Reference manual

STM32MP21xx advanced Arm®-based 32/64-bit MPUs

Introduction

This reference manual targets application developers. It provides complete information on how to use the STM32MP21xx microprocessor memory and peripherals.

The STM32MP21xx is a family of microprocessors with different packages and peripherals.

Refer to the corresponding datasheets for ordering information, mechanical and electrical device characteristics.

For information on the Arm® Cortex®-A35 and Cortex®-M33 cores, refer to the corresponding Technical Reference Manuals available on http://infocenter.arm.com.

The STM32MP21xx microprocessors include ST state-of-the-art patented technology.

3.5.4 Cortex-M33 boot configuration registers 213
3.5.5 CA35SS SYSCFG register map 215
3.6 Standardized status and control registers 217
3.6.1 Standardized status and control registers (SSC) access modes 217
3.6.2 SSC access types 217
3.6.3 Secure/non-secure access to SSC 218
3.6.4 SSC registers details 218
3.6.5 CA35SS SSC register map 225

4 Arm Cortex-M33 (CM33SS) 228
4.1 Overview 228
4.2 Cortex-M33 reset 230
4.3 Cortex-M33 clocking 230
4.4 Cortex-M33 boot mode 230
4.5 Cortex-M33 configuration register 230
4.6 Memory protection unit (MPU) 231
4.7 Floating point unit (FPU) 231
4.8 Attribution units 231
4.8.1 Security attribution unit (SAU) 231
4.8.2 Implementation defined attribution unit (IDAU) 231
4.9 Nested vectored interrupt controllers (NVIC) 232
4.9.1 NVIC features 232
4.9.2 Interrupt and exception vectors 232
4.10 Cortex-M33 memory interfaces 232

5 System security 234
5.1 Key security features 234
5.2 Secure boot 235
5.3 Secure provisioning 236

5.4 Resource isolation framework (RIF) 236
5.4.1 RIF security architecture 237
5.4.2 RIF access control 239
5.4.3 Application interrupt management in RIF 241
5.4.4 RIF illegal access definition 242
5.4.5 Managing illegal accesses with RIF 244
5.4.6 RIF special security domain: trusted domain 244
5.4.7 RIF special security domain: debug domain 245
5.4.8 Managing security in RIF-aware peripherals 245
5.4.9 Activating RIF security 246
5.4.10 Programming of RIFSC, RCC and IAC 247

6 Boot and security control (BSEC) 248
6.1 Introduction 248
6.2 BSEC main features 249
6.3 BSEC functional description 250
6.3.1 BSEC block diagram 250
6.3.2 BSEC internal signals 250
6.3.3 BSEC reset and clocks 251
6.3.4 Organization and use of fuses 251
6.3.5 Operations on fuses 253
6.3.6 BSEC read and programming status reporting 255
6.3.7 Lifecycle management 256
6.3.8 Epoch registers 258
6.3.9 BSEC local access control 258
6.3.10 Temporal isolation in BSEC 258
6.3.11 BSEC debug and trace control 260
6.3.12 Device features control 262
6.3.13 Scratch registers 262
6.3.14 JTAG registers 262
6.3.15 STM32 root hardware unique key (RHUK) 262
6.3.16 BSEC error management 263
6.3.17 BSEC tamper response mechanisms 263
6.4 BSEC interrupts 263
6.5 BSEC registers 263
6.5.1 BSEC fuse word w value register (BSEC_FVRw) 264

6.5.2 BSEC sticky programming lock register x (BSEC_SPLOCKx) 265
6.5.3 BSEC sticky write lock register x (BSEC_SWLOCKx) 265
6.5.4 BSEC sticky reload lock register x (BSEC_SRLOCKx) 266
6.5.5 BSEC OTP valid register x (BSEC_OTPVLDRx) 266
6.5.6 BSEC shadowed fuses status register x (BSEC_SFSRx) 267
6.5.7 BSEC OTP control register (BSEC_OTPCR) 267
6.5.8 BSEC write data register (BSEC_WDR) 268
6.5.9 BSEC scratch register x (BSEC_SCRATCHRx) 269
6.5.10 BSEC lock register (BSEC_LOCKR) 269
6.5.11 BSEC JTAG input register (BSEC_JTAGINR) 270
6.5.12 BSEC JTAG output register (BSEC_JTAGOUTR) 270
6.5.13 BSEC debug enable register (BSEC_DENR) 271
6.5.14 BSEC unmap register (BSEC_UNMAPR) 272
6.5.15 BSEC status register (BSEC_SR) 273
6.5.16 BSEC OTP status register (BSEC_OTPSR) 274
6.5.17 BSEC epoch register (BSEC_EPOCHRx) 275
6.5.18 BSEC epoch selection control register (BSEC_EPOCHSELCR) 276
6.5.19 BSEC debug control register for Cortex-M (BSEC_DBGMCR) 276
6.5.20 BSEC AP unlock (BSEC_AP_UNLOCK) 277
6.5.21 BSEC HDPL for Cortex-M status register (BSEC_HDPLMSR) 278
6.5.22 BSEC HDPL for Cortex-M control register (BSEC_HDPLMCR) 278
6.5.23 BSEC next HDPL control register for Cortex-M (BSEC_NEXTHDPLMCR) 279
6.5.24 BSEC debug control register for Cortex-A (BSEC_DBGACR) 279
6.5.25 BSEC HDPL for Cortex-A status register (BSEC_HDPLASR) 280
6.5.26 BSEC HDPL for Cortex-A control register (BSEC_HDPLACR) 281
6.5.27 BSEC next HDPL control register for Cortex-A (BSEC_NEXTHDPLACR) 281
6.5.28 BSEC write once scratch register x (BSEC_WOSCRx) 282
6.5.29 BSEC hot reset count register (BSEC_HRCR) 282
6.5.30 BSEC warm reset count register (BSEC_WRCR) 283
6.5.31 BSEC version register (BSEC_VERR) 283
6.5.32 BSEC identification register (BSEC_IPIDR) 284
6.5.33 BSEC size identification register (BSEC_SIDR) 284
6.5.34 BSEC register map 284

7 OTP mapping (OTP) 288

8 Resource isolation framework security controller (RIFSC) 307

8.1 Introduction 307

8.2 RIFSC main features 307

8.3 RIFSC implementation 308

8.4 RIFSC functional description 310

8.4.1 RIFSC block diagrams 310

8.4.2 RIFSC internal signals 312

8.4.3 RIFSC reset and clocks 312

8.4.4 RIFSC control of masters (RIMU) 313

8.4.5 RIFSC control of debug access port (DAP) 313

8.4.6 RIFSC control of peripherals (RISUP) 315

8.4.7 Managing illegal accesses 317

8.5 RIFSC registers 317

8.5.1 RIFSC RISC slave configuration register x (RIFSC_RISC_CR) 318

8.5.2 RIFSC RISC slave security configuration register x (RIFSC_RISC_SECCFGRx) 318

8.5.3 RIFSC RISFC slave privileged register x (RIFSC_RISC_PRIVCFGRx) 319

8.5.4 RIFSC RISC slave resource configuration lock register x (RIFSC_RISC_RCFGLOCKRx) 319

8.5.5 RIFSC RISC slave peripheral y CID configuration register (RIFSC_RISC_PERy_CIDCFGR) 320

8.5.6 RIFSC RISC slave peripheral y semaphore control register (RIFSC_RISC_PERy_SEMCR) 321

8.5.7 RIFSC RIMC master configuration register (RIFSC_RIMC_CR) 322

8.5.8 RIFSC RIMC master status register (RIFSC_RIMC_SR) 323

8.5.9 RIFSC RIMC master attribute register x (RIFSC_RIMC_ATTRx) 324

8.5.10 RIFSC peripheral protection status register x (RIFSC_PPSRx) 325

8.5.11 RIFSC hardware configuration register 3 (RIFSC_HWCFGR3) 325

8.5.12 RIFSC hardware configuration register 2 (RIFSC_HWCFGR2) 325

8.5.13 RIFSC hardware configuration register 1 (RIFSC_HWCFGR1) 326

8.5.14 RIFSC version register (RIFSC_VERR) 326

8.5.15 RIFSC identification register (RIFSC_IPIDR) 327

8.5.16 RIFSC size identification register (RIFSC_SIDR) 327

8.5.17 RIFSC register map 327

9 Resource isolation slave unit for address space protection (block-based) (RISAB) 330

9.1 RISAB introduction 330
9.2 RISAB main features 330
9.3 RISAB implementation 330
9.4 RISAB functional description 331
9.4.1 RISAB block diagram 331
9.4.2 RISAB internal signals 331
9.4.3 RISAB reset and clocks 331
9.4.4 RISAB address space management 332
9.4.5 RISAB programming 332
9.4.6 RISAB runtime modification of region or subregion configuration 333
9.4.7 Managing illegal accesses 333
9.5 RISAB registers 334
9.5.1 RISAB configuration register (RISAB_CR) 334
9.5.2 RISAB illegal access status register (RISAB_IASR) 334
9.5.3 RISAB illegal access clear register (RISAB_IACR) 335
9.5.4 RISAB configuration lock register (RISAB_RCFGLOCKR) 335
9.5.5 RISAB illegal access error status register (RISAB_IAESR) 336
9.5.6 RISAB illegal address register (RISAB_IADDR) 337
9.5.7 RISAB page y security configuration register (RISAB_PGy_SECCFGR) 337
9.5.8 RISAB page y default privileged configuration register (RISAB_PGy_PRIVCFGR) 338
9.5.9 RISAB page y privileged configuration register for compartment 2 (RISAB_PGy_C2PRIVCFGR) 338
9.5.10 RISAB compartment x privilege configuration register (RISAB_CIDxPRIVCFGR) 339
9.5.11 RISAB compartment x read configuration register (RISAB_CIDxRDCFGR) 340
9.5.12 RISAB compartment x write configuration register (RISAB_CIDxWRCFGR) 340
9.5.13 RISAB page y CID configuration register (RISAB_PGy_CIDCFGR) . . 341
9.5.14 RISAB hardware configuration register 3 (RISAB_HWCFGR3) 342
9.5.15 RISAB hardware configuration register 2 (RISAB_HWCFGR2) 342
9.5.16 RISAB hardware configuration register 1 (RISAB_HWCFGR1) 343
9.5.17 RISAB version register (RISAB_VERR) 343
9.5.18 RISAB identification register (RISAB_IPIDR) 344
9.5.19 RISAB size identification register (RISAB_SIDR) 344
9.5.20 RISAB register map 345

10 Resource isolation slave unit for address space protection (full version) (RISAF) 347

10.1 RISAF introduction 347

10.2 RISAF main features 347

10.3 RISAF implementation 348

10.4 RISAF functional description 348

10.4.1 RISAF block diagram 348

10.4.2 RISAF internal signals 349

10.4.3 RISAF reset and clocks 349

10.4.4 RISAF address space management 349

10.4.5 RISAF programming 351

10.4.6 RISAF runtime modification of region or subregion configuration 353

10.4.7 Managing illegal accesses 354

10.5 RISAF registers 355

10.5.1 RISAF configuration register (RISAF_CR) 355

10.5.2 RISAF status register (RISAF_SR) 355

10.5.3 RISAF illegal access status register (RISAF_IASR) 356

10.5.4 RISAF illegal access clear register (RISAF_IACR) 357

10.5.5 RISAF illegal access error status register x (RISAF_IAESRx) 357

10.5.6 RISAF illegal address register x (RISAF_IADDRx) 358

10.5.7 RISAF encryption key y (RISAF_KEYRy) 358

10.5.8 RISAF region x configuration register (RISAF_REGx_CFGR) 359

10.5.9 RISAF region x start-address register (RISAF_REGx_STARTR) 360

10.5.10 RISAF region x end-address register (RISAF_REGx_ENDR) 361

10.5.11 RISAF region x CID configuration register (RISAF_REGx_CIDCFGR) 361

10.5.12 RISAF region x subregion A configuration register (RISAF_REGx_ACFGR) 362

10.5.13 RISAF region x subregion A start-address register (RISAF_REGx_ASTARTR) 364

10.5.14 RISAF region x subregion A end-address register (RISAF_REGx_AENDR) 364

10.5.15 RISAF region x subregion A nested mode register (RISAF_REGx_ANESTR) 365

10.5.16 RISAF region x subregion B configuration register (RISAF_REGx_BCFGR) 366

10.5.17 RISAF region x subregion B start-address register (RISAF_REGx_BSTARTR) 367

10.5.18 RISAF region x subregion B end-address register (RISAF_REGx_BENDR) . . . 368
10.5.19 RISAF region x subregion B nested mode register (RISAF_REGx_BNESTR) . . . 369
10.5.20 RISAF hardware configuration register (RISAF_HWCFGR) . . . 369
10.5.21 RISAF version register (RISAF_VERR) . . . 370
10.5.22 RISAF identification register (RISAF_IPIDR) . . . 370
10.5.23 RISAF size identification register (RISAF_SIDR) . . . 371
10.5.24 RISAF extended configuration register (RISAF_XCR) . . . 371
10.5.25 RISAF extended status register (RISAF_XSR) . . . 372
10.5.26 RISAF master key y (RISAF_MKEYRy) . . . 373
10.5.27 RISAF register map . . . 373

11 Illegal access controller (IAC) . . . 376

11.1 IAC introduction . . . 376
11.2 IAC main features . . . 376
11.3 IAC implementation . . . 376
11.4 IAC functional description . . . 376
11.4.1 IAC block diagram . . . 376
11.4.2 IAC internal signals . . . 377
11.4.3 IAC reset and clocks . . . 377
11.4.4 IAC use in RIF . . . 377
11.4.5 IAC management by trusted application . . . 377
11.5 IAC interrupts . . . 378
11.6 IAC registers . . . 378
11.6.1 IAC interrupt enable register x (IAC_IERx) . . . 378
11.6.2 IAC interrupt status register x (IAC_ISRx) . . . 379
11.6.3 IAC interrupt clear register x (IAC_ICRx) . . . 379
11.6.4 IAC ILAC input status register x (IAC_IISRx) . . . 380
11.6.5 IAC hardware configuration register 2 (IAC_HWCFGR2) . . . 380
11.6.6 IAC hardware configuration register 1 (IAC_HWCFGR1) . . . 380
11.6.7 IAC version register (IAC_VERR) . . . 381
11.6.8 IAC identification register (IAC_IPIDR) . . . 381
11.6.9 IAC size identification register (IAC_SIDR) . . . 382
11.6.10 IAC register map . . . 382

12 DDR subsystem architecture (DDRSS) . . . 383

12.1 DDRS introduction . . . 383
12.2 DDRSS block diagram . . . 384
12.3 DDRSS interfaces . . . 384
12.4 DDRSS embedded fractional PLL2 . . . 385
12.5 DDRSS top-level features . . . 386
12.5.1 Filtering and AES encryption . . . 386
12.5.2 DDR3/4 AC-swizzling . . . 387
12.5.3 Mode register read . . . 388
12.5.4 Observability . . . 389
12.5.5 DDRSS low power . . . 391
12.5.6 DFI errors . . . 392
12.6 DDRSS registers . . . 393
12.6.1 DDRDBG low-power disable register (DDRDBG_LP_DISABLE) . . . 393
12.6.2 DDRDBG bypass P_{CLKEN} register (DDRDBG_BYPASS_PCLKEN) . . 393
12.6.3 DDRDBG DDRC auto SR delay register (DDRDBG_DDRC_AUTO_SR_DELAY) . . . 394
12.6.4 DDRDBG OBSP control register (DDRDBG_OBSP_CTRL) . . . 394
12.6.5 DDRDBG FRAC PLL lock register (DDRDBG_FRAC_PLL_LOCK) . . . 395
12.6.6 DDRDBG DTO output register (DDRDBG_DTO_OUTPUT) . . . 395
12.6.7 DDRDBG DFI error control register (DDRDBG_DFI_ERRORS_CTRL) . . . 396
12.6.8 DDRDBG DFI error status register (DDRDBG_DFI_ERROR_STATUS) . . . 396
12.6.9 DDRDBG DFI error mask register (DDRDBG_DFI_ERROR_MSK) . . . 397
12.6.10 DDRDBG DDR34 AC swizzle ADD3_0 register (DDRDBG_DDR34_AC_SWIZZLE_ADD3_0) . . . 397
12.6.11 DDRDBG DDR34 AC swizzle ADD7_4 register (DDRDBG_DDR34_AC_SWIZZLE_ADD7_4) . . . 399
12.6.12 DDRDBG DDR34 AC swizzle ADD11_8 register (DDRDBG_DDR34_AC_SWIZZLE_ADD11_8) . . . 399
12.6.13 DDRDBG DDR34 AC swizzle ADD15_12 register (DDRDBG_DDR34_AC_SWIZZLE_ADD15_12) . . . 400
12.6.14 DDRDBG DDR34 AC swizzle BK2 0 ACTN register (DDRDBG_DDR34_AC_SWIZZLE_BK2_0_ACTN) . . . 400
12.6.15 DDRDBG DDR34 AC swizzle RASN CASN BG1_0 register (DDRDBG_DDR34_AC_SWIZZLE_RASN_CASN_BG1_0) . . . 401
12.6.16 DDRDBG DDR34 AC swizzle WEN register (DDRDBG_DDR34_AC_SWIZZLE_WEN) . . . 402

12.6.17 DDRSS register map 402

13 DDR3L/DDR4/LPDDR4 controller (DDRCTRL) 405

13.1 DDRCTRL introduction 405
13.2 DDRCTRL features 405
13.3 DDRCTRL block diagram 406
13.4 DDRCTRL architecture overview 406
13.4.1 AXI port interface (XPI) 407
13.4.2 Port arbiter (PA) 408
13.4.3 Host interface (HIF) 408
13.4.4 DDR scheduler (DDRC) 409
13.5 DDRCTRL functional description 409
13.5.1 Transaction service control (TSC) and quality of service (QoS) 409
13.5.2 Paging policy options 410
13.5.3 Power saving features 411
13.5.4 Address mapper 411
13.5.5 DRAM timing parameters 412
13.5.6 SDRAM initialization sequence 412
13.5.7 Refresh controls 412
13.5.8 ZQ calibration 413
13.5.9 Register programming 413
13.6 DDRCTRL configuration 414
13.7 DDRCTRL registers 415
13.7.1 DDRCTRL master0 register (DDRCTRL_REGS_MSTR) 415
13.7.2 DDRCTRL operating mode status register (DDRCTRL_REGS_STAT) 417
13.7.3 DDRCTRL mode read/write control 0 register (DDRCTRL_REGS_MRCTRL0) 418
13.7.4 DDRCTRL mode read/write control 1 register (DDRCTRL_REGS_MRCTRL1) 420
13.7.5 DDRCTRL mode register read/write status register (DDRCTRL_REGS_MRSTAT) 421
13.7.6 DDRCTRL mode register read/write control 2 register (DDRCTRL_REGS_MRCTRL2) 421
13.7.7 DDRCTRL temperature derate enable register (DDRCTRL_REGS_DERATEEN) 422
13.7.8 DDRCTRL temperature derate interval register (DDRCTRL_REGS_DERATEINT) 423

13.7.9 DDRCTRL temperature derate control register (DDRCTRL_REGS_DERATECTL) 424
13.7.10 DDRCTRL low-power control register (DDRCTRL_REGS_PWRCTL) 424
13.7.11 DDRCTRL low-power timing register (DDRCTRL_REGS_PWRTMG) 426
13.7.12 DDRCTRL hardware low-power control register (DDRCTRL_REGS_HWLPCTL) 426
13.7.13 DDRCTRL refresh control 0 register (DDRCTRL_REGS_RFSHCTL0) 427
13.7.14 DDRCTRL refresh control 1 register (DDRCTRL_REGS_RFSHCTL1) 429
13.7.15 DDRCTRL refresh control 3 register (DDRCTRL_REGS_RFSHCTL3) 429
13.7.16 DDRCTRL refresh timing register (DDRCTRL_REGS_RFSHTMG) . . 431
13.7.17 DDRCTRL refresh timing1 register (DDRCTRL_REGS_RFSHTMG1) 432
13.7.18 DDRCTRL SDRAM initialization 0 register (DDRCTRL_REGS_INIT0) 433
13.7.19 DDRCTRL SDRAM initialization 1 register (DDRCTRL_REGS_INIT1) 434
13.7.20 DDRCTRL SDRAM initialization 3 register (DDRCTRL_REGS_INIT3) 434
13.7.21 DDRCTRL SDRAM initialization 4 register (DDRCTRL_REGS_INIT4) 435
13.7.22 DDRCTRL SDRAM initialization 5 register (DDRCTRL_REGS_INIT5) 435
13.7.23 DDRCTRL SDRAM initialization 6 register (DDRCTRL_REGS_INIT6) 436
13.7.24 DDRCTRL SDRAM initialization 7 register (DDRCTRL_REGS_INIT7) 436
13.7.25 DDRCTRL rank control register (DDRCTRL_REGS_RANKCTL) 437
13.7.26 Rank control 1 register (DDRCTRL_REGS_RANKCTL1) 439
13.7.28 DDRCTRL SDRAM timing 1 register (DDRCTRL_REGS_DRAMTMG1) 441
13.7.29 DDRCTRL SDRAM timing 2 register (DDRCTRL_REGS_DRAMTMG2) 442
13.7.30 DDRCTRL SDRAM timing 3 register (DDRCTRL_REGS_DRAMTMG3) 444
13.7.31 DDRCTRL SDRAM timing 4 register (DDRCTRL_REGS_DRAMTMG4) 445
13.7.32 DDRCTRL SDRAM timing 5 register (DDRCTRL_REGS_DRAMTMG5) 446
13.7.33 DDRCTRL SDRAM timing 6 register (DDRCTRL_REGS_DRAMTMG6) 447
13.7.34 DDRCTRL SDRAM timing 7 register (DDRCTRL_REGS_DRAMTMG7) 448
13.7.35 DDRCTRL SDRAM timing 8 register (DDRCTRL_REGS_DRAMTMG8) 449

13.7.36 DDRCTRL SDRAM timing 9 register (DDRCTRL_REGS_DRAMTMG9) 450
13.7.37 DDRCTRL SDRAM timing 10 register (DDRCTRL_REGS_DRAMTMG10) 451
13.7.38 DDRCTRL SDRAM timing 11 register (DDRCTRL_REGS_DRAMTMG11) 452
13.7.39 DDRCTRL SDRAM timing 12 register (DDRCTRL_REGS_DRAMTMG12) 453
13.7.40 DDRCTRL SDRAM timing 13 register (DDRCTRL_REGS_DRAMTMG13) 454
13.7.41 DDRCTRL SDRAM timing 14 register (DDRCTRL_REGS_DRAMTMG14) 454
13.7.42 DDRCTRL SDRAM timing 15 register (DDRCTRL_REGS_DRAMTMG15) 455
13.7.43 DDRCTRL ZQ control 0 register (DDRCTRL_REGS_ZQCTL0) 456
13.7.44 DDRCTRL ZQ control 1 register (DDRCTRL_REGS_ZQCTL1) 457
13.7.45 DDRCTRL ZQ control 2 register (DDRCTRL_REGS_ZQCTL2) 457
13.7.46 DDRCTRL ZQ status register (DDRCTRL_REGS_ZQSTAT) 458
13.7.47 DDRCTRL DFI timing 0 register (DDRCTRL_REGS_DFITMG0) 459
13.7.48 DDRCTRL DFI timing 1 register (DDRCTRL_REGS_DFITMG1) 460
13.7.49 DDRCTRL DFI low-power configuration 0 register (DDRCTRL_REGS_DFILPCFG0) 461
13.7.50 DDRCTRL DFI update 0 register (DDRCTRL_REGS_DFIUPD0) 463
13.7.51 DDRCTRL DFI update 1 register (DDRCTRL_REGS_DFIUPD1) 464
13.7.52 DDRCTRL DFI update 2 register (DDRCTRL_REGS_DFIUPD2) 465
13.7.53 DDRCTRL DFI miscellaneous control register (DDRCTRL_REGS_DFIMISC) 465
13.7.54 DDRCTRL DFI timing 2 register (DDRCTRL_REGS_DFITMG2) 466
13.7.55 DDRCTRL DFI timing 3 register (DDRCTRL_REGS_DFITMG3) 467
13.7.56 DDRCTRL DFI status register (DDRCTRL_REGS_DFISTAT) 467
13.7.57 DDRCTRL DM/DBI control register (DDRCTRL_REGS_DBICTL) . . . 468
13.7.58 DDRCTRL DFI PHY master register (DDRCTRL_REGS_DFIPHYMSTR) 469

14.4.5 PUB (PHY utility block) . . . 531
14.4.6 PHY and SDRAM initialization . . . 532
14.4.7 DRAM initialization sequence . . . 533
14.4.8 Device initialization . . . 534
14.4.9 Command address (CA) training . . . 534
14.4.10 Read gate training . . . 534
14.4.11 Write leveling fine phase training . . . 534
14.4.12 Read deskew . . . 535
14.4.13 Read 1D (SI friendly) training . . . 535
14.4.14 Write leveling coarse delay training . . . 535
14.4.15 Write 1D training . . . 536
14.4.16 Read 1D training (optimized delay centering) . . . 536
14.4.17 Max read latency training . . . 536

14.5 DDRPHYC registers 537
14.5.1 DDRPHYC MtestMuxSel register (DDRPHYC_ANIBx_MTESTMUXSEL) 537
14.5.2 DDRPHYC AForceDrvCont register (DDRPHYC_ANIBx_AFORCEDRVCONT) 538
14.5.3 DDRPHYC AForceTriCont register (DDRPHYC_ANIBx_AFORCETRICONT) 538
14.5.4 DDRPHYC address Tx impedance control register (DDRPHYC_ANIBx_ATXIMPEDANCE) 539
14.5.5 DDRPHYC ATestPrbsErr register (DDRPHYC_ANIBx_ATESTPRBSERR) 539
14.5.6 DDRPHYC address Tx slew rate and predriver control register (DDRPHYC_ANIBx_ATXSLEWRATE) 540
14.5.7 DDRPHYC ATestPrbsErrCnt register (DDRPHYC_ANIBx_ATESTPRBSERRCNT) 541
14.5.8 DDRPHYC ATxDly register (DDRPHYC_ANIBx_ATXDLY) 541
14.5.9 DDRPHYC DBYTE module disable register (DDRPHYC_DBYTEx_DBYTEMISCMODE) 542
14.5.10 DDRPHYC MtestMuxSel register (DDRPHYC_DBYTEx_MTESTMUXSEL) 542
14.5.11 DDRPHYC DFIMRL register (DDRPHYC_DBYTEx_DFIMRL) 543
14.5.12 DDRPHYC VrefDAC0_ry register (DDRPHYC_DBYTEx_VREFDAC0_Ry) 543
14.5.13 DDRPHYC data Tx impedance controls register (DDRPHYC_DBYTEx_TXIMPEDANCECTRL0_By) 544
14.5.14 DDRPHYC DQ/DQS receiver control register (DDRPHYC_DBYTEx_DQDQSRCVCNTRL_By) 545
14.5.15 DDRPHYC DQ/DQS receiver control register (DDRPHYC_DBYTEx_DQDQSRCVCNTRL1) 546
14.5.16 DDRPHYC DQ/DQS receiver control register (DDRPHYC_DBYTEx_DQDQSRCVCNTRL2) 546
14.5.17 DDRPHYC TX ODT driver strength control register (DDRPHYC_DBYTEx_TXODTDRVSTREN_By) 547
14.5.18 DDRPHYC status of RX FIFO consistency checks register (DDRPHYC_DBYTEx_RXFIFOCHECKSTATUS) 548
14.5.19 DDRPHYC captured values associated with an RxFIFO consistency error register (DDRPHYC_DBYTEx_RXFIFOCHECKERRVALUES) . 549
14.5.20 DDRPHYC data receive FIFO pointer values register (DDRPHYC_DBYTEx_RXFIFOINFO) 549
14.5.21 DDRPHYC Rx FIFO visibility register (DDRPHYC_DBYTEx_RXFIFOVISIBILITY) 550
14.5.22 DDRPHYC Rx FIFO content DQ321x register (DDRPHYC_DBYTEx_RXFIFOCONTENTSDQ3210) 551

14.5.23 DDRPHYC Rx FIFO content DQ7654 register (DDRPHYC_DBYTEx_RXFIFOCONTENTSDQ7654) 552
14.5.24 DDRPHYC Rx FIFO content DBI register (DDRPHYC_DBYTEx_RXFIFOCONTENTSDBI) 552
14.5.25 DDRPHYC Tx slew rate controls register (DDRPHYC_DBYTEx_TXSLEWRATE_By) 553
14.5.26 DDRPHYC RxPBDlyTgx_r0 register (DDRPHYC_DBYTEx_RXPBDLYTG0_Ry) 553
14.5.27 DDRPHYC RxPBDlyTg1_rx register (DDRPHYC_DBYTEx_RXPBDLYTG1_Ry) 554
14.5.28 DDRPHYC RxEnDlyTgx_u0 register (DDRPHYC_DBYTEx_RXENDLYTG0_U0) 554
14.5.29 DDRPHYC RxEnDlyTg1_ux register (DDRPHYC_DBYTEx_RXENDLYTG1_U0) 555
14.5.30 DDRPHYC RxClkDlyTgx_u0 register (DDRPHYC_DBYTEx_RXCLKDLYTG0_U0) 555
14.5.31 DDRPHYC RxClkDlyTg1_ux register (DDRPHYC_DBYTEx_RXCLKDLYTG1_U0) 556
14.5.32 DDRPHYC RxClkcDlyTgx_u0 register (DDRPHYC_DBYTEx_RXCLKCDLYTG0_U0) 556
14.5.33 DDRPHYC RxClkcDlyTg1_ux register (DDRPHYC_DBYTEx_RXCLKCDLYTG1_U0) 557
14.5.34 DDRPHYC DqLnSel register (DDRPHYC_DBYTEx_DQyLNSEL) . . . 557
14.5.35 DDRPHYC TxDqDlyTgx_r0 register (DDRPHYC_DBYTEx_TXDQDLYTG0_Ry) 558
14.5.36 DDRPHYC TxDqDlyTg1_rx register (DDRPHYC_DBYTEx_TXDQDLYTG1_Ry) 558
14.5.37 DDRPHYC TxDqsDlyTgx_u0 register (DDRPHYC_DBYTEx_TXDQSDLYTG0_U0) 559
14.5.38 DDRPHYC TxDqsDlyTg1_ux register (DDRPHYC_DBYTEx_TXDQSDLYTG1_U0) 559
14.5.39 DDRPHYC debug status of the DBYTE LCDL register (DDRPHYC_DBYTEx_DXLCDLSTATUS) 560
14.5.40 DDRPHYC RxEnDlyTgx_u1 register (DDRPHYC_DBYTEx_RXENDLYTG0_U1) 561
14.5.41 DDRPHYC RxEnDlyTg1_u1 register (DDRPHYC_DBYTEx_RXENDLYTG1_U1) 561
14.5.42 DDRPHYC RxClkDlyTgx_u1 register (DDRPHYC_DBYTEx_RXCLKDLYTG0_U1) 562
14.5.43 DDRPHYC RxClkDlyTg1_u1 register (DDRPHYC_DBYTEx_RXCLKDLYTG1_U1) 562
14.5.44 DDRPHYC RxClkcDlyTgx_u1 register (DDRPHYC_DBYTEx_RXCLKCDLYTG0_U1) 563

14.5.45 DDRPHYC RxClkcDlyTg1_u1 register (DDRPHYC_DBYTEx_RXCLKCDLYTG1_U1) 563
14.5.46 DDRPHYC TxDqsDlyTgx_u1 register (DDRPHYC_DBYTEx_TXDQSDLYTG0_U1) 564
14.5.47 DDRPHYC TxDqsDlyTg1_u1 register (DDRPHYC_DBYTEx_TXDQSDLYTG1_U1) 564
14.5.48 DDRPHYC Rx FIFO pointer initialization control register (DDRPHYC_MASTER0_RXFIFOINIT) 565
14.5.49 DDRPHYC ForceClkDisable register (DDRPHYC_MASTER0_FORCECLKDISABLE) 565
14.5.50 DDRPHYC ForceInternalUpdate register (DDRPHYC_MASTER0_FORCEINTERNALUPDATE) 566
14.5.51 DDRPHYC read-only displays PHY configuration register (DDRPHYC_MASTER0_PHYCONFIG) 566
14.5.52 DDRPHYC PHY general configuration register (DDRPHYC_MASTER0_PGCR) 567
14.5.53 DDRPHYC test bump control1 register (DDRPHYC_MASTER0_TESTBUMPCNTRL1) 568
14.5.54 DDRPHYC impedance calibration clock ratio register (DDRPHYC_MASTER0_CALUCLKINFO) 568
14.5.55 DDRPHYC test bump control register (DDRPHYC_MASTER0_TESTBUMPCNTRL) 569
14.5.56 DDRPHYC Seq0BDLY0 register (DDRPHYC_MASTER0_SEQ0BDLY0) 570
14.5.57 DDRPHYC Seq0BDLY1 register (DDRPHYC_MASTER0_SEQ0BDLY1) 570
14.5.58 DDRPHYC Seq0BDLY2 register (DDRPHYC_MASTER0_SEQ0BDLY2) 571
14.5.59 DDRPHYC Seq0BDLY3 register (DDRPHYC_MASTER0_SEQ0BDLY3) 572
14.5.60 DDRPHYC PHY alert status bit register (DDRPHYC_MASTER0_PHYALERTSTATUS) 573
14.5.61 DDRPHYC setup intervals for DFI PHY master operation register (DDRPHYC_MASTER0_PPTTRAINSETUP) 574
14.5.62 DDRPHYC ATestMode control register (DDRPHYC_MASTER0_ATESTMODE) 575
14.5.63 DDRPHYC TxCalBinP register (DDRPHYC_MASTER0_TXCALBINP) 575
14.5.64 DDRPHYC TxCalBinN register (DDRPHYC_MASTER0_TXCALBINN) 576
14.5.65 DDRPHYC TX P impedance calibration override register (DDRPHYC_MASTER0_TXCALPOVR) 576

14.5.66 DDRPHYC TX N impedance calibration override register (DDRPHYC_MASTER0_TXCALNOVR) 577
14.5.67 DDRPHYC enables for update and low-power interfaces for DFI0 and DFI1 register (DDRPHYC_MASTER0_DFIMODE) 578
14.5.68 DDRPHYC mode select register for MEMCLK/address/command tristate register (DDRPHYC_MASTER0_TRISTATEMODECA) 579
14.5.69 DDRPHYC MtestMuxSel register (DDRPHYC_MASTER0_MTESTMUXSEL) 580
14.5.70 DDRPHYC MtestPgmInfo register (DDRPHYC_MASTER0_MTESTPGMINFO) 580
14.5.71 DDRPHYC dynamic power up/down control register (DDRPHYC_MASTER0_DYNPWRDNUP) 581
14.5.72 DDRPHYC PMIEnable register (DDRPHYC_MASTER0_PMIENABLE) 581
14.5.73 DDRPHYC PhyTID register (DDRPHYC_MASTER0_PHYTID) 582
14.5.74 DDRPHYC HwtMRL register (DDRPHYC_MASTER0_HWTMRL) . . . 582
14.5.75 DDRPHYC DFI PhyUpdate request time counter register (DDRPHYC_MASTER0_DFIPHYUPD) 583
14.5.76 DDRPHYC PdaMrsWriteMode register (DDRPHYC_MASTER0_PDAMRSWRITEMODE) 584
14.5.77 DDRPHYC DFIGEARDOWNCTL register (DDRPHYC_MASTER0_DFIGEARDOWNCTL) 585
14.5.78 DDRPHYC control the PHY logic related to the read and write DQS preamble register (DDRPHYC_MASTER0_DQSPREAMBLECONTROL) 585
14.5.79 DDRPHYC MasterX4Config register (DDRPHYC_MASTER0_MASTERX4CONFIG) 586
14.5.80 DDRPHYC write level feedback DQ observability selection register (DDRPHYC_MASTER0_WRLEVBITS) 587
14.5.81 DDRPHYC EnableCsMulticast register (DDRPHYC_MASTER0_ENABLECSMULTICAST) 588
14.5.82 DDRPHYC Acx4AnibDis register (DDRPHYC_MASTER0_ACX4ANIBDIS) 588
14.5.83 DDRPHYC enable Read-DBI function in each DBYTE register (DDRPHYC_MASTER0_DMIPINPRESENT) 589
14.5.84 DDRPHYC ARdPtrInitVal register (DDRPHYC_MASTER0_ARDPTRINITVAL) 589
14.5.85 DDRPHYC DLL mode control for DBYTEs register (DDRPHYC_MASTER0_DBYTEDLLMODECNTRL) 590
14.5.86 IDDRPHYC impedance calibration offsets control register (DDRPHYC_MASTER0_CALOFFSETS) 590
14.5.87 DDRPHYC SarInitVals register (DDRPHYC_MASTER0_SARINITVALS) 591

14.5.88 DDRPHYC CalPExtOvr register (DDRPHYC_MASTER0_CALPEXTOVR) 591
14.5.89 DDRPHYC CalCmpr5Ovr register (DDRPHYC_MASTER0_CALCMPR5OVR) 592
14.5.90 DDRPHYC CalNIntOvr register (DDRPHYC_MASTER0_CALNINTOVR) 592
14.5.91 DDRPHYC impedance calibration driver strength control register (DDRPHYC_MASTER0_CALDRVSTR0) 593
14.5.92 DDRPHYC read data on-die termination timing control register (DDRPHYC_MASTER0_PROCODTTIMECTL) 593
14.5.93 DDRPHYC MemAlert receiver configuration register (DDRPHYC_MASTER0_MEMALERTCONTROL) 595
14.5.94 DDRPHYC MemAlert receiver configuration register 2 (DDRPHYC_MASTER0_MEMALERTCONTROL2) 596
14.5.95 DDRPHYC protection and control of BP_MemReset_L register (DDRPHYC_MASTER0_MEMRESETL) 597
14.5.96 DDRPHYC PUBMODE - HWT Mux select register (DDRPHYC_MASTER0_PUBMODE) 598
14.5.97 DDRPHYC misc PHY status bits register (DDRPHYC_MASTER0_MISCPHYSTATUS) 598
14.5.98 DDRPHYC CoreLoopbackSel register (DDRPHYC_MASTER0_CORELOOPBACKSEL) 599
14.5.99 DDRPHYC DLL various training parameters register (DDRPHYC_MASTER0_DLLTRAINPARAM) 599
14.5.100 DDRPHYC HwtLpCsEnBypass register (DDRPHYC_MASTER0_HWTLPCSENBYPASS) 600
14.5.101 DDRPHYC DFI command/address mode register (DDRPHYC_MASTER0_DFICAMODE) 600
14.5.102 DDRPHYC DLL lock state machine control register (DDRPHYC_MASTER0_DLLCONTROL) 601
14.5.103 DDRPHYC DLL update phase control register (DDRPHYC_MASTER0_PULSEDLLUPDATEPHASE) 602
14.5.104 DDRPHYC DLL gain control register (DDRPHYC_MASTER0_DLLGAINCTL) 603
14.5.105 DDRPHYC impedance calibration control register (DDRPHYC_MASTER0_CALRATE) 604
14.5.106 DDRPHYC CalZap register (DDRPHYC_MASTER0_CALZAP) 605
14.5.107 DDRPHYC PState register (DDRPHYC_MASTER0_PSTATE) 605
14.5.108 DDRPHYC PLL output control register (DDRPHYC_MASTER0_PLLOUTGATECONTROL) 606
14.5.109 DDRPHYC PMU power-on reset control register (DDRPHYC_MASTER0_PORCONTROL) 606
14.5.110 DDRPHYC CalBusy register (DDRPHYC_MASTER0_CALBUSY) . . . 607

14.5.111 DDRPHYC misc impedance calibration control register (DDRPHYC_MASTER0_CALMISC2) 607
14.5.112 DDRPHYC controls for disabling the impedance calibration of certain target register (DDRPHYC_MASTER0_CALMISC) 609
14.5.113 DDRPHYC CalVRef register (DDRPHYC_MASTER0_CALVREFS) 610
14.5.114 DDRPHYC CalCmpr5 register (DDRPHYC_MASTER0_CALCMPR5) 610
14.5.115 DDRPHYC impedance calibration NInt control register (DDRPHYC_MASTER0_CALNINT) 611
14.5.116 DDRPHYC impedance calibration PExt control register (DDRPHYC_MASTER0_CALPEXT) 611
14.5.117 DDRPHYC impedance calibration Cmp invert control register (DDRPHYC_MASTER0_CALCMPINVERT) 612
14.5.118 DDRPHYC impedance calibration Cmpana control register (DDRPHYC_MASTER0_CALCMPANACNTRL) 612
14.5.119 DDRPHYC maps dfi_rddata_cs_n to destination dimm timing group register (DDRPHYC_MASTER0_DFIRDDATACSDESTMAP) . 613
14.5.120 PHY global V_{REF} controls register (DDRPHYC_MASTER0_VREFINGLOBAL) 613
14.5.121 DDRPHYC maps dfi_rddata_cs_n to destination dimm timing group register (DDRPHYC_MASTER0_DFIWRDATACSDESTMAP) . 614
14.5.122 DDRPHYC MasUpdGoodCtr register (DDRPHYC_MASTER0_MASUPDGOODCTR) 615
14.5.123 DDRPHYC PhyUpd0GoodCtr register (DDRPHYC_MASTER0_PHYUPD0GOODCTR) 616
14.5.124 DDRPHYC PhyUpd1GoodCtr register (DDRPHYC_MASTER0_PHYUPD1GOODCTR) 616
14.5.125 DDRPHYC CtlUpd0GoodCtr register (DDRPHYC_MASTER0_CTLUPD0GOODCTR) 617
14.5.126 DDRPHYC MasUpdFailCtr register (DDRPHYC_MASTER0_MASUPDFAILCTR) 617
14.5.127 DDRPHYC PhyUpd0FailCtr register (DDRPHYC_MASTER0_PHYUPD0FAILCTR) 618
14.5.128 DDRPHYC performance counter enable register (DDRPHYC_MASTER0_PHYPERFCTRENABLE) 618
14.5.129 DDRPHYC PllPwrDn register (DDRPHYC_MASTER0_PLLPWRDN) 619
14.5.130 DDRPHYC PllReset register (DDRPHYC_MASTER0_PLLRESET) . . 619
14.5.131 DDRPHYC PState dependent PLL control 2 register (DDRPHYC_MASTER0_PLLCTRL2) 620
14.5.132 DDRPHYC PLL control 0 register (DDRPHYC_MASTER0_PLLCTRL0) 620

14.5.133 DDRPHYC PState dependent PLL control 1 register (DDRPHYC_MASTER0_PLLCTRL1) 621
14.5.134 DDRPHYC PLL testing control register (DDRPHYC_MASTER0_PLLTST) 622
14.5.135 DDRPHYC PllLockStatus register (DDRPHYC_MASTER0_PLLLOCKSTATUS) 623
14.5.136 DDRPHYC PII TestMode register (DDRPHYC_MASTER0_PLLTESTMODE) 624
14.5.137 DDRPHYC PLL control 3 register (DDRPHYC_MASTER0_PLLCTRL3) 624
14.5.138 DDRPHYC PState dependent PLL control 4 register (DDRPHYC_MASTER0_PLLCTRL4) 625
14.5.139 DDRPHYC PllEndofCal register (DDRPHYC_MASTER0_PLLENDOFCAL) 625
14.5.140 DDRPHYC PllStandbyEff register (DDRPHYC_MASTER0_PLLSTANDBYEFF) 626
14.5.141 DDRPHYC PllDacValOut register (DDRPHYC_MASTER0_PLLDACVALOUT) 626
14.5.142 DDRPHYC LcdlDbgCntl register (DDRPHYC_MASTER0_LCDLDBGCNTL) 627
14.5.143 DDRPHYC Debug status of the DBYTE LCDL register (DDRPHYC_MASTER0_ACLCDLSTATUS) 628
14.5.144 DDRPHYC CUSTPHYREV register (DDRPHYC_MASTER0_CUSTPHYREV) 628
14.5.145 DDRPHYC PHYREV register (DDRPHYC_MASTER0_PHYREV) . . . 629
14.5.146 DDRPHYC Start vector value for LP3-exit or init PIE sequence register (DDRPHYC_MASTER0_LP3EXITSEQ0BSTARTVECTOR) . 629
14.5.147 DDRPHYC DFI frequency translation 0 register (DDRPHYC_MASTER0_DFIFREQXLAT0) 630
14.5.148 DDRPHYC DFI frequency translation 1 register (DDRPHYC_MASTER0_DFIFREQXLAT1) 630
14.5.149 DDRPHYC DFI frequency translation 2 register (DDRPHYC_MASTER0_DFIFREQXLAT2) 631
14.5.150 DDRPHYC DFI frequency translation 3 register (DDRPHYC_MASTER0_DFIFREQXLAT3) 631
14.5.151 DDRPHYC DFI frequency translation 4 register (DDRPHYC_MASTER0_DFIFREQXLAT4) 632
14.5.152 DDRPHYC DFI frequency translation 5 register (DDRPHYC_MASTER0_DFIFREQXLAT5) 632
14.5.153 DDRPHYC DFI frequency translation 6 register (DDRPHYC_MASTER0_DFIFREQXLAT6) 633
14.5.154 DDRPHYC DFI frequency translation 7 register (DDRPHYC_MASTER0_DFIFREQXLAT7) 633

14.5.155 DDRPHYC TxRdPtrInit register (DDRPHYC_MASTER0_TXRDPTRINIT) 634
14.5.156 DDRPHYC DfiInitComplete register (DDRPHYC_MASTER0_DFIINITCOMPLETE) 634
14.5.157 DDRPHYC DfiFreqRatio register (DDRPHYC_MASTER0_DFIFREQRATIO) 635
14.5.158 DDRPHYC RxFifoCheck register (DDRPHYC_MASTER0_RXFIFOCHECKS) 635
14.5.159 DDRPHYC MTestCombo output enable on core-side copy register (DDRPHYC_MASTER0_MTESTDTOCTRL) 636
14.5.160 DDRPHYC MapCAA[0to7]toDfi register (DDRPHYC_MASTER0_MAPCAAxTODFI) 636
14.5.161 DDRPHYC interrupt enable register (DDRPHYC_MASTER0_PHYINTERRUPTENABLE) 637
14.5.162 DDRPHYC interrupt firmware control register (DDRPHYC_MASTER0_PHYINTERRUPTFWCONTROL) 638
14.5.163 DDRPHYC interrupt mask register (DDRPHYC_MASTER0_PHYINTERRUPTMASK) 638
14.5.164 DDRPHYC interrupt clear register (DDRPHYC_MASTER0_PHYINTERRUPTCLEAR) 639
14.5.165 DDRPHYC interrupt status register (DDRPHYC_MASTER0_PHYINTERRUPTSTATUS) 640
14.5.166 DDRPHYC HwtSwizzleHwtAddress0 register (DDRPHYC_MASTER0_HWTSWIZZLEHWTADDRESSx) 642
14.5.167 DDRPHYC HwtSwizzleHwtActN register (DDRPHYC_MASTER0_HWTSWIZZLEHWTACTN) 644
14.5.168 DDRPHYC HwtSwizzleHwtBank0 register (DDRPHYC_MASTER0_HWTSWIZZLEHWTBANK0) 644
14.5.169 DDRPHYC HwtSwizzleHwtBank1 register (DDRPHYC_MASTER0_HWTSWIZZLEHWTBANK1) 645
14.5.170 DDRPHYC HwtSwizzleHwtBank2 register (DDRPHYC_MASTER0_HWTSWIZZLEHWTBANK2) 645
14.5.171 DDRPHYC HwtSwizzleHwtBg0 register (DDRPHYC_MASTER0_HWTSWIZZLEHWTBG0) 646
14.5.172 DDRPHYC HwtSwizzleHwtBg1 register (DDRPHYC_MASTER0_HWTSWIZZLEHWTBG1) 646
14.5.173 DDRPHYC HwtSwizzleHwtCasN register (DDRPHYC_MASTER0_HWTSWIZZLEHWTCASN) 647
14.5.174 DDRPHYC HwtSwizzleHwtRasN register (DDRPHYC_MASTER0_HWTSWIZZLEHWTRASN) 647
14.5.175 DDRPHYC HwtSwizzleHwtWeN register (DDRPHYC_MASTER0_HWTSWIZZLEHWTWEN) 648

14.5.176 DDRPHYC HwtSwizzleHwtParityIn register (DDRPHYC_MASTER0_HWTSWIZZLEHWTPARITYIN) 648
14.5.177 DDRPHYC small delays on handshake signals register 0 (DDRPHYC_MASTER0_DFIHANDSHAKEDELAYS0) 649
14.5.178 DDRPHYC small delays on handshake signals register 1 (DDRPHYC_MASTER0_DFIHANDSHAKEDELAYS1) 649
14.5.179 DDRPHYC remote impedance calibration status register (DDRPHYC_MASTER0_REMOTEIMPCAL) 650
14.5.180 DDRPHYC PhyInLP3 register (DDRPHYC_INITENG0_PHYINLP3) . 651
14.5.181 DDRPHYC Ucclk and Hclk enable register (DDRPHYC_DRTUB0_UCCLKHCLKENABLES) 651
14.5.182 DDRPHYC CurPstate0b register (DDRPHYC_DRTUB0_CURPSTATE0B) 652
14.5.183 DDRPHYC CUSTPUBREV register (DDRPHYC_DRTUB0_CUSTPUBREV) 652
14.5.184 DDRPHYC PUBREV register (DDRPHYC_DRTUB0_PUBREV) 653
14.5.185 DDRPHYC MicroContMuxSel register (DDRPHYC_APBONLY0_MICROCONTMUXSEL) 653
14.5.186 DDRPHYC PMU/controller protocol, controller read-only shadow register (DDRPHYC_APBONLY0_UCTSHADOWREGS) . . . 654
14.5.187 DDRPHYC DctWriteOnly register (DDRPHYC_APBONLY0_DCTWRITEONLY) 654
14.5.188 DDRPHYC DctWriteProt register (DDRPHYC_APBONLY0_DCTWRITEPROT) 655
14.5.189 DDRPHYC UctWriteOnlyShadow register (DDRPHYC_APBONLY0_UCTWRITEONLYSHADOW) 655
14.5.190 DDRPHYC UctDatWriteOnlyShadow register (DDRPHYC_APBONLY0_UCTDATWRITEONLYSHADOW) 656
14.5.191 DDRPHYC DfiCfgRdDataValidTicks register (DDRPHYC_APBONLY0_DFICFGRDDATAVALIDTICKS) 656
14.5.192 DDRPHYC reset and clock shutdown control register (DDRPHYC_APBONLY0_MICRORESET) 657

29.3.1 EXTI connections between peripherals and CPU 1506
29.3.2 EXTI1 wake-up interrupt list 1507
29.3.3 EXTI2 wake-up interrupt list 1510
29.4 EXTI functional description 1512
29.4.1 EXTI configurable event input wake-up 1513
29.4.2 EXTI direct event input wake-up 1513
29.4.3 EXTI multiplexer selection 1515
29.5 EXTI functional behavior 1515
29.6 EXTI event protection 1516
29.6.1 EXTI register security protection 1517
29.6.2 EXTI register privilege protection 1517
29.6.3 EXTI register CID protection 1517
29.7 EXTIx registers 1518
29.7.1 EXTI1 rising trigger selection register (EXTI1_RTSR1) 1519
29.7.2 EXTI1 falling trigger selection register (EXTI1_FTSR1) 1520
29.7.3 EXTI1 software interrupt event register (EXTI1_SWIER1) 1520
29.7.4 EXTI1 rising edge pending register (EXTI1_RPR1) 1521
29.7.5 EXTI1 falling edge pending register (EXTI1_FPR1) 1522
29.7.6 EXTI1 security configuration register (EXTI1_SECCFGR1) 1522

29.7.7 EXTI1 privilege configuration register (EXTI1_PRIVCFGR1) 1523
29.7.8 EXTI1 rising trigger selection register (EXTI1_RTSR2) 1524
29.7.9 EXTI1 falling trigger selection register (EXTI1_FTSR2) 1524
29.7.10 EXTI1 software interrupt event register (EXTI1_SWIER2) 1525
29.7.11 EXTI1 rising edge pending register (EXTI1_RPR2) 1526
29.7.12 EXTI1 falling edge pending register (EXTI1_FPR2) 1527
29.7.13 EXTI1 security enable register (EXTI1_SECCFGR2) 1528
29.7.14 EXTI1 privilege enable register (EXTI1_PRIVCFGR2) 1529
29.7.15 EXTI1 rising trigger selection register (EXTI1_RTSR3) 1530
29.7.16 EXTI1 falling trigger selection register (EXTI1_FTSR3) 1531
29.7.17 EXTI1 software interrupt event register (EXTI1_SWIER3) 1532
29.7.18 EXTI1 rising edge pending register (EXTI1_RPR3) 1533
29.7.19 EXTI1 falling edge pending register (EXTI1_FPR3) 1534
29.7.20 EXTI1 security enable register (EXTI1_SECCFGR3) 1535
29.7.21 EXTI1 privilege enable register (EXTI1_PRIVCFGR3) 1536
29.7.22 EXTI1 external interrupt selection register 1 (EXTI1_EXTICR1) 1537
29.7.23 EXTI1 external interrupt selection register 2 (EXTI1_EXTICR2) 1539
29.7.24 EXTI1 external interrupt selection register 3 (EXTI1_EXTICR3) 1542
29.7.25 EXTI1 external interrupt selection register 4 (EXTI1_EXTICR4) 1545
29.7.26 EXTI1 lock register (EXTI1_LOCKR) 1548
29.7.27 EXTI1 CPUm wake-up with interrupt mask register (EXTI1_CmIMR1) (m = 1 to 2) 1549
29.7.28 EXTI1 CPU2 wake-up with event mask register (EXTI1_C2EMR1) . 1550
29.7.29 EXTI1 CPUm wake-up with interrupt mask register (EXTI1_CmIMR2) (m = 1 to 2) 1551
29.7.30 EXTI1 CPUm wake-up with interrupt mask register (EXTI1_CmIMR3) (m = 1 to 2) 1552
29.7.31 EXTI1 CPU2 wake-up with event mask register (EXTI1_C2EMR3) . 1553
29.7.32 EXTI1 event CID configuration register (EXTI1_EnCIDCFGR) 1554
29.7.33 EXTI1 processor m CID configuration register (EXTI1_CmCIDCFGR) 1554
29.7.34 EXTI1 hardware configuration registers 13 (EXTI1_HWCFGR13) . . 1555
29.7.35 EXTI1 hardware configuration registers 12 (EXTI1_HWCFGR12) . . 1555
29.7.36 EXTI1 hardware configuration registers 11 (EXTI1_HWCFGR11) . . 1556
29.7.37 EXTI1 hardware configuration registers 7 (EXTI1_HWCFGR7) 1556
29.7.38 EXTI1 hardware configuration registers 6 (EXTI1_HWCFGR6) 1556
29.7.39 EXTI1 hardware configuration registers 5 (EXTI1_HWCFGR5) 1557
29.7.40 EXTI1 hardware configuration registers 4 (EXTI1_HWCFGR4) 1557

29.7.41 EXTI1 hardware configuration registers 3 (EXTI1_HWCFGR3) 1557
29.7.42 EXTI1 hardware configuration registers 2 (EXTI1_HWCFGR2) 1558
29.7.43 EXTI1 hardware configuration register 1 (EXTI1_HWCFGR1) 1558
29.7.44 EXTI1 version register (EXTI1_VERR) 1558
29.7.45 EXTI1 identification register (EXTI1_IPIDR) 1559
29.7.46 EXTI1 size identification register (EXTI1_SIDR) 1559
29.7.47 EXTI2 rising trigger selection register (EXTI2_RTSR1) 1559
29.7.48 EXTI2 falling trigger selection register (EXTI2_FTSR1) 1560
29.7.49 EXTI2 software interrupt event register (EXTI2_SWIER1) 1561
29.7.50 EXTI2 rising edge pending register (EXTI2_RPR1) 1562
29.7.51 EXTI2 falling edge pending register (EXTI2_FPR1) 1563
29.7.52 EXTI2 security configuration register (EXTI2_SECCFGR1) 1563
29.7.53 EXTI2 privilege configuration register (EXTI2_PRIVCFGR1) 1564
29.7.54 EXTI2 rising trigger selection register (EXTI2_RTSR2) 1565
29.7.55 EXTI2 falling trigger selection register (EXTI2_FTSR2) 1566
29.7.56 EXTI2 software interrupt event register (EXTI2_SWIER2) 1567
29.7.57 EXTI2 rising edge pending register (EXTI2_RPR2) 1567
29.7.58 EXTI2 falling edge pending register (EXTI2_FPR2) 1568
29.7.59 EXTI2 security enable register (EXTI2_SECCFGR2) 1569
29.7.60 EXTI2 privilege enable register (EXTI2_PRIVCFGR2) 1570
29.7.61 EXTI2 external interrupt selection register 1 (EXTI2_EXTICR1) 1571
29.7.62 EXTI2 external interrupt selection register 2 (EXTI2_EXTICR2) 1573
29.7.63 EXTI2 external interrupt selection register 3 (EXTI2_EXTICR3) 1576
29.7.64 EXTI2 external interrupt selection register 4 (EXTI2_EXTICR4) 1578
29.7.65 EXTI2 lock register (EXTI2_LOCKR) 1581
29.7.66 EXTI2 CPUm wake-up with interrupt mask register (EXTI2_CmIMR1) (m = 1 to 2) 1581
29.7.67 EXTI2 CPU2 wake-up with event mask register (EXTI2_C2EMR1) 1582
29.7.68 EXTI2 CPUm wake-up with interrupt mask register (EXTI2_CmIMR2) (m = 1 to 2) 1583
29.7.69 EXTI2 CPU2 wake-up with event mask register (EXTI2_C2EMR2) 1584
29.7.70 EXTI2 event CID config register (EXTI2_EnCIDCFGR) 1584
29.7.71 EXTI2 processor m CID configuration register (EXTI2_CmCIDCFGR) 1585
29.7.72 EXTI2 hardware configuration registers 13 (EXTI2_HWCFGR13) . . 1586
29.7.73 EXTI2 hardware configuration registers 12 (EXTI2_HWCFGR12) . . 1586

29.7.74 EXTI2 hardware configuration registers 11 (EXTI2_HWCFGR11) . . 1586
29.7.75 EXTI2 hardware configuration registers 7 (EXTI2_HWCFGR7) 1587
29.7.76 EXTI2 hardware configuration registers 6 (EXTI2_HWCFGR6) 1587
29.7.77 EXTI2 hardware configuration registers 5 (EXTI2_HWCFGR5) 1587
29.7.78 EXTI2 hardware configuration registers 4 (EXTI2_HWCFGR4) 1588
29.7.79 EXTI2 hardware configuration registers 3 (EXTI2_HWCFGR3) 1588
29.7.80 EXTI2 hardware configuration registers 2 (EXTI2_HWCFGR2) 1588
29.7.81 EXTI2 hardware configuration register 1 (EXTI2_HWCFGR1) 1589
29.7.82 EXTI2 version register (EXTI2_VERR) 1589
29.7.83 EXTI2 identification register (EXTI2_IPIDR) 1589
29.7.84 EXTI2 size identification register (EXTI2_SIDR) 1590

29.7.86 EXTI2 register map 1595

30 Cyclic redundancy check calculation unit (CRC) 1599

30.1 CRC introduction 1599
30.2 CRC main features 1599
30.3 CRC functional description 1600
30.3.1 CRC block diagram 1600
30.3.2 CRC internal signals 1600
30.3.3 CRC operation 1600
30.4 CRC registers 1602
30.4.1 CRC data register (CRC_DR) 1602
30.4.2 CRC independent data register (CRC_IDR) 1602
30.4.3 CRC control register (CRC_CR) 1603
30.4.4 CRC initial value (CRC_INIT) 1604
30.4.5 CRC polynomial (CRC_POL) 1604
30.4.6 CRC register map 1605

31 Mass storage interfaces 1606

31.1 Overview 1606
31.2 FMC interface 1606
31.2.1 FMC interface block diagram 1607
31.2.2 FMC interface reset 1607
31.2.3 FMC interface interrupt 1608
31.3 Octo-SPI interface 1608

31.3.1 Main features of the Octo-SPI interface 1608
31.3.2 Octo-SPI interface block diagram 1609
31.3.3 Octo-SPI interface resets 1610
31.3.4 Octo-SPI interface memory 1610
31.3.5 OCTOSPI1 description 1611
31.3.6 OTFDEC1 description 1611
31.3.7 DLYBOS1 description 1611
31.3.8 Octo-SPI interface interrupts 1613
31.3.9 Chip select management 1613
31.3.10 Octo-SPI interface programmable parameters 1615
31.3.11 Select the RX sampling strobe and configure the TX clock 1616
31.4 SD/eMMC interface 1617
31.4.1 SD/eMMC interface main features 1618
31.4.2 SD/eMMC interface block diagram 1620
31.4.3 SD/eMMC interface reset 1621
31.4.4 SDMMC1/2 description 1621
31.4.5 DLYBSD1/2 description 1622
31.4.6 SD/eMMC interface interrupts 1622
31.4.7 SD/eMMC interface programmable parameters 1622
31.4.8 Guidelines for selecting the RX sampling clock 1624

32 Flexible memory controller (FMC) 1627
32.1 FMC main features 1627
32.2 FMC implementation 1628
32.3 FMC block diagram 1628
32.4 FMC internal signals 1629
32.5 AHB interface 1629
32.6 AXI interface 1630
32.6.1 Supported memories and transactions 1630
32.7 External device address mapping 1631
32.7.1 NOR/PSRAM address mapping 1631
32.7.2 NAND flash memory address mapping 1632
32.8 FMC security and isolation 1633
32.9 FMC RIF registers 1636
32.9.1 FMC security configuration register (FMC_SECCFGR) 1636
32.9.2 FMC security configuration register (FMC_PRIVCFGR) 1637

32.9.3 FMC CID configuration lock register (FMC_RCFGLOCKR) 1638
32.9.4 FMC resource x CID register (FMC_CIDCFGRx) 1639
32.9.5 FMC resource x semaphore control register (FMC_SEMCRx) 1640
32.10 NOR flash/PSRAM controller 1641
32.10.1 External memory interface signals 1643
32.10.2 Supported memories and transactions 1645
32.10.3 General timing rules 1647
32.10.4 NOR flash/PSRAM controller asynchronous transactions 1647
32.10.5 Synchronous transactions 1666
32.10.6 NOR/PSRAM controller registers 1671
32.11 NAND flash controller 1684
32.11.1 External memory interface signals 1685
32.11.2 NAND flash supported memories and transactions 1686
32.11.3 Timing diagrams for NAND flash memory 1686
32.11.4 NAND flash operations 1688
32.11.5 NAND flash prewait function 1689
32.11.6 NAND ECC controller 1689
32.11.7 FMC command sequencer 1692
32.11.8 NAND flash controller interrupt 1699
32.11.9 NAND flash controller registers 1700
32.12 FMC register map 1724

33 Octo-SPI interface (OCTOSPI) 1729
33.1 OCTOSPI introduction 1729
33.2 OCTOSPI main features 1729
33.3 OCTOSPI implementation 1730
33.4 OCTOSPI functional description 1731
33.4.1 OCTOSPI block diagram 1731
33.4.2 OCTOSPI pins and internal signals 1732
33.4.3 OCTOSPI interface to memory modes 1733
33.4.4 OCTOSPI regular-command protocol 1733
33.4.5 OCTOSPI regular-command protocol signal interface 1737
33.4.6 HyperBus protocol 1740
33.4.7 Specific features 1744
33.4.8 OCTOSPI operating mode introduction 1745
33.4.9 OCTOSPI indirect mode 1745

33.4.10 OCTOSPI automatic status-polling mode 1747
33.4.11 OCTOSPI memory-mapped mode 1748
33.4.12 OCTOSPI configuration introduction 1749
33.4.13 OCTOSPI system configuration 1749
33.4.14 OCTOSPI device configuration 1750
33.4.15 OCTOSPI regular-command mode configuration 1752
33.4.16 OCTOSPI HyperBus protocol configuration 1755
33.4.17 OCTOSPI error management 1755
33.4.18 OCTOSPI BUSY and ABORT 1756
33.4.19 OCTOSPI reconfiguration or deactivation 1756
33.4.20 NCS behavior 1757
33.4.21 Software control of two external memories 1758
33.5 Address alignment and data number 1759
33.6 OCTOSPI interrupts 1760
33.7 OCTOSPI registers 1760
33.7.1 OCTOSPI control register (OCTOSPI_CR) 1760
33.7.2 OCTOSPI device configuration register 1 (OCTOSPI_DCR1) 1763
33.7.3 OCTOSPI device configuration register 2 (OCTOSPI_DCR2) 1765
33.7.4 OCTOSPI device configuration register 3 (OCTOSPI_DCR3) 1766
33.7.5 OCTOSPI device configuration register 4 (OCTOSPI_DCR4) 1767
33.7.6 OCTOSPI status register (OCTOSPI_SR) 1767
33.7.7 OCTOSPI flag clear register (OCTOSPI_FCR) 1768
33.7.8 OCTOSPI data length register (OCTOSPI_DLR) 1769
33.7.9 OCTOSPI address register (OCTOSPI_AR) 1769
33.7.10 OCTOSPI data register (OCTOSPI_DR) 1770
33.7.11 OCTOSPI polling status mask register (OCTOSPI_PSMKR) 1770
33.7.12 OCTOSPI polling status match register (OCTOSPI_PSMAR) 1771
33.7.13 OCTOSPI polling interval register (OCTOSPI_PIR) 1771
33.7.14 OCTOSPI communication configuration register (OCTOSPI_CCR) . 1772
33.7.15 OCTOSPI timing configuration register (OCTOSPI_TCR) 1774
33.7.16 OCTOSPI instruction register (OCTOSPI_IR) 1774
33.7.17 OCTOSPI alternate bytes register (OCTOSPI_ABR) 1775
33.7.18 OCTOSPI low-power timeout register (OCTOSPI_LPTR) 1775
33.7.19 OCTOSPI wrap communication configuration register (OCTOSPI_WPCCR) 1776
33.7.20 OCTOSPI wrap timing configuration register (OCTOSPI_WPTCR) . 1778
33.7.21 OCTOSPI wrap instruction register (OCTOSPI_WPIR) 1778

33.7.22 OCTOSPI wrap alternate bytes register (OCTOSPI_WPABR) 1779
33.7.23 OCTOSPI write communication configuration register (OCTOSPI_WCCR) 1779
33.7.24 OCTOSPI write timing configuration register (OCTOSPI_WTCR) . . . 1781
33.7.25 OCTOSPI write instruction register (OCTOSPI_WIR) 1782
33.7.26 OCTOSPI write alternate bytes register (OCTOSPI_WABR) 1782
33.7.27 OCTOSPI HyperBus latency configuration register (OCTOSPI_HLCR) 1783
33.7.28 OCTOSPI hardware configuration register 2 (OCTOSPI_HWCFGR2) 1783
33.7.29 OCTOSPI hardware configuration register (OCTOSPI_HWCFGR) . 1784
33.7.30 OCTOSPI version register (OCTOSPI_VERR) 1785
33.7.31 OCTOSPI identification register (OCTOSPI_IDR) 1785
33.7.32 OCTOSPI hardware magic identification register (OCTOSPI_MIDR) 1786
33.7.33 OCTOSPI register map 1786

34 Secure digital input/output MultiMediaCard interface (SDMMC) . . 1790

34.1 SDMMC main features 1790
34.2 SDMMC implementation 1790
34.3 SDMMC bus topology 1791
34.4 SDMMC operation modes 1793
34.5 SDMMC functional description 1794
34.5.1 SDMMC block diagram 1794
34.5.2 SDMMC pins and internal signals 1794
34.5.3 General description 1795
34.5.4 SDMMC adapter 1797
34.5.5 SDMMC AHB slave interface 1819
34.5.6 SDMMC AHB master interface 1820
34.5.7 AHB and SDMMC_CK clock relation 1823
34.6 Card functional description 1824
34.6.1 SD I/O mode 1824
34.6.2 CMD12 send timing 1832
34.6.3 Sleep (CMD5) 1836
34.6.4 Interrupt mode (Wait-IRQ) 1837
34.6.5 Boot operation 1838
34.6.6 Response R1b handling 1841
34.6.7 Reset and card cycle power 1842

34.7 Hardware flow control 1843
34.7.1 Hardware flow control during data transfer 1843
34.7.2 Block gap hardware flow control 1844
34.8 Ultra-high-speed phase I (UHS-I) voltage switch 1845
34.9 SDMMC interrupts 1848
34.10 SDMMC registers 1850
34.10.1 SDMMC power control register (SDMMC_POWER) 1850
34.10.2 SDMMC clock control register (SDMMC_CLKCR) 1851
34.10.3 SDMMC argument register (SDMMC_ARGR) 1853
34.10.4 SDMMC command register (SDMMC_CMDR) 1853
34.10.5 SDMMC command response register (SDMMC_RESPCMDR) 1855
34.10.6 SDMMC response x register (SDMMC_RESPxR) 1856
34.10.7 SDMMC data timer register (SDMMC_DTIMER) 1856
34.10.8 SDMMC data length register (SDMMC_DLENR) 1857
34.10.9 SDMMC data control register (SDMMC_DCTRL) 1858
34.10.10 SDMMC data counter register (SDMMC_DCNTR) 1859
34.10.11 SDMMC status register (SDMMC_STAR) 1860
34.10.12 SDMMC interrupt clear register (SDMMC_ICR) 1863
34.10.13 SDMMC mask register (SDMMC_MASKR) 1865
34.10.14 SDMMC acknowledgment timer register (SDMMC_ACKTIMER) . . . 1868
34.10.15 SDMMC data FIFO threshold register (SDMMC_FIFOTHRR) 1868
34.10.16 SDMMC DMA control register (SDMMC_IDMACTRLR) 1869
34.10.17 SDMMC IDMA buffer size register (SDMMC_IDMABSIZER) 1869
34.10.18 SDMMC IDMA buffer base address register (SDMMC_IDMABASER) 1870
34.10.19 SDMMC IDMA linked list address register (SDMMC_IDMALAR) . . . 1870
34.10.20 SDMMC IDMA linked list memory base register (SDMMC_IDMABAR) 1871
34.10.21 SDMMC data FIFO registers x (SDMMC_FIFORx) 1872
34.10.22 SDMMC hardware configuration register 1 (SDMMC_HWCFGR1) . 1872
34.10.23 SDMMC version register (SDMMC_VERR) 1873
34.10.24 SDMMC identification register (SDMMC_IPIDR) 1873
34.10.25 SDMMC size identification register (SDMMC_SIDR) 1873
34.10.26 SDMMC register map 1874

35 Delay block (DLYB) 1877

35.1 DLYB introduction 1877

35.2 DLYB main features . . . 1877
35.3 DLYB implementation . . . 1877
35.4 DLYB functional description . . . 1877
35.4.1 DLYB diagram . . . 1877
35.4.2 DLYB internal signals . . . 1879
35.4.3 General description . . . 1881
35.4.4 Lock mode procedure . . . 1882
35.4.5 Bypass mode procedure . . . 1882

36 Analog-to-digital converters (ADC) . . . 1883
36.1 ADC introduction . . . 1883
36.2 ADC main features . . . 1883
36.3 ADC implementation . . . 1885
36.4 ADC functional description . . . 1886
36.4.1 ADC block diagram . . . 1886
36.4.2 ADC pins and internal signals . . . 1887
36.4.3 ADC clocks . . . 1892
36.4.4 ADC connectivity . . . 1894
36.4.5 Slave AHB interface . . . 1896
36.4.6 ADC Deep-power-down mode (DEEPPWD) . . . 1896
36.4.7 Single-ended and differential input channels . . . 1896
36.4.8 Calibration (ADCAL, CALADDOS, ADC_CALFACT) . . . 1897
36.4.9 ADC on-off control (ADEN, ADDIS, ADRDY) . . . 1899
36.4.10 Constraints when writing the ADC control bits . . . 1900
36.4.11 Channel selection (ADC_SQRy, ADC_JSQR) . . . 1901
36.4.12 Channel preselection register (ADC_PCSEL) . . . 1901
36.4.13 Channel-wise programmable sampling time (SMPR1, SMPR2) . . . 1902
36.4.14 Single conversion mode . . . 1903
36.4.15 Continuous conversion mode (CONT = 1) . . . 1904
36.4.16 Discontinuous mode (DISCEN, DISCNUM, JDISCEN) . . . 1905
36.4.17 Starting conversions (ADSTART, JADSTART) . . . 1906
36.4.18 Timing . . . 1907
36.4.19 Stopping an ongoing conversion (ADSTP, JADSTP) . . . 1908
36.4.20 Conversion on external trigger and trigger polarity (EXTSEL, EXTEN, JEXTSEL, JEXTEN) . . . 1910
36.4.21 Injected channel management . . . 1911
36.4.22 Programmable resolution (RES) - fast conversion mode . . . 1912

36.4.23 End of conversion and end of sampling phase (EOC, JEOC, EOSMP) . . . 1912
36.4.24 End of conversion sequence (EOS, JEOS) . . . 1912
36.4.25 Timing diagram examples (single/continuous modes, hardware/software triggers) . . . 1913
36.4.26 Data management . . . 1915
36.4.27 Managing conversions using the MDF . . . 1923
36.4.28 Dynamic low-power features . . . 1923
36.4.29 Analog window watchdog (AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWDCH of ADC_AWD2CR and ADC_AWD3CR, HTR, LTR, AWDFILT) . . . 1927
36.4.30 Oversampler . . . 1932
36.4.31 VBAT supply monitoring . . . 1939
36.4.32 Monitoring the internal voltage reference . . . 1940
36.4.33 Monitoring the supply voltage . . . 1942
36.5 ADC interrupts . . . 1942
36.6 ADC registers (for each ADC) . . . 1943
36.6.1 ADC interrupt and status register (ADC_ISR) . . . 1943
36.6.2 ADC interrupt enable register (ADC_IER) . . . 1945
36.6.3 ADC control register (ADC_CR) . . . 1947
36.6.4 ADC configuration register (ADC_CFGR1) . . . 1950
36.6.5 ADC configuration register 2 (ADC_CFGR2) . . . 1953
36.6.6 ADC sample time register 1 (ADC_SMPR1) . . . 1956
36.6.7 ADC sample time register 2 (ADC_SMPR2) . . . 1957
36.6.8 ADC channel preselection register (ADC_PCSEL) . . . 1958
36.6.9 ADC regular sequence register 1 (ADC_SQR1) . . . 1958
36.6.10 ADC regular sequence register 2 (ADC_SQR2) . . . 1959
36.6.11 ADC regular sequence register 3 (ADC_SQR3) . . . 1960
36.6.12 ADC regular sequence register 4 (ADC_SQR4) . . . 1961
36.6.13 ADC regular data register (ADC_DR) . . . 1962
36.6.14 ADC injected sequence register (ADC_JSQR) . . . 1962
36.6.15 ADC offset y configuration register (ADC_OFCFGRy) . . . 1964
36.6.16 ADC offset y register (ADC_OFRy) . . . 1965
36.6.17 ADC gain compensation register (ADC_GCOMP) . . . 1966
36.6.18 ADC injected channel y data register (ADC_JDRy) . . . 1967
36.6.19 ADC analog watchdog 2 configuration register (ADC_AWD2CR) . . . 1967
36.6.20 ADC analog watchdog 3 configuration register (ADC_AWD3CR) . . . 1968
36.6.21 ADC analog watchdog 1 lower threshold register (ADC_AWD1LTR) 1968

36.6.22 ADC analog watchdog 1 higher threshold register (ADC_AWD1HTR) . . . 1969
36.6.23 ADC analog watchdog 2 lower threshold register (ADC_AWD2LTR) 1969
36.6.24 ADC analog watchdog 2 higher threshold register (ADC_AWD2HTR) . . . 1970
36.6.25 ADC analog watchdog 3 lower threshold register (ADC_AWD3LTR) 1970
36.6.26 ADC analog watchdog 3 higher threshold register (ADC_AWD3HTR) . . . 1970
36.6.27 ADC differential mode selection register (ADC_DIFSEL) . . . 1971
36.6.28 ADC calibration factors (ADC_CALFACT) . . . 1971
36.6.29 ADC option register (ADC_OR) . . . 1973
36.7 ADC common registers . . . 1974
36.7.1 ADC common status register (ADCC_CSR) . . . 1974
36.7.2 ADC common control register (ADCC_CCR) . . . 1975
36.7.3 ADC hardware configuration register (ADCC_HWCFGR1) . . . 1976
36.7.4 ADC version register (ADCC_VERR) . . . 1976
36.7.5 ADC identification register (ADCC_IPIDR) . . . 1977
36.7.6 ADC size identification register (ADCC_SIDR) . . . 1977
36.8 ADC register map . . . 1978

37 Digital temperature sensor (DTS) . . . 1982
37.1 Introduction . . . 1982
37.2 DTS main features . . . 1982
37.3 DTS functional description . . . 1982
37.3.1 DTS block diagram . . . 1982
37.3.2 DTS pins and internal signals . . . 1983
37.3.3 DTS reset and clocks . . . 1983
37.3.4 DTS serial data adapter (SDA) . . . 1985
37.3.5 Alarms . . . 1991
37.3.6 Main APB programming routines . . . 1992
37.3.7 Temperature sensor configuration . . . 1995
37.4 DTS interrupts . . . 1997
37.5 DTS registers . . . 1998
37.5.1 DTS PVT common registers . . . 1998
37.5.2 PVT IRQ registers . . . 2000
37.5.3 TS common registers . . . 2004

37.5.4 TS individual registers 2011
37.5.5 DTS register map 2018

38 Voltage reference buffer (VREFBUF) 2023
38.1 VREFBUF introduction 2023
38.2 VREFBUF implementation 2023
38.3 VREFBUF functional description 2023
38.4 VREFBUF trimming 2024
38.5 VREFBUF power sequence 2025
38.6 VREFBUF registers 2026
38.6.1 VREFBUF control and status register (VREFBUF_CSR) 2026
38.6.2 VREFBUF calibration control register (VREFBUF_CCR) 2027
38.6.3 VREFBUF register map 2027

39 Multi-function digital filter (MDF) 2028
39.1 MDF introduction 2028
39.2 MDF main features 2029
39.3 MDF implementation 2029
39.4 MDF functional description 2031
39.4.1 MDF block diagram 2031
39.4.2 MDF pins and internal signals 2032
39.4.3 Serial input interfaces (SITF) 2033
39.4.4 ADC slave interface (ADCITF) 2039
39.4.5 Clock generator (CKGEN) 2040
39.4.6 Bitstream matrix (BSMX) 2042
39.4.7 Short-circuit detectors (SCD) 2043
39.4.8 Digital filter processing (DFLT) 2045
39.4.9 Out-of-limit detector (OLD) 2055
39.4.10 Digital filter acquisition modes 2058
39.4.11 Start-up sequence examples 2068
39.4.12 Break interface 2069
39.4.13 Data transfer to memory 2070
39.4.14 Autonomous mode 2075
39.4.15 Register protection 2076
39.5 MDF low-power modes 2077
39.6 MDF interrupts 2077

39.7 MDF application informations 2079
39.7.1 MDF configuration examples for audio capture 2079
39.7.2 Programming examples 2080
39.7.3 Connection examples 2082
39.7.4 Global frequency response 2083
39.7.5 Total MDF gain 2084
39.8 MDF registers 2088
39.8.1 MDF global control register (MDF_GCR) 2089
39.8.2 MDF clock generator control register (MDF_CKGCR) 2089
39.8.3 MDF serial interface control register x (MDF_SITFxCR) 2092
39.8.4 MDF bitstream matrix control register x (MDF_BSMXxCR) 2093
39.8.5 MDF digital filter control register x (MDF_DFLTxCR) 2094
39.8.6 MDF digital filter configuration register x (MDF_DFLTxCICR) 2096
39.8.7 MDF reshape filter configuration register x (MDF_DFLTxRSFR) . . . 2097
39.8.8 MDF integrator configuration register x (MDF_DFLTxINTR) 2098
39.8.9 MDF out-of limit detector control register x (MDF_OLDxCR) 2099
39.8.10 MDF OLDx low threshold register x (MDF_OLDxTHLR) 2101
39.8.11 MDF OLDx high threshold register x (MDF_OLDxTHHR) 2101
39.8.12 MDF delay control register x (MDF_DLYxCR) 2102
39.8.13 MDF short circuit detector control register x (MDF_SCDxCR) 2102
39.8.14 MDF DFLT0 interrupt enable register 0 (MDF_DFLT0IER) 2103
39.8.15 MDF DFLTx interrupt enable register x (MDF_DFLTxIER) 2105
39.8.16 MDF DFLT0 interrupt status register 0 (MDF_DFLT0ISR) 2106
39.8.17 MDF DFLTx interrupt status register x (MDF_DFLTxISR) 2108
39.8.18 MDF offset error compensation control register x (MDF_OECxCR) . 2109
39.8.19 MDF snapshot data register x (MDF_SNPSxDR) 2110
39.8.20 MDF digital filter data register x (MDF_DFLTxDR) 2110
39.8.21 MDF hardware configuration register (MDF_HWCFGR) 2111
39.8.22 MDF version register (MDF_VERR) 2112
39.8.23 MDF identification register (MDF_IPIDR) 2112
39.8.24 MDF size identification register (MDF_SIDR) 2112
39.8.25 MDF register map 2113

40 Camera subsystem 2116
40.1 Introduction 2116
40.2 Camera path main features 2116
40.2.1 DCMI path main features 2116

40.2.2 DCMIPP path main features 2117
40.3 Camera subsystem implementation 2118
40.3.1 Hardware settings 2118
40.4 Camera subsystem functional description 2119
40.4.1 Camera subsystem block diagram 2119
40.4.2 Camera subsystem pins and external signal interface 2119
40.4.3 Camera subsystem reset and clocks 2120
40.4.4 Camera subsystem security 2120
40.5 Camera subsystem programmable parameters 2122
40.5.1 Low-resolution parallel camera and DCMI 2122
40.5.2 High-resolution parallel camera and DCMIPP 2123
40.5.3 High-resolution CSI2 camera and DCMIPP 2123
40.5.4 Sensors over target resolution 2124
40.5.5 Sensors over target pixel rate 2124
40.5.6 Double sensors 2125
40.6 Camera subsystem interrupts 2125
40.7 Camera subsystem registers 2125

41 Digital camera interface (DCMI) 2126
41.1 DCMI introduction 2126
41.2 DCMI main features 2126
41.3 DCMI functional description 2126
41.3.1 DCMI block diagram 2127
41.3.2 DCMI pins and internal signals 2127
41.3.3 DCMI clocks 2128
41.3.4 DCMI DMA interface 2128
41.3.5 DCMI physical interface 2128
41.3.6 DCMI synchronization 2130
41.3.7 DCMI capture modes 2132
41.3.8 DCMI crop feature 2133
41.3.9 DCMI JPEG format 2134
41.3.10 DCMI FIFO 2134
41.3.11 DCMI data format description 2135
41.4 DCMI interrupts 2137
41.5 DCMI registers 2137
41.5.1 DCMI control register (DCMI_CR) 2137

41.5.2 DCMI status register (DCMI_SR) 2140
41.5.3 DCMI raw interrupt status register (DCMI_RIS) 2140
41.5.4 DCMI interrupt enable register (DCMI_IER) 2141
41.5.5 DCMI masked interrupt status register (DCMI_MIS) 2142
41.5.6 DCMI interrupt clear register (DCMI_ICR) 2143
41.5.7 DCMI embedded synchronization code register (DCMI_ESCR) 2144
41.5.8 DCMI embedded synchronization unmask register (DCMI_ESUR) . 2144
41.5.9 DCMI crop window start (DCMI_CWSTRT) 2145
41.5.10 DCMI crop window size (DCMI_CWSIZE) 2146
41.5.11 DCMI data register (DCMI_DR) 2146
41.5.12 DCMI hardware configuration register (DCMI_HWCFGR) 2147
41.5.13 DCMI version register (DCMI_VERR) 2147

41.5.15 DCMI size identification register (DCMI_SIDR) 2148
41.5.16 DCMI register map 2148

42 Digital camera interface pixel pipeline (DCMIPP) 2150

42.1 DCMIPP introduction 2150
42.2 DCMIPP main features 2153
42.3 DCMIPP functional description 2155
42.3.1 DCMIPP block diagram 2155
42.3.2 DCMIPP pads and internal signals 2156
42.3.3 DCMIPP reset and clocks 2156
42.3.4 DCMIPP maximum resolution 2159
42.3.5 DCMIPP minimum requirements for frame structure 2160
42.3.6 Description of DCMIPP pixel format support 2160
42.4 DCMIPP input and flow control 2161
42.4.1 DCMIPP common configuration 2162
42.4.2 Parallel input interface 2162
42.4.3 Interface from CSI-2 host 2166
42.4.4 Test pattern generator (TPG) 2166
42.4.5 Input selection 2168
42.4.6 Flow selection 2168
42.4.7 Frame counter 2170
42.4.8 Frame control 2170
42.4.9 Pipe deactivation 2176
42.5 Pipe0 (dump pipe) 2177

42.5.1 Overview . . . 2177
42.5.2 Decimation . . . 2178
42.5.3 Crop/statistics selection/suppression . . . 2178
42.5.4 Header insertion . . . 2179
42.5.5 Dump counter . . . 2180
42.6 Pipe1 (ISP part) . . . 2181
42.6.1 Overview . . . 2181
42.6.2 Byte-to-pixel conversion . . . 2182
42.6.3 Statistics removal . . . 2183
42.6.4 Bad pixel removal . . . 2183
42.6.5 Input decimation . . . 2185
42.6.6 Black level calibration . . . 2186
42.6.7 Exposure compensation and white-balance calibration . . . 2186
42.6.8 Demosaicing . . . 2188
42.6.9 Color conversion . . . 2190
42.6.10 Contrast enhancement . . . 2192
42.6.11 Statistics extraction . . . 2194
42.6.12 Histogram . . . 2197
42.7 Pipe1 (post-processing part) . . . 2204
42.7.1 Overview . . . 2204
42.7.2 Pixel 2D cropping . . . 2204
42.7.3 Decimation pre-downsize . . . 2205
42.7.4 Downsize . . . 2206
42.7.5 Gamma conversion . . . 2208
42.7.6 YUV conversion . . . 2208
42.7.7 Chroma down-sampling . . . 2208
42.7.8 Pixel packing . . . 2209
42.7.9 Overrun detection . . . 2210
42.8 Pipe2 (post-processing) . . . 2211
42.8.1 Overview . . . 2211
42.8.2 Pipe1 and Pipe2 sharing image processing functions . . . 2211
42.9 Application use cases . . . 2212
42.9.1 Parallel interface camera sensor module . . . 2212
42.9.2 CSI2 camera sensor module . . . 2213
42.9.3 Force data type format from CSI-2 data flow (pixel pipes only) . . . 2219
42.10 Pixel format description . . . 2222

42.10.1 Parallel interface formats . . . 2222
42.10.2 Pixel pipe formats . . . 2224
42.10.3 Dump pipe formats . . . 2225
42.10.4 AXI IP-Plug . . . 2227
42.11 Shadow registers . . . 2233
42.12 DCMIPP low power modes . . . 2235
42.13 DCMIPP interrupts . . . 2236
42.13.1 Free-running DCMIPP . . . 2236
42.13.2 Interrupts . . . 2236
42.13.3 Event pins . . . 2239
42.14 DCMIPP registers . . . 2241
42.14.1 DCMIPP IP-Plug global register 1 (DCMIPP_IPGR1) . . . 2241
42.14.2 DCMIPP IP-Plug global register 2 (DCMIPP_IPGR2) . . . 2242
42.14.3 DCMIPP IP-Plug global register 3 (DCMIPP_IPGR3) . . . 2242
42.14.4 DCMIPP IP-Plug identification register (DCMIPP_IPGR8) . . . 2243
42.14.5 DCMIPP IP-Plug Clientx register 1 (DCMIPP_IPCxR1) . . . 2243
42.14.6 DCMIPP IP-Plug Clientx register 2 (DCMIPP_IPCxR2) . . . 2244
42.14.7 DCMIPP IP-Plug Clientx register 3 (DCMIPP_IPCxR3) . . . 2244
42.14.8 DCMIPP parallel interface control register (DCMIPP_PRCR) . . . 2245
42.14.9 DCMIPP parallel interface embedded synchronization code register (DCMIPP_PRESCR) . . . 2246
42.14.10 DCMIPP parallel interface embedded synchronization unmask register (DCMIPP_PRESUR) . . . 2247
42.14.11 DCMIPP parallel interface interrupt enable register (DCMIPP_PRIER) . . . 2248
42.14.12 DCMIPP parallel interface status register (DCMIPP_PRSR) . . . 2248
42.14.13 DCMIPP parallel interface interrupt clear register (DCMIPP_PRFCR) . . . 2249
42.14.14 DCMIPP common IP HW configuration register (DCMIPP_CMHWCFGR) . . . 2250
42.14.15 DCMIPP common configuration register (DCMIPP_CMCR) . . . 2250
42.14.16 DCMIPP common frame counter register (DCMIPP_CMFRCR) . . . 2251
42.14.17 DCMIPP common test pattern generator configuration register 1 (DCMIPP_CMTPGCR1) . . . 2251
42.14.18 DCMIPP common test pattern generator configuration register 2 (DCMIPP_CMTPGCR2) . . . 2252
42.14.19 DCMIPP common interrupt enable register (DCMIPP_CMIER) . . . 2253
42.14.20 DCMIPP common status register 1 (DCMIPP_CMSR1) . . . 2255
42.14.21 DCMIPP common status register 2 (DCMIPP_CMSR2) . . . 2256

42.14.22 DCMIPP common interrupt clear register (DCMIPP_CMFCR) 2259
42.14.23 DCMIPP Pipe0 HW configuration register (DCMIPP_P0HWCFGR) . 2260
42.14.24 DCMIPP Pipe0 flow selection configuration register (DCMIPP_P0FSCR) 2261
42.14.25 DCMIPP Pipe0 flow control configuration register (DCMIPP_P0FCTCR) 2262
42.14.26 DCMIPP Pipe0 statistic/crop start register (DCMIPP_P0SCSTR) . . . 2262
42.14.27 DCMIPP Pipe0 statistic/crop size register (DCMIPP_P0SCSZR) . . . 2263
42.14.28 DCMIPP Pipe0 dump counter register (DCMIPP_P0DCCNTR) 2264
42.14.29 DCMIPP Pipe0 dump limit register (DCMIPP_P0DCLMTR) 2264
42.14.30 DCMIPP Pipe0 pixel packer configuration register (DCMIPP_P0PPCR) 2265
42.14.31 DCMIPP Pipe0 pixel packer Memory0 address register 1 (DCMIPP_P0PPM0AR1) 2266
42.14.32 DCMIPP Pipe0 status Memory0 address register (DCMIPP_P0STM0AR) 2266
42.14.33 DCMIPP Pipe0 interrupt enable register (DCMIPP_P0IER) 2267
42.14.34 DCMIPP Pipe0 status register (DCMIPP_P0SR) 2267
42.14.35 DCMIPP Pipe0 interrupt clear register (DCMIPP_P0FCR) 2269
42.14.36 DCMIPP Pipe0 current flow selection configuration register (DCMIPP_P0CFSCR) 2269
42.14.37 DCMIPP Pipe0 current flow control configuration register (DCMIPP_P0CFCTCR) 2270
42.14.38 DCMIPP Pipe0 current statistic/crop start register (DCMIPP_P0CSCSTR) 2271
42.14.39 DCMIPP Pipe0 current statistic/crop size register (DCMIPP_P0CSCSZR) 2271
42.14.40 DCMIPP Pipe0 current pixel packer configuration register (DCMIPP_P0CPPCR) 2272
42.14.41 DCMIPP Pipe0 current pixel packer Memory0 address register 1 (DCMIPP_P0CPPM0AR1) 2274
42.14.42 DCMIPP Pipex HW configuration register (DCMIPP_PxHWCFGR) . 2274
42.14.43 DCMIPP Pipe1 flow selection configuration register (DCMIPP_P1FSCR) 2275
42.14.44 DCMIPP Pipe1 stat removal configuration register (DCMIPP_P1SRCR) 2276
42.14.45 DCMIPP Pipe1 bad pixel removal control register (DCMIPP_P1BPRCR) 2277
42.14.46 DCMIPP Pipe1 bad pixel removal status register (DCMIPP_P1BPRSR) 2277
42.14.47 DCMIPP Pipe1 decimation register (DCMIPP_P1DECR) 2278

42.14.48 DCMIPP Pipe1 black level calibration control register (DCMIPP_P1BLCCR) 2278
42.14.49 DCMIPP Pipe1 exposure control register 1 (DCMIPP_P1EXCR1) . . 2279
42.14.50 DCMIPP Pipe1 exposure control register 2 (DCMIPP_P1EXCR2) . . 2279
42.14.51 DCMIPP Pipe1 statistics1 control register (DCMIPP_P1ST1CR) . . . 2280
42.14.52 DCMIPP Pipe1 statistics 2 control register (DCMIPP_P1ST2CR) . . . 2281
42.14.53 DCMIPP Pipe1 statistics 3 control register (DCMIPP_P1ST3CR) . . . 2282
42.14.54 DCMIPP Pipe1 statistics window start register (DCMIPP_P1STSTR) 2283
42.14.55 DCMIPP Pipe1 statistics window size register (DCMIPP_P1STSZR) 2283
42.14.56 DCMIPP Pipe1 statistics 1 status register (DCMIPP_P1ST1SR) . . . 2284
42.14.57 DCMIPP Pipe1 statistics 2 status register (DCMIPP_P1ST2SR) . . . 2285
42.14.58 DCMIPP Pipe1 statistics 3 status register (DCMIPP_P1ST3SR) . . . 2285
42.14.59 DCMIPP Pipe1 demosaicing configuration register (DCMIPP_P1DMCR) 2285
42.14.60 DCMIPP Pipe1 ColorConv configuration register (DCMIPP_P1CCCR) 2286
42.14.61 DCMIPP Pipe1 ColorConv red coefficient register 1 (DCMIPP_P1CCRR1) 2287
42.14.62 DCMIPP Pipe1 ColorConv red coefficient register 2 (DCMIPP_P1CCRR2) 2287
42.14.63 DCMIPP Pipe1 ColorConv green coefficient register 1 (DCMIPP_P1CCGR1) 2288
42.14.64 DCMIPP Pipe1 ColorConv green coefficient register 2 (DCMIPP_P1CCGR2) 2288
42.14.65 DCMIPP Pipex ColorConv blue coefficient register 1 (DCMIPP_P1CCBR1) 2289
42.14.66 DCMIPP Pipe1 ColorConv blue coefficient register 2 (DCMIPP_P1CCBR2) 2289
42.14.67 DCMIPP Pipe1 contrast control register 1 (DCMIPP_P1CTCR1) . . . 2290
42.14.68 DCMIPP Pipe1 contrast control register 2 (DCMIPP_P1CTCR2) . . . 2290
42.14.69 DCMIPP Pipe1 contrast control register 3 (DCMIPP_P1CTCR3) . . . 2291
42.14.70 DCMIPP Pipe1 histogram configuration register (DCMIPP_P1HSCR) . . . 2291
42.14.71 DCMIPP Pipe1 histogram window start register (DCMIPP_P1HSSTR) 2293
42.14.72 DCMIPP Pipe1 histogram window size register (DCMIPP_P1HSSZR) 2294
42.14.73 DCMIPP Pipe1 histogram memory address register 1 (DCMIPP_P1HSMAR1) 2294

42.14.74 DCMIPP Pipe1 histogram memory status address register 3 (DCMIPP_P1HSSMAR) . . . 2295

48.4.2 SAES internal signals 2534

48.4.3 SAES reset and clocks . . . 2535
48.4.4 SAES symmetric cipher implementation . . . 2535
48.4.5 SAES encryption or decryption typical usage . . . 2536
48.4.6 SAES authenticated encryption, decryption, and cipher-based message authentication . . . 2538
48.4.7 SAES ciphertext stealing and data padding . . . 2539
48.4.8 SAES suspend and resume operations . . . 2539
48.4.9 SAES basic chaining modes (ECB, CBC) . . . 2540
48.4.10 SAES counter (CTR) mode . . . 2544
48.4.11 SAES Galois/counter mode (GCM) . . . 2546
48.4.12 SAES Galois message authentication code (GMAC) . . . 2551
48.4.13 SAES counter with CBC-MAC (CCM) . . . 2552
48.4.14 SAES basic operations with wrapped keys . . . 2557
48.4.15 Wrapped key usage outside the SAES peripheral . . . 2562
48.4.16 SAES data registers and data swapping . . . 2562
48.4.17 SAES key registers . . . 2565
48.4.18 SAES initialization vector registers . . . 2567
48.4.19 SAES error management . . . 2567
48.5 SAES interrupts . . . 2569
48.6 SAES DMA requests . . . 2570
48.6.1 Data input using DMA . . . 2570
48.6.2 Data output using DMA . . . 2570
48.6.3 Stopping DMA transfers . . . 2570
48.7 SAES processing latency . . . 2570
48.8 SAES registers . . . 2571
48.8.1 SAES control register (SAES_CR) . . . 2571
48.8.2 SAES status register (SAES_SR) . . . 2575
48.8.3 SAES data input register (SAES_DINR) . . . 2576
48.8.4 SAES data output register (SAES_DOUTR) . . . 2577
48.8.5 SAES key register 0 (SAES_KEYR0) . . . 2577
48.8.6 SAES key register 1 (SAES_KEYR1) . . . 2578
48.8.7 SAES key register 2 (SAES_KEYR2) . . . 2578
48.8.8 SAES key register 3 (SAES_KEYR3) . . . 2578
48.8.9 SAES key register 4 (SAES_KEYR4) . . . 2579
48.8.10 SAES key register 5 (SAES_KEYR5) . . . 2579
48.8.11 SAES key register 6 (SAES_KEYR6) . . . 2579
48.8.12 SAES key register 7 (SAES_KEYR7) . . . 2580

48.8.13 SAES initialization vector register 0 (SAES_IVR0) 2580
48.8.14 SAES initialization vector register 1 (SAES_IVR1) 2580
48.8.15 SAES initialization vector register 2 (SAES_IVR2) 2581
48.8.16 SAES initialization vector register 3 (SAES_IVR3) 2581
48.8.17 SAES context swap registers (SAES_SUSPRx) 2581
48.8.18 SAES interrupt enable register (SAES_IER) 2582
48.8.19 SAES interrupt status register (SAES_ISR) 2582
48.8.20 SAES interrupt clear register (SAES_ICR) 2584
48.8.21 SAES hardware configuration register (SAES_HWCFGR) 2585
48.8.22 SAES version register (SAES_VERR) 2585
48.8.23 SAES identification register (SAES_IPIDR) 2585
48.8.24 SAES size ID register (SAES_SIDR) 2586
48.8.25 SAES register map 2586

49 Cryptographic processor (CRYP) 2589

49.1 CRYP introduction 2589
49.2 CRYP main features 2589
49.3 CRYP implementation 2590
49.4 CRYP functional description 2591
49.4.1 CRYP block diagram 2591
49.4.2 CRYP internal signals 2592
49.4.3 CRYP reset and clocks 2592
49.4.4 CRYP symmetric cipher implementation 2592
49.4.5 CRYP encryption/ decryption typical usage 2593
49.4.6 CRYP authenticated encryption, decryption, and cipher-based message authentication 2596
49.4.7 CRYP ciphertext stealing and data padding 2597
49.4.8 CRYP suspend and resume operations 2597
49.4.9 CRYP DES/TDES basic chaining modes (ECB, CBC) 2598
49.4.10 CRYP AES basic chaining modes (ECB, CBC) 2601
49.4.11 CRYP counter mode (AES-CTR) 2605
49.4.12 CRYP AES Galois/counter mode (GCM) 2608
49.4.13 CRYP AES Galois message authentication code (GMAC) 2613
49.4.14 CRYP AES Counter with CBC-MAC (CCM) 2614
49.4.15 AES key sharing with secure AES co-processor 2619
49.4.16 CRYP data registers and data swapping 2620
49.4.17 CRYP key registers 2624

49.4.18 CRYP initialization vector registers 2625
49.4.19 CRYP error management 2625
49.5 CRYP interrupts 2626
49.6 CRYP DMA requests 2627
49.7 CRYP processing time 2628
49.8 CRYP registers 2629
49.8.1 CRYP control register (CRYP_CR) 2629
49.8.2 CRYP status register (CRYP_SR) 2632
49.8.3 CRYP data input register (CRYP_DINR) 2633
49.8.4 CRYP data output register (CRYP_DOUTR) 2634
49.8.5 CRYP DMA control register (CRYP_DMACR) 2634
49.8.6 CRYP interrupt mask set/clear register (CRYP_IMSCR) 2635
49.8.7 CRYP raw interrupt status register (CRYP_RISR) 2635
49.8.8 CRYP masked interrupt status register (CRYP_MISR) 2636
49.8.9 CRYP key register 0L (CRYP_K0LR) 2637
49.8.10 CRYP key register 0R (CRYP_K0RR) 2637
49.8.11 CRYP key register 1L (CRYP_K1LR) 2638
49.8.12 CRYP key register 1R (CRYP_K1RR) 2638
49.8.13 CRYP key register 2L (CRYP_K2LR) 2638
49.8.14 CRYP key register 2R (CRYP_K2RR) 2639
49.8.15 CRYP key register 3L (CRYP_K3LR) 2639
49.8.16 CRYP key register 3R (CRYP_K3RR) 2640
49.8.17 CRYP initialization vector register 0L (CRYP_IV0LR) 2640
49.8.18 CRYP initialization vector register 0R (CRYP_IV0RR) 2640
49.8.19 CRYP initialization vector register 1L (CRYP_IV1LR) 2641
49.8.20 CRYP initialization vector register 1R (CRYP_IV1RR) 2641
49.8.21 CRYP context swap GCM-CCM registers (CRYP_CSGCMCCMxR) 2642
49.8.22 CRYP context swap GCM registers (CRYP_CSGCMxR) 2642
49.8.23 CRYP hardware configuration register (CRYP_HWCFGR) 2643
49.8.24 CRYP version register (CRYP_VERR) 2643
49.8.25 CRYP identification (CRYP_IPIDR) 2644
49.8.26 CRYP size identification register (CRYP_SIDR) 2644
49.8.27 CRYP register map 2644

50 Hash processor (HASH) 2647

50.1 HASH introduction 2647

50.2 HASH main features . . . 2647
50.3 HASH implementation . . . 2648
50.4 HASH functional description . . . 2648
50.4.1 HASH block diagram . . . 2648
50.4.2 HASH internal signals . . . 2649
50.4.3 About secure hash algorithms . . . 2649
50.4.4 Message data feeding . . . 2650
50.4.5 Message digest computing . . . 2651
50.4.6 Message padding . . . 2654
50.4.7 HMAC operation . . . 2655
50.4.8 HASH suspend/resume operations . . . 2657
50.4.9 HASH DMA interface . . . 2659
50.4.10 HASH error management . . . 2660
50.4.11 HASH processing time . . . 2660
50.5 HASH interrupts . . . 2660
50.6 HASH registers . . . 2661
50.6.1 HASH control register (HASH_CR) . . . 2661
50.6.2 HASH data input register (HASH_DIN) . . . 2663
50.6.3 HASH start register (HASH_STR) . . . 2664
50.6.4 HASH digest registers . . . 2665
50.6.5 HASH interrupt enable register (HASH_IMR) . . . 2667
50.6.6 HASH status register (HASH_SR) . . . 2667
50.6.7 HASH context swap registers . . . 2669
50.6.8 HASH hardware configuration register (HASH_HWCFGR) . . . 2669
50.6.9 HASH version register (HASH_VERR) . . . 2670
50.6.10 HASH identification register (HASH_IPIDR) . . . 2670
50.6.11 HASH size identification register (HASH_SIDR) . . . 2671
50.6.12 HASH register map . . . 2671

51 On-the-fly decryption engine (OTFDEC) . . . 2673
51.1 OTFDEC introduction . . . 2673
51.2 OTFDEC main features . . . 2673
51.3 OTFDEC functional description . . . 2674
51.3.1 OTFDEC block diagram . . . 2674
51.3.2 OTFDEC internal signals . . . 2674
51.3.3 OTFDEC on-the-fly decryption . . . 2674

51.3.4 OTFDEC usage of AES in counter mode decryption 2676
51.3.5 Flow control management 2677
51.3.6 OTFDEC error management 2677
51.4 OTFDEC interrupts 2678
51.5 OTFDEC application information 2678
51.5.1 OTFDEC initialization process 2678
51.5.2 OTFDEC and power management 2679
51.5.3 Encrypting for OTFDEC 2680
51.5.4 OTFDEC key CRC source code 2681
51.6 OTFDEC registers 2682
51.6.1 OTFDEC control register (OTFDEC_CR) 2682
51.6.2 OTFDEC region x configuration register (OTFDEC_RxCFGR) 2682
51.6.3 OTFDEC region x start address register (OTFDEC_RxSTARTADDR) 2684
51.6.4 OTFDEC region x end address register (OTFDEC_RxENDADDR) . 2684
51.6.5 OTFDEC region x nonce register 0 (OTFDEC_RxNONCER0) 2685
51.6.6 OTFDEC region x nonce register 1 (OTFDEC_RxNONCER1) 2685
51.6.7 OTFDEC region x key register 0 (OTFDEC_RxKEYR0) 2685
51.6.8 OTFDEC region x key register 1 (OTFDEC_RxKEYR1) 2686
51.6.9 OTFDEC region x key register 2 (OTFDEC_RxKEYR2) 2686
51.6.10 OTFDEC region x key register 3 (OTFDEC_RxKEYR3) 2687
51.6.11 OTFDEC interrupt status register (OTFDEC_ISR) 2687
51.6.12 OTFDEC interrupt clear register (OTFDEC_ICR) 2688
51.6.13 OTFDEC interrupt enable register (OTFDEC_IER) 2689
51.6.14 OTFDEC hardware configuration register (OTFDEC_HWCFGR) . . . 2689
51.6.15 OTFDEC version register (OTFDEC_VERR) 2690
51.6.16 OTFDEC identification register (OTFDEC_IPIDR) 2690
51.6.17 OTFDEC size identification register (OTFDEC_SIDR) 2691
51.6.18 OTFDEC register map 2691

52 Public key accelerator (PKA) 2695
52.1 PKA introduction 2695
52.2 PKA main features 2695
52.3 PKA functional description 2696
52.3.1 PKA block diagram 2696
52.3.2 PKA internal signals 2696
52.3.3 PKA reset and clocks 2696

52.3.4 PKA public key acceleration . . . 2697
52.3.5 Typical applications for PKA . . . 2699
52.3.6 PKA procedure to perform an operation . . . 2701
52.3.7 PKA error management . . . 2702
52.4 PKA operating modes . . . 2703
52.4.1 Introduction . . . 2703
52.4.2 Montgomery parameter computation . . . 2704
52.4.3 Modular addition . . . 2704
52.4.4 Modular subtraction . . . 2705
52.4.5 Modular and Montgomery multiplication . . . 2705
52.4.6 Modular exponentiation . . . 2706
52.4.7 Modular inversion . . . 2708
52.4.8 Modular reduction . . . 2708
52.4.9 Arithmetic addition . . . 2709
52.4.10 Arithmetic subtraction . . . 2709
52.4.11 Arithmetic multiplication . . . 2710
52.4.12 Arithmetic comparison . . . 2710
52.4.13 RSA CRT exponentiation . . . 2710
52.4.14 Point on elliptic curve Fp check . . . 2711
52.4.15 ECC Fp scalar multiplication . . . 2712
52.4.16 ECDSA sign . . . 2713
52.4.17 ECDSA verification . . . 2715
52.4.18 ECC complete addition . . . 2716
52.4.19 ECC double base ladder . . . 2716
52.4.20 ECC projective to affine . . . 2717
52.5 Example of configurations and processing times . . . 2718
52.5.1 Supported elliptic curves . . . 2718
52.5.2 Computation times . . . 2720
52.6 PKA interrupts . . . 2722
52.7 PKA registers . . . 2723
52.7.1 PKA control register (PKA_CR) . . . 2723
52.7.2 PKA status register (PKA_SR) . . . 2725
52.7.3 PKA clear flag register (PKA_CLRFR) . . . 2726
52.7.4 PKA RAM . . . 2726
52.7.5 PKA hardware configuration register (PKA_HWCFGR) . . . 2727
52.7.6 PKA version register (PKA_VERR) . . . 2727
52.7.7 PKA identification register (PKA_IPIDR) . . . 2727

52.7.8 PKA size identification register (PKA_SIDR) 2728
52.7.9 PKA register map 2729

53 Advanced-control timers (TIM1/TIM8) 2730

53.1 TIM1/TIM8 introduction 2730
53.2 TIM1/TIM8 main features 2730
53.3 TIM1/TIM8 functional description 2731
53.3.1 Block diagram 2731
53.3.2 TIM1/TIM8 pins and internal signals 2732
53.3.3 Time-base unit 2736
53.3.4 Counter modes 2738
53.3.5 Repetition counter 2750
53.3.6 External trigger input 2751
53.3.7 Clock selection 2752
53.3.8 Capture/compare channels 2756
53.3.9 Input capture mode 2758
53.3.10 PWM input mode 2759
53.3.11 Forced output mode 2760
53.3.12 Output compare mode 2761
53.3.13 PWM mode 2762
53.3.14 Asymmetric PWM mode 2770
53.3.15 Combined PWM mode 2771
53.3.16 Combined 3-phase PWM mode 2772
53.3.17 Complementary outputs and dead-time insertion 2773
53.3.18 Using the break function 2776
53.3.19 Bidirectional break inputs 2782
53.3.20 Clearing the tim_ocxref signal on an external event 2783
53.3.21 6-step PWM generation 2784
53.3.22 One-pulse mode 2785
53.3.23 Retriggerable One-pulse mode 2787
53.3.24 Pulse on compare mode 2788
53.3.25 Encoder interface mode 2790
53.3.26 Direction bit output 2807
53.3.27 UIF bit remapping 2808
53.3.28 Timer input XOR function 2808
53.3.29 Interfacing with Hall sensors 2808
53.3.30 Timer synchronization 2810

53.3.31 ADC triggers . . . 2815
53.3.32 DMA burst mode . . . 2815
53.3.33 TIM1/TIM8 DMA requests . . . 2816
53.3.34 Debug mode . . . 2816
53.4 TIM1/TIM8 low-power modes . . . 2817
53.5 TIM1/TIM8 interrupts . . . 2817
53.6 TIM1/TIM8 registers . . . 2818
53.6.1 TIMx control register 1 (TIMx_CR1)(x = 1, 8) . . . 2818
53.6.2 TIMx control register 2 (TIMx_CR2)(x = 1, 8) . . . 2819
53.6.3 TIMx slave mode control register (TIMx_SMCR)(x = 1, 8) . . . 2823
53.6.4 TIMx DMA/interrupt enable register (TIMx_DIER)(x = 1, 8) . . . 2827
53.6.5 TIMx status register (TIMx_SR)(x = 1, 8) . . . 2828
53.6.6 TIMx event generation register (TIMx_EGR)(x = 1, 8) . . . 2831
53.6.7 TIMx capture/compare mode register 1 (TIMx_CCMR1) (x = 1, 8) . . . 2832
53.6.8 TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 1, 8) . . . 2834
53.6.9 TIMx capture/compare mode register 2 (TIMx_CCMR2) (x = 1, 8) . . . 2837
53.6.10 TIMx capture/compare mode register 2 [alternate] (TIMx_CCMR2)(x = 1, 8) . . . 2838
53.6.11 TIMx capture/compare enable register (TIMx_CCER)(x = 1, 8) . . . 2841
53.6.12 TIMx counter (TIMx_CNT)(x = 1, 8) . . . 2845
53.6.13 TIMx prescaler (TIMx_PSC)(x = 1, 8) . . . 2845
53.6.14 TIMx autoreload register (TIMx_ARR)(x = 1, 8) . . . 2846
53.6.15 TIMx repetition counter register (TIMx_RCR)(x = 1, 8) . . . 2846
53.6.16 TIMx capture/compare register 1 (TIMx_CCR1)(x = 1, 8) . . . 2847
53.6.17 TIMx capture/compare register 2 (TIMx_CCR2)(x = 1, 8) . . . 2847
53.6.18 TIMx capture/compare register 3 (TIMx_CCR3)(x = 1, 8) . . . 2848
53.6.19 TIMx capture/compare register 4 (TIMx_CCR4)(x = 1, 8) . . . 2849
53.6.20 TIMx break and dead-time register (TIMx_BDTR)(x = 1, 8) . . . 2850
53.6.21 TIMx capture/compare register 5 (TIMx_CCR5)(x = 1, 8) . . . 2854
53.6.22 TIMx capture/compare register 6 (TIMx_CCR6)(x = 1, 8) . . . 2855
53.6.23 TIMx capture/compare mode register 3 (TIMx_CCMR3) (x = 1, 8) . . . 2856
53.6.24 TIMx timer deadtime register 2 (TIMx_DTR2)(x = 1, 8) . . . 2857
53.6.25 TIMx timer encoder control register (TIMx_ECR)(x = 1, 8) . . . 2858
53.6.26 TIMx timer input selection register (TIMx_TISEL)(x = 1, 8) . . . 2859

53.6.27 TIMx alternate function option register 1 (TIMx_AF1)(x = 1, 8) 2860
53.6.28 TIMx alternate function register 2 (TIMx_AF2)(x = 1, 8) 2863
53.6.29 TIMx DMA control register (TIMx_DCR)(x = 1, 8) 2865
53.6.30 TIMx DMA address for full transfer (TIMx_DMAR)(x = 1, 8) 2867
53.6.31 TIMx hardware configuration 2 register (TIMx_HWCFGR2)(x = 1, 8) 2867
53.6.32 TIMx hardware configuration 1 register (TIMx_HWCFGR1)(x = 1, 8) 2868
53.6.33 TIMx IP version register (TIMx_VERR)(x = 1, 8) 2869
53.6.34 TIMx IP identification register (TIMx_IPIDR)(x = 1, 8) 2870
53.6.35 TIMx size ID register (TIMx_SIDR)(x = 1, 8) 2870
53.6.36 TIMx register map 2870

54 General-purpose timers (TIM2/TIM3/TIM4/TIM5) 2874

54.1 TIM2/TIM3/TIM4/TIM5 introduction 2874
54.2 TIM2/TIM3/TIM4/TIM5 main features 2874
54.3 TIM2/TIM3/TIM4/TIM5 implementation 2875

63.3.8 Real-time clock and calendar . . . 3311
63.3.9 Calendar ultra-low power mode . . . 3312
63.3.10 Programmable alarms . . . 3312
63.3.11 Periodic auto-wake-up . . . 3313
63.3.12 RTC initialization and configuration . . . 3313
63.3.13 Reading the calendar . . . 3316
63.3.14 Resetting the RTC . . . 3317
63.3.15 RTC synchronization . . . 3318
63.3.16 RTC reference clock detection . . . 3318
63.3.17 RTC smooth digital calibration . . . 3319
63.3.18 Timestamp function . . . 3321
63.3.19 Calibration clock output . . . 3322
63.3.20 Tamper and alarm output . . . 3322
63.4 RTC low-power modes . . . 3323
63.5 RTC interrupts . . . 3323
63.6 RTC registers . . . 3325
63.6.1 RTC time register (RTC_TR) . . . 3326
63.6.2 RTC date register (RTC_DR) . . . 3327
63.6.3 RTC subsecond register (RTC_SSR) . . . 3328
63.6.4 RTC initialization control and status register (RTC_ICSR) . . . 3329

63.6.5 RTC prescaler register (RTC_PRER) . . . 3331
63.6.6 RTC wake-up timer register (RTC_WUTR) . . . 3332
63.6.7 RTC control register (RTC_CR) . . . 3332
63.6.8 RTC privilege mode control register (RTC_PRIVCFGR) . . . 3336
63.6.9 RTC secure configuration register (RTC_SECCFGR) . . . 3338
63.6.10 RTC write protection register (RTC_WPR) . . . 3340
63.6.11 RTC calibration register (RTC_CALR) . . . 3340
63.6.12 RTC shift control register (RTC_SHIFTR) . . . 3342
63.6.13 RTC timestamp time register (RTC_TSTR) . . . 3343
63.6.14 RTC timestamp date register (RTC_TSDR) . . . 3344
63.6.15 RTC timestamp subsecond register (RTC_TSSSR) . . . 3345
63.6.16 RTC alarm A register (RTC_ALRMAR) . . . 3346
63.6.17 RTC alarm A subsecond register (RTC_ALRMASSR) . . . 3347
63.6.18 RTC alarm B register (RTC_ALRMBR) . . . 3348
63.6.19 RTC alarm B subsecond register (RTC_ALRMBSSR) . . . 3350
63.6.20 RTC status register (RTC_SR) . . . 3351
63.6.21 RTC nonsecure masked interrupt status register (RTC_MISR) . . . 3352
63.6.22 RTC secure masked interrupt status register (RTC_SMISR) . . . 3353
63.6.23 RTC status clear register (RTC_SCR) . . . 3355
63.6.24 RTC option register (RTC_OR) . . . 3356
63.6.25 RTC alarm A binary mode register (RTC_ALRABINR) . . . 3356
63.6.26 RTC alarm B binary mode register (RTC_ALRBBINR) . . . 3357
63.6.27 RTC Resource x CID configuration register (RTC_RxCIDCFGR) . . . 3357
63.6.28 RTC hardware configuration register 2 (RTC_HWCFGR2) . . . 3358
63.6.29 RTC hardware configuration register (RTC_HWCFGR1) . . . 3359
63.6.30 RTC version register (RTC_VERR) . . . 3360
63.6.31 RTC identification register (RTC_IPIDR) . . . 3360
63.6.32 RTC size identification register (RTC_SIDR) . . . 3360
63.6.33 RTC register map . . . 3361

64 Tamper and backup registers (TAMP) . . . 3364

64.1 TAMP introduction . . . 3364
64.2 TAMP main features . . . 3365
64.3 TAMP functional description . . . 3366
64.3.1 TAMP block diagram . . . 3366
64.3.2 TAMP pins and internal signals . . . 3367
64.3.3 GPIOs controlled by the RTC and TAMP . . . 3370

64.3.4 TAMP register write protection 3370
64.3.5 TAMP secure protection modes 3370
64.3.6 Backup registers protection zones 3371
64.3.7 TAMP privilege protection modes 3371
64.3.8 TAMP compartment-based isolation 3372
64.3.9 Boot hardware key (BHK) 3375
64.3.10 Tamper detection 3376
64.3.11 TAMP backup registers and other device secrets erase 3376
64.3.12 Tamper detection configuration and initialization 3378
64.4 TAMP low-power modes 3385
64.5 TAMP interrupts 3385
64.6 TAMP registers 3386
64.6.1 TAMP control register 1 (TAMP_CR1) 3386
64.6.2 TAMP control register 2 (TAMP_CR2) 3389
64.6.3 TAMP control register 3 (TAMP_CR3) 3391
64.6.4 TAMP filter control register (TAMP_FLTCR) 3393
64.6.5 TAMP active tamper control register 1 (TAMP_ATCR1) 3394
64.6.6 TAMP active tamper seed register (TAMP_ATSEEDR) 3397
64.6.7 TAMP active tamper output register (TAMP_ATOR) 3397
64.6.8 TAMP active tamper control register 2 (TAMP_ATCR2) 3398
64.6.9 TAMP secure configuration register (TAMP_SECCFGR) 3401
64.6.10 TAMP privilege configuration register (TAMP_PRIVCFGR) 3403
64.6.11 TAMP interrupt enable register (TAMP_IER) 3404
64.6.12 TAMP status register (TAMP_SR) 3406
64.6.13 TAMP nonsecure masked interrupt status register (TAMP_MISR) . . 3408
64.6.14 TAMP secure masked interrupt status register (TAMP_SMISR) 3409
64.6.15 TAMP status clear register (TAMP_SCR) 3411
64.6.16 TAMP monotonic counter 1 register (TAMP_COUNT1R) 3414
64.6.17 TAMP monotonic counter 2 register (TAMP_COUNT2R) 3415
64.6.18 TAMP option register (TAMP_OR) 3415
64.6.19 TAMP resources protection configuration register (TAMP_RPCFGR) 3416
64.6.20 TAMP Backup registers RIF register 1(TAMP_BKPRIFR1) 3417
64.6.21 TAMP Backup registers RIF register 2(TAMP_BKPRIFR2) 3417
64.6.22 TAMP Backup registers RIF register 3(TAMP_BKPRIFR3) 3418
64.6.23 TAMP Resource x CID configuration register (TAMP_RxCIDCFGR) 3418
64.6.24 TAMP backup x register (TAMP_BKPxR) 3419
64.6.25 TAMP hardware configuration register 2 (TAMP_HWCFGR2) 3419

64.6.26 TAMP hardware configuration register 1 (TAMP_HWCFGR1) 3420
64.6.27 TAMP version register (TAMP_VERR) 3421
64.6.28 TAMP identification register (TAMP_IPIDR) 3421
64.6.29 TAMP size identification register (TAMP_SIDR) 3422
64.6.30 TAMP register map 3423

65 Inter-integrated circuit interface (I2C) 3426

65.1 I2C introduction 3426
65.2 I2C main features 3426
65.3 I2C implementation 3427
65.4 I2C functional description 3427
65.4.1 I2C block diagram 3428
65.4.2 I2C pins and internal signals 3428
65.4.3 I2C clock requirements 3431
65.4.4 I2C mode selection 3431
65.4.5 I2C initialization 3432
65.4.6 I2C reset 3436
65.4.7 I2C data transfer 3437
65.4.8 I2C target mode 3439
65.4.9 I2C controller mode 3448
65.4.10 I2C_TIMINGR register configuration examples 3459
65.4.11 SMBus specific features 3461
65.4.12 SMBus initialization 3463
65.4.13 SMBus I2C_TIMEOUTR register configuration examples 3465
65.4.14 SMBus target mode 3466
65.4.15 SMBus controller mode 3469
65.4.16 Autonomous mode 3472
65.4.17 Error conditions 3474
65.5 I2C in low-power modes 3475
65.6 I2C interrupts 3476
65.7 I2C DMA requests 3477
65.7.1 Transmission using DMA 3477
65.7.2 Reception using DMA 3477
65.7.3 Controller event control using DMA 3477
65.8 I2C debug modes 3478
65.9 I2C registers 3478

65.9.1 I2C control register 1 (I2C_CR1) . . . 3478
65.9.2 I2C control register 2 (I2C_CR2) . . . 3481
65.9.3 I2C own address 1 register (I2C_OAR1) . . . 3483
65.9.4 I2C own address 2 register (I2C_OAR2) . . . 3483
65.9.5 I2C timing register (I2C_TIMINGR) . . . 3485
65.9.6 I2C timeout register (I2C_TIMEOUTR) . . . 3486
65.9.7 I2C interrupt and status register (I2C_ISR) . . . 3487
65.9.8 I2C interrupt clear register (I2C_ICR) . . . 3489
65.9.9 I2C PEC register (I2C_PECR) . . . 3490
65.9.10 I2C receive data register (I2C_RXDR) . . . 3490
65.9.11 I2C transmit data register (I2C_TXDR) . . . 3491
65.9.12 I2C autonomous mode control register (I2C_AUTOCR) . . . 3491
65.9.13 I2C hardware configuration register (I2C_HWCFGR) . . . 3492
65.9.14 I2C version register (I2C_VERR) . . . 3493
65.9.15 I2C identification register (I2C_IPIDR) . . . 3493
65.9.16 I2C size identification register (I2C_SIDR) . . . 3493
65.9.17 I2C register map . . . 3494

66 Improved inter-integrated circuit (I3C) . . . 3496

66.1 I3C introduction . . . 3496
66.2 I3C main features . . . 3496
66.3 I3C implementation . . . 3498
66.3.1 I3C instantiation . . . 3498
66.3.2 I3C wake-up from low-power mode(s) . . . 3498
66.3.3 I3C autonomous mode with DMA in Stop mode(s) . . . 3498
66.3.4 I3C FIFOs . . . 3498
66.3.5 I3C triggers . . . 3499
66.3.6 I3C interrupt(s) . . . 3499
66.3.7 I3C MIPI® support . . . 3500
66.4 I3C block diagram . . . 3501
66.5 I3C pins and internal signals . . . 3501
66.6 I3C reset and clocks . . . 3502
66.6.1 I3C reset . . . 3502
66.6.2 I3C clocks and requirements . . . 3502
66.7 I3C peripheral state and programming . . . 3504
66.7.1 I3C peripheral state . . . 3504

66.7.2 I3C controller state and programming sequence . . . 3505
66.7.3 I3C target state and programming sequence . . . 3510
66.8 I3C registers and programming . . . 3514
66.8.1 I3C register set, as controller/target . . . 3514
66.8.2 I3C registers and fields use versus peripheral state, as controller . . . 3515
66.8.3 I3C registers and fields usage versus peripheral state, as target . . . 3518
66.9 I3C bus transfers and programming . . . 3520
66.9.1 I3C command set (CCCs), as controller/target . . . 3520
66.9.2 I3C broadcast/direct CCC transfer (except ENTDAA, RSTACT), as controller . . . 3524
66.9.3 I3C broadcast ENTDAA CCC transfer, as controller . . . 3526
66.9.4 I3C broadcast/direct RSTACT CCC transfer, as controller . . . 3526
66.9.5 I3C broadcast/direct CCC transfer (except ENTDAA, DEFTGTS, DEFGRPA), as target . . . 3528
66.9.6 I3C broadcast ENTDAA CCC transfer, as target . . . 3530
66.9.7 I3C broadcast DEFTGTS CCC transfer, as target . . . 3531
66.9.8 I3C broadcast DEFGRPA CCC transfer, as target . . . 3532
66.9.9 I3C direct GETSTATUS CCC response, as target . . . 3533
66.9.10 I3C private read/write transfer, as controller . . . 3534
66.9.11 I3C private read/write transfer, as target . . . 3535
66.9.12 Legacy I2C read/write transfer, as controller . . . 3536
66.9.13 I3C IBI transfer, as controller/target . . . 3537
66.9.14 I3C hot-join request transfer, as controller/target . . . 3539
66.9.15 I3C controller-role request transfer, as controller/target . . . 3540
66.10 I3C FIFOs management, as controller . . . 3541
66.10.1 C-FIFO management, as controller . . . 3541
66.10.2 TX-FIFO management, as controller . . . 3542
66.10.3 RX-FIFO management, as controller . . . 3545
66.10.4 S-FIFO management, as controller . . . 3547
66.11 I3C FIFOs management, as target . . . 3549
66.11.1 RX-FIFO management, as target . . . 3549
66.11.2 TX-FIFO management, as target . . . 3550
66.12 I3C error management . . . 3553
66.12.1 Controller error management . . . 3553
66.12.2 Target error management . . . 3555
66.13 I3C wake-up from low-power mode(s) . . . 3556
66.13.1 Wake-up from Stop . . . 3556

66.14 I3C in low-power modes 3559
66.15 I3C interrupts 3560
66.16 I3C registers 3560
66.16.1 I3C message control register (I3C_CR) 3560
66.16.2 I3C message control register [alternate] (I3C_CR) 3562
66.16.3 I3C configuration register (I3C_CFGR) 3564
66.16.4 I3C receive data byte register (I3C_RDR) 3569
66.16.5 I3C receive data word register (I3C_RDWR) 3570
66.16.6 I3C transmit data byte register (I3C_TDR) 3571
66.16.7 I3C transmit data word register (I3C_TDWR) 3572
66.16.8 I3C IBI payload data register (I3C_IBIDR) 3573
66.16.9 I3C target transmit configuration register (I3C_TGTTDR) 3574
66.16.10 I3C status register (I3C_SR) 3575
66.16.11 I3C status error register (I3C_SER) 3576
66.16.12 I3C received message register (I3C_RMR) 3578
66.16.13 I3C event register (I3C_EVR) 3579
66.16.14 I3C interrupt enable register (I3C_IER) 3583
66.16.15 I3C clear event register (I3C_CEVR) 3585
66.16.16 I3C masked interrupt status register (I3C_MISR) 3587

73 USB subsystem (USBSS) 4079

73.1 Overview 4079
73.2 USB2 host high-speed port 4079
73.2.1 USB2 host high-speed port main features 4079
73.2.2 USB2 host high-speed port implementation 4081
73.2.3 USB2 host high-speed port functional description 4082
73.2.4 USB2 host high-speed host interrupts 4085
73.2.5 USB2PHY1 integration 4085
73.2.6 Connections to SYSCFG block 4087
73.3 USB2 OTG high-speed port 4089
73.3.1 USB2 OTG port main features 4089
73.3.2 USB2 OTG high-speed port functional description 4090
73.3.3 USB2 OTG high-speed port interrupts 4093
73.3.4 USB2PHY2 integration 4093
73.3.5 SYSCFG registers 4095
73.3.6 Connections to SYSCFG block 4096
73.4 Debug signals 4097

74 USB on-the-go high-speed (OTG) 4099
74.1 OTG introduction 4099
74.2 OTG main features 4100
74.2.1 General features 4100
74.2.2 Host-mode features 4101
74.2.3 Peripheral-mode features 4101
74.3 OTG implementation 4101
74.4 OTG functional description 4102
74.4.1 OTG block diagram 4102
74.4.2 OTG pin and internal signals 4102
74.4.3 OTG core 4103
74.4.4 High-speed OTG PHY connected to OTG 4103
74.4.5 Battery charging detection 4103
74.5 OTG dual role device (DRD) 4104
74.6 OTG as a USB peripheral 4104
74.6.1 Peripheral states 4105
74.6.2 Peripheral endpoints 4106
74.7 OTG as a USB host 4108
74.7.1 USB host states 4109

74.7.2 Host channels 4110
74.7.3 Host scheduler 4111
74.8 OTG SOF trigger 4112
74.8.1 Host SOFs 4113
74.8.2 Peripheral SOFs 4113
74.9 OTG low-power modes 4113
74.10 OTG Dynamic update of the OTG_HFIR register 4114
74.11 OTG data FIFOs 4115
74.11.1 Peripheral FIFO architecture 4115
74.11.2 Host FIFO architecture 4116
74.11.3 FIFO RAM allocation 4118
74.12 **OTG** interrupts 4119
74.13 **OTG** control and status registers 4121
74.13.1 CSR memory map 4121
74.14 **OTG** registers 4126
74.14.1 OTG control and status register (OTG_GOTGCTL) 4126
74.14.2 OTG interrupt register (OTG_GOTGINT) 4128
74.14.3 OTG AHB configuration register (OTG_GAHBCFG) 4129
74.14.4 OTG USB configuration register (OTG_GUSBCFG) 4130
74.14.5 OTG reset register (OTG_GRSTCTL) 4132
74.14.6 OTG core interrupt register [alternate] (OTG_GINTSTS) 4135
74.14.7 OTG core interrupt register [alternate] (OTG_GINTSTS) 4139
74.14.8 OTG interrupt mask register [alternate] (OTG_GINTMSK) 4144
74.14.9 OTG interrupt mask register [alternate] (OTG_GINTMSK) 4145
74.14.10 OTG receive status debug read register [alternate] (OTG_GRXSTSR) 4147
74.14.11 OTG receive status debug read register [alternate] (OTG_GRXSTSR) 4148
74.14.12 OTG status read and pop registers (OTG_GRXSTSP) 4149
74.14.13 OTG status read and pop registers [alternate] (OTG_GRXSTSP) . . 4150
74.14.14 OTG receive FIFO size register (OTG_GRXFSIZ) 4151
74.14.15 OTG host non-periodic transmit FIFO size register [alternate] (OTG_HNPTXFSIZ) 4152
74.14.16 Endpoint 0 transmit FIFO size [alternate] (OTG_DIEPTXF0) 4152
74.14.17 OTG non-periodic transmit FIFO/queue status register (OTG_HNPTXSTS) 4153
74.14.18 OTG general core configuration register (OTG_GCCFG) 4154

74.14.19 OTG core ID register (OTG_CID) 4155
74.14.20 OTG core LPM configuration register (OTG_GLPMCFG) 4156
74.14.21 OTG host periodic transmit FIFO size register (OTG_HPTXFSIZ) 4160
74.14.22 OTG device IN endpoint transmit FIFO x size register (OTG_DIEPTXFx) 4160
74.14.23 Host-mode registers 4160
74.14.24 OTG host configuration register (OTG_HCFG) 4161
74.14.25 OTG host frame interval register (OTG_HFIR) 4161
74.14.26 OTG host frame number/frame time remaining register (OTG_HFNUM) 4162
74.14.27 OTG_Host periodic transmit FIFO/queue status register (OTG_HPTXSTS) 4163
74.14.28 OTG host all channels interrupt register (OTG_HAINT) 4164
74.14.29 OTG host all channels interrupt mask register (OTG_HAINTMSK) 4164
74.14.30 OTG host port control and status register (OTG_HPRT) 4165
74.14.31 OTG host channel x characteristics register (OTG_HCCHARx) 4167
74.14.32 OTG host channel x split control register (OTG_HCSPLTx) 4168
74.14.33 OTG host channel x interrupt register (OTG_HCINTx) 4169
74.14.34 OTG host channel x interrupt mask register (OTG_HCINTMSKx) . . 4170
74.14.35 OTG host channel x transfer size register (OTG_HCTSIZx) 4171
74.14.36 OTG host channel x DMA address register(OTG_HCDMAx) 4172
74.14.37 Device-mode registers 4172
74.14.38 OTG device configuration register (OTG_DCFG) 4172
74.14.39 OTG device control register (OTG_DCTL) 4174
74.14.40 OTG device status register (OTG_DSTS) 4176
74.14.41 OTG device IN endpoint common interrupt mask register (OTG_DIEPMSK) 4177
74.14.42 OTG device OUT endpoint common interrupt mask register (OTG_DOEPMSK) 4178
74.14.43 OTG device all endpoints interrupt register (OTG_DAINT) 4179
74.14.44 OTG all endpoints interrupt mask register (OTG_DAINTMSK) 4180
74.14.45 OTG device threshold control register (OTG_DTHRCTL) 4180
74.14.46 OTG device IN endpoint FIFO empty interrupt mask register (OTG_DIEPEMPMSK) 4181
74.14.47 OTG device IN endpoint x control register [alternate] (OTG_DIEPCTLx) 4182

74.14.48 OTG device IN endpoint x control register [alternate] (OTG_DIEPCTLx) 4184
74.14.49 OTG device IN endpoint x interrupt register (OTG_DIEPINTx) 4186
74.14.50 OTG device IN endpoint 0 transfer size register (OTG_DIEPTSIZ0) 4187
74.14.51 OTG device IN endpoint x DMA address register (OTG_DIEPDMAx) 4188
74.14.52 OTG device IN endpoint transmit FIFO status register (OTG_DTXFSTSx) 4188
74.14.53 OTG device IN endpoint x transfer size register (OTG_DIEPTSIZx) . 4189
74.14.54 OTG device control OUT endpoint 0 control register (OTG_DOEPCTL0) 4189
74.14.55 OTG device OUT endpoint x interrupt register (OTG_DOEPINTx) . . 4191
74.14.56 OTG device OUT endpoint 0 transfer size register (OTG_DOEPTSIZ0) 4193
74.14.57 OTG device OUT endpoint x DMA address register (OTG_DOEPDMAx) 4194
74.14.58 OTG device OUT endpoint x control register [alternate] (OTG_DOEPCTLx) 4194
74.14.59 OTG device OUT endpoint x control register [alternate] (OTG_DOEPCTLx) 4196
74.14.60 OTG device OUT endpoint x transfer size register (OTG_DOEPTSIZx) 4198
74.14.61 OTG power and clock gating control register (OTG_PCGCCTL) . . . 4199
74.14.62 OTG power and clock gating control register 1 (OTG_PCGCCTL1) . 4200
74.14.63 OTG register map 4201
74.15 **OTG** programming model 4208
74.15.1 Core initialization 4208
74.15.2 Host initialization 4209
74.15.3 Device initialization 4210
74.15.4 DMA mode 4210
74.15.5 Host programming model 4210
74.15.6 Device programming model 4243

1 Documentation conventions

1.1 General information

The STM32MP21xx devices embed an Arm®[a] Cortex®-M33, and an Arm® Cortex®-A35 core.

arm

1.2 List of abbreviations for registers

The following abbreviations[b] are used in register descriptions:

read/write (rw)	Software can read and write to this bit.
read-only (r)	Software can only read this bit.
write-only (w)	Software can only write to this bit. Reading this bit returns the reset value.
read/clear write0 (rc_w0)	Software can read as well as clear this bit by writing 0. Writing 1 has no effect on the bit value.
read/clear write1 (rc_w1)	Software can read as well as clear this bit by writing 1. Writing 0 has no effect on the bit value.
read/clear write (rc_w)	Software can read as well as clear this bit by writing to the register. The value written to this bit is not important.
read/clear by read (rc_r)	Software can read this bit. Reading this bit automatically clears it to 0. Writing this bit has no effect on the bit value.
read/set by read (rs_r)	Software can read this bit. Reading this bit automatically sets it to 1. Writing this bit has no effect on the bit value.
read/set (rs)	Software can read as well as set this bit. Writing 0 has no effect on the bit value.
read/write once (rwo)	Software can only write once to this bit and can also read it at any time. Only a reset can return the bit to its reset value.
toggle (t)	The software can toggle this bit by writing 1. Writing 0 has no effect.
read-only write trigger (rt_w1)	Software can read this bit. Writing 1 triggers an event but has no effect on the bit value.
Reserved (Res.)	Reserved bit, must be kept at reset value.

a. Arm is a registered trademark of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

b. This is an exhaustive list of all abbreviations applicable to STMicroelectronics microcontrollers, some of them may not be used in the current document.

1.3 Register reset value

Bits (binary notation) or bits nibbles (hexadecimal notation) of which the reset value is undefined are marked as X.

Bits (binary notation) or bits nibbles (hexadecimal notation) of which the reset value is unmodified are marked as U.

1.4 Glossary

This section gives a brief definition of acronyms and abbreviations used in this document:

- The product integrates two debug ports:
  - JTAG debug port (**JTAG-DP**) provides a 5-pin standard interface based on the Joint Test Action Group (JTAG) protocol.
  - SWD debug port (**SWD-DP**) provides a 2-pin (clock and data) interface based on the Serial Wire Debug (SWD) protocol.
- **Word**: data of 32-bit length.
- **Half-word**: data of 16-bit length.
- **Byte**: data of 8-bit length.
- **Double word**: data of 64-bit length.
- **Option bytes**: product configuration bits stored in internal fuses.
- **OTP**: one-time programming (fuses).
- **AHB**: advanced high-performance bus.
- **APB**: advanced peripheral bus.
- **AXI**: Advanced extensible interface protocol.
- **ECC**: error code correction.
- **DMA**: direct memory access.
- **AHBS**: AHB slave bus.
- **MLAHB**: Multi-Layer AHB interconnect matrix.
- **STNoC**: ST network on-chip interconnect.

1.5 Availability of peripherals

For availability of peripherals and their number across all devices, refer to the particular device datasheet.

2 Memory and bus architecture

2.1 System architecture

In the whole document:

- The Cortex-A35 is also called CPU1 or MPU.
- The Cortex-M33 is also called CPU2 or MCU.

2.1.1 Bus architecture

The bus architecture is organized around two interconnect matrices, which operate in different frequency domains, as described in *Figure 1*.

- one high-speed multi-frequency domain, AXI compliant STNoC interconnect:

  This high-performance interconnect is mainly used by the CPU1 subsystem and the following high-bandwidth masters (this part of the system is called MPU-side in the rest of the document): USBH EHCI, USBH OHCI, OTG, ETH1/2, SDMMC1/2/3, HPDMA1/2/3 (for their AXI ports), LTDC, DCMIPP.

  The CPU2 traffic directed to these targets ends up also in this interconnect.

  It manages accesses to:

  – external memories DDR (through DDRCTRL), NAND/NOR (through FMC)
  – main system internal memories (SYSRAM, ROM)
  – main cluster of security peripherals through the AHB bus
  – some low-speed communication peripherals through the APB4 bus
  – control and configuration of the high-bandwidth masters
  – STM (system trace macrocell)

Note: Boot ROM and GIC are only accessible to the CPU1 through an intermediate AXI interconnect downstream of the CPU1 (see Figure 1).

- one multi-layer AHB interconnect (this part of the system is called MCU-side in the following). It is itself spread in two MLAHBs (MLAHB300 and MLAHB150, where 150 and 300 refer to the maximum clock frequency of the interconnect).

  This low-latency interconnect receives traffic from the CPU2 subsystem and associated masters: HPDMA1/2/3 (for their AHB ports). High-bandwidth initiators whose traffics are directed towards peripherals and MCU-side memories (SRAM, OCTOSPI) end up in these MLAHB as well.

  MLAHB300 manages accesses to:

  – CPU2 dedicated SRAM1
  – CPU2 dedicated retention memory (RETRAM)
  – external memories NAND/NOR through OCTOSPI
  – connection to MLAHB150 through the frequency downsizer

MLAHB150 manages accesses to:

- most timers and low-speed communication peripherals through AHB2, AHB6 and APB1/2/5 bus
- secondary cluster of security peripherals and camera interface through AHB3/2 bus
- resources dedicated to communication with CPU1 cluster (mailbox through the AHB2 bus)
- main infrastructure blocks as clock generation, power control, system configuration, security configuration, and miscellaneous peripherals through the AHB4 bus

- AXI and multi-layer AHB matrices are connected to each other through dedicated data paths in both directions.
- One STNoC master port has access to MLAHB300 slaves, allowing access from the CPU1 to SRAM1, RETRAM, and OCTOSPI.
- One STNoC master port has access to MLAHB150 slaves, allowing access from the CPU1 to all peripherals.
- One MLAHB300 master port has access to STNoC through an AHB2AXI converter, allowing access from the CPU2 to DDR, SYSRAM, STM and FMC.
- One MLAHB150 master port has access to STNoC through an AHB2AXI converter, allowing access from the CPU2 to MPU-side peripherals.
- CPU2 has no access to the ROM and GIC.

The bus architecture diagram in *Figure 1* describes the interconnect for STM32MP21xx devices.

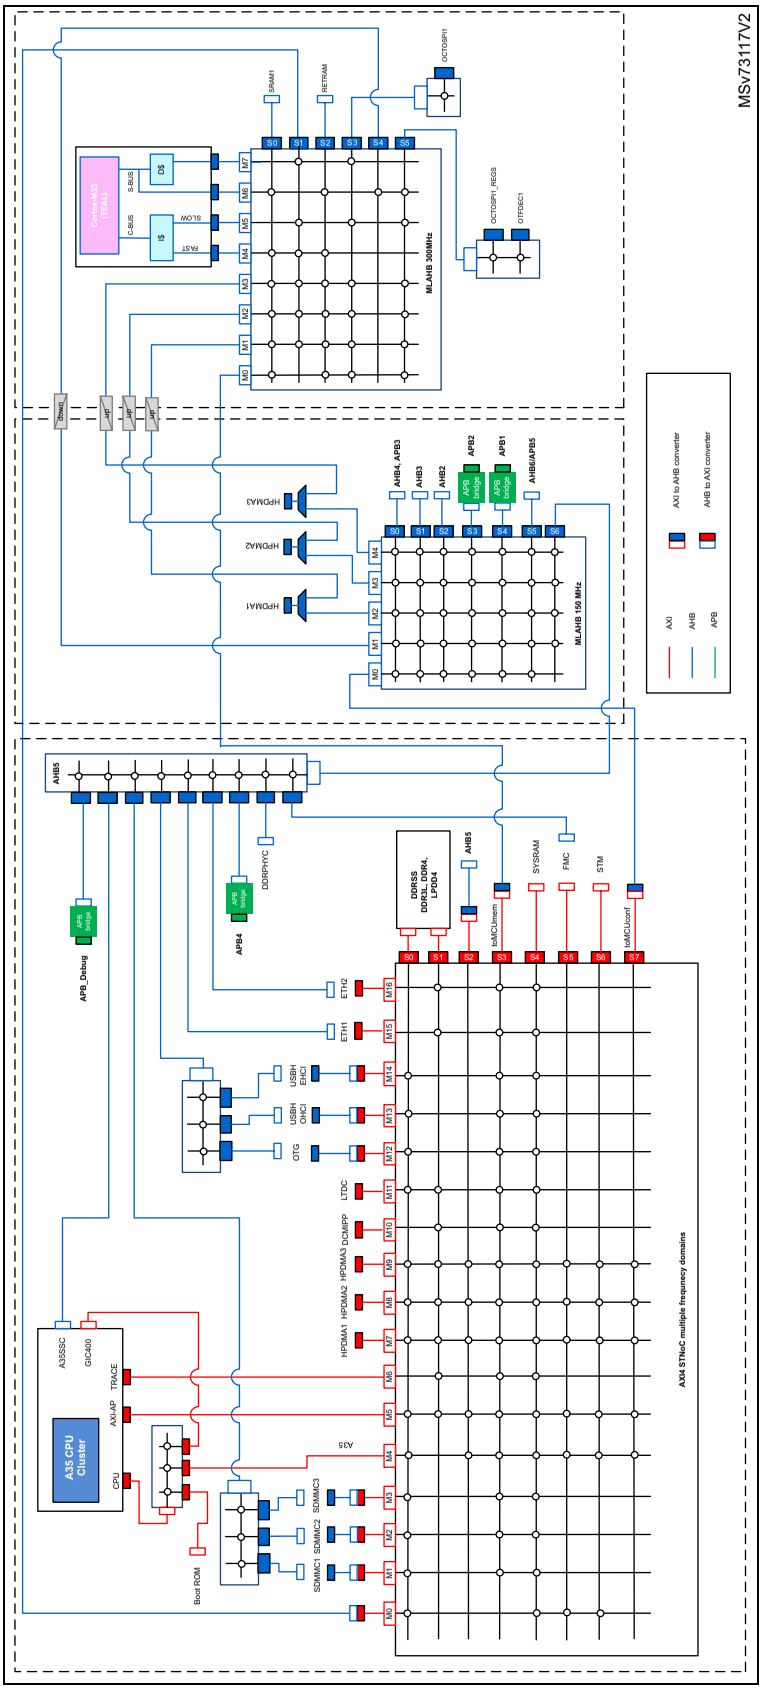

Figure 1. STM32MP21xx interconnect top view

2.1.2 Memory map organization

Introduction

For the detailed mapping of available memory and register areas, refer to *Section 2.4: Memory organization*.

The following paragraphs describe the various resources in the system.

Embedded memories

- **Boot ROM**

  The 192-Kbyte embedded ROM is dedicated to the CPU1 subsystem for boot code execution. This memory and the associated memory controller operate at 400 MHz typical.

- **SYSRAM**

  The 256-Kbyte embedded SYSRAM is preferably used by the CPU1 subsystem for code execution and low-latency data management. The CPU2 has access too. The SRAM itself is 0 wait-state. Some latency is added when data are propagated through the AXI interconnect (access from MPU-side). This memory and the associated memory controller operate at 400 MHz typical.

- **MCU SRAM1**

  The SRAM1 is a 64-Kbyte RAM preferably used by the CPU2 for the code execution, low-latency data management, and data storage for exchange with the CPU1 subsystem. The SRAM1 is 0 wait-state. This memory and the associated memory controller operate at 300 MHz typical.

- **Retention RAM (RETRAM)**

  The RETRAM is a 128-Kbyte RAM with specific supply providing data retention in low-power modes (including Standby and V_{BAT} modes). The RETRAM is 0 wait-state. Some latency is added when data are propagated through the AXI interconnect (access from MPU-side). This memory and the associated memory controller operate at 300 MHz typical.

- **Backup RAM (BKPSRAM)**

  The backup RAM is an 8-Kbyte static RAM with dual-rail supply providing data backup for the whole system, whatever the power mode, with standard latency. This memory and the associated memory controller operate at 150 MHz typical.

External memory support

- **DDR3L/4 LPDDR4 controller (DDRCTRL)**

  The DDR supported types are LPDDR4, DDR3L, and DDR4. Regarding external memory, 16-bit data width is supported, while internally, the DDRCTRL is connected to 128-bit data width interconnect. The maximum supported size is 4 Gbytes (DDR4). The DDRCTRL is accessible through two AXI data ports, which have same characteristics. However, only a transaction going through port 1 can be AES encrypted. The secure traffic is then default routed to the DDRSS XPI0 while non-secure traffic is routed towards the DDRSS XPI1.

  The following table presents the routing of the STNoC ports towards the DDR subsystem.

Table 1. STNoC routing of the DDR traffic

Initiator	DDRSS XPI0	DDRSS XPI1	Comment
CPU1	All traffic	None	-
AXI-AP (DebugSS)	Secure traffic	Non-secure traffic	-
TRACE	All traffic	None	-
DCMIPP	None	All traffic	-
LTDC	Secure traffic	Non secure traffic	-
OTG	None	All traffic	-
ETH1/2	None	All traffic	-
USBH (EHCI/OHCI)	All traffic	None	-
SDMMC1/2/3	All traffic	None	-
HPDMA1/2/3	Secure traffic	Non secure traffic	Relative to HPDMA AXI ports
MCU1	All traffic	None	Traffic from CPU2

More information on memory characteristics and controller parametrization is available in *Section 13: DDR3L/DDR4/LPDDR4 controller (DDRCTRL)* and *Section 14: DDR physical interface control (DDRPHYC)*. The DDRCTRL operates at up to ddr_ck = 400 MHz. The external memory operates at up to 1600 MHz (800 MHz dual data rate) depending on the system configuration.

- **Flexible memory controller (FMC) and OCTOSPI**

  The external flash memory is accessible through NAND/NOR configurable FMC, or through OCTOSPI. The FMC also allows parallel connection of an SRAM/PSRAM instead of flash memory, if needed.

- **SD/SDIO/MMC card host interfaces (SDMMCx)**

  The SD, SDIO, *e*•MMC™ devices are interfaced through three SDMMC controllers, all connected to the STNoC interconnect. These controllers are masters of the interconnect, and originate the transfers to/from SD/SDIO/MMC memories.

Peripheral clusters

There are eight peripheral clusters in the system, briefly described hereafter:

Note: The AHBx/APBy notation means that the resources are accessed through AHBx bus, and for some of them, through AHBx bus in combination with APBy bus.

- **MLAHB150/APB1 - APB2**

  This cluster groups most of the usual MCU peripherals: timers, low-speed communication interfaces (SPI, I3C, I2C, U(S)ART, SAI), ADC, FDCAN, and MDF. Functional blocks are under control of CPU1 or CPU2, either directly or through the DMA.

- **AHB2**

  This cluster groups the ADC1/2, MDF1, IPCC1 (mailbox for interprocessor communication), DCMI, PSSI, CRC, and gives access to the three HPDMA programming ports, and to the CPU2 ICACHE and DCACHE programming ports.

- **AHB3**

  The AHB3 groups all RIF infrastructure configuration ports, and security/encryption cells (PKA, SAES, CRYP1/2, RNG1/2, HASH1/2). It is also the BKPSRAM access point.

- **AHB4/APB3**

This cluster groups important system functions as clock and power control, system configuration, most GPIO control, plus some additional timers, and low-speed communication interfaces. The BSEC is also connected to this bus, as well as some watchdogs.

- **AHB5/APB4**

  This cluster groups most of the resources control for the MPU side, including graphic and display, as well as the access to the configuration registers of the fast masters: ETH1/2, SDMMC1/2/3, USBH (EHCI/OHCI) and OTG. Additionally, the control register accesses for the DDRSS are located in the APB4. The AHB5 matrix has two independent inputs: one coming from the MCU-side (MLAHB150), and one coming from the MPU-side (STNoC).

- **AHB6/APB5**

  This cluster groups the GPIOZ control, RTC/TAMP, LPTIMERs and some low speed communication interfaces (SPI, I2C, I3C, LPUART). Functional blocks are under control of CPU1 or CPU2, either directly or through the DMA.

- **Debug**

  This cluster groups all debug features including Arm CoreSight™ infrastructure.

2.1.3 Connectivity matrix overview

The following table summarizes which master can access which the memory-mapped resource.

Table 2. Connectivity matrix

Resource	CPU1	CPU2	AXI-AP	HPDMA1/2/3	USBH EHCI USBH OHCI	OTG	ETH1/2	SDMMC1/2/3	LTDC	DCMIPP	TRACE
DDR	X	X	X	X(1)	X	X	X	X	X	X	X

1. Only HPDMA1/2/3 AXI traffic

2.2 STNoC AXI network-on-chip

2.2.1 STNoC features

The STM32MP21xx STNoC AXI interconnect is built out of the ST in-house network-on-chip. Its main features are:

- 17 master ports and 8 slave ports with optimized interconnect topology from masters to slaves (no full connected)
- Source routed, packet based, wormhole switching forwarding scheme for simultaneous and parallel/pipelined accesses from master to slave
- Independent read and write input/output points to cope with AXI independent channels
- Size and frequency conversion, asynchronism management
- Fine grain automatic clock gating shutting down the clocks to unused network parts at any point in time, with zero delay clock resume
- Internal packets buffering for improved traffic efficiency
- Independent request and response network
- Software accessible registers to observe and report traffic statistics, performances, blocking sources (if any) over the network

2.2.2 STNoC interconnect configurations

The STNoC interconnect configuration is described in the figure below.

The STNoC interconnect internal router topology is described in *Figure 3*.

Note: Only the request network topology is presented, the response network has a dual topology.

Figure 2. STNoC-based MPU-side AXI interconnect

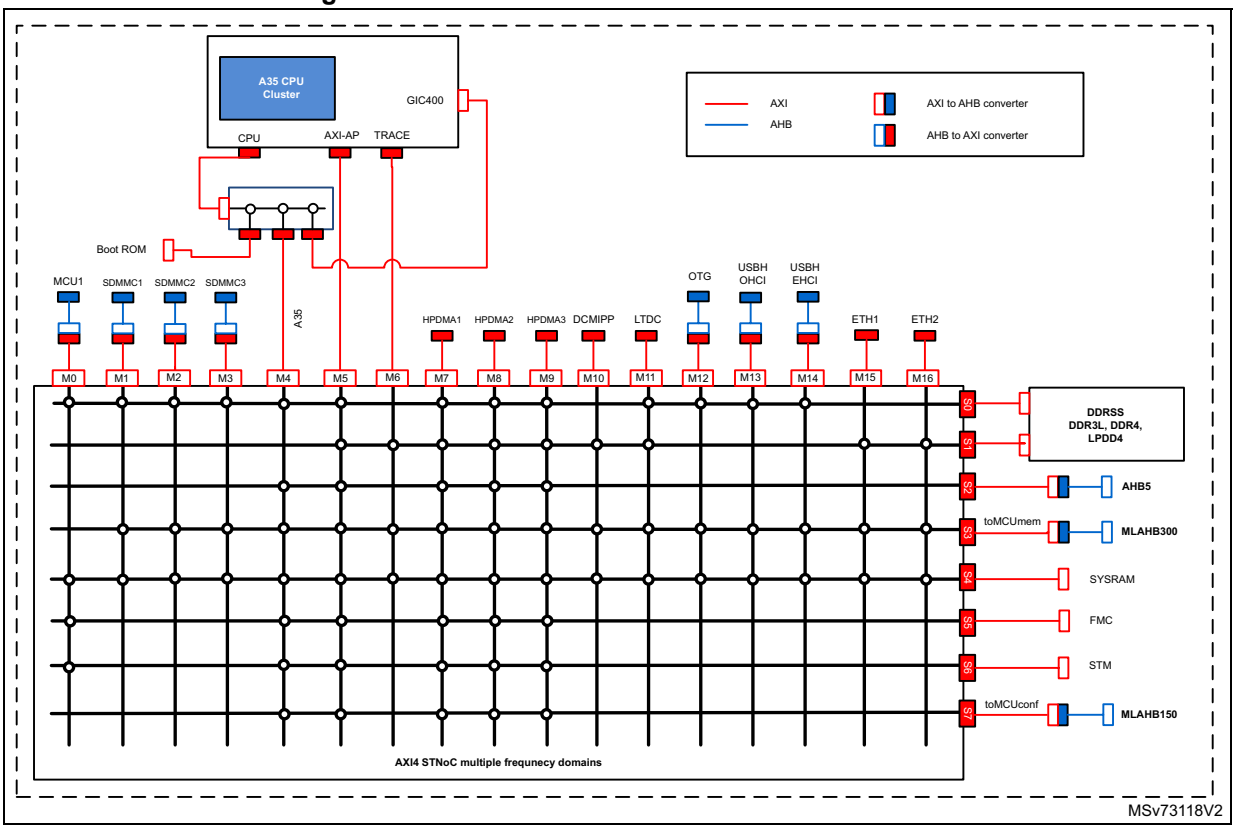

Figure 3. STNoC internal router distribution (request path) and frequency distribution

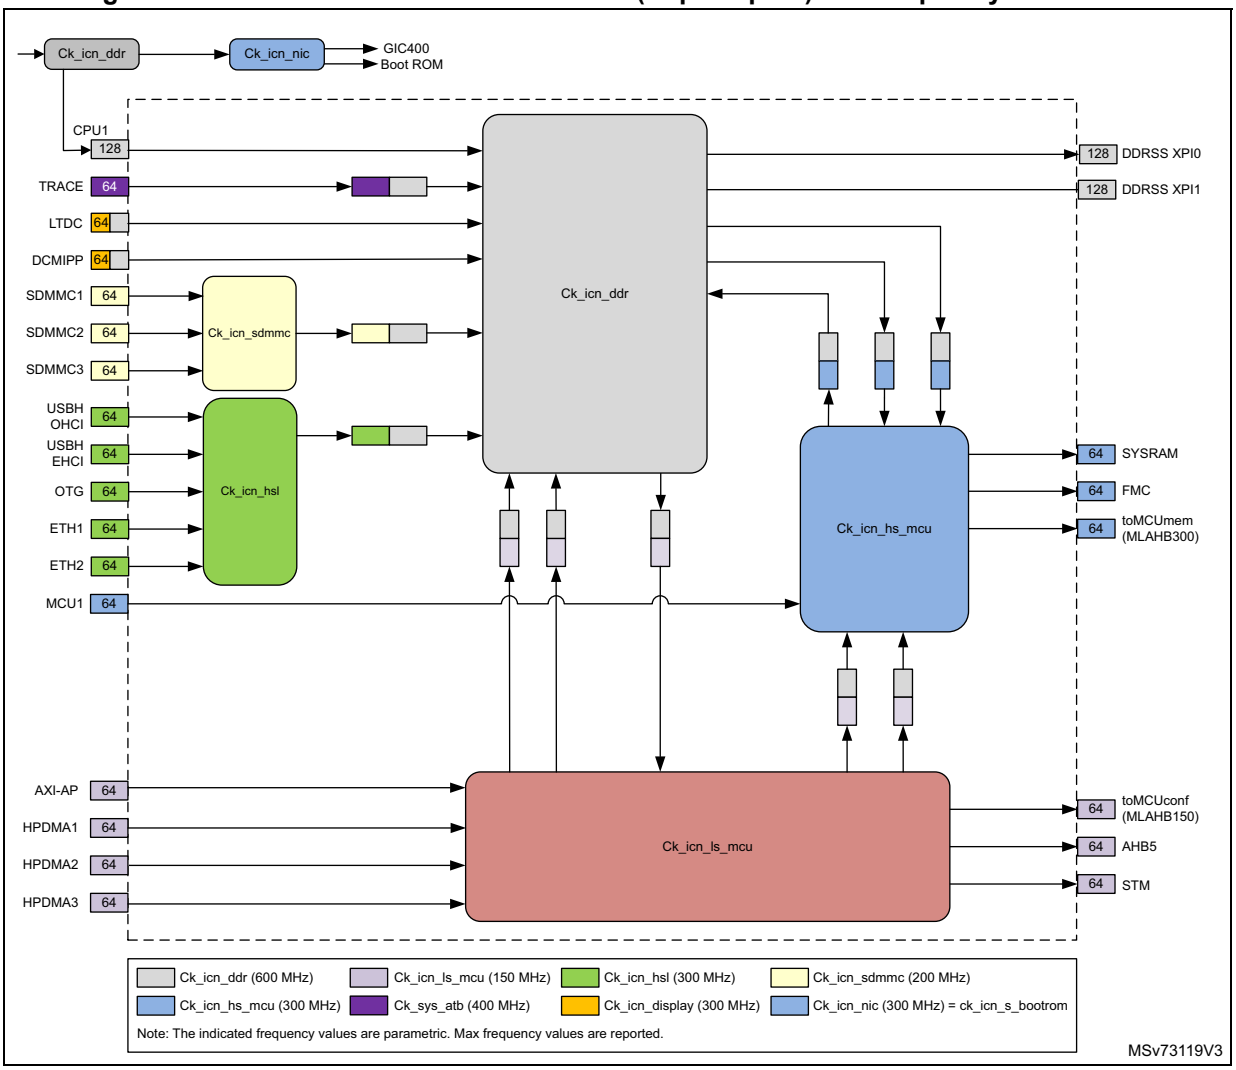


2.2.3 Master port description

The M0 to M21 master ports of AXI_STNoc are described in *Figure 2*.

- **M0**:

  M0 is used by masters from the MCU to access the memories (DDR, FMC, SYSRAM) of the MPU world and the STM. The CPU2 port reach the DDR subsystem through this port. They can only reach port 1 of the DDR subsystem. M1 is bridged to AXI externally.

- **M1/M2/M3**:

  Three AHB ports externally bridged to AXI protocol for connecting the three SDMMC controllers, with access to the SYSRAM, DDRSS XPI0 only, and MCU side memories.

- **M4**:

  M4 is the AXI access port of the CPU1 to the AXI main interconnect, 128-bit wide. The CPU subsystem is connected to DDR controller port 1 only. An intermediate NIC 400 AXI interconnect connects the CPU to the boot ROM and the GIC400.

- **M5**:

  M5 is the AXI port for the debug access port of the CPU1 cluster. It is 64-bit wide, and has access to all STNoC targets, including reaching the MCU world.

- **M6**:

  M6 is a 64-bit wide AXI port connecting to the trace output of the CPU cluster, for storing debug traces in DDR, SYSRAM. Alternatively, debug traces can also be stored on the MCU-side RAMs.

- **M7/M8/M9**:

  Three AXI 64-bit wide interfaces for connecting the AXI ports of the HPDMA, with access to all STNoC targets. The HPDMA accesses the DDR through port 1 or 2, depending if the traffic is secure or not.

- **M10**:

  M10 is a 64-bit wide AXI write-only interface for DCMIPP, with connection on the MPU-side to the DDR2 port only and SYSRAM, and access to the MCU-side memories.

- **M11**:

  M11 is a 64-bit wide AXI interface for the LTDC initiator, with connection on the MPU-side to the DDRSS XPI0 and DDRSS XPI1 (depending if traffic is secure or not) and SYSRAM, and access to the MCU-side memories.

- **M12**:

  M12 is an AHB ports externally bridged to AXI for OTG initiator, with access to the SYSRAM, DDRSS XPI0 only, and MCU side memories.

- **M13/M14**:

  These are two AHB ports externally bridged to AXI protocol for USBH OHCI and USBH EHCI, with access to the SYSRAM, DDRSS XPI0 only, and MCU side memories. M13 and M14 are not active on the interconnect at the same time.

- **M15/M16**:

  These are two 64-bit wide AXI ports for ETH1/2 with access to DDRSS XPI1 only, SYSRAM, and MCU-side memories.

2.2.4 Master port main characteristics

The following table summarizes main characteristics of the master ports.

Table 3. STNoC master port main characteristics

#	Master port	Protocol	Data bus width	Frequency (MHz)	Id width	Default QoS(1) value	Read/write issuing capability
M0	MCU1	AHB->AXI	32	300	1	15	1/1
M1	SDMMC1	AHB->AXI	32	200	1	12	1/1
M2	SDMMC2	AHB->AXI	32	200	1	12	1/1
M3	SDMMC3	AHB->AXI	32	200	1	12	1/1
M4	CPU1	AXI	128	600	6	14	16/16 (up to 16 outstanding destinations)
M5	AXI-AP	AXI	64	200	4	10	1/1
M6	TRACE	AXI	64	400	4	3	1/32 (1 single destination)
M7	HPDMA1	AXI	64	150	4	11	16/16 (up to 16 outstanding destinations)
M8	HPDMA2	AXI	64	150	4	11	16/16 (up to 16 outstanding destinations)

Table 3. STNoC master port main characteristics (continued)

#	Master port	Protocol	Data bus width	Frequency (MHz)	Id width	Default QoS(1) value	Read/write issuing capability
M9	HPDMA3	AXI	64	150	4	11	16/16 (up to 16 outstanding destinations)
M10	DCMIPP	AXI	64	300	4	8	Write only, 16 (1 single destination)
M11	LTDC	AXI	64	300	4	9	Read: 16 (up to 8 outstanding destinations) Write: 16 (single destination)
M12	OTG	AHB->AXI	32	300	1	10	1/1
M13	USBH OHCI	AHB->AXI	32	300	1	10	1/1
M14	USBH EHCI	AHB->AXI	32	300	1	10	1/1
M15	ETH1	AXI	64	300	4	7	16/16 (1 single destination)
M16	ETH2	AXI	64	300	4	7	16/16 (1 single destination)

1. The default QoS values are programmable (see *Section 23: System configuration controller (SYSCFG)*. They are used in the DDR controller when assigning a transaction to a controller internal queue. They are not used in the interconnect.

2.2.5 Slave port description

The S0 to S10 slave ports of AXI_STNoc are described in *Figure 2*.

- **S0/S1**: AXI 128-bit wide ports for accessing the DDRSS. The secure traffic, low-latency traffic and CPU1/CPU2 traffic, goes through the DDRSS XPI0. Other traffics go through the DDRSS XPI1 traffic.
- **S2**: AXI port externally bridged to AHB 32-bit wide to access the AHB5/APB4 peripheral clusters, that is the configuration peripherals for the MPU parts (such as SDMMC, DDRSS, USB, ETH) and the debug.
- **S3**: AXI port externally bridged to AHB 32-bit wide to access the MCU-side memories. This port leads to an input of the MLAHB300 AHB matrix.
- **S4**: AXI 64-bit wide port to access the SYSRAM
- **S5**: AXI 64-bit wide port for accessing the FMC target device
- **S6**: AXI 64-bit wide target port for accessing the CPU1 STM port
- **S7**: AXI port externally bridged to AHB 32-bit wide to access the MCU-side peripherals. This port leads to an input of the MLAHB150 AHB matrix

2.2.6 Slave port main characteristics

The following table lists main characteristics of the slave ports.

Table 4. Slave port main characteristics

Slave port	Port number	Protocol	Data bus width	Frequency (MHz)
DDRSS XPI0	S0	AXI	128	600
DDRSS XPI1	S1	AXI	128	600
toMCUmem	S2	AXI->AHB	32	300
MPU_AHB5	S3	AXI->AHB	32	150
SYSRAM	S4	AXI	64	400
FMC	S5	AXI	64	400
STM	S6	AXI	64	200
toMCUconf	S7	AXI->AHB	32	150

2.3 Multi-layer AHB interconnect

2.3.1 Multi-layer AHB features

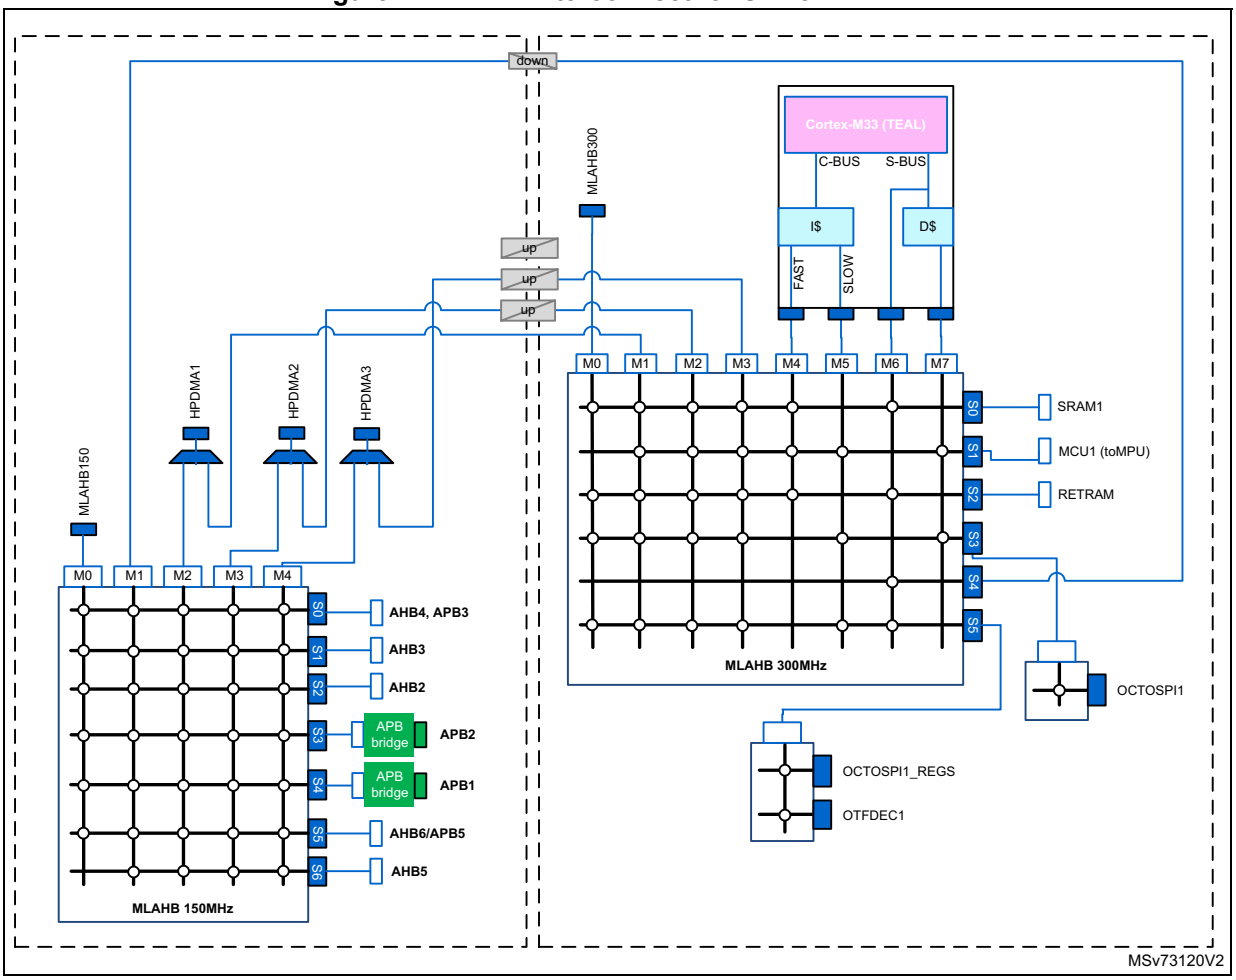
The multi-layer AHB main features are:

- Spread in two matrices working at different frequencies to trade off high performances versus low-latency accesses to peripherals
- MLAHB300 connects eight initiator ports to six target ports, running at 300 MHz, and allowing mainly accesses from the CPU2 and HPDMA to the MCU-side memories.
- MLAHB150 connects five initiator ports to seven target ports, running at 150 MHz, and allowing mainly access to the CPU2 and HPDMA to the MCU side peripherals.
- Simultaneous accesses support from different masters to the slaves connected to separated layers

2.3.2 Multi-layer AHB interconnect configuration

The multi-layer AHB interconnect configuration is described in the figure below.

Figure 4. MLAHB interconnect for STM32MP21xx



2.3.3 Multi-layer AHB 300 MHz master port characteristics

The M0 to M7 slave ports of MLAHB300 are described in *Figure 4*.

- **M0**:
  M0 is connected to an MPU interconnect master port, allowing masters from the MPU subsystem to access the memories located in the MCU-side.
- **M1/M2/M3**:
  M1/M2/M3 ports connecting the demultiplexed AHB ports of the HPDMA, to give access to the HPDMA AHB ports to the AHB memories.
- **M4**:
  CPU2 I$ (C-BUS) fast access, dedicated to embedded memories with low-access latencies
- **M5**:
  CPU2 I$ (C-BUS) slow access, dedicated to memories with high-access latencies, namely the DDR on the MPU side or the OCTOSPI connected memory device
- **M6**:
  CPU2 D$ (S-BUS) bypass access, dedicated to embedded memories with low access latencies. The traffic from the Cortex-M33 towards SYSRAM (ranges above 0x2000 0000), SRAM1, RETRAM and peripherals is routed through this port.
- **M7**:
  CPU2 D$ (S-BUS) access, dedicated to high-latency memories such as DDR on the MPU side, or OCTOSPI connected device. The traffic from the Cortex-M33 towards FMC, DDR, and OCTOSPI memories is routed through this port.

The following table lists the main characteristics of MLAHB300 master ports.

Table 5. MLAHB300 master port main characteristics

Master port	Port number	Protocol	Data bus width (bits)	Synchronicity
MLAHB300 (toMCUMem)	M0	AHB	32	Sync
HPDMA1	M1			
HPDMA2	M2			
HPDMA3	M3			
Cortex-M33_i$_fast	M4			
Cortex-M33_i$_slow	M5			
Cortex-M33_D$_bypass	M6			
Cortex-M33_D$	M7			

2.3.4 Multi-layer AHB 300 MHz slave port characteristics

The S0 to S6 slave ports of MLAHB300 are described in *Figure 4*.

- **S0**: AHB ports to SRAM1
- **S1**: AHB port to access the MPU-side memories. When directed towards DDR, all traffics coming from this port are routed to DDRSS XPI0 (secure-enabled one), including HPDMA traffic from their AHB port.
- **S2**: AHB port to access the retention RAM
- **S3**: AHB port to access the OCTOSPI cluster

- **S4**: AHB port bridging to the MLAHB150 for accessing the peripherals on MCU side. The HPDMA has a dedicated access on the MLAHB150 and must not use this port for accessing the MCU-side peripherals. There is a downsync block on this path towards the MLAHB150.
- **S5**: AHB port accessing configuration registers for the OTFDEC1, and OCTOSPI1/2 registers.

The following table lists the main characteristics of the MLAHB300 target ports.

Table 6. MLAHB300 target port main characteristics

Slave port	Port number	Protocol	Data bus width	Synchronicity
SRAM1	S0	AHB	32	Sync
MCU1 (toMPU)	S1			
RETRAM	S2			
OCTOSPI	S3			
ToMLAHB150	S4			
OCTO_CONFIG	S5			

2.3.5 Multi-layer AHB 150 MHz master port characteristics

The M0 to M4 master ports of MLAHB150 are described in *Figure 4*.

- **M0**: AHB port receiving traffic towards the MCU-side peripherals from the MPU initiators
- **M1**: AHB port receiving traffic from the MLAHB300 towards the MCU peripherals. Only the CPU2 initiated traffic must go through this port, since the HPDMA AHB ports have a dedicated access port on this matrix.
- **M2/M3/M4**: AHB port receiving traffic from the demultiplexed HPDMA1/2/3 AHB ports aimed at peripherals

The following table lists the main characteristics of the MLAHB150 master ports.

Table 7. MLAHB150 master port main characteristics.

Master port	Port number	Protocol	Data bus width	Synchronicity
MLAHB150 (toMCUconf)	M0	AHB	32	Sync
fromMLAHB300	M1			
HPDMA1	M2			
HPDMA2	M3			
HPDMA3	M4			

2.3.6 Multi-layer AHB 150 MHz slave port characteristics

The S0 to S8 slave ports of MLAHB150 are described in *Figure 4*.

- **S0**: AHB target port to connect to the AHB4/APB3 peripherals, where mainly GPIOs are accessible
- **S1**: AHB target port to connect to AHB3 peripherals, where mainly security peripherals are located
- **S2**: AHB target port to connect to the AHB2 peripherals, where mainly registers for configuring different cells (HPDMA, CPU2 cache) and ADC are located

- **S3**: AHB target port to connect to the APB2 peripherals through AHB2APB in-house bridge
- **S4**: AHB target port to connect to the APB1 peripherals through AHB2APB in-house bridge
- **S5**: AHB target port to connect to AHB6/APB5 peripherals
- **S6**: AHB target port to connect to AHB5 peripherals, where the resources control for the MPU side are located

The table below lists the main characteristics of the MLAHB150 target ports.

Table 8. MLAHB150 slave ports main characteristics

Slave port	Port number	Protocol	Data bus width	Synchronicity
toAHB4	S0	AHB	32	Sync
toAHB3	S1			
toAHB2	S2			
toAPB2	S3			
toAPB1	S4			
toAHB6	S5			
toAHB5	S6			

2.4 Memory organization

2.4.1 Introduction

Program memory, data memory, registers and I/O ports are organized within the same linear address space.

The bytes are coded in memory in Little Endian format. The lowest numbered byte in a word is considered the word's least significant byte and the highest numbered byte the most significant.

The access to some part of the address space is master dependent, see *Section 2.4.2: Memory map and register boundary addresses* for details.

2.4.2 Memory map and register boundary addresses

Figure 5. Memory map

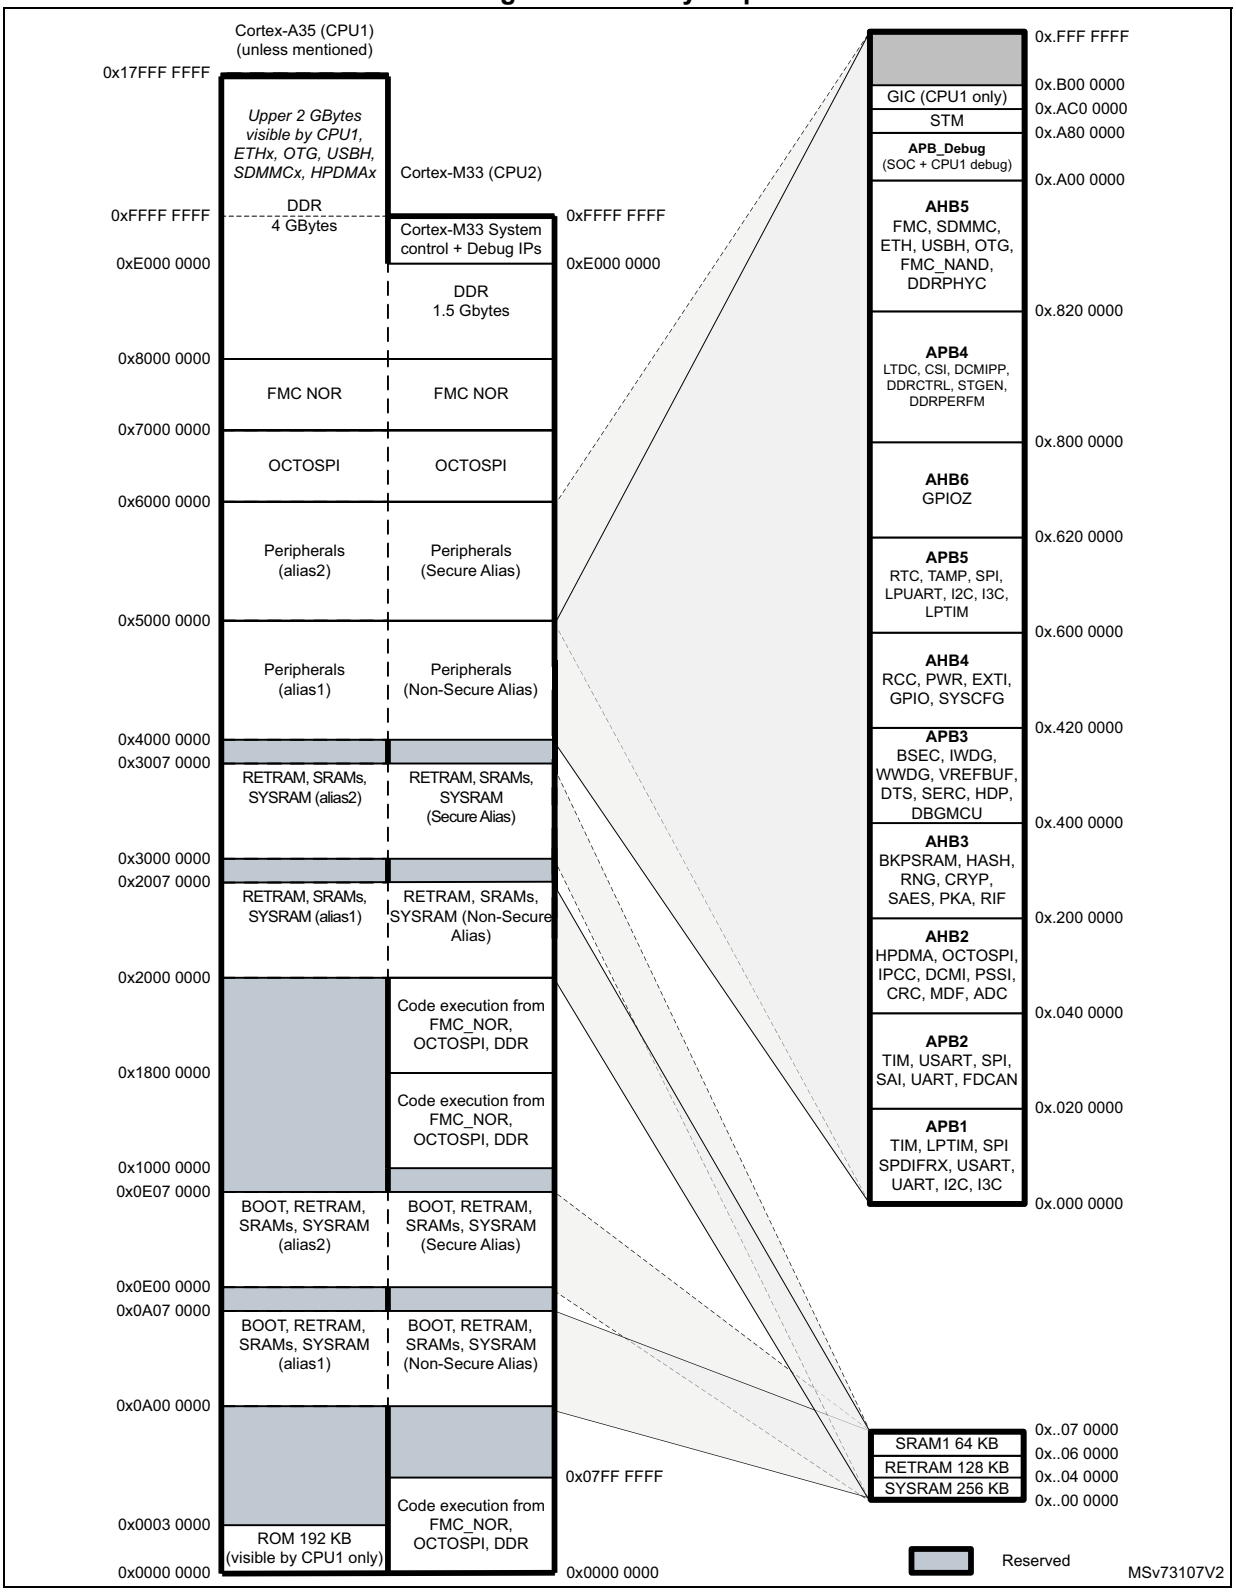


Table 9. Register boundary addresses for Cortex-A35 (CPU1) and Cortex-M33 (CPU2)(1)

Bus	Boundary address	Size (Kbytes)	Peripheral	Peripheral register map

3 Arm Cortex-A35 (CA35SS)

3.1 Overview

The Cortex-A35 includes the following features:

- Full implementation of the Armv8-A A64, A32, and T32 instruction sets
- Both AArch32 and AArch64 execution states at all exception levels (EL0 to EL3)
- In order pipeline with direct and indirect branch prediction
- Separate Level 1 (L1) data- and instruction-side memory systems with a memory management unit (MMU)
- Level 2 (L2) memory system that provides Cortex-A35 subsystem memory coherency
- Arm TrustZone
- Advanced SIMD and floating-point architecture support
- Armv8 debug logic
- Performance monitoring unit (PMU)
- Program trace macrocell (PTM) that supports instruction trace only
- Generic timers supporting 64-bit count input from an external system counter

The STM32MP21xx feature a Cortex-A35 subsystem with characteristics detailed in the table below.

Table 10. Cortex-A35 subsystem configuration

Level	Characteristics	Comments
Core level	L1 instruction cache size	32 Kbytes
	L1 data cache size	32 Kbytes
	Cache protection	No
	NEON/FPU	Yes
Subsystem level	Number of processor cores	1
	Master bus interface	AXI4
	Debug memory map	v8
	L2 cache size	128 Kbytes

Some peripherals are associated with the Cortex-A35, and build the Cortex-A35 subsystem:

- Arm GIC (generic interrupt controller): centralizes resources to support and manage interrupts. Its registers manage interrupt sources, interrupt behavior, and interrupt routing to one or more processor cores (see *Section 28: Global interrupt controller (GIC)*).
- STGEN (time generator): provides a time reference for the internal timers of the Cortex-A35 processor core (see *Section 59: System timer generator (STGEN)*).
- system configuration registers (*Section 3.5*) that deal with some static but programmable Cortex-A35 subsystem configuration
- standardized status and control registers (*Section 3.6*) that deal with control and status of subblocks such as Cortex-A35 processor core, PLL, and debug

3.2 Cortex-A35 reset

There are different reset signals that apply to the Cortex-A35 subsystem. The RCC allows some of them to be under software control, as shown in the table below.

Table 11. Cortex-A35 subsystem reset sources

RCC register	Bit	Name	Description
-	-	POR	Device power-on reset (POR)
RCC_GRSTCSETR	0	SYSRST	System reset
RCC_C1RSTCSETR	0	C1RST	Power-on reset for the Cortex-A35 subsystem

The effect of RCC registers on core reset becomes effective only when the Cortex-A35 core enters in idle mode after execution of the wait-for-interrupt (WFI) instruction, ensuring that any transactions on the interconnect are completed. Refer to *Section 20* for more details.

3.3 Cortex-A35 clocking

The clock for the Cortex-A35 subsystem can be selected among:

- a clock from the device clock generator (aka ck_cpu1_ext2f). The maximum frequency on this clock is 400 MHz with a divider by two, enabled thanks to the CA35SS_SSC_CHGCLKREQ SSC register.
- a dedicated PLL that is identical to those embedded in the device clock generator but without the SSCG feature

This selection is done thanks to the CA35SS_SSC_CHGCLKREQ register detailed in *Section 3.6*.

3.4 CortexA35 boot mode

The Cortex-A35 can execute code in either 32 (aarch32) or 64 (aarch64) architecture bit mode.

By default, the Cortex-A35 core boots in the aarch32 bit mode, but this can be changed through a specific procedure conducted by the boot ROM firmware as follows:

1. The core sets the AA64NAA32 bit and RVBARADDRL boot address in dedicated system configuration (CA35SS_SYSCFG) registers detailed in next section.
2. The core requests a warm reset through its internal reset management register in secure mode.
3. The core enters in WFI state.
4. Once this is effective, a warm reset is generated.
5. The core restarts in aarch64 bit mode from the address specified in CA35SS_SYSCFG_VBAR_CR register.

3.5 CA35SS SYSCFG registers

A set of dedicated registers allows the control on static configuration signals for the Cortex-A35 core and a few debug components. They are also controlling the Cortex-M33 core boot parameters as this one is under control of the Cortex-A35 at boot time.

These registers are detailed in the next section. Their address is an offset related to the CA35SS registers base address (refer to *Section 2.4.2*).

These registers have different security access rights that are described in the different following sub-sections along with their meaning.

3.5.1 System debug configuration registers

The following registers allow the programming of system debug registers. They are not reserved to a particular master, and as such, are not subject to access restrictions. They are reset only by a power-on reset.

CA35SS ETR low-power interface control register (CA35SS_SYSCFG_ETR_LPI_CR)

Address offset: 0x2000

Reset value: 0x0000 0001

This register controls the low-power interface of the embedded trace router.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ETR_CSYSREQ
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **ETR_CSYSREQ**:

0: Request ETR AXI bus to be stalled (csysreq is active low).

1: Request ETR AXI activity to resume.

CA35SS ETR low-power interface status register (CA35SS_SYSCFG_ETR_LPI_SR)

Address offset: 0x2004

Reset value: 0x0000 0000

This register returns the status of the low-power interface of the embedded trace router.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ETR_CSYSACK
															r

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **ETR_CSYSACK**:

0: ETR AXI transactions stalled

1: ETR AXI transactions not stalled

CA35SS STM non-secure guaranteed access register (CA35SS_SYSCFG_STM_NSGUAREN_CR)

Address offset: 0x2008

Reset value: 0x0000 0001

This register controls the STM behavior for non-secure accesses on its stimulus port.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STM_NSGUAREN
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **STM_NSGUAREN**:

0: Non-secure access is not guaranteed to be traced. The AXI write data channel does not stall when the STM is unable to trace the transaction immediately. The STM discards write data if it cannot be traced.

1: Non-secure access is guaranteed to be traced, that is the AXI write data channel stalls until the STM can emit the trace. This is obviously intrusive with respect to the real time.

CA35SS TPIU export clock divider register (CA35SS_SYSCFG_TRACE_CLK_DIV_CR)

Address offset: 0x200C

Reset value: 0x0000 0000

This register allows the trace port interface unit export clock trace (ck_ker_tpiu) to be reduced further to what is delivered at the flexible clock generator channel number 44.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRACE_CLK_DIV_VALUE[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **TRACE_CLK_DIV_VALUE[5:0]**:
0: Divider bypassed
0x1 to 0x3F: Divider ratio from 2 to 64

CA35SS Cortex-A35 core debug power mode register (CA35SS_SYSCFG_DBGPWR_CR)

Address offset: 0x2010

Reset value: 0x0000 0003

This register controls the power on Cortex-A35 debug resources by preventing any external debug to access a core that is powered down.

															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **DBGPWRUP0**:
0: Core 0 debug powered down
1: Core 0 debug powered up

CA35SS Cortex-A35 L1 data cache register (CA35SS_SYSCFG_DBGL1RSTDISABLE_CR)

Address offset: 0x2014

Reset value: 0x0000 0000

This register controls the behavior of the L1 data cache at processor reset. This can be used when debugging an external reset as this makes the contents of the L1 data cache from before the reset observable after the reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBGL1RSTDIS
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **DBGL1RSTDIS**:

0: Enable automatic invalidation of L1 data cache on reset.

1: Disable automatic invalidation of L1 data cache on reset.

CA35SS Cortex-A35 debug power register (CA35SS_SYSCFG_DBGPWR_SR)

Address offset: 0x2018

Reset value: 0x0000 0000

This register returns information on debug requests with respect to power management.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBGPWRUPREQ0	Res.	DBGNOPWRDWN0
													r		r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DBGPWRUPREQ0**:

0: Debug does not request that the core 0 is powered-up.

1: Debug requests that the core 0 is powered-up.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **DBGNOPWRDWN0**:

0: Debug does not request that the core 0 stays powered-up.

1: Debug requests that the core 0 stays powered-up.

CA35SS Cortex-A35 debug mode status register (CA35SS_SYSCFG_EDBGACK_SR)

Address offset: 0x201C

Reset value: 0x0000 0000

This register returns information on whether a core has entered in debug mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBGACK_C0
															r

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **DBGACK_C0**:
0: Core 0 is not in debug mode.
1: Core 0 is halted in debug mode.

3.5.2 Cortex-A35 subsystem configuration registers

These registers are used to modify the GIC setup, and to provide some information on Cortex-A35 states.

They are only accessible to a master with a CID = 1 (such as the Cortex-A35 or the debugger when Cortex-A35 debug is enabled). No secure or privilege rights apply to them.

These registers are reset by the power-on reset, the application reset or C1RST in the RCC.

GIC configuration register (CA35SS_SYSCFG_GIC_CFGR)

Address offset: 0x2020

Reset value: 0x0000 0000

This register allows the GIC to be used in a 64-Kbyte translation, so that the GICC register frame is spread across two MMU pages.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GIC_400_CFG_DISABLE	GIC_4KNOT64K
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **GIC_400_CFG_DISABLE**:
0: GIC400 secure registers can be written
1: GIC400 secure registers locked

Bit 0 **GIC_4KNOT64K**:
0: Use the GIC in a 64-Kbyte translation granule system.
1: Use the GIC in a 4-Kbyte translation granule system.

Cortex-A35 low-power status register (CA35SS_SYSCFG_LP_SR)

Address offset: 0x2024

Reset value: 0x0000 0000

This register returns information on low-power states for core and L2 cache.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

											r		r		r

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **STANDBYWFIL2:**
0: L2 memory system not in WFI low-power state
1: L2 memory system in WFI low-power state

Bit 3 Reserved, must be kept at reset value.

Bit 2 **STANDBYWFI_0**:
0: Core 0 not in WFI low-power state
1: Core 0 in WFI low-power state

Bit 1 Reserved, must be kept at reset value.

Bit 0 **STANDBYWFE_0**:
0: Core 0 not in WFE low-power state
1: Core 0 in WFE low-power state

Cortex-A35 reset status register (CA35SS_SYSCFG_RSTACK_SR)

Address offset: 0x2028

Reset value: 0x0000 0000

This register returns information on reset states.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NRESET_FCT_ACK	NRESET_DBG_ACK
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **NRESET_FCT_ACK**:
- 0: Functional reset active
- 1: Functional reset inactive

Bit 0 **NRESET_DBG_ACK**:
- 0: Debug reset active
- 1: Debug reset inactive

Cortex-A35 configuration register (CA35SS_SYSCFG_CP15_CFGR)

Address offset: 0x202C

Reset value: 0x0000 0000

This register configures the access to Cortex-A35 registers.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CP15_DISABLE_CORE_0
															r

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **CP15_DISABLE_CORE_0**:
- 0: access allowed
- 1: disable access to Cortex-A35 CP15 system control coprocessor core 0

3.5.3 Cortex-A35 boot configuration registers

These registers are used to modify the architecture state of the Cortex-A35 core. They are only accessible to the trusted master, thus protected by the TD_CID, with secure and

privilege rights. They are reset by the power-on reset, the application reset or C1RST in the RCC.

CA35SS architecture mode register (CA35SS_SYSCFG_AARCH_MODE_CR)

Address offset: 0x2080

Reset value: 0x0000 0000

This register forces the architecture mode at reset exit for the core. This is a write once register so that the architecture mode is locked.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	AA64NAA32
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **AA64NAA32**:
0: Cortex-A35 core boots in 32-bit mode.
1: Cortex-A35 core boots in 64-bit mode.

CA35SS reset vector register (CA35SS_SYSCFG_VBAR_CR)

Address offset: 0x2084

Reset value: 0x0000 0000

This register forces the reset vector base address in 64-bit mode. Its value is sampled when the core is released from reset. It is not applicable for 32-bit architecture mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RVBARADDRL[31:16]

RVBARADDRL[15:2]														Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		

Bits 31:2 **RVBARADDRL[31:2]:** Set the value of reset vector at the boundaries of the Cortex-A35 core.

Bits 1:0 Reserved, must be kept at reset value.

3.5.4 Cortex-M33 boot configuration registers

These registers are used to setup the boot configuration of the Cortex-M33. They are only accessible to the trusted master thus protected by the TD_CID.

CA35SS_SYSCFG_M33_ACCESS_CR register sets secure and/or privilege rights to access the Cortex-M33 boot options. It must be accessed with secure and privilege rights.

These registers are reset by the power-on reset or an application reset.

Cortex-M33 boot register access rights register (CA35SS_SYSCFG_M33_ACCESS_CR)

Address offset: 0x2088

Reset value: 0x0000 0003

This register sets up the access conditions on the boot options.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	M33CFG_PRIV	M33CFG_SEC
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **M33CFG_PRIV**:
0: Cortex-M33 boot option registers are accessed in non-privilege and privilege modes.
1: Cortex-M33 boot option registers are accessed in privilege mode only.

Bit 0 **M33CFG_SEC**:
0: Cortex-M33 boot option registers are accessed in non-secure and secure modes.
1: Cortex-M33 boot option registers are accessed in secure mode only.

Cortex-M33 secure extension enable register (CA35SS_SYSCFG_M33_TZEN_CR)

Address offset: 0x20A0

Reset value: 0x0000 0001

This register enables support for Armv8-M security extension in Cortex-M33.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

3.6 Standardized status and control registers

Another set of registers is implemented to control and monitor some features tightly coupled with the Cortex-A35 subsystem.

3.6.1 Standardized status and control registers (SSC) access modes

The SSC addresses offset are related to the CA35SS register base address (Refer to *Section 2.4.2*). There are four addresses for each SSC register.

Different actions are performed when writing the registers with each of the four addresses. Each register address is given in the ‘Address offset’ line by a formula such as: <reg_address> + 0x4 * x (x = 0 to 3), and additional information is given through the ‘Type’ line, for example RW, WS1, WC1, WT1:

- Writing data at address <reg_address> + 0x0 is a standard write of all data bits to all bits of the register.
- Writing data at address <reg_address> + 0x4 is a 'write set bit': all data bits at 1 set corresponding register bits to 1. Other register bits are unchanged.
- Writing data at address <reg_address> + 0x8 is a 'write clear bit': all data bits at 1 reset corresponding register bits to 0. Other register bits are unchanged.
- Writing data at address <reg_address> + 0xC is a 'write toggle bit': all data bits at 1 toggle corresponding register bits to their complementary value. Other register bits are unchanged.

Reading at any of the four addresses returns the register value to the extent that the secure access right defined for the register is matched. Otherwise, it returns zero when read.

3.6.2 SSC access types

The SSC registers are accessible only from a master with a CID = 1 (for example the Cortex-A35 or the debugger when Cortex-A35 debug is enabled). They can only be accessed in non-burst 4-byte mode. Any other access type is not authorized.

3.6.3 Secure/non-secure access to SSC

By default all SSC registers must be accessed in secure mode, but this can be changed as explained here below.

The global security control of SSC registers is achieved by setting one SSC register CA35SS_SSC_NS_ENABLE_0. This register as well as CA35SS_SSC_NS_ENABLE_1 can only be accessed in secure mode, in all cases.

For convenience, these two registers are called security registers.

Inside the SSC register set, each of all the other registers has a flag to control its accessibility from non-secure mode through CA35SS_SSC_NS_ENABLE_0. This security register is located at position 60 in the SSC register map. The registers associated with the bits are shown in table below:

Table 13. Mapping SSC registers to secure flag register

Register number	Address offset	Flag register	Flag register bit position
0	0x0000	CA35SS_SSC_NS_ENABLE_0	0
1	0x0010		1
...	...		...
31	0x01F0		31
60	0x03C0	Always treated as secure	
61	0x03D0		
62	0x03E0	Reserved	
63	0x03F0	Always treated as non-secure	

3.6.4 SSC registers details

CA35SS SSC CHGCLKREQ register (CA35SS_SSC_CHGCLKREQx)

Address offset: 0x000 + 0x4 * x (x = 0 to 3)

Type: RW, WS1, WC1, WT1

Reset value: 0x0003 0003

This register allows the selection of the Cortex-A35 clock.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ARM_DIVSELACK	ARM_DIVSEL
														r	rw

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ARM_CHGCLKACK	ARM_CHGCLKREQ
														r	rw

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **ARM_DIVSELACK**:
Defines if ck_cpu_ext2f clock is divided by 2 or not.
0: ck_cpu1_ext2f divided by two
1: ck_cpu1_ext2f not divided by two

Bit 16 **ARM_DIVSEL**:
Selects divider by 2 for ck_cpu1_ext2f clock.
0: Divide external clock ck_cpu1_ext2f by two.
1: Do not divide external clock ck_cpu1_ext2f.

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **ARM_CHGCLKACK**:
Indicates clock source.
0: Cortex-A35 clock is the PLL.
1: Cortex-A35 clock is the external device clock.

Bit 0 **ARM_CHGCLKREQ**:
Selects clock source.
0: Select internal PLL for Cortex-A35 clock.
1: Select external clock ck_cpu1_ext2f for Cortex-A35 clock.

CA35SS SSC BRM register (CA35SS_SSC_BRMx)

Address offset: 0x010 + 0x4 * x (x = 0 to 3)

Type: RW, WS1, WC1, WT1

Reset value: 0x0300 2000

When the core is in WFI and the L2 cache is idle, the binary rate multiplier (BRM) is automatically dividing the main clock of the Cortex-A35 and its derived clocks to save dynamic power. The clock division ends when the CPU or the L2 cache leaves its idle state.

This register configures the BRM of the Cortex-A35 clock (ck_cpu1_ext2f or ck_cpu1_ext2f/2 or Cortex-A35 PLL).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	BRM_IDLEDIV[1:0]		Res.	Res.	Res.	Res.	Res.	Res.	Res.	BRM_IDLEDIVEN

Res.	Res.	BRM_RATE[5:0]						Res.	Res.	Res.	Res.	Res.	Res.	BRM_RATEACK	BRM_RATEVAL
		rw	rw	rw	rw	rw	rw							r	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **BRM_IDLEDIV[1:0]**: BRM rate when idle mode is entered
Must not be modified when BRM_IDLEDIVEN = 1.
00: CPU clock = BRM clock input / 4
01: CPU clock = BRM clock input / 8
10: CPU clock = BRM clock input / 16
11: CPU clock = BRM clock input / 32

Bits 23:17 Reserved, must be kept at reset value.

Bit 16 **BRM_IDLEDIVEN**:
Defines BRM_RATE behaviour in idle mode.
0: BRM_RATE remains unchanged when the idle mode is entered.
1: BRM_RATE switches to the BRM_IDLEDIV when the idle mode is entered [CPU0(WFI or WFE) and CPU1(WFI or WFE) and L2 idle mode].

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **BRM_RATE[5:0]**: BRM rate in normal or idle mode when BRM_IDLEDIVEN = 0
1XXXXX: CPU clock = BRM input clock (default reset value)
0YYYYY: CPU clock = BRM input clock * (YYYYY / 32). YYYYY = 00000 is forbidden.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **BRM_RATEACK**: BRM_RATE status
0: BRM ready for a new setting
1: BRM new setting acknowledged

Bit 0 **BRM_RATEVAL**: BRM_RATE operation
0: BRM module is ready for a new setting.
1: Forces the BRM module to sample a new setting.

CA35SS SSC PLL FREQ1 register (CA35SS_SSC_PLL_FREQ1_x)

Address offset: 0x080 + 0x4 * x (x = 0 to 3)

Type: RW, WS1, WC1, WT1

Reset value: 0x0000 0000

This register configures the PLL for the Cortex-A35 clock (see *Section 20.4.5: PLL description* in the RCC for details).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	FBDIV[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:16 **FREFDIV[5:0]**: Reference divide value

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **FBDIV[11:0]**: Feedback divide value

CA35SS SSC PLL FREQ2 register (CA35SS_SSC_PLL_FREQ2_x)

Address offset: 0x090 + 0x4 * x (x = 0 to 3)

Type: RW, WS1, WC1, WT1

Reset value: 0x0000 0000

This register configures the PLL for the Cortex-A35 clock (see *Section 20.4.5: PLL description* in the RCC for details).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	POSTDIV2[2:0]			POSTDIV1[2:0]		
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:3 **POSTDIV2[2:0]**: PLL post divide 2 setting (1 to 7)
POSTDIV2 = 0 is unused.

Bits 2:0 **POSTDIV1[2:0]**: PLL post divide 1 setting (1 to 7)
POSTDIV1 = 0 is unused.

CA35SS SSC PLL enable register (CA35SS_SSC_PLL_ENx)

Address offset: 0x0A0 + 0x4 * x (x = 0 to 3)

Type: RW, WS1, WC1, WT1

Reset value: 0x0000 0004

This register configures the PLL for the Cortex-A35 clock.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NRESET_SWPLL	LOCKP	PLL_EN
													rw	r	rw

Bit 31 **EN_PLL_OBS**: PLL observation output status
0: PLL is not observable.
1: Enable PLL output observation in functional mode (PLL clock is divided by 42).

Bits 30:3 Reserved, must be kept at reset value.

Bit 2 **NRESET_SWPLL**: Clock switcher reset state
0: Clock switcher logic clocked by the PLL under reset
1: Clock switcher logic not in reset

Bit 1 **LOCKP**: PLLL lock state
0: PLL not locked
1: PLL locked

Bit 0 **PLL_EN**: PLL enable for Cortex-A35
0: PLL disabled
1: PLL enabled

CA35SS SSC LPI TSGEN NTS CR register (CA35SS_SSC_LPI_TSGEN_NTS_CRx)

Address offset: 0x0D0 + 0x4 * x (x = 0 to 3)

Type: RW, WS1, WC1, WT1

Reset value: 0x0000 0300

This register configures the low-power Interface for the trace time stamp asynchronous bridge used between the device timestamp generator and the Cortex-A35 PTM.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	TS_CSYSACK	TS_CSYSREQ	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
						r	rw								

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **TS_CSYSACK**: Timestamp asynchronous bridge power status
0: Timestamp asynchronous bridge powered down
1: Timestamp asynchronous bridge powered up

Bit 8 **TS_CSYSREQ**: Timestamp asynchronous bridge power request
0: Request timestamp asynchronous bridge to be powered down (csysreq is active low).
1: Request timestamp asynchronous bridge to be powered up.

Bits 7:0 Reserved, must be kept at reset value.

CA35SS SSC LPI STGEN NTS CR register (CA35SS_SSC_LPI_STGEN_NTS_CRx)

Address offset: 0x140 + 0x4 *x (x = 0 to 3)

Type: RW, WS1, WC1, WT1

Reset value: 0x0300 0000

This register configures the low-power interface for the time generator asynchronous bridge used between the system time generator (STGEN) and the Cortex-A35 internal timers.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **STGEN_CSYSACK**: STGEN asynchronous bridge power status
0: STGEN asynchronous bridge is powered down.
1: STGEN asynchronous bridge is powered up.

Bit 24 **STGEN_CSYSREQ**: STGEN asynchronous bridge power request
0: Request STGEN asynchronous bridge to be powered down (csysreq is active low).
1: Request STGEN asynchronous bridge to be powered up.

Bits 23:0 Reserved, must be kept at reset value.

CA35SS SSC OPP REQ register (CA35SS_SSC_OPP_REQx)

Address offset: 0x1A0+ 0x4 * x (x = 0 to 3)

Type: RW, WS1, WC1, WT1

Reset value: 0x0000 0000

This register allows to control the operating point change request and acknowledge for Cortex-A35. This register must be controlled with a specific sequence with other registers or peripherals such as V_{DDCPU} voltage and Cortex-A35 clock controls.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OPP_ACK	OPP_REQ
														r	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **OPP_ACK**: Operating point change request status
0: OPP_REQ not active or not acknowledged
1: OPP_REQ acknowledged

Bit 0 **OPP_REQ**: Request
0: Ddo not request an operating point change request to the Cortex-A35 subsystem.
1: Request an operating point change request to the Cortex-A35 subsystem.

CA35SS SSC memory control register (CA35SS_SSC_MEM_CTRLx)

Address offset: 0x1C0+ 0x4 * x (x = 0 to 3)

Type: RW, WS1, WC1, WT1

Reset value: 0x0000 0052

This register control the speed of memories inside Cortex-A35. This register must be controlled with a specific sequence with other registers or peripherals such as V_{DDCPU} voltage and Cortex-A35 clock controls.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RME	RM[2:0]		
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **RME**: Cortex-A35 Memory Read-Write margin enable.
0: default margin setting. Default for nominal Cortex-A35 frequencies.
1: margin setting from RM[2:0]. Recommended for overdrive Cortex-A35 frequencies.

Bits 2:0 **RM[2:0]**: Cortex-A35 memory Read-Write margin. Ignored if RME=0.
3: recommended value for Cortex-A35 overdrive frequencies.

CA35SS SSC NS enable 0 register (CA35SS_SSC_NS_E0Rx)

Address offset: 0x3C0 + 0x4 * x (x = 0 to 3)

Type: RW, WS1, WC1, WT1

Reset value: 0x0000 0000

This register controls the secure/non-secure setting of each mapped SSC register from 0x000 to 0x1F0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ALLOW_NONSECn**: SSC register security settings (n = 31 to 0)
Bit[n] configures the security settings of the SSC register at address 16 * n up to 0x1F0.
0: SSC register access is secure.
1: SSC register access is non-secure.

CA35SS SSC NS enable 1 register (CA35SS_SSC_NS_ENABLE_1)

Address offset: 0x3D0

Reset value: 0x8000 0000

This register returns the secure/non-secure setting of each mapped SSC register from 0x3C0 to 0x3F0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:28 **ALLOW_NONSEC_ROn**: SSC register security settings (n = 3 to 0)
Bit[n] indicates the security settings of the SSC register from 0x3C0 (bit 28) up to 0x3F0 (bit 31).
0: SSC register access is secure.
1: SSC register access is non-secure.

Bits 27:0 Reserved, must be kept at reset value.

3.6.5 CA35SS SSC register map

Table 14. CA35SS SSC register map and reset value

4 Arm Cortex-M33 (CM33SS)

4.1 Overview

The Cortex-M33 processor is based on the Armv8-M architecture.

The processor supports the following interfaces:

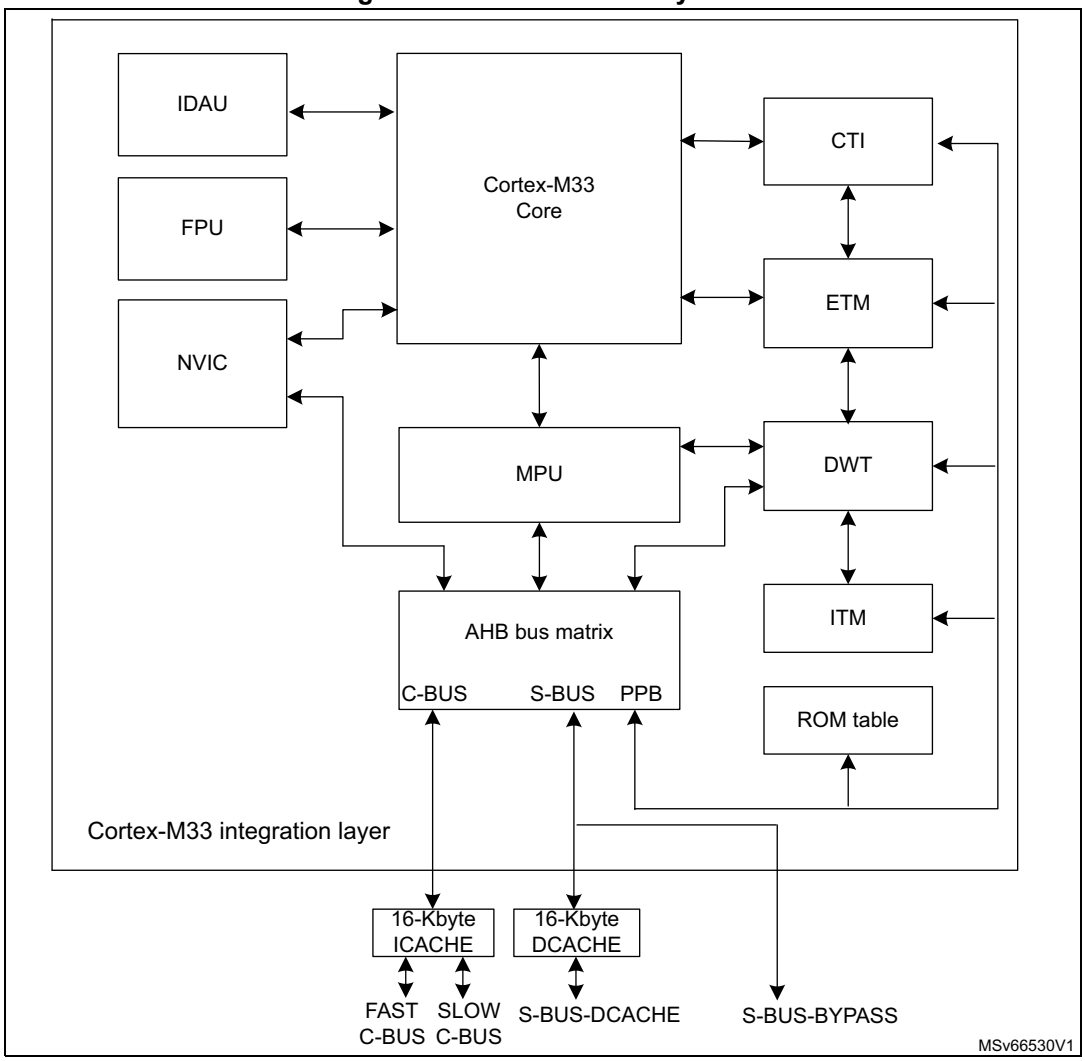
- Code AHB (C-AHB) interface
- System AHB (S-AHB) interface
- External PPB (EPPB) APB interface
- Debug AHB (D-AHB) interface

The STM32MP21xx implementation of the Cortex-M33 supports:

- the Armv8-M security extension
- the floating-point extension
- the Armv8-M DSP extension
- a nested vectored interrupt controller (NVIC) closely integrated with the processor with 320 interrupts and 16 levels of priority
- a memory system with memory protection unit (MPU) with up to 16 non-secure regions and 16 secure regions
- a security attribution unit (SAU) with up to eight regions
- an implementation defined attribution unit (IDAU)
- debug components including breakpoints (BPU), data watchpoints (DWT), instrumentation and processor trace (ITM/ETM), and cross trigger interface (CTI)

16-Kbyte instruction and 16-Kbyte data caches (ICACHE/DCACHE) are added respectively on C-AHB and S-AHB interfaces as shown in *Figure 6*.

Figure 6. Cortex-M33 sub-system



For information on the Arm Cortex-M33 core, refer to the Cortex-M33 r1p0 Technical Reference Manual available at http://infocenter.arm.com.

See *Section 17: Instruction cache (ICACHE)* and *Section 18: Data cache (DCACHE)* for more details.

The debug logic for the Cortex-M33 and its integration within the device are detailed in *Section 80: Debug support (DBG)*.

4.2 Cortex-M33 reset

There are different reset signals that apply to the Cortex-M33 subsystem.

The RCC allows some of them to be under control of the software. The following table indicates these different reset sources.

Table 15. Cortex-M33 reset sources

RCC register	Bit	Name	Description
-	-	POR	Device power-on reset (POR)
RCC_DBGCFGR	12	DBGRST	Reset the Cortex-M33 debug logic
RCC_C2RSTCSETR	0	C2RST	Reset all Cortex-M33 resources but the debug logic
-	-	SYSRESETREQ	Request for functional reset generated by AIRCR core register

4.3 Cortex-M33 clocking

A single clock for the Cortex-M33 system is provided from the device clock generator (ck_cpu2). This clock can be adjusted and gated automatically with respect to the low-power mode of the core.

The RCC feeds the Cortex-M33 system timer (SysTick) external clock with the core clock divided by eight. The SysTick can work either with this clock or directly with the Cortex-M33 clock configurable in the SysTick control and status register. The calibration value is unknown, and the software must compute it from the RCC registers setting up the Cortex-M33 clock.

4.4 Cortex-M33 boot mode

The Cortex-M33 can boot with the Armv8-M security extension ON or OFF depending on its input configuration signal CFGSECEXT is high or low.

This signal is driven from the M33_TZEN_CR register detailed in *Section 3.5.4: Cortex-M33 boot configuration registers*. Restriction applies when accessing this register to comply with security rules.

With the Armv8-M security extension ON, the Cortex-M33 uses two vector tables: one for the secure exceptions, and one for the non-secure exceptions. These vector tables are controlled from the Cortex-M33_INITSVTOR_CR and Cortex-M33_INITNSVTOR_CR registers detailed in *Section 3.5.4: Cortex-M33 boot configuration registers*.

4.5 Cortex-M33 configuration register

A system configuration register SYSCFG_M33SSCR detailed in *Section 3.5: CA35SS SYSCFG registers* is used to prevent changes to occur on SAU/MPU/Vector, and to mask FPU interrupts.

4.6 Memory protection unit (MPU)

The MPU defines the memory attributes for different memory regions. It provides up to 16 non-secure regions and 16 secure regions with the Armv8-M security extension on.

In particular, the cacheable memory regions are defined and programmed by the user in the MPU that is responsible for the generation of the AHB attribute signals for any transaction addressing a given region.

4.7 Floating point unit (FPU)

The Cortex-M33 supports a single-precision FPU that fully supports single-precision add, subtract, multiply, divide, multiply and accumulate, and square root operations. The FPU also provides conversions between fixed-point and floating-point data formats, and floating-point constant instructions.

The FPU can generate six different interrupts that are combined into a single interrupt connected to the NVIC. The SYSCFG_M33SSCR register allows the different FPU interrupts to be masked individually.

4.8 Attribution units

4.8.1 Security attribution unit (SAU)

The SAU is a programmable unit that determines the security of an address. The SAU is enabled when the Armv8-M security extension is on. It provides up to eight different regions, and a default background region.

At reset, before any SAU region is programmed and apart from specific region in the PPB space, all memories are set to secure state.

Secure (S)

Secure addresses are used for memory and peripherals that are only accessible by secure software or secure masters.

Non-secure callable (NSC)

NSC is a special type of secure location. This type of memory is the only type which an Armv8-M processor is used to hold an SG instruction that enables software to transition from non-secure to secure state.

Non-secure (NS)

The non-secure addresses are used for memory and peripherals accessible by all software running on the device. The non-secure transactions are only permitted to access non-secure addresses.

4.8.2 Implementation defined attribution unit (IDAU)

The IDAU provides a first memory partition as non-secure or non-secure callable attributes. Its memory-map partition is not configurable, and is fixed by hardware implementation as

shown in *Table 16*. It is then combined with the results from the SAU security attribution and the higher security state is selected.

Table 16. IDAU partitioning

Address range	Security attribution
0x00000000 - 0x07FFFFFF	Non-secure
0x08000000 - 0x0BFFFFFF	Non-secure
0x0C000000 - 0x0FFFFFFF	Secure/Non-secure callable
0x10000000 - 0x17FFFFFF	Non-secure
0x18000000 - 0x1FFFFFFF	Non-secure
0x20000000 - 0x2FFFFFFF	Non-secure
0x30000000 - 0x3FFFFFFF	Secure/Non-secure callable
0x40000000 - 0x4FFFFFFF	Non-secure
0x50000000 - 0x5FFFFFFF	Secure/Non-secure callable
0x60000000 - 0xFFFFFFFF	Non-secure

4.9 Nested vectored interrupt controllers (NVIC)

4.9.1 NVIC features

The NVIC includes the following features:

- 320 maskable interrupt channels
- 16 programmable priority levels (4 bits of interrupt priority)
- Low-latency exception and interrupt handling
- Power management control
- Implementation of system control registers

The NVIC and the Cortex-M33 core are closely coupled, which enables low-latency interrupt processing and efficient processing of late arriving interrupts.

All the interrupts including the Cortex-M33 core exceptions are managed by the NVIC. For more information on exceptions and NVIC programming, refer to Cortex-M33 technical documentation.

4.9.2 Interrupt and exception vectors

Refer to *Section 26: Interrupt list*.

4.10 Cortex-M33 memory interfaces

Fast C-BUS

This bus connects the C-AHB interface of the Cortex-M33 core to the device interconnect via the ICACHE master1 port. This bus is used for instruction fetch and data access to the memories mapped in code region.

Slow C-BUS

This bus connects the C-AHB interface of the Cortex-M33 core to the device interconnect via the ICACHE master2 port. This bus is used for instruction fetch and data access to memories mapped in code region.

S-BUS

This bus connects the S_AHB interface of the Cortex-M33 core to the device interconnect. This bus is used for instruction fetch and data access to the memories mapped in system region, and to access peripherals. The DCACHE located on this interface is bypassed for internal memories.

The following table shows the memory connectivity with respect to the different interfaces.

Table 17. Memory partitioning(1)

Target	Fast C_BUS	Slow C_BUS	S_BUS_BYPASS	S_BUS_DCACHE
SYSRAM	P	P	P	-
SRAM1	P	-	P	-
RETRAM	P	-	P	-
FMC	-	(2)	-	P
OCTOSPI	-	(2)	-	P
DDR	-	(2)	-	P
SOC peripherals	-	-	P	-

1. This matrix shows possible memory access (P) from the Cortex-M33 core, without consideration about security filtering or memory availability.
2. This implies using remap capability of the ICACHE master2 port.

5 System security

The STM32MP21xx devices are designed with a comprehensive set of security features, some of which being built on top of the standard Arm TrustZone technology.

This section explains the different security features available on these devices.

5.1 Key security features

- Resource isolation using privilege mode and Armv8-M mainline security extension of the Cortex-M33, extended to allocated I/Os, DMA channels, memories, and peripherals
- Resource isolation using privilege mode and Arm TrustZone security extension of the Cortex-A35, extended to allocated I/Os, DMA channels, memories, and peripherals
- For other masters than the Cortex-M33 and Cortex-A35, the STM32 resource isolation framework (RIF) can allocate peripherals, fixed-sized embedded memory blocks and variable-sized address space regions, under the control of security firmware.
- Boot ROM, supporting the download of boot image through USART, USB, serial NOR or NAND flash (via OCTOSPI), parallel NAND flash (via FMC), SD-card or *e*MMC (via SDMMC)
- Non-volatile storage (in BSEC), featuring:
  - ECC protected OTP words, one-time programmable
  - Redundancy protected OTP words, bit per bit programmable
  - Embedded lifecycle management (such as sticky lock, permanent lock, tamper mode)
- Secure storage, featuring:
  - Battery-powered volatile secure storage, automatically erased in case of tamper (8-Kbyte RAM, 128-byte registers)
  - Write-only key registers in the AES engines
  - Device 96-bit unique ID, readable via JTAG
  - Provisioning of AES wrapped keys in non-volatile storage (for example external flash memory), encrypted with unreadable device-unique keys derived from non-volatile hardware unique key (DHUK). These provisioned AES keys are never readable in the clear, are only usable on this device, and are only usable in the target AES accelerator (SAES, CRYP1, or CRYP2). If the application-defined volatile boot hardware key (BHK) is used in the wrapping, the provisioned AES keys are not usable after a tamper.
- General-purpose cryptographic acceleration:
  - Two cryptographic processors (CRYP1, CRYP2) supporting AES 256-bit and DES/triple DES with chaining modes ECB and CBC. CTR, GCM, and CCM chaining modes are also supported in AES mode.
  - Secure AES 128/192/256-bit security coprocessor, supporting ECB, CBC, CTR, GCM, and CCM chaining modes with side-channel counter-measures and mitigations. Using dedicated key bus, optional key sharing with faster CRYP1 or CRYP2, controlled by the SAES.

  - Two HASH processors (HASH1, HASH2) supporting SHA-1 checksum, SHA-2 secure hash (224, 256, 384 and 512) and six Keccak-based functions (SHA3-224, SHA3-256, SHA3-384, SHA3-512, SHAKE128, and SHAKE256).
  - Public key accelerator (PKA) for RSA/DH (up to 4096 bits) and ECC (up to 640 bits), implementing side-channel counter measures and mitigations when manipulating secrets.
  - Two true random number generators (RNG1, RNG2), NIST SP800-90B pre-certified
- On-the-fly encryption/decryption of external DDR-SDRAM memory region(s).
  - Any secure region can be encrypted, with an automatic key erase in case of tamper, with user option to select, per region, between enhanced robustness and faster performance.
- On-the-fly decryption of encrypted image stored on external flash memory connected through the OCTOSPI:
  - Almost-zero latency with standard NOR flash memories
  - Can be used to encrypt the image using device-unique secret keys
  - Automatic key erase in case of tamper
- Secure lifecycle management (secret provisioning, return material for analysis using customer-defined 128-bit key, debug deactivation)
- Secure software monitoring using independent watchdog 3 (for Cortex-M33) and independent watchdog 1 (for Cortex-A35)
- Active tamper and protection against temperature, voltage, and frequency attacks
  - 7 tamper inputs, 5 active tamper output pins, available in all power modes
  - Immediate erase of battery-backed volatile secrets on confirmed tamper detection

5.2 Secure boot

On an application reset, the Cortex-A35 always boots from the start of an on-chip ROM. This ROM code is used to authenticate and decrypt images loaded into the internal memory from an external flash memory, or through FMC, UART, USB, OCTOSPI, or JTAG.

The lifecycle state of the device is represented in the values of specific fuses. Transforming from one lifecycle state to the next always involves blowing fuses. The BootROM acts in accordance with what it finds to be the current lifecycle state.

Lifecycle states can be partitioned into two underlying categories: BSEC-open or BSEC-closed (refer to *Section 6.3.7: Lifecycle management* for more details). This is determined by hardware on every system reset by examining the state of the lifecycle fuses.

If the hardware determines at power-up that the device is BSEC-open, it immediately enables debug, and disables any access to fused secrets and secure parts of the ROM. This is referred to as non-secure boot. The device is in a BSEC-open lifecycle state at the start of manufacturing. It can be transformed back into a BSEC-open lifecycle state if there is a fault requiring the part to be returned for analysis.

If the hardware determines that the device is BSEC-closed, the debug remains disabled. The secure boot from ROM is then enforced, and the BootROM then consults additional fuses to determine the precise lifecycle state.

Devices are delivered to customers in a BSEC-closed state, so the BootROM execution is enforced.

On a BSEC-closed device, if the secure_boot fuse bit (see *Section 7: OTP mapping (OTP)*) is still unblown, then the BootROM behavior depends on the BOOTx pin:

- If the BOOTx pins are set to "development boot", the BootROM disables the access to secrets, and opens the debug to allow customer development.
- If the BOOTx pins are not set to "Development boot", the BootROM executes the boot image regardless of whether it is correctly signed.

BOOTx pins should be set to 0011 or 1010 for "development boot" mode (see datasheet boot sources table).

However, on a BSEC-closed device, once the secure_boot fuse bit is blown, authenticated secure boot is enforced.

STMicroelectronics supplies signing tools to allow customers to create signed and encrypted boot images. The boot image is sometimes referred as an FSBL (first-stage bootloader), or as an uRoT (updatable root-of-trust firmware).

5.3 Secure provisioning

ST supplies customers with an RSSe (Root Security Services extension) code image to implement SFI (secure firmware install) functionality. The BootROM authenticates this RSSe code with a hard-coded public key. ST also provisions an ST-certified device-unique key pair into fuses. When customers receive the device, they can boot the supplied SFI image to securely provision their own keys into fuses. The BootROM uses these keys, whenever it boots, to authenticate and decrypt the customer boot images. The ST-certified device-unique key pair ensures that this provisioning process is secure and counted. This protects against cloning.

The BootROM supports up to eight irreversible revocations of firmware signing keys.

The boot image header contains a constant decrypted by the BootROM using the provisioned firmware encryption key. This derived key is used to decrypt the actual image.

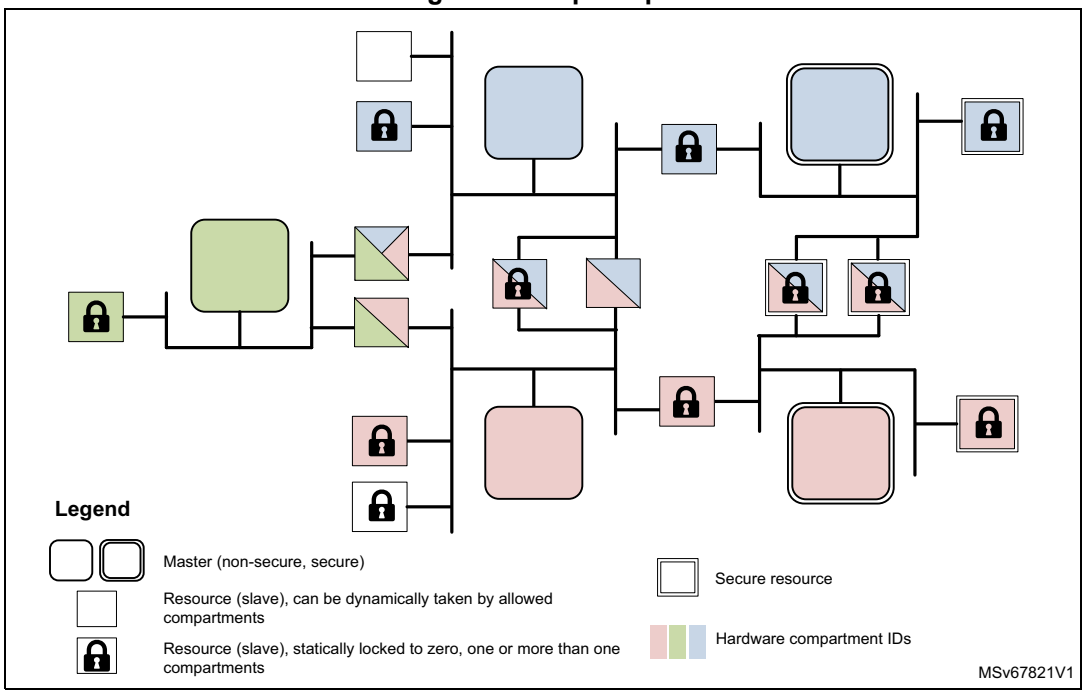
5.4 Resource isolation framework (RIF)

The resource isolation framework (RIF) is a comprehensive set of hardware blocks designed to enforce and manage the isolation of STM32MP21xx hardware resources, like memory and peripherals.

Application software can use RIF to assign hardware resources to dedicated processing environments that are isolated from each other using hardware isolation boundaries. Within these environments masters are assigned to a security domain and can be secure, non-secure, running privileged or unprivileged code, executing from a CPU, an MCU, or a complex hardware subsystem like a multimedia engine.

RIF-protected resources are assigned at boot time (and subsequently locked) or assigned at run-time. Some RIF-protected resources are exclusively assigned, some are shared, and some are unassigned, as shown in *Figure 7*.

Figure 7. RIF principle

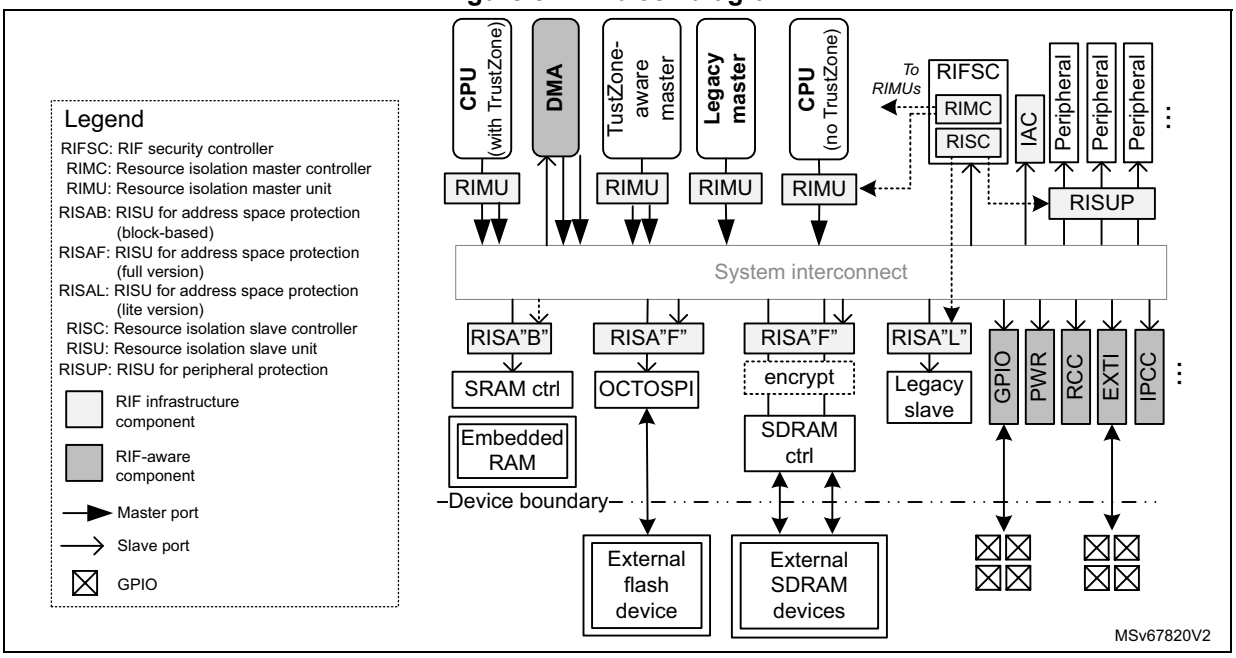


Note: In the RIF, a security domain corresponds to a triplet (privilege, secure, compartment ID).

5.4.1 RIF security architecture

The resource isolation framework (RIF) is typically implemented as described in the figure below.

Figure 8. RIF block diagram



The core components constituting the RIF are summarized below, and in *Table 18*:

- RIMU (resource isolation master unit) are components associated to masters
- RISU or RIS (resource isolation slave unit) are components associated to slave targets
  - filtering accesses to fixed-sized embedded memory blocks (RISAB), or variable sized address space regions (RISAF, RISAL)
  - filtering accesses to each peripheral (RISUP)
- The RIFSC (RIF security controller) registers contains the following blocks:
  - RIMC (resource isolation master controller) configures the RIMU components.
  - RISC (resource isolation slave controller) configures the RISUP and RISAL components.
- The IAC (illegal access controller) concentrates all illegal access events managed through the RIF framework (see *Section 5.4.9*)

When a peripheral needs a finer-grained filtering (like DMA, GPIO, or RTC), it becomes **RIF-aware**, implementing the needed resource isolation policy within itself (see *Section 5.4.8*).

Table 18. Overview of RIF core components

-	RIFSC			RISAF	RISAB
	RIMU	**RISUP**	**RISAL**		
Affecting target	Initiator	Target			
Resource type	Fixed		Variable		Fixed
	Master port	Peripheral	Address space regions		Memory block
Access filtering	N/A	Privilege, secure, compartment ID			
Read/write filtering		No		Yes	
Special feature		Semaphore	N/A	Delegation	

Refer to the following sections for more details:

- *Section 8: Resource isolation framework security controller (RIFSC)*
- *Section 9: Resource isolation slave unit for address space protection (block-based) (RISAB)*
- *Section 10: Resource isolation slave unit for address space protection (full version) (RISAF)*

As shown on *Table 18*, the access filtering can be, depending on the case:

- restricted to none, one or more than one hardware compartment IDs
- secure-only, non-secure only, or both
- privileged-only or privileged/unprivileged
- read-only, write-only, or read/write

Depending on the device, a couple of special features are available:

- in-built hardware semaphores to dynamically change ownership of resources
  - This method is also available for GPIOs, DMA channels, as well as control of power, clock, and reset (in RCC and PWR).

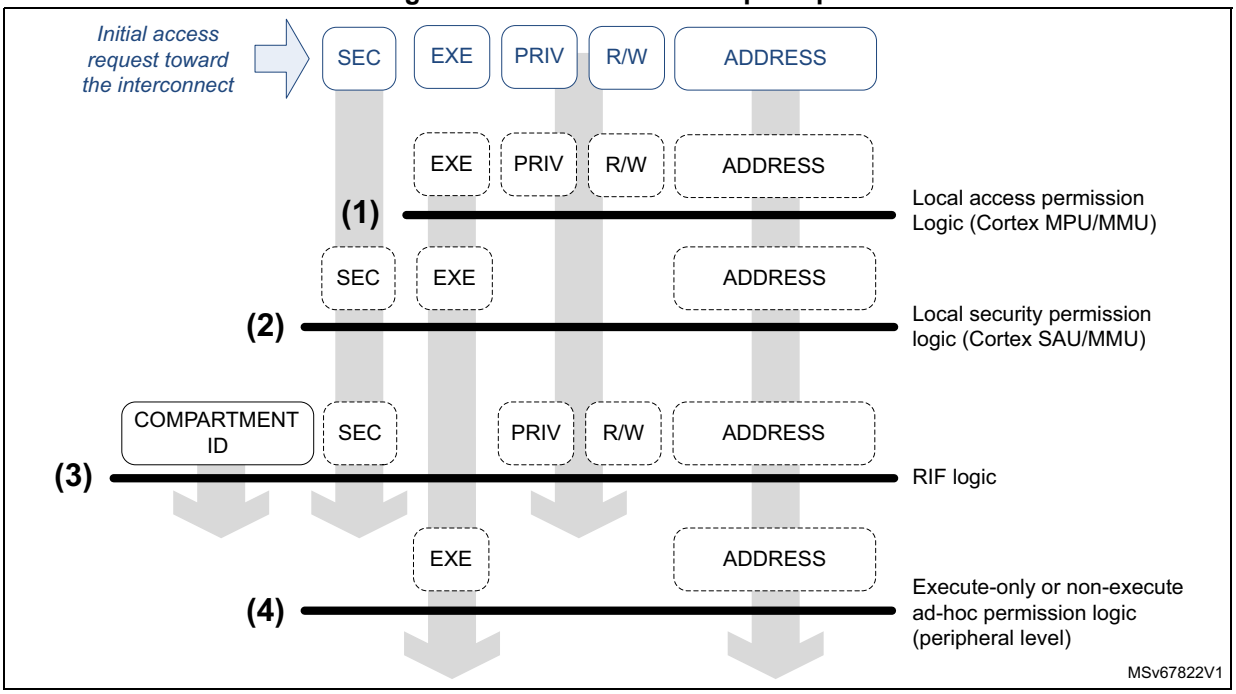
- delegation of resource isolation configuration software (from trusted domain) to the processing environment that owns the resource

Any RIF configuration of a resource can be locked at boot time.

5.4.2 RIF access control

The RIF access control principle is outlined in the figure below.

Figure 9. RIF access control principle



For Arm Cortex processors, each access to an hardware resource goes through the following steps:

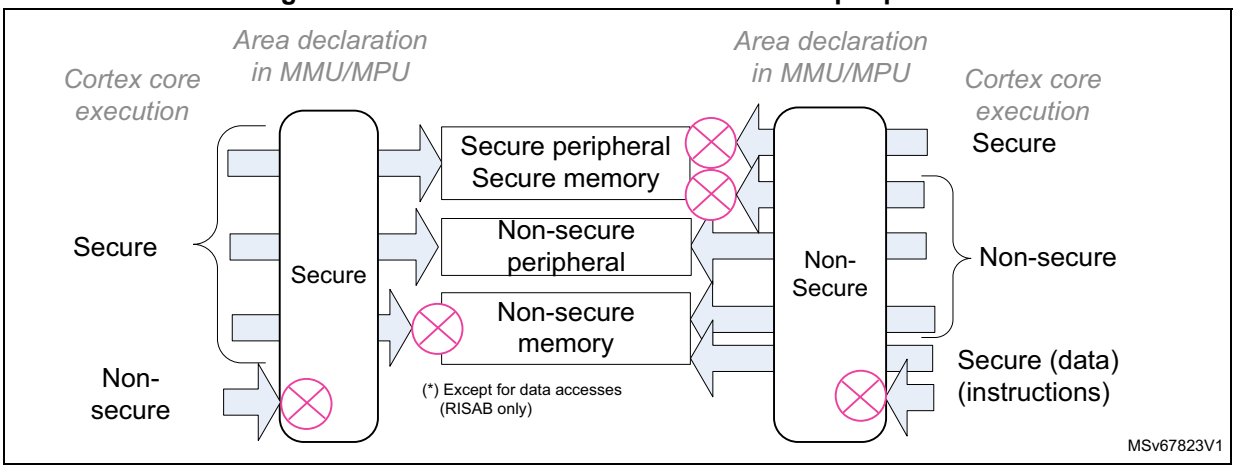
1. Within the cores, the MPU or MMU performs filtering based on privilege, execute, and read/write criteria.
2. Still within the cores (when TrustZone is supported), a secure/non-secure access control is done, sometimes taking into account whether access is instruction or data.
3. The RIF verifies that the access is granted based on the compartment ID of the access initiator. Additional controls based on secure and privileged properties are also performed. Read/write extra control is supported for some RIF resources (such as embedded memory pages).
4. Finally, some resources performs extra-filtering like no-execute on banks of registers.

Accessing secure memories and peripherals

An application executing in non-secure state can only access non-secure memories and peripherals. An application executing in secure state can access both secure and non-secure memories and peripherals.

In the latter case, there is an important rule to follow: A secure application must access a non-secure memory or peripheral through a non-secure alias in the MMU/MPU table, as explained in *Figure 10*.

Figure 10. Accesses to secure memories and peripherals



More specifically, when a secure application wants to write data to the non-secure world, the secure data access is transformed automatically by the core into a non-secure data access, as the target region is mapped into a non-secure space in the MMU (Cortex-A) or SAU/IDAU (Cortex-M).

Note: This secure to non-secure conversion is also supported by the DMA, under the supervision of a secure application.

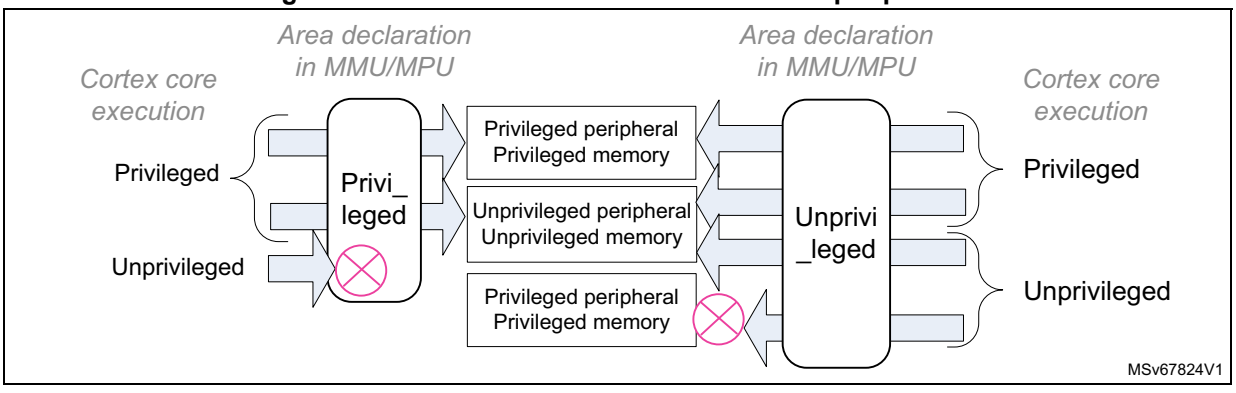
The RISAB supports the option of deactivating the secure read/write illegal access to non-secure memory (see SRWIAD bit in RISAB_CR).

Mapping peripherals in two address spaces (secure and non-secure) is optional for Cortex-A.

Accessing privileged memories and peripherals

An application executing in unprivileged state can only access unprivileged memories and peripherals. An application executing in privileged state can access both privileged and unprivileged memories and peripherals. Unlike with security, a privileged application can always access an unprivileged memory or peripheral, as shown in the figure below.

Figure 11. Accesses to secure memories and peripherals



5.4.3 Application interrupt management in RIF

As shown on *Figure 7*, a secure application can allocate or deallocate any resource to any compartment thanks to the RIF. The interrupt infrastructure between peripherals and CPU/MCUs must take into account this flexibility, with each compartment being able to see only the interrupt events of the resources allocated to its CPU/MCU.

Figure 12 and *Table 19* describe the various interrupt management options in a dual-CPU context.

Note: When the compartment filtering is disabled (CFEN = 0), the interrupts are broadcasted to all CPU/MCUs. When a peripheral is not allocated to any compartment (CFEN = 1, SEM_EN = 1, and SEM_MUTEX = 0), no CPU/MCUs receive interrupts from this peripheral.

Figure 12. RIF interrupt connection types

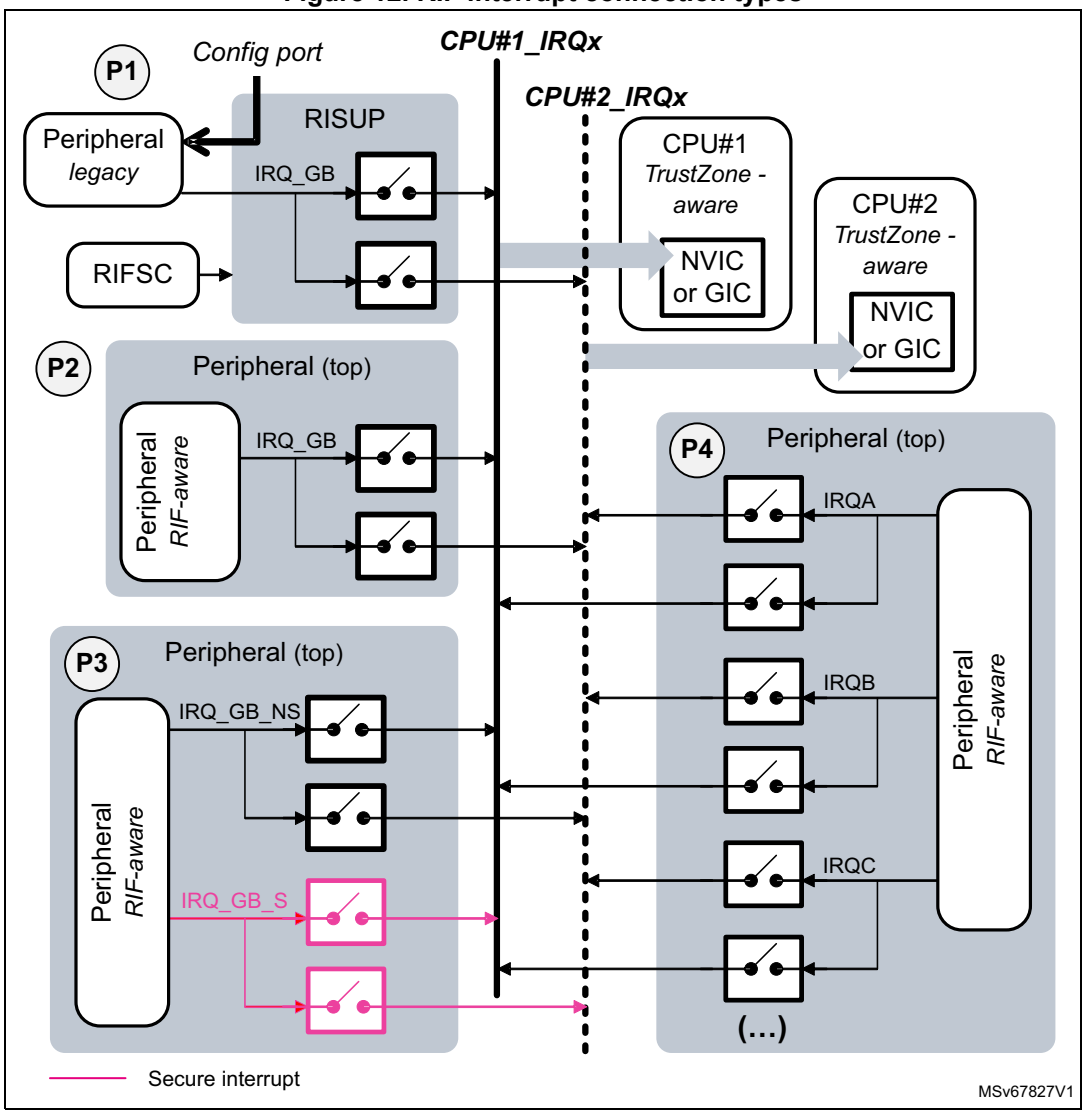


Table 19. Interrupt connection types

Peripheral type	RIF aware(1)	Global IT(2)	Secure/ non-secure IT	Interrupt events destination
P1	No	Yes	No	The allocated CPU, for all events (secure and non-secure)
P2	Yes			
P3			Yes	
P4	Yes(3)	No	No	The CPU concerned by its specific events (secure or non-secure, according to event resource setup)

1. If yes, the peripheral is RIF-aware. It manages resources that are associated to more than one CID.
2. If yes, a single interrupt line captures all the interrupt events.
3. Any interrupt status bit in this peripheral must be readable only by the correct CPU in the correct security and privileged mode.

Note: The debug domain does not manage interrupts.

5.4.4 RIF illegal access definition

When RIF access control is enforced, illegal access events are defined in following tables.

Table 20. Access-type definitions for Arm TrustZone cores

Processing environment	Core access	MPU(1)/MMU setup	Access type
Secure	Data	Secure	Secure
		Non-secure	Non-secure
	Instruction	Secure	Secure
		Non-secure	Denied(2)
Non-secure	Data	Secure	Denied(2)
		Non-secure	Non-secure
	Instruction	Secure	Denied(2)
		Non-secure	Non-secure

1. Actual configuration in Cortex-M33 is done as a mix of programmable SAU and fixed IDAU.
2. A fault is triggered within the core.

Table 21. RIF illegal access definitions (security)

Access type (see *Table 20*)		Memory resource		Peripheral resource	
		Secure	Non-secure	Secure	Non-secure
Secure	Data	OK	Silent fail(1)(2)	OK	OK
Non-secure		Silent fail(2)	OK	Silent fail(2)	OK
Secure	Instruction	OK	Bus error	Bus error	Bus error
Non-secure		Bus error	OK	Bus error	Bus error

1. Always OK for debug domain. Configurable as OK for any compartment if SRWIAD = 1 in RISAB_CR.
2. Secure illegal access event, also triggered toward the IAC.

Table 22. RIF illegal access definitions (privilege)

Access type (see *Table 20*)		Memory resource		Peripheral resource	
		Privileged	Unprivileged	Privileged	Unprivileged
Privileged	Data	OK	OK	OK	OK
Unprivileged		Silent fail(1)	OK	Silent fail(1)	OK
Privileged	Instruction	OK	OK	Bus error	Bus error
Unprivileged		Bus error	OK	Bus error	Bus error

1. Privileged illegal access event, also triggered toward the IAC.

Table 23. RIF illegal access definitions (compartments)

Access type		Memory resource		Peripheral resource	
		CID1	CID2	CID1	CID2
CID1	Data	OK	Silent fail(1)	OK	Silent fail(1)
CID2		Silent fail(1)	OK	Silent fail(1)	OK
CID1	Instruction	OK	Bus error(1)	Bus error	Bus error
CID2		Bus error(1)	OK	Bus error	Bus error

1. Compartment illegal access event, also triggered toward the IAC.

As shown in *Table 20*, for a core executing in a TrustZone secure processing environment, the memory and peripheral resources must be mapped into a secure space.

A silent fail is defined as read as zero (for data reads) and write ignored (for writes). An illegal access signaling to the IAC usually also occurs (see *Section 5.4.5*).

A bus error is defined as read as zero and generation of an error on the system bus, so that the Cortex core can get the fault address. Bus errors do not raise any error flags in the device.

Note: A read as zero (RaZ) answer to an illegal instruction fetch also generates an HardFault in Cortex cores, because when decoding all-zero instruction code, the core triggers an HardFault exception.

Events not generating an illegal access

When a valid access tries to read (resp. write) to a read-only (resp. write-only) register protected by RIF, the access is denied (RaZ/write ignored), without the generation of an illegal access.

During a register read (resp. write) access, if at least one bitfield is not read (resp. write) xx-protected, meaning that at least one bitfield can be read (resp. written), then the output signal xx_ilac is not asserted (xx = sec, priv or cid).

For legacy peripherals protected by RISUP, no compartment access error is triggered when the semaphore is taken via one of RISC_PERy_SEMCR registers, unless the compartment of this access is not part of the white-listed compartments.

5.4.5 Managing illegal accesses with RIF

The RIF components do not use the standard interrupt lines toward NVIC or GIC concentrators. The IAC, captures all RIF interrupt events, called illegal access events.

Such events are triggered in the following cases:

- illegal access to a RIF protected resource because of security
- illegal access to a RIF protected resource because of privilege
- illegal access to a RIF protected resource because of bad CID

See *Section 11: Illegal access controller (IAC)* for more information on the way illegal accesses are managed.

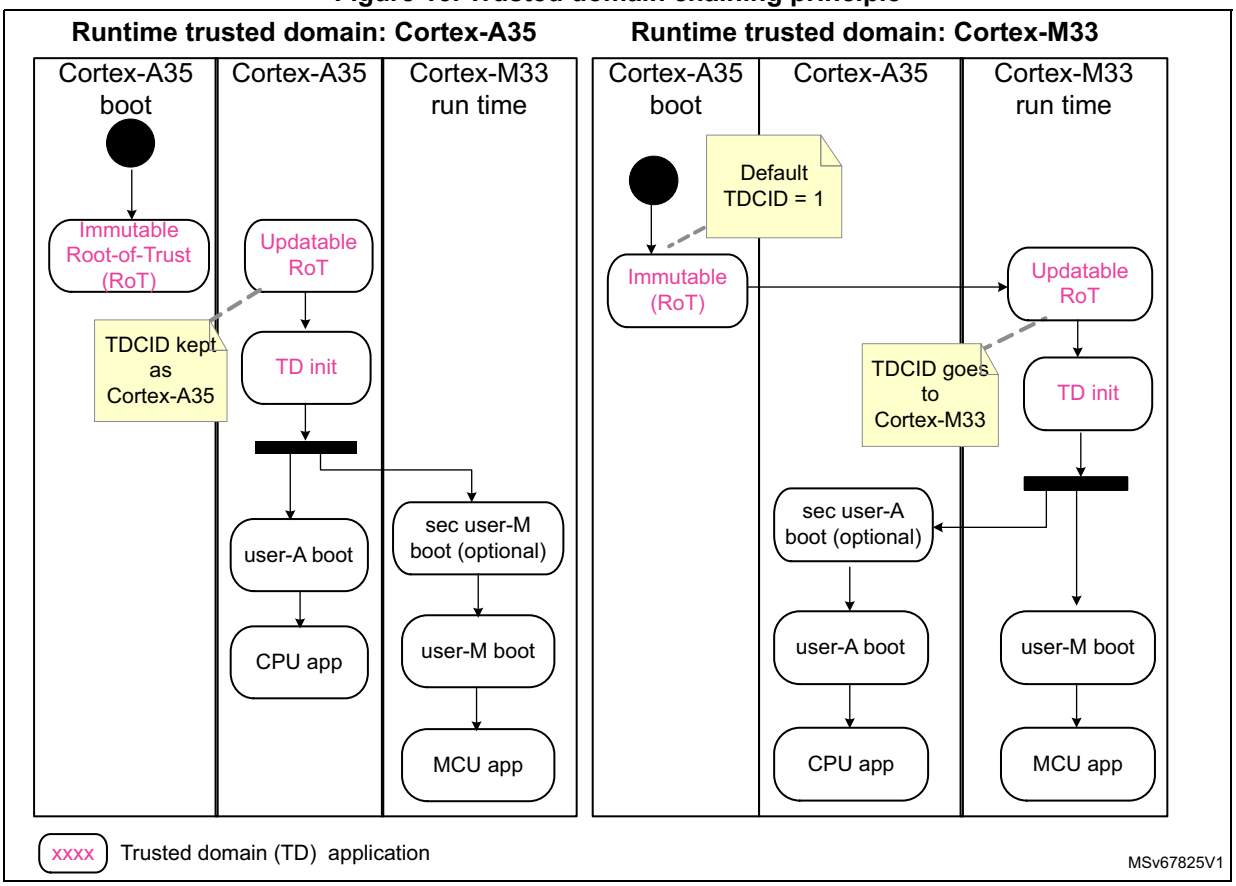
5.4.6 RIF special security domain: trusted domain

In the RIF, a master with a security domain that equals to secure, privileged, and CID = TDCID, is part of a special domain called the trusted domain. Such a master is initialized as part of the trusted boot in order to manage the critical RIF configuration.

The trusted domain compartment TDCID is fixed by default to 0x1, and is stored in RIMC_CR. The default TDCID corresponds to the boot ROM executing on Cortex-A35.

The devices support two trusted domain scenarios, shown in the figure below.

Figure 13. Trusted domain chaining principle



In the first scenario, a typical chain of trust executes on the default trusted CPU (Cortex-A35 secure privileged). In the second scenario, after securely installing MCU firmware in the embedded SRAM, the Cortex-A35 transfers the trusted domain ownership to the Cortex-M33 secure privileged, by setting TDCID = 0x2 in RIMC_CR.

Note: A TDCID transfer is possible only once.

5.4.7 RIF special security domain: debug domain

In the RIF, a privileged master with CID = DDCID, is part of a special domain called the debug domain. Such a master (usually a DAP peripheral) is initialized as part of the trusted boot to manage the debugging of a RIF protected device.

Note: In the STM32MP21xx devices, DDCID is fixed to value 0x7.

The debugging tools with debug domain access rights (privileged, DDCID) can access to all peripheral and memory resources in the device, if their security level is sufficient.

More specifically:

- Non-secure debug domain can only access peripherals and memories that are tagged by application as non-secure.
- Secure debug domain can read and write anywhere in the device, including registers reserved to the trusted domain.

Note: The debug domain master is always privileged.

When the debug domain is activated, DDEN = 1 in RIMC_CR. It is always activated in STM32MP21xx devices.

The debugging tool access right setup by trusted application is detailed in *Section 6.3.11: BSEC debug and trace control*. For more information on RIF debug access port security, see *Section 8: Resource isolation framework security controller (RIFSC)*.

5.4.8 Managing security in RIF-aware peripherals

The resources isolated by the RIF core framework defined in *Section 5.4.1* are peripherals, fixed-sized embedded memory blocks, and variable-sized address space regions.

As a RIF framework extension, additional resources are available in this device (see corresponding sections for more details).

- central DMA channels (see HPDMA)
- reset and clock control (see RCC)
- power control (see PWR)
- general purpose I/Os (see GPIO)
- real-time clock and tamper/backup registers (see RTC and TAMP)
- inter-processor communication controller (IPCC)
- flexible memory controller (FMC)
- system configuration controller (SYSCFG)
- extended interrupts and event controller (see EXTI)

5.4.9 Activating RIF security

RIF state following a system reset

After a general reset (POR, power-on reset), all non RIF-aware peripherals become non-secure and unprivileged (RISC_SECCFGRx and RISC_PRIVCFGRx are zeroed).

For embedded SRAM protected by RISAB (resp. RISAL), default values are defined in *Section 9.3: RISAB implementation* (resp. *Section 8.3: RIFSC implementation*).

Address spaces protected by RISAF are by default secure, privileged, and TDCID only.

Note: Out-of-reset compartment-based filtering is bypassed only for peripherals and for memories protected by RISAB.

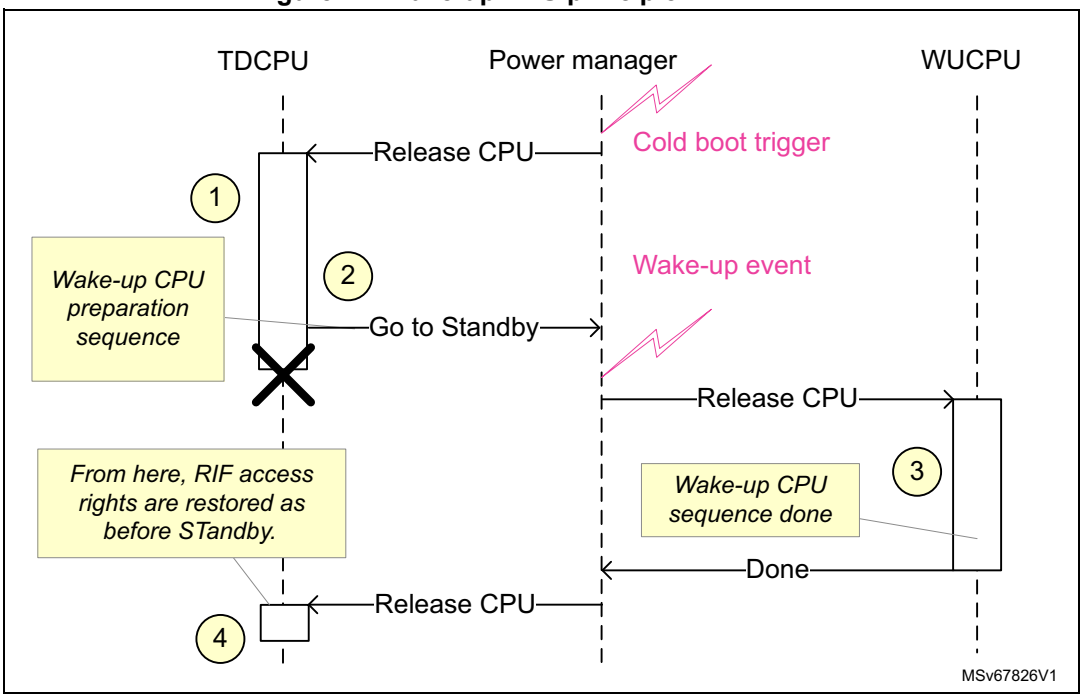
RIF wake-up from standby

When the device leaves the Standby state (see PWR), the RIF allows the Cortex-M33 to execute a RIF restoration sequence, temporarily upgrading CID = 0x2 as TDCID in RIFSC_RIMC.

Note: When the wake-up CPU option is enabled, the TDCID information out of reset from RIFSC is not RIFSC_RIMC_CR default value 0x1 (Cortex-A35), but the wake-up CID value 0x2 (Cortex-M33).

A typical wake-up CPU sequence is described in the figure below.

Figure 14. Wake-up CPU principle



The main steps are detailed below:

1. The trusted CPU executes following a cold boot trigger. The RIF is properly initialized while the applications are installed in the device.

2. The trusted CPU configures the device to allow the Cortex-M33 to quickly restore the context that is lost in Standby state. Following steps are expected:
   – Store restoration firmware in RETRAM, writing reference CRC in RAMCFG.
   – Set up wake-up event mode in the RCC, and adapt the EXTI2 configuration accordingly. The trusted domain also sets in the RCC, the necessary configuration to have wu_cpuen signal to RIFSC set.
   – Enable automatic CRC and ECC protection in RAMCFG.
3. When a wake-up event occurs, the Cortex-M33 executes restoration firmware stored in the RETRAM, if CRC is correct and if no double-error detection (DED) occurred on the RETRAM. By hardware, WUCEN is also set in RIMC_SR. At the end of the restoration sequence, the Cortex-M33 sets WUCDONE in RIMC_CR. The TDCID value goes back to the original one, stored in RIMC_CR.
4. The power manager releases the CPUs to wake up. The device is fully functional.

5.4.10 Programming of RIFSC, RCC and IAC

In order to properly program the RISUP and the RCC, and to read back illegal access information in the IAC, refer to the peripheral index tables (in *Section 8.3: RIFSC implementation*), as follows:

- When an illegal access occurs, the secure privileged application running in the trusted domain can find the source of the error using the given index x:
  – IAIEx bit to set/clear in IAC_IER
  – IAFx bit to read (resp. write) in IAC_ISR (resp. IAC_ICR)
- For legacy peripherals protected with RISUP (that is, all peripherals in *Table 38: Indexes for non-RIF-aware peripherals (RISUP)*, without footnote #2 or #3), the index x provides the following extra information:
  – SECx bit to set/clear in RISC_SECCFGR
  – PRIVx bit to set/clear in RISC_PRIVCFGR
  – RLOCKx bit to set in RISC_RCFGLOCKR
  – which RISC_PERx_CIDFGR to use: offset = 0x100 + 0x8 * x
  – which RISC_PERx_SEMCR to use: offset = 0x104 + 0x8 * x
  – which RCC register to use for clock enable and reset: offset = 0x700 + 0x4 * x
- For the local resources protected in RIF-aware RCC peripheral, the index y (RCC index) provides the following extra information:
  – SECy bit to set/clear in RCC_SECCFGR
  – PRIVy bit to set/clear in RCC_PRIVCFGR
  – RLOCKy bit to set in RCC_RCFGLOCKR
  – which RCC_RyCIDFGR to use: offset = 0x030 + 0x8 * y
  – which RCC_RySEMCR to use: offset = 0x034 + 0x8 * y

6 Boot and security control (BSEC)

6.1 Introduction

The boot and security control (BSEC) peripheral manages the accesses to an embedded one time programmable (OTP) array of fuses. Those fuses are used to store on-chip, non-volatile data like boot and security parameters.

Embedded non-volatile secrets are stored in BSEC upper area that is only accessible while BSEC is operating in its BSEC-closed state. When the BSEC state is BSEC-open, those non-volatile secrets are permanently hidden.

BSEC usage is reserved to the trusted domain CPU, but it can also be accessed by the boot CPU ROM code following a BSEC reset (cold/warm or hot). In addition, the non-trusted CPU can access its own HDPL registers.

Note: In this section, boot CPU refers to the Cortex-A.

6.2 BSEC main features

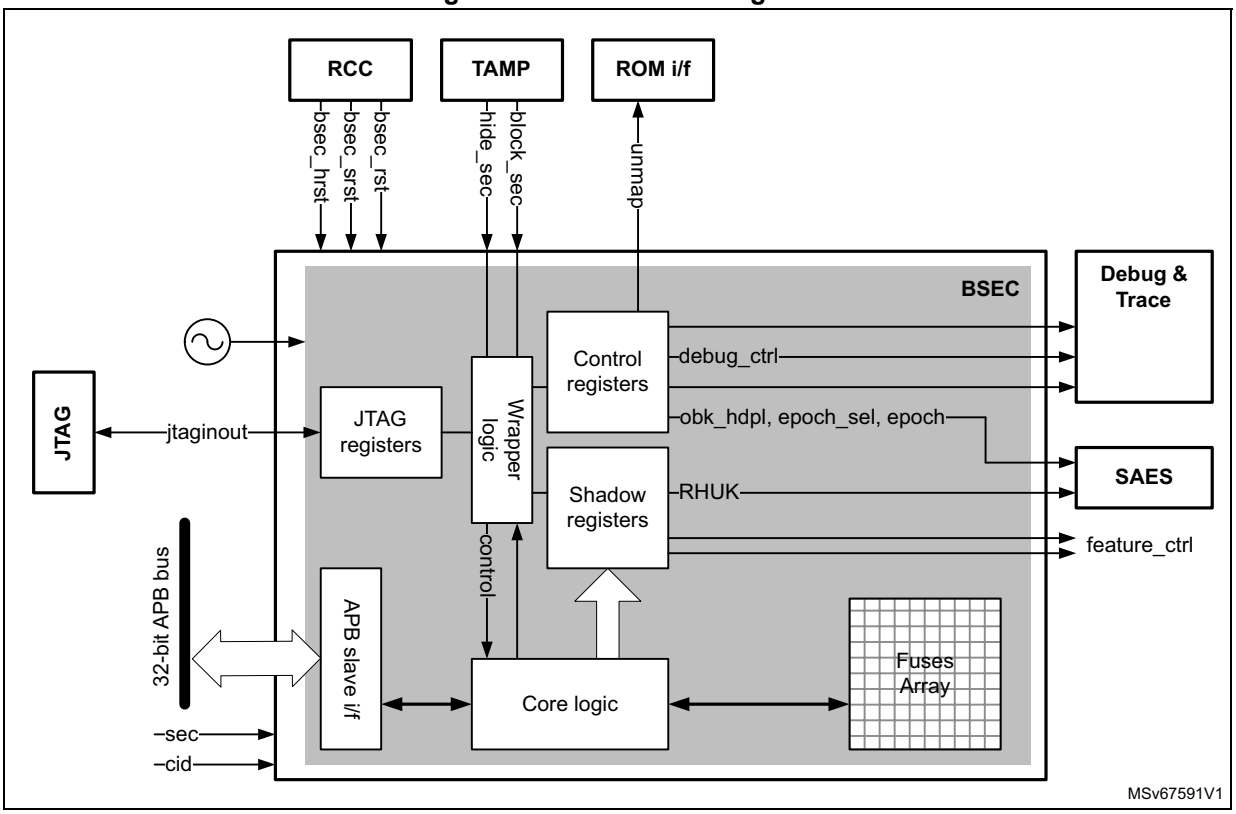
- APB peripheral, accessible through 32-bit word accesses only.
- 12 Kbits of OTP (effective)
  - 4096 lower OTP bits, bitwise (1-bit) programmable
  - 4096 middle OTP bits, bulk (32-bit) programmable
  - 4096 upper OTP bits, bulk (32-bit) programmable, only accessible when BSEC is in the BSEC-closed state.
- Reading and programming of OTP fuses, with detailed status reporting
- Shadowing in register flops of predefined fuse words, loaded at BSEC cold and warm resets. Shadow fuse registers are writable unless write locked until next BSEC cold or warm reset.
- Locking of OTP word programming, permanently or until next BSEC cold and warm resets. Option of global programming lock until next BSEC cold and warm reset.
- Read locking of fuse words (word granularity) until next BSEC cold or warm reset
  - Locked shadowed words cannot be reloaded from the fuse array (fixed value)
  - Locked unshadowed words read as 0.
- Device lifecycle management.
  - Read as 0 of upper fuse words (including RHUK) when STMicroelectronics engineering modes are enabled (BSEC-open state).
  - Possibility to go to BSEC open state using a 128-bit password (four trials).
  - Non-volatile key storage revocation counter (epoch).
- Four 32-bit scratch registers to store values persistent across device warm reboot.
- IN and OUT 32-bit registers to communicate information with external agent via JTAG.
- Multi-core debug and trace lifecycle management, with global configuration locking until next BSEC reset.
- Monotonic hide protection level counters allowing temporal isolation of keys and debug ability for each core.
- Support for TrustZone® and STM32 resource isolation framework (RIF).
- Non-volatile storage of randomly generated 256-bit root hardware unique key (RHUK), directly delivered to SAES peripheral. This key is never readable by any software, and it can be zeroed until next BSEC cold or warm reset.

6.3 BSEC functional description

6.3.1 BSEC block diagram

Figure 15 shows the BSEC block diagram.

Figure 15. BSEC block diagram



6.3.2 BSEC internal signals

Table 24 describes the user relevant internal signals interfacing the BSEC peripheral.

Table 24. BSEC internal input/output signals

Signal name	Signal type	Description
bsec_rst	Digital input	BSEC cold/warm resets from RCC (see *Section 6.3.17*).
bsec_srst		
bsec_hrst		BSEC hot reset from RCC (see *Section 6.3.17*).
jtaginout	Digital input and output	Interface to JTAG, including clock and reset.
hide_sec	Digital input	Set by TAMP in case of confirmed tamper (see *Section 6.3.17*).
block_sec	Digital input	Set by TAMP in case of potential tamper (see *Section 6.3.17*).
rhuk	Digital output	256-bit root hardware unique key output to SAES peripheral.

Table 24. BSEC internal input/output signals (continued)

Signal name	Signal type	Description
obk_hdpl	Digital output	Control outputs to SAES peripheral to influence generation of DHUK.
epoch_sel epoch	Digital output	Control outputs to SAES peripheral to influence generation of DHUK.
debug_ctrl	Digital output	Device debug and trace control signals (see *Section 6.3.11*).
feature_ctrl	Digital output	Device feature control signals (see *Section 6.3.12*)

6.3.3 BSEC reset and clocks

BSEC flops on the cold reset retain their values through warm reset, while the rest of the system remains in reset until the auto-load process has completed (*bsec_done* = 1) and fuse output values are stable.

On a POR, the BSEC temporarily emerges from warm reset for the duration of the auto-load process, even if *bsec_rst* remains asserted, so that the auto-load process can determine values for flops on the cold reset. This means when the device is powered up, the security state is immediately established, so that a debugger may be allowed to perform discovery operations soon after power-up, even if the PAD reset is still being asserted.

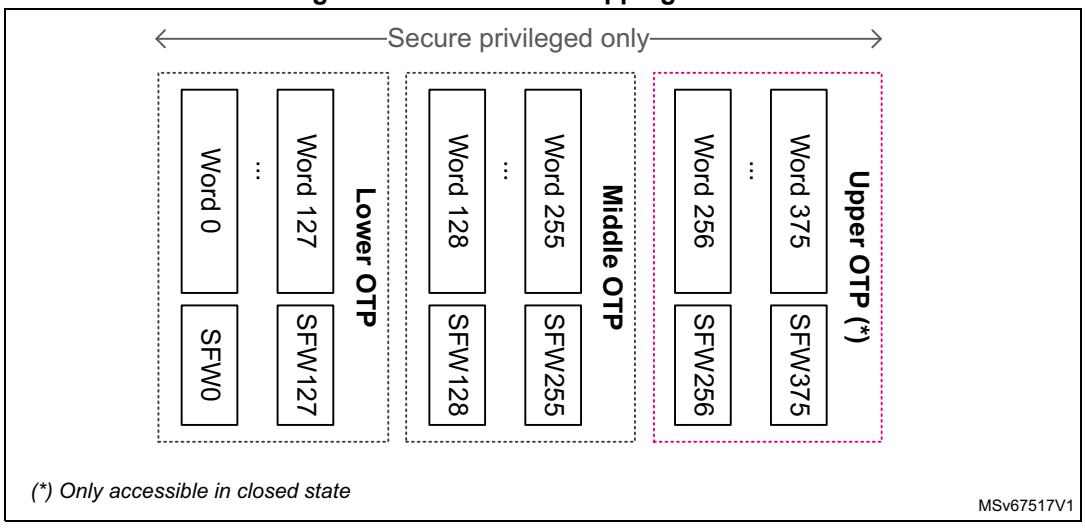
Some flops in the BSEC are on *bsec_hrst*, so they remain in reset until *bsec_done* is asserted. This reset is asserted while the Cortex-A is under reset.

6.3.4 Organization and use of fuses

Organization of fuses

One-time programmable fuse bits are organized in three groups of 32-bit words, as shown on *Figure 16*.

Figure 16. BSEC fuse mapping overview



The **lower** fuses region is used to store non-volatile, non-secret information that may require bitwise update during the life of the product.

The **middle** fuses region is used to store non-volatile, non-secret information that are written once, in 32-bit words bulk.

The **upper** fuses region is similar to the middle region, except that it is hidden when in the BSEC-open state (see *Section 6.3.7*). Hence it is used to store secrets like symmetric keys or private asymmetric keys.

Each fuse word w is either “shadowed” or “unshadowed”, as defined by flag bit SFWw in corresponding BSEC_SFSRx register. A shadowed fuse word is loaded into flops at cold or warm reset, and can be read quickly by software. An unshadowed fuse word is not read out of the fuse memory at reset, then stored permanently in flops. It needs to be reloaded from the fuse memory each time it is needed. See *Reading fuses* in *Section 6.3.5* for details.

Note: The whole OTP space can only be controlled by a secure privileged CPU.

Each individual lower fuse bit is one-time programmable, from 0 to 1. Transitions from 1 to 0 are not possible.

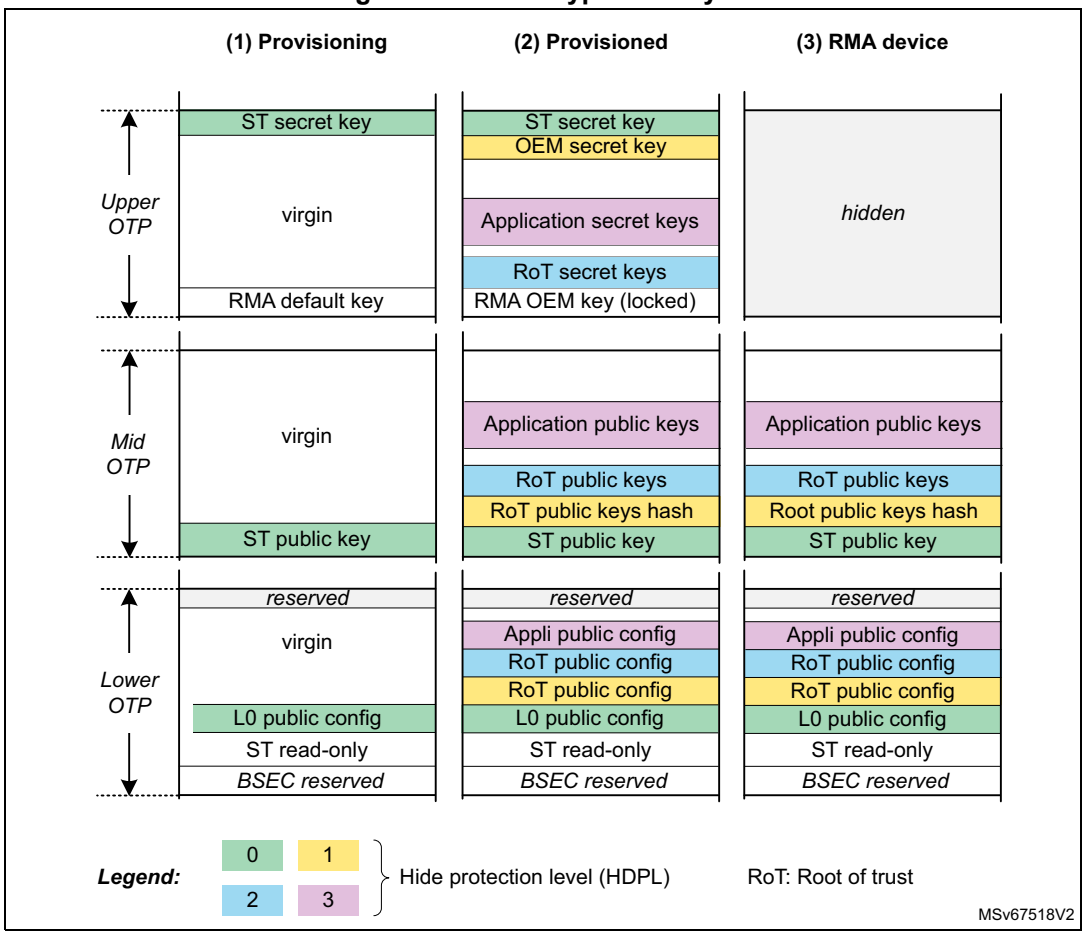
Use of fuses

Figure 17 shows how one-time programmable fuse bits are typically used during the life of a device:

1. Device being provisioned with root of trust and application keys, on an untrusted OEM production line or using STM32 tools
2. Device on the final personalization line of the OEM, or in the field
3. Return material for analysis (RMA) device, decommissioned by OEM or STMicroelectronics to investigate a particular product.

The state is BSEC-open for case (3), and BSEC-closed for cases (1) and (2). For more details on BSEC state transitions, refer to *Section 6.3.7*.

Figure 17. Device typical lifecycle



Boot levels, with associated isolation enforcements, are described in *Section 6.3.10*.

Details on fuse usage are described in *Section 7: OTP mapping (OTP)*.

6.3.5 Operations on fuses

Reading fuses

If fuse word w is shadowed (SFWw bit set in corresponding BSEC_SFSRx register), and either the state is BSEC-closed or w < 256, then BSEC_FVRw register is auto-loaded at cold or warm reset with the contents of fuse word w.

If fuse word w is accessible and shadowed, then if SRLOCKw = 0 the contents of fuse w can be reloaded by software into BSEC_FVRw register.

If fuse word w is accessible and unshadowed (SFWw bit cleared in corresponding BSEC_SFSRx register), a read to BSEC_FVRw register returns the content of fuse word w if the last operation on the fuse memory successfully reloaded word w, and if no unshadowed fuse word has been read since that reload.

Each time the application reloads the content of a word stored in fuse memory using BSEC_OTPCR register with PROG bit cleared, BUSY bit and error status should be checked in BSEC_OTPSR (see *Section 6.3.6*).

Note: Unshadowed fuse word information stored in BSEC_FVRw is cleared as soon as it is read.

Only the CPU that requested a fuse word load through BSEC_OTPCR can read the data fetched from fuses.

Writing shadow registers

When a fuse word w = {i + 32 * x} above word 9 is shadowed (SFWw bit set in BSEC_SFSRx) the application can update its shadowed value by writing directly to BSEC_FVRw register, if SWLOCKw bit is cleared in BSEC_SWLOCKx register.

Note: A shadow register write does not change the underlying fuse value.

Programming fuses

When programming is not blocked, lower fuse words can be blown bit-per-bit at different times. Middle and upper fuses must be programmed 32-bits at a time, only once. As reprogramming middle and upper fuses can let them with invalid content (an ECC error might be reported), it is strongly recommended to set PPLOCK = 1 after the first (and only) programming of the middle and upper fuses.
The procedure for blowing fuse word w is as follows:

1. Write the value to be blown in BSEC_WDR, then set ADDR = w, PROG = 1 and PPLOCK = 0 in BSEC_OTPCR register.
2. When BUSY bit is cleared in BSEC_OTPSR, verify that PROGFAIL is cleared. If PROGFAIL is set try again step 1.
3. Reload the fuse word w using BSEC_OTPCR with PROG bit cleared.
4. When BUSY bit is cleared in BSEC_OTPSR, verify that BSEC_FVRw register returns the correct value. If not, try again step 1.

Note: OTP bits are initially set to 0 and once a bit is set to 1 it cannot be programmed back to 0 (bit stays at 1). Bitfields with 0s in BSEC_WDR are not programmed, while bitfields with 1s are programmed.

As lower fuse words can be programmed multiple times, when the application requests a specific bit to be programmed to 1 more than once, BSEC does the burning only once.

Permanent program lock (PPLOCK)

The application can make further programming of fuse word w impossible by following the sequence:

1. Clear BSEC_WDR register, then set ADDR = w, PROG = 1 and PPLOCK = 1 in BSEC_OTPCR register.
2. When BUSY bit is cleared in BSEC_OTPSR, verify that PROGFAIL is cleared. If PROGFAIL is set try again step 1.
3. Reload the fuse word w using BSEC_OTPCR with PROG bit cleared.
4. When BUSY bit is cleared in BSEC_OTPSR, verify that the PPLF in BSEC_OTPSR is set. If not, try again step 1.

There is no register in BSEC to store PPLOCK information. When the application needs to know if a fuse word programming is permanently locked, it has first to perform a reload of this word using BSEC_OTPCR and then check if the PPLF bit in BSEC_OTPSR register is set. See *Table 26* for details.

Fuse word locking features

In order to make fuse usage suitable for security, for example to implement the isolation scheme detailed in *Section 6.3.10*, BSEC has the following locking features:

Sticky program lock (SPLOCK)

The application can prevent fuse word w = {i + 32* x} programming until next BSEC reset (cold or warm) by setting the SPLOCKw bit in BSEC_SPLOCKx register.

Sticky write lock (SWLOCK)

The application can make the BSEC_FVRw register of a shadowed fuse word w = {i + 32 * x} unwritable until next BSEC reset (cold or warm) by setting the SWLOCKw bit in BSEC_SWLOCKx register.

Sticky reload lock (SRLOCK)

Reload of word w = {i + 32 * x} using BSEC_OTPCR register can be blocked until next BSEC reset (cold or warm) by setting the SRLOCKw bit in BSEC_SRLOCKx register.

When read is sticky-locked, unshadowed fuse words return 0 while shadowed fuse words return their current value (value is not zeroed).

Upper fuses read and write locking (HIDEUP)

When HIDEUP bit is set by hardware in BSEC_OTPSR, neither read nor write are possible to fuse words located in the upper region.

6.3.6 BSEC read and programming status reporting

After a cold and warm reset BSEC performs a first set of OTP reads, reporting the specific status structure defined in *Table 25*.

Table 25. BSEC initial status reporting structure

Bit offset	BSEC_ OTPSR bit	Name	Error flag	Meaning when bit is set
0	[0]	BUSY	No	BSEC ongoing operation is not completed.
1	[1]	INIT_DONE		BSEC initialized following a cold or warm reset.
2	[2]	HIDEUP		Upper fuses are not accessible to the application.
4	[4]	OTPNVIR		BSEC is not virgin. This bit should always be set.
5	[5]	OTPERR	Yes	At least one error has been detected during the reading of shadowed fuse words, as reported in BSEC_OTPVLDR registers (VLDF bit = 0). The recommended mitigation is to reload the faulty fuse word using BSEC_OTPCR and analyze the 8-bit error structure in BSEC_OTPSR, as detailed below.
6	[6]	OTPSEC		At least one single-error has been corrected during the reading of shadowed fuse words, as reported in BSEC_OTPVLDR registers (VLDF bit = 0). In this case the shadowed fuse word value is correct, hence if OTPSEC = 1 and OTPERR = 0 the application does not need to reload the faulty fuse word.

After any read or programming request, the BUSY bit is cleared, and BSEC reports the specific status structure defined in *Table 26*. When this structure is different than 0 the read or program operation might have failed, as indicated in the table.

Table 26. BSEC ad-hoc error/status reporting structure

Bit offset	BSEC_ OTPSR bit	Name	Failed operation	Retry if error(1)	Error description
0	**[16]**	PROGFAIL	Write	Yes	Programming operation failed.
1	**[17]**	DISTURB	Read		Integrity of the fuse value is not guaranteed.
2	**[18]**	DEDF			Double error detected. Fuse word is corrupted.
3	**[19]**	SECF		No	Single bit error correction.
4	**[20]**	PPLF			Permanent programming lock detected.
5	**[21]**	PPLMF			Permanent programming lock information on the two lower fuse values in the array is not identical.
6	**[22]**	AMEF(2)		Yes	Fuse address mismatch. Fuse value cannot be trusted, and should be read again.

1. For reads: need to reload the fuse (reported value cannot be trusted). For writes: need to retry the programming operation.
2. Always be 0 in normal operating conditions.

6.3.7 Lifecycle management

BSEC state initialization

Following a cold or warm reset BSEC can be in the following possible security states, defined in *Table 27*.

Table 27. BSEC states definition

BSEC states(1)	Upper fuses	DHUK in SAES(2)	Full debug	BootROM access	Fuse programming
BSEC-open	Inaccessible(3)	Unusable	yes(4)	partial	Enabled
BSEC-closed	Accessible	Hardware unique	no(5)	full(6)	
BSEC-invalid	Inaccessible(3)	Unusable	no	partial	Disabled

1. Defined in NVSTATE bitfield in BSEC_SR register (0x16: BSEC-open, 0x0D: BSEC-closed).
2. Derived hardware unique key in SAES peripheral uses RHUK information from BSEC (see *Section 6.3.15*).
3. Cannot be read or programmed by any means (functional or non-functional).
4. ST engineering modes are also available.
5. Root of trust application can unlock debug features unless DENLOCK sticky bit is set in BSEC_LOCKR register. ST engineering modes are disabled, by hardware, provided bit 20 of fuse word 124 is blown.
6. At the end of its execution the boot ROM writes 0xB9D8 FF1F to BSEC_UNMAPR, reverting boot ROM access to partial.

Errors following a BSEC initialization are detailed in *Section 6.3.6*. Details about reset management can be found in *Section 6.3.17*.

When neither BSEC-open nor BSEC-closed state (NVSTATE different than 0x16 or 0x0D), the security state is considered invalid, and the most conservative security configuration is applied: that is, fuse programming is disabled, upper fuses read as 0, debug is disabled, ROM is partially unmapped and shadow registers are read only. When NVSTATE = 0x23, a confirmed tamper is active in the device (see *Section 6.3.17*).

Note: On any reset, including hot reset, if the state is BSEC-closed, the BSEC_UNMAPR register is set to 0xA1C0 DE0D, ensuring the whole boot ROM is visible.

Opening BSEC

BSEC can transition from BSEC-closed to BSEC-open only if the user enters the programmed 128-bit password via JTAG, and then performs a global reset (JTAG + device), clearing all secrets.

The recommended JTAG password programming sequence is:

1. Write the four password words to upper fuses words 256 to 259 with PPLOCK bit cleared in BSEC_OTPCR. JTAG_PSWD0 is stored in word 256, while JTAG_PSWD3 is stored in word 259.
2. Read back password value to verify it is correct
3. Write 0x0 to the same fuse words 256 to 259, with PPLOCK bit set in BSEC_OTPCR. After this, password words cannot be read nor programmed anymore by the application.

The BSEC opening sequence is described below:

1. Bring the device TAP out of reset, and enter the device secret password sequentially using the JTAG commands 0100 (SET_JTAG_PSWD0), 0101 (SET_JTAG_PSWD1), 0110 (SET_JTAG_PSWD2) then 0111 (SET_JTAG_PSWD3).
2. Trigger a device reset, without causing a TAP reset. When BSEC emerges from reset, it blows the RMA fuse word with adequate values.
3. Trigger a TAP reset to destroy any record of the entered password, and after the next cold or warm reset, the BSEC changes its NVSTATE to “BSEC-open” in BSEC_SR. It can be verified using the JTAG command 0011 (READ_SEC). BSEC returns 0x00 BSEC_DENR[19:0] & 0x1 for an BSEC-open device, 0x00 & BSEC_DENR[19:0] & 0x2 for a BSEC-closed device.
4. Ship the device to STMicroelectronics for field return analysis (RMA)

Once the device has been opened it can be closed again by blowing to 0xF the next unblown 4-bit nibble in BSEC_FVR1 (see *Closing BSEC*). At most four device re-opening attempts are allowed, regardless of whether they are successful or unsuccessful.

By blowing at least one bit in BSEC_FVR1[27:24], the application can reduce the number of re-opening cycles to only one.

If the application blows at least one bit in BSEC_FVR1[31:28] a closed device can never be re-opened.

The application can also ensure that if a closed device is ever re-opened, it is not possible to subsequently re-close it again. It is done by blowing the permanent programming lock (PPLOCK) of fuse word 1, writing 0x00000000 to BSEC_WDR then writing 0x00006001 to BSEC_OTPCR.

Note: By default BSEC opening password is 0x0. It is advised to change it.

Closing BSEC

BSEC can transition from BSEC-open to BSEC-closed by blowing some bits such that *s*[7:0] becomes greater than *r*[7:0], or *s*[7] = 1. Bytes *s*[7:0] and *r*[7:0] are defined as follows:

s[7:0] = OR(BSEC_FVR1[31:28]) | OR(BSEC_FVR1[27:24]) | ... | OR(BSEC_FVR1[3:0])

r[7:0] = AND(BSEC_FVR2[31:28]) | AND(BSEC_FVR2[27:24]) | ... | AND(BSEC_FVR2[3:0])

With the following conventions:

- “|” is concatenation operand
- OR(bits[1:0])= bit[1] OR bit[0]
- AND(bits[1:0])= bit[1] AND bit[0]

When the device is being closed, the application can limit re-opening cycles to only one attempt by blowing at least one bit in BSEC_FVR1[27:24]. To reduce re-opening cycles to zero, the application must blow at least one bit in BSEC_FVR1[31:28].

Note: For the device to become BSEC-closed, the application must perform a BSEC cold or warm reset.

6.3.8 Epoch registers

There are two 32-bit readable registers, BSEC_EPOCHR0 and BSEC_EPOCHR1, that are writable only by boot ROM accesses. It is the responsibility of the boot ROM to read bitwise fuses and populate these registers.

There is a 1-bit programmable register BSEC_EPOCHSELCR (output on *epoch_sel*) that, when programmed to *n*, ensures that BSEC_EPOCHR*n* is output on *epoch*. Both *epoch* and *epoch_sel* are wired to the SAES where they influence the generation of DHUK, derived from the RHUK.

Secure software can blow additional bits in the appropriate fuse word to increment an Epoch, thereby making impossible the use of all keys derived from the RHUK prior to that point.

6.3.9 BSEC local access control

Any access that is not both secure and privileged is blocked, with read data zeroed and write accesses ignored. Compartment IDs that are not Trusted domain CPU, debug domain, or boot CPU are also blocked.

When BSEC is used concurrently by trusted domain CPU and boot CPU, secure application should always verify that an *unshadowed* word reading as zero is a valid value. Indeed, the returned BSEC_FVR value is correct only if LASTCID value in BSEC_OTPCR register is correct, for example LASTCID = TDCID value in *RIMC_CR* for the trusted domain CPU.

When the state is BSEC-closed, password fuse words 256 to 259 reads as zero when permanent programming lock is set for those words.

6.3.10 Temporal isolation in BSEC

In order to enforce isolation between boot stages the running application in each boot level must hide the secrets it was using before proceeding to the next level of code in the boot chain. Such protections must remain until the next boot sequence.

Four boot levels, with its corresponding hide protection level (HDPL), are defined:

- Level 0 (HDPL0) corresponds to hardware state machine or ROM code execution.
- Level 1 (HDPL1) corresponds to the execution of STMicroelectronics signed code or ROMed code. This code is the first stage of the secure boot.
- Level 2 (HDPL2) corresponds to the execution of the OEM signed code, stored in embedded SRAM. This code is the second stage of the secure boot.
- Level 3 (HDPL3) corresponds to the application run-time.

Note: The first two levels are always executed by the boot CPU.

Each CPU has its own independent notion of HDPL level. Secure software running on a CPU decides when to advance its HDPL level, but the trusted CPU can also increment the HDPL level of the non-trusted CPU. The Cortex-A reverts to HDPL0 on a hot reset, and the Cortex-M reverts to HDPL0 on a warm reset.

To help enforcing such isolation between boot stages, the ROM code and the application secure boot can use the following temporal isolation hardware capabilities of BSEC:

- When BSEC is in a closed state, ROM partially hides itself at the end of its execution in level 0 or level 1, writing 0xB9D8 FF1F to BSEC_UNMAPR register.
- When BSEC is in a closed state, fuse words 356 to 375 are reloadable only when BSEC_UNMAP=0xA1C0DE0D and when the access is from Cortex-A.
- Any 32-bit OTP word can be made non-readable and/or non-writable until next cold or warm reset. It can also be made non-programmable, permanently. See Fuse word locking features and Permanent program lock (PPLOCK) methods in *Section 6.3.5*.

Note: Details on fuse usage are described in Section 7: OTP mapping (OTP).

The registers BSEC_HDPLMSR and BSEC_HDPLASR determine the current hide protection level of Cortex-M and Cortex-A respectively. The encoding offers physical robustness.

Table 28. Current HDPL coding

HDPL field	Level
0xB4	0
0x51	1
0x8A	2
0x6F	3
others	undefined

The BSEC_HDPLMSR register is reset to 0xB4 by *bsec_rst*. The BSEC_HDPLASR register is reset to 0xB4 by *bsec_hrst*. These registers are not directly writable. If less than 3, the current level in each can be incremented by writing a value of 0x60B166E7 to BSEC_HDPLMCR or BSEC_HDPLACR respectively.

The 2-bit INCR field of the BSEC_NEXTHDPLMCR (respectively BSEC_NEXTHDPLACR) register is added to the level given by BSEC_HDPLMSR (respectively BSEC_HDPLASR), but clamped at a ceiling of 3. The result is output on *obk_hdpl[7:0],* provided the SAES currently belongs to that particular CPU. If the SAES is currently not owned by either CPU, the *obk_hdpl[7:0]* output is set to 0x00.

Table 29. BSEC Next HDPL register usage

obk_hdpl [7:0]		INCR field			
		0	1	2	3
BSEC_HDPL*SR[HDPL]	0 (0xB4)	0xB4	0x51	0x8A	0x6F
	1 (0x51)	0x51	0x8A	0x6F	
	2 (0x8A)	0x8A	0x6F		
	3 (0x6F)	0x6F			
	others (0x*PQ*)	0x*PQ*			

The *obk_hdpl* output goes to the SAES where it influences the generation of DHUK, derived from the RHUK. This mechanism allows keys for a later temporal level to be generated in advance.

Cortex-M secure privileged code can always read BSEC_HDPLMSR and can always write BSEC_HDPLMCR and BSEC_NEXTHDPLMCR, even if the Cortex-M is not the trusted domain. Cortex-A secure privileged code can always read BSEC_HDPLASR and can always write BSEC_HDPLACR and BSEC_NEXTHDPLACR, even if the Cortex-A is not the trusted domain.

6.3.11 BSEC debug and trace control

Secure privileged application can select the debug and trace profiles defined on *Table 30*, writing to BSEC_DENR register. For each profile there are two proposed configuration to BSEC_DENR register:

- A *trace-only* session allows the debugger or the self-hosted application to configure components that can be used to trace events from application code without modifying this code. This option includes dumps to DDR-SDRAM via ETR.
- A *full debug* session allows the debugger to configure components that are used to set breakpoints to the application under debug, as well as configuring any available trace features.

To increase robustness against attacks, when something other than 0xDEB followed by the Hamming code of the bottom 12-bits is written to bits [31:12], the entire BSEC_DENR register is zeroed. Write to BSEC_DENR register is ignored until next BSEC cold or warm reset if DENLOCK or GWLOCK bit is set in BSEC_LOCKR register

The secure privileged application can decide to delay the opening of debug on a CPU until that CPU has reached a particular HDPL level. This condition is given in the penultimate column of the table below, and is explained after the table.

Table 30. Debug and trace profiles

Debug profile			Cortex-A35 debug	Cortex-M33 debug	HDPL condition	Value in BSEC_DENR (LSB)
Micro-controller debug	Secure(1)	Trace-only	No	Yes	dbgs_m	0xDEB3BA98
		Full debug				0xDEB3EF98
	Nonsecure	Trace-only			dbg_m	0xDEB18298
		Full debug				0xDEB02398

Table 30. Debug and trace profiles (continued)

Debug profile			Cortex-A35 debug	Cortex-M33 debug	HDPL condition	Value in BSEC_DENR (LSB)
Application processor debug	Secure	Trace-only	Yes	No	dbgs_a	0xDEB1F0DC
		Full debug				0xDEB010FE
	Nonsecure	Trace-only			dbg_a	0xDEB0909C
		Full debug				0xDEB0209E
Global debug (MCUs + CPU)	Global secure	Trace-only	Yes	Yes	dbgs_a, dbgs_m	0xDEB20ADC
		Full debug				0xDEB3BFFE
	Nonsecure, with Cortex-M33 secure debug enabled(2)	Trace-only			dbg_a, dbgs_m	0xDEB36A9C
		Full debug				0xDEB38F9E
	Nonsecure	Trace-only			dbg_a, dbs_m	0xDEB1529C
		Full debug				0xDEB0439E

1. A secure profile can debug code running in secure and nonsecure modes.
2. Secure application running on application processor cannot be debugged nor traced. Cortex-M33 secure is running protected 3rd party applications, usually not used for security.

The wrapper contains BSEC_DBGMCR and BSEC_DBGACR registers, both reset to zero on the warm reset, and both writeable only once per warm reset. The bytes of these registers are named as follows

Table 31. BSEC debug register legal values

BSEC_DBGMCR BSEC_DBGACR	Bitfield name	Legal values
31:24	AUTH_SEC	0x00, 0xB4
23:16	AUTH_HDPL	0x00, 0xB4,0x51,0x8A,0x6F
15:8	UNLOCK	0x00, 0xB4
7:0	reserved	-

The AUTH_HDPL field encodes levels in the same way as the HDPL field of the BSEC_HDPLMSR and BSEC_HDPLASR registers.

Any attempt to write a non-legal byte value into these fields results in a 0x00 being written in that byte field.

The register is forced to zero (writes have no effect) whenever the device is BSEC-open.

On a BSEC-closed device, debug is only possible on Cortex-M if BSEC_DBGMCR[UNLOCK] = 0xB4, and the HDPL level indicated in BSEC_HDPLMSR is non-zero and reaches or surpasses that indicated by BSEC_DBGMCR[AUTH_HDPL]. In this case, secure debug is only possible if BSEC_DBGMCR[AUTH_SEC] = 0xB4. These two conditions are represented by the signals *dbg_m* and *dbgs_m* respectively in *Table 30*. They gate the appropriate CoreSight™ enables.

Similarly, on a BSEC-closed device, debug is only possible on Cortex-A if BSEC_DBGACR[UNLOCK] = 0xB4, and the HDPL level indicated in BSEC_HDPLASR is non-zero and reaches or surpasses that indicated by BSEC_DBGACR[AUTH_HDPL]. In this case, secure debug is only possible if BSEC_DBGACR[AUTH_SEC] = 0xB4. These two conditions are represented by the signals *dbg_a* and *dbgs_a* respectively in *Table 30*. They gate the appropriate CoreSight enables.

The BSEC_AP_UNLOCK register is forced to zero (writes have no effect) whenever the state is BSEC-open. The *ap_unlocked* output, when taking the value 0xB4, indicates that the debugger can access the Cortex-M33 debug subsystem. It is set to 0xB4 whenever the state is BSEC-open, otherwise it is directly driven by the BSEC_AP_UNLOCK register, which is reset to 0 on a scratch reset.

A rising edge on *hide_sec* (a confirmed tamper) resets these registers to zero, and closes debug. They are not writeable until the next cold or warm reset.

6.3.12 Device features control

Device features are controlled through read-only shadowed fuse word 9.See *Section 7: OTP mapping (OTP)* for details.

6.3.13 Scratch registers

The four BSEC_SCRATCHRx registers are only reset by a cold boot. They are therefore useful to store values that must remain persistent for the application across warm boots.

The eight BSEC_WOSCRx registers are only reset by a cold or warm boot. They are therefore useful to store values that must remain persistent for the application across hot boots.

Note: BSEC_WOSCRx registers are write once.

6.3.14 JTAG registers

The BSEC_JTAGINR and BSEC_JTAGOUTR registers are available to facilitate communication between the application (for example ROM) and the debug tools connected through the JTAG interface.

6.3.15 STM32 root hardware unique key (RHUK)

BSEC stores a root HUK that has been programmed by STMicroelectronics during the device manufacturing. A successful provisioning is indicated with HVALID bit set in BSEC_SR register.

The value of this key is obtained from the RNG peripheral of the device, without disclosure to the outside word. This key cannot be read or programmed by any secure application nor debugger.

When BSEC detects an integrity issue while reading the key information from non-volatile memory, or when application sets the sticky HKLOCK bit in BSEC_LOCKR, the key is indicated as invalid. When the key is invalid the SAES peripheral uses a default fixed value.

6.3.16 BSEC error management

Shadowed fuse word automatic readout errors

After a cold or warm reset, shadowed fuse words are automatically loaded into BSEC_FVR registers. At the end of this process, when INIT_DONE is set in BSEC_OTPSR, additional error information can be found in this register, as described in *Section 6.3.6*.

Individual fuse loading errors

Upon each fuse loading from OTP memory array, an 8-bit error structure in BSEC_OTPSR register is updated to tell the application if there was a problem with this particular fuse load. This structure is defined in *Section 6.3.6*.

6.3.17 BSEC tamper response mechanisms

This device uses tamper-detection and response mechanisms that can make it immediately inoperable, resulting in the automatic and immediate erasure of any sensitive data that may be stored in the device. The device also supports the concept of potential tamper event, where the device secrets are blocked while application software verifies that such tamper event is confirmed or not.

BSEC manages above mechanisms in the following way:

- When a tamper source triggers a potential tamper event in TAMP peripheral (NOERASE = 1), BSEC masks the RHUK value to SAES, and upper fuses read as 0 (unless BSEC_UNMAP = 0xA1C0 DE0D, meaning that the boot CPU is executing).
- When a tamper source triggers a confirmed tamper event in TAMP peripheral (NOERASE = 0), or a potential tamper becomes a confirmed tamper, fuses cannot be blown or reloaded, upper fuses read as 0, BSEC_DENR register is cleared, BSEC_DBGMCR, BSEC_DBGACR, and BSEC_AP_UNLOCK registers are cleared, RHUK information is physically cleared to 0 & invalidated, and NVSTATE is set to 0x23 in BSEC_SR register. These limitations are deactivated after device secrets have been erased, and a SoC reset has been applied.

Above limitations are deactivated when the application clears the active tamper source(s) in TAMP peripheral. See *Section 64: Tamper and backup registers (TAMP)* for details.

Note: While tamper events are active the boot CPU can always execute the application firmware following an application reset or an exit from Standby for the boot CPU.

6.4 BSEC interrupts

BSEC does not support any interrupt.

6.5 BSEC registers

Those registers are accessible through the register interface of the BSEC peripheral.

If security and privileged policy allows it, when the debug domain feature is activated, the debug domain traffic goes through, regardless of any CID filtering policy.

6.5.1 BSEC fuse word w value register (BSEC_FVRw)

Address offset: 0x000 + 0x4 * w, (w = 0 to 375)

Reset value: 0xXXXX XXXX

Note: The reset value is 0x0000 0000 if the fuse word is unshadowed, defined by the fuse value if the fuse word is shadowed.

Secure privileged read and write only. Illegal reads return 0, illegal writes are ignored.

See the bitfield description for further details on fuse word accessibility.

If fuse word is not shadowed, only the CPU that reloads fuse information using BSEC_OTPCR register can read the actual bit values (the register returns 0 otherwise). See LASTCID in BSEC_OTPCR for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FV[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FV[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **FV[31:0]**: fuse value

If fuse word {w} is shadowed (SFW{w} bit set in corresponding BSEC_SFSRx register), and either the state is BSEC-closed or {w} < 256, then this register is auto-loaded at cold or warm reset with the contents of fuse word w.

If fuse word {w} is accessible and shadowed, then:

– if SRLOCK{w} = 0, fuse word {w} can be reloaded by software into this register

– if SWLOCK{w} = 0, and {w} > 9, this register can be written to (otherwise, writes are ignored).

If fuse word {w} is accessible and unshadowed (SFW{w} bit cleared in corresponding BSEC_SFSRx register), writes are ignored and provided:

– the last operation on the fuse memory successfully reloaded word {w}

– no unshadowed fuse words have been read since that reload

then a read to this register returns the content of fuse word {w} (otherwise it returns 0).

If the fuse word {w} is inaccessible, then writes are ignored and reads return 0.

Unshadowed fuse word information stored in this register is cleared as soon as it is read.

When the state is BSEC-closed:

– Fuse words 356 to 375 are accessible only when BSEC_UNMAP=0xA1C0DE0D and when the access is from boot CPU.

– Fuse words 256 to 259 read as zero when permanent programming lock is set for those words.

6.5.2 BSEC sticky programming lock register x (BSEC_SPLOCKx)

Address offset: 0x800 + 0x4 * x (x = 0 to 11)

Reset value: 0x0000 0000

Secure privileged read and write only. Illegal reads return 0, illegal writes are ignored. Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SPLOCK{i + 32 * x}															
rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SPLOCK{i + 32 * x}															
rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:0 **SPLOCK{i + 32 * x}**: Sticky programming lock for word {i + 32 * x} (i = 0 to 31)

Setting this bit prevents permanent programming for the fuse word {i + 32 * x} until next cold or warm reset.

0: Fuse word {i + 32 * x} can be burnt in fuse memory array

1: Attempt to program fuse word {i + 32 * x} in OTP memory array is silently ignored

While BUSY is set in BSEC_OTPSR, writes have no effect, and reads return 0.

6.5.3 BSEC sticky write lock register x (BSEC_SWLOCKx)

Address offset: 0x840 +0x4 * x (x=0 to 11)

Reset value: 0x0000 0000

Secure privileged read and write only. Illegal reads return 0, illegal writes are ignored. Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SWLOCK{i + 32 * x}															
rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SWLOCK{i + 32 * x}															
rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:0 **SWLOCK{i + 32 * x}**: sticky write lock for shadow register {i + 32 * x} (i = 0 to 31)

When fuse word {i + 32 * x} is shadowed, setting this bit prevents the writing of the shadow register of this fuse word until next cold or warm reset.

0: Write to shadow register BSEC_FVR{i + 32 * x} is allowed

1: Writes to shadow register BSEC_FVR{i + 32 * x} are silently ignored

While BUSY is set in BSEC_OTPSR, writes have no effect, and reads return 0.

6.5.4 BSEC sticky reload lock register x (BSEC_SRLOCKx)

Address offset: 0x880 + 0x4 * x (x = 0 to 11)

Reset value: 0x0000 0000

Secure privileged read and write only. Illegal reads return 0, illegal writes are ignored. Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SRLOCK{i + 32 * x}															
rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SRLOCK{i + 32 * x}															
rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:0 **SRLOCK{i + 32 * x}**: sticky reload lock for fuse word {i + 32 * x} (i = 0 to 31)

Setting this bit locks reloading of fuse word {i + 32 * x} from the OTP memory array until next cold or warm reset.

0: Fuse word {i + 32 * x} loading through BSEC_OTPCR is authorized.

1: Fuse word {i + 32 * x} loading through BSEC_OTPCR is denied until next cold or warm reset.

While BUSY is set in BSEC_OTPSR, writes have no effect, and reads return 0.

6.5.5 BSEC OTP valid register x (BSEC_OTPVLDRx)

Address offset: 0x8C0 + 0x4 * x (x = 0 to 11)

Reset value: 0x0000 0000

Secure privileged read only (return 0 otherwise). Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
VLDF{i + 32 * x}															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
VLDF{i + 32 * x}															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **VLDF{i + 32 * x}**: Valid flag for shadow register {i + 32 * x} (i = 0 to 31)

This bit represents the validity of the last reload of fuse word {i + 32 * x}.

0: An error occurred while fuse word {i + 32 * x} was last reloaded. The value read from BSEC_FVR{i + 32 * x} register cannot be relied on.

1: Last reload of fuse word {i + 32 * x} was done without error.

Each VLDF bit is updated when BSEC or the allowed application reloads corresponding fuse word from the OTP array.

6.5.6 BSEC shadowed fuses status register x (BSEC_SFSRx)

Address offset: 0x940 + 0x4 * x (x = 0 to 11)

Reset value: 0x0001 EBFF (SFSR0)

Reset value: 0xFF00 000F (SFSR3)

Reset value: 0x0000 000F (SFSR8)

Reset value: 0xFF00 0000 (SFSR11)

Reset value: 0x0000 0000 (others)

Secure privileged read-only (return 0 otherwise). Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SFW{i + 32 * x}															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SFW{i + 32 * x}															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **SFW{i + 32 * x}**: Shadowed fuse word {i + 32 * x} (i = 0 to 31)

This bit indicates whether fuse word {i + 32 * x} is shadowed or not.

0: Fuse word {i + 32 * x} is not shadowed. Fuse value must be reloaded using BSEC_OTPCR before reading BSEC_FVR{i + 32 * x} register.

1: Fuse word is shadowed in BSEC_FVR{i + 32 * x} register. Reloading the fuse value using BSEC_OTPCR is only required if the fuse value changed since the last BSEC cold or warm reset.

6.5.7 BSEC OTP control register (BSEC_OTPCR)

Address offset: 0xC04

Reset value: 0x0000 0000

Writing to this register causes an access to be made to the fuse memory.

Secure privileged read and write only. Illegal reads return 0, illegal writes are ignored. Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LASTCID[2:0]			Res.	Res.	Res.
										r	r	r			
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	PP LOCK	PROG	Res.	Res.	Res.	Res.	ADDR[8:0]								
	rw	rw					rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:19 **LASTCID[2:0]:** Last CID

This read-only bitfield returns the compartment ID of the CPU that performed the last write in this register.

Bits 18:15 Reserved, must be kept at reset value.

Bit 14 **PPLOCK:** Permanent programming lock

When this bit is set together with PROG bit, no further write to this fuse word is possible.
0: Fuse word at address ADDR[8:0] is programmed normally.
1: Fuse word at address ADDR[8:0] is locked, preventing further modifications.
Permanent programming lock mechanism is immutable, as it is committed in the fuse memory.

Bit 13 **PROG:** Fuse word programming

This bit determines whether BSEC operation is a read or a write. If a write is selected, the data stored in BSEC_WDR is programmed in the fuse word indexed by ADDR bitfield.
0: Fuse word read operation is required
1: Fuse word programming operation is required
While BUSY is set in BSEC_OTPSR, writes to PROG bit have no effect.

Bits 12:9 Reserved, must be kept at reset value.

Bits 8:0 **ADDR[8:0]:** Fuse word address

This bitfield represents the address of the fuse word in the OTP memory array.
When a lower fuse address is selected two fuse words are addressed by BSEC.
When fuse words 376 to 383 are selected, read or programming requests are denied.
When fuse words 364 to 375 are selected, programming requests are ignored.

6.5.8 BSEC write data register (BSEC_WDR)

Address offset: 0xC08

Reset value: 0x0000 0000

Secure privileged write only. Any reads return 0. Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
WRDATA[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

WRDATA[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **WRDATA[31:0]:** OTP write data

The value written to this register can be written to fuse memory. This happens when the BSEC_OTPCR register is written with the PROG bit set.
When a lower fuse address is selected in BSEC_OTPCR (ADDR=0x0 to 0x3F), two fuse words are programmed by BSEC (one fuse word is programmed otherwise).
While BUSY is set in BSEC_OTPSR, writes to this register have no effect.

6.5.9 BSEC scratch register x (BSEC_SCRATCHRx)

Address offset: 0xE00 + 0x4 * x (x = 0 to 3)

Reset value: 0x0000 0000

This register is reset when *bsec_srst* is asserted.

Secure privileged read and write only. Illegal reads return 0, illegal writes are ignored. Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SDATA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

SDATA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SDATA[31:0]**: Scratch data

This register can be used to store values that needs to be persistent across warm reset.

6.5.10 BSEC lock register (BSEC_LOCKR)

Address offset: 0xE10

Reset value: 0x0000 0000

Secure privileged read and write only. Illegal reads return 0, illegal writes are ignored. Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HK LOCK	DEN LOCK	GW LOCK
													rs	rs	rs

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **HKLOCK:** Hardware key lock

0: Derived hardware unique key (DHUK) in SAES peripheral is usable if HVALID is set in BSEC_SR

1: Derived hardware unique key (DHUK) in SAES peripheral is not usable.

Once set, this bit is cleared only by BSEC cold or warm reset.

Bit 1 **DENLOCK:** Debug enable register sticky lock

0: Writes to BSEC_DENR register are allowed

1: Writes to BSEC_DENR register are ignored

Once set, this bit is cleared only by BSEC cold or warm reset.

Bit 0 **GWLOCK:** Global write lock

0: Writes to BSEC registers are allowed

1: Writes to BSEC registers are ignored (fuse programming and fuse reload disabled)

Once set, this bit is cleared only by BSEC cold or warm reset.

6.5.11 BSEC JTAG input register (BSEC_JTAGINR)

Address offset: 0xE14

Reset value: 0x0000 0000

Secure privileged read only (return 0 otherwise). Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
JDATAIN[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
JDATAIN[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **JDATAIN[31:0]**: JTAG input data

Reads give the last input value from the JTAG interface

6.5.12 BSEC JTAG output register (BSEC_JTAGOUTR)

Address offset: 0xE18

Reset value: 0x0000 0000

Secure privileged write only (write ignored otherwise). Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
JDATAOUT[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
JDATAOUT[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **JDATAOUT[31:0]**: JTAG output data

Application can write any value in this field to be output on the JTAG interface.

6.5.13 BSEC debug enable register (BSEC_DENR)

Address offset: 0xE20

Reset value: 0xDEB3 CFFF (BSEC-open)

Reset value: 0x0000 0000 (not BSEC-open)

When something other than 0xDEB is written to bits [31:20], the entire register is zeroed. When the correct SECDED hamming code of bits [11:0] is not written to bits [17:12], then BSEC_DENR[19:0] is zeroed.

Secure privileged read and write only. Illegal reads return 0, illegal writes are ignored. Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PATTERN[11:0]												Res.	Res.	R CODE5	R CODE4
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw			rw	rw

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	

Bits 31:20 **PATTERN[11:0]**: Pattern to validate write data value
If this is written with anything other than 0xDEB, then BSEC_DENR is zeroed.

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **RCODE5**: SECDED code
Set this to what is being written to bit 11, otherwise BSEC_DENR[19:0] is zeroed.

Bit 16 **RCODE4**: SECDED code
Set this to the XOR of what is being written to bits 10, 9, 8, 7, 6, 5, 4, otherwise BSEC_DENR[19:0] is zeroed.

Bit 15 **RCODE3**: SECDED code
Set this to the XOR of what is being written to bits 10, 9, 8, 7, 3, 2, 1, otherwise BSEC_DENR[19:0] is zeroed.

Bit 14 **RCODE2**: SECDED code
Set this to the XOR of what is being written to bits 10, 9, 6, 5, 3, 2, 0, otherwise BSEC_DENR[19:0] is zeroed.

Bit 13 **RCODE1**: SECDED code
Set this to the XOR of what is being written to bits 11, 10, 8, 6, 4, 3, 1, 0, otherwise BSEC_DENR[19:0] is zeroed.

Bit 12 **RCODE0**: SECDED code
Set this to the XOR of what is being written to bits 17, 16, 15, 14, 13, 11, 10, 9, 8, 7, 6, 5, 4, 3, 2, 1, 0, otherwise BSEC_DENR[19:0] is zeroed.

Bit 11 **SPNIDENM:** Secure privilege non-invasive debug enable for Cortex-M
0: Secure privilege non-invasive debug is disabled for Cortex-M
1: Secure privilege non-invasive debug is enabled for Cortex-M

Bit 10 **SPIDENM:** Secure privilege invasive debug enable for Cortex-M
0: Secure privilege invasive debug is disabled for Cortex-M
1: Secure privilege invasive debug is enabled for Cortex-M

Bit 9 **NIDENM**: Non invasive debug enable for Cortex-M
0: Non invasive debug disabled for Cortex-M
1: Non invasive debug enabled for Cortex-M

Bit 8 **DBGENM**: Debug enable for Cortex-M
0: Disabled
1: Enabled

Bit 7 **DBGSWEN**: Self-hosted debug enable
This bit controls application driven, self-hosted debug capability of the device.
0: Software access to all debug components is disabled
1: Software access to all debug components is enabled

Bit 6 **SPNIDENA:** Secure privilege non-invasive debug enable for Cortex-A
0: Secure privilege non-invasive debug is disabled for Cortex-A
1: Secure privilege non-invasive debug is enabled for Cortex-A

Bit 5 **SPIDENA:** Secure privilege invasive debug enable for Cortex-A
0: Secure privilege invasive debug is disabled for Cortex-A
1: Secure privilege invasive debug is enabled for Cortex-A

Bit 4 **HDPEN:** Hardware debug port enable
This bit controls the hardware debug port (HDP), allowing the observation of internal signals.
0: Hardware debug tracing port is disabled
1: Hardware debug tracing port is enabled

Bit 3 **DEVICEEN:** Device debug enable
This bit controls the access to debug components via external debug port.
0: External debugger is not usable with the device
1: External debugger is usable with the device, depending on the value stored in this register.

Bit 2 **NIDENA**: Non invasive debug enable for Cortex-A
0: Non invasive debug disabled for Cortex-A
1: Non invasive debug enabled for Cortex-A

Bit 1 **DBGENA**: Debug enable for Cortex-A
0: Disabled
1: Enabled

Bit 0 Reserved, must be kept at reset value.

6.5.14 BSEC unmap register (BSEC_UNMAPR)

Address offset: 0xE24

Reset value: 0xXXXX XXXX

Note: The reset value is 0xA1C0 DE0D on a BSEC-closed device, 0xFFFF FFFF on a BSEC-open device.

Register bits cannot be cleared by application, they can only be set to 1.

Secure privileged read and write only. Illegal reads return 0, illegal writes are ignored. Only BootROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UNMAP[31:16]

UNMAP[15:0]															
rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:0 **UNMAP[31:0]**: Unmap key
If this bitfield equals 0xA1C0 DE0D, the whole ROM is visible, else ROM is partially hidden.

6.5.15 BSEC status register (BSEC_SR)

Address offset: 0xE40

Reset value: 0x0000 0000

Secure privileged read only (return 0 otherwise). Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
NVSTATE[5:0]						Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HVALID	Res.
														r	

Bits 31:26 **NVSTATE[5:0]**: Non-volatile state
0x16: BSEC-open state
0x0D: BSEC-closed state
0x7: BSEC-invalid state
0x23: BSEC-invalid state, with an active confirmed tamper triggered in the device
The BSEC state is evaluated each time INIT_DONE is set in BSEC_OTPSR.
For more information, refer to *Section 6.3.7: Lifecycle management*

Bits 25:2 Reserved, must be kept at reset value.

Bit 1 **HVALID**: Hardware key valid
0: Derived hardware unique key (DHUK) feature cannot be used in SAES peripheral.
1: Derived hardware unique key (DHUK) feature can be used in SAES peripheral.

Bit 0 Reserved, must be kept at reset value.

6.5.16 BSEC OTP status register (BSEC_OTPSR)

Address offset: 0xE44

Reset value: 0x0000 0000

This register is refreshed each time a fuse operation is triggered through BSEC_OTPCR.

Secure privileged read only (return 0 otherwise). Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	AMEF	PPLMF	PPLF	SECF	DEDF	DISTURBF	PROGFAIL
									r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OTPSEC	OTPERR	OTPNVIR	Res.	HIDEUP	INIT_DONE	BUSY
									r	r	r		r	r	r

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **AMEF**: Addresses mismatch error flag

This bit is set when the address used by BSEC to read a fuse word is different from the programmed address (either by BSEC or by the application). Such event should never happen in normal BSEC operations.

Bit 21 **PPLMF**: Permanent programming lock mismatch flag

This bit is set when the two words constituting a lower fuse word are reporting different permanent programming lock statuses after BSEC reset or after the latest read.
For more details about permanent programming lock, refer to PPLOCK in BSEC_OTPCR.

Bit 20 **PPLF**: Permanent programming lock flag

This bit is set when the most recently read word is detected permanently locked.
For more details about permanent programming lock, refer to PPLOCK in BSEC_OTPCR.

Bit 19 **SECF**: Single error correction flag

This bit is set when a single-bit-error correction is detected after BSEC reset or after the latest read.

Bit 18 **DEDF**: Double error detection flag

This bit is set when a double error is detected after BSEC reset or after the latest read.
When DEDF bit is set after reading fuse word w, the value in BSEC_FVRw is the one read from OTP memory.

Bit 17 **DISTURBF**: Disturb flag

This bit is set when an unexpected error occurred after BSEC reset or after the latest read.
When DISTURBF bit is set after reading fuse word w, the value in BSEC_FVRw is the one read from OTP memory.

Bit 16 **PROGFAIL**: Programming failed

This bit is set when last OTP programming by BSEC failed.

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **OTPSEC**: OTP with single error correction

This bit is set when at least one single-error correction is detected during BSEC reset operations. In this case shadow registers are usable.

Bit 5 **OTPERR**: OTP with error

This bit is set when at least one error is detected during BSEC reset operations.

Bit 4 **OTPNVIR**: OTP not virgin

This bit is set when first fuse word 0 is detected non-0 after BSEC reset operations.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **HIDEUP**: Hide upper fuse words

This bit is set when application secret fuse words 256 to 383 becomes physically inaccessible, that is functionally hidden fuse words read as 0 and programming requests are ignored.

Bit 1 **INIT_DONE**: Initialization done

This bit is set when BSEC reset operations are completed. All shadowed fuses are readable in BSEC_FVRw registers, and status bits in BSEC_SR and BSEC_OTPSR are up to date.

Bit 0 **BUSY**: Busy flag

0: BSEC is idle.

1: BSEC is busy.

6.5.17 BSEC epoch register (BSEC_EPOCHRx)

Address offset: 0xE80 + 0x4 * x (x = 0 to 1)

Reset value: 0x0000 0000

Writeable by boot ROM only, readable by secure privileged trusted domain or BootROM code only. Illegal reads return 0, illegal writes are ignored.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EPOCH[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EPOCH[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rs

Bits 31:0 **EPOCH[31:0]**: epoch

This value is wired out to the SAES peripheral, depending on the EPOCH_SEL bit in BSEC_EPOCHSELCR.

6.5.18 BSEC epoch selection control register (BSEC_EPOCHSELCR)

Address offset: 0xE88

Reset value: 0x0000 0000

Secure privileged read and write only. Illegal reads return 0, illegal writes are ignored.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EPOCH_SEL
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **EPOCH_SEL**: Selection of the epoch value to be sent to the SAES
0: SAES peripheral uses BSEC_EPOCHR0 as EPOCH value.
1: SAES peripheral uses BSEC_EPOCHR1 as EPOCH value.

6.5.19 BSEC debug control register for Cortex-M (BSEC_DBGMCR)

Address offset: 0xE8C

Reset value: 0x0000 0000

Secure privileged read and write by trusted domain only. Writeable only on a BSEC-closed device, once per warm reset. Illegal reads return 0, illegal writes are ignored. Reset to zero on *bsec_rst* (warm reset).

The AUTH_HDPL byte field indicates a temporal isolation level, as follows: the value 0xB4 means level 0, the value 0x51 means level 1, the value 0x8A means level 2, and the value 0x6F means level 3. All other byte values are undefined.

On a BSEC-closed device, debug is only possible on Cortex-M
if BSEC_DBGMCR[UNLOCK] = 0xB4, and the HDPL level indicated in BSEC_HDPLMSR is non-zero and reaches or surpasses that indicated by BSEC_DBGMCR[AUTH_HDPL]. In this case, secure debug is only possible if BSEC_DBGMCR[AUTH_SEC] = 0xB4.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
AUTH_SEC[7:0]								AUTH_HDPL[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

UNLOCK[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw								

Bits 31:24 **AUTH_SEC[7:0]:**
0xB4: Cortex-M secure debug possible when UNLOCK = 0xB4 and the level indicated in BSEC_HDPLMSR is greater than or equal to the level indicated by AUTH_HDPL.
Others: Cortex-M secure debug not possible (provided state is not BSEC-open)

Bits 23:16 **AUTH_HDPL[7:0]:** level at which debug may be opened.
0xB4: Level 0
0x51: Level 1
0x8A: Level 2
0x6F: Level 3
Others: undefined

Bits 15:8 **UNLOCK[7:0]:**
0xB4: Cortex-M nonsecure debug possible when the level indicated in BSEC_HDPLMSR is greater than or equal to the level given by AUTH_HDPL
Others: Cortex-M debug not possible (provided state is not BSEC-open)

Bits 7:0 Reserved, must be kept at reset value.

6.5.20 BSEC AP unlock (BSEC_AP_UNLOCK)

Address offset: 0xE90

Reset value: 0x0000 0000

Secure privileged read and write only. Writeable only on a BSEC-closed device, once per warm reset. Illegal reads return 0, illegal writes are ignored. Reset to zero on *bsec_srst* (cold reset).

When the state is BSEC-open, the *ap_unlocked* output to the DBG_MCU block is set to 0xB4. and the register is zeroed. When the BSEC state is not BSEC-open, it takes the value of the 8-bit UNLOCK field.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UNLOCK[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **UNLOCK[7:0]:**
0xB4: Unlock the DBG_MCU AP interface.
Others: Do not unlock.

6.5.21 BSEC HDPL for Cortex-M status register (BSEC_HDPLMSR)

Address offset: 0xE94

Reset value: 0x0000 00B4

Secure privileged read only, by trusted domain or Cortex-M. Illegal reads return 0, writes are ignored. Reset to 0xB4 on *bsec_rst* (warm reset).

When coding a value of less than 3, it can be incremented by writing 0x60B166E7 to BSEC_HDPLMCR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HDPL[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **HDPL[7:0]:** current HDPL for Cortex-M
0xB4: Level 0
0x51: Level 1
0x8A: Level 2
0x6F: Level 3
Others: undefined

6.5.22 BSEC HDPL for Cortex-M control register (BSEC_HDPLMCR)

Address offset: 0xE98

Reset value: 0x0000 0000

Secure privileged write only by trusted domain or Cortex-M. Illegal reads return 0, writes are ignored.

When BSEC_HDPLMSR codes a value of less than 3, BSEC_HDPLMSR can be incremented by writing 0x60B166E7 to BSEC_HDPLMCR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
INCR_HDPL[31:16]

INCR_HDPL[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **INCR_HDPL[31:0]**: Increment HDPL for Cortex-M
When HDPL is less than 3, writing 0x60B1 66E7 increments HDPL by one in BSEC_HDPLMSR.
Otherwise, writes are ignored. Reads return zero.

6.5.23 BSEC next HDPL control register for Cortex-M (BSEC_NEXTHDPLMCR)

Address offset: 0xE9C

Reset value: 0x0000 0000

Secure privileged read and write only, by trusted domain or Cortex-M. Illegal reads return 0, writes are ignored. Reset to 0 on *bsec_rst* (warm reset).

This value determines the amount to add to the level indicated by BSEC_HDPLMSR to output to the SAES on obk_hdpl

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	INCR[1:0]	
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **INCR[1:0]**: Increment

Amount to add to the level indicated by BSEC_HDPLMSR to generate *obk_hdpl[7:0]* output (clamped at 3).

6.5.24 BSEC debug control register for Cortex-A (BSEC_DBGACR)

Address offset: 0xEAC

Reset value: 0x0000 0000

Secure privileged access by trusted domain only. Writeable only on a BSEC-closed device, once per warm reset. Illegal reads return 0, illegal writes are ignored. Reset to zero on *bsec_rst* (warm reset).

The AUTH_HDPL byte field indicates a temporal isolation level, as follows: the value 0xB4 means level 0, the value 0x51 means level 1, the value 0x8A means level 2, and the value 0x6F means level 3. All other byte values are undefined.

On a BSEC-closed device, debug is only possible on Cortex-A if BSEC_DBGACR[UNLOCK] = 0xB4, and the HDPL level indicated in BSEC_HDPLASR is non-zero and reaches or surpasses that indicated by BSEC_DBGACR[AUTH_HDPL]. In this case, secure debug is only possible if BSEC_DBGACR[AUTH_SEC] = 0xB4.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

UNLOCK[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw								

Bits 31:24 **AUTH_SEC[7:0]:**

0xB4: Cortex-A secure debug possible when UNLOCK = 0xB4 and the level indicated in BSEC_HDPLASR is greater than or equal to the level indicated by AUTH_HDPL

Others: secure debug not possible (provided state is not BSEC-open)

Bits 23:16 **AUTH_HDPL[7:0]:** level at which Cortex-A debug may be opened.

0xB4: Level 0

0x51: Level 1

0x8A: Level 2

0x6F: Level 3

Others: undefined

Bits 15:8 **UNLOCK[7:0]:**

0xB4: Cortex-A nonsecure debug possible when the level indicated in BSEC_HDPLASR is greater than or equal to the level given by AUTH_HDPL

Others: Cortex-A debug not possible (provided state is not BSEC-open)

Bits 7:0 Reserved, must be kept at reset value.

6.5.25 BSEC HDPL for Cortex-A status register (BSEC_HDPLASR)

Address offset: 0xEB4

Reset value: 0x0000 00B4

Secure privileged read only, by trusted domain or Cortex-A. Illegal reads return 0, writes are ignored. Reset to 0xB4 on *bsec_hrst* (hot reset).

When coding a value of less than 3, it can be incremented by writing 0x60B166E7 to BSEC_HDPLACR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 7:0 **HDPL[7:0]:** current HDPL for Cortex-A

0xB4: Level 0

0x51: Level 1

0x8A: Level 2

0x6F: Level 3

Others: undefined

6.5.26 BSEC HDPL for Cortex-A control register (BSEC_HDPLACR)

Address offset: 0xEB8

Reset value: 0x0000 0000

Secure privileged write only, by trusted domain or Cortex-A. Illegal reads return 0, writes are ignored.

When BSEC_HDPLASR codes a value of less than 3, BSEC_HDPLASR can be incremented by writing 0x60B166E7 to BSEC_HDPLACR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **INCR_HDPL[31:0]**: Increment HDPL for Cortex-A

When HDPL is less than 3, writing 0x60B1 66E7 increments HDPL by 1 in BSEC_HDPLASR.

Otherwise, writes are ignored. Reads return zero.

6.5.27 BSEC next HDPL control register for Cortex-A (BSEC_NEXTHDPLACR)

Address offset: 0xEBC

Reset value: 0x0000 0000

Secure privileged read and write only, by trusted domain or Cortex-A. Illegal reads return 0, writes are ignored. Reset to zero on *bsec_hrst* (hot reset)

This value determines the amount to add to the level indicated by BSEC_HDPLASR to output to the SAES on obk_hdpl.

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **INCR[1:0]**: Increment

Amount to add to the level indicated by BSEC_HDPLASR to generate *obk_hdpl[7:0]* output (clamped at 3).

6.5.28 BSEC write once scratch register x (BSEC_WOSCRx)

Address offset: 0xF40 + 0x4 * x (x = 0 to 7)

Reset value: 0x0000 0000

This register is reset when *bsec_rst* is asserted.

Secure privileged read and write only. Illegal reads return 0, illegal writes are ignored. Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
WOSDATA[31:16]															
rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo

WOSDATA[15:0]															
rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo	rwo

Bits 31:0 **WOSDATA[31:0]**: Write once scratch data

ROM code can use this register to store values that needs to be persistent across hot resets. It is writable once, reset by either cold or warm BSEC reset.

6.5.29 BSEC hot reset count register (BSEC_HRCR)

Address offset: 0xFE8

Reset value: 0x0000 0000

This register is reset when *bsec_rst* is asserted.

Secure privileged read only (return 0 otherwise). Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HRC[31:16]

HRC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **HRC[31:0]**: Hot reset counter

This bitfield counts the number of hot resets since the last BSEC cold/warm reset.
See *Section 6.3.3: BSEC reset and clocks* for details about resets.

6.5.30 BSEC warm reset count register (BSEC_WRCR)

Address offset: 0xFEC

Reset value: 0x0000 0000

This register is reset when *bsec_srst* is asserted.

Secure privileged read only (return 0 otherwise). Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

WRC[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **WRC[31:0]**: Warm reset counter

This bitfield counts the number of warm resets since the last BSEC cold reset.
See *Section 6.3.3: BSEC reset and clocks* for details about resets.

6.5.31 BSEC version register (BSEC_VERR)

Address offset: 0xFF4

Reset value: 0x0000 0012

Secure privileged read access only (return 0 otherwise). Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJREV[3:0]				MINREV[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision

Bits 3:0 **MINREV[3:0]**: Minor revision

6.5.32 BSEC identification register (BSEC_IPIDR)

Address offset: 0xFF8

Reset value: 0x0010 0033

Secure privileged read access only (return 0 otherwise). Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ID[31:0]**: BSEC identification

6.5.33 BSEC size identification register (BSEC_SIDR)

Address offset: 0xFFC

Reset value: 0xA3C5 DD04

Secure privileged read access only (return 0 otherwise). Only trusted domain or Boot ROM code can access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

SID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **SID[31:0]**: BSEC size identification

This bitfield returns the size identification code of the BSEC IP as defined below:
Bits[31:8] = 0xA3C5DD (fixed code)
Bits[7:0] = 0x04 (4 Kbytes address decoding)

6.5.34 BSEC register map

1. See register description.

Refer to *Section 2.4* for the register boundary addresses.

7 OTP mapping (OTP)

The STM32MP21xx devices have 12288 OTP (one-time programmable) bits which can be read-accessed in 384 words: BSEC_OTP_DATAx (x = 0 to 383).

The OTP bits are read or programmed by the BSEC (boot, security and OTP control). See *Section 6: Boot and security control (BSEC)*.

Before being programmed, the OTP bit is at zero. The OTP words are described in the table below.

OTP are organized into the following regions:

- lower OTP (OTP0 to OTP127)
- mid OTP (OTP128 to OTP255)
- upper OTP (OTP256 to OTP383)

The OTP word most relevant properties are listed in the following columns:

- Description: OTP word acronym and function
- Shadowed: OTP word is shadowed into a register after reset. A shadowed word may be read/write, read only, or no access, according to shadowed type column.
- Wired: OTP word is shadowed with a wired connection in the device.
- D1STDBY: OTP is used by the boot ROM at D1 Standby exit.
- Owner: ST side: OTP word is programmed by STMicroelectronics at factory level.
  Customer side: OTP can be programmed by the application.
- Shadowed type: A shadow register can be read/write, read only, no access.

Table 33. STM32MP21xx OTP mapping

The following OTP words are described in details in *Table 34: STM32MP21xx OTP fuse description (lower OTP region)* or by BSEC:

- OTP0 to OTP4 are used by BSEC for the security life cycle (see *Section 6: Boot and security control (BSEC)*).
- OTP9 is used to code device part number (see *Section 81: Device electronic signature*).
- OTP10 to OTP22 are used for the boot ROM configuration.
- OTP104 to OTP 111 are used for analog calibration parameters set in ST factory.
- OTP112 to OTP 119 are used for engineering purposes and are set in ST factory.
- OTP120 to OTP123 are used for settings such as analog trimming and are set in ST factory.
- OTP124 is used for the product configuration by the user.
- OTP125 to OTP 127 are used for memory repair and are set in ST factory.

Table 34: STM32MP21xx OTP fuse description (lower OTP region) provides the bit-level description and other word properties in the following columns:

- wplock:
  - y: permanent programming lock by factory programming

Key storage in OTP

Keys are represented as a string of byte to be stored in consecutive OTP words. For example a 64-bit key (0xAABBCCDDEEFF5566) is stored into two consecutive OTP words KEY0 and KEY1.

A key is stored in OTP words using one of the following formats

- Format 1 KEY0 = 0xAABBCCDD, KEY1 = 0xEEFF5566
- Format 2 KEY0 = 0xDDCCBBAA, KEY1 = 0x6655FFEE
- Format 3 KEY0 = 0xEEFF5566, KEY1 = 0xAABBCCDD

Table 34. STM32MP21xx OTP fuse description (lower OTP region)(1)

OTP words/ bits	Name/description	wplock(2)	Detailed description
OTP0	OTP_HW_WORD0	y	OTP check word (virgin -> non virgin)
OTP1	OTP_HW_WORD1	-	OTP security word to close security state BSECXW
OTP2	OTP_HW_WORD2	-	OTP word for re-opening (CLOSE->OPEN) via RMA password: RMA bits
OTP3	OTP_HW_WORD3	-	OTP Word for re-opening (CLOSE->OPEN) via RMA password: RMA tries bits
OTP4	OTP_HW_WORD4	-	OTP word for TK retries (ECIES)
OTP5	ID0	y	ID0 for engineering purposes
OTP6	ID1	y	ID1 for engineering purposes
OTP7	ID2	y	ID2 for engineering purposes
OTP8	OTP_CID_PROV	y	OTP word for CID provisioning control
7 to 0	prov_cid_switch_enabling	-	Enable/disable provisioning cid for rsse_fw 0x0F (enabled): provisioning cid switching is enabled for rsse_fw. 0xFF (disabled): provisioning cid switching is permanently disabled. OTP8[7:0] to be programmed to 0x0F for life cycle state CLOSED_LOCKED_UNPROVD and OTP8[7:0] to be programmed to 0xFF for life cycle state CLOSED_LOCKED_PROVD.
31 to 8	Reserved	-	-
OTP9	RPN_CODING	y	-
OTP10	BOOTROM_CONFIG_1	-	-
0	chip_cpbk_y_sign	-	0 (positive): Device public key Y is positive 1 (negative): Device public key Y is negative
1	stkeyprov_ecies_ok	-	Status of ECIES ST key provisioning when it was attempted. 0 (failed): ECIES ST key provisioning last attempt was failed 1 (successful): ECIES ST key provisioning last attempt was successful

Table 34. STM32MP21xx OTP fuse description (lower OTP region)(1) (continued)

OTP words/ bits	Name/description	wplock(2)	Detailed description
2	stkeyprov_hwkey_done	-	0 (no): HWKEY not provisioned 1 (yes): HWKEY was provisioned
3 to 6	security_counter	-	Security counter involved in productID for device certificate verification by HSM-OEM in RSSe_prov context
7 to 14	st_pub_key_id	-	ST ECDSA public key ID (ST key instance fuse part) involved in productID for device certificate verification by HSM-OEM in RSSe_prov context
15 to 18	rssefw_active_signing_key	-	[1-0xFF] → [1-8]: Value of monotonic counter is X where X is position of the most significant bit at 1. 8 possible ST public keys (ST key revocation feature for RSSe_FW authentication)
19 to 26	nb_added_stsecrets	-	0: no additional ST secrets [1-63]: number of OTP words located in upper area [360-nb_added_stsecrets..359] that were provisioned with ST secrets.
27 to 31	Reserved	-	-
OTP11	BOOTROM_CONFIG_2	-	boot source configuration word
0 to 4	Reserved	-	-
5	no_cpu_pll	-	0 (enabled): PLLs for CPU/AXI are enable for cold boot. 1 (disabled): PLLs for CPU/AXI are not enable for cold boot
6 to 9	Reserved	-	-
10 to 14	no_data_cache	-	0b00001: disables USART2 0b00010: disables UART5 0b00100: disables UART6
15	no_data_cache	-	0 (enabled): Data cache is used by boot ROM. 1 (disabled): Data cache is not used by boot ROM.
16 to 23	boot_source_disable	-	Each bit disables a boot source. Default to UART if all disabled. 0b00000001 : disable FMC boot source. 0b00000010 : disable QSPI NOR boot source. 0b00000100 : disable eMMC boot source. 0b00001000 : disable SD boot source. 0b00010000 : disable UART boot source. 0b00100000 : disable USB boot source. 0b01000000: disable QSPI NAND boot source. 0b10000000: disable QSPI HyperFlash boot source.
24 to 25	bootpins_layout_sel	-	[0-3]: Select one among the three possible BOOT pin layouts
26 to 29	boot_source_sel	-	[0-15]: Select one among the 16 possible boot source of the selected BOOT pin layout
30	dont_boot_on_cfm_tamper	-	0: boot on confirmed tamper 1: do not boot on confirmed tamper
31	Reserved	-	-

Table 34. STM32MP21xx OTP fuse description (lower OTP region)(1) (continued)

OTP words/ bits	Name/description	wplock(2)	Detailed description
OTP12	BOOTROM_CONFIG_3	-	-
0 to 31	oem_fsbla_monotonic_counter	-	[1-0xFFFF] -> [1-32]: Value of monotonic counter is X where X is position of the most significant bit at 1.
OTP13	Reserved by ST	y	-
OTP14	Reserved by ST	y	-
OTP15	Reserved by ST	y	-
OTP16	BOOTROM_CONFIG_7	-	-
0	disable_traces	-	0 (no): boot ROM traces are enabled 1 (yes): boot ROM traces are disabled
1	disable_hse_freq_detect	-	0 (no): HSE frequency autodetection is enabled 1 (yes): HSE frequency autodetection is disabled
2	disable_hse_bypass_detect	-	0 (no): HSE bypass detection is enabled 1 (yes): HSE bypass detection is disabled
3	disable_blocking_failure_ traces	-	0 (no): blocking failure traces are enabled 1 (yes): blocking failure traces are disabled
4	a35_mode	-	0 (aarch64): FSBL-A is AArch64 1 (aarch32): FSBL-A is AArch32
5	fmc_force_sw_reset	-	FMC is used by CA35 to connect a NAND and by CM33 to connect a NOR or PSRAM 0 (no): Use RCC to reset FMC 1 (yes): Use software procedure to reset FMC without impacting CM33
6	emergency_debug_req	-	0 (no): emergency debug is not requested 1 (yes): emergency debug is requested
7	emmc_128k_boot_partition	-	0 (no): Boot ROM does not support *e*•MMC with 128Kb boot partition. 1 (yes): boot ROM supports *e*•MMC with 128 Kb boot partition.
8	fsbl_decrypt_prio	-	0 (speed): use CRYP (fast but no DPA protection) 1 (security): use SAES (slow but DPA protection)
9	Reserved	-	-
10	Reserved	-	-
11 to 13	HSE_value	-	0b000 (auto): HSE value is autodetected among 16, 20, 24, 28, 32, 36, 40, 48 MHz 0b001 (24 MHz): HSE = 24 MHz 0b010 (25 MHz): HSE = 25 MHz 0b011 (26 MHz): HSE = 26 MHz 0b100 (19_2 MHz): HSE = 19.2 MHz 0b101 (40 MHz): HSE = 40 MHz 0b110 (48 MHz): HSE = 48 MHz 0b111 (unused): Reserved
14	snand_need_plane_select_1	-	0 (no): Serial NAND plane select is not needed 1 (yes): Serial NAND plane select is need

Table 34. STM32MP21xx OTP fuse description (lower OTP region)(1) (continued)

OTP words/ bits	Name/description	wplock(2)	Detailed description
15 to 17	snand_need_plane_select_1	-	0 (unset): ECC unset 1 (hamming): ECC 1bit (Hamming) 2 (bch4): ECC 4bit (BCH4) 3 (bch8): ECC 8bit (BCH8) 4 (ondie): on-die ECC
18	pnand_bus_width_1	-	0 (8-bits): data width is 8-bits 1 (16-bits): data width is 16-bits
19 to 26	pnand_bus_width_1	-	[1-256]: Number of block = 256 * value
27 to 28	nand_block_size_1	-	[1-4]: Block size in number of pages
29 to 30	nand_page_size_1	-	0 (64): 64 pages per block 1 (128): 128 pages per block 2 (256): 256 pages per block
31	pnand_param_stored_in_otp	-	0 (no): Boot ROM uses ONFI parameter table to get parallel nand parameters. 1 (yes): parallel nand parameters are defined in bank1 or bank2, depending on nand_config_distribution value.
OTP17	BOOTROM_CONFIG_8	-	-
0 to 7	oem_active_signing_key1	-	[1-256] -> [1-8]: Value of monotonic counter is X where X is position of the most significant bit at 1. 8 possible OEM public keys (OEM key revocation feature for OEM-FSBL authentication).
8	oem_keys2_enable	-	0 (no): keys2 are not used; keys1 are used for both FSBLA and FSBLM. 1 (yes): keys2 are enabled; keys1 are used for FSBLA; keys2 are used for FSBLM.
16 to 31	Reserved	-	-
OTP18	BOOTROM_CONFIG_9	-	-
0 to 3	secure_boot	-	0 (unlocked): device is in CLOSED_UNLOCKED state. Secure boot is not enforced (FSBL authentication is not mandatory). [1-15] (locked): device is in CLOSED_LOCKED state. Secure boot is enforced (FSBL authentication is mandatory).
4 to 7	prov_done	-	0: RSSE provisioning is not done [1-15]: RSSE provisioning is done
8 to 11	debug_lock	-	Lock debug enabling until next reset when device is CLOSED-LOCKED. 0: does not lock debug enabling [1-15]: locks debug enabling
12 to 15	otp_prov_done	-	0: RSSe OTP provisioning is not done [1-15]: RSSe OTP provisioning part done, used to manage RSSe extension issue
16 to 21	Reserved	-	-

Table 34. STM32MP21xx OTP fuse description (lower OTP region)(1) (continued)

OTP words/ bits	Name/description	wplock(2)	Detailed description
22	ns_epoch_enable		0: Boot ROM does not manage NS_EPOCH. The BOOTROM_NS_EPOCH monotonic counter fuse bits are free for other use. 1: Boot ROM manages NS_EPOCH. The Boot ROM uses BOOTROM_NS_EPOCH monotonic counter fuse bits.
23 to 26	fingerprint_enable		0 (no): fingerprint feature is disabled 1 (yes): fingerprint feature is enabled
27 to 31	Reserved	-	-
OTP19	BOOTROM_CONFIG_10	-	-
0 to 31	oem_keys2_enable	-	Monotonic version number of OEM-FSBL [1-0xFFFF] -> [1-32]: Value of monotonic counter is X where X is position of the most significant bit at 1.
OTP20	BOOTROM_CONFIG_11	-	-
0	nand_config_distribution	-	0 (bk1_snand_bk2_pnand): pNAND config in nand*_2 fields / sNAND config in nand*_1 fields 1 (bk1_pnand_bk2_snand): pNAND config in nand*_1 fields / sNAND config in nand*_2 fields
1	snand_need_plane_select_2	-	idem BOOTROM_CONFIG_7.snand_need_plane_select_1

8 Resource isolation framework security controller (RIFSC)

8.1 Introduction

Resource isolation framework (RIF) is a comprehensive set of hardware blocks designed to enforce and manage isolation of STM32 hardware resources, like memory and peripherals.

The RIFSC (RIF security controller) is composed of three sets of registers, each managing a specific set of hardware resources:

- **RISC** registers associated with **RISUP** logic (resource isolation slave unit for peripherals), assign all non RIF-aware peripherals to zero, one or any security domains (secure, privilege, compartment).
- **RIMC** registers: associated with **RIMU** logic (resource isolation master unit for address space protection), assign all non RIF-aware bus master to one security domain by setting secure, privileged, and compartment information on the system bus. Alternatively, the RISUP logic controlling the slave port access to a peripheral can assign target bus attributes to this peripheral master port (supported attribute: CID).

8.2 RIFSC main features

- As a RIF core component, assign specific device resources to security domains: isolating resources defined as peripherals and some variable sized address space regions
- Centralized set of registers controlling the RIF logic associated to legacy slave peripheral targets: RISUP
- Centralized set of registers controlling the RIF logic associated to master ports of legacy peripherals: RIMU
- Support for legacy master port RIF attribute inheritance from configuration port programming (supported attribute: CID)
- Secure guard: legacy master port forced to non-secure when its associated configuration port is programmed non-secure
- Built-in hardware semaphores to change dynamically ownership of peripheral resources
- Each compartment CPU can see only the interrupt events of the legacy peripheral resources allocated to it
- Support to RIF special debug domain, with greater accesses for debugger used in secure or non-secure global debug sessions

8.3 RIFSC implementation

RIMU

Master port RIF protections in this device (using RIMU) are defined in *Table 37*. Possible inheritance from RISUP of RIF configuration is also defined.

Table 37. RIMU resource assignment

Index(1)	Master name	CID at reset	RISUP(2) inheritance
-	CPU1 (Cortex-A35)	0x1	No
-	CPU2 (Cortex-M33)	0x2	
0	Trace (ETR)	0x0	
1	SDMMC1	RISUP76	CID, secure guard(3)
2	SDMMC2	RISUP77	
3	SDMMC3	RISUP78	
4	OTG_HS	RISUP66	
5	USBH	RISUP63	
6	ETH1	RISUP60	
7	ETH2	RISUP61	
10	DCMIPP (camera)	RISUP87	
11	LTDC L1 or L2	0x0	No
12	LTDC L3		

1. When no index is written, the CID values are hardcoded, and the master manages security.
2. When applicable, the corresponding CIDSEL bit is available in RIFSC_RIMC_ATTRx.
3. The master is forced by hardware to non-secure when its associated RISUP is programmed non-secure.

Note: All DMA instances (HPDMA, LPDMA) are not mentioned, as they automatically manage the CID to use on their master ports (0 to 2, or 0 to 3 only), inheriting the value from the CPU that controls a given channel.

RISUP

Table 38 defines the index of the non-RIF-aware peripherals managed by the RIFSC (RISUP blocks) and the IAC. Few RIF-aware peripherals are also listed.

When a peripheral is used by multiple security domains (like multiple CPU codes), the RCC implements specific clock and reset access control registers, using a dedicated *rcc* index, also shown in this table.

Table 38. Indexes for non-RIF-aware peripherals (RISUP)

RIFSC, RCC, and IAC common programming

To program the RISUP and the RCC, and to read back illegal access information in the IAC, refer to *Section 5.4: Resource isolation framework (RIF)*.

8.4 RIFSC functional description

8.4.1 RIFSC block diagrams

The RIFSC is composed of two sets of registers, each managing a specific set of hardware resources: RIMU and RISUP

RIFSC and RIMU block diagram

The following figures show the RIMU block diagrams, associated with its master on the interconnect, and the RIFSC peripheral. RISUP inheritance is defined in *Section 8.3*.

Figure 18. RIMU block diagram (without inheritance)

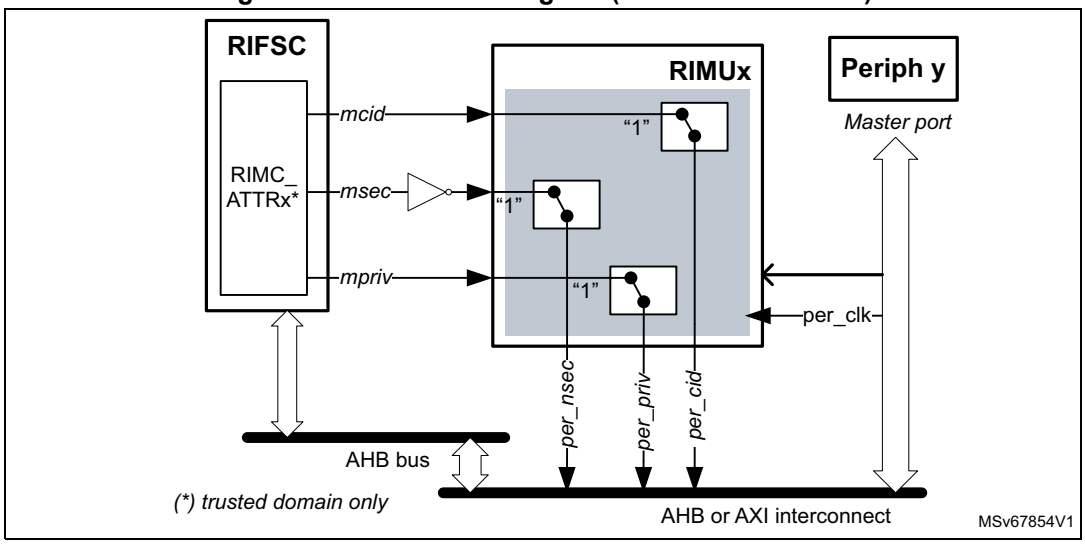

Figure 19. RIMU block diagram (with inheritance from RISUP programming)

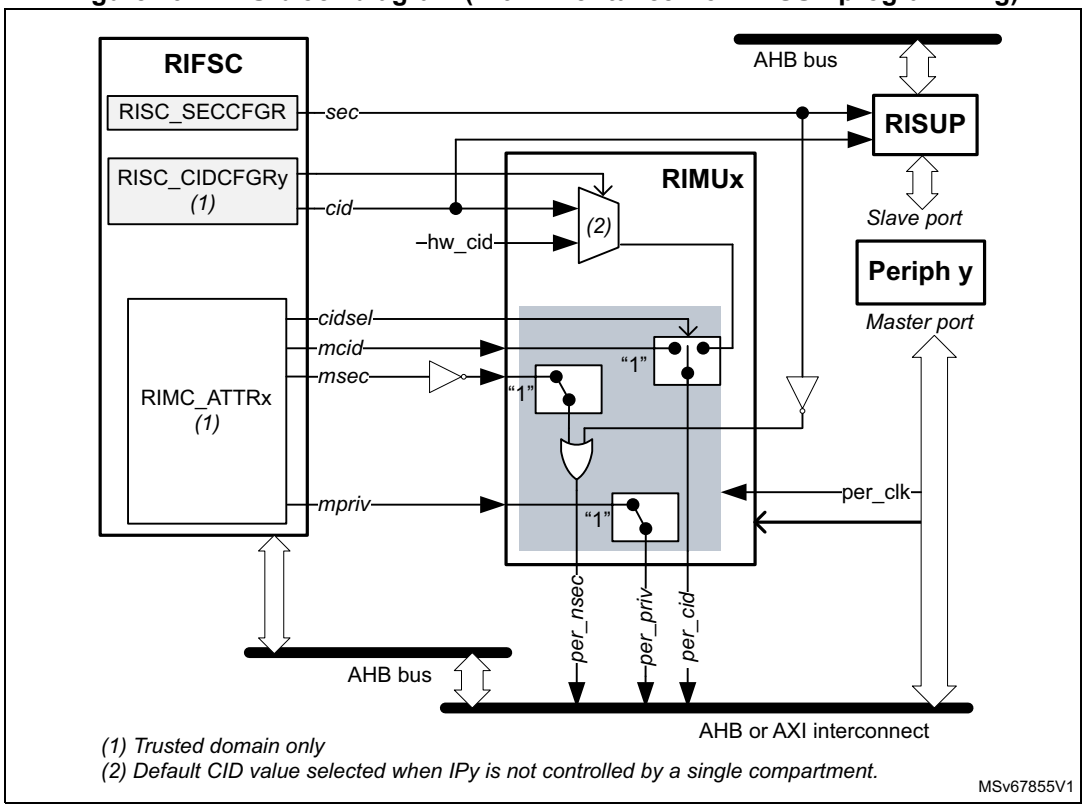
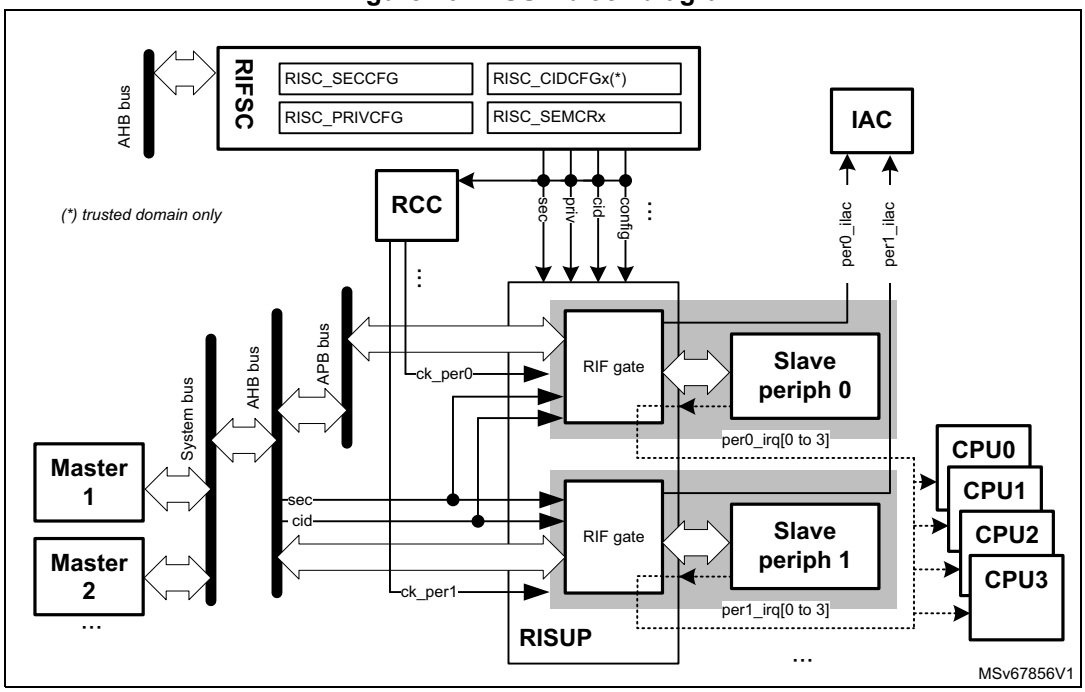


RIFSC and RISUP block diagram

Figure 20 shows the block diagram of the RISUP, associated with its slaves on the interconnect, the IAC, and the RIFSC peripherals.

The RISUP logic protecting a peripheral uses information from the RIFSC to determine which security, privilege, and compartment are allowed to go through. There is also inheritance between the access right to the peripheral and the access to the corresponding clocking and reset bits in the RCC peripheral.

Figure 20. RISUP block diagram



8.4.2 RIFSC internal signals

Table 40 and *Table 41* describe some internal signals available at, respectively, RIMU and RISUP logic levels.

Table 40. RIMU internal input/output signal

Name	Type	Description
per_clk	Digital input	Peripheral master port bus clock

Table 41. RISUP internal input/output signals

Name	Type	Description
ck_perX	Digital input	Peripheral x kernel clock from RCC
ilac	Digital output	Illegal access signal to IAC

8.4.3 RIFSC reset and clocks

RIMU and RISUP logics share the same clock and the same reset as the resource they are protecting.

The RIFSC has a single reset. After a SoC general reset (power-on reset), all non RIF-aware peripherals become non-secure and unprivileged, reachable by any CID.

8.4.4 RIFSC control of masters (RIMU)

RIMC registers in RIFSC, associated with the RIMU logic, assign bus master x to a security domain by setting secure, privileged, and compartment information on the system bus using RIMC_ATTRx registers. Alternatively, when clearing the corresponding SEL bit in RIMC_ATTRx, the bus attribute of the master port x is taken from the RISUP that controls the access to slave port of this peripheral x (supported attribute: CID).

RIMC registers must be initialized by a trusted domain application after the device reset. Optionally this application can set the GLOCK bit in RIMC_CR, preventing further writes to all RIMC registers. This bit can be cleared only by a power-on reset.

If a trusted domain application programs a compartment ID equals 4, 5, or 6 using the MCID[2:0] bitfield, these masters are usually sand boxed to dedicated chunk of memories, and have a reduced set of peripherals and GPIOs.

Note: In the STM32MP21xx device, CID 7 is reserved for multicore debugging (see Section 5.4.7: RIF special security domain: debug domain).

8.4.5 RIFSC control of debug access port (DAP)

For the protection of the DAP master port, a specific hardware has been implemented in the device. The table below summarizes how the DAP peripheral performs its accesses on the interconnect, based on the debug profile selected by the secure application in the device.

Table 42. DAP compartment ID allocation

Debug profile	CPU debug	MCUs debug	DAP CID value	Comment
Microcontroller debug	No	Yes	same as Cortex-M33 (0x2)	In this profile, both MCUs can be debugged. Only peripherals accessible to Cortex-M33 can be accessed by the DAP, if security and privilege allow it.
Application processor debug	Yes	No	same as Cortex-A35 (0x1)	Only peripherals accessible to Cortex-A35 can be accessed by the DAP, if security and privilege allow it.
Global debug (MCUs and CPU)	Yes	Yes	Any CID (default: 0x7)	DAP CID is defined by DAPCID bitfield in RIMC_CR. DAPCID is writable by secure, non-secure, privileged or unprivileged DAP.

Three important notes are linked to this table:

- In **microcontroller** and **application processor debug** modes, the DAP has exactly the same right in the RIF as the Cortex core under debug (Cortex-M or Cortex-A).
- In **non-secure global debug mode,** when DAPCID = 0x7, the DAP in privileged mode can access (in read and write) all non-secure resources without changing the RIF configuration.
- In **secure global debug mode,** when DAPCID = 0x7, the DAP in privileged mode can access (in read and write) any resources in the device (peripheral and memory), including registers reserved to the trusted domain.

The way to set up these debug profiles in the device is explained in *Section 6.3.11: BSEC debug and trace control*.

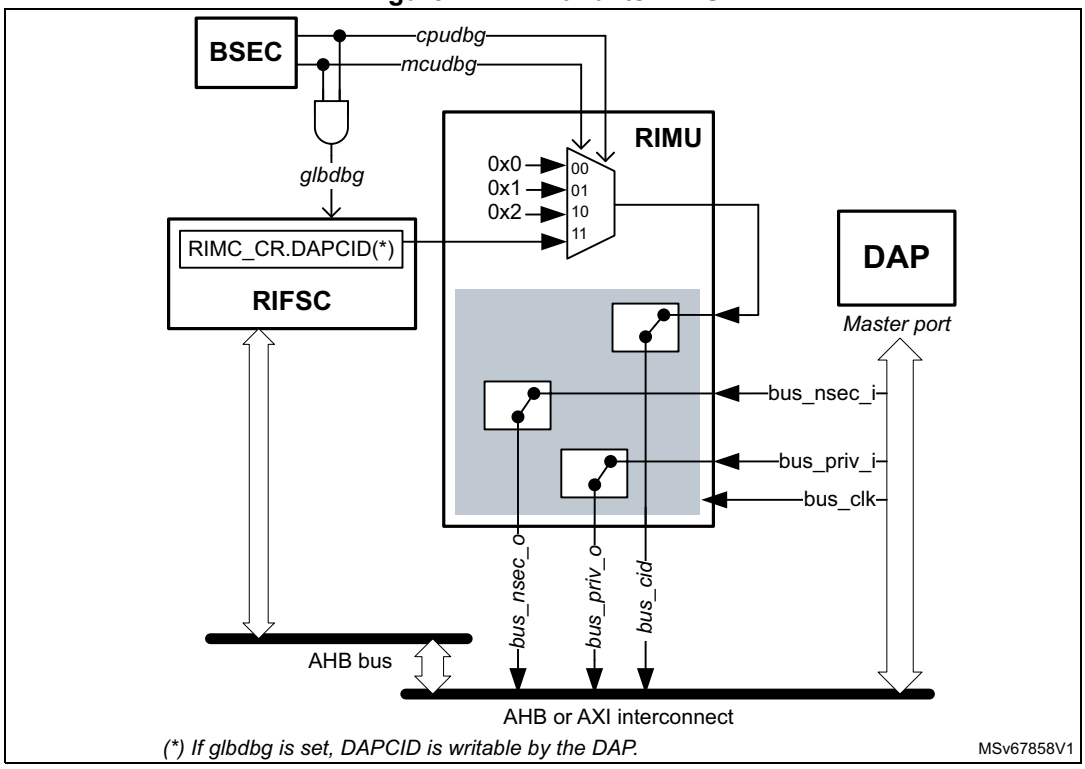
Figure 21 illustrates how BSEC, DAP, RIMU, and RIMC are integrated. If a global debug profile is selected in BSEC (CPU + MCU debug activated), the DAPCID bitfield in RIMC_CR is writable by secure, non-secure, privileged, or unprivileged DAP. The GDPEN bit is also set in RIMC_SR. If any other debug profile is selected, RIMC_CR can be written only by a trusted domain application.

Note: When no debug profile is selected, the DAP CID is zero.

When DAPCID is left with its default value (0x7), the DAP is assigned to the RIF debug domain, when a global debug profile is selected.

DAP privileged level is not defined by RIMU. Hence, if debug tools define the DAP as unprivileged, its access can be rejected by the target even if DAPCID = 0x7.

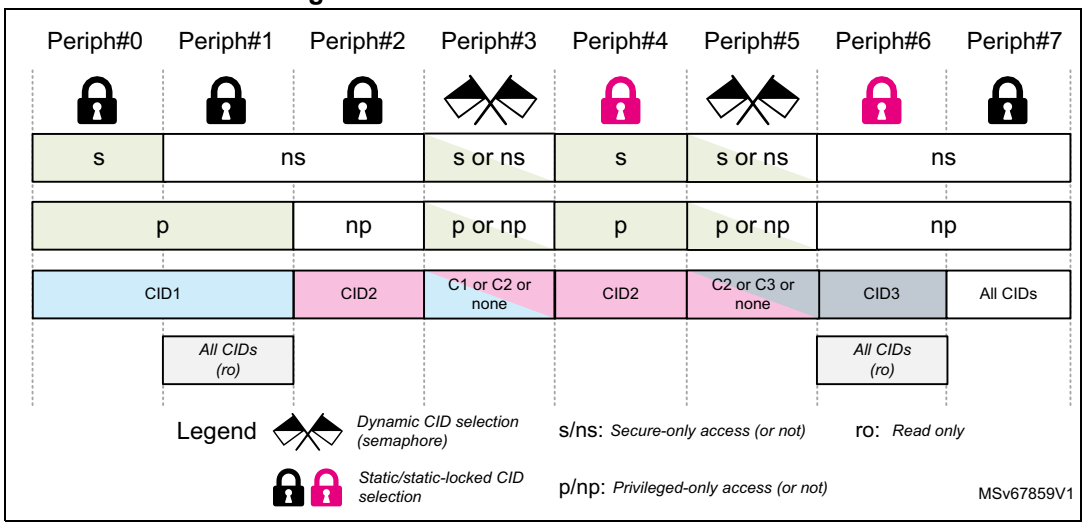
Figure 21. DAP and its RIMU



8.4.6 RIFSC control of peripherals (RISUP)

RISC registers in RIFSC, associated with the RISUP logic, assign non-RIF aware peripherals to none, one or any security domain (secure, privilege, compartment). The figure below illustrates the principle of this allocation.

Figure 22. Allocation of RISUP resources



For each peripheral, the RIF allows the following policies:

- any compartment access (default configuration)
- single-compartment access, statically defined by the trusted domain application
- single-compartment access, dynamically taken by non-trusted domain applications, granted by the trusted domain
- no compartment access, statically configured by the trusted domain application

Note: For the first three cases, the filtering based on secure and privileged always applies.

At any point in time, the trusted domain application can lock the RIF configuration of a peripheral until the next reset, by setting the RLOCK bit in RISC_RCFGLOCKR.

As defined in *Section 5.4: Resource isolation framework (RIF)*, the debug domain (privileged) must be granted following accesses when activated:

- A secure debug domain can read and write anywhere in the device, including registers reserved for the trusted domain.
- A non-secure debug domain can only access (in read and write) peripherals that are tagged by the application as non-secure.

RISUP application information

To assign statically the peripheral x to the compartment y, a trusted domain application must set SCID to CIDy and CFEN to 1 in RISC_PERx_CIDCFGR. An application in compartment y can then set or clear the SECx bit in RISC_SECCFG, and the PRIVx bit in RISC_PRIVCFGR, if the security and privilege of the access are sufficient.

To grant statically the peripheral x to any compartment, a trusted domain application must clear CFEN bit to 0 in RISC_PERx_CIDCFGR. An application in any compartment can then set or clear SECx in RISC_SECCFG, and PRIVx in RISC_PRIVCFGR, if the security and privilege of the access are sufficient.

Note: Only a secure privileged application can write to RISC_SECCFGR, while only a privileged application can write to RISC_PRIVCFGR.

The SECx bit in RISC_SECCFG controls the secure access to PRIVx in RISC_PRIVCFGR.

The dynamic assignment of peripheral x to compartment y1 or y2 is done as follows:

- A trusted domain application sets the white-listed SEMWLCy1 and SEMWLCy2 bits in RISC_PERx_CIDCFGR. The SEM_EN and CFEN bits must also be set.
- An application running in Cy1 or Cy2 compartment can now take the SEM_MUTEX bit in RISC_PERx_SEMCR, by setting it to 1. When SEM_MUTEX = 0, the first white-listed application that takes this bit owns it (only this application can clear the MUTEX bit.
- When the RISUP semaphore takes the peripheral x and associated clocking, the reset bits in the RCC peripheral become accessible to the application that has taken the semaphore. This application can then set or clear SECx in RISC_SECCFG, and PRIVx in RISC_PRIVCFGR, if the security and privilege of the access are sufficient. If the applications running in other compartments try to access this peripheral, the reads return zero and the writes are ignored.

Note: At any time, a trusted domain application can reset the peripheral x semaphore by clearing then setting SEM_EN in RISC_PERx_CIDCFGR.

When the trusted domain needs to prevent any compartment to access a peripheral x, the recommended procedure is the following:

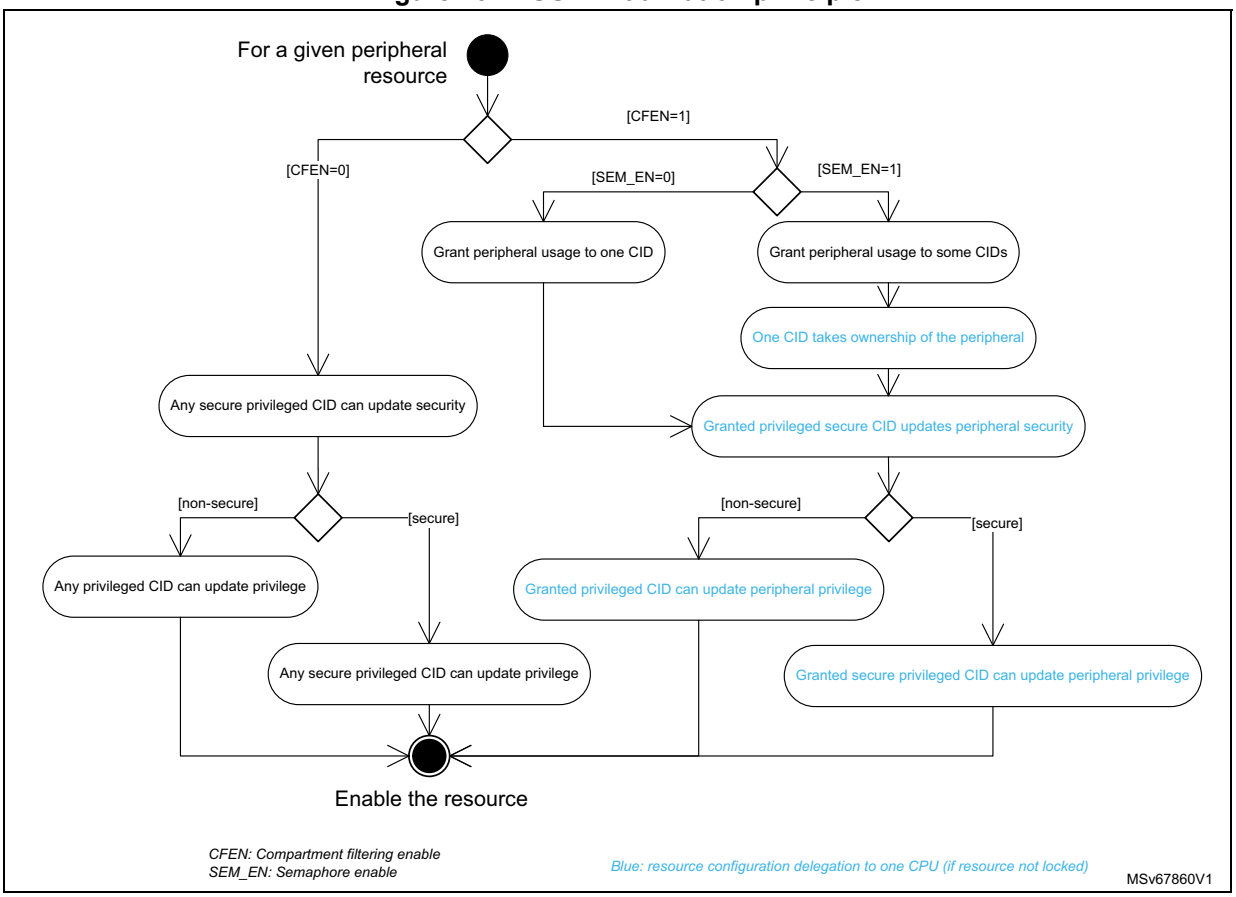
1. Mask illegal access interrupts from peripheral x in IAC_IER register.
2. Set RISC_CIDCFGRx to statically assign it to TDCID.
3. Set RCC_xCFGR with default values.
4. Reset all SEMWLCy bits, and set SEM_EN and CFEN bits in RISC_PERx_CIDCFGR.

From that point, no applications can take the semaphore, hence the access to the peripheral is prevented.

Note: Steps 2 to 3 are not needed if the RCC bits corresponding to this peripheral are at the default values.

The above methods are summarized in the figure below.

Figure 23. RISUP initialization principle



8.4.7 Managing illegal accesses

RIF component RISUP does not use the standard interrupt lines toward NVIC or GIC concentrators. The IAC captures all RIF interrupt events, called illegal access events.

Refer to *Section 11: Illegal access controller (IAC)* for more information on the way illegal accesses are managed.

8.5 RIFSC registers

These registers are accessible through the register interface of the RIFSC peripheral.

Registers *Section 8.5.1* to *Section 8.5.6* are slave control registers for peripherals.

Registers *Section 8.5.7* and *Section 8.5.9* are master configuration registers.

If security and privileged policy allows it, the debug domain traffic goes through, regardless of any CID filtering policy.

8.5.1 RIFSC RISC slave configuration register x (RIFSC_RISC_CR)

Address offset: 0x000

Reset value: 0x0000 0000

Secure privileged, trusted domain CID write access only. Any read access is allowed on this register. Writes are ignored if GLOCK is set.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GLOCK
															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **GLOCK**: Global lock

This bit locks the configuration of RIFSC RISC registers until next reset. This bit is cleared by default and, once set, it cannot be reset until global RIFSC reset.

0: RIFSC RISC registers are writable.

1: All writes to RIFSC RISC registers are ignored, except RIFSC_RISC_PERy_SEMCR.

8.5.2 RIFSC RISC slave security configuration register x (RIFSC_RISC_SECCFGRx)

Address offset: 0x010 + 0x4 * x, (x = 0 to 5)

Reset value: 0x0000 0000

Non-secure or unprivileged writes to this register are ignored, while any read is allowed. Writes are ignored if GLOCK is set in RIFSC_RISC_CR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SEC{i + 32 * x}															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SEC{i + 32 * x}															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SEC{i + 32 * x}**: Security configuration for peripheral {i + 32 * x} (i = 0 to 31)

0: Secure and non-secure data access are granted to the peripheral {i + 32 * x}.

1: Secure data access only are granted to the peripheral {i + 32 * x}.

*Note: Regardless of SEC value, any execute access to peripheral {i + 32 * x} triggers a bus error.*

*If the compartment filtering for peripheral {i + 32 * x} is enabled (resp. disabled) using CFEN in RIFSC_RISC_PERy_CIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if privilege and security of the access is sufficient.*

Authorized compartment is defined as SCID if SEM_EN = 0 in RIFSC_RISC_PERy_CIDCFGR. If SEM_EN = 1, it is equal to SEMCID, if SEM_MUTEX = 1 in RIFSC_RISC_PERy_SEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

8.5.3 RIFSC RISFC slave privileged register x (RIFSC_RISC_PRIVCFGRx)

Address offset: 0x030 + 0x4 * x, (x = 0 to 5)

Reset value: 0x0000 0000

Unprivileged writes to this register are ignored, while any read is allowed. Writes are ignored if GLOCK is set in RIFSC_RISC_CR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PRIV{i + 32 * x}															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PRIV{i + 32 * x}															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PRIV{i + 32 * x}**: Privileged-only access permission for peripheral {i + 32 * x} (i = 0 to 31)

0: Privileged and unprivileged data access are granted to the peripheral {i + 32 * x}.

1: Privileged data access only are granted to the peripheral {i + 32 * x}.

*Note: If corresponding SEC{i + 32 * x} bit is set in RIFSC_RISC_SECCFGRx, this bit can only be written by a secure privileged application.*

*If the compartment filtering for peripheral {i + 32 * x} is enabled (resp. disabled) using CFEN in RIFSC_RISC_PERy_CIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if privilege and security of the access is sufficient.*

Authorized compartment is defined as SCID if SEM_EN = 0 in RIFSC_RISC_PERy_CIDCFGR. If SEM_EN = 1, it is equal to SEMCID, if SEM_MUTEX = 1 in RIFSC_RISC_PERy_SEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

8.5.4 RIFSC RISC slave resource configuration lock register x (RIFSC_RISC_RCFGLOCKRx)

Address offset: 0x050 + 0x4 * x, (x = 0 to 5)

Reset value: 0x0000 0000

Secure privileged, trusted domain CID write access only. Any read access is allowed on this register. Writes are ignored if GLOCK is set in RIFSC_RISC_CR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RLOCK{i + 32 * x}															
rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RLOCK{i + 32 * x}															
rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:0 **RLOCK{i + 32 * x}**: rRsource lock for peripheral {i + 32 * x} (i = 0 to 31)
This bit is set to lock the peripheral resource {i + 32 * x}. It is cleared by default and, once set, this bit cannot be cleared until the RIFSC RISC peripheral is reset.
0: SEC{i + 32 * x} in RIFSC_RISC_SECCFGRx and PRIV{i + 32 * x} in RIFSC_RISC_PRIVCFGRx are writable. RIFSC_RISC_PERy_CIDCFGR is writable.
1: Writes to SEC{i + 32 * x} and PRIV{i + 32 * x} are ignored. Writes to RIFSC_RISC_PERy_CIDCFGR register are ignored.

8.5.5 RIFSC RISC slave peripheral y CID configuration register (RIFSC_RISC_PERy_CIDCFGR)

Address offset: 0x100 + 0x8 * y, (y = 0 to 127)

Reset value: 0x0000 0000

Secure privileged, trusted domain CID write access only. Any read access is allowed on this register. Writes are ignored if GLOCK is set in RIFSC_RISC_CR, or if RLOCKy is set in RIFSC_RISC_RCFGLOCKRx.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEMWLC7	SEMWLC6	SEMWLC5	SEMWLC4	SEMWLC3	SEMWLC2	SEMWLC1	SEMWLC0
								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCID[2:0]			Res.	Res.	SEM_EN	CFEN
									rw	rw	rw			rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **SEMWLCi**: Semaphore white list for compartment i (i = 7 to 0)
0: Application running in compartment i cannot get access to peripheral y through the semaphore SEM_MUTEX.
1: Application running in compartment i can get access to peripheral y through the semaphore SEM_MUTEX.
Note: This bit is not taken into account by RISC when the semaphore is disabled (SEM_EN = 0) or compartment filtering is off (CFEN = 0).

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:4 **SCID[2:0]**: Static CID
The trusted domain application uses this bitfield to statically define which compartment has access to the peripheral y when SEM_EN = 0.
Note: This CID is not taken into account by RISC when the semaphore is enabled (SEM_EN = 1) or compartment filtering is off (CFEN = 0).

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **SEM_EN**: Semaphore enable
0: Access to peripheral y is granted only if CID of the access equals to SCID.
1: Access to peripheral y is granted only if SEM_MUTEX = 1 and CID of the access equals to SEMCID in RIFSC_RISC_PERy_SEMCR.
Note: This bit is not taken into account by RISC if the compartment filtering is off (CFEN = 0). When this bit is cleared from 1 by the trusted domain application, SEM_MUTEX is cleared to zero by RISC.

Bit 0 **CFEN**: CID filtering enable

0: Compartment-based filtering defined in RIFSC_RISC_PERy_CIDCFGR and optionally RIFSC_RISC_PERy_SEMCR is disabled for peripheral y.

1: Compartment-based filtering defined in RIFSC_RISC_PERy_CIDCFGR and optionally RIFSC_RISC_PERy_SEMCR is enabled for peripheral y.

For any CFEN value, access controls to peripheral y defined in RIFSC_RISC_PRIVCFGRx and RIFSC_RISC_SECCFGRx always apply.

Note: When this bit is cleared from 1 by the trusted domain application, SEM_MUTEX is cleared to zero by RISC.

8.5.6 RIFSC RISC slave peripheral y semaphore control register (RIFSC_RISC_PERy_SEMCR)

Address offset: 0x104 + 0x8 * y, (y = 0 to 127)

Reset value: 0x0000 0000

If the compartment filtering is disabled (CFEN = 0) or the semaphore is disabled (SEM_EN = 0) in RIFSC_RISC_PERy_CIDCFGR, any write to this register is ignored.

Privileged-only write if PRIVy is set in RIFSC_RISC_PRIVCFGRx. Secure-only write if SECy bit is set in RIFSC_RISC_SECCFGRx.

If compartment filtering is enabled and semaphore is enabled (CFEN = SEM_EN = 1), only an authorized compartment can write to this register. For this register, the authorized compartment is equal to SEMCID if SEM_MUTEX = 1, else it is defined by the CID white list (SEMWLCy) in register RIFSC_RISC_PERy_CIDCFGR. There is no authorized compartment if the semaphore is disabled (SEM_EN = 0).

Any read access is allowed to this register. The debug domain is managed like any other masters, when activated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEMCID[2:0]			Res.	Res.	Res.	SEM_ MUTEX
									r	r	r				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **SEMCID[2:0]**: Semaphore current CID

When SEM_EN and CFEN are set in RIFSC_RISC_PERy_CIDCFGR, this read-only bitfield is updated with the CID value of the latest successful acquisition of RIFSC_RISC_PERy_SEMCR semaphore (SEM_MUTEX = 1).

In all the other cases, this bitfield stays unchanged.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **SEM_MUTEX**: Semaphore mutex

A white-listed application can set this bit to get exclusive access to peripheral y when SEM_EN is set in RIFSC_RISC_PERy_CIDCFGR (writes are ignored otherwise).

Read 0: Semaphore is free to take.

Read 1: Semaphore is taken.

Write 0: Release semaphore.

Write 1: Acquire semaphore.

Note: When SEM_MUTEX = 0, only applications belonging to white-listed compartments (defined with SEMWLCi bits in RIFSC_RISC_PERy_CIDCFGR) can acquire this semaphore.

When SEM_MUTEX = 1, only applications belonging to compartment SEMCID can release this semaphore.

This bit is cleared when CFEN or SEM_EN are cleared from 1 by the trusted domain application in RIFSC_RISC_PERy_CIDCFGR.

8.5.7 RIFSC RIMC master configuration register (RIFSC_RIMC_CR)

Address offset: 0xC00

Reset value: 0x0000 8710

Any read access is allowed on this register. Writes are ignored if GLOCK is set in this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DDEN	Res.	Res.	Res.	Res.	DAPCID[2:0]			Res.	TDCID[2:0]			Res.	Res.	WUCD ONE	GLOCK
r					rw	rw	rw		rwo	rwo	rwo			rs	rs

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **DDEN**: Debug domain enable

This read-only bit gives the status on the debug domain feature availability on this device.

0: Debug domain not available

1: Debug domain available

Bits 14:11 Reserved, must be kept at reset value.

Bits 10:8 **DAPCID[2:0]**: Debug access port compartment ID

This bitfield defines the CID of the DAP when GDPEN is set in RIFSC_RIMC_SR.

When DAPCID[2:0] = 0x7, debugging tools have the highest level of debug access, if secure global debug profile is enabled in the BSEC peripheral.

When GDPEN = 0, DAPCID[2:0] can be written by trusted application (TDCID secure privileged). When GDPEN = 1, the DAP can also change this bitfield regardless of the access type (secure, non-secure, privileged, or unprivileged).

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **TDCID[2:0]**: Trusted domain compartment ID

Master with this compartment ID runs the application with the highest level of trust. TDCID[2:0] value is distributed in all the device. This bitfield is write once (subsequent writes are ignored).

Note: Secure privileged write access only. Write only by debug domain and trusted domain CIDs, as defined in this register.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **WUCDONE**: Wake-up CPU done

Setting this bit deactivates the wake-up CPU mechanism described in *Section 5.4: Resource isolation framework (RIF)*. Reading this bit always returns zero.

0: When WUCEN = 1 in RIFSC_RIMC_SR, the trusted domain CID information is fixed to 0x2 (wake-up CPU), else it is defined in this register.

1: Setting this bit clears WUCEN after few cycles. Once WUCEN =0, the trusted domain CID information is defined in this register.

Note: Secure privileged write access only. Write only by debug domain and trusted domain CIDs, as defined in this register (including this bit).

Bit 0 **GLOCK**: Global lock

This bit is used to lock the configuration of RIFSC RIMC registers until next reset. This bit is cleared by default and, once set, it cannot be reset until global RIFSC reset.

0: RIFSC RIMC registers are writable.

1: All writes to RIFSC RIMC registers are ignored.

Note: Secure privileged write access only. Write only by debug domain and trusted domain CIDs, as defined in this register.

8.5.8 RIFSC RIMC master status register (RIFSC_RIMC_SR)

Address offset: 0xC04

Reset value: 0x0000 0000

Any read access is allowed on this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WUCEN	GDPEN
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **WUCEN**: Wake-up CPU enable

This read-only bit is set when the application properly initializes the wake-up CPU mechanism described in *Section 5.4: Resource isolation framework (RIF)*.

0: Wake-up CPU is disabled. The trusted domain CID value is driven by RIFSC_RIMC_CR.

1: Wake-up CPU is enabled. The trusted domain CID value is fixed to 0x2 until the application sets WUCDONE in RIFSC_RIMC_CR (in this case, WUCDONE is cleared after few cycles).

Bit 0 **GDPEN**: Global debug profile enable

This read-only bit is set when the global-debug profile is activated in the device (CPU and MCU debugging allowed).

0: Global-debug profile (CPU + MCU) is not activated.

1: Global-debug profile (CPU + MCU) is activated.

8.5.9 RIFSC RIMC master attribute register x (RIFSC_RIMC_ATTRx)

Address offset: 0xC10 + x * 0x4 (x = 0 to 15)

Reset value: 0x0000 0000

Secure privileged, trusted domain CID write access only. Any read access is allowed on this register. Writes are ignored if GLOCK is set in RIFSC_RIMC_CR register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	MPRIV	MSEC	Res.	MCID[2:0]			Res.	CIDSEL	Res.	Res.
						rw	rw		rw	rw	rw		rw		

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **MPRIV**: Master privileged

Value of the privileged flag on the interconnect for this master, programmed by the trusted domain.

0: This master is unprivileged.

1: This master is privileged.

Bit 8 **MSEC**: Master secure

Value of the secure flag on the interconnect for this master, programmed by the trusted domain.

0: This master is non-secure.

1: This master is secure.

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **MCID[2:0]**: Master CID

Value of the CID flag on the interconnect for this master, programmed by the trusted domain. Valid only if indicated in RIF masters table in *Section 8.3*. This bitfield is not taken into account when CIDSEL = 0 in this register.

This bitfield cannot be written with a value of 0x7 (write to MCID[2:0] is ignored).

Bit 3 Reserved, must be kept at reset value.

Bit 2 **CIDSEL**: CID selection

0: Compartment ID of master x is driven by hardware value or by inheritance to associated RISUP. See master table in *Section 8.3* for details.

1: Compartment ID of master x is defined by MCID[2:0] in this register.

Bits 1:0 Reserved, must be kept at reset value.

8.5.10 RIFSC peripheral protection status register x (RIFSC_PPSRx)

Address offset: 0xFB0 + 0x4 * x, (x = 0 to 3)

Reset value: 0xCFFE FFFF, 0xBFDE 0F3F, 0xF9C3 740C, 0x21DC 7DFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PPEN{i + 32 * x}															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PPEN{i + 32 * x}															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **PPEN{i + 32 * x}**: Peripheral protection enable {i + 32 * x} (i = 0 to 31)

0: RISUP protection to peripheral {i + 32 * x} is not present. The corresponding RIFSC_RISC_PERy_CIDCFGR and RIFSC_RISC_PERy_SEMCR (where y = i + 32 * x) are reserved.

1: RISUP protection to peripheral {i + 32 * x} is present.

8.5.11 RIFSC hardware configuration register 3 (RIFSC_HWCFGR3)

Refer to *Section 2.4* for the register boundary addresses.

9 Resource isolation slave unit for address space protection (block-based) (RISAB)

9.1 RISAB introduction

The RIF (resource isolation framework) is a comprehensive set of hardware blocks designed to enforce and manage isolation of STM32 hardware resources, such as memory and peripherals.

Through RISAB registers, a trusted domain application, or the application to whom the page configuration has been delegated assigns memory pages to one or more security domains (secure, privilege, compartment).

9.2 RISAB main features

- As an RIF core component, the RISAB assigns specific device resources to security domains:
  - Isolating resources defined as fixed sized embedded memory blocks and pages
- Isolation of hardware memory resources based on multiple criteria:
  - Restricted to one or more hardware compartments
  - Secure-only or nonsecure-only
  - Privileged-only or privileged/unprivileged
  - Read-only, write-only, or read/write
- The trusted domain can delegate the resource isolation configuration to the processing environment that owns a page resource.
- Support to RIF special debug domain, with greater accesses for debugger used in secure or non-secure global debug sessions.

9.3 RISAB implementation

Table 44 describes the characteristics of the available instances.

Table 44. RISAB resource assignment

Protected memory	Resource name(1)	Blocks per pages(2)	Number of pages	Memory size (Kbytes)	Default protection(3)
SYSRAM	RISAB1(4)	8	32	128	Secure, privileged or unprivileged, any CID
	RISAB2(5)				
RETRAM	RISAB5				
SRAM1	RISAB3		16	64	Non-secure, privileged or unprivileged, any CID

1. According to the resource name, the reset values of RISAB_HWCFGR1 change, they are 0x05393111 for RISAB1/2/5 and 0x04393111 for RISAB3. Similarly, the reset values of RISAB_HWCFGR2 change: 0x00020000 for RISAB1/2/5, 0x00010000 for RISAB3.
2. The block size is fixed to 512 bytes, the page size to 4 Kbytes.
3. Default protection policy out of reset. When default protection is secure, the reset value of RISAB_PGy_SECCFGR is 0x0000 00FF (instead of 0x0000 0000).

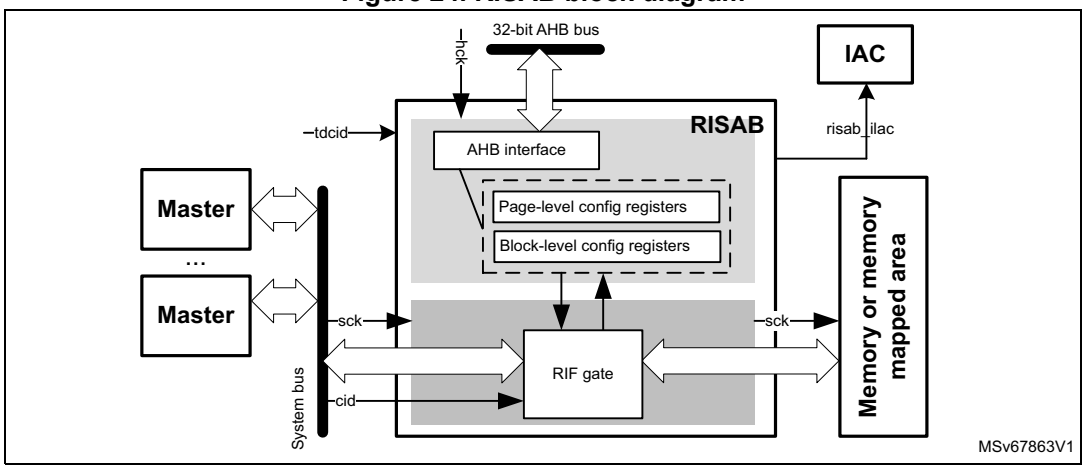
4. Manages pages 0 to 31 of the 256-Kbyte SYSRAM. Only Cortex-A35 can program RISAB1.
5. Manages pages 32 to 63 of the 256-Kbyte SYSRAM. Only Cortex-A35 can program RISAB2.

9.4 RISAB functional description

9.4.1 RISAB block diagram

Figure 24 shows the block diagram of the RISAB, associated with its memory controller on the interconnect (optional), and the IAC peripheral.

Figure 24. RISAB block diagram



9.4.2 RISAB internal signals

Table 45 describes the signals available at RISAB level, not at product level (on pads).

Table 45. RISAB internal input/output signals

Name	Type	Description
risab_sck	Digital input	System bus clock, also used by the protected memory controller
risab_hclk		AHB bus clock
risab_ilac	Digital output	Illegal access signal to IAC

9.4.3 RISAB reset and clocks

The RISAB peripheral has two clocks: one for its AHB register interface, and one for its system bus interface. The system bus clock is shared with the system bus memory controller target.

The RISAB peripheral has a single reset input.

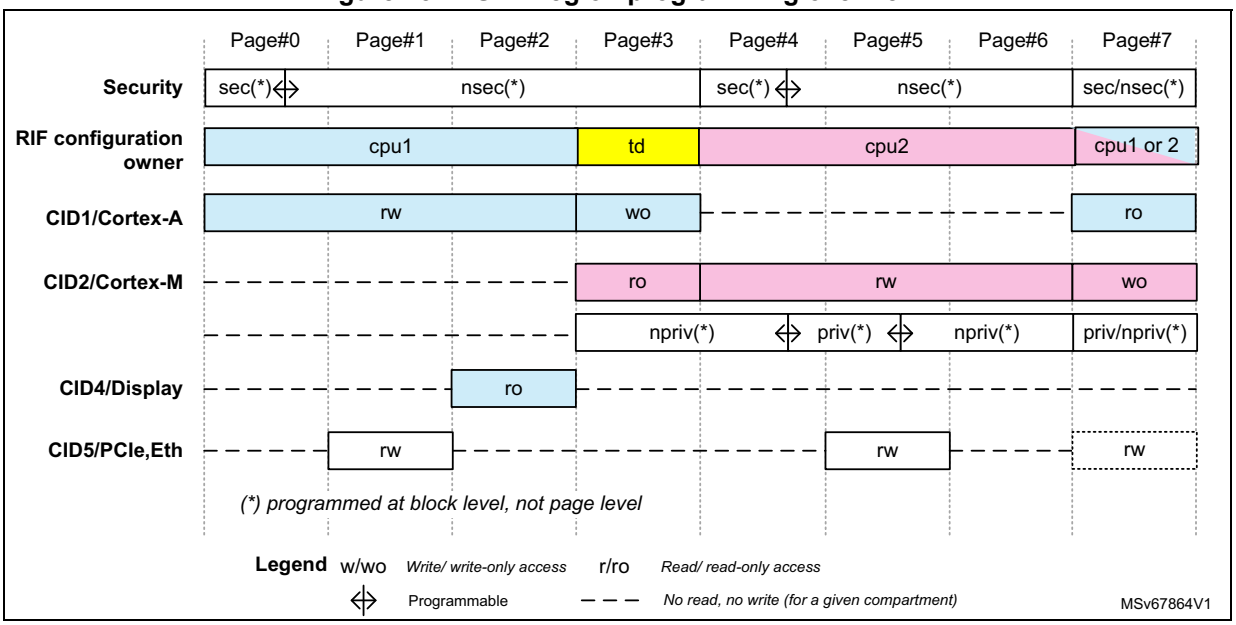
Default RISAB values after a device general reset (power-on reset) are defined in *Section 9.3*.

9.4.4 RISAB address space management

Through RISAB registers, a trusted domain application, or the application to which the page configuration has been delegated, assigns memory pages to one or more security domains (secure, privilege, compartment). *Figure 25* illustrates the principle of this allocation.

Note: Page size is defined in Section 9.3.

Figure 25. RISAB region programming overview



As a Cortex-M defines the configurable regions in its address space with a 256-byte granularity, the RISAB can also be used to allocate secure and privileged access protection, at a lower 512-byte block level. The application can then align Cortex-M, and RISAB secure and privileged regions allocation.

At any time, the trusted domain application can lock the RIF configuration of a page until the next reset, by setting the RLOCK bit in RISAB_RCFGLOCKR.

As defined in *Section 5.4: Resource isolation framework (RIF)*, a debug domain (privileged) must be granted the following accesses, depending on its security:

- A secure debug domain can read and write any RISAB pages. It can also modify registers reserved to the trusted domain.
- For reads (writes), a non-secure debug domain can only access non-secure pages, readable (writeable) by at least one compartment.

Access rules to secure, non-secure, privileged, and unprivileged memory regions are described in *Section 5.4.2: RIF access control*.

9.4.5 RISAB programming

When an application needs to use page x there are two configuration options:

- The trusted domain programs the RIF configuration for this page. In this case, DCEN is cleared in RISAB_PGx_CIDCFGR.
- The trusted domain delegates the RIF configuration to a single CID, defined with DCCID in RISAB_PGx_CIDCFGR. In this case, DCEN must be set in this register.

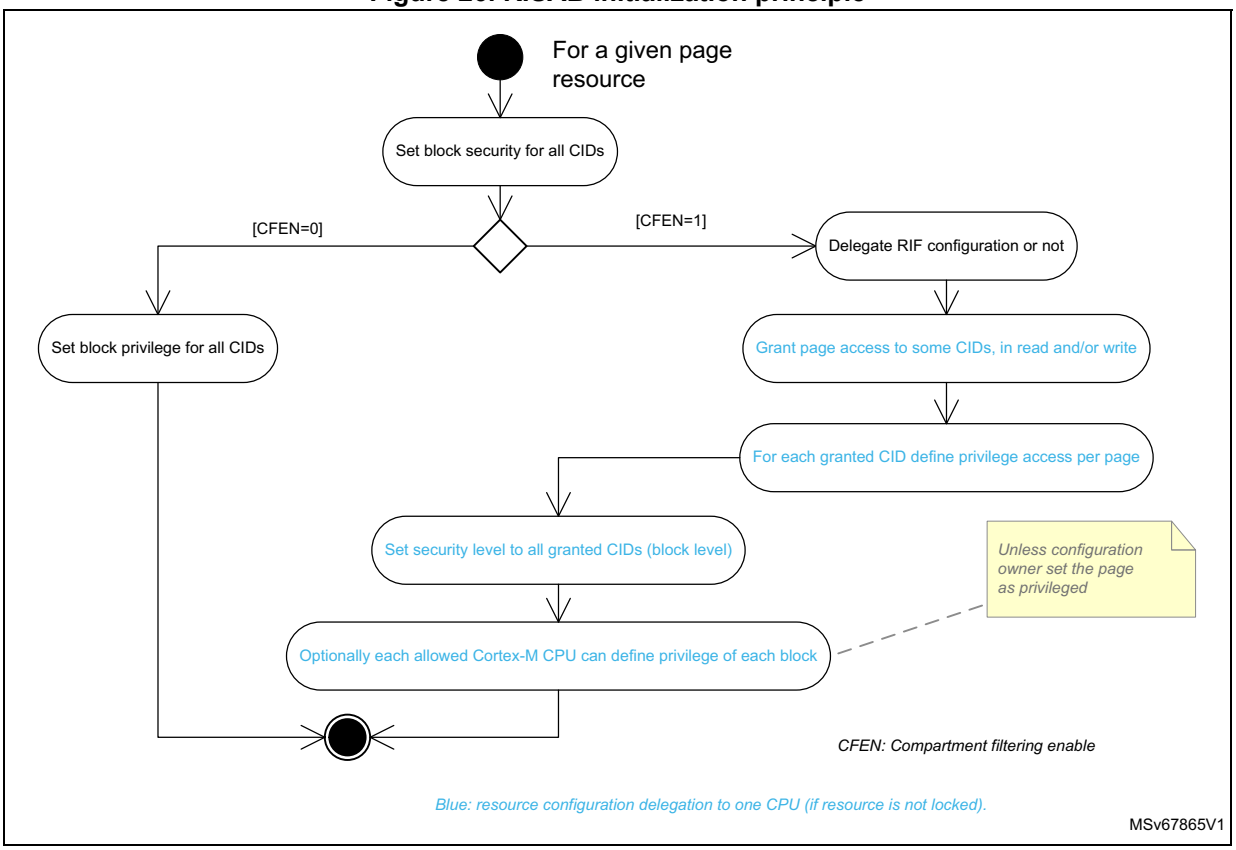
To configure a page x go through the following steps (block and page sizes are defined in *Section 9.3*):

1. Define the security level of each block in the page, using RISAB_PGx_SECCFGR.
2. Define which CIDs can access the page in read and write, and with which privilege, using, respectively RISAB_CIDyRDCFGR, RISAB_CIDyWRCFGR, and RISAB_CIDyPRIVCFGR.
3. Each Cortex-M CPUz can define, if applicable, the privileged level of each block in the page, using RISAB_PGx_CzPRIVCFGR, unless the whole page has been defined privileged by the configuration owner, using RISAB_CIDzPRIVCFGR.

Note: When at least one block is defined secure in RISAB_PGx_SECCFGR, the read, write, and privileged configuration at page level becomes secure-only. This is important when the RIF configuration is delegated (DCEN = 1).

The RISAB initialization method is summarized in *Figure 26*.

Figure 26. RISAB initialization principle



9.4.6 RISAB runtime modification of region or subregion configuration

The RISAB supports on-the-fly update of blocks and pages programming.

9.4.7 Managing illegal accesses

As a RIF component, the RISAB does not use the standard interrupt lines towards NVIC or GIC concentrators. The IAC captures all RIF interrupt events, called illegal access events.

Refer to *Section 11: Illegal access controller (IAC)* for more information on the way illegal accesses are managed.

9.5 RISAB registers

These registers are accessible through the register interface of each RISAB instance. Only word accesses (32 bits) are supported.

If the debug domain feature is activated and security and privileged policy allows it, the debug domain traffic goes through, regardless of any CID filtering policy. If the debug domain feature is deactivated, the CID filtering policy also applies to debug domain traffic.

9.5.1 RISAB configuration register (RISAB_CR)

Address offset: 0x000

Reset value: 0x0000 0000

Secure privileged trusted domain CID write access only. Any read access is allowed on this register. Writes are ignored if GLOCK is set in this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GLOCK
															rs

Bit 31 **SRWIAD**: Secure read/write illegal access disable

When set, this bit allows secure read/write data accesses to nonsecure blocks and pages (secure execute remains illegal).

0: Any secure access to nonsecure blocks or pages is illegal.

1: Secure read/write data access is allowed to nonsecure blocks or pages, while secure execute generates a bus error.

Bits 30:1 Reserved, must be kept at reset value.

Bit 0 **GLOCK**: Global lock

This bit locks the configuration of RISAB registers until next reset. This bit is cleared by default and, once set, cannot be reset until global RISAB reset.

0: RISAB registers are writable.

1: All writes to RISAB registers are ignored, except RISAB_IACR.

9.5.2 RISAB illegal access status register (RISAB_IASR)

Address offset: 0x008

Reset value: 0x0000 0000

Secure privileged trusted domain CID read access only.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IAEF	CAEF
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **IAEF**: Illegal access error flag

This bit is set when an illegal access is detected on the system bus. More details on the error can be found in RISAB_IAESR and RISAB_IADDR.

This bit is cleared by setting the corresponding bit in RISAB_IACR.

Bit 0 **CAEF**: configuration access error flag

This bit is set when an illegal access to any RISAB configuration register is detected. This bit is cleared by setting the corresponding bit in RISAB_IACR.

9.5.3 RISAB illegal access clear register (RISAB_IACR)

Address offset: 0x00C

Reset value: 0x0000 0000

Secure privileged trusted domain CID write access only.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IAEF	CAEF
														w	w

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **IAEF**: Illegal access error flag

Set this bit to clear IAEF in RISAB_IASR, allowing the capture of new error information in RISAB_IAESR and RISAB_IADDR.

Note: Clearing this bit does not clear RISAB_IADDR.

Bit 0 **CAEF**: Configuration access error flag

Set this bit to clear CAEF in RISAB_IASR.

9.5.4 RISAB configuration lock register (RISAB_RCFGLOCKR)

Address offset: 0x010

Reset value: 0x0000 0000

Secure privileged trusted domain CID write access only. Any read access is allowed on this register. Writes are ignored if GLOCK is set in RISAB_CR. Refer to *Section 9.3* for the actual number of blocks per page.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:0 **RLOCKy**: Resource lock for page y (y = 31 to 0)

This bit is set to lock page y resource. It is cleared by default and, once set, cannot be cleared until RISAB is reset.

0: RISAB_PGy_CIDCFGR, RISAB_PGy_SECCFGR, RISAB_PGy_PRIVCFGR, and RISAB_PGy_C2PRIVCFGR are writable. Bit y in RISAB_CIDxPRIVCFGR, RISAB_CIDxRDCFGR, and RISAB_CIDxWRCFGR are writable (x = 0 to 6).

1: Writes to RISAB_PGy_CIDCFGR, RISAB_PGy_SECCFGR, RISAB_PGy_PRIVCFGR, and RISAB_PGy_C2PRIVCFGR are ignored. Writes to bit y in RISAB_CIDxPRIVCFGR, RISAB_CIDxRDCFGR, and RISAB_CIDxWRCFGR are ignored (m = 0 to 6).

9.5.5 RISAB illegal access error status register (RISAB_IAESR)

Address offset: 0x020

Reset value: 0x0000 0000

Secure privileged trusted domain CID read access only.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IANRW	Res.	IASEC	IAPRIV	Res.	IACID[2:0]		
								r		r	r		r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **IANRW**: Illegal access read/write

When IAEF = 1 in RISAB_IASR, IANRW captures the access type of the illegal access that occurred on the system bus.

0: Illegal access was a data read.

1: Illegal access was a data write.

Bit 6 Reserved, must be kept at reset value.

Bit 5 **IASEC**: Illegal access security

When IAEF = 1 in RISAB_IASR, IASEC captures the security type of the illegal access that occurred on the system bus.

0: Illegal access was nonsecure.

1: Illegal access was secure.

Bit 4 **IAPRIV**: Illegal access privileged
When IAEF = 1 in RISAB_IASR, IAPRIV captures the privilege state of the master that issued the illegal access on the system bus.
0: Illegal access was unprivileged.
1: Illegal access was privileged.

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **IACID[2:0]**: illegal access compartment ID
When IAEF = 1 in RISAB_IASR, IACID[2:0] captures the compartment ID of the master that issued the illegal access on the system bus.

9.5.6 RISAB illegal address register (RISAB_IADDR)

Address offset: 0x024

Reset value: 0x0000 0000

Secure privileged trusted domain CID read access only.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IADD[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IADD[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **IADD[31:0]**: Illegal address
When IAEF = 1 in RISAB_IASR, IADD[31:0] captures the address of the erroneous access. Additional information can be found in RISAB_IAESR.

9.5.7 RISAB page y security configuration register (RISAB_PGy_SECCFGR)

Address offset: 0x100 + 0x4 * y (y = 0 to 31)

Reset value: 0x0000 00XX (refer to *Section 9.3* for the actual value)

Nonsecure or unprivileged writes to this register are ignored, all reads are allowed. Writes are ignored if GLOCK is set in RISAB_CR, or RLOCKy is set in RISAB_RCFGLOCKR. Refer to *Section 9.3* for the actual number of blocks per page.

When the compartment filtering and delegated configuration are enabled (CFEN = DCEN = 1 in RISAB_PGy_CIDCFGR), only the compartment DCCID defined in RISAB_PGy_CIDCFGR can write to this register. When the compartment filtering is enabled but delegation is disabled (CFEN = 1, DCEN = 0), only the trusted domain CID can program this register.

When the compartment filtering is disabled (CFEN = 0), any compartment can program this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEC7	SEC6	SEC5	SEC4	SEC3	SEC2	SEC1	SEC0
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **SECz**: Security configuration for block z (z = 7 to 0)

0: Only nonsecure requests can access block z of page y. Secure data access can be granted if SRWIAD = 1 in RISAB_CR (secure instruction fetch triggers a bus error).

1: Only secure requests can access block z of page y.

9.5.8 RISAB page y default privileged configuration register (RISAB_PGy_PRIVCFGR)

Address offset: 0x200 + 0x4 * y (y = 0 to 31)

Reset value: 0x0000 0000

Unprivileged writes to this register are ignored, while all reads are allowed. Writes are ignored if GLOCK is set in RISAB_CR, or RLOCKy is set in RISAB_RCFGLOCKR. Refer to *Section 9.3* for the actual number of blocks per page.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIV7	PRIV6	PRIV5	PRIV4	PRIV3	PRIV2	PRIV1	PRIV0
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PRIVz**: Privileged configuration for block z (z = 7 to 0)

This bit is ignored if the filtering per compartment is activated for page y (CFEN = 1 in RISAB_PGy_CIDCFGR).

0: Privileged and unprivileged access are granted to block z of page y.

1: Only privileged access is granted to block z of page y.

Note: Nonsecure write to this bit is ignored if SECz is set in RISAB_PGy_SECCFGR.

9.5.9 RISAB page y privileged configuration register for compartment 2 (RISAB_PGy_C2PRIVCFGR)

Address offset: 0x600 + 0x4 * y (y = 0 to 31)

Reset value: 0x0000 0000

Unprivileged writes to this register are ignored, all reads are allowed. Writes are ignored if GLOCK is set in RISAB_CR, or RLOCKy is set in RISAB_RCFGLOCKR.

Only a compartment 2 master can write to this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **PRIVz**: Privileged configuration for block z (z = 7 to 0)

This bit is ignored if the filtering per compartment is not activated for page y (CFEN = 0 in RISAB_PGy_CIDCFGR).

0: Compartment 2 privileged and unprivileged accesses are granted to block z of page y, if PRIVy is cleared in RISAB_CID2PRIVCFGR. If PRIVy is set, only privileged access is granted.

1: Only compartment 2 privileged access is granted to block z of page y.

Note: Nonsecure write to this bit is ignored if SECz is set in RISAB_PGy_SECCFGR.

9.5.10 RISAB compartment x privilege configuration register (RISAB_CIDxPRIVCFGR)

Address offset: 0x800 + 0x20 * x (x = 0 to 6)

Reset value: 0x0000 0000

Unprivileged writes to this register are ignored, any read is allowed. Writes are ignored if GLOCK is set in RISAB_CR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PPRIV 31	PPRIV 30	PPRIV 29	PPRIV 28	PPRIV 27	PPRIV 26	PPRIV 25	PPRIV 24	PPRIV 23	PPRIV 22	PPRIV 21	PPRIV 20	PPRIV 19	PPRIV 18	PPRIV 17	PPRIV 16
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PPRIV 15	PPRIV 14	PPRIV 13	PPRIV 12	PPRIV 11	PPRIV 10	PPRIV 9	PPRIV 8	PPRIV 7	PPRIV 6	PPRIV 5	PPRIV 4	PPRIV 3	PPRIV 2	PPRIV 1	PPRIV 0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PPRIVy**: Page y privileged configuration (y = 31 to 0)

PPRIVy is ignored if the filtering per compartment is not activated for page y (CFEN = 0 in RISAB_PGy_CIDCFGR).

Non-secure write to this bit is ignored if any bit is set in RISAB_PGy_SECCFGR, or if DCEN = 0 while CFEN = 1 in RISAB_PGy_CIDCFGR.

Writes are ignored if RLOCKy is set in RISAB_RCFGLOCKR.

0: Privileged and unprivileged access for compartment x are granted to page y.

Note: Additional privilege access control is defined in RISAB_PGy_C2PRIVCFGR.

1: Compartment x unprivileged accesses to page y are blocked (read as 0, write is ignored).

Note: When the delegated configuration is enabled (DCEN = 1 in RISAB_PGy_CIDCFGR), only the compartment DCCID defined in RISAB_PGy_CIDCFGR can write to this bit. When the delegation is disabled (DCEN = 0), only the trusted domain CID can write to this bit.

When the compartment filtering is disabled (CFEN = 0 in RISAB_PGy_CIDCFGR), any compartment can program this bit.

9.5.11 RISAB compartment x read configuration register (RISAB_CIDxRDCFGR)

Address offset: 0x808 + 0x20 * x (x = 0 to 6)

Reset value: 0x0000 0000

Unprivileged writes to this register are ignored, any read is allowed. Writes are ignored if GLOCK is set in RISAB_CR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PRDEN 31	PRDEN 30	PRDEN 29	PRDEN 28	PRDEN 27	PRDEN 26	PRDEN 25	PRDEN 24	PRDEN 23	PRDEN 22	PRDEN 21	PRDEN 20	PRDEN 19	PRDEN 18	PRDEN 17	PRDEN 16
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PRDEN 15	PRDEN 14	PRDEN 13	PRDEN 12	PRDEN 11	PRDEN 10	PRDEN 9	PRDEN 8	PRDEN 7	PRDEN 6	PRDEN 5	PRDEN 4	PRDEN 3	PRDEN 2	PRDEN 1	PRDEN 0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PRDENy**: Page y read access enable (y = 31 to 0)

PRDENy is ignored if the filtering per compartment is not activated for page y (CFEN = 0 in RISAB_PGy_CIDCFGR).

Non-secure write to this bitfield is ignored if any bit is set in RISAB_PGy_SECCFGR, or if DCEN = 0 while CFEN = 1 in RISAB_PGy_CIDCFGR.

Writes are ignored if RLOCKy is set in RISAB_RCFGLOCKR.

0: Compartment x read as 0 when accessing page y.

1: Compartment x can read page y.

Note: When the delegated configuration is enable (DCEN = 1 in RISAB_PGy_CIDCFGR), only the compartment DCCID defined in RISAB_PGy_CIDCFGR can write to this bit. When the delegation is disabled (DCEN = 0), only the trusted domain CID can write to this bit.

When compartment filtering is disabled (CFEN = 0 in RISAB_PGy_CIDCFGR), any compartment can program this bit.

9.5.12 RISAB compartment x write configuration register (RISAB_CIDxWRCFGR)

Address offset: 0x810 + 0x20 * x (x = 0 to 6)

Reset value: 0x0000 0000

Unprivileged writes to this register are ignored, any read is allowed. Writes are ignored if GLOCK is set in RISAB_CR.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PWRENy**: Page y write access enable (y = 31 to 0)

PWRENy is ignored if the filtering per compartment is not activated for page y (CFEN = 0 in RISAB_PGy_CIDCFGR).

Non-secure write to this bitfield is ignored if any bit is set in RISAB_PGy_SECCFGR, or if DCEN = 0 while CFEN = 1 in RISAB_PGy_CIDCFGR.

Writes are ignored if RLOCKy is set in RISAB_RCFGLOCKR.

0: Compartment x write to page y is ignored.

1: Compartment x can write page y.

Note: When the delegated configuration is enable (DCEN = 1 in RISAB_PGy_CIDCFGR), only the compartment DCCID defined in RISAB_PGy_CIDCFGR can write to this bit. When the delegation is disabled (DCEN = 0), only the trusted domain CID can write to this bit.
When compartment filtering is disabled (CFEN = 0 in RISAB_PGy_CIDCFGR), any compartment can program this bit.

9.5.13 RISAB page y CID configuration register (RISAB_PGy_CIDCFGR)

Address offset: 0xA00 + 0x4 * y (y = 0 to 31)

Reset value: 0x0000 0000

Secure privileged trusted domain CID write access only. Any read access is allowed on this register. Writes are ignored if GLOCK is set in RISAB_CR, or RLOCKx is set in RISAB_RCFGLOCKR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCCID[2:0]			Res.	DCEN	Res.	CFEN
									rw	rw	rw		rw		rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **DCCID[2:0]**: Delegated configuration CID

The trusted domain application can use this bitfield to statically define which compartment can program the security domain of page y, if DCEN = 1.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **DCEN**: Delegated configuration enable

This bit defines the access control of RISAB_PGy_SECCFGR, PPRIVy in RISAB_CIDxPRIVCFGR, PRDENy in RISAB_CIDxRDCFGR, and PWRENy in RISAB_CIDxWRCFGR.

0: Bit/register can be written only by trusted domain application.

1: Bit/register can be written only by the compartment DCCID[2:0], defined in this register.

Note: When DCEN is set, the configuration application must be secure if at least one bit is set in RISAB_PGy_SECCFGR.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **CFEN**: CID filtering enable

0: Compartment-based filtering is disabled for page y.

1: Compartment-based filtering is enabled for page y.

Note: For any CFEN value, the access controls to page y, defined in RISAB_PGy_SECCFGR, and RISAB_zzPRIVCFGR (zz = PGy_ if CFEN = 0, zz=PGy_C2 or CIDx if CFEN = 1) always apply.

9.5.14 RISAB hardware configuration register 3 (RISAB_HWCFGR3)

Address offset: 0xFE8

Reset value: 0x0000 0000

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **CFG7[3:0]**: Hardware configuration 7
This bitfield returns the number of pages (LOG_NUM_PAGE).

Bits 23:20 **CFG6[3:0]**: Hardware configuration 6
This bitfield returns the number of blocks per pages (LOG_BLOCKS_PER_PAGE).

Bits 19:16 **CFG5[3:0]**: Hardware configuration 5
This bitfield returns the block size (LOG_BLOCK_SIZE).

Bits 15:12 **CFG4[3:0]**: Hardware configuration 4
This bitfield returns the generic value CID_WIDTH.

Bits 11:8 **CFG3[3:0]**: Hardware configuration 3
This bitfield returns the generic value PRIV_ENABLED.

Bits 7:4 **CFG2[3:0]**: Hardware configuration 2
This bitfield returns the generic value SEC_ENABLED.

Bits 3:0 **CFG1[3:0]**: Hardware configuration 1
This bitfield returns the generic value RIF_ENABLED.

9.5.17 RISAB version register (RISAB_VERR)

Address offset: 0xFF4

Reset value: 0x0000 0010

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

10 Resource isolation slave unit for address space protection (full version) (RISAF)

10.1 RISAF introduction

The RIF (resource isolation framework) is a comprehensive set of hardware blocks designed to enforce and manage isolation of STM32 hardware resources, like memory and peripherals.

Through RISAF registers, a trusted domain application or the application to whom the configuration has been delegated, assigns memory regions and subregions to one or more security domains (secure, privileged, compartment).

RISAF includes the DDR memory cipher engine (DDRMCE) feature.

10.2 RISAF main features

- Assign variable sized address space regions and subregions to security domains.
- Make memory regions:
  - Restricted to one or more than one hardware compartments
  - Secure-only or nonsecure-only
  - Privileged-only or privileged/unprivileged
  - Read-only, write-only, or read/write
- The trusted domain can delegate configuration and positioning of a subregion (within a region) to another security domain.
- The trusted domain can delegate configuration and positioning of a subregion (within a nonsecure region) to a nonsecure privileged software.
- Support of special debug domain with greater accesses in either secure or nonsecure
- When applicable, the DDRMCE can encrypt/decrypt on-the-fly the traffic going to/from the DDR-SDRAM. There are two options:
  - Fast block cipher:
    - > Best performance (128-bit AES ECB cipher)
    - > Uses random key automatically drawn from the RNG peripheral at each power on
  - Block cipher:
    - > Best security (128- or 256-bit AES ECB cipher)
    - > Associated with a side-channel protected key derivation function based on Keccak-400 algorithm published on https://keccak.team

10.3 RISAF implementation

The following table describes the characteristics of the available RISAFs, including watermark programming details (such as granularity and protected address space).

Table 47. RISAF resource assignment

Protected memory	Resource name(1)	Number of base regions	Subregions per base region	Granularity (bytes)	Address space size and alignment(2)	DDRMCE option	Dual port option	Default protection (3)
BKPSRAM	RISAF1	4	2	256	8 Kbytes	No	No	Primary region only: secure, privileged, TDCID only
OCTOSPI1	RISAF2	4		4096	256 Mbytes			
DDR	RISAF4	15			4 Gbytes	Yes	Yes	

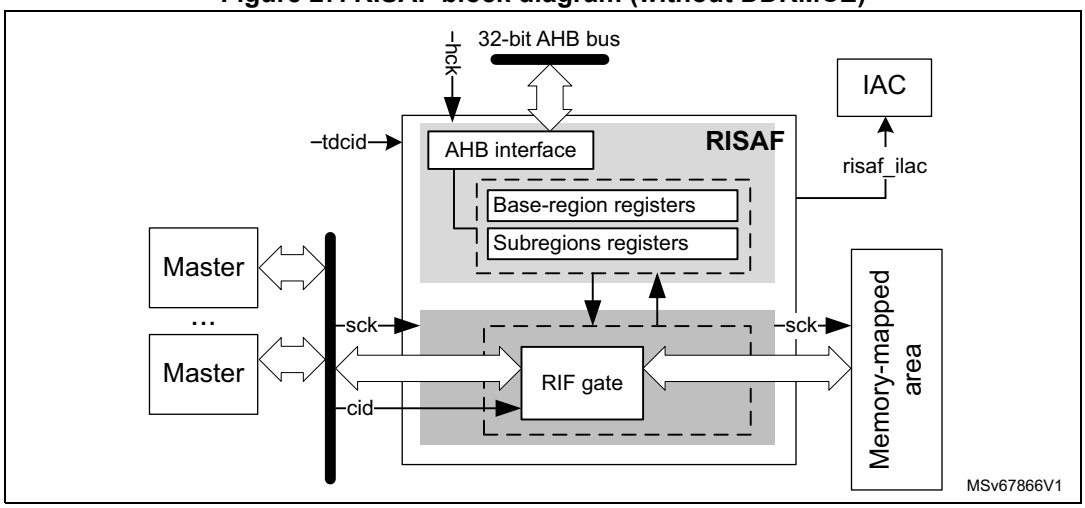
1. According to the resource name, the reset value of RISAF_HWCFGR changes: 0x05080505 for RISAF1, 0x100C0505 for RISAF2, and 0x140C1010 for RISAF4. The reset value of RISAF_IPIDR is 0x00100166 for RISAF1 and RISAF2, and 0x00100167 for RISAF4. The reset value of RISAF_VERR is 0x0000 0010 for RISAF1 and RISAF2, 0x0000 0020 for RISAF4. The reset value of RISAF_SIDR is 0xA3C5 DD01 for RISAF1 and RISAF2, and 0xA3C5 DD08 for RISAF4.
2. When address space size is the full 32-bit address space (4 Gbytes), watermarks are programmed using physical addresses, on 32 bits.
3. Default protection policy out of reset.

10.4 RISAF functional description

10.4.1 RISAF block diagram

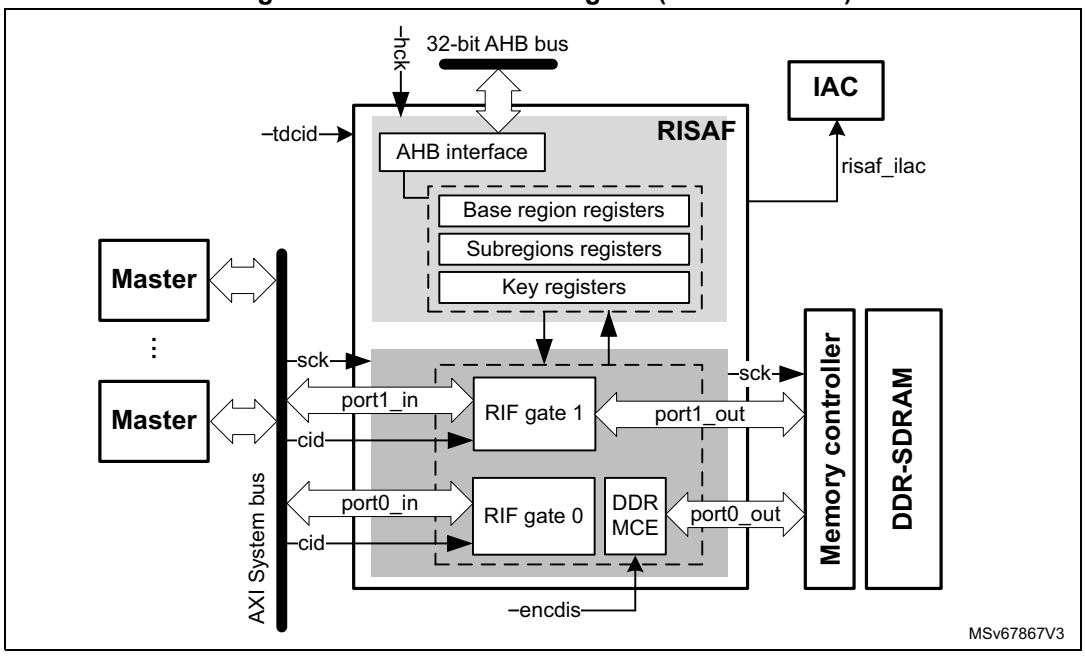
The following figures show the block diagrams of the two RISAF types (single port or dual port with encryption) associated with the IAC, and optionally, a memory controller. Both types are programmed the same way.

Figure 27. RISAF block diagram (without DDRMCE)



1. The tdcid input value is equal to TDCID.

Figure 28. RISAF4 block diagram (with DDRMCE)



10.4.2 RISAF internal signals

Table 48 describes internal signals available at RISAF level, not at product level (on pins).

Table 48. RISAF internal input/output signals

Name	Type	Description
risaf_sck	Digital input	System bus clock, also used by the protected memory controller
risaf_hclk		AHB bus clock
risaf_ilac	Digital output	Illegal access signal to IAC
risaf_encdis	Digital input	Static control signal disabling encryption

10.4.3 RISAF reset and clocks

The RISAF peripheral has two clocks, one for its AHB register interface, and one for its system bus interfaces. The system bus clock is shared with the system bus memory controller target.

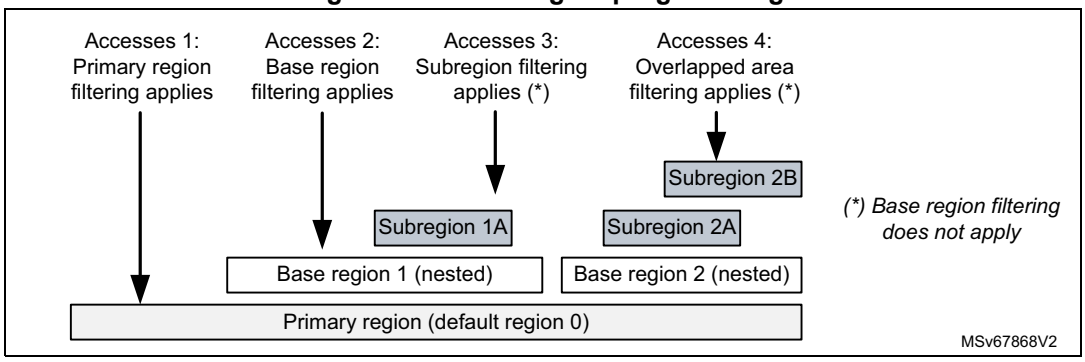
The RISAF peripheral has a single reset input.

Address spaces protected by the RISAF are by default secure, privileged, and TDCID only.

10.4.4 RISAF address space management

Through RISAF registers, a trusted domain application, or the application to whom the configuration has been delegated, assigns memory regions to one or more security domains (secure, privilege, compartment ID). *Figure 29* illustrates the principle of this allocation.

Figure 29. RISAF region programming



As shown in *Figure 29*, there are multiple types of access filtered by RISAF:

- Accesses 1 - Default region: access to an area not belonging to any enabled base region. Filtering for such access is fixed to secure, privileged and TDCID only.
- Accesses 2 - Application region > 0: access to an area in an enabled base region, not belonging to any enabled subregion. Filtering for such access is defined in the base region, where one or more compartments can be granted specific accesses.
- Accesses 3 - Non overlapped subregion: access to an area in an enabled nested subregion. Filtering for such access is defined in the subregion, with only one compartment that can be granted access.
- Accesses 4 - Overlapped subregion: accesses to an area overlapping two enabled nested subregions. In this case, filtering rules for these subregions are used by the RISAF as follows:
  - If both subregions are secure (resp. nonsecure), the overlap is secure (resp. nonsecure).
  - If a subregion is nonsecure (resp. unprivileged), the overlap is nonsecure (resp. unprivileged).
  - If a subregion grants access to a compartment, the access can go through. Up to two compartments can be granted access to an overlapped subregion.

Note: When a base or subregion is disabled, the associated filtering is disabled as well. For access types 3 or 4 (detailed above), base region filtering rules do not apply. When two enabled regions overlap, if one region grants access, the access goes through.

As defined in *Section 5.4: Resource isolation framework (RIF)*, a debug domain (privileged) must be granted the following accesses, depending on its security:

- The secure debug domain can read and write anywhere in the address space protected by RISAF. It can also modify the registers reserved to the trusted domain.
- For reads (resp. writes), the nonsecure debug domain can only access regions that are tagged by an application as nonsecure, readable (resp. writable) by at least one compartment.

Access rules to secure, nonsecure, privileged, and unprivileged memory regions are described in *Section 5.4: Resource isolation framework (RIF)*.

10.4.5 RISAF programming

Only the trusted domain can set up the access configuration to base region x through RISAF_REGx_CFGR, RISAF_REGx_CIDCFGR, RISAF_REGx_STARTR, and RISAF_REGx_ENDR.

The trusted domain, or the application to which the subregion z configuration has been delegated in RISAF_REGx_zNESTR, can set up the access configuration to subregion z of base region x through RISAF_REGx_zCFGR, RISAF_REGx_zSTARTR, and RISAF_REGx_zENDR (z = A or B).

As shown in *Table 49*, subregion right options depend upon the base region privileged and security rights.

Table 49. RISAF subregion security setup matrix

Base region rights	Nested subregion rights			
	Secure, privileged	Secure, unprivileged	Nonsecure, privileged	Nonsecure, unprivileged
Secure, privileged	OK(1)	OK	OK	OK
Secure, unprivileged	Not allowed	OK(1)	Not allowed	OK
Nonsecure, privileged	Not allowed	Not allowed	OK(1)	OK
Nonsecure, unprivileged	Not allowed	Not allowed	Not allowed	OK(1)

1. Default configuration

Configuring base regions in RISAF

The number of regions, the region watermark granularity, and the address space size depend upon the RISAF instance (see *Section 10.3*).

If the trusted domain must use a base region x (for example at boot time), the following steps are recommended.

1. The trusted domain sets start and end addresses for each of the required base region x, using RISAF_REGx_STARTR and RISAF_REGx_ENDR:
   - These registers are initialized with 32-bit physical addresses when the protected address space size is 4 Gbytes. For different sizes, refer to the register description.
   - Base regions must be defined within their primary region. The hardware enforces this rule if the application does not follow it.
2. For each of the above region x, the trusted domain programs RISAF_REGx_CIDCFGR, granting read and/or write access to any compartment.
3. For each of the above region x, the trusted domain finalizes the programming by configuring RISAF_REGx_CFGR, setting up security parameters (secure or encrypted if applicable), and granting privileged-only access, or not, to each compartment that has access to the region (see step *2*).
4. After a final check on the above configuration, the trusted domain enables each required base region x, setting the BREN bit in RISAF_REGx_CFGR.

At any time the trusted domain can lock the RISAF configuration until the next reset, by setting the GLOCK bit in RISAF_CR. Subregion registers are the exception to this rule, as explained in *Configuring subregions in RISAF*.

If the RISAF instance supports encryption (see *Section 10.3*), and if the trusted application requires region x to be encrypted, the recommended steps are:

- When ENC[1:0] = 0x2, the AES key is used directly without key derivation and is shared with all similarly encrypted regions, hence it is recommended to have all these regions secure.
- When ENC[1:0] = 0x1 side-channel protection is activated, impacting performance.
- When ENCDIS = 1 in RISAF_SR, or when the AXI port that receives the transaction does not support encryption (see port 1 in *Figure 28*), all writes to this base region x are ignored and all read requests return 0 if ENC[1:0] = 0x1 or 0x2 and BREN is set in RISAF_REGx_CFGR.

Configuring subregions in RISAF

Note: The number of subregions, the subregion watermark granularity, and the primary region address space size depend on the RISAF resource described in Section 10.3.

When an application needs to use the subregion z defined in the base region x, there are two configuration options in RISAF_REGx_zNESTR:

- The trusted domain programs the RIF configuration for this subregion. In this case DCEN is cleared.
- The secure privileged software delegates the RIF configuration to a single CID, defined with DCCID. In this case DCEN must also be set.

Configuring a subregion z consists in the following steps.

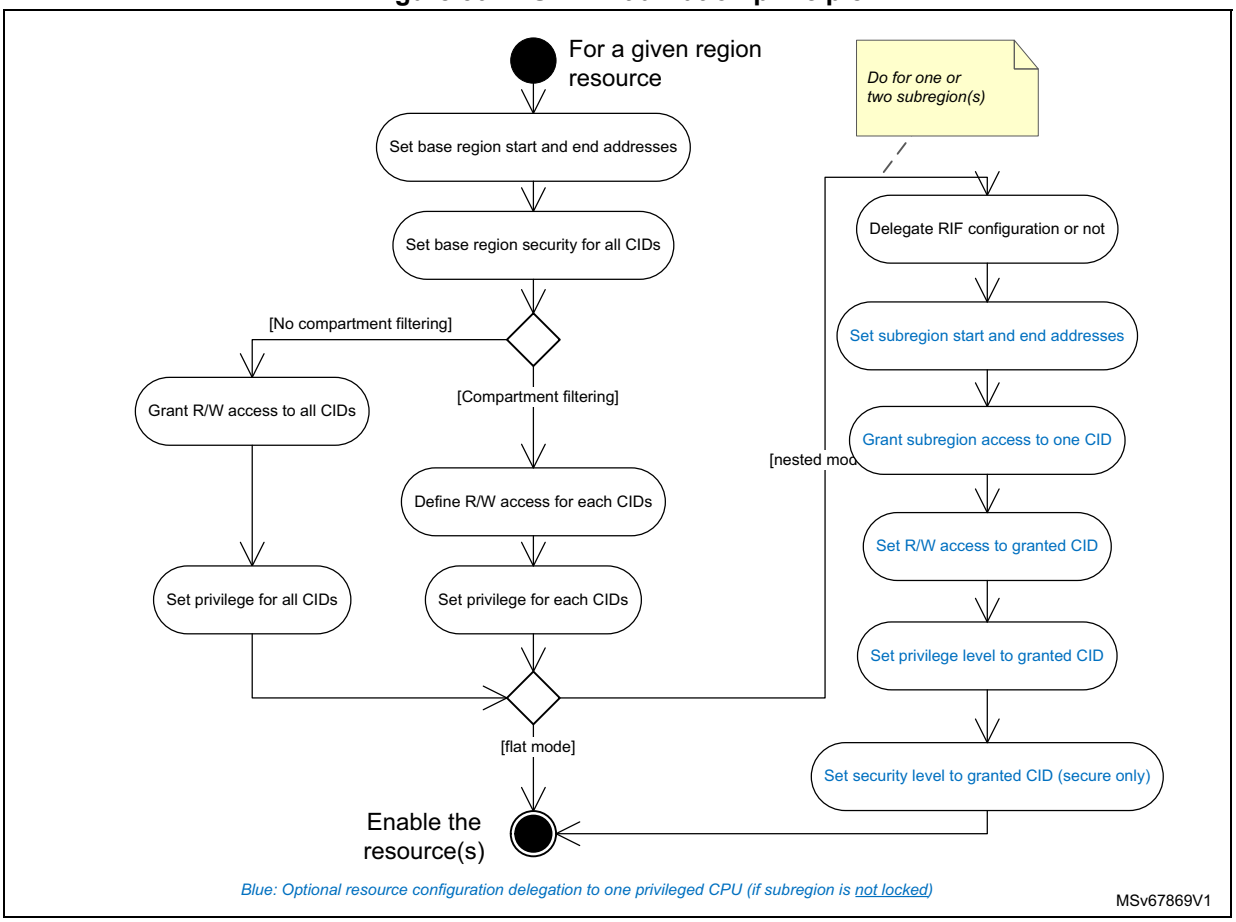
1. Define the start and end address of the subregion using RISAF_REGx_zSTARTR and RISAF_REGx_zENDR registers.
   - When programming subregion watermarks, use similar rules as for base regions (see *Configuring base regions in RISAF*).
   - Subregions must be defined within their base region. The RISAF enforces this rule if the application does not follow it.
2. Modify WREN and RDEN in RISAF_REGx_zCFGR to modify the access right of allowed compartment (defined with SCID bits).
3. In the same registers, modify the security and privileged access rights for the allowed compartment, if needed (see *Table 49* for applicable restrictions).
4. After a final check on the above configuration, the subregion must be enabled by setting SREN bit in RISAF_REGx_zCFGR.

After a trusted domain has locked all base regions (using GLOCK bit), subregion owners can lock their configuration using the RLOCK bit in RISAF_REGx_zCFGR.

Note: Only a secure application can change SEC in RISAF_REGx_zCFGR. If the base region is secure, only a secure application can configure subregion registers.

The overall RISAF initialization is summarized in *Figure 30*.

Figure 30. RISAF initialization principle



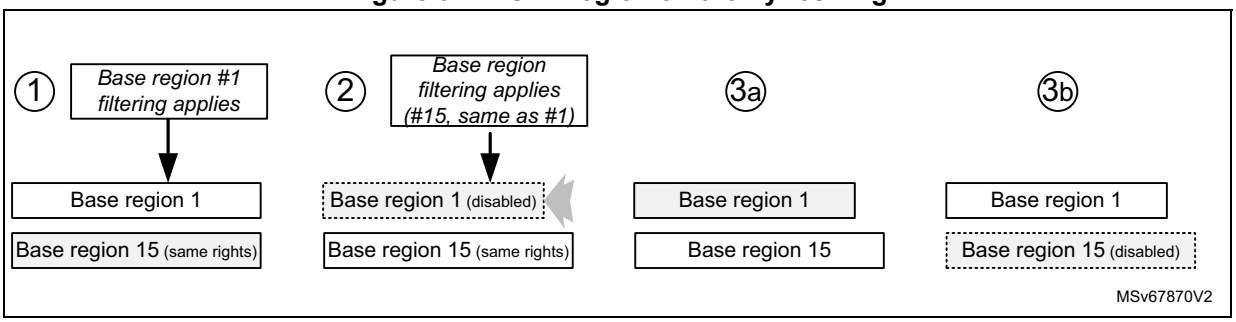
10.4.6 RISAF runtime modification of region or subregion configuration

The RISAF supports the on-the-fly update of the base region and subregion programming, except for the start- and end-address boundaries:

- To change RISAF_REGx_STARTR and RISAF_REGx_ENDR, the base region must be disabled (BREN = 0). In this case, the default primary region access rules apply immediately (secure, privileged, TDCID only).
- To change RISAF_REGx_zSTARTR and RISAF_REGx_zENDR (z = A or B), the subregion must be disabled (SREN = 0). In this case, the base region access rules apply immediately.

If the first solution introduces too many constraints, a workaround is shown in *Figure 31*.

Figure 31. RISAF region on-the-fly resizing



The recommended on-the-fly resizing of base region 1 becomes:

1. Define a spare base region (for example 15), exactly as current region 1.
2. Disable region 1 by clearing BREN.The region 15 access control (identical to region 1) immediately applies. No effect is experienced at system level. The region 1 can be safely resized.
3. Enable region 1, then disable region 15. The new region 1 access control immediately applies. Optionally, subregions can be added on top.

10.4.7 Managing illegal accesses

As a RIF component, the RISAF does not use the standard interrupt lines toward NVIC or GIC concentrators. The IAC captures all RIF interrupt events, called illegal access events.

Refer to *Section 11: Illegal access controller (IAC)* for more information on how illegal accesses are managed.

10.5 RISAF registers

The registers are accessible through the interface of the RISAF. Only word (32-bit) accesses are supported.

If the debug domain feature is activated and security and privileged policy allows it, the debug domain traffic goes through, regardless of any CID filtering policy. If the debug domain feature is de-activated the CID filtering policy also applies to debug domain traffic.

10.5.1 RISAF configuration register (RISAF_CR)

Address offset: 0x000

Reset value: 0x0000 0000

Secure, privileged, trusted domain TDCID, write access only. Any read access is allowed, writes are ignored if GLOCK is set.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GLOCK
															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **GLOCK**: Global lock

This bit locks the. configuration of RISAF registers until next reset. It is cleared by default, and, once set, cannot be reset until global RISAF reset.

0: RISAF registers are writable.

1: All writes to RISAF registers are ignored, except RISAF_IACR, RISAF_REGx_zCFGR, RISAF_REGx_zSTARTR, and RISAF_REGx_zENDR (z = A to B).

10.5.2 RISAF status register (RISAF_SR)

Address offset: 0x004

Reset value: 0x0000 0000

Secure, privileged, trusted domain TDCID, read access only.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ENC DIS	KEY RDY	KEY VALID
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **ENCDIS**: Encryption disabled

This bit is reserved if the encryption feature is not available in RISAF (see *Section 10.3*). It is a non-volatile product configuration that cannot be changed by software.

0: When ENC[1:0] = 0x1 or 0x2 and BREN is set in RISAF_REGx_CFGR, all allowed write accesses in region x are encrypted, and all allowed read requests are decrypted.

1: When ENC[1:0] = 0x1 or 0x2 and BREN is set in RISAF_REGx_CFGR, all write accesses in region x are ignored, and all read requests return 0. In other words, the AES feature of RISAF is unusable, for any region.

Note: If BREN = 0, the AES feature of RISAF is not usable for a given region.

Bit 1 **KEYRDY**: Key ready

This bit is reserved if the encryption feature is not available in RISAF (see *Section 10.3*).

0: The most recently written key in RISAF_KEYRy is being expanded

1: The most recently written key in RISAF_KEYRy is ready for use

Bit 0 **KEYVALID**: Key valid

This bit is reserved if the encryption feature is not available in RISAF (see *Section 10.3*).

0: A valid key has not been written in RISAF_KEYRy

1: A valid key has been written in RISAF_KEYRy

10.5.3 RISAF illegal access status register (RISAF_IASR)

Address offset: 0x008

Reset value: 0x0000 0000

Secure, privileged, trusted domain TDCID, read access only.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IAEF1	IAEF0	CAEF
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IAEF1**: Illegal access error flag 1

This bit is reserved if the dual port feature is not available in the RISAF instance (see *Section 10.3*). The bit is set when an illegal access is detected by checker unit 1 on the system bus. More details on the error can be found in RISAF_IAESR1 and RISAF_IADDR1.

This bit is cleared by setting the corresponding bit in RISAF_IACR.

Bit 1 **IAEF0**: Illegal access error flag 0

This bit is set when an illegal access is detected by checker unit 0 on the system bus. More details on the error can be found in RISAF_IAESR0 and RISAF_IADDR0.

This bit is cleared by setting corresponding bit in RISAF_IACR.

Bit 0 **CAEF**: Configuration access error flag

This bit is set when an illegal access to any RISAF configuration register is detected. It is cleared by setting the corresponding bit in RISAF_IACR.

10.5.4 RISAF illegal access clear register (RISAF_IACR)

Address offset: 0x00C

Reset value: 0x0000 0000

Secure, privileged, trusted domain TDCID, write access only.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IAEF1	IAEF0	CAEF
													w	w	w

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IAEF1**: Illegal access error flag 1

This bit is reserved if the dual port feature is not available in the RISAF instance (see *Section 10.3*). Set this bit to clear IAEF1 in RISAF_IASR, allowing the capture of a new error information from RIF gate 1 in RISAF_IAESR1 and RISAF_IADDR1.

Note: Clearing this bit does not clear RISAF_IADDR1.

Bit 1 **IAEF0**: Illegal access error flag 0

Set this bit to clear IAEF0 in RISAF_IASR, allowing the capture of a new error information from RIF gate 0 in RISAF_IAESR0 and RISAF_IADDR0 registers.

Note: Clearing this bit does not clear RISAF_IADDR0.

Bit 0 **CAEF**: Configuration access error flag

Set this bit to clear CAEF in RISAF_IASR.

10.5.5 RISAF illegal access error status register x (RISAF_IAESRx)

Address offset: 0x020 + 0x8 * x (x = 0 to 1)

Reset value: 0x0000 0000

Secure, privileged, trusted domain TDCID, read access only.

Note: RISAF_IAESR1 is reserved if the dual port feature is not available in the RISAF instance (see *Section 10.3*).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IANRW	Res.	IASEC	IAPRIV	Res.	IACID[2:0]		
								r		r	r		r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **IANRW**: Illegal access read/write
When IAEFx = 1 in RISAF_IASR, IANRW captures the access type of the illegal access that has been detected by RIF gate x.
0: Illegal access was a data read or an instruction fetch
1: Illegal access was a data write

Bit 6 Reserved, must be kept at reset value.

Bit 5 **IASEC**: Illegal access security
When IAEFx = 1 in RISAF_IASR, IASEC captures the security type of the illegal access that has been detected by RIF gate x.
0: Illegal access was nonsecure
1: Illegal access was secure

Bit 4 **IAPRIV**: Illegal access privileged
When IAEFx = 1 in RISAF_IASR, IAPRIV captures the privilege state of the master that issued the illegal access detected by RIF gate x.
0: Illegal access was unprivileged
1: Illegal access was privileged

Bit 3 Reserved, must be kept at reset value.

Bits **2**:0 **IACID[2:0]**: Illegal access compartment ID
When IAEFx = 1 in RISAF_IASR, IACID[2:0] captures the compartment ID of the master that issued the illegal access detected by RIF gate x.

10.5.6 RISAF illegal address register x (RISAF_IADDRx)

Address offset: 0x024 + 0x8 * x (x = 0 to 1)

Reset value: 0x0000 0000

Secure, privileged, trusted domain TDCID, read access only.

Note: RISAF_IADDR1 is reserved if the dual port feature is not available in the RISAF instance (see *Section 10.3*).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IADD[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IADD[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **IADD[31:0]**: Illegal address
When IAEFx = 1 in RISAF_IASR, IADD[31:0] captures the address of the erroneous access through RIF gate x. Additional information can be found in RISAF_IAESRx. Captured address information is the byte offset from the base of the protected address space.

10.5.7 RISAF encryption key y (RISAF_KEYRy)

Address offset: 0x030 + 0x4 * y (y = 0 to 3)

Reset value: 0x0000 0000

Secure, privileged, trusted domain TDCID, write access only. Writes are ignored if GLOCK is set in RISAF_CR.

Note: RISAF_KEYR0/1/2/3 are reserved if the DDRMCE feature is not available in the RISAF instance (see *Section 10.3*).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
KEY{i + 32 * y}															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
KEY{i + 32 * y}															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **KEY{i + 32 * y}**: Cryptographic key (i = 31 to 0)

Write any value to this register to initialize this part of the key used by the DDRMCE when ENC[1:0]= 0x2.

The four key registers must be written in ascending order (KEYR0 to KEYR3) to set the KEYVALID bit. If this bit is not set after successful writing to those four registers, BSEC peripheral must be reset.

10.5.8 RISAF region x configuration register (RISAF_REGx_CFGR)

Address offset: 0x040 + 0x40 * (x - 1) (x = 1 to 15)

Reset value: 0x0000 0000

Secure, privileged, trusted domain TDCID, write access only. Any read access is allowed on this register. Writes are ignored if GLOCK is set in RISAF_CR.

Refer to *Section 10.3* to verify the number of base regions supported by this RISAF instance.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIVC7	PRIVC6	PRIVC5	PRIVC4	PRIVC3	PRIVC2	PRIVC1	PRIVC0
								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ENC[1:0]		Res.	Res.	Res.	Res.	Res.	SEC	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BREN
rw	rw						rw								rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **PRIVCy**: Privileged access for compartment y (y = 7 to 0)

This bit is taken into account only if BREN = 1.

0: Application running in compartment y can access to region x in privileged and unprivileged mode.

1: Application running in compartment y can access to region x in privileged mode only.

Bits 15:14 **ENC[1:0]**: Encrypted region

This bitfield is taken into account only if BREN = 1 and if the DDRMCE feature is available in RISAF (see ENCDIS in RISAF_SR and *Section 10.3*).

0x0: No effect

0x1: Block cipher: all allowed write accesses are encrypted, all allowed read requests are decrypted. In this mode special side-channel protection is activated, impacting performance.

0x2: Fast block cipher: all allowed write accesses are encrypted, all allowed read requests are decrypted, when KEYRDY is set in RISAF_SR (to be used for secure regions only).

0x3: No effect

As the AES key is computed using the physical address information, ENC[1:0] = 0x1 must not be used only for secure regions. Key registers RISAF_KEYRy must be properly initialized before writing 0x2 to ENC[1:0] (KEYVALID set in RISAF_SR). Similarly, key registers RISAF_MKEYRy must be properly initialized before writing 0x1 to ENC[1:0] (MKVALID set in RISAF_XSR).

Bits 13:9 Reserved, must be kept at reset value.

Bit 8 **SEC**: Secure region

This bit is taken into account only if BREN = 1.

0: Only nonsecure requests can access region x. SEC value in RISAF_REGx_zCFGR is internally treated as 0-ed by RISAF (only nonsecure requests to subregions).

1: Only secure requests can access region x, and optional subregions can be defined as secure or nonsecure.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **BREN**: Base region enable

0: Base region x is disabled. Access control of primary region 0 (secure, privileged, trusted domain TDCID) applies to any access between region x start and end addresses. Associated subregions are also disabled.

1: Base region x is enabled. Access controls defined in region x apply to any access between region x start and end addresses.

Note: The filtering starts from start address RISAF_REGx_STARTR (included) and ends at end address RISAF_REGx_ENDR (included).

10.5.9 RISAF region x start-address register (RISAF_REGx_STARTR)

Address offset: 0x044 + 0x40 * (x - 1) (x = 1 to 15)

Reset value: 0x0000 0000

Secure, privileged, trusted domain TDCID, write access only. Any read access is allowed on this register. Writes are ignored if GLOCK is set in RISAF_CR, or if BREN is set in RISAF_REGx_CFGR.

Refer to *Section 10.3* to verify the number of base regions supported by this RISAF instance, and for details on protected address space size and watermark granularity.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BADDSTART[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BADDSTART[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **BADDSTART[31:0]**: Base region address start

This bitfield defines the byte-address offset (relative to the base address of the protected address space) of the lowest byte-address in base region x.

Address bits less than the granularity and greater than the protected address space size cannot be written to, and remain 0.

10.5.10 RISAF region x end-address register (RISAF_REGx_ENDR)

Address offset: 0x048 + 0x40 * (x - 1) (x = 1 to 15)

Reset value: 0x0000 0FFF

The reset value given here applies when the granularity is 4 Kbytes. If the granularity is 2^n, the reset value is 2^n - 1.

Secure, privileged, trusted domain TDCID, write access only. Any read access is allowed on this register. Writes are ignored if GLOCK is set in RISAF_CR, or if BREN is set in RISAF_REGx_CFGR.

Refer to *Section 10.3* to verify the number of base regions supported by this RISAF instance, and for details on protected address space size and watermark granularity.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BADDEND[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BADDEND[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **BADDEND[31:0]**: Base region address end

This bitfield defines the byte-address offset (relative to the base address of the protected address space) of the highest byte-address in base region x.

Address bits less than the granularity cannot be modified, and remain 1.

Address bits greater than the protected address space size cannot be written, and remain 0.

10.5.11 RISAF region x CID configuration register (RISAF_REGx_CIDCFGR)

Address offset: 0x04C + 0x40 * (x - 1) (x = 1 to 15)

Reset value: 0x0000 0000

Secure, privileged, trusted domain TDCID, write access only. Any read access is allowed on this register. Writes are ignored if GLOCK is set in RISAF_CR.

Refer to *Section 10.3* to verify the number of base regions supported by this RISAF instance.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WRENC7	WRENC6	WRENC5	WRENC4	WRENC3	WRENC2	WRENC1	WRENC0

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RDENC7	RDENC6	RDENC5	RDENC4	RDENC3	RDENC2	RDENC1	RDENC0
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **WRENCy**: Write enable for compartment y (y = 7 to 0)

This bit is taken into account only if BREN = 1 in RISAF_REGx_CFGR.

0: Application running in compartment y cannot write to region x (write ignored).

1: Application running in compartment y can write to region x. Additional control defined by SEC and PRIVCy in RISAF_REGx_CFGR, also applies.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **RDENCy**: Read enable for compartment y (y = 7 to 0)

This bit is taken into account only if BREN = 1 in RISAF_REGx_CFGR.

0: Application running in compartment y cannot read region x (read as 0).

1: Application running in compartment y can read region x. Additional control defined by SEC and PRIVCy in RISAF_REGx_CFGR, also applies.

10.5.12 RISAF region x subregion A configuration register (RISAF_REGx_ACFGR)

Address offset: 0x050 + 0x40 * (x - 1) (x = 1 to 15)

Reset value: 0x0000 0000

Unprivileged writes are ignored. Nonsecure writes are ignored if SEC = 1 in RISAF_REGx_CFGR, or if DCEN = 0 in RISAF_REGx_ANESTR. Any read access is allowed to this register. Writes are ignored if RLOCK = 1 in this register.

When the delegated configuration is enabled (DCEN = 1 in RISAF_REGx_ANESTR), only the compartment DCCID defined in RISAF_REGx_ANESTR can write to this register.

When the delegation is disabled (DCEN = 0), only the trusted domain can program this register.

Refer to *Section 10.3* to verify the number of base regions and subregions supported by this RISAF instance.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

r	r	rw	rw			rw	rw		rw	rw	rw			rs	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:14 **ENC[1:0]**: Encrypted subregion

This read-only bitfield is a mirror to ENC[1:0] in RISAF_REGx_CFGR. It is reserved if the encryption feature is not available in RISAF (see ENCDIS in RISAF_SR, and *Section 10.3*).

0x0: No effect

0x1, 0x2: Allowed read (write) requests to subregion A of region x are decrypted (encrypted)

0x3: No effect

Bit 13 **WREN**: Write enable

This bit is taken into account only if SREN = 1 in this register.

0: Any write to subregion A of region x is ignored

1: Subregion A of region x can be written

Bit 12 **RDEN**: Read enable

This bit is taken into account only if SREN = 1 in this register.

0: Any read to subregion A of region x returns 0

1: Subregion A of region x can be read

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **PRIV**: Privileged subregion

This bit is taken into account only if SREN = 1 in this register.

0: Privileged and unprivileged accesses are granted in subregion A of region x

1: Only privileged accesses are granted in subregion A of region x

Note: When base region x is defined as unprivileged for the SCID compartment (PRIVCy = 0 in RISAF_REGx_CFGR, with SRCID = Cy), unprivileged accesses to subregion A are always granted.

Bit 8 **SEC**: Secure subregion

This bit is taken into account only if SREN = 1 in this register. Nonsecure modification to it are discarded.

0: Only nonsecure requests can access subregion A of region x

1: Only secure requests can access subregion A of region x

Note: When base region x is defined as nonsecure (SEC = 0 in RISAF_REGx_CFGR), only nonsecure accesses to subregion A are granted.

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **SRCID[2:0]**: Subregion CID

When SREN = 1 in this register, SRCID[2:0] defines which compartment has access to subregion A of RISAF region x.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **RLOCK**: Resource lock

When this bit is set, the subregion resource is locked.

0: RISAF_REGx_ACFGR, RISAF_REGx_ASTARTR, and RISAF_REGx_AENDR are writable

1: Writes to RISAF_REGx_ACFGR, RISAF_REGx_ASTARTR, and RISAF_REGx_AENDR are ignored

Note: This bit is set once, cleared only by RISAF reset. It cannot be set if GLOCK = 0 in RISAF_CR.

Bit 0 **SREN**: Subregion enable

0: Subregion A is disabled. Access control of base region x applies to any access between this subregion start and end addresses.

1: Subregion A of region x is enabled. Access control defined in subregion A applies to any access between subregion A start and end addresses.

Note: The filtering starts from address RISAF_REGx_ASTARTR (included), and ends at address RISAF_REGx_AENDR (included).

10.5.13 RISAF region x subregion A start-address register (RISAF_REGx_ASTARTR)

Address offset: 0x054 + 0x40 * (x - 1) (x = 1 to 15)

Reset value: 0x0000 0000

Unprivileged writes are ignored. Nonsecure writes are ignored if SEC = 1 in RISAF_REGx_CFGR, or if DCEN = 0 in RISAF_REGx_ANESTR. Any read access is allowed to this register. Writes are ignored if RLOCK = 1 or SREN = 1 in RISAF_REGx_ACFGR.

When the delegated configuration is enabled (DCEN = 1 in RISAF_REGx_ANESTR), only the compartment DCCID defined in RISAF_REGx_ANESTR can write to this register. When the delegation is disabled (DCEN = 0), only the trusted domain can program this register.

Refer to *Section 10.3* to verify the number of base regions and subregions supported by this RISAF instance, and for details on protected address space size and watermark granularity.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SADDSTART[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

SADDSTART[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SADDSTART[31:0]**: Subregion address start

This bitfield defines the byte-address offset (relative to the base address of the protected address space) of the lowest byte-address in subregion A in base region x.

Address bits less than the granularity and greater than the protected address space size cannot be written, and remain 0.

The effective subregion is the intersection of the subregion and its base region (there is no point in programming SADDSTART below the associated BADDSTART).

10.5.14 RISAF region x subregion A end-address register (RISAF_REGx_AENDR)

Address offset: 0x058 + 0x40 * (x - 1) (x = 1 to 15)

Reset value: 0x0000 0FFF

This reset value applies when the granularity is 4 Kbytes. More in general, if the granularity is 2^n, the reset value is 2^n - 1.

Unprivileged writes are ignored. Nonsecure writes are ignored if SEC = 1 in RISAF_REGx_CFGR, or if DCEN = 0 in RISAF_REGx_ANESTR. Any read access is allowed to this register. Writes are ignored if RLOCK = 1 or SREN = 1 in RISAF_REGx_ACFGR.

When the delegated configuration is enabled (DCEN = 1 in RISAF_REGx_ANESTR), only the compartment DCCID defined in RISAF_REGx_ANESTR can write to this register. When the delegation is disabled (DCEN = 0), only the trusted domain can program this register.

Refer to *Section 10.3* to verify the number of base regions and subregions supported by this RISAF instance, and for details on protected address space size and watermark granularity.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

SADDEND[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SADDEND[31:0]**: Subregion address end

This bitfield defines the byte-address offset (relative to the base address of the protected address space) of the highest byte-address of subregion A in base region x.
Address bits less than the granularity cannot be modified, and remain 1.
Address bits greater than the protected address space size cannot be written, and remain 0.
The effective subregion is the intersection of the subregion and its base region (there is no point in programming SADDEND higher than the associated BADDEND).

10.5.15 RISAF region x subregion A nested mode register (RISAF_REGx_ANESTR)

Address offset: 0x05C + 0x40 * (x - 1) (x = 1 to 15)

Reset value: 0x0000 0000

Secure, privileged, trusted domain TDCID, write access only. Any read access is allowed on this register. Writes are ignored if GLOCK is set in RISAF_CR.

Refer to *Section 10.3* to verify the number of base regions and subregions supported by this RISAF instance.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

									rw	rw	rw		rw		

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **DCCID[2:0]**: Delegated configuration CID

The trusted domain can use this bitfield to statically define which compartment can program the RIF configuration of subregion A if DCEN = 1 in this register.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **DCEN**: Delegated configuration enable

0: RIF configuration for subregion A can be written only by the trusted domain.

1: RIF configuration for subregion A can be written only by compartment DCCID, defined in this register. If base region x is defined as secure (SEC = 1), nonsecure write accesses to this subregion RIF configuration by compartment DCCID are ignored.

Note: RIF configuration of subregion A is defined as RISAF_REGx_ACFGR, RISAF_REGx_ASTARTR, and RISAF_REGx_AENDR.

Bits 1:0 Reserved, must be kept at reset value.

10.5.16 RISAF region x subregion B configuration register (RISAF_REGx_BCFGR)

Address offset: 0x060 + 0x40 * (x - 1) (x = 1 to 15)

Reset value: 0x0000 0000

Unprivileged writes are ignored. Nonsecure writes are ignored if SEC = 1 in RISAF_REGx_CFGR, or if DCEN = 0 in RISAF_REGx_BNESTR. Any read access is allowed to this register. Writes are ignored if RLOCK = 1 in this register.

When the delegated configuration is enabled (DCEN = 1 in RISAF_REGx_BNESTR), only the compartment DCCID defined in RISAF_REGx_BNESTR can write to this register.

When the delegation is disabled (DCEN = 0), only the trusted domain can program this register.

Refer to *Section 10.3* to verify the number of base regions and subregions supported by this RISAF instance.

r	r	rw	rw			rw	rw		rw	rw	rw			rs	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:14 **ENC[1:0]**: Encrypted subregion

This read-only bitfield is a mirror to ENC[1:0] in RISAF_REGx_CFGR. It is reserved if the encryption feature is not available in RISAF (see ENCDIS in RISAF_SR, and *Section 10.3*).

0x0: No effect

0x1, 0x2: Allowed read (write) requests to subregion B of region x are decrypted (encrypted)

0x3: No effect

Bit 13 **WREN**: Write enable

This bit is taken into account only if SREN = 1 in this register.

0: Any write to subregion B of region x is ignored

1: Subregion B of region x can be written

Bit 12 **RDEN**: Read enable

This bit is taken into account only if SREN = 1 in this register.

0: Any read to subregion B of region x returns 0

1: Subregion B of region x can be read

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **PRIV**: Privileged subregion

This bit is taken into account only if SREN = 1 in this register.

0: Privileged and unprivileged accesses are granted in subregion B of region x

1: Only privileged accesses are granted in subregion B of region x

Note: When base region x is defined as unprivileged for the SCID compartment (PRIVCy = 0 in RISAF_REGx_CFGR, with SRCID = Cy), unprivileged accesses to subregion B are always granted.

Bit 8 **SEC**: Secure subregion

This bit is taken into account only if SREN = 1 in this register. Nonsecure modification to it are discarded.

0: Only nonsecure requests can access subregion B of region x

1: Only secure requests can access subregion B of region x

Note: When base region x is defined as nonsecure (SEC = 0 in RISAF_REGx_CFGR), only nonsecure accesses to subregion B are granted.

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **SRCID[2:0]**: Subregion CID

When SREN = 1 in this register, SRCID[2:0] defines which compartment has access to subregion B of RISAF region x.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **RLOCK**: Resource lock

When this bit is set, the subregion resource is locked.

0: RISAF_REGx_BCFGR, RISAF_REGx_BSTARTR, and RISAF_REGx_BENDR are writable

1: Writes to RISAF_REGx_BCFGR, RISAF_REGx_BSTARTR, and RISAF_REGx_BENDR are ignored

Note: This bit is set once, cleared only by RISAF reset. It cannot be set if GLOCK = 0 in RISAF_CR.

Bit 0 **SREN**: Subregion enable

0: Subregion B of region x is disabled. Access control of base region x applies to any access between this subregion start and end addresses.

1: Subregion B of region x is enabled. Access control defined in subregion B applies to any access between subregion B start and end addresses.

Note: The filtering starts from address RISAF_REGx_BSTARTR (included), and ends at address RISAF_REGx_BENDR (included).

10.5.17 RISAF region x subregion B start-address register (RISAF_REGx_BSTARTR)

Address offset: 0x064 + 0x40 * (x - 1) (x = 1 to 15)

Reset value: 0x0000 0000

Unprivileged writes are ignored. Nonsecure writes are ignored if SEC = 1 in RISAF_REGx_CFGR, or if DCEN = 0 in RISAF_REGx_BNESTR. Any read access is allowed to this register. Writes are ignored if RLOCK = 1 or SREN = 1 in RISAF_REGx_BCFGR.

When the delegated configuration is enabled (DCEN = 1 in RISAF_REGx_BNESTR), only the compartment DCCID defined in RISAF_REGx_BNESTR can write to this register. When the delegation is disabled (DCEN = 0), only the trusted domain can program this register.

Refer to *Section 10.3* to verify the number of base regions and subregions supported by this RISAF instance, and for details on protected address space size and watermark granularity.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SADDSTART[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SADDSTART[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SADDSTART[31:0]**: Subregion address start

This bitfield defines the byte-address offset (relative to the base address of the protected address space) of the lowest byte-address in subregion B in base region x.

Address bits less than the granularity and greater than the protected address space size cannot be written, and remain 0.

The effective subregion is the intersection of the subregion and its base region (there is no point in programming SADDSTART below the associated BADDSTART).

10.5.18 RISAF region x subregion B end-address register (RISAF_REGx_BENDR)

Address offset: 0x068 + 0x40 * (x - 1) (x = 1 to 15)

Reset value: 0x0000 0FFF

This reset value applies when the granularity is 4 Kbytes. More in general, if the granularity is 2^n, the reset value is 2^n - 1.

Unprivileged writes are ignored. Nonsecure writes are ignored if SEC = 1 in RISAF_REGx_CFGR, or if DCEN = 0 in RISAF_REGx_BNESTR. Any read access is allowed to this register. Writes are ignored if RLOCK = 1 or SREN = 1 in RISAF_REGx_BCFGR.

When the delegated configuration is enabled (DCEN = 1 in RISAF_REGx_BNESTR), only the compartment DCCID defined in RISAF_REGx_BNESTR can write to this register. When the delegation is disabled (DCEN = 0), only the trusted domain can program this register.

Refer to *Section 10.3* to verify the number of base regions and subregions supported by this RISAF instance, and for details on protected address space size and watermark granularity.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SADDEND[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SADDEND[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SADDEND[31:0]**: Subregion address end

This bitfield defines the byte-address offset (relative to the base address of the protected address space) of the highest byte-address of subregion B in base region x.

Address bits less than the granularity cannot be modified, and remain 1.

Address bits greater than the protected address space size cannot be written, and remain 0.

The effective subregion is the intersection of the subregion and its base region (there is no point in programming SADDEND higher than the associated BADDEND).

10.5.19 RISAF region x subregion B nested mode register (RISAF_REGx_BNESTR)

Address offset: 0x06C + 0x40 * (x - 1) (x = 1 to 15)

Reset value: 0x0000 0000

Secure, privileged, trusted domain TDCID, write access only. Any read access is allowed on this register. Writes are ignored if GLOCK is set in RISAF_CR.

Refer to *Section 10.3* to verify the number of base regions and subregions supported by this RISAF instance.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCCID[2:0]			Res.	DCEN	Res.	Res.
									rw	rw	rw		rw		

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **DCCID[2:0]**: Delegated configuration CID

The trusted domain can use this bitfield to statically define which compartment can program the RIF configuration of subregion B if DCEN = 1 in this register.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **DCEN**: Delegated configuration enable

0: RIF configuration for subregion B can be written only by the trusted domain.

1: RIF configuration for subregion B can be written only by compartment DCCID, defined in this register. If base region x is defined as secure (SEC = 1), nonsecure write accesses to this subregion RIF configuration by compartment DCCID are ignored.

Note: RIF configuration of subregion B is defined as RISAF_REGx_BCFGR, RISAF_REGx_BSTARTR, and RISAF_REGx_BENDR.

Bits 1:0 Reserved, must be kept at reset value.

10.5.20 RISAF hardware configuration register (RISAF_HWCFGR)

Address offset: 0xFF0

Reset value: 0xXXXX XXXX

Refer to *Section 10.3* for each instance reset value.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CFG4[7:0]								CFG3[7:0]

CFG2[7:0]								CFG1[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 **CFG4[7:0]**: Hardware generic 4

This bitfield returns the number of address bits to match when determining access to a base region or subregion (WIDTH).

Bits 23:16 **CFG3[7:0]**: Hardware generic 3

This bitfield returns the smallest possible region size (granularity) (LOG_BLOCKSIZE).

Bits 15:8 **CFG2[7:0]**: Hardware generic 2

This bitfield returns the total number of subregions A and B (NUM_SUBREGIONAS, NUM_SUBREGIONBS).

Bits 7:0 **CFG1[7:0]**: Hardware generic 1

This bitfield returns the number of base regions (NUM_REGS).

10.5.21 RISAF version register (RISAF_VERR)

Address offset: 0xFF4

Reset value: 0xXXXX XXXX

Refer to *Section 10.3* for each instance reset value.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJREV[3:0]				MINREV[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**:RISAF major revision

Bits 3:0 **MINREV[3:0]**: RISAF minor revision

10.5.22 RISAF identification register (RISAF_IPIDR)

Address offset: 0xFF8

Reset value: 0xXXXX XXXX (refer to *Section 10.3* for each instance reset value)

This offset is valid for instances not supporting the DDRMCE feature. For instance with DDRMCE feature, the offset is 0x1FF8.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ID[31:0]**: RISAF identification code

10.5.23 RISAF size identification register (RISAF_SIDR)

Address offset: 0xFFC

Reset value: 0xA3C5 DD0X

This offset is valid for instances not supporting the DDRMCE feature. For instance with DDRMCE feature, the offset is 0x1FFC. Refer to *Section 10.3: RISAF implementation* for each instance reset value.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

SID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **SID[31:0]**: RISAF size identification code
Bits[31:8] = 0xA3C5DD (fixed code)
Bits[7:0] = 0x01 or 0x08 (1- or 8-Kbyte address decoding)

10.5.24 RISAF extended configuration register (RISAF_XCR)

Address offset: 0x1C00

Reset value: 0x0000 0100

Secure, privileged, trusted domain TDCID, write access only. Writes are ignored if XLOCK is set in RISAF_XCR.

This register is reserved if the DDRMCE feature is not available in the RISAF instance (see *Section 10.3*).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CIPHERSEL[1:0]		Res.	Res.	MKLOCK	XLOCK
										rw	rw			rs	rs

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:4 **CIPHERSEL[1:0]**: Cipher selection

Set these bits to select the encryption algorithm for encrypted regions with ENC[1:0] = 0x1. When CIPHERSEL[1:0] = 0x0, any read (resp. write) to an encrypted region with BREN = 1 and ENC[1:0] = 0x1 returns 0 (resp. is ignored).

0x0: No cipher selected

0x1, 0x2: AES-128 cipher selected

0x3: AES-256 cipher selected

When CIPHERSEL value is changed with a successful write, RISAF_MKEYRx registers are 0-ed.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **MKLOCK**: Master keys lock

Lock the master key configuration until next reset. This bit is cleared by default, and, once set, cannot be reset until MCE reset.

0: Writes to RISAF_MKEYRy registers are is allowed

1: Writes to RISAF_MKEYRy registers are is ignored until next RISAF reset

Bit 0 **XLOCK**: Extended lock

Set to lock the extended configuration of RISAF (RISAF_XCR and RISAF_MKEYRy registers). This bit is cleared by default, and, once set, cannot be reset until RISAF reset.

0: Extended registers are writable

1: All writes to extended registers are ignored

10.5.25 RISAF extended status register (RISAF_XSR)

Address offset: 0x1C04

Reset value: 0x0000 0000

Secure, privileged, trusted domain TDCID, read access only.

This register is reserved if the DDRMCE feature is not available in the RISAF instance (see *Section 10.3*).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MKVALID
															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **MKVALID**: Master key valid

0: A valid key has not been written in RISAF_MKEYRy registers, or a valid unlocked master key has been erased by hardware (if bit was set before).

1: A valid key has been written in RISAF_MKEYRy registers (write R0 → R1 → R2 → R3, or the reverse).

When this bit is set, any successful write to RISAF_MKEYRy registers clears MKVALID bit (for example after a write when XLOCK or MKLOCK are cleared).

10.5.26 RISAF master key y (RISAF_MKEYRy)

Address offset: 0x1E00 + 0x4 * y (y = 0 to 7)

Reset value: 0x0000 0000

Secure, privileged, trusted domain TDCID, read access only. Writes are ignored if XLOCK is set in RISAF_XCR.

These register are reserved if the DDRMCE feature is not available in the RISAF instance (see *Section 10.3*).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MKEY{i + 32 * y}															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MKEY{i + 32 * y}															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **MKEY{i + 32 * y}**: Cryptographic key (i = 31 to 0)
This write-only bitfield contains the key used by the DDRMCE when ENC[1:0] = 0x1 (side-channel protected mode).

10.5.27 RISAF register map

Table 50. RISAF register map and reset values

1. Reset value is 0x0000 0FFF when the granularity is 4 Kbytes.
2. This register is not reserved if this RISAF instance supports the DDRMCE option.
3. Refer to *Section 10.3: RISAF implementation* for the actual reset value.
4. This register is reserved if this RISAF instance supports the DDRMCE option.

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

11 Illegal access controller (IAC)

11.1 IAC introduction

The RIF (resource isolation framework) is a comprehensive set of hardware blocks designed to enforce and manage the isolation of STM32 hardware resources, such as memory and peripherals.

The RIF uses the IAC (illegal access controller) to centralize the detection of RIF-related illegal accesses, managed by a secure application running in the trusted domain.

11.2 IAC main features

- Centralized detection of RIF-related illegal accesses, managed by a secure application running in the trusted domain. Supported illegal accesses are: secure, privileged, CID.
- Only accessible by secure privileged trusted domain CPU

11.3 IAC implementation

The index table (from 0 to 127) of the non-RIF-aware peripherals managed by the IAC is centralized in *Section 8: Resource isolation framework security controller (RIFSC)*.

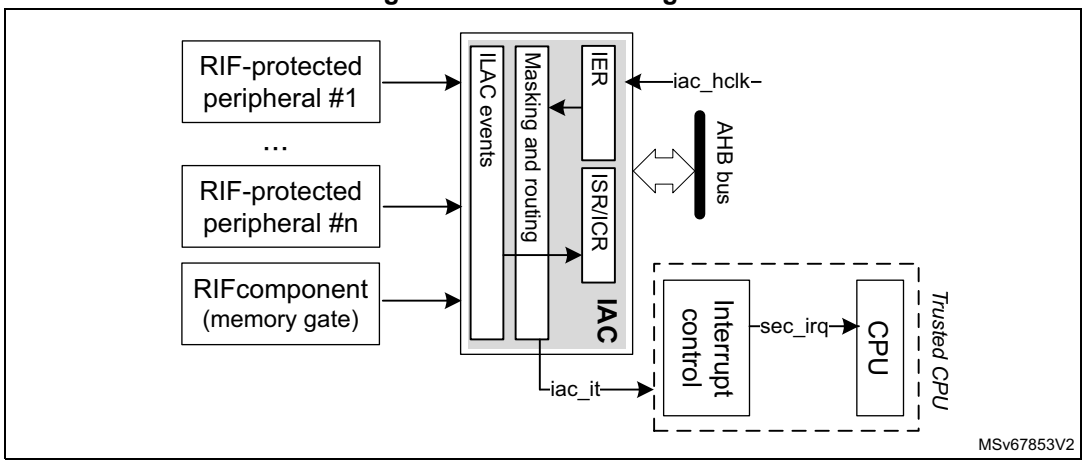
The index table (from 128 and above) for the RIF components and RIF-aware peripherals also managed by the IAC is found as well in *Section 8: Resource isolation framework security controller (RIFSC)*.

11.4 IAC functional description

11.4.1 IAC block diagram

Figure 32 shows the IAC block diagram, in context.

Figure 32. IAC block diagram



11.4.2 IAC internal signals

Table 51 lists the internal signals available at IAC level, not at product level.

Table 51. IAC internal signals

Name	Type	Description
iac_hclk	Digital input	AHB bus clock
iac_it	Digital output	Global interrupt request

11.4.3 IAC reset and clocks

The IAC peripheral clock is automatically managed by the device, and the peripheral is reset only by a system reset.

The IAC requires its clock in order to trigger an interrupt request event.

11.4.4 IAC use in RIF

The IAC gathers illegal events generated within the system when an illegal access is detected. The IAC can then generate a secure interrupt towards the secure trusted CPU, if needed. By default, all events in the IAC are masked.

The IAC has room for 256 interrupt sources. Each source corresponds to an IAC index from 0 to 255. The interrupt sources from non-RIF-aware peripherals occupy most of the first 128 indexes. The interrupt sources from RIF-aware peripherals and RIF firewalls occupy indexes from 128 onwards. All these sources are defined in *Section 11.3*.

Refer to *Section 5.4: Resource isolation framework (RIF)* for more information on illegal access definitions.

11.4.5 IAC management by trusted application

For each interrupt source of index <i>, an illegal access sets the IAFi flag in IAC_ISRx. A secure privileged trusted application can clear this flag using the corresponding bit in IAC_ICRx. An IAC interrupt is triggered when IAFi is set while IAIEi is set in IAC_IERx.

Indexes between 0 to 127 are assigned to non-RIF-aware peripherals, with a RISUP block instantiated in front of its configuration port to filter configuration accesses. The programming of these RISUP blocks (in the RIFSC) uses the same index as the IAC.

Indexes 128 and above are assigned to RIF components and RIF-aware peripherals. These peripherals can block illegal accesses to their configuration registers (without RISUP).

For RIF-aware peripherals that protect a memory, a secure privileged trusted application can obtain, in the peripheral, more details about the cause of the illegal access event:

- The illegal access status register (xx_IASR) indicates if it is a configuration access error (CAEF= 1), or/and a system bus access error (IAEF = 1).
- The illegal access error status register (xx_IAESR) and the illegal address register (xx_IADDR) give detailed information on the system bus access error.

The IAC interrupt handler must clear IAFi in IAC_ISR before clearing the error flag(s) in the firewall peripheral xx (using xx_IACR register). Otherwise, an illegal access can occur between clearing the flags in the firewall and clearing the flag in the IAC, and the application is unaware of this error.

11.5 IAC interrupts

The RIF interrupt management in the IAC is summarized in *Table 52*.

Note: Only secure privileged trusted domain application, or debugger executing in the secure privileged debug domain can enable, read, and clear illegal access interrupts.

If there is an illegal access to the IAC itself, the status flag corresponding to the IAC index in Section 8: Resource isolation framework security controller (RIFSC) is set.

Table 52. IAC interrupt request

Acronym	Interrupt event	Event flag in IAC_ISR	Enable control bit in IAC_IER	Interrupt clear method
IAC	Illegal access error	IAF	IAIE	Set IAF bit in IAC_ICR

11.6 IAC registers

All IAC registers are accessed only by words (32 bits).

If the debug domain feature is activated and security and privileged policy allows it, the debug domain traffic goes through, regardless of any CID filtering policy. If the debug domain feature is de-activated the CID filtering policy also applies to debug domain traffic.

11.6.1 IAC interrupt enable register x (IAC_IERx)

Address offset: 0x000 + 0x4 * x (x = 0 to 5)

Reset value: 0x0000 0000

Secure privileged, trusted domain CID, read and write only.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IAIE{i + 32 * x}															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IAIE{i + 32 * x}															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **IAIE{i + 32 * x}**: Illegal access interrupt enable for peripheral {i + 32 * x} (i = 0 to 31)
Each bit is set to unmask illegal access events from peripheral {i + 32 * x}.
0: Illegal access event from peripheral {i + 32 * x} does not generate interrupt (masked).
1: Illegal access event from peripheral {i + 32 * x} can generate interrupts (unmasked).

11.6.2 IAC interrupt status register x (IAC_ISRx)

Address offset: 0x080 + 0x4 * x (x = 0 to 5)

Reset value: 0x0000 0000

Secure privileged, trusted domain CID, read only.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IAF{i + 32 * x}															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IAF{i + 32 * x}															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **IAF{i + 32 * x}**: Illegal access interrupt enable for peripheral {i + 32 * x} (i = 0 to 31)

Each bit is set when an illegal access event occurs in the peripheral {i + 32 * x} (see *Section 11.3* for details). This bit is cleared when the corresponding IAF bit is set in IAC_ICRx.

0: No illegal access event detected for peripheral {i + 32 * x} (since reset or the last time this bit was cleared).

1: At least one illegal access event has been detected for peripheral {i + 32 * x} (since the last time this bit was cleared).

11.6.3 IAC interrupt clear register x (IAC_ICRx)

Address offset: 0x100 + 0x4 * x (x = 0 to 5)

Reset value: 0x0000 0000

Secure privileged, trusted domain CID, write only.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IAF{i + 32 * x}															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IAF{i + 32 * x}															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **IAF{i + 32 * x}**: Illegal access flag clear for peripheral {i + 32 * x} (i = 0 to 31)

Setting each bit clears the status flag of the illegal access event {i + 32 * x} in IAC_ISRx.

0: IAF {i + 32 * x} flag status not affected

1: IAF {i + 32 * x} flag status cleared in IAC_ISRx

11.6.4 IAC ILAC input status register x (IAC_IISRx)

Address offset: 0x36C + 0x4 * x (x = 0 to 5)

Reset value: 0xCFFE FFFF, 0xBFDE 0F3F, 0xF9C3 760C, 0xA1DC 7DFF, 0xFFB9 12D7, 0x0003 C9FF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

12 DDR subsystem architecture (DDRSS)

12.1 DDRS introduction

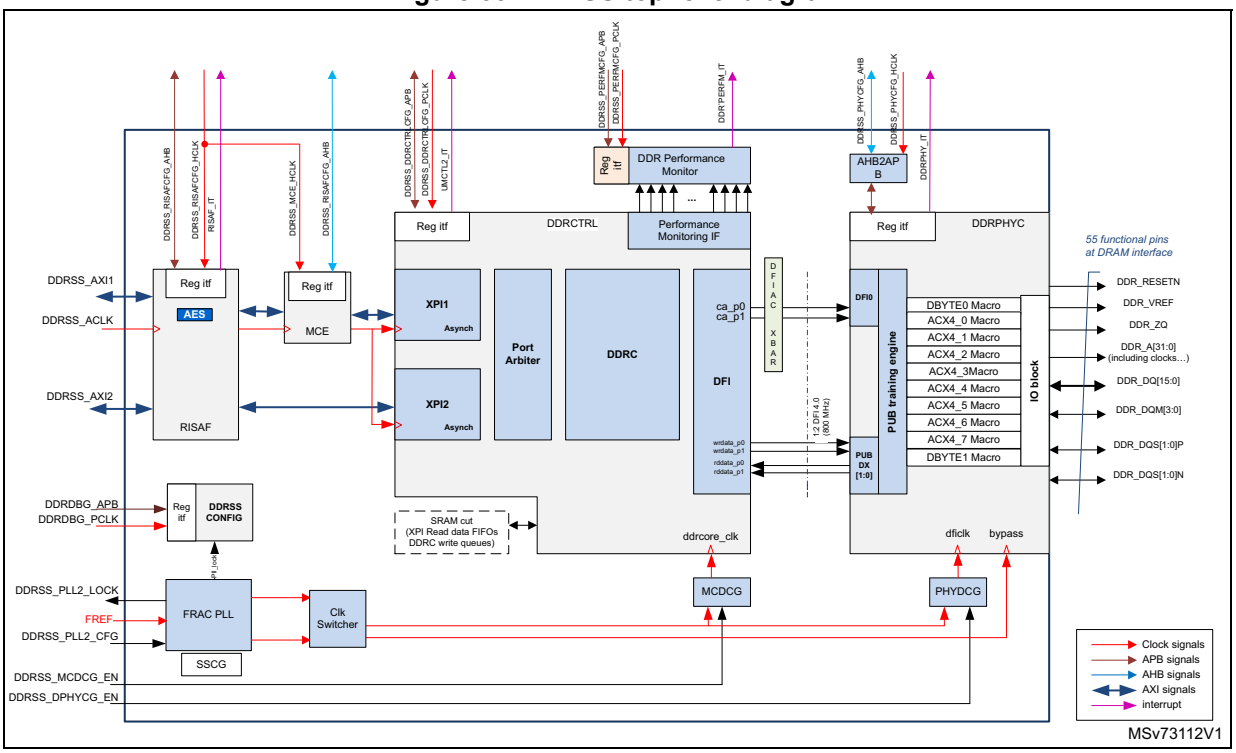
The DDR subsystem (DDRSS) includes:

- Part of the RIF infrastructure, a dual-port RISAF configurable filtering engine with 128-bit AES encryption/decryption capability.
- A Memory cipher engine (MCE) with AES 128/256-bit encryption/decryption features including leakage resilient mode of operation as defense against side channel.
- A dual-port DDRCTRL (see *Section 13: DDR3L/DDR4/LPDDR4 controller (DDRCTRL)*) that gathers all system requests, arbitrates, and schedules the DDR bus accesses.
- A DDRPHYC (see *Section 14: DDR physical interface control (DDRPHYC)*) responsible for adapting DDR command to one of the JEDEC DDR standards (LPDDR4, DDR3L or DDR4).
- A local widely configurable PLL2 generating the clock for the DDRCTRL core part and the DDRPHYC, plus the clock forwarded by the DDRPHYC to the external SDRAM.
- Embedded top-level registers (DDRDBG) for configuring some DDRSS top-level glue logic features, such as DDR3/4 AC swizzling, low-power features, mode register read data accesses, and observability signal muxing.
- A programmable performance monitor DDRPERFM (see *Section 15: DDR performance monitor (DDRPERFM)*) that monitors the DFI interface and reports selected performances.

Caution: DDRCTRL and DDRPHYC are configured to support multiple ranks (dual rank), however it is strongly recommended to use single rank LPDDR4 devices.
Dual rank implementation is susceptible to signal integrity (SI) limitations due to unterminated lanes inside the DRAM which can restrict its frequency range.

12.2 DDRSS block diagram

Figure 33. DDRSS top-level diagram



12.3 DDRSS interfaces

The DDRSS connects to the system bus through the following interfaces:

- Two AXI4 ports @ 600 MHz for actual DDR SDRAM data accesses.

  Only one of these ports (port 0) goes through the AES encryption/decryption in the RISAF (not present on all devices, refer to the datasheet).
- One APB interface @200 MHz for accessing the DDRCTRL registers.
- One APB interface @200 MHz for accessing the DDRPERFM registers.
- One APB interface @200 MHz for accessing/programming top-level DDRSS registers.

  Through this interface, the following features are programmed: low-power (partially), observability, AC-swizzling for DDR3/DDR4, mode register read value access, and data-rate adaptation.
- One AHB interface @150 MHz for accessing/programming the RISAF4 registers, its filtering regions, and which ones are encrypted.
- One AHB interface @150 MHz for accessing/programming the MCE registers.
- One AHB interface @150 MHz for accessing/programming DDRPHYC registers.

Note: The RIF protection is detailed in Section 20: Reset and clock control (RCC) (not RIFSC) and pointer towards RCC (for access rights and low-power status), and Section 5.4: Resource isolation framework (RIF) (pointer to RIF) for access rights.

12.4 DDRSS embedded fractional PLL2

The DDRSS embeds locally a fractional PLL2 provided with a spread-spectrum modulator. While physically located in the DDRSS, this PLL2 is under the RCC control. Especially, registers controlling the different PLL2 tuning are RCC registers.

The clock delivered by the PLL2 is configurable in a range from 16 MHz to 3200 MHz, and addresses the DDRCTRL core part and the DDRPHYC. The DDRPHYC relies on this clock for the DDR interface transactions.

The spread-spectrum modulator connected to the PLL2 allows modulating the DRAM clock frequency (triangular down-spread modulation) in order to reduce EMI at DRAM interface.

Depending on the requested data rate, the clock distribution to the DDRPHYC varies as follows.

- for data rates greater than 667 MT/s:
  - Clear the DDRDBG_BYPASS_PCLKEN register to 0 (BypassPclk is gated low).
  - Set the PLL2 to deliver a frequency of data rate/4 MHz.
  - DDRCTRL and DDRPHYC operate synchronously at half of the DRAM clock frequency.
  - A low-jitter PLL embedded in the DDRPHYC delivers a high-speed DDRPHYC internal clock running at four times the DDRPHYC input clock frequency. The DDRPHYC delivers also the DRAM differential clocks (DDRA_CKP/N and DDRB_CKP/N) running at two times the DDRPHYC input clock frequency.
- for data rates lower than 667 MT/s:
  - Set the DDRDBG_BYPASS_PCLKEN register to 1 (BypassPclk is active).
  - Set the PLL2 to deliver a frequency of data rate MHz.
  - The DDRCTRL and DDRPHYC DFI interfaces operate synchronously at data rate/4 MHz.
  - BypassPclk clock runs at four times the DFI interface clock. BypassPclk connects to the PLL2 main output, and DFI_clock/ddrc_core_clock connect to the “divided-by-4” output.

Note: Enabling BypassPclk_enable also drives to 1 the PLL2 Foutpostdiven input to enable the FOUT2 output.

The table below presents, depending on the configured data rate, the various frequency values in the DDRSS.

Table 54. Frequency values for the DDRSS clocks versus data rate versus DDR JEDEC standard

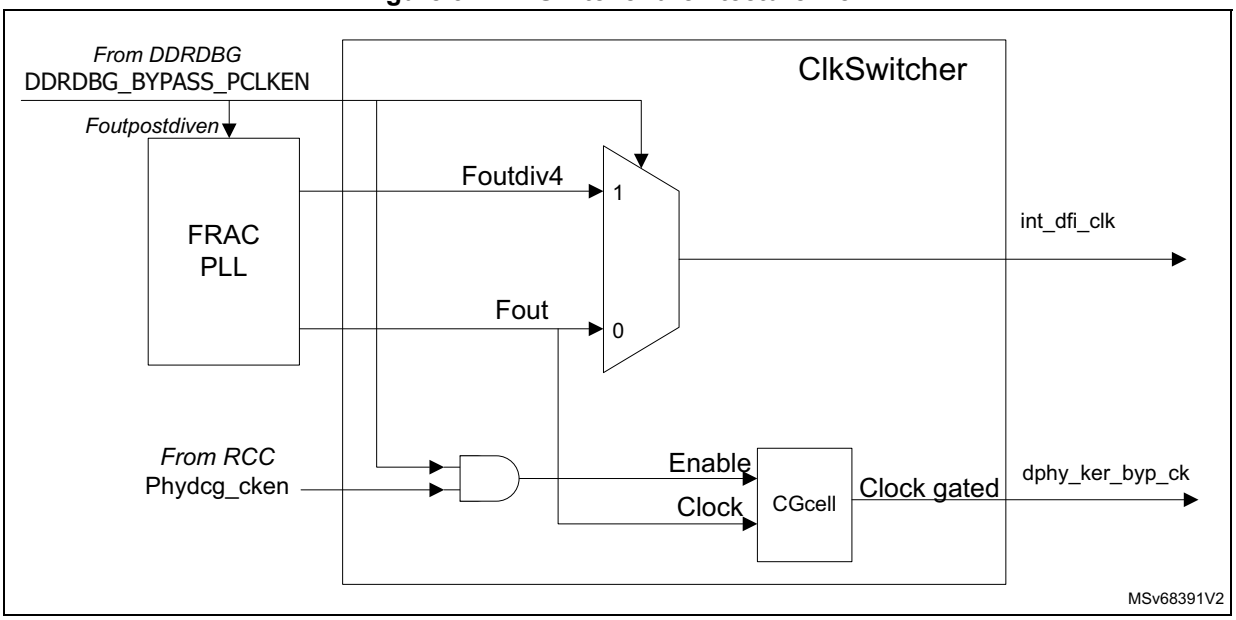
Conditions		Bypass Pclk_ enable	PLL2 delivered clock (MHz)	PLL2 divided by 4 delivered clock (MHz)	DDRCTRL core clock (MHz)	DDRPHYC DFI clock (MHz)	DDRPHYC bypass Pclk (MHz)	DDR_CLK (MHz)
Data rate < 667 MT/s	LPDDR4	1	Up to 666	Up to 166	Up to 166	Up to 166	Up to 166	Up to 333
	DDR3L	1	Up to 666	Up to 166	Up to 166	Up to 166	Up to 166	Up to 333
	DDR4	DDR4 DLL-on mode only possible starting from 625 MHz						

Table 54. Frequency values for the DDRSS clocks versus data rate versus DDR JEDEC standard (continued)

Conditions		Bypass Pclk_ enable	PLL2 delivered clock (MHz)	PLL2 divided by 4 delivered clock (MHz)	DDRCTRL core clock (MHz)	DDRPHYC DFI clock (MHz)	DDRPHYC bypass Pclk (MHz)	DDR_CLK (MHz)
Data rate > 667 MT/s	LPDDR4	0	Up to 400	Gated down	Up to 400	Up to 400	Gated down	Up to 800
	DDR3L	0	Up to 400	Gated down	Up to 400	Up to 400	Gated down	Up to 800
	DDR4	0	Up to 400	Gated down	Up to 400	Up to 400	Gated down	Up to 800

The figure below presents a high-level view of the ClkSwitcher logic.

Figure 34. ClkSwitcher architecture view



12.5 DDRSS top-level features

12.5.1 Filtering and AES encryption

Incoming data transfers to the DDRSS are first checked against security rules. The RISAF4 performs this security checking. The security rules are defined per SDRAM memory subregions, and programmed into the RISAF through its AHB interface (see *Section 10.5: RISAF registers* more details on programming rules).

The DDRSS is dual port, as the RISAF and the DDRCTRL. The security rules are set identically for all these access ports.

The read transactions that do not comply to the security rules result as read-as-zeros (RAZ).

The write transactions that do not comply to the defined security rules result in non-effective writes: the write transaction is forwarded downstream but nothing is written in the SDRAM array.

At reset, the RISAF is configured with a single region covering the whole SDRAM memory space, and accepting only trusted domain (secure and privilege) traffic.

On top of security defined rules, some regions can be AES-128 encrypted. Encrypted regions are programmed through the RISAF registers. The AES encryption/decryption engine is embedded in the RISAF. While the RISAF is dual port, the AES encryption/decryption engine can be applied only on RISAF port 1.

In addition, memory region can be defined to be encrypted using MCE with AES-128 bits or AES 256 bits encryption/decryption engines. MCE provides advanced features against side channel attacks.

The STM32MP21xx bus interconnect is set so that the following initiator list is candidate for encryption: CPU1, CPU2, HPDMA1/2/3 AHB traffic, HPDMA 1/2/3 AXI traffic, and LTDC secure traffic.

At DDRSS initialization time, the 128-bit encryption key must be written in the RISAF registers before any data transfer occurs.

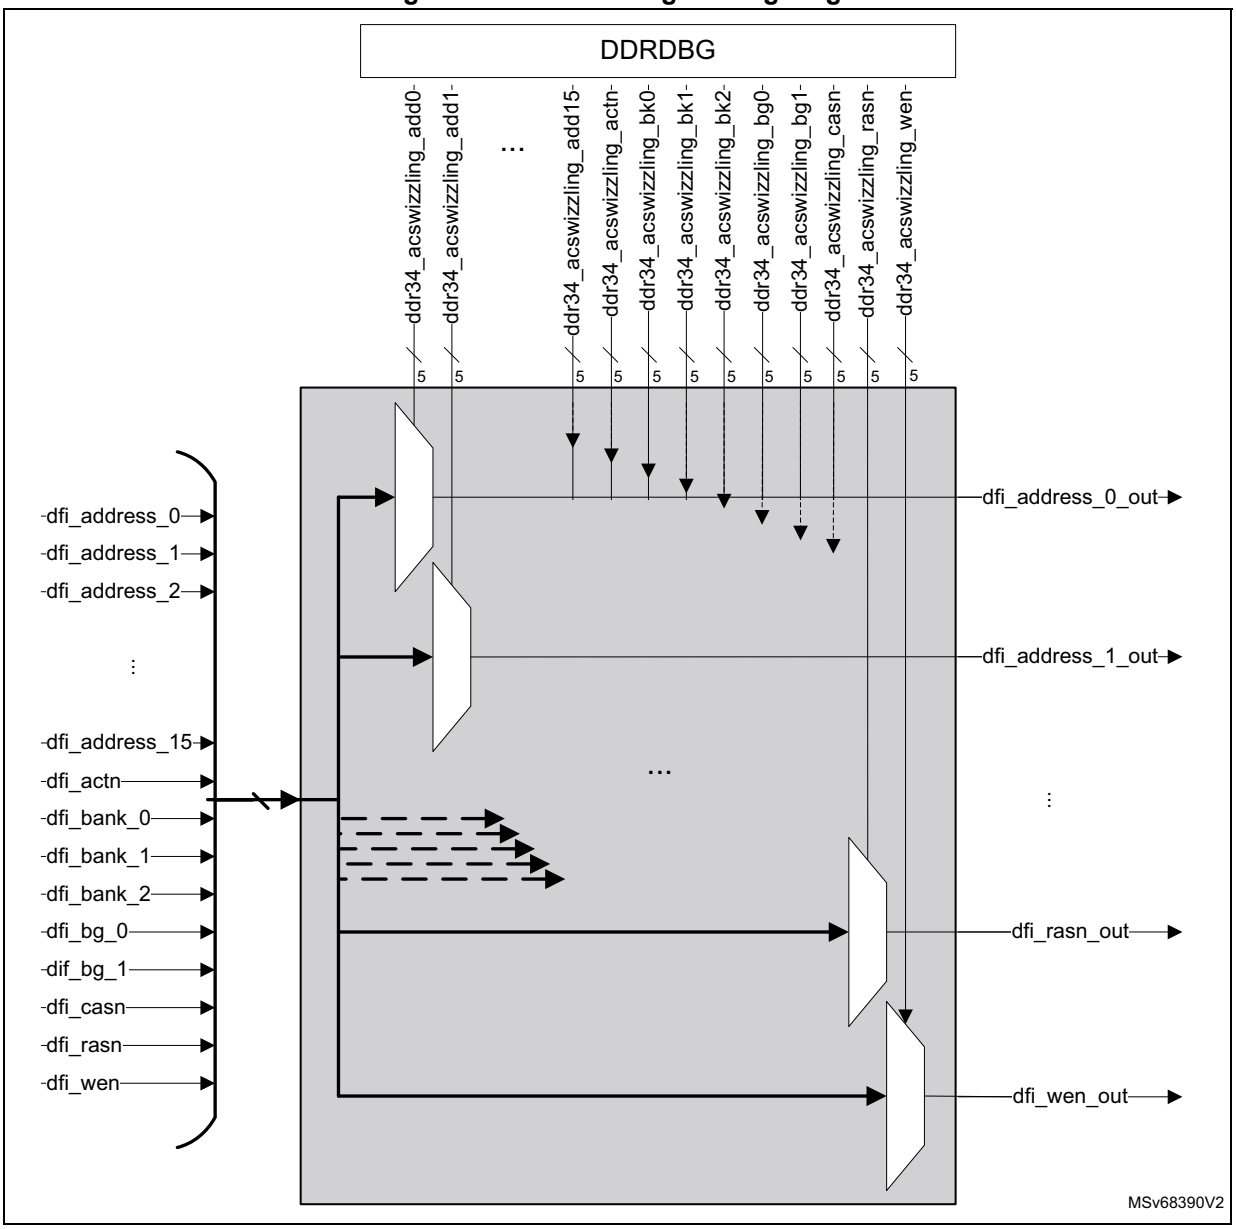
12.5.2 DDR3/4 AC-swizzling

The DDRPHYC natively allows swapping address pad connections for LPDDR4. This is especially helpful when the PCB routing requires to swap the AC ball connections (see *Section 14.2: DDRPHYC block diagram* for more details).

The DDRPHYC does not natively support the same feature for DDR3 and DDR4.
At the DFI interface between the DDRCTRL and the DDRPHYC, a set of multiplexers enables this functionality. These multiplexers driving inputs are programmable through DDRSS DDRDBG registers. The figure below presents this muxing stage.

Any of the 25 input signals can be swapped to match the remapping performed downstream of the DDRPHYC. By default, these signals are not remapped.

Figure 35. AC-swizzling muxing stage



12.5.3 Mode register read

The LPDDR4 standard is provided with a mode register read command. The DDR4 is provided with a multi-purpose register read command. The DDRCTRL supports these commands but does not register the resulting read value.

The DDRSS is then enhanced with registers to store these values, to monitor the status, and to clear them.

Addresses to these registers are the following:

- MRR 0x4804 2000 - 128-bit data (RO)
- MRR 0x4804 2010 - status (RO)
- MRR 0x4804 2014 - clear (WO)

The sequence to perform a mode read register (LPDDR4) or a multi-purpose register read (DDR4) is detailed below:

1. Program the mode register read through the DDRCTRL APB interface:
   a) The DDRCTL performs the command sequence for reading the mode register value.
   b) When the read value comes back on the hif_mrr_data interface and is valid, it is stored in the DDRDBG MRR read value.
   c) The DDRDBG MRR status indicates a valid data is present in the register.
2. Poll on the DDRDBG MRR status register through the DDRSS DDRDBG APB interface.
3. When the DDRDBG MRR status register indicates a valid data is present in the read value register, read it from the DDRDBG APB interface.
4. Clear the read data and the status bit writing the clear register bit through the DDRDBG APB interface.

12.5.4 Observability

The DDRSS reports 16 parallel signals to the HDP (hardware debug port):

- Twelve of these signals are directly tied to DDRSS internal signals.
- Four of these signals are software controllable (through DDRSS DDRDBG) to select four out of a max of 16 meaningful signals.

The 12 signals directly assigned to an observability port of the HDP are listed in the following table.

Table 55. List of observable signals sent directly to HDP

#	Signal	Source	Meaning
0	ddrss_lpiddrc_csysreq	RCC	csysreq signal from the DDRCTRL core low-power interface
1	ddrss_lpiddrc_csysack	DDRCTRL	csysack signal from the DDRCTRL core low-power interface
2	ddrss_lpiddrc_cactive	DDRCTRL	cactive signal from the DDRCTRL core low power interface
3	ddrss_mcdcg_en	RCC	cken signal from the RCC to the MCDCG block
4	ddrss_dphycg_en	RCC	cken signal from the RCC to the PHYDCG block
5	dfi0_init_start	DDRCTRL	dfi interface signal, used for initialization and going into LP2/LP3 low-power mode
6	dfi0_init_complete	DDRPHYC	dfi interface signal, used for initialization and going into LP2/LP3 low-power mode
7	dfi0_ctrlupd_req	DDRCTRL	Update request from the controller that the DDRPHYC updates the delay-line values from the master delay line
8	dfi0_phyupd_req	DDRPHYC	DDRPHYC requests to the DDRCTRL to hold traffic for the time the DDRPHYC performs a VT compensation of its internal delay line.
9	dfi0_phymstr_req	DDRPHYC	DDRPHYC requests control over the DRAM bus.
10	dfi0_lp_req	DDRCTRL	There is no opportunity for low-power mode entry.
11	dfi0_freq[0]	DDRCTRL	Used, in STM32MP21xx, to switch to LP2/LP3 low-power mode

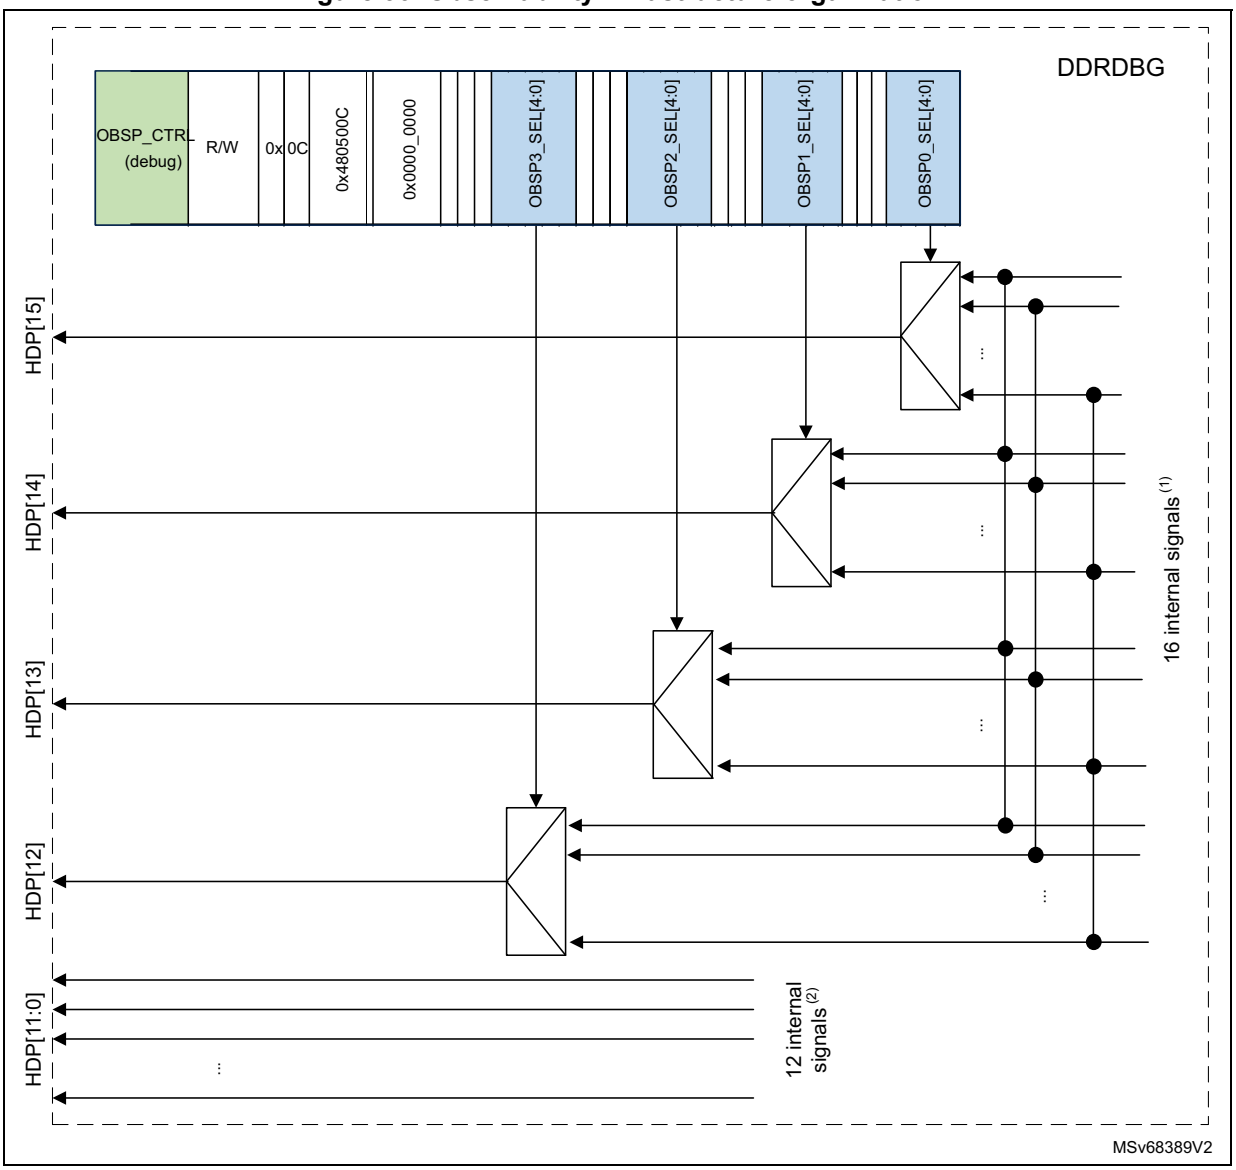
The pool of 16 signals among which four can be selected to be routed to the HDP are listed in the table below.

Table 56. List of observable signals selectable and sent to HDP

#	Signal	Source	Meaning
0	ddrctrl_reg_selfref_type[0]	DDRCTRL	Bit 0 of the reg_selfref_type DDRCTRL register
1	ddrctrl_reg_selfref_type[1]	DDRCTRL	Bit 1 of the reg_selfref_type DDRCTRL register
2	pll2_div_10	Frac_PLL	Main output of the Frac_PLL, divided by 10
3	pll2_lock	Frac_PLL	Lock of the frac_PLL
4	dwc_ddrphy_dto_div_10	DDRPHYC	DDRPHYC internal PLL output divided by 10
5	dwc_ddrphy_dto	DDRPHYC	DDRPHYC internal PLL lock
6	lpi_cactive_n_1	DDRCTRL	cactive from AXI port 1, allowing to shut down port clock
7	lpi_cactive_n_2	DDRCTRL	cactive from AXI port 2, allowing to shut down port clock
8	ddrss_phy_pwok_tcr	PWRCTRL	PWROKIN provided to the DDRPHYC by the PWRCTRL
9	um_ddrss_axi1_awpoison and um_ddrss_axi1_awvalid	RISAF	At the output of the RISAF, write poison bit sent to DDRCTRL
10	um_ddrss_axi1_arpoison and um_ddrss_axi1_arvalid	RISAF	At the output of the RISAF, read poison bit sent to DDRCTRL
11	um_ddrss_axi1_ruser[0] and um_ddrss_axi1_rvalid	DDRCTRL	Read transaction must be decrypted by RISAF
12	um_perf_op_is_enter_selfref	DDRCTRL	Assert for every entry into self-refresh
13	um_lpr_credit_cnt == 0b0 0b1: 0b0	DDRCTRL	Signal asserted when there is no more space in the low priority read cam
14	um_hpr_credit_cnt == 0b0 0b1: 0b0	DDRCTRL	Signal asserted when there is no more space in the high priority read cam
15	um_wr_credit_cnt == 0b0 0b1: 0b0	DDRCTRL	Signal asserted when there is no more space in the write cam

The figure below presents the observability signals sent to HDP from the DDRSS.

Figure 36. Observability infrastructure organization



1. These 16 signals are detailed in *Table 56*.
2. These 12 signals are detailed in *Table 55*.

12.5.5 DDRSS low power

The DDRSS low-power strategy is a complex joint work involving the RCC, the PWR, the DDRCTRL, and the DDRPHYC. At DDRSS level, registers are used to control two low-power strategy features.

DDRCTRL XPI port clock gating

The DDRCTRL XPI ports (AXI ports) can be clocked down if there are no traffic going through for a programmable amount of time. This duration is programmable in DDRCTRL registers. The clock gating logic however is outside of the DDRCTRL. The DDRDBG

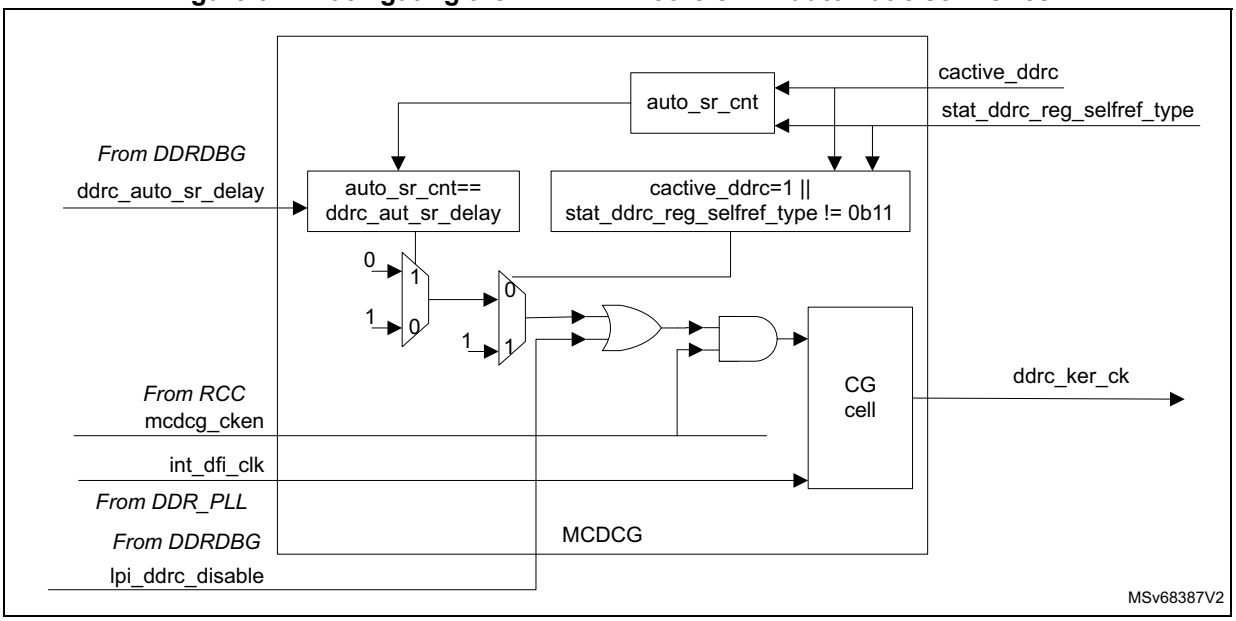
register lp_disable bitfield lpi_xpi_disable can be used to disable this clock gating feature for both xpi ports simultaneously.

Automatic self-refresh involving DDRCTRL clock gating

The STM32MP21xx supports three ways to set the SRAM in self-refresh: automatic, hardware, and software self-refreshs.

An automatic self-refresh relies on DDRCTRL internal counters programmed by software. When the DDRCTRL is idle for an expired counter period, it can set the SDRAM in self-refresh. Once the SDRAM is in self-refresh, the DDRCTRL asserts an external signal (stat_ddrc_reg_selfref_type). A glue logic in the DDRSS relies on this signal to gate down the clock delivered to the DDRCTRL core part, as depicted in the figure below.

Figure 37. Clock gating the DDRCTRL core clk in automatic self-refresh



At DDRSS top level, the registers are used:

- to enable/disable the gating of the clock in automatic self refresh (lp_disable bitfield lpi_ddrc_disable register)
- to control the delay before gating down the clock to the DDRCTRL core part (ddrc_auto_sr_delay bitfield delay_cycles register).

Note: DDRCTRL registers are in the gated-down clock domain. The delay must let any ongoing transaction on the DDRCTRL registers complete.

12.5.6 DFI errors

The DDRPHYC uses the dfi_error signal at the DFI interface to report two kind of errors to the system:

- When the DDRPHYC internal counter DFIPHYUPDCNT expires, the DDRPHYC issues to the DDRCTRL an update request to perform an internal delay element compensation and to avoid that temperature and voltage drifts affect the memory operation. If the DDRCTRL does not acknowledge this request in time, the DDRPHYC

asserts the dfi_error_signal with dfi_error_info = 0b0000. In this case, the DDRPHYC compensation time is over and correct memory operation is no longer guaranteed.

- In LPDDR4, the DDRPHYC must perform periodic DRAM drift compensation operations. The DDRPHYC requires the ownership of the DRAM through dfi_phymstr_req interface, and the DDRCTRL must answer with dfi_phymstr_ack in a given time ($t_{phymstr_resp}$). If the DDRCTRL has not acknowledged the request within this time, a dfi_error is asserted with dfi_error_info = 0b0001.

The dfi_error is reported at the top of the DDRSS as an interrupt, and status is logged in the DDRSS DDRDBG.

12.6 DDRSS registers

12.6.1 DDRDBG low-power disable register (DDRDBG_LP_DISABLE)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPI_DDRC_DISABLE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPI_XPI_DISABLE
							rw								rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **LPI_DDRC_DISABLE**:
0: No effect
1: Disable automatic clock gating of DDRC when idle.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **LPI_XPI_DISABLE**:
0: No effect
1: Disable automatic clock gating of XPIs when idle.

12.6.2 DDRDBG bypass P_{CLKEN} register (DDRDBG_BYPASS_PCLKEN)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ENABLE
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **ENABLE**:

0: No effect

1: The DDRPHYC Bypass_Pclken is active. The targeted data rate is less than 666 MT/s. The clock fed to the SDRAM interface is the one coming directly from the interfan frac pll, and the DDRPHYC does not alter it.

12.6.3 DDRDBG DDRC auto SR delay register (DDRDBG_DDRC_AUTO_SR_DELAY)

Address offset: 0x008

Reset value: 0x0000 0020

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DELAY_CYCLES[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **DELAY_CYCLES[7:0]**: Number of delay cycles to wait before to gate down the DDRC clock when in auto self-refresh

This delay allows any ongoing register access to be completed before to gate the DDRC clock.

12.6.4 DDRDBG OBSP control register (DDRDBG_OBSP_CTRL)

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	OBSP3_SEL[4:0]					Res.	Res.	Res.	OBSP2_SEL[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	OBSP1_SEL[4:0]					Res.	Res.	Res.	OBSP0_SEL[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **OBSP3_SEL[4:0]**:

Selects which of the input observable signal is forwarded to the HDP on selectable observability line 3.

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **OBSP2_SEL[4:0]**:

Selects which of the input observable signal is forwarded to the HDP on selectable observability line 2.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **OBSP1_SEL[4:0]**:
Selects which of the input observable signal is forwarded to the HDP on selectable observability line 1.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **OBSP0_SEL[4:0]**:
Selects which of the input observable signal is forwarded to the HDP on selectable observability line 0.

12.6.5 DDRDBG FRAC PLL lock register (DDRDBG_FRAC_PLL_LOCK)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LOCK
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **LOCK**:
0: No effect
1: PLL lock, direct copy of ddrss_pll2_lock

12.6.6 DDRDBG DTO output register (DDRDBG_DTO_OUTPUT)

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DTO
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **DTO**:
0: No effect
1: DDRPHYC DTO output is stored in this register. Among other signals of interests, the DDRPHYC PLL lock can be observed in this register.

12.6.7 DDRDBG DFI error control register (DDRDBG_DFI_ERRORS_CTRL)

Address offset: 0x030

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	DFI_ERROR1_SET	DFI_ERROR1_CLEAR	Res.	Res.	Res.	Res.	Res.	Res.	DFI_ERROR0_SET	DFI_ERROR0_CLEAR
						rw	rw							rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **DFI_ERROR1_SET**:
0: No effect
1: Trigger the interrupt linked with dfi_error.

Bit 8 **DFI_ERROR1_CLEAR**:
0: No effect
1: Clear the interrupt linked with dfi_error1.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **DFI_ERROR0_SET**:
0: No effect
1: Trigger the interrupt linked with dfi_error0.

Bit 0 **DFI_ERROR0_CLEAR**:
0: No effect
1: Clear the interrupt linked with dfi_error0.

12.6.8 DDRDBG DFI error status register (DDRDBG_DFI_ERROR_STATUS)

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFI_ERROR1_STATUS	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFI_ERROR0_STATUS
							rw								rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **DFI_ERROR1_STATUS**: Status bit for dfi_error1
0: No effect
1: Clear the interrupt linked with dfi_error1.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **DFI_ERROR0_STATUS**: Status bit for dfi_error0
0: No effect
1: Clear the interrupt linked with dfi_error0.

12.6.9 DDRDBG DFI error mask register (DDRDBG_DFI_ERROR_MSK)

Address offset: 0x38

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFI_ERROR1_MASK	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFI_ERROR0_MASK
							rw								rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **DFI_ERROR1_MASK**:
0: No effect
1: Interrupt linked to dfi_error1 is masked. Clear the interrupt linked with dfi_error1.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **DFI_ERROR0_MASK**:
0: No effect
1: Interrupt linked to dfi_error0 is masked. Clear the interrupt linked with dfi_error0.

12.6.10 DDRDBG DDR34 AC swizzle ADD3_0 register (DDRDBG_DDR34_AC_SWIZZLE_ADD3_0)

Address offset: 0x100

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	DDR34_AC_SWIZZLING_ADD3[4:0]					Res.	Res.	Res.	DDR34_AC_SWIZZLING_ADD2[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DDR34_AC_SWIZZLING_ADD1[4:0]					Res.	Res.	Res.	DDR34_AC_SWIZZLING_ADD0[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **DDR34_AC_SWIZZLING_ADD3[4:0]**: Remapping input bit on add3 DDRPHYC input at the DFI interface (remapping defined in *Table 57*)

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **DDR34_AC_SWIZZLING_ADD2[4:0]**: Remapping input bit on add2 DDRPHYC input at the DFI interface (remapping defined in *Table 57*)

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **DDR34_AC_SWIZZLING_ADD1[4:0]**: Remapping input bit on add1 DDRPHYC input at the DFI interface (remapping defined in *Table 57*)

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **DDR34_AC_SWIZZLING_ADD0[4:0]**: Remapping input bit on add0 DDRPHYC input at the DFI interface (remapping defined in *Table 57*)

Table 57. Detailed AC swizzling register values

Register value (binary format)	Selected remapping (selected input signal)	Register value (binary format)	Selected remapping (selected input signal)
00000	No remapping	01110	DFI_ADDRSS_13
00001	DFI_ADDRSS_0	01111	DFI_ADDRSS_14 (DDR3 only)
00010	DFI_ADDRSS_1	10000	DFI_ADDRSS_15 (DDR3 only)
00011	DFI_ADDRSS_2	10001	Reserved
00100	DFI_ADDRSS_3	10010	DFI_ACTN (DDR4 only)
00101	DFI_ADDRSS_4	10011	DFI_BANK_0
00110	DFI_ADDRSS_5	10100	DFI_BANK_1
00111	DFI_ADDRSS_6	10101	DFI_BANK_2
01000	DFI_ADDRSS_7	10110	DFI_BANK_0
01001	DFI_ADDRSS_8	10111	DFI_BANK_1
01010	DFI_ADDRSS_9	11000	DFI_CASN
01011	DFI_ADDRSS_10	11001	DFI_RASN
01100	DFI_ADDRSS_11	11010	DFI_WEN

Refer to *Section 2.4* for the register boundary addresses.

13 DDR3L/DDR4/LPDDR4 controller (DDRCTRL)

13.1 DDRCTRL introduction

The DDRCTRL is a DDR-SDRAM controller. Combined with the DDRPHYC (DDR PHY with PUBL block), it provides a complete memory interface solution for the DDR memory subsystem.

13.2 DDRCTRL features

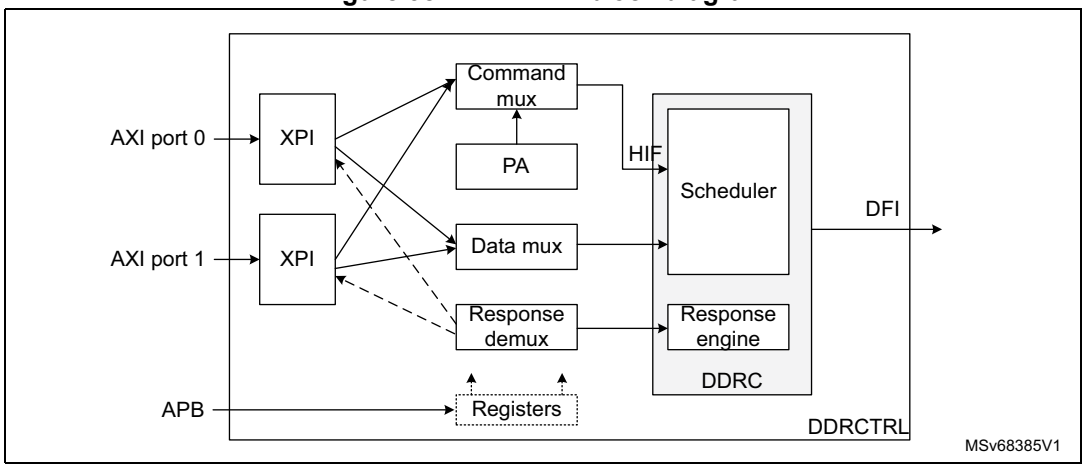
- Two 128-bit AXI port interfaces (XPIs)
- AXI clock asynchronous to the controller
- Supported standards
  - JEDEC compliant LPDDR4 SDRAM up to 1600 MT/s
  - JEDEC compliant DDR4 SDRAM up to 1600 MT/s with DLL on-range
  - JEDEC compliant DDR3L SDRAM up to 1600 MT/s with DLL on-range
  - Single- or dual-rank for LPDDR4 devices
  - Single- or dual-rank for DDR3L/DDR4 devices
- 64 bits with DFI 4.0 compliant interface to DDRPHYC
- Advanced scheduler and SDRAM command generator
- 1:2 frequency ratio between DDRC clock and DDR PHY/external memory clock
- Asynchronous clock between AXI ports and DDRC (clock crossing local to XPIs)
- Programmable full data width (32-bit) or half data width (16-bit)
- Options to avoid starvation of lower-priority traffic
- Guaranteed coherency for write-after-read (WAR) and read-after-write (RAW) on AXI ports
- Programmable support for burst length options (8, 16)
- Write combine (multiple writes to the same address combined into a single write)
- Automatic SDRAM power-down entry/exit caused by a lack of transaction arrival for programmable time
- Automatic clock stop entry/exit caused by lack of transaction arrival
- Automatic low-power mode operation caused by a lack of transaction arrival for programmable time via hardware low-power interface
- Programmable paging policy selectable as any of the following:
  - Leave page open after accesses (open page policy).
  - Close page when no further accesses available in the controller for that page.
  - Auto-precharge with each access, with an optimization for page-close mode which leaves the page open after a flush for read-write and write-read collision cases.
- Self-refresh entry/exit as follows:
  - Automatic self-refresh entry/exit caused by lack of transaction arrival for programmable time
  - Self-refresh entry/exit under software control
- Explicit SDRAM mode register updates under software control

- Flexible address mapper logic to allow application specific mapping of (rank,) row, column, bank bits
- Programmable support for 1T or 2T timing
- User-selectable refresh control options:
  - Controller-generated auto-refreshes at programmable average intervals
  - Ability to group up to eight controller-generated refreshes together to be issued consecutively (this reduces the frequency of page closings, and increases the overall efficiency)
  - When controller-generated refreshes are grouped, some refreshes can be issued speculatively when the controller is idle for a programmable period of time
  - Ability to disable controller-generated auto-refreshes
  - Ability to issue a refresh through direct software request

13.3 DDRCTRL block diagram

A simplified DDRCTRL block diagram is shown in the figure below.

Figure 38. DDRCTRL block diagram



13.4 DDRCTRL architecture overview

The DDRCTRL block diagram in *Figure 38* shows:

- the AXI port interface (XPI): provides the interface to the AXI port with the AXI bus protocol handling, data buffering and reordering for read data, data bus size/clock domain conversion and memory burst address alignment.
- the port arbiter (PA): provides latency sensitive, priority-based arbitration between the addresses issued by the XPIs.
- the DDR controller (DDRC): contains a logical CAM (content addressable memory). This holds information on the commands and is used by the scheduling algorithms to optimally schedule commands to be sent to the PHY, based on priority, bank/rank status and DDR timing constraints.
- the APB register: contains the software accessible registers.

- the write data: stored until its associated command is issued to the PHY. The write data buffer is local to the DDRC.

The read data are handled by the response engine in the DDRC, and returned in the order of scheduled read commands on the HIF (host interface). the read data are stored in the read reorder buffer (local to XPI), and returned in order to the AXI ports.

13.4.1 AXI port interface (XPI)

The XPI processes the AXI information: address, burst size, burst length, and burst type. It converts the AXI burst into read/write requests which are forwarded to the PA.

In the opposite direction, the XPI converts the responses from the DDRC into appropriate AXI responses.

Read address channel features

- Supports any burst length for incremental bursts (≤ 256) and burst with length ≤ 16 for WRAP bursts.
- The start address can be unaligned to the AXI width.
- The burst size can be less than the AXI width.
- The read-address queue (RAQ) is configured with a single queue.
- The clock crossing is performed in RAQ.
- The depth of RAQ is set to four.
- The generation of read request is based on AXI address and burst information, than is divided into packets equal to memory burst length (BL2, BL4, BL8, BL16).
- In case of an unaligned burst, the first read request is unaligned, and the remaining read requests are aligned.

Note: The device interconnect performs the realignment to a memory burst boundary. It may cause some data beats to be discarded (affecting bandwidth), and introduce additional latency on the read data and response channel.

Write address channel features

- The write address queue (WAQ) is used to store all addresses for write requests from a given port.
- There is a single queue for all AXI IDs from a given port.
- The write address channel behavior is similar to the read address channel.
- The clock crossing is performed in WAQ.
- The depth of WAQ is set to four.

Read data and response channels

- The read data and response channel has a single data storage queue (RDQ).
- The clock crossing is performed in RDQ.
- The depth of RDQ is set to 10.
- The data from different IDs are stored in the same queue, and are returned in the order of read address acceptance.
- A read reorder buffer is implemented in each port to reorder the read data for that port to the same order as the order of the AXI read commands.
- The virtual channels and dynamic mapping allow optimum reordering of read data.

13.4.2 Port arbiter (PA)

The PA arbitrates command requests from the two AXI ports to the HIF of the DDR controller. The PA is comprised of multiple tiers of arbitration stages which include:

- read/write arbitration (single HIF option)
- two priority level arbitration, based on port aging and expired-VPR/expired-VPW commands (timeout - priority0)
- two priority level arbitration for read requests based on DDRC read priorities (HPR/LPR-VPR)
- 32 priority level arbitration based on internal port aging, or 16 priority level arbitration based AXI QoS inputs (programmed in AXI interconnect)
- round-robin arbitration to resolve ports having the same priority after passing all stages of arbitration

Note: The port aging refers to counting down the time when a port has a request, but is not granted access to the DDRC.

The port timeout refers to when the port age becomes 0, which is also referred as the highest priority -priority0.

The expired-VPR refers to variable priority read commands whose counter has expired. Read/write credits refer to the DDRC 'Credit Mechanism' employed at the HIF interface.

13.4.3 Host interface (HIF)

The HIF is an internal interface to the DDRCTRL (AXI port interface and PA handle all signals on this interface). It is only described for the sake of understanding QoS and of multi-tier arbitration.

The read/write requests and write data are transferred from PA to DDRC using HIF.

The requests are throttled by:

- a credit mechanism that ensures the buffer space is available for any request made to the DDRC, prior to the request being made
- an independent stall mechanism that throttles requests when address collisions take place, or whether entering a self-refresh via the software self-refresh.

The read data are sent back via a common response interface

Credit mechanism

The DDRC uses a credit mechanism to ensure that buffers do not overflow. The interface making the request to the DDRC, can only request commands for which it has been granted credits to issue.

The credits are tracked separately for the following three command types:

- high-priority read (HPR)
- low-priority read (LPR)
- write (WR)

The interface logic includes counters to track the number of credits. The credit count increments every time the DDRC issues a credit. VPR commands are counted in the LPR credit bucket. VPW commands are counted in the WR credit bucket.

Read requests

When the LPR or HPR credit count is greater than zero, the interface can issue read requests to the DDRC.

Write requests

When the WR credit count is greater than zero, the interface can issue write requests to the DDRC.

13.4.4 DDR scheduler (DDRC)

The DDRC queues commands for scheduling and for the SDRAM command generation unit. The DDRC includes the following stores:

- HPR and LPR stores in common read CAM
- WR store in write CAM

Both CAMs are 16 entries. HPR/LPR split is software programmable.

The DDRC allows the user to manage the TSC (transaction service control) according to QoS and timeouts.

13.5 DDRCTRL functional description

13.5.1 Transaction service control (TSC) and quality of service (QoS)

The TSC allows the user to carefully manage:

- costly read/write bus turn-around
- priorities of read requests to generally favor high-priority traffic, while also preventing starvation of low priority traffic

This functionality is implemented in a simple 2-state machine for each traffic type, with completely configurable controls. The states of the 2-state machine determine when reads/writes are serviced, and the relative priority (high-priority versus low-priority reads) at any time.

The transactions are separated into the following read/write classes:

- low-priority reads (LPR)
- variable-priority reads (VPR)
- high-priority reads (HPR)
- normal-priority writes (NPW)
- variable-priority writes (VPW)

These traffic classes are determined according to AXI QoS values (AxQOS[3:0]) set by the device AXI interconnect (AXIM) and QoS region settings.

HPR and VPR/LPR are stored in a common read CAM which is split according to LPR_NUM_ENTRIES in DDRCTRL_REGS_SCHED.

VPR commands move to the expired-VPR after a timeout set by RQOS_MAP_TIMEOUTB in DDRCTRL_MP_PCFGQOS1_x. The expired-VPR goes to highest priority (Priority0).

VPW and NPW are stored in a common write CAM. VPW commands go to the expired-VPR after timeout set by WQOS_MAP_TIMEOUT2 in DDRCTRL_MP_PCFGWQOS1_x. Expired-VPW commands go to highest priority (Priority0).

The following registers are related to TSC and QoS control:

- DDRCTRL_REGS_SCHED: main scheduler control
- DDRCTRL_REGS_SCHED1: page close timer
- DDRCTRL_REGS_PERFHPR1: controls HPR starvation and run_length
- DDRCTRL_REGS_PERFLPR1: controls LPR starvation and run_length
- DDRCTRL_MP_PCFGR_0/1: AXI port read control for port 0/1
- DDRCTRL_MP_PCFGW_0/1: AXI port write control for port 0/1
- DDRCTRL_MP_PCFGQOS0_x or DDRCTRL_MP_PCFGQOS1_x (where x is the port number): AXI port read QoS region mapping for port 0/1 and port timeouts.
- DDRCTRL_MP_PCFGWQOS0_x or DDRCTRL_MP_PCFGWQOS1_x (where x is the port number): AXI port write QoS region mapping for port 0/1 and port timeouts.

13.5.2 Paging policy options

Open page policy is set by PAGECLOSE = 0 in DDRCTRL_REGS_SCHED. Any bank remains open until there is a need to close it because of a page miss or refresh timeout.

Intelligent precharge is a mid way between open- and close-page policies, set by PAGECLOSE = 1 in DDRCTRL_REGS_SCHED. PAGECLOSE_TIMER value in DDRCTRL_REGS_SCHED1 gives the time waited when there are no page hits to a bank in the CAM, before the auto-precharge or the explicit precharge is scheduled.

This timer allows the page to be kept open for a configurable number of clock cycles after there are no more commands pending in the CAM to a bank. Intelligent precharge is an option between open page and closed page

13.5.3 Power saving features

The DDRCTRL supports various methods to save power within the system using power saving opportunities in the SDRAM, the DDRPHYC, and the device.

Precharge power down (PDN)

The DDRCTRL automatically puts the SDRAM in PDN under the control of following parameters:

- POWERDOWN_EN in DDRCTRL_REGS_PWRCTRL to enter PDN (PDN entry, PDE) after a number of idle cycle
- POWERDOWN_TO_X32 in DDRCTRL_REGS_PWRTMG: number of idle clocks in multiple of 32 to enter PDN
- T_XP in DDRCTRL_REGS_DRAMTMG1: minimum time to wait after PDN exit (PDX) to any command (DLL stays locked during PDN)

Note: During PDN, refresh commands are performed and clocks must be maintained.
The DDRCTRL precharges all banks before PDE.

DDR3L slow power down (with MR0[12] =1) is not supported.

Self-refresh (SR)

The SR is a significant power saving opportunity for the SDRAM. During SR, the DDRPHYC provides additional power savings, and the DDRCTRL/DDRPHYC clocks can be stopped.

The DDRCTRL puts the SDRAM in SR in the following cases:

- automatic SR, when there are no read/write for a predefined time, controlled by:
  - SELFREF_EN in DDRCTRL_REGS_PWRCTRL: to enter SR (SRE) after a number of idle cycle
  - SELFREF_TO_X32 in DDRCTRL_REGS_PWRTMG: number of idle clocks in multiple of 32 to enter SR
- software controlled SR, controlled by SELFREF_SW in DDRCTRL_REGS_PWRCTRL: setting this bit is referred as software SRE.
- hardware controlled SR, supported by the FSM external to the DDRCTRL, and under the RCC control (see *Section 20: Reset and clock control (RCC)* for mode details). When the devices goes in Stop mode, the DDRCTRL can put the SDRAM into SR.

Maximum power saving mode (MPSM)

- MPSM is applicable only to DDR4.
- These power-saving opportunities are supported but do not present any significant interest because the SDRAM content is lost during DPD (Deep power-down) and MPSM, that are practically not different from shutting down the DDR.

DDR3L/DDR4 DLL off mode

The DDR3L and DDR4 DLL off modes are not supported.

13.5.4 Address mapper

The DDRCTRL address mapper converts the AXI port read/write request into row, bank, column (rank if any) SDRAM address at XPI level. The address mapping is very flexible and

defined according to DDRCTRL_REGS_ADDRMAP1 to DDRCTRL_REGS_ADDRMAP11 settings.

13.5.5 DRAM timing parameters

The DDRCTRL schedule commands to the SDRAM according to multiple timing constraints, as programmed in DDRCTRL_REGS_DRAMTMGx, according to SDRAM JEDEC timing parameters versus frequency.

The following registers are related to timings constrains:

- DDRCTRL_REGS_DRAMTMG0 to DDRCTRL_REGS_DRAMTMG17
- DDRCTRL_REGS_ODTTMG
- DDRCTRL_REGS_DFITMG0/1

13.5.6 SDRAM initialization sequence

The initialization is controlled by the DDRPHYC supporting a PUBL built-in initialization sequence for each DDR type, and triggered by PIR registers (see *Section 14: DDR physical interface control (DDRPHYC)* for more details).

13.5.7 Refresh controls

The refresh can be issued using one of the following method:

- using the direct software request of the refresh command (DIS_AUTO_REFRESH = 1 in DDRCTRL_REGS_RFSHCTL3)
- the auto-refresh feature in the DDRCTRL (DIS_AUTO_REFRESH = 0)

Refresh using the direct software request of refresh command

Follow these steps:

1. Set DIS_AUTO_REFRESH = 1. DDRCTRL checks for any pending refreshes. Any pending refreshes are issued right away using the ‘critical refresh’ feature inside the DDRCTRL. After these refreshes are issued, all refresh timers inside the DDRCTRL are reset to 0. They are re-activated only when the auto-refresh feature is enabled.
2. The device core must keep track of the refresh requirements of the SDRAM.
3. The refresh command can be issued by setting RANK0_REFRESH to 1 in DDRCTRL_REGS_DBGCMD. When the refresh request is stored, the corresponding bit is automatically cleared. The device core can initiate a refresh operation only if RANK0_REFRESH _BUSY = 0 in DDRCTRL_REGS_DBGSTAT. The DDRCTRL issues refresh to the SDRAM at the earliest.
4. Software-driven refresh commands are loaded into a 9-entry buffer, and are issued by the DDRCTRL on the DFI as soon as it is legal to do so. If the buffer saturates, RANK0_REFRESH _BUSY remains asserted to prevent software from initiating further refreshes.

Refresh using the auto-refresh feature inside DDRCTRL

The DDRCTRL provides advanced refresh controls. Besides fully-configurable refresh constraints ($t_{RFC(min)}$ and t_{REFI}), it can also be programmed to gather refreshes to each rank of the SDRAM, to reduce the bandwidth consumed by refreshes, and to increase the

likelihood that refreshes can be serviced during an idle period. The following registers are related to refresh controls:

- DDRCTRL_REGS_RFSHCTL0
- DDRCTRL_REGS_RFSHCTL3
- DDRCTRL_REGS_RFSHTMG

The purposes of refresh control are the following:

- reduce the bandwidth impact of refresh cycles
- increase the likelihood of refreshes being serviced during idle periods
- provide fine-gain control of the trading-off between above benefits (to gather refreshes) versus the increased worst-case latencies associated with gathering refreshes

For more information, refer to each register description. Beside issuing refresh at regular intervals according to $t_{RFC(min)}$ and t_{REFI}, several optimization options are possible: burst refresh, speculative refresh, and per-bank refresh (applicable to LPDDR4).

13.5.8 ZQ calibration

This feature is applicable to all DDR types. The DDRCTRL can use the ZQ calibration command to calibrate SDRAM RON (resistor on) and ODT (on-die termination) values over PVT (process, voltage, temperature).

The DDRPHYC supports RON and ODT calibration at initialization (see *Section 14: DDR physical interface control (DDRPHYC)* for more details).

The DDRCTRL can issue periodic calibrations which take less time at regular interval (ZQCS). The DDRCTRL can also issue a long calibration (ZQCL) after SR exit.

The following registers are related to ZQ calibration controls:

- DDRCTRL_REGS_ZQCTL0/1/2
- DDRCTRL_REGS_ZQSTAT

For more information on ZQ Calibration, refer to JEDEC specifications of the corresponding SDRAM.

13.5.9 Register programming

Most registers are static and must be programmed only when DDRCTRL is under reset.

Dynamic registers can be programmed at any time.

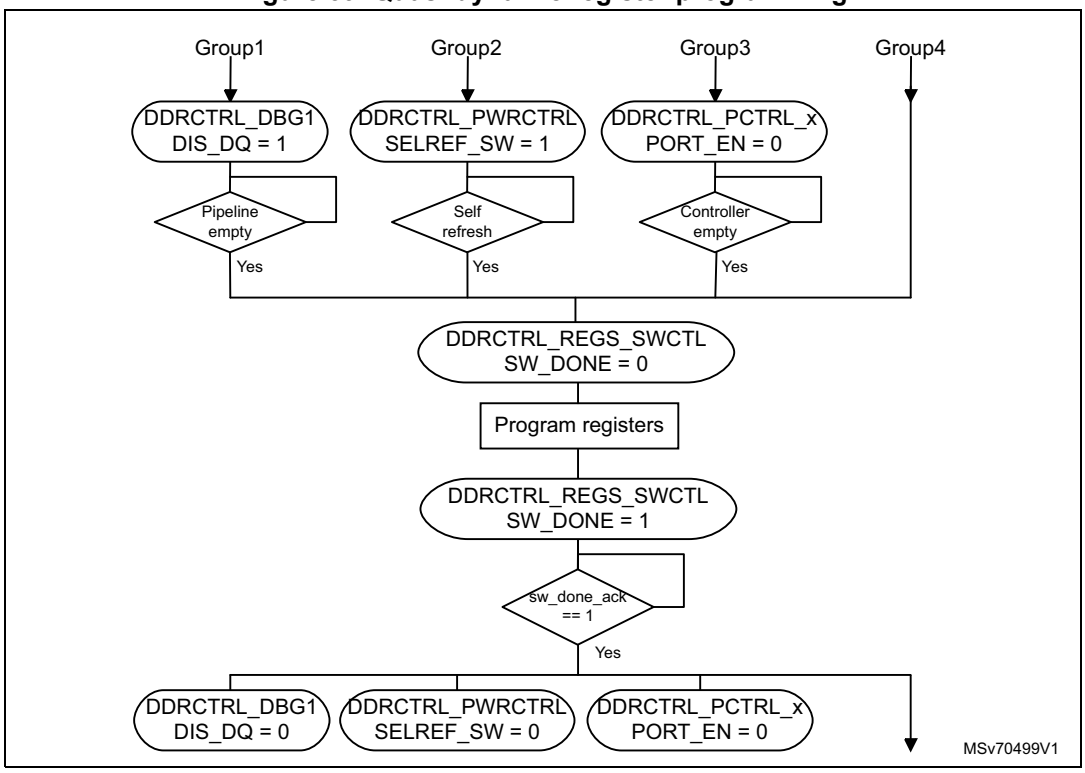
Refresh related registers are dynamic registers but the following steps are needed to update them:

- Change the refresh-related parameter as desired.
- After the changed register is stable, toggle REFRESH_UPDATE_LEVEL in DDRCTRL_REGS_RFSHCTL3.

Quasi-dynamic parameters can be programmed following the flow described in *Figure 39*, with the group as listed in the bitfield programming mode:

- Group 1: parameter that can be written when no read/write traffic is present at DFI (pipeline empty)
- Group 2: parameter that can be written in self-refresh, DPD, or MPSM
- Group 3: parameter that can be written when the controller is empty
- Group 4: parameter that can be written depending on MSTR frequency_mode and MSTR2 target_frequency

Figure 39. Quasi-dynamic register programming



13.6 DDRCTRL configuration

The DDRCTRL is configured with these major hardware options:

- DDR mode support: LPDDR4/DDR4/DDR3L
- frequency ratio: 1:2
- arbiter: include PA with two AXI ports
- CAM depth: 32 with bypass enabled
- single HIF
- single RAQ per port

13.7 DDRCTRL registers

The following variables are considered with fixed values:

- MEMC_NO_OF_ENTRY = 32

13.7.1 DDRCTRL master0 register (DDRCTRL_REGS_MSTR)

Address offset: 0x000

Reset value: 0x0304 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DEVICE_CONFIG[1:0]		Res.	Res.	Res.	Res.	ACTIVE_RANKS[1:0]		Res.	Res.	Res.	Res.	BURST_RDWR[3:0]			
rw	rw					rw	rw					rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DLL_OFF_MODE	Res.	DATA_BUS_WIDTH[1:0]		Res.	EN_2T_TIMING_MODE	BURSTCHOP	Res.	Res.	Res.	LPDDR4	DDR4	Res.	Res.	Res.	DDR3L
rw		rw	rw		rw	rw				rw	rw				rw

Bits 31:30 **DEVICE_CONFIG[1:0]**: Device configuration
00: x4 device
01: x8 device
10: x16 device
11: x32 device
Note: Programming mode: Static.

Bits 29:26 Reserved, must be kept at reset value.

Bits 25:24 **ACTIVE_RANKS[1:0]**: Only present for multi-rank configurations
Each bit represents one rank. For two-rank configurations, only bits[25:24] are present.
1: Populated
0: Unpopulated
LSB is the lowest rank number. For two ranks, the following combinations are legal:
01: One rank
11: Two ranks
Others: reserved
Note: Programming mode: Static.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **BURST_RDWR[3:0]**: SDRAM burst length
This bitfield controls the burst size used to access the SDRAM. This must match the burst length mode register setting in the SDRAM. For DDR3L, DDR4, this must be set to 0x0100 (BL8).
For LPDDR4, this must be set to 0x1000 (BL16).
0010: Burst length of 4
0100: Burst length of 8
1000: Burst length of 16 (only supported for LPDDR4)
Others: reserved
Note: Programming mode: Static.

Bit 15 **DLL_OFF_MODE**:
1: When the DDRCTRL and DRAM has to be put in DLL-off mode for low frequency operation
0: To put DDRCTRL and DRAM in DLL-on mode for normal frequency operation
Note: Programming mode: Quasi-dynamic Group 2.

Bit 14 Reserved, must be kept at reset value.

Bits 13:12 **DATA_BUS_WIDTH[1:0]**: Proportion of DQ bus width that is used by the SDRAM
00: 32 bits
01: 16 bits
10: 8 bits (supported for DDR3L half populated)
Note: Programming mode: Static.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **EN_2T_TIMING_MODE**:
0: DDRCTRL uses 1T timing.
1: DDRCTRL uses 2T timing.
In 2T timing, all command signals (except chip select) are held for two clocks on the SDRAM bus. Chip select is asserted on the second cycle of the command.
2T timing is not supported in LPDDR4 mode and in shared-AC dual channel mode (register value is don't care).
Note: Programming mode: Static.

Bit 9 **BURSTCHOP**: Burst chop (BC4 or 8 on-the-fly) enable in DDR3L/DDR4
Burst chop for reads is exercised only:
- in HIF configurations (DDRCTRL_REGS_INCL_ARB not set)
- in full bus width mode (DATA_BUS_WIDTH = 00 in this register)

BC4 (fixed) mode is not supported.
Note: Programming mode: Static.

Bits 8:6 Reserved, must be kept at reset value.

Bit 5 **LPDDR4**: Selects LPDDR4 SDRAM
1: LPDDR4 SDRAM device
0: Non-LPDDR4 device
Note: Programming mode: Static.

Bit 4 **DDR4**: Selects DDR4 SDRAM
1: DDR4 SDRAM device
0: Non-DDR4 device
Note: Programming mode: Static.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **DDR3L**: Selects DDR3L SDRAM
1: DDR3L SDRAM device
0: Non-DDR3L SDRAM device
Note: Programming mode: Static.

13.7.2 DDRCTRL operating mode status register (DDRCTRL_REGS_STAT)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	SELFREF_CAM_NOT_EMPTY	Res.	Res.	SELFREF_STATE[1:0]		Res.	Res.	SELFREF_TYPE[1:0]		Res.	OPERATING_MODE[2:0]		
			r			r	r			r	r		r	r	r

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **SELFREF_CAM_NOT_EMPTY**: Self-refresh (SR) with CAMs not empty

Set to 1 when SR is entered but CAMs are not drained. Cleared after exiting SR.

Note: Programming mode: Static.

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:8 **SELFREF_STATE[1:0]**: SR or SRPD (SR power-down) for LPDDR4

This bitfield is used for frequency change and MRR/MRW access during SR.

00: SDRAM not in SR

01: SR 1

10: SRPD

11: SR 2

Note: Programming mode: Static.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **SELFREF_TYPE[1:0]**: Flags if SR (except LPDDR4), or SRPD (LPDDR4) is entered, and if it is under automatic SR control only or not

00: SDRAM is not in SR (except LPDDR4) or SRPD (LPDDR4).

11: SDRAM is in SR (except LPDDR4) or SRPD(LPDDR4), which was caused by automatic SR only. If retry is enabled, this ensures that the SR entry (SRE) command is executed correctly without parity error.

10: SDRAM is in SR (except LPDDR4) or SRPD (LPDDR4), which was not caused solely under automatic SR control. It may have been caused by hardware low-power interface and/or software (SELFREF_SW in DDRCTRL_REGS_PWRCTL). If retry is enabled, this ensures that the SRE command is executed correctly without parity error.

01: SDRAM is in SR, which is caused by PHY master request.

Note: Programming mode: Static.

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **OPERATING_MODE[2:0]**:
DDR3L design:
00: Init
01: Normal
10: PDN
11: SR
DDR4 design:
000: Init
001: Normal
010: PDN
011: SR
Others: reserved
LPDDR4 design:
000: Init
001: Normal
010: PDN
011: SR/SRSRPD
Others: reserved

13.7.3 DDRCTRL mode read/write control 0 register (DDRCTRL_REGS_MRCTRL0)

Address offset: 0x010

Reset value: 0x0000 0030

Note: Do not enable more than one of the following bitfields simultaneously: SW_INIT_INT, PDA_EN, and MPR_EN

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MR_WR	PBA_MODE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rs	rw														

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MR_ADDR[3:0]				Res.	Res.	Res.	Res.	Res.	Res.	MR_RANK[1:0]		SW_INIT_INT	PDA_EN	MPR_EN	MR_TYPE
r	r	r	r							rw	rw	rw	rw	rw	rw

Bit 31 **MR_WR**: Mode register (MR) read or write
Setting this bit to 1 triggers a mode register read or write operation.
When the MR operation is complete, the DDRCTRL automatically clears this bit.
The other bitfields of this register must be written in a separate APB transaction, before setting this MR_WR bit.
It is recommended NOT to set this signal if in init operating mode.
Note: Programming mode: Dynamic.

Bit 30 **PBA_MODE**: PBA access execution

When setting this bit to 1 along with setting PDA_EN to 1, the DDRCTRL initiates PBA (per buffer addressability) access instead of PDA (per DRAM addressability) access.
The completion of PBA access is confirmed by PODA_DONE in DDRCTRL_REGS_MRSTAT in the same way as PDA.
0: PDA
1: PBA

Note: Programming mode: Dynamic.

Bits 29:16 Reserved, must be kept at reset value.

Bits 15:12 **MR_ADDR[3:0]**: MR address to be written to

0000: MR0
0001: MR1
0010: MR2
0011: MR3
0100: MR4
0101: MR5
0110: MR6
0111: MR7
Don't care for LPDDR4 (see MR_DATA in DDRCTRL_REGS_MRCTRL1 for mode register addressing in LPDDR4).

Note: Programming mode: Dynamic.

Bits 11:6 Reserved, must be kept at reset value.

Bits 5:4 **MR_RANK[1:0]**: Rank accessed by MR_WR in this register

For multi-rank UDIMMs/RDIMMs/LRDIMMs, which implement address mirroring, it may be necessary to access ranks individually.
Examples (assuming DDRCTRL is configured for four ranks):
0x1: Select rank 0 only
0x2: Select rank 1 only
0x5: Select ranks 0 and 2
0xA: Select ranks 1 and 3
0xF: Select ranks 0, 1, 2, and 3

Note: Programming mode: Dynamic.

Bit 3 **SW_INIT_INT**: Software intervention enable

This bit indicates whether a software intervention is allowed through DDRCTRL_REGS_MRCTRL0/1 before automatic SDRAM initialization routine or not.
For DDR4, this bit can be used to initialize the DDR4 RCD (MR7) before automatic SDRAM initialization.
For LPDDR4, this bit can be used to program additional mode registers before automatic SDRAM initialization if necessary. In LPDDR4 dual channel mode, this bit must be programmed to both channels beforehand.
This bit must be cleared to 0 after completing software operation. Otherwise, the SDRAM initialization routine does not restart.
0: Software intervention not allowed
1: Software intervention allowed

Note: Programming mode: Dynamic.

Bit 2 **PDA_EN**: Mode register operation is MRS in PDA mode or not
0: MRS
1: MRS in PDA
When PBA_MODE = 1 in this register, PBA access is initiated instead of PDA access.
Note: Programming mode: Dynamic.

Bit 1 **MPR_EN**: Mode register operation is MRS or WR/RD for MPR (only supported for DDR4)
0: MRS
1: WR/RD for MPR
Note: Programming mode: Dynamic.

Bit 0 **MR_TYPE**: Mode register operation is read or write (only for LPDDR4/DDR4)
0: Write
1: Read
Note: Programming mode: Dynamic.

13.7.4 DDRCTRL mode read/write control 1 register (DDRCTRL_REGS_MRCTRL1)

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MR_DATA[17:16]	
														rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MR_DATA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:0 **MR_DATA[17:0]**: Mode register write data for all non-LPDDR4 modes
This bitfield is 18-bit wide in configurations with DDR4 support, and 16-bit in all other configurations.
For LPDDR4, MRCTRL1[15:0] are interpreted as:
- [15:8]: MR address
- [7:0]: MR data for writes, don't care for reads

Note: Programming mode: Dynamic.

13.7.5 DDRCTRL mode register read/write status register (DDRCTRL_REGS_MRSTAT)

Address offset: 0x018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	PDA_DONE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MR_WR_BUSY
							r								r

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **PDA_DONE**: Initiate an MR write operation in PDA/PBA mode only if this bit is low
This bit goes high when three consecutive MRS commands related to the PDA/PBA mode are issued to the SDRAM.
This bit goes low when PDA_EN becomes 0 in DDRCTRL_REGS_MRCTRL0.
It is recommended to write o to PDA_EN after PDA_DONE bit goes high in order to prepare to perform PDA operation next time.
0: Mode register write operation related to PDA/PBA is in progress or has not started yet.
1: Mode register write operation related to PDA/PBA has competed.
Note: Programming mode: Dynamic.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **MR_WR_BUSY**: Initiate an MR write operation only if this bit is low
This bit goes high in the clock after the DDRCTRL accepts the MRW/MRR request.
This bit is low when the MRW/MRR command is issued to the SDRAM.
It is recommended not to perform MRW/MRR commands when this bit is high.
0: The device can initiate a mode register write operation.
1: Mode register write operation is in progress.
Note: Programming mode: Dynamic.

13.7.6 DDRCTRL mode register read/write control 2 register (DDRCTRL_REGS_MRCTRL2)

Address offset: 0x01C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MR_DEVICE_SEL[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MR_DEVICE_SEL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MR_DEVICE_SEL[31:0]**: Device selection during the MRS that happens in PDA mode

Each bit is associated with one device (bit[0] corresponds to device 0, bit[1] to device 1 and so on). For each bit:

1: MRS command must be applied to that device.

0: MRS commands must be skipped for that device.

Note: Programming mode: Dynamic.

13.7.7 DDRCTRL temperature derate enable register (DDRCTRL_REGS_DERATEEN)

Address offset: 0x020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	DERATE_MR4_PAUSE_FC	DERATE_MR4_TUF_DIS	Res.	RC_DERATE_VALUE[2:0]			DERATE_BYTE[3:0]				Res.	DERATE_VALUE[1:0]		DERATE_ENABLE
		rw	rw		rw	rw	rw	rw	rw	rw	rw		rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **DERATE_MR4_PAUSE_FC**: Pauses MR4 reads

Must only be set to 1 as part of frequency change procedures, if DERATE_ENABLE = 1 in this register.

Note: Programming mode: Dynamic.

Bit 12 **DERATE_MR4_TUF_DIS**: Disables use of MR4 TUF flag (MR4[7])

For LPDDR4, it is recommended to set this bit to 1. This affects both the periodic derate logic (DERATE_ENABLE) and DDRCTRL_REGS_DERATE_TEMP_LIMIT_INTR in DDRCTRL_REGS_DERATESTAT.

0: Use MR4 TUF flag (MR4[7]).

1: Do not use MR4 TUF Flag (MR4[7]).

Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bit 11 Reserved, must be kept at reset value.

Bits 10:8 **RC_DERATE_VALUE[2:0]**: Derate value of t_{RC} for LPDDR4

The required cycles for derating can be determined by dividing 3.75 ns by the core_ddrc_core_clk period, and rounding it up to the next integer.

This bitfield must be set to the previous value - 1.

000: Derating uses +1.

001: Derating uses +2.

010: Derating uses +3.

011: Derating uses +4.

100: Derating uses +5.

101: Derating uses +6.

110: Derating uses +7.

111: Derating uses +8.

Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 7:4 **DERATE_BYTE[3:0]**: MRR data used for derating
Note: Programming mode: Static.

Bit 3 Reserved, must be kept at reset value.

Bits 2:1 **DERATE_VALUE[1:0]**: Derate value
The required cycles for derating can be determined by dividing 1.875 ns by the core_ddrc_core_clk period, and rounding it up to the next integer.
This bitfield must be set to the previous value - 1.
00: Derating uses +1.
01: Derating uses +2.
10: Derating uses +3.
11: Derating uses +4.
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bit 0 **DERATE_ENABLE**: Enables derating
This bit must be set to 0 for non-LPDDR4 mode.
0: Timing parameter derating is disabled.
1: Timing parameter derating is enabled using MR4 read value.
Note: Programming mode: Dynamic.

13.7.8 DDRCTRL temperature derate interval register (DDRCTRL_REGS_DERATEINT)

Address offset: 0x024

Reset value: 0x0080 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MR4_READ_INTERVAL[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MR4_READ_INTERVAL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MR4_READ_INTERVAL[31:0]**: Interval between two MR4 reads
This bitfield value is used to derate the timing parameters.
This register must not be set to zero. Unit: DFI clock cycles
Note: Programming mode: Static.

13.7.9 DDRCTRL temperature derate control register (DDRCTRL_REGS_DERATECTL)

Address offset: 0x02C

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DERATE_TEMP_LIMIT_INTR_FORCE	DERATE_TEMP_LIMIT_INTR_CLR	DERATE_TEMP_LIMIT_INTR_EN
													rc_w1	rc_w1	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DERATE_TEMP_LIMIT_INTR_FORCE**: Interrupt force bit for DERATE_TEMP_LIMIT_INTR
Setting this bit to 1 causes the DERATE_TEMP_LIMIT_INTR output pin to be asserted.
At the end of the interrupt force operation, the DDRCTRL automatically clears this bit.
Note: Programming mode: Dynamic.

Bit 1 **DERATE_TEMP_LIMIT_INTR_CLR**: Interrupt clear bit for DERATE_TEMP_LIMIT_INTR
At the end of the interrupt clear operation, the DDRCTRL automatically clears this bit.
Note: Programming mode: Dynamic.

Bit 0 **DERATE_TEMP_LIMIT_INTR_EN**: Interrupt enable bit for DERATE_TEMP_LIMIT_INTR
1: Enabled
0: Disabled
Note: Programming mode: Dynamic.

13.7.10 DDRCTRL low-power control register (DDRCTRL_REGS_PWRCTL)

Address offset: 0x030

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPDDR4_SR_ALLOWED	DIS_CAM_DRAIN_SELFREF	STAY_IN_SELFREF	SELFREF_SW	Res.	EN_DFI_DRAM_CLK_DISABLE	Res.	POWERDOWN_EN	SELFREF_EN
							rw	rw	rw	rw		rw		rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **LPDDR4_SR_ALLOWED**: Transition from SRPD to SR, and back to SRPD allowed
This bit cannot be modified while SELFREF_SW = 1 in this register.
0: SRPD -> SR -> SRPD not allowed
1: SRPD -> SR -> SRPD allowed
Note: Programming mode: Dynamic.

Bit 7 **DIS_CAM_DRAIN_SELFREF**: Skipping CAM draining allowed when entering SR
This bit cannot be modified while SELFREF_SW = 1 in this register.
0: CAMs must be empty before entering SR.
1: CAMs are not empty before entering SR (not supported).
Note: Programming mode: Dynamic.

Bit 6 **STAY_IN_SELFREF**: SR state transition
SR is an intermediate state to enter/exit SRPD state for LPDDR4. This bit controls transition from SR state.
1: Transition from SR not allowed
0: Transition from SR allowed
Note: Programming mode: Dynamic.

Bit 5 **SELFREF_SW**: SR state entry
A value of 1 to this bit causes the system to move to SR state immediately, as long as it is not in init operating mode. This is referred to as software entry/exit to SR.
1: Software entry to SR
0: Software exit from SR
Note: Programming mode: Dynamic.

Bit 4 Reserved, must be kept at reset value.

Bit 3 **EN_DFI_DRAM_CLK_DISABLE**: dfi_dram_clk_disable enable
Enables the assertion of dfi_dram_clk_disable whenever a clock is not required by the SDRAM.
0: dfi_dram_clk_disable is never asserted.
1: Assertion of dfi_dram_clk_disable as follows: In DDR3L and DDR4, can only be asserted in SR. In LPDDR4, can be asserted in SRPD, in PDN, and during normal operation (clock Stop).
Note: Programming mode: Dynamic.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **POWERDOWN_EN**: PDN enable
If this bit is set to 1, the DDRCTRL goes into PDN after a programmable number of cycles: maximum idle clocks before power down = POWERDOWN_TO_X32 in DDRCTRL_REGS_PWRTMG.
This bit can be reprogrammed during the course of normal operation.
Note: Programming mode: Dynamic.

Bit 0 **SELFREF_EN**: SDRAM into SR enable
If this bit is set to 1, the DDRCTRL puts the SDRAM into SR after a programmable number of cycles: maximum idle clocks before SR = PWRTMG.SELFREF_TO_X32 in DDRCTRL_REGS.
This bit can be reprogrammed during the course of normal operation.
Note: Programming mode: Dynamic.

13.7.11 DDRCTRL low-power timing register (DDRCTRL_REGS_PWRTMG)

Address offset: 0x034

Reset value: 0x0040 2010

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SELFREF_TO_X32[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	POWERDOWN_TO_X32[4:0]				
											rw	rw	rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **SELFREF_TO_X32[7:0]**: Maximum idle clocks before SR

After this number of clocks of the DDRC command channel being idle, the DDRCTRL automatically puts the SDRAM into SR.

The DDRC command channel is considered idle when there are no HIF commands outstanding. This must be enabled by PWRCTL.SELFREF_EN in DDRCTRL_REGS.

Unit: multiples of 32 DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 4.

Bits 15:5 Reserved, must be kept at reset value.

Bits 4:0 **POWERDOWN_TO_X32[4:0]**: Maximum idle clocks before PDN

After this number of clocks of the DDRC command channel being idle, the DDRCTRL automatically puts the SDRAM into PDN.

The DDRC command channel is considered idle when there are no HIF commands outstanding. This must be enabled by POWERDOWN_EN in DDRCTRL_REGS_PWRCTL.

Unit: multiples of 32 DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 4.

13.7.12 DDRCTRL hardware low-power control register (DDRCTRL_REGS_HWLPCTL)

Address offset: 0x038

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	HW_LP_IDLE_X32[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HW_LP_EXIT_IDLE_EN	HW_LP_EN
														rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **HW_LP_IDLE_X32[11:0]**: Hardware idle period

The CACTIVE_DDRC output is driven low if the DDRC command channel is idle for the number of cycles defined in this bitfield, if not in init operating mode.

The DDRC command channel is considered idle when there are no HIF commands outstanding.

The hardware idle function is disabled when this bitfield = 0 (1 is an illegal value).

Unit: multiples of 32 DFI clock cycles

Note: Programming mode: Static.

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **HW_LP_EXIT_IDLE_EN**: CACTIVE_IN_DDRC pin enable

When this bit is set to 1, the CACTIVE_IN_DDRC pin of the DDRC can be used to exit from the automatic clock stop, automatic power down, or automatic SR.

This does not cause exit of SR that was caused by hardware low-power interface, and/or software (see SELREF_SW in DDRCTRL_REGS_PWRCTL).

Note: Programming mode: Static.

Bit 0 **HW_LP_EN**: Hardware low-power interface enable

Note: Programming mode: Quasi-dynamic Group 2.

13.7.13 DDRCTRL refresh control 0 register (DDRCTRL_REGS_RFSHCTL0)

Address offset: 0x050

Reset value: 0x8021 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REFRESH_TO_AB_X32[4:0]					Res.	Res.	Res.	REFRESH_MARGIN[3:0]				Res.	Res.	Res.	REFRESH_TO_X1_X32[4]
rw	rw	rw	rw	rw				rw	rw	rw	rw				rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REFRESH_TO_X1_X32[3:0]				Res.	Res.	REFRESH_BURST[5:0]						Res.	PER_BANK_REFRESH	AUTO_REFAB_EN[1:0]	
rw	rw	rw	rw			rw	rw	rw	rw	rw	rw		rw	rw	rw

Bits 31:27 **REFRESH_TO_AB_X32[4:0]**: When the DDRCTRL switches automatically from per-bank to all-bank refresh (if enabled by AUTO_REFAB_EN[1:0]), it will use this register to determine when to perform speculative all-bank refreshes.

If the refresh timer (t_{RFCnom}, also known as t_{REFI}) has expired at least once, then a speculative refresh may be performed.

A speculative refresh is a refresh performed at a time when refresh would be useful. When the SDRAM bus is idle for a period of time determined by REFRESH_TO_AB_X32[4:0] and the refresh timer has expired at least once since the last refresh, then a speculative refresh is performed.

Speculative refreshes continues successively until there are no refreshes pending or until new reads or writes are issued to the DDRCTRL.

FOR PERFORMANCE ONLY.

Unit: multiples of 32 DFI clock cycles.

Note: Programming mode: Dynamic - Refresh related.

Bits 26:24 Reserved, must be kept at reset value.

Bits 23:20 **REFRESH_MARGIN[3:0]**: DFI clock cycles before the critical refresh or page timer expires

A critical refresh must be issued before this threshold is reached. It is recommended not to change from the default value 0x2. It must always be less than internally used t_rfc_nom/32n that is equal to:

- T_RFC_NOM_X1_X32 * 32 in DDRCTRL_REGS_RFSHTMG if T_RFC_NOM_X1_SEL = 0 in the same register
- T_RFC_NOM_X1_X32 if T_RFC_NOM_X1_SEL = 1 (for LPDDR4 per-bank refresh only)
- In LPDDR4, t_rfc_nom can be divided by four if derating is enabled by DERATE_ENABLE = 1 in DDRCTRL_REGS_DERATEEN.

Unit: multiples of 32 DFI clock cycles

Note: Programming mode: Dynamic - Refresh related.

Bits 19:17 Reserved, must be kept at reset value.

Bits 16:12 **REFRESH_TO_X1_X32[4:0]**:

If the refresh timer (t_{RFCnom}, also known as t_{REFI}) has expired at least once, a speculative refresh can be performed.

A speculative refresh is a refresh performed at a time when refresh is useful. When the SDRAM bus is idle for a period of time determined by this field, and the refresh timer has expired at least once since the last refresh, then a speculative refresh is performed.

Speculative refreshes continues successively until there are no refreshes pending or until new reads or writes are issued to the DDRCTRL.

Unit: DFI clock cycles or multiples of 32 DFI clock cycles, depending on T_RFC_NOM_X1_SEL in DDRCTRL_REGS_RFSHTMG.

Note: Programming mode: Dynamic - Refresh related.

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:4 **REFRESH_BURST[5:0]**:

This bitfield + 1 is the number of refresh timeouts that can be accumulated before traffic is blocked, and refreshes are forced to execute.

Closing pages to perform a refresh is a one-time penalty that must be paid for each group of refreshes. Performing refreshes in a burst reduces then the per-refresh penalty of these page closings.

Higher numbers for this bitfield slightly increase utilization. Lower numbers decrease the worst-case latency associated with refreshes.

00000: Single refresh

00001: Burst-of-2 refresh

...

00111: Burst-of-8 refresh

- For more information on burst refresh feature, see section 3.9 of DDR2 JEDEC specification (JESD79-2F.pdf).
- For DDR3L, the refresh is always per-rank and not per-bank. The rank refresh can be accumulated over 8 * t_{REFI} cycles using the burst refresh feature.
- In DDR4 mode, according to the fine-granularity feature, eight refreshes can be postponed in 1X mode, 16 refreshes in 2X mode, and 32 refreshes in 4X mode.
- If using PHY-initiated updates, care must be taken in the setting of this bitfield to ensure that t_{RFCmax} is not violated due to a PHY-initiated update occurring shortly before a refresh burst is due. In this situation, the refresh burst is delayed until the PHY-initiated update is complete.
- In per-bank refresh mode of LPDDR4 (PER_BANK_REFRESH = 1 in this register), 64 refreshes can be postponed.

Note: Programming mode: Dynamic - Refresh related.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **PER_BANK_REFRESH**:

Per bank refresh allows traffic to flow to other banks (supported by all LPDDR4 devices).

1: Per bank refresh

0: All bank refresh

Note: Programming mode: Static.

Bits 1:0 **AUTO_REFAB_EN[1:0]**: Enables automatic switching from per-bank to all-bank refresh when the derated refresh period is small.

Automatically switches back to per-bank refresh when the derated refresh period is no longer small.

This register should be programmed to 00 if PER_BANK_REFRESH = 0.

This register should be programmed to 00 for LPDDR4 2Gb and 4Gb.

0x0: Disable automatic switching

0x3: Reserved

0x1: Enable automatic switching when the derated refresh period is $t_{REFI}/2$ or lower

0x2: Enable automatic switching when the derated refresh period is $t_{REFI}/4$

Note: Programming mode: Static.

13.7.14 DDRCTRL refresh control 1 register (DDRCTRL_REGS_RFSHCTL1)

Address offset: 0x054

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	REFRESH_TIMER1_START_VALUE_X32[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	REFRESH_TIMER0_START_VALUE_X32[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **REFRESH_TIMER1_START_VALUE_X32[11:0]**: Refresh timer start for rank 1 (only present in multirank configurations)

This is useful in staggering the refreshes to multiple ranks to help traffic to proceed.

Unit: multiples of 32 DFI clock cycles

Note: Programming mode: Dynamic - Refresh related.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **REFRESH_TIMER0_START_VALUE_X32[11:0]**: Refresh timer start for rank 0 (only present in multirank configurations)

This is useful in staggering the refreshes to multiple ranks to help traffic to proceed.

Unit: multiples of 32 DFI clock cycles.

Note: Programming mode: Dynamic - Refresh related.

13.7.15 DDRCTRL refresh control 3 register (DDRCTRL_REGS_RFSHCTL3)

Address offset: 0x060

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	REFRESH_MODE[2:0]			Res.	Res.	REFRESH_UPDATE_LEVEL	DIS_AUTO_REFRESH
									rw	rw	rw			rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **REFRESH_MODE[2:0]**: Fine granularity refresh mode

This bitfield must be set up while the controller is in reset, or while the controller is in SR mode. Changing this during normal operation is not allowed.

Only fixed 1x mode is supported if DIS_AUTO_REFRESH = 1 in this register.

This bitfield has effect only if a DDR4 SDRAM device is in use (DDR4 = 1 in DDRCTRL_REGS_MSTR).

000: Fixed 1x (normal mode)

001: Fixed 2x

010: Fixed 4x

101: Enable on-the-fly 2x (not supported)

110: Enable on-the-fly 4x (not supported)

Others: reserved

Note: Programming mode: Quasi-dynamic Group 2.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **REFRESH_UPDATE_LEVEL**: Refresh register update

Toggle this bit (either from 0 to 1 or from 1 to 0) to indicate that the refresh registers have been updated.

This bit must not be toggled when the DDRC is in reset (core_ddrc_rstn = 0).

The refresh registers are automatically updated when exiting reset.

Note: Programming mode: Dynamic.

Bit 0 **DIS_AUTO_REFRESH**: Auto-refresh disable

When this bit is 1, the auto-refresh generated by the DDRCTRL is disabled. In this case, the device must generate refreshes using RANKx_REFRESH in DDRCTRL_REGS_DBGCMD.

When this bit transitions from 0 to 1, any pending refreshes are immediately scheduled by the DDRCTRL. For DDR4 only, if the FGR mode is enabled (REFRESH_MODE > 0 in DDRCTRL_REGS_RFSHCTL3), DISABLE AUTO-REFRESH is not supported, and this bit must be set to 0.

This bit can be changed on-the-fly.

Note: Programming mode: Dynamic - Refresh related.

13.7.16 DDRCTRL refresh timing register (DDRCTRL_REGS_RFSHTMG)

Address offset: 0x064

Reset value: 0x0062 008C

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
T_RFC_NOM_X1_SEL	Res.	Res.	Res.	T_RFC_NOM_X1_X32[11:0]											
rw				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	T_RFC_MIN[9:0]									
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **T_RFC_NOM_X1_SEL**:
This bit specifies whether values of T_RFC_NOM_X1_X32 in this register and REFRESH_TO_X1_X32 in DDRCTRL_REGS_RFSHCTL0 are x1 or x32.
This applies only when per-bank refresh is enabled (PER_BANK_REFRESH = 1 in DDRCTRL_REGS_RFSHCTL0). Otherwise, x32 register values are used, and this bit is ignored.
0: x32 register values
1: x1 register values
Note: Programming mode: Dynamic - Refresh related.

Bits 30:28 Reserved, must be kept at reset value.

Bits 27:16 **T_RFC_NOM_X1_X32[11:0]**: Average time interval between refreshes per rank (7.8 µs for DDR3L and DDR4, see JEDEC specification for LPDDR4)
If DDRCTRL operates in 1:2 mode, set this bitfield to RoundDown(RoundDown(t_{REFI} / t_{CK}) / 2).
In previous cases, if T_RFC_NOM_X1_SEL = 0 in this register, divide the previous result by 32 and round down.

For LPDDR4:
- If using all-bank refreshes (PER_BANK_REFRESH = 0 in DDRCTRL_REGS_RFSHCTL0), use t_{REFIab} in the previous calculations.
- If using per-bank refreshes (PER_BANK_REFRESH = 1), use t_{REFIpb} in the previous calculations.

For DDR4 mode, t_{REFI} value is different depending on the refresh mode. The appropriate value must be programmed from the specification based on the value programmed in the refresh-mode register.

Notes:
- This bitfield value must be greater than 0x1.
- If T_RFC_NOM_X1_SEL = 1, this bitfield must be greater than T_RFC_MIN in this register.
- If T_RFC_NOM_X1_SEL = 0, this bitfield * 32 must be greater than T_RFC_MIN.
- In non-DDR4 or DDR4 fixed 1x mode, this bitfield must be less than or equal to 0xFFE.
- In DDR4 fixed 2x mode, this bitfield must be less than or equal to 0x7FF.
- In DDR4 fixed 4x mode, this bitfield must be less than or equal to 0x3FF.

Unit: DFI clock cycles or multiples of 32 DFI clock cycles, depending on T_RFC_NOM_X1_SEL.
Note: Programming mode: Dynamic - Refresh related.

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:0 **T_RFC_MIN[9:0]**: t_{RFCmin}, minimum time from refresh to refresh or activate
If the DDRCTRL operates in 1:2 mode, set this bitfield to RoundUp(RoundUp(t_{RFCmin} / t_{CK}) / 2).

In LPDDR4 mode:
- If using all-bank refreshes, t_{RFCmin} in previous equations is equal to t_{RFCab}.
- If using per-bank refreshes, t_{RFCmin} in previous equations is equal to t_{RFCpb}.

In DDR4 mode, t_{RFCmin} in previous equations is different depending on the refresh mode (fixed 1x, 2x, 4x) and device density. The appropriate value must be programmed from the specification based on refresh mode and device density used.
Unit: DFI clock cycles.

Note: Programming mode: Dynamic - Refresh related.

13.7.17 DDRCTRL refresh timing1 register (DDRCTRL_REGS_RFSHTMG1)

Address offset: 0x068

Reset value: 0x008C 0000

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **T_PBR2PBR[7:0]**: $t_{pbR2pbR}$ for LPDDR4
Per-bank refresh to per-bank refresh different bank time.
If DDRCTRL operates in 1:2 mode, set this bitfield to RoundUp(RoundUp($t_{pbR2pbR}$ / t_{CK}) / 2).
tpbR2pbR in previous equations is different depending on the device density.
The appropriate value must be programmed from the specification.
This bitfield is valid only in LPDDR4 per-bank refresh mode (PER_BANK_REFRESH_MODE = 1 in DDRCTRL_REGS_RFSHCTL0).

Note: Programming mode: Dynamic - Refresh related.

Bits 15:0 Reserved, must be kept at reset value.

13.7.18 DDRCTRL SDRAM initialization 0 register (DDRCTRL_REGS_INIT0)

Address offset: 0x0D0

Reset value: 0x0002 004E

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SKIP_DRAM_INIT[1:0]		Res.	Res.	Res.	Res.	POST_CKE_X1024[9:0]									
rw	rw					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	PRE_CKE_X1024[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 **SKIP_DRAM_INIT[1:0]**: SDRAM initialization routine

If the lower bit of this bitfield is 1, the SDRAM initialization routine is skipped. The upper bit decides in which state the controller starts up when a reset is removed.

00: The SDRAM initialization routine is run after power-up.

01: The SDRAM initialization routine is skipped after power-up. The controller starts up in normal mode.

11: The SDRAM initialization routine is skipped after power-up. The controller starts up in SR mode

Others: Reserved

Note: Programming mode: Quasi-dynamic Group 2.

Bits 29:26 Reserved, must be kept at reset value.

Bits 25:16 **POST_CKE_X1024[9:0]**: Number of cycles to wait after driving CKE high to start the SDRAM initialization sequence

LPDDR4 typically requires this bitfield to be programmed for a delay of 2 µs.

If the DDRCTRL operates in 1:2 mode, set this bitfield to JEDEC spec value divided by 2, and round it up to the next integer value.

Unit: multiples of 1024 DFI clock cycles.

Note: Programming mode: Static.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **PRE_CKE_X1024[11:0]**: Number of cycles to wait after reset before driving CKE high to start the SDRAM initialization sequence

LPDDR4: t_{INIT3} of 2 ms (min)

If the DDRCTRL operates in 1:2 mode, set this bitfield to JEDEC spec value divided by 2, and round it up to the next integer value.

Unit: multiples of 1024 DFI clock cycles.

Note: Programming mode: Static.

13.7.19 DDRCTRL SDRAM initialization 1 register (DDRCTRL_REGS_INIT1)

Address offset: 0x0D4

Reset value: 0x0000 0000

												rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:16 **DRAM_RSTN_X1024[8:0]**: Number of cycles to assert SDRAM reset signal during the init sequence

This bitfield must be set to a minimum of 1. If the DDRCTRL operates in 1:2 mode, set this bitfield to JEDEC spec value divided by 2, and round it up to the next integer value.

Unit: multiples of 1024 DFI clock cycles.

Note: Programming mode: Static.

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **PRE_OCD_X32[3:0]**: Wait period before driving the OCD complete command to SDRAM

Set this bitfield to zero, except if any specific requirement.

Unit: multiples of 32 DFI clock cycles.

Note: Programming mode: Static.

13.7.20 DDRCTRL SDRAM initialization 3 register (DDRCTRL_REGS_INIT3)

Address offset: 0x0DC

Reset value: 0x0000 0510

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **DEV_ZQINIT_X32[7:0]**: t_{ZQINIT}, ZQ initial calibration
DDR3L typically requires 512 SDRAM clock cycles.
DDR4 requires 1024 SDRAM clock cycles.
If the DDRCTRL operates in 1:2 mode, set this bitfield to JEDEC spec value divided by 2, and round it up to the next integer value.
Unit: multiples of 32 DFI clock cycles.
Note: Programming mode: Static.

Bits 15:0 Reserved, must be kept at reset value.

13.7.23 DDRCTRL SDRAM initialization 6 register (DDRCTRL_REGS_INIT6)

Address offset: 0x0E8

Reset value: 0x0000 0000

MR6[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **MR22[15:0]**:
LPDDR4: Value to be loaded into SDRAM MR22 registers
Note: Programming mode: Quasi-dynamic Group 4.

Bits 15:0 **MR6[15:0]**:
DDR4: Value to be loaded into SDRAM MR6 registers
LPDDR4: Value to be loaded into SDRAM MR14 registers
Note: Programming mode: Quasi-dynamic Group 4.

13.7.25 DDRCTRL rank control register (DDRCTRL_REGS_RANKCTL)

Address offset: 0x0F4

Reset value: 0x0000 066F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	DIFF_RANK_WR_GAP_MSB	Res.	DIFF_RANK_RD_GAP_MSB	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
					rw		rw								

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MAX_RANK_WR[3:0]				DIFF_RANK_WR_GAP[3:0]				DIFF_RANK_RD_GAP[3:0]				MAX_RANK_RD[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **DIFF_RANK_WR_GAP_MSB**:

1-bit extension to be used when DIFF_RANK_WR_GAP in this register needs to be set to a value greater than 0xF. Only present for multirank configurations

Note: Programming mode: Quasi-dynamic Group 2.

Bit 25 Reserved, must be kept at reset value.

Bit 24 **DIFF_RANK_RD_GAP_MSB**:

1-bit extension to be used when DIFF_RANK_RD_GAP in this register needs to be set to a value greater than 0xF. Only present for multi-rank configurations

Note: Programming mode: Quasi-dynamic Group 2.

Bits 23:16 Reserved, must be kept at reset value.

Bits 15:12 **MAX_RANK_WR[3:0]**: Maximum number of writes that can be scheduled consecutively to the same rank (only present for multirank configurations)

Writes to the same rank can be performed back-to-back. Writes to different ranks require additional gap dictated by DIFF_RANK_WR_GAP in this register. This avoids possible data bus contention, and gives PHY enough time to switch the delay when changing ranks.

The DDRCTRL arbitrates bus accesses on a cycle-by-cycle basis: after a write is scheduled, there are few clock cycles (determined by DIFF_RANK_WR_GAP) in which only writes from the same rank can be scheduled. This prevents writes from other ranks from having fair access to the data bus.

After this number is reached, a delay equal to DIFF_RANK_WR_GAP is inserted by the scheduler to give all ranks a fair opportunity to be scheduled. Higher numbers increase bandwidth utilization. Lower numbers increase fairness.

This feature can be disabled by setting this bitfield to 0. In this case, the DDRCTRL stays on the same rank as long as commands are available for it.

Note: Programming mode: Static.

Bits 11:8 **DIFF_RANK_WR_GAP[3:0]**: Number of clocks of gap in data responses when performing consecutive writes to different ranks (only present for multirank configurations)

This bitfield is used to switch the delays in the PHY to match the rank requirements. This value must consider both PHY requirement and ODT requirement.

- PHY requirement ($t_{phy_wrcsgap}$)
  If write preamble is set to $2*t_{CK}$ (DDR4 only), this bitfield must be increased by 1.
  Write preamble is always set to $2*t_{CK}$ for LPDDR4.
  If write postamble is set to $1.5*t_{CK}$ (LPDDR4 only), this bitfield must be increased by 1.
- ODT requirement: This bitfield takes care of the ODT switch off timing requirement when switching ranks during writes.
  For LPDDR4, with DQ ODT enabled, this bitfield must be a minimum of ODTLoff - ODTLon - BL/2 + 1.
  For other cases, this bitfield must be a minimum of WR_ODT_HOLD - BL / 2 (in DDRCTRL_REGS_ODTCFGR).
  If the DDRCTRL operates in 1:2 mode, set this field to the larger value divided by two and round it up to the next integer.
  After PHY has completed training, the programmed value may need to be increased.
  If a value greater than 0xF is needed, DIFF_RANK_WR_GAP_MSB must be used as extension. The maximum supported value is:
- for DFI 1:2 mode, (DIFF_RANK_WR_GAP_MSB, DIFF_RANK_WR_GAP) < 0x11.
  Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 2.

Bits 7:4 **DIFF_RANK_RD_GAP[3:0]**: Number of clocks of gap in data responses when performing consecutive reads to different ranks (only present for multi-rank configurations)

This bitfield is used to switch the delays in the PHY to match the rank requirements. This value must consider both PHY requirement and ODT requirement.

- PHY requirement ($t_{phy_rdcsgap}$)
  If read preamble is set to $2*t_{CK}$ (DDR4 only), this bitfield must be increased by 1.
  If read postamble is set to $1.5*t_{CK}$ (LPDDR4 only), this bitfield must be increased by 1.
- ODT requirement - This bitfield takes care of the ODT switch off timing requirement when switching ranks during reads.
  This bitfield must be a minimum of RD_ODT_HOLD - BL / 2 (in DDRCTRL_REGS_ODTCFGR).
  If the DDRCTRL operates in 1:2 mode, set this bitfield to the larger value divided by 2, and round it up to the next integer.
  After PHY has completed training, the programmed value may need to be increased.
  If a value greater than 0xF is needed, DIFF_RANK_RD_GAP_MSB must be used as extension. The maximum supported value is:
- for DFI 1:2 mode, (DIFF_RANK_WR_GAP_MSB, DIFF_RANK_WR_GAP) < 0x11.
  Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 2.

Bits 3:0 **MAX_RANK_RD[3:0]**: Maximum number of reads that can be scheduled consecutively to the same rank (only present for multirank configurations)

Reads to the same rank can be performed back-to-back. Reads to different ranks require additional gap dictated by DIFF_RANK_RD_GAP in this register. This avoids possible data bus contention, and gives PHY enough time to switch the delay when changing ranks.

The DDRCTRL arbitrates bus accesses on a cycle-by-cycle basis: after a read is scheduled, there are few clock cycles (determined by DIFF_RANK_WR_GAP) in which only reads from the same rank can be scheduled. This prevents reads from other ranks from having fair access to the data bus.

After this number is reached, a delay equal to DIFF_RANK_RD_GAP is inserted by the scheduler to give all ranks a fair opportunity to be scheduled. Higher numbers increase bandwidth utilization. Lower numbers increase fairness.

This feature can be disabled by setting this bitfield to 0. In this case, the DDRCTRL stays on the same rank as long as commands are available for it.

Note: Programming mode: Static.

13.7.26 Rank control 1 register (DDRCTRL_REGS_RANKCTL1)

Address offset: 0x0F8

Reset value: 0x0000 0008

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WR2RD_DR[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **WR2RD_DR[5:0]**: Minimum time from write command to read command on different physical ranks.

This must include time for bus turn-around between ranks and all PHY and system requirements.

After the PHY has completed training, the value programmed may need to be increased.

The following calculations are minimum values, and do not include the PHY/system requirements: WL + BL/2 - RL + WR_POSTAMBLE + RD_PREAMBLE

If using DDR4-LRDIMM, the following has to be satisfied: $t_{RPRE}/2$ + BL/2 + 2.7 - (CL - CWL)

If the calculated value is less than BL/2 (including negative values), the value should be BL/2.

When the controller is operating in 1:2 frequency ratio mode, divide the value calculated using the above equation by 2, and round it up to next integer.

For DDR4, this register value must be smaller than or equal to WR2RD_S[5:0].

For other protocols, this register value must be smaller than or equal to WR2RD[5:0].

Note: Programming mode: Quasi-dynamic Group 1, Group 2, Group 4.

13.7.27 DDRCTRL SDRAM timing 0 register (DDRCTRL_REGS_DRAMTMG0)

Address offset: 0x100

Reset value: 0x0F10 1B0F

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	WR2PRE[6:0]							Res.	Res.	T_FAW[5:0]					
	rw	rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	T_RAS_MAX[6:0]							Res.	Res.	T_RAS_MIN[5:0]					
	rw	rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:24 **WR2PRE[6:0]**: Minimum time between write and precharge to same bank

Specifications: WL + BL / 2 + t_{WR} = approximately 8 cycles + 15 ns = 14 clocks @400MHz and less for lower frequencies.

where:

- WL: Write latency
- BL: Burst length, must match the value programmed in the BL bit of the mode register to the SDRAM. BST (burst terminate) is not supported.
- t_{WR}: Write recovery time, comes directly from the SDRAM specification

Add one extra cycle for LPDDR4 for this parameter.

If the DDRCTRL operates in 1:2 mode, 1T mode, divide the previous value by 2 (no round-up).

If the DDRCTRL operates in 1:2 mode, 2T mode or LPDDR4 mode, divide the previous value by 2, and round it up to the next integer value.

For DDR4, LPDDR4, use nWR (WR) instead of t_{WR} to calculate the value of this bitfield.

Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 1, Group 2, Group 4.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **T_FAW[5:0]**: t_{FAW}, valid only when 8 or more banks (or banks x bank groups) are present

In 8-bank design, at most 4 banks must be activated in a rolling window of t_{FAW} cycles.

If the DDRCTRL operates in 1:2 mode, set this bitfield to t_{FAW} / 2, and round up to next integer value. In a 4-bank design, set this bitfield to 0x1.

Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bit 15 Reserved, must be kept at reset value.

Bits 14:8 **T_RAS_MAX[6:0]**: t_{RASmax}, max time between activate and precharge to same bank

This is the maximum time that a page can be kept open. This bitfield minimum value is 1 (0 is invalid).

If the DDRCTRL operates in 1:2 mode, this bitfield must be set to RoundDown((RoundDown(t_{RASmax} / t_{CK} / 1024) - 1) / 2).

Unit: multiples of 1024 DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **T_RAS_MIN[5:0]**: t_{RASmin}, minimum time between activate and precharge to same bank
If the DDRCTRL operates in 1:2 mode, 1T mode, set this bitfield to RoundDown(RoundUp(t_{RASmin} / t_{CK}) / 2).
If the DDRCTRL operates in 1:2 mode, 2T mode or LPDDR4 mode, set this bitfield to RoundUp(RoundUp(t_{RASmin} / t_{CK}) / 2).
Unit: DFI clock cycles.
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.28 DDRCTRL SDRAM timing 1 register (DDRCTRL_REGS_DRAMTMG1)

Address offset: 0x104

Reset value: 0x0008 0414

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	T_XP[4:0]				
											rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	RD2PRE[5:0]						Res.	T_RC[6:0]						
		rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **T_XP[4:0]**: t_{XP}, minimum time after PDN exit to any operation
For DDR3L, this bitfield must be set to t_{XPDLL} if slow PDN exit is selected in MR0[12].
If C/A parity for DDR4 is used, set this bitfield to (t_{XP+PL}).
For LPDDR4 with t_{CKELPD} specified, set this bitfield to the larger of t_{XP} and t_{CKELPD}.
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{XP} / 2), and round it up to the next integer value.
Units: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **RD2PRE[5:0]**: t_{RTP}, minimum time from read to precharge of same bank
For DDR3L: t_{AL} + max (RoundUp(t_{RTP} / t_{CK}), 4)
For DDR4: Max of [t_{AL} + max (RoundUp(t_{RTP} / t_{CK}), 4)]or, [RL + BL / 2 - t_{RP}].
For LPDDR4: BL / 2 + max(RoundUp(t_{RTP} / t_{CK}),8) - 8
If the DDRCTRL operates in 1:2 mode, 1T mode, divide the previous value by 2 (no round-up).
If the DDRCTRL operates in 1:2 mode, 2T mode or LPDDR4 mode, divide the previous value by 2, and round it up to the next integer value.
For DDR4, use RTP instead of t_{RTP} to calculate the value of this parameter.
Unit: DFI clock cycles
Programming mode: Quasi-dynamic Group 1, Group 2, Group 4.

Bit 7 Reserved, must be kept at reset value.

Bits 6:0 **T_RC[6:0]**: t_{RC}, minimum time between activates to same bank
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{RC} / 2), and round up to next integer value. Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.29 DDRCTRL SDRAM timing 2 register (DDRCTRL_REGS_DRAMTMG2)

Address offset: 0x108

Reset value: 0x0305 060D

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	WRITE_LATENCY[5:0]						Res.	Res.	READ_LATENCY[5:0]					
		rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	RD2WR[5:0]						Res.	Res.	WR2RD[5:0]					
		rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:24 **WRITE_LATENCY[5:0]**: Time from write command to write data on SDRAM interface
This bitfield must be set to WL.
If the DDRCTRL operates in 1:2 mode, divide the value calculated using the previous equation by two, and round it up to next integer.
This bitfield is not required for DDR3L, as the DFI read and write latencies defined in DFITMG0 and DFITMG1 are sufficient for this protocol.
For all protocols, in addition to programming this bitfield, it is necessary to program DFITMG0 and DFITMG1 to control the read and write latencies.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 1, Group 2, Group 4.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **READ_LATENCY[5:0]**: Time from read command to read data on SDRAM interface
This bitfield must be set to RL.
If the DDRCTRL operates in 1:2 mode, divide the value calculated using the previous equation by two, and round it up to next integer.
This bitfield is not required for DDR3L, as the DFI read/write latencies defined in DDRCTRL_REGS_DFITMG0/1 registers are sufficient for this protocol.
For all protocols, in addition to setting this bitfield, DDRCTRL_REGS_DFITMG0/1 must be programmed to control the read and write latencies.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 1, Group 2, Group 4.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **RD2WR[5:0]**: Minimum time from read command to write command

This bitfield must include time for bus turnaround (both within ranks and between ranks), and all PHY and system requirements.

After the PHY has completed training, this bitfield may need to be increased.

The following calculations give minimum values (not including PHY/system requirements):

For DDR3L: RL + BL/2 + 2 - WL

For DDR4: RL + BL/2 + 1 + WR_PREAMBLE - WL

For LPDDR4 (DQ ODT disabled):

RL + BL/2 + RoundUp($t_{DQSCKmax}$ / t_{CK}) + WR_PREAMBLE + RD_POSTAMBLE - WL

For LPDDR4 (DQ ODT enabled): RL + BL/2 + RoundUp($t_{DQSCKmax}$ / t_{CK}) + RD_POSTAMBLE - ODTLon - RoundUp($t_{ODTonmin}$ / t_{CK}) + 1,

where:

- WL: Write latency
- BL: Burst length, must match the value programmed in the BL bit of the mode register to the SDRAM.
- RL: Read latency = CAS latency
- WR_PREAMBLE: 1 ($1t_{CK}$ write preamble), 2 ($2t_{CK}$ write preamble). This is unique to DDR4 and LPDDR4.
- RD_POSTAMBLE: 0.5 ($0.5t_{CK}$ read postamble), 1.5 ($1.5t_{CK}$ read postamble). This is unique to LPDDR4.

For LPDDR4, if derating is enabled (DERATEEN.derate_enable = 1), derated $t_{DQSCKmax}$ must be used.

If the DDRCTRL operates in 1:2 mode, divide the value calculated using the previous equation by two, and round it up to next integer.

Depending on the PHY, if using LRDIMM, it may be necessary to adjust the value of this parameter to compensate for the extra cycle of latency through the LRDIMM.

Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 1, Group 2, Group 4.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **WR2RD[5:0]**:

In DDR4, minimum time from write command to read command for same bank group.
In other protocols, minimum time from write command to read command. This must include time for bus turnaround and all PHY and system requirements.
After the PHY has completed training, the value programmed may need to be increased.
The following calculations give minimum values (not including PHY/system requirements):
DDR4: CWL + PL + BL / 2 + t_{WTR_L}
LPDDR4: WL + BL / 2 + t_{WTR} + 1
Others: CWL + BL / 2 + t_{WTR}
Where:

- CWL: CAS write latency
- WL: Write latency
- PL: Parity latency
- BL: Burst length, must match the value programmed in the BL bit of the mode register to the SDRAM
- t_{WTR_L}: Internal write to read command delay for same bank group. This comes directly from the SDRAM specification
- t_{WTR}: Internal write to read command delay. This comes directly from the SDRAM specification. Add one extra cycle for LPDDR4 operation.

WTR_L must be increased by one if DDR4 $2t_{CK}$ write preamble is used.
If the DDRCTRL operates in 1:2 mode, divide the value calculated using the previous equation by two, and round it up to next integer.
Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 1, Group 2, Group 4.

13.7.30 DDRCTRL SDRAM timing 3 register (DDRCTRL_REGS_DRAMTMG3)

Address offset: 0x10C

Reset value: 0x0050 400C

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	T_MRW[9:0]										Res.	Res.	T_MRD[5:4]	
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw			rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
T_MRD[3:0]				Res.	Res.	T_MOD[9:0]									
rw	rw	rw	rw			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:20 **T_MRW[9:0]**: Time to wait after a mode register write or read (MRW or MRR)
LPDDR4: Set this to the larger of t_{MRW} and $t_{MRWCKEL}$.
Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 19:18 Reserved, must be kept at reset value.

Bits 17:12 **T_MRD[5:0]**: t_{MRD}, number of cycles to wait after a mode register write or read
Depending on the connected SDRAM, t_{MRD} represents:
- DDR3L/4: Time from MRS to MRS command
- LPDDR4: Time from MRS to non-MRS command

If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{MRD} / 2), and round it up to the next integer value.
If CAL mode is enabled (DFI_T_CMD_LAT > 0 in DDRCTRL_REGS_DFITMG1), t_{CAL} (= DFI_CMD_LAT in DDRCTRL_REGS_DFITMG1) must be added to the previous calculations.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:0 **T_MOD[9:0]**: t_{MOD}, number of cycles between load mode command and following non-load mode command (only in DDR3L and DDR4)
If CAL mode is enabled (DFI_T_CMD_LAT > 0 in DDRCTRL_REGS_DFITMG1), t_{CAL} (= DFI_CMD_LAT in DDRCTRL_REGS_DFITMG1) must be added to the previous calculations.
If the DDRCTRL operates in 1:2, set this bitfield to (t_{MOD} / 2), and round it up to the next integer value.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.31 DDRCTRL SDRAM timing 4 register (DDRCTRL_REGS_DRAMTMG4)

Address offset: 0x110

Reset value: 0x0504 0405

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	T_RCD[4:0]					Res.	Res.	Res.	Res.	T_CCD[3:0]			
			rw	rw	rw	rw	rw					rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	T_RRD[3:0]				Res.	Res.	Res.	T_RP[4:0]				
				rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **T_RCD[4:0]**: t_{RCD} - t_{AL}, minimum time from activate to read or write command to same bank
If the DDRCTRL operates in 1:2 mode, set this bitfield to ((t_{RCD} - t_{AL}) / 2), and round it up to the next integer value.
Minimum value allowed for this register is 1, which implies minimum (t_{RCD} - t_{AL}) value to be two when the DDRCTRL operates in 1:2 mode.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 1, Group 2, Group 4.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **T_CCD[3:0]**:
For DDR4, t_{CCD_L}, minimum time between two reads or two writes for same bank group.
For other protocols, t_{CCD}, minimum time between two reads or two writes.
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{CCD_L} / 2 or t_{CCD} / 2), and round it up to the next integer value.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **T_RRD[3:0]**:
For DDR4, t_{RRD_L}, minimum time between activates from bank a to bank b for same bank.
For other protocols, t_{RRD}, minimum time between activates from bank a to bank b.
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{RRD_L} / 2 or t_{RRD} / 2), and round it up to the next integer value.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **T_RP[4:0]**: t_{RP}, minimum time from single-bank precharge to activate of same bank
If the DDRCTRL operates in 1:2 mode, set this bitfield to
RoundDown(RoundUp(t_{RP} / t_{CK}) / 2) + 1.
If the DDRCTRL operates in 1:2 mode in LPDDR4, set this bitfield to
RoundUp(RoundUp(t_{RP} / t_{CK}) / 2).
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.32 DDRCTRL SDRAM timing 5 register (DDRCTRL_REGS_DRAMTMG5)

Address offset: 0x114

Reset value: 0x0505 0403

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	T_CKSRX[3:0]				Res.	T_CKSRE[6:0]						
				rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	T_CKESR[5:0]						Res.	Res.	Res.	T_CKE[4:0]				
		rw	rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **T_CKSRX[3:0]**: Time before SR exit that CK is maintained as a valid clock before issuing SRX
This bitfield specifies the clock stable time before SRX. The recommended settings are:
- LPDDR4: t_{CKCKEH}
- DDR3L and DDR4: t_{CKSRX}

If the DDRCTRL operates in 1:2 mode, set this bitfield to recommended value divided by two, and round it up to next integer.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bit 23 Reserved, must be kept at reset value.

Bits 22:16 **T_CKSRE[6:0]**: Time after SR entry that CK is maintained as a valid clock
This bitfield specifies the clock disable delay after SRE. The recommended settings are:
- LPDDR4: t_{CKELCK}
- DDR3L and DDR4 (no RDIMM): Max(10 ns, 5 t_{CK})

If the DDRCTRL operates in 1:2 mode, set this bitfield to recommended value divided by two and round it up to next integer.
Unit: DFI clock cycles.
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **T_CKESR[5:0]**: Minimum CKE low width for SR or SRPD entry to exit timing in memory clock cycles
The recommended settings are:
- LPDDR4: Max(t_{CKE}, t_{SR})
- DDR3L and DDR4 (no RDIMM): t_{CKE} + 1

If the DDRCTRL operates in 1:2 mode, set this bitfield to recommended value divided by two, and round it up to next integer.
Unit: DFI clock cycles.
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **T_CKE[4:0]**: Minimum number of cycles of CKE high/low during PDN and SR
The recommended settings are:
- LPDDR4: Max(t_{CKE}, t_{SR})
- DDR3L and DDR4: t_{CKE}

If the DDRCTRL operates in 1:2 mode, set this bitfield to recommended value divided by two, and round it up to the next integer.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.33 DDRCTRL SDRAM timing 6 register (DDRCTRL_REGS_DRAMTMG6)

Address offset: 0x118

Reset value: 0x0202 0005

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	T_CKCSX[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **T_CKCSX[3:0]**: time before clock Stop exit that CK is maintained as a valid clock before issuing clock Stop exit

This bitfield specifies the clock stable time before next command after clock Stop exit. The recommended settings for LPDDR4 is t_{XP} + 2.

If the DDRCTRL operates in 1:2 mode, set this bitfield to recommended value divided by two, and round it up to next integer.

Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.34 DDRCTRL SDRAM timing 7 register (DDRCTRL_REGS_DRAMTMG7)

Address offset: 0x11C

Reset value: 0x0000 0202

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	T_CKPDE[3:0]				Res.	Res.	Res.	Res.	T_CKPDX[3:0]			
				rw	rw	rw	rw					rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **T_CKPDE[3:0]**: Time after PDN entry that CK is maintained as a valid clock

This bitfield specifies the clock disable delay after PDE. The recommended settings are:

- LPDDR4: t_{CKELCK}.
- DDR4 SDRAM: this bitfield must be set to the same value as T_CKSRE in DDRCTRL_REGS_DRAMTMG5.

If the DDRCTRL operates in 1:2 mode, set this bitfield to recommended value divided by two, and round it up to next integer.

Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **T_CKPDX[3:0]**: Time before PDN exit that CK is maintained as a valid clock before issuing PDX

This bitfield specifies the clock stable time before PDX. The recommended settings are:

- LPDDR4: t_{CKCKEH}.
- DDR4 SDRAM: this bitfield must be set to the same value as T_CKSRX in DDRCTRL_REGS_DRAMTMG5.

If the DDRCTRL operates in 1:2 mode, set this bitfield to recommended value divided by two, and round it up to next integer.

Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.35 DDRCTRL SDRAM timing 8 register (DDRCTRL_REGS_DRAMTMG8)

Address offset: 0x120

Reset value: 0x0303 4405

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	T_XS_FAST_X32[6:0]							Res.	T_XS_ABORT_X32[6:0]						
	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	T_XS_DLL_X32[6:0]							Res.	T_XS_X32[6:0]						
	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:24 **T_XS_FAST_X32[6:0]**: t_{XS_FAST}, exit SR to ZQCL, ZQCS and MRS (only CL, WR, RTP mode)
This is applicable to only ZQCL/ZQCS commands. Ensure this bitfield ≤ T_XS_X32.
If the DDRCTRL operates in 1:2 mode, set this bitfield to the previous value divided by two, and round it up to next integer.
Unit: multiples of 32 DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bit 23 Reserved, must be kept at reset value.

Bits 22:16 **T_XS_ABORT_X32[6:0]**: t_{XS_ABORT}, exit SR to commands not requiring a locked DLL in SR abort
Ensure this bitfield ≤ T_XS_X32.
If the DDRCTRL operates in 1:2 mode, set this bitfield to the previous value divided by two, and round it up to next integer.
Unit: multiples of 32 DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bit 15 Reserved, must be kept at reset value.

Bits 14:8 **T_XS_DLL_X32[6:0]**: t_{XSDLL}, exit SR to commands requiring a locked DLL (only for DDR3L and DDR4 SDRAMs)
If the DDRCTRL operates in 1:2 mode, set this bitfield to the previous value divided by two, and round it up to next integer.
Unit: multiples of 32 DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bit 7 Reserved, must be kept at reset value.

Bits 6:0 **T_XS_X32[6:0]**: t_{XS}, exit SR to commands not requiring a locked DLL (only for DDR3L and DDR4 SDRAMs)
If the DDRCTRL operates in 1:2 mode, set this bitfield to the previous value divided by two, and round it up to next integer.
Unit: Multiples of 32 DFI clock cycles.
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.36 DDRCTRL SDRAM timing 9 register (DDRCTRL_REGS_DRAMTMG9)

Address offset: 0x124

Reset value: 0x0004 040D

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	DDR4_WR_PREAMBLE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	T_CCD_S[2:0]		
	rw												rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	T_RRD_S[3:0]				Res.	Res.	WR2RD_S[5:0]					
				rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bit 30 **DDR4_WR_PREAMBLE**: DDR4 write preamble mode
0: $1t_{CK}$ preamble
1: $2t_{CK}$ preamble
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 29:19 Reserved, must be kept at reset value.

Bits 18:16 **T_CCD_S[2:0]**: t_{CCD_S}, minimum time between two reads/writes for different bank group
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{CCD_S} / 2), and round it up to the next integer.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **T_RRD_S[3:0]**: t_{RRD_S}, minimum time between activates for different bank group
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{RRD_S} / 2), and round it up to the next integer.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **WR2RD_S[5:0]**: Minimum time from write command to read command for different bank group
This must include time for bus turn-around and all PHY and system requirements.
After the PHY has completed training, the value programmed may need to be increased.
The following calculations gives minimum values (not including PHY/system requirements):
CWL + PL + BL / 2 + t_{WTR_S}
Where:
- CWL: CAS write latency
- PL: Parity latency
- BL: Burst length, must match the value programmed in the BL bit of the mode register to the SDRAM
- t_{WTR_S}: Internal write to read command delay for different bank group. This comes directly from the SDRAM specification.

WTR_S must be increased by one if DDR4 $2t_{CK}$ write preamble is used.
If the DDRCTRL operates in 1:2 mode, divide the value calculated using the previous equation by two, and round it up to next integer.
Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 1, Group 2, Group 4.

13.7.37 DDRCTRL SDRAM timing 10 register (DDRCTRL_REGS_DRAMTMG10)

Address offset: 0x128

Reset value: 0x001C 180A

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	T_SYNC_GEAR[4:0]				
											rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	T_CMD_GEAR[4:0]					Res.	Res.	Res.	Res.	T_GEAR_SETUP[1:0]		T_GEAR_HOLD[1:0]	
			rw	rw	rw	rw	rw					rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **T_SYNC_GEAR[4:0]**: Time between MRS command and the sync pulse time
This must be even number of clocks.
For DDR4-2666 and DDR4-3200, this parameter is defined as $t_{MOD(min)}$ + 4nCK,
with $t_{MOD(min)}$ = Max(24nCK, 15 ns). The maximum value for this register is 24 + 4 = 28.
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{SYNC_GEAR} / 2), and round it up to the next integer.
Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **T_CMD_GEAR[4:0]**: sync pulse to first valid command
For DDR4-2666 and DDR4-3200, this parameter is defined as
$t_{MOD(min)}$ = Max(24nCK, 15 ns). The maximum value for this bitfield is 24.
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{CMD_GEAR} / 2), and round it up to the next integer.
Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:2 **T_GEAR_SETUP[1:0]**: Geardown setup time
Minimum value of this bitfield is 1 (0 is invalid).
For DDR4-2666 and DDR4-3200, this parameter is defined as 2 clocks.
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{GEAR_setup} / 2), and round it up to the next integer.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 1:0 **T_GEAR_HOLD[1:0]**: Geardown hold time
Minimum value of this bitfield is 1 (0 is invalid).
For DDR4-2666 and DDR4-3200, this parameter is defined as 2 clocks.
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{GEAR_hold} / 2), and round it up to the next integer value.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.38 DDRCTRL SDRAM timing 11 register (DDRCTRL_REGS_DRAMTMG11)

Address offset: 0x12C

Reset value: 0x440C 021C

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	POST_MPSM_GAP_X32[6:0]							Res.	Res.	Res.	T_MPX_LH[4:0]				
	rw	rw	rw	rw	rw	rw	rw				rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	T_MPX_S[1:0]		Res.	Res.	Res.	T_CKMPE[4:0]				
						rw	rw				rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:24 **POST_MPSM_GAP_X32[6:0]**: t_{XMPDLL}, minimum exit MPSM to commands requiring a locked DLL
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{XMPDLL} / 2), and round it up to the next integer.
Unit: multiples of 32 DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **T_MPX_LH[4:0]**: t_{MPX_LH}, minimum CS_n low hold time to CKE rising edge
If the DDRCTRL operates in 1:2 mode, set this bitfield to RoundUp(t_{MPX_LH} / 2) + 1.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:8 **T_MPX_S[1:0]**: t_{MPX_S}, minimum time CS setup time to CKE
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{MPX_S} / 2), and round it up to the next integer.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **T_CKMPE[4:0]**: t_{CKMPE}, minimum valid clock requirement after MPSM entry
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{CKMPE} / 2), and round it up to the next integer.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.39 DDRCTRL SDRAM timing 12 register (DDRCTRL_REGS_DRAMTMG12)

Address offset: 0x130

Reset value: 0x1A02 0010

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	T_WR_MPR[5:0]						Res.	Res.	Res.	Res.	Res.	Res.	T_CMDCKE[1:0]	
		rw	rw	rw	rw	rw	rw							rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	T_MRD_PDA[4:0]				
											rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:24 **T_WR_MPR[5:0]**: Cycles between MPR write and other commands (DDR4 only)
Set this bitfield to t_{MOD} + AL.
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{WR_MPR} / 2), and round it up to the next integer.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 23:18 Reserved, must be kept at reset value.

Bits 17:16 **T_CMDCKE[1:0]**: t_{CMDCKE}, delay from valid command to CKE input low
Set this bitfield to Max(t_{ESCKE}, t_{CMDCKE}).
If the DDRCTRL operates in 1:2 mode, divide this value by two, and round it up to the next integer.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 15:5 Reserved, must be kept at reset value.

Bits 4:0 **T_MRD_PDA[4:0]**: t_{MRD_PDA}, cycle time of mode register set command in PDA mode
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{MRD_PDA} / 2), and round it up to the next integer.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.40 DDRCTRL SDRAM timing 13 register (DDRCTRL_REGS_DRAMTMG13)

Address offset: 0x134

Reset value: 0x1C20 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	ODTLOFF[6:0]							Res.	Res.	T_CCD_MW[5:0]					
	rw	rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	T_PPD[2:0]		
													rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:24 **ODTLOFF[6:0]**: ODTLoff, latency from CAS-2 command to ODToff reference (only LPDDR4)
If the DDRCTRL operates in 1:2 mode, set this bitfield to (ODTLoff / 2), and round it up to the next integer.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **T_CCD_MW[5:0]**: t_{CCDMW}, minimum time from write or masked write to masked write command for same bank (only LPDDR4)
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{CCDMW} / 2), and round it up to the next integer.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 15:3 Reserved, must be kept at reset value.

Bits 2:0 **T_PPD[2:0]**: t_{PPD}, minimum time from precharge to precharge command (only LPDDR4)
If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{PPD} / 2), and round it up to the next integer.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.41 DDRCTRL SDRAM timing 14 register (DDRCTRL_REGS_DRAMTMG14)

Address offset: 0x138

Reset value: 0x0000 00A0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	T_XSR[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **T_XSR[11:0]**: t_{XSR}, exit SR time to any command (only LPDDR4)
If the DDRCTRL operates in 1:2 mode, divide the previous value by two, and round it up to the next integer. The 0xFFF value is illegal for this bitfield.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.42 DDRCTRL SDRAM timing 15 register (DDRCTRL_REGS_DRAMTMG15)

Address offset: 0x13C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EN_DFI_LP_T_STAB	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	T_STAB_X32[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **EN_DFI_LP_T_STAB**:
1: Enable using t_{STAB} when exiting DFI LP. This must be set when the PHY stops the clock during DFI LP to save the maximum power.
0: Disable using t_{STAB} when exiting DFI LP.
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 30:8 Reserved, must be kept at reset value.

Bits 7:0 **T_STAB_X32[7:0]**: t_{STAB}, stabilization time
It is required in the following cases for DDR3L and DDR4 RDIMM:
- when exiting power saving mode, if the clock is stopped. After reenabling it, the clock must be stable for a time specified by t_{STAB}.
- when an input clock frequency change (DDR4)
- after issuing control words that refer to clock timing (spec: 6 µs for DDR3L, 5 µs for DDR4)

If the DDRCTRL operates in 1:2 mode, set this bitfield to recommended value divided by two, and round it up to next integer.
Unit: multiples of 32 DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.43 DDRCTRL ZQ control 0 register (DDRCTRL_REGS_ZQCTL0)

Address offset: 0x180

Reset value: 0x0200 0040

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DIS_AUTO_ZQ	DIS_SRX_ZQCL	ZQ_RESISTOR_SHARED	DIS_MPSMX_ZQCL	Res.	T_ZQ_LONG_NOP[10:0]										
rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	T_ZQ_SHORT_NOP[9:0]									
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **DIS_AUTO_ZQ**:

1: Disable DDRCTRL generation of ZQCS/MPC(ZQ calibration) command. ZQ_CALIB_SHORT in DDRCTRL_REGS_DBGCMD can be used instead to issue ZQ calibration request from APB module.

0: Internally generate ZQCS/MPC (ZQ calibration) commands based on T_ZQ_SHORT_INTERVAL_X1024 in DDRCTRL_REGS_ZQCTL1.

Note: Programming mode: Dynamic.

Bit 30 **DIS_SRX_ZQCL**:

1: Disable issuing a ZQCL/MPC(ZQ calibration) command at SR or SRPD exit.

0: Enable issuing a ZQCL/MPC(ZQ calibration) command at SR or SRPD exit.

Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bit 29 **ZQ_RESISTOR_SHARED**:

1: Denotes that ZQ resistor is shared between ranks. ZQinit/ZQCL/ZQCS/MPC(ZQ calibration) commands are sent to one rank at a time with t_{ZQinit}, t_{ZQCL}, t_{ZQCS}, t_{ZQCAL}, and t_{ZQLAT} met between commands (so that commands to different ranks do not overlap).

0: ZQ resistor is not shared.

Note: Programming mode: Static.

Bit 28 **DIS_MPSMX_ZQCL**: Only for DDR4

1: Disable issuing a ZQCL command at MPS (maximum power saving) mode exit.

0: Enable issuing a ZQCL command at MPS mode exit.

Caution: The software can send ZQCS after exiting MPS mode.

Note: Programming mode: Static.

Bit 27 Reserved, must be kept at reset value.

Bits 26:16 **T_ZQ_LONG_NOP[10:0]**: DFI clock cycles of NOP required after ZQCL (ZQ calibration long) t_{ZQoper} for DDR3L/DDR4, t_{ZQCAL} for LPDDR4. MPC(ZQ Start) command is issued to the SDRAM.

If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{ZQoper} / 2 or t_{ZQCAL} / 2), and round it up to the next integer.

Unit: DFI clock cycles

Note: Programming mode: Static.

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:0 **T_ZQ_SHORT_NOP[9:0]**: DFI clock cycles of NOP required after ZQCS (ZQ calibration short) t_{ZQCS} for DDR3L/DDR4, t_{ZQLAT} for LPDDR4. MPC(ZQ Latch) command is issued to SDRAM. If the DDRCTRL operates in 1:2 mode, set this bitfield to (t_{ZQCS} / 2 or t_{ZQLAT} / 2), and round it up to the next integer.
Unit: DFI clock cycles
Note: Programming mode: Static.

13.7.44 DDRCTRL ZQ control 1 register (DDRCTRL_REGS_ZQCTL1)

Address offset: 0x184

Reset value: 0x0200 0100

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	T_ZQ_RESET_NOP[9:0]										T_ZQ_SHORT_INTERVAL_X1024[19:16]			
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
T_ZQ_SHORT_INTERVAL_X1024[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:20 **T_ZQ_RESET_NOP[9:0]**: $t_{ZQReset}$, DFI clock cycles of NOP required after ZQReset (ZQ calibration reset) command is issued to SDRAM
If the DDRCTRL operates in 1:2 mode, set this bitfield to ($t_{ZQReset}$ / 2) ,and round it up to the next integer.
Unit: DFI clock cycles
Note: Programming mode: Static.

Bits 19:0 **T_ZQ_SHORT_INTERVAL_X1024[19:0]**: Average interval to wait between automatically issuing ZQCS (ZQ calibration short) and MPC(ZQ calibration) commands to DDR3L/DDR4/LPDDR4 devices
Meaningless if DIS_AUTO_ZQ = 1 in DDRCTRL_REGS_ZQCTL0.
Unit: multiples of 1024 DFI clock cycles
Note: Programming mode: Static.

13.7.45 DDRCTRL ZQ control 2 register (DDRCTRL_REGS_ZQCTL2)

Address offset: 0x188

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ZQ_RESET
															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **ZQ_RESET**: ZQ Reset operation

Setting this bit to 1 triggers a ZQ Reset operation.

When the ZQ Reset operation is complete, the DDRCTRL automatically clears this bit.

It is recommended NOT to set this bit if in init, SR (except LPDDR4), SRPD (LPDDR4), or DPD operating modes.

For SR (except LPDDR4) or SRPD (LPDDR4), ZQ Reset is scheduled after SR (except LPDDR4) or SPRD(LPDDR4) has been exited.

For DPN, ZQ Reset is not scheduled, although ZQ_RESET_BUSY is deasserted in DDRCTRL_REGS_ZQSTAT.

Note: Programming mode: Dynamic.

13.7.46 DDRCTRL ZQ status register (DDRCTRL_REGS_ZQSTAT)

Address offset: 0x18C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ZQ_RESET_BUSY
															r

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **ZQ_RESET_BUSY**: ZQ Reset operation possible only if this bit is low

This bit goes high in the clock after the DDRCTRL accepts the ZQ Reset request.

It goes low when the ZQ Reset command is issued to the SDRAM, and the associated NOP period is over. It is recommended not to perform ZQ Reset commands when this bit is high.

0: AZQ Reset operation can be initiated.

1: A ZQ Reset operation is in progress.

Note: Programming mode: Dynamic.

13.7.47 DDRCTRL DFI timing 0 register (DDRCTRL_REGS_DFITMG0)

Address offset: 0x190

Reset value: 0x0702 0002

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	DFI_T_CTRL_DELAY[4:0]					DFI_RDDATA_USE_DFI_PHY_CLK	DFI_T_RDDATA_EN[6:0]						
			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DFI_WRDATA_USE_DFI_PHY_CLK	Res.	DFI_TPHY_WRDATA[5:0]						Res.	Res.	DFI_TPHY_WRLAT[5:0]					
rw		rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **DFI_T_CTRL_DELAY[4:0]**: DFI clock cycles after an assertion or deassertion of DFI control signals

Control signals at the PHY-DRAM interface reflect this assertion or deassertion.

If the DFI clock and the memory clock are not phase-aligned, this timing parameter must be rounded up to the next integer.

Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 4.

Bit 23 **DFI_RDDATA_USE_DFI_PHY_CLK**: dfi_rddata_en, dfi_rddata, or dfi_rddata_valid generated

This bit selects whether DFI_T_RDDATA_EN value in this register is in terms of HDR (DFI clock) or SDR (DFI PHY clock) cycles:

0: HDR (DFI clock) cycles

1: SDR (DFI PHY clock) cycles

If a Synopsys DWC gen2 multiPHY is used, this bit must be 0.

Note: Programming mode: Static.

Bits 22:16 **DFI_T_RDDATA_EN[6:0]**: Time from the assertion of a read command on the DFI interface to the assertion of dfi_rddata_en

Refer to *Section 14: DDR physical interface control (DDRPHYC)* for correct value.

This bitfield corresponds to the DFI parameter trddata_en.

Unit: DFI clock cycles or DFI PHY clock cycles, depending on DFI_RDDATA_USE_DFI_PHY_CLK in this register

Note: Programming mode: Quasi-dynamic Group 1, Group 4.

Bit 15 **DFI_WRDATA_USE_DFI_PHY_CLK**: dfi_wrdata_en, dfi_wrdata, or dfi_wrdata_mask generated

This bit selects whether DFI_TPHY_WRLAT and DFI_TPHY_WRDATA values in this register are in terms of HDR (DFI clock) or SDR (DFI PHY clock) cycles.

0: HDR (DFI clock) cycles

1: SDR (DFI PHY clock) cycles

If a Synopsys DWC gen2 multiPHY is used, this bit must be 0.

Note: Programming mode: Static.

Bit 14 Reserved, must be kept at reset value.

Bits 13:8 **DFI_TPHY_WRDATA[5:0]**: $t_{PHY_WRDATA,}$ number of clock cycles between dfi_wrdata_en assertion and associated write data driven on dfi_wrdata

Refer to *Section 14: DDR physical interface control (DDRPHYC)* for correct value.
The maximum supported value is 8.
Unit: DFI clock cycles or DFI PHY clock cycles, depending on DFI_WRDATA_USE_DFI_PHY_CLK in this register

Note: Programming mode: Quasi-dynamic Group 4.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **DFI_TPHY_WRLAT[5:0]**: t_{PHY_WRLAT}, write latency

Number of clocks from write command to write data enable (dfi_wrdata_en).
For LPDDR4, DFI_TPHY_WRLAT > 60 is not supported.
Unit: DFI clock cycles or DFI PHY clock cycles, depending on DFI_WRDATA_USE_DFI_PHY_CLK in this register

Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.48 DDRCTRL DFI timing 1 register (DDRCTRL_REGS_DFITMG1)

Address offset: 0x194

Reset value: 0x0000 0404

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DFI_T_CMD_LAT[3:0]				Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFI_T_WRDATA_DELAY[4:0]				
rw	rw	rw	rw								rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DFI_T_DRAM_CLK_DISABLE[4:0]					Res.	Res.	Res.	DFI_T_DRAM_CLK_ENABLE[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:28 **DFI_T_CMD_LAT[3:0]**: Number of DFI PHY clock cycles between when dfi_cs assertion and when the associated command is driven

This bitfield is used for CAL mode, and must be set to 0 or t_{CAL}, which matches the CAL mode register setting in the DRAM (valid range: 0 to 8).
If the PHY can add the latency for CAL mode, this bitfield must be set to 0.
Unit: DFI PHY clock cycles

Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 27:21 Reserved, must be kept at reset value.

Bits 20:16 **DFI_T_WRDATA_DELAY[4:0]**: t_{WRDATA_DELAY}, DFI clock cycles between dfi_wrdata_en assertion, and when the corresponding write data transfer is completed on the DRAM bus

For more information on correct value, see PHY specification.
For DFI 3.0 PHY, set this bitfield to t_{WRDATA_DELAY} (new parameter introduced in DFI 3.0).
For DFI 2.1 PHY, set this bitfield to t_{PHY_WRDATA} + (delay of DFI write data to the DRAM).
Value to be programmed is in terms of DFI clocks, not PHY clocks.
In FREQ_RATIO = 2, divide recommended value by two, and round it up to next integer.
If DFI_WRDATA_USE_DFI_PHY_CLK = 1 in DDRCTRL_REGS_DFITMG0, add 1 to the value.
Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 4.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **DFI_T_DRAM_CLK_DISABLE[4:0]**: DFI clock cycles from dfi_dram_clk_disable assertion on the DFI until the clock to the DRAM memory devices, at the PHY-DRAM boundary

This bitfield maintains a low value on CLK. If the DFI clock and the memory clock are not phase-aligned, this timing parameter must be rounded up to the next integer.

Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 4.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **DFI_T_DRAM_CLK_ENABLE[4:0]**: DFI clock cycles from dfi_dram_clk_disable deassertion on the DFI until the first valid rising edge of the clock to the DRAM memory devices, at the PHY-DRAM boundary

If the DFI clock and the memory clock are not phase aligned, this timing parameter must be rounded up to the next integer.

Unit: DFI clock cycles

Note: Programming mode: Quasi-dynamic Group 4.

13.7.49 DDRCTRL DFI low-power configuration 0 register (DDRCTRL_REGS_DFILPCFG0)

Address offset: 0x198

Reset value: 0x0700 0000

rw	rw	rw	rw				rw	rw	rw	rw	rw				rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **DFI_TLP_RESP[4:0]**: t_{LP_RESP}, DFI clock cycles setting for DFI

Same value is used for both PDN, SR, DPD, and MPS modes.

Unit: DFI clock cycles

Note: Programming mode: Static.

Bits 23:16 Reserved, must be kept at reset value.

Bits 15:12 **DFI_LP_WAKEUP_SR[3:0]**: t_{LP_WAKEUP}, DFI clock cycles to drive on dfi_lp_wakeup signal when SR is entered
0000: 16 cycles
0001: 32 cycles
0010: 64 cycles
0011: 128 cycles

						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **DIS_AUTO_CTRLUPD**:
1: Disable the automatic DFI_CTRLUPD_REQ generation. The DDRCTRL must issue this signal using CTRLUPD in DDRCTRL_REGS_DBGCMD.
0: DDRCTRL issues DFI_CTRLUPD_REQ periodically.
Note: Programming mode: Quasi-dynamic Group 3.

Bit 30 **DIS_AUTO_CTRLUPD_SRX**:
1: Disable the automatic DFI_CTRLUPD_REQ generation by the DDRCTRL at SR exit.
0: DDRCTRL issues a DFI_CTRLUPD_REQ before or after exiting SR, depending on CTRLUPD_PRE_SRX in this register.
Note: Programming mode: Static.

Bit 29 **CTRLUPD_PRE_SRX**: DFI_CTRLUPD_REQ requirements at SRX
0: Send DFI_CTRLUPD_REQ after SRX.
1: Send DFI_CTRLUPD_REQ before SRX.
If DIS_AUTO_CTRLUPD_SRX = 1, this bit has no impact (no DFI_CTRLUPD_REQ issued).
For STM32MP21xx, keep the default value 0x0.
Note: Programming mode: Static.

Bits 28:26 Reserved, must be kept at reset value.

Bits 25:16 **DFI_T_CTRLUP_MAX[9:0]**: Maximum number of DFI clock cycles that DFI_CTRLUPD_REQ signal can assert
The lowest value to assign to this bitfield is 0x40.
Unit: DFI clock cycles
Note: Programming mode: Static.

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:0 **DFI_T_CTRLUP_MIN[9:0]**: Minimum number of DFI clock cycles to which the DFI_CTRLUPD_REQ signal must be asserted

The DDRCTRL expects the PHY to respond within this time. If the PHY does not respond, the DDRCTRL deasserts DFI_CTRLUPD_REQ after DFI_T_CTRLUP_MIN + 2 cycles.

The lowest value to assign to this variable is 0x1.

Unit: DFI clock cycles

Note: Programming mode: Static.

13.7.51 DDRCTRL DFI update 1 register (DDRCTRL_REGS_DFIUPD1)

Address offset: 0x1A4

Reset value: 0x0001 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFI_T_CTRLUPD_INTERVAL_MIN_X1024[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFI_T_CTRLUPD_INTERVAL_MAX_X1024[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **DFI_T_CTRLUPD_INTERVAL_MIN_X1024[7:0]**: Minimum amount of time between DDRCTRL initiated DFI update requests (which is executed whenever the DDRCTRL is idle)

Set this bitfield higher to reduce the frequency of update requests, which can have a small impact on the latency of the first read request when the DDRCTRL is idle.

The minimum allowed value for this bitfield is 1.

Unit: multiples of 1024 DFI clock cycles

Note: Programming mode: Static.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **DFI_T_CTRLUPD_INTERVAL_MAX_X1024[7:0]**: Maximum amount of time between DDRCTRL initiated DFI update requests

This timer resets with each update request. When the timer expires, DFI_CTRLUPD_REQ is sent, and the traffic is blocked until the DFI_CTRLUPD_ACKx is received.

The PHY can use this idle time to recalibrate the delay lines to the DLLs. The DFI controller update is also used to reset PHY FIFO pointers in case of data capture errors.

Updates are required to maintain calibration over PVT, but frequent updates may impact performance. The minimum allowed value for this bitfield is 1.

This bitfield must be greater than DFI_T_CTRLUPD_INTERVAL_MIN_X1024.

Unit: multiples of 1024 DFI clock cycles

Note: Programming mode: Static.

13.7.52 DDRCTRL DFI update 2 register (DDRCTRL_REGS_DFIUPD2)

Address offset: 0x1A8

Reset value: 0x8000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DFI_PHYUPD_EN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	DFI_FREQUENCY[4:0]					LP_OPTIMIZED_WRITE	DIS_DYN_ADR_TRI	DFI_INIT_START	CTL_IDLE_EN	Res.	DFI_DATA_CS_POLARITY	PHY_DBI_MODE	DFI_INIT_COMPLETE_EN
			rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:8 **DFI_FREQUENCY[4:0]**: System operating frequency
The number of supported frequencies and the mapping of signal values to clock frequencies are defined by the PHY.
Note: Programming mode: Quasi-dynamic Group 1

Bit 7 **LP_OPTIMIZED_WRITE**:
1: LPDDR4 write DQ is set to 0xF8 if masked write with enabling DBI.
0: LPDDR4 write DQ is set to 0xFF.
Note: Programming mode: Quasi-dynamic Group 3

Bit 6 **DIS_DYN_ADR_TRI**:
1: PHY specific dynamic tristating is disabled (specific feature to some Synopsys PHYs).
0: A special IDLE command is issued on the DFI while dfi_cs is inactive state, so that the PHY can detect it to turn the command/address bus Hi-Z.
It is recommended to leave this bit to its default value
Note: Programming mode: Quasi-dynamic Group 3

Bit 5 **DFI_INIT_START**: PHY init start request
When asserted, this bit triggers the PHY init start request.
Note: Programming mode: Quasi-dynamic Group 3

Bit 4 **CTL_IDLE_EN**: Enables support of ctl_idle signal (non-DFI related pin specific to certain Synopsys PHYs)
This bit must be kept at reset value.
Note: Programming mode: Static

Bit 3 Reserved, must be kept at reset value.

Bit 2 **DFI_DATA_CS_POLARITY**: Polarity of dfi_wrdata_cs and dfi_rddata_cs signals
0: Active low
1: Active high
Note: Programming mode: Static

Bit 1 **PHY_DBI_MODE**: DBI implemented in DDRC or PHY
0: DDRC implements DBI functionality.
1: PHY implements DBI functionality.
Note: Programming mode: Static

Bit 0 **DFI_INIT_COMPLETE_EN**: PHY initialization complete enable
When asserted, the dfi_init_complete signal can be used to trigger SDRAM initialization.
Note: Programming mode: Quasi-dynamic Group 3

13.7.54 DDRCTRL DFI timing 2 register (DDRCTRL_REGS_DFITMG2)

Address offset: 0x1B4

Reset value: 0x0000 0202

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	DFI_TPHY_RDCSLAT[6:0]							Res.	Res.	DFI_TPHY_WRCSLAT[5:0]					
	rw	rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:8 **DFI_TPHY_RDCSLAT[6:0]**: $t_{PHY_RDCSLAT}$, DFI PHY clock cycles between read command sent on the DFI control interface, and associated dfi_rddata_cs signal asserted
Refer to *Section 14: DDR physical interface control (DDRPHYC)* for the correct value.
Unit: DFI PHY clock cycles
Note: Programming mode: Quasi-dynamic Group 2, Group 4.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **DFI_TPHY_WRCSLAT[5:0]**: $t_{PHY_WRCSLAT}$, DFI PHY clock cycles between write command sent on the DFI control interface, and associated dfi_wrdata_cs signal asserted.

Refer to *Section 14: DDR physical interface control (DDRPHYC)* for the correct value.

Unit: DFI PHY clock cycles

Note: Programming mode: Quasi-dynamic Group 2, Group 4.

13.7.55 DDRCTRL DFI timing 3 register (DDRCTRL_REGS_DFITMG3)

Address offset: 0x1B8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFI_T_GEARDOWN_DELAY[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **DFI_T_GEARDOWN_DELAY[4:0]**: Delay from dfi_geardown_en assertion to the time of t he PHY being ready to receive commands

Refer to *Section 14: DDR physical interface control (DDRPHYC)* for the correct value.

If the DDRCTRL operates in 1:2 mode, set this bitfield to ($t_{geardown_delay}$ / 2), and round it up to the next integer.

Unit: DFI clock cycles

Note: Programming mode: Static

13.7.56 DDRCTRL DFI status register (DDRCTRL_REGS_DFISTAT)

Address offset: 0x1BC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFI_LP_ACK	DFI_INIT_COMPLETE
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DFI_LP_ACK**:

Stores the value of dfi_lp_ack input to the controller

Note: Programming mode: Dynamic

Bit 0 **DFI_INIT_COMPLETE**: Status flag that announces when DFI initialization is completed
The DFI INIT is triggered by dfi_init_start signal.This flag is polled to know when the initialization is done.
Note: Programming mode: Dynamic

13.7.57 DDRCTRL DM/DBI control register (DDRCTRL_REGS_DBICTL)

Address offset: 0x1C0

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RD_DBI_EN	WR_DBI_EN	DM_EN
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **RD_DBI_EN**: Read DBI enable signal in DDRC
0: Read DBI disabled
1: Read DBI enabled
This bit must be set at the same value as DRAM mode register.
- DDR4: MR5 bit A12. When x4 devices are used, this signal must be set to 0.
- LPDDR4: MR3[6]

Note: Programming mode: Quasi-dynamic Group 1

Bit 1 **WR_DBI_EN**: Write DBI enable signal in DDRC
0: Write DBI disabled
1: Write DBI enabled
This bit must be set at the same value as DRAM mode register.
- DDR4: MR5 bit A11. When x4 devices are used, this signal must be set to 0.
- LPDDR4: MR3[7]

Note: Programming mode: Quasi-dynamic Group 1

Bit 0 **DM_EN**: DM enable signal in DDRC
0: DM disabled
1: DM enabled
This bit must be set at the same logical value as DRAM mode register.
- DDR4: MR5 bit A10. When x4 devices are used, this signal must be set to 0.
- LPDDR4: inverted value of MR13[5] (opposite polarity from this bit)

Note: Programming mode: Static

13.7.58 DDRCTRL DFI PHY master register (DDRCTRL_REGS_DFIPHYMSTR)

Address offset: 0x1C4

Reset value: 0x8000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DFI_PHYMSTR_BLK_REF_X32[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFI_PHYMSTR_EN
															rw

Bits 31:24 **DFI_PHYMSTR_BLK_REF_X32[7:0]**: Maximum number of DFI clock cycles that are needed to send pending refreshes before starting SR entry process

This bitfield must be used at default value (0x80) unless Synopsys suggests to change it.
00000000: 0 DFI clock cycles (no delay)
00000001: 32 DFI clock cycles
...
11111111: 8160 DFI clock cycles
Unit: multiples of 32 DFI clock cycles

Note: Programming mode: Static

Bits 23:1 Reserved, must be kept at reset value.

Bit 0 **DFI_PHYMSTR_EN**: PHY master interface enable

0: Disabled
1: Enabled

Note: Programming mode: Static

13.7.59 DDRCTRL address map 0 register (DDRCTRL_REGS_ADDRMAP0)

Address offset: 0x200

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ADDRMAP_CS_BIT0[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **ADDRMAP_CS_BIT0[4:0]**:
This bitfield selects the HIF address bit used as rank address bit 0.
Valid range: 0 to 29, and 31
Internal base: 6
The selected HIF address bit is determined by adding the internal base to this bitfield value.
If unused, this bitfield is set to 31: rank address bit 0 is set to 0.
Note: Programming mode: Static

13.7.60 DDRCTRL address map 1 register (DDRCTRL_REGS_ADDRMAP1)

Address offset: 0x204

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ADDRMAP_BANK_B2[5:0]					
										rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	ADDRMAP_BANK_B1[5:0]						Res.	Res.	ADDRMAP_BANK_B0[5:0]					
		rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:16 **ADDRMAP_BANK_B2[5:0]**:
This bitfield selects the HIF address bit used as bank address bit 2.
Valid range: 0 to 31, and 63
Internal base: 4
The selected HIF address bit is determined by adding the internal base to this bitfield value.
If unused, this bitfield is set to 63: bank address bit 2 is set to 0.
Note: Programming mode: Static

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **ADDRMAP_BANK_B1[5:0]**:
This bitfield selects the HIF address bits used as bank address bit 1.
Valid range: 0 to 32, and 63
Internal base: 3
The selected HIF address bit is determined by adding the internal base to this bitfield value.
If unused, this bitfield is set to 63: bank address bit 1 is set to 0.
Note: Programming mode: Static

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **ADDRMAP_BANK_B0[5:0]**:
This bitfield selects the HIF address bits used as bank address bit 0.
Valid range: 0 to 32, and 63
Internal base: 2
The selected HIF address bit is determined by adding the internal base to this bitfield value.
If unused, this bitfield is set to 63: bank address bit 0 is set to 0.
Note: Programming mode: Static

13.7.61 DDRCTRL address map 2 register (DDRCTRL_REGS_ADDRMAP2)

Address offset: 0x208

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	ADDRMAP_COL_B5[3:0]				Res.	Res.	Res.	Res.	ADDRMAP_COL_B4[3:0]			
				rw	rw	rw	rw					rw	rw	rw	rw

			rw	rw	rw	rw	rw					rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **ADDRMAP_COL_B5[3:0]**:
- Full bus width mode: selects the HIF address bit used as column address bit 5.
- Half bus width mode: selects the HIF address bit used as column address bit 6.
- Quarter bus width mode: selects the HIF address bit used as column address bit 7.

Valid range: 0 to 7, and 15
Internal base: 5
The selected HIF address bit is determined by adding the internal base to this bitfield value.
If unused, this bitfield is set to 15: the column address bit is set to 0.

Note: Programming mode: Static

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **ADDRMAP_COL_B4[3:0]**:
- Full bus width mode: selects the HIF address bit used as column address bit 4.
- Half bus width mode: selects the HIF address bit used as column address bit 5.
- Quarter bus width mode: selects the HIF address bit used as column address bit 6.

Valid range: 0 to 7, and 15
Internal base: 4
The selected HIF address bit is determined by adding the internal base to this bitfield value.
If unused, this bitfield is set to 15: the column address bit is set to 0.

Note: Programming mode: Static

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **ADDRMAP_COL_B3[4:0]**:
- Full bus width mode: selects the HIF address bit used as column address bit 3.
- Half bus width mode: selects the HIF address bit used as column address bit 4.
- Quarter bus width mode: selects the HIF address bit used as column address bit 5.

Valid range: 0 to 7
Internal base: 3
The selected HIF address bit is determined by adding the internal base to this bitfield value.

Note: Programming mode: Static

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **ADDRMAP_COL_B2[3:0]**:

- Full bus width mode: selects the HIF address bit used as column address bit 2.
- Half bus width mode: selects the HIF address bit used as column address bit 3.
- Quarter bus width mode: selects the HIF address bit used as column address bit 4.

Valid range: 0 to 7

Internal base: 2

The selected HIF address bit is determined by adding the internal base to this bitfield value.

Note: Programming mode: Static

13.7.62 DDRCTRL address map 3 register (DDRCTRL_REGS_ADDRMAP3)

Address offset: 0x20C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	ADDRMAP_COL_B9[4:0]					Res.	Res.	Res.	ADDRMAP_COL_B8[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	ADDRMAP_COL_B7[4:0]					Res.	Res.	Res.	ADDRMAP_COL_B6[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **ADDRMAP_COL_B9[4:0]**:

- Full bus width mode: selects the HIF address bit used as column address bit 9.
- Half bus width mode: selects the HIF address bit used as column address bit 11.
- Quarter bus width mode: selects the HIF address bit used as column address bit 13.

Valid range: 0 to 7 and 31

Internal base: 9

The selected HIF address bit is determined by adding the internal base to this bitfield value.

- Per JEDEC DDR3L specification, column address bit 10 is reserved for indicating auto-precharge. Hence no source address bit can be mapped to column address bit 10.
- If column bit 9 is the highest column address bit, it must map to the highest valid HIF address bit (x = the highest valid HIF address bit - internal base).
- If column bit 9 is the second highest column address bit, it must map to the second highest valid HIF address bit (x = the highest valid HIF address bit 1: internal base).
- If column bit 9 is the third highest column address bit, it must map to the third highest valid HIF address bit. (x = the highest valid HIF address bit 2: internal base)

If unused, set this bitfield to 31: the column address bit is set to 0.

Note: Programming mode: Static

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **ADDRMAP_COL_B8[4:0]**:

- Full bus width mode: selects the HIF address bit used as column address bit 8.
- Half bus width mode: selects the HIF address bit used as column address bit 9.
- Quarter bus width mode: selects the HIF address bit used as column address bit 11.

Valid range: 0 to 7, and 31

Internal base: 8

The selected HIF address bit is determined by adding the internal base to this bitfield value.

- Per JEDEC DDR3L specification, column address bit 10 is reserved for indicating auto-precharge. Hence no source address bit can be mapped to column address bit 10.
- If column bit 8 is the second highest column address bit, it must map to the second highest valid HIF address bit (x = the highest valid HIF address bit 1: internal base).
- If column bit 8 is the third highest column address bit, it must map to the third highest valid HIF address bit (x = the highest valid HIF address bit 2: internal base).

If unused, set this bitfield to 31: the column address bit is set to 0.

Note: Programming mode: Static

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **ADDRMAP_COL_B7[4:0]**:

- Full bus width mode: selects the HIF address bit used as column address bit 7.
- Half bus width mode: selects the HIF address bit used as column address bit 8.
- Quarter bus width mode: selects the HIF address bit used as column address bit 9.

Valid range: 0 to 7, and 31

Internal base: 7

The selected HIF address bit is determined by adding the internal base to this bitfield value.

- If column bit 7 is the third highest column address bit, it must map to the third highest valid HIF address bit (x = the highest valid HIF address bit 2: internal base).

If unused, set this bitfield to 31: the column address bit is set to 0.

Note: Programming mode: Static

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **ADDRMAP_COL_B6[4:0]**:

- Full bus width mode: selects the HIF address bit used as column address bit 6.
- Half bus width mode: selects the HIF address bit used as column address bit 7.
- Quarter bus width mode: selects the HIF address bit used as column address bit 8.

Valid range: 0 to 7 and 31

Internal base: 6

The selected HIF address bit is determined by adding the internal base to this bitfield value.

If unused, set this bitfield to 31: the column address bit is set to 0.

Note: Programming mode: Static

13.7.63 DDRCTRL address map 4 register (DDRCTRL_REGS_ADDRMAP4)

Address offset: 0x210

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	ADDRMAP_COL_B11[4:0]					Res.	Res.	Res.	ADDRMAP_COL_B10[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:8 **ADDRMAP_COL_B11[4:0]**:

- Full bus width mode: selects the HIF address bit used as column address bit 13.
- Half bus width mode: unused (see below the value to set to make it unused)
- Quarter bus width mode: unused (see below the value to set to make it unused)

Valid range: 0 to 7 and 31

Internal base: 11

The selected HIF address bit is determined by adding the internal base to this bitfield value.

- Per JEDEC DDR3L specification, column address bit 10 is reserved for indicating auto-precharge, and hence no source address bit can be mapped to column address bit 10.
- If column bit 11 is the highest column address bit, it must map to the highest valid HIF address bit (x = the highest valid HIF address bit: internal base).
- If column bit 11 is the second highest column address bit, it must map to the second highest valid HIF address bit (x = the highest valid HIF address bit 1: internal base).
- If column bit 11 is the third highest column address bit, it must map to the third highest valid HIF address bit (x = the highest valid HIF address bit 2: internal base).

If unused, set this bitfield to 31: the column address bit is set to 0.

Note: Programming mode: Static

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **ADDRMAP_COL_B10[4:0]**:

- Full bus width mode: selects the HIF address bit used as column address bit 11.
- Half bus width mode: selects the HIF address bit used as column address bit 13.
- Quarter bus width mode: unused (see below the value to set to make it unused)

Valid range: 0 to 7, and 31.

Internal base: 10

The selected HIF address bit is determined by adding the internal base to this bitfield value.

- Per JEDEC DDR3L specification, column address bit 10 is reserved for indicating auto-precharge, and hence no source address bit can be mapped to column address bit 10.
- If column bit 10 is the highest column address bit, it must map to the highest valid HIF address bit (x = the highest valid HIF address bit: internal base).
- If column bit 10 is the second highest column address bit, it must map to the second highest valid HIF address bit (x = the highest valid HIF address bit 1: internal base).
- If column bit 10 is the third highest column address bit, it must map to the third highest valid HIF address bit (x = the highest valid HIF address bit 2: internal base).

If unused, set this bitfield to 31: the column address bit is set to 0.

Note: Programming mode: Static

13.7.64 DDRCTRL address map 5 register (DDRCTRL_REGS_ADDRMAP5)

Address offset: 0x214

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	ADDRMAP_ROW_B11[3:0]				Res.	Res.	Res.	Res.	ADDRMAP_ROW_B2_10[3:0]			
				rw	rw	rw	rw					rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	ADDRMAP_ROW_B1[3:0]				Res.	Res.	Res.	Res.	ADDRMAP_ROW_B0[3:0]			
				rw	rw	rw	rw					rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **ADDRMAP_ROW_B11[3:0]**:

This bitfield selects the HIF address bit used as row address bit 11.

Valid range: 0 to 11, and 15

Internal base: 17

The selected HIF address bit is determined by adding the internal base to this bitfield value.

If unused, set this bitfield to 15: the row address bit 11 is set to 0.

Note: Programming mode: Static

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **ADDRMAP_ROW_B2_10[3:0]**:

This bitfield selects the HIF address bits used as row address bits 2 to 10.

Valid range: 0 to 11, and 15

Internal base: 8 (for row address bit 2), 9 (for row address bit 3), 10 (for row address bit 4) and so on, increasing to 16 (for row address bit 10)

The selected HIF address bit is determined by adding the internal base to this bitfield value.

When this bitfield is set to 15, values of row address bits 2 to 10 are defined by DDRCTRL_REGS_ADDRMAP9/10/11 registers.

Note: Programming mode: Static

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **ADDRMAP_ROW_B1[3:0]**:
This bitfield selects the HIF address bits used as row address bit 1.
Valid range: 0 to 11
Internal base: 7
The selected HIF address bit is determined by adding the internal base to this bitfield value.
Note: Programming mode: Static

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **ADDRMAP_ROW_B0[3:0]**:
This bitfield selects the HIF address bits used as row address bit 0.
Valid range: 0 to 11
Internal base: 6
The selected HIF address bit is determined by adding the internal base to this bitfield value.
Note: Programming mode: Static

13.7.65 DDRCTRL address map 6 register (DDRCTRL_REGS_ADDRMAP6)

Address offset: 0x218

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

				rw	rw	rw	rw					rw	rw	rw	rw

Bits 31:29 **LPDDR34_3GB_6GB_12GB[2:0]**: Density size/channel for LPDDR4 SDRAM device in use
When LPDDR4 device is used:
000: No LPDDR4 SDRAM 3-, 6, or 12-Gbyte device. All addresses are valid.
001: LPDDR4 SDRAM 3-Gbyte device with x16 mode. Every address having row[14:13] = 0b11 is considered as invalid.
010: LPDDR4 SDRAM 6-Gbyte device with x16 mode, or 3-Gbyte device with byte mode. Every address having row[15:14] = 0b11 is considered as invalid.
011: LPDDR4 SDRAM 12-Gbyte device with x16 mode, or 6-Gbyte device with byte mode. Every address having row[16:15] = 0b11 is considered as invalid.
101: LPDDR4 SDRAM 12-Gbyte device with byte mode. Every address having row[17:16] = 0b11 is considered as invalid.
Note: Programming mode: Static

Bit 28 Reserved, must be kept at reset value.

Bits 27:24 **ADDRMAP_ROW_B15[3:0]**:
This bitfield selects the HIF address bit used as row address bit 15.
Valid range: 0 to 11, and 15
Internal base: 21
The selected HIF address bit is determined by adding the internal base to this bitfield value.
If unused, set this bitfield to 15: the row address bit 15 is set to 0.
Note: Programming mode: Static

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **ADDRMAP_ROW_B14[3:0]**:
This bitfield selects the HIF address bit used as row address bit 14.
Valid range: 0 to 11, and 15
Internal base: 20
The selected HIF address bit is determined by adding the internal base to this bitfield value.
If unused, set this bitfield to 15: the row address bit 14 is set to 0.
Note: Programming mode: Static

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **ADDRMAP_ROW_B13[3:0]**:
This bitfield selects the HIF address bit used as row address bit 13.
Valid range: 0 to 11, and 15
Internal base: 19
The selected HIF address bit is determined by adding the internal base to this bitfield value.
If unused, set this bitfield to 15: the row address bit 13 is set to 0.
Note: Programming mode: Static

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **ADDRMAP_ROW_B12[3:0]**:
This bitfield selects the HIF address bit used as row address bit 12
Valid range: 0 to 11, and 15
Internal base: 18
The selected HIF address bit is determined by adding the internal base to this bitfield value.
If unused, set this bitfield to 15: the row address bit 12 is set to 0.
Note: Programming mode: Static

13.7.66 DDRCTRL address map 7 register (DDRCTRL_REGS_ADDRMAP7)

Address offset: 0x21C

Reset value: 0x0000 0000

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **ADDRMAP_ROW_B17[3:0]**:
This bitfield selects the HIF address bit used as row address bit 17.
Valid range: 0 to 11, and 15
Internal base: 23
The selected HIF address bit is determined by adding the internal base to this bitfield value.
If unused, set this bitfield to 15: the row address bit 17 is set to 0 for DDR4, or set to 1 for LPDDR4 backward compatibility.
Note: Programming mode: Static

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **ADDRMAP_ROW_B16[3:0]**:
This bitfield selects the HIF address bit used as row address bit 16.
Valid range: 0 to 11, and 15
Internal base: 22
The selected HIF address bit is determined by adding the internal base to this bitfield value.
If unused, set this bitfield to 15: the row address bit 16 is set to 0.
Note: Programming mode: Static

13.7.67 DDRCTRL address map 8 register (DDRCTRL_REGS_ADDRMAP8)

Address offset: 0x220

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:8 **ADDRMAP_BG_B1[5:0]**:
This bitfield selects the HIF address bits used as bank group address bit 1.
Valid range: 0 to 32, and 63
Internal base: 3
The selected HIF address bit is determined by adding the internal base to this bitfield value.
If unused, set this bitfield to 63: the bank group address bit 1 is set to 0.
Note: Programming mode: Static

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **ADDRMAP_BG_B0[5:0]**:
This bitfield selects the HIF address bits used as bank group address bit 0
Valid range: 0 to 32, and 63
Internal base: 2
The selected HIF address bit is determined by adding the internal base to this bitfield value.
If unused, set this bitfield to 63: the bank group address bit 0 is set to 0.
Note: Programming mode: Static

13.7.68 DDRCTRL address map 9 register (DDRCTRL_REGS_ADDRMAP9)

Address offset: 0x224

Reset value: 0x0000 0000

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **ADDRMAP_ROW_B5[3:0]**:
This bitfield selects the HIF address bits used as row address bit 5.
Valid range: 0 to 11
Internal base: 11
The selected HIF address bit is determined by adding the internal base to this bitfield value.
This bitfield is used only when ADDRMAP_ROW_B2_10 = 15
in DDRCTRL_REGS_ADDRMAP5.
Note: Programming mode: Static

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **ADDRMAP_ROW_B4[3:0]**:
This bitfield selects the HIF address bits used as row address bit 4
Valid range: 0 to 11
Internal base: 10
The selected HIF address bit is determined by adding the internal base to this bitfield value.
This bitfield is used only when ADDRMAP_ROW_B2_10 = 15
in DDRCTRL_REGS_ADDRMAP5.
Note: Programming mode: Static

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **ADDRMAP_ROW_B3[3:0]**:
This bitfield selects the HIF address bits used as row address bit 3
Valid range: 0 to 11
Internal base: 9
The selected HIF address bit is determined by adding the internal base to this bitfield value.
This bitfield is used only when ADDRMAP_ROW_B2_10 = 15
in DDRCTRL_REGS_ADDRMAP5.
Note: Programming mode: Static

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **ADDRMAP_ROW_B2[3:0]**:
This bitfield selects the HIF address bits used as row address bit 2
Valid range: 0 to 11
Internal base: 8
The selected HIF address bit is determined by adding the internal base to this bitfield value.
This bitfield is used only when ADDRMAP_ROW_B2_10 = 15
in DDRCTRL_REGS_ADDRMAP5.
Note: Programming mode: Static

13.7.69 DDRCTRL address map 10 register (DDRCTRL_REGS_ADDRMAP10)

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **ADDRMAP_ROW_B9[3:0]**:
This bitfield selects the HIF address bits used as row address bit 9
Valid range: 0 to 11
Internal base: 15
The selected HIF address bit is determined by adding the internal base to this bitfield value.
This bitfield is used only when ADDRMAP_ROW_B2_10 = 15
in DDRCTRL_REGS_ADDRMAP5.
Note: Programming mode: Static

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **ADDRMAP_ROW_B8[3:0]**:
This bitfield selects the HIF address bits used as row address bit 8
Valid range: 0 to 11
Internal base: 14
The selected HIF address bit is determined by adding the internal base to this bitfield value.
This bitfield is used only when ADDRMAP_ROW_B2_10 = 15
in DDRCTRL_REGS_ADDRMAP5.
Note: Programming mode: Static

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **ADDRMAP_ROW_B7[3:0]**:
This bitfield selects the HIF address bits used as row address bit 7
Valid range: 0 to 11
Internal base: 13
The selected HIF address bit is determined by adding the internal base to this bitfield value.
This bitfield is used only when ADDRMAP_ROW_B2_10 = 15
in DDRCTRL_REGS_ADDRMAP5.
Note: Programming mode: Static

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **ADDRMAP_ROW_B6[3:0]**:
This bitfield selects the HIF address bits used as row address bit 6
Valid range: 0 to 11
Internal base: 12
The selected HIF address bit is determined by adding the internal base to this bitfield value.
This bitfield is used only when ADDRMAP_ROW_B2_10 = 15
in DDRCTRL_REGS_ADDRMAP5.
Note: Programming mode: Static

13.7.70 DDRCTRL address map 11 register (DDRCTRL_REGS_ADDRMAP11)

Address offset: 0x22C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ADDRMAP_ROW_B10[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **ADDRMAP_ROW_B10[3:0]**:
This bitfield selects the HIF address bits used as row address bit 10
Valid range: 0 to 11
Internal base: 16
The selected HIF address bit is determined by adding the internal base to this bitfield value.
This bitfield is used only when ADDRMAP_ROW_B2_10 = 15
in DDRCTRL_REGS_ADDRMAP5.
Note: Programming mode: Static

13.7.71 DDRCTRL ODT configuration register (DDRCTRL_REGS_ODTCFG)

Address offset: 0x240

Reset value: 0x0400 0400

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	WR_ODT_HOLD[3:0]				Res.	Res.	Res.	WR_ODT_DELAY[4:0]				
				rw	rw	rw	rw				rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	RD_ODT_HOLD[3:0]				Res.	RD_ODT_DELAY[4:0]					Res.	Res.
				rw	rw	rw	rw		rw	rw	rw	rw	rw		

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **WR_ODT_HOLD[3:0]**: DFI PHY clock cycles to hold ODT for a write command
The minimum supported value is 2.
Recommended values:
DDR3L: BL8 - 0x6
DDR4: BL8 - 5 + WR_PREAMBLE with WR_PREAMBLE = 1 ($1t_{CK}$ write preamble), or 2 ($2t_{CK}$ write preamble)
Unit: DFI PHY clock cycles
Note: Programming mode: Quasi-dynamic Group 1, Group 4.

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **WR_ODT_DELAY[4:0]**: DFI PHY clock cycles, from issuing a write command to setting ODT values associated with this command
ODT setting must remain constant for the entire time that DQS is driven by the DDRCTRL.
Recommended values:
DDR3L: 0x0
DDR4: DFI_T_CMD_LAT in DDRCTRL_REGS_DFITMG1 (to adjust for CAL mode)
Unit: DFI PHY clock cycles
Note: Programming mode: Quasi-dynamic Group 1, Group 4.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **RD_ODT_HOLD[3:0]**: DFI PHY clock cycles to hold ODT for a read command
The minimum supported value is 2.
Recommended values:
DDR3L: BL8 - 0x6
DDR4: BL8 - 5 + RD_PREAMBLE with RD_PREAMBLE = 1 ($1t_{CK}$ read preamble), or 2 ($2t_{CK}$ read preamble)
Unit: DFI PHY clock cycles
Note: Programming mode: Quasi-dynamic Group 1, Group 4.

Bit 7 Reserved, must be kept at reset value.

Bits 6:2 **RD_ODT_DELAY[4:0]**: DFI PHY clock cycles, from issuing a read command to setting ODT values associated with that command
ODT setting must remain constant for the entire time that DQS is driven by the DDRCTRL.
Recommended values:
DDR3L: CL - CWL
DDR4: CL - CWL - RD_PREAMBLE + WR_PREAMBLE + DFI_T_CMD_LAT (to adjust for CAL mode) with
- DFI_T_CMD_LAT in DDRCTRL_REGS_DFITMG1
- WR_PREAMBLE = 1 ($1t_{CK}$ write preamble), or 2 ($2t_{CK}$ write preamble)
- RD_PREAMBLE = 1 ($1t_{CK}$ read preamble), or 2 ($2t_{CK}$ read preamble)

If (CL - CWL - RD_PREAMBLE + WR_PREAMBLE) < 0, the DDRCTRL does not support ODT for read operation.
Unit: DFI PHY clock cycles
Note: Programming mode: Quasi-dynamic Group 1, Group 4.

Bits 1:0 Reserved, must be kept at reset value.

13.7.72 DDRCTRL ODT/rank map register (DDRCTRL_REGS_ODTMAP)

Address offset: 0x244

Reset value: 0x0000 2211

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	RANK1_RD_ODT[1:0]		Res.	Res.	RANK1_WR_ODT[1:0]		Res.	Res.	RANK0_RD_ODT[1:0]		Res.	Res.	RANK0_WR_ODT[1:0]	
		rw	rw			rw	rw			rw	rw			rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:12 **RANK1_RD_ODT[1:0]**: Remote ODTs to turn on during a read from rank 1

Each rank has a remote ODT (in the SDRAM), which can be turned on by setting the appropriate bit in this bitfield.

Rank 0 is controlled by the LSB. Rank 1 is controlled by the MSB.

For each rank, set its bit to 1 to enable its ODT.

Note: Programming mode: Static.

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:8 **RANK1_WR_ODT[1:0]**: Remote ODTs to turn on during a write to rank 1

Each rank has a remote ODT (in the SDRAM), which can be turned on by setting the appropriate bit in this bitfield.

Rank 0 is controlled by the LSB; rank 1 is controlled by bit next to the LSB, and so on.

For each rank, set its bit to 1 to enable its ODT.

Note: Programming mode: Static.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **RANK0_RD_ODT[1:0]**: Remote ODTs to turn on during a read from rank 0

Each rank has a remote ODT (in the SDRAM), which can be turned on by setting the appropriate bit in this bitfield.

Rank 0 is controlled by the LSB; rank 1 is controlled by bit next to the LSB, and so on.

For each rank, set its bit to 1 to enable its ODT.

Note: Programming mode: Static.

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **RANK0_WR_ODT[1:0]**: Remote ODTs to turn on during a write to rank 0

Each rank has a remote ODT (in the SDRAM), which can be turned on by setting the appropriate bit in this bitfield.

Rank 0 is controlled by the LSB; rank 1 is controlled by bit next to the LSB, and so on.

For each rank, set its bit to 1 to enable its ODT.

Note: Programming mode: Static.

13.7.73 DDRCTRL scheduler control register (DDRCTRL_REGS_SCHED)

Address offset: 0x250

OPT_VPRW_SCH	RDWR_IDLE_GAP[6:0]							GO2CRITICAL_HYSTERESIS[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LPDDR4_OPT_ACT_TIMING	Res.	Res.	LPR_NUM_ENTRIES[4:0]					AUTOPRE_RMW	Res.	Res.	OPT_WRCAM_FILL_LEVEL	RDWR_SWITCH_POLICY_SEL	PAGECLOSE	PREFER_WRITE	Res.
rw			rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	

Bit 31 **OPT_VPRW_SCH**: Optimize exVPR/exVPW scheduling.

Program to 1 can improve utilization as other traffic class can utilize bandwidth while pages for exVPR/exVPW are being prepared or ranks/banks for exVPR/exVPW are being refreshed, but it can delay execution of exVPR/exVPW due to delay of Activate by read/write command of other traffic class.

Programming Mode: Static.

0: When any exVPR/exVPW are pending on CAM, read/write command of all other traffic class are masked to be scheduled

1: When any exVPR/exVPW are pending as page-hit, read/write command of all other traffic class are masked to be scheduled.

Note: Programming mode: Static.

Bits 30:24 **RDWR_IDLE_GAP[6:0]**:

When the preferred transaction store is empty for these many clock cycles, switch to the alternate transaction store if it is non-empty.

The read transaction store (both high and low priority) is the default preferred transaction store. The write transaction store is the alternative store. When prefer write over read is set, this is reversed.

0x0: The transaction store switching happens immediately when the switching conditions become true.

Unit: DFI clock cycles

Note: Programming mode: Static.

Bits 23:16 **GO2CRITICAL_HYSTERESIS[7:0]**: Not used

Note: Programming mode: Static.

Bit 15 **LPDDR4_OPT_ACT_TIMING**: Optimized ACT timing control for LPDDR4

In LPDDR4, RD/WR/ACT takes 4 cycles. To stream read/write, there is only a 4-cycle space between reads and writes.

If ACT is scheduled out after RD/WR with 1-, 2-, or 3-cycle gap, the next RD/WR may be pushed by 1, 2, or 3 cycles, and create a gap on DQ.

When this bit is set, ACT is not scheduled out with the 1-, 2-, and 3-cycle gap.

If enabled, there may be performance impact especially for random traffic (latency/utilization).

1: Enable this feature.

0: Disable this feature.

This bit is ignored when LPDDR4 = 0 in DDRCTRL_REGS_MSTR.

Note: Programming mode: Static.

Bits 14:13 Reserved, must be kept at reset value.

Bits 12:8 **LPR_NUM_ENTRIES[4:0]**: Number of entries in the low-priority transaction store

This bitfield value + 1 gives the number of entries in the low-priority transaction store.

(1 - this bitfield) is the number of entries available in the high-priority transaction store.

Setting this bitfield to the maximum value allocates all entries to the low-priority transaction store. Setting this bitfield to 0 allocates one entry to the low-priority transaction store, and the rest to the high-priority transaction store.

Note: Programming mode: Static.

Bit 7 **AUTOPRE_RMW**: Selection of the hif_cmd_autopre behavior if a RMW is received on HIF with hif_cmd_autopre = 1

1: Apply auto-precharge only for write part of RMW.

0: Apply auto-precharge for both read and write parts of RMW.

Note: Programming mode: Static.

Bits 6:5 Reserved, must be kept at reset value.

Bit 4 **OPT_WRCAM_FILL_LEVEL**: Enable the feature of optimized write CAM fill level by switching to write when write CAM reaches certain fill level set in DDRCTRL_REGS_SCHED3.WRCAM_HIGHTHRESH.

When it is enabled, write starvation timer and write transaction counter automatically are not used. They are only active when the feature is disabled.

If RDWR_SWITCH_POLICY_SEL = 0, this register is ignored.

0: Disabled

1: Enabled

Note: Programming mode: Static.

Bit 3 **RDWR_SWITCH_POLICY_SEL**: Selects read write switching policy.

1: Select "enhanced" read write switching policy

0: Select "original" read write switching policy

Note: Programming mode: Static.

Bit 2 **PAGECLOSE**:

1: The bank is kept open only while there are page hit transactions available in the CAM to this bank. The last read or write command in the CAM with a bank and page hit is executed with auto-precharge if PAGECLOSE_TIMER = 0 in DDRCTRL_REGS_SCHED1.

Even if this bit is set to 1 and PAGECLOSE_TIMER = 0, an explicit precharge (and not auto-precharge) may be issued in some cases where there is a mode switch between write and read, or between LPR and HPR.

0: The bank remains open until there is a need to close it (to open a different page, or for page timeout or refresh timeout). This is also known as open-page policy, which can be overridden by setting the per-command-autopre bit on the HIF interface (hif_cmd_autopre).

This provides a midway between open- and close-page policies.

Note: Programming mode: Quasi-dynamic Group 3.

Bit 1 **PREFER_WRITE**:

If this bit is set, the bank selector prefers writes over reads. For debug purpose only.

Note: Programming mode: Static.

Bit 0 Reserved, must be kept at reset value.

13.7.74 DDRCTRL scheduler control 1 register (DDRCTRL_REGS_SCHED1)

Address offset: 0x254

Reset value: 0x0000 2000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OPT_HIT_GT_HPR	PAGE_HIT_LIMIT_RD[2:0]			Res.	PAGE_HIT_LIMIT_WR[2:0]			Res.	VISIBLE_WINDOW_LIMIT_RD[2:0]			Res.	VISIBLE_WINDOW_LIMIT_WR[2:0]		
rw	rw	rw	rw		rw	rw	rw		rw	rw	rw		rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DELAY_SWITCH_WRITE[3:0]				Res.	Res.	Res.	Res.	PAGECLOSE_TIMER[7:0]							
rw	rw	rw	rw					rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **OPT_HIT_GT_HPR**: Optimize the priority between page-hit LPR and page-miss HPR.

This is to choose trade-off between HPR latency and total utilization.

0: Page-miss HPR has priority (default). HPR latency can be better than 1 because HPR has priority over LPR.

1: Page-hit LPR has priority. DRAM utilization can be better than 0 because number of ACT-PRE is reduced.

It is recommended to enable page-hit limiter so that once page-hit limiter is expired, HPR can have priority.

Note: Programming mode: Static.

Bits 30:28 **PAGE_HIT_LIMIT_RD[2:0]**: Page-hit limiter for read.

When certain number of read commands are scheduled out without ACT for a bank (schedule page-hit commands), all entries belonging to the bank priority are increased equal to page-hit entry even if these are page-miss so that oldest entry belonging to the bank can be served regardless of page-hit/page-miss.

The priority is reset once any ACT/PRE/AP is served to the bank.

0x0: Disable this feature

0x1: 4

0x2: 8

0x3: 16

0x4: 32

Other: Reserved

Note: Programming mode: Static.

Bit 27 Reserved, must be kept at reset value.

Bits 26:24 **PAGE_HIT_LIMIT_WR[2:0]**: Page-hit limiter for write.
When certain number of write commands are scheduled out without ACT for a bank (schedule page-hit commands), all entries belonging to the bank priority are increased equal to page-hit entry even if these are page-miss so that oldest entry belonging to the bank can be served regardless of page-hit/page-miss.
The priority is reset once any ACT/PRE/AP is served to the bank.
0x0: Disable this feature
0x1: 4
0x2: 8
0x3: 16
0x4: 32
Others: Reserved
Note: Programming mode: Static.

Bit 23 Reserved, must be kept at reset value.

Bits 22:20 **VISIBLE_WINDOW_LIMIT_RD[2:0]**: Visible window limiter for read.
This is to prevent extreme starvation against other entries within a CAM.
Each read CAM entry has a counter, it is set to the value programmed in this register when command is pushed and is counted-down when newer read CAM entry is scheduled-out.
The counter represents starvation within RD CAM in terms of number of commands to be over taken.
When the counter reaches 0, the entry becomes expired-VPR to eliminate more starvation.
0x0: Disable this feature
0x1: 31
0x2: 63
0x3: 127
0x4: 255
Others: Reserved
Note: Programming mode: Static.

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **VISIBLE_WINDOW_LIMIT_WR[2:0]**: Visible window limiter for write.
This is to prevent extreme starvation against other entries within a CAM.
Each write CAM entry has a counter, it is set to the value programmed in this register when command is pushed and is counted-down when newer write CAM entry is scheduled-out.
The counter represents starvation within WR CAM in terms of number of commands to be over taken.
When the counter reaches 0, the entry becomes expired-VPW to eliminate more starvation.
0x0: Disable this feature
0x1: 31
0x2: 63
0x3: 127
0x4: 255
Others: Reserved
Note: Programming mode: Static.

Bits 15:12 **DELAY_SWITCH_WRITE[3:0]**: Indicates the number of cycles to delay switching read to write mode when write page-hit request is there and no read page-hit request is there. Setting higher value may reduce number of read to write switching but increase read to write turn-around time.
The register indicates the number of cycles.
0: no delay
1: 2 cycles delay
2: 4 cycles delay
3: 6 cycles delay
4: 8 cycles delay
...
15: 30 cycles delay
If RDWR_SWITCH_POLICY_SEL = 0, this register is ignored.
Note: Programming mode: Static.

Bits 11:8 Reserved, must be kept at reset value.

Bits 7:0 **PAGECLOSE_TIMER[7:0]**:
This bitfield works in conjunction with PAGECLOSE in DDRCTRL_REGS_SCHED. It has meaning only if PAGECLOSE = 1.
0: An auto-precharge can be scheduled for last read or write command in the CAM with a bank and page hit. Sometimes an explicit precharge is scheduled instead of the auto-precharge (see PAGECLOSE description for more details).
> 0: An auto-precharge is not scheduled for last read or write command in the CAM with a bank and page hit. A timer is started instead, with this bitfield as initial value. There is a timer on a per bank basis. This timer decrements unless the next read or write in the CAM to a bank is a page hit. It gets reset to this bitfield value if the next read or write in the CAM to a bank is a page hit. Once the timer reached zero, an explicit precharge is attempted to be scheduled.
Unit: DFI clock cycles
Note: Programming mode: Static.

13.7.75 DDRCTRL high priority read CAM 1 register (DDRCTRL_REGS_PERFHPR1)

Address offset: 0x25C

Reset value: 0x0F00 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HPR_XACT_RUN_LENGTH[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

W_MAX_STARVE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **W_XACT_RUN_LENGTH[7:0]**: Transactions serviced once the WR queue goes critical
This bitfield is the smaller of this number and the number of transactions available.
Unit: transaction
Note: Programming mode: Quasi-dynamic Group 3.

Bits 23:16 Reserved, must be kept at reset value.

Bits 15:0 **W_MAX_STARVE[15:0]**: DFI clocks that the WR queue can be starved before it goes critical
The minimum valid functional value for this bitfield is 0x1. Programming it to 0x0 disables the starvation functionality.
During normal operation, this function must not be disabled as it causes excessive latencies.
Unit: DFI clock cycles
Note: Programming mode: Quasi-dynamic Group 3.

13.7.78 Scheduler control 3 register (DDRCTRL_REGS_SCHED3)

Address offset: 0x270

Reset value: 0x0404 0208

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	RD_PGHIT_NUM_THRESH[4:0]					Res.	Res.	Res.	WR_PGHIT_NUM_THRESH[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	WRCAM_HIGHTHRESH[4:0]					Res.	Res.	Res.	WRCAM_LOWTHRESH[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **RD_PGHIT_NUM_THRESH[4:0]**: Switch to read mode once number of read page-hit request exceeds the threshold set in the register during waiting t_{W2R}.
Setting to 0 disables the feature.
If RDWR_SWITCH_POLICY_SEL = 0, this register is ignored.
Note: Programming mode: Static.

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **WR_PGHIT_NUM_THRESH[4:0]**: Switch to write mode once number of write page-hit request exceeds threshold set in this register during waiting delay_switch_write timeout.
Setting to 0 disables the feature.
If RDWR_SWITCH_POLICY_SEL = 0, this register is ignored.
Note: Programming mode: Static.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **WRCAM_HIGHTHRESH[4:0]**: The high threshold used in optimized write CAM fill level.
When (MEMC_NO_OF_ENTRY - (number of loaded entries) < wrcam_highthresh), switch to write mode and prepare banks for write direction if no Exp-VPR or read collision is there.
wrcam_highthresh must be set to a smaller value than wrcam_lowthresh.
This feature is enabled when opt_wrcam_fill_level is 1.
Note: Programming mode: Static.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **WRCAM_LOWTHRESH[4:0]**: The low threshold used in optimized write CAM fill level.
When (MEMC_NO_OF_ENTRY - (number of loaded entries) < wrcam_lowthresh), keep to write mode and stop to prepare banks for read direction if no Exp-VPR or read collision is there.
This feature is enabled when opt_wrcam_fill_level is 1.
Note: Programming mode: Static.

13.7.79 Scheduler control 4 register (DDRCTRL_REGS_SCHED4)

Address offset: 0x274

Reset value: 0x0840 0810

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
WR_PAGE_EXP_CYCLES[7:0]								RD_PAGE_EXP_CYCLES[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WR_ACT_IDLE_GAP[7:0]								RD_ACT_IDLE_GAP[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **WR_PAGE_EXP_CYCLES[7:0]**: Indicates the number of cycles to keep the bank opened for write direction in read mode when both directions has request to the bank.
The register indicates the number of cycle.
If RDWR_SWITCH_POLICY_SEL = 0, this register is ignored.
Note: Programming mode: Static.

Bits 23:16 **RD_PAGE_EXP_CYCLES[7:0]**: Indicates the number of cycles to keep the bank opened for read direction in write mode when both directions has request to the bank.
The register indicates the number of cycle.
If RDWR_SWITCH_POLICY_SEL = 0, this register is ignored.
Note: Programming mode: Static.

Bits 15:8 **WR_ACT_IDLE_GAP[7:0]**: Indicates the number of cycles when write direction has no request to start preparing bank for read direction.
The register indicates the number of cycle.
If RDWR_SWITCH_POLICY_SEL = 0, this register is ignored.
Note: Programming mode: Static.

Bits 7:0 **RD_ACT_IDLE_GAP[7:0]**: Indicates the number of cycles when read direction has no request to start preparing bank for write direction.
The register indicates the number of cycle.
If RDWR_SWITCH_POLICY_SEL = 0, this register is ignored.
Note: Programming mode: Static.

13.7.80 DDRCTRL debug 0 register (DDRCTRL_REGS_DBG0)

Address offset: 0x300

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DIS_MAX_RANK_WR_OPT	DIS_MAX_RANK_RD_OPT	Res.	DIS_COLLISION_PAGE_OPT	Res.	DIS_ACT_BYPASS	DIS_RD_BYPASS	DIS_WC
								rw	rw		rw		rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **DIS_MAX_RANK_WR_OPT**: Disable optimized max_rank_wr and max_logical_rank_wr
This bit is for debug purpose only. For normal operation, this bit must be set to 0.
Note: Programming mode: Static.

Bit 6 **DIS_MAX_RANK_RD_OPT**: Disable optimized max_rank_rd and max_logical_rank_rd .
This bit is for debug purpose only. For normal operation, this bit must be set to 0.
Note: Programming mode: Static.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **DIS_COLLISION_PAGE_OPT**:
0: The auto-precharge is disabled for the flushed command in a collision case.
Collision cases are write followed by read to the same address, read followed by write to the same address, or write followed by write to same address with DIS_WC = 1 in this register (where same address comparisons exclude the two address bits representing critical word).
For debug purpose only.
Note: Programming mode: Static.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **DIS_ACT_BYPASS**:
Only present in designs supporting activate bypass.
1: Disable bypass path for high-priority read activates.
For debug purpose only.
Note: Programming mode: Static.

Bit 1 **DIS_RD_BYPASS**:
Only present in designs supporting read bypass.
1: Disable bypass path for high-priority read page hits.
For debug purpose only.
Note: Programming mode: Static.

Bit 0 **DIS_WC**:
1: Disable write combine.
For debug purpose only.
Note: Programming mode: Static.

13.7.81 DDRCTRL debug 1 register (DDRCTRL_REGS_DBG1)

Address offset: 0x304

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DIS_HIF	DIS_DQ
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DIS_HIF**:

1: DDRCTRL asserts the HIF command signal hif_cmd_stall. The DDRCTRL ignores hif_cmd_valid and all other associated request signals.

This bit is intended to be switched on-the-fly.

Note: Programming mode: Dynamic.

Bit 0 **DIS_DQ**:

1: DDRCTRL does not dequeue any transaction from the CAM. Bypass is also disabled. All transactions are queued in the CAM. No reads or writes are issued to SDRAM as long as this bit is asserted.

This bit can be used to prevent reads or writes being issued by the DDRCTRL, which makes it safe to modify some fields associated with reads/writes.

After setting this bit, it is strongly recommended to poll WR_DATA_PIPELINE_EMPTY and RD_DATA_PIPELINE_EMPTY in DDRCTRL_REGS_DBGCAM, before making changes to any register which affect reads and writes. This ensures that the relevant logic in the DDRC is idle. This bit is intended to be switched on-the-fly.

Note: Programming mode: Dynamic.

13.7.82 DDRCTRL CAM debug register (DDRCTRL_REGS_DBGCAM)

Address offset: 0x308

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	WR_DATA_PIPELINE_EMPTY	RD_DATA_PIPELINE_EMPTY	Res.	DBG_WR_Q_EMPTY	DBG_RD_Q_EMPTY	DBG_STALL	Res.	Res.	DBG_W_Q_DEPTH[5:0]					
		r	r		r	r	r			r	r	r	r	r	r

Res.	Res.	DBG_LPR_Q_DEPTH[5:0]						Res.	Res.	DBG_HPR_Q_DEPTH[5:0]					
		r	r	r	r	r	r			r	r	r	r	r	r

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **WR_DATA_PIPELINE_EMPTY**: Empty write data pipeline on the DFI interface
This bit is intended to be polled at least twice after setting DIS_DQ in DDRCTRL_RGES_DBG1, to ensure that all remaining commands/data have completed.
Note: Programming mode: Dynamic.

Bit 28 **RD_DATA_PIPELINE_EMPTY**: Empty read data pipeline on the DFI interface
This bit is intended to be polled at least twice after setting DIS_DQ in DDRCTRL_RGES_DBG1, to ensure that all remaining commands/data have completed.
Note: Programming mode: Dynamic.

Bit 27 Reserved, must be kept at reset value.

Bit 26 **DBG_WR_Q_EMPTY**:
1: All write command queues and write data buffers inside the DDRC are empty.
Use-case: When the DDRCTRL enters SR using the low-power entry sequence, the following is expected:
- All commands in its queues are executed.
- Write command queue and data buffers are empty.

This bit must be 1 at that time. For debug purpose only.
Note: Programming mode: Dynamic.

Bit 25 **DBG_RD_Q_EMPTY**:
1: All read command queues and read data buffers inside DDRC are empty.
Use-case: When the DDRCTRL enters SR using the low-power entry sequence, the following is expected:
- All commands in its queues are executed.
- Write command queue and data buffers are empty.

This bit must be 1 at that time. For debug purpose only.
Note: Programming mode: Dynamic.

Bit 24 **DBG_STALL**: Stall (for debug purpose only)
Note: Programming mode: Dynamic.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **DBG_W_Q_DEPTH[5:0]**: Write queue depth (for debug purpose only)
Note: Programming mode: Dynamic.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **DBG_LPR_Q_DEPTH[5:0]**: Low-priority read queue depth (for debug purpose only)
Note: Programming mode: Dynamic.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **DBG_HPR_Q_DEPTH[5:0]**: High-priority read queue depth (for debug purpose only)
Note: Programming mode: Dynamic.

13.7.83 DDRCTRL command debug register (DDRCTRL_REGS_DBGCMD)

Address offset: 0x30C

Reset value: 0x0000 0000

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CTRLUPD	ZQ_CALIB_SHORT	Res.	Res.	RANK1_REFRESH	RANK0_REFRESH
										rs	rs			rs	rs

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **CTRLUPD**: dfi_ctrlupd_req to the PHY

1: The DDRCTRL issues a dfi_ctrlupd_req to the PHY. When this request is stored in the DDRCTRL, this bit is automatically cleared. This operation must only be performed when DIS_AUTO_CTRLUPD = 1 in DDRCTRL_REGS_DFIUPD0.

Note: Programming mode: Dynamic.

Bit 4 **ZQ_CALIB_SHORT**: ZQCS/MPC command to the SDRAM

1: The DDRCTRL issues a ZQCS (ZQ calibration short)/MPC (ZQ calibration) command to the SDRAM. When this request is stored in the DDRCTRL, the bit is automatically cleared.
This operation can be performed only when DIS_AUTO_ZQ = 1 in DDRCTRL_REGS_ZQCTL0.
It is recommended NOT to set this bit if in Init, in SR (except LPDDR4), or SRPD (LPDDR4).
For SR (except LPDDR4) or SRPD (LPDDR4), ZQCS is scheduled after SR (except LPDDR4) or SPRD (LPDDR4) has been exited.

Note: Programming mode: Dynamic.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **RANK1_REFRESH**: Refresh to rank 1

1: The DDRCTRL issues a refresh to rank 1.
Writing to this bit causes RANK1_REFRESH_BUSY to be set in DDRCTRL_REGS_DBGSTAT. When RANK1_REFRESH_BUSY is cleared, the command has been stored in the DDRCTRL.
For 3DS configuration, refresh is sent to rank index 1.
This operation can be performed only when DIS_AUTO_REFRESH = 1 in DDRCTRL_REGS_RFSHCTL3.
It is recommended NOT to set this bit if in Init mode.

Note: Programming mode: Dynamic.

Bit 0 **RANK0_REFRESH**: Refresh to rank 0

1: The DDRCTRL issues a refresh to rank 0.
Writing to this bit causes RANK0_REFRESH_BUSY to be set in DDRCTRL_REGS_DBGSTAT. When RANK0_REFRESH_BUSY is cleared, the command has been stored in the DDRCTRL.
For 3DS configuration, refresh is sent to rank index 1.
This operation can be performed only when DIS_AUTO_REFRESH = 1 in DDRCTRL_REGS_RFSHCTL3.
It is recommended NOT to set this bit if in Init mode.

Note: Programming mode: Dynamic.

13.7.84 DDRCTRL status debug register (DDRCTRL_REGS_DBGSTAT)

Address offset: 0x310

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CTRLUPD_BUSY	ZQ_CALIB_SHORT_BUSY	Res.	Res.	RANK1_REFRESH_BUSY	RANK0_REFRESH_BUSY
										r	r			r	r

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **CTRLUPD_BUSY**: CTRLUPD operation

The device can initiate a CTRLUPD operation only if this bit is low. This bit goes high in the clock after the DDRCTRL accepts the CTRLUPD request. It goes low when the CTRLUPD operation is initiated in the DDRCTRL.

It is recommended NOT to perform CTRLUPD operations when this bit is high.

0: The device can initiate a CTRLUPD operation.

1: No CTRLUPD operation has been initiated yet in the DDRCTRL.

Note: Programming mode: Dynamic.

Bit 4 **ZQ_CALIB_SHORT_BUSY**: ZQCS operation

The device can initiate a ZQCS (ZQ calibration short) operation only if this bit is low. This bit goes high in the clock after the DDRCTRL accepts the ZQCS request. It goes low when the ZQCS operation is initiated in the DDRCTRL.

It is recommended NOT to perform ZQCS operations when this bit is high.

0: The device can initiate a ZQCS operation.

1: No ZQCS operation has been initiated yet in the DDRCTRL.

Note: Programming mode: Dynamic.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **RANK1_REFRESH_BUSY**: rank1_refresh operation

The device can initiate a rank1_refresh operation (refresh operation to rank 1) only if this bit is low. This bit goes high in the clock after RANK1_REFRESH is set in DDRCTRL_REGS_DBGCMD. It goes low when rank1_refresh operation is stored in the DDRCTRL.

It is recommended NOT to perform rank1_refresh operations when this bit is high.

0: The device can initiate a rank1_refresh operation.

1: No rank1_refresh operation has been stored yet in the DDRCTRL.

Note: Programming mode: Dynamic.

Bit 0 **RANK0_REFRESH_BUSY**: rank0_refresh operation

The device can initiate a rank0_refresh operation (refresh operation to rank 1) only if this bit is low. This bit goes high in the clock after RANK0_REFRESH is set in DDRCTRL_REGS_DBGCMD. It goes low when rank0_refresh operation is stored in the DDRCTRL.

It is recommended NOT to perform rank1_refresh operations when this bit is high.

0: The device can initiate a rank0_refresh operation.

1: No rank0_refresh operation has been stored yet in the DDRCTRL.

Note: Programming mode: Dynamic.

13.7.85 DDRCTRL software programming control enable register (DDRCTRL_REGS_SWCTL)

Address offset: 0x320

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SW_DONE
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **SW_DONE**: Enable quasi-dynamic register programming outside reset

0: Quasi-dynamic programming enabled. Set back this bit to 1 once programming is done.

Note: Programming mode: Dynamic.

13.7.86 DDRCTRL software programming control status register (DDRCTRL_REGS_SWSTAT)

Address offset: 0x324

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SW_DONE_ACK
															r

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **SW_DONE_ACK**: Register programming done

This bit is the echo of SW_DONE in DDRCTRL_REGS_SWCTL.

Wait for SW_DONE = 1 to propagate to SW_DONE_ACK at the end of the programming sequence. This ensures that the correct register values are propagated to the destination clock domains.

Note: Programming mode: Static.

13.7.87 DDRCTRL statics write enable register (DDRCTRL_REGS_SWCTLSTATIC)

Address offset: 0x328

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SW_STATIC_UNLOCK
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **SW_STATIC_UNLOCK**: Enables static register programming outside reset

1: Static register programming enabled. Set this bit back to 0 once programming is done.

Note: Programming mode: Dynamic.

13.7.88 DDRCTRL AXI poison configuration register (DDRCTRL_REGS_POISONCFG)

Address offset: 0x36C

Reset value: 0x0011 0011

This register is common to all AXI ports.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	RD_POISON_INTR_CLR	Res.	Res.	Res.	RD_POISON_INTR_EN	Res.	Res.	Res.	RD_POISON_SLVERR_EN
							rc_w1				rw				rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	WR_POISON_INTR_CLR	Res.	Res.	Res.	WR_POISON_INTR_EN	Res.	Res.	Res.	WR_POISON_SLVERR_EN
							rc_w1				rw				rw

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **RD_POISON_INTR_CLR**: Interrupt clear for read transaction poisoning
1, 2, or 3 clock cycles for correct value to propagate to the DDRCTRL logic, and to clear the interrupts. The DDRCTRL automatically clears this bit.
Note: Programming mode: Dynamic.

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **RD_POISON_INTR_EN**: Interrupts for read transaction poisoning enable
1: Enable interrupts for read transaction poisoning.
Note: Programming mode: Dynamic.

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **RD_POISON_SLVERR_EN**: SLVERR response for read transaction poisoning enable
1: Enable SLVERR response for read transaction poisoning.
Note: Programming mode: Dynamic.

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **WR_POISON_INTR_CLR**: Interrupt clear for write transaction poisoning
1, 2, or 3 clock cycles for correct value to propagate to the DDRCTRL logic, and to clear the interrupts. The DDRCTRL automatically clears this bit.
Note: Programming mode: Dynamic.

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **WR_POISON_INTR_EN**: Interrupts for write transaction poisoning enable
1: Enable interrupts for write transaction poisoning.
Note: Programming mode: Dynamic.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **WR_POISON_SLVERR_EN**: SLVERR response for write transaction poisoning enable
1: Enable SLVERR response for write transaction poisoning.
Note: Programming mode: Dynamic.

13.7.89 DDRCTRL AXI poison status register (DDRCTRL_REGS_POISONSTAT)

Address offset: 0x370

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RD_POISON_INTR_1	RD_POISON_INTR_0
														r	r

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WR_POISON_INTR_1	WR_POISON_INTR_0
														r	r

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **RD_POISON_INTR_1**: Read transaction poisoning error interrupt for port 1
This bit is an APB clock copy (double register synchronizer) of the interrupt asserted when a transaction is poisoned on the corresponding AXI port read address channel.
The interrupt is cleared by RD_POISON_INTR_CLR in DDRCTRL_REGS_POISONCFG, then the value is propagated to the APB clock.
Note: Programming mode: Dynamic.

Bit 16 **RD_POISON_INTR_0**: Read transaction poisoning error interrupt for port 0
This bit is an APB clock copy (double register synchronizer) of the interrupt asserted when a transaction is poisoned on the corresponding AXI port read address channel.
The interrupt is cleared by RD_POISON_INTR_CLR in DDRCTRL_REGS_POISONCFG, then the value is propagated to the APB clock.
Note: Programming mode: Dynamic.

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **WR_POISON_INTR_1**: Write transaction poisoning error interrupt for port 1
This bit is an APB clock copy (double register synchronizer) of the interrupt asserted when a transaction is poisoned on the corresponding AXI port read address channel.
The interrupt is cleared by WR_POISON_INTR_CLR in DDRCTRL_REGS_POISONCFG, then the value is propagated to the APB clock.
Note: Programming mode: Dynamic.

Bit 0 **WR_POISON_INTR_0**: Write transaction poisoning error interrupt for port 0
This bit is an APB clock copy (double register synchronizer) of the interrupt asserted when a transaction is poisoned on the corresponding AXI port read address channel.
The interrupt is cleared by WR_POISON_INTR_CLR in DDRCTRL_REGS_POISONCFG, then the value is propagated to the APB clock.
Note: Programming mode: Dynamic.

13.7.90 DDRCTRL temperature derate status register (DDRCTRL_REGS_DERATESTAT)

Address offset: 0x3F0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DERATE_TEMP_LIMIT_INTR
															r

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **DERATE_TEMP_LIMIT_INTR**: Derate temperature interrupt
This bit indicates that the LPDDR4 SDRAM temperature operating limit is exceeded. It is set to 1 when the value read from MR4[2:0] is 0b000 or 0b111. This bit is cleared by DERATE_TEMP_LIMIT_INTR_CLR in DDRCTRL_REGS_DERATECTL.
Note: Programming mode: Static.

13.7.91 DDRCTRL port status register (DDRCTRL_MP_PSTAT)

Address offset: 0x3FC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WR_PORT_BUSY_1	WR_PORT_BUSY_0
														r	r

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RD_PORT_BUSY_1	RD_PORT_BUSY_0
														r	r

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **WR_PORT_BUSY_1**: Indicates if there are outstanding writes for AXI port 1.
Note: Programming mode: Dynamic.

Bit 16 **WR_PORT_BUSY_0**: Indicates if there are outstanding writes for AXI port 0.
Note: Programming mode: Dynamic.

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **RD_PORT_BUSY_1**: Indicates if there are outstanding reads for AXI port 1.
Note: Programming mode: Dynamic.

Bit 0 **RD_PORT_BUSY_0**: Indicates if there are outstanding reads for AXI port 0.
Note: Programming mode: Dynamic.

13.7.92 DDRCTRL port common configuration register (DDRCTRL_MP_PCCFG)

Address offset: 0x400

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	BL_EXP_MODE	Res.	Res.	Res.	PAGEMATCH_LIMIT	Res.	Res.	Res.	GO2CRITICAL_EN
							rw				rw				rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **BL_EXP_MODE**: Burst length expansion mode

0: (default value) XPI expands every AXI burst into multiple HIF commands, using the memory burst length as a unit.

1: The XPI uses half of the memory burst length as a unit. This applies to both reads and writes.

When DATA_BUS_WIDTH = 0 in DDRCTRL_REGS_MSTR, setting this bit has no effect. This can be used in order to avoid or minimize t_ccd_l penalty in DDR4, and t_ccd_mw penalty in LPDDR4. Setting this bit is then only recommended for DDR4 or LPDDR4.

If DM_EN = 0 in DDRCTRL_REGS_DBICTL, this functionality is not supported if the DCI (data channel interleave) is enabled.

Note: Programming mode: Static.

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **PAGEMATCH_LIMIT**: Page match four limit

1: Limit to four the number of consecutive same page DDRC transactions that can be granted by the port arbiter, when the page match feature is enabled.

0: No limit imposed on number of consecutive same page DDRC transactions

Note: Programming mode: Static.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **GO2CRITICAL_EN**:

1: (enabled) Set co_gs_go2critical_wr and co_gs_go2critical_lpr/co_gs_go2critical_hpr signals going to DDRC based on urgent input (awurgent, arurgent) coming from AXI master.

0: (disabled) co_gs_go2critical_wr and co_gs_go2critical_lpr/co_gs_go2critical_hpr signals at DDRC are driven to 0.

Note: Programming mode: Static.

13.7.93 DDRCTRL port x configuration read register (DDRCTRL_MP_PCFGR_x)

Address offset: 0x404 + 0xB0 * x, (x = 0 to 1)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RRB_LOCK_THRESHOLD[3:0]				Res.	Res.	Res.	Res.
								rw	rw	rw	rw				

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	RD_PORT_PAGEMATCH_EN	RD_PORT_URGENT_EN	RD_PORT_AGING_EN	Res.	Res.	RD_PORT_PRIORITY[9:0]									
	rw	rw	rw			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:20 **RRB_LOCK_THRESHOLD[3:0]**: Specifies the RRB lock threshold in configurations that disable read data interleaving.

Threshold is specified in terms of the HIF bursts that belong to the same AXI transaction. RRB locks onto VC only when this specified number of HIF bursts are returned by DDRC. RRB lock occurs earlier in cases where the AXI transaction itself is shorter and the total number of corresponding HIF bursts are below the programmed threshold and all of them are returned by DDRC.

When N is programmed in this field, the threshold will be set to N+1 bursts. Max thresholding is up to 16 bursts.

Note: Programming mode: Static.

Bits 19:15 Reserved, must be kept at reset value.

Bit 14 **RD_PORT_PAGEMATCH_EN**: Page match feature enable

1: Enable the page match feature. If enabled, once a requesting port is granted, the port is kept granted if the following immediate commands are to the same memory page (same rank, same bank and same row). See also PAGEMATCH_LIMIT in DDRCTRL_MP_PCCFG.

Note: Programming mode: Static.

Bit 13 **RD_PORT_URGENT_EN**: AXI urgent sideband signal (arurgent) enable

1: Enables arurgent. When enabled and arurgent is asserted by the master, the port becomes the highest priority, and co_gs_go2critical_lpr/co_gs_go2critical_hpr signal to the DDRC is asserted if enabled by GO2CRITICAL_EN in DDRCTRL_MP_PCCFG.

The arurgent signal can be asserted anytime, and as long as required, independently of address handshaking (not associated with any particular command).

Note: Programming mode: Static.

Bit 12 **RD_PORT_AGING_EN**: Aging function for the read channel enable

1: Enable the aging function for the read channel of the port.

Note: Programming mode: Static.

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:0 **RD_PORT_PRIORITY[9:0]**: Initial load value of read aging counters

These counters are loaded in parallel after reset, or after each grant to corresponding port. The aging counters down count every clock cycle where the port requests but is not granted. The higher significant 5 bits of the counter set the priority of the read channel of a given port.

- The port priority increases as the higher significant 5 bits of the counter start to decrease.
- When the aging counter becomes 0, the corresponding port channel has the highest priority level (timeout condition - priority0).
- For multi-port configurations, aging counters cannot be used to set port priorities when external dynamic priority inputs (arqos) are enabled (timeout still applicable).
- For single-port configurations, aging counters are only used when they timeout (become 0) to force read-write direction switching. In this case, external dynamic priority input, arqos (for reads only), can still be used to set the DDRC read priority (two priority levels: low-priority read, LPR, and high-priority read, HPR) on a command-by-command basis.

The two LSBs of this bitfield are tied internally to 0b00.

Note: Programming mode: Static.

13.7.94 DDRCTRL port x configuration write register (DDRCTRL_MP_PCFGW_x)

Address offset: 0x408 + 0xB0 * x, (x = 0 to 1)

Reset value: 0x0000 4000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	WR_PORT_PAGEMATCH_EN	WR_PORT_URGENT_EN	WR_PORT_AGING_EN	Res.	Res.	WR_PORT_PRIORITY[9:0]									
	rw	rw	rw			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **WR_PORT_PAGEMATCH_EN**: Page match feature enable

1: Enable the page match feature. If enabled, once a requesting port is granted, the port is kept granted if the following immediate commands are to the same memory page (same rank, same bank and same row). See also PAGEMATCH_LIMIT in DDRCTRL_MP_PCCFG.

Note: Programming mode: Static.

Bit 13 **WR_PORT_URGENT_EN**: AXI urgent sideband signal (awurgent) enable

1: Enable awurgent. When enabled and awurgent is asserted by the master, the port becomes the highest priority, and co_gs_go2critical_wr signal to DDRC is asserted if enabled by GO2CRITICAL_EN in DDRCTRL_MP_PCCFG.

The awurgent signal can be asserted anytime and as long as required, independently of address handshaking (not associated with any particular command).

Note: Programming mode: Static.

Bit 12 **WR_PORT_AGING_EN**: Aging function enable for the write channel

1: Enable the aging function for the write channel of the port.

Note: Programming mode: Static.

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:0 **WR_PORT_PRIORITY[9:0]**: Initial load value of write aging counters

These counters are loaded in parallel after reset, or after each grant to corresponding port.

The aging counters down count every clock cycle where the port requests but is not granted.

The higher significant 5 bits of the write aging counter set the initial priority of the write channel of a given port.

- The port priority increases as the higher significant 5 bits of the counter start to decrease. When the aging counter becomes 0, the corresponding port channel has the highest priority level.
- For multi-port configurations, aging counters cannot be used to set port priorities when external dynamic priority inputs (awqos) are enabled (timeout still applicable).
- For single-port configurations, aging counters are only used when they timeout (become 0) to force read-write direction switching.

The two LSBs of this bitfield are tied internally to 0b00.

Note: Programming mode: Static.

13.7.95 DDRCTRL port x control register (DDRCTRL_MP_PCTRL_x)

												rw	rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:20 **RQOS_MAP_REGION1[1:0]**: Traffic class of region 1
00: LPR
01: VPR
10 HPR
Note: Programming mode: Quasi-dynamic Group 3.

Bits 19:18 Reserved, must be kept at reset value.

Bits 17:16 **RQOS_MAP_REGION0[1:0]**: Traffic class of region 0
V00: LPR
01: VPR
10 HPR
Note: Programming mode: Quasi-dynamic Group 3.

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **RQOS_MAP_LEVEL1[3:0]**: Separation level1 that gives the end of region 0 mapping
The start of region 0 is 0. Possible values for level1 are 0 to 13 (for dual RAQ), or 0 to 14 (for single RAQ) which corresponds to arqos.
For PA, arqos values are used directly as port priorities, where the higher the value corresponds to higher port priority.
Note: Programming mode: Quasi-dynamic Group 3.

13.7.97 DDRCTRL port x read QoS configuration 1 register (DDRCTRL_MP_PCFGQOS1_x)

Address offset: 0x498 + 0xB0 * x, (x = 0 to 1)

Reset value: 0x0000 0000

						rw	rw			rw	rw			rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	WQOS_MAP_LEVEL2[3:0]				Res.	Res.	Res.	Res.	WQOS_MAP_LEVEL1[3:0]			
				rw	rw	rw	rw					rw	rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **WQOS_MAP_REGION2[1:0]**: Traffic class of region 2
00: NPW
01: VPW
When VPW support is disabled (DDRCTRL_REGS_VPW_EN = 0), and this bitfield is set to 01 (VPW), the VPW traffic is aliased to NPW traffic.
Note: Programming mode: Quasi-dynamic Group 3.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:20 **WQOS_MAP_REGION1[1:0]**: Traffic class of region 1
00: NPW
01: VPW
When VPW support is disabled (DDRCTRL_REGS_VPW_EN = 0), and this bitfield is set to 01 (VPW), the VPW traffic is aliased to NPW traffic.
Note: Programming mode: Quasi-dynamic Group 3.

Bits 19:18 Reserved, must be kept at reset value.

Bits 17:16 **WQOS_MAP_REGION0[1:0]**: Traffic class of region 0
V00: NPW
01: VPW
When VPW support is disabled (DDRCTRL_REGS_VPW_EN = 0), and this bitfield is set to 01 (VPW), the VPW traffic is aliased to NPW traffic.
Note: Programming mode: Quasi-dynamic Group 3.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **WQOS_MAP_LEVEL2[3:0]**: Separation level2 that indicates the end of region 1 mapping
The start of region 1 is (level1 + 1). Possible values for level2 are (level1 + 1) to 14, which corresponds to awqos. Region2 starts from (level2 + 1) up to 15.
For PA, awqos values are used directly as port priorities, where the higher the value corresponds to higher port priority.
WQOS_MAP_LEVEL1 and WQOS_MAP_LEVEL2 must have distinct values.
Note: Programming mode: Quasi-dynamic Group 3.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **WQOS_MAP_LEVEL1[3:0]**: Separation level indicating the end of region 0 mapping
The start of region 0 is 0. Possible values for level1 are 0 to 13 which corresponds to awqos.
For PA, awqos values are used directly as port priorities, where the higher the value corresponds to higher port priority.
WQOS_MAP_LEVEL1 and WQOS_MAP_LEVEL2 must have distinct values.
Note: Programming mode: Quasi-dynamic Group 3.

13.7.99 DDRCTRL port x write QoS configuration 1 register (DDRCTRL_MP_PCFGWQOS1_x)

Address offset: 0x4A0 + 0xB0 * x, (x = 0 to 1)

Reset value: 0x0000 0000

14 DDR physical interface control (DDRPHYC)

Portions Copyright (c) Synopsys, Inc. All rights reserved. Used with permission.

14.1 DDRPHYC features

- 16-bit DDR PHY compatible with JEDEC Standards for DDR4, DDR3L, LPDDR4 SDRAMs
- The DDRPHYC allows operations with SDRAMs narrower than the implemented data width.
- Operating up to 1600 MT/s with LPDDR4
- Operating up to 1600 MT/s with DDR4
- Operating up to 1600 MT/s with DDR3L
- PHY utility block (PUB) to support PHY initialization, control and calibrations
- Dual interface DFI 4.0 compliant interface to the DDRCTRL
- PHY independent, firmware-based training using an embedded calibration processor, based on specialized hardware acceleration engines, and allowing automatic periodic retraining through PHY master interface
- Three inactive idle states: DFI_LP mode (most clocks and delay lines gated), PHY inactive (leakage only), PHY retention (core power removed, most I/Os powered down, SDRAMs held in SR).
- Includes a low-jitter PLL for both PHY and SDRAM clock generation. The PLL can be bypassed to support 50 to 666 MT/s.
- Test support: BIST with at-speed loopback testing, MUX-scan ATPG (stuck-at SCAN), RX and TX asynchronous paths support a maximum bit rate of 400 Mbit/s (200 MHz), PLL lock and ZQ calibration test
- Programmable output and ODT impedance with dynamic PVT compensation

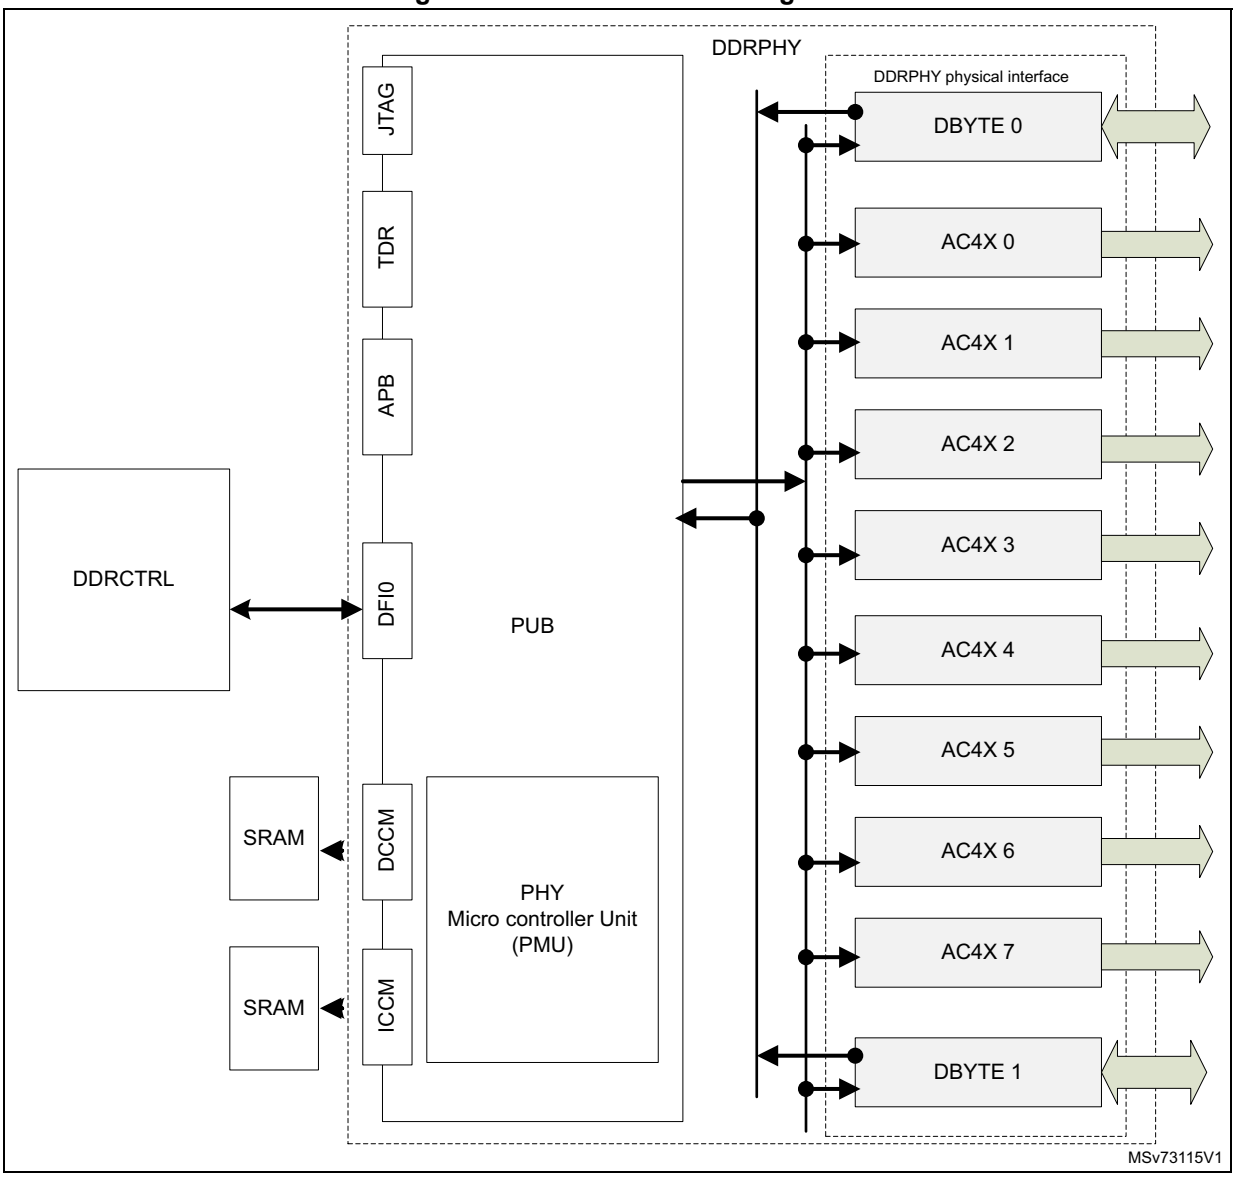
14.2 DDRPHYC block diagram

The DDRPHYC block diagram is shown in *Figure 40*.

The DDRPHYC is composed of:

- a DDRPHY physical interface
- a PUB which is used to service the PHY. It is controlled via the APB and JTAG interfaces. This PUB embeds a microcontroller as training engine, and interfaces with a local coupled memory for training firmware and data.

Figure 40. DDRPHYC block diagram



14.3 DDRPHYC SDRAM interface

The DDRPHYC SDRAM interfaces are listed in the table below.

Table 60. Function of DDRPHYC pins versus DDR protocol

Pin name	Pin function according to protocol			Comment

1. For observation only.

14.4 DDRPHY functional overview

The DDRPHY includes the following components:

- MASTER: contains the PLL, as well as observation and debug signals
- ACX4: responsible for the address and command bus
- DBYTE: responsible for the DQ bus data transfers and timing

14.4.1 MASTER

The MASTER block contains the PLL, the primary voltage reference, thermal calibration, reset, and I/O cells for test and control.

- PLL

  The PLL takes the DFICLK (generated from the RCC PLL2) as an input, and creates an internal clock by quadrupling the DFICLK frequency. The PLL in the MASTER can only multiply the input clock frequency to produce an output clock that is four times the frequency of the input clock. The internal clock is the output of the MASTER to the ACX4 and DBYTE.PLL. Control signals are controlled through registers in the PUB.

- Calibration

  The MASTER contains the analog blocks to perform output drive and input termination impedance calibration. Using a digital control state machine, located in the PUB, the full mixed-signal calibration loop matches the impedance of the driver and termination with the impedance of an external precision resistor. The resulting digital calibration code is fed to the address/command, DQ, and DQS blocks to control their impedance.

- Reset

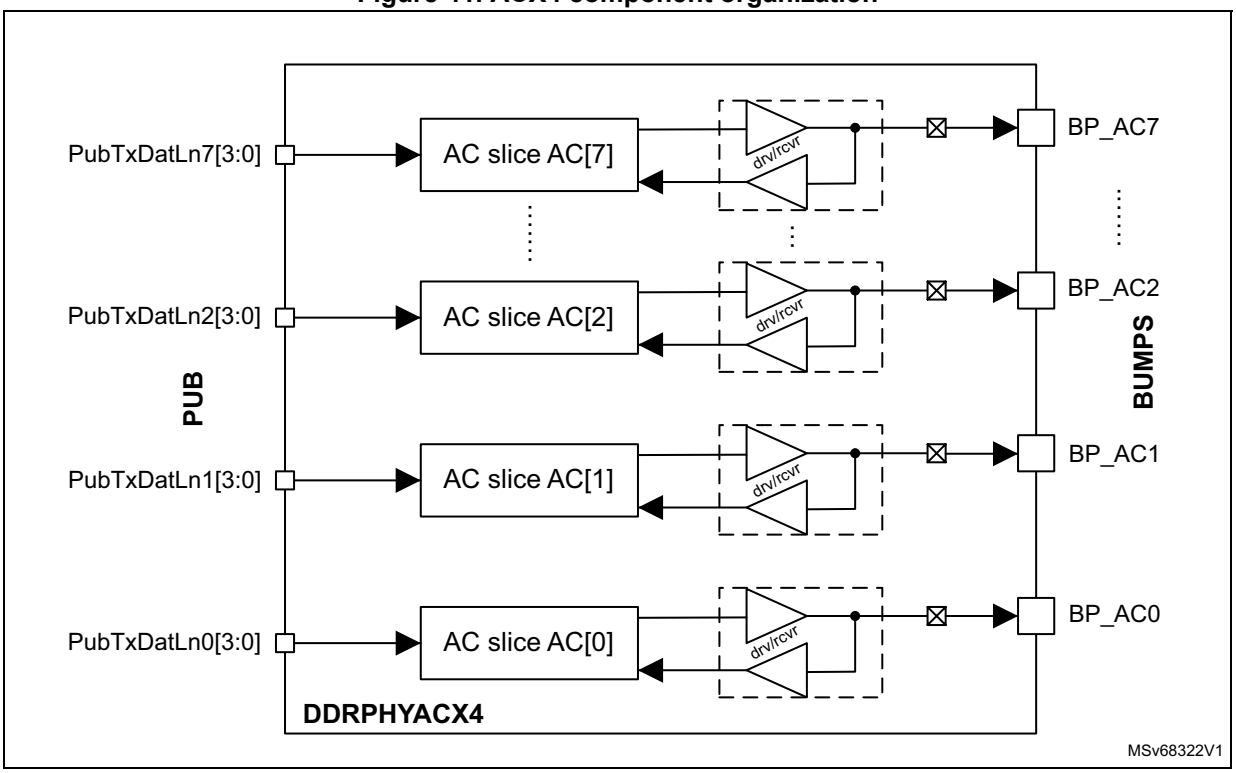
The reset takes the asynchronous reset pin, the PwrOk pin, and dfi_reset_n signal, combines them, and synchronizes to the DFI clock. This is used by ACX4 and DBYTE.

14.4.2 ACX4

The DDR SDRAM address/command PHY (ACX4) provides an address and command interface to the external SDRAM memories. *Figure 41* shows the organization of the ACX4.

The address/command (AC) consists of multiple design slices. The AC slice is used for all address and command and clk/cs/odt signals. Each slice contains all logic required for both output (address/command) and input (loopback) paths of the respective signals.
This configuration of DDRPHYC uses eight ACX4 macros

Figure 41. ACX4 component organization



14.4.3 DBYTE

The DDR SDRAM data PHY (DBYTE) provides data interface to one byte and matching strobe of an external SDRAM memory.

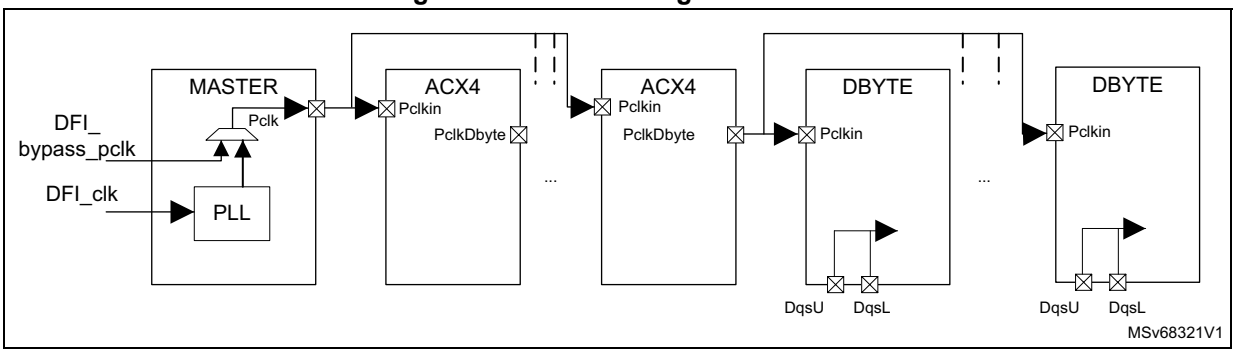
On the writing path, the controlled data pipeline logic inside the DBYTE slice converts the DFI-rate signals from the PUB to double-data rate (DDR) signals going to the SDRAM.

On the reading path, the read data from the SDRAM is written using the DQS clock into a four-deep asynchronous FIFO that is implemented inside the DQ slice, and read using the controller clock. A per-bit delay line at the input of the DQ slice is used to optionally deskew the read data with respect to the read strobe in order to maximize the read data eye.

14.4.4 PHY clocking

Figure 42 presents the PHY clocking distribution. The main input clock is the DFI clock, coming from the DDRSS PLL2 (configured through RCC dedicated registers).
In the MASTER, the embedded PLL multiplies the DFI clock by four, and is fed to ACX4 and DBYTE macros.

Figure 42. PHY clocking distribution



Only one side of the MASTER Pclk tree is represented. The MASTER feeds the clock to the ACX4 on both sides. Only the ACX4 closest to each DBYTE on each side feeds the clock to the DBYTE. All other PClkDbyte are left unconnected.

Note: For a data transfer less than 600 MT/s, the MASTER inner PLL can be bypassed. In this case, the clock coming from the DFI_Bypass_pclk is fed to the ACX4, and then to the DBYTE. A specific register in the DDRSS registers must be enabled for this purpose.

14.4.5 PUB (PHY utility block)

The PUB provides control and configuration for all the PHY hard macros (MASTER, 8x ACX4, 2x DBYTE). It handles the following functions for the PHY:

- driving initialization sequences
- providing all training functions
- implementing the DFI protocol
- managing the low power states
- implementing registers and a register access bus

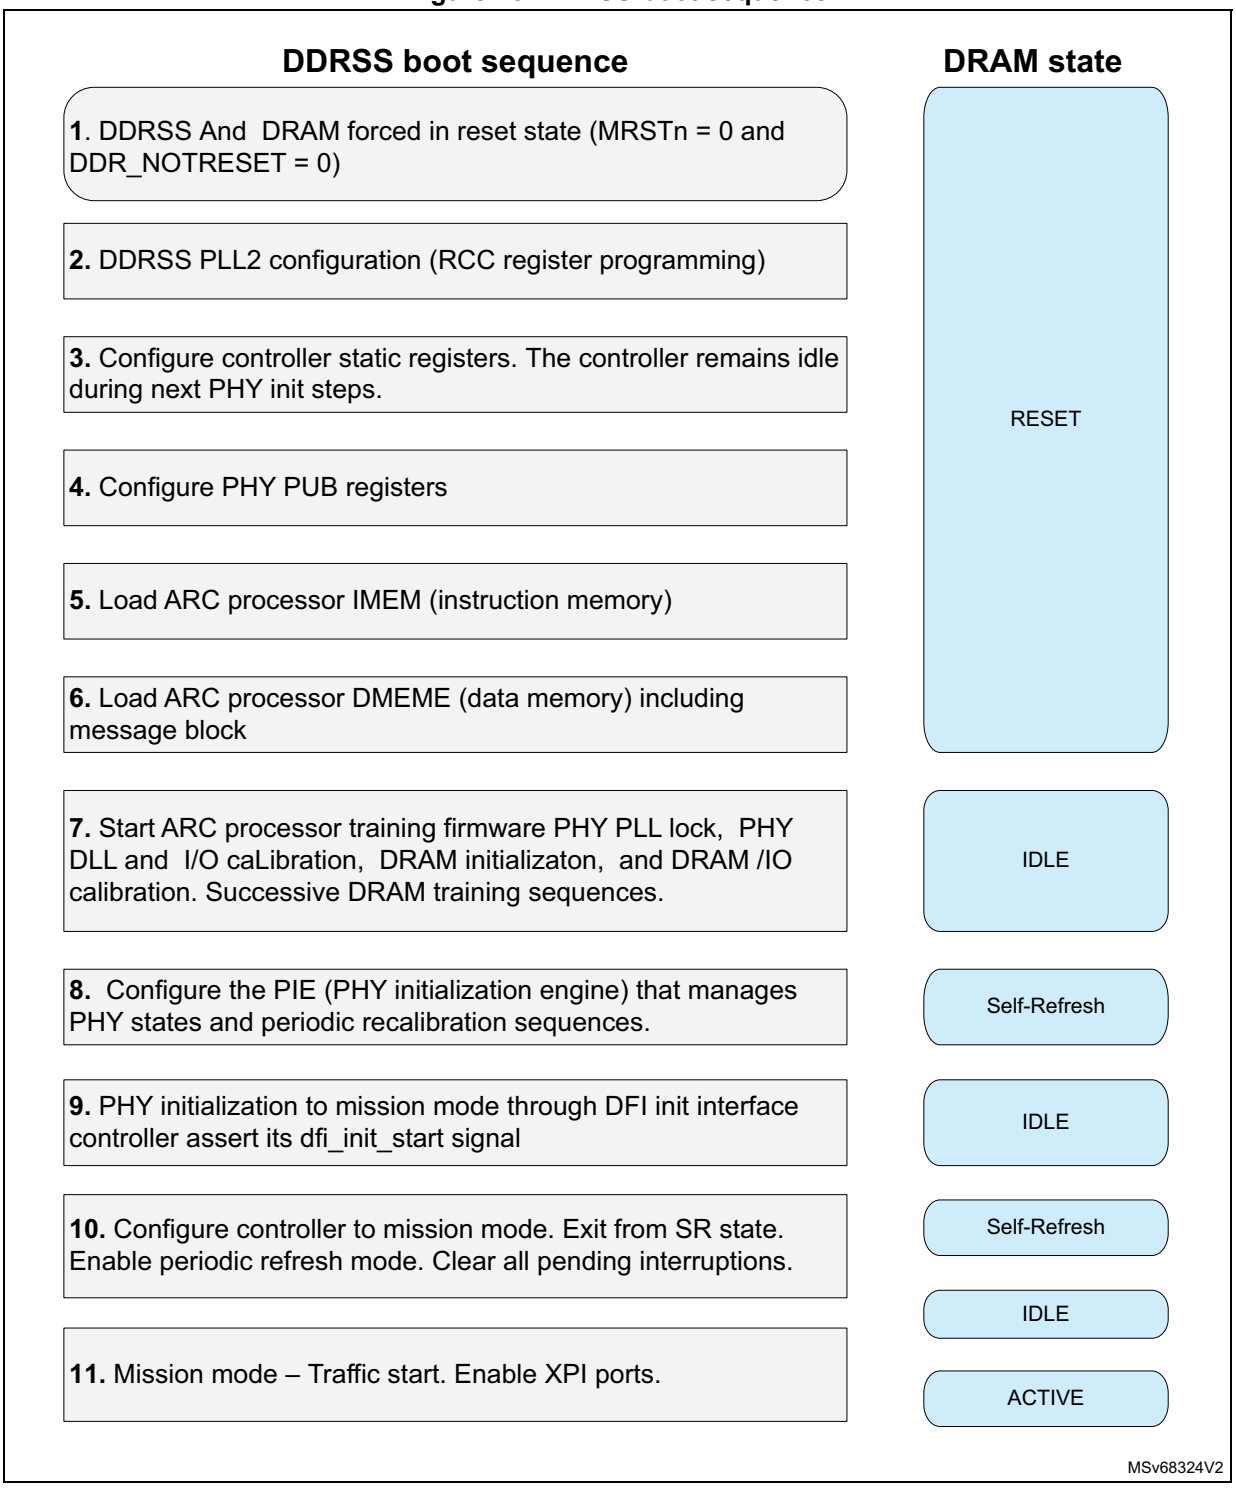
The PUB supports a DFI 4.0 interface with the DDRCTRL. Its registers are accessible through an APB interface. It also provides a JTAG interface for test purposes.

The PUB includes a programmable microcontroller unit (PMU) to support the training. Once the PHY is initialized and the firmware is loaded in the IMEM and DMEM, the PMU executes the training firmware, and is then shutdown.

14.4.6 PHY and SDRAM initialization

The figure below presents the initialization flow for the whole DDRSS.

Figure 43. DDRSS boot sequence



Details on the boot sequence are the following:

1. Bring up the power: power supplies can come up and stabilize in any order.
2. Through RCC registers, program the PLL2 to the desired frequency, and wait for the PLL to be locked. Meanwhile, DDRCTRL and DDRPHYC are kept under reset.
3. Configure the controller static registers: once the controller is configured, its XPI ports remain disabled while the DDRPHYC initialization and training is not completed.
4. Configure the PUB registers.
5. Load the PMU instruction memory: before the PHY training firmware can be run, the firmware program image must be loaded into the instruction memory SRAM. This is provided by the STM32CubeMx tool. After this stage, the PHY clock frequency (PLL2 setting through the RCC registers) must run at the desired frequency.
6. Load the PMU data memory (DMEM). In order to run the firmware, some information must be given about the system, the memory configuration, and the memory training steps to run.
7. Start the PMU training firmware: the training firmware can now be run. It configures the PHY PLL, calibrates the PHY DLL and I/Os, initializes the DRAM and calibrates DRAM I/Os, and runs the successive SDRAM training stages, depending on the SDRAM connected.
8. Once the firmware training is completed, the PMU is shutdown, and the retraining is performed by the PHY init engine. The PIE also manages the PHY state. Hence PIE registers must be written. Meanwhile the SDRAM is in SR.
9. PHY initialization to the mission mode: the controller sets the PHY into the mission mode through the DFI interface (dfi_init_start signal).
10. Configure the controller to the mission mode: gets the controller out of SR, and enables the periodic refresh. Clears all pending interruptions generated during the training (if any).
11. The DDRSS is ready to the mission mode: enables the controller AXI ports.

14.4.7 DRAM initialization sequence

This section describes the successive steps to initialize the DRAM. All training steps are common to LPDDR4, DDR4, DDR3, except the command address training (*Section 14.4.9*) which is only for LPDDR4.

The DDR initialization sequence is provided by the STM32CubeMx: the training firmware, including data and sequence is provided by the STM32CubeMx according to configuration input from the user. The explanations hereafter provide details to help understanding the initialization sequence, but the different steps of the sequence are abstracted to the user through the STM32CubeMx.

The DDRPHYC training sequence must be performed in the order described in this section. The proper operation is not guaranteed if any training stages are skipped or executed out of sequence. Each subsequent step is dependent on the DDRPHYC register values, internal states, and configurations (of both the DDRPHYC and the DRAMs) that are set during prior steps. Stopping and resuming training is not supported. The reconfiguration of the DDRPHYC or DRAM between, or during, training steps is not supported. The violation of any of these requirements may result in an inoperable memory system.

14.4.8 Device initialization

The device initialization performs the basic initialization of the DDRPHYC and DRAM that is required before any training stage is run. The initialization includes tasks such as locking the internal PLL and DLLs to the current input clock, and calculates the parameters to accelerate future lock operations, resetting the DRAMS, and writing the appropriate mode registers (MR). The training may modify the initial MRs from the values provided in the message block to avoid putting the DRAMs into an untrainable state.

14.4.9 Command address (CA) training

This step is only for LPDDR4.

During the CA training, the DRAM is put into a mode where the command/address lines are sampled and fed back on the DQ lines. A series of bit patterns are sent with varying timing to determine the valid delay range for each bit. The timing is then set to the optimal value for each bit.

This step compensates for the differences between CK signals and command/address signals to the DRAM devices.

A single delay for each ANIB is calculated by finding the time where all bits of each ANIB are sampled correctly at each device, and changing the delay of the ANIB signals to place the middle of this region as close to the edge of the clock used to capture the values.

Note: The LPDDR4 specification requires that the DRAM uses a slower frequency clock prior to training the command bus. The DDRPHYC has dedicated circuits to generate a divided down clock that is designed to meet these requirements, without the user having to change the input clock to the DDRPHYC.

14.4.10 Read gate training

The goal of read gate training (RxEn training) is to determine the round-trip latency, including RCAS latency, between the DDRPHYC and the DRAM. The round-trip latency must be known so that the DDRPHYC receivers are activated by the read gate at the right time in order to capture the full burst of read data. All DBYTE instances can be trained in parallel, but each rank must be trained independently.

This step compensates the delay for the read command to reach each DRAM, and to have the DQS pulse for the read return to the DDRPHYC. This delay does include all DRAM DQS related parameters such as t_{DQSCK}. This delay does not include the read CAS latency, which is known ahead of time.

A delay is calculated for each nibble of each DBYTE to each timing group by finding the time of the first rising edge of DQS for each timing group, and changing the delay of the RxEnb to place it as close to the middle of the DQS preamble as possible.

14.4.11 Write leveling fine phase training

The write leveling fine grain phase is performed first.

The goal of write leveling fine phase training is to align DQS rising edge with the MEMCLK rising edge at each DRAM device. The write leveling fine phase training is required to compensate for any analog phase differences between MEMCLK and DQS distribution.

This fine training ensures that the edges are aligned correctly, but not necessarily at the correct WCAS latency. The coarse part of the write leveling training calculates the delay to

ensure the edges aligned with the correct WCAS latency. See JEDEC specifications for example timing diagrams.

This step compensates for the phase difference between the CK signal and the DQS at each DRAM. A delay is calculated for each DBYTE to each timing group by using the write leveling mode of DRAMs to place the DQS rising edge as close as possible to the CK rising edge.

14.4.12 Read deskew

The read DQ deskew training compensates for the delay differences, primarily caused by board routing and DRAM DQ output skew, among the DQ lanes during reads. The read deskew must not be skipped in silicon, even on systems without much skew between lanes. The failure to run read deskew can cause part of the read-eye to be missed by later stages, leading to non-optimal results.

The read deskew training is implemented by using per lane delays to align the beginnings of the passing regions for each nibble. Because the read enable and write leveling are completed, the read deskew can send simple writes and reads to the devices to collect data on the skews, such as using MPR pattern as 0xB2B2. The firmware sets up the chosen pattern, forces the receive clock delay to 0, and then runs an in-phase left search, to find the largest passing per-lane delays for every lane. Any nibble, which lanes all succeed in finding a left edge, has all per-lane delays recorded while the failing lanes continue to try incrementally a larger receive clock delay, extending the search range, until every nibble finds a working set of per-lane delays.

This step compensates for the delay difference between DQ signals from each DRAM, and ensures the full receive-eye exists at positive rxclkdlys. A delay is calculated for each signal in each DBYTE from each timing group to align all the DQ signals with each other as close as possible.

14.4.13 Read 1D (SI friendly) training

The read 1D fine training is done so that reads can be trained to work and perform further training to properly train the write operations. The result of this training is not guaranteed to be optimal but is guaranteed to work well enough to perform the write training.

Once the write training is complete, the read DQ/DQS timing can be optimized further with longer more complex patterns to a final trained position. The firmware implements this step of training by programming a pattern into an MPR, then running an automatic eye search using the read clock delay. The results of the automatic eye search are then used to write the read clock delay values to their eye midpoints.

This step compensates for the delay difference between the DQ and the DQS signals from each DRAM device. This step also moves the sampling edge of DQS to the center of the DQ eye. A delay is calculated for the upper and lower nibble of each DBYTE separately by calculating the compound eye for all signals in each nibble and centering the sampling edge of DQS in this eye.

14.4.14 Write leveling coarse delay training

The TX DQS is phase-aligned to MEMCLK during the write leveling fine phase training (*Section 14.4.11*), but the TX DQS latency may not match the CAS write latency.
As the TX DQS delay is already phase-aligned, it can be incorrect by some integer multiple of MEMCLK periods.

During initialization, the course search calculates an educated guess for the delay between the transmitted DQS and DQ signals. This delay works for writes but is not delay margin optimized. The coarse search writes a relatively slow square wave to the rank being trained and then reads back the values. The DDRPHYC generates extra DQS pulses to ensure that DRAMs see enough DQS pulses during the time of the write even if the timing is off.

Any error in the comparisons between what is written to the DRAM and what is read out can be attributed to a coarse offset between DQS and MEMCLK signals. The firmware adds to the DQS delay currently set, and reruns the square wave write/read sequence to check if the new delay has fixed the errors. The firmware continues to loop, adding delay, until the data comes back without issue. If all reasonable delay settings fail to return the data as it was written, the firmware terminates the training. The delays start to be unreasonable around the 20 UI mark. Such a large delay likely means something has gone wrong.

This step compensates for the delay difference between the CK signal and the DQS at each DRAM. A delay is calculated for each DBYTE to each timing group by using the write leveling mode of the DRAMs to place the rising edge of DQS as close as possible to the rising edge of CK.

14.4.15 Write 1D training

At this point, the user can safely read back arbitrary data from DRAM, even if the read training is not perfectly centered on the read eye. The objective of this training is to center the write DQ timing in the write DQS eye (write DQS timing is set in the write leveling steps). The DDRPHYC has per-lane write DQ adjustment, allowing all the lanes to simultaneously train to their own value.

The write DQ/DQS delay center training is implemented by an automatic eye search that varies the delay on the write DQ signals. Once the automatic eye search has completed, the resulting eye mid-points are written to the DQ delay DDRPHYC register.

This step compensates for the delay difference between DQ and DQS signals to each DRAM. This step also moves the center of each DQ eye to sampling edge of DQS.

14.4.16 Read 1D training (optimized delay centering)

This training stage is almost the same as the read 1D (SI friendly) (*Section 14.4.13*) delay centering presented above but using longer more complex data patterns known as PRBS patterns. The complex PRBS patterns are used to obtain a more accurate estimate of the mission mode eye and to optimize the DQS position for electrically stressful patterns. Like the write DQ/DQS delay centering, all lanes are trained in parallel, but each nibble shares a common read delay setting. If read DBI is enabled the DBI lanes are trained at the same time as the DQ lanes.

This step compensates for the delay difference between DQ and DQS signals from each DRAM. This step also moves the sampling edge of DQS to the center of the DQ eye.
A delay is calculated the upper and lower nibble of each DBYTE separately by calculating the compound eye for all signals in each nibble and centering the sampling edge of DQS in this eye.

14.4.17 Max read latency training

When reading data from the DRAMs, the received data is temporarily buffered in an internal receive data FIFO. After a short period, called the read latency, the data in the FIFO is

guaranteed to be valid. The read latency training stage finds the smallest read latency that works for all FIFOS in the DDRPHYC, limiting the system memory latency.

The training is done by setting the read latency very low, then incrementing it while repeatedly performing reads. Most of these reads fail because the read latency is too small. As the read latency approaches the minimum correct value, the reads on some bytes begins to pass. Once the read passes on all bytes, the firmware stops searching, and adds an offset passed in through the message block field “DFIMRLMargin”. By default, the DDRPHYC trains all max read latency to the same value, ensuring all data are aligned on the DFI.

14.5 DDRPHYC registers

14.5.1 DDRPHYC MtestMuxSel register (DDRPHYC_ANIBx_MTESTMUXSEL)

Address offset: 0x068 + 0x4000 * x, (x = 0 to 7)

Reset value: 0x0000 0000

Digital observation pin control

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MTESTMUXSEL[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **MTESTMUXSEL[5:0]**:

Controls for the 64-1 mux for asynchronous data to the digital observation pin.
0x0: Drives 0 from this chiplet (allows flat OR of pass-through information).
0x01 to 0x1F: Selects local data from AC, DBYTE, and MASTER macros.
0x20: Drives 0 from PUB synthesized logic path into mux.
0x21 to 0x3F: Selects local data from PUB AC, DBYTE, and MASTER synthesized logic.
Others: Reserved

14.5.2 DDRPHYC AForceDrvCont register (DDRPHYC_ANIBx_AFORCEDRVCONT)

Address offset: 0x09C + 0x4000 * x, (x = 0 to 7)

Reset value: 0x0000 0000

Force address/command driven (lanes A3-A0)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:8 **ATXPREDRVMODE[2:0]**:
Controls predrivers to adjust timing of turn-on/-off of pull-up/-down segments.
- Recommended settings if the ANIB drives CK pins:
DDR3 = 000
DDR4 = 000
LPDDR4 = 001
- Recommended settings if the ANIB does not drive CK pins:
DDR3 = 011
DDR4 = 011
LPDDR4 = 001

Bits 7:4 **ATXPREN[3:0]**: 4-bit binary trim for the driver pull-down slew rate
0000 has a slower slew rate than 1111.

Bits 3:0 **ATXPREP[3:0]**: 4-bit binary trim for the driver pull-up slew rate
0000 has a slower slew rate than 1111.

14.5.7 DDRPHYC ATestPrbsErrCnt register (DDRPHYC_ANIBx_ATESTPRBSERRCNT)

Address offset: 0x158 + 0x4000 * x, (x = 0 to 7)

Reset value: 0xXXXX XXXX

Address loopback test result

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ATXDLY[6:0]						
									rw	rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:0 **ATXDLY[6:0]**: Trained for LPDDR4 to generate timed address and command signals to the DRAMs (per ACX4)
For DDR3/DDR4, it is recommended that ACX4 address and commands have its ATxDly configured to 0x0. The four signals generated by an ACX4 have a common timing.
Bit[6]: Coarse delay (one unit of delay is 1 UI).
Bit[5]: Reserved.
Bit[4:0]: Fine delay (one unit of delay is one-thirty second of a UI = UI/32).

Note: The target ACX4 used for the memory clock generation must have its ATxDly configured to 0x0.

14.5.9 DDRPHYC DBYTE module disable register (DDRPHYC_DBYTEx_DBYTEMISCMODE)

Address offset: 0x40000 + 0x4000 * x, (x = 0 to 1)

Reset value: 0x0000 0000

Controls the DBYTE enable/disable state.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:7 **GAINCURRADJ[4:0]**:
Adjusts gain current of RX amplifier stage. It is recommended to use default values for this bitfield.

Bits 6:4 **MAJORMODEDBYTE[2:0]**: Selection of the major mode of operation for the receiver
These settings are determined by PHY configuration based on DRAM protocol.
000: Input signal is terminated/referenced to $V_{DDQ}/2$ (or unterminated).
010: Input signal is terminated/referenced to V_{SSQ}.
011: Input signal is terminated/referenced to V_{DDQ}.
Other: Reserved

Bits 3:2 **DFECTRL[1:0]**:
00: DFE off
01: DFE on
10: Train DFE0 amplifier
11: Train DFE1 amplifier
Note: These settings are determined by PHY training firmware, and must not be overridden.

Bit 1 **EXTVREFRANGE**: Extends the range available in the local per-bit VREF generator.

Bit 0 **SELANALOGVREF**:
Setting this bit forces the local per-bit V_{REF} generator to pass the global VREFA to the samplers.

14.5.15 DDRPHYC DQ/DQS receiver control register (DDRPHYC_DBYTEx_DQDQSRCVCNTRL1)

Address offset: 0x40128 + 0x4000 * x, (x = 0 to 1)

Reset value: 0x0000 0400

Various controls of Rx DQS and Rx DQ cells.

				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **ENLPREQPDR**: not used

Bit 10 **RXPADSTANDBYEN**: Enables rxdq/rxdqs Standby power savings, per pad-group.

Bit 9 **POWERDOWNRCVRDQS**: Active high signal which powers down the receiver
After this bit is deasserted, the receiver cannot be used for a minimum of 100 ns.
This control powers down both upper and lower DQS receivers.
If X4TG = 0x0 in DDRPHYC_MASTER0_MASTERX4CONFIG, the upper DQS receiver is powered down.

Bits 8:0 **POWERDOWNRCVR[8:0]**: Active high signal which powers down the receiver
After this bitfield is deasserted, the receiver cannot be used for a minimum of 100 ns.
7:0 -> dq[7:0]
8 -> dbi

14.5.16 DDRPHYC DQ/DQS receiver control register (DDRPHYC_DBYTEx_DQDQSRCVCNTRL2)

Address offset: 0x40130 + 0x4000 * x, (x = 0 to 1)

Reset value: 0x0000 0000

Control for an aggressive power-saving feature to power down DQ and DQS receiver cells dynamically.

14.5.18 DDRPHYC status of RX FIFO consistency checks register (DDRPHYC_DBYTEx_RXFIFOCHECKSTATUS)

Address offset: 0x40158 + 0x4000 * x, (x = 0 to 1)

Reset value: 0xXXXX XXXX

When a PhyRxFifoCheck interrupt is posted, these bits indicate which pair of FIFO pointers do not match as expected. The non-zero pointer values can be read from DDRPHYC_DBYTEx_RXFIFOCHECKERRVALUES. Setting PHYRXFIFOCHECKCLR in DDRPHYC_MASTER0_PHYINTERRUPTCLEAR clears these bits.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RXFIFOLOCUERR	RXFIFOLOCERR
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **RXFIFOLOCUERR**:
If this bit is set, the read pointer (DFI side) on the read FIFO associated with data bits [7:4] did not match. The write pointer (DQS side) on the read FIFO associated with data bits [7:4].

Bit 0 **RXFIFOLOCERR**:
If this bit is set, the read pointer (DFI side) on the read FIFO associated with data bits [3:0] did not match. The write pointer (DQS side) on the read FIFO associated with data bits [3:0].

14.5.19 DDRPHYC captured values associated with an RxFIFO consistency error register (DDRPHYC_DBYTEx_RXFIFOCHECKERRVALUES)

Address offset: 0x4015C + 0x4000 * x, (x = 0 to 1)

Reset value: 0xXXXX XXXX

Contains the value of the FIFO pointer for the first mismatch captured in DDRPHYC_DBYTEx_RXFIFOCHECKSTATUS. Setting PHYRXFIFOCHECKCLR in DDRPHYC_MASTER0_PHYINTERRUPTCLEAR clears these bits.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **RXFIFOWRLOCU[3:0]**: Mission mode write pointer of the upper-nibble Rx FIFO

Bits 11:8 **RXFIFORDLOCU[3:0]**: Mission mode read pointer of the upper-nibble Rx FIFO

Bits 7:4 **RXFIFOWRLOC[3:0]**: Mission mode write pointer of the lower-nibble Rx FIFO

Bits 3:0 **RXFIFORDLOC[3:0]**: Mission mode read pointer of the lower-nibble Rx FIFO

14.5.21 DDRPHYC Rx FIFO visibility register (DDRPHYC_DBYTEx_RXFIFOVISIBILITY)

Address offset: 0x40164 + 0x4000 * x, (x = 0 to 1)

Reset value: 0x0000 0000

Allows the contents of the data Rx FIFO to be read via RXFIFOCONTENTSDBI, RXFIFOCONTENTSDQ7654, RXFIFOCONTENTSDQ3210 bitfields. The FIFO must be quiescent (no actual operations in progress, while reading the FIFO): read from the Rx FIFO must be after the max-read-latency (DFIMRL) time.

Procedure to read the contents of the entire Rx FIFO:

1. Wait for any outstanding reads to complete (min 2*DFIMRL MemClks).
2. Read and store RXFIFOWRLOC[3:0] and RXFIFOWRLOCU[3:0] (must be equal).
3. Perform four BL8 memory reads.
4. Wait at least 2 * DFIMRL MemClks.
5. For (INIB = 0, INIB < 8, INIB++) - [
   a) MYRDPTR[2:0] = (stored RXFIFOWRLOC[3:0]>>1) + INIB (can wrap 7 to 0)
   b) Write addr = RXFIFOVISIBILITY, data = [RXFIFORDEN = 0, RXFIFORDPTROVR = 1, RXFIFORDPTR = myRdPtr]
   c) Write addr = RXFIFOVISIBILITY, data = [RXFIFORDEN = 1, RXFIFORDPTROVR = 1,RXFIFORDPTR = myRdPtr].
   d) Write addr = RXFIFOVISIBILITY, data = [RXFIFORDEN = 0, RXFIFORDPTROVR = 1, RXFIFORDPTR = myRdPtr].
   e) Wait for 8 DfiClk.
   f) Read addr = RXFIFOCONTENTSDBI.
   g) Read addr = RXFIFOCONTENTSDQ7654.
   h) Read addr = RXFIFOCONTENTSDQ3210.
   i) Unpack/align resulting data as described in descriptions of RXFIFOCONTENTS registers, and map according to the configuration of Dq<7..0>LnSel[2:0]. -].
6. Evaluate/compare with data that travels through normal read path (dfi_read_data_dbi,dfi_read_data).
7. Write [RXFIFORDEN = 0, RXFIFORDPTROVR = 0, RXFIFORDPTR = 0].
8. PHY is now available for normal mission-mode operation.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RXFIFORDEN	RXFIFORDPTROVR	RXFIFORDPTR[2:0]		
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **RXFIFORDEN**:

Pulse [set 0-->1-->0] this bit to capture the FIFO contents.

Bit 3 **RXFIFORDPTROVR**:

This bit is programmable as follows:

0: Normal operation - Mission mode read pointer is enabled.

1: Override - Control of the Rx FIFO read pointer is ceded to this bit.

Bits 2:0 **RXFIFORDPTR[2:0]**:

If RXFIFORDPTROVR is set, this bitfield selects the Rx FIFO entry. This bitfield addresses 4-bit units of the 8x4b (32 entry) FIFO:
rdfifo_nibble_address[2:0] = RXFIFORDPTR[2:0].
For example, RXFIFORDPTR[2:0] = 2 enables reading bit-entries 11..8.
The exact location of read data depends on the prior history of reads and PHY initialization.

14.5.22 DDRPHYC Rx FIFO content DQ321x register (DDRPHYC_DBYTEx_RXFIFOCONTENTSDQ3210)

Address offset: 0x40168 + 0x4000 * x, (x = 0 to 1)

Reset value: 0xXXXX XXXX

Rx FIFO contents, lane[3:0].

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **RXFIFOCONTENTSDQ3210[15:0]**: Window into the contents of the Rx FIFO, as controlled by RXFIFOVISIBILITY.

This bitfield reads 4 bits at a time from lane0..3, from the four FIFO entries addressed by rdfifo_nibble_address[2:0] = RXFIFORDPTR[2:0].
[15:12] = [lane3_ui3,lane3_ui2,lane3_ui1,lane3_ui0] where ui0 is the first occurring bit
[11: 8] = [lane2_ui3,lane2_ui2,lane2_ui1,lane2_ui0]
[7: 4] = [lane1_ui3,lane1_ui2,lane1_ui1,lane1_ui0]
[3: 0] = [lane0_ui3,lane0_ui2,lane0_ui1,lane0_ui0]

Note: The DBYTE lane of a given index is not the same as a memory DQ of the same index unless the Dq<7..0>LnSel[2:0] have their default/reset value.

14.5.23 DDRPHYC Rx FIFO content DQ7654 register (DDRPHYC_DBYTEx_RXFIFOCONTENTSDQ7654)

Address offset: 0x4016C + 0x4000 * x, (x = 0 to 1)

Reset value: 0xXXXX XXXX

Rx FIFO contents, lane[7:4].

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **RXFIFOCONTENTSDQ7654[15:0]**: Window into the contents of the Rx FIFO as controlled by RXFIFOVISIBILITY.

This bitfield reads 4 bits at a time from lane4..7 from the four FIFO entries addressed by rdfifo_nibble_address[2:0] = RXFIFORDPTR[2:0].
[15:12] = [lane7_ui3,lane7_ui2,lane7_ui1,lane7_ui0]
[11: 8] = [lane6_ui3,lane6_ui2,lane6_ui1,lane6_ui0]
[7: 4] = [lane5_ui3,lane5_ui2,lane5_ui1,lane5_ui0]
[3: 0] = [lane4_ui3,lane4_ui2,lane4_ui1,lane4_ui0]

Note: The DBYTE lane of a given index is not the same as a memory DQ of the same index unless the Dq<7..0>LnSel[2:0] have their default/reset value.

14.5.24 DDRPHYC Rx FIFO content DBI register (DDRPHYC_DBYTEx_RXFIFOCONTENTSDBI)

Address offset: 0x40170 + 0x4000 * x, (x = 0 to 1)

Reset value: 0xXXXX XXXX

Rx FIFO contents, DBI.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RXFIFOCONTENTSDBI[3:0]			
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **RXFIFOCONTENTSDBI[3:0]**: Window into the contents of the Rx FIFO, as controlled by RXFIFOVISIBILITY.

This bitfield reads 4 bits at a time from DBI, from the four FIFO entries addressed by rdfifo_nibble_address[2:0] = RXFIFORDPTR[2:0].
[3: 0] = [dbi_ui3,dbi_ui2,dbi_ui1,dbi_ui0]

Note: The DBYTE DBI lane is the same as the memory DBI; it is not subject to mapping using Dq<7..0>LnSel[2:0] as the DQ are.

14.5.25 DDRPHYC Tx slew rate controls register (DDRPHYC_DBYTEx_TXSLEWRATE_By)

Address offset: 0x4017C + 0x4000 * x + 0x400 * y, (x = 0 to 1; y = 0 to 1)

Reset value: 0x0000 07FF

Controls slew rates of DQ/DQS drivers per nibble. Tx predriver cal trims driver timing to account for clock duty cycle variation.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:8 **TXPREDRVMODE[2:0]**:
Controls predrivers to adjust timing of turn-on and turn-off of pull-up and pull-down segments.
Recommended settings:
- DDR3 = 011
- DDR4 = 010
- LPDDR4 = 001

Bits 7:4 **TXPREN[3:0]**: 4-bit binary trim for the driver pull -own slew rate
0000 has a slower slew rate than 1111.

Bits 3:0 **TXPREP[3:0]**: 4-bit binary trim for the driver pull-up slew rate
0000 has a slower slew rate than 1111.

14.5.26 DDRPHYC RxPBDlyTgx_r0 register (DDRPHYC_DBYTEx_RXPBDLYTG0_Ry)

Address offset: 0x401A0 + 0x4000 * x + 0x400 * y, (x = 0 to 1; y=0 to 8)

Reset value: 0x0000 0000

Read DQ per-bit BDL delay (timing group 0).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

									rw	rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:0 **RXPBDLYTG0_R0[6:0]**: Read DQ per-bit BDL delay (timing group 0)

Trained to deskew the read DQ data that are sampled by the incoming per-nibble read DQS, to improve the composite eye. The unit of change is an LSB in the control of the delay circuit, and is not denominated in units of UI.

Note: Timing group 0 = RANK0.

14.5.27 DDRPHYC RxPBDlyTg1_rx register (DDRPHYC_DBYTEx_RXPBDLYTG1_Ry)

Address offset: 0x401A4 + 0x4000 * x + 0x400 * y, (x = 0 to 1; y = 0 to 8)

Reset value: 0x0000 0000

Read DQ per-bit BDL delay (timing group 1).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **RXENDLYTG0_U0[10:0]**: Trained receive enable delay (timing group 0)
Trained to set the delay from the memory-read command to the signal enabling the read DQS to generate read-data strobes. The trained read DQS enable asserts during the read DQS preamble and deasserts at the end of the read burst.
- Bit[10:6]: Coarse delay (one unit of delay is 1 UI)
- Bit[4:0]: Fine delay (one unit of delay is one-thirty second of a UI = UI/32)
- Bit[5]: Reserved

Note: Timing group 0 = RANK0.

14.5.29 DDRPHYC RxEnDlyTg1_ux register (DDRPHYC_DBYTEx_RXENDLYTG1_U0)

Address offset: 0x40204 + 0x4000 * x, (x = 0 to 1)

Reset value: 0x0000 0100

Trained receive enable delay (timing group 1).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	RXENDLYTG1_U0[10:0]										
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **RXENDLYTG1_U0[10:0]**: Trained receive enable delay (timing group 1)
Trained to set the delay from the memory-read command to the signal enabling the read DQS to generate read-data strobes. The trained read DQS enable asserts during the read DQS preamble and deasserts at the end of the read burst.
- Bit[10:6]: Coarse delay (one unit of delay is 1 UI)
- Bit[4:0]: Fine delay (one unit of delay is one-thirty second of a UI = UI/32)
- Bit[5]: Reserved

Note: Timing group 1 = RANK1.

14.5.30 DDRPHYC RxClkDlyTgx_u0 register (DDRPHYC_DBYTEx_RXCLKDLYTG0_U0)

Address offset: 0x40230 + 0x4000 * x, (x = 0 to 1)

Reset value: 0x0000 0010

Trained read DQS to RxClk delay (timing group 0).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RXCLKDLYTG0_U0[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **RXCLKDLYTG0_U0[5:0]**: Trained read DQS to RxClk delay (timing group 0)
Trained to generate read DQ receive clock from the received read DQS. RxClk Delay (6 bits, fine delay only).
- Bit[4:0]: Fine delay (one unit of delay is one-thirty second of a UI = UI/32)
- Bit[5]: Reserved
There is no coarse delay field: the max configurable delay is 31/32 UI.

Note: Timing group 0 = RANK0.

14.5.31 DDRPHYC RxClkDlyTg1_ux register (DDRPHYC_DBYTEx_RXCLKDLYTG1_U0)

Address offset: 0x40234 + 0x4000 * x, (x = 0 to 1)

Reset value: 0x0000 0010

Trained read DQS to RxClk delay (timing group 1).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RXCLKCDLYTG1_U0[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **RXCLKCDLYTG1_U0[5:0]**: Trained read DQS_c to RxClkc delay (timing group 1)
Trained to generate read DQ receive clock from the received read DQS_c. RxClkc delay (6 bits, fine delay only).
- Bit[4:0]: Fine delay (one unit of delay is one-thirty second of a UI = UI/32)
- Bit[5]: Reserved
There is no coarse delay field: the max configurable delay is 31/32 UI.

Note: Timing group 1 = RANK1.

14.5.34 DDRPHYC DqLnSel register (DDRPHYC_DBYTEx_DQyLNSEL)

Address offset: 0x40280 + 0x4000 * x + 0x4 * y, (x = 0 to 1; y = 0 to 7)

Reset value: 0x0000 0000, 0x0000 0001, 0x0000 0002, 0x0000 0003, 0x0000 0004, 0x0000 0005, 0x0000 0006, 0x0000 0007

Maps PHY DQ lane to memory DQy.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DQYLNSEL[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **DQYLNSEL[2:0]**:

Supports mapping of PHY DQ to DRAM DQ within a byte (swizzle). Intended to undo the swizzle of board-level phy-to-dram connections such that MRR operations of binary counters return correct values.

This bitfield is per-DBYTE such that the swizzle may be different per DBYTE.

Each bit in a byte set of DqyLnSel must have a unique value within the set.

For example, if, on a DBYTE, PHY lane 3 is connected to memory DQY (on this DBYTE), then DQYLNSEL[2:0] for this DBYTE must be 3.

14.5.35 DDRPHYC TxDqDlyTgx_r0 register (DDRPHYC_DBYTEx_TXDQDLYTG0_Ry)

Address offset: 0x40300 + 0x4000 * x + 0x400 * y, (x = 0 to 1; y = 0 to 8)

Reset value: 0x0000 0010

Write DQ delay (timing group 0).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	TXDQDLYTG0_R0[8:0]								
							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bits 8:0 **TXDQDLYTG0_R0[8:0]**: Write DQ delay (timing group 0)

Trained to center the delay between the write DQ to the write DQS. Tx DQ delay (9 bits, includes 3-bit coarse and 6-bit fine delays).

- Bit[8:6]: Coarse delay (one unit of delay is 1 UI)
- Bit[4:0]: Fine (fractional UI) delay (one unit of delay is one-thirty second of a UI = UI/32)

Note: - Bit[5]: Reserved*Timing group 0 = RANK0.*

14.5.36 DDRPHYC TxDqDlyTg1_rx register (DDRPHYC_DBYTEx_TXDQDLYTG1_Ry)

Address offset: 0x40304 + 0x4000 * x + 0x400 * y, (x = 0 to 1; y = 0 to 8)

Reset value: 0x0000 0010

Write DQ delay (timing group 1).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	TXDQSDLYTG0_U0[9:0]									
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **TXDQSDLYTG0_U0[9:0]**: Write DQS delay (timing group 0)
Trained to set the delay from the memory-write command to the signal driving the write DQS. Tx DQS delay (10 bits, includes coarse and fine delays).
- Bit[9:6]: Coarse delay (one unit of delay is 1 UI)
- Bit[4:0]: Fine delay (one unit of delay is one-thirty second of a UI = UI/32)
- Bit[5]: Reserved

Note: This register is per nibble, per timing-group. Timing group 0 = RANK0.

14.5.38 DDRPHYC TxDqsDlyTg1_ux register (DDRPHYC_DBYTEx_TXDQSDLYTG1_U0)

Address offset: 0x40344 + 0x4000 * x, (x = 0 to 1)

Reset value: 0x0000 0100

Write DQS delay (timing group 1).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **TXDQSDLYTG1_U0[9:0]**: Write DQS delay (timing group 1)
Trained to set the delay from the memory-write command to the signal driving the write DQS. Tx DQS delay (10 bits, includes coarse and fine delays).
- Bit[9:6]: Coarse delay (one unit of delay is 1 UI)
- Bit[4:0]: Fine delay (one unit of delay is one-thirty second of a UI = UI/32)
- Bit[5]: Reserved

Note: This register is per nibble, per timing-group. Timing group 1 = RANK1.

14.5.39 DDRPHYC debug status of the DBYTE LCDL register (DDRPHYC_DBYTEx_DXLCDLSTATUS)

Address offset: 0x40390 + 0x4000 * x, (x = 0 to 1)

Reset value: 0xXXXX XXXX

Status of DBYTE macro LCDL selected by LcdlStatusSel register, that is per DBYTE.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

		r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **DXLCDLLIVELOCK**: Present value of whether the LCDL is locked
Valid when LCDLTSTENABLE = 1.

Bit 12 **DXLCDLSTICKYUNLOCK**: Latched value of whether the LCDL ever lost lock after the assertion of LCDLTSTENABLE

Bit 11 **DXLCDLSTICKYLOCK**: Latched value of whether the LCDL ever achieved lock after the assertion of LCDLTSTENABLE

Bit 10 **DXLCDLPHDSNAPVAL**: Value of the LCDL phase-detector output, latched by pulse on LCDLFINESNAP while LCDLTSTENABLE = 1

Bits 9:0 **DXLCDLFINESNAPVAL[9:0]**: Value of the LCDL 1UI estimate code, latched by pulse on LCDLFINESNAP while LCDLTSTENABLE = 1
Index 9 is reserved for growth.

14.5.40 DDRPHYC RxEnDlyTgx_u1 register (DDRPHYC_DBYTEx_RXENDLYTG0_U1)

Address offset: 0x40600 + 0x4000 * x, (x = 0 to 1)

Reset value: 0x0000 0100

Trained receive enable delay (timing group 0).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	RXENDLYTG0_U1[10:0]										
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **RXENDLYTG0_U1[10:0]**: Trained receive enable delay (timing group 0)

Trained to set the delay from the memory-read command to the signal enabling the read DQS to generate read-data strobes. The trained read DQS enable asserts during the read DQS preamble and deasserts at the end of the read burst.

- Bit[10:6]: Coarse delay (one unit of delay is 1 UI)
- Bit[4:0]: Fine delay (one unit of delay is one-thirty second of a UI = UI/32)
- Bit[5]: Reserved

Note: Timing group 0 = RANK0.

14.5.41 DDRPHYC RxEnDlyTg1_u1 register (DDRPHYC_DBYTEx_RXENDLYTG1_U1)

Address offset: 0x40604 + 0x4000 * x, (x = 0 to 1)

Reset value: 0x0000 0100

Trained receive enable delay (timing group 1).

Res.	Res.	Res.	Res.	Res.	RXENDLYTG1_U1[10:0]										
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **RXENDLYTG1_U1[10:0]**: Trained receive enable delay (timing group 1)

Trained to set the delay from the memory-read command to the signal enabling the read DQS to generate read-data strobes. The trained read DQS enable asserts during the read DQS preamble and deasserts at the end of the read burst.

- Bit[10:6]: Coarse delay (one unit of delay is 1 UI)
- Bit[4:0]:Fine delay (one unit of delay is one-thirty second of a UI = UI/32)
- Bit[5]: Reserved

Note: Timing group 1 = RANK1.

14.5.42 DDRPHYC RxClkDlyTgx_u1 register (DDRPHYC_DBYTEx_RXCLKDLYTG0_U1)

Address offset: 0x40630 + 0x4000 * x, (x = 0 to 1)

Reset value: 0x0000 0010

Trained read DQS to RxClk delay (timing group 0).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RXCLKDLYTG0_U1[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **RXCLKDLYTG0_U1[5:0]**: Trained read DQS to RxClk delay (timing group 0)
Trained to generate read DQ receive clock from the received read DQS. RxClk delay (6 bits, fine delay only).
- Bit[4:0]: Fine delay (one unit of delay is one-thirty second of a UI = UI/32)
- Bit[5]: Reserved

There is no coarse delay field: the max configurable delay is 31/32 UI.

Note: Timing group 0 = RANK0.

14.5.43 DDRPHYC RxClkDlyTg1_u1 register (DDRPHYC_DBYTEx_RXCLKDLYTG1_U1)

Address offset: 0x40634 + 0x4000 * x, (x = 0 to 1)

Reset value: 0x0000 0010

Trained read DQS to RxClk delay (timing group 1).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **RXCLKDLYTG1_U1[5:0]**: Trained read DQS to RxClk delay (timing group 1)
Trained to generate read DQ receive clock from the received read DQS. RxClk delay (6 bits, fine delay only).
- Bit[4:0]: Fine delay (one unit of delay is one-thirty second of a UI = UI/32)
- Bit[5]: Reserved

There is no coarse delay field: the max configurable delay is 31/32 UI.

Note: Timing group 1 = RANK1.

14.5.44 DDRPHYC RxClkcDlyTgx_u1 register (DDRPHYC_DBYTEx_RXCLKCDLYTG0_U1)

Address offset: 0x40640 + 0x4000 * x, (x = 0 to 1)

Reset value: 0x0000 0010

Trained read DQS_c to RxClkc delay (timing group 0).

Res.	Res.	Res.	Res.	Res.	Res.	TXDQSDLYTG0_U1[9:0]									
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **TXDQSDLYTG0_U1[9:0]**: Write DQS delay (timing group 0)

Trained to set the delay from the memory-write command to the signal driving the write DQS.
Tx DQS delay (10 bits, includes coarse and fine delays)
- Bit[9:6]: Coarse delay (one unit of delay is 1 UI)
- Bit[4:0]: Fine delay (one unit of delay is one-thirty second of a UI = UI/32)
- Bit[5]: Reserved

Note: This register is per nibble, per timing-group. Timing group 0 = RANK0.

14.5.47 DDRPHYC TxDqsDlyTg1_u1 register (DDRPHYC_DBYTEx_TXDQSDLYTG1_U1)

Address offset: 0x40744 + 0x4000 * x, (x = 0 to 1)

Reset value: 0x0000 0100

Write DQS delay (timing group 1).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	TXDQSDLYTG1_U1[9:0]									
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **TXDQSDLYTG1_U1[9:0]**: Write DQS delay (timing group 1)

Trained to set the delay from the memory-write command to the signal driving the write DQS.
Tx DQS delay (10 bits, includes coarse and fine delays).
- Bit[9:6]: Coarse delay (one unit of delay is 1 UI)
- Bit[4:0]: Fine delay (one unit of delay is one-thirty second of a UI = UI/32)
- Bit[5]: Reserved

Note: This register is per nibble, per timing-group.Timing group 1 = RANK1.

14.5.48 DDRPHYC Rx FIFO pointer initialization control register (DDRPHYC_MASTER0_RXFIFOINIT)

Address offset: 0x80000

Reset value: 0x0000 0000

This register enables overrides of the PHY RXDATAFIFO pointers.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	INHIBITRXFIFORD	RXFIFOINITPTR
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **INHIBITRXFIFORD**: Reserved for training firmware use
Setting this inhibits reads of the PHYRXDATAFIFO.

Bit 0 **RXFIFOINITPTR**:
Setting this bit resets the PHY RXDATAFIFO read and write pointers. This bit must be cleared to return to normal operation. This is not required in normal operation, but can be used instead of a dfi_ctrlupdate (for controllers that do not support ctrlupdate).

14.5.49 DDRPHYC ForceClkDisable register (DDRPHYC_MASTER0_FORCECLKDISABLE)

Address offset: 0x80004

Reset value: 0x0000 0000

Clock gating control.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FORCECLKDISABLE[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **FORCECLKDISABLE[3:0]**:
This bitfield forces the gating of MEMCLKs driven from the PHY.
- Bit[0]: Controls CLK_[H/L0].
- Bit[1]: Controls CLK_[H/L]1 (if present).
- Bit[2]: Controls CLK_[H/L]2 (if present).
- Bit[3]: Controls CLK_[H/L]3 (if present).

14.5.50 DDRPHYC ForceInternalUpdate register (DDRPHYC_MASTER0_FORCEINTERNALUPDATE)

Address offset: 0x8000C

Reset value: 0x0000 0000

This register used by training firmware to force an internal PHY update event.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FORCEINTERNALUPDATE
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **FORCEINTERNALUPDATE**: Used by training firmware to force an internal PHY update event
Optionally can be used by system software to issue a PHY update event. This bit can be written to 0x1 only when all of the following are true:
- The DFI interface is offline.
- The training hardware sends only DES and all transactions have retired.

This bit must stay asserted for at least 32 DFICLKs before clearing. Prematurely clearing this bit may result in an incomplete update.

14.5.51 DDRPHYC read-only displays PHY configuration register (DDRPHYC_MASTER0_PHYCONFIG)

Address offset: 0x80010

Reset value: 0xXXXX X128

Displays PHY configuration.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	PHYCONFIGDFI[1:0]		PHYCONFIGDBYTES[3:0]				PHYCONFIGANIBS[3:0]			
						r	r	r	r	r	r	r	r	r	r

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:8 **PHYCONFIGDFI[1:0]**:
Returns the following value depending on the define:
- 0x1 if DWC_DDRPHY_DFI1_EXISTS is not defined.
- 0x2 if DWC_DDRPHY_DFI1_EXISTS is defined.

Bits 7:4 **PHYCONFIGDBYTES[3:0]**:

Returns the following value depending on the define:
- 0x1 if DWC_DDRPHY_NUM_DBYTES_1
- 0x2 if DWC_DDRPHY_NUM_DBYTES_2
- 0x3 if DWC_DDRPHY_NUM_DBYTES_3
- 0x4 if DWC_DDRPHY_NUM_DBYTES_4
- 0x5 if DWC_DDRPHY_NUM_DBYTES_5
- 0x6 if DWC_DDRPHY_NUM_DBYTES_6
- 0x7 if DWC_DDRPHY_NUM_DBYTES_7
- 0x8 if DWC_DDRPHY_NUM_DBYTES_8
- 0x9 if DWC_DDRPHY_NUM_DBYTES_9
- 0xA if DWC_DDRPHY_NUM_DBYTES_10

Bits 3:0 **PHYCONFIGANIBS[3:0]**:

Returns the following value depending on the define:
- 0x3 if DWC_DDRPHY_NUM_ANIBS_3
- 0x6 if DWC_DDRPHY_NUM_ANIBS_6
- 0x8 if DWC_DDRPHY_NUM_ANIBS_8
- 0xA if DWC_DDRPHY_NUM_ANIBS_10
- 0xC if DWC_DDRPHY_NUM_ANIBS_12

14.5.52 DDRPHYC PHY general configuration register (DDRPHYC_MASTER0_PGCR)

Address offset: 0x80014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RXCLKRISEFALLMODE
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **RXCLKRISEFALLMODE**:

Controls independent training for RxClk_c and RxClk_t.
0: Independent training for RxClk_c and RxClk_t is disabled (default value).
1: Independent training for RxClk_c and RxClk_t is enabled.

14.5.53 DDRPHYC test bump control1 register (DDRPHYC_MASTER0_TESTBUMPCNTRL1)

Address offset: 0x8001C

Reset value: 0x0000 0B03

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **TESTPOWERGATEEN**: Do not use, for debug only

Bit 14 **TESTEXTVREFRANGE**:
Setting this bit extends the VREF DAC range for debug.
Must be set to zero in mission mode when MemAlert is enabled.

Bit 13 **TESTSELEXTERNALVREF**: Do not use, for debug only

Bits 12:8 **TESTGAINCURRADJ[4:0]**:
Adjust gain and current of analog observe RX amplifier stage at analog test point.
Recommended mission mode default = 0x01011.

Bits 7:4 **TESTANALOGOUTCTRL[3:0]**: Reserved and returns zero on reads.

Bit 3 **TESTBIASBYPASSEN**: Do not use, for debug only

Bits 2:0 **TESTMAJORMODE[2:0]**:
Selects the major mode of operation for the receiver. These modes are mutually exclusive.
011: Setting for DDR4 systems to receive Alert_n
Others: Reserved

14.5.54 DDRPHYC impedance calibration clock ratio register (DDRPHYC_MASTER0_CALUCLKINFO)

Address offset: 0x80020

Reset value: 0x0000 0320

Informs the impedance calibration engine about frequency of DfiClk.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	CALUCLKTICKSPER1US[10:0]										
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **CALUCLKTICKSPER1US[10:0]**:
Must be programmed to the number of DfiClks in 1 µs (rounded up), with minimum value of 24.
- if (DfiClk < 24MHz) CalUclkInfo = 24
- else CalUclkInfo = (number of DfiClks in 1 µs)

14.5.55 DDRPHYC test bump control register (DDRPHYC_MASTER0_TESTBUMPCNTRL)

Address offset: 0x80028

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **FORCEMTESTONALERT**:
When set, this bit causes the digital observation output pin to be driven onto BP_ALERT_N.

Bits 8:3 **TESTBUMPDATASEL[5:0]**: RVSD

Bit 2 **TESTBUMPTOGGLE**:
Controls the output function of the signal. Digital observation pin, if available in the PHY configuration.
0: The output is tristate.
1: The output is selected by MtestMuxSel.

Bits 1:0 **TESTBUMPEN[1:0]**:
Controls the output function of the signal BP_ALERT_N.
TestBumpEn Value on [BP_ALERT_N] | output
00: High-z
01: Pllout-divided-by-2, works up to full data rate.
10: PllDigTst[1], works up to 400 MHz.
11: PllDigTst[1], works up to 400 MHz.

14.5.56 DDRPHYC Seq0BDLY0 register (DDRPHYC_MASTER0_SEQ0BDLY0)

Address offset: 0x8002C

Reset value: 0x0000 0000

PHY initialization engine (PIE) delay register 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SEQ0BDLY0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SEQ0BDLY0[15:0]**: PIE delay register 0

This bitfield is available for selection by the NOP and WAIT instructions in the PIE for the delay value. Programmed by dwc_ddrphy_phyinit_I_loadPIEImage() to support frequency changes.

Programming bit[3,2,1,0]:

- These bits are used to control various delays during PLL, DLL initialization.
- These bits must be programmed with the corresponding number of MEMCLK cycles representing a fixed amount of delay irrespective of DfiClk frequency.
- When calculating the number of cycles to be programmed, it must be noted that the sequencer multiplies programmed values by a factor of eight, and values are round down to the closest integer.

Bit: Required delay | Programmed value

- Bit[0]: 0.5 µs | (0.5 µs / MEMCLK period) / 8)
- Bit[1]: 1.0 µs | (1.0 µs / MEMCLK period) / 8)
- Bit[2]: 10.0 µs | (10.0 µs / MEMCLK period) / 8)
- Bit[2]: 10.0 µs | 64/4 if (MEMCLK freq ≤ 400 MHz)
- Bit[3]: - | 132/4 if (400 MHz freq < MEMCLK freq ≤ 533 MHz)
- Bit[3]: - | 176/4 if (MEMCLK freq > 533 MHz)

14.5.57 DDRPHYC Seq0BDLY1 register (DDRPHYC_MASTER0_SEQ0BDLY1)

Address offset: 0x80030

Reset value: 0x0000 0000

PIE delay register 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

- Bit[2]: 10.0 µs | 64/4 if (MEMCLK freq ≤ 400 MHz)
- Bit[3]: - | 132/4 if (400 MHz freq < MEMCLK freq ≤ 533 MHz)
- Bit[3]: - | 176/4 if (MEMCLK freq > 533 MHz)

14.5.59 DDRPHYC Seq0BDLY3 register (DDRPHYC_MASTER0_SEQ0BDLY3)

Address offset: 0x80038

Reset value: 0x0000 0000

PIE delay register 3.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SEQ0BDLY3[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SEQ0BDLY3[15:0]**: PIE delay register 3

This bitfield is available for selection by the NOP and WAIT instructions in the PIE for the delay value. Programmed by dwc_ddrphy_phyinit_I_loadPIEImage() to support frequency changes.

Programming bit[3,2,1,0]:

- These bits are used to control various delays during PLL, DLL initialization.
- These bits must be programmed with the corresponding number of MEMCLK cycles representing a fixed amount of delay irrespective of DfiClk frequency.
- When calculating the number of cycles to be programmed, it must be noted that the sequencer multiplies programmed values by a factor of 8 and values are round down to the closest integer.

Bit: Required delay | Programmed value

- Bit[0]: 0.5 µs | (0.5 µs / MEMCLK period) / 8)
- Bit[1]: 1.0 µs | (1.0 µs / MEMCLK period) / 8)
- Bit[2]: 10.0 µs | (10.0 µs / MEMCLK period) / 8)
- Bit[2]: 10.0 µs | 64/4 if (MEMCLK freq ≤ 400 MHz)
- Bit[3]: - | 132/4 if (400 MHz freq < MEMCLK freq ≤ 533 MHz)
- Bit[3]: - | 176/4 if (MEMCLK freq > 533 MHz)

14.5.60 DDRPHYC PHY alert status bit register (DDRPHYC_MASTER0_PHYALERTSTATUS)

Address offset: 0x8003C

Reset value: 0xXXXX XXXX

This read-only register represents the status of the ALERT_N pin to the PHY.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PHYALERT
															r

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **PHYALERT**: Current state of ALERT_N

14.5.61 DDRPHYC setup intervals for DFI PHY master operation register (DDRPHYC_MASTER0_PPTTRAINSETUP)

Address offset: 0x80040

Reset value: 0x0000 0000

For LPDDR4 some tracking is required periodically using the DFI PHY MASTER interface. This register control the interval. Setting this register to 0 completely disables the MASTER. Programmed by dwc_ddrphy_phyinit_I_loadPIEImage() to support LPDDR4 DRAM drift compensation.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PHYMSTRMAXREQTOACK[2:0]			PHYMSTRTRAININTERVAL[3:0]			
									rw	rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **PHYMSTRMAXREQTOACK[2:0]**: Max time from tdfi_phymstr_req asserted to tdfi_phymstr_ack asserted.

If the request is not acknowledged by this time, dfi_error is asserted.
000: Disable PHY MASTER.
001: Set tPHYMSTR_resp. = 512 MEMCLKs.
010: Set tPHYMSTR_resp. = 1024 MEMCLKs.
011: Set tPHYMSTR_resp. = 2048 MEMCLKs.
100: Set tPHYMSTR_resp. = 4096 MEMCLKs.
101: Set tPHYMSTR_resp. = 8192 MEMCLKs.
110: Set tPHYMSTR_resp. = 32768 MEMCLKs.
111: Reserved

*Note: The above are nominal values. The actual values are reduced by (2 + (DWC_DDRPHY_PIPE_DFI_MISC * MEMCLK/DfiCtlClk)) * 2*

This signal interacts with dfi_phyupd_req.

Bits 3:0 **PHYMSTRTRAININTERVAL[3:0]**: Time between the end of one training, and the start of the next.

As per section 11 of the preliminary DFI 4.0 Specification,V2, it is the max expected time from dfi_init_complete asserted to tdfi_phymstr_ack asserted.
0000: Disable PHY MASTER.
0001: PHY MASTER request interval = 524288 MEMCLKs.
0010: PHY MASTER request interval = 1048576 MEMCLKs.
0011: PHY MASTER request interval = 2097152 MEMCLKs.
0100: PHY MASTER request interval = 4194304 MEMCLKs.
0101: PHY MASTER request interval = 8388608 MEMCLKs.
0110: PHY MASTER request interval = 16777216 MEMCLKs.
0111: PHY MASTER request interval = 33554432 MEMCLKs.
1000: PHY MASTER request interval = 67108864 MEMCLKs.
1001: PHY MASTER request interval = 134217728 MEMCLKs.
1010: PHY MASTER request interval = 268435456 MEMCLKs.
Other: Reserved

14.5.62 DDRPHYC ATestMode control register (DDRPHYC_MASTER0_ATESTMODE)

Address offset: 0x80048

Reset value: 0x0000 0000

Controls for address command loopback. This register is written by ATE firmware.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ATESTMODESEL[2:0]			ATEST CLKEN	ATEST PRBSEN
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:2 **ATESTMODESEL[2:0]**: Master mode select for ATest (loopback)

000: Mission mode, all ATest disabled, loopback receivers powered down

001: External loopback mode [Single data rate pattern - dfi_cas sent to all lanes]

010: Internal loopback mode [Single data rate pattern]

011: Internal loopback mode [Double data rate pattern]

100: External loopback mode [Single data rate pattern - corresponding DFI signal sent to each lane]

Bit 1 **ATESTCLKEN**: Not used

Bit 0 **ATESTPRBSEN**:

Enables loopback PRBS7 testing of all the DDR output pins.

The asserting edge resets all the individual. TestPrbsErrCnt and there is no other reset for the TestPrbsErrCnt.

14.5.63 DDRPHYC TxCalBinP register (DDRPHYC_MASTER0_TXCALBINP)

Address offset: 0x80050

Reset value: 0xXXXX XXXX

TX P impedance calibration observation

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TXCALBINPOVREN	TXCALBINPOVRVAL[4:0]				
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **TXCALBINPOVREN**:
1: Use the override value present in TxCalBinPOvrVal bit.
0: Reserved

Bits 4:0 **TXCALBINPOVRVAL[4:0]**: Binary value which can override TXCALBINP bitfiled Calibrator results if TXCALBINPOVREN bit is set.

14.5.66 DDRPHYC TX N impedance calibration override register (DDRPHYC_MASTER0_TXCALNOVR)

Address offset: 0x8005C

Reset value: 0x0000 0000

Override values for TXCALBINN bitfield.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TXCALBINNOVREN	TXCALBINNOVRVAL[4:0]				
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **TXCALBINNOVREN**:

1: Use the override value present in TXCALBINNOVRVAL bitfield.

0: reserved.

Bits 4:0 **TXCALBINNOVRVAL[4:0]**: Binary value which can override TXCALBINN bitfield Calibrator results if TXCALBINNOVREN bit is set.

14.5.67 DDRPHYC enables for update and low-power interfaces for DFI0 and DFI1 register (DDRPHYC_MASTER0_DFIMODE)

Address offset: 0x80060

Reset value: 0x0000 0001

Each bit enables the PHY update, PHY MASTER update, and low-power logic for the respective interfaces.

There are three valid configurations:

- 101: DFI0 is enabled and controls the entire PHY.
- 001: DFI0 controls 1/2 the PHY, external logic ties off inputs to DFI1.
- 011: DFI0 and DFI1 are active and are separately controlled.

This register interacts with the DWC_DDRPHY_DFI1_EXISTS define as follows:

- DfiMode = 001, DWC_DDRPHY_DFI1_EXISTS defined: ANIBs/DBYTEs assigned to DFI1 are idle.
- DfiMode = 011, DWC_DDRPHY_DFI1_EXISTS defined: DFI0 controls 1/2 PHY (CH. A), DFI1 controls 1/2 PHY (CH. B).
- DfiMode = 101, DWC_DDRPHY_DFI1_EXISTS defined: ANIBs/DBYTEs assigned to DFI1 are controlled by DFI0. Only DFI0 sideband signals are active.
- DfiMode = 001, DWC_DDRPHY_DFI1_EXISTS undefined: DFI0 controls entire PHY.
- DfiMode = 011, DWC_DDRPHY_DFI1_EXISTS undefined: illegal.
- DfiMode = 101, DWC_DDRPHY_DFI1_EXISTS undefined: not applicable

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFI1OVERRIDE	DFI1ENABLE	DFI0ENABLE
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DFI1OVERRIDE**:
Controls the PHY logic associated with both DFI0 and DFI1.

Bit 1 **DFI1ENABLE**:
Enables operation for the PHY logic associated with DFI1.

Bit 0 **DFI0ENABLE**:
Enables operation for the PHY logic associated with DFI0.

14.5.68 DDRPHYC mode select register for MEMCLK/address/command tristate register (DDRPHYC_MASTER0_TRISTATEMODECA)

Address offset: 0x80064

Reset value: 0x0000 0000

This register is used to control the PHY dynamic address/command tristate feature, and the stopped MEMCLK state.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CKDISVAL[1:0]		DDR2T MODE	DISDY NADRT RI
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:2 **CKDISVAL[1:0]**:

The PHY provides four memory clocks (0 to 3).

- When the toggling of memory clock CK_t[n] is disabled with dfi_clk_disable[n] = 1, the memory clock CK_t[n] is driven with CkDisVal[1] bit.
- When the toggling of memory clock CK_c[n] is disabled with dfi_clk_disable[n] = 1, the memory clock CK_c[n] is driven with ~(CkDisVal[0] bit) (inverted).

Note: The non-toggling differential memory clock [CK_t[n],CK_c[n]] can be driven with any combination, LL,LH,HL,HH; the default [CK_t[n], CK_c[n]] = LH.

Bit 1 **DDR2TMODE**:

Must be set to 1 for dynamic tristate to work when CA bus is 2T or Geardown mode.
This bit has no effect when DISDYNADRTRI == 1.

Bit 0 **DISDYNADRTRI**:

When this bit is set, the dynamic tristate feature is disabled (on by default). This feature must be disabled for these modes:

- DR3/2T (if the controller cannot follow the 2T PHY tristate protocol)
- DDR4/2T/2N (if the controller cannot follow the 2T PHY tristate protocol)
- LPDDR4

When this bit =0 (default):

- In DDR4 mode, the following SDRAM pins can be dynamically tristated: A, BA, BG, ACT_n.
- In 1T mode, the PHY tristates the relevant pins when all ranks are deselected.
- In 2T mode (or geardown), the PHY tristates the relevant pins when:
  - DDR3: All ranks deselected (all CS_L==1) and [RAS_n,CAS_n,WE_n,BA0] = [1,1,1,0]
  - DDR4: All ranks deselected (all CS_L==1) and [RAS_n,CAS_n,WE_n,BA0,ACT_n] = [1,1,1,0,1]
    When in this mode, the controller must avoid sending the above patterns with any rank selected (for example: NOPs sent by the controller must have BA0 set to a non-zero value).

14.5.69 DDRPHYC MtestMuxSel register (DDRPHYC_MASTER0_MTESTMUXSEL)

Address offset: 0x80068

Reset value: 0x0000 0000

Digital observation pin control.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MTESTMUXSEL[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **MTESTMUXSEL[5:0]**:

Controls for the 64-1 mux for asynchronous data to the digital observation pin.
0x0: Drive 0 from this device (allows flat 'OR' of pass-through information).
0x01 to 0x1F: Select local data from AC/DBYTE/MASTER macro.
0x20: Drive 0 from PUB synth logic path into mux.
0x21 to 0x3F: Select local data from PUB AC/DBYTE/MASTER synthesized logic.

14.5.70 DDRPHYC MtestPgmInfo register (DDRPHYC_MASTER0_MTESTPGMINFO)

Address offset: 0x8006C

Reset value: 0x0000 0000

Digital observation pin program information for debug.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MTESTPGMINFO
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **MTESTPGMINFO**:

This bit value can be driven onto the digital observation pin (no other hardware effect).

14.5.71 DDRPHYC dynamic power up/down control register (DDRPHYC_MASTER0_DYNPWRDNUP)

Address offset: 0x80070

Reset value: 0x0000 0000

Register written by PIE and the data in here are overwritten.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DYNPOWERDOWN
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **DYNPOWERDOWN**:

1: Analog circuitry (voltage dacs, bias gen) is turned off.

0: Normal operation

14.5.72 DDRPHYC PMIEnable register (DDRPHYC_MASTER0_PMIENABLE)

Address offset: 0x80074

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PMIENABLE
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **PMIENABLE**:

This bit is dynamically written by PIE during frequency changes and must not be written by the user.

14.5.73 DDRPHYC PhyTID register (DDRPHYC_MASTER0_PHYTID)

Address offset: 0x80078

Reset value: 0x0000 0000

PHY technology ID register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

PHYTID[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PHYTID[15:0]**: Placeholder to store technology-specific information

14.5.74 DDRPHYC HwtMRL register (DDRPHYC_MASTER0_HWTMRL)

Address offset: 0x80080

Reset value: 0x0000 0006

HWT MaxReadLatency.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HWTMRL[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **HWTMRL[4:0]**: Master copy of MRL used by the PHY training firmware only

14.5.75 DDRPHYC DFI PhyUpdate request time counter register (DDRPHYC_MASTER0_DFIPHYUPD)

Address offset: 0x80084

Reset value: 0x0000 FF07

This register is used to determine the DFI update request interval (in MEMCLKs) and the maximum update response time. DFIPHYUPDCNT and DFIPHYUPDRESP must be chosen such that DFIPHYUPDCNT > DFIPHYUPDRESP

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DFIPHYUPDINTTHRESHOLD[3:0]				DFIPHYUPDTHRESHOLD[3:0]				DFIPHYUPDMODE	DFIPHYUPDRESP[2:0]			DFIPHYUPDCNT[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **DFIPHYUPDINTTHRESHOLD[3:0]**:

Similar to DFIPHYUPDTHRESHOLD except that, rather than affecting the Phy update request, this bitfield affects only the threshold used to generate the VT drift alarm interrupt. The actual threshold is twice what is specified in this bitfield.

Bits 11:8 **DFIPHYUPDTHRESHOLD[3:0]**:

0x0: Disable threshold-based Phy update requests when DFIPHYUPDMODE = 0x1.

- Nonzero codes are the threshold value for the change in the master LCDL 1UI phase code since the last Phy update request that triggers a new Phy update request;
- If (current_1UI_phase - last_1UI_phase) > DFIPHYUPDTHRESHOLD, then a Phy update is requested.

In units of native-control phase units, minimum value is 1.

With DFIPHYUPDTHRESHOLD = 1, a master LCDL dithering between two values does not cause a Phy update request.

Bit 7 **DFIPHYUPDMODE**:

0: Deterministic timer-based Phy update requests. Enables multi-channel/multi-phy lockstep operation (default, recommended).

1: Non-deterministic threshold-based Phy update requests. Multi-channel/multi-phy operation not permitted, all requests must be acknowledged.

Bits 6:4 **DFIPHYUPDRESP[2:0]**:

Enforces the t_phyupd_resp time (max time allowed to the controller to respond to the request for a PHY update). A dfi_error is signaled if there is no acknowledgement of the update request within nMEMCLKs_phyupd_resp.

000: nMEMCLKs_phyupd_resp= 1024 MEMCLKs (default)

001: nMEMCLKs_phyupd_resp= 2048 MEMCLKs

010: nMEMCLKs_phyupd_resp= 4096 MEMCLKs

011: nMEMCLKs_phyupd_resp= 8192 MEMCLKs (not allowed in LPDDR4 mode)

*Note: The above are nominal values. The actual values are reduced by (2 + (DWC_DDRPHY_PIPE_DFI_MISC * MEMCLK/DfiCtlClk)) * 2.*

Any code not enumerated above is reserved and must not be set.

This signal interacts with dfi_phymstr_req.

Bits 3:0 **DFIPHYUPDCNT[3:0]**:

Controls the interval between the end of a PHY update transaction and a subsequent request.

0000: Disable timer-based PHY update when DFIPHYUPDMODE= 0.

0001: 16K MEMCLKs minus nMEMCLKs_phyupd_resp

0011: 32K MEMCLKs minus nMEMCLKs_phyupd_resp

0111: 64K MEMCLKs minus nMEMCLKs_phyupd_resp

1111: 128K MEMCLKs minus nMEMCLKs_phyupd_resp

Note: Any code not enumerated above is reserved and must not be set.

14.5.76 DDRPHYC PdaMrsWriteMode register (DDRPHYC_MASTER0_PDAMRSWRITEMODE)

Address offset: 0x80088

Reset value: 0x0000 0000

Controls the write DQ generation for Per-Dram-Addressing of MRS.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PDAMRSWRITEMODE
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **PDAMRSWRITEMODE**:

Controls the write DQ generation per the timing requirements on DQ signals used for Per-Dram-Addressing mode of MRS commands.

When asserted, the DQ are driven for an additional UI before the logical burst, and for an additional UI after the logical burst. The early UI has the value of first logical UI, and the late UI has the value of the last logical UI. The timing of the logical burst is unchanged.

No modification to TxDqDly bit is required or performed.

Note: It is strongly recommended to clear this bit after completing the MRS that clears MR3 A4 and for mission-mode writes, else required bubbles are larger and the power consumed is greater. See JEDEC MR3 A4, Per DRAM Addressability.

14.5.77 DDRPHYC DFIGEARDOWNCTL register (DDRPHYC_MASTER0_DFIGEARDOWNCTL)

Address offset: 0x8008C

Reset value: 0x0000 0000

Controls whether dfi_geardown_en causes CS and CKE timing to change.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFIGEARDOWNCTL[1:0]	
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **DFIGEARDOWNCTL[1:0]**:

Bit[0] controls whether dfi_geardown_en causes chip-select (CS) timing to change.
0: CS timing is not dynamically modified with dfi_geardown_en.
1: CS is delayed by an additional 1UI dynamically when dfi_geardown_en==1.

Note: This bit must be set to zero if the PHY is not in DDR4 mode.

Bit[1] controls whether dfi_geardown_en causes clock-enable (CKE) timing to change.
0: CKE timing is not dynamically modified with dfi_geardown_en
1: CKE is delayed by an additional 1UI dynamically when dfi_geardown_en==1

Note: This bitfield must be set to zero if the PHY is not in DDR4 mode.

14.5.78 DDRPHYC control the PHY logic related to the read and write DQS preamble register (DDRPHYC_MASTER0_DQSPREAMBLECONTROL)

Address offset: 0x80090

Reset value: 0x0000 0008

For improved robustness in operating with DRAM timing drift, this register provides controls for the width of the write DQS preamble and postamble, and controls for the anticipated width of DQS preamble for reads.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	WDQSEXTENSION	LP4STCPREBRIDGERXEN	LP4POSTAMBLEEXT	LP4TGLTWOTCKTXDQSPRE	POSITIONDFEINIT[2:0]			TWOTCKTXDQSPRE	TWOTCKRXDQSPRE
							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **WDQSEXTENSION**:

When this bits is set, DQS_T and DQS_C are driven differentially to 0 and 1, respectively, before and after a write burst, except during a memory read transaction.

Note: Use of WDQSEXTENSION requires POdtTailWidth = 3 and POdtStartDelay = 00.

Bit 7 **LP4STTCPREBRIDGERXEN**: Used in LPDDR4 static-preamble mode to bridge the RxEn between two reads to the same timing group when the bubble is 1 memclk

LPDDR4 static-preamble mode is set in the DRAMs with MR1, OP[3] = 0.

Bit 6 **LP4POSTAMBLEEXT**:

In LPDDR4 mode, this bit must be set to extend the write postamble.

0: Half-memclk postamble, as in D4

1: One-and-one-half-memclk postamble

Note: See LPDDR4 Spec MR3, OP[1] WR PST, vendor-specific function.

Bit 5 **LP4TGLTWOTCKTXDQSPRE**: Used in LPDDR4 mode to modify the early preamble when TwoTckTxDqsPre = 1.

0: Level first-memclk preamble

1: Toggling first-memclk preamble

Bits 4:2 **POSITIONDFEINIT[2:0]**: For DDR4 PHY, only when receive DFE is enabled

0b010 is the nominal recommended value for leading edge used by receiver.

- Bit[2] = 1 causes DfeInit to be asserted late.
- Bit[1] = 1 causes DfeInit to be asserted at the nominal time.
- Bit[0] = 1 causes DfeInit to be asserted early.

Bit 1 **TWOTCKTXDQSPRE**:

For LPDDR4, all write operations are 2nCK such that this control must be set to 1.

Bit 0 **TWOTCKRXDQSPRE**:

Widens the RxDqsEn window to allow larger drift in the incoming read DQS to take advantage of the larger/wider preamble generated by the DRAMs when D4 DRAMS are configured with DDR4 MR4 A11 read preamble = 1 for causing a 2nCK read preamble.

For LPDDR4, all read operations are 2nCK such that this control must be set to 1.

Note: The nominal trained-to-center point is earlier relative to the first strobing edge of DQS than when not in this mode.

14.5.79 DDRPHYC MasterX4Config register (DDRPHYC_MASTER0_MASTERX4CONFIG)

Address offset: 0x80094

Reset value: 0x0000 0000

DBYTE module controls to select X4 DRAM device mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	X4TG[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **X4TG[3:0]**:
Set to 1 if this timing group/rank is x4 (as opposed to x8) memory.
xxx[1|0]: TxReqDest/RxReqDest 0 X4/X8.
xx[1|0]x: TxReqDest/RxReqDest 1 X4/X8.
x[1|0]xx: TxReqDest/RxReqDest 2 X4/X8.
[1|0]xxx: TxReqDest/RxReqDest 3 X4/X8.
Note: This bit must be written before dfi_init_start is asserted.

14.5.80 DDRPHYC write level feedback DQ observability selection register (DDRPHYC_MASTER0_WRLEVBITS)

Address offset: 0x80098

Reset value: 0x0000 0098

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **WRLEVFORDQSU[3:0]**: DQ bit used for write levelization
0000: use DQ0
..
0111: use DQ7
1000: use |DQ[3:0]
1001: use |DQ[7:4]
1010: use |DQ[7:0]

Bits 3:0 **WRLEVFORDQSL[3:0]**: DQ bit used for write levelization
0000: use DQ0
..
0111: use DQ7
1000: use |DQ[3:0]
1001: use |DQ[7:4]
1010: use |DQ[7:0]

14.5.81 DDRPHYC EnableCsMulticast register (DDRPHYC_MASTER0_ENABLECSMULTICAST)

Address offset: 0x8009C

Reset value: 0x0000 0000

In DDR4 mode, this controls whether CS_N[3:2] must be multicast on CID[1:0].

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ENABLECSMULTICAST
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **ENABLECSMULTICAST**:

Controls whether CS_N[3:2] must be multicast on CID[1:0] in DDR4 mode.
0: Do not override pins corresponding to cid[1:0] (dfi_cid[1:0] connects to the pads).
1: Override pins corresponding to cid[1:0] with dfi_cs[3:2]. (cs[3:2] is multicast on cs[3:2] and cid[1:0]).

14.5.82 DDRPHYC Acx4AnibDis register (DDRPHYC_MASTER0_ACX4ANIBDIS)

Address offset: 0x800B0

Reset value: 0x0000 0000

Disable for unused ACX nibbles.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	ACX4ANIBDIS[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **ACX4ANIBDIS[11:0]**:

When a bit is set, the corresponding ACX nibble is disabled. Specifically, the I/O OE is disabled, as is the Dfi-side FIFO clock

14.5.83 DDRPHYC enable Read-DBI function in each DBYTE register (DDRPHYC_MASTER0_DMIPINPRESENT)

Address offset: 0x800B4

Reset value: 0x0000 0000

This register is used to instruct the PHY whether to enable the Read-DBI function on lane 8 of each DBYTE. Only the LPDDR4 and DDR4 protocols support the Read-DBI feature.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RDDBIENABLED
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **RDDBIENABLED**:

This bit must be set if Read-DBI is enabled in a connected DDR4 or LPDDR4 device. If set, the following DRAM MR must also be set [DDR4.MR5.A12 = 1 or LPDDR4.MR3.OP[7] = 1].

14.5.84 DDRPHYC ARdPtrInitVal register (DDRPHYC_MASTER0_ARDPTRINITVAL)

Address offset: 0x800B8

Reset value: 0x0000 0000

Address/command FIFO read pointer initial value

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ARDPTRINITVAL[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **ARDPTRINITVAL[3:0]**: Initial pointer offset for the free-running FIFOs in the DBYTE and ACX4 hardips

The units of this bitfield are in UI. The pointer separation must be chosen to compensate for all sources of skew and drift of the PHY DFICLK and PCLK networks.

This bitfield must be programmed in Step C of the PHY Initialization sequence.

14.5.85 DDRPHYC DLL mode control for DBYTEs register (DDRPHYC_MASTER0_DBYTEDLLMODECNTRL)

Address offset: 0x800E8

Reset value: 0x0000 0000

DLL mode control register in DBYTE modules.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DLLRX PREA MBLE MODE	Res.
														rw	

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DLLRXPREAMBLEMODE**:
This bit must be set to 1 if read DQS preamble contains a toggle, for example DDR4 or LPDDR4 read toggling preamble mode.
In LPDDR4, the PIE always sets this bit field to 0x1 for correct operation of the retraining algorithm.

Bit 0 Reserved, must be kept at reset value.

14.5.86 IDDRPHYC impedance calibration offsets control register (DDRPHYC_MASTER0_CALOFFSETS)

Address offset: 0x80114

Reset value: 0x0000 0000

Safety register that can be used to correct systematic offsets from each calibration stage. It is not recommended to change these values from the default zero value.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	CALDRVPUTHOFFSET[3:0]				CALDRVPDTHOFFSET[3:0]				CALCMPR5OFFSET[5:0]					
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:10 **CALDRVPUTHOFFSET[3:0]**:
Adjusts the driver pull-up calibration code.

Bits 9:6 **CALDRVPDTHOFFSET[3:0]**:
Adjusts the driver pull-down calibration code.

Bits 5:0 **CALCMPR5OFFSET[5:0]**:
Adjusts the offset-compensated DAC code for the cmpana circuit at VREF == 0.5 * VDDQ.

14.5.87 DDRPHYC SarInitVals register (DDRPHYC_MASTER0_SARINITVALS)

Address offset: 0x8011C

Reset value: 0x0000 0127

This register specifies the initial value for the compensation engine. It is not recommended to change the default value.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	SARINITPEXT[2:0]			SARINITNINT[2:0]			SARINITOFFSET05[2:0]		
							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bits 8:6 **SARINITPEXT[2:0]**:
Specifies the SAR starting value for PEXT calibration. This is a 5-bit wide target.

Bits 5:3 **SARINITNINT[2:0]**:
Specifies the SAR starting value for NINT calibration. This is a 5-bit wide target.

Bits 2:0 **SARINITOFFSET05[2:0]**:
Specifies the SAR starting value for OFFSET05 calibration. This is an 8-bit wide target.

14.5.88 DDRPHYC CalPExtOvr register (DDRPHYC_MASTER0_CALPEXTOVR)

Address offset: 0x80124

Reset value: 0x0000 0000

Impedance calibration PExt override control.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CALPEXTOVR[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **CALPEXTOVR[4:0]**:
If CALPEXTDIS is set, the value provided here by software is used instead of the automatically generated value which is visible via CalPExt field.
This bitfield can only be written when the calibrator is not running.

14.5.89 DDRPHYC CalCmpr5Ovr register (DDRPHYC_MASTER0_CALCMPR5OVR)

Address offset: 0x80128

Reset value: 0x0000 0000

Impedance calibration Cmpr 50 control.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CALCMPR5OVR[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **CALCMPR5OVR[7:0]**:

If CALCMPR5DIS is set, the value provided here by software is used instead of the automatically generated value which is visible via CalCmpr5 field.
This bitfield can only be written when the calibrator is not running.

14.5.90 DDRPHYC CalNIntOvr register (DDRPHYC_MASTER0_CALNINTOVR)

Address offset: 0x8012C

Reset value: 0x0000 0000

Impedance calibration NInt override control.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CALNINTOVR[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **CALNINTOVR[4:0]**:

If the CALNINTDIS is set, the value provided here by software is used instead of the automatically generated value which is visible via CalNInt field.
This bitfield can only be written when the calibrator is not running.

14.5.91 DDRPHYC impedance calibration driver strength control register (DDRPHYC_MASTER0_CALDRVSTR0)

Address offset: 0x80140

Reset value: 0x0000 0000

For a given calibration target, this register specifies the drive strength(s) to be used. There is no encoding. The strength selected must match the external resistor value used for calibration.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CALDRVSTRPU50[3:0]				CALDRVSTRPD50[3:0]			
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **CALDRVSTRPU50[3:0]**:
0: 240.0R (Default)
1: 120.0R
2: 40.0R
3 to 15: Reserved

Bits 3:0 **CALDRVSTRPD50[3:0]**:
0: 240.0R (Default)
1: 120.0R
2: 40.0R
3 to 15: Reserved

14.5.92 DDRPHYC read data on-die termination timing control register (DDRPHYC_MASTER0_PROCODTTIMECTL)

Address offset: 0x80158

Reset value: 0x0000 001F

Controls timing of ProcOdt for DQ and DQS termination during reads (by PHY). Enabling and disabling of ProcOdt can be shifted with a granularity of 1UI. If WDQSEXTENSION is enabled, this register must be set to 0x03. Otherwise, use the recommended settings based

on MEMCLK frequency and TwoTckRxDqsPre. This ensures that ProcOdt is enabled before the DQS preamble begins, and is not disabled until after the DQS postamble ends.

Recommended configuration if TwoTckRxDqsPre == 1:

- 0 MHz < memclk-freq ≤ 933, PODTSTARTDELAY[1:0] = 2, PODTTAILWIDTH[1:0] = 2
- 933 MHz < memclk-freq ≤ 1200, PODTSTARTDELAY[1:0] = 0, PODTTAILWIDTH[1:0] = 2
- 1200 MHz < memclk-freq ≤ NA, PODTSTARTDELAY[1:0] = 0, PODTTAILWIDTH[1:0] = 3

Recommended configuration if TwoTckRxDqsPre == 0:

- 0 MHz < memclk-freq ≤ 933, PODTSTARTDELAY[1:0] = 2, PODTTAILWIDTH[1:0] = 2
- 933 MHz < memclk-freq ≤ 1200, PODTSTARTDELAY[1:0] = 1, PODTTAILWIDTH[1:0] = 2
- 1200 MHz < memclk-freq < PODTSTARTDELAY[1:0] = 3

See related DDRPHYC_DBYTEy_TXODTDRVSTREN_By registers.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PODTTAILWIDTHEXT[1:0]		PODTSTARTDELAY[1:0]		PODTTAILWIDTH[1:0]	
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:4 **PODTTAILWIDTHEXT[1:0]**:

Controls the length of the tail of ProcOdt (units of UI). Controls the time from closing the window to receive DQS to ProcOdt deassertion. This bitfield can be set with values ranging from 0 to 3.

The aforementioned timing is defined as
(3 + PODTTAILWIDTH + PODTTAILWIDTHEXT - TwoTckRxDqsPre) UIs.

- It is recommended to use this bitfield as an extension to POdtTailWidth, and has a default value of 1. Note that this might not be the optimal value, since it is technology dependent.

Bits 3:2 **PODTSTARTDELAY[1:0]**:

Controls the start of ProcOdt (units of UI).

11: delay start 2 UI (maximum delay of start of ProcOdt)

10; delay start 1 UI

01: delay start 0 UI (default)

00: early by 1 UI

The time from ProcOdt assertion to open the window to receive DQS is than
(10 - PODTSTARTDELAY) UI. It can be up to 4 pclk smaller if small coarse delays are used (only at the lowest clock frequencies).

Bits 1:0 **PODTTAILWIDTH[1:0]**:

Controls the length of the tail of ProcOdt (units of UI). Controls the time from closing the window to receive DQS to ProcOdt deassertion. This bitfield can be set with values ranging from 0 to 3.

The aforementioned timing is defined as
(3 + PODTTAILWIDTH + PODTTAILWIDTHEXT - TwoTckRxDqsPre) UIs.

It is recommended to use this bitfield as the main timing configuration unit, with default value of 3. This may not be the optimal value, since it is technology dependent.

14.5.93 DDRPHYC MemAlert receiver configuration register (DDRPHYC_MASTER0_MEMALERTCONTROL)

Address offset: 0x8016C

Reset value: 0x0000 4000

Controls for the receiver for MemAlert (D4 parity or WCRC error) or, alternately, for ERR_n (D3 registered DIMM).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MALERTFORCEERROR	MALERTDISABLEVAL	MALERTRXEN	MALERTPUEN	MALERTPUSTREN[3:0]				MALERTVREFEXTEN	MALERTVREFLEVEL[6:0]						
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **MALERTFORCEERROR**:

When set, this bit state is used to force the parity error to memory.

Bit 14 **MALERTDISABLEVAL**:

When MALERTRXEN is not set, this bit state is used to drive dfi_alert_n.

Bit 13 **MALERTRXEN**:

This bit is programmable as follows:
0: Disable the receiver and send MALERTDISABLEVAL to dfi_alert_n.
1: Enable the receiver, and received data are forwarded to dfi_alert_n.

Bit 12 **MALERTPUEN**:

When set, this bit enables the pull-up termination on MALERT

Bits 11:8 **MALERTPUSTREN[3:0]**:
Controls the pull-up termination on MALERT.
- bit[8]: Controls a 240 Ω pull-up leg.
- bit[9]: Controls a 240 Ω pull-up leg.
- bit[10]: Controls a 120 Ω pull-up leg.
- bit[11]: Controls a 120 Ω pull-up leg.

This bitfield is programmable as follows:
0000: No pull-up strength
0001: 240 Ω pull-up strength
0010: 240 Ω pull-up strength
0011 - 120 Ω pull-up strength
0100: 120 Ω pull-up strength
0101: 80 Ω pull-up strength
0110: 80 Ω pull-up strength
0111: 60 Ω pull-up strength
1000: 120 Ω pull-up strength
1001: 80 Ω pull-up strength
1010: 80 Ω pull-up strength
1011: 60 Ω pull-up strength
1100: 60 Ω pull-up strength
1101: 48 Ω pull-up strength
1110: 48 Ω pull-up strength
1111: 40 Ω pull-up strength

Bit 7 **MALERTVREFEXTEN**:
When set for test/debug, this bit selects external V_{REF} source. It must not be set in mission mode.

Bits 6:0 **MALERTVREFLEVEL[6:0]**:
Sets the V_{REF} level of internal V_{REF} DAC, assuming the following mission mode settings: [TestExtVrefRange,TestMajorMode] = 0011 or 0000.
The V_{REF} level chosen by the receiver follows the equation:
$V_{REF} = V_{DDQ} * (0.51 + MALERTVREFLEVEL[6:0] * 0.00345)$.
The min/max values possible are:
- V_{REF} min = $V_{DDQ} * 0.51$
- V_{REF} max = $V_{DDQ} * 0.948$

14.5.94 DDRPHYC MemAlert receiver configuration register 2 (DDRPHYC_MASTER0_MEMALERTCONTROL2)

Address offset: 0x80170

Reset value: 0x0000 0000

Controls for the MemAlert output (dfi_alert_n) The DFI interface defines that the signal dfi_alert_n as a synchronous output on DFICLK. For some memory systems, this signal is

synchronized again elsewhere in the device. The synchronizer in the PHY is then useless (and simply added to the latency of observing an ALERT transition).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MALERTSYNCBYPASS
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **MALERTSYNCBYPASS**:

This bit is programmed as follows:

0: The phy drives dfi_alert_n with a synchronized value of the ALERT_N receiver.

1: The phy drives dfi_alert_n with the asynchronous value of the ALERT_N receiver.

14.5.95 DDRPHYC protection and control of BP_MemReset_L register (DDRPHYC_MASTER0_MEMRESETL)

Address offset: 0x80180

Reset value: 0x0000 0000

Controls the MemResetL output of the PHY. Intended to be used to protect/force the BP_MemReset_L output.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PROTECTMEMRESET	MEMRESETLVALUE
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **PROTECTMEMRESET**:

Controls the MemResetL output of the PHY. The state of the MemResetL is transfered to the PHY BP_MemReset_L output when this bit is set.

Bit 0 **MEMRESETLVALUE**:

Controls the MemResetL output of the PHY. The state of this bit is transfered to the PHY BP_MemReset_L output when PROTECTMEMRESET is set.

14.5.96 DDRPHYC PUBMODE - HWT Mux select register (DDRPHYC_MASTER0_PUBMODE)

Address offset: 0x801B8

Reset value: 0x0000 0000

Selects between HWT and DCT as source of memory transactions.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HWTMEMSRC
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **HWTMEMSRC**:

When this bit is set, the mux that switches between DCT and HWT for the source of memory transactions is switched to HWT.

0: Control to the DCT

1: Control to the HWT

The transition can only be made when the FIFOs are all in PtrInit (all PtrInit signals are high).

14.5.97 DDRPHYC misc PHY status bits register (DDRPHYC_MASTER0_MISCPHYSTATUS)

Address offset: 0x801BC

Reset value: 0xXXXX XXXX

This read-only register represents the miscellaneous status of the PHY

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PORMEMRESET	DCTSANE
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **PORMEMRESET**:

Returns the active-high value used by the custom circuit which drives the memory reset signal. To comply with JEDEC specifications for memory reset, this signal powers on 1. This signal is reset during the PHY initialization sequence.

Bit 0 **DCTSANE**:

Returns the status of the custom circuit which protects the MemResetL output of the PHY on the initial power-on or reset.

0: Hardware controls the MemResetL output.

1: The memory reset is being controlled by MEMRESESETLVALUE and PROTECTMEMRESET or dfi_reset_n.

14.5.98 DDRPHYC CoreLoopbackSel register (DDRPHYC_MASTER0_CORELOOPBACKSEL)

Address offset: 0x801C0

Reset value: 0x0000 0000

Controls whether the loopback path bypasses the final PAD node.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CORELOOPBACKSEL
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **CORELOOPBACKSEL**:

This bit is controlled by the PHY test firmware. It enables core-side loopback operation of the PHY.

When set, the PHY PAD node is bypassed, and pre-pad node is selected for sampling by the PHY RX. Setting this bit enables full-speed loopback operation of the PHY regardless of the loading of the pad.

This bit must be set to 0x0 for mission mode operation (or pad-side loopback).

14.5.99 DDRPHYC DLL various training parameters register (DDRPHYC_MASTER0_DLLTRAINPARAM)

Address offset: 0x801C4

Reset value: 0x0000 0002

DLL training parameters

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EXTENDPHDTIME[1:0]	
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **EXTENDPHDTIME[1:0]**: Used by the PHY firmware locking the LCDL delay cells
Number of extra DfiClk periods (= 4 * UI) for the DLL phase-detector outputs to become not-metastable

14.5.100 DDRPHYC HwtLpCsEnBypass register (DDRPHYC_MASTER0_HWTLPCSENBYPASS)

Address offset: 0x801D0

Reset value: 0x0000 0000

CSn disable bypass for LPDDR4.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HWTLPCSENBYPASS
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **HWTLPCSENBYPASS**:
When set, this bit disables LpCsEn function for LPDDR4.

14.5.101 DDRPHYC DFI command/address mode register (DDRPHYC_MASTER0_DFICAMODE)

Address offset: 0x801D4

Reset value: 0x0000 0000

This register controls the PHY signal-to-bump-mapping mode. The default state is all bits 0. Setting bits changes the arch mode, and are required to be 1-hot. While all bits are present in all products, some are not always relevant as a particular DRAM type may not be supported. Irrelevant bits must always be set to 0. Programmed by dwc_ddrphy_phyinit_C_initPhyConfig() according to PHY configuration and DRAM type.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFID4ALTCAMODE	DFILP4CAMODE	DFID4CAMODE	DFILP3CAMODE
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **DFID4ALTCAMODE**: DDR4-Alt mode enable (only available in certain configurations)
0: D4-Alt mode disabled
1: D4-Alt mode enabled

Bit 2 **DFILP4CAMODE**: LP4 mode enable
0: LP4 mode disabled
1: LP4 mode enabled

Bit 1 **DFID4CAMODE**: DDR4 mode enable
0: D4 mode disabled
1: D4 mode enabled

Bit 0 **DFILP3CAMODE**: Reserved, must be kept at reset value.

14.5.102 DDRPHYC DLL lock state machine control register (DDRPHYC_MASTER0_DLLCONTROL)

Address offset: 0x801E0

Reset value: 0x0000 0003

This register is written by the PIE, and data in here are overwritten.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DLLRESETRSVD	DLLRESETSLAVE	DLLRESETRELOCK
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DLLRESETRSVD**: Reserved

Bit 1 **DLLRESETSLAVE**: Reserved.

Bit 0 **DLLRESETRELOCK**: Used to reset the DDL/LCDL lock state machine
Deasserting starts locking sequence. This must be done anytime the DLLs are to be relocked (for example: frequency change).

14.5.103 DDRPHYC DLL update phase control register (DDRPHYC_MASTER0_PULSEDLLUPDATEPHASE)

Address offset: 0x801E4

Reset value: 0x0000 0000

This register is used only for test and for training. It is not used in PIE frequency change or power-state change. The CfgWE for this register causes an UpdatePhase (ClkPhase) for the DLL associated with the subfield enables.

- Writing 1 to one of the PULSExxxDLLUPDATEPHASE causes a pulse. It asserts ClkPhase = 1, then clears ClkPhase = 0.
- There is no need to write a 0 after writing a 1 to one of the PulseXDllUpdatePhase.
- A written 1 reads back a 1, but that does not mean that ClkPhase to the corresponding DLL is being held high.
- Writing this register must be in a traffic bubble.
- Writing all-0s to this register is a NOP for the DLLs. It clears any read-back values if they are set.
- This function requires AlwaysEnCfgClk = 1.

Example to update the active phases of the DBYTE module DLLs (NOP for AC module DLLs):

```
io_write16(c0 | tMASTER | csr_CalAndPllConfig_ADDR,
csr_AlwaysEnCfgClk_MASK);
io_write16(cbrd | tANIB | csr_PulseDllUpdatePhase_ADDR,
csr_PulseDbyteDllUpdatePhase_MASK);
io_write16(cbrd | tANIB | csr_PulseDllUpdatePhase_ADDR, 0x0);
```

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ALWAYSUPDATELCDLPHASE	TRAINUPDATEPHASEONLONGBUBBLE	UPDATEPHASEDESTRESERVED[2:0]			PULSEACADLLUPDATEPHASE	PULSEACKDLLUPDATEPHASE	PULSEDBYTEDLLUPDATEPHASE
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **ALWAYSUPDATELCDLPHASE**:
Causes each new operation to reload the LcdlPhase, and increases bubbles.

Bit 6 **TRAINUPDATEPHASEONLONGBUBBLE**:
Causes LongBubble to update the DBYTE and ANIB LDCL phase. Can be used for training, but not to be used for mission mode.

Bits 5:3 **UPDATEPHASEDESTRESERVED[2:0]**: reserved, not used

Bit 2 **PULSEACADLLUPDATEPHASE**:
Causes an AC module CA (command/address/cke/odt) DLL phase update.

Bit 1 **PULSEACKDLLUPDATEPHASE**:

Causes an AC module CK (memck) DLL phase update. This bit must be set only when the memory CKE = 0 or memory RST = 0, or when there is no memory, as in tester mode.

Bit 0 **PULSEDBYTEDLLUPDATEPHASE**:

Causes a LongBubble to the DBYTE modules, which causes an update of the DBYTE module DLLs (tx,rxen,rxclk).

14.5.104 DDRPHYC DLL gain control register (DDRPHYC_MASTER0_DLLGAINCTL)

Address offset: 0x801F0

Reset value: 0x0000 00A1

Controls for the DllGain sequencing for locking and maintaining lock of the LCDL delay cells.

- The DllGain sequencer starts locking with the DllGainIV.
- As the end of locking approaches, the DllGain is incremented in stages until, at the end of locking, the DllGain is the terminal values DllGainTV.
- 2^(5-DllGain) is fractional change in the DAC code MstPhase1UI[8:0] of DLL per pclk.
- Firmware uses values for DllGainIV, DllGainTV, and LcdlSeed0 that are optimized for minimum locking time. These controls are not to be configured by the user.

				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **DLLSEEDSEL[3:0]**: Reserved, must be configured to be 0.

Bits 7:4 **DLLGAINTV[3:0]**: Terminal value of DllGain (value in effect when locking is done), and value used for maintaining lock (tracking pclk variation)

DllGainTV must be greater than or equal to DllGainIV. The maximum value is 10.

Bits 3:0 **DLLGAINIV[3:0]**: Initial value of DllGain

14.5.105 DDRPHYC impedance calibration control register (DDRPHYC_MASTER0_CALRATE)

Address offset: 0x80220

Reset value: 0x0000 0009

Controls the impedance calibration engine in the PHY.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DISABLEBACKGROUNDZQUPDATES	CALONCE	CALRUN	CALINTERVAL[3:0]			
									rw	rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **DISABLEBACKGROUNDZQUPDATES**: Reserved for debug only

When this bit is set, ZQ compensation code updates occur only during a DFI sideband [PHYUPDATE,CTRLUPDATE,PHYMSTR] handshake.

This debug feature must be disabled if DFI1 is active.

Bit 5 **CALONCE**:

The setting of this bit changes the behavior of CALRUN.

0: The calibration proceeds at the rate determined by CALINTERVAL[3:0].

1: The 0->1 transition of CALRUN causes a single iteration of the calibration sequence to occur. Once the calibration is complete, the calibration engine remains idle until another CALRUN trigger.

This bit must only be changed while the calibrator is idle (before CALRUN is set).

Bit 4 **CALRUN**:

This bit is programmed as follows:

0: The calibrator does not run. If already active, then it completes the current sequence before quiescing (default value because the calibrator needs to know the correct operating mode before it starts up).

1: A calibration sequence is triggered by the 0->1 transition of this bit, as determined by CALONCE.

This bit does not make anything while CALZAP = 1.

Bits 3:0 **CALINTERVAL[3:0]**: Interval between successive calibrations
0000: 0 ms (continuous)
0001: 0.010 ms
0010: 0.10 ms
0011: 1 ms
0100: 2 ms
0101 3 ms
0110: 4 ms
0111: 8 ms
1000: 10 ms
1001: 20 ms
Others: Reserved
This bitfield must only be changed while the calibrator is idle (before CALRUN is set).
The calibration intervals are valid only at DFICLK frequency ≥ 24 MHz.
If the DFICLK frequency is less than 24 MHz, the interval cab be up to 2.4x larger than the value programmed in this bitfield.

14.5.106 DDRPHYC CalZap register (DDRPHYC_MASTER0_CALZAP)

Address offset: 0x80224

Reset value: 0x0000 0000

Impedance calibration zap/reset

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CALZAP
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **CALZAP**:
This bit is written by the PIE, and the data in here are overwritten. Setting this bit resets the calibrator to its idle state. This bit must be cleared for the calibration engine to run again.

14.5.107 DDRPHYC PState register (DDRPHYC_MASTER0_PSTATE)

Address offset: 0x8022C

Reset value: 0x0000 000C

PSTATE selection

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PSTATE[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **PSTATE[3:0]**:

This bitfield is written by the PIE, and the data in here are overwritten.
The current PState inferred by the PIE from handshake requests on DFI status interface.
0000: PState P0
1100: LP2
1111: LP3
Others: Reserved
The lower two bits of this bitfield are used to select the PHY current PState for all PStateable registers.

Note: The value selected in either LP2 or LP3 is don't care because no transactions are taking place when in these states.

14.5.108 DDRPHYC PLL output control register (DDRPHYC_MASTER0_PLLOUTGATECONTROL)

Address offset: 0x80234

Reset value: 0x0000 0000

This register is written by the PIE, and the data in here are overwritten.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PLLDLLLOCKDONE
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **PLLDLLLOCKDONE**:

This bit is set by the PIE during execution, and cleared on PHY reset, or on power cycle. When set, this bit releases control of PHY I/Os from power-on defaults.

Note: This is a legacy bit name and no longer represents when PHY internal PLL or DLL is locked.

14.5.110 DDRPHYC CalBusy register (DDRPHYC_MASTER0_CALBUSY)

Address offset: 0x8025C

Reset value: 0xXXXX XXXX

Impedance calibration busy status

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **RESERVED15**: Miscellaneous impedance calibration controls

Bit 14 **CALSLOWCMPANA**:

When set, this bit doubles the time allowed for the analog comparator cell to settle before sampling begins.

Bit 13 **CALCANCELROUNDERRDIS**:

The PEXT and NINT calibration results naturally include a rounding error which manifests as a change of impedance at the pad. Where these errors are in the same direction, the PEXT calibration result is adjusted by 1 to offset NINT error. Setting this bit to 1 prevents this adjustment.

Bit 12 **CALCMPTRRESTRIM**: Reserved

Bit 11 **RESERVED11**: Reserved (formerly used to skip ODT calibration if required)

Bits 10:3 **RESERVED10X3[7:0]**: Reserved

Bits 2:0 **CALNUMVOTES[2:0]**:

This bitfield controls the number of consecutive comparator output bits over which majority voting is done. It effectively works as a sampling window, since each sample serves as a single vote. The result of the voting is fed into the successive approximation register (SAR). The voting is initiated after the time configured via CALSLOWCMPANA has elapsed. The number of votes is given below.

000: 1
001: 9
010: 17
011: 33
100: 65 (default)
101: 129
110: 193
111: 255

14.5.112 DDRPHYC controls for disabling the impedance calibration of certain target register (DDRPHYC_MASTER0_CALMISC)

Address offset: 0x80268

Reset value: 0x0000 0000

Table of impedance calibration bit relatedness:

Target: OFFSET05

- also known as: CALCMPR5
- working state: RESCALCMPR5
- r/w viewing bit: CALCMPR5
- override bit: CALCMPR5OVR
- offset bit: CALCMPR5OFFSET

Target: NINT

- also known as: CALDRVPD5
- working state: RESCALNINT
- r/w viewing bit: CALNINT
- override bit: CALNINTOVR
- offset bit: [CALDRVPDOFFSET, CALDRVPDTHOFFSET]

Target: PEXT

- also known as: CALDRVPU5
- working state: RESCALPEXT
- r/w viewing bit: CALPEXT
- Override bit: CALPEXTOVR
- Offset bit: [CALDRVPUOFFSET, CALDRVPUTHOFFSET]

Miscellaneous calibration control knobs. These values can only be changed when the calibrator is not running.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CALPEXTDIS**:

Setting this bit prevents the calibration engine from overwriting TXCALBINP and TXCALTHP with an automatically generated value, in which case a value must be supplied by software.

Bit 1 **CALNINTDIS**:

Setting this bit prevents the calibration engine from overwriting TXCALBIN and TXCALTHN with an automatically generated value, in which case a value must be supplied by software.

Bit 0 **CALCMPR5DIS**:
Setting this bit prevents the calibration engine from using the result from the CALCMPR5 stage of calibration. Software must supply a replacement value via CALCMPR5OVR.

14.5.113 DDRPHYC CalVRef register (DDRPHYC_MASTER0_CALVREFS)

Address offset: 0x8026C

Reset value: 0x0000 0002

VREF code for comparator offset compensation

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFIRDDESTM3[1:0]		DFIRDDESTM2[1:0]		DFIRDDESTM1[1:0]		DFIRDDESTM0[1:0]	
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **DFIRDDESTM3[1:0]**:
Maps dfi_rddata_cs_n[3] to destination DfiRdDestm3 timing.
For example, if 3 dfi_rddata_cs_n[3] uses Register Rx[En,Clk]DlyTg3 timing.

Bits 5:4 **DFIRDDESTM2[1:0]**:
Maps dfi_rddata_cs_n[2] to destination DfiRdDestm2 timing.
For example, if 2 dfi_rddata_cs_n[2] uses Register Rx[En,Clk]DlyTg2 timing.

Bits 3:2 **DFIRDDESTM1[1:0]**:
Maps dfi_rddata_cs_n[1] to destination DfiRdDestm1 timing.
For example, if 1 dfi_rddata_cs_n[1] uses Register Rx[En,Clk]DlyTg1 timing.

Bits 1:0 **DFIRDDESTM0[1:0]**:
Maps dfi_rddata_cs_n[0] to destination DfiRdDestm0 timing.
For example, if 0 dfi_rddata_cs_n[0] uses Register Rx[En,Clk]DlyTg0 timing.

14.5.120 PHY global V_{REF} controls register (DDRPHYC_MASTER0_VREFINGLOBAL)

Address offset: 0x802C8

Reset value: 0x0000 0200

This register controls the PHY global V_{REF} generator, and the PHY analog pad BP_VREF. The mission mode function of the PHY V_{REF} generator is to generate V_{REF}DQ for the PHY

RX function. This register is written and configured by the PHY training firmware for mission mode function.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	GLOBALVREFINMODE	GLOBALVREFINTRIM[3:0]				GLOBALVREFINDAC[6:0]							GLOBALVREFINSEL[2:0]		
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **GLOBALVREFINMODE**: Reserved

Bits 13:10 **GLOBALVREFINTRIM[3:0]**: Reserved

Bits 9:3 **GLOBALVREFINDAC[6:0]**: DAC code for internal V_{REF} generation
The DAC has two ranges; the range is set by GLOBALVREFINSEL[2]
Range0: [GLOBALVREFINSEL[2] = 0] (TBD)
– DAC output voltage = GLOBALVREFINDAC == 0x00 then set to Hi-Z, else set to 0.345 * V_{DDQ} + (0.005 * GLOBALVREFINDAC * V_{DDQ})
Range1: [GLOBALVREFINSEL[2] = 1]
– DAC output voltage = GLOBALVREFINDAC == 0x00 then set to Hi-Z, else set to 0.005 * (GLOBALVREFINDAC - 1) * V_{DDQ}

Bits 2:0 **GLOBALVREFINSEL[2:0]**:
[1:0] controls the mode of the PHY V_{REF} DAC and the BP_VREF pin.
00: PHY V_{REF} DAC range0 -- BP_VREF = Hi-Z
01: Reserved
10: PHY V_{REF} DAC range0 -- BP_VREF connected to PLL analog bus
11: PHY V_{REF} DAC range0 -- BP_VREF connected to PHY V_{REF} DAC
[2] controls the DAC range for internal V_{REF} generation.

14.5.121 DDRPHYC maps dfi_rddata_cs_n to destination dimm timing group register (DDRPHYC_MASTER0_DFIWRDATACSDESTMAP)

Address offset: 0x802D0

Reset value: 0x0000 00E4

This register must be default values in LPDDR4 mode Maps dfi_wrdata_cs_n (write chip-select asserted low) to destination dimm timing group. The full dfi interface has 72 values of dfi_wrdata_cs_n, with eight per byte. Byte db (0..8) uses values dfi_wrdata_cs_n[(db*8 + 7):(db*8 + 0)], and this register, which is per byte, to determine the

timing-control registers to use for the asserted chip-select. For simplicity, the subfield description does not include the byte offset for dfi_wrdata_cs_n.

Note: The example values below are the default/reset values. If this register is written to all zeroes, then all writes use register Tx[Dq,Dqs]Dlyd0 timing.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFIWRDESTM3[1:0]		DFIWRDESTM2[1:0]		DFIWRDESTM1[1:0]		DFIWRDESTM0[1:0]	
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:6 **DFIWRDESTM3[1:0]**:
Maps dfi_wrdata_cs_n[3] to destination DfiWrDestm3 timing (use register Tx[Dq,Dqs]DlyTg3)
For example, if 3 dfi_wrdata_cs_n[0] uses register Tx[Dq,Dqs]DlyTg3 timing.

Bits 5:4 **DFIWRDESTM2[1:0]**:
Maps dfi_wrdata_cs_n[2] to destination DfiWrDestm2 timing
For example, if 2 dfi_wrdata_cs_n[0] uses register Tx[Dq,Dqs]DlyTg2 timing.

Bits 3:2 **DFIWRDESTM1[1:0]**:
Maps dfi_wrdata_cs_n[1] to destination DfiWrDestm1 timing
For example, if 1 dfi_wrdata_cs_n[0] uses register Tx[Dq,Dqs]DlyTg1 timing.

Bits 1:0 **DFIWRDESTM0[1:0]**:
Maps dfi_wrdata_cs_n[0] to destination DfiWrDestm0 timing
For example, if 0 dfi_wrdata_cs_n[0] uses register Tx[Dq,Dqs]DlyTg0 timing.

14.5.122 DDRPHYC MasUpdGoodCtr register (DDRPHYC_MASTER0_MASUPDGOODCTR)

Address offset: 0x802D4

Reset value: 0xXXXX XXXX

Counts successful PHY master interface updates (PPT, periodic phase training).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CTLUPD0GOODCTR[15:0]**:

This bitfield increments whenever the PHY acknowledges a memory controller-initiated DFI0 interface update request. The counter saturates at max value 65535.

14.5.126 DDRPHYC MasUpdFailCtr register (DDRPHYC_MASTER0_MASUPDFAILCTR)

Address offset: 0x802E8

Reset value: 0xXXXX XXXX

Counts unsuccessful PHY master interface updates.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PLLFREQSEL[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **PLLFREQSEL[4:0]**:
Adjusts the loop parameters to compensate for different VCO bias points, and input/output clock division ratios.

14.5.132 DDRPHYC PLL control 0 register (DDRPHYC_MASTER0_PLLCTRL0)

Address offset: 0x80318

Reset value: 0x0000 2008

This register is written by the PIE, and the data in here are overwritten.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

PLLSPARECTRL0	PLLLOCKPHSEL[1:0]		PLLLOCKCNTSEL	PLLGEARSHIFT	PLLRESERVED10X9[1:0]		PLLSYNCBUSBYP	PLLSYNCBUSFLUSH	PLLSELDFIFREQRATIO	PLLBYPASSMODE	PLLPRESET	PLLOUTBYPEN	PLLX2MODE	PLLBYPSEL	PLLSTANDBY
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **PLLSPARECTRL0**: Spare bits for PLL control

Bits 14:13 **PLLLOCKPHSEL[1:0]**: Lock detect phase selection
00: Test mode reduced lock window
01: Default operation phase lock
10: Test mode (mismatch check)
11: Test mode (+80ps window)

Bit 12 **PLLLOCKCNTSEL**: Lock detect counter selection
0: Normal lock detector behavior phase lock
1: Test mode (shorten lock cycle count 16->8)

Bit 11 **PLLGEARSHIFT**: PLL fast re-locking mode
0: Normal mode (default)
1: Fast relock gear

Bits 10:9 **PLLRESERVED10X9[1:0]**: Reserved

Bit 8 **PLLSYNCBUSBYP**:
When asserted, bypasses the Pll SyncPulse, and uses a synchronizer of the same latency.

Bit 7 **PLLSYNCBUSFLUSH**:
Used to flush the syncbus logic of the PLL during PHY initialization or LP3 exit sequence. Must only be toggled when syncbus is not used and PLLOUTBYPEN is asserted.

Bit 6 **PLLSELDFIFREQRATIO**: Reserved

Bit 5 **PLLBYPASSMODE**: PLL bypass clock mux control
If set, BypassPclk input is used as byp_pll1x_in clock for PLL (default 0).

Bit 4 **PLLPRESET**: PLL preset mode

Bit 3 **PLLOUTBYPEN**:
Controls the anti-glitch mux on the pllout_x1x2x4 path.
1: pllout_x1x2x4 = byp_pllin_x1
0: pllout_x1x2x4 = VCO (SCD) (selected by x2_mode)

Bit 2 **PLLX2MODE**:
Connects to x2_mode pins of PLL (pllout_x4x2 output frequency selection).
0: PLOUT_X4X2 output = 4*pllin_x1 frequency
1: PLOUT_X4X2 output = 2*pllin_x1 frequency

Bit 1 **PLLBYPSEL**: Reserved

Bit 0 **PLLSTANDBY**:
Connects directly to standby pin of the PLL. Puts PLL into Standby mode.

14.5.133 DDRPHYC PState dependent PLL control 1 register (DDRPHYC_MASTER0_PLLCTRL1)

Address offset: 0x8031C

Reset value: 0x0000 0020

This register is to be programmed by bios or other means to set PLL charge-pump settings in various PStates.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	PLLCPPROPCTRL[3:0]				PLLCPINTCTRL[4:0]				
							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bits 8:5 **PLLCPPROPCTRL[3:0]**:
Connects directly to cp_prop_cntrl<3:0> of the PLL. Charge pump proportional current control.

Bits 4:0 **PLLCPINTCTRL[4:0]**:
Connects directly to cp_int_cntrl<4:0> in the PLL. Charge pump integrating current control.

14.5.134 DDRPHYC PLL testing control register (DDRPHYC_MASTER0_PLLTST)

Address offset: 0x80320

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	PLLDIGTSTSEL[3:0]				PLLANATSTSEL[3:0]				PLLANATSTEN
							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bits 8:5 **PLLDIGTSTSEL[3:0]**: Digital test mux select

Connects directly to pll_dig_test_sel<2:0> of PLL. Control bits are decoded to enable various digital test signals to be brought out via digital test pin (decode details below).
- PllDigTstOut[1] is observable on BP_ALERT and digital observation pin via MtestMuxSel logic.
- PllDigTstOut[0] is observable on digital observation pin via MtestMuxSel logic only (if enabled in this configuration).
- During mission mode PLLDIGTSTSEL must be set to 0x0.
- Byp = PLLBYPASSMODE value
- Sel = PLLDIGTSTSEL value

Byp | Sel | PllDigTstOut[1] | PllDigTstOut[0] | Description
- 0 | 000 | 0 | 0 | This code must be set during normal use to minimize clock jitter.
- 0 | 001 | fbk_clk_ldet | pllin_x1 | Buffered version of fbk_clk at PFD input
- 0 | 010 | ref_clk_ldet | pllin_x1 | Buffered version of ref_clk at PFD input
- 0 | 011 | pllin_x1 | pllin_x1 | For calibrating delay skew between two test outputs - input reference clock
- 0 | 100 | clk_fbk | pllin_x1 | Buffered version of pllout_x1
- 0 | 101 | pllout_amux_x1x2x4 | pllin_x1 | Syncbus clock output (Fout < Fmax_dto only)
- 0 | 110 | en_count | pll_lock | Lock detector state test
- 0 | 111 | standby_eff | eoc | Calibration state test
- 1 | 000 | 0 | 0 | This code must be set during normal use to minimize clock jitter.
- 1 | 001 | fbk_clk_ldet | pllin_x1 | Buffered version of fbk_clk at PFD input if PLL in mission/byp 1 modes
- 1 | 010 | ref_clk_ldet | pllin_x1 | Buffered version of ref_clk at PFD input -if PLL in mission/byp 1 modes
- 1 | 011 | pllin_x1 | pllin_x1 | For calibrating delay skew between two test outputs - input reference clock
- 1 | 100 | clk_fbk | pllin_x1 | Buffered version of pllout_x1 if PLL in mission/byp 1 modes
- 1 | 101 | pllout_amux_x1x2x4 | pllin_x1 | Syncbus clock output (Fout < Fmax_dto only)
- 1 | 110 | en_count | pll_lock | Lock detector test if PLL in mission/byp 1 modes
- 1 | 111 | standby_eff | eoc | Calibration state test if PLL in mission/byp 1 modes

Note: Fmax_dto=400 MHz

Bits 4:1 **PLLANATSTSEL[3:0]**:

Connects directly to pll_ana_test_sel<3:0> of PLL. Control bits are decoded to enable various analog test signals to be brought out via analog test pin (pll_analog_test) (decode details below).

PLLANATSTSEL: Pll Analog Pin Function: Description

0000: Hi-Z: This code must be set when the PLL is in normal use or when the digital test port is being used for accurate timing measurements.

0001: core: Override vmarg_ext with analog pin.

0010: core: Override regulator input with analog pin.

0011: core: Observe gd voltage on analog test pin.

0100: core: Observe vp voltage on analog test pin.

0101: core: Observe vph voltage on analog test pin.

0110: core: Observe vreg_cp voltage on analog test pin.

0111: core: Observe v2i current (~10uA) on analog test pin.

1000: core: Observe vreg_v2i voltage on analog test pin.

1001: core: Observe vbp voltage from current source on analog pin.

1010: core: Observe vbn voltage from current source on analog pin.

1011: core: NC

1100: core: NC

1101: VSS: 0v probe IR drop test

1110: VP: Core supply probe SCD IR drop test

1111: VPH: Core supply probe Refdiv IR drop test

Bit 0 **PLLANATSTEN**: Analog test port enable

Connects directly to pll_ana_test_en of PLL..

0: Analog test port disabled (hi-Z)

1: Analog test port enabled

14.5.135 DDRPHYC PllLockStatus register (DDRPHYC_MASTER0_PLLLOCKSTATUS)

Address offset: 0x80324

Reset value: 0xXXXX XXXX

PLL pll_lock pin output

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PLLLOCKSTATUS
															r

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **PLLLOCKSTATUS**: Directly connected to the pll_Lock output

When asserted, PLL macro has asserted the lock status. To avoid metastability issues, this bit must perform a majority-vote after reading this bit several times.

14.5.136 DDRPHYC PII TestMode register (DDRPHYC_MASTER0_PLLTESTMODE)

Address offset: 0x80328

Reset value: 0x0000 0124

Additional controls for PLL CP/VCO modes of operation

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

PLLTESTMODE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PLLTESTMODE[15:0]**:

Default values for this bitfield must be used unless directed otherwise by Synopsys.
Directly connected to testmode[15:0] pin of PLL

14.5.137 DDRPHYC PLL control 3 register (DDRPHYC_MASTER0_PLLCTRL3)

Address offset: 0x8032C

Reset value: 0x0000 01F0

It is recommended to use default values for this register. Otherwise, it can be programmed by bios or other means.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **PLLENCAL**:

0: The calibration does not run.
1: The calibration runs at standby rising edge.

Bit 14 **PLLFORCECAL**:

Connects directly to force_cal of PLL.
0: Previous stored value used
1: Forces the calibration code dacval_in<4:0> to be used at preset mode.

Bits 13:9 **PLLDACVALIN[4:0]**:

Connects directly to dacval_in<4:0> of PLL. If this bitfield is set, the calibration DAC input current setting can be forced at rising edge of preset.

Bits 8:4 **PLLMAXRANGE[4:0]**:
Connects directly to maxrange of PLL. Setting for saturation control of PLL.

Bits 3:0 **PLLSPARE[3:0]**: Spare bits

14.5.138 DDRPHYC PState dependent PLL control 4 register (DDRPHYC_MASTER0_PLLCTRL4)

Address offset: 0x80330

Reset value: 0x0000 017F

This register is to be programmed by bios or other means to set PLL charge-pump settings in various PStates.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bits 8:5 **PLLCPPROPGSCTRL[3:0]**:
Connects directly to cp_prop_gs_cntrl<3:0> of PLL. Charge pump proportional current control for fast relock and gearshift.

Bits 4:0 **PLLCPINTGSCTRL[4:0]**:
Connects directly to cp_int_gs_cntrl<4:0> in PLL. Charge pump integrating current control for fast relock and gearshift.

14.5.139 DDRPHYC PllEndofCal register (DDRPHYC_MASTER0_PLLENDOFCAL)

Address offset: 0x80334

Reset value: 0xXXXX XXXX

PLL eoc (end of calibration) output

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PLLDACVALOUT[4:0]				
											r	r	r	r	r

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **PLLDACVALOUT[4:0]**:

Directly connected to the PLL dacval_out output. Used for observation of PLL DAC code

14.5.142 DDRPHYC LcdlDbgCntl register (DDRPHYC_MASTER0_LCDLDBGCNTL)

Address offset: 0x8038C

Reset value: 0x0000 0000

Controls for use in observing and testing the LCDLs.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

1000: lcdl_txln8 (dm/dqs-upper) anib8-tx
0111: lcdl_txln7 (dq7) anib7-tx
0110: lcdl_txln6 (dq6) anib6-tx
0101: lcdl_txln5 (dq5) anib5-tx
0100: lcdl_txln4 (dq4) anib4-tx
0011: lcdl_txln3 (dq3) anib3-tx
0010: lcdl_txln2 (dq2) anib2-tx
0001: lcdl_txln1 (dq1) anib1-tx
0000: lcdl_txln0 (dq0) anib0-tx

Bit 11 **LCDLTSTENABLE**: Debug/test operations enable

Ovr, Snap, StickyLock, StickyUnlock, and LiveLock status

Bit 10 **LCDLFINESNAP**: Latch enable for reading the present LCDL 1UI estimate code in LCDLFINESNAPVAL, and the present phase-detector value in LCDLPHDSNAPVAL.

Bit 9 **LCDLFINEOVR**:

Forces the value of the present LCDL 1UI estimate code to be LCDLFINEOVRVAL for all LCDLs.

Bits 8:0 **LCDLFINEOVRVAL[8:0]**: Value forced as the initial value while LCDLTSTENABLE = 1 and LCDLFINEOVR

After the deassertion of LCDLFINEOVR, the locking state-machine attempts locking.

14.5.143 DDRPHYC Debug status of the DBYTE LCDL register (DDRPHYC_MASTER0_ACLCDLSTATUS)

Address offset: 0x80390

Reset value: 0xXXXX XXXX

Status of ANIB macro LCDL selected by LCDLSTATUSSEL

Note: There is just one copy of this register, with the information from the implemented ANIBs multiplexed per LCDLSTATUSSEL.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

		r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **ACLCDLLIVELOCK**: Present value of whether the LCDL is locked
Valid when LCDLTSTENABLE = 1.

Bit 12 **ACLCDLSTICKYUNLOCK**: Latched value of whether the LCDL ever lost lock after the assertion of LCDLTSTENABLE.

Bit 11 **ACLCDLSTICKYLOCK**: Latched value of whether the LCDL ever achieved lock after the assertion of LCDLTSTENABLE.

Bit 10 **ACLCDLPHDSNAPVAL**: Value of the LCDL phase-detector output, latched by pulse on LCDLFINESNAP, while LCDLTSTENABLE = 1.

Bits 9:0 **ACLCDLFINESNAPVAL[9:0]**: Value of the LCDL 1UI estimate code, latched by pulse on LCDLFINESNAP, while LCDLTSTENABLE = 1. Index 9 is reserved for growth.

14.5.144 DDRPHYC CUSTPHYREV register (DDRPHYC_MASTER0_CUSTPHYREV)

Address offset: 0x803B4

Reset value: 0xXXXX XXXX

Customer settable PHY version number

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TXRDP TRINIT
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **TXRDPTRINIT**:

This bit controls TxRdPtrInit, and is meant to be written by the PState sequencer as part of the power state switching sequence. It must be set once the transition to LP2 is complete, and as follows:

- 32 cycles before the deasserting of init_complete. It must be cleared once the transition to an active PState is complete.
- 32 cycles before the assertion of init_complete. It must be reset to 1 on both warm and cold resets.

14.5.156 DDRPHYC DfiInitComplete register (DDRPHYC_MASTER0_DFIINITCOMPLETE)

Address offset: 0x803E4

Reset value: 0x0000 0000

DFI init complete control

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFIINIT COMP LETE
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **DFIINITCOMPLETE**:

This bit directly controls DfiInitComplete, and is meant to be written by the PState sequencer as part of the power state switching sequence. It must set once the transition to LP2 is complete. It must be cleared once the transition to an active PState is complete. It must be reset to a 0 on both warm and cold resets.

14.5.157 DDRPHYC DfiFreqRatio register (DDRPHYC_MASTER0_DFIFREQRATIO)

Address offset: 0x803E8

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFIFREQRATIO[1:0]	
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **DFIFREQRATIO[1:0]**: Ratio DfiCtlClk:MemClk

00 = 1:1 mode

01 = 1:2 mode

1x = 1:4 mode

When DWC_DDRPHY_FIXED_DFICTLCLK_RATIO is defined, this bitfield is ignored and 1:2 mode is selected.

14.5.158 DDRPHYC RxFifoCheck register (DDRPHYC_MASTER0_RXFIFOCHECKS)

Address offset: 0x803EC

Reset value: 0x0000 0000

Enable more frequent consistency checks of the Rx FIFOs.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DOFREQUENTRXFIFOCHECKS
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **DOFREQUENTRXFIFOCHECKS**:

0: Read data FIFO pointer consistency checks are performed only during sideband transactions (phyupd, ctrlupd, lp_data, phymstr), or when dfi_init_start is asserted. This option relies upon intentional quiescing of the DFI interface in order for the check to be performed.

1: Read data FIFO consistency checks are performed as when this bit is 0, and also at the beginning of each break in read data traffic from the DRAM. This options provides the lowest latency in reporting of a discrepancy in the read data FIFO pointer values.

14.5.159 DDRPHYC MTestCombo output enable on core-side copy register (DDRPHYC_MASTER0_MTESTDTOCTRL)

Address offset: 0x803FC

Reset value: 0x0000 0000

If set, this register allows the MTestCombo observability signal to be routed out core-side through the dwc_ddrphy_dto pin

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MTEST DTOEN
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **MTESTDTOEN**:

This bit is programmed as follows:
- MTESTdtoEn==[0], dwc_ddrphy_dto is squelched (0).
- MTESTdtoEn==[1], dwc_ddrphy_dto reflects the observability signal multiplexed on MTestCombo.

14.5.160 DDRPHYC MapCAA[0to7]toDfi register (DDRPHYC_MASTER0_MAPCAAxTODFI)

Address offset: 0x80400 + 0x4 * x (x = 0 to 7)

Reset value: 0x0000 0000, 0x0000 0001, 0x0000 0002, 0x0000 0003, 0x0000 0004, 0x0000 0005, 0x0000 0006, 0x0000 0007

Maps PHY CAA lane x from dfi0_address of the index of the register contents.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAPCAATODFI[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **MAPCAATODFI[3:0]**:

For LPDDR4 application, this bitfield maps a dfi0_address to CAA x. It is not used for DDR3 and DDR4 applications. Each bit must have a unique value within the set.

For example, if PHY CAA0 is mapped from dfi0_address[2], then MAPCAATODFI must be 2.

- LPDDR4 ACX3, ACX6, ACX10, ACX12 registers MAPCAA[0..5]toDfi are used.
  - Values 0-5 are valid.
  - Values 6-15 are reserved.
  - MAPCAA[6..7]toDfi are reserved.

14.5.161 DDRPHYC interrupt enable register (DDRPHYC_MASTER0_PHYINTERRUPTENABLE)

Address offset: 0x8046C

Reset value: 0x0000 0000

Enables various interrupts to appear in DDRPHYC_MASTER0_PHYINTERRUPTSTATUS register. Only interrupts which are enabled by setting the appropriate bits in this register are observable in DDRPHYC_MASTER0_PHYINTERRUPTSTATUS. If a 0 is written in a particular bit, the corresponding interrupt is not visible in DDRPHYC_MASTER0_PHYINTERRUPTSTATUS.

14.5.162 DDRPHYC interrupt firmware control register (DDRPHYC_MASTER0_PHYINTERRUPTFWCONTROL)

Address offset: 0x80470

Reset value: 0x0000 0000

A 0-to-1 transition for any of the interrupts sets the corresponding bit location in DDRPHYC_MASTER0_PHYINTERRUPTSTATUS, if the corresponding bit location in DDRPHYC_MASTER0_PHYINTERRUPTENABLE is set to 1.

Bit 1 **PHYINITCMPLTFW**: PHY initialization complete firmware interrupt
The PhyInitCmpIt interrupt is not written by PHY firmware. It can be written by the user once dfi_init_complete is asserted.
0: Interrupt not asserted
1: Interrupt asserted

Bit 0 **PHYTRNGCMPLTFW**: PHY training complete firmware interrupt
Written only by PHY firmware.
0: Interrupt not asserted
1: Interrupt asserted

14.5.163 DDRPHYC interrupt mask register (DDRPHYC_MASTER0_PHYINTERRUPTMASK)

Address offset: 0x80474

Reset value: 0x0000 0000

This register is used to mask various interrupts to prevent them from affecting the output pin dwc_ddrphy_int_n. Only interrupts which are not masked by clearing to 0 the corresponding bit in this register are able to affect the dwc_ddrphy_int_n output when asserted in DDRPHYC_MASTER0_PHYINTERRUPTSTATUS. If a bit is set, the interrupt is still visible

in DDRPHYC_MASTER0_PHYINTERRUPTSTATUS but this interrupt does not affect the output pin dwc_ddrphy_int_n.

0: Interrupt not masked
1: Interrupt masked

14.5.164 DDRPHYC interrupt clear register (DDRPHYC_MASTER0_PHYINTERRUPTCLEAR)

Address offset: 0x80478

Reset value: 0x0000 0000

This register clears various interrupts, and negates the output pin dwc_ddrphy_int_n if the cleared interrupt is the cause of the assertion of the output pin dwc_ddrphy_int_n. A 0-to-1

transition on a bit clears the corresponding interrupt, and causes the hardware to immediately clear the bit.

1: Interrupt cleared

14.5.165 DDRPHYC interrupt status register (DDRPHYC_MASTER0_PHYINTERRUPTSTATUS)

Address offset: 0x8047C

Reset value: 0xXXXX XXXX

This read-only register displays the current status of various PHY interrupts. The PHY is the only entity which can write to it. In order for a bit to become set in DDRPHYC_MASTER0_PHYINTERRUPTSTATUS, the corresponding bit must be set in DDRPHYC_MASTER0_PHYINTERRUPTENABLE.

If an interrupt is set in DDRPHYC_MASTER0_PHYINTERRUPTSTATUS and the corresponding bit in DDRPHYC_MASTER0_PHYINTERRUPTENABLE is cleared, the dwc_ddrphy_int_n output signal is asserted. Once the dwc_ddrphy_int_n output signal is asserted, it can only be negated when all unmasked interrupts in

DDRPHYC_MASTER0_PHYINTERRUPTSTATUS have been cleared by setting the corresponding bit in DDRPHYC_MASTER0_PHYINTERRUPTSTATUS.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:11 **PHYHWRESERVED[4:0]**: Reserved

Bit 10 **PHYRXFIFOCHECK**:

A mechanism in the PHY checks the read FIFO pointers for consistency at times they are idle. If a check fails, this interrupt is asserted, and detailed status is in DDRPHYC_DBYTE0_RXFIFOCHECKSTATUS.

0: Interrupt not enabled and asserted

1: Interrupt enabled and asserted

Bits 9:8 **VTDRIFTALARM[1:0]**: PHY VT drift alarm interrupt

Assertion of this interrupt indicates the number of tap points in the master DLL has shifted by an amount greater than 2 * DFIPHYUPDINTTHRESHOLD. There is one bit for each master DLL, and they are fully independent of one another. See DFIPHYUPDINTTHRESHOLD[3:0] for additional information.

0: Interrupt not enabled and asserted

1: Interrupt enabled and asserted

Bits 7:3 **PHYFWRESERVED[4:0]**: Reserved

Bit 2 **PHYTRNGFAIL**: PHY training failure interrupt

Assertion of this interrupt indicates there was an issue during training which did not allow the PHY to successfully complete the training.

0: Interrupt not enabled and asserted

1: Interrupt enabled and asserted

Bit 1 **PHYINITCMPLT**: PHY initialization complete interrupt

Written by the user. Assertion of this interrupt is meant to indicate that the PIE has been fully loaded, and dfi_init_complete has been asserted.

0: Interrupt not enabled and asserted

1: Interrupt enabled and asserted

Bit 0 **PHYTRNGCMPLT**: PHY training complete interrupt

Assertion of this interrupt indicates that the PHY has successfully trained the memory interface at all indicated frequencies, and is ready for the PIE to be loaded.

0: Interrupt not enabled and asserted

1: Interrupt enabled and asserted

14.5.166 DDRPHYC HwtSwizzleHwtAddress0 register (DDRPHYC_MASTER0_HWTSWIZZLEHWTADDRESSx)

Address offset: 0x80480 + 0x4 * x (x = 0 to 17)

Reset value: 0x0000 0000

Signal swizzle selection for HWT swizzle

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HWTSWIZZLEHWTADDRESS[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **HWTSWIZZLEHWTADDRESS[4:0]**:

This bitfield is used in DDR3/DDR4 mode where a user has remapped the DFI inputs to the PHY. It does not affect the mapping of these signals, or remaps the tristate properties of the bumps. However, when the user remaps the DFI signals, the HWT inputs must be mapped in a similar fashion using this bitfield.

Each remappable HWT has a bit associated with it. When the bit value is zero, the HWT is not remapped. When the register value is non-zero, the signal associated with the number below is mapped to the signal associated with the bit.

For example, if the value for the register associated with hwt_act_n (HwtSwizzleHwtActN) is set to 27, then hwt_parity_in is mapped to hwt_act_n.

These bits must always be 0 for LPDDR4. Some bits are used only for DDR3 or DDR4 (noted in the descriptions).

											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **HWTSWIZZLEHWTPARITYIN[4:0]**:
See HWTSWIZZLEHWTADDRESS0[4:0] description for details.

14.5.177 DDRPHYC small delays on handshake signals register 0 (DDRPHYC_MASTER0_DFIHANDSHAKEDELAYS0)

Address offset: 0x804F0

Reset value: 0x0000 0000

Add assertion/deassertion delays on handshake signals. Logic assumes that DFI signal assertions exceed the programmed delays

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CTRLUPDREQDELAY0[3:0]				CTRLUPDACKDELAY0[3:0]				PHYUPDREQDELAY0[3:0]				PHYUPDACKDELAY0[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **CTRLUPDREQDELAY0[3:0]**:
Adds 0-15 DfiClks of delay after the PHY completes all PHY update activities, before deasserting dfi0_ctrlupd_ack.

Bits 11:8 **CTRLUPDACKDELAY0[3:0]**:
Adds 0-15 DfiClks of delay after dfi0_ctrlupd_req asserts, before the PHY takes any action.

Bits 7:4 **PHYUPDREQDELAY0[3:0]**:
Adds 0-15 DfiClks of delay after the PHY completes all PHY update activities, before deasserting dfi0_phyupd_req.

Bits 3:0 **PHYUPDACKDELAY0[3:0]**:
Adds 0-15 DfiClks of delay after dfi0_phyupd_ack asserts, before the PHY takes any action (such as starting DDL calibration).

14.5.178 DDRPHYC small delays on handshake signals register 1 (DDRPHYC_MASTER0_DFIHANDSHAKEDELAYS1)

Address offset: 0x804F4

Reset value: 0x0000 0000

Add assertion/deassertion delays on handshake signals. Logic assumes that dfi signal assertions exceed the programmed delays

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PHYUPDREQDELAY1[3:0]				PHYUPDACKDELAY1[3:0]			
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **PHYUPDREQDELAY1[3:0]**:
Adds 0-15 DfiClks of delay after the PHY completes all PHY update activities, before deasserting dfi1_phyupd_req.

Bits 3:0 **PHYUPDACKDELAY1[3:0]**:
Adds 0-15 DfiClks of delay after dfi1_phyupd_ack asserts, before the PHY takes any action (such as starting DDL calibration).

14.5.179 DDRPHYC remote impedance calibration status register (DDRPHYC_MASTER0_REMOTEIMPCAL)

Address offset: 0x804F8

Reset value: 0xXXXX XXXX

This register is written by hardware to provide information about remote impedance calibration status. Its value allows software to determine if the PHY acts as calibration slave (1) or master (0). If the PHY acts as calibration slave, this register can be checked to determine if calibration codes have been captured.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SLAVE CODE UPDATED	CALIB SLAVE
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **SLAVECODEUPDATED**:
- if DWC_DDRPHY_REMOTE_IMP_CAL is defined, this bit is set by hardware when the PHY acts as calibration slave, and calibration codes from the master have been loaded.
- if DWC_DDRPHY_REMOTE_IMP_CAL is not defined, this bit is reserved.

Bit 0 **CALIBSLAVE**:
- if DWC_DDRPHY_REMOTE_IMP_CAL is defined, this bit is set by hardware when the PHY acts as calibration slave.
- if DWC_DDRPHY_REMOTE_IMP_CAL is not defined, this bit is reserved.

14.5.180 DDRPHYC PhyInLP3 register (DDRPHYC_INITENG0_PHYINLP3)

Address offset: 0x2400A0

Reset value: 0x0000 0001

Indicator for PIE lower power 3 (LP3) status

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PHYIN LP3
															r

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **PHYINLP3**:

This bit is set by the PIE once the LP3 entry sequence is completed. it is cleared during LP3 exit sequence. System software can read this bit for the status of the PIE.

14.5.181 DDRPHYC Ucclk and Hclk enable register (DDRPHYC_DRTUB0_UCCLKHCLKENABLES)

Address offset: 0x300200

Reset value: 0x0000 0003

Ucclk/Hclk enable. Ucclk and Hclk run at either DFICLK or are gated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HCLKEN	UCCLKEN
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **HCLKEN**:

When the training is complete (and assuming no further need for training hardware), this bit must be cleared to reduce power.

Bit 0 **UCCLKEN**:

When the training is complete (and assuming no further need for the microcontroller), this bit must be cleared to reduce power.

14.5.182 DDRPHYC CurPstate0b register (DDRPHYC_DRTUB0_CURPSTATE0B)

Address offset: 0x300204

Reset value: 0x0000 0000

PIE current PState value

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CURPSTATE0B[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CURPSTATE0B[3:0]**: PIE current PState

This bitfield is used to select values for writing by the PState sequencer. It is written at the beginning of the PState switch. It can also be used to reference which PState the sequencer thinks is in.

14.5.183 DDRPHYC CUSTPUBREV register (DDRPHYC_DRTUB0_CUSTPUBREV)

Address offset: 0x3003B4

Reset value: 0xXXXX XXXX

Customer settable PUB version number

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

PUBMJR[7:0]								PUBMDR[3:0]				PUBMNR[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **PUBMJR[7:0]**: PUB major revision

Bits 7:4 **PUBMDR[3:0]**: PUB moderate revision

Bits 3:0 **PUBMNR[3:0]**: PUB minor revision

14.5.185 DDRPHYC MicroContMuxSel register (DDRPHYC_APBONLY0_MICROCONTMUXSEL)

Address offset: 0x340000

Reset value: 0x0000 0000

PMU config mux select

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MICROCONTMUXSEL
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **MICROCONTMUXSEL**:

Controls access to the PHY configuration registers.

1: Microcontroller/PIE has control of csr bus.

0: Microcontroller/PIE csr requests are ignored.

14.5.186 DDRPHYC PMU/controller protocol, controller read-only shadow register (DDRPHYC_APBONLY0_UCTSHADOWREGS)

Address offset: 0x340010

Reset value: 0xXXXX XXXX

This register is used for the mailbox protocol between the firmware and the system.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UCTDATWRITEPROTSHADOW	UCTWRITEPROTSHADOW
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **UCTDATWRITEPROTSHADOW**: Reserved

Bit 0 **UCTWRITEPROTSHADOW**:

0: The PMU has a message for the user.

14.5.187 DDRPHYC DctWriteOnly register (DDRPHYC_APBONLY0_DCTWRITEONLY)

Address offset: 0x3400C0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

DCTWRITEONLY[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **DCTWRITEONLY[15:0]**: Reserved

14.5.188 DDRPHYC DctWriteProt register (DDRPHYC_APBONLY0_DCTWRITEPROT)

Address offset: 0x3400C4

Reset value: 0x0000 0001

DCT downstream mailbox protocol

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCTWRITEPROT
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **DCTWRITEPROT**:

By clearing this bit, the user acknowledges the receipt of the message.

14.5.189 DDRPHYC UctWriteOnlyShadow register (DDRPHYC_APBONLY0_UCTWRITEONLYSHADOW)

Address offset: 0x3400C8

Reset value: 0xXXXX XXXX

Read-only view of the UctDatWriteOnly register (reserved for PHY training purpose)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
UCTWRITEONLYSHADOW[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **UCTWRITEONLYSHADOW[15:0]**:

Used to pass the message ID for major messages, and to pass the lower 16 bits for streaming messages.

14.5.190 DDRPHYC UctDatWriteOnlyShadow register (DDRPHYC_APBONLY0_UCTDATWRITEONLYSHADOW)

Address offset: 0x3400D0

Reset value: 0xXXXX XXXX

Read-only view of the UctDatWriteOnly register (reserved for PHY training purpose)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
UCTDATWRITEONLYSHADOW[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **UCTDATWRITEONLYSHADOW[15:0]**: Used to pass the upper 16 bits for streaming messages. Not used in passing major messages.

14.5.191 DDRPHYC DfiCfgRdDataValidTicks register (DDRPHYC_APBONLY0_DFICFGRDDATAVALIDTICKS)

Address offset: 0x3400DC

Reset value: 0x0000 0006

Number of DfiClk ticks required for valid Rd Data register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFICFGRDDATAVALIDTICKS[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **DFICFGRDDATAVALIDTICKS[5:0]**: Round trip delay of a register read access
This value must not be changed from its reset value.

14.5.192 DDRPHYC reset and clock shutdown control register (DDRPHYC_APBONLY0_MICRORESET)

Address offset: 0x340264

Reset value: 0x0000 0001

Controls reset and clock shutdown on the local microcontroller.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RESETTOMICRO	RSVDMICRO	TESTWAKEUP	STALLTOMICRO
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **RESETTOMICRO**:

This bit is programmable as follows:

- Set this bit to apply synchronous reset to the microcontroller.
- Clear this bit to release reset to the microcontroller.

Note: This reset initializes the program counter to begin execution from the boot vector. This reset also clears the interrupt sticky bits.

Bit 2 **RSVDMICRO**: Reserved

Bit 1 **TESTWAKEUP**: Reserved, must always be set to 0.

Bit 0 **STALLTOMICRO**:

This bit is programmable as follows:

- Set this bit to stall the microcontroller by hardware.
- Clear this bit to allow the microcontroller to continue executing from its current program counter location.

This bit is used at power up to hold the program counter at the boot vector while bios loads the microcontroller program code. While stalled, the microcontroller clocks are gated off for power reduction.

14.5.193 DDRPHYC DfiInitCompleteShadow register (DDRPHYC_APBONLY0_DFIINITCOMPLETESHADOW)

Address offset: 0x3403E8

Reset value: 0xXXXX XXXX

dfi_init_complete, controller read-only shadow

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DFIINITCOMPLETESHADOW
															r

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **DFIINITCOMPLETESHADOW**:

This bit presents a read-only view (a shadow) of DfiInitComplete which is used by the sequencer to control the state of dfi_init_complete.
While MICROCONTMUXSEL = 1, access to this bit does not steal config bus bandwidth. The microcontroller that is polling does not have any performance penalty.

14.5.194 DDRPHYC register map

Table 61. DDRPHYC register map and reset values

Refer to *Section 2.4* for the register boundary addresses.

15 DDR performance monitor (DDRPERFM)

15.1 DDRPERFM introduction

The DDRPERFM is intended to monitor DDR controller performance by counting events from a set of signals and gathering results under the software control. The DDRPERFM can be used to feedback important statistics such as the DDR utilization, read/write bandwidth, bank activation, idle state duration for some off-line analysis of the DDR system performance and for optimal parameter settings to improve the DDR utilization, and for power optimization.

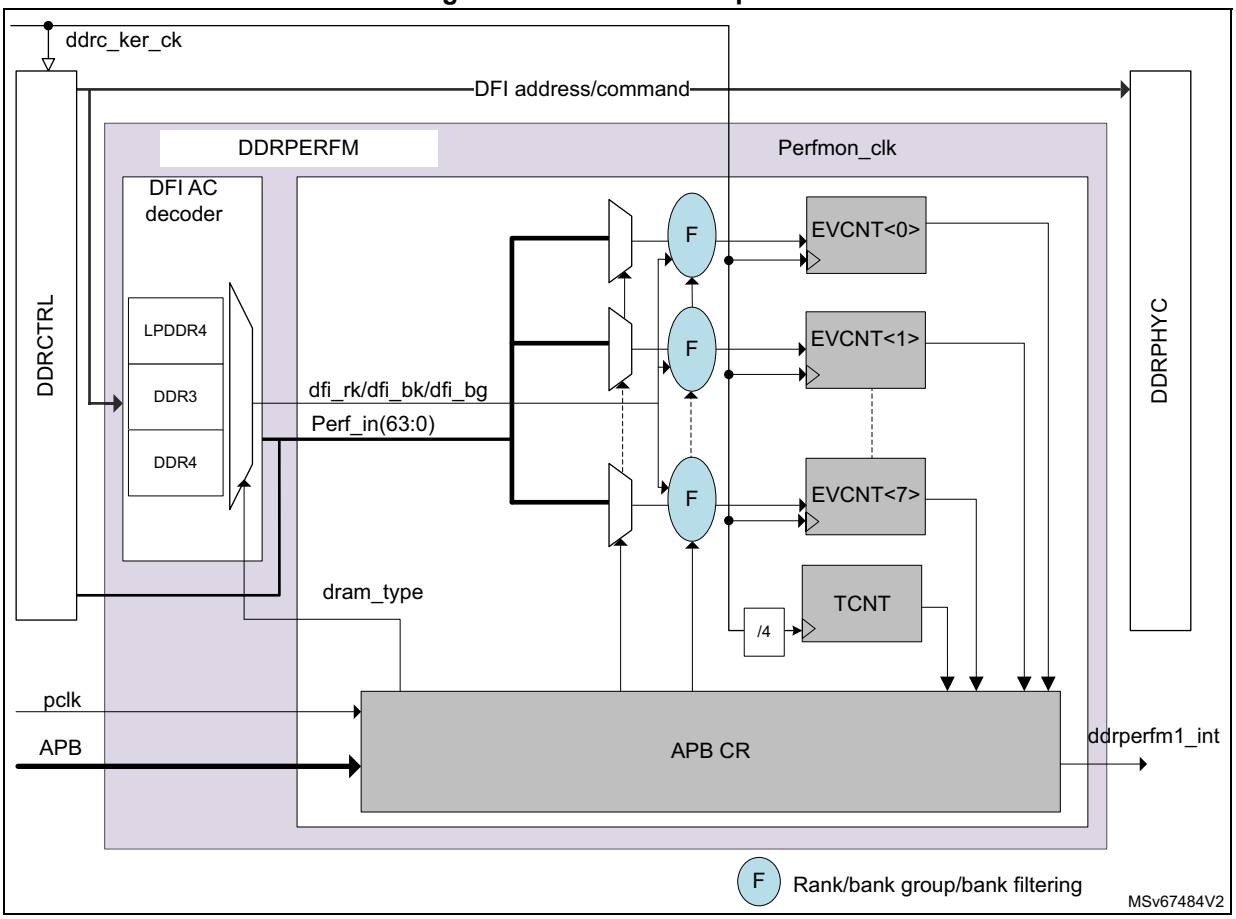
15.2 DDRPERFM main features

- 32-bit time counter (TCNT) clocked at DFI_CLK/4 (that is ddrc_ker_clk/4)
- Eight 32-bit event counters (EVCNT0 to EVCNT7) clocked at DFI_CLK.
- For each of the 8 counters, selection among 64 signals:
  - Either selection of performance logging signals exported by DDRCTRL
  - Information generated decoding DFI commands between DDRCTRL and DDRPHYC
  - Counters that can be individually enabled
- Programmable rank, bank group (only for DDR4), and bank address filtering module in front of each event counter
  - The filter only applies to commands monitored at the DFI interface.
- Global start/stop triggered by software
- Automatic stop when the time counter reaches a programmable value or when an event counter overflows
- All counters are frozen and a dedicated (maskable) interruption line is asserted when a stop condition occurs.
- APB interface: 1 Kbyte used for control register mapping
  - The performance monitor interface is shared with DDRCTRL and the mode register read registers. The performance monitor base address is 0x1000 (above DDRCTRL registers), then the address space is from 0x1000 to 0x13FF.

15.3 DDRPERFM block diagram

Figure 44 presents the overall architecture of the DDRPERFM. The DDRPERFM either sniffs signals on the DFI interface, or receives inputs from the DDRCTRL performance port. Based on the filtering scheme programmed in its registers, the DDRPERFM counts filtered event occurrences in one of its eight internal counters. An interrupt is fired when a stop condition occurs (the counter overflows or the stop is reached).

Figure 44. DDRPERFM top view



15.4 DDRPERFM functional description

A free running 32-bit time counter (TCNT) shares the DDRCTRL counter, and enables to compute the DDRSS statistics. The maximum value is programmable through the APB register. The default value is 0xFFFF FFFF. The TCNT is incremented every 4 DFI_CLK (= 8 DRAM_CLK cycles = burst length). When the TCNT overflows, all counters are frozen. The counter values can be read through the APB interface.

The DDRPERM implements eight independent 32-bit counters: EVCNT<7-0> sharing DDRCTRL clock. The counters input selection is configured through a dedicated control register (SEL_EVENT<I>) which enables to choose one of the 64 events that are available.

For each counter, a filtering can be applied based on bank or bank group (for DDR4 only). This filtering is managed through FILT_EVENT<i>.

The EVTCNT counters can be cleared by software through the APB interface, and their values can be read through the APB registers.

The DDRPERFM is inactive by default. It starts counting events when a start triggered by software is received. Counters are stopped when a stop is triggered by the software.

When the counter overflows, all counters are frozen and a dedicated maskable interruption line is asserted (ddrperfm_int). When an interrupt is detected, before clearing the interrupt, the software must clear the counters to avoid the interrupt to be raised again.

15.4.1 DDRPERFM performance monitor events

The commands sent by the controller can be monitored either at the DFI interface (signal name DFI_xxx), or at the performance logging interface (signal name OP_xxx).

A better granularity is provided for commands captured at DFI interface:

- ability to discriminate between read/write commands with and without auto-precharge
- ability to filter activate, precharge, read, write, and refresh commands per bank

The list of events which can be captured by the performance monitor is given in the tables below:

- *Table 62* lists the events generated from the DFI command address decoder.
- *Table 63* lists the events generated natively by the DDRCTRL (with event number).

Table 62. Signals coming from DFI command-address decoder

-	N^0	Signal name	Description
DFI decoded DRAM commands	0	DFI_IS_ACT	Asserted when an ACT command is sent by the controller
	1	DFI_IS_PREPB	Asserted when a PRE per bank command is sent by the controller
	2	DFI_IS_PREAB	Asserted when a PRE all banks command is sent by the controller
	3	DFI_IS_RD	Asserted when a RD command is sent by the controller (AP bit ignored)
	4	DFI_IS_RDA	Asserted when a RD with AP command is sent by the controller
	5	Reserved	Reserved
	6	DFI_IS_WR	Asserted when a WR command is sent by the controller (AP bit ignored)
	7	DFI_IS_WRA	Asserted when a WR with AP command is sent by the controller
	8	Reserved	Reserved
	9	DFI_IS_MWR	Asserted when a MWR command is sent by the controller (AP bit ignored, LPDDR4 only)
	10	DFI_IS_MWRA	Asserted when a MWR with AP command is sent by the controller (LPDDR4 only)
	11	Reserved	Reserved
	12	DFI_IS_MRW	Asserted when a MRW command is sent by the controller
	13	DFI_IS_MRR	Asserted when a MRR command is sent by the controller
	14	DFI_IS_REFPB	Asserted when a refresh per bank command is sent by the controller
	15	DFI_IS_REFAB	Asserted when a refresh all banks command is sent by the controller
	16	DFI_IS_MPC	Asserted when an MPC command is sent by the controller (LPDDR4 only)

Table 63. Signals monitored at performance logging interface (provided by DDRCTRL)

-	N[0]	Signal name	Description
DDRC recorded DRAM commands	32	PERF_OP_IS_ACT	Asserted for every DRAM activate command logged by the controller
	33	PERF_OP_IS_RD	Asserted for every DRAM read command logged by the controller
	34	PERF_OP_IS_WR	Asserted for every DRAM write command logged by the controller
	35	PERF_OP_IS_MWR	Asserted for every DRAM masked write command logged by the controller
	36	PERF_OP_IS_REF	Asserted for every DRAM refresh command logged by the controller
	37	PERF_OP_IS_CRIT_REF	Asserted for every critical DRAM refresh command logged by the controller
	38	PERF_OP_IS_SPEC_REF	Asserted for every speculative DRAM refresh command logged by the controller
	39	PERF_OP_IS_ZQCAL	Asserted for every ZQCS or ZQCL calibration command logged by the controller
	40	PERF_OP_IS_ENTER_POWDN	Asserted for every entry into DRAM power-down mode
	41	PERF_OP_IS_ENTER_SELFREF	Asserted for every entry into DRAM self-refresh mode
	42	PERF_OP_IS_PRE	Asserted for every precharge command logged by the controller
	43	PERF_OP_IS_PRE_FOR_RDWR	Asserted when the precharge command is associated to a read or write command
	44	PERF_OP_IS_PRE_FOR _OTHERS	Asserted when the precharge command is due to requests other than read or write
	45	PERF_OP_IS_RD_ACTIVATE	Asserts for every read activate that is issued
DDRCTRL p.i. (performance indicators)	48	PERF_HPR_REQ_WITH _NOCREDIT	Asserted when there is a high priority read request (from XPI to port arbiter) which is not served due to no available credit
	49	PERF_LPR_REQ_WITH _NOCREDIT	Asserted when there is a low priority read request (from XPI to port arbiter) which is not served due to no available credit
	50	PERF_HPR_XACT_WHEN _CRITICAL	Asserted for every high priority read transaction that is scheduled when the high priority queue is in critical state
	51	PERF_LPR_XACT_WHEN _CRITICAL	Asserted for every low priority read transaction that is scheduled when the low priority queue is in critical state
	52	PERF_WR_XACT_WHEN _CRITICAL	Asserted for every high priority write transaction that is scheduled when the write queue is in critical state
	53	PERF_RDWR_TRANSITIONS	Asserted for every read to write and write to read bus turnaround
	54	PERF_WAR_HAZARD	Asserted for every write after read collision that happens in the DDRC
	55	RAW_HAZARD	Asserted for every read after write collision that happens in the DDRC
	56	PERF_WAW_HAZARD	Asserted for every write after write collision that happens in the DDRC
	57	Reserved	Reserved
	58	PERF_RANK	Gives the rank number for every scheduled command through the DDRC.

Table 63. Signals monitored at performance logging interface (provided by DDRCTRL) (continued)

-	N[0]	Signal name	Description
DDRCTRL p.i	59	PERF_READ_BYPASS	Asserts for every read command that is sent through the bypass path
	60	PERF_ACT_BYPASS	Asserts for every activate command that is sent through the bypass path
	61	PERF_WINDOW_LIMIT_ REACHED_RD	Indicates that at least one RD CAM entry reaches visible window limit at this cycle. Performance feature to avoid extreme starvation.
	62	PERF_WINDOW_LIMIT_ REACHED_WR	Indicates that at least one WR CAM entry reaches visible window limit at this cycle. Performance feature to avoid extreme starvation.
	63	NO_EVENT	Signal number to be selected for event counters that are unused in the DDRPERFM module

15.4.2 DDRPERFM DFI command decoder

The DFI command decoder is implemented to extract specific events decoding the DFI commands sent by controller to PHY. The inputs are:

- DDR3/4: dfi_address, dfi_cs for all protocols, dfi_ras_n dfi_cas_n, dfi_we_n, dfi_bank
- DDR4 only: dfi_act_n, dfi_bg

The DFI command decoder has a selector (dram_type) which defines the DRAM type attached to the device. It is used to select the DFI decoder depending on the DRAM protocol used.

The following table lists the events generated by DFI command address decoder (concerned filters are highlighted in gray).

Table 64. Events generated by the DFI command address decoder

Event name	DRAM type	Bank filter	BG filter	Comment
DFI_IS_MRW	LPDDR4	No	No	Asserted when a mode register write (MRW) commands is sent by the controller: MRS in DDR3/4
	LPDDR3	No	No	
	DDR4	No	No	
	DDR3	No	No	
DFI_IS_MRR	LPDDR4	No	No	Asserted when a mode register read (MRR) commands is sent by the controller: Does not exist in DDR3/4
	LPDDR3	No	No	
DFI_IS_MPC	LPDDR4	No	No	Asserted when a multi-purpose command (MPC) is sent by the controller. Only for LPDDR4.
DFI_IS_REFPB	LPDDR4	Yes	No	Asserted when a refresh per bank command is sent by the controller. For LPDDR3, bank to refresh is defined in DRAM round robin algorithm.
	LPDDR3	No	No	
DFI_IS_REFAB	LPDDR4	No	No	Asserted when a refresh all banks command is sent by the controller. For DDR3/4, the refresh addressing is generated by the internal refresh controller.
	LPDDR3	No	No	
	DDR4	No	No	
	DDR3	No	No	

Table 64. Events generated by the DFI command address decoder (continued)

Event name	DRAM type	Bank filter	BG filter	Comment
DFI_IS_PREPB	LPDDR4	Yes	No	Asserted when an PRE per bank command is sent by the controller.
	LPDDR3	Yes	No	
	DDR4	Yes	Yes	
	DDR3	Yes	No	
DFI_IS_PREAB	LPDDR4	No	No	Asserted when an PRE all banks command is sent by the controller.
	LPDDR3	No	No	
	DDR4	No	No	
	DDR3	No	No	
DFI_IS_ACT	LPDDR4	Yes	No	Asserted when an ACTIVATE command is sent by the controller.
	LPDDR3	Yes	No	
	DDR4	Yes	Yes	
	DDR3	Yes	No	
DFI_IS_WR	LPDDR4	Yes	No	Asserted when a WR command is sent by the controller (AP bit ignored).
	LPDDR3	Yes	No	
	DDR4	Yes	Yes	
	DDR3	Yes	No	
DFI_IS_WRA	LPDDR4	Yes	No	Asserted when a WR with AP command is sent by the controller.
	LPDDR3	Yes	No	
	DDR4	Yes	Yes	
	DDR3	Yes	No	
DFI_IS_MWR	LPDDR4	Yes	No	Asserted when a masked write command is sent by the controller (AP bit ignored, LPDDR4 only)
DFI_IS_MWRA	LPDDR4	Yes	No	Asserted when a masked write command with AP is sent by the controller (LPDDR4 only)
DFI_IS_RD	LPDDR4	Yes	No	Asserted when a RD command is sent by the controller (AP bit is ignored)
	LPDDR3	Yes	No	
	DDR4	Yes	Yes	
	DDR3	Yes	No	
DFI_IS_RDA	LPDDR4	Yes	No	Asserted when a RD command with AP is sent by the controller
	LPDDR3	Yes	No	
	DDR4	Yes	Yes	
	DDR3	Yes	No	

15.5 DDRPERFM registers

This section presents the registers for controlling the performance monitor.

15.5.1 DDRPERFM control register (DDRPERFM_CTRL)

Address offset: 0x0000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STOP	START
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **STOP**:

Writing 1 stops all counters. Writing 0 has no effect. Writing 1 when counters are stopped has not effect.

Bit 0 **START**:

Writing 1 starts all counters. All internal counters and status bits are cleared before events are monitored. Writing 0 has no effect. Writing 1 when counters are running has not effect.

15.5.2 DDRPERFM interrupt mask register (DDRPERFM_IMSK)

Address offset: 0x0004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	INTRMSK
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **INTRMSK**:

0: No effect

1: DDRPERFM interruption signal masked.

15.5.3 DDRPERFM interrupt clear register (DDRPERFM_ICLR)

Address offset: 0x0008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	INTRSET	INTRCLR
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **INTRSET**:

0: No effect

1: Set the interruption signal when asserted.

Bit 0 **INTRCLR**:

0: No effect

1: Clear the interruption signal when asserted.

Note: The counters must be cleared first (to remove the interruption condition) before the interruption is cleared.

15.5.4 DDRPERFM counter clear register (DDRPERFM_CLR)

Address offset: 0x000C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	TNTCLR	CNTCLR[7:0]							
							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **TNTCLR**:

0: No effect

1: Clear free running counter and associated status bits (timeout and overflow indicators).

Note: Setting this bit is ignored if BUSY = 1 in DDRPERFM_STATUS.

Bits 7:0 **CNTCLR[7:0]**:

0: No effect

1: Clear corresponding counters and associated status bits (timeout and overflow indicators).

Note: Setting this bit is ignored if BUSY = 1 in DDRPERFM_STATUS.

15.5.5 DDRPERFM configuration register 0 (DDRPERFM_CFG0)

Address offset: 0x0010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	SEL_EVENT3[5:0]						Res.	Res.	SEL_EVENT2[5:0]					
		rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	SEL_EVENT1[5:0]						Res.	Res.	SEL_EVENT0[5:0]					
		rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:24 **SEL_EVENT3[5:0]**: Selection of the performance logging signal to be monitored by the event counter 3

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **SEL_EVENT2[5:0]**: Selection of the performance logging signal to be monitored by the event counter 2

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **SEL_EVENT1[5:0]**: Selection of the performance logging signal to be monitored by the event counter 1

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **SEL_EVENT0[5:0]**: Selection of the performance logging signal to be monitored by the event counter 0

15.5.6 DDRPERFM configuration register 1 (DDRPERFM_CFG1)

Address offset: 0x0014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	SEL_EVENT7[5:0]						Res.	Res.	SEL_EVENT6[5:0]					
		rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	SEL_EVENT5[5:0]						Res.	Res.	SEL_EVENT4[5:0]					
		rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:24 **SEL_EVENT7[5:0]**: Selection of the performance logging signal to be monitored by the event counter 7

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **SEL_EVENT6[5:0]**: Selection of the performance logging signal to be monitored by the event counter 6

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **SEL_EVENT5[5:0]**: Selection of the performance logging signal to be monitored by the event counter 5

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **SEL_EVENT4[5:0]**: Selection of the performance logging signal to be monitored by the event counter 4

15.5.7 DDRPERFM configuration register 2 (DDRPERFM_CFG2)

Address offset: 0x0018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FILT_POL3[2:0]			FILT_RBG3[4:0]					FILT_POL2[2:0]			FILT_RBG2[4:0]				
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FILT_POL1[2:0]			FILT_RBG1[4:0]					FILT_POL0[2:0]			FILT_RBG0[4:0]				
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 **FILT_POL3[2:0]**: Selection of the performance logging signal to be monitored by the event counter 3

Filtering policy for the event counter 3 (refer to *Table 65*).

Bits 28:24 **FILT_RBG3[4:0]**: Configuration of the rank/bank/bank group filtering for the event counter 3 based on FILT_POL3 value

Bit 4: Define the rank value when rank filtering is activated. Value 0 means that only commands applied on Rank0 are counted. Value 1 means that only commands applied on rank1 are counted.

Bits 3:0: Define drank group/bank address/ used for filtering

When filtering is activated:

- For DDR4, the FILT_RBGx[3:2] bits correspond to bank group, and FILT_RBGx[1:0] correspond to bank address.
- For LPDDR3/4, the DDR3 bits FILT_RBGx[2:0] bits correspond to bank address, and FILT_RBG3 is unused.

Bits 23:21 **FILT_POL2[2:0]**: Filtering policy for the event counter 2. (refer to *Table 65*)

Bits 20:16 **FILT_RBG2[4:0]**: Configuration of the rank/bank/bank group filtering for the event counter 2 based on FILT_POL2 value

Bits 15:13 **FILT_POL1[2:0]**: Filtering policy for the event counter 1 (refer to *Table 65*)

Bits 12:8 **FILT_RBG1[4:0]**: Configuration of the rank/bank/bank group filtering for the event counter 1 based on FILT_POL1 value

Bits 7:5 **FILT_POL0[2:0]**: Filtering policy for the event counter 0 (refer to *Table 65*)

Bits 4:0 **FILT_RBG0[4:0]**: Configuration of the rank/bank/bank group filtering for the event counter 0 based on FILT_POL0 value

Table 65. Filtering policy

FILT_POLx	Rank filtering	Bank group filtering[1]	Bank filtering	comment
000	No	No	No	No filtering is applied. The counter counts all events whatever rank, bank group and bank address.
001	No	No	Yes	Filtering based on FILT_RBGx value
010	No	Yes	No	Filtering based on FILT_RBGx value
011	No	Yes	Yes	Filtering based on FILT_RBGx value
100	Yes	No	No	Filtering based on FILT_RBGx value
101	Yes	No	Yes	Filtering based on FILT_RBGx value
110	Yes	Yes	No	Filtering based on FILT_RBGx value
111	Yes	Yes	Yes	Filtering based on FILT_RBGx value

1. Only relevant for DDR4.

15.5.8 DDRPERFM configuration register 3 (DDRPERFM_CFG3)

Address offset: 0x001C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FILT_POL7[2:0]			FILT_RBG7[4:0]					FILT_POL6[2:0]			FILT_RBG6[4:0]				
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FILT_POL5[2:0]			FILT_RBG5[4:0]					FILT_POL4[2:0]			FILT_RBG4[4:0]				
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 **FILT_POL7[2:0]**: Filtering policy for the event counter 7 (refer to *Table 65*)

Bits 28:24 **FILT_RBG7[4:0]**: Configuration of the rank/bank/bank group filtering for the event counter 7 based on FILT_POL7 value

Bits 23:21 **FILT_POL6[2:0]**: Filtering policy for the event counter 6 (refer to *Table 65*)

Bits 20:16 **FILT_RBG6[4:0]**: Configuration of the rank/bank/bank group filtering for the event counter 6 based on FILT_POL6 value

Bits 15:13 **FILT_POL5[2:0]**: Filtering policy for the event counter 5 (refer to *Table 65*)

Bits 12:8 **FILT_RBG5[4:0]**: Configuration of the rank/bank/bank group filtering for the event counter 5 based on FILT_POL5 value

Bits 7:5 **FILT_POL4[2:0]**: Filtering policy for the event counter 4 (refer to *Table 65*)

Bits 4:0 **FILT_RBG4[4:0]**: Configuration of the rank/bank/bank group filtering for the event counter 4 based on FILT_POL4 value

15.5.9 DDRPERFM configuration register 4 (DDRPERFM_CFG4)

Address offset: 0x0020

Reset value: 0xFFFF FFFF

Timeout value for the time counter.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TIME_OUT[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TIME_OUT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **TIME_OUT[31:0]**: Timeout value for the time counter
When this value is reached, the DDRPERFM automatically stops: All counters are frozen. The status bit TCNT_TIMOUT is asserted. The (maskable) interrupt signal is asserted.

15.5.10 DDRPERFM event counter enable register (DDRPERFM_CFG5)

Address offset: 0x0024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EVCNT_EN[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **EVCNT_EN[7:0]**: Event counter enable
When bit <i> is set, the corresponding counter is enabled.
Note: Enable must be written when counters are not running.

15.5.11 DDRPERFM DRAM information register (DDRPERFM_DRAMINF)

Address offset: 0x0028

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DRAM_TYPE[1:0]	
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **DRAM_TYPE[1:0]:** DRAM information used for DFI decoding
00: LPDDR4
01: LPDDR3
10: DDR4
11: DDR3

15.5.12 DDRPERFM event counter 0 register (DDRPERFM_EVCNT0)

Address offset: 0x0040

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EVCNT0[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EVCNT0[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **EVCNT0[31:0]**:Counter value for event 0

15.5.13 DDRPERFM event counter 1 register (DDRPERFM_EVCNT1)

Address offset: 0x0044

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EVCNT1[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EVCNT1[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **EVCNT1[31:0]**:Counter value for event 1

15.5.14 DDRPERFM event counter 2 register (DDRPERFM_EVCNT2)

Address offset: 0x0048

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EVCNT2[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EVCNT2[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **EVCNT2[31:0]**: Counter value for event 2

15.5.15 DDRPERFM event counter 3 register (DDRPERFM_EVCNT3)

Address offset: 0x004C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EVCNT3[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EVCNT3[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **EVCNT3[31:0]**: Counter value for event 3

15.5.16 DDRPERFM event counter 4 register (DDRPERFM_EVCNT4)

Address offset: 0x0050

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EVCNT4[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EVCNT4[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **EVCNT4[31:0]**: Counter value for event 4

15.5.17 DDRPERFM event counter 5 register (DDRPERFM_EVCNT5)

Address offset: 0x0054

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EVCNT5[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EVCNT5[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **EVCNT5[31:0]**: Counter value for event 5

15.5.18 DDRPERFM event counter 6 register (DDRPERFM_EVCNT6)

Address offset: 0x0058

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EVCNT6[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EVCNT6[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **EVCNT6[31:0]**: Counter value for event 6

15.5.19 DDRPERFM event counter 7 register (DDRPERFM_EVCNT7)

Address offset: 0x005C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EVCNT7[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EVCNT7[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **EVCNT7[31:0]**: Counter value for event 7

15.5.20 DDRPERFM time counter register (DDRPERFM_TCNT)

Address offset: 0x0060

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TCNT[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TCNT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **TCNT[31:0]**: Time counter value

Must only be read when the PERFM is stopped.

15.5.21 DDRPERFM status register (DDRPERFM_STATUS)

Address offset: 0x0080

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BUSY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TCNT_OVFL
r															r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EVCNT7_OVFL	EVCNT6_OVFL	EVCNT5_OVFL	EVCNT4_OVFL	EVCNT3_OVFL	EVCNT2_OVFL	EVCNT1_OVFL	EVCNT0_OVFL
								r	r	r	r	r	r	r	r

Bit 31 **BUSY**: Real-time busy indicator

This bit is asserted as long as counters are running, and deasserted when a stop condition occurs (software controlled stop command or counter overflow).

Bits 30:17 Reserved, must be kept at reset value.

Bit 16 **TCNT_OVFL**:

When read to 1, the DDRPERFM is stopped due to time counter reaching the timeout value.

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **EVCNT7_OVFL**:

When read to 1, the DDRPERFM is stopped due to event counter 7 overflow.

Bit 6 **EVCNT6_OVFL**:

When read to 1, the DDRPERFM is stopped due to event counter 6 overflow.

Bit 5 **EVCNT5_OVFL**:

When read to 1, the DDRPERFM is stopped due to event counter 5 overflow.

Bit 4 **EVCNT4_OVFL**:

When read to 1, the DDRPERFM is stopped due to event counter 4 overflow.

Bit 3 **EVCNT3_OVFL**:

When read to 1, the DDRPERFM is stopped due to event counter 3 overflow.

Bit 2 **EVCNT2_OVFL**:

When read to 1, the DDRPERFM is stopped due to event counter 2 overflow.

Bit 1 **EVCNT1_OVFL**:

When read to 1, the DDRPERFM is stopped due to event counter 1 overflow.

Bit 0 **EVCNT0_OVFL**:

When read to 1, the DDRPERFM is stopped due to event counter 0 overflow.

15.5.22 DDRPERFM version register (DDRPERFM_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0020

16 SRAM configuration controller (RAMCFG)

16.1 RAMCFG introduction

The RAMCFG configures the features of the internal SRAMs (SYSRAM, RETRAM, SRAM1 and BKPSRAM).

16.2 RAMCFG main features

The internal SRAM supports some of the features listed hereafter, configured in RAMCFG:

- Error code correction (ECC):
  - Single error detection and correction with interrupt generation
  - Double error detection with interrupt generation
  - Status with failing address
- SRAM hardware erase
- SRAM software erase
- Cyclic redundancy check (CRC-32)

16.3 RAMCFG functional description

16.3.1 Internal SRAM features

Four SRAMs are embedded in the STM32MP21xx devices, each with specific features:

- SYSRAM and SRAM1 are the main SRAMs. BKPSRAM and RETRAM have retention feature for low-power modes even when V_{DD} is off in V_{BAT} mode. See *Section 19: Power control (PWR)* for more details.
- The SYSRAM is partially or fully erased (upper 128 Kbytes erased when allowed by SYSRAM_ERASE option byte) when a system reset occurs. The RETRAM is erased when a system reset occurs if SRAMHWERDIS in RAMCFG_RETRAMCR is not set.
- SRAM1 and BKPSRAM are protected by the tamper detection circuit, and are erased by hardware in case of tamper detection. They are also erased by hardware in case of a backup domain supply power-on (see *Section 64: Tamper and backup registers (TAMP)*).
- The RAMCFG embeds the registers related to the internal SRAMs ECC, CRC and software erase.

The tables below summarize the features supported by each internal SRAM.

Table 67. Internal SRAM features

SRAM feature	SYSRAM	RETRAM	SRAM1	BKPSRAM
	256 Kbytes	128 Kbytes	64 Kbytes	8 Kbytes
LPBAM Stop/LP-Stop	-	X	X	-
Optional retention in V_{BAT} mode	-	X	-	X
Erase with tamper detection	-	-	X	X
Hardware erase	X	X	-	-
Software erase	X	X	X	X
ECC	-	X	-	X
CRC	-	X	-	-

Table 68. Internal SRAM hardware erase feature

SRAM (size in Kbytes)	Conditional hardware erase	Condition
SYSRAM low bank (128)	No	Erase done on each system reset
SYSRAM high bank (128)	Yes	Erase on system reset only once SYSRAM_ERASE in OTP HCONF1 is fused to 1
RETRAM (128)	Yes	Erase on system reset. Can be disabled by SRAMHWERDIS in RAMCFG_RETRAMCR.

16.3.2 Error code correction (RETRAM, BKPSRAM)

The ECC is supported by RETRAM and BKPSRAM.

Seven ECC bits are added per 32 bits of SRAM, allowing a 2-bit error detection and 1-bit error correction on memory read access.

As the ECC is calculated and checked for a 32-bit word, the byte and half-word write accesses are managed by the SRAM interface by first reading the whole word, then writing the word again with the new byte/half-word value. The ECC double errors are also detected during these byte or half-word AHB write accesses (read/modify/write done by interface). The byte or half-word write access latency is two AHB clock cycles.

Caution: In case of a byte or half-word write on SRAM with ECC, the read/modify/write operation is done in a buffer. The buffer content is written into the SRAM, two AHB clock cycles after the SRAM AHB is released (when SRAM is no more accessed).

Single- and double-ECC errors

When a single error is detected, it is automatically corrected and the SEC bit is set in RAMCFG_xISR. An interrupt is generated if enabled by SEIE in RAMCFG_xIER. The failing address is stored in RAMCFG_xSEAR if ALE is set in RAMCFG_xCR.

Caution: Single errors are not reported if the SEC flag is not cleared in time when a new error happens.

When a double error is detected, the DED bit is set in RAMCFG_xISR. An interrupt is generated if enabled by DEIE in RAMCFG_xIER. The failing address is stored in RAMCFG_xDEAR if ALE is set in RAMCFG_xCR.

Caution: Double errors are not reported if the DED flag is not cleared. Double errors are not corrected, and must be managed by exception.

The ECC can be activated / deactivated by executing the following software sequence:

1. Write 0xAE in RAMCFG_xECCKEYR.
2. Write 0x75 in RAMCFG_xECCKEYR.
3. Write 1 in the ECCE bit of RAMCFG_xCR to activate the ECC (write 0 in this bit to deactivate the ECC).

RETRAM ECC specific management

The ECC must be enabled on RETRAM to allow the CPU2 boot when exiting Standby modes in wake-up event mode (ignored in legacy boot mode). If a double error is detected during the wake-up phase, an application reset may be generated (reset always generated if the CPU2 is the trusted domain). Refer to *Section 20: Reset and clock control (RCC)* for more details.

This signal (combined with CRC check error) is also routed to the EXTI2 in order to wake up the CPU1.

16.3.3 Cyclic redundancy check (RETRAM)

The hardware CRC (32-bit CRC P(x) = $x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$) is supported by RETRAM.

The CRC module may be used to calculate a signature of part of the memory content (instruction code in RETRAM for the CPU2) before jumping in low-power mode. When exiting low-power mode, the CRC can be used to check, without any CPU intervention, that the value of the memory is not modified/altered.

The CRC check can be launched by software or by hardware when exiting low-power modes as follows:

- For the RETRAM, the CRC engine (if check is enabled before entering low-power mode) starts when the system wakes up from Standby mode.

Refer to *Section 19: Power control (PWR)* for more details.

The following software sequence must be executed to calculate the signature of the memory content:

1. Write 0x0 in CRCC[1:0] of RAMCFG_RETRAMCCR1 to deactivate the CRC.
2. Write 1 in SRAMHWERDIS of RAMCFG_RETRAMCR to disable the hardware erase.
3. Select the buffer size to take into account during the CRC computation by setting CRCBS[2:0] in RAMCFG_RETRAMCCR1.
4. Write 0x1 in CRCC[1:0] of RAMCFG_RETRAMCCR1 to activate the CRC.
5. Write 1 in CRCCS of RAMCFG_RETRAMCCR2 to start the CRC computation.

The calculated signature is stored in RAMCFG_RETRAMCCSR when CRCEOC is set in RAMCFG_RETRAMCSR.

The following software sequence must be executed to check the memory content to prepare

the CRC signature used while exiting a low-power mode:

1. Write 0x0 in CRCC[1:0] of RAMCFG_RETRAMCCR1 to deactivate the CRC.
2. Write 1 in SRAMHWERDIS of RAMCFG_RETRAMCR to disable the hardware erase.
3. Select the buffer size to take into account during CRC computation by setting CRCBS[2:0] in RAMCFG_RETRAMCCR1.
4. Write 0x1 in CRCC[1:0] of RAMCFG_RETRAMCCR1 to activate the CRC.
5. Write 1 in CRCCS of RAMCFG_RETRAMCCR2 to start the CRC computation.
6. Wait until CRCEOC is set in RAMCFG_RETRAMCSR.
7. Read calculated signature in RAMCFG_RETRAMCCSR.
8. Write calculated signature in RAMCFG_RETRAMCRSR.
9. Write 1 in CRCFC of RAMCFG_RETRAMCCR2 to clear the CRCEOC flag.
10. Write 0x2 in CRCC[1:0] of RAMCFG_RETRAMCCR1 to enable the CRC computation and signature check.

When exiting a low-power mode, the CRC calculates the signature of the memory content and compares the signature against the precalculated signature.

If no error is detected during signature check, CRCSCS and CRCEOC are set in RAMCFG_RETRAMCSR.

RETRAM CRC specific management

The CRC computation and signature check must be enabled on RETRAM to allow the CPU2 boot when exiting Standby mode in wake-up event mode (ignored in the legacy boot mode). If the CRC check fails, the CPU2 is not allowed to boot and an application reset or a notification can be generated (reset always generated if the CPU2 is the trusted CPU). The CRC check is ignored in the legacy boot mode. See *Section 20: Reset and clock control (RCC)* for more details on the RETRAM CRC error system reset enable.

This signal (combined with the ECC DED) is also routed to the EXTI2 in order to wake up the CPU1.

16.4 RAMCFG low-power modes

Table 69. Effect of low-power modes on RAMCFG

Mode	Description
Sleep	No effect. RAMCFG interrupts cause the device to exit Sleep mode.
Stop	The content of RAMCFG registers is kept.
Standby	The RAMCFG is powered down. Only few register bits are kept in Standby (see bit description for more details).

16.5 RAMCFG interrupts

Four interrupts are generated internally (all maskable by software) and a global interrupt request is exported to the interrupt controller. The table below gives the list of RAMCFG interrupt requests.

Table 70. RAMCFG interrupt requests

Interrupt acronym	Memory	Interrupt event	Event flag(1)	Enable control bit	Interrupt clear method
RAMCFG	RETRAM	ECC single error detection and correction	SEC	SEIE	Write 1 in CSEC
		ECC double error detection	DED	DEIE	Write 1 in CDED
	BKPSRAM	ECC single error detection and correction	SEC	SEIE	Write 1 in CSEC
		ECC double error detection	DED	DEIE	Write 1 in CDED

1. All these bits are in RAMCFG_RETRAMISR.

16.6 RAMCFG registers

The RAMCFG registers can be accessed in word, half-word, and byte format, unless explicitly specified differently.

16.6.1 RAMCFG SYSRAM control register (RAMCFG_SYSRAMCR)

Address offset: 0x000

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	SRAMER	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
							rw								

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **SRAMER**: SRAM erase
This bit can be set by software only after writing the unlock sequence in ERASEKEY of RAMCFG_SYSRAMERASEKEY. Setting this bit starts the SRAM erase. This bit is automatically cleared by hardware at the end of the erase operation.
0: No erase operation ongoing
1: Erase operation ongoing

Bits 7:0 Reserved, must be kept at reset value.

16.6.2 RAMCFG SYSRAM interrupt status register (RAMCFG_SYSRAMISR)

Address offset: 0x008

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	SRAM BUSY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
							r								

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **SRAMBUSY**: SRAM busy with erase operation

0: No erase operation ongoing
1: Erase operation ongoing

Note: Depending on the SRAM, the erase operation can be performed due to software request, system reset if the option is not disabled by software and tamper detection. Refer to Table 67: Internal SRAM features.

Bits 7:0 Reserved, must be kept at reset value.

16.6.3 RAMCFG SYSRAM erase key register (RAMCFG_SYSRAMERKEYR)

Address offset: 0x028

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ERASEKEY[7:0]							
								w	w	w	w	w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **ERASEKEY[7:0]**: Erase write protection key

The following steps are required to unlock the write protection of SRAMER in RAMCFG_SYSRAMCR.

a) Write 0xCA into ERASEKEY[7:0].
b) Write 0x53 into ERASEKEY[7:0].

Note: Writing a wrong key reactivates the write protection.

16.6.4 RAMCFG SRAM1 control register (RAMCFG_SRAM1CR)

Address offset: 0x080

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	SRAMER	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
							rw								

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **SRAMER**: SRAM erase.
This bit can be set by software only after writing the unlock sequence in ERASEKEY of RAMCFG_MCURAM1ERASEKEY. Setting this bit starts the SRAM erase. This bit is automatically cleared by hardware at the end of the erase operation.
0: No erase operation ongoing
1: Erase operation ongoing

Bits 7:0 Reserved, must be kept at reset value.

16.6.5 RAMCFG SRAM1 interrupt status register (RAMCFG_SRAM1ISR)

Address offset: 0x088

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	SRAMBUSY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
							r								

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **SRAMBUSY**: SRAM busy with erase operation
0: No erase operation ongoing
1: Erase operation ongoing

Note: Depending on the SRAM, the erase operation can be performed due to software request, system reset if the option is not disabled by software and tamper detection. Refer to Table 67: Internal SRAM features.

Bits 7:0 Reserved, must be kept at reset value.

16.6.6 RAMCFG SRAM1 erase key register (RAMCFG_SRAM1ERKEYR)

Address offset: 0x0A8

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ERASEKEY[7:0]							
								w	w	w	w	w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **ERASEKEY[7:0]**: Erase write protection key

The following steps are required to unlock the write protection of SRAMER in RAMCFG_MCURAM1CR.

a) Write 0xCA into ERASEKEY[7:0].

b) Write 0x53 into ERASEKEY[7:0].

Note: Writing a wrong key reactivates the write protection.

16.6.7 RAMCFG RETRAM control register (RAMCFG_RETRAMCR)

Address offset: 0x180

Reset value: 0x0000 0000

See individual bits for reset condition.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	SRAMHWERDIS	Res.	Res.	Res.	SRAMER	Res.	Res.	Res.	ALE	Res.	Res.	Res.	ECCE
			rw				rs				rw				rs

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **SRAMHWERDIS:** SRAM hardware erase disable

0: Erase operation done after a system reset

1: No erase operation done after a system reset

Note: This bit is reset on a reset only by VSW POR and VSWRST.

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **SRAMER**: SRAM erase.
This bit can be set by software only after writing the unlock sequence in ERASEKEY of RAMCFG_RETRAMERASEKEY. Setting this bit starts the SRAM erase. This bit is automatically cleared by hardware at the end of the erase operation.
0: No erase operation ongoing
1: Erase operation ongoing
Note: This bit is reset on any system reset.

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **ALE:** Address latch enable
0: Failing address not stored in the RETRAMECC single/double error address registers
1: Failing address stored in the RETRAMECC single/double error address registers
Note: This bit is reset on any system reset.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **ECCE**: ECC enable
When set, this bit can be cleared by software only after writing the unlock sequence in RAMCFG_RETRAMECCKEYR.
0: ECC disabled
1: ECC enabled
Note: This bit is reset on an application reset.

16.6.8 RAMCFG RETRAM interrupt enable register (RAMCFG_RETRAMIER)

Address offset: 0x184

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DEIE	SEIE
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DEIE:** ECC double error interrupt enable
0: Double error interrupt disabled
1: Double error interrupt enabled

Bit 0 **SEIE:** ECC single error interrupt enable
0: Single error interrupt disabled
1: Single error interrupt enabled

16.6.9 RAMCFG RETRAM interrupt status register (RAMCFG_RETRAMISR)

Address offset: 0x188

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	SRAM BUSY	Res.	Res.	Res.	Res.	Res.	Res.	DED	SEC
							r							r	r

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **SRAMBUSY**: SRAM busy with erase operation

0: No erase operation ongoing
1: Erase operation ongoing

Note: Depending on the SRAM, the erase operation can be performed due to software request, system reset if the option is not disabled by software and tamper detection. Refer to Table 67: Internal SRAM features.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **DED:** ECC double error detected

0: No double error
1: Double error detected

Bit 0 **SEC:** ECC single error corrected

0: No single error
1: Single error corrected

16.6.10 RAMCFG RETRAM ECC single error address register (RAMCFG_RETRAMSEAR)

Address offset: 0x18C

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	ESEA[14:0]														
	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:0 **ESEA[14:0]:** ECC single error address

When ALE is set in RAMCFG_RETRAMCR, this bitfield is updated with the word-address corresponding to the ECC single error.

16.6.11 RAMCFG RETRAM ECC double error address register (RAMCFG_RETRAMDEAR)

Address offset: 0x190

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	EDEA[14:0]														
	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:0 **EDEA[14:0]:** ECC double error address

When ALE is set in RAMCFG_RETRAMCR, this bitfield is updated with the word-address corresponding to the ECC double error.

16.6.12 RAMCFG RETRAM interrupt clear flag register (RAMCFG_RETRAMICR)

Address offset: 0x194

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CDED	CSEC
														w	w

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **CDED:** Clear of ECC double error detected

Writing 1 to this flag clears DED in RAMCFG_RETRAMISR.

Bit 0 **CSEC:** Clear of ECC single corrected

Writing 1 to this flag clears SEC in RAMCFG_RETRAMISR.

16.6.13 RAMCFG RETRAM ECC key register (RAMCFG_RETRAMECCKEYR)

Address offset: 0x1A4

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ECCKEY[7:0]							
								w	w	w	w	w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **ECCKEY[7:0]:** ECC write protection key

The following steps are required to unlock the write protection of ECCE in RAMCFG_RETRAMCR.
a) Write 0xAE into ECCKEY[7:0].
b) Write 0x75 into ECCKEY[7:0].

Note: Writing a wrong key reactivates the write protection.

16.6.14 RAMCFG RETRAM erase key register (RAMCFG_RETRAMERKEYR)

Address offset: 0x1A8

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ERASEKEY[7:0]							
								w	w	w	w	w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **ERASEKEY[7:0]**: Erase write protection key

The following steps are required to unlock the write protection of SRAMER in RAMCFG_RETRAMCR.
a) Write 0xCA into ERASEKEY[7:0].
b) Write 0x53 into ERASEKEY[7:0].

Note: Writing a wrong key reactivates the write protection.

16.6.15 RAMCFG RETRAM CRC control register 1 (RAMCFG_RETRAMCCR1)

Address offset: 0x1B0

Reset value: 0x0000 0070

Not reset by wake-up from Standby mode, but by any application reset (such as NRST or IWDG).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CRCBS[2:0]			Res.	Res.	CRCC[1:0]	
									rw	rw	rw			rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **CRCBS[2:0]**: CRC buffer size
This bitfield is used to program the buffer size to take into account during CRC computation. Starting from RETRAM start address.
0x0: 16 Kbytes
0x1: 32 Kbytes
0x2: 48 Kbytes
.....
0x7: 128 Kbytes (default)

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **CRCC[1:0]:** CRC configuration.
00: CRC disabled
01: CRC computation enabled. The calculated signature is stored in RAMCFG_RETRAMCCSR when the CRCEOC flag is set.
10: CRC computation and signature check enabled. The status of the signature check is available in RAMCFG_RETRAMCSR when the CRCEOC flag is set.
11: Reserved

16.6.16 RAMCFG RETRAM CRC control register 2 (RAMCFG_RETRAMCCR2)

Address offset: 0x1B4

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CRCFC	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CRCCS
															rw

Bit 31 **CRCFC:** CRC flags clear.
Setting this bit clears the CRC status flags in RAMCFG_RETRAMCSR.
0: CRC flags are not affected.
1: CRC flags are cleared in RAMCFG_RETRAMCSR.
Note: This bit is automatically cleared by hardware.

Bits 30:1 Reserved, must be kept at reset value.

Bit 0 **CRCCS**: CRC computation start
Setting this bit starts the CRC computation. This bit is automatically cleared by hardware at the end of the CRC computation phase.
0: CRC computation not launched
1: CRC computation launched

16.6.17 RAMCFG RETRAM CRC reference signature register (RAMCFG_RETRAMCRSR)

Address offset: 0x1B8

Reset value: 0x0000 0000

Not reset by wake-up from Standby mode, but by any application reset (such as NRST or IWDG).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CRCRS[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CRCRS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CRCRS[31:0]:** CRC reference signature.
This bitfield is used to write the reference signature (precalculated signature) used for CRC signature comparison check.

16.6.18 RAMCFG RETRAM CRC status register (RAMCFG_RETRAMCSR)

Address offset: 0x1BC

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CRCSCS	CRCEOC
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **CRCSCS:** CRC signature check status flag

This bit is set when the computed signature matches the reference signature stored in RAMCFG_RETRAMCRSR. This bit is valid only when the CRCEOC flag is set.

0: Fault detected is SRAM data. Calculated signature does not match the reference signature.

1: SRAM data is correct. Calculated signature matches the reference signature.

Bit 0 **CRCEOC:** CRC end-of-computation flag

0: Computation ongoing

1: Computation done

16.6.19 RAMCFG RETRAM CRC calculated signature register (RAMCFG_RETRAMCCSR)

Address offset: 0x1C0

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CRCCS[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CRCCS[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **CRCCS[31:0]:** CRC calculated signature

When CRCEOC is set in RAMCFG_RETRAMCSR, this bitfield is updated with the calculate signature representing the content of the SRAM buffer to compute.

16.6.20 RAMCFG BKPSRAM control register (RAMCFG_BKPSRAMCR)

Address offset: 0x380

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	SRAMER	Res.	Res.	Res.	ALE	Res.	Res.	Res.	ECCE
							rs				rw				rs

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **SRAMER**: SRAM erase.
This bit can be set by software only after writing the unlock sequence in ERASEKEY of RAMCFG_BKPSRAMERASEKEY. Setting this bit starts the SRAM erase. This bit is automatically cleared by hardware at the end of the erase operation.
0: No erase operation ongoing
1: Erase operation ongoing

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **ALE:** Address latch enable
0: Failing address not stored in the BKPSRAMECC single/double error address registers
1: Failing address stored in the BKPSRAMECC single/double error address registers

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **ECCE**: ECC enable
When set, this bit can be cleared by software only after writing the unlock sequence in RAMCFG_BKPSRAMECCKEYR.
0: ECC disabled
1: ECC enabled

16.6.21 RAMCFG BKPSRAM interrupt enable register (RAMCFG_BKPSRAMIER)

Address offset: 0x384

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DEIE	SEIE
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DEIE:** ECC double-error interrupt enable
0: Double-error interrupt disabled
1: Double-error interrupt enabled

Bit 0 **SEIE:** ECC single-error interrupt enable
0: Single-error interrupt disabled
1: Single-error interrupt enabled

16.6.22 RAMCFG BKPSRAM interrupt status register (RAMCFG_BKPSRAMISR)

Address offset: 0x388

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	SRAM BUSY	Res.	Res.	Res.	Res.	Res.	Res.	DED	SEC
							r							r	r

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **SRAMBUSY**: SRAM busy with erase operation

0: No erase operation ongoing
1: Erase operation ongoing

Note: Depending on the SRAM, the erase operation can be performed due to software request, system reset if the option is not disabled by software and tamper detection. Refer to Table 67: Internal SRAM features.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **DED:** ECC double error detected

0: No double error
1: Double error detected

Bit 0 **SEC:** ECC single error corrected

0: No single error
1: Single error detected and corrected

16.6.23 RAMCFG BKPSRAM ECC single error address register (RAMCFG_BKPSRAMEEAR)

Address offset: 0x38C

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	ESEA[10:0]										
					r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **ESEA[10:0]:** ECC single error address

When ALE is set in RAMCFG_BKPSRAMCR, this field is updated with the word-address corresponding to the ECC single error.

16.6.24 RAMCFG BKPSRAM ECC double error address register (RAMCFG_BKPSRAMDEAR)

Address offset: 0x390

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	EDEA[10:0]										
					r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **EDEA[10:0]:** ECC double error address

When ALE is set in RAMCFG_BKPSRAMCR, this bitfield is updated with the word-address corresponding to the ECC double error.

16.6.25 RAMCFG BKPSRAM interrupt clear flag register (RAMCFG_BKPSRAMICR)

Address offset: 0x394

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CDED	CSEC
														w	w

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **CDED:** Clear of ECC double error detected

Writing 1 to this flag clears DED in RAMCFG_BKPSRAMISR.

Bit 0 **CSEC:** Clear of ECC single corrected

Writing 1 to this flag clears SEC in RAMCFG_BKPSRAMISR.

16.6.26 RAMCFG BKPSRAM ECC key register (RAMCFG_BKPSRAMECCKEYR)

Address offset: 0x3A4

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ECCKEY[7:0]							
								w	w	w	w	w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **ECCKEY[7:0]:** ECC write protection key

The following steps are required to unlock the write protection of ECCE in RAMCFG_BKPSRAMCR.
a) Write 0xAE into ECCKEY[7:0].
b) Write 0x75 into ECCKEY[7:0].

Note: Writing a wrong key reactivates the write protection.

16.6.27 RAMCFG BKPSRAM erase key register (RAMCFG_BKPSRAMERKEYR)

Address offset: 0x3A8

Reset value: 0x0000 0000

Reset on any system reset.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ERASEKEY[7:0]							
								w	w	w	w	w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **ERASEKEY[7:0]**: Erase write protection key

The following steps are required to unlock the write protection of SRAMER in RAMCFG_BKPSRAMCR.
a) Write 0xCA into ERASEKEY[7:0].
b) Write 0x53 into ERASEKEY[7:0].

Note: Writing a wrong key reactivates the write protection.

16.6.28 RAMCFG register map

Table 71. RAMCFG register map and reset values

Refer to *Section 2.4* for the register boundary addresses.

17 Instruction cache (ICACHE)

17.1 ICACHE introduction

The instruction cache (ICACHE) is implemented on the C-AHB code bus of the Cortex®-M33 processor to improve performance when fetching instructions and data from internal and external memories.

Some specific features, like dual master ports, hit-under-miss, and critical-word-first refill policy, result in close to zero-wait-state performance in most use cases.

17.2 ICACHE main features

The main features of ICACHE are listed below:

- Bus interface
  - One 32-bit AHB slave port, the execution port (input from Cortex®-M33 C-AHB code interface)
  - Two AHB master ports: master1 and master2 ports, with outputs to Fast and Slow buses of main AHB bus matrix, respectively
  - One 32-bit AHB slave port for control (input from AHB peripherals interconnect, for ICACHE registers access)
- Cache access
  - 0 wait-state on hits
  - Hit-under-miss capability: ability to serve processor requests (access to cached data) during an ongoing line refill due to a previous cache miss
  - Dual master access: feature used to decouple the traffic according to targeted memory. For example, the ICACHE assigns fast traffic (addressing flash memories and SRAMs) to the AHB master1 port, and slow traffic (addressing external memories) to the AHB master2 port, thus preventing processor stalls on line refills from external memories. This allows ISR (interrupt service routine) fetching on internal flash memory to take place in parallel with a cache line refill from external memories.
  - Minimal impact on interrupt latency, thanks to dual master
  - Optimal cache line refill thanks to WRAPw bursts of the size of the cache line (32-bit word size, **w**, aligned on cache line size)
  - n-way set-associative default configuration with possibility to configure as 1-way, means direct mapped cache, for applications needing very-low-power consumption profile
- Memory address remap
  - Possibility to remap input address falling into up to four memory regions (used to remap aliased code in external memories to the code region, for execution from the C-AHB code interface)
- Replacement and refill
  - pLRU-t (pseudo-least-recently-used, based on binary tree) replacement policy, algorithm with best complexity/performance balance
  - Critical-word-first refill policy, minimizing processor stalls

  - Possibility to configure burst type of AHB memory transaction for remapped regions: INCRw or WRAPw (size w aligned on cache line size)
- Performance counters

  The ICACHE implements two performance counters:
  - Hit monitor counter (32-bit)
  - Miss monitor counter (16-bit)
- Error management
  - Possibility to detect an unexpected cacheable write access, to flag an error, and optionally, to raise an interrupt
- TrustZone® security support
- Maintenance operation
  - Cache invalidate: full cache invalidation, fast command, noninterruptible

17.3 ICACHE implementation

Table 72. ICACHE features

Feature	ICACHE
Number of ways	2
Cache size	16 Kbytes
Cache line width	32 bytes
Range granularity of memory regions to be remapped	2 Mbytes
Number of regions to remap	4
Data size of AHB slave interface	32 bits
Data size of AHB fast master1 interface	32 bits
Data size of AHB slow master2 interface	32 bits

17.4 ICACHE functional description

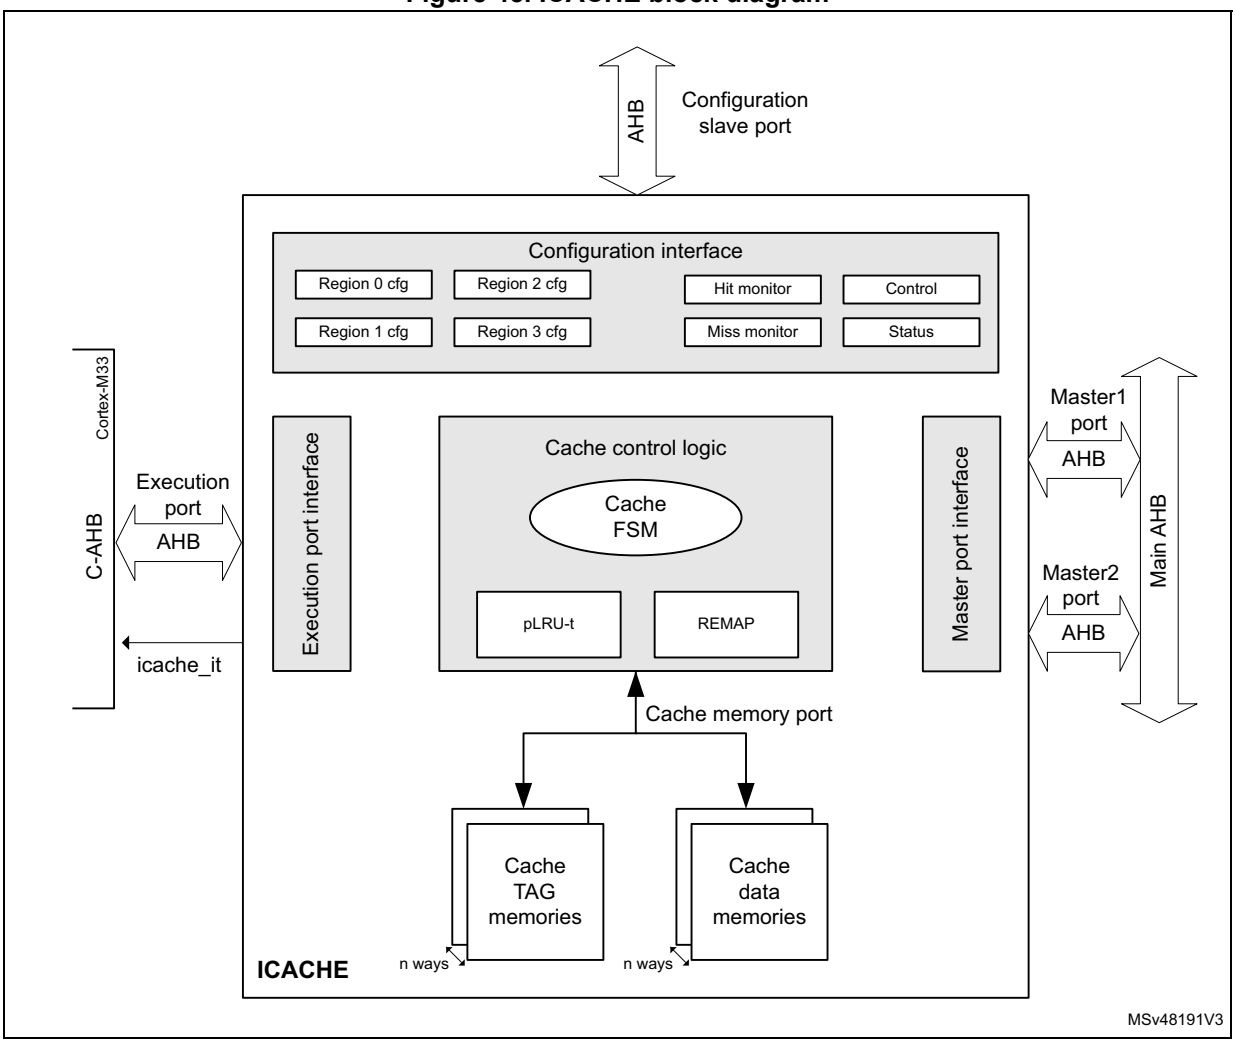
The purpose of this block is to cache instruction fetches or instruction memories loads, coming from the processor. As such, the ICACHE manages only cacheable read transactions, and does not manage cacheable write transactions.

The noncacheable transactions (both read and write) bypass the ICACHE.

For the error management purpose, if a write cacheable transaction is presented (this happens only in case of bad software programming), the ICACHE sets an error flag and, if enabled, raises an interrupt to the processor.

17.4.1 ICACHE block diagram

Figure 45. ICACHE block diagram



17.4.2 ICACHE reset and clocks

The ICACHE is clocked on the Cortex®-M33 C-AHB bus clock.

When the ICACHE reset signal is released, a cache invalidate procedure is automatically launched, making the ICACHE busy (ICACHE_SR = 0x0000 0001).

When this procedure is finished:

- the ICACHE is invalidated: “cold cache”, with all cache line valid bits = 0 (ICACHE must be filled up)
- ICACHE_SR = 0x0000 0002 (reflecting the cache is no longer busy)
- the ICACHE is disabled: the EN bit in ICACHE_CR holds its reset state (= 0).

Note: When disabled, the ICACHE is bypassed, except the remapping mechanism that is still functional: slave input requests (remapped or not) are forwarded to the master port(s).

17.4.3 ICACHE TAG memory

The ICACHE TAG memory contains:

- address tags indicating which data are contained in the cache data memories
- validity bits

There is one valid bit per cache line (per way).

The valid bit is set when a cache line is refilled (after a miss).

Valid bits are reset in any of the below cases:

- after the ICACHE reset is released
- when the cache is disabled, by setting EN = 0 in ICACHE_CR (by software)
- when executing an ICACHE invalidate command, by setting CACHEINV = 1 in ICACHE_CR (by software)

When a cacheable transaction is received at the execution input port, its AHB address (HADDR_in) is split into the following fields (see *Table 73* for B and W definitions):

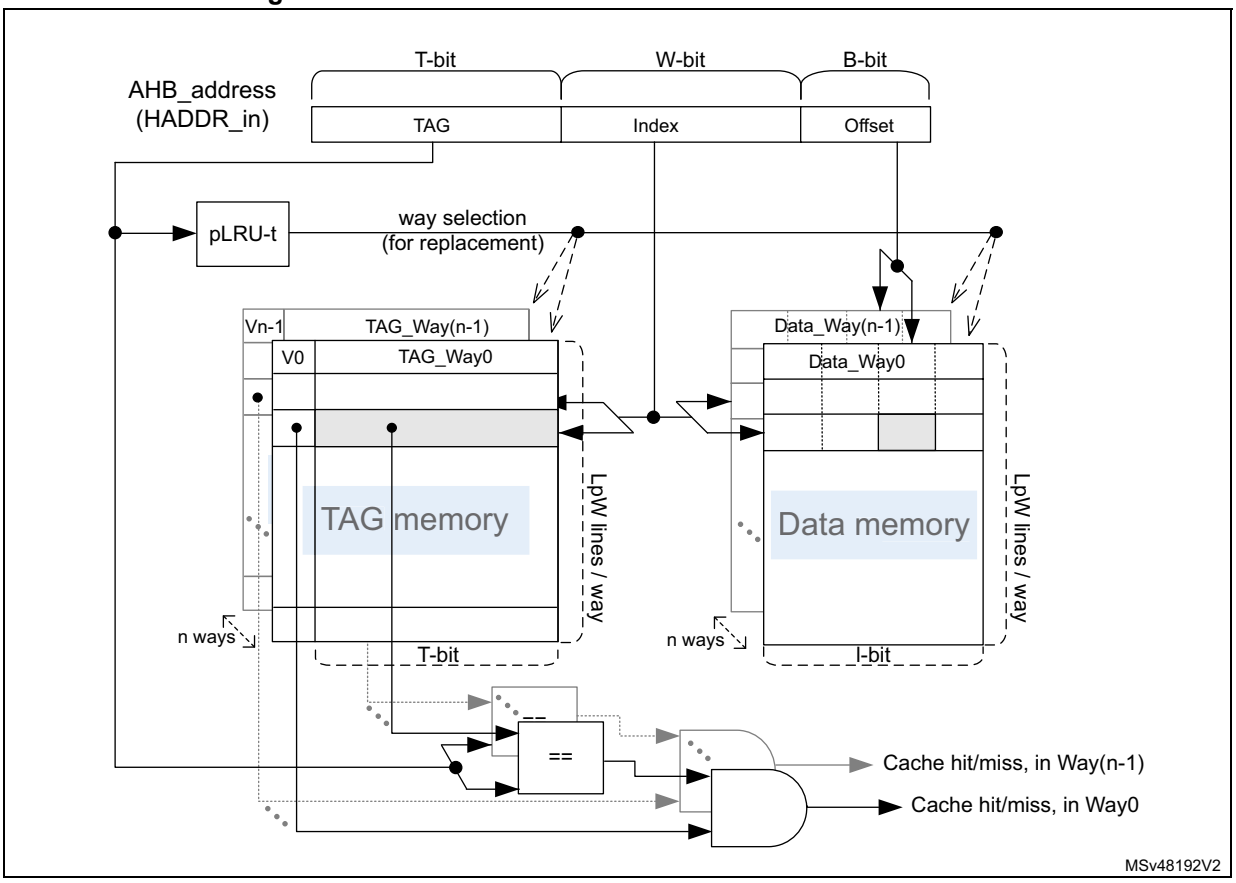
- HADDR_in[B-1:0]: address byte offset, indicates which byte to select inside a cache line.
- HADDR_in[B+W-1:B]: address way index, indicates which cache line to select inside each way.
- HADDR_in[31:B+W]: tag address, to be compared to the TAG memory address to check if the requested data is already available (meaning valid) inside the ICACHE.

The following table gives a summary of the ICACHE main parameters for TAG memory dimensioning. *Figure 46* shows the functional view of TAG and data memories, for an n-way set associative ICACHE.

Table 73. TAG memory dimensioning parameters for n-way set associative operating mode (default)

Parameter	Value	Example
Cache size	S Kbytes = s bytes (s = 1024 x S)	8 Kbytes = 8192 bytes
Cache number of ways	n	2
Cache line size	L-byte = l-bit (l = 8 x L)	16-byte = 128-bit
Number of cache lines	LpW = s / (n x L) lines / way	256 lines / way
Address byte offset size	B = $\log_2$(L) bit	4-bit
Address way index size	W = $\log_2$(LpW) bit	8-bit
TAG address size	T = (32 - W - B) bit	20-bit

Figure 46. ICACHE TAG and data memories functional view



17.4.4 Direct-mapped ICACHE (1-way cache)

The default configuration (at reset) is an n-way set associative cache (WAYSEL = 1 in ICACHE_CR), but the user can configure the ICACHE as direct mapped by writing WAYSEL = 0 (only possible when the cache is disabled, EN = 0 in ICACHE_CR).

The following table gives a summary of ICACHE main parameters for TAG memory when the direct-mapped cache operating mode is selected.

Table 74. TAG memory dimensioning parameters for direct-mapped cache mode

Parameter	Value	Example
Cache size	S Kbytes = s bytes (s = 1024 x S)	8 Kbytes = 8192 bytes
Cache number of ways	1	1
Cache line size	L-byte = l-bit (l = 8 x L)	16-byte = 128-bit
Number of cache lines	LpW = s / L lines	512 lines
Address byte offset size	B = $\log_2$(L) bit	4-bit
Address way index size	W = $\log_2$(LpW) bit	9-bit
TAG address size	T = (32 - W - B) bit	19-bit

All cache operations (such as read, refill, remapping, invalidation) remain the same in the direct-mapped configuration. The only difference is the absence of a replacement algorithm in case of line eviction (as explained in *Section 17.4.8*): only one way (the unique one) is possible for any data refill.

17.4.5 ICACHE enable

To activate the ICACHE, the EN bit in ICACHE_CR must be set to 1.

When the ICACHE is disabled, it is bypassed and all transactions are copied from the slave to the master ports in the same clock cycle.

It is recommended to initialize or modify the main memory content (region to be later cached) with the ICACHE disabled, and to enable the ICACHE only when this region remains unchanged (an enabled ICACHE detects cacheable write transactions as errors).

To ensure performance determinism, it is recommended to wait for the end of a potential cache invalidate procedure before enabling the ICACHE. This procedure occurs when the hardware reset signal is released, when CACHEINV is set, or when EN is cleared in ICACHE_CR. During the procedure, BUSYF is set in ICACHE_SR, and once finished, BUSYF is cleared and BSYENDF is set in the same register (raising the ICACHE interrupt if enabled on such a busy end condition).

The software must test BUSYF and/or BSYENDF values before enabling the ICACHE. Else, if the ICACHE is enabled before the end of an invalidate procedure, any cache access (while BUSYF = 1) is treated as noncacheable, and its performance depends on the main memory access time.

The address remapping is performed, whether the ICACHE is enabled or not, if the input transaction address falls into the memory regions defined and enabled in ICACHE_CRRx (see *Figure 47*).

The ICACHE is, by default, disabled at boot.

17.4.6 Cacheable and noncacheable traffic

The ICACHE is developed for the Cortex®-M33 core. It is placed on the C-AHB bus, and thus caches the code memory region, ranging from address 0x0000 0000 to 0x1FFF FFFF of the memory map.

To make other memory regions cacheable, the ICACHE supports a memory region remapping feature, used to define up to four external memory regions, whose addresses have an alias in the code region. Addressing these memory regions through their code alias address allows the memory request to be routed to the C-AHB bus, and to be managed by the ICACHE.

Any external memory space physically mapped at an address in the range [0x6000 0000:0xAFFF FFFF] can be aliased with an address in the range [0x0000 0000:0x07FF FFFF] or [0x1000 0000:0x1FFF FFFF].

For a given memory request in the code region, the ICACHE implements the address remapping functionality first. If aliased, it is the remapped address, which is then cached, and, if needed, provided to the master port to address the main AHB bus matrix. The destination physical address does not need further manipulation on the AHB bus.

The remapping functionality is available also for noncacheable traffic, and when the cache is disabled.

Additional details on address remapping are provided in *Section 17.4.7*.

An incoming memory request to the ICACHE is defined as cacheable according to its AHB transaction memory lookup attribute, as shown in *Table 75*. This AHB attribute depends on the MPU (memory protection unit) programming for the addressed region.

Table 75. ICACHE cacheability for AHB transaction

AHB lookup attribute	Cacheability
1	Cacheable
0	Noncacheable

In the case of a noncacheable access (read or write), the ICACHE is bypassed. The AHB transaction is propagated unchanged to the master output port, except the transaction address, which may be modified due to the address remapping feature (see *Section 17.4.7*).

The bypass, and eventual remap logic, does not increase the latency of the access to the targeted memory.

In the case of a cacheable access, the ICACHE behaves as explained in *Section 17.4.8*.

Cacheable memory regions are defined and programmed by the user in the MPU responsible for the generation of the AHB attribute signals for any transaction addressing a given region.

Table 76 summarizes programmable configurations of various memories.

Table 76. Memory configurations

Memory	Cacheable (MPU programming)	Remapped in the ICACHE (ICACHE_CRRx programming)
Flash	Yes or no	Not required
SRAM	Not recommended	Not required
External memories	Yes	Required
	No	Required if the user wants code in external memories fetched on C-AHB bus (else on S-AHB bus)

17.4.7 Address remapping

The ICACHE allows an alias address to be defined in the code region for up to four external memory regions.

The address remapping is applied on the code alias address, transforming it into the destination external physical address.

The remapping operation is fully software configurable by programming ICACHE_CRRx (x = 0 to 3, number of remapped regions). This programming can be done only when the ICACHE is disabled.

Each region x can be individually enabled with REN in ICACHE_CRRx. Once enabled, the remap operation occurs even if the ICACHE is disabled, or if the transaction is noncacheable.

Remap regions can have different size: each can be programmed in RSIZE of its ICACHE_CRRx. The size of each region is a power of two multiple of range granularity (2 Mbytes), with a minimum of 2 Mbytes, and a maximum of 128 Mbytes.

The address remapping mechanism is based on the matching of an incoming AHB address (HADDR_in) with a given code subregion base-address, and the modification of this address into its (remapped) physical address, as follows:

- HADDR_in belongs to region x if HADDR_in[31:RI] = 000:BASEADDR[28:RI], where:
  - 000:BASEADDR is the code subregion base-address programmed in BASEADDR of ICACHE_CRRx.
  - RI defines the number of significant bits to consider. RI = $\log_2$ (region size) with a minimum value of 21 (for a 2-Mbyte region) and a maximum value of 27 (for a 128-Mbyte region).
- If the region x is enabled, the master port output AHB address (HADDR_out) is composed by concatenating the two below parts:
  - REMAPADDR[31:RI] field of ICACHE_CRRx as MSBs
  - HADDR_in[RI-1:0] as LSBs

Figure 47 describes the matching and the output address generation.

Figure 47. ICACHE remapping address mechanism

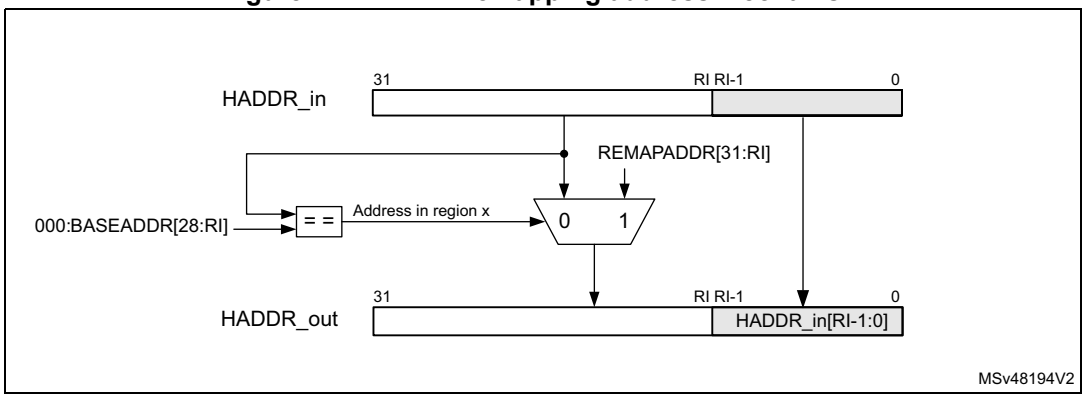


Table 77 summarizes all possible configurations of BASEADDR and REMAPADDR sizes (number of significant MSBs) in ICACHE_CRRx, depending upon RSIZE.

Table 77. ICACHE remap region size, base address, and remap address

Region size (Mbytes)	Base address size (MSBs)	Remap address (MSBs)
2	8	11
4	7	10
8	6	9
16	5	8
32	4	7
64	3	6
128	2	5

Care must be taken while programming BASEADDR and REMAPADDR in ICACHE_CRRx: if the programmed value is bigger than expected (number of MSBs, see *Table 77*), the unneeded extra LSBs are ignored.

Typical remapping example: a 128-Mbyte external RAM region physically located in the external address range [0x9000 0000:0x97FF FFFF], remapped in the code section range [0x1800 0000:0x1FFF FFFF]:

- REMAPADDR[31:21] = 0x480
- BASEADDR[28:21] = 0xC0
- HADDR_in[31:27] is compared to 000:BASEADDR[28:27], while HADDR_in and BASEADDR[26:21] are ignored.

If the comparison matches:

- HADDR_out[31:27] gets REMAPADDR[31:27] (in place of HADDR_in[31:27])
- HADDR_out[26:0] gets HADDR_in[26:0]

The software can program the kind of AHB burst generated by the ICACHE master ports on the bus matrix (for cache line refill), by setting HBURST in ICACHE_CRRx with:

- WRAP for remapped external memories accessed through interfaces that can support WRAP burst mode, providing the benefit of the critical-word-first feature performance:
  - WRAP burst size = cache line size
  - WRAP burst start address = word address of the first data requested by the core
- INCR: INCR burst mode for external memories accessed through the interfaces that do not support WRAP burst mode (losing the benefit of critical-word-first feature):
  - INCR burst size = cache line size
  - INCR burst start address = address aligned on the boundary of the cache line containing the requested word.

Note: Coherency is needed when programming the SAU (secure attribution unit) and the MPU (memory protection unit) attributes for both the external regions and their aliased code subregions.

17.4.8 Cacheable accesses

When the ICACHE receives a cacheable transaction from the Cortex®-M33, it checks if the address requested is present in its TAG memory, and if the corresponding cache line is valid.

There are then three alternatives:

- The address is present inside the TAG memory, the cache line is valid: **cache hit**, the data is read from the cache and provided to the processor in the same cycle.
- The address is not present in the TAG memory: **cache miss**, the data is read from the main memory and provided to the processor, and a cache line refill is performed.

  The critical-word-first policy ensures minimum wait cycles for the processor, since read data can be provided while the cache still performs a cache line refill (associated latency is the latency of fetching one word from the main memory).

  The burst generated on the ICACHE master bus is WRAPw (w being the cache line width, in words) if no address remap occurs. If an address remap occurs, the kind of burst depends upon the HBURST programmed in corresponding ICACHE_CRRx.

  The AHB transaction attributes are also propagated to the main AHB bus matrix on the master port selected for the line refill.

- The address is not present in TAG memory, but belongs to the refill burst from the main memory currently ongoing: **cache hit** (hit-under-miss feature).

  This happens during cache-line refill. The ICACHE can provide the requested data as soon as data are available at its master interface, thus avoiding a miss (fetching data from the main memory).

In the case of cache refill (due to cache miss), the ICACHE selects which cache line is written with the refill data:

- In direct map (1-way) mode, only one line can be used to store the refill data: the line pointed by the index of the input address.
- In n-way set associative mode, one line among n can be used (the line pointed by the address index, in each of the n ways). The way selection is based on a pLRU-t replacement algorithm that points, for each index, on the way candidate for the next refill.

If the cache line where the refill data must be written is already valid, the targeted cache line must be invalidated first. This is true whatever the direct map or n-way set associative cache mode.

17.4.9 Dual-master cache

The ICACHE implements a dual-port AHB master on the main AHB bus matrix: master1 and master2 ports. This is used to split the traffic going to different destination memories.

The nonremapped traffic goes systematically to master1 port. The remapped traffic can be routed on the master2 port by programming MSTSEL in ICACHE_CRRx (on a region basis).

The code can typically be fetched as follows:

- internal flash memory and internal SRAM on master1 port (Fast bus)
- external flash memory/RAM on master2 port (Slow bus)

For systems not implementing external memories, the traffic to the internal flash memory can be decoupled from the traffic to the internal SRAM (when remapped by the ICACHE). This feature is used to prevent further processor stalls on misses.

Alongside with hit-under-miss, this dual-master feature allows the processor to have an alternative path in case of fetching from different memories.

17.4.10 ICACHE security

The ICACHE implements an Armv8-M TrustZone.

ICACHE configuration registers are protected at system level.

17.4.11 ICACHE maintenance

The software can invalidate the whole content of the ICACHE by programming CACHEINV in the ICACHE_CR register.

When CACHEINV = 1, the ICACHE control logic sets the BUSYF flag in ICACHE_SR and launches the invalidate cache operation, resetting each TAG valid bit to 0 (one valid bit per cache line). CACHEINV is automatically cleared.

Once the invalidate operation is finished (all valid bits reset to 0), the ICACHE automatically clears BUSYF, and sets BSYENDF in the ICACHE_SR register.

If enabled on this flag condition (BSYENDIE = 1 in ICACHE_IER), the ICACHE interrupt is raised. Then, the (empty) cache is available again.

17.4.12 ICACHE performance monitoring

The ICACHE provides the following monitors for performance analysis:

- The 32-bit hit monitor counts the cacheable AHB-transactions on the slave cache port that hits the ICACHE content.

  It also takes into account all accesses whose address is present in the TAG memory or in the refill buffer (due to a previous miss, and whose data is coming, or is soon to come, from the cache master port) (see *Section 17.4.8*).
- The 16-bit miss monitor counts the cacheable AHB-transactions on the slave cache port that misses the ICACHE content.

  It also takes into account all accesses whose address is not present neither in the TAG memory nor in the refill buffer.

Upon reaching their maximum values, these monitors do not wrap over.

Hit and miss monitors can be enabled and reset by software allowing the analysis of specific pieces of code.

The software can perform the following tasks:

- Enable/stop the hit monitor through HITMEN in ICACHE_CR.
- Reset the hit monitor by setting HITMRST in ICACHE_CR.
- Enable/stop the miss monitor through MISSMEN in ICACHE_CR.
- Reset the miss monitor by setting MISSMRST in ICACHE_CR.

To reduce power consumption, these monitors are disabled (stopped) by default.

17.4.13 ICACHE boot

The ICACHE is disabled (EN = 0 in ICACHE_CR) at boot.

The code remapping at boot is not needed for a Cortex®-M33 as it implements the VTOR (vector tables) that allows a boot start address definition different than 0x0.

Once the boot is finished, the ICACHE can be enabled (software setting EN = 1 in CACHE_CR).

17.5 ICACHE low-power modes

At device level, using the ICACHE reduces the power consumption by fetching instructions from the internal ICACHE most of the time, rather than from the bigger and then more power consuming main memories. This reduction is even higher if the cached main memories are external.

Applications with lower performance profile (in terms of hit ratio) and stringent power consumption constraints may benefit from the lower power consumption of an ICACHE configured as direct mapped. This single-way cache configuration is obtained by programming WAYSEL = 0 in ICACHE_CR (see *Figure 46*). The power consumption is reduced by accessing, for each request, only the necessary cut of TAG and data memories. The cache effect still improves fetch performance, even if for most code execution, it is less efficient than with an n-way set associative cache mode.

17.6 ICACHE error management and interrupts

If an unsupported cacheable write request is detected (functional error), the ICACHE generates an error by setting the ERRF flag in ICACHE_SR. An interrupt is generated if the corresponding interrupt enable bit is set (ERRIE = 1 in ICACHE_IER).

The other possible interrupt generation is at the end of a cache invalidation operation. When the cache-busy state is finished, the ICACHE sets the BSYENDF flag in ICACHE_SR. An interrupt is generated if the corresponding interrupt enable bit is set (BSYENDIE = 1 in ICACHE_IER).

All ICACHE interrupt sources raise the same and unique interrupt signal, icache_it, and then use the same interrupt vector.

Table 78. ICACHE interrupts

Interrupt vector	Interrupt event	Event flag	Enable control bit	Interrupt clear method
ICACHE	Functional error	ERRF in ICACHE_SR	ERRIE in ICACHE_IER	Set CERRF to 1 in ICACHE_FCR
	End of busy state (invalidate finished)	BSYENDF in ICACHE_SR	BSYENDIE in ICACHE_IER	Set CBSYENDF to 1 in ICACHE_FCR

The ICACHE also propagates all AHB bus errors (such as security issues, address decoding issues) from the master1 or master2 port back to the execution port.

17.7 ICACHE registers

17.7.1 ICACHE control register (ICACHE_CR)

Address offset: 0x000

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MISSMRST	HITMRST	MISSMEN	HITMEN
												rw	rw	rw	rw

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WAYSEL	CACHEINV	EN
													rw	w	rw

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **MISSMRST**: miss monitor reset
0: release the cache miss monitor reset (needed to enable the counting)
1: reset cache miss monitor

Bit 18 **HITMRST**: hit monitor reset
0: release the cache miss monitor reset (needed to enable the counting)
1: reset cache hit monitor

Bit 17 **MISSMEN**: miss monitor enable
0: cache miss monitor switched off. Stopping the monitor does not reset it.
1: cache miss monitor enabled

Bit 16 **HITMEN**: hit monitor enable
0: cache hit monitor switched off. Stopping the monitor does not reset it.
1: cache hit monitor enabled

Bits 15:3 Reserved, must be kept at reset value.

Bit 2 **WAYSEL**: cache associativity mode selection
This bit allows user to choose ICACHE set-associativity. It can be written by software only when cache is disabled (EN = 0).
0: direct mapped cache (1-way cache)
1: n-way set associative cache (reset value)

Bit 1 **CACHEINV**: cache invalidation
Set by software and cleared by hardware when the BUSYF flag is set (during cache maintenance operation). Writing 0 has no effect.
0: no effect
1: invalidate entire cache (all cache lines valid bit = 0)

Bit 0 **EN**: enable
0: cache disabled
1: cache enabled

17.7.2 ICACHE status register (ICACHE_SR)

Address offset: 0x004

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ERRF	BSYENDF	BUSYF
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **ERRF**: cache error flag
0: no error
1: an error occurred during the operation (cacheable write)

Bit 1 **BSYENDF**: busy end flag
0: cache busy
1: full invalidate CACHEINV operation finished

Bit 0 **BUSYF**: busy flag
0: cache not busy on a CACHEINV operation
1: cache executing a full invalidate CACHEINV operation

17.7.3 ICACHE interrupt enable register (ICACHE_IER)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ERRIE	BSYENDIE	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **ERRIE**: interrupt enable on cache error

Set by software to enable an interrupt generation in case of cache functional error (cacheable write access)

0: interrupt disabled on error

1: interrupt enabled on error

Bit 1 **BSYENDIE**: interrupt enable on busy end

Set by software to enable an interrupt generation at the end of a cache invalidate operation.

0: interrupt disabled on busy end

1: interrupt enabled on busy end

Bit 0 Reserved, must be kept at reset value.

17.7.4 ICACHE flag clear register (ICACHE_FCR)

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CERRF	CBSYENDF	Res.
													w	w	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CERRF**: clear cache error flag

Set by software.

0: no effect

1: clears ERRF flag in ICACHE_SR

Bit 1 **CBSYENDF**: clear busy end flag

Set by software.

0: no effect

1: clears BSYENDF flag in ICACHE_SR.

Bit 0 Reserved, must be kept at reset value.

17.7.5 ICACHE hit monitor register (ICACHE_HMONR)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

HITMON[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **HITMON[31:0]**: cache hit monitor counter

17.7.6 ICACHE miss monitor register (ICACHE_MMONR)

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MISSMON[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MISSMON[15:0]**: cache miss monitor counter

17.7.7 ICACHE region x configuration register (ICACHE_CRRx)

Address offset: 0x020 + 0x4 * x, (x = 0 to 3)

Reset value: 0x0000 0200

Define an alias address in the code region for other regions, making them cacheable.

BASEDADDR and REMAPADDR fields are write locked (read only) when EN = 1 in ICACHE_CR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HBURST	Res.	Res.	MSTSEL	Res.	REMAPADDR[31:21]										
rw			rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REN	Res.	Res.	Res.	RSIZE[2:0]			Res.	BASEADDR[28:21]							
rw				rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **HBURST**: output burst type for region x
0: WRAP
1: INCR

Bits 30:29 Reserved, must be kept at reset value.

Bit 28 **MSTSEL**: AHB cache master selection for region x
0: no action (master1 selected by default)
1: master2 selected

Bit 27 Reserved, must be kept at reset value.

Bits 26:16 **REMAPADDR[31:21]**: remapped address for region x
This field replaces the alias address defined by BASEADDR field.
The only useful bits are [31:RI], where 21 ≤ RI ≤ 27 is the number of bits of RSIZE (see *Section 17.4.7*). If the programmed value has more LSBs, the useless bits are ignored.

Bit 15 **REN**: enable for region x
0: disabled
1: enabled

Bits 14:12 Reserved, must be kept at reset value.

Bits 11:9 **RSIZE[2:0]**: size for region x
000: reserved
001: 2 Mbytes
010: 4 Mbytes
011: 8 Mbytes
100: 16 Mbytes
101: 32 Mbytes
110: 64 Mbytes
111: 128 Mbytes

Bit 8 Reserved, must be kept at reset value.

Bits 7:0 **BASEADDR[28:21]**: base address for region x
This alias address is replaced by REMAPADDR field.
The only useful bits are [28:RI], where 21 ≤ RI ≤ 27 is the number of bits of RSIZE (see *Section 17.4.7*). If the programmed value has more LSBs, the useless bits are ignored.

17.7.8 ICACHE hardware configuration register (ICACHE_HWCFGR)

Address offset: 0x3F0

Reset value: 0x00A4 1641

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ECC	Res.	Res.	Res.	GSWIDTH[1:0]		Res.	SMASTER[1:0]		FMASTER[1:0]		Res.	Res.	REGION[2:0]		
r				r	r		r	r	r	r			r	r	r

r	r	r	r		r	r			r	r	r			r	r

Bit 31 **ECC**: error detection and correction support
0: no ECC hardware support
1: ECC hardware support

Bits 30:28 Reserved, must be kept at reset value.

Bits 27:26 **GSWIDTH[1:0]**: data size of the AHB slave interface
00: 32-bit
01: 64-bit
10: 128-bit
11: reserved

Bit 25 Reserved, must be kept at reset value.

Bits 24:23 **SMASTER[1:0]**: data size of the second AHB master interface (master2)
00: no second master (single master cache)
01: 32-bit
10: 64-bit
11: reserved

Bits 22:21 **FMASTER[1:0]**: data size of the first AHB master interface (master1)
00: reserved
01: 32-bit
10: 64-bit
11: 128-bit

Bits 20:19 Reserved, must be kept at reset value.

Bits 18:16 **REGION[2:0]**: number of regions that can be remapped
000: no region
001: 1 region
010: 2 regions
011: 3 regions
100: 4 regions
others: reserved

Bits 15:12 **RANGE[3:0]**: range granularity of remapped memory regions
0000: reserved
0001: 2 Mbytes
0010: 4 Mbytes
0011: 8 Mbytes
0100: 16 Mbytes
0101: 32 Mbytes
0110: 64 Mbytes
0111: 128 Mbytes
others: reserved

Bit 11 Reserved, must be kept at reset value.

Bits 10:9 **LWIDTH[1:0]**: cache line width
00: reserved
01: 64-bit (8 bytes per line)
10: 128-bit (16 bytes per line)
11: 256-bit (32 bytes per line)

Bits 8:7 Reserved, must be kept at reset value.

Bits 6:4 **SIZE[2:0]**: cache size
000: reserved
001: 2-Kbyte
010: 4-Kbyte
011: 8-Kbyte
100: 16-Kbyte
101: 32-Kbyte
others: reserved

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **WAYS[1:0]**: cache associativity, number of ways
00: reserved
01: 2-way set associative
10: 4-way set associative
11: reserved

17.7.9 ICACHE version register (ICACHE_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0012

18 Data cache (DCACHE)

18.1 DCACHE introduction

The data cache (DCACHE) is introduced on S-AHB system bus of the Cortex®-M33 processor to improve the performance of data traffic to/from external memories.

Some specific features, like hit-under-miss and critical-word-first refill policy, optimize performance on external memories data accesses.

18.2 DCACHE main features

The main features of DCACHE are described below:

- Bus interface
  - One 32-bit AHB slave port, the system port (input from Cortex®-M33 S-AHB system interface)
  - One 32-bit AHB master port (output to main AHB bus matrix)
  - One 32-bit AHB slave port for control (input from AHB peripherals interconnect, for access to DCACHE registers)
- Cache access
  - 0 wait-state on hits
  - Hit-under-miss capability: ability to serve processor requests (access to cached data) during an ongoing line refill due to a previous cache miss
  - Optimized cache line refill thanks to WRAP bursts of the size of the cache line (such as WRAP4 for 128-bit cache line)
  - 2-way set-associative
  - Supports both write-back and write-through policies (selectable with AHB bufferable attribute)
  - Read and write-back always allocate
  - Write-through always non-allocate (write-around)
  - Supports byte, half-word, and word writes
- Replacement and refill
  - pLRU-t replacement policy (pseudo-least-recently-used, based on binary tree), algorithm with best complexity/performance balance
  - Critical-word-first refill policy for read transactions, minimizing processor stalls
  - Possibility to configure burst type of all AHB memory transactions: INCRw or WRAPw (size w aligned on cache line size)
- Performance counters

  The DCACHE implements four performance counters:
  - Two hit-monitor counters (32-bit): number of read hits, number of write hits
  - Two miss-monitor counters (16-bit): number of read misses, number of write misses

- Error management
  - Possibility to detect error for master port request initiated by DCACHE itself (a cache line written back into main memory, because of an eviction or a clean operation), to flag this error, and optionally to raise an interrupt
- TrustZone security support
- Maintenance operations
  - Cache invalidate: full cache invalidation, fast command, non-interruptible
  - Cache invalidate range: invalidates cache lines whose address belongs to defined range, background task, interruptible
  - Cache clean range: cleans cache lines (if dirty bit = 1, write back line, then clear dirty bit) whose address belongs to defined range, background task, interruptible
  - Cache clean and invalidate range: cleans and invalidates cache lines (if dirty bit = 1, write back line, then invalidate it) whose address belongs to defined range, background task, interruptible

18.3 DCACHE implementation

The DCACHE is placed on Cortex-M33 S-AHB bus, and caches the external memory regions (OCTOSPI, FMC) and DDR.

Indeed, by placing a busmatrix demultiplexing node in front of the DCACHE, S-AHB bus memory requests addressing SRAM region or peripherals region (respectively in ranges [0x2000 0000:0x3FFF FFFF] and [0x4000 0000:0x5FFF FFFF]) are routed directly to the Cortex-M33 AHB busmatrix and DCACHE is bypassed.

Table 80. DCACHE features

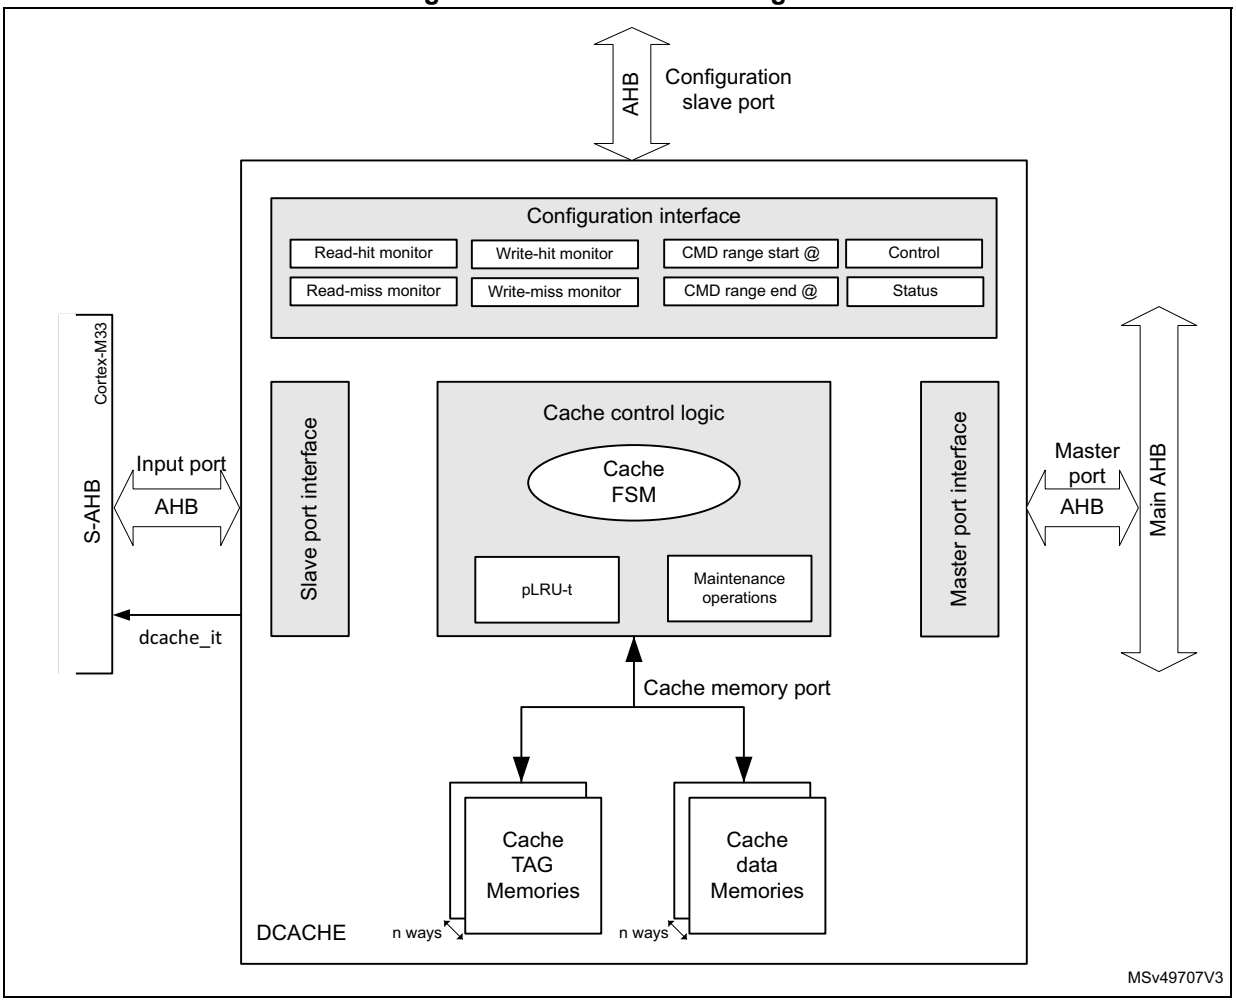
Features	DCACHE
Number of ways	2
Cache size	16 Kbytes
Cache line width	32 bytes
Data size of AHB Master interface	32 bits

18.4 DCACHE functional description

The purpose of the data cache is to cache external memory data loads and stores, coming from the processor. These accesses include the instruction fetches that may occur at an external memory address. The DCACHE manages both read and write transactions.

18.4.1 DCACHE block diagram

Figure 48. DCACHE block diagram



18.4.2 DCACHE reset and clocks

The DCACHE is clocked on the Cortex®-M33 S-AHB bus clock.

When the DCACHE reset signal is released, a cache invalidate procedure is automatically launched, making the DCACHE busy (DCACHE_SR = 0x0000 0001).

When this procedure is finished:

- The DCACHE is invalidated: cold cache, with all cache line valid, dirty, and privilege bits = 0 (DCACHE must be filled up)
- DCACHE_SR = 0x0000 0002 (reflecting the cache is no longer busy)
- The DCACHE is disabled: the EN bit in DCACHE_CR holds its reset state (= 0).

Note: When disabled, the DCACHE is bypassed: slave input requests are just forwarded to the master port.

18.4.3 DCACHE TAG memory

The DCACHE TAG memory contains:

- address tags that indicate which data are contained in the cache data memories
- validity bits
- dirty bits
- privilege bits

There is one valid bit, one dirty bit, and one privilege bit per cache line (per way).

The valid bit enables/disables access to the data cache line: if the line is not valid, the data access (read or write) is performed in the main memory.

The valid bit is set when the cache line is written (refilled by either a read miss or a write-back miss).

Valid bits are reset in any of the below cases:

- after the DCACHE reset is released
- when the cache is disabled, by setting EN = 0 in DCACHE_CR (by software)
- when executing one of the DCACHE invalidate commands, setting by software CACHEINV = 0, or CACHECMD = 0b010 or 0b011 in DCACHE_CR (see *Section 18.4.8*).

The dirty bit indicates that the cache line has up-to-date values with respect to the main memory content (the cache has last right value, the main memory is not up to date).

The dirty bit is set when the cache line is written by a slave port write transaction (only in case of an access with write-back attribute).

Dirty bits are reset in any of the below cases:

- after the DCACHE reset is released
- when a line refill is performed on a read miss (on a write-back miss, the refilled cache line is modified by the written data, and dirty bit = 1)
- when the cache invalidation is performed
- when executing one of the DCACHE clean operations (cache line written back to the main memory), setting by software CACHECMD = 0b001 or 0b011 in DCACHE_CR (see *Section 18.4.8*).

The privilege bit indicates if the data is managed by a privileged entity. It is assigned according to the value of AHB privileged attribute at the input slave port, for the first access to this line (it is written only during the line refill, on read miss or write-back miss).

The privilege bit holds the same polarity as the privileged attribute: 1 for privileged access, 0 for unprivileged access.

Privilege bits are reset when the cache is invalidated, and after the DCACHE reset is released.

When a cacheable transaction is received at input slave port, its AHB address (HADDR_in) is split into the following fields (see the table below for B and W values):

- HADDR_in[B-1:0]: address byte offset, indicates which byte to select within a cache line.
- HADDR_in[B+W-1:B]: address way index, indicates which cache line to select inside each way.
- HADDR_in[31:B+W]: tag address, to be compared to TAG memory address to check if the requested data is already available (meaning valid) within the DCACHE

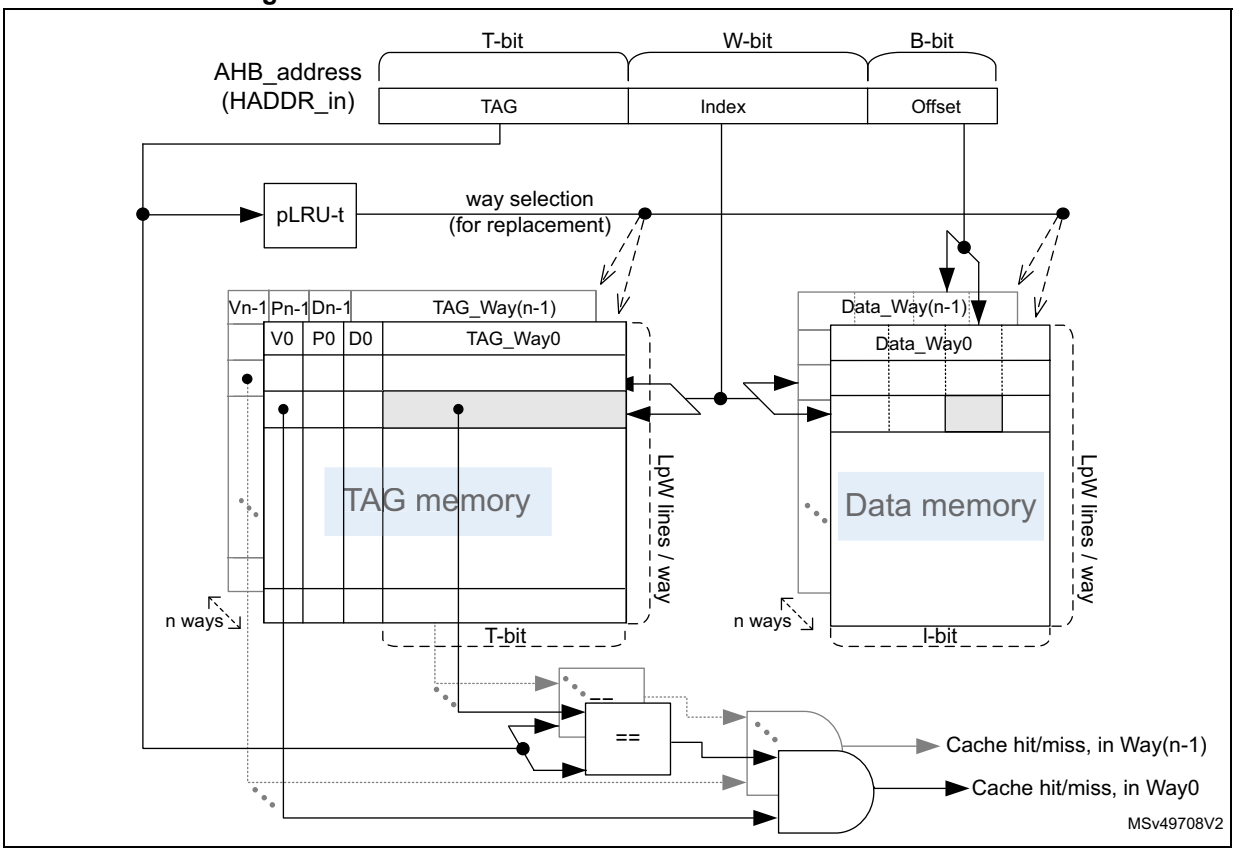
Table 81 gives DCACHE main parameters for TAG memory dimensioning.

Figure 49 shows the functional view of TAG and data memories, for an n-way set associative DCACHE.

Table 81. TAG memory dimensioning parameters

Parameter	Value	Example
Cache size	S Kbytes = s bytes (s = 1024 x S)	4 Kbytes = 4096 bytes
Cache number of ways	n	2
Cache line size	L-byte = l-bit (l = 8 x L)	16-byte = 128-bit
Number of cache lines (per way)	LpW = s / (n x L) lines/way	128 lines/way
Address byte offset size	B = $\log_2$(L) bit	4-bit
Address way index size	W = $\log_2$(LpW) bit	7-bit
TAG address size	T = (32 - W - B) bit	21-bit

Figure 49. DCACHE TAG and data memories functional view



18.4.4 DCACHE enable

To activate the DCACHE functioning, the EN bit must be set in DCACHE_CR control register.

When DCACHE is disabled, it is bypassed and all transactions are copied from slave port to master port in the same clock cycle, and no comparison is performed with TAG address.

DCACHE is by default disabled at boot.

18.4.5 Cacheable and noncacheable traffic

DCACHE is developed for a Cortex®-M33 core and caches the memory regions addressed by the AHB bus connected to it.

In addition, the AHB bus traffic to the memory regions can be cacheable or noncacheable. An incoming memory request to DCACHE is defined as cacheable according to its AHB transaction memory lookup attribute.

In case of write transaction, the DCACHE write policy is defined as write-through or write-back according to its AHB transaction memory bufferable attribute (see *Table 82*).

These AHB attributes depend on the memory protection unit (MPU) programming for the addressed region.

Table 82. DCACHE cacheability for AHB transaction

AHB lookup attribute	AHB bufferable attribute	Cacheability
0	x	Read and write: non cacheable
1	0	Read: cacheable Write: (cacheable) write-through
1	1	Read: cacheable Write: (cacheable) write-back

In case of noncacheable access, the DCACHE is bypassed, meaning that the AHB transaction is propagated unchanged to the master output port.

The bypass does not increase the latency of the access to the targeted memory.

In case of cacheable access, the DCACHE behaves as explained in *Section 18.4.6*.

Cacheable memory regions are defined and programmed by the user in the MPU, responsible for the generation of the AHB attribute signals for any transaction addressing a given region.

18.4.6 Cacheable accesses

When the DCACHE receives a cacheable transaction from Cortex®-M33 on its slave port, the DCACHE checks if the address requested is present in its TAG memory and if the corresponding cache line is valid.

For **read** transaction, there are three alternatives:

- The address is present inside the TAG memory, the cache line is valid: **cache read hit**, the data is read from cache and provided to the processor in the same cycle.
- The address is not present in the TAG memory: **cache read miss**, the data is read from the main memory and provided to the processor, and a cache line refill is performed.

  The critical-word-first refill policy insures minimum wait cycles for the processor, since read data can be provided while cache is still performing cache line refill (associated latency is the latency of fetching one word from main memory).

  The kind of burst generated on the DCACHE master bus depends on HBURST bit in DCACHE_CR: either INCRw or WRAPw (w being the cache line width, in words).

  The AHB transaction attributes are also propagated from the slave input (missing) request to the master output refill request.
- The address is not present in the TAG memory but belongs to the refill burst from main memory that is currently ongoing: **cache read hit** as well (hit-under-miss feature).

  Whatever the line refill is due to a read or write (missing) transaction, the DCACHE can provide the requested read data as soon as the data is available at its master interface, thus avoiding a miss (with data fetch from main memory).

For **write-back** transaction (write transaction, with write-back bufferable attribute), there are three alternatives as well:

- The address is present inside the TAG memory, cache line is valid: **cache write-back hit**, the data is written in cache.
- The address is not present in the TAG memory (or the cache line is not valid): **cache write-back miss**.

  First, a line allocation is performed by reading the entire cache line data from main memory. The kind of burst generated on the DCACHE master bus for this line refill depends on HBURST bit in DCACHE_CR: either INCRw or WRAPw (w being the cache line width, in words), and the AHB transaction attributes are propagated from the slave port initial request.

  Once the refilled line is written in the DCACHE, the initial data provided on the slave port is written in this DCACHE line (it overwrites the data part of the cache line that was refilled just before).
- The address is not present in the TAG memory but belongs to the refill burst from main memory that is currently ongoing: **cache write-back hit** as well (hit-under-miss feature).

  Whatever the line refill is due to a read or write (missing) transaction, the DCACHE can write incoming data directly inside the refilled line, thus avoiding a miss (with refill from main memory).

For **write-through** transaction (write transaction, with write-through bufferable attribute), only two alternatives exist:

- The address is present inside the TAG memory, cache line is valid: **cache write-through hit**, the data is written both in cache and in main memory (through master port).
- The address is not present in the TAG memory (or the cache line is not valid): **cache write-through miss**, the data incoming at slave port is written only in main memory (unlike the write-back miss, there is no line allocation and data written in cache).

In case of cache refill (due to cache miss), the DCACHE selects which cache line is written with the refill data: as a 2-way set associative cache, one line among two can be used (line pointed by the address index, in each of the two ways). The way selection is based on a pLRU-t replacement algorithm that points, for each index, on the way candidate for the next refill.

If the cache line where the refill data must be written is already valid, the targeted cache line must be evicted first:

- If the dirty tag of this line equals 0 (clean data), the line is simply invalidated.
- If it equals 1 (dirty data), the line must be written back in the main memory.

  The DCACHE generates a burst write transaction on its master port, with burst type set to INCRw (w being the cache line width, in words), and with AHB memory transaction attribute signals set as below:
  - data (not instruction)
  - privileged = TAG privilege bit
  - write-back (even if it does not care)
  - normal memory
  - cacheable
  - allocate (even if it does not care)

– nonshareable

These AHB attributes cannot be propagated from the slave port (as it is the case for all other transactions emitted by the DCACHE) because the evicting transaction has no relation with the initial missing transaction. Setting of the AHB attributes is fixed, except for the privileged bit that is copied from the TAG privilege bit of the evicted line.

18.4.7 DCACHE security

The DCACHE implements an Armv8-M TrustZone.

DCACHE configuration registers are protected at system level.

18.4.8 DCACHE maintenance

The DCACHE features several maintenance operations that the software can programmed in DCACHE_CR control register:

- **Full invalidate**: invalidates the whole cache, non interruptible task.

  The software can invalidate the whole DCACHE content by programming CACHEINV in DCACHE_CR.

  When CACHEINV = 1, the DCACHE control logic sets BUSYF flag in DCACHE_SR status register, and performs the operation of cache invalidation, resetting each TAG valid bit to 0 (one valid bit per cache line). Each dirty and privilege bits are also reset to 0 during cache invalidation to prevent unknown values at next cache line validation. CACHEINV is automatically cleared.

  Once the full invalidate operation is finished, the DCACHE automatically clears BUSYF flag, and sets BSYENDF in DCACHE_SR.

  If enabled on this flag condition (BSYENDIE = 1 in DCACHE_IER), the DCACHE interrupt is raised. Then, the (empty) cache is available again.

  This full invalidate operation is not interruptible, meaning that the cache does not treat any cacheable request while BUSYF = 1. However, non-cacheable traffic is treated (since the request address is not compared to TAG ones), the DCACHE being bypassed in the same clock cycle (same behavior as when the DCACHE is disabled).

- **Invalidate range**: invalidates a certain range of addresses in the cache, background task (interruptible).

  The software can invalidate a given data region in the DCACHE by programming STARTCMD = 1 and CACHECMD = 0b010 in DCACHE_CR, after the address range was programmed into DCACHE_CMDRSADDRR (range start address) and DCACHE_CMDREADDRR (range end address).

  The DCACHE control logic then parses the whole TAG memory. If the read line address (TAG address + line index) falls in the programmed address range (DCACHE_CMDRSADDRR ≤ Line Addr ≤ DCACHE_CMDREADDRR), the

corresponding cache line is invalidated (line TAG bits cleared, valid bit = dirty bit = privilege bit = 0).

When STARTCMD is set, the DCACHE control logic sets BUSYCMDF in DCACHE_SR and launches the invalidate range operation. STARTCMD is also automatically cleared.

Once the operation is finished (all TAG memory parsed), the DCACHE automatically clears BUSYCMDF and sets CMDENDF in DCACHE_SR.

If enabled on this flag condition (CMDENDIE = 1 in DCACHE_IER), the DCACHE interrupt is raised.

During this invalidate range operation, the DCACHE is interruptible, meaning it can accept new incoming requests that take higher priority than the invalidation process. The TAG memory is accessed for invalidate range operation only if not already accessed by an external cache request. This implies that invalidate range execution is usually not performed in one go, but can be interrupted.

- **Clean range**: cleans a certain range of addresses in the cache, background task (interruptible).

  Cleaning a cache line means making sure that the main memory content is up-to-date with the data, which may have been modified in the cache. The clean operation consists in performing the write-back in the main memory of the cache lines that are tagged as “dirty” (the ones with TAG dirty bit set).

  The software can clean a given data region in DCACHE by programming STARTCMD = 1, and CACHECMD = 0b001 in DCACHE_CR, after the address range was programmed into DCACHE_CMDRSADDRR (range start address) and DCACHE_CMDREADDRR (range end address).

  The DCACHE control logic then parses the whole TAG memory. If the read line address (TAG address + line index) falls in the programmed address range (DCACHE_CMDRSADDRR ≤ Line Addr ≤ DCACHE_CMDREADDRR), and the corresponding line is dirty, this line is cleaned, meaning the whole cache line is written-back in the memory through the DCACHE master port, and its TAG dirty bit is cleared.

  When STARTCMD is set, the DCACHE control logic sets BUSYCMDF in DCACHE_SR and launches the clean range operation. STARTCMD is also automatically cleared.

  Once the operation is finished (all TAG memory parsed), the DCACHE automatically clears BUSYCMDF and sets CMDENDF in DCACHE_SR.

  If enabled on this flag condition (CMDENDIE = 1 in DCACHE_IER), the DCACHE interrupt is raised.

  During this clean range operation, the DCACHE is interruptible, meaning it can accept new incoming requests that take higher priority than the cleaning process. The TAG memory is accessed for clean range operation only if not already accessed by an external cache request. This implies that clean range execution is usually not performed in one go, but can be interrupted.

  It is under the software responsibility that no bus initiator attempts to change the content of the region being cleaned until clean range is completed. For that, the software can take advantage of BUSYCMDF flag in DCACHE_SR, and can poll this flag to prevent any spurious access to the area being cleaned.

Alternatively it can also rely on the command end flag (CMDENDF) or on the DCACHE interrupt to detect the end of the clean range execution.

- **Clean and invalidate range**: cleans and invalidates a certain range of addresses in the cache, background task (interruptible).

  This operation cleans the “dirty” cache lines that belong to the operation address range (the same as the clean range operation), and also invalidates all the (valid) cache lines that belong to this address range (whether they are dirty or not).

  The software can launch this clean and invalidate range operation, by programming STARTCMD = 1, and CACHECMD = 0b011 in DCACHE_CR, after the address range was programmed into DCACHE_CMDRSADDRR (range start address) and DCACHE_CMDREADDRR (range end address).

  This sets and clears the same flags, and potentially the same interrupt as invalidate range or clean range operations.

18.4.9 DCACHE performance monitoring

The DCACHE provides the following monitors for performance analysis:

- The two 32-bit read-hit and write-hit monitors count the AHB transactions at the DCACHE input (slave port) that do not generate a transaction on the DCACHE output (master port).

  These monitors also take into account all accesses whose address is present in the TAG memory, or in the refill buffer (due to a previous miss, and whose data is coming, or is soon to come, from the cache master port) (see *Section 18.4.6*).
- The two 16-bit read-miss and write-miss monitors count the AHB transactions at the DCACHE input (slave port) that generate a transaction on the DCACHE output (master port).

  These monitors also take into account all accesses whose address is not present neither in the TAG memory, nor in the refill buffer.

Upon reaching their maximum values, the monitors do not wrap over.

The software can perform the following tasks:

- Enable/stop the read (write) hit monitor, through R(W)HITMEN in DCACHE_CR.
- Reset the read (write) hit monitor, by setting R(W)HITMRST in DCACHE_CR.
- Enable/stop the read (write) miss monitor, through R(W)MISSMEN in DCACHE_CR.
- Reset the read (write) miss monitor, by setting R(W)MISSMRST in DCACHE_CR.

To reduce power consumption, these monitors are disabled (stopped) by default.

18.4.10 DCACHE boot

The DCACHE is disabled (EN = 0 in DCACHE_CR) at boot.

Once the boot is finished, the DCACHE can be enabled (software setting EN = 1 in DCACHE_CR).

18.5 DCACHE low-power modes

At product level, the DCACHE reduces the power consumption by loading/storing data from/to the internal DCACHE most of the time, rather than from the bigger and then more power consuming main memories. This reduction is even much higher, since the cached main memories are external.

18.6 DCACHE error management and interrupts

A transaction initiated on the DCACHE master port may return an error (a write attempt into a read-only memory, for instance). If the master port request was propagated from a slave port request, the error is propagated back to the slave port. If ever the master port request is initiated by the DCACHE itself (a cache line is written back into the main memory because of an eviction or a clean operation), the DCACHE receives this functional error and flags it internally by setting the ERRF flag in DCACHE_SR.

In such a case, an interrupt is generated if the corresponding interrupt enable bit is set (ERRIE = 1 in DCACHE_IER).

Another case of potential interrupt generation is at the end of a full invalidate operation: when the cache busy state is finished, the DCACHE sets BSYENDF flag in DCACHE_SR.

An interrupt is then generated if the corresponding interrupt enable bit is set (BSYENDIE = 1 in DCACHE_IER).

Last case is at the end of invalidate and/or clean range operations: when the command busy state is finished, the DCACHE sets CMDENDF flag in DCACHE_SR.

An interrupt is also generated if the corresponding interrupt enable bit is set (CMDENDIE = 1 in DCACHE_IER).

All DCACHE interrupt sources raise the same and unique interrupt signal, dcache_it, and then use the same interrupt vector.

Table 83. DCACHE interrupts

Interrupt vector	Interrupt event	Event flag	Enable control bit	Interrupt clear method
DCACHE	Functional error	ERRF in DCACHE_SR	ERRIE in DCACHE_IER	Set CERRF to 1 in DCACHE_FCR
	End of busy state (full invalidate finished)	BSYENDF in DCACHE_SR	BSYENDIE in DCACHE_IER	Set CBSYENDF to 1 in DCACHE_FCR
	End of cache operations (address range based)	CMDENDF in DCACHE_SR	CMDENDIE in DCACHE_IER	Set CCMDENDF to 1 in DCACHE_FCR

The DCACHE also propagates all AHB bus errors (such as security issues, address decoding issues) from master port back to the S-AHB slave port.

18.7 DCACHE registers

18.7.1 DCACHE control register (DCACHE_CR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HBURST	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WMISSMRST	WHITMRST	WMISSMEN	WHITMEN	RMISSMRST	RHITMRST	RMISSMEN	RHITMEN
rw								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	STARTCMD	CACHECMD[2:0]			Res.	Res.	Res.	Res.	Res.	Res.	CACHEINV	EN
				w	rw	rw	rw							w	rw

Bit 31 **HBURST:** output burst type for cache master port read accesses
Can be set by software, only when EN = 0.
Master port write accesses are always done in INCR burst type.
0: WRAP
1: INCR

Bits 30:24 Reserved, must be kept at reset value.

Bit 23 **WMISSMRST:** write-miss monitor reset
0: release the cache miss monitor reset (needed to enable the counting)
1: reset cache write-miss monitor

Bit 22 **WHITMRST:** write-hit monitor reset
0: release the cache miss monitor reset (needed to enable the counting)
1: reset cache write-hit monitor

Bit 21 **WMISSMEN:** write-miss monitor enable
0: cache write-miss monitor switched off. Stopping the monitor does not reset it.
1: cache write-miss monitor enabled

Bit 20 **WHITMEN:** write-hit monitor enable
0: cache write-hit monitor switched off. Stopping the monitor does not reset it.
1: cache write-hit monitor enabled

Bit 19 **RMISSMRST:** read-miss monitor reset
0: release the cache miss monitor reset (needed to enable the counting)
1: reset cache read-miss monitor

Bit 18 **RHITMRST:** read-hit monitor reset
0: release the cache miss monitor reset (needed to enable the counting)
1: reset cache read-hit monitor

Bit 17 **RMISSMEN:** read-miss monitor enable
0: cache read-miss monitor switched off. Stopping the monitor does not reset it.
1: cache read-miss monitor enabled

Bit 16 **RHITMEN:** read-hit monitor enable
0: cache read-hit monitor switched off. Stopping the monitor does not reset it.
1: cache read-hit monitor enabled

Bits 15:12 Reserved, must be kept at reset value.

Bit 11 **STARTCMD:** starts maintenance command (maintenance operation defined in CACHECMD).
Can be set by software, only when EN = 1, BUSYCMDF = 0, BUSYF = 0 and CACHECMD = 0b001, 0b010 or 0b011.
Cleared by hardware when the BUSYCMDF flag is set (during cache maintenance operation). Writing 0 has no effect.
0: command operation (cache maintenance) finished
1: start maintenance command (cache maintenance)

Bits 10:8 **CACHECMD[2:0]:** cache command maintenance operation (cleans and/or invalidates an address range)
Can be set and cleared by software, only when no maintenance command is ongoing (BUSYCMDF = 0).
000: no operation
001: clean range
010: invalidate range
011: clean and invalidate range
others: reserved

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **CACHEINV:** full cache invalidation
Can be set by software, only when EN = 1.
Cleared by hardware when the BUSYF flag is set (during full cache invalidation operation). Writing 0 has no effect.
0: no effect
1: invalidate entire cache (all cache lines valid bit = 0)

Bit 0 **EN:** enable
0: cache disabled
1: cache enabled

18.7.2 DCACHE status register (DCACHE_SR)

Address offset: 0x004

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

											r	r	r	r	r

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CMDENDF:** command end flag
Cleared by writing DCACHE_FCR.CCMDENDF = 1.
0: cache busy or in idle
1: CACHECMD command finished

Bit 3 **BUSYCMDF:** command busy flag
0: cache not busy on a CACHECMD command
1: cache busy on a CACHECMD command (clean and/or invalidate an address range)

Bit 2 **ERRF:** cache error flag
Cleared by writing DCACHE_FCR.CERRF = 1.
0: no error
1: an error occurred during the operation (eviction or clean operation write-back error).

Bit 1 **BSYENDF:** full invalidate busy end flag
Cleared by writing DCACHE_FCR.CBSYENDF = 1.
0: cache busy or in idle
1: full invalidate CACHEINV operation finished

Bit 0 **BUSYF:** full invalidate busy flag
0: cache not busy on a CACHEINV operation
1: cache executing a full invalidate CACHEINV operation

18.7.3 DCACHE interrupt enable register (DCACHE_IER)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CMDENDIE	Res.	ERRIE	BSYENDIE	Res.
											rw		rw	rw	

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CMDENDIE**: interrupt enable on command end
Set by software to enable an interrupt generation at the end of a cache command (clean and/or invalidate an address range)
0: interrupt disabled on command end
1: interrupt enabled on command end

Bit 3 Reserved, must be kept at reset value.

Bit 2 **ERRIE:** interrupt enable on cache error
Set by software to enable an interrupt generation in case of cache functional error (eviction or clean operation write-back error)
0: interrupt disabled on error
1: interrupt enabled on error

Bit 1 **BSYENDIE:** interrupt enable on busy end
Set by SW to enable an interrupt generation at the end of a cache full invalidate operation.
0: Interrupt disabled on busy end
1: Interrupt enabled on busy end

Bit 0 Reserved, must be kept at reset value.

18.7.4 DCACHE flag clear register (DCACHE_FCR)

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCMDENDF	Res.	CERRF	CBSYENDF	Res.
											w		w	w	

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CCMDENDF:** clear command end flag
Set by software.
0: no effect
1: clears CMDENDF flag in DCACHE_SR

Bit 3 Reserved, must be kept at reset value.

Bit 2 **CERRF:** clear cache error flag
Set by software.
0: no effect
1: clears ERRF flag in DCACHE_SR

Bit 1 **CBSYENDF:** clear full invalidate busy end flag
Set by software.
0: no effect
1: clears BSYENDF flag in DCACHE_SR

Bit 0 Reserved, must be kept at reset value.

18.7.5 DCACHE read-hit monitor register (DCACHE_RHMONR)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

19 Power control (PWR)

The power control (PWR) provides an overview of the supply architecture of the different power domains, and the control of the supply configuration.

It provides an overview of the power supply supervisor features and provides the control of the V_{DDCPU} and V_{DDCORE} supply domains according to the operating modes. In the whole document:

- The Cortex-A35 is also called CPU1 or MPU.
- The Cortex-M33 is also called CPU2 or MCU.

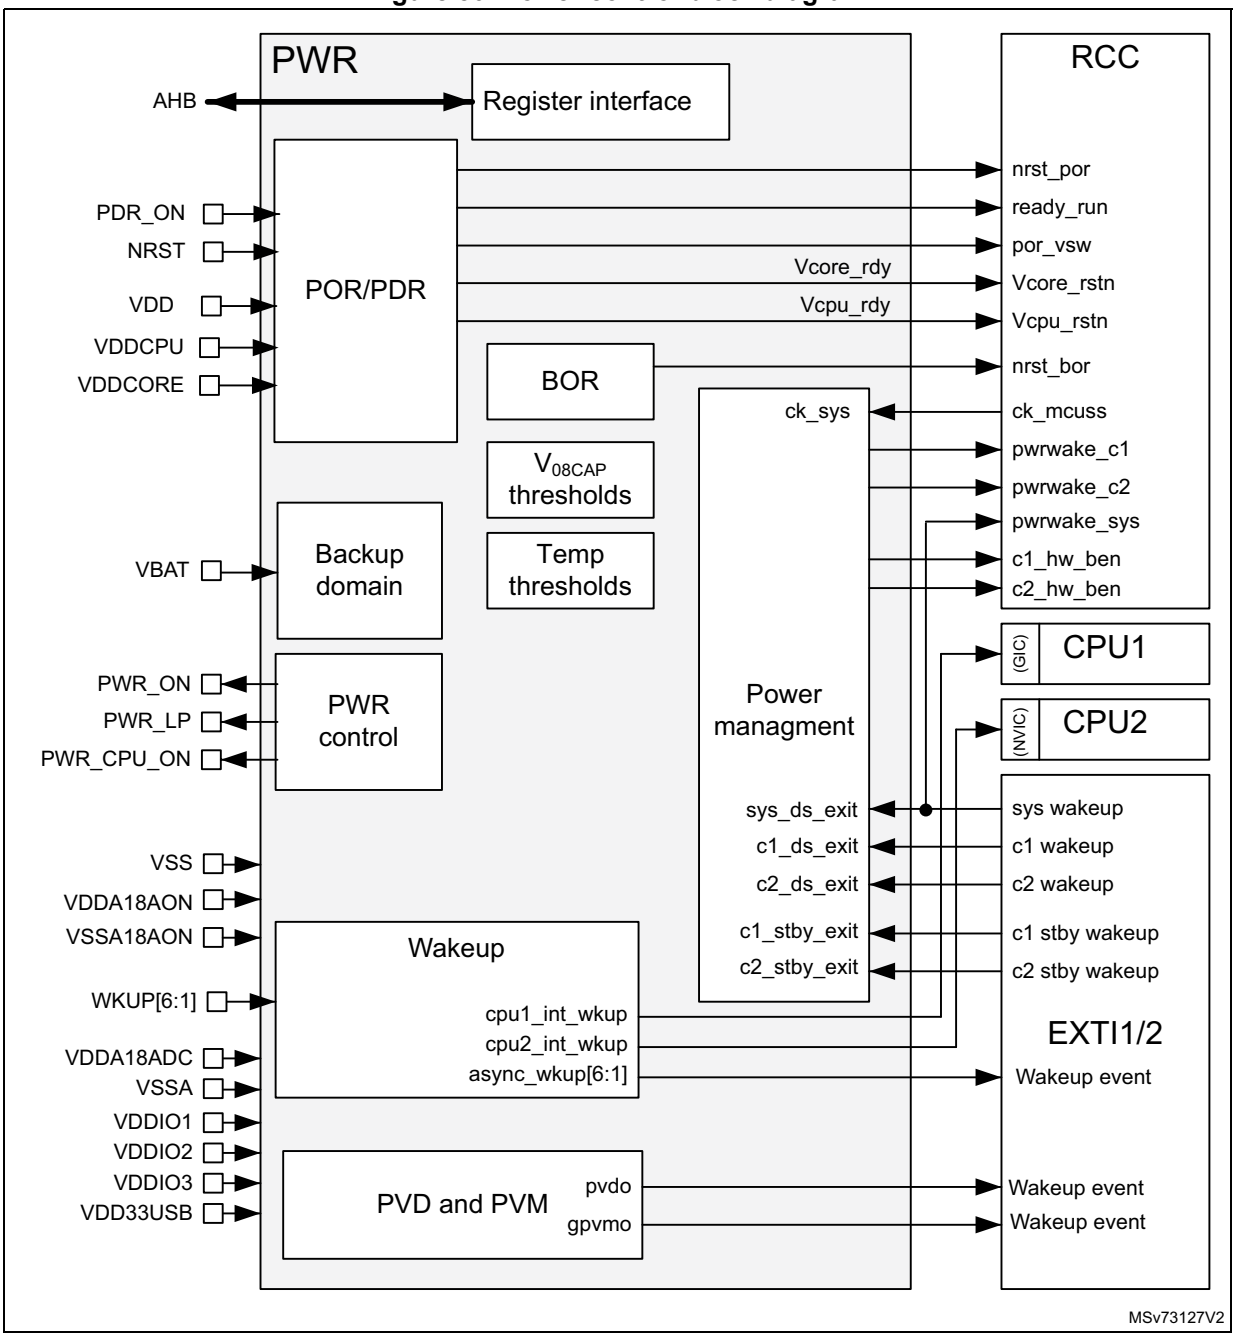
19.1 PWR main features

- System supply external regulation control
  - V_{DDCORE} supply request PWR_ON
  - V_{DDCPU} supply request PWR_CPU_ON
  - V_{DDCORE}/V_{DDCPU} low-power mode control PWR_LP
- Supply regulation
  - 0.8 V backup regulator (external to PWR)
- Power supply supervision
  - POR/PDR monitor
  - BOR monitor
  - PVD monitor
  - PVM monitor (V_{DDIO1}, V_{DDOI2}, V_{DDIO3}, $V_{DD33USB}$, $V_{DDA18ADC}$)
  - V_{08CAP} thresholds
  - Temperature thresholds
  - V_{DDCORE} monitor
  - V_{DDCPU} monitor
- Power management
  - Operating modes
  - Low-power modes

19.2 PWR block diagram

The figure below gives a PWR simplified view and the key signals exchanged with the other blocks.

Figure 50. Power control block diagram



19.2.1 PWR pin overview

The table below lists the PWR signals connected to pads or balls.

Table 85. PWR pin overview

Pin name	I/O	Description
VDD	Power	Main I/O and V_{DD} domain supply input
VDDA18AON	Power	Main analog supply input
VBAT	Power	Backup battery supply input
VDDCPU	Power	CPU (Cortex-A35) domain supply
VDDCORE	Power	Core domain supply
VDDA18ADC	Power	ADC analog supply
VDDIO1	Power	Independent I/O supply 1 (PE[5:0])
VDDIO2	Power	Independent I/O supply 2 (PE[15:6])
VDDIO3	Power	Independent I/O supply 3 (PD[11:0])
VDD33USB	Power	USB HS PHY IO 3.3 V supply input
VSS	Power	Main ground
VSSA	Power	Analog ground
PWR_ON	Output	Core supply enable output
PWR_LP	Output	Core/CPU supply low-power Stop mode selection output
PWR_CPU_ON	Output	CPU supply enable output
NRST	Input/output	Application pad reset input/output.
PDR_ON	Input	Used during STMicroelectronics production tests, must always be connected to $V_{DDA18AON}$ in final application.

19.3 PWR power supplies

The system requires supply on VDD, VDDA18AON, VDDCPU and VDDCORE, and provides independent supplies for VDDA18ADC, VBAT, VDD33USB, VDDIO1, VDDIO2, VDDIO3, and VDDQDDR:

- V_{DD} power supply for I/Os
- $V_{DDA18AON}$ power supply for system analog such as reset, power management, oscillators and OTP
- V_{BAT} optional power supply for backup domain when V_{DD} is not present (V_{BAT} mode)
- V_{DDCORE} digital core domain supply, dependent on V_{DD} and $V_{DDA18AON}$ supplies. V_{DD} and $V_{DDA18AON}$ must be present before V_{DDCORE}.
- V_{DDCPU} digital CPU domain supply (Cortex-A35), dependent on V_{DD} and $V_{DDA18AON}$ supplies. V_{DD} and $V_{DDA18AON}$ must be present before V_{DDCPU}.
- $V_{DDA18ADC}$ analog power supply input for ADCs and voltage reference buffers, independent from any other supply.
- V_{REF+} external reference voltage for ADCs, independent from any other supply.
  - supply output when the voltage reference buffer is enabled

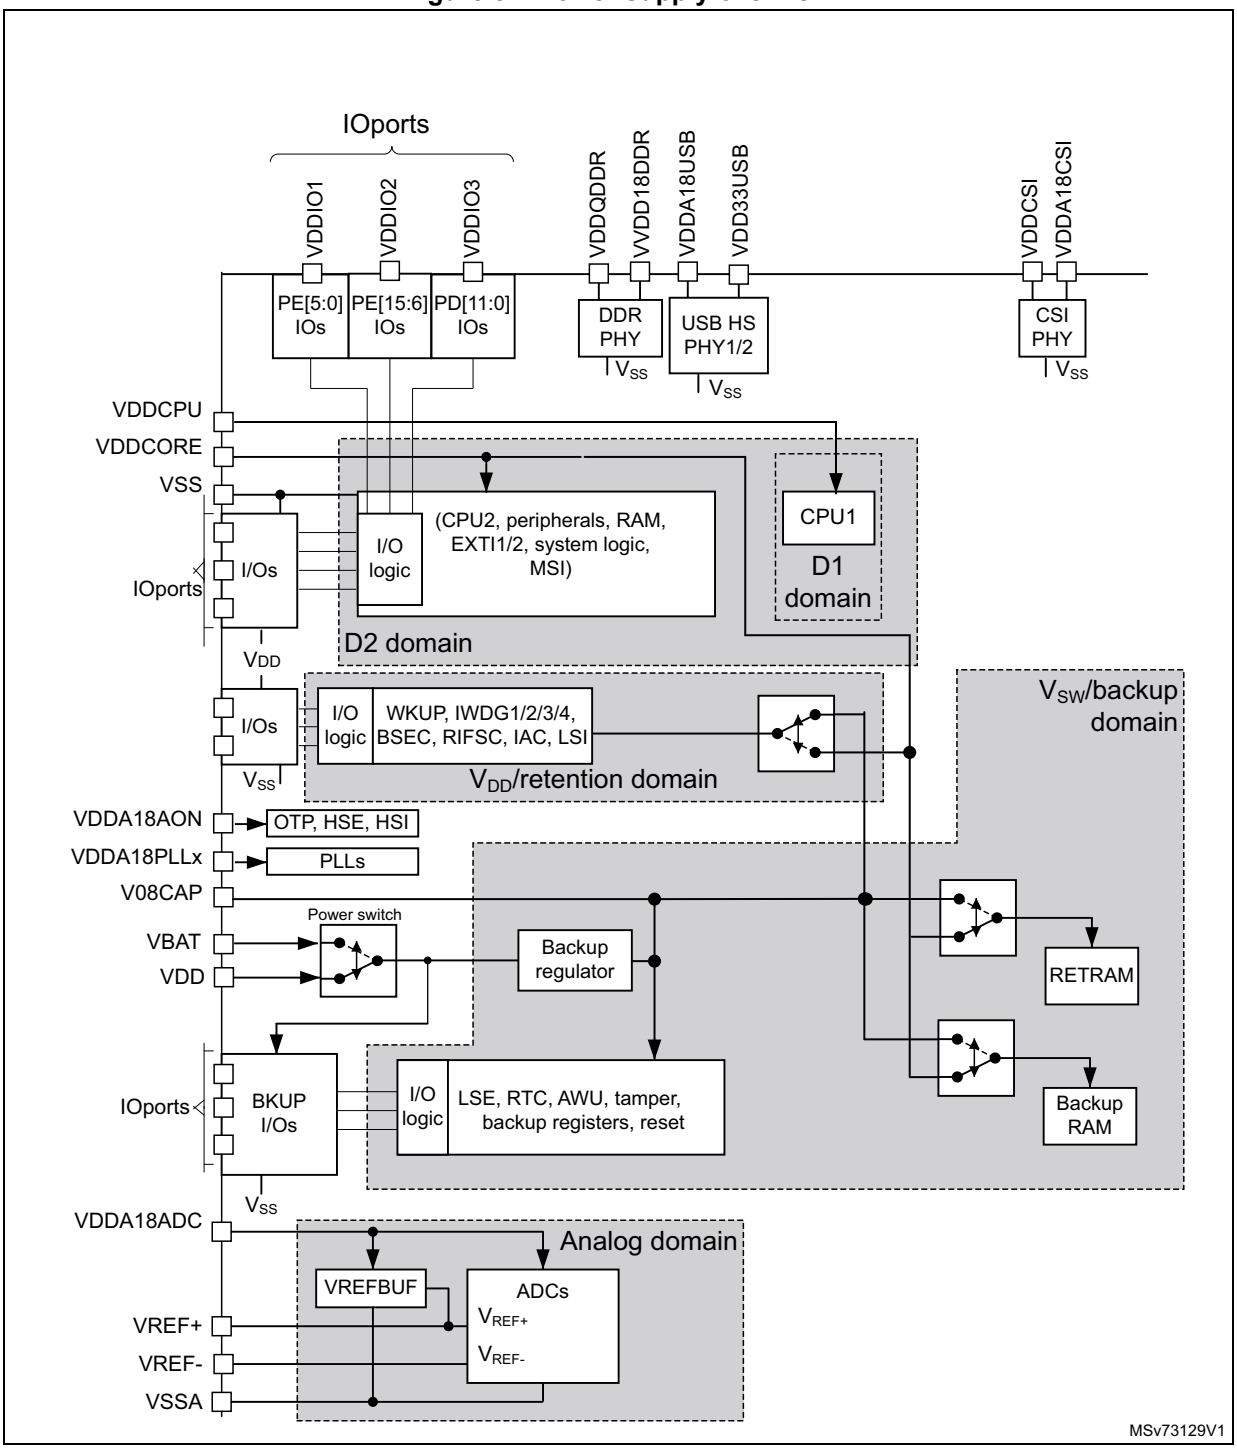
  - independent external reference supply input when the voltage reference buffer is disabled
- V_{SSA} separate analog and reference voltage ground
- $V_{DD33USB}$ supply for USB HS PHY, independent from any other supply
- V_{DDIO1} supply for six I/Os (port E[5:0]), independent from any other supply
- V_{DDIO2} supply for 10 I/Os (port E[15:6]), independent from any other supply
- V_{DDIO3} supply for 12 I/Os (port D[11:0]), independent from any other supply
- $V_{SS33USB}$ separate USB HS PHY ground
- V_{SS} common ground for all supplies except for analog

Note: Depending on the operating power supply range, some peripheral can be used with limited functionality and performance. For more details, refer to section "General operating conditions" in the device datasheet.

An external DDR memory must be supplied from an external regulator which is NOT controlled by the PWR. When the system enters low-power modes it is up to the firmware to control the DDR memory supply directly through the external regulator. When the system enters Standby mode, the PWR_ON pin can be used by the external DDR memory regulator to power down the DDR memory supply.

The figure below gives an overview of the power supply.

Figure 51. Power supply overview



19.3.1 PWR CPU and CORE domains

The V_{DDCPU} CPU domain supply is provided from an external regulator. The V_{DDCPU} supplies the Cortex-A35 platform (CPU1). This domain is called D1 domain.

The V_{DDCORE} core domain supply is provided from an external regulator. The V_{DDCORE} supplies all the digital circuitries (including the Cortex-M33) except for the backup, retention when in Standby. This domain is called system D2 domain.

Following a V_{DD} power-on reset, the external regulators are enabled via PWR_ON or PWR_CPU_ON, and supply the V_{DDCORE} and V_{DDCPU}.

The $V_{DDCPU\ and}$ V_{DDCORE} supplies require special explanation. To save power, these power voltages are changed during the run time of the use cases. The target voltage levels of the V_{DDCPU} can vary for different modes according to the use cases. The modes are the nominal and the overdrive modes. The voltage levels of these supplies can be reduced in low-power modes (low voltage mode) or switched off.

Table 86. V_{DDCPU}/V_{DDCORE} voltage levels (for reference only)

Power rail	Typ value (V)	Description
V_{DDCPU}	0.9	Overdrive mode
	0.8	Nominal mode
	0.67	Low-voltage mode
V_{DDCORE}	0.8	Nominal mode
	0.67	Low-voltage mode

The external regulators can operate in different modes (main, low-power, off) which are used depending on the system operating modes (Run, Stop, LP-Stop, and Standby):

- In Run1/2 modes
  - The regulator supplies full power to the V_{DDCORE} domain. In its main mode, PWR_ON and PWR_LP are set high. In this mode, the PMIC allows the device to change voltage of power rails through the I^2C interface.
  - The external regulator supplying the V_{DDCPU} can be independently controlled using the PWR_CPU_ON pin. When set high, the regulator supplies full power to the V_{DDCPU} domain. When set low, the external regulator supplying V_{DDCPU} domain is switched off (Run2).
- In Stop1/2 modes
  - The regulators supply the V_{DDCORE} and V_{DDCPU} domains to retain the content of registers and internal memories. The external regulators are kept in main mode to allow a fast exit. The low-power mode signaling is disabled with LPDS_D1 in PWR_CPU1R and with LPDS_D2 in PWR_CPU2R. PWR_ON, PWR_CPU_ON, and PWR_LP are kept set high.
  - The external regulator supplying the V_{DDCPU} can be also switched off when the Standby mode is enabled by PDDS_D1 in PWR_CPU1R (Stop2).
- In LP-Stop1/2 modes
  - The regulators supply the V_{DDCORE} and V_{DDCPU} domains to retain the content of registers and internal memories. The external regulators are allowed to enter low-power mode. The low-power mode signaling on PWR_LP is enabled with LPDS_D1 in PWR_CPU1R, and with LPDS_D2 in PWR_CPU2R.

The PWR_CPU_ON is kept set high. PWR_ON is also kept set high, or follows PWR_LP as selected by LPCFG_D2 in PWR_D2CR. PWR_LP is cleared to low.

When the low-voltage Deepsleep mode is enabled by LVDS_D1 in PWR_CPU1R and by LVDS_D2 in PWR_CPU2R, the V_{DDCORE} and V_{DDCPU} supply level can be lowered during LPLV-Stop mode.

  - The external regulator supplying the V_{DDCPU} can be also switched off when Standby mode is enabled by PDDS_D1 in PWR_CPU1R (LP-Stop2).

- In Standby mode
  - PWR_ON, PWR_CPU_ON, and PWR_LP signals are set low. The external regulators are switched off. V_{DDCORE} and V_{DDCPU} domains are powered down. The content of the registers and memories are lost except for the backup and retention domains.

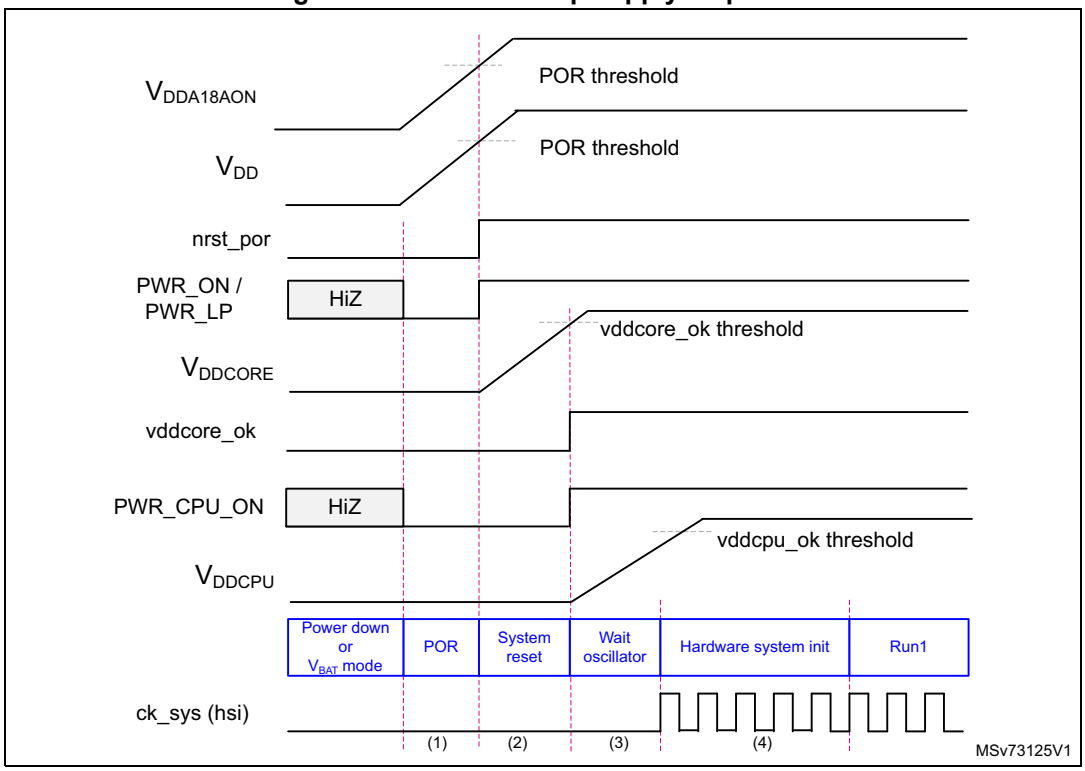
19.3.2 PWR supply system startup sequence

The system startup sequence is detailed below and shown in *Figure 52*:

1. From power-on, the POR monitors V_{DD} and $V_{DDA18AON}$ supplies.

   Once these supplies are above the POR threshold level, the external voltage regulators providing the V_{DDCORE} supply is enabled via the PWR_ON signal.
2. As long as V_{DDCORE} is below the vddcore_ok threshold, the system is kept in reset.
3. Once V_{DDCORE} supply is above the vddcore_ok threshold level, the system is taken out of reset, where after the HSI oscillator is enabled. The external voltage regulator providing the V_{DDCPU} supply is enabled via PWR_CPU_ON signal.
4. Once the oscillator is stable, the hardware initializes the system (option bytes loading), after which Run1 mode is entered if the V_{DDCPU} supply is above the vddcpu_ok threshold.

Figure 52. Device startup supply sequence.

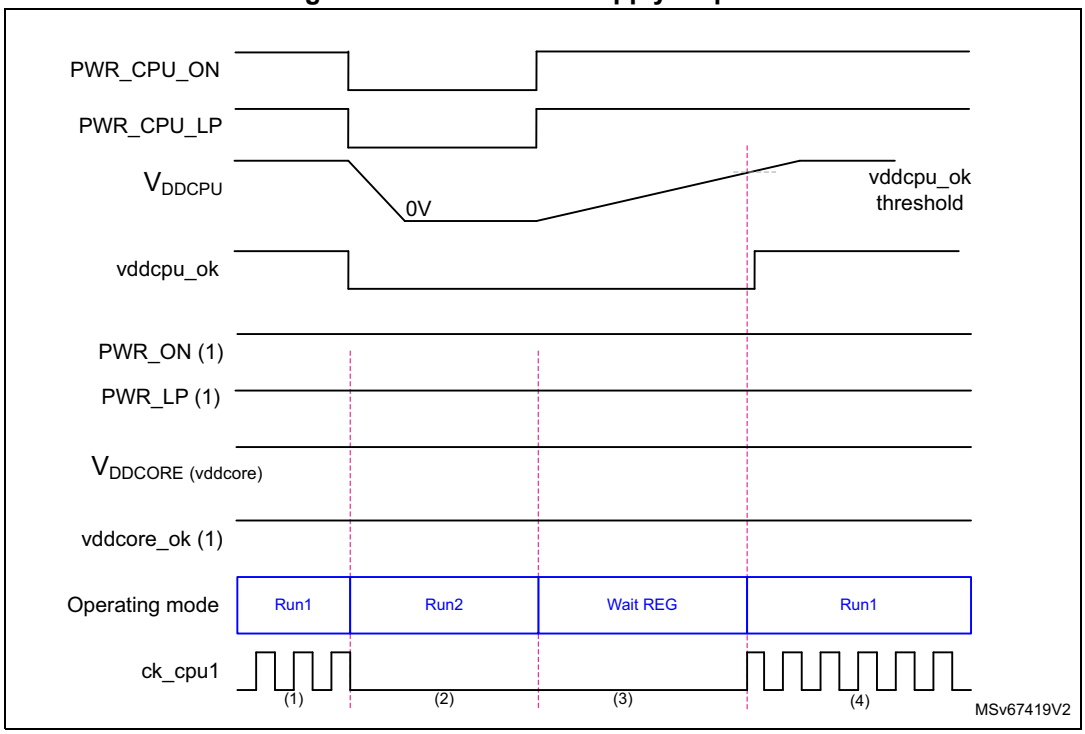


19.3.3 PWR supply Run2 sequence

The system Run2 sequence is detailed below and shown in *Figure 53*.

1. When entering Run2 mode, all CPU1 clocks are stopped.
2. The PWR_CPU_ON signals request the V_{DDCPU} supply to be powered off. If needed, a guaranteed minimum PWR_CPU_ON pulse low time can be defined by POPL_D1 in PWR_D1CR. The PWR_ON and PWR_LP are kept high. The external regulator suppling the V_{DDCORE} remains in Main mode.
3. On a CPU1 wake-up event, the external regulator suppling V_{DDCPU} is requested, via the PWR_CPU_ON signal. As long as V_{DDCPU} is below the vddcpu_ok threshold, the system is kept in Run2 mode. When a wake-up event occurs before the guaranteed minimum PWR_CPU_ON pulse low time, the external regulator is only requested to switch on the V_{DDCPU} supply till after the minimum PWR_CPU_ON pulse low time.
4. Once V_{DDCPU} supply is above the vddcpu_ok threshold level, the CPU1 clocks are enabled and the system enters Run1 mode.

Figure 53. Device Run2 supply sequence.



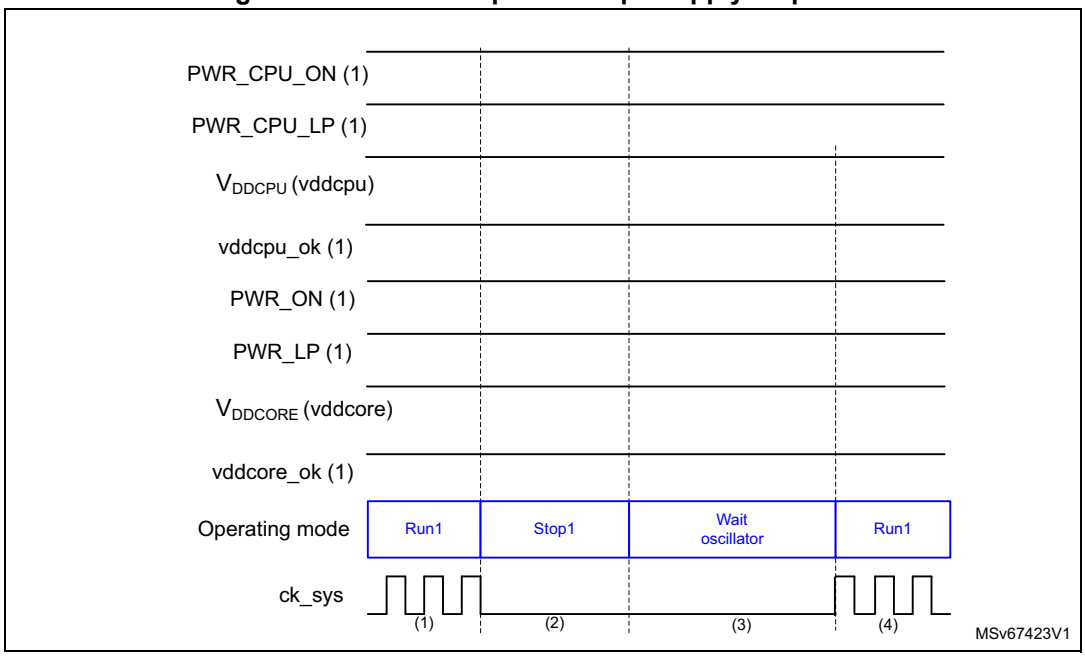
19.3.4 PWR supply Stop sequences

Stop1

The system Stop1 sequence is detailed below and shown in *Figure 54*. Stop1 mode is entered when selected by LPDS_D1 in PWR_CPU1CR, and by LPDS_D2 in PWR_CPU2CR:

1. When entering Stop1 mode, the ck_mcuss (ck_sys) is stopped.
2. In Stop1 mode, the PWR_ON, PWR_CPU_ON, but also PWR_LP are kept high. The external regulators supplying the V_{DDCORE} and V_{DDCPU} remain in Main mode.
3. On a wake-up event, the selected oscillators are enabled.
4. Once the oscillator is stable, the system enters Run1 mode.

Figure 54. Device low-power Stop1 supply sequence

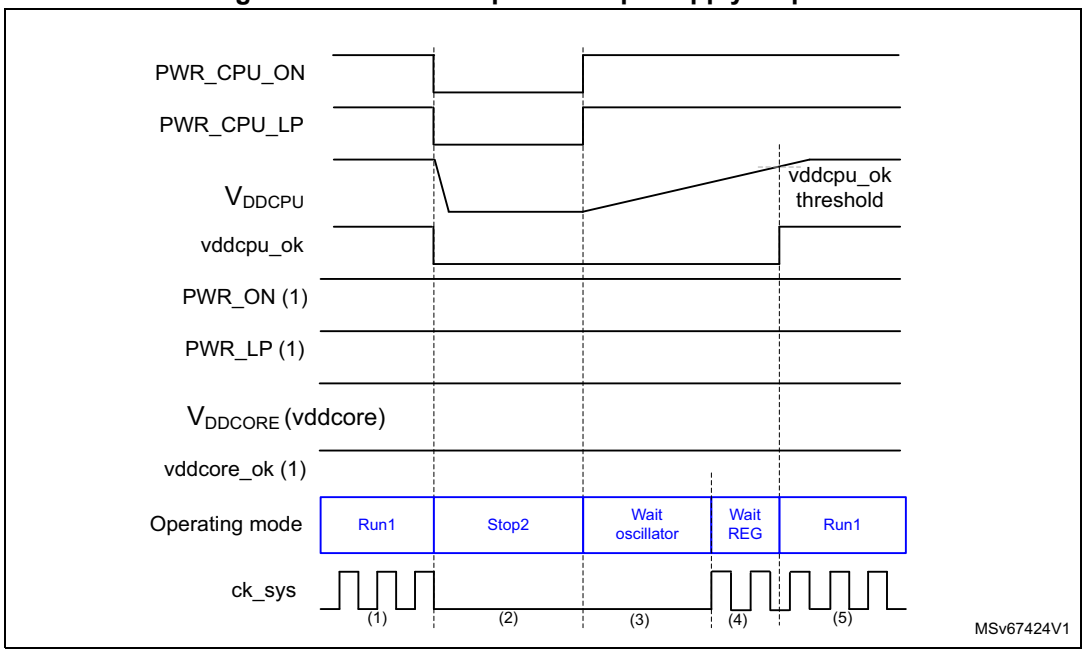


Stop2

The PWR_CPU_ON signal can request the V_{DDCPU} supply to be powered off when D1 Standby mode is selected by PDDS_D1 in PWR_CPU1CR. This mode is called Stop2. The system Stop2 mode sequence is detailed below and shown in *Figure 55*:

1. When entering Stop2 mode, the ck_mcuss (ck_sys) is stopped.
2. The PWR_CPU_ON signal requests the V_{DDCPU} supply to be powered off. If needed, a guaranteed minimum PWR_CPU_ON pulse low time can be defined by POPL_D1 in PWR_D1CR. PWR_ON and PWR_LP are kept high. The external regulator suppling the V_{DDCORE} remains in main mode.
3. On a CPU1 wake-up event, the external voltage regulators providing the V_{DDCPU} supply are enabled via the PWR_CPU_ON signal, and the selected oscillators are enabled.
4. Once the oscillator is stable, and as long as the V_{DDCPU} is below the vddcpu_ok threshold, the CORE domain is kept under system reset.
5. Once the V_{DDCPU} is above the vddcpu_ok threshold level, the system enters Run1 mode.

Figure 55. Device low-power Stop2 supply sequence



19.3.5 PWR supply LP/LPV-Stop sequences

LP-Stop1/LPV_Stop1

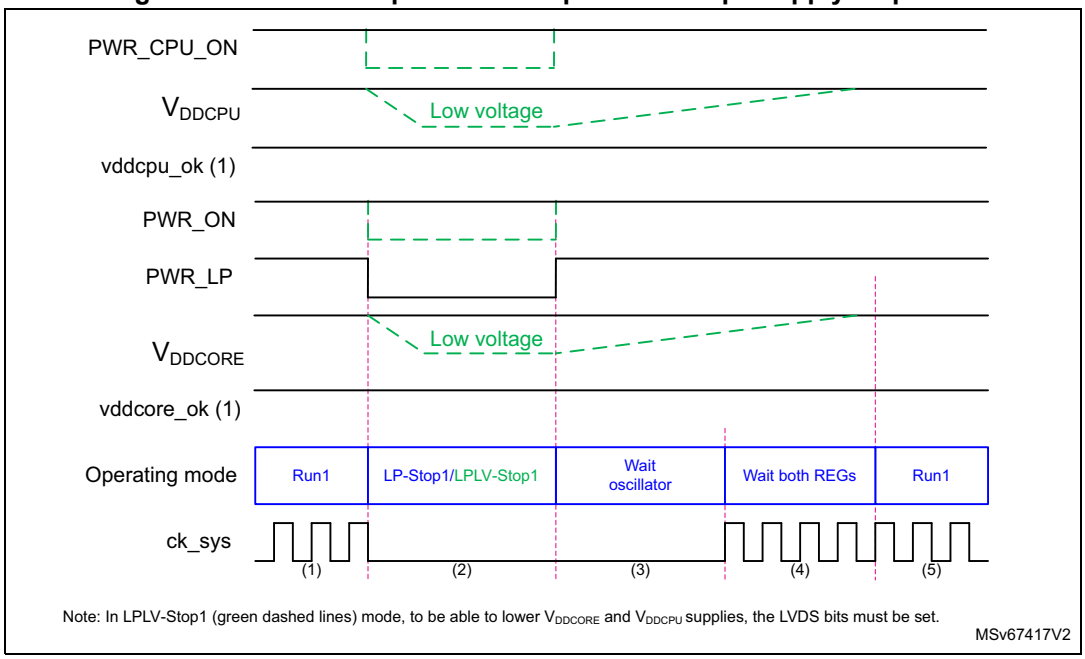
The system LP-Stop1 mode sequence is detailed below and shown in *Figure 56*. LP-Stop1 mode is entered when selected by LPDS_D1 in PWR_CPU1CR and by LPDS_D2 in PWR_CPU2CR:

1. When entering LP-Stop1 mode, the ck_mcuss (ck_sys) is stopped.
2. In LP-Stop1 mode, PWR_CPU_ON and PWR_ON are either kept high (pwr_on) or follow the PWR_LP as selected with LPCFG_D1 in PWR_CPU1CR and LPCFG_D2 in PWR_CPU2CR. The PWR_LP is de-asserted, signaling LP-Stop1. After that, the external regulators can enter low-power mode.

   In LPLV-Stop1 (LVDS bits set), V_{DDCPU} and V_{DDCORE} supplies can be lowered.
3. On a wake-up event, the external regulators are taken out of low-power mode via PWR_LP, and the selected oscillators are enabled.

   In LPLV-Stop1 mode, a delay t_LPLVDLY (defined by LPLVDLY_D2 in PWR_D2CR) is started to wait for V_{DDCPU} and V_{DDCORE} to reach the Run mode operating supply level. After this delay, the oscillators are enabled.
4. Once the oscillator is stable, a delay is timed out to allow the external regulator to switch to Main mode.
5. After the delay timeout, the system enters Run1 mode.

Figure 56. Device low-power LP-Stop1/LPLV-Stop1 supply sequence



LP-Stop2/LPLV-Stop2

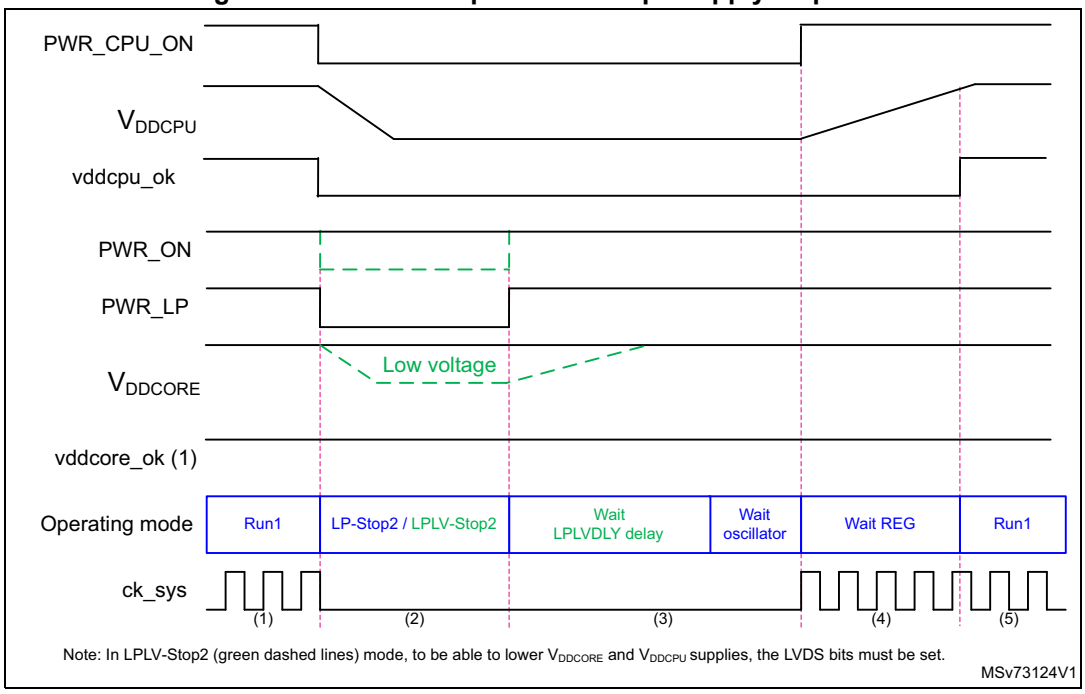
The PWR_CPU_ON signal can request the V_{DDCPU} supply to be powered off when D1 Standby mode is selected by PDDS_D1 in PWR_CPU1CR. This mode is called LP-Stop2. The system LP-Stop2 mode sequence is detailed below and shown in *Figure 57*:

1. When entering LP-Stop2 mode, the ck_mcuss (ck_sys) is stopped.
2. The PWR_CPU_ON signal requests the V_{DDCPU} supply to be powered off. If needed, a guaranteed minimum PWR_CPU_ON pulse low time can be defined by POPL_D1 in PWR_D1CR. The PWR_ON is either kept high (pwr_on) or follows the PWR_LP (pwr_onlp) as selected with LPCFG_D2 in PWR_CPU2CR. The PWR_LP is asserted, signaling LP-Stop2. After that, the external regulator can enter low-power mode.
3. On a CPU1 wake-up event, the external regulator suppling V_{DDCORE} is taken out of low-power mode via PWR_LP signal. The selected oscillators are enabled.

   In LPLV-Stop2 mode, a delay t_LPLVDLY (defined by LPLVDLY_D2 in PWR_D2CR) is started to wait for V_{DDCORE} to reach the Run mode operating supply level. After this delay, the oscillators are enabled.
4. Once the oscillator is stable, the external Voltage regulator providing the V_{DDCPU} supply is enabled via the PWR_CPU_ON signal.
5. After the delay timeout, and once V_{DDCPU} is above the vddcpu_ok threshold, the system enters Run1 mode.

Note: If the CPU1 wake-up event is generated from one of the WKUP pins, the PWR_CPU_ON will rise at same time than PWR_LP. The vddcpu_ok delay is then running concurrently than the LPLVDLY and oscillator wait delays, which mean the overall wakeup time to RUN1 is slightly better.

Figure 57. Device low-power LP-Stop2 supply sequence

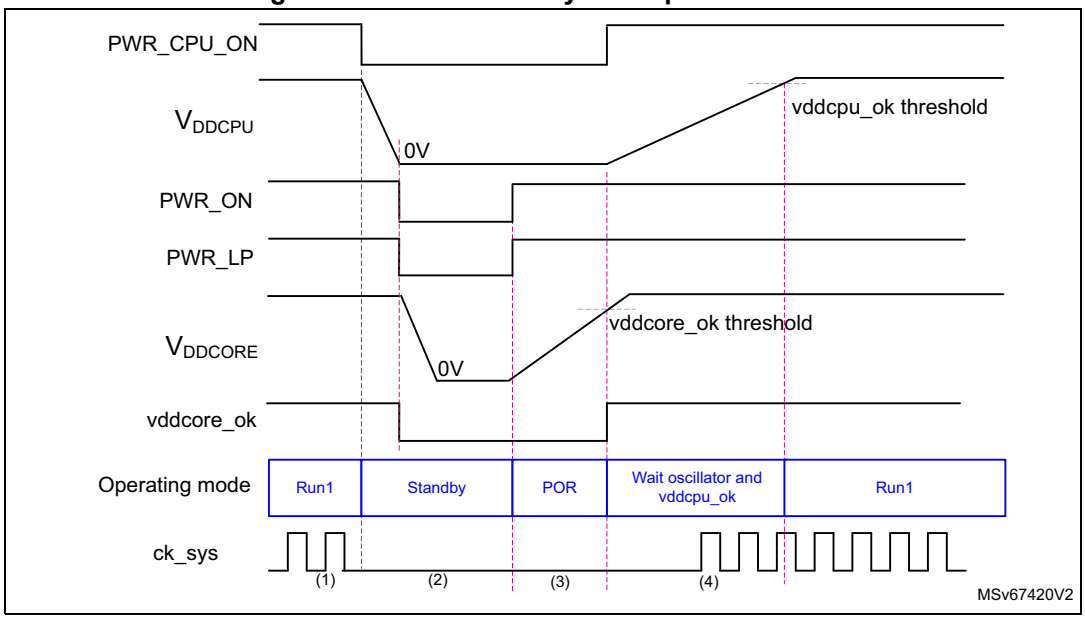


19.3.6 PWR supply Standby sequence

The system Standby mode sequence is detailed below and shown in *Figure 58*:

1. When entering Standby mode, the PWR_CPU_ON signal requests the V_{DDCPU} supply to be powered off, after a delay defined by PODH_D2 in PWR_D2CR. If needed, a guaranteed minimum PWR_ON/PWR_CPU_ON pulse low time can be defined by POPL_D1/2 in PWR_D1CR/PWR_D2CR.
2. On a wake-up event, the external regulator suppling the V_{DDCORE} is requested via the PWR_ON signals. As long as V_{DDCORE} is below the vddcore_ok threshold, the system is kept in Standby mode, and V_{DDCPU} is not requested. When a wake-up event occurs before the guaranteed minimum PWR_ON pulse low time, the external regulator is only requested to switch on the V_{DDCORE} supply till after the minimum PWR_ON pulse low time.
3. Once V_{DDCORE} is above the vddcore_ok threshold level, the HSI oscillator is enabled. The PWR_CPU_ON signal requests the V_{DDCPU} supply to be powered on.
4. Once the oscillator is stable, and as long as the V_{DDCPU} supply is requested and below the vddcpu_ok threshold, the system does not enter Run1 mode.

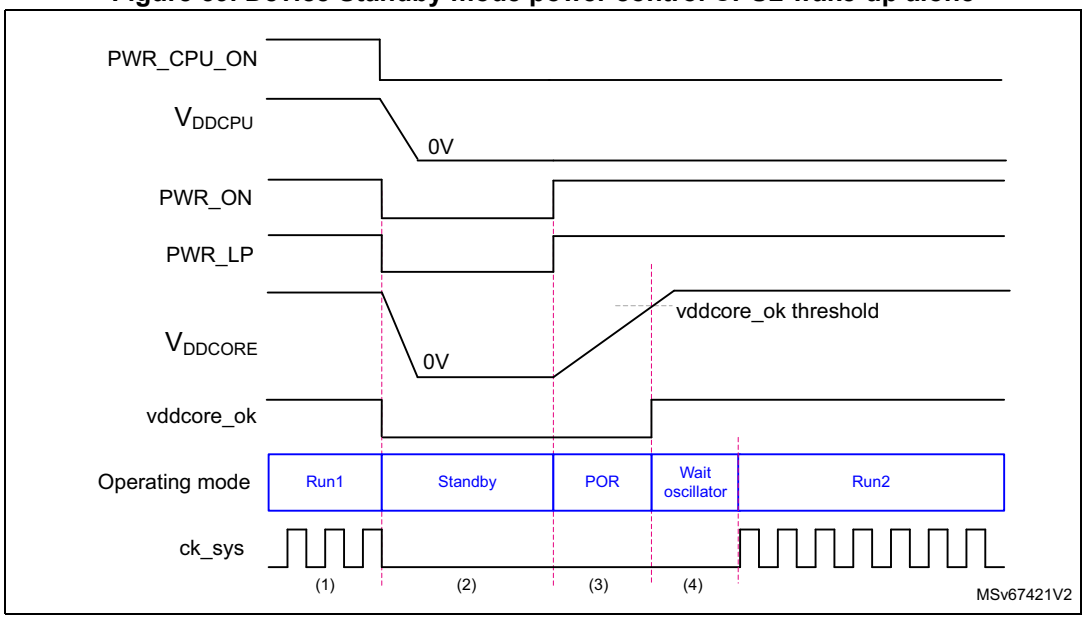
Figure 58. Device Standby mode power control



On a CPU2 wake-up event, and if CPU2 standalone wake-up is allowed by configuration, only the external regulator suppling V_{DDCORE} is switched on via the PWR_ON signals.

The system enters in Run2 mode once the oscillator is stable (as shown in the figure below).

Figure 59. Device Standby mode power control CPU2 wake-up alone

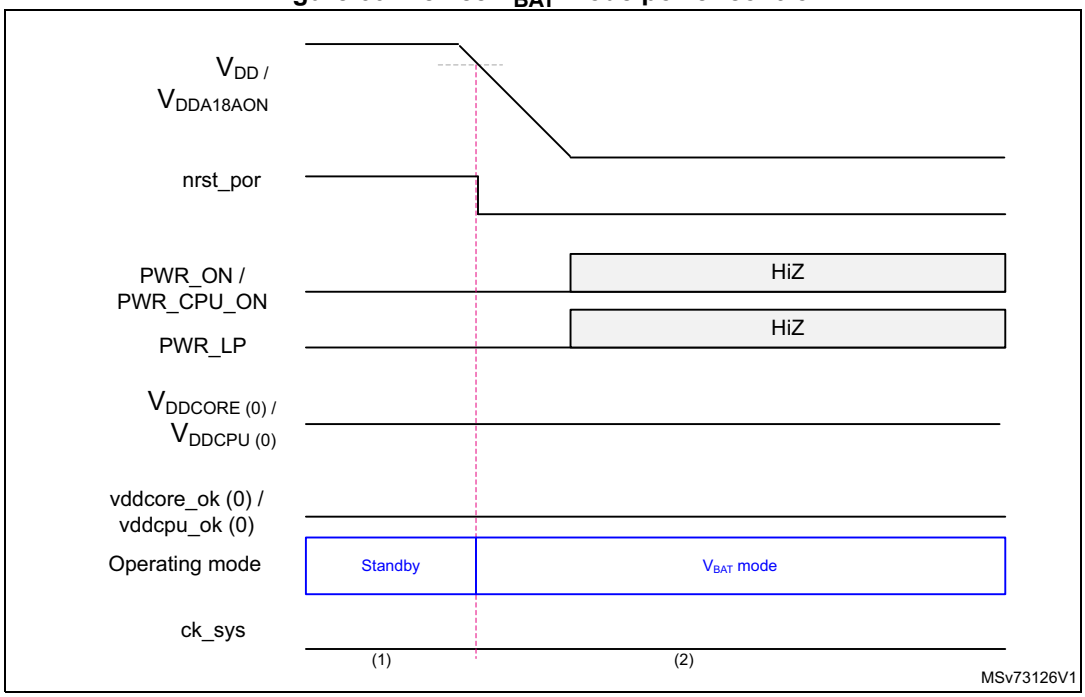


19.3.7 PWR supply V_{BAT} sequence from Standby

The system V_{BAT} mode sequence after Standby is detailed below and shown in *Figure 60*.

1. When in Standby mode, the device can be set in V_{BAT} mode by powering down V_{DD} and $V_{DDA18AON}$ supplies. The PWR_ON and PWR_CPU_ON signals keep requesting V_{DDCORE} and V_{DDCPU} supplies to be powered off.
2. When powering down V_{DD}, the device enters V_{BAT} mode. PWR_ON, PWR_CPU_ON, and PWR_LP signals become HiZ.

Figure 60. Device V_{BAT} mode power control



When V_{BAT} mode is entered from Run1, Stop, or LP-Stop mode, V_{DD}, $V_{DDA18AON}$, V_{DDCORE}, and V_{DDCPU} supplies must all be powered down.

19.3.8 PWR V_{SW} domain

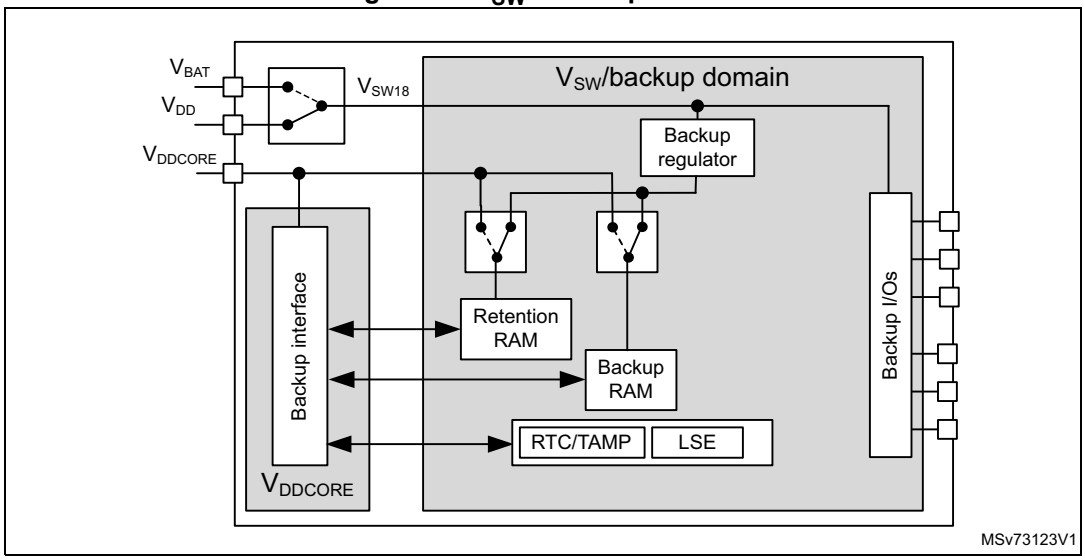
To retain the content of the backup domain (RTC, backup registers, LSE and backup ram) when V_{DD} and $V_{DDA18AON}$ are turned off, the VBAT pin can be connected to an optional standby voltage supplied from a battery or an another source.

Switching to the V_{BAT} supply (V_{BAT} mode) is controlled by the power-down reset (PDR) embedded in the reset block, monitoring the V_{DD} and $V_{DDA18AON}$ supplies.

Warning: **During $t_{RSTTEMPO}$ (temporization at V_{DD} and $V_{DDA18AON}$ startup) or after a PDR is detected, the power switch between V_{BAT} and V_{DD} remains connected to V_{BAT}.**
During the startup phase, if V_{DD} is established in less than $t_{RSTTEMPO}$ (refer to the datasheet for the value of $t_{RSTTEMPO}$) and $V_{DD} > V_{BAT} + 0.6$ V, a current may be injected into V_{BAT}

through an internal diode connected between V_{DD} and the power switch (V_{BAT}).
If the power supply/battery connected to the VBAT pin cannot support this current injection, it is strongly recommended to connect an external low-drop diode between this power supply and the VBAT pin.

Figure 61. V_{SW} / Backup domain



When the V_{DD} and $V_{DDA18AON}$ supplies are present, the backup domain is supplied from V_{DD}. This allows V_{BAT} power supply battery life time optimization.

If no external backup battery is used in the application, it is recommended to connect V_{BAT} externally to V_{DD} through a 100 nF external ceramic capacitor.

Whenever V_{DD} and $V_{DDA18AON}$ supplies are present and above the PDR threshold, the backup domain is supplied by V_{DD}. When V_{DD} or $V_{DDA18AON}$ supply is not present and a supply is present on V_{BAT}, the backup domain is supplied by V_{BAT}.

The table below shows the functions available in Backup domain when the core low-power supply is powered off.

Table 87. V_{SW} domain function when V_{DD} and $V_{DDA18AON}$ are presents

Pin name	GPIO	LSE	RTC	TAMPER_OUT(1)	TAMPER_IN(1)
PC3, PC4, PC5, PF6, PF7	-	-	-	-	X(2)
PC13	X	-	X(3)	X	-
PC14, PC15	X	X	-	-	-
PI8	X	-	X(4)	X	X
PZ0, PZ1, PZ3	X	-	-	X	-

1. When configured by the RTC as tamper pin.
2. It is the only function when in V_{SW} domain.
3. See *Table 621: RTC pin PC13 configuration*.
4. See *Table 622: PI8 configuration*.

19.3.9 PWR backup RAM (BKPSRAM)

The backup domain includes an 8-Kbyte backup RAM, accessible in 32-, 16-, or 8-bit data mode.

- In Run, Stop and LP-Stop modes, the BKPSRAM is supplied from the V_{DDCORE} supply.
- In LPLV-Stop, Standby and V_{BAT} modes, the BKPSRAM can be supplied through the backup regulator in the V_{SW} domain.

When the backup supply is enabled by BKPRBSEN in PWR_CR9, the BKPSRAM content is retained even in Standby and/or V_{BAT} mode.

The BKPSRAM can be erased by a tamper event (see *Section 64* for details).

19.3.10 PWR retention RAM (RETRAM)

The backup domain includes a 128-Kbyte retention RAM, accessible in 32-, 16-, or 8-bit data mode.

- In Run, Stop and LP-Stop modes the RETRAM is supplied from the V_{DDCORE} supply.
- In LPLV-Stop, Standby and V_{BAT} modes, the RETRAM is supplied through the backup regulator in the V_{SW} domain.

When the backup supply is enabled by RETRBSEN in PWR_CR10, the RETRAM content is retained even in Standby and/or V_{BAT} mode.

19.3.11 PWR backup domain access

After a system reset, the backup domain (RCC_BDCR, RTC, TAMP and backup registers, backup SRAM) are protected against possible unwanted write accesses. To enable access to the backup domain, DBD in PWR_BDCR must be set.

For more detail on RTC and backup registers, see *Section 63*.

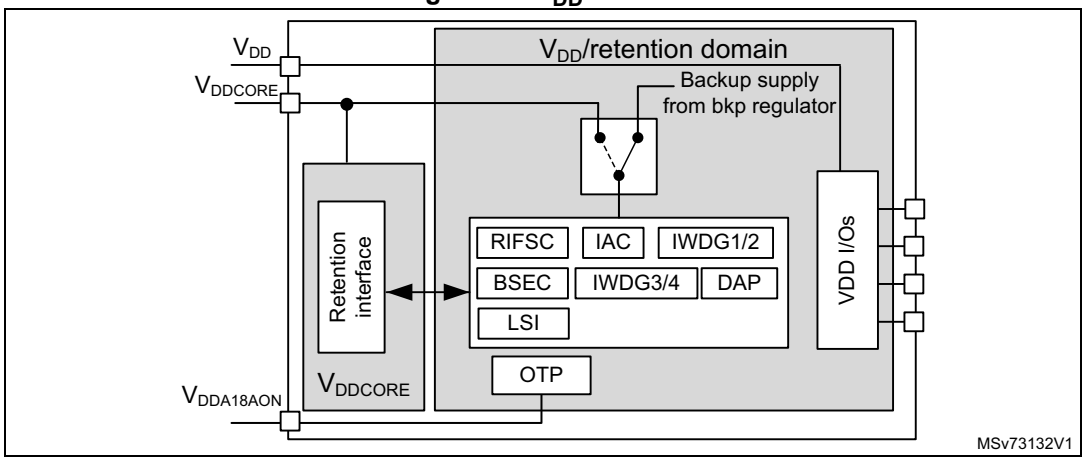
19.3.12 PWR V_{DD} domain

The V_{DD} domain includes boot, security and OTP controller (BSEC), independent watchdog (IWDG), resource isolation framework controller (RIFSC and IAC), and the debug access port (DAP).

- In Run, Stop and LP-Stop modes, the V_{DD} domain is supplied from the V_{DDCORE} supply.
- In LPLV-Stop and Standby modes, the V_{DD} domain is supplied through the backup regulator.

The content of the domain is retained in Standby mode (not powered in V_{BAT} mode).

Figure 62. V_{DD} domain



19.3.13 PWR analog supply

PWR separate analog $V_{DDA18ADC}$ supply

The analog supply domain has separate VDDA18ADC and VSSA pads to allow the supply to be filtered and shielded from noise on the PCB. This improves the ADC conversion accuracy.

- The analog voltage supply input is available on a separate VDDA18ADC pin.
- An isolated supply ground connection is provided on pin VSSA.

PWR analog reference voltage V_{REF}

To allow better accuracy on low-voltage signals, the ADC has a separate reference voltage VREF+ pin. The user can connect a separate external reference voltage on VREF+.
The V_{REF+} supply controls the highest voltage, represented by the full scale value.
The lower voltage reference V_{REF-} must be connected together with V_{SSA}.

When enabled by ENVR in VREFBUF_CSR (see *Section 38.6.1*), the V_{REF+} is provided from the internal voltage reference buffer. The internal voltage reference buffer can also provide a reference voltage to external components through pin (see *Section 38*). The reference voltage can also be generated internally by the ADC cell by setting the SELBG and SELREF bits in ADC_OR (see *Section 36*).

To enable the ADC with an external V_{REF}, the ADC supply must be up and stable before the V_{REF} is enabled. The sequence to monitor the $V_{DD18ADC}$ supply is described in

Section 19.4.6: Peripheral voltage monitoring (PVM). Once done, ENVR and HIZ bit in VREFBUF_CSR register can be used to enable VREF+ pin input (ENVR = 0, HIZ = 1).

19.4 PWR power supply supervision

Power supply level monitoring is available on the following supplies:

- $V_{DD}/V_{DDA18AON}$ via POR/PDR (*Section 19.4.1*), BOR (*Section 19.4.2*), and PVD monitor (*Section 19.4.5*)
  - The POR/PDR monitoring flag is available from PORRSTF in the RCC.
  - The BOR monitoring flag is available from BORRSTF in the RCC.
  - The PVD monitoring flag is available from the PVDO in PWR_CR3. In addition, an interrupt and wake-up can be generated via the EXTI1.
- V_{BAT} via V_{08CAP} threshold (see *Section 19.4.7*)
  - The V_{08CAP} monitoring flags are available from V08CAPH and V08CAPL in PWR_CR2. In addition, an interrupt and wake-up can be generated via the EXTI2.
- V_{DDCORE} via vcore_rdy which keeps V_{DDCORE} domain in reset as long as the level is not OK (see *Section 19.4.3*)
  - The V_{DDCORE} OK monitoring flags are available from SBF in PWR_CPU1CR and PWR_CPU2CR, and from VCORERSTF in the RCC.
- V_{DDCPU} via vcpu_rdy which keeps V_{DDCPU} domain in reset as long as the level is not OK (see *Section 19.4.4*)
  - The V_{DDCPU} OK monitoring flag is available from SBF_D1 in PWR_CPU1CR, and from VCPURSTF in the RCC.
- V_{DDIO1}, V_{DDIO2}, V_{DDIO3}, $V_{DD33USB}$ and $V_{DDA18ADC}$ via peripheral voltage monitor
- V_{SW} via rst_vsw, which keeps V_{SW} domain in reset as long as the level is not OK
  - The V_{SW} monitoring has no flag. The V_{SW} registers reset value can be used.

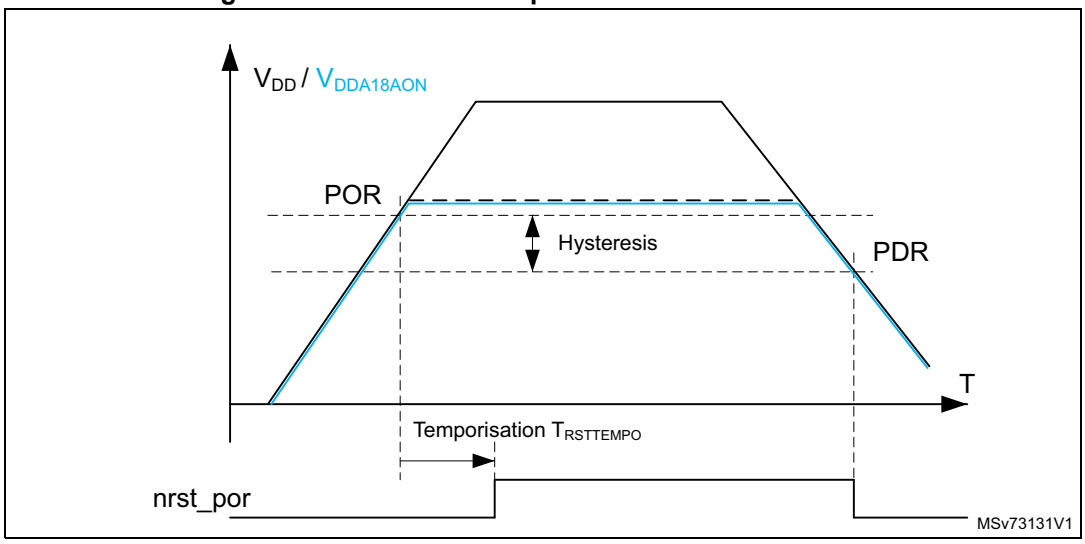
19.4.1 PWR power-on reset (POR)/power-down reset (PDR)

The system has an integrated POR/PDR circuitry that allows proper startup operation.

The system remains in reset mode when V_{DD} and $V_{DDA18AON}$ are below a specified V_{POR} threshold, without the need for an external reset circuit. Once V_{DD} and $V_{DDA18AON}$ supply levels are above the V_{POR} threshold, the system is taken out of reset. Refer to the electrical characteristics of the device datasheet for more details on the POR/PDR thresholds.

The POR/PDR generate also an application reset (NRST).

Figure 63. Power-on reset/power-down reset waveform



Note: For thresholds and hysteresis, refer to the datasheet.

19.4.2 PWR brownout reset (BOR)

During power-on, the brownout reset (BOR) keeps the system under reset until the V_{DD} supply reaches the specified V_{BOR} threshold, that is configured through system option bytes. By default, BOR is off. When selecting another BOR threshold, this only takes effect after the device has loaded to option bytes. The following programmable V_{BOR} thresholds can be selected:

- BOR off (V_{BOR0}): reset threshold level for above 1.67 V voltage operation
- BOR level 1 (V_{BOR1}): reset threshold level for above 2.97 V voltage operation

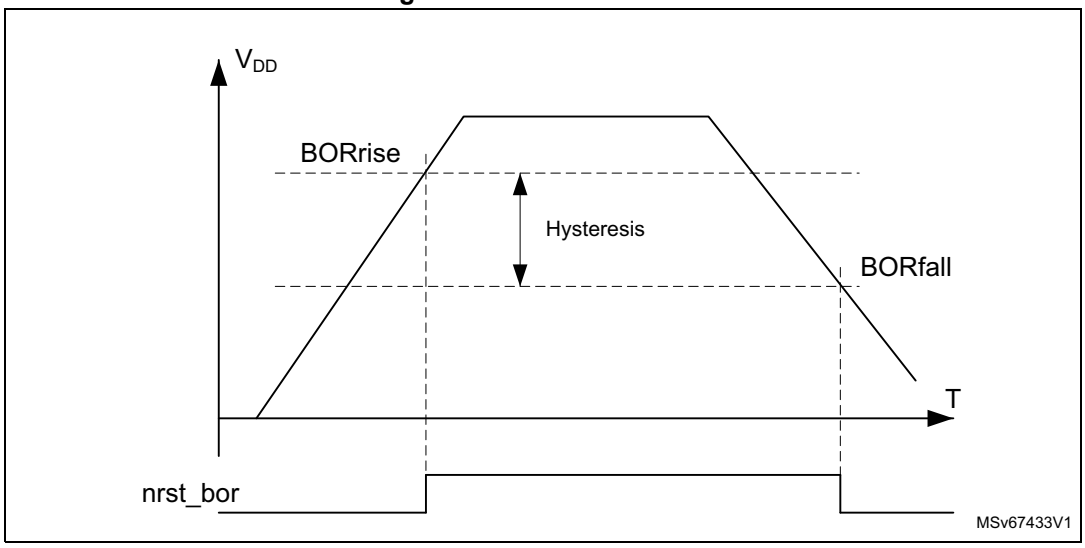
The BOR generates also an application reset (NRST).

When the BOR is enabled and the V_{DD} supply drops below the selected V_{BOR} threshold, a NRST is generated.

BOR can be disabled by programming the system option bytes. To disable the BOR function, V_{DD} must be higher than V_{BOR0} to start the system option byte programming sequence. The power down is then monitored by the PDR (see *Section 19.4.1*).

The BOR threshold hysteresis is ~100 mV for level 1, and ~40 mV for level 0 (between the rising and the falling edge of the supply voltage).

Figure 64. BOR thresholds



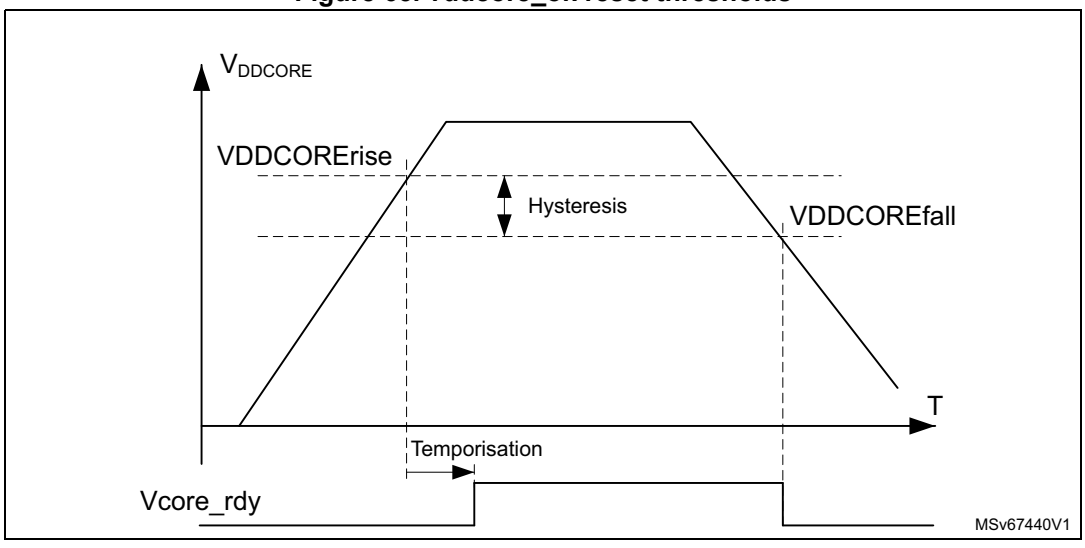
19.4.3 PWR V_{DDCORE} OK reset

The system has an integrated circuitry that allows proper startup operation of the V_{DDCORE} domain.

This domain remains in Reset mode when V_{DDCORE} is below the operation threshold vddcore_ok. Once V_{DDCORE} supply is above vddcore_ok, the V_{DDCORE} domain is taken out of reset. For more details concerning the V_{DDCORE} OK reset threshold, refer to the electrical characteristics of the device datasheet.

When LVDS_D2 is set in PWR_CPU2CR, the V_{DDCORE} supply level can be lowered in LPLV-Stop mode.

Figure 65. vddcore_ok reset thresholds



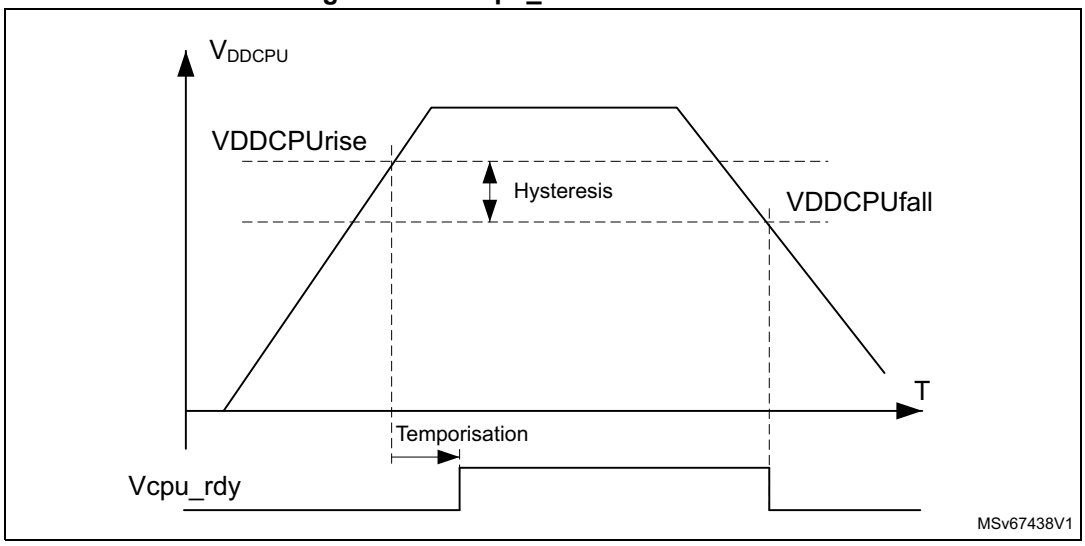
19.4.4 PWR V_{DDCPU} OK reset

The system has an integrated circuitry that allows proper startup operation of the V_{DDCPU} domain.

This domain remains in Reset mode when V_{DDCPU} is below the operation threshold vddcpu_ok. Once V_{DDCPU} is above this threshold, the V_{DDCPU} domain is taken out of reset. For more details concerning this threshold, refer to the electrical characteristics of the device datasheet.

When LVDS_D1 is set in PWR_CPU1CR, the V_{DDCPU} supply level can be lowered in LPLV-Stop mode.

Figure 66. vddcpu_ok reset thresholds



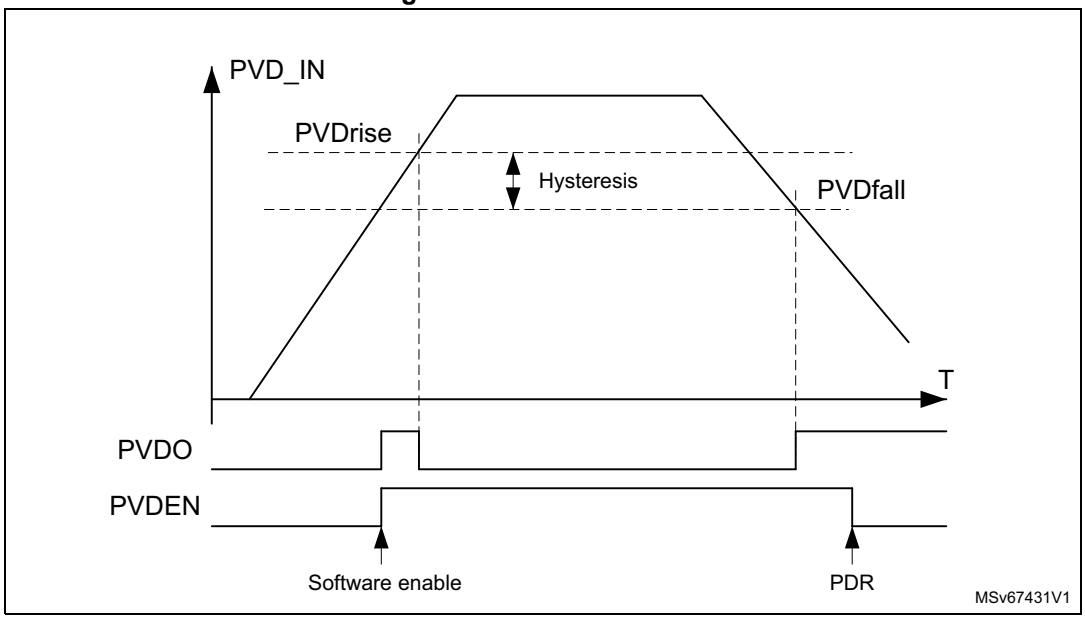
19.4.5 PWR programmable voltage detector (PVD)

The PVD can be used to monitor a voltage level on the PVD_IN pin: the voltage level on PVD_IN is compared to the internal V_{REFINT} level.

The PVD is enabled by setting PVDEN in PWR_CR3. The PVD is not available in Standby mode.

A PVDO flag in PWR_CR3 indicates if the voltage level on PVD_IN is higher or lower than the PVD threshold. This event is internally connected to the EXTI1, and can generate an interrupt if enabled through the EXTI1 registers. The PVDO output interrupt can be generated when the voltage level on PVD_IN drops below the PVD threshold, and/or when the voltage level on PVD_IN rises above the PVD threshold, depending on EXTI1 rising/falling edge configuration. As an example the service routine can perform emergency shutdown tasks.

Figure 67. PVD thresholds



Note: For thresholds and hysteresis, refer to the datasheet.

19.4.6 Peripheral voltage monitoring (PVM)

Only V_{DD} is monitored by default, as it is the only supply required for all system-related functions. The other supplies (V_{DDIO1}, V_{DDIO2}, V_{DDIO3}, $V_{DD33USB}$ and $V_{DDA18ADC}$) can be independent from V_{DD}, and can be monitored with six peripheral voltage monitoring (PVM):

- VDDIO1VM monitors the PE[5:0] supply V_{DDIO1}. VDDIO1RDY in PWR_CR8 indicates if V_{DDIO1} is higher or lower than the V_{IO1VM} threshold.
- VDDIO2VM monitors the PE[15:6] supply V_{DDIO2}. VDDIO2RDY in PWR_CR7 indicates if V_{DDIO2} is higher or lower than the V_{IO2VM} threshold.
- VDDIO3VM monitors the PD[11:0] supply V_{DDIO3}. VDDIO3RDY in PWR_CR1 indicates if V_{DDIO3} is higher or lower than the V_{IO3VM} threshold.
- USB33VM monitors the USB supply $V_{DD33USB}$. USB33RDY in PWR_CR1 indicates if $V_{DD33USB}$ is higher or lower than the $V_{USB33VM}$ threshold.
- AVM monitors the ADC supply $V_{DDA18ADC}$. ARDY in PWR_CR1 indicates if $V_{DDA18ADC}$ is higher or lower than the V_{AVM} threshold.

Note: For thresholds and hysteresis, refer to the device datasheet.

The GPVMO flag in PWR_CR1 indicates if all enabled independent power supplies are higher or lower than the PVM threshold. This event is internally connected to the EXTI1, and can generate an interrupt if enabled through the EXTI1 registers. The GPVMO interrupt can be generated when all enabled independent power supplies rise above the PVM threshold, or when at least one enabled independent power supply drops below the PVM threshold, depending on EXTI1 line rising/falling edge configuration.

The PVM is not available in Standby mode.

The independent supplies (V_{DDIO1}, V_{DDIO2},V_{DDIO3}, $V_{DD33USB}$ and $V_{DDA18ADC}$) are not considered as present by default, and a logical and electrical isolation is applied to ignore any information coming from the peripherals supplied by these dedicated supplies.

- If these supplies are shorted externally to V_{DD}, the application must assume they are available without enabling any peripheral voltage monitoring. The power isolation can be removed by setting the corresponding supply valid bits.
- If these supplies are independent from V_{DD}, the PVM can be enabled to confirm whether the supply is present or not.

The following sequence must be done before using the USB HS PHYs:

1. If $V_{DD33USB}$ is independent from V_{DD}:
   a) Enable USB33VM by setting USB33VMEN in PWR_CR1.
   b) Wait for the USB33VM wake-up time.
   c) Wait until USB33RDY is set in PWR_CR1.
   d) Optional: Disable USB33VM for consumption saving.

The following sequence must be done before using the analog to digital converters:

1. If $V_{DDA18ADC}$ is independent from V_{DD}:
   a) Enable AVM by setting AVMEN in PWR_CR1.
   b) Wait for the AVM wake-up time.
   c) Wait until ARDY is set in PWR_CR1.
2. Set ASV in PWR_CR1 to remove the $V_{DDA18ADC}$ power isolation.

The GPIOs have the capability to work in the 1.8 V or 3.3 V power supply ranges. It is needed to select the supply range of the I/Os before to use it. By default, the 3.3 V range is selected. The voltage range configuration for V_{DD} and V_{DDIO3} is retained in Standby mode. The configuration can be retained for V_{DDIO1} and V_{DDIO2} in Standby mode when VDDIO1VRSTBY and VDDIO2VRSTBY are set in PWR_CR7 and PWR_CR8. The voltage range must not be retained if the supply range can change when exiting from Standby mode (such as SD card).

The following sequence must be done before using the VDDIO1 I/Os:

1. If V_{DDIO1} is independent from V_{DD}:
   a) Enable VDDIO1VM by setting VDDIO1VMEN in PWR_CR8.
   b) Wait for the VDDIO1VM wake-up time.
   c) Wait until VDDIO1RDY is set in PWR_CR8.
   d) Optional: Disable VDDIO1VM for consumption saving.
   e) If V_{DDIO1} is in 1.8 V range, set V_{DDIO1} voltage range by setting VDDIO1VRSEL in PWR_CR8.
   f) Optional: Retain VDDIO1VRSEL configuration by setting VDDIO1VRSTBY in PWR_CR8.
2. Set VDDIO1SV in PWR_CR8 to remove the V_{DDIO1} power isolation.

The following sequence must be done before using the VDDOI2 I/Os:

1. If V_{DDIO2} is independent from V_{DD}:
   a) Enable VDDIO2VM by setting VDDIO2VMEN in PWR_CR7.
   b) Wait for the VDDIO2VM wake-up time.
   c) Wait until VDDIO2RDY is set in PWR_CR7.

d) Optional: Disable VDDIO2VM for consumption saving.

e) If V_{DDIO2} is in 1.8 V range, set V_{DDIO2} voltage range by setting VDDIO2VRSEL in PWR_CR7.

f) Optional: Retain VDDIO1VRSEL configuration by setting VDDIO2VRSTBY in PWR_CR7.

2. Set VDDIO2SV in PWR_CR7 to remove the V_{DDIO2} power isolation.

The following sequence must be done before using the VDDIO3 I/Os:

1. If V_{DDIO3} is independent from V_{DD}:
   a) Enable VDDIO3VM by setting VDDIO3VMEN in PWR_CR1.
   b) Wait for the VDDIO3VM wake-up time.
   c) Wait until VDDIO3RDY is set in PWR_CR1.
   d) Optional: Disable VDDIO3VM for consumption saving.
   e) If V_{DDIO3} is in 1.8 V range, set the V_{DDIO3} voltage range by setting VDDIO3VRSEL in PWR_CR1.
2. Set VDDIO3SV in PWR_CR1 to remove the V_{DDIO3} power isolation.

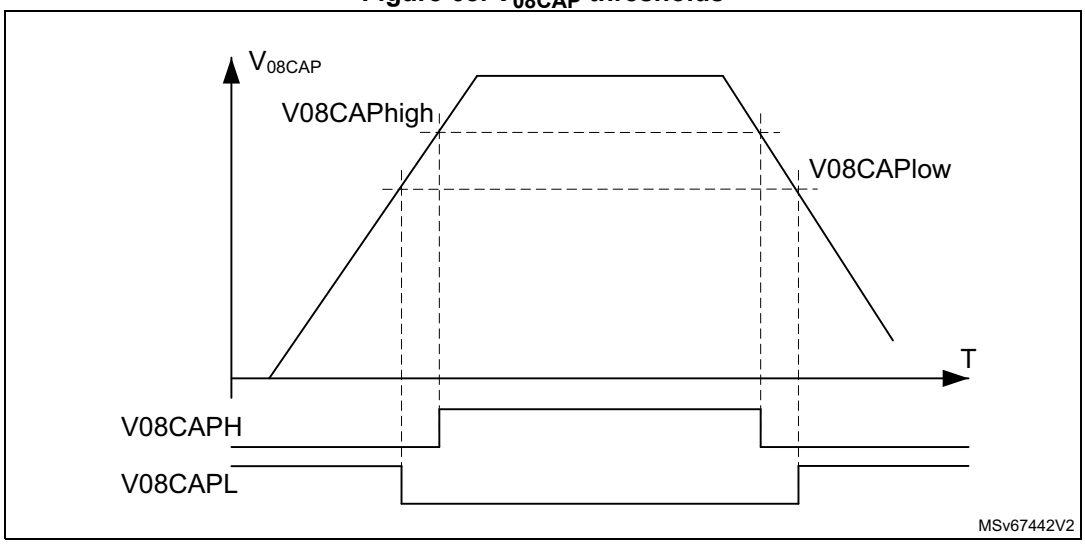
19.4.7 PWR V_{08CAP} voltage thresholds

The backup domain voltage V_{08CAP} supply can be monitored by comparing it with two threshold levels. The V08CAPH and V08CAPL flags in PWR_CR2 indicate if V_{08CAP} is higher or lower than the thresholds. These flags are available on tamper signals (see *Section 64*).

The V_{08CAP} supply monitor can be enabled/disabled with MONEN in PWR_CR2. When enabled, the V_{08CAP} voltage thresholds increase the power consumption. As an example, the levels can be used to trigger a routine to perform emergency saving tasks.

The V_{08CAP} voltage thresholds, when enabled, are also available in Standby and VBAT modes.

Figure 68. V_{08CAP} thresholds



Note: For thresholds and hysteresis, refer to the datasheet.

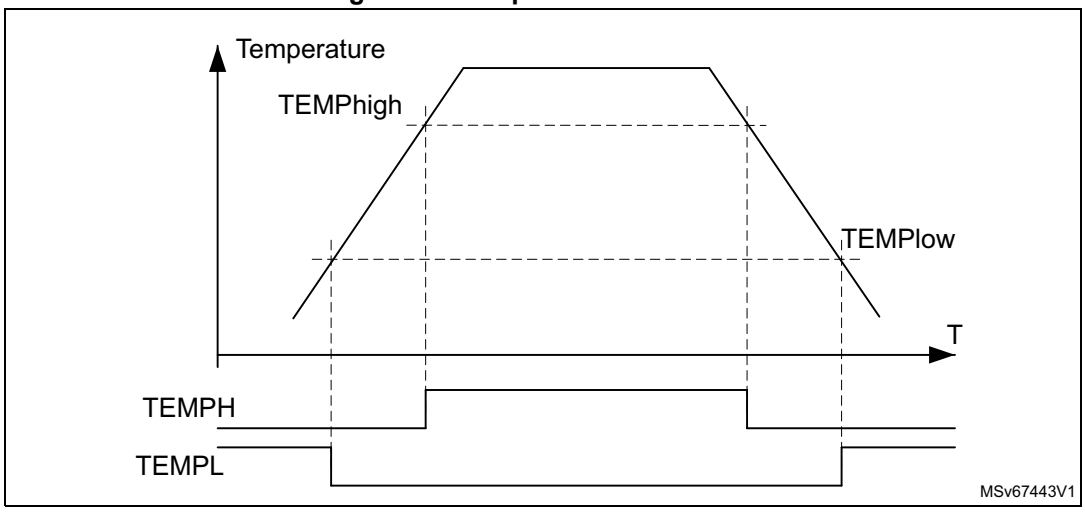
19.4.8 PWR temperature thresholds

The temperature can be monitored by comparing it with two threshold levels. The TEMPH and TEMPL flags in PWR_CR2 indicate if the device temperature is higher or lower than the threshold. These flags are available on tamper signals (see *Section 64*).

The temperature monitor can be enabled/disabled with MONEN in PWR_CR2.
When enabled, the temperature thresholds increases power consumption. As an example, the levels can be used to trigger a routine to perform temperature control tasks.

The temperature thresholds, when enabled, are also available in Standby and V_{BAT} modes.

Figure 69. Temperature thresholds



Note: For thresholds and hysteresis, refer to the datasheet.

19.5 PWR power management

The power management controls V_{DDCPU} and V_{DDCORE} supplies in accordance with the system operation modes (see *Section 19.5.1*). The system is split into three domains:

- D1 domain supplied by V_{DDCPU}, containing the Cortex-A35 (CPU1)
- system D2 domain supplied by V_{DDCORE}, containing the Cortex-M33 (CPU2), a large part of the peripherals and the system control including the EXTI1

D1 and system D2 can be in one of the following operating modes:

- DRun, Run1/2, (power On, clock On)
- DStop1/2/3, Stop1/2, LP-Stop1/2, LPLV-Stop1/2 (power on, clock off)
- DStandby, Standby (power off, clock off)

At PWR controller level, the dual-core Cortex-A35 is seen as a single CPU1.

V_{DDCORE} supply follows the system operating mode (Run, Stop, LP-Stop, LPLV-Stop and Standby).

V_{DDCPU} supply follows the domain operating mode (DRun, DStop1/2/3 and DStandby). This supply can be powered down individually when the D1 domain is in DStandby mode.

Several system operating modes are available to tune the system according to the performance needed, that is when the CPU(s) do not need to execute code and wait for an

external event. It is up to the user to select the operating mode that gives the best compromise between low-power consumption, short startup time, and available wake-up sources.

The operating modes allow the control of the clock distribution to the different system parts and the system power. The system operating mode is driven by the CPU1 subsystem and CPU2 subsystem. A CPU subsystem can include multiple domains depending on its peripheral allocation. The operating modes for the different system parts are defined below.

CPU1 and CPU2 subsystem modes

- **CRun**

  CPU and CPU subsystem peripherals according to RCC PERxEN are clocked.
- **CSleep**

  CPU clocks are stalled and CPU subsystem allocated peripheral clocks operate according to RCC PERxLPEN.

  When the CPU1 enters CSleep with WFE, the CPU1 subsystem allocated peripheral clocks operate as in CPU1 CRun mode, irrespective of RCC PERxLPEN.
- **CStop**

  CPU and CPU subsystem peripheral clocks are stalled. The peripherals in autonomous mode can be clocked (independent clock request capability).

D1 domain modes

- **DRun**

  The CPU is clocked. The domain CPU subsystem is in CRun or CSleep mode.
- **DStop1**

  LPDS_D1 in PWR_CPU1R selects Stop. The CPU clock is stalled. The domain CPU subsystem is in CStop mode and PDDS_D1 in PWR_CPU1CR selects Stop.
- **DStop2**

  LPDS_D1 in PWR_CPU1R selects LP-Stop. LVDS_D1 in PWR_CPU1R selects normal voltage.The CPU clock is stalled. The domain CPU subsystem is in CStop mode and PDDS_D1 in PWR_CPU1CR selects DStop.
- **DStop3**

  LPDS_D1 and LVDS_D1 in PWR_CPU1R select LPLV-Stop.The CPU clock is stalled. The domain CPU subsystem is in CStop mode and PDDS_D1 in PWR_CPU1CR selects DStop.
- **DStandby**

  The domain is power down.The domain CPU subsystem is in CStop mode and PDDS_D1 in PWR_CPU1CR selects DStandby.

System D2 modes

- **Run1**

  The system clock and bus matrix clocks run. CPU1 and/or CPU2 subsystems are in CRun or CSleep. The Run mode is entered after a POR reset and a wake-up from Standby.
- **Run2**

The system clock and bus matrix clocks run. The D1 domain is in power down. The CPU2 subsystem is in CRun or CSleep. The CPU1 subsystem is in CStop, and PDDS_D1 in PWR_CPU1CR selects DStandby.

- **Stop1, LP-Stop1, LPLV-Stop1**

  The system clock and D2 bus matrix clocks are stalled. CPU1 and CPU2 subsystems are in CStop, and PDDS_D1 in PWR_CPU1CR selects DStop. At least on PDDS_D2 in PWR_CPU1CR and PWR_CPU2CR select Stop mode.

- **Stop2/LP-Stop2/LPLV-Stop2**

  The system clock and D2 bus matrix clocks are stalled. The D1 domain is in power down. CPU1 and CPU2 subsystems are in CStop, and PDDS_D1 PWR_CPU1CR selects DStandby. At least on PDDS_D2 in PWR_CPU1CR and PWR_CPU2CR select Stop mode.

- **Standby**

  The system is powered down. All CPU subsystems are in CStop. PDDS_D1 in PWR_CPU1CR selects DStandby. PDDS_D2 n PWR_CPU1CR and PWR_CPU2CR select Standby.

Note: In Run modes, the power consumption can be reduced by gating the clocks to AHBx and APBx peripherals when they are unused, with PERxEN.

PWR CPU1 low-power mode summary

The CPU1 system supports the following low-power modes:

Table 88. CPU1 low-power mode summary

<table>
<tr><th>CPU1</th><th>Processor0</th><th>Processor1</th><th>L2</th><th>Entry(1)</th><th>Wake-up</th><th>clk</th><th>Processor0 clk</th><th>Processor1 clk</th><th>Periph bus clk</th></tr>
<tr><td rowspan="6">CRun</td><td>P0RUN</td><td>P1RUN</td><td rowspan="5">L2RUN</td><td>-</td><td>-</td><td rowspan="6">ON</td><td rowspan="3">ON</td><td>ON</td><td rowspan="5">ON</td></tr>
<tr><td rowspan="2">P0RUN</td><td rowspan="2">P1STOP</td><td>WFE</td><td>CPU1 processor1 interrupt, or event, or reset</td><td rowspan="2">OFF</td></tr>
<tr><td>WFI</td><td>CPU1 processor1 interrupt or reset</td></tr>
<tr><td rowspan="2">P0STOP</td><td rowspan="2">P1RUN</td><td>WFE</td><td>CPU1 processor0 interrupt, or event, or reset</td><td rowspan="3">OFF</td><td rowspan="2">ON</td></tr>
<tr><td>WFI</td><td>CPU1 processor0 interrupt, or reset</td></tr>
<tr><td rowspan="2">CSleep</td><td rowspan="3">P0STOP</td><td rowspan="3">P1STOP</td><td>WFE(2)</td><td>CPU1(3) interrupt, or event, or reset</td><td rowspan="2">OFF</td></tr>
<tr><td rowspan="2">L2STOP</td><td>STPREQ_P[1:0] = 0b11 WFI(4)</td><td>CPU1(3) interrupt or reset</td><td>OFF</td><td>ON/OFF(5)</td></tr>
<tr><td>CStop</td><td>STPREQ_P[1:0] = 0b11 WFI(4)</td><td>CPU1(3) EXTI interrupt or reset</td><td>OFF</td><td>OFF</td><td>OFF</td><td>OFF</td></tr>
</table>

1. For STPREQ_P[1:0] register bits functionality refer to the RCC. WFI = wait for interrupt. WFE = wait for event.

2. At least one CPU1 processor is in WFE, and the other CPU1 processor is in WFE or WFI.
3. Wakes up the respective processor associated with the event or interrupt.
4. All CPU1 processors are in WFI.
5. CPU1 subsystem peripherals having a PERxLPEN bit operate accordingly.

PWR CPU2 low-power mode summary

Table 89. CPU2 low-power mode summary

CPU2	Entry	Wake-up	CPU2 clk	CPU2 periph bus clk
CRun	-	-	ON	ON
CSleep	Cortex-M33 SCR SLEEPDEEP = 0, WFE	Any CPU2 interrupt or event or reset	OFF	ON/OFF(1)
	Cortex-M33 SCR SLEEPDEEP = 0, WFI or return from ISR	Any CPU2 interrupt or reset		
CStop	Cortex-M33 SCR SLEEPDEEP = 1, WFE	Any CPU2 EXTI interrupt, or event, or reset		OFF
	Cortex-M33 SCR SLEEPDEEP = 1, WFI or return from ISR	Any CPU2 EXTI interrupt or reset		

1. CPU2 subsystem peripherals having a PERxLPEN bit operate accordingly.

PWR system low-power mode summary

The system low-power modes are derived from the CPU1 and CPU2 low-power modes.

Table 90. System low-power modes

System D2 domain	D1 domain	CPU1	CPU2	Wake-up	System clk	V_{DDCCPU}	V_{DDCORE}
Run1	DRun	CRun or CSleep	CRun or CSleep	See *Table 91*	ON	ON (nominal/overdrive)	ON (nominal)
			CStop

1. Legend: Y = Yes (Enable), O = Optional (Disable by default. Can be enabled by software), R = data/state retained, - = not available, wake-up highlighted in gray.
2. The BKPSRAM and RETSRAM content can optionally be retained when enabled.
3. SRAM1 and RETRAM can be accessed by HPDMA in Stop1/2 and LP-Stop1/2 modes.
4. HPDMA transfers are functional and autonomous in Stop1/2, and LP-Stop1/2 modes, and generate a wake-up interrupt on transfer events.
5. Some peripherals with wake-up from Stop capability can request HSI to be enabled. In this case, HSI is woken up by the peripheral, and only feeds the peripheral which requested it. HSI is automatically put off when the peripheral does not need it anymore.
6. USART and LPUART reception and transmission are functional and autonomous in low-power modes in asynchronous, and in SPI master modes, and generate a wake-up interrupt on transfer events.
7. I^2C reception and transmission are functional and autonomous in low-power modes, and generate a wake-up interrupt on transfer events.
8. I^3C reception and transmission are functional and autonomous in low-power modes, and generate a wake-up interrupt on transfer events.
9. SPI reception and transmission are functional and autonomous in low-power modes, and generate a wake-up interrupt on transfer events.
10. MDF1 is functional and autonomous in low-power modes, and generate a wake-up interrupt on events.
11. STGEN not accessible in Stop2, LP-Stop2, LPLV-Stop2 mode since STGEN is in V_{DDCPU} power domain.
12. LPTIM is functional and autonomous in Stop mode, and generates a wake-up interrupt on events.
13. Not present on all device part numbers (see the related datasheet for more information).

19.5.1 PWR power modes

The power control handles V_{DDCORE} and V_{DDCPU} supplies for system modes. The system operating mode depends on the individual CPU subsystem modes, and on the domain modes.

D1 domain power modes

- In DRun, V_{DDCPU} is supplied.
- In DStop1, V_{DDCPU} is supplied, and the external regulator is kept in main mode.
- In DStop2, V_{DDCPU} is supplied and the external regulator is switched in low-power mode.
- In DStop3, V_{DDCPU} may be supplied at a lower level.
- In DStandby, V_{DDCPU} is switched off.

System D2 power modes

- In Run, V_{DDCORE} is supplied. V_{DDCPU} is supplied (Run1) or switched off (Run2).

- In Stop, V_{DDCORE} is supplied. V_{DDCPU} is supplied (Stop1) or switched off (Stop2).
- In LP-Stop, V_{DDCORE} is supplied and the external regulator is switched in low-power mode. V_{DDCPU} is supplied (LP-Stop1) or switched off (LP-Stop2).
- In LPLV-Stop, V_{DDCORE} can be supplied at a lower level. V_{DDCPU} can be also supplied at a lower level (LPLV-Stop1) or switched off (LPLV-Stop2).
- In Standby, V_{DDCORE} and V_{DDCPU} are switched off.

PWR_CPU_ON and PWR_ON are used to control the external regulators suppling the D1 domain (V_{DDCPU}) and the system D2 domain (V_{DDCORE}). PWR_LP is used to notify low-power Stop mode selection for both external regulators.

If the same external regulator is used to supply V_{DDCORE} and V_{DDCPU}, only PWR_ON/PWR_LP must be used.

Table 92. External regulators control

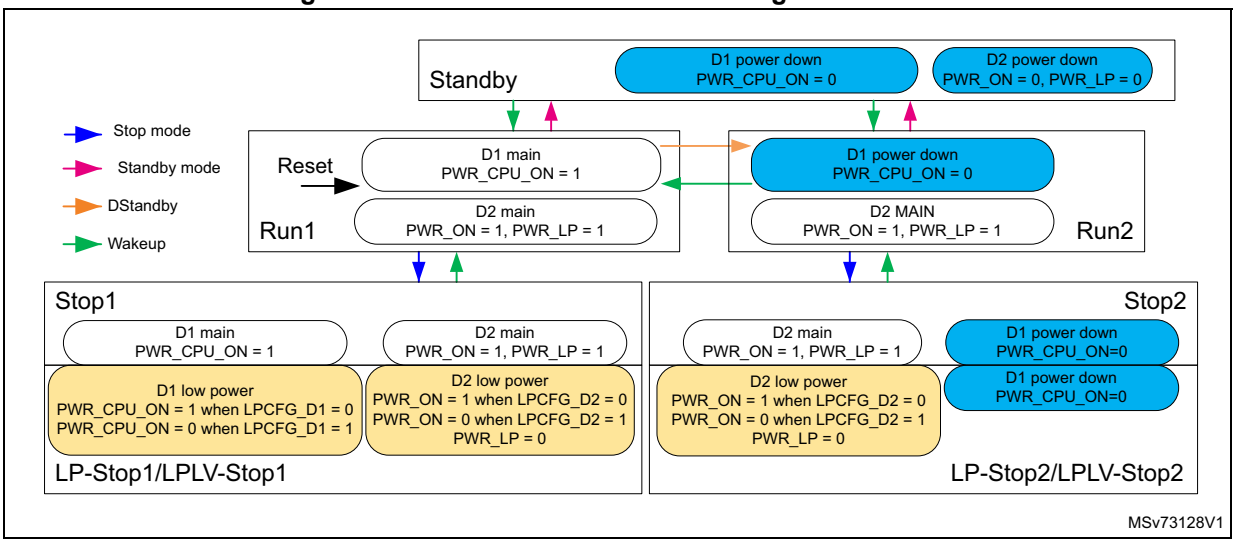
D2 system mode	D1 domain mode	PWR_CPU_ON		PWR_LP	PWR_ON	
		LPCFG_D1 = 0	LPCFG_D1 = 1		LPCFG_D2 = 0	LPCFG_D2 = 1
Run1	DRun	1	1	1	1	1
	DStop1	1	1	1	1	1
Run2	DStandby	0(1)	0(1)	1	1	1
Stop1	DStop1	1	1	1	1	1
Stop2	DStandby	0(1)	0(1)	1	1	1
LP-Stop1/LPLV-Stop1	DStop2/3	1	0	0(2)	1	0(2)
LP-Stop2/LPLV-Stop2	DStandby	0(1)	0	0(2)	1	0(2)
Standby	DStandby	0(1)	0(1)	0(3)	0(3)	0(3)

1. A guaranteed minimum PWR_CPU_ON pulse low time can be defined by POPL_D bits in PWR_D1CR.
2. Setting POPL_D2 bits in PWR_D2CR has no impact on LP-Stop/LPLV-Stop PWR_ON and PWR_LP pulse low time.
3. A guaranteed minimum PWR_ON and PWR_LP pulse low time can be defined by POPL_D bits in PWR_D2CR.

In LP-Stop1 and LPLV-Stop1 modes the PWR_CPU_ON is kept asserted or may be deasserted according to LPCFG_D1 in PWR_D1CR. In LP-Stop1/2 and LPLV-Stop1/2 modes, the PWR_ON is kept asserted or may be deasserted according to LPCFG_D2 in PWR_D2CR.

The definition (power off or low-power mode) of PWR_ON/PWR_CPU_ON must have been defined in the external regulator before entering LP-Stop/LPLV-Stop.

Figure 70. Power states and external regulator control

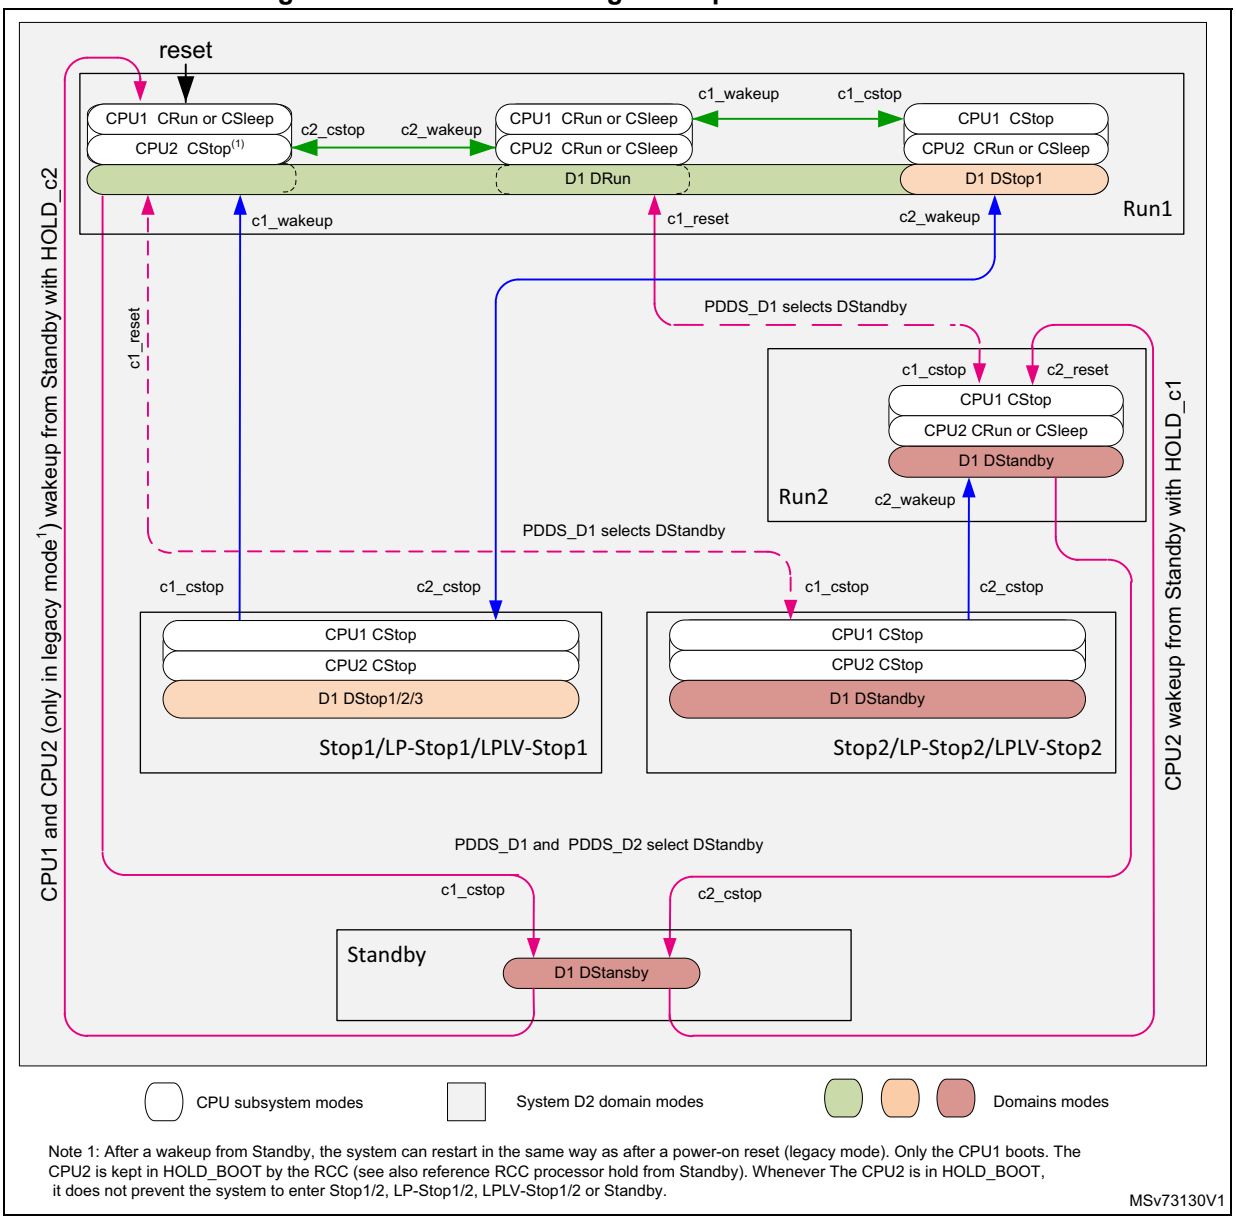


The system mode selection between Stop, LP-Stop or LPLV-Stop, and Standby is controlled by PDDS_D1 and PDDS_D2 in PWR_CPU1CR and PWR_CPU2CR. The system only enters Standby when these two bits allow so.

Table 93. PDD low-power mode control

CPU1 PDDS_D1	CPU1 PDDS_D2	CPU2 PDDS_D2	System operation mode
0	X	X	Stop1, LP-Stop1, LPLV-Stop1
1	X	0	Stop2, LP-Stop2, LPLV-Stop2
1	0	X	Stop2, LP-Stop2, LPLV-Stop2
1	1	1	Standby

Figure 71. Detailed state diagram of power control modes



Note 1: After a wakeup from Standby, the system can restart in the same way as after a power-on reset (legacy mode). Only the CPU1 boots. The CPU2 is kept in HOLD_BOOT by the RCC (see also reference RCC processor hold from Standby). Whenever The CPU2 is in HOLD_BOOT, it does not prevent the system to enter Stop1/2, LP-Stop1/2, LPLV-Stop1/2 or Standby.

MSv73130V1

The power control state transitions are initiated by (referring to *Figure 71*):

- CPU1 or CPU2 going to CStop
  - Green transitions: the system stays in Run modes (Run1 or Run2).
  - Blue line transitions: the system enters Stop1/2, LP-Stop1/2 or LPLV-Stop1/2.
  - Red transitions: the system enters Standby.
- D1 going to DStandby
  - Dotted red line transitions: The system mode entered depends also on CPU2.
    The system enters Run2 when CPU2 is in CRun or CSleep.
    The system enters Stop2, LP-Stop2 or LPLV-Stop2 when CPU2 is in CStop.

- Wake-up event
  - Green transitions: CPU1 or CPU2 wake up as from CSleep.
  - Blue transitions: CPU1 or CPU2 wake up from CStop. STOPF is set in PWR_CPU1CR and PWR_CPU2CR.
  - Dotted red line transitions: D1 wakes up from DStandby. SBF_D1 is set in PWR_CPU1CR.

    When the system remains in Run modes, no additional flags are set.

    When the system wakes up from Stop2, LP-Stop2 or LPLV-Stop2, STOPF is also set in PWR_CPU1CR.
  - Red transitions: CPU1 and CPU2 wake up from Standby. SBF_D1/2 are set in PWR_CPU1CR and PWR_CPU2CR.

The flags provided to determine from which mode the system exits are shown in the table below. CPU1 and CPU2 have their own set of flags which can be read from PWR_CPU1CR and PWR_CPU2CR. CPU1 and CPU2 have their own reset bit CSSF to clear their wake-up flags. CPU1 and CPU2 CSSF bits are located in the same register as CPU1 and CPU2 flags.

Table 94. Low-power mode exit flags

System D2 mode	D1 domain	SBF_D1	SBF_D2	SBF	STOPF	VBF	Comment
Run1	DRun/DStop1	0	0	0	0	0	Retained system contents
Run2	DStandby	1	0	0	0	0	Lost D1 contents. Retained system contents.
Stop1 LP-Stop1 LPLV-Stop1	DStop1/2/3	0	0	0	1	0	Retained system contents. System clock stopped.
Stop2 LP-Stop2 LPLV-Stop2	DStandby	1	0	0	1	0	Lost D1 contents. Retained system contents. System clock stopped.
Standby	DStandby	1	1	1	0	0	Lost system contents
V_{BAT}	NA	0	0	0	0	1	

19.5.2 Low-power batch acquisition mode (LPBAM)

The devices support Low-power batch acquisition mode (LPBAM), which allows peripherals to be functional and autonomous in low-power modes (without any software running).

Stop1/2, LP-Stop1/2 modes

In Stop1/2 and LP-Stop1/2 modes, the autonomous peripherals are: LPTIMx (x = 1 to 5), USARTx (x = 1 to 7), LPUART1, SPIx (x = 1 to 6), I2Cx (x = 1 to 3), I3Cx (x = 1 to 3), MDF1 and HPDMAx (x = 1 to 3). In these modes, SRAM1 and RETRAM can be accessed by the HPDMAx. GPIOA-I,Z can be also accessed by the HPDMAx.

LPBAM features

These autonomous peripherals support the following features:

- Functionality in Stop mode thanks to their own independent clock (named kernel clock) request capability: the peripheral kernel clock is automatically switched on when requested by a peripheral, and automatically switched off when no peripheral requests it.
- DMA transfers supported in Stop mode thanks to system clock request capability: the system clock (HSI) automatically switched on when requested by a peripheral, and automatically switched off when no peripheral requests it. When the system clock is requested by an autonomous peripheral, the system clock is woken up and distributed to all autonomous peripherals, and to all GPIOs enabled in the RCC. This allows the DMA to access the enabled SRAM, and any enabled peripheral register (for instance any autonomous peripherals or GPIO registers).
- Automatic start of the peripheral thanks to hardware synchronous or asynchronous triggers (such as I/Os edge detection and low-power timer event).
- Wake-up from Stop mode with peripheral interrupt: the HPDMAs are fully functional and the linked-list is updated in Stop mode, allowing the different DMA transfers to be linked without any CPU wake-up. This can be used to chain different peripheral transfers, or to write peripheral registers in order to change their configuration while remaining in Stop mode.

  The DMA transfers from memory-to-memory can be started by hardware synchronous or asynchronous triggers. The DMA transfers between peripherals and memories can also be gated by these triggers.

Here below some examples of use-cases that can be done while remaining in Stop mode:

- I^2C target reception or transmission, SPI reception, UART/LPUART reception
  - wake-up at the end of peripheral transfer or on DMA buffer event
- I^2C controller transfer, SPI transmission, UART/LPUART transmission, triggered by a low-power trigger (or any other trigger)
  - example: sensor periodic read
  - wake-up at the end of peripheral transfer or on DMA buffer event
- Data transfer from/to GPIO to/from SRAM:
  - to control external components
  - to implement data transmission and reception protocols

19.5.3 PWR system wake-up

From an application reset (such as NRST PAD, IWDG, POR, BOR), the system wakes up the CPU1. The CPU2 is kept in HOLD_BOOT. From this point, the CPU1 boot ROM manages the startup (see *Section 20*).

From Stop1/2, LP-Stop1/2, LPLV-Stop1/2, and Standby, the system can be configured to wake up CPU1 or CPU2 independently.

19.6 PWR low-power modes

Several low-power modes are available to save power when CPU1 and/or CPU2 do not need to execute code (when waiting for an external event). It is up to the user to select the

mode that gives the best compromise between low-power consumption, short startup time and available wake-up sources:

- slowing down system clocks (see *Section 20*)
- controlling individual peripheral clocks (see *Section 20*)
- low-power modes:
  - CSleep (CPU clock stopped)
  - CStop (CPU subsystem clock stopped)
  - D1 DStop1 (CPU subsystem clock stopped, normal mode signaled to external regulator)
  - D1 DStandby (domain power down and wake-up via reset)
  - Stop1, LP-Stop1, and LPLV-Stop1 (system clock stalled, normal or low-power mode signaled to external regulator supplying V_{DDCPU} and V_{DDCORE})
  - Stop2, LP-Stop2, and LPLV-Stop2 (system clock stalled, powered-down mode signaled to external regulator supplying V_{DDCPU}. Normal or low-power mode signaled to external regulator supplying V_{DDCORE}).
  - Standby (system domain in power down)

19.6.1 PWR slowing down CPU and/or bus matrix clocks

In Run mode, the speed of CPU1, CPU2 and/or bus matrix clocks can be reduced (see *Section 20* for more details).

19.6.2 PWR controlling peripheral clocks

In Run mode, the bus clock for individual peripherals can be stopped by RCC PERxEN register bits at any time to reduce power consumption.

To reduce power consumption in CSleep mode, the individual peripheral clocks can be disabled by the RCC PERxLPEN register bit. For the peripherals still receiving a clock in CSleep mode, their clock can be slowed down before entering CSleep mode.

19.6.3 PWR entering low-power modes

The CPU1 subsystem low-power modes CSleep and CStop are entered by the CPU1 when executing WFI or WFE instructions.

The CPU2 subsystem low-power modes CSleep and CStop are entered by the CPU2 when executing WFI or WFE instructions, or when SLEEPONEXIT in Cortex-M33 system control register is set on Return from ISR.

The D1 domain can enter in DStandby when all EXTI wake-up sources assigned to CPU1 are cleared, and the CPU1 is in CStop.

The system enters to Stop1/2, LP-Stop1/2, LPLV-Stop1/2, or Standby when all EXTI wake-up sources are cleared, and both CPU1 and CPU2 are in CStop.

The system enters in Standby when all EXTI wake-up sources are cleared, and all CPUs are in CStop.

19.6.4 PWR exiting from low-power modes

From CSleep mode, CPU1 and CPU2, subsystems exit from low-power mode through any interrupt or event, depending on how the low-power mode was entered.

If the WFI instruction or Return from ISR was used to enter low-power mode, any peripheral interrupt acknowledged by the GIC/NVIC can wake up the system.

If the WFE instruction is used to enter low-power mode, CPU1 and CPU2 exit from low-power mode as soon as an event occurs. The wake-up event can be generated by one of the following ways:

- GIC/NVIC IRQ interrupt
  - For CPU1, enable an interrupt in the peripheral control register and in the GIC.
  - Only GIC interrupts with sufficient priority wakes up and interrupt the CPU1.
  - For CPU2, when SEVONPEND = 0 in Cortex-M33 system control register, enable an interrupt in the peripheral control register and in the NVIC. When CPU2 resumes from WFE, the peripheral interrupt pending bit and the NVIC peripheral IRQ channel pending bit (in the NVIC interrupt clear pending register) have to be cleared.
  - Only NVIC interrupts with sufficient priority wake up and interrupt CPU2.
  - For CPU2, when SEVONPEND = 1 in Cortex-M33 system control register, enable an interrupt in the peripheral control register and optionally in the NVIC. When CPU2 resumes from WFE, the peripheral interrupt pending bit and when enabled the NVIC peripheral IRQ channel pending bit (in the NVIC interrupt clear pending register) have to be cleared.

    All NVIC interrupts wake up CPU2 , even the disabled ones.

    Only enabled NVIC interrupts with sufficient priority wake up and interrupt the CPU2.
- Event

  For CPU1 and CPU2 configuring an EXTI line in event mode, when CPU1 or CPU2, resumes from WFE, it is not necessary to clear the EXTI peripheral interrupt pending bit or the GIC/NVIC IRQ channel pending bit, as the pending bits corresponding to the event line are not set. It may be necessary to clear the interrupt flag in the peripheral.

From CStop, when the system is in Stop1, LP-Stop1, and LPLV-Stop1 modes, CPU1 and/or CPU2 subsystems exit from low-power mode only through an enabled EXTI interrupt or event, depending on how the low-power mode was entered.

From CStop, when the system is in Run2, Stop2, LP-Stop2, and LPLV-Stop2, the CPU1 subsystem exits from low-power mode only through an enabled EXTI interrupt.The program execution restarts with a CPU1 reset. The CPU2 subsystem exits from low-power mode through an enabled EXTI interrupt or event, depending on how the low-power mode was entered.

From Standby, CPU1 and/or CPU2 subsystems exit from low-power mode only through an application reset (such as NRST, IWDG), enabled WKUPx pins and a RTC event.

In legacy mode, the program execution restarts in the same way as after a power-on reset (such as reset vector fetched). An event, if enabled, can wake up the CPU2 and kept the D1 domain in DStandby. The CPU2 firmware is in charge to restore the secure context of the system before executing application restart.

19.6.5 PWR CSleep mode

The CSleep mode applies only to the CPU subsystems. In CSleep mode, the CPU clock is stopped. The CPU subsystem peripheral clocks operate according to the PERxLPEN bits.

PWR entering to CSleep mode

The CSleep mode is entered according to *Section 19.6.3*:

- For CPU1, one of the STPREQ_P[1:0] register bits in RCC is cleared (see *Table 95*).
- For CPU2, SLEEPDEEP bit in Cortex-M33 system control register is cleared (see *Table 96*).

PWR exiting from CSleep mode

The CSleep mode is exited according to *Section 19.6.4* and the tables below.

Table 95. CPU1 CSleep mode

CPU1 CSleep	Comments
Mode entry	WFI while: – STPREQ_P[1:0] = 0b11 (see *Section 20*). – CPU1 GIC interrupts and events are cleared.
	WFE while CPU1 GIC interrupts and events cleared.
Mode exit	If WFI was used for entry, any interrupt enabled in GIC (see *Section 28.4).* If WFE was used for entry, any interrupt event when disabled in GIC (see *Section 28.4),* or any event (see *Section 19.6.4)*
Wake-up latency	None

Table 96. CPU2 CSleep mode

CPU2 CSleep	Comments
Mode entry	WFI or WFE while: – SLEEPDEEP = 0 (see the Cortex-M33 system control register). – CPU2 NVIC interrupts and events are cleared.
	On return from ISR while: – SLEEPDEEP = 0 and SLEEPONEXIT = 1 (see the Cortex-M33 system control register). – CPU2 NVIC interrupts and events are cleared.
Mode exit	If WFI or return from ISR was used for entry, any interrupt enabled in NVIC (see *Section 27.3*) If WFE was used for entry and SEVONPEND = 0, any event (see *Section 19.6.4)* If WFE was used for entry and SEVONPEND = 1, any interrupt event disabled in NVIC (see *Section 27.3*), or any event (see *Section 19.6.4).*
Wake-up latency	None

19.6.6 PWR CStop mode

The CStop mode applies only to the CPU subsystems. In CStop mode, the CPU clock and CPU subsystem peripheral clocks are stopped.

In CStop mode, CPU subsystem peripherals having a kernel clock request are still able to request their kernel clock, when selecting a clock in the RCC, which is able to run in CStop mode.

PWR entering to CStop mode

The CStop mode is entered according to *Section 19.6.3:*

- For CPU1, when STPREQ_P[1:0] in RCC are set (see *Table 97*).
- For CPU2, when SLEEPDEEP in Cortex-M33 system control register is set (see *Table 98*)

PWR exiting from CStop mode

The CStop mode is exited according to *Section 19.6.4* and the tables below.

Table 97. CPU1 CStop mode

CPU1 CStop	Comments
Mode entry	WFI while: – STPREQ_P[1:0] = 0b11 (see *Section 20*) – CPU1 GIC interrupts and events are cleared. – All CPU1 EXTI1-2 wake-up sources are cleared.
Mode exit	EXTI1-2 interrupt is enabled in GIC (see *Section 28.4)* for peripherals which are not stopped.
Wake-up latency	EXTI and RCC wake-up synchronization (see *Section 20*)

Table 98. CPU2 CStop mode

CPU2 CStop	Comments
Mode entry	WFI or WFE while: – SLEEPDEEP = 1 (see Cortex-M33 system control register). – CPU2 NVIC interrupts and events are cleared. – All CPU2 EXTI1-2 wake-up sources are cleared.
	On return from ISR while: – SLEEPDEEP = 1 and SLEEPONEXIT = 1 (see Cortex-M33 system control register). – CPU2 NVIC interrupts and events are cleared. – All CPU2 EXTI1-2 wake-up sources are cleared.
Mode exit	If WFI or return from ISR was used for entry, EXTI1-2 interrupt enabled in NVIC (see *Section 27.3*) for peripherals which are not stopped If WFE was used for entry and SEVONPEND = 0, EXTI1-2 event (see *Section 19.6.4*) for peripherals which are not stopped. If WFE was used for entry and SEVONPEND = 1, EXTI1-2 interrupt event when disabled in NVIC (see *Section 27.3*), or EXTI event (see *Section 19.6.4*) for peripherals which are not stopped
Wake-up latency	EXTI and RCC wake-up synchronization. (see *Section 20*)

19.6.7 PWR D1 DStop1 mode

In DStop1 mode, the domain CPU clock is stalled.

PWR entering to DStop1 mode

The DStop1 mode is entered according to *Section 19.6.3* when PDDS_D1 in PWR_CPU1CR selects Stop for the D1 domain.

See *Table 99* for details on how D1 domain enters DStop1.

PWR exiting DStop1 mode

The DStop1 mode is exited according to *Section 19.6.4.* See the table below for more details on how D1 domain exit DStop1. When exiting DStop1 mode, the CPU subsystem clock is the same as when entering DStop1.

Table 99. D1 DStop1 mode

D1 DStop1	Comments
Mode entry	– When CPU1 subsystem is in CStop mode. – PDDS_D1 = 0 in PWR_CPU1CR – LPDS_D1 = 0 in PWR_CPU1CR.
Mode exit	On an EXTI1-2 wake-up
Wake-up latency	Clocks restored, and EXTI and RCC wake-up synchronization (see *Section 20*)

19.6.8 PWR D1 DStandby mode

Like the DStop1 mode, the DStandby mode is based on CPU subsystem CStop mode, but the domain supply is powered off.

In DStandby, the domain is powered down and the domain RAM and register contents are lost.

Entering D1 DStandby mode

The D1 DStandby mode is entered according to *Section 19.6.3* when PDDS_D1 in PWR_CPU1CR selects Standby.

Refer to *Table 100* for details on how D1 domain enters DStandby mode.

Exiting D1 DStandby mode

The DStandby mode is exited according to *Section 19.6.4*. See the table below for more details on how D1 domain exit DStandby.

When exiting D1 DStandby mode, the domain CPU and peripherals are reset. The state of the CPU subsystem clocks depends on the system mode:

- When the system did not enter Standby mode, the CPU subsystem clocks are the same as when entering DStandby.
- When the system entered Standby mode, the CPU subsystem clocks are reset.

Table 100. D1 DStandby mode

D1 DStandby	Comments
Mode entry	– When CPU1 subsystem is in CStop and there is no active EXTI1/2 wake-up source assigned to CPU1 – PDDS_D1 = 1 in PWR_CPU1CR.
Mode exit	– On an EXTI1-2 wake-up when the system did not enter in Standby – Otherwise WKUP pins, RTC alarm (Alarm A and Alarm B), RTC wake-up, tamper event, time stamp event, application reset (such as NRST, IWDG)
Wake-up latency	– EXTI and RCC wake-up synchronization (see *Section 20*) – Domain power up and CPU1 reset – CPU1 reboot from boot ROM

19.6.9 PWR Stop1 mode

The system enters Stop1 mode only when both CPU1 and CPU2 subsystems are in CStop, and EXTI1/2 wake-up sources are inactive. In Stop1 mode, the system clock including any PLL, and the system bus matrix clocks are stopped. The system oscillators operate according to the xxxKERON register bit.

In Stop1 mode, peripherals using the LSI or LSE clock, and peripherals having a kernel clock request, selecting a clock source in the RCC which is able to run in Stop1 mode, are still able to operate.

In system Stop1 mode, the following features can be selected to be kept active by programming individual control bits:

- Independent watchdog: the IWDG is started by writing to its Key register or by hardware option. Once started, it cannot be stopped except by an application reset (see *Section 61*).
- Real-time clock: the RTC is configured by RCC_RTCCFGR.
- Internal RC oscillator: the LSI RC is configured by LSION in RCC_BDCR.
- External 32.768 kHz oscillator: the LSE OSC is configured by LSEON in RCC_BDCR.
- Peripherals can run on the LSI or LSE clock.
- Peripherals have a kernel clock request.
- Internal RC oscillators: The HSI, MSI, and HSE oscillators are configured by the corresponding xxxKERON bit in the *Section 20: Reset and clock control (RCC)*
- The ADCs can also consume power during Stop mode, unless they are disabled before entering this mode. To disable them, ADON bits in ADC_CR2 register must both be written to 0.

PWR entering to Stop1 mode

The Stop1 mode is entered according to *Section 19.6.3* when PDDS_D1 in PWR_CPU1CR requests Stop, and at least one of PDDS_D2 bits in PWR_CPU1CR and PWR_CPU2CR requests Stop.

Refer to *Table 101* for details on how to enter Stop1 mode.

PWR exiting from Stop1 mode

The Stop mode is exited according to *Section 19.6.4*. See *Table 101* for more details on how to exit Stop1 mode.

When exiting Stop mode, the RCC restores the CPU subsystem and matrix clocks. STOPF flags in PWR_CPU1CR and PWR_CPU1CR indicate that the system has exit Stop.

Table 101. Stop1 mode

Stop1	Comments
Mode entry	– When CPU1and CPU2 subsystems are in CStop and there is no active EXTI1-2 wake-up source – PDDS_D1 = 0 in PWR_CPU1CR – PDDS_D2 = 0 in PWR_CPU1CR or PWR_CPU2CR – LPDS_D1 = 0 in PWR_CPU1CR or LPDS_D2 = 0 in PWR_CPU2CR
Mode exit	On an EXTI1/2 wake-up
Wake-up latency	Clocks restored, EXTI and RCC wake-up synchronization and PWRLP_TEMPO (see *Section 20*)

PWR I/O states in Stop1 mode

In Stop1 mode, all I/O pins keep their configuration.

19.6.10 PWR Stop2 mode

The Stop2 mode is used to save D1 domain power consumption. This mode is equivalent to Stop1 mode in term of available features, but with the D1 in DStandby mode.

The system enters Stop2 mode only when both CPU1 and CPU2 subsystems are in CStop and the EXTI1/2 wake-up sources are inactive.

PWR entering Stop2 mode

The Stop2 mode is entered according to *Section 19.6.3* when PDDS_D1 in PWR_CPU1CR requests Standby, and at least one of PDDS_D2 bits in PWR_CPU1CR or PWR_CPU2CR requests Stop.

Refer to *Table 102* for details on how to enter Stop2 mode.

PWR exiting from Stop2 mode

The Stop2 mode is exited according to *Section 19.6.4*. See the table below for more details on how to exit Stop2 mode.

When exiting Stop2 mode, the RCC restores the CPU subsystem and matrix clocks. SBF_D1 in PWR_CPU1CR, and STOPF in PWR_CPU1CR and PWR_CPU2CR indicate that the system has exit Stop2 mode.

Table 102. Stop2 mode

Stop2	Comments
Mode entry	– When CPU1 and CPU2 subsystems are in CStop and there is no active EXTI1/2 wake-up source – PDDS_D1 = 1 in PWR_CPU1CR – PDDS_D2 = 0 in PWR_CPU1CR or PWR_CPU2CR – LPDS_D2 = 0 in PWR_CPU2CR
Mode exit	On an EXTI1/2 wake-up
Wake-up latency	Clocks restored, EXTI and RCC wake-up synchronization and PWRLP_TEMPO (see *Section 20*) D1 Domain power up and CPU1 reset, CPU1 reboot from boot ROM

PWR I/O states in Stop2 mode

In Stop2 mode, all I/O pins keep their configuration.

19.6.11 PWR LP-Stop1 and LPLV-Stop1 modes

The LP-Stop1 mode is handled in the same way as Stop1 mode, when LP-Stop mode is selected by LPDS_D1 in PWR_CPU1CR and LPDS_D2 in PWR_CPU2CR. See the table below for more details on how to enter and exit LP-Stop1 mode.

Table 103. LP-Stop1 mode

LP-Stop1	Comments
Mode entry	– When CPU1 and CPU2 subsystems are in CStop and there is no active EXTI1/2 wake-up source – PDDS_D1 = 0 in PWR_CPU1CR – PDDS_D2 = 0 in PWR_CPU1CR or PWR_CPU2CR – LPDS_D1 = 1 in PWR_CPU1CR and LPDS_D2 = 1 in PWR_CPU2CR
Mode exit	On an EXTI1/2 wake-up
Wake-up latency	Clock restored, LP-Stop timeout (external regulator to switch to main mode), EXTI and RCC wake-up synchronization and PWRLP_TEMPO (see *Section 20*)

LVDS_D1 in PWR_CPU1CR and LVDS_D2 in PWR_CPU2CR are used to select whether V_{DDCPU} and V_{DDCORE} supplies during LP-Stop1 mode are kept at Run mode level, or lowered (LP-Stop1 with low-voltage mode).

In LP-Stop1 with low-voltage mode peripherals in D2 domain that can wake up from Stop1 (such as TIM, UART, I2C, SPI), must all be disabled. The DDR retention must be enabled by

DDRRETEN in PWR_CR11. See the table below for more details on how to enter and exit LP-Stop1 with low-voltage mode.

Table 104. LPLV-Stop1 mode

LPLV-Stop1	Comments
Mode entry	– When CPU1 and CPU2 subsystems are in CStop and there is no active EXTI1/2 wake-up source – PDDS_D1 = 0 in PWR_CPU1CR – PDDS_D2 = 0 in PWR_CPU1CR or PWR_CPU2CR – LPDS_D1 = 1 in PWR_CPU1CR and LPDS_D2 = 1 in PWR_CPU2CR – LVDS_D1 = 1 in PWR_CPU1CR and LVDS_D2 = 1 in PWR_CPU2CR
Mode exit	On an EXTI1/2 wake-up
Wake-up latency	Clock restored, LPLV-Stop timeout (external regulator to restore Run mode operating supply level), EXTI and RCC wake-up synchronization and PWRLP_TEMPO (see *Section 20*)

19.6.12 PWR LP-Stop2 and LPLV-Stop2 modes

The Lp-Stop2 mode is used to save D1 domain power consumption. This mode is equivalent to LP-Stop1 mode but with the D1 in DStandby mode.

The LP-Stop2 mode is handled in the same way as Stop2 mode, when LP-Stop mode is selected by LPDS_D2 register bit in PWR_CPU2CR.

Refer to the table below for more details on how to enter and exit LP-Stop2 mode.

Table 105. LP-Stop2 mode

LP-Stop2	Comments
Mode entry	– When CPU1 and CPU2 subsystems are in CStop and there is no active EXTI1/2 wake-up source – PDDS_D1 = 1 in PWR_CPU1CR – PDDS_D2 = 0 in PWR_CPU1CR or PWR_CPU2CR – LPDS_D2 = 1 in PWR_CPU2CR
Mode exit	On an EXTI1/2 wake-up
Wake-up latency	Clock restored, LP-Stop timeout (external regulator to switch to main mode), EXTI and RCC wake-up synchronization and PWRLP_TEMPO (see *Section 20*) D1 domain power up and CPU1 reset, CPU1 reboot from boot ROM

LVDS_D2 in PWR_CPU2CR selects whether V_{DDCORE} supply during LP-Stop2 mode is kept at Run mode level, or lowered (LP-Stop2 with low-voltage mode).

In LP-Stop2 with low-voltage mode the peripherals in D2 domain that can wake up from Stop2 (such as TIM, UART, I2C, SPI), must all be disabled. The DDR retention must be enabled by DDRRETEN in PWR_CR11. See the table below for more details on how to enter and exit LP-Stop2 with low-voltage mode.

Table 106. LPLV-Stop2 mode

LPLV-Stop2	Comments
Mode entry	– When CPU1 and CPU2 subsystems are in CStop and there is no active EXTI1/2 wake-up source – PDDS_D1 = 1 in PWR_CPU1CR – PDDS_D2 = 0 in PWR_CPU1CR or PWR_CPU2CR – LPDS_D2 = 1 in PWR_CPU2CR – LVDS_D2 = 1 in PWR_CPU2CR
Mode exit	On an EXTI1/2 wake-up
Wake-up latency	Clock restored, LPLV-Stop timeout (external regulator to restore Run mode operating supply level), EXTI and RCC wake-up synchronization and PWRLP_TEMPO (see *Section 20*) D1 domain power up and CPU1 reset, CPU1 reboot from boot ROM

19.6.13 PWR Standby mode

The Standby mode is used to achieve the lowest power consumption. It is based on CPU1 and CPU2 subsystem CStop mode, as for Stop modes, but with V_{DDCORE} and V_{DDCPU} supply regulators powered off.

When the system enters Standby, PWR_ON, PWR_CPU_ON and PWR_LP pins are set low. The external voltage regulators that provide V_{DDCORE} and V_{DDCPU} supplies, are disabled. Complete V_{DDCORE} and V_{DDCPU} domains are consequently powered off. PLLs, HSI and HSE oscillators are also switched off. SRAM and register contents are lost except for V_{DD}, V_{SW}, backup domain, and retention domain (RTC registers, RTC backup register, LSE, backup RAM and retention RAM) and Standby circuitry.

In system Standby mode, the following features can be selected by programming individual control bits:

- Independent watchdog: the IWDG is started by writing to its Key register or by hardware option. Once started it cannot be stopped except by an application reset (see *Section 61*).
- Real-time clock: the RTC is configured by RCC_RTCCFGR.
- Internal RC oscillator: the LSI RC is configured by LSION in RCC_BDCR.
- External 32.768 kHz oscillator: the LSE OSC is configured by LSEON in RCC_BDCR

PWR entering Standby mode

The Standby mode is entered according to *Section 19.6.3* when all PDDS_Dn bits in PWR_CPU1CR and PWR_CPU2CR request Standby mode.

Refer to *Table 108* for more details on how to enter Standby mode.

PWR exiting from Standby mode

The Standby mode is exited according to *Section 19.6.4*. See the table below for more details on how to exit Standby mode.

The system exits Standby when an application reset (such as NRST, IWDG), a WKUP pin event is detected. PWR registers are reset after wake-up from Standby, except for power control and status registers (reset condition defined for each PWR register).

Wake-up event source (WKUP pins and RTC/TAMP when the resource isolation framework is used) can be assigned independently to CPU1 and/or CPU2. The external regulators that provide V_{DDCPU} and V_{DDCORE} are enabled according to the CPU to wake up but also according to the first CPU allowed to boot. Refer to RCC Processor state after Standby exit for more details about the first CPU allowed to boot.

The selection of the CPU to wake-up is notified to the RCC through PWR CPU1_HW_BEN and CPU2_HW_BEN signals. Once the wake-up source is cleared, CPU1_HW_BEN and CPU2_HW_BEN are cleared to 0.

Table 107. CPU1_HW_BEN and CPU2_HW_BEN management

Standby exit event	First CPU allowed to boot	CPU1_HW_BEN	CPU2_HW_BEN	PWR_CPU_ON	PWR_ON
CPU1 wake-up event	CPU1	1	0	1	1
	CPU2	1	0	1	1
CPU2 wake-up event	CPU1	0	1	1	1
	CPU2	0	1	0	1
CPU1and CPU2 wake-up event	CPU1	1	1	1	1
	CPU2	1	1	1	1

SBF_D1, SBF_D2 and SBF flags in PWR_CPU1CR and PWR_CPU2CR indicate that the system has exit Standby.

Table 108. Standby mode

Standby	Comments
Mode entry	– All CPU subsystems are in CStop and there is no active EXTI1/2 wake-up source – All WKUPF bits in PWR_WKUPCRx are cleared. – All RTC wake-up events are cleared. – PDDS_D1=1 in PWR_CPU1CR – PDDS_D2=1 in both PWR_CPU1CR and PWR_CPU2CR
Mode exit	WKUP pins, RTC alarm (Alarm A and Alarm B), RTC wake-up, tamper event, timestamp event, application reset (such as NRST, IWDG(1))
Wake-up latency	System reset phase (see *Section 20*) or CPU1 boot from boot ROM or CPU2 boot from RETRAM

1. The IWDG1/2/3/4 when configured to generate an application reset, and when configured to generate a system debug wake-up event, reset the system in both cases.

PWR I/O states in Standby mode

In Standby mode, all I/O pins are high impedance no pulls except for:

- NRST, PWR_ON, PWR_CPU_ON, and PWR_LP pins (still available)
- RTC_AF1 pin if configured for tamper, timestamp, RTC Alarm out, or RTC clock calibration out
- WKUP pins, if enabled (WKUP pin pulls can be configured by WKUPPUPD in PWR_WKUPCRx)

19.7 PWR VBAT operation

The VBAT pin is used to power the V_{BAT} domain from an external battery.

The VBAT pin supplies the RTC with LSE, anti-tamper detection (TAMP), backup registers and 8-Kbyte backup SRAM. Sixteen anti-tamper detection pins are available in V_{BAT} mode.

The device can be set in V_{BAT} mode by powering down the V_{DD} and $V_{DDA18AON}$ supplies. The V_{DDCPU} and V_{DDCORE} supplies must be powered off before V_{DD} and $V_{DDA18AON}$ (PWR_ON and PWR_CPU_ON low level).

VBF flag in PWR_CPU1CR and PWR_CPU2CR indicate that the system has exit V_{BAT} mode.

PWR I/O states in V_{BAT} mode

In V_{BAT} mode, all I/O pins are powered down except for RTC and tamper pins.

19.7.1 PWR debug Stop mode

When the system enters Stop, its operation depends on the DBG_STOP configuration in DBGMCU_CR.

When the Stop mode debug is enabled, when entering Stop mode, the PWR does not signal low-power mode on PWR_ON, PWR_CPU_ON and PWR_LP signals. V_{DDCORE} and V_{DDCPU} domains are kept supplied by the regulator in main mode.

When exiting Stop mode, the system CPU and logic are enabled as from normal Stop mode. STOPF is set in PWR_CPU1CR.

When the Stop mode debug is enabled, when entering Run2 or Stop2 mode, the PWR does not signal power-down mode on the PWR_CPU_ON signal. V_{DDCPU} domain is kept supplied by the regulator in main mode.

When exiting Run2 or Stop2 mode, a CPU1 reset is generated, which resets the V_{DDCPU} logic excluding the debug logic. SBF_D1 is set in PWR_CPU1CR.

19.7.2 PWR debug Standby mode

When the system enters low-power mode Standby, its operation depends on the DBG_STANDBY configuration in DBGMCU_CR.

When the Standby mode debug is enabled, when entering Standby mode, the PWR keeps pwr_on and pwr_cpu_on active, allowing V_{DDCORE} and V_{DDCPU} domains to remain supplied. In Standby mode, V_{DDCORE} and V_{DDCPU} domains are not reset, allowing the CPU and bus clocks to be active.

When exiting Standby mode, a reset is generated, which resets V_{DDCORE} and V_{DDCPU} logic, excluding the debug logic. Waking up from debug Standby modes, the system CPUs and logic are reset, as from normal Standby mode. SBF, SBF_D1 and SBF_D2 are set.

19.8 PWR WKUP pins

The WKUP polarity must only be changed by configuring WKUPP in PWR_WKUPPCRx when the wake-up interrupt is disabled in WKUPENCPU1/2 bits. To avoid false interrupts, WKUPF must be cleared with WKUPC in PWR_WKUPPCRx, before enabling the wake-up interrupt in WKUPENCPU1/2.

19.9 PWR_ON, PWR_CPU_ON and PWR_LP pins

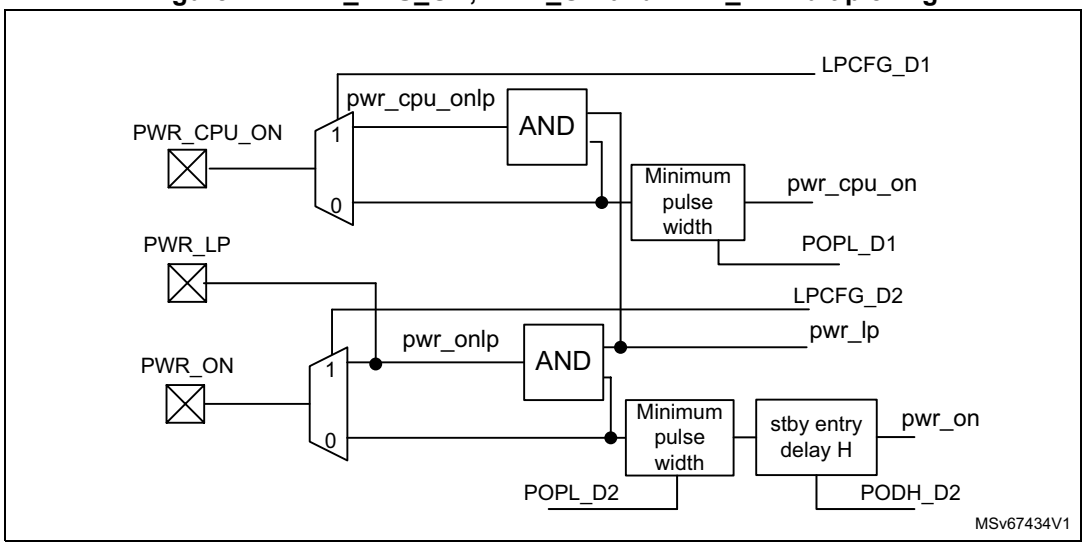
V_{DDCORE} and V_{DDCPU} domains can be independently controlled using PWR_ON, PWR_CPU_ON, and PWR_LP pins.

PWR_CPU_ON signals pwr_cpu_on or pwr_cpu_onlp depending on LPCFG_D1 in PWR_DC1R.

PWR_ON signals pwr_on or pwr_onlp depending on LPCFG_D2 in PWR_D2CR.

PWR_LP signals pwr_onlp.

Figure 72. PWR_CPU_ON, PWR_ON and PWR_LP multiplexing



When LPCFG_D1 selects pwr_cpu_on, PWR_CPU_ON pins are only low in DStandby.

When LPCFG_D1 selects pwr_cpu_onlp on PWR_CPU_ON, the definition (DStandby or DStop2/3) of the signal being low must be communicated to the external power management prior entering low-power mode. PWR_CPU_ON pins are low in DStandby, DStop2, and DStop3 modes.

When LPCFG_D2 selects pwr_on, PWR_ON pin is only low in Standby.

When LPCFG_D2 selects pwr_onlp on PWR_ON, the definition (Standby, LP-Stop1, LP-Stop2, LPLV-Stop1, or LPLV-Stop2) of the signal being low must be communicated to the

external power management prior entering low-power mode. PWR_ON pin is low in Standby, LP-Stop1, LP-Stop2, LPLV-Stop1, and LP-Stop1 modes.

The same external regulator can be used to supply V_{DDCORE} and V_{DDCPU}. Only PWR_ON and PWR_LP signaling are used to control the external regulator. Run2, Stop2, LP-Stop2, and LPLV-Stop2 modes are no more supported.

19.10 PWR interrupts

The PWR provides the following interrupts:

- Wake-up interrupt to CPU1
  - enabled by WKUPENCPU1 in PWR_WKUPPCRx
  - corresponding WKUPF available in PWR_WKUPPCRx
- Wake-up interrupt to CPU2
  - enabled by WKUPENCPU2 in PWR_WKUPPCRx
  - corresponding WKUPF available in PWR_WKUPPCRx

Other status flags associated with Stop, Standby and monitoring functions are not present on all device part numbers (see the related datasheet for more information).

Table 109. PWR status flags

Status flag	Description	Interrupt	Cleared through
STOPF	Exit Stop	Wake-up from Stop events	CSSF
SBF	Exit Standby	Wake-up from Standby events	CSSF
SBF_D1	D1 exits DStandby	Wake-up from DStandby events	CSSF
SBF_D2	D2 exits Standby	Wake-up from Standby events	CSSF
VBF	Exit VBAT	No associated interrupt	CSSF
WKUPF[6:1]	Wake-up flags	CPU1 and CPU2 wake up from Standby and Stop events.	WKUPC[6:1]

TEMPL, TEMPH	Temperature monitoring	Interrupt via EXTI2	NA

19.11 PWR resource isolation framework (RIF)

In order to be compliant with the device security definition, the PWR implements the following security/isolation requirements which apply to any defined security domain:

- filtering of secure/non-secure accesses
- privileged/unprivileged accesses
- filtering of hardware execution compartments (called CIDs): up to eight CIDs including TDCID (trusted domain compartment ID) and DDCID (debug domain compartment ID)

There are three different profiles for PWR local resources:

- single access (only one master can access)
- shared between different masters with semaphore protection
- no access

There are two kinds of local resources in the PWR:

- non-shareable resources (R0 to R6), that can be statically assigned to only one master
- shareable wake-up I/O resources (WIO1 to WIO6) that can be statically assigned to one master, or shared between different masters with semaphore protection

19.11.1 PWR RIF configuration

After any application or system reset, the PWR does not filter any access (default configuration: no CID filtering, non-secure, any privilege) until the TDCID agent has programmed the RIF configuration and enabled the filtering. The PWR RIF configuration is based on the local and external RIF configurations.

The local RIF configuration is managed by the following registers:

- non-shareable resources (R0 to R6)
  - PWR_RSECCFGR to set a secure/non-secure attribute per local PWR resource
  - PWR_RPRIVCFGR to set a privileged/unprivileged attribute per local PWR resource
  - PWR_RxCIDCFGR to set a CID filtering policy per local PWR resource
- shareable wake-up I/O resources (WIO1 to WIO6)
  - PWR_WIOSECCFGR to set a secure/non-secure attribute per local PWR resource
  - PWR_WIOPRIVCFGR to set a privileged/unprivileged attribute per local PWR resource
  - PWR_WIOxCIDCFGR and PWR_WIOxSEMCR to set a CID filtering policy per local PWR resource

The external RIF configuration is inherited from the RIF peripheral configurations and it applies to the related local resources. *Table 110* shows all PWR local resource content (first column) and the RIF configuration attached to it (third column).

Secure/non-secure access filtering

To enable the filtering access based on this attribute, the authorized master agent has to set RSECx in PWR_RSECCFGR, or WIOSECx in PWR_WIOSECCFGR, for the PWR local resource x.

When the local resource is configured as secure, read/write operations are only allowed by a secure access. Non-secure read/write accesses are denied (RAZ/WI). An illegal secure access event is generated to the IAC (illegal access controller). There is no bus error generated.

When the local resource is configured as non-secure, read/write operations are allowed by both secure and non-secure accesses.

Privileged/unprivileged access filtering

To enable the filtering access based on this attribute, the authorized master agent has to set RPRIVx in PWR_RPRIVCFGR, or WIOPRIVx in PWR_WIOPRIVCFGR, for the PWR local resource x.

When the local resource is configured as privileged, read/write operations are only allowed by a privileged access. Unprivileged read/write accesses are denied (RAZ/WI). An illegal privileged access event is generated to the IAC. There is no bus error generated.

When the local resource is configured as unprivileged, read/write operations are allowed by both privileged and unprivileged accesses.

CID access filtering

The PWR_RxCIDCFGR register controls the CID filtering policy for each non-shareable local resources (without semaphore mechanism). PWR_WIOxCIDCFGR and PWR_WIOxSEMCR registers control the CID filtering policy for each local shareable resources (with semaphore mechanism).

When the compartment-based filtering is active (CFEN = 1), local non-shareable resources are individually controlled by a specific CPU. The trusted domain application sets CID in PWR_RxCIDCFGR (x = 0 to 6).

When the compartment-based filtering is active (CFEN = 1), local shareable resources can be individually controlled by a specific CPU using two techniques:

- The trusted domain application keeps SEM_EN cleared, and sets SCID in PWR_WIOxCIDCFGR (x = 1 to 6).
- The trusted domain application sets SEM_EN. It also sets the compartments that are authorized to take the local resource by setting corresponding SEMWLCm in PWR_WIOxCIDCFGR (x = 1 to 6). Each white-listed CPU is authorized to take SEM_MUTEX in PWR_WIOxSEMCR (x = 1 to 6) to have ownership on this register until this CPU releases the mutex.

Any read access is allowed on PWR_RxCIDCFGR, PWR_WIOxCIDCFGR, and PWR_WIOxSEMCR registers.

A non-allowed CID access to a CID-filtered register is denied (RAZ/WI). An illegal CID access event is generated to the IAC. There is no bus error generated.

For debug purpose, the debug domain compartment master, defined by the DDCID compartment value, can access any resource if privileged and secure attributes allow it.

19.12 PWR registers

The PWR registers can be accessed in word, half-word, and byte format, unless explicitly specified differently.

The table below gives the RIF allocation for all PWR registers.

Table 110. PWR register allocation to RIF resource and access conditions

Register name	PWR RIF resource number	RIF resource configuration	Access type(1)	Description
PWR_R0CIDCFGR	R0	Secure, privileged and TDCID/DDCID	RW	Resource 0 CID filtering control
PWR_CR1		PWR_RSECCFGR[0] PWR_RPRIVCFGR[0] PWR_R0CIDCFGR	RW	Peripheral voltage monitor
PWR_CR2			RW	V_{08CAP} and TEMP monitor
PWR_CR3			RW	Programmable voltage detector
PWR_R1CIDCFGR	R1	Secure, privileged and TDCID/DDCID	RW	Resource 1 CID filtering control
PWR_CR9		PWR_RSECCFGR[1] PWR_RPRIVCFGR[1] PWR_R1CIDCFGR	RW	BKPRAM low-power control
PWR_CR10			RW	RETRAM low-power control
PWR_D1CR			RW	V_{DDCPU} power pin control
PWR_D2CR			RW	V_{DDCORE} power pin control
PWR_R2CIDCFGR	R2	Secure, privileged and TDCID/DDCID	RW	Resource 2 CID filtering control
PWR_CPU1CR		PWR_RSECCFGR[2] PWR_RPRIVCFGR[2] PWR_R2CIDCFGR	RW	CPU1 power control
PWR_R3CIDCFGR	R3	Secure, privileged and TDCID/DDCID	RW	Resource 3 CID filtering control
PWR_CPU2CR		PWR_RSECCFGR[3] PWR_RPRIVCFGR[3] PWR_R3CIDCFGR	RW	CPU2 power control
PWR_R4CIDCFGR	R4	Secure, privileged and TDCID/DDCID	RW	Resource 4 CID filtering control
Reserved		PWR_RSECCFGR[4] PWR_RPRIVCFGR[4] PWR_R4CIDCFGR	RW	Reserved
PWR_R5CIDCFGR	R5	Secure, privileged and TDCID/DDCID	RW	Resource 5 CID filtering control
PWR_CR7		PWR_RSECCFGR[5] PWR_RPRIVCFGR[5] PWR_R5CIDCFGR	RW	V_{DDIO2} peripheral voltage monitor
PWR_R6CIDCFGR	R6	Secure, privileged and TDCID/DDCID	RW	Resource 6 CID filtering control
PWR_CR8		PWR_RSECCFGR[6] PWR_RPRIVCFGR[6] PWR_R6CIDCFGR	RW	V_{DDIO1} peripheral voltage monitor

Table 110. PWR register allocation to RIF resource and access conditions (continued)

Register name	PWR RIF resource number	RIF resource configuration	Access type(1)	Description
PWR_WIO1CIDCFGR	WIO1	Secure, privileged and TDCID/DDCID	RW	Wake-up I/O resource 1 CID filtering control
PWR_WIO1SEMCR		PWR_WIOSECCFGR[0] PWR_WIOPRIVCFGR[0] PWR_WIO1CIDCFGR PWR_WIO1SEMCR	RW	
PWR_WKUPCR1			RW	Wake-up pin #1 control
PWR_WIO2CIDCFGR	WIO2	Secure, privileged and TDCID/DDCID	RW	Wake-up I/O resource 2 CID filtering control
PWR_WIO2SEMCR		PWR_WIOSECCFGR[1] PWR_WIOPRIVCFGR[1] PWR_WIO2CIDCFGR PWR_WIO2SEMCR	RW	
PWR_WKUPCR2			RW	Wake-up pin #2 control
PWR_WIO3CIDCFGR	WIO3	Secure, privileged and TDCID/DDCID	RW	Wake-up /IO resource 3 CID filtering control
PWR_WIO3SEMCR		PWR_WIOSECCFGR[2] PWR_WIOPRIVCFGR[2] PWR_WIO3CIDCFGR PWR_WIO3SEMCR	RW	
PWR_WKUPCR3			RW	Wake-up pin #3 control
PWR_WIO4CIDCFGR	WIO4	Secure, privileged and TDCID/DDCID	RW	Wake-up I/O resource 4 CID filtering control
PWR_WIO4SEMCR		PWR_WIOSECCFGR[3] PWR_WIOPRIVCFGR[3] PWR_WIO4CIDCFGR PWR_WIO4SEMCR	RW	
PWR_WKUPCR4			RW	Wake-up pin #4 control
PWR_WIO5CIDCFGR	WIO5	Secure, privileged and TDCID/DDCID	RW	Wake-up I/O resource 5 CID filtering control
PWR_WIO5SEMCR		PWR_WIOSECCFGR[4] PWR_WIOPRIVCFGR[4] PWR_WIO5CIDCFGR PWR_WIO5SEMCR	RW	
PWR_WKUPCR5			RW	Wake-up pin #5 control
PWR_WIO6CIDCFGR	WIO6	Secure, privileged and TDCID/DDCID	RW	Wake-up I/O resource 6 CID filtering control
PWR_WIO6SEMCR		PWR_WIOSECCFGR[5] PWR_WIOPRIVCFGR[5] PWR_WIO6CIDCFGR PWR_WIO6SEMCR	RW	
PWR_WKUPCR6			RW	Wake-up pin #6 control
PWR_CR11	NA	Inherited from RCC internal resource 104 RIF configuration RCC_SECCFGR3[8] RCC_PRIVCFGR3[8] RCC_CIDCFG_LOCKR3[8] RCC_R104CIDCFGR RCC_R104SEMCR	RW	DDR PHY retention control

Table 110. PWR register allocation to RIF resource and access conditions (continued)

Register name	PWR RIF resource number	RIF resource configuration	Access type(1)	Description
PWR_BDCR	NA	Secure, privileged and TDCID/DDCID	RW	Backup domain control register
PWR_CPU1D1SR	NA	NA	R	PWR CPU1 and D1 domain status register

PWR_IPIDR	NA	NA	R	PWR identification register
PWR_SIDR	NA	NA	R	PWR size identification register

1. RW = read or write, R = read, W = write

19.12.1 PWR control register 1 (PWR_CR1)

Address offset: 0x000

Reset value: 0x0000 0000

See individual bits for reset condition. Access 6 wait states when writing this register.

When a system reset occurs during the register write cycle, the written data is not guaranteed. Secure restriction is defined by RSEC0 in PWR_RSECCFGR. Privileged restriction is defined by RPRIV0 in PWR_RPRIVCFGR.

If compartment filtering is enabled, only an authorized compartment can write this register, on top of secure and privileged restrictions. Any read access from CPU1 and CPU2 is allowed to this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
GPVMO	Res.	Res.	Res.	Res.	Res.	VDDIO3VRSEL	VDDIOVRSEL	Res.	Res.	Res.	ARDY	Res.	USB33RDY	Res.	VDDIO3RDY
r						rw	rw				r		r		r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	ASV	Res.	Res.	Res.	VDDIO3SV	Res.	Res.	Res.	AVMEN	Res.	USB33VMEN	Res.	VDDIO3VMEN
			rw				rw				rw		rw		rw

Bit 31 **GPVMO:** Global peripheral voltage monitor output

This bit is set and cleared by hardware. It is valid only if at least on independent power supply monitor (including V_{DDIO1} and V_{DDIO2} monitors) is enabled, and the supply is valid (voltage monitor enable bit and supply valid bit must be set for the same power supply).

0: All enabled/valid independent power supplies are equal or higher than PVM threshold.

1: At least one enabled/valid independent power supply is lower than PVM threshold.

Bits 30:26 Reserved, must be kept at reset value.

Bit 25 **VDDIO3VRSEL:** VDDIO3 I/O voltage range selection

This bit is used to select the voltage range supported by the I/Os supplied by V_{DDIO3}.It is not reset by wake-up from Standby, but by any application reset (such as NRST, IWDG).

0: 3.3 V voltage range selected. If V_{DDIO3} is in 1.8 V range with this setting, the I/Os work in degraded mode.

1: 1.8 V voltage range selected. HSLV_VDDIO3 OTP bit must be set to allow 1.8 V voltage range operation. Setting this configuration while V_{DDIO3} is in 3.3 V range damages the device.

Bit 24 **VDDIOVRSEL:** VDD I/O voltage range selection

This bit is used to select the voltage range supported by the I/Os supplied by V_{DD}. It is not reset by wake-up from Standby, but by any application reset (such as NRST, IWDG).

0: 3.3 V voltage range selected. If V_{DD} is in 1.8 V range with this setting, the I/Os work in degraded mode.

1: 1.8 V voltage range selected. HSLV_VDD OTP bit must be set to allow 1.8 V voltage range operation. Setting this configuration while V_{DD} is in 3.3 V range damages the device.

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **ARDY**: $V_{DDA18ADC}$ ready

0: $V_{DDA18ADC}$ is below the threshold of the $V_{DDA18ADC}$ voltage monitor.

1: $V_{DDA18ADC}$ is equal or above the threshold of the $V_{DDA18ADC}$ voltage monitor.

Bit 19 Reserved, must be kept at reset value.

Bit 18 **USB33RDY**: $V_{DD33USB}$ ready

0: $V_{DD33USB}$ is below the threshold of the USB33 voltage monitor.

1: $V_{DD33USB}$ is equal or above the threshold of the USB33 voltage monitor.

Bit 17 Reserved, must be kept at reset value.

Bit 16 **VDDIO3RDY**: V_{DDIO3} ready

0: V_{DDIO3} is below the threshold of the V_{DDIO3} voltage monitor.

1: V_{DDIO3} is equal or above the threshold of the V_{DDIO3} voltage monitor.

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **ASV**: $V_{DDA18ADC}$ independent supply valid

This bit is used to validate $V_{DDA18ADC}$ supply for electrical and logical isolation purpose. Setting this bit is mandatory to use the A/D converters. If $V_{DDA18ADC}$ is not always present in the application, the $V_{DDA18ADC}$ voltage monitor can be used to determine whether this supply is ready or not. This bit is reset on any system reset.

0: $V_{DDA18ADC}$ is not present. Logical and electrical isolation is applied to ignore this supply.

1: $V_{DDA18ADC}$ is valid.

Bit 11:9 Reserved, must be kept at reset value.

Bit 8 **VDDIO3SV**: V_{DDIO3} independent supply valid

This bit is used to validate the V_{DDIO3} supply for electrical and logical isolation purpose. Setting this bit is mandatory to use PD[11:0] I/Os. If V_{DDIO3} is not always present in the application, the V_{DDIO3} voltage monitor can be used to determine whether this supply is ready or not. This bit is reset on any system reset.

0: V_{DDIO3} is not present. Logical and electrical isolation is applied to ignore this supply.

1: V_{DDIO3} is valid.

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **AVMEN:** $V_{DDA18ADC}$ independent ADC voltage monitor enable
This bit is reset on any system reset.
0: $V_{DDA18ADC}$ voltage monitor disabled.
1: $V_{DDA18ADC}$ voltage monitor enabled.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **USB33VMEN:** $V_{DD33USB}$ independent USB 33 voltage monitor enable
This bit is reset on any system reset.
0: $V_{DD33USB}$ voltage monitor disabled.
1: $V_{DD33USB}$ voltage monitor enabled.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **VDDIO3VMEN:** V_{DDIO3} independent voltage monitor enable
This bit is reset on any system reset.
0: V_{DDIO3} voltage monitor disabled.
1: V_{DDIO3} voltage monitor enabled.

19.12.2 PWR control register 2 (PWR_CR2)

Address offset: 0x004

Reset value: 0x0000 0000

Not reset by wake-up from Standby, application reset (such as NRST, IWDG) and V_{DD} POR, but reset only by V_{SW} POR and VSWRST. Access 6 wait states when writing this register.

After reset, this register is write-protected, and DBD in PWR_BDCR has to be set before this register can be written. When DBD is cleared, there are no bus errors generated when writing this register. This register must not be accessed when RCC VSWRST in RCC_BDCR resets the V_{SW} domain. Secure restriction is defined by RSEC0 in PWR_RSECCFGR. Privilege restriction is defined by RPRIV0 in PWR_RPRIVCFGR.

If compartment filtering is enabled, only an authorized compartment can write this register, on top of secure and privileged restrictions. Any read access from CPU1 and CPU2 is allowed to this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

				r	r	r	r								rw

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **TEMPH**: Monitored temperature level above high threshold
0: Temperature below high threshold level, or monitor disabled
1: Temperature equal or above high threshold level

Bit 10 **TEMPL**: Monitored temperature level above low threshold

0: Temperature above low threshold level, or monitor disabled

1: Temperature equal or below low threshold level

Bit 9 **V08CAPH**: Monitored V_{08CAP} level above high threshold

0: V_{08CAP} level below high threshold level, or monitor disabled

1: V_{08CAP} level equal or above high threshold level

Bit 8 **V08CAPL**: Monitored V_{08CAP} level above low threshold

0: V_{08CAP} level above low threshold level, or monitor disabled

1: V_{08CAP} level equal or below low threshold level

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **MONEN:** V_{08CAP} and temperature monitoring enable

0: V_{08CAP} and temperature monitoring disabled

1: V_{08CAP} and temperature monitoring enabled

19.12.3 PWR control register 3 (PWR_CR3)

Address offset: 0x008

Reset value: 0x0000 0000

Reset on any system reset.

Secure restriction is defined by RSEC0 in PWR_RSECCFGR. Privilege restriction is defined by RPRIV0 in PWR_RPRIVCFGR.

If compartment filtering is enabled, only an authorized compartment can write this register, on top of secure and privileged restrictions. Any read access from CPU1 and CPU2 is allowed to this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	PVDO	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PVDEN
							r								rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **PVDO**: Programmable voltage detector (PVD) output

This bit is set and cleared by hardware. It is valid only if PVD is enabled by the PVDEN bit.

0: Voltage level on PVD_IN is equal or higher than the internal V_{REFINT}.

1: Voltage level on PVD_IN is lower than the internal V_{REFINT}.

Note: The PVD is disabled in Standby and after a system reset. This bit is then equal to 0 after Standby and system reset.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **PVDEN:** PVD enable

This bit is read only when the SYSCFG register bit PVDL is set (no bus errors generated when writing this register).

0: PVD disabled
1: PVD enabled

19.12.4 PWR control register 7 (PWR_CR7)

Address offset: 0x018

Reset value: 0x0000 0000

See individual bits for reset condition. Access 6 wait states when writing this register.

When a system reset occurs during the register write cycle, the written data is not guaranteed. Secure restriction is defined by RSEC5 in PWR_RSECCFGR. Privilege restriction is defined by RPRIV5 in PWR_RPRIVCFGR.

If compartment filtering is enabled, only an authorized compartment can write this register, on top of secure and privileged restrictions. Any read access from CPU1 and CPU2 is allowed to this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

							rw								rw

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **VDDIO2VRSTBY:** V_{DDIO2} I/O voltage range Standby mode

When set, this bit is used to retain VDDIO2VRSEL configuration in Standby mode.
This bit must be written to 1 if the V_{DDIO2} is in 1.8 V range in Standby, and when exiting Standby. It must not be set when V_{DDIO2} is in 3.3 V range in Standby, or when exiting Standby. This bit is not reset by wake-up from Standby, but by any application reset (such as NRST or IWDG).

0: VDDIO2VRSEL not retained in Standby mode
1: VDDIO2VRSEL retained in Standby mode

Bit 24 **VDDIO2VRSEL:** V_{DDIO2} I/O voltage range selection

This bit is used to select the voltage range supported by the I/Os supplied by V_{DDIO2}. It is not reset by wake-up from Standby, but by any Application reset (such as NRST, IWDG) when VDDIO2VRSTBY is set, otherwise reset on any system reset.

0: 3.3 V voltage range selected. If V_{DDIO2} is in 1.8 V range with this setting, the I/Os work in degraded mode.
1: 1.8 V voltage range selected. HSLV_VDDIO2 OTP bit must be set to allow 1.8 V voltage range operation. Setting this configuration while V_{DDIO2} is in 3.3 V range damages the device.

Bits 23:17 Reserved, must be kept at reset value.

Bit 16 **VDDIO2RDY**: V_{DDIO2} ready

0: V_{DDIO2} is below the threshold of the V_{DDIO2} voltage monitor.

1: V_{DDIO2} is equal or above the threshold of the V_{DDIO2} voltage monitor.

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **VDDIO2SV**: V_{DDIO2} Independent supply valid.

This bit is used to validate the V_{DDIO2} supply for electrical and logical isolation purpose. Setting this bit is mandatory to use PE[15:6] I/Os. If V_{DDIO2} is not always present in the application, the V_{DDIO2} voltage monitor can be used to determine whether this supply is ready or not. This bit is reset on any system reset.

0: V_{DDIO2} is not present. Logical and electrical isolation is applied to ignore this supply.

1: V_{DDIO2} is valid.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **VDDIO2VMEN:** V_{DDIO2} independent voltage monitor enable

This bit is reset on any system reset.

0: V_{DDIO2} voltage monitor disabled

1: V_{DDIO2} voltage monitor enabled

19.12.5 PWR control register 8 (PWR_CR8)

Address offset: 0x01C

Reset value: 0x0000 0000

See individual bits for reset condition. Access 6 wait states when writing this register.

When a system reset occurs during the register write cycle, the written data is not guaranteed. Secure restriction is defined by RSEC6 in PWR_RSECCFGR. Privilege restriction is defined by RPRIV6 in PWR_RPRIVCFGR.

If compartment filtering is enabled, only an authorized compartment can write this register, on top of secure and privileged restrictions. Any read access from CPU1 and CPU2 is allowed to this register.

							rw								rw

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **VDDIO1VRSTBY:** V_{DDIO1} I/O voltage range Standby mode

When set, this bit is used to retain VDDIO1VRSEL configuration in Standby. This bit must be written to 1 if V_{DDIO1} is in 1.8 V range in Standby, and when exiting Standby. It must not be set when V_{DDIO1} is in 3.3 V range in Standby, or when exiting Standby. This bit is not reset by wake-up from Standby, but by any Application reset (such as NRST, IWDG).

0: VDDIO1VRSEL not retained in Standby mode

1: VDDIO1VRSEL bit retained in Standby mode

Bit 24 **VDDIO1VRSEL:** V_{DDIO1} I/O voltage range selection

This bit is used to select the voltage range supported by the I/Os supplied by V_{DDIO1}. It is not reset by wake-up from Standby, but by any application reset (such as NRST, IWDG) when VDDIO1VRSTBY is set, otherwise reset on any system reset.

0: 3.3 V voltage range selected. If V_{DDIO1} is in 1.8 V range with this setting, the I/Os work in degraded mode.

1: 1.8 V voltage range selected. HSLV_VDDIO1 OTP bit must be set to allow 1.8 V voltage range operation. Setting this configuration while V_{DDIO1} is in 3.3 V range damages the device.

Bits 23:17 Reserved, must be kept at reset value.

Bit 16 **VDDIO1RDY**: V_{DDIO1} ready

0: V_{DDIO1} is below the threshold of the V_{DDIO1} voltage monitor.

1: V_{DDIO1} is equal or above the threshold of the V_{DDIO1} voltage monitor.

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **VDDIO1SV**: V_{DDIO1} independent I/O supply valid

This bit is used to validate the V_{DDIO1} supply for electrical and logical isolation purpose. Setting this bit is mandatory to use PE[5:0] I/Os. If V_{DDIO1} is not always present in the application, the V_{DDIO1} voltage monitor can be used to determine whether this supply is ready or not. This bit is reset on any system reset.

0: V_{DDIO1} is not present. Logical and electrical isolation is applied to ignore this supply.

1: V_{DDIO1} is valid.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **VDDIO1VMEN:** V_{DDOI1} independent I/O voltage monitor enable

This bit is reset on any system reset.

0: V_{DDIO1} voltage monitor disabled

1: V_{DDIO1} voltage monitor enabled

19.12.6 PWR control register 9 (PWR_CR9)

Address offset: 0x020

Reset value: 0x0000 0000

Not reset by wake-up from Standby mode, application reset (such as NRST, IWDG), and V_{DD} POR, but reset only by V_{SW} POR and VSWRST. Access 6 wait states when writing this register. After reset, this register is write-protected, and DBP in PWR_BDCR has to be set before it can be written. When DBP is cleared, there are no bus errors generated when writing this register. This register must not be accessed when RCC VSWRST in RCC_BDCR resets the V_{SW} domain. When a system reset occurs during the register write cycle, the written data is not guaranteed. Secure restriction is defined by RSEC1 in PWR_RSECCFGR. Privilege restriction is defined by RPRIV1 in PWR_RPRIVCFGR.

If compartment filtering is enabled only an authorized compartment can write this register, on top of secure and privileged restrictions. Any read access from CPU1 and CPU2 is allowed to this register.

															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **BKPRBSEN:** Backup RAM backup supply enable

This bit is used to maintain BKPSRAM content in Standby and V_{BAT} modes.When it is set, the BKPSRAM is supplied from backup regulator in Standby and V_{BAT}. When this bit is reset, the BKPSRAM can still be used in Run and Stop, but its content is lost in Standby and V_{BAT}.

0: BKPSRAM backup supply disabled

1: BKPSRAM backup supply enabled

19.12.7 PWR control register 10 (PWR_CR10)

Address offset: 0x024

Reset value: 0x0000 0000

Not reset by wake-up from Standby, application reset (such as NRST, IWDG), and V_{DD} POR, but reset only by V_{SW} POR and VSWRST. Access 6 wait states when writing this register.

After reset, this register is write-protected, and DBP in PWR_BDCR has to be set before it can be written. When DBP is cleared, there are no bus errors generated when writing this register. This register must not be accessed when RCC VSWRST in RCC_BDCR resets the V_{SW} domain. When a system reset occurs during the register write cycle the written data is not guaranteed. Secure restriction is defined by RSEC1 in PWR_RSECCFGR. Privilege restriction is defined by RPRIV1 in PWR_RPRIVCFGR.

If compartment filtering is enabled only an authorized compartment can write this register, on top of secure and privileged restrictions. Any read access from CPU1 and CPU2 is allowed to this register.

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **RETRBSEN[1:0]:** Retention RAM backup supply enable

This bit is used to maintain RETRAM content in Standby and V_{BAT} modes. When it is set, the RETRAM is supplied from backup regulator in Standby and V_{BAT}. When this bit is reset, the RETRAM can still be used in Run and Stop, but its content is lost in Standby and VBAT.

00: RETRAM backup supply disabled

01: RETRAM backup supply enabled in Standby and VBAT

10-11: RETRAM backup supply enabled only in Standby (memory content lost in V_{BAT} mode)

Others: Reserved

19.12.8 PWR control register 11 (PWR_CR11)

Address offset: 0x028

Reset value: 0x0000 0000

Reset on any system reset.

Compartment filtering, secure and privilege restriction inherited from RCC internal resource 104 RIF configuration (see *Section 20: Reset and clock control (RCC)* for details. Any read access from CPU1 and CPU2 is allowed to this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **DDRRETDIS:** DDR retention disable

When written 1 to this bit, the DDR PHY exits LP3/IO retention. To enable retention software must write this bit to 0.

0: DDR self-refresh retention enabled
1: DDR self-refresh retention disabled

19.12.9 PWR backup domain control register (PWR_BDCR)

Address offset: 0x038

Reset value: 0x0000 0000

Reset on any system reset.

Secure privileged write access only. Write only by trusted domain CID, as defined in RIMC. Any read access from CPU1 and CPU2 is allowed to this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **DBP*:*** Disable backup write protection

In reset state, all registers in backup domain are protected against parasitic write access. This bit must be set to enable write access to these registers.

0: Write access to backup domain disabled
1: Write access to backup domain enabled

19.12.10 PWR CPU1 control register (PWR_CPU1CR)

Address offset: 0x040

Reset value: 0x0000 0000

See individual bits for reset condition. Access 6 wait states when writing this register. When a system reset occurs during the register write cycle, the written data is not guaranteed. Secure restriction is defined by RSEC2 in PWR_RSECCFGR. Privilege restriction is defined by RPRIV2 in PWR_RPRIVCFGR.

If compartment filtering is enabled, only an authorized compartment can write this register, on top of secure and privileged restrictions. Any read access from CPU1 and CPU2 is allowed to this register.

r						w		r	r	r	rw			rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **LVDS_D1:** Low-voltage Deepsleep LPLV-Stop mode selection for the D1 domain (DStop3)
This bit is reset on any system reset. It has effect only when LPDS_D1 = 1. It changes the V_{DDCPU} domain supply reset level.
0: LP-Stop mode V_{DDCPU} domain supply reset level at same level as Run mode.
V_{DDCPU} domain supply level in LP-Stop mode must be kept at same level as Run mode.
1: LPLV-Stop mode V_{DDCPU} domain supply reset level at lower level than Run mode.
V_{DDCPU} supply can be lowered in LPLV-Stop mode (see datasheet for voltage levels).

Bit 16 **LPDS_D1:** low-power Deepsleep Stop mode selection for the D1 domain (DStop2)
This bit is reset on any system reset.
0: Stop mode selected, external regulator kept in main power mode.
1: LP/LPLV-Stop mode selected, external regulator may enter low-power mode (low-power mode selection provided by LVDS_D1).

Bit 15 **STANDBYWFIL2:** CPU1 system idle indication
This bit is set and reset by hardware based on the CPU1 operation mode.
0: CPU1 system active
1: CPU1 system idle

Bits 14:10 Reserved, must be kept at reset value.

Bit 9 **CSSF:** Clear CPU1 STOPF, SBF_D1, SBF, VBF and CPU2 SBF flags (Always read as 0)
This bit is reset on any system reset.
0: No effect.
1: Clear CPU1 (STOPF, SBF_D1, SBF, VBF) and CPU2 SBF flags. Register bit is cleared to 0 by hardware.

Bit 8 Reserved, must be kept at reset value.

Bit 7 **SBF_D1:** D1 DStandby flag

This bit is set by hardware and cleared only by a V_{DD} POR reset, or by setting the CPU1 CSSF bit. It is not reset when exiting Standby mode.

0: D1 domain has not been in DStandby mode.

1: D1 domain has been in DStandby mode.

Bit 6 **SBF:** System Standby flag

This bit is set by hardware and cleared only by a V_{DD} POR reset, or by setting the CPU1 or CPU2 CSSF bit. It is not reset when exiting Standby mode.

0: System has not been in Standby mode.

1: System has been in Standby mode and system contents has been lost.

Bit 5 **STOPF:** System Stop flag

This bit is set by hardware, and cleared only by any system reset, or by setting the CPU1 CSSF bit.

0: System has not been in Stop mode.

1: System has been in Stop mode, and the clock system has been stopped.

Bit 4 **VBF:** V_{BAT} mode exit flag

This bit is set by hardware, and cleared only by a V_{sw} POR reset, or by setting the CPU1 CSSF bit. It is not reset when exiting V_{BAT} mode.

0: System has not been in V_{BAT} mode.

1: System has been in V_{BAT} mode.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **PDDS_D1:** D1 domain power-down Deepsleep selection

This bit is reset only by a V_{DD} POR reset. It is not reset when exiting Standby. It allows CPU1 to define the Deepsleep mode for the system.

0: DStop mode kept when CPU1 enters CStop

1: DStandby mode allowed when CPU1 enters CStop

Bit 0 **PDDS_D2*:*** D2 domain/system power-down Deepsleep selection

This bit is reset only by a V_{DD} POR reset. It is not reset when exiting Standby. it allows CPU1 to define the Deepsleep mode for the D2/system.

0: Stop mode kept when CPU1 enters CStop

1: Standby mode allowed when CPU1 enters CStop

19.12.11 PWR CPU2 control register (PWR_CPU2CR)

Address offset: 0x044

Reset value: 0x0000 0000

See individual bits for reset condition. Access 6 wait states when writing this register. When a system reset occurs during the register write cycle, the written data is not guaranteed. Secure restriction is defined by RSEC3 in PWR_RSECCFGR. Privilege restriction is defined by RPRIV3 in PWR_RPRIVCFGR.

If compartment filtering is enabled, only an authorized compartment can write this register, on top of secure and privileged restrictions. Any read access from CPU1 and CPU2 is allowed to this register.

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **LVDS_D2:** Low-voltage Deepsleep LPLV-Stop mode selection for the D2 domain/system
This bit is reset on any system reset. It has effect only when LPDS_D2 = 1. It changes the V_{DDCORE} domain supply reset level.
0: LP-Stop mode V_{DDCORE} domain supply reset level at same level as Run mode. V_{DDCORE} domain supply level in LP-Stop mode must be kept at same level as Run mode.
1: LPLV-Stop mode V_{DDCORE} domain supply reset level at lower level than Run mode. V_{DDCORE} supply can be lowered in LPLV-Stop mode (see datasheet for voltage levels).

Bit 16 **LPDS_D2:** low-power Deepsleep Stop mode selection for the D2 domain/syste.
This bit is reset on any system reset.
0: Stop mode selected, external regulator kept in main power mode (pwr_lp = 1)
1: LP/LPLV-Stop mode selected, external regulator may enter low-power mode (pwr_lp = 0) (low-power mode selection provided by LVDS_D2).

Bit 15 **DEEPSLEEP:** CPU2 system idle indication
This bit is set and reset by hardware based on the CPU2 operation mode.
0: CPU2 system active
1: CPU2 system idle

Bits 14:10 Reserved, must be kept at reset value.

Bit 9 **CSSF:** Clear CPU2 STOPF, SBF_D2, SBF, VBF and CPU1 SBF flags (Always read as 0)
This bit is reset on any system reset.
0: No effect
1: Clear CPU2 (STOPF, SBF_D2, SBF, VBF) and CPU1 SBF flags. Register bit is cleared to 0 by hardware.

Bit 8 Reserved, must be kept at reset value.

Bit 7 **SBF_D2:** D2 Standby flag

This bit is set by hardware, and cleared only by a V_{DD} POR reset, or by setting the CPU2 CSSF bit. It is not reset when exiting Standby mode.

0: D2 domain has not been in Standby mode.

1: D2 domain has been in Standby mode.

Bit 6 **SBF:** System Standby flag

This bit is set by hardware, and cleared only by a V_{DD} POR reset, or by setting the CPU2 or CPU1 CSSF bit. It is not reset when exiting Standby mode.

0: System has not been in Standby mode

1: System has been in Standby mode, system contents has been lost.

Bit 5 **STOPF:** System Stop flag

This bit is set by hardware, and cleared only by any system reset ,or by setting the CPU2 CSSF bit.

0: System has not been in Stop mode.

1: System has been in Stop mode, and the clock system has been stopped.

Bit 4 **VBF:** V_{BAT} exit flag

This bit is set by hardware, and cleared only by a V_{sw} POR reset, or by setting the CPU2 CSSF bit. i ti snot reset when exiting V_{BAT} mode.

0: System has not been in V_{BAT} mode.

1: System has been in V_{BAT} mode.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **PDDS_D2*:*** D2 domain/system power-down Deepsleep selection

This bit is reset only by a V_{DD} POR reset. It is not reset when exiting Standby mode. It allows CPU2 to define the Deepsleep mode for the D2/system.

0: Stop mode kept when CPU2 enters CStop

1: Standby mode allowed when CPU2 enters CStop

19.12.12 PWR D1 control register (PWR_D1CR)

Address offset: 0x04C

Reset value: 0x0000 0000

Not reset by wake-up from Standby and application reset (such as NRST, IWDG) but only reset by V_{DD} POR. Access 6 wait states when writing this register. When a system reset occurs during the register write cycle, the written data is not guaranteed. Secure restriction is defined by RSEC1 in PWR_RSECCFGR. Privilege restriction is defined by RPRIV1 in PWR_RPRIVCFGR.

If compartment filtering is enabled, only an authorized compartment can write this register, on top of secure and privileged restrictions. Any read access from CPU1 and CPU2 is allowed to this register.

Res.	Res.	Res.	POPL_D1[4:0]					Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPCFG_D1
			rw	rw	rw	rw	rw								rw

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:8 **POPL_D1[4:0]**: pwr_cpu_on pulse low configuration

These bits are set and cleared by software. They define the minimum guaranteed duration of the pwr_cpu_on low pulse in DStandby mode (no impact on DSTOP2/3 modes). The LSI oscillator is automatically enabled when needed by the POPL_D1 pulse low configuration.

00000: No guaranteed minimum low time

00001: ~1 ms guaranteed minimum low time (1 x 32 LSI cycles)

00010: ~2 ms guaranteed minimum low time (2 x 32 LSI cycles)

...

11111: ~31 ms guaranteed minimum low time. (31 x 32 LSI cycles)

Note: POPL_D1 value must not be smaller than PODH_D2 value.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **LPCFG_D1:** PWR_CPU_ON pin configuration

0: PWR_CPU_ON pin signals DStandby mode (PWR_CPU_ON = 1 in DRun, DStop1/2/3, and = 0 in DStandby) (pwr_cpu_on).

1: PWR_CPU_ON pin signals DStandby and DStop2/3 modes (PWR_CPU_ON = 1 in DRun, DStop1, and = 0 in DStop2/3 and DStandby) (pwr_cpu_onlp).

19.12.13 PWR D2 control register (PWR_D2CR)

Address offset: 0x050

Reset value: 0x0007 0000

See individual bits for reset condition. Access 6 wait states when writing this register. When a system reset occurs during the register write cycle, the written data is not guaranteed. Secure restriction is defined by RSEC1 in PWR_RSECCFGR. Privilege restriction is defined by RPRIV1 in PWR_RPRIVCFGR.

If compartment filtering is enabled, only an authorized compartment can write this register, on top of secure and privileged restrictions. Any read access from CPU1 and CPU2 is allowed to this register.

Res.	Res.	Res.	POPL_D2[4:0]					Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPCFG_D2
			rw	rw	rw	rw	rw								rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **PODH_D2[3:0]**: pwr_on delay high configuration

These bits are set and cleared by software. They define the delay to maintain PWR_ON high when entering in Standby mode. This delay is used to switch off V_{DDCPU} before V_{DDCORE}. There is no impact when exiting Standby or on LP-Stop and LPLV-Stop modes. The LSI oscillator is automatically enabled when needed by the PODH_D2 delay high configuration. These bits are not reset by wake-up from Standby and application reset (such as NRST, IWDG) but only reset by V_{DD} POR.

0000: No delay

0001: ~1 ms delay (1 x 32 LSI cycles)

0010: ~2 ms delay (2 x 32 LSI cycles)

...

1111: ~15 ms delay (15 x 32 LSI cycles)

Bits 23:19 Reserved, must be kept at reset value.

Bits 18:16 **LPLVDLY_D2**[2:0]: LPLV delay value

These bits are set and cleared by software. They define the minimum delay value to be observed before activating PLLs and interconnect clocks, after one of the LPLV system Stop. The LSI oscillator is automatically enabled when needed by the counter. These bits are reset on any system reset.

000: ~187 µs delay (1 x 6 LSI cycles)

001: ~375 µs delay (2 x 6 LSI cycles)

010: ~562 µs delay (3 x 6 LSI cycles)

...

111: ~1.5 ms delay (8 x 6 LSI cycles) (default)

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **POPL_D2[4:0]**: pwr_on pulse low configuration

These bits are set and cleared by software. They define the minimum guaranteed duration of the pwr_on low pulse in Standby (no impact on LP-Stop and LPLV-Stop modes). The LSI oscillator is automatically enabled when needed by the POPL_D2 pulse low configuration. These bits are not reset by wake-up from Standby and application reset (such as NRST, IWDG) but only reset by V_{DD} POR.

00000: No guaranteed minimum low time

00001: ~1 ms guaranteed minimum low time (1 x 32 LSI cycles)

00010: ~2 ms guaranteed minimum low time (2 x 32 LSI cycles)

...

11111: ~31 ms guaranteed minimum low time (31 x 32 LSI cycles)

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **LPCFG_D2:** PWR_ON pin configuration

This bit is not reset by wake-up from Standby and application reset (such as NRST, IWDG) but only reset by V_{DD} POR.

0: PWR_ON pin signals Standby (PWR_ON = 1 in Run, Stop1/2, LP-Stop1/2, LPLV-Stop1/2, and = 0 in Standby) (pwr_on).

1: PWR_ON pin signals Standby, LP-Stop, and LPLV-Stop modes (PWR_ON = 1 in Run, Stop1/2, and = 0 in LP-Stop1/2, LPLV-Stop1/2 and Standby) (pwr_onlp).

19.12.14 PWR wake-up control register x (PWR_WKUPCRx)

Address offset: 0x060 + 0x4 * (x - 1) (x = 1 to 6)

Reset value: 0x0000 0000

Not reset by wake-up from Standby, but by any application reset (such as NRST, IWDG). Access 6 wait states when writing this register. When clearing a WKUPF, the AHB write access completes after WKUPF has been cleared). When a system reset occurs during the register write cycle, the written data is not guaranteed. Secure restriction is defined by WIOSECx in PWR_WIOSECCFGR. Privilege restriction is defined by WIOPRIVx in PWR_WIOSECCFGR.

If compartment filtering is enabled, only an authorized compartment can write this register, on top of secure and privileged restrictions. Authorized compartment value depends on the value of SEM_EN in PWR_WIOxCIDCFGR, and optionally SEM_MUTEX in PWR_WIOxSEMCR. Any read access from CPU1 and CPU2 is allowed to this register.

		rw	rw				rw								w

Bit 31 **WKUPF:** Wake-up flag for WKUPx pin before enable

This bit is set by hardware and cleared only by a NRST reset, or by setting WKUPC in PWR_WKUPCRx.

0: No wake-up event occurred.

1: A wake-up event was received from WKUPx pin.

Bits 30:18 Reserved, must be kept at reset value.

Bit 17 **WKUPENCPU2:** Enable WKUPx pin and interrupt for CPU2

0: An event on WKUPx pin does not wake up the system from Standby or Stop, nor generates an interrupt to CPU2.

1: A rising or falling edge on WKUPx pin wakes up the system from Standby or Stop, and generates an interrupt to CPU2.

Bit 16 **WKUPENCPU1:** Enable WKUPx pin and interrupt for CPU1

0: An event on WKUPx pin does not wake up the system from Standby or Stop, nor generates an interrupt to CPU1.

1: A rising or falling edge on WKUPx pin wakes up the system from Standby or Stop, and generates an interrupt to CPU1.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:12 **WKUPPUPD[1:0]**: Wake-up pull configuration for WKUPx pin
These bits define the I/O pin pull configuration used when WKUPENCPU1 or/and WKUPENCPU2 are set to 1 (associated GPIO port pull configuration must be set to the same value or 00). The wake-up pin pull configuration is maintained in Standby mode.
00: No pulls
01: Pull-up
10: Pull-down
11: Reserved

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **WKUPP**: Wake-up polarity bit for WKUPx pin
This bit defines the polarity used for event detection on external WKUPx pin.
0: High-level detection (rising edge)
1: Low-level detection (falling edge)

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **WKUPC:** Clear wake-up flag for WKUPx pin
This bit is always read as 0. It is cleared to 0 by hardware.
0: No effect
1: Clear WKUPF in PWR_WKUPCRx

19.12.15 PWR resource secure configuration register (PWR_RSECCFGR)

Address offset: 0x100

Reset value: 0x0000 0000

Reset on any system reset.

Non-secure or unprivileged writes to this register are ignored, while any read access from CPU1 and CPU2 is allowed.

Debug domain can write to this register if the feature is activated.

									rw	rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **RSEC6**: Secure attribute reference for the local resource number 6
See RSEC0 for details.

Bit 5 **RSEC5**: Secure attribute reference for the local resource number 5
See RSEC0 for details.

Bit 4 **RSEC4**: Secure attribute reference for the local resource number 4
See RSEC0 for details.

Bit 3 **RSEC3**: Secure attribute reference for the local resource number 3
See RSEC0 for details.

Bit 2 **RSEC2**: Secure attribute reference for the local resource number 2
See RSEC0 for details.

Bit 1 **RSEC1**: Secure attribute reference for the local resource number 1
See RSEC0 for details.

Bit 0 **RSEC0**: Secure attribute reference for the local resource number 0
This bit is written by software to enable the secure mode for the local resource 0.
If compartment filtering for this local resource is enabled (resp. disabled) by CFEN in PWR_R0CIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if privilege and security of the access is sufficient.
0: The local resource number 0 is non-secure. Secure access is also possible.
1: The local resource number 0 is secure only.

19.12.16 PWR resource privileged configuration register (PWR_RPRIVCFGR)

Address offset: 0x104

Reset value: 0x0000 0000

Reset on any system reset.

Unprivileged writes to this register are ignored while any read access from CPU1 and CPU2 is allowed.

Debug domain can write to this register if the feature is activated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RPRIV6	RPRIV5	RPRIV4	RPRIV3	RPRIV2	RPRIV1	RPRIV0
									rw	rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **RPRIV6:** Privileged attribute reference for the local resource number 6
See RPRIV0 for details.

Bit 5 **RPRIV5:** Privileged attribute reference for the local resource number 5
See RPRIV0 for details.

Bit 4 **RPRIV4:** Privileged attribute reference for the local resource number 4)
See RPRIV0 for details.

Bit 3 **RPRIV3:** Privileged attribute reference for the local resource number 3
See RPRIV0 for details.

Bit 2 **RPRIV2:** Privileged attribute reference for the local resource number 2
See RPRIV0 for details.

Bit 1 **RPRIV1:** Privileged attribute reference for the local resource number 1
See RPRIV0 for details.

Bit 0 **RPRIV0**: Privileged attribute reference for the local resource number 0

This bit is written by software to enable the privileged mode for the local resource 0. If corresponding SEC0 is set in PWR_RSECCFGR, this bit can only be written by a secure privileged application. If compartment filtering for this local resource is enabled (resp. disabled) by CFEN in PWR_R0CIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if privilege and security of the access is sufficient.

0: The local resource number 0is unprivileged. Secure access is also possible.

1: The local resource number 0is privileged only.

19.12.17 PWR resource x CID configuration register (PWR_RxCIDCFGR)

Address offset: 0x108 + 0x4 * x, (x = 0 to 6)

Reset value: 0x0000 0000

Reset on any system reset.

This register is used to configure the local resource x as belonging to a specific compartment (or not). Secure privileged write access only. Write only by trusted domain and secure privileged debug domain CID. Any read access from CPU1 and CPU2 is allowed on this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCID[2:0]			Res.	Res.	Res.	CFEN
									rw	rw	rw				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **SCID[2:0]**: Static compartment identifier

When CFEN = 1, this field is used by the trusted domain application to define which compartment has access to the local resource number x.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **CFEN:** Compartment ID filter enable

0: Compartment-based filtering is disabled for resource number x.

1: Compartment-based filtering is enabled for resource number x.

19.12.18 PWR WIO secure configuration register (PWR_WIOSECCFGR)

Address offset: 0x180

Reset value: 0x0000 0000

Reset on any system reset.

Non-secure or unprivileged writes to this register are ignored, while any read access from CPU1 and CPU2 is allowed.

Debug domain can write to this register if the feature is activated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **WIOSEC6**: Secure attribute reference for the wake-up I/O 6
See WIOSEC1 for details.

Bit 4 **WIOSEC5**: Secure attribute reference for the wake-up I/O 5
See WIOSEC1 for details.

Bit 3 **WIOSEC4**: Secure attribute reference for the wake-up I/O 4
See WIOSEC1 for details.

Bit 2 **WIOSEC3**: Secure attribute reference for the wake-up I/O 3
See WIOSEC1 for details.

Bit 1 **WIOSEC2**: Secure attribute reference for the wake-up I/O 2)
See WIOSEC1 for details.

Bit 0 **WIOSEC1**: Secure attribute reference for the wake-up I/O 1
This bit is written by software to enabled the secure mode for the wake-up I/O 1.
If compartment filtering for this wake-up I/O is enabled (resp. disabled) by CFEN bit in PWR_WIO1CIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if privilege and security of the access is sufficient.
Authorized compartment is defined as SCID if SEM_EN=0 in PWR_WIO1CIDCFGR.
if SEM_EN = 1, it is equal to SEMCID, if SEM_MUTEX = 1 in PWR_WIO1SEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.
0: The wake-up I/O 1 is non-secure. Secure access is also possible.
1: The wake-up I/O 1 is secure only.

19.12.19 PWR WIO privileged configuration register (PWR_WIOPRIVCFGR)

Address offset: 0x184

Reset value: 0x0000 0000

Reset on any system reset.

Unprivileged writes to this register are ignored while any read access from CPU1 and CPU2 is allowed.

Debug domain can write to this register if the feature is activated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WIOPRIV6	WIOPRIV5	WIOPRIV4	WIOPRIV3	WIOPRIV2	WIOPRIV1
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **WIOPRIV6:** Privileged attribute reference for the wake-up I/O 6
See WIOPRIV1 for details.

Bit 4 **WIOPRIV5:** Privileged attribute reference for the wake-up I/O 5
See WIOPRIV1 for details.

Bit 3 **WIOPRIV4:** Privileged attribute reference for the wake-up I/O 4
See WIOPRIV1 for details.

Bit 2 **WIOPRIV3:** Privileged attribute reference for the wake-up I/O 3
See WIOPRIV1 for details.

Bit 1 **WIOPRIV2:** Privileged attribute reference for the wake-up I/O 2
See WIOPRIV1 for details.

Bit 0 **WIOPRIV1**: Privileged attribute reference for the wake-up I/O 1
This bit is written by software to enabled the privileged mode for the wake-up I/O 1.If corresponding SEC1 bit is set in PWR_WIOSECCFGR this bit can only be written by a secure privileged application. If compartment filtering for this wake-up I/O is enabled (resp. disabled) by CFEN in PWR_WIO1CIDCFGR, only an authorized privileged compartment (resp. any compartment) can write this bit, if privileged and security of the access is sufficient.
Authorized compartment is defined as SCID if SEM_EN = 0 in PWR_WIO1CIDCFGR.
If SEM_EN = 1, it is equal to SEMCID, if SEM_MUTEX = 1 in PWR_WIO1SEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.
0: The wake-up I/O 1 is unprivileged. Privileged access is also possible.
1: The wake-up I/O 1 is privileged only.

19.12.20 PWR WIO x CID configuration register (PWR_WIOxCIDCFGR)

Address offset: 0x188 + 0x8 * (x - 1) (x = 1 to 6)

Reset value: 0x0000 0000

Reset on any system reset.

This register is used to configure the wake-up I/O x as belonging to a specific compartment (or not). Secure privileged write access only. Write only by trusted domain CID.

Debug domain can also access if the feature is activated. Any read access from CPU1 and CPU2 is allowed to this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEMWLC7	SEMWLC6	SEMWLC5	SEMWLC4	SEMWLC3	SEMWLC2	SEMWLC1	SEMWLC0
								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCID[2:0]			Res.	Res.	SEM_EN	CFEN
									rw	rw	rw			rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **SEMWLC7**: Semaphore CID 7 enable

This bit is not ignored when semaphore is disabled (SEM_EN = 0) or compartment filtering is off (CFEN = 0).

0: CID 7 agent disabled to take the semaphore

1: CID 7 agent enabled to take the semaphore

Bit 22 **SEMWLC6**: Semaphore CID 6 enable

This bit is not ignored when semaphore is disabled (SEM_EN = 0) or compartment filtering is off (CFEN = 0).

0: CID 6 agent disabled to take the semaphore

1: CID 6 agent enabled to take the semaphore

Bit 21 **SEMWLC5**: Semaphore CID 5 enable

This bit is not ignored when semaphore is disabled (SEM_EN = 0) or compartment filtering is off (CFEN = 0).

0: CID 5 agent disabled to take the semaphore

1: CID 5 agent enabled to take the semaphore

Bit 20 **SEMWLC4**: Semaphore CID 4 enable

This bit is not ignored when semaphore is disabled (SEM_EN = 0) or compartment filtering is off (CFEN = 0).

0: CID 4 agent disabled to take the semaphore

1: CID 4 agent enabled to take the semaphore

Bit 19 **SEMWLC3**: Semaphore CID 3 enable

This bit is not ignored when semaphore is disabled (SEM_EN = 0) or compartment filtering is off (CFEN = 0).

0: CID 3 agent disabled to take the semaphore

1: CID 3 agent enabled to take the semaphore

Bit 18 **SEMWLC2**: Semaphore CID 2 enable

This bit is not ignored when semaphore is disabled (SEM_EN = 0) or compartment filtering is off (CFEN = 0).

0: CID 2 agent disabled to take the semaphore

1: CID 2 agent enabled to take the semaphore

Bit 17 **SEMWLC1**: Semaphore CID 1 enable

This bit is not ignored when semaphore is disabled (SEM_EN = 0) or compartment filtering is off (CFEN = 0).

0: CID 1 agent disabled to take the semaphore

1: CID 1 agent enabled to take the semaphore

Bit 16 **SEMWLC0**: Semaphore CID 0 enable

This bit is not ignored when semaphore is disabled (SEM_EN = 0) or compartment filtering is off (CFEN = 0).

0: CID 0 agent disabled to take the semaphore

1: CID 0 agent enabled to take the semaphore

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:4 **SCID[2:0]**: Static CID

Trusted domain application uses this bitfield to statically define which compartment has access to the peripheral x when SEM_EN = 0.

This CID is ignored when semaphore is enabled (SEM_EN = 1) or compartment filtering is off (CFEN = 0).

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **SEM_EN**: Semaphore enable

This bit is ignored if filtering is off (CFEN = 0). When this bit is cleared from 1 by trusted domain application, SEM_MUTEX is cleared to zero.

0: Wake-up I/O x access granted only if CID of the access equals to SCID.

1: Wake-up I/O x access granted only if SEM_MUTEX = 1 and CID of the access equals to SEMCID in PWR_WIOxSEMCR.

Bit 0 **CFEN:** CID filtering enable

Set and cleared by software. For any CFEN value, access controls to wake-up I/O x defined in PWR_WIOPRIVCFGR and PWR_WIOSECCFGR always apply. When this bit is cleared from 1 by trusted domain application, SEM_MUTEX is cleared to zero.

0: Compartment-based filtering defined in PWR_WIOxCIDCFGR and optionally PWR_WIOxSEMCR is disabled for wake-up I/O x.

1: Compartment-based filtering defined in PWR_WIOxCIDCFGR and optionally PWR_WIOxSEMCR is enabled for wake-up I/O x.

19.12.21 PWR WIO x semaphore control register (PWR_WIOxSEMCR)

Address offset: 0x18C + 0x8 * (x - 1) (x = 1 to 6)

Reset value: 0x0000 0000

Reset on any system reset.

If compartment filtering is disabled (CFEN = 0) or semaphore is disabled (SEM_EN = 0) in PWR_WIOxCIDCFGR, any write to this register is ignored. Privileged-only write if WIOPRIVx is set in PWR_WIOPRIVCFGR. Secure-only write if WIOSECx is set in PWR_WIOSECCFGR.

If compartment filtering is enabled and semaphore is enabled (CFEN and SEM_EN set in PWR_WIOxCIDCFGR), only an authorized compartment can write to this register. For this register, authorized compartment is equal to SEMCID if SEM_MUTEX = 1, else it is defined by the CID white list (SEMWLCy) in PWR_WIOxCIDCFGR. There is no authorized compartment if semaphore is disabled (SEM_EN = 0). Any read access from CPU1 and CPU2 is allowed on this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEMCID[2:0]			Res.	Res.	Res.	SEM_MUTEX
									r	r	r				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **SEMCID[2:0]**: Semaphore current CID

When SEM_EN and CFEN are set in PWR_WIOxCIDCFGR, this read-only bitfield is updated with the CID value of the latest successful acquisition of PWR_WIOxSEMCR semaphore (SEM_MUTEX bit set to 1). In all other cases, SEMCID stays unchanged.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **SEM_MUTEX:** Semaphore mutex

White listed application can set semaphore bit to get exclusive access to wake-up I/O x when SEM_EN is set in PWR_WIOxCIDCFGR (writes are ignored otherwise).
When SEM_MUTEX = 0, only applications belonging to white-listed compartments (defined with SEMWLCy in PWR_WIOxCIDCFGR) can acquire this semaphore.
When SEM_MUTEX = 1, only applications belonging to compartment SEMCID can release this semaphore. This bit is cleared when CFEN or SEM_EN are cleared from 1 by trusted domain application in PWR_WIOxCIDCFGR.
Read 0: Semaphore is free to take.
Read 1: Semaphore is taken.
Write 0: Release semaphore.
Write 1: Acquire semaphore.

19.12.22 PWR CPU1 status register (PWR_CPU1D1SR)

Address offset: 0x200

Reset value: 0x0000 0000

Any read access from CPU1 and CPU2 is allowed on this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	DSTATE[2:0]			Res.	Res.	Res.	Res.	CSTATE[1:0]		Res.	HOLD_ BOOT
					r	r	r					r	r		r

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:8 **DSTATE[2:0]**: D1 domain state status

Set by hardware to indicate when the D1 domain is in DRun, DStop1/2/3 or DStandby mode.
000: DRun
001: DStop1
010: DStop2
011: DStop3
100: DStandby

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:2 **CSTATE[1:0]**: CPU1 cluster state status

Set by hardware to indicate when the CPU1 is in CRun, CSleep or CStop state.
00: CPU1 in reset
01: CPU1 in CRun
10: CPU1 in CSleep
11: CPU1 in CStop

Bit 1 Reserved, must be kept at reset value.

Bit 0 **HOLD_BOOT**: CPU1 HOLD_BOOT status flag.

This flag is not valid when the D1 domain is in DStandby mode. It is set by hardware to indicate when the CPU1 is in HOLD_BOOT state.
0: CPU1 allowed to boot
1: CPU1 maintained in HOLD_BOOT state by hardware

Note: Refer to Section 20 for details on HOLD_BOOT processor state.

19.12.23 PWR CPU2 status register (PWR_CPU2D2SR)

Address offset: 0x204

Reset value: 0x0000 0000

Any read access from CPU1 and CPU2 is allowed on this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

					r	r	r					r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:8 **DSTATE[2:0]**: System/D2 state status

Set by hardware to indicate when the system/D2 domain is in Run, Stop, LP-Stop, LPLV-Stop, Standby or V_{BAT} mode.

000: Run

001: Stop

010: LP-Stop

011: LPLV-Stop

100: Standby

101: VBAT

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:2 **CSTATE[1:0]**: CPU2 cluster state status flag

Set by hardware to indicate when the CPU2 is in CRun, CSleep or CStop state.

00: CPU2 in reset

01: CPU2 in CRun

10: CPU2 in CSleep

11: CPU2 in CStop

Bit 1 **WFBEN**: CPU2 wait-for-boot enable status flag

Set by hardware to indicate when the CPU2 is in wait-for-boot enable state. Only applicable in wake-up event mode. This flag is not valid when the system is in Standby mode.

0: CPU2 is not in wait-for-boot enable state (bit set at 0 in legacy boot mode).

1: CPU2 is in wait-for-boot enable state. It starts once an event assign to it is raised.

Note: Refer to Section 20 for details on HOLD_BOOT processor state.

Bit 0 **HOLD_BOOT**: CPU2 HOLD_BOOT status flag

This flag is not valid when the system is in Standby. Set by hardware to indicate when the CPU2 is in HOLD_BOOT state.

0: CPU2 is allowed to boot.

1: CPU2 is maintained in HOLD_BOOT state by hardware.

Note: Refer to Section 20 for details on HOLD_BOOT processor state.

19.12.24 PWR VER register (PWR_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0010

Any read access from CPU1 and CPU2 is allowed on this register.

Refer to *Section 2.4* for the register boundary addresses.

20 Reset and clock control (RCC)

The RCC manages the clock and reset generation for the complete circuit (see *Section 19: Power control (PWR)* for more details on operating modes).

In the whole document:

- The Cortex-A35 is also called CPU1 or MPU.
- The Cortex-M33 is also called CPU2 or MCU.

D1 domain holds CPU1 (supplied by V_{DDCPU}). D2 domain holds CPU2 and the majority of the peripherals (supplied by V_{DDCORE}).

20.1 RCC main features

- AMBA 5 AHB bus interface
- RIF (resource isolation framework) aware
- Reset:
  - Generation of local and system reset
  - Bidirectional pin reset (NRST) to reset external devices, or the circuit
  - Output pin reset (NRSTC1MS) to reset external mass-storage devices used by CPU1
- Clock generation:
  - Generation and distribution of clocks for the complete system
  - 5 separate PLLs (excluding external CPU1 and DDR ones):
    - Integer or fractional mode
    - Spread-spectrum function to reduce the amount of EMI peaks
    - Possibility to change the PLLs fractional ratios on the fly
  - Smart clock gating for reduction of power dissipation
  - 2 external oscillators:
    - HSE supporting a wide range of crystals (8 to 48 MHz)
    - LSE for the 32.768 kHz crystals
  - 3 internal oscillators:
    - HSI running around 64 MHz
    - MSI running around 16 MHz
    - LSI running around 32 kHz
  - Buffered clock outputs for external devices
  - HSI and MSI frequency monitors
- 2 independent interrupt interfaces (one dedicated to CPU1 and one dedicated to CPU2)
- 2 independent failure events (HSE and LSE)
- 2 independent events to wake up CPU1 and CPU2 (one dedicated for each)

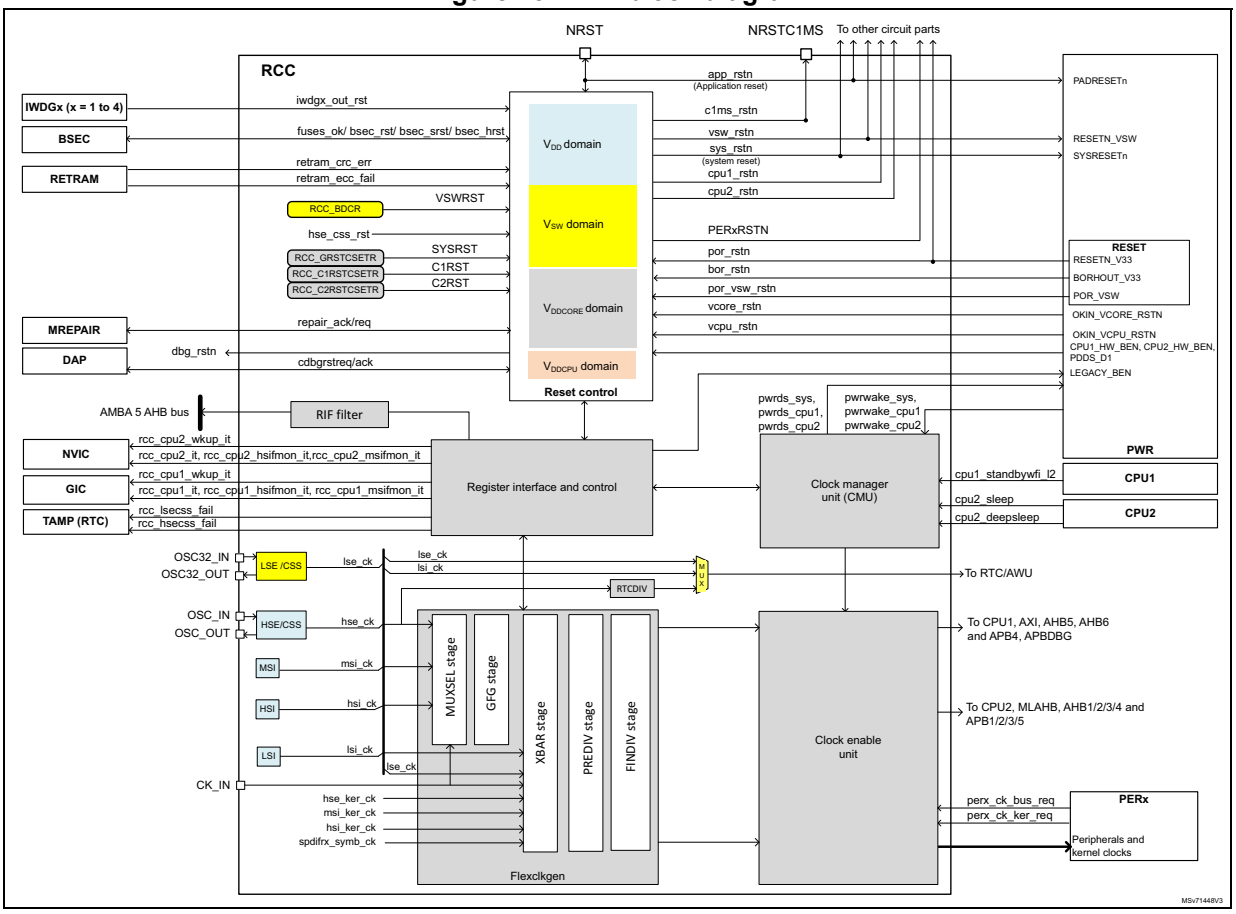
20.2 RCC block diagram

The figure below gives a simplified view of the RCC, and the key signals exchanged with the other peripherals. Four voltage domains are present in the RCC: V_{DD} domain, V_{SW} domain, V_{DDCPU} domain called D1 domain and V_{DDCORE} domain called D2 domain.

For the reset, analog comparators located into PWR provide all reset signals dependent of the power supplies: por_rstn, bor_rstn, vcore_rstn and por_vsw_rstn. One reset source comes from pins: NRST. The RCC also receives resets from various other sources (such as watchdogs, CPU2, or registers). All these resets are handled by the RCC in order to reset properly all system parts.

For the clock generation, the RCC handles the generation and the gating for all the clocks according to register settings and operating modes.

Figure 73. RCC block diagram



The RCC exchanges also some signals with the PWR in order to control the entry/exit of CPUx in CStop, D1 domain in DStandby mode, and system in Stop and Standby modes.

20.2.1 RCC pin overview

The table below lists the RCC signals connected to pins or balls.

Table 112. Pin overview

Pin name	Type	Description
NRST	Input/output	External (application) reset, can be used to provide reset to external devices
OSC32_IN	Input	32 kHz oscillator input
OSC32_OUT	Output	32 kHz oscillator output
OSC_IN	Input	System oscillator input
OSC_OUT	Output	System oscillator output
MCO1	Output	Output clock 1 for external devices
MCO2	Output	Output clock 2 for external devices
NRSTC1MS	Output	Output reset flag for external mass-storage devices used by CPU1
CK_IN	Input	External kernel clock input for digital audio interfaces: SPI/I2S, SAI, and MDF

20.3 RCC functional description - Reset

There are several sources able to generate a reset:

- supply monitors (V_{DD}, V_{DDCORE}, V_{DDCPU} or V_{SW}) lower than expected values
- independent watchdogs timeout
- D1 domain exiting DStandby
- device exiting Standby
- external signals driving the NRST pin
- software commands

The scope of the resets differs according to the source initiating the reset. The following categories are defined below: power-on/off, system, and local resets

20.3.1 Power-on/off resets

The PWR provides the following reset signals to the RCC:

- por_rstn signal, asserted when V_{DD} supply is lower than V_{POR} threshold
- bor_rstn signal, asserted when V_{DD} supply is lower than V_{BOR} threshold
- vcore_rstn signal, asserted when V_{DDCORE} supply is lower than V_{CORE} threshold
- vcpu_rstn signal, asserted when V_{DDCPU} supply is lower than V_{CPU} threshold
- por_vsw_rstn signal, asserted when V_{SW} supply is lower than the expected threshold

As shown in *Figure 74*, the signals provided by the PWR, indicating that V_{DDCORE} and V_{DDCPU} are valid (OKIN_VCORE_RSTN, OKIN_VCPU_RSTN), are used by the RCC in order to trigger the hardware system initialization sequence and the memory repair. When this initialization sequence is completed, vcore_rstn and vcpu_rstn signals are released, and CPU1/2 can start (see *Table 115* for details).

See *Section 19: Power control (PWR)* for details on the generation of power-on/off resets.

20.3.2 Application and system resets

An application reset (app_rstn) is generated from one of the following sources:

- reset from NRST pin
- reset from por_rstn signal (generally called power-on reset)
- reset from bor_rstn signal (generally called brownout reset)
- reset from the independent watchdogs (iwdg1_out_rst, iwdg2_out_rst, iwdg3_out_rst, iwdg4_out_rst) if the application allows them in RCC_IWDGC1CFGSETR, RCC_IWDGC2CFGSETR
- software reset from the RCC, when either CPU1 or CPU2 sets SYSRST in RCC_GRSTCSETR
- failure on HSE, when the clock security system feature is activated (hse_css_rst)
- RETRAM CRC error in wake-up event mode. After system Standby exit, when RET_CRCERR_RSTEN is set in RCC_STBYBOOTCR, and TDCID = 0x1. When TDCID = 0x2, it triggers an application reset whatever RET_CRCERR_RSTEN.
- RETRAM ECC failure during the CRC computation in wake-up event mode. After system Standby exit, when RET_CRCERR_RSTEN is set in RCC_STBYBOOTCR and TDCID = 0x1. When TDCID = 0x2, it triggers an application reset whatever RET_CRCERR_RSTEN.
- RETRAM ECC failure in wake-up event mode, after system Standby exit, and during system wake-up restoration phase, once CRC is done

A system reset (sys_rstn) is generated from one of the following sources:

- reset from app_rstn signal (application reset)
- reset from vcore_rstn signal
- reset from vcpu_rstn signal when the D1 domain does not exit Standby

Note: When the system is in Standby, V_{DDCORE} and V_{DDCPU} are switched off, but V_{DD} is still present. When the system exits Standby, vcore_rstn is activated, generating a sys_rstn reset. vcpu_rstn may also be activated depending on the selected system Standby exit strategy.

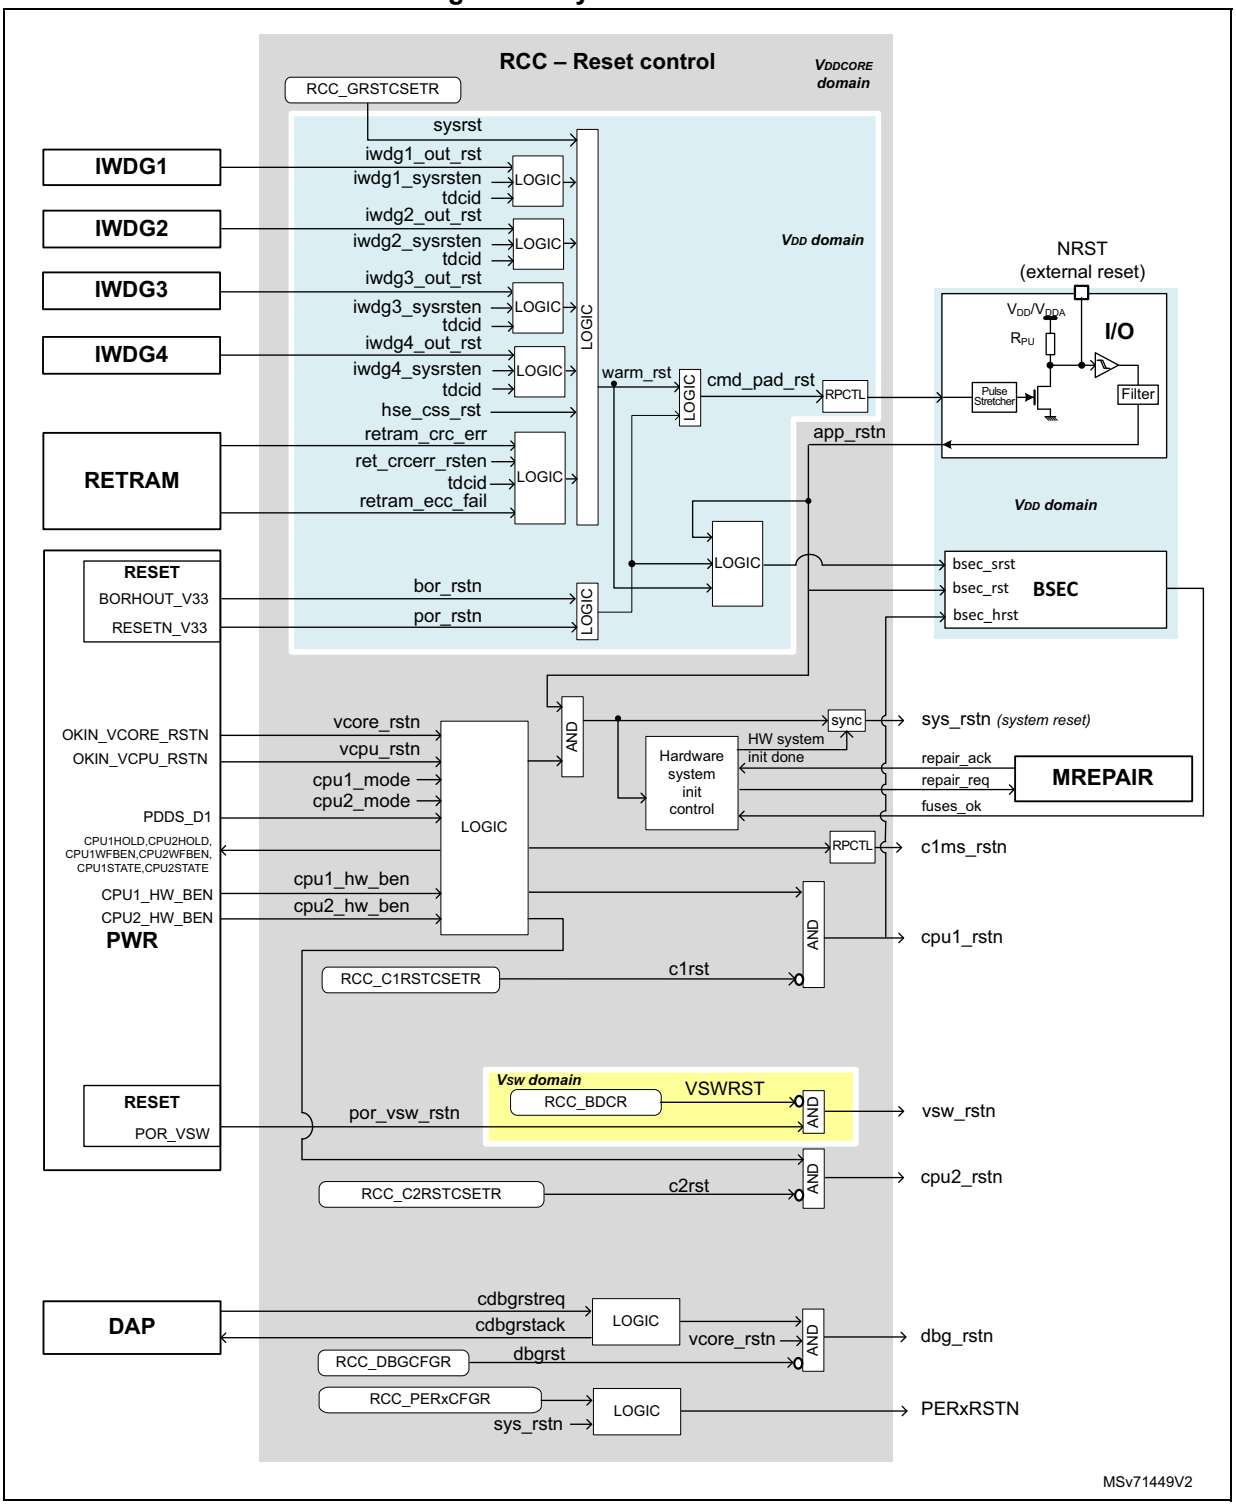
As shown in *Figure 74*, the NRST pin is activated by:

- por_rstn, bor_rstn, or hse_css_rst
- iwdg1_out_rst, iwdg2_out_rst, iwdg3_out_rst, iwdg4_out_rst according to the application program
- sysrst
- retram_crc_err, or retram_ecc_fail according to the application program
- assertion of NRST by an external source

A programmable reset pulse control (RPCTL) allows the application to define a minimum pulse width for the NRST assertion. When the RPCTL is disabled, the reset pin embeds a pulse stretcher which guarantees a minimum reset pulse duration of 20 microseconds for each internal reset source. app_rstn and sys_rstn are also impacted by this function (see *Section 20.3.10* for details on RPCTL).

Note: It is not recommended to let the NRST pin unconnected. When it is not used, connect this pin to ground via a capacitor of 10 to 100 nF.

Figure 74. System reset circuit



20.3.3 Local resets

The local resets do not directly affect the whole system, but only one CPUx subsystem (cores and its associated peripherals, like GIC or NVIC).

Here is the most important local reset:

When the D1 domain exits DStandby, and the system was not in Standby, the CPU1 is reset by a reset named cpu1_rstn, and the external mass-storage devices used by CPU1 can be reset by the c1ms_rstn signal (NRSTC1MS pin). Refer to *NRSTC1MS I/O* for details.

20.3.4 Resets generated by CPUs

All CPUs can generate system and local resets. The RCC offers the following possibilities:

- CPUx can generate a system reset by means of SYSRST in RCC_GRSTCSETR.
- C2RST in RCC_C2RSTCSETR can reset CPU2 and its related watchdogs (IWDG3/4).
- C1RST in RCC_C1RSTCSETR can reset CPU1 and its related watchdogs (IWDG1/2).

The CPU1 is reset whenever the D1 domain exits DStandby.

When the CPU2 uses C1RST to reset the CPU1, the following procedure must be used:

1. Clear RCC_CPUBOOTCR.BOOT_CPU1.
2. Activate RCC_C1RSTCSETR.C1RST.
3. Poll RCC_C1RSTCSETR.C1RST until it is 0.
4. Set RCC_CPUBOOTCR.BOOT_CPU1.

20.3.5 Watchdog resets

The following watchdogs are provided to the application:

- IWDG1 (secure) and IWDG2 (non-secure) dedicated to the CPU1
- IWDG3 (secure) and IWDG4 (non-secure) dedicated to the CPU2

All these watchdogs can generate a system reset when a timeout occurs, according to the application selection.

The system reset operation is controlled by (see *Table 113* and *Table 114* for details):

- IWDG1_SYSRSTEN, IWDG2_SYSRSTEN in RCC_IWDGC1CFGSETR
- IWDG3_SYSRSTEN, IWDG4_SYSRSTEN in RCC_IWDGC2CFGSETR
- TCID selected trusted domain master agent

Warning: The application must set these IWDGx_SYSRSTEN bits prior enabling any watchdog.

These registers are located in V_{DD} domain and are reset by app_rstn.

Table 113. IWDG timeout event combinations when TDCID = CPU1

IWDG1_ SYSRSTEN(1)	IWDG2_ SYSRSTEN	IWDG3_ SYSRSTEN	IWDG4_ SYSRSTEN	Timeout event description
-	0	0	0	System reset from IWDG1
			1	System reset from IWDG1 and IWDG4
	1		0	System reset from IWDG1 and IWDG2
			1	System reset from IWDG1, IWDG2, and IWDG4
	0	1	0	System reset from IWDG1 and IWDG3
			1	System reset from IWDG1, IWDG3, and IWDG4
	1		0	System reset from IWDG1, IWDG2, and IWDG3
			1	System reset from all watchdogs

1. "-" means don't care.

Table 114. IWDG timeout event combinations when TDCID = CPU2

IWDG1_ SYSRSTEN	IWDG2_ SYSRSTEN	IWDG3_ SYSRSTEN(1)	IWDG4_ SYSRSTEN	Timeout event description
0	0	-	0	System reset from IWDG3
			1	System reset from IWDG3 and IWDG4
	1		0	System reset from IWDG2 and IWDG3
			1	System reset from IWDG2, IWDG3, and IWDG4
1	0		0	System reset from IWDG1 and IWDG3
			1	System reset from IWDG1, IWDG3, and IWDG4
	1		0	System reset from IWDG1, IWDG2, and IWDG3
			1	System reset from all watchdogs

1. "-" means don't care.

In addition, any IWDG timeout event is sent to the main EXTI to be routed to all CPUs.

20.3.6 Backup domain reset

A backup domain reset (vsw_rstn) is generated when one of the following events occurs:

- software reset, triggered by setting VSWRST in RCC_BDCR

  All RTC registers and RCC_BDCR are set to their reset values. The BKPSRAM is not affected.
- when V_{SW} voltage is outside the operating range (por_vsw_rstn)

  All RTC registers and RCC_BDCR are set to their reset values. The BKPSRAM is no longer valid.

The por_rstn reset source for the V_{DD} domain is gated by the por_vsw_rstn reset in order to secure the internal power sequence. See *Section 19: Power control (PWR)* for additional information.

20.3.7 CoreSight debug reset

The CoreSight debug components including the CPU1 debug part can be reset in three different ways:

- over the DAP by setting to 1 CDBGRSTREQ in control/status register of the debug port
  Setting CDBGRSTREQ = 1 asserts the debug reset request signal CDBGRSTREQ connected to the RCC. The RCC activates dbg_rstn. An handshake signal cdbgrstack is provided to the DAP request. dbg_rstn is active as long as the CDBGRSTREQ = 1.
- by the application by setting to 1 DBGRST in RCC_DBGCFGR
  When DBGRST = 1, the dbg_rstn reset is activated. dbg_rstn reset is released when DBGRST = 0.
- when V_{DDCORE} power-on reset occurs (vcore_rstn)
  This reset is activated after a power-on reset, or when the product exits Standby.

20.3.8 Option-byte loading

The boot and security register interface module (BSEC) controls an OTP (one-time programmable) array of fuse words that hold the option-byte configuration for the product.

This configuration must be set every time an app_rstn or a NRST reset is activated. The system reset is kept active until this configuration has been properly loaded (via the fuse_ok signal received from the BSEC).

The BSEC handles the following reset sources (see *Section 6: Boot and security control (BSEC)* for details):

- a main reset (bsec_rst) active when an app_rstn or a NRST reset is triggered
- a scratch reset (bsec_srst) active when a por_rstn, bor_rstn or a NRST reset is triggered
- a hot reset (bsec_hrst) active when a CPU1 reset is triggered

Note: When a warm reset occurs, any NRST reset is filtered, and the bsec_srst reset is not performed.

20.3.9 Peripheral reset

The application can reset individually any peripheral whenever it is requested. This can be done by CPUx via RCC_PERxCFGR (with PERx = peripheral name).

Note: Access rights to these registers are inherited from the related peripheral RIF configuration (see Section 20.7.1 for details).

When a peripheral needs to be reset, it is recommended to first enable its peripheral clock by setting the corresponding peripheral enable bit to 1 (see *Section 20.4.11* for details).

For peripherals having a reset process which is executed very fast, it is up to the application to assert and release the peripheral reset (in RCC_PERxCFGR, with PERx = peripheral name).

For some peripherals, the reset process may take several clock cycles. For that purpose, the application can read back the reset bit in order to check if the reset process is ongoing or completed.

Note: DCMIPP, ETH1, ETH2, HPDMA1, HPDMA2, HPDMA3, LTDC, SDMMC1, SDMMC2, SDMMC3, USBH and OTG peripherals are following this above reset behavior: when the

application releases the peripheral reset, it must read back the related PERxRST in RCC_PERxCFGR (with PERx = peripheral name) to be sure that the reset has been properly released. This applies when the CFG_ENABLE bit is set in SYSCFG_SAFERSTCR.

20.3.10 Reset pulse control (RPCTL)

The RPCTL allows the application to control the minimum activation time of NRST and NRSTC1MS pins. This feature is particularly helpful because some external devices may request a specific duration for the activation of these pins. In addition, the internal reset pulse like IWDGx may be too short for external devices.

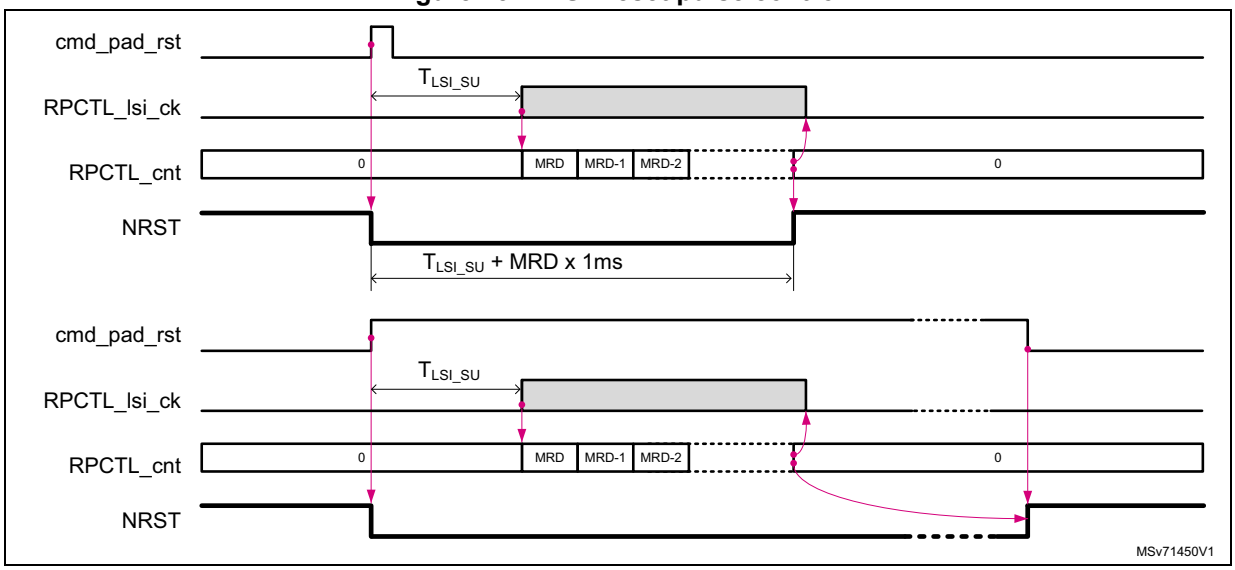
NRST pin

The RPCTL is located into the V_{DD} domain, and is only reset after a power-on reset. It is controlled by MRD[4:0] in RCC_RDCR as follows:

- If MRD = 0, the RPCTL is bypassed, and the cmd_pad_rst signal directly drives the reset pin. The minimum activation time is given by the pulse stretcher embedded into the reset pin (typically 20 microseconds).
- If MRD = 1, when the reset is activated (cmd_pad_rst rising edge), NRST is immediately driven low at least for a duration equal to the value given by MRD[4:0]. The reset duration is not affected by RPCTL when the cmd_pad_rst signal is active for a duration longer than the value programmed in MRD[4:0]. The MRD[4:0] is used to adjust the minimum activation time between 1 to 31 ms.

Note: The RPCTL uses the LSI clock in order to control the reset width. When cmd_pad_rst goes high, the RPCTL requests the LSI clock in order to control the reset duration. If the LSI was not enabled by another function, it may take some microseconds before having the LSI ready (T_{LSI_SU}).

Figure 75. NRST reset pulse control

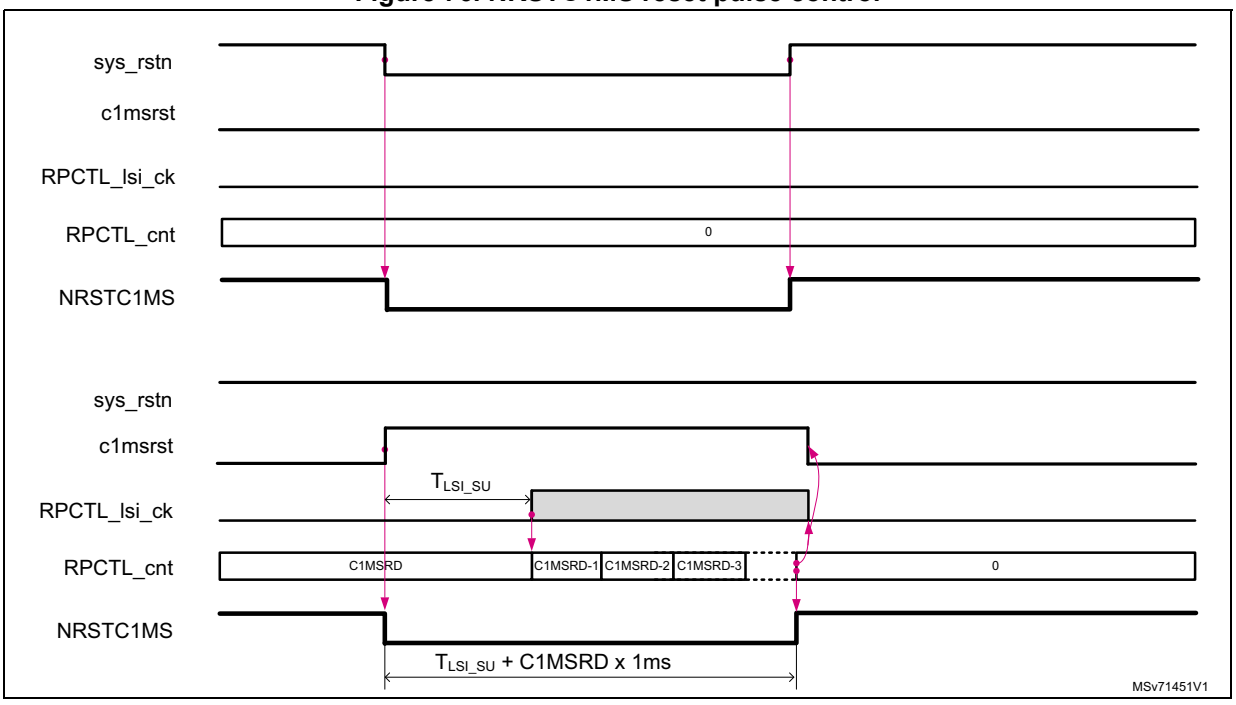


NRSTC1MS I/O

The RPCTL is the same as the NRST except the following:

- It is located into the V_{DDCORE} domain and the NRSTC1MS pin is open drain.
- It is reset after a system reset.
- It is controlled by C1MSRST and C1MSRD[4:0] in RCC_C1MSRDCR.

Figure 76. NRSTC1MS reset pulse control



20.3.11 Reset coverage summary

The table below gives a detailed view of reset sources and reset domains. Each column represents a reset source.

Note: It is assumed that when V_{DD} is not valid, V_{DDCORE} and V_{DDCPU} are not valid.

Table 115. Reset coverage summary

Reset items	Reset lines[1]									
	por_rstn[2]	vcore_rstn	sys_rstn	app_rstn	vcpu_rstn	cpu1_rstn	cpu2_rstn	dbg_rstn	perx_rstn	vsw_rstn
V_{DD} domain	x	-	-	-	-	-	-	-	-	-
DDR ITF	x	x	x	x	-	-	-	-	-	-
CPU1 (D1 domain)	x	-	x	x	x	x	-	-	-	-
CPU2 (D2 domain)	x	x	x	x	-	-	x	-	-	-
AXI/AHB interconnections (D2 domain)	x	x	x	x	-	-	-	-	-	-
CoreSight debug components: reset all the debug parts including the ones located in CPU1 except SWJ-DP function. The SWJ-DP is reset by NTRST or an app_rstn reset.	x	x	x	x	-	-	-	x	-	-

Table 115. Reset coverage summary (continued)

Reset items		Reset lines[1]									
		por_rstn[2]	vcore_rstn	sys_rstn	app_rstn	vcpu_rstn	cpu1_rstn	cpu2_rstn	dbg_rstn	perx_rstn	vsw_rstn

1. The reset lines that correspond reset item are highlighted in gray.
2. When por_rstn is asserted, all resets are asserted as well except perx_rstn and vsw_rstn.

Reset of RCC registers

The table below lists registers having bits into a voltage domain different from V_{DDCORE}. As a consequence some of these registers are not always reset by sys_rstn. The RCC registers not shown in the table below are reset by sys_rstn.

Table 116. RCC registers with specific reset and specific voltages

RCC register name	Voltage domain	Reset condition	Comment
RCC_LEGBOOTCR, RCC_STBYBOOTCR, RCC_LSICR, RCC_IWDGC1CFGSETR, RCC_IWDGC1CFGCLRR, RCC_IWDGC2CFGSETR, RCC_IWDGC2CFGCLRR	V_{DD}	app_rstn	Must be reset after a system reset, but not after Standby reset
RCC_OCENSETR, RCC_OCENCLRR, RCC_OCRDYR, RCC_HSICFGR, RCC_MSICFGR		sys_rstn	-
RCC_HWRSTSCLRR, RCC_C1HWRSTSCLRR, RCC_C2HWRSTSCLRR, RCC_RDCR		por_rstn	Only reset when a V_{DD} is removed
RCC_BDCR	V_{SW}	vsw_rstn	VSWRST not reset by por_vsw_rstn

20.3.12 Reset source identification

The RCC offers the following registers in order to identify the root cause of reset:

- *RCC hardware reset status clear register (RCC_HWRSTSCLRR)*
- *RCC CPU1 hardware reset status clear register (RCC_C1HWRSTSCLRR)*
- *RCC CPU2 hardware reset status clear register (RCC_C2HWRSTSCLRR)*
- *RCC CPU1 boot reset status set register (RCC_C1BOOTRSTSSETR)*
- *RCC CPU1 boot reset status clear register (RCC_C1BOOTRSTSCLRR)*
- *RCC CPU2 boot reset status set register (RCC_C2BOOTRSTSSETR)*
- *RCC CPU2 boot reset status clear register (RCC_C2BOOTRSTSCLRR)*

The first booting CPUx can access RCC_HWRSTSCLRR to identify the reset root cause. It also relies on PWR_CPUxCR content (see *Section 19: Power control (PWR)* for details) to set which kind of boot sequence must be performed after any kind of reset. RCC_C1HWRSTSCLRR and RCC_C2HWRSTSCLRR are respectively dedicated to CPU1 and CPU2 to identify their own root cause of reset.

When CPU1 first booting, the boot ROM uses RCC_HWRSTSCLRR, RCC_C1HWRSTSCLRR, and PWR_CPU1CR to set the boot reset reason via RCC_C1BOOTRSTSSETR after every system reset, power-on reset, or exit from Standby. The CPU1 can then check the boot reason and clear the flags via RCC_C1BOOTRSTSCLRR.

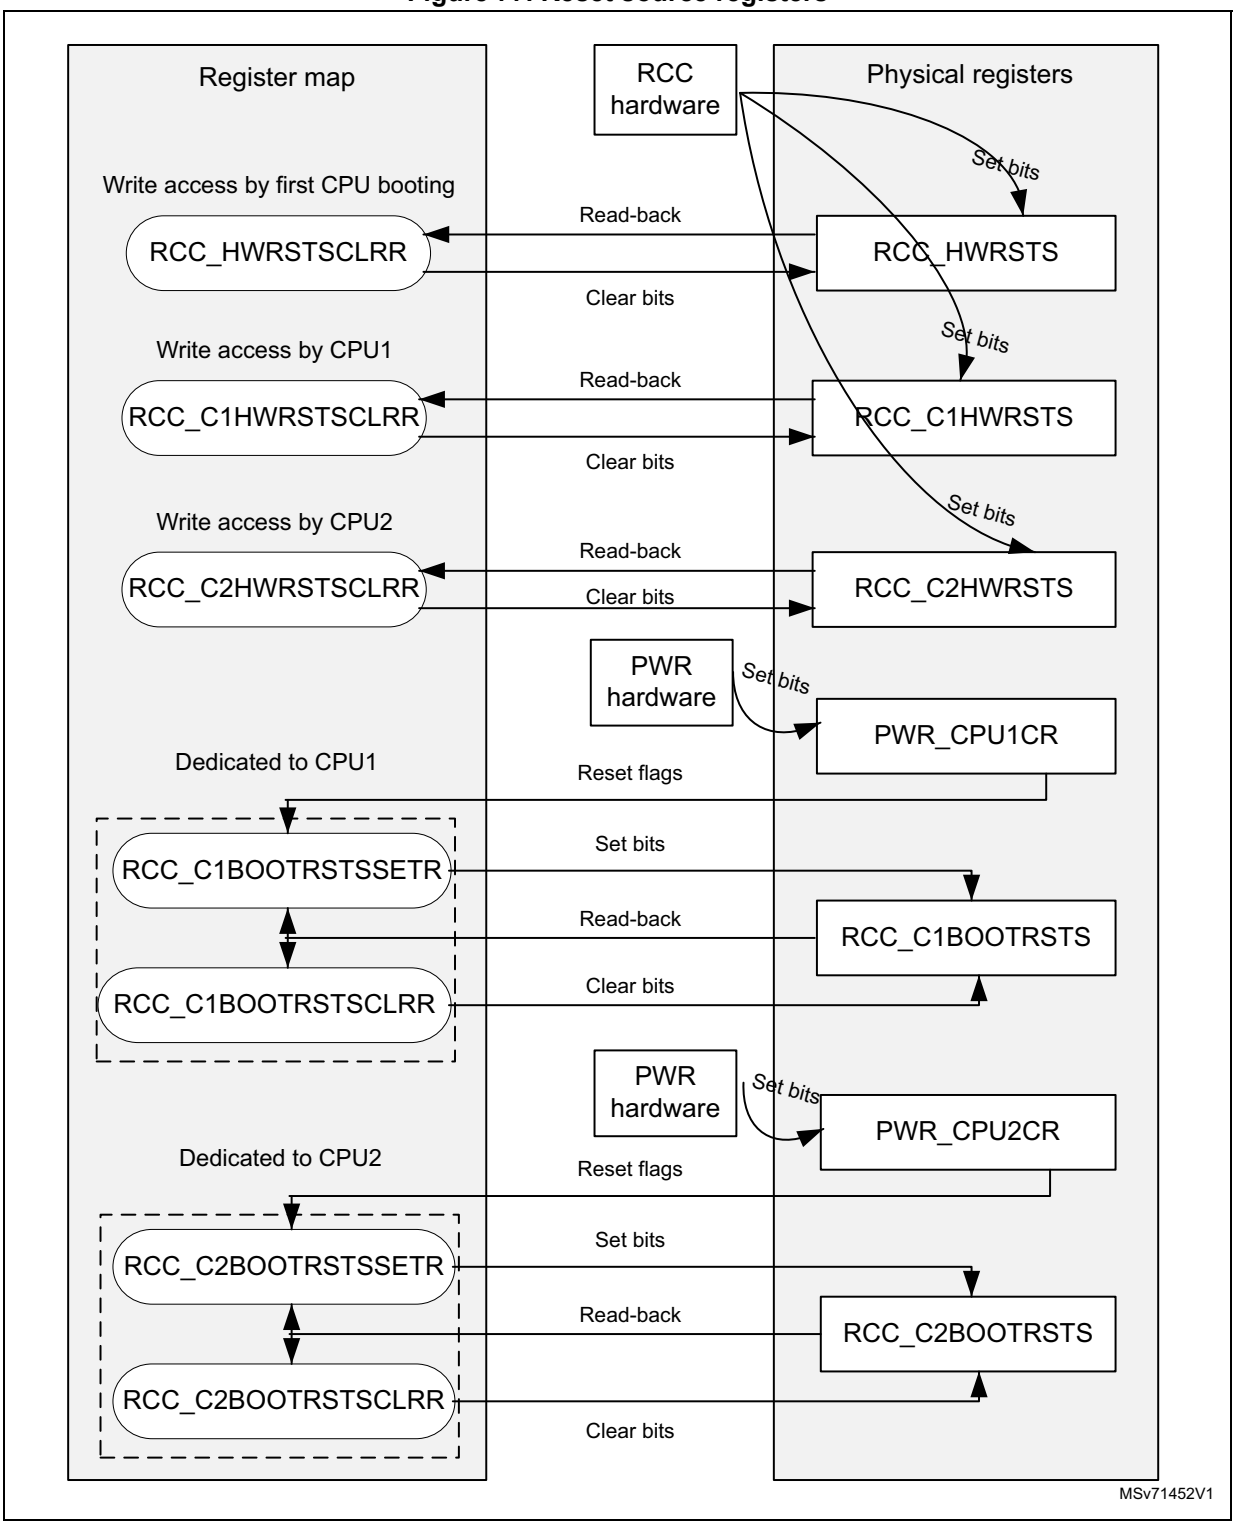
When CPU2 first booting, the CPU2 boot code uses also RCC_HWRSTSCLRR, RCC_C2HWRSTSCLRR, and PWR_CPU2CR to set the boot reset reason via RCC_C2BOOTRSTSSETR.

Note: STBYC1RSTF, STBYC2RSTF, D2STBYRSTF and D1STBYRSTF flags in RCC_C1BOOTRSTSSETR and RCC_C2BOOTRSTSSETR are copied from SBF, SBF_D2 and SBF_D1 in PWR_CPU1CR and PWR_CPU2CR.

There is not any hardware protection on bit clear inside RCC_HWRSTSCLRR, RCC_C1HWRSTSCLRR, and RCC_C2HWRSTSCLRR. Once the boot reset reason has

been set, the application (CPU1 or/and CPU2) must clear RCC_HWRSTSCLRR, RCC_C1HWRSTSCLRR, and RCC_C2HWRSTSCLRR.

Figure 77. Reset source registers



The table below shows the status bits in RCC_HWRSTSCLRR, RCC_C1HWRSTSCLRR, and RCC_C2HWRSTSCLRR according to the reset source.

Table 117. RCC HWRSTSCLRR, RCC_C1HWRSTSCLRR, RCC_C2HWRSTSCLRR flags(1)

#	Reset source	RETECCFAILRESTRSTF	RETECCFAILCRCRSTF	RETCRCERRRSTF	C2RSTF	C1RSTF	IWDG4SYSRSTF	IWDG3SYSRSTF	IWDG2SYSRSTF	IWDG1SYSRSTF	SYSC2RSTF	SYSC1RSTF	VCPURSTF	VCORERSTF	HCSSRSTF	PADRSTF	BORRSTF	PORRSTF
1	Power-on reset (por_rstn)	-	-	-	1	1	-	-	-	-	-	-	1	1	-	1	-	1
2	Brownout reset (bor_rstn)	-	-	-	1	1	-	-	-	-	-	-	-	-	-	1	1	-
3	Pin reset from NRST	-	-	-	1	1	-	-	-	-	-	-	-	-	-	1	-	-
4	Clock failure on HSE	-	-	-	1	1	-	-	-	-	-	-	-	-	1	1	-	-
5	System reset (SYSRST) by CPU1	-	-	-	1	1	-	-	-	-	-	1	-	-	-	1	-	-

7	System reset from V_{CPU} monitor	-	-	-	1	1	-	-	-	-	-	-	1	-	-	-	-	-
8	CPU1 reset by CPU2 (C1RST)(2)	-	-	-	-	1	-	-	-	-	-	-	-	-	-	-	-	-
9	CPU2 reset by CPU1 (C2RST)(3)	-	-	-	1	-	-	-	-	-	-	-	-	-	-	-	-	-
10	System exits Standby in cold boot CPU2 mode without error	-	-	-	1	-	-	-	-	-	-	-	-	1	-	-	-	-
11	System exits Standby in other modes(4) without error	-	-	-	1	1	-	-	-	-	-	-	1	1	-	-	-	-
12	System exits Standby with RETRAM CRC error	-	-	1	1	1	-	-	-	-	-	-	1	1	-	1	-	-
13	System exits Standby with RETRAM ECC failure during CRC	-	1	-	1	1	-	-	-	-	-	-	1	1	-	1	-	-
14	System exits Standby with RETRAM ECC failure during system restoration	1	-	-	1	1	-	-	-	-	-	-	1	1	-	1	-	-
15	D1 domain exits DStandby	-	-	-	-	1	-	-	-	-	-	-	1	-	-	-	-	-
16	IWDG1 system reset (iwdg1_out_rst)	-	-	-	1	1	-	-	-	1	-	-	-	-	-	1	-	-
17	IWDG2 system reset (iwdg2_out_rst)	-	-	-	1	1	-	-	1	-	-	-	-	-	-	1	-	-
18	IWDG3 system reset (iwdg3_out_rst)	-	-	-	1	1	-	1	-	-	-	-	-	-	-	1	-	-
19	IWDG4 system reset (iwdg4_out_rst)	-	-	-	1	1	1	-	-	-	-	-	-	-	-	1	-	-

1. The 1 status is highlighted in grey.
2. This bit is set when C1RST is activated in RCC_C1RSTCSETR.
3. This bit is set when C2RST is activated in RCC_C2RSTCSETR.
4. VCPURSTF is present only when D1 is not in kept in DStandby.

20.3.13 Power-on and wake-up sequences

For detailed diagrams refer to *Section 19: Power control (PWR)*.

The time interval between the event which exits the product from a low-power mode and the moment where the CPUs are able to execute code, depends on the state of the system and its configuration. *Figure 78* shows the most usual examples.

Power-on wake-up sequence

The power-on wake-up sequence of *Figure 78* gives the most significant phases of the power-on sequence. It is the longest sequence as the circuit was not powered.

Note: This sequence remains unchanged if V_{BAT} was present or not.

Boot sequence from pin reset (NRST)

The pin reset gives the most important steps of the boot sequence.

Note: In this case, V_{DD}/V_{DDA} have not been removed.

- The setting time is faster as the reference voltage is already stable.
- The HSI restart delay may be needed if the HSI was not enabled when the NRST occurred. Otherwise this restart delay phase is skipped.
- The option byte reloading is performed.

Boot sequence from system Standby

For a wake-up from system Standby, as the V_{DD} is not removed, the settling time is also fast as the reference voltage is already stable. As V_{DDCORE} and V_{DDCPU} were not there, the restart delay for the HSI cannot be skipped.

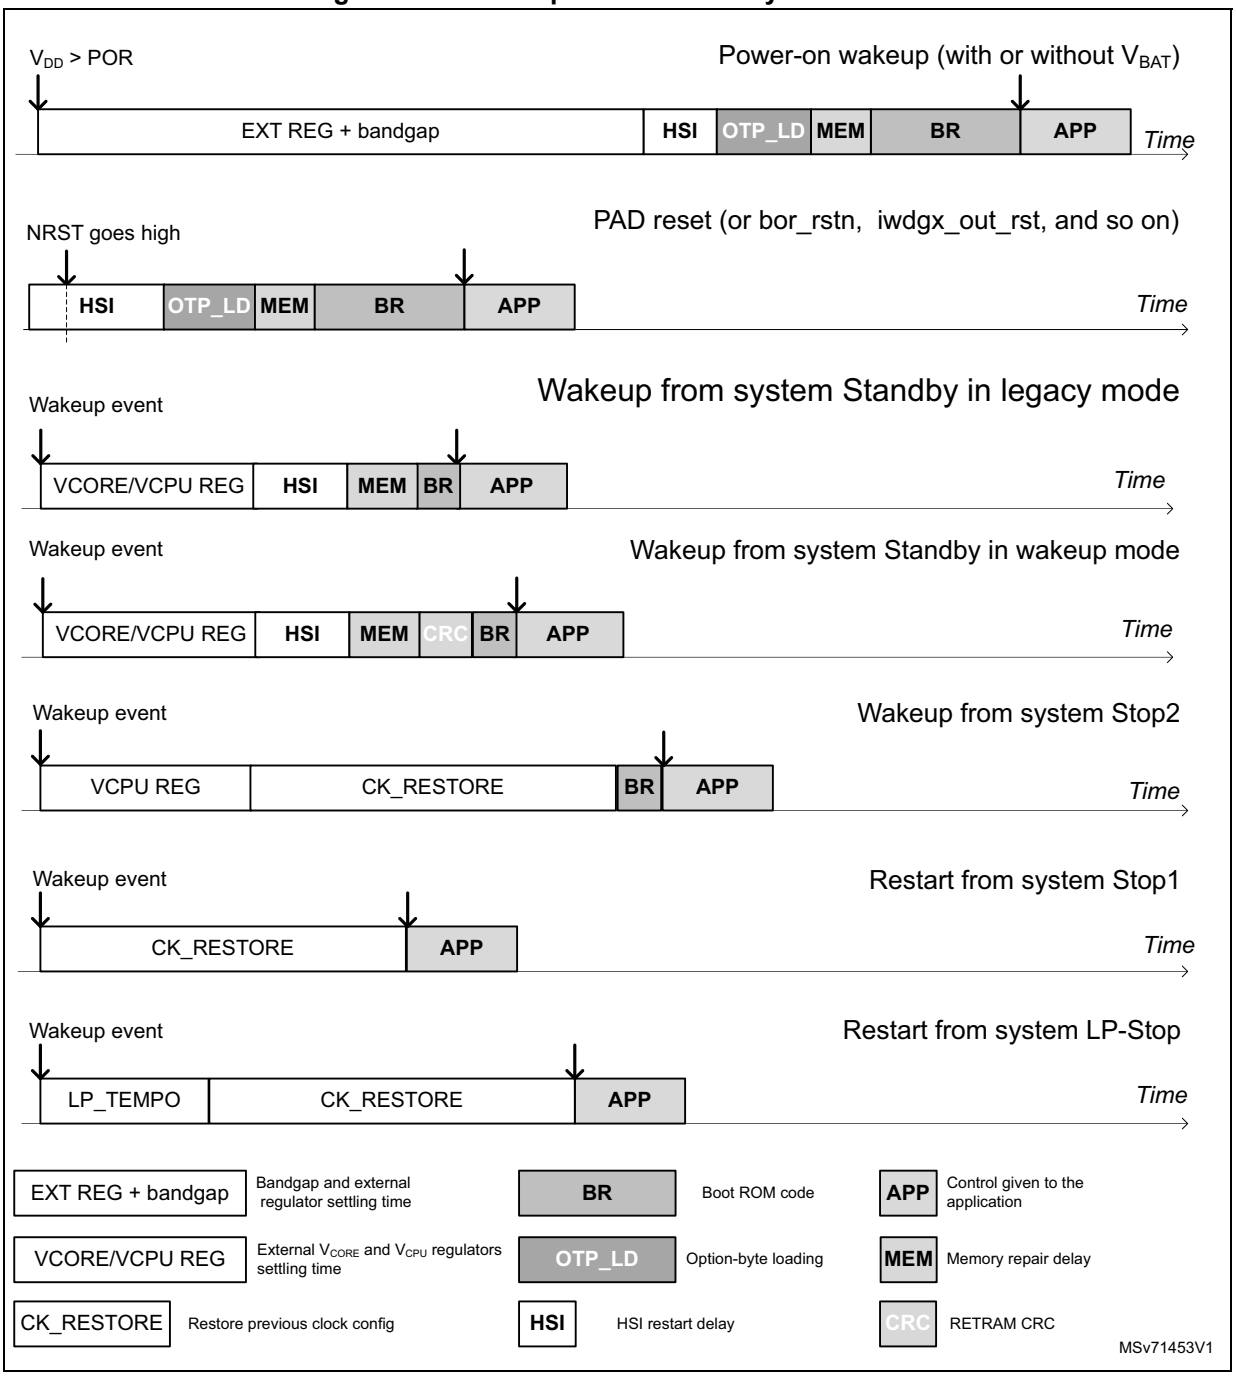
In the cold boot CPU2 and wake-up event modes, when the system exits Standby, the CRC is run on the RETRAM content, whatever the wake-up source. This fastens the CPU2 firmware execution in case of CPU2 wake-up event.

Restart sequence from system Stop

For a restart from system Stop1, both V_{DDCORE} and V_{DDCPU} have not been removed, so the settling time is mainly due to the restart delay of the clock. The system restarts according to the clock restore sequence (see *Clock restore sequence* for details).

For a restart from system Stop2, in case of CPU1 wake-up event, the boot ROM code execution time is added.

Figure 78. Boot sequences versus system states



CPUx state after application reset

After an application reset (from IWDG, POR, BOR, or pin), the CPU1 always starts the boot ROM code execution. The boot ROM code selects which CPU has to boot first (CPU1 or CPU2) while the other CPU is maintained on HOLD_BOOT state. The CPUx selected to boot first is called cold boot CPU.

This HOLD_BOOT state is controlled via BOOT_CPU1 and BOOT_CPU2 in RCC_CPUBOOTCR (see *HOLD_BOOT CPUx state* for more details).

CPUx state after Standby exit

After any system Standby exit (vcore_rstn and vcpu_rstn are low), the product can select which CPUx (CPU1 or CPU2) boots first.

The selection of the first CPUx to boot depends on the following criteria:

- LEGACY_BEN, COLD_CPU2, and CPU_BEN_SEL in RCC_LEGBOOTCR and RCC_STBYBOOTCR

  They are reset by hardware after an application reset (from IWDG, POR, BOR, or pin), but not when the product exits Standby. These bits are located in the V_{DD} domain in order to be reset after a power-on reset.
- cpu1_hw_ben and cpu2_hw_ben from the PWR (see *Section : PWR entering Standby mode*)

There are different behaviors regarding this selection process.

- Legacy mode for first CPUx selection boot

  This mode is active when LEGACY_BEN is set to 1. In this mode, only CPU1 is allowed to boot, thus to execute the boot ROM code, while CPU2 is always maintained on HOLD_BOOT by the hardware.

  In order to allow CPU2 to boot, CPU1 must only set BOOT_CPU2 in RCC_CPUBOOTCR.
- Cold boot CPU2 mode for first CPUx selection boot

  This mode is active when LEGACY_BEN is cleared to 0 and COLD_CPU2 is set to 1. In this mode, only CPU2 can boot, while CPU1 is always maintained on HOLD_BOOT by the hardware. In case of RETRAM CRC or ECC failure, an application reset is triggered.

  In order to allow CPU1 to boot, CPU2 must set BOOT_CPU1 located in RCC_CPUBOOTCR and CPU1_HW_BEN must be active.
- Wake-up event mode for first CPUx selection boot

  This mode is active when LEGACY_BEN and COLD_CPU2 are cleared to 0. In this mode, the selection of the first CPUx to boot is based on CPU1_HW_BEN and CPU2_HW_BEN which are set according to the Standby exit wake-up events definition done in the PWR (see *Section 19: Power control (PWR)* for details about CPU1_HW_BEN and CPU2_HW_BEN).

  Example: if a CPU2 wake-up event occurs, the CPU2 boots on the authenticated RETRAM (based on hardware CRC engine), and restores the product security configuration, while CPU1 is kept on HOLD_BOOT state (see *HOLD_BOOT CPUx state* for details).

Table 118. First CPUx boot selection

LEGACY_BEN	COLD_CPU2	CPU_BEN_SEL	CPU1_HW_BEN	CPU2_HW_BEN	First CPUx boot selection
1	0	NA	0	0	CPU1
			1	0	
			0	1	
			1	1	

Table 118. First CPUx boot selection (continued)

LEGACY_BEN	COLD_CPU2	CPU_BEN_SEL	CPU1_HW_BEN	CPU2_HW_BEN	First CPUx boot selection
0	0	NA	1	0	CPU1
			0	1	CPU2
		0	0	0	CPU1
		1			
		0	1	1	CPU1
		1			CPU2
	1	NA	NA	NA	CPU2

HOLD_BOOT CPUx state

The RCC is used to put either CPU1 or CPU2 on HOLD_BOOT every time the CPUx is reset by a CPU reset (cpu1_rstn or cpu2_rstn).

This function is controlled by BOOT_CPU1 and BOOT_CPU2 in *Section 20.8.27*.

For example, after a CPU2 reset (cpu2_rstn), if BOOT_CPU2 = 0, the CPU2 is kept on HOLD_BOOT state. Else CPU2 is allowed to boot.

Having one CPUx on HOLD_BOOT does not prevent the system to go to Stop or Standby mode. For example, when CPU2 is on HOLD_BOOT, the system is in Stop if CPU1 goes to CStop, then if CPU1 allows the Standby mode (if PDDS bits are set to 1), then the system goes to Standby. The same behavior applies for CPU2 when CPU1 is on HOLD_BOOT.

Figure 79 shows an example of CPU2 reset (cpu2_rstn).

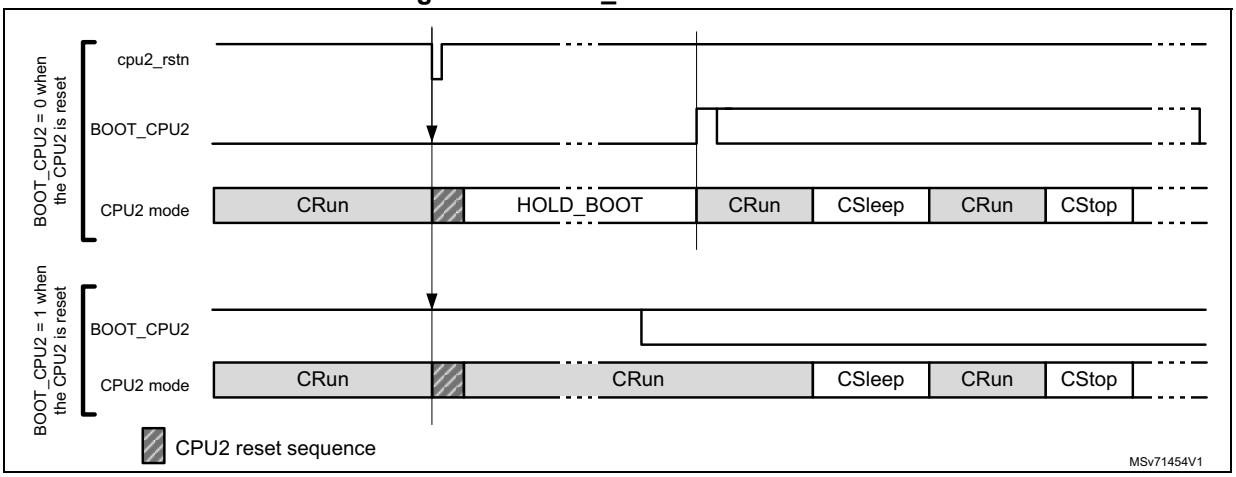
If BOOT_CPU2 = 0, the CPU2 stays in HOLD_BOOT mode until CPU1 sets BOOT_CPU2 to 1.

If BOOT_CPU2 = 1, the CPU2 switches immediately to CRun mode as soon as the CPU2 hardware reset sequence is completed.

In that case, the HOLD_BOOT state is equivalent to CStop. This means that when the CPUx is in HOLD_BOOT, all peripherals allocated by it, are no longer clocked, except the ones able to request a kernel clock, or working with lse_ck or lsi_ck.

Note: Once CPU2 is in CRun, the BOOT_CPU2 bit can be cleared again to 0 without disturbing the CPU2 activity. In that way, the CPU2 is again set in HOLD_BOOT state the next time it is reset via cpu2_rstn. It also applies to CPU1.

Figure 79. HOLD_BOOT CPUx reset



HOLD_BOOT CPUx state after D1 Standby exit

In this case, the CPU1 HOLD_BOOT state is controlled by BOOT_CPU1 in RCC_CPUBOOTCR.

If BOOT_CPU1 = 1, the CPU1 reset is released to allow its boot sequence.

HOLD_BOOT CPUx state after system Standby exit

In this case, HOLD_BOOT state depends on the selection mode of the first CPUx to boot.

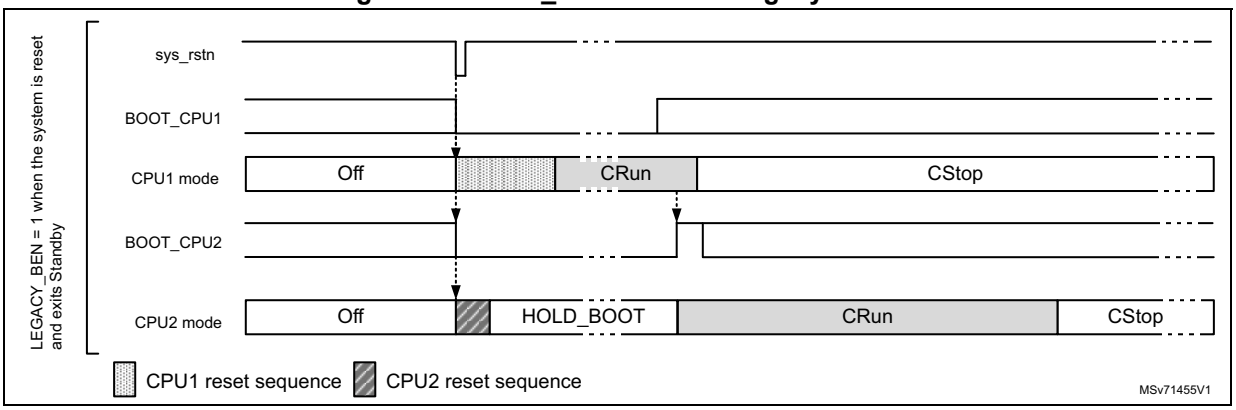
Table 119. HOLD_BOOT state control after system Standby exit

LEGACY_BEN	CPU1 HOLD_BOOT control	CPU2 HOLD_BOOT control
0	CPU1_HW_BEN(1), RCC_STBYBOOTCR.COLD_CPU2, RCC_STBYBOOTCR.CPU_BEN_SEL and RCC_CPUBOOTCR.BOOT_CPU1	CPU2_HW_BEN(1), RCC_STBYBOOTCR.COLD_CPU2, RCC_STBYBOOTCR.CPU_BEN_SEL and RCC_CPUBOOTCR.BOOT_CPU2
1	None	RCC_CPUBOOTCR.BOOT_CPU2(2)

1. CPU1_HW_BEN and CPU2_HW_BEN mirror the wake-up events defined in the PWR to exit system Standby. They can be read in RCC_STBYBOOTCR.
2. The reset value of BOOT_CPU2 applies in this case (see *Legacy mode for first CPUx selection boot*).

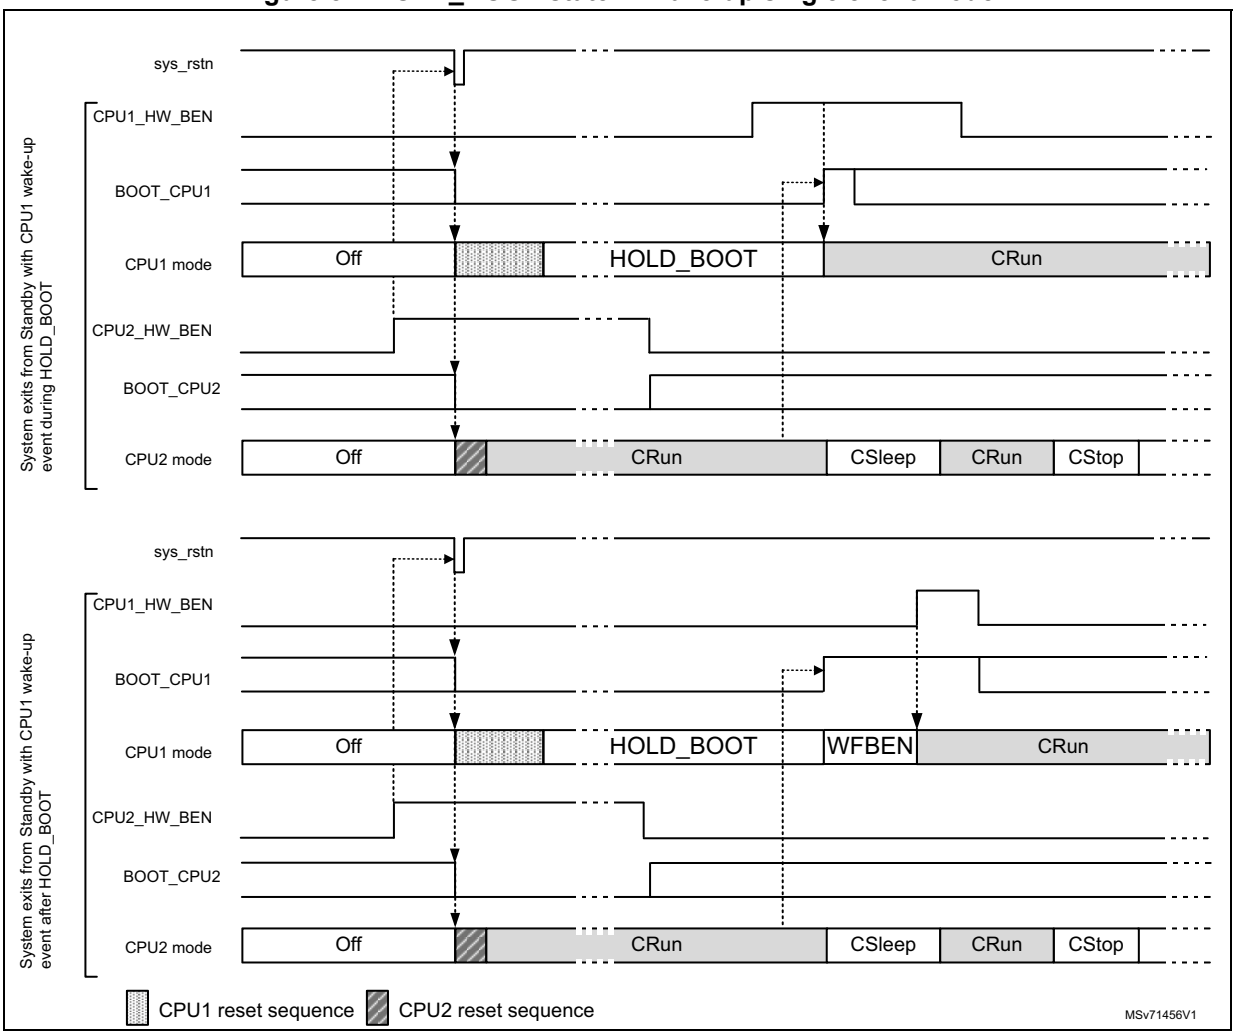
In legacy mode, the HOLD_BOOT state is controlled in the same way as the one described in *HOLD_BOOT CPUx state*.

Figure 80. HOLD_BOOT state in legacy mode



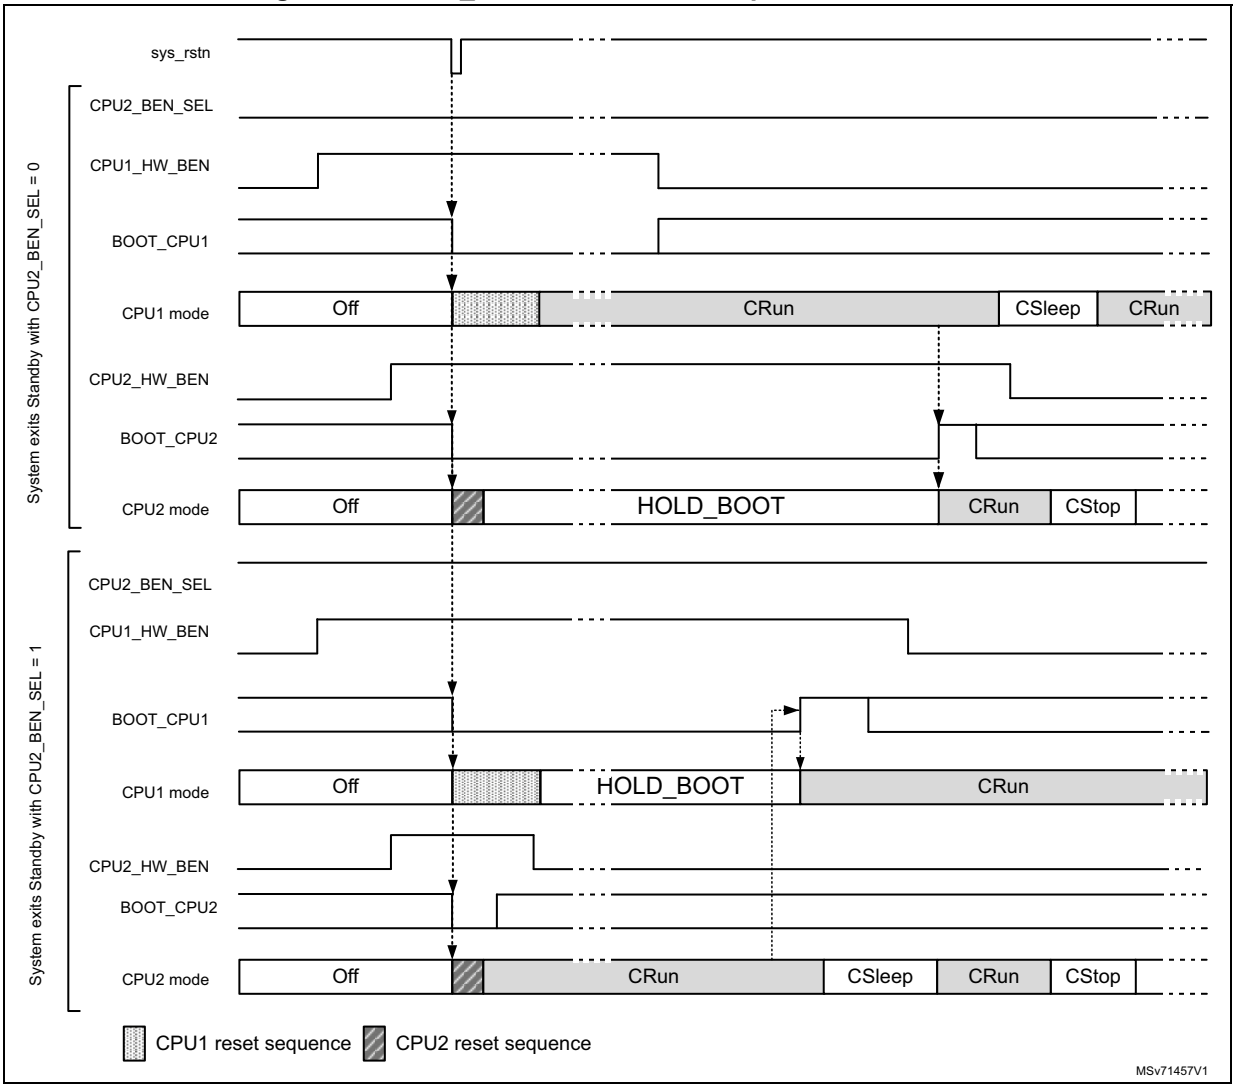
In wake-up event mode, the HOLD_BOOT state is dependent on CPU1_HW_BEN and CPU2_HW_BEN.

Figure 81. HOLD_BOOT state in wake-up single event mode



In this example, the CPU2 is selected first, and it can release the CPU1 HOLD_BOOT state by setting the BOOT_CPU1 bit.

Figure 82. HOLD_BOOT state in wake-up dual event mode



Note: Once a CPU is in CRun, BOOT_CPU1 and BOOT_CPU2 bits can be modified without disturbing the CPU activity.

HOLD_BOOT and WFBEN status for both CPUs are accessible in PWR_CPU1D1SR and PWR_CPU2D2SR (see *Section 19: Power control (PWR)* for details).

20.4 RCC functional description - Clocks

The RCC provides a high degree of flexibility to the application in the choice of the clock generators:

- clock from HSI (high-speed internal) oscillator (~ 64 MHz)
- clock from HSE (high-speed external) oscillator (8 to 48 MHz)
- clock from LSE (low-speed external) oscillator (32 kHz)

- clock from LSI (low-speed internal) oscillator (~ 32 kHz)
- clock from MSI (low-power internal) oscillator (~ 16 MHz)

The RCC offers a good flexibility for the application to select the appropriate clock for CPUs and peripherals, especially for peripherals that need a specific clock (such as SPI(I2S), SAI and SDMMC).

Each clock source can be switched on or off independently in order to optimize the power consumption.

There are mainly three clock paths:

- CPU1 bus matrix
- CPU2 and its bus matrix
- peripheral kernel clocks

Clocking of CPU1 and DDR interfaces are derived locally because of high frequency use. The RCC manages only the source clocks for their related local PLLs.

The RCC provides a flexible clock engine named flexclkgen based on five PLLs and HSI, HSE, MSI and CK_IN clocks to generate all root clocks.

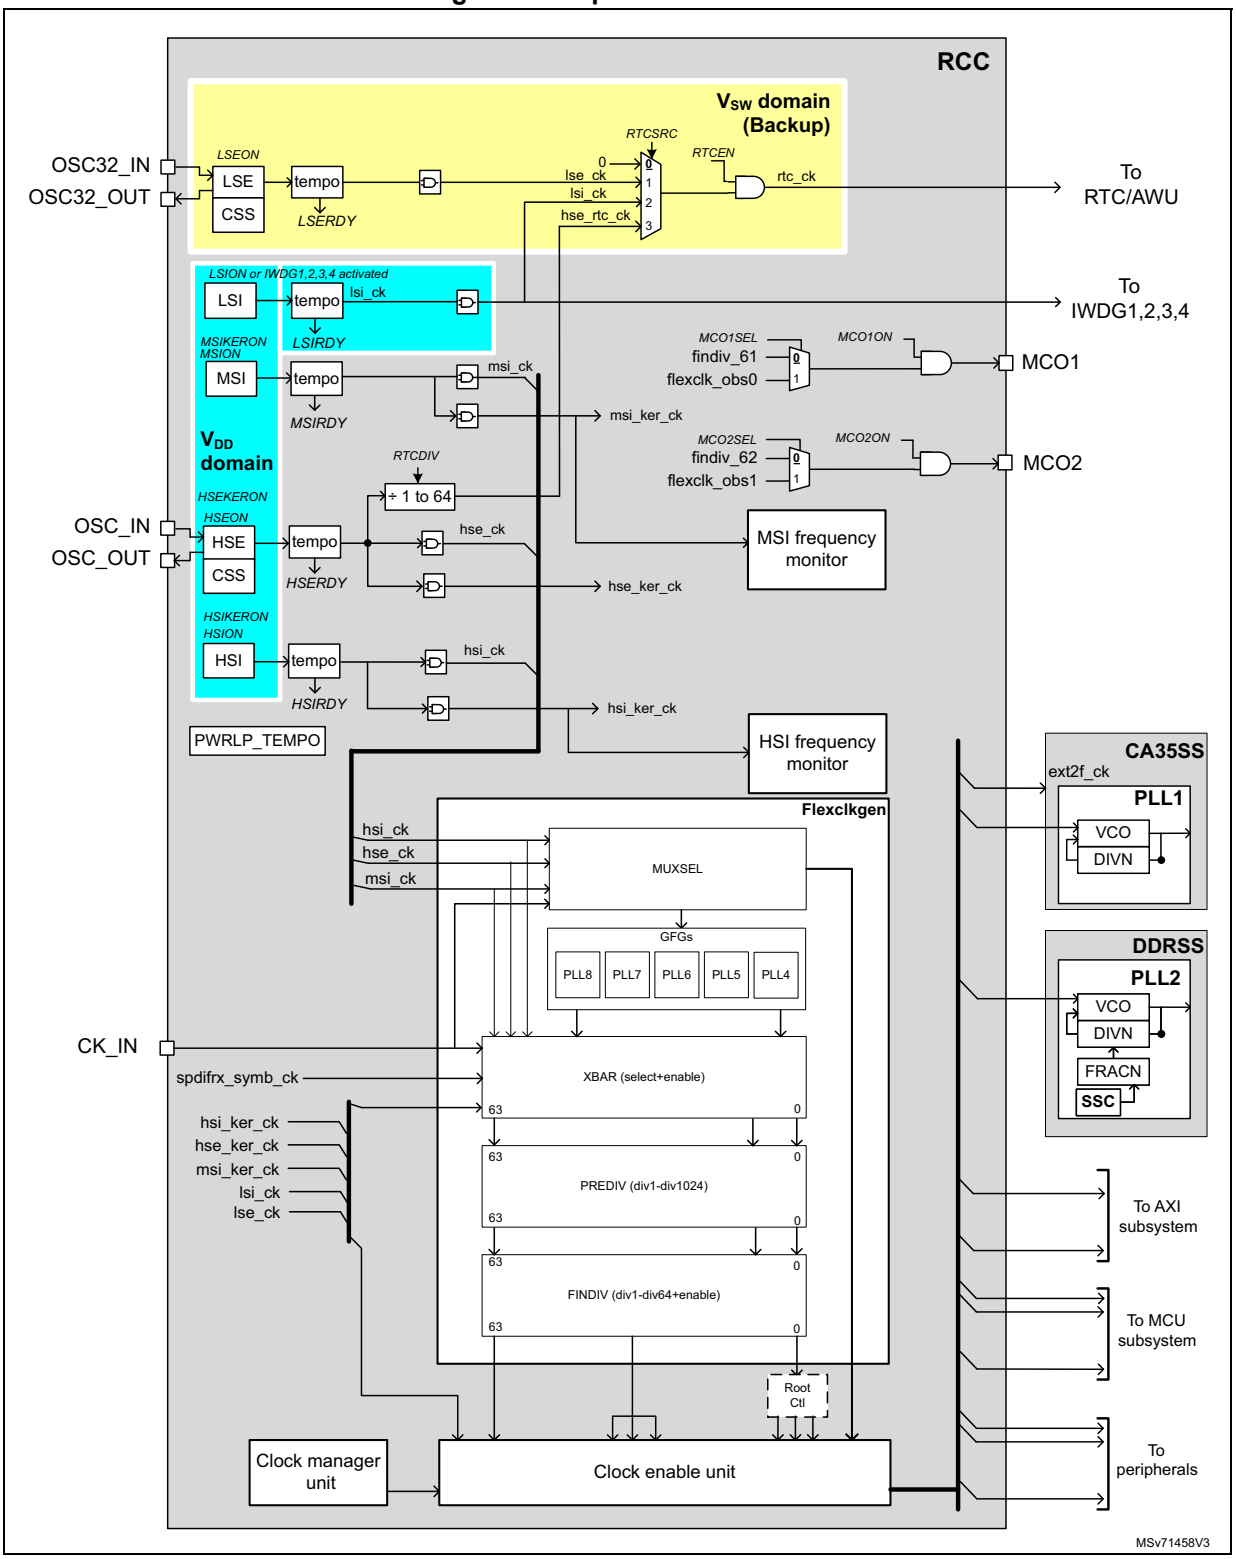
These root clocks are used in the final clock gating stage to generate all product clocks according to the different product system modes (such as Run, Stop, or Standby).

The block named clock enable unit is used to gate the peripheral kernel clock, the bus interface, cores, and bus matrix clocks.

The block named clock manager unit is responsible of the clock stop and restore sequences according to the CPU power states.

As shown in *Figure 83*, the RCC offers two clock outputs (MCO1 and MCO2), with a great flexibility on the clock selection and frequency adjustment.

Figure 83. Top-level clock tree



20.4.1 Clock naming convention

The RCC provides clocks to the complete circuit. In order to avoid misunderstanding, the following terms are used in this document:

- **peripheral clocks**

  Clocks provided by the RCC to peripherals (xxx as peripheral name):

  – programing bus interface clocks ck_icn_p_xxx
  – master data bus interface clocks ck_icn_m_xxx
  – slave data bus interface clocks ck_icn_s_xxx
  – kernel clocks ck_ker_xxx

  A peripheral receives from the RCC one or several bus interface clocks. This clock is generally the AHB, APB, or AXI clock depending on which bus the peripheral is connected to. Some peripherals only need a bus interface clock (such as GPIOx or DMAx).

  Some peripheral request as well a dedicated clock in order to handle the interface function. This clock is named kernel clock. For example peripherals such as SAI, need to generate specific and accurate master clock frequencies, which request dedicated kernel clock frequencies. Another advantage of decoupling the bus interface clock from the specific need of the interface, is that the bus clock can be changed without requesting any reprogramming of the peripheral.

- **external PLL reference clocks**

  For CPU1 and DDR, the RCC provides the following clocks:

  – ck_pll1_ref source clock for PLL1 (CPU1)
  – ck_pll2_ref source clock for PLL2 (DDR)

- **bus matrix clocks**

  Clocks provided to the different bridges (APB, AHB or AXI), called ck_icn_xxx, with xxx is the bus matrix island clock name

20.4.2 Oscillator description

The table hereafter shows the oscillator states versus system modes when the oscillators are enabled via registers. The term “available” means that the resource can be used if activated via registers.

Table 120. Oscillator states versus system modes

System modes	V_{DD} domain					V_{SW} domain
	HSE	HSI	RCBSEC	LSI	MSI	LSE
Exit from system reset	OFF	ON	ON	Available	OFF	Available
In Run1, Run2	Available	Available	ON	Available	Available	Available
In LP-Stop, Stop1, Stop2	Available(1)	Available(2)	OFF	Available	Available(3)	Available
In LPLV-Stop	OFF	OFF	OFF	Available	OFF	Available
In Standby	OFF	OFF	OFF	Available	OFF	Available
In V_{BAT}	OFF	OFF	OFF	OFF	OFF	Available

1. HSE can remain activated in Stop mode if HSEKERON = 1, or if the peripheral generates a kernel clock request.

2. HSI can remain activated in Stop mode if HSIKERON = 1, or HSION = 1, or if the peripheral generates a kernel clock request or a bus interface clock request (autonomous peripheral).
3. MSI can remain activated in Stop mode if MSIKERON = 1, or if the peripheral generates a kernel clock request.

HSE oscillator

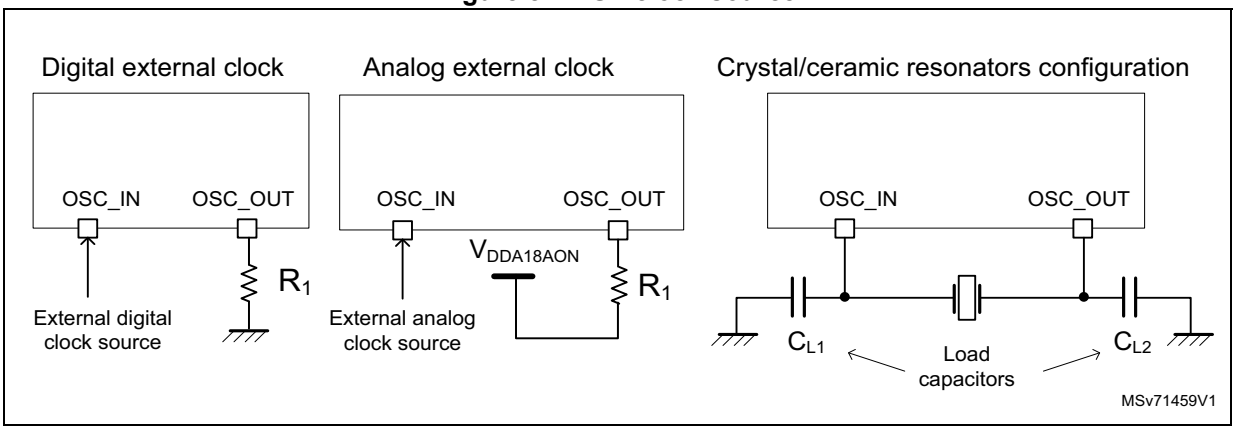
The HSE can generate a clock from three possible sources:

- external analog clock source
- external digital clock source
- external crystal/ceramic resonator

In order to allow the boot ROM to detect in which configuration the HSE is used, a resistor (R_1) must be connected either to the GND or to V_{DD}.

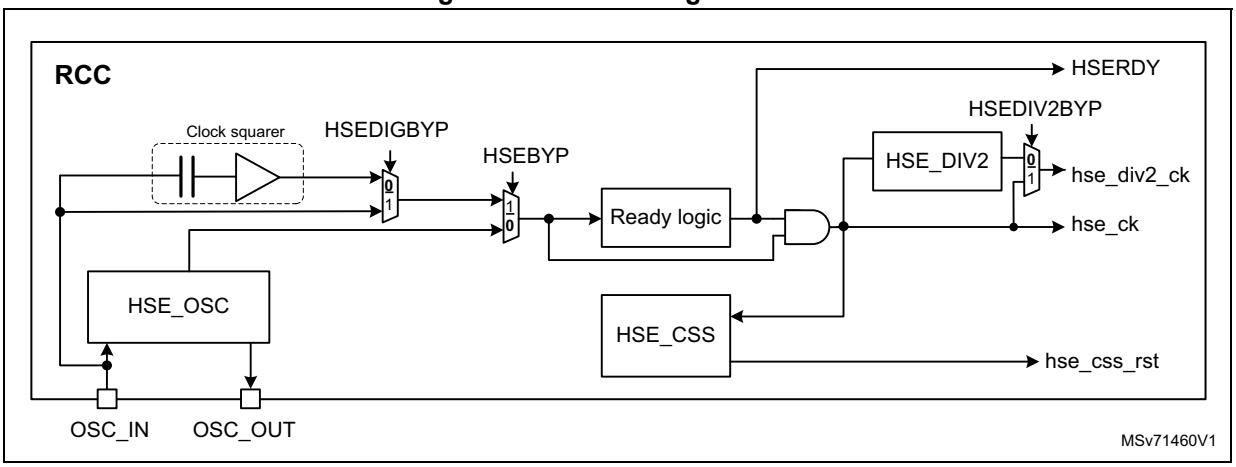
The resistor must be connected to GND when the HSE uses an external digital clock. The resistor must be connected to $V_{DDA18AON}$ when the HSE uses an external analog clock, and removed if a crystal or ceramic resonator is used. See the datasheet for C_{L1}, C_{L2} and R_1 values.

Figure 84. HSE clock source



HSERDY in RCC_OCRDYR indicates if the HSE is stable or not. When the HSE is enabled (HSEON = 1), HSERDY goes to 1 when 1024 cycles of HSE clock have been counted. The hse_ck clock is not released until HSERDY is set by hardware. An interrupt can be generated if enabled in RCC_C1CIESETR or RCC_C2CIESETR.

Figure 85. HSE clock generation



The HSE frequency can also be measured via the clock frequency calculator module in the flexclkgen engine (see *Section 20.6.1* for details).

Note: The HSE can be kept enabled when the system is in one of LP-Stop or Stop modes (see Section 20.4.8).

The HSE clock can be driven to MCO1 and MCO2 outputs, and can be used as a clock source for other application components.

External clock configuration (HSE bypass)

The HSE accepts an external clock source on OSC_IN when the bypass mode is selected (HSEBYP = 1).

The external clock signal connected to OSC_IN pin can be digital or low-swing (analog). The low-swing clock signal is supported thanks to an internal clock squarer. The input signal must have a duty cycle close to 50%.

In order to switch the HSE in external clock mode, the following steps are needed:

1. Disable the HSE by writing 1 to HSEON in RCC_OCENCLRR.
2. Check that the HSE is disabled (HSERDY = 0 in RCC_OCRDYR).
3. Set HSEDIGBYP
   - to 1 if the clock provided to OSC_IN is full-swing digital signal
   - to 0 if the clock provided to OSC_IN is low-swing signal

   This bit is controlled via RCC_OCENSETR and RCC_OCENCLRR.
4. Set HSEBYP bit by writing 1 to HSEBYP in RCC_OCENSETR.
5. Enable again the HSE by writing 1 to HSEON in RCC_OCENSETR, to activate hse_ck.
6. Check that the HSE is ready for use (HSERDY = 1 in RCC_OCRDYR).

The OSC_OUT pin must be left HI-Z (see *Figure 84* and *Figure 85* for details). Refer to the datasheet for additional information.

External crystal/ceramic resonator configuration

The oscillator is enabled by setting HSEBYP to 0 and HSEON to 1.

The HSE can be used when the product needs a very-accurate high-speed clock. When HSEDIV2ON = 1 in RCC_OCENSETR, a divide-by-two clock path (hse_div2_ck) is available for dedicated peripherals that require the same low noise sensitivity as USB2PHY1 or USB2PHY2. HSEDIV2BYP in RCC_OCENSETR selects the hse_div2_ck clock source.

The associated hardware configuration is shown in *Figure 84*. The resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize the output distortion and the startup stabilization time. The loading capacitance values must be adjusted according to the selected crystal or ceramic resonator (see the electrical characteristics of the datasheet for more details).

HSI oscillator

The HSI provides the default clock to the product. It is a high-speed internal RC oscillator which can also be used directly as clock source for CPUx, interconnects, and peripherals, or as PLL input.

Some HSI advantages are listed below:

- no need of external crystal (low-cost clock source)
- startup time faster than HSE (few microseconds)
- reduced power consumption

The HSI frequency precision, even with frequency calibration, is less accurate than an external crystal oscillator or ceramic resonator.

Care must be taken when the HSI is used as kernel clock for communication peripherals: the application has to take into account the following parameters:

- time interval between the moment where the peripheral generates a kernel clock request, and the moment where the clock is really available
- frequency accuracy

Note: The HSI can be kept enabled when the system is in one of LP-Stop or Stop modes (see Section 20.4.8).

HSIRDY in RCC_OCRDYR indicates if the HSI is stable or not. At startup, the HSI output clock is not released until HSIRDY is set by hardware. The HSI activation can also be controlled by the application via HSION in RCC_OCENSETR and RCC_OCENCLRR.

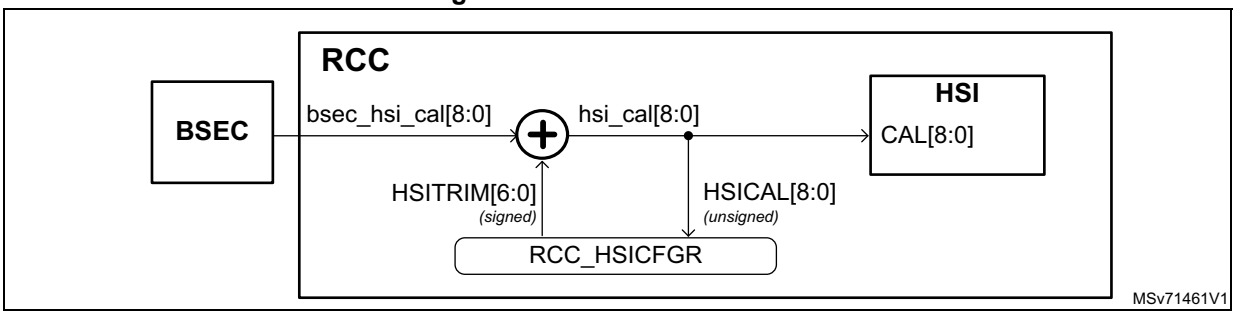
The HSI clock can be driven to MCO1 and MCO2 outputs and can be used as a clock source for other application components.

HSI calibration

RC oscillator frequencies can vary from one chip to another due to manufacturing process variations. This is why each device is factory calibrated by ST for an accuracy of ACC_{HSI} (see the product datasheet for more information).

When an app_rstn occurred, the factory calibration value is reloaded in the HSI, and is visible in HSICAL[8:0] bits. If the application is subject to voltage or temperature variations, this may affect the RC oscillator frequency. The user can trim the HSI frequency using the HSITRIM[6:0] bits. HSICAL[8:0] and HSITRIM[6:0] are in RCC_HSICFGR (see *Section 20.6.2* for additional information).

Figure 86. HSI calibration flow



Note: The HSI clock divided by 8 is also used for I/O compensation mechanism, and needs to be enabled if the I/O compensation mechanism is activated (see Section 23: System configuration controller (SYSCFG) for details).

MSI oscillator

The MSI is a low-power RC oscillator which can also be used directly as source clock for CPUx, interconnects, peripherals, or as PLL input.

The following point must be considered: If the MSI clock is currently used as kernel clock for some peripherals, the application has to ensure that the MSI frequency change does not disturb the peripherals.

Some MSI advantages are listed below:

- no need of external crystal (low-cost clock source)
- startup time faster than HSE (few microseconds)
- very-low-power consumption

Note: The MSI provides a clock frequency of 16 MHz, while the HSI is able to provide a clock up to 64 MHz.

The MSI frequency precision, even with frequency calibration, is less accurate than an external crystal oscillator or ceramic resonator.

Even if the MSI settling time is faster than the HSI one, care must be taken when the MSI is used as kernel clock for communication peripherals: the application has to take into account the following parameters:

- time interval between the moment where the peripheral generates a kernel clock request and the moment where the clock is really available
- frequency accuracy

Note: The MSI can be kept enabled when the system is in one of LP-Stop, Stop modes (see Section 20.4.8 for additional information).

The MSI clock can be driven to MCO1 and MCO2 outputs and can be used as a clock source for other application components.

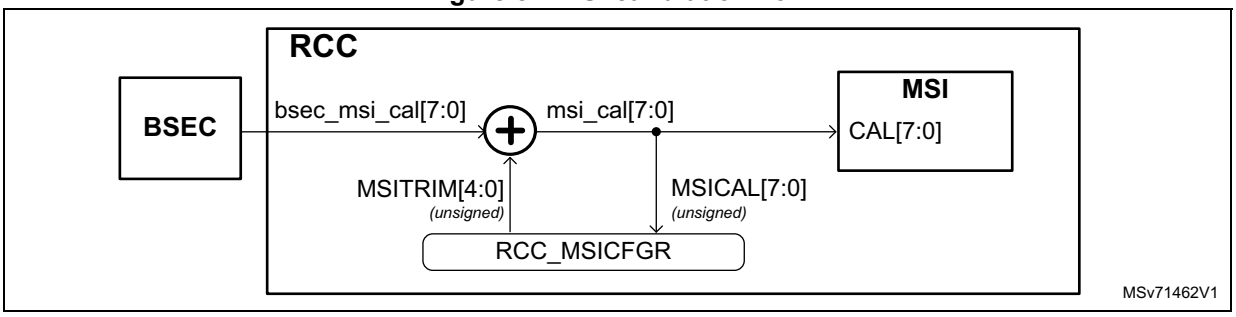
The MSI can also be controlled by the application via MSION in RCC_OCENSETR and RCC_OCENCLRR.

MSI calibration

RC oscillator frequencies can vary from one chip to another due to manufacturing process variations. This is why each device is factory calibrated by ST for an accuracy of ACC_{MSI} (see the product datasheet for more information).

When an app_rstn occurred, the factory calibration value is reloaded into the MSI, and is visible on MSICAL[7:0] bits. If the application is subject to voltage or temperature variations, this may affect the RC oscillator frequency. The user can trim the MSI frequency using the MSITRIM[4:0] bits. MSICAL[7:0] and MSITRIM[4:0] are in RCC_MSICFGR (see *Section 20.6.2* for additional information.

Figure 87. MSI calibration flow



RCBSEC oscillator

The RCBSEC is a 64 MHz RC oscillator dedicated to clock the BSEC.It is always activated after a vcore_rstn reset.

When the system goes in Stop or Standby mode, the RCBSEC clock is disabled by hardware (see *Section 20.4.8* for additional information).

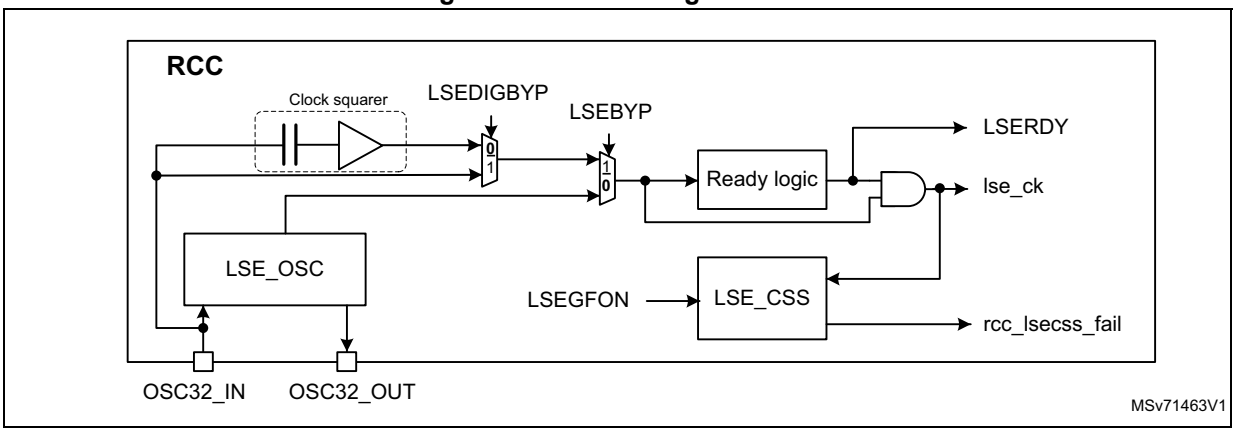
Note: The RCBSEC is also used as the source of the RNG1 and RNG2 kernel clocks. Peripheral kernel clock gating rules apply.

LSE oscillator

The LSE can generate a clock from two possible sources: external crystal/ceramic resonator, or external user clock.

The LSE offers a LSERDY flag which indicates if the LSE clock is available or not. When the LSE is enabled (LSEON = 1), LSERDY goes to 1 when 4096 cycles of LSE clock have been detected. This mechanism is also activated for an external clock source (LSEBYP = 1) with LSERDY set after the detection of 16 cycles of LSE clock. An interrupt can be generated if enabled in RCC_C1CIESETR or RCC_C2CIESETR when the LSE is ready.

Figure 88. LSE clock generation



The LSE oscillator is switched on and off using the LSEON bit. The LSE remains enabled when the system enters Stop, LP-Stop, LPLV-Stop, Standby, or V_{BAT} mode.

The LSE clock can be driven to MCO1 and MCO2 outputs and can be used as a clock source for other application components.

External clock source (LSE bypass)

In this mode, an external clock source must be provided to OSC32_IN pin. The input clock can have a frequency up to 32.768 kHz, and be low-swing. This mode is selected by setting LSEBYP to 1.

The external clock signal can be digital or analog (square, sinus or triangle). Analog clock signal with a reduced amplitude is supported thanks to an internal clock squarer. The input signal must have a duty cycle close to 50%. The OSC32_OUT pin must be left HI-Z (see *Figure 84* and *Figure 85* for details). Refer to the datasheet for additional information.

In order to select the external clock source, the following steps are needed:

1. Set DBP = 1 in PWR_BDCR to allow write accesses to RCC_BDCR.
2. Disable the LSE by writing 0 to LSEON.
3. Check that the LSE is disabled (LSERDY = 0).
4. Set LSEDIGBYP
   - to 1 if the clock provided to OSC32_IN is full-swing digital signal
   - to 0 if the clock provided to OSC32_IN is low-swing signal
5. Set LSEBYP to 1.
6. Enable again the LSE by writing 1 to LSEON.
7. Check that the LSE is ready for use (LSERDY = 1).
8. Set DBP = 0 in PWR_BDCR to write-protect accesses to RCC_BDCR.

Note: All these bits (except DBP*) are in RCC_BDCR.*

External crystal/ceramic resonator (LSE crystal)

The LSE clock is generated from a 32.768 kHz crystal or ceramic resonator. It has the advantage of providing a low-power but highly accurate clock source to the RTC for clock/calendar or other timing functions.

In order to select the external clock source, the following steps are needed:

- Set DBP = 1 in PWR_BDCR to allow write accesses to RCC_BDCR.
- Disable the LSE by writing 0 to LSEON.
- Check that the LSE is disabled (LSERDY = 0).
- Clear LSEBYP to 0.
- Enable again the LSE by writing 1 to LSEON.
- Check that the LSE is ready for use (LSERDY = 1.
- Set DBP = 0 in PWR_BDCR to write-protect accesses to RCC_BDCR.

Note: All these bits (except DBP*) are in RCC_BDCR.*

The LSE on MCO1 or MCO2 outputs is only available in Run, LP-Stop, or Stop. In LPLV-Stop, Standby and V_{BAT}, LSE is not available from MCO1 or MCO2 outputs. When entering Standby or V_{BAT}, a spike may occur on MCO1 or MCO2.

The LSE offers a programmable driving capability (LSEDRV[1:0]) of the oscillator amplifier. The driving capability must be changed before enabling the LSE oscillator.

Warning: It is not allowed to change the driving capability when the LSE is enabled. The LSE behavior is not guaranteed in that case.

LSI oscillator

The LSI acts as a low-power clock source that can be kept running when the system is in Stop or Standby mode, for the independent watchdogs (IWDGx) and auto-wake-up unit (AWU). The clock frequency is around 32 kHz (see electrical characteristics in the product the datasheet for details).

The LSI can be switched on and off using LSION in RCC_LSICR. LSIRDY in RCC_LSICR indicates if the LSI oscillator is stable or not. If an independent watchdog is started by either hardware option or software access, the LSI is forced on and cannot be disabled.

At LSI startup, the clock is not provided until the hardware sets LSIRDY. An interrupt can be generated if enabled in RCC_C1CIESETR or RCC_C2CIESETR.

The LSI clock can be driven to MCO1 and MCO2 outputs and can be used as a clock source for other application components.

Note: The LSI on MCO1 or MCO2 outputs is only available in Run, LP-Stop or Stop. In LPLV-Stop and Standby, LSI is not available from MCO1 or MCO2 outputs. When entering Standby, a spike may occur on MCO1 or MCO2.

20.4.3 Clock security system (CSS)

CSS on HSE

The RCC features a clock security system allowing the application to detect if the HSE clock stops toggling due to an unexpected reason, or if the HSE frequency clock is below 8 MHz. This may be caused for example, by an hardware failure or an attack. In the case of failure detection, the CSS generates a system reset, and protects the sensitive BKPSRAM data.

The CSS can be activated by the application software via HSECSSON. This bit can be activated even when HSEON = 0. The CSS on HSE is enabled by the hardware when the HSE is enabled and ready, and HSECSSON = 1.

The CSS on HSE is disabled when the HSE is disabled (system is Stop or Standby mode).

HSECSSON cannot be cleared by software. It is cleared by hardware when a system reset occurs, or when the system enters Standby mode.

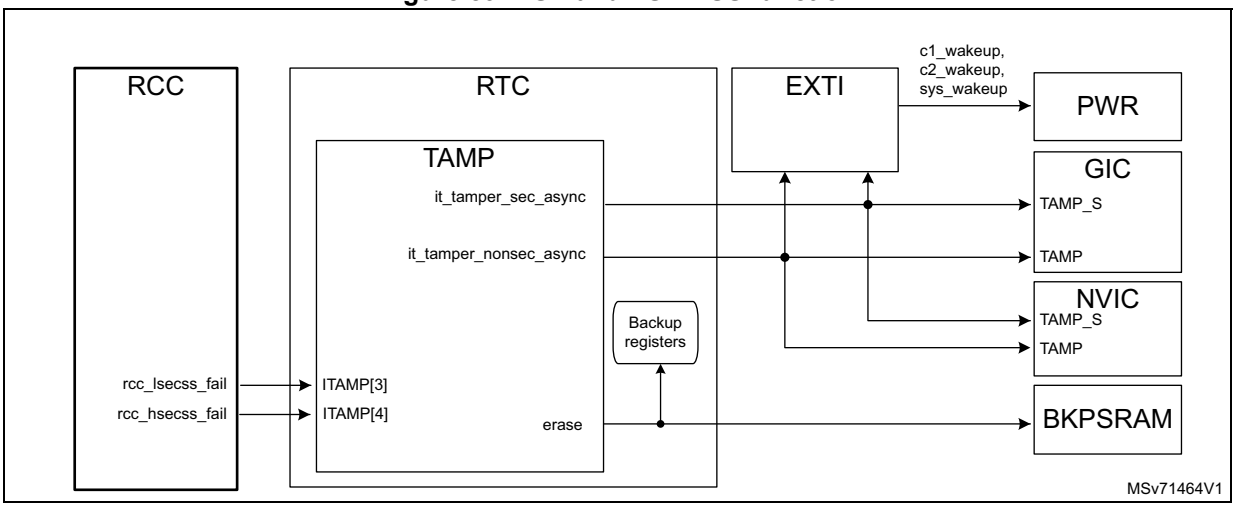
If a failure is detected on the HSE:

- RCC generates an application reset (app_rstn) via hse_css_rst. HCSSRSTF is set in order to allow the application to identify the reset root cause.
- A failure event (rcc_hsecss_fail) is generated. This event is connected to the TAMP block, allowing the protection of backup registers and BKPSRAM.

Figure 89 shows the blocks involved in the HSE and LSE CSS function. Refer to these blocks description for more details.

Note: Before selecting again the HSE clock after an HSE failure, HCSSRSTF must be cleared in RCC_HWRSTSCLRR. The Boot ROM performs this task by resetting HCSSRSTF after an HSE failure. The Boot ROM reboots then the circuit if the selected boot source does not require the HSE resource. Refer to Boot ROM documentation for details.

Figure 89. HSE and LSE CSS function



CSS on LSE

The RCC features a CSS allowing the application to detect if the LSE clock stops toggling due to an unexpected reason, or if the LSE frequency clock is above 2 MHz max frequency. This may be caused for example, by an hardware failure or an attack. In case of failure detection, the CSS generates a failure event, disables the clock provided to the RTC, and protects sensitive BKPSRAM data.

The CSS on LSE can be activated by setting to 1 LSECSSON in RCC_BDCR. This bit can be disabled only by hardware in one of the following conditions:

- after a vsw_rstn reset (see *Figure 74*)
- after a failure detection on LSE

The CSS on LSE activation must be done in the following order:

1. Set LSEGFON to 1 in RCC_BDCR to filter glitch on LSE clock.
2. Set LSEON to 1 in RCC_BDCR, and wait for LSERDY = 1 in RCC_BDCR.
3. Select the LSE clock via RTCSRC in RCC_BDCR.
4. Set LSECSSON to 1 in RCC_BDCR.

The CSS on LSE works in all system modes.

If a failure is detected on the LSE:

- The clock provided to the RTC is disabled immediately by the hardware (with RTCSRC = 0).
- LSEGFON, LSEON and LSECSSON values are not changed by hardware.
- A failure event is generated (rcc_lsecss_fail). This event is connected to the TAMP, allowing wake-up from Standby, and protection of backup registers and BKPSRAM.
- LSECSSF interrupt flag is activated in order to generate an interrupt to the CPU1 or CPU2 if needed.

The CSS on LSE offers two flags in order to detect a failure: LSECSSD in RCC_BDCR, and LSECSSF in RCC_C1CIFCLRR and RCC_C2CIFCLRR.

In case of failure, the following steps are needed:

1. Disable the CSS function (mandatory).
   a) Clear LSECSSON to 0.
   b) Clear LSEON to 0 in order to disable the LSE.
   c) Clear LSECSSF if interrupt was enabled for this event.
2. Change the clock source for the RTC if needed:
   a) Clear RTCEN to 0 to disable the RTC clock.
   b) Enable the new clock source for the RTC.
   c) Select the proper clock source via RTCSRC.
   d) Set RTCEN to 1 to enable the RTC clock.

The software can take any other required actions to secure the application.

Figure 89 shows the blocks involved in the HSE and LSE CSS function.

Note: The clock security feature must not be re-enabled.

Before reusing the CSS function for LSE, a backup domain reset must be performed for example via VSWRST in RCC_BDCR.

20.4.4 Clock output generation (MCO1 and MCO2)

Two clock output (MCO) pins are available: MCO1 and MCO2. A clock source can be selected for each one. MCO1 and MCO2 outputs are provided via two channels of the flexclkgen engine (see *Figure 90* for additional information).

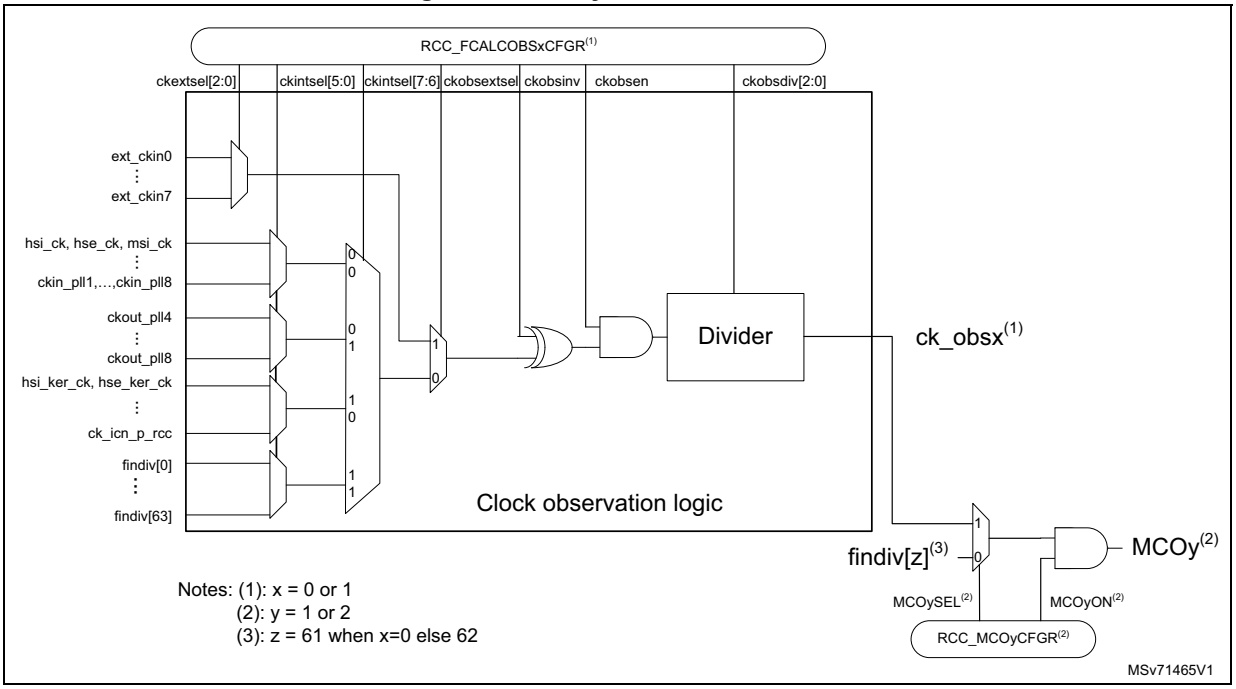
MCO1 and MCO2 outputs are controlled via MCO1ON, MCO1SEL, MCO2ON and MCO2SEL in RCC_MCO1CFGR and RCC_MCO2CFGR.

For each MCO pin, the corresponding GPIO port has to be programmed in the right alternate function mode. When the final divider channel is used for these outputs, the duty cycle is 50%.

MCO1 and MCO2 outputs are only available in Run and Stop modes. In Stop mode, the PLL clocks are not available.

Caution: The clock provided to the MCOs outputs must not exceed the maximum I/O speed (see the product datasheet for information about the supported I/O speed).

Figure 90. MCOy clock observation



20.4.5 PLL description

The RCC features five PLLs with the same features:

- PLL4 and PLL5 used to provide the system clocks
- PLL6 used for the generation of kernel clocks to video peripherals.
- PLL7 and PLL8 used for the generation of kernel clocks to audio peripherals.

Note: The above PLL use is only a recommendation.

PLLTS16FFCLAFRAC2 main features

- VCO range between 800 and 3200 MHz
- Input frequency range:
  - Integer mode: 5 MHz to 1200 MHz
  - Fractional mode: 10 MHz to 1200 MHz

  Note: The maximum input frequency is 64 MHz on the STM32MP21xx.
- Working modes
  - Fractional mode, using 24-bit delta-sigma modulator. The delta-sigma modulator can be updated on-the-fly, without generating frequency overshoots on PLL outputs.
  - Integer mode
  - Spread spectrum mode in order to reduce EMI. The fully digital component (spread-spectrum modulator called SSMOD) is used in that case.
- Up to 6 outputs:

– 1 output without post-divider
– 5 outputs with post-dividers

Figure 91. PLL block diagram

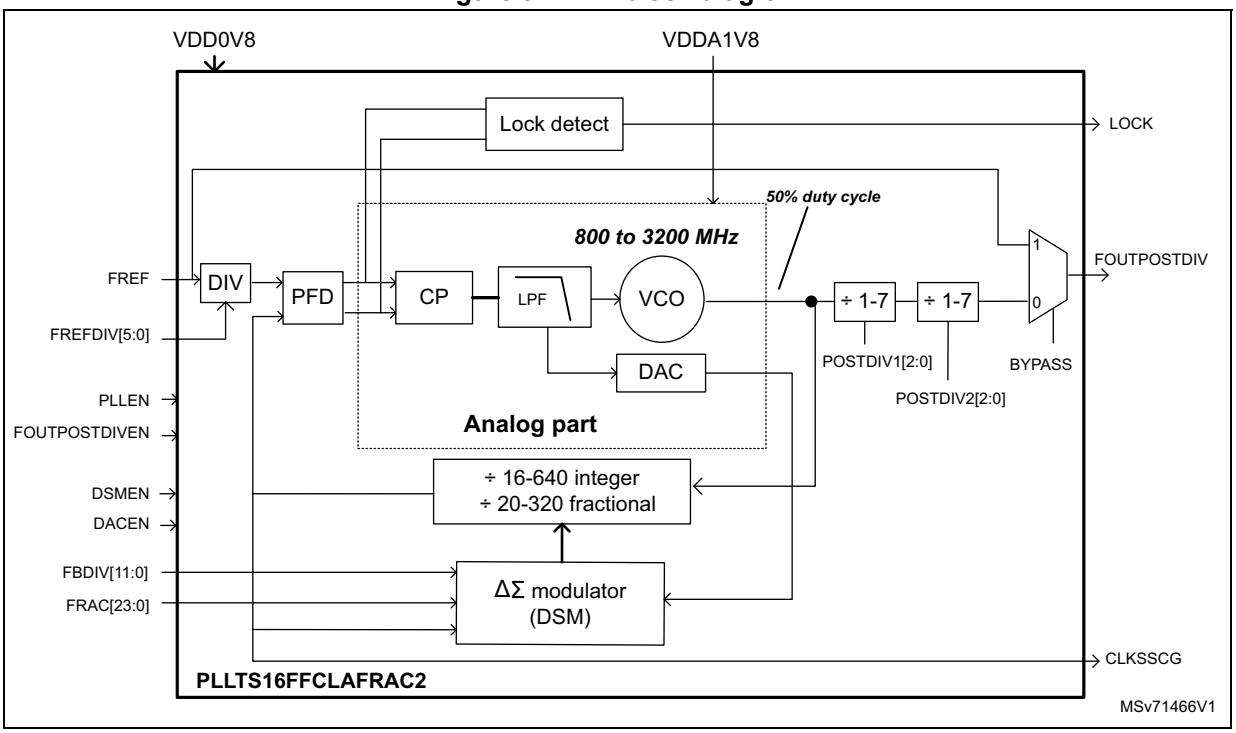


Figure 92. PLL with SSMOD (spread-spectrum modulator) configuration

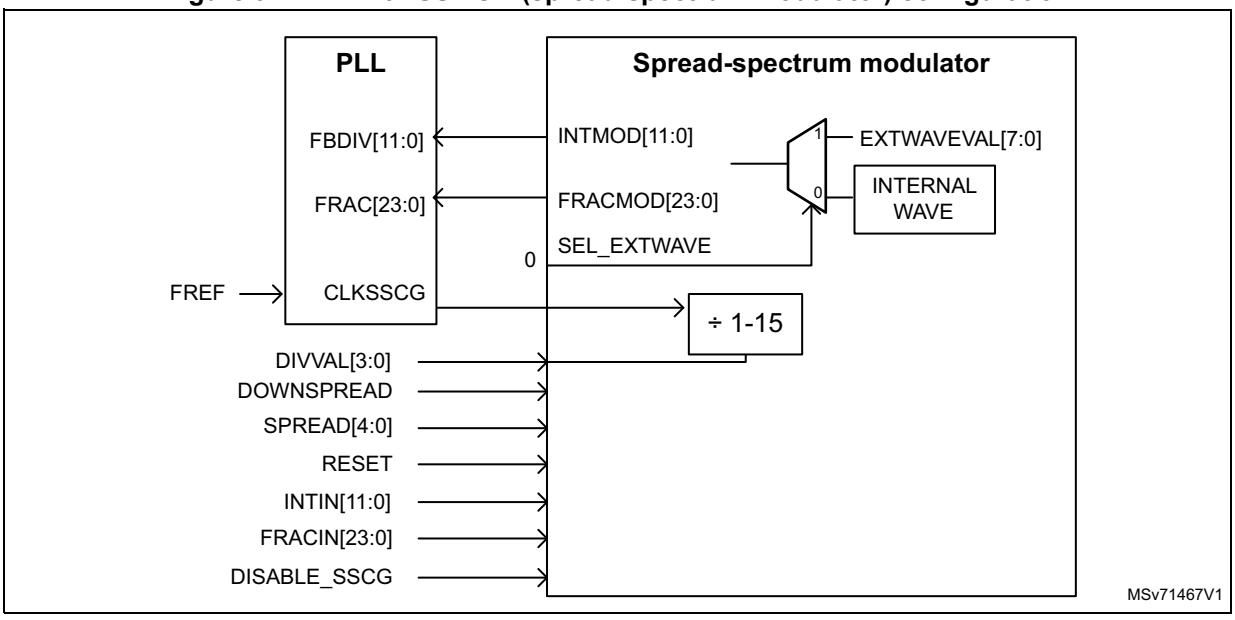


The FOUTPOSTDIV output is provided as a source clock on the flexclkgen crossbar stage. The PLLs are embedded in the generic frequency generator (GFG) stage of the flexclkgen component, and are controlled via RCC_PLLxCFGRy (x = 4 to 8 and y = 1 to 7).

The user must provide to each PLL, a clean reference clock (FREF) in the accepted input frequency range:

- 5 to 1200 MHz in the integer mode
- 10 to 1200 MHz in the fractional mode

The application has to program properly the FREFDIV dividers in order to match these conditions. The PLL loop divider (FBDIV) has to be programmed in order to get the expected frequency at VCO output. The VCO output range must be respected.

The PLLs can be disabled by setting the corresponding PLLEN bit to 0. LOCK bits inform the user that the PLL is ready (locked).

When the PLLs are enabled, post-dividers (POSTDIV1, POSTDIV2) values can be changed without disabling the corresponding PLL.

PLL programming recommendations

This section provides recommendations to follow in order to guarantee a good PLL use.

- Before enabling the PLLs, the user must ensure that the reference frequency (FREF) provided to the PLL is in the good range.
- When the PLLs are enabled, changing FREFDIV, FBDIV, FRAC, POSTDIV1,or POSTDIV2 values conducts to an invalid output frequency, with the risk of crashing the system. There is no hardware protection. It is up to the application to avoid this situation.
- When one or several PLL outputs are not used, the application must set the corresponding enable bit PLLEN to 0.

The PLLs can work in three different modes:

- Integer mode

  The PLL works in integer mode when the delta-sigma modulator (DSM) is loaded with 0, and DISABLE_SSCG = 1.

  In order to load 0 into the DSM, the user has to perform the following sequence:

  a) Write 0 to FRAC, DSMEN, and DACEN.

  b) Write 1 to RESET.

  c) Write 1 to PLLEN.

  The VCO frequency (FOUT) is given by the following expression:

$$F_{FOUT} = \frac{F_{FREF} \times FBDIV}{FREFDIV}$$

  The frequency at the output of the post-divider is given by:

$$F_{FOUTPOSTDIV} = \frac{F_{FOUT}}{POSTDIV1 \times POSTDIV2}$$

- Fractional mode

  The fractional mode is activated when the value loaded into the DSM is different from 0, DISABLE_SSCG = 1, and DSMEN = 1.

  The DSM value can be updated at anytime by the application by executing the following sequence:

  a) Write into FRAC the new fractional value.

  b) The new FRAC value is loaded into the DSM when CLKSSCG goes from 0 to 1.

  The DSM is designed to minimize the jitter impact while allowing very small frequency steps. When the PLL is used in fractional mode, the FBDIV divider value must be initialized before enabling the PLL (FBDIV min = 20), but the FRAC value can be changed on-the-fly without disturbing the PLL output. This feature can be used either to generate a specific frequency, with a good accuracy from any crystal value, or to perform a fine tuning of the frequency on-the-fly.

  The VCO frequency is given by the following expression:

$$F_{FOUT} = \frac{F_{FREF} \times \left(FBDIV + \frac{FRAC}{2^{24}} \right)}{FREFDIV}$$

  See FOUTPOSTDIV frequency formula above.

- Spread-spectrum mode

  This mode is activated when the DSM is loaded with 0, and when DISABLE_SSCG = 0. This feature is available on all PLLs.

  The spread-spectrum technique consists of modulating the VCO frequency with a low-frequency signal (in our case a triangular signal), in order to spread the clock energy into a wider frequency band. The amount of emitted EMI peaks is then reduced.

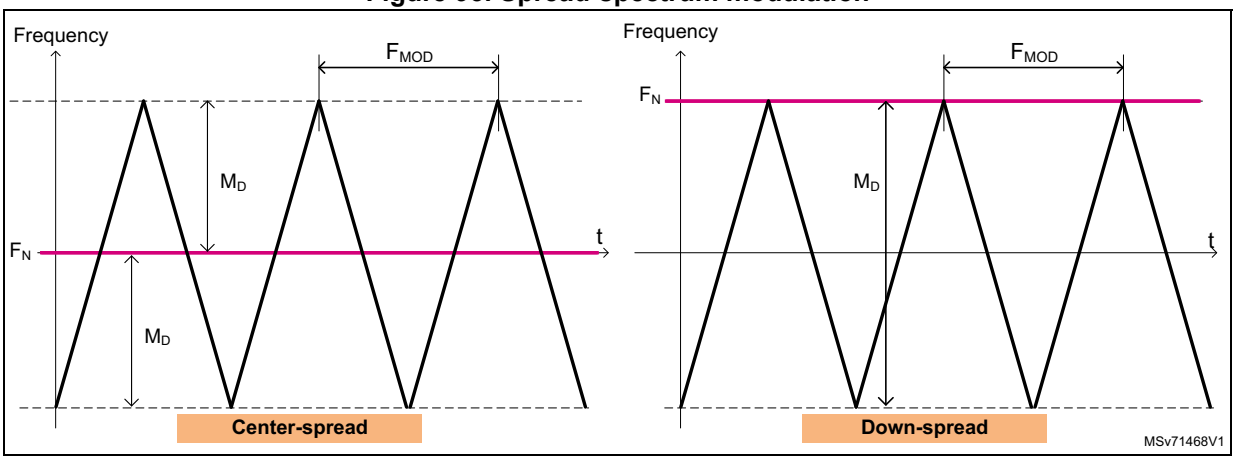
  The spread-spectrum modulation parameters are adjusted via the following fields:

  – DIVVAL[3:0] in RCC_PLLxCFGR5 used to adjust the modulation frequency
  – SPREAD[4:0] in RCC_PLLxCFGR5 used to adjust the modulation depth (or modulation index)
  – DOWNSPREAD in RCC_PLLxCFGR3 used to define if the modulation is centered around the VCO frequency (center-spread), or if it is lowered with respect to VCO frequency (down-spread)

  The figure below shows the signal modulating the nominal frequency (F_N), when DOWNSPREAD = 0 (center-spread) and DOWNSPREAD = 1 (down-spread).
  The nominal frequency is the frequency output by the PLL in integer mode, when no clock spreading is applied.

  Setting DOWNSPREAD = (down-spread) guaranties that the PLL output frequency does not exceed the programmed frequency value when the SSCG is enabled.

Figure 93. Spread-spectrum modulation



The peak modulation depth (in percentage) is given by the following formula:

$$M_D\ (\%) = \pm \text{SPREAD} \times 0.1$$

Example: SPREAD = 0b10010 means a ±1.8% modulation amplitude in center-spread mode, and -1.8% in down-spread mode.

Note: The modulation is turned off when SPREAD = 0.

The modulation frequency (F_{MOD}) is given by:

$$F_{MOD} = \frac{F_{CLKSSCG}}{128 \times \text{DIVVAL}}$$

where 128 equals to the number of points in the internal wave table, and DIVVAL equals to the user defined divide value.

Note: When the PLL is locked, $F_{CLKSSCG} = F_{PFD}$. The upper limit of the modulation frequency (F_{MOD}) is set by the PLL bandwidth.

The PLL bandwidth limits the maximum modulation to $F_{CLKSSCG}/200$ where $F_{CLKSSCG} = F_{FREF}/FREFDIV$ or 50 MHz, whichever is lower.

In order to use the spread spectrum feature, the following steps are needed:

a) Program the PLL as detailed in *Integer mode* in order to adjust the nominal frequency (F_N) according to the targeted by the application.

b) Compute DIVVAL according to the wanted modulation frequency (F_{MOD}):

$$DIVVAL = ROUND\left(\frac{F_{CLKSSCG}}{128 \times F_{MOD}}\right)$$

c) Compute SPREAD according to the wanted modulation depth (M_D).

d) Set DOWNSPREAD according to the wanted modulation type.

e) Compute INTIN accordingly (FRACIN = 0):

$$INTIN = ROUND\left(\frac{F_N \times FREFDIV}{F_{FREF}}\right)$$

f) Clear DISABLE_SSCG, DSMEN, and DACEN to 0.

g) Assert RESET to 1 and PLLEN to 0. PLLEN must be held at 0 for 1 ?s to make sure the PLL is fully reset.

h) Set PLLEN, DSMEN and DACEN to 1 (see note below).

i) Wait until the first CLKSSCG edge, and clear RESET to 0 (can be done before PLL is locked, or anytime afterwards).

Note: After some time the PLL is locked and outputs a spread-spectrum clock. Since the spread-spectrum accuracy relies on the fractional-N capability of the PLL the fractional modulator must be operating. DSMEN and DACEN must be set to 1.

The user can check F_{MIN},F_{MAX} and F_N as follow:

– If DOWNSPREAD = 0 (centered-spread)

  F_N is given by the formula in *Integer mode*

  $F_{MIN} = F_N$ x (1 - M_D/100)

  $F_{MAX} = F_N$ x (1 + M_D/100)

– If DOWNSPREAD = 1 (down-spread)

  F_{MAX} is given by the formula in *Integer mode*

  $F_{MIN} = F_{MAX}$ x (1 - M_D/100)

  $F_N = F_{MAX}$ x (1 - M_D/100)

20.4.6 PLL root clocks

The RCC handles the following PLL root clocks:

- ck_pll1_ref for CPU1 subsystem
- ck_pll2_ref for DDR subsystem

PLL root clock selection

After a system reset, the HSI is selected for the complete system. All the PLLs are switched off, as well as MSI and HSE oscillators.

When the system is running, the user has the possibility to select the clock source to be used for all above subsystem clocks. It relies on the following clock sources: HSI, HSE, MSI and CK_IN.

20.4.7 Root clocks

The RCC handles two types of root clocks:

- Bus root clocks:
  - Interconnect subsystems: ck_icn_hs_mcu, ck_icn_ls_mcu, ck_icn_sdmmc, ck_icn_ddr, ck_icn_display, ck_icn_hsl, ck_icn_nic, ck_icn_vid
  - Peripheral bridges: ck_icn_apb1, ck_icn_apb2, ck_icn_apb3, ck_icn_apb4, ck_icn_apb5, ck_icn_apbdbg
- Kernel root clocks (see *Table 125* for details)

Root clock generation

Figure 94 shows the flexclkgen engine which is used to generate all root clocks when the system is in Run mode.

After any system reset, the flexclkgen default configuration is to output the HSI reference clock (64 MHz) on all root clocks while all PLLs are disabled.

It is up to the boot code to configure the PLLs and the clock dividers with the appropriate values.

The flexclkgen is based on the following stages:

- MUXSEL stage used to select the input clock reference for all PLLs in the GFG stage and for the external clock outputs (see RCC_MUXSELCFGR)
- GFG stage used to control all PLLs (see RCC_PLLxCFGRy (x = 4 to 8 and y = 1 to 7)
- XBAR (clock cross bar) stage used to select clock channels driven to divider stages (see RCC_XBARxCFGR)
- PREDIV (pre divider) stage used for a first level of clock division (div1, div2, div4 and div1024) (see RCC_PREDIVxCFGR, RCC_PREDIVSR1, and RCC_PREDIVSR2)
- FINDIV (final divider) stage used for the last level of clock division (div1 to div64) (see RCC_FINDIVxCFGR, RCC_FINDIVSR1, and RCC_FINDIVSR2)

Figure 94. Flexclkgen block diagram

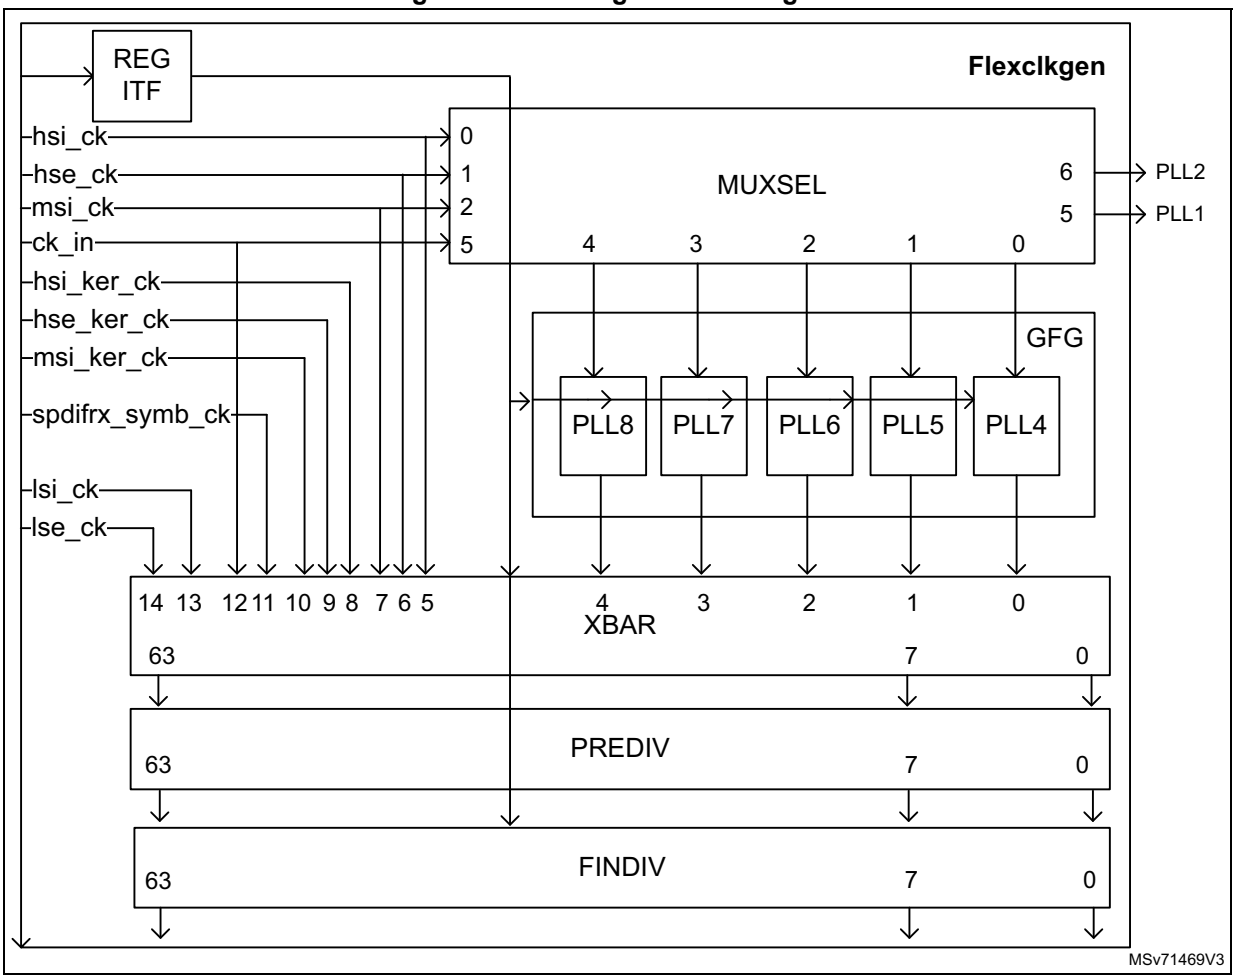


Figure 95. Flexclkgen programming flow

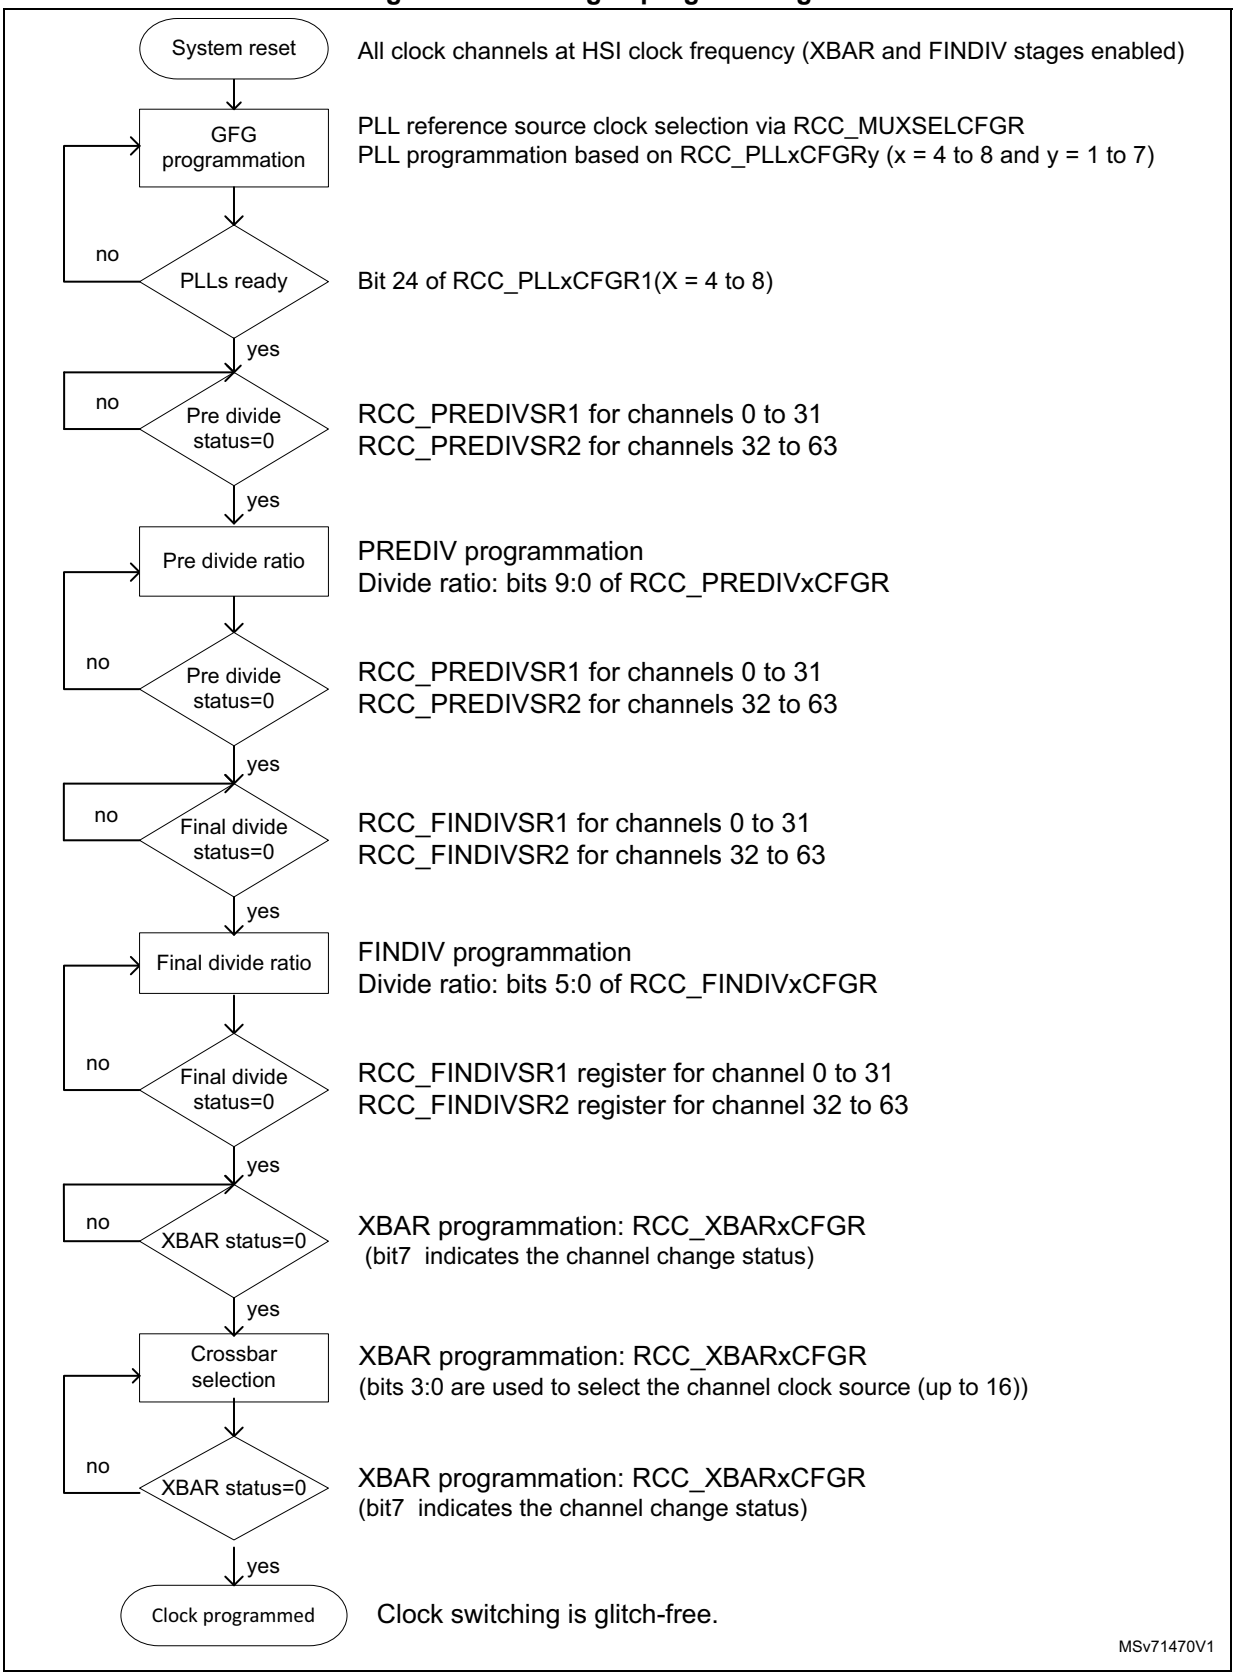

Caution: The channel clock used to generate ck_icn_hs_mcu and ck_icn_ls_mcu subsystem clocks cannot be stopped in Run mode as it is the source of the RCC main clock.

The table below shows the flexclkgen clock channel assignment for root clocks, and its distribution versus local peripheral bus clocks.

Table 121. Root clock mapping

Flexclkgen channel number	Root clock name	Max frequency (MHz)	Bus matrix	Target peripheral bus clock

1. ck_icn_p_risaf1, ck_icn_p_risaf2, ck_icn_p_risaf4, ck_icn_p_risab1, ck_icn_p_risab2, ck_icn_p_risab3, ck_icn_p_risab5 clocks are enabled according to the related resource clock gating logic. Refer to RISAB and RISAF sections for resource assignment.

The root control module shown in *Figure 96* is added between the flexclkgen engine and the clock enabling stage to generate dynamically all root clocks with synchronous relationships (interconnect, bridges and timer peripherals).

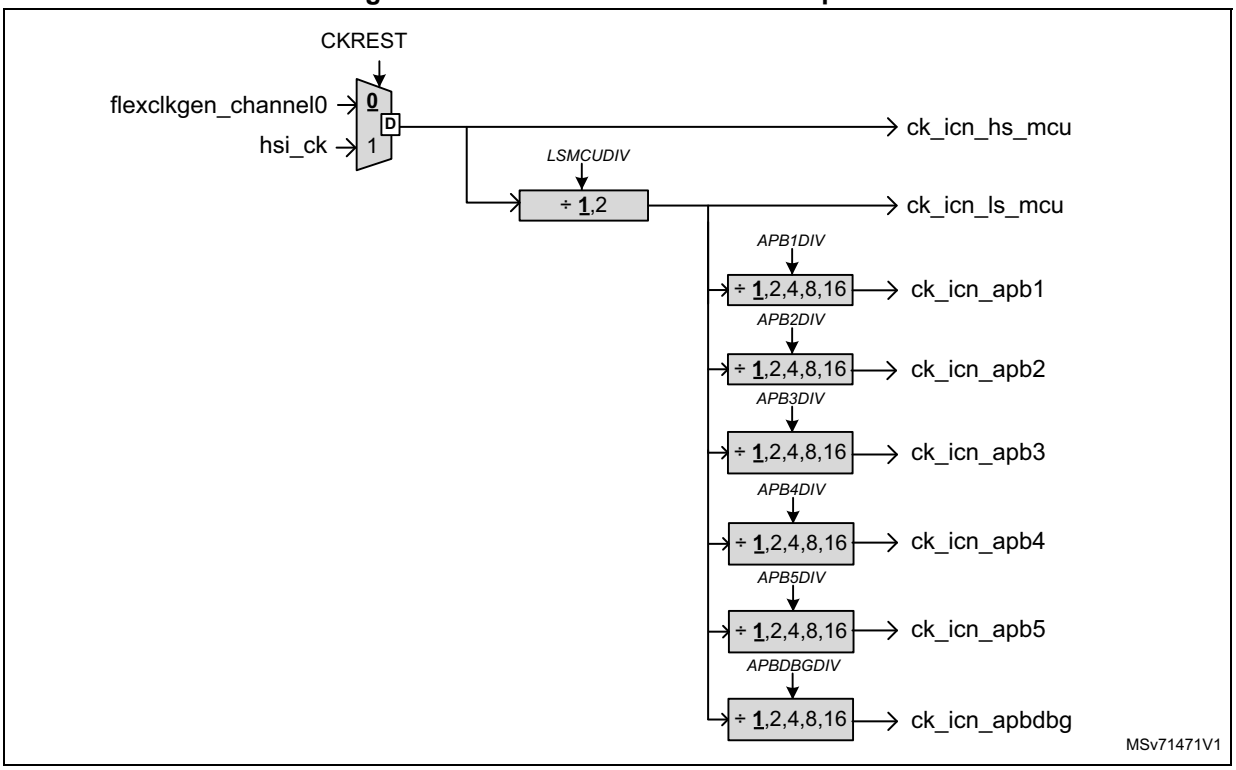
In the product, the root control module applies to the root clock ck_icn_ls_mcu, with:

- ck_icn_apb1, ck_ker_timx (x = 2 to 7, and 10 to 14)
- ck_icn_apb2, ck_ker_timy (y = 1, 8, 15, 16, 17)
- ck_icn_apb3
- ck_icn_apb4
- ck_icn_apb5
- ck_icn_apbdb

The APB1DIV divider in RCC_APB1DIVR can be used to adjust dynamically the clock for the APB1 bridge. Similar implementation is available for APB2, APB3, APB4, APB5 and APBDBG.

Note: Dividers having the possibility to be updated on-the-fly provide a ready bit in order to inform the application on the moment when the new division ratio is taken into account.

Figure 96. Root control module description.



The table below shows the peripheral root bus clock distribution versus peripherals.

20.4.8 Clock generation in Stop and Standby modes

The product supports six system Stop modes (see *Section 19: Power control (PWR)* for details):

- Stop 1: normal system Stop mode
- LP-Stop1: low-power system Stop mode
- LPLV-Stop1: low-power, low-voltage system Stop mode
- Stop2: enhanced system Stop mode
- LP-Stop2: enhanced low-power system Stop mode
- LPLV-Stop2: enhanced low-power, low-voltage system Stop mode

There is one low-power system Standby mode.

The main difference between Stop modes is the handling of D1 and D2 domain supply voltages:

- In Stop1 mode, V_{DDCORE} and V_{DDCPU} supplies remain the same as in system Run mode, with the same power capability.
- In LP-Stop1 mode, V_{DDCORE} and V_{DDCPU} supplies remain the same as in system Run mode, but with a limited power capability. This is usually achieved thanks to an external PMIC having two power modes:
  - a high power mode (HP) for nominal cases (Run and Stop1)
  - a low-power mode (LP) limiting the power capability for LP-Stop1 and LPLV-Stop1
- In LPLV-Stop1 mode, V_{DDCORE} and V_{DDCPU} supplies are reduced, and the power capability is reduced as well.
- For all Stop2 modes, it is the same behavior as the Stop1 ones, except that V_{DDCPU} supply is powered down.
- Refer to *Section 20.4.3* for PLL1 management in Stop modes

The amount of peripherals able to wake up the system from Stop depends on the activated Stop mode. For example, Stop1, Stop2, LP-Stop1 or LP-Stop2 mode offers a larger choice of peripherals able to wake up the system than LPLV-Stop1 or LPLV-Stop2 mode.

Entering one of the Stop modes

The system can go to one these Stop modes when both CPU1 and CPU2 are in CStop without any pending wake-up event on the EXTI. To go in one of the Stop or LP-Stop modes, any autonomous peripheral that requests a bus clock delays the system entry in the requested low-power mode (see *Section 19.5.2: Low-power batch acquisition mode (LPBAM)* for the list of supported autonomous peripherals).

Once the above conditions are met, the RCC informs the PWR that CPU1 and/or CPU2 subsystems are in CStop via pwrds_cpu1, pwrds_cpu2 and pwrds_sys (see *Figure 73*). Any autonomous bus clock request is postponed until the sequence to go in Stop is done.

- pwrds_cpu1 is used to indicate to the PWR that the CPU1 is in CStop.
- pwrds_cpu2 is used to indicate to the PWR that the CPU2 is in CStop.
- pwrds_sys is used to indicate to the PWR that the system is in one of the Stop modes, and no longer clocked.

Note: When only one CPUx goes to CStop, all RCC PLLs and oscillators generating the root and kernel clocks of all shared peripherals (CPU1 and CPU2) are kept activated (see Section 20.3.11 for details on these peripherals).

The PLL1 is disabled when CPU1 is in CStop. The PLL2 state is based on DDRSHR bit and the CPU1 or system state (see *Clock distribution for the DDR* for details).

As before going to CStop, each CPUx has to mask all the interrupts except the RCC wake-up interrupt in order to insure a safe Stop sequence entry and exit. The RCC provides two wake-up interrupts (rcc_cpu1_wkup_it and rcc_cpu2_wkup_it) which can be enabled via their corresponding WKUPIE bit (see *Section 20.5* for additional information).

Note: When the D1 domain is put in DStandby mode (Stop2, LP-Stop2 or LPLV-Stop2 mode), the RCC wake-up interrupt for CPU1 is not relevant as the CPU1 reboots in case of CPU1 wake-up event.

Before switching off all the clocks, the RCC waits for the DDRCTRL to enter in self-refresh mode (SSR RCC mode is the only mode that allows the system to go in one of Stop modes). As a consequence, the effective entry in on of the Stop modes may be delayed until the DDRCTRL allows it. The RCC stops then all the clocks (subsystem and kernel clocks), and the following clock sources are disabled as well:

- HSI (if HSIKERON = 0)
- HSE (if HSEKERON = 0)
- MSI (if MSIKERON = 0)
- RCBSEC
- PLL1(CPU1), PLL2(DDR), PLL4(RCC), PLL5(RCC), PLL6(RCC), PLL7(RCC) and PLL8(RCC)

Note: In LPLV-Stop1 or LPLV-Stop2 mode, HSI, HSE and MSI cannot be used.

LSE and LSI oscillators remain active in all Stop modes if enabled.

During one of the Stop modes

As explained in the previous section, in one of the system Stop modes, all clocks, PLLs and oscillators are disabled, except LSE and LSI which are kept in their current states. There are specific cases in Stop1, Stop2, LP-Stop1 or LP-Stop2 mode, where the HSE, HSI or MSI can be enabled:

- when a dedicated peripheral requests a kernel clock

  The peripheral receives HSE, HSI, or MSI according to the kernel clock source selected for this peripheral (via RCC_XBARxCFGR).
- when HSEKERON, HSIKERON, or MSIKERON is set

  The HSE, HSI, or MSI is kept running during Stop modes but the kernel clock is not provided to the peripherals. The clock is then available immediately when the system

exits one of the Stop modes, or when a peripheral requests the kernel clock (see *Table 123* for details).

- when an autonomous peripheral requests a bus interface clock

  The provided bus interface clock is always the HSI (see *Section 19: Power control (PWR)* for the list of autonomous peripherals).

HSIKERON, MSIKERON and HSEKERON are in RCC_OCENSETR and RCC_OCENCLLR.

The table below details the behavior of these bits with 'ON' status highlighted in grey.

Note: HSE, HSI and MSI outputs provide two clock paths (see Figure 83):
- one path for the CPUx and subsystem clocks (hse_ck, hsi_ck or msi_ck)
- one path for the peripheral kernel clocks (hse_ker_ck, hsi_ker_ck or msi_ker_ck)
These paths are available via the flexclkgen engine.

Table 123. HSI, MSI and HSE states versus system modes

System mode	HSION (HSEON) (MSION)	HSIKERON (HSEKERON) (MSIKERON)	Kernel clock request(1)	Bus clock request(2)	-	HSI state (HSE state) (MSI state)	hsi_ck (hse_ck) (msi_ck)	hsi_ker_ck (hse_ker_ck) (msi_ker_ck)
Run1 or Run2	0	X	1	X	-	ON	Gated	ON
			0		-	OFF		Gated
	1		X		-	ON	ON	ON
Stop1, LP-Stop1, Stop2 or LP-Stop2	X	X	1	0	-	ON(3)	Gated	ON
		0	0		-	OFF		Gated
		1			-	ON		ON(4)
		X	X	1	-	ON	ON(5)	ON(6)
Standby	X	X	X	X	-	OFF	Gated	Gated

1. Kernel clock request is equal 1 when the peripheral requests a kernel clock, and its corresponding RCC_XBARxCFGR selects HSE, HSI or MSI, and the corresponding PERxEN and PERxLPEN are set to 1 (see *Table 140* for details).
2. Bus clock request is equal 1 when the peripheral requests a bus interface clock, and the corresponding PERxEN and PERxLPEN are set to 1, and the system is in one of the Stop modes.
3. Only the oscillator selected by RCC_XBARxCFGR of the peripheral that requests the kernel clock is enabled.
4. The kernel clock is provided to the clock enabling block, and gated as long as the peripheral does not generate a kernel clock request.
5. Only HSI is supported in these modes.
6. The kernel clock selected by RCC_XBARxCFGR is enabled.

Exiting one of the Stop modes

The system can leave one of the Stop modes thanks to events generated by peripherals able to work in the selected mode.

The exit from system Stop is generally done in the following way:

1. A peripheral sends a wake-up interrupt to the EXTI.
2. The EXTI generates an event to the PWR (sys_wakeup).
3. The PWR signals to the external PMIC or the external regulator that the main power must be restored (through PWR_LP or optionally PWR_ON/PWR_CPU_ON pins).
4. If the PMIC was in LPLV-Stop1 or LPLV-Stop2, the PWR waits for a nominal V_{DDCORE}.
5. When V_{DDCORE} reached the nominal value, the PWR asserts pwrwake_sys for the RCC.
6. Thanks to this signal, the RCC provides the hsi_ck clock to the EXTI and PWR, and starts the clock restore sequence (see *Clock restore sequence* for details).
7. When the hsi_ck is available, the EXTI asserts the cpu1_wakeup and/or cpu2_wakeup signals, indicating to the PWR which CPUx must be activated. If the PMIC was in Stop2, LP-Stop2 or LPLV-Stop2, the PWR waits for a nominal V_{DDCPU} voltage.
8. The PWR asserts the pwrwake_cpu1 signal once V_{DDCPU} has reached the nominal value when leaving Stop2, LP-Stop2 or LPLV-Stop2, and/or the pwrwake_cpu2 signal for the RCC according to the CPUx to be activated.
9. On the RCC side:
   - If pwrwake_cpu1 is activated while leaving Stop1, LP-Stop1 or LPLV-Stop1, the RCC asserts rcc_cpu1_wkup_it, and provides the clocks to the CPU1 domain when these clocks are available.
   - If pwrwake_cpu1 is activated while leaving Stop2, LP-Stop2 or LPLV-Stop2, the RCC releases the CPU1 reset, and provides the clocks to the CPU1 domain when these clocks are available.
   - If pwrwake_cpu2 is activated, the RCC asserts rcc_cpu2_wkup_it, and provides the clocks to the CPU2 domain when these clocks are available.
10. The targeted CPUx exits from CStop, and reenables the interrupts of the peripherals activated during Stop mode. The peripheral which has generated the wake-up event is then able to generate an interrupt to the CPUx.
11. The RCC acknowledges pwrwake_cpu1 or pwrwake_cpu2 requests by releasing pwrds_cpu1 or pwrds_cpu2.

The RCC integrates a state machine able to restore the clock configuration which was used before going to one of the Stop modes.

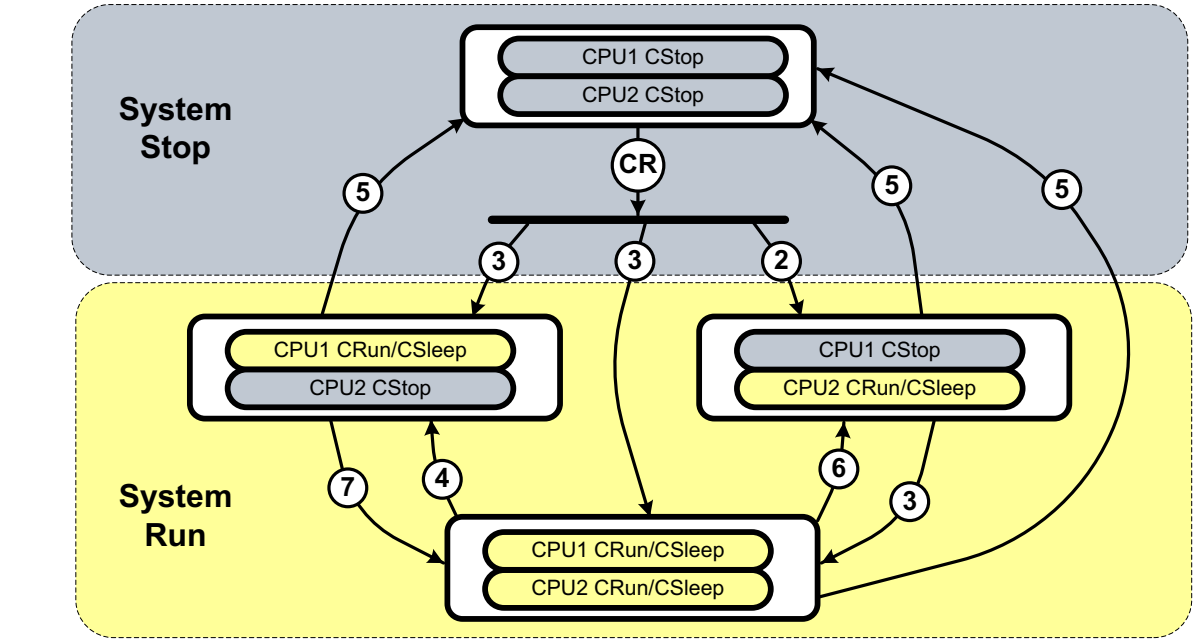
Remarks: Exiting the system from one of the Stop modes requests that peripherals are able to generate wake-up events, even when the system clock is not available.

The EXTI is used to trigger the wake-up sequence (see *Section 29: Extended interrupts and event controller (EXTI)* to get the list of peripherals that can wake-up a system from Stop or a CPUx from CStop).

The RCC executes the clock restore sequence every time the system exits Stop as shown in the figure below. When the system is in Run, all oscillators and PLLs requested by the

application are activated, but each CPU clock domain is only activated according to the related CPU mode.

Figure 97. Clock restore activation versus system mode



CR Clock restore sequence triggered by pwrwake_sys event. hsi_ck is enabled for RCC, EXTI and PWR. All PLLs are reenabled if their respective PLLxEN = 1.

2 Enabling of CPU2 clock domain (pwrwake_cpu2) once all PLLs are ready except when HSI clock is selected on CPU2

3 Enabling of ck_pll1_ref, ck_cpu1_ext2f, and CPU1 clock domain (pwrwake_cpu1)

4 Disable all clocks allocated to CPU2 domain.

5 Disable all clocks, all PLLs, and oscillators if allowed.

6 Disabling of ck_pll1_ref, ck_cpu1_ext2f, and CPU1 clock domain

7 Enable all clocks allocated to CPU2 domain.

Stop, CStop

MSv71472V1

Handling the PWRLP_TEMPO

The PWRLP_TEMPO is used to wait automatically that the external PMIC switched from low-power (LP) to high-power (HP) mode, before enabling power-consuming parts. The application can control the delay value via RCC_PWRLPDLYCR.

The PWRLP_TEMPO uses the ck_icn_ls_mcu clock as reference which is sourced during the clock restore sequence by either hsi_ck (when LSMCU = 0 in RCC_LSMCUDIVR) or by hsi_ck/2 (when LSMCU = 1).

In order to allow a fast restart time when the CPU2 clock wakes up from system LP-Stop1, LP-Stop2, LPLV-Stop1 or LPLV-Stop2, ck_icn_hs_mcu and ck_icn_ls_mcu clocks may bypass the PWRLP_TEMPO delay. This is only possible when the CPU2 power consumption is low enough to be supported by the PMIC LP mode. This function is controlled by CPU2TMPSKP in RCC_PWRLPDLYCR.

Note: In this case, the PMIC still transitions from LP to HP mode.

Refer to *Clock restore sequence* for additional informations.

Warning: **When CPU2TMPSKP is set to 1, the application must insure that the CPU2 did not allocate peripherals located into the AXI subsystem (AHB5, APB4 or APBDBG). If this rule is not respected, a system reset may be generated.**

Clock restore sequence

Every time the system exits one of the Stop modes (pwrwake_sys), the RCC reenables the requested oscillators and PLLs in order to restore the subsystem clocks. These clock settings are defined by the registers listed in *Table 124*, that cannot be modified during the clock restore sequence.

If the system exits from one of the Stop modes due to a CPU1 wake-up event (pwrwake_cpu1), the RCC enables ck_pll1_ref and ck_cpu1_ext2f clocks. All CPU1 subsystem clocks are reenabled simultaneously once all internal and external PLL ready signals are received.

The same strategy applies in case of a CPU2 wake-up event (pwrwake_cpu2) except when the selected CPU2 clock (ck_icn_hs_mcu) is an oscillator clock (HSI, HSE or MSI) before the system goes to one of the Stop modes. In this case, the CPU2 clock domain is reenabled before waiting for all internal and external PLL ready signals. It is up to the application to take care of the PLL states prior using any peripherals clocked by PLLs.

Note: When leaving Stop2, LP-Stop2 or LPLV-Stop2, the PLL1 ready signal is not taken into account.

The PLL2 clock source (ck_pll2_ref) is always reenabled when the system exits from one of the Stop modes, if DDR is shared.

More precisely, the clock restore sequence when the system exits Stop, is split into the following main steps (see *Figure 98* and *Figure 99*):

1. Set CKREST = 1 in order to inform that a clock restore sequence is initiated. Registers listed on *Table 124* cannot be modified during the clock restore sequence.
2. Enable the oscillators which were enabled before going to system Stop.
3. When the HSI is ready, the RCC can trigger the PWRLP_TEMPO to allow a delay to the external PMIC to switch in HP mode, before doing power-consuming operations on V_{DDCORE}.
4. When the oscillators used by PLLs are ready, the PLL analog parts can be powered. As these parts are not powered by V_{DDCORE}, it is possible to enable the VCOs (no need to wait that PWRLP_TEMPO elapsed).
5. In case of CPU2 wake-up event, the CPU2 clock domain is reenabled without waiting for PLLs to be ready, if the CPU2 clock source is an oscillator.
6. Before enabling the PLL outputs, the RCC must wait until the PWRLP_TEMPO elapsed, and the PLLs are ready. The process generating the CPU2 clock domain may also need to wait until the PWRLP_TEMPO elapsed when CPU2TMPSKP = 0.
7. Depending on the wake-up event, only the related CPU clock domain is reenabled. The RCC clears CKREST to 0. Registers listed in *Table 124* can then be modified by the application if needed.

Figure 98. Clock restore process activated after system Stop

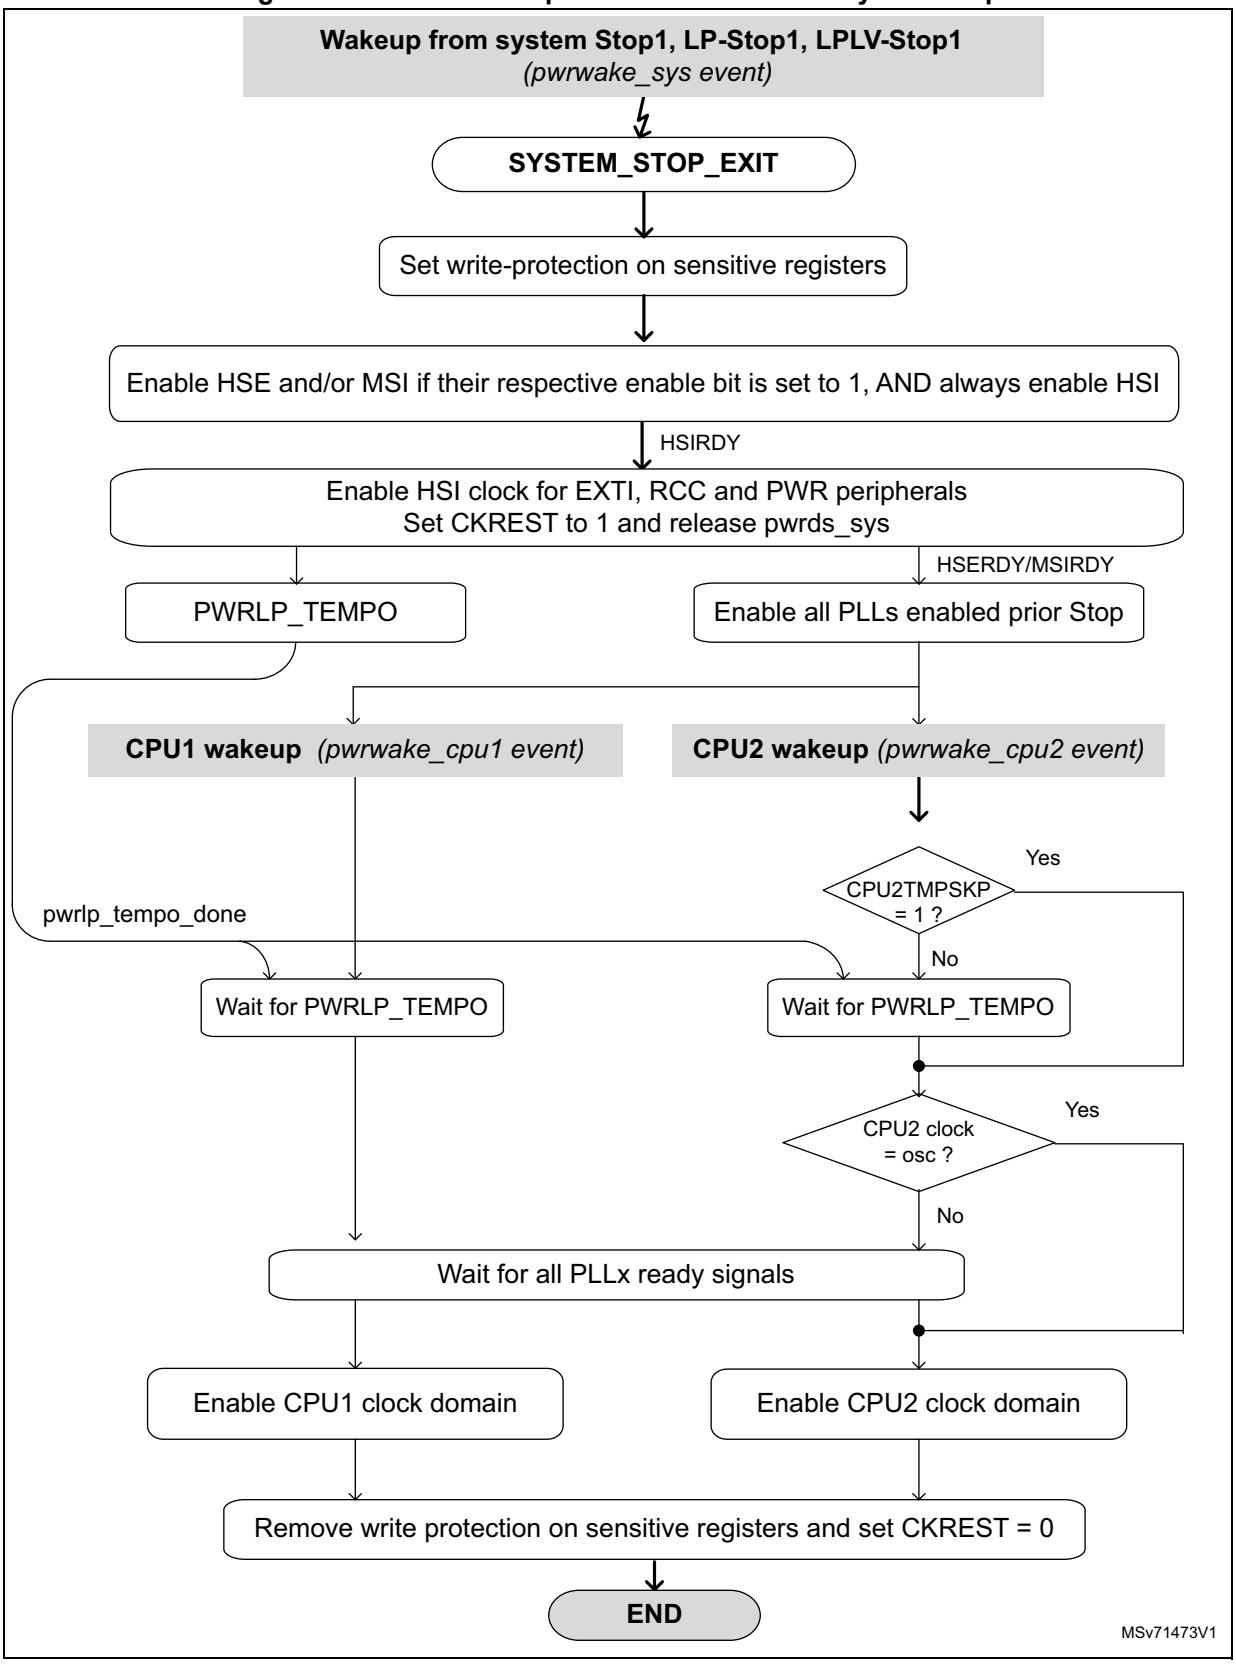

Figure 99. Wake-up from CStop

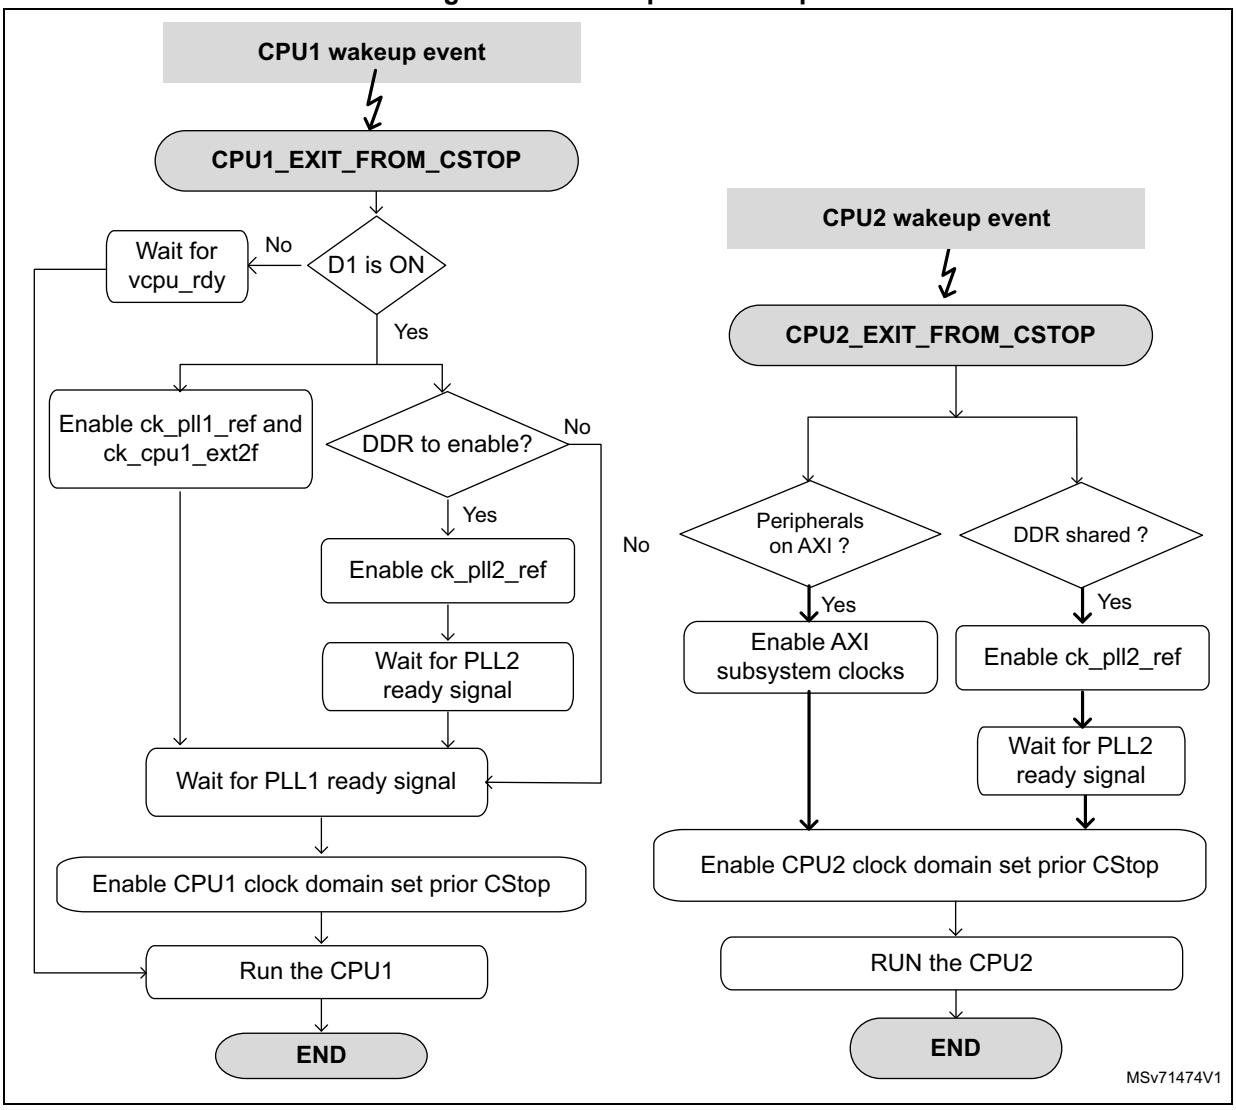

Note: When the system exits from Stop due to a wake-up event for the CPU2, if the CPU2 has a peripheral using HSE as kernel clock, the CPU2 has to check that the HSE is ready before using this peripheral.

In order to avoid any unexpected behavior during the clock restore, the RCC provides a write protection to all registers having a sensitive content for the clock restore.
The application must not attempt to write these registers when the clock restore sequence is running. If a CPUx attempts to write one of the registers listed in *Table 124*, the write operation is ignored. This situation may occur if one CPUx is already running while the other exits CStop.

Note: The RCC provides CKREST in order to inform the application if a clock restore is ongoing.

Going to Standby mode

The system can go to Standby mode when both CPU1 and CPU2 are in CStop, without any pending wake-up event on the EXTI, and when both CPUx allow Standby mode (see *Section 19: Power control (PWR)* for details).

When the complete system goes to Standby mode, the RCC stops all the clocks and PLLs, with the exception of the LSI and LSE. The RCC also informs the PWR that CPU1 and CPU2 subsystems are in CStop via pwrds_cpu1 and pwrds_cpu2 signals (see *Figure 73*). The PWR can then request the external PMIC to switch off V_{DDCORE} and V_{DDCPU} voltages.

Only parts working on V_{DD} and V_{SW} are kept operating in Standby.

Leaving Standby mode

When the circuit exits Standby mode, the HSI is selected as default clock for the complete system, the RCC registers are reset to their initial values (except RCC_LEGBOOTCR, RCC_STBYBOOTCR, RCC_LSICR, RCC_BDCR, RCC_RDCR, RCC_HWRSTSCLRR, RCC_C1HWRSTSCLRR, and RCC_C2HWRSTSCLRR).

Note: A system reset is generated when the circuit exits Standby mode.

20.4.9 Peripheral clock distribution

Some peripherals are designed to work with two different clock domains asynchronous each other:

- a clock domain synchronous to the register and bus interface (ck_icn_p_perx clock)
- a clock domain generally synchronous to the peripheral (kernel clock ck_ker_perx)

The benefit of having peripherals supporting these two clock domains is that the user has more freedom to choose optimized clock frequency for the CPUs, bus matrix, and for the kernel part of the peripheral. The user can then change the bus frequency without reprogramming the peripherals. For example, an ongoing transfer with UART is not disturbed if its APB clock is changed on-the-fly.

Table 125 displays the kernel clock that the RCC can provide to the peripherals. Each row of this table represents generally a MUX, and peripherals connected to its output. The columns starting at number 5, represent a clock source. Column 3 gives the maximum allowed frequency at each MUX output. Columns 6 up to 18 represent the possible low-power kernel clock sources (“X” means supported clock).

Table 125. Kernel clock distribution overview

1. ‘A’ means that the kernel clock is asynchronous with respect to bus interface clock. ‘S’ means that the kernel clock is synchronous with respect to bus interface clock.
2. ‘X’ means supported kernel clock source. ‘LP’ means supported kernel clock source when the CPU that has allocated the peripheral is in CStop. hsi_ck, hse_ck, and msi_ck are possible for all Flexclkgen channels.
3. MDF1 is on AHB2 bus.
4. MDF1 low power modes (LP) requires to set HSIKERON, MSIKERON or HSEKERON bit in RCC_OCENSETR register according to the selected kernel clock sources.
5. The RTC switch is in the VSW domain. When HSE is selected, the kernel clock is divided. By default, the RTC kernel clock is off. Refer to RCC_BDCR for details.
6. Depends on I/O capability.

For CPU2, the SysTick timer clock requires synchronous clock enables, SSTCLKEN and NSSTCLKEN, that are pulsed every 8 cycles of ck_icn_hs_mcu root clock.

Debug authentication is possible when system is under reset. In this case all debug components located behind AP0 (APB-AP) access port are required to be clocked. These components are belonging to the ck_dap clock domain which is only sourced with HSI clock (hsi_ck).

The following sections show a more detailed view of the kernel clock and bus interface clock distribution (see *Section 20.4.12* for details).

In order to reduce the amount of switches, some peripherals share the same kernel clock source. Nevertheless, all peripherals have their dedicated enable signal.

Clock distribution for timers

The TIMs timers use kernel clocks (ck_ker_timx, ck_ker_timy) phase aligned with the bus interface clock. The frequency of the timer clocks depends on:

- the APB prescaler corresponding to the bus where the timer is connected
- TIMG[2:1]PRE bits

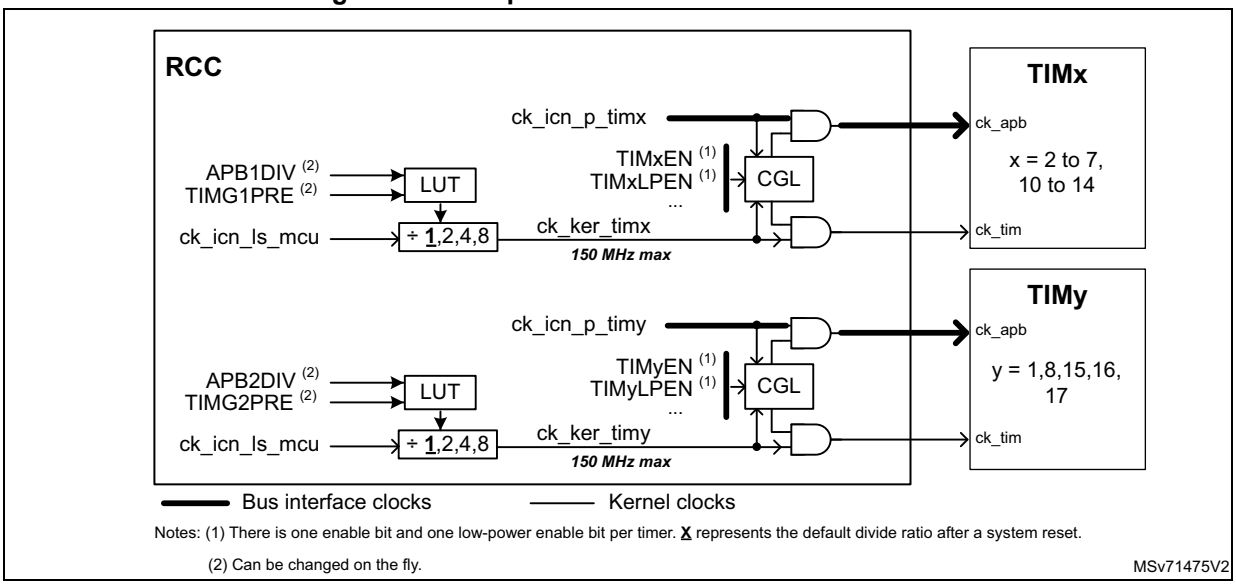
The table below shows how to select the timer clock frequency.

Table 126.Ratio between clock timers and ck_icn_apbx

APB1DIV APB2DIV(1)	TIMG1PRE TIMG2PRE(2)	$F_{ck_ker_timx}$ $F_{ck_ker_timy}$	$F_{ck_icn_apb1}$ $F_{ck_icn_apb2}$	Comments
000	x	$F_{ck_icn_ls_mcu}$	$F_{ck_icn_ls_mcu}$	The timer clock is equal to the bus clock.
001	x	$F_{ck_icn_ls_mcu}$	$F_{ck_icn_ls_mcu}$ / 2	The timer clock is two times faster than the bus clock.
010	0	$F_{ck_icn_ls_mcu}$ / 2	$F_{ck_icn_ls_mcu}$ / 4	
011	0	$F_{ck_icn_ls_mcu}$ / 4	$F_{ck_icn_ls_mcu}$ / 8	
100	0	$F_{ck_icn_ls_mcu}$ / 8	$F_{ck_icn_ls_mcu}$ / 16	
010	1	$F_{ck_icn_ls_mcu}$	$F_{ck_icn_ls_mcu}$ / 4	The timer clock is four times faster than the bus clock.
011	1	$F_{ck_icn_ls_mcu}$ / 2	$F_{ck_icn_ls_mcu}$ / 8	
100	1	$F_{ck_icn_ls_mcu}$ / 4	$F_{ck_icn_ls_mcu}$ / 16	

1. APB1DIV and APB2DIV are in RCC_APB1DIVR and RCC_APB2DIVR.
2. TIMG1PRE and TIMG2PRE are in RCC_TIMG1PRER and RCC_TIMG2PRER.

Figure 100. Peripheral clock distribution for TIMs



Notes: (1) There is one enable bit and one low-power enable bit per timer. X represents the default divide ratio after a system reset.

(2) Can be changed on the fly.

MSv71475V2

Refer to *Section 20.4.12* for details on the behavior of the clock gating logic (CGL).

Clock distribution for ADCs

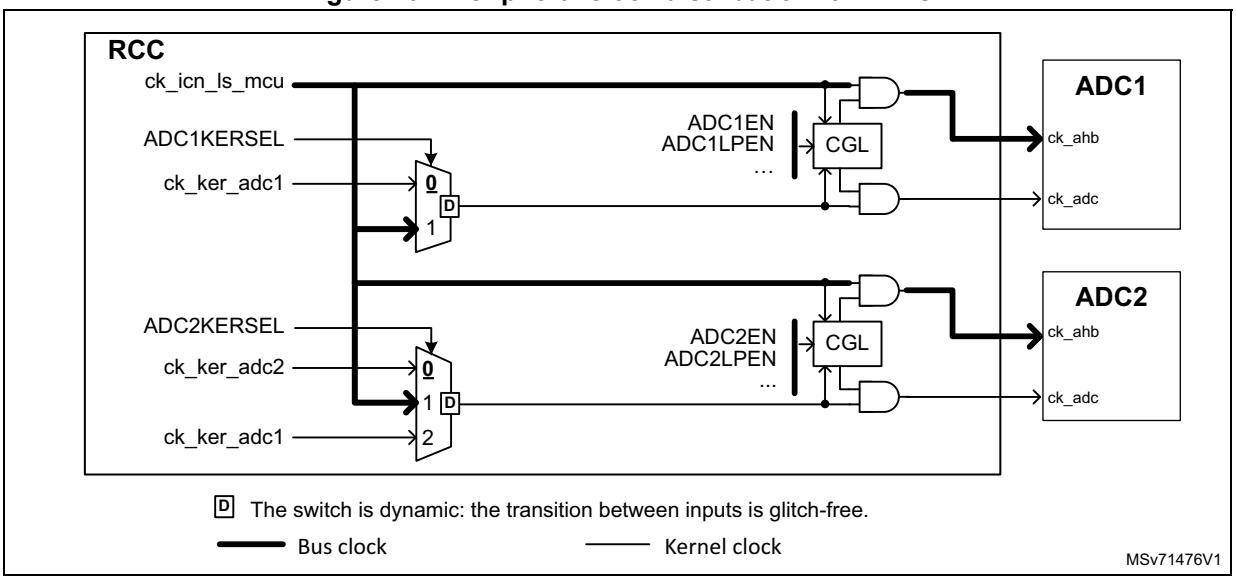
The ADC kernel clocks can be selected among the following source clocks: ck_ker_adc1, ck_ker_adc2 or ck_icn_ls_mcu.

Depending on the accuracy of measured values at ADC level, their kernel clocks can be selected to be either synchronous or asynchronous, according to ADC1KERSEL and ADC2KERSEL[1:0] in RCC_ADC1CFGR and RCC_ADC2CFGR.The table below shows how to select the kernel clocks source of the 2 ADCs.

Table 127. ADC kernel clock source selection

ADC1KERSEL	ADC2KERSEL[1:0]	ADC1 ck_adc source	ADC2 ck_adc source	Comments
~~0~~	0x0	ck_ker_adc1	ck_ker_adc2	Asynchronous mode
	0x1		ck_icn_ls_mcu	
	0x2		ck_ker_adc1	Synchronous mode
	0x3		NA	-
1	0x0	ck_icn_ls_mcu	ck_ker_adc2	Asynchronous mode
	0x1		ck_icn_ls_mcu	Synchronous mode
	0x2		ck_ker_adc1	Asynchronous mode
	0x3		NA	-

Figure 101. Peripheral clock distribution for ADCs



Clock distribution for the DDR

Figure 102 shows a simplified view of the clock distribution for the different blocks inside the DDR subsystem (DDRCTRL, DDRPHYC, DDRPERFM, RISAF4, MCE, PLL2).

The RCC needs to provide the following clocks:

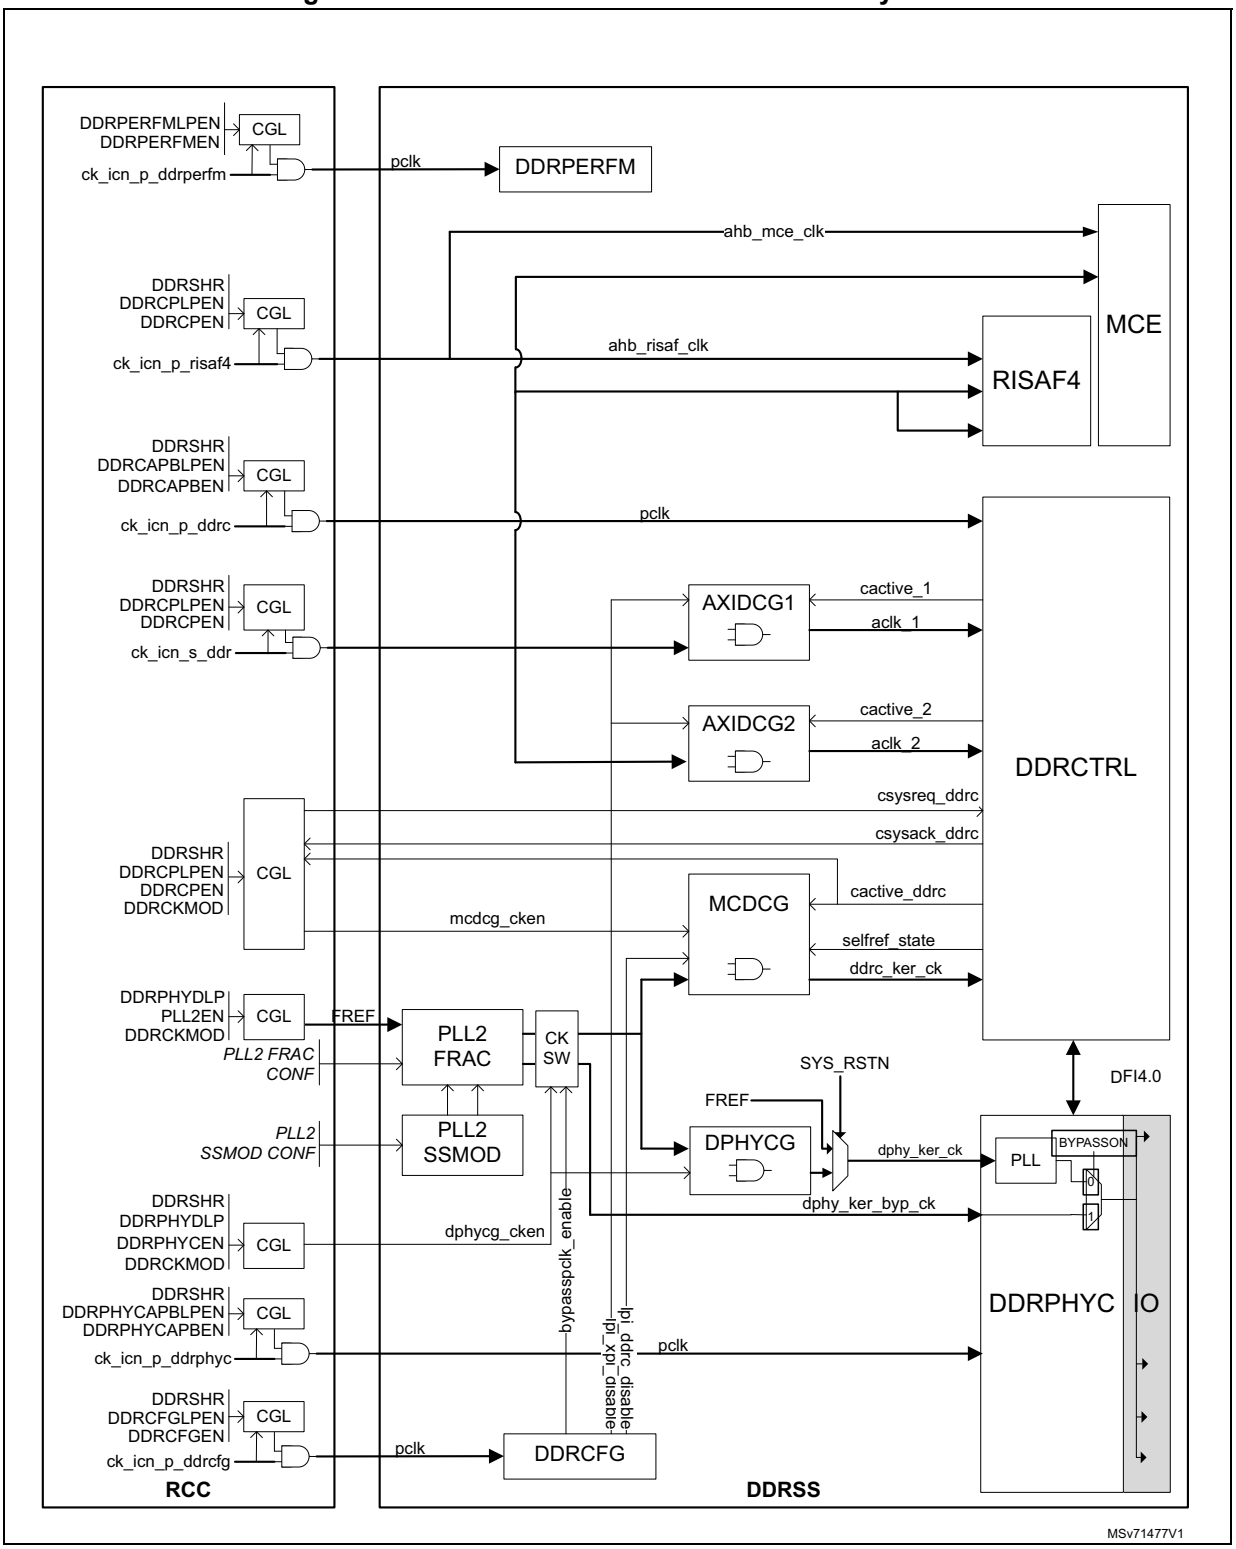
- APB and AHB clocks for the register interface (ck_icn_p_ddrc, ck_icn_p_ddrphyc, ck_icn_p_ddrperfm, ck_icn_p_risaf4 and ck_icn_p_ddrcfg)
- AXI clock for the three AXI ports of DDRCTRL, RISAF4 and MCE (ck_icn_s_ddr)

- reference clock for the PLL2

The RCC needs to provide also the following control bits:

- MCDCG control bit (mcdcg_cken). Refer to *Table 134* and *Table 135* for details.
- DPHYCG control bit (dphycg_cken). Refer to *Table 136* and *Table 137* for details.
- PLL2 configuration bits. Refer to *Section 20.8.95* to *Section 20.8.101* for details.

Figure 102. Clock distribution for the DDR subsystem



Control of APB and AHB clocks

The control of the APB/AHB clock gating is performed via the following bits:

- DDRSHR, DDRCAPBEN, and DDRCAPBLPEN control the gating of the APB clock of the DDRCTRL interface (ck_icn_p_ddrc).
- DDRSHR, DDRPHYCAPBEN, and DDRPHYCAPBLPEN control the gating of the APB clock of the DDRPHYC interface (ck_icn_p_ddrphyc).
- DDRSHR, DDRCFGEN, and DDRCFGLPEN control the gating of the APB clock of the DDRCFG interface (ck_icn_p_ddrcfg).
- DDRSHR, DDRCPEN, and DDRCPLPEN control the gating of the AHB clock of the RISAF4/MCE interface (ck_icn_p_risaf4).
- DDRPERFMEN and DDRPERFMLPEN control the gating of the APB clock of the DDRPERFM interface (ck_icn_p_ddrperfm).

The dedicated RCC control bits for the DDR (DDRSHR, DDRCKMOD and DDRPHYDLP) are located in RCC_DDRITFCFGR.

Table 128. Gating control of the APB clocks with ck_icn_p_ddrc and ck_icn_p_ddrphyc

DDRxEN(1)	DDRxLPEN(1)	DDRSHR(2)	CPU1 state	System mode	ck_icn_p_apbx clock	Comments
0	X	X	Any	Run	OFF	ck_icn_p_apbx is gated because DDRxEN = 0.
1	X	0	CRun	Run	ON	ck_icn_p_apbx is forced ON because DDRxEN = 1, DDRSHR = 0, and CPU1 is in CRun.
1	0	0	CSleep	Run	OFF	ck_icn_p_apbx is gated because DDRxLPEN = 0, and CPU1 is in CSleep.
	1				ON	ck_icn_p_apbx is forced ON because DDRxLPEN = 1, and CPU1 is in CSleep.
1	X	0	CStop	Any	OFF	ck_icn_p_apbx is gated because CPU1 is in CStop.
1	X	1	Any	Run	ON	ck_icn_p_apbx is forced ON because DDRSHR = 1 and system is in Run.
1	X	1	Any	Stop or Standby	OFF	ck_icn_p_apbx is gated.

1. DDRxEN and DDRxLPEN are respectively the enable and low-power enable bits of any DDR APB port.
2. DDRSHR = 0 means that the DDR is only used by CPU1. Otherwise, the DDR is shared by both CPU1 and CPU2.

Control of AXI clocks

AXIDCG[1:2] handle the gating of the AXI clocks (aclk_1 and aclk_2) provided to the DDRCTRL AXI ports. ck_icn_s_ddr clock is the source clocks of the AXI clocks.

Table 129 details the gating control of ck_icn_s_ddr clock inside the RCC.
When LPI_XPI_DISABLE is cleared to 0 (see *Section 12: DDR subsystem architecture (DDRSS)* for details), the AXI clocks (aclk_1 and aclk_2) are gated according to the cactive_[1:2] signals provided by the DDRCTRL.

Table 129. Gating control of ck_icn_s_ddr clock

DDRCPEN	DDRCPLPEN	DDRSHR	CPU1 state	System mode	ck_icn_s_ddr clock	Comments
0	X	X	Any	Run	OFF	ck_icn_s_ddr is gated because DDRCPEN = 0’
1	X	0	CRun	Run	ON(1)	ck_icn_s_ddr is forced ON because DDRCPEN = 1, DDRSHR = 0, and CPU1 is in CRun.
1	0	0	CSleep	Run	OFF	ck_icn_s_ddr is gated because DDRCPLPEN = 0 and CPU1 is in CSleep.
	1				ON(1)	ck_icn_s_ddr is forced ON because DDRCPLPEN = 1
1	X	0	CStop	Any	OFF	ck_icn_s_ddr is gated.
1	X	1	Any	Run	ON(1)	ck_icn_s_ddr is forced ON because DDRSHR = 1 and system is in Run.
1	X	1	Any	Stop or Standby	OFF	ck_icn_s_ddr is gated.

1. When LPI_XPI_DISABLE = 0 locally in the DDR subsystem, ck_icn_s_ddr is gated dynamically according to **cactive_x**. This allows ASR and HSR modes to be supported.

Control of DDRCTRL and DDRPHYC kernel clocks

MCDCG and DPHYCG handle respectively the clock gating of ddrc_ker_ck, dphy_ker_ck, and dphy_ker_byp_ck. The source clocks come from the PLL2. The control bits come from the RCC, and are gated according to the way the DDRCTRL and the RCC are programmed.

Note: As some part of DDRPHYC is reset synchronously to dphy_ker_ck clock (DfiClk), PLL2 reference clock (FREF) is provided to DDRPHYC after any system reset to avoid extra power consumption.

The table below details how ddrc_ker_ck, dphy_ker_ck, and dphy_ker_byp_ck clocks are handled according to DDRCKMOD value.

Table 130. DDRCKMOD control description

DDRCKMOD	MCDCG mode	DPHYDCG mode	Comment
00	Normal	Normal	**Software self-refresh (SSR)**(1): The gating of the ddrc_ker_ck clock depends on DDRCPEN, DDRCPLPEN, DDRSHR bits, and CPU1 or system mode. The gating of dphy_ker_ck and dphy_ker_byp_ck clocks depends on DDRPHYCEN, DDRPHYDLP bits, and CPU1 or system mode.
01	Auto	Normal	**Automatic self-refresh (ASR)**(2): The clock ddrc_ker_ck is gated automatically according to cactive_ddrc signal in MCDCG. In this mode, DDRPHYCEN must be set to 1. DDRCPEN is still used to disable/enable the DDR interface
10	DDRC_LP	Normal	**Hardware self-refresh mode (HSR)**(2): The gating of the ddrc_ker_ck clock is controlled by the RCC via the DDRCTRL low-power interface. In this mode, DDRPHYCEN must be set to 1. DDRCPEN is still used to disable/enable the DDR interface.

1. This mode must be selected during DDRCTRL and DDRPHYC initialization phase, and if the application is using the software self-refresh.
2. This mode can be used when the application wants to maintain a clock to the DDRPHY.

DDRCTRL low-power interface

The DDRCTRL provides a low-power interface which can be used to control the entry/exit of the DDRCTRL and DDRPHYC into LP1 low-power mode (see *Section 12* for details). This interface controls also the gating of ddrc_ker_ck clock. This low-power interface is compliant to AMBA3 AXI LP protocol specification. In order to simplify the drawings, this document only shows the most significant states of the DDRCTRL low-power interface (see *Section 12* for details).

The table below gives details on the DDRCTRL low-power states. The DDRCTRL low-power interface can be used in HSR mode in order to control:

- the entry/exit of the external DDR device into low-power (self-refresh)
- the generation of the DDRCTRL kernel clock

Table 131. DDRCTRL low-power states description

DDRCTRL low-power states	Comment
RUN	Normal clocked operation: MCDCG and DPHYCG provide the kernel clock(s) to DDRCTRL and DDRPHYC. csysreq_ddrc, csysack_ddrc and cactive_ddrc are all set to 1 by hardware.
LP1	Low-power operation: MCDCG does not provide the kernel clock to the DDRCTRL while the DDRPHYC is kept clocked. csysreq_ddrc, csysack_ddrc and cactive_ddrc are all set to 0. The PLL2 is kept running.
LP1_Rreq	Low-power entry initiated by the RCC: The RCC requests the DDRCTRL to enter into low-power by setting csysreq_ddrc to 0. The DDRCTRL may accept or deny the request. If a request is denied, the interface comes back to RUN state, and the RCC retries a new low-power request entry. When the low-power request is accepted by the DDRCTRL (csysack_ddrc and cactive_ddrc = 0), the RCC sets MCDCG_CKEN bit to disable the DDRCTRL kernel clock. The state switches to LP1.
LP1_Rexit	Low-power exit initiated by the RCC: The RCC sets csysreq_ddrc to 1, and waits for csysack_ddrc and cactive_ddrc set to 1 before going to RUN state.
LP1_Dexit	Low-power exit initiated by the DDRCTRL: The DDRCTRL requests the kernel clock by setting cactive_ddrc to 1. The RCC sets csysreq_ddrc to 1, and waits for csysack_ddrc set to 1 before going to RUN.

Self-refresh mode control

Switching the external DDR device into self-refresh is important for energy saving. When the external DDR device is in self-refresh, the application can switch off DDRCTRL and DDRPHYC clocks without loosing the external DDR content. When the external DDR device is in self-refresh, the application can no longer access to the content of the external DDR device.

Exiting a DDR device from self-refresh can take several microseconds. The application has to take into account this latency that is due to the external DDR device, but also to the way the PLL located into the DDRPHYC is handled.

The RCC offers three ways to control the DDRCTRL kernel clock:

- software self-refresh mode (SSR)
- automatic self-refresh mode (ASR)
- hardware self-refresh mode (HSR)

There is only one way to control the DDRPHYC kernel clock:

- software self-refresh mode (SSR)

The RCC behavior is different according to the self-refresh mode selected by the application. The application has to program DDRCKMOD in accordance with DDRCTRL and DDRPHYC configuration.

Software self-refresh mode (SSR)

In this mode, the application has to program directly the DDRCTRL in order to switch the external DDR device immediately into self-refresh. Typically, when the CPU1 wants to go to CSleep or CStop, and the DDR is not shared with the CPU2 (DDRSHR = 0), the CPU1 must insure that the DDR resource is not longer needed, and program the DDRCTRL in order to switch it to self-refresh.

The piece of code performing the entry/exit of the DDRCTRL to self-refresh must be located into the SYSRAM because some software routines need to run when the DDR device is in self-refresh.

Automatic self-refresh mode (ASR)

In this mode, the software does not need to program the DDRCTRL every time the DDRCTRL must be set into self-refresh. The DDRCTRL goes automatically into self-refresh mode when the DDRCTRL is inactive for an amount of time defined into the DDRCTRL.

Even when the system is in Run mode, the DDRCTRL may go to self-refresh if there is no activity on its AXI ports. The automatic self-refresh mode allows the entry into self-refresh whatever CPUx mode.

When the CPU1 goes to CSleep, and the DDR is not shared with the CPU2, if the clock of the DDRCTRL needs to be gated, the MCDCG delays this clock gating until the DDRCTRL switches into self-refresh mode.

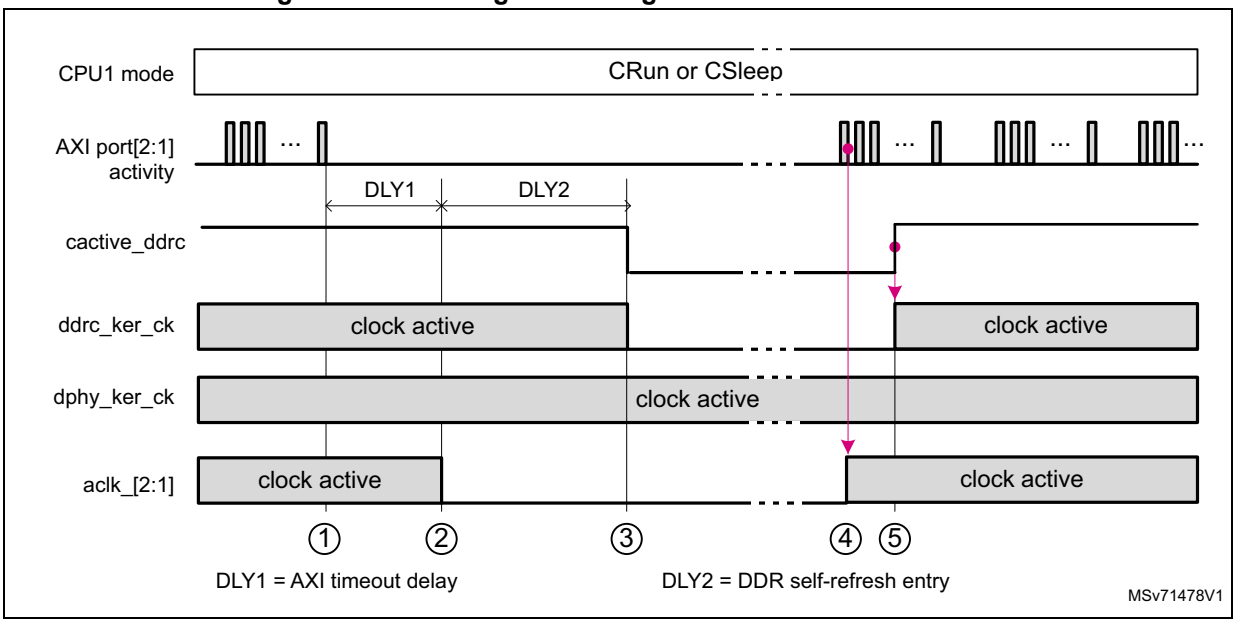
The ASR mode must be used only if the DDRCTRL has been programmed in automatic self-refresh mode, otherwise the behavior of the DDR interface is not guaranteed.
This mode can only be used when system is in Run mode.

The ASR mode impacts the gating of the DDRCTRL kernel clock (ddrc_ker_ck). dphy_ker_ck must be kept running in this mode.

When the ASR mode is used, DDRCPEN must be set to 1.

The figure below shows a simplified timing for the entry and exit from self-refresh. In this example, DDRCPEN = DDRCPLPEN = 1, DDRPHYCEN = 1, LPI_XPI_DISABLE = 0, and DDRSHR = 0.

Figure 103. Entering and exiting self-refresh in ASR mode



1. The activity on AXI port x is stopped, due for example to the fact that the CPU1 goes to CSleep, but it can be also the case between two activity bursts.
2. When no activity is detected in the AXI port x for at least UMCTL2_AXI_LOWPWR_NOPXCNT * aclk_x cycles (DLY1), the AXI clock (aclk_x) is gated if LPI_XPI_DISABLE is cleared to 0 (see *Section 12: DDR subsystem architecture (DDRSS)* for details).
3. When the AXI interfaces are gated, if they do not switch back to active after DLY2 delay, ddrc_ker_ck is gated. The CPU1 can be in CRun or CSleep.
4. If a transaction is performed in one of the two AXI ports, the AXI clock (aclk_x) is reenabled. The AXI transaction can be caused by any master using DDR resources.
5. Few AXI clock cycles later, the DDRCTRL sets cactive_ddrc to 1 in order to request the kernel clock. ddrc_ker_ck is reenabled. The external DDR is then ready to process the pending transactions.

Hardware self-refresh mode (HSR)

This mode uses the DDRCTRL low-power interface (DDRCTRL-LP) in order to request to the DDR to enter or exit LP1 low-power mode (see *Section 12* for details). The HSR mode can only be used when system is in Run mode.

The DDRCTRL-LP allows the entry of the DDR interface into self-refresh in the following cases:

- when the interface is disabled via DDRCPEN bit
- when CPU1 transitions from CRun to CSleep, and the DDR is not shared with CPU2 (DDRSHR = 0)
- when CPU1 transitions from CRun to CStop, the DDR is not shared with CPU2 (DDRSHR = 0), and the CPU2 is not in CStop.

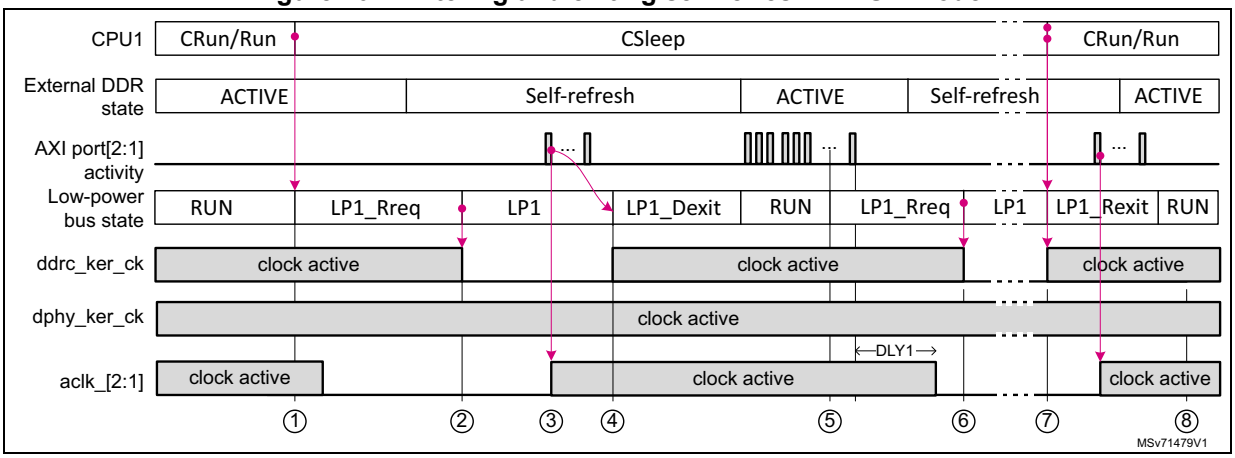
The DDRCTRL-LP allows the exit of the DDR interface from self-refresh in the following cases:

- when the interface is enabled via DDRCPEN bit
- when the CPU1 exits CSleep or CStop, and the DDR is not shared with CPU2 (DDRSHR = 0)
- when the DDRCTRL requests to exit self-refresh. This may happen if another master accesses one of the AXI ports when CPU1 is in CSleep and DDR is not shared, or when the system is in Run and DDR is shared.

This HSR mode may be less efficient in term of power saving than the ASR mode but it prevents the DDRCTRL to go accidentally to self-refresh when CPU1 is in CRun, increasing the system performances.

Figure 104 shows simplified timing for the self-refresh entry and exit. This is typically what happens when the CPU1 goes to CSleep while some masters are still enabled.
This example is based on *Table 131* configuration with DDRCPEN = DDRCPLPEN = 1, DDRPHYCEN = 1, DDRPHYDLP = 0, LPI_XPI_DISABLE = 0, and DDRSHR = 0.

Figure 104. Entering and exiting self-refresh in HSR mode



1. When the CPU1 goes to CSleep, the RCC requests to the DDRCTRL to go to self-refresh, using the DDRCTRL low-power interface (LP1_Rreq). The AXI clock is disabled if no transactions occur on AXI ports for a programmed DLY1 delay and LPI_XPI_DISABLE = 0 (see *Section 12* for details).
2. When all conditions in the DDRCTRL are met (no transaction pending, DDR in self-refresh), the DDRCTRL acknowledges the request. If the DDRCTRL denies the request, the RCC has to generate a new request until it is accepted by the DDRCTRL, or if the CPU1 exits from CSleep.

   When the DDRCTRL acknowledges the low-power request, the RCC disables ddrc_ker_ck. The DDRCTRL low-power bus is then in LP1 state.
3. If a transaction is performed in one of the two AXI ports, the AXI clock (aclk_x) is reenabled. The AXI transaction can be caused by any master using DDR resources.
4. Few AXI clock cycles later, the DDRCTRL requests to the RCC to re-enable the kernel clock, using the DDRCTRL low-power interface (LP1_Dexit). As soon as the RCC receives the request, ddrc_ker_ck is reenabled. The external DDR is then ready to process the pending transactions.
5. As the CPU1 is still in CSleep, the RCC requests to the DDRCTRL to go to self-refresh, using the DDRCTRL low-power interface (LP1_Rreq). The DDRCTRL may deny the

request several times if all conditions to enter in self-refresh are not met. The RCC has to renew its request regularly until it is accepted by the DDRCTRL. The RCC must stop performing this request if the CPU1 goes to CRun meanwhile.

6. When all conditions in the DDRCTRL are met (no transaction pending, DDR in self-refresh), the DDRCTRL acknowledges the request. When the DDRCTRL acknowledges the low-power request, the RCC disables ddrc_ker_ck. The DDRCTRL low-power interface is then in LP1 state.

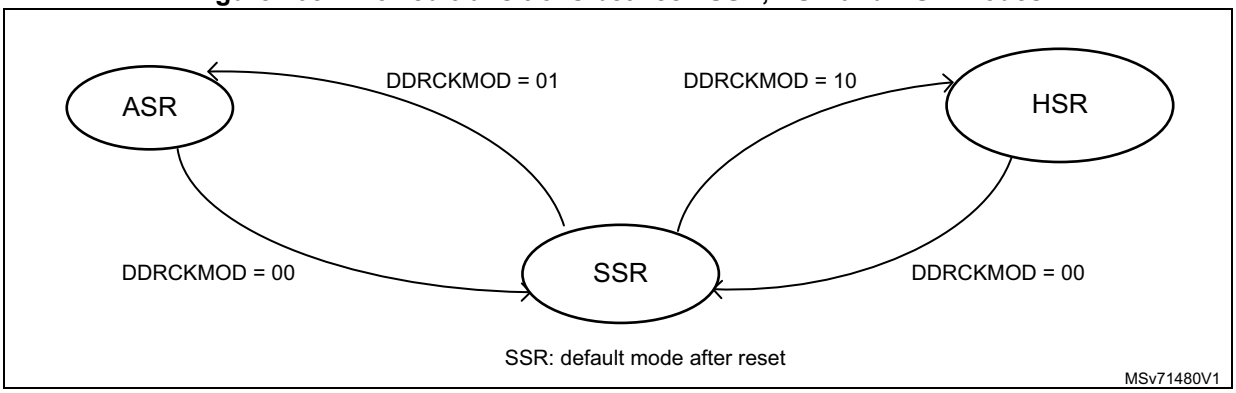
Note: The sequence described between step 4 to step 7 may be repeated several times until the CPU1 is in CSleep.

7. When the CPU1 exits from CSleep, the RCC reenables ddrc_ker_ck, and requests to the DDRCTRL to exit the DDR from self-refresh, using the DDRCTRL low-power bus (LP1_Rreq).
8. The DDRCTRL acknowledges the request by setting the DDRCTRL low-power interface into RUN state. The external DDR is then ready to process the pending transactions.

Transitions between SSR, ASR and HSR

The application can change DDRCKMOD value without disabling the DDR interface. The figure below shows the allowed transition between SSR, ASR and HSR modes.

Figure 105. Allowed transitions between SSR, ASR and HSR modes



The following direct transitions are not allowed:

- From ASR to HSR: the application needs first to set DDRCKMOD[1:0] to 0x0 (SSR), and then to set DDRCKMOD[1:0] to 0x2 (HSR mode).
- From HSR to ASR: the application needs first to set DDRCKMOD[1:0] to 0x0 (SSR), and then to set DDRCKMOD[1:0] to 0x1 (ASR mode).

Control of PLL2 reference clock

In all DDR self-refresh modes (SSR, ASR or HSR) described before, the PLL2 always runs. If the application wants to set more power savings (gated dphy_ker_ck and dphy_ker_byp_ck, and powered down PLL2), it has to set the DDRPHY in deep low-power mode (LP2 or LP3 low-power mode). This is only possible in SSR mode.

DDRPHYDLP in RCC_DDRITFCFGR is used to notify deep low-power mode for the RCC.

Recommended configurations

DDRCPEN and DDRPHYCEN bits are used to enable/disable the DDR interface.

Table 132 and *Table 133* show the recommended RCC configurations. The application has to select the configuration adapted to its DDR configuration.

Note: In configurations #4 and #8, the PLL2 is powered down by hardware.

Table 132. Recommended configurations when DDR is not shared (DDRSHR = 0)

Conf #	DDRCKMOD	DDRCPEN	DDRCPLPEN	DDRPHYCEN	DDRPHYDLP	CPU1 CRun			CPU1 CSleep			CPU1 CStop			Comments
						AXI clocks (1)	DDRCTRL clock(2)	DDRPHYC clock	AXI clocks (1)	DDRCTRL clock(2)	DDRPHYC clock	AXI clocks (1)	DDRCTRL clock	DDRPHYC clock	
1	Any	0	x	0	x	OFF	OFF	OFF	OFF	OFF	OFF	OFF	OFF	OFF	Interface disabled
2	SSR	1	1	1	0	**ON**	**ON**	**ON**	**ON**	**ON**	**ON**	OFF	OFF	**ON**	Gating of DDRCTRL and DDRPHYC clocks depends on CPU1 state, and DDRPHYDLP. The application software must switch the DDR interface into a low-power mode, before gating clocks.
3		1	0	1	0	**ON**	**ON**	**ON**	OFF	OFF	**ON**	OFF	OFF	**ON**	
4		1	0	1	1	**ON**	**ON**	**ON**	OFF	OFF	OFF	OFF	OFF	OFF	
5	ASR	1	1	1	0	**ON**	**ON**	**ON**	**ON**	**ON**	**ON**	OFF	OFF	**ON**	Only the DDRCTRL kernel clock is controlled according to automatic mode
6	HSR	1	0	1	0	**ON**	**ON**	**ON**	OFF	**DLP**	**ON**	OFF	OFF	**ON**	The DDRCTRL kernel clock is controlled according to DDRCTRL-LP interface. The DDRPHYC kernel clock must be maintained active by setting DDRPHYCEN = 1.

1. When LPI_XPI_DISABLE = 0, the AXI clock is gated automatically according to **c**active_[2:1] (DCG), except when DDRCPEN = 0.
2. Dynamic clock gating is supported according to cactive_ddrc and selfref_state.

Table 133.Recommended configurations when DDR is shared (DDRSHR = 1)

Conf #	DDRCKMOD	DDRCPEN	DDRCPLPEN	DDRPHYCEN	DDRPHYDLP	System Run			System Stop1/2			Comments
						AXI clocks (1)	DDRCTRL clock(2)	DDRPHYC clock	AXI clocks (1)	DDRCTRL clock(2)	DDRPHYC clock	
7	SSR	1	x	1	0	**ON**	**ON**	**ON**	NA			Gating of DDRCTRL and DDRPHYC clocks depends on system mode and DDRPHYDLP. The application software must switch the DDR interface into a low-power mode, before gating the clocks.
8		1	x	1	1	**ON**	**ON**	**ON**	OFF	OFF	OFF	
9	ASR	1	x	1	0	**ON**	**ON**	**ON**	NA			Only DDRCTRL kernel clock is controlled according to the automatic mode
10	HSR	1	x	1	0	**ON**	**DLP**	**ON**	NA			The DDRCTRL kernel clock is controlled according to DDRCTRL-LP interface. LP1_Rreq is only possible when DDRCPEN = 0 in this case. The DDRPHYC kernel clock must be maintained active by setting DDRPHYCEN = 1.

1. When LPI_XPI_DISABLE = 0, the AXI clock is gated automatically according to cactive_[2:1] (DCG), except when DDRCPEN = 0.
2. Dynamic clock gating is supported according to cactive_ddrc and selfref_state. Only valid in SSR and ASR modes.

MCDCG control interface

The tables below detail the mcdcg_cken control value in all DDR use cases.

Table 134. MCDCG control bit when DDR is not shared (DDRSHR = 0)

DDRCKMOD	DDRCPEN	DDRCPLPEN	CPU1 state	mcdcg_cken	Comments
SSR	0	x	Any	0	DDR not used
	1	x	CRun	1	Application put the DDR in self-refresh.
	1	0	CSleep	0	
	1	1		1

	1	0		1	No gating

1. DDRPHYDLP = 1 is not applicable in Run mode.

20.4.10 General clock concept overview

The RCC handles the distribution of the CPU, bus interface, and peripheral clocks for the system, according to the operating mode of each CPUx (see *Section 19: Power control (PWR)* for details on operating modes and *Section 20.4.1* for clock definitions).

For most of the peripherals, it is possible for the application to control the activation/deactivation of their kernel and bus interface clocks.

Prior to use a peripheral, the CPU1 or CPU2 has to enable it (setting its PERxEN to 1), and to define if this peripheral remains active in CSleep (setting its PERxLPEN to 1).
This operation is called ‘allocate’ a peripheral to a CPUx (see *Section 20.4.11* for details).
The peripheral allocation is used by the RCC to control automatically the clock gating according to CPU states.

For example if the CPU1 enables a peripheral and decides that the kernel clock of this peripheral must be gated when it goes to CSleep, the CPU2 state has no effect on the clock gating of this peripheral, but the clock gating obeys to CPU1 state. This is true if the peripheral is not shared (see *Section 20.4.11* for details). Allocating a peripheral based on

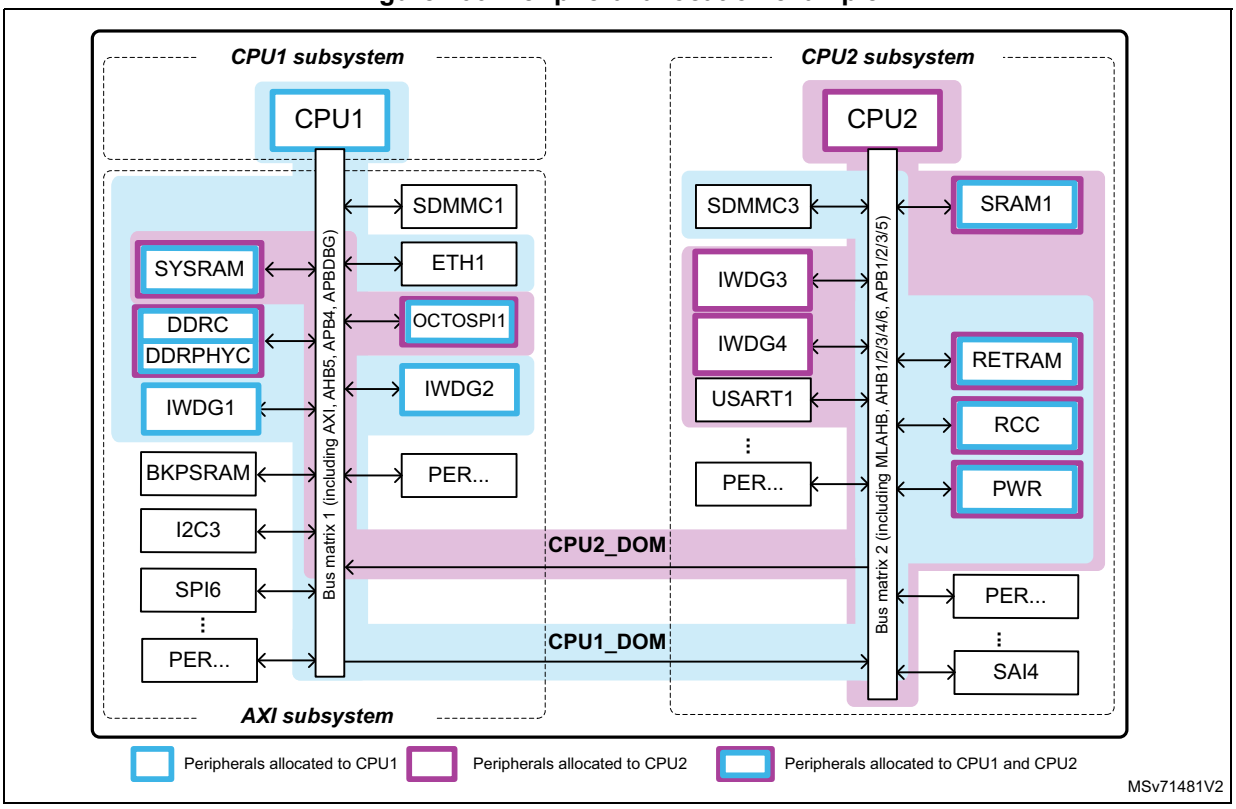
its RIF configuration guarantees to a CPUx that this peripheral remains accessible, whatever the other CPUx mode.

Figure 106 gives an example of peripheral allocation:

- CPU1 enabled ETH1, SDMMC3 and RETRAM. The group composed by the CPU1, bus matrix 1, bus matrix 2, and peripherals allocated via RCC_PERxCFGR form the CPU1 peripheral domain (CPU1_DOM).
- CPU2 enabled SYSRAM, OCTOSPI1, SRAM1 and USART1. The group composed by the CPU2, bus matrix 1, bus matrix 2, and peripherals allocated via RCC_PERxCFGR form the CPU2 peripheral domain (CPU2_DOM).

Note: IWDG1 and IWDG2 are expected to be allocated only to CPU1. IWDG3 and IWDG4 are expected to be allocated only to CPU2. PWR and RCC are common resources and allocated to both CPU1 and CPU2. Memories are allocated to both CPUx (see Figure 106 and Handling of memory devices for more details).

Figure 106. Peripheral allocation example



Note: CPU1_DOM and CPU2_DOM can be spread over the two domains.

When the CPU1 goes to CStop, the RCC disables automatically the bus interface and kernel clocks of all peripherals of CPU1_DOM, as well as CPU1 clock. If CPU2 is still in CRun, the bus matrix 1 is still clocked as CPU2_DOM contains peripherals (SYSRAM, OCTOSPI1) physically connected to this bus matrix. The PLLs, if enabled, are not disabled by the RCC as the CPU2 still runs.

If CPU2 goes to CStop, the bus matrix 1 is no longer clocked.

Note: In this scenario, the complete system can go to Stop. If both CPUs allowed Standby mode, the system goes to Standby.

The wake-up events can exit the system from Standby or Stop.

Handling of memory devices

Both CPU1 and CPU2 can access all memory devices available in the product:

- SYSRAM
- SRAM1, OCTOSPI1
- RETRAM, BKPSRAM

By default, the RETRAM memory is allocated (enabled) to both CPUx to allow accesses when the system exits Standby. All others memories are not allocated by default.

According to the RCC RIF resource configuration, any internal memory can be dedicated or shared by CPUs (see *Section 20.4.11* for details).

Refer to *Section 20.4.12* and *Section 20.4.13* for details on clock enabling.

20.4.11 Peripheral allocation inside RCC

Each CPU can allocate any peripheral and hence control its kernel and bus interface clock. A peripheral is allocated when dedicated PERxEN is set in RCC_PERxCFGR (PERx is the peripheral x).

A peripheral is deallocated when dedicated PERxEN is reset in RCC_PERxCFGR.

According to the product RIF policy (see *Section 20.7* for details), each CPU peripheral domain is created based on the following criteria (see *Table 115* for details):

- RIF peripheral configuration

  Filters which CPU is allowed to allocate/deallocate the peripheral. Each RIF peripheral configuration is propagated to the RCC via perxrifcfgr signals.
- RCC RIF resource configuration

  Concerns peripherals that can be used simultaneously by both CPUs and are mainly the RIF-aware peripherals and the internal memories (see *Table 138*).

  The RCC RIF resource configuration must be set in “Shared between different masters with semaphore protection” to allow these peripherals to be shared by both CPUs.

Warning: Any peripheral configured in single-access mode must be deallocated to become free for any other CPU. If not, any RIF configuration change does not work for any new allocation.

Nevertheless, any peripheral listed in the table below can be allocated by one CPU when the related RCC RIF resource configuration is set in “single-access” mode. The application must program the RIF peripheral configuration accordingly.

Example: If the application wants HPDMA1 to be used only by CPU1, the following steps are needed:

1. Set HPDMA1 RIF configuration in CPU1 single-access mode.
2. Set RCC HPDMA1 RIF configuration in CPU1 single-access mode (CFEN = 1, SEM_EN = 0 and SCID = CPU1 ID in RCC_R83CIDCFGR).

Table 138.Shareable peripherals list

Category	List
Peripherals	DDR(1), RCC, PWR, EXTI, SYSCFG, IPCC1, HPDMA1, HPDMA2, HPDMA3, GPIOA, GPIOB, GPIOC, GPIOD, GPIOE, GPIOF, GPIOG, GPIOH, GPIOI, GPIOZ, FMC, BSEC, ETR, DBGMCU, RTC
Memories	SYSRAM, OCTOSPI1, SRAM1, RETRAM, BKPSRAM

1. DDR can be set shareable according to DDRSHR in RCC_DDRITFCFGR.

When the RIF peripheral configuration is set in legacy mode (CFEN = 0):

- The peripheral is allocated to the first allowed CPU which has set the enable bit. The application must manage the peripheral allocation/deallocation in case of shareable peripheral.

When the RIF resource configuration is set in legacy mode (CFEN = 0):

- The resource is allocated to the latest allowed CPU which has set the enable bit except for the ones listed in *Table 138*. Once the resource is allocated, it is also available for the other CPU (clocking depends on the system state).

PERxEN is used by the hardware to provide the kernel and bus clocks according to the CPU state for peripherals not listed in *Table 138*, whereas it is based on the system state for peripherals set as shareable in *Table 138*.

Clock enabling delays

In order to avoid spurs, the clock gating logic synchronizes the enable command (coming generally from a clock request or PERxEN) with the selected clock.

- A maximum delay of 2 periods of the enabled clock may occur between the enable command and the first rising edge of the clock. The enable command can be the rising edge of PERxEN, or a clock request asserted by a peripheral.
- A maximum delay of 1.5 periods of the disabled clock may occur between the disable command and the last falling edge of the clock. The disable command can be the falling edge of PERxEN, or a clock request released by a peripheral.

Note: Both kernel and bus interface clocks are affected by this resynchronization delay.

In addition, the clock enabling delay may increase if the application enables for the first time, a peripheral which is not located into its domain (the subsystem where the peripheral is located may not have its subsystem clock ready). The subsystem clock must be switched on before the application can use this peripheral.

For example if CPU2 is enables a peripheral located into the AXI subsystem, while the CPU1 is in CStop, the RCC has to provide a clock to the AXI subsystem.

In order to allocate properly a peripheral, the following sequence must be respected:

1. Enable the peripheral clocks (allocate the peripheral) by writing PERxEN = 1.
2. Read back the RCC_PERxCFGR register. This operation can be considered as a dummy read.
3. The peripheral can now be used.

Note: When the bus interface clock is not active, the read/write accesses to the peripheral registers are not supported. A read access results in reading invalid data. A write access is ignored, and do not create any bus errors.

20.4.12 Peripheral clock gating control

As mentioned previously, each peripheral requires a bus interface clock, named ck_icn_p_perx or ck_icn_s_perx (for peripheral x). This clock is an APB, AHB or AXI clock, according to which bus the peripheral is connected.

The clock source used as bus interface clock for peripherals located into the CPU1 domain can be one of the *Table 121* (such as ck_icn_hs_mcu, ck_icn_ls_mcu, ck_icn_sdmmc, or ck_icn_hsl) depending on the bus connected to each peripheral.

Some peripherals (such as SAI, or UART) need also a dedicated clock for their communication interface. This clock is generally asynchronous with respect to the bus interface clock, and is named kernel clock (ck_ker_perx).

Bus interface and kernel clocks can both be gated according to several conditions detailed hereafter.

As shown in the *Figure 107*, the enabling of the kernel and bus interface clocks of each peripheral depends on several input signals:

- PERxEN, PERxLPEN bits in RCC_PERxCFGR
  - PERxEN represents the peripheral enable (allocation) bit for the CPU.
  - PERxLPEN represents the peripheral low-power enable bit.
- cpu1_mode, cpu2_mode (see *Section 20.4.13* for details)
  - CPU1 state (cpu1_mode) is a logic combination of CPU states (WFI or WFE) and STPREQ_P0 bit (see *Table 141* for details).
  - For CPU2 (cpu2_mode), the state depends on the low-power core setting (see *CPU2 clock gating*).
- sys_mode
  - System mode (sys_mode) is used to filter the clock request of autonomous peripherals.
- kernel clock request (req_ck_ker_perx) of the peripheral itself (when feature available)
- bus clock request (req_ck_bus_perx) of the peripheral itself (when feature available) (autonomous peripherals).
- flexclkgen cross bar channel selection (XBARxSEL in RCC_XBARxCFGR)

Due to jitter constraints, the final clock gating stage for bus and/or kernel clocks is not inside the RCC but at the peripheral boundary. The RCC provides only the enable signal for the following peripherals: USBH, OTG, USB2PHY1 and USB2PHY2 (see *Section 20.4.11* for more details).

Figure 107. Peripheral clock enable logic details

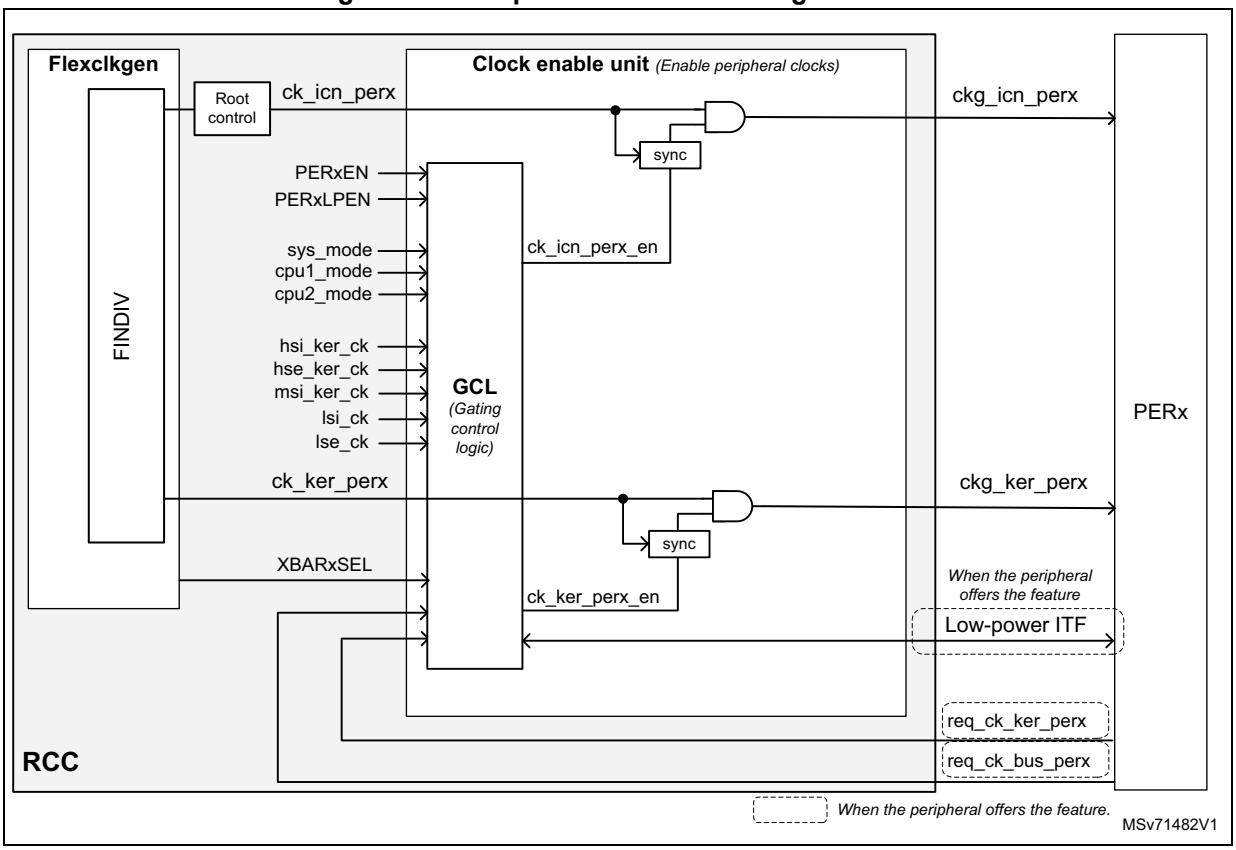


Table 139 and *Table 140* detail the enabling logic of most peripheral clocks for peripherals allocated by CPUs.

Table 139.Peripheral bus clock enabling logic

PERxEN	PERxLPEN	req_ck_bus_perx(1)	CPUx(2)	System mode	ck_icn_perx_en	Comments
0	X	X	X	X	0	No clock provided to the peripheral (PERxEN = 0)
1	X	X	CRun	Run	1	Bus interface clock provided to the peripheral (CPUx in CRun and PERxEN = 1)
1	0	X	CSleep		0	No clock provided to the peripheral (CPUx in CSleep and PERxLPEN = 0)
1	1	X			1	Bus interface clock provided to the peripheral (CPUx in CSleep and PERxLPEN = 1)

Table 139.Peripheral bus clock enabling logic (continued)

PERxEN	PERxLPEN	req_ck_bus_perx[1]	CPUx[2]	System mode	ck_icn_perx_en	Comments
1	0	X	CStop	Run, Stop or LP-Stop	0	No clock provided to the peripheral (CPUx in CStop and PERxLPEN = 0).
1	1	0			0	No clock provided to the peripheral (CPUx in CStop, system in Run, Stop or LP-Stop mode, and req_ck_bus_perx = 0)
1	1	1			1	Bus interface clock provided to the peripheral (CPUx in CStop, system in Run, Stop or LP-Stop mode, and PERxEN = PERxLPEN = req_ck_bus_perx = 1) In system Stop or LP-Stop, HSI is the source clock
1	1	0	CStop	LPLV-Stop	0	No clock provided to the peripheral (system in LPLV-Stop and no bus clock request pending)
1	1	1			1	Bus interface clock provided to the peripheral (system in LPLV-Stop and req_ck_bus_perx = 1)

1. See *Section 19.5.2: Low-power batch acquisition mode (LPBAM)* for the list of supported autonomous peripherals. All enabled autonomous peripherals are clocked when at least one req_ck_bus_perx is active.
2. CPUx = CPU1, CPU2 (see *Section 20.4.14* for details).

As a summary, the bus interface clock is provided to the peripherals in the following conditions:

- when the CPU to which the peripheral is allocated is in CRun
- when the CPU is in CSleep, with PERxLPEN = 1
- when the CPU is in CStop, system in Run, Stop or LP-Stop mode, with PERxLPEN = 1, and the peripheral generates a bus clock request
- when the CPU is in CStop, system in LPLV-Stop mode, with PERxLPEN = 1, and the peripheral generates a bus clock request

Table 140.Peripheral kernel clock enabling logic

PERxEN	PERxLPEN	XBARxSEL	req_ck_ker_perx	CPUx[1]	System mode	ck_ker_perx_en	Comments
0	X	X	X	X	X	0	No clock provided to the peripheral (PERxEN = 0)
1	X	X	X	CRun	Run	1	Kernel clock provided to the peripheral (CPUx in CRun and PERxEN = 1)
1	0	X	X	CSleep		0	No clock provided to the peripheral (CPUx in CSleep and PERxLPEN = 0)
1	1	X	X			1	Kernel clock provided to the peripheral (CPUx in CSleep and PERxLPEN = 1)

Table 140.Peripheral kernel clock enabling logic (continued)

PERxEN	PERxLPEN	XBARxSEL	req_ck_ker_perx	CPUx(1)	System mode	ck_ker_perx_en	Comments
1	1	no lsi_ck and no lse_ck and no hsi_ker_ck and no msi_ker_ck and no hse_ker_ck	X	CStop	Run, Stop or LP-Stop	0	No clock provided to the peripheral (CPUx in CStop and lse_ck, lsi_ck, hsi_ker_ck, msi_ker_ck or hse_ker_ck not selected)
1	1	lsi_ck or lse_ck	X			1	Kernel clock provided to the peripheral (PERxEN = PERxLPEN = 1 and lsi_ck or lse_ck selected) The application must enable LSE or LSI if requested.
1	1	hsi_ker_ck or msi_ker_ck or hse_ker_ck	1			1(2)	Kernel clock provided to the peripheral (req_ck_ker_perx = PERxEN = PERxLPEN = 1 and hsi_ker_ck, msi_ker_ck or hse_ker_ck selected) If the oscillators are off, the RCC enables them when a kernel clock request occurs.
1	1	hsi_ker_ck or msi_ker_ck or hse_ker_ck	0(3)			0	No clock provided to the peripheral (CPUx in CStop, and no kernel clock request pending)
1	1	lsi_ck or lse_ck or msi_ker_ck	0(3)	CStop	LPLV-Stop	0	No clock provided to the peripheral (no kernel clock request pending)
1	1		1			1	Kernel clock provided to the peripheral (PERxLPEN = 1, lsi_ck or lse_ck or msi_ker_ck selected and req_ck_ker_perx = 1)

1. CPUx = CPU1 or CPU2 (see *Section 20.4.14* for details).
2. The DTS does not support the kernel clock request, but the kernel clock is still delivered in CStop.
3. For MDF1 the kernel clock is provided when PERxEN = PERxLPEN = 1 if selected from a PLL, see *Table 125* footnote (4) for oscillator cases. For LPTIM1/2/3/4/5, the kernel clock is provided when lsi_ck or lse_ck is selected.

Note: The kernel clock request generated by the peripheral, enables the corresponding oscillator only if XBARxSEL[3:0] in RCC_XBARxCFGR selects an oscillator: HSI, MSI or HSE.

As a summary, the kernel clock is provided to the peripherals in the following conditions:

- when the CPU to which the peripheral is allocated is in CRun
- when the CPU is in CSleep, with PERxLPEN = 1
- when the CPU is in CStop, with PERxLPEN = 1, the peripheral generates a kernel clock request, and the selected clock is hsi_ker_ck or msi_ker_ck or hse_ker_ck
- when the CPU is in CStop, with PERxLPEN = 1, and the kernel source clock of the peripheral is lse_ck or lsi_ck
- when the CPU is in CStop, with PERxLPEN = 1, the peripheral generates a kernel clock request, and the selected clock is lsi_ck, lse_ck or msi_ker_ck

Note: Only some peripherals are able to request the kernel clock: I2C, I3C, SPI, U(S)ART. This feature gives to the peripheral the capability to wait for an event with an optimal power consumption.

20.4.13 CPUx and interconnect clocks gating

CPU1 clock gating

The CPU1 embeds one core and its own PLL (PLL1) provides all local clocks. The RCC provides only the PLL1 source reference clock (ck_pll1_ref), and the PLL1 bypass reference clock (ck_cpu1_ext2f).

When the CPU1 core goes to WFI, it is set in low-power state by gating its clocks, except for the functions used to wake up the core from WFI.

When the CPU1 core goes to WFE, it is set in low-power state by gating its clocks, except for the functions used to wake up the core from WFE.

When the CPU1 core is in WFI, the L2 memory system logic can also enter in WFI, and the cpu1_standbywfi_l2 signal is asserted. More precisely, when the CPU1 core is in WFI, the L2 memory system completes the pending transactions, enters in WFI, and cpu1_standbywfi_l2 is asserted. If CStop has been requested via STPREQ_P0 bit, the RCC disables ck_pll1_ref, ck_cpu1_ext2f clocks, and the AXI interface clock (ck_icn_m_cpu1).

The table below details the CPU1 modes according to the L2 memory system logic state (WFI), and RCC register values.

Table 141. CPU1 mode details(1)

STPREQ_P0	L2 memory logic in WFI	CPU1 mode
-	N	CRun
0	Y	CSleep
1	Y	CStop

1. "-" means don't care.

The CPU1 can go in an enhanced CSleep when th ESLPREQ is set in RCC_C1SREQSETR. When this bit is set and STPREQ_P0 bits combination is 0, PLL1 is powered down and bypassed (ck_pll1_ref is also disabled) each time cpu1_standbywfi_l2 is asserted. ck_cpu1_ext2f clock must be used to be able to leave this mode.

When CPU1 is in CStop, PLL1 is also powered down when the system goes in one of Stop1 modes without any software assistance. If the system goes in one of Stop2 modes, the application software is required to disable PLL1 first, before putting the core in WFI state.

PLL1 disable application software procedure is the following:

1. Set CA35SS_SSC_CHGCLKREQ.ARM_CHGCLKREQ.
2. Poll CA35SS_SSC_CHGCLKREQ.ARM_CHGCLKACK bit until it is 1.
3. Clear CA35SS_SSC_PLL_ENABLE.NRESET_SWPLL.
4. Clear CA35SS_SSC_PLL_ENABLE.PLL_EN.
5. Poll CA35SS_SSC_PLL_ENABLE.LOCKP until it is 0.

Figure 108. CPU1 low-power interface

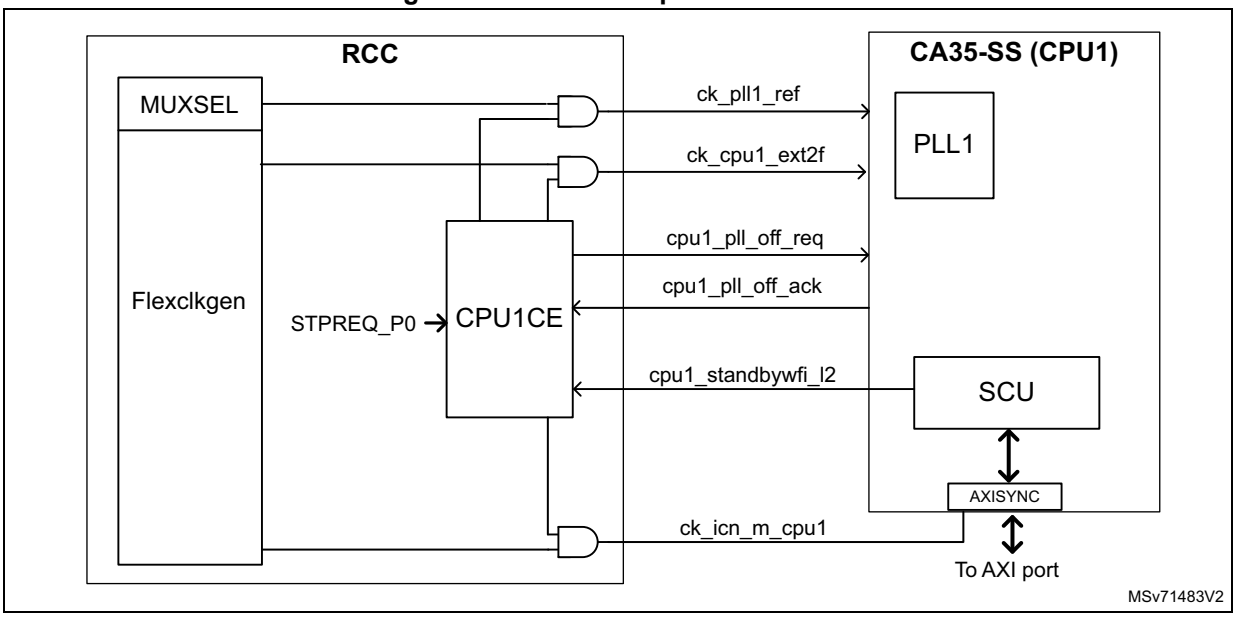

Figure 109. CPU1 PLL1 stop sequence

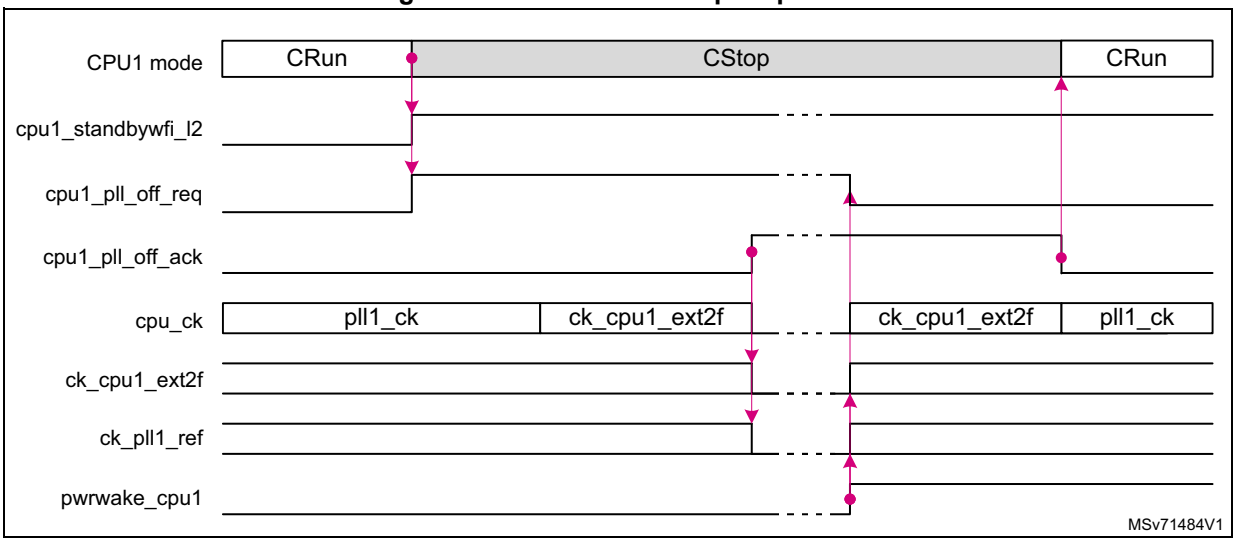

CPU2 clock gating

CPU2 main clock (ck_cpu2) is sourced from ck_icn_hs_mcu clock.

CPU2 support two low-power states: sleep (SLEEPING output set high) and deepsleep (SLEEPING and SLEEPDEEP outputs set high).

CPU2 sleep state is equivalent to CSleep. CPU2 deepsleep state is equivalent to CStop for RCC. CPU2 main clock is only gated when it is in CStop.

Bus matrix and bridge clock gating

Bridge and bus matrix clocks are gated according to CPUx mode, and to the peripheral allocated to these CPUx. *Table 142* shows in which conditions the RCC gates the bus matrix and bridge clocks (see *Section 20.4.12* for information about convention naming).

Table 142. Bus clock enable details for ck_icn_ahbx with x = 2,5,6 and ck_icn_apby with y = 1,2,3,4,5,dbg

   cpu1_perlpen_ahbx(apby) is set to 1 when at least one peripheral connected to AHBx (APBy) is allocated to CPU1, with its PERxLPEN set to 1.
   cpu2_peren_ahbx(apby) is set to 1 when at least one peripheral connected to AHBx (APBy) is allocated to CPU2.
   cpu2_perlpen_ahbx(apby) is set to 1 when at least one peripheral connected to AHBx (APBy) is allocated to CPU2, with its PERxLPEN set to 1.

20.4.14 Mass storage interface clocking

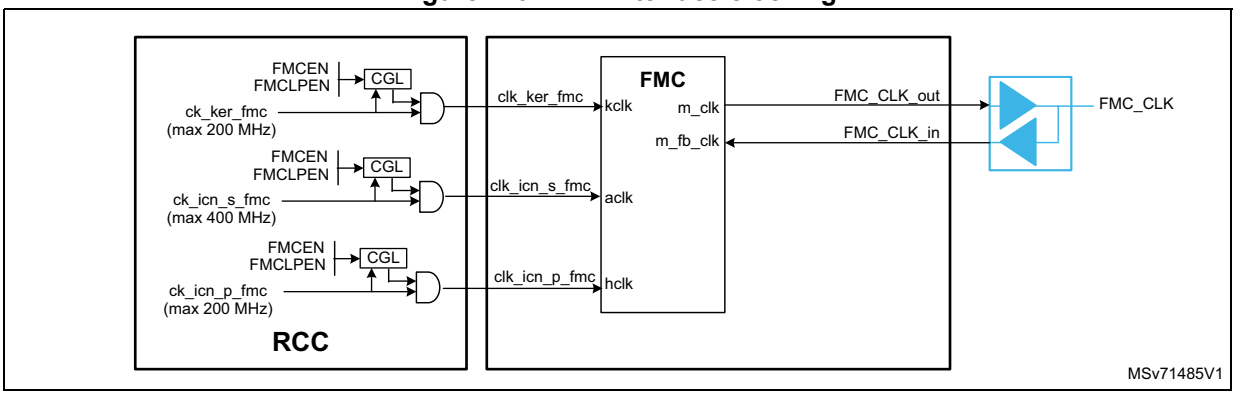
One programmable delay (DLYB) is used for each SDMMC and the OCTOSPI interface. These programmable delays are used:

- to tune the RX sampling clock phase for SDMMC1/2/3, OCTOSPI1 controllers
- to tune the TX launch clock phase for OCTOSPI1, and thus to meet setup/hold constraints of TX signals versus the OCTOSPI memory clocks

These programmable delays are based on a DLL that compensates voltage and temperature variations. This DLL features 32 taps and covers the frequency range from 50 MHz to 208 MHz. The clock on which the DLL locks is provided by SDMMC or OCTOSPI controllers. This clock is at the same frequency as the memory clock, and it is free running. The programmable delays control bits are described in system configuration controller (SYSCFG) section. More details in Mass storage interfaces section.

FMC interface - Clocking schematic

Figure 110. FMC interface clocking



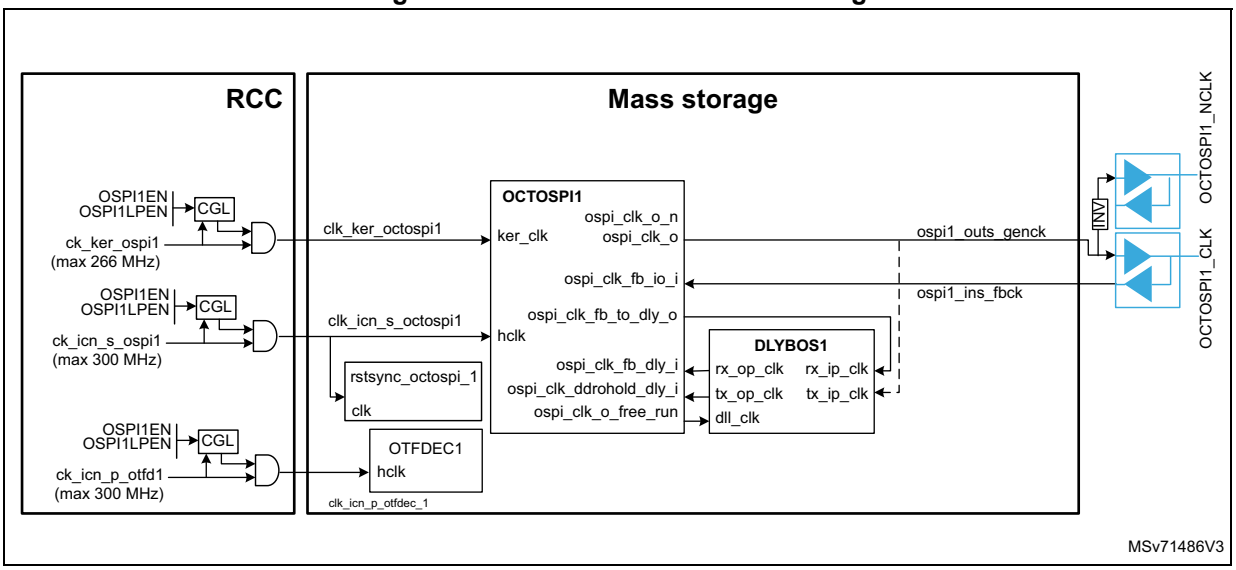
The FMC controller receives its kernel, AHB and AXI clocks from the RCC.

Table 143. FMC interface clocks from RCC

Subsystem clock signal name	Peripheral	Clock signal name	Clock direction	RCC clock line	Max frequency	Description
clk_ker_fmc	FMC	KCLK	Input	ck_ker_fmc	200 MHz	kernel clock
clk_icn_s_fmc		ACLK	Input	ck_icn_s_fmc	400 MHz	AXI clock
clk_icn_p_fmc		HCLK	Input	ck_icn_p_fmc	200 MHz	AHB clock

OCTOSPI interface - Clocking schematic

Figure 111. OCTOSPI interface clocking



The RCC provides kernel and bus clocks to OCTOSPI1 and OTFDEC1. DLYBOS1 provide delayed feedback clocks, and delayed TX launch clocks to OCTOSPI1.

Table 144. OCTOSPI clocks from RCC

Subsystem clock signal name	Peripheral	Clock signal name	Clock direction	RCC clock line	Max frequency	Description
clk_ker_octospi1	OCTOSPI1	ker_clk	Input	ck_ker_ospi1	266 MHz	kernel clock
clk_icn_s_octospi1	OCTOSPI1	HCLK	Input	ck_icn_s_ospi1	300 MHz	AHB clock
clk_icn_p_otfdec_1	OTFDEC1	HCLK	Input	ck_icn_p_otfd1	300 MHz	AHB clock

Table 145. OCTOSPI interface clocks from DLYBOS1

Peripheral	Clock signal name	Clock direction	Max frequency	Description
DLYBOS1	rx_op_clk	Output	200 MHz	Delayed RX sampling clock
DLYBOS1	tx_op_clk	Output	200 MHz	Delayed TX launch clock

Details of the OCTOSPI interface clocking

For OCTOSPI1 interface, the RX sampling strobe can be selected between:

- the memory clock after loopback at pin level (OCTOSPI ospi_clk_fb_io_i input)
- a delayed version of this loopback clock (OCTOSPI ospi_clk_fb_dly_i input)
- the DQS signal provided by the memory device (OCTOSPI afi_dqs input)
- a delayed version of DQS (OCTOSPI ospi_clk_fb_dly_i input)

For OCTOSPI1 interface, the delay on loopback clock or DQS relies on a DLL. This DLL is used to tune the phase of the RX sampling strobe, so that it is positioned in the middle of the

data valid window, and guarantees that this phase remains constant even if voltage or temperature conditions vary.

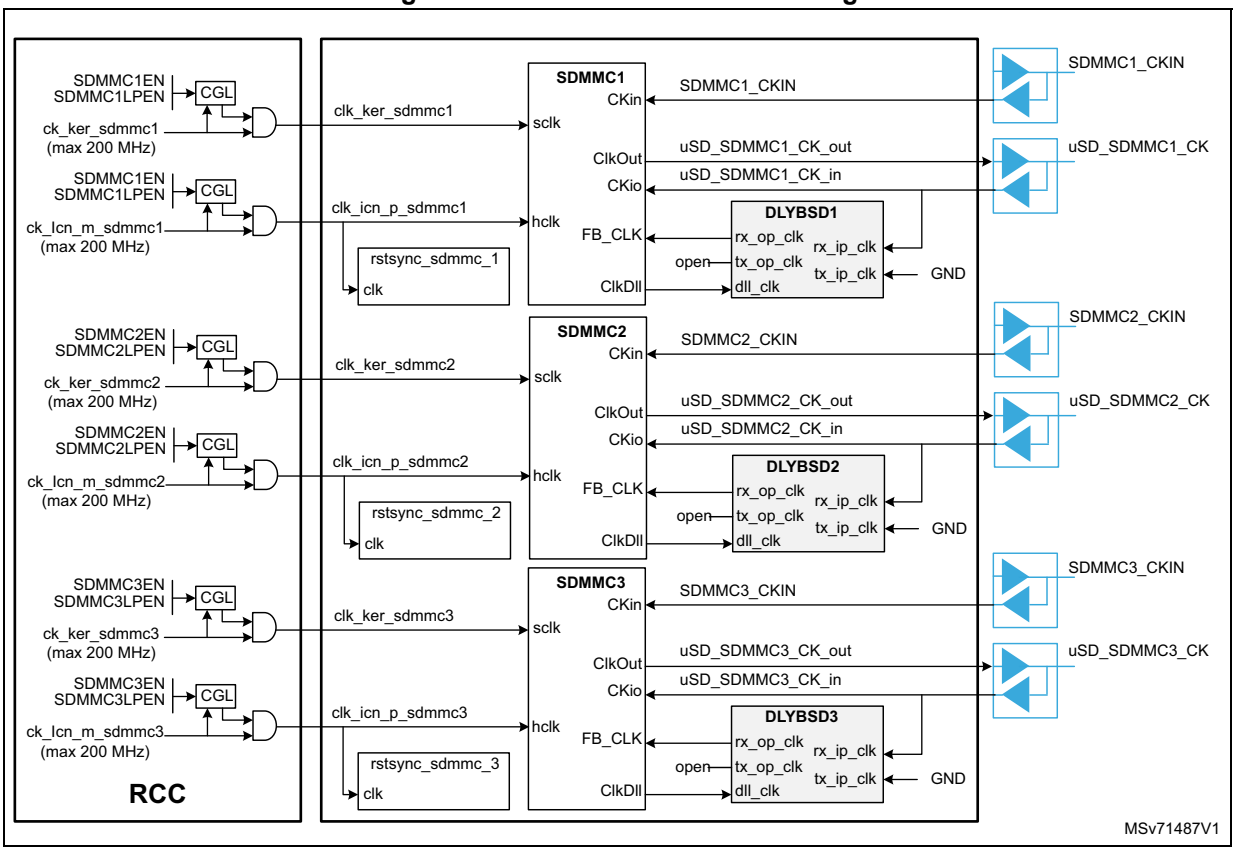
Using this DLL is mandatory at all frequencies for protocols where a DQS is provided by the memory device to qualify read data. This DQS is edge-aligned with data at the output of the memory device, and must be shifted to enable data safe sampling. For memory frequencies above 50 MHz, the DLL is used in lock mode. For memory frequencies below 50 MHz, the DLL is used in bypass mode (pure delay).
For non DQS based protocols, using the DLL is recommended when memory frequency is greater than 100 MHz (STR), or 66 MHz (DTR). This is optional for lower speeds where using the loopback clock is sufficient. The DLL must not be used in lock mode for speed modes below 50 MHz.

A delay relying on a DLL is also implemented for the TX path, with the following delay use cases:

- If operating in STR mode, data are generated by the OCTOSPI on the falling edge of the memory clock. This ensures by construction an optimal setup and hold timing versus the rising edge of the memory clock. The TX delay is not used.
- If operating in DTR mode with a kernel clock that is a multiple of the memory clock, DHQC in OCTOSPI_TCR must be set to 1. This bit is used to shift the data versus memory clock edges (shift by T/4 if kernel clock frequency is twice the memory clock frequency). The TX delay is not used.
- If operating in DTR mode with a kernel clock frequency equal to the memory clock frequency, the TX delay is required to shift the data versus the memory clock edges. This delay is used to shift the TX launch clock (OCTOSPI ospi_clk_ddrohold_dly_i input).

SDMMC interface - Clocking schematic

Figure 112. SDMMC interface clocking



The RCC provides the kernel and bus clocks to the SDMMC1/2/3. DLYBSD1/2/3 provide delayed feedback clocks for RX sampling to the SDMMC1/2/3.

Table 146. SDMMC clocks from RCC

Subsystem clock signal name	Functional block	Clock signal name	Clock direction	RCC clock line	Max frequency	Description
clk_ker_sdmmc1	SDMMC1	SClk	Input	ck_ker_sdmmc1	200 MHz	kernel clock
clk_icn_p_sdmmc1	SDMMC1	HCLK	Input	ck_icn_m_sdmmc1	200 MHz	AHB clock
clk_ker_sdmmc2	SDMMC2	SClk	Input	ck_ker_sdmmc2	200 MHz	kernel clock
clk_icn_p_sdmmc2	SDMMC2	HCLK	Input	ck_icn_m_sdmmc2	200 MHz	AHB clock
clk_ker_sdmmc3	SDMMC3	SClk	Input	ck_ker_sdmmc3	200 MHz	kernel clock
clk_icn_p_sdmmc3	SDMMC3	HCLK	Input	ck_icn_m_sdmmc3	200 MHz	AHB clock

Table 147. SDMMC interface clocks from DLYBSD1/2/3

Peripheral	Clock signal name	Clock direction	Max frequency	Description
DLYBSD1	rx_op_clk	Output	200 MHz	Delayed RX sampling clock
DLYBSD2	rx_op_clk	Output	200 MHz	Delayed RX sampling clock
DLYBSD3	rx_op_clk	Output	200 MHz	Delayed RX sampling clock

Details of the SDMMC interface clocking

For all SDMMC1/2/3 interfaces, the RX sampling clock can be selected between:

- the memory clock after loopback at pin level (SDMMC CKio input)
- a delayed version of this loopback clock (SDMMC FB_CLK input)
- the memory clock after loopback in an external level shifter (SDMMC CKin input)

For each SDMMC interface, the delayed loopback clock relies on a DLL. This DLL is used to tune the phase of the RX sampling clock so that it is positioned in the middle of the data valid window (also valid for Cmd), and guarantees that this phase remains constant even if voltage or temperature conditions vary. Using this DLL is mandatory for speed modes where the phase of the data (respectively Cmd) valid window is not guaranteed by the memory device (SDR104, HS200 modes). This is optional for other speed modes where using the loopback clock is sufficient. The DLL must not be used in lock mode for speed modes below 50 MHz.

There is no programmable delay nor DLL implemented for the TX paths of the SDMMC. The SDMMC generates data (respectively Cmd) with the maximum setup/hold timings versus the active edge of the clock sent to the memory device.

20.4.15 Ethernet interface clocking

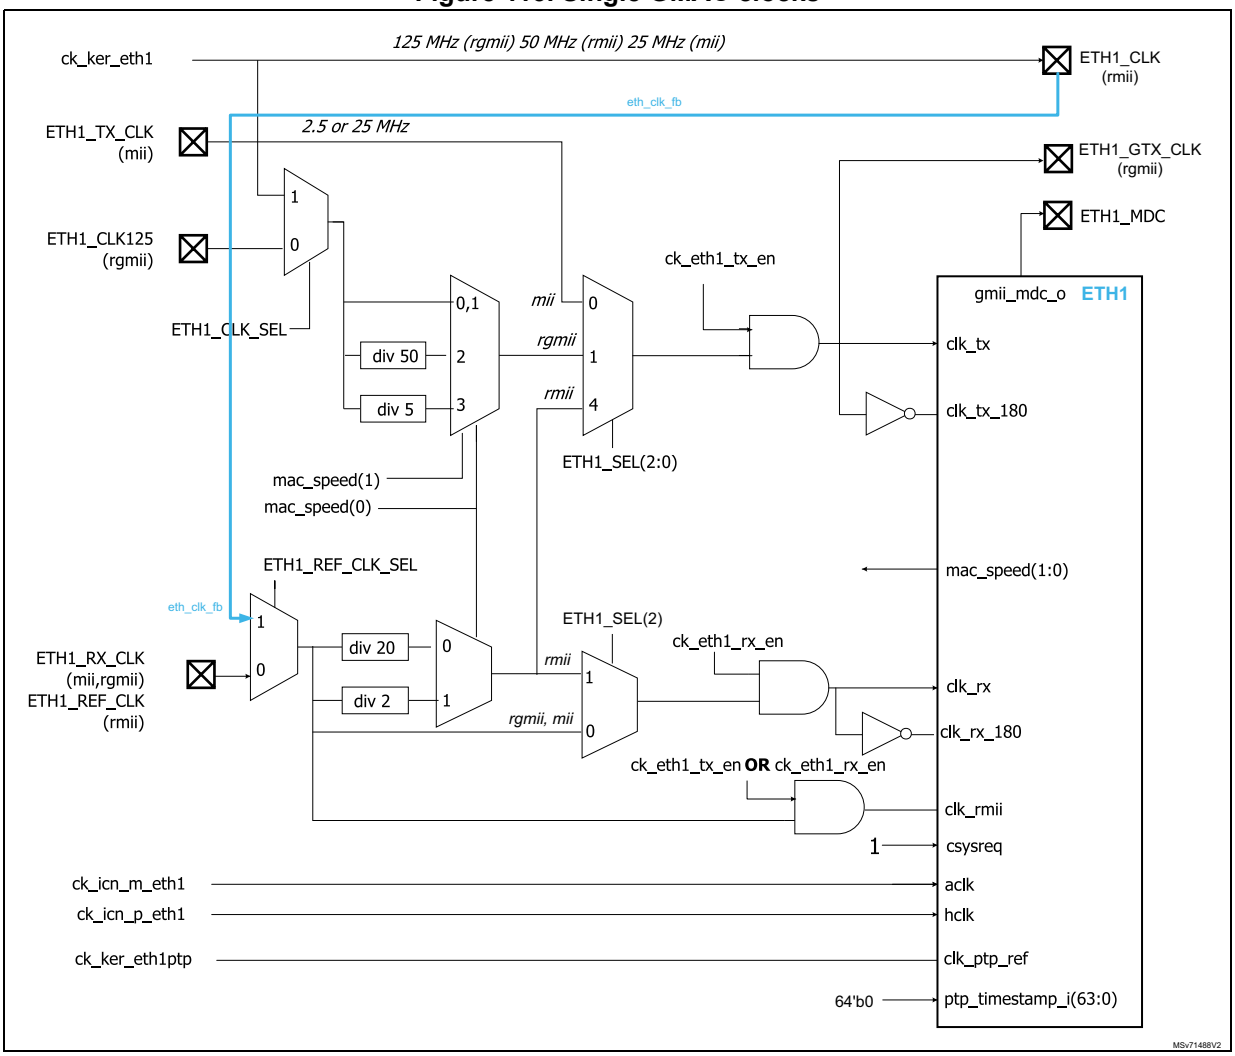
There are two independent GMAC controllers (ETH1 and ETH2) that support MII, RMII and RGMII interfaces.

ETH1 and ETH2 include an MDIO interface. External clock I/Os are multiplexed to support internal or external clock generation. ETH1 and ETH2 support TSN.

Clocking schematic

Each GMAC has the same (but independent) clock management. The clocking for a single GMAC is shown in the figure below.

Figure 113. Single GMAC clocks



The RCC provides all the clocks except from the I/O inputs (ETH1_CLK125, ETH1_TX_CLK, ETH1_RX_CLK). the Ethernet clocks are also available as outputs (ETH1_CLK, ETH1_GTX_CLK) when the device is the clock master.

The main clock for the Ethernet is generated by the RCC (ck_ker_eth1) or externally (ETH1_CLK125 or ETH1_REF_CLK).

Clock signals

Table 148. Ethernet clocks from RCC

Subsystem clock signal name	Peripheral	Clock signal name	Clock direction	RCC clock	Max frequency	Clock description
clk_eth1_hclk	ETH1 controller	hclk	Input	ck_icn_p_eth1	150 MHz	AHB register access
clk_eth1_ axi_master	ETH1 controller	aclk	Input	ck_icn_m_eth1	300 MHz	AXI data master
clk_ker_eth1	ETH1 controller	(multiple divided)	Input	ck_ker_eth1	125 MHz	Internal GMAC clock
clk_eth1_ptp_ref	ETH1 controller	clk_ptp_ref	Input	ck_ker_eth1ptp	200 MHz	PTP reference clock

In the table below, signals and I/Os for ETH2 are not shown, but repeat these called “_eth1” or “ETH1” with “_eth2” or “ETH2”.

Table 149. Ethernet clocks to/from I/Os

Subsystem clock pin name	Peripheral	Clock signal name	Clock direction	Max frequency	Clock description
ETH1_CLK125	ETH x controller	-	Input	125 MHz	Optional RGMII external reference (fixed frequency)
ETH1_TX_CLK		-	Input	25 MHz	MII external TX clock
ETH1_RX_CLK/ ETH1_REF_CLK		-	Input	125 MHz	MII or RGMII external RX clock, RMII external reference
ETH1_CLK		-	Output	125 MHz	To external PHY (fixed frequency)
ETH1_GTX_CLK		clk_tx_i	Output	125 MHz	To external PHY (dynamic frequency)
ETH1_MDC		gmii_mdc_o	Output	hclk/4	Clock for MDIO

All RGMII I/Os must support 125 MHz dual-edge toggling. Only 1.8 V and 3.3 V I/O signaling is supported (V_{DD} common to other GPIOs). 1.5 V support is not required as most PHYs also support 1.8 V. This means that the RGMII v2.0 is supported except for HSTL 1.5 V.

Ethernet I/O use

Table 150. Active I/O per mode (MII, RMII, RGMII)

Direction	MII	RMII	RGMII	Comments
Input/output	ETH_CLK	ETH_CLK	ETH_CLK	125/50/25 MHz to PHY (static)
Output	-	-	GTX_CLK	125/25/2.5 MHz in RGMII (dynamic)
Input	-	-	ETH_CLK125	125 MHz from PHY (static)
Input	RX_CLK	REF_CLK	RX_CLK	125/25/2.5 MHz, or 50 MHz RMII
Input	RX_DV	CRS_DV	RX_CTL	-

Table 150. Active I/O per mode (MII, RMII, RGMII) (continued)

Direction	MII	RMII	RGMII	Comments
Input	RX_ER	-	-	-
Input	COL	-	-	-
Input	CRS	-	-	-
Input	RXD0	RXD0	RXD0	DDR (except MII)
Input	RXD1	RXD1	RXD1	-
Input	RXD2	-	RXD2	-
Input	RXD3	-	RXD3	-
Input	TX_CLK	-	-	25/2.5 MHz in MII
Input	TX_EN	TX_EN	TX_CTL	-
Output	TXD0	TXD0	TXD0	DDR (except MII)
Output	TXD1	TXD1	TXD1	-
Output	TXD2	-	TXD2	-
Output	TXD3	-	TXD3	-
Output	MDC	MDC	MDC	2.5 MHz or faster
Input/output	MDIO	MDIO	MDIO	-

Description

The two controllers have separate register programming ports with independent clocks. Each controller also has a master port for data transfers, clocked by ck_icn_m_eth1 or ck_icn_m_eth2.

The RCC clock enable ck_ker_eth1_en gates the main Ethernet clock. There are also RCC clock enable for transmit (ck_eth1_tx_en) and receive (ck_eth1_rx_en) clocks, and an interconnect clock enable (ck_icn_eth1_en) for aclk and hclk.

The application can control the gating according to the CPUx modes (CRun, CSleep). It can also control the gating of clocks coming from ETH1_RX_CLK and ETH1_TX_CLK I/Os in CStop and Stop modes (see ETH1STPEN in RCC_ETH1CFGR).

The main Ethernet clock provided by the RCC is available on ETH1_CLK I/O. The clock selection for the RX and TX paths is controlled via the SYSCFG.

ETH1_SEL[2:0] in RCC_ETH1CFGR must be set to match the interface type used.

MII mode

The transmit clock is received from the external PHY via ETH1_TX_CLK I/O. The clock frequency is 2.5 or 25 MHz. The receive clock is received from the external PHY via ETH1_RX_CLK I/O. The clock frequency is 2.5 or 25 MHz. The ETH1_CLK output can be used to provide a reference clock (25 MHz) to the external PHY.

RGMII mode

The transmit clock can be selected between an internal clock provided by the RCC, or the clock received on the ETH1_CLK125 I/O. This selection is controlled via ETH1_CLK_SEL

in SYSCFG_ETH1CR. The clock frequency can be adjusted dynamically to 2.5, 25 or 125 MHz according to the mac_speed_o[1:0] signal provided by the ETH1 controller

The receive clock is coming directly from ETH1_RX_CLK I/O. The clock frequency is 2.5, 25, or 125 MHz. The dynamic transmit clock is provided to the PHY via ETH1_GTX_CLK I/O.

A constant reference clock of 125 MHz (50% duty cycle ± 5%) can also be provided to the external PHY via ETH1_CLK I/O.

Note: When the internal clock is provided externally, ck_ker_eth1 must not be gated.

RMII mode

The continuous reference clock (50 MHz) can be internally generated (ck_ker_eth1), or can come from ETH1_REF_CLK I/O. This selection is controlled via ETH1_REF_CLK_SEL in SYSCFG_ETH1CR.

The transmit and receive clock frequency can be adjusted dynamically to 2.5 or 25 MHz according to the mac_speed_o[0] signal provided by the ETH1 controller.

A continuous reference clock (50 MHz) can also be provided to the external PHY via ETH1_CLK I/O. To track the skew on the board when the internal clock is selected, the RMII clock (eth_clk_fb) is actually driven from the ETH1_CLK I/O buffer.

Note: To be continuous, ck_ker_eth1 must not be gated in Stop mode.

Dynamic clock generation

Internal transmit and receive clocks vary dynamically according to the MAC interface speed. The internal transmit clock is also available on ETH1_GTX_CLK I/O.

The ETH1 controller reports the speed of the MAC interface which may change dynamically during normal operation.

Table 151. Ethernet MAC speed encoding

mac_speed_o[1:0]	MAC speed (Mbit/s)
0x	1000
10	10
11	100

Clock multiplexers controlled by mac_speed_o produce a glitch-free output.

Station management clock

ETH1_MDC is the output clock for the station management interface. The MDC clock is a divided version of ck_icn_p_eth1 ("CSR clock"). The clock range (CR) setting in ETH1_MACMDIOAR selects the division ratio.

IEEE 802.3 specifies a maximum MDC frequency of 2.5 MHz, but higher frequencies can be selected if required. 12 MHz is supported by STM32MP21xx devices, but ETH1 supports up to 50 MHz (hclk/4). See *Section 77: Ethernet (ETH): gigabit media access control (GMAC) with DMA controller* section for the available ratios. The same register can be used to add extra clock cycles at the end of an MDIO frame transmission.

20.4.16 CA35SS clocking

Clocks definition

All clocks provided to the CA35SS are controlled from the RCC, and related information to the clocks gating are described in the RCC specification. The table below lists clocks from the RCC and their usage in the CA35SS.

Table 152. Cortex-A35 interface clocks from RCC

RCC clock line	CA35SS instance	Max frequency	Description
ck_cpu1_ext2f	CRMR	400 MHz	Default clock frequency for Cortex-A35 core
ck_pll1_ref	PLL1	64 MHz	Reference clock for Cortex-A35 PLL1
ck_icn_m_cpu1	AXI4 bridge	600 MHz	AXI4 clock for master side of asynchronous bridge
ck_icn_s_gic400	GIC400	400 MHz	Interface clock for GIC400
ck_ker_stgen	STGEN	64 MHz	STGEN timer clock
clk_icn_p_stgen	STGEN	150 MHz	STGEN programming interface clock
ck_icn_p_syscpu1	SYSCFG	150 MHz	Interface clock for system configuration registers

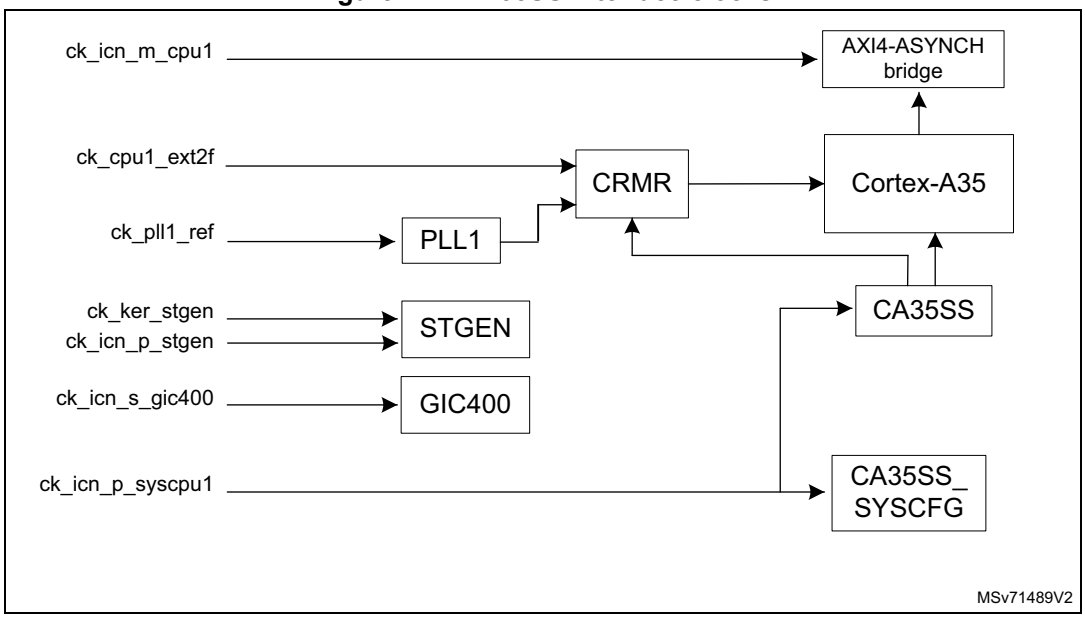
The reference clock for the PLL1 can be selected among three sources (HSI, HSE, MSI) through RCC_MUXSELCFGR register. Four of these clocks have explicit clock gating controlled from RCC registers as follows:

- ck_ker_stgen and clk_icn_p_stgen from RCC_STGENCFGR
- ck_icn_p_syscpu1 from RCC_SYSCPU1CFGR

The others have dynamic clock gating depending on the Cortex-A35 core power states.

Clocking schematic

Figure 114. CA35SS interface clocks



The following clock sources can be selected by CA35SS registers to compute the Cortex-A35 clock, which is the main clock to the Arm core and its caches:

- clkext2f
- clkext2f divided by 2
- PLL1 output clock

The CRMR handles this selection by providing appropriate clocks in a “glitch free” manner.

Note: After initial power-up reset, the dual Cortex-A35 clock is driven from clkext2f (not divided).

PLL1 enable procedure is the following:

1. Clear CA35SS_SSC_PLL_ENABLE.NRESET_SWPLL.
2. Configure PLL parameters in CA35SS_SSC_PLL_FREQ1 and CA35SS_SSC_PLL_FREQ2.
3. Set CA35SS_SSC_PLL_ENABLE.PLL_EN.
4. Poll CA35SS_SSC_PLL_ENABLE.LOCKP until it is 1.
5. Set CA35SS_SSC__PLL_ENABLE.NRESET_SWPLL.
6. Clear CA35SS_SSC_CHGCLKREQ.ARM_CHGCLKREQ.
7. Poll CA35SS_SSC_CHGCLKREQ.ARM_CHGCLKACK until it is 0.

20.4.17 Debug and trace clocking

Main debug and trace clocks are provided according to:

- DAP CDBGPWRUPREQ request.
- RCC_DBGCFGR register (DBGEN, DBGMCUEN, TRACEEN).
- RCC_ETRCFGR and RCC_STMCFGR registers.

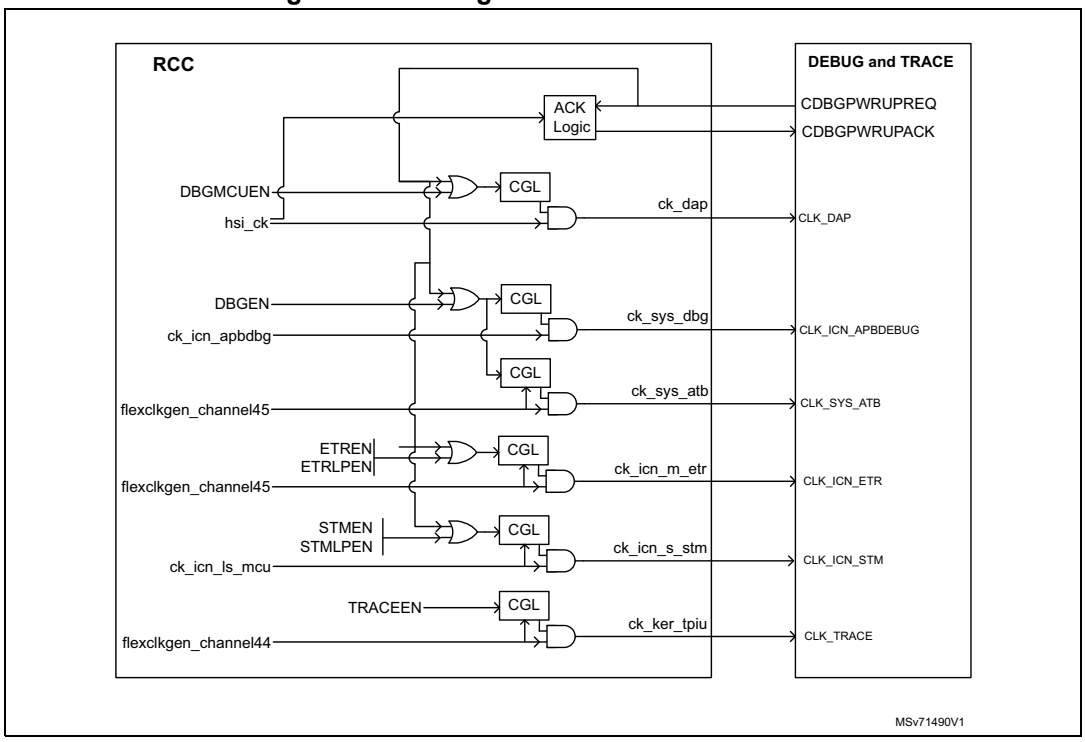
The table below presents the list of the debug and trace external clocks.

Table 153. Debug and Trace subsystem external clocks

RCC clock line	Debug and Trace instance	Instance signal name	Max. frequency	Description
ck_dap	DEBUG	clk_dap	64 MHz	DAP clock domain (DBGMCU included)
ck_sys_dbg	DEBUG	ck_icn_apbdebug	150 MHz	Debug clock domain
ck_sys_atb	DEBUG	clk_sys_atb	400 MHz	ATB clock domain
ck_icn_m_etr	TRACE	clk_icn_etr	400 MHz	ETR AXI master port clock
ck_icn_s_stm	TRACE	clk_icn_stm	150 MHz	STM AXI slave port clock
ck_ker_tpiu	TRACE	clk_trace	200 MHz	Processing clock for trace

Clocking schematic

Figure 115. Debug and Trace external clocks



20.4.18 Camera subsystem clocking

The DCMI and the PSSI have a slow input parallel interface that receives a clock when this interface is used. Both share a clock for their slave interface.

The DCMIPP has a fast input parallel interface that receives a clock when this interface is used. It also has a clock for its internal pixel processing, and its master and slave interface.

The CSI interface requires a hard macrocell which retrieves the clock. This clock is then used for processing.

The table below presents the list of the camera subsystem external clocks.

Table 154. Camera subsystem external clocks

Subsystem clock signal name	Camera instance	Clock signal name	Clock direction	RCC clock line	Max. frequency	Description
ck_icn_m_dcmipp	DCMIPP	aclk clk_axi_csi	Input	ck_icn_ display	400 MHz	DCMIPP master port interconnect clock
ck_icn_p_dcmipp	DCMIPP	pclk	Input	ck_icn_apb4	150 MHz	DCMIPP peripheral port clock
ck_ker_dcmipp	DCMIPP CSI (host)	clk_proc clk_proc_csi	Input	ck_ker_ dcmipp	333 MHz	Processing clock for Camera subsystem
ck_icn_p_csi	CSI (host)	pclk	Input	ck_icn_apb4	150 MHz	CSI peripheral port clock

Table 154. Camera subsystem external clocks (continued)

Subsystem clock signal name	Camera instance	Clock signal name	Clock direction	RCC clock line	Max. frequency	Description
ck_ker_csiphy	CSI (phy)	i_cfg_clk	Input	ck_ker_ csiphy	27 MHz	-
ck_ker_csitxesc	CSI (phy)	i_TxClkEsc	Input	ck_ker_ csitxesc	20 MHz	-
ck_icn_p_dcmipssi	DCMI/PSSI	hclk_cci	Input	ck_icn_ls _mcu	150 MHz	DCMI and PSSI peripheral port clock
pixck_pdck_cci	DCMI/PSSI DCMIPP	pixck_pdck_cci clk_pix	Input	NA	80 MHz	External DCMI_PIXCLK clock lane
cn_rx_dphy	CSI (phy)	io_Cn	Input/output	NA	1250 MHz	External CSI_CK_N clock lane (2500 Mbps/lane)
cp_rx_dphy	CSI (phy)	io_Cp	Input/output	NA	1250 MHz	External CSI_CK_P clock lane (2500 Mbps/lane)

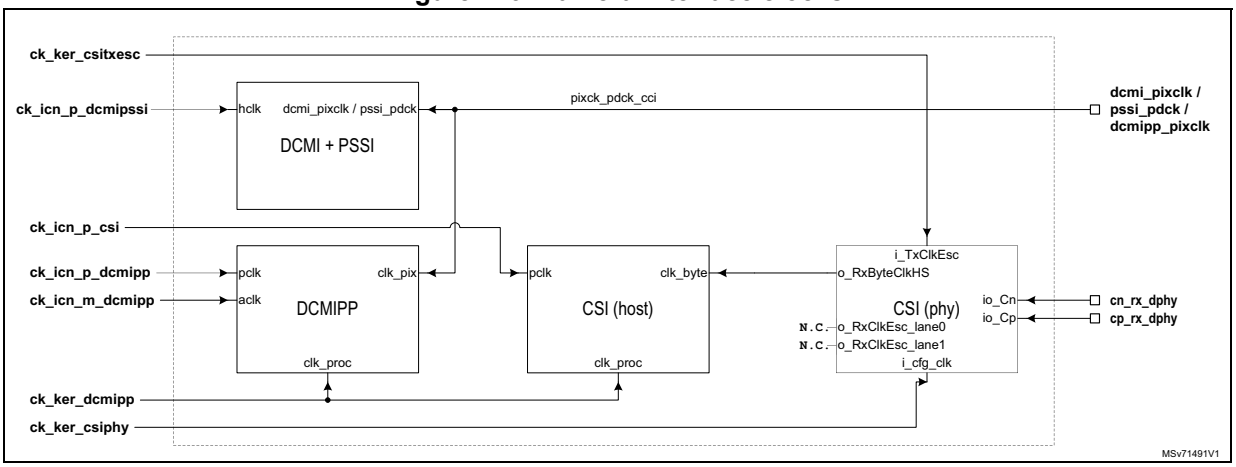
The table below presents the list of the camera subsystem internal clocks.

Table 155. Camera subsystem internal clocks

Functional block	Clock signal name	Clock direction	Max frequency	Description
CSI (phy)	o_RxByteClkHS	Output	312.5 MHz	-

Clocking schematic

Figure 116. Camera interface clocks



20.4.19 Display subsystem clocking

The LTDC uses a clock for its internal pixel processing, which is used to drive its output parallel interface. It also needs clock for its bus master and its bus slave interface.

The table below presents the list of display subsystem external clocks.

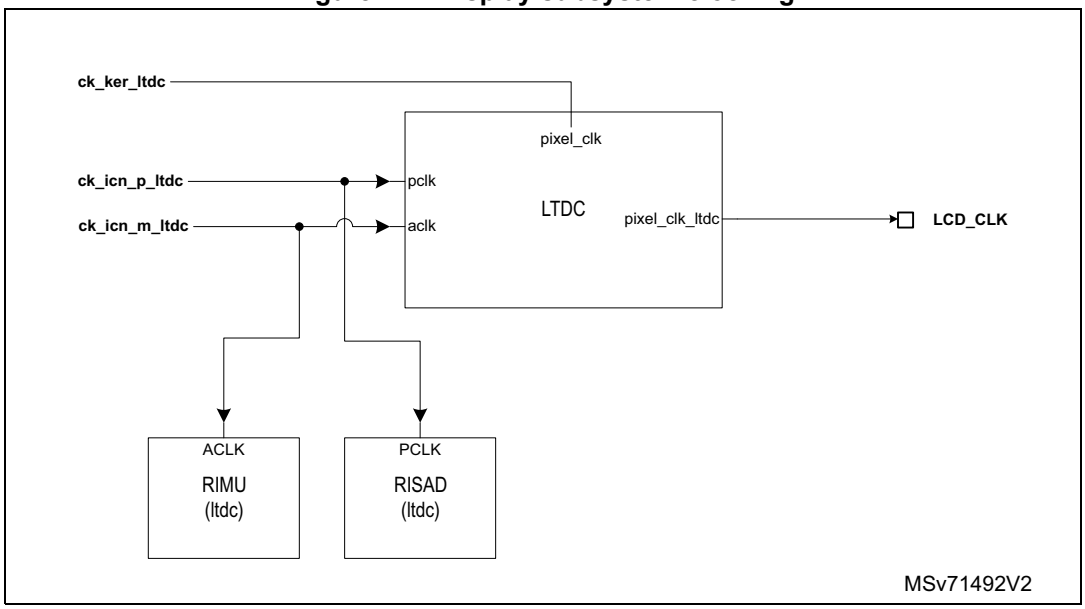
Table 156. Display subsystem external clocks

Subsystem clock signal name	Functional block	Clock signal name	Clock direction	RCC clock line	Max. frequency	Description
ck_icn_m_ltdc	LTDC LTDC (rimu)	aclk ACLK	Input	ck_icn_display	400 MHz	Master port clock
ck_icn_p_ltdc	LTDC LTDC (risad)	pclk PCLK	Input	ck_icn_apb4	150 MHz	Peripheral clock
ck_ker_ltdc	LTDC	pixel_clk	Input	ck_ker_ltdc	314 MHz	Pixel clock Pixel clock LaneByte clock
LCD_CLK	LTDC	pixel_clk_ltdc	Output	NA	150 MHz	External pixel interface clock

Clocking schematic

The clocking tree for the display subsystem is described in the figure below.

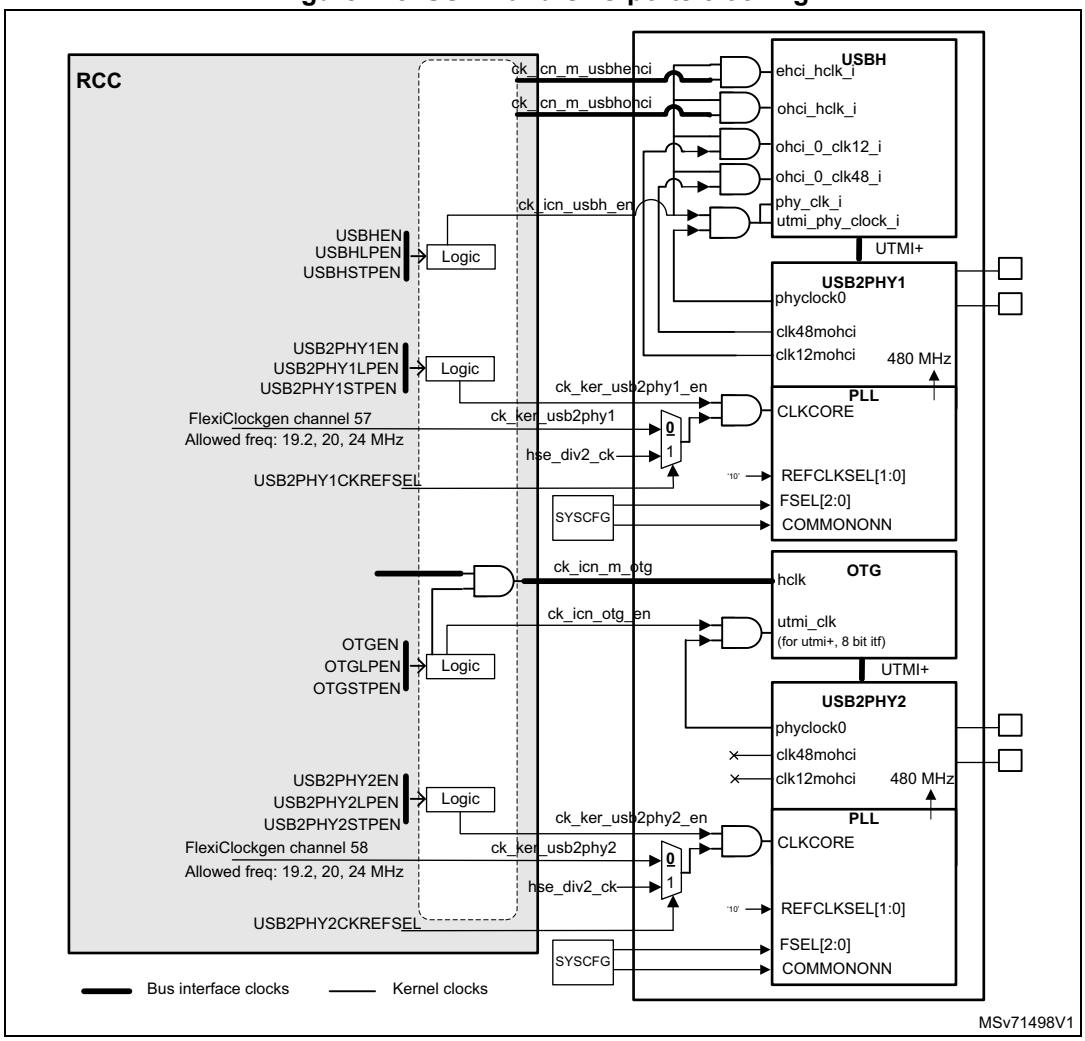
Figure 117. Display subsystem clocking



20.4.20 USB clocking

USB2 Host-only (USBH) and OTG clocking schematic

Figure 118. USBH and OTG ports clocking



USB2 Host-only high speed port

The USB2 Host-only controller (USBH) receives AHB clocks from the RCC, and processes clocks from USB2PHY1.

Table 157. USBH port clocks

Functional block	Clock signal name	Clock direction	RCC clock line	Max frequency	Description
USBH	ehci_hclk_i	Input	ck_icn_m_usbhehci	300 MHz	EHCI AHB clock
USBH	ohci_hclk_i	Input	ck_icn_m_usbhohci	300 MHz	OHCI AHB clock
USBH	ohci_0_clk48_i	Input	-	48 MHz	48 MHz reference clock for EHCI controller

Table 157. USBH port clocks (continued)

Functional block	Clock signal name	Clock direction	RCC clock line	Max frequency	Description
USBH	ohci_0_clk12_i	Input	-	12 MHz	12 MHz reference clock for OHCI controller
USB2PHY1	CLKCORE	Input	ck_ker_usb2phy1	24 MHz	One of the possible sources of USB2PHY1 reference clock
USB2PHY1	CLKCORE	Input	-	19.2, 20 or 24 MHz	Clock from HSE oscillator: one of the possible sources of USB2PHY1 reference clock

Details of the USB2 Host-only high speed port clocking

The USB2PHY1 PHY receives its reference clock from the RCC or directly from the HSE oscillator (hse_div2_ck clock). This is controlled by the bit USB2PHY1CKREFSEL in RCC_USB2PHY1CFGR register. If the USB2PHY1 reference clock is received from the RCC, it can be sourced from the HSE or re-generated by one of the PLLs and dividers located in the RCC.

The frequency of the USB2PHY1 reference clock can be selected among 19.2, 20 or 24 MHz (50 MHz is reserved for test purpose). This selection is controlled by theUSB2PHY1SEL[2:0] bit-field in SYSCFG_USB2PHY1CR register. These bits must be set to the desired value before USB2PHY1 reset is released.

The clocks provided by USB2PHY1 to the USB2 Host Controller are divisions of a 480 MHz clock that is generated by a PLL inside the PHY (this is a fixed frequency PLL which cannot be programmed).

The USB2PHY1 PLL can be powered down during Suspend and Sleep modes. This is controlled by the USB2PHY1CMN bit in SYSCFG_USB2PHY1CR register. If the OHCI controller is used (FS and LS mode of operation), the USB2PHY1 PLL clock must remain ON during Suspend and Sleep modes to be able to access the OHCI registers.

The clocks provided to the USB2 Host-only port are controlled by enable bits in RCC_USBHCFGR and RCC_USB2PHY1CFGR registers.

USB2 OTG high speed port

The USB2 OTG controller (OTG) receives an AHB clock from the RCC and a processing clock from USB2PHY2.

Table 158. USB2 OTG high speed clocks from RCC and oscillator

Functional block	Clock signal name	Clock direction	RCC clock line	Max frequency	Description
OTG	hclk	Input	ck_icn_m_uotg	300 MHz	AHB clock
OTG	utmi_clk	Input	-	60 MHz	Processing clock

Table 158. USB2 OTG high speed clocks from RCC and oscillator (continued)

Functional block	Clock signal name	Clock direction	RCC clock line	Max frequency	Description
USB2PHY2	CLKCORE	Input	ck_ker_usb2phy2	24 MHz	One of the possible sources of USB2PHY1 reference clock
USB2PHY2	CLKCORE	Input	-	19.2, 20 or 24 MHz	Clock from HSE oscillator: one of the possible sources of USB2PHY1 reference clock
USB2PHY2	phyclock0	Output	-	60 MHz	UTMI 60 MHz clock (data bus width is 8-bit)

Details of the USB2 Dual Role high speed port clocking

The USB2PHY2 receives its reference clock from the RCC or directly from the HSE oscillator (hse_div2_ck clock). This is controlled by the bit USB2PHY2CKREFSEL in RCC_USB2PHY2CFGR register. If the USB2PHY2 reference clock is received from the RCC, it can be sourced from the HSE or re-generated by one of the PLLs and dividers located in the RCC.

The frequency of the USB2PHY2 reference clock can be selected among 19.2, 20 or 24 MHz (50 MHz is reserved for test purpose). This selection is controlled by the USB2PHY2FSEL[2:0] bit-field in SYSCFG_USB2PHY2CR register. These bits must be set to the desired value before USB2PHY2 reset is released.

The 60 MHz processing clock provided by USB2PHY2 to OTG is obtained by division of the 480 MHz clock which is generated by a PLL inside the PHY (this is a fixed frequency PLL which cannot be programmed).

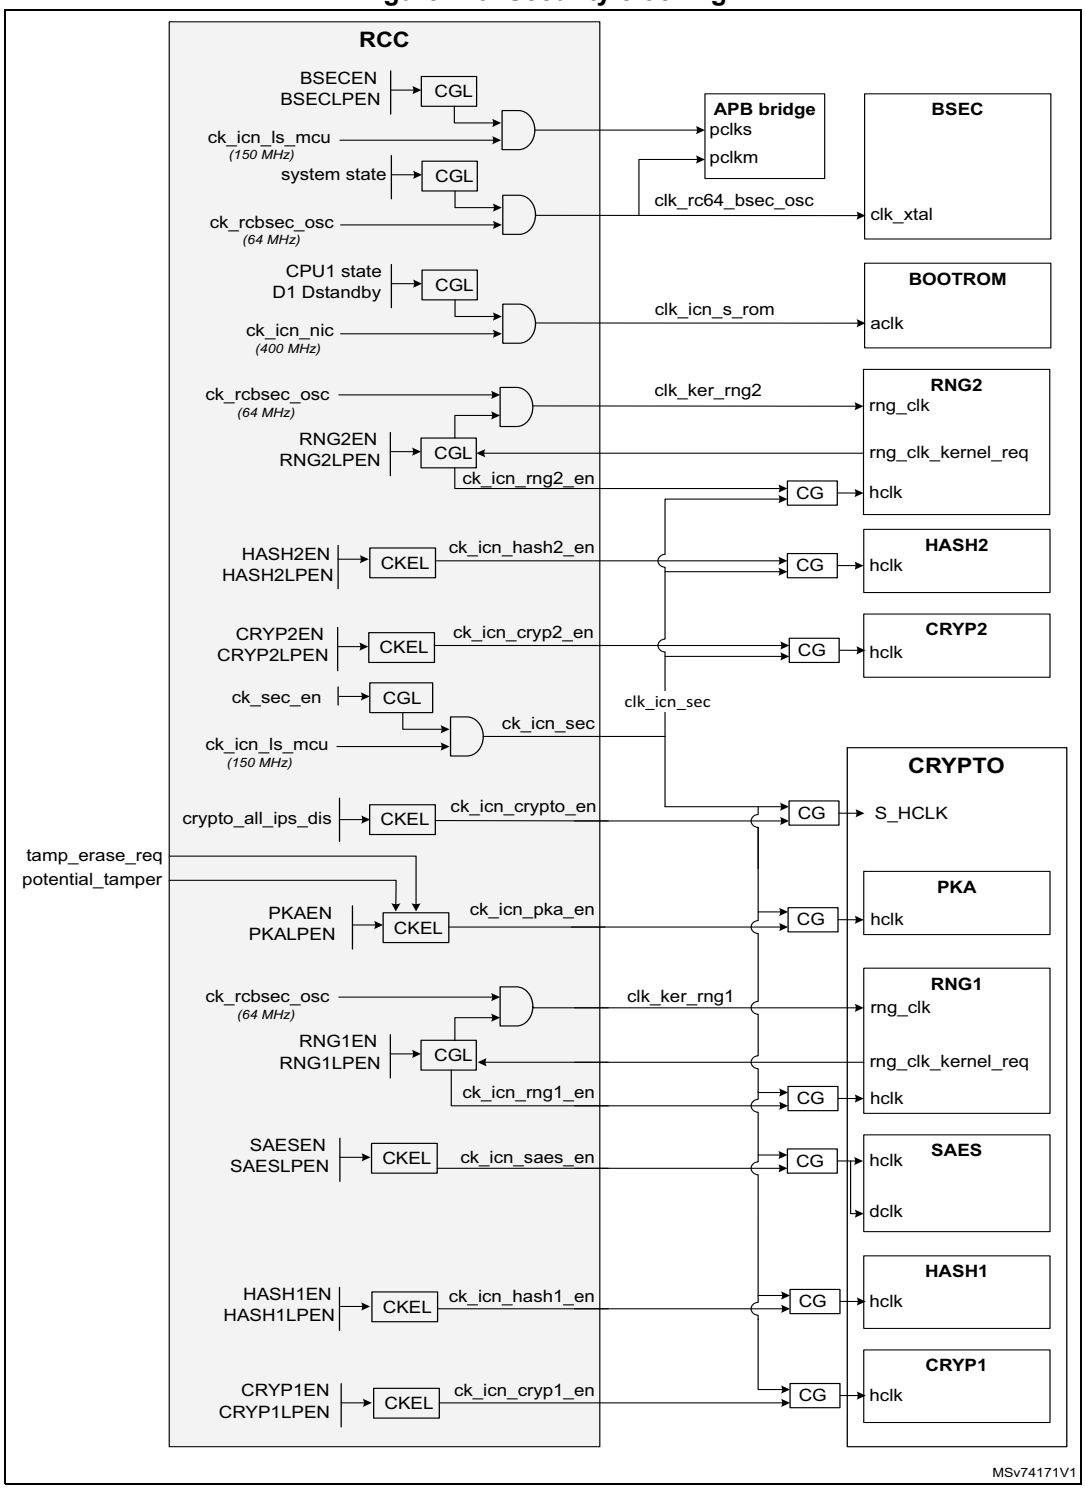
The USB2PHY2 PLL can be powered down during USB Suspend and Sleep modes. This is controlled by the USB2PHY2CMN bit in SYSCFG_USB2PHY2CR register.

The clocks provided by the RCC are controlled by enable bits in RCC_OTGCFGR and RCC_USB2PHY2CFGR registers.

20.4.21 Security clocking

Security interface - Clocking schematic

Figure 119. Security clocking



Note: The peripheral clocks of the following cryptographic peripherals: PKA, RNG1, SAES, HASH1, CRYP1, must all be disabled before issuing a reset request to any of them.

The software should ensure that no cryptographic peripheral is busy (refer to the respective BUSY bit flag of each peripheral (PKA, RNG1, SAES, HASH1, CRYP1) before disabling the peripheral clock.

Table 159. Security clocks from RCC

Subsystem clock signal name	Functional block	Clock signal name	Clock direction	RCC clock line	Max frequency	Description

20.5 RCC interrupts

The RCC provides two independent interrupt interfaces, and interrupt lines for HSI and MSI frequency monitoring:

- an interrupt interface dedicated to the CPU1
- an interrupt interface dedicated to the CPU2

Each interrupt interface provides two interrupt lines:

- a general interrupt line (rcc_cpu1_it or rcc_cpu2_it) that provides events when the PLLs are ready, or when the oscillators are ready
- an interrupt line dedicated to the wake-up of the CPUx when they are in CStop (rcc_cpu1_wkup_it or rcc_cpu2_wkup_it)

All interrupt lines are active high and level triggered.

rcc_cpu1_it and rcc_cpu1_wkup_it interrupts are enabled in RCC_C1CIESETR.

rcc_cpu2_it and rcc_cpu2_wkup_it interrupts are enabled in RCC_C2CIESETR.

rcc_cpu1_it (or rcc_cpu2_it) line is activated when an event flag is set to 1, and its corresponding enable bit is set to 1. In order to release the rcc_cpu1_it (or rcc_cpu2_it) line, all the event flags which have been enabled must be cleared.

rcc_cpu1_wkup_it (or rcc_cpu2_wkup_it) line is activated when the RCC has to exit the CPU1 (or CPU2) from CStop, and if WKUPIE = 1. In order to release the rcc_cpu1_wkup_it (or rcc_cpu2_wkup_it) line, the CPU1 (or CPU2) must write 1 to WKUPF in the corresponding register.

The interrupt flags can be checked and cleared in RCC_C1CIFCLRR or RCC_C2CIFCLRR.

The event flags goes to 1 on rising edge of the corresponding ready bit (xxxRDY).

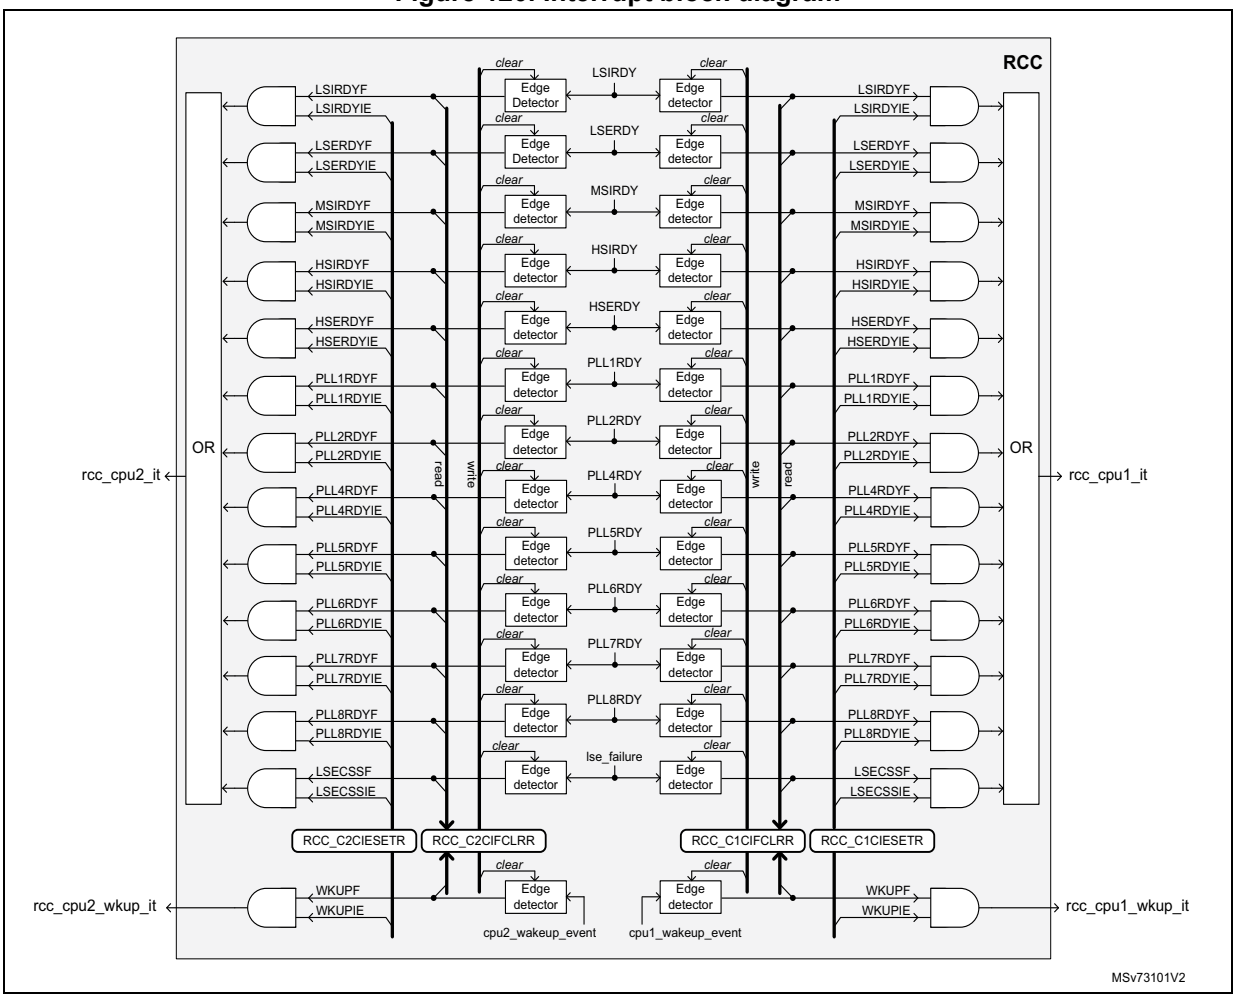
rcc_hsifmon_it interrupt line is used to provide an event to wake up the system when the HSI clock frequency deviates from its defined window while rcc_cpu1_hsifmon_it and rcc_cpu2_hsifmon_it interrupts are used to notify each related CPU.

rcc_hsifmon_it, rcc_cpu1_hsifmon_it, and rcc_cpu2_hsifmon_it interrupts are controlled via RCC_HSIFMONCR.

rcc_msifmon_it interrupt line is used to provide an event to wake up the system when the MSI clock frequency deviates from its defined window while rcc_cpu1_msifmon_it and rcc_cpu2_msifmon_it interrupts are used to notify each related CPU.

rcc_msifmon_it, rcc_cpu1_msifmon_it, and rcc_cpu2_msifmon_it interrupts are controlled via RCC_MSIFMONCR.

Figure 120. Interrupt block diagram



See *Section 20.6.1* for information on CSS for LSE.

Note: The interrupt flags are relevant even if the corresponding interrupt enable bit is not set.

The table below summarizes the interrupt sources, and the way to control them.

Table 160. Interrupt sources and control

Interrupt event flag	Description	Interrupt enable	Action to clear the interrupt(1)	Interrupt lines
LSIRDYF	LSI ready	LSIRDYIE	Set LSIRDYF to 1.	rcc_cpu1_it, rcc_cpu2_it
LSERDYF	LSE ready	LSERDYIE	Set LSERDYF to 1.	
HSIDRYF	HSI ready	HSIDRYIE	Set HSIRDYF to 1.	
HSERDYF	HSE ready	HSERDYIE	Set HSERDYF to 1.

WKUPF	Wake-up from CStop event	WKUPIE	Set WKUPF to 1.	rcc_cpu1_wkup_it, rcc_cpu2_wkup_it
HSIMONF	HSI frequency monitor flag(3)	HSIMONIE(4)	Set HSIMONF to 1.	rcc_hsifmon_it, rcc_cpu1_hsifmon_it, rcc_cpu2_hsifmon_it
MSIMONF	MSI frequency monitor flag(3)	MSIMONIE(5)	Set MSIMONF to 1.	rcc_msifmon_it, rcc_cpu1_msifmon_it, rcc_cpu2_msifmon_it

1. In RCC_CxCIFCLRR registers.
2. The security system feature must also be enabled (LSECSSON = 1) in order to generate interrupts.
3. Refer to *Section 20.6.3* for details.
4. In RCC_HSIFMONCR register.
5. n RCC_MSIFMONCR register.

20.6 RCC application information

20.6.1 Clock frequency calculation

The flexclkgen engine offers the capability to calculate the frequency of any internal clock via an internal module called clock frequency calculator. For any clock frequency calculation (ckin), the clock frequency calculator requires a reference clock (ckref).

First step - Select the input clock as follows:

1. Set FCALCRSTN in RCC_FCALCOBS1CFGR to enable the clock frequency calculator.

2. Set CKINTSEL (or CKEXTSEL if FCALCCKEXTSEL = 1) in RCC_FCALCOBS0CFGR to select the clock frequency calculator input clock (ckin).
3. Set FCALCCKEN in RCC_FCALCOBS0CFGR to enable the selected input clock at the input of clock frequency calculator.

2nd step - Select the reference clock as follows:

1. Set FCALCREFCKSEL in RCC_FCALCREFCFGR to select the reference clock (ckref).

3rd step - Run the clock frequency calculation as follows:

1. Set FCALCTYP = 0x0C in RCC_FCALCCR2 to select the frequency value type.
2. Select the application mode with FCALCMD in RCC_FCALCCR2.
3. For optimal calculation, loop on the clock frequency time window value with FCALCTWC in RCC_FCALCCR2, from its biggest value (0xF) to its minimum value (0x1) as described below:
   a) Set FCALCTWC biggest value.
   b) Set FCALCRUN in RCC_FCALCCR1.
   c) Poll RCC_FCALCSR until the calculation is valid (FCALCSTS = 1 and FVAL[15:0] not equal to 0)
   d) Reset FCALCRUN in RCC_FCALCCR1.
   e) Check FVAL[16]. If FVAL[16] = 0, exit the loop (FVAL[15:0] is the optimal calculated value). Otherwise continue.
   f) Reset FCALCRSTN in RCC_FCALCOBS1CFGR.
   g) Poll RCC_FCALCSR until it is cleared.
   h) Set FCALCRSTN in RCC_FCALCOBS1CFGR before trying next FCALCTWC value.

Last step - Calculate F_{ckin} clock frequency as follows:

$$TWVAL = ((2^{(FCALCTWC+1)}) + 5) \times CKREFPER$$

with FCALCTWC > 0, and CKREFPER = reference clock period

$$F_{ckin} = \frac{1}{TWVAL / (FVAL - 16)}$$

with F_{ckin} = frequency input clock, TWVAL = clock frequency time window value, and FVAL[15:0] = decimal value

20.6.2 Clock calibration

Frequencies of most of clock source generators can be measured by means of the TIMx input capture, or the clock frequency calculator module.

Calibrating HSI or MSI with the LSE and TIMx

The primary purpose of having the LSE connected to a TIMx input capture is to be able to precisely measure the HSI or MSI. This requires to have the HSI or MSI used as interconnect clock source, via channel 0 the flexclkgen, either directly or via a PLL.
The number of interconnect clock counts between consecutive edges of the LSE provides a calculation of the internal clock period. Taking advantage of the LSE crystal high precision (typically a few tens of ppm), the user can determine the internal clock frequency with the same resolution, and can trim the source to compensate for manufacturing-process, temperature, and/or voltage-related frequency deviations.

The basic concept consists in providing a relative calculation (HSI/LSE ratio): the precision is tightly linked to the ratio between the two clock sources. The greater the ratio is, the more accurate the calculation is.

The HSI and MSI have dedicated user-accessible calibration bits in RCC_HSICFGR and RCC_MSICFGR. When HSI or MSI are used via the PLLx, the interconnect clock can be fine-tuned using the calibration fractional divider.

Calibrating HSI or MSI with the clock frequency calculator

Refer to *Section 20.6.1: Clock frequency calculation*.

20.6.3 Clock monitoring

Monitoring HSI or MSI with LSE

The purpose is to assist the software calibration procedure when the HSI or MSI frequency drifts out of a predefined range because of environmental variation (such as temperature).

This monitoring can be enabled in all system modes except Standby and V_{BAT}, when HSI or MSI is used. When enabled, the number of HSI/MSI kernel clock counts between consecutive edges of the LSE signal provides a calculation of the internal clock period which is checked according to a defined threshold. If the internal clock period is above this threshold, a CPU interrupt (rcc_cpu1_hsifmon_it/rcc_cpu1_msifmon_it or rcc_cpu2_hsifmon_it/rcc_cpu2_msifmon_it), or a wake-up event (rcc_hsifmon_it/rcc_msifmon_it) is triggered to allow the application to trim the HSI/MSI source accordingly.

HSI monitoring control is based on RCC_HSIFMONCR and RCC_HSIFVALR (respectively RCC_MSIFMONCR and RCC_MSIFVALR for MSI). The following steps can be used to enable HSI frequency monitoring (same procedure applies for MSI):

1. Enable LSE signal:
   a) Write 1 to DBP in PWR_BDCR.
   b) Write 1 to in LSEON in RCC_BDCR.
   c) Wait for LSERDY = 1 in RCC_BDCR.
   d) Write 0 to DBP in PWR_BDCR.
2. Setup HSI clock period monitoring:
   a) Write HSIREF in RCC_HSIFMONCR to define the reference period if the default value not suitable (default value = 64 MHz/32.767 kHz = 1953).
   b) Write HSIDEV in RCC_HSIFMONCR to define the threshold if the default value is not suitable (default value = 31, around 1.6% of the reference value).
   c) Write 1 to HSIMONIE in RCC_HSIFMONCR to enable interrupt for application.

d) Write 1 in HSIMONEN in RCC_HSIFMONCR to start monitoring.

The interrupt occurs when the below condition is met:

$$HSIREF + HSIDEV < HSIVAL < HSIREF - HSIDEV$$

Note: MSIREF default value is 488 and MSIDEV default value is 15

20.7 RCC RIF function

To be compliant with the product security definition, the RCC implements the following security/isolation requirements which apply to any defined security domain (see *Section 5.4: Resource isolation framework (RIF)*):

- filtering of secure/non-secure accesses
- filtering of privileged/unprivileged accesses
- filtering of hardware execution compartments (CIDs) such as
  - up to eight CIDs including trusted domain compartment ID (TDCID)
  - dynamic compartment ID (semaphore),
  - debug domain compartment ID (DDCID)

There are four possible profiles for any resource:

- single access (only one master can access)
- shared between different masters with semaphore protection
- shared between different masters without semaphore protection (legacy mode)
- no access

20.7.1 RCC RIF configuration

After any application reset or system reset, all RCC resources are accessible until the trusted domain master agent programs the RCC RIF configuration. This configuration is based on the local and external RIF configurations.

The local RIF configuration is managed by the following registers:

- RCC_SECCFGR0/1/2/3 used to set secure/non-secure attribute per local RCC resource
- RCC_PRIVCFGR0/1/2/3 used to set privileged/unprivileged attribute per local RCC resource
- RCC_RxCIDCFGR and RCC_RxSEMCR used to set the CID filtering policy per local RCC resource
- RCC_SRCFGLOCKR0/1/2/3 are used to lock the local RCC resource configuration.

The external RIF configuration is inherited from the RIF peripheral configuration and it applies to the related RCC_PERxCFGR local resource. This external RIF configuration is used to filter any write access to the related RCC_PERxCFGR register.

The RIF peripheral configuration is driven to the RCC through perxrifcfg signals (with PERx as peripheral x).

Table 161 shows all RCC local resource content (first column) and the RIF configuration attached to it (third column).

Secure/non-secure access filtering

In AMBA5 AHB protocol, the secure/non-secure attribute is propagated via the HNONSEC signal. To enable the filtering access based on this attribute, the authorized master agent has to set SECx in RCC_SECCFGRx related to the RCC resource x.

Any register access with a not-allowed secure attribute is denied (RAZ, WI). An illegal secure access event is generated to the IAC (see *Section 5.4: Resource isolation framework (RIF)* for details). There is no bus error generated.

Privileged/unprivileged access filtering

In AMBA5 AHB protocol, the privileged/unprivileged attribute is propagated via the HPROT[1] signal. To enable the filtering access based on this attribute, the authorized master agent has to set PRIVx in RCC_PRIVCFGRx related to the RCC resource x.

Any register access with a not-allowed privileged attribute is denied (RAZ, WI). An illegal privileged access event is generated to the IAC (see *Section 5.4: Resource isolation framework (RIF)* for details). There is no bus error generated.

CID access filtering

In AMBA5 AHB protocol, the CID attribute is propagated via the HAUSER signals. RCC_RxCIDCFGR controls the CID filtering policy for each non-shareable local resources (without semaphore mechanism). RCC_RxCIDCFGR and RCC_RxSEMCR control the CID filtering policy for each local shareable resources (with semaphore mechanism).

When the compartment-based filtering is active (CFEN = 1):

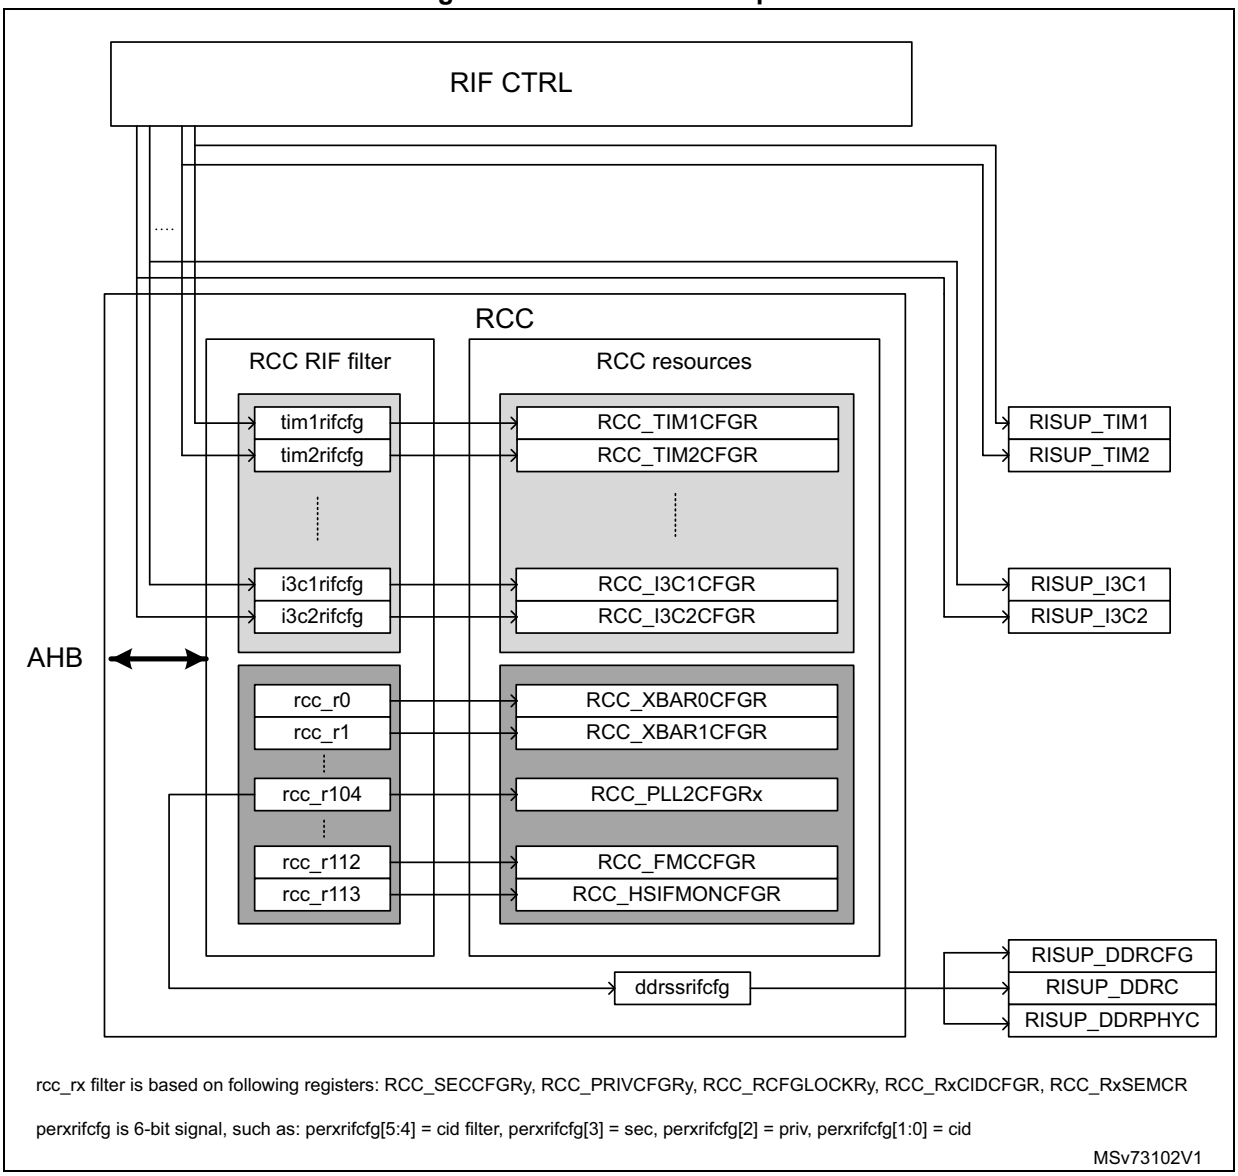
- local non-shareable resources can be individually controlled by a specific CPU. The trusted domain application sets the authorized compartment with SCID in RCC_RxCIDCFGR.
- local shareable resources can be individually controlled by a specific CPU. The trusted domain application sets the compartment values that are authorized to take the local resource, by setting SEMWLCy in RCC_RxCIDCFGR, and sets SEM_EN bit. Each white-listed agent is authorized to take SEM_MUTEX in RCC_RxSEMCR to get the ownership on the resource, until this agent releases the mutex.

A not-allowed CID access to a CID-filtered register is denied (RAZ/WI). An illegal CID access event is generated to the IAC (see *Section 5.4: Resource isolation framework (RIF)* for details). There is no bus error generated.

For debug purpose, the debug domain compartment master, defined by DDCID, can access any resource if secure and privileged attributes are enough.

Note: The RIF configuration (secure and privileged attributes, CID filtering mode) of any RCC local resource can be locked via RCC_RCFGLOCKRx registers.

Figure 121. RCC RIF description



20.8 RCC registers

Some registers can be accessed by all bus masters. Some others can only be accessed by the trusted domain master (see *Section 8: Resource isolation framework security controller (RIFSC)* for details on register accesses).

Note: Any bus transaction initiated by the trusted domain master is secure and privileged.

Table 161 gives the RIF local resource allocation for all RCC registers:

- First column lists all RCC registers defined as a RCC RIF resource number (see second column).
- Second column lists all RCC RIF resources.
- Third column lists RCC registers used to define the RIF configuration of the RCC resource number.

For example, following steps are needed to set the RIF configuration of the RCC RIF resource number 64:

1. A trusted domain agent (with secure, privileged, and TDCID) must program RCC_R64CIDCFGR.
2. A secure agent can set the secure attribute (RCC_SECCFGR2[0] = 1).
3. A privileged agent can set the privileged attribute (RCC_PRIVCFGR2[0] = 1).
4. A secure and privileged agent can lock the RIF configuration (RCC_RCFGLOCKR2[0] = 1).

Table 161. RCC register allocation to RIF resource and access conditions

RCC_VERR				-
RCC_IDR				-
RCC_SIDR				-

1. RW = read or write, SR = set or read (noted RWS1 in the register description), CR = clear or read (noted rwc1 in the register description, R = read, and W = write.
2. DDR RIF configuration (resource number 104) is exported to the DDR subsystem to filter any DDR programming ports.

All RCC registers can be accessed in word, half-word and byte format, unless explicitly specified differently. All RCC registers are reset by the sys_rstn signal, unless explicitly specified differently.

Note: The burst access mode is not supported; and any opcode fetch transfer generates a bus error.

20.8.1 RCC secure configuration register 0 (RCC_SECCFGR0)

Address offset: 0x000

Reset value: 0x0000 0000

This register is used to set the secure attribute that filters any write access to the RCC local resource number 0 to 31 (see *Table 161* for RCC local resource mapping). Non-secure or unprivileged writes to this register are ignored, and illegal access related events are generated. Any read is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SEC[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

SEC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SEC[31:0]**: Secure attribute reference for local resource number x (x = 31 to 0)

If compartment filtering for local resource number x is enabled (resp. disabled) using CFEN in RCC_RxCIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if access privilege and security are sufficient. Writes are ignored if RLOCKx = 1 in RCC_RCFGLOCKR0.

Authorized compartment is defined as SCID if SEM_EN = 0 in RCC_RxCIDCFGR.
If SEM_EN = 1, it is equal to SEMCID if SEM_MUTEX = 1 in RCC_RxSEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

0: Secure and non-secure data accesses are granted to local resource number x.

1: Only secure data access is granted to local resource number x.

20.8.2 RCC secure configuration register 1 (RCC_SECCFGR1)

Address offset: 0x004

Reset value: 0x0000 0000

This register is used to set the secure attribute value used to filter any write access to the RCC local resources number 32 to 63 (see *Table 161* for RCC local resource mapping). Non-secure or unprivileged writes to this register are ignored, and illegal access related events are generated. Any read is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

SEC[47:32]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SEC[63:32]**: Secure attribute reference for the local resource number x (x = 32 to 63)

If compartment filtering for local resource number x is enabled (resp. disabled) using CFEN in RCC_RxCIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if access privilege and security are sufficient. Writes are ignored if RLOCK(x - 32) = 1 in RCC_RCFGLOCKR1.

Authorized compartment is defined as SCID if SEM_EN = 0 in RCC_RxCIDCFGR.
If SEM_EN = 1, it is equal to SEMCID if SEM_MUTEX = 1 in RCC_RxSEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

0: Secure and non-secure data accesses are granted to local resource number x

1: Only secure data access is granted to local resource number x

20.8.3 RCC secure configuration register 2 (RCC_SECCFGR2)

Address offset: 0x008

Reset value: 0x0000 0000

This register is used to set the secure attribute value used to filter any write access to the RCC local resources number 64 to 95 (see *Table 161* for RCC local resource mapping). Non-secure or unprivileged writes to this register are ignored, and illegal access related events are generated. Any read is allowed.

rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw

Bits 25, 18:16, 8 Reserved, must be kept at reset value.

Bits 31:26, 24:19, 15:9, 7:0 **SECx**: Secure attribute reference for the local resource number x (x = 95 to 90, 88 to 83, 79 to 73, 71 to 64)

If compartment filtering for local resource number x is enabled (resp. disabled) using CFEN in RCC_RxCIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if access privilege and security are sufficient. Writes are ignored if RLOCK(x - 64) = 1 in RCC_RCFGLOCKR2.

Authorized compartment is defined as SCID if SEM_EN = 0 in RCC_RxCIDCFGR.
If SEM_EN = 1 it is equal to SEMCID if SEM_MUTEX = 1 in RCC_RxSEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

0: Secure and non-secure data accesses are granted to local resource number x

1: Only secure data access is granted to local resource number x

20.8.4 RCC secure configuration register 3 (RCC_SECCFGR3)

Address offset: 0x00C

Reset value: 0x0000 0000

This register is used to set the secure attribute value used to filter any write access to the RCC local resources number 96 to 113 (see *Table 161* for RCC local resource

mapping). Non-secure or unprivileged writes to this register are ignored, and illegal access related events are generated.Any read is allowed.

rw	rw	rw	rw		rw	rw	rw	rw	rw	rw			rw	rw	rw

Bits 31:18, 11, 4:3 Reserved, must be kept at reset value.

Bits 17:12, 10:5, 2:0 **SECx**: Secure attribute reference for the local resource number x (x = 113 to 108, 106 to 101, 98 to 96)

If compartment filtering for local resource number x is enabled (resp. disabled) using CFEN in RCC_RxCIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if access privilege and security are sufficient. Writes are ignored if RLOCK(x - 96) = 1 in RCC_RCFGLOCKR3.

Authorized compartment is defined as SCID if SEM_EN = 0 in RCC_RxCIDCFGR.
If SEM_EN = 1, it is equal to SEMCID if SEM_MUTEX = 1 in RCC_RxSEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

0: Non-secure write access is allowed.

1: Secure write access is allowed.

20.8.5 RCC privileged configuration register 0 (RCC_PRIVCFGR0)

Address offset: 0x010

Reset value: 0x0000 0000

This register is used to set the privileged attribute value used to filter any write access to the RCC local resource number 0 to 31 (see *Table 161* for RCC local resource mapping). Unprivileged writes to this register are ignored, and illegal access event is generated. Any read is allowed.

PRIV[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PRIV[31:0]**: Privileged attribute reference for local resource number x (x = 31 to 0)

If corresponding SECx is set in RCC_SECCFGR0, each bit can only be written by a secure privileged application.

If compartment filtering for local resource number x is enabled (resp. disabled) using CFEN in RCC_RxCIDCFGR, only an authorized compartment (resp. any compartment) can write this bit, if access privilege and security are sufficient. Writes are ignored if RLOCKx = 1 in RCC_RCFGLOCKR0.

Authorized compartment is defined as SCID if SEM_EN = 0 in RCC_RxCIDCFGR.
If SEM_EN = 1, it is equal to SEMCID if SEM_MUTEX = 1 in RCC_RxSEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

0: Privileged and unprivileged data accesses are granted to local resource number x.

1: Only privileged data access is granted to local resource number x.

20.8.6 RCC privileged configuration register 1 (RCC_PRIVCFGR1)

Address offset: 0x014

Reset value: 0x0000 0000

This register is used to set the privileged attribute value used to filter any write access to the RCC local resources number 32 to 63 (see *Table 161* for RCC local resource mapping). Unprivileged writes to this register are ignored, and illegal access event is generated. Any read is allowed.

RLOCK[47:32]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **RLOCK[63:32]**: RCC local resource number x lock (x = 63 to 32)

Each bit is set to lock the RCC local resource x. It is cleared by default, and once set, it cannot be reset until RCC is reset.

0: SEC(x - 32) in RCC_SECCFGR1 and PRIV(x - 32) in RCC_PRIVCFGR1 are writable. RCC_RxCIDCFGR is writable.

1: Writes to SEC(x - 32) in RCC_SECCFGR1 and PRIV(x - 32) in RCC_PRIVCFGR1 are ignored. Writes to RCC_RxCIDCFGR are ignored.

20.8.11 RCC resource configuration lock register 2 (RCC_RCFGLOCKR2)

Address offset: 0x028

Reset value: 0x0000 0000

Secure privileged write access only. Write only by trusted domain. Debug domain can write to this register if the feature is activated.Otherwise, illegal access events are generated. Any read access is allowed.

rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw

Bits 25, 18:16, 8 Reserved, must be kept at reset value.

Bits 31:26, 24:19, 15:9, 7:0 **RLOCKx**: RCC local resource number x lock (x = 95 to 90, 88 to 83, 79 to 73, 71 to 64)

Each bit is set to lock the RCC local resource x. It is cleared by default, and once set. It cannot be reset until the RCC is reset.

0: SEC(x - 64) in RCC_SECCFGR2 and PRIV(x - 64) in RCC_PRIVCFGR2 are writable. RCC_RxCIDCFGR is writable.

1: Writes to SEC(x - 64) in RCC_SECCFGR2 and PRIV(x - 64) in RCC_PRIVCFGR2 are ignored. Writes to RCC_RxCIDCFGR are ignored.

20.8.12 RCC resource configuration lock register 3 (RCC_RCFGLOCKR3)

Address offset: 0x02C

Reset value: 0x0000 0000

Secure privileged write access only. Write only by trusted domain.Debug domain can write to this register if the feature is activated.Otherwise, illegal access events are generated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw		rw	rw	rw	rw	rw	rw			rw	rw	rw

Bits 31:18, 11, 4:3 Reserved, must be kept at reset value.

Bits 17:12, 10:5, 2:0 **RLOCKx**: RCC local resource number x lock (x = 113 to 108, 106 to 101, 98 to 96)
Each bit is set to lock the RCC local resource x. It is cleared by default, and once set. It cannot be reset until the RCC is reset.
0: SEC(x - 96) in RCC_SECCFGR3 and PRIV(x - 96) in RCC_PRIVCFGR3 are writable. RCC_RxCIDCFGR is writable.
1: Writes to SEC(x - 96) in RCC_SECCFGR3 and PRIV(x - 96) in RCC_PRIVCFGR3 are ignored. Writes to RCC_RxCIDCFGR are ignored.

20.8.13 RCC resource x CID configuration register (RCC_RxCIDCFGR)

Address offset: 0x030 + 0x8 * x, (x = 0 to 71, 73 to 79, 83 to 88, 90 to 98, 101 to 106, 108 to 113)

Reset value: 0x0000 0000

This register is used to configure the CID filtering policy for the RCC local resource x (see *Table 161* for RCC local resource mapping). Secure privileged write access only. Write only by trusted domain. Debug domain can write to this register if the feature is activated.

Any write is ignored if the local resource x is locked (RLOCK(x - 32 * z) = 1 in RCC_RCFGLOCKRz, with z = 0 to 3).Otherwise, illegal access events are generated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEMWLC[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCID[2:0]			Res.	Res.	SEM_EN	CFEN
									rw	rw	rw			rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **SEMWLC[7:0]**: Semaphore white-list for compartment y (y = 7 to 0)
Set and cleared by software.
0: Application running in compartment y cannot get access to local resource x through semaphore SEM_MUTEX.
1: Application running in compartment y can get access to local resource x through semaphore SEM_MUTEX.
Note: This bit is ignored if SEM_EN = 0 or CFEN = 0

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:4 SCID[2:0]: Static compartment ID
Set by software.
Trusted domain application uses this bit-field to statically define which compartment has access to local resource number x when SEM_EN = 0.
This bit-field is ignored if SEM_EN = 1 or CFEN = 0.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 SEM_EN: Semaphore enable
Set and cleared by software.
0: Access to local resource number x is only granted if the CID of the access is equal to SCID.
1: Access to local resource number x is only granted if SEM_MUTEX = 1 and the CID of the access is equal to SEMCID.
This bit is not taken into account if CFEN = 0. When this bit is cleared, SEM_MUTEX is cleared.

Bit 0 **CFEN**: Static CID filter enable
Set and cleared by software. Additional access controls to local resource x apply, as defined in RCC_PRIVCFGRz and RCC_SECCFGRz with z = 0 to 3.
0: Compartment-based filtering is defined in RCC_RxCIDCFGR, and optionally RCC_RxSEMCR is disabled for local resource x.
1: Compartment-based filtering is defined in RCC_RxCIDCFGR, and optionally RCC_RxSEMCR is enabled for local resource x.
Note: When this bit is cleared, SEM_MUTEX is cleared.

20.8.14 RCC resource x semaphore control register (RCC_RxSEMCR)

Address offset: 0x034 + 0x8 * x**,** (x = 0 to 71, 73 to 79, 83 to 88, 90 to 98, 101 to 106, 108 to 113)

Reset value: 0x0000 0000

This register is used to control the semaphore access for the RCC local resource x.
If compartment filtering is disabled (CFEN = 0 in RCC_RxCIDCFGR), or semaphore is disabled (SEM_EN = 0 in RCC_RxCIDCFGR), any write to this register is ignored. Illegal access event generation is disabled in this case.

Secure-only write access if SEC(x - 32 * z) is set in RCC_SECCFGRz (with z = 0 to 3).
Privileged-only write access if PRIV(x - 32 * z) is set in RCC_PRIVCFGRz (with z = 0 to 3).

If compartment filtering is enabled and semaphore is enabled (CFEN and SEM_EN set in RCC_RxCIDCFGR), only an authorized compartment can write this register. Authorized compartment is defined by SEMCID if SEM_MUTEX = 1. Otherwise, it is defined by the CID white list (SEMWLCy with y = 0 to 7) in RCC_RxCIDCFGR. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEMCID[2:0]			Res.	Res.	Res.	SEM_ MUTEX
									r	r	r				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **SEMCID[2:0]**: Semaphore compartment ID

Set by hardware. When SEM_EN and CFEN are set in RCC_RxCIDCFGR, this bitfield is updated with the CID value of the latest successful acquisition of RCC_RxSEMCR semaphore (SEM_MUTEX = 1).

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **SEM_MUTEX**: Semaphore mutex

Set and cleared by software. White-listed application can set this bit to get exclusive access to local resource x, when SEM_EN = 1 in RCC_RxCIDCFGR (writes ignored otherwise).
When SEM_MUTEX = 0, only applications belonging to the white-listed compartments (defined by SEMWLCy in RCC_RxCIDCFGR) can acquire this semaphore.
When SEM_MUTEX = 1, only applications belonging to the SEMCID compartment can release this semaphore.

0: Reading 0 means that the semaphore is free. Writing 0 means that the semaphore is going to be released.

1: Reading 1 means that the semaphore is taken. Writing 1 means that the semaphore is going to be acquired.

Note: This bit is cleared when CFEN or SEM_EN are cleared in RCC_RxCIDCFGR.

20.8.15 RCC global reset control set register (RCC_GRSTCSETR)

Address offset: 0x400

Reset value: 0x0000 0000

This register is used to generate a system reset. Writing 0 has no effect, reading returns the effective values of the corresponding bits. Writing 1 activates a system reset. Write accesses are defined according to the RCC local resource number 66 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SYSRST
															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **SYSRST**: System reset
Set by software, cleared by hardware.
0: Writing 0 has no effect. Reading 0 means that the system reset is released.
1: Writing 1 generates a system reset (see *Figure 74*).

20.8.16 RCC CPU1 reset control set register (RCC_C1RSTCSETR)

Address offset: 0x404

Reset value: 0x0000 0000

This register is used to generate the CPU1 reset, and IWDG1/2 kernel resets. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 activates the bit. Write accesses are defined according to the RCC local resource number 66 configuration (see *Table 161* for details).Any read access is allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	C1RST
															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **C1RST**: CPU1 reset
Set by software, cleared by hardware when the reset command is completed. Resets the CPU1 subsystem, and IWDG1/2 kernel clocks.
0: Writing 0 has no effect. Reading 0 means that the CPU1 reset is released.
1: Writing 1 generates a CPU1 reset. Reading 1 means that the reset is asserted (see *Figure 74*).

20.8.17 RCC CPU2 reset control set register (RCC_C2RSTCSETR)

Address offset: 0x40C

Reset value: 0x0000 0000

This register is used to generate a CPU2 reset, and IWDG3/4 kernel resets. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 activates the reset of the corresponding peripheral. Write accesses are defined according to the RCC local resource number 66 configuration (see *Table 161* for details).Any read access is allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	C2RST
															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **C2RST**: CPU2 reset

Set by software and cleared by hardware when the reset command is completed. Resets the CPU2 subsystem, and IWDG3/4 kernel clocks.

0: Writing 0 has no effect. Reading 0 means that the CPU2 reset is released.

1: Writing 1 generates a CPU2 reset. Reading 1 means that the reset is asserted (see *Figure 74*).

20.8.18 RCC hardware reset status clear register (RCC_HWRSTSCLRR)

Address offset: 0x410

Reset value: 0x0000 0015

This register is used by the trusted application to check the reset source. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. This register is located in V_{DD} domain, and is reset by por_rstn reset. Write accesses are defined according to the RCC local resource number 66 configuration (see *Table 161* for details).Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:15 Reserved, must be kept at reset value.

Bit 14 **RETECCFAILRESTRSTF**: RETRAM ECC failure reset flag during system restoration phase

Cleared by software and set by hardware when a reset due to an ECC failure on RETRAM during the system restoration phase occurs.

0: Writing 0 has no effect. Reading 0 means that no reset due to an ECC failure on RETRAM during the system restoration phase occurred (default after por_rstn reset).

1: Writing 1 clears the RETECCFAILRESTRSTF flag. Reading 1 means that a reset due to an ECC failure on RETRAM during the system restoration phase occurred.

Bit 13 **RETECCFAILCRCRSTF**: RETRAM ECC failure reset flag during the CRC computation phase

Cleared by software and set by hardware when a reset due to an ECC failure on RETRAM during CRC computation phase occurs.

0: Writing 0 has no effect. Reading 0 means that no reset due to an ECC failure on RETRAM during CRC computation phase occurred (default after por_rstn reset).

1: Writing 1 clears the RETECCFAILCRCRSTF flag. Reading 1 means that a reset due to an ECC failure on RETRAM during CRC computation phase occurred.

Bit 12 **RETCRCERRRSTF**: RETRAM CRC error reset flag

Cleared by software and set by hardware when a reset due to a CRC error on RETRAM content occurs.

0: Writing 0 has no effect. Reading 0 means that no reset due to a CRC error on RETRAM content occurred (default after por_rstn reset).

1: Writing 1 clears the RETCRCERRRSTF flag. Reading 1 means that a reset due to a CRC error on RETRAM content occurred.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **IWDG4SYSRSTF**: IWDG4 system reset flag

Cleared by software and set by hardware when an IWDG4 system reset occurs.

0: Writing 0 has no effect. Reading 0 means that no IWDG4 system reset occurred (default after por_rstn reset).

1: Writing 1 clears the IWDG4SYSRSTF flag. Reading 1 means that an IWDG4 system reset occurred.

Bit 9 **IWDG3SYSRSTF**: IWDG3 system reset flag

Cleared by software and set by hardware when an IWDG3 system reset occurs.

0: Writing 0 has no effect. Reading 0 means that no IWDG3 system reset occurred (default after por_rstn reset).

1: Writing 1 clears the IWDG3SYSRSTF flag. Reading 1 means that an IWDG3 system reset occurred.

Bit 8 **IWDG2SYSRSTF**: IWDG2 system reset flag

Cleared by software and set by hardware when an IWDG2 system reset occurs.

0: Writing 0 has no effect. Reading 0 means that no IWDG2 system reset occurred (default after por_rstn reset).

1: Writing 1 clears the IWDG2SYSRSTF flag. Reading 1 means that an IWDG2 system reset occurred.

Bit 7 **IWDG1SYSRSTF**: IWDG1 system reset flag

Cleared by software and set by hardware when an IWDG1 system reset occurs.

0: Writing 0 has no effect. Reading 0 means that no IWDG1 system reset occurred (default after por_rstn reset).

1: Writing 1 clears the IWDG1SYSRSTF flag. Reading 1 means that an IWDG1 system reset occurred.

Bit 6 **SYSC2RSTF**: CPU2 system reset flag

Cleared by software and set by hardware when a CPU2 system reset occurs.

0: Writing 0 has no effect. Reading 0 means that no system reset generated by the CPU2 occurred (default after por_rstn reset).

1: Writing 1 clears the SYSC2RSTF flag. Reading 1 means that a system reset generated by the CPU2 occurred.

Bit 5 **SYSC1RSTF**: CPU1 system reset flag

Cleared by software and set by hardware when a CPU1 system reset occurs.

0: Writing 0 has no effect. Reading 0 means that no system reset generated by the CPU1 occurred (default after por_rstn reset).

1: Writing 1 clears the SYSC1RSTF flag. Reading 1 means that a system reset generated by the CPU1occurred.

Bit 4 **VCORERSTF**: V_{DDCORE} reset flag

Cleared by software and set by hardware when a reset occurs because V_{DDCORE} is lower than the expected value.

0: Writing 0 has no effect. Reading 0 means that V_{DDCORE} is not the origin of the reset.

1: Writing 1 clears the VCORERSTF flag. Reading 1 means that V_{DDCORE} is the origin of the reset (default after por_rstn reset).

Bit 3 **HCSSRSTF**: HSE CSS reset flag

Cleared by software and set by hardware when a failure is detected on HSE.

0: Writing 0 has no effect. Reading 0 means that no HSE CSS reset occurred (default after por_rstn reset).

1: Writing 1 clears the HCSSRSTF flag. Reading 1 means that a HSE CSS reset occurred.

Bit 2 **PADRSTF**: NRST reset flag

Cleared by software and set by hardware when a PAD reset occurs.

0: Writing 0 has no effect. Reading 0 means that no PAD reset occurred.

1: Writing 1 clears the PADRSTF flag. Reading 1 means that a PAD reset occurred (default after por_rstn reset).

Bit 1 **BORRSTF**: BOR reset flag

Cleared by software and set by hardware when a BOR occurs.

0: Writing 0 has no effect. Reading 0 means that no BOR occurred (default after por_rstn reset).

1: Writing 1 clears the BORRSTF flag. Reading 1 means that a BOR occurred.

Bit 0 **PORRSTF**: POR/PDR reset flag

Cleared by software and set by hardware when a POR/PDR occurs.

0: Writing 0 has no effect. Reading 0 means that no POR/PDR occurred.

1: Writing 1 clears the PORRSTF flag. Reading 1 means that a POR/PDR occurred (default after por_rstn reset).

20.8.19 RCC CPU1 hardware reset status clear register (RCC_C1HWRSTSCLRR)

Address offset: 0x414

Reset value: 0x0000 0003

This register is used by the CPU1 to check the reset source. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. This register is located in V_{DD} domain, and is reset by por_rstn reset. This flag is located in the V_{DDCORE} domain, and is reset by sys_rstn reset. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

														rc_w1	rc_w1

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **C1RSTF**: CPU1 reset flag

Cleared by software and set by hardware when a CPU1 reset occurs.

0: Writing 0 has no effect. Reading 0 means that no CPU1 reset occurred.

1: Writing 1 clears the C1RSTF flag. Reading 1 means that a CPU1 reset occurred (default after por_rstn reset).

Bit 0 **VCPURSTF**: V_{DDCPU} reset flag

Cleared by software and set by hardware when a reset occurs because V_{DDCPU} is lower than the expected value.

0: Writing 0 has no effect. Reading 0 means that V_{DDCPU} is not the origin of the reset.

1: Writing 1 clears the VCPURSTF flag. Reading 1 means that V_{DDCPU} is the origin of the reset (default after por_rstn reset).

20.8.20 RCC CPU2 hardware reset status clear register (RCC_C2HWRSTSCLRR)

Address offset: 0x418

Reset value: 0x0000 0001

This register is used by the CPU2 to check the reset source. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. This register is located in the V_{DD} domain, and is reset by por_rstn reset. Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 161* for details).Any read access is allowed.

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **C2RSTF**: CPU2 reset flag

Cleared by software and set by hardware when a CPU2 reset occurs.

0: Writing 0 has no effect. Reading 0 means that no CPU2 reset occurred.

1: Writing 1 clears the C2RSTF flag. Reading 1 means that a CPU2 reset occurred (default after por_rstn reset).

20.8.21 RCC CPU1 boot reset status set register (RCC_C1BOOTRSTSSETR)

Address offset: 0x41C

Reset value: 0x0000 0000

This register is used by the CPU1 to set the boot reset source. This register is updated by the boot ROM code after any reset source. Writing 0 to this register has no effect. Writing 1 sets the corresponding bits (see *Section 20.3.13* for details). The register is located in the V_{DDCORE} domain. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 161* for details).Any read access is allowed.

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **D2STBYRSTF**: D2 DStandby reset flag
Set by software. Indicates that the D2 domain has been in DStandby mode.
0: No effect
1: Set the D2STBYRSTF bit

Bit 22 **D1STBYRSTF**: D1 DStandby reset flag
Set by software. Indicates that the D1 domain has been in DStandby mode.
0: No effect
1: Set the D1STBYRSTF bit.

Bit 21 Reserved, must be kept at reset value.

Bit 20 **STBYC1RSTF**: CPU1 system Standby reset flag
Set by software. Indicates that the system has been in Standby mode for CPU1.
0: No effect
1: Set the STBYC1RSTF bit.

Bit 19 **RETECCFAILRESTRSTF**: RETRAM ECC failure reset flag during system restoration phase
Set by software. Indicates that a reset due to an ECC failure on RETRAM during the system restoration phase occurred.
0: No effect
1: Set the RETECCFAILRESTRSTF bit.

Bit 18 **RETECCFAILCRCRSTF**: RETRAM ECC failure reset flag during the CRC computation phase
Set by software. Indicates that a reset due to an ECC failure on RETRAM during CRC computation phase occurred.
0: No effect
1: Set the RETECCFAILCRCRSTF bit.

Bit 17 **RETCRCERRRSTF**: RETRAM CRC error reset flag
Set by software. Indicates that a reset due to a CRC error on RETRAM content occurred.
0: No effect
1: Set the RETCRCERRRSTF bit.

Bits 16:14 Reserved, must be kept at reset value.

Bit 13 **C1RSTF**: CPU1 reset flag
Set by software. Indicates that a CPU1 reset occurred.
0: No effect
1: Set the C1RSTF bit.

Bit 12 Reserved, must be kept at reset value.

Bit 11 **IWDG4SYSRSTF**: IWDG4 system reset flag
Set by software.Indicates that a system reset occurred due to an IWDG4 timeout.
0: No effect
1: Set the IWDG4SYSRSTF bit.

Bit 10 **IWDG3SYSRSTF**: IWDG3 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG3 timeout.
0: No effect
1: Set the IWDG3SYSRSTF bit.

Bit 9 **IWDG2SYSRSTF**: IWDG2 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG2 timeout.
0: No effect
1: Set the IWDG2SYSRSTF bit.

Bit 8 **IWDG1SYSRSTF**: IWDG1 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG1 timeout.
0: No effect
1: Set the IWDG1SYSRSTF bit.

Bit 7 **SYSC2RSTF**: CPU2 system reset flag
Set by software. Indicates that a system reset generated by the CPU2 occurred.
0: No effect
1: Set the SYSC2RSTF bit.

Bit 6 **SYSC1RSTF**: CPU1 system reset flag
Set by software. Indicates that a system reset generated by the CPU1 occurred.
0: No effect
1: Set the SYSC1RSTF bit.

Bit 5 **VCPURSTF**: V_{DDCPU} reset flag
Set by software. Indicates that a reset occurred because V_{DDCPU} is lower than the expected value.
0: No effect
1: Set the VCPURSTF bit.

Bit 4 **VCORERSTF**: V_{DDCORE} reset flag
Set by software. Indicates that a reset occurred because V_{DDCORE} is lower than the expected value.
0: No effect
1: Set the VCORERSTF bit.

Bit 3 **HCSSRSTF**: HSE CSS reset flag
Set by software. Indicates that a reset occurred due to a failure detection on HSE.
0: No effect
1: Set the HCSSRSTF bit.

Bit 2 **PADRSTF**: NRST reset flag
Set by software. Indicates that a pad reset occurred.
0: No effect
1: Set the PADRSTF bit.

Bit 1 **BORRSTF**: BOR reset flag
Set by software. Indicates that a BOR reset occurred.
0: No effect
1: Set the BORRSTF bit.

Bit 0 **PORRSTF**: POR/PDR reset flag
Set by software. Indicates that a POR/PDR reset occurred.
0: No effect
1: Set the PORRSTF bit.

20.8.22 RCC CPU1 boot reset status clear register (RCC_C1BOOTRSTSCLRR)

Address offset: 0x420

Reset value: 0x0000 0000

This register is used by the CPU1 to check the boot reset source. This register is updated by the boot ROM code after any reset source. Writing 0 to this register has no effect. Writing 1

clears the corresponding bits (see *Section 20.3.13* for details). The register is located in the V_{DDCORE} domain. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 161* for details).Any read access is allowed.

Bit 23 **D2STBYRSTF**: D2 DStandby reset flag
Cleared by software. Indicates that the D2 domain has been in DStandby mode.
0: No effect
1: Clear the D2STBYRSTF bit.

Bit 22 **D1STBYRSTF**: D1 DStandby reset flag
Cleared by software. Indicates that the D1 domain has been in DStandby mode.
0: No effect
1: Clear the D1STBYRSTF bit.

Bit 21 Reserved, must be kept at reset value.

Bit 20 **STBYC1RSTF**: CPU1 system Standby reset flag
Cleared by software. Indicates that the system has been in Standby mode for CPU1.
0: No effect
1: Clear the STBYC1RSTF bit.

Bit 19 **RETECCFAILRESTRSTF**: RETRAM ECC failure reset flag during system restoration phase
Cleared by software. Indicates that a reset due to an ECC failure on RETRAM during the system restoration phase occurred.
0: No effect
1: Clear the RETECCFAILRESTRSTF bit.

Bit 18 **RETECCFAILCRCRSTF**: RETRAM ECC failure reset flag during the CRC computation phase
Cleared by software. Indicates that a reset due to an ECC failure on RETRAM during CRC computation phase occurred.
0: No effect
1: Clear the RETECCFAILCRCRSTF bit.

Bit 17 **RETCRCERRRSTF**: RETRAM CRC error reset flag
Cleared by software. Indicates that a reset due to a CRC error on RETRAM content occurred.
0: No effect
1: Clear the RETCRCERRRSTF bit.

Bits 16:14 Reserved, must be kept at reset value.

Bit 13 **C1RSTF**: CPU1 reset flag
Cleared by software. Indicates that a CPU1 reset occurred.
0: No effect
1: Clear the C1RSTF bit.

Bit 12 Reserved, must be kept at reset value.

Bit 11 **IWDG4SYSRSTF**: IWDG4 system reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG4 timeout.
0: No effect
1: Clear the IWDG4SYSRSTF bit.

Bit 10 **IWDG3SYSRSTF**: IWDG3 system reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG3 timeout.
0: No effect
1: Clear the IWDG3SYSRSTF bit.

Bit 9 **IWDG2SYSRSTF**: IWDG2 system reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG2 timeout.
0: No effect
1: Clear the IWDG2SYSRSTF bit.

Bit 8 **IWDG1SYSRSTF**: IWDG1 system reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG1 timeout.
0: No effect
1: Clear the IWDG1SYSRSTF bit.

Bit 7 **SYSC2RSTF**: CPU2 system reset flag
Cleared by software. Indicates that a system reset generated by the CPU2 occurred.
0: No effect
1: Clear the SYSC2RSTF bit.

Bit 6 **SYSC1RSTF**: CPU1 system reset flag
Cleared by software. Indicates that a system reset generated by the CPU1 occurred.
0: No effect
1: Clear the SYSC1RSTF bit.

Bit 5 **VCPURSTF**: V_{DDCPU} reset flag
Cleared by software. Indicates that a reset occurred because V_{DDCPU} is lower than the expected value.
0: No effect
1: Clear the VCPURSTF bit.

Bit 4 **VCORERSTF**: V_{DDCORE} reset flag
Cleared by software. Indicates that a reset occurred because V_{DDCORE} is lower than the expected value.
0: No effect
1: Clear the VCORERSTF bit.

Bit 3 **HCSSRSTF**: HSE CSS reset flag
Cleared by software. Indicates that a reset occurred due to a failure detection on HSE.
0: No effect
1: Clear the HCSSRSTF bit.

Bit 2 **PADRSTF**: NRST reset flag
Cleared by software. Indicates that a pad reset occurred.
0: No effect
1: Clear the PADRSTF bit.

Bit 1 **BORRSTF**: BOR reset flag
Cleared by software. Indicates that a BOR reset occurred.
0: No effect
1: Clear the BORRSTF bit.

Bit 0 **PORRSTF**: POR/PDR reset flag
Cleared by software. Indicates that a POR/PDR reset occurred.
0: No effect
1: Clear the PORRSTF bit.

20.8.23 RCC CPU2 boot reset status set register (RCC_C2BOOTRSTSSETR)

Address offset: 0x424

Reset value: 0x0000 0000

This register is used by the CPU2 to set the boot reset source. This register is updated by the CPU2 wake-up firmware after any reset source. Writing 0 to this register has no effect. Writing 1 sets the corresponding bits (see *Section 20.3.13* for details). The register is located in the V_{DDCORE} domain. Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 161* for details).Any read access is allowed.

Bit 23 **D2STBYRSTF**: D2 DStandby reset flag
Set by software. Indicates that the D2 domain has been in DStandby mode.
0: No effect
1: Set the D2STBYRSTF bit.

Bit 22 Reserved, must be kept at reset value.

Bit 21 **STBYC2RSTF**: CPU2 system Standby reset flag
Set by software. Indicates that the system has been in Standby mode for CPU2.
0: No effect
1: Set the STBYC2RSTF bit.

Bit 20 Reserved, must be kept at reset value.

Bit 19 **RETECCFAILRESTRSTF**: RETRAM ECC failure reset flag during system restoration phase
Set by software. Indicates that a reset due to an ECC failure on RETRAM during the system restoration phase occurred.
0: No effect
1: Set the RETECCFAILRESTRSTF bit.

Bit 18 **RETECCFAILCRCRSTF**: RETRAM ECC failure reset flag during the CRC computation phase
Set by software. Indicates that a reset due to an ECC failure on RETRAM during CRC computation phase occurred.
0: No effect
1: Set the RETECCFAILCRCRSTF bit.

Bit 17 **RETCRCERRRSTF**: RETRAM CRC error reset flag
Set by software. Indicates that a reset due to a CRC error on RETRAM content occurred.
0: No effect
1: Set the RETCRCERRRSTF bit.

Bits 16:15 Reserved, must be kept at reset value.

Bit 14 **C2RSTF**: CPU2 reset flag
Set by software. Indicates that a CPU2 reset occurred.
0: No effect
1: Set the C2RSTF bit.

Bits 13:12 Reserved, must be kept at reset value.

Bit 11 **IWDG4SYSRSTF**: IWDG4 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG4 timeout.
0: No effect
1: Set the IWDG4SYSRSTF bit.

Bit 10 **IWDG3SYSRSTF**: IWDG3 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG3 timeout.
0: No effect
1: Set the IWDG3SYSRSTF bit.

Bit 9 **IWDG2SYSRSTF**: IWDG2 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG2 timeout.
0: No effect
1: Set the IWDG2SYSRSTF bit.

Bit 8 **IWDG1SYSRSTF**: IWDG1 system reset flag
Set by software. Indicates that a system reset occurred due to an IWDG1 timeout.
0: No effect
1: Set the IWDG1SYSRSTF bit.

Bit 7 **SYSC2RSTF**: CPU2 system reset flag
Set by software. Indicates that a system reset generated by the CPU2 occurred.
0: No effect
1: Set the SYSC2RSTF bit.

Bit 6 **SYSC1RSTF**: CPU1 system reset flag
Set by software. Indicates that a system reset generated by the CPU1 occurred.
0: No effect
1: Set the SYSC1RSTF bit.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **VCORERSTF**: V_{DDCORE} reset flag
Set by software. Indicates that a reset occurred because V_{DDCORE} is lower than the expected value.
0: No effect
1: Set the VCORERSTF bit.

Bit 3 **HCSSRSTF**: HSE CSS reset flag
Set by software. Indicates that a reset occurred due to a failure detection on HSE.
0: No effect
1: Set the HCSSRSTF bit.

Bit 2 **PADRSTF**: NRST reset flag
Set by software. Indicates that a pad reset occurred.
0: No effect
1: Set the PADRSTF bit.

Bit 1 **BORRSTF**: BOR reset flag
Set by software. Indicates that a BOR reset occurred.
0: No effect
1: Set the BORRSTF bit.

Bit 0 **PORRSTF**: POR/PDR reset flag
Set by software. Indicates that a POR/PDR reset occurred.
0: No effect
1: Set the PORRSTF bit.

20.8.24 RCC CPU2 boot reset status clear register (RCC_C2BOOTRSTSCLRR)

Address offset: 0x428

Reset value: 0x0000 0000

This register is used by the CPU2 to check the boot reset source. This register is updated by the CPU2 wake-up firmware after any reset source. Writing 0 to this register has no effect. Writing 1 clears the corresponding bits (see *Section 20.3.13* for details). The register is located in the V_{DDCORE} domain. Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 161* for details). Any read access is allowed.

Bit 23 **D2STBYRSTF**: D2 DStandby reset flag
Cleared by software. Indicates that the D2 domain has been in DStandby mode.
0: No effect
1: Clear the D2STBYRSTF bit.

Bit 22 Reserved, must be kept at reset value.

Bit 21 **STBYC2RSTF**: CPU2 system Standby reset flag
Cleared by software. Indicates that the system has been in Standby mode for CPU2.
0: No effect
1: Clear the STBYC2RSTF bit.

Bit 20 Reserved, must be kept at reset value.

Bit 19 **RETECCFAILRESTRSTF**: RETRAM ECC failure reset flag during system restoration phase
Cleared by software. Indicates that a reset due to an ECC failure on RETRAM during the system restoration phase occurred.
0: No effect
1: Clear the RETECCFAILRESTRSTF bit.

Bit 18 **RETECCFAILCRCRSTF**: RETRAM ECC failure reset flag during the CRC computation phase
Cleared by software. Indicates that a reset due to an ECC failure on RETRAM during CRC computation phase occurred.
0: No effect
1: Clear the RETECCFAILCRCRSTF bit.

Bit 17 **RETCRCERRRSTF**: RETRAM CRC error reset flag
Cleared by software. Indicates that a reset due to a CRC error on RETRAM content occurred.
0: No effect
1: Clear the RETCRCERRRSTF bit.

Bits 16:15 Reserved, must be kept at reset value.

Bit 14 **C2RSTF**: CPU2 reset flag
Cleared by software. Indicates that a CPU2 reset occurred.
0: No effect
1: Clear the C2RSTF bit.

Bits 13:12 Reserved, must be kept at reset value.

Bit 11 **IWDG4SYSRSTF**: IWDG4 reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG4 timeout.
0: No effect
1: Clear the IWDG4SYSRSTF bit.

Bit 10 **IWDG3SYSRSTF**: IWDG3 reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG3 timeout.
0: No effect
1: Clear the IWDG3SYSRSTF bit.

Bit 9 **IWDG2SYSRSTF**: IWDG2 reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG2 timeout.
0: No effect
1: Clear the IWDG2SYSRSTF bit.

Bit 8 **IWDG1SYSRSTF**: IWDG1 system reset flag
Cleared by software. Indicates that a system reset occurred due to an IWDG1 timeout.
0: No effect
1: Clear the IWDG1SYSRSTF bit.

Bit 7 **SYSC2RSTF**: CPU2 system reset flag
Cleared by software. Indicates that a system reset generated by the CPU2 occurred.
0: No effect
1: Clear the SYSC2RSTF bit.

Bit 6 **SYSC1RSTF**: CPU1 system reset flag
Cleared by software. Indicates that a system reset generated by the CPU1 occurred.
0: No effect
1: Clear the SYSC1RSTF bit.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **VCORERSTF**: V_{DDCORE} reset flag
Cleared by software. Indicates that a reset occurred because V_{DDCORE} is lower than the expected value.
0: No effect
1: Clear the VCORERSTF bit.

Bit 3 **HCSSRSTF**: HSE CSS reset flag
Cleared by software. Indicates that a reset occurred due to a failure detection on HSE.
0: No effect
1: Clear the HCSSRSTF bit.

Bit 2 **PADRSTF**: NRST reset flag
Cleared by software. Indicates that a pad reset occurred.
0: No effect
1: Clear the PADRSTF bit.

Bit 1 **BORRSTF**: BOR reset flag
Cleared by software. Indicates that a BOR reset occurred.
0: No effect
1: Clear the BORRSTF bit.

Bit 0 **PORRSTF**: POR/PDR reset flag
Cleared by software. Indicates that a POR/PDR reset occurred.
0: No effect
1: Clear the PORRSTF bit.

20.8.25 RCC CPU1 stop request set register (RCC_C1SREQSETR)

Address offset: 0x42C

Reset value: 0x0000 0000

Writing 0 has no effect. Reading returns the values of the bits. Writing 1 sets the corresponding bit to 1. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ESLPREQ

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STPREQ_P0
															rs

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **ESLPREQ**: Enhanced CSleep request for CPU1 subsystem

Set by software. Allows the entry in enhanced CSleep for CPU1 sub-ystem, when the complete CPU1 is in WFI.

0: Writing 0 has no effect. Reading 0 means that enhanced CSleep for CPU1 subsystem is not requested.

1: Writing 1 sets the ESLPREQ bit. Reading 1 means that enhanced CSleep for CPU1 subsystem is requested.

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **STPREQ_P0**: Stop request for CPU1 processor

Set by software. Indicates if the CPU1 processor allows the entry in Stop mode for CPU1 subsystem, when the CPU1 is in WFI.

0: Writing 0 has no effect. Reading 0 means that the CPU1 processor does not allow the CPU1 subsystem to go to CStop.

1: Writing 1 sets the STPREQ_P0 bit. Reading 1 means that the CPU1 processor allows the CPU1 subsystem to go to CStop.

20.8.26 RCC CPU1 stop request clear register (RCC_C1SREQCLRR)

Address offset: 0x430

Reset value: 0x0000 0000

Writing 0 has no effect. Reading returns the effective values of the bits. Writing 1 clears the corresponding bit to 0. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STPREQ_P0
															rc_w1

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **ESLPREQ**: Enhanced CSleep request for CPU1 subsystem

Cleared by software. Allows the entry in enhanced CSleep for CPU1 subsystem, when the complete CPU1 is in WFI.

0: Writing 0 has no effect. Reading 0 means that enhanced CSleep for CPU1 subsystem is not requested.

1: Writing 1 clears the ESLPREQ bit. Reading 1 means that enhanced CSleep for the CPU1 subsystem is requested.

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **STPREQ_P0**: Stop request for CPU1 processor

Cleared by software. Indicates if the CPU1 processor allows the entry in Stop mode for CPU1 subsystem, when the CPU1 is in WFI.

0: Writing 0 has no effect. Reading 0 means that the CPU1 processor does not allow the CPU1 subsystem to go to CStop.

1: Writing 1 clears the STPREQ_P0 bit. Reading 1 means that the CPU1 processor allows the CPU1 subsystem to go to CStop.

20.8.27 RCC CPU boot control register (RCC_CPUBOOTCR)

Address offset: 0x434

Reset value: 0x0000 0000

The register is used to control the HOLD_BOOT state of the CPUs after reset (see *HOLD_BOOT CPUx state* for details). Write accesses are defined according to the

RCC local resource number 67 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BOOT_CPU1	BOOT_CPU2
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **BOOT_CPU1**: CPU1 boot

Set and cleared by software to set the CPU1 in HOLD_BOOT after a reset of the CPU1. If the CPU1 was in HOLD_BOOT, it causes the CPU1 to boot.

0: The CPU1 is set in HOLD_BOOT when the next CPU1 reset occurs.

1: The CPU1 is not in HOLD_BOOT mode when the next CPU1 reset occurs.

Bit 0 **BOOT_CPU2**: CPU2 to boot

Set and cleared by software to set the CPU2 in HOLD_BOOT after a reset of the CPU2 core. If the CPU2 was in HOLD_BOOT, it causes the CPU2 to boot.

0: The CPU2 is set in HOLD_BOOT when the next CPU2 core reset occurs.

1: The CPU2 is not in HOLD_BOOT mode when the next CPU2 core reset occurs.

20.8.28 RCC standby boot control register (RCC_STBYBOOTCR)

Address offset: 0x438

Reset value: 0x0000 0000

This register is used to control the boot sequence when the system exits Standby (see *Section 20.3.13* for details). This register is reset when a system reset occurs (app_rstn), but not when the circuit exits from Standby. Wait states are inserted in case of successive write accesses to this register. The number of wait states can be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 67 configuration (see *Table 161* for details). Any read access is allowed.

							rw			r	r		rwo	rw	

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **RET_CRCERR_RSTEN**: RETRAM CRC error system reset enable
Set and cleared by software to select whether a RETRAM CRC error triggers a system reset or not.
0: RETRAM CRC error does not trigger a system reset (default after reset).
1: RETRAM CRC error triggers a system reset.

Bits 7:6 Reserved, must be kept at reset value.

Bit 5 **CPU1_HW_BEN**: CPU1 hardware boot enable
Set and cleared by hardware to indicate whether the CPU1 is enabled to restart after the system exits Standby.
0: CPU1 remains in HOLD_BOOT state.
1: CPU1 is allowed to restart.

Bit 4 **CPU2_HW_BEN**: CPU2 hardware boot enable
Set and cleared by hardware to indicate whether the CPU2 is enabled to restart after the system exits Standby.
0: CPU2 remains in HOLD_BOOT state.
1: CPU2 is allowed to restart.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **COLD_CPU2**: CPU2 cold boot
Set by software to indicate that CPU2 started first after POR. This bit can be written only one time after system reset.
0: CPU1 is the cold boot CPU.
1: CPU2 is the cold boot CPU.

Bit 1 **CPU_BEN_SEL**: CPU boot select
Set and cleared by software to select the CPU to restart first after the system exits Standby, in wake-up event mode in case of simultaneous CPU events.
0: CPU1 restarts first (default after reset).
1: CPU2 restarts first.

Bit 0 Reserved, must be kept at reset value.

20.8.29 RCC legacy boot control register (RCC_LEGBOOTCR)

Address offset: 0x43C

Reset value: 0x0000 0000

This register is used to control the first CPUx to boot (see *Section 20.3.13* for details). This register is reset when a system reset (app_rstn) occurs but not when the circuit exits Standby. Wait states are inserted in case of successive write accesses to this register. The number of wait states can be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 67 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LEGACY_BEN
															rwo

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **LEGACY_BEN**: Enable of the legacy selection mode to choose the first CPU to boot
Set by software to indicate that the CPU1 boots first. This bit can be written only one time after system reset.
0: The legacy selection mode is disabled (default after reset).
1: The legacy selection mode is enabled.

20.8.30 RCC backup domain control register (RCC_BDCR)

Address offset: 0x440

Reset value: 0x0000 0020

This register is used to control LSE functions. Wait states are inserted in case of successive write accesses to this register. The number of wait states may be up to 7 cycles of the RCC clock. After a system reset, this register is write-protected. In order to modify this register, DBP in PWR_BDCR must be set to 1. This register is only reset after a backup domain reset (vsw_rstn, see *Section 20.3.6*). Any other internal or external reset does not have any effect on these bits. This register is located in the V_{SW} domain.
Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
VSWRST	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RTCCKEN	Res.	Res.	RTCSRC[1:0]	
rw											rw			rwo	rwo
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	LSECSSD	LSEGFON	LSECSSON	LSEDRV[1:0]		LSEDIGBYP	LSERDY	LSEBYP	LSEON
							r	rw	rw	rw	rw	rw	r	rw	rw

Bit 31 **VSWRST**: V_{SW} domain software reset
Set and cleared by software.
0: Reset not activated (default after backup domain reset)
1: Resets the entire V_{SW} domain.

Bits 30:21 Reserved, must be kept at reset value.

Bit 20 **RTCCKEN**: RTC clock enable
Set and cleared by software.
0: rtc_ck clock disabled (default after backup domain reset)
1: rtc_ck clock enabled

Bits 19:18 Reserved, must be kept at reset value.

Bits 17:16 **RTCSRC[1:0]**: RTC clock source selection
Set by software to select the clock source for the RTC. This field can be written only one time after backup domain reset. When an LSE failure occurs, this field is cleared to 0, and the software can write it again once. This field must be written before LSECSSON is enabled (see *CSS on LSE* for details).
0x0: No clock (default after backup domain reset)
0x1: LSE clock used as RTC clock
0x2: LSI clock used as RTC clock
0x3: HSE clock divided by RTCDIV value used as RTC clock

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **LSECSSD**: LSE CSS failure detection

Set by hardware to indicate when a failure has been detected by the CSS on the external 32 kHz oscillator.

0: No failure detected on 32 kHz oscillator (default after backup domain reset)

1: Failure detected on 32 kHz oscillator

Bit 7 **LSEGFON**: LSE clock glitch filter enable

Set and cleared by software to enable the LSE clock glitch filter. This bit can be written only when LSE is disabled (LSEON = 0).

0: LSE clock glitch filter disabled

1: LSE clock glitch filter enabled

Bit 6 **LSECSSON**: LSE CSS enable

Set by software to enable the CSS on 32 kHz oscillator (see *LSE oscillator* for details on the activation and deactivation sequences). Once this bit is set, it cannot be cleared, except after a LSE failure detection (LSECSSD = 1).

0: CSS on 32 kHz oscillator off (default after backup domain reset)

1: CSS on 32 kHz oscillator on

Bits 5:4 **LSEDRV[1:0]**: LSE oscillator driving capability

Set by software to select the driving capability of the LSE oscillator.

0x0: Lowest drive

0x1: Medium-high drive

0x2: Medium-low drive (default after backup domain reset)

0x3: Highest drive

Caution: The low drive to high drive programming values are not in increasing order of LSEDRV[1:0].

Bit 3 **LSEDIGBYP**: LSE digital bypass

Set and cleared by software to select the analog or digital bypass mode

0: LSE in analog bypass mode (default after backup domain reset)

1: LSE in digital bypass mode

Bit 2 **LSERDY**: LSE oscillator ready

Set and cleared by hardware to indicate when the LSE is stable. This bit needs 6 cycles of lse_ck to fall down after LSEON has been cleared to 0.

0: LSE oscillator not ready (default after backup domain reset)

1: LSE oscillator ready

Bit 1 **LSEBYP**: LSE oscillator bypass

Set and cleared by software to bypass oscillator in debug mode. This bit must not be written when the LSE is enabled (LSEON = 1) (see *LSE oscillator* for details).

0: LSE oscillator not bypassed (default after backup domain reset)

1: LSE oscillator bypassed

Bit 0 **LSEON**: LSE oscillator enable

Set and cleared by software.

0: LSE oscillator off (default after backup domain reset)

1: LSE oscillator on

20.8.31 RCC reset duration control register (RCC_RDCR)

Address offset: 0x44C

Reset value: 0x0600 0000

This register is used to control the minimum NRST active duration. Wait states are inserted in case of successive write accesses to this register. The number of wait states may be up to 7 cycles of the RCC clock. This register is reset by por_rstn reset, and it is located in the V_{DD} domain. Write accesses are defined according to the RCC local resource number 68 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	EADLY[3:0]				Res.	Res.	Res.	MRD[4:0]				
				rw	rw	rw	rw				rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **EADLY[3:0]**: External access delays

Set and cleared by software. Time to wait before boot ROM performs any external access (for peripherals like UART, USB, OCTOSPI, FMC, or SDMMC).

0x0: No extra delay added by boot ROM
0x1: 100 microseconds
0x2: 200 microseconds
0x3: 500 microseconds
0x4: 1 milliseconds
0x5: 2 milliseconds
0x6: 5 milliseconds (default after reset)
0x7: 10 milliseconds
0x8: 20 milliseconds
0x9: 50 milliseconds
0xA: 100 milliseconds
0xB: 200 milliseconds
0xC: 500 milliseconds
0xD: 1 second
0xE: 2 seconds
0xF: 5 seconds

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **MRD[4:0]**: Minimum reset duration

Set and cleared by software. This field defines the minimum guaranteed duration of the NRST low pulse. The LSI oscillator is automatically enabled when needed by the RPCTL.

0x0: NRST low-pulse duration is guaranteed by the pulse stretcher of the pin. The RPCTL is bypassed (default after reset).
0x1: The guaranteed NRST low-pulse duration is about 1 ms (1 x 32 lsi_ck cycles).
0x2: The guaranteed NRST low-pulse duration is about 2 ms (2 x 32 lsi_ck cycles).
...
0x1F:The guaranteed NRST low-pulse duration is about 31 ms (31 x 32 lsi_ck cycles).

Bits 15:0 Reserved, must be kept at reset value.

20.8.32 RCC C1MS reset delay control register (RCC_C1MSRDCR)

Address offset: 0x450

Reset value: 0x0000 0000

This register is used to control the minimum NRSTC1MS active duration after any D1 Standby exit. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	C1MSRST	Res.	Res.	Res.	C1MSRD[4:0]				
							rs				rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **C1MSRST**: Trigger low-level pulse on NRSTC1MS pin
Set by software and cleared by hardware.
0: Reading 0 means that the NRSTC1MS level is high (inactive) (default after reset).
1: Writing 1 triggers a low-level pulse on NRSTC1MS according to C1MSRD value.
Reading 1 means that the NRSTC1MS level is low (active).

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **C1MSRD[4:0]**: Minimum Standby reset duration
Set and cleared by software. This filed defines the minimum duration of the low-level pulse on NRSTC1MS when C1MSRST is high. The LSI is automatically enabled after any D1 DStandby exit.
0x0: 'No pulse on NRSTC1MS (default after reset)
0x1: The guaranteed NRSTC1MS low-pulse duration is about 1 ms (1 x 32 lsi_ck cycles).
0x2: The guaranteed NRSTC1MS low-pulse duration is about 2 ms (2 x 32 lsi_ck cycles).
...
0x1F:The guaranteed NRSTC1MS low-pulse duration is about 31 ms (31 x 32 lsi_ck cycles).

20.8.33 RCC PWR_LP delay control register (RCC_PWRLPDLYCR)

Address offset: 0x454

Reset value: 0x0000 0000

This register is used to program the delay between the moment where the system exits Stop mode, and the moment where it is allowed to enable the PLLs and to provide a clock to bridges and CPUx. Write access to this register is not allowed during the clock restore sequence (see *Clock restore sequence* for details). Write accesses are defined according to the RCC local resource number 67 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	CPU2TMPSKP	Res.	Res.	PWRLP_DLY[21:16]					
							rw			rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PWRLP_DLY[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **CPU2TMPSKP**: Skip of PWR_LP delay for CPU2

Set and cleared by software. This bit is used by the clock restore sequence to skip the PWR_LP delay for the CPU2 clock restore when the system exits Stop mode.

0: The CPU2 clock restore sequence waits for the PWR_LP delay before activating power consuming elements (default after reset).

1: The CPU2 clock restore sequence runs the PWR_LP delay, but did not wait for the delay to elapse before activating power consuming elements

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:0 **PWRLP_DLY[21:0]**: PWR_LP delay value

Set and cleared by software. This register contains the delay value to be observed before activating the PLL and interconnect clocks, after one of the system Stop modes. The delay is counted with the HSI, or HSI/2 clock.

When LSMCU = 0 in RCC_LSMCUDIVR, the delay value is given by the formula:
PWRLP_DLY[21:0] / FHSI or PWRLP_DLY[21:0] / FHSI / 2

0x0: PWR_LP delay bypassed (default after reset)

0x1: PWR_LP delay of one 64 MHz HSI period (LSMCU = 0) or two HSI periods (LSMCU = 1) is observed.

...

0x3FFFFF: PWR_LP delay of about 65.5 ms (LSMCU = 0) or 131 ms (LSMCU = 1) is observed.

20.8.34 RCC CPU1 clock source interrupt enable set register (RCC_C1CIESETR)

Address offset: 0x458

Reset value: 0x0000 0000

This register is used by the CPU1 to control the interrupt source enable (see *Section 20.5* for details). Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

			rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **WKUPIE**: CPU1 wake-up from CStop interrupt enable
Set and cleared by software to enable/disable the generation of the interrupt used to wake up the CPU1 from CStop.
0: Wake-up interrupt disabled (default after reset)
1: Wake-up interrupt enabled

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **LSECSSIE**: LSE clock security system interrupt enable
Set and cleared by software to enable/disable interrupt caused by the CSS on the external 32 kHz oscillator.
0:LSE CSS interrupt disabled (default after reset)
1: LSE CSS interrupt enabled

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **PLL8RDYIE**: PLL8 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL8 lock.
0: PLL8 lock interrupt disabled (default after reset)
1: PLL8 lock interrupt enabled

Bit 11 **PLL7RDYIE**: PLL7 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL7 lock.
0: PLL7 lock interrupt disabled (default after reset)
1: PLL7 lock interrupt enabled

Bit 10 **PLL6RDYIE**: PLL6 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL6 lock.
0: PLL6 lock interrupt disabled (default after reset)
1: PLL6 lock interrupt enabled

Bit 9 **PLL5RDYIE**: PLL5 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL5 lock.
0: PLL5 lock interrupt disabled (default after reset)
1: PLL5 lock interrupt enabled

Bit 8 **PLL4RDYIE**: PLL4 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL4 lock.
0: PLL4 lock interrupt disabled (default after reset)
1: PLL4 lock interrupt enabled

Bit 7 Reserved, must be kept at reset value.

Bit 6 **PLL2RDYIE**: PLL2 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL2 lock.
0: PLL2 lock interrupt disabled (default after reset)
1: PLL2 lock interrupt enabled

Bit 5 **PLL1RDYIE**: PLL1 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL1 lock.
0: PLL1 lock interrupt disabled (default after reset)
1: PLL1 lock interrupt enabled

Bit 4 **MSIRDYIE**: MSI ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by the MSI oscillator stabilization.
0: MSI ready interrupt disabled (default after reset)
1: MSI ready interrupt enabled

Bit 3 **HSERDYIE**: HSE ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by the HSE oscillator stabilization.
0: HSE ready interrupt disabled (default after reset)
1: HSE ready interrupt enabled

Bit 2 **HSIRDYIE**: HSI ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by the HSI oscillator stabilization.
0: HSI ready interrupt disabled (default after reset)
1: HSI ready interrupt enabled

Bit 1 **LSERDYIE**: LSE ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by the LSE oscillator stabilization.
0: LSE ready interrupt disabled (default after reset)
1: LSE ready interrupt enabled

Bit 0 **LSIRDYIE**: LSI ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by the LSI oscillator stabilization.
0: LSI ready interrupt disabled (default after reset)
1: LSI ready interrupt enabled

20.8.35 RCC CPU1 clock source interrupt flag clear register (RCC_C1CIFCLRR)

Address offset: 0x45C

Reset value: 0x0000 0004

This register is used by the CPU1 to read and clear the interrupt flags. Writing 0 has no effect. Writing 1 clears the corresponding flag (see *Section 20.5* for details). Write accesses

are defined according to the RCC local resource number 70 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

			rc_w1	rc_w1	rc_w1	rc_w1	rc_w1		rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **WKUPF**: CPU1 wake-up from CStop interrupt flag
Reset by software by writing this flag to 1. Set by hardware when CPU1 needs to exit CStop.
0: No wake-up interrupt pending (default after reset)
1: Wake-up interrupt pending. Writing 1 clears this flag.

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **LSECSSF**: LSE CSS interrupt flag
Reset by software by writing this flag to 1. Set by hardware when a failure is detected on the external 32 kHz oscillator.
0: No failure detected on the external 32 kHz oscillator (default after reset)
1: A failure is detected on the external 32 kHz oscillator. Writing 1 clears this flag.

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **PLL8RDYF**: PLL8 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL8 locks.
0: No clock ready interrupt caused by PLL8 lock (default after reset)
1: Clock ready interrupt caused by PLL8 lock. Writing 1 clears this flag.

Bit 11 **PLL7RDYF**: PLL7 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL7 locks.
0: No clock ready interrupt caused by PLL7 lock (default after reset)
1: Clock ready interrupt caused by PLL7 lock. Writing 1 clears this flag.

Bit 10 **PLL6RDYF**: PLL6 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL6 locks.
0: No clock ready interrupt caused by PLL6 lock (default after reset)
1: Clock ready interrupt caused by PLL6 lock. Writing 1 clears this flag.

Bit 9 **PLL5RDYF**: PLL5 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL5 locks.
0: No clock ready interrupt caused by PLL5 lock (default after reset)
1: Clock ready interrupt caused by PLL5 lock. Writing 1 clears this flag.

Bit 8 **PLL4RDYF**: PLL4 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL4 locks.
0: No clock ready interrupt caused by PLL4 lock (default after reset)
1: Clock ready interrupt caused by PLL4 lock. Writing 1 clears this flag.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **PLL2RDYF**: PLL2 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL2 locks.
0: No clock ready interrupt caused by PLL2 lock (default after reset)
1: Clock ready interrupt caused by PLL2 lock. Writing 1 clears this flag.

Bit 5 **PLL1RDYF**: PLL1 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL1 locks.
0: No clock ready interrupt caused by PLL1 lock (default after reset)
1: Clock ready interrupt caused by PLL1 lock. Writing 1 clears this flag.

Bit 4 **MSIRDYF**: MSI ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when MSI clock becomes stable.
0: No clock ready interrupt caused by the MSI (default after reset)
1: Clock ready interrupt caused by the MSI. Writing 1 clears this flag.

Bit 3 **HSERDYF**: HSE ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when HSE clock becomes stable.
0: No clock ready interrupt caused by the HSE (default after reset)
1: Clock ready interrupt caused by the HSE. Writing 1 clears this flag.

Bit 2 **HSIRDYF**: HSI ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when HSI clock becomes stable.
0: No clock ready interrupt caused by the HSI (default after reset)
1: Clock ready interrupt caused by the HSI. Writing 1 clears this flag.

Bit 1 **LSERDYF**: LSE ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when LSE clock becomes stable.
0: No clock ready interrupt caused by the LSE (default after reset)
1: Clock ready interrupt caused by the LSE. Writing 1 clears this flag.

Bit 0 **LSIRDYF**: LSI ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when LSI clock becomes stable.
0: No clock ready interrupt caused by the LSI (default after reset)
1: Clock ready interrupt caused by the LSI. Writing 1 clears this flag.

20.8.36 RCC CPU2 clock source interrupt enable set register (RCC_C2CIESETR)

Address offset: 0x460

Reset value: 0x0000 0000

This register is used by the CPU2 to control the interrupt source enable (see *Section 20.5* for more details). Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

			rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **WKUPIE**: CPU2 wake-up from CStop Interrupt Enable
Set and cleared by software to enable/disable the generation of the interrupt used to wake up the CPU2 from CStop.
0: Wake-up interrupt disabled (default after reset)
1: Wake-up interrupt enabled

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **LSECSSIE**: LSE CSS interrupt enable
Set and cleared by software to enable/disable interrupt caused by the CSS on external 32 kHz oscillator.
0: LSE CSS interrupt disabled (default after reset)
1: LSE CSS interrupt enabled

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **PLL8RDYIE**: PLL8 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL8 lock.
0: PLL8 lock interrupt disabled (default after reset)
1: PLL8 lock interrupt enabled

Bit 11 **PLL7RDYIE**: PLL7 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL7 lock.
0: PLL7 lock interrupt disabled (default after reset)
1: PLL7 lock interrupt enabled

Bit 10 **PLL6RDYIE**: PLL6 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL6 lock.
0: PLL6 lock interrupt disabled (default after reset)
1: PLL6 lock interrupt enabled

Bit 9 **PLL5RDYIE**: PLL5 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL5 lock.
0: PLL5 lock interrupt disabled (default after reset)
1: PLL5 lock interrupt enabled

Bit 8 **PLL4RDYIE**: PLL4 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL4 lock.
0: PLL4 lock interrupt disabled (default after reset)
1: PLL4 lock interrupt enabled

Bit 7 Reserved, must be kept at reset value.

Bit 6 **PLL2RDYIE**: PLL2 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL2 lock.
0: PLL2 lock interrupt disabled (default after reset)
1: PLL2 lock interrupt enabled

Bit 5 **PLL1RDYIE**: PLL1 ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by PLL1 lock.
0: PLL1 lock interrupt disabled (default after reset)
1: PLL1 lock interrupt enabled

Bit 4 **MSIRDYIE**: MSI ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by MSI stabilization.
0: MSI ready interrupt disabled (default after reset)
1: MSI ready interrupt enabled

Bit 3 **HSERDYIE**: HSE ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by HSE stabilization.
0: HSE ready interrupt disabled (default after reset)
1: HSE ready interrupt enabled

Bit 2 **HSIRDYIE**: HSI ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by HSI stabilization.
0: HSI ready interrupt disabled (default after reset)
1: HSI ready interrupt enabled

Bit 1 **LSERDYIE**: LSE ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by LSE stabilization.
0: LSE ready interrupt disabled (default after reset)
1: LSE ready interrupt enabled

Bit 0 **LSIRDYIE**: LSI ready interrupt enable
Set and cleared by software to enable/disable interrupt caused by LSI stabilization.
0: LSI ready interrupt disabled (default after reset)
1: LSI ready interrupt enabled

20.8.37 RCC CPU2 clock source interrupt flag clear register (RCC_C2CIFCLRR)

Address offset: 0x464

Reset value: 0x0000 0004

This register is used by the CPU2 to read and clear the interrupt flags. Writing 0 has no effect. Writing 1 clears the corresponding flag (see *Section 20.5* for more details).
Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WKUPF	Res.	Res.	Res.	LSECSSF
											rc_w1				rc_w1
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

			rc_w1	rc_w1	rc_w1	rc_w1	rc_w1		rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **WKUPF**: CPU2 wake-up from CStop interrupt flag
Reset by software by writing this flag to 1. Set by hardware when CPU2 needs to exit CStop.
0: No wake-up interrupt pending (default after reset)
1: Wake-up interrupt pending. Writing 1 clears this flag.

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **LSECSSF**: LSE clock security system interrupt flag
Reset by software by writing this flag to 1. Set by hardware when a failure is detected on the external 32 kHz oscillator.
0: No failure detected on the external 32 kHz oscillator (default after reset)
1: A failure is detected on the external 32 kHz oscillator. Writing 1 clears this flag.

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **PLL8RDYF**: PLL8 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL8 locks.
0: No clock ready interrupt caused by PLL8 lock (default after reset)
1: Clock ready interrupt caused by PLL8 lock. Writing 1 clears this flag.

Bit 11 **PLL7RDYF**: PLL7 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL7 locks.
0: No clock ready interrupt caused by PLL7 lock (default after reset)
1: Clock ready interrupt caused by PLL7 lock. Writing 1 clears this flag.

Bit 10 **PLL6RDYF**: PLL6 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL6 locks.
0: No clock ready interrupt caused by PLL6 lock (default after reset)
1: Clock ready interrupt caused by PLL6 lock. Writing 1 clears this flag.

Bit 9 **PLL5RDYF**: PLL5 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL5 locks.
0: No clock ready interrupt caused by PLL5 lock (default after reset)
1: Clock ready interrupt caused by PLL5 lock. Writing 1 clears this flag.

Bit 8 **PLL4RDYF**: PLL4 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL4 locks.
0: No clock ready interrupt caused by PLL4 lock (default after reset)
1: Clock ready interrupt caused by PLL4 lock. Writing 1 clears this flag.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **PLL2RDYF**: PLL2 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL2 locks.
0: No clock ready interrupt caused by PLL2 lock (default after reset)
1: Clock ready interrupt caused by PLL2 lock. Writing 1 clears this flag.

Bit 5 **PLL1RDYF**: PLL1 ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when the PLL1 locks.
0: No clock ready interrupt caused by PLL1 lock (default after reset)
1: Clock ready interrupt caused by PLL1 lock. Writing 1 clears this flag.

Bit 4 **MSIRDYF**: MSI ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when MSI clock becomes stable.
0: No clock ready interrupt caused by the MSI (default after reset)
1: Clock ready interrupt caused by the MSI. Writing 1 clears this flag.

Bit 3 **HSERDYF**: HSE ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when HSE clock becomes stable.
0: No clock ready interrupt caused by the HSE (default after reset)
1: Clock ready interrupt caused by the HSE. Writing 1 clears this flag.

Bit 2 **HSIRDYF**: HSI ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when HSI clock becomes stable.
0: No clock ready interrupt caused by the HSI (default after reset)
1: Clock ready interrupt caused by the HSI. Writing 1 clears this flag.

Bit 1 **LSERDYF**: LSE ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when LSE clock becomes stable.
0: No clock ready interrupt caused by the LSE (default after reset)
1: Clock ready interrupt caused by the LSE. Writing 1 clears this flag.

Bit 0 **LSIRDYF**: LSI ready interrupt flag
Reset by software by writing this flag to 1. Set by hardware when LSI clock becomes stable.
0: No clock ready interrupt caused by the LSI (default after reset)
1: Clock ready interrupt caused by the LSI. Writing 1 clears this flag.

20.8.38 RCC IWDG CPU1 clock freeze set register (RCC_IWDGC1FZSETR)

Address offset: 0x468

Reset value: 0x0000 0000

This register is used by to freeze IWDG1 and IWDG2 clocks. After a system reset, a Standby reset (sys_rstn), or a D1 DStandby reset (vcpu_rstn), the CPU1 can write this register once. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 sets the corresponding bit to 1. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FZ_IWDG2	FZ_IWDG1
														rs	rs

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FZ_IWDG2**: Freeze of IWDG2 clock
Set once by software after a system, Standby, or D1 DStandby reset, to freeze IWDG2 clock.
0: Writing 0 has no effect. Reading 0 means IWDG2 clock is not frozen (default after reset).
1: Writing 1 freezes IWDG2 clock. Reading 1 means that the IWDG2 clock is frozen.

Bit 0 **FZ_IWDG1**: Freeze of IWDG1 clock
Set once by software after a system, Standby, or D1 DStandby reset, to freeze IWDG1 clock.
0: Writing 0 has no effect. Reading 0 means IWDG1 clock is not frozen (default after reset).
1: Writing 1 freezes IWDG1 clock. Reading 1 means that IWDG1 clock is frozen.

20.8.39 RCC IWDG CPU1 clock freeze clear register (RCC_IWDGC1FZCLRR)

Address offset: 0x46C

Reset value: 0x0000 0000

This register is used to unfreeze IWDG1 and IWDG2 clocks. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FZ_IWDG2	FZ_IWDG1
														rc_w1	rc_w1

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FZ_IWDG2**: Unfreeze IWDG2 clock
Cleared by software to unfreeze IWDG2 clock.
0: Writing 0 has no effect. Reading 0 means IWDG2 clock is not frozen (default after reset).
1: Writing 1 unfreezes IWDG2 clock. Reading 1 means that IWDG2 clock is frozen.

Bit 0 **FZ_IWDG1**: Unfreeze IWDG1 clock
Cleared by software to unfreeze the IWDG1 clock.
0: Writing 0 has no effect. Reading 0 means IWDG1 clock is not frozen (default after reset).
1: Writing 1 unfreezes IWDG1 clock. Reading 1 means that IWDG1 clock is frozen.

20.8.40 RCC IWDG CPU1 configuration set register (RCC_IWDGC1CFGSETR)

Address offset: 0x470

Reset value: 0x0000 0000

This register is used to enable IWDG1 and IWDG2 timeout event reset behavior, and to activate IWDG2 kernel reset. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 sets the corresponding bit to 1. Wait states are inserted in case of successive write accesses to IWDG1_SYSRSTEN and IWDG2_SYSRSTEN. The number of wait states may be up to 7 cycles of the RCC clock. IWDG1_SYSRSTEN

and IWDG2_SYSRSTEN are reset by app_rstn reset, and are located in V_{DD} domain. IWDG2_KERRST is reset by sys_rstn reset. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IWDG2_KERRST	Res.	Res.
													rs		
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

													rs		rs

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **IWDG2_KERRST**: IWDG2 kernel reset

Set by software.

0: Writing 0 has no effect. Reading 0 means that the IWDG2 kernel reset is not active.

1: Writing 1 activates IWDG2 kernel reset Reading 1 means IWDG2 kernel reset is active.

Bits 17:3 Reserved, must be kept at reset value.

Bit 2 **IWDG2_SYSRSTEN**: Enable of IWDG2 timeout event to reset the application

Set by software.

0: Writing 0 has no effect. Reading 0 means that IWDG2 timeout event cannot trigger an application reset.

1: Writing 1 enables IWDG2 timeout event to reset the application. Reading 1 means that IWDG2 timeout event triggers an application reset.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **IWDG1_SYSRSTEN**: Enable of IWDG1 timeout event to reset the application

Set by software.

0: Writing 0 has no effect. Reading 0 means that IWDG1 timeout event does not trigger an application reset when CPU1 is not the trusted agent.

1: Writing 1 enables IWDG1 timeout event to reset the application when CPU1 is not the trusted agent. Reading 1 means that IWDG1 timeout event triggers an application reset when CPU1 is not the trusted agent.

20.8.41 RCC IWDG CPU1 configuration clear register (RCC_IWDGC1CFGCLRR)

Address offset: 0x474

Reset value: 0x0000 0000

This register is used to disable IWDG1 and IWDG2 timeout event reset behavior, and to deactivate IWDG2 kernel reset. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. Wait states are inserted in case of successive write accesses to IWDG1_SYSRSTEN and IWDG2_SYSRSTEN. The number of wait states may be up to 7 cycles of RCC clock. Write accesses are defined according to the RCC local resource number 70 configuration (see *Table 161* for details). Any read access is allowed.

													rc_w1		rc_w1

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **IWDG2_KERRST**: IWDG2 kernel reset

Set by software.

0: Writing 0 has no effect. Reading 0 means that IWDG2 kernel reset is not active

1: Writing 1 deactivates IWDG2 kernel reset. Reading 1 means IWDG2 kernel reset is active.

Bits 17:3 Reserved, must be kept at reset value.

Bit 2 **IWDG2_SYSRSTEN**: Clear of IWDG2 timeout event to reset the application

Set by software.

0: Writing 0 has no effect. Reading 0 means that IWDG2 timeout event cannot trigger an application reset.

1: Writing 1 clears IWDG2 timeout event to reset the application. Reading 1 means that IWDG2 timeout event is enabled.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **IWDG1_SYSRSTEN**: Clear of IWDG1 timeout event to reset the application

Set by software.

0: Writing 0 has no effect. Reading 0 means that IWDG1 timeout event cannot trigger an application reset when CPU1 is not the trusted agent.

1: Writing 1 clears IWDG1 timeout event to reset the application when CPU1 is not the trusted agent. Reading 1 means that IWDG1 timeout event triggers an application reset when CPU1 is not the trusted agent.

20.8.42 RCC IWDG CPU2 clock freeze set register (RCC_IWDGC2FZSETR)

Address offset: 0x478

Reset value: 0x0000 0000

This register is used by to freeze IWDG3 and IWDG4 clocks. After a system reset, or a Standby reset (sys_rstn), the CPU2 can write this register once. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 sets the corresponding bit to 1. Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 161* for details). Any read access is allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FZ_IWDG4	FZ_IWDG3
														rs	rs

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FZ_IWDG4**: Freeze of IWDG4 clock

Set once by software after a system or Standby reset to freeze IWDG4 clock.
0: Writing 0 has no effect. Reading 0 means IWDG4 clock is not frozen (default after reset).
1: Writing 1 freezes IWDG4 clock. Reading 1 means that IWDG4 clock is frozen.

Bit 0 **FZ_IWDG3**: Freeze of IWDG3 clock

Set once by software after a system or Standby reset to freeze IWDG3 clock.
0: Writing 0 has no effect. Reading 0 means IWDG3 clock is not frozen (default after reset).
1: Writing 1 freezes IWDG3 clock. Reading 1 means that IWDG3 clock is frozen.

20.8.43 RCC IWDG CPU2 clock freeze clear register (RCC_IWDGC2FZCLRR)

Address offset: 0x47C

Reset value: 0x0000 0000

This register is used to unfreeze IWDG3 and IWDG4 clocks. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 161* for details). Any read access is allowed.

														rc_w1	rc_w1

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **FZ_IWDG4**: Unfreeze of IWDG4 clock
Cleared by software to unfreeze IWDG4 clock.
0: Writing 0 has no effect. Reading 0 means that the IWDG4 clock is not frozen (default after reset).
1: Writing 1 unfreezes the IWDG4 clock. Reading 1 means that the IWDG4 clock is frozen.

Bit 0 **FZ_IWDG3**: Unfreeze of IWDG3 clock
Cleared by software to unfreeze IWDG3 clock.
0: Writing 0 has no effect. Reading 0 means IWDG3 clock is not frozen (default after reset).
1: Writing 1 unfreezes IWDG3 clock. Reading 1 means that IWDG3 clock is frozen.

20.8.44 RCC IWDG CPU2 configuration set register (RCC_IWDGC2CFGSETR)

Address offset: 0x480

Reset value: 0x0000 0000

This register is used to enable IWDG3 and IWDG4 timeout event reset behavior, and to activate IWDG4 kernel reset. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 sets the corresponding bit to 1. Wait states are inserted in case of successive write accesses to IWDG3_SYSRSTEN and IWDG4_SYSRSTEN. The number of wait states may be up to 7 cycles of the RCC clock. IWDG3_SYSRSTEN and IWDG4_SYSRSTEN are reset by app_rstn reset, and are located in the V_{DD} domain. IWDG4_KERRST is reset by sys_rstn reset. Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 161* for details). Any read access is allowed.

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **IWDG4_KERRST**: IWDG4 kernel reset
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG4 kernel reset is not active.
1: Writing 1 activates IWDG4 kernel reset. Reading 1 means IWDG4 kernel reset is active.

Bits 17:3 Reserved, must be kept at reset value.

Bit 2 **IWDG4_SYSRSTEN**: Enable of IWDG4 timeout event to reset the application
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG4 timeout event cannot trigger an application reset.
1: Writing 1 enables IWDG4 timeout event to reset the application. Reading 1 means that IWDG4 timeout event triggers an application reset.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **IWDG3_SYSRSTEN**: Enable of IWDG3 timeout event to reset the application
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG3 timeout event does not trigger an application reset when CPU1 is not the trusted agent.
1: Writing 1 enables IWDG3 timeout event to reset the application when CPU1 is not the trusted agent. Reading 1 means that IWDG3 timeout event triggers an application reset when CPU1 is not the trusted agent.

20.8.45 RCC IWDG CPU2 configuration clear register (RCC_IWDGC2CFGCLRR)

Address offset: 0x484

Reset value: 0x0000 0000

This register is used to disable IWDG3 and IWDG4 timeout event reset behavior, and to deactivate IWDG4 kernel reset. Writing 0 has no effect. Reading returns the effective values of the corresponding bits. Writing 1 clears the corresponding bit to 0. Wait states are inserted in case of successive write accesses to IWDG3_SYSRSTEN and IWDG4_SYSRSTEN. The number of wait states may be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 71 configuration (see *Table 161* for details). Any read access is allowed.

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **IWDG4_KERRST**: IWDG4 kernel reset
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG4 kernel reset is not active.
1: Writing 1 deactivates IWDG4 kernel reset. Reading 1 means IWDG4 kernel reset is active.

Bits 17:3 Reserved, must be kept at reset value.

Bit 2 **IWDG4_SYSRSTEN**: Clear of IWDG4 timeout event to reset the application
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG4 timeout event cannot trigger an application reset.
1: Writing 1 clears IWDG4 timeout event to reset the application. Reading 1 means that IWDG4 timeout event is enabled.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **IWDG3_SYSRSTEN**: Clear of IWDG3 timeout event to reset the application
Set by software.
0: Writing 0 has no effect. Reading 0 means that IWDG3 timeout event cannot trigger an application reset when CPU1 is not the trusted agent.
1: Writing 1 clears IWDG3 timeout event to reset the application when CPU1 is not the trusted agent. Reading 1 means that IWDG3 timeout event triggers an application reset when CPU1 is not the trusted agent.

20.8.46 RCC MCO1 configuration register (RCC_MCO1CFGR)

Address offset: 0x488

Reset value: 0x0000 0000

This register is used to select the clock generated on the MCO1 output. Write accesses are defined according to the RCC local resource number 108 configuration (see *Table 161* for details). Any read access is allowed.

							rw								rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **MCO1ON**: Control of MCO1 output
Set and cleared by software.
0: MCO1 output disabled (default after reset)
1: MCO1 output enabled

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **MCO1SEL**: MCO1 clock output selection
Set and cleared by the software. Clock source selection may generate glitches on MCO1. It is highly recommended to configure this bit only after reset, before enabling the external oscillators and the PLLs.
0: Channel 61 output of the flexclkgen engine (default after reset)
1: Clock observation 0 of the flexclkgen engine

20.8.47 RCC MCO2 configuration register (RCC_MCO2CFGR)

Address offset: 0x48C

Reset value: 0x0000 0000

This register is used to select the clock generated on the MCO2 output. Write accesses are defined according to the RCC local resource number 109 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	MCO2 ON	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MCO2 SEL
							rw								rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **MCO2ON**: Control of the MCO2 output
Set and cleared by software.
0: MCO2 output disabled (default after reset)
1: MCO2 output enabled

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **MCO2SEL**: MCO2 clock output selection
Set and cleared by software. Clock source selection may generate glitches on MCO2. It is highly recommended to configure this bit only after reset, before enabling the external oscillators and the PLLs.
0: Channel 62 output of the flexclkgen engine (default after reset)
1: Clock observation 1 of the flexclkgen engine

20.8.48 RCC oscillator clock enable set register (RCC_OCENSETR)

Address offset: 0x490

Reset value: 0x0000 0001

This register is used to control the oscillators. Writing 0 has no effect. Writing 1 sets the corresponding bits. Reading gives the effective values of each bit. Write access to this register is not allowed during the clock restore sequence (see *Clock restore sequence* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	HSECSSON	HSEBYP	HSEKERON	HSEON	HSEDIGBYP	HSEDIV2BYP	HSEDIV2ON	Res.	MSIKERON	MSION	HSIKERON	HSION
				rs	rs	rs	rs	rs	rs	rs		rs	rs	rs	rs

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **HSECSSON**: HSECSSON bit set
Set CSS on HSE. This bit is set-only (disabled by system reset, or when the system enters Standby). When this bit is set, the clock detector is enabled by hardware when HSE is ready.
0: Reading 0 means that CSS on HSE is off (default after reset).
1: Writing 1 enables CSS on HSE. Reading 1 means that CSS on HSE is on.

Bit 10 **HSEBYP**: HSEBYP bit set
Set by software in order to enable the HSE bypass mode.
0: No effect
1: Set the HSEBYP bit.

Bit 9 **HSEKERON**: HSEKERON bit set
Set by software to force HSE on even in Stop mode, to be quickly available as kernel clock for some peripherals. This bit has no effect on HSEON value.
0: No effect
1: Set the HSEKERON bit.

Bit 8 **HSEON**: HSEON bit set
Set by software to enable HSE.
0: No effect
1: Set HSEON bit.

Bit 7 **HSEDIGBYP**: HSEDIGBYP bit set
Set by software when the external clock connected to OSC_IN is a full-swing digital signal.
0: No effect
1: Set HSEDIGBYP bit (digital bypass).

Bit 6 **HSEDIV2BYP**: HSEDIV2BYP bit set
Set by software to bypass the HSE divide-by-2 clock.
0: No effect
1: Set HSEDIV2BYP bit.

Bit 5 **HSEDIV2ON**: HSEDIV2ON bit set
Set by software to enable the HSE divide-by-2 clock.
0: No effect
1: Set HSEDIV2ON bit.

Bit 4 Reserved, must be kept at reset value.

Bit 3 **MSIKERON**: MSIKERON bit set
Set by software to force MSI on even in Stop mode, to be quickly available as kernel clock for peripherals. This bit has no effect on MSION value.
0: No effect
1: Set the MSIKERON bit.

Bit 2 **MSION**: MSION bit set
Set by software to enable MSI.
0: No effect
1: Set the MSION bit.

Bit 1 **HSIKERON**: HSIKERON bit set
Set by software to force HSI on even in Stop mode, to be quickly available as kernel clock for peripherals. This bit has no effect on HSION value.
0: No effect
1: Set the HSIKERON bit.

Bit 0 **HSION**: HSION bit set

Set by software to enable HSI. This bit is also set by hardware to force HSI on when the product exits Standby or Stop, or in case of a failure of HSE which is used as the system clock source.

0: No effect

1: Set the HSION bit.

20.8.49 RCC oscillator clock enable clear register (RCC_OCENCLRR)

Address offset: 0x494

Reset value: 0x0000 0001

This register is used to control the oscillators. Writing 0 has no effect. Writing 1 clears the corresponding bits. Reading gives the effective values of the enable bits. Write access to this register is not allowed during the clock restore sequence (see *Clock restore sequence* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	HSEBYP	HSEKERON	HSEON	HSEDIGBYP	HSEDIV2BYP	HSEDIV2ON	Res.	MSIKERON	MSION	HSIKERON	HSION
					rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1		rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **HSEBYP**: HSEBYP bit clear

Cleared by software in order to disable the bypass mode.

0: No effect

1: Clear the HSEBYP bit.

Bit 9 **HSEKERON**: HSEKERON bit clear

Cleared by software to allow the HSE to be switched off in Stop mode.

0: No effect

1: Clear the HSEKERON bit.

Bit 8 **HSEON**: HSEON bit clear

Cleared by software to disable the HSE clock.

0: No effect

1: Clear the HSEON bit.

Bit 7 **HSEDIGBYP**: HSEDIGBYP bit clear

Cleared by software when the external clock connected to OSC_IN is a low-swing signal.

0: No effect

1: Clear the HSEDIGBYP bit (analog bypass).

Bit 6 **HSEDIV2BYP**: HSEDIV2BYP bit clear

Cleared by software to use the HSE divide-by-2 clock.

0: No effect

1: Clear the HSEDIV2BYP bit.

Bit 5 **HSEDIV2ON**: HSEDIV2ON bit clear
Cleared by software to disable the HSE divide-by-2 clock.
0: No effect
1: Clear HSEDIV2ON bit.

Bit 4 Reserved, must be kept at reset value.

Bit 3 **MSIKERON**: MSIKERON bit clear
Cleared by software to allow the MSI to be switched off in Stop mode. This bit has no effect on MSION value.
0: No effect
1: Clear the MSIKERON bit.

Bit 2 **MSION**: MSION bit clear
Cleared by software to disable the MSI clock.
0: No effect
1: Clear the MSION bit.

Bit 1 **HSIKERON**: HSIKERON bit clear
Cleared by software to allow the HSI to be switched off in Stop mode. This bit has no effect on HSION value.
0: No effect
1: Clear the HSIKERON bit.

Bit 0 **HSION**: HSION bit clear
Cleared by software to disable the HSI clock.
0: No effect
1: Clear the HSION bit.

20.8.50 RCC oscillator clock ready register (RCC_OCRDYR)

Address offset: 0x498

Reset value: 0x0000 0001

This is a read-only access register that contains the status flags of the oscillators. Writing has no effect. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	CKRESTT	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	HSERDY	Res.	Res.	Res.	Res.	Res.	MSIRDY	Res.	HSIRDY
							r						r		r

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **CKREST**: Clock restore state machine status
Set by hardware to indicate if the clock restore sequence is on-going.
0: Clock restore process not ongoing (default after reset)
1: Clock restore process ongoing

Bits 24:9 Reserved, must be kept at reset value.

Bit 8 **HSERDY**: HSE clock ready flag
Set by hardware to indicate that the HSE oscillator is stable.
0: HSE clock not ready (default after reset)
1: HSE clock ready

Bits 7:3 Reserved, must be kept at reset value.

Bit 2 **MSIRDY**: MSI clock ready flag
Set by hardware to indicate that the MSI oscillator is stable.
0: MSI clock not ready (default after reset)
1: MSI clock ready

Bit 1 Reserved, must be kept at reset value.

Bit 0 **HSIRDY**: HSI clock ready flag
Set by hardware to indicate that the HSI oscillator is stable.
0: HSI clock not ready (default after reset)
1: HSI clock ready

20.8.51 RCC HSI configuration register (RCC_HSICFGR)

Address offset: 0x49C

Reset value: 0x0000 0000

This register is used to fine tune the HSI frequency. Write access is not allowed during the clock restore sequence (see *Clock restore sequence* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	HSICAL[8:0]

Res.	HSITRIM[6:0]							Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
	rw	rw	rw	rw	rw	rw	rw								

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:16 **HSICAL[8:0]**: HSI clock calibration
Set by hardware when option-byte loading during system reset. Adjusted by software through HSITRIM trimming bits.
This bitfield contains the sum of engineering option-byte calibration and HSITRIM values.

Bit 15 Reserved, must be kept at reset value.

Bits 14:8 **HSITRIM[6:0]**: HSI clock trimming

Set by software to adjust calibration. This bitfield represents a signed value. It is added to engineering option bytes loaded during reset phase (bsec_hsi_cal[8:0]) to form calibration trimming value: HSICAL[8:0] = HSITRIM[6:0] + bsec_hsi_cal[8:0].

0x40: bsec_hsi_cal[8:0] - 64
0x41: bsec_hsi_cal[8:0] - 63
...
0x0: bsec_hsi_cal[8:0] (default after reset)
...
0x3E: bsec_hsi_cal[8:0] + 62
0x3F: bsec_hsi_cal[8:0] + 63

Bits 7:0 Reserved, must be kept at reset value.

20.8.52 RCC MSI configuration register (RCC_MSICFGR)

Address offset: 0x4A0

Reset value: 0x0010 1000

This register is used to fine tune the MSI frequency. Write access is not allowed during the clock restore sequence (see *Clock restore sequence* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	MSITRIM[4:0]					Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
			rw	rw	rw	rw	rw								

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **MSICAL[7:0]**: MSI clock calibration

Set by hardware when option-byte loading during system reset. Adjusted by software through MSITRIM trimming bits.

This bit-field contains the sum of engineering option-byte calibration and MSITRIM values.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **MSITRIM[4:0]**: MSI clock trimming

Set by software to adjust calibration. This bitfield is added to engineering option bytes loaded during reset phase (bsec_msi_cal[7:0]) to form the calibration trimming value.

MSICAL[7:0] = MSITRIM[4:0] + bsec_msi_cal[7:0].

Bits 7:0 Reserved, must be kept at reset value.

20.8.53 RCC LSI control register (RCC_LSICR)

Address offset: 0x4A4

Reset value: 0x0000 0000

This register is used to control the LSI. This register is reset when a system reset occurs (app_rstn), but not when the circuit exits from Standby. Wait states are inserted in case of successive write accesses to this register. The number of wait states can be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LSIRDY	LSION
														r	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **LSIRDY**: LSI oscillator ready
Set and cleared by hardware to indicate when the LSI is stable. This bit needs 3 cycles of lsi_ck to fall down after LSION has been cleared to 0.
0: LSI oscillator not ready
1: LSI oscillator ready

Bit 0 **LSION**: LSI oscillator enabled
Set and cleared by software.
0: LSI oscillator off
1: LSI oscillator on

20.8.54 RCC RTC clock divider register (RCC_RTCDIVR)

Address offset: 0x4A8

Reset value: 0x0000 0000

This register is used to divide the HSE clock for the RTC. Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RTCDIV[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **RTCDIV[5:0]**: HSE division factor for RTC clock

Set and cleared by software to divide the HSE clock for RTC.

Caution: The software must set these bits correctly to ensure that the clock supplied to the RTC is lower than 4 MHz. These bits must be configured if needed before selecting the RTC clock source.

Note: When RTCSRC not equal to 3, this divider is disabled (does not provide clock).

0x0: HSE (default after reset)
0x1: HSE/2
0x2: HSE/3
0x3: HSE/4
...
0x3E:HSE/63
0x3F:HSE/64

20.8.55 RCC APB1 clock divider register (RCC_APB1DIVR)

Address offset: 0x4AC

Reset value: 0x8000 0000

This register is used to control the APB1 clock prescaler (see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

													rw	rw	rw

Bit 31 **APB1DIVRDY**: APB1 clock prescaler status

Set and cleared by hardware to indicate if the new division factor is taken into account.
0: The new division factor is not yet taken into account.
1: The new division factor is taken into account (default after reset).

Bits 30:3 Reserved, must be kept at reset value.

Bits 2:0 **APB1DIV[2:0]**: APB1 clock divider

Set and cleared by software to control the APB1 clock division factor. Changing this division ratio impacts the APB1 clock domain frequency. Clocks are divided with the new prescaler factor, from 1 to 16 ck_icn_ls_mcu cycles after APB1DIV update. The application can check if the new division factor is taken into account by reading APB1DIVRDY.

0x0: ck_icn_ls_mcu (default after reset)
0x1: ck_icn_ls_mcu / 2
0x2: ck_icn_ls_mcu / 4
0x3: ck_icn_ls_mcu / 8
0x4: ck_icn_ls_mcu / 16
Others: Reserved

20.8.56 RCC APB2 clock divider register (RCC_APB2DIVR)

Address offset: 0x4B0

Reset value: 0x8000 0000

This register is used to control the APB2 clock prescaler (see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit 31 **APB2DIVRDY**: APB2 clock prescaler status

Set and cleared by hardware to indicate if the new division factor is taken into account.
0: The new division factor is not yet taken into account.
1: The new division factor is taken into account (default after reset).

Bits 30:3 Reserved, must be kept at reset value.

Bits 2:0 **APB2DIV[2:0]**: APB2 clock divider

Set and cleared by software to control APB2 clock division factor. Changing this division ratio impacts the APB2 clock domain frequency. Clocks are divided with the new prescaler factor, from 1 to 16 ck_icn_ls_mcu cycles after APB2DIV update. The application can check if the new division factor is taken into account by reading APB2DIVRDY.
0x0: ck_icn_ls_mcu (default after reset)
0x1: ck_icn_ls_mcu / 2
0x2: ck_icn_ls_mcu / 4
0x3: ck_icn_ls_mcu / 8
0x4: ck_icn_ls_mcu / 16
Others: Reserved

20.8.57 RCC APB3 clock divider register (RCC_APB3DIVR)

Address offset: 0x4B4

Reset value: 0x8000 0000

This register is used to control the APB3 clock prescaler (see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

													rw	rw	rw

Bit 31 **APB3DIVRDY**: APB3 clock prescaler status

Set and cleared by hardware to indicate if the new division factor is taken into account.
0: The new division factor is not yet taken into account.
1: The new division factor is taken into account. (default after reset)

Bits 30:3 Reserved, must be kept at reset value.

Bits 2:0 **APB3DIV[2:0]**: APB3 clock divider

Set and cleared by software to control APB3 clock division factor.
Changing this division ratio has an impact on the frequency of the APB3 clock domain. Clocks are divided with the new prescaler factor, from 1 to 16 ck_icn_ls_mcu cycles after APB3DIV update. The application can check if the new division factor is taken into account by reading APB3DIVRDY.
0x0: ck_icn_ls_mcu (default after reset)
0x1: ck_icn_ls_mcu / 2
0x2: ck_icn_ls_mcu / 4
0x3: ck_icn_ls_mcu / 8
0x4: ck_icn_ls_mcu / 16
Others: Reserved

20.8.58 RCC APB4 clock divider register (RCC_APB4DIVR)

Address offset: 0x4B8

Reset value: 0x8000 0000

This register is used to control the APB4 clock divider (see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

													rw	rw	rw

Bit 31 **APB4DIVRDY**: APB4 clock divider status

Set and cleared by hardware to indicate if the new division factor is taken into account.
0: The new division factor is not yet taken into account.
1: The new division factor is taken into account (default after reset).

Bits 30:3 Reserved, must be kept at reset value.

Bits 2:0 **APB4DIV[2:0]**: APB4 clock divider

Set and cleared by software to control APB4 clock division factor. This division ratio can be changed on-the-fly. It impacts only the APB4 clock frequency. Clocks are divided with the new prescaler factor, from 1 to 16 ck_icn_ls_mcu cycles after APB4DIV update.
The application can check if the new division factor is taken into account by reading APB4DIVRDY.
0x0: ck_icn_ls_mcu (default after reset)
0x1: ck_icn_ls_mcu / 2
0x2: ck_icn_ls_mcu / 4
0x3: ck_icn_ls_mcu / 8
0x4: ck_icn_ls_mcu / 16
Others: Reserved

20.8.59 RCC APB5 clock divider register (RCC_APB5DIVR)

Address offset: 0x4BC

Reset value: 0x8000 0000

This register is used to control the APB5 clock divider (see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
APB5DIVRDY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	APB5DIV[2:0]		
													rw	rw	rw

Bit 31 **APB5DIVRDY**: APB5 clock divider status

Set and cleared by hardware to indicate if the new division factor is taken into account.
0: The new division factor is not yet taken into account.
1: The new division factor is taken into account (default after reset).

Bits 30:3 Reserved, must be kept at reset value.

Bits 2:0 **APB5DIV[2:0]**: APB5 clock divider

Set and cleared by software to control APB5 clock division factor. This division ratio can be changed on-the-fly. It impacts only the APB5 clock frequency. Clocks are divided with the new prescaler factor, from 1 to 16 ck_icn_ls_mcu cycles after APB5DIV update.
The application can check if the new division factor is taken into account by reading APB5DIVRDY.
0x0: ck_icn_ls_mcu (default after reset)
0x1: ck_icn_ls_mcu / 2
0x2: ck_icn_ls_mcu / 4
0x3: ck_icn_ls_mcu / 8
0x4: ck_icn_ls_mcu / 16
Others: Reserved

20.8.60 RCC APBDBG clock divider register (RCC_APBDBGDIVR)

Address offset: 0x4C0

Reset value: 0x8000 0000

This register is used to control the APBDBG clock divider (see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	APBDBGDIV[2:0]		
													rw	rw	rw

Bit 31 **APBDBGDIVRDY**: APBDBG clock divider status

Set and cleared by hardware to indicate if the new division factor is taken into account.

0: The new division factor is not yet taken into account.

1: The new division factor is taken into account (default after reset).

Bits 30:3 Reserved, must be kept at reset value.

Bits 2:0 **APBDBGDIV[2:0]**: APBDBG clock divider

Set and cleared by software to control APBDBG clock division factor. This division ratio can be changed on-the-fly. It impacts only the APBDBG clock frequency. Clocks are divided with the new prescaler factor, from 1 to 16 ck_icn_ls_mcu cycles after APBDBGDIV update. The application can check if the new division factor is taken into account by reading APBDBGDIVRDY.

0x0: ck_icn_ls_mcu (default after reset)

0x1: ck_icn_ls_mcu / 2

0x2: ck_icn_ls_mcu / 4

0x3: ck_icn_ls_mcu / 8

0x4: ck_icn_ls_mcu / 16

Others: Reserved

20.8.61 RCC TIM group 1 prescaler register (RCC_TIMG1PRER)

Address offset: 0x4C8

Reset value: 0x8000 0000

This register is used to control the prescaler value of timers located in the APB1 domain: TIM2 to TIM7, and TIM10 to TIM14 (see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TIMG1PRERDY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIMG1PRE
															rw

Bit 31 **TIMG1PRERDY**: Clock prescaler status for timers of group 1

Set and cleared by hardware to indicate if the new division factor is taken into account.

0: The new division factor is not yet taken into account.

1: The new division factor is taken into account (default after reset).

Bits 30:1 Reserved, must be kept at reset value.

Bit 0 **TIMG1PRE**: Clock prescaler selection for timers of group 1

This bit is set and cleared by software to control the clock frequency of all timers connected to APB1 domain (see *Table 126)*.

0: Timer kernel clock is equal to ck_icn_ls_mcu if APB1DIV corresponds to a division by 1 or 2. Otherwise it is equal to 2 x Fck_icn_apb1 (default after reset).

1: Timer kernel clock is equal to ck_icn_ls_mcu if APB1DIV corresponds to a division by 1, 2, or 4. Otherwise, it is equal to 4 x Fck_icn_apb1.

20.8.62 RCC TIM group 2 prescaler register (RCC_TIMG2PRER)

Address offset: 0x4CC

Reset value: 0x8000 0000

This register is used to control the prescaler value of timers located in the APB2 domain: TIM1, TIM8, TIM15, TIM16, TIM17 (see *Root clock generation* for details).
Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIMG2PRE
															rw

Bit 31 **TIMG2PRERDY**: Clock prescaler status for timers of group 2

Set and cleared by hardware to indicate if the new division factor is taken into account.

0: The new division factor is not yet taken into account.

1: The new division factor is taken into account. (default after reset)

Bits 30:1 Reserved, must be kept at reset value.

Bit 0 **TIMG2PRE**: Clock prescaler selection for timers of group 2

This bit is set and cleared by software to control the clock frequency of all timers connected to APB2 domain (see *Table 126)*.

0: Timer kernel clock is equal to ck_icn_ls_mcu if APB2DIV corresponds to a division by 1 or 2. Otherwise it is equal to 2 x Fck_icn_apb2 (default after reset).

1: Timer kernel clock is equal to ck_icn_ls_mcu if APB2DIV corresponds to division by 1, 2, or 4.Otherwise it is equal to 4 x Fck_icn_apb2.

20.8.63 RCC LSMCU clock divider register (RCC_LSMCUDIVR)

Address offset: 0x4D0

Reset value: 0x8000 0000

This register is used to control the LSMU (low-speed MCU clock divider, see *Root clock generation* for details). Write accesses are defined according to the RCC local resource number 69 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LSMCUDIVRDY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LSMCUDIV
															rw

Bit 31 **LSMCUDIVRDY**: LSMCU clock divider status

Set and cleared by hardware to indicate if the new division factor is taken into account.

0: The new division factor is not yet taken into account.

1: The new division factor is taken into account (default after reset).

Bits 30:1 Reserved, must be kept at reset value.

Bit 0 **LSMCUDIV**: LSMCU clock divider

Set and cleared by software to control ck_icn_ls_mcu clock division factor. This division ratio can be changed on-the-fly. It impacts only the ck_icn_ls_mcu clock frequency. This clock is divided with the new prescaler factor, from 1 to 2 ck_icn_hs_mcu cycles after LSMCUDIV update. The application can check if the new division factor is taken into account by reading LSMCUDIVRDY.

0x0: ck_icn_hs_mcu (default after reset)

0x1: ck_icn_hs_mcu / 2

20.8.64 RCC DDRCTRL AXI port configuration register (RCC_DDRCPCFGR)

Address offset: 0x4D4

Reset value: 0x0000 0005

This register is used to control reset, clock gating, and low-power behavior of the DDRCTRL AXI ports. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRC PLPEN	DDRC PEN	DDRC PRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DDRCPLPEN**: DDRCTRL AXI port clock enable during CSleep

Set and cleared by software. This bit controls ck_icn_s_ddr clock gating in CSleep.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **DDRCPEN**: DDRCTRL AXI port clock enable

Set and cleared by software. This bit control sck_icn_s_ddr clock gating.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DDRCPRST**: DDRCTRL AXI port reset

Set and cleared by software.

0: Writing 0 releases DDRCTRL AXI port interface reset. Reading 0 means that DDRCTRL AXI port interface is not under reset (default after reset).

1: Writing 1 sets DDRCTRL AXI port interface under reset. Reading 1 means that DDRCTRL AXI port interface is under reset.

20.8.65 RCC DDRCTRL APB configuration register (RCC_DDRCAPBCFGR)

Address offset: 0x4D8

Reset value: 0x0000 0005

This register is used to control reset, clock gating, and low-power behavior of the DDRCTRL APB. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRC APBLP EN	DDRC APBEN	DDRC APBRS T
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DDRCAPBLPEN**: DDRCTRL APB clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enbled in CSleep.

Bit 1 **DDRCAPBEN**: DDRCTRL APB clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DDRCAPBRST**: DDRCTRL APB reset

Set and cleared by software.

0: Writing 0 releases DDRCTRL APB interface reset. Reading 0 means that DDRCTRL APB interface is not under reset (default after reset).

1: Writing 1 sets DDRCTRL APB interface under reset. Reading 1 means that DDRCTRL APB interface is under reset.

20.8.66 RCC DDRPHYC APB configuration register (RCC_DDRPHYCAPBCFGR)

Address offset: 0x4DC

Reset value: 0x0000 0005

This register is used to control reset, clock gating, and low-power behavior of the DDRPHYC APB interface. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRPHYCAPBLPEN	DDRPHYCAPBEN	DDRPHYCAPBRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DDRPHYCAPBLPEN**: DDRPHYC APB clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **DDRPHYCAPBEN**: DDRPHYC APB clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DDRPHYCAPBRST**: DDRPHYC APB reset

Set and cleared by software.

0: Writing 0 releases DDRPHYC APB interface reset. Reading 0 means that DDRPHYC APB interface is not under reset (default after reset).

1: Writing 1 sets DDRPHYC APB interface under reset. Reading 1 means that DDRPHYC APB interface is under reset.

20.8.67 RCC DDRPHYC configuration register (RCC_DDRPHYCCFGR)

Address offset: 0x4E0

Reset value: 0x0000 0000

This register is used to control clock gating behavior of the DDRPHYC. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRP HYCEN	Res.
														rw	

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DDRPHYCEN**: DDRPHYC kernel clock enable
Set and cleared by software.
0: Writing 0 disables DDRPHYC kernel clock. Reading 0 means that DDRPHYC kernel clock is disabled.
1: Writing 1 enables DDRPHYC kernel clock. Reading 1 means that DDRPHYC kernel clock is enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.68 RCC DDR configuration register (RCC_DDRCFGR)

Address offset: 0x4E4

Reset value: 0x0000 0005

This register is used to control reset, clock gating, and low-power behavior of the DDR APB configuration. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRCF GLPEN	DDRCF GEN	DDRCF GRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DDRCFGLPEN**: DDR APB configuration clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **DDRCFGEN**: DDR APB configuration clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DDRCFGRST**: DDR APB configuration reset
Set and cleared by software.
0: Writing 0 releases DDR APB configuration interface reset. Reading 0 means that DDR APB configuration interface is not under reset (default after reset).
1: Writing 1 sets DDR APB configuration interface under reset. Reading 1 means that DDR APB configuration interface is under reset.

20.8.69 RCC DDR interface configuration register (RCC_DDRITFCFGR)

Address offset: 0x4E8

Reset value: 0x0000 0001

This register is used to control the DDR interface according to supported low-power modes. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRPHYDLP
															rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRSHR	Res.	Res.	DDRCKMOD[1:0]		Res.	Res.	Res.	DDRRST
							rw			rw	rw				rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **DDRPHYDLP**: DDRPHY deep low-power mode (LP2 or LP3)
Set and cleared by software.
0: DDRPHY not set in low-power mode (default after reset)
1: DDRPHY set in deep low-power mode

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **DDRSHR**: DDR peripheral mode
Set and cleared by software.
0: DDR defined as single peripheral (default after reset)
1: DDR defined as shared peripheral

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **DDRCKMOD[1:0]**: RCC mode for DDR clock control

Set and cleared by software.

0x0: Normal mode: dphy_ker_ck and dphy_ker_byp_ck gating depends on DDRPHYCEN, DDRSHR, DDRPHYDLP, and CPU1 or system mode. ddrc_ker_ck gating depends on DDRCPEN, DDRCPLPEN, DDRSHR, and CPU1 or system mode. This mode must be selected during DDRCTRL and DDRPHYC initialization phase, and if the application uses SSR (software self-refresh) mode.

0x1: ASR (automatic self-refresh) mode: ddrc_ker_ck is gated automatically according to cactive_ddrc signal. dphy_ker_ck and dphy_ker_byp_ck must be kept running in this mode.

0x2: HSR (hardware self-refresh) mode: ddrc_ker_ck gating depends on DDRCPEN, DDRCLPEN, DDRSHR, and CPU1 or system mode. The dphy_ker_ck and dphy_ker_byp_ck must be kept running in this mode.

Others: Reserved

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **DDRRST**: DDR core and PHY reset

Set and cleared by software.

0: DDR core and PHY are not reset.

1: DDR core and PHY are reset (default after reset).

20.8.70 RCC SYSRAM configuration register (RCC_SYSRAMCFGR)

Address offset: 0x4F0

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the SYSRAM. Write accesses are defined according to the RCC local resource number 74 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SYSRAMLPEN	SYSRAMEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SYSRAMLPEN**: SYSRAM clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SYSRAMEN**: SYSRAM clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.71 RCC SRAM1 configuration register (RCC_SRAM1CFGR)

Address offset: 0x4F8

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the SRAM1. Write accesses are defined according to the RCC local resource number 78 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SRAM1 LPEN	SRAM1 EN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SRAM1LPEN**: SRAM1 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SRAM1EN**: SRAM1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.72 RCC RETRAM configuration register (RCC_RETRAMCFGR)

Address offset: 0x500

Reset value: 0x0000 0006

This register is used to control clock gating and low-power behavior of the RETRAM. Write accesses are defined according to the RCC local resource number 76 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RETRA MLPEN	RETRA MEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **RETRAMLPEN**: RETRAM clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **RETRAMEN**: RETRAM clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.73 RCC BKPSRAM configuration register (RCC_BKPSRAMCFGR)

Address offset: 0x504

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the BKPSRAM. Write accesses are defined according to the RCC local resource number 77 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BKPSRAMLPEN	BKPSRAMEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **BKPSRAMLPEN**: BKPSRAM clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **BKPSRAMEN**: BKPSRAM clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.74 RCC OCTOSPI1 configuration register (RCC_OSPI1CFGR)

Address offset: 0x514

Reset value: 0x0000 0004

This register is used to control the reset, clock gating, and low-power behavior of the OCTOSPI1 and the OTFDEC1. Write accesses are defined according to the RCC local resource number 110 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OSPI1 DLLRST
															rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	OTFDEC1RST	Res.	Res.	Res.	Res.	Res.	OSPI1LPEN	OSPI1EN	OSPI1RST
							rw						rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **OSPI1DLLRST**: OCTOSPI1 DLL reset

Set and cleared by software.

0: Writing 0 releases OCTOSPI1 DLL reset. Reading 0 means that OCTOSPI1 DLL reset is released.

1: Writing 1 asserts OCTOSPI1 DLL reset. Reading 1 means that OCTOSPI1 DLL reset is asserted.

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **OTFDEC1RST**: OTFDEC1 reset

Set and cleared by software.

0: Writing 0 releases OTFDEC1 reset. Reading 0 means that OTFDEC1 reset is released.

1: Writing 1 asserts OTFDEC1 reset. Reading 1 means that OTFDEC1 reset is asserted.

Bits 7:3 Reserved, must be kept at reset value.

Bit 2 **OSPI1LPEN**: OCTOSPI1, OTFDEC1 and OCTOSPI1 delay (DLYBOSPI1) clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **OSPI1EN**: OCTOSPI1 and OTFDEC1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **OSPI1RST**: OCTOSPI1 reset

Set and cleared by software.

0: Writing 0 releases OCTOSPI1 reset. Reading 0 means that OCTOSPI1 reset is released.

1: Writing 1 asserts OCTOSPI1 reset. Reading 1 means that OCTOSPI1 reset is asserted.

20.8.75 RCC FMC configuration register (RCC_FMCCFGR)

Address offset: 0x51C

Reset value: 0x0000 0004

This register is used to control the reset, clock gating, and low-power behavior of the FMC. Write accesses are defined according to the RCC local resource number 112 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FMCLPEN	FMCEN	FMCRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **FMCLPEN**: FMC clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **FMCEN**: FMC clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **FMCRST**: FMC reset

Set and cleared by software.

0: Writing 0 releases FMC reset. Reading 0 means that FMC reset is released.

1: Writing 1 asserts FMC reset. Reading 1 means that FMC reset is asserted.

20.8.76 RCC debug configuration register (RCC_DBGCFGR)

Address offset: 0x520

Reset value: 0x0000 0000

This is register contains the enable control of debug and trace functions. Write accesses are defined according to the RCC local resource number 73 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DBGRST	Res.	DBGMCUEN	TRACEEN	DBGEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
			rw		rw	rw	rw								

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **DBGRST**: Debug function reset
Set and cleared by software to control the reset generation for trace and all debug.
0: Trace and debug parts are not reset (default after reset).
1: Trace and debug parts are under reset.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **DBGMCUEN**: Clock enable for dbgmcu
Set and cleared by software to control ck_icn_p_dbgmcu and ck_dap generation.
0: Clock for dbgmcu function disabled (default after reset)
1: Clock for dbgmcu function enabled

Bit 9 **TRACEEN**: Clock enable for trace port interface
Set and cleared by software to control ck_ker_tpiu generation.
0: Clock for trace function disabled (default after reset)
1: Clock for trace function enabled

Bit 8 **DBGEN**: Debug function clock enable
Set and cleared by software to control ck_icn_apbdbg and ck_sys_atb generation.
0: Enabling of clocks for debug function is controlled by cdbgpwrupreq signal from DAP (default after reset).
1: Clocks for debug function are enabled.

Bits 7:0 Reserved, must be kept at reset value.

20.8.77 RCC STM configuration register (RCC_STMCFGR)

Address offset: 0x524

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the STM. Write accesses are defined according to the RCC local resource number 73 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STMLPEN	STMEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **STMLPEN**: STM clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **STMEN**: STM clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.78 RCC ETR configuration register (RCC_ETRCFGR)

Address offset: 0x528

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the Cortex-A35 ETR interface. Write accesses are defined according to the RCC local resource number 73 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ETRLPEN	ETREN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **ETRLPEN**: ETR clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **ETREN**: ETR clocks enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.79 RCC GPIOx configuration register (RCC_GPIOxCFGR) (x = A to I)

Address offset: Block A: 0x52C

Address offset: Block B: 0x530

Address offset: Block C: 0x534

Address offset: Block D: 0x538

Address offset: Block E: 0x53C

Address offset: Block F: 0x540

Address offset: Block G: 0x544

Address offset: Block H: 0x548

Address offset: Block I: 0x54C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the GPIOx. Write accesses are defined according to the RCC local resource number 90 to 98 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GPIOx LPEN	GPIOx EN	GPIOx RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **GPIOxLPEN**: GPIO x clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **GPIOxEN**: GPIO x clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **GPIOxRST**: GPIO x reset

Set and cleared by software.

0: Writing 0 releases GPIOx reset. Reading 0 means that GPIOx reset is released.

1: Writing 1 asserts GPIOx reset. Reading 1 means that GPIOx reset is asserted.

20.8.80 RCC GPIOZ configuration register (RCC_GPIOZCFGR)

Address offset: 0x558

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-power, and autonomous clock mode behavior of the GPIOZ. Wait states are inserted in case of successive write accesses to this register, except on GPIOZRST. The number of wait states may be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 101 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GPIOZ LPEN	GPIOZ EN	GPIOZ RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **GPIOZLPEN**: GPIOZ clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **GPIOZEN**: GPIOZ clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **GPIOZRST**: GPIOZ reset

Set and cleared by software.

0: Writing 0 releases GPIOZ reset. Reading 0 means that GPIOZ reset is released.

1: Writing 1 asserts GPIOZ reset. Reading 1 means that GPIOZ reset is asserted.

20.8.81 RCC HPDMA1 configuration register (RCC_HPDMA1CFGR)

Address offset: 0x55C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the HPDMA1. Write accesses are defined according to the RCC local resource number 83 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HPDMA1LPEN	HPDMA1EN	HPDMA1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **HPDMA1LPEN**: HPDMA1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **HPDMA1EN**: HPDMA1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **HPDMA1RST**: HPDMA1 reset

Set and cleared by software.

0: Writing 0 releases HPDMA1 reset. Reading 0 means that HPDMA1 reset is released.

1: Writing 1 asserts HPDMA1 reset. Reading 1 means that HPDMA1 reset is asserted.

20.8.82 RCC HPDMA2 configuration register (RCC_HPDMA2CFGR)

Address offset: 0x560

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the HPDMA2. Write accesses are defined according to the RCC local resource number 84 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HPDMA2LPEN	HPDMA2EN	HPDMA2RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **HPDMA2LPEN**: HPDMA2 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **HPDMA2EN**: HPDMA2 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **HPDMA2RST**: HPDMA2 reset

Set and cleared by software.

0: Writing 0 releases HPDMA2 reset. Reading 0 means that HPDMA2 reset is released.

1: Writing 1 asserts HPDMA2 reset. Reading 1 means that HPDMA2 reset is asserted.

20.8.83 RCC HPDMA3 configuration register (RCC_HPDMA3CFGR)

Address offset: 0x564

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the HPDMA3. Write accesses are defined according to the RCC local resource number 85 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HPDMA3LPEN	HPDMA3EN	HPDMA3RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **HPDMA3LPEN**: HPDMA3 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **HPDMA3EN**: HPDMA3 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **HPDMA3RST**: HPDMA3 reset

Set and cleared by software.

0: Writing 0 releases HPDMA3 reset. Reading 0 means that HPDMA3 reset is released.

1: Writing 1 asserts HPDMA3 reset. Reading 1 means that HPDMA3 reset is asserted.

20.8.84 RCC IPCC1 configuration register (RCC_IPCC1CFGR)

Address offset: 0x570

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of IPCC1. Write accesses are defined according to the RCC local resource number 87 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IPCC1LPEN	IPCC1EN	IPCC1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IPCC1LPEN**: IPCC1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **IPCC1EN**: IPCC1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **IPCC1RST**: IPCC1 reset

Set and cleared by software.

0: Writing 0 releases IPCC1 reset. Reading 0 means that IPCC1 reset is released.

1: Writing 1 asserts IPCC1 reset. Reading 1 means that IPCC1 reset is asserted.

20.8.85 RCC RTC configuration register (RCC_RTCCFGR)

Address offset: 0x578

Reset value: 0x0000 0004

This register is used to control clock gating, low-power, and autonomous clock mode behavior of the RTC. Wait states are inserted in case of successive write accesses to this register. The number of wait states may be up to 7 cycles of the RCC clock. Write accesses are defined according to the RCC local resource number 102 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RTCLPEN	RTCEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **RTCLPEN**: RTC bus clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.
1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clocks is enabled in CSleep.

Bit 1 **RTCEN**: RTC bus clock enable
Set and cleared by software.
0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.
1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.86 RCC SYSCPU1 configuration register (RCC_SYSCPU1CFGR)

Address offset: 0x580

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the CPU1 system configuration. Write accesses are defined according to the RCC local resource number 106 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SYSCPU1LPEN	SYSCPU1EN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SYSCPU1LPEN**: CPU1 system configuration clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.
1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clocks is enabled in CSleep.

Bit 1 **SYSCPU1EN**: CPU1 system configuration clock enable
Set and cleared by software.
0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.
1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.87 RCC BSEC configuration register (RCC_BSECCFGR)

Address offset: 0x584

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of the BSEC. Write accesses are defined according to the RCC local resource number 103 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BSECLPEN	BSECEN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **BSECLPEN**: BSEC clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.
1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clocks is enabled in CSleep.

Bit 1 **BSECEN**: BSEC clock enable
Set and cleared by software.
0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.
1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.88 RCC PLL2 configuration register 1 (RCC_PLL2CFGR1)

Address offset: 0x590

Reset value: 0x0000 0001

This register is used to configure PLL2 in the device. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	CKREFST	Res.	Res.	Res.	PLLRDY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
			rc_w				r								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	PLLEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SSMODRST
							rw								rw

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **CKREFST**: PLL2 reference clock state

Set by hardware and cleared by software. Indicates if PLL2 reference clock is running. After any reset, this bit is updated after 5 clock cycles of the selected PLL reference clock.

0: Reading 0 means that PLL2 reference clock is not running. Writing 0 resets the reference clock running detector.

1: Reading 1 means that PLL2 reference clock is running. Writing 1 resets the reference clock running detector.

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **PLLRDY**: PLL2 clock ready flag

Set by hardware to indicate when the PLL2 is locked

0: PLL2 unlocked (default after reset)

1: PLL2 locked

Bits 23:9 Reserved, must be kept at reset value.

Bit 8 **PLLEN**: PLL2 enable

Set and cleared by software to enable PLL2.

0: PLL2 off (default after reset)

1: PLL2 on

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **SSMODRST**: PLL2 spread-spectrum modulator reset

Set and cleared by software.

0: PLL2 spread-spectrum modulator reset module is released.

1: PLL2 spread-spectrum modulator reset module is asserted (default after reset).

20.8.89 RCC PLL2 configuration register 2 (RCC_PLL2CFGR2)

Address offset: 0x594

Reset value: 0x0000 0000

This register is used to configure PLL2 in the device. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	FBDIV[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FREFDIV[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **FBDIV[11:0]**: PLL2 VCO multiplication factor

Set and cleared by software to control the VCO multiplication factor.
In integer mode, this value must be set between 16 and 640.
In fractional mode, this value must be set between 20 and 320.

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:0 **FREFDIV[5:0]**: PLL2 reference input clock divide frequency ratio

Set and cleared by software.
0x0: Not applicable when PLL2 is enabled
0x1: FREF divided by 1 (min value)
0x2: FREF divided by 2
0x3: FREF divided by 3
...
0x3C: FREF divided by 60
0x3D: FREF divided by 61
0x3E: FREF divided by 62
0x3F: FREF divided by 63

20.8.90 RCC PLL2 configuration register 3 (RCC_PLL2CFGR3)

Address offset: 0x598

Reset value: 0x0400 0000

This register is used to configure the PLL2 in the device. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	SSCGDIS	DACEN	DOWNSPREAD	FRACIN[23:16]

FRACIN[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **SSCGDIS**: PLL2 spread-spectrum modulator enable

Set and cleared by software to enable the PLL2 clock spreading generator.
0: PLL2 spread-spectrum modulator enabled
1: PLL2 spread-spectrum modulator disabled (default after reset)

Bit 25 **DACEN**: PLL2 noise canceling DAC enable in fractional mode

Set and cleared by software to enable the noise cancellation in fractional mode.
0: DAC not active (default after reset)
1: DAC active

Bit 24 **DOWNSPREAD**: PLL2 VCO frequency modulation mode

Set and cleared by software to select the PLL2 clock spreading mode.
0: Center-spread modulation selected (default after reset)
1: Down-spread modulation selected

Bits 23:0 **FRACIN[23:0]**: Fractional part of PLL2 VCO multiplication factor

Set and cleared by software to control the VCO fractional multiplication factor.
VCO output frequency = FREF * (FBDIV + FRAC / 2^{24}) / FREFDIV

20.8.91 RCC PLL2 configuration register 4 (RCC_PLL2CFGR4)

Address offset: 0x59C

Reset value: 0x0000 0000

This register is used to configure PLL2 in the device. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	BYPASS	FOUTPOSTDIVEN	DSMEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
					rw	rw	rw								

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **BYPASS**: PLL2 FOUTPOSTDIV bypass
Set and cleared by software to bypass FOUTPOSTDIV by FREF.
0: FOUTPOSTDIV driven by POSTDIV2
1: FOUTPOSTDIV driven by FREF

Bit 9 **FOUTPOSTDIVEN**: PLL2 output and post divider enable
Set and cleared by software to enable PLL2 output and post dividers.
0: FOUTPOSTDIV output, POSTDIV1, and POSTDIV2 are powered down.
1: FOUTPOSTDIV output, POSTDIV1, and POSTDIV2 dividers are active.

Bit 8 **DSMEN**: PLL2 delta-sigma modulator enable
Set and cleared by software to enable the delta-sigma modulator (DSM).
0: DSM is powered down.
1: DSM is active.

Bits 7:0 Reserved, must be kept at reset value.

20.8.92 RCC PLL2 configuration register 5 (RCC_PLL2CFGR5)

Address offset: 0x5A0

Reset value: 0x0000 0000

This register is used to configure PLL2 in the device. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPREAD[4:0]				
											rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DIVVAL[3:0]			
												rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **SPREAD[4:0]**: Modulation depth adjustment for PLL2
Set and cleared by software to adjust the modulation depth of clock spreading generator.

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **DIVVAL[3:0]**: Modulation frequency adjustment for PLL2
Set and cleared by software to adjust the modulation frequency of clock spreading generator.

20.8.93 RCC PLL2 configuration register 6 (RCC_PLL2CFGR6)

Address offset: 0x5A8

Reset value: 0x0000 0000

This register is used to configure PLL2 in the product. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	POSTDIV1[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **POSTDIV1[2:0]**: PLL2 VCO frequency divide level 1
Set and cleared by software to divide the VCO frequency output.
0x0: Not applicable
0x1: FOUTVCO divided by 1 (minimum value)
...
0x6: FOUTVCO divided by 6
0x7: FOUTVCO divided by 7

20.8.94 RCC PLL2 configuration register 7 (RCC_PLL2CFGR7)

Address offset: 0x5AC

Reset value: 0x0000 0000

This register is used to configure PLL2 in the product. Write accesses are defined according to the RCC local resource number 104 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	POSTDIV2[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **POSTDIV2[2:0]**: PLL2 VCO frequency divide level 2

Set and cleared by software to divide the VCO frequency output.

0x0: Not applicable

0x1: FOUTVCO/POSTDIV1 divided by 1 (minimum value)

...

0x6: FOUTVCO/POSTDIV1 divided by 6

0x7: FOUTVCO/POSTDIV1 divided by 7

*Note: FOUTPOSTDIV = FOUTVCO / POSTDIV1 * POSTDIV2*

20.8.95 RCC HSI frequency monitoring control register (RCC_HSIFMONCR)

Address offset: 0x5E0

Reset value: 0x001F 07A1

This register is used to control the HSI frequency monitoring module. Write accesses are defined according to the RCC local resource number 113 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HSIMONF	HSIMONIE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HSIDEV[5:0]					
rc_w1	rw									rw	rw	rw	rw	rw	rw

HSIMONEN	Res.	Res.	Res.	Res.	HSIREF[10:0]										
rw					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **HSIMONF**: HSI clock period monitor interrupt flag

Reset by software by writing 1 to this flag. Set by hardware when a deviation is detected on HSI clock period.

0: No deviation detected on HSI clock period (default after reset)

1: Deviation detected on HSI clock period. Writing 1 clears this flag.

Bit 30 **HSIMONIE**: HSI clock period monitor interrupt enable

Set and cleared by software to enable/disable interrupt caused by HSI clock period monitoring.

0: HSI clock period monitoring interrupt disabled (default after reset)

1: HSI clock period monitoring interrupt enabled

Bits 29:22 Reserved, must be kept at reset value.

Bits 21:16 **HSIDEV[5:0]**: HSI clock count deviation value

Set and cleared by software.

Bit 15 **HSIMONEN**: HSI clock period monitor enable

Set and cleared by software.

0: Writing 0 disables HSI clock period monitoring. Reading 0 means that HSI clock period monitoring is disabled.

1: Writing 1 enables HSI clock period monitoring. Reading 1 means that HSI clock period monitoring is enabled.

Bits 14:11 Reserved, must be kept at reset value.

Bits 10:0 **HSIREF[10:0]**: HSI clock count reference value
Set and cleared by software.

20.8.96 RCC HSI frequency value register (RCC_HSIFVALR)

Address offset: 0x5E4

Reset value: 0x0000 0000

This read-only access register contains the number of HSI clock cycles measured between consecutive edges of LSE. Writing has no effect. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	HSIVAL[10:0]										
					r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:0 **HSIVAL[10:0]**: HSI clock-cycle counter value
Set by hardware.

20.8.97 RCC MSI frequency monitoring control register (RCC_MSIFMONCR)

Address offset: 0x5E8

Reset value: 0x000F 01E8

This register is used to control the MSI frequency monitoring module. Write accesses are defined according to the RCC local resource number 88 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MSIMONF	MSIMONIE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MSIDEV[4:0]

MSIMONEN	Res.	Res.	Res.	Res.	Res.	Res.	MSIREF[8:0]								
rw							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **MSIMONF**: MSI clock period monitor interrupt flag
Reset by software by writing 1 to this flag. Set by hardware when a deviation is detected on MSI clock period.
0: No deviation detected on MSI clock period (default after reset)
1: Deviation detected on MSI clock period. Writing 1 clears this flag.

Bit 30 **MSIMONIE**: MSI clock period monitor interrupt enable
Set and cleared by software to enable/disable interrupt caused by MSI clock period monitoring.
0: MSI clock period monitoring interrupt disabled (default after reset)
1: MSI clock period monitoring interrupt enabled

Bits 29:21 Reserved, must be kept at reset value.

Bits 20:16 **MSIDEV[4:0]**: MSI clock count deviation value
Set and cleared by software.

Bit 15 **MSIMONEN**: MSI clock period monitor enable
Set and cleared by software.
0: Writing 0 disables MSI clock period monitoring. Reading 0 means that MSI clock period monitoring is disabled.
1: Writing 1 enables MSI clock period monitoring. Reading 1 means that MSI clock period monitoring is enabled.

Bits 14:9 Reserved, must be kept at reset value.

Bits 8:0 **MSIREF[8:0]**: MSI clock count reference value
Set and cleared by software.

20.8.98 RCC MSI frequency value register (RCC_MSIFVALR)

Address offset: 0x5EC

Reset value: 0x0000 0000

This read-only access register contains the number of MSI clock cycles measured between consecutive edges of LSE. Writing has no effect. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	MSIVAL[8:0]								
							r	r	r	r	r	r	r	r	r

Bits 31:9 Reserved, must be kept at reset value.

Bits 8:0 **MSIVAL[8:0]**: MSI clock-cycle counter value
Set by hardware.

20.8.99 RCC TIM1 configuration register (RCC_TIM1CFGR)

Address offset: 0x700

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM1LPEN	TIM1EN	TIM1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM1LPEN**: TIM1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM1EN**: TIM1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM1RST**: TIM1 reset

Set and cleared by software.

0: Writing 0 releases TIM1 reset. Reading 0 means that TIM1 reset is released.

1: Writing 1 asserts TIM1 reset. Reading 1 means that TIM1 reset is asserted.

20.8.100 RCC TIM2 configuration register (RCC_TIM2CFGR)

Address offset: 0x704

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM2LPEN	TIM2EN	TIM2RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM2LPEN**: TIM2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM2EN**: TIM2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM2RST**: TIM2 reset
Set and cleared by software.
0: Writing 0 releases TIM2 reset. Reading 0 means that TIM2 reset is released.
1: Writing 1 asserts TIM2 reset. Reading 1 means that TIM2 reset is asserted.

20.8.101 RCC TIM3 configuration register (RCC_TIM3CFGR)

Address offset: 0x708

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM3LPEN	TIM3EN	TIM3RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM3LPEN**: TIM3 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM3EN**: TIM3 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM3RST**: TIM3 reset
Set and cleared by software.
0: Writing 0 releases TIM3 reset. Reading 0 means that TIM3 reset is released.
1: Writing 1 asserts TIM3 reset. Reading 1 means that TIM3 reset is asserted.

20.8.102 RCC TIM4 configuration register (RCC_TIM4CFGR)

Address offset: 0x70C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM4. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
