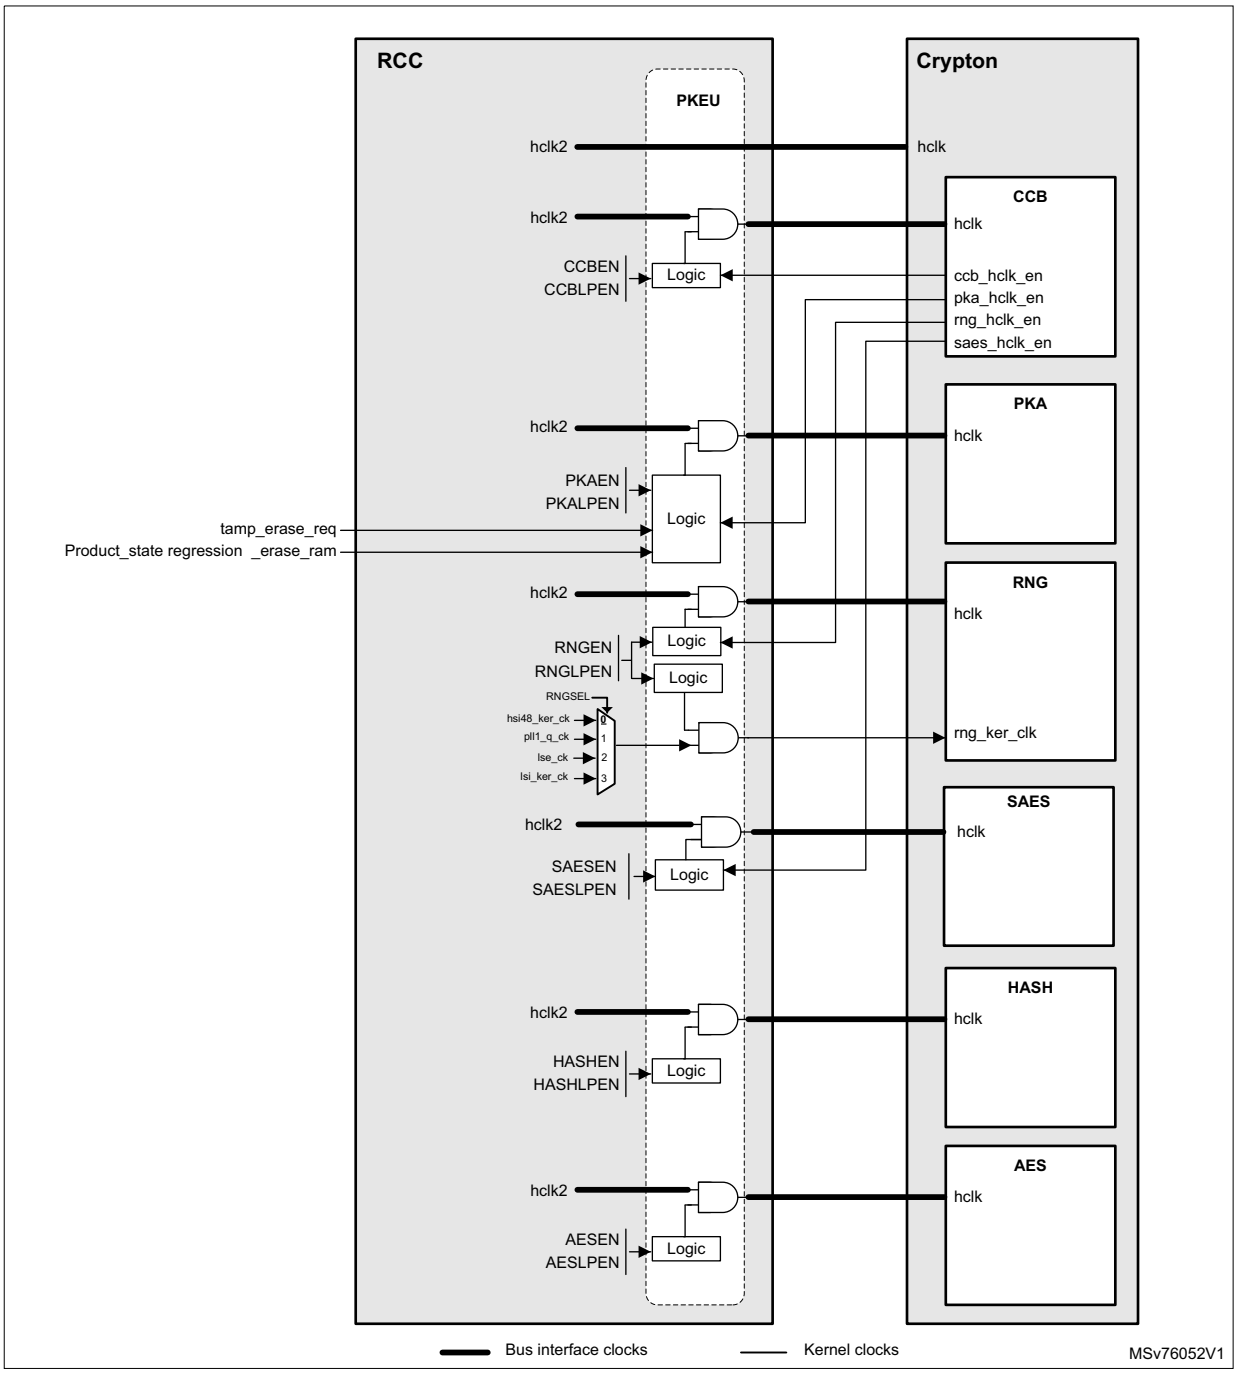
Peripherals dedicated to control and data transfer

Peripherals such as SPIs, I2Cs, UARTs do not need a specific kernel clock frequency but a clock fast enough to generate the correct baud rate, or the required bit clock on the serial interface. For that purpose the source can be selected among the following ones:

- PLL1 when the amount of active PLLs must be reduced
- PLL2 or PLL3[b] if better flexibility is required. As an example, this solution allows changing the frequency bus via PLL1 without affecting the speed of some serial interfaces.
- HSI or CSI for low-power use-cases or when the peripheral must quickly wake up from Stop mode (such as UART or I2C)

Note: UARTs also need the LSE clock when high baud rates are not required.

The OCTOSPI and SDMMC1/2[a] can also use a clock different from the bus interface one for more flexibility.



a. Refer to the device datasheet for the availability of the peripherals.

b. PLL3 is not available on STM32H543/553xx devices.

Clock distribution for CCB subsystem

Available only on STM32H543/553xx devices.

Figure 61. Clock distribution for CCB subsystem

RTC/AWU clock

The **rtc_ck** clock source can be one of the following:

- the **hse_1M_ck** (**hse_ck** divided by a programmable prescaler)
- the **lse_ck**
- the **lsi_ck** clock

The source clock is selected by programming the RTCSEL[1:0] bits in the *RCC Backup domain control register (RCC_BDCR)* and the RTCPRE[5:0] bits in the *RCC clock configuration register1 (RCC_CFGR1)*.

This selection cannot be modified without resetting the Backup domain.

If the LSE is selected as RTC clock, the RTC works normally even if the backup or the V_{DD} supply disappears.

The LSE clock is in the Backup domain, whereas the other oscillators are not. As a consequence:

- If LSE is selected as RTC clock, the RTC continues working even if the V_{DD} supply is switched OFF, provided the V_{BAT} supply is maintained.
- If LSI is selected as the RTC clock, the AWU state is not guaranteed if the V_{DD} supply is powered off.
- If the HSE clock is used as RTC clock, the RTC state is not guaranteed if the V_{DD} supply is powered off or if the V_{CORE} supply is powered off.

The **rtc_ck** clock is enabled through RTCEN bit located in the *RCC Backup domain control register (RCC_BDCR)*.

The RTC bus interface clock (APB clock) is enabled through RTCAPBEN and RTCAPBLPEN bits located in RCC_APB3ENR/LPENR registers.

Note: To read the RTC calendar register when the APB clock frequency is less than seven times the RTC clock frequency ($F_{APB} < 7 \times F_{RTCLCK}$), the software must read the calendar time and date registers twice. The data are correct if the second read access to RTC_TR gives the same result than the first one. Otherwise a third read access must be performed.

Watchdog clocks

The RCC provides the clock for the two watchdog blocks available on the circuit. The independent watchdog (IWDG) is connected to the LSI. The window watchdog (WWDG) is connected to the APB clock.

If an independent watchdog is started by either hardware option or software access, the LSI is forced ON and cannot be disabled. After the LSI oscillator setup delay, the clock is provided to the IWDG.

Clock frequency measurement using TIMx

Most of the clock source generator frequencies can be measured by means of the input capture of TIMx.

- Calibrating the HSI or CSI with the LSE:

  The primary purpose of having the LSE connected to a TIMx input capture is to be able to accurately measure the HSI or CSI. This requires to use the HSI or CSI as system clock source either directly or via PLL1. The number of system clock counts between consecutive edges of the LSE signal gives a measurement of the internal clock period. Taking advantage of the high precision of LSE crystals (typically a few tens of ppm) we

can determine the internal clock frequency with the same resolution, and trim the source to compensate for manufacturing-process and/or temperature- and voltage-related frequency deviations.

The basic concept consists in providing a relative measurement (e.g. HSI/LSE ratio). The precision is therefore tightly linked to the ratio between the two clock sources. The greater the ratio is, the more accurate the measurement is.

The HSI and CSI oscillators have dedicated user-accessible calibration bits for this purpose (see *RCC CSI calibration register (RCC_CSICFGR)*). When HSI or CSI is used via the PLLx, the system clock can also be fine-tuned by using the fractional divider of the PLLs.

- Calibrating the LSI with the HSI:

  The LSI frequency can also be measured: this is useful for applications that do not have a crystal. The ultra-low-power LSI oscillator has a large manufacturing process deviation. The LSI clock frequency can be measured using the more precise HSI clock source. Using this measurement, a more accurate RTC time base timeouts (when LSI is used as the RTC clock source) and/or an IWDG timeout with an acceptable accuracy can be obtained.

11.4.13 RTC and TAMP clock

The RTCCLK clock source is used by RTC and TAMP, and can be either the HSE / 32, LSE or LSI clock. It is selected by programming the RTCSEL[1:0] bits in the *RCC Backup domain control register (RCC_BDCR)*. This selection cannot be modified without resetting the Backup domain. The system must always be configured so as to get a PCLK frequency greater than or equal to the RTCCLK frequency for a proper operation of the RTC. The TAMP does not require any kernel clock if only the backup registers are used, with tampers in edge detection mode. All other tamper detection modes require a kernel clock (refer to *Section 52: Tamper and backup registers (TAMP)* for more details).

The LSE is in the Backup domain, whereas the HSE and LSI clocks are not. Consequently:

- If LSE is selected as RTC and TAMP clock, these peripherals continue to work even if the V_{DD} supply is switched off, provided the V_{BAT} supply is maintained.
- If the HSE clock divided by a prescaler is used as the RTC or TAMP clock, the RTC state is not guaranteed if the V_{DD} supply is powered off or if the internal voltage regulator is powered off (removing power from the core domain). Depending on the TAMP configuration, this one can remain functional if used in a mode that does not need any kernel clock.
- If the LSI is used as the RTC or TAMP clock, the RTC state is not guaranteed if the V_{DD} supply is powered off. Depending on the TAMP configuration, this one can remain functional if used in a mode that does not need any kernel clock.

When the RTC and TAMP clock is LSE or LSI, the RTC remains clocked and functional under system reset.

11.4.14 Timer clock

The timer clock frequencies are automatically defined by hardware.

There are two cases:

- If the APB prescaler equals 1, the timer clock frequencies are set to the APB domain frequency.
- Otherwise, they are set to twice (×2) the APB domain frequency.

11.4.15 Watchdog clock

If the independent watchdog (IWDG) is started by either hardware option or software access, the LSI oscillator is forced on and cannot be disabled. After the LSI oscillator temporization, the LSI 32 kHz clock is provided to the IWDG.

11.4.16 Peripherals clock gating and autonomous mode

Peripherals clock gating in Run mode

Each peripheral clock can be enabled by the corresponding EN bit in the RCC_AHBxENR and RCC_APBxENR registers.

When the peripheral clock is not active, read or write accesses to the peripheral registers are not supported.

The enable bit has a synchronization mechanism to create a glitch-free clock for the peripheral. After the enable bit is set, there the clock is active after 2 cycles of the peripheral bus clock.

Caution: Just after enabling the clock for a peripheral, the software must wait for these 2 clock cycles before accessing the peripheral registers.

Peripherals clock gating in Sleep mode

When a peripheral is enabled, its clock can be automatically gated off when the device is in Sleep mode, by clearing the peripheral LPEN bit in the RCC_AHBxLPENR and RCC_APBxLPENR registers. Both EN and LPEN bit of the peripheral must be set to keep the clock on in Sleep mode.

11.5 RCC security and privilege functional description

11.5.1 RCC TrustZone security protection modes

When the TrustZone security is activated by the TZEN option byte in the Flash option byte configuration register, the RCC is able to secure RCC configuration and status bits from being modified by nonsecure accesses.

This is configured through the *RCC secure configuration register (RCC_SECCFGR)* to prevent nonsecure access to read or modify the following features:

- HSE, HSE-CSS, HSI, CSI, LSI, LSE, LSE-CSS, LSCO, HSI48 configuration and status bits
- PLL1, PLL2, PLL3, AHB and APB prescalers configuration and status bits
- system clock (SYSCLK) and ICLK source clock selection and status bits
- MCO clock output configuration and STOPWUCK and STOPKERWUCK bit
- Remove reset flag RMVF configuration

If SPRIV is set in the *RCC privilege configuration register (RCC_PRIVCFGR)*, the RCC_SECCFGR register can be written only by secure and privileged access. If SPRIV is cleared in RCC_PRIVCFGR, RCC_SECCFGR can be written only by secure access, privileged or unprivileged.

RCC_SECCFGR can be read by secure, nonsecure, privileged and unprivileged access.

When a peripheral is configured as secure, its related clock, reset, clock source selection and clock enable during low-power modes control bits, are also secure in the RCC_AHBxENR, RCC_APBxENR, RCC_CCIPRx and RCC_BDCR registers.

Note: When at least one feature in RTC or TAMP is secure, the RTCPRE[5:0] in RCC_CFGR1, as well as RTCEN and RTCSEL[1:0] in RCC_BDCR, become secure.

A peripheral is secure when:

- For securable peripherals by TZSC (see *Section 5.4.3: TrustZone security controller (TZSC)*), the SEC security bit corresponding to this peripheral is set in the GTZC TZSC secure configuration registers.
- For TrustZone®-aware peripherals, a security feature of this peripheral is enabled through its dedicated bits.

Table 122 summarizes the RCC secured bits following the security configuration bit in the RCC_SECCFGR register.

When one security configuration bit is set, some configuration and status bits are secured. The RCC registers may contain secure and nonsecure bits:

- Secured bits: read and write operations are only allowed by a secure access. Nonsecure read returns 0 and write accesses are ignored. No illegal access event is generated.
- Nonsecure bits: no restriction. Read and write operations are allowed by both secure and nonsecure accesses.
- A nonsecure write access to RCC_SECCFGR is ignored and generates an illegal access event. An illegal access interrupt is generated if the RCC illegal access interrupt is enabled in the GTZC TZIC registers. RCC_SECCFGR can be read by secure or nonsecure access.

When the TrustZone security is disabled (TZEN = 0xC3), all registers are nonsecure. RCC_SECCFGR write accesses are ignored.

Table 122. RCC security configuration summary

Configuration bit in RCC_SECCFGR	Secured bits	Corresponding register
HSISEC	HSION, HSIKERON, HSIRDY	RCC_CR
	HSICAL[11:0], HSITRIM[6:0]	RCC_HSICFGR
	HSIRDYIE	RCC_CIER
	HSIRDYIF	RCC_CIFR
	HSIRDYC	RCC_CICR
HSESEC	HSEON, HSERDY, HSEBYP, HSECSSON, HSEEXT	RCC_CR
	HSERDYIE, HSECSSF	RCC_CIER
	HSERDYIF, HSECSSF	RCC_CIFR

1. PLL3SEC registers are not available on STM32H543/553xx devices.
2. TRIM field of the HSI48 is located in CRS peripheral. Be sure to secure it using CRSSEC bit in GTZC1 TZSC secure configuration register 1.

11.5.2 RCC privilege protection modes

By default, after reset, all RCC registers can be read or written with both privileged and unprivileged access except *RCC privilege configuration register (RCC_PRIVCFGR)* that can be written with privileged access only. RCC_PRIVCFGR can be read by secure and non secure, privileged and unprivileged access.

The SPRIV bit in RCC_PRIVCFGR can be written with secure privileged access only. This bit configures the privileged access of all RCC secure functions (as defined by *RCC secure configuration register (RCC_SECCFGR)* or by the GTZC for securable peripherals, or by the peripheral itself in case of TrustZone-aware peripherals).

When the SPRIV bit is set in RCC_PRIVCFGR:

- Writing the RCC secure bits is possible only with privileged access, including RCC_SECCFGR.
- The RCC secure bits can be read only with privileged access except RCC_SECCFGR and RCC_PRIVCFGR that can be read by privileged or unprivileged access.
- An unprivileged access to a privileged RCC bit or register is discarded: the bits are read as zero and the write to these bits is ignored (RAZ/WI).

The NSPRIV bit in RCC_PRIVCFGR can be written with privileged access only, secure or nonsecure. This bit configures the privileged access of all RCC nonsecure functions (as defined by RCC_SECCFGR, or by the GTZC for securable peripherals, or by the peripheral itself in case of TrustZone-aware peripherals).

When the NSPRIV bit is set in RCC_PRIVCFGR:

- Writing the RCC nonsecure bits is possible only with privileged access.
- The RCC nonsecure bits can be read only with privileged access except RCC_PRIVCFGR that can be read by privileged or unprivileged access.
- An unprivileged access to a privileged RCC bit or register is discarded: the bits are read as zero and the write to these bits is ignored (RAZ/WI).

11.6 RCC low-power modes

- AHB and APB peripheral clocks, including DMA clock, can be disabled by software.
- Sleep mode stops the CPU clock. The memory interface clocks (flash memory, caches and all SRAM interfaces) can be stopped by software during Sleep mode. The AHB to APB bridge clocks are disabled by hardware during Sleep mode when all the clocks of the peripherals connected to them are disabled.
- Stop mode stops all the clocks in the core domain and disable the PLLs, HSI, HSI48, CSI and HSE oscillators. However, HSI or CSI can be switched ON to generate a wake-up interrupt. LSI and LSE remain active in Stop mode.
- Standby mode stops all the clocks in the core domain and disable the PLLs, HSI, HSI48, CSI and HSE oscillators.

The CPU DeepSleep mode can be overridden for debugging by setting the DBG_STOP or DBG_STANDBY bit in the DBGMCU_CR register.

When exiting Stop mode, the system clock is either HSI or CSI, depending on the software configuration of STOPWUCK in the *RCC CPU domain clock configuration register 2 (RCC_CFGR2)*. The frequency (range and user trim) of the HSI is the one configured before entering Stop mode.

The other internal oscillator can be automatically woken up in addition to the one used by the system clock, to avoid waiting for the other oscillator wake-up time when the device is back in Run mode. This is done thanks to STOPKERWUCK in RCC_CFGR1.

When leaving the Standby mode, the system clock is HSI (32 MHz). The user trim is lost.

If a flash memory programming operation is ongoing, Stop or Standby mode entry is delayed until the flash memory interface access is finished. If an access to the APB domain is ongoing, Stop or Standby mode entry is delayed until the APB access is finished.

11.7 RCC interrupts

Table 123 summarizes the interrupt sources and the way to control them.

Table 123. Interrupt sources and control

Interrupt vector	Interrupt event flag	Description	Enable control bits	Interrupt clear method	Exit from Sleep mode	Exit from Stop and Standby modes
RCC	LSIRDYF	LSI ready	LSIRDYIE and LSISEC = 0	Set LSIRDYC to 1	Yes	No
	LSERDYF	LSE ready	LSERDYIE and LSESEC = 0	Set LSERDYC to 1	Yes	No
	HSIDRYF	HSI ready	HSIDRYIE and HSISEC = 0	Set HSIRDYC to 1	Yes	No
	HSERDYF	HSE ready	HSERDYIE and HSESEC = 0	Set HSERDYC to 1	Yes	No
	CSISRDYF	CSIS ready	CSISRDYIE and CSISEC = 0	Set CSISRDYC to 1	Yes	No
	HSI48RDYF	HSI48 ready	HSI48RDYIE and HSI48SEC = 0	Set HSI48RDYC to 1	Yes	No
	PLL1RDYF	PLL1 ready	PLL1RDYIE and PLL1SEC = 0	Set PLL1RDYC to 1	Yes	No
	PLL2RDYF	PLL2 ready	PLL2RDYIE and PLL2SEC = 0	Set PLL2RDYC to 1	Yes	No
	PLL3RDYF(1)	PLL3 ready	PLL3RDYIE and PLL3SEC = 0	Set PLL3DYC to 1	Yes	No
RCC_S(2)	LSIRDYF	LSI ready	LSIRDYIE and LSISEC = 1	Set LSIRDYC to 1	Yes	No
	LSERDYF	LSE ready	LSERDYIE and LSESEC = 1	Set LSERDYC to 1	Yes	No
	HSIDRYF	HSI ready	HSIDRYIE and HSISEC = 1	Set HSIRDYC to 1	Yes	No
	HSERDYF	HSE ready	HSERDYIE and HSESEC = 1	Set HSERDYC to 1	Yes	No
	CSISRDYF	CSIS ready	CSISRDYIE and CSISEC = 1	Set CSISRDYC to 1	Yes	No
	HSI48RDYF	HSI48 ready	HSI48RDYIE and HSI48SEC = 1	Set HSI48RDYC to 1	Yes	No
	PLL1RDYF	PLL1 ready	PLL1RDYIE and PLL1SEC = 1	Set PLL1RDYC to 1	Yes	No
	PLL2RDYF	PLL2 ready	PLL2RDYIE and PLL2SEC = 1	Set PLL2RDYC to 1	Yes	No
	PLL3RDYF(1)	PLL3 ready	PLL3RDYIE and PLL3SEC = 1	Set PLL3RDYC to 1	Yes	No

Table 123. Interrupt sources and control (continued)

Interrupt vector	Interrupt event flag	Description	Enable control bits	Interrupt clear method	Exit from Sleep mode	Exit from Stop and Standby modes
TAMP	ITAMP3F(3)	LSE CSS failure	LSECSSON and ITAMP3E(3) and ITAMP3IE(3)	Set CITAMP3F(3) to 1	Yes	Yes
NMI	HSECSSF	HSE CSS failure	(4)	Set HSECSSC to 1	Yes	No

1. PLL3 is not available on STM32H543/553xx devices.
2. The RCC secure interrupt vector is used only when TrustZone is enabled.
3. The LSE CSS failure event (LSECSSD) is connected to TAMP internal tamper 3. to get the interrupt associated to this event, the internal tamper 3 must be enabled, and the internal tamper 3 interrupt must be enabled. The ITAMP3F, ITAMP3E, ITAMP3IE, and CITAMP3F bits are in the TAMP peripheral.
4. It is not possible to mask this interrupt when the security system feature is enabled (HSECSSON = 1).

11.8 RCC registers

11.8.1 RCC clock control register (RCC_CR)

Address offset: 0x000

Reset value: 0x0000 002B

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	PLL3RDY	PLL3ON	PLL2RDY	PLL2ON	PLL1RDY	PLL1ON	Res.	Res.	Res.	HSEEXT	HSECSSON	HSEBYP	HSERDY	HSEON
		r	rw	r	rw	r	rw				rw	rs	rw	r	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	HSI48RDY	HSI48ON	Res.	CSIKERON	CSIRDY	CSION	Res.	Res.	HSIDIVF	HSIDIV[1:0]		HSIKERON	HSIRDY	HSION
		r	rw		rw	r	rw			r	rw	rw	rw	r	rw

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **PLL3RDY:** PLL3 clock ready flag

Set by hardware to indicate that the PLL3 is locked.

0: PLL3 unlocked (default after reset)

1: PLL3 locked

Note: This bit is not available on STM32H543/553xx devices. If not present, consider this bit as reserved, and keep its bits at reset value.

Bit 28 **PLL3ON**: PLL3 enable

Set and cleared by software to enable PLL3.

Cleared by hardware when entering Stop or Standby mode.

0: PLL3 OFF (default after reset)

1: PLL3 ON

Note: This bit is not available on STM32H543/553xx devices. If not present, consider this bit as reserved, and keep its bits at reset value.

Bit 27 **PLL2RDY**: PLL2 clock ready flag

Set by hardware to indicate that the PLL is locked.

0: PLL2 unlocked

1: PLL2 locked

Bit 26 **PLL2ON**: PLL2 enable

Set and cleared by software to enable PLL2.

Cleared by hardware when entering Stop or Standby mode.

0: PLL2 OFF (default after reset)

1: PLL2 ON

Bit 25 **PLL1RDY**: PLL1 clock ready flag

Set by hardware to indicate that the PLL1 is locked.

0: PLL1 unlocked (default after reset)

1: PLL1 locked

Bit 24 **PLL1ON**: PLL1 enable
Set and cleared by software to enable PLL1.
Cleared by hardware when entering Stop or Standby mode. Note that the hardware prevents writing this bit to 0, if the PLL1 output is used as the system clock.
0: PLL1 OFF (default after reset)
1: PLL1 ON

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **HSEEXT**: external high speed clock type in Bypass mode
Set and reset by software to select the external clock type (analog or digital).
The external clock must be enabled with the HSEON bit to be used by the device. The HSEEXT bit can be written only if the HSE oscillator is disabled.
0: HSE in analog mode (default after reset)
1: HSE in digital mode

Bit 19 **HSECSSON**: HSE clock security system enable
Set by software to enable clock security system on HSE.
This bit is “set only” (disabled by a system reset or when the system enters in Standby mode). When HSECSSON is set, the clock detector is enabled by hardware when the HSE is ready and disabled by hardware if an oscillator failure is detected.
0: CSS on HSE OFF (clock detector OFF) (default after reset)
1: CSS on HSE ON (clock detector ON if the HSE oscillator is stable, OFF if not).

Bit 18 **HSEBYP**: HSE clock bypass
Set and cleared by software to bypass the oscillator with an external clock. The external clock must be enabled with the HSEON bit to be used by the device.
The HSEBYP bit can be written only if the HSE oscillator is disabled.
0: HSE oscillator not bypassed (default after reset)
1: HSE oscillator bypassed with an external clock

Bit 17 **HSERDY**: HSE clock ready flag
Set by hardware to indicate that the HSE oscillator is stable.
0: HSE clock is not ready (default after reset)
1: HSE clock is ready

Bit 16 **HSEON**: HSE clock enable
Set and cleared by software.
Cleared by hardware to stop the HSE when entering Stop or Standby mode.
This bit cannot be cleared if the HSE is used directly (via SW mux) as system clock, or if the HSE is selected as reference clock for PLL1 with PLL1 enabled (PLL1ON bit set to 1).
0: HSE is OFF (default after reset)
1: HSE is ON

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **HSI48RDY**: HSI48 clock ready flag
Set by hardware to indicate that the HSI48 oscillator is stable.
0: HSI48 clock is not ready (default after reset)
1: HSI48 clock is ready

Bit 12 **HSI48ON**: HSI48 clock enable
Set by software and cleared by software or by the hardware when the system enters to Stop or Standby mode.
0: HSI48 is OFF (default after reset)
1: HSI48 is ON

Bit 11 Reserved, must be kept at reset value.

Bit 10 **CSIKERON**: CSI clock enable in Stop mode

Set and reset by software to force the CSI to ON, even in Stop mode, to be quickly available as kernel clock for some peripherals. This bit has no effect on the value of CSION.

0: no effect on CSI (default after reset)

1: CSI is forced to ON even in Stop mode

Bit 9 **CSIRDY**: CSI clock ready flag

Set by hardware to indicate that the CSI oscillator is stable. This bit is activated only if the RC is enabled by CSION (it is not activated if the CSI is enabled by CSIKERON or by a peripheral request).

0: CSI clock is not ready (default after reset)

1: CSI clock is ready

Bit 8 **CSION**: CSI clock enable

Set and reset by software to enable/disable CSI clock for system and/or peripheral.

Set by hardware to force the CSI to ON when the system leaves Stop mode, if STOPWUCK = 1 or STOPKERWUCK = 1.

This bit cannot be cleared if the CSI is used directly (via SW mux) as system clock, or if the CSI is selected as reference clock for PLL1 with PLL1 enabled (PLL1ON bit set to 1).

0: CSI is OFF (default after reset)

1: CSI is ON

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **HSIDIVF**: HSI divider flag

Set and reset by hardware.

As a write operation to HSIDIV has not an immediate effect on the frequency, this flag indicates the

current status of the HSI divider. HSIDIVF goes immediately to 0 when HSIDIV value is changed, and is set back to 1 when the output frequency matches the value programmed into HSIDIV.

0: new division ratio not yet propagated to hsi_ck , hsi_ker_ck (default after reset)

1: hsi_ck , hsi_ker_ck clock frequency reflects the new HSIDIV value (default register value when the clock setting is completed).

Bits 4:3 **HSIDIV[1:0]**: HSI clock divider

Set and reset by software.

These bits allow selecting a division ratio to configure the wanted HSI clock frequency. The HSIDIV cannot be changed if the HSI is selected as reference clock for at least one enabled PLL (PLLxON bit set to 1). In that case, the new HSIDIV value is ignored..

00: division by 1, hsi_ck, hsi_ker_ck = 64 MHz

01: division by 2, hsi_ck, hsi_ker_ck = 32 MHz (default after reset)

10: division by 4, hsi_ck, hsi_ker_ck = 16 MHz

11: division by 8, hsi_ck, hsi_ker_ck = 8 MHz

Bit 2 **HSIKERON**: HSI clock enable in Stop mode

Set and reset by software to force the HSI to ON, even in Stop mode, to be quickly available as kernel clock for peripherals. This bit has no effect on the value of HSION.

0: no effect on HSI (default after reset)

1: HSI is forced to ON even in Stop mode

Bit 1 **HSIRDY**: HSI clock ready flag

Set by hardware to indicate that the HSI oscillator is stable.

0: HSI clock is not ready (default after reset)

1: HSI clock is ready

Bit 0 **HSION**: HSI clock enable

Set and cleared by software.

Set by hardware to force the HSI to ON when the product leaves Stop mode, if STOPWUCK = 1 or STOPKERWUCK = 1.

Set by hardware to force the HSI to ON when the product leaves Standby mode or in case of a failure of the HSE which is used as the system clock source.

This bit cannot be cleared if the HSI is used directly (via SW mux) as system clock, or if the HSI is selected as reference clock for PLL1 with PLL1 enabled (PLL1ON bit set to 1).

0: HSI is OFF

1: HSI is ON (default after reset)

11.8.2 RCC HSI calibration register (RCC_HSICFGR)

Address offset: 0x010

Reset value: 0x0040 0XXX

Reset value depends on the flash memory option bytes setting.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HSITRIM[6:0]						
									rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	HSICAL[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:16 **HSITRIM[6:0]**: HSI clock trimming

Set by software to adjust calibration.

HSITRIM field is added to the engineering option bytes loaded during reset phase (FLASH_HSI_OPT) to form the calibration trimming value.

HSICAL = HSITRIM + FLASH_HSI_OPT.

After a change of HSITRIM it takes one system clock cycle before the new HSITRIM value is updated

Note: The reset value of the field is 0x40.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **HSICAL[11:0]**: HSI clock calibration

Set by hardware by option byte loading during system reset nreset. Adjusted by software through trimming bits HSITRIM.

This field represents the sum of engineering option byte calibration and HSITRIM bits values.

11.8.3 RCC clock recovery RC register (RCC_CRRCR)

Address offset: 0x014

Reset value: 0x0000 0XXX

Reset value depends on the flash option bytes setting

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	HSI48CAL[9:0]									
						r	r	r	r	r	r	r	r	r	r

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **HSI48CAL[9:0]**: Internal RC 48 MHz clock calibration

Set by hardware by option-byte loading during system reset NRESET. Read-only.

11.8.4 RCC CSI calibration register (RCC_CSICFGR)

Address offset: 0x018

Reset value: 0x0020 0XXX

Reset value depends on the flash option bytes setting

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CSITRIM[5:0]					
										rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CSICAL[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:16 **CSITRIM[5:0]**: CSI clock trimming

Set by software to adjust calibration.

CSITRIM field is added to the engineering option bytes loaded during reset phase (FLASH_CSI_OPT) to form the calibration trimming value.

CSICAL = CSITRIM + FLASH_CSI_OPT.

Note: The reset value of the field is 0x20.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **CSICAL[7:0]**: CSI clock calibration

Set by hardware by option byte loading during system reset NRESET. Adjusted by software through trimming bits CSITRIM.

This field represents the sum of engineering option byte calibration value and CSITRIM bits value.

11.8.5 RCC clock configuration register1 (RCC_CFGR1)

Address offset: 0x01C

Reset value: 0x0000 0000

Access: 0 ≤ wait state ≤ 2; word, half-word and byte access

One or two wait states are inserted only if the access occurs during clock source switch.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MCO2SEL[2:0]			MCO2PRE[3:0]				MCO1SEL[2:0]			MCO1PRE[3:0]				Res.	Res.

rw		rw	rw	rw	rw	rw	rw	rw	rw		r	r		rw	rw

Bits 31:29 **MCO2SEL[2:0]**: microcontroller clock output 2

Set and cleared by software. Clock source selection may generate glitches on MCO2.
It is highly recommended to configure these bits only after reset, before enabling the external oscillators and the PLLs.
000: system clock selected (**sys_ck**) (default after reset)
001: PLL2 oscillator clock selected (**pll2_p_ck**)
010: HSE clock selected (**hse_ck**)
011: PLL1 clock selected (**pll1_p_ck**)
100: CSI clock selected (**csi_ck**)
101: LSI clock selected (**lsi_ck**)
Others: reserved

Bits 28:25 **MCO2PRE[3:0]**: MCO2 prescaler

Set and cleared by software to configure the prescaler of the MCO2. Modification of this prescaler may generate glitches on MCO2. It is highly recommended to change this prescaler only after reset, before enabling the external oscillators and the PLLs.
0000: prescaler disabled (default after reset)
0001: division by 1 (bypass)
0010: division by 2
0011: division by 3
0100: division by 4
...
1111: division by 15

Bits 24:22 **MCO1SEL[2:0]**: Microcontroller clock output 1

Set and cleared by software. Clock source selection may generate glitches on MCO1.
It is highly recommended to configure these bits only after reset, before enabling the external oscillators and the PLLs.
000: HSI clock selected (**hsi_ck**) (default after reset)
001: LSE oscillator clock selected (**lse_ck**)
010: HSE clock selected (**hse_ck**)
011: PLL1 clock selected (**pll1_q_ck**)
100: HSI48 clock selected (**hsi48_ck**)
Others: reserved

Bits 21:18 **MCO1PRE[3:0]**: MCO1 prescaler

Set and cleared by software to configure the prescaler of the MCO1. Modification of this prescaler may generate glitches on MCO1. It is highly recommended to change this prescaler only after reset, before enabling the external oscillators and the PLLs.

0000: prescaler disabled (default after reset)
0001: division by 1 (bypass)
0010: division by 2
0011: division by 3
0100: division by 4
...
1111: division by 15

Bits 17:16 Reserved, must be kept at reset value.

Bit 15 **TIMPRE**: timers clocks prescaler selection

This bit is set and reset by software to control the clock frequency of all the timers connected to APB1 and APB2 domains.

0: The timers kernel clock is equal to **rcc_hclk1** if PPRE1 or PPRE2 corresponds to a division by 1 or 2, else it is equal to 2 x $\mathbf{F_{rcc_pclk1}}$ or 2 x $\mathbf{F_{rcc_pclk2}}$ (default after reset)
1: The timers kernel clock is equal to 2 x $\mathbf{F_{rcc_pclk1}}$ or 2 x $\mathbf{F_{rcc_pclk2}}$ if PPRE1 or PPRE2 corresponds to a division by 1, 2 or 4, else it is equal to 4 x $\mathbf{F_{rcc_pclk1}}$ or 4 x $\mathbf{F_{rcc_pclk2}}$

Bit 14 Reserved, must be kept at reset value.

Bits 13:8 **RTCPRE[5:0]**: HSE division factor for RTC clock

Set and cleared by software to divide the HSE to generate a clock for RTC.
Caution: The software must set these bits correctly to ensure that the clock supplied to the RTC is lower than 1 MHz. These bits must be configured if needed before selecting the RTC clock source.

000000: no clock (default after reset)
000001: no clock
000010: HSE/2
000011: HSE/3
000100: HSE/4
...
111110: HSE/62
111111: HSE/63

Bit 7 **STOPKERWUCK**: kernel clock selection after a wakeup from system Stop

Set and reset by software to select the kernel wakeup clock from system Stop.

0: HSI selected as wakeup clock from system Stop (default after reset)
1: CSI selected as wakeup clock from system Stop

Bit 6 **STOPWUCK**: system clock selection after a wakeup from system Stop

Set and reset by software to select the system wakeup clock from system Stop.
The selected clock is also used as emergency clock for the clock security system (CSS) on HSE. 0: HSI selected as wakeup clock from system Stop (default after reset)
1: CSI selected as wakeup clock from system Stop

Caution: STOPWUCK must not be modified when CSS is enabled (by HSECSSON bit) and the system clock is HSE (SWS = 10) or a switch on HSE is requested (SW =10).

Bit 5 Reserved, must be kept at reset value.

Bits 4:3 **SWS[1:0]**: system clock switch status
Set and reset by hardware to indicate which clock source is used as system clock. 000: HSI used as system clock (**hsi_ck**) (default after reset).
01: CSI used as system clock (**csi_ck**)
10: HSE used as system clock (**hse_ck**)
11: PLL1 used as system clock (**pll1_p_ck**)
Others: reserved

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **SW[1:0]**: system clock and trace clock switch
Set and reset by software to select system clock and trace clock sources (**sys_ck**).
Set by hardware to:
-force the selection of the HSI or CSI (depending on STOPWUCK selection) when leaving a system Stop mode
-force the selection of the HSI in case of failure of the HSE when used directly or indirectly as system clock
00: HSI selected as system clock (**hsi_ck**) (default after reset)
01: CSI selected as system clock (**csi_ck**)
10: HSE selected as system clock (**hse_ck**)
11: PLL1 selected as system clock (**pll1_p_ck** for **sys_ck**)
Others: reserved

11.8.6 RCC CPU domain clock configuration register 2 (RCC_CFGR2)

Address offset: 0x020

Reset value: 0x0000 0000

1 or 2 wait states are inserted only if the access occurs during clock source switch.

From 0 to 15 wait states are inserted if the access occurs when the APB or AHB prescalers values update is ongoing.

	rw	rw	rw		rw	rw	rw		rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **APB3DIS**: APB3 clock disable value.Set and cleared by software
This bit can be set to further reduce power consumption, when none of the APB3 peripherals are used and when their clocks are disabled in RCC_APB3ENR. When this bit is set, all the APB3 peripherals clocks are off.
0: APB3 clock enabled, distributed to peripherals according to their dedicated clock enable control bits
1: APB3 clock disabled

Bit 21 **APB2DIS**: APB2 clock disable value

This bit can be set to further reduce power consumption, when none of the APB2 peripherals are used and when their clocks are disabled in RCC_APB2ENR. When this bit is set, all the APB2 peripherals clocks are off.

0: APB2 clock enabled, distributed to peripherals according to their dedicated clock enable control bits

1: APB2 clock disabled

Bit 20 **APB1DIS**: APB1 clock disable value

This bit can be set to further reduce power consumption, when none of the APB1 peripherals (except IWDG) are used and when their clocks are disabled in RCC_APB1ENR. When this bit is set, all the APB1 peripherals clocks are off, except for IWDG.

0: APB1 clock enabled, distributed to peripherals according to their dedicated clock enable control bits

1: APB1 clock disabled

Bit 19 **AHB4DIS**: AHB4 clock disable

This bit can be set to further reduce power consumption, when none of the AHB4 peripherals from RCC_AHB4ENR are used and when their clocks are disabled in RCC_AHB4ENR. When this bit is set, all the AHB4 peripherals clocks from RCC_AHB4ENR are off.

0: AHB4 clock enabled, distributed to peripherals according to their dedicated clock enable control bits

1: AHB4 clock disabled

Bit 18 Reserved, must be kept at reset value.

Bit 17 **AHB2DIS**: AHB2 clock disable

This bit can be set to further reduce power consumption, when none of the AHB2 peripherals from RCC_AHB2ENR are used and when their clocks are disabled in RCC_AHB2ENR. When this bit is set, all the AHB2 peripherals clocks are off, except for SRAM2 and SRAM3.

0: AHB2 clock enabled, distributed to peripherals according to their dedicated clock enable control bits

1: AHB2 clock disabled

Bit 16 **AHB1DIS**: AHB1 clock disable

This bit can be set to further reduce power consumption, when none of the AHB1 peripherals from RCC_AHB1ENR are used and when their clocks are disabled in RCC_AHB1ENR. When this bit is set, all the AHB1 peripherals clocks are off, except for FLASH, BKPSRAM, ICACHE, DCACHE1 and SRAM1.

0: AHB1 clock enabled, distributed to peripherals according to their dedicated clock enable control bits

1: AHB1 clock disabled

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **PPRE3[2:0]**: APB low-speed prescaler (APB3)

Set and reset by software to control APB low-speed clocks division factor.

The clocks are divided with the new prescaler factor from 1 to 16 APB cycles after PPRE3 write.

0xx: rcc_pclk3 = rcc_hclk1

100: rcc_pclk3 = rcc_hclk1 / 2

101: rcc_pclk3 = rcc_hclk1 / 4

110: rcc_pclk3 = rcc_hclk1 / 8

111: rcc_pclk3 = rcc_hclk1 / 16

Bit 11 Reserved, must be kept at reset value.

Bits 10:8 **PPRE2[2:0]**: APB high-speed prescaler (APB2)

Set and reset by software to control APB high-speed clocks division factor.
The clocks are divided with the new prescaler factor from 1 to 16 APB cycles after PPRE2 write.
0xx: rcc_pclk2 = rcc_hclk1
100: rcc_pclk2 = rcc_hclk1 / 2
101: rcc_pclk2 = rcc_hclk1 / 4
110: rcc_pclk2 = rcc_hclk1 / 8
111: rcc_pclk2 = rcc_hclk1 / 16

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **PPRE1[2:0]**: APB low-speed prescaler (APB1)

Set and reset by software to control the division factor of rcc_pclk1.
The clock is divided by the new prescaler factor from 1 to 16 cycles of rcc_hclk after PPRE write.
0xx: rcc_pclk1 = rcc_hclk1 (default after reset)
100: rcc_pclk1 = rcc_hclk1 / 2
101: rcc_pclk1 = rcc_hclk1 / 4
110: rcc_pclk1 = rcc_hclk1 / 8
111: rcc_pclk1 = rcc_hclk1 / 16

Bits 3:0 **HPRE[3:0]**: AHB prescaler

Set and reset by software to control the division factor of rcc_hclk. Changing this division ratio has an impact on the frequency of all bus matrix clocks
0xxx: rcc_hclk = sys_ck (default after reset)
1000: rcc_hclk = sys_ck / 2
1001: rcc_hclk = sys_ck / 4
1010: rcc_hclk = sys_ck / 8
1011: rcc_hclk = sys_ck / 16
1100: rcc_hclk = sys_ck / 64
1101: rcc_hclk = sys_ck / 128
1110: rcc_hclk = sys_ck / 256
1111: rcc_hclk = sys_ck / 512

Caution: Be careful when using the voltage scaling. Due to the propagation delay of the new division factor, after a prescaler factor change, and before lowering the V_{CORE} voltage, this register must be read to check that the new prescaler value has been taken into account.
Depending upon the clock source frequency and the voltage range, the software application must program a correct value in HPRE to make sure that the system frequency does not exceed the maximum frequency.

11.8.7 RCC PLL clock source selection register (RCC_PLL1CFGR)

Address offset: 0x028

Reset value: 0x0000 0000

Access: no wait state, word, half-word and byte access

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

		rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **PLL1REN**: PLL1 DIVR divider output enable

Set and reset by software to enable the pll1_r_ck output of the PLL1.

To save power, DIVR1EN and DIVR1 bits must be set to 0 when the pll1_r_ck is not used.

This bit can be written only when the PLL1 is disabled (PLL1ON = 0 and PLL1RDY = 0).

0: pll1_r_ck output disabled (default after reset)

1: pll1_r_ck output enabled

Bit 17 **PLL1QEN**: PLL1 DIVQ divider output enable

Set and reset by software to enable the pll1_q_ck output of the PLL1.

To save power, when the pll1_q_ck output of the PLL1 is not used, the pll1_q_ck must be disabled.

This bit can be written only when the PLL1 is disabled (PLL1ON = 0 and PLL1RDY = 0).

0: pll1_q_ck output disabled (default after reset)

1: pll1_q_ck output enabled

Bit 16 **PLL1PEN**: PLL1 DIVP divider output enable

Set and reset by software to enable the pll1_p_ck output of the PLL1.

This bit can be written only when the PLL1 is disabled (PLL1ON = 0 and PLL1RDY = 0).

To save power, when the pll1_p_ck output of the PLL1 is not used, the pll1_p_ck must be disabled.

0: pll1_p_ck output disabled (default after reset)

1: pll1_p_ck output enabled

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **PLL1M[5:0]**: prescaler for PLL1

Set and cleared by software to configure the prescaler of the PLL1.
The hardware does not allow any modification of this prescaler when PLL1 is enabled (PLL1ON = 1 or PLL1RDY = 1).
To save power when PLL1 is not used, the value of PLL1M must be set to 0.
000000: prescaler disabled (default after reset)
000001: division by 1 (bypass)
000010: division by 2
000011: division by 3
...
100000: division by 32
...
111111: division by 63

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **PLL1VCOSEL**: PLL1 VCO selection

Set and reset by software to select the proper VCO frequency range used for PLL1. This bit must be written before enabling the PLL1.
0: wide VCO range: 128 to 560 MHz (default after reset)
1: medium VCO range: 150 to 420 MHz

Bit 4 **PLL1FRACEN**: PLL1 fractional latch enable

Set and reset by software to latch the content of FRACN1 into the sigma-delta modulator.
To latch the FRACN1 value into the sigma-delta modulator, PLL1FRACEN must be set to 0, then set to 1. The transition 0 to 1 transfers the content of FRACN1 into the modulator.

Bits 3:2 **PLL1RGE[1:0]**: PLL1 input frequency range

Set and reset by software to select the proper reference frequency range used for PLL1. This bit must be written before enabling the PLL1.
00: PLL1 input (ref1_ck) clock range frequency between 1 and 2 MHz (default after reset)
01: PLL1 input (ref1_ck) clock range frequency between 2 and 4 MHz
10: PLL1 input (ref1_ck) clock range frequency between 4 and 8 MHz
11: PLL1 input (ref1_ck) clock range frequency between 8 and 16 MHz

Bits 1:0 **PLL1SRC[1:0]**: PLL1M and PLLs clock source selection

Set and reset by software to select the PLL clock source. These bits can be written only when all PLLs are disabled.
To save power, when no PLL is used, the value of PLL1SRC must be set to '00'.
00: no clock send to PLL1M divider and PLLs (default after reset).
01: HSI selected as PLL clock (hsi_ck)
10: CSI selected as PLL clock (csi_ck)
11: HSE selected as PLL clock (hse_ck)

11.8.8 RCC PLL clock source selection register (RCC_PLL2CFGR)

Address offset: 0x02C

Reset value: 0x0000 0000

Access: no wait state, word, half-word and byte access

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **PLL2REN**: PLL2 DIVR divider output enable

Set and reset by software to enable the pll2_r_ck output of the PLL2.
To save power, DIVR2EN and DIVR2 bits must be set to 0 when the pll2_r_ck is not used.
0: pll2_r_ck output disabled (default after reset)
1: pll2_r_ck output enabled

Bit 17 **PLL2QEN**: PLL2 DIVQ divider output enable

Set and reset by software to enable the pll2_q_ck output of the PLL2.
To save power, when the pll2_q_ck output of the PLL2 is not used, the pll2_q_ck must be disabled.
0: pll2_q_ck output disabled (default after reset)
1: pll2_q_ck output enabled

Bit 16 **PLL2PEN**: PLL2 DIVP divider output enable

Set and reset by software to enable the pll2_p_ck output of the PLL2.
To save power, when the pll2_p_ck output of the PLL2 is not used, the pll2_p_ck must be disabled.
0: pll2_p_ck output disabled (default after reset)
1: pll2_p_ck output enabled

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **PLL2M[5:0]**: prescaler for PLL2

Set and cleared by software to configure the prescaler of the PLL2.
The hardware does not allow any modification of this prescaler when PLL2 is enabled (PLL2ON = 1 or PLL2RDY = 1).
To save power when PLL2 is not used, the value of PLL2M must be set to 0.
000000: prescaler disabled (default after reset)
000001: division by 1 (bypass)
000010: division by 2
000011: division by 3
...
100000: division by 32
...
111111: division by 63

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **PLL2VCOSEL**: PLL2 VCO selection

Set and reset by software to select the proper VCO frequency range used for PLL2.
This bit must be written before enabling the PLL2.
0: wide VCO range: 128 to 560 MHz (default after reset)
1: medium VCO range 150 to 420 MHz

Bit 4 **PLL2FRACEN**: PLL2 fractional latch enable

Set and reset by software to enable the pll2_p_ck output of the PLL2.
To save power, when the pll2_p_ck output of the PLL2 is not used, the pll2_p_ck must be disabled.
0: pll2_p_ck output disabled (default after reset)
1: pll2_p_ck output enabled

Bits 3:2 **PLL2RGE[1:0]**: PLL2 input frequency range

Set and reset by software to select the proper reference frequency range used for PLL2.
These bits must be written before enabling the PLL2.
00: PLL2 input (ref2_ck) clock range frequency between 1 and 2 MHz (default after reset)
01: PLL2 input (ref2_ck) clock range frequency between 2 and 4 MHz
10: PLL2 input (ref2_ck) clock range frequency between 4 and 8 MHz
11: PLL2 input (ref2_ck) clock range frequency between 8 and 16 MHz

Bits 1:0 **PLL2SRC[1:0]**: PLL2M and PLLs clock source selection

Set and reset by software to select the PLL clock source.
These bits can be written only when all PLLs are disabled.
To save power, when no PLL is used, the value of PLL2SRC must be set to '00'.
00: no clock send to PLL2M divider and PLLs (default after reset)
01: HSI selected as PLL clock (hsi_ck)
10: CSI selected as PLL clock (csi_ck)
11: HSE selected as PLL clock (hse_ck)

11.8.9 RCC PLL clock source selection register (RCC_PLL3CFGR)

Address offset: 0x030

Reset value: 0x0000 0000

Access: no wait state, word, half-word and byte access

Note: The RCC_PLL3CFGR register is not available on STM32H543/553xx devices

Bit 18 **PLL3REN**: PLL3 DIVR divider output enable
Set and reset by software to enable the pll3_r_ck output of the PLL3.
To save power, DIVR2EN and DIVR2 bits must be set to 0 when the pll3_r_ck is not used.
0: pll3_r_ck output disabled (default after reset)
1: pll3_r_ck output enabled

Bit 17 **PLL3QEN**: PLL3 DIVQ divider output enable
Set and reset by software to enable the pll3_q_ck output of the PLL3.
To save power, when the pll3_q_ck output of the PLL3 is not used, the pll3_q_ck must be disabled.
0: pll3_q_ck output disabled (default after reset)
1: pll3_q_ck output enabled

Bit 16 **PLL3PEN**: PLL3 DIVP divider output enable
Set and reset by software to enable the pll3_p_ck output of the PLL3.
To save power, when the pll3_p_ck output of the PLL3 is not used, the pll3_p_ck must be disabled.
0: pll3_p_ck output disabled (default after reset)
1: pll3_p_ck output enabled

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **PLL3M[5:0]**: prescaler for PLL3
Set and cleared by software to configure the prescaler of the PLL3.
The hardware does not allow any modification of this prescaler when PLL3 is enabled (PLL3ON = 1 or PLL3RDY = 1).
To save power when PLL3 is not used, the value of PLL3M must be set to 0.
000000: prescaler disabled (default after reset)
000001: division by 1 (bypass)
000010: division by 2
000011: division by 3

111111: division by 63

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **PLL3VCOSEL**: PLL3 VCO selection
Set and reset by software to select the proper VCO frequency range used for PLL3.
This bit must be written before enabling the PLL3.
0: wide VCO range 128 to 560 MHz (default after reset)
1: medium VCO range 150 to 420 MHz

Bit 4 **PLL3FRACEN**: PLL3 fractional latch enable
Set and reset by software to latch the content of FRACN3 into the sigma-delta modulator.
To latch the FRACN3 value into the sigma-delta modulator, PLL3FRACEN must be set to 0, then set to 1. The transition 0 to 1 transfers the content of FRACN3 into the modulator.

Bits 3:2 **PLL3RGE[1:0]**: PLL3 input frequency range
Set and reset by software to select the proper reference frequency range used for PLL3.
This bit must be written before enabling the PLL3.
00: PLL3 input (ref3_ck) clock range frequency between 1 and 2 MHz (default after reset)
01: PLL3 input (ref3_ck) clock range frequency between 2 and 4 MHz
10: PLL3 input (ref3_ck) clock range frequency between 4 and 8 MHz
11: PLL3 input (ref3_ck) clock range frequency between 8 and 16 MHz

Bits 1:0 **PLL3SRC[1:0]**: PLL3M and PLLs clock source selection

Set and reset by software to select the PLL clock source. These bits can be written only when all PLLs are disabled.
To save power, when no PLL is used, the value of PLL3SRC must be set to '00'.
00: no clock send to PLL3M divider and PLLs (default after reset)
01: HSI selected as PLL clock (hsi_ck)
10: CSI selected as PLL clock (csi_ck)
11: HSE selected as PLL clock (hse_ck)

11.8.10 RCC PLL1 dividers register (RCC_PLL1DIVR)

Address offset: 0x034

Reset value: 0x0101 0280

Access: no wait state, word, half-word and byte access

PLL1FRACN[12:0]													Res.	Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw			

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:3 **PLL1FRACN[12:0]**: fractional part of the multiplication factor for PLL1 VCO

Set and reset by software to control the fractional part of the multiplication factor of the VCO. These bits can be written at any time, allowing dynamic fine-tuning of the PLL1 VCO.

Caution: The software must set correctly these bits to insure that the VCO output frequency is in the valid frequency range, that is:
* 128 to 560 MHz if PLL1VCOSEL = 0
* 150 to 420 MHz if PLL1VCOSEL = 1
VCO output frequency = F_{ref1_ck} x (PLL1N + (PLL1FRACN / 2^{13})), with
* PLL1N between 8 and 420
* PLL1FRACN between 0 and 2^{13} - 1
* The input frequency F_{ref1_ck} must be between 1 and 16 MHz.
To change the PLL1FRACN value on-the-fly even if the PLL is enabled, the application must proceed as follows:
* Set the bit PLL1FRACEN to 0
* Write the new fractional value into PLL1FRACN
* Set the bit PLL1FRACEN to 1

Bits 2:0 Reserved, must be kept at reset value.

11.8.12 RCC PLL2 dividers register (RCC_PLL2DIVR)

Address offset: 0x03C

Reset value: 0x0101 0280

Access: no wait state, word, half-word and byte access

Bit 31 Reserved, must be kept at reset value.

Bits 30:24 **PLL2R[6:0]**: PLL2 DIVR division factor

Set and reset by software to control the frequency of the pll2_r_ck clock.
These bits can be written only when the PLL1 is disabled (PLL2ON = 0 and PLL2RDY = 0).
0000000: pll2_r_ck = vco2_ck
0000001: pll2_r_ck = vco2_ck / 2 (default after reset)
0000010: pll2_r_ck = vco2_ck / 3
0000011: pll2_r_ck = vco2_ck / 4
...
1111111: pll2_r_ck = vco2_ck / 128

Bit 23 Reserved, must be kept at reset value.

Bits 22:16 **PLL2Q[6:0]**: PLL2 DIVQ division factor
Set and reset by software to control the frequency of the pll2_q_ck clock.
These bits can be written only when the PLL2 is disabled (PLL2ON = 0 and PLL2RDY = 0).
0000000: pll2_q_ck = vco2_ck
0000001: pll2_q_ck = vco2_ck / 2 (default after reset)
0000010: pll2_q_ck = vco2_ck / 3
0000011: pll2_q_ck = vco2_ck / 4
...
1111111: pll2_q_ck = vco2_ck / 128

Bits 15:9 **PLL2P[6:0]**: PLL2 DIVP division factor
Set and reset by software to control the frequency of the pll2_p_ck clock.
These bits can be written only when the PLL2 is disabled (PLL2ON = 0 and PLL2RDY = 0).
0000000: pll2_p_ck = vco2_ck
0000001: pll2_p_ck = vco2_ck / 2 (default after reset)
0000010: pll2_p_ck = vco2_ck / 3
0000011: pll2_p_ck = vco2_ck / 4
...
1111111: pll2_p_ck = vco2_ck / 128

Bits 8:0 **PLL2N[8:0]**: Multiplication factor for PLL2VCO
Set and reset by software to control the multiplication factor of the VCO.
These bits can be written only when the PLL is disabled (PLL2ON = 0 and PLL2RDY = 0).
0x003: PLL2N = 4
0x004: PLL2N = 5
0x005: PLL2N = 6
...
0x080: PLL2N = 129 (default after reset)
...
0x1FF: PLL2N = 512
Others: reserved

11.8.13 RCC PLL2 fractional divider register (RCC_PLL2FRACR)

							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **PLL3RDYIE**: PLL3 ready interrupt enable

Set and reset by software to enable/disable interrupt caused by PLL3 lock.
0: PLL3 lock interrupt disabled (default after reset)
1: PLL3 lock interrupt enabled

Note: This bit is not available on STM32H543/553xx devices. If not present, consider this bit as reserved and keep it at reset value.

Bit 7 **PLL2RDYIE**: PLL2 ready interrupt enable

Set and reset by software to enable/disable interrupt caused by PLL2 lock.
0: PLL2 lock interrupt disabled (default after reset)
1: PLL2 lock interrupt enabled

Bit 6 **PLL1RDYIE**: PLL1 ready interrupt enable

Set and reset by software to enable/disable interrupt caused by PLL1 lock.
0: PLL1 lock interrupt disabled (default after reset)
1: PLL1 lock interrupt enabled

Bit 5 **HSI48RDYIE: HSI48 ready interrupt enable**
Set and reset by software to enable/disable interrupt caused by the HSI48 oscillator stabilization.
0: HSI48 ready interrupt disabled (default after reset)
1: HSI48 ready interrupt enabled

Bit 4 **HSERDYIE**: HSE ready interrupt enable
Set and reset by software to enable/disable interrupt caused by the HSE oscillator stabilization.
0: HSE ready interrupt disabled (default after reset)
1: HSE ready interrupt enabled

Bit 3 **HSIRDYIE**: HSI ready interrupt enable
Set and reset by software to enable/disable interrupt caused by the HSI oscillator stabilization.
0: HSI ready interrupt disabled (default after reset)
1: HSI ready interrupt enabled

Bit 2 **CSIRDYIE**: CSI ready interrupt enable
Set and reset by software to enable/disable interrupt caused by the CSI oscillator stabilization.
0: CSI ready interrupt disabled (default after reset)
1: CSI ready interrupt enabled

Bit 1 **LSERDYIE**: LSE ready interrupt enable
Set and reset by software to enable/disable interrupt caused by the LSE oscillator stabilization.
0: LSE ready interrupt disabled (default after reset)
1: LSE ready interrupt enabled

Bit 0 **LSIRDYIE**: LSI ready interrupt enable
Set and reset by software to enable/disable interrupt caused by the LSI oscillator stabilization.
0: LSI ready interrupt disabled (default after reset)
1: LSI ready interrupt enabled

11.8.17 RCC clock source interrupt flag register (RCC_CIFR)

Address offset: 0x054

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

					r		r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **HSECSSF**: HSE clock security system interrupt flag
Reset by software by writing HSECSSC bit.
Set by hardware in case of HSE clock failure.
0: no clock security interrupt caused by HSE clock failure (default after reset)
1: clock security interrupt caused by HSE clock failure

Bit 9 Reserved, must be kept at reset value.

Bit 8 **PLL3RDYF**: PLL3 ready interrupt flag
Reset by software by writing PLL3RDYC bit.
Set by hardware when the PLL3 locks and PLL3RDYIE is set.
0: no clock ready interrupt caused by PLL3 lock (default after reset)
1: clock ready interrupt caused by PLL3 lock
Note: This bit is not available on STM32H543/553xx devices. If not present, consider this bit as reserved and keep it at reset value.

Bit 7 **PLL2RDYF**: PLL2 ready interrupt flag
Reset by software by writing PLL2RDYC bit.
Set by hardware when the PLL2 locks and PLL2RDYIE is set.
0: no clock ready interrupt caused by PLL2 lock (default after reset)
1: clock ready interrupt caused by PLL2 lock

Bit 6 **PLL1RDYF**: PLL1 ready interrupt flag
Reset by software by writing PLL1RDYC bit.
Set by hardware when the PLL1 locks and PLL1RDYIE is set.
0: no clock ready interrupt caused by PLL1 lock (default after reset)
1: clock ready interrupt caused by PLL1 lock

Bit 5 **HSI48RDYF**: HSI48 ready interrupt flag
Reset by software by writing HSI48RDYC bit.
Set by hardware when the HSI48 clock becomes stable and HSI48RDYIE is set.
0: no clock ready interrupt caused by the HSI48 oscillator (default after reset)
1: clock ready interrupt caused by the HSI48 oscillator

Bit 4 **HSERDYF**: HSE ready interrupt flag
Reset by software by writing HSERDYC bit.
Set by hardware when the HSE clock becomes stable and HSERDYIE is set.
0: no clock ready interrupt caused by the HSE (default after reset)
1: clock ready interrupt caused by the HSE

Bit 3 **HSIRDYF**: HSI ready interrupt flag
Reset by software by writing HSIRDYC bit.
Set by hardware when the HSI clock becomes stable and HSIRDYIE is set.
0: no clock ready interrupt caused by the HSI (default after reset)
1: clock ready interrupt caused by the HSI

Bit 2 **CSIRDYF**: CSI ready interrupt flag
Reset by software by writing CSIRDYC bit.
Set by hardware when the CSI clock becomes stable and CSIRDYIE is set.
0: no clock ready interrupt caused by the CSI (default after reset)
1: clock ready interrupt caused by the CSI

Bit 1 **LSERDYF**: LSE ready interrupt flag
Reset by software by writing LSERDYC bit.
Set by hardware when the LSE clock becomes stable and LSERDYIE is set.
0: no clock ready interrupt caused by the LSE (default after reset)
1: clock ready interrupt caused by the LSE

Bit 0 **LSIRDYF**: LSI ready interrupt flag
Reset by software by writing LSIRDYC bit.
Set by hardware when the LSI clock becomes stable and LSIRDYIE is set.
0: no clock ready interrupt caused by the LSI (default after reset)
1: clock ready interrupt caused by the LSI

11.8.18 RCC clock source interrupt clear register (RCC_CICR)

Address offset: 0x058

Reset value: 0x0000 0000

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **HSECSSC**: HSE clock security system interrupt clear
Set by software to clear HSECSSF.
Reset by hardware when clear done.
0: HSECSSF no effect (default after reset)
1: HSECSSF cleared

Bit 9 Reserved, must be kept at reset value.

Bit 8 **PLL3RDYC**: PLL3 ready interrupt clear
Set by software to clear PLL3RDYF.
Reset by hardware when clear done.
0: PLL3RDYF no effect (default after reset)
1: PLL3RDYF cleared
Note: This bit is not available on STM32H543/553xx devices. If not present, consider this bit as reserved and keep it at reset value.

Bit 7 **PLL2RDYC**: PLL2 ready interrupt clear
Set by software to clear PLL2RDYF.
Reset by hardware when clear done.
0: PLL2RDYF no effect (default after reset)
1: PLL2RDYF cleared

Bit 6 **PLL1RDYC**: PLL1 ready interrupt clear
Set by software to clear PLL1RDYF.
Reset by hardware when clear done.
0: PLL1RDYF no effect (default after reset)
1: PLL1RDYF cleared

Bit 5 **HSI48RDYC**: HSI48 ready interrupt clear
Set by software to clear HSI48RDYF.
Reset by hardware when clear done.
0: HSI48RDYF no effect (default after reset)
1: HSI48RDYF cleared

Bit 4 **HSERDYC**: HSE ready interrupt clear
Set by software to clear HSERDYF.
Reset by hardware when clear done.
0: HSERDYF no effect (default after reset)
1: HSERDYF cleared

Bit 3 **HSIRDYC**: HSI ready interrupt clear
Set by software to clear HSIRDYF.
Reset by hardware when clear done.
0: HSIRDYF no effect (default after reset)
1: HSIRDYF cleared

Bit 2 **CSIRDYC**: HSI ready interrupt clear
Set by software to clear CSIRDYF.
Reset by hardware when clear done.
0: CSIRDYF no effect (default after reset)
1: CSIRDYF cleared

Bit 1 **LSERDYC**: LSE ready interrupt clear
Set by software to clear LSERDYF.
Reset by hardware when clear done.
0: LSERDYF no effect (default after reset)
1: LSERDYF cleared

Bit 0 **LSIRDYC**: LSI ready interrupt clear
Set by software to clear LSIRDYF.
Reset by hardware when clear done.
0: LSIRDYF no effect (default after reset)
1: LSIRDYF cleared

11.8.19 RCC AHB1 reset register (RCC_AHB1RSTR)

Address offset: 0x060

Reset value: 0x0000 0000

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **ETHRST**: ETHRST block reset
Set and reset by software
0: does not reset ETHRST block (default after reset)
1: resets the ETHRST block

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 18 Reserved, must be kept at reset value.

Bit 17 **RAMCFGRST**: RAMCFG block reset
Set and reset by software.
0: does not reset RAMCFG block (default after reset)
1: resets RAMCFG block

Bit 16 Reserved, must be kept at reset value.

Bit 15 **FMACRST**: FMAC block reset
Set and reset by software.
0: does not reset FMAC block (default after reset)
1: resets FMAC block
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value..

Bit 14 **CORDICRST**: CORDIC block reset
Set and reset by software.
0: does not reset CORDIC block (default after reset)
1: resets CORDIC block
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 13 Reserved, must be kept at reset value.

Bit 12 **CRCRST**: CRC block reset Set and reset by software.
0: does not reset CRC block (default after reset)
1: resets CRC block

Bits 11:2 Reserved, must be kept at reset value.

Bit 1 **GPDMA2RST**: GPDMA2 block reset
Set and reset by software.
0: does not reset GPDMA2 block (default after reset)
1: resets GPDMA2 block

Bit 0 **GPDMA1RST**: GPDMA1 block reset
Set and reset by software.
0: does not reset GPDMA1 block (default after reset)
1: resets GPDMA1 block

			rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **ADC3RST**: ADC3 reset
Set and reset by software.
0: does not reset ADC3 (default after reset)
1: resets ADC3
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **CCBRST**: CCB reset
Set and reset by software.
0: does not reset CCB(default after reset)
1: resets CCB
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 20 **SAESRST**: SAES block reset
Set and reset by software.
0: does not reset SAES block (default after reset)
1: resets SAES block

Bit 19 **PKARST**: PKA block reset
Set and reset by software.
0: does not reset PKA block (default after reset)
1: resets PKA block

Bit 18 **RNGRST**: RNG block reset
Set and reset by software.
0: does not reset RNG block (default after reset)
1: resets RNG block

Bit 17 **HASHRST**: HASH block reset
Set and reset by software.
0: does not reset HASH block (default after reset)
1: resets HASH block

Bit 16 **AESRST**: AES block reset
Set and reset by software.
0: does not reset AES block (default after reset)
1: resets AES block

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **DCMI_PSSIRST**: digital camera interface block reset (DCMI or PSSI depending which interface is active)
Set and reset by software.
0: does not reset the DCMI/PSSI block (default after reset)
1: resets the DCMI/PSSI block
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 11 **DAC1RST**: DAC block reset
Set and reset by software.
0: does not reset DAC block (default after reset)
1: resets DAC block

Bit 10 **ADCRST**: ADC1 and 2 blocks reset
Set and reset by software.
0: does not reset ADC1 and 2 blocks (default after reset)
1: resets ADC1 and 2 blocks

Bit 9 Reserved, must be kept at reset value.

Bit 8 **GPIOIRST**: GPIOI block reset
Set and reset by software.
0: does not reset the GPIOI block (default after reset)
1: resets the GPIOI block
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 7 **GPIOHRST**: GPIOH block reset
Set and reset by software.
0: does not reset the GPIOH block (default after reset)
1: resets the GPIOH block

Bit 6 **GPIOGRST**: GPIOG block reset
Set and reset by software.
0: does not reset the GPIOG block (default after reset)
1: resets the GPIOG block

Bit 5 **GPIOFRST**: GPIOF block reset
Set and reset by software.
0: does not reset the GPIOF block (default after reset)
1: resets the GPIOF block

Bit 4 **GPIOERST**: GPIOE block reset
Set and reset by software.
0: does not reset the GPIOE block (default after reset)
1: resets the GPIOE block

Bit 3 **GPIODRST**: GPIOD block reset
Set and reset by software.
0: does not reset the GPIOD block (default after reset)
1: resets the GPIOD block

Bit 2 **GPIOCRST**: GPIOC block reset
Set and reset by software.
0: does not reset the GPIOC block (default after reset)
1: resets the GPIOC block

Bit 1 **GPIOBRST**: GPIOB block reset
Set and reset by software.
0: does not reset the GPIOB block (default after reset)
1: resets the GPIOB block

Bit 0 **GPIOARST**: GPIOA block reset
Set and reset by software.
0: does not reset the GPIOA block (default after reset)
1: resets the GPIOA block

11.8.21 RCC AHB4 peripheral reset register (RCC_AHB4RSTR)

Address offset: 0x06C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

			rw	rw				rw							

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **OCTOSPI1RST**: OCTOSPI1 block reset
Set and reset by software.
0: does not reset OCTOSPI1 block (default after reset)
1: resets OCTOSPI1 block

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **FMCRST**: FMC block reset
Set and reset by software.
0: does not reset FMC block (default after reset)
1: resets FMC block

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **SDMMC2RST**: SDMMC2 and SDMMC2 delay blocks reset
Set and reset by software.
0: does not reset SDMMC2 and SDMMC2 delay blocks (default after reset)
1: resets SDMMC2 and SDMMC2 delay blocks
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 11 **SDMMC1RST**: SDMMC1 and SDMMC1 delay blocks reset
Set and reset by software.
0: does not reset SDMMC1 and SDMMC1 delay blocks (default after reset)
1: resets SDMMC1 and SDMMC1 delay blocks

Bits 10:8 Reserved, must be kept at reset value.

Bit 7 **OTFDEC1RST**: OTFDEC1 block reset
Set and reset by software.
0: does not reset OTFDEC1 block (default after reset)
1: resets OTFDEC1 block

Bits 6:0 Reserved, must be kept at reset value.

11.8.22 RCC APB1 peripheral low reset register (RCC_APB1LRSTR)

Address offset: 0x074

Reset value: 0x0000 0000

rw	rw						rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **UART8RST**: UART8 block reset

Set and reset by software.

0: does not reset the UART8 block (default after reset)

1: resets the UART8 block

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 30 **UART7RST**: UART7 block reset

Set and reset by software.

0: does not reset the UART7 block (default after reset)

1: resets the UART7 block

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 29 Reserved, must be kept at reset value.

Bit 28 **CECRST**: HDMI-CEC block reset

Set and reset by software.

0: does not reset the HDMI-CEC block (default after reset)

1: resets the HDMI-CEC block

Bit 27 **USART11RST**: USART11 block reset

Set and reset by software.

0: does not reset the USART11 block (default after reset)

1: resets the USART11 block

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 26 **USART10RST**: USART10 block reset

Set and reset by software.

0: does not reset the USART10 block (default after reset)

1: resets the USART10 block

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 25 **USART6RST**: USART6 block reset
Set and reset by software.
0: does not reset the USART6 block (default after reset)
1: resets the USART6 block

Bit 24 **CRSRST**: CRS block reset
Set and reset by software.
0: does not reset the CRS block (default after reset)
1: resets the CRS block

Bit 23 **I3C1RST**: I3C1 block reset
Set and reset by software.
0: does not reset the I3C1 block (default after reset)
1: resets the I3C1 block

Bit 22 **I2C2RST**: I2C2 block reset
Set and reset by software.
0: does not reset the I2C2 block (default after reset)
1: resets the I2C2 block

Bit 21 **I2C1RST**: I2C1 block reset
Set and reset by software.
0: does not reset the I2C1 block (default after reset)
1: resets the I2C1 block

Bit 20 **UART5RST**: UART5 block reset
Set and reset by software.
0: does not reset the UART5 block (default after reset)
1: resets the UART5 block

Bit 19 **UART4RST**: UART4 block reset
Set and reset by software.
0: does not reset the UART4 block (default after reset)
1: resets the UART4 block

Bit 18 **USART3RST**: USART3 block reset
Set and reset by software.
0: does not reset the USART3 block (default after reset)
1: resets the USART3 block

Bit 17 **USART2RST**: USART2 block reset
Set and reset by software.
0: does not reset the USART2 block (default after reset)
1: resets the USART2 block

Bit 16 **COMPRST**: COMP block reset
Set and reset by software.
0: does not reset the COMP block (default after reset)
1: resets the COMP block

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 15 **SPI3RST**: SPI3 block reset
Set and reset by software.
0: does not reset the SPI3 block (default after reset)
1: resets the SPI3 block

Bit 14 **SPI2RST**: SPI2 block reset
Set and reset by software.
0: does not reset the SPI2 block (default after reset)
1: resets the SPI2 block

Bits 13:9 Reserved, must be kept at reset value.

Bit 8 **TIM14RST**: TIM14 block reset
Set and reset by software.
0: does not reset the TIM14 block (default after reset)
1: resets the TIM14 block
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 7 **TIM13RST**: TIM13 block reset
Set and reset by software.
0: does not reset the TIM13 block (default after reset)
1: resets the TIM13 block
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 6 **TIM12RST**: TIM12 block reset
Set and reset by software.
0: does not reset the TIM12 block (default after reset)
1: resets the TIM12 block

Bit 5 **TIM7RST**: TIM7 block reset
Set and reset by software.
0: does not reset the TIM7 block (default after reset)
1: resets the TIM7 block

Bit 4 **TIM6RST**: TIM6 block reset
Set and reset by software.
0: does not reset the TIM6 block (default after reset)
1: resets the TIM6 block

Bit 3 **TIM5RST**: TIM5 block reset
Set and reset by software.
0: does not reset the TIM5 block (default after reset)
1: resets the TIM5 block

Bit 2 **TIM4RST**: TIM4 block reset
Set and reset by software.
0: does not reset the TIM4 block (default after reset)
1: resets the TIM4 block

Bit 1 **TIM3RST**: TIM3 block reset
Set and reset by software.
0: does not reset the TIM3 block (default after reset)
1: resets the TIM3 block

Bit 0 **TIM2RST**: TIM2 block reset
Set and reset by software.
0: does not reset the TIM2 block (default after reset)
1: resets the TIM2 block

11.8.23 RCC APB1 peripheral high reset register (RCC_APB1HRSTR)

Address offset: 0x078

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

						rw				rw		rw		rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **UCPD1RST**: UCPD1 block reset
Set and reset by software.
0: does not reset the UCPD1 block (default after reset)
1: resets the UCPD1 block

Bits 22:10 Reserved, must be kept at reset value.

Bit 9 **FDCANRST**: FDCAN1 and FDCAN2 blocks reset
Set and reset by software.
0: does not reset the FDCAN1 and FDCAN2 blocks (default after reset)
1: resets the FDCAN1 and FDCAN2 blocks

Bits 8:6 Reserved, must be kept at reset value.

Bit 5 **LPTIM2RST**: LPTIM2 block reset
Set and reset by software.
0: does not reset the LPTIM2 block (default after reset)
1: resets the LPTIM2 block

Bit 4 Reserved, must be kept at reset value.

Bit 3 **DTSRST**: DTS block reset
Set and reset by software.
0: does not reset the DTS block (default after reset)
1: resets the DTS block

Bit 2 Reserved, must be kept at reset value.

Bit 1 **UART12RST**: UART12 block reset
Set and reset by software.
0: does not reset the UART12 block (default after reset)
1: resets the UART12 block

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 0 **UART9RST**: UART9 block reset
Set and reset by software.
0: does not reset UART9 block (default after reset)
1: resets UART9 block

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

11.8.24 RCC APB2 peripheral reset register (RCC_APB2RSTR)

Address offset: 0x07C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	USBRST	Res.	SAI2RST	SAI1RST	SPI6RST	SPI4RST	TIM17RST	TIM16RST	TIM15RST
							rw		rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	USART1RST	TIM8RST	SPI1RST	TIM1RST	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
	rw	rw	rw	rw											

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **USBRST**: USB block reset
Set and reset by software.
0: does not reset the USB block (default after reset)
1: resets the USB block

Bit 23 Reserved, must be kept at reset value.

Bit 22 **SAI2RST**: SAI2 block reset
Set and reset by software.
0: does not reset the SAI2 block (default after reset)
1: resets the SAI2 block

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 21 **SAI1RST**: SAI1 block reset
Set and reset by software.
0: does not reset the SAI1 (default after reset)
1: resets the SAI1

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 20 **SPI6RST**: SPI6 block reset
Set and reset by software.
0: does not reset the SPI6 block (default after reset)
1: resets the SPI6 block

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 19 **SPI4RST**: SPI4 block reset
Set and reset by software.
0: does not reset the SPI4 block (default after reset)
1: resets the SPI4 block

Bit 18 **TIM17RST**: TIM17 block reset
Set and reset by software.
0: does not reset the TIM17 block (default after reset)
1: resets the TIM17 block
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 17 **TIM16RST**: TIM16 block reset
Set and reset by software.
0: does not reset the TIM16 block (default after reset)
1: resets the TIM16 block
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 16 **TIM15RST**: TIM15 block reset
Set and reset by software.
0: does not reset the TIM15 block (default after reset)
1: resets the TIM15 block

Bit 15 Reserved, must be kept at reset value.

Bit 14 **USART1RST**: USART1 block reset
Set and reset by software.
0: does not reset the USART1 block (default after reset)
1: resets the USART1 block

Bit 13 **TIM8RST**: TIM8 block reset
Set and reset by software.
0: does not reset the TIM8 block (default after reset)
1: resets the TIM8 block

Bit 12 **SPI1RST**: SPI1 block reset
Set and reset by software.
0: does not reset the SPI1 block (default after reset)
1: resets the SPI1 block

Bit 11 **TIM1RST**: TIM1 block reset
Set and reset by software.
0: does not reset the TIM1 block (default after reset)
1: resets the TIM1 block

Bits 10:0 Reserved, must be kept at reset value.

11.8.25 RCC APB3 peripheral reset register (RCC_APB3RSTR)

Address offset: 0x080

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw		rw	rw	rw	rw	rw					

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **PLAY1RST**: PLAY1 block reset

Set and reset by software. This bit does not reset the user configuration registers and the matrix

0: does not reset the PLAY1 block (default after reset)

1: resets the PLAY1 block

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 21 **PLAY1POR**: PLAY1 block power-on-reset

Set and rest by software. This bit dgenerates a global reset including the user configuration registers and the matrix

0: does not reset the PLAY1 block (default after reset)

1: resets the PLAY1 block

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 20 **VREFRST**: VREFBUF block reset

Set and reset by software.

0: does not reset the VREFBUF block (default after reset)

1: resets the VREFBUF block

Bits 19:16 Reserved, must be kept at reset value.

Bit 15 **LPTIM6RST**: LPTIM6 block reset

Set and reset by software.

0: does not reset the LPTIM6 block (default after reset)

1: resets the LPTIM6 block

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 14 **LPTIM5RST**: LPTIM5 block reset
Set and reset by software.
0: does not reset the LPTIM5 block (default after reset)
1: resets the LPTIM5 block
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 13 **LPTIM4RST**: LPTIM4 block reset
Set and reset by software.
0: does not reset the LPTIM4 block (default after reset)
1: resets the LPTIM4 block
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 12 **LPTIM3RST**: LPTIM3 block reset
Set and reset by software.
0: does not reset the LPTIM3 block (default after reset)
1: resets the LPTIM3 block
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 11 **LPTIM1RST**: LPTIM1 block reset
Set and reset by software.
0: does not reset the LPTIM1 block (default after reset)
1: resets the LPTIM1 block

Bit 10 Reserved, must be kept at reset value.

Bit 9 **I3C2RST**: I3C2 block reset
Set and reset by software.
0: does not reset the I3C2 block (default after reset)
1: resets the I3C2 block
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value..

Bit 8 **I2C4RST**: I2C4 block reset
Set and reset by software.
0: does not reset the I2C4 block (default after reset)
1: resets the I2C4 block
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 7 **I2C3RST**: I2C3 block reset
Set and reset by software.
0: does not reset the I2C3 block (default after reset)
1: resets the I2C3 block

Bit 6 **LPUART1RST**: LPUART1 block reset
Set and reset by software.
0: does not reset the LPUART1 block (default after reset)
1: resets the LPUART1 block

Bit 5 **SPI5RST**: SPI5 block reset
Set and reset by software.
0: does not reset the SPI5 block (default after reset)
1: resets the SPI5 block

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 4:0 Reserved, must be kept at reset value.

11.8.26 RCC AHB1 peripherals clock register (RCC_AHB1ENR)

Address offset: 0x088

Reset value: 0xD000 0100

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit 31 **SRAM1EN**:SRAM1 clock enable
Set and reset by software.
0: SRAM1 clock disabled
1: SRAM1 clock enabled (default after reset)

Bit 30 **DCACHEEN**: DCACHE clock enable
Set and reset by software
0: DCACHE peripheral clock disabled (default after reset)
1: DCACHE peripheral clock enabled

Bit 29 Reserved, must be kept at reset value.

Bit 28 **BKPRAMEN**: BKPRAM clock enable
Set and reset by software
0: BKPRAM peripheral clock disabled (default after reset)
1: BKPRAM peripheral clock enabled

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **TZSC1EN**: TZSC1 clock enable
Set and reset by software
0: TZSC1 peripheral clock disabled (default after reset)
1: TZSC1 peripheral clock enabled

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **ETHRXEN**: ETHRX clock enable
Set and reset by software
0: ETHRX clock disabled (default after reset)
1: ETHRX clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 20 **ETHTXEN**: ETHTX clock enable
Set and reset by software
0: ETHTX clock disabled (default after reset)
1: ETHTX clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 19 **ETHEN**: ETH clock enable
Set and reset by software
0: ETH peripheral clock disabled (default after reset)
1: ETH peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 18 **ETHCKEN**: ETH internal clock enable
Set and reset by software.
0: ETH internal clock disabled (default after reset)
1: ETH internal clock enabled
Note: This bit is only available on STM32H543/553xx devices. If not present, consider this bit as reserved, and keep its bits at reset value.

Bit 17 **RAMCFGEN**: RAMCFG clock enable
Set and reset by software.
0: RAMCFG peripheral clock disabled (default after reset)
1: RAMCFG peripheral clock enabled

Bit 16 Reserved, must be kept at reset value.

Bit 15 **FMACEN**: FMAC clock enable
Set and reset by software.
0: FMAC peripheral clock disabled (default after reset)
1: FMAC peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 14 **CORDICEN**: CORDIC clock enable
Set and reset by software.
0: CORDIC peripheral clock disabled (default after reset)
1: CORDIC peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 13 Reserved, must be kept at reset value.

Bit 12 **CRCEN**: CRC clock enable
Set and reset by software.
0: CRC peripheral clock disabled (default after reset)
1: CRC peripheral clock enabled

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **FLITFEN**: Flash interface clock enable
Set and reset by software.
0: FLASH interface clock disabled
1: FLASH interface clock enabled (default after reset)

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **GPDMA2EN**: GPDMA2 clock enable
Set and reset by software.
0: GPDMA2 peripheral clock disabled (default after reset)
1: GPDMA2 peripheral clock enabled

Bit 0 **GPDMA1EN**: GPDMA1 clock enable
Set and reset by software.
0: GPDMA1 peripheral clock disabled (default after reset)
1: GPDMA1 peripheral clock enabled

11.8.27 RCC AHB2 peripheral clock register (RCC_AHB2ENR)

Address offset: 0x08C

Reset value: 0xC000 0000

Bit 31 **SRAM3EN**: SRAM3 clock enable
Set and reset by software.
0: SRAM3 clock disabled
1: SRAM3 clock enabled (default after reset)

Bit 30 **SRAM2EN**: SRAM2 clock enable
Set and reset by software.
0: SRAM2 clock disabled
1: SRAM2 clock enabled (default after reset)

Bits 29:25 Reserved, must be kept at reset value.

Bit 24 **ADC3EN**: ADC3 clock enable
Set and reset by software.
0: ADC3 clock disabled (default after reset)
1: ADC3 clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **CCBEN**: CCB clock enable
Set and reset by software.
0: CCB clock disabled (default after reset)
1: CCB clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 20 **SAESEN**: SAES clock enable
Set and reset by software.
0: SAES peripheral clock disabled (default after reset)
1: SAES peripheral clock enabled

Bit 19 **PKAEN**: PKA clock enable
Set and reset by software.
0: PKA peripheral clock disabled (default after reset)
1: PKA peripheral clock enabled

Bit 18 **RNGEN**: RNG clock enable
Set and reset by software.
0: RNG peripheral clock disabled (default after reset)
1: RNG peripheral clock enabled

Bit 17 **HASHEN**: HASH clock enable
Set and reset by software.
0: HASH peripheral clock disabled (default after reset)
1: HASH peripheral clock enabled

Bit 16 **AESEN**: AES clock enable
Set and reset by software.
0: AES peripheral clock disabled (default after reset)
1: AES peripheral clock enabled

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **DCMI_PSSIEN**: digital camera interface clock enable (DCMI or PSSI depending which interface is active)
Set and reset by software.
0: DCMI/PSSI peripheral clock disabled (default after reset)
1: DCMI/PSSI peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 11 **DAC1EN**: DAC clock enable
Set and reset by software.
0: DAC peripheral clock disabled (default after reset)
1: DAC peripheral clock enabled

Bit 10 **ADCEN**: ADC1 and 2 peripherals clock enable
Set and reset by software.
0: ADC1 and 2 peripherals clock disabled (default after reset)
1: ADC1 and 2 peripherals clock enabled

Bit 9 Reserved, must be kept at reset value.

Bit 8 **GPIOIEN**: GPIOI clock enable
Set and reset by software.
0: GPIOI peripheral clock disabled (default after reset)
1: GPIOI peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 7 **GPIOHEN**: GPIOH clock enable
Set and reset by software.
0: GPIOH peripheral clock disabled (default after reset)
1: GPIOH peripheral clock enabled

Bit 6 **GPIOGEN**: GPIOG clock enable
Set and reset by software.
0: GPIOG peripheral clock disabled (default after reset)
1: GPIOG peripheral clock enabled

Bit 5 **GPIOFEN**: GPIOF clock enable
Set and reset by software.
0: GPIOF peripheral clock disabled (default after reset)
1: GPIOF peripheral clock enabled

Bit 4 **GPIOEEN**: GPIOE clock enable
Set and reset by software.
0: GPIOE peripheral clock disabled (default after reset)
1: GPIOE peripheral clock enabled

Bit 3 **GPIODEN**: GPIOD clock enable
Set and reset by software.
0: GPIOD peripheral clock disabled (default after reset)
1: GPIOD peripheral clock enabled

Bit 2 **GPIOCEN**: GPIOC clock enable
Set and reset by software.
0: GPIOC peripheral clock disabled (default after reset)
1: GPIOC peripheral clock enabled

Bit 1 **GPIOBEN**: GPIOB clock enable
Set and reset by software.
0: GPIOB peripheral clock disabled (default after reset)
1: GPIOB peripheral clock enabled

Bit 0 **GPIOAEN**: GPIOA clock enable
Set and reset by software.
0: GPIOA peripheral clock disabled (default after reset)
1: GPIOA peripheral clock enabled

11.8.28 RCC AHB4 peripheral clock register (RCC_AHB4ENR)

Address offset: 0x094

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **OCTOSPI1EN**: OCTOSPI1 clock enable
Set and reset by software.
0: OCTOSPI1 peripheral clock disabled (default after reset)
1: OCTOSPI1 peripheral clock enabled

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **FMCEN**: FMC clock enable
Set and reset by software.
0: FMC peripheral clock disabled (default after reset)
1: FMC peripheral clock enabled

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **SDMMC2EN**: SDMMC2 and SDMMC2 delay peripheral clock enable
Set and reset by software.
0: SDMMC2 and SDMMC2 delay peripherals clock disabled (default after reset)
1: SDMMC2 and SDMMC2 delay peripherals clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 11 **SDMMC1EN**: SDMMC1 and SDMMC1 delay peripheral clock enable reset
0: SDMMC1 and SDMMC1 delay peripherals clock disabled (default after reset)
1: SDMMC1 and SDMMC1 delay peripherals clock enabled

Bits 10:8 Reserved, must be kept at reset value.

Bit 7 **OTFDEC1EN**: OTFDEC1 clock enable
Set and reset by software.
0: OTFDEC1 peripheral clock disabled (default after reset)
1: OTFDEC1 peripheral clock enabled

Bits 6:0 Reserved, must be kept at reset value.

11.8.29 RCC APB1 peripheral clock register (RCC_APB1LENR)

Address offset: 0x09C

Reset value: 0x0000 0000

Bit 31 **UART8EN**: UART8 clock enable

Set and reset by software.

0: UART8 peripheral clock disabled (default after reset)

1: UART8 peripheral clock enabled

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 30 **UART7EN**: UART7 clock enable

Set and reset by software.

0: UART7 peripheral clock disabled (default after reset)

1: UART7 peripheral clock enabled

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 29 Reserved, must be kept at reset value.

Bit 28 **CECEN**: HDMI-CEC clock enable

Set and reset by software.

0: HDMI-CEC peripheral clock disabled (default after reset)

1: HDMI-CEC peripheral clock enabled

Bit 27 **USART11EN**: USART11 clock enable

0: USART11 peripheral clock disabled (default after reset)

1: USART11 peripheral clock enabled

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 26 **USART10EN**: USART10 clock enable

Set and reset by software.

0: USART10 peripheral clock disabled (default after reset)

1: USART10 peripheral clock enabled

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 25 **USART6EN**: USART6 clock enable
Set and reset by software.
0: USART6 peripheral clock disabled (default after reset)
1: USART6 peripheral clock enabled

Bit 24 **CRSEN**: CRS clock enable
Set and reset by software.
0: CRS peripheral clock disabled (default after reset)
1: CRS peripheral clock enabled

Bit 23 **I3C1EN**: I3C1 clock enable
Set and reset by software.
0: I3C1 peripheral clock disabled (default after reset)
1: I3C1 peripheral clock enabled

Bit 22 **I2C2EN**: I2C2 clock enable
Set and reset by software.
0: I2C2 peripheral clock disabled (default after reset)
1: I2C2 peripheral clock enabled

Bit 21 **I2C1EN**: I2C1 clock enable
Set and reset by software.
0: I2C1 peripheral clock disabled (default after reset)
1: I2C1 peripheral clock enabled

Bit 20 **UART5EN**: UART5 clock enable
Set and reset by software.
0: UART5 peripheral clock disabled (default after reset)
1: UART5 peripheral clock enabled

Bit 19 **UART4EN**: UART4 clock enable
Set and reset by software.
0: UART4 peripheral clock disabled (default after reset)
1: UART4 peripheral clock enabled

Bit 18 **USART3EN**: USART3 clock enable
Set and reset by software.
0: USART3 peripheral clock disabled (default after reset)
1: USART3 peripheral clock enabled

Bit 17 **USART2EN**: USART2 clock enable
Set and reset by software.
0: USART2 peripheral clock disabled (default after reset)
1: USART2 peripheral clock enabled

Bit 16 **COMPEN**: COMP clock enable
Set and reset by software.
0: COMP peripheral clock disabled (default after reset)
1: COMP peripheral clock enabled

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 15 **SPI3EN**: SPI3 clock enable
Set and reset by software.
0: SPI3 peripheral clock disabled (default after reset)
1: SPI3 peripheral clock enabled

Bit 14 **SPI2EN**: SPI2 clock enable
Set and reset by software.
0: SPI2 peripheral clock disabled (default after reset)
1: SPI2 peripheral clock enabled

Bits 13:12 Reserved, must be kept at reset value.

Bit 11 **WWDGEN**: WWDG clock enable
Set and reset by software.
0: WWDG peripheral clock disabled (default after reset)
1: WWDG peripheral clock enabled

Bits 10:9 Reserved, must be kept at reset value.

Bit 8 **TIM14EN**: TIM14 clock enable
Set and reset by software.
0: TIM14 peripheral clock disabled (default after reset)
1: TIM14 peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 7 **TIM13EN**: TIM13 clock enable
Set and reset by software.
0: TIM13 peripheral clock disabled (default after reset)
1: TIM13 peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 6 **TIM12EN**: TIM12 clock enable
Set and reset by software.
0: TIM12 peripheral clock disabled (default after reset)
1: TIM12 peripheral clock enabled

Bit 5 **TIM7EN**: TIM7 clock enable
Set and reset by software.
0: TIM7 peripheral clock disabled (default after reset)
1: TIM7 peripheral clock enabled

Bit 4 **TIM6EN**: TIM6 clock enable
Set and reset by software.
0: TIM6 peripheral clock disabled (default after reset)
1: TIM6 peripheral clock enabled

Bit 3 **TIM5EN**: TIM5 clock enable
Set and reset by software.
0: TIM5 peripheral clock disabled (default after reset)
1: TIM5 peripheral clock enabled

Bit 2 **TIM4EN**: TIM4 clock enable
Set and reset by software.
0: TIM4 peripheral clock disabled (default after reset)
1: TIM4 peripheral clock enabled

Bit 1 **TIM3EN**: TIM3 clock enable
Set and reset by software.
0: TIM3 peripheral clock disabled (default after reset)
1: TIM3 peripheral clock enabled

Bit 0 **TIM2EN**: TIM2 clock enable
Set and reset by software.
0: TIM2 peripheral clock disabled (default after reset)
1: TIM2 peripheral clock enabled

11.8.30 RCC APB1 peripheral clock register (RCC_APB1HENR)

Address offset: 0x0A0

Reset value: 0x0000 0000

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **UCPD1EN**: UCPD1 clock enable
Set and reset by software.
0: UCPD peripheral clock disabled (default after reset)
1: UCPD peripheral clock enabled

Bits 22:10 Reserved, must be kept at reset value.

Bit 9 **FDCANEN**: FDCAN1 and FDCAN2 peripheral clock enable
Set and reset by software.
0: FDCAN1 and FDCAN2 peripheral clock disabled (default after reset)
1: FDCAN1 and FDCAN2 peripheral clock enabled

Bits 8:6 Reserved, must be kept at reset value.

Bit 5 **LPTIM2EN**: LPTIM2 clock enable
Set and reset by software.
0: LPTIM2 peripheral clock disabled (default after reset)
1: LPTIM2 peripheral clock enabled

Bit 4 Reserved, must be kept at reset value.

Bit 3 **DTSEN**: DTS clock enable
Set and reset by software.
0: DTS peripheral clock disabled (default after reset)
1: DTS peripheral clock enabled

Bit 2 Reserved, must be kept at reset value.

Bit 1 **UART12EN**: UART12 clock enable
Set and reset by software.
0: UART12 peripheral clock disabled (default after reset)
1: UART12 peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 0 **UART9EN**: UART9 clock enable
Set and reset by software.
0: UART9 peripheral clock disabled (default after reset)
1: resets UART9 peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

11.8.31 RCC APB2 peripheral clock register (RCC_APB2ENR)

Address offset: 0x0A4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **USBEN**: USB clock enable
Set and reset by software.
0: USB peripheral clock disabled (default after reset)
1: USB peripheral clock enabled

Bit 23 Reserved, must be kept at reset value.

Bit 22 **SAI2EN**: SAI2 clock enable
Set and cleared by software.
0: SAI2 clock disabled
1: SAI2 clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 21 **SAI1EN**: SAI1 clock enable
Set and reset by software.
0: SAI1 peripheral clock disabled (default after reset)
1: SAI1 peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 20 **SPI6EN**: SPI6 clock enable
Set and reset by software.
0: SPI6 peripheral clock disabled (default after reset)
1: SPI6 peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value..

Bit 19 **SPI4EN**: SPI4 clock enable
Set and reset by software.
0: SPI4 peripheral clock disabled (default after reset)
1: SPI4 peripheral clock enabled

Bit 18 **TIM17EN**: TIM17 clock enable
Set and reset by software.
0: TIM17 peripheral clock disabled (default after reset)
1: TIM17 peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 17 **TIM16EN**: TIM16 clock enable
Set and reset by software.
0: TIM16 peripheral clock disabled (default after reset)
1: TIM16 peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 16 **TIM15EN**: TIM15 clock enable
Set and reset by software.
0: TIM15 peripheral clock disabled (default after reset)
1: TIM15 peripheral clock enabled

Bit 15 Reserved, must be kept at reset value.

Bit 14 **USART1EN**: USART1 clock enable
Set and reset by software.
0: USART1 peripheral clock disabled (default after reset)
1: USART1 peripheral clock enabled

Bit 13 **TIM8EN**: TIM8 clock enable
Set and reset by software.
0: TIM8 peripheral clock disabled (default after reset)
1: TIM8 peripheral clock enabled

Bit 12 **SPI1EN**: SPI1 clock enable
Set and reset by software.
0: SPI1 peripheral clock disabled (default after reset)
1: SPI1 peripheral clock enabled

Bit 11 **TIM1EN**: TIM1 clock enable
Set and reset by software.
0: TIM1 peripheral clock disabled (default after reset)
1: TIM1 peripheral clock enabled

Bits 10:0 Reserved, must be kept at reset value.

11.8.32 RCC APB3 peripheral clock register (RCC_APB3ENR)

Address offset: 0x0A8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw		rw	rw	rw	rw	rw				rw	

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **PLAY1EN**: PLAY1 clock enable

Set and reset by software.

0: PLAY1 clock disabled (default after reset)

1: PLAY1 clock enabled

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 22 **PLAY1APBEN**: Clock enable for PLAY1 configuration

Set and reset by software.

0: PLAY1 clock disabled (default after reset)

1: PLAY1 clock enabled

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 21 **RTCAPBEN**: RTC APB interface clock enable

Set and reset by software.

0: RTC APB interface clock disabled (default after reset)

1: RTC APB interface clock enabled

Bit 20 **VREFBUFEN**: VREFBUF clock enable

Set and reset by software.

0: VREFBUF peripheral clock disabled (default after reset)

1: VREFBUF peripheral clock enabled

Bits 19:16 Reserved, must be kept at reset value.

Bit 15 **LPTIM6EN**: LPTIM6 clock enable

Set and reset by software.

0: LPTIM6 peripheral clock disabled (default after reset)

1: LPTIM6 peripheral clock enabled

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 14 **LPTIM5EN**: LPTIM5 clock enable
Set and reset by software.
0: LPTIM5 peripheral clock disabled (default after reset)
1: LPTIM5 peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 13 **LPTIM4EN**: LPTIM4 clock enable
Set and reset by software.
0: LPTIM4 peripheral clock disabled (default after reset)
1: LPTIM4 peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 12 **LPTIM3EN**: LPTIM3 clock enable
Set and reset by software.
0: LPTIM3 peripheral clock disabled (default after reset)
1: LPTIM3 peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 11 **LPTIM1EN**: LPTIM1 clock enable
Set and reset by software.
0: LPTIM1 peripheral clock disabled (default after reset)
1: LPTIM1 peripheral clock enabled

Bit 10 Reserved, must be kept at reset value.

Bit 9 **I3C2EN**: I3C2 clock enable
Set and reset by software.
0: I3C2 peripheral clock disabled (default after reset)
1: I3C2 peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 8 **I2C4EN**: I2C4 clock enable
Set and reset by software.
0: I2C4 peripheral clock disabled (default after reset)
1: I2C4 peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 7 **I2C3EN**: I2C3 clock enable
Set and reset by software.
0: I2C3 peripheral clock disabled (default after reset)
1: I2C3 peripheral clock enabled

Bit 6 **LPUART1EN**: LPUART1 clock enable
Set and reset by software.
0: LPUART1 peripheral clock disabled (default after reset)
1: LPUART1 peripheral clock enabled

Bit 5 **SPI5EN**: SPI5 clock enable
Set and reset by software.
0: SPI5 peripheral clock disabled (default after reset)
1: SPI5 peripheral clock enabled
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **SBSEN**: SBS clock enable
Set and reset by software.
0: SBS peripheral clock disabled (default after reset)
1: SBS peripheral clock enabled

Bit 0 Reserved, must be kept at reset value.

11.8.33 RCC AHB1 sleep clock register (RCC_AHB1LPENR)

Address offset: 0x0B0

Reset value: 0xFFFF FFFF (for STM32H543/553xx)

Reset value: 0xF13A D103 (for STM32H562/563/573xx)

Reset value: 0xF102 1103 (for STM32H523/533xx)

Bit 31 **SRAM1LPEN**: SRAM1 clock enable during Sleep mode
Set and reset by software
0: SRAM1 peripheral clock disabled during Sleep mode
1: SRAM1 peripheral clock enabled during Sleep mode (default after reset)

Bit 30 **DCACHELPEN**: DCACHE clock enable during Sleep mode
Set and reset by software
0: DCACHE peripheral clock disabled during Sleep mode
1: DCACHE peripheral clock enabled during Sleep mode (default after reset)

Bit 29 **ICACHELPEN**: ICACHE clock enable during Sleep mode
Set and reset by software
0: ICACHE peripheral clock disabled during Sleep mode
1: ICACHE peripheral clock enabled during Sleep mode (default after reset)

Bit 28 **BKPRAMLPEN**: BKPRAM clock enable during Sleep mode
Set and reset by software
0: BKPRAM peripheral clock disabled during Sleep mode
1: BKPRAM peripheral clock enabled during Sleep mode (default after reset)

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **TZSC1LPEN**: TZSC1 clock enable during Sleep mode
Set and reset by software
0: TZSC1 peripheral clock disabled during Sleep mode
1: TZSC1 peripheral clock enabled during Sleep mode (default after reset)

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **ETHRXLPEN**: ETHRX clock enable during Sleep mode
Set and reset by software
0: ETHRX clock disabled during Sleep mode
1: ETHRX clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 20 **ETHTXLPEN**: ETHTX clock enable during Sleep mode
Set and reset by software
0: ETHTX clock disabled during Sleep mode
1: ETHTX clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 19 **ETHLPEN**: ETH clock enable during Sleep mode
Set and reset by software
0: ETH peripheral clock disabled during Sleep mode
1: ETH peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 18 **ETHCKLPEN**: ETH internal clock enable during Sleep mode
Set and reset by software
0: ETH internal clock disabled during Sleep mode
1: ETH internal clock enabled during Sleep mode (default after reset)
Note: This bit is only available on STM32H543/553xx devices. If not present, consider this bit as reserved, and keep its bits at reset value.

Bit 17 **RAMCFGLPEN**: RAMCFG clock enable during Sleep mode
Set and reset by software.
0: RAMCFG peripheral clock disabled during Sleep mode
1: RAMCFG peripheral clock enabled during Sleep mode (default after reset)

Bit 16 Reserved, must be kept at reset value.

Bit 15 **FMACLPEN**: FMAC clock enable during Sleep mode
Set and reset by software.
0: FMAC peripheral clock disabled during Sleep mode
1: FMAC peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 14 **CORDICLPEN**: CORDIC clock enable during Sleep mode
Set and reset by software.
0: CORDIC peripheral clock disabled during Sleep mode
1: CORDIC peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 13 Reserved, must be kept at reset value.

Bit 12 **CRCLPEN**: CRC clock enable during Sleep mode
Set and reset by software.
0: CRC peripheral clock disabled during Sleep mode
1: CRC peripheral clock enabled during Sleep mode (default after reset)

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **FLITFLPEN**: Flash interface (FLITF) clock enable during Sleep mode
Set and reset by software.
0: FLITF peripheral clock disabled during Sleep mode
1: FLITF peripheral clock enabled during Sleep mode (default after reset)

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **GPDMA2LPEN**: GPDMA2 clock enable during Sleep mode
Set and reset by software.
0: GPDMA2 peripheral clock disabled during Sleep mode
1: GPDMA2 peripheral clock enabled during Sleep mode (default after reset)

Bit 0 **GPDMA1LPEN**: GPDMA1 clock enable during Sleep mode
Set and reset by software.
0: GPDMA1 peripheral clock disabled during Sleep mode
1: GPDMA1 peripheral clock enabled during Sleep mode (default after reset)

11.8.34 RCC AHB2 sleep clock register (RCC_AHB2LPENR)

Address offset: 0x0B4

Reset value: 0xFFFF FFFF (for STM32H543/553xx)

Reset value: 0xC01F 1DFF (for STM32H562/563/573xx)

Reset value: 0xC01F 1CFF (for STM32H523/533xx)

Bit 31 **SRAM3LPEN**: SRAM3 clock enable during Sleep mode
Set and reset by software.
0: SRAM3 peripheral clock disabled during Sleep mode
1: SRAM3 peripheral clock enabled during Sleep mode (default after reset)

Bit 30 **SRAM2LPEN**: SRAM2 clock enable during Sleep mode
Set and reset by software.
0: SRAM2 peripheral clock disabled during Sleep mode
1: SRAM2 peripheral clock enabled during Sleep mode (default after reset)

Bits 29:25 Reserved, must be kept at reset value.

Bit 24 **ADC3LPEN**: ADC3 peripheral clock enable during Sleep mode
Set and reset by software.
0: ADC3 peripheral clock disabled during Sleep mode
1: ADC3 peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **CCBLPEN**: CCB clock enable during Sleep mode
Set and reset by software.
0: CCB peripheral clock disabled during Sleep mode
1: CCB peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 20 **SAESLPEN**: SAES clock enable during Sleep mode
Set and reset by software.
0: SAES peripheral clock disabled during Sleep mode
1: SAES peripheral clock enabled during Sleep mode (default after reset)

Bit 19 **PKALPEN**: PKA clock enable during Sleep mode
Set and reset by software.
0: PKA peripheral clock disabled during Sleep mode
1: PKA peripheral clock enabled during Sleep mode (default after reset)

Bit 18 **RNGLPEN**: RNG clock enable during Sleep mode
Set and reset by software.
0: RNG peripheral clock disabled during Sleep mode
1: RNG peripheral clock enabled during Sleep mode (default after reset)

Bit 17 **HASHLPEN**: HASH clock enable during Sleep mode
Set and reset by software.
0: HASH peripheral clock disabled during Sleep mode
1: HASH peripheral clock enabled during Sleep mode (default after reset)

Bit 16 **AESLPEN**: AES clock enable during Sleep mode
Set and reset by software.
0: AES peripheral clock disabled during Sleep mode
1: AES peripheral clock enabled during Sleep mode (default after reset)

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **DCMI_PSSILPEN**: digital camera interface clock enable during Sleep mode (DCMI or PSSI depending which interface is active)

Set and reset by software.
0: DCMI/PSSI peripheral clock disabled during Sleep mode
1: DCMI/PSSI peripheral clock enabled during Sleep mode (default after reset)

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 11 **DAC1LPEN**: DAC clock enable during Sleep mode

Set and reset by software.
0: DAC peripheral clock disabled during Sleep mode
1: DAC peripheral clock enabled during Sleep mode (default after reset)

Bit 10 **ADCLPEN**: ADC1 and 2 peripherals clock enable during Sleep mode

Set and reset by software.
0: ADC1 and 2 peripherals clock disabled during Sleep mode
1: ADC1 and 2 peripherals clock enabled during Sleep mode (default after reset)

Bit 9 Reserved, must be kept at reset value.

Bit 8 **GPIOILPEN**: GPIOI clock enable during Sleep mode

Set and reset by software.
0: GPIOI peripheral clock disabled during Sleep mode
1: GPIOI peripheral clock enabled during Sleep mode (default after reset)

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 7 **GPIOHLPEN**: GPIOH clock enable during Sleep mode

Set and reset by software.
0: GPIOH peripheral clock disabled during Sleep mode
1: GPIOH peripheral clock enabled during Sleep mode (default after reset)

Bit 6 **GPIOGLPEN**: GPIOG clock enable during Sleep mode

Set and reset by software.
0: GPIOG peripheral clock disabled during Sleep mode
1: GPIOG peripheral clock enabled during Sleep mode (default after reset)

Bit 5 **GPIOFLPEN**: GPIOF clock enable during Sleep mode

Set and reset by software.
0: GPIOF peripheral clock disabled during Sleep mode
1: GPIOF peripheral clock enabled during Sleep mode (default after reset)

Bit 4 **GPIOELPEN**: GPIOE clock enable during Sleep mode

Set and reset by software.
0: GPIOE peripheral clock disabled during Sleep mode
1: GPIOE peripheral clock enabled during Sleep mode (default after reset)

Bit 3 **GPIODLPEN**: GPIOD clock enable during Sleep mode

Set and reset by software.
0: GPIOD peripheral clock disabled during Sleep mode
1: GPIOD peripheral clock enabled during Sleep mode (default after reset)

Bit 2 **GPIOCLPEN**: GPIOC clock enable during Sleep mode
Set and reset by software.
0: GPIOC peripheral clock disabled during Sleep mode
1: GPIOC peripheral clock enabled during Sleep mode (default after reset)

Bit 1 **GPIOBLPEN**: GPIOB clock enable during Sleep mode
Set and reset by software.
0: GPIOB peripheral clock disabled during Sleep mode
1: GPIOB peripheral clock enabled during Sleep mode (default after reset)

Bit 0 **GPIOALPEN**: GPIOA clock enable during Sleep mode
Set and reset by software.
0: GPIOA peripheral clock disabled during Sleep mode
1: GPIOA peripheral clock enabled during Sleep mode (default after reset)

11.8.35 RCC AHB4 sleep clock register (RCC_AHB4LPENR)

Address offset: 0x0BC

Reset value: 0xFFFF FFFF (for STM32H543/553xx)

Reset value: 0x0011 1880 (for STM32H562/563/573xx)

Reset value: 0x0011 0880 (for STM32H523/533xx)

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **OCTOSPI1LPEN**: OCTOSPI1 clock enable during Sleep mode
Set and reset by software.
0: OCTOSPI1 peripheral clock disabled during Sleep mode
1: OCTOSPI1 peripheral clock enabled during Sleep mode (default after reset)

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **FMCLPEN**: FMC clock enable during Sleep mode
Set and reset by software.
0: FMC peripheral clock disabled during Sleep mode
1: FMC peripheral clock enabled during Sleep mode (default after reset)

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **SDMMC2LPEN**: SDMMC2 and SDMMC2 delay peripheral clock enable during Sleep mode
Set and reset by software.
0: SDMMC2 and SDMMC2 delay peripherals clock disabled during Sleep mode
1: SDMMC2 and SDMMC2 delay peripherals clock enabled during Sleep mode (default after reset)

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 11 **SDMMC1LPEN**: SDMMC1 and SDMMC1 delay peripheral clock enable during Sleep mode
Set and reset by software
0: SDMMC1 and SDMMC1 delay peripherals clock disabled during Sleep mode
1: SDMMC1 and SDMMC1 delay peripherals clock enabled during Sleep mode (default after reset)

Bits 10:8 Reserved, must be kept at reset value.

Bit 7 **OTFDEC1LPEN**: OTFDEC1 clock enable during Sleep mode
Set and reset by software.
0: OTFDEC1 peripheral clock disabled during Sleep mode
1: OTFDEC1 peripheral clock enabled during Sleep mode (default after reset)

Bits 6:0 Reserved, must be kept at reset value.

11.8.36 RCC APB1 sleep clock register (RCC_APB1LLPENR)

Address offset: 0x0C4

Reset value: 0xFFFF FFFF (for STM32H543/553xx)

Reset value: 0xDFFE C9FF (for STM32H562/563/573xx)

Reset value: 0x13FE C87F (for STM32H523/533xx)

Bit 31 **UART8LPEN**: UART8 clock enable during Sleep mode
Set and reset by software.
0: UART8 peripheral clock disabled during Sleep mode
1: UART8 peripheral clock enabled during Sleep mode (default after reset)

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 30 **UART7LPEN**: UART7 clock enable during Sleep mode
Set and reset by software.
0: UART7 peripheral clock disabled during Sleep mode
1: UART7 peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 29 Reserved, must be kept at reset value.

Bit 28 **CECLPEN**: HDMI-CEC clock enable during Sleep mode
Set and reset by software.
0: HDMI-CEC peripheral clock disabled during Sleep mode
1: HDMI-CEC peripheral clock enabled during Sleep mode (default after reset)

Bit 27 **USART11LPEN**: USART11 clock enable during Sleep mode
Set and reset by software.
0: USART11 peripheral clock disabled during Sleep mode
1: USART11 peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 26 **USART10LPEN**: USART10 clock enable during Sleep mode
Set and reset by software.
0: USART10 peripheral clock disabled during Sleep mode
1: USART10 peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 25 **USART6LPEN**: USART6 clock enable during Sleep mode
Set and reset by software.
0: USART6 peripheral clock disabled during Sleep mode
1: USART6 peripheral clock enabled during Sleep mode (default after reset)

Bit 24 **CRSLPEN**: CRS clock enable during Sleep mode
Set and reset by software.
0: CRS peripheral clock disabled during Sleep mode
1: CRS peripheral clock enabled during Sleep mode (default after reset)

Bit 23 **I3C1LPEN**: I3C1 clock enable during Sleep mode
Set and reset by software.
0: I3C1 peripheral clock disabled during Sleep mode
1: I3C1 peripheral clock enabled during Sleep mode (default after reset)

Bit 22 **I2C2LPEN**: I2C2 clock enable during Sleep mode
Set and reset by software.
0: I2C2 peripheral clock disabled during Sleep mode
1: I2C2 peripheral clock enabled during Sleep mode (default after reset)

Bit 21 **I2C1LPEN**: I2C1 clock enable during Sleep mode
Set and reset by software.
0: I2C1 peripheral clock disabled during Sleep mode
1: I2C1 peripheral clock enabled during Sleep mode (default after reset)

Bit 20 **UART5LPEN**: UART5 clock enable during Sleep mode
Set and reset by software.
0: UART5 peripheral clock disabled during Sleep mode
1: UART5 peripheral clock enabled during Sleep mode (default after reset)

Bit 19 **UART4LPEN**: UART4 clock enable during Sleep mode
Set and reset by software.
0: UART4 peripheral clock disabled during Sleep mode
1: UART4 peripheral clock enabled during Sleep mode (default after reset)

Bit 18 **USART3LPEN**: USART3 clock enable during Sleep mode
Set and reset by software.
0: USART3 peripheral clock disabled during Sleep mode
1: USART3 peripheral clock enabled during Sleep mode (default after reset)

Bit 17 **USART2LPEN**: USART2 clock enable during Sleep mode
Set and reset by software.
0: USART2 peripheral clock disabled during Sleep mode
1: USART2 peripheral clock enabled during Sleep mode (default after reset)

Bit 16 **COMPLPEN**: COMP clock enable during Sleep mode
Set and reset by software.
0: COMP peripheral clock disabled during Sleep mode
1: COMP peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 15 **SPI3LPEN**: SPI3 clock enable during Sleep mode
Set and reset by software.
0: SPI3 peripheral clock disabled during Sleep mode
1: SPI3 peripheral clock enabled during Sleep mode (default after reset)

Bit 14 **SPI2LPEN**: SPI2 clock enable during Sleep mode
Set and reset by software.
0: SPI2 peripheral clock disabled during Sleep mode
1: SPI2 peripheral clock enabled during Sleep mode (default after reset)

Bits 13:12 Reserved, must be kept at reset value.

Bit 11 **WWDGLPEN**: WWDG clock enable during Sleep mode
Set and reset by software.
0: WWDG peripheral clock disabled during Sleep mode
1: WWDG peripheral clock enabled during Sleep mode (default after reset)

Bits 10:9 Reserved, must be kept at reset value.

Bit 8 **TIM14LPEN**: TIM14 clock enable during Sleep mode
Set and reset by software.
0: TIM14 peripheral clock disabled during Sleep mode
1: TIM14 peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 7 **TIM13LPEN**: TIM13 clock enable during Sleep mode
Set and reset by software.
0: TIM13 peripheral clock disabled during Sleep mode
1: TIM13 peripheral clock enabled during Sleep mode (default after reset)
Note: For the actual availability of this bit refer to the datasheet. If not present, consider it as reserved, and keep it at reset value.

Bit 6 **TIM12LPEN**: TIM12 clock enable during Sleep mode
Set and reset by software.
0: TIM12 peripheral clock disabled during Sleep mode
1: TIM12 peripheral clock enabled during Sleep mode (default after reset)

Bit 5 **TIM7LPEN**: TIM7 clock enable during Sleep mode
Set and reset by software.
0: TIM7 peripheral clock disabled during Sleep mode
1: TIM7 peripheral clock enabled during Sleep mode (default after reset)

Bit 4 **TIM6LPEN**: TIM6 clock enable during Sleep mode
Set and reset by software.
0: TIM6 peripheral clock disabled during Sleep mode
1: TIM6 peripheral clock enabled during Sleep mode (default after reset)

Bit 3 **TIM5LPEN**: TIM5 clock enable during Sleep mode
Set and reset by software.
0: TIM5 peripheral clock disabled during Sleep mode
1: TIM5 peripheral clock enabled during Sleep mode (default after reset)

Bit 2 **TIM4LPEN**: TIM4 clock enable during Sleep mode
Set and reset by software.
0: TIM4 peripheral clock disabled during Sleep mode
1: TIM4 peripheral clock enabled during Sleep mode (default after reset)

Bit 1 **TIM3LPEN**: TIM3 clock enable during Sleep mode
Set and reset by software.
0: TIM3 peripheral clock disabled during Sleep mode
1: TIM3 peripheral clock enabled during Sleep mode (default after reset)

Bit 0 **TIM2LPEN**: TIM2 clock enable during Sleep mode
Set and reset by software.
0: TIM2 peripheral clock disabled during Sleep mode
1: TIM2 peripheral clock enabled during Sleep mode (default after reset)

11.8.37 RCC APB1 sleep clock register (RCC_APB1HLPENR)

Address offset: 0x0C8

Reset value: 0xFFFF FFFF (for STM32H543/553xx)

Reset value: 0x4080 022B (for STM32H562/563/573xx)

Reset value: 0x4080 0228 (for STM32H523/533xx)

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **UCPD1LPEN**: UCPD1 clock enable during Sleep mode
Set and reset by software.
0: UCPD peripheral clock disabled during Sleep mode
1: UCPD peripheral clock enabled during Sleep mode (default after reset)

Bits 22:10 Reserved, must be kept at reset value.

Bit 9 **FDCANLPEN**: FDCAN1 and FDCAN2 peripheral clock enable during Sleep mode
Set and reset by software.
0: FDCAN1 and FDCAN2 peripheral clock disabled during Sleep mode
1: FDCAN1 and FDCAN2 peripheral clock enabled during Sleep mode (default after reset)

Bits 8:6 Reserved, must be kept at reset value.

Bit 5 **LPTIM2LPEN**: LPTIM2 clock enable during Sleep mode
Set and reset by software.
0: LPTIM2 peripheral clock disabled during Sleep mode
1: LPTIM2 peripheral clock enabled during Sleep mode (default after reset)

Bit 4 Reserved, must be kept at reset value.

Bit 3 **DTSLPEN**: DTS clock enable during Sleep mode
Set and reset by software.
0: DTS peripheral clock disabled during Sleep mode
1: DTS peripheral clock enabled during Sleep mode (default after reset)

Bit 2 Reserved, must be kept at reset value.

Bit 1 **UART12LPEN**: UART12 clock enable during Sleep mode
Set and reset by software.
0: UART12 peripheral clock disabled during Sleep mode
1: UART12 peripheral clock enabled during Sleep mode (default after reset)

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 0 **UART9LPEN**: UART9 clock enable during Sleep mode
Set and reset by software.
0: UART9 peripheral clock disabled during Sleep mode
1: resets UART9 peripheral clock enabled during Sleep mode (default after reset)

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.e.

11.8.38 RCC APB2 sleep clock register (RCC_APB2LPENR)

Address offset: 0x0CC

Reset value: 0xFFFF FFFF (for STM32H543/553xx)

Reset value: 0x017F 7800 (for STM32H562/563/573xx)

Reset value: 0x0109 7800 (for STM32H523/533xx)

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **USBLPEN**: USB clock enable during Sleep mode
Set and reset by software.
0: USB peripheral clock disabled during Sleep mode
1: USB peripheral clock enabled during Sleep mode (default after reset)

Bit 23 Reserved, must be kept at reset value.

Bit 22 **SAI2LPEN**: SAI2 clock enable during Sleep mode
Set and reset by software.
0: SAI2 peripheral clock disabled during Sleep mode
1: SAI2 peripheral clock enabled during Sleep mode (default after reset)

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 21 **SAI1LPEN**: SAI1 clock enable during Sleep mode
Set and reset by software.
0: SAI1 peripheral clock disabled during Sleep mode
1: SAI1 peripheral clock enabled during Sleep mode (default after reset)

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 20 **SPI6LPEN**: SPI6 clock enable during Sleep mode
Set and reset by software.
0: SPI6 peripheral clock disabled during Sleep mode
1: SPI6 peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 19 **SPI4LPEN**: SPI4 clock enable during Sleep mode
Set and reset by software.
0: SPI4 peripheral clock disabled during Sleep mode
1: SPI4 peripheral clock enabled during Sleep mode (default after reset)

Bit 18 **TIM17LPEN**: TIM17 clock enable during Sleep mode
Set and reset by software.
0: TIM17 peripheral clock disabled during Sleep mode
1: TIM17 peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value

Bit 17 **TIM16LPEN**: TIM16 clock enable during Sleep mode
Set and reset by software.
0: TIM16 peripheral clock disabled during Sleep mode
1: TIM16 peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 16 **TIM15LPEN**: TIM15 clock enable during Sleep mode
Set and reset by software.
0: TIM15 peripheral clock disabled during Sleep mode
1: TIM15 peripheral clock enabled during Sleep mode (default after reset)

Bit 15 Reserved, must be kept at reset value.

Bit 14 **USART1LPEN**: USART1 clock enable during Sleep mode
Set and reset by software.
0: USART1 peripheral clock disabled during Sleep mode
1: USART1 peripheral clock enabled during Sleep mode (default after reset)

Bit 13 **TIM8LPEN**: TIM8 clock enable during Sleep mode
Set and reset by software.
0: TIM8 peripheral clock disabled during Sleep mode
1: TIM8 peripheral clock enabled during Sleep mode (default after reset)

Bit 12 **SPI1LPEN**: SPI1 clock enable during Sleep mode
Set and reset by software.
0: SPI1 peripheral clock disabled during Sleep mode
1: SPI1 peripheral clock enabled during Sleep mode (default after reset)

Bit 11 **TIM1LPEN**: TIM1 clock enable during Sleep mode
Set and reset by software.
0: TIM1 peripheral clock disabled during Sleep mode
1: TIM1 peripheral clock enabled during Sleep mode (default after reset)

Bits 10:0 Reserved, must be kept at reset value.

11.8.39 RCC APB3 sleep clock register (RCC_APB3LPENR)

Address offset: 0x0D0

Reset value: 0xFFFF FFFF (for STM32H543/553xx)

Reset value: 0x0030 F9E2 (for STM32H562/563/573xx)

Reset value: 0x0030 FAE2 (for STM32H523/533xx)

rw	rw	rw	rw	rw		rw	rw	rw	rw	rw				rw	

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **PLAY1LPEN**: PLAY1 clock enable during Sleep mode
Set and reset by software.
0: PLAY1 clock disabled during Sleep mode
1: PLAY1 clock enabled during Sleep mode (default after reset)

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 22 Reserved, must be kept at reset value.

Bit 21 **RTCAPBLPEN**: RTC APB interface clock enable during Sleep mode
Set and reset by software.
0: RTC APB interface clock disabled during Sleep mode
1: RTC APB interface clock enabled during Sleep mode (default after reset)

Bit 20 **VREFLPEN**: VREFBUF clock enable during Sleep mode
Set and reset by software.
0: VREFBUF peripheral clock disabled during Sleep mode
1: VREFBUF peripheral clock enabled during Sleep mode (default after reset)

Bits 19:16 Reserved, must be kept at reset value.

Bit 15 **LPTIM6LPEN**: LPTIM6 clock enable during Sleep mode
Set and reset by software.
0: LPTIM6 peripheral clock disabled during Sleep mode
1: LPTIM6 peripheral clock enabled during Sleep mode (default after reset)

Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 14 **LPTIM5LPEN**: LPTIM5 clock enable during Sleep mode
Set and reset by software.
0: LPTIM5 peripheral clock disabled during Sleep mode
1: LPTIM5 peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 13 **LPTIM4LPEN**: LPTIM4 clock enable during Sleep mode
Set and reset by software.
0: LPTIM4 peripheral clock disabled during Sleep mode
1: LPTIM4 peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 12 **LPTIM3LPEN**: LPTIM3 clock enable during Sleep mode
Set and reset by software.
0: LPTIM3 peripheral clock disabled during Sleep mode
1: LPTIM3 peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 11 **LPTIM1LPEN**: LPTIM1 clock enable during Sleep mode
Set and reset by software.
0: LPTIM1 peripheral clock disabled during Sleep mode
1: LPTIM1 peripheral clock enabled during Sleep mode (default after reset)

Bit 10 Reserved, must be kept at reset value.

Bit 9 **I3C2LPEN**: I3C2 clock enable during Sleep mode
Set and reset by software.
0: I3C2 peripheral clock disabled during Sleep mode
1: I3C2 peripheral clock enabled during Sleep mode (default after reset)

Bit 8 **I2C4LPEN**: I2C4 clock enable during Sleep mode
Set and reset by software.
0: I2C4 peripheral clock disabled during Sleep mode
1: I2C4 peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 7 **I2C3LPEN**: I2C3 clock enable during Sleep mode
Set and reset by software.
0: I2C3 peripheral clock disabled during Sleep mode
1: I2C3 peripheral clock enabled during Sleep mode (default after reset)

Bit 6 **LPUART1LPEN**: LPUART1 clock enable during Sleep mode
Set and reset by software.
0: LPUART1 peripheral clock disabled during Sleep mode
1: LPUART1 peripheral clock enabled during Sleep mode (default after reset)

Bit 5 **SPI5LPEN**: SPI5 clock enable during Sleep mode
Set and reset by software.
0: SPI5 peripheral clock disabled during Sleep mode
1: SPI5 peripheral clock enabled during Sleep mode (default after reset)
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **SBSLPEN**: SBS clock enable during Sleep mode
Set and reset by software.
0: SBS peripheral clock disabled during Sleep mode
1: SBS peripheral clock enabled during Sleep mode (default after reset)

Bit 0 Reserved, must be kept at reset value.

11.8.40 RCC kernel clock configuration register (RCC_CCIPR1)

Address offset: 0x0D8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **TIMICSEL**: TIM12, TIM15 and LPTIM2 input capture source selection
Set and reset by software.
0: No internal clock available for timers input capture (default after reset)
1: hsi_ker_ck/1024, hsi_ker_ck/8 and csi_ker_ck/128 selected for timers input capture

Bit 30 Reserved, must be kept at reset value.

Bits 29:27 **USART10SEL[2:0]**: USART10 kernel clock source selection
000: rcc_pclk1 selected as kernel clock (default after reset)
001: pll2_q_ck selected as kernel clock
010: pll3_q_ck selected as kernel clock
011: hsi_ker_ck selected as kernel clock
100: csi_ker_ck selected as kernel clock
101: lse_ck selected as kernel clock
Others: reserved, the kernel clock is disabled
Note: These bits are only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 26:24 **UART9SEL[2:0]**: UART9 kernel clock source selection
000: rcc_pclk1 selected as kernel clock (default after reset)
001: pll2_q_ck selected as kernel clock
010: pll3_q_ck selected as kernel clock
011: hsi_ker_ck selected as kernel clock
100: csi_ker_ck selected as kernel clock
101: lse_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Note: These bits are only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 23:21 **UART8SEL[2:0]**: UART8 kernel clock source selection
000: rcc_pclk1 selected as kernel clock (default after reset)
001: pll2_q_ck selected as kernel clock
010:
– pll3_q_ck selected as kernel clock for STM32H562/563/573xx devices
– reserved for STM32H543/553xx devices
011: hsi_ker_ck selected as kernel clock
100: csi_ker_ck selected as kernel clock
101: lse_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Bits 20:18 **UART7SEL[2:0]**: UART7 kernel clock source selection
000: rcc_pclk1 selected as kernel clock (default after reset)
001: pll2_q_ck selected as kernel clock
010:
– pll3_q_ck selected as kernel clock for STM32H562/563/573xx devices
– reserved for STM32H543/553xx devices
011: hsi_ker_ck selected as kernel clock
100: csi_ker_ck selected as kernel clock
101: lse_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Bits 17:15 **USART6SEL[2:0]**: USART6 kernel clock source selection
000: rcc_pclk1 selected as kernel clock (default after reset)
001: pll2_q_ck selected as kernel clock
010:
– pll3_q_ck selected as kernel clock for STM32H523/533/562/563/573xx devices
– reserved for STM32H543/553xx devices
011: hsi_ker_ck selected as kernel clock
100: csi_ker_ck selected as kernel clock
101: lse_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Bits 14:12 **UART5SEL[2:0]**: UART5 kernel clock source selection
000: rcc_pclk1 selected as kernel clock (default after reset)
001: pll2_q_ck selected as kernel clock
010:
– pll3_q_ck selected as kernel clock for STM32H523/533/562/563/573xx devices
– reserved for STM32H543/553xx devices
011: hsi_ker_ck selected as kernel clock
100: csi_ker_ck selected as kernel clock
101: lse_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Bits 11:9 **UART4SEL[2:0]**: UART4 kernel clock source selection
000: rcc_pclk1 selected as kernel clock (default after reset)
001: pll2_q_ck selected as kernel clock
010:
– pll3_q_ck selected as kernel clock for STM32H523/533/562/563/573xx devices
– reserved for STM32H543/553xx devices
011: hsi_ker_ck selected as kernel clock
100: csi_ker_ck selected as kernel clock
101: lse_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Bits 8:6 **USART3SEL[2:0]**: USART3 kernel clock source selection
Set and reset by software.
000: rcc_pclk1 selected as kernel clock (default after reset)
001: pll2_q_ck selected as kernel clock
010:
– pll3_q_ck selected as kernel clock for STM32H523/533/562/563/573xx devices
– reserved for STM32H543/553xx devices
011: hsi_ker_ck selected as kernel clock
100: csi_ker_ck selected as kernel clock
101: lse_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Bits 5:3 **USART2SEL[2:0]**: USART2 kernel clock source selection
Set and reset by software.
000: rcc_pclk1 selected as kernel clock (default after reset)
001: pll2_q_ck selected as kernel clock
010:
– pll3_q_ck selected as kernel clock for STM32H523/533/562/563/573xx devices
– reserved for STM32H543/553xx devices
011: hsi_ker_ck selected as kernel clock
100: csi_ker_ck selected as kernel clock
101: lse_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Bits 2:0 **USART1SEL[2:0]**: USART1 kernel clock source selection
Set and reset by software.
000: rcc_pclk2 selected as kernel clock (default after reset)
001: pll2_q_ck selected as kernel clock
010:
– pll3_q_ck selected as kernel clock for STM32H523/533/562/563/573xx devices
– reserved for STM32H543/553xx devices
011: hsi_ker_ck selected as kernel clock
100: csi_ker_ck selected as kernel clock
101: lse_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

11.8.41 RCC kernel clock configuration register (RCC_CCIPR2)

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **LPTIM6SEL[2:0]**: LPTIM6 kernel clock source selection
000: rcc_pclk3 selected as kernel clock (default after reset)
001: pll2_p_ck selected as kernel clock
010: pll3_r_ck selected as kernel clock
011: lse_ck selected as kernel clock
100: lsi_ck selected as kernel clock
101: per_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Note: These bits are only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 27 Reserved, must be kept at reset value.

Bits 26:24 **LPTIM5SEL[2:0]**: LPTIM5 kernel clock source selection
000: rcc_pclk3 selected as kernel clock (default after reset)
001: pll2_p_ck selected as kernel clock
010: pll3_r_ck selected as kernel clock
011: lse_ck selected as kernel clock
100: lsi_ck selected as kernel clock
101: per_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Note: These bits are only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 23 Reserved, must be kept at reset value.

Bits 22:20 **LPTIM4SEL[2:0]**: LPTIM4 kernel clock source selection
000: rcc_pclk3 selected as kernel clock (default after reset)
001: pll2_p_ck selected as kernel clock
010: pll3_r_ck selected as kernel clock
011: lse_ck selected as kernel clock
100: lsi_ck selected as kernel clock
101: per_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Note: These bits are only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **LPTIM3SEL[2:0]**: LPTIM3 kernel clock source selection
000: rcc_pclk3 selected as kernel clock (default after reset)
001: pll2_p_ck selected as kernel clock
010: pll3_r_ck selected as kernel clock
011: lse_ck selected as kernel clock
100: lsi_ck selected as kernel clock
101: per_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Note: These bits are only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **LPTIM2SEL[2:0]**: LPTIM2 kernel clock source selection
000: rcc_pclk1 selected as kernel clock (default after reset)
001: pll2_p_ck selected as kernel clock
010:
– pll3_r_ck selected as kernel clock for STM32H523/533/562/563/573xx devices
– reserved for STM32H543/553xx devices
011: lse_ck selected as kernel clock
100: lsi_ck selected as kernel clock
101: per_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Bit 11 Reserved, must be kept at reset value.

Bits 10:8 **LPTIM1SEL[2:0]**: LPTIM1 kernel clock source selection
000: rcc_pclk3 selected as kernel clock (default after reset)
001: pll2_p_ck selected as kernel clock
010:

0000: N = 0, PLAY1DIV_1
0001: N = 1, PLAY1DIV_2 (default after reset)
0010: N = 2, PLAY1DIV_4
0011: N = 3, PLAY1DIV_8
...
1111: N = 15, PLAY1DIV_32768
Note: These bits are only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 19:18 Reserved, must be kept at reset value.

Bits 17:15 **SPI6SEL[2:0]**: SPI6 kernel clock source selection
000: rcc_pclk2 selected as kernel clock (default after reset)
001: pll2_q_ck selected as kernel clock
010: pll3_q_ck selected as kernel clock
011: hsi_ker_ck selected as kernel clock
100: csi_ker_ck selected as kernel clock
101: hse_ck selected as kernel clock
Others: reserved, the kernel clock is disabled
Note: These bits are only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 14:12 **SPI5SEL[2:0]**: SPI5 kernel clock source selection
000: rcc_pclk3 selected as kernel clock (default after reset)
001: pll2_q_ck selected as kernel clock
010: pll3_q_ck selected as kernel clock
011: hsi_ker_ck selected as kernel clock
100: csi_ker_ck selected as kernel clock
101: hse_ck selected as kernel clock
Others: reserved, the kernel clock is disabled
Note: These bits are only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 11:9 **SPI4SEL[2:0]**: SPI4 kernel clock source selection
000: rcc_pclk2 selected as kernel clock (default after reset)
001: pll2_q_ck selected as kernel clock
010:
– pll3_q_ck selected as kernel clock for STM32H523/533/562/563/573xx devices
– reserved for STM32H543/553xx devices
011: hsi_ker_ck selected as kernel clock
100: csi_ker_ck selected as kernel clock
101: hse_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Bits 8:6 **SPI3SEL[2:0]**: SPI3 kernel clock source selection
Set and reset by software.
000: pll1_q_ck selected as kernel clock (default after reset)
001: pll2_p_ck selected as kernel clock
010:
– pll3_p_ck selected as kernel clock for STM32H523/533/562/563/573xx devices
– reserved for STM32H543/553xx devices
011: AUDIOCLK selected as kernel clock
100: per_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Bits 5:3 **SPI2SEL[2:0]**: SPI2 kernel clock source selection
Set and reset by software.
000: pll1_q_ck selected as kernel clock (default after reset)
001: pll2_p_ck selected as kernel clock
010:
– pll3_p_ck selected as kernel clock for STM32H523/533/562/563/573xx devices
– reserved for STM32H543/553xx devices
011: AUDIOCLK selected as kernel clock
100: per_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

Bits 2:0 **SPI1SEL[2:0]**: SPI1 kernel clock source selection
Set and reset by software.
000: pll1_q_ck selected as kernel clock (default after reset)
001: pll2_p_ck selected as kernel clock
010:
– pll3_p_ck selected as kernel clock for STM32H523/533/562/563/573xx devices
– reserved for STM32H543/553xx devices
011: AUDIOCLK selected as kernel clock
100: per_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

11.8.43 RCC kernel clock configuration register (RCC_CCIPR4)

Address offset: 0x0E4

Reset value: 0x0000 0000

							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 **ETHPTPDIV[3:0]**: ETH PTP clock division

This bitfield selects the division factor of the PTP clock.

0000: Divided by 1 (default after reset)

0001: Divided by 2

...

1110: Divided by 15

1111: Divided by 16

Note: This bit is only available on STM32H543/553xx devices. If not present, consider this bit as reserved, and keep its bits at reset value.

Bits 27:26 **I3C2SEL[1:0]**: I3C2 kernel clock source selection

00: rcc_pclk3 selected as kernel clock (default after reset)

01:

– pll2_r_ck selected as kernel clock for STM32H543/553xx devices

– pll3_r_ck selected as kernel clock for the other STM32H5 series devices

10: hsi_ker_ck selected as kernel clock

11: no clock selected

Note: These bits are only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 25:24 **I3C1SEL[1:0]**: I3C1 kernel clock source selection

00: rcc_pclk1 selected as kernel clock (default after reset)

01:

– pll2_r_ck selected as kernel clock for STM32H543/553xx devices

– pll3_r_ck selected as kernel clock for the other STM32H5 series devices

10: hsi_ker_ck selected as kernel clock

11: no clock selected

Bits 23:22 **I2C4SEL[1:0]**: I2C4 kernel clock source selection

00: rcc_pclk3 selected as kernel clock (default after reset)

01: pll3_r_ck selected as kernel clock

10: hsi_ker_ck selected as kernel clock

11: csi_ker_ck selected as kernel clock

Note: These bits are only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 21:20 **I2C3SEL[1:0]**: I2C3 kernel clock source selection
00: rcc_pclk3 selected as kernel clock (default after reset)
01:
– pll2_r_ck selected as kernel clock for STM32H543/553xx devices
– pll3_r_ck selected as kernel clock for the other STM32H5 series devices
10: hsi_ker_ck selected as kernel clock
11: csi_ker_ck selected as kernel clock

Bits 19:18 **I2C2SEL[1:0]**: I2C2 kernel clock source selection
00: rcc_pclk1 selected as kernel clock (default after reset)
01:
– pll2_r_ck selected as kernel clock for STM32H543/553xx devices
– pll3_r_ck selected as kernel clock for the other STM32H5 series devices
10: hsi_ker_ck selected as kernel clock
11: csi_ker_ck selected as kernel clock

Bits 17:16 **I2C1SEL[1:0]**: I2C1 kernel clock source selection
00: rcc_pclk1 selected as kernel clock (default after reset)
01:
– pll2_r_ck selected as kernel clock for STM32H543/553xx devices
– pll3_r_ck selected as kernel clock for the other STM32H5 series devices
10: hsi_ker_ck selected as kernel clock
11: csi_ker_ck selected as kernel clock

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **ETHCLKSEL**: EHTH clock source selection
This bit selects the reference clock of the PAD ETH_CLK
0: hse_ck (default after reset)
1: pll1_q_ck
Note: This bit is only available on STM32H543/553xx devices. If not present, consider this bit as reserved, and keep its bits at reset value.

Bit 7 **SDMMC2SEL**: SDMMC2 kernel clock source selection
0: pll1_q_ck selected as kernel clock (default after reset)
1: pll2_r_ck selected as kernel clock
Note: This bit is only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bit 6 **SDMMC1SEL**: SDMMC1 kernel clock source selection
0: pll1_q_ck selected as kernel clock (default after reset)
1: pll2_r_ck selected as kernel clock

Bits 5:4 **USBSEL[1:0]**: USB kernel clock source selection
00: no clock is selected as kernel clock (default after reset)
01: pll1_q_ck selected as kernel clock
10:
– pll2_q_ck selected as kernel clock for STM32H543/553xx devices
– pll3_q_ck selected as kernel clock for the other STM32H5 series devices
11: hsi48_ker_ck selected as kernel clock

Bits 3:2 **SYSTICKSEL[1:0]**: SYSTICK clock source selection
00: rcc_hclk/8 selected as clock source (default after reset)
01: lsi_ker_ck[1] selected as clock source
10: lse_ck[1] selected as clock source
11: reserved, the kernel clock is disabled
Note: rcc_hclk frequency must be four times higher than lsi_ker_ck/lse_ck, that is, period (LSI/LSE) ≥ 4 * period (HCLK).

Bits 1:0 **OCTOSPI1SEL[1:0]**: OCTOSPI1 kernel clock source selection
Set and reset by software.
00: rcc_hclk4 selected as kernel clock (default after reset)
01: pll1_q_ck selected as kernel clock
10: pll2_r_ck selected as kernel clock
11: per_ck selected as kernel clock

11.8.44 RCC kernel clock configuration register (RCC_CCIPR5)

Address offset: 0x0E8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 **CKPERSEL[1:0]**: per_ck clock source selection
00: hsi_ker_ck selected as kernel clock (default after reset)
01: csi_ker_ck selected as kernel clock
10: hse_ck selected as kernel clock
11: reserved, the per_ck clock is disabled

Bits 29:24 Reserved, must be kept at reset value.

Bit 23 **ETHREFCLKSEL**: ETH RMII reference kernel clock source selection
This bit selects the reference clock of the ETH for RMII mode. It must be set to 0 in any other mode than RMII.
0: ETH_RMII_REF_CLK (default after reset)
1: eth_clk_fb
Note: This bit is only available on STM32H543/553xx devices. If not present, consider this bit as reserved, and keep its bits at reset value.

Bit 22 Reserved, must be kept at reset value.

Bits 21:19 **SAI2SEL[2:0]**: SAI2 kernel clock source selection
000: pll1_q_ck selected as kernel clock (default after reset)
001: pll2_p_ck selected as kernel clock
010: pll3_p_ck selected as kernel clock
011: AUDIOCLK selected as kernel clock
100: per_ck selected as kernel clock
Others: reserved, the kernel clock is disabled
Note: These bits are only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 18:16 **SAI1SEL[2:0**]: SAI1 kernel clock source selection
000: pll1_q_ck selected as kernel clock (default after reset)
001: pll2_p_ck selected as kernel clock
010: pll3_p_ck selected as kernel clock
011: AUDIOCLK selected as kernel clock
100: per_ck selected as kernel clock
Others: reserved, the kernel clock is disabled
Note: These bits are only available on some devices in the STM32H5 series. Refer to the device datasheet for availability of its associated peripheral. If not present, consider this bit as reserved and keep it at reset value.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:10 **ETHPTPCLKSEL[1:0]**: ETH PTP kernel clock source selection
Set and reset by software.
00: rcc_hclk1 selected as kernel clock (default after reset)
01: pll1_r_ck selected as kernel clock
10: pll1_q_ck selected as kernel clock
11: pll2_p_ck selected as kernel clock
Note: This bit is only available on STM32H543/553xx devices. If not present, consider this bit as reserved, and keep its bits at reset value.

Bits 9:8 **FDCANSEL[1:0]**: FDCAN1 and FDCAN2 kernel clock source selection
00: hse_ck selected as kernel clock (default after reset)
01: pll1_q_ck selected as kernel clock
10: pll2_q_ck selected as kernel clock
11: reserved, the kernel clock is disabled

Bits 7:6 **CECSEL[1:0]**: HSMI-CEC kernel clock source selection
00: lse_ck selected as kernel clock (default after reset)
01: lsi_ker_ck selected as kernel clock
10: csi_ker_ck/122 selected as kernel clock
11: reserved, the kernel clock is disabled

Bits 5:4 **RNGSEL[1:0]**: RNG kernel clock source selection
00: hsi48_ker_ck selected as kernel clock (default after reset)
01: pll1_q_ck selected as kernel clock
10: lse_ck selected as kernel clock
11: lsi_ker_ck selected as kernel clock

Bit 3 **DACSEL**: DAC sample and hold clock
0: dac_hold_ck selected as kernel clock (default after reset)
1: dac_hold_ck selected as kernel clock

Bits 2:0 **ADCDACSEL[2:0]**: ADC and DAC kernel clock source selection
000: rcc_hclk selected as kernel clock (default after reset)
001: sys_ck selected as kernel clock
010: pll2_r_ck selected as kernel clock
011: hse_ck selected as kernel clock
100: hsi_ker_ck selected as kernel clock
101: csi_ker_ck selected as kernel clock
Others: reserved, the kernel clock is disabled

11.8.45 RCC Backup domain control register (RCC_BDCR)

Address offset: 0x0F0

Reset value: 0x0000 0000

Reset value: 0x0000 0080 (for STM32H543/553xx devices)

Reset by Backup domain reset.

Access: 0 ≤ wait state ≤ 3, word, half-word and byte access.

Wait states are inserted in case of successive accesses to this register.

Note: After a system reset, this register is write-protected (except bits 27:24 and bit 16). To modify the backup domain bits, the DBP bit in the PWR Backup domain control register (PWR_BDCR) must be set to 1. All bits (except bits 27:24 and bit 16) are reset only after a Backup domain reset (see Section 11.3.3). Other resets do not have effect on these bits.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	LSIRDY	LSION	LSCOSEL	LSCOEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VSWRST
				rw	rw	rw	rw								rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RTCEN	Res.	Res.	Res.	Res.	Res.	RTCSEL[1:0]		LSEEXT	LSECSSD	LSECSSON	LSEDRV[1:0]		LSEBYP	LSERDY	LSEON
rw						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **LSIRDY**: LSI oscillator ready
Set and cleared by hardware to indicate when the LSI oscillator is stable. After the LSION bit is cleared, LSIRDY goes low after three internal low-speed oscillator clock cycles.
This bit is set when the LSI is used by IWDG or RTC, even if LSION = 0.
0: LSI oscillator not ready
1: LSI oscillator ready

Bit 26 **LSION**: LSI oscillator enable
Set and cleared by software.
0: LSI oscillator off
1: LSI oscillator on

Bit 25 **LSCOSEL**: Low-speed clock output selection
Set and cleared by software.
0: LSI clock selected
1: LSE clock selected

Bit 24 **LSCOEN**: Low-speed clock output (LSCO) enable
Set and cleared by software.
0: LSCO output disabled
1: LSCO output enabled

Bits 23:17 Reserved, must be kept at reset value.

Bit 16 **VSWRST**: VSwitch domain software reset
Set and reset by software.
0: reset not activated (default after Backup domain reset)
1: resets the entire VSW domain

Bit 15 **RTCEN**: RTC clock enable
Set and reset by software.
0: rtc_ck disabled (default after Backup domain reset)
1: rtc_ck enabled

Bits 14:10 Reserved, must be kept at reset value.

Bits 9:8 **RTCSEL[1:0]**:RTC clock source selection
Set by software to select the clock source for the RTC.
These bits can be written only one time (except in case of failure detection on LSE).
These bits must be written before LSECSSON is enabled.
The VSWRST bit can be used to reset them, then it can be written one time again.
If HSE is selected as RTC clock, this clock is lost when the system is in Stop mode or in case of a pin reset (NRST).
00: no clock (default after Backup domain reset)
01: LSE selected as RTC clock
10: LSI selected as RTC clock
11: HSE divided by RTCPRE value selected as RTC clock

Bit 7 **LSEEXT**: low-speed external clock type in bypass mode
Set and reset by software to select the external clock type (analog or digital).
The external clock must be enabled with the LSEON bit, to be used by the device.
The LSEEXT bit can be written only if the LSE oscillator is disabled.
0: LSE in analog mode (default after Backup domain reset)
1: LSE in digital mode
Note: The default value after a Backup domain reset is 1 for the STM32H543/553xx.

Bit 6 **LSECSSD**: LSE clock security system failure detection
Set by hardware to indicate when a failure has been detected by the clock security system on the external 32 kHz oscillator.
0: no failure detected on 32 kHz oscillator (default after Backup domain reset)
1: failure detected on 32 kHz oscillator

Bit 5 **LSECSSON**: LSE clock security system enable
Set by software to enable the clock security system on 32 kHz oscillator.
LSECSSON must be enabled after LSE is enabled (LSEON enabled) and ready (LSERDY set by hardware) and after RTCSEL is selected.
Once enabled, this bit cannot be disabled, except after a LSE failure detection (LSECSSD = 1). In that case the software must disable LSECSSON.
0: CSS on 32 kHz oscillator OFF (default after Backup domain reset)
1: CSS on 32 kHz oscillator ON

Bits 4:3 **LSEDRV[1:0]**: LSE oscillator driving capability
Set by software to select the driving capability of the LSE oscillator.
These bit can be written only if LSE oscillator is disabled (LSEON = 0 and LSERDY = 0).
00: lowest drive (default after Backup domain reset)
01: medium-low drive
10: medium-high drive
11: highest drive

Bit 2 **LSEBYP**: LSE oscillator bypass
Set and reset by software to bypass oscillator in debug mode. This bit must not be written when the LSE is enabled (by LSEON) or ready (LSERDY = 1)
0: LSE oscillator not bypassed (default after Backup domain reset)
1: LSE oscillator bypassed

Bit 1 **LSERDY**: LSE oscillator ready
Set and reset by hardware to indicate when the LSE is stable.
This bit needs 6 cycles of lse_ck clock to fall down after LSEON has been set to 0.
0: LSE oscillator not ready (default after Backup domain reset)
1: LSE oscillator ready

Bit 0 **LSEON**: LSE oscillator enabled
Set and reset by software.
0: LSE oscillator OFF (default after Backup domain reset)
1: LSE oscillator ON

11.8.46 RCC reset status register (RCC_RSR)

Address offset: 0x0F4

Reset value: 0x0C00 0000

Reset by power-on reset only.

Access: 0 ≤ wait state ≤ 3, word, half-word and byte access.

Wait states are inserted in case of successive accesses to this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LPWRRSTF	WWDGRSTF	IWDGRSTF	SFTRSTF	BORRSTF	PINRSTF	Res.	Res.	RMVF	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bit 31 **LPWRRSTF**: Low-power reset flag
Set by hardware when a reset occurs due to Stop or Standby mode entry, whereas the corresponding nRST_STOP, nRST_STBY option bit is cleared.
Cleared by writing to the RMVF bit.
0: No illegal low-power mode reset occurred
1: Illegal low-power mode reset occurred

Bit 30 **WWDGRSTF**: window watchdog reset flag
Reset by software by writing the RMVF bit.
Set by hardware when a window watchdog reset occurs.
0: no window watchdog reset occurred from WWDG (default after power-on reset)
1: window watchdog reset occurred from WWDG

Bit 29 **IWDGRSTF**: independent watchdog reset flag
Reset by software by writing the RMVF bit.
Set by hardware when an independent watchdog reset occurs.
0: no independent watchdog reset occurred (default after power-on reset)
1: independent watchdog reset occurred

Bit 28 **SFTRSTF**: system reset from CPU reset flag
Reset by software by writing the RMVF bit.
Set by hardware when the system reset is due to CPU.The CPU can generate a system reset by writing SYSRESETREQ bit of AIRCR register of the core M33.
0: no CPU software reset occurred (default after power-on reset)
1: a system reset has been generated by the CPU

Bit 27 **BORRSTF**: BOR reset flag
Reset by software by writing the RMVF bit.
Set by hardware when a BOR reset occurs (pwr_bor_rst).
0: no BOR reset occurred
1: BOR reset occurred (default after power-on reset)

Bit 26 **PINRSTF**: pin reset flag (NRST)
Reset by software by writing the RMVF bit.
Set by hardware when a reset from pin occurs.
0: no reset from pin occurred
1: reset from pin occurred (default after power-on reset)

Bits 25:24 Reserved, must be kept at reset value.

Bit 23 **RMVF**: remove reset flag
Set and reset by software to reset the value of the reset flags.
0: reset of the reset flags not activated (default after power-on reset)
1: resets the value of the reset flags

Bits 22:0 Reserved, must be kept at reset value.

11.8.47 RCC secure configuration register (RCC_SECCFGR)

Address offset: 0x110

Reset value: 0x0000 0000

Access: no wait state; word, half-word and byte access

When the system is secure (TZEN = 0xB4), this register can be written only by a secure privileged access if SPRIV = 1, and by a secure privileged or unprivileged access if SPRIV = 0. A non-secure write access generates an illegal access event and data is not written. This register can be read by secure or non-secure, privilege or unprivileged access.

When the system is not secure (TZEN = 0xC3), this register is read as 0 and the register write is ignored.

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **CKPERSELSEC**: per_ck selection security
Set and reset by software.
0: non secure
1: secure

Bit 12 **RMVFSEC**: Remove reset flag security
Set and reset by software.
0: non secure
1: secure

Bit 11 **HSI48SEC**: HSI48 clock configuration and status bits security
Set and reset by software.
0: non secure
1: secure

Bit 10 Reserved, must be kept at reset value.

Bit 9 **PLL3SEC**: PLL3 clock configuration and status bits security
Set and reset by software.
0: non secure
1: secure
Note: This bit is not available on STM32H543/553xx devices. If not present, consider this bit as reserved, and keep its bits at reset value.

Bit 8 **PLL2SEC**: PLL2 clock configuration and status bits security
Set and reset by software.
0: non secure
1: secure

Bit 7 **PLL1SEC**: PLL1 clock configuration and status bits security
Set and reset by software.
0: non secure
1: secure

Bit 6 **PRESCSEC**: AHBx/APBx prescaler configuration bits security
Set and reset by software.
0: non secure
1: secure

Bit 5 **SYSCLKSEC**: SYSCLK clock selection, STOPWUCK bit, clock output on MCO configuration security
Set and reset by software.
0: non secure
1: secure

Bit 4 **LSESEC**: LSE clock configuration and status bits security
Set and reset by software.
0: non secure
1: secure

Bit 3 **LSISEC**: LSI clock configuration and status bits security
Set and reset by software.
0: non secure
1: secure

Bit 2 **CSISEC**: CSI clock configuration and status bits security
Set and reset by software.
0: non secure
1: secure

Bit 1 **HSESEC**: HSE clock configuration bits, status bits and HSE_CSS security
Set and reset by software.
0: non secure
1: secure

Bit 0 **HSISEC**: HSI clock configuration and status bits security
Set and reset by software.
0: non secure
1: secure

11.8.48 RCC privilege configuration register (RCC_PRIVCFGR)

Address offset: 0x114

Reset value: 0x0000 0000

Access: no wait state; word, half-word and byte access

This register can be written only by a privileged access. It can be read by privileged or unprivileged access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NSPRIV	SPRIV
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **NSPRIV**: RCC non-secure functions privilege configuration

Set and reset by software. This bit can be written only by privileged access, secure or non-secure.

0: Read and write to RCC non-secure functions can be done by privileged or unprivileged access.

1: Read and write to RCC non-secure functions can be done by privileged access only

Bit 0 **SPRIV**: RCC secure functions privilege configuration

Set and reset by software. This bit can be written only by a secure privileged access.

0: Read and write to RCC secure functions can be done by privileged or unprivileged access.

1: Read and write to RCC secure functions can be done by privileged access only

3. Available only on STM32H543/553xx devices. If not present, consider it as reserved, and keep it at reset value.
4. The Reset value is 1 for STM32H523/533/543/553xx devices.
5. For the actual availability of these bits check the datasheet. If not present, consider them as reserved, and keep them at reset value.
6. The reset value is 1 for STM32H543/553xx devices.

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

12 Clock recovery system (CRS)

12.1 CRS introduction

The clock recovery system (CRS) is an advanced digital controller acting on the internal fine-granularity trimmable RC oscillator HSI48. The CRS provides powerful means to evaluate the oscillator output frequency, based on comparison with a selectable synchronization signal. The CRS can perform automatic trimming adjustments based on the measured frequency error value, while keeping the possibility of a manual trimming.

The CRS is ideally suited to provide a precise clock to the USB peripheral. In this case, the synchronization signal can be derived from the start-of-frame (SOF) packet signalization on the USB bus, sent by a USB host at 1 ms intervals.

The synchronization signal can also be derived from alternative synchronization or generated by the user software.

12.2 CRS main features

- Selectable synchronization source with programmable prescaler and polarity (see *Section 12.4.2: CRS internal signals*)
- Possibility to generate synchronization pulses by software
- Automatic oscillator trimming capability with no need of CPU action
- Manual control option for faster startup convergence
- 16-bit frequency error counter with automatic error value capture and reload
- Programmable limit for automatic frequency error value evaluation and status reporting
- Maskable interrupts/events:
  - Expected synchronization (ESYNC)
  - Synchronization OK (SYNCOK)
  - Synchronization warning (SYNCWARN)
  - Synchronization or trimming error (ERR)

12.3 CRS implementation

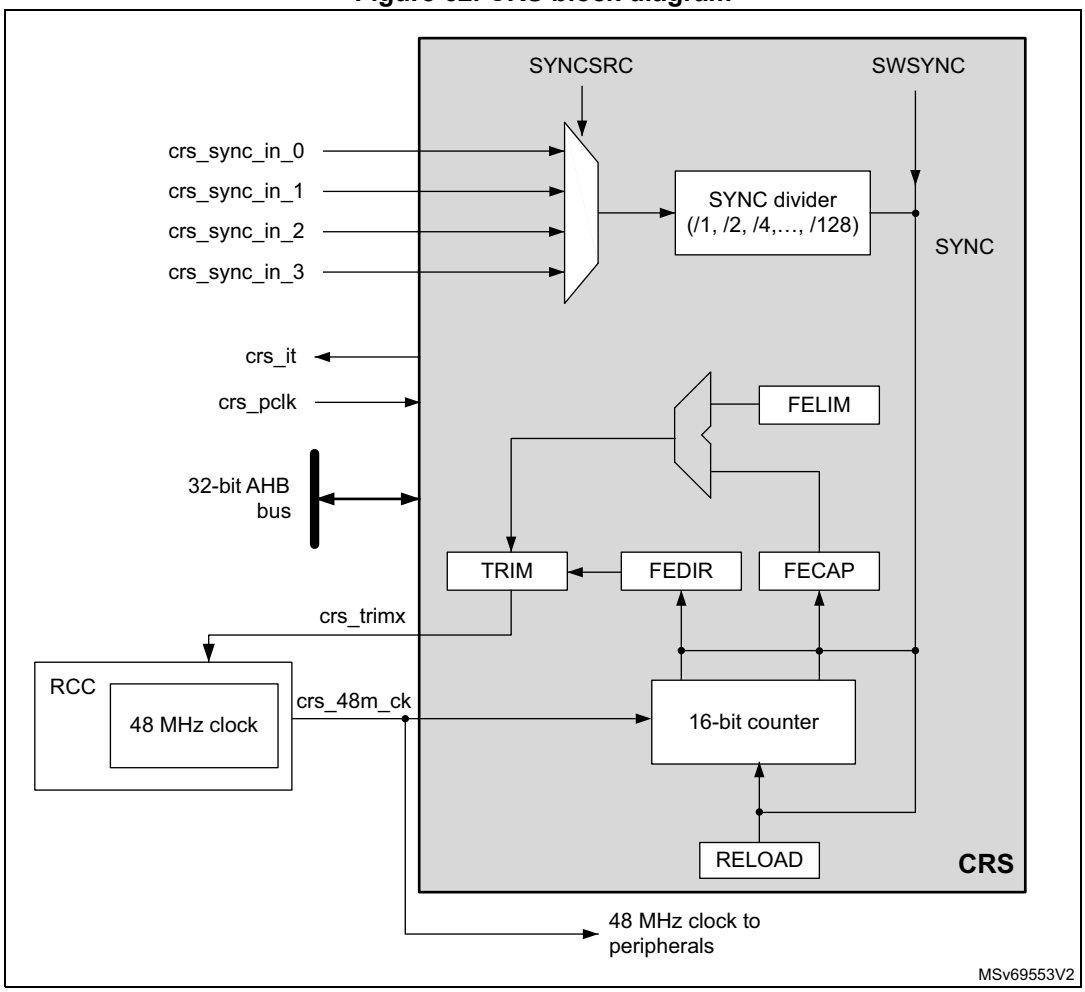

Table 125. CRS features

Feature	CRS
TRIM width	6 bits

Internal signal name	Signal type	Description
crs_sync_in_0	Digital input	SYNC signal source
crs_sync_in_1		
crs_sync_in_2		
crs_sync_in_3		

Table 127. CRS interconnection

Internal signal name	Description
crs_sync_in_0	GPIO selected as SYNC signal source
crs_sync_in_1	LSE selected as SYNC signal source
crs_sync_in_2	USB SOF selected as SYNC signal source (default)
crs_sync_in_3	Reserved

12.4.3 Synchronization input

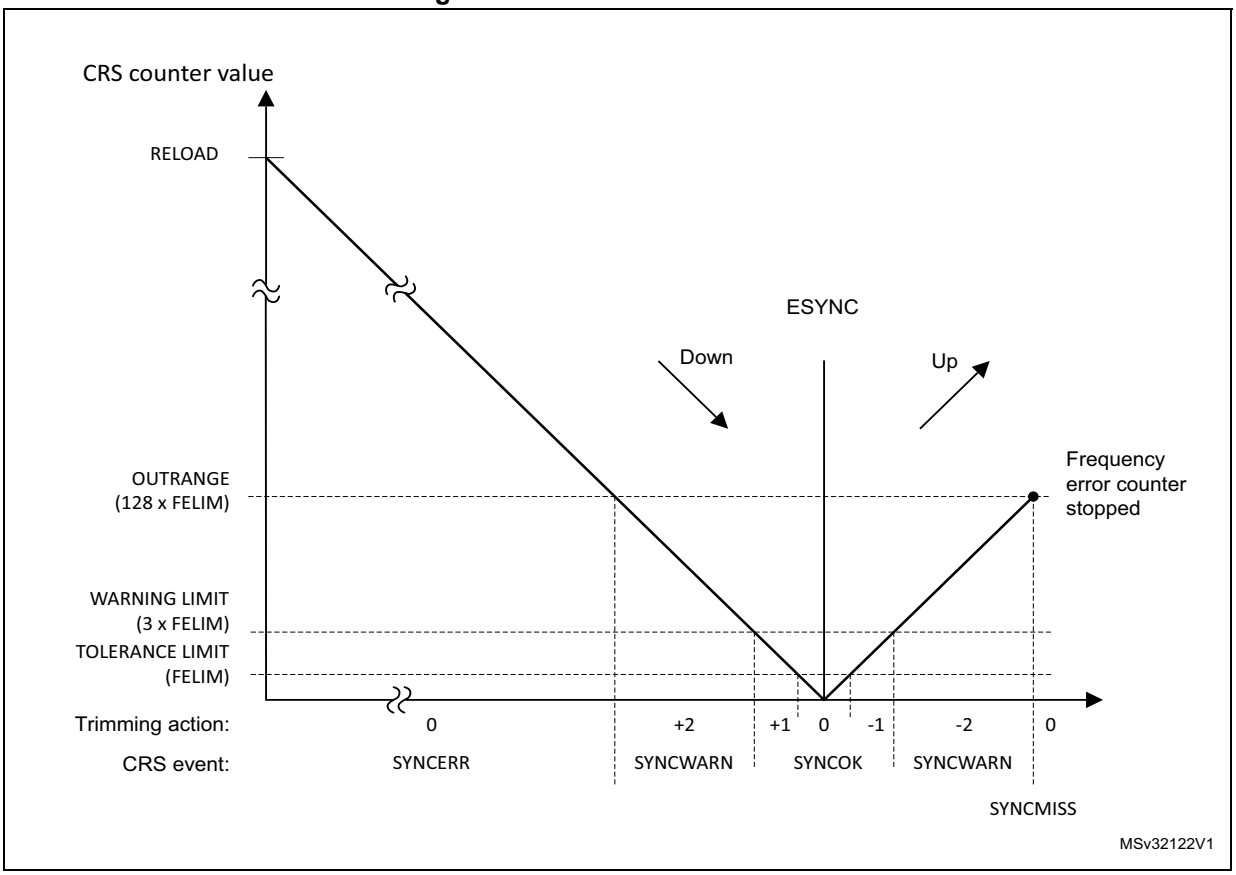
The CRS synchronization source (crs_sync_in_x) can be selected through SYNCSRC[1:0] bitfield of CRS_CFGR register (refer to *Section 12.4.2: CRS internal signals* for the possible sources). For a better robustness of the crs_sync_in_x input, a simple digital filter (2 out of 3 majority votes, sampled by the 48 MHz clock) is implemented to filter out glitches. In addition, the source signal has a configurable polarity (selected through SYNCPOL bit of CRS_CFGR). The signal can then be divided by a programmable binary prescaler to obtain a synchronization signal in a suitable frequency range (usually around 1 kHz).

For more information on the CRS synchronization source configuration, refer to CRS_CFGR register.

It is also possible to generate a synchronization event by software, by setting the SWSYNC bit in the CRS_CR register.

For more information on the CRS synchronization source configuration, refer to *CRS configuration register (CRS_CFGR)*.

It is also possible to generate a synchronization event by software, by setting the SWSYNC bit in the CRS_CR register.



12.4.4 Frequency error measurement

The frequency error counter is a 16-bit down/up counter, reloaded with the RELOAD value on each SYNC event. It starts counting down until it reaches the zero value, where the ESYNC (expected synchronization) event is generated. Then it starts counting up to the OUTRANGE limit, where it eventually stops (if no SYNC event is received), and generates a SYNCMISS event. The OUTRANGE limit is defined as the frequency error limit (FELIM field of the CRS_CFGR register) multiplied by 128.

When the SYNC event is detected, the actual value of the frequency error counter and its counting direction are stored in the FECAP (frequency error capture) field and in the FEDIR (frequency error direction) bit of the CRS_ISR register. When the SYNC event is detected during the down-counting phase (before reaching the zero value), it means that the actual

frequency is lower than the target (the TRIM value must be incremented). When it is detected during the up-counting phase, it means that the actual frequency is higher (the TRIM value must be decremented).

Figure 63. CRS counter behavior

12.4.5 Frequency error evaluation and automatic trimming

The measured frequency error is evaluated by comparing its value with a set of limits:

- TOLERANCE LIMIT, given directly in the FELIM field of the CRS_CFGR register
- WARNING LIMIT, defined as 3 × FELIM value
- OUTRANGE (error limit), defined as 128 × FELIM value

The result of this comparison is used to generate the status indication and also to control the automatic trimming, which is enabled by setting the AUTOTRIMEN bit in the CRS_CR register:

- When the frequency error is below the tolerance limit, it means that the actual trimming value in the TRIM field is the optimal one, hence no trimming action is needed.
  - SYNCOK status indicated
  - TRIM value not changed in AUTOTRIM mode
- When the frequency error is below the warning limit but above or equal to the tolerance limit, it means that some trimming action is necessary but that adjustment by one trimming step is enough to reach the optimal TRIM value.
  - SYNCOK status indicated

  - TRIM value adjusted by one trimming step in AUTOTRIM mode
- When the frequency error is above or equal to the warning limit but below the error limit, a stronger trimming action is necessary, and there is a risk that the optimal TRIM value is not reached for the next period.
  - SYNCWARN status indicated
  - TRIM value adjusted by two trimming steps in AUTOTRIM mode
- When the frequency error is above or equal to the error limit, the frequency is out of the trimming range. This can also happen when the SYNC input is not clean, or when some SYNC pulse is missing (for example when one USB SOF is corrupted).
  - SYNCERR or SYNCMISS status indicated
  - TRIM value not changed in AUTOTRIM mode

Note: If the actual value of the TRIM field is close to its limits and the automatic trimming can force it to overflow or underflow, the TRIM value is set to the limit, and the TRIMOVF status is indicated.

In AUTOTRIM mode (AUTOTRIMEN bit set in the CRS_CR register), the TRIM field of CRS_CR is adjusted by hardware and is read-only.

12.4.6 CRS initialization and configuration

RELOAD value

The RELOAD value must be selected according to the ratio between the target frequency and the frequency of the synchronization source after prescaling. This value is decreased by 1, to reach the expected synchronization on the zero value. The formula is the following:

$$RELOAD = (f_{TARGET} / f_{SYNC}) - 1$$

The reset value of the RELOAD field corresponds to a target frequency of 48 MHz and a synchronization signal frequency of 1 kHz (SOF signal from USB).

FELIM value

The selection of the FELIM value is closely coupled with the HSI48 oscillator characteristics and its typical trimming step size. The optimal value corresponds to half of the trimming step size, expressed as a number of oscillator clock ticks. The following formula can be used:

$$FELIM = (f_{TARGET} / f_{SYNC}) * STEP[\%] / 100\% / 2$$

The result must be always rounded up to the nearest integer value to obtain the best trimming response. If frequent trimming actions are not needed in the application, the hysteresis can be increased by slightly increasing the FELIM value.

The reset value of the FELIM field corresponds to $(f_{TARGET} / f_{SYNC}) = 48000$, and to a typical trimming step size of 0.14%.

Note: The trimming step size depends upon the product, check the datasheet for accurate setting.

Caution: There is no hardware protection from a wrong configuration of the RELOAD and FELIM fields, this can lead to an erratic trimming response. The expected operational mode requires proper setup of the RELOAD value (according to the synchronization source frequency), which is also greater than 128 * FELIM value (OUTRANGE limit).

12.5 CRS in low-power modes

Table 128. Effect of low-power modes on CRS

Mode	Description
Sleep	No effect. CRS interrupts cause the device to exit the Sleep mode.
Stop	CRS registers are frozen. The CRS stops operating until the Stop mode is exited and the HSI48 oscillator is restarted.
Standby	The peripheral is powered down and must be reinitialized after exiting Standby mode.
Shutdown	The peripheral is powered down and must be reinitialized after exiting Shutdown mode.

12.6 CRS interrupts

Table 129. Interrupt control bits

Interrupt event	Event flag	Enable control bit	Clear flag bit
Expected synchronization	ESYNCF	ESYNCIE	ESYNCC
Synchronization OK	SYNCOKF	SYNCOKIE	SYNCOKC
Synchronization warning	SYNCWARNF	SYNCWARNIE	SYNCWARNC
Synchronization or trimming error (TRIMOVF, SYNCMISS, SYNCERR)	ERRF	ERRIE	ERRC

12.7 CRS registers

Refer to *Section 1.2* for a list of abbreviations used in register descriptions.

The peripheral registers can be accessed only by words (32-bit).

12.7.1 CRS control register (CRS_CR)

Address offset: 0x00

Reset value: 0x0000 2000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	TRIM[5:0]						SW SYNC	AUTO TRIMEN	CEN	Res.	ESYNC IE	ERR IE	SYNC WARNIE	SYNC OKIE
		rw	rw	rw	rw	rw	rw	rt_w1	rw	rw		rw	rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:8 **TRIM[5:0]**: HSI48 oscillator smooth trimming

These bits provide a user-programmable trimming value to the HSI48 oscillator. They can be programmed to adjust to variations in voltage and temperature that influence the oscillator frequency.

The default value of the HSI48 oscillator smooth trimming is 32, for a complete TRIM range of 64 steps.

The trimming step is specified in the product datasheet. A higher TRIM value corresponds to a higher output frequency.

When the AUTOTRIMEN bit is set, this field is controlled by hardware and is read-only.

Bit 7 **SWSYNC**: Generate software SYNC event

This bit is set by software in order to generate a software SYNC event. It is automatically cleared by hardware.

0: No action

1: A software SYNC event is generated.

Bit 6 **AUTOTRIMEN**: Automatic trimming enable

This bit enables the automatic hardware adjustment of TRIM bits according to the measured frequency error between two SYNC events. If this bit is set, the TRIM bits are read-only. The TRIM value can be adjusted by hardware by one or two steps at a time, depending on the measured frequency error value. Refer to *Section 12.4.5* for more details.

0: Automatic trimming disabled, TRIM bits can be adjusted by the user.

1: Automatic trimming enabled, TRIM bits are read-only and under hardware control.

Bit 5 **CEN**: Frequency error counter enable

This bit enables the oscillator clock for the frequency error counter.

0: Frequency error counter disabled

1: Frequency error counter enabled

When this bit is set, the CRS_CFGR register is write-protected and cannot be modified.

Bit 4 Reserved, must be kept at reset value.

Bit 3 **ESYNCIE**: Expected SYNC interrupt enable

0: Expected SYNC (ESYNCF) interrupt disabled

1: Expected SYNC (ESYNCF) interrupt enabled

Bit 2 **ERRIE**: Synchronization or trimming error interrupt enable

0: Synchronization or trimming error (ERRF) interrupt disabled

1: Synchronization or trimming error (ERRF) interrupt enabled

Bit 1 **SYNCWARNIE**: SYNC warning interrupt enable

0: SYNC warning (SYNCWARNF) interrupt disabled

1: SYNC warning (SYNCWARNF) interrupt enabled

Bit 0 **SYNCOKIE**: SYNC event OK interrupt enable

0: SYNC event OK (SYNCOKF) interrupt disabled

1: SYNC event OK (SYNCOKF) interrupt enabled

12.7.2 CRS configuration register (CRS_CFGR)

This register can be written only when the frequency error counter is disabled (the CEN bit is cleared in CRS_CR). When the counter is enabled, this register is write-protected.

Address offset: 0x04

Reset value: 0x2022 BB7F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SYNCPOL	Res.	SYNCSRC[1:0]		Res.	SYNCDIV[2:0]			FELIM[7:0]							
rw		rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RELOAD[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **SYNCPOL**: SYNC polarity selection

This bit is set and cleared by software to select the input polarity for the SYNC signal source.

0: SYNC active on rising edge (default)

1: SYNC active on falling edge

Bit 30 Reserved, must be kept at reset value.

Bits 29:28 **SYNCSRC[1:0]**: SYNC signal source selection

These bits are set and cleared by software to select the SYNC signal source (see *Section 12.4.2: CRS internal signals*).

00: crs_sync_in_0 selected as SYNC signal source

01: crs_sync_in_1 selected as SYNC signal source

10: crs_sync_in_2 selected as SYNC signal source

11: crs_sync_in_3 selected as SYNC signal source

Note: When using USB LPM (link power management) and the device is in Sleep mode, the periodic USB SOF is not generated by the host. No SYNC signal is therefore provided to the CRS to calibrate the 48 MHz clock on the run. To guarantee the required clock precision after waking up from Sleep mode, the LSE clock or the SYNC pin must be used as SYNC signal.

Bit 27 Reserved, must be kept at reset value.

Bits 26:24 **SYNCDIV[2:0]**: SYNC divider

These bits are set and cleared by software to control the division factor of the SYNC signal.

000: SYNC not divided (default)

001: SYNC divided by 2

010: SYNC divided by 4

011: SYNC divided by 8

100: SYNC divided by 16

101: SYNC divided by 32

110: SYNC divided by 64

111: SYNC divided by 128

Bits 23:16 **FELIM[7:0]**: Frequency error limit

FELIM contains the value to be used to evaluate the captured frequency error value latched in the FECAP[15:0] bits of the CRS_ISR register. Refer to *Section 12.4.5* for more details about FECAP evaluation.

Bits 15:0 **RELOAD[15:0]**: Counter reload value

RELOAD is the value to be loaded in the frequency error counter with each SYNC event. Refer to *Section 12.4.4* for more details about counter behavior.

12.7.3 CRS interrupt and status register (CRS_ISR)

Address offset: 0x08

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FECAP[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FEDIR	Res.	Res.	Res.	Res.	TRIM OVF	SYNC MISS	SYNC ERR	Res.	Res.	Res.	Res.	ESYNCF	ERRF	SYNC WARNF	SYNC OKF
r					r	r	r					r	r	r	r

Bits 31:16 **FECAP[15:0]**: Frequency error capture

FECAP is the frequency error counter value latched in the time of the last SYNC event. Refer to *Section 12.4.5* for more details about FECAP usage.

Bit 15 **FEDIR**: Frequency error direction

FEDIR is the counting direction of the frequency error counter latched in the time of the last SYNC event. It shows whether the actual frequency is below or above the target.

0: Up-counting direction, the actual frequency is above the target

1: Down-counting direction, the actual frequency is below the target

Bits 14:11 Reserved, must be kept at reset value.

Bit 10 **TRIMOVF**: Trimming overflow or underflow

This flag is set by hardware when the automatic trimming tries to over- or under-flow the TRIM value. An interrupt is generated if the ERRIE bit is set in the CRS_CR register. It is cleared by software by setting the ERRC bit in the CRS_ICR register.

0: No trimming error signaled

1: Trimming error signaled

Bit 9 **SYNCMISS**: SYNC missed

This flag is set by hardware when the frequency error counter reaches value FELIM * 128 and no SYNC is detected, meaning either that a SYNC pulse was missed, or the frequency error is too big (internal frequency too high) to be compensated by adjusting the TRIM value, hence some other action must be taken. At this point, the frequency error counter is stopped (waiting for a next SYNC), and an interrupt is generated if the ERRIE bit is set in the CRS_CR register. It is cleared by software by setting the ERRC bit in the CRS_ICR register.

0: No SYNC missed error signaled

1: SYNC missed error signaled

Bit 8 **SYNCERR**: SYNC error

This flag is set by hardware when the SYNC pulse arrives before the ESYNC event and the measured frequency error is greater than or equal to FELIM * 128. This means that the frequency error is too big (internal frequency too low) to be compensated by adjusting the TRIM value, and that some other action has to be taken. An interrupt is generated if the ERRIE bit is set in the CRS_CR register. It is cleared by software by setting the ERRC bit in the CRS_ICR register.

0: No SYNC error signaled

1: SYNC error signaled

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **ESYNCF**: Expected SYNC flag

This flag is set by hardware when the frequency error counter reached a zero value. An interrupt is generated if the ESYNCIE bit is set in the CRS_CR register. It is cleared by software by setting the ESYNCC bit in the CRS_ICR register.

0: No expected SYNC signaled

1: Expected SYNC signaled

Bit 2 **ERRF**: Error flag

This flag is set by hardware in case of any synchronization or trimming error. It is the logical OR of the TRIMOVF, SYNCMISS and SYNCERR bits. An interrupt is generated if the ERRIE bit is set in the CRS_CR register. It is cleared by software in reaction to setting the ERRC bit in the CRS_ICR register, which clears the TRIMOVF, SYNCMISS and SYNCERR bits.

0: No synchronization or trimming error signaled

1: Synchronization or trimming error signaled

Bit 1 **SYNCWARNF**: SYNC warning flag

This flag is set by hardware when the measured frequency error is greater than or equal to FELIM * 3, but smaller than FELIM * 128. This means that to compensate the frequency error, the TRIM value must be adjusted by two steps or more. An interrupt is generated if the SYNCWARNIE bit is set in the CRS_CR register. It is cleared by software by setting the SYNCWARNC bit in the CRS_ICR register.

0: No SYNC warning signaled

1: SYNC warning signaled

Bit 0 **SYNCOKF**: SYNC event OK flag

This flag is set by hardware when the measured frequency error is smaller than FELIM * 3. This means that either no adjustment of the TRIM value is needed or that an adjustment by one trimming step is enough to compensate the frequency error. An interrupt is generated if the SYNCOKIE bit is set in the CRS_CR register. It is cleared by software by setting the SYNCOKC bit in the CRS_ICR register.

0: No SYNC event OK signaled

1: SYNC event OK signaled

12.7.4 CRS interrupt flag clear register (CRS_ICR)

Address offset: 0x0C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ESYNCC	ERRC	SYNC WARNC	SYNC OKC
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **ESYNCC**: Expected SYNC clear flag
Writing 1 to this bit clears the ESYNCF flag in the CRS_ISR register.

Bit 2 **ERRC**: Error clear flag
Writing 1 to this bit clears TRIMOVF, SYNCMISS, and SYNCERR bits and consequently also the ERRF flag in the CRS_ISR register.

Bit 1 **SYNCWARNC**: SYNC warning clear flag
Writing 1 to this bit clears the SYNCWARNF flag in the CRS_ISR register.

Bit 0 **SYNCOKC**: SYNC event OK clear flag
Writing 1 to this bit clears the SYNCOKF flag in the CRS_ISR register.

12.7.5 CRS register map

Table 130. CRS register map and reset values

13 General-purpose I/Os (GPIO)

13.1 GPIO introduction

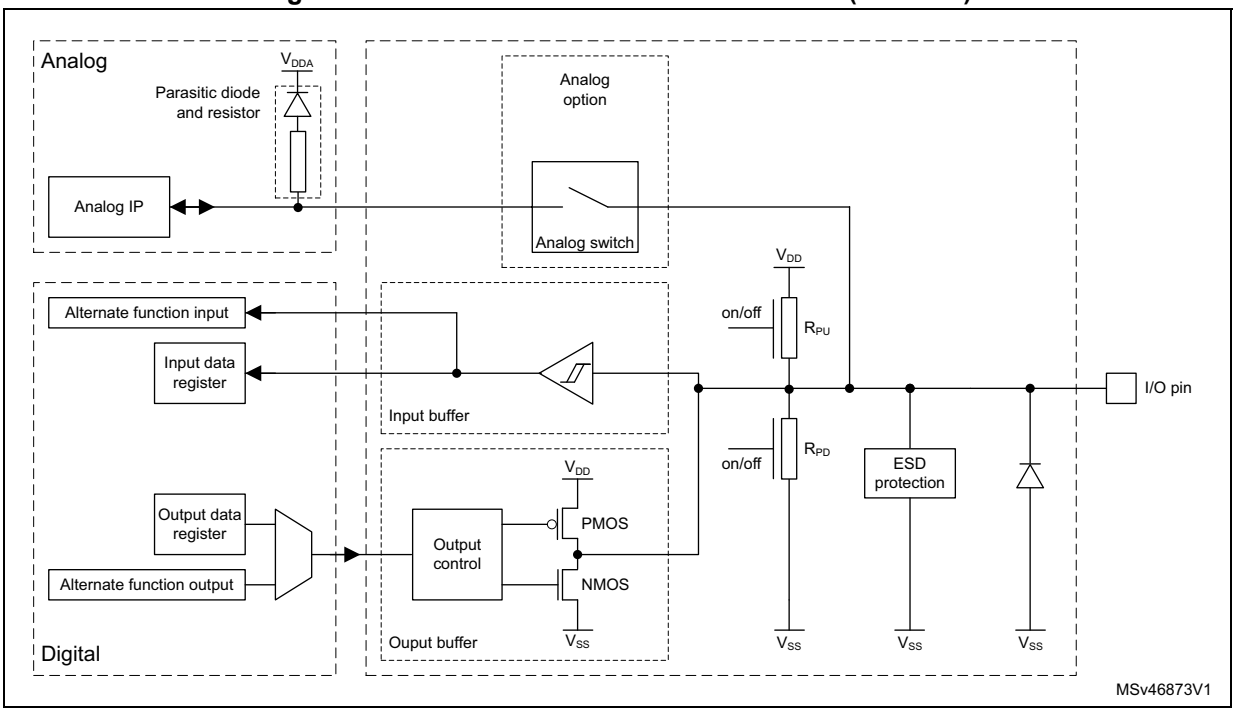
Each general-purpose I/O port has four 32-bit configuration registers (GPIOx_MODER, GPIOx_OTYPER, GPIOx_OSPEEDR and GPIOx_PUPDR), two 32-bit data registers (GPIOx_IDR and GPIOx_ODR), a 16-bit reset register (GPIOx_BRR), and a 32-bit set/reset register (GPIOx_BSRR).

In addition, all GPIOs have a 32-bit locking register (GPIOx_LCKR), two 32-bit alternate function selection registers (GPIOx_AFRH and GPIOx_AFRL), a secure configuration register (GPIOx_SECCFGR), and a high-speed low-voltage register (GPIOx_HSLVR).

13.2 GPIO main features

- Output states: push-pull or open drain + pull-up/down
- Output data from output data register (GPIOx_ODR) or peripheral (alternate function output)
- Speed selection for each I/O
- Input states: floating, pull-up/down, analog
- Input data to input data register (GPIOx_IDR) or peripheral (alternate function input)
- Bit set and reset register (GPIOx_ BSRR) for bit-wise write access to GPIOx_ODR
- Lock mechanism (GPIOx_LCKR) provided to freeze the I/O port configurations
- Analog function
- Alternate function selection registers
- Fast toggle capable of changing every two clock cycles
- Highly flexible pin multiplexing allows the use of I/O pins as GPIOs or as one of several peripheral functions
- TrustZone® security support
- I/Os state retention during Standby mode

13.3 GPIO functional description



Subject to the specific hardware characteristics of each I/O port listed in the datasheet, each port bit of the general-purpose I/O (GPIO) ports can be individually configured by software in several modes:

- Input floating
- Input pull-up
- Input-pull-down
- Analog
- Output open-drain with pull-up or pull-down capability
- Output push-pull with pull-up or pull-down capability
- Alternate function push-pull with pull-up or pull-down capability
- Alternate function open-drain with pull-up or pull-down capability

Each I/O port bit is freely programmable, however the I/O port registers must be accessed as 32-bit words, half-words, or bytes. The GPIOx_BSRR and GPIOx_BRR registers allow atomic read/modify accesses to any of the GPIOx_ODR registers. In this way, there is no risk of an IRQ occurring between the read and the modify access.

Figure 64 shows the basic structure of a 3- or 5-V tolerant GPIO (TT or FT). *Table 131* gives the possible port bit configurations.

Figure 64. Structure of 3- or 5-V tolerant GPIO (TT or FT)

Note: On a TT GPIO, the analog switch is not present, it is replaced by a direct connection. The analog bloc parasitic circuitry does not allow 5-V tolerance.

Table 131. Port bit configuration(1)

MODE(i)[1:0]	OTYPE(i)	OSPEED(i)[1:0]	PUPD(i)[1:0]		I/O configuration	
01	0	SPEED[1:0]	0	0	GP output	PP
	0		0	1	GP output	PP + PU
	0		1	0	GP output	PP + PD
	0		1	1	Reserved	
	1		0	0	GP output	OD
	1		0	1	GP output	OD + PU
	1		1	0	GP output	OD + PD
	1		1	1	Reserved (GP output OD)	

Table 131. Port bit configuration[1] (continued)

MODE(i)[1:0]	OTYPE(i)	OSPEED(i)[1:0]		PUPD(i)[1:0]		I/O configuration	
10	0	SPEED[1:0]		0	0	AF	PP
	0			0	1	AF	PP + PU
	0			1	0	AF	PP + PD
	0			1	1	Reserved	
	1			0	0	AF	OD
	1			0	1	AF	OD + PU
	1			1	0	AF	OD + PD
	1			1	1	Reserved	
00	x	x	x	0	0	Input	Floating
	x	x	x	0	1	Input	PU
	x	x	x	1	0	Input	PD
	x	x	x	1	1	Reserved (input floating)	
11	x	x	x	0	0	Input/output	Analog
	x	x	x	0	1	Reserved	
	x	x	x	1	0	Input/output	Analog, PD
	x	x	x	1	1	Reserved	

1. GP = general-purpose, PP = push-pull, PU = pull-up, PD = pull-down, OD = open-drain, AF = alternate function.

13.3.1 General-purpose I/O (GPIO)

During and just after reset, the alternate functions are not active and most of the I/O ports are configured in analog mode.

The debug pins are in AF pull-up/pull-down after reset:

- PA15: JTDI in pull-up
- PA14: JTCK/SWCLK in pull-down
- PA13: JTMS/SWDIO in pull-up
- PB4: NJTRST in pull-up
- PB3: JTDO/TRACESWO in floating state no pull-up/pull-down

BOOT0 is in input mode during the reset until at least the end of the option byte loading phase (see *Section 13.3.14*).

When the pin is configured as output, the value written to the output data register (GPIOx_ODR) is output on the I/O pin. It is possible to use the output driver in push-pull mode or open-drain mode (only the low level is driven, high level is high-Z).

The input data register (GPIOx_IDR) captures the data present on the I/O pin at every AHB clock cycle.

All GPIO pins have weak internal pull-up and pull-down resistors, which can be activated or not, depending upon the value in the GPIOx_PUPDR register.

13.3.2 I/O pin alternate function multiplexer and mapping

The device I/O pins are connected to on-board peripherals/modules through a multiplexer that allows only one peripheral alternate function (AF) connected to an I/O pin at a time. In this way, there is no conflict between peripherals available on the same I/O pin.

Each I/O pin has a multiplexer with up to 16 alternate function inputs (AF0 to AF15) that can be configured through the GPIOx_AFRL (for pin 0 to 7) and GPIOx_AFRH (for pin 8 to 15) registers:

- After reset, the multiplexer selection is alternate function 0 (AF0). The I/Os are configured in alternate function mode through GPIOx_MODER register.
- The specific alternate function assignments for each pin are detailed in the device datasheet.

In addition to this flexible I/O multiplexing architecture, each peripheral has alternate functions mapped onto different I/O pins to optimize the number of peripherals available in smaller packages.

To use an I/O in a given configuration, the user must proceed as follows:

- **Debug function**: after each device reset these pins are assigned as alternate function pins immediately usable by the debugger host.
- **GPIO**: configure the desired I/O as output, input, or analog in the GPIOx_MODER register.
- **Peripheral alternate function**:
  - Connect the I/O to the desired AFx in one of the GPIOx_AFRL or GPIOx_AFRH register.
  - Select the type, pull-up/pull-down, and output speed via the GPIOx_OTYPER, GPIOx_PUPDR and GPIOx_OSPEEDR registers respectively.
  - Configure the desired I/O as an alternate function in the GPIOx_MODER register.
- **Cortex®-M33 alternate function (EVENTOUT)**
  - The Cortex-M33 output EVENTOUT signal can be output as alternate function on I/O pin. An event can be signaled through the configured pin after executing SEV instruction
  - EVENTOUT signal can be used internally as a trigger for some peripherals (see *Table 139: Peripherals interconnect matrix*)
- **Additional functions:**
  - For the ADC and DAC, configure the desired I/O in analog mode in the GPIOx_MODER register and configure the required function in the ADC and DAC registers.
  - For the additional functions like RTC, WKUPx, and oscillators, configure the required function in the related RTC, PWR, and RCC registers. These functions have priority over the configuration in the standard GPIO registers.

Refer to the “Alternate function mapping” table in the device datasheet for the detailed mapping of the alternate function I/O pins.

13.3.3 I/O port control registers

Each of the GPIO ports has four 32-bit memory-mapped control registers (GPIOx_MODER, GPIOx_OTYPER, GPIOx_OSPEEDR, GPIOx_PUPDR) to configure up to 16 I/Os.

- GPIOx_MODER is used to select the I/O mode (input, output, AF, analog).
- GPIOx_OTYPER and GPIOx_OSPEEDR are used to select the output type (push-pull

or open-drain) and speed.

- GPIOx_PUPDR is used to select the pull-up/pull-down whatever the I/O direction.I/O port data registers.

Each GPIO has two 16-bit memory-mapped data registers: input and output data registers (*GPIO port input data register (GPIOx_IDR) (x = A to I)* and *GPIO port output data register (GPIOx_ODR) (x = A to I)*).

GPIOx_ODR stores the data to be output, it is read/write accessible. The data entered through the I/Os are stored into the input data register (GPIOx_IDR), a read-only register.

13.3.4 I/O data bitwise handling

The bit set reset register (GPIOx_BSRR) is a 32-bit register that allows the application to set and reset each individual bit in the output data register (GPIOx_ODR). The bit set reset register has twice the size of GPIOx_ODR.

To each bit in GPIOx_ODR, correspond two control bits in GPIOx_BSRR: BS(i) and BR(i). When written to 1, BS(i) sets the corresponding ODR(i) bit. When written to 1, BR(i) resets the ODR(i) corresponding bit.

Writing any bit to 0 in GPIOx_BSRR does not have any effect on the corresponding bit in GPIOx_ODR. If there is an attempt to both set and reset a bit in GPIOx_BSRR, the set action takes priority.

Using the GPIOx_BSRR register to change the values of individual bits in GPIOx_ODR is a “one-shot” effect that does not lock the GPIOx_ODR bits. The GPIOx_ODR bits can always be accessed directly. The GPIOx_BSRR register provides a way of performing atomic bitwise handling.

There is no need for the software to disable interrupts when programming the GPIOx_ODR at bit level: one or more bits can be modified in a single atomic AHB write access.

13.3.5 GPIO locking mechanism

The GPIO control registers can be frozen by applying a specific write sequence to the GPIOx_LCKR register. The frozen registers are GPIOx_MODER, GPIOx_OTYPER, GPIOx_OSPEEDR, GPIOx_PUPDR, GPIOx_AFRL, GPIOx_AFRH and GPIOx_HSLVR.

To write the GPIOx_LCKR register, a specific write/read sequence must be applied. When the right LOCK sequence is applied to the bit 16 in this register, the value of LCKR[15:0] is used to lock the configuration of the I/Os (during the write sequence the LCKR[15:0] value must be the same). When the LOCK sequence is applied to a port bit, the value of the port bit can no longer be modified until the next MCU reset or peripheral reset. Each GPIOx_LCKR bit freezes the corresponding bit in the control registers (GPIOx_MODER, GPIOx_OTYPER, GPIOx_OSPEEDR, GPIOx_PUPDR, GPIOx_AFRL and GPIOx_AFRH.

The LOCK sequence can be performed only using a word (32-bit long) access to the GPIOx_LCKR register, because GPIOx_LCKR bit 16 must be set at the same time as the [15:0] bits.

13.3.6 I/O alternate function input/output

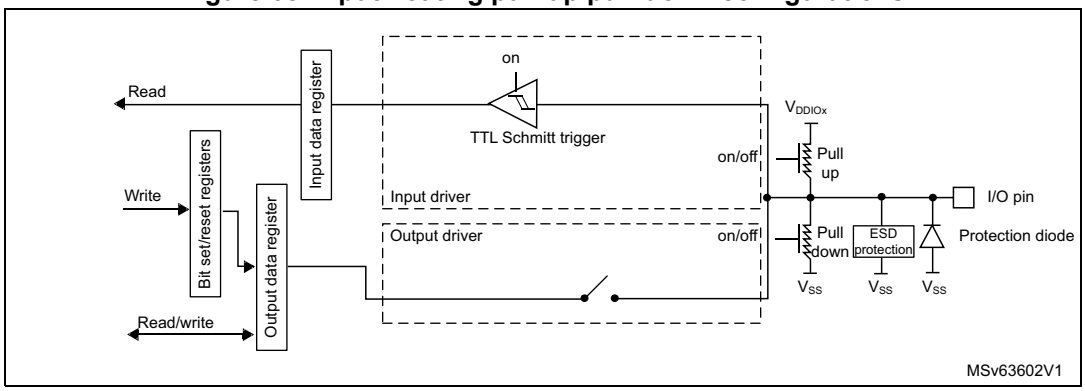
Two registers are provided to select one of the alternate function inputs/outputs available for each I/O. With these registers, the user can connect an alternate function to some other pin as required by the application.

This means that some peripheral functions are multiplexed on each GPIO using the GPIOx_AFRL and GPIOx_AFRH alternate function registers. The application can thus select any one of the possible functions for each I/O. The AF selection signal being common to the alternate function input and alternate function output, a single channel is selected for the alternate function input/output of a given I/O.

To know which functions are multiplexed on each GPIO pin, refer to the device datasheet.

13.3.7 External interrupt/wake-up lines

All ports have external interrupt capability. To use external interrupt lines, the port can be configured in input, output, or alternate function mode (the port must not be configured in analog mode). Refer to *Section 18: Extended interrupts and event controller (EXTI)*.



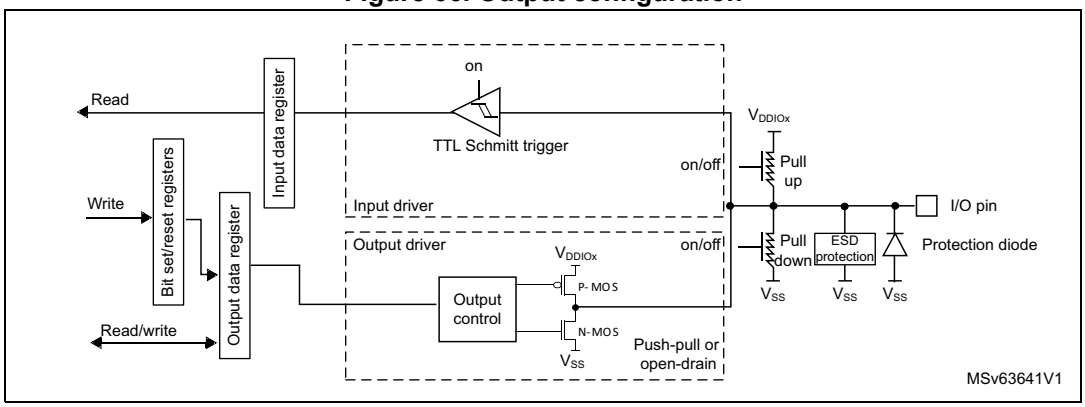
13.3.8 Input configuration

When the I/O port is programmed as input:

- The output buffer is disabled.
- The Schmitt trigger input is activated.
- The pull-up and pull-down resistors are activated depending on the value in the GPIOx_PUPDR register.
- The data present on the I/O pin are sampled into the input data register every AHB clock cycle.
- A read access to the input data register provides the I/O state.

Figure 65 shows the input configuration of the I/O port bit.

Figure 65. Input floating/pull-up/pull-down configurations



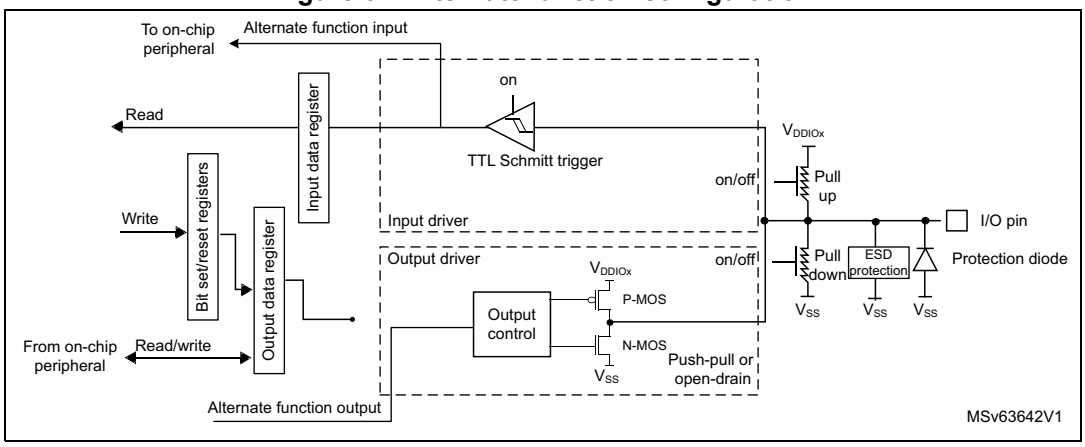
13.3.9 Output configuration

When the I/O port is programmed as output:

- The output buffer is enabled:
  - Open-drain mode: a 0 in the output register activates the N-MOS whereas a 1 in the output register leaves the port in high-Z (the P-MOS is never activated).
  - Push-pull mode: a 0 in the output register activates the N-MOS whereas a 1 in the output register activates the P-MOS.
- The Schmitt trigger input is activated.
- The pull-up and pull-down resistors are activated depending on the value in the GPIOx_PUPDR register.
- The data present on the I/O pin are sampled into the input data register every AHB clock cycle.
- A read access to the input data register gets the I/O state.
- A read access to the output data register gets the last written value.

Figure 66 shows the output configuration of the I/O port bit.

Figure 66. Output configuration



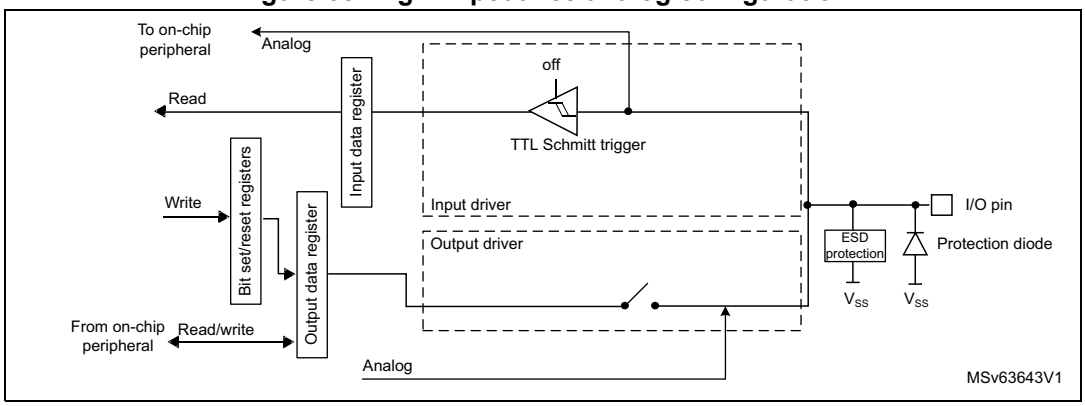
13.3.10 Alternate function configuration

When the I/O port is programmed as alternate function:

- The output buffer can be configured in open-drain or push-pull mode.
- The output buffer is driven by the signals coming from the peripheral (transmitter enable and data).
- The Schmitt trigger input is activated.
- The weak pull-up and pull-down resistors are activated or not depending on the value in the GPIOx_PUPDR register.
- The data present on the I/O pin are sampled into the input data register every AHB clock cycle.
- A read access to the input data register gets the I/O state.

Figure 67 shows the alternate function configuration of the I/O port bit.

Figure 67. Alternate function configuration



13.3.11 Analog configuration

When the I/O port is programmed as analog configuration:

- The output buffer is disabled.
- The Schmitt trigger input is deactivated, providing zero consumption for every analog value of the I/O pin. The output of the Schmitt trigger is forced to a constant value (0).
- The weak pull-up is disabled by hardware. The weak pull-down is configurable.
- Read access to the input data register gets the value 0.

Figure 68 shows the high-Z, analog-input configuration of the I/O port bits.

Figure 68. High-impedance analog configuration

13.3.12 Using the HSE or LSE oscillator pins as GPIOs

When the HSE or LSE oscillator is switched off (default state after reset), the related oscillator pins can be used as normal GPIOs.

When the HSE or LSE oscillator is switched on (by setting the HSEON or LSEON bit in the RCC_CSR register), the oscillator takes control of its associated pins and the GPIO configuration of these pins has no effect.

When the oscillator is configured in a user external clock mode, only the pin is reserved for clock input, and the OSC_OUT or OSC32_OUT pin can still be used as normal GPIO.

13.3.13 Using the GPIO pins in the RTC supply domain

The PC13/PC14/PC15/PI8 GPIO functionality is lost when the core supply domain is powered off (when the device enters Standby mode). In this case, if their GPIO configuration is not bypassed by the RTC configuration, these pins are set in an analog input mode.

For details about I/O control by the RTC, refer to *Section 51.3: RTC functional description*

13.3.14 I/Os state retention during standby mode

In the Standby mode, the I/Os are by default in floating state.

If the IORETEN bit in the PWR_IORETR register is set, the I/Os state is sampled during standby entry. The state of I/Os is applied to the pin via pull-up and pull-down resistors. The pull-up and pull-down resistors remains applied after Standby wake-up until the IORETEN bit in the PWR_IORETR register is cleared by software.

13.3.15 TrustZone security

The TrustZone security is activated by the TZEN option byte in the FLASH option byte register. When the TrustZone is active (TZEN = 0xB4), each I/O pin of GPIO port can be individually configured as secure through the GPIOx_SECCFGR register.

When the selected I/O pin is configured as secure, its corresponding configuration bits for alternate function, mode selection, I/O data are secure against a nonsecure access. In case of nonsecure access, these bits are RAZ/WI.

The I/Os with peripherals functions are also conditioned by the peripheral security configuration (see *Section 5: Global TrustZone® controller (GTZC)* for more details):

- For peripherals for which the I/O pin selection is done through alternate functions registers: if the peripheral is configured as secure, it cannot be connected to a nonsecure I/O pin. If this is not respected, the input data to the secure peripheral is forced to 0 (I/O input pin value is ignored) and the output pin value is forced to 0, thus avoiding any secure information leak through nonsecure I/Os.
- For I/Os with analog switches, directly controlled by peripherals (such as ADC for instance): If the I/O is secure, the I/O analog switch cannot be controlled by a nonsecure peripheral. If this is not respected, the switch remains open. This prevents the redirection of secure data to a nonsecure peripheral or I/O through the analog path. Refer to *Section 3: System security* for more details.
- Some of the paths between I/Os “additional functions” and peripherals are not blocked if the I/O is secure and the peripheral is nonsecure. Therefore, it is recommended to configure those peripherals as secure even when not used by the application. Refer to *Section 3: System security* for the list of concerned peripherals. When the path has a security control, it follows the same rule as I/O selection through alternate functions.

Refer to the device pins definition table in datasheet for more information about peripherals alternate functions and additional functions mapping.

After reset, all GPIO ports are secure.

The table below gives a summary of the I/O port secured bits following the security configuration bit in the GPIO_SECCFGR register. When the I/O bit port is configured as secure:

- Secured bits: read and write operations are only allowed by a secure access. Non secure-read or write accesses on secured bits are RAZ/WI. There is no illegal access event generated.
- Nonsecure bits: no restriction. Read and write operations are allowed by both secure and nonsecure accesses.

When the TrustZone security is disabled (TZEN = 0xC3 in FLASH_OPTSR2 register), all registers bits are nonsecure. The GPIOx_SECCFGR register is RAZ/WI.

Table 132. GPIO secured bits

Secure configuration bit	Secured bit	Register name	Nonsecure access on secure bits
SECy = 1 in GPIOx_SECCFGR(1) (2)	MODEy[1:0]	GPIOx_MODER	RAZ/WI
	OTy	GPIOx_OTYPER	
	OSPEEDy[1:0]	GPIOx_OSPEEDR	
	PUPDy[1:0]	GPIOx_PUPDR	
	IDy	GPIOx_IDR	
	ODy	GPIOx_ODR	
	BSy and BRy	GPIOx_BSRR	
	LCKy	GPIOx_LCKR	
	BRy	GPIOx_BRR	
	AFSELy[3:0]	GPIOx_AFRH	
		GPIOx_AFRL	
	HSLVy	GPIOx_HSLVR	

1. GPIOx, x = A to I. For x = A to H, y = 0 to 15. For x = I, y = 0 to 11.
2. The number of GPIOx ports depends upon the device. Refer to the product datasheet for availability of a particular port. If not present, consider the associated bits as reserved, and keep them at reset value.

13.3.16 Privileged and unprivileged modes

All GPIO registers can be read and written by privileged and unprivileged accesses, whatever the security state (secure or nonsecure).

13.3.17 High-speed low-voltage mode (HSLV)

Some I/Os have the capability to increase their maximum speed at low voltage by configuring them in HSLV mode. The I/O HSLV bit controls whether the I/O output speed is optimized to operate at 3.3 V (default setting) or at 1.8 V (HSLV = 1).

Caution: The I/O HSLV configuration bit must not be set if the I/O supply (V_{DD} or V_{DDIO2}) is above 2.7 V. Setting it while the voltage is higher than 2.7 V can damage the device. The I/O HSLV bit can be set only when the corresponding option bit is activated (IO_VDD_HSLV or IO_VDDIO2_HSLV depending on the I/O supply, refer to *Section 7.4: FLASH option bytes*).

There is no hardware protection associated to this feature so it is recommended to use it only as a static configuration for fixed I/O supply.

13.3.18 I/O compensation cell

The I/O commutation slew rate (tfall / trise) can be adapted by software depending on process, voltage and temperatures conditions, to reduce the I/O noise on power supply. Refer to *Section 14: System configuration, boot, and security (SBS)* for more details.

13.4 GPIO registers

This section gives a detailed description of the GPIO registers. Note that the number of GPIOx ports depends upon the device. Refer to the product datasheet for the availability of a particular port. If not present, consider the associated bits as reserved, and keep them at reset value.

The peripheral registers can be written in word, half word, or byte mode.

13.4.1 GPIO port mode register (GPIOx_MODER) (x = A to I)

Address offset:0x00

Reset value: 0xABFF FFFF (for port A)

Reset value: 0xFFFF FEBF (for port B)

Reset value: 0xFFFF FFFF (for ports C..H)

Reset value: 0x00FF FFFF (for port I)

Note: For STM32H523/33xx devices, the reset value for port B is 0xFF3F FEBF.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MODE15[1:0]		MODE14[1:0]		MODE13[1:0]		MODE12[1:0]		MODE11[1:0]		MODE10[1:0]		MODE9[1:0]		MODE8[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MODE7[1:0]		MODE6[1:0]		MODE5[1:0]		MODE4[1:0]		MODE3[1:0]		MODE2[1:0]		MODE1[1:0]		MODE0[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MODEy[1:0]:** Port x configuration I/O pin y (y = 15 to 0)
These bits are written by software to configure the I/O mode.
00: Input mode
01: General purpose output mode
10: Alternate function mode
11: Analog mode (reset state)

Note: The bitfield is reserved and must be kept to reset value when the corresponding I/O is not available on the selected package.

13.4.2 GPIO port output type register (GPIOx_OTYPER) (x = A to I)

Address offset: 0x04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **OTy:** Port x configuration I/O pin y (y = 15 to 0)

These bits are written by software to configure the I/O output type.

0: Output push-pull (reset state)

1: Output open-drain

Note: The bit is reserved and must be kept to reset value when the corresponding I/O is not available on the selected package.

13.4.3 GPIO port output speed register (GPIOx_OSPEEDR) (x = A to I)

Address offset: 0x08

Reset value: 0x0C00 0000 (for port A)

Reset value: 0x0000 00C0 (for port B)

Reset value: 0x0000 0000 (for the other ports)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OSPEED15[1:0]		OSPEED14[1:0]		OSPEED13[1:0]		OSPEED12[1:0]		OSPEED11[1:0]		OSPEED10[1:0]		OSPEED9[1:0]		OSPEED8[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **OSPEEDy[1:0]**: Port x configuration I/O pin y (y = 15 to 0)

These bits are written by software to configure the I/O output speed.

00: Low speed

01: Medium speed

10: High speed

11: Very-high speed

Note: Refer to the device datasheet for the frequency specifications, the power supply, and the load conditions for each speed.

The bitfield is reserved and must be kept to reset value when the corresponding I/O is not available on the selected package.

13.4.4 GPIO port pull-up/pull-down register (GPIOx_PUPDR) (x = A to I)

Address offset: 0x0C

Reset value: 0x6400 0000 (for port A)

Reset value: 0x0000 0100 (for port B)

Reset value: 0x0000 0000 (for the other ports)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PUPD15[1:0]		PUPD14[1:0]		PUPD13[1:0]		PUPD12[1:0]		PUPD11[1:0]		PUPD10[1:0]		PUPD9[1:0]		PUPD8[1:0]

ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID7	ID6	ID5	ID4	ID3	ID2	ID1	ID0
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **IDy:** Port x input data I/O pin y (y = 15 to 0)

These bits are read-only. They contain the input value of the corresponding I/O port.

Note: The bit is reserved and must be kept to reset value when the corresponding I/O is not available on the selected package.

13.4.6 GPIO port output data register (GPIOx_ODR) (x = A to I)

Address offset: 0x14

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OD15	OD14	OD13	OD12	OD11	OD10	OD9	OD8	OD7	OD6	OD5	OD4	OD3	OD2	OD1	OD0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **ODy:** Port output data I/O pin y (y = 15 to 0)

These bits can be read and written by software.

Note: For atomic bit set/reset, the OD bits can be individually set and/or reset by writing to the GPIOx_BSRR or GPIOx_BRR registers (x = A to I).

The bit is reserved and must be kept to reset value when the corresponding I/O is not available on the selected package.

13.4.7 GPIO port bit set/reset register (GPIOx_BSRR) (x = A to I)

Address offset: 0x18

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BR15	BR14	BR13	BR12	BR11	BR10	BR9	BR8	BR7	BR6	BR5	BR4	BR3	BR2	BR1	BR0
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BS15	BS14	BS13	BS12	BS11	BS10	BS9	BS8	BS7	BS6	BS5	BS4	BS3	BS2	BS1	BS0
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:16 **BRy:** Port x reset I/O pin y (y = 15 to 0)

These bits are write-only. A read to these bits returns the value 0x0000.

0: No action on the corresponding ODy bit

1: Resets the corresponding ODy bit

Note: If both BSy and BRy are set, BSy has priority.

The bit is reserved and must be kept to reset value when the corresponding I/O is not available on the selected package.

Bits 15:0 **BSy:** Port x set I/O pin y (y = 15 to 0)

These bits are write-only. A read to these bits returns the value 0x0000.

0: No action on the corresponding ODy bit

1: Sets the corresponding ODy bit

Note: The bit is reserved and must be kept to reset value when the corresponding I/O is not available on the selected package.

13.4.8 GPIO port configuration lock register (GPIOx_LCKR) (x = A to I)

This register is used to lock the configuration of the port bits when a correct write sequence is applied to bit 16 (LCKK). The value of bits [15:0] is used to lock the configuration of the GPIO. During the write sequence, the value of LCKR[15:0] must not change. When the LOCK sequence has been applied on a port bit, the value of this port bit can no longer be modified until the next MCU reset or peripheral reset.

Note: A specific write sequence is used to write to the GPIOx_LCKR register. Only word access (32-bit long) is allowed during this locking sequence.

Each bit freezes a specific configuration register (control and alternate function registers).

Address offset: 0x1C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LCKK
															rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LCK15	LCK14	LCK13	LCK12	LCK11	LCK10	LCK9	LCK8	LCK7	LCK6	LCK5	LCK4	LCK3	LCK2	LCK1	LCK0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **LCKK:** Lock key

This bit can be read any time. It can only be modified using the lock key write sequence.

0: Port configuration lock key not active

1: Port configuration lock key active. The GPIOx_LCKR register is locked until the next MCU reset or peripheral reset.

- LOCK key write sequence:

WR LCKR[16] = 1 + LCKR[15:0]

WR LCKR[16] = 0 + LCKR[15:0]

WR LCKR[16] = 1 + LCKR[15:0]

- LOCK key read

RD LCKR[16] = 1 (this read operation is optional but it confirms that the lock is active)

Note: During the LOCK key write sequence, the value of LCK[15:0] must not change.

Any error in the lock sequence aborts the LOCK.

After the first LOCK sequence on any bit of the port, any read access on the LCKK bit returns 1 until the next MCU reset or peripheral reset.

Bits 15:0 **LCKy:** Port x lock I/O pin y (y = 15 to 0)

These bits are read/write but can only be written when the LCKK bit is 0

0: Port configuration not locked

1: Port configuration locked

Note: The bit is reserved and must be kept to reset value when the corresponding I/O is not available on the selected package.

13.4.9 GPIO alternate function low register (GPIOx_AFRL) (x = A to I)

Address offset: 0x20

Reset value: 0x0000 0000

w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **BRy:** Port x reset IO pin y (y = 15 to 0)
These bits are write-only. A read to these bits returns the value 0x0000.
0: No action on the corresponding ODy bit
1: Reset the corresponding ODy bit

Note: The bit is reserved and must be kept to reset value when the corresponding I/O is not available on the selected package.

13.4.12 GPIO high-speed low-voltage register (GPIOx_HSLVR) (x = A to I)

Address offset: 0x2C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **HSLVy:** Port x high-speed low-voltage configuration (y = 15 to 0)

These bits are written by software to optimize the I/O speed when the I/O supply is low.

Each bit is active only if the corresponding IO_VDD_HSLV/IO_VDDIO2_HSLV user option bit is set. It must be used only if the I/O supply voltage is below 2.7 V.

Setting these bits when the I/O supply (VDD or VDDIO2) is higher than 2.7 V may be destructive.

0: I/O speed optimization disabled

1: I/O speed optimization enabled

Note: Not all I/Os support the HSLV mode. Refer to the I/O structure in the corresponding datasheet for the list of I/Os supporting this feature. Other I/Os HSLV configuration must be kept at reset value.

The bit is reserved and must be kept to reset value when the corresponding I/O is not available on the selected package.

13.4.13 GPIO secure configuration register (GPIOx_SECCFGR) (x = A to I)

When the system is secure (TZEN = 0xB4), this register provides write access security and can be written only by a secure access. It is used to configure a selected I/O as secure. A nonsecure write access to this register is discarded.

When the system is not secure (TZEN = 0xC3), this register is RAZ/WI.

Address offset: 0x30

Reset value: 0x0000 FFFF (for ports A to H)

Reset value: 0x0000 0FFF (for port I)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SECy**: I/O pin of Port x secure bit enable y (y = 15 to 0)

These bits are written by software to enable or disable the I/O port pin security.

0: The I/O pin is nonsecure

1: The I/O pin is secure. Refer to *Table 132* for all corresponding secured bits.

Note: The bit is reserved and must be kept to reset value when the corresponding I/O is not available on the selected package.

13.4.14 GPIO register map

Table 133. GPIO register map and reset values

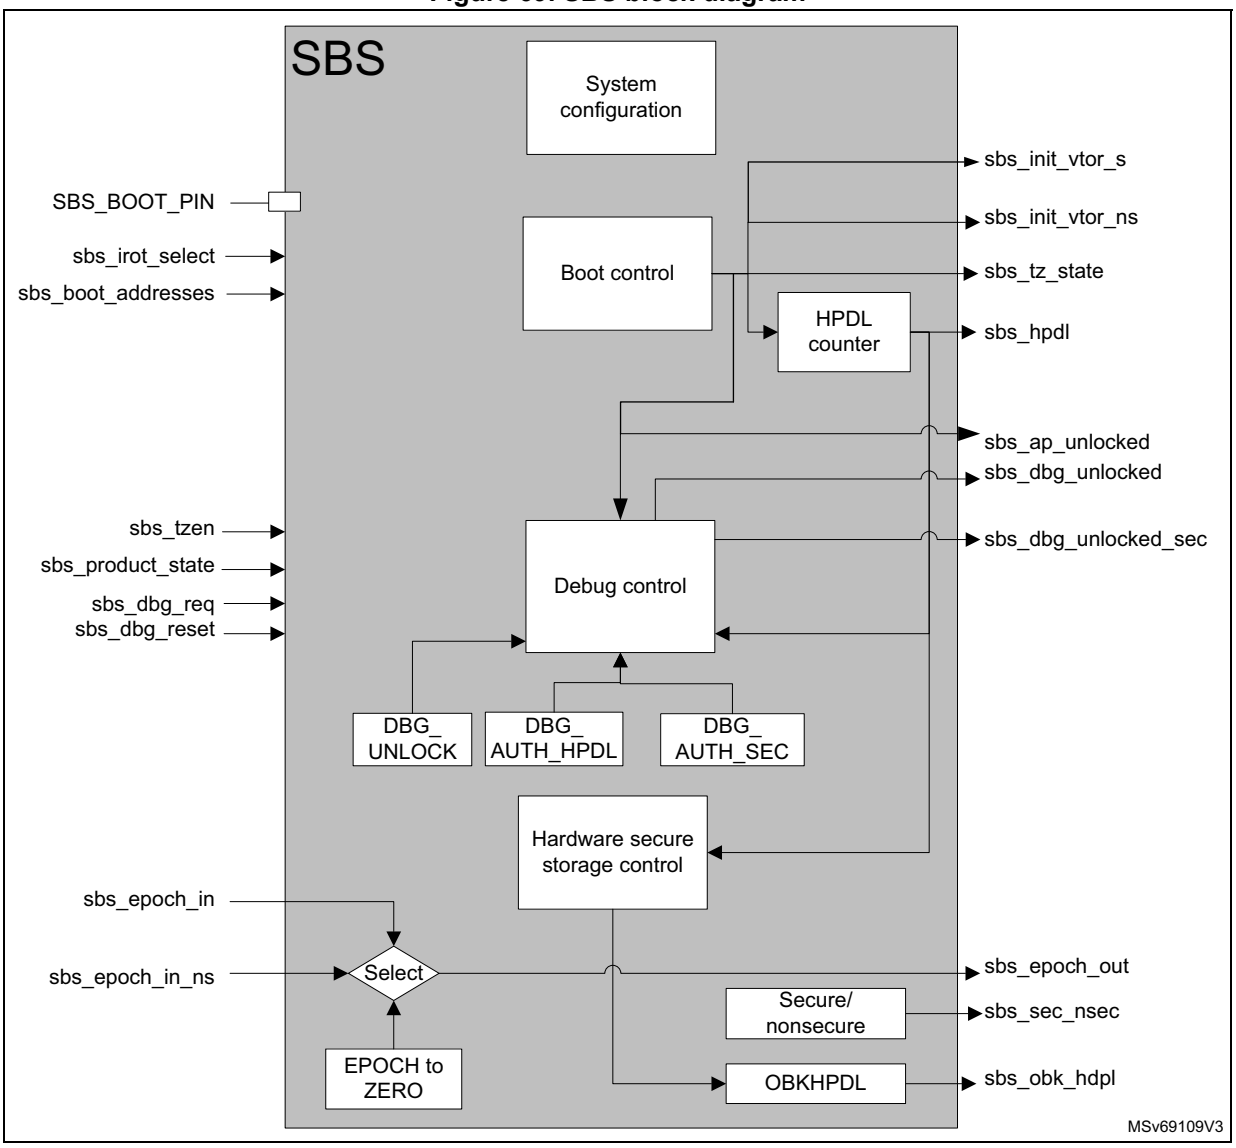
14 System configuration, boot, and security (SBS)

14.1 SBS introduction

The devices feature a set of configuration registers located in the SBS. On top of various device configurations, this peripheral controls key boot and security features, including debug control and secure storage control.

14.2 SBS main features

- System configuration
  - Manage safety feature
  - Enable/disable the FMP (Fast-mode Plus) high-drive capability of some I/Os and voltage booster for I/O analog switches
  - Manage the I/O compensation cell
  - Configure register security access
  - Configuration for Cortex-M33 FPU interrupts
  - Selection and configuration of the Ethernet PHY interface
- Boot control
  - Upon system reset, configure the Cortex-M33 boot address and the temporal isolation level depending on the current configuration such as PRODUCT_STATE (sbs_product_state), BOOT_UBE (sbs_irot_select), or TZEN (sbs_tzen).
  - Manage the temporal isolation feature implemented thanks to the hide protect level (HDPL) monotonic counter
- Debug control
  - Control the opening of the device debug interface, ensuring the sequencing of events that guarantee the device security
- Hardware secure storage control
  - Control the secure storage selections: OBK-HDPL selection (selects the area of secure storage of the flash memory and selects the corresponding DHUK in SAES), EPOCH selection
- Security status
  - SRAM and caches erase status



14.3 SBS functional description

14.3.1 SBS block diagram

Figure 69 shows the SBS block diagram, including the four main functions:

- System configuration
- Boot control
- Debug control
- Hardware secure storage control

Figure 69. SBS block diagram

14.3.2 SBS signals

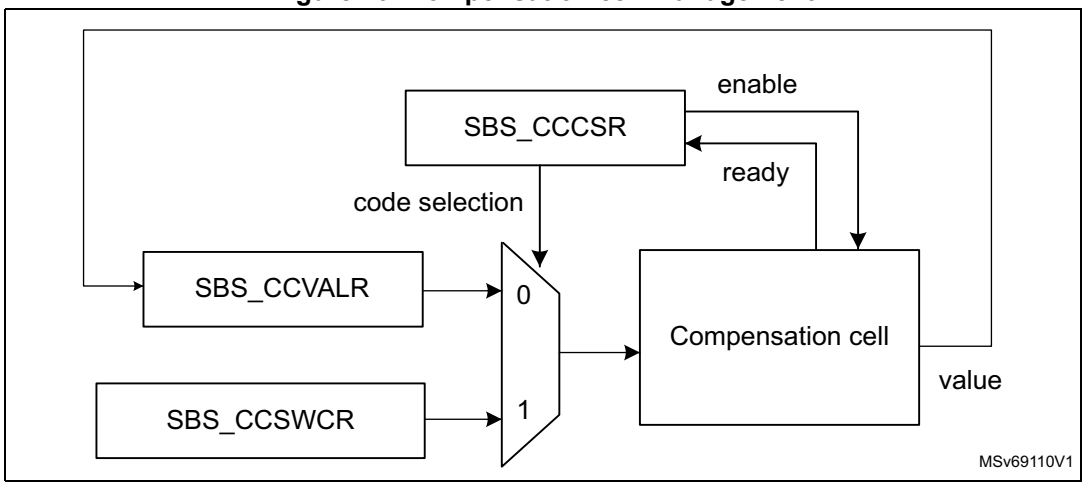
Table 134 details the user relevant internal signals that interface the SBS.

Table 134. SBS internal input/output signals

Signal name	Type	Description
BOOT0	Input	Select booting on user flash memory or Bootloader when TrustZone is disabled (TZEN = 0xC3), or on RSS when TrustZone is enabled (TZEN = 0xB4).
sbs_irot_select		Signal based on BOOT_UBE option byte to select the iRoT between STiRoT and user flash memory (OEMiRoT)
sbs_tzen		Signal based on TZEN option byte to activate/deactivate the TrustZone
sbs_boot_addresses		List of addresses defined by the flash memory: – NSBOOTADD: nonsecure boot address – SECBOOTADD: secure boot address
sbs_product_state		Signal based on PRODUCT_STATE option byte to activate the different security mechanisms depending on the product use. Expected values are described in *Section 7: Embedded flash memory (FLASH)*.
sbs_dbg_req		Launch the debug authentication protocol when booting.
sbs_init_vtor_s	Output	Vector address for Cortex-M33 secure entry point
sbs_init_vtor_ns		Vector address for Cortex-M33 nonsecure entry point
sbs_tz_state		Inform the Cortex-M33 on the secure state of the core.
sbs_hdpl		HDPL (temporal isolation level, ID of the boot level, used to isolate boot levels) This signal reflects a monotonic counter that can be incremented from 0 to 3, and that is reset to zero only on software reset or POR.
sbs_ap_unlocked		Control the Cortex-M33 access port.
sbs_dbg_unlocked		Unlock the debug (when set to 1) for the Cortex-M33 nonsecure part.
sbs_dbg_unlocked_sec		Unlock the debug (when set to 1) for the Cortex-M33 secure part.
sbs_dbg_reset	Input	This signal is used to control the reset of the debug authentication configuration to be done with a system reset or a power-on reset. The configuration is done through the DBGMCU using the DCRT bitfield of DBGMCU_CR register.
sbs_obk_hdpl	Output	Select secure storage domain (OBK-HDPL) for current HDPL, or greater ones (to allow provisioning).
sbs_epoch_out		EPOCH counters (NS_EPOCH and SEC_EPOCH, inputs from flash memory) are used to manage the REPLAY protection.
sbs_sec_nsec		Reflect secure/nonsecure selection for the secure storage.

14.3.3 SBS reset and clocks

The SBS configuration port is clocked by the AHB bus clock. There is a general reset and a debug configuration reset controlled in DBGMCU.



14.3.4 SBS system configuration

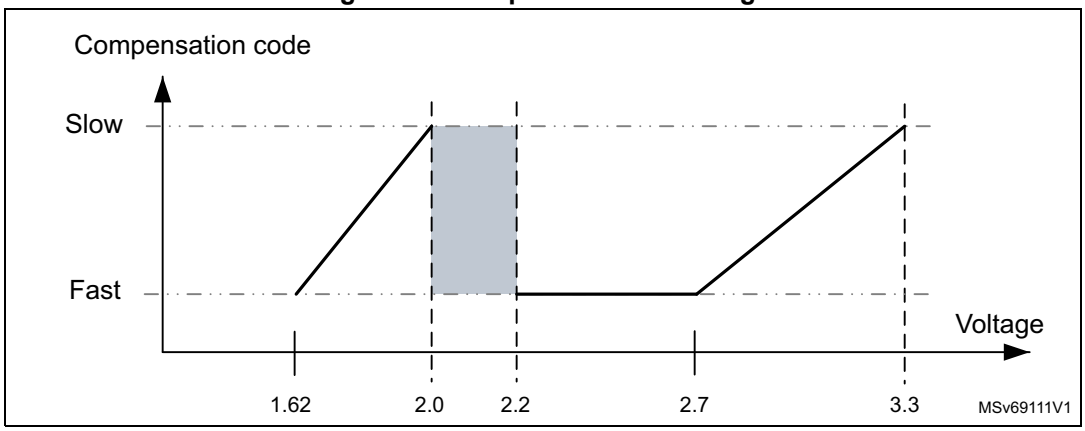
SBS I/O compensation cell management

The I/O compensation cell generates an 8-bit value for the I/O buffer (4 bits for N-MOS and 4 bits for P-MOS), that depends on PVT operating conditions (process, voltage, temperature). These bits are used to control the output impedance in the I/O buffer, and the slew rate of the I/O commutation (t_{fall} and t_{rise}), to reduce the I/O noise on power supply.

As shown in *Figure 70*, the compensation cell is split in two blocks, one to provide an optimal code for the current PVT, and another to drive the block controlled by the software.

Figure 70. Compensation cell management

The compensation cell value can be read when the READY flag is set in SBS_CCCSR. With CODESEL in SBS_CCCSR, the application can select the value to apply between two options: the code from the cell or the code from SBS_CCSWCR.



Two compensation cells are embedded in STM32H5 devices, one for the I/Os supplied by V_{DDIO} power rail, another for the I/Os supplied by V_{DDIO2} power rail.

By default, the compensation cells are disabled, and a fixed code is applied to all the I/Os.

Note: The compensation cell can be used only when 2.7 V ≤ V_{DDIOx} ≤ 3.6 V or 1.62 V ≤ V_{DDIOx} ≤ 2 V (see Figure 71).

Note: The compensation cell can be used only when the CSI oscillator is enabled, see Section 11: Reset and clock control (RCC) for more details on CSI oscillator.

Figure 71. Compensation cell usage

SBS TrustZone security and privilege

- SBS TrustZone security

  When the TrustZone security is activated, the SBS is able to protect secure registers from being modified by nonsecure accesses.

  The TrustZone security is activated by the TZEN option byte in FLASH_OPTSR2_PRG.

  A nonsecure read/write access to a secured register is RAZ/WI and generates an illegal access event. An illegal access interrupt is generated if the SBS illegal access event is enabled in the GTZC.
- Privileged/unprivileged mode

  The SBS registers can be read and written by privileged and unprivileged accesses except the SBS registers for CPU configuration:

  – SBS_CSLCKR, SBS_FPUIMR and SBS_CNSLCKR

  – FPUSEC in SBS_SECCFGR

  An unprivileged access to a privileged register is RAZ/WI.

14.3.5 SBS boot control

The SBS can be used to control the boot entry points considering the product settings. The main boot control actions are listed below:

- Run product with or without TrustZone enabled.
- Select between STiRoT or OEMiRoT.
- Boot when launching a debug authentication sequence.
- Select boot between the bootloader or the user flash memory boot.
- Initialize the HDPL boot value.

Figure 72. SBS boot control

The boot configurations are selected considering the product settings:

- BOOT0: to select booting on user flash memory or RSS (root secure services)
- BOOT_UBE option byte to select the iRoT between STiRoT and OEMiRoT
- TZEN option byte to activate/deactivate the Trust Zone
- sbs_boot_addresses: list of addresses defined by the flash memory:
  - NSBOOTADD: nonsecure boot address
  - SECBOOTADD: secure boot address
- PRODUCT_STATE: option byte to activate the different security mechanisms depending on the product use. Expected values are described in *Section 7: Embedded flash memory (FLASH)*.
- sbs_dbg_req: used to launch the debug authentication protocol when booting

The boot control logic sets the following data:

- sbs_init_vtor_s: vector address for Cortex-M33 secure entry point
- sbs_init_vtor_ns: vector address for Cortex-M33 nonsecure entry point
- sbs_tz_state (secure/nonsecure): informs the Cortex-M33 on the secure state of the core.
- HDPL (see the description below)

SBS HDPL (temporal isolation level) management

The HDPL is a monotonic counter incremented during the boot stages. The HDPL is reset to its default value only after a power-on or a system reset. This default value (0 or 1) depends on the device life cycle, as defined in boot logic.

The STM32H5 series devices use HDPL information to automatically isolate code and its associated secrets (like keys) during the boot process. Incrementing HPDL ensures that private code and data for one boot stage cannot be directly accessible from later boot stages.

The HDPL is used by the user flash memory, see *Section 7: Embedded flash memory (FLASH)* for more details. The HDPL can take values from 0 to 3. When reaching the value 3, HDPL keeps this value until reset. The current HDPL value is readable in HDPL bitfield in SBS_HDPLSR.

To increment the HDPL by one, the application must write 0x6A to INCR_HDPL in SBS_HDPLCR. After such increment, and before doing any subsequent action, the user must check that the HDPL has effectively been incremented, by reading SBS_HDPLSR.

Table 135. HDPL encoded values

HDPL	Code
0	0xB4
1	0x51
2	0x8A
3	0x6F
	All other values

14.3.6 SBS debug control

The SBS debug control is used to manage debug opening, taking care on the product context (PRODUCT_STATE, TZEN, HDPL) on register settings, or through a debug authentication control.

When the debug is forbidden, the mailbox access port, Cortex-M33 access port and CPU debug interface are locked. In this situation, the debugger cannot access the CPU and no effective debug can be done. Refer to the *Section 66: Debug support (DBG)* for more details.

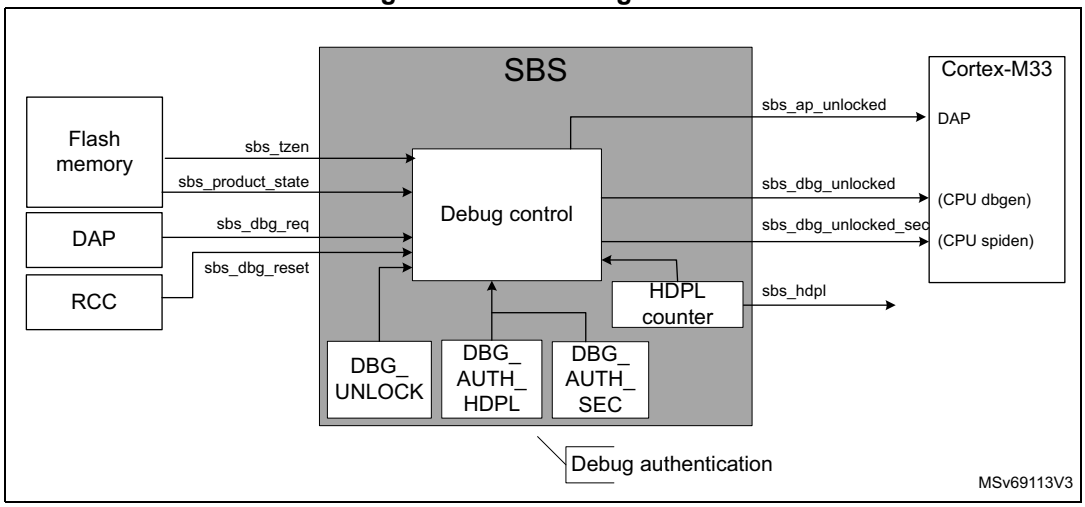
Authenticated debug sequence

1. The external host requests to launch the debug authentication protocol, via the DBGMCU access port mailbox. The rest of the device is kept under reset.
2. SBS selects the STMicroelectronics RSS-DA (debug authentication library) boot address, and requests the CPU to be released from reset.

3. The CPU running RSS-DA library executes the debug authentication protocol in the system flash memory. If the device is closed, the access port mailbox is closed until RSS-DA acknowledges the authentication sequence start request.
4. The authentication method depends on TrustZone activation:
   – When TrustZone is activated (TZEN = 0xB4), the authentication method is based on certificates. As soon as a debug certificate chain is fully verified by the device, if the certificate concerns a debug permission, the RSS-DA programs the debug opening of the Cortex-M33. Alternatively, the certificate can authorize partial or full regression, allowing debug on a regressed part.
   – When TrustZone is disabled (TZEN = 0xC3), the authentication method is based on a password. This method only allows the full regression of the product to be controlled.
5. Above reopenings are effective only when HDPL in SBS_HDPLSR has a value equal or superior to the value programmed in DBG_AUTH_HDPL in SBS_DBGCR. In case of authentication failure, the user is informed through the host interface.

*Note: The debug authentication library in system flash memory is available only when HDPL = 0 or 1 in SBS*_HDPL*SR. Only this library can perform the steps 3 and 4 described above.*

Debug reset



The debug opening can have the configuration to be reset by system or power-on reset, depending on a DBGMCU register field.

Debug locking

The debug configuration can be locked thanks to DBGCFG_LOCK in SBS_DBGLOCKR. SBS_DBGCR is then no longer writable.

When DBGCFG_LOCK is set to 1, it can be reset only by system or power-on reset. The configuration is done through the DBGMCU using the DCRT field of DBGMCU_CR.

Figure 73. SBS debug control

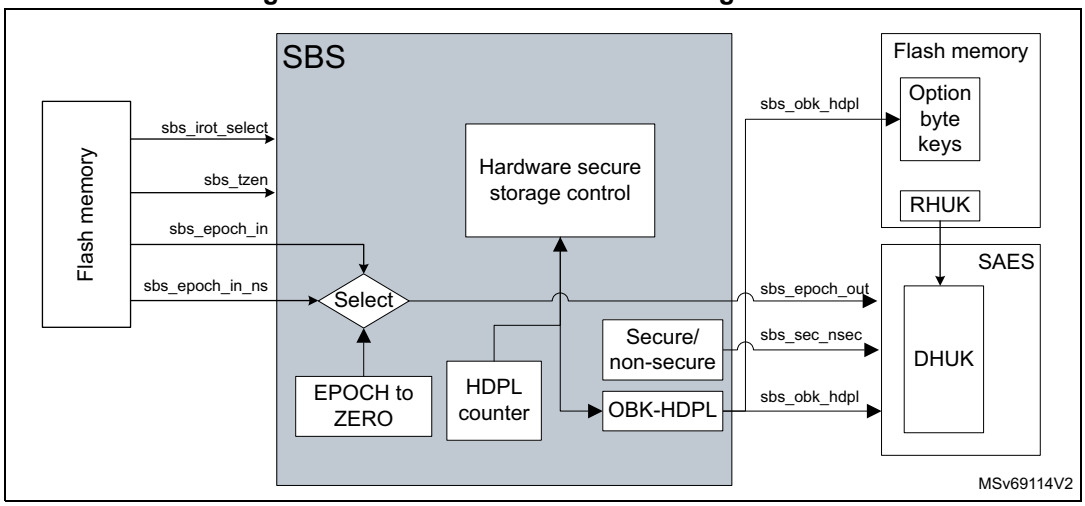
Inputs used to control the debug opening:

- sbs_dbg_req: input signal that a host requests to launch the debug authentication protocol. When this signal is set, the boot address is set to launch the debug authentication library.
- sbs_tzen: inform on the selected platform configuration related to TrustZone activation. When TZEN value is set to zero (0xC3), the platform does not support TrustZone and the simplified life cycle is proposed. See *Section 7: Embedded flash memory (FLASH)* for more details.
- sbs_product_state: provide the current PRODUCT_STATE (from flash memory). See *Section 7: Embedded flash memory (FLASH)* for more details.
- sbs_dbg_reset: reset information coming from the RCC, and reset SBS_DBGCR if this register is configured to be reset.

Configuration

- DBG_UNLOCK in SBS_DBGCR: debug unlock when DBG_AUTH_HDPL is reached
- AP_UNLOCK in SBS_DBGCR: access port unlock
- DBG_AUTH_HDPL in SBS_DBGCR: authenticated debug temporal isolation level. Define the HDPL value from which the debug can be opened. Value can only be from 1 to 3.
- DBG_AUTH_SEC in SBS_DBGCR: specify if the debug reopening is for nonsecure only or for both (secure and nonsecure).
- DBGC_LOCK in SBS_DBGLOCKR: lock the current debug configuration (released only by a reset).

Outputs



- sbs_ap_unlocked: signal controlling the Cortex-M33 access port
  - 1: 0xB4
  - 0: all other codes
- sbs_dbg_unlocked: unlock the debug (when set to 1) for the Cortex-M33 nonsecure.
  - 1: 0xB4
  - 0: all other codes
- sbs_dbg_unlocked_sec: unlock the debug (when set to 1) for the Cortex-M33 secure.
  - 1: 0xB4
  - 0: all other codes

14.3.7 SBS hardware secure storage control

This feature ensures the isolation of keys and data related to RoT (root-of-trust) when re-opening the debug (when product in the field).

This includes a dedicated area called OB-Keys in the flash memory (see *Section 7: Embedded flash memory (FLASH)* for more details), and the key derivation (DHUK) mechanism protecting data using a hardware key different for the identified domains.

Figure 74. SBS hardware secure storage control

- sbs_obk_hdpl: select secure storage context for current HDPL, or greater ones (to allow provisioning). This signal is set thanks to the SBS_NEXTHDPLCR register. This information is used by the flash memory to select the right area, and by the SAES when processing the derived key to generate a key derived related to HDPL context.
- sbs_epoch_out: EPOCH counters are used to manage the REPLAY protection. These counters are incremented when regressions are done. Injecting the EPOCH in the DHUK (in the SAES) ensures that all information encrypted with the DHUK cannot be replayed after a regression.
- sbs_sec_nsec: apply a different protection DHUK for secure and nonsecure assets.

All keys encrypted using the SAES/DHUK inherit of the RHUK property: unique per device.

All data encrypted thanks to the SAES using the DHUK are specific to a combination of [sbs_obk_hdpl + sbs_epoch_out + sbs_sec_nsec].

Inputs used to control the hardware secure storage control

sbs_epoch_in and sbs_epoch_in_ns: 24-bit values coming from the flash memory and representing regression counters respectively for secure and nonsecure.

Configuration

- NEXTHDPL in SBS_NEXTHDPLCR: access to next HDPL secure storage areas.
- EPOCH_SEL in SBS_EPOCHSELCR: select the EPOCH source related to the secure storage under control (SEC_EPOCH, NS_EPOCH, or FORCED_To_Zero).

Table 137. OBK-HDPL logic

HDPL[7:0] in SBS_HDPLSR	NEXTHDPL[1:0]			
	0x0	0x1	0x2	0x3
0 (0xB4)	0xB4	0x51	0x8A	0x6F
1 (0x51)	0x51	0x8A	0x6F	
2 (0x8A)	0x8A	0x6F		
3 (0x6F)	0x6F			
Others				

14.4 SBS interrupts

SBS does not support interrupts.

14.5 SBS registers

14.5.1 SBS temporal isolation control register (SBS_HDPLCR)

Address offset: 0x010

Reset value: 0x0000 00B4

Reset: system reset

Register security: no restriction

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	INCR_HDPL[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **INCR_HDPL[7:0]**: increment HDPL value
0xB4: no increment
0x6A: recommended value to increment HDPL level by one
Others: all other values allow a HDPL level increment.

14.5.2 SBS temporal isolation status register (SBS_HDPLSR)

Address offset: 0x014

Reset value: 0xXXXX XXXX

The reset value depends on boot case: booting with HDPL0 for ST code, or HDPL1 for all other cases. See *Table 136* for more details.

Reset: system reset

Register security: no restriction

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HDPL[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **HDPL[7:0]**: temporal isolation level

This bitfield returns the current temporal isolation level.
0xB4: HDPL0, RSS
0x51: HDPL1, iRoT
0x8A: HDPL2, uRoT
0x6F: HDPL3, application (secure/nonsecure)

14.5.3 SBS next HDPL control register (SBS_NEXTHDPLCR)

Address offset: 0x018

Reset value: 0x0000 0000

Reset: system reset

Register security: no restriction

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NEXTHDPL[1:0]	
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **NEXTHDPL[1:0]**: index to point to a higher HDPL than the current one

Index to add to the current HDPL to point (through OBK-HDPL) to the next secure storage areas (OBK-HDPL = HDPL + NEXTHDPL). See *Table 137: OBK-HDPL logic* for more details.

14.5.4 SBS debug control register (SBS_DBGCR)

Address offset: 0x020

Reset value: 0x0000 0000

Reset: debug reset (system reset or power-on reset)

Register security: HDPL0/1, RAZ/WI otherwise

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DBG_AUTH_SEC[7:0]								DBG_AUTH_HDPL[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DBG_UNLOCK[7:0]								AP_UNLOCK[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **DBG_AUTH_SEC[7:0]**: control debug opening secure/nonsecure
Write 0xB4 to this bitfield to open debug for secure and any other values only opens nonsecure

Bits 23:16 **DBG_AUTH_HDPL[7:0]**: authenticated debug temporal isolation level
Writing to this bitfield defines at which HDPL the authenticated debug opens.
0x51: HDPL1
0x8A: HDPL2
0x6F: HDPL3

Note: Writing any other values is ignored. Reading any other value means the debug never opens.

Bits 15:8 **DBG_UNLOCK[7:0]**: debug unlock when DBG_AUTH_HDPL is reached
Write 0xB4 to this bitfield to open the debug when HDPL in SBS_HDPLSR equals to DBG_AUTH_HDPL in this register.

Bits 7:0 **AP_UNLOCK[7:0]**: access port unlock
Write 0xB4 to this bitfield to open the device access port.

14.5.5 SBS debug lock register (SBS_DBGLOCKR)

Address offset: 0x024

Reset value: 0x0000 00B4

Reset: debug reset (system reset or power-on reset)

Register security: HDPL0/1, RAZ/WI otherwise

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBGCFG_LOCK[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **DBGCFG_LOCK[7:0]**: debug configuration lock
Reading this bitfield returns 0x6A if the bitfield value is different from 0xB4.
0xC3 is the recommended value to lock the debug configuration using this bitfield.
0xB4: Writes to SBS_DBGCR allowed (default)
Others: Writes to SBS_DBGCR ignored

14.5.6 SBS RSS command register (SBS_RSSCMDR)

Address offset: 0x034

Reset value: 0x0000 0000

Reset: power-on reset

Register security: always secure (RAZ/WI if nonsecure)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RSSCMD[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **RSSCMD[15:0]**: RSS command

The application can use this bitfield to pass on a command to the RSS, executed at the next reset.

When RSSCMD ≠ 0 and PRODUCT_STATE is in Open, then the system always boots on RSS whatever is the boot pin value.

14.5.7 SBS EPOCH selection control register (SBS_EPOCHSELCR)

Address offset: 0x0A0

Reset value: 0x0000 0000

Reset: system reset

Register security: Secure when TZ_STATE = 1 (RAZ, WI in nonsecure access). Nonsecure protection when TZ_STATE = 0. This register is protected by privileged whatever is TZ_STATE, RAZ/WI if non privileged access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EPOCH_SEL[1:0]	
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **EPOCH_SEL[1:0]**: select EPOCH value to be sent to the SAES

00: NS_EPOCH (nonsecure) counter input selected

01: SEC_EPOCH counter input selected

1x: EPOCH forced to zero (value used to retrieve PUF reference value at boot time)

14.5.8 SBS security mode configuration control register (SBS_SECCFGR)

Address offset: 0x0C0

Reset value: 0x0000 0000

Reset: system reset

Register security: always secure. RAZ/WI if nonsecure transaction and TZ_STATE = 1. RAZ/WI if TZ_STATE = 0.

This register is programmed by secure software if the user wants functions configurable through system registers to be secure or not.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FPUSEC	Res.	CLASSBSEC	SBSSEC
												rw		rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **FPUSEC**: FPU security enable
0: SBS_FPUIMP register accessible through secure or nonsecure transaction
1: SBS_FPUIMP register accessible only through secure transaction
Note: This bit can be written only through privilege transaction.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CLASSBSEC**: ClassB security enable
0: SBS_CFGR2 register accessible through secure or nonsecure transaction
1: SBS_CFGR2 register accessible only through secure transaction

Bit 0 **SBSSEC**: SBS clock control, memory-erase status register and compensation cell register security enable
0: SBS_MESR, SBS_CCCSR, SBS_CCVALR, SBS_CCSWCR registers accessible through secure or nonsecure transaction
1: SBS_MESR, SBS_CCCSR, SBS_CCVALR, SBS_CCSWCR registers accessible only through secure transaction

14.5.9 SBS product mode and configuration register (SBS_PMCR)

Address offset: 0x100

Reset value: 0x0000 0000

Reset: system reset

STM32H523/533/562/563/573xx devices only

Register security:

- When TrustZone is activated (TZEN = 0xB4):
  - depending on ADC12SEC secure input for ANASWVDD and IO_ANA_BOOST_EN configuration bits
  - depending on I/O PBx_SEC_EN secure input for PBx_FMP configuration bits
  - depending on Ethernet ETHSEC secure input for ETH_SEL_PHY configuration bits
  - depending on SDCE_SEC_EN in SBS_SECCFGR for SMPS_DIV_CLOCK_EN
- When TrustZone is disabled (TZEN = 0xC3) there is no access restriction.

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:21 **ETH_SEL_PHY[2:0]**: Ethernet PHY interface selection
000: GMII or MII
001: reserved (RGMII)
100: RMII
Others: reserved
Refer to the product datasheet for the availability of Ethernet. If not present, consider the associated bits as reserved, and keep them at reset value.

Bit 20 Reserved, must be kept at reset value.

Bit 19 **PB9_FMP**: Fast-mode Plus driving capability activation on PB9
This bit can be read and written only with secure access if PB9 is secure in GPIOB. This bit enables the Fm+ driving mode for PB9 when PB9 is not used by I2C peripheral. This can be used to drive a LED for instance.
0: PB9 pin operates in standard mode.
1: Fm+ mode is enabled on PB9 pin and the speed control is bypassed.

Bit 18 **PB8_FMP**: Fast-mode Plus driving capability activation on PB8
This bit can be read and written only with secure access if PB8 is secure in GPIOB. This bit enables the Fm+ driving mode for PB8 when PB8 is not used by I2C peripheral. This can be used to drive a LED for instance.
0: PB8 pin operates in standard mode.
1: Fm+ mode is enabled on PB8 pin and the speed control is bypassed.

Bit 17 **PB7_FMP**: Fast-mode Plus driving capability activation on PB7
This bit can be read and written only with secure access if PB7 is secure in GPIOB. This bit enables the Fm+ driving mode for PB7 when PB7 is not used by I2C peripheral. This can be used to drive a LED for instance.
0: PB7 pin operates in standard mode.
1: Fm+ mode is enabled on PB7 pin and the speed control is bypassed.

Bit 16 **PB6_FMP**: Fast-mode Plus driving capability activation on PB6
This bit can be read and written only with secure access if PB6 is secure in GPIOB. This bit enables the Fm+ driving mode for PB6 when PB6 is not used by I2C peripheral. This can be used to drive a LED for instance.
0: PB6 pin operates in standard mode.
1: Fm+ mode is enabled on PB6 pin and the speed control is bypassed.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 Reserved, must be kept at reset value.

14.5.10 SBS product mode and configuration register [alternate] (SBS_PMCR)

Address offset: 0x100

Reset value: 0x4000 0000

Reset: system reset

STM32H543/553xx devices only

Register security:

- When TrustZone is activated (TZEN = 0xB4):
  - depending on I/O PBx_SEC_EN secure input for PBx_FMP configuration bits
  - depending on Ethernet ETH_SEC_EN secure input for ETH_SEL_PHY configuration bits
- When TrustZone is disabled (TZEN = 0xC3), there is no access restriction.

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **ETHTHLPI**: ETH TxLPI status
This bit is set and reset by hardware.
When set, this bit indicates that the MAC has entered Tx LPI mode.

Bit 26 **ETHPDACK**: ETH power-down acknowledge
This bit is set and reset by hardware.
When set, this bit indicates that the Ethernet controller has completed its power-down sequence and its clocks can be stopped.
0: ETH functional / power-down sequence not yet completed
1: ETH power-down sequence completed

Bit 25 **ETHINTPOL**: ETH external PHY interrupt polarity configuration
0: active high
1: active low

Bits 24:21 **ETH_SEL_PHY[3:0]**: Ethernet PHY interface selection
0000: GMII or MII
0001: reserved (RGMII)
0100: RMII
Others: reserved

Bit 20 Reserved, must be kept at reset value.

Bit 19 **PB9_FMP**: Fast-mode Plus driving capability activation on PB9
This bit can be read and written only with secure access if PB9 is secure in GPIOB. This bit enables the Fm+ driving mode for PB9 when PB9 is not used by I2C peripheral. This can be used to drive a LED for instance.
0: PB9 pin operates in standard mode.
1: Fm+ mode is enabled on PB9 pin and the speed control is bypassed.

Bit 18 **PB8_FMP**: Fast-mode Plus driving capability activation on PB8
This bit can be read and written only with secure access if PB8 is secure in GPIOB. This bit enables the Fm+ driving mode for PB8 when PB8 is not used by I2C peripheral. This can be used to drive a LED for instance.
0: PB8 pin operates in standard mode.
1: Fm+ mode is enabled on PB8 pin and the speed control is bypassed.

Bit 17 **PB7_FMP**: Fast-mode Plus driving capability activation on PB7
This bit can be read and written only with secure access if PB7 is secure in GPIOB. This bit enables the Fm+ driving mode for PB7 when PB7 is not used by I2C peripheral. This can be used to drive a LED for instance.
0: PB7 pin operates in standard mode.
1: Fm+ mode is enabled on PB7 pin and the speed control is bypassed.

Bit 16 **PB6_FMP**: Fast-mode Plus driving capability activation on PB6
This bit can be read and written only with secure access if PB6 is secure in GPIOB. This bit enables the Fm+ driving mode for PB6 when PB6 is not used by I2C peripheral. This can be used to drive a LED for instance.
0: PB6 pin operates in standard mode.
1: Fm+ mode is enabled on PB6 pin and the speed control is bypassed.

Bits 15:0 Reserved, must be kept at reset value.

14.5.11 SBS FPU interrupt mask register (SBS_FPUIMR)

Address offset: 0x104

Reset value: 0x0000 001F

Reset: system reset

Register security: depends on FPUSEC in SBS_SECCFGR

This register is accessible only through privilege transaction.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FPU_IE[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **FPU_IE[5:0]**: FPU interrupt enable

Set and cleared by software to enable the Cortex-M33 FPU interrupts
FPU_IE[5]: inexact interrupt enable (interrupt disabled at reset)
FPU_IE[4]: input abnormal interrupt enable
FPU_IE[3]: overflow interrupt enable
FPU_IE[2]: underflow interrupt enable
FPU_IE[1]: divide-by-zero interrupt enable
FPU_IE[0]: invalid operation interrupt enable

14.5.12 SBS memory erase status register (SBS_MESR)

Address offset: 0x108

Reset value: 0x0000 000X (bit 0 is not affected by system reset)

Register security: depends on SBSSEC in SBS_SECCFGR

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IPMEE
															rc_w1

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MCLR
															rc_w1

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **IPMEE**: ICACHE erase status

This bit is set by hardware when ICACHE and PKA RAMs erase is completed after potential tamper detection or a product state regression (refer to *Section 52: Tamper and backup registers (TAMP)* for more details).
This bit is cleared by software by writing 1 to it.
0: ICACHE and PKA RAM erase on going
1: ICACHE and PKA SRAM erase done

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **MCLR**: device memories erase status

This bit is set by hardware when SRAM2, BKPSRAM, ICACHE, DCACHE and PKA RAMs erase is completed after power-on reset or tamper detection or product state regression (refer to *Section 52: Tamper and backup registers (TAMP)*).
This bit is not reset by system reset and is cleared by software by writing 1 to it.
0: memory erase on going if not yet cleared by software
1: Memory erase done

14.5.13 SBS compensation cell for I/Os control and status register (SBS_CCCSR)

Address offset: 0x110

Reset value: 0x0000 0000

Reset: system reset

Register security: depends on SBSSEC in SBS_SECCFGR

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	RDY2	RDY1	Res.	Res.	Res.	Res.	CS2	EN2	CS1	EN1
						r	r					rw	rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **RDY2**: VDDIO2 compensation cell ready flag
This bit provides the status of the VDDIO2 compensation cell.
0: VDDIO2 compensation cell not ready
1: VDDIO2 compensation cell ready (code value provided by the cell can be used)

Bit 8 **RDY1**: VDDIO compensation cell ready flag
This bit provides the status of the compensation cell.
0: VDDIO compensation cell not ready
1: VDDIO compensation cell ready (code value provided by the cell can be used)

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **CS2**: code selection for VDDIO2 power rail (reset value set to 1)
This bit selects the code to be applied for the I/O compensation cell.
0: Code from the cell (available in SBS_CCVR)
1: Code from SBS_CCCR

Bit 2 **EN2**: enable compensation cell for VDDIO2 power rail
This bit enables the I/O compensation cell.
0: I/O compensation cell disabled
1: I/O compensation cell enabled

Bit 1 **CS1**: code selection for VDDIO power rail (reset value set to 1)
This bit selects the code to be applied for the I/O compensation cell.
0: Code from the cell (available in the SBS_CCVR)
1: Code from SBS_CCCR

Bit 0 **EN**1: enable compensation cell for VDDIO power rail
This bit enables the I/O compensation cell.
0: I/O compensation cell disabled
1: I/O compensation cell enabled

14.5.14 SBS compensation cell for I/Os value register (SBS_CCVALR)

Address offset: 0x114

Reset value: 0x0000 0088

Reset: system reset

Register security: depends on SBSSEC in SBS_SECCFGR

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **APSRC2[3:0]**: compensation value for the PMOS transistor

This value is provided by the cell and must be interpreted by the processor to compensate the slew rate in the functional range.

Bits 11:8 **ANSRC2[3:0]**: Compensation value for the NMOS transistor

This value is provided by the cell and must be interpreted by the processor to compensate the slew rate in the functional range.

Bits 7:4 **APSRC1[3:0]**: compensation value for the PMOS transistor

This value is provided by the cell and must be interpreted by the processor to compensate the slew rate in the functional range.

Bits 3:0 **ANSRC1[3:0]**: compensation value for the NMOS transistor

This value is provided by the cell and must be interpreted by the processor to compensate the slew rate in the functional range.

14.5.15 SBS compensation cell for I/Os software code register (SBS_CCSWCR)

Address offset: 0x118

Reset value: 0x0000 7878

Reset: system reset

Register security: depends on SBSSEC in SBS_SECCFGR

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **SW_APSRC2[3:0]**: PMOS compensation code for the V_{DDIO} power rails

This bitfield is written by software to define an I/O compensation cell code for PMOS transistors of the VDDIO power rail. This code is applied to the I/O when CS2 is set in SBS_CCSR.

Bits 11:8 **SW_ANSRC2[3:0]**: NMOS compensation code for VDDIO power rails

This bitfield is written by software to define an I/O compensation cell code for NMOS transistors of the VDD power rail. This code is applied to the I/O when CS2 is set in SBS_CCSR.

Bits 7:4 **SW_APSRC1[3:0]**: PMOS compensation code for the VDD power rails

This bitfield is written by software to define an I/O compensation cell code for PMOS transistors of the VDDIO power rail. This code is applied to the I/O when CS1 is set in SBS_CCSR.

Bits 3:0 **SW_ANSRC1[3:0]**: NMOS compensation code for VDD power rails

This bitfield is written by software to define an I/O compensation cell code for NMOS transistors of the VDD power rail. This code is applied to the I/O when CS1 is set in SBS_CCSR.

14.5.16 SBS Class B register (SBS_CFGR2)

Address offset: 0x120

Reset value: 0x0000 0000

Reset: system reset

Register security: depends on CLASSBSEC in SBS_SECCFGR

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ECCL	PVDL	SEL	CLL
												rs	rs	rs	rs

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **ECCL**: ECC lock

This bit is set and cleared by software. It can be used to enable and lock the flash memory double ECC error with break input of TIM1/8/15/6/17.

0: double ECC error flag disconnected to timer break inputs

1: double ECC error flag connected to timer break inputs

Bit 2 **PVDL**: PVD lock

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the PVD connection with TIM1/8/15/16/17 break inputs.

0: PVD interrupt disconnected from timer break inputs. PVD_EN and PVD_SEL[2:0] in the PWR registers are read/write.

1: PVD interrupt is connected to timer break inputs. PVD_EN and PVD_SEL[2:0] in the PWR registers are read only

Bit 1 **SEL**: SRAM ECC error lock

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the SRAM double ECC error signal with break input of TIM1/8/15/16/17.

0: SRAM double ECC error flag disconnected from timer break inputs

1: SRAM double ECC error flag connected to timer break inputs

Bit 0 **CLL**: core lockup lock

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the lockup (HardFault) output of Cortex-M33 with TIM1/8/15/16/17 break inputs.

0: lockup output disconnected from timer break inputs

1: lockup output connected to timer break inputs

14.5.17 SBS CPU nonsecure lock register (SBS_CNSLCKR)

Address offset: 0x144

Reset value: 0x0000 0000

Reset: system reset

Register security: This register can be read and written by privileged access only. Unprivileged access is RAZ/WI.

This register is used to lock the configuration of nonsecure MPU and VTOR_NS registers of the Cortex-M33.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCKNSMPU	LOCKNSVTOR
														rs	rs

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **LOCKNSMPU**: nonsecure MPU register lock

This bit is set by software and cleared only by a system reset. When set, this bit disables write access to nonsecure MPU_CTRL_NS, MPU_RNR_NS and MPU_RBAR_NS registers.

0: nonsecure MPU registers write enabled

1: nonsecure MPU registers write disabled

Bit 0 **LOCKNSVTOR**: VTOR_NS register lock

This bit is set by software and cleared only by a system reset.

0: VTOR_NS register write enabled

1: VTOR_NS register write disabled

14.5.18 SBS CPU secure lock register (SBS_CSLCKR)

Address offset: 0x148

Reset value: 0x0000 0000

Reset: system reset

Register security: This register can be written only when the access is secure/privilege.

A nonsecure read/write access is RAZ/WI and generates an illegal access event. When the system is not secure (TZ_STATE = 0), this register is RAZ/WI.

This register is used to lock the configuration of PRIS and BFHFNMINS in the AIRCR, SAU, secure MPU and VTOR_S registers of the Cortex-M33.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCKSAU	LOCKSMPU	LOCKSVTAIRCR
													rs	rs	rs

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LOCKSAU**: SAU registers lock

This bit is set by software and cleared only by a system reset. When set, this bit disables write access to SAU_CTRL, SAU_RNR, SAU_RBAR and SAU_RLAR registers.

0: SAU registers write enabled

1: SAU registers write disabled

Bit 1 **LOCKSMPU**: secure MPU registers lock

This bit is set by software and cleared only by a system reset. When set, this bit disables write access to secure MPU_CTRL, MPU_RNR and MPU_RBAR registers.

0: Secure MPU registers writes enabled

1: Secure MPU registers writes disabled

Bit 0 **LOCKSVTAIRCR**: VTOR_S and AIRCR register lock

This bit is set by software and cleared only by a system reset. When set, this bit disables write access to VTOR_S register, PRIS and BFHFNMINS bits in the AIRCR register.

0: VTOR_S register PRIS and BFHFNMINS bits in the AIRCR register write enabled

1: VTOR_S register PRIS and BFHFNMINS bits in the AIRCR register write disabled

14.5.19 SBS flitf ECC NMI mask register (SBS_ECCNMIR)

Address offset: 0x14C

Reset value: 0x0000 0000

Reset: system reset

Register security: secure access only when TZ_STATE = 1 (RAZ/WI in nonsecure access). No security protection if TZ_STATE = 0.

This register is accessible only through privilege transaction.

This register sets up the expected behavior on NMI regarding double ECC errors from the flash memory.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1. Refer to the product datasheet for the availability of Ethernet. If not present, consider the associated bits as reserved, and keep them at reset value.
2. Only for STM32H543/553xx devices.

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

15 Peripherals interconnect matrix

15.1 Interconnect matrix introduction

Several peripherals have direct connections between them, enabling autonomous communication and/or synchronization: this approach saves CPU resources, and power supply consumption. In addition, these hardware connections remove software latency and help the design of predictable system.

Depending on peripherals, these interconnections can operate in Run, Sleep, and Stop modes.

15.2 Connection summary

1. Numbers in this table are links to corresponding subsections of *Section 15.3*.
2. "-" means no interconnect.
3. .Refer to the product datasheet for the availability of peripherals. If the peripheral is not present, consider the associated interconnection as unavailable.

15.3 Interconnection details

15.3.1 Master to slave interconnection for timers

From timer (TIM1/2/3/4/5/8/12/13/14/15/16/17) to timer (TIM1/2/3/4/5/8/12/15).

Purpose

Some timers are linked together internally for synchronization or chaining.

When one timer is configured in master mode, it can reset, start, stop, or clock the counter of another timer configured in slave mode.

A description of the feature is provided in *Section 44.4.23: Timer synchronization*.

The synchronization modes are detailed in:

- *Section 43.3.30* for advanced-control timers TIM1/8
- *Section 44.4.22* for general-purpose timers TIM2/3/4/5
- *Section 46* for the general-purpose timers TIM12/13/14
- *Section 47.4.23* for the general-purpose timer TIM15

Triggering signals

The output (from master) is on signal TIMx_TRGO (and TIMx_TRGO2 for TIM1/8) following a configurable timer event. It can be also from signals tim16_oc1 and tim17_oc1 in case of TIM16/17. The input (to slave) is on signals TIMx_ITR0/1/2/3.

The possible master/slave connections are given in:

- *Table 456* for advanced-control timers TIM1/8
- *Table 480* for general-purpose timers TIM2/3/4/5
- *Table 502* for the general-purpose timers TIM12/13/14
- *Table 514* for the general-purpose timer TIM15

Active power mode

Timers are optionally active in Run and Sleep modes. The effects of low-power modes on TIMx are given in:

- *Table 469: Effect of low-power modes on TIM1/TIM8*
- *Table 488: Effect of low-power modes on TIM2/TIM3/TIM4/TIM5*
- *Table 504: Effect of low-power modes on TIM12/TIM13/TIM14*
- *Table 521: Effect of low-power modes on TIM15/TIM16/TIM17*

15.3.2 Triggers to ADCs

From EXTI, timers (TIM1/2/3/4/6/8/15), low-power timers (LPTIM1/2), and PLAY to ADC1/ADC2/ADC3.

Purpose

A conversion (or a sequence of conversions) can be triggered either by software or by an external event (such as timer capture or input pins). For ADC12, if the EXTEN[1:0] (for a regular conversion) or JEXTEN[1:0] bits (for an injected conversion) are different from 0b00, external events can trigger a conversion with the selected polarity.

More details in:

- *Section 28.4.18: Conversion on external trigger and trigger polarity (EXTSEL, EXTEN,JEXTSEL, JEXTEN)*
- EXTEN[1:0] defined in *ADC configuration register (ADC_CFGR)*
- JEXTEN[1:0] defined in *ADC injected sequence register (ADC_JSQR)*

General-purpose timers (TIM2/3/4), basic timer (TIM6), advanced-control timers (TIM1/8), and general-purpose timer (TIM15) can be used to generate the ADC triggering event through the timer outputs tim_oc and tim_trgo.

Low-power timers (LPTIM1/2) can be used to generate the ADC triggering event through the LPTIM channels, in addition to the EXTI on channels 11 and 15.

PLAY can be used to generate the ADC triggering event through the PLAY outputs 7 and 9.

Triggering signals

For ADC1/ADC2/ADC3, the input triggering signals and the description of the interconnection between ADC1/ADC2/ADC3 and timers are given in:

- adc_ext_trg: *Table 282: ADC interconnection*
- adc_jext_trg: *Table 282: ADC interconnection*
- *Section 28.4.18: Conversion on external trigger and trigger polarity (EXTSEL, EXTEN,JEXTSEL, JEXTEN)*
- *Section 28.4.25: Timing diagrams example (single/continuous modes, hardware/software triggers)*

Active power mode

This interconnection is active in Run and Sleep modes for all ADCs. The timers are active only in Run and Sleep modes. The effects of low-power modes are given in:

- *Table 469: Effect of low-power modes on TIM1/TIM8*
- *Table 488: Effect of low-power modes on TIM2/TIM3/TIM4/TIM5*
- *Table 521: Effect of low-power modes on TIM15/TIM16/TIM17*
- *Table 527: STM32H5 LPTIM features*
- *Table 542: Effect of low-power modes on the LPTIM*

15.3.3 ADC analog watchdogs as triggers to timers and PLAY

From ADC1/ADC2/ADC3 to TIM1/8 and from ADC1/ADC2 to PLAY.

Purpose

The internal analog watchdog output signals coming from ADC1/ADC2/ADC3 are connected to on-chip timers. ADC1/ADC2/ADC3 can provide trigger events through analog watchdog signals to advanced-control timers (TIM1/8) to reset, start, stop, or clock the counter.

Settings description of the ADC analog watchdog and timer trigger, are provided in:

- *Section 43.3.6: External trigger input* for TIM1/8
- *Table 457* for the internal ADC1/ADC2 sources connected to TIM1/8 (tim_etr) input multiplexer
- *Section 28.4.28* for the ADC1/ADC2/ADC_AWDy_OUT signal output generation

Triggering signals

The output (from ADC) is on signals ADCn_AWDx_OUT, with n being the ADC instance and x = 1, 2, 3 (three watchdogs per ADC). The input (to timer) is on signal TIMx_ETR (external trigger).

The inputs (to PLAY) are on signal PLAY1_IN[15:0].

Active power mode

ADC1/ADC2/ADC3 are active in Run and Sleep modes.

15.3.4 Triggers to DAC

From timer (TIM1/2/4/5/6/7/8/15), low-power timers (LPTIM1/2), COMP1/2, and EXTI to DAC.

Purpose

General-purpose timers (TIM2/4/5/15), basic timers (TIM6/7), advanced-control timers (TIM1/8), low-power timers (LPTIM1/2) outputs channels (lptim1_ch1 and lptim2_ch1), comparators (COMP1/2) output channels (comp1_out and comp2_out), and EXTI can be used as triggering event to start a DAC conversion.

Triggering signals

The output (from timer) on the TIMx_TRGO signal and from low-power timers are directly connected to corresponding DAC inputs.

The selection of input triggers on DAC is provided in:

- *Table 306: DAC interconnection*
- *Section 30.4.8: DAC trigger selection*

Active power mode

This interconnect is active in Run, Sleep, and Stop modes.

15.3.5 Clock sources to timers

From HSE, LSE, LSI, HSI, and MCO to timers (TIM2/12/15/16/17) and LP timers (LPTIM1/2).

Purpose

A timer input or counter can receive different clock sources, and can be used, for example, to calibrate the internal oscillator on a reference clock.

External clocks (HSE, LSE), internal clocks (LSI, CSI, HSI), and microcontroller output clock (MCO) can be used as input to timers:

- LSE, HSI, and CSI are assigned to general-purpose timers TIM2/12 as external inputs signals. LSE can be selected as counter clock provided by an external clock source in

mode1 (tim_ti1_in) and mode2 (external trigger input tim_etr_in). Inputs assignment and clock selection description are detailed in:

  - *Section 44.4.5: Clock selection* for TIM2
  - External clock mode1: *Table 500: Interconnect to the tim_ti1 input multiplexer* for TIM12, tim_ti1_in4 (HSI), and tim_ti1_in5 (CSI)
  - External clock mode2: *Table 481: Interconnect to the tim_etr input multiplexer* for tim_etr3 (LSE)

- LSE, LSI, CSI, and HSE are assigned to general-purpose timers TIM15/16/17 as external inputs signals. LSE/LSI/CSI/HSE can be selected as counter clock provided by an external clock source in mode1 (tim_ti1 or tim_ti2 signals). Inputs assignment and clock selection description are detailed in:
  - *Section 47.4.6: Clock selection* for TIM15/16/17. External clock mode1: external input pin (tim_ti1 or tim_ti2, if available)
  - *Table 452: Interconnect to the tim_ti1 input multiplexer*, tim_ti1_in1 (LSI-TIM16), tim_ti1_in2 (LSE-TIM16/HSE-TIM17), tim_ti1_in4 (LSE- TIM15), and tim_ti1_in5 (CSI-TIM15)
- Microcontroller output clock (MCO): MCO1 is connected as external input to general-purpose timer TIM17, MCO2 is connected as external input to general-purpose timer TIM15.
  - *Table 512: Interconnect to the tim_ti1 input multiplexer* for TIM15/TIM16/TIM17
- LSI and LSE can be selected as input capture 2 to LPTIM1 as described in *Table 536: LPTIM1 input capture 2 connections*.
- HSI/1024, CSI/128, and HSI/8 can be selected as input capture 2 to LPTIM2 as described in *Table 537: LPTIM2 input capture 2 connections*.

Triggering signals

lptim_ic2_mux1 LPTIM input capture selection can be set in the LPTIM configuration register 2 (LPTIM_CFGR2). For timers, the internal clock signal can be selected as counter clock provided by an external clock source in mode1 (tim_ti1_in) and mode2 (external trigger input tim_etr_in).

Active power mode

This feature is available under Run and Sleep modes.

15.3.6 Triggers to low-power timers

From EXTI, TAMP, PLAY, comparators (COMP1/2), GPDMA1, and RTC alarm to low-power timers (LPTIM1/2/3/4/5/6).

Purpose

LPTIM1/2/3/4/5/6 counters can be started either by software, or after the detection of an active edge on one of the eight trigger inputs (see *Section 48.4.7: Trigger multiplexer*).

RTC alarm, TAMP input detection, COMP1_OUT, and GPDMA transfer complete can be used as a trigger to start LPTIM counters (LPTIM1/2).

Triggering signals

This trigger feature is described in *Section 48.4.7: Trigger multiplexer* and the following sections. The input selection is described in *Table 532: LPTIM1/2/3/4/5/6 external trigger connections*.

Active power mode

This interconnection is active in Run, Sleep, and Stop modes.

15.3.7 RTC wake-up as inputs to timers

From RTC to timer (TIM16).

Purpose

RTC wake-up interrupt can be used as input to general-purpose timer (TIM16) channel 1.

Triggering signals

RTC wake-up signal is connected to tim_ti1_in3 signal as described in *Table 512: Interconnect to the tim_ti1 input multiplexer* for TIM16.

Active power mode

This interconnection is active down to Stop mode. Timers are not active but the count is performed at wake-up.

15.3.8 System errors as break signals to timers

From system errors to timers (TIM1/8/15/16/17).

Purpose

CSS, CPU lockup, SRAM2/3 ECC double errors, SRAM1 parity errors, FLASH ECC double-error detection, and PVD can generate system errors in the form of timer break toward timers (TIM1/8/15/16/17).

The purpose of the break function is to protect power switches driven by PWM signals generated by the timers.

Triggering signals

The possible sources of break are described in:

- *Section 43.3.18: Using the break function* for TIM1/8
- *Section 47.4.15: Using the break function* for TIM15/16/17
- *Table 460: System break interconnect* for TIM1/8
- *Table 516: System break interconnect* for TIM15/16/17

Active power mode

Timers are optionally active in Run and Sleep modes. The effects of low-power modes on TIMx are given in:

- *Table 469: Effect of low-power modes on TIM1/TIM8*
- *Table 488: Effect of low-power modes on TIM2/TIM3/TIM4/TIM5*

- *Table 521: Effect of low-power modes on TIM15/TIM16/TIM17*

15.3.9 Triggers for communication peripherals

From Ethernet to timers (TIM2/TIM3).

Purpose

To synchronize system clock with network, internal connections are available between timers and PTP to check for clock drifts.

Triggering signals

- The outputs (from timer) are directly connected to Ethernet PTP triggers inputs. More details are given in the sections below:
- *Section 63.3: Ethernet pins and internal signals*
- *Table 476: Interconnect to the tim_ti1 input multiplexer*
- *Table 481: Interconnect to the tim_etr input multiplexer*

Active power mode

These interconnections remain active in Run and Sleep modes.

15.3.10 Triggers to GPDMA1/2

From EXTI, RTC (alarm/wake-up), TAMP, timers (TIM2/12/15), low-power timers (LPTIM1/2/3/4/5/6), comparators (COMP1/2), PLAY, EVENTOUT, GPDMA1 transfer complete (gpdma1_chx_tc, gpdma2_chx_tcf) to GPDMA1/2.

Purpose

A GPDMA trigger can be assigned to GPDMA channel x. A programmed GPDMA transfer can be triggered by a rising/falling edge of a selected input trigger event. The trigger mode can also be programmed to condition the LLI link transfer. More details are given in the sections below:

- *Section 16.3.7: GPDMA triggers*
- *Section 16.4.12: GPDMA triggered transfer*
- *GPDMA channel x transfer register 2 (GPDMA_CxTR2)* for more details on:
  - Trigger selection TRIGSEL[5:0] field
  - Trigger mode (LLI) defined by TRIGM[1:0]
  - Trigger polarity as defined by TRIGPOL[1:0]

Triggering signals

GPDMA trigger mapping is specified in *Table 146: Programmed GPDMA1/2 trigger*, according to GPDMA_CxTR2.TRIGSEL[5:0].

Active power mode

This interconnection remains functional in Sleep mode.

Refer to *Section 16.6: GPDMA in low-power modes*

15.3.11 Internal analog signals to analog peripherals

From internal analog source to ADC (ADC1/ADC2/ADC3).

Purpose

The internal reference voltage (V_{REFINT}), the internal temperature sensor (V_{SENSE}), the internal digital core voltage (V_{DDCORE}), and the V_{BAT} monitoring channel are connected to ADC (ADC1/ADC2/ADC3) input channels.

This is according to:

- *Section 28.2: ADC main features*
- *Section 28.4.11: Channel selection (ADC_SQRy, ADC_JSQR)*

15.3.12 Clock source for the DAC sample and hold mode

From LSI/LSE to DAC1.

Purpose

DAC1 can run in Stop mode. The sample and hold block and its associated registers use the LSI or LSE clock source (dac_hold_ck) in Stop mode.

Table 305: DAC internal input/output signals: dac_hold_ck, Input, DAC low-power clock used in sample and hold mode

Active power mode

This feature remains available in Run, Sleep and Stop modes.

15.3.13 Internal tamper sources

From internal peripherals, clocks, or monitoring, to tamper.

Purpose

To detect any abnormal activity or tentative to corrupt the device, embedded tampers alert the system of undesired events. Different actions can be taken as consequence.

The list of tamper sources can be found in *Table 569: TAMP interconnection*.

Active power mode

This interconnection is active in all power modes if the tamper source is activated.

15.3.14 Output from tamper to RTC

From TAMP to RTC.

Purpose

The RTC can timestamp a tamper event to retrieve history of the detection. The RTC can also control GPIOs, and set a signal based on tamp or alarm status outside the MCU.

Refer to *Section 51.3.3: GPIOs controlled by the RTC and TAMP* for more details.

Active power mode

This interconnection remains active in all power modes.

15.3.15 Encryption keys to AES/SAES

From TAMP backup registers, system flash memory to and in between SAES and AES.

Purpose

The encryption mechanism requires an hardware key that must be stored in a protected nonvolatile memory. Different approaches are implemented to load them in a non-readable way. Tamper backup registers or system flash memory can be used to store respectively BHK or RHUK, and to implement a dedicated bus to pass it to the SAES.

Refer to *Section 38.4.14: SAES operation with wrapped keys* for more details.

The AES encryption mechanism (faster than the SAES) can benefit from the sharing key of the SAES. Refer to *Section 38.4.15: SAES operation with shared keys* for more details.

Active power mode

AES and SAES are operating under Run and Sleep modes.

15.3.16 Comparators as inputs, trigger, or break signals to timers1

From comparators to timers (TIM1/2/3/4/5/8/12/15).

Purpose

The comparators (COMP1/2) output values can be connected to timers (TIM1/2/3/4/5/8/12/15) input captures, TIMx_ETR, or timer break signals. The connection to ETR is described in *Section 43.3.6: External trigger input*.

Comparators (COMP1/2) output values can also generate break input signals for timers (such as TIM1 or TIM8).

The sources for the break (tim_brk) channel are one of the following:

- External: connected to one of the TIMx_BKIN pin (as per selection done in the AFIO controller) with polarity selection and optional digital filtering.
- Internal: coming from comparators, tim_brk_cmpx input (refer to *Section 43.3.2: TIM1/TIM8 pins and internal signals* for product specific implementation).

Triggering signals

The tim_etr and tim_brk signals connected TIM1/8 (coming from COMP1/2) are given in:

- tim_etr: external trigger internal input bus. These inputs can be used as trigger, external clock or for hardware cycle-by-cycle pulse width control.
- tim_brk (*Table 458: Timer break interconnect* and *Table 459: Timer break2 interconnect*)
- *Section 43.3.6: External trigger input*
- *Section 43.3.18: Using the break function*

For TIM2/3/4/5, the sources connected to the tim_ti[1:4] input multiplexers coming from comparators and some other peripherals, are given in:

- *Table 476: Interconnect to the tim_ti1 input multiplexer*
- *Table 477: Interconnect to the tim_ti2 input multiplexer*
- *Table 478: Interconnect to the tim_ti3 input multiplexer*
- *Table 479: Interconnect to the tim_ti4 input multiplexer*
- *Table 481: Interconnect to the tim_etr input multiplexer*

For TIM12, the sources connected to timers coming from comparators and other peripherals, are given in:

- *Table 500: Interconnect to the tim_ti1 input multiplexer*
- *Table 500: Interconnect to the tim_ti1 input multiplexer*

For TIM15, the sources connected to timers coming from comparators and other peripherals are given in:

- *Table 512: Interconnect to the tim_ti1 input multiplexer*
- *Table 513: Interconnect to the tim_ti2 input multiplexer*
- *Table 524: TIM15 register map and reset values*

Active power mode

Run, Sleep, and wake-up capability in Stop 0, Stop 1, and Stop 2 modes for trigger sources.

Input and break remain active in the same low-power modes as timer activities, specifically during Run and Sleep modes.

15.3.17 Blanking sources to comparators

From timers (TIM1/2/3/8/15) and low-power timers (LPTIM1/2) to comparators (COMP1/2).

Purpose

Advanced-control timers (TIM1/8), general-purpose timers (TIM2/3/15), and low-power timers (LPTIM1/2) can be used as blanking window input to COMP1/2.

The blanking function is described in *Section 32.3.7: Comparator output blanking function*.

The blanking sources are given in:

- COMP1 control and status register
- COMP2 control and status register

Triggering signals

Timer output signal TIMx_Ocx are the inputs to the blanking source of COMP1/2.

The low-power timer output signal lptimx_ch2 are the input to the blanking source of COMP1.

Active power mode

This feature is available under Run and Sleep modes.

15.3.18 Play as input to timers

From PLAY to TIM1/TIM2/TIM3/TIM8.

Purpose

The PLAY outputs can be connected to the advanced-control timers (TIM1/8) and general-purpose timers (TIM2/3).

Triggering signals

Timer input signals of the timers are connected to the output signals of the PLAY play_out[3:0].

More details for connections are given in:

- *Table 183: PLAY logic array input n signal selection*
- *Table 452: Interconnect to the tim_ti1 input multiplexer*
- *Table 476: Interconnect to the tim_ti1 input multiplexer*
- *Table 458: Timer break interconnect*

Active power mode

These interconnections remain active in Run and Sleep modes.

15.3.19 Clock source to PLAY

MCO1/2 to PLAY

Purpose

Microcontroller output clock (MCO): MCO1/2 can be used as an input to the programmable logic array PLAY.

Triggering signals

MCO1/2 can be connected to the PLAY internal inputs play_in[15:0].

The inputs connections are detailed in *Table 183: PLAY logic array input n signal selection*.

Active power mode

This feature is available under Run and Sleep modes.

15.3.20 Inputs to PLAY

From timers(TIM2/3), low-power timers (LPTIM1/2), comparators (COMP1/2), USART1/2, SPI1/2, and CPU to PLAY.

Purpose

General-purpose timers (TIM2/3), low-power timers (LPTIM1/2), comparators (COMP1/2), USART1/2, SPI1/2, and CPU are connected to PLAY1 inputs.

Triggering signals

The PLAY inputs play_in[15:0] are connected to the timers (TIM2/3), low-power timers (LPTIM1/2), comparators(COMP1/2), USART1/2, SPI1/2, and CPU.

The input connections are detailed in *Table 183: PLAY logic array input n signal selection*.

Active power mode

This feature is available under Run and Sleep modes. It is also available under Stop mode for the low-power timers (LPTIM1/2), the comparators (COMP1/2), USART1/2, SPI1/2, except for the general-purpose timers (TIM2/3), and CPU.

15.3.21 Triggers to DTS

From EXTI, low-power timers (LPTIM1/2) and PLAY to DTS.

Purpose

A temperature measurement can be triggered either by software, by low-power timers, by PLAY, or by an external event.

Triggering signals

The input triggering signals and the description of the interconnection between DTS, PLAY and low-power timers, are given in *Table 299: Trigger configuration*.

16 General purpose direct memory access controller (GPDMA)

16.1 GPDMA introduction

The general purpose direct memory access (GPDMA) controller is a bus master and system peripheral.

The GPDMA is used to perform programmable data transfers between memory-mapped peripherals and/or memories via linked-lists, upon the control of an off-loaded CPU.

16.2 GPDMA main features

- Dual bidirectional AHB master
- Memory-mapped data transfers from a source to a destination:
  - Peripheral-to-memory
  - Memory-to-peripheral
  - Memory-to-memory
  - Peripheral-to-peripheral

  Transfer arbitration based on a 4-grade programmed priority at channel level:
  - One high-priority traffic class, for time-sensitive channels (queue 3)
  - Three low-priority traffic classes, with a weighted round-robin allocation for non time-sensitive channels (queues 0, 1, 2)
- Per channel event generation, on any of the following events: transfer complete, half-transfer complete, data transfer error, user setting error, link transfer error, completed suspension, and trigger overrun
- Per channel interrupt generation, with separately programmed interrupt enable per event
- 8 concurrent GPDMA channels:
  - Per channel FIFO for queuing source and destination transfers (see *Section 16.3.2*)
  - Intra-channel GPDMA transfers chaining via programmable linked-list into memory, supporting two execution modes: run-to-completion and link step mode
  - Intra-channel and inter-channel GPDMA transfers chaining via programmable GPDMA input triggers connection to GPDMA task completion events
- Per linked-list item within a channel:
  - Separately programmed source and destination transfers
  - Programmable data handling between source and destination: byte-based reordering, packing or unpacking, padding or truncation, sign extension and left/right realignment
  - Programmable number of data bytes to be transferred from the source, defining the block level
  - Linear source and destination addressing: either fixed or contiguously incremented addressing, programmed at a block level, between successive burst transfers

  - 2D source and destination addressing: programmable signed address offsets between successive burst transfers (non-contiguous addressing within a block, combined with programmable signed address offsets between successive blocks, at a second 2D/repeated block level, for a reduced set of channels (see *Section 16.3.2*)
  - Support for scatter-gather (multi-buffer transfers), data interleaving and deinterleaving via 2D addressing
  - Programmable GPDMA request and trigger selection
  - Programmable GPDMA half-transfer and transfer complete events generation
  - Pointer to the next linked-list item and its data structure in memory, with automatic update of the GPDMA linked-list control registers
  - Channel abort and restart
- Debug:
  - Channel suspend and resume support
  - Channel status reporting, including FIFO level, and event flags
- TrustZone support:
  - Support for secure and nonsecure GPDMA transfers, independently at a first channel level, and independently at a source/destination and link sublevels
  - Secure and nonsecure interrupts reporting, resulting from any of the respectively secure and nonsecure channels
  - TrustZone-aware AHB slave port, protecting any GPDMA secure resource (register, register field) from a nonsecure access
- Privileged/unprivileged support:
  - Support for privileged and unprivileged GPDMA transfers, independently at a channel level
  - Privileged-aware AHB slave port

16.3 GPDMA implementation

16.3.1 GPDMA instances

There are two instances of the GPDMA in the devices, named as GPDMA1 and GPDMA2.

Each GPDMA instance has the same channel-based implementation and is connected to the same requests and triggers, as detailed in the following sub-sections.

16.3.2 GPDMA channels

A given GPDMA channel x is implemented with the following features and intended usage. To make the best use of the GPDMA performances, the table below lists some general recommendations, allowing the user to select and allocate a channel, given its implemented FIFO size and the requested GPDMA transfer.

Table 140. GPDMA1/2 channel implementation

Channel x	Hardware parameters		Features
	dma_fifo_size[x]	dma_addressing[x]	
x = 0 to 3	2	0	Channel x (x = 0 to 3) is implemented with: – a FIFO of 8 bytes, 2 words – fixed/contiguously incremented addressing These channels must be typically allocated for GPDMA transfers between an APB or AHB peripheral and SRAM.
x = 4 to 5	4	0	Channel x (x = 4 to 5) is implemented with: – a FIFO of 32 bytes, 8 words – fixed/contiguously incremented addressing These channels may be used for GPDMA transfers between a demanding AHB peripheral and SRAM, or for transfers from/to external memories.
x = 6 to 7	4	1	Channel x (x = 6 to 7) is implemented with: – a FIFO of 32 bytes, 8 words – 2D addressing These channels may be used for GPDMA transfers between a demanding AHB peripheral and SRAM, or for transfers from/to external memories.

16.3.3 GPDMA in low-power modes

The GPDMA wake-up feature is implemented in the device low-power modes as per the table below.

Table 141. GPDMA1/2 wake-up in low-power modes

Feature	Low-power modes
Wake-up	GPDMA1/2 in Sleep mode

16.3.4 GPDMA requests

A GPDMA request from a peripheral can be assigned to a GPDMA channel x, via REQSEL[7:0] in GPDMA_CxTR2, provided that SWREQ = 0.

The GPDMA requests mapping is specified in the table below.

Table 142. Programmed GPDMA1/2 request

1. Not available in STM32H523/533xx devices.
2. Not available in STM32H523/533xx and STM32H543/553xx devices.

3. Depends on which exclusive function is used.
4. Not available in STM32H543/553xx devices.
5. Not available in STM32H562/563/573xx devices.
6. Available only on STM32H543/553xx devices.

16.3.5 GPDMA block requests

Some GPDMA requests must be programmed as a block request, and not as a burst request. Then BREQ in GPDMA_CxTR2 must be set for a correct GPDMA execution of the requested peripheral transfer at the hardware level.

Table 143. Programmed GPDMA1/2 request as a block request

16.3.6 GPDMA channels with peripheral early termination

A GPDMA channel, if implemented with this feature, can support the early termination of the data transfer from the peripheral which does also support this feature.

Table 144. GPDMA1/2 channel with peripheral early termination

GPDMA channel x with peripheral early termination
x = 0 and x = 7

This GPDMA support is activated when the channel x is programmed with GPDMA_CxTR2.PFREQ = 1. Then, the peripheral itself can initiate and request a data transfer completion, before the GPDMA has transferred the whole block (see *Section 16.4.14* for more details).

16.3.7 GPDMA triggers

A GPDMA trigger can be assigned to a GPDMA channel x, via TRIGSEL[5:0] in GPDMA_CxTR2, provided that TRIGPOL[1:0] defines a rising or a falling edge of the selected trigger (TRIGPOL[1:0] = 01 or TRIGPOL[1:0] = 10).

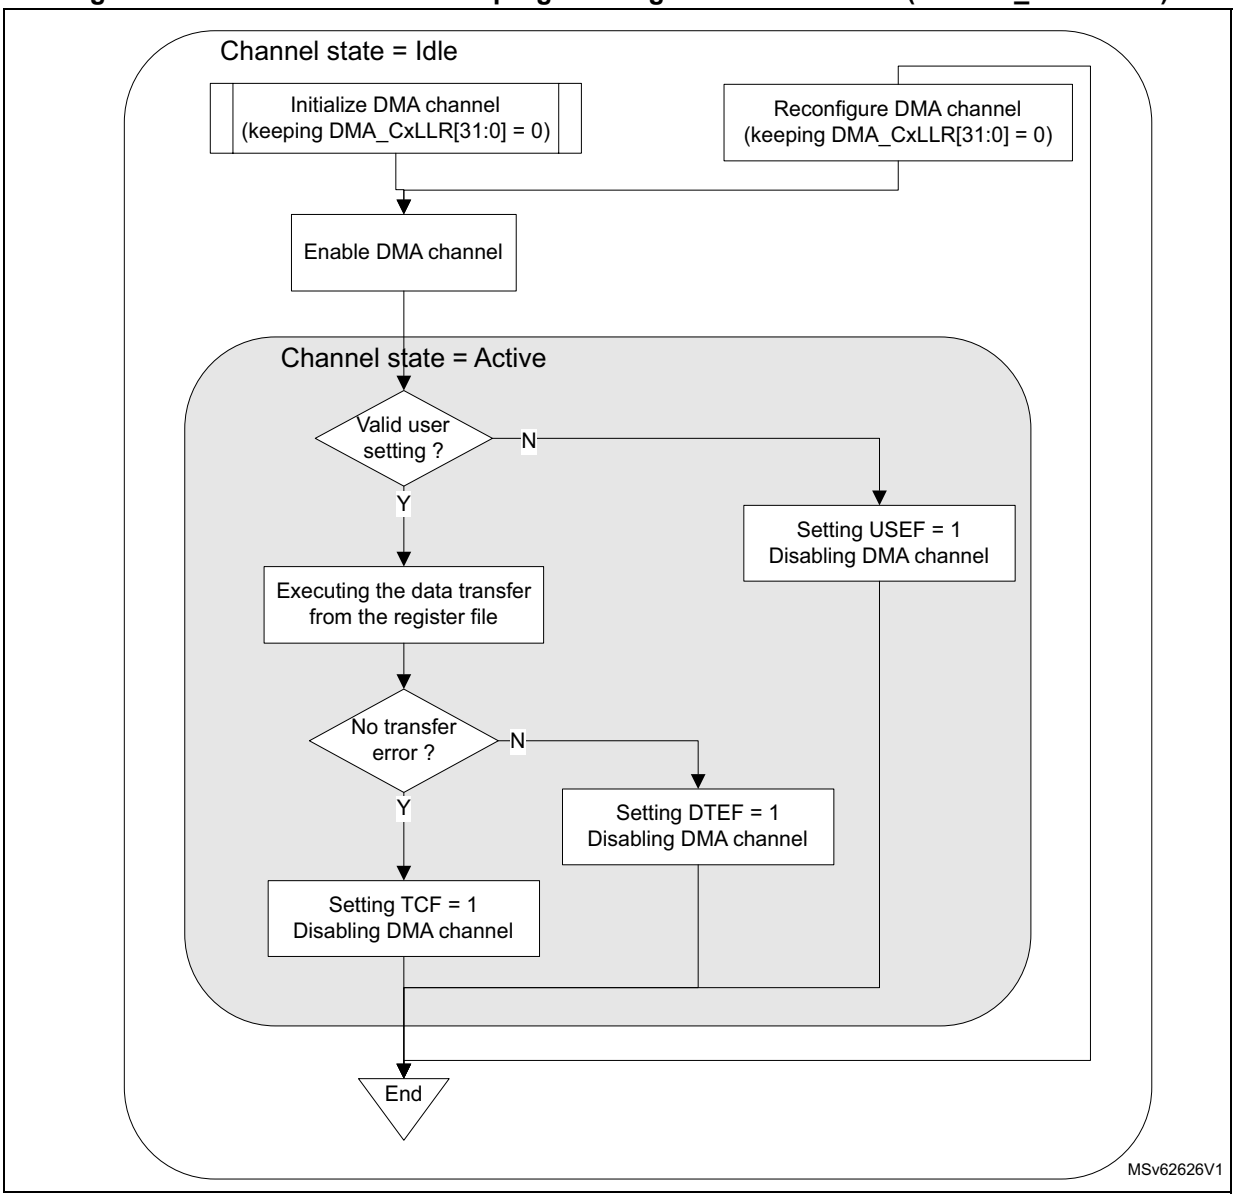
16.4 GPDMA functional description

16.4.1 GPDMA block diagram

Figure 75. GPDMA block diagram



16.4.2 GPDMA channel state and direct programming without any linked-list

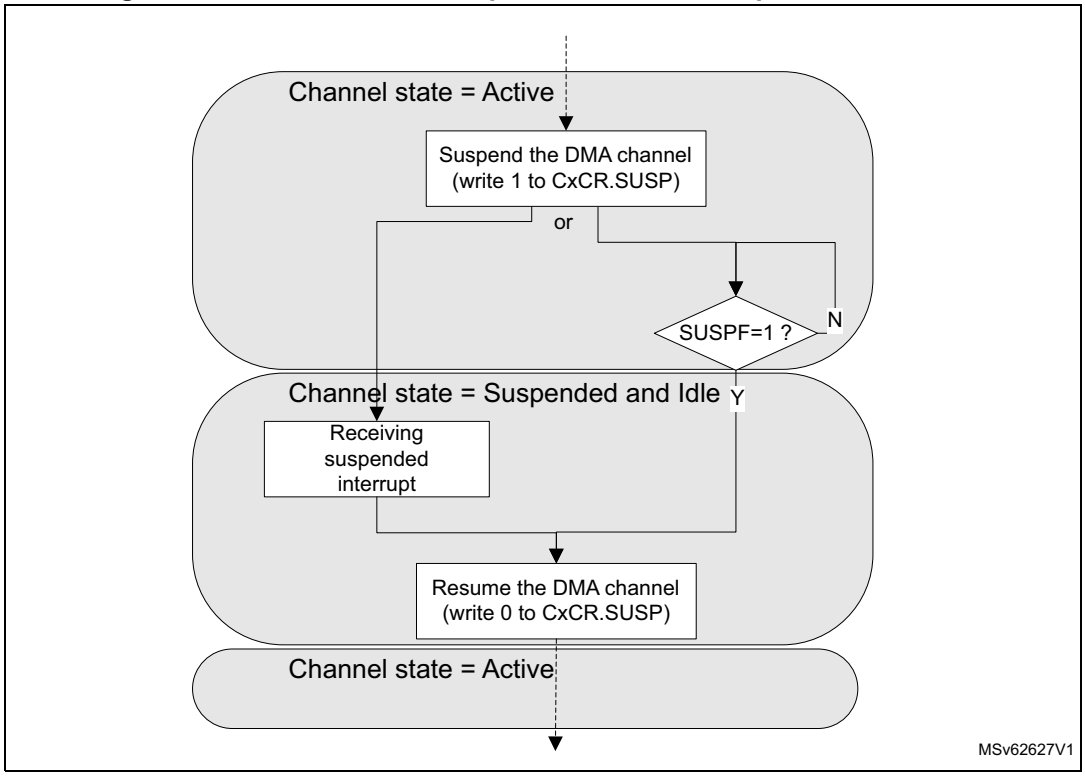
After a GPDMA reset, a GPDMA channel x is in idle state. When the software writes 1 in GPDMA_CxCR.EN, the channel takes into account the value of the different channel configuration registers (GPDMA_CxXXX), switches to the active/non-idle state and starts to execute the corresponding requested data transfers.

After enabling/starting a GPDMA channel transfer by writing 1 in GPDMA_CxCR.EN, a GPDMA channel interrupt on a complete transfer notifies the software that the GPDMA channel is back in idle state (EN is then deasserted by hardware) and that the channel is ready to be reconfigured then enabled again.

Figure 76 illustrates this GPDMA direct programming without any linked-list (GPDMA_CxLLR = 0).

Figure 76. GPDMA channel direct programming without linked-list (GPDMA_CxLLR = 0)

16.4.3 GPDMA channel suspend and resume



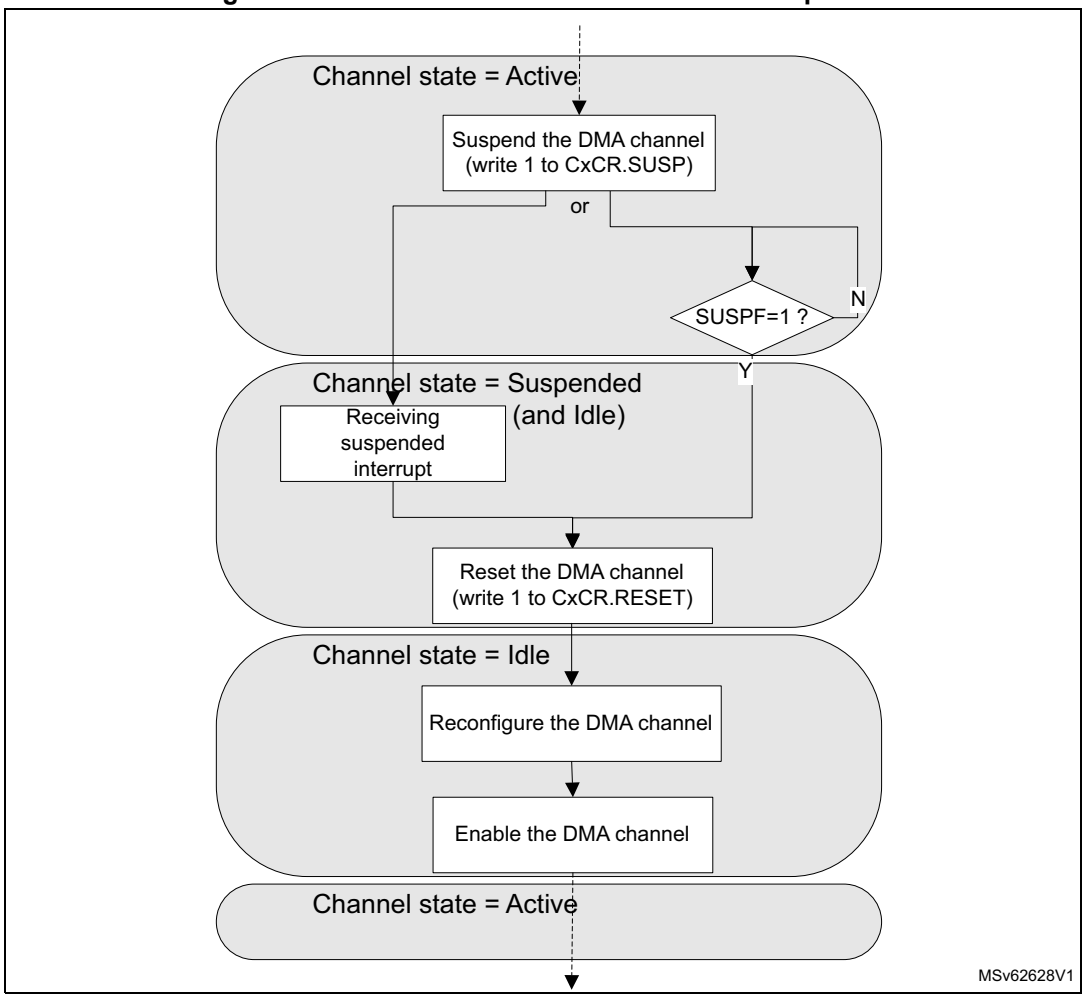
The software can suspend on its own a channel still active, with the following sequence:

1. The software writes 1 into the GPDMA_CxCR.SUSP bit.
2. The software polls the suspended flag GPDMA_CxSR.SUSPF until SUSPF = 1, or waits for an interrupt previously enabled by writing 1 to GPDMA_CxCR.SUSPIE. Wait for the channel to be effectively in suspended state means wait for the completion of any ongoing GPDMA transfer over its master ports. Then the software can observe, in a steady state, any read register or register field that is hardware modifiable.

Note: An ongoing GPDMA transfer can be a data transfer (a source/destination burst transfer) or a link transfer for the internal update of the linked-list register file from the next linked-list item.

3. The software safely resumes the suspended channel by writing 0 to GPDMA_CxCR.SUSP.

Figure 77. GPDMA channel suspend and resume sequence



Note: A suspend and resume sequence does not impact the GPDMA_CxCR.EN bit. Suspending a channel (transfer) does not suspend a started trigger detection.

16.4.4 GPDMA channel abort and restart

Alternatively, like for aborting a continuous GPDMA transfer with a circular buffering or a double buffering, the software can abort, on its own, a still active channel with the following sequence:

1. The software writes 1 into the GPDMA_CxCR.SUSP bit.
2. The software polls suspended flag GPDMA_CxSR.SUSPF until SUSPF = 1, or waits for an interrupt previously enabled by writing 1 to GPDMA_CxCR.SUSPIE. Wait for the channel to be effectively in suspended state means wait for the completion of any ongoing GPDMA transfer over its master port.
3. The software resets the channel by writing 1 to GPDMA_CxCR.RESET. This causes the reset of the FIFO, the reset of the channel internal state, the reset of the GPDMA_CxCR.EN bit, and the reset of the GPDMA_CxCR.SUSP bit.
4. The software safely reconfigures the channel. The software must reprogram the hardware-modified GPDMA_CxBR1, GPDMA_CxSAR, and GPDMA_CxDAR registers.
5. In order to restart the aborted then reprogrammed channel, the software enables it again by writing 1 to the GPDMA_CxCR.EN bit.

Figure 78. GPDMA channel abort and restart sequence

16.4.5 GPDMA linked-list data structure

Alternatively to the direct programming mode, a channel can be programmed by a list of transfers, known as a list of linked-list items (LLI). Each LLI is defined by its data structure.

The base address in memory of the data structure of a next LLI_{n+1} of a channel x is the sum of the following:

- the link base address of the channel x (in GPDMA_CxLBAR)
- the link address offset (LA[15:2] field in GPDMA_CxLLR). The linked-list register GPDMA_CxLLR is the updated result from the data structure of the previous LLIn of the channel x.

The data structure for each LLI may be specific.

A linked-list data structure is addressed following the value of the following UT1, UT2, UB1, USA, UDA, UT3 and UB2 if present, and ULL bits in GPDMA_CxLLR.

In linked-list mode, each GPDMA linked-list register (GPDMA_CxTR1, GPDMA_CxTR2, GPDMA_CxBR1, GPDMA_CxSAR, GPDMA_CxDAR, GPDMA_CxTR3 and GPDMA_CxBR2 if present, and GPDMA_CxLLR) is conditionally and automatically updated from the next linked-list data structure in the memory, following the current value of the

GPDMA_CxLLR register that was conditionally updated from the linked-list data structure of the previous LLI.

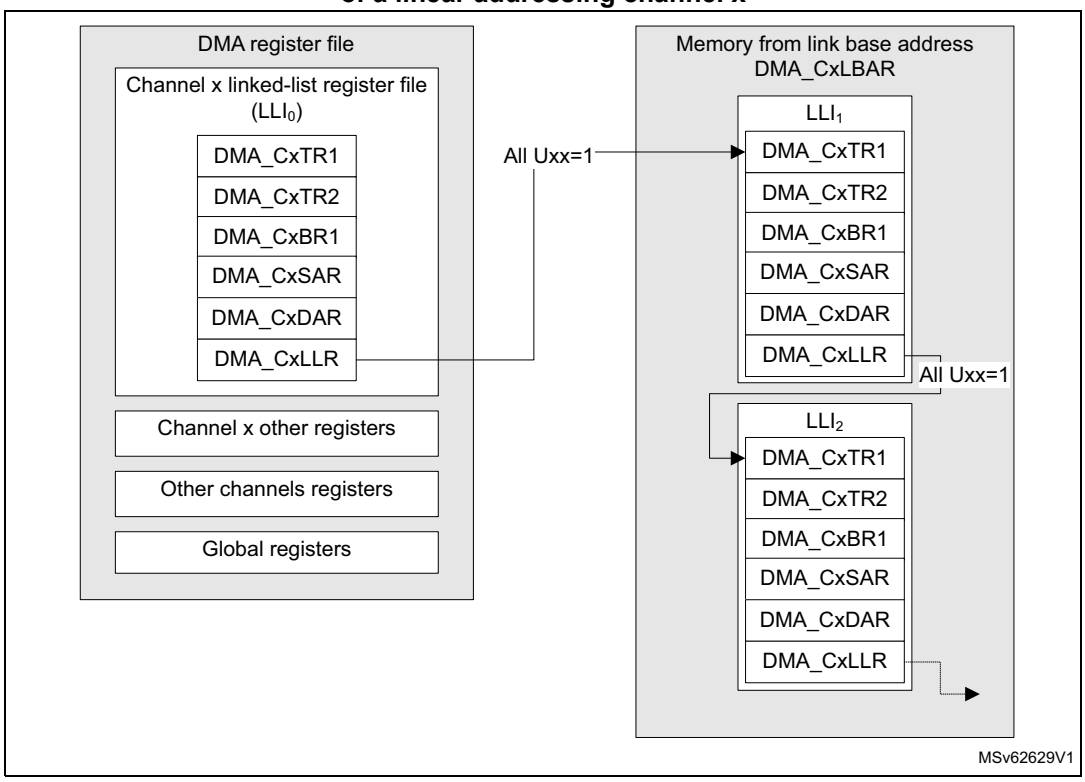
Caution: The user must program the pointer to the next linked-list data structure (GPDMA_CxLLR[15:0]) not to exceed the 64-Kbyte addressable space defined by the link base address register (GPDMA_CxLBAR). The complete linked-list data structure must be included in the 64-Kbyte addressable space.

Static linked-list data structure

For example, when the update bits (UT1, UT2, UB1, USA, UDA, plus UB2 and UT3 if present, and ULL) in GPDMA_CxLLR are all asserted, the linked-list data structure in the memory is maximal with:

- channel x (x = 0 to 5) contiguous 32-bit locations, including GPDMA_CxTR1, GPDMA_CxTR2, GPDMA_CxBR1, GPDMA_CxSAR, GPDMA_CxDAR and GPDMA_CxLLR (see *Figure 79*) and including the first linked-list register file (LLI_0) and the next LLIs (such as LLI_1, LLI_2) in the memory
- channel x (x = 6 to 7), contiguous 32-bit locations, including GPDMA_CxTR1, GPDMA_CxTR2, GPDMA_CxBR1, GPDMA_CxSAR, GPDMA_CxDAR, GPDMA_CxTR3, GPDMA_CxBR2 and GPDMA_CxLLR, (see *Figure 80*), and including the first linked-list register file (LLI_0) and the next LLIs (such as LLI_1, LLI_2) in the memory

Figure 79. Static linked-list data structure (all Uxx = 1) of a linear addressing channel x



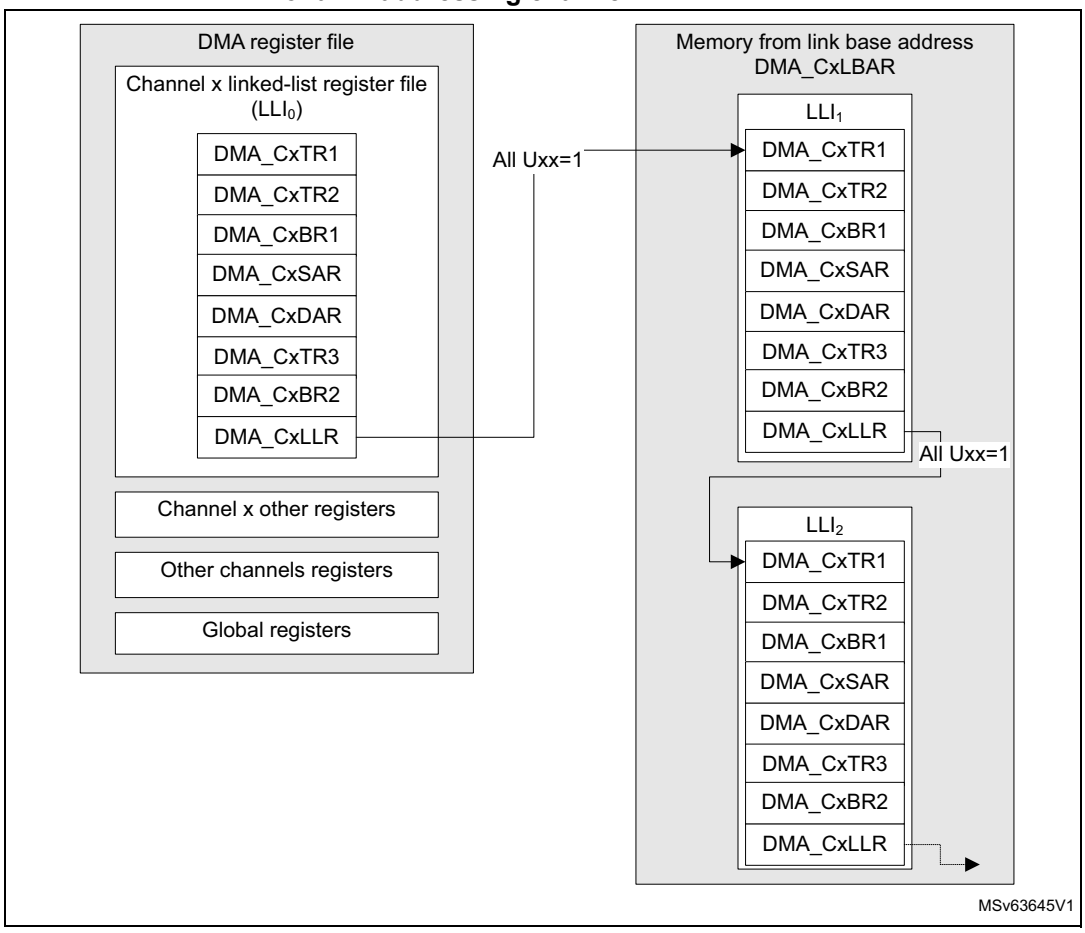


Figure 80. Static linked-list data structure (all Uxx = 1) of a 2D addressing channel x

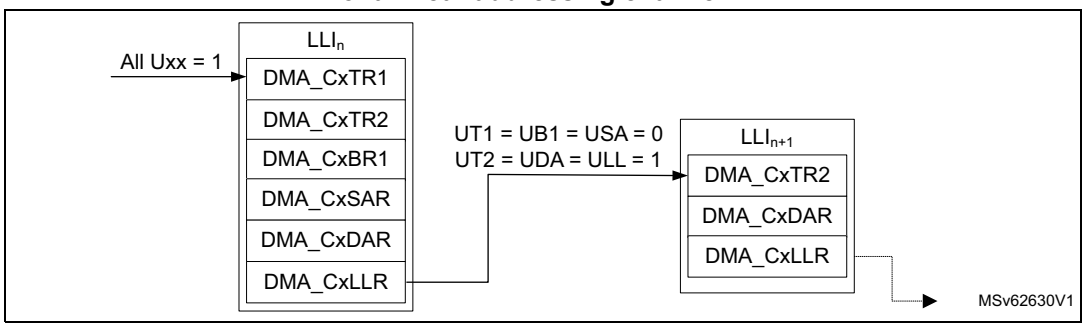
Dynamic linked-list data structure

Alternatively, the memory organization for the full list of LLIs can be compacted with specific data structure for each LLI.

If UT1 = 0 and UT2 = 1, the link address offset of the register GPDMA_CxLLR is pointing to the updated value of the GPDMA_CxTR2 instead of the GPDMA_CxTR1 which is not to be modified (see *Figure 81*).

Example: if UT1 = UB1 = USA = 0 and if UT3 = UB2 = 0, when channel x is with 2D addressing, and if UT2 = UDA = ULL = 1, the next LLI does not contain an (updated) value for GPDMA_CxTR1, nor GPDMA_CxBR1, nor GPDMA_CxSAR, nor GPDMA_CxTR3, nor GPDMA_CxBR2 when channel x is with 2D addressing. The next LLI contains an updated value for GPDMA_CxTR2, GPDMA_CxDAR, and GPDMA_CxLLR, as shown in *Figure 82*.

Figure 81. GPDMA dynamic linked-list data structure of a linear addressing channel x



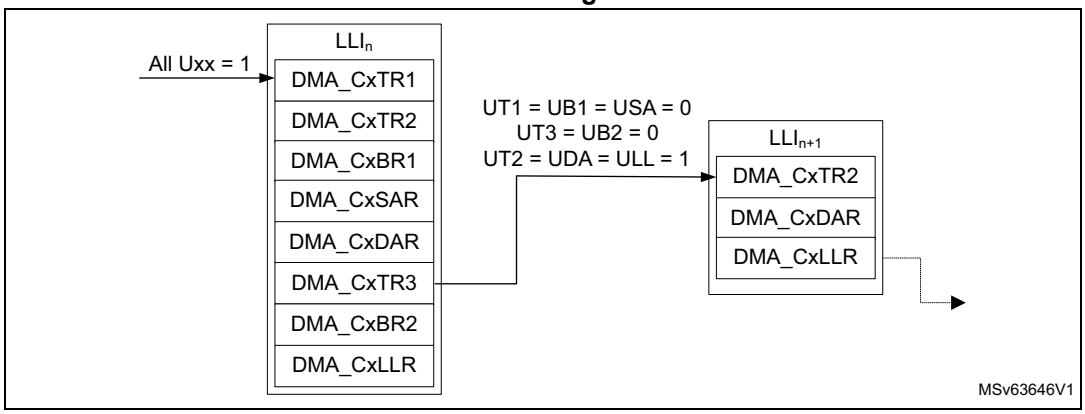


Figure 82. GPDMA dynamic linked-list data structure of a 2D addressing channel x

16.4.6 Linked-list item transfer execution

A LLI_n transfer is the sequence of:

1. a data transfer: GPDMA executes the data transfer as described by the GPDMA internal register file (this data transfer can be void/null for LLI_0)
2. a conditional link transfer: GPDMA automatically and conditionally updates its internal register file by the data structure of the next LLI_{n+1}, as defined by the GPDMA_CxLLR value of the LLI_n.

Note: The initial data transfer as defined by the internal register file (LLI_0) can be null (GPDMA_CxBR1.BNDT[15:0] = 0 and GPDMA_CxTR2.PFREQ = 0) provided that the conditional update bit UB1 in GPDMA_CxLLR is set (meaning there is a non-null data transfer described by the next LLI_1 in the memory to be executed).

Depending on the intended GPDMA usage, a GPDMA channel x can be executed as described by the full linked-list (run-to-completion mode, GPDMA_CxCR.LSM = 0) or a GPDMA channel x can be programmed for a single execution of a LLI (link step mode, GPDMA_CxCR.LSM = 1), as described in the next sections.

16.4.7 GPDMA channel state and linked-list programming in run-to-completion mode

When GPDMA_CxCR.LSM = 0 (in full list execution mode, execution of the full sequence of LLIs, named run-to-completion mode), a GPDMA channel x is initially programmed, started

by writing 1 to GPDMA_CxCR.EN, and after completed at channel level. The channel transfer is:

- configured with at least the following:
  - the first LLI_0, internal linked-list register file: GPDMA_CxTR1, GPDMA_CxTR2, GPDMA_CxBR1, GPDMA_CxSAR, GPDMA_CxDAR, and GPDMA_CxLLR, plus GPDMA_CxTR3 and GPDMA_CxBR2
  - the last LLI_N, described by the linked-list data structure in memory, as defined by the GPDMA_CxLLR reflecting the before last LLI_{N-1}
- completed when GPDMA_CxLLR[31:0] = 0, GPDMA_CxBR1.BRC[10:0] = 0, and GPDMA_CxBR1.BNDT[15:0] = 0, at the end of the last LLI_{N-1} transfer

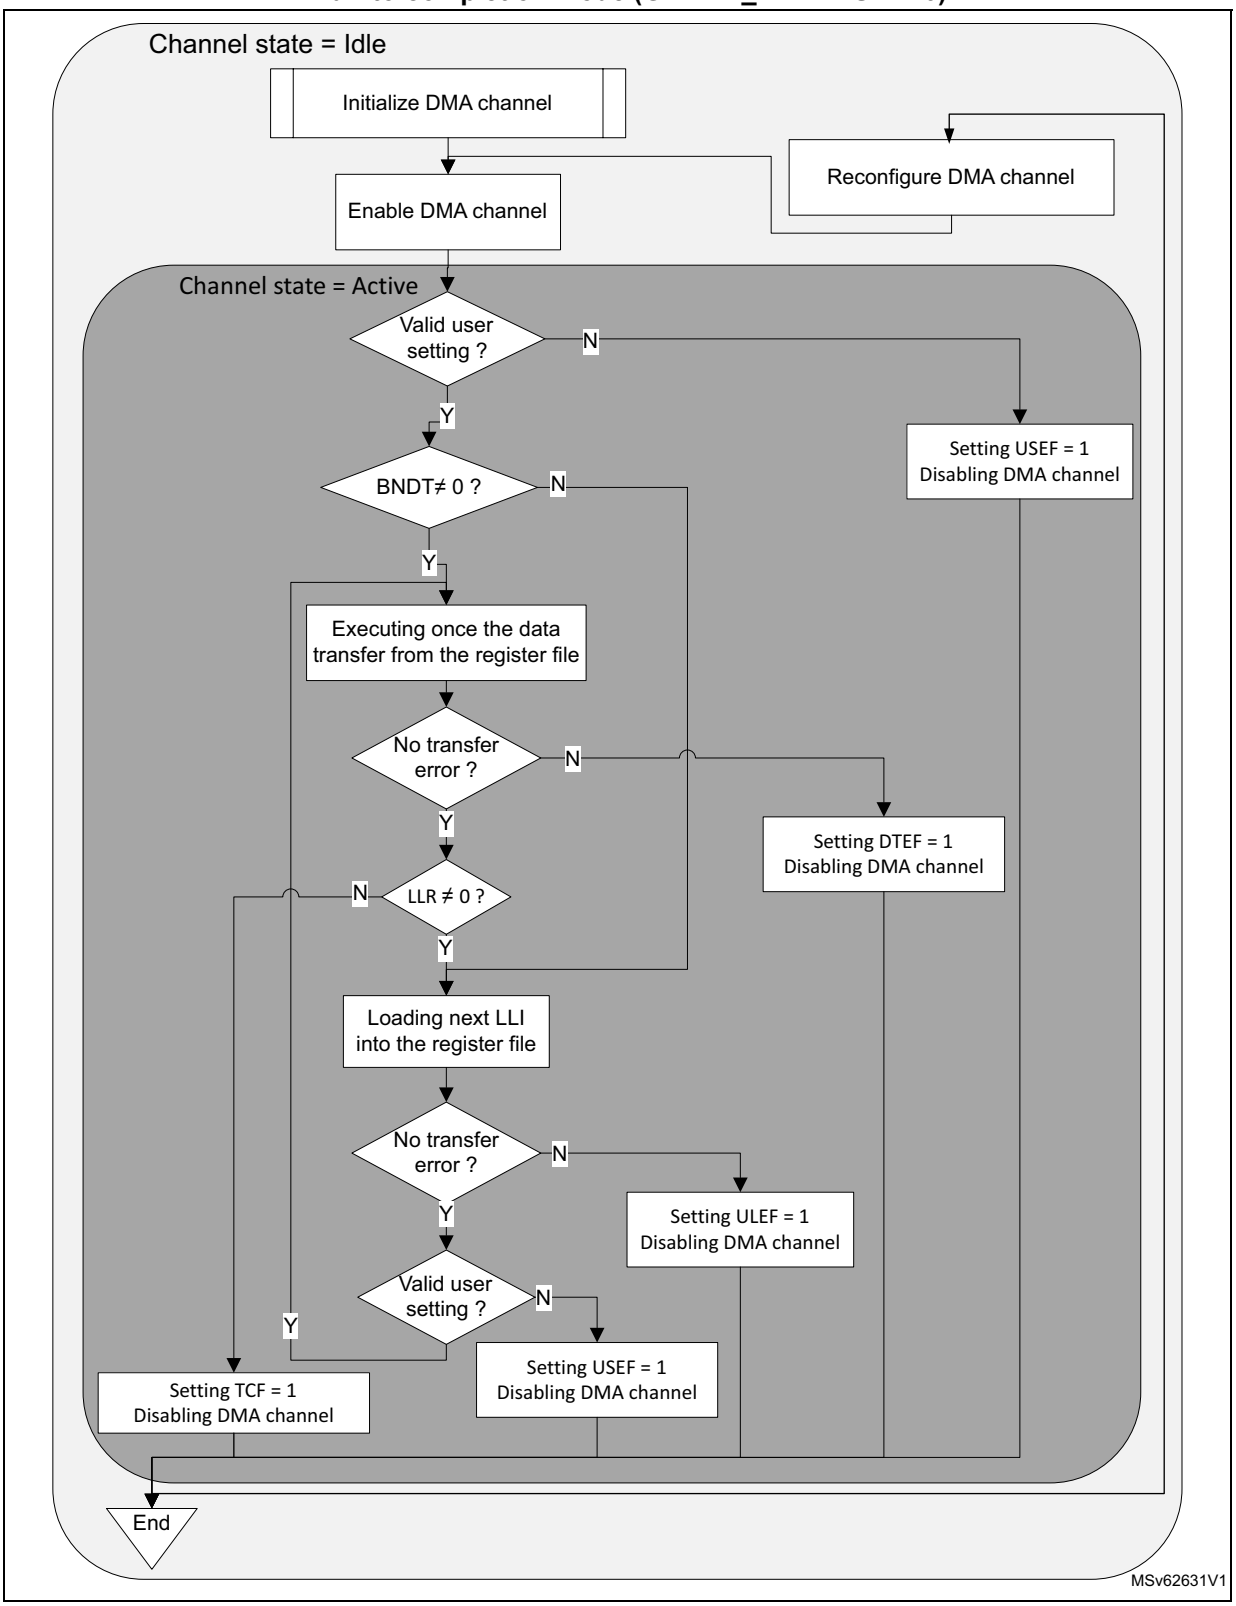
GPDMA_CxLLR[31:0] = 0 is the condition of a linked-list based channel completion and means the following:

- The 16 low significant bits GPDMA_CxLLR.LA[15:0] of the next link address are null.
- All the update bits GPDMA_CxLLR.Uxx are null (UT1, UT2, UB1, USA, UDA and ULL, plus UB2 and UT3).

The channel may never be completed when GPDMA_CxLLR.LSM = 0:

- If the last LLI_N is recursive, pointing to itself as a next LLI:
  - either GPDMA_CxLLR.ULL = 1 and GPDMA_CxLLR.LA[15:2] is updated with the same value
  - or GPDMA_CxLLR.ULL = 0
- If LLI_N is pointing to a previous LLI

In the regular data transfer completion at a block level, GPDMA_CxBR1.BNDT[15:0] = 0 and GPDMA_CxBR1.BRC[10:0] = 0 (if present). Alternatively, a block transfer may be early completed by a peripheral (such as an I3C in Rx mode), and then BNDT[15:0] is not null (see *Section 16.4.14* for more details).



In typical run-to-completion mode, allocation of an GPDMA channel, including detailed programming, occurs once during GPDMA initialization. This process reserves a data communication link and GPDMA service during run-time for repeated transfers, such as transfers from a peripheral to memory, from memory to a peripheral, or memory-to-memory transfers. The reserved data communication link may consist of a dedicated channel, or the channel may be shared. A repeated transfer consists of a sequence of linked list items (LLIs).

Figure 83 depicts the GPDMA channel execution and its registers programming in run-to-completion mode.

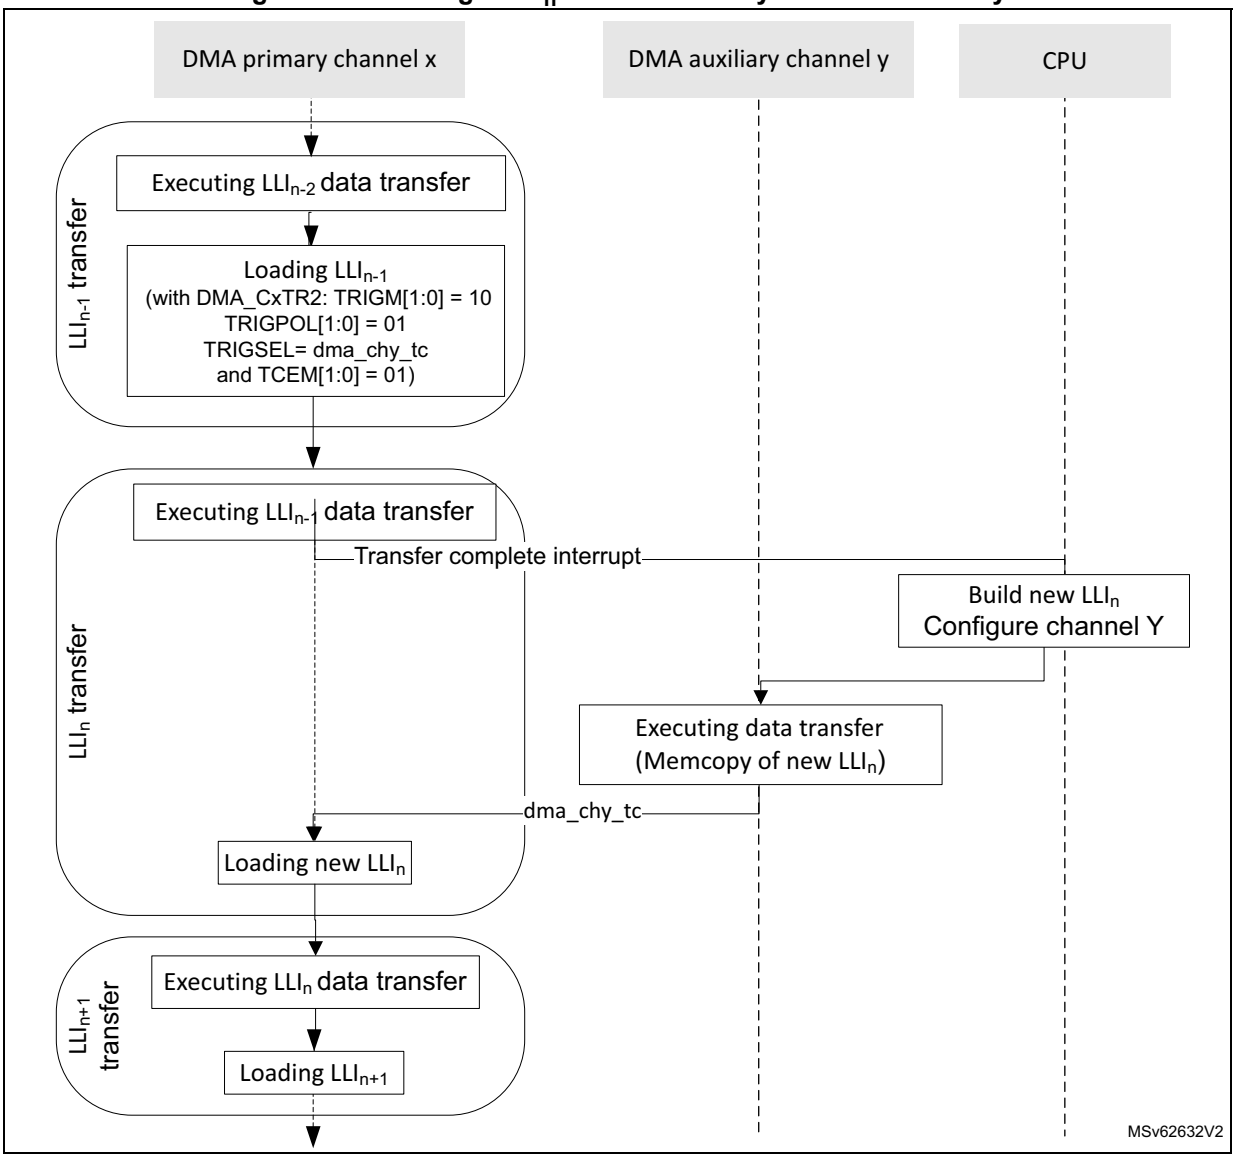
Note: Figure 83 is not intended to illustrate how often a TCEF can be raised, depending on the programmed value of TCEM[1:0] in GPDMA_CxTR2. It can be raised at (each) block completion, at (each) 2D block completion, at (each) LLI completion, or only at channel completion. In run-to-completion mode, whatever is the value of TCEM[1:0], at the channel completion, the hardware always set TCEF = 1 and disables the channel.

In Figure 83, BNDT ≠ 0 is the typical condition for starting the first data transfer in this figure. This condition becomes (BNDT ≠ 0 and PFREQ = 1) if the peripheral requests a data transfer with early termination (see Section 16.3.6).

Figure 83. GPDMA channel execution and linked-list programming in run-to-completion mode (GPDMA_CxCR.LSM = 0)

Run-time inserting a LLI_n via an auxiliary channel, in run-to-completion mode

The start of the link transfer of the LLI_{n-1} (start of the LLI_n loading) can be conditioned by the occurrence of a trigger, when programming the following fields of the GPDMA_CxTR2 in the data structure of the LLI_{n-1}:



- TRIGM[1:0] = 10 (link transfer triggering mode)
- TRIGPOL[1:0] = 01 or 10 (rising or falling edge)
- TRIGSEL[5:0] (see *Section 16.3.7* for the trigger selection details)

Another auxiliary channel y can be used to store the channel x LLI_n in the memory and to generate a transfer complete event gpdma_chy_tc. By selecting this event as the input trigger of the link transfer of the LLI_{n-1} of the channel x, the software can pause the primary channel x after its LLI_{n-1} data transfer, until it is indeed written the LLI_n.

Figure 84 depicts such a dynamic elaboration of a linked-list of a primary channel x, via another auxiliary channel y.

Caution: This use case is restricted to an application with a LLI_{n-1} data transfer that does not need a trigger. The triggering mode of this LLI_{n-1} is used to load the next LLI_n.

Figure 84. Inserting a LLI_n with an auxiliary GPDMA channel y

16.4.8 GPDMA channel state and linked-list programming in link step mode

When GPDMA_CxCR.LSM = 1 (in link step execution mode, single execution of one LLI), a channel transfer is executed and completed after each single execution of a LLI, including its (conditional) data transfer and its (conditional) link transfer.

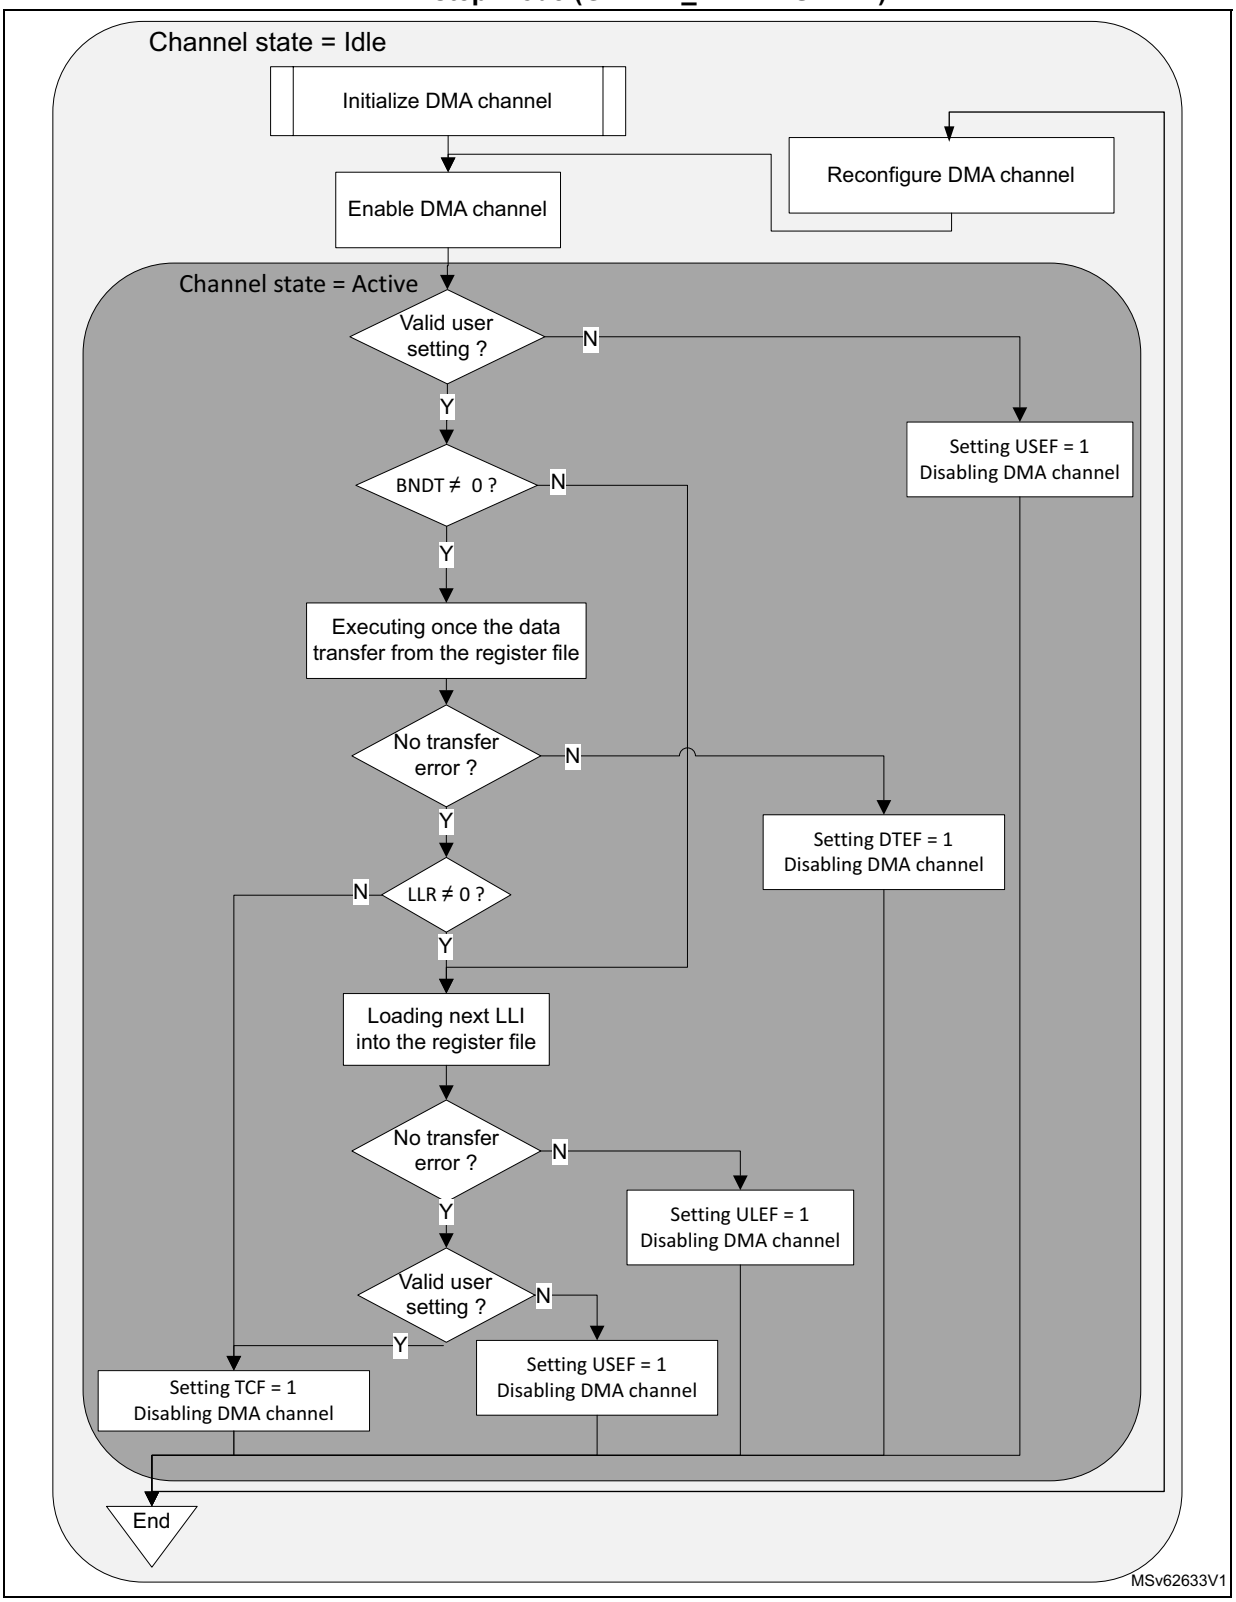
A GPDMA channel transfer can be programmed at LLI level, started by writing 1 into GPDMA_CxCR.EN, and after completed at LLI level:

- The current LLI_n transfer is described with:
  - GPDMA_CxTR1 defines the source/destination elementary single/burst transfers.
  - GPDMA_CxBR1 defines the number of bytes at a block level (BNDT[15:0]) and, for channel x (x = 6 to 7), the number of blocks at a 2D/repeated block level (BRC[10:0]+1) and the incrementing/decrementing mode for address offsets.

  - GPDMA_CxTR2 defines the input control (request, trigger) and the output control (transfer complete event) of the transfer.
  - GPDMA_CxSAR/GPDMA_CxDAR define the source/destination transfer start address.
  - GPDMA_CxTR3 for channel x (x = 6 to 7) defines the source/destination additional address offset between burst transfers.
  - GPDMA_CxBR2 for channel x (x = 6 to 7) defines the source/destination additional address offset between blocks at a 2D/repeated block level.
  - GPDMA_CxLLR defines the data structure and the address offset of the next LLI_{n+1} in the memory.
- The current LLI_n transfer is completed after the single execution of the current LLI_n:
  - after the (conditional) data transfer completion (when GPDMA_CxBR1.BRC[10:0] = 0, and GPDMA_CxBR1.BNDT[15:0] = 0
  - after the (conditional) update of the GPDMA link register file from the data structure of the next LLI_{n+1} in memory

Note: If a LLI is recursive (pointing to itself as a next LLI, either GPDMA_CxLLR.ULL = 1 and GPDMA_CxLLR.LA[15:2] is updated with the same value, or GPDMA_CxLLR.ULL = 0), a channel in link step mode is completed after each repeated single execution of this LLI.

In the regular data transfer completion at a block level, GPDMA_CxBR1.BNDT[15:0] = 0 and GPDMA_CxBR1.BRC[10:0] = 0. Alternatively, a block transfer may be early completed by a peripheral (such as an I3C in Rx mode), and then BNDT[15:0] is not null (see *Section 16.4.14* for more details).



The link step mode can be used to elaborate dynamically LLIs in memory during run-time. The software can be facilitated by using a static data structure for any LLI_n (all update bits of GPDMA_CxLLR have a static value, LLI_n.LLR.LA = LLI_{n-1}.LLR.LA + constant).

Figure 85 depicts the GPDMA channel execution mode, and its programming in link step mode.

Note: Figure 85 is not intended to illustrate how often a TCEF can be raised, depending on the programmed value of TCEM[1:0] in GPDMA_CxTR2. It can be raised at (each) block completion, at (each) 2D block completion, at (each) LLI completion, or only at the last LLI data transfer completion. In link step mode, the channel is disabled after each single execution of a LLI, and depending on the value of TCEM[1:0] a TCEF is raised or not.

In Figure 85, BNDT ≠ 0 is the typical condition for starting the first data transfer. This condition becomes (BNDT ≠ 0 and PFREQ = 1) if the peripheral requests a data transfer with early termination (see Section 16.3.6).

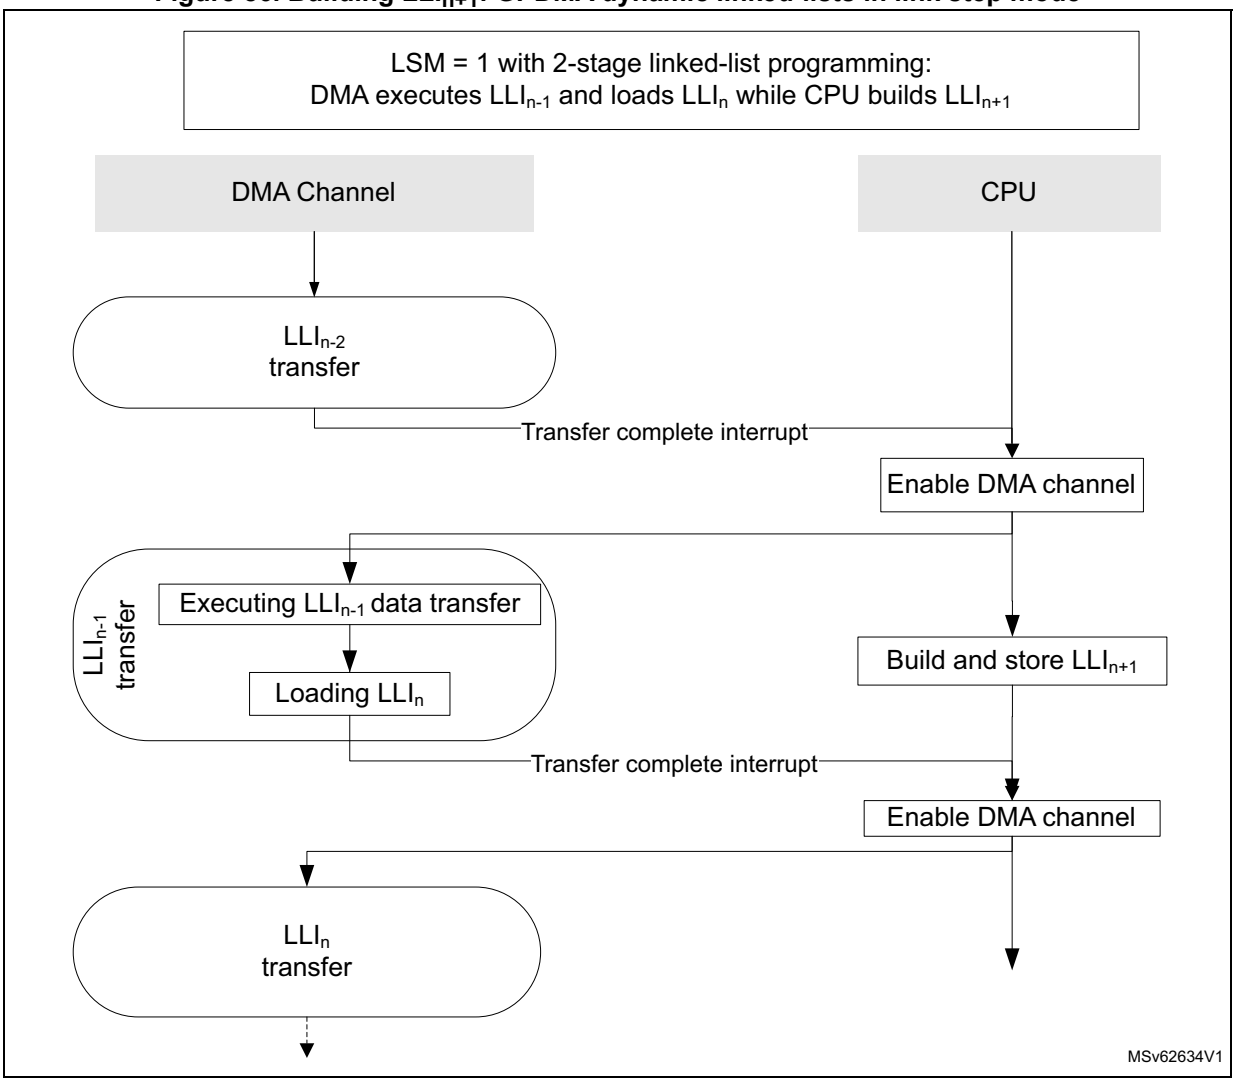


Figure 85. GPDMA channel execution and linked-list programming in link step mode (GPDMA_CxCR.LSM = 1)

Run-time adding a LLI_{n+1} in link step mode

During run-time, the software can defer the elaboration of the LLI_{n+1} (and next LLIs), until/after GPDMA executed the transfer from the LLI_{n-1} and loaded the LLI_n from the memory, as shown in *Figure 86*.

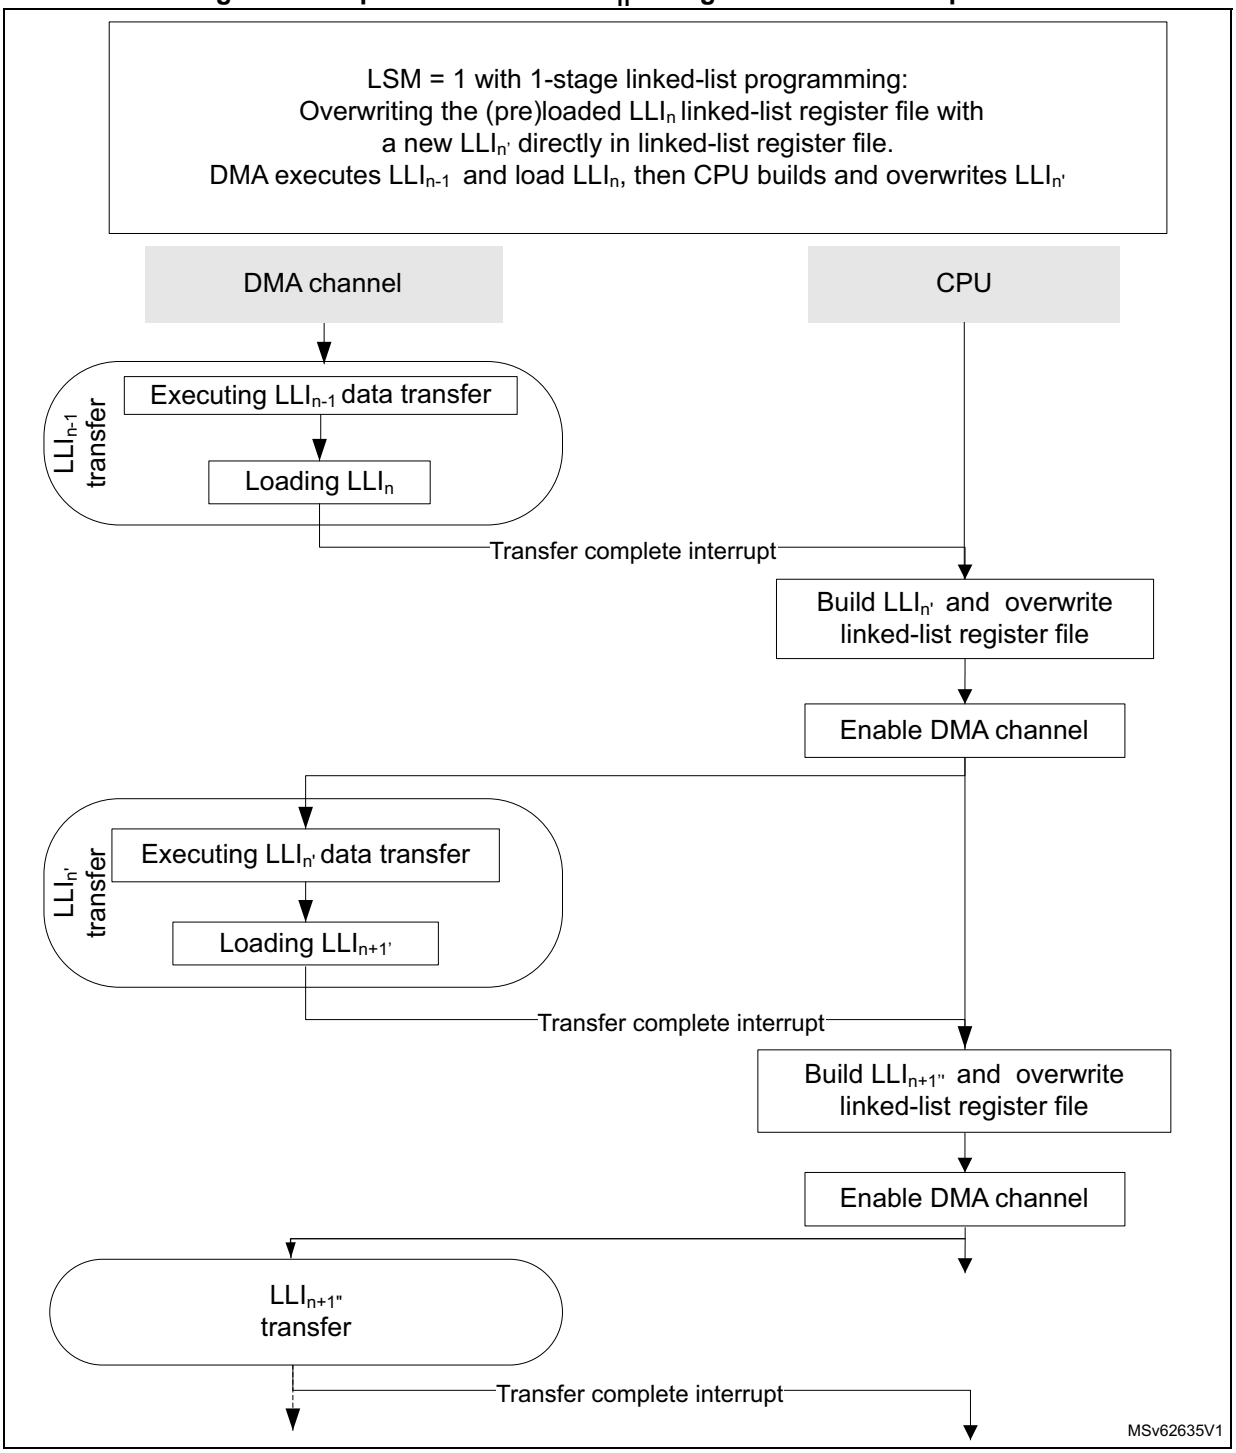

Figure 86. Building LLI_{n+1}: GPDMA dynamic linked-lists in link step mode

Run-time replacing a LLI_n with a new $LLI_{n'}$ in link step mode (in linked-list register file)

In this link step mode, during run-time, the software can build and insert a new $LLI_{n'}$, after GPDMA executed the transfer from the LLI_{n-1} and loaded a formerly elaborated LLI_n from the memory by overwriting directly the linked-list register file with the new $LLI_{n'}$, as shown in *Figure 87*.

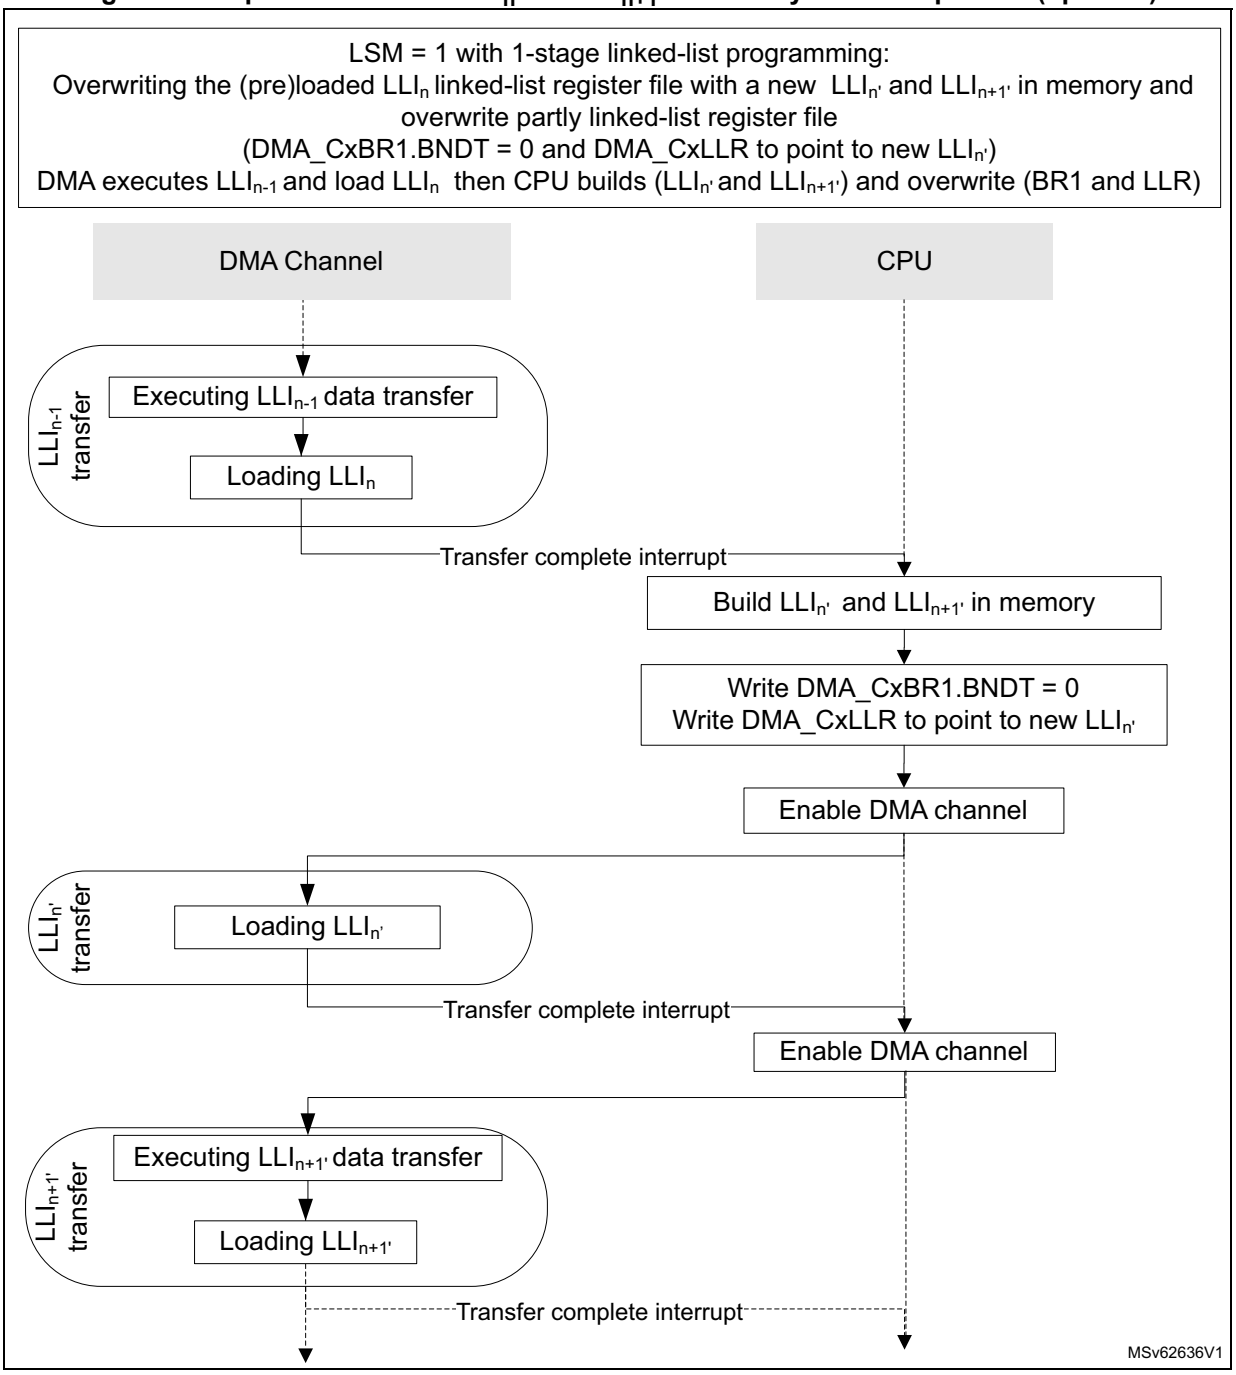

Figure 87. Replace with a new $LLI_{n'}$ in register file in link step mode

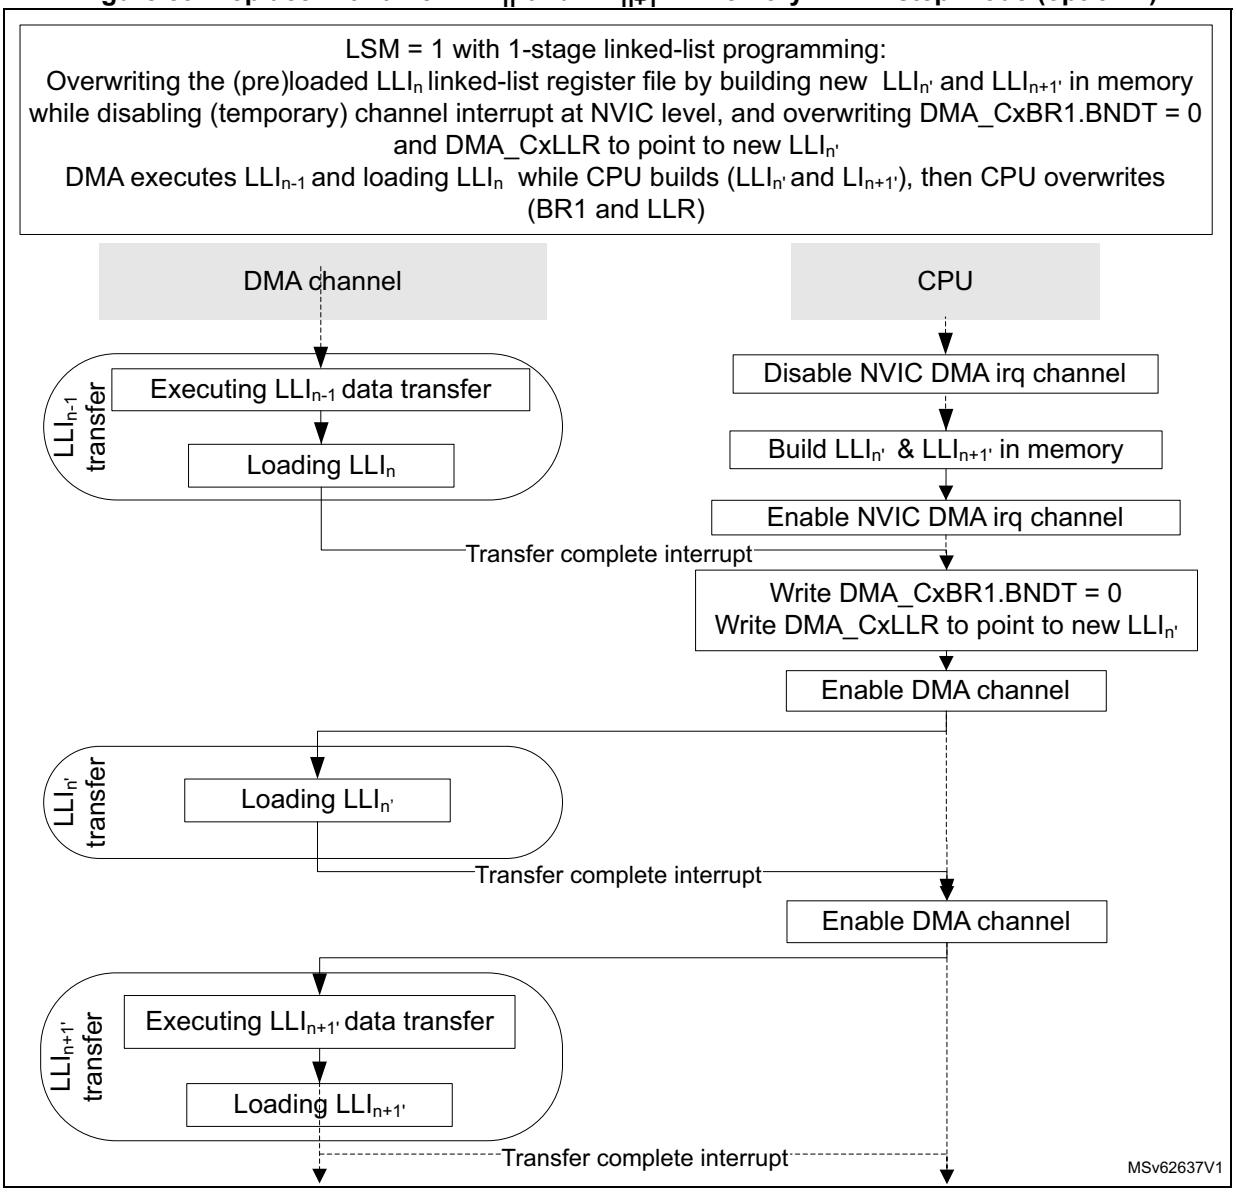
Run-time replacing a LLI_n with a new $LLI_{n'}$ in link step mode (in the memory)

The software can build and insert a new $LLI_{n'}$ and $LLI_{n+1'}$ in the memory, after GPDMA executed the transfer from the LLI_{n-1} and loaded a formerly elaborated LLI_n from the memory, by overwriting partly the linked-list register file (GPDMA_CxBR1.BNDT[15:0] to be null and GPDMA_CxLLR to point to new $LLI_{n')}$ as shown in *Figure 88*.

Figure 88. Replace with a new $LLI_{n'}$ and $LLI_{n+1'}$ in memory in link step mode (option 1)



Run-time replacing a LLI_n with a new $LLI_{n'}$ in link step mode

Other software implementations exist. Meanwhile GPDMA executes the transfer from the LLI_{n-1} and loads a formerly elaborated LLI_n from the memory (or even earlier), the software can do the following:

1. Disable the NVIC for not being interrupted by the interrupt handling.
2. Build a new $LLI_{n'}$ and a new $LLI_{n+1'}$.
3. Enable again the NVIC for the channel interrupt (transfer complete) notification.

The software in the interrupt handler for LLI_{n-1} is then restricted to overwrite GPDMA_CxBR1.BNDT[15:0] to be null and GPDMA_CxLLR to point to new $LLI_{n'}$, as shown in *Figure 89*.

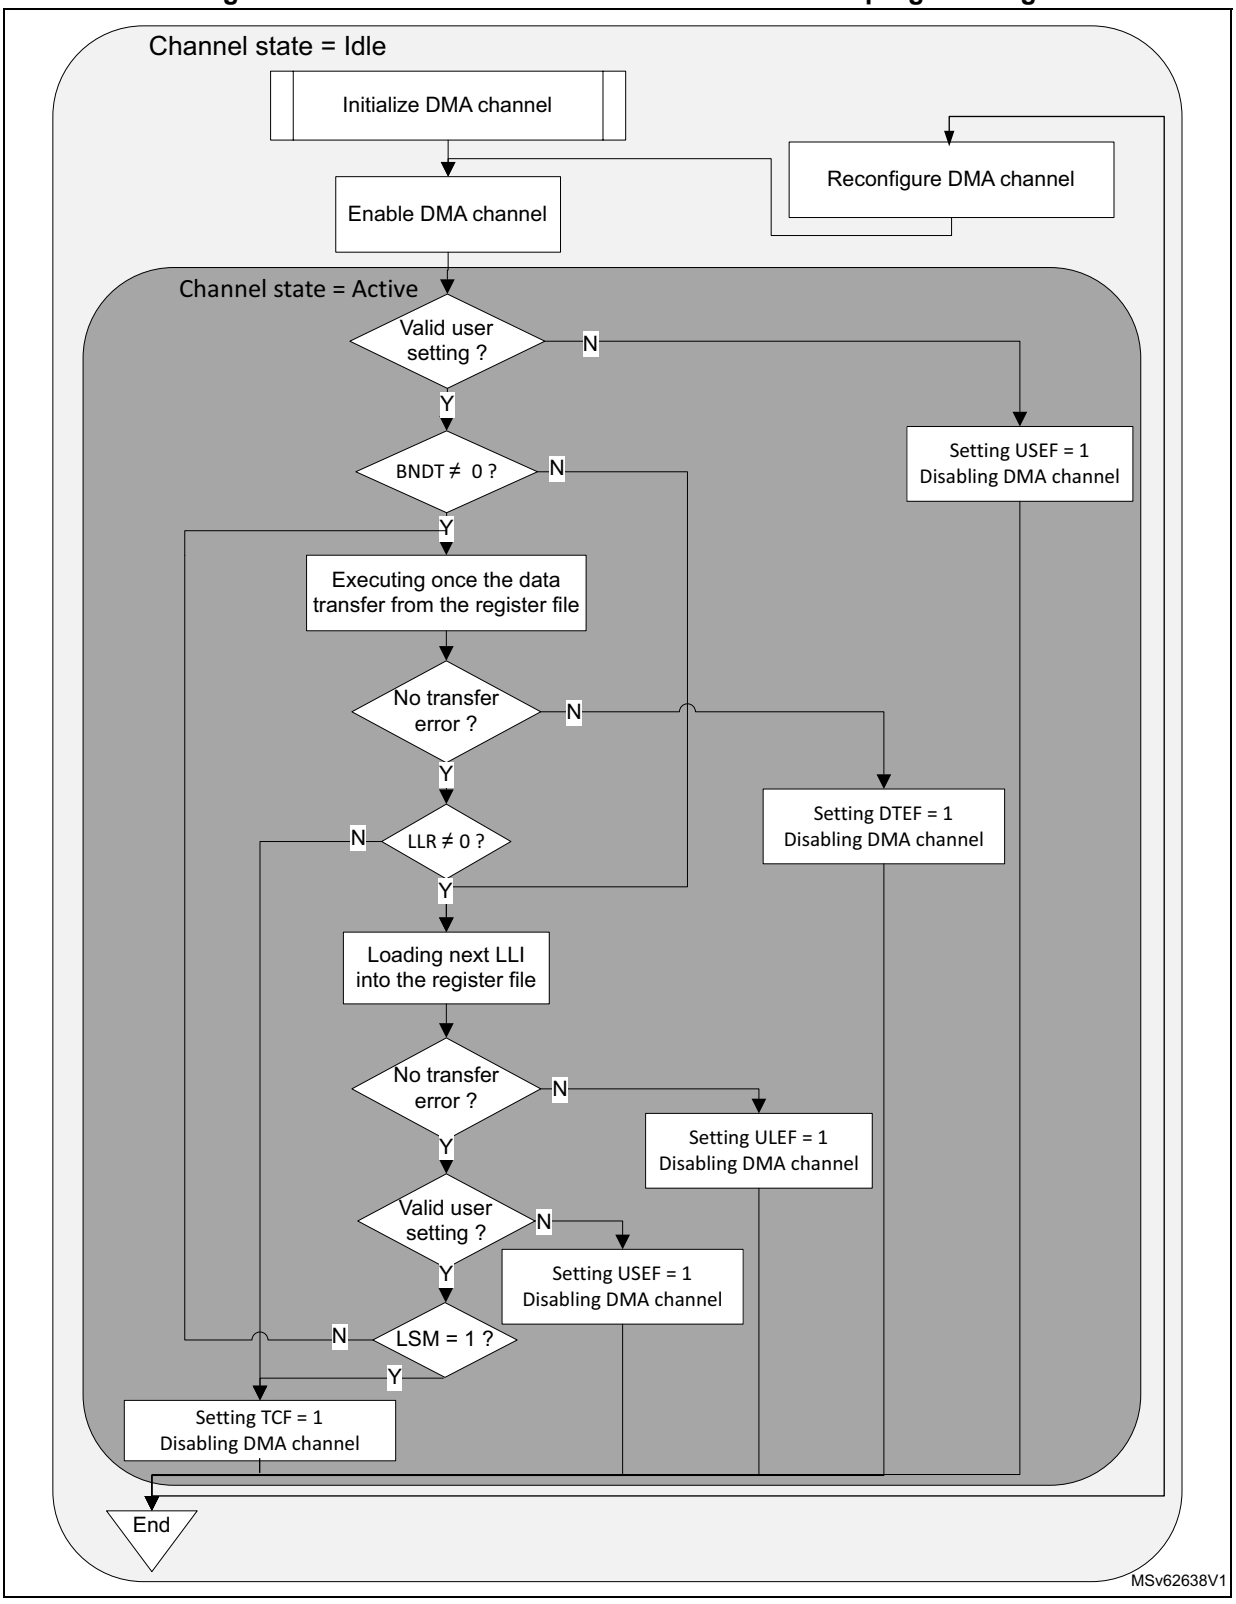
Figure 89. Replace with a new $LLI_{n'}$ and $LLI_{n+1'}$ in memory in link step mode (option 2)

16.4.9 GPDMA channel state and linked-list programming

The software can reconfigure a channel when the channel is disabled (GPDMA_CxCR.EN = 0) and update the execution mode (GPDMA_CxCR.LSM) to change from/to run-to-completion mode to/from link step mode.

In any execution mode, the software can:

- reprogram LLI_{n+1} in the memory to finally complete the channel by this LLI_{n+1} (clear the GPDMA_CxLLR of this LLI_{n+1}), before this LLI_{n+1} is loaded/used by the GPDMA channel
- abort and reconfigure the channel with a LSM update (see *Section 16.4.4*.)



In link step mode, the software can clear LSM after each a single execution of any LLI, during LLI_{n-1}.

Figure 90 shows the overall and unified GPDMA linked-list programming, whatever is the execution mode.

Note: Figure 90 is not intended to illustrate how often a TCEF can be raised, depending on the programmed value of TCEM[1:0] in GPDMA_CxTR2. It can be raised at (each) block completion, at (each) 2D block completion, at (each) LLI completion, or only at the last LLI data transfer completion. In run-to-completion mode, whatever is the value of TCEM[1:0], at the channel completion the hardware always set TCEF = 1 and disables the channel. In link step mode, the channel is disabled after each single execution of a LLI, and depending on the value of TCEM[1:0] a TCEF is raised or not.

In Figure 90, BNDT ≠ 0 is the typical condition for starting the first data transfer. This condition becomes (BNDT ≠ 0 and PFREQ = 1) if the peripheral requests a data transfer with early termination (see Section 16.3.6).

Figure 90. GPDMA channel execution and linked-list programming

16.4.10 GPDMA FIFO-based transfers

There is a single transfer operation mode: the FIFO mode. There are FIFO-based transfers. Any channel x is implemented with a dedicated FIFO whose size is defined by dma_fifo_size[x] (see *Section 16.3.2* for more details).

GPDMA burst

A programmed transfer at the lowest level is a GPDMA burst.

A GPDMA burst is a burst of data received from the source, or a burst of data sent to the destination. A source (and destination) burst is programmed with a burst length by the field SBL_1[5:0] (respectively DBL_1[5:0]), and with a data width defined by the field SDW_LOG2[1:0] (respectively DDW_LOG2[1:0]) in the GPDMA_CxTR1 register.

The addressing mode after each data (named beat) of a GPDMA burst is defined by SINC and DINC in GPDMA_CxTR1, for source and destination respectively: either a fixed addressing or an incremented addressing with contiguous data.

The start and next addresses of a GPDMA source/destination burst (defined by GPDMA_CxSAR and GPDMA_CxDAR) must be aligned with the respective data width.

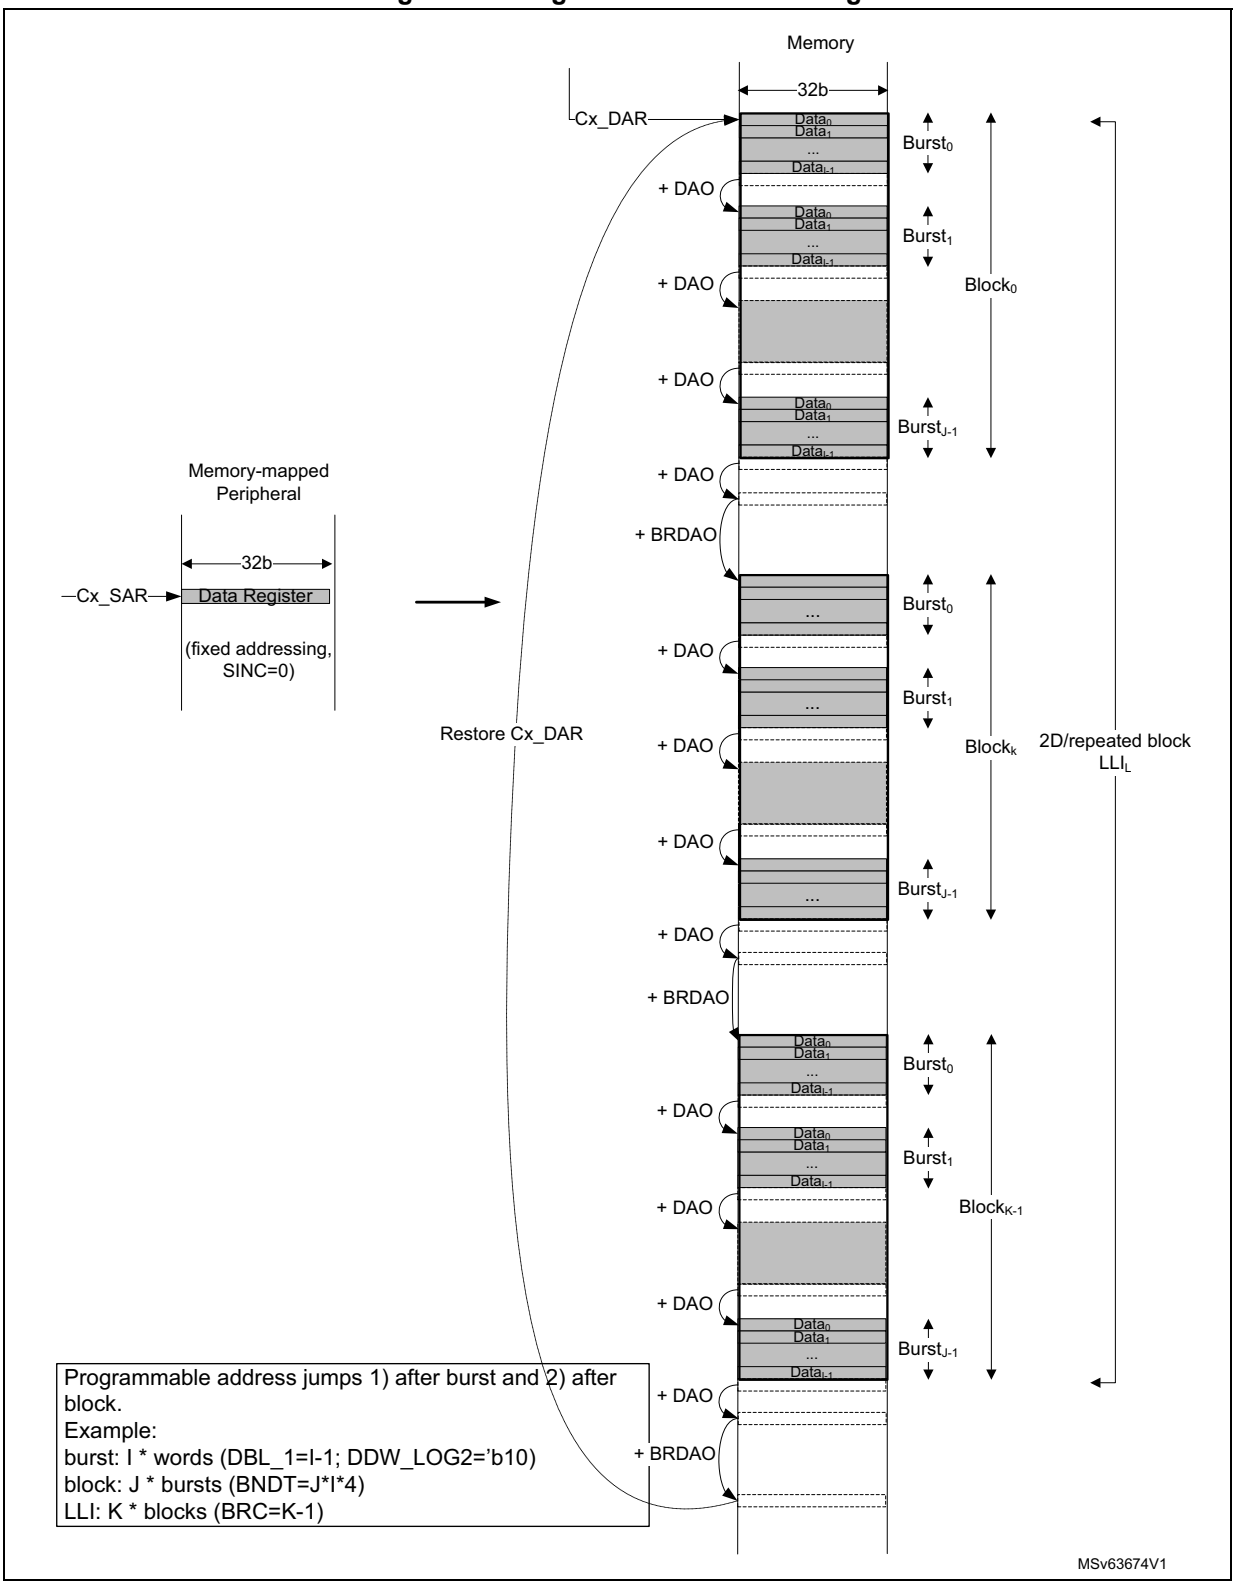
The table below lists the main characteristics of a GPDMA burst.

Table 147. Programmed GPDMA source/destination burst

SDW_LOG2[1:0] DDW_LOG2[1:0]	Data width (bytes)	SINC/DINC	SBL_1[5:0] DBL_1[5:0]	Burst length (data/beats)	Next data/ beat address	Next burst address	Burst address alignment
00	1	0 (fixed)	n = 0 to 63(1)	n+1	+ 0	+ 0	1
01	2						2
10	4						4
00	1	1 (contiguously incremented)			+ 1	+ (n + 1)	1
01	2				+ 2	+ 2 * (n + 1)	2
10	4				+ 4	+ 4 * (n + 1)	4
11	forbidden user setting, causing USEF generation and none burst to be issued.						

1. When S/DBL_1[5:0] = 0, burst is of length 1. Then burst can be also named as single.

The next burst address in the above table is the next source/destination default address pointed by GPDMA_CxSAR or GPDMA_CxDAR, once the programmed source/destination burst is completed. This default value refers to the fixed/contiguously incremented address.



GPDMA burst with 2D addressing (channel x = 6 to 7)

When the channel has additional 2D addressing feature, this default value refers to the value without taking into account the two programmed incremented or decremented offsets. These two additional offsets (with a null default value) are applied:

- after each completed source/destination burst, as defined respectively by GPDMA_CxTR2.SAO[12:0]/DAO[12:0] and GPDMA_CxBR1.SDEC/DDEC
- after each completed block, as defined respectively by GPDMA_CxBR2.BRSAO[15:0]/BRDAO[15:0] and GPDMA_CxBR1.BRSDEC/BRDDEC)

Then, a 2D/repeated block can be addressed with a first programmed address jump after each completed burst, and with a second programmed address jump after each block, as depicted by *Figure 91* with a 2D destination buffer.

Figure 91. Programmed 2D addressing

GPDMA FIFO-based burst

In FIFO-mode, a transfer generally consists of two pipelined and separated burst transfers:

- one burst from the source to the FIFO over the allocated source master port, as defined by GPDMA_CxTR1.SAP
- one burst from the FIFO to the destination over the allocated destination master port, as defined by GPDMA_CxTR1.DAP

GPDMA source burst

The requested source burst transfer to the FIFO can be scheduled as early as possible over the allocated port, depending on the current FIFO level versus the programmed burst size (when the FIFO is ready to get one new burst from the source):

when FIFO level ≤ $2^{dma_fifo_size[x]}$ - (SBL_1[5:0]+1) * $2^{SDW_LOG2[1:0]}$

where:

- FIFO level is the current filling level of the FIFO, in bytes.
- $2^{dma_fifo_size[x]}$ is the half the FIFO size of channel x, in bytes (see *Section 16.3.2* for the implementation details and dma_fifo_size[x] value).
- (SBL_1[5:0]+1) * $2^{SDW_LOG2[1:0]}$ is the size of the programmed source burst transfer, in bytes.

Based on the channel priority (GPDMA_CxCR.PRIO[1:0]), this ready FIFO-based source transfer is internally arbitrated versus the other requested and active channels.

GPDMA destination burst

The requested destination burst transfer from the FIFO can be scheduled as early as possible over the allocated port, depending on the current FIFO level versus the programmed burst size (when the FIFO is ready to push one new burst to the destination):

when FIFO level ≥ (DBL_1[5:0]+1) * $2^{DDW_LOG2[1:0]}$

where:

- FIFO level is the current filling level of the FIFO, in bytes.
- (DBL_1[5:0]+1) * $2^{DDW_LOG2[1:0]}$ is the size of the programmed destination burst transfer, in bytes.

Based on the channel priority, this ready FIFO-based destination transfer is internally arbitrated versus the other requested and active channels.

GPDMA burst vs source block size, 1-Kbyte address boundary and FIFO size

The programmed source/destination GPDMA burst is implemented with an AHB burst as is, unless one of the following conditions is met:

- When half of the FIFO size of the channel x is lower than the programmed source/destination burst size, the programmed source/destination GPDMA burst is implemented with a series of singles or bursts of a lower size. Each transfer is of a size that is lower than or equal to half of the FIFO size, without any user constraint.
- If the source block size (GPDMA_CxBR1.BNDT[15:0]) is not a multiple of the source burst size but is a multiple of the data width of the source burst (GPDMA_CxTR1.SDW_LOG2[1:0]), the GPDMA modifies and shortens bursts into singles or bursts of lower length, in order to transfer exactly the source block size, without any user constraint.

- If the source/destination burst transfer have crossed the 1-Kbyte address boundary on a AHB transfer, the GPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the AHB protocol, without any user constraint.
- If the source/destination burst length exceeds 16 on a AHB transfer, the GPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the AHB protocol, without any user constraint.

In any case, the GPDMA keeps ensuring source/destination data (and address) integrity without any user constraint. The current FIFO level (software readable in GPDMA_CxSR) is compared to and updated with the effective transfer size, and the GPDMA re-arbitrates between each AHB single or burst transfer, possibly modified.

Based on the channel priority, each single or burst of a lower burst size versus the programmed burst, is internally arbitrated versus the other requested and active channels.

Note: In linked-list mode, the GPDMA read transfers related to the update of the linked-list parameters from the memory to the internal GPDMA registers, are scheduled over the link allocated port, as programmed by GPDMA_CxCR.LAP.

GPDMA data handling: byte-based reordering, packing/unpacking, padding/truncation, sign extension and left/right alignment

The data handling is controlled by GPDMA_CxTR1. The source/destination data width of the programmed burst is byte, half-word or word, as per the SDW_LOG2[1:0] and DDW_LOG2[1:0] fields (see *Table 148*).

The user can configure the data handling between transferred data from the source and transfer to the destination. More specifically, programmed data handling is orderly performed with:

1. Byte-based source reordering
   - If SBX = 1 and if source data width is a word, the two bytes of the unaligned half-word at the middle of each source data word are exchanged.
2. Data width conversion by packing, unpacking, padding or truncation, if destination data width is different than the source data width, depending on PAM[1:0]:
   - If destination data width > source data width, the post SBX source data is either right-aligned and padded with 0 s, or sign extended up to the destination data width, or is FIFO queued and packed up to the destination data width.
   - If destination data width < source data width, the post SBX data is either right-aligned and left-truncated down to the destination data width, or is FIFO queued and unpacked and streamed down to the destination data width.
3. Byte-based destination re-ordering:
   - If DBX = 1 and if the destination data width is not a byte, the two bytes are exchanged within the aligned post PAM[1:0] half-words.
   - If DHX = 1 and if the destination data width is neither a byte nor a half-word, the two aligned half-words are exchanged within the aligned post PAM[1:0] words.

Note: Left-alignment with 0s-padding can be achieved by programming both a right-alignment with a 0s-padding and a destination byte-based re-ordering.

The table below lists the possible data handling from the source to the destination.

Table 148. Programmed data handling

SDW_LOG2 [1:0]	Source data	Source data stream(1)	SBX	DDW_LOG2 [1:0]	Destination data	PAM[1:0](2)	DBX	DHX	Destination data stream(1)

1. Data stream is timely ordered starting from the byte with the lowest index (B_0).
2. RA= right aligned, LA = left aligned, RT = right truncated, LT = left truncated, 0P = zero bit padding up to the destination data width, SE = sign bit extended up to the destination data width.

16.4.11 GPDMA transfer request and arbitration

GPDMA transfer request

As defined by GPDMA_CxTR2, a programmed GPDMA data transfer is requested with one of the following:

- a software request if the control bit SWREQ = 1: This is used typically by the CPU for a data transfer from a memory-mapped address to another memory mapped address (memory-to-memory, GPIO to/from memory)
- an input hardware request coming from a peripheral if SWREQ = 0: The selection of the GPDMA hardware peripheral request is driven by the REQSEL[7:0] field (see *Section 16.3.4*). The selected hardware request can be one of the following:
  - an hardware request from a peripheral configured in GPDMA mode (for a transfer from/to the peripheral data register respectively to/from the memory)
  - an hardware request from a peripheral for its control registers update from the memory
  - an hardware request from a peripheral for a read of its status registers transferred to the memory

Caution: The user must not assign a same input hardware peripheral GPDMA request via GPDMA_CxTR.REQSEL[7:0] to two different channels, if at a given time this request is asserted by the peripheral and each channel is ready to execute this requested data transfer. There is no user setting error reporting.

GPDMA transfer request for arbitration

A ready FIFO-based GPDMA source single/burst transfer (from the source address to the FIFO) to be scheduled over the allocated master port (GPDMA_CxTR1.SAP) is arbitrated based on the channel priority (GPDMA_CxCR.PRIO[1:0]) versus the other simultaneous requested GPDMA transfers to the same master port.

A ready FIFO-based GPDMA destination single/burst transfer (from the FIFO to the destination address) to be scheduled over the allocated master port (GPDMA_CxTR1.DAP) is arbitrated based on the channel priority (GPDMA_CxCR.PRIO[1:0]) versus the other simultaneous requested GPDMA transfers to the same master port.

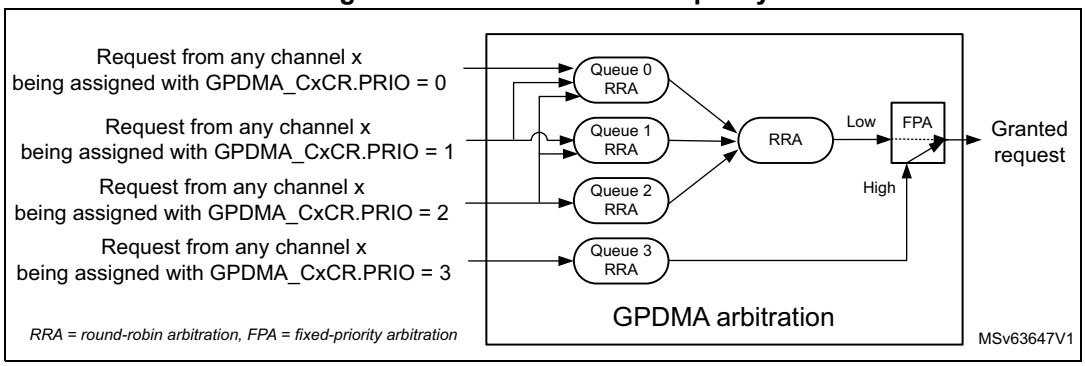
An arbitrated GPDMA requested link transfer consists of one 32-bit read from the linked-list data structure in memory to one of the linked-list registers (GPDMA_CxTR1, GPDMA_CxTR2, GPDMA_CxBR1, GPDMA_CxSAR, GPDMA_CxDAR or GPDMA_CxLLR, plus GPDMA_CxTR3, GPDMA_CxBR2). Each 32-bit read from memory is arbitrated with the same channel priority as for data transfers, in order to be scheduled over the allocated master port (GPDMA_CxCR.LAP).

Whatever the requested data transfer is programmed with a software request for a memory-to- memory transfer (GPDMA_CxTR2.SWREQ = 1), or with a hardware request (GPDMA_CxTR2.SWREQ = 0) for a memory-to-peripheral transfer or a peripheral-to-memory transfer and whatever is the hardware request type, re-arbitration occurs after each granted single/burst transfer.

When an hardware request is programmed from a destination peripheral (GPDMA_CxTR2.SWREQ = 0 and GPDMA_CxTR2.DREQ = 1), the first memory read of a (possibly 2D/repeated) block (the first ready FIFO-based source burst request), is gated by the occurrence of the corresponding and selected hardware request. This first read request to memory is not taken into account earlier by the arbiter (not as soon as the block transfer is enabled and executable).

GPDMA arbitration

The GPDMA arbitration is directed from the 4-grade assigned channel priority (GPDMA_CxCR.PRIO[1:0]). The arbitration policy, as illustrated in *Figure 92*, is defined by:



- one high-priority traffic class (queue 3), dedicated to the assigned channels with priority 3, for time-sensitive channels

  This traffic class is granted via a fixed-priority arbitration against any other low-priority traffic class. Within this class, requested single/burst transfers are round-robin arbitrated.
- three low-priority traffic classes (queues 0, 1, or 2) for non time-sensitive channels with priority 0, 1, or 2

  Each requested single/burst transfer within this class is round-robin arbitrated, with a weight that is monotonically driven from the programmed priority:
  - Requests with priority 0 are allocated to the queue 0.
  - Requests with priority 1 are allocated and replicated to the queue 0 and queue 1.

– Requests with priority 2 are allocated and replicated to the queue 0, queue 1, and queue 2.
– Any queue 0, 1, or 2 equally grants any of its active input requests in a round-robin manner, provided there are simultaneous requests.
– Additionally, there is a second stage for the low-traffic with a round-robin arbiter that fairly alternates between simultaneous selected requests from queue 0, queue 1, and queue 2.

Figure 92. GPDMA arbitration policy

GPDMA arbitration and bandwidth

With this arbitration policy, the following is guaranteed:

- Equal maximum bandwidth between requests with same priority
- Reserved bandwidth (noted as B_{Q3}) to the time-sensitive requests (with priority 3)
- Residual weighted bandwidth between different low-priority requests (priority 0 versus priority 1 versus priority 2).

The two following examples highlight that the weighted round-robin arbitration is driven by the programmed priorities:

- **Example 1**: basic application with two non time-sensitive GPDMA requests: req0 and req1. There are the following programming possibilities:
  – If they are assigned with same priority, the allocated bandwidth by the arbiter to req0 (B_{req0}) is **equal** to the allocated bandwidth to req1(B_{req1}).
  $B_{req0} = B_{req1} = 1/2 * (1 - B_{Q3})$
  – If req0 is assigned to priority 0 and req1 to priority 1, the allocated bandwidth to req0 (B_{P0}) is **3 times less** than the allocated bandwidth to req1 (B_{P1}).
  $B_{req0} = B_{P0} = 1/2 * 1/2 * (1 - B_{Q3}) = 1/4 * (1 - B_{Q3})$
  $B_{req1} = B_{P1} = (1/2 + 1) * 1/2 * (1 - B_{Q3}) = 3/4 * (1 - B_{Q3})$
  – If req0 is assigned to priority 0 and req1 to priority 2, the allocated bandwidth to req0 (B_{P0}) is **5 times less** than the allocated bandwidth to req1 (B_{P2}).
  $B_{req0} = B_{P0} = 1/2 * 1/3 * (1 - B_{Q3}) = 1/6 * (1 - B_{Q3})$
  $B_{req1} = B_{P2} = (1/2 + 1 + 1) * 1/3 * (1 - B_{Q3}) = 5/6 * (1 - B_{Q3})$
  The above computed bandwidth calculation is based on a theoretical input request, always active for any GPDMA clock cycle. This computed bandwidth from the arbiter must be weighted by the frequency of the request given by the application, that cannot be always active and may be quite much variable from one GPDMA client (example I2C at 400 kHz) to another one (PWM at 1 kHz) than the above x3 and x5 ratios.

- **Example 2**: application where the user distributes a same non-null N number of GPDMA requests to every non time-sensitive priority 0, 1 and 2. The bandwidth calculation is then the following:
  - The allocated bandwidth to the set of requests of priority 0 (B_{P0}) is
    $B_{P0} = 1/3 * 1/3 * (1 - B_{Q3}) = 1/9 * (1 - B_{Q3})$
  - The allocated bandwidth to the set of requests of priority 1(B_{P1}) is
    $B_{P1} = (1/3 + 1/2) * 1/3 * (1 - B_{Q3}) = 5/18 * (1 - B_{Q3})$
  - The allocated bandwidth to the set of requests of priority 2(B_{P2}) is
    $B_{P2} = (1/3 + 1/2 + 1) * 1/3 * (1 - B_{Q3}) = 11/18 * (1 - B_{Q3})$
  - The allocated bandwidth to any request n ($B_{n)}$ among the N requests of that priority Pi (i = 0 to 2) is $B_n = 1/N * B_{Pi}$
  - The allocated bandwidth to any request n of priority 0i ($B_{n, Pi}$) is
    $B_{n, P0} = 1/N *1/9 * (1 - B_{Q3})$
    $B_{n, P1} = 1/N *5/18 * (1 - B_{Q3})$
    $B_{n, P2} = 1/N *11/18 * (1 - B_{Q3})$

  In this example, when the master port bus bandwidth is not totally consumed by the time-sensitive queue 3, the residual bandwidth is such that 2.5 times less bandwidth is allocated to any request of priority 0 versus priority 1, and 5.5 times less bandwidth is allocated to any request of priority 0 versus priority 2.

More generally, assume that the following requests are present:

- I requests (I ≥ 0) assigned to priority 0
  If I > 0, these requests are noted from i = 0 to I-1.
- J requests (J ≥ 0) assigned to priority 1
  If J > 0, these requests are noted from j = 0 to J-1.
- K requests (K > 0) assigned to priority 2
  These requests are noted from k = 0 to K-1
- L requests (L ≥ 0) assigned to priority 3
  If L > 0, these requests are noted from l = 0 to L-1.

As B_{Q3} is the reserved bandwidth to time-sensitive requests, the bandwidth for each request L with priority 3 is:

- $B_l = B_{Q3} / L$ for L > 0 (else: $B_l = 0$)

The bandwidth for each non-time sensitive queue is:

- $B_{Q0} = 1/3 * (1 - B_{Q3})$
- $B_{Q1} = 1/3 * (1 - B_{Q3})$
- $B_{Q2} = 1/3 * (1 - B_{Q3})$

The bandwidth for the set of requests with priority 0 is:

- $B_{P0} = I / (I + J + K) * B_{Q0}$

The bandwidth for each request i with priority 0 is:

- $B_i = B_{P0} / I$ for L > 0 (else $B_{P0} = 0$)

The bandwidth for the set of requests with priority 1 and routed to queue 0 is:

- $B_{P1,Q0} = J / (I + J + K) * B_{Q0}$

The bandwidth for the set of requests with priority 1 and routed to queue 1 is:

- $B_{P1,Q1} = J / (J + K) * B_{Q1}$

The total bandwidth for the set of requests with priority 1 is:

- $B_{P1} = B_{P1,Q0} + B_{P1,Q1}$

The bandwidth for each request j with priority 1 is:

- $B_j = B_{P1} / J$ for $J > 0$ (else $B_j = 0$)

The bandwidth for the set of requests with priority 2 and routed to queue 0 is:

- $B_{P2,Q0} = K / (I + J + K) * B_{Q0}$

The bandwidth for the set of requests with priority 2 and routed to queue 1 is:

- $B_{P2,Q1} = K / (J + K) * B_{Q1}$

The bandwidth for the set of requests with priority 2 and routed to queue 2 is:

- $B_{P2,Q2} = B_{Q2}$

The total bandwidth for the set of requests with priority 2 is:

- $B_{P2} = B_{P2,Q0} + B_{P2,Q1} + B_{P2,Q2}$

The bandwidth for each request k with priority 2 is:

- $B_k = B_{P2} / K$ ($K>0$ in the general case)

Thus finally the maximum allocated residual bandwidths for any i, j, k non-time sensitive request are:

- in the general case (when there is at least one request k with a priority 2 ($K > 0$)):
  - $B_i = 1/I * 1/3 * I/(I + J + K) * (1 - B_{Q3})$
  - $B_j = 1/J * 1/3 *[J/(I + J + K) + J/(J + K)] * (1 - B_{Q3})$
  - $B_k = 1/K * 1/3 *[K/(I + J + K) + K/(J + K) + 1] * (1 - B_{Q3})$
- in the specific case (when there is no request k with a priority 2 ($K = 0$)):
  - $B_i = 1/I * 1/2 * I/(I + J) * (1 - B_{Q3})$
  - $B_j = 1/J * 1/2 *[J/(I + J) + 1] * (1 - B_{Q3})$

Consequently, the GPDMA arbiter can be used as a programmable weighted bandwidth limiter, for each queue and more generally for each request/channel. The different weights are monotonically resulting from the programmed channel priorities.

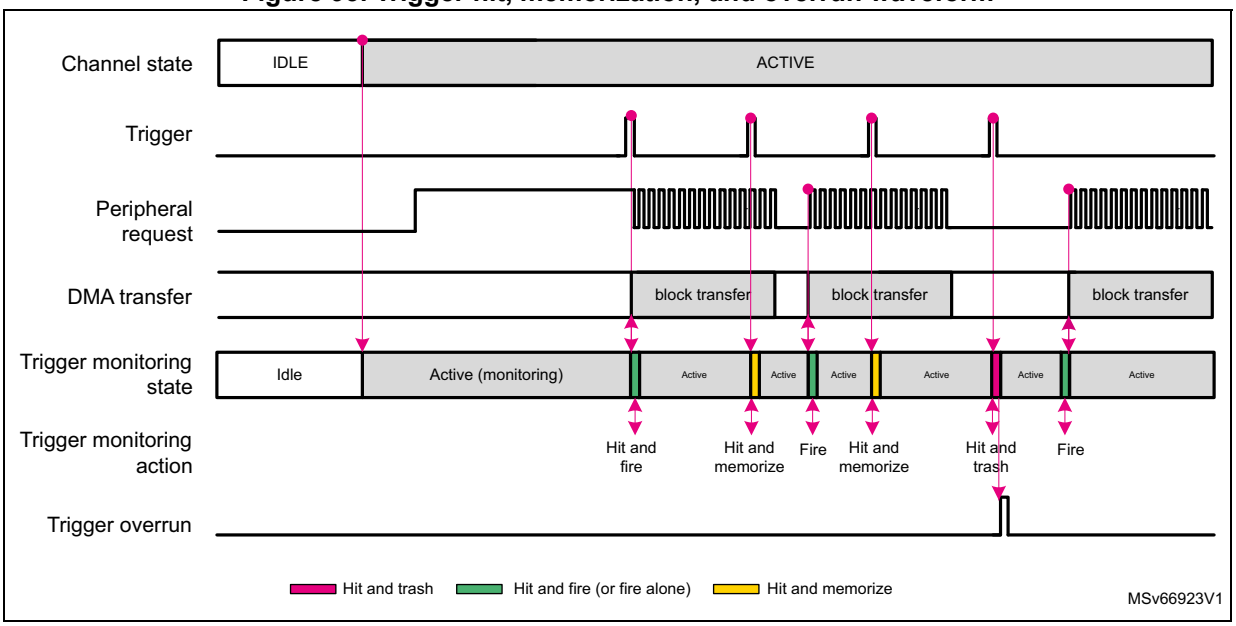
16.4.12 GPDMA triggered transfer

A programmed GPDMA transfer can be triggered by a rising/falling edge of a selected input trigger event, as defined by GPDMA_CxTR2.TRIGPOL[1:0] and GPDMA_CxTR2.TRIGSEL[5:0] (see *Section 16.3.7* for the trigger selection).

The triggered transfer, as defined by the trigger mode in GPDMA_CxTR2.TRIGM[1:0], can be at LLI data transfer level, to condition the first burst read of a block, the first burst read of a 2D/repeated block for channel x (x = 6 to 7), or each programmed single read. The trigger mode can also be programmed to condition the LLI link transfer (see TRIGM[1:0] in GPDMA_CxTR2 for more details).

Trigger hit memorization and trigger overrun flag generation

The GPDMA monitoring of a trigger for a channel x is started when the channel is enabled/loaded with a new active trigger configuration: rising or falling edge on a selected trigger (respectively TRIGPOL[1:0] = 01 or TRIGPOL[1:0] = 10).



The monitoring of this trigger is kept active during the triggered and uncompleted (data or link) transfer. If a new trigger is detected, this hit is internally memorized to grant the next transfer, as long as the defined rising/falling edge and TRIGSEL[5:0] are not modified, and the channel is enabled.

Transferring a next $LLI_{n+1,}$ that updates the GPDMA_CxTR2 with a new value for any of TRIGSEL[5:0] or TRIGPOL[1:0], resets the monitoring, trashing the possible memorized hit of the formerly defined LLI_n trigger.

Caution: After a first new trigger hit_{n+1} is memorized, if another trigger hit_{n+2} is detected and if the hit_n triggered transfer is still not completed, hit_{n+2} is lost and not memorized. A trigger overrun flag is reported (GPDMA_CxSR.TOF = 1) and an interrupt is generated if enabled (if GPDMA_CxCR.TOIE = 1). The channel is not automatically disabled by hardware due to a trigger overrun.

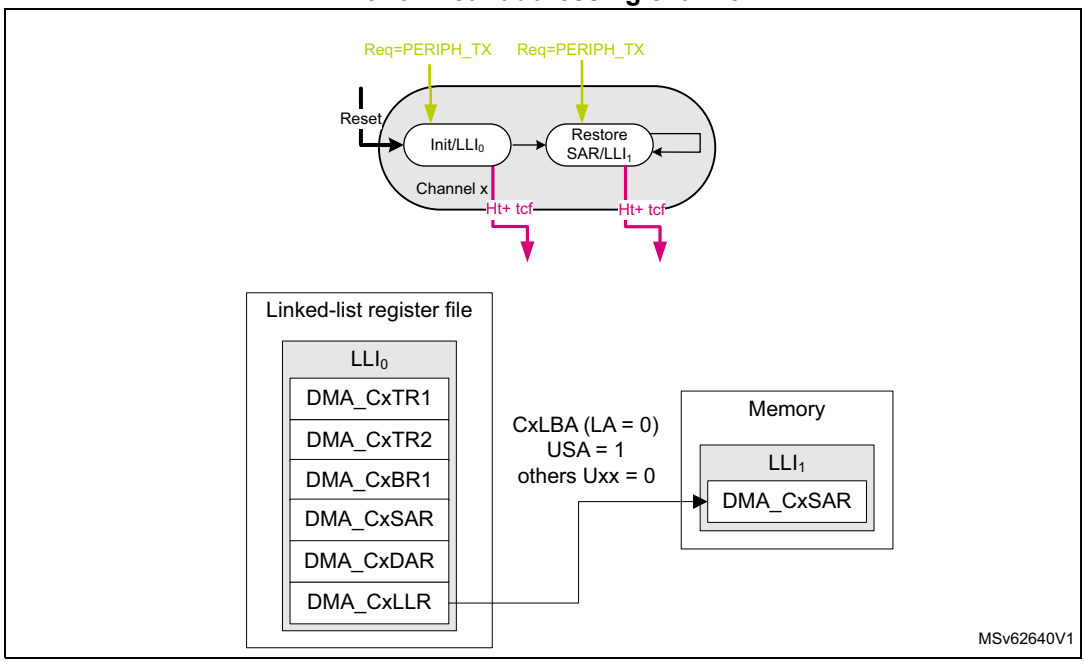
Figure 93 illustrates the trigger hit, memorization and overrun in the configuration example with a block-level trigger mode and a rising edge trigger polarity.

Figure 93. Trigger hit, memorization, and overrun waveform

Note: The user can assign the same input trigger event to different channels. This can be used to trigger different channels on a broadcast trigger event.

16.4.13 GPDMA circular buffering with linked-list programming

GPDMA circular buffering for memory-to-peripheral and peripheral-to-memory transfers, with a linear addressing channel



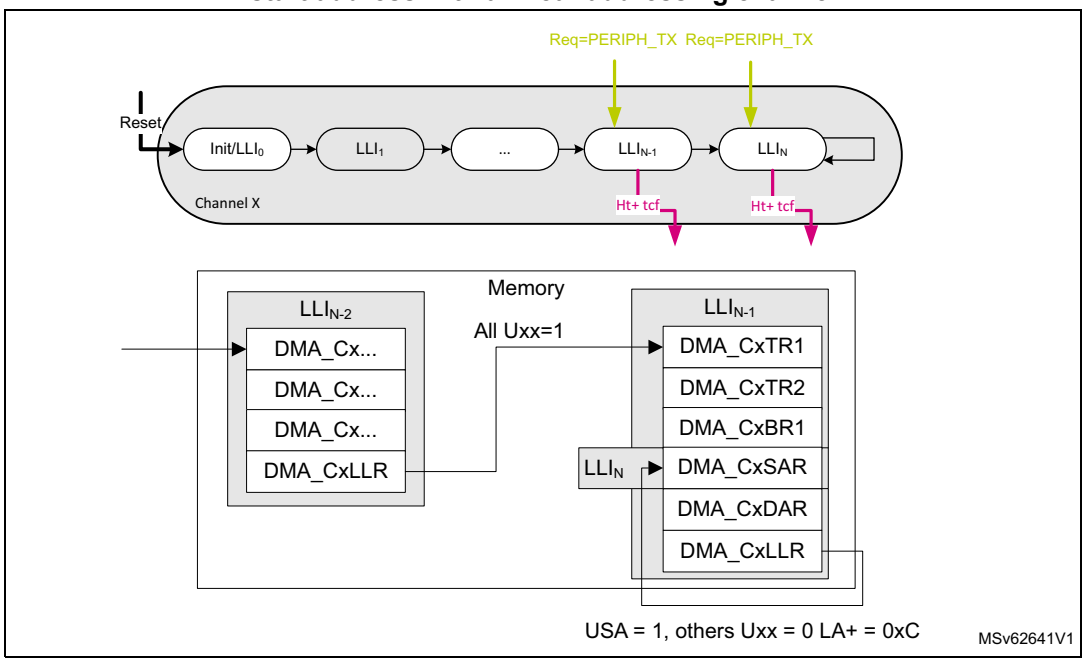
For a circular buffering, with a continuous memory-to-peripheral (or peripheral-to-memory) transfer, the software must set up a channel with half-transfer and complete transfer

events/interrupts generation (GPDMA_CxCR.HTIE = 1 and GPDMA_CxCR.TCIE = 1), in order to enable a concurrent buffer software processing.

LLI_0 is configured for the first block transfer with the linear addressing channel. A continuously-executed LLI_1 is needed to restore the memory source (or destination) start address, for the memory-to-peripheral transfer (respectively the peripheral-to-memory transfer). GPDMA automatically reloads the initially programmed GPDMA_CxBR1.BNDT[15:0] when a block transfer is completed, and there is no need to restore GPDMA_CxBR1.

Figure 94 illustrates this programming with a linear addressing GPDMA channel and a source circular buffer.

Figure 94. GPDMA circular buffer programming: update of the memory start address with a linear addressing channel



Note: With a 2D addressing channel, the user may use a single LLI with GPDMA_CxBR1.BRC[10:0] = 1, and program a negative memory block address offset with GDMA_CxBR2 and GDMA_CxBR1, in order to jump back to the memory source or the destination start address.

If circular buffering must be executed after some other transfers over the shared GPDMA channel x, the before-last LLI_{N-1} in memory is needed to configure the first block transfer. And the last LLI_N restores the memory source (or destination) start address in memory-to-peripheral transfer (respectively in peripheral-to-memory transfer).

Figure 95 illustrates this programming with a linear addressing shared GPDMA channel, and a source circular buffer.

Figure 95. Shared GPDMA channel with circular buffering: update of the memory start address with a linear addressing channel

16.4.14 GPDMA transfer in peripheral flow-control mode

A peripheral with the peripheral flow-control mode feature can decide to early terminate a GPDMA block transfer, provided that the allocated channel is implemented with this feature (see *Section 16.3.6*).

If the related GPDMA channel x is also programmed in peripheral flow-control mode (GPDMA_CxTR2.PFREQ = 1):

- The GPDMA block transfer starts as follows:
  - If GPDMA_CxBR1.BNDT[15:0] ≠ 0, the programmed value is internally taken into account by the GPDMA hardware.
  - If GPDMA_CxBR1.BNDT[15:0] = 0, the GPDMA hardware internally considers a 64-Kbyte value for the maximum source block size to be transferred.
- The GPDMA block transfer is completed as soon as the first occurrence of one of the following condition occurs:
  - when GPDMA_CxBR1.BNDT[15:0] = 0
  - when the peripheral early terminates the block. The complete transfer event is generated if programmed, depending on GPDMA_CxTR2 (see *GPDMA channel x transfer register 2 (GPDMA_CxTR2)*). Then the software can read the current number of transferred bytes from the source (GPDMA_CxBR1.BNDT[15:0]), and/or read the current source or destination address of the buffer in memory (GPDMA_CxSAR[31:0] or GPDMA_CxDAR[31:0]).

In peripheral flow-control mode:

- a destination peripheral with a hardware requested transfer is not supported: memory-to-peripheral transfer is not supported.
- Data packing from a source peripheral is not supported.
- 2D/repeated block is not supported.
- GPDMA_CxBR1.BNDT[15:0] must be programmed as a multiple of the source (peripheral) burst size.

16.4.15 GPDMA secure/nonsecure channel

The GPDMA controller is compliant with the TrustZone hardware architecture at channel level, partitioning all its resources so that they exist in one of the secure and nonsecure worlds at any given time.

Any channel x is a secure or a nonsecure hardware resource, as configured by GPDMA_SECCFGR.SECx.

When a channel x is configured in secure state by a secure and privileged agent, the following access control rules are applied:

- A nonsecure read access to a register field of this channel is forced to return 0, except for GPDMA_SECCFGR, GPDMA_PRIVCFGR, GPDMA_RCFGLOCKR that are readable by a nonsecure agent.
- A nonsecure write access to a register field of this channel has no impact.

When a channel x is configured in secure state, a secure agent can configure separately as secure or nonsecure the GPDMA data transfer from the source (GPDMA_CxTR1.SSEC) and the GPDMA data transfer to the destination (GPDMA_CxTR1.DSEC).

When a channel x is configured in secure state and in linked-list mode, the loading of the next linked-list data structure from the GPDMA memory into its register file, is automatically performed with secure transfers via the GPDMA_CxCR.LAP allocated master port.

The GPDMA generates a secure bus that reflects GPDMA_SECCFGR, to keep the other peripherals informed of the secure/nonsecure state of each GPDMA channel x.

The GPDMA also generates a security illegal access pulse signal on an illegal nonsecure access to a secure GPDMA register. This signal is routed to the TrustZone interrupt controller.

When the secure software must switch a channel from a secure state to a nonsecure state, the secure software must abort the channel or wait until the secure channel is completed before switching. This is needed to dynamically re-allocate a channel to a next nonsecure transfer as a nonsecure software is not allowed to do so and must have GPDMA_CxCR.EN = 0 before the nonsecure software can reprogram the GPDMA_CxCR for a next transfer. The secure software may reset not only the channel x (GPDMA_CxCR.RESET = 1) but also the full channel x register file to its reset value.

16.4.16 GPDMA privileged/unprivileged channel

Any channel x is a privileged or unprivileged hardware resource, as configured by a privileged agent via GPDMA_PRIVCFGR.PRIVx.

When a channel x is configured in a privileged state by a privileged agent, the following access control rules are applied:

- An unprivileged read access to a register field of this channel is forced to return 0, except for GPDMA_PRIVCFGR, GPDMA_SECCFGR, GPDMA_RCFGLOCKR that are readable by an unprivileged agent.
- An unprivileged write access to a register field of this channel has no impact.

When a channel is configured in a privileged (or unprivileged) state, the source and destination data transfers are privileged (respectively unprivileged) transfers over the AHB master port.

When a channel is configured in a privileged (or unprivileged) state and in linked-list mode, the loading of the next linked-list data structure from the GPDMA memory into its register file, is automatically performed with privileged (respectively unprivileged) transfers, via the GPDMA_CxCR.LAP allocated master port.

The GPDMA generates a privileged bus that reflects GPDMA_PRIVCFGR, to keep the other peripherals informed of the privileged/unprivileged state of each GPDMA channel x.

When the privileged software must switch a channel from a privileged state to an unprivileged state, the privileged software must abort the channel or wait until that the privileged channel is completed before switching. This is needed to dynamically re-allocate a channel to a next unprivileged transfer as an unprivileged software is not allowed to do so, and must have GPDMA_CxCR.EN = 0 before the unprivileged software can reprogram the GPDMA_CxCR for a next transfer. The privileged software may reset not only the channel x (GPDMA_CxCR.RESET = 1) but also the full channel x register file to its reset value.

16.4.17 GPDMA error management

The GPDMA is able to manage and report to the user a transfer error, as follows, depending on the root cause.

Data transfer error

On a bus access (as a AHB single or a burst) to the source or the destination:

- The source or destination target reports an AHB error.
- The programmed channel transfer is stopped (GPDMA_CxCR.EN cleared by the GPDMA hardware). The channel status register reports an idle state (GPDMA_CxSR.IDLEF = 1) and the data error (GPDMA_CxSR.DTEF = 1).
- After a GPDMA data transfer error, the user must perform a debug session, taking care of the product-defined memory mapping of the source and destination, including the protection attributes.
- After a GPDMA data transfer error, the user must issue a channel reset (set GPDMA_CxCR.RESET) to reset the hardware GPDMA channel data path and the content of the FIFO, before the user enables again the same channel for a next transfer.

Link transfer error

On a tentative update of a GPDMA channel register from the programmed LLI in the memory:

- The linked-list memory reports an AHB error.
- The programmed channel transfer is stopped (GPDMA_CxCR.EN cleared by the GPDMA hardware), the channel status register reports an idle state (GPDMA_CxSR.IDLEF = 1) and the link error (GPDMA_CxSR.ULEF = 1).
- After a GPDMA link error, the user must perform a debug session, taking care of the product-defined memory mapping of the linked-list data structure (GPDMA_CxLBAR and GPDMA_CxLLR), including the protection attributes.
- After a GPDMA link error, the user must explicitly write the linked-list register file (GPDMA_CxTR1, GPDMA_CxTR2, GPDMA_CxBR1, GPDMA_CxSAR, GPDMA_CxDAR and GPDMA_CxLLR, plus GPDMA_CxTR3 and GPDMA_CxBR2), before the user enables again the same channel for a next transfer.

User setting error

On a tentative execution of a GPDMA transfer with an unauthorized user setting:

- The programmed channel transfer is disabled (GPDMA_CxCR.EN forced and cleared by the GPDMA hardware) preventing the next unauthorized programmed data transfer from being executed. The channel status register reports an idle state (GPDMA_CxSR.IDLEF = 1) and a user setting error (GPDMA_CxSR.USEF = 1).
- After a GPDMA user setting error, the user must perform a debug session, taking care of the GPDMA channel programming. A user setting error can be caused by one of the following:
  - a programmed null source block size without a programmed update of this value from the next LLI_1 (GPDMA_CxBR1.BNDT[15:0] = 0 and GPDMA_CxLLR.UB1 = 0)
  - a programmed non-null source block size being not a multiple of the programmed data width of a source burst transfer (GPDMA_CxBR1.BNDT[2:0] versus GPDMA_CxTR1.SDW_LOG2[1:0])
  - when in packing/unpacking mode (if PAM[1] = 1), a programmed non-null source block size being not a multiple of the programmed data width of a destination burst transfer (GPDMA_CxBR1.BNDT[2:0] versus GPDMA_CxTR1.DDW_LOG2[1:0])
  - a programmed unaligned source start address, being not a multiple of the programmed data width of a source burst transfer (GPDMA_CxSAR[2:0] versus GPDMA_CxTR1.SDW_LOG2[1:0])
  - for channel x (x = 6 to 7): a programmed unaligned source address offset being not a multiple of the programmed data width of a source burst transfer (GPDMA_CxTR3.SAO[2:0] versus GPDMA_CxTR1.SDW_LOG2[1:0])
  - for channel x (x = 6 to 7): a programmed unaligned block repeated source address offset being not a multiple of the programmed data width of a source burst transfer (GPDMA_CxBR2.BRSAO[2:0] versus GPDMA_CxTR1.SDW_LOG2[1:0])
  - a programmed unaligned destination start address, being not a multiple of the programmed data width of a destination burst transfer (GPDMA_CxDAR[2:0] versus GPDMA_CxTR1.DDW_LOG2[1:0])
  - for channel x (x = 6 to 7): a programmed unaligned destination address offset being not a multiple of the programmed data width of a destination burst transfer (GPDMA_CxTR3.DAO[2:0] versus GPDMA_CxTR1.DDW_LOG2[1:0])

- for channel x (x = 6 to 7): a programmed unaligned block repeated destination address offset being not a multiple of the programmed data width of a destination burst transfer (GPDMA_CxBR2.BRDAO[2:0] versus GPDMA_CxTR1.DDW_LOG2[1:0])
- a programmed double-word source data width (GPDMA_CxTR1.SDW_LOG2[1:0] = 11)
- a programmed double-word destination data width (GPDMA_CxTR1.DDW_LOG2[1:0] = 11)
- a programmed linked-list item LLI_{n+1} with a null data transfer (GPDMA_CxLLR.UB1 = 1 and GPDMA_CxBR1. BNDT = 0)

16.5 GPDMA in debug mode

When the microcontroller enters debug mode (core halted), any channel x can be individually either continued (default) or suspended, depending on the programmable control bit in the DBGMCU module.

Note: In debug mode, GPDMA_CxSR.SUSPF is not altered by a suspension from the programmable control bit in the DBGMCU module. In this case, GPDMA_CxSR.IDLEF can be checked to know the completion status of the channel suspension.

16.6 GPDMA in low-power modes

Table 149. Effect of low-power modes on GPDMA

Mode	Description
Sleep	No effect. GPDMA interrupts cause the device to exit Sleep mode.
Stop(1)	The content of the GPDMA registers is kept when entering Stop mode.
Standby	The GPDMA is powered down and must be reinitialized after exiting Standby mode.

1. Refer to *Section 16.3.3* to know if any Stop mode is supported.

16.7 GPDMA interrupts

There is one GPDMA interrupt line for each channel, and separately for each CPU (if several ones in the devices).

Table 150. GPDMA interrupt requests

Interrupt acronym	Interrupt event	Interrupt enable	Event flag	Event clear method
GPDMA_CHx	Transfer complete	GPDMA_CxCR.TCIE	GPDMA_CxSR.TCF	Write 1 to GPDMA_CxFCR.TCF
	Half transfer	GPDMA_CxCR.HTIE	GPDMA_CxSR.HTF	Write 1 to GPDMA_CxFCR.HTF
	Data transfer error	GPDMA_CxCR.DTEIE	GPDMA_CxSR.DTEF	Write 1 to GPDMA_CxFCR.DTEF
	Update link error	GPDMA_CxCR.ULEIE	GPDMA_CxSR.ULEF	Write 1 to GPDMA_CxFCR.ULEF
	User setting error	GPDMA_CxCR.USEIE	GPDMA_CxSR.USEF	Write 1 to GPDMA_CxFCR.USEF
	Suspended	GPDMA_CxCR.SUSPIE	GPDMA_CxSR.SUSPF	Write 1 to GPDMA_CxFCR.SUSPF
	Trigger overrun	GPDMA_CxCR.TOFIE	GPDMA_CxSR.TOF	Write 1 to GPDMA_CxFCR.TOF

A GPDMA channel x event may be:

- a transfer complete
- a half-transfer complete
- a transfer error, due to either:
  - a data transfer error
  - an update link error
  - a user setting error completed suspension
- a trigger overrun

Note: When a channel x transfer complete event occurs, the output signal gpdma_chx_tc is generated as a high pulse of one clock cycle.

An interrupt is generated following any xx event, provided that both:

- the corresponding interrupt event xx is enabled (GPDMA_CxCR.xxIE = 1)
- the corresponding event flag is cleared (GPDMA_CxSR.xxF = 0). This means that, after a previous same xx event occurrence, a software agent must have written 1 into the corresponding xx flag clear control bit (write 1 into GPDMA_CxFCR.xxF).

TCF (transfer complete) and HTF (half transfer) events generation is controlled by GPDMA_CxTR2.TCEM[1:0] as follows:

- A transfer complete event is a block transfer complete, a 2D/repeated block transfer complete, or a LLI transfer complete including the upload of the next LLI if any, or the full linked-list completion, depending on the transfer complete event mode GPDMA_CxTR2.TCEM[1:0].

- A half-transfer event is a half-block transfer or a half 2D/repeated block transfer, depending on the transfer complete event mode GPDMA_CxTR2.TCEM[1:0].

  A half-block transfer occurs when half of the source block size bytes (rounded-up integer of GPDMA_CxBR1.BNDT[15:0] / 2) is transferred to the destination.

  A half 2D/repeated block transfer occurs when half of the repeated blocks (rounded-up integer of (GPDMA_CxBR1.BRC[10:0] + 1) / 2) is transferred to the destination.

See *GPDMA channel x transfer register 2 (GPDMA_CxTR2)* for more details.

A transfer error rises in one of the following situations:

- during a single/burst data transfer from the source or to the destination (DTEF)
- during an update of a GPDMA channel register from the programmed LLI in memory (ULEF)
- during a tentative execution of a GPDMA channel with an unauthorized setting (USEF)

  The user must perform a debug session to correct the GPDMA channel programming versus the USEF root causes list (see *Section 16.4.17*).

A trigger overrun is described in *Trigger hit memorization and trigger overrun flag generation*.

16.8 GPDMA registers

The GPDMA registers must be accessed with an aligned 32-bit word data access.

16.8.1 GPDMA secure configuration register (GPDMA_SECCFGR)

Address offset: 0x00

Reset value: 0x0000 0000

A write access to this register must be secure and privileged. A read access is secure or nonsecure, privileged or unprivileged.

A write access is ignored at bit level if the corresponding channel x is locked (GPDMA_RCFGLOCKR.LOCKx = 1).

This register must be written when GPDMA_CxCR.EN = 0.

This register is read-only when GPDMA_CxCR.EN = 1.

This register must be programmed at a bit level, at the initialization/closure of a GPDMA channel (when GPDMA_CxCR.EN = 0), to securely allocate individually any channel x to the secure or nonsecure world.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **SECx**: secure state of channel x (x = 7 to 0)
0: Nonsecure
1: Secure

16.8.2 GPDMA privileged configuration register (GPDMA_PRIVCFGR)

Address offset: 0x04

Reset value: 0x0000 0000

A write access to this register must be privileged. A read access can be privileged or unprivileged, secure or nonsecure.

This register can mix secure and nonsecure information. If a channel x is configured as secure (GPDMA_SECCFGR.SECx = 1), the PRIVx bit can be written only by a secure (and privileged) agent.

A write access is ignored at bit level if the corresponding channel x is locked (GPDMA_RCFGLOCKR.LOCKx = 1).

This register must be written when GPDMA_CxCR.EN = 0.

This register is read-only when GPDMA_CxCR.EN =1.

This register must be programmed at a bit level, at the initialization/closure of a GPDMA channel (GPDMA_CxCR.EN = 0), to individually allocate any channel x to the privileged or unprivileged world.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PRIVx**: privileged state of channel x (x = 7 to 0)
0: unprivileged
1: privileged

16.8.3 GPDMA configuration lock register (GPDMA_RCFGLOCKR)

Address offset: 0x08

Reset value: 0x0000 0000

This register can be written by a software agent with secure privileged attributes in order to individually lock, for example at boot time, the secure privileged attributes of any GPDMA

channel/resource (to lock the setting of GPDMA_CxSECCFGR, GPDMA_CxPRIVCFGR for any channel x, for example at boot time).

A read access may be privileged or unprivileged, secure or nonsecure.

Note: If TZEN = 0, this register cannot be written.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCK7	LOCK6	LOCK5	LOCK4	LOCK3	LOCK2	LOCK1	LOCK0
								rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **LOCKx**: lock the configuration of GPDMA_SECCFGR.SECx, GPDMA_PRIVCFGR.PRIVx until a global GPDMA reset (x = 7 to 0)

This bit is cleared after reset and, once set, it cannot be reset until a global GPDMA reset.

0: secure privilege configuration of the channel x is writable.

1: secure privilege configuration of the channel x is not writable.

16.8.4 GPDMA nonsecure masked interrupt status register (GPDMA_MISR)

Address offset: 0x0C

Reset value: 0x0000 0000

This register is a read register.

This is a nonsecure register, containing the masked interrupt status bit MISx for each nonsecure channel x (channel x configured with GPDMA_SECCFGR.SECx = 0). It is a logical OR of all the flags of GPDMA_CxSR, each source flag being enabled by the corresponding interrupt enable bit of GPDMA_CxCR.

Every bit is deasserted by hardware when writing 1 to the corresponding flag clear bit in GPDMA_CxFCR.

If a channel x is in secure state (GPDMA_SECCFGR.SECx = 1), a read access to the masked interrupt status bit MISx of this channel x returns zero.

This register may mix privileged and unprivileged information, depending on the privileged state of each channel GPDMA_PRIVCFGR.PRIVx. A privileged software can read the full nonsecure interrupt status. An unprivileged software is restricted to read the status of unprivileged (and nonsecure) channels, other privileged bit fields returning zero.

								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **MISx**: masked interrupt status of channel x (x = 7 to 0)
0: no interrupt occurred on channel x
1: an interrupt occurred on channel x

16.8.5 GPDMA secure masked interrupt status register (GPDMA_SMISR)

Address offset: 0x10

Reset value: 0x0000 0000

This is a secure read register, containing the masked interrupt status bit MISx for each secure channel x (GPDMA_SECCFGR.SECx = 1). It is a logical OR of all the GPDMA_CxSR flags, each source flag being enabled by the corresponding GPDMA_CxCR interrupt enable bit.

Every bit is deasserted by hardware when securely writing 1 to the corresponding GPDMA_CxFCR flag clear bit.

This register does not contain any information about a nonsecure channel.

This register can mix privileged and unprivileged information, depending on the privileged state of each channel GPDMA_PRIVCFGR.PRIVx. A privileged software can read the full secure interrupt status. An unprivileged software is restricted to read the status of unprivileged and secure channels, other privileged bit fields returning zero.

								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **MISx**: masked interrupt status of the secure channel x (x = 7 to 0)
0: no interrupt occurred on the secure channel x
1: an interrupt occurred on the secure channel x

16.8.6 GPDMA channel x linked-list base address register (GPDMA_CxLBAR)

Address offset: 0x50 + 0x80 * x (x = 0 to 7)

Reset value: 0x0000 0000

This register must be written by a privileged software. It is either privileged readable or not, depending on the privileged state of the channel x GPDMA_PRIVCFGR.PRIVx.

This register is either secure or nonsecure depending on the secure state of the channel x (GPDMA_SECCFGR.SECx).

This register must be written when GPDMA_CxCR.EN = 0.

This register is read-only when GPDMA_CxCR.EN = 1.

This channel-based register is the linked-list base address of the memory region, for a given channel x, from which the LLIs describing the programmed sequence of the GPDMA transfers, are conditionally and automatically updated.

This 64-Kbyte aligned channel x linked-list base address is offset by the 16-bit GPDMA_CxLLR register that defines the word-aligned address offset for each LLI.

Bits 31:16 **LBA[31:16]**: linked-list base address of GPDMA channel x

Bits 15:0 Reserved, must be kept at reset value.

16.8.7 GPDMA channel x flag clear register (GPDMA_CxFCR)

Address offset: 0x5C+ 0x80 * x (x = 0 to 7)

Reset value: 0x0000 0000

This is a write register, secure or nonsecure depending on the secure state of channel x (GPDMA_SECCFGR.SECx) and privileged or unprivileged, depending on the privileged state of the channel x (GPDMA_PRIVCFGR.PRIVx).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **TOF**: trigger overrun flag clear
0: no effect
1: corresponding TOF flag cleared

Bit 13 **SUSPF**: completed suspension flag clear
0: no effect
1: corresponding SUSPF flag cleared

Bit 12 **USEF**: user setting error flag clear
0: no effect
1: corresponding USEF flag cleared

Bit 11 **ULEF**: update link transfer error flag clear
0: no effect
1: corresponding ULEF flag cleared

Bit 10 **DTEF**: data transfer error flag clear
0: no effect
1: corresponding DTEF flag cleared

Bit 9 **HTF**: half-transfer flag clear
0: no effect
1: corresponding HTF flag cleared

Bit 8 **TCF**: transfer complete flag clear
0: no effect
1: corresponding TCF flag cleared

Bits 7:0 Reserved, must be kept at reset value.

16.8.8 GPDMA channel x status register (GPDMA_CxSR)

Address offset: 0x60 + 0x80 * x (x = 0 to 7)

Reset value: 0x0000 0001

This is a read register, reporting the channel status.

This register is secure or nonsecure, depending on the secure state of channel x (GPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of the channel (GPDMA_PRIVCFGR.PRIVx).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	r	r	r	r	r	r	r								r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **FIFOL[7:0]**: monitored FIFO level
Number of available write beats in the FIFO, in units of the programmed destination data width (see GPDMA_CxTR1.DDW_LOG2[1:0], in units of bytes, half-words, or words).

Note: After having suspended an active transfer, the user may need to read FIFOL[7:0], additionally to GPDMA_CxBR1.BDNT[15:0] and GPDMA_CxBR1.BRC[10:0], to know how many data have been transferred to the destination. Before reading, the user may wait for the transfer to be suspended (GPDMA_CxSR.SUSPF = 1).

Bit 15 Reserved, must be kept at reset value.

Bit 14 **TOF**: trigger overrun flag
0: no trigger overrun event
1: a trigger overrun event occurred

Bit 13 **SUSPF**: completed suspension flag
0: no completed suspension event
1: a completed suspension event occurred

Bit 12 **USEF**: user setting error flag
0: no user setting error event
1: a user setting error event occurred

Bit 11 **ULEF**: update link transfer error flag
0: no update link transfer error event
1: a master bus error event occurred while updating a linked-list register from memory

Bit 10 **DTEF**: data transfer error flag
0: no data transfer error event
1: a master bus error event occurred on a data transfer

Bit 9 **HTF**: half-transfer flag
0: no half-transfer event
1: a half-transfer event occurred
A half-transfer event is either a half-block transfer or a half 2D/repeated block transfer, depending on the transfer complete event mode (GPDMA_CxTR2.TCEM[1:0]).
A half-block transfer occurs when half of the bytes of the source block size (rounded up integer of GPDMA_CxBR1.BNDT[15:0]/2) has been transferred to the destination.
A half 2D/repeated block transfer occurs when half of the repeated blocks (rounded up integer of (GPDMA_CxBR1.BRC[10:0] + 1) / 2)) has been transferred to the destination.

Bit 8 **TCF**: transfer complete flag
0: no transfer complete event
1: a transfer complete event occurred
A transfer complete event is either a block transfer complete, a 2D/repeated block transfer complete, or a LLI transfer complete including the upload of the next LLI if any, or the full linked-list completion, depending on the transfer complete event mode (GPDMA_CxTR2.TCEM[1:0]).

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **IDLEF**: idle flag
0: channel not in idle state
1: channel in idle state
This idle flag is deasserted by hardware when the channel is enabled (GPDMA_CxCR.EN = 1) with a valid channel configuration (no USEF to be immediately reported).
This idle flag is asserted after hard reset or by hardware when the channel is back in idle state (in suspended or disabled state).

16.8.9 GPDMA channel x control register (GPDMA_CxCR)

Address offset: 0x64 + 0x80 * x (x = 0 to 7)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (GPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of the channel x (GPDMA_PRIVCFGR.PRIVx).

This register is used to control a channel (activate, suspend, abort or disable it).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIO[1:0]		Res.	Res.	Res.	Res.	LAP	LSM
								rw	rw					rw	rw

Res.	TOIE	SUSPIE	USEIE	ULEIE	DTEIE	HTIE	TCIE	Res.	Res.	Res.	Res.	Res.	SUSP	RESET	EN
	rw	rw	rw	rw	rw	rw	rw						rw	w	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:22 **PRIO[1:0]:** priority level of the channel x GPDMA transfer versus others
00: low priority, low weight
01: low priority, mid weight
10: low priority, high weight
11: high priority
Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bits 21:18 Reserved, must be kept at reset value.

Bit 17 **LAP**: linked-list allocated port
This bit is used to allocate the master port for the update of the GPDMA linked-list registers from the memory.
0: port 0 (AHB) allocated
1: port 1 (AHB) allocated
Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bit 16 **LSM**: Link step mode
0: channel executed for the full linked-list and completed at the end of the last LLI (GPDMA_CxLLR = 0). The 16 low-significant bits of the link address are null (LA[15:0] = 0) and all the update bits are null (UT1 = UB1 = UT2 = USA = UDA = ULL = 0 and UT3 = UB2 = 0). Then GPDMA_CxBR1.BNDT[15:0] = 0 and GPDMA_CxBR1.BRC[10:0] = 0.
1: channel executed **once** for the current LLI
First the (possible 1D/repeated) block transfer is executed as defined by the current internal register file until GPDMA_CxBR1.BNDT[15:0] = 0 and GPDMA_CxBR1.BRC[10:0] = 0. Secondly the next linked-list data structure is conditionally uploaded from memory as defined by GPDMA_CxLLR. Then channel execution is completed.
Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bit 15 Reserved, must be kept at reset value.

Bit 14 **TOIE**: trigger overrun interrupt enable
0: interrupt disabled
1: interrupt enabled

Bit 13 **SUSPIE**: completed suspension interrupt enable
0: interrupt disabled
1: interrupt enabled

Bit 12 **USEIE**: user setting error interrupt enable
0: interrupt disabled
1: interrupt enabled

Bit 11 **ULEIE**: update link transfer error interrupt enable
0: interrupt disabled
1: interrupt enabled

Bit 10 **DTEIE**: data transfer error interrupt enable
0: interrupt disabled
1: interrupt enabled

Bit 9 **HTIE**: half-transfer complete interrupt enable
0: interrupt disabled
1: interrupt enabled

Bit 8 **TCIE**: transfer complete interrupt enable
0: interrupt disabled
1: interrupt enabled

Bits 7:3 Reserved, must be kept at reset value.

Bit 2 **SUSP:** suspend
Writing 1 into the field RESET (bit 1) causes the hardware to de-assert this bit, whatever is written into this bit 2. Else:
Software must write 1 in order to suspend an active channel (channel with an ongoing GPDMA transfer over its master ports).
The software must write 0 in order to resume a suspended channel, following the programming sequence detailed in *Figure 77*.
0: write: resume channel, read: channel not suspended
1: write: suspend channel, read: channel suspended.

Bit 1 **RESET:** reset
This bit is write only. Writing 0 has no impact. Writing 1 implies the reset of the following: the FIFO, the channel internal state, SUSP and EN bits (whatever is written receptively in bit 2 and bit 0).
The reset is effective when the channel is in steady state, meaning one of the following:
- active channel in suspended state (GPDMA_CxSR.SUSPF = 1 and GPDMA_CxSR.IDLEF = GPDMA_CxCR.EN = 1)
- channel in disabled state (GPDMA_CxSR.IDLEF = 1 and GPDMA_CxCR.EN = 0).
After writing a RESET, to continue using this channel, the user must explicitly reconfigure the channel including the hardware-modified configuration registers (GPDMA_CxBR1, GPDMA_CxSAR, and GPDMA_CxDAR) before enabling again the channel (see the programming sequence in *Figure 78*).
0: no channel reset
1: channel reset

Bit 0 **EN:** enable
Writing 1 into the field RESET (bit 1) causes the hardware to de-assert this bit, whatever is written into this bit 0. Else:
this bit is deasserted by hardware when there is a transfer error (master bus error or user setting error) or when there is a channel transfer complete (channel ready to be configured, for example if LSM = 1 at the end of a single execution of the LLI).
Else, this bit can be asserted by software.
Writing 0 into this EN bit is ignored.
0: write: ignored, read: channel disabled
1: write: enable channel, read: channel enabled

16.8.10 GPDMA channel x transfer register 1 (GPDMA_CxTR1)

Address offset: 0x90 + 0x80 * x (x = 0 to 7)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (GPDMA_SECCFGR.SECx) except for secure DSEC and SSEC, privileged or unprivileged, depending on the privileged state of the channel x in GPDMA_PRIVCFGR.PRIVx.

This register controls the transfer of a channel x.

This register must be written when GPDMA_CxCR.EN = 0.

This register is read-only when GPDMA_CxCR.EN = 1.

This register must be written when the channel is completed. Then the hardware has deasserted GPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by GPDMA from the memory if GPDMA_CxLLR.UT1 = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DSEC	DAP	Res.	Res.	DHX	DBX	DBL_1[5:0]						DINC	Res.	DDW_LOG2[1:0]

rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw		rw	rw

Bit 31 **DSEC**: security attribute of the GPDMA transfer to the destination

If GPDMA_SECCFGR.SECx = 1 and the access is secure:

0: GPDMA transfer nonsecure

1: GPDMA transfer secure

This is a secure register bit. This bit can only be read by a secure software. This bit must be written by a secure software when GPDMA_SECCFGR.SECx = 1. A secure write is ignored when GPDMA_SECCFGR.SECx = 0.

When GPDMA_SECCFGR.SECx is deasserted, this DSEC bit is also deasserted by hardware (on a secure reconfiguration of the channel as nonsecure), and the GPDMA transfer to the destination is nonsecure.

Bit 30 **DAP**: destination allocated port

This bit is used to allocate the master port for the destination transfer

0: port 0 (AHB) allocated

1: port 1 (AHB) allocated

Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bits 29:28 Reserved, must be kept at reset value.

Bit 27 **DHX**: destination half-word exchange

If the destination data size is shorter than a word, this bit is ignored.

If the destination data size is a word:

0: no halfword-based exchanged within word

1: the two consecutive (post PAM) half-words are exchanged in each destination word.

Bit 26 **DBX**: destination byte exchange

If the destination data size is a byte, this bit is ignored.

If the destination data size is not a byte:

0:no byte-based exchange within half-word

1: the two consecutive (post PAM) bytes are exchanged in each destination half-word.

Bits 25:20 **DBL_1[5:0]**: destination burst length minus 1, between 0 and 63

The burst length unit is one data named beat within a burst. If DBL_1[5:0] = 0, the burst can be named as single. Each data/beat has a width defined by the destination data width DDW_LOG2[1:0].

Note: If a burst transfer crossed a 1-Kbyte address boundary on a AHB transfer, the GPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the AHB protocol.

If a burst transfer is of length greater than the FIFO size of the channel x, the GPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the FIFO size. Transfer performance is lower, with GPDMA re-arbitration between effective and lower singles/bursts, but the data integrity is guaranteed.

Bit 19 **DINC**: destination incrementing burst

0: fixed burst

1: contiguously incremented burst

The destination address, pointed by GPDMA_CxDAR, is kept constant after a burst beat/single transfer, or is incremented by the offset value corresponding to a contiguous data after a burst beat/single transfer.

Bit 18 Reserved, must be kept at reset value.

Bits 17:16 **DDW_LOG2[1:0]**: binary logarithm of the destination data width of a burst, in bytes

00: byte

01: half-word (2 bytes)

10: word (4 bytes)

11: user setting error reported and no transfer issued

Note: A destination burst transfer must have an aligned address with its data width (start address GPDMA_CxDAR[2:0] and if present address offset GPDMA_CxTR3.DAO[2:0], versus DDW_LOG2[1:0]). Otherwise a user setting error is reported and no transfer is issued.

When configured in packing mode (PAM[1] = 1 and destination data width different from source data width), a source block size must be a multiple of the destination data width (see GPDMA_CxBR1.BNDT[2:0] versus DDW_LOG2[1:0]). Else a user setting error is reported and none transfer is issued.

Setting a 8-byte data width causes a user setting error to be reported and none transfer is issued.

Bit 15 **SSEC**: security attribute of the GPDMA transfer from the source

If GPDMA_SECCFGR.SECx = 1 and the access is secure:

0: GPDMA transfer nonsecure

1: GPDMA transfer secure

This is a secure register bit. This bit can only be read by a secure software. This bit must be written by a secure software when GPDMA_SECCFGR.SECx = 1. A secure write is ignored when GPDMA_SECCFGR.SECx = 0.

When GPDMA_SECCFGR.SECx is deasserted, this SSEC bit is also deasserted by hardware (on a secure reconfiguration of the channel as nonsecure), and the GPDMA transfer from the source is nonsecure.

Bit 14 **SAP**: source allocated port

This bit is used to allocate the master port for the source transfer

0: port 0 (AHB) allocated

1: port 1 (AHB) allocated

Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bit 13 **SBX**: source byte exchange within the unaligned half-word of each source word
If the source data width is shorter than a word, this bit is ignored.
If the source data width is a word:
0:no byte-based exchange within the unaligned half-word of each source word
1: the two consecutive bytes within the unaligned half-word of each source word are exchanged.

Bits 12:11 **PAM[1:0]**: padding/alignment mode
If DDW_LOG2[1:0] = SDW_LOG2[1:0]: if the data width of a burst destination transfer is equal to the data width of a burst source transfer, these bits are ignored.
Else, in the following enumerated values, the condition PAM_1 is when destination data width is higher than source data width, and the condition PAM_2 is when source data width is higher than destination data width.
Condition: PAM_1
00: source data is transferred as right aligned, padded with 0s up to the destination data width
01: source data is transferred as right aligned, sign extended up to the destination data width
10-11: successive source data are FIFO queued and packed at the destination data width, in a left (LSB) to right (MSB) order (named little endian), before a destination transfer
Condition: PAM_2
00: source data is transferred as right aligned, left-truncated down to the destination data width
01: source data is transferred as left-aligned, right-truncated down to the destination data width
10-11: source data is FIFO queued and unpacked at the destination data width, to be transferred in a left (LSB) to right (MSB) order (named little endian) to the destination

Note: If the transfer from the source peripheral is configured with peripheral flow-control mode (SWREQ = 0 and PFREQ = 1 and DREQ = 0), and if the destination data width > the source data width, packing is not supported.

Bit 10 Reserved, must be kept at reset value.

Bits 9:4 **SBL_1[5:0]**: source burst length minus 1, between 0 and 63
The burst length unit is one data named beat within a burst. If SBL_1[5:0] = 0, the burst can be named as single. Each data/beat has a width defined by the destination data width SDW_LOG2[1:0].

Note: If a burst transfer crossed a 1-Kbyte address boundary on a AHB transfer, the GPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the AHB protocol.

If a burst transfer is of length greater than the FIFO size of the channel x, the GPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the FIFO size. Transfer performance is lower, with GPDMA re-arbitration between effective and lower singles/bursts, but the data integrity is guaranteed.

Bit 3 **SINC**: source incrementing burst
0: fixed burst
1: contiguously incremented burst
The source address, pointed by GPDMA_CxSAR, is kept constant after a burst beat/single transfer or is incremented by the offset value corresponding to a contiguous data after a burst beat/single transfer.

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **SDW_LOG2[1:0]**: binary logarithm of the source data width of a burst in bytes
00: byte
01: half-word (2 bytes)
10: word (4 bytes)
11: user setting error reported and no transfer issued

Note: A source block size must be a multiple of the source data width (GPDMA_CxBR1.BNDT[2:0] versus SDW_LOG2[1:0]). Otherwise, a user setting error is reported and no transfer is issued.

A source burst transfer must have an aligned address with its data width (start address GPDMA_CxSAR[2:0] versus SDW_LOG2[1:0]). Otherwise, a user setting error is reported and none transfer is issued.

Setting a 8-byte data width causes a user setting error to be reported and no transfer is issued.

16.8.11 GPDMA channel x transfer register 2 (GPDMA_CxTR2)

Address offset: 0x94 + 0x80 * x (x = 0 to 7)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (GPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (GPDMA_PRIVCFGR.PRIVx).

This register controls the transfer of a channel x. This register must be written when GPDMA_CxCR.EN = 0.

This register is read-only when GPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (the hardware deasserted GPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block or LLI or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by GPDMA from the memory, if GPDMA_CxLLR.UT2 = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TCEM[1:0]		Res.	Res.	Res.	Res.	TRIGPOL[1:0]		Res.	Res.	TRIGSEL[5:0]					
rw	rw					rw	rw			rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRIGM[1:0]		Res.	PFREQ	BREQ	DREQ	SWREQ	Res.	REQSEL[7:0]							
rw	rw		rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 **TCEM[1:0]**: transfer complete event mode

These bits define the transfer granularity for the transfer complete and half-transfer complete events generation.

00: at block level (when GPDMA_CxBR1.BNDT[15:0] = 0): the complete (and the half) transfer event is generated at the (respectively half of the) end of a block.

Note: If the initial LLI_0 data transfer is null/void (directly programmed by the internal register file with GPDMA_CxBR1.BNDT[15:0] = 0), then neither the complete transfer event nor the half-transfer event is generated.

01: channel x (x = 0 to 5), same as 00, channel x (x = 6 to 7), at 2D/repeated block level (when GPDMA_CxBR1.BRC[10:0] = 0 and GPDMA_CxBR1.BNDT[15:0] = 0). The complete (and the half) transfer event is generated at the end (respectively half of the end) of the 2D/repeated block.

Note: If the initial LLI_0 data transfer is null/void (directly programmed by the internal register file with GPDMA_CxBR1.BNDT[15:0] = 0), then neither the complete transfer event nor the half-transfer event is generated.

10: at LLI level: the complete transfer event is generated at the end of the LLI transfer, including the update of the LLI if any. The half-transfer event is generated at the half of the LLI data transfer The LLI data transfer is a block transfer or a 2D/repeated block transfer for channel x (x = 6 to 7), if any data transfer.

Note: If the initial LLI_0 data transfer is null/void (directly programmed by the internal register file with GPDMA_CxBR1.BNDT[15:0] = 0), then the half-transfer event is not generated, and the transfer complete event is generated when is completed the loading of the LLI_1.

11: at channel level: the complete transfer event is generated at the end of the last LLI transfer. The half-transfer event is generated at the half of the data transfer of the last LLI. The last LLI updates the link address GPDMA_CxLLR.LA[15:2] to zero and clears all the GPDMA_CxLLR update bits (UT1, UT2, UB1, USA, UDA and ULL, plus UT3 and UB2). If the channel transfer is continuous/infinite, no event is generated.

Bits 29:26 Reserved, must be kept at reset value.

Bits 25:24 **TRIGPOL[1:0]**: trigger event polarity

These bits define the polarity of the selected trigger event input defined by TRIGSEL[5:0].

00: no trigger (masked trigger event)

01: trigger on the rising edge

10: trigger on the falling edge

11: same as 00

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **TRIGSEL[5:0]**: trigger event input selection

These bits select the trigger event input of the GPDMA transfer (as per *Section 16.3.7*), with an active trigger event if TRIGPOL[1:0] ≠ 00.

Bits 15:14 **TRIGM[1:0]**: trigger mode

These bits define the transfer granularity for its conditioning by the trigger.

If the channel x is enabled (GPDMA_CxCR.EN asserted) with TRIGPOL[1:0] = 00 or 11, these TRIGM[1:0] bits are ignored.

Else, a GPDMA transfer is conditioned by one trigger hit:

00: at block level: the first burst read of each block transfer is conditioned by one hit trigger (channel x (x = 6 to 7): same, each block also if a 2D/repeated block is configured with GPDMA_CxBR1.BRC[10:0] ≠ 0).

01: channel x (x = 0 to 5): same as 00; channel x (x = 6 to 7): at 2D/repeated block level: the first burst read of the 2D/repeated block transfer is conditioned by one hit trigger.

10: at link level: a LLI link transfer is conditioned by one hit trigger. LLI data transfer is not conditioned.

11: at programmed burst level: If SWREQ = 1, each programmed burst read is conditioned by one hit trigger. If SWREQ = 0, each programmed burst that is requested by the selected peripheral, is conditioned by one hit trigger:

– If the peripheral is the source (DREQ = 0) of the LLI data transfer, each programmed burst read is conditioned.

– If the peripheral is the destination (DREQ = 1) of the LLI data transfer, each programmed burst write is conditioned. The first memory burst read of a (possibly 2D/repeated) block, also named as the first ready FIFO-based source burst, is gated by the occurrence of both the hardware request and one trigger hit.

As shown in *Figure 93: Trigger hit, memorization, and overrun waveform*, the GPDMA monitoring of a trigger for channel x is started when the channel is enabled/loaded with a new active trigger configuration: rising or falling edge on a selected trigger (TRIGPOL[1:0] = 01 or respectively TRIGPOL[1:0] = 10). The monitoring of this trigger is kept active during the triggered and uncompleted (data or link) transfer; and if a new trigger is detected then, this hit is internally memorized to grant the next transfer, as long as the defined rising or falling edge is not modified, and the TRIGSEL[5:0] is not modified, and the channel is enabled. After a first new trigger hit_{n+1} is memorized, if another second trigger hit_{n+2} is detected and if the hit_n triggered transfer is still not completed, hit_{n+2} is lost and not memorized. A trigger overrun flag is reported (GPDMA_CxSR.TOF = 1), and an interrupt is generated if enabled (GPDMA_CxCR.TOIE = 1). The channel is not automatically disabled by hardware due to a trigger overrun.

Transferring a next LLI_{n+1} that updates the GPDMA_CxTR2 with a new value for any of TRIGSEL[5:0] or TRIGPOL[1:0], resets the monitoring, trashing the memorized hit of the formerly defined LLI_n trigger.

Note: When the source block size is not a multiple of the source burst size and is a multiple of the source data width, then the last programmed source burst is not completed and is internally shorten to match the block size. In this case, if TRIGM[1:0] = 11 and (SWREQ = 1 or (SWREQ = 0 and DREQ = 0)), the shortened burst transfer (by singles or/and by bursts of lower length) is conditioned once by the trigger.

When the programmed destination burst is internally shortened by singles or/and by bursts of lower length (versus FIFO size, versus block size, 1-Kbyte boundary address crossing): if the trigger is conditioning the programmed destination burst (if TRIGM[1:0] = 11 and SWREQ = 0 and DREQ = 1), this shortened destination burst transfer is conditioned once by the trigger.

Bit 13 Reserved, must be kept at reset value.

Bit 12 **PFREQ**: Hardware request in peripheral flow control mode

Important: If a given channel x is not implemented with this feature, this bit is reserved and PFREQ is not present (see Section 16.3.2 for the list of the implemented channels with this feature).

If the channel x is activated (GPDMA_CxCR.EN asserted) with SWREQ = 1 (software request for a memory-to-memory transfer), this bit is ignored. Else:

0: the selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol in GPDMA control mode. The GPDMA is programmed with GPDMA_CxTR1.BNDT[15:0] and this is internally used by the hardware for the block transfer completion.

1: the selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol in peripheral control mode. The GPDMA block transfer can be early completed by the peripheral itself (see *Section 16.3.6* for more details).

Note: In peripheral flow control mode, there are the following restrictions:

- no 2D/repeated block support (GPDMA_CxBR1.BRC[10:0] must be set to 0)

- the peripheral must be set as the source of the transfer (DREQ = 0).

- data packing to a wider destination width is not supported (if destination width > source data width, GPDMA_CxTR1.PAM[1] must be set to 0).

- GPDMA_CxBR1.BNDT[15:0] must be programmed as a multiple of the source (peripheral) burst size.

Bit 11 **BREQ**: Block hardware request

If the channel x is activated (GPDMA_CxCR.EN asserted) with SWREQ = 1 (software request for a memory-to-memory transfer), this bit is ignored. Else:

0: the selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol at a burst level.

1: the selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol at a block level (see *Section 16.3.4*).

Bit 10 **DREQ**: destination hardware request

This bit is ignored if channel x is activated (GPDMA_CxCR.EN asserted) with SWREQ = 1 (software request for a memory-to-memory transfer). Else:

0: selected hardware request driven by a source peripheral (request signal taken into account by the GPDMA transfer scheduler over the source/read port)

1: selected hardware request driven by a destination peripheral (request signal taken into account by the GPDMA transfer scheduler over the destination/write port)

Note: If the channel x is activated (GPDMA_CxCR.EN is asserted) with SWREQ = 0 and PFREQ = 1 (peripheral hardware request with peripheral flow-control mode), any software assertion to this DREQ bit is ignored: in peripheral flow-control mode, only a peripheral-to-memory transfer is supported.

Bit 9 **SWREQ**: software request

This bit is internally taken into account when GPDMA_CxCR.EN is asserted.

0: no software request. The selected hardware request REQSEL[7:0] is taken into account.

1: software request for a memory-to-memory transfer. The default selected hardware request as per REQSEL[7:0] is ignored.

Bit 8 Reserved, must be kept at reset value.

Bits 7:0 **REQSEL[7:0]**: GPDMA hardware request selection

These bits are ignored if channel x is activated (GPDMA_CxCR.EN asserted) with SWREQ = 1(software request for a memory-to-memory transfer). Else, the selected hardware request is internally taken into account as per *Section 16.3.4*.

Caution: The user must not assign a same input hardware request (same REQSEL[7:0] value) to different active GPDMA channels (GPDMA_CxCR.EN = 1 and GPDMA_CxTR2.SWREQ = 0 for these channels). GPDMA is not intended to hardware support the case of simultaneous enabled channels incorrectly configured with a same hardware peripheral request signal, and there is no user setting error reporting.

16.8.12 GPDMA channel x block register 1 (GPDMA_CxBR1)

Address offset: 0x98 + 0x80 * x (x = 0 to 5)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (GPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (GPDMA_PRIVCFGR.PRIVx).

This register controls the transfer of a channel x at a block level.

This register must be written when GPDMA_CxCR.EN = 0.

This register is read-only when GPDMA_CxCR.EN = 1.

This register must be written when channel x is completed (then the hardware has deasserted GPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, or LLI or full linked-list.

In linked-list mode, during the link transfer:

- if GPDMA_CxLLR.UB1 = 1, this register is automatically updated by the GPDMA from the next LLI in memory.
- If GPDMA_CxLLR.UB1 = 0 and if there is at least one linked-list register to be updated from the next LLI in memory, this register is automatically and internally restored with the programmed value for the field BNDT[15:0].
- If all the update bits GPDMA_CxLLR.Uxx are null and if GPDMA_CxLLR.LA[15:0] ≠ 0, the current LLI is the last one and is continuously executed: this register is automatically and internally restored with the programmed value for BNDT[15:0] after each execution of this final LLI
- If GPDMA_CxLLR = 0, this register and BNDT[15:0] are kept as null, channel x is completed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BNDT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **BNDT[15:0]**: block number of data bytes to transfer from the source

Block size transferred from the source. When the channel is enabled, this field becomes read-only and is decremented, indicating the remaining number of data items in the current source block to be transferred. BNDT[15:0] is programmed in number of bytes, maximum source block size is 64 Kbytes -1.

Once the last data transfer is completed (BNDT[15:0] = 0):

- if GPDMA_CxLLR.UB1 = 1, this field is updated with the LLI in the memory.
- if GPDMA_CxLLR.UB1 = 0 and if there is at least one non null Uxx update bit, this field is internally restored to the programmed value.
- if all GPDMA_CxLLR.Uxx = 0 and if GPDMA_CxLLR.LA[15:0] = 0, this field is internally restored to the programmed value (infinite/continuous last LLI).
- if GPDMA_CxLLR = 0, this field is kept as zero following the last LLI data transfer.

Note: A non-null source block size must be a multiple of the source data width (BNDT[2:0] versus GPDMA_CxTR1.SDW_LOG2[1:0]). Else a user setting error is reported and no transfer is issued.

When configured in packing mode (GPDMA_CxTR1.PAM[1] = 1 and destination data width different from source data width), a non-null source block size must be a multiple of the destination data width (BNDT[2:0] versus GPDMA_CxTR1.DDW_LOG2[1:0]). Else a user setting error is reported and no transfer is issued.

16.8.13 GPDMA channel x alternate block register 1 (GPDMA_CxBR1)

Address offset: 0x98 + 0x80 * x (x = 6 to 7)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (GPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (GPDMA_PRIVCFGR.PRIVx).

This register controls the transfer of a channel x at a block level.

This register must be written when GPDMA_CxCR.EN = 0.

This register is read-only when GPDMA_CxCR.EN = 1.

This register must be written when channel x is completed (then the hardware has deasserted GPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, or LLI or full linked-list.

In linked-list mode, during the link transfer:

- if GPDMA_CxLLR.UB1 = 1, this register is automatically updated by the GPDMA from the next LLI in memory.
- If GPDMA_CxLLR.UB1 = 0 and if there is at least one linked-list register to be updated from the next LLI in memory, this register is automatically and internally restored with the programmed value for the fields BNDT[15:0] and BRC[10:0].
- If all the update bits GPDMA_CxLLR.Uxx are null and if GPDMA_CxLLR.LA[15:0] ≠ 0, the current LLI is the last one and is continuously executed: this register is

automatically and internally restored with the programmed value for the fields BNDT[15:0] and BRC[10:0] after each execution of this final LLI

- If GPDMA_CxLLR = 0, BNDT[15:0] and BRC[10:0] are kept as null, channel x is completed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BRDDEC	BRSDEC	DDEC	SDEC	Res.	BRC[10:0]										
rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BNDT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **BRDDEC**: Block repeat destination address decrement

0: at the end of a block transfer, the GPDMA_CxDAR register is updated by adding the programmed offset GPDMA_CxBR2.BRDAO to the current GPDMA_CxDAR value (current destination address)

1: at the end of a block transfer, the GPDMA_CxDAR register is updated by subtracting the programmed offset GPDMA_CxBR2.BRDAO from the current GPDMA_CxDAR value (current destination address)

Note: On top of this increment/decrement (depending on BRDDEC), GPDMA_CxDAR is in the same time also updated by the increment/decrement (depending on DDEC) of the GPDMA_CxTR3.DAO value, as it is usually done at the end of each programmed burst transfer.

Bit 30 **BRSDEC**: Block repeat source address decrement

0: at the end of a block transfer, the GPDMA_CxSAR register is updated by adding the programmed offset GPDMA_CxBR2.BRSAO to the current GPDMA_CxSAR value (current source address)

1: at the end of a block transfer, the GPDMA_CxSAR register is updated by subtracting the programmed offset GPDMA_CxBR2.BRSAO from the current GPDMA_CxSAR value (current source address)

Note: On top of this increment/decrement (depending on BRSDEC), GPDMA_CxSAR is in the same time also updated by the increment/decrement (depending on SDEC) of the GPDMA_CxTR3.SAO value, as it is done after any programmed burst transfer.

Bit 29 **DDEC**: destination address decrement

0: At the end of a programmed burst transfer to the destination, the GPDMA_CxDAR register is updated by adding the programmed offset GPDMA_CxTR3.DAO to the current GPDMA_CxDAR value (current destination address)

1: At the end of a programmed burst transfer to the destination, the GPDMA_CxDAR register is updated by subtracting the programmed offset GPDMA_CxTR3.DAO to the current GPDMA_CxDAR value (current destination address)

Bit 28 **SDEC**: source address decrement

0: At the end of a programmed burst transfer from the source, the GPDMA_CxSAR register is updated by adding the programmed offset GPDMA_CxTR3.SAO to the current GPDMA_CxSAR value (current source address)

1: At the end of a programmed burst transfer from the source, the GPDMA_CxSAR register is updated by subtracting the programmed offset GPDMA_CxTR3.SAO to the current GPDMA_CxSAR value (current source address)

Bit 27 Reserved, must be kept at reset value.

Bits 26:16 **BRC[10:0]**: Block repeat counter

This field contains the number of repetitions of the current block (0 to 2047).

When the channel is enabled, this field becomes read-only. After decrements, this field indicates the remaining number of blocks, excluding the current one. This counter is hardware decremented for each completed block transfer.

Once the last block transfer is completed (BRC[10:0] = BNDT[15:0] = 0):

– If GPDMA_CxLLR.UB1 = 1, all GPDMA_CxBR1 fields are updated by the next LLI in the memory.

– If GPDMA_CxLLR.UB1 = 0 and if there is at least one not null Uxx update bit, this field is internally restored to the programmed value.

– if all GPDMA_CxLLR.Uxx = 0 and if GPDMA_CxLLR.LA[15:0] ≠ 0, this field is internally restored to the programmed value (infinite/continuous last LLI).

– if GPDMA_CxLLR = 0, this field is kept as zero following the last LLI and data transfer.

Bits 15:0 **BNDT[15:0]**: block number of data bytes to transfer from the source

Block size transferred from the source. When the channel is enabled, this field becomes read-only and is decremented, indicating the remaining number of data items in the current source block to be transferred. BNDT[15:0] is programmed in number of bytes, maximum source block size is 64 Kbytes -1.

Once the last data transfer is completed (BNDT[15:0] = 0):

- if GPDMA_CxLLR.UB1 = 1, this field is updated with the LLI in the memory.

- if GPDMA_CxLLR.UB1 = 0 and if there is at least one not null Uxx update bit, this field is internally restored to the programmed value.

- if all GPDMA_CxLLR.Uxx = 0 and if GPDMA_CxLLR.LA[15:0] ≠ 0, this field is internally restored to the programmed value (infinite/continuous last LLI).

- if GPDMA_CxLLR = 0, this field is kept as zero following the last LLI data transfer.

Note: A non-null source block size must be a multiple of the source data width (BNDT[2:0] versus GPDMA_CxTR1.SDW_LOG2[1:0]). Else a user setting error is reported and no transfer is issued.

When configured in packing mode (GPDMA_CxTR1.PAM[1] = 1 and destination data width different from source data width), a non-null source block size must be a multiple of the destination data width (BNDT[2:0] versus GPDMA_CxTR1.DDW_LOG2[1:0]). Else a user setting error is reported and no transfer is issued.

16.8.14 GPDMA channel x source address register (GPDMA_CxSAR)

Address offset: 0x9C + 0x80 * x (x = 0 to 7)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (GPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (GPDMA_PRIVCFGR.PRIVx).

This register configures the source start address of a transfer.

This register must be written when GPDMA_CxCR.EN = 0.

This register is read-only when GPDMA_CxCR.EN = 1, and continuously updated by hardware, in order to reflect the address of the next burst transfer from the source.

This register must be written when the channel is completed (then the hardware has deasserted GPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the GPDMA from the memory if GPDMA_CxLLR.USA = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SA[31:0]**: source address

This field is the pointer to the address from which the next data is read.

During the channel activity, depending on the source addressing mode (GPDMA_CxTR1.SINC), this field is kept fixed or incremented by the data width (GPDMA_CxTR1.SDW_LOG2[1:0]) after each burst source data, reflecting the next address from which data is read.

During the channel activity, this address is updated after each completed source burst, consequently to:

– the programmed source burst; either in fixed addressing mode or in contiguous-data incremented mode. If contiguously incremented (GPDMA_CxTR1.SINC = 1), then the additional address offset value is the programmed burst size, as defined by GPDMA_CxTR1.SBL_1[5:0] and GPDMA_CxTR1.SDW_LOG2[1:0]

– the additional source incremented/decremented offset value as programmed by GPDMA_CxBR1.SDEC and GPDMA_CxTR3.SAO[12:0].

– once/if completed source block transfer, for a channel x with 2D addressing capability (x = 6 to 7). additional block repeat source incremented/decremented offset value as programmed by GPDMA_CxBR1.BRSDEC and GPDMA_CxBR2.BRSAO[15:0]

In linked-list mode, after a LLI data transfer is completed, this register is automatically updated by GPDMA from the memory, provided the LLI is set with GPDMA_CxLLR.USA = 1.

Note: A source address must be aligned with the programmed data width of a source burst (SA[2:0] versus GPDMA_CxTR1.SDW_LOG2[1:0]). Else, a user setting error is reported and no transfer is issued.

When the source block size is not a multiple of the source burst size and is a multiple of the source data width, the last programmed source burst is not completed and is internally shorten to match the block size. In this case, the additional GPDMA_CxTR3.SAO[12:0] is not applied.

16.8.15 GPDMA channel x destination address register (GPDMA_CxDAR)

Address offset: 0xA0 + 0x80 * x (x = 0 to 7)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (GPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (GPDMA_PRIVCFGR.PRIVx).

This register configures the destination start address of a transfer.

This register must be written when GPDMA_CxCR.EN = 0.

This register is read-only when GPDMA_CxCR.EN = 1, and continuously updated by hardware, in order to reflect the address of the next burst transfer to the destination.

This register must be written when the channel is completed (then the hardware has deasserted GPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by GPDMA from the memory if GPDMA_CxLLR.UDA = 1.

DA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DA[31:0]**: destination address

This field is the pointer to the address from which the next data is written.

During the channel activity, depending on the destination addressing mode (GPDMA_CxTR1.DINC), this field is kept fixed or incremented by the data width (GPDMA_CxTR1.DDW_LOG2[1:0]) after each burst destination data, reflecting the next address from which data is written.

During the channel activity, this address is updated after each completed destination burst, consequently to:

– the programmed destination burst; either in fixed addressing mode or in contiguous-data incremented mode. If contiguously incremented (GPDMA_CxTR1.DINC = 1), then the additional address offset value is the programmed burst size, as defined by GPDMA_CxTR1.DBL_1[5:0] and GPDMA_CxTR1.DDW_LOG2[1:0]

– the additional destination incremented/decremented offset value as programmed by GPDMA_CxBR1.DDEC and GPDMA_CxTR3.DAO[12:0].

– once/if completed destination block transfer, for a channel x with 2D addressing capability (x = 6 to 7), the additional block repeat destination incremented/decremented offset value as programmed by GPDMA_CxBR1.BRDDEC and GPDMA_CxBR2.BRDAO[15:0]

In linked-list mode, after a LLI data transfer is completed, this register is automatically updated by the GPDMA from the memory, provided the LLI is set with GPDMA_CxLLR.UDA = 1.

Note: A destination address must be aligned with the programmed data width of a destination burst (DA[2:0] versus GPDMA_CxTR1.DDW_LOG2[1:0]). Else, a user setting error is reported and no transfer is issued.

16.8.16 GPDMA channel x transfer register 3 (GPDMA_CxTR3)

Address offset: 0xA4 + 0x80 * x (x = 6 to 7)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (GPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (GPDMA_PRIVCFGR.PRIVx).

This register controls the transfer of a channel x.

This register must be written when GPDMA_CxCR.EN = 0.

This register is read-only when GPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (then the hardware has deasserted GPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block or LLI or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the GPDMA from the memory if GPDMA_CxLLR.UT3 = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	DAO[12:0]												
			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Res.	Res.	Res.	SAO[12:0]												
			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:16 **DAO[12:0]**: destination address offset increment

The destination address, pointed by GPDMA_CxDAR, is incremented or decremented (depending on GPDMA_CxBR1.DDEC) by this offset DAO[12:0] for each programmed destination burst. This offset is not including and is added to the programmed burst size when the completed burst is addressed in incremented mode (GPDMA_CxTR1.DINC = 1).

Note: A destination address offset must be aligned with the programmed data width of a destination burst (DAO[2:0] versus GPDMA_CxTR1.DDW_LOG2[1:0]). Else, a user setting error is reported and no transfer is issued.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:0 **SAO[12:0]**: source address offset increment

The source address, pointed by GPDMA_CxSAR, is incremented or decremented (depending on GPDMA_CxBR1.SDEC) by this offset SAO[12:0] for each programmed source burst. This offset is not including and is added to the programmed burst size when the completed burst is addressed in incremented mode (GPDMA_CxTR1.SINC = 1).

Note: A source address offset must be aligned with the programmed data width of a source burst (SAO[2:0] versus GPDMA_CxTR1.SDW_LOG2[1:0]). Else a user setting error is reported and none transfer is issued.

When the source block size is not a multiple of the destination burst size, and is a multiple of the source data width, then the last programmed source burst is not completed and is internally shorten to match the block size. In this case, the additional GPDMA_CxTR3.SAO[12:0] is not applied.

16.8.17 GPDMA channel x block register 2 (GPDMA_CxBR2)

Address offset: 0xA8 + 0x80 * x (x = 6 to 7)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (GPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (GPDMA_PRIVCFGR.PRIVx).

This register controls the transfer of a channel x at a 2D/repeated block level.

This register must be written when GPDMA_CxCR.EN = 0.

This register is read-only when GPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (then the hardware has deasserted GPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the GPDMA from the memory if GPDMA_CxLLR.UB2 = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

BRSAO[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **BRDAO[15:0]**: Block repeated destination address offset

For a channel with 2D addressing capability, this field is used to update (by addition or subtraction depending on GPDMA_CxBR1.BRDDEC) the current destination address (GPDMA_CxDAR) at the end of a block transfer.

Note: A block repeated destination address offset must be aligned with the programmed data width of a destination burst (BRDAO[2:0] versus GPDMA_CxTR1.DDW_LOG2[1:0]). Else a user setting error is reported and no transfer is issued. BRDAO[15:0] must be set to 0 in peripheral flow-control mode (if GPDMA_CxTR2.PFREQ = 1).

Bits 15:0 **BRSAO[15:0]**: Block repeated source address offset

For a channel with 2D addressing capability, this field is used to update (by addition or subtraction depending on GPDMA_CxBR1.BRSDEC) the current source address (GPDMA_CxSAR) at the end of a block transfer.

Note: A block repeated source address offset must be aligned with the programmed data width of a source burst (BRSAO[2:0] versus GPDMA_CxTR1.SDW_LOG2[1:0]). Else a user setting error is reported and no transfer is issued. BRSAO[15:0] must be set to 0 in peripheral flow-control mode (if GPDMA_CxTR2.PFREQ = 1).

16.8.18 GPDMA channel x linked-list address register (GPDMA_CxLLR)

Address offset: 0xCC + 0x80 * x (x = 0 to 5)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (GPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (GPDMA_PRIVCFGR.PRIVx).

This register configures the data structure of the next LLI in the memory and its address pointer. A channel transfer is completed when this register is null.

This register must be written when GPDMA_CxCR.EN = 0.

This register is read-only when GPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (then the hardware has deasserted GPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block or LLI or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the GPDMA from the memory if GPDMA_CxLLR.ULL = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw											rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LA[15:2]														Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		

Bit 31 **UT1**: Update GPDMA_CxTR1 from memory

This bit controls the update of GPDMA_CxTR1 from the memory during the link transfer.
0: no GPDMA_CxTR1 update
1: GPDMA_CxTR1 update

Bit 30 **UT2**: Update GPDMA_CxTR2 from memory

This bit controls the update of GPDMA_CxTR2 from the memory during the link transfer.
0: no GPDMA_CxTR2 update
1: GPDMA_CxTR2 update

Bit 29 **UB1**: Update GPDMA_CxBR1 from memory

This bit controls the update of GPDMA_CxBR1 from the memory during the link transfer.
If UB1 = 0 and if GPDMA_CxLLR ≠ 0, the linked-list is not completed.
GPDMA_CxBR1.BNDT[15:0] is then restored to the programmed value after data transfer is completed and before the link transfer.
0: no GPDMA_CxBR1 update from memory (GPDMA_CxBR1.BNDT[15:0] restored if any link transfer)
1: GPDMA_CxBR1 update

Bit 28 **USA**: update GPDMA_CxSAR from memory

This bit controls the update of GPDMA_CxSAR from the memory during the link transfer.
0: no GPDMA_CxSAR update
1: GPDMA_CxSAR update

Bit 27 **UDA**: Update GPDMA_CxDAR register from memory

This bit is used to control the update of GPDMA_CxDAR from the memory during the link transfer.

0: no GPDMA_CxDAR update

1: GPDMA_CxDAR update

Bits 26:17 Reserved, must be kept at reset value.

Bit 16 **ULL**: Update GPDMA_CxLLR register from memory

This bit is used to control the update of GPDMA_CxLLR from the memory during the link transfer.

0: no GPDMA_CxLLR update

1: GPDMA_CxLLR update

Bits 15:2 **LA[15:2]**: pointer (16-bit low-significant address) to the next linked-list data structure

If UT1 = UT2 = UB1 = USA = UDA = ULL = 0 and if LA[15:2] = 0, the current LLI is the last one. The channel transfer is completed without any update of the linked-list GPDMA register file.

Else, this field is the pointer to the memory address offset from which the next linked-list data structure is automatically fetched from, once the data transfer is completed, in order to conditionally update the linked-list GPDMA internal register file (GPDMA_CxTR1, GPDMA_CxTR2, GPDMA_CxBR1, GPDMA_CxSAR, GPDMA_CxDAR, and GPDMA_CxLLR).

Caution: The user must program this pointer not to exceed the 64-Kbyte addressable space defined by the link base address register GPDMA_CxLBAR. The complete linked-list data structure must be included in the 64-Kbyte addressable space.

Note: The user must program the pointer to be 32-bit aligned. The two low-significant bits are write ignored.

Bits 1:0 Reserved, must be kept at reset value.

16.8.19 GPDMA channel x alternate linked-list address register (GPDMA_CxLLR)

Address offset: 0xCC + 0x80 * x (x = 6 to 7)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (GPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (GPDMA_PRIVCFGR.PRIVx).

This register configures the data structure of the next LLI in the memory and its address pointer. A channel transfer is completed when this register is null.

This register must be written when GPDMA_CxCR.EN = 0.

This register is read-only when GPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (then the hardware has deasserted GPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block or LLI or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the GPDMA from the memory if GPDMA_CxLLR.ULL = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UT1	UT2	UB1	USA	UDA	UT3	UB2	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ULL
rw	rw	rw	rw	rw	rw	rw									rw

LA[15:2]														Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		

Bit 31 **UT1**: Update GPDMA_CxTR1 from memory

This bit controls the update of GPDMA_CxTR1 from the memory during the link transfer.

0: no GPDMA_CxTR1 update

1: GPDMA_CxTR1 update

Bit 30 **UT2**: Update GPDMA_CxTR2 from memory

This bit controls the update of GPDMA_CxTR2 from the memory during the link transfer.

0: no GPDMA_CxTR2 update

1: GPDMA_CxTR2 update

Bit 29 **UB1**: Update GPDMA_CxBR1 from memory

This bit controls the update of GPDMA_CxBR1 from the memory during the link transfer.
If UB1 = 0 and if GPDMA_CxLLR ≠ 0, the linked-list is not completed.
GPDMA_CxBR1.BNDT[15:0] is then restored to the programmed value after data transfer is completed and before the link transfer.

0: no GPDMA_CxBR1 update from memory (GPDMA_CxBR1.BNDT[15:0] restored if any link transfer)

1: GPDMA_CxBR1 update

Bit 28 **USA**: update GPDMA_CxSAR from memory

This bit controls the update of GPDMA_CxSAR from the memory during the link transfer.

0: no GPDMA_CxSAR update

1: GPDMA_CxSAR update

Bit 27 **UDA**: Update GPDMA_CxDAR register from memory
This bit is used to control the update of GPDMA_CxDAR from the memory during the link transfer.
0:no GPDMA_CxDAR update
1: GPDMA_CxDAR update

Bit 26 **UT3**: Update GPDMA_CxTR3 from memory
This bit controls the update of GPDMA_CxTR3 from the memory during the link transfer.
0: no GPDMA_CxTR3 update
1: GPDMA_CxTR3 update

Bit 25 **UB2**: Update GPDMA_CxBR2 from memory
This bit controls the update of GPDMA_CxBR2 from the memory during the link transfer.
0: no GPDMA_CxBR2 update
1: GPDMA_CxBR2 update

Bits 24:17 Reserved, must be kept at reset value.

Bit 16 **ULL**: Update GPDMA_CxLLR register from memory
This bit is used to control the update of GPDMA_CxLLR from the memory during the link transfer.
0: no GPDMA_CxLLR update
1: GPDMA_CxLLR update

Bits 15:2 **LA[15:2]**: pointer (16-bit low-significant address) to the next linked-list data structure
If UT1 = UT2 = UB1 = USA = UDA = ULL = 0 and if LA[15:2] = 0, the current LLI is the last one. The channel transfer is completed without any update of the linked-list GPDMA register file.
Else, this field is the pointer to the memory address offset from which the next linked-list data structure is automatically fetched from, once the data transfer is completed, in order to conditionally update the linked-list GPDMA internal register file (GPDMA_CxTR1, GPDMA_CxTR2, GPDMA_CxBR1, GPDMA_CxSAR, GPDMA_CxDAR, and GPDMA_CxLLR).

Caution: The user must program this pointer not to exceed the 64-Kbyte addressable space defined by the link base address register GPDMA_CxLBAR. The complete linked-list data structure must be included in the 64-Kbyte addressable space.

Note: The user must program the pointer to be 32-bit aligned. The two low-significant bits are write ignored.

Bits 1:0 Reserved, must be kept at reset value.

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

17 Nested vectored interrupt controller (NVIC)

17.1 NVIC main features

- Up to 150 maskable interrupt channels (not including the 16 Cortex-M33 with FPU interrupt lines)
- 16 programmable priority levels (four bits of interrupt priority used)
- Low-latency exception and interrupt handling
- Power management control
- Implementation of system control registers

The NVIC and the processor core interface are closely coupled, enabling low-latency interrupt processing and efficient processing of late arriving interrupts.

The NVIC registers are banked across secure and nonsecure states.

All interrupts. including the core exceptions, are managed by the NVIC.

17.2 SysTick calibration value register

The Cortex-M33 with TrustZone mainline security extension embeds two SysTick timers.

When TrustZone is activated, the following SysTick timers are available:

- SysTick, secure instance
- SysTick, nonsecure instance

When TrustZone is disabled, only one SysTick timer is available.

The SysTick timer calibration value (STCALIB) is 0x3E8. It gives a reference time base of 1 ms based on a SysTick clock frequency of 1 MHz. To match the 1 ms time base for an application running at a given frequency, the SysTick reload value must be programmed as follows in the SYST_RVR register:

- When SysTick clock source is CPU clock HCLK reload value = (HCLK x STCALIB) - 1
- When SysTick clock source is external clock (HCLK/8) reload value = ((HCLK / 8) x STCALIB) - 1

The HCLK refers to the AHB frequency value in MHz.

Example: SysTick clock source is CPU clock HCLK of 100 MHz, to match a time base of 1 ms: SysTick reload value = (100 x STCALIB) - 1 = 0x1869F.

17.3 Interrupt and exception vectors

The gray rows in *Table 152*, *Table 153*, and *Table 154* describe the vectors without specific position.

Table 152. STM32H562/563/573xx vector table

18 Extended interrupts and event controller (EXTI)

18.1 EXTI introduction

The extended interrupts and event controller (EXTI) manages the individual CPU and system wake-up through configurable and direct event inputs. It provides wake-up requests to the power control and generates an interrupt request to the CPU NVIC and events to the CPU event input. For the CPU, an additional event generation block (EVG) is needed to generate the CPU event signal.

The EXTI wake-up requests allow the system to be woken up from Stop modes.

The interrupt request and event request generation can be used also in Run modes.

The EXTI also includes the EXTI mux IO port selection.

18.2 EXTI main features

The EXTI main features are the following:

- Up to 67 input events supported
- All event inputs allow the possibility to wake up the system.
- Events that do not have an associated wake-up flag in the peripheral, have a flag in the EXTI and generate an interrupt to the CPU from the EXTI.
- Events can be used to generate a CPU wake-up event.

The asynchronous event inputs are classified in two groups:

- Configurable events (signals from I/Os or peripherals able to generate a pulse), with the following features
  - Selectable active trigger edge
  - Interrupt pending status register bits independent for the rising and falling edge
  - Individual interrupt and event generation mask, used for conditioning the CPU wake-up, interrupt and event generation
  - Software trigger possibility
  - Secure events: The access to control and configuration bits of secure input events can be made secure and or privilege.
  - EXTI IO port selection
- Direct events (interrupt and wake-up sources from peripherals having an associated flag which requires to be cleared in the peripheral), with the following features:
  - Fixed rising edge active trigger
  - No interrupt pending status register bit in the EXTI (the interrupt pending status flag is provided by the peripheral generating the event)
  - Individual interrupt and event generation mask, used to condition the CPU wake-up and event generation
  - No software trigger possibility

18.3 EXTI block diagram

The EXTI consists of a register block accessed via an AHB interface, the event input trigger block, the masking block and EXTI mux as shown in *Figure 96*.

The register block contains all the EXTI registers.

The event input trigger block provides event input edge trigger logic.

The masking block provides the event input distribution to the different wake-up, interrupt and event outputs, and their masking.

The EXTI mux provides the IO port selection on to the EXTI event signal.

Figure 96. EXTI block diagram

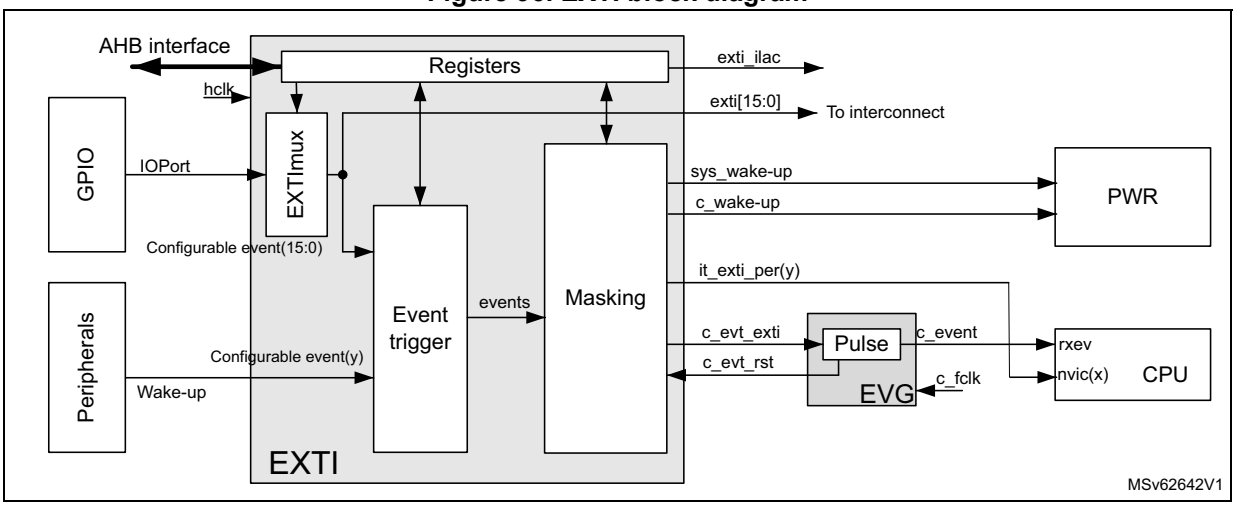

Table 155. EXTI signals

Pin name	I/O	Description
AHB interface	I/O	EXTI register bus interface. When one event is configured to enable security, the AHB interface supports secure accesses.
hclk	I	AHB bus clock and EXTI system clock
Configurable event(y)	I	Asynchronous wake-up events from peripherals without an associated interrupt and flag
Direct event(x)	I	Synchronous and asynchronous wake-up events from peripherals with an associated interrupt and flag
exti_ilac	O	Illegal access event
IOPort(n)	I	GPIOs block IO ports[15:0]
exti[15:0]	O	EXTI GPIO output port to trigger other peripherals
it_exti_per (y)	O	Interrupts to the CPU associated with configurable event (y)
c_evt_exti	O	High-level sensitive event output for CPU, synchronous to hclk
c_evt_rst	I	Asynchronous reset input to clear c_evt_exti
sys_wakeup	O	Asynchronous system wake-up request to PWR for ck_sys and hclk
c_wakeup	O	Wake-up request to PWR for CPU, synchronous to hclk

Table 156. EVG signals

Pin name	I/O	Description
c_fclk	I	CPU free running clock
c_evt_in	I	High-level sensitive events input from EXTI, asynchronous to CPU clock
c_event	O	Event pulse, synchronous to CPU clock
c_evt_rst	O	Event reset signal, synchronous to CPU clock

18.3.1 EXTI connections between peripherals and CPU

Some peripherals able to generate wake-up or interrupt events when the system is in Stop mode, are connected to the EXTI.

- Peripheral wake-up signals that generate a pulse or do not have an interrupt status bits in the peripheral, are connected to an EXTI configurable event input. For these events, the EXTI provides a status pending bit to be cleared. It is the EXTI interrupt, associated with the status bit, that interrupts the CPU.
- Peripheral interrupt and wake-up signals with a status bit in the peripheral to be cleared are connected to an EXTI direct event input. There is no status pending bit within the EXTI. The interrupt or wake-up is cleared by the CPU in the peripheral. It is the peripheral interrupt that interrupts the CPU directly.

All GPIO ports input to the EXTI multiplexer allow the selection of a port pin to wake up the system via a configurable event.

The EXTI configurable event interrupts are connected to the NVIC.

The dedicated EXTI/EVG CPU event is connected to the CPU rxev input.

The EXTI CPU wake-up signals are connected to the PWR and are used to wake up the system and the CPU sub-system bus clocks.

18.3.2 EXTI interrupt/event mapping

The EXTI lines are connected as shown in the following table.

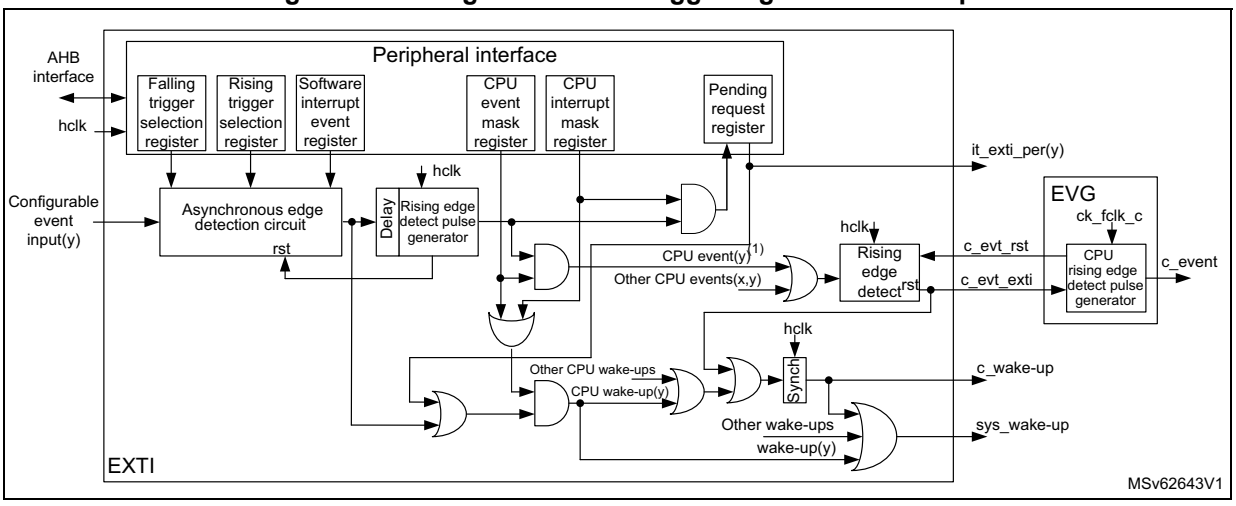
18.4 EXTI functional description



The events features are controlled from register bits as follows:

- Active trigger edge enable
  - by rising edge selection in *EXTI rising trigger selection register (EXTI_RTSR1)* and *EXTI rising trigger selection register 2 (EXTI_RTSR2)*, *EXTI rising trigger selection register 2 (EXTI_RTSR2)*, and *EXTI rising trigger selection register 3 (EXTI_RTSR3)*
  - by falling edge selection in *EXTI falling trigger selection register (EXTI_FTSR1)*, *EXTI falling trigger selection register 2 (EXTI_FTSR2)*, and *EXTI falling trigger selection register 3 (EXTI_FTSR3)*
- Software trigger in the *EXTI software interrupt event register (EXTI_SWIER1)*, *EXTI software interrupt event register 2 (EXTI_SWIER2)*, and *EXTI software interrupt event register 3 (EXTI_SWIER3)*
- Interrupt pending flag in:
  - *EXTI rising edge pending register (EXTI_RPR1)*, *EXTI rising edge pending register 2 (EXTI_RPR2)*, and *EXTI rising edge pending register 3 (EXTI_RPR3)*
  - *EXTI falling edge pending register (EXTI_FPR1)*, *EXTI falling edge pending register 2 (EXTI_FPR2)* and *EXTI falling edge pending register 3 (EXTI_FPR3)*
- CPU wake-up and interrupt enable in *EXTI CPU wake-up with interrupt mask register (EXTI_IMR1)*, *EXTI CPU wake-up with interrupt mask register 2 (EXTI_IMR2)*, and *EXTI CPU wake-up with interrupt mask register 3 (EXTI_IMR3)*
- CPU wake-up and event enable *EXTI CPU wake-up with event mask register (EXTI_EMR1)*, *EXTI CPU wake-up with event mask register 2 (EXTI_EMR2)*, and *EXTI CPU wake-up with event mask register 3 (EXTI_EMR3)*

18.4.1 EXTI configurable event input wake-up

The figure below is a detailed representation of the logic associated with configurable event inputs that wake up the CPU sub-system bus clocks and generate an EXTI pending flag and interrupt to the CPU, and/or a CPU wake-up event.

Figure 97. Configurable event trigger logic CPU wake-up

1. Only for the input events that support CPU rxev generation c_event.

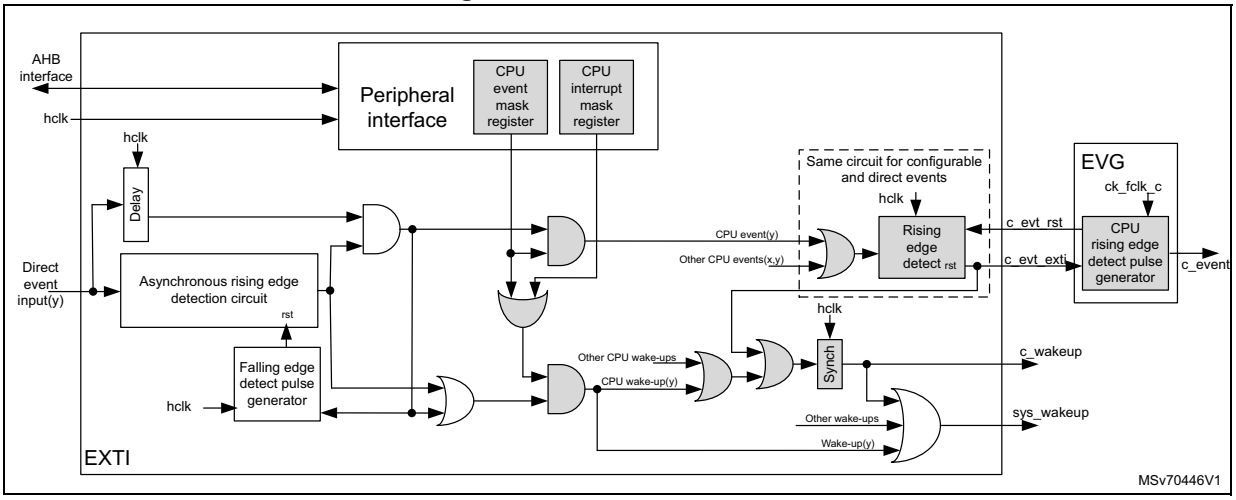
The software interrupt event register allows configurable events to be triggered by software, writing the corresponding register bit, whatever the edge selection setting.

The configurable event active trigger edge (or both edges) is selected and enabled in the rising/falling edge selection registers.

The CPU has its dedicated wake-up (interrupt) mask register and a dedicated event mask registers. When the event is enabled, it is generated to the CPU. All events for the CPU are ORed together into a single CPU event signal. The event pending registers (EXTI_RPR and EXTI_FPR) are not set for an unmasked CPU event.

The configurable events have unique interrupt pending request registers. The pending register is only set for an unmasked interrupt. Each configurable event provides a common interrupt to the CPU. The configurable event interrupts must be acknowledged by software in the EXTI_RPR and/or EXTI_FPR registers.

When a CPU wake-up (interrupt) or CPU event is enabled, the asynchronous edge detection circuit is reset by the clocked delay and rising edge detect pulse generator. This guarantees that the EXTI hclk clock is woken up before the asynchronous edge detection circuit is reset.



Note: A detected configurable event interrupt pending request can be cleared by the CPU with the correct access permission. The system is not able to enter into low-power modes as long as an interrupt pending request is active.

18.4.2 EXTI direct event input wake-up

The direct events do not have an associated EXTI interrupt. The EXTI only wakes up the system and CPU subsystem clocks, and can generate a CPU wake-up event. The peripheral synchronous interrupt, associated with the direct wake-up event, wakes up the CPU.

The EXTI direct event is able to generate a CPU event that wakes up the CPU. The CPU event may occur before the associated peripheral interrupt flag is set.

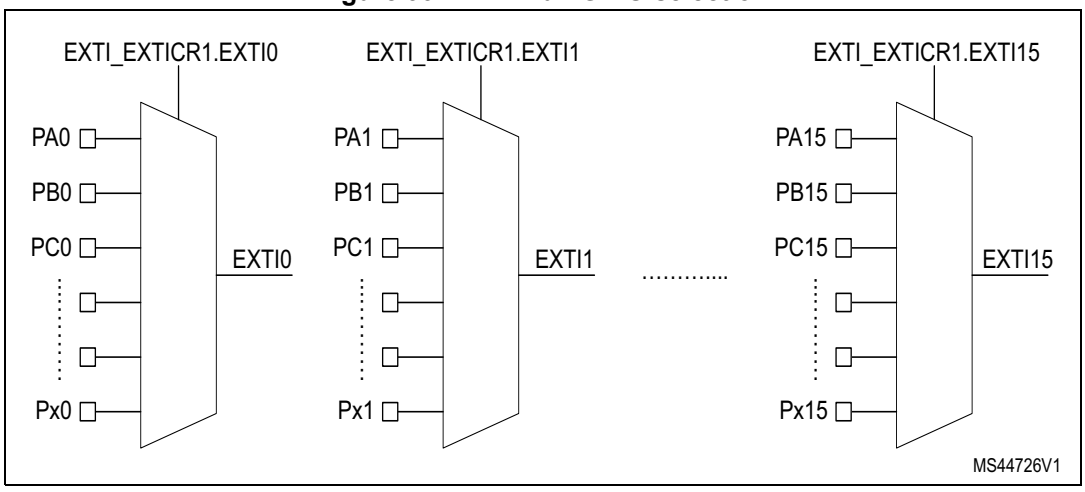


Figure 98. EXTI direct events

18.4.3 EXTI mux selection

The EXTI mux allows the selection of GPIOs as interrupts and wake-up. GPIOs are connected via 16 EXTI mux lines to the first 16 EXTI events as configurable event. The selection of GPIO port as EXTI mux output is controlled in *EXTI rising trigger selection register 3 (EXTI_RTSR3)*.

Figure 99. EXTI mux GPIO selection

The EXTI mux outputs are available as output signals from the EXTI to trigger other peripherals, whatever the masking in EXTI_IMR and EXTI_EMR registers.

18.5 EXTI functional behavior

The configurable events are enabled by enabling at least one of the trigger edges.

Once an event input is enabled, the CPU wake-up generation is conditioned by the CPU interrupt mask and CPU event mask.

Table 158. Masking functionality

CPU interrupt enable (in EXTI_IMR.IMn)	CPU event enable (in EXTI_EMR.EMn)	Configurable event inputs (in EXTI_RPR.RPIFn and EXTI_FPR.FPIFn)	Exti(n) interrupt(1)	CPU event	CPU wake-up
0	0	No	Masked	Masked	Masked
	1	No	Masked	Yes	Yes
1	0	Status latched	Yes	Masked	Yes(2)
	1	Status latched	Yes	Yes	Yes

1. The single exti(n) interrupt goes to the CPU. If no interrupt is required for CPU(m), the exti(n) interrupt must be masked in the CPU NVIC.
2. Only if CPU interrupt is enabled in EXTI_IMR.IMn.

For configurable event inputs, when the enabled edges occur on the event input, an event request is generated. When the associated CPU interrupt is unmasked, the corresponding pending bits EXTI_RPR.RPIFn and/or EXTI_FPR.FPIFn is/are set: the CPU sub-system is woken up and the CPU interrupt signal is activated. The EXTI_RPR.RPIFn and/or EXTI_FPR.FPIFn pending bits must be cleared by software writing it to 1. This action clears the CPU interrupt.

For the configurable event inputs, an event request can be generated by software when writing a 1 in the software interrupt/event register EXTI_SWIER, allowing the generation of a rising edge on the event. The rising edge event pending bit is set in EXTI_RPR, whatever the setting in EXTI_RTSR.

18.6 EXTI event protection

The EXTI is able to protect event register bits from being modified by nonsecure and unprivileged accesses. The protection is individually activated per input event via the register bits in EXTI_SECCFGR and EXTI_PRIVCFGR. At EXTI level, the protection consists in preventing the following unauthorized write access:

- Change the settings of the secure and/or privileged configurable events.
- Change the masking of the secure and/or privileged input events.
- Clear pending status of the secure and/or privileged input events.

Table 159. Register protection overview

Register name	Access type	Protection(1)(2)
EXTI_RTSR	RW	Security and privilege can be bit-wise enabled in EXTI_SECCFGR and EXTI_PRIVCFGR.
EXTI_FTSR	RW	
EXTI_SWIER	RW	
EXTI_RPR	RW	
EXTI_FPR	RW	

Table 159. Register protection overview

Register name	Access type	Protection[1][2]
EXTI_SECCFGR	RW	Always secure. Privilege can be bit-wise enabled in EXTI_PRIVCFGR.
EXTI_PRIVCFGR	RW	Always privilege. Security can be bit-wise enabled in EXTI_SECCFGR.
EXTI_EXTICRn	RW	Security and privilege can be bit-wise enabled in EXTI_SECCFGR and EXTI_PRIVCFGR.
EXTI_LOCKR	RW	Always secure
EXTI_IM	RW	Security and privilege can be bit-wise enabled in EXTI_SECCFGR and EXTI_PRIVCFGR.
EXTI_EMR	RW	

1. Security is enabled with the individual input event (EXTI_SECCFGR register).
2. Privilege is enabled with the individual Input event (EXTI_PRIVCFGR register).

18.6.1 EXTI security protection

When security is enabled for an input event, the associated input event configuration and control bits can only be modified and read by a secure access. A nonsecure write access is discarded and a read returns 0.

When input events are nonsecure, the security is disabled. The associated input event configuration and control bits can be modified and read by a secure access and nonsecure access.

The security configuration in registers EXTI_SECCFGR can be globally locked after reset by EXTI_LOCKR.LOCK.

18.6.2 EXTI privilege protection

When privilege is enabled for an input event, the associated input event configuration and control bits can only be modified and read by a privileged access. An unprivileged write access is discarded and a read returns 0.

When input events are unprivileged, the privilege is disabled. The associated input event configuration and control bits can be modified and read by a privileged access and unprivileged access.

The privileged configuration in registers EXTI_PRIVCFGR can be globally locked after reset by EXTI_LOCKR.LOCK.

18.7 EXTI registers

Table 160. EXTI register map sections

Address offset	Description
0x000 - 0x01C	General configurable event [31:0] configuration
0x020 - 0x03C	General configurable event [64:32] configuration
0x040 - 0x05C	General configurable event [95:64] configuration
0x060 - 0x06C	EXTI IO port mux selection
0x070	EXTI protection lock configuration
0x080 - 0x0BC	CPU input event configuration

All registers can be accessed with word (32-bit), half-word (16-bit) and byte (8-bit) access.

18.7.1 EXTI rising trigger selection register (EXTI_RTSR1)

Address offset: 0x000

Reset value: 0x0000 0000

Contains only register bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RT16
															rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RT15	RT14	RT13	RT12	RT11	RT10	RT9	RT8	RT7	RT6	RT5	RT4	RT3	RT2	RT1	RT0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:0 **RTx:** Rising trigger event configuration bit of configurable event input x[(1)] (x = 16 to 0)

When EXTI_SECCFGR.SECx is disabled, RTx can be accessed with nonsecure and secure access.

When EXTI_SECCFGR.SECx is enabled, RTx can be accessed only with secure access. Nonsecure write to this bit x is discarded and nonsecure read returns 0.

When EXTI_PRIVCFGR.PRIVx is disabled, RTx can be accessed with unprivileged and privileged access.

When EXTI_PRIVCFGR.PRIVx is enabled, RTx can be accessed only with privileged access. Unprivileged write to this bit x is discarded, unprivileged read returns 0.

0: Rising trigger disabled (for event and interrupt) for input line

1: Rising trigger enabled (for event and interrupt) for input line

1. The configurable event inputs are edge triggered, no glitch must be generated on these inputs.
If a rising edge on the configurable event input occurs during writing of the register, the associated pending bit is not set.
Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

18.7.2 EXTI falling trigger selection register (EXTI_FTSR1)

Address offset: 0x004

Reset value: 0x0000 0000

Contains only register bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FT16
															rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FT15	FT14	FT13	FT12	FT11	FT10	FT9	FT8	FT7	FT6	FT5	FT4	FT3	FT2	FT1	FT0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:0 **FTx:** Falling trigger event configuration bit of configurable event input x [(1)] (x = 16 to 0)

When EXTI_SECCFGR.SECx is disabled, FTx can be accessed with nonsecure and secure access.

When EXTI_SECCFGR.SECx is enabled, FTx can be accessed only with secure access. Nonsecure write to this FTx is discarded, nonsecure read returns 0.

When EXTI_PRIVCFGR.PRIVx is disabled, FTx can be accessed with unprivileged and privileged access.

When EXTI_PRIVCFGR.PRIVx is enabled, FTx can be accessed only with privileged access. Unprivileged write to this FTx is discarded, unprivileged read returns 0.

0: Falling trigger disabled (for event and Interrupt) for input line

1: Falling trigger enabled (for event and Interrupt) for input line.

1. The configurable event inputs are edge triggered, no glitch must be generated on these inputs.
If a falling edge on the configurable event input occurs during writing of the register, the associated pending bit is not set.
Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

18.7.3 EXTI software interrupt event register (EXTI_SWIER1)

Address offset: 0x008

Reset value: 0x0000 0000

Contains only register bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWI16
															rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SWI15	SWI14	SWI13	SWI12	SWI11	SWI10	SWI9	SWI8	SWI7	SWI6	SWI5	SWI4	SWI3	SWI2	SWI1	SWI0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:0 **SWIx:** Software interrupt on event x (x = 16 to 0)

When EXTI_SECCFGR.SECx is disabled, SWIx can be accessed with nonsecure and secure access.

When EXTI_SECCFGR.SECx is enabled, SWIx can be accessed only with secure access. Nonsecure write to this SWI x is discarded, nonsecure read returns 0.

When EXTI_PRIVCFGR.PRIVx is disabled, SWIx can be accessed with unprivileged and privileged access.

When EXTI_PRIVCFGR.PRIVx is enabled, SWIx can be accessed only with privileged access. Unprivileged write to this SWIx is discarded, unprivileged read returns 0.

A software interrupt is generated independent from the setting in EXTI_RTSR and EXTI_FTSR. It always returns 0 when read.

0: Writing 0 has no effect.

1: Writing 1 triggers a rising edge event on event x. This bit is auto cleared by hardware.

18.7.4 EXTI rising edge pending register (EXTI_RPR1)

Address offset: 0x00C

Reset value: 0x0000 0000

Contains only register bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RPIF16
															rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RPIF15	RPIF14	RPIF13	RPIF12	RPIF11	RPIF10	RPIF9	RPIF8	RPIF7	RPIF6	RPIF5	RPIF4	RPIF3	RPIF2	RPIF1	RPIF0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:0 **RPIFx:** configurable event inputs x rising edge pending bit (x = 16 to 0)

When EXTI_SECCFGR.SECx is disabled, RPIFx can be accessed with nonsecure and secure access.

When EXTI_SECCFGR.SECx is enabled, RPIFx can be accessed only with secure access. Nonsecure write to this RPIFx is discarded, nonsecure read returns 0.

When EXTI_PRIVCFGR.PRIVx is disabled, RPIFx can be accessed with unprivileged and privileged access.

When EXTI_PRIVCFGR.PRIVx is enabled, RPIFx can be accessed only with privileged access. Unprivileged write to this RPIFx is discarded, unprivileged read returns 0.

0: No rising edge trigger request occurred

1: Rising edge trigger request occurred

This bit is set when the rising edge event or an EXTI_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing 1 to it.

18.7.5 EXTI falling edge pending register (EXTI_FPR1)

Address offset: 0x010

Reset value: 0x0000 0000

Contains only register bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FPIF16
															rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FPIF15	FPIF14	FPIF13	FPIF12	FPIF11	FPIF10	FPIF9	FPIF8	FPIF7	FPIF6	FPIF5	FPIF4	FPIF3	FPIF2	FPIF1	FPIF0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:0 **FPIFx:** configurable event inputs x falling edge pending bit (x = 16 to 0)

When EXTI_SECCFGR.SECx is disabled, FPIFx can be accessed with nonsecure and secure access.

When EXTI_SECCFGR.SECx is enabled, FPIFx can be accessed only with secure access. Nonsecure write to this FPIFx is discarded, nonsecure read returns 0.

When EXTI_PRIVCFGR.PRIVx is disabled, FPIFx can be accessed with unprivileged and privileged access.

When EXTI_PRIVCFGR.PRIVx is enabled, FPIFx can be accessed only with privileged access. Unprivileged write to this FPIFx is discarded, unprivileged read returns 0.

0: No falling edge trigger request occurred

1: Falling edge trigger request occurred

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing 1 to it.

18.7.6 EXTI security configuration register (EXTI_SECCFGR1)

Address offset: 0x014

Reset value: 0x0000 0000

This register provides write access security, a nonsecure write access is ignored and causes the generation of an illegal access event. A nonsecure read returns the register data.

Contains only register bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SEC31	SEC30	SEC29	SEC28	SEC27	SEC26	SEC25	SEC24	SEC23	SEC22	SEC21	SEC20	SEC19	SEC18	SEC17	SEC16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SECx:** Security enable on event input x (x = 31 to 0)

When EXTI_PRIVCFGR.PRIVx is disabled, SECx can be accessed with privileged and unprivileged access.

When EXTI_PRIVCFGR.PRIVx is enabled, SECx can only be written with privileged access. Unprivileged write to this SECx is discarded.

0: Event security disabled (nonsecure)

1: Event security enabled (secure)

18.7.7 EXTI privilege configuration register (EXTI_PRIVCFGR1)

Address offset: 0x018

Reset value: 0x0000 0000

This register provides privileged write access protection. An unprivileged read returns the register data.

Contains only register bits for privilege capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PRIV31	PRIV30	PRIV29	PRIV28	PRIV27	PRIV26	PRIV25	PRIV24	PRIV23	PRIV22	PRIV21	PRIV20	PRIV19	PRIV18	PRIV17	PRIV16
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PRIV15	PRIV14	PRIV13	PRIV12	PRIV11	PRIV10	PRIV9	PRIV8	PRIV7	PRIV6	PRIV5	PRIV4	PRIV3	PRIV2	PRIV1	PRIV0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PRIVx:** Security enable on event input x (x = 31 to 0)

When EXTI_SECCFGR.SECx is disabled, PRIVx can be accessed with secure and nonsecure access.

When EXTI_SECCFGR.SECx is enabled, PRIVx can only be written with secure access. Nonsecure write to this PRIVx is discarded.

0: Event privilege disabled (unprivileged)

1: Event privilege enabled (privileged)

18.7.8 EXTI rising trigger selection register 2 (EXTI_RTSR2)

Address offset: 0x020

Reset value: 0x0000 0000

Contains only register bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	RT59	RT58	Res.	Res.	Res.	Res.	RT53	Res.	Res.	RT50	RT49	Res.

	rw														

Bits 31:28, 25:22, 20:19, 16:15, 13:0 Reserved, must be kept at reset value.

Bit 27 **RT59:** Rising trigger event configuration bit of configurable event input x[1]
When EXTI_SECCFGR.SECx is disabled, RTx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, RTx can be accessed only with secure access. Nonsecure write to this bit x is discarded and nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, RTx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, RTx can be accessed only with privileged access. Unprivileged write to this bit x is discarded, unprivileged read returns 0.
0: Rising trigger disabled (for event and interrupt) for input line
1: Rising trigger enabled (for event and interrupt) for input line
This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 26 **RT58:** Rising trigger event configuration bit of configurable event input x[1]
When EXTI_SECCFGR.SECx is disabled, RTx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, RTx can be accessed only with secure access. Nonsecure write to this bit x is discarded and nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, RTx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, RTx can be accessed only with privileged access. Unprivileged write to this bit x is discarded, unprivileged read returns 0.
0: Rising trigger disabled (for event and interrupt) for input line
1: Rising trigger enabled (for event and interrupt) for input line
This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 21 **RT53:** Rising trigger event configuration bit of configurable event input x[1]
When EXTI_SECCFGR.SECx is disabled, RTx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, RTx can be accessed only with secure access. Nonsecure write to this bit x is discarded and nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, RTx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, RTx can be accessed only with privileged access. Unprivileged write to this bit x is discarded, unprivileged read returns 0.
0: Rising trigger disabled (for event and interrupt) for input line
1: Rising trigger enabled (for event and interrupt) for input line

Bit 18 **RT50:** Rising trigger event configuration bit of configurable event input x[1]
When EXTI_SECCFGR.SECx is disabled, RTx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, RTx can be accessed only with secure access. Nonsecure write to this bit x is discarded and nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, RTx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, RTx can be accessed only with privileged access. Unprivileged write to this bit x is discarded, unprivileged read returns 0.
0: Rising trigger disabled (for event and interrupt) for input line
1: Rising trigger enabled (for event and interrupt) for input line

Bit 17 **RT49:** Rising trigger event configuration bit of configurable event input x[1]

When EXTI_SECCFGR.SECx is disabled, RTx can be accessed with nonsecure and secure access.

When EXTI_SECCFGR.SECx is enabled, RTx can be accessed only with secure access. Nonsecure write to this bit x is discarded and nonsecure read returns 0.

When EXTI_PRIVCFGR.PRIVx is disabled, RTx can be accessed with unprivileged and privileged access.

When EXTI_PRIVCFGR.PRIVx is enabled, RTx can be accessed only with privileged access. Unprivileged write to this bit x is discarded, unprivileged read returns 0.

0: Rising trigger disabled (for event and interrupt) for input line

1: Rising trigger enabled (for event and interrupt) for input line

This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 14 **RT46:** Rising trigger event configuration bit of configurable event input x[1]

When EXTI_SECCFGR.SECx is disabled, RTx can be accessed with nonsecure and secure access.

When EXTI_SECCFGR.SECx is enabled, RTx can be accessed only with secure access. Nonsecure write to this bit x is discarded and nonsecure read returns 0.

When EXTI_PRIVCFGR.PRIVx is disabled, RTx can be accessed with unprivileged and privileged access.

When EXTI_PRIVCFGR.PRIVx is enabled, RTx can be accessed only with privileged access. Unprivileged write to this bit x is discarded, unprivileged read returns 0.

0: Rising trigger disabled (for event and interrupt) for input line

1: Rising trigger enabled (for event and interrupt) for input line

1. The configurable event inputs are edge triggered, no glitch must be generated on these inputs.
If a rising edge on the configurable event input occurs during writing of the register, the associated pending bit is not set.
Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

18.7.9 EXTI falling trigger selection register 2 (EXTI_FTSR2)

Address offset: 0x024

Reset value: 0x0000 0000

Contains only register bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	FT59	FT58	Res.	Res.	Res.	Res.	FT53	Res.	Res.	FT50	FT49	Res.

Res.	FT46	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
	rw														

Bits 31:28, 25:22, 20:19, 16:15, 13:0 Reserved, must be kept at reset value.

Bit 27 **FT59:** Falling trigger event configuration bit of configurable event input x [1]
When EXTI_SECCFGR.SECx is disabled, FTx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, FTx can be accessed only with secure access. Nonsecure write to this FTx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, FTx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, FTx can be accessed only with privileged access. Unprivileged write to this FTx is discarded, unprivileged read returns 0.
0: Falling trigger disabled (for event and Interrupt) for input line
1: Falling trigger enabled (for event and Interrupt) for input line.
This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 26 **FT58:** Falling trigger event configuration bit of configurable event input x [1]
When EXTI_SECCFGR.SECx is disabled, FTx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, FTx can be accessed only with secure access. Nonsecure write to this FTx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, FTx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, FTx can be accessed only with privileged access. Unprivileged write to this FTx is discarded, unprivileged read returns 0.
0: Falling trigger disabled (for event and Interrupt) for input line
1: Falling trigger enabled (for event and Interrupt) for input line.
This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 21 **FT53:** Falling trigger event configuration bit of configurable event input x [1]
When EXTI_SECCFGR.SECx is disabled, FTx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, FTx can be accessed only with secure access. Nonsecure write to this FTx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, FTx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, FTx can be accessed only with privileged access. Unprivileged write to this FTx is discarded, unprivileged read returns 0.
0: Falling trigger disabled (for event and Interrupt) for input line
1: Falling trigger enabled (for event and Interrupt) for input line.

Bit 18 **FT50:** Falling trigger event configuration bit of configurable event input x [1]
When EXTI_SECCFGR.SECx is disabled, FTx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, FTx can be accessed only with secure access. Nonsecure write to this FTx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, FTx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, FTx can be accessed only with privileged access. Unprivileged write to this FTx is discarded, unprivileged read returns 0.
0: Falling trigger disabled (for event and Interrupt) for input line
1: Falling trigger enabled (for event and Interrupt) for input line.

Bit 17 **FT49:** Falling trigger event configuration bit of configurable event input x (1)

When EXTI_SECCFGR.SECx is disabled, FTx can be accessed with nonsecure and secure access.

When EXTI_SECCFGR.SECx is enabled, FTx can be accessed only with secure access. Nonsecure write to this FTx is discarded, nonsecure read returns 0.

When EXTI_PRIVCFGR.PRIVx is disabled, FTx can be accessed with unprivileged and privileged access.

When EXTI_PRIVCFGR.PRIVx is enabled, FTx can be accessed only with privileged access. Unprivileged write to this FTx is discarded, unprivileged read returns 0.

0: Falling trigger disabled (for event and Interrupt) for input line

1: Falling trigger enabled (for event and Interrupt) for input line.

This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 14 **FT46:** Falling trigger event configuration bit of configurable event input x (1)

When EXTI_SECCFGR.SECx is disabled, FTx can be accessed with nonsecure and secure access.

When EXTI_SECCFGR.SECx is enabled, FTx can be accessed only with secure access. Nonsecure write to this FTx is discarded, nonsecure read returns 0.

When EXTI_PRIVCFGR.PRIVx is disabled, FTx can be accessed with unprivileged and privileged access.

When EXTI_PRIVCFGR.PRIVx is enabled, FTx can be accessed only with privileged access. Unprivileged write to this FTx is discarded, unprivileged read returns 0.

0: Falling trigger disabled (for event and Interrupt) for input line

1: Falling trigger enabled (for event and Interrupt) for input line.

1. The configurable event inputs are edge triggered, no glitch must be generated on these inputs.
If a falling edge on the configurable event input occurs during writing of the register, the associated pending bit is not set.
Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

18.7.10 EXTI software interrupt event register 2 (EXTI_SWIER2)

Address offset: 0x028

Reset value: 0x0000 0000

Contains only register bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	SWI59	SWI58	Res.	Res.	Res.	Res.	SWI53	Res.	Res.	SWI50	SWI49	Res.
				rw	rw					rw			rw	rw

Res.	SWI46	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
	rw														

Bits 31:28, 25:22, 20:19, 16:15, 13:0 Reserved, must be kept at reset value.

Bit 27 **SWI59:** Software interrupt on event x

When EXTI_SECCFGR.SECx is disabled, SWIx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, SWIx can be accessed only with secure access. Nonsecure write to this SWI x is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, SWIx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, SWIx can be accessed only with privileged access. Unprivileged write to this SWIx is discarded, unprivileged read returns 0.
A software interrupt is generated independent from the setting in EXTI_RTSR and EXTI_FTSR. It always returns 0 when read.
0: Writing 0 has no effect.
1: Writing 1 triggers a rising edge event on event x. This bit is auto cleared by hardware.
This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 26 **SWI58:** Software interrupt on event x

When EXTI_SECCFGR.SECx is disabled, SWIx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, SWIx can be accessed only with secure access. Nonsecure write to this SWI x is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, SWIx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, SWIx can be accessed only with privileged access. Unprivileged write to this SWIx is discarded, unprivileged read returns 0.
A software interrupt is generated independent from the setting in EXTI_RTSR and EXTI_FTSR. It always returns 0 when read.
0: Writing 0 has no effect.
1: Writing 1 triggers a rising edge event on event x. This bit is auto cleared by hardware.
This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 21 **SWI53:** Software interrupt on event x

When EXTI_SECCFGR.SECx is disabled, SWIx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, SWIx can be accessed only with secure access. Nonsecure write to this SWI x is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, SWIx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, SWIx can be accessed only with privileged access. Unprivileged write to this SWIx is discarded, unprivileged read returns 0.
A software interrupt is generated independent from the setting in EXTI_RTSR and EXTI_FTSR. It always returns 0 when read.
0: Writing 0 has no effect.
1: Writing 1 triggers a rising edge event on event x. This bit is auto cleared by hardware.

Bit 18 **SWI50:** Software interrupt on event x

When EXTI_SECCFGR.SECx is disabled, SWIx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, SWIx can be accessed only with secure access. Nonsecure write to this SWI x is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, SWIx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, SWIx can be accessed only with privileged access. Unprivileged write to this SWIx is discarded, unprivileged read returns 0.
A software interrupt is generated independent from the setting in EXTI_RTSR and EXTI_FTSR. It always returns 0 when read.
0: Writing 0 has no effect.
1: Writing 1 triggers a rising edge event on event x. This bit is auto cleared by hardware.

Bit 17 **SWI49:** Software interrupt on event x

When EXTI_SECCFGR.SECx is disabled, SWIx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, SWIx can be accessed only with secure access. Nonsecure write to this SWI x is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, SWIx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, SWIx can be accessed only with privileged access. Unprivileged write to this SWIx is discarded, unprivileged read returns 0.
A software interrupt is generated independent from the setting in EXTI_RTSR and EXTI_FTSR. It always returns 0 when read.
0: Writing 0 has no effect.
1: Writing 1 triggers a rising edge event on event x. This bit is auto cleared by hardware.
This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 14 **SWI46:** Software interrupt on event x

When EXTI_SECCFGR.SECx is disabled, SWIx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, SWIx can be accessed only with secure access. Nonsecure write to this SWI x is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, SWIx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, SWIx can be accessed only with privileged access. Unprivileged write to this SWIx is discarded, unprivileged read returns 0.
A software interrupt is generated independent from the setting in EXTI_RTSR and EXTI_FTSR. It always returns 0 when read.
0: Writing 0 has no effect.
1: Writing 1 triggers a rising edge event on event x. This bit is auto cleared by hardware.

18.7.11 EXTI rising edge pending register 2 (EXTI_RPR2)

Address offset: 0x02C

Reset value: 0x0000 0000

Contains only register bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	RPIF59	RPIF58	Res.	Res.	Res.	Res.	RPIF53	Res.	Res.	RPIF50	RPIF49	Res.

Res.	RPIF46	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
	rw														

Bits 31:28, 25:22, 20:19, 16:15, 13:0 Reserved, must be kept at reset value.

Bit 27 **RPIF59:** configurable event inputs x rising edge pending bit

When EXTI_SECCFGR.SECx is disabled, RPIFx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, RPIFx can be accessed only with secure access. Nonsecure write to this RPIFx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, RPIFx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, RPIFx can be accessed only with privileged access. Unprivileged write to this RPIFx is discarded, unprivileged read returns 0.
0: No rising edge trigger request occurred
1: Rising edge trigger request occurred
This bit is set when the rising edge event or an EXTI_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing 1 to it.
This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 26 **RPIF58:** configurable event inputs x rising edge pending bit

When EXTI_SECCFGR.SECx is disabled, RPIFx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, RPIFx can be accessed only with secure access. Nonsecure write to this RPIFx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, RPIFx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, RPIFx can be accessed only with privileged access. Unprivileged write to this RPIFx is discarded, unprivileged read returns 0.
0: No rising edge trigger request occurred
1: Rising edge trigger request occurred
This bit is set when the rising edge event or an EXTI_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing 1 to it.
This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 21 **RPIF53:** configurable event inputs x rising edge pending bit

When EXTI_SECCFGR.SECx is disabled, RPIFx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, RPIFx can be accessed only with secure access. Nonsecure write to this RPIFx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, RPIFx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, RPIFx can be accessed only with privileged access. Unprivileged write to this RPIFx is discarded, unprivileged read returns 0.
0: No rising edge trigger request occurred
1: Rising edge trigger request occurred
This bit is set when the rising edge event or an EXTI_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing 1 to it.

Bit 18 **RPIF50:** configurable event inputs x rising edge pending bit

When EXTI_SECCFGR.SECx is disabled, RPIFx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, RPIFx can be accessed only with secure access. Nonsecure write to this RPIFx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, RPIFx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, RPIFx can be accessed only with privileged access. Unprivileged write to this RPIFx is discarded, unprivileged read returns 0.
0: No rising edge trigger request occurred
1: Rising edge trigger request occurred
This bit is set when the rising edge event or an EXTI_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing 1 to it.

Bit 17 **RPIF49:** configurable event inputs x rising edge pending bit

When EXTI_SECCFGR.SECx is disabled, RPIFx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, RPIFx can be accessed only with secure access. Nonsecure write to this RPIFx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, RPIFx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, RPIFx can be accessed only with privileged access. Unprivileged write to this RPIFx is discarded, unprivileged read returns 0.
0: No rising edge trigger request occurred
1: Rising edge trigger request occurred
This bit is set when the rising edge event or an EXTI_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing 1 to it.
This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 14 **RPIF46:** configurable event inputs x rising edge pending bit

When EXTI_SECCFGR.SECx is disabled, RPIFx can be accessed with nonsecure and secure access.

When EXTI_SECCFGR.SECx is enabled, RPIFx can be accessed only with secure access. Nonsecure write to this RPIFx is discarded, nonsecure read returns 0.

When EXTI_PRIVCFGR.PRIVx is disabled, RPIFx can be accessed with unprivileged and privileged access.

When EXTI_PRIVCFGR.PRIVx is enabled, RPIFx can be accessed only with privileged access. Unprivileged write to this RPIFx is discarded, unprivileged read returns 0.

0: No rising edge trigger request occurred

1: Rising edge trigger request occurred

This bit is set when the rising edge event or an EXTI_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing 1 to it.

18.7.12 EXTI falling edge pending register 2 (EXTI_FPR2)

Address offset: 0x030

Reset value: 0x0000 0000

Contains only register bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	FPIF59	FPIF58	Res.	Res.	Res.	Res.	FPIF53	Res.	Res.	FPIF50	FPIF49	Res.

Res.	FPIF46	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
	rw														

Bits 31:28, 25:22, 20:19, 16:15, 13:0 Reserved, must be kept at reset value.

Bit 27 **FPIF59:** configurable event inputs x falling edge pending bit

When EXTI_SECCFGR.SECx is disabled, FPIFx can be accessed with nonsecure and secure access.

When EXTI_SECCFGR.SECx is enabled, FPIFx can be accessed only with secure access. Nonsecure write to this FPIFx is discarded, nonsecure read returns 0.

When EXTI_PRIVCFGR.PRIVx is disabled, FPIFx can be accessed with unprivileged and privileged access.

When EXTI_PRIVCFGR.PRIVx is enabled, FPIFx can be accessed only with privileged access. Unprivileged write to this FPIFx is discarded, unprivileged read returns 0.

0: No falling edge trigger request occurred

1: Falling edge trigger request occurred

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing 1 to it.

This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 26 **FPIF58:** configurable event inputs x falling edge pending bit

When EXTI_SECCFGR.SECx is disabled, FPIFx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, FPIFx can be accessed only with secure access. Nonsecure write to this FPIFx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, FPIFx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, FPIFx can be accessed only with privileged access. Unprivileged write to this FPIFx is discarded, unprivileged read returns 0.
0: No falling edge trigger request occurred
1: Falling edge trigger request occurred
This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing 1 to it.
This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 21 **FPIF53:** configurable event inputs x falling edge pending bit

When EXTI_SECCFGR.SECx is disabled, FPIFx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, FPIFx can be accessed only with secure access. Nonsecure write to this FPIFx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, FPIFx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, FPIFx can be accessed only with privileged access. Unprivileged write to this FPIFx is discarded, unprivileged read returns 0.
0: No falling edge trigger request occurred
1: Falling edge trigger request occurred
This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing 1 to it.

Bit 18 **FPIF50:** configurable event inputs x falling edge pending bit

When EXTI_SECCFGR.SECx is disabled, FPIFx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, FPIFx can be accessed only with secure access. Nonsecure write to this FPIFx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, FPIFx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, FPIFx can be accessed only with privileged access. Unprivileged write to this FPIFx is discarded, unprivileged read returns 0.
0: No falling edge trigger request occurred
1: Falling edge trigger request occurred
This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing 1 to it.

Bit 17 **FPIF49:** configurable event inputs x falling edge pending bit

When EXTI_SECCFGR.SECx is disabled, FPIFx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, FPIFx can be accessed only with secure access. Nonsecure write to this FPIFx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, FPIFx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, FPIFx can be accessed only with privileged access. Unprivileged write to this FPIFx is discarded, unprivileged read returns 0.
0: No falling edge trigger request occurred
1: Falling edge trigger request occurred
This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing 1 to it.
This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 14 **FPIF46:** configurable event inputs x falling edge pending bit

When EXTI_SECCFGR.SECx is disabled, FPIFx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, FPIFx can be accessed only with secure access. Nonsecure write to this FPIFx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, FPIFx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, FPIFx can be accessed only with privileged access. Unprivileged write to this FPIFx is discarded, unprivileged read returns 0.
0: No falling edge trigger request occurred
1: Falling edge trigger request occurred
This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing 1 to it.

18.7.13 EXTI security configuration register 2 (EXTI_SECCFGR2)

Address offset: 0x034

Reset value: 0x0000 0000

This register provides write access security, a nonsecure write access is ignored and causes the generation of an illegal access event. A nonsecure read returns the register data.

Contains only register bits for privilege capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	SEC61	Res.	SEC59	SEC58	SEC57	SEC56	SEC55	SEC54	SEC53	SEC52	SEC51	SEC50	SEC49	SEC48
		rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **SEC61:** Security enable on event input 61
When EXTI_PRIVCFGR.PRIVx is disabled, SECx can be accessed with privileged and unprivileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, SECx can only be written with privileged access. Unprivileged write to this SECx is discarded.
0: Event security disabled (nonsecure)
1: Event security enabled (secure)
This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 28 Reserved, must be kept at reset value.

Bits 27:0 **SECx:** Security enable on event input x (x = 59 to 32)
When EXTI_PRIVCFGR.PRIVx is disabled, SECx can be accessed with privileged and unprivileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, SECx can only be written with privileged access. Unprivileged write to this SECx is discarded.
0: Event security disabled (nonsecure)
1: Event security enabled (secure)
Bits SEC[59:58] are available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

18.7.14 EXTI privilege configuration register 2 (EXTI_PRIVCFGR2)

Address offset: 0x038

Reset value: 0x0000 0000

This register provides privileged write access protection. An unprivileged read returns the register data.

Contains only register bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	PRIV61	Res.	PRIV59	PRIV58	PRIV57	PRIV56	PRIV55	PRIV54	PRIV53	PRIV52	PRIV51	PRIV50	PRIV49	PRIV48
		rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PRIV47	PRIV46	PRIV45	PRIV44	PRIV43	PRIV42	PRIV41	PRIV40	PRIV39	PRIV38	PRIV37	PRIV36	PRIV35	PRIV34	PRIV33	PRIV32
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **PRIV61:** Security enable on event input 61
When EXTI_SECCFGR.SECx is disabled, PRIVx can be accessed with secure and nonsecure access.
When EXTI_SECCFGR.SECx is enabled, PRIVx can only be written with secure access. Nonsecure write to this PRIVx is discarded.
0: Event privilege disabled (unprivileged)
1: Event privilege enabled (privileged)
This bit is available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 28 Reserved, must be kept at reset value.

Bits 27:0 **PRIVx:** Security enable on event input x (x = 59 to 32)
When EXTI_SECCFGR.SECx is disabled, PRIVx can be accessed with secure and nonsecure access.
When EXTI_SECCFGR.SECx is enabled, PRIVx can only be written with secure access. Nonsecure write to this PRIVx is discarded.
0: Event privilege disabled (unprivileged)
1: Event privilege enabled (privileged)
Bits [59:58] are available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

18.7.15 EXTI rising trigger selection register 3 (EXTI_RTSR3)

Address offset: 0x040

Reset value: 0x0000 0000

It contains only register bits for configurable events.

STM32H543/553xx devices only

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RT66	Res.	RT64
													rw		rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **RT66:** Rising trigger event configuration bit of configurable event input x(1)
When EXTI_SECCFGR.SECx is disabled, RTx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, RTx can only be accessed with secure access. Nonsecure write to this bit x is discarded and nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, RTx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, RTx can only be accessed with privileged access. Unprivileged write to this bit x is discarded, unprivileged read returns 0.
0: Rising trigger disabled (for event and interrupt) for input line
1: Rising trigger enabled (for event and interrupt) for input line

Bit 1 Reserved, must be kept at reset value.

Bit 0 **RT64:** Rising trigger event configuration bit of configurable event input x(1)
When EXTI_SECCFGR.SECx is disabled, RTx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, RTx can only be accessed with secure access. Nonsecure write to this bit x is discarded and nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, RTx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, RTx can only be accessed with privileged access. Unprivileged write to this bit x is discarded, unprivileged read returns 0.
0: Rising trigger disabled (for event and interrupt) for input line
1: Rising trigger enabled (for event and interrupt) for input line

18.7.16 EXTI falling trigger selection register 3 (EXTI_FTSR3)

Address offset: 0x044

Reset value: 0x0000 0000

It contains only register bits for configurable events.

STM32H543/553xx devices only

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FT66	Res.	FT64
													rw		rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **FT66:** Falling trigger event configuration bit of configurable event input x (1)

When EXTI_SECCFGR.SECx is disabled, FTx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, FTx can only be accessed with secure access. Nonsecure write to this FTx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, FTx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, FTx can only be accessed with privileged access. Unprivileged write to this FTx is discarded, unprivileged read returns 0.
0: Falling trigger disabled (for event and Interrupt) for input line
1: Falling trigger enabled (for event and Interrupt) for input line.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **FT64:** Falling trigger event configuration bit of configurable event input x (1)

When EXTI_SECCFGR.SECx is disabled, FTx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, FTx can only be accessed with secure access. Nonsecure write to this FTx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, FTx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, FTx can only be accessed with privileged access. Unprivileged write to this FTx is discarded, unprivileged read returns 0.
0: Falling trigger disabled (for event and Interrupt) for input line
1: Falling trigger enabled (for event and Interrupt) for input line.

1. The configurable event inputs are edge triggered. No glitch must be generated on these inputs.
If a falling edge on the configurable event input occurs during writing of the register, the associated pending bit is not set.
Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

18.7.17 EXTI software interrupt event register 3 (EXTI_SWIER3)

Address offset: 0x048

Reset value: 0x0000 0000

It contains only register bits for configurable events.

STM32H543/553xx devices only

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWI66	Res.	SWI64
													rw		rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SWI66:** Software interrupt on event x

When EXTI_SECCFGR.SECx is disabled, SWIx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, SWIx can only be accessed with secure access. Nonsecure write to this SWI x is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, SWIx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, SWIx can only be accessed with privileged access. Unprivileged write to this SWIx is discarded, unprivileged read returns 0.
A software interrupt is generated independent from the setting in EXTI_RTSR and EXTI_FTSR. It always returns 0 when read.
0: Writing 0 has no effect.
1: Writing 1 triggers a rising edge event on event x. This bit is auto cleared by hardware.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **SWI64:** Software interrupt on event x

When EXTI_SECCFGR.SECx is disabled, SWIx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, SWIx can only be accessed with secure access. Nonsecure write to this SWI x is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, SWIx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, SWIx can only be accessed with privileged access. Unprivileged write to this SWIx is discarded, unprivileged read returns 0.
A software interrupt is generated independent from the setting in EXTI_RTSR and EXTI_FTSR. It always returns 0 when read.
0: Writing 0 has no effect.
1: Writing 1 triggers a rising edge event on event x. This bit is auto cleared by hardware.

18.7.18 EXTI rising edge pending register 3 (EXTI_RPR3)

Address offset: 0x04C

Reset value: 0x0000 0000

It contains only register bits for configurable events.

STM32H543/553xx devices only

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RPIF66	Res.	RPIF64
													rw		rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **RPIF66:** configurable event inputs x rising edge pending bit

When EXTI_SECCFGR.SECx is disabled, RPIFx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, RPIFx can only be accessed with secure access. Nonsecure write to this RPIFx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, RPIFx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, RPIFx can only be accessed with privileged access. Unprivileged write to this RPIFx is discarded, unprivileged read returns 0.
0: No rising edge trigger request occurred
1: Rising edge trigger request occurred
This bit is set when the rising edge event or an EXTI_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing 1 to it.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **RPIF64:** configurable event inputs x rising edge pending bit

When EXTI_SECCFGR.SECx is disabled, RPIFx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, RPIFx can only be accessed with secure access. Nonsecure write to this RPIFx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, RPIFx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, RPIFx can only be accessed with privileged access. Unprivileged write to this RPIFx is discarded, unprivileged read returns 0.
0: No rising edge trigger request occurred
1: Rising edge trigger request occurred
This bit is set when the rising edge event or an EXTI_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing 1 to it.

18.7.19 EXTI falling edge pending register 3 (EXTI_FPR3)

Address offset: 0x050

Reset value: 0x0000 0000

It contains only register bits for configurable events.

STM32H543/553xx devices only

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FPIF66	Res.	FPIF64
													rw		rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **FPIF66:** configurable event inputs x falling edge pending bit

When EXTI_SECCFGR.SECx is disabled, FPIFx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, FPIFx can only be accessed with secure access. Nonsecure write to this FPIFx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, FPIFx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, FPIFx can only be accessed with privileged access. Unprivileged write to this FPIFx is discarded, unprivileged read returns 0.
0: No falling edge trigger request occurred
1: Falling edge trigger request occurred
This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing 1 to it.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **FPIF64:** configurable event inputs x falling edge pending bit

When EXTI_SECCFGR.SECx is disabled, FPIFx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, FPIFx can only be accessed with secure access. Nonsecure write to this FPIFx is discarded, nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, FPIFx can be accessed with unprivileged and privileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, FPIFx can only be accessed with privileged access. Unprivileged write to this FPIFx is discarded, unprivileged read returns 0.
0: No falling edge trigger request occurred
1: Falling edge trigger request occurred
This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing 1 to it.

18.7.20 EXTI security configuration register 3 (EXTI_SECCFGR3)

Address offset: 0x054

Reset value: 0x0000 0000

This register provides write access security. A nonsecure write access is ignored and causes the generation of an illegal access event. A nonsecure read returns the register data.

It contains only register bits for privilege capable input events.

STM32H543/553xx devices only

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEC66	SEC65	SEC64
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **SECx:** Security enable on event input x (x = 66 to 64)

When EXTI_PRIVCFGR.PRIVx is disabled, SECx can be accessed with privileged and unprivileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, SECx can only be written with privileged access. Unprivileged write to this SECx is discarded.
0: Event security disabled (nonsecure)
1: Event security enabled (secure)

18.7.21 EXTI privilege configuration register 3 (EXTI_PRIVCFGR3)

Address offset: 0x058

Reset value: 0x0000 0000

This register provides privileged write access protection. An unprivileged read returns the register data.

It contains only register bits for security capable input events.

STM32H543/553xx devices only

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

18.7.26 EXTI lock register (EXTI_LOCKR)

Address offset: 0x070

Reset value: 0x0000 0000

This register provides write access security: a nonsecure write access is ignored, a read access returns zero data, and both generate an illegal access event.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCK
															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **LOCK**: Global security and privilege configuration registers (EXTI_SECCFGR and EXTI_PRIVCFGR) lock

This bit is written once after reset.

0: Security and privilege configuration open, can be modified.

1: Security and privilege configuration locked, can no longer be modified.

18.7.27 EXTI CPU wake-up with interrupt mask register (EXTI_IMR1)

Address offset: 0x080

Reset value: 0xFFFE 0000

Contains register bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IM31	IM30	IM29	IM28	IM27	IM26	IM25	IM24	IM23	IM22	IM21	IM20	IM19	IM18	IM17	IM16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **IMx:** CPU wake-up with interrupt mask on event input x [(1)] (x = 31 to 0)

When EXTI_SECCFGR.SECx is disabled, IMx can be accessed with nonsecure and secure access.

When EXTI_SECCFGR.SECx is enabled, IMx can be accessed only with secure access. Nonsecure write to this bit is discarded and nonsecure read returns 0.

When EXTI_PRIVCFGR.PRIVx is disabled, IMx can be accessed with privileged and unprivileged access.

When EXTI_PRIVCFGR.PRIVx is enabled, IMx can be accessed only with privileged access. Unprivileged write to this bit is discarded.

0: Wake-up with interrupt request from input event x is masked.

1: Wake-up with interrupt request from input event x is unmasked.

Bit IM31 is not available on all devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

1. The reset value for configurable event inputs is set to 0 in order to disable the interrupt by default.

18.7.28 EXTI CPU wake-up with event mask register (EXTI_EMR1)

Address offset: 0x084

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:0 **EMx:** CPU wake-up with event generation mask on event input x (x = 16 to 0)

When EXTI_SECCFGR.SECx is disabled, EMx can be accessed with nonsecure and secure access.

When EXTI_SECCFGR.SECx is enabled, EMx can be accessed only with secure access. Nonsecure write to this bit x is discarded and nonsecure read returns 0.

When EXTI_PRIVCFGR.PRIVx is disabled, EMx can be accessed with privileged and unprivileged access.

When EXTI_PRIVCFGR.PRIVx is enabled, EMx can be accessed only with privileged access. Unprivileged write to this bit is discarded.

0: Wake-up with event generation from Line x is masked.

1: Wake-up with event generation from Line x is unmasked.

18.7.29 EXTI CPU wake-up with interrupt mask register 2 (EXTI_IMR2)

Address offset: 0x090

Reset value: 0x23D9 BFFF (STM32H543/553xx devices)

Reset value: 0x07DB BFFF (STM32H56x/573xx devices)

Contains register bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	IM61	Res.	IM59	IM58	IM57	IM56	IM55	IM54	IM53	IM52	IM51	IM50	IM49	IM48

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **IM61:** CPU wake-up with interrupt mask on event input 61(1)

When EXTI_SECCFGR.SECx is disabled, IMx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, IMx can be accessed only with secure access. Nonsecure write to this bit is discarded and nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, IMx can be accessed with privileged and unprivileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, IMx can be accessed only with privileged access. Unprivileged write to this bit is discarded.
0: Wake-up with interrupt request from input event x is masked.
1: Wake-up with interrupt request from input event x is unmasked.
This bit is not available on all devices, refer to *Table 157*. If not present, consider this bit as reserved, and keep it at reset value.

Bit 28 Reserved, must be kept at reset value.

Bits 27:0 **IMx:** CPU wake-up with interrupt mask on event input x (1) (x = 59 to 0)

When EXTI_SECCFGR.SECx is disabled, IMx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, IMx can be accessed only with secure access. Nonsecure write to this bit is discarded and nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, IMx can be accessed with privileged and unprivileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, IMx can be accessed only with privileged access. Unprivileged write to this bit is discarded.
0: Wake-up with interrupt request from input event x is masked.
1: Wake-up with interrupt request from input event x is unmasked.
Bits IM[59:54],IM52, IM[46:44], and IM[36:32] are not available on all devices, refer to *Table 157*. If not present, consider these bits as reserved, and keep them at reset value.

1. The reset value for configurable event inputs is set to 0 in order to disable the interrupt by default.

18.7.30 EXTI CPU wake-up with event mask register 2 (EXTI_EMR2)

Address offset: 0x094

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	rw														

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:26 **EMx:** CPU wake-up with event generation mask on event input x (x = 59 to 58)
When EXTI_SECCFGR.SECx is disabled, EMx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, EMx can be accessed only with secure access. Nonsecure write to this bit x is discarded and nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, EMx can be accessed with privileged and unprivileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, EMx can be accessed only with privileged access. Unprivileged write to this bit is discarded.
0: Wake-up with event generation from Line x is masked.
1: Wake-up with event generation from Line x is unmasked.
These bits are available only on STM32H543/553xx devices, refer to *Table 157*. If not present, consider these bits as reserved, and keep them at reset value.

Bits 25:22 Reserved, must be kept at reset value.

Bit 21 **EM53:** CPU wake-up with event generation mask on event input
When EXTI_SECCFGR.SECx is disabled, EM53 can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, EM53 can be accessed only with secure access. Nonsecure write to this bit is discarded and nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, EM53 can be accessed with privileged and unprivileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, EM53 can be accessed only with privileged access. Unprivileged write to this bit is discarded.
0: Wake-up with event generation from Line x is masked.
1: Wake-up with event generation from Line x is unmasked.

Bits 20:19 Reserved, must be kept at reset value.

Bits 18:17 **EMx:** CPU wake-up with event generation mask on event input x (x = 50 to 49)
When EXTI_SECCFGR.SECx is disabled, EMx can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, EMx can be accessed only with secure access. Nonsecure write to this bit is discarded and nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, EMx can be accessed with privileged and unprivileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, EMx can be accessed only with privileged access. Unprivileged write to this bit is discarded.
0: Wake-up with event generation from Line x is masked.
1: Wake-up with event generation from Line x is unmasked.
The EM49 bit is available only on STM32H543/553xx devices.

Bits 16:15 Reserved, must be kept at reset value.

Bit 14 **EM46:** CPU wake-up with event generation mask on event input
When EXTI_SECCFGR.SECx is disabled, EM46 can be accessed with nonsecure and secure access.
When EXTI_SECCFGR.SECx is enabled, EM46 can be accessed only with secure access. Nonsecure write to this bit is discarded and nonsecure read returns 0.
When EXTI_PRIVCFGR.PRIVx is disabled, EM46 can be accessed with privileged and unprivileged access.
When EXTI_PRIVCFGR.PRIVx is enabled, EM46 can be accessed only with privileged access. Unprivileged write to this bit is discarded.
0: Wake-up with event generation from Line x is masked.
1: Wake-up with event generation from Line x is unmasked.

Bits 13:0 Reserved, must be kept at reset value.

18.7.31 EXTI CPU wake-up with interrupt mask register 3 (EXTI_IMR3)

Address offset: 0x0A0

Reset value: 0x0000 0002

Contains register bits for configurable events.

STM32H543/553xx devices only

1. Available only on STM32H543/553xx devices.
2. Some bits in this register are not available on some devices, refer to *Table 157*. If not present, consider these bits as reserved, and keep them at reset value.

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

19 Cyclic redundancy check calculation unit (CRC)

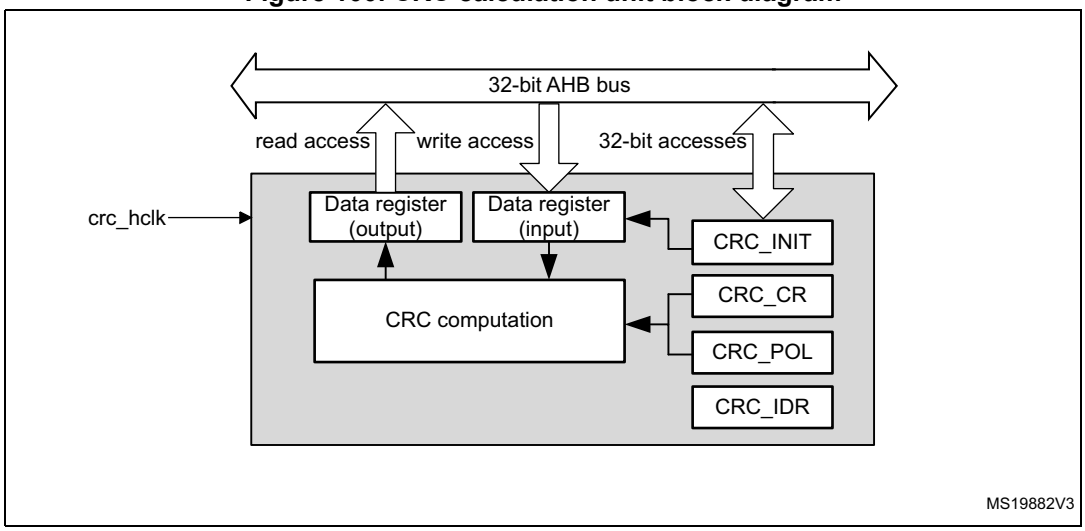
19.1 CRC introduction

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code from 8-, 16- or 32-bit data word and a generator polynomial.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the functional safety standards, they offer a means of verifying the flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link time and stored at a given memory location.

19.2 CRC main features

- Uses CRC-32 (Ethernet) polynomial: 0x4C11DB7
  $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$
- Alternatively, uses fully programmable polynomial with programmable size (7, 8, 16, 32 bits)
- Handles 8-,16-, 32-bit data size
- Programmable CRC initial value
- Single input/output 32-bit data register
- Input buffer to avoid bus stall during calculation
- CRC computation done in 4 AHB clock cycles (HCLK) for the 32-bit data size
- General-purpose 8-bit register (can be used for temporary storage)
- Reversibility options on I/O data
- Accessed through AHB slave peripheral by 32-bit words only, with the exception of CRC_DR register that can be accessed by words, right-aligned half-words and right-aligned bytes



19.3 CRC implementation

The byte or half word swapping features controlled by RTYPE_x bits in CRC_CR are only present for STM32H543/553xx devices.

19.4 CRC functional description

19.4.1 CRC block diagram

Figure 100. CRC calculation unit block diagram

19.4.2 CRC internal signals

Table 162. CRC internal input/output signals

Signal name	Signal type	Description
crc_hclk	Digital input	AHB clock

19.4.3 CRC operation

The CRC calculation unit has a single 32-bit read/write data register (CRC_DR). It is used to input new data (write access), and holds the result of the previous CRC calculation (read access).

Each write operation to the data register creates a combination of the previous CRC value (stored in CRC_DR) and the new one. CRC computation is done on the whole 32-bit data word or byte by byte depending on the format of the data being written.

The CRC_DR register can be accessed by word, right-aligned half-word and right-aligned byte. When the RTYPE_IN bit is set in CRC_CR, non-word accesses to CRC_DR register are ignored. For the other registers only 32-bit accesses are allowed.

The duration of the computation depends on input data width:

- 4 AHB clock cycles for 32 bits
- 2 AHB clock cycles for 16 bits
- 1 AHB clock cycles for 8 bits

An input buffer allows a second data to be immediately written without waiting for any wait-states due to the previous CRC calculation.

The data size can be dynamically adjusted to minimize the number of write accesses for a given number of bytes. For instance, a CRC for 5 bytes can be computed with a word write followed by a byte write.

The input data can be reversed to manage the various endianness schemes. The reversing operation can be performed on 8 bits, 16 bits and 32 bits depending on the REV_IN[1:0] bits in the CRC_CR register. If RTYPE_IN bit is set in this register, the input reversing operation can be performed with a byte or half-word granularity, but not with single bit granularity.

For example, with RTYPE_IN cleared, 0x1A2B3C4D input data are used for CRC calculation as:

- 0x58D43CB2 with bit-reversal done by byte (REV_IN[1:0] = 01)
- 0xD458B23C with bit-reversal done by half-word (REV_IN[1:0] = 10)
- 0xB23CD458 with bit-reversal done on the full word (REV_IN[1:0] = 11)

With RTYPE_IN set, 0x1A2B3C4D input data are used for CRC calculation as:

- 0x3C4D1A2B with half-word reversal done by word (REV_IN[1:0] = 01)
- 0x4D3C2B1A with byte-reversal done by word (REV_IN[1:0] = 10)

The output data can also be reversed by setting the REV_OUT[1:0] bits in the CRC_CR register. If RTYPE_OUT is set in this register, the output reversing operation is performed with a byte or half-word granularity, but not with single bit granularity.

With RTYPE_OUT cleared, the operation is done at bit level. For example, 0x11223344 output data are converted to 0x22CC4488.

With RTYPE_OUT set, 0x11223344 output data are converted as:

- 0x33441122 with half-word reversal done by word (REV_IN[1:0] = 01)
- 0x44332211 with byte-reversal done by word (REV_IN[1:0] = 10)

The CRC calculator can be initialized to a programmable value using the RESET control bit in the CRC_CR register (the default value is 0xFFFFFFFF).

The initial CRC value can be programmed with the CRC_INIT register. The CRC_DR register is automatically initialized upon CRC_INIT register write access.

The CRC_IDR register can be used to hold a temporary value related to CRC 7-, 8-, 16-, and 32-bit calculations. It is not affected by the RESET bit in the CRC_CR register.

Polynomial programmability

The polynomial coefficients are fully programmable through the CRC_POL register, and the polynomial size can be configured to be 7-, 8-, 16-, or 32-bits by programming the POLYSIZE[1:0] bits in the CRC_CR register. Even polynomials are not supported.

Note: The type of an even polynomial is $X+X^2+..+X^n$, while the type of an odd polynomial is $1+X+X^2+..+X^n$.

If the CRC data is less than 32-bit, its value can be read from the least significant bits of the CRC_DR register.

To obtain a reliable CRC calculation, the change on-fly of the polynomial value or size can not be performed during a CRC calculation. As a result, if a CRC calculation is ongoing, the application must either reset it or perform a CRC_DR read before changing the polynomial.

The default polynomial value is the CRC-32 (Ethernet) polynomial: 0x4C11DB7.

19.5 CRC registers

The CRC_DR register can be accessed by words, right-aligned half-words and right-aligned bytes when RTYPE bit is cleared in CRC_CR. When RTYPE is set, only word accesses are allowed. For the other registers only 32-bit accesses are allowed.

19.5.1 CRC data register (CRC_DR)

Address offset: 0x00

Reset value: 0xFFFF FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DR[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DR[31:0]:** Data register bits

This register is used to write new data to the CRC calculator.

It holds the previous CRC calculation result when it is read.

If the data size is less than 32 bits, the least significant bits are used to write/read the correct value.

19.5.2 CRC independent data register (CRC_IDR)

Address offset: 0x04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IDR[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **IDR[31:0]**: General-purpose 32-bit data register bits

These bits can be used as a temporary storage location for four bytes.

This register is not affected by CRC resets generated by the RESET bit in the CRC_CR register

19.5.3 CRC control register (CRC_CR)

Address offset: 0x08

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

					rw	rw	rw	rw	rw	rw	rw	rw			rs

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **RTYPE_OUT**: Reverse type output
This bit controls the reversal granularity of the output data.
0: Bit level output
1: Byte or half-word level output

Bit 9 **RTYPE_IN**: Reverse type input
This bit controls the reversal granularity of the input data.
0: Bit level input
1: Byte or half-word level input

Bits 8:7 **REV_OUT[1:0]**: Reverse output data
This bitfield controls the reversal of the bit order of the output data.
00: Bit order not affected (RTYPE_OUT = 0 or 1)
01: Bit-reversed output format (RTYPE_OUT = 0) or half-word reversal done by word (RTYPE_OUT = 1)
10: Bit order not affected (RTYPE_OUT = 0) or byte reversal done by word (RTYPE_OUT = 1)
11: Bit order not affected (RTYPE_OUT = 0 or 1)

Bits 6:5 **REV_IN[1:0]**: Reverse input data
This bitfield controls the reversal of the bit order of the input data
00: Bit order not affected (RTYPE_IN = 0 or 1)
01: Bit reversal done by byte (RTYPE_IN = 0) or half-word reversal done by word (RTYPE_IN = 1)
10: Bit reversal done by half-word (RTYPE_IN = 0) or byte reversal done by word (RTYPE_IN = 1)
11: Bit reversal done by word (RTYPE_IN = 0) or bit order is not affected (RTYPE_IN = 1)

Bits 4:3 **POLYSIZE[1:0]**: Polynomial size

These bits control the size of the polynomial.

00: 32 bit polynomial

01: 16 bit polynomial

10: 8 bit polynomial

11: 7 bit polynomial

Bits 2:1 Reserved, must be kept at reset value.

Bit 0 **RESET**: RESET bit

This bit is set by software to reset the CRC calculation unit and set the data register to the value stored in the CRC_INIT register. This bit can only be set, it is automatically cleared by hardware.

19.5.4 CRC initial value (CRC_INIT)

Address offset: 0x10

Reset value: 0xFFFF FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CRC_INIT[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

CRC_INIT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CRC_INIT[31:0]**: Programmable initial CRC value

This register is used to write the CRC initial value.

19.5.5 CRC polynomial (CRC_POL)

Address offset: 0x14

Reset value: 0x04C1 1DB7

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
POL[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

POL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **POL[31:0]**: Programmable polynomial

This register is used to write the coefficients of the polynomial to be used for CRC calculation.

If the polynomial size is less than 32 bits, the least significant bits have to be used to program the correct value.

19.5.6 CRC register map

Table 163. CRC register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

20 CORDIC coprocessor (CORDIC)

This section applies only to STM32H543/53/62/63/73xx devices.

20.1 CORDIC introduction

The CORDIC coprocessor provides hardware acceleration of mathematical functions (mainly trigonometric ones) commonly used in motor control, metering, signal processing, and many other applications.

It speeds up the calculation of these functions compared to a software implementation, making possible the use of a lower operating frequency, or freeing up processor cycles to perform other tasks.

20.2 CORDIC main features

- 24-bit CORDIC rotation engine
- Circular and Hyperbolic modes
- Rotation and Vectoring modes
- Functions: sine, cosine, sinh, cosh, atan, atan2, atanh, modulus, square root, natural logarithm
- Programmable precision
- Low latency AHB slave interface
- Results can be read as soon as ready, without polling or interrupt
- DMA read and write channels
- Multiple register read/write by DMA

20.3 CORDIC functional description

20.3.1 General description

The CORDIC is a cost-efficient successive approximation algorithm for evaluating trigonometric and hyperbolic functions.

In trigonometric (circular) mode, the sine and cosine of an angle θ are determined by rotating the unit vector [1, 0] through decreasing angles until the cumulative sum of the rotation angles equals the input angle θ. The x and y cartesian components of the rotated vector then correspond, respectively, to the cosine and sine of θ. Inversely, the angle of a vector [x, y] corresponding to arctangent (y / x), is determined by rotating [x, y] through successively decreasing angles to obtain the unit vector [1, 0]. The cumulative sum of the rotation angles gives the angle of the original vector.

The CORDIC algorithm can also be used for calculating hyperbolic functions (sinh, cosh, atanh), by replacing the successive circular rotations by steps along a hyperbole.

Other functions can be derived from the basic functions described above.

20.3.2 CORDIC functions

The first step when using the coprocessor is to select the required function, by programming the FUNC field of the CORDIC_CR register.

Table 164 lists the functions supported by the CORDIC coprocessor.

Table 164. CORDIC functions

Function	Primary argument (ARG1)	Secondary argument (ARG2)	Primary result (RES1)	Secondary result (RES2)
Cosine	angle θ	modulus m	$m \cdot \cos\theta$	$m \cdot \sin\theta$
Sine	angle θ	modulus m	$m \cdot \sin\theta$	$m \cdot \cos\theta$
Phase	x	y	atan2(y,x)	$\sqrt{x^2 + y^2}$
Modulus	x	y	$\sqrt{x^2 + y^2}$	atan2(y,x)
Arctangent	x	none	$\tan^{-1} x$	none
Hyperbolic cosine	x	none	cosh x	sinh x
Hyperbolic sine	x	none	sinh x	cosh x
Hyperbolic arctangent	x	none	$\tanh^{-1} x$	none
Natural logarithm	x	none	ln x	none
Square root	x	none	$\sqrt{x}$	none

Several functions take two input arguments (ARG1 and ARG2), and some generate two results (RES1 and RES2) simultaneously. This is a side-effect of the algorithm and means that only one operation is needed to obtain two values. This is the case, for example, when performing polar-to-rectangular conversion: sin θ also generates cos θ, and cos θ also generates sin θ. Similarly for rectangular-to-polar conversion (phase(x,y), modulus(x,y)) and for hyperbolic functions (cosh θ, sinh θ).

Note: The exponential function, exp x, can be obtained as the sum of sinh x and cosh x. Furthermore, base N logarithms, $\log_N x$, can be derived by multiplying ln x by a constant K, where K = 1/ln N.

For certain functions (atan, log, sqrt) a scaling factor (see *Section 20.3.4*) can be applied to extend the range beyond the maximum [-1, 1] supported by the q1.31 fixed point format. The scaling factor must be set to 0 for all other circular functions, and to 1 for hyperbolic functions.

Cosine

Table 165. Cosine parameters

Parameter	Description	Range
ARG1	Angle θ in radians, divided by π	[-1, 1]
ARG2	Modulus m	[0, 1]
RES1	m • cos θ	[-1, 1]
RES2	m • sin θ	[-1, 1]
SCALE	Not applicable	0

This function calculates the cosine of an angle in the range -π to π. It can also be used to perform polar to rectangular conversion.

The primary argument is the angle θ in radians. It must be divided by π before programming ARG1.

The secondary argument is the modulus m. If m is greater than 1, a scaling must be applied in software to adapt it to the q1.31 range of ARG2.

The primary result, RES1, is the cosine of the angle, multiplied by the modulus.

The secondary result, RES2, is the sine of the angle, multiplied by the modulus.

Sine

Table 166. Sine parameters

Parameter	Description	Range
ARG1	Angle θ in radians, divided by π	[-1, 1]
ARG2	Modulus m	[0, 1]
RES1	m • sin θ	[-1, 1]
RES2	m • cos θ	[-1, 1]
SCALE	Not applicable	0

This function calculates the sine of an angle in the range -π to π. It can also be used to perform polar to rectangular conversion.

The primary argument is the angle θ in radians. It must be divided by π before programming ARG1.

The secondary argument is the modulus m. If m is greater than 1, a scaling must be applied in software to adapt it to the q1.31 range of ARG2.

The primary result, RES1, is the sine of the angle, multiplied by the modulus.

The secondary result, RES2, is the cosine of the angle, multiplied by the modulus.

Phase

Table 167. Phase parameters

Parameter	Description	Range
ARG1	x coordinate	[-1, 1]
ARG2	y coordinate	[-1, 1]
RES1	Phase angle θ in radians, divided by π	[-1, 1]
RES2	Modulus m	[0, 1]
SCALE	Not applicable	0

This function calculates the phase angle in the range -π to π of a vector **v** = [x y] (also known as atan2(y,x). It can also be used to perform rectangular to polar conversion.

The primary argument is the x coordinate, that is, the magnitude of the vector in the direction of the x axis. If |x| > 1, a scaling must be applied in software to adapt it to the q1.31 range of ARG1.

The secondary argument is the y coordinate, that is, the magnitude of the vector in the direction of the y axis. If |y| > 1, a scaling must be applied in software to adapt it to the q1.31 range of ARG2.

The primary result, RES1, is the phase angle θ of the vector **v**. RES1 must be multiplied by π to obtain the angle in radians. Note that values close to π may sometimes wrap to -π due to the circular nature of the phase angle.

The secondary result, RES2, is the modulus, given by: $|v| = \sqrt{x^2 + y^2}$. If |**v**| > 1 the result in RES2 is saturated to 1.

Modulus

Table 168. Modulus parameters

Parameter	Description	Range
ARG1	x coordinate	[-1, 1]
ARG2	y coordinate	[-1, 1]
RES1	Modulus m	[0, 1]
RES2	Phase angle θ	[-1, 1]
SCALE	Not applicable	0

This function calculates the magnitude, or modulus, of a vector **v** = [x y]. It can also be used to perform rectangular to polar conversion.

The primary argument is the x coordinate, that is, the magnitude of the vector in the direction of the x axis. If |x| > 1, a scaling must be applied in software to adapt it to the q1.31 range of ARG1.

The secondary argument is the y coordinate, that is, the magnitude of the vector in the direction of the y axis. If |y| > 1, a scaling must be applied in software to adapt it to the q1.31 range of ARG2.

The primary result, RES1, is the modulus, given by: $|v| = \sqrt{x^2 + y^2}$. If $|\mathbf{v}| > 1$ the result in RES1 is saturated to 1.

The secondary result, RES2, is the phase angle θ of the vector **v**. RES2 must be multiplied by π to obtain the angle in radians. Note that values close to π may sometimes wrap to $-\pi$ due to the circular nature of the phase angle.

Arctangent

Table 169. Arctangent parameters

Parameter	Description	Range
ARG1	$x \cdot 2^{-n}$	[-1, 1]
ARG2	Not applicable	-
RES1	$2^{-n} \bullet \tan^{-1} x$, in radians, divided by p	[-1, 1]
RES2	Not applicable	-
SCALE	n	[0 7]

This function calculates the arctangent, or inverse tangent, of the input argument x.

The primary argument, ARG1, is the input value, $x = \tan \theta$. If $|x| > 1$, a scaling factor of 2^{-n} must be applied in software such that $-1 < x \bullet 2^{-n} < 1$. The scaled value $x \bullet 2^{-n}$ is programmed in ARG1 and the scale factor n must be programmed in the SCALE parameter.

Note that the maximum input value allowed is $\tan \theta = 128$, which corresponds to an angle $\theta = 89.55$ degrees. For $|x| > 128$, a software method must be used to find $\tan^{-1} x$.

The secondary argument, ARG2, is unused.

The primary result, RES1, is the angle $\theta = \tan^{-1} x$. RES1 must be multiplied by $2^n \bullet \pi$ to obtain the angle in radians.

The secondary result, RES2, is unused.

Hyperbolic cosine

Table 170. Hyperbolic cosine parameters

Parameter	Description	Range
ARG1	$x \cdot 2^{-n}$	[-0.559 0.559]
ARG2	Not applicable	-
RES1	$2^{-n} \cdot \cosh x$	[0.5 0.846]
RES2	$2^{-n} \cdot \sinh x$	[-0.683 0.683]
SCALE	n	1

This function calculates the hyperbolic cosine of a hyperbolic angle x. It can also be used to calculate the exponential functions $e^x = \cosh x + \sinh x$, and $e^{-x} = \cosh x - \sinh x$.

The primary argument is the hyperbolic angle x. Only values of x in the range -1.118 to +1.118 are supported. Since the minimum value of cosh x is 1, which is beyond the range of the q1.31 format, a scaling factor of 2^{-n} must be applied in software. The factor n = 1 must be programmed in the SCALE parameter.

The secondary argument is not used.

The primary result, RES1, is the hyperbolic cosine, cosh x. RES1 must be multiplied by 2 to obtain the correct result.

The secondary result, RES2, is the hyperbolic sine, sinh x. RES2 must be multiplied by 2 to obtain the correct result.

Hyperbolic sine

Table 171. Hyperbolic sine parameters

Parameter	Description	Range
ARG1	$x \cdot 2^{-n}$	[-0.559, 0.559]
ARG2	Not applicable	-
RES1	$2^{-n} \cdot \sinh x$	[-0.683, 0.683]
RES2	$2^{-n} \cdot \cosh x$	[0.5, 0.846]
SCALE	n	1

This function calculates the hyperbolic sine of a hyperbolic angle x. It can also be used to calculate the exponential functions e^x = cosh x + sinh x, and e^{-x} = cosh x- sinh x.

The primary argument is the hyperbolic angle x. Only values of x in the range -1.118 to +1.118 are supported. For all input values, a scaling factor of 2^{-n} must be applied in software, where n = 1. The scaled value x • 0.5 is programmed in ARG1 and the factor n = 1 must be programmed in the SCALE parameter.

The secondary argument is not used.

The primary result, RES1, is the hyperbolic sine, sinh x. RES1 must be multiplied by 2 to obtain the correct result.

The secondary result, RES2, is the hyperbolic cosine, cosh x. RES2 must be multiplied by 2 to obtain the correct result.

Hyperbolic arctangent

Table 172. Hyperbolic arctangent parameters

Parameter	Description	Range
ARG1	$x \bullet 2^{-n}$	[-0.403 0.403]
ARG2	Not applicable	-
RES1	$2^{-n} \bullet$atanh x	[-0.559 0.559]

Table 172. Hyperbolic arctangent parameters (continued)

Parameter	Description	Range
RES2	Not applicable	-
SCALE	n	1

This function calculates the hyperbolic arctangent of the input argument x.

The primary argument is the input value x. Only values of x in the -0.806 to +0.806 range are supported. The value x must be scaled by a factor 2^{-n}, where n = 1. The scaled value x • 0.5 is programmed in ARG1 and the factor n = 1 must be programmed in the SCALE parameter.

The secondary argument is not used.

The primary result is the hyperbolic arctangent, atanh x. RES1 must be multiplied by 2 to obtain the correct value.

The secondary result is not used.

Natural logarithm

Table 173. Natural logarithm parameters

Parameter	Description	Range
ARG1	$x \bullet 2^{-n}$	[0.054 0.875]
ARG2	Not applicable	-
RES1	$2^{-(n+1)}.\ln x$	[-0.279 0.137]
RES2	Not applicable	-
SCALE	n	[1 4]

This function calculates the natural logarithm of the input argument x.

The primary argument is the input value x. Only values of x in the range 0.107 to 9.35 are supported. The value x must be scaled by a factor 2^{-n}, such that $x < 2^{-n} < 1-2^{-n}$. The scaled value $x \bullet 2^{-n}$ is programmed in ARG1 and the factor n must be programmed in the SCALE parameter.

Table 174 lists the valid scaling factors, n, and the corresponding ranges of x and ARG1.

Table 174. Natural log scaling factors and corresponding ranges

n	x range	ARG1 range
1	$0.107 \le x < 1$	$0.0535 \le ARG1 < 0.5$
2	$1 \le x < 3$	$0.25 \le ARG1 < 0.75$
3	$3 \le x < 7$	$0.375 \le ARG1 < 0.875$
4	$7 \le x \le 9.35$	$0.4375 \le ARG1 < 0.584$

The secondary argument is not used.

The primary result is the natural logarithm, ln x. RES1 must be multiplied by $2^{(n+1)}$ to obtain the correct value.

The secondary result is not used.

Square root

Table 175. Square root parameters

Parameter	Description	Range
ARG1	$x \cdot 2^{-n}$	[0.027 0.875]
ARG2	Not applicable	-
RES1	$2^{-n}\sqrt{x}$	[0.04 1]
RES2	Not applicable	-
SCALE	n	[0 2]

This function calculates the square root of the input argument x.

The primary argument is the input value x. Only values of x in the range 0.027 to 2.34 are supported. The value x must be scaled by a factor 2^{-n}, such that $x \cdot 2^{-n} < (1 - 2^{(-n-2)})$.

The scaled value $x \cdot 2^{-n}$ is programmed in ARG1 and the factor n must be programmed in the SCALE parameter.

Table 176 lists the valid scaling factors, n, and the corresponding ranges of x and ARG1.

Table 176. Square root scaling factors and corresponding ranges

n	x range	ARG1 range
0	$0.027 \le x < 0.75$	$0.027 \le ARG1 < 0.75$
1	$0.75 \le x < 1.75$	$0.375 \le ARG1 < 0.875$
2	$1.75 \le x \le 2.341$	$0.4375 \le ARG1 \le 0.585$

The secondary argument is not used.

The primary result is the square root of x. RES1 must be multiplied by 2^n to obtain the correct value.

The secondary result is not used.

20.3.3 Fixed point representation

The CORDIC operates in fixed point signed integer format. Input and output values can be either q1.31 or q1.15.

In q1.31 format, numbers are represented by one sign bit and 31 fractional bits (binary decimal places). The numeric range is therefore -1 (0x80000000) to $1 - 2^{-31}$ (0x7FFFFFFF).

In q1.15 format, the numeric range is 1 (0x8000) to $1 - 2^{-15}$ (0x7FFF). This format has the advantage that two input arguments can be packed into a single 32-bit write, and two results can be fetched in one 32-bit read.

20.3.4 Scaling factor

Several of the functions listed in *Section 20.3.2* specify a scaling factor, SCALE. This allows the function input range to be extended to cover the full range of values supported by the CORDIC, without saturating the input, output, or internal registers. If the scaling factor is required, it must be calculated by software and programmed into the SCALE field of the CORDIC_CSR register. The input arguments must be scaled accordingly before programming the scaled values in the CORDIC_WDATA register. The scaling must also be undone on the results read from the CORDIC_RDATA register.

Note: The scaling factor entails a loss of precision due to truncation of the scaled value.

20.3.5 Precision

The precision of the result is dependent on the number of CORDIC iterations. The algorithm converges at a constant rate of one binary digit per iteration for trigonometric functions (sine, cosine, phase, modulus), see *Figure 101*.

For hyperbolic functions (hyperbolic sine, hyperbolic cosine, natural logarithm), the convergence rate is less constant due to the peculiarities of the CORDIC algorithm (see *Figure 102*). The square root function converges at roughly twice the speed of the hyperbolic functions (see *Figure 103*).

Figure 101. CORDIC convergence for trigonometric functions

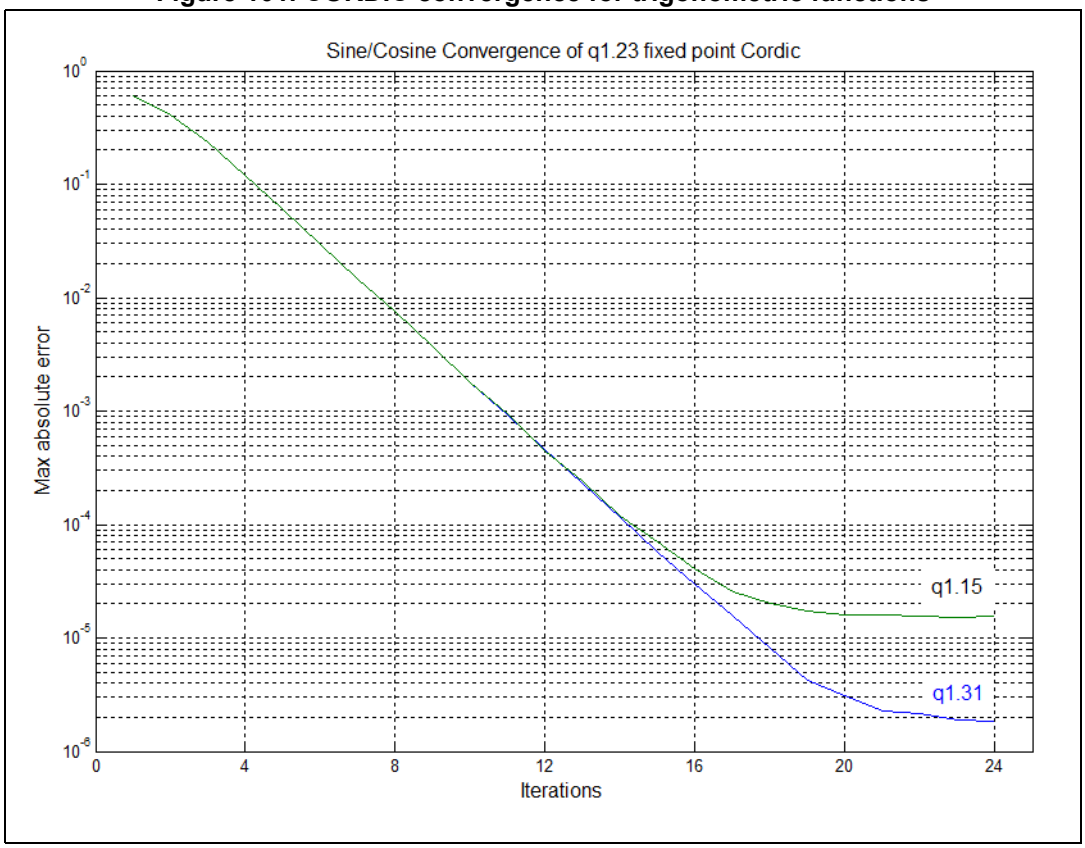

Figure 102. CORDIC convergence for hyperbolic functions

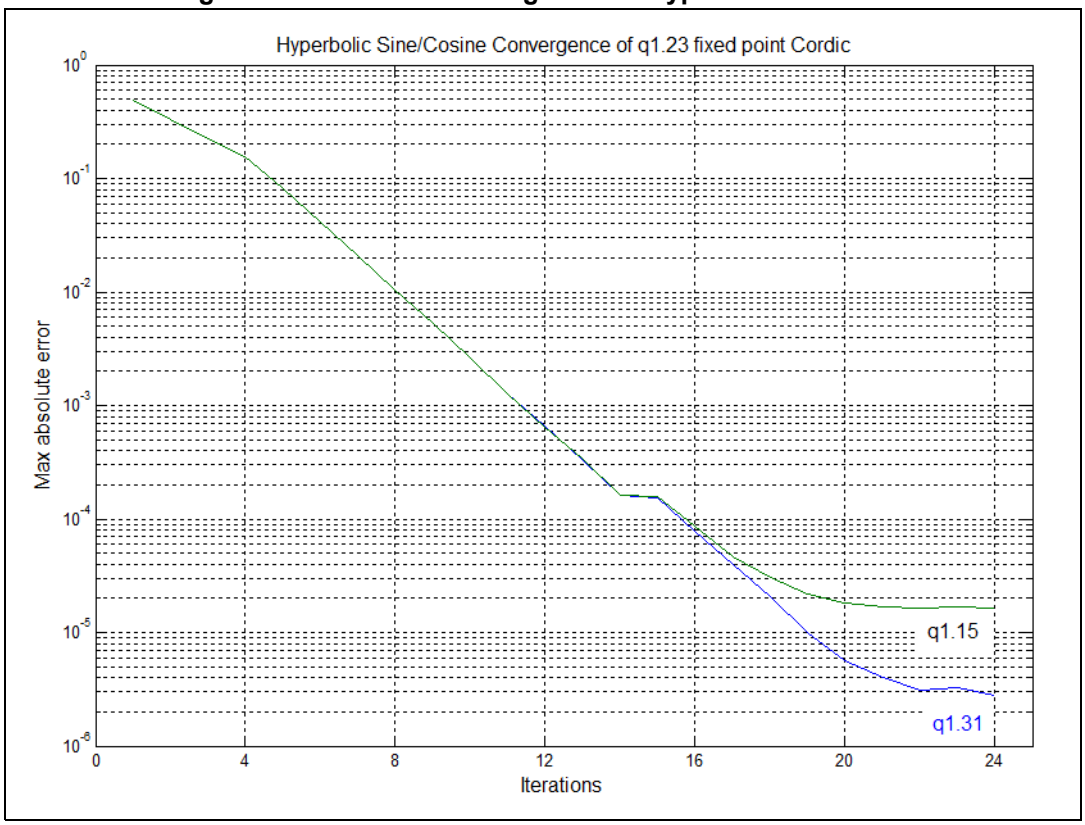

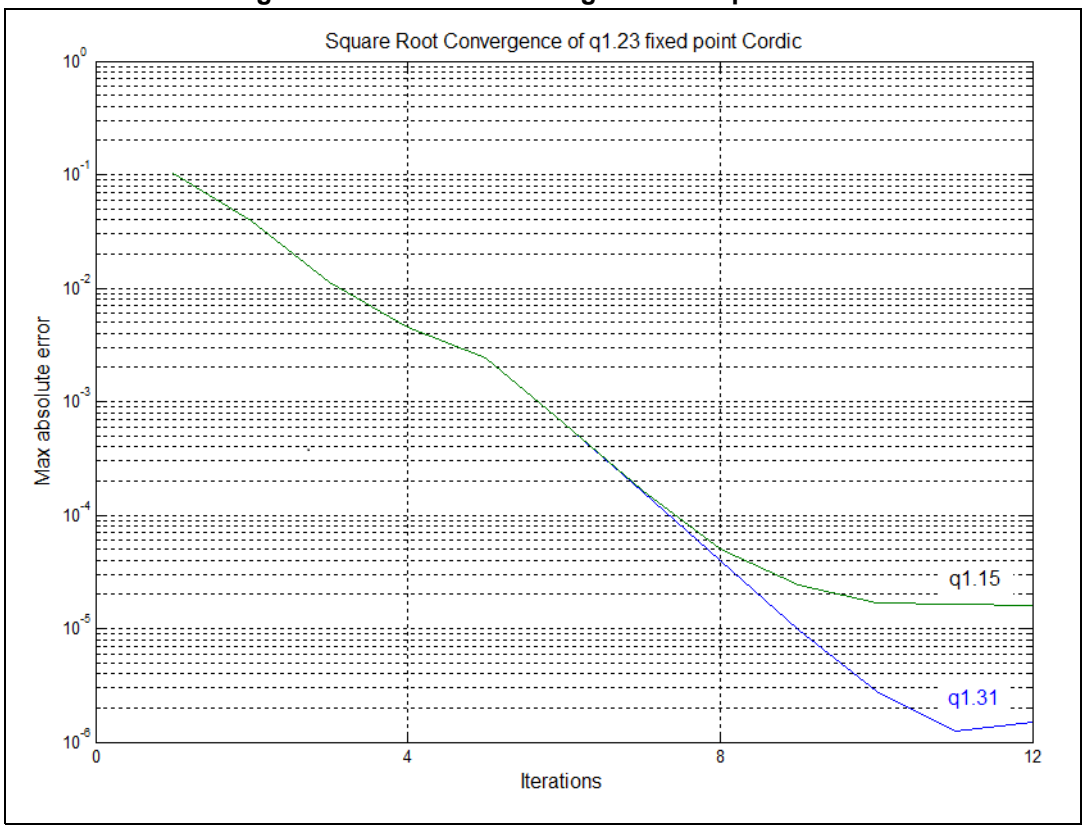

Figure 103. CORDIC convergence for square root

Note: The convergence rate decreases as the quantization error starts to become significant.

The CORDIC can perform four iterations per clock cycle. For each function, the maximum error remaining after every four iterations is shown in *Table 177*, together with the number of clock cycles required to reach that precision. From this table, the desired number of cycles can be determined and programmed in the PRECISION field of the CORDIC_CR register. The coprocessor stops as soon as the programmed number of iterations is completed, and the result can be read immediately.

Table 177. Precision vs. number of iterations

Function	Number of iterations	Number of cycles	Max residual error(1)	
			q1.31 format	q1.15 format
Sin, Cos, Phase(2), Mod, Atan(4)	4	1	2^{-3}	2^{-3}
	8	2	2^{-7}	2^{-7}
	12	3	2^{-11}	2^{-11}
	16	4	2^{-15}	2^{-15}
	20	5	2^{-18}	2^{-16}
	24	6	2^{-19}	2^{-16}

Table 177. Precision vs. number of iterations (continued)

Function	Number of iterations	Number of cycles	Max residual error(1)	
			q1.31 format	q1.15 format
Sinh, Cosh, Atanh, Ln(3)	4	1	2^{-2}	2^{-2}
	8	2	2^{-6}	2^{-6}
	12	3	2^{-10}	2^{-10}
	16	4	2^{-13}	2^{-13}
	20	5	2^{-17}	2^{-15}
	24	6	2^{-18}	2^{-15}
Sqrt(4)	4	1	2^{-7}	2^{-7}
	8	2	2^{-14}	2^{-14}
	12	3	2^{-19}	2^{-15}

1. Max residual error is the maximum error remaining after the given number of iterations, compared to the identical calculation performed in double precision floating point. An additional rounding error may be incurred, of up to 2^{-16} for q15 format or 2^{-20} for q31 format.
2. For modulus > 0.5. The achievable precision reduces proportionally to the magnitude of the modulus, as quantization error becomes significant.
3. SCALE = 1. If a higher scaling factor is used, the achievable precision is reduced proportionally.
4. SCALE = 0. If a higher scaling factor is used, the achievable precision is reduced proportionally.

20.3.6 Zero-overhead mode

The fastest way to use the coprocessor is to preprogram the CORDIC_CSR register with the function to be performed (FUNC), the desired number of clock cycles (PRECISION), the size of the input and output values (ARGSIZE, RESSIZE), the number of input arguments (NARGS) and/or results (NRES), and the scaling factor (SCALE), if applicable.

The calculation is triggered by writing the input arguments to the CORDIC_WDATA register. As soon as the correct number of input arguments has been written (and any ongoing calculation has finished), a new calculation is launched using these input arguments and the current CORDIC_CSR settings. There is no need to reprogram the CORDIC_CSR register if there is no change.

If a dual 32-bit input argument is needed (ARGSIZE = 0, NARGS = 1), the primary input argument (ARG1) must be written first, followed by the secondary argument (ARG2). If the secondary argument remains unchanged for a series of calculations, the second write can be avoided, by reprogramming the number of arguments to one (NARGS = 0), once the first calculation has started. The secondary argument retains its programmed value as long as the function is not changed.

Note: ARG2 is set to +1 (0x7FFFFFFF) after a reset.

If two 16-bit arguments are used (ARGSIZE = 1) they must be packed into a 32-bit word, with ARG1 in the least significant half-word and ARG2 in the most significant half-word. The packed 32-bit word is then written to the CORDIC_WDATA register. Only one write is needed in this case (NARGS = 0).

For functions taking only one input argument, ARG1, it is recommended to set NARGS = 0. If NARGS = 1, a second write to CORDIC_WDATA must be performed to trigger the calculation. The ARG2 data in this case is not used.

Once the calculation starts, any attempt to read the CORDIC_RDATA register inserts bus wait-states until the calculation is completed, before returning the result. It is then possible for the software to write the input and immediately read the result without polling to see if it is valid. Alternatively, the processor can wait for the appropriate number of clock cycles before reading the result. This time can be used to program the CORDIC_CSR register for the next calculation, and prepare the next input data, if needed. The CORDIC_CSR register can be reprogrammed while a calculation is in progress, without affecting the result of the ongoing calculation. In the same way, the CORDIC_WDATA register can be updated with the next argument(s) once the previous ones have been taken into account. The next arguments and settings remain pending until the previous calculation has completed.

When a calculation is finished, the result(s) can be read from the CORDIC_RDATA register. If two 32-bit results are expected (NRES = 1, RESSIZE = 0), the primary result (RES1) is read out first, followed by the secondary result (RES2). If only one 32-bit result is expected (NRES = 0, RESSIZE = 0), then RES1 is output on the first read.

If 16-bit results are expected (RESSIZE = 1), a single read to CORDIC_RDATA fetches both results packed into a 32-bit word. RES1 is in the lower half-word, and RES2 in the upper half-word. In this case, it is recommended to program NRES = 0. IF NRES = 1, a second read of CORDIC_RDATA must be performed to free up the CORDIC for the next operation. The data from this second read must be discarded.

The next calculation starts when the expected number of results has been read, provided the expected number of arguments has been written. This means that at any time, there can be a calculation in progress, or waiting for the results to be read, and an operation pending. Any further access to CORDIC_WDATA while an operation is pending cancels it and overwrites the data.

The following sequence summarizes the use of the CORDIC_IP in zero-overhead mode:

1. Program the CORDIC_CSR register with the appropriate settings
2. Program the argument(s) for the first calculation in the CORDIC_WDATA register. This launches the first calculation.
3. If needed, update the CORDIC_CSR register settings for the next calculation.
4. Program the argument(s) for the next calculation in the CORDIC_WDATA register.
5. Read the result(s) from the CORDIC_RDATA register. This triggers the next calculation.
6. Go to step *3*.

20.3.7 Polling mode

When a new result is available in the CORDIC_RDATA register, the RRDY flag is set in the CORDIC_CSR register. The flag can be polled by reading the register. It is reset by reading the CORDIC_RDATA register (once or twice, depending on the NRES field of the CORDIC_CSR register).

Polling the RRDY flag takes slightly longer than reading the CORDIC_RDATA register directly, since the result is not read as soon as it is available. The processor and bus interface are not stalled while reading the CORDIC_CSR register, so this mode may be of interest if stalling the processor is not acceptable (for example, if low latency interrupts must be serviced).

20.3.8 Interrupt mode

By setting the interrupt enable (IE) bit in the CORDIC_CSR register, an interrupt is generated whenever the RRDY flag is set. The interrupt is cleared when the flag is reset.

This mode allows the result of the calculation to be read under interrupt service routine, and hence given a priority relative to other tasks. However, it is slower than directly reading the result, or polling the flag, due to the interrupt handling delays.

20.3.9 DMA mode

If the DMA write enable (DMAWEN) bit is set in the CORDIC_CSR register, and no operation is pending, a DMA write channel request is generated. The DMA controller can transfer a primary input argument (ARG1) from memory into the CORDIC_WDATA register. Writing into the register deasserts the DMA request. If NARGS = 1 in the CORDIC_CSR register, a second DMA write channel request is generated to transfer the secondary input argument (ARG2) into the CORDIC_WDATA register. When all input arguments have been written, and any ongoing calculation has been completed (by reading the results), a new calculation is started and another DMA write channel request is generated.

If the DMA read enable (DMAREN) bit is set in the CORDIC_CSR register, the RRDY flag going active generates a DMA read channel request. The DMA controller can then transfer the primary result (RES1) from the CORDIC_RDATA register to memory. Reading the register deasserts the DMA request. If NRES = 1 in the CORDIC_CSR register, a second DMA request is generated to read out the secondary result (RES2). When all results have been read, the RRDY flag is deasserted.

The DMA read and write channels can be enabled separately. If both channels are enabled, the CORDIC can autonomously perform repeated calculations on a buffer of data without processor intervention. This allows the processor to perform other tasks. The DMA controller is operating in memory-to-peripheral mode for the write channel, and peripheral-to-memory mode for the read channel. The sequence is started by the processor setting the DMAWEN flag, the DMA read and write requests are generated as fast as the CORDIC can process the data.

In some cases, the input data may be stored in memory, and the output is transferred at regular intervals to another peripheral, such as a digital-to-analog converter. In this case, the destination peripheral generates a DMA request each time it needs a new data. The DMA controller can directly fetch the next sample from the CORDIC_RDATA register (in this case the DMA controller is operating in memory-to-peripheral mode, even though the source is a peripheral register). The act of reading the result allows the CORDIC to start a new calculation, which in turn generates a DMA write channel request, and the DMA controller transfers the next input value to the CORDIC_WDATA register. The DMA write channel is enabled (DMAWEN = 1), but the read channel must not be enabled.

In a similar way, data coming from another peripheral, such as an ADC, can be transferred directly to the CORDIC_WDATA register (in peripheral-to-memory mode). The DMA write channel must not be enabled. The CORDIC processes the input data and generates a DMA read request when complete, if DMAREN = 1. The DMA controller then transfers the result from CORDIC_RDATA register to memory (peripheral-to-memory mode).

Note: No DMA request is generated to program the CORDIC_CSR register. DMA mode is therefore useful only when repeatedly performing the same function with the same settings. The scale factor cannot be changed during a series of DMA transfers.

Note: Each DMA request must be acknowledged, as a result of the DMA performing an access to the CORDIC_WDATA or CORDIC_RDATA register. If an extraneous access to the relevant register occurs before this, the acknowledge is asserted prematurely, and may block the DMA channel. Therefore, when the DMA read channel is enabled, CPU access to the CORDIC_RDATA register must be avoided. Similarly, the processor must avoid accessing the CORDIC_WDATA register when the DMA write channel is enabled.

20.4 CORDIC registers

The CORDIC registers can be accessed only in 32-bit word format

20.4.1 CORDIC control/status register (CORDIC_CSR)

Address offset: 0x00

Reset value: 0x0000 0050

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RRDY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ARG SIZE	RES SIZE	N ARGS	NRES	DMA WEN	DMA REN	IEN
r									rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	SCALE[2:0]			PRECISION[3:0]				FUNC[3:0]			
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **RRDY**: Result ready flag

0: No new data in output register

1: CORDIC_RDATA register contains new data.

This bit is set by hardware when a CORDIC operation completes. It is reset by hardware when the CORDIC_RDATA register is read (NRES+1) times.

When this bit is set, if the IEN bit is also set, the CORDIC interrupt is asserted. If the DMAREN bit is set, a DMA read channel request is generated. While this bit is set, no new calculation is started.

Bits 30:23 Reserved, must be kept at reset value.

Bit 22 **ARGSIZE**: Width of input data

0: 32-bit

1: 16-bit

ARGSIZE selects the number of bits used to represent input data.

If 32-bit data is selected, the CORDIC_WDATA register expects arguments in q1.31 format.

If 16-bit data is selected, the CORDIC_WDATA register expects arguments in q1.15 format. The primary argument (ARG1) is written to the least significant half-word, and the secondary argument (ARG2) to the most significant half-word.

Bit 21 **RESSIZE**: Width of output data

0: 32-bit

1: 16-bit

RESSIZE selects the number of bits used to represent output data.

If 32-bit data is selected, the CORDIC_RDATA register contains results in q1.31 format.

If 16-bit data is selected, the least significant half-word of CORDIC_RDATA contains the primary result (RES1) in q1.15 format, and the most significant half-word contains the secondary result (RES2), also in q1.15 format.

Bit 20 **NARGS**: Number of arguments expected by the CORDIC_WDATA register
0: Only one 32-bit write (or two 16-bit values if ARGSIZE = 1) is needed for the next calculation.
1: Two 32-bit values must be written to the CORDIC_WDATA register to trigger the next calculation.
Reads return the current state of the bit.

Bit 19 **NRES**: Number of results in the CORDIC_RDATA register
0: Only one 32-bit value (or two 16-bit values if RESSIZE = 1) is transferred to the CORDIC_RDATA register on completion of the next calculation. One read from CORDIC_RDATA resets the RRDY flag.
1: Two 32-bit values are transferred to the CORDIC_RDATA register on completion of the next calculation. Two reads from CORDIC_RDATA are necessary to reset the RRDY flag.
Reads return the current state of the bit.

Bit 18 **DMAWEN**: Enable DMA write channel
0: Disabled. No DMA write requests are generated.
1: Enabled. Requests are generated on the DMA write channel whenever no operation is pending
This bit is set and cleared by software. A read returns the current state of the bit.

Bit 17 **DMAREN**: Enable DMA read channel
0: Disabled. No DMA read requests are generated.
1: Enabled. Requests are generated on the DMA read channel whenever the RRDY flag is set.
This bit is set and cleared by software. A read returns the current state of the bit.

Bit 16 **IEN**: Enable interrupt.
0: Disabled. No interrupt requests are generated.
1: Enabled. An interrupt request is generated whenever the RRDY flag is set.
This bit is set and cleared by software. A read returns the current state of the bit.

Bits 15:11 Reserved, must be kept at reset value.

Bits 10:8 **SCALE[2:0]**: Scaling factor
The value of this field indicates the scaling factor applied to the arguments and/or results. A value n implies that the arguments have been multiplied by a factor 2^{-n}, and/or the results need to be multiplied by 2^{n}. Refer to *Section 20.3.2* for the applicability of the scaling factor for each function and the appropriate range.

Bits 7:4 **PRECISION[3:0]**: Precision required (number of iterations)
0: reserved
1 to 15: (Number of iterations)/4
To determine the number of iterations needed for a given accuracy refer to *Table 177*.
Note that for most functions, the recommended range for this field is 3 to 6.

Bits 3:0 **FUNC[3:0]**: Function

0: Cosine
1: Sine
2: Phase
3: Modulus
4: Arctangent
5: Hyperbolic cosine
6: Hyperbolic sine
7: Arctanh
8: Natural logarithm
9: Square root
10 to 15: Reserved

20.4.2 CORDIC argument register (CORDIC_WDATA)

Address offset: 0x04

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ARG[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARG[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **ARG[31:0]**: Function input arguments

This register is programmed with the input arguments for the function selected in the CORDIC_CSR register FUNC field.

If 32-bit format is selected (CORDIC_CSR.ARGSIZE = 0) and two input arguments are required (CORDIC_CSR.NARGS = 1), two successive writes are required to this register. The first writes the primary argument (ARG1), the second writes the secondary argument (ARG2).

If 32-bit format is selected and only one input argument is required (NARGS = 0), only one write is required to this register, containing the primary argument (ARG1).

If 16-bit format is selected (CORDIC_CSR.ARGSIZE = 1), one write to this register contains both arguments. The primary argument (ARG1) is in the lower half, ARG[15:0], and the secondary argument (ARG2) is in the upper half, ARG[31:16]. In this case, NARGS must be set to 0.

Refer to *Section 20.3.2* for the arguments required by each function, and their permitted range.

When the required number of arguments has been written, the CORDIC evaluates the function designated by CORDIC_CSR.FUNC using the supplied input arguments, provided any previous calculation has completed. If a calculation is ongoing, the ARG1 and ARG 2 values are held pending until the calculation is completed and the results read. During this time, a write to the register cancels the pending operation and overwrite the argument data.

20.4.3 CORDIC result register (CORDIC_RDATA)

Address offset: 0x08

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RES[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RES[31:0]**: Function result

If 32-bit format is selected (CORDIC_CSR.RESSIZE = 0) and two output values are expected (CORDIC_CSR.NRES = 1), this register must be read twice when the RRDY flag is set. The first read fetches the primary result (RES1). The second read fetches the secondary result (RES2) and resets RRDY.

If 32-bit format is selected and only one output value is expected (NRES = 0), only one read of this register is required to fetch the primary result (RES1) and reset the RRDY flag.

If 16-bit format is selected (CORDIC_CSR.RESSIZE = 1), this register contains the primary result (RES1) in the lower half, RES[15:0], and the secondary result (RES2) in the upper half, RES[31:16]. In this case, NRES must be set to 0, and only one read performed.

A read from this register resets the RRDY flag in the CORDIC_CSR register.

20.4.4 CORDIC register map

Table 178. CORDIC register map and reset value

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

21 Filter math accelerator (FMAC)

This section applies only to STM32H56x/573xx devices.

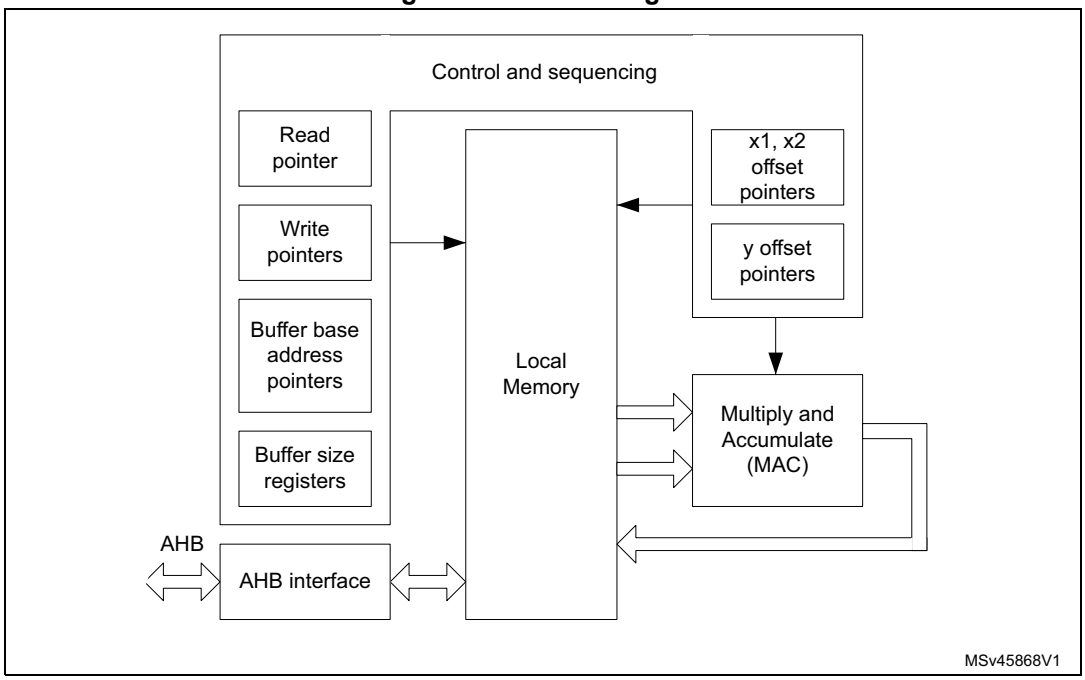
21.1 FMAC introduction

The filter math accelerator unit performs arithmetic operations on vectors. It comprises a multiplier/accumulator (MAC) unit, together with address generation logic which allows it to index vector elements held in local memory.

The unit includes support for circular buffers on input and output, which allows digital filters to be implemented. Both finite and infinite impulse response filters can be realized.

The unit allows frequent or lengthy filtering operations to be offloaded from the CPU, freeing up the processor for other tasks. In many cases it can accelerate such calculations compared to a software implementation, resulting in a speed-up of time critical tasks.

21.2 FMAC main features



- 16 x 16-bit multiplier
- 24 + 2-bit accumulator with addition and subtraction
- 16-bit input and output data
- 256 x 16-bit local memory
- Up to three areas can be defined in memory for data buffers (two input, one output), defined by programmable base address pointers and associated size registers
- Input and output buffers can be circular
- Filter functions: FIR, IIR (direct form 1)
- Vector functions: Dot product, convolution, correlation
- AHB slave interface
- DMA read and write data channels

21.3 FMAC functional description

21.3.1 General description

The FMAC is shown in *Figure 104*.

Figure 104. Block diagram

The unit is built around a fixed point multiplier and accumulator (MAC). The MAC can take two 16-bit input signed values from memory, multiply them together and add them to the contents of the accumulator. The address of the input values in memory is determined using a set of pointers. These pointers can be loaded, incremented, decremented or reset by the internal hardware. The pointer and MAC operations are controlled by a built-in sequencer in order to execute the requested operation.

To calculate a dot product, the two input vectors are loaded into the local memory by the processor or DMA controller, and the requested operation is selected and started. Each pair of input vector elements is fetched from memory, multiplied together and accumulated. When all the vector elements have been processed, the contents of the accumulator are stored in the local memory, from where they can be read out by the processor or DMA.

The finite impulse response (FIR) filter operation (also known as convolution) consists in repeatedly calculating the dot product of the coefficient vector and a vector of input samples, the latter being shifted by one sample delay, with the least recent sample being discarded and a new sample added, at each repetition.

The infinite impulse response (IIR) filter operation is the convolution of the feedback coefficients with the previous output samples, added to the result of the FIR convolution.

A more detailed description of the filter operations is given in *Section 21.3.6: Filter functions*.

21.3.2 Local memory and buffers

The unit contains a 256 x 16-bit read/write memory which is used for local storage:

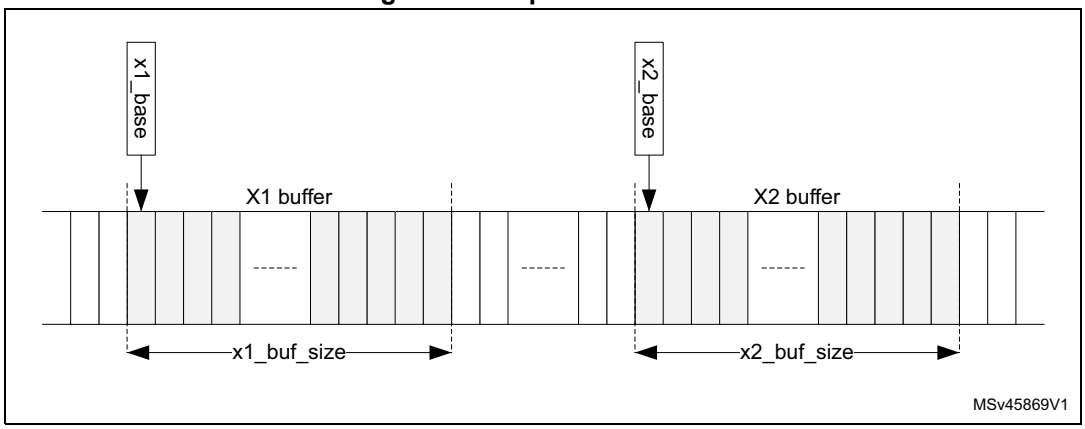
- Input values (the elements of the input vectors) are stored in two buffers, X1 and X2.
- Output values (the results of the operations) are stored in another buffer, Y.
- The locations and sizes of the buffers are designated as follows:
  - x1_base: the base address of the X1 buffer
  - x2_base: the base address of the X2 buffer
  - y_base: the base address of the Y buffer
  - x1_buf_size: the number of 16-bit addresses allocated to the X1 buffer
  - x2_buf_size: the number of 16-bit addresses allocated to the X2 buffer
  - y_buf_size: the number of 16-bit addresses allocated to the Y buffer.

These parameters are programmed in the corresponding registers when configuring the unit.

The CPU (or DMA controller) can initialize the contents of each buffer using the Initialization functions (*Section 21.3.5: Initialization functions*) and writing to the write data register. The data is transferred to the location within the target buffer indicated by a write pointer. After each new write, the write pointer is incremented. When the write pointer reaches the end of the allocated buffer space, it wraps back to the base address. This feature is used to load the elements of a vector prior to an operation, or to initialize a filter and load filter coefficients.

Buffer configuration

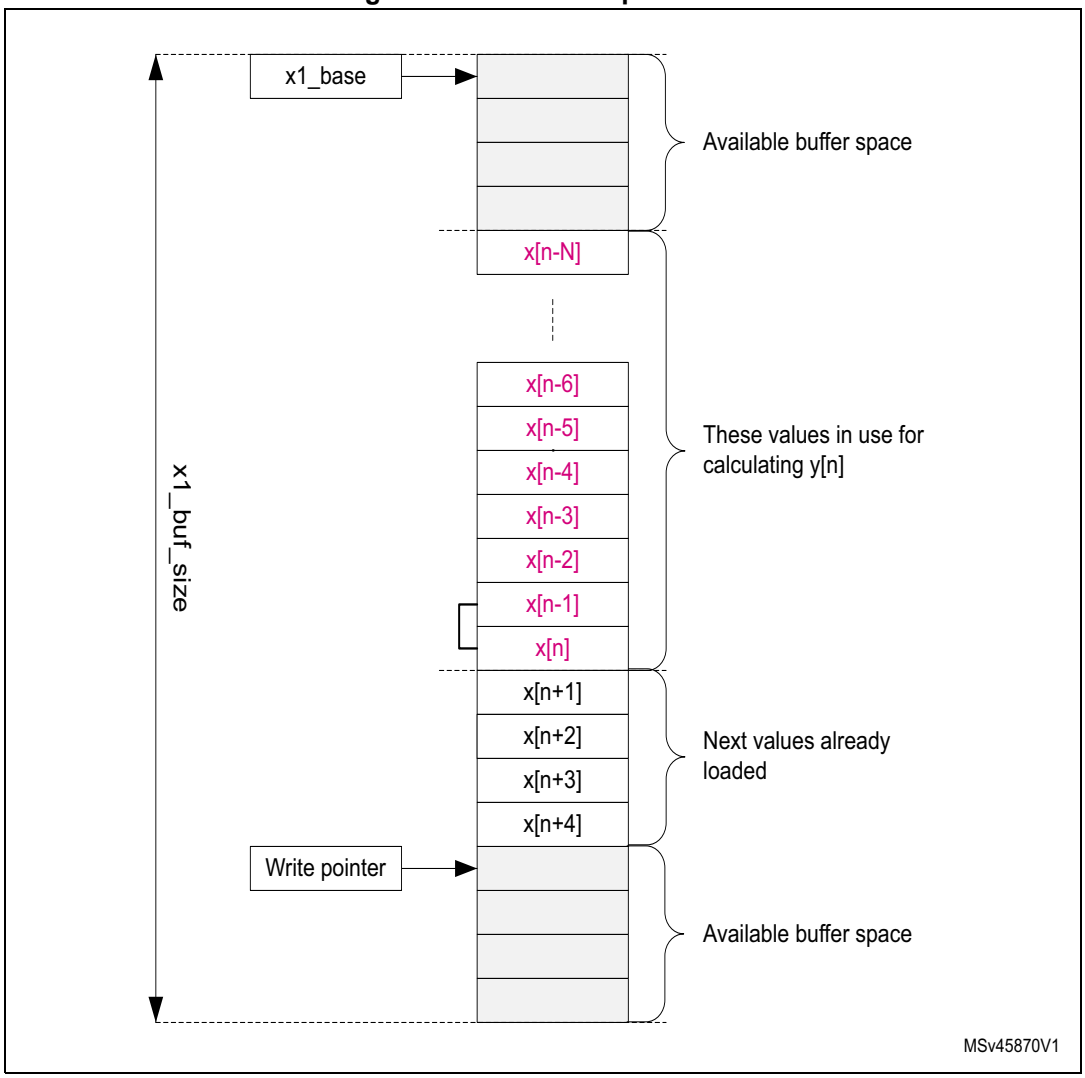
The buffer sizes and base address offsets must be configured in the X1, X2 and Y buffer configuration registers. For each function, the required buffer size is specified in the function description in *Section 21.3.6: Filter functions*. The base addresses can be chosen anywhere in internal memory, provided that all buffers fit within the internal memory address range (0x00 to 0xFF), that is, base address + buffer size must be less than 256.



There is no constraint on the size and location of the buffers (they can overlap or even coincide exactly). For filter functions it is recommended not to overlap buffers as this can lead to erroneous behavior.

When circular buffer operation is required, an optional “headroom”, d, can be added to the buffer size. Furthermore, a watermark level can be set, to regulate the CPU or DMA activity. The value of d and the watermark level must be chosen according to the application performance requirements. For maximum throughput, the input buffer must never go empty, so d must be somewhat greater than the watermark level, allowing for any interrupt or DMA latency. On the other hand, if the input data can not be provided as fast as the unit can process them, the buffer can be allowed to empty waiting for the next data to be written, so d can be equal to the watermark level (to ensure that no overflow occurs on the input).

21.3.3 Input buffers



The X1 and X2 buffers are used to store data for input to the MAC. Each multiplication takes a value from the X1 buffer and a value from the X2 buffer and multiplies them together. A pointer in the control unit generates the read address offset (relative to the buffer base address) for each value. The pointers are managed by hardware according to the current function.

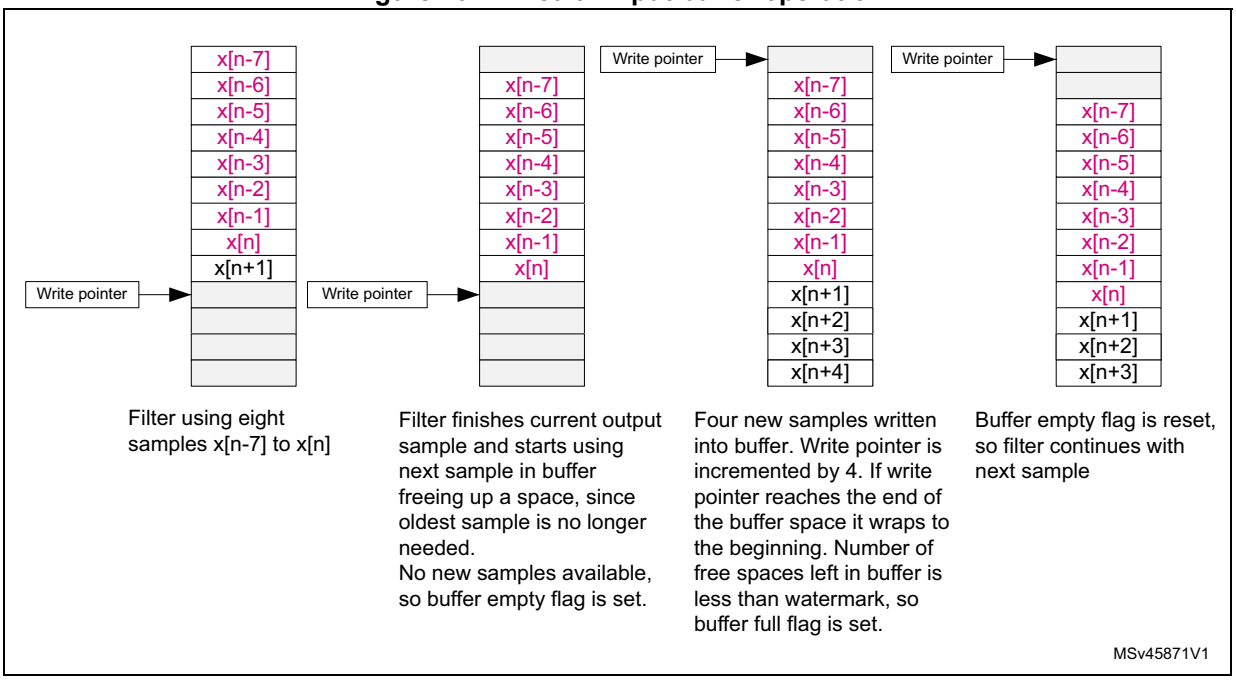
Figure 105. Input buffer areas

The X1 buffer can be used as a circular buffer, in which case new data are continually transferred into the input buffer whenever space is available. Pre-loading this buffer is optional for digital filters, since if no input samples have been written in the buffer when the operation is started, it is flagged as empty, which triggers the CPU or DMA to load new samples until there are enough to begin operation. Pre-loading is nevertheless useful in the case of a vector operation, that is, the input data is already available in system memory and circular operation is not required.

Figure 106. Circular input buffer

The X2 buffer can only be used in vector mode (that is not circular), and needs to be pre-loaded, except if the contents of the buffer do not change from one operation to the next. For filter functions, the X2 buffer is used to store the filter coefficients.

When operating as a circular buffer, the space allocated to the buffer (x1_buf_size) must generally be bigger than the number of elements in use for the current calculation, so that there are always new values available in the buffer. *Figure 106* illustrates the layout of the buffer for a filter operation. While calculating an output sample y[n], the unit uses a set of N+1 input samples, x[n-N] to x[n]. When this is finished, the unit starts the calculation of y[n+1], using the set of input samples x[n-N+1] to x[n+1]. The least-recent input sample, x[n-N], drops out of the input set, and a new sample, x[n+1], is added to it.



The processor, or DMA controller, must ensure that the new sample x[n+1] is available in the buffer space when required. If not, the buffer is flagged as empty, which stalls the execution of the unit until a new sample is added. No underflow condition is signaled on the X1 buffer.

Note: If the flow of samples is controlled by a timer or other peripheral such as an ADC, the buffer regularly goes empty, since the filter processes each new sample faster than the source can provide it. This is an essential feature of filter operation.

If the number of free spaces in the buffer is less than the watermark threshold programmed in the FULL_WM bitfield of the FMAC_X1BUFCFG register, the buffer is flagged as full. As long as the full flag is not set, interrupts are generated, if enabled, to request more data for the buffer. The watermark allows several data to be transferred under one interrupt, without danger of overflow. Nevertheless, if an overflow does occur, the OVFL error flag is set and the write data is ignored. The write pointer is not incremented in the event of an overflow.

The operation of the X1 buffer during a filtering operation is illustrated in *Figure 107*. This example shows an 8-tap FIR filter with a watermark set to four.

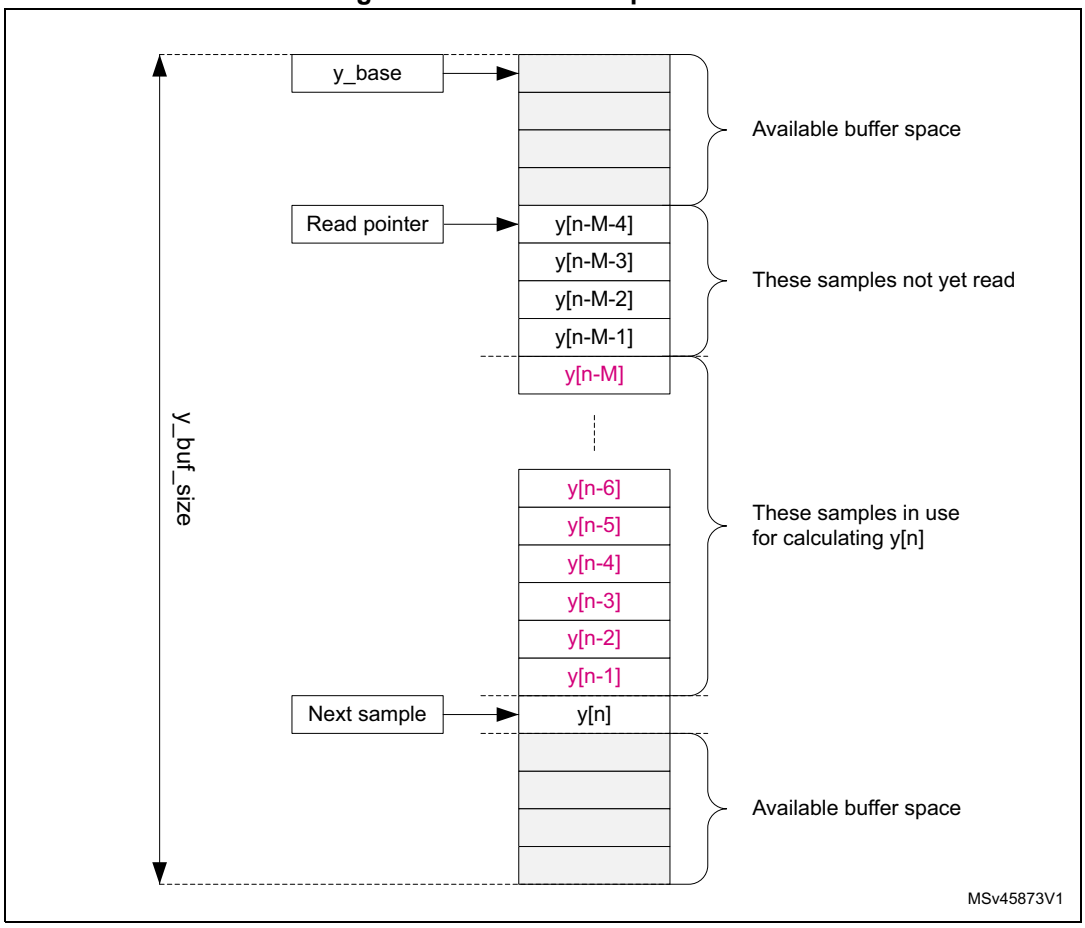


Figure 107. Circular input buffer operation

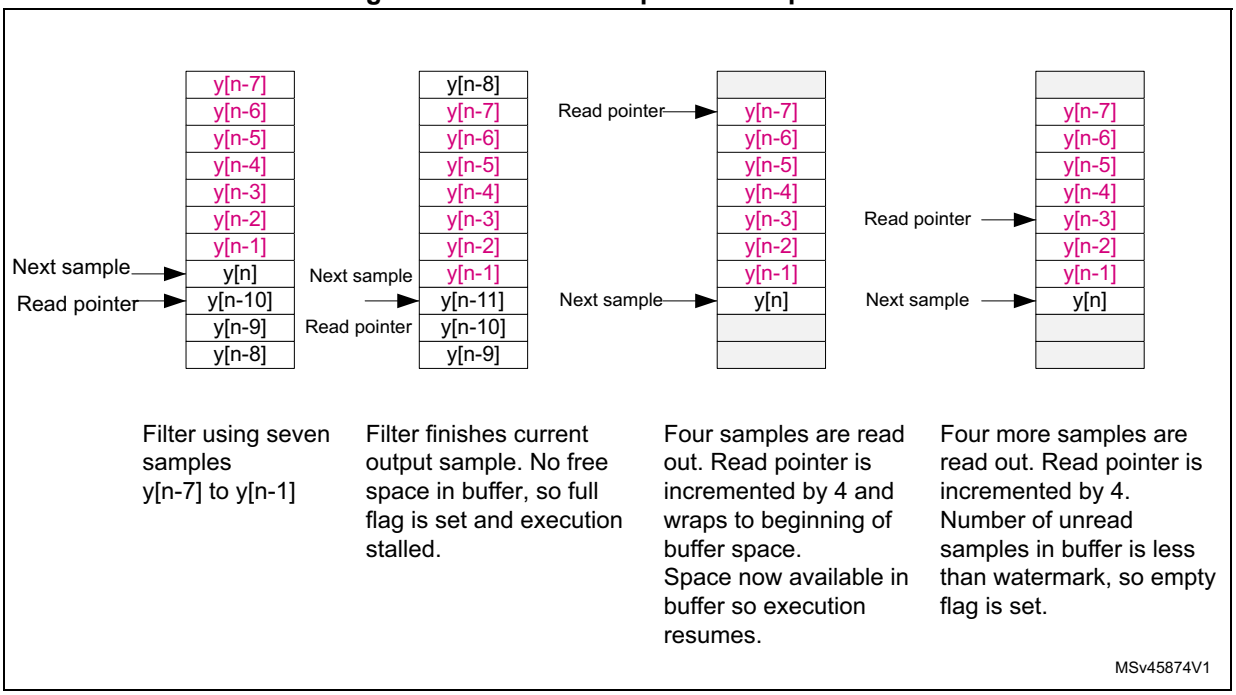
21.3.4 Output buffer

The Y (output) buffer is used to store the output of an accumulation. Each new output value is stored in the buffer until it is read by the processor or DMA controller. Each time a read access is made to the read data register, the read data is fetched from the address indicated by the read pointer. This pointer is incremented after each read, and wraps back to the base address when it reaches the end of the allocated Y buffer space.

Figure 108. Circular output buffer



The Y buffer can also operate as a circular buffer. If the address for the next output value is the same as that indicated by the read pointer (an unread sample), then the buffer is flagged as full and execution stalled until the sample is read.

In the case of IIR filters, the Y buffer is used to store the set of M previous output samples, y[n-M] to y[n-1], used for calculating the next output sample y[n]. Each time a new sample is added to the set, the least recent sample y[n-M] drops out.

If the number of unread data in the buffer is less than the watermark threshold programmed in the EMPTY_WM bitfield of the FMAC_YBUFCFG register, the buffer is flagged as empty. As long as the empty flag is not set, interrupts or DMA requests are generated, if enabled, to request reads from the buffer. The watermark allows several data to be transferred under one interrupt, without danger of underflow. Nevertheless, if an underflow does occur, the UNFL error flag is set. In this case, the read pointer is not incremented and the read operation returns the content of the memory at the read pointer address.

The operation of the Y buffer in circular mode is illustrated in *Figure 109*. This example shows a 7-tap IIR filter with a watermark set to four.

Figure 109. Circular output buffer operation

21.3.5 Initialization functions

The following functions initialize the FMAC unit. They are triggered by writing the appropriate value in the FUNC bitfield of the FMAC_PARAM register, with the START bit set. The P and Q bitfields must also contain the appropriate parameter values for each function as detailed below. The R bitfield is not used. When the function completes, the START bit is automatically reset by hardware.

During initialization, it is recommended that the DMA requests and interrupts be disabled. The transfer of data into the FMAC memory can be done by software or by memory-to-memory DMA transfers, since no flow control is required.

Load X1 buffer

This function pre-loads the X1 buffer with N values, starting from the address in X1_BASE. Successive writes to the FMAC_WDATA register load the write data into the X1 buffer and increment the write address. The write pointer points to the address X1_BASE + N when the function completes.

The function can be used to pre-load the buffer with the elements of a vector, or to initialize the input storage elements of a filter.

Parameters

- The parameter P contains the number of values, N, to be loaded into the X1 buffer.
- The parameters Q and R are not used.

The function completes when N writes have been performed to the FMAC_WDATA register.

Load X2 buffer

This function pre-loads the X2 buffer with N + M values, starting from the address in X2_BASE. Successive writes to the FMAC_WDATA register load the write data into the X2 buffer and increment the write address.

The function can be used to pre-load the buffer with the elements of a vector, or the coefficients of a filter. In the case of an IIR, the N feed-forward and M feed-back coefficients are concatenated and loaded together into the X2 buffer. The total number of coefficients is equal to N + M. For an FIR, there are no feedback coefficients, so M = 0.

Parameters

- The parameter P contains the number of values, N, to be loaded into the X2 buffer starting from address X2_BASE.
- The parameter Q contains the number of values, M, to be loaded into the X2 buffer starting from address X2_BASE + N.
- The parameter R is not used.

The function completes when N + M writes have been performed to the FMAC_WDATA register.

Load Y buffer

This function pre-loads the Y buffer with N values, starting from the address in Y_BASE. Successive writes to the FMAC_WDATA register load the write data into the Y buffer and increment the write address. The read pointer points to the address Y_BASE + N when the function completes.

The function can be used to pre-load the feedback storage elements of an IIR filter.

Parameters

- The parameter P contains the number of values to be loaded into the Y buffer.
- The parameters Q and R are not used.

The function completes when N writes have been performed to the FMAC_WDATA register.

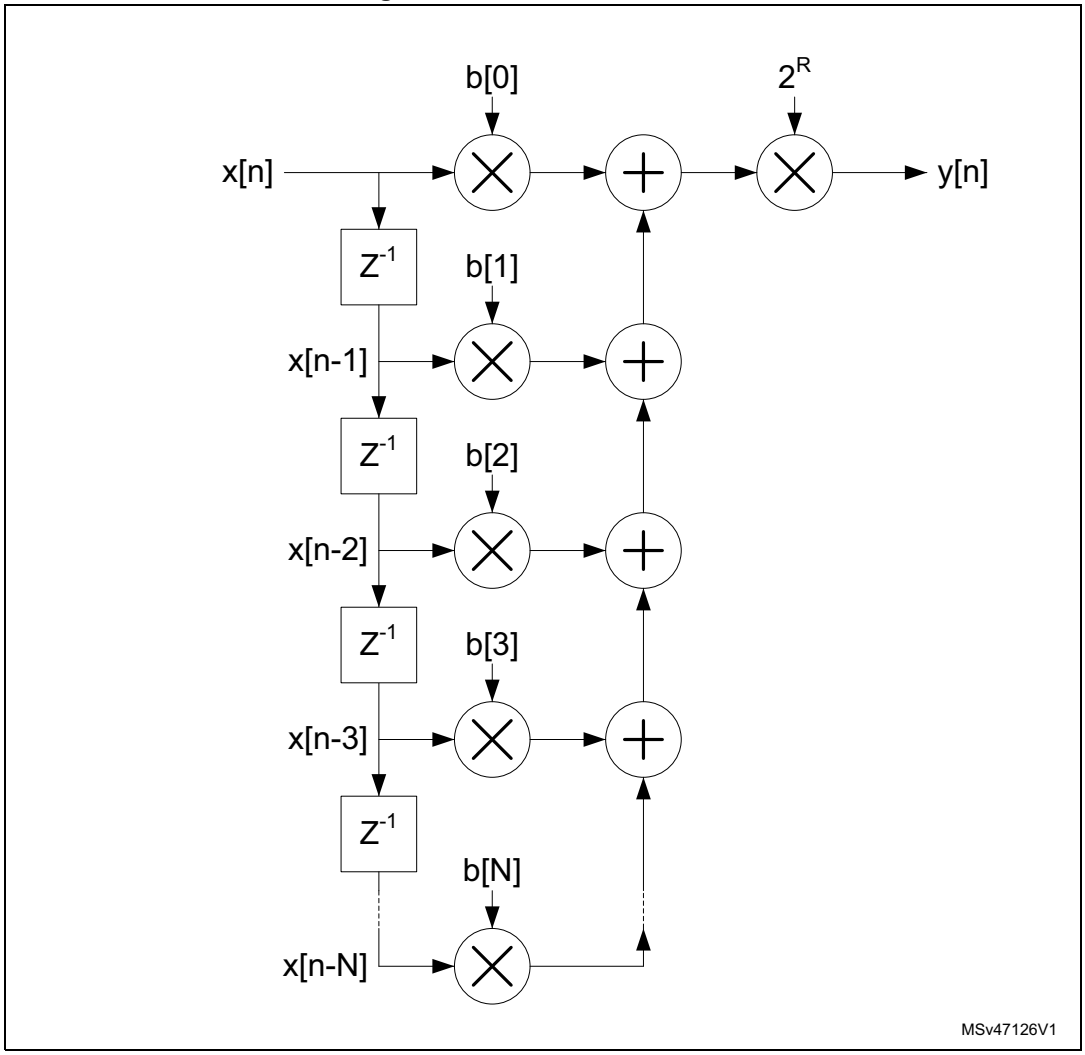
21.3.6 Filter functions

The following filter functions are supported by the FMAC unit. These functions are triggered by writing the corresponding value in the FUNC bitfield of the FMAC_PARAM register with the START bit set. The P, Q and R bitfields must also contain the appropriate parameter values for each function as detailed below. The filter functions continue to run until the START bit is reset by software.

Convolution (FIR filter)

Y = **B***__X__

$$y_n = 2^R \cdot \sum_{k=0}^{N} b_k x_{n-k}$$



This function performs a convolution of a vector **B** of length N+1 and a vector **X** of indefinite length. The elements of **Y** for incrementing values of n are calculated as the dot product,

$y_n = \underline{\mathbf{B}}.\underline{\mathbf{X}}_{\mathbf{n}}$, where $\underline{\mathbf{X}}_{\mathbf{n}} = [x_{n-N},...,x_n]$ is composed of the N+1 elements of **X** at indexes n - N to n.

This function corresponds to a finite impulse response (FIR) filter, where vector **B** contains the filter coefficients and vector **X** the sampled data.

The structure of the filter (direct form) is shown in *Figure 110*.

Figure 110. FIR filter structure

Note that the cross correlation vector can be calculated by reversing the order of the coefficient vector **B**.

Input:

- X1 buffer contains the elements of vector **X**. It is a circular buffer of length N + 1 + d.
- X2 buffer contains the elements of vector **B**. It is a fixed buffer of length N + 1.

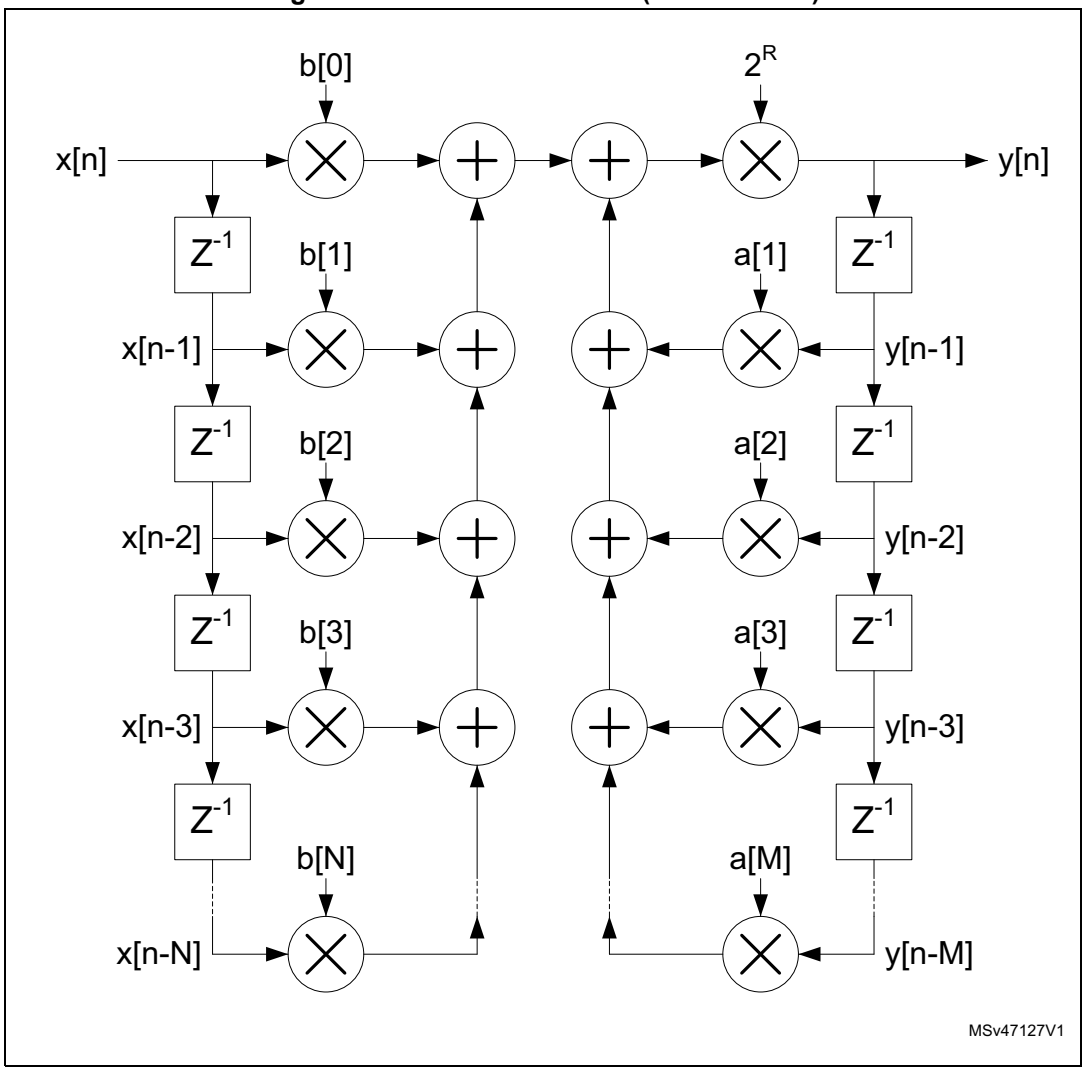
Output:

- Y buffer contains the output values, y_n. It is a circular buffer of length d.

Parameters:

- The parameter P contains the length, N+1, of the coefficient vector **B** in the range [2:127].
- The parameter R contains the gain to be applied to the accumulator output. The value output to the Y buffer is multiplied by 2^R, where R is in the range [0:7]
- The parameter Q is not used.

The function completes when the START bit in the FMAC_PARAM register is reset by software.



IIR filter

Y = B*X+A*Y'

$$y_n = 2^R \cdot \left(\sum_{k=0}^{N} b_k x_{n-k} + \sum_{k=1}^{M} a_k y_{n-k} \right)$$

This function implements an infinite impulse response (IIR) filter. The filter output vector **Y** is the convolution of a coefficient vector **B** of length N+1 and a vector **X** of indefinite length, plus the convolution of the delayed output vector **Y'** with a second coefficient vector **A**, of length M. The elements of **Y** for incrementing values of n are calculated as y_n = **B**.$\mathbf{X_n}$ + **A**.$\mathbf{Y_{n-1}}$, where $\mathbf{X_n}$ = $[x_{n-N},...,x_n]$ comprises the N+1 elements of **X** at indexes n - N to n, while $\mathbf{Y_{n-1}}$ = $[y_{n-M},...,y_{n-1}]$ comprises the M elements of **Y** at indexes n - M to n - 1. The structure of the filter (direct form 1) is shown in *Figure 111*.

Figure 111. IIR filter structure (direct form 1)

Input:

- X1 buffer contains the elements of vector **X**. It is a circular buffer of length N + 1+ d.
- X2 buffer contains the elements of coefficient vectors **B** and **A** concatenated (b_0, b_1, b_2..., b_N, a_1, a_2, ..., a_M). It is a fixed buffer of length M+N+1.

Output:

- Y buffer contains the output values, y_n. It is a circular buffer of length M + d.

Parameters

- The parameter P contains the length, N + 1, of the coefficient vector **B** in the range [2:64].
- The parameter Q contains the length, M, of the coefficient vector **A** in the range [1:63].
- The parameter R contains the gain to be applied to the accumulator output. The value output to the Y buffer is multiplied by 2^R, where R is in the range [0:7].

The function completes when the START bit in the FMAC_PARAM register is reset by software.

21.3.7 Fixed point representation

The FMAC operates in fixed point signed integer format. Input and output values are q1.15.

In q1.15 format, numbers are represented by one sign bit and 15 fractional bits (binary decimal places). The numeric range is therefore -1 (0x8000) to 1 - 2^{-15} (0x7FFF).

The accumulator has 26 bits, of which 22 are fractional and 4 are integer/sign (q4.22). This allows it to support partial accumulation sums in the range -8 (0x2000000) to +7.99999976 (0x1FFFFFF). A programmable gain from 0dB to 42dB in steps of 6dB can be applied at the output of the accumulator.

Note that the content of the accumulator is not saturated if the numeric range is exceeded. Partial sums whose value is greater than +7.99999976 or less than -8, wrap but this is harmless provided subsequent accumulations undo the wrapping. Nevertheless, the SAT flag in the FMAC_SR register is set if wrapping occurs, and generates an interrupt if the SATIEN bit is set in the FMAC_CR register. This helps in debugging the filter.

The data output by the accumulator can optionally be saturated, after application of the programmable gain, by setting the CLIPEN bit in the FMAC_CR register. If this bit is set, then any value which exceeds the numeric range of the q1.15 output, is set to 1 - 2^{-15} or -1, according to the sign. If clipping is not enabled, the unused accumulator bits after applying the gain is simply truncated.

21.3.8 Implementing FIR filters with the FMAC

The FMAC supports FIR filters of length N, where N is the number of taps or coefficients. The minimum local memory requirement for a FIR filter of length N is 2N + 1:

- N coefficients
- N input samples
- 1 output sample

Since the local memory size is 256, the maximum value for N is 127.

If maximum throughput is required, it may be necessary to allocate a small amount of extra space, d1 and d2, to the input and output sample buffers respectively, to ensure that the filter never stalls waiting for a new input sample, or waiting for the output sample to be read. In this case, the local memory requirement is 2N + d1 + d2.

The buffers must be configured as follows:

- X1_BUF_SIZE = N + d1;
- X2_BUF_SIZE = N;
- Y_BUF_SIZE = d2 (or 1 if no extra space is required)

The buffer base addresses can be allocated anywhere, but the X2 buffer must not overlap with the others, or else the coefficients are overwritten. An example configuration is:

- X2_BASE = 0;
- X1_BASE = N;
- Y_BASE = 2N + d1

However, if the memory space is limited, the X1 and Y buffer areas can be overlapped, such that each output sample takes the place of the oldest input sample, which is no longer required:

- X2_BASE = 0;
- X1_BASE = N;
- Y_BASE = N

In this case, Y_BUF_SIZE = X1_BUF_SIZE = N + d1, so that the buffers remain in sync.

Note: The FULL_WM bitfield of X1 buffer configuration register must be programmed with a value less than or equal to $log_2(d1)$, otherwise the buffer is flagged full before N input samples have been written, and no more samples are requested. Similarly, the EMPTY_WM bitfield of the Y buffer configuration register must be less than or equal to $log_2(d2)$.

The filter coefficients **must** be pre-loaded into the X2 buffer, using the Load X2 Buffer function. The X1 buffer can optionally be pre-loaded with any number of samples up to a maximum of N. There is no point in pre-loading the Y buffer, since for the FIR filter there is no feedback path.

After configuring and initializing the buffers, the FMAC_CR register must be programmed according to the method used for writing and reading data to and from the FMAC memory.

Three methods are supported:

- Polling: No DMA request or Interrupt request is generated. Software must check that the X1_FULL flag is low before writing to WDATA, or that the Y_EMPTY flag is low before reading from RDATA.
- Interrupt: The interrupt request is asserted while the X1_FULL flag is low, for writes, or when the Y_EMPTY flag is low, for reads.
- DMA: DMA requests are asserted on the DMA write channel while the X1_FULL flag is low, and on the read channel while the Y_EMPTY flag is low.

Different methods can be used for read and for write. However it is not recommended to use both interrupts and DMA requests for the same operation[(a)]. The valid combinations are listed in *Table 179*.

Table 179. Valid combinations for read and write methods

WIEN	RIEN	DMAWEN	DMAREN	Write	Read
0	0	0	0	Polling	Polling
0	1	0	0	Polling	Interrupt
1	0	0	0	Interrupt	Polling
1	1	0	0	Interrupt	Interrupt
0	0	0	1	Polling	DMA
0	0	1	0	DMA	Polling
0	0	1	1	DMA	DMA
0	1	1	0	DMA	Interrupt
1	0	0	1	Interrupt	DMA

a. If both interrupts and DMA requests are enabled then only DMA must perform the transfer.

The filter is started by writing to the FMAC_PARAM register with the following bitfield values:

- FUNC = 8 (FIR filter);
- P = N (number of coefficients);
- Q = “Don’t care”;
- R = Gain;
- START = 1;

If less than N + d - 2^{FULL_WM} values have been pre-loaded in the X1 buffer, the X1FULL flag remains low. If the WIEN bit is set in the FMAC_CR register, then the interrupt request is asserted immediately to request the processor to write 2^{FULL_WM} additional samples into the buffer, via the FMAC_WDATA register. It remains asserted until the X1FULL flag goes high in the FMAC_SR register. The interrupt service routine must check the X1FULL flag after every 2^{FULL_WM} writes to the FMAC_WDATA register, and repeat the transfer until the flag goes high. Similarly, if the DMAWEN bit is set in the FMAC_CR register, DMA write channel requests are generated until the X1FULL flag goes high.

The filter calculates the first output sample when at least N samples have been written into the X1 buffer (including any pre-loaded samples).

When 2^{EMPTY_WM} output samples have been written into the Y buffer, the YEMPTY flag in the FMAC_SR register goes low. If the RIEN bit is set in the FMAC_CR register, the interrupt request is asserted to request the processor to read 2^{EMPTY_WM} samples from the buffer, via the FMAC_RDATA register. It remains asserted until the YEMPTY flag goes high. The interrupt service routine must check the YEMPTY flag after every 2^{EMPTY_WM} reads from the FMAC_RDATA register, and repeat the transfer until the flag goes high. If the DMAREN bit is set in the FMAC_CR, DMA read channel requests are generated until the YEMPTY flag goes high.

The filter continues to operate in this fashion until it is stopped by the software resetting the START bit.

21.3.9 Implementing IIR filters with the FMAC

The FMAC supports IIR filters of length N, where N is the number of feed-forward taps or coefficients. The number of feedback coefficients, M, can be any value from 1 to N-1. Only direct form 1 implementations can be realized, so filters designed for other forms need to be converted.

The minimum memory requirement for an IIR filter with N feed-forward coefficients and M feed-back coefficients is 2N + 2M:

- N + M coefficients
- N input samples
- M output samples

If M = N-1, then the maximum filter length that can be implemented is N = 64.

As for the FIR, for maximum throughput, a small amount of additional space, d1 and d2, is allowed in the input and output buffer size respectively, making the total memory requirement 2M + 2N + d1 + d2.

The buffers must be configured as follows:

- X1_BUF_SIZE = N + d1;
- X2_BUF_SIZE = N + M;
- Y_BUF_SIZE = M + d2;

The buffer base addresses can be allocated anywhere, but must not overlap. An example configuration is given below:

- X2_BASE = 0;
- X1_BASE = N + M;
- Y_BASE = 2N + M + d1;

Note: The FULL_WM bitfield of X1 buffer configuration register must be programmed with a value less than or equal to $log_2(d1)$, otherwise the buffer is flagged full before N input samples have been written, and no more samples are requested. Similarly, the EMPTY_WM bitfield of the Y buffer configuration register must be less than or equal to $log_2(d2)$.

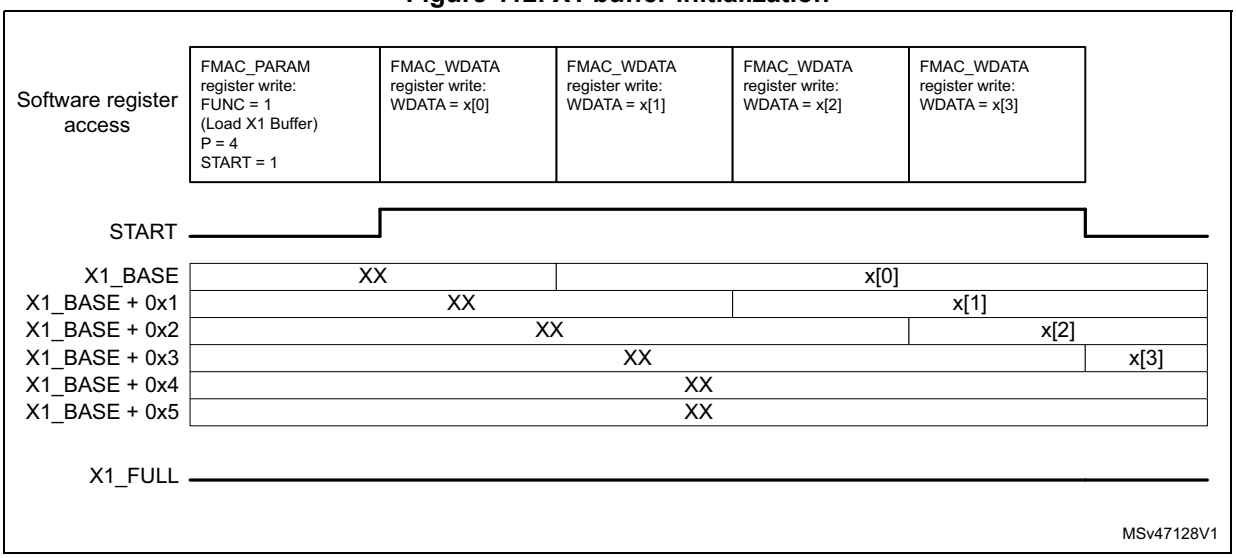
The filter coefficients (N feed-forward followed by M feedback) **must** be pre-loaded into the X2 buffer, using the Load X2 Buffer function. The X1 buffer can optionally be pre-loaded with any number of samples up to a maximum of N. The Y buffer can optionally be pre-loaded with any number of values up to a maximum of M. This has the effect of initializing the feedback delay line.

After configuring the buffers, the FMAC_CR register must be programmed in the same way as for the FIR filter (see *Section 21.3.8: Implementing FIR filters with the FMAC*).

The filter is started by writing to the FMAC_PARAM register with the following bitfield values:

- FUNC = 9 (IIR filter);
- P = N (number of feed-forward coefficients);
- Q = M (number of feed-back coefficients);
- R = Gain;
- START = 1;

If less than N + d - 2^{FULL_WM} values have been pre-loaded in the X1 buffer, the X1FULL flag remains low. If the WIEN bit is set in the FMAC_CR register, then the interrupt request is asserted immediately to request the processor to write 2^{FULL_WM} additional samples into the buffer, via the FMAC_WDATA register. It remains asserted until the X1FULL flag goes high in the FMAC_SR register. The interrupt service routine must check the X1FULL flag after every 2^{FULL_WM} writes to the FMAC_WDATA register, and repeat the transfer until the flag goes high. Similarly, if the DMAWEN bit is set in the FMAC_CR register, DMA write channel requests are generated until the X1FULL flag goes high.



The filter calculates the first output sample when at least N samples have been written into the X1 buffer (including any pre-loaded samples). The first sample is calculated using the first N samples in the X1 buffer, and the first M samples in the Y buffer (whether or not they are preloaded. The first output sample is written into the Y buffer at Y_BASE + M.

When 2^{EMPTY_WM} new output samples have been written into the Y buffer, the YEMPTY flag in the FMAC_SR register goes low. If the RIEN bit is set in the FMAC_CR register, the interrupt request is asserted to request the processor to read 2^{EMPTY_WM} samples from the buffer, via the FMAC_RDATA register. It remains asserted until the YEMPTY flag goes high. The interrupt service routine must check the YEMPTY flag after every 2^{EMPTY_WM} reads from the FMAC_RDATA register, and repeat the transfer until the flag goes high. If the DMAREN bit is set in the FMAC_CR, DMA read channel requests are generated until the YEMPTY flag goes high

The filter continues to operate in this fashion until it is stopped by the software resetting the START bit.

21.3.10 Examples of filter initialization

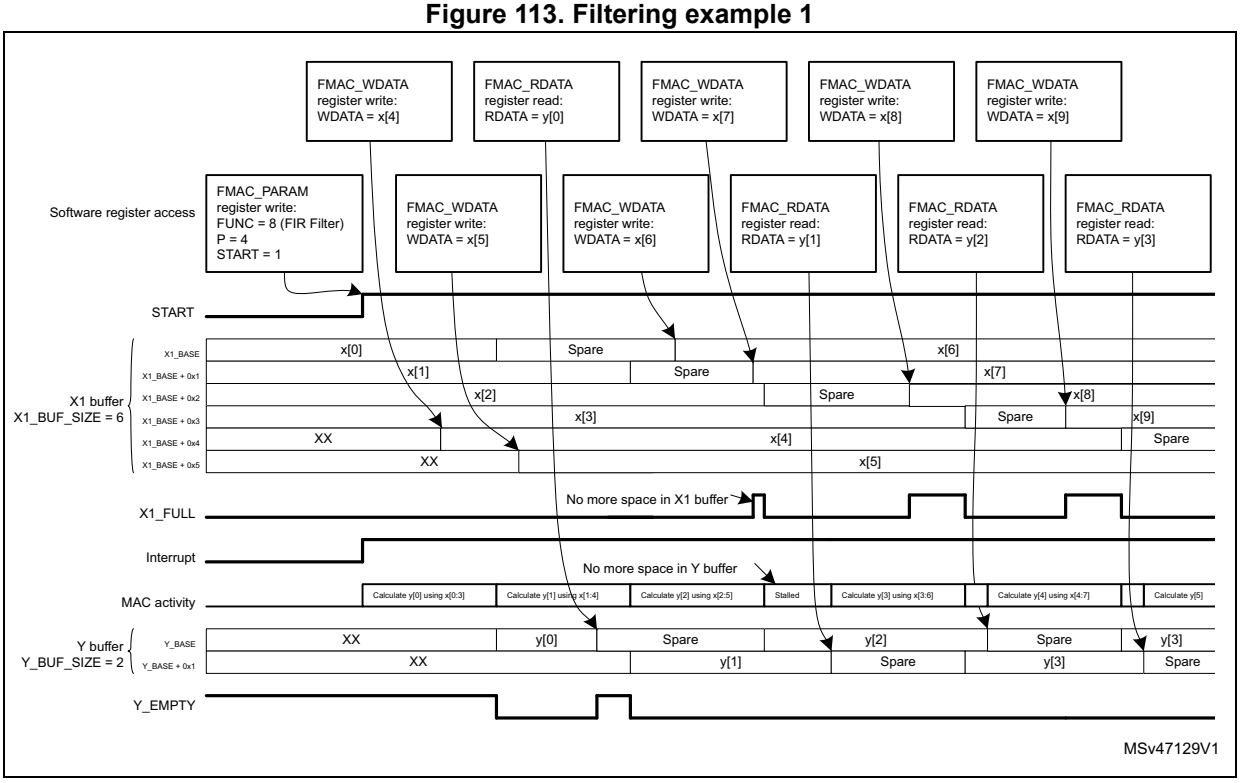


Figure 112. X1 buffer initialization

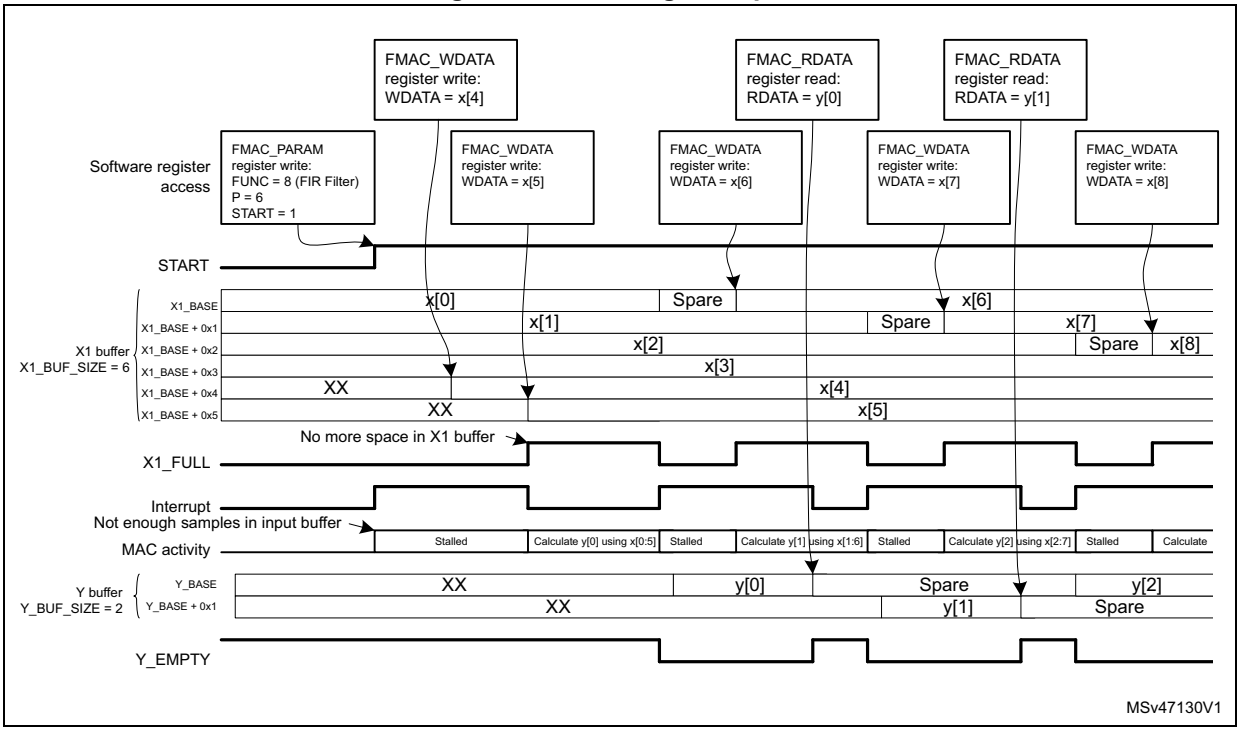
The example in *Figure 112* illustrates an X1 buffer pre-load with four samples (P = 4). The buffer size is six (X1_BUF_SIZE = 6). The initialization is launched by programming the FMAC_PARAM register with the START bit set. The four samples are then written to FMAC_WDATA, and transferred into local memory from X1_BASE onwards. The START bit resets after the fourth sample has been written. At this point, the X1 buffer contains the four samples, in order of writing, and the write pointer (next empty space) is at X1_BASE + 0x4.

21.3.11 Examples of filter operation

Figure 113. Filtering example 1

The example in *Figure 113* illustrates the beginning of a filter operation. The filter has four taps (P=4). The X1 buffer size is six and the Y buffer size is two. The FULL_WM and EMPTY_WM bitfields are both set to 0. Prior to starting the filter, the X1 buffer has been pre-loaded with four samples, x[0:3] as in *Figure 112*. So the filter starts calculating the first output sample, y[0], immediately after the START bit is set. Since the X1FULL flag is not set (due to two uninitialized spaces in the X1 buffer), the interrupt is asserted straight away, to request new data. The processor writes two new samples, x[4] and x[5], to the FMAC_WDATA register, which are transferred to the empty locations in the X1 buffer.



In the mean time, the FMAC finishes calculating the first output sample, y[0], and writes it into the Y buffer, causing the Y_EMPTY flag to go low. At the same time, the x[0] sample is discarded, as it is no longer required, freeing up its location in memory (at X1_BASE). The FMAC can immediately start work on the second output sample, y[1], since all the required input samples x[1:5] are present in the X1 buffer.

Since the Y_EMPTY flag is low, the interrupt remains active after the processor finishes writing x[5]. The processor reads y[0] from the FMAC_RDATA register, freeing up its location in the Y buffer. There are now no samples in the output buffer since y[1] is still being calculated, so the Y_EMPTY flag goes high. Nevertheless, the interrupt remains active, because there is still free space in the X1 buffer, which the processor next fills with x[6], and so on.

Note: In this example, the processor can fill the input buffer more quickly than the FMAC can process them, so the X1_full flag regularly goes active. However, it struggles to read the Y buffer fast enough, so the FMAC stalls regularly waiting for space to be freed up in the Y buffer. This means the filter is not executing at maximum throughput. The reason is that the

filter length is small and the processor relatively slow, in this example. So increasing the Y buffer size does not help.

Figure 114. Filtering example 2

The example in *Figure 114* illustrates the beginning of the same filter operation, but this time the filter has six taps (P=6). The X1 buffer size is six and the Y buffer size is two. The FULL_WM and EMPTY_WM bitfields are both set to 0. Prior to starting the filter, the X1 buffer has been pre-loaded with four samples, x[0:3] as in *Figure 112*. Because there are not enough samples in the input buffer, the X1FULL flag is not set, so the interrupt is asserted straight away, to request new data. The FMAC is stalled.

The processor writes two new samples, x[4] and x[5], to the FMAC_WDATA register, which are transferred to the empty locations in the X1 buffer. As soon as there are six unused samples in the X1 buffer, the X1_FULL flag goes active (since the buffer size is six), causing the interrupt to go inactive. The FMAC starts calculating the first output sample, y[0]. Since this requires all six input samples, there are no free spaces in the X1 buffer and so the X1_FULL flag remains active. Only when the FMAC finishes calculating y[0] and writes it into the Y buffer, can x[0] be discarded, freeing up a space in the X1 buffer, and deasserting X1_FULL. At the same time, the Y_EMPTY flag goes inactive. Both these flag states cause the interrupt to be asserted, requesting the processor to write a new input sample, first of all, and then read the output sample just calculated. The FMAC remains stalled until a new input sample is written.

In this example, the processor has to wait for the FMAC to finish calculating the current output sample, before it can write a new input sample, and therefore the X1 buffer regularly goes empty, stalling the FMAC. This can be avoided by allowing some extra space in the input buffer.

21.3.12 Filter design tips

The FMAC architecture imposes some constraints detailed below, on the design of digital filters.

1. Implementation of direct form 2, or transposed forms, is not efficient. Filters which have been designed for such forms must be converted to direct form 1.
2. Cascaded filters must either be combined into a single stage, or implemented as separate filters. In the latter case, multiple sets of filter coefficients can be pre-loaded into the memory, one set per stage, and only the X2_BASE address changed to select which set is used. The most efficient method of implementing a multi-stage filter is to pre-load a large X1 buffer with input samples, run the IIR filter function on it using the first stage coefficients, and store the output samples back in memory. Then change the X2_BASE pointer to point to the 2nd stage coefficients, and reload the input buffer with the output of the first stage (with a gain if required), before running the IIR function again. The procedure is repeated for all stages. Once the final stage samples have been transferred back into system memory, the input buffer can be loaded with the next set of input samples, and a new round of calculations started. Note that the N sample input buffer of each stage must be pre-loaded first of all with the N-1 last inputs from the previous round, plus one new sample, in order to keep continuity between each round. Similarly, the output buffer of each stage must be loaded with the last M samples from the previous round, for the same reason.
3. The use of direct form 1 for IIR designs can lead to large positive or negative partial sums in the accumulator, if for example a large step occurs on the input, or some of the filter coefficients' absolute values are >1. Since the accumulator is limited to 26 bits, the biggest value that it can handle without wrapping (changing sign) is 0x1FFFFFF positive or 0x2000000 negative. This corresponds to 3.99999988 and -4 respectively in q3.23 fixed point format. Wrapping does not represent a problem provided the wrapping is "undone" before the end of the accumulation. However this is not always the case when a filter is starting up and can lead to unexpected results. Consider pre-loading the output buffer with suitable values to avoid this.
4. The IIR filter has feed-forward (numerator) coefficients $[b_0, b_1, ..., b_{N-1}]$, and feed-back (denominator) coefficients $[1, a_1, ..., a_M]$. Many IIR filters require some of the denominator coefficients to have an absolute value greater than 1 to achieve a steep roll-off in the frequency response. Given that the coefficients are coded in fixed point q1.15 format, this is not possible. Nevertheless, by scaling the denominator coefficients by a factor 2^{-R}, such that $2^{-R}.[1, a_1, ..., a_M]$ are all less than 1, such filters can be implemented. However an inverse gain of 2^R must be applied at the output of the accumulator to compensate the scaling. This has an adverse effect on the signal-to-noise ratio.

21.4 FMAC registers

21.4.1 FMAC X1 buffer configuration register (FMAC_X1BUFCFG)

Address offset: 0x00

Reset value: 0x0000 0000

Access: word access

This register can only be modified if START = 0 in the FMAC_PARAM register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	FULL_WM[1:0]		Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
						rw	rw								

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
X1_BUF_SIZE[7:0]								X1_BASE[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **FULL_WM[1:0]**: Watermark for buffer full flag

Defines the threshold for setting the X1 buffer full flag when operating in circular mode. The flag is set if the number of free spaces in the buffer is less than 2^{FULL_WM}.

0: Threshold = 1

1: Threshold = 2

2: Threshold = 4

3: Threshold = 8

Setting a threshold greater than 1 allows several data to be transferred into the buffer under one interrupt.

Threshold must be set to 1 if DMA write requests are enabled (DMAWEN = 1 in FMAC_CR register).

Bits 23:16 Reserved, must be kept at reset value.

Bits 15:8 **X1_BUF_SIZE[7:0]**: Allocated size of X1 buffer in 16-bit words

The minimum buffer size is the number of feed-forward taps in the filter (+ the watermark threshold - 1).

Bits 7:0 **X1_BASE[7:0]**: Base address of X1 buffer

21.4.2 FMAC X2 buffer configuration register (FMAC_X2BUFCFG)

Address offset: 0x04

Reset value: 0x0000 0000

Access: word access

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
X2_BUF_SIZE[7:0]								X2_BASE[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **X2_BUF_SIZE[7:0]**: Size of X2 buffer in 16-bit words
This bitfield can not be modified when a function is ongoing (START = 1).

Bits 7:0 **X2_BASE[7:0]**: Base address of X2 buffer
The X2 buffer base address can be modified while START=1, for example to change coefficient values. The filter must be stalled when doing this, since changing the coefficients while a calculation is ongoing affects the result.

21.4.3 FMAC Y buffer configuration register (FMAC_YBUFCFG)

Address offset: 0x08

Reset value: 0x0000 0000

Access: word access

This register can only be modified if START = 0 in the FMAC_PARAM register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	EMPTY_WM[1:0]		Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
						rw	rw								

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Y_BUF_SIZE[7:0]								Y_BASE[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **EMPTY_WM[1:0]**: Watermark for buffer empty flag
Defines the threshold for setting the Y buffer empty flag when operating in circular mode. The flag is set if the number of unread values in the buffer is less than 2^{EMPTY_WM}.
0: Threshold = 1
1: Threshold = 2
2: Threshold = 4
3: Threshold = 8
Setting a threshold greater than 1 allows several data to be transferred from the buffer under one interrupt.
Threshold must be set to 1 if DMA read requests are enabled (DMAREN = 1 in FMAC_CR register).

Bits 23:16 Reserved, must be kept at reset value.

Bits 15:8 **Y_BUF_SIZE[7:0]**: Size of Y buffer in 16-bit words
For FIR filters, the minimum buffer size is 1 (+ the watermark threshold). For IIR filters the minimum buffer size is the number of feedback taps (+ the watermark threshold).

Bits 7:0 **Y_BASE[7:0]**: Base address of Y buffer

21.4.4 FMAC parameter register (FMAC_PARAM)

Address offset: 0x0C

Reset value: 0x0000 0000

Access: word access

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
START	FUNC[6:0]							R[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Q[7:0]								P[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **START**: Enable execution
0: Stop execution
1: Start execution
Setting this bit triggers the execution of the function selected in the FUNC bitfield. Resetting it by software stops any ongoing function. For initialization functions, this bit is reset by hardware.

Bits 30:24 **FUNC[6:0]**: Function
0: Reserved
1: Load X1 buffer
2: Load X2 buffer
3: Load Y buffer
4 to 7: Reserved
8: Convolution (FIR filter)
9: IIR filter (direct form 1)
10 to 127: Reserved
This bitfield can not be modified when a function is ongoing (START = 1)

Bits 23:16 **R[7:0]**: Input parameter R.
The value of this parameter is dependent on the function.
This bitfield can not be modified when a function is ongoing (START = 1)

Bits 15:8 **Q[7:0]**: Input parameter Q.
The value of this parameter is dependent on the function.
This bitfield can not be modified when a function is ongoing (START = 1)

Bits 7:0 **P[7:0]**: Input parameter P.
The value of this parameter is dependent on the function
This bitfield can not be modified when a function is ongoing (START = 1)

21.4.5 FMAC control register (FMAC_CR)

Address offset: 0x10

Reset value: 0x0000 0000

Access: word access

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RESET
															rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CLIP EN	Res.	Res.	Res.	Res.	Res.	DMA WEN	DMA REN	Res.	Res.	Res.	SAT IEN	UNFL IEN	OVFL IEN	WIEN	RIEN
rw						rw	rw				rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **RESET**: Reset FMAC unit

This resets the write and read pointers, the internal control logic, the FMAC_SR register and the FMAC_PARAM register, including the START bit if active. Other register settings are not affected. This bit is reset by hardware.

0: Reset inactive

1: Reset active

Bit 15 **CLIPEN**: Enable clipping

0: Clipping disabled. Values at the output of the accumulator which exceed the q1.15 range, wrap.

1: Clipping enabled. Values at the output of the accumulator which exceed the q1.15 range are saturated to the maximum positive or negative value (+1 or -1) according to the sign.

Bits 14:10 Reserved, must be kept at reset value.

Bit 9 **DMAWEN**: Enable DMA write channel requests

0: Disable. No DMA requests are generated

1: Enable. DMA requests are generated while the X1 buffer is not full.

This bit can only be modified when START= 0 in the FMAC_PARAM register. A read returns the current state of the bit.

Bit 8 **DMAREN**: Enable DMA read channel requests

0: Disable. No DMA requests are generated

1: Enable. DMA requests are generated while the Y buffer is not empty.

This bit can only be modified when START= 0 in the FMAC_PARAM register. A read returns the current state of the bit.

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **SATIEN**: Enable saturation error interrupts

0: Disabled. No interrupts are generated upon saturation detection.

1: Enabled. An interrupt request is generated if the SAT flag is set

This bit is set and cleared by software. A read returns the current state of the bit.

Bit 3 **UNFLIEN**: Enable underflow error interrupts

0: Disabled. No interrupts are generated upon underflow detection.

1: Enabled. An interrupt request is generated if the UNFL flag is set

This bit is set and cleared by software. A read returns the current state of the bit.

Bit 2 **OVFLIEN**: Enable overflow error interrupts
0: Disabled. No interrupts are generated upon overflow detection.
1: Enabled. An interrupt request is generated if the OVFL flag is set
This bit is set and cleared by software. A read returns the current state of the bit.

Bit 1 **WIEN**: Enable write interrupt
0: Disabled. No write interrupt requests are generated.
1: Enabled. An interrupt request is generated while the X1 buffer FULL flag is not set.
This bit is set and cleared by software. A read returns the current state of the bit.

Bit 0 **RIEN**: Enable read interrupt
0: Disabled. No read interrupt requests are generated.
1: Enabled. An interrupt request is generated while the Y buffer EMPTY flag is not set.
This bit is set and cleared by software. A read returns the current state of the bit.

21.4.6 FMAC status register (FMAC_SR)

Address offset: 0x14

Reset value: 0x0000 0001

Access: word access

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	SAT	UNFL	OVFL	Res.	Res.	Res.	Res.	Res.	Res.	X1 FULL	Y EMPTY
					r	r	r							r	r

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **SAT**: Saturation error flag
Saturation occurs when the result of an accumulation exceeds the numeric range of the accumulator.
0: No saturation detected
1: Saturation detected. If the SATIEN bit is set, an interrupt is generated.
This flag is cleared by a reset of the unit.

Bit 9 **UNFL**: Underflow error flag
An underflow occurs when a read is made from FMAC_RDATA when no valid data is available in the Y buffer.
0: No underflow detected
1: Underflow detected. If the UNFLIEN bit is set, an interrupt is generated.
This flag is cleared by a reset of the unit.

Bit 8 **OVFL**: Overflow error flag
An overflow occurs when a write is made to FMAC_WDATA when no free space is available in the X1 buffer.
0: No overflow detected
1: Overflow detected. If the OVFLIEN bit is set, an interrupt is generated.
This flag is cleared by a reset of the unit.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **X1FULL**: X1 buffer full flag

The buffer is flagged as full if the number of available spaces is less than the FULL_WM threshold. The number of available spaces is the difference between the write pointer and the least recent sample currently in use.

0: X1 buffer not full. If the WIEN bit is set, the interrupt request is asserted until the flag is set. If DMAWEN is set, DMA write channel requests are generated until the flag is set.

1: X1 buffer full.

This flag is set and cleared by hardware, or by a reset.

Note: after the last available space in the X1 buffer is filled there is a delay of 3 clock cycles before the X1FULL flag goes high. To avoid any risk of overflow it is recommended to insert a software delay after writing to the X1 buffer before reading the FMAC_SR. Alternatively, a FULL_WM threshold of 2 can be used.

Bit 0 **YEMPTY**: Y buffer empty flag

The buffer is flagged as empty if the number of unread data is less than the EMPTY_WM threshold. The number of unread data is the difference between the read pointer and the current output destination address.

0: Y buffer not empty. If the RIEN bit is set, the interrupt request is asserted until the flag is set. If DMAREN is set, DMA read channel requests are generated until the flag is set.

1: Y buffer empty.

This flag is set and cleared by hardware, or by a reset.

Note: after the last sample is read from the Y buffer there is a delay of 3 clock cycles before the YEMPTY flag goes high. To avoid any risk of underflow it is recommended to insert a software delay after reading from the Y buffer before reading the FMAC_SR. Alternatively, an EMPTY_WM threshold of 2 can be used.

21.4.7 FMAC write data register (FMAC_WDATA)

Address offset: 0x18

Reset value: 0x0000 0000

Access: word access

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WDATA[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **WDATA[15:0]**: Write data

When a write access to this register occurs, the write data are transferred to the address offset indicated by the write pointer. The pointer address is automatically incremented after each write access.

21.4.8 FMAC read data register (FMAC_RDATA)

Address offset: 0x1C

Reset value: 0x0000 0000

Access: word access

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RDATA[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **RDATA[15:0]**: Read data

When a read access to this register occurs, the read data are the contents of the Y output buffer at the address offset indicated by the READ pointer. The pointer address is automatically incremented after each read access.

21.4.9 FMAC register map

Table 180.FMAC register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

22 Programmable logic array (PLAY)

This section is applied only to STM32H543/553xx devices.

22.1 PLAY introduction

The programmable logic array allows the user to create custom logic and state machines without the need for external programmable logic devices, such as FPGAs. The PLAY provides a number of programmable logic elements, in the form of look-up tables (LUTs), each of which have four inputs and one output. The output can be programmed to be any logical function of the four inputs. More complex functions can be created by cascading logic elements.

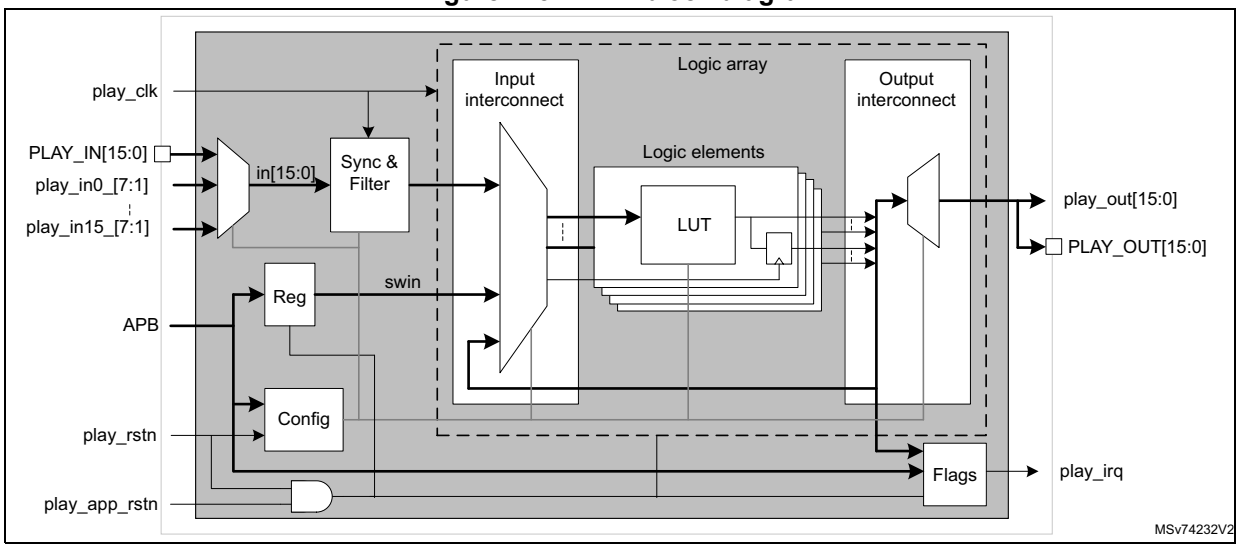
Inputs to and outputs from the logic array can be selected from a choice of external I/Os, internal signals or software programmable register bits. External inputs can be synchronized to the internal clock and filtered to remove short pulses, or connected directly to the logic array if purely combinatorial or asynchronous functions are required.

Each logic element output can be registered using the internal clock, or another signal. Registered outputs can be fed back to the logic array inputs to create finite state machines. Transitions on the outputs can set flags, which can generate interrupts to the processor. The state of the flags can be read and reset by software. The raw states of the logic element outputs can also be read by software or by an external debugger. This provides visibility of the logic array state to simplify debugging of the programmed logic functions.

The array is configured via memory-mapped registers. Configuration is simple and intuitive. Configuration registers are protected against accidental programming by a lock bit. The configuration is maintained in case of a warm system reset.

22.2 PLAY main features

- Glitch-free programmable logic elements each comprising a 4-input look-up table and a register
- Configurable input and output interconnects
- Optional synchronization of inputs, with programmable glitch filters and edge detection/pulse extension feature.
- Software programmable inputs
- Flags with interrupt capability for communication with software
- Simple register-based configuration interface, protected by software lock



22.3 PLAY functional description

- a logic array, including
  - 16 logic elements
  - an input interconnect
  - an output interconnect
- a synchronization and filter unit
- a configuration unit
- a flag and interrupt unit
- an APB bus slave interface

These are shown in *Figure 115*.

22.3.3 PLAY reset and clocks

The PLAY has two reset inputs:

- play_rstn: connected to the power reset
- play_app_rstn: connected to the system reset

The PLAY configuration registers are reset by:

- play_rstn

All other registers, including the PLAY logic element output registers, are reset by:

- play_rstn
- play_app_rstn

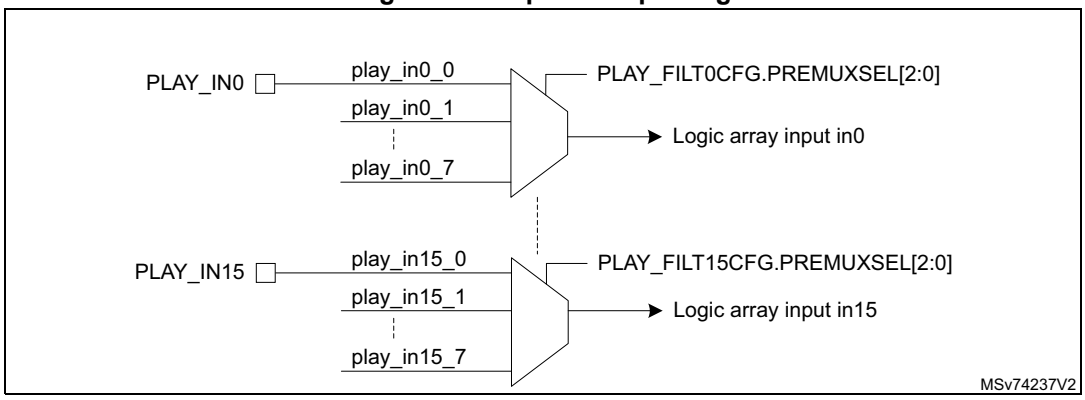
The PLAY configuration and control registers are clocked by:

- pclk (APB bus clock)

The synchronisation and filters are clocked by:

- play_clk

The PLAY logic element output registers are clocked by:



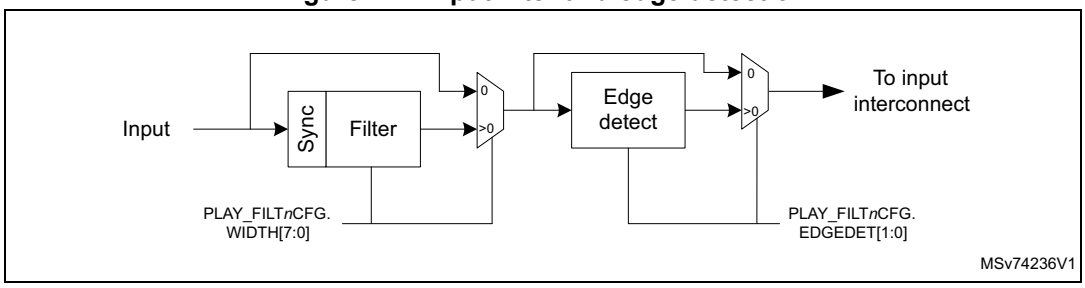
- play_clk, optionally conditioned by any of the PLAY inputs or logic element registered outputs

22.3.4 Input selection

There are 16 inputs to the logic array, in0 to in15, which can be connected to external I/Os or internal signals coming from other functional units.

Each logic array input can connect to one of eight signals. A pre-multiplexer selects which signal is connected to an input. The pre-multiplexer for logic array input *n* is configured by the PLAY_FILT*n*CFG.PREMUXSEL[2:0] register field (see *Figure 116*). Only one signal can be chosen per input.

Figure 116. Input multiplexing

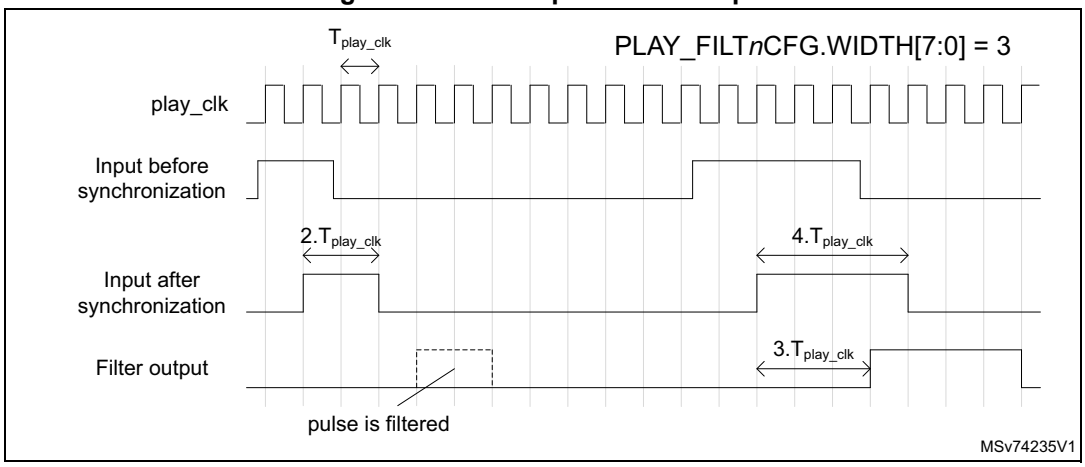


The mapping of signals to logic array inputs is shown in *Table 183*. The left hand column contains the logic array input number. The columns to the right show the play_in signal name as well as the source signal to which it is connected, for each setting of PLAY_FILT*n*CFG.PREMUXSEL[2:0]. Some source signal names appear more than once in the table, which means they can be mapped to more than one input. This offers more flexibility when mapping source signals to logic array inputs.

22.3.5 Input filtering and edge detection

Inputs pass through a filter stage, which can be configured to remove short pulses or glitches and generate a pulse if an edge is detected (see *Figure 117*).

Figure 117. Input filter and edge detection



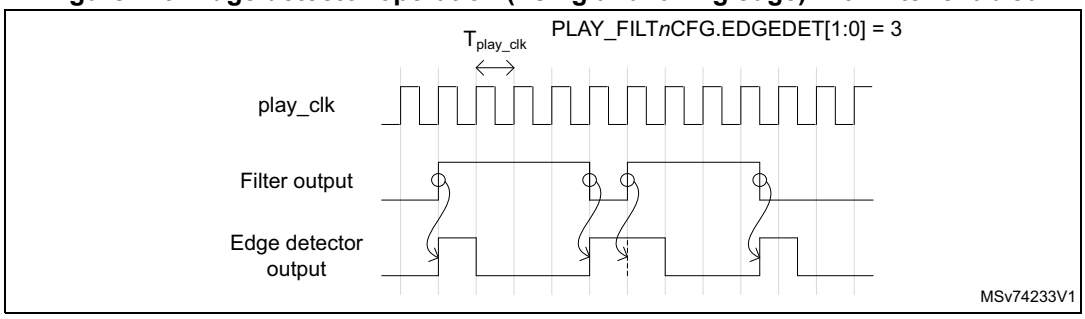
Filtering

Every input has a filter which removes pulses shorter than a programmable number of play_clk clock cycles (after synchronization). The filter samples the input at the play_clk clock frequency and starts a counter if it detects a change in state. If the input transitions again before the counter reaches zero, the counter is stopped and reloaded, and the filter output state remains unchanged. If the counter reaches zero, it is reloaded and the filter output state toggles.

The minimum pulse width for input *n* can be programmed from 1 to 255 cycles in register bits PLAY_FILTCFG*n*.WIDTH[7:0]. Note that the filter introduces a delay equal to the programmed minimum pulse width.

Figure 118 illustrates the operation of the filter for PLAY_FILTCFG*n*.WIDTH[7:0] = 3. Pulses whose width is less than three periods of play_clk (T_{play_clk}) are filtered. Pulses whose width is three periods or more propagate through the filter, with a delay of three T_{play_clk} periods.

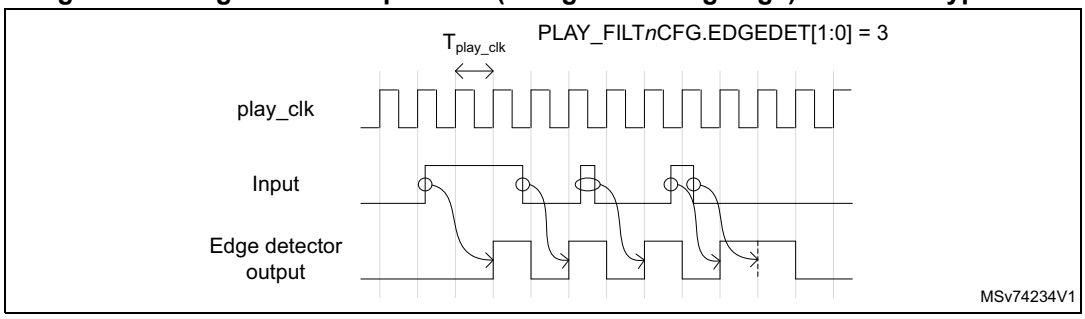
Figure 118. Filter operation example



The filter can be bypassed by setting PLAY_FILT*n*CFG.WIDTH[7:0] = 0.

Edge detection and pulse generation

For all inputs there is an optional edge detection feature which detects a transition and generates a positive pulse of one play_clk clock period. This can be used to detect and lengthen pulses which are shorter than the play_clk clock period, or to trigger actions on an edge rather than a level. The edge detection feature is enabled for input *n* by programming the PLAY_FILTCFG*n*.EDGEDET[1:0] field with direction of the transition (rising, falling or both edges). Setting the field to 0 disables and bypasses the edge detection.



If the filter is enabled (PLAY_FILTCFG*n*.WIDTH[7:0] > 0), the edge detector generates a pulse when an edge is detected at the output of the filter (see *Figure 119*). Note that if both rising and falling edges are programmed, back-to-back transitions on successive clocks generate a double length pulse.

Figure 119. Edge detector operation (rising and falling edge) with filter enabled

To lengthen a pulse shorter than one play_clk period, the filter must be bypassed. This is done by setting PLAY_FILTCFG*n*.WIDTH[7:0] = 0. The synchronization is done by the edge detection unit. When an edge is detected on the input signal, a positive pulse is generated after a delay of between one and two play_clk periods (see *Figure 120*).

Figure 120. Edge detector operation (rising and falling edge) with filter bypassed

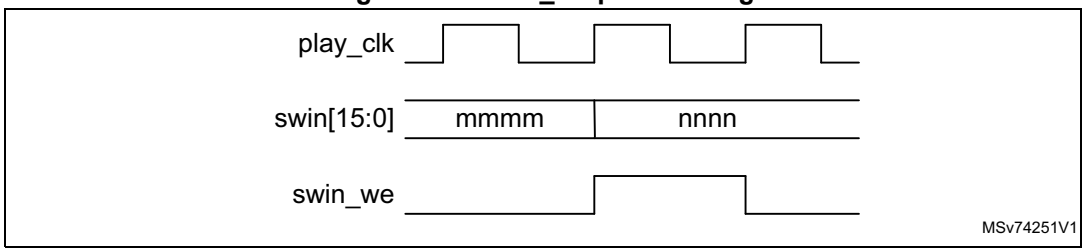
If both rising and falling edges are programmed, and the input pulse width is less than one play_clk period, only one output pulse is generated. Note however that if two transitions occur either side of a clock edge, a double length pulse is generated.

Synchronization

All input signals are considered to be asynchronous to the play_clk clock. If any synchronous logic is connected downstream, it is mandatory to synchronize the inputs to the play_clk clock, to avoid meta-stability. Synchronization introduces a delay of 1 to 2 play_clk periods.

Synchronization is performed by enabling the filter or the edge detector. If both the filter and edge detector are bypassed (PLAY_FILT*n*CFG.WIDTH[7:0] = 0 and PLAY_FILT*n*CFG.EDGEDET[1:0] = 0), the input signal is propagated directly to the logic array without synchronization.

Caution: If both edge detector and filter are bypassed, the input must only be used to drive purely combinatorial logic.



22.3.6 Software programmable inputs

The PLAY_SWIN register contains 16 bits which are connected to inputs swin0 to swin15. This allows software programmable functionality to be included in the logic expression. This can be used for example to enable or disable functionality, or to trigger state transitions, by software. These inputs also allow testing of the programmed logic array functionality.

The PLAY_SWIN register bits can be set independently by writing a 1 to the corresponding bits in the PLAY_SWIN_SET register. In the same way they can be reset by writing a 1 to the corresponding bits in the PLAY_SWIN_CLR register. It is also possible to read and write the bits directly in the PLAY_SWIN register.

Every time there is a write to the PLAY_SWIN, PLAY_SWIN_SET or PLAY_SWIN_CLR register, a positive pulse is generated on the swin_we signal. The pulse lasts one play_clk cycle, starting from the moment the register value is updated (see *Figure 121*). The swin_we signal is connected to the input interconnect and can be used as a clock enable for any of the logic element output registers. This means that writing to the PLAY_SWIN register can trigger a state transition conditioned by the new values on swin0 to swin15, for example.

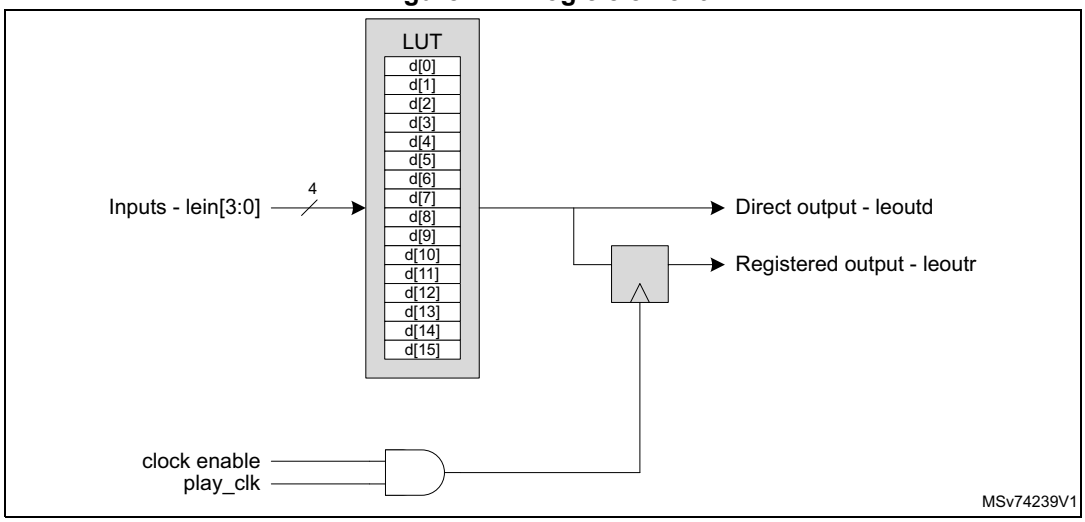


Figure 121. swin_we pulse timing

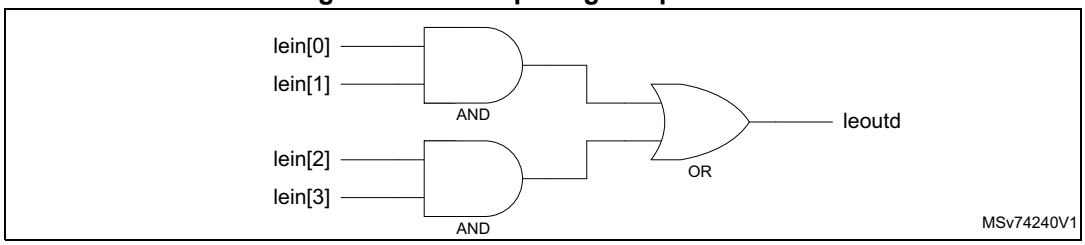
22.3.7 Logic elements

The logic array provides 16 logic elements (LEs), each containing a 4-input, single output look-up table (LUT) and a register (*Figure 122*).

Figure 122. Logic element

Look-up table (LUT)

The LUT is a 16 x 1-bit memory which generates a single output, leoutd, whose value is a function of the four LUT inputs, lein[3:0] which make up the address. The LUT is programmed at configuration time with the required state of the output for every possible combination of lein[3:0].



To implement a Boolean logic expression, the full truth table for the expression must be detailed.

This is demonstrated using the following logic expression as an example:

leoutd = lein[0] AND lein[1] OR lein[2] AND lein[3]

This expression corresponds to the diagram in *Figure 123*.

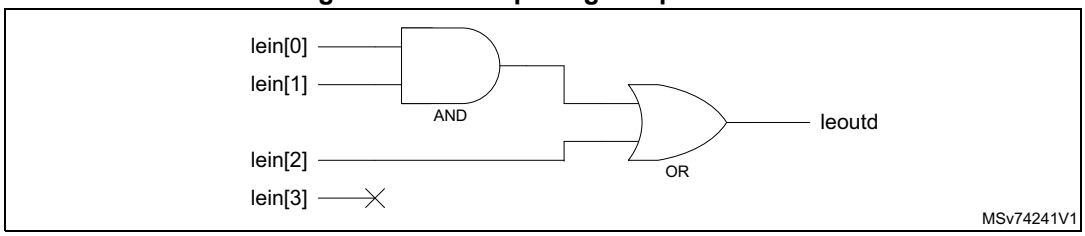
Figure 123. Example logic expression 1

The truth table is given in *Table 185*.

Table 185. Truth table example 1

Inputs - lein[3:0]	Output - leoutd
0000	0
0001	0
0010	0
0011	1
0100	0
0101	0
0110	0
0111	1
1000	0
1001	0
1010	0
1011	1
1100	1
1101	1
1110	1
1111	1

The left hand column lists the address formed by the combination of the four LUT inputs, lein[3:0], and the right hand column lists the required output value on leoutd for each input combination.



During configuration, the LUT is programmed as a single 16-bit register, with the data read from the output column of the truth table, read from bottom (MSB) to top (LSB). In this example the LUT configuration register would be programmed with 1111 1000 1000 1000 (0xF888).

If any of the inputs are unused or “don’t care”, the output must be the same for both possible values of the unused input. In other words, the contents of address 0bxnnn must be the same for x = 0 or x = 1.

For example, in the following logic expression, lein[3] is unused:

leoutd = lein[0] AND lein[1] OR lein[2]

Figure 124. Example logic expression 2

The truth table for this expression is shown in *Table 186*. To obtain the full LUT, each row containing an ‘x’ is split into two identical rows. Then the ‘x’ is replaced by ‘0’ and ‘1’ respectively.

In this example the configuration register is programmed with 1111 1000 1111 1000 (0xF8F8).

Table 186. Truth table example 2

lein[3:0]	leoutd
x000	0
x001	0
x010	0
x011	1
x100	1
x101	1
x110	1
x111	1

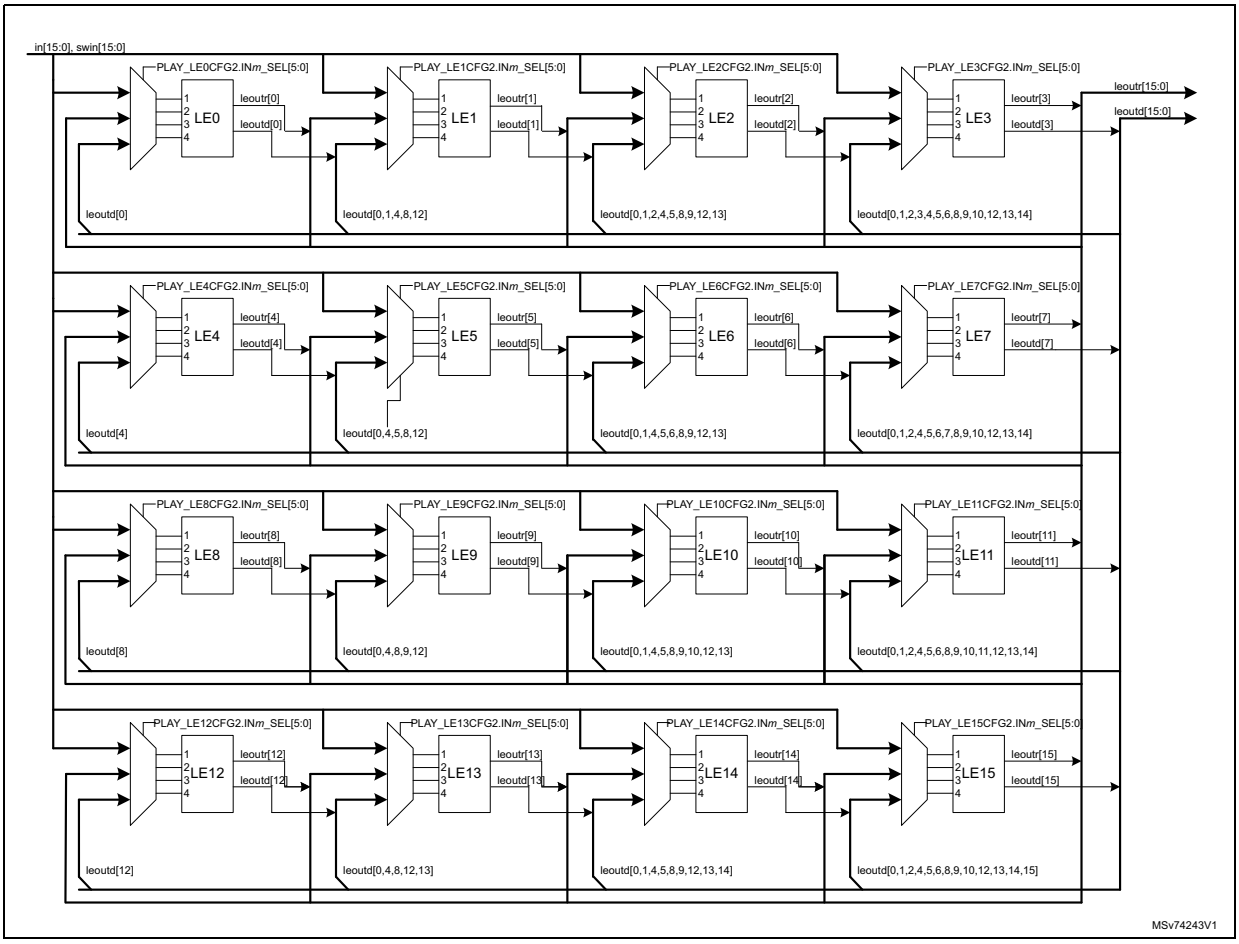
Alternatively, the unused input can be connected to an unused input with value 0 (see *Table 187*), so that addresses with x = 1 are never accessed and can be left at 0.

The LUT configuration registers are directly mapped in the PLAY APB address space. The LUT configuration for logic element *n* is programmed in the register bit field PLAY_LE*n*CFG1.LUT[15:0].

LE output register

The LUT output can be direct or registered. Output registers are clocked by the play_clk, optionally qualified by a clock enable signal. When the clock enable signal is high, the register is updated with the LUT output every play_clk cycle. A clock enable must be high for at least one play_clk cycle. This constraint is guaranteed for input signals using edge detection or filtering (see *Section 22.3.5: Input filtering and edge detection*). It is also guaranteed for the synchronous feedback signals leoutr[15:0].

Caution: Asynchronous signals must not be selected as clock enables.



During configuration (when PLAY_CFGCR.UNLOCK = 1), the logic element registers are held in reset.

Logic element registers are also reset by play_rstn and play_app_rstn.

22.3.8 Input interconnect

The input interconnect selects which signals are connected to each logic element, as shown in *Figure 125*.

Figure 125. Input interconnect

LUT input selection

For each logic element, up to four input signals can be configured as LUT inputs, and one as a clock enable for the LE register. The LUT inputs can be selected from among the following signals:

- in[15:0] - 16 inputs from I/Os or other functional blocks, via the filter and edge detection unit
- swin[15:0] - 16 register bits (PLAY_SWIN register)
- leoutr[15:0] - 16 feedback signals from LE registered outputs
- logic 0

Each logic element's direct output can be fed back to one of its inputs. This allows implementation of asynchronous latches.

It is also possible to connect the direct outputs of certain logic elements to the inputs of others - see *Combining logic elements*.

For logic element *n* (0 to 15), the signals connected to input *m* (0 to 3), are selected by configuration register PLAY_LE*n*CFG2, bit field IN*m*_SEL[5:0].

The selection of the LUT input signals is summarized in *Table 187*.

For example, to connect input signal in15 to input 2 of logic element 0, program PLAY_LE0CFG2.IN2_SEL[5:0] = 47. To connect input 3 of logic element 1 to the direct output of logic element 0, leoutd0, program PLAY_LE1CFG2.IN3_SEL[5:0] = 0.

Table 187. Logic element *n* LUT input selection

PLAY_LE*n*CFG2.IN*m*_SEL [5:0]	Signal connected to LUT input *m*	Source
0	For *n* = 4,8,12: 0	-

9	For *n* = 0,1,4,5,8,12,13: 0	-
	For *n* = 2,3,6,7,9,10,11,14,15: leoutd[*9*]	LE 9 direct output
10	For *n* = 0,1,2,4,5,6,8,9,12,13,14,15: 0	-
	For *n* = 3,7,10,11: leoutd[*10*]	LE 10 direct output
11	For *n* = 0,1,2,3,4,5,6,7,8,9,10,12,13,14,15: 0	-
	For *n* = 11: leoutd[*11*]	LE 11 direct output
12	For *n* = 0,4,8: 0	-
	For *n* = 1,2,3,5,6,7,9,10,11,12,13,14,15: leoutd[*12*]	LE 12 direct output
13	For *n* = 0,1,4,5,8,9,12: 0	-
	For *n* = 2,3,6,7,10,11,13,14,15: leoutd[*13*]	LE 13 direct output

Table 187. Logic element *n* LUT input selection (continued)

PLAY_LE*n*CFG2.IN*m*_SEL [5:0]	Signal connected to LUT input *m*	Source
14	For *n* = 0,1,2,4,5,6,8,9,10,12,13: 0	-
	For *n* = 3,7,11,14,15: leoutd[*14*]	LE 14 direct output
15	For *n* = 0,1,2,3,4,5,6,7,8,9,10,11,12,13,14: 0	-
	For *n* = 15: leoutd[*15*]	LE 15 direct output
16 to 31	leoutr[0] to leoutr[15]	LE registered outputs
32 to 47	in0 to in15	input signals
48 to 63	swin0 to swin15	PLAY_SWIN

LE clock enable selection

The LE register clock enable can be selected from any of these signals:

- in[15:0] - 16 inputs from I/Os or other functional blocks, via the filter and edge detection
- swin[15:0] - 16 register bits (PLAY_SWIN register)
- swin_we - pulse indicating that a write to the PLAY_SWIN register has taken place
- leoutr[15:0] - 16 feedback signals from LE registered outputs
- 0- clock disabled
- 1- always enabled

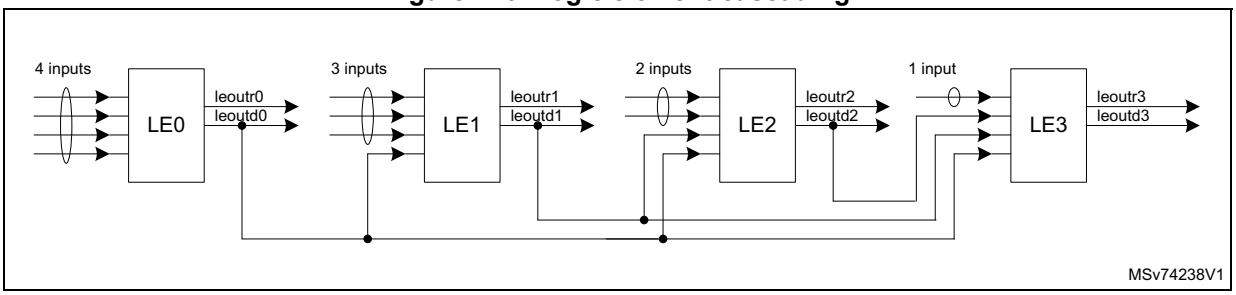
For logic element n the clock enable is selected by configuration register bits PLAY_LE*n*CFG2.CK_SEL[5:0].

The selection of the LE register clock is summarized in *Table 188*.

Table 188. Logic element *n* register clock selection

PLAY_LE*n*CFG2.CK_SEL[5:0]	Clock enable signal[1]	Source
0	0 (clock disabled)	-
1	1 (always enabled)	-
2	swin_we	APB interface
3 to 15	reserved	-
16 to 31	leoutr0 to leoutr15 (excluding leoutr*n*)	LE registered outputs
32 to 47	in0 to in15	input signals
48 to 63	swin0 to swin15	PLAY_SWIN

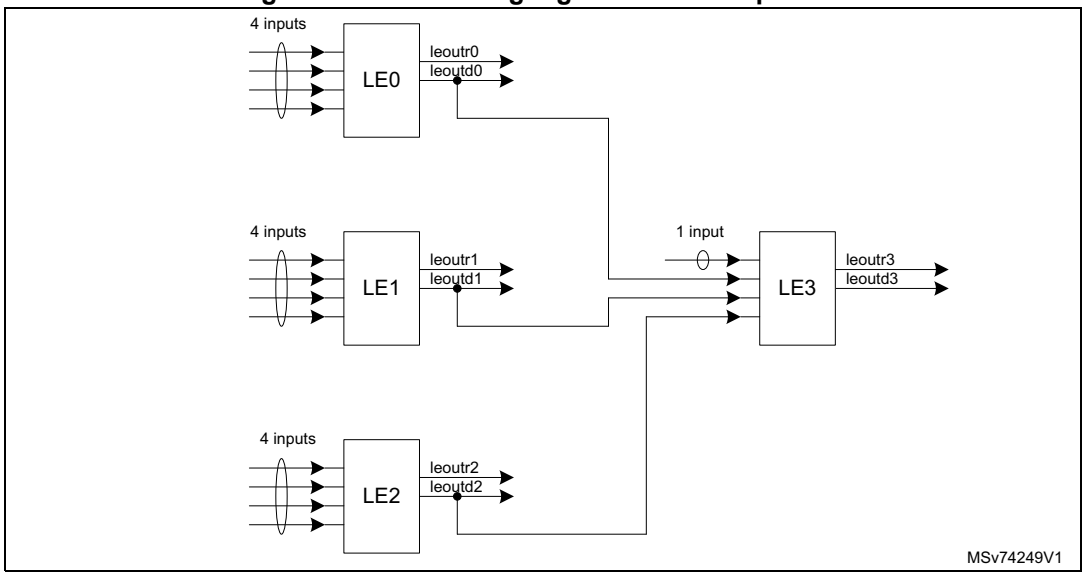
1. Reserved values select 0



Combining logic elements

LE 0-3 form a group which can be cascaded combinatorially from left to right (see *Figure 126*):

- LE0 direct output can be connected to LE1-3 inputs
- LE1 direct output can be connected to LE2-3 inputs
- LE2 direct output can be connected to LE3 inputs



The other groups of four (LE 4-7, LE 8-11, LE12-15) can be cascaded in the same way. Furthermore, logic elements from different groups can be connected together, provided the left to right logic flow is respected. For example, LE4 direct output can be connected to LE1 input, but not to LE0 input.

Figure 126. Logic element cascading

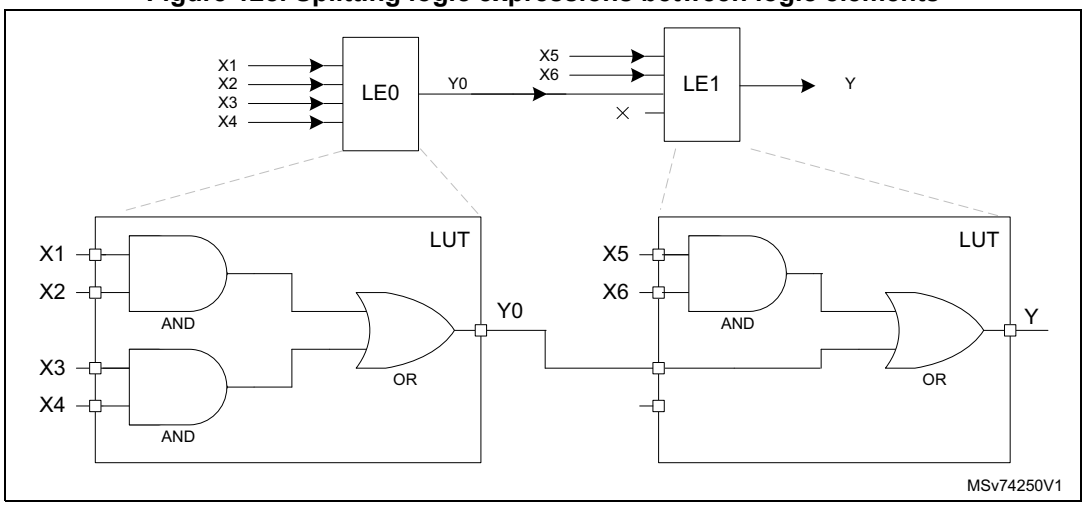
It is also possible to use one logic element to combine the outputs of up to three others, as shown in *Figure 127*. In this example, the direct outputs of LE0-2 are connected to the inputs of LE3. This allows up to 13 different inputs to be combined in a single logic expression.

Figure 127. Combining logic elements in parallel

Note that combining logic elements in this way requires the logic expression to be split into partial expressions, with up to four inputs each.

For example, consider the following expression:

Y = (X1 AND X2) OR (X3 AND X4) OR (X5 AND X6).



This expression has six inputs (X1 to X6) and one output (Y). It therefore requires at least two logic elements, for example LE0 and LE1, as illustrated in *Figure 128*. The expression for Y can be split into two expressions:

a) Y0 = (X1 AND X2) OR (X3 AND X4)

b) Y = Y0 OR (X5 AND X6)

Then LE0 is configured with expression ‘a’, and LE1 with expression ‘b’. Inputs X1 to X4 are connected to LE0. Inputs X5 and X6, are connected to LE1, together with Y0, the direct output of LE0.

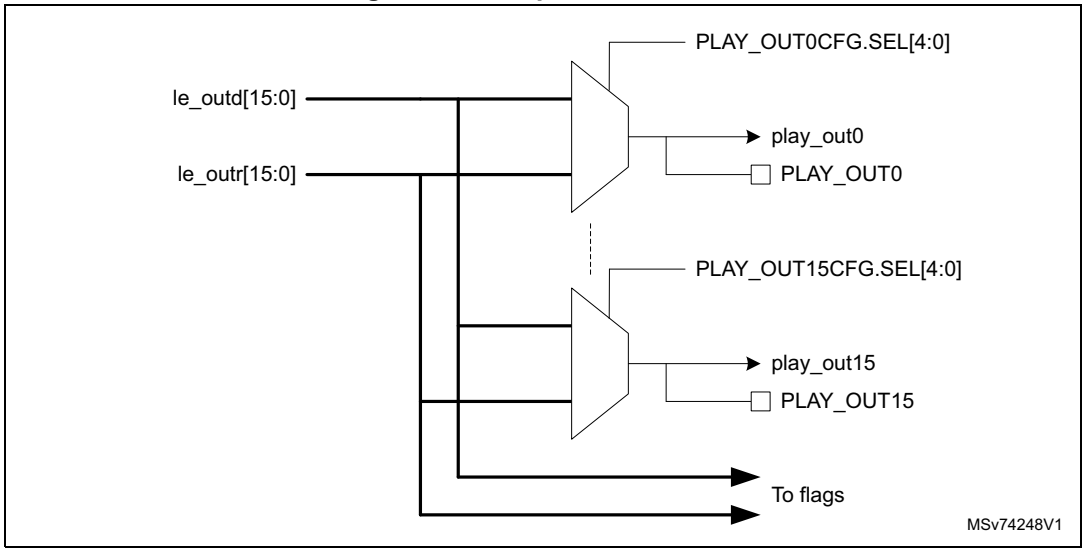


Figure 128. Splitting logic expressions between logic elements

22.3.9 Output interconnect

The output interconnect selects which logic element or eFPGA outputs are connected to which PLAY outputs, as shown in *Figure 129*.

Figure 129. Output interconnect

The PLAY outputs include the following signals:

- play_out[15:0] - 16 outputs to I/Os or other functional blocks

Each output can be connected to any one of the logic element outputs, registered or direct. The signal connected to output *n* is selected by configuration register bits PLAY_OUT*n*CFG.SEL[4:0].

The output selection is summarized in *Table 189*.

Table 189. Output n source selection

PLAY_OUT*n*CFG.SEL[4:0]	Source
0	leoutd0 - LE0 direct output
1	leoutd1 - LE1 direct output
2	leoutd2 - LE2 direct output
3	leoutd3 - LE3 direct output
4	leoutd4 - LE4 direct output
5	leoutd5 - LE5 direct output
6	leoutd6 - LE6 direct output
7	leoutd7 - LE7 direct outpu
8	leoutd8 - LE8 direct output
9	leoutd9 - LE9 direct output
10	leoutd10 - LE10 direct output

Table 189. Output n source selection (continued)

PLAY_OUT*n*CFG.SEL[4:0]	Source
11	leoutd11 - LE11 direct output
12	leoutd12 - LE12 direct output
13	leoutd13 - LE13 direct output
14	leoutd14 - LE14 direct output
15	leoutd15 - LE15 direct output
16	leoutr0 - LE0 register output
17	leoutr1 - LE1 register output
18	leoutr2 - LE2 register output
19	leoutr3 - LE3 register output
20	leoutr4 - LE4 register output
21	leoutr5 - LE5 register output
22	leoutr6 - LE6 register output
23	leoutr7 - LE7 register output
24	leoutr8 - LE8 register output
25	leoutr9 - LE9 register output
26	leoutr10 - LE10 register output
27	leoutr11 - LE11 register output
28	leoutr12 - LE12 register output
29	leoutr13 - LE13 register output
30	leoutr14 - LE14 register output
31	leoutr15 - LE15 register output

22.3.10 Flags

A transition on any of the logic element outputs leoutd[15:0] or leoutr[15:0] can set the corresponding flag in the PLAY_FLSTAT register.

The direction of the transition (rising or falling) can be selected in the PLAY_FLCTL register. Once set, the flag can only be reset by software writing to the PLAY_FLCLR register (or by a reset). Setting a flag generates an interrupt to the CPU on the play_irq signal, if the enable bit for the flag is set in the PLAY_FLIER register. To clear the interrupt the software must reset the flag, or mask it by resetting the enable.

Due to the asynchronous relationship between play_clk and the pclk, a resynchronisation delay is incurred between a transition on the logic element output and the setting of the corresponding flag. The maximum delay is approximately one period of play_clk plus three periods of pclk. The play_irq interrupt is not asserted until the flag goes high. Note that if successive transitions occur on the same output before the flag is cleared, they are not taken into account. However if a subsequent transition on another logic element output occurs during the resynchronization delay, a second resynchronization starts as soon as the first is finished, at the end of which the second flag is set.

The raw state of the signals can also be read by software via the PLAY_OSR register. This is primarily intended for debugging the programmed logic. The user must be aware that the logic element outputs can change asynchronously and the value that is read from PLAY_OSR may not correspond to the actual state of the outputs at the moment of reading.

22.3.11 Miscellaneous status bits

The software input register (PLAY_SWIN), and the flag edge control register (PLAY_FLCTL) are in the play_clk domain. When a write occurs to one of these registers (including to PLAY_SWINSET/CLR), the write data is stored temporarily in the APB bus clock (pclk) domain until the next play_clk pulse at which point the data is transferred to the target register. If play_clk is slow compared to pclk, or if it is inactive, the update could take an indefinitely long time to complete. To avoid stalling the processor, any subsequent writes to the same register before the target register update has completed, are ignored.

To ensure that updates are not lost, the PLAY_MSR register contains two read-only status bits, SWIN write busy flag (SWIN_WBFS) and FLCTL write busy flag (FLCTL_WBFS). When one of these bits is set to 1, it indicates that an update is pending to the corresponding register, PLAY_SWIN or PLAY_FLCTL. The busy flags are automatically reset to 0 when the update completes.

If play_clk is significantly slower than pclk, it is recommended to poll the busy flag in the PLAY_MSR prior to writing to the corresponding register, to be sure that it has reset to 0 indicating that the previous update has completed.

Alternatively, software can enable the write complete interrupts in the PLAY_IER register to generate an interrupt request when a pending write completes (see *Section 22.5*).

22.4 PLAY in low-power modes

The play_clk can be maintained when the system is in low-power mode (Stop mode). The full functionality of the logic array is available, but the memory-mapped registers are not accessible and the flags are not updated.

When the play_clk is stopped, the logic element output registers do not operate, neither does the edge detection and filtering. However combinatorial logic continues to function as programmed.

If a logic element direct output is mapped to an asynchronous wake-up event, a transition on the output can wake the system from Stop mode. It is recommended to configure one of the software programmable inputs to reset the output so that software can deassert the wake-up event, if it is not otherwise deasserted.

In Standby mode, the PLAY is powered down and no longer functional. It must be reconfigured on exit from Standby.

22.5 PLAY interrupts

There is one interrupt request, play_irq, which can be configured to interrupt the processor when any of the following conditions occurs:

1. One or more of the flags are set, as indicated by the PLAY_FLSTAT register
2. An outstanding write to the PLAY_FLCTL register has completed, as indicated by the FLCTLWBFS bit in the PLAY_MSR register.
3. An outstanding write to the PLAY_SWIN register has completed, as indicated by the SWINWBFS bit in the PLAY_MSR register.

An interrupt handler must first read the PLAY interrupt status register (PLAY_ISR) to determine the source of the interrupt.

If the FLCTL write complete (FLCTLWC) or SWIN write complete (SWINWC) bits are set, it means that a previous write respectively to the PLAY_FLCTL or PLAY_SWIN register has completed. The write complete status bits can be cleared by writing a one to the corresponding bit in the interrupt clear (PLAY_ICR) register. The write complete interrupts are enabled and disabled by writing to the PLAY_IER register.

If the PLAY_ISR.FLAGS bit is set, the interrupt handler must read the PLAY_FLSTAT register to determine which flag(s) caused the interrupt. The FLAGS bit is reset by hardware when all the flags are inactive or masked. See *Section 22.3.10* for more details.

22.6 PLAY registers

There are three types of PLAY registers:

- Access control registers:

  PLAY_SECCFGR

  PLAY_PRIVCFGR

  These registers control software access rights to the PLAY registers.
- Configuration registers: PLAY_CFGCR, PLAY_FILTxCFGR, PLAY_LExCFG1, PLAY_LExCFG2, PLAY_OUTxCFG

  These registers configure the logic elements, input and output interconnects, input multiplexers and filters.
- Functional registers: PLAY_SWIN, PLAY_SWINSET, PLAY_SWINCLR, PLAY_OSR, PLAY_FLSTAT, PLAY_FLSET, PLAY_FLCLR, PLAY_FLIER, PLAY_FLCTL, PLAY_MSR, PLAY_ISR, PLAY_IER, PLAY_ICR

  These registers are used by the application software to interact with the logic array during operation.

22.6.1 PLAY configuration control register (PLAY_CFGCR)

Address offset: 0x000

Reset value: 0x0000 0001

This register contains miscellaneous configuration bits. It is a configuration register and is reset by play_rstn.

If PLAY_SECCFGR.SEC[0] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[0] = 1, the register requires privileged access (unprivileged accesses are ignored).

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UNLOCK
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **UNLOCK**: Unlock configuration

When configuration is complete, it must be set to 0 to prevent accidental corruption of the configuration registers and enable operation of the logic element registers.

0: Configuration is locked. All configuration registers are write protected.

1: Configuration is unlocked. Configuration registers can be programmed.

22.6.2 PLAY security attributes configuration register (PLAY_SECCFGR)

Address offset: 0x004

Reset value: 0x0000 0000

This register controls the security attributes of the PLAY registers. It is an access control register and is reset by play_rstn.

The register can only be modified by a secure, privileged write access. It can be read by any access. A nonsecure write access is ignored. An unprivileged write access is ignored.

														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **SEC**[1:0]: Secure access control

0: All registers are accessible in nonsecure or secure state

1: Configuration registers can only be accessed in secure state. All other registers can be accessed in secure or nonsecure state.

2: Reserved

3: All registers are accessible in secure state only.

22.6.3 PLAY privilege attributes configuration register (PLAY_PRIVCFGR)

Address offset: 0x008

Reset value: 0x0000 0000

This register controls the privilege attributes of the PLAY registers. It is an access control register and is reset by play_rstn. It can only be modified by a privileged write access. It can be read by any access.

If PLAY_SECFGR.SEC[n] = 1, PLAY_PRIVCFG.PRIV[n] can only be modified by a secure write access. A nonsecure write access to PLAY_PRIVCFG.PRIV[n] is ignored.

If PLAY_SECCFGR.SEC[n] = 0, PLAY_PRIVCFG.PRIV[n] can be modified by secure or nonsecure write access.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIV[1:0]	
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **PRIV**[1:0]: Privilege access control

0: All registers are accessible in unprivileged or privileged state

1: Configuration registers can only be accessed in privileged state. All other registers can be accessed in privileged or unprivileged state.

2: Reserved

3: All registers are accessible in privileged state only.

22.6.4 PLAY filter x configuration register (PLAY_FILTxCFG)

Address offset: 0x020 + 0x04 * x, (x = 0 to 15)

Reset value: 0x0000 0000

This register configures the filter, edge detector and premultiplexer for logic array input x. It is a configuration register and is reset by play_rstn. Write accesses to this register are ignored if PLAY_CFGCR.UNLOCK = 0.

If PLAY_SECCFGR.SEC[0] = 1, the register requires secure access (nonsecure accesses are ignored, and signaled on play_sec_ilac).

If PLAY_PRIVCFGR.PRIV[0] = 1, the register requires privileged access (unprivileged accesses are ignored, and signaled on play_priv_ilac).

						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:16 **PREMUXSEL[2:0]**: Input pre-multiplexer select

Selects the signal to be connected to the input. See *Table 183* for details.

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:8 **EDGEDET[1:0]**: Edge detection mode.

0: Edge detection is bypassed

1: A rising edge transition on the input is converted into a positive pulse of 1 play_clk cycle.

2: A falling edge transition on the input is converted into a positive pulse of 1 play_clk cycle.

3: A rising or falling edge transition on the input is converted into a positive pulse of 1 play_clk cycle.

Bits 7:0 **WIDTH[7:0]**: Minimum pulse width

0: Filter is bypassed.

1 to 255: Minimum pulse width, in play_clk cycles. Any pulse on the input shorter than this is ignored.

22.6.5 PLAY logic element x configuration register 1 (PLAY_LExCFG1)

Address offset: 0x060 + 0x04 * x, (x = 0 to 15)

Reset value: 0x0000 0000

This register configures the look-up table contents for logic element x. It is a configuration register and is reset by play_rstn. Write accesses to this register are ignored if PLAY_CFGCR.UNLOCK = 0.

If PLAY_SECCFGR.SEC[0] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[0] = 1, the register requires privileged access (unprivileged accesses are ignored).

LUT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **LUT[15:0]**: Look-up table contents.
Truth table output for the logic element.

22.6.6 PLAY logic element x configuration register 2 (PLAY_LExCFG2)

Address offset: 0x0A0 + 0x04 * x, (x = 0 to 15)

Reset value: 0x00FF FFFF

This register configures the input source and the register clock source for logic element x. It is a configuration register and is reset by play_rstn. Write accesses to this register are ignored if PLAY_CFGCR.UNLOCK = 0.

If PLAY_SECCFGR.SEC[0] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[0] = 1, the register requires privileged access (unprivileged accesses are ignored).

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:24 **CK_SEL[5:0]**: Clock enable selection
Selects source to be used as the clock enable for the logic element register. See *Table 188* for details.
After reset, this bit field is set to 0x0 (disabled)

Bits 23:18 **IN3_SEL[5:0]**: Logic element input 3 selection
Selects source for LUT input 3. See *Table 187* for details.
After reset, this bit field is set to 0x1F: PLAY_SWIN[15]

Bits 17:12 **IN2_SEL[5:0]**: Logic element input 2 selection
Selects source for LUT input 2. See *Table 187* for details.
After reset, this bit field is set to 0x1F: PLAY_SWIN[15]

Bits 11:6 **IN1_SEL[5:0]**: Logic element input 1 selection
Selects source for LUT input 1. See *Table 187* for details.
After reset, this bit field is set to 0x1F: PLAY_SWIN[15]

Bits 5:0 **IN0_SEL[5:0]**: Logic element input 0 selection
Selects source for LUT input 0. See *Table 187* for details.
After reset, this bit field is set to 0x1F: PLAY_SWIN[15]

22.6.7 PLAY output x configuration register (PLAY_OUTxCFG)

Address offset: 0x100 + 0x04 * x, (x = 0 to 15)

Reset value: 0x0000 0000

This register selects the source for play_out[x]. It is a configuration register and is reset by play_rstn. Write accesses to this register are ignored if PLAY_CFGCR.UNLOCK = 0.

If PLAY_SECCFGR.SEC[0] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[0] = 1, the register requires privileged access (unprivileged accesses are ignored).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEL[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **SEL[4:0]**: Output source selection.
The value of this field selects which LE output is connected to the output. See *Table 189* for details.

22.6.8 PLAY software input status register (PLAY_SWIN)

Address offset: 0x200

Reset value: 0x0000 0000

This register is used to read and write the state of the software programmable inputs. It is a functional register and is reset by play_rstn and play_app_rstn.

If PLAY_SECCFGR.SEC[1] = 1, the register requires secure access (nonsecure accesses are ignored, and signaled on play_sec_ilac).

If PLAY_PRIVCFGR.PRIV[1] = 1, the register requires privileged access (unprivileged accesses are ignored).

Caution: play_clk must be active when writing to this register. Any subsequent write access to this register (or PLAY_SWINSET or PLAY_SWINCLR) is ignored until the write completes. Software must poll the PLAY_SWIN write busy flag in the *PLAY miscellaneous status register (PLAY_MSR)* to make sure that no writes are pending. If play_clk is slow compared to the bus clock, pclk, a write may take a long time to complete. In this case, the PLAY_SWIN register write complete interrupt - see *PLAY interrupt status register (PLAY_ISR)* - can be used to signal to the software when the registers can be accessed again.

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SWINy**: Input swiny state (y = 15 to 0)
0: Input low
1: Input high

22.6.9 PLAY software input set register (PLAY_SWINSET)

Address offset: 0x204

Reset value: 0x0000 0000

This register is used to set the state of the software programmable inputs. It is a functional register and is reset automatically by hardware.

If PLAY_SECCFGR.SEC[1] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[1] = 1, the register requires privileged access (unprivileged accesses are ignored).

Caution: play_clk must be active when writing to this register. Any subsequent write access to this register (or PLAY_SWIN or PLAY_SWINCLR) is ignored until the write completes. Software must poll the PLAY_SWIN write busy flag in the *PLAY miscellaneous status register (PLAY_MSR)* to make sure that no writes are pending. If play_clk is slow compared to the

bus clock, pclk, a write may take a long time to complete. In this case, the PLAY_SWIN register write complete interrupt - see *PLAY interrupt status register (PLAY_ISR)* - can be used to signal to the software when the register can be accessed again.

Bits 15:0 **SWINy**: Set PLAY_SWIN.SWINy (y = 15 to 0)
0: Input low
1: Input high

22.6.10 PLAY software input clear register (PLAY_SWINCLR)

Address offset: 0x208

Reset value: 0x0000 0000

This register is used to reset the state of the software programmable inputs. It is a functional register and is reset automatically by hardware.

If PLAY_SECCFGR.SEC[1] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[1] = 1, the register requires privileged access (unprivileged accesses are ignored).

Caution: play_clk must be active when writing to this register. Any subsequent write access to this register (or PLAY_SWIN or PLAY_SWINSET) is ignored until the write completes. Software must poll the PLAY_SWIN write busy flag in the *PLAY miscellaneous status register (PLAY_MSR)* to make sure that no writes are pending. If play_clk is slow compared to the bus clock, pclk, a write may take a long time to complete. In this case, the PLAY_SWIN register write complete interrupt - see *PLAY interrupt status register (PLAY_ISR)* - can be used to signal to the software when the registers can be accessed again.

0: Input low
1: Input high

22.6.11 PLAY output status register (PLAY_OSR)

Address offset: 0x210

Reset value: 0x0000 0000

This register allows software to read the state of the LE direct and registered outputs. It is a functional register and is reset by play_rstn and play_app_rstn.

If PLAY_SECCFGR.SEC[1] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[1] = 1, the register requires privileged access (unprivileged accesses are ignored).

Bits 15:0 **LEOUTDy**: State of LE direct outputs leoutdy (y = 15 to 0)

22.6.12 PLAY flag status register (PLAY_FLSTAT)

Address offset: 0x220

Reset value: 0x0000 0000

This register allows software to read the state of the LE output flags. It is a functional register and is reset by play_rstn and play_app_rstn.

If PLAY_SECCFGR.SEC[1] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[1] = 1, the register requires privileged access (unprivileged accesses are ignored).

1: Flag set

Bits 15:0 **FLAGDy**: Flag state for LEy direct output (y = 15 to 0)
0: Flag reset
1: Flag set

22.6.13 PLAY flag set register (PLAY_FLSET)

Address offset: 0x224

Reset value: 0x0000 0000

This register allows software to set the LE output flags. It is a functional register and is reset automatically by hardware.

If PLAY_SECCFGR.SEC[1] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[1] = 1, the register requires privileged access (unprivileged accesses are ignored).

Bits 31:16 **FLAGR_SETy**: Flag set for LEy registered output (y = 15 to 0)
0: No effect
1: Set flag

Bits 15:0 **FLAGD_SETy**: Flag set for LEy direct output (y = 15 to 0)
0: No effect
1: Set flag

22.6.14 PLAY flag clear register (PLAY_FLCLR)

Address offset: 0x228

Reset value: 0x0000 0000

This register allows software to clear the state of the LE output flags. It is a functional register and is reset automatically by hardware.

If PLAY_SECCFGR.SEC[1] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[1] = 1, the register requires privileged access (unprivileged accesses are ignored).

Bits 31:16 **FLAGR_CLRy**: Flag clear for LEy registered output (y = 15 to 0)
0: No effect
1: Clear flag

Bits 15:0 **FLAGD_CLRy**: Flag clear for LEy direct output (y = 15 to 0)
0: No effect
1: Clear flag

22.6.15 PLAY flag interrupt enable register (PLAY_FLIER)

Address offset: 0x22C

Reset value: 0x0000 0000

This register enables interrupt requests based on LE output flag state. It is a functional register and is reset by play_rstn and play_app_rstn.

If PLAY_SECCFGR.SEC[1] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[1] = 1, the register requires privileged access (unprivileged accesses are ignored).

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **FLAGR_IENy**: Flag interrupt enable for LEy registered output (y = 15 to 0)
0: No interrupt is generated on play_irq
1: An interrupt is generated on play_irq if PLAY_FLSTAT.FLAGRy = 1

Bits 15:0 **FLAGD_IENy**: Flag interrupt enable for LEy direct output (y = 15 to 0)
0: No interrupt is generated on play_irq
1: An interrupt is generated on play_irq if PLAY_FLSTAT.FLAGDy = 1

22.6.16 PLAY flag control register (PLAY_FLCTL)

Address offset: 0x230

Reset value: 0x0000 0000

This register selects the direction of signal transition to set the corresponding LE output flag. It is a functional register and is reset by play_rstn and play_app_rstn.

If PLAY_SECCFGR.SEC[1] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[1] = 1, the register requires privileged access (unprivileged accesses are ignored).

Caution: play_clk must be active when writing to this register. Any subsequent write access to this register is ignored until the write completes. Software must poll the PLAY_FLCTL write busy flag in the *PLAY miscellaneous status register (PLAY_MSR)* to make sure that no writes are pending. If play_clk is slow compared to the bus clock, pclk, a write may take a long time to complete. In this case, the PLAY_FLCTL register write complete interrupt - see *PLAY interrupt status register (PLAY_ISR)* - can be used to signal to the software when the register can be accessed again.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **FLAGR_EDGEy**: Edge direction for LEy registered output (y = 15 to 0)
0: FLAGRy is set by a falling edge on leoutry
1: FLAGRy is set by a rising edge on leoutry

Bits 15:0 **FLAGD_EDGEy**: Edge direction for LEy direct output (y = 15 to 0)
0: FLAGDy is set by a falling edge on leoutdy
1: FLAGDy is set by a rising edge on leoutdy

22.6.17 PLAY miscellaneous status register (PLAY_MSR)

Address offset: 0x234

Reset value: 0x0000 0000

This register allows software to read the state of miscellaneous status flags (not including LE output flags). It is a functional register and is reset by play_rstn and play_app_rstn.

If PLAY_SECCFGR.SEC[1] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[1] = 1, the register requires privileged access (unprivileged accesses are ignored).

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FLCTLWBFS**: PLAY_FLCTL register write busy flag status
0: PLAY_FLCTL register can be written
1: Write is pending, any new write access to PLAY_FLCTL register is ignored

Bit 0 **SWINWBFS**: PLAY_SWIN register write busy flag status
0: PLAY_SWIN register can be written
1: Write is pending, any new write access to PLAY_SWIN, PLAY_SWINCLR or PLAY_SWINSET registers is ignored

22.6.18 PLAY interrupt status register (PLAY_ISR)

Address offset: 0x238

Reset value: 0x0000 0000

This register allows software to read the state of the interrupt request sources. The PLAY_ISR register must be read first of all when the play_irq is asserted, to identify the source(s) of the interrupt request. It is a functional register and is reset by play_rstn and play_app_rstn.

If PLAY_SECCFGR.SEC[1] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[1] = 1, the register requires privileged access (unprivileged accesses are ignored).

													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **FLAGS**: Flag interrupts status
0: No flag interrupts active
1: One or more bits in PLAY_FLSTAT register is active and has generated an interrupt request

Bit 1 **FLCTLWC**: PLAY_FLCTL register write complete interrupt status
0: Interrupt request is not pending
1: Interrupt request is pending

Bit 0 **SWINWC**: PLAY_SWIN register write complete interrupt status
0: Interrupt request is not pending
1: Interrupt request is pending

22.6.19 PLAY interrupt clear register (PLAY_ICR)

Address offset: 0x23C

Reset value: 0xXXXX XXXX

This register allows software to clear active interrupt requests, except for those generated by flags - see *Section 22.6.14: PLAY flag clear register (PLAY_FLCLR)*. It is a functional register.

If PLAY_SECCFGR.SEC[1] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[1] = 1, the register requires privileged access (unprivileged accesses are ignored).

Bit 1 **FLCTLWC_CLR**: PLAY_FLCTL register write complete interrupt clear
0: No action
1: Clear interrupt request

Bit 0 **SWINWC_CLR**: PLAY_SWIN register write complete interrupt clear
0: No action
1: Clear interrupt request

22.6.20 PLAY interrupt enable register (PLAY_IER)

Address offset: 0x240

Reset value: 0x0000 0000

This register allows software to enable or disable interrupt requests, except for those generated by flags - see *Section 22.6.15: PLAY flag interrupt enable register (PLAY_FLIER)*. It is a functional register and is reset by play_rstn and play_app_rstn.

If PLAY_SECCFGR.SEC[1] = 1, the register requires secure access (nonsecure accesses are ignored).

If PLAY_PRIVCFGR.PRIV[1] = 1, the register requires privileged access (unprivileged accesses are ignored).

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

23 Flexible memory controller (FMC)

23.1 FMC introduction

The flexible memory controller (FMC) includes three memory controllers:

- The NOR/PSRAM memory controller
- The NAND memory controller
- The Synchronous DRAM (SDRAM/Mobile LPSDR SDRAM) controller (not available on STM32H523/533xx devices)

23.2 FMC main features

The FMC functional block makes the interface with: synchronous and asynchronous static memories, SDRAM memories, and NAND flash memory. Its main purposes are:

- to translate AHB transactions into the appropriate external device protocol
- to meet the access time requirements of the external memory devices

All external memories share the addresses, data and control signals with the controller. Each external device is accessed by means of a unique chip select. The FMC performs only one access at a time to an external device.

The main features of the FMC controller are the following:

- Interface with static-memory mapped devices including:
  - Static random access memory (SRAM)
  - NOR flash memory/OneNAND flash memory
  - PSRAM (4 memory banks)
  - Ferroelectric RAM (FRAM)
  - NAND flash memory with ECC hardware to check up to 8 Kbytes of data
- Interface with synchronous DRAM (SDRAM/Mobile LPSDR SDRAM) memories
- Interface with parallel LCD modules, supporting Intel 8080 and Motorola 6800 modes.
- Burst mode support for faster access to synchronous devices such as NOR flash memory, PSRAM and SDRAM)
- Programmable continuous clock output for asynchronous and synchronous accesses
- 8-,16-bit wide data bus
- Independent chip select control for each memory bank
- Independent configuration for each memory bank
- Write enable and byte lane select outputs for use with PSRAM, SRAM and SDRAM devices
- External asynchronous wait control
- Write FIFO with 16 x32-bit depth
- Cacheable Read FIFO with 6 x32-bit depth (6 x14-bit address tag) for SDRAM controller.

The Write FIFO is common to all memory controllers and consists of:

- a Write Data FIFO which stores the AHB data to be written to the memory (up to 32 bits) plus one bit for the AHB transfer (burst or not sequential mode)
- a Write Address FIFO which stores the AHB address (up to 28 bits) plus the AHB data size (up to 2 bits). When operating in burst mode, only the start address is stored except when crossing a page boundary (for PSRAM and SDRAM). In this case, the AHB burst is broken into two FIFO entries.

At startup the FMC pins must be configured by the user application. The FMC I/O pins which are not used by the application can be used for other purposes.

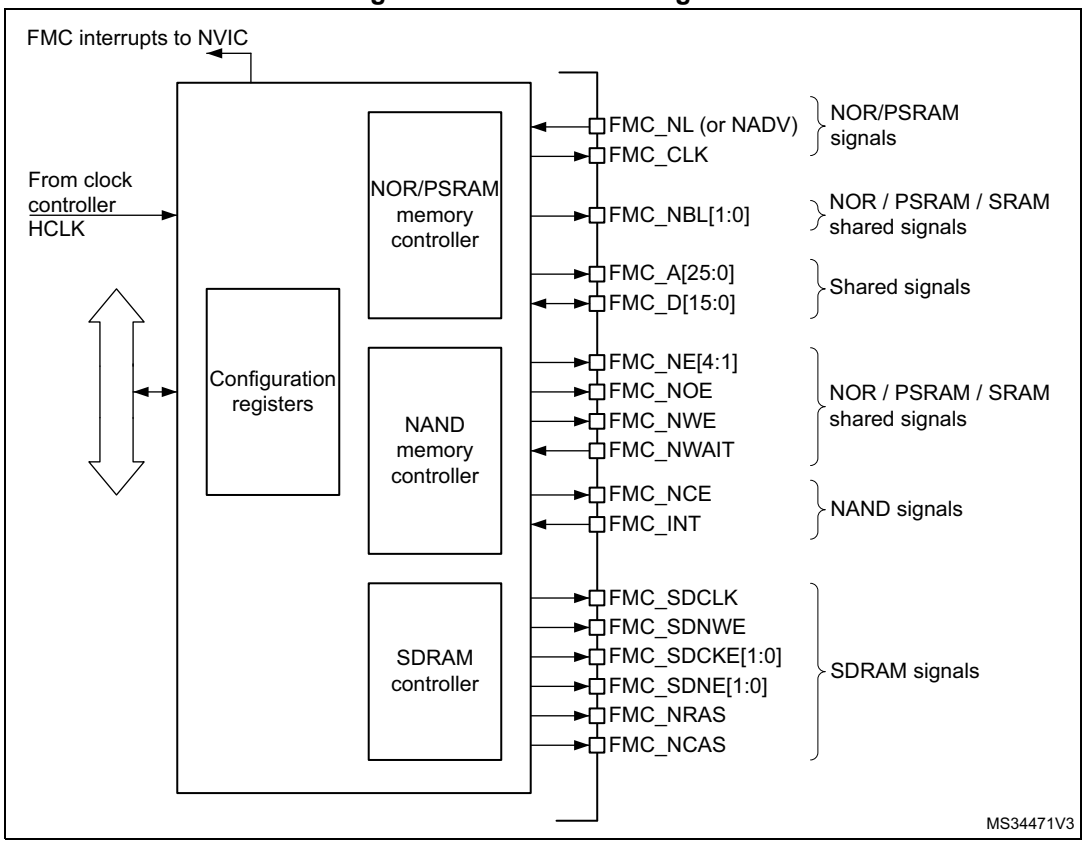
The FMC registers that define the external device type and associated characteristics are usually set at boot time and do not change until the next reset or power-up.

However, only a few bits can be changed on-the-fly:

- MBKEN, FMCEN, WEN bits in FMC_BCRx register
- ECCEN and PBKEN bits in the FMC_PCR register
- IFS, IRS and ILS bits in the FMC_SR register

Follow the below sequence to modify parameters while the FMC is enabled:

1. First disable the FMC controller to prevent further accesses to any memory controller while the register is modified.
2. Update all required configurations.
3. Enable the FMC controller again.



23.3 FMC block diagram

The FMC consists of the following main blocks:

- The AHB interface (including the FMC configuration registers)
- The NOR flash/PSRAM/SRAM controller
- The SDRAM controller

The block diagram is shown in the figure below.

Figure 130. FMC block diagram

23.4 AHB interface

The AHB slave interface allows internal CPUs and other bus master peripherals to access the external memories.

AHB transactions are translated into the external device protocol. In particular, if the selected external memory is 16- or 8-bit wide, 32-bit wide transactions on the AHB are split into consecutive 16- or 8-bit accesses. The FMC chip select (FMC_NEx) does not toggle between the consecutive accesses except in case of Access mode D when the Extended mode is enabled.

The FMC generates an AHB error in the following conditions:

- When reading or writing to a FMC bank (Bank 1 to 4) which is not enabled.
- When reading or writing to the NOR flash bank while the FACCEN bit is reset in the FMC_BCRx register.
- When writing to a write protected SDRAM bank (WP bit set in the SDRAM_SDCRx register).
- When the SDRAM address range is violated (access to reserved address range)

The effect of an AHB error depends on the AHB master which has attempted the R/W access:

- If the access has been attempted by the Cortex-M33 CPU, a hard fault interrupt is generated.
- If the access has been performed by a DMA controller, a DMA transfer error is generated and the corresponding DMA channel is automatically disabled.

The AHB clock (HCLK) is the reference clock for the FMC.

23.4.1 Supported memories and transactions

General transaction rules

The requested AHB transaction data size can be 8-, 16- or 32-bit wide whereas the accessed external device has a fixed data width. This may lead to inconsistent transfers.

Therefore, some simple transaction rules must be followed:

- AHB transaction size and memory data size are equal

  There is no issue in this case.
- AHB transaction size is greater than the memory size:

  In this case, the FMC splits the AHB transaction into smaller consecutive memory accesses to meet the external data width. The FMC chip select (FMC_NEx) does not toggle between the consecutive accesses. If the bus turnaround timings is configured to any other value than 0, the FMC chip select (FMC_NEx) toggles between the consecutive accesses. This feature is required when interfacing with FRAM memory.
- AHB transaction size is smaller than the memory size:

  The transfer may or not be consistent depending on the type of external device:
  - Accesses to devices that have the byte select feature (SRAM, ROM, PSRAM, SDRAM)

    In this case, the FMC allows read/write transactions and accesses to the right data through its byte lanes NBL[1:0].

    Bytes to be written are addressed by NBL[1:0].

    All memory bytes are read (NBL[1:0] are driven low during read transaction) and the useless ones are discarded.
  - Accesses to devices that do not have the byte select feature (NOR and NAND flash memories)

    This situation occurs when a byte access is requested to a 16-bit wide flash memory. Since the device cannot be accessed in Byte mode (only 16-bit words can be read/written from/to the flash memory), Write transactions and Read transactions are allowed (the controller reads the entire 16-bit memory word and uses only the required byte).

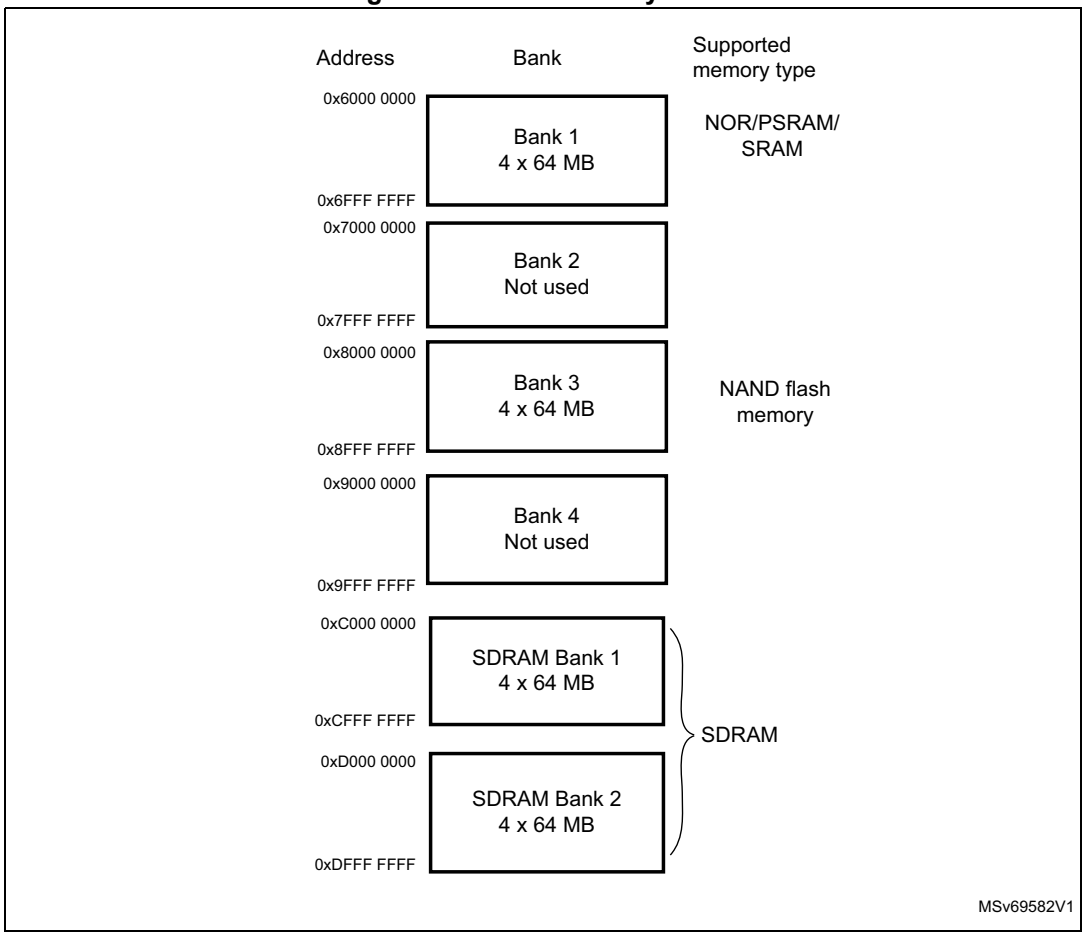
Wrap support for NOR flash/PSRAM and SDRAM

Wrap burst mode for synchronous memories is not supported. The memories must be configured in Linear burst mode of undefined length.

Configuration registers

The FMC can be configured through a set of registers. Refer to *Section 23.6.6*, for a detailed description of the NOR flash/PSRAM controller registers. Refer to *Section 23.7.7*,

for a detailed description of the NAND flash registers and to *Section 23.8.5* for a detailed description of the SDRAM controller registers.



23.5 External device address mapping

From the FMC point of view, the external memory is divided into fixed-size banks of 256 Mbytes each (see *Figure 131*):

- Bank 1 used to address up to 4 NOR flash memory or PSRAM devices. This bank is split into 4 NOR/PSRAM subbanks with 4 dedicated chip selects, as follows:
  - Bank 1 - NOR/PSRAM 1
  - Bank 1 - NOR/PSRAM 2
  - Bank 1 - NOR/PSRAM 3
  - Bank 1 - NOR/PSRAM 4
- Bank 3 used to address NAND flash memory devices.The MPU memory attribute for this space must be reconfigured by software to Device.
- Bank 4 and 5 used to address SDRAM devices (1 device per bank).

For each bank the type of memory to be used can be configured by the user application through the Configuration register.

Figure 131. FMC memory banks

23.5.1 NOR/PSRAM address mapping

HADDR[27:26] bits are used to select one of the four memory banks as shown in *Table 191*.

Table 191. NOR/PSRAM bank selection

HADDR[27:26](1)	Selected bank
00	Bank 1 - NOR/PSRAM 1
01	Bank 1 - NOR/PSRAM 2
10	Bank 1 - NOR/PSRAM 3
11	Bank 1 - NOR/PSRAM 4

1. HADDR are internal AHB address lines that are translated to external memory.

The HADDR[25:0] bits contain the external memory address. Since HADDR is a byte address whereas the memory is addressed at word level, the address actually issued to the memory varies according to the memory data width, as shown in the following table.

Table 192. NOR/PSRAM External memory address

Memory width(1)	Data address issued to the memory	Maximum memory capacity (bits)
8-bit	HADDR[25:0]	64 Mbytes x 8 = 512 Mbits
16-bit	HADDR[25:1] >> 1	64 Mbytes/2 x 16 = 512 Mbits

1. In case of a 16-bit external memory width, the FMC internally uses HADDR[25:1] to generate the address for external memory FMC_A[24:0].
Whatever the external memory width, FMC_A[0] must be connected to external memory address A[0].

23.5.2 NAND flash memory address mapping

The NAND bank is divided into memory areas as indicated in *Table 193*.

Table 193. NAND memory mapping and timing registers

Start address	End address	FMC bank	Memory space	Timing register
0x8800 0000	0x8BFF FFFF	Bank 3 - NAND flash	Attribute	FMC_PATT (0x8C)
0x8000 0000	0x83FF FFFF		Common	FMC_PMEM (0x88)

For NAND flash memory, the common and attribute memory spaces are subdivided into three sections (see in *Table 194* below) located in the lower 256 Kbytes:

- Data section (first 64 Kbytes in the common/attribute memory space)
- Command section (second 64 Kbytes in the common / attribute memory space)
- Address section (next 128 Kbytes in the common / attribute memory space)

Table 194. NAND bank selection

Section name	HADDR[17:16]	Address range
Address section	1X	0x020000-0x03FFFF
Command section	01	0x010000-0x01FFFF
Data section	00	0x000000-0x0FFFF

The application software uses the 3 sections to access the NAND flash memory:

- **To sending a command to NAND flash memory**, the software must write the command value to any memory location in the command section.
- **To specify the NAND flash address that must be read or written**, the software must write the address value to any memory location in the address section. Since an address can be 4 or 5 bytes long (depending on the actual memory size), several consecutive write operations to the address section are required to specify the full address.
- **To read or write data,** the software reads or writes the data from/to any memory location in the data section.

Since the NAND flash memory automatically increments addresses, there is no need to increment the address of the data section to access consecutive memory locations.

23.5.3 SDRAM address mapping

The HADDR[28] bit (internal AHB address line 28) is used to select one of the two memory banks as indicated in *Table 195*.

Table 195. SDRAM bank selection

HADDR[28]	Selected bank	Control register	Timing register
0	SDRAM Bank1	FMC_SDCR1	FMC_SDTR1
1	SDRAM Bank2	FMC_SDCR2	FMC_SDTR2

The following table shows SDRAM mapping for a 13-bit row, a 11-bit column and a 4 internal bank configuration.

Table 196. SDRAM address mapping

Memory width(1)	Internal bank	Row address	Column address(2)	Maximum memory capacity (Mbytes)
8-bit	HADDR[25:24]	HADDR[23:11]	HADDR[10:0]	64 Mbytes: 4 x 8K x 2K
16-bit	HADDR[26:25]	HADDR[24:12]	HADDR[11:1]	128 Mbytes: 4 x 8K x 2K x 2

1. When interfacing with a 16-bit memory, the FMC internally uses the HADDR[11:1] internal AHB address lines to generate the external address. Whatever the memory width, FMC_A[0] has to be connected to the external memory address A[0].
2. The AutoPrecharge is not supported. FMC_A[10] must be connected to the external memory address A[10] but it is always driven low.

The HADDR[27:0] bits are translated to external SDRAM address depending on the SDRAM controller configuration:

- Data size:8 or 16 bits
- Row size:11, 12 or 13 bits
- Column size: 8, 9, 10 or 11 bits
- Number of internal banks: two or four internal banks

The following tables show the SDRAM address mapping versus the SDRAM controller configuration.

Table 197. SDRAM address mapping with 8-bit data bus width(1)(2)

Row size configuration	HADDR(AHB Internal Address Lines)																										
	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
11-bit row size configuration	Res.							Bank [1:0]		Row[10:0]											Column[7:0]							
	Res.							Bank [1:0]		Row[10:0]											Column[8:0]							
	Res.							Bank [1:0]		Row[10:0]											Column[9:0]							
	Res.							Bank [1:0]		Row[10:0]											Column[10:0]							
12-bit row size configuration	Res.							Bank [1:0]		Row[11:0]											Column[7:0]							
	Res.							Bank [1:0]		Row[11:0]											Column[8:0]							
	Res.							Bank [1:0]		Row[11:0]											Column[9:0]							
	Res.							Bank [1:0]		Row[11:0]											Column[10:0]							
13-bit row size configuration	Res.							Bank [1:0]		Row[12:0]											Column[7:0]							
	Res.							Bank [1:0]		Row[12:0]											Column[8:0]							
	Res.							Bank [1:0]		Row[12:0]											Column[9:0]							
	Res.							Bank [1:0]		Row[12:0]											Column[10:0]							

1. BANK[1:0] are the Bank Address BA[1:0]. When only 2 internal banks are used, BA1 must always be set to ‘0’.
2. Access to Reserved (Res.) address range generates an AHB error.

Table 198. SDRAM address mapping with 16-bit data bus width(1)(2)

Row size Configuration	HADDR(AHB address Lines)																										
	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
11-bit row size configuration	Res.						Bank [1:0]		Row[10:0]											Column[7:0]								BM0(3)
	Res.						Bank [1:0]		Row[10:0]											Column[8:0]								BM0
	Res.						Bank [1:0]		Row[10:0]											Column[9:0]								BM0
	Res.				Bank [1:0]		Row[10:0]													Column[10:0]								BM0
12-bit row size configuration	Res.						Bank [1:0]		Row[11:0]											Column[7:0]								BM0
	Res.						Bank [1:0]		Row[11:0]											Column[8:0]								BM0
	Res.				Bank [1:0]		Row[11:0]													Column[9:0]								BM0
	Res.						Bank [1:0]		Row[11:0]											Column[10:0]								BM0
13-bit row size configuration	Res.						Bank [1:0]		Row[12:0]											Column[7:0]								BM0
	Res.				Bank [1:0]		Row[12:0]													Column[8:0]								BM0
	Res.						Bank [1:0]		Row[12:0]											Column[9:0]								BM0
	Res.				Bank [1:0]		Row[12:0]													Column[10:0]								BM0

1. BANK[1:0] are the Bank Address BA[1:0]. When only 2 internal banks are used, BA1 must always be set to ‘0’.
2. Access to Reserved space (Res.) generates an AHB error.
3. BM0: is the byte mask for 16-bit access.

23.6 NOR flash/PSRAM controller

The FMC generates the appropriate signal timings to drive the following types of memories:

- Asynchronous SRAM, FRAM and ROM
  - 8 bits
  - 16 bits
- PSRAM (CellularRAM™)
  - Asynchronous mode
  - Burst mode for synchronous accesses
  - Multiplexed or non-multiplexed
- NOR flash memory
  - Asynchronous mode
  - Burst mode for synchronous accesses
  - Multiplexed or non-multiplexed

The FMC outputs a unique chip select signal, NE[4:1], per bank. All the other signals (addresses, data and control) are shared.

The FMC supports a wide range of devices through a programmable timings among which:

- Programmable wait states (up to 15)
- Programmable bus turnaround cycles (up to 15)
- Programmable output enable and write enable delays (up to 15)
- Independent read and write timings and protocol to support the widest variety of memories and timings
- Programmable continuous clock (FMC_CLK) output.

The FMC Clock (FMC_CLK) is a submultiple of the HCLK clock. It can be delivered to the selected external device either during synchronous accesses only or during asynchronous and synchronous accesses depending on the CCKEN bit configuration in the FMC_BCR1 register:

- If the CCLKEN bit is reset, the FMC generates the clock (CLK) only during synchronous accesses (Read/write transactions).
- If the CCLKEN bit is set, the FMC generates a continuous clock during asynchronous and synchronous accesses. To generate the FMC_CLK continuous clock, Bank 1 must be configured in Synchronous mode (see *Section 23.6.6: NOR/PSRAM controller registers*). Since the same clock is used for all synchronous memories, when a continuous output clock is generated and synchronous accesses are performed, the AHB data size has to be the same as the memory data width (MWID) otherwise the FMC_CLK frequency is changed depending on AHB data transaction (refer to *Section 23.6.5: Synchronous transactions* for FMC_CLK divider ratio formula).

The size of each bank is fixed and equal to 64 Mbytes. Each bank is configured through dedicated registers (see *Section 23.6.6: NOR/PSRAM controller registers*).

The programmable memory parameters include access times (see *Table 199*) and support for wait management (for PSRAM and NOR flash accessed in Burst mode).

Table 199. Programmable NOR/PSRAM access parameters

Parameter	Function	Access mode	Unit	Min.	Max.
Address setup	Duration of the address setup phase	Asynchronous	AHB clock cycle (HCLK)	0	15
Address hold	Duration of the address hold phase	Asynchronous, muxed I/Os	AHB clock cycle (HCLK)	1	15
NBL setup	Duration of the byte lanes setup phase	Asynchronous	AHB clock cycle (HCLK)	0	3
Data setup	Duration of the data setup phase	Asynchronous	AHB clock cycle (HCLK)	1	256
Data hold	Duration of the data hold phase	Asynchronous	AHB clock cycle (HCLK)	0	3
Bust turn	Duration of the bus turnaround phase	Asynchronous and synchronous read / write	AHB clock cycle (HCLK)	0	15

Table 199. Programmable NOR/PSRAM access parameters (continued)

Parameter	Function	Access mode	Unit	Min.	Max.
Clock divide ratio	Number of AHB clock cycles (HCLK) to build one memory clock cycle (CLK)	Synchronous	AHB clock cycle (HCLK)	2	16
Data latency	Number of clock cycles to issue to the memory before the first data of the burst	Synchronous	Memory clock cycle (CLK)	2	17

23.6.1 External memory interface signals

Table 200, *Table 201* and *Table 202* list the signals that are typically used to interface with NOR flash memory, SRAM and PSRAM.

Note: The prefix "N" identifies the signals that are active low.

NOR flash memory, non-multiplexed I/Os

Table 200. Non-multiplexed I/O NOR flash memory

FMC signal name	I/O	Function
CLK	O	Clock (for synchronous access)
A[25:0]	O	Address bus
D[15:0]	I/O	Bidirectional data bus
NE[x]	O	Chip select, x = 1..4
NOE	O	Output enable
NWE	O	Write enable
NL(=NADV)	O	Latch enable (this signal is called address valid, NADV, by some NOR flash devices)
NWAIT	I	NOR flash wait input signal to the FMC

The maximum capacity is 512 Mbits (26 address lines).

NOR flash memory, 16-bit multiplexed I/Os

Table 201. 16-bit multiplexed I/O NOR flash memory

FMC signal name	I/O	Function
CLK	O	Clock (for synchronous access)
A[25:16]	O	Address bus
AD[15:0]	I/O	16-bit multiplexed, bidirectional address/data bus (the 16-bit address A[15:0] and data D[15:0] are multiplexed on the databus)
NE[x]	O	Chip select, x = 1..4
NOE	O	Output enable
NWE	O	Write enable

Table 201. 16-bit multiplexed I/O NOR flash memory (continued)

FMC signal name	I/O	Function
NL(=NADV)	O	Latch enable (this signal is called address valid, NADV, by some NOR flash devices)
NWAIT	I	NOR flash wait input signal to the FMC

The maximum capacity is 512 Mbits.

PSRAM/FRAM/SRAM, non-multiplexed I/Os

Table 202. Non-multiplexed I/Os PSRAM/SRAM

FMC signal name	I/O	Function
CLK	O	Clock (only for PSRAM synchronous access)
A[25:0]	O	Address bus
D[15:0]	I/O	Data bidirectional bus
NE[x]	O	Chip select, x = 1..4 (called NCE by PSRAM (CellularRAM™ i.e. CRAM))
NOE	O	Output enable
NWE	O	Write enable
NL(= NADV)	O	Address valid only for PSRAM input (memory signal name: NADV)
NWAIT	I	PSRAM wait input signal to the FMC
NBL[1:0]	O	Byte lane output. Byte 0 and Byte 1 control (upper and lower byte enable)

The maximum capacity is 512 Mbits.

PSRAM, 16-bit multiplexed I/Os

Table 203. 16-Bit multiplexed I/O PSRAM

FMC signal name	I/O	Function
CLK	O	Clock (for synchronous access)
A[25:16]	O	Address bus
AD[15:0]	I/O	16-bit multiplexed, bidirectional address/data bus (the 16-bit address A[15:0] and data D[15:0] are multiplexed on the databus)
NE[x]	O	Chip select, x = 1..4 (called NCE by PSRAM (CellularRAM™ i.e. CRAM))
NOE	O	Output enable
NWE	O	Write enable
NL(= NADV)	O	Address valid PSRAM input (memory signal name: NADV)
NWAIT	I	PSRAM wait input signal to the FMC
NBL[1:0]	O	Byte lane output. Byte 0 and Byte 1 control (upper and lower byte enable)

The maximum capacity is 512 Mbits (26 address lines).

23.6.2 Supported memories and transactions

Table 204 below shows an example of the supported devices, access modes and transactions when the memory data bus is 16-bit wide for NOR flash memory, PSRAM and SRAM. The transactions not allowed (or not supported) by the FMC are shown in gray in this example.

Table 204. NOR flash/PSRAM: example of supported memories and transactions

Device	Mode	R/W	AHB data size	Memory data size	Allowed/ not allowed	Comments
NOR flash (muxed I/Os and nonmuxed I/Os)	Asynchronous	R	8	16	Y	-
	Asynchronous	W	8	16	N	-
	Asynchronous	R	16	16	Y	-
	Asynchronous	W	16	16	Y	-
	Asynchronous	R	32	16	Y	Split into 2 FMC accesses
	Asynchronous	W	32	16	Y	Split into 2 FMC accesses
	Asynchronous page	R	-	16	N	Mode is not supported
	Synchronous	R	8	16	N	-
	Synchronous	R	16	16	Y	-
	Synchronous	R	32	16	Y	-
PSRAM (multiplexed I/Os and non-multiplexed I/Os)	Asynchronous	R	8	16	Y	-
	Asynchronous	W	8	16	Y	Use of byte lanes NBL[1:0]
	Asynchronous	R	16	16	Y	-
	Asynchronous	W	16	16	Y	-
	Asynchronous	R	32	16	Y	Split into 2 FMC accesses
	Asynchronous	W	32	16	Y	Split into 2 FMC accesses
	Asynchronous page	R	-	16	N	Mode is not supported
	Synchronous	R	8	16	N	-
	Synchronous	R	16	16	Y	-
	Synchronous	R	32	16	Y	-
	Synchronous	W	8	16	Y	Use of byte lanes NBL[1:0]
	Synchronous	W	16/32	16	Y	-
SRAM and ROM	Asynchronous	R	8 / 16	16	Y	-
	Asynchronous	W	8 / 16	16	Y	Use of byte lanes NBL[1:0]
	Asynchronous	R	32	16	Y	Split into 2 FMC accesses
	Asynchronous	W	32	16	Y	Split into 2 FMC accesses Use of byte lanes NBL[1:0]

23.6.3 General timing rules

Signals synchronization

- All controller output signals change on the rising edge of the internal clock (HCLK)
- In Synchronous mode (read or write), all output signals change on the rising edge of HCLK. Whatever the CLKDIV value, all outputs change as follows:
  - NOEL/NWEL/ NEL/NADVL/ NADVH /NBLL/ Address valid outputs change on the falling edge of FMC_CLK clock.
  - NOEH/ NWEH / NEH/ NOEH/NBLH/ Address invalid outputs change on the rising edge of FMC_CLK clock.

23.6.4 NOR flash/PSRAM controller asynchronous transactions

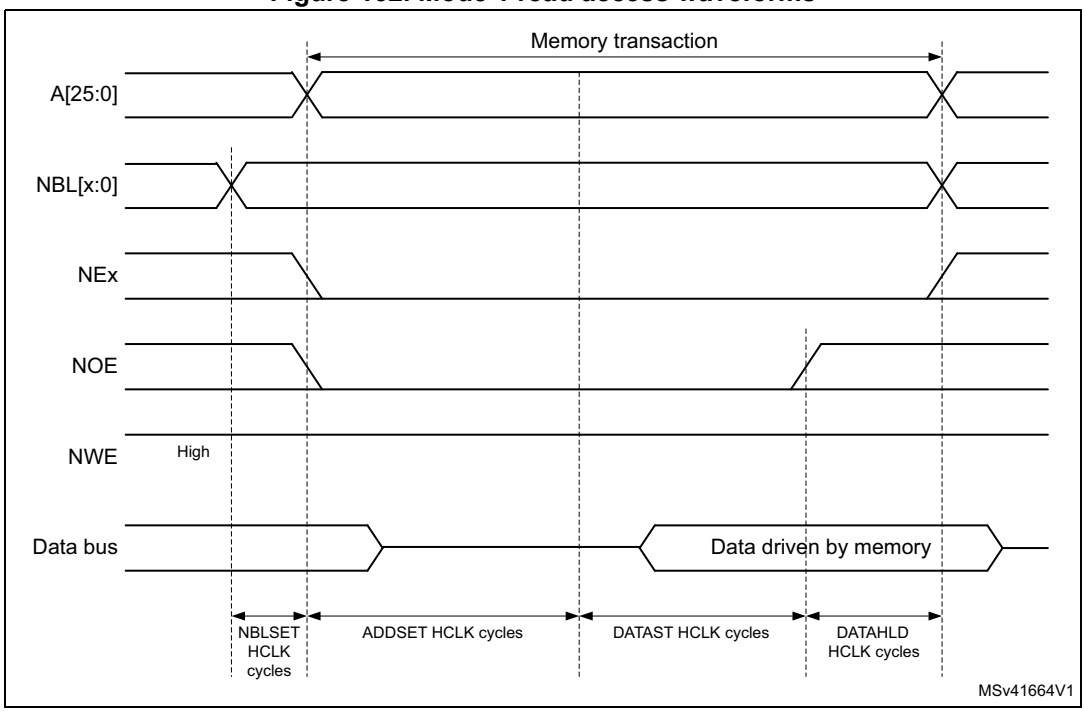
Asynchronous static memories (NOR flash, PSRAM, SRAM, FRAM)

- Signals are synchronized by the internal clock HCLK. This clock is not issued to the memory
- The FMC always samples the data before de-asserting the NOE signal. This guarantees that the memory data hold timing constraint is met (minimum Chip Enable high to data transition is usually 0 ns)
- If the Extended mode is enabled (EXTMOD bit is set in the FMC_BCRx register), up to four extended modes (A, B, C and D) are available. It is possible to mix A, B, C and D modes for read and write operations. For example, read operation can be performed in mode A and write in mode B.
- If the Extended mode is disabled (EXTMOD bit is reset in the FMC_BCRx register), the FMC can operate in mode 1 or mode 2 as follows:
  - Mode 1 is the default mode when SRAM/PSRAM memory type is selected (MTYP = 0x0 or 0x01 in the FMC_BCRx register)
  - Mode 2 is the default mode when NOR memory type is selected (MTYP = 0x10 in the FMC_BCRx register).

Mode 1 - SRAM/FRAM/PSRAM (CRAM)

The next figures show the read and write transactions for the supported modes followed by the required configuration of FMC_BCRx, and FMC_BTRx/FMC_BWTRx registers.

Figure 132. Mode 1 read access waveforms



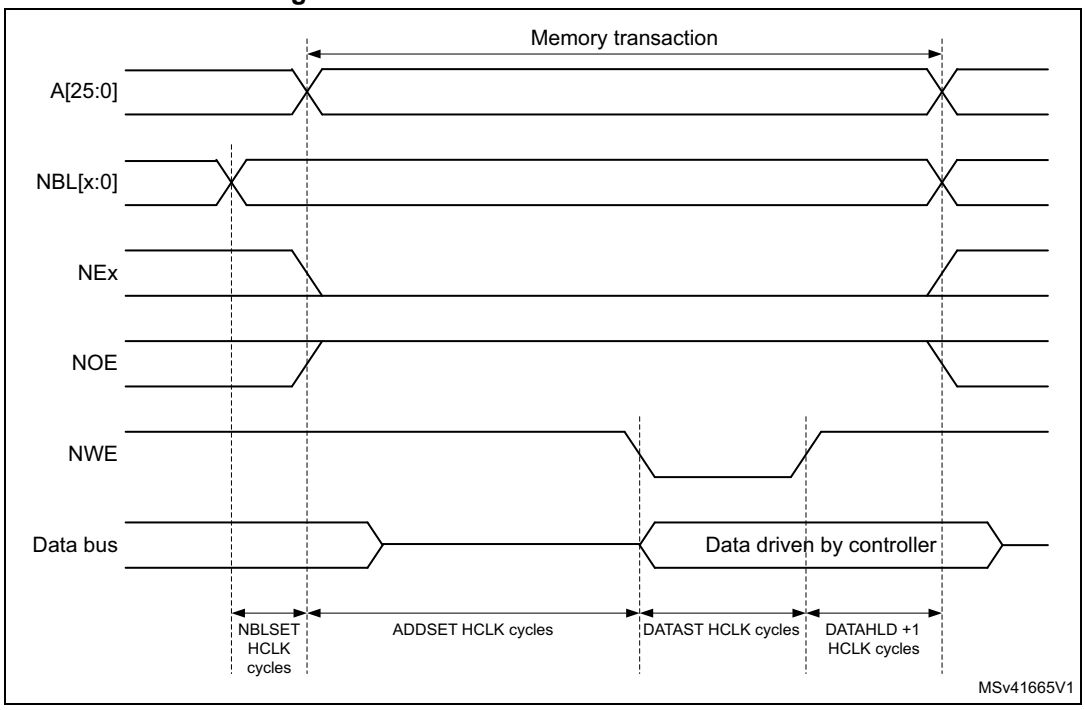


Figure 133. Mode 1 write access waveforms

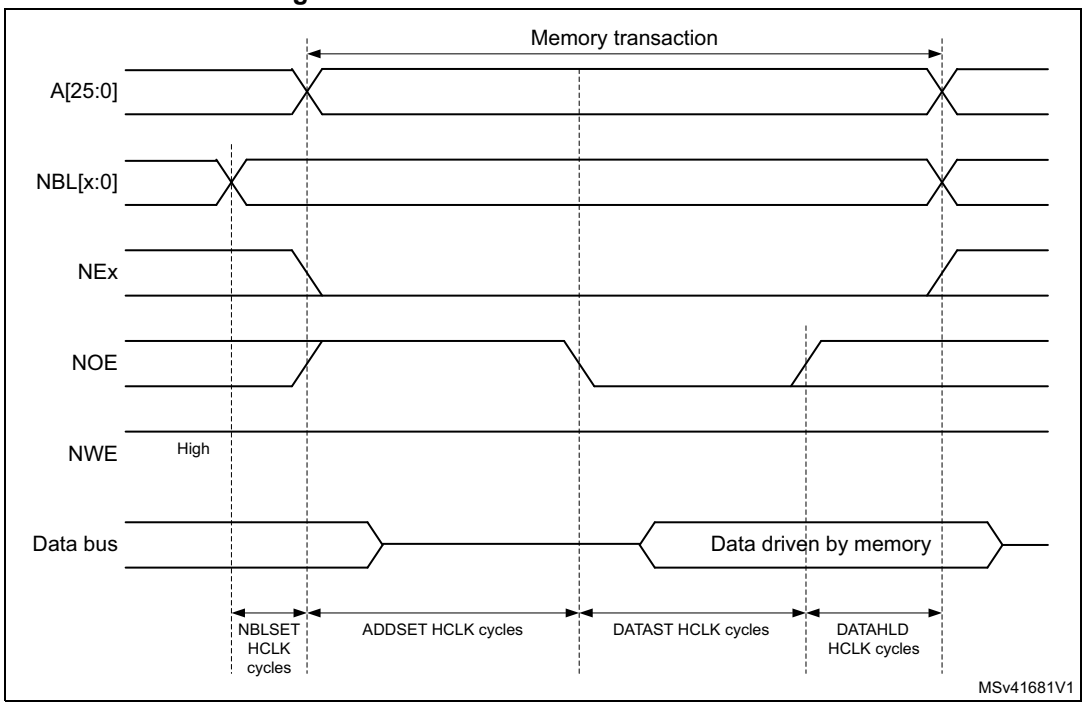
The DATAHLD time at the end of the read and write transactions guarantee the address and data hold time after the NOE/NWE rising edge. The DATAST value must be greater than zero (DATAST > 0).

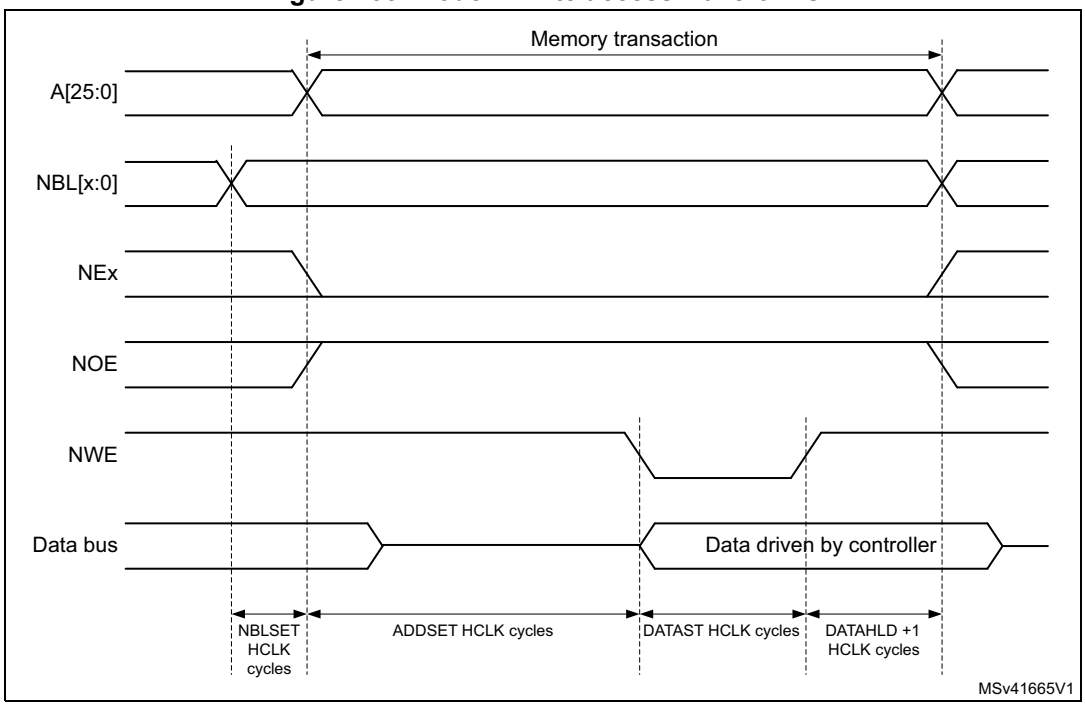
Table 205. FMC_BCRx bitfields (mode 1)



Bit number	Bit name	Value to set
31	FMCEN	0x1
30:24	Reserved	0x000
23:22	NBLSET[1:0]	As needed
20	CCLKEN	As needed
19	CBURSTRW	0x0 (no effect in Asynchronous mode)
18:16	CPSIZE	0x0 (no effect in Asynchronous mode)
15	ASYNCWAIT	Set to 1 if the memory supports this feature. Otherwise keep at 0.
14	EXTMOD	0x0
13	WAITEN	0x0 (no effect in Asynchronous mode)
12	WREN	As needed
10	Reserved	0x0
9	WAITPOL	Meaningful only if bit 15 is 1
8	BURSTEN	0x0
7	Reserved	0x1
6	FACCEN	Don’t care
5:4	MWID	As needed
3:2	MTYP	As needed, exclude 0x2 (NOR flash memory)
1	MUXE	0x0
0	MBKEN	0x1

Table 206. FMC_BTRx bitfields (mode 1)

Bit number	Bit name	Value to set
31:30	DATAHLD	Duration of the data hold phase (DATAHLD HCLK cycles for read accesses, DATAHLD+1 HCLK cycles for write accesses).
29:28	ACCMOD	Don’t care
27:24	DATLAT	Don’t care
23:20	CLKDIV	Don’t care
19:16	BUSTURN	Time between NEx high to NEx low (BUSTURN HCLK).
15:8	DATAST	Duration of the second access phase (DATAST HCLK cycles).
7:4	ADDHLD	Don’t care
3:0	ADDSET	Duration of the first access phase (ADDSET HCLK cycles). Minimum value for ADDSET is 0.



Mode A - SRAM/FRAM/PSRAM (CRAM) OE toggling

Figure 134. Mode A read access waveforms

1. NBL[1:0] are driven low during the read access

Figure 135. Mode A write access waveforms

The differences compared with Mode 1 are the toggling of NOE and the independent read and write timings.

Table 207. FMC_BCRx bitfields (mode A)

Bit number	Bit name	Value to set
31	FMCEN	0x1
30:24	Reserved	0x000
23:22	NBLSET[1:0]	As needed
20	CCLKEN	As needed
19	CBURSTRW	0x0 (no effect in Asynchronous mode)
18:16	CPSIZE	0x0 (no effect in Asynchronous mode)
15	ASYNCWAIT	Set to 1 if the memory supports this feature. Otherwise keep at 0.
14	EXTMOD	0x1
13	WAITEN	0x0 (no effect in Asynchronous mode)
12	WREN	As needed
11	WAITCFG	Don’t care
10	Reserved	0x0
9	WAITPOL	Meaningful only if bit 15 is 1
8	BURSTEN	0x0
7	Reserved	0x1

5:4	MWID	As needed
3:2	MTYP	As needed, exclude 0x2 (NOR flash memory)
1	MUXEN	0x0
0	MBKEN	0x1

Table 208. FMC_BTRx bitfields (mode A)

Bit number	Bit name	Value to set
31:30	DATAHLD	Duration of the data hold phase (DATAHLD HCLK cycles for read accesses).
29:28	ACCMOD	0x0
27:24	DATLAT	Don’t care
23:20	CLKDIV	Don’t care
19:16	BUSTURN	Time between NEx high to NEx low (BUSTURN HCLK).
15:8	DATAST	Duration of the second access phase (DATAST HCLK cycles) for read accesses.
7:4	ADDHLD	Don’t care
3:0	ADDSET	Duration of the first access phase (ADDSET HCLK cycles) for read accesses. Minimum value for ADDSET is 0.

Table 209. FMC_BWTRx bitfields (mode A)

Bit number	Bit name	Value to set
31:30	DATAHLD	Duration of the data hold phase (DATAHLD+1 HCLK cycles for write accesses).
29:28	ACCMOD	0x0
27:24	DATLAT	Don't care
23:20	CLKDIV	Don't care
19:16	BUSTURN	Time between NEx high to NEx low (BUSTURN HCLK).
15:8	DATAST	Duration of the second access phase (DATAST HCLK cycles) for write accesses.
7:4	ADDHLD	Don't care
3:0	ADDSET	Duration of the first access phase (ADDSET HCLK cycles) for write accesses. Minimum value for ADDSET is 0.

Mode 2/B - NOR flash

Figure 136. Mode 2 and mode B read access waveforms

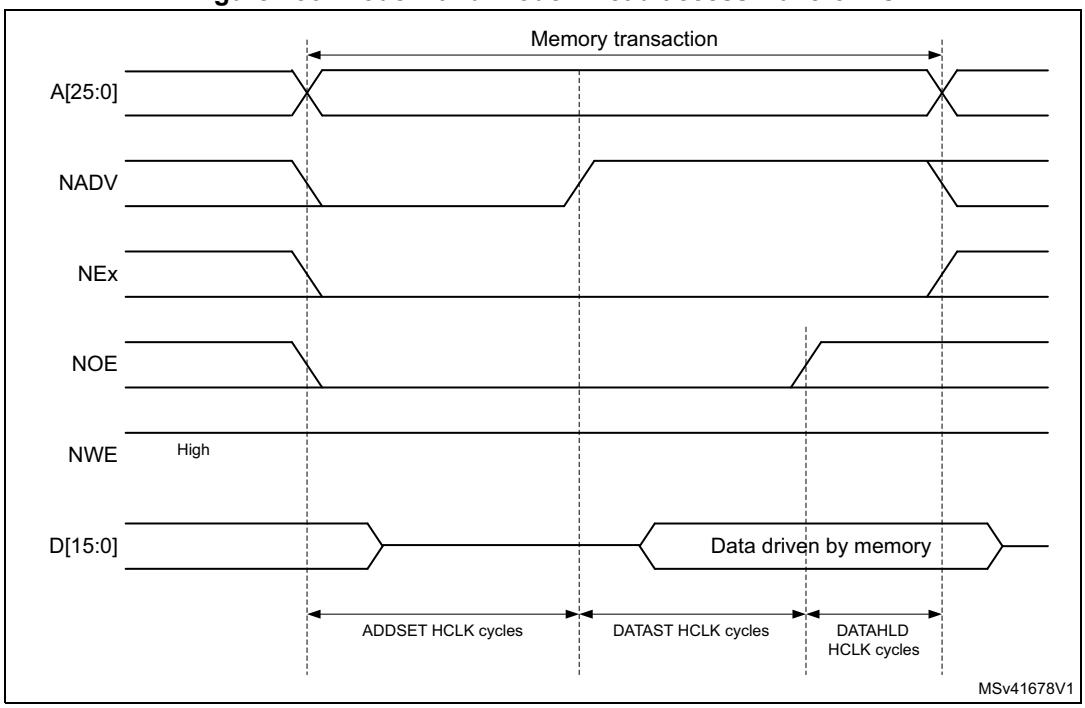

Figure 137. Mode 2 write access waveforms

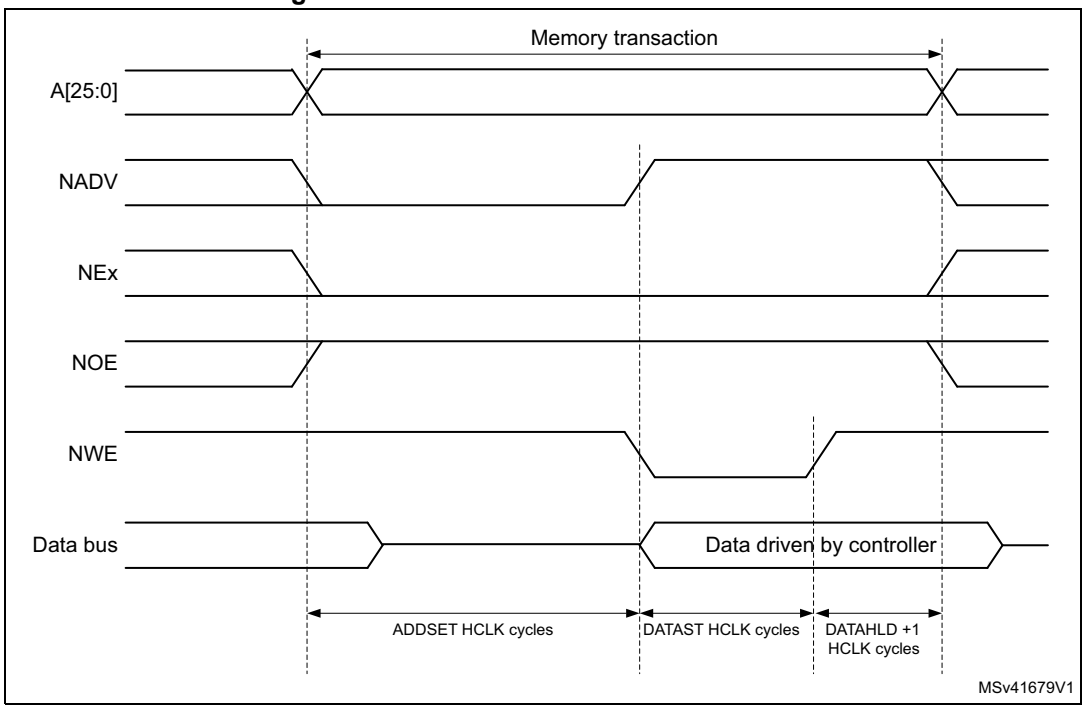

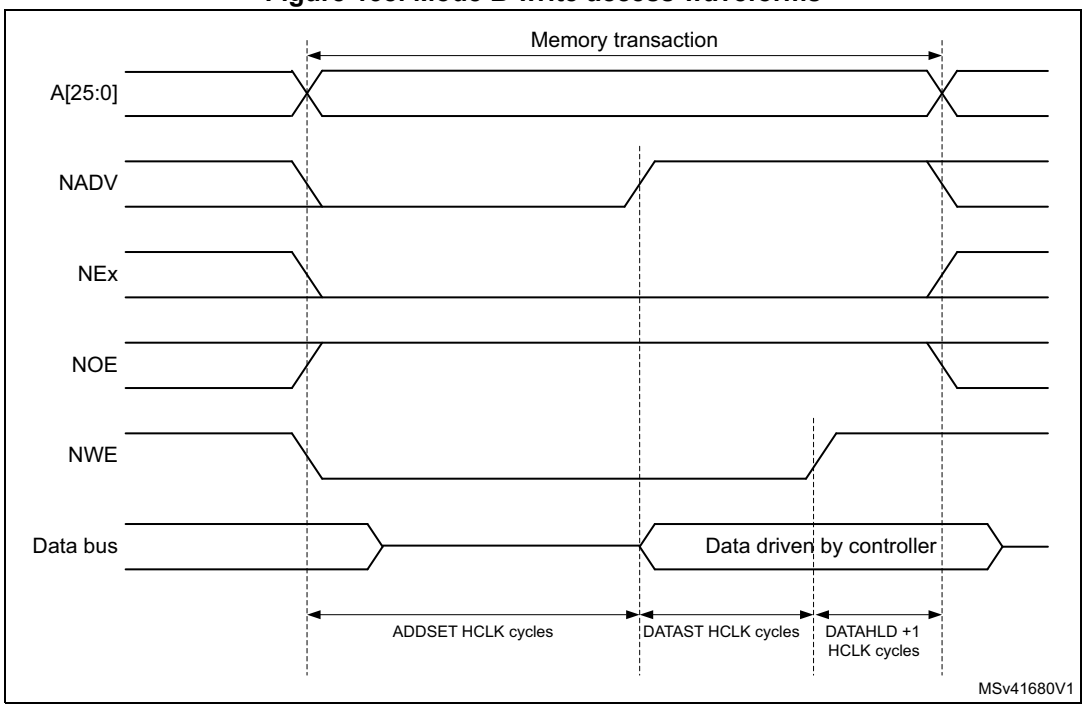

Figure 138. Mode B write access waveforms

The differences with mode 1 are the toggling of NWE and the independent read and write timings when extended mode is set (mode B).

Table 210. FMC_BCRx bitfields (mode 2/B)

Bit number	Bit name	Value to set
31	FMCEN	0x1
30:24	Reserved	0x000
23:22	NBLSET[1:0]	Don’t care
20	CCLKEN	As needed
19	CBURSTRW	0x0 (no effect in Asynchronous mode)
18:16	CPSIZE	0x0 (no effect in Asynchronous mode)
15	ASYNCWAIT	Set to 1 if the memory supports this feature. Otherwise keep at 0.
14	EXTMOD	0x1 for mode B, 0x0 for mode 2
13	WAITEN	0x0 (no effect in Asynchronous mode)
12	WREN	As needed
11	WAITCFG	Don’t care
10	Reserved	0x0
9	WAITPOL	Meaningful only if bit 15 is 1
8	BURSTEN	0x0
7	Reserved	0x1
6	FACCEN	0x1
5:4	MWID	As needed
3:2	MTYP	0x2 (NOR flash memory)
1	MUXEN	0x0
0	MBKEN	0x1

Table 211. FMC_BTRx bitfields (mode 2/B)

Bit number	Bit name	Value to set
31:30	DATAHLD	Duration of the data hold phase (DATAHLD HCLK cycles for read accesses and DATAHLD+1 HCLK cycles for write accesses when Extended mode is disabled).
29:28	ACCMOD	0x1 if Extended mode is set
27:24	DATLAT	Don’t care
23:20	CLKDIV	Don’t care
19:16	BUSTURN	Time between NEx high to NEx low (BUSTURN HCLK).
15:8	DATAST	Duration of the access second phase (DATAST HCLK cycles) for read accesses.
7:4	ADDHLD	Don’t care
3:0	ADDSET	Duration of the access first phase (ADDSET HCLK cycles) for read accesses. Minimum value for ADDSET is 0.

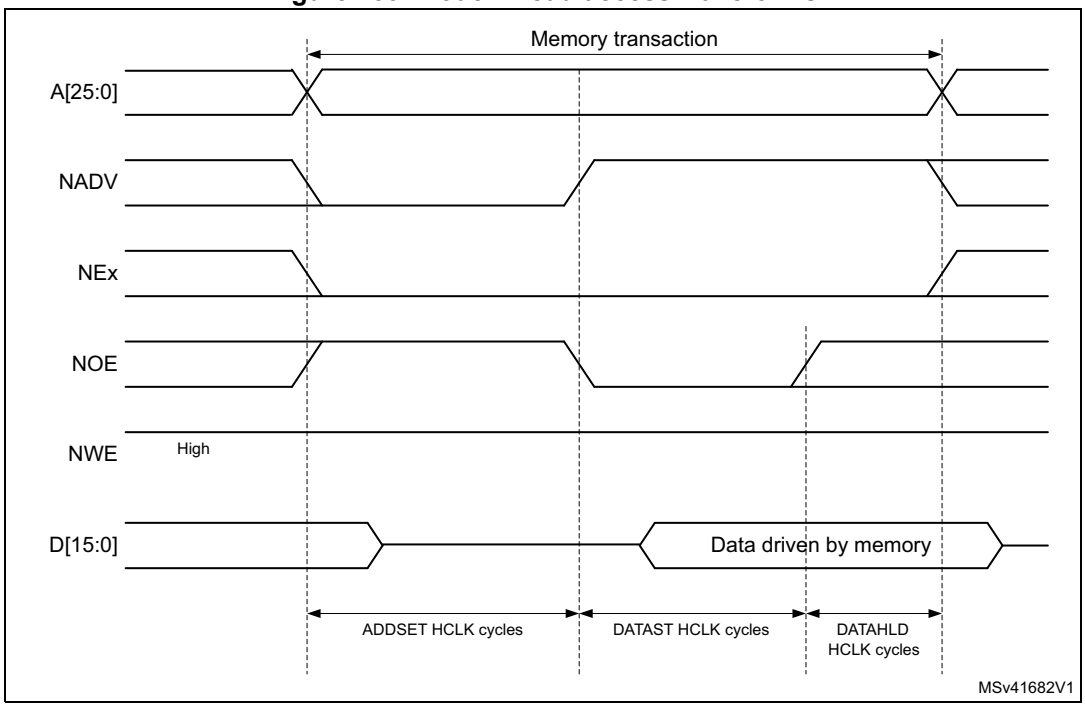
Table 212. FMC_BWTRx bitfields (mode 2/B)

Bit number	Bit name	Value to set
31:30	DATAHLD	Duration of the data hold phase (DATAHLD+1 HCLK cycles for write accesses).
29:28	ACCMOD	0x1 if Extended mode is set
27:24	DATLAT	Don't care
23:20	CLKDIV	Don't care
19:16	BUSTURN	Time between NEx high to NEx low (BUSTURN HCLK).
15:8	DATAST	Duration of the access second phase (DATAST HCLK cycles) for write accesses.
7:4	ADDHLD	Don't care
3:0	ADDSET	Duration of the access first phase (ADDSET HCLK cycles) for write accesses. Minimum value for ADDSET is 0.

Note: The FMC_BWTRx register is valid only if the Extended mode is set (mode B), otherwise its content is don't care.

Mode C - NOR flash - OE toggling

Figure 139. Mode C read access waveforms



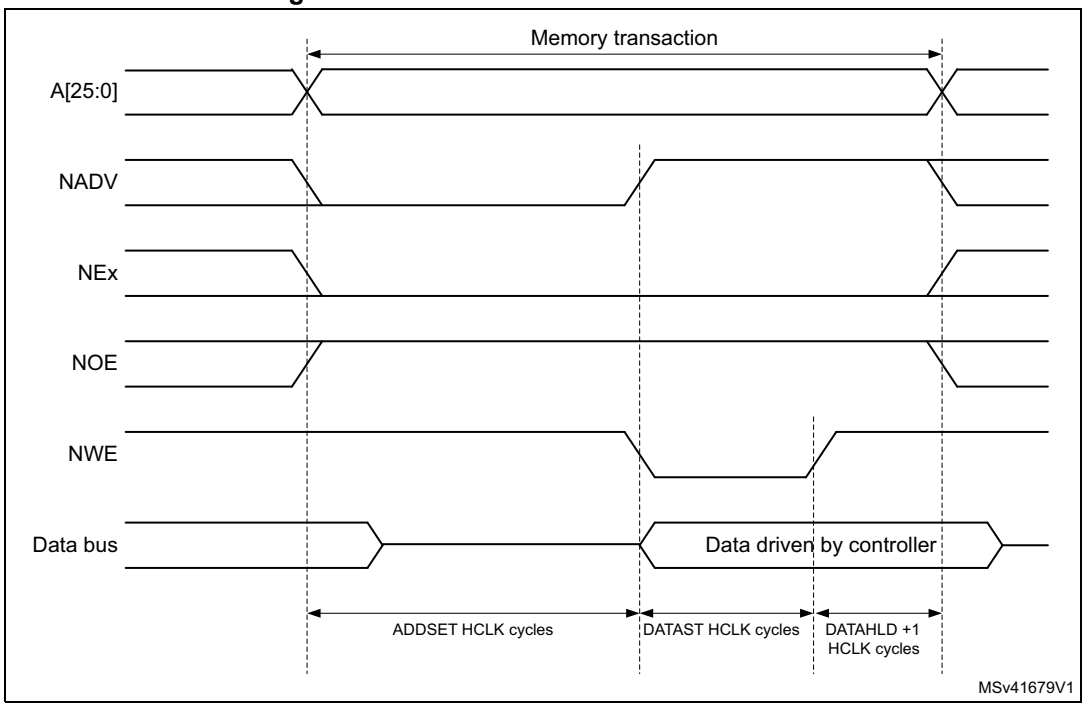


Figure 140. Mode C write access waveforms

The differences compared with mode 1 are the toggling of NOE and the independent read and write timings.

Table 213. FMC_BCRx bitfields (mode C)

Bit number	Bit name	Value to set
31	FMCEN	0x1
30:24	Reserved	0x000
23:22	NBLSET[1:0]	Don’t care
20	CCLKEN	As needed
19	CBURSTRW	0x0 (no effect in Asynchronous mode)
18:16	CPSIZE	0x0 (no effect in Asynchronous mode)

1	MUXEN	0x1
0	MBKEN	0x1

Table 220. FMC_BTRx bitfields (Muxed mode)

Bit number	Bit name	Value to set
31:30	DATAHLD	Duration of the data hold phase (DATAHLD HCLK cycles for read accesses, DATAHLD+1 HCLK cycles for write accesses).
29:28	ACCMOD	0x0
27:24	DATLAT	Don’t care
23:20	CLKDIV	Don’t care
19:16	BUSTURN	Time between NEx high to NEx low (BUSTURN HCLK).
15:8	DATAST	Duration of the second access phase (DATAST HCLK cycles).
7:4	ADDHLD	Duration of the middle phase of the access (ADDHLD HCLK cycles).
3:0	ADDSET	Duration of the first access phase (ADDSET HCLK cycles). Minimum value for ADDSET is 1.

WAIT management in asynchronous accesses

If the asynchronous memory asserts the WAIT signal to indicate that it is not yet ready to accept or to provide data, the ASYNCWAIT bit has to be set in FMC_BCRx register.

If the WAIT signal is active (high or low depending on the WAITPOL bit), the second access phase (Data setup phase), programmed by the DATAST bits, is extended until WAIT becomes inactive. Unlike the data setup phase, the first access phases (Address setup and Address hold phases), programmed by the ADDSET and ADDHLD bits, are not WAIT sensitive and so they are not prolonged.

The data setup phase must be programmed so that WAIT can be detected 4 HCLK cycles before the end of the memory transaction. The following cases must be considered:

1. The memory asserts the WAIT signal aligned to NOE/NWE which toggles:

$$DATAST \geq (4 \times HCLK) + max_wait_assertion_time$$

2. The memory asserts the WAIT signal aligned to NEx (or NOE/NWE not toggling):

   if

$$max_wait_assertion_time > address_phase + hold_phase$$

   then:

$$DATAST \geq (4 \times HCLK) + (max_wait_assertion_time - address_phase - hold_phase)$$

   otherwise

$$DATAST \geq 4 \times HCLK$$

   where max_wait_assertion_time is the maximum time taken by the memory to assert the WAIT signal once NEx/NOE/NWE is low.

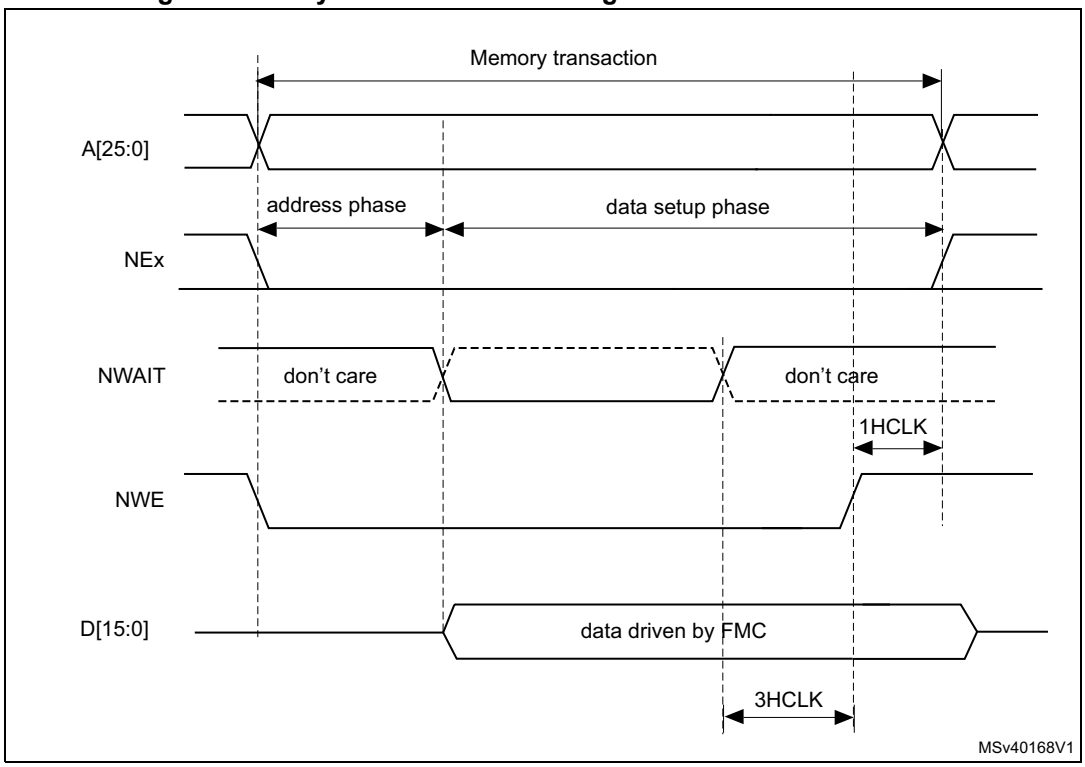

Figure 145 and *Figure 146* show the number of HCLK clock cycles that are added to the memory access phase after WAIT is released by the asynchronous memory (independently of the above cases).

Figure 145. Asynchronous wait during a read access waveforms

1. NWAIT polarity depends on WAITPOL bit setting in FMC_BCRx register.

Figure 146. Asynchronous wait during a write access waveforms

1. NWAIT polarity depends on WAITPOL bit setting in FMC_BCRx register.

CellularRAM™ (PSRAM) refresh management

The CellularRAM™ does not enable maintaining the chip select signal (NE) low for longer than the t_{CEM} timing specified for the memory device. This timing can be programmed in the FMC_PCSCNTR register. It defines the maximum duration of the NE low pulse in HCLK cycles for asynchronous accesses and FMC_CLK cycles for synchronous accesses

23.6.5 Synchronous transactions

The memory clock, FMC_CLK, is a submultiple of HCLK. It depends on the value of CLKDIV and the MWID/ AHB data size, following the formula given below:

Whatever MWID size: 16 or 8-bit, the FMC_CLK divider ratio is always defined by the programmed CLKDIV value.

Example:

- If CLKDIV=1, MWID = 16 bits, AHB data size=8 bits, FMC_CLK=HCLK/2.

NOR flash memories specify a minimum time from NADV assertion to CLK high. To meet this constraint, the FMC does not issue the clock to the memory during the first internal clock cycle of the synchronous access (before NADV assertion). This guarantees that the rising edge of the memory clock occurs in the middle of the NADV low pulse.

Data latency versus NOR memory latency

The data latency is the number of cycles to wait before sampling the data. The DATLAT value must be consistent with the latency value specified in the NOR flash configuration

register. The FMC does not include the clock cycle when NADV is low in the data latency count.

Caution: Some NOR flash memories include the NADV Low cycle in the data latency count, so that the exact relation between the NOR flash latency and the FMC DATLAT parameter can be either:

- NOR flash latency = (DATLAT + 2) CLK clock cycles
- or NOR flash latency = (DATLAT + 3) CLK clock cycles

Some recent memories assert NWAIT during the latency phase. In such cases DATLAT can be set to its minimum value. As a result, the FMC samples the data and waits long enough to evaluate if the data are valid. Thus the FMC detects when the memory exits latency and real data are processed.

Other memories do not assert NWAIT during latency. In this case the latency must be set correctly for both the FMC and the memory, otherwise invalid data are mistaken for good data, or valid data are lost in the initial phase of the memory access.

Single-burst transfer

When the selected bank is configured in Burst mode for synchronous accesses, if for example an AHB single-burst transaction is requested on 16-bit memories, the FMC performs a burst transaction of length 1 (if the AHB transfer is 16 bits), or length 2 (if the AHB transfer is 32 bits) and de-assert the chip select signal when the last data is strobed.

Such transfers are not the most efficient in terms of cycles compared to asynchronous read operations. Nevertheless, a random asynchronous access would first require to re-program the memory access mode, which would altogether last longer.

Cross boundary page for CellularRAM™ 1.5

CellularRAM™ 1.5 does not allow burst access to cross the page boundary. The FMC controller is used to split automatically the burst access when the memory page size is reached by configuring the CPSIZE bits in the FMC_BCR1 register following the memory page size.

Wait management

For synchronous NOR flash memories, NWAIT is evaluated after the programmed latency period, which corresponds to (DATLAT+2) CLK clock cycles.

If NWAIT is active (low level when WAITPOL = 0, high level when WAITPOL = 1), wait states are inserted until NWAIT is inactive (high level when WAITPOL = 0, low level when WAITPOL = 1).

When NWAIT is inactive, the data is considered valid either immediately (bit WAITCFG = 1) or on the next clock edge (bit WAITCFG = 0).

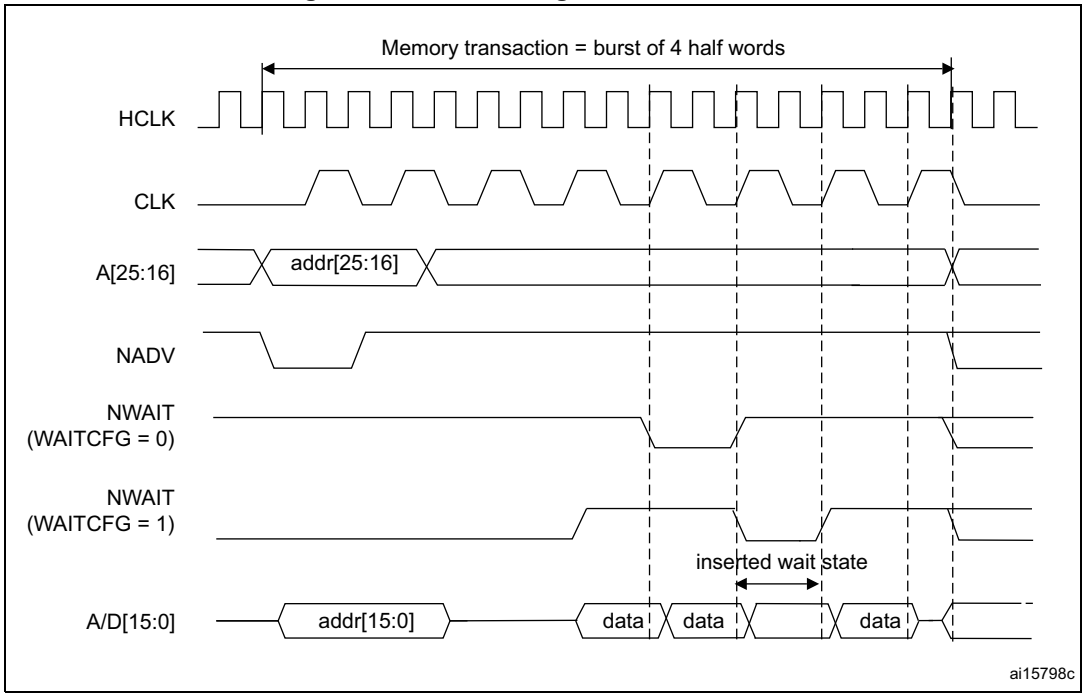
During wait-state insertion via the NWAIT signal, the controller continues to send clock pulses to the memory, keeping the chip select and output enable signals valid. It does not consider the data as valid.

In Burst mode, there are two timing configurations for the NOR flash NWAIT signal:

- The flash memory asserts the NWAIT signal one data cycle before the wait state (default after reset).
- The flash memory asserts the NWAIT signal during the wait state

The FMC supports both NOR flash wait state configurations, for each chip select, thanks to the WAITCFG bit in the FMC_BCRx registers (x = 0..3).

Figure 147. Wait configuration waveforms



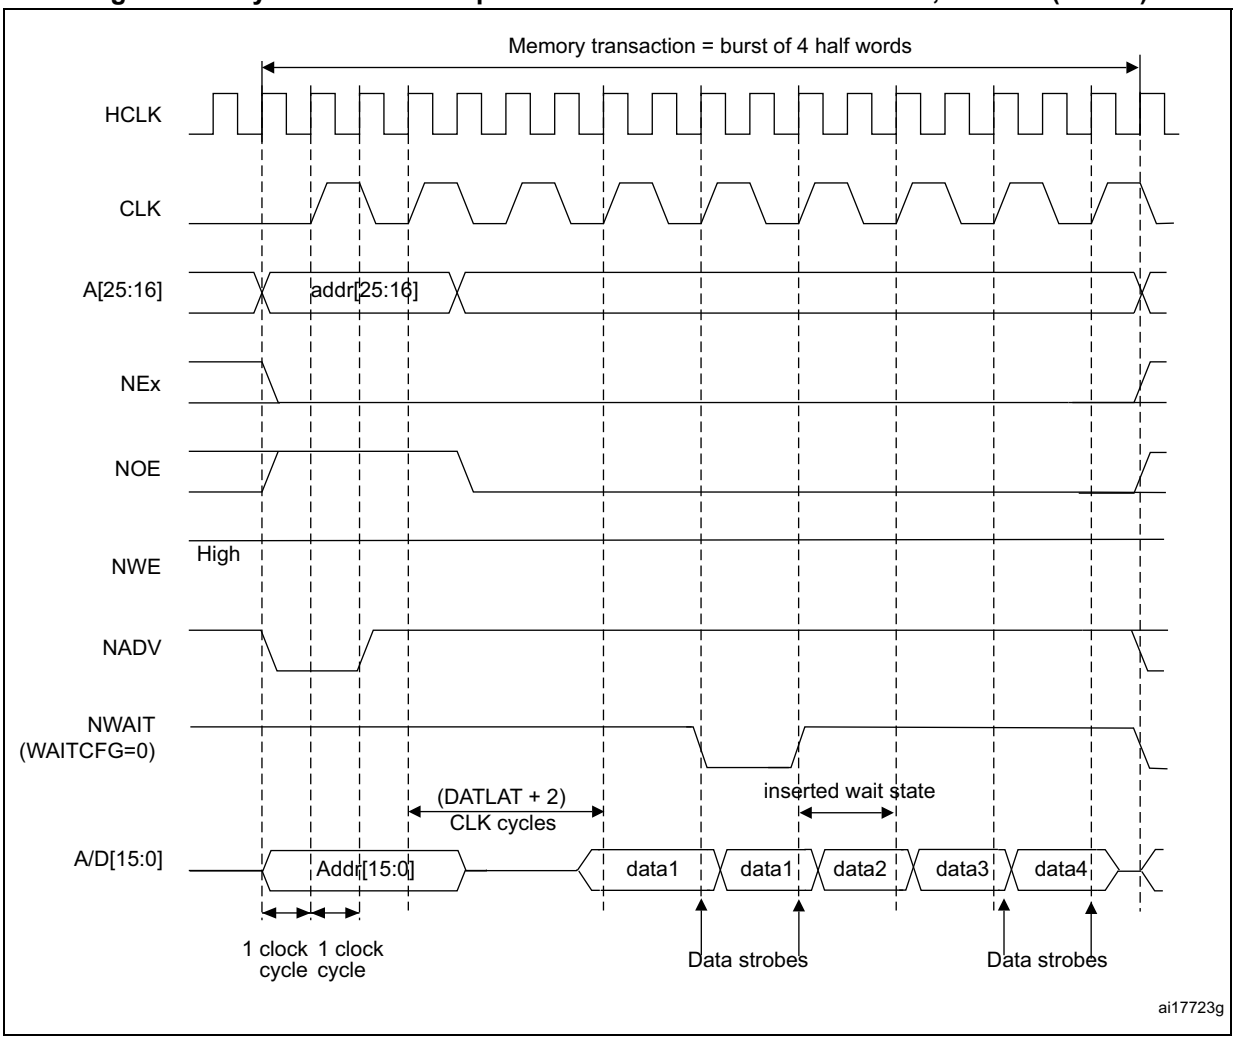


Figure 148. Synchronous multiplexed read mode waveforms - NOR, PSRAM (CRAM)

1. Byte lane outputs (NBL are not shown; for NOR access, they are held high, and, for PSRAM (CRAM) access, they are held low.

Table 221. FMC_BCRx bitfields (Synchronous multiplexed read mode)

Bit number	Bit name	Value to set
31	FMCEN	0x1

23.6.6 NOR/PSRAM controller registers

SRAM/NOR-flash chip-select control register for bank x (FMC_BCRx)

Address offset: 0x00 + 0x8 * (x - 1), (x = 1 to 4)

Reset value: 0x0000 30DB, 0x0000 30D2, 0x0000 30D2, 0x0000 30D2

This register contains the control information of each memory bank, used for SRAMs, PSRAM, FRAM and NOR flash memories.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit 31 **FMCEN**: FMC controller enable

This bit enables or disables the FMC controller.

0: Disable the FMC controller

1: Enable the FMC controller

Note: The FMCEN bit of the FMC_BCR2..4 registers is don't care. It is only enabled through the FMC_BCR1 register.

Bits 30:24 Reserved, must be kept at reset value.

Bits 23:22 **NBLSET[1:0]:** Byte lane (NBL) setup

These bits configure the NBL setup timing from NBLx low to chip select NEx low.

00: NBL setup time is 0 AHB clock cycle

01: NBL setup time is 1 AHB clock cycle

10: NBL setup time is 2 AHB clock cycles

11: NBL setup time is 3 AHB clock cycles

Bit 21 **WFDIS:** Write FIFO disable

This bit disables the Write FIFO used by the FMC controller.

0: Write FIFO enabled (Default after reset)

1: Write FIFO disabled

Note: The WFDIS bit of the FMC_BCR2..4 registers is don't care. It is only enabled through the FMC_BCR1 register.

Bit 20 **CCLKEN:** Continuous clock enable

This bit enables the FMC_CLK clock output to external memory devices.

0: The FMC_CLK is only generated during the synchronous memory access (read/write transaction). The FMC_CLK clock ratio is specified by the programmed CLKDIV value in the FMC_BCRx register (default after reset).

1: The FMC_CLK is generated continuously during asynchronous and synchronous access. The FMC_CLK clock is activated when the CCLKEN is set.

Note: The CCLKEN bit of the FMC_BCR2..4 registers is don't care. It is only enabled through the FMC_BCR1 register. Bank 1 must be configured in Synchronous mode to generate the FMC_CLK continuous clock.

Note: If CCLKEN bit is set, the FMC_CLK clock ratio is specified by CLKDIV value in the FMC_BTR1 register. CLKDIV in FMC_BWTR1 is don't care.

Note: If the Synchronous mode is used and CCLKEN bit is set, the synchronous memories connected to other banks than Bank 1 are clocked by the same clock (the CLKDIV value in the FMC_BTR2..4 and FMC_BWTR2..4 registers for other banks has no effect.)

Bit 19 **CBURSTRW:** Write burst enable

For PSRAM (CRAM) operating in Burst mode, the bit enables synchronous accesses during write operations. The enable bit for synchronous read accesses is the BURSTEN bit in the FMC_BCRx register.

0: Write operations are always performed in Asynchronous mode.

1: Write operations are performed in Synchronous mode.

Bits 18:16 **CPSIZE[2:0]**: CRAM page size

These are used for CellularRAM™ 1.5 which does not allow burst access to cross the address boundaries between pages. When these bits are configured, the FMC controller splits automatically the burst access when the memory page size is reached (refer to memory datasheet for page size).

000: No burst split when crossing page boundary (default after reset)

001: 128 bytes

010: 256 bytes

011: 512 bytes

100: 1024 bytes

Others: Reserved, must not be used

Bit 15 **ASYNCWAIT**: Wait signal during asynchronous transfers

This bit enables/disables the FMC to use the wait signal even during an asynchronous protocol.

0: NWAIT signal is not taken in to account when running an asynchronous protocol (default after reset).

1: NWAIT signal is taken in to account when running an asynchronous protocol.

Bit 14 **EXTMOD:** Extended mode enable

This bit enables the FMC to program the write timings for non multiplexed asynchronous accesses inside the FMC_BWTR register, thus resulting in different timings for read and write operations.

0: values inside FMC_BWTR register are not taken into account (default after reset)

1: values inside FMC_BWTR register are taken into account

Note: When the Extended mode is disabled, the FMC can operate in mode 1 or mode 2 as follows:

- *Mode 1 is the default mode when the SRAM/PSRAM memory type is selected (MTYP = 0x0 or 0x01)*
- *Mode 2 is the default mode when the NOR memory type is selected (MTYP = 0x10).*

Bit 13 **WAITEN:** Wait enable bit

This bit enables/disables wait-state insertion via the NWAIT signal when accessing the memory in Synchronous mode.

0: NWAIT signal is disabled (its level not taken into account, no wait state inserted after the programmed flash latency period).

1: NWAIT signal is enabled (its level is taken into account after the programmed latency period to insert wait states if asserted) (default after reset).

Bit 12 **WREN:** Write enable bit

This bit indicates whether write operations are enabled/disabled in the bank by the FMC.

0: Write operations are disabled in the bank by the FMC, an AHB error is reported.

1: Write operations are enabled for the bank by the FMC (default after reset).

Bit 11 **WAITCFG:** Wait timing configuration

The NWAIT signal indicates whether the data from the memory are valid or if a wait state must be inserted when accessing the memory in Synchronous mode. This configuration bit determines if NWAIT is asserted by the memory one clock cycle before the wait state or during the wait state:

0: NWAIT signal is active one data cycle before wait state (default after reset).

1: NWAIT signal is active during wait state (not used for PSRAM).

Bit 10 Reserved, must be kept at reset value.

Bit 9 **WAITPOL:** Wait signal polarity bit

Defines the polarity of the wait signal from memory used for either in Synchronous or Asynchronous mode.

0: NWAIT active low (default after reset)

1: NWAIT active high

Bit 8 **BURSTEN:** Burst enable bit

This bit enables/disables synchronous accesses during read operations. It is valid only for synchronous memories operating in Burst mode.

0: Burst mode disabled (default after reset). Read accesses are performed in Asynchronous mode.

1: Burst mode enable. Read accesses are performed in Synchronous mode.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **FACCEN:** Flash access enable

Enables NOR flash memory access operations.

0: Corresponding NOR flash memory access is disabled.

1: Corresponding NOR flash memory access is enabled (default after reset).

Bits 5:4 **MWID[1:0]:** Memory data bus width

Defines the external memory device width, valid for all type of memories.

00: 8 bits

01: 16 bits (default after reset)

10: reserved

11: reserved

Bits 3:2 **MTYP[1:0]:** Memory type

Defines the type of external memory attached to the corresponding memory bank.

00: SRAM/FRAM (default after reset for Bank 2...4)

01: PSRAM (CRAM) / FRAM

10: NOR flash/OneNAND flash (default after reset for Bank 1)

11: reserved

Bit 1 **MUXEN:** Address/data multiplexing enable bit

When this bit is set, the address and data values are multiplexed on the data bus, valid only with NOR and PSRAM memories:

0: Address/data non multiplexed

1: Address/data multiplexed on databus (default after reset)

Bit 0 **MBKEN:** Memory bank enable bit

Enables the memory bank. After reset Bank1 is enabled, all others are disabled. Accessing a disabled bank causes an ERROR on AHB bus.

0: Corresponding memory bank is disabled.

1: Corresponding memory bank is enabled.

SRAM/NOR-flash chip-select timing register for bank x (FMC_BTRx)

Address offset: 0x04 + 0x8 * (x - 1), (x = 1 to 4)

Reset value: 0x0FFF FFFF

This register contains the control information of each memory bank, used for SRAMs, PSRAM and NOR flash memories.If the EXTMOD bit is set in the FMC_BCRx register, then this register is partitioned for write and read access, that is, 2 registers are available: one to configure read accesses (this register) and one to configure write accesses (FMC_BWTRx registers).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATAHLD[1:0]		ACCMOD[1:0]		DATLAT[3:0]				CLKDIV[3:0]				BUSTURN[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATAST[7:0]								ADDHLD[3:0]				ADDSET[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 **DATAHLD[1:0]:** Data hold phase duration

These bits are written by software to define the duration of the data hold phase in HCLK cycles (refer to *Figure 132* to *Figure 144*), used in asynchronous accesses:

For read accesses

00: DATAHLD phase duration = 0 × HCLK clock cycle (default)

01: DATAHLD phase duration = 1 × HCLK clock cycle

10: DATAHLD phase duration = 2 × HCLK clock cycle

11: DATAHLD phase duration = 3 × HCLK clock cycle

For write accesses

00: DATAHLD phase duration = 1 × HCLK clock cycle (default)

01: DATAHLD phase duration = 2 × HCLK clock cycle

10: DATAHLD phase duration = 3 × HCLK clock cycle

11: DATAHLD phase duration = 4 × HCLK clock cycle

Bits 29:28 **ACCMOD[1:0]:** Access mode

Specifies the asynchronous access modes as shown in the timing diagrams. These bits are taken into account only when the EXTMOD bit in the FMC_BCRx register is 1.

00: Access mode A

01: Access mode B

10: Access mode C

11: Access mode D

Bits 27:24 **DATLAT[3:0]:** (see note below bit descriptions): Data latency for synchronous memory
For synchronous access with read/write Burst mode enabled (BURSTEN / CBURSTRW bits set), defines the number of memory clock cycles (+2) to issue to the memory before reading/writing the first data:
This timing parameter is not expressed in HCLK periods, but in FMC_CLK periods.
For asynchronous access, this value is don't care.
0000: Data latency of 2 CLK clock cycles for first burst access
1111: Data latency of 17 CLK clock cycles for first burst access (default value after reset)

Bits 23:20 **CLKDIV[3:0]:** Clock divide ratio (for FMC_CLK signal)
Defines the period of FMC_CLK clock output signal, expressed in number of HCLK cycles:
0000: FMC_CLK period= 1x HCLK period
0001: FMC_CLK period = 2 × HCLK periods
0010: FMC_CLK period = 3 × HCLK periods
1111: FMC_CLK period = 16 × HCLK periods (default value after reset)
In asynchronous NOR flash, SRAM or PSRAM accesses, this value is don't care.
Note: Refer to Section 23.6.5: Synchronous transactions for FMC_CLK divider ratio formula)

Bits 19:16 **BUSTURN[3:0]:** Bus turnaround phase duration
These bits are written by software to add a delay at the end of current read or write transaction to next transaction on the same bank.
This delay is used to match the minimum time between consecutive transactions (t_{EHEL} from NEx high to NEx low) and the maximum time needed by the memory to free the data bus after a read access (t_{EHQZ}, chip enable high to output Hi-Z). This delay is recommended for mode D and muxed mode. For non-muxed memory, the bus turnaround delay can be set to minimum value.
(BUSTURN + 1)HCLK period ≥ max(t_{EHEL} min, t_{EHQZ} max)
For FRAM memories, the bus turnaround delay must be configured to match the minimum tPC (precharge time) timings. The bus turnaround delay is inserted between any consecutive transactions on the same bank (read/read, write/write, read/write and write/read) to match the tPC memory timing. The chip select is toggling between any consecutive accesses.
(BUSTURN + 1)HCLK period ≥ t_{PC} min

0000: BUSTURN phase duration = 1 HCLK clock cycle added
...
1111: BUSTURN phase duration = 16 x HCLK clock cycles added (default value after reset)

Bits 15:8 **DATAST[7:0]:** Data-phase duration
These bits are written by software to define the duration of the data phase (refer to *Figure 132* to *Figure 144*), used in asynchronous accesses:
0000 0000: Reserved
0000 0001: DATAST phase duration = 1 × HCLK clock cycles
0000 0010: DATAST phase duration = 2 × HCLK clock cycles
...
1111 1111: DATAST phase duration = 255 × HCLK clock cycles (default value after reset)
For each memory type and access mode data-phase duration, refer to the respective figure (*Figure 132* to *Figure 144*).
Example: Mode 1, write access, DATAST=1: Data-phase duration= DATAST+1 = 2 HCLK clock cycles.
Note: In synchronous accesses, this value is don't care.

Bits 7:4 **ADDHLD[3:0]:** Address-hold phase duration

These bits are written by software to define the duration of the *address hold* phase (refer to *Figure 132* to *Figure 144*), used in mode D or multiplexed accesses:
0000: Reserved
0001: ADDHLD phase duration =1 × HCLK clock cycle
0010: ADDHLD phase duration = 2 × HCLK clock cycle
...
1111: ADDHLD phase duration = 15 × HCLK clock cycles (default value after reset)
For each access mode address-hold phase duration, refer to the respective figure (*Figure 132* to *Figure 144*).

Note: In synchronous accesses, this value is not used, the address hold phase is always 1 memory clock period duration.

Bits 3:0 **ADDSET[3:0]:** Address setup phase duration

These bits are written by software to define the duration of the *address setup* phase (refer to *Figure 132* to *Figure 144*), used in SRAMs, ROMs, asynchronous NOR flash and PSRAM:
0000: ADDSET phase duration = 0 × HCLK clock cycle
...
1111: ADDSET phase duration = 15 × HCLK clock cycles (default value after reset)
For each access mode address setup phase duration, refer to the respective figure (*Figure 132* to *Figure 144*).

Note: In synchronous accesses, this value is don't care.
In Muxed mode or mode D, the minimum value for ADDSET is 1.
In mode 1 and PSRAM memory, the minimum value for ADDSET is 1.

Note: PSRAMs (CRAMs) have a variable latency due to internal refresh. Therefore these memories issue the NWAIT signal during the whole latency phase to prolong the latency as needed.
With PSRAMs (CRAMs) the filled DATLAT must be set to 0, so that the FMC exits its latency phase soon and starts sampling NWAIT from memory, then starts to read or write when the memory is ready.
This method can be used also with the latest generation of synchronous flash memories that issue the NWAIT signal, unlike older flash memories (check the datasheet of the specific flash memory being used).

SRAM/NOR-flash write timing registers x (FMC_BWTRx)

Address offset: 0x104 + 0x8 * (x - 1), (x = 1 to 4)

Reset value: 0x0FFF FFFF

This register contains the control information of each memory bank. It is used for SRAMs, PSRAMs and NOR flash memories. When the EXTMOD bit is set in the FMC_BCRx register, then this register is active for write access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 **DATAHLD[1:0]:** Data hold phase duration

These bits are written by software to define the duration of the data hold phase in HCLK cycles (refer to *Figure 132* to *Figure 144*), used in asynchronous write accesses:
00: DATAHLD phase duration = 1 × HCLK clock cycle (default)
01: DATAHLD phase duration = 2 × HCLK clock cycle
10: DATAHLD phase duration = 3 × HCLK clock cycle
11: DATAHLD phase duration = 4 × HCLK clock cycle

Bits 29:28 **ACCMOD[1:0]:** Access mode.

Specifies the asynchronous access modes as shown in the next timing diagrams.These bits are taken into account only when the EXTMOD bit in the FMC_BCRx register is 1.
00: Access mode A
01: Access mode B
10: Access mode C
11: Access mode D

Bits 27:20 Reserved, must be kept at reset value.

Bits 19:16 **BUSTURN[3:0]**: Bus turnaround phase duration

These bits are written by software to add a delay at the end of current write transaction to next transaction on the same bank.
For FRAM memories, the bus turnaround delay must be configured to match the minimum t_{PC} (precharge time) timings. The bus turnaround delay is inserted between any consecutive transactions on the same bank (read/read, write/write, read/write and write/read). The chip select is toggling between any consecutive accesses.
(BUSTURN + 1)HCLK period ≥ tPC min

0000: BUSTURN phase duration = 1 HCLK clock cycle added
...
1111: BUSTURN phase duration = 16 x HCLK clock cycles added (default value after reset)

Bits 15:8 **DATAST[7:0]:** Data-phase duration.

These bits are written by software to define the duration of the data phase (refer to *Figure 132* to *Figure 144*), used in asynchronous SRAM, PSRAM and NOR flash memory accesses:
0000 0000: Reserved
0000 0001: DATAST phase duration = 1 × HCLK clock cycles
0000 0010: DATAST phase duration = 2 × HCLK clock cycles
...
1111 1111: DATAST phase duration = 255 × HCLK clock cycles (default value after reset)

Bits 7:4 **ADDHLD[3:0]:** Address-hold phase duration.

These bits are written by software to define the duration of the *address hold* phase (refer to *Figure 141* to *Figure 144*), used in asynchronous multiplexed accesses:
0000: Reserved
0001: ADDHLD phase duration = 1 × HCLK clock cycle
0010: ADDHLD phase duration = 2 × HCLK clock cycle
...
1111: ADDHLD phase duration = 15 × HCLK clock cycles (default value after reset)

Note: In synchronous NOR flash accesses, this value is not used, the address hold phase is always 1 flash clock period duration.

Bits 3:0 **ADDSET[3:0]:** Address setup phase duration.

These bits are written by software to define the duration of the *address setup* phase in HCLK cycles (refer to *Figure 132* to *Figure 144*), used in asynchronous accesses:

0000: ADDSET phase duration = 0 × HCLK clock cycle

...

1111: ADDSET phase duration = 15 × HCLK clock cycles (default value after reset)

Note: In synchronous accesses, this value is not used, the address setup phase is always 1 flash clock period duration. In muxed mode, the minimum ADDSET value is 1.

PSRAM chip select counter register (FMC_PCSCNTR)

Address offset: 0x20

Reset value: 0x0000 0000

This register contains the PSRAM chip select counter value for Synchronous and Asynchronous modes. The chip select counter is common to all banks and can be enabled separately on each bank. During PSRAM read or write accesses, this value is loaded into a timer which is decremented while the NE signal is held low. When the timer reaches 0, the PSRAM controller splits the current access, toggles NE to allow PSRAM device refresh, and restarts a new access. The programmed counter value guarantees a maximum NE pulse width (t_{CEM}) as specified for PSRAM devices. The counter is reloaded and starts decrementing each time a new access is started by a transition of NE from high to low.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CNTB4EN	CNTB3EN	CNTB2EN	CNTB1EN
												rw	rw	rw	rw

CSCOUNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **CNTB4EN:** Counter Bank 4 enable

This bit enables the chip select counter for PSRAM/NOR Bank 4.

0: Counter disabled for Bank 4

1: Counter enabled for Bank 4

Bit 18 **CNTB3EN:** Counter Bank 3 enable

This bit enables the chip select counter for PSRAM/NOR Bank 3.

0: Counter disabled for Bank 3.

1: Counter enabled for Bank 3

Bit 17 **CNTB2EN:** Counter Bank 2 enable

This bit enables the chip select counter for PSRAM/NOR Bank 2.

0: Counter disabled for Bank 2

1: Counter enabled for Bank 2

Bit 16 **CNTB1EN:** Counter Bank 1 enable

This bit enables the chip select counter for PSRAM/NOR Bank 1.

0: Counter disabled for Bank 1

1: Counter enabled for Bank 1

Bits 15:0 **CSCOUNT[15:0]:** Chip select counter.

This bitfield is used to define the maximum duration of the chip select low, which is obtained by the formula:

CSCOUNT[15:0] * T_{AHB}, where T_{AHB} is the AHB clock period.

For refresh considerations, the PSRAM chip select must not stay low for more than t_{CEM} = ~4 µs.

CSCOUNT[15:0] applies both to asynchronous and synchronous modes.

When CSCOUNT[15:0] = 0x0000, the feature is disabled.

23.7 NAND flash controller

The FMC generates the appropriate signal timings to drive the following types of device:

- 8- and 16-bit NAND flash memories

The NAND bank is configured through dedicated registers (*Section 23.7.7*). The programmable memory parameters include access timings (shown in *Table 225*) and ECC configuration.

Table 225. Programmable NAND flash access parameters

Parameter	Function	Access mode	Unit	Min.	Max.
Memory setup time	Number of clock cycles (HCLK) required to set up the address before the command assertion	Read/Write	AHB clock cycle (HCLK)	1	255
Memory wait	Minimum duration (in HCLK clock cycles) of the command assertion	Read/Write	AHB clock cycle (HCLK)	2	255
Memory hold	Number of clock cycles (HCLK) during which the address must be held (as well as the data if a write access is performed) after the command de-assertion	Read/Write	AHB clock cycle (HCLK)	1	254
Memory databus high-Z	Number of clock cycles (HCLK) during which the data bus is kept in high-Z state after a write access has started	Write	AHB clock cycle (HCLK)	1	255

23.7.1 External memory interface signals

The following tables list the signals that are typically used to interface NAND flash memory.

Note: The prefix “N” identifies the signals which are active low.

8-bit NAND flash memory

Table 226. 8-bit NAND flash

FMC signal name	I/O	Function
A[17]	O	NAND flash address latch enable (ALE) signal
A[16]	O	NAND flash command latch enable (CLE) signal
D[7:0]	I/O	8-bit multiplexed, bidirectional address/data bus

Table 226. 8-bit NAND flash (continued)

FMC signal name	I/O	Function
NCE	O	Chip select
NOE(= NRE)	O	Output enable (memory signal name: read enable, NRE)
NWE	O	Write enable
NWAIT/INT	I	NAND flash ready/busy input signal to the FMC

Theoretically, there is no capacity limitation as the FMC can manage as many address cycles as needed.

16-bit NAND flash memory

Table 227. 16-bit NAND flash

FMC signal name	I/O	Function
A[17]	O	NAND flash address latch enable (ALE) signal
A[16]	O	NAND flash command latch enable (CLE) signal
D[15:0]	I/O	16-bit multiplexed, bidirectional address/data bus
NCE	O	Chip select
NOE(= NRE)	O	Output enable (memory signal name: read enable, NRE)
NWE	O	Write enable
NWAIT/INT	I	NAND flash ready/busy input signal to the FMC

Theoretically, there is no capacity limitation as the FMC can manage as many address cycles as needed.

23.7.2 NAND flash supported memories and transactions

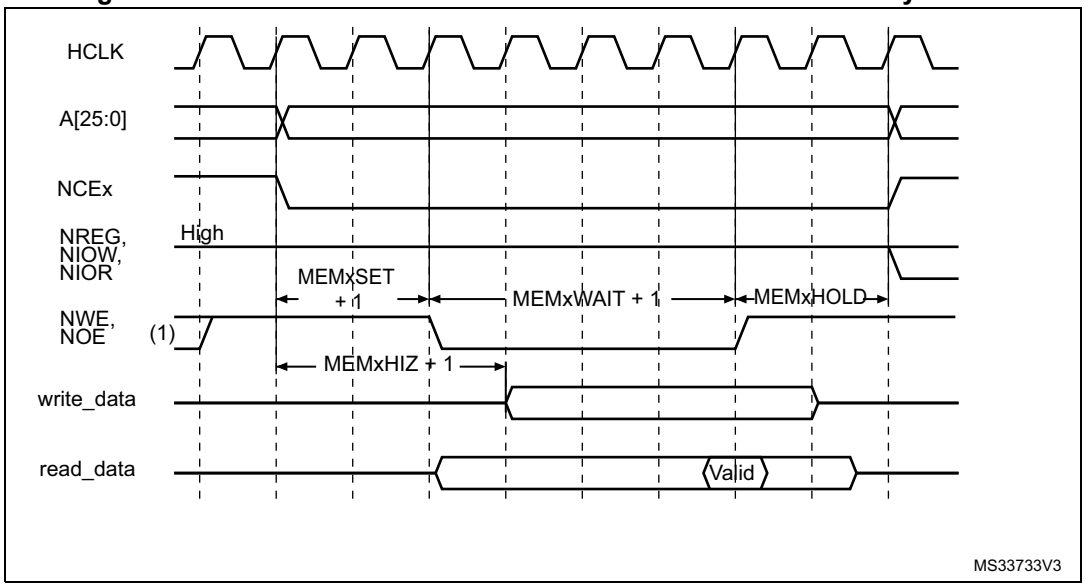
Table 228 shows the supported devices, access modes and transactions. Transactions not allowed (or not supported) by the NAND flash controller are shown in gray.

Table 228. Supported memories and transactions

Device	Mode	R/W	AHB data size	Memory data size	Allowed/ not allowed	Comments
NAND 8-bit	Asynchronous	R	8	8	Y	-
	Asynchronous	W	8	8	Y	-
	Asynchronous	R	16	8	Y	Split into 2 FMC accesses
	Asynchronous	W	16	8	Y	Split into 2 FMC accesses
	Asynchronous	R	32	8	Y	Split into 4 FMC accesses
	Asynchronous	W	32	8	Y	Split into 4 FMC accesses

Table 228. Supported memories and transactions (continued)

Device	Mode	R/W	AHB data size	Memory data size	Allowed/ not allowed	Comments
NAND 16-bit	Asynchronous	R	8	16	Y	-
	Asynchronous	W	8	16	N	-
	Asynchronous	R	16	16	Y	-
	Asynchronous	W	16	16	Y	-
	Asynchronous	R	32	16	Y	Split into 2 FMC accesses
	Asynchronous	W	32	16	Y	Split into 2 FMC accesses



23.7.3 Timing diagrams for NAND flash memory

The NAND flash memory bank is managed through a set of registers:

- Control register: FMC_PCR
- Interrupt status register: FMC_SR
- ECC register: FMC_ECCR
- Timing register for Common memory space: FMC_PMEM
- Timing register for Attribute memory space: FMC_PATT

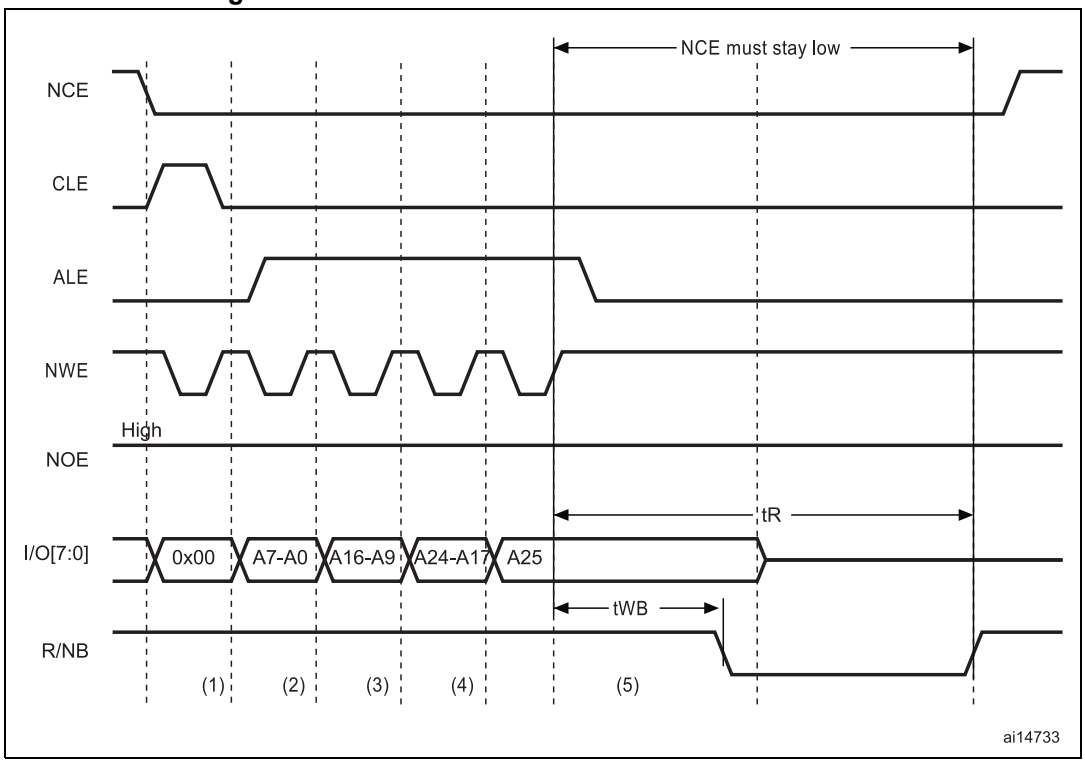
Each timing configuration register contains three parameters used to define number of HCLK cycles for the three phases of any NAND flash access, plus one parameter that defines the timing for starting driving the data bus when a write access is performed. *Figure 150* shows the timing parameter definitions for common memory accesses, knowing that Attribute memory space access timings are similar.

Figure 150. NAND flash controller waveforms for common memory access

1. NOE remains high (inactive) during write accesses. NWE remains high (inactive) during read accesses.
2. For write access, the hold phase delay is (MEMHOLD) HCLK cycles and for read access is (MEMHOLD + 2) HCLK cycles.

23.7.4 NAND flash operations

The command latch enable (CLE) and address latch enable (ALE) signals of the NAND flash memory device are driven by address signals from the FMC controller. This means that to send a command or an address to the NAND flash memory, the CPU has to perform a write to a specific address in its memory space.



A typical page read operation from the NAND flash device requires the following steps:

1. Program and enable the corresponding memory bank by configuring the FMC_PCR and FMC_PMEM (and for some devices, FMC_PATT, see *Section 23.7.5: NAND flash prewait functionality*) registers according to the characteristics of the NAND flash memory (PWID bits for the data bus width of the NAND flash, PTYP = 1, PWAITEN = 0 or 1 as needed, see *Section 23.5.2: NAND flash memory address mapping* for timing configuration).
2. The CPU performs a byte write to the common memory space, with data byte equal to one flash command byte (for example 0x00 for Samsung NAND flash devices). The LE input of the NAND flash memory is active during the write strobe (low pulse on NWE), thus the written byte is interpreted as a command by the NAND flash memory. Once the command is latched by the memory device, it does not need to be written again for the following page read operations.
3. The CPU can send the start address (STARTAD) for a read operation by writing four bytes (or three for smaller capacity devices), STARTAD[7:0], STARTAD[16:9], STARTAD[24:17] and finally STARTAD[25] (for 64 Mb x 8 bit NAND flash memories) in the common memory or attribute space. The ALE input of the NAND flash device is active during the write strobe (low pulse on NWE), thus the written bytes are interpreted as the start address for read operations. Using the attribute memory space makes it possible to use a different timing configuration of the FMC, which can be used to implement the prewait functionality needed by some NAND flash memories (see details in *Section 23.7.5: NAND flash prewait functionality*).
4. The controller waits for the NAND flash memory to be ready (R/NB signal high), before starting a new access to the same or another memory bank. While waiting, the controller holds the NCE signal active (low).
5. The CPU can then perform byte read operations from the common memory space to read the NAND flash page (data field + Spare field) byte by byte.
6. The next NAND flash page can be read without any CPU command or address write operation. This can be done in three different ways:
   - by simply performing the operation described in step 5
   - a new random address can be accessed by restarting the operation at step 3
   - a new command can be sent to the NAND flash device by restarting at step 2

23.7.5 NAND flash prewait functionality

Some NAND flash devices require that, after writing the last part of the address, the controller waits for the R/NB signal to go low (see *Figure 151*).

Figure 151. Access to non 'CE don't care' NAND-flash

1. CPU wrote byte 0x00 at address 0x7001 0000.
2. CPU wrote byte A7~A0 at address 0x7002 0000.
3. CPU wrote byte A16~A9 at address 0x7002 0000.
4. CPU wrote byte A24~A17 at address 0x7002 0000.
5. CPU wrote byte A25 at address 0x7802 0000: FMC performs a write access using FMC_PATT timing definition, where ATTHOLD ≥ 7 (providing that (7+1) × HCLK = 112 ns > t_{WB} max). This guarantees that NCE remains low until R/NB goes low and high again (only requested for NAND flash memories where NCE is not don't care).

When this functionality is required, it can be ensured by programming the MEMHOLD value to meet the t_{WB} timing. However any CPU read access to the NAND flash memory has a hold delay of (MEMHOLD + 2) HCLK cycles and CPU write access has a hold delay of (MEMHOLD) HCLK cycles inserted between the rising edge of the NWE signal and the next access.

To cope with this timing constraint, the attribute memory space can be used by programming its timing register with an ATTHOLD value that meets the t_{WB} timing, and by keeping the MEMHOLD value at its minimum value. The CPU must then use the common memory space for all NAND flash read and write accesses, except when writing the last address byte to the NAND flash device, where the CPU must write to the attribute memory space.

23.7.6 Computation of the error correction code (ECC) in NAND flash memory

The FMC NAND Card controller includes two error correction code computation hardware blocks, one per memory bank. They reduce the host CPU workload when processing the ECC by software.

These two ECC blocks are identical and associated with Bank 2 and Bank 3. As a consequence, no hardware ECC computation is available for memories connected to Bank 4.

The ECC algorithm implemented in the FMC can perform 1-bit error correction and 2-bit error detection per 256, 512, 1 024, 2 048, 4 096 or 8 192 bytes read or written from/to the NAND flash memory. It is based on the Hamming coding algorithm and consists in calculating the row and column parity.

The ECC modules monitor the NAND flash data bus and read/write signals (NCE and NWE) each time the NAND flash memory bank is active.

The ECC operates as follows:

- When accessing NAND flash memory bank 2 or bank 3, the data present on the D[15:0] bus is latched and used for ECC computation.
- When accessing any other address in NAND flash memory, the ECC logic is idle, and does not perform any operation. As a result, write operations to define commands or addresses to the NAND flash memory are not taken into account for ECC computation.

Once the desired number of bytes has been read/written from/to the NAND flash memory by the host CPU, the FMC_ECCR registers must be read to retrieve the computed value. Once read, they must be cleared by resetting the ECCEN bit to ‘0’. To compute a new data block, the ECCEN bit must be set to one in the FMC_PCR registers.

To perform an ECC computation:

1. Enable the ECCEN bit in the FMC_PCR register.
2. Write data to the NAND flash memory page. While the NAND page is written, the ECC block computes the ECC value.
3. Read the ECC value available in the FMC_ECCR register and store it in a variable.
4. Clear the ECCEN bit and then enable it in the FMC_PCR register before reading back the written data from the NAND page. While the NAND page is read, the ECC block computes the ECC value.
5. Read the new ECC value available in the FMC_ECCR register.
6. If the two ECC values are the same, no correction is required, otherwise there is an ECC error and the software correction routine returns information on whether the error can be corrected or not.

23.7.7 NAND flash controller registers

NAND flash control registers (FMC_PCR)

Address offset: 0x80

Reset value: 0x0000 0018

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ECCPS[2:0]			TAR3
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TAR[2:0]			TCLR[3:0]				Res.	Res.	ECCEN	PWID[1:0]		PTYP	PBKEN	PWAITEN	Res.
rw	rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw	

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:17 **ECCPS[2:0]:** ECC page size
Defines the page size for the extended ECC:
000: 256 bytes
001: 512 bytes
010: 1024 bytes
011: 2048 bytes
100: 4096 bytes
101: 8192 bytes

Bits 16:13 **TAR[3:0]:** ALE to RE delay
Sets time from ALE low to RE low in number of AHB clock cycles (HCLK).
Time is: t_ar = (TAR + SET + 2) × THCLK where THCLK is the HCLK clock period
0000: 1 HCLK cycle (default)
1111: 16 HCLK cycles
Note: SET is MEMSET or ATTSET according to the addressed space.

Bits 12:9 **TCLR[3:0]:** CLE to RE delay
Sets time from CLE low to RE low in number of AHB clock cycles (HCLK).
Time is t_clr = (TCLR + SET + 2) × THCLK where THCLK is the HCLK clock period
0000: 1 HCLK cycle (default)
1111: 16 HCLK cycles
Note: SET is MEMSET or ATTSET according to the addressed space.

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 **ECCEN:** ECC computation logic enable bit
0: ECC logic is disabled and reset (default after reset),
1: ECC logic is enabled.

Bits 5:4 **PWID[1:0]:** Data bus width
Defines the external memory device width.
00: 8 bits
01: 16 bits (default after reset).
10: reserved.
11: reserved.

Bit 3 **PTYP:** Memory type
Defines the type of device attached to the corresponding memory bank:
0: Reserved, must be kept at reset value
1: NAND flash (default after reset)

Bit 2 **PBKEN:** NAND flash memory bank enable bit
Enables the memory bank. Accessing a disabled memory bank causes an ERROR on AHB bus
0: Corresponding memory bank is disabled (default after reset)
1: Corresponding memory bank is enabled

Bit 1 **PWAITEN:** Wait feature enable bit
Enables the Wait feature for the NAND flash memory bank:
0: disabled
1: enabled

Bit 0 Reserved, must be kept at reset value.

FIFO status and interrupt register (FMC_SR)

Address offset: 0x84

Reset value: 0x0000 0040

This register contains information about the FIFO status and interrupt. The FMC features a FIFO that is used when writing to memories to transfer up to 16 words of data from the AHB.

This is used to quickly write to the FIFO and free the AHB for transactions to peripherals other than the FMC, while the FMC is draining its FIFO into the memory. One of these register bits indicates the status of the FIFO, for ECC purposes.

The ECC is calculated while the data are written to the memory. To read the correct ECC, the software must consequently wait until the FIFO is empty.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FEMPT	IFEN	ILEN	IREN	IFS	ILS	IRS
									r	rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **FEMPT:** FIFO empty
Read-only bit that provides the status of the FIFO
0: FIFO not empty
1: FIFO empty

Bit 5 **IFEN:** Interrupt falling edge detection enable bit
0: Interrupt falling edge detection request disabled
1: Interrupt falling edge detection request enabled

Bit 4 **ILEN:** Interrupt high-level detection enable bit
0: Interrupt high-level detection request disabled
1: Interrupt high-level detection request enabled

Bit 3 **IREN:** Interrupt rising edge detection enable bit
0: Interrupt rising edge detection request disabled
1: Interrupt rising edge detection request enabled

Bit 2 **IFS:** Interrupt falling edge status
The flag is set by hardware and reset by software.
0: No interrupt falling edge occurred
1: Interrupt falling edge occurred
Note: If this bit is written by software to 1 it is set.

Bit 1 **ILS:** Interrupt high-level status
The flag is set by hardware and reset by software.
0: No Interrupt high-level occurred
1: Interrupt high-level occurred

Bit 0 **IRS:** Interrupt rising edge status

The flag is set by hardware and reset by software.

0: No interrupt rising edge occurred

1: Interrupt rising edge occurred

Note: If this bit is written by software to 1 it is set.

Common memory space timing register (FMC_PMEM)

Address offset: 0x88

Reset value: 0xFCFC FCFC

The FMC_PMEM read/write register contains the timing information for NAND flash memory bank. This information is used to access either the common memory space of the NAND flash for command, address write access and data read/write access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MEMHIZ[7:0]								MEMHOLD[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MEMWAIT[7:0]								MEMSET[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **MEMHIZ[7:0]:** Common memory x data bus Hi-Z time

Defines the number of HCLK clock cycles during which the data bus is kept Hi-Z after the start of a NAND flash write access to common memory space on socket. This is only valid for write transactions:

0000 0000: 1 HCLK cycle

1111 1110: 255 HCLK cycles

1111 1111: reserved.

Bits 23:16 **MEMHOLD[7:0]:** Common memory hold time

Defines the number of HCLK clock cycles for write access and HCLK (+2) clock cycles for read access during which the address is held (and data for write accesses) after the command is deasserted (NWE, NOE), for NAND flash read or write access to common memory space on socket x:

0000 0000: reserved.

0000 0001: 1 HCLK cycle for write access / 3 HCLK cycles for read access

1111 1110: 254 HCLK cycles for write access / 256 HCLK cycles for read access

1111 1111: reserved.

Bits 15:8 **MEMWAIT[7:0]:** Common memory wait time

Defines the minimum number of HCLK (+1) clock cycles to assert the command (NWE, NOE), for NAND flash read or write access to common memory space on socket. The duration of command assertion is extended if the wait signal (NWAIT) is active (low) at the end of the programmed value of HCLK:

0000 0000: reserved

0000 0001: 2HCLK cycles (+ wait cycle introduced by deasserting NWAIT)

1111 1110: 255 HCLK cycles (+ wait cycle introduced by deasserting NWAIT)

1111 1111: reserved.

Bits 7:0 **MEMSET[7:0]:** Common memory x setup time

Defines the number of HCLK (+1) clock cycles to set up the address before the command assertion (NWE, NOE), for NAND flash read or write access to common memory space on socket x:
0000 0000: 1 HCLK cycle
1111 1110: 255 HCLK cycles
1111 1111: reserved

Attribute memory space timing register (FMC_PATT)

Address offset: 0x8C

Reset value: 0xFCFC FCFC

The FMC_PATT read/write register contains the timing information for NAND flash memory bank. It is used for 8-bit accesses to the attribute memory space of the NAND flash for the last address write access if the timing must differ from that of previous accesses (for Ready/Busy management, refer to *Section 23.7.5: NAND flash prewait functionality*).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ATTHIZ[7:0]								ATTHOLD[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ATTWAIT[7:0]								ATTSET[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **ATTHIZ[7:0]:** Attribute memory data bus Hi-Z time

Defines the number of HCLK clock cycles during which the data bus is kept in Hi-Z after the start of a NAND flash write access to attribute memory space on socket. Only valid for writ transaction:
0000 0000: 1 HCLK cycle
1111 1110: 255 HCLK cycles
1111 1111: reserved.

Bits 23:16 **ATTHOLD[7:0]:** Attribute memory hold time

Defines the number of HCLK clock cycles for write access and HCLK (+2) clock cycles for read access during which the address is held (and data for write access) after the command deassertion (NWE, NOE), for NAND flash read or write access to attribute memory space on socket:
0000 0000: reserved
0000 0001: 1 HCLK cycle for write access / 3 HCLK cycles for read access
1111 1110: 254 HCLK cycles for write access / 256 HCLK cycles for read access
1111 1111: reserved.

Bits 15:8 **ATTWAIT[7:0]:** Attribute memory wait time

Defines the minimum number of HCLK (+1) clock cycles to assert the command (NWE, NOE), for NAND flash read or write access to attribute memory space on socket x. The duration for command assertion is extended if the wait signal (NWAIT) is active (low) at the end of the programmed value of HCLK:
0000 0000: reserved
0000 0001: 2 HCLK cycles (+ wait cycle introduced by deassertion of NWAIT)
1111 1110: 255 HCLK cycles (+ wait cycle introduced by deasserting NWAIT)
1111 1111: reserved.

Bits 7:0 **ATTSET[7:0]:** Attribute memory setup time

Defines the number of HCLK (+1) clock cycles to set up address before the command assertion (NWE, NOE), for NAND flash read or write access to attribute memory space on socket:
0000 0000: 1 HCLK cycle
1111 1110: 255 HCLK cycles
1111 1111: reserved.

ECC result registers (FMC_ECCR)

Address offset: 0x94

Reset value: 0x0000 0000

This register contain the current error correction code value computed by the ECC computation modules of the FMC NAND controller. When the CPU reads the data from a NAND flash memory page at the correct address (refer to *Section 23.7.6: Computation of the error correction code (ECC) in NAND flash memory*), the data read/written from/to the NAND flash memory are processed automatically by the ECC computation module. When X bytes have been read (according to the ECCPS field in the FMC_PCR registers), the CPU must read the computed ECC value from the FMC_ECC registers. It then verifies if these computed parity data are the same as the parity value recorded in the spare area, to determine whether a page is valid, and, to correct it otherwise. The FMC_ECCR register must be cleared after being read by setting the ECCEN bit to 0. To compute a new data block, the ECCEN bit must be set to 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

101	8192	ECC[31:0]

23.8 SDRAM controller

23.8.1 SDRAM controller main features

The main features of the SDRAM controller are the following:

- Two SDRAM banks with independent configuration
- 8-bit, 16-bit data bus width
- 13-bits Address Row, 11-bits Address Column, 4 internal banks: 4x16Mx16bit (128 MB), 4x16Mx8bit (64 MB)
- Word, half-word, byte access
- Automatic row and bank boundary management
- Multibank ping-pong access
- Programmable timing parameters
- Automatic Refresh operation with programmable Refresh rate
- Self-refresh mode
- Power-down mode
- SDRAM power-up initialization by software
- CAS latency of 1,2,3
- Cacheable Read FIFO with depth of 6 lines x32-bit (6 x14-bit address tag)

23.8.2 SDRAM External memory interface signals

At startup, the SDRAM I/O pins used to interface the FMC SDRAM controller with the external SDRAM devices must configured by the user application. The SDRAM controller I/O pins which are not used by the application, can be used for other purposes.

Table 230. SDRAM signals

SDRAM signal	I/O type	Description	Alternate function
SDCLK	O	SDRAM clock	-
SDCKE[1:0]	O	SDCKE0: SDRAM Bank 1 Clock Enable SDCKE1: SDRAM Bank 2 Clock Enable	-
SDNE[1:0]	O	SDNE0: SDRAM Bank 1 Chip Enable SDNE1: SDRAM Bank 2 Chip Enable	-

SDNWE	O	Write Enable	-
NBL[1:0]	O	Output Byte Mask for write accesses (memory signal name: DQM[1:0]	FMC_NBL[1:0]

23.8.3 SDRAM controller functional description

All SDRAM controller outputs (signals, address and data) change on the falling edge of the memory clock (FMC_SDCLK).

SDRAM initialization

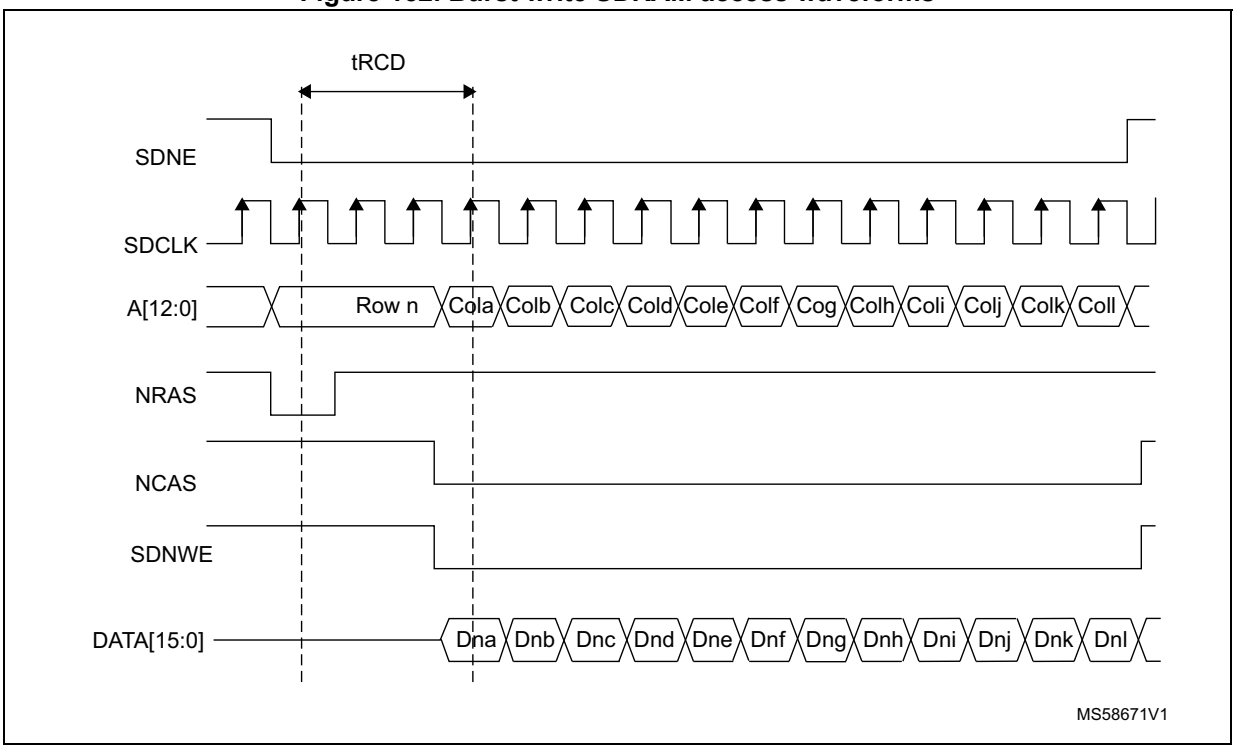
The initialization sequence is managed by software. If the two banks are used, the initialization sequence must be generated simultaneously to Bank 1and Bank 2 by setting the Target Bank bits CTB1 and CTB2 in the FMC_SDCMR register:

1. Program the memory device features into the FMC_SDCRx register. The SDRAM clock frequency, RBURST and RPIPE must be programmed in the FMC_SDCR1 register.
2. Program the memory device timing into the FMC_SDTRx register. The TRP and TRC timings must be programmed in the FMC_SDTR1 register.
3. Set MODE bits to ‘001’ and configure the Target Bank bits (CTB1 and/or CTB2) in the FMC_SDCMR register to start delivering the clock to the memory (SDCKE is driven high).
4. Wait during the prescribed delay period. Typical delay is around 100 µs (refer to the SDRAM datasheet for the required delay after power-up).
5. Set MODE bits to ‘010’ and configure the Target Bank bits (CTB1 and/or CTB2) in the FMC_SDCMR register to issue a “Precharge All” command.
6. Set MODE bits to ‘011’, and configure the Target Bank bits (CTB1 and/or CTB2) as well as the number of consecutive Auto-refresh commands (NRFS) in the FMC_SDCMR register. Refer to the SDRAM datasheet for the number of Auto-refresh commands that should be issued. Typical number is 8.
7. Configure the MRD field according to the SDRAM device, set the MODE bits to '100', and configure the Target Bank bits (CTB1 and/or CTB2) in the FMC_SDCMR register to issue a "Load Mode Register" command in order to program the SDRAM device. In particular:
   a) the CAS latency must be selected following configured value in FMC_SDCR1/2 registers
   b) the Burst Length (BL) of 1 must be selected by configuring the M[2:0] bits to 000 in the mode register. Refer to SDRAM device datasheet.

   If the Mode Register is not the same for both SDRAM banks, this step has to be repeated twice, once for each bank, and the Target Bank bits set accordingly.
8. Program the refresh rate in the FMC_SDRTR register

   The refresh rate corresponds to the delay between refresh cycles. Its value must be adapted to SDRAM devices.
9. For mobile SDRAM devices, to program the extended mode register it should be done once the SDRAM device is initialized: First, a dummy read access should be performed while BA1=1 and BA=0 (refer to SDRAM address mapping section for BA[1:0] address mapping) in order to select the extended mode register instead of the load mode register and then program the needed value.

At this stage the SDRAM device is ready to accept commands. If a system reset occurs during an ongoing SDRAM access, the data bus might still be driven by the SDRAM device. Therefor the SDRAM device must be first reinitialized after reset before issuing any new access by the NOR flash/PSRAM/SRAM or NAND flash controller.



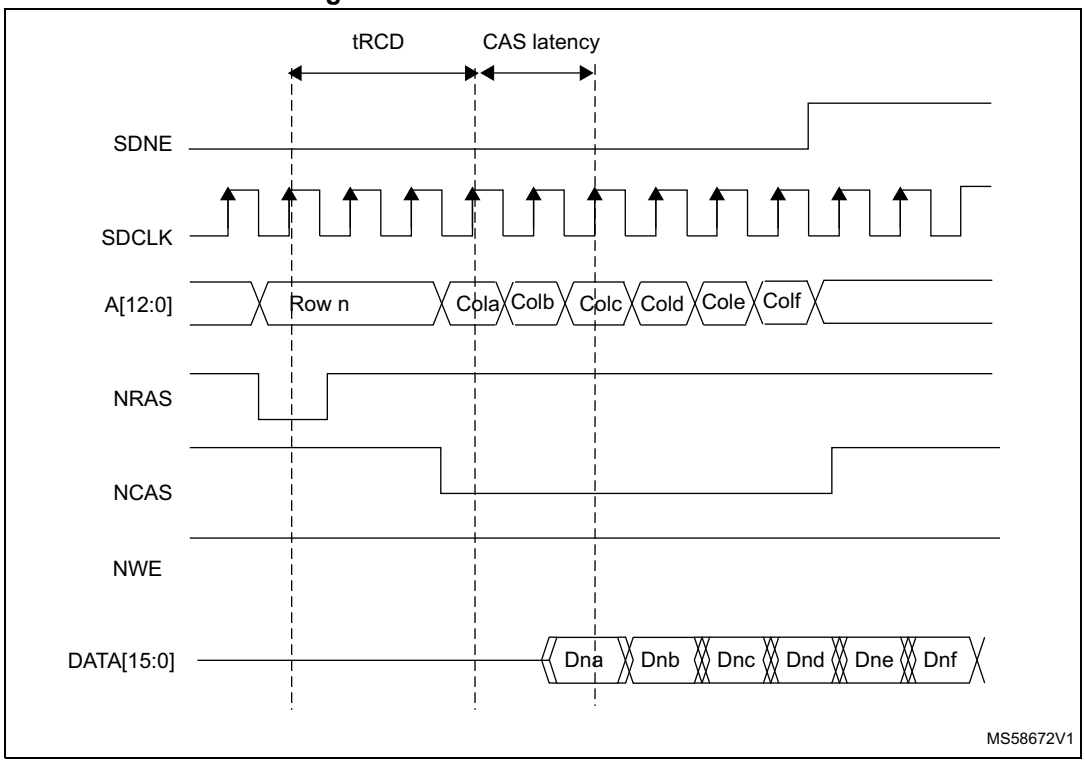
Note: If two SDRAM devices are connected to the FMC, all the accesses performed at the same time to both devices by the Command Mode register (Load Mode Register command) are issued using the timing parameters configured for SDRAM Bank 1 (TMRD andTRAS timings) in the FMC_SDTR1 register.

SDRAM controller write cycle

The SDRAM controller accepts single and burst write requests and translates them into single memory accesses. In both cases, the SDRAM controller keeps track of the active row for each bank to be able to perform consecutive write accesses to different banks (Multibank ping-pong access).

Before performing any write access, the SDRAM bank write protection must be disabled by clearing the WP bit in the FMC_SDCRx register.

Figure 152. Burst write SDRAM access waveforms



The SDRAM controller always checks the next access.

- If the next access is in the same row or in another active row, the write operation is carried out,
- if the next access targets another row (not active), the SDRAM controller generates a precharge command, activates the new row and initiates a write command.

SDRAM controller read cycle

The SDRAM controller accepts single and burst read requests and translates them into single memory accesses. In both cases, the SDRAM controller keeps track of the active row in each bank to be able to perform consecutive read accesses in different banks (Multibank ping-pong access).

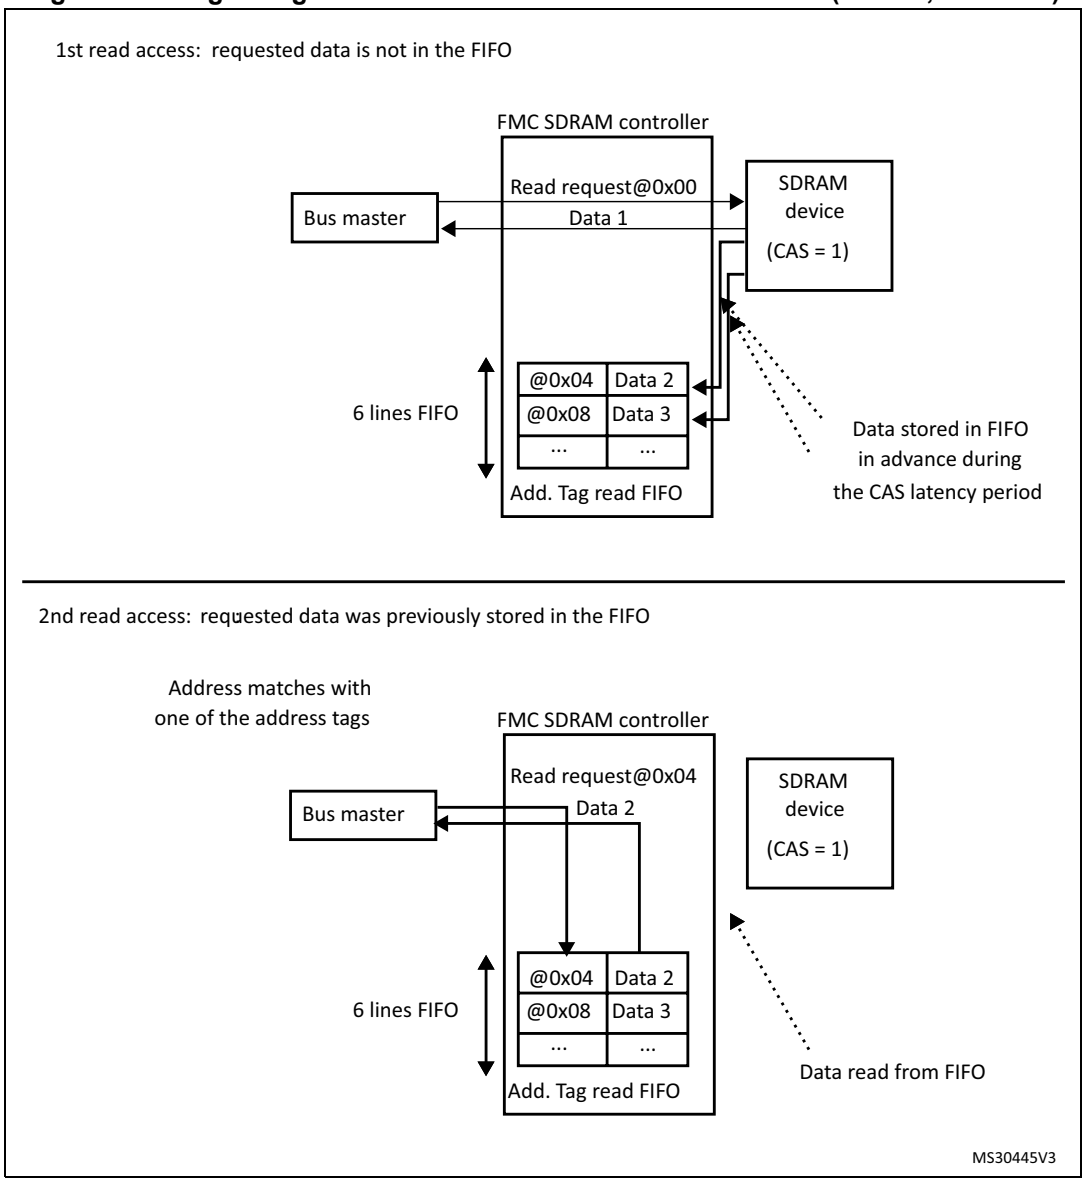
Figure 153. Burst read SDRAM access

The FMC SDRAM controller features a Cacheable read FIFO (6 lines x 32 bits). It is used to store data read in advance during the CAS latency period and the RPIPE delay following the below formula. The RBURST bit must be set in the FMC_SDCR1 register to anticipate the next read access.

Number for anticipated data = CAS latency + 1 + (RPIPE delay)/2

Examples:

- CAS latency = 3, RPIPE delay = 0: Four data (not committed) are stored in the FIFO.
- CAS latency = 3, RPIPE delay = 2: Five data (not committed) are stored in the FIFO.



The read FIFO features a 14-bit address tag to each line to identify its content: 11 bits for the column address, 2 bits to select the internal bank and the active row, and 1 bit to select the SDRAM device

When the end of the row is reached in advance during an AHB burst read, the data read in advance (not committed) are not stored in the read FIFO. For single read access, data are correctly stored in the FIFO.

Each time a read request occurs, the SDRAM controller checks:

- If the address matches one of the address tags, data are directly read from the FIFO and the corresponding address tag/ line content is cleared and the remaining data in the FIFO are compacted to avoid empty lines.
- Otherwise, a new read command is issued to the memory and the FIFO is updated with new data. If the FIFO is full, the older data are lost.

Figure 154. Logic diagram of Read access with RBURST bit set (CAS=1, RPIPE=0)

During a write access or a Precharge command, the read FIFO is flushed and ready to be filled with new data.

After the first read request, if the current access was not performed to a row boundary, the SDRAM controller anticipates the next read access during the CAS latency period and the RPIPE delay (if configured). This is done by incrementing the memory address. The following condition must be met:

- RBURST control bit should be set to ‘1’ in the FMC_SDCR1 register.

The address management depends on the next AHB request:

- Next AHB request is sequential (AHB Burst)

  In this case, the SDRAM controller increments the address.
- Next AHB request is not sequential
  - If the new read request targets the same row or another active row, the new address is passed to the memory and the master is stalled for the CAS latency period, waiting for the new data from memory.
  - If the new read request does not target an active row, the SDRAM controller generates a Precharge command, activates the new row, and initiates a read command.

If the RURST is reset, the read FIFO is not used.

Row and bank boundary management

When a read or write access crosses a row boundary, if the next read or write access is sequential and the current access was performed to a row boundary, the SDRAM controller executes the following operations:

1. Precharge of the active row,
2. Activation of the new row
3. Start of a read/write command.

At a row boundary, the automatic activation of the next row is supported for all columns and data bus width configurations.

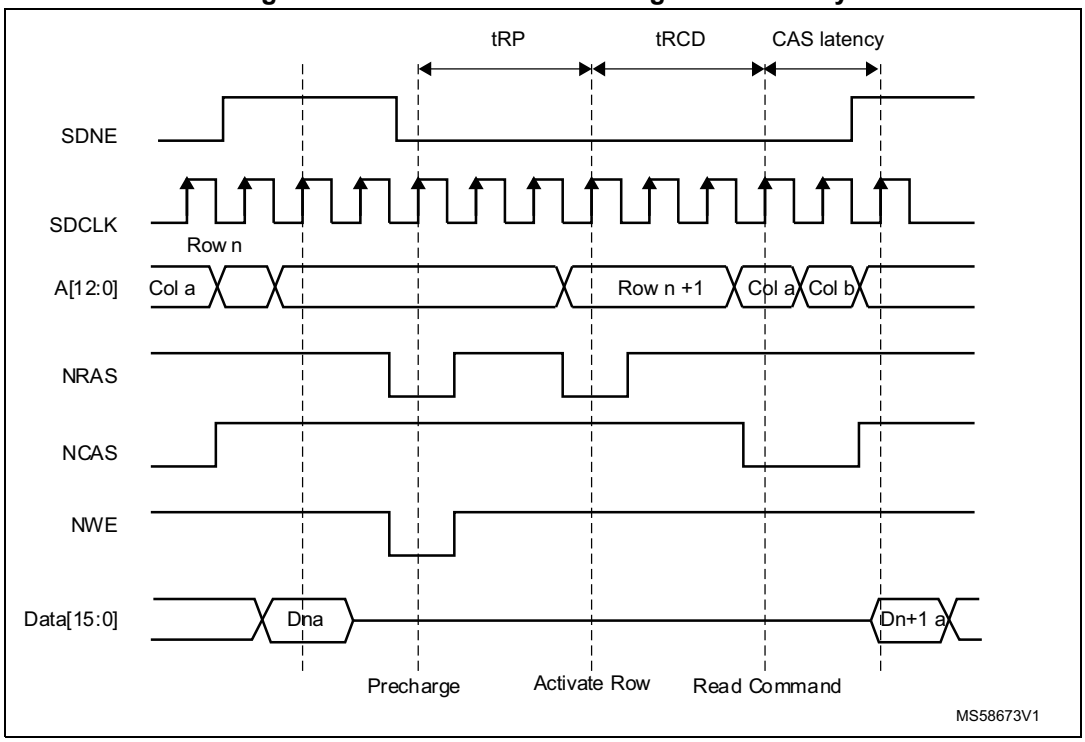
If necessary, the SDRAM controller inserts additional clock cycles between the following commands:

- Between Precharge and Activate commands to match TRP parameter (only if the next access is in a different row in the same bank),
- Between Activate and Read commands to match the TRCD parameter.

These parameters are defined into the FMC_SDTRx register.

Refer to *Figure 152* and *Figure 153* for read and burst write access crossing a row boundary.

Figure 155. Read access crossing row boundary



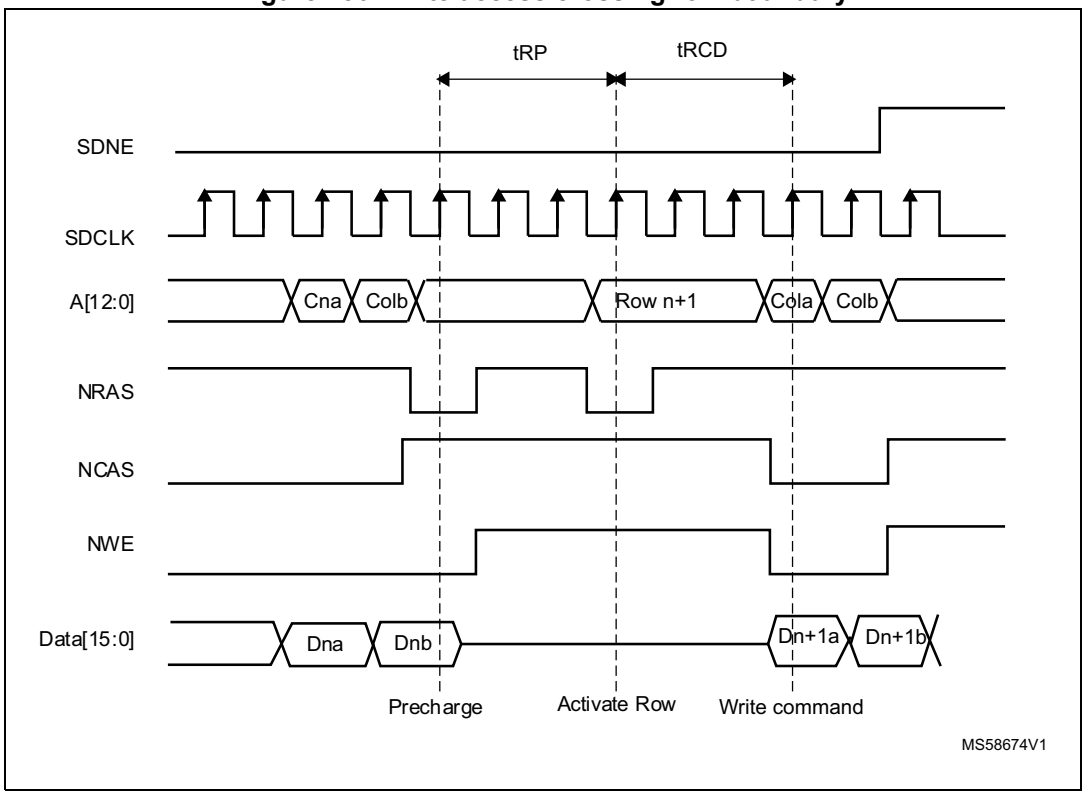


Figure 156. Write access crossing row boundary

If the next access is sequential and the current access crosses a bank boundary, the SDRAM controller activates the first row in the next bank and initiates a new read/write command. Two cases are possible:

- If the current bank is not the last one, the active row in the new bank must be precharged.At a bank boundary, the automatic activation of the next row is supported for all rows/columns and data bus width configuration.
- If the current bank is the last one and the selected SDRAM device is connected to Bank 1, the automatic activation of the next row in device connected to SDRAM Bank2 is not supported. A PALL software command must be issused on Bank1 before any any access on Bank2.

SDRAM controller refresh cycle

The Auto-refresh command is used to refresh the SDRAM device content. The SDRAM controller periodically issues auto-refresh commands. An internal counter is loaded with the COUNT value in the register FMC_SDRTR. This value defines the number of memory clock cycles between the refresh cycles (refresh rate). When this counter reaches zero, an internal pulse is generated.

If a memory access is ongoing, the auto-refresh request is delayed. However, if the memory access and the auto-refresh requests are generated simultaneously, the auto-refresh request takes precedence.

If the memory access occurs during an auto-refresh operation, the request is buffered and processed when the auto-refresh is complete.

If a new auto-refresh request occurs while the previous one was not served, the RE (Refresh Error) bit is set in the Status register. An Interrupt is generated if it has been enabled (REIE = ‘1’).

If SDRAM lines are not in idle state (not all row are closed), the SDRAM controller generates a PALL (Precharge ALL) command before the auto-refresh.

If the Auto-refresh command is generated by the FMC_SDCMR Command Mode register (Mode bits = ‘011’), a PALL command (Mode bits =’ 010’) must be issued first.

23.8.4 Low-power modes

Two low-power modes are available:

- Self-refresh mode

  The auto-refresh cycles are performed by the SDRAM device itself to retain data without external clocking.
- Power-down mode

  The auto-refresh cycles are performed by the SDRAM controller.

Self-refresh mode

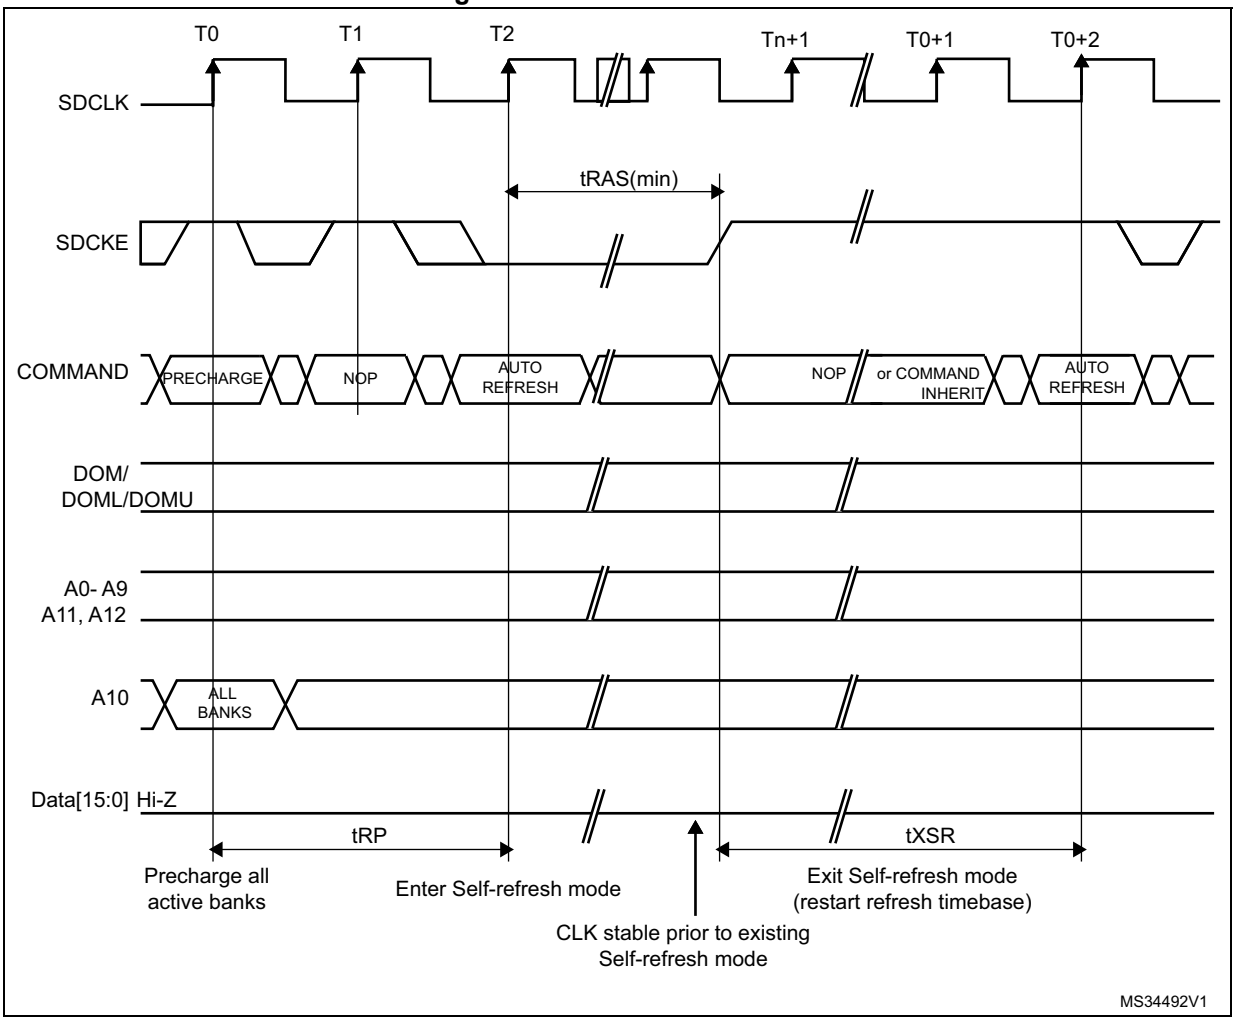
This mode is selected by setting the MODE bits to ‘101’ and by configuring the Target Bank bits (CTB1 and/or CTB2) in the FMC_SDCMR register.

The SDRAM clock stops running after a TRAS delay and the internal refresh timer stops counting only if one of the following conditions is met:

- A Self-refresh command is issued to both devices
- One of the devices is not activated (SDRAM bank is not initialized).

Before entering Self-Refresh mode, the SDRAM controller automatically issues a PALL command.

If the Write data FIFO is not empty, all data are sent to the memory before activating the Self-refresh mode and the BUSY status flag remains set.



In Self-refresh mode, all SDRAM device inputs become don't care except for SDCKE which remains low.

The SDRAM device must remain in Self-refresh mode for a minimum period of time of TRAS and can remain in Self-refresh mode for an indefinite period beyond that. To guarantee this minimum period, the BUSY status flag remains high after the Self-refresh activation during a TRAS delay.

As soon as an SDRAM device is selected, the SDRAM controller generates a sequence of commands to exit from Self-refresh mode. After the memory access, the selected device remains in Normal mode.

To exit from Self-refresh, the MODE bits must be set to '000' (Normal mode) and the Target Bank bits (CTB1 and/or CTB2) must be configured in the FMC_SDCMR register.

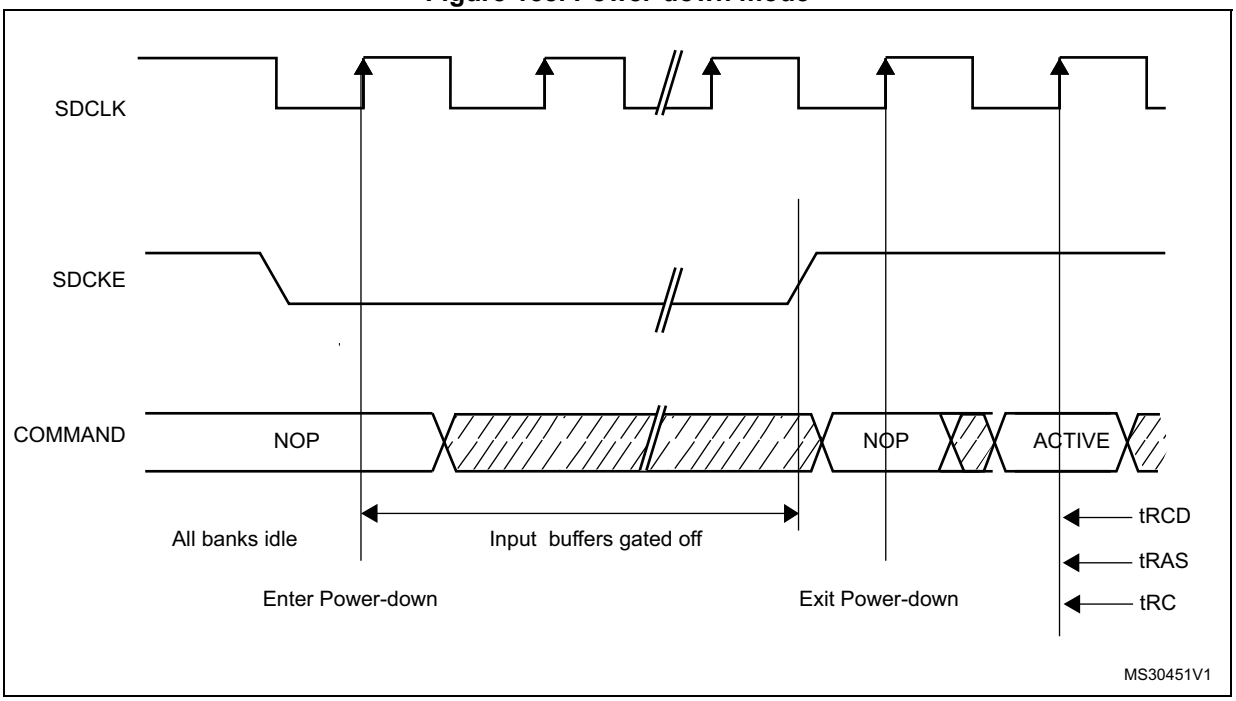


Figure 157. Self-refresh mode

Power-down mode

This mode is selected by setting the MODE bits to ‘110’ and by configuring the Target Bank bits (CTB1 and/or CTB2) in the FMC_SDCMR register.

Figure 158. Power-down mode

If the Write data FIFO is not empty, all data are sent to the memory before activating the Power-down mode.

As soon as an SDRAM device is selected, the SDRAM controller exits from the Power-down mode. After the memory access, the selected SDRAM device remains in Normal mode.

During Power-down mode, all SDRAM device input and output buffers are deactivated except for the SDCKE which remains low.

The SDRAM device cannot remain in Power-down mode longer than the refresh period and cannot perform the Auto-refresh cycles by itself. Therefore, the SDRAM controller carries out the refresh operation by executing the operations below:

1. Exit from Power-down mode and drive the SDCKE high
2. Generate the PALL command only if a row was active during Power-down mode
3. Generate the auto-refresh command
4. Drive SDCKE low again to return to Power-down mode.

To exit from Power-down mode, the MODE bits must be set to ‘000’ (Normal mode) and the Target Bank bits (CTB1 and/or CTB2) must be configured in the FMC_SDCMR register.

23.8.5 SDRAM controller registers

SDRAM control register x (FMC_SDCRx)

Address offset: 0x140+ 0x4* (x -1), (x = 1,2)

Reset value: 0x0000 02D0

This register contains the control parameters for each SDRAM memory bank

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	RPIPE[1:0]		RBURST	SDCLK[1:0]		WP	CAS[1:0]		NB	MWID[1:0]		NR[1:0]		NC[1:0]	
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:13 **RPIPE[1:0]:** Read pipe

These bits define the delay, in clock cycles, for reading data after CAS latency.

00: No clock cycle delay

01: One clock cycle delay

10: Two clock cycle delay

11: reserved.

Note: The corresponding bits in the FMC_SDCR2 register is read only.

Bit 12 **RBURST:** Burst read

This bit enables Burst read mode. The SDRAM controller anticipates the next read commands during the CAS latency and stores data in the Read FIFO.

0: single read requests are not managed as bursts

1: single read requests are always managed as bursts

Note: The corresponding bit in the FMC_SDCR2 register is don't care.

Bits 11:10 **SDCLK[1:0]:** SDRAM clock configuration

These bits define the SDRAM clock period for both SDRAM banks and allow disabling the clock before changing the frequency. In this case the SDRAM must be re-initialized.

00: SDCLK clock disabled

01: SDCLK period = 1x HCLK periods

10: SDCLK period = 2 x HCLK periods

11: SDCLK period = 3 x HCLK periods

Note: The corresponding bits in the FMC_SDCR2 register are don't care.

Bit 9 **WP:** Write protection

This bit enables write mode access to the SDRAM bank.

0: Write accesses allowed

1: Write accesses ignored

Bits 8:7 **CAS[1:0]:** CAS Latency

This bits sets the SDRAM CAS latency in number of memory clock cycles

00: reserved.

01: 1 cycle

10: 2 cycles

11: 3 cycles

Bit 6 **NB:** Number of internal banks
This bit sets the number of internal banks.
0: Two internal Banks
1: Four internal Banks

Bits 5:4 **MWID[1:0]:** Memory data bus width.
These bits define the memory device width.
00: 8 bits
01: 16 bits
10: reserved
11: reserved.

Bits 3:2 **NR[1:0]:** Number of row address bits
These bits define the number of bits of a row address.
00: 11 bit
01: 12 bits
10: 13 bits
11: reserved.

Bits 1:0 **NC[1:0]:** Number of column address bits
These bits define the number of bits of a column address.
00: 8 bits
01: 9 bits
10: 10 bits
11: 11 bits.

Note: Before modifying the RBURST or RPIPE settings or disabling the SDCLK clock, the user must first send a PALL command to make sure ongoing operations are complete.

SDRAM timing register x (FMC_SDTRx)

Address offset: 0x148 + 0x4 * (x - 1), (x = 1,2)

Reset value: 0x0FFF FFFF

This register contains the timing parameters of each SDRAM bank

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	TRCD[3:0]				TRP[3:0]				TWR[3:0]			
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRC[3:0]				TRAS[3:0]				TXSR[3:0]				TMRD[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **TRCD[3:0]:** Row to column delay
These bits define the delay, tRCD, from the Activate command to a Read/Write command in number of memory clock cycles.
0000: 2 cycles
0001: 3 cycles
....
1111: 17 cycles
Note: tRCD delay is replaced by (TWR[3:0]+2) cycles when TWR[3:0] > TRCD[3:0].

Bits 23:20 **TRP[3:0]:** Row precharge delay

These bits define the delay, tRP, from a Precharge command to another command in number of memory clock cycles. The TRP timing is only configured in the FMC_SDTR1 register. If two SDRAM devices are used, the TRP must be programmed with the timing of the slowest device.

0000: 2 cycle

0001: 3 cycles

....

1111: 17 cycles

Note: The corresponding bits in the FMC_SDTR2 register are don't care.

Bits 19:16 **TWR[3:0]:** Recovery delay

These bits define the delay, tWR, from a Write to a Precharge command in number of memory clock cycles.

0000: 2 cycle

0001: 3 cycles

....

1111: 17 cycles

Note: TWR must be programmed to match the write recovery time (t_{WR}) defined in the SDRAM datasheet, and to guarantee that:

TWR ≥ TRAS - TRCD and TWR ≥TRC - TRCD - TRP

Example: TRAS= 4 cycles, TRCD= 2 cycles. So, TWR >= 2 cycles. TWR must be programmed to 0x0.

If two SDRAM devices are used, the FMC_SDTR1 and FMC_SDTR2 must be programmed with the same TWR timing corresponding to the slowest SDRAM device.

If only one SDRAM device is used, the TWR timing must be kept at reset value (0xF) for the not used bank.

Bits 15:12 **TRC[3:0]:** Row cycle delay

These bits define the delay, tRC, from the Refresh command to the Activate command, as well as the delay between two consecutive Refresh commands. It is expressed in number of memory clock cycles. The TRC timing is only configured in the FMC_SDTR1 register. If two SDRAM devices are used, the TRC must be programmed with the timings of the slowest device.

0000: 2 cycle

0001: 3 cycles

....

1111: 17 cycles

Note: TRC must match the TRC and TRFC (Auto Refresh period) timings defined in the SDRAM device datasheet.

Note: The corresponding bits in the FMC_SDTR2 register are don't care.

Bits 11:8 **TRAS[3:0]:** Self refresh time

These bits define the minimum Self-refresh period in number of memory clock cycles.

0000: 2 cycle

0001: 3 cycles

....

1111: 17 cycles

Bits 7:4 **TXSR[3:0]:** Exit Self-refresh delay

These bits define the delay from releasing the Self-refresh command to issuing the Activate command in number of memory clock cycles.

0000: 2 cycle

0001: 3 cycles

....

1111: 17 cycles

Note: The tXSR delay is replaced by (TWR[3:0]+2) cycles when TWR[3:0] > TXSR[3:0].

Note: If two SDRAM devices are used, the FMC_SDTR1 and FMC_SDTR2 must be programmed with the same TXSR timing corresponding to the slowest SDRAM device.

Bits 3:0 **TMRD[3:0]:** Load Mode Register to Active

These bits define the delay, tMRD, from a Load Mode Register command to an Active or Refresh command in number of memory clock cycles.

0000: 3 cycle

0001: 4 cycles

....

1111: 18 cycles

Note: If two SDRAM devices are connected, all the accesses performed simultaneously to both devices by the Command Mode register (Load Mode Register command) are issued using the timing parameters configured for Bank 1 (TMRD and TRAS timings) in the FMC_SDTR1 register.

The TRP and TRC timings are only configured in the FMC_SDTR1 register. If two SDRAM devices are used, the TRP and TRC timings must be programmed with the timings of the slowest device.

SDRAM Command Mode register (FMC_SDCMR)

Address offset: 0x150

Reset value: 0x0000 0000

This register contains the command issued when the SDRAM device is accessed. This register is used to initialize the SDRAM device, and to activate the Self-refresh and the Power-down modes. As soon as the MODE field is written, the command is issued only to one or to both SDRAM banks according to CTB1 and CTB2 command bits. This register is the same for both SDRAM banks.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MRD[12:7]					
										rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MRD[6:0]							NRFS[3:0]				CTB1	CTB2	MODE[2:0]		
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	w	w	w	w	w

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:9 **MRD[12:0]:** Mode Register definition

This 13-bit field defines the SDRAM Mode Register content. The Mode Register is programmed using the Load Mode Register command.

Bits 8:5 **NRFS[3:0]:** Number of Auto-refresh
These bits define the number of consecutive Auto-refresh commands issued when MODE = '011'.
0000: 1 Auto-refresh cycle
0001: 2 Auto-refresh cycles
....
1110: 15 Auto-refresh cycles
1111: 16 Auto-refresh cycles

Bit 4 **CTB1:** Command Target Bank 1
This bit indicates whether the command is issued to SDRAM Bank 1 or not.
0: Command not issued to SDRAM Bank 1
1: Command issued to SDRAM Bank 1

Bit 3 **CTB2:** Command Target Bank 2
This bit indicates whether the command is issued to SDRAM Bank 2 or not.
0: Command not issued to SDRAM Bank 2
1: Command issued to SDRAM Bank 2

Bits 2:0 **MODE[2:0]:** Command mode
These bits define the command issued to the SDRAM device.
000: Normal Mode
001: Clock Configuration Enable
010: PALL ("All Bank Precharge") command
011: Auto-refresh command
100: Load Mode Register
101: Self-refresh command
110: Power-down command
111: Reserved

Note: When a command is issued, at least one Command Target Bank bit (CTB1 or CTB2) must be set otherwise the command is ignored.

Note: If two SDRAM banks are used, the Auto-refresh and PALL command must be issued simultaneously to the two devices with CTB1 and CTB2 bits set otherwise the command is ignored.

Note: If only one SDRAM bank is used and a command is issued with it's associated CTB bit set, the other CTB bit of the the unused bank must be kept to 0.

SDRAM refresh timer register (FMC_SDRTR)

Address offset:0x154

Reset value: 0x0000 0000

This register sets the refresh rate in number of SDCLK clock cycles between the refresh cycles by configuring the Refresh Timer Count value.

$$\text{Refresh rate} = (\text{COUNT} + 1) \times \text{SDRAM clock frequency}$$

$$\text{COUNT} = (\text{SDRAM refresh period} / \text{Number of rows}) - 20$$

Example

$$\text{Refresh rate} = 64\ \text{ms} / (8196\text{rows}) = 7.81\mu\text{s}$$

where 64 ms is the SDRAM refresh period.

$$7.81\mu s \times 60MHz = 468.6$$

The refresh rate must be increased by 20 SDRAM clock cycles (as in the above example) to obtain a safe margin if an internal refresh request occurs when a read request has been accepted. It corresponds to a COUNT value of '0000111000000' (448).

This 13-bit field is loaded into a timer which is decremented using the SDRAM clock. This timer generates a refresh pulse when zero is reached. The COUNT value must be set at least to 41 SDRAM clock cycles.

As soon as the FMC_SDRTR register is programmed, the timer starts counting. If the value programmed in the register is '0', no refresh is carried out. This register must not be reprogrammed after the initialization procedure to avoid modifying the refresh rate.

Each time a refresh pulse is generated, this 13-bit COUNT field is reloaded into the counter.

If a memory access is in progress, the Auto-refresh request is delayed. However, if the memory access and Auto-refresh requests are generated simultaneously, the Auto-refresh takes precedence. If the memory access occurs during a refresh operation, the request is buffered to be processed when the refresh is complete.

This register is common to SDRAM bank 1 and bank 2.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	REIE	COUNT[12:0]													CRE
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	w

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **REIE:** RES Interrupt Enable
0: Interrupt is disabled
1: An Interrupt is generated if RE = 1

Bits 13:1 **COUNT[12:0]:** Refresh Timer Count
This 13-bit field defines the refresh rate of the SDRAM device. It is expressed in number of memory clock cycles. It must be set at least to 41 SDRAM clock cycles (0x29).
Refresh rate = (COUNT + 1) x SDRAM frequency clock
COUNT = (SDRAM refresh period / Number of rows) - 20

Bit 0 **CRE:** Clear Refresh error flag
This bit is used to clear the Refresh Error Flag (RE) in the Status Register.
0: no effect
1: Refresh Error flag is cleared

Note: The programmed COUNT value must not be equal to the sum of the following timings: TWR+TRP+TRC+TRCD+4 memory clock cycles.

SDRAM status register (FMC_SDSR)

Address offset: 0x158

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BUSY	MODES2[1:0]		MODES1[1:0]		RE
										r	r	r	r	r	r

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **BUSY:** Busy status

This bit defines the status of the SDRAM controller after a Command Mode request

0: SDRAM Controller is ready to accept a new request

1; SDRAM Controller is not ready to accept a new request

Bits 4:3 **MODES2[1:0]:** Status Mode for Bank 2

This bit defines the Status Mode of SDRAM Bank 2.

00: Normal Mode

01: Self-refresh mode

10: Power-down mode

Bits 2:1 **MODES1[1:0]:** Status Mode for Bank 1

This bit defines the Status Mode of SDRAM Bank 1.

00: Normal Mode

01: Self-refresh mode

10: Power-down mode

Bit 0 **RE:** Refresh error flag

0: No refresh error has been detected

1: A refresh error has been detected

An interrupt is generated if REIE = 1 and RE = 1

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

24 Octo-SPI interface (OCTOSPI)

This section applies only to STM32H523/33xx, STM32H562/63xx, STM32H573xx devices.

24.1 OCTOSPI introduction

The OCTOSPI supports most external serial memories such as serial PSRAMs, serial NAND and serial NOR flash memories, HyperRAM™ and HyperFlash™ memories, with the following functional modes:

- indirect mode: all the operations are performed using the OCTOSPI registers to preset commands, addresses, data, and transfer parameters.
- automatic status-polling mode: the external memory status register is periodically read and an interrupt can be generated in case of flag setting. This feature is only available in regular-command protocol.
- memory-mapped mode: the external memory is memory mapped and it is seen by the system as if it was an internal memory, supporting both read and write operations.

The OCTOSPI supports the following protocols with associated frame formats:

- the regular-command frame format with the command, address, alternate byte, dummy cycles, and data phase
- the HyperBus™ frame format

24.2 OCTOSPI main features

- Functional modes: indirect, automatic status-polling, and memory-mapped
- Read and write support in memory-mapped mode
- External (P)SRAM memory support
- Support for single, dual, quad, and octal communication
- Dual memory configuration, where eight bits can be sent/received simultaneously by accessing two quad memories in parallel
- SDR (single-data rate) and DTR (double-transfer rate) support
- Data strobe support
- Fully programmable opcode
- Fully programmable frame format
- Support wrapped-type access to memory in read direction
- HyperBus support
- Integrated FIFO for reception and transmission
- Asynchronous bus clock versus kernel clock support
- 8-, 16-, and 32-bit data accesses allowed
- DMA protocol support
- DMA channel for indirect mode operations
- Interrupt generation on FIFO threshold, timeout, operation complete, and access error
- AHB interface with transaction acceptance limited to one: the interface accepts the next transfer on AHB bus only once the previous is completed on memory side.

24.3 OCTOSPI implementation

Table 232. OCTOSPI implementation

OCTOSPI feature	OCTOSPI1
HyperBus standard compliant	X

24.4 OCTOSPI functional description

24.4.1 OCTOSPI block diagram

Figure 159. OCTOSPI block diagram in octal configuration

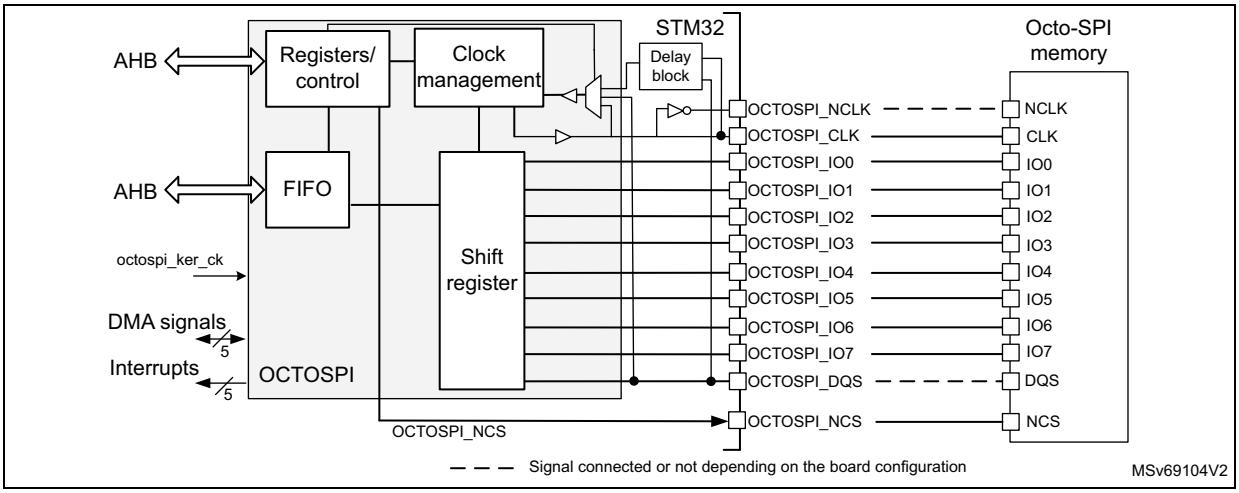

Figure 160. OCTOSPI block diagram in quad configuration

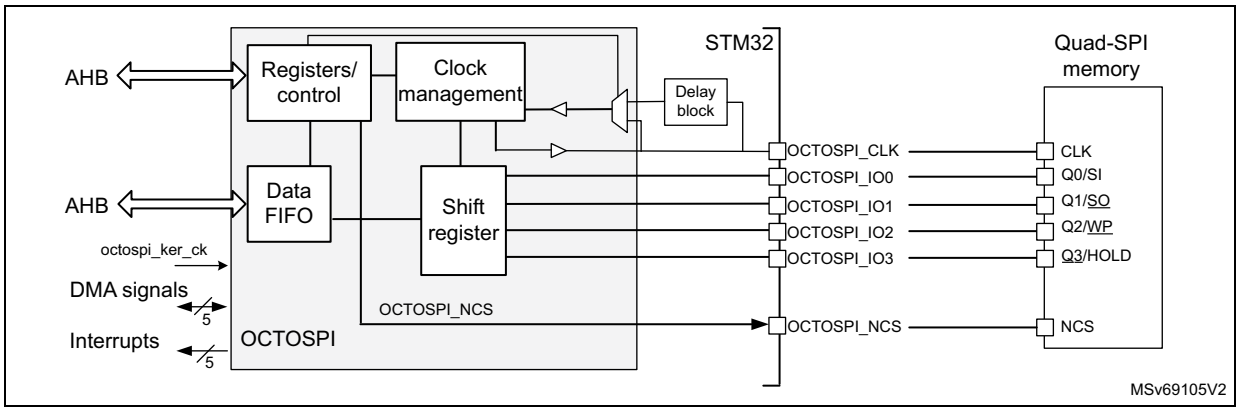

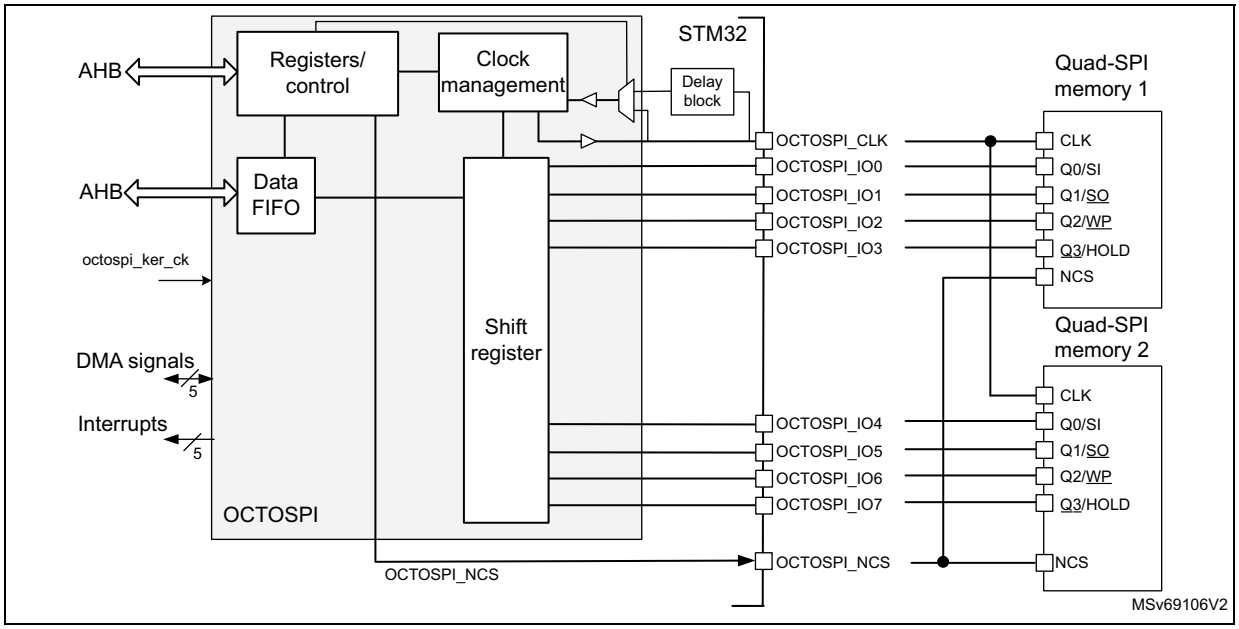

Figure 161. OCTOSPI block diagram in dual-quad configuration

24.4.2 OCTOSPI pins and internal signals

Table 233. OCTOSPI input/output pins

Pin name	Type	Description
OCTOSPI_NCLK	Output	OCTOSPI inverted clock to support 1.8 V HyperBus protocol
OCTOSPI_CLK		OCTOSPI clock
OCTOSPI_IOn (n = 0 to 7)	Input/output	OCTOSPI data pins
OCTOSPI_NCS	Output	Chip select for the memory
OCTOSPI_DQS	Input/output	Data strobe/write mask signal from/to the memory

Caution: Use the same configuration (output speed, HSLV[(a)]) for all OCTOSPI input/output pins to avoid any data corruption.

Table 234. OCTOSPI internal signals

Signal name	Type	Description
octospi_hclk	Input	OCTOSPI AHB clock
octospi_ker_ck	Input	OCTOSPI kernel clock
octospi_dma	N/A	DMA request signal
octospi_it	Output	Global interrupt line (see *Table 238* for the multiple sources of interrupt)

a. When applicable.

24.4.3 OCTOSPI interface to memory modes

The OCTOSPI supports the following protocols:

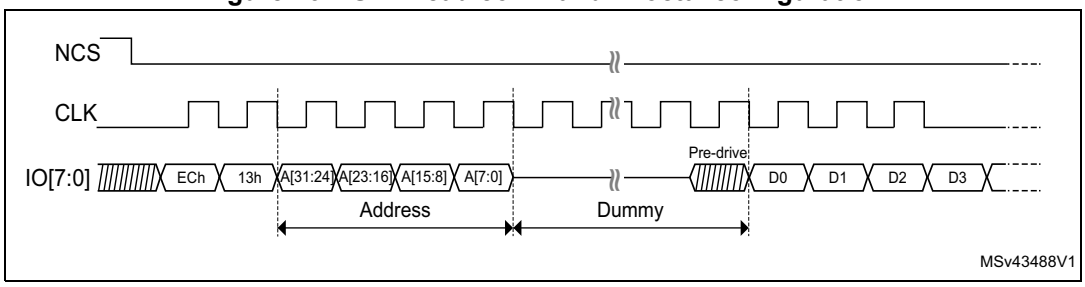
- regular-command protocol
- HyperBus protocol

The OCTOSPI uses from 6 to 12 signals to interface with a memory, depending on the functional mode:

- NCS: chip-select
- CLK: communication clock
- NCLK: inverted clock used only in the 1.8 V HyperBus protocol
- DQS: data strobe used only in regular-command protocol as input only
- IO[3:0]: data bus LSB
- IO[7:4]:
  - data bus MSB used in dual-quad and octal configurations
  - data bus can be used as possible remap for quad-SPI mode

24.4.4 OCTOSPI regular-command protocol

When in regular-command protocol, the OCTOSPI communicates with the external device using commands. Each command can include the following phases:



- Instruction phase
- Address phase
- Alternate-byte phase
- Dummy-cycle phase
- Data phase

Any of these phases can be configured to be skipped but, in case of single-phase command, the only use case supported is instruction-phase-only.

The NCS falls before the start of each command and rises again after each command finishes.

In memory-mapped mode, both read and write operations are supported: as a consequence, some of the configuration registers are duplicated to specify write operations (read operations are configured using regular registers).

Figure 162. SDR read command in octal configuration

The specific regular-command protocol features are configured through the registers in the 0x0100-0x01FC offset range.

Instruction phase

During this phase, a 1- to 4-byte instruction is sent to the external device specifying the type of operation to be performed. The size of the instruction to be sent is configured by ISIZE[1:0] in OCTOSPI_CCR and the instruction is programmed in INSTRUCTION[31:0] of OCTOSPI_IR.

The instruction phase can optionally send:

- 1 bit at a time (over IO0, SO single in single-SPI mode)
- 2 bits at a time (over IO0/IO1 in dual-SPI mode)
- 4 bits at a time (over IO0 to IO3 in quad-SPI mode)
- 8 bits at a time (over IO0 to IO7 in octal-SPI mode)

This can be configured using IMODE[2:0] of OCTOSPI_CCR.

The instruction can be sent in DTR mode on each rising and falling edge of the clock, by setting IDTR in OCTOSPI_CCR.

When IMODE[2:0] = 000 in OCTOSPI_CCR, the instruction phase is skipped, and the command sequence starts with the address phase, if present.

In memory-mapped mode, the instruction used for the write operation is specified in OCTOSPI_WIR, and the instruction format is specified in OCTOSPI_WCCR. The instruction used for the read operation and the instruction format are specified in OCTOSPI_IR and OCTOSPI_CCR.

Address phase

In the address phase, 1 to 4 bytes are sent to the external device, to indicate the address of the operation. The number of address bytes to be sent is configured by ADSIZE[1:0] in OCTOSPI_CCR.

In indirect and automatic status-polling modes, the address bytes to be sent are specified by ADDRESS[31:0] in OCTOSPI_AR. In memory-mapped mode, the address is given directly via the AHB (from any master in the system).

The address phase can send:

- 1 bit at a time (over IO0, SO single in single-SPI mode)
- 2 bits at a time (over IO0/IO1 in dual-SPI mode)
- 4 bits at a time (over IO0 to IO3 in quad-SPI mode)
- 8 bits at a time (over IO0 to IO7 in octal-SPI mode)

This can be configured using ADMODE[2:0] in OCTOSPI_CCR.

The address can be sent in DTR mode (on each rising and falling edge of the clock) setting ADDTR in OCTOSPI_CCR.

When ADMODE[2:0] = 000, the address phase is skipped and the command sequence proceeds directly to the next phase, if any.

In memory-mapped mode, the address format for the write operation is specified in OCTOSPI_WCCR. The address format for the read operation is specified in OCTOSPI_CCR.

Alternate-byte phase

In the alternate-byte phase, 1 to 4 bytes are sent to the external device, generally to control the mode of operation. The number of alternate bytes to be sent is configured by ABSIZE[1:0] in OCTOSPI_CCR. The bytes to be sent are specified in OCTOSPI_ABR.

The alternate-byte phase can send:

- 1 bit at a time (over IO0, SO single in single-SPI mode)
- 2 bits at a time (over IO0/IO1 in dual-SPI mode)
- 4 bits at a time (over IO0 to IO3 in quad-SPI mode)
- 8 bits at a time (over IO0 to IO7 in octal-SPI mode)

This can be configured using ABMODE[2:0] in OCTOSPI_CCR.

The alternate bytes can be sent in DTR mode (on each rising and falling edge of the clock) setting ABDTR in OCTOSPI_CCR.

When ABMODE[2:0] = 000, the alternate-byte phase is skipped and the command sequence proceeds directly to the next phase, if any.

There may be times when only a single nibble needs to be sent during the alternate-byte phase rather than a full byte, such as when the dual-SPI mode is used and only two cycles are used for the alternate bytes.

In this case, the firmware can use the quad-SPI mode (ABMODE[2:0] = 011) and send a byte with bits 7 and 3 of ALTERNATE[31:0] set to 1 (keeping the IO3 line high), and bits 6 and 2 set to 0 (keeping the IO2 line low), in OCTOSPI_IR.

The upper two bits of the nibble to be sent are then placed in bits 5:4 of ALTERNATE[31:0] while the lower two bits are placed in bits 1:0. For example, if the nibble 2 (0010) is to be sent over IO0/IO1, then ALTERNATE[31:0] must be set to 0x8A (1000_1010).

In memory-mapped mode, the alternate bytes used for the write operation are specified in OCTOSPI_WABR, and the alternate byte format is specified in OCTOSPI_WCCR. The alternate bytes used for read operation and the alternate byte format are specified in OCTOSPI_ABR and OCTOSPI_CCR.

Dummy-cycle phase (memory latency)

In the dummy-cycle phase, 1 to 31 cycles are given without any data being sent or received, in order to give the external device, the time to prepare for the data phase when higher clock frequencies are used. The number of cycles given during this phase is specified by DCYC[4:0] in OCTOSPI_TCR. In both SDR and DTR modes, the duration is specified as a number of full CLK cycles.

When DCYC[4:0] = 00000, the dummy-cycle phase is skipped, and the command sequence proceeds directly to the data phase, if present.

In order to assure enough “turn-around” time for changing the data signals from the output mode to the input mode, there must be at least one dummy cycle when using the dual-SPI, the quad-SPI, or the octal-SPI mode, to receive data from the external device.

In memory-mapped mode, the dummy cycles for the write operations are specified in OCTOSPI_WTCR. The dummy cycles for the read operation are specified in OCTOSPI_TCR.

Data phase

During the data phase, any number of bytes can be sent to or received from the external device.

In indirect mode, the number of bytes to be sent/received is specified in OCTOSPI_DLR. In this mode, the data to be sent to the external device must be written to OCTOSPI_DR, while in indirect-read mode the data received from the external device is obtained by reading OCTOSPI_DR.

In automatic status-polling mode, the number of bytes to be received is specified in OCTOSPI_DLR, and the data received from the external device can be obtained by reading OCTOSPI_DR.

In memory-mapped mode, the data read or written, is sent or received directly over the AHB to the Cortex core or to a DMA.

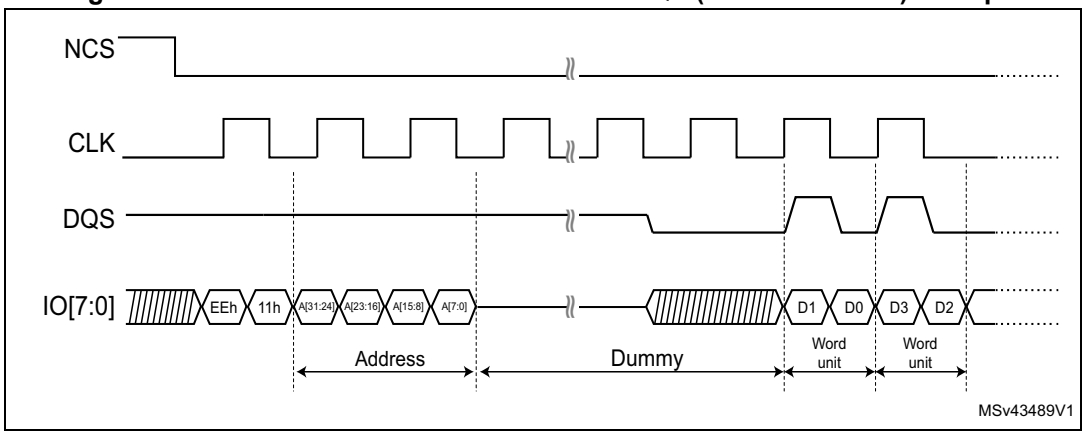
The data phase can send/receive:

- 1 bit at a time (over IO0/IO1 (SO/SI respectively) in single-SPI mode)
- 2 bits at a time (over IO0/IO1 in dual-SPI mode)
- 4 bits at a time (over IO0 to IO3 in quad-SPI mode)
- 8 bits at a time (over IO0 to IO7 in octal-SPI mode)

This can be configured using DMODE[2:0] in OCTOSPI_CCR.

The data can be sent or received in DTR mode (on each rising and falling edge of the clock) setting DDTR in OCTOSPI_CCR.

When DMODE[2:0] = 000, the data phase is skipped, and the command sequence finishes immediately by raising the NCS. This configuration must be used only in indirect-write mode.



In memory-mapped mode, the data format for the write operation is specified in OCTOSPI_WCCR. The data format for the read operation is specified in OCTOSPI_CCR.

DQS use

The DQS signal can be used for data strobing during the read transactions when the device toggles the DQS aligned with the data.

The DQS management can be enabled by setting DQSE in OCTOSPI_CCR.

Figure 163. DTR read in octal-SPI mode with DQS (Macronix mode) example

24.4.5 OCTOSPI regular-command protocol signal interface

Single-SPI mode

The legacy SPI mode allows just a single bit to be sent/received serially. In this mode, the data is sent to the external device over the SO signal (Single-SPI Output) (whose I/Os are shared with IO0). The data received from the external device arrives via SI (Single-SPI Input) (whose I/Os are shared with IO1).

Compared to the SPI legacy mode, I0/SO and I1/SI are respectively equivalent to MOSI and MISO, having the OCTOSPI generating the clock.

The different phases can each be configured separately to use this single-SPI mode by setting to 001 the IMODE, ADMODE, ABMODE, and DMODE fields in OCTOSPI_CCR and OCTOSPI_WCCR.

In each phase configured in single-SPI mode:

- IO0 (SO) is in output mode.
- IO1 (SI) is in input mode (high impedance).
- IO2 is in output mode and forced to 0.
- IO3 is in output mode and forced to 1 (to deactivate the “hold” function).
- IO4 to IO7 are in output mode and forced to 0.

This is the case even for the dummy phase if DMODE[2:0] = 001.

Dual-SPI mode

In dual-SPI mode, two bits are sent/received simultaneously over the IO0/IO1 signals.

The different phases can each be configured separately to use dual-SPI mode by setting to 010 the IMODE, ADMODE, ABMODE, and DMODE fields in OCTOSPI_CCR and OCTOSPI_WCCR.

In each phase configured in dual-SPI mode:

- IO0/IO1 are at high-impedance (input) during the data phase for the read operations, and outputs in all other cases.
- IO2 is in output mode and forced to 0.
- IO3 is in output mode and forced to 1.
- IO4 to IO7 are in output mode and forced to 0.

In the dummy phase, when DMODE[2:0] = 010, IO0 and IO1 are in a high-impedance state during read transactions, and are forced to either high or low levels during write transactions.

Quad-SPI mode

In quad-SPI mode, four bits are sent/received simultaneously over the IO0/IO1/IO2/IO3 signals.

The different phases can each be configured separately to use the quad-SPI mode by setting to 011 the IMODE, ADMODE, ABMODE, and DMODE fields in OCTOSPI_CCR and OCTOSPI_WCCR.

In each phase configured in quad-SPI mode:

- IO0 to IO3 are all at high-impedance (inputs) during the data phase for the read operations, and outputs in all other cases.
- IO4 to IO7 are in output mode and forced to 0.

In the dummy phase, when DMODE[2:0] = 011, IO0 to IO3 are in a high-impedance state during read transactions, and are forced to either high or low levels during write transactions.

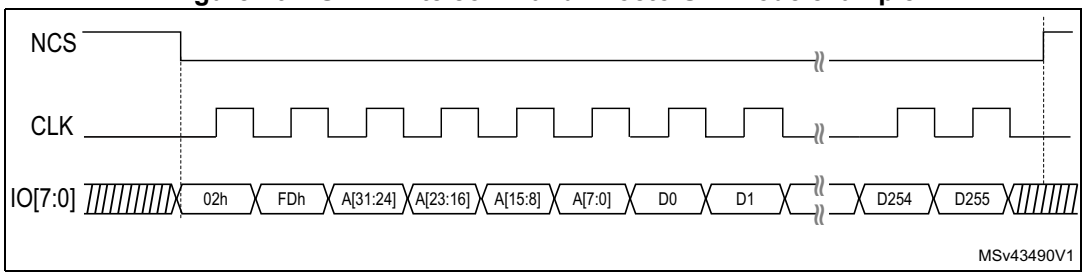
Octal-SPI mode

In regular octal-SPI mode, the eight bits are sent/received simultaneously over the IO[0:7] signals.

The different phases can each be configured separately to use the octal-SPI mode by setting to 100 the IMODE, ADMODE, ABMODE, and DMODE fields in OCTOSPI_CCR and OCTOSPI_WCCR.

In each phase that is configured in octal-SPI mode, IO[0:7] are all at high-impedance (input) during the data phase for read operations, and outputs in all other cases.

In the dummy phase, when DMODE[2:0] = 100, IO[0:7] are in a high-impedance state during read transactions, and are forced to either high or low levels during write transactions.



Single-data rate (SDR) mode

By default, all the phases operate in SDR mode.

In this mode, when the OCTOSPI drives the IO0/SO, IO1 to IO7 signals, these signals transition only with the falling edge of CLK.

When receiving data in SDR mode, the OCTOSPI assumes that the external devices also send the data using CLK falling edge. By default (when SSHIFT = 0 in OCTOSPI_TCR), the signals are sampled using the following (rising) edge of CLK.

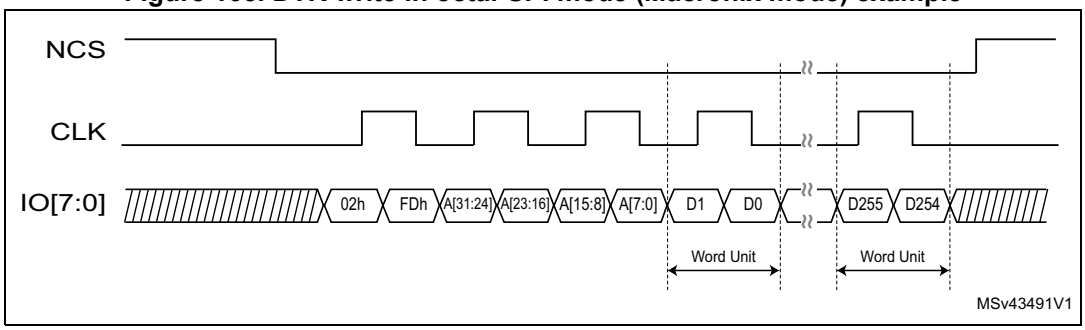
Figure 164. SDR write command in octo-SPI mode example

Note: Due to internal synchronization, up to six extra dummy clock cycles may be generated by the Octo-SPI interface after the last data is read.

Double-transfer rate (DTR) mode

Each of the instruction, address, alternate-byte, and data phases can be configured to operate in DTR mode setting IDTR, ADDTR, ABDTR, and DDTR in OCTOSPI_CCR.

In memory-mapped mode, the DTR mode for each phase of the write operations is specified in OCTOSPI_WCCR. The DTR mode for each phase of the read operations is specified in OCTOSPI_CCR.



In DTR mode, when the OCTOSPI drives the IO0/SO and IO1 to IO7 signals in the instruction, address, and alternate-byte phases, a bit is sent or received on each of the falling and rising edges of CLK.

When receiving data in DTR mode, the OCTOSPI assumes that the external devices also send the data using both CLK rising and falling edges. When DDTR = 1 in OCTOSPI_CCR, the software must clear SSHIFT in OCTOSPI_TCR. Thus, the signals are sampled one half of a CLK cycle later (on the following, opposite edge).

In DTR mode, it is recommended to set DHQC of OCTOSPI_TCR, to shift the outputs by a quarter of cycle and avoid holding issues on the memory side.

Note: DHQC must not be set when the prescaler value is 0, as this action leads to unpredictable behavior.

Figure 165. DTR write in octal-SPI mode (Macronix mode) example

Note: Due to internal synchronization, up to six extra dummy clock cycles may be generated by the Octo-SPI interface after the last data is read.

Dual-quad configuration

When DMM = 1 in OCTOSPI_CR, the OCTOSPI is in dual-memory configuration: if DMODE = 011, two external Quad-SPI devices (device A and device B) are used in order to send/receive eight bits (or 16 bits in DTR mode) every cycle, effectively doubling the throughput.

Each device (A or B) uses the same CLK and NCS signals, but each has separate IO0 to IO3 signals.

The dual-quad configuration can be used in conjunction with the single-SPI, dual-SPI, and quad-SPI modes, as well as with either the SDR or DTR mode.

The device size, as specified by DEVSIZE[4:0] in OCTOSPI_DCR1, must reflect the total external device capacity that is the double of the size of one individual component.

If address X is even, then the byte that the OCTOSPI gives for address X is the byte at the address X/2 of device A, and the byte that the OCTOSPI gives for address X + 1 is the byte at the address X/2 of device B. In other words, the bytes at even addresses are all stored in device A and the bytes at odd addresses are all stored in device B.

When reading the status registers of the devices in dual-quad configuration, twice as many bytes must be read compared to the same read in regular-command protocol: if each device gives eight valid bits after the instruction for fetching the status register, then the OCTOSPI must be configured with a data length of 2 bytes (16 bits), and the OCTOSPI receives one byte from each device.

If each device gives a status of 16 bits, then the OCTOSPI must be configured to read 4 bytes to get all the status bits of both devices in dual-quad configuration. The least-significant byte of the result (in the data register) is the least-significant byte of device A status register. The next byte is the least-significant byte of device B status register. Then, the third byte of the data register is the device A second byte. The fourth byte is the device B second byte (if devices have 16-bit status registers).

An even number of bytes must always be accessed in dual-quad configuration. For this reason, bit 0 of DL[31:0] in OCTOSPI_DLR is stuck at 1 when DMM = 1.

In dual-quad configuration, the behavior of device A interface signals is basically the same as in normal mode. Device B interface signals have exactly the same waveforms as device A ones during the instruction, address, alternate-byte, and dummy-cycle phases. In other words, each device always receives the same instruction and the same address.

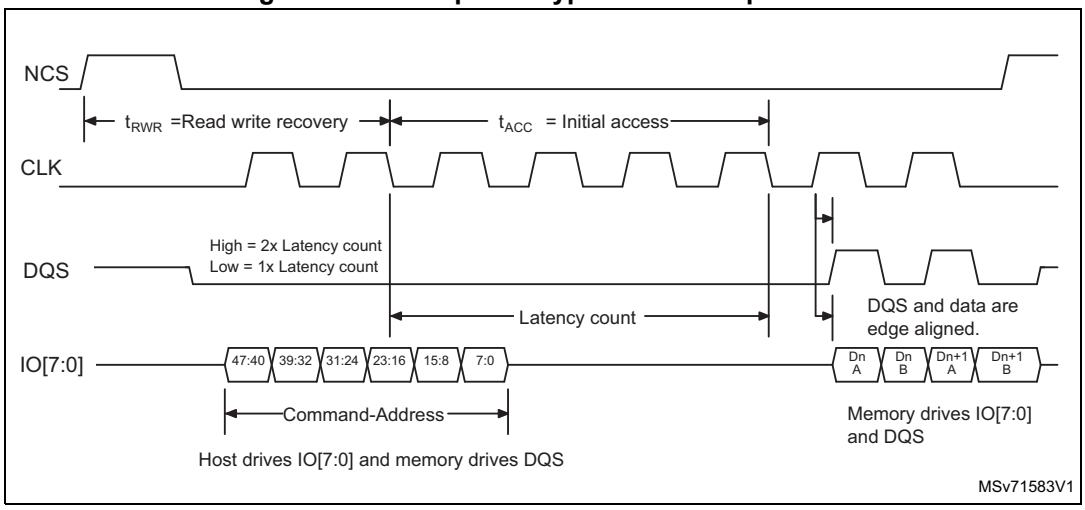
Then, during the data phase, the AIOx and the BIOx buses both transfer data in parallel, but the data that is sent to (or received from) device A is distinct than the one from device B.

24.4.6 HyperBus protocol

The OCTOSPI can communicate with the external device using the HyperBus protocol.

The HyperBus uses 11 to 12 pins depending on the operating voltage:

- IO[7:0] as bidirectional data bus
- DQS for read and write data strobe and latency insertion
- NCS
- CLK
- NCLK for 1.8 V operations (to support this mode, the device must be powered with 1.8 V)



The HyperBus does not require any command specification nor any alternate bytes. As a consequence, a separate register set is used to define the timing of the transaction.

The HyperBus frame is composed of the following phases:

- Command/address phase
- Data phase

The NCS falls before the start of a transaction and rises again after each transaction finishes.

Figure 166. Example of HyperBus read operation

Note: Due to internal synchronization, up to six extra dummy clock cycles may be generated by the Octo-SPI interface after the last data is read.

The specific HyperBus features are configured through the registers in the 0x0200-0x02FC offset range.

Command/address phase

During this initial phase, the OCTOSPI sends 48 bits over IO[7:0] to specify the operations to be performed with the external device.

Table 235. Command/address phase description

CA bit	Bit name	Description
47	R/W#	Identifies the transaction as a read or a write.
46	Address space	Indicates if the transaction accesses the memory or the register space.
45	Burst type	Indicates if the burst is linear or wrapped.
44-16	Row and upper column address	Selects the row and the upper column addresses.
15-3	Reserved	-
2-0	Lower column address	Selects the starting 16-bit word within the half page.

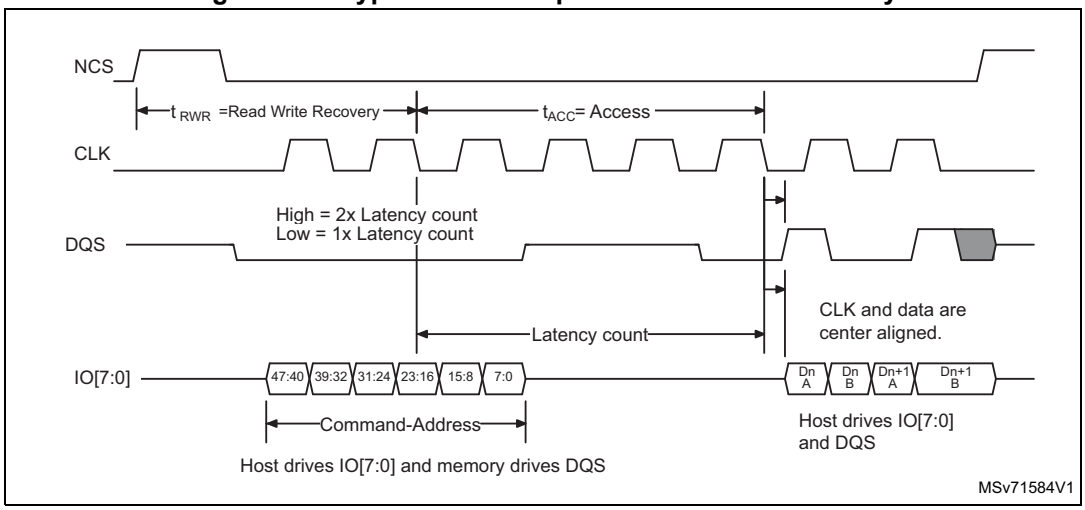
The address space is configured through the memory type MTYP[2:0] in OCTOSPI_DCR1.

The total size of the device must be configured through DEVSIZE[4:0] of OCTOSPI_DCR1. In case of multi-chip product (MCP), the device size is the sum of all the sizes of all the MCP dies.

Read/write operation with initial latency

The HyperBus read and write operations need to respect two timings:

- t_{RWR}: minimal read/write recovery time for the device (defined by TRWR[7:0] in OCTOSPI_HLCR)
- t_{ACC}: access time for the device (defined by TACC[7:0] in OCTOSPI_HLCR) according to the memory latency



During the read operation, the DQS is used by the device, in two ways (see *Figure 166*):

- during the command/address phase, to request an additional latency
- during the data phase, for data strobing

During the write operation, the DQS is used:

- by the device, during the command/address phase, to request an additional latency.
- by the OCTOSPI, during the data phase, for write data masking.

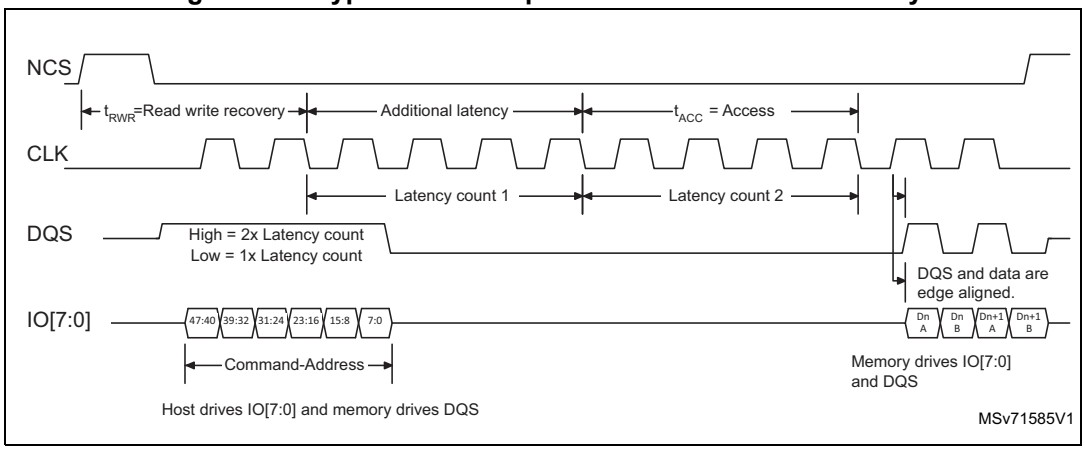
Figure 167. HyperBus write operation with initial latency

Read/write operation with additional latency

If the device needs an additional latency (during refresh period of an SDRAM for example), DQS must be tied to one during one of the DQS signals, during the command/address phase.

An additional t_{ACC} duration is added by the OCTOSPI to meet the device request.

Figure 168. HyperBus read operation with additional latency



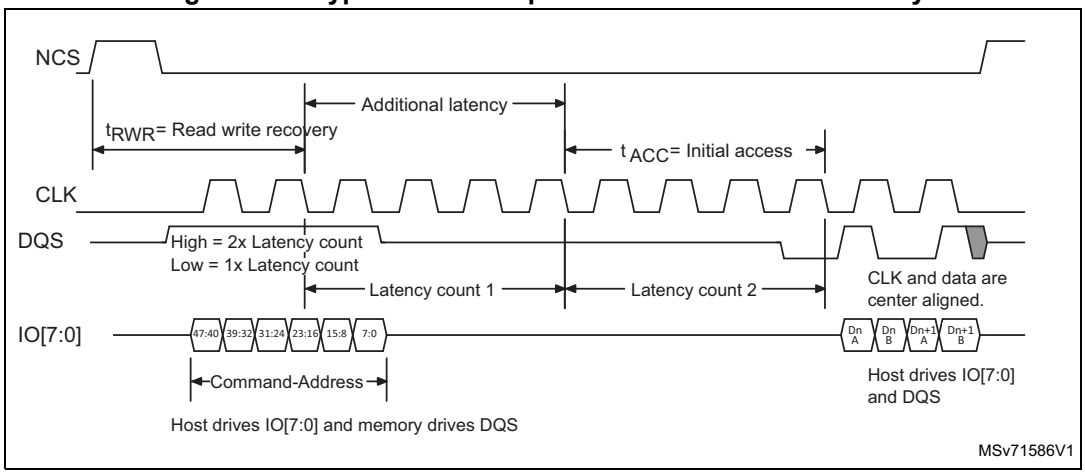


Figure 169. HyperBus write operation with additional latency

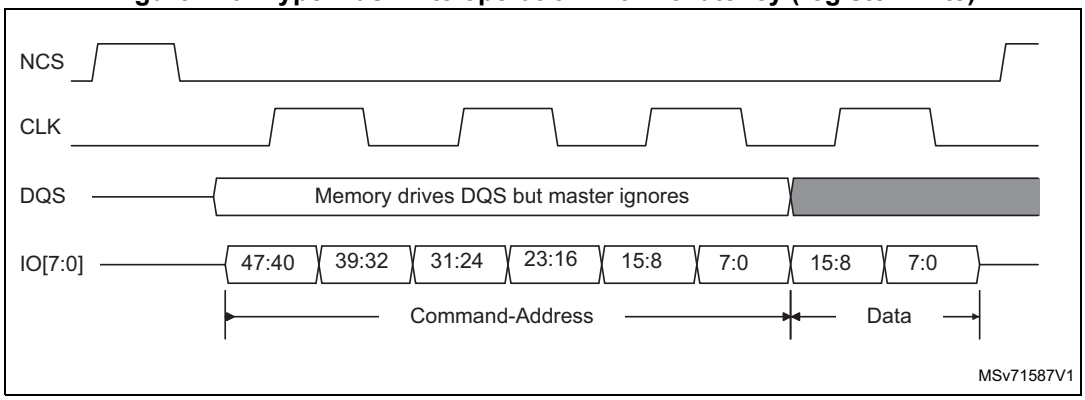
Fixed-latency mode

Some devices or some applications may not want to operate with a variable latency time as described above.



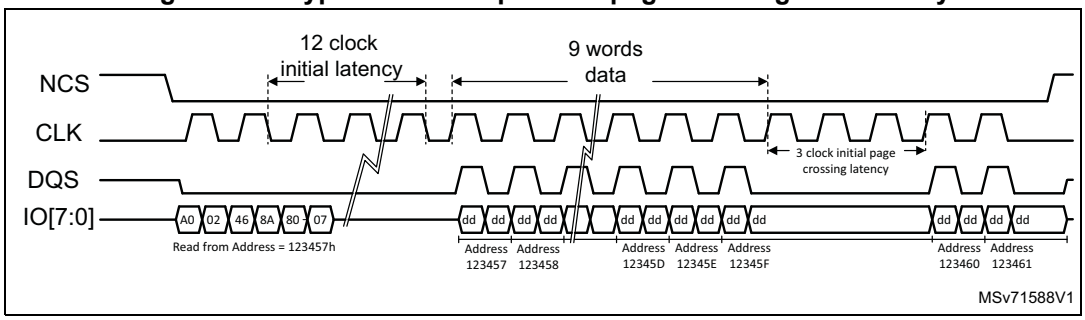
The latency can be forced to 2 x t_{ACC} by setting LM in OCTOSPI_HLCR.

In this OCTOSPI latency mode, the state of the DQS signal is not taken into account by the OCTOSPI, and an additional latency is always added, leading to a fixed 2 x t_{ACC} latency time.

Write operation with no latency

Some devices can also require a zero latency for the write operations. This write-zero latency can be forced by setting WZL in OCTOSPI_HLCR.

Figure 170. HyperBus write operation with no latency (register write)



Latency on page-crossing during the read operations

An additional latency can be needed by some devices for the read operation when crossing pages.

The initial latency must be respected for any page access, as a consequence, when the first access is close to the page boundary, a latency is automatically added at the page crossing to respect the t_{ACC} time.

Figure 171. HyperBus read operation page crossing with latency

24.4.7 Specific features

The OCTOSPI supports some specific features, such as:

- Wrap support
- NCS boundary and refresh

Wrap support

The OCTOSPI supports a hybrid wrap as defined by the HyperBus protocol. A hybrid wrap is also supported in the regular-command protocol.

In hybrid wrap, the transaction can continue after the initial wrap with an incremental access.

The wrap size supported by the target memory is configured by WRAPSIZE in OCTOSPI_DCR2.

Wrap is supported only in memory-read direction and only for data size = 4 bytes. Wrapped reads are supported for both HyperBus and regular-command protocols. To enable wrapped-read accesses, the dedicated OCTOSPI_WPxxx registers must be programmed according to the wrapped-read access characteristics. These registers apply for both HyperBus and regular-command protocols.

If the target memory is not supporting the hybrid wrap, WRAPSIZE must be set to 0.

Note: Hybrid wrap requires that the nonwrapped registers (OCTOSPI_CCR, OCTOSPI_TCR, OCTOSPI_IR) are set according to the memory configuration to satisfy its correct data prefetch (initiated after the wrap command).

The wrap operation cannot be interrupted by a refresh. The refresh event is only considered after the wrap completion.

NCS boundary and refresh

Two processes can be activated to regulate the OCTOSPI transactions:

- NCS boundary
- Refresh

The NCS boundary feature limits a transaction to a boundary of aligned addresses. The size of the address to be aligned with, is configured by CSBOUND[4:0] in OCTOSPI_DCR3: it is equal to $2^{CSBOUND}$.

As an example, if CSBOUND(4:0] = 0x4, the boundary is set to 2^4 = 16 bytes. The NCS is then released each time the LSB address is equal to 0xF, and each time a new transaction is issued to address the next data.

If CSBOUND[4:0] = 0, the feature is disabled. A minimum value of three is recommended.

The NCS boundary feature cannot be used for flash memory devices in write mode since a command is necessary to program another page of the flash memory.

The refresh feature limits the duration of the transactions to the value programmed by REFRESH[31:0] in OCTOSPI_DCR4. The duration is expressed in number of cycles. This allows an external RAM to perform its internal refresh operation regularly.

The refresh value must be greater than the minimal transaction size in terms of number of cycles including the command/address/alternate/dummy phases.

If NCS boundary and refresh are enabled at the same time, the NCS is released on the first condition met.

Restarting after an interrupted transfer

When a read or write operation is interrupted by a timeout or communication regulation feature, the Octo-SPI interface, as soon as possible after getting back the port ownership, reissues the initial command sequence together with the address following the last address actually accessed before interruption. The transfer initially set goes on and ends seamlessly.

24.4.8 OCTOSPI operating mode introduction

The OCTOSPI has the following operating modes regardless of the low-level protocol used (either regular-command or HyperBus):

- indirect mode (read or write)
- automatic status-polling mode (only in regular-command protocol)
- memory-mapped mode

24.4.9 OCTOSPI indirect mode

In indirect mode, the commands are started by writing to the OCTOSPI registers, and data are transferred by writing or reading the data register, in a similar way to other communication peripherals.

When FMODE[1:0] = 00 in OCTOSPI_CR, the OCTOSPI is in indirect-write mode: bytes are sent to the external device during the data phase. Data are provided by writing to OCTOSPI_DR.

When FMODE[1:0] = 01, the OCTOSPI is in indirect-read mode: bytes are received from the external device during the data phase. Data are recovered by reading OCTOSPI_DR.

In indirect mode, when the OCTOSPI is configured in DTR mode over eight lanes with DQS disabled, the given starting address and the data length must be even.

Note: The OCTOSPI_AR register must be updated even if the start address is the same as the start address of the previous indirect access.

The number of bytes to be read/written is specified in OCTOSPI_DLR:

- If DL[31:0] = 0xFFFF FFFF, the data length is considered undefined and the OCTOSPI simply continues to transfer data until it reaches the end of the external device (as

defined by DEVSIZE). If no bytes are to be transferred, DMODE[2:0] must be set to 0 in OCTOSPI_CCR.

- If DL[31:0] = 0xFFFF FFFFF and DEVSIZE[4:0] = 0x1F (its maximum value indicating at 4-Gbyte device), the transfers continue indefinitely, stopping only after an abort request or after the OCTOSPI is disabled. After the last memory address is read (at address 0xFFFF FFFF), reading continues with address = 0x0000 0000.

When the programmed number of bytes to be transmitted or received is reached, the TCF bit is set in OCTOSPI_SR, and an interrupt is generated if TCIE = 1 in OCTOSPI_CR. In the case of an undefined number of data, TCF is set when the limit of the external SPI memory is reached, according to the device size defined in OCTOSPI_DCR1.

Triggering the start of a transfer in regular-command protocol

Depending on the OCTOSPI configuration, there are three different ways to trigger the start of a transfer in indirect mode when using the regular-command protocol. In general, the start of transfer is triggered as soon as the software gives the last information that is necessary for the command. More specifically in indirect mode, a transfer starts when one of the following sequence of events occurs:

- if no address is necessary (ADMODE[2:0] = 000) and if no data need to be provided by the software (FMODE[1:0] = 01 or DMODE[2:0] = 000), and at the moment when a write is performed to INSTRUCTION[31:0] in OCTOSPI_IR
- if an address is necessary (when ADMODE[2:0] ≠ 000) and if no data need to be provided by the software (when FMODE[1:0] = 01 or DMODE[2:0] = 000), and at the moment when a write is performed to ADDRESS[31:0] in OCTOSPI_AR
- if data need to be provided by the software (when FMODE[1:0] = 00 and DMODE[2:0] ≠ 000), and at the moment when a write is performed to DATA[31:0] in OCTOSPI_DR

A write to OCTOSPI_ABR never triggers the communication start. If alternate bytes are required, they must have been programmed before.

As soon as a command is started, the BUSY bit is automatically set in OCTOSPI_SR.

Triggering the start of a transfer in HyperBus protocol

Depending on the OCTOSPI configuration, there are different ways to trigger the start of a command in indirect mode. In general, it is triggered as soon as the firmware gives the last information that is necessary for the transfer to start, and more specifically, a communication in indirect mode is triggered by one of the following register settings, when it is the last one to be executed:

- when a write is performed to ADDRESS[31:0] (OCTOSPI_AR) with ADMODE[2:0] ≠ 000 in indirect read mode (FMODE[1:0] = 01).
- when a write is performed to DATA[31:0] (OCTOSPI_DR) in indirect-write mode (when FMODE = 00).
- when a (dummy) write is performed to INSTRUCTION[31:0] (OCTOSPI_IR) for indirect read mode (with ADMODE[2:0] = 000 and FMODE = 01).

As soon as a transfer is started, the BUSY bit (OCTOSPI_SR[5]) is automatically set.

FIFO and data management

Data in indirect mode passes through a 32-byte FIFO that is internal to the OCTOSPI. FLEVEL in OCTOSPI_SR indicates how many bytes are currently being held in the FIFO.

AHB burst transactions are supported. Data of the burst are successively written in OCTOSPI_DR, and immediately transferred in the internal FIFO.

In indirect-write mode (FMODE[1:0] = 00), the software adds data to the FIFO when it writes in OCTOSPI_DR. A word write adds 4 bytes to the FIFO, a half-word write adds 2 bytes, and a byte write adds only 1 byte. If the software adds too many bytes to the FIFO (more than indicated in DL[31:0]), the extra bytes are flushed from the FIFO at the end of the write operation (when TCF is set).

The byte/half-word accesses to OCTOSPI_DR must be done only to the least significant byte/halfword of the 32-bit register.

FTHRES is used to define a FIFO threshold after which point the FIFO threshold flag, FTF, gets set. In indirect-read mode, FTF is set when the number of valid bytes to be read from the FIFO is above the threshold. FTF is also set if there is any data left in the FIFO after the last byte is read from the external device, regardless of FTHRES setting. In indirect-write mode, the FTF is set when the number of empty bytes in the FIFO is above the threshold.

If FTIE = 1, there is an interrupt when the FTF is set. If DMAEN = 1, a DMA transfer is initiated when the FTF is set. The FTF is cleared by hardware as soon as the threshold condition is no longer true (after enough data has been transferred by the CPU or DMA).

The last data read in RX FIFO remains valid as long as there is no request for the next line. This means that, when the application reads several times in a row at the same location, the data is provided from the RX FIFO and not read again from the distant memory.

24.4.10 OCTOSPI automatic status-polling mode

In automatic status-polling mode, the OCTOSPI periodically starts a command to read a defined number of status bytes (up to four). The received bytes can be masked to isolate some status bits and an interrupt can be generated when the selected bits have a defined value. The automatic status-polling mode must be used only in regular-command protocol. For HyperBus protocol, it is not exploitable since the read status register into the HyperFlash memory must be performed in two steps (a write operation followed by a read operation).

The access to the device begins in the same manner as in indirect-read mode. BUSY in OCTOSPI_SR goes high at this point and stays high even between the periodic accesses.

The content of MASK[31:0] in OCTOSPI_PSMAR is used to mask the data from the external device in automatic status-polling mode:

- If the MASK[n] = 0, then bit n of the result is masked and not considered.
- If MASK[n] = 1, and the content of bit[n] is the same as MATCH[n] in OCTOSPI_PSMAR, then there is a match for bit n.

If PMM = 0 in OCTOSPI_CR, the AND-match mode is activated: SMF is set in OCTOSPI_SR only when there is a match on all of the unmasked bits.

If PMM = 1 in OCTOSPI_CR, the OR-match mode is activated: SMF gets set if there is a match on any of the unmasked bits.

An interrupt is called when SMF = 1 if SMIE = 1.

If APMS is set in OCTOSPI_CR, the operation stops and BUSY goes to 0 as soon as a match is detected. Otherwise, BUSY stays at 1 and the periodic accesses continue until there is an abort or until the OCTOSPI is disabled (EN = 0).

OCTOSPI_DR contains the latest received status bytes (FIFO deactivated). The content of this register is not affected by the masking used in the matching logic. FTF in OCTOSPI_SR is set as soon as a new reading of the status is complete. FTF is cleared as soon as the data is read.

In automatic status-polling mode, variable latency is not supported. The memory must then be configured in fixed latency.

24.4.11 OCTOSPI memory-mapped mode

When configured in memory-mapped mode, the external SPI device is seen as an internal memory.

Note: No more than 256 Mbytes can be addressed even if the external device capacity is larger.

If an access is made to an address outside of the range defined by DEVSIZE[4:0] but still within the 256 Mbytes range, then an AHB error is given. The effect of this error depends on the AHB master that attempted the access:

- If it is the Cortex CPU, a hard-fault interrupt is generated.
- If it is a DMA, a DMA transfer error is generated, and the corresponding DMA channel is automatically disabled.

Byte, half-word, and word access types are all supported.

A support for execute in place (XIP) operation is implemented, where the OCTOSPI continues to load the bytes to the addresses following the most recent access. If subsequent accesses are continuous to the bytes that follow, then these operations end up quickly since their results were prefetched.

By default, the OCTOSPI never stops its prefetch operation. It either keeps the previous read operation active with the NCS maintained low or it relaunches a new transfer, even if no access to the external device occurs for a long time.

Since external devices tend to consume more power when the NCS is held low, the application may want to activate the timeout counter (TCEN = 1 in OCTOSPI_CR): the NCS is released after a period defined by TIMEOUT[15:0] in OCTOSPI_LPTR, when x cycles have elapsed without access since the clock is inactive.

BUSY goes high as soon as the first memory-mapped access occurs. Because of the prefetch operations, BUSY does not fall until there is an abort, or the peripheral is disabled.

It is not recommended to program the flash memory using the memory-mapped writes. The indirect-write mode fulfills this operation.

However, if the application requires the use of the MCE for encryption (check MCE product availability), the memory-mapped write mode may be used to program encrypted data to external flash memory under the following conditions:

- Prefetch must be enabled.
- In block cipher mode, the CPU must write a complete 128-bit data block to prevent the MCE from initiating read-modify-write operations when only a few bytes need to be

programmed. This precaution avoids incorrect programming operations. There are no specific constraints to respect if the MCE is used in stream cipher mode.

- Apply the abort sequence to exit memory-mapped mode when the data linked to the page has been written in the external memory buffers. The abort sequence triggers the start of the page programming.
- Switch to the automatic status-polling mode to monitor the completion of the page programing phase.
- Relaunch the write enable command in indirect mode, then switch back to the memory-mapped mode configuration to continue to program additional pages if any.

It is recommended to add a synchronization barrier between the end of the controller registers configuration and the first memory-mapped access to the external memory when the controller is configured in memory-mapped mode.

The controller can apply an automatic address offset to simplify memory area code switching, such as during a firmware update (if the address offset feature is available in the product implementation table). To enable this feature, set the ADOFFEN bit in the XSPI_CR register and configure the offset value in the ADOFF[4:0] bitfield of the XSPI_DCR1 register. The offset is modulo 256 bytes.

24.4.12 OCTOSPI configuration introduction

The OCTOSPI configuration is done in three steps:

1. OCTOSPI system configuration
2. OCTOSPI device configuration
3. OCTOSPI mode configuration

24.4.13 OCTOSPI system configuration

The OCTOSPI is configured using OCTOSPI_CR. The user must program:

- the functional mode with FMODE[1:0]
- the automatic status-polling mode behavior if needed with PMM and APMS
- the FIFO level with FTHRES
- the DMA use with DMAEN
- the timeout counter use with TCEN
- the dual-memory configuration, if needed, with DMM

In case of an interrupt use, the respective enable bit can also be set during this phase.

If the timeout counter is used, the timeout value is programmed in OCTOSPI_LPTR.

The DMA channel must not be enabled during the OCTOSPI configuration: it must be enabled only when the operation is fully configured, to avoid any unexpected request generation.

The DMA and OCTOSPI must be configured in a coherent manner regarding data length: FTHRES value must reflect the DMA burst size.

24.4.14 OCTOSPI device configuration

The parameters related to the external device targeted are configured through OCTOSPI_DCR1 and OCTOSPI_DCR2.The user must program:

- the device size with DEVSIZE[4:0]
- the chip-select minimum high time with CSHT[5:0]
- the clock mode with FRCK and CKMODE
- the device frequency with PRESCALER[7:0]

DEVSIZE[4:0] defines the size of external memory using the following formula:

$$\text{Number of bytes in the device} = 2^{\text{DEVSIZE+1}}$$

where DEVSIZE+1 is the number of address bits required to address the external device. The external device capacity can go up to 4 Gbytes (addressed using 32 bits) in indirect mode, but the addressable space in memory-mapped mode is limited to 256 Mbytes.

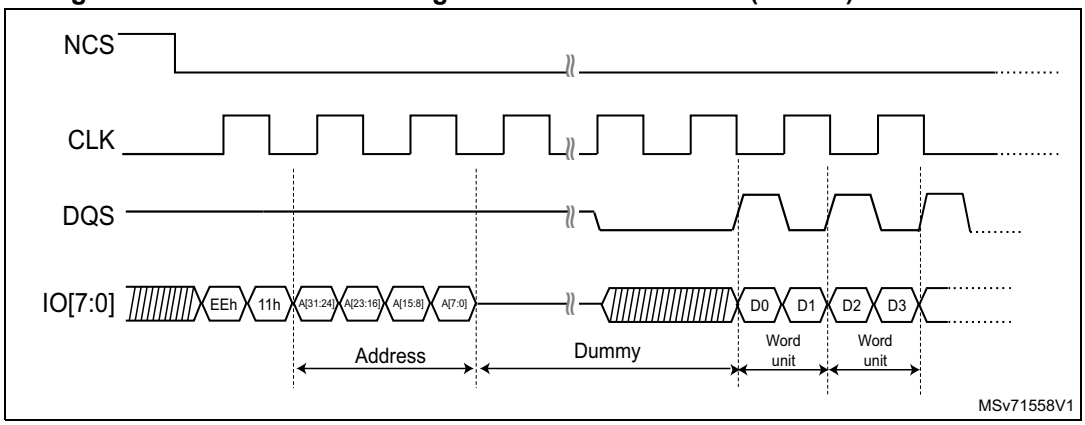
If DMM = 1, DEVSIZE[4:0] must reflect the total capacity of the two devices together considering the above formula (DEVSIZE[4:0] value is so equal to one of the two memory capacities).

When the OCTOSPI executes two commands, one immediately after the other, it raises the chip-select signal (NCS) high between the two commands for only one CLK cycle by default.

If the external device requires more time between commands, the chip-select high time CSHT[5:0] can be used to specify the minimum number of CLK cycles for which the NCS must remain high.

CKMODE indicates the level that the CLK takes between commands (when NCS = 1).

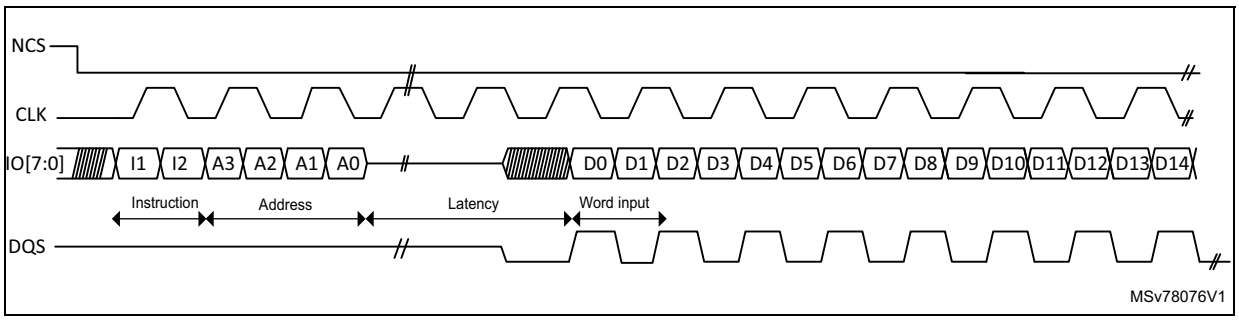
In HyperBus protocol, the device timing (t_{ACC} and t_{RWR}) and the latency mode must be configured in OCTOSPI_HLCR.



Memory types

External memory providers may present some architecture and slight data formatting differences between them. The bitfield MTYP[2:0] into the OCTOSPI_CR register allows targeting the right controller configuration depending on the associated memory type selected in the application. This is the responsibility of the software developer to align the controller configuration to fit with the targeted memory type.

The memory types are grouped in a such way:



- D0/D1 data ordering in octal-SPI data mode (DMODE[2:0] = 100) in DTR mode by configuring MTYP[2:0] = 000. For instance, Micron is using such data ordering. In this configuration, the DQS is sent with a polarity inverted respect to the clock polarity.

Figure 172. D0/D1 data ordering in octal-SPI DTR mode (Micron) - Read access

- D1/D0 data ordering in octal-SPI data mode (DMODE[2:0] = 100) in DTR mode by configuring MTYP[2:0] = 001. For instance, Macronix is using this reverse data ordering in its Octaflash portfolio (this configuration is not adapted to its OctaRAM™ memories). DQS is keeping the same polarity as the clock when reading data from the memory. Refer to *Figure 163: DTR read in octal-SPI mode with DQS (Macronix mode) example*.
- D0/D1 data ordering in octal-SPI data mode (DMODE[2:0] = 100) in DTR mode by configuring MTYP[2:0] = 010. DQS is keeping the same polarity as the clock when reading data from the memory. It is defined as the standard mode since it is the configuration to select when the targeted memory does not fit with any others modes proposed by the MTYP configuration values.

Figure 173. D0/D1 data ordering in octal-SPI DTR mode with DQS and CLK polarity aligned during Read access

- D1/D0 data ordering in octal-SPI data mode (DMODE[2:0] = 100) in DTR mode by configuring MTYP[2:0] = 011 with specific address phase built with row and column to fit with Macronix OctaRAM™ memories requirement (refer to *Table 236: OctaRAM command address bit assignment (based on 64-Mbyte OctaRAM)*. This is the controller which translates internally the targeted address provided by the software in row/column address formatting to sent to the memory. DQS is keeping the same polarity as the clock one when reading data from the memory.

Figure 174. OctaRAM read operation with reverse data ordering D1/D0

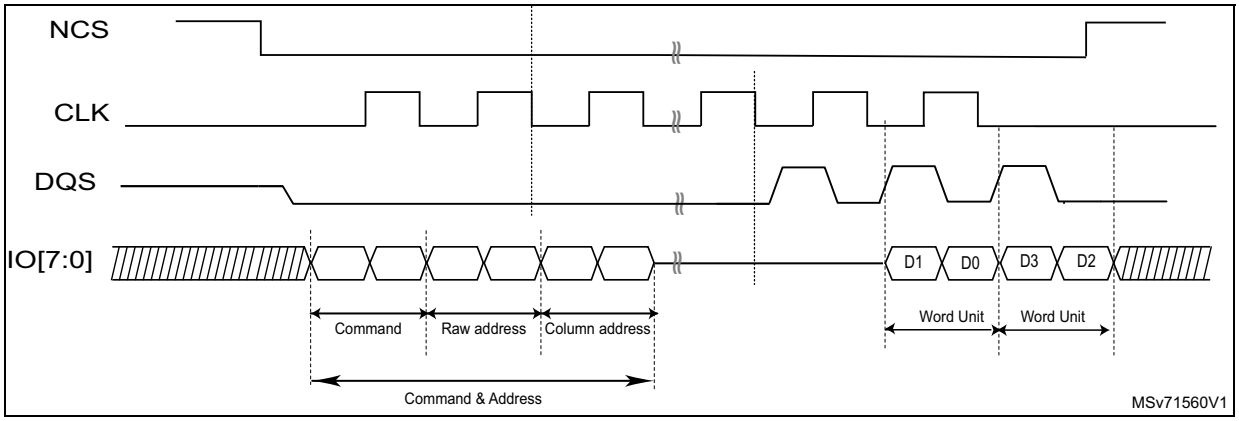


Table 236. OctaRAM command address bit assignment (based on 64-Mbyte(1) OctaRAM)

Clock	1st clock	2nd clock		3rd clock	
Function	Command	Row address		Column address	
SIO[7]	Command	Reserved	RA7	CA9	Reserved
SIO[6]		Reserved	RA6	CA8	Reserved
SIO[5]		Reserved	RA5	CA7	Reserved
SIO[4]		RA12	RA4	CA6	Reserved
SIO[3]		RA11	RA3	CA5	CA3
SIO[2]		RA10	RA2	CA4	CA2
SIO[1]		RA9	RA1	Reserved	CA1
SIO[0]		RA8	RA0	Reserved	CA0(2)

1. Example of 64-Mbyte OctaRAM address assignment:
Row Address [RA12:RA0]: 8K. Column address [CA9:CA0]: 1K. 64-Mbyte density = 8K x 1K x 8 bits
2. Column address A0 must be always 0.

- HyperBus memories need to be selected when targeted by the application. The configuration to set depends on the access type:
  - HyperBus memory mode: The protocol follows the HyperBus specification. MTYP[2:0] = 100 is the configuration to use to access the memory space.
  - HyperBus register mode (addressing register space): the memory-mapped accesses in this mode must be noncacheable, or the indirect read/write modes must be used. The configuration to be set for this particular register space access is MTYP[2:0] = 101.

24.4.15 OCTOSPI regular-command mode configuration

Indirect mode configuration

When FMODE[1:0] = 00, the indirect-write mode is selected and data can be sent to the external device. When FMODE[1:0] = 01, the indirect-read mode is selected, and data can be read from the external device.

When the OCTOSPI is used in indirect mode, the frames are constructed in the following way:

1. Specify a number of data bytes to read or write in OCTOSPI_DLR.
2. Specify the frame timing in OCTOSPI_TCR.
3. Specify the frame format in OCTOSPI_CCR.
4. Specify the instruction in OCTOSPI_IR.
5. Specify the optional alternate byte to be sent right after the address phase in OCTOSPI_ABR.
6. Specify the targeted address in OCTOSPI_AR.
7. Enable the DMA channel if needed.
8. Read/write the data from/to the FIFO through OCTOSPI_DR (if no DMA usage).

If neither the address register (OCTOSPI_AR) nor the data register (OCTOSPI_DR) need to be updated for a particular command, then the command sequence starts as soon as OCTOSPI_IR is written. This is the case when both ADMODE[2:0] and DMODE[2:0] equal 000, or if just ADMODE[2:0] = 000 when in indirect-read mode (FMODE[1:0] = 01).

When an address is required (ADMODE[2:0] ≠ 000) and the data register does not need to be written (FMODE[1:0] = 01 or DMODE[2:0] = 000), the command sequence starts as soon as the address is updated with a write to OCTOSPI_AR.

In case of data transmission (FMODE[1:0] = 00 and DMODE[2:0] ≠ 000), the communication start is triggered by a write in the FIFO through OCTOSPI_DR.

Automatic status-polling mode configuration

The automatic status-polling mode is enabled by setting FMODE[1:0] = 10. In this mode, the programmed frame is sent and data are retrieved periodically.

The maximum amount of data read in each frame is 4 bytes. If more data is requested in OCTOSPI_DLR, it is ignored, and only 4 bytes are read. The periodicity is specified in OCTOSPI_PIR.

Once the status data has been retrieved, the following can be processed:

- Set SMF (an interrupt is generated if enabled).
- Stop automatically the periodic retrieving of the status bytes.

The received value can be masked with the value stored in OCTOSPI_PSMKR, and can be ORed or ANDed with the value stored in OCTOSPI_PSMAR.

In case of a match, SMF is set and an interrupt is generated if enabled. The OCTOSPI can be automatically stopped if AMPS is set. In any case, the latest retrieved value is available in OCTOSPI_DR.

When the OCTOSPI is used in automatic status-polling mode, the frames are constructed in the following way:

1. Specify the input mask in OCTOSPI_PSMKR.

2. Specify the comparison value in OCTOSPI_PSMAR.
3. Specify the read period in OCTOSPI_PIR.
4. Specify a number of data bytes to read in OCTOSPI_DLR.
5. Specify the frame timing in OCTOSPI_TCR.
6. Specify the frame format in OCTOSPI_CCR.
7. Specify the instruction in OCTOSPI_IR.
8. Specify the optional alternate byte to be sent right after the address phase in OCTOSPI_ABR.
9. Specify the optional targeted address in OCTOSPI_AR.

If the address register (OCTOSPI_AR) does not need to be updated for a particular command, then the command sequence starts as soon as OCTOSPI_CCR is written. This is the case when ADMODE[2:0] = 000.

When an address is required (ADMODE[2:0] ≠ 000), the command sequence starts as soon as the address is updated with a write to OCTOSPI_AR.

Memory-mapped mode configuration

In memory-mapped mode, the external device is seen as an internal memory but with some latency during accesses. Read and write operations are allowed to the external device in this mode.

It is not recommended to program the flash memory using memory-mapped writes, as the internal flags for erase or programming status have to be polled. The indirect-write mode fulfills this operation, possibly in conjunction with the automatic status-polling mode.

The memory-mapped mode is entered by setting FMODE[1:0] = 11 in OCTOSPI_CR.

The programmed instruction and frame are sent when an AHB master accesses the memory-mapped space.

The FIFO is used as a prefetch buffer to anticipate any linear reads. Any access to OCTOSPI_DR in this mode returns zero.

The data length register (OCTOSPI_DLR) has no meaning in memory-mapped mode.

When the OCTOSPI is used in memory-mapped mode, the frames are constructed in the following way:

1. Specify the frame timing in OCTOSPI_TCR for read operation.
2. Specify the frame format in OCTOSPI_CCR for read operation.
3. Specify the instruction in OCTOSPI_IR.
4. Specify the optional alternate byte to be sent right after the address phase in OCTOSPI_ABR for read operation.
5. Specify the frame timing in OCTOSPI_WTCR for write operation.
6. Specify the frame format in OCTOSPI_WCCR for write operation.
7. Specify the instruction in OCTOSPI_WIR.
8. Specify the optional alternate byte to be sent right after the address phase in OCTOSPI_WABR for write operation.

All configuration operations must be completed (ensured by checking BUSY = 0) before the first access to the memory area: any register write operation when BUSY = 1 has no effect and is not signaled with an error response. On the first access, the OCTOSPI becomes

busy, and no further configuration is allowed. Then, the only way to get BUSY low is to clear the ENABLE bit or to abort by setting the ABORT bit.

OCTOSPI delayed data sampling when no DQS is used

By default, when no DQS is used, the OCTOSPI samples the data driven by the external device one half of a CLK cycle after the external device drives the signal.

In case of any external signal delays, it may be useful to sample the data later. Using SSHIFT in OCTOSPI_TCR, the sampling of the data can be shifted by half of a CLK cycle.

The firmware must clear SSHIFT when the data phase is configured in DTR mode (DDTR = 1).

OCTOSPI delayed data sampling when DQS is used

When external DQS is used as a sampling clock, it can be shifted in time to compensate the data propagation delay.

This shift is performed by a delay hardware element located outside of the controller into the RCC (RCC_DLYCFGR) or implemented on an external dedicated block delay peripheral depending on the product (refer to the product reference manual for information about how to manage and configure the delay).

In configurations where delay does not need to be compensated, the external delay block can be bypassed by setting DLYBYP in OCTOSPI_DCR1.

24.4.16 OCTOSPI HyperBus protocol configuration

Indirect mode configuration (HyperBus)

When FMODE[1:0] = 00, the indirect-write mode is selected and data can be sent to the external device. When FMODE[1:0] = 01, the indirect-read mode is selected where data can be read from the external device. ADMODE must be configured with a value different from 000 (for instance ADMODE = 100).

When the OCTOSPI is used in indirect mode, the frames are constructed in the following way:

1. Specify a number of data bytes to read or write in OCTOSPI_DLR.
2. Specify the targeted address in OCTOSPI_AR.
3. Enable the DMA channel if needed.
4. Read/write the data from/to the FIFO through OCTOSPI_DR (if no DMA usage).

In indirect-read mode, the command sequence starts as soon as the address is updated with a write to OCTOSPI_AR.

In indirect-write mode, the communication start is triggered by a write in the FIFO through OCTOSPI_DR.

Memory-mapped mode configuration (HyperBus)

In memory-mapped mode, the external device is seen as an internal memory but with some latency during the accesses. Read and write operations are allowed to the external device in this mode.

It is not recommended to program the flash memory using the memory-mapped writes: the indirect-write mode fulfills this operation.

The memory-mapped mode is entered by setting FMODE[1:0] = 11. The programmed instruction and frame is sent when an AHB master accesses the memory-mapped space.

The FIFO is used as a prefetch buffer to anticipate any linear reads. Any access to OCTOSPI_DR in this mode returns zero.

The data length register (OCTOSPI_DLR) has no meaning in memory-mapped mode.

All the configuration operation must be completed before the first access to the memory area. On the first access, the OCTOSPI becomes busy, and no configuration is allowed. Then, the only way to get BUSY low is to clear the ENABLE bit, or to abort by setting the ABORT bit.

24.4.17 OCTOSPI error management

The following errors set the TEF flag in OCTOSPI_SR and generates an interrupt if enabled (TEIE = 1 in OCTOSPI_CR):

- in indirect or automatic status-polling mode, when a wrong address has been programmed in OCTOSPI_AR (according to the device size defined by DEVSIZE[4:0]).
- in indirect mode, if the address plus the data length exceed the device size: TEF is set as soon as the access is triggered.

In memory-mapped mode, the OCTOSPI generates an AHB slave error in the following situations, setting the BERRF flag in XSPI_SR and generating an interrupt if enabled (BERRIE = 1 in XSPI_CR) (if the Bus error bit feature is available in the product implementation table, otherwise the Slave bus error response is generated at system level as transaction response with no dedicated bit into the controller status register):

- The memory-mapped mode is disabled and an AHB read or write request occurs.
- A read or write address (including the address offset if ADOFFEN bit is set) exceeds the size of the external memory.
- An abort is received while a read or write burst is ongoing.
- The OCTOSPI is disabled while a read or write burst is requested.
- A write wrap burst is received.
- A write request is received while DQSE = 0 in OCTOSPI_WCCR in octal DTR mode, in dual-memory configuration, in HyperBus mode.
- A read or write request is received while DMODE[2:0] = 000 (no data phase), except when MTYP[2:0] is HyperBus.
- Illegal access size when wrap read burst. This means that the AHB bus transfer size (HSIZE) is different from 4 bytes (only for memory-mapped mode).
- Bit DMM is set in OCTOSPI_CR (dual-memory configuration) and octal mode is set.

24.4.18 OCTOSPI BUSY and ABORT

Once the OCTOSPI starts an operation with the external device, BUSY is automatically set in OCTOSPI_SR.

In indirect mode, BUSY is reset once the OCTOSPI has completed the requested command sequence and the FIFO is empty.

In automatic status-polling mode, BUSY goes low only after the last periodic access is complete, due to a match when APMS = 1 or due to an abort.

After the first access in memory-mapped mode, BUSY goes low only on an abort.

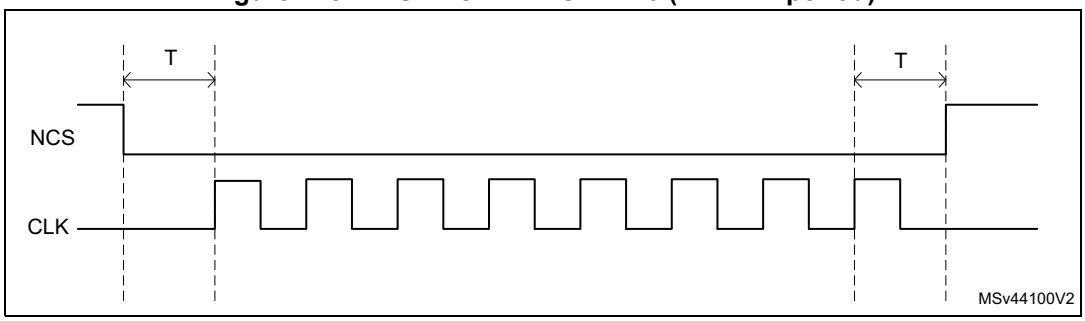
Any operation can be aborted by setting ABORT in OCTOSPI_CR. Once the abort is completed, BUSY and ABORT are automatically reset, and the FIFO is flushed.

Before setting ABORT, the software must ensure that all the current transactions are finished using the synchronization barriers. When DMA is enabled to handle the data read or write operations in OCTOSPI_DR, it is recommended to disable the DMA channel before aborting the OCTOSPI.

Note: Some devices may misbehave if a write operation to a status register is aborted.

24.4.19 OCTOSPI reconfiguration or deactivation

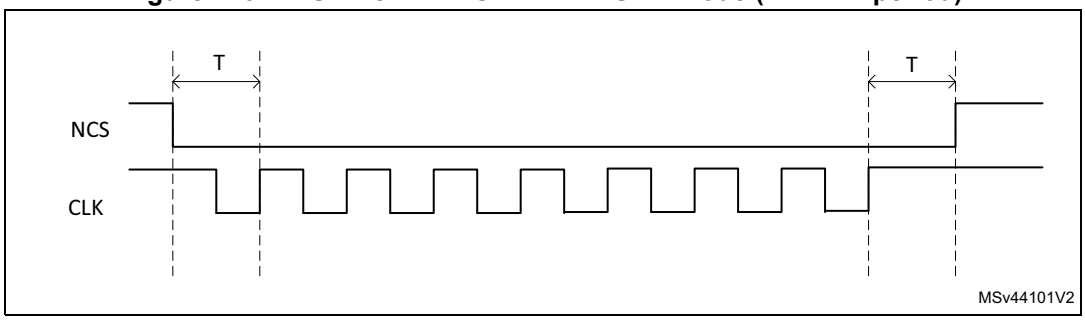
Before any OCTOSPI reconfiguration, the software must ensure that all the transactions are completed:



- After a memory-mapped write, the software must perform a dummy read followed by a synchronization barrier, then an abort.
- After a memory-mapped read, the software must perform a synchronization barrier than an abort.

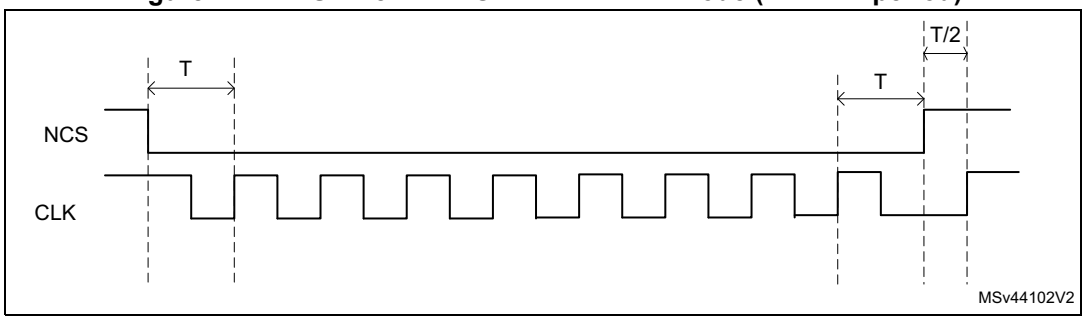
24.4.20 NCS behavior

By default, NCS is high, deselecting the external device. NCS falls before an operation begins and rises as soon as it finishes.



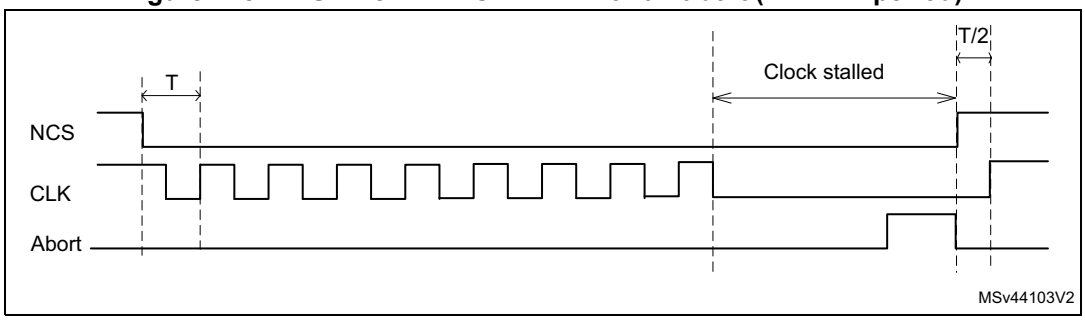
When CKMODE = 0 (clock mode 0: CLK stays low when no operation is in progress), NCS falls one CLK cycle before an operation first rising CLK edge, and NCS rises one CLK cycle after the operation final rising CLK edge (see the figure below).

Figure 175. NCS when CKMODE = 0 (T = CLK period)



When CKMODE = 1 (clock mode 3: CLK goes high when no operation is in progress) and when in SDR mode, NCS falls one CLK cycle before an operation first rising CLK edge, and NCS rises one CLK cycle after the operation final rising CLK edge (see the figure below).

Figure 176. NCS when CKMODE = 1 in SDR mode (T = CLK period)



When the CKMODE = 1 (clock mode 3) and DDTR = 1 (data DTR mode), NCS falls one CLK cycle before an operation first rising CLK edge, and NCS rises one CLK cycle after the operation final active rising CLK edge (see the figure below). Because the DTR operations must finish with a falling edge, CLK is low when NCS rises, and CLK rises back up one half of a CLK cycle afterwards.

Figure 177. NCS when CKMODE = 1 in DTR mode (T = CLK period)

When the FIFO stays full during a read operation, or if the FIFO stays empty during a write operation, the operation stalls and CLK stays low until the software services the FIFO. If an abort occurs when an operation is stalled, NCS rises just after the abort is requested and then CLK rises one half of a CLK cycle later (see the figure below).

Figure 178. NCS when CKMODE = 1 with an abort (T = CLK period)

24.5 Address alignment and data number

The table below summarizes the effect of the address alignment and programmed data number depending on the use case.

Table 237. Address alignment cases

Memory type	Transaction type	Constraint on address(1)	Impact if constraint on address not respected	Constraint on number of bytes(1)	Impact if constraint on bytes not respected
Single, dual, quad flash or SRAM (DMM = 0)	IND(2) read	None	None	None	None
	MM(3) read				
	IND write				
	MM write				
Single, dual, quad flash or SRAM (DMM = 1)	IND read	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM read	None	None	None	None
	IND write	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM write	Even	Slave error	Even	Last byte is lost.
Octal flash in SDR mode	IND read	None	None	None	None
	MM read				
	IND write				
	MM write				
Octal memory in DTR mode without WDM(6) or 8-bit HyperFLASH	IND read	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM read	None	None	None	None
	IND write	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM write	Even	Slave error	Even	Last byte is lost.
Octal flash or RAM in DTR mode with WDM	IND read	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM read	None	None	None	None
	IND write(7)				
	MM write				
8-bit HyperRAM	IND read	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM read	None	None	None	None
	IND write(7)				
	MM write				

1. To be respected by the software.
2. IND = indirect mode.
3. MM = memory-mapped mode
4. Extra data at transfer start.
5. Extra data at transfer end.
6. WDM = write data mask.

7. If the FTHRES bitfield is set to the maximum value with DLR value greater than the data burst length, and if the DMA is enabled or the interrupt based on FIFO THRESHOLD Flag is enabled (FTF), the address must be modulo 2 aligned in DTR mode when the initiator (DMA, CPU, ...) is writing the data with a burst length equal to the FIFO size.

24.6 OCTOSPI interrupts

An interrupt can be produced on the following events:

- Timeout
- Status match
- FIFO threshold
- Transfer complete
- Transfer error

Separate interrupt enable bits are available to provide more flexibility.

Table 238. OCTOSPI interrupt requests

Interrupt event	Event flag	Enable control bit
Timeout	TOF	TOIE
Status match	SMF	SMIE
FIFO threshold	FTF	FTIE
Transfer complete	TCF	TCIE
Transfer error	TEF	TEIE

24.7 OCTOSPI registers

24.7.1 OCTOSPI control register (OCTOSPI_CR)

Address offset: 0x0000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	FMODE[1:0]		Res.	Res.	Res.	Res.	PMM	APMS	BERRIE	TOIE	SMIE	FTIE	TCIE	TEIE
		rw	rw					rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	FTHRES[4:0]					MSEL	DMM	Res.	ADOFFEN	TCEN	DMAEN	ABORT	EN
			rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	w	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:28 **FMODE[1:0]**: Functional mode

This bitfield defines the OCTOSPI functional mode of operation.

00: Indirect-write mode

01: Indirect-read mode

10: Automatic status-polling mode (relevant in regular-command protocol only)

11: Memory-mapped mode

If DMAEN = 1 already, then the DMA controller for the corresponding channel must be disabled before changing the FMODE[1:0] value.

Note: This bitfield can be modified only when BUSY = 0.

Bits 27:24 Reserved, must be kept at reset value.

Bit 23 **PMM**: Polling match mode

This bit indicates which method must be used to determine a match during the automatic status-polling mode.

0: AND-match mode, SMF is set if all the unmasked bits received from the device match the corresponding bits in the match register.

1: OR-match mode, SMF is set if any of the unmasked bits received from the device matches its corresponding bit in the match register.

Note: This bit can be modified only when BUSY = 0.

Bit 22 **APMS**: Automatic status-polling mode stop

This bit determines if the automatic status-polling mode is stopped after a match.

0: Automatic status-polling mode is stopped only by abort or by disabling the OCTOSPI.

1: Automatic status-polling mode stops as soon as there is a match.

Note: This bit can be modified only when BUSY = 0.

Bit 21 **BERRIE**: Bus error interrupt enable

This bit enables the bus error interrupt (if Bus error bit feature is available in the product implementation table).

0: Interrupt disabled

1: Interrupt enabled

Bit 20 **TOIE**: Timeout interrupt enable

This bit enables the timeout interrupt.

0: Interrupt disabled

1: Interrupt enabled

Bit 19 **SMIE**: Status-match interrupt enable

This bit enables the status-match interrupt.

0: Interrupt disabled

1: Interrupt enabled

Bit 18 **FTIE**: FIFO threshold interrupt enable

This bit enables the FIFO threshold interrupt.

0: Interrupt disabled

1: Interrupt enabled

Bit 17 **TCIE**: Transfer complete interrupt enable

This bit enables the transfer complete interrupt.

0: Interrupt disabled

1: Interrupt enabled

Bit 16 **TEIE**: Transfer error interrupt enable

This bit enables the transfer error interrupt.

0: Interrupt disabled

1: Interrupt enabled

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **FTHRES[4:0]**: FIFO threshold level

This bitfield defines, in indirect mode, the threshold number of bytes in the FIFO that causes the FIFO threshold flag FTF in OCTOSPI_SR, to be set.

00000: FTF is set if there are one or more free bytes available to be written to in the FIFO in indirect-write mode, or if there are one or more valid bytes can be read from the FIFO in indirect-read mode.

00001: FTF is set if there are two or more free bytes available to be written to in the FIFO in indirect-write mode, or if there are two or more valid bytes can be read from the FIFO in indirect-read mode.

...

11111: FTF is set if there are 32 free bytes available to be written to in the FIFO in indirect-write mode, or if there are 32 valid bytes can be read from the FIFO in indirect-read mode.

Note: If DMAEN = 1, the DMA controller for the corresponding channel must be disabled before changing the FTHRES[4:0] value.

Bit 7 **MSEL**: External memory select

This bit selects the external memory to be addressed in single-, dual-, quad-SPI mode in single-memory configuration (when DMM = 0).

0: External memory 1 selected (data exchanged over IO[3:0])

1: External memory 2 selected (data exchanged over IO[7:4])

This bit is ignored when DMM = 1 or when octal-SPI mode is selected.

Bit 6 **DMM**: Dual-memory configuration

This bit activates the dual-memory configuration, where two external devices are used simultaneously to double the throughput and the capacity

0: Dual-memory configuration disabled

1: Dual-memory configuration enabled

Note: This bit can be modified only when BUSY = 0.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **ADOFFEN**: Address offset enable

An offset may be applied on the memory address. The offset value is set into ADOFF[4:0].

0: Address offset disabled

1: Address offset enabled

Note: This bit can be modified only when BUSY = 0. This bit is present only if the address offset feature is available in the product implementation table.

Bit 3 **TCEN**: Timeout counter enable

This bit is valid only when the memory-mapped mode (FMODE[1:0] = 11) is selected. This bit enables the timeout counter.

0: The timeout counter is disabled, and thus the chip-select (NCS) remains active indefinitely after an access in memory-mapped mode.

1: The timeout counter is enabled, and thus the chip-select is released in the memory-mapped mode after TIMEOUT[15:0] cycles of external device inactivity.

Note: This bit can be modified only when BUSY = 0.

Bit 2 **DMAEN**: DMA enable

In indirect mode, the DMA can be used to input or output data via OCTOSPI_DR. DMA transfers are initiated when FTF is set.

0: DMA disabled for indirect mode

1: DMA enabled for indirect mode

Note: Resetting the DMAEN bit while a DMA transfer is ongoing, breaks the handshake with the DMA. Do not write this bit during DMA operation.

Bit 1 **ABORT**: Abort request

This bit aborts the ongoing command sequence. This bit stops the current transfer.

0: No abort requested

1: Abort requested

Note: This bit is always read as 0.

Bit 0 **EN**: Enable

This bit enables the OCTOSPI.

0: OCTOSPI disabled

1: OCTOSPI enabled

Note: The DMA request can be aborted without having received the ACK in case this EN bit is cleared during the operation.
In case this bit is set to 0 during a DMA transfer, the REQ signal to DMA returns to inactive state without waiting for the ACK signal from DMA to be active.

24.7.2 OCTOSPI device configuration register 1 (OCTOSPI_DCR1)

Address offset: 0x0008

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADOFF[4:0]					MTYP[2:0]			Res.	Res.	Res.	DEVSIZE[4:0]				
rw	rw	rw	rw	rw	rw	rw	rw				rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	CSHT[5:0]						Res.	Res.	Res.	Res.	DLY BYP	Res.	FRCK	CKMO DE
		rw	rw	rw	rw	rw	rw					rw		rw	rw

Bits 31:27 **ADOFF[4:0]**: Address offset

This bitfield defines the memory address offset value added to the current address requested to be sent by the controller to hit the external memory using the following formula:
Offset value = $2^{[ADOFF+8]}$. (modulo 256 bytes)
Maximum allowed value is 19 since the memory-mapped mode is limited to 256 Mbytes address space. For greater value, the address offset will not be applied to the address sent by the controller.
This bitfield is relevant only if ADOFFEN is set and if FMODE[1:0] = 11 (memory-mapped mode) and if the address offset feature is available in the product implementation table.

Bits 26:24 **MTYP[2:0]**: Memory type

This bitfield indicates the type of memory to be supported.

000: Micron mode, D0/D1 ordering in DTR 8-data-bit mode. regular-command protocol in single-, dual-, quad- and octal-SPI modes.

Note: In this mode, DQS signal polarity is inverted with respect to the memory clock signal. This is the default value and care must be taken to change MTYP[2:0] for memories different from Micron.

001: Macronix mode, D1/D0 ordering in DTR 8-data-bit mode. Regular-command protocol in single-, dual-, quad-, and octal-SPI modes.

010: Standard mode. D0/D1 ordering with DQS and CLK having the same polarity during read operation. This is the mode to use when the targeted memory does not fit with any others MTYP configuration values. This mode is typically the one targeting the APmemory 8-bit memories for instance.

011: Macronix RAM mode, D1/D0 ordering in DTR 8-data-bit mode. Regular-command protocol in single-, dual-, quad-, and octal-SPI modes with dedicated address mapping (address is built with row and column to fit with Macronix requirements).

100: HyperBus memory mode, the protocol follows the HyperBus specification.

101: HyperBus register mode, addressing register space. The memory-mapped accesses in this mode must be noncacheable, or indirect-read/write modes must be used.

Others: Reserved

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **DEVSIZE[4:0]**: Device size

This bitfield defines the size of the external device using the following formula:

Number of bytes in device = $2^{[DEVSIZE+1]}$.

DEVSIZE + 1 is effectively the number of address bits required to address the external device. The device capacity can be up to 4 Gbytes (addressed using 32-bits) in indirect mode, but the addressable space in memory-mapped mode is limited to 256 Mbytes.

In regular-command protocol, if DMM = 1, DEVSIZE[4:0] must reflect the total capacity of the two devices together considering the above formula (DEVSIZE[4:0] value is so equal to one of the two memory capacities).

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **CSHT[5:0]**: Chip-select high time

CSHT + 1 defines the minimum number of CLK cycles where the chip-select (NCS) must remain high between commands issued to the external device.

0x0: NCS stays high for at least 1 cycle between external device commands.

0x1: NCS stays high for at least 2 cycles between external device commands.

...

0x3F: NCS stays high for at least 64 cycles between external device commands.

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **DLYBYP**: Delay block bypass

0: The internal sampling clock (called feedback clock) or the DQS data strobe external signal is delayed by the delay block (for more details on this block, refer to the dedicated section of the reference manual as it is not part of the OCTOSPI peripheral).

1: The delay block is bypassed, so the internal sampling clock or the DQS data strobe external signal is not affected by the delay block. The delay is shorter than when the delay block is not bypassed, even with the delay value set to minimum value in delay block.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **FRCK**: Free running clock

This bit configures the free running clock.

0: CLK is not free running.

1: CLK is free running (always provided).

Note: Free running clock mode is intended for delay calibration only. No memory or other device access is possible when FRCK is set. Once the bit has been set to 1, the BSY bit is set, the NCS signal remains set to 1 and the clock is sent. The only way to stop the clock is to perform an abort (which clears the BSY bit). Then, the FRCK bit must be cleared by software to allow controller transactions to take place with the external memory.

Bit 0 **CKMODE**: Clock mode 0/mode 3

This bit indicates the level taken by the CLK between commands (when NCS = 1).

0: CLK must stay low while NCS is high (chip-select released). This is referred to as clock mode 0.

1: CLK must stay high while NCS is high (chip-select released). This is referred to as clock mode 3.

24.7.3 OCTOSPI device configuration register 2 (OCTOSPI_DCR2)

Address offset: 0x000C

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WRAPSIZE[2:0]		
													rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRESCALER[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:16 **WRAPSIZE[2:0]**: Wrap size

This bitfield indicates the wrap size to which the memory is configured. For memories which have a separate command for wrapped instructions, this bitfield indicates the wrap-size associated with the command held in the OCTOSPI1_WPIR register.

000: Wrapped reads are not supported by the memory.

010: External memory supports wrap size of 16 bytes.

011: External memory supports wrap size of 32 bytes.

100: External memory supports wrap size of 64 bytes.

101: External memory supports wrap size of 128 bytes.

Others: Reserved

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **PRESCALER[7:0]**: Clock prescaler

This bitfield defines the scaler factor for generating the CLK based on the kernel clock (value + 1).

0: $F_{CLK} = F_{KERNEL}$, kernel clock used directly as OCTOSPI CLK (prescaler bypassed). In this case, if the DTR mode is used, it is mandatory to provide to the OCTOSPI a kernel clock that has 50% duty-cycle.

1: $F_{CLK} = F_{KERNEL}/2$

2: $F_{CLK} = F_{KERNEL}/3$

...

255: $F_{CLK} = F_{KERNEL}/256$

For odd clock division factors, the CLK duty cycle is not 50 %. The clock signal remains low one cycle longer than it stays high.

24.7.4 OCTOSPI device configuration register 3 (OCTOSPI_DCR3)

Address offset: 0x0010

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CSBOUND[4:0]				
											rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **CSBOUND[4:0]**: NCS boundary

This bitfield enables the transaction boundary feature. When active, a minimum value of 3 is recommended. The NCS is released on each boundary of $2^{CSBOUND}$ bytes.

0: NCS boundary disabled

Others: NCS boundary set to $2^{CSBOUND}$ bytes

Bits 15:0 Reserved, must be kept at reset value.

24.7.5 OCTOSPI device configuration register 4 (OCTOSPI_DCR4)

Address offset: 0x0014

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REFRESH[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REFRESH[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **REFRESH[31:0]**: Refresh rate

This bitfield enables the refresh rate feature. The NCS is released every REFRESH + 1 clock cycles for writes, and REFRESH + 4 clock cycles for reads. These two values can be extended with few clock cycles when refresh occurs during a byte transmission in single-, dual- or quad-SPI mode, because the byte transmission must be completed.

0: Refresh disabled

Others: Maximum communication length is set to REFRESH + 1 clock cycles.

Note: REFRESH count is based on the divided clock period: if OCTOSPI_DCR2 PRESCALER bitfield is changed, the REFRESH field must be updated accordingly.

24.7.6 OCTOSPI status register (OCTOSPI_SR)

Address offset: 0x0020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	FLEVEL[5:0]						Res.	BERRF	BUSY	TOF	SMF	FTF	TCF	TEF
		r	r	r	r	r	r		r	r	r	r	r	r	r

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:8 **FLEVEL[5:0]**: FIFO level

This bitfield gives the number of valid bytes that are being held in the FIFO. FLEVEL = 0 when the FIFO is empty, and 32 when it is full.

In automatic status-polling mode, FLEVEL is zero.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **BERRF**: Bus error flag

This bit is set when a bus error occurs. It is cleared by writing 1 to CBERRF. This bit has a meaning if Bus error bit feature is available in the product implementation table.

Bit 5 **BUSY**: Busy

This bit is set when an operation is ongoing. It is cleared automatically when the operation with the external device is finished and the FIFO is empty.

Bit 4 **TOF**: Timeout flag

This bit is set when timeout occurs. It is cleared by writing 1 to CTOF.

Bit 3 **SMF**: Status match flag

This bit is set in automatic status-polling mode when the unmasked received data matches the corresponding bits in the match register (OCTOSPI_PSMAR).

It is cleared by writing 1 to CSMF.

Bit 2 **FTF**: FIFO threshold flag

In indirect mode, this bit is set when the FIFO threshold has been reached, or if there is any data left in the FIFO after the reads from the external device are complete.

It is cleared automatically as soon as the threshold condition is no longer true.

In automatic status-polling mode, this bit is set every time the status register is read, and the bit is cleared when the data register is read.

Bit 1 **TCF**: Transfer complete flag
This bit is set in indirect mode when the programmed number of data has been transferred or in any mode when the transfer has been aborted.It is cleared by writing 1 to CTCF.

Bit 0 **TEF**: Transfer error flag
This bit is set in indirect mode when an invalid address is being accessed in indirect mode. It is cleared by writing 1 to CTEF.

24.7.7 OCTOSPI flag clear register (OCTOSPI_FCR)

Address offset: 0x0024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CBERRF	Res.	CTOF	CSMF	Res.	CTCF	CTEF
									w		w	w		w	w

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **CBERRF**: Clear bus error flag
Writing 1 clears the BERRF flag in the XSPI_SR register (if Bus error bit feature is available in the product implementation table).

Bit 5 Reserved, must be kept at reset value.

Bit 4 **CTOF**: Clear timeout flag
Writing 1 clears the TOF flag in the OCTOSPI_SR register.

Bit 3 **CSMF**: Clear status match flag
Writing 1 clears the SMF flag in the OCTOSPI_SR register.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CTCF**: Clear transfer complete flag
Writing 1 clears the TCF flag in the OCTOSPI_SR register.

Bit 0 **CTEF**: Clear transfer error flag
Writing 1 clears the TEF flag in the OCTOSPI_SR register.

24.7.8 OCTOSPI data length register (OCTOSPI_DLR)

Address offset: 0x0040

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DL[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DL[31:0]**: Data length

Number of data to be retrieved (value+1) in indirect and automatic status-polling modes. A value not greater than three (indicating 4 bytes) must be used for automatic status-polling mode.

All 1's in indirect mode means undefined length, where OCTOSPI continues until the end of the memory, as defined by DEVSIZE.

0x0000_0000: 1 byte is to be transferred.

0x0000_0001: 2 bytes are to be transferred.

0x0000_0002: 3 bytes are to be transferred.

0x0000_0003: 4 bytes are to be transferred.

...

0xFFFF_FFFD: 4,294,967,294 (4G-2) bytes are to be transferred.

0xFFFF_FFFE: 4,294,967,295 (4G-1) bytes are to be transferred.

0xFFFF_FFFF: undefined length; all bytes, until the end of the external device, (as defined by DEVSIZE) are to be transferred. Continue reading indefinitely if DEVSIZE = 0x1F.

DL[0] is stuck at 1 in dual-memory configuration (DMM = 1) even when 0 is written to this bit, thus assuring that each access transfers an even number of bytes.

This bitfield has no effect in memory-mapped mode.

24.7.9 OCTOSPI address register (OCTOSPI_AR)

Address offset: 0x0048

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0 and FMODE ≠ 11.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADDRESS[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDRESS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ADDRESS[31:0]**: Address

Address to be sent to the external device. In HyperBus protocol, this field must be even as this protocol is 16-bit word oriented. In dual-memory configuration, AR[0] is forced to 0.

24.7.10 OCTOSPI data register (OCTOSPI_DR)

Address offset: 0x0050

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DATA[31:0]**: Data

Data to be sent/received to/from the external SPI device

In indirect-write mode, data written to this register is stored on the FIFO before it is sent to the external device during the data phase. If the FIFO is too full, a write operation is stalled until the FIFO has enough space to accept the amount of data being written.

In indirect-read mode, reading this register gives (via the FIFO) the data that was received from the external device. If the FIFO does not have as many bytes as requested by the read operation and if BUSY = 1, the read operation is stalled until enough data is present or until the transfer is complete, whichever happens first.

In automatic status-polling mode, this register contains the last data read from the external device (without masking).

Word, half-word, and byte accesses to this register are supported. In indirect-write mode, a byte write adds 1 byte to the FIFO, a half-word write 2 bytes, and a word write 4 bytes. Similarly, in indirect-read mode, a byte read removes 1 byte from the FIFO, a halfword read 2 bytes, and a word read 4 bytes. Accesses in indirect mode must be aligned to the bottom of this register: A byte read must read DATA[7:0] and a half-word read must read DATA[15:0].

24.7.11 OCTOSPI polling status mask register (OCTOSPI_PSMKR)

Address offset: 0x0080

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MASK[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MASK[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MASK[31:0]**: Status mask

Mask to be applied to the status bytes received in automatic status-polling mode

For bit n:

0: Bit n of the data received in automatic status-polling mode is masked and its value is not considered in the matching logic.

1: Bit n of the data received in automatic status-polling mode is unmasked and its value is considered in the matching logic.

24.7.12 OCTOSPI polling status match register (OCTOSPI_PSMAR)

Address offset: 0x0088

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MATCH[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MATCH[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MATCH[31:0]**: Status match
Value to be compared with the masked status register to get a match

24.7.13 OCTOSPI polling interval register (OCTOSPI_PIR)

Address offset: 0x0090

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

INTERVAL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **INTERVAL[15:0]**: Polling interval
Number of CLK cycles between a read during the automatic status-polling phases

24.7.14 OCTOSPI communication configuration register (OCTOSPI_CCR)

Address offset: 0x0100

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	DQSE	Res.	DDTR	DMODE[2:0]			Res.	Res.	ABSIZE[1:0]		ABDTR	ABMODE[2:0]

		rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **DQSE**: DQS enable
This bit enables the data strobe management.
0: DQS disabled
1: DQS enabled

Bit 28 Reserved, must be kept at reset value.

Bit 27 **DDTR**: Data double transfer rate
This bit sets the DTR mode for the data phase.
0: DTR mode disabled for data phase
1: DTR mode enabled for data phase

Bits 26:24 **DMODE[2:0]**: Data mode
This bitfield defines the data phase mode of operation.
000: No data
001: Data on a single line
010: Data on two lines
011: Data on four lines
100: Data on eight lines
Others: Reserved

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:20 **ABSIZE[1:0]**: Alternate-byte size
This bitfield defines the alternate-byte size.
00: 8-bit alternate bytes
01: 16-bit alternate bytes
10: 24-bit alternate bytes
11: 32-bit alternate bytes

Bit 19 **ABDTR**: Alternate- byte double transfer rate
This bit sets the DTR mode for the alternate-byte phase.
0: DTR mode disabled for the alternate-byte phase
1: DTR mode enabled for the alternate-byte phase

Bits 18:16 **ABMODE[2:0]**: Alternate-byte mode
This bitfield defines the alternate-byte phase mode of operation.
000: No alternate bytes
001: Alternate bytes on a single line
010: Alternate bytes on two lines
011: Alternate bytes on four lines
100: Alternate bytes on eight lines
Others: Reserved

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:12 **ADSIZE[1:0]**: Address size
This bitfield defines the address size.
00: 8-bit address
01: 16-bit address
10: 24-bit address
11: 32-bit address

Bit 11 **ADDTR**: Address double transfer rate
This bit sets the DTR mode for the address phase.
0: DTR mode disabled for the address phase
1: DTR mode enabled for the address phase

Bits 10:8 **ADMODE[2:0]**: Address mode
This bitfield defines the address phase mode of operation.
000: No address
001: Address on a single line
010: Address on two lines
011: Address on four lines
100: Address on eight lines
Others: Reserved

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **ISIZE[1:0]**: Instruction size
This bitfield defines instruction size.
00: 8-bit instruction
01: 16-bit instruction
10: 24-bit instruction
11: 32-bit instruction

Bit 3 **IDTR**: Instruction double transfer rate
This bit sets the DTR mode for the instruction phase.
0: DTR mode disabled for the instruction phase
1: DTR mode enabled for the instruction phase

Bits 2:0 **IMODE[2:0]**: Instruction mode
This bitfield defines the instruction phase mode of operation.
000: No instruction
001: Instruction on a single line
010: Instruction on two lines
011: Instruction on four lines
100: Instruction on eight lines
Others: Reserved

24.7.15 OCTOSPI timing configuration register (OCTOSPI_TCR)

Address offset: 0x0108

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	SSHIFT	Res.	DHQC	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
	rw		rw												

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCYC[4:0]				
											rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bit 30 **SSHIFT**: Sample shift
By default, the OCTOSPI samples data 1/2 of a CLK cycle after the data is driven by the external device.
This bit allows the data to be sampled later in order to consider the external signal delays.
0: No shift
1: 1/2 cycle shift
The software must ensure that SSHIFT = 0 when the data phase is configured in DTR mode (when DDTR = 1.)

Bit 29 Reserved, must be kept at reset value.

Bit 28 **DHQC**: Delay hold quarter cycle
0: No delay hold
1: 1/4 cycle hold

Bits 27:5 Reserved, must be kept at reset value.

Bits 4:0 **DCYC[4:0]**: Number of dummy cycles
This bitfield defines the duration of the dummy phase according to the memory latency.
In both SDR and DTR modes, it specifies a number of CLK cycles (0-31).

24.7.16 OCTOSPI instruction register (OCTOSPI_IR)

Address offset: 0x0110

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
INSTRUCTION[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

ALTERNATE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ALTERNATE[31:0]**: Alternate bytes

Optional data to be sent to the external SPI device right after the address.

24.7.18 OCTOSPI low-power timeout register (OCTOSPI_LPTR)

Address offset: 0x00130

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

TIMEOUT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **TIMEOUT[15:0]**: Timeout period

After each access in memory-mapped mode, the OCTOSPI prefetches the subsequent bytes and hold them in the FIFO.

This bitfield indicates how many CLK cycles the OCTOSPI waits after the clock becomes inactive and until it raises the NCS, putting the external device in a lower-consumption state.

24.7.19 OCTOSPI wrap communication configuration register (OCTOSPI_WPCCR)

Address offset: 0x0140

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

		rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **DQSE**: DQS enable

This bit enables the data strobe management.

0: DQS disabled

1: DQS enabled

Bit 28 Reserved, must be kept at reset value.

Bit 27 **DDTR**: Data double transfer rate
This bit sets the DTR mode for the data phase.
0: DTR mode disabled for the data phase
1: DTR mode enabled for the data phase

Bits 26:24 **DMODE[2:0]**: Data mode
This bitfield defines the data phase mode of operation.
000: No data
001: Data on a single line
010: Data on two lines
011: Data on four lines
100: Data on eight lines
Others: Reserved

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:20 **ABSIZE[1:0]**: Alternate-byte size
This bitfield defines the alternate-byte size.
00: 8-bit alternate bytes
01: 16-bit alternate bytes
10: 24-bit alternate bytes
11: 32-bit alternate bytes

Bit 19 **ABDTR**: Alternate-byte double transfer rate
This bit sets the DTR mode for the alternate-byte phase.
0: DTR mode disabled for the alternate-byte phase
1: DTR mode enabled for the alternate-byte phase

Bits 18:16 **ABMODE[2:0]**: Alternate-byte mode
This bitfield defines the alternate-byte phase mode of operation.
000: no alternate bytes
001: alternate bytes on a single line
010: alternate bytes on two lines
011: alternate bytes on four lines
100: alternate bytes on eight lines
Others: reserved

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:12 **ADSIZE[1:0]**: Address size
This bitfield defines the address size.
00: 8-bit address
01: 16-bit address
10: 24-bit address
11: 32-bit address

Bit 11 **ADDTR**: Address double transfer rate
This bit sets the DTR mode for the address phase.
0: DTR mode disabled for address phase
1: DTR mode enabled for address phase

Bits 10:8 **ADMODE[2:0]**: Address mode
This bitfield defines the address phase mode of operation.
000: No address
001: Address on a single line
010: Address on two lines
011: Address on four lines
100: Address on eight lines
Others: Reserved

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **ISIZE[1:0]**: Instruction size
This bitfield defines the instruction size.
00: 8-bit instruction
01: 16-bit instruction
10: 24-bit instruction
11: 32-bit instruction

Bit 3 **IDTR**: Instruction double transfer rate
This bit sets the DTR mode for the instruction phase.
0: DTR mode disabled for the instruction phase
1: DTR mode enabled for the instruction phase

Bits 2:0 **IMODE[2:0]**: Instruction mode
This bitfield defines the instruction phase mode of operation.
000: No instruction
001: Instruction on a single line
010: Instruction on two lines
011: Instruction on four lines
100: Instruction on eight lines
Others: Reserved

24.7.20 OCTOSPI wrap timing configuration register (OCTOSPI_WPTCR)

Address offset: 0x0148

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	SSHIFT	Res.	DHQC	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCYC[4:0]				
											rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bit 30 **SSHIFT**: Sample shift
By default, the OCTOSPI samples data 1/2 of a CLK cycle after the data is driven by the external device.
This bit allows the data to be sampled later in order to consider the external signal delays.
0: No shift
1: 1/2 cycle shift
The firmware must assure that SSHIFT=0 when the data phase is configured in DTR mode (when DDTR = 1).

Bit 29 Reserved, must be kept at reset value.

Bit 28 **DHQC**: Delay hold quarter cycle
Add a quarter cycle delay on the outputs in DTR communication to match hold requirement.
0: No quarter cycle delay
1: 1/4 cycle delay inserted

Bits 27:5 Reserved, must be kept at reset value.

Bits 4:0 **DCYC[4:0]**: Number of dummy cycles
This bitfield defines the duration of the dummy phase according to the memory latency.
In both SDR and DTR modes, it specifies a number of CLK cycles (0-31).

24.7.21 OCTOSPI wrap instruction register (OCTOSPI_WPIR)

Address offset: 0x0150

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
INSTRUCTION[31:16]

INSTRUCTION[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **INSTRUCTION[31:0]**: Instruction
Instruction to be sent to the external SPI device

24.7.22 OCTOSPI wrap alternate bytes register (OCTOSPI_WPABR)

Address offset: 0x0160

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ALTERNATE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ALTERNATE[31:0]**: Alternate bytes
Optional data to be sent to the external SPI device right after the address

24.7.23 OCTOSPI write communication configuration register (OCTOSPI_WCCR)

Address offset: 0x0180

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0. Its content has a meaning only when requesting write operations in memory-mapped mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **DQSE**: DQS enable
This bit enables the data strobe management.
0: DQS disabled
1: DQS enabled

Bit 28 Reserved, must be kept at reset value.

Bit 27 **DDTR**: data double transfer rate
This bit sets the DTR mode for the data phase.
0: DTR mode disabled for the data phase
1: DTR mode enabled for the data phase

Bits 26:24 **DMODE[2:0]**: Data mode
