- YT: 0 (not used)
- PATTERN: 0 (color bar)
- GSEN: 0 (keep the colors)
- LFLEN: 0 (no lifeline for now)
- TPGEN: 1 (test pattern generator active)

42.4.5 Input selection

Input selection block is ahead of any pipe to select the camera sensor module interface connected to the DCMIPP. Two interfaces are supported:

- Parallel interface: up to 16-bit parallel interface with physical synchronization signals (DCMIPP_VSYNC/DCMIPP_HSYNC) or software embedded ones (as in CCIR601).
- MIPI CSI-2 interface: Host ISB byte header internal connection from the CSI2 host controller placed in front of the DCMIPP.

Both interfaces are exclusive. The selected one is applied to all the input pipes.

The camera sensor interface is selected by means of bit INSEL of the DCMIPP_CMCR register.

42.4.6 Flow selection

The module, present in each pipe, handles the flow control around the CSI2 camera sensor interface. For each pipe, the software needs to configure which virtual channel (VC) and which Datatypes (DT) are processed by the pipe.

For Pipe0 and Pipe1, multiple Datatypes can be selected whereas only one virtual channel can be defined for a frame. Configuration can be changed frame by frame if the application requires it, offering some flexibility.

For Pipe2, when the pipe is independent with PIPEDIFF = 1, only one virtual channel and only one data type by frame can be selected.

The software has to reconfigure the flow selection module to handle interleaved frames from a sensor if it uses virtual channels as a mean to make the differentiation, accepting to lose frames since there can be only one virtual channel active for a given frame (it decreases the FPS).

Multiple cameras data flow can be received simultaneously through the CSI2 ISB header bus. For instance, for a system having two different camera data flows, it is possible to redirect one virtual channel on a pipe and the other one on the other pipe. It can be

interesting to dump them on Pipe0, but only one frame over two since the flow selection block has to be reconfigured to switch from one VC to another one.

The flow selection module is used also to share some image processing features (demosaicing, color conversion, statistics, contrast enhancement, auto exposure, statistics removal and basic decimation) between Pipe1 and Pipe2, whatever the camera sensor interface solution (parallel interface or CSI2 interface): when bit PIPEDIFF in the DCMIPP_P1FSCR register is 0, or the input is on the parallel interface that provides unique flow, the Pipe2 samples pixels from the output of the ISP of Pipe1 (see *Figure 342*). PIPEDIFF must be reconfigured when Pipe1 and Pipe2 are disabled.

Software configuration

The following configurations must be set first, because static in the DCMIPP_PxFSCR registers:

Pipe0

- DTMODE[1:0]: Mode for CSI flow selection into that pipe
  - 0: only flow VC/DTIDA is forwarded in the pipe
  - 1: flows VC/DTIDA and/or VC/DTIDB are forwarded in the pipe
  - 2: all Datatypes of the selected virtual channel, except the VC/DTIDA or VC/DTIDB, are forwarded in the pipe
  - 3: all Datatypes of the selected virtual channel are forwarded in the pipe
- VC[1:0]: Virtual channel ID of the CSI flow to select for further processing on the pipe
- DTIDA[5:0]: Data type ID A to select in the CSI flow for further processing in the pipe
- DTIDB[5:0]: Data type ID B to select in the CSI flow for further processing in the pipe
- PIPEN: activation of the Pipes, to be set after the above configurations.

Pipe1

- DTMODE[1:0]: mode for CSI flow selection into that pipe
  - 0: only flow VC/DTIDA is forwarded in the pipe
  - 1: flows VC/DTIDA and VC/DTIDB are forwarded in the pipe
- VC[1:0]: virtual channel ID of the CSI flow to select for further processing on the pipe
- DTIDA[5:0]: data type ID A to select in the CSI flow for further processing in the pipe
- DTIDB[5:0]: data type ID B to select in the CSI flow for further processing in the pipe
- FDTFEN: when the DTIDx is detected depending on DTMODE, the software forces the data type format to the value set into FDTF[5:0] for the pixel pipe processing. It can be used, for instance, to address sensor 3D camera through specific bridge using CSI2 “user data type” to make distinction between left and right camera sensor (each camera has its own user data type value, but sharing the same pixel format).
- FDTF[5:0]: data type value to be forced
- PIPEDIFF: Pipe2 to take same input as Pipe1 or differentiated:
  - 0: Pipe1 and Pipe2 take the flow selection configuration of Pipe1. Pipe1 shares the image processing functions with Pipe2.
  - 1: Pipe1 and Pipe2 are considered as two independent pipes, without any shared configuration.
- PIPEN: activation of the pipes, to be set after the above configurations.

Pipe2

- VC[1:0]: Virtual channel ID of the CSI flow to select for further processing on the pipe.
- DTIDA[5:0]: Data type ID A to select in the CSI flow for further processing in the pipe
- FDTFEN: When the DTIDx is detected depending on DTMODE, the software forces the data type format to the value set into FDTF[5:0] for the pixel pipe processing. It can be used to address sensor 3D camera through specific bridge using CSI2 “user data type” to make distinction between left and right camera sensor for instance (each camera having its own user data type value, but sharing the same pixel format).
- FDTF[5:0]: Data type value to be forced
- PIPEN: activation of the pipes, to be set after the above configurations.

If PIPEDIFF = 0 in DCMIPP_P1FSCR, the configuration bits are directly those set in the DCMIPP_P1FSCR register.

The above bit fields are meaningful when PIPEDIFF = 1.

42.4.7 Frame counter

A frame counter is available for a tag purpose and counts all the frame received on the selected pipe.

The counter is 32-bit, read-only. It is active at least when bit PIPEN of the pipe to whom it is connected is enabled (PIPEN = 1).

It provides an (almost) unique frame number, with a loop time of 4.5 years (if 30 fps).

The counter can be incremented, depending on the PSFC in DCMIPP_CMCR, at the FrameStart event of the selected virtual channel, when a CSI-2 camera sensor is connected, or at the FrameStart event of the pipe when the camera sensor module is connected with parallel interface.

The frame counter is cleared by setting CFC in the DCMIPP_CMCR register.

Software configuration

The frame counter must be configured before it is used for the pipe. Software action(s) must be performed in the DCMIPP_CMCR register:

- Select on which pipe the frame counter is connected by configuring bit PSFC[1:0]
- Frame counter runs as soon as the selected pipe is active (PIPEN = 1)

Note: It is possible to have the Frame counter run on a pipe, while having the pipe not flowing any pixel: this is achieved with pipe enable active (PIPEN = 1) to have the frame counter run, but with CPTREQ = 0 to avoid any pixel flow.

42.4.8 Frame control

The module is replicated for each dump and pixel pipe. It handles the frame control and the capture of each pipe, grouping data into frames, and capturing them when requested.

Definitions

There are two notions of frame events

- Event used inside the hardware (provided by the input interfaces):
  - FrameStart: when a frame starts at the input of the pipes (at frame control)
    - > Parallel interface with VSync fall
    - > CSI-2 interface: SoF (Start-of-Frame) packet
  - FrameEnd: when a frame finishes at the input of pipes (at frame control)
    - > Parallel interface: VSync rise (End-of-Frame)
    - > CSI-2 interface: EoF (End-of-Frame) packet
- Events exposed to software via DCMIPP events and interrupts:
  - VSYNC
    - > When a frame starts, observed at the input of the pipes (at frame control)
    - > It indicates that the current frame has started and has sampled its shadow registers, and that the software can start to configure the next frame
    - > It is recommended to use that interrupt to trigger the software that reconfigures the DCMIPP.
  - FRAME END
    - > When a frame finishes, observed at the output of pipes (when the last pixel has been written on the AXI)
    - > It indicates that the current frame has finished writing all its data to memory, and that the application can immediately start using them
    - > It is recommended to use that interrupt to trigger the software that forwards the memory buffer to other applications

Features

- Frame delineation: allows to dump data with the required frame granularity.
  - Extracts, per pipe, the FrameStart and FrameEnd event, based on the input Start-of-Frame and End-of-Frame.
    - > The FrameStart immediately generates a VSYNC event.
    - > The FrameEnd ripples till the end of the pipe, at the pixel packer level, where it generates the FRAME event.
  - Based on the algorithm detailed in *Extraction algorithm for FrameStart and FrameEnd*.
- Capture mode: can capture a frame snapshot, or capture continuously.
- Capture rate: can capture all frames, or one out of 2, 4, 8. It is only active when the Capture mode is in Continuous mode.
- Frame status: stores infos about the last captured frame (PxLSTFRM, PxLSTLINE), re-sampled at the FrameEnd event.

Extraction algorithm for FrameStart and FrameEnd

The extraction of the FrameStart and FrameEnd is straightforward.

In CSI-2 mode, each pipe is handling a unique virtual channel ID by frame. In case of interleaved flow in input of the DCMIPP, the software can decide to:

- Dedicate each virtual channel on a single pipe in case of multiple pipes, each of them having its own virtual channel number selected
- Decide to decrease the FPS ratio by changing the pipe configuration swapping with the other virtual channel ID (mainly in case of single pipe)

The interlaced mode can be handled by the software in CSI-2 mode by changing the pipe configuration frame by frame.

The following usecases are supported and detailed in the figures below:

- Default single VC: straightforward behavior, support in both pixel and dump pipes (*Figure 344*)
- Overlapping VC (supported on a single pipe via the loss of one frame when switching)
  - It can be supported by affecting each VC on a dedicated pipe (*Figure 346*)
- Exclusive VC (supported in both pixel and dump pipes), see *Figure 345*:

The use cases with two exclusive VCs can be handled either using one single pipe, by reconfiguring it from frame to frame, or by splitting the flow on more than one pipe, each of them handling its own VC:

- each flow arrives exclusively in one pipe and is processed as an independent frame, with its Start-of-Frame and End-of-Frame
- FrameStart and FrameEnd are generated per VC flow.

Figure 344. VC flow processed by one pipe

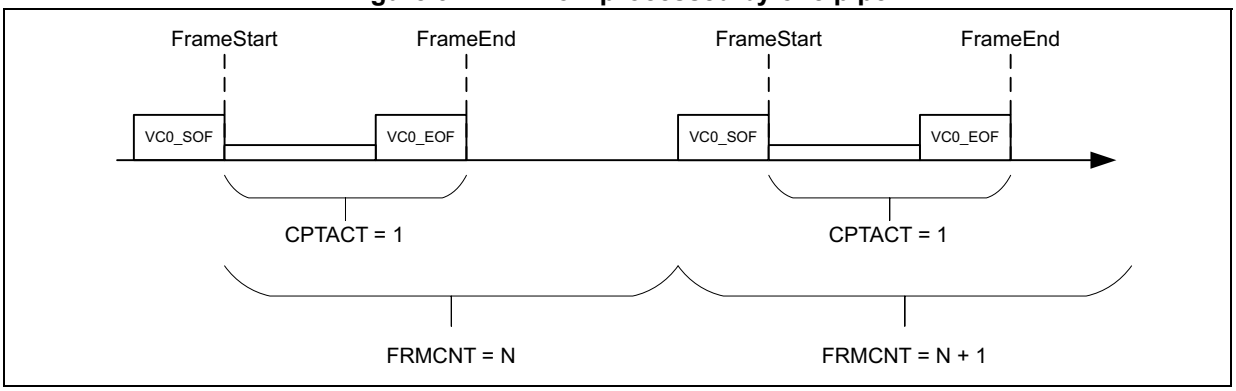

Figure 345. Two exclusive VC flows processed by one reconfigured pipe

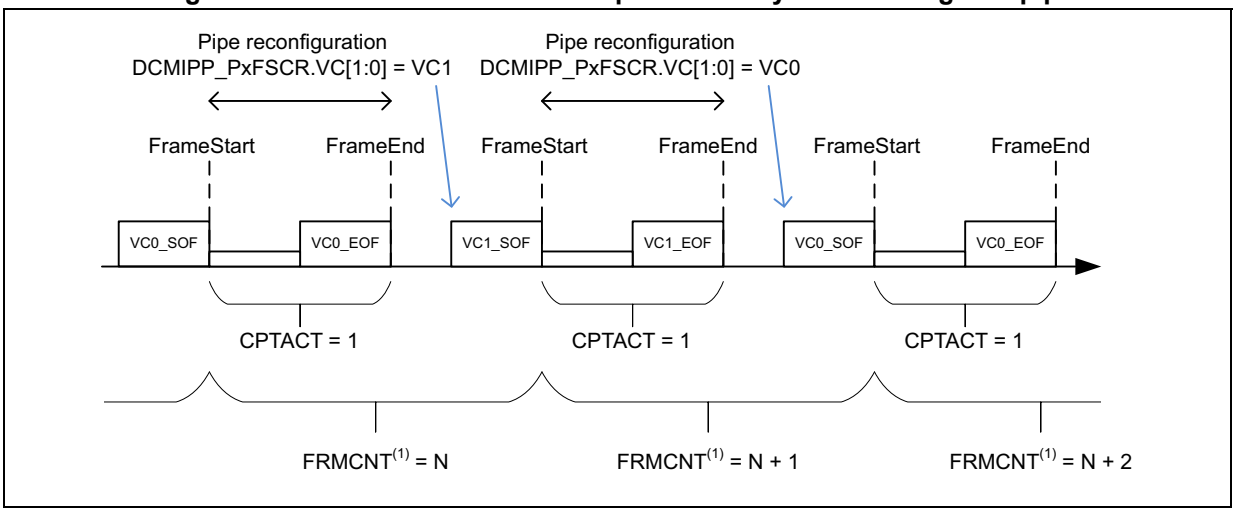
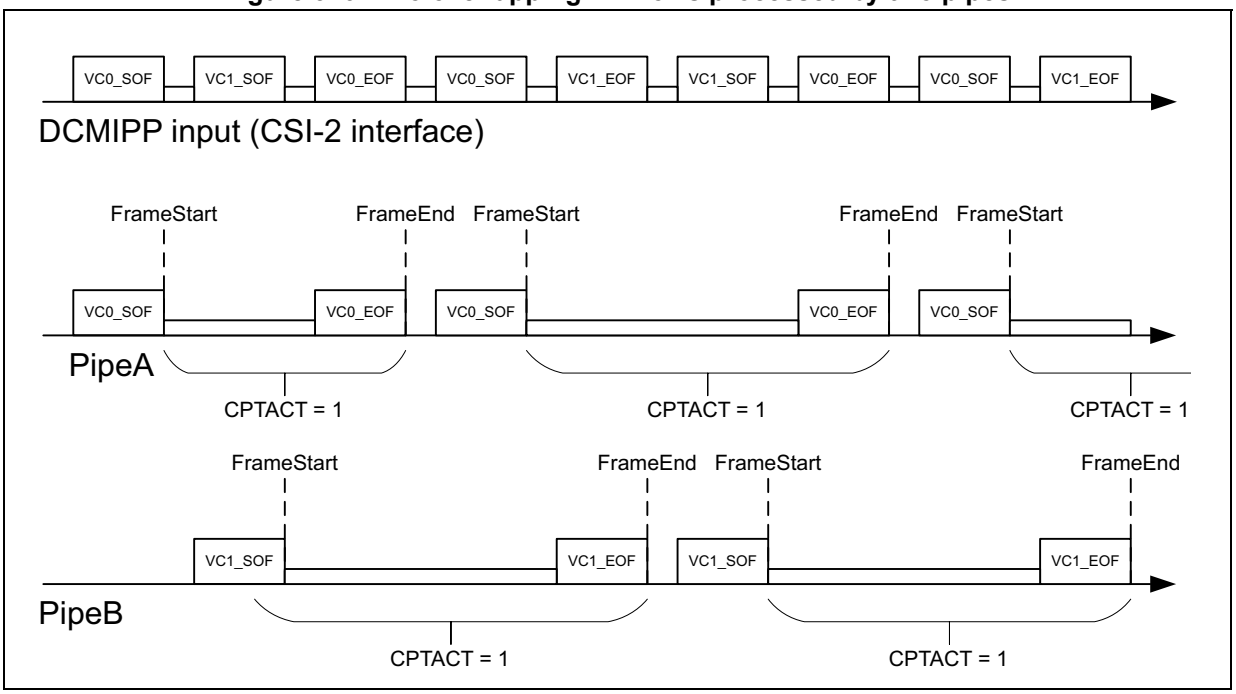


1. If frame counter is attached to the pipe and if reset is not requested when changing VC.

Figure 346. Two overlapping VC flows processed by two pipes



Use cases

The Continuous mode is typically used to send to display or to software-analysis a continuous stream of frames.

The Snapshot mode is typically used to dump a high-resolution frame.

The Frame rate mode is typically used for a low-power continuous analysis, where only one frame every eight is dumped and analyzed.

The frame informations are typically used for interlaced video use cases, where the sensors transmit alternatively odd and even fields (top vs. bottom), and where software must be able to retrieve the type of field. Depending on the sensor, it can be retrieved from:

- the VC-ID, if the sensor uses one VC for one field and another for the other
- the LSB of the counted number of lines in that frame (indicates if the number is odd or even)
- the LSB of the frame counter extracted from the CSI information (if counting this pipe), which can be odd or even.

Software configuration

The frame control supports two different capture modes:

- Snapshot mode: the software captures single frames
- Continuous mode: the software captures a continuous sequence.

The timing diagram of these two modes is shown in *Figure 347*.

Figure 347. Snapshot (CPTMODE = 1) and Continuous (CPTMODE = 0) capture modes

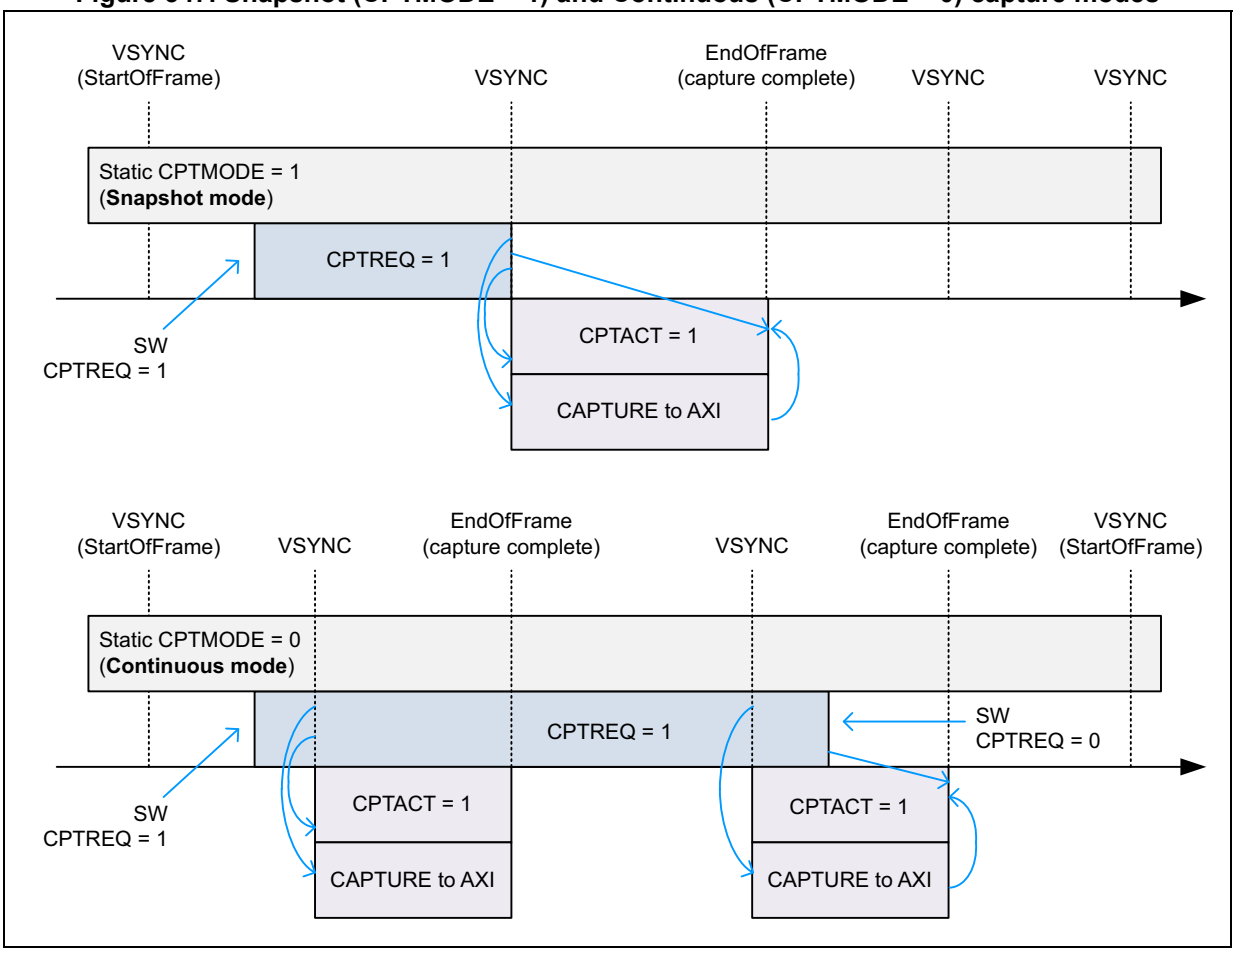


Table 384. DCMIPP_PxFCTCR bit function

Bit ID	Function	Values
CPTMODE	Capture mode	– 0: Continuous – 1: Snapshot
CPTREQ	Capture request	– 1: Capture requested
FRATE	Frame rate	– 0: Full rate capture – 1: 1/2-rate capture – 2: 1/4-rate capture – 3: 1/8-rate capture
CPTACT(1)	Capture status	– 1: Capture currently active

1. Bit read from the DCMIPP_PxSR register.

Configuration example

The software operations when using the Snapshot mode are the following:

1. Software sets CPTMODE = 1, to use the Snapshot mode.
2. Software sets PIPEN = 1, to let the flow selection send data to PipeN.
3. Software sets CPTREQ = 1, to request the capture of one frame.
4. At the first following VSync, the HW samples CPTREQ at 1, with the following impact:
   a) The capture effectively starts: pixels flow into the pipe and are dumped in memory.
   b) CPTACT is set to 1, to mention that a capture is currently ongoing, and that it is best to not modify the configuration of the pipe operators, unless shadowed.
   c) CPTREQ is reset to 0, so that only a single frame is dumped.
5. At the following capture complete interrupt
   a) CPTACT is reset to 0, to signal that the capture is over.
   b) The capture is complete, no more pixels are flowing, hence software can restart to update the configuration of non-shadowed registers without any issue, and use the captured pixels in memory. Depending upon the sensor blanking, this period can be short.
6. At the next VSync, CPTREQ usually is sampled at 0, so that no more frames are captured
   – As soon as CPTREQ is reset to 0 the software can set it again to 1, to request a capture at the following frame. It means that a continuous sequence of frame can be captured by setting again CPTREQ to 1, continuously frame after frame.

The software operations when using the Continuous mode are the following:

1. Software sets CPTMODE = 0, to use the Continuous mode.
2. Software sets PIPEN = 1, to let the flow selection send data to PipeN.
3. Software sets CPTREQ = 1, to request the continuous capture of frames.
4. At the first following VSync, CPTREQ is sampled at 1, with the following impact:
   – As in Snapshot mode, the capture starts, and CPTACT is set at 1.
   – Unlike the Snapshot mode, CPTREQ is not modified and remains at 1.
5. At the following capture complete interrupt:
   – As in Snapshot mode, CPTACT is reset to 0, capture stops, software can shortly reconfigure the pipes, and software can use the captured pixels.
6. At the next VSync, and as long as CPTREQ remains at 1, the capture restarts, similarly as described above.
7. To stop capturing later frames, software resets CPTREQ to 0.
   – An ongoing capture continues until completion.
8. At the next VSync, CPTREQ is sampled at 0, and the next capture does not restart.

42.4.9 Pipe deactivation

It is possible to abort a pipe to stop any frame acquisition and to potentially offer a mean to reprogram it completely (including non-shadowed registers), or to let it fully disabled for some time. The following operating mode has to be considered to correctly stop the pipe:

1. Disable the CPTREQ bit of the DCMIPP_PxFCTCR register of the corresponding pipe
2. Poll CPTACT = 0 status bit in the DCMIPP_CMSR1 register to check if the pipe is no longer active (idle state)
3. Disable PIPEN in the DCMIPP_PxFCTCR register.

When disabling the pipe, the last frame is processed completely by respecting the above operating mode.

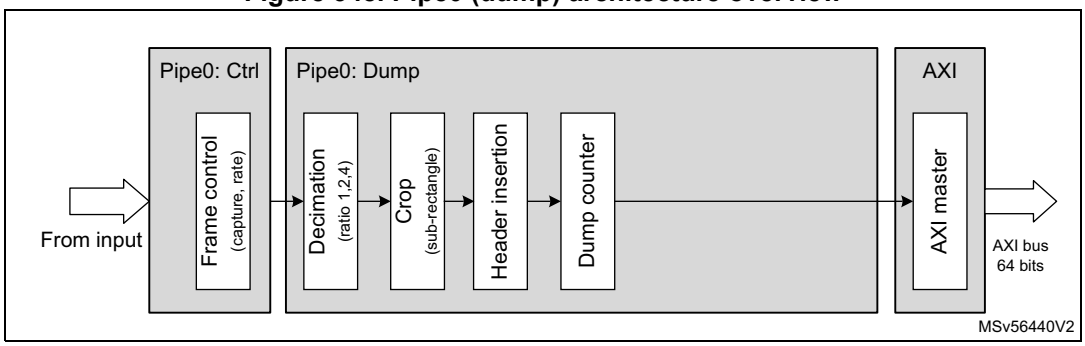
Note: To disable the parallel interface (PREN = 0 in the DCMIPP_PxFSCR), it is recommended to first disable the pipes considering the above operation mode, before switching off the parallel interface.

42.5 Pipe0 (dump pipe)

42.5.1 Overview

Pipe0 works as a dump pipe: it extracts data from the camera sensor module and dumps them (as-is) to the targeted memory, with some basic decimation and cropping 2D operations in between.

Figure 348. Pipe0 (dump) architecture overview



Pipe0 retrieves data from the camera sensor module connected to the DCMIPP through the 16-bit parallel interface or the CSI-2 interface, by means of the CSI-2 host controller peripheral. The selection between interfaces is managed by means of bit INSEL in the DCMIPP_CMCR register.

The flow selection chooses the virtual channels and data types to be processed by the pipe from the CSI2 host controller, see *Section 42.4.6* for more details.

The frame controller handles mainly the camera acquisition mode (continuous or snapshot, frame rate), see *Section 42.4.8* for more details.

When the input data from the camera is valid and supposed to be processed by Pipe0, 2D-cropping and decimation operations can be configured by the software. A dump counter combining with a limit amount of data to be set is offered to handle unknown length of data or to avoid the amount of data to be too wide within a frame.

Pipe0 can be reconfigured from time to time. Some events can be used to trigger the software reconfiguration routines (refer to *Section 42.13.2: Interrupts*).

It is also possible to write into the shadow registers within the processing of a frame. The values are loaded into the physical register based on the start of frame event.

42.5.2 Decimation

The decimation allows to cheaply downsize a frame.

Based on parallel interface camera module:

- Factor 1x, 2x, 4x at data/byte level depending on the configuration of bit field BSM[1:0] of the DCMIPP_P0PPCR register. The decimation is not working directly at pixel level, but it is based on either byte or 16-bit word granularity (for padded raw 10, for instance) to make equivalent decimation to one pixel out of two. Bit OEBS is used to start from the odd or even byte (or data) to capture first.
- The decimation can also be based on entire line, by capturing all the lines, or one line out of two thanks to bit LSM. Here, again, choice is given to the software to reject odd or even lines within the frame by configuring bit OELS.

When the camera sensor module is designed on CSI-2 interface, the decimation can be based filter out potentially, one line out of two. Indeed, each packet is by protocol composed for an entire line.

Note: Care must be taken when the CSI-2 header is dumped, as it is 32-bit wide, and it increases by one unit the data counter, taking part of the decimation. It is advised not to use the CSI header option when decimation takes place.

Table 385. DCMIPP_P0PPCR bit function

Bit ID	Function
BSM[1:0]	To select how much byte/data have to be captured within a line. This feature is available only for a parallel interface camera module.
OEBS	Allows the user to chose if the filtering starts from the odd or the even byte.
LSM	Possibility to filter out one line out of two.
OELS	The software can select if the filtering rejects the odd or even lines.

42.5.3 Crop/statistics selection/suppression

The dump pipe (Pipe0) has the capability to handle 2-D crop processing. The vertical cropping is based on line, thanks to HSYNC event (from the physical IOs or the embedded code detection if selected). It can be extracted from the CSI-2 packet information (each packet is one line wide by protocol).

The horizontal area on which the crop is applied is based on data (32-bit wide), and not on pixels since this pipe is not directly considering the pixels. It handles the data flow with 32-bit granularity. The CROP functionality is not supported when the pipe is convoying JPEG format. The ENABLE bit must be kept cleared into DCMIPP_P0SCSZR to avoid any unpredictable behavior.

The area to be captured within the frame has to be specified configuring the registers DCMIPP_P0SCSTR and DCMIPP_P0SCSZR. The starting point on the two axis are set accordingly as well as the width in both directions. It is possible to take the data inside or outside this area by means of bit POSNEG in the DCMIPP_P0SCSZR register. Some sensors can send sensor configuration data and statistics (histogram) on the very first and last lines of a frame. By specifying active the area outside of this window selection (POSNEG = 1), only statistic data are extracted by the way, and the software can decide to apply some processing on the data to correct, such as contrast or exposure.

Features

- 2D-Crop operation with granularity:
  - Lines in the vertical axis
  - 32-bit data in the horizontal axis
- Possibility to capture data inside or outside the defined window (valid image data or statistic data)
- Cropping with 0 value for HSIZE[11:0] or VSIZE[11:0] has no crop effect to the dimension for which the 0 value has been applied (vertical or horizontal axis).

Software configuration

Registers DCMIPP_P0SCSTR and DCMIPP_P0SCSZR have to be configured to set the crop feature into the dump pipe:

1. Configure the cropped horizontal starting point with HSTART[11:0] and the width with HSIZE[11:0] (both with a 32-bit data granularity).
2. Configure the cropped lines, starting at line VSTART[11:0] and with a height of VSIZE[11:0] (both with a line granularity)
3. If any value HSIZE or VSIZE is set to 0, the hardware does not consider crop operation in the vertical or horizontal dimension for which the 0 value has been applied, so that all the pixels in that dimension are sampled.
4. Select the inner or the outer part of the window for the data capture by configuring POSNEG bit.
5. Enable the crop feature setting ENABLE bit. This bit must be cleared when JPEG is selected as the input format for Pipe0.

Note: Cropping out the picture size (with too large HSTART or VSTART) leads to a not guaranteed processed frame.

42.5.4 Header insertion

The module works on the dump pipe(s) and it optionally inserts an header before the data of a former CSI packet.

Features

- Optionally inserts non-data information to help software interpreting the following data payload. The non-data info is Frame sync short packets and Header of data long packets (both non-data info into a 32-bit word), mapped as follows:
  - Frame sync short packet: defined by Frame type = SOF or EOF
    - > bits 31:16: Frame number
    - > bits 15:8: Reserved (forced to 0)
    - > bits 7:4: Virtual channel ID in CSI-2_v1.3, bits 7:6 = 00
    - > bits 3:0: Frame type (SOF = 0x1 or EOF = 0x2)
  - Header of data long packet (defined by below Frame type = DATA)
    - > bits 31:16: Amount of bytes in the payload
    - > bits 15:8: Data type ID in CSI-2_v1.3, bits 15:14 = 00
    - > bits 7:4: Virtual channel ID in CSI-2_v1.3, bits 7:6 = 00
    - > bits 3:0: Frame type (DATA = 0x0)

To keep consistency between the amount of bytes provided by the header versus those effectively dumped, it is recommended to not activate the header insertion simultaneously with the crop or decimation, as these functions modify the amount of dumped data.

When header insertion is active, the FrameEnd packet is dumped as a header, and is considered as the unique part of an additional line, inducing an event.

Software configuration

It is configured with the DCMIPP_P0PPCR register:

- HEADEREN:
  - 0: No header insertion
  - 1: Insertion of the headers, aligned on 32 bits.

42.5.5 Dump counter

The dump counter is present on dump pipe. It is used to count the amount of data that are dumped in that frame, and to potentially limit the amount dumped if too large. It allows the software to know the size of dumped buffer, and to make sure that no dump is made out of a preallocated buffer.

It is specifically useful when dumping a content whose length is unknown prior to reception, like an encoded JPG stream. When dumping a pixel frame, the size is known thanks to the configured width and height of the frame.

The counter is counting 32-bit data for almost all the input formats, even if the value is expressed in number of bytes. The counter increment is 4-bytes granularity for all formats except the JPEG byte stream input mode, for which the counter granularity is 8-bit because the application does not know the amount of dumped data.

Features

- Dump counter, counting the amount of bytes dumped. It counts the amount of dumped 32-bit words (the increment is 4), except when connected to a parallel interface camera and dumping a 8-bit data in byte stream mode (see FORMAT bit field in the DCMIPP_PRCR register), where it counts per byte (the increment is 1).
  - The counter saturates at 0x03FF_FFFF.
  - At FrameEnd, the counter value is recopied in a readable shadow register and the counter itself is reset to start the count of the next frame.
- Dump limit, that clamps the dumped words below a maximum limit:
  - If the counter reaches the limit, all following bytes are deleted until the next VSync.
  - The counter continues to count over the limit, to indicate how many bytes have been received and must have been dumped if not deleted.
- Interrupt limit is triggered when some bytes are deleted due to dump limit crossed.
- CSI headers, when dumped (HEADEREN = 1), participate to the counted and limited data volumes.
- Monochrome or raw Bayer padding (alignment of 10/12/14 bpp to 16 bpp) is also taken into account in data volumes.

Software configuration

Table 386. DCMIPP_P0DCCNTR and DCMIPP_P0DCLMTR bit function

Bit ID	Function
ENABLE	1: Enables the limit check.
CNT	Read-only, counts the amount of data with a 4-byte granularity for most of the input formats or with an 8-bit data granularity in JPEG byte stream mode selected into DCMIPP_PRCR.FORMAT). The counter increment is based on dumped data at the pipe output standpoint. The value is expressed in bytes, whatever the input format.
LIMIT	Gives the maximum amount of 32-bit data that can be dumped. Limit value 0 is inconsistent and the processed frame is not guaranteed if ENABLE bit is set.
LIMITIE	DCMIPP_PxIER.LIMITIE bit enables the interrupt.

Note: The dump counter sees the CSI-2 packet headers as normal 32-bit words. Raw Bayer and monochrome pixels on 10/12/14 bpc are padded onto 16 bits, and are thus slightly larger than their 10/12/14 bit size.

42.6 Pipe1 (ISP part)

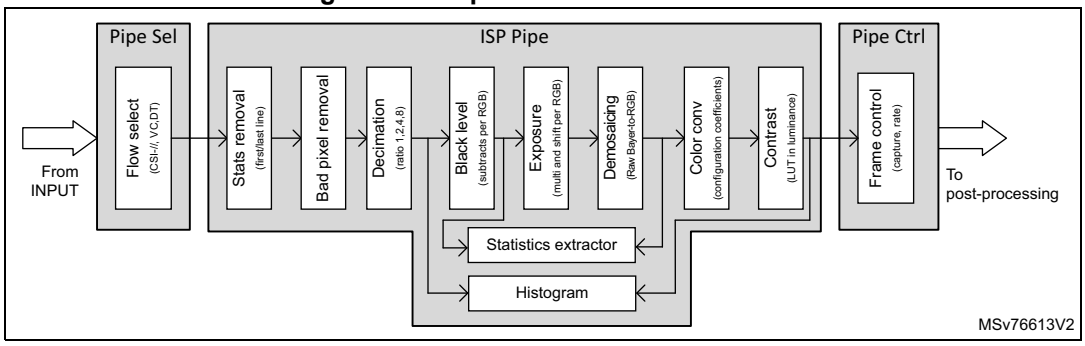
42.6.1 Overview

Pipe1 is a pixel pipeline in which some image processing (ISP) and post-processing functions are integrated, to relieve the software from very specific (time and memory consuming) operations. The ISP part implements functions like:

- Statistics removal within the dataflow
- Bad pixel detection to automatically remove noisy pixels
- Basic decimation to reduce high resolution camera sensor to fit with the image processing maximum resolution tolerance
- Auto exposure and statistics extraction based on pixel analysis
- Demosaicing algorithm to convert raw Bayer input pixels to RGB ones
- Color conversion and contrast enhancement functions

Pipe1 ISP block diagram is shown in *Figure 349*.

Figure 349. Pipe1 ISP architecture view



Pipe1 is the most featured pixel pipeline, even if the image processing functions can be shared with Pipe2 (refer to *Section 42.8.2*).

Pipe1 retrieves data from the camera sensor module connected to the DCMIPP with the 16-bit parallel interface or with the CSI-2 interface, thanks to the external CSI-2 host controller peripheral. The selection between interfaces is managed by means of bit INSEL in the DCMIPP_CMCR register.

The flow selection chooses the virtual channels and data types to be processed by the pipe from the CSI2 host controller. Refer to *Section 42.4.6: Flow selection* for more details.

The frame controller handles mainly the camera acquisition mode (continuous or snapshot, the frame rate). Refer to *Section 42.4.8: Frame control*.

Pipe1 can be reconfigured from time to time. Some events can be used to trigger the software reconfiguration routines (refer to *Section 42.13.2: Interrupts*).

It is also possible to write into the shadow registers during the processing of a frame. The values are loaded into the physical register based on the following start of frame event.

42.6.2 Byte-to-pixel conversion

The module works on the pixel pipes: it gets 32-bit words from the input (parallel or CSI) interfaces, extracts the pixels depending on the provided pixel format, and maps them onto the triple-component pixel pipeline, that is 14 bpc at this stage (and 8 bpc later downstream).

Functionality

- Extracts various input pixel formats to a triple R, G, B lane
  - All CSI-2 formats of versions CSI v1.3 and v2.0 are supported, except Raw 6/7 bpc, YUV422-10 bpc, YUV420 (see *Table 379*)
- YUV420-to-YUV444 conversion is not supported
  - Pipe1 and Pipe2 cannot extract and process YUV420 pixels received from the CSI interface
- YUV422-to-YUV444 conversion:
  - Done by replication of the U and V components. It thus assumes that the location of the common chroma is defined at mid-distance between the two pixels.
- Extension of short triple component (RGB/YUV) to the output triple 8 bpc:
  - The extension is done by replicating the input MSB onto the missing output LSB. The replication onto the LSB allows to map any input dynamic on the full downstream dynamic.
  - Examples of 5 and 6 bpc extended to the output 8 bpc:
    - > Input Di[4:0]: Output Do = Di[4:0] and Di[4:2]
    - > Input Di[5:0]: Output Do = Di[5:0] and Di[5:4]
- Keeps as-is the single-components, usually wide:
  - The monochrome and raw Bayer 10/12/14 bpc are fed into the pipes as-is (the monochrome assumes a Y, with U = V = 128).

Software configuration

The used pixel format depends upon the source of the pixels:

- CSI-2 interface: the pixel format is embedded in the received CSI-2 packets, and defined in the data type field of the packet header.
  - When FDTFEN = 0, the byte-to-pixel conversion uses the data type provided by the CSI-2 packet, and works automatically, without need for any configuration.
  - When FDTFEN = 1, the data type is configured by software in the FDTF field.
- Parallel interface: the pixel format is determined by the source of the pixels, i.e. the camera sensor. The byte-to-pixel extracts the pixels based on the pixel format provided by the software in the parallel interface configuration, in the field of the DCMIPP_PRCR register.

42.6.3 Statistics removal

The module is used to removing potential statistic data inserted by a sensor, prior to starting the demosaicing conversion that is multi-pixel and would be impacted by remaining statistics. It is typically used by sensors with a parallel interface, which does not have any way to distinguish between statistics and pixel data. CSI-2 sensors typically split these flows using different virtual channel IDs.

Features

- Suppression of some of the first lines of the frame.
- Suppression of the last lines of the frame, after a configured line N.

Software configuration

Table 387. DCMIPP_P1SRCR bit function

Bit ID	Values	Comments
CROPEN	1: Active	If CROPEN = 0 all pixels are fed through.
FIRSTLINEDEL	0 to 7	Amount of first lines to delete when CROPEN = 1
LASTLINE	0 to 4094	Amount of lines to keep after the removed first lines. If LASTLINE is null, all remaining lines after FIRSTLINEDEL are fed through.

Configuration example

If the received frame contains four lines of statistics, followed by 100 lines of pixels and eight lines of ancillary data, the configuration to extract the 100 lines of pixels is the following:

- CROPEN = 1, to have the removal active
- FIRSTLINEDEL = 4, to remove the first four lines
- LASTLINE = 100, to keep the next 100 lines

42.6.4 Bad pixel removal

This module aims at detecting and correcting artifacts generated by a bad pixel on the sensor array. It is based on a correlation extraction, and not on fixed locations.

Functionality

- Works for raw Bayer flows only, as RGB flows are assumed as already processed.
- Scans all the arriving components, and extracts the horizontal continuity correlation versus the two left and two right neighbors, on both the local component and on the adjacent raw Bayer component:
  - if a component is seen as too light, it is declared as bad
  - too dark components are not extracted, to avoid false positives
- A component assumed bad is replaced by the horizontal average of its two neighbors (with the same component).

Software configuration

Table 388. DCMIPP_P1BPRCR and DCMIPP_P1BPRSR bit function

Bit ID	Function
ENABLE	– 1: Active – 0: No component checked nor replaced. To be enabled only for raw Bayer flows, as it corrupts RGB flows.
STRENGTH	3 bits, 0 (high tolerance) to 7 (aggressive detection)
BADCNT	12-bit counter, reporting the amount of bad components corrected. The counter saturates at its maximum value (4095). At FrameEnd, the counter is re-clocked (the read value remains stable one full frame), even if the frame is skipped (not captured), and reset to restart accumulation at the next frame.

Configuration example

A too aggressive bad pixel detection might detect false bad pixels and erroneously correct them (it can occur for very thin light vertical lines that cannot be distinguished from bad pixels in the implemented horizontal filter). To avoid such artifacts, it is advised to setup a software loop-back that tunes the filter strength so that the detected bad pixels remain within a predefined valid range.

Start configuration (or without software feedback loop):

- ENABLE = 1 (enabled)
- STRENGTH = 0 (high tolerance)

Software feedback loop:

Assumes a maximum amount of 100 bad pixels on the array (any other value can be used).

- BADCNT read: gets the amount of corrected bad pixels of the last frame
- Low-pass filter on the BADCNT, and/or hysteresis
  - BADCNT > 100: too aggressive, decrease STRENGTH
  - BADCNT < 30: too tolerant, increase STRENGTH (assuming there are bad pixel on the array)

Note: The expected amount of bad pixels (100 in the above example) can be set to other values, or made dependent upon the equivalent gain of the sensor (analog gain, exposure duration). A high-gain picture has more noisy pixels and can accept a more aggressive filter to smooth the noise, while a low-gain picture has mostly correct pixels, only very uncorrelated pixels need to be corrected.

42.6.5 Input decimation

The decimation makes it possible to cheaply downsize a frame, by a factor 2, 4, or 8, in both horizontal and vertical directions. It supports a special mode adapted to a raw Bayer format in input.

The decimation is redundant with the downsize, that brings a higher quality (the decimation discards the data of the dropped pixels, while the downsize averages all pixels and does not lose information).

The decimation has two main usages:

- Reduces the width of very high resolution sensors to one accepted by the raw Bayer-to-RGB conversion. Indeed, the raw Bayer-to-RGB embeds a line buffer that limits its processed images to a maximum width of 2688 pixels. The decimation makes possible, for instance, to plug a 12 Mpixel sensor (4000 x 3000), decimate its width by a factor 2x to 2000 pixels wide, and have it converted to RGB.
- Complements the downsize (limited to ratio of 8 x 8), to have a combined downsizing ratio of 64 x 64. It is recommended to have the largest ratio implemented in the downsize, and the decimation complement to that. For instance, for a ratio 30x, is it recommended to have a ratio 4x in decimation, and a ratio 30 / 4 = 7.5 in the downsize.

Features

- Forwards one item every 1, 2, 4, 8 pixels, independently, vertical and horizontal.
- Supports raw Bayer formats, where RG-GB components must remain grouped. In that mode the above forwarded items are not pixels, but a double component (for example R and G or G and B for a RGGB format), in both vertical and horizontal directions. For instance, with a decimation of 2x, the input sequence R0, G0, R1, G1, R2, G2, R3, G3 gets forwarded as R0, G0, R2, G2 and not R0, R1, R2. The same applies vertically.

Software configuration

Table 389. DCMIPP_P1DECR bit function

Bit ID	Function	Value	Comments
HDEC[1:0]	Ratio (2 bits)	0	No decimation
		1	Ratio 1/2
		2	Ratio 1/4
		3	Ratio 1/8
VDEC[1:0]		0	No decimation
		1	Ratio 1/2
		2	Ratio 1/4
		3	Ratio 1/8

The raw Bayer mode in decimation is indirectly activated when the Datatype is defined as raw Bayer.

42.6.6 Black level calibration

This module suppresses a potential positive black level offset, which happens when the sensor sends non-null pixels when capturing a black picture.

Functionality

- Subtracts an offset from the R, G, B components.
- A different constant is used for R vs. G vs. B, including within raw Bayer pixels.

Software configuration

Table 390. DCMIPP_P1BLCCR bit function

Bit ID	Value	Comments
ENABLE	– 1: Active – 0: Bypasses R, G, B components	-
BLCR	-	8-bit offset, for red
BLCG	-	8-bit offset, for green
BLCB	-	8-bit offset, for blue

The offset subtracted is aligned components MSB: for instance, if components are defined on 12 bits, the 8-bit offset subtracted for red is BLCR « 4.

Configuration example

It is possible to use the statistics extraction, to extract the long-term most-dark R, G, B components, and assign their darkness as black. Their RGB values become the black level offset for each RGB.

For a raw Bayer sensor with 12-bit components, if the measured black level offset for red is 64 (out of a maximum of 4095), configure BLCR as 16.

42.6.7 Exposure compensation and white-balance calibration

This module aims at compensating bad exposure (too short/dark or too long/light), and at compensating a bad color balance to recenter the colors to more white ones.

The exposure and white balance operations are purely linear, and do not distort colors if performed correctly.

Functionality

- Multiplies R, G, B by a configured floating-point constant.
- A different constant is used for R vs. G vs. B, including within raw Bayer pixels.

Software configuration

Table 391. DCMIPP_P1EXCR1 and DCMIPP_P1EXCR2 bit function

Bit ID	Value	Comments
ENABLE	– 1: Active – 0: Bypasses R, G, B components	-
MULTR, SHFR	-	8-bit multiplier (mantissa), and up-shift value (0, 1, 2, 3, 4, 5, 6, 7) for red components.
MULTG, SHTG	-	8-bit multiplier and exponent, for green components.
MULTB, SHTB	-	8-bit multiplier and exponent, for blue components.

The idle setting (that sends out a similar value as input) is:

- MULTR = MULTG = MULTB = 128
- SHFR = SHFG = SHFB = 0

Similar idle couples are MULTx = 64 and SHFx = 1, or 32 and 2, or 16 and 3.

Configuration example for exposure alone

It is recommended to use the exposure control in conjunction with the contrast enhancement below in the pipe: the idea is to deliberately keep an exposure lower than ideal, to avoid burning the whites: the contrast enhancement, thanks to non-linear operator on luminance, lightens the dark pixels, and reduces the dynamic of the light pixels without burning them.

It is recommended to use the statistics to extract the average luminance across the whole frame (done best by extracting the R, G, B averages, and computing the luminance from the RGB).

The idea is to push the average output luminance to 128, or if working with the contrast enhancement too, to push it to a lower value, for instance 64.

When measuring an average luminance of 26 (target is 64), the exposure factor to apply is 64 / 26 = 2.5x = 1.25x * 2, hence the following configuration must be set:

- MULTR = MULTG = MULTB = 128 * 1.25 = 160
- SHFR = SHFG = SHFB = 1

Configuration example for an additional white balance

An example of easy way to recenter the colors is using the Gray-world algorithm.

This algorithm assumes that a default scene has an inherent balance of its red, green, and blue pixels, so that the average values of the red, green, and blue components across the ideal picture are the same. If the measured averages are not the same, it means that there has been a distortion of the white balance, that must be corrected by amplifying or reducing the red, green, and blue strengths in the exposure module, thanks to the differentiated red vs. green vs. blue multipliers and exponents.

In practice this is the same approach used for the exposure compensation, but, instead of forcing the output luminance to a default target (64 in the example), user must force the red, green, and blue averages towards the same exposure target.

As an example:

- Exposure target is defined as 64.
- Measured red is 26: red factor is 64 / 26 = 2.5x, hence MULTR = 160, SHFR = 1.
- Measured green is 32: green factor is 64 / 32 = 2.0x, hence MULTG = 128, SHFG = 1.
- Measured blue is 10: blue factor is 64 / 10 = 6.4x, hence MULTB = 205, SHFB = 2.

42.6.8 Demosaicing

The module works on the pixel pipes, and implements a mid-quality conversion from raw Bayer 8 bpp to an RGB 24 bpp, with no implicit half-sizing: the output RGB pixel rate is the same as the input component rate.

The conversion targets real-time but medium quality purposes, like display or low-resolution software analysis. For higher quality conversions, it is recommended to convert the raw Bayer in software, with higher quality algorithms but limited to non-real-time, thus still-picture applications.

The algorithm takes the surrounding 3 x 3 components in input, applies linear heuristics to determine the most likely missing components, and generates an output RGB888 pixel.

To provide the 3 x 3 input matrix to the algorithm, the demosaicing module embeds a double line-buffer, 2 x 2688 components wide. As such, it limits the maximum width of a converted demosaicing buffer to 2688 components/pixels wide. Wider camera sensor resolution can be connected and goes through the first decimation stage in front of the demosaicing operation.

Note: This demosaicing conversion algorithm can create some artifacts, like Zipper. Such artifacts are much reduced by a later downsizing or even suppressed for a 2 x 2 downsizing. Applications like display, video encode, or software analysis usually require such a downsize, so the artifacts become invisible.

The underlying heuristic filters try to extract and adapt to edges, horizontal and vertical lines, and lone pixels.

Functionality

- Input pixel format: from 1 (raw Bayer) to three (RGB/YUV) components on 8 bits
- Max input width of 2688 components
- Demosaicing conversion:
  - 2-line buffer
  - provides a 3 x 3 matrix to the algorithm + one trailing component (2 left)
  - Extraction and optimization for specific shapes:
    - Edges (on left, right, top, bottom)
    - Lines (horizontal and vertical)
    - Peaking (lone pixels detection)
- Output pixel format: three RGB components on 8 bits.

Software configuration

Table 392. DCMIPP_P1DMCR bit function

Bit ID	Values	Comments
ENABLE	– 1: Active – 0: Bypasses R, G, B components.	If the camera sensor transmits an RGB or YUV frame and not raw Bayer, the demosaicing conversion must be disabled, by setting Enable = 0. All other parameters are ignored.
TYPE	– 0:RGGB – 1:GRBG – 2:GBRG – 3:BGGR	Default raw Bayer with three components (R, G, B)
EDGE	– 0: No edge detection, pure linear interpolation – 1 to 7: Relative algorithm strength (respectively 3, 4, 6, 8, 12, 16, 24)	-
LINEH	– 0: No horizontal line detection, pure linear interpolation – 1 to 7: Relative algorithm strength (respectively 3, 4, 6, 8, 12, 16, 24)	-
LINEV	– 0: No vertical line detection, pure linear interpolation – 1 to 7: Relative algorithm strength (respectively 3, 4, 6, 8, 12, 16, 24)	-
PEAK	– 0: No peak detection, pure linear interpolation – 1 to 7: Relative algorithm strength (respectively 3, 4, 6, 8, 12, 16, 24)	-

The four filters, EDGE, LINEH, LINEV, PEAK, improve the zoomed accuracy of the filtered picture (thus mostly luminance correctness, like no Zipper artifact), however at the expense of some chrominance blurring or distortion. Some scenes can require specific settings:

- Scenes where chrominance distortion is very visible (like a mostly black and white scene viewed by an RGB sensor) can require lower strength of the filters.
- On the opposite, scenes heavily loaded with geometric shapes (and thus source of artifacts) can require strengthening the filters.

Globally, 6/4/4/2 is a good compromise for the filter strength.

Configuration example

If the camera sensor is raw Bayer, with a grid with a red top-left pixel, the next configuration can be used:

- ENABLE = 1 to have the demosaicing active
- TYPE = 0 to have a top-red pixel, thus a RGGB grid
- EDGE, LINEH, LINEV, PEAK = (4, 4, 4, 4) as typical setting (so an internal strength of 8 for each parameter).

42.6.9 Color conversion

This module implements a color conversion with flexible (fully programmable coefficients), which can be used to map the following features:

- YUV-to-RGB: when the pixels of a YUV-sensor are used as RGB (display, GPU)
- RGB-to-YUV: when the pixels of a RGB-sensor are used by software (for example video encode)
- Tone change: to map special color references (sepia), emphasize some tone/colors
- Monochrome: to compute a monochrome from RGB/YUV with a specific linear mix
- Expansion: to handle a YUV (or RGB) expansion or compression
- Gamma: to emulate a gamma correction via a linear scale

Features

- Linear rotation of color space: 3 x 3 matrix + 3 x 1 column.
- Clamping optional on either [16 to 235] for Y, R, G, B and [16 to 240] for U, V.

Software configuration

Table 393. DCMIPP_PxCCyy (yy = R0, R1, G0, G1, B0, B1) bit function

Bit ID	Value	Comments
ENABLE	– 1: Activates the color conversion	-
CLAMP	– 1: Clamps the output pixel, when using a reduced dynamic	-
TYPE	– 1: Clamps as RGB – 0: Clamps as YUV	-
Matrix3x3_Coeff	-	11 bits (sign, 2 int, 8 dec, with sign as complement to 2)
Added3x1_Coeff	-	10 bits (sign, 9 int, with sign as complement to 2)

Configuration example

Table 394 provides examples of the most used conversions:

- To / from RGB from/to YUV (as SDTV ITU-R BT.601 or HDTV BT.709).
- With a full (0 to 255) or a reduced (16 to 235) dynamic for Y and RGB, 16 to 240 for CbCr.
- Matrix fields are defined as XY bit fields in the color conversion coefficient registers, with X being the input R or G or B, and Y being the output R or G or B. For conversions to/from YUV, the R must be assumed as Cr (= V), G must be assumed as Y, and B must be assumed as Cb (= U).
- Coefficients are defined signed, and multiplied by 256 when there are decimals (the matrix coefficients). Negative values are on 11 bits: N11(val) = XOR (val, 0x7FF) + 1, on 10 bits for Added_Coeff: N10(val) = XOR (val, 0x3FF) + 1.

Table 394. Color conversion: examples of coefficients

Conversion	Output components	Input components				
RGB-255 to YUV601-255	-	R	G	B	Added	Clamping

42.6.10 Contrast enhancement

This module ends the image processing pipe. It makes possible to enhance the contrast of the frame, by non-linear emphasis of the luminance of the pixels, and to provide more luminance quantification steps at highly used luminances (usually central grays), by reducing the amount of quantification steps less used by the picture (usually the few very dark and very light pixels).

Functionality

- Inputs RGB from the pipe
- Computes the luminance of the local pixel
- Extracts the desired luminance increase/decrease factor, in function of the input luminance, non-linearly (using a look-up table)
- Multiplies the input RGB with the amplification factor
- Outputs the clamped RGB components on 8 bits

Software configuration

Table 395. DCMIPP_P1CTCR1,2,3 bit function

Bit ID	Values	Comments
ENABLE	– 1: Active – 0: Bypasses R, G, B components	-
LUMx (x = 0 to 8, respectively inputs at 0, 32, 64, 96, 128, 160, 192, 224, 256)	0 to 63	Amplification factor: – LUMx = 8 halves the pixel luminance – LUMx = 16 does not modify the pixel luminance – LUMx = 32 doubles the pixel luminance

Configuration example

There are multiple approaches to handle contrasts.

It is possible to flatten the spectrum of luminance density (that is, to try have a similar amount of pixel per each segment of luminance), which is to fill each of the eight segments of luminance with 12.5% of the pixels of the frame.

An intermediate approach is to proceed with only the upper and lower half pixels: half of pixels must have a luminance below and another half above the mid-dynamic (128 for 8-bit components).

It is advised to use the statistics extraction module, sample the luminance after the exposure control (to avoid an impact on the exposure compensation), and sort it in the 12 available bins (refer to *Section 42.6.11*). From the extracted bins the user must linearly extrapolate the luminance of the median of the amount of pixels. The luminance of median pixel must be increased/decreased to be moved to the targeted output median luminance, which is recommended to be the median dynamic (128).

For instance, a 400 kpixels VGA picture can have 200 kpixels below a luminance of 64, and the other 200 kpixels above that value. The ideal luminance amplification factor can be set to 128 / 64 = 2x:

- pixels darker than 64 are lightened by a factor 2x
- pixels lighter than 64 are lightened a bit less, decreasingly
- pixel of luminance of 255 get an idle, 1x, factor.

The above assertions can be used to compute the LUMx values to configure:

- Ratio 2x from lum = 0 to 64:
  - LUM0 = LUM1 = LUM2 = 32.
- Decreasing ratio from 32 to 256, best exponentially decreasing:
  - LUM3 = 27
  - LUM4 = 23
  - LUM5 = 20
  - LUM6 = 18
  - LUM7 = 17
  - LUM8 = 16 (the maximum luminance, 256, must remain idle).

42.6.11 Statistics extraction

This module extracts several statistics across the frame, to provide inputs to the software image compensation algorithms, that configure feedbacks to the following implemented hardware modules: black level calibration, exposure compensation, white balance, and contrast enhancement.

The statistics are accumulated during a full frame, and sampled at the end of the frame, thus allows the software to have the full next frame to read the accumulated statistics, process them, define the adapted configuration for the hardware feedback modules, and to configure these modules.

Thanks the shadowing mechanism, the newly configuration parameters are active at the following frame, thus active at an average two frames after the statistics are accumulated. The statistics extraction block is considering all frames selected by means of the DCMIPP_P1FSCR configuration registers. Statistics block is running even when the frame is not supposed to be captured, respect to the DCMIPP_FCTCR configuration register.

The latency is not an issue, as the captured scene is expected to be almost static, and typical software compensation algorithms filter the statistic variations to avoid oscillations and visual artifacts (the low-pass filter typically has a one-second period).

Functionality

- Three statistics accumulators available, allowing three statistics extractions per frame.
  - Different types of statistics can be extracted frame over frame
- 32-bit accumulators, allowing to accumulate 8-bit samples over 16 Mpixels.
- Average mode, that extracts averages (accumulates component values)
  - Capability to discard extreme values (if value is <16 or >240, same for 32 or 64).
- Binning mode, which extracts presences (accumulates 256 per fit)
  - 12 available bins (values: <4, <8, <16, <32, <64, <128, and reverse to 256).
- Capability to define a sub-rectangle within the frame where statistics are extracted
  - Allows to focus the statistics on a specific region of interest.
- Raw Bayer supported, with the statistics using the specific locally available R, G, B components of the raw Bayer
- Statistics can be performed on either the input data (before any pixel modification) or after demosaicing, to benefit of a full RGB and thus luminance presence per pixel.

Software configuration

Table 396. DCMIPP_P1STyCR (y = 1, 2, 3), DCMIPP_P1STySR (y = 1, 2, 3), DCMIPP_P1STSTR and DCMIPP_P1STSZR bit function

Bit ID	Value	Comments
ENABLE	– 1: Active – 0: Bypasses R, G, B components	-
MODE	– 0: Average mode	Values of pixels are accumulated as-is.
	– 1: Bin mode	Values of pixels are used to see if the pixel fits one of the 12 bins

Table 396. DCMIPP_P1STyCR (y = 1, 2, 3), DCMIPP_P1STySR (y = 1, 2, 3), DCMIPP_P1STSTR and DCMIPP_P1STSZR bit function (continued)

Bit ID		Value	Comments
SRC (3 bits)		– (R, G, B, L)_up	– Up: refers to sampling after black level. – L: luma (Y') computed as R / 4 + G / 2 + B / 4 when receiving RGB pixels, (R or G or B) when in raw Bayer mode.
		– (R, G, B, L)_down	– Down: refers to sampling after demosaicing (raw Bayer to RGB conversion), thus after both the exposure and white balance compensation, and when true RGB components (and thus luminance components) are available.
BINS (2 bits)	MODE = Average	– 0: AllPixels: no components are rejected – 1: NoExt16: components are rejected if < 16 or ≥ 240 – 2: NoExt32: components are rejected if < 32 or ≥ 224 – 3: NoExt64: components are rejected if < 64 or ≥ 192	Enables to reject extreme data, not accumulated for statistics. Additional statistics (with MODE = Bin) are needed to count the amount of selected pixels. BINS = 0 is likely to be the most used setting.
	MODE = Bin	– 0: Low: Accu0 counts if V < 4, Accu1 if V < 8, Accu2 if V < 16 – 1: LowMid: Accu0 counts if V < 32, Accu1 if V < 64, Accu2 if V < 128 – 2: UpMid: Accu0 counts if V ≥ 128, Accu1 if V ≥ 192, Accu2 if V ≥ 224 – 3: Up: Accu0 counts if V ≥ 240, Accu1 if V ≥ 248, Accu2 if V ≥ 252	Counts the amount of components V.
CROPEN (1 bit)		– 1: Statistics extracted from sub-rectangle – 0: Statistics extracted from whole frame	-
VSTART (12 bits)		-	Upper position of rectangle, from which statistics are extracted.
HSTART (12 bits)		-	Left position of the rectangle, from which statistics are extracted.
VSIZE (12 bits)		-	Height of the sub-rectangle, from which statistics are extracted.
HSIZE (12 bits)		-	Width of the sub-rectangle, from which statistics are extracted.
ACCU (24 bits)		-	Result of the 32-bit accumulation, re-sampled at frame boundary, and divided by 256 to fit the ACCU width of 24 bits.

Note: If HSIZE or VSIZE = 0 when the CROPEN bit is set, the block internally forces the "0" value at the maximum for the corresponding bit field (i.e. 0xFFE).

Table 397. Statistics extraction: collected data vs. modes

Mode	Average		Bin	
SRC	RGB	Raw	RGB	Raw
R, G, B up	012 = R / G / B	012 = RGB / 0 / 0	012 = R / G / B	012 = RGB / 0 / 0
L up	012 = R / 4 + G / 2 + B / 4	012 = RGB + 0 + 0	012 = R / 4 + G / 2 + B / 4	012 = RGB + 0 + 0
R, G, B down	012 = R / G / B	-	012 = R / G / B	-
L down	012 = R / 4 + G / 2 + B / 4	-	012 = R / 4 + G / 2 + B / 4	-

Configuration example for exposure control

For exposure control and white balance calibration, user would typically extract the average values of the luminance, and of the R, G, B. It can be done in a single frame capture campaign, with the following settings:

- ENABLE = 1 (enabled)
- MODE = 0 (average mode)
- SRC = 0 for red, 1 for G, 2 for B (upper values, before processing)
- BINS = 0 (all pixel values)
- CROPEN = 1 (1 below: to select a 300 x 220 close to top-left corner: 10,10)
- VSTART = 10
- HSTART = 10
- VSIZE= 220
- HSIZE= 300

After one frame (after a VSync), the Accu0, Accu1, Accu2 counters contain, respectively, the average red, green, blue accumulated across the 300 x 220 rectangle.

The value to expect from the Accu0, Accu1, Accu2 can be computed according to the following hypotheses:

- Amount of pixels: 300 x 220 (or full frame if statistics has CROPEN = 0)
- Amount of components:
  - Raw Bayer-red: 1/4, as one pixel every four in raw Bayer has a red component.
  - Raw Bayer-green: 1/2, as one pixel every two in raw Bayer has a green component.
  - Raw Bayer-blue: 1/4, as one pixel every four in raw Bayer has a blue component.
  - RGB: 1, as all pixels contain R, G, B components.
- Average value on 8 bits: 128 typically for a mid-gray picture (RGB: 128, 128, 128).
- Re-sampling: 1/256 (re-sampling accumulator to ACCU at end of frame).

The expected values in the accumulators are:

- Accu0 (red): 300 x 220 / 4 x 128 / 256 = 8250
- Accu1 (green): 300 x 220 / 2 x 128 / 256 = 16500
- Accu2 (blue): 300 x 220 / 4 x 128 / 256 = 8250

Configuration example for contrast enhancement

For contrast enhancement, the amount of pixels with a luminance inside a bin is typically extracted. As statistics are extracted 3 by 3, and as 12 bins can be accumulated, data are extracted during four consecutive frames, with three different bins for each frame.

The typical configuration is the following:

- ENABLE = 1 (enabled)
- MODE = 1 (bin mode)
- SRC = 3 (upper value, luminance selected)
- BINS = 0 (then, at next frame 1, then 2, then 3)
- CROPEN = 0 (no stat sub-rectangle)

After one frame (after a VSync), Accu0, Accu1, Accu2 counters contain the amount of pixels fitting bins <4, <8, <16, respectively.

The value to expect from the Accu0, Accu1, Accu2 can be computed by multiplying the following:

- Amount of pixels: 640 x 480 (assuming a full frame resolution of VGA).
- Amount of components: 1 (all pixels contribute to the luminance, even in raw Bayer).
- All pixels contribute to the statistics, both in raw Bayer and in RGB. In raw Bayer, a fake statistics is extracted, assuming a RGB-balanced pixel (Gray-world algorithm).
- Average value for bins: 256 (as in Bin mode, 256 is added for each fitting presence).
- Re-sampling: 1/256 (at end of frame)

The resulting value in accumulators are:

- Accu0 (bin < 4): 640 x 480 x 1 x 256 / 256 x 1% = 3072 (assuming 1% of pixels have lum < 4)
- Accu1 (bin < 8): 640 x 480 x 1 x 256 / 256 x 3% = 9000 (assuming 3% of pixels have lum < 8)
- Accu2 (bin < 16): 640 x 480 x 1 x 256 / 256 x 8% = 24000 (assuming 8% of pixels have lum < 16)

At the following frame, with BINS = 1, the statistics for luminance <32, <64, <128 are extracted, providing figures like 72k (25%), 144k (50%), and 210k (75%).

Such values indicate a median luminance ~64, as 50% of the pixels have a luminance <64.

42.6.12 Histogram

This module extracts from the ongoing frame histograms as statistic informations, and dumps them to external memory via the AXI.

The histograms can be computed from various location of the ISP pipe (before or after some key processing), computed on the full frame or across a grid of region, and one or more pixel components.

Functionality

- Configurable location of the sampled region(s) from which the histogram is extracted. It allows to focus the histogram on specific region of interest.
- Configurable amount of regions, shaped in a grid, with independent amount (vertically or horizontally), that can be 1 to 16: 1 to 4 histograms are extracted per region.
- Configurable bins per histogram: each histogram can contain 4, 16, 64, or 256 bins.
- Configurable dynamic of the input pixels. It is possible to concentrate on the dark pixels (to tune the black level), or in the opposite, to concentrate on the light pixels and the full dynamic (to tune the contrast). When the input pixel dynamic extends the bin dynamic, the upper bin collects the presence of all the too high pixel values.
- Configurable decimation (vertical and horizontal) of the extracted pixels, to tune the total sampled pixels and the local sampling rate.
- Configurable component selection: one or four among the available RGrBGb or RGBL.
- An interrupt is generated when the capture of the histogram statistics across the AXI has been completed. Two other interrupts warn that the software configuration is inconsistent or the memory bandwidth has not been high enough.

Software configuration

The software configuration register of the histogram (DCMIPP_P1HSCR) is shadowed, and can be updated from frame to frame.

Table 398. DCMIPP_P1HSCR, DCMIPP_P1HSSR, DCMIPP_P1HSMAR1, DCMIPP_P1HSMAR2, and DCMIPP_P1HSSMAR bit function

Bit ID	Function
EN	Activates the histogram extraction and write-out on the AXI to the external memory.
SRC	Selects the stage in the ISP pipe, from which the histograms are built. – Can be early and in raw Bayer pixel format, before any pixel processing after the decimation, or just before the exposure or the demosaicing. – Can be later, after the demosaicing and thus in RGB pixel format, before the ColorConv, or before the Contrast, or after the ISP processing. When a source is selected after the demosaicing, a RGB format is considered by the implementation.
HREG	Horizontal amount of regions per frame: 1 to 16 regions.
VREG	Vertical amount of regions per frame: 1 to 16 regions.
HDEC	Decimation in H of the input pixels, before extracting the histograms. A decimation factor of 1, 2, 4, 8, 16x can be applied. It makes possible to reduce the total amount of pixels to sample, or the pixel rate to sample.
VDEC	Decimation in V of the input pixels, before extracting the histograms. A decimation factor of 1, 2, 4, 8, 16x can be applied.
BIN	Bin amount per histogram, can be 4, 16, 64, or 256 bins. The bins are linearly spaced (they have the same width).
DYN	Selects the dynamic of the input components. The histogram can concentrate on the dark, the semi-dark, the semi-light, or the light value. The latter configuration (the recommended setting) balances the histogram across the whole dynamic range of the input sample.

Table 398. DCMIPP_P1HSCR, DCMIPP_P1HSSR, DCMIPP_P1HSMAR1, DCMIPP_P1HSMAR2, and DCMIPP_P1HSSMAR bit function (continued)

Bit ID	Function
COMP	Selects which components are extracted to build a histogram: 1 or 4 components are selected, and 1 or 4 histograms built. Depending on the input source, the four collected components are: – if rawBayer: R, Gr, B, Gb – if RGB: R, G, B, – if YUV: V, Y, U, V/4 + Y/2 + U/4 – if monochrome: 128, Y, 128, 128/4 + Y/2 + 128/4
HSTART VSTART HSIZE VSIZE	Location and size of the top-left region. The regions have all the same size. HSIZE and VSIZE must be multiple of their respective decimations.
MA	Memory address where the histograms are stored in the system memory. It is a multiple of 16 (the four LSBs must be 0). The address is configured in DCMIPP_P1HSMAR for the next frame. The last dumped address is in DCMIPP_P1HSSMAR register.

The histogram module is an open toolbox, that must be configured consistently. An inconsistent configuration leads to unpredictable and non-supported behaviors. The constraints are the following:

- Local storage capability:
  - The histogram module embeds a storage for 320 bins, shared for a line of region.
  - Depending on the amount of regions per line (1 to 16), and the amount of components to extract in parallel (1 or 4), a maximal amount of bins is available per histogram. The BIN field must select an amount not larger than the available one. In practice: #Region/line x #Component x #Bins ≤ 320.

  - For instance, with HREG = 4 (for a 5x5 grid, and thus five regions per line) and COMP = 4 (for four components extracted in parallel in four histograms), we have 320 / 5 / 4 = 16 bins maximum per histogram. BIN must be configured with 0 (four bins per histogram) or 1 (16 bins per histogram).
- Global decimation, versus the dynamic of each bin
  - Each bin is implemented with a 16-bit counter, and can thus accumulate a maximum of 64 k presences. The counter saturates afterwards at 65535, but trying precision of the stats.
  - It is recommended to configure the decimation in H and V, so that the amount of pixels extracted per region is smaller than 64 k (best) or not too high.
  - For instance, for a 5 Mpixel picture and one big region spanning the full frame, decimate the pixels by a ratio 5 M / 64 k = 76x. It can be configured with a 16x decimation in H, and an 8x decimation in V.
  - Note that when extracting a histogram from a raw Bayer source, the components, are already subsampled by the raw Bayer grid and its R, Gr, B, Gb sequence: only 25% of the pixels have a red component for instance.
- Decimation in H, versus the storage access rate:
  - The histogram extraction requires two clock cycles (of clk_proc) to store one component.
  - A minimal decimation in H is mandatory to provide the required free cycles to update the bins.
  - For instance, if COMP = 0 (or 1, 2, or 3), one component is extracted per pixel. One can thus extract one data every two pixels:
    > For an RGB pixel, it means a decimation by a factor 2x or larger, and thus configure HDEC = 1.
    > For a raw Bayer pixel, the interleaved R vs. Gr or B vs. Gb makes that any R, Gr, Gb, B component comes only once every two pixels, so that a decimation in H is not mandatory.
  - For instance, if COMP = 4, four components are extracted per pixel.
    > An RGB source requires a decimation of 8x or larger (HDEC = 3).
    > All the R, Gr, B, Gb components of a raw Bayer source are sampled, but one per cycle: the user must configure a decimation on H of a factor 2x or larger.
- Decimation in V, for the Line-of-region to line-of-region spacing:
  - After collecting the histograms across a full line of region, the histogram module exports the completed histograms via the AXI to the external memory, and reset them. For these tasks, 2 x 320 cycles must be provided after each line of region.
  - It is mandatory to configure a decimation in V, that frees 2 x 320 cycles. The decimation factor depends on the picture width. For a width of 640 pixels or more, a decimation in V of a factor 2x (VDEC = 1) is enough.
- All the regions from which the histograms are extracted must be defined (with VSTART, HSTART, VSIZE, HSIZE) to be fully within the frame. VSIZE and HSIZE define the size of a single region, that can be replicated many times in function of VREG and HREG.
  - HSTART and VSTART are not required to be multiple of the decimation, but must be even for raw Bayer pixels.

Note: When the source is raw Bayer, the decimation preserves the integrity of the pattern: in either H or V, a decimation by a factor 2x samples two pixels every four. A decimation by a factor

4x samples two pixels every eight, and so on. When no decimation is active, all pixels are sampled.

- When a grid of regions is configured, histograms for each region are computed and written to memory in sequence, starting at the location specified by the DCMIPP_P1HSMAR1 register. Regions within the grid are processed horizontally left to right and vertically top to bottom. Histogram bins are stored from lower to higher indices, and for each color component selected in DCMIPP_P1HSCR.COMP.

An interrupt is generated when the capture of the statistics for this frame has been completed on the AXI. The interrupt is the STFRAMEF located in both the DCMIPP_P1SR and the DCMIPP_CMSR2 registers.

Some software inconsistencies can be detected: if so, the interrupt STBCF is triggered in both the DCMIPP_P1SR and DCMIPP_CMSR2 registers. The main detected inconsistencies are for instance (such as usage of reserved/ parameters, too much temporary storage is used, size is not a multiple of the decimation).

In case of the AXI bandwidth has not been sufficient to store the statistics, an interrupt is generated: STOVRF in both the DCMIPP_P1SR and DCMIPP_CMSR2 registers.

In the last two cases, STBCF or STOVRF, the capture of any statistics at this frame is immediately aborted.

Configuration example 1

For a 5M (2560x2048) pixels sensor, full frame extraction across 5x5 regions of the raw Bayer R, Gr, Gb, B components in parallel, sampled at the source of the pipe before any processing:

- Local storage constraint: 320 bins, stored on five regions and four components, resulting in 320 / 5 / 4 = up to 16 bins/histogram.
- Global decimation constraint: because of the raw Bayer pattern, each component is present only 25% of the time, thus 1.25 M red components per frame (same for Gr, Gb, B). The frame is divided in 25 regions, hence 1.25 M / 25 = 51 k samples per region (for each component). It is lower than the recommended maximum (64 k), hence no need for decimation.
- Decimation in H: all the four RGrBGb components are sampled. As in raw Bayer, one component is sampled per pixel. To allow two cycles per component, a minimum decimation by 2x in H is needed.
- Decimation in V: the frame is 2560 pixels wide, more than the needed 640 free cycles between two lines or region. One single line between two lines of regions is needed, hence a decimation in V by 2x.

It results in the following configuration:

HDEC = 1	Decimation by 2x in H
VDEC = 1	Decimation by 2x in V
HREG = 4	To have five regions per line on the frame
VREG = 4	To have five regions vertically on the frame
HSTART = 0	Start at the left side of the frame
VSTART = 0	Start at the top of the frame
HSIZE = 128	2560 pixels / 2 (decimation factor) / 2 (decimation in raw Bayer) / 5 (region)

VSIZE = 100 2048 pixels / 2 (decimation factor) / 2 (decimation in raw Bayer) / 5 (region)

SRC = 0 Samples at the input of the ISP, after the BadPixelRemoval

COMP = 4 To build four histograms, one from each RGGB component

DYN = 0 Take the MSB, to sample the full pixels dynamics

BIN = 1 For 16 bins per histogram

EN = 1 To start the histogram extraction and dump

Configuration example 2

For a 5M (2560x2048) pixels sensor, full frame extraction with a single large region of the single luminance component (extracted from a RGB pixel format), sampled after demosaicing and before the ColorConv stage:

- Local storage constraint: 320 bins, stored on one region and one component, resulting in 320 / 1 / 1 = up to 320 bins/histogram, rounded to the configurable value of 256.
- Global decimation constraint: the frame is 5 Mpixel, versus a recommended maximum of 64k samples per region. It results in 5 M / 64 k = 76x decimation, shared best among 16x in H, and 8x in V.
- Decimation in H: one components per pixel is sampled, resulting in a decimation by a factor 2x minimum. The above decimation in H by 16x sets a larger constraint.
- Decimation in V: with 2560 pixels wide, one line is needed between two lines of regions, thus a decimation in V by 2x minimum. The above decimation in V by 8x is a larger constraint.

It results in the following configuration:

HDEC = 4 Decimation by 16x in H

VDEC = 3 Decimation by 8x in V

HREG = 0 To have a single region, one per line on the frame

VREG = 0 To have a single region, one vertically on the frame

HSTART = 0 Start at the left side of the frame

VSTART = 0 Start at the top of the frame

HSIZE = 160 2560 pixels / 16 (decimation factor) / 1 (region)

VSIZE = 256 2048 pixels / 8 (decimation factor) / 1 (region)

SRC = 2 Samples at the output of the demosaicing

COMP = 3 To sample the computed luminance

DYN = 0 Take the MSB, to sample the full pixels dynamics

BIN = 3 For 256 bins per histogram

EN = 1 To start the histogram extraction and dump

Simplified configuration and constraints

A simplified set of constraints can be defined by setting a conservative configuration for the decimation, that fits any case, at the expense of fewer samples and less precision in the histograms.

A decimation by 16 horizontally and 8 vertically fits all the constraints, whatever the resolution or sampling factor.

Assume a Width and Height of the input frame:

HDEC =	4	RGB source	Start/size counts per 16 pixels
	3	Raw Bayer source	
VDEC =	3	RGB source	
	2	Raw Bayer source	
HSTART = 0		Left side, always full frame	
VSTART = 0		Start at the top of the frame	
HSIZE = Width / 16 (decimation) / R (regions)			
VSIZE = Height / 16 (decimation) / R (regions)			
SRC = any		Samples at the input of the ISP, after the BadPixelRemoval	
HREG = any		Any amount, 1 to 16 of regions per line	
VREG = any		Any amount, 1 to 16 of regions vertically per frame	
COMP = any		Any amount, 1 to 4 components	
DYN = 0		Take the MSB, to sample the full pixels dynamics	
BIN = compute		In function of 320 bins / R (regions) / C (components)	
EN = 1		To start the histogram extraction and dump	

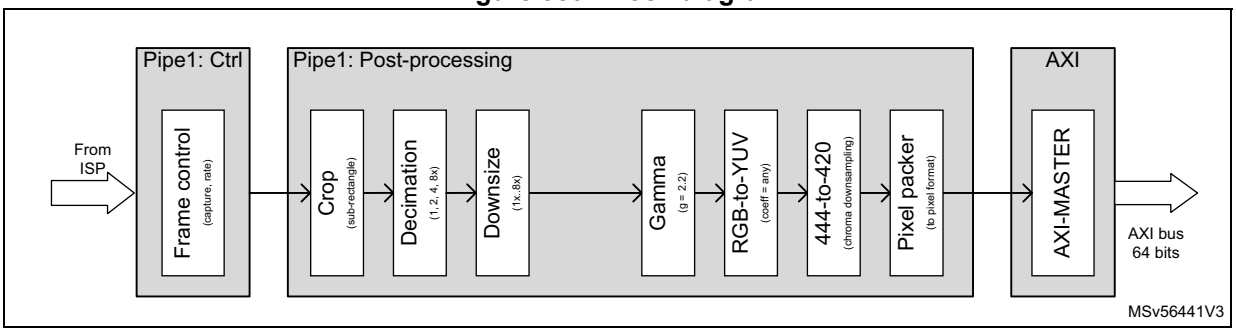
42.7 Pipe1 (post-processing part)

42.7.1 Overview

The post-processing Pipe1 (whose diagram is shown in *Figure 350*) is a pixel pipeline in which post-processing functions are integrated to relieve the software from very specific operations (time and memory consuming), like:

- Crop, to keep only the part of the picture required by the targeted application
- Decimation, as a cheap preprocessing before the downsize
- Downsize, to reduce the picture resolution (size reduction)
- Gamma correction before sending the data to the memory for further displaying operations
- YUV conversion with possible down-sampling option, to optimize the memory size needed to store the corresponding image or to match a YUV420 video encoder.

Figure 350. Block diagram



The applicative Pipe1 is the most featured pixel pipeline, even if the image processing functions can be shared with Pipe2 (refer to *Section 42.8.2*).

Pipe1 can be reconfigured from time to time. Some events can be used to trigger the software reconfiguration routines (refer to *Section 42.13.2*).

It is also possible to write into the shadow registers during the processing of a frame. The values are loaded into the physical register based on the following start of frame event.

42.7.2 Pixel 2D cropping

The pixel 2D cropping aims at extracting and forwarding a rectangle of pixels.

The cropping assigns an X and Y location to its input pixels, and selects a configured rectangle among the pixels, and forward the pixels of this rectangle farther in the pixel pipe. The pixels around the selected rectangle are discarded.

Functionality

- Counts lines thanks to HSync (if from parallel interface) or packets (if from CSI-2)
- Counts pixels inside a line
- Positive cropping (forwards a selected rectangle of pixels in the pipe)
- Cropping with 0 value for HSIZE[11:0] or VSIZE[11:0] forces the internal crop to get the maximum value on the parameter where the software sets to the 0 value

Software configuration

Table 399. DCMIPP_PxCRSTR and DCMIPP_PxCRSZR bit function

Bit ID	Values	Comments
ENABLE	– 1: Cropping active – 0: All data transmitted	-
HSTART, VSTART	0 to 4094	Top-left corner of the cropped rectangle.
HSIZE, VSIZE	0 to 4094	Width and height of the cropped rectangle. Can be larger than the received picture to grab everything.

If the cropped window is larger than the received window, only the received pixels are forwarded (no pixels are inserted to match the window size).

If the software sets 0 in one or both horizontal/vertical size bit fields (HSIZE, VSIZE), the crop forces internally the value to be at the maximum on the corresponding bit field.

Configuration example

To select a small rectangle (size 100 x 50), whose upper pixel is located at position (30, 10), provide the following setting:

- ENABLE = 1 to crop a sub-rectangle
- HSTART, VSTART = (30, 10) to start cropping at x = 30, y = 10 of the received picture
- HSIZE, VSIZE = (100, 50)

The most bottom-right selected pixels have a position (129, 59) from the received picture.

The frame forwarded is handled downstream in the pipe as a 100 x 50 frame.

42.7.3 Decimation pre-downsize

The decimation (prior to downsize) makes it possible to cheaply downsize a frame by a factor 2, 4, or 8x, in both horizontal and vertical directions.

The decimation is partially redundant with the downsize, that brings a higher quality (the decimation discards the data of the dropped pixels, while the downsize averages all pixels and does not lose information).

The decimation complements the downsize (limited to ratio of 8 x 8), to have a combined downsizing ratio of 64 x 64. It is recommended to have the largest ratio implemented in the higher quality downsize, and have needed the decimation complement to that. For instance, for a ratio 30x, is it recommended to have a ratio 4x in decimation, and a ratio 30 / 4 = 7.5 in the downsize.

Features

- Forwards one item (typically pixel) every 1, 2, 4, 8 pixels, independently vertical and horizontal.

Software configuration

Table 400. DCMIPP_PxDCCR bit function

Bit ID	Function	Value	Comments
HDEC[1:0]	Ratio (2 bits)	0	No decimation
		1	Ratio 1/2
		2	Ratio 1/4
		3	Ratio 1/8
VDEC[1:0]		0	No decimation
		1	Ratio 1/2
		2	Ratio 1/4
		3	Ratio 1/8

42.7.4 Downsize

This module implements a downsize based on box filtering, which allows ratios from 1x to 8x, independently, in both X and Y directions.

The box filter has properties close to a bilinear filter for small ratios (from 1x to 2x), but provides the advantage of avoiding some Moiré effect for higher ratios (from 2x to 8x) thanks to using all the samples.

Functionality

- Features:
  - Integer + decimal ratio, different vertically and horizontally.
  - Ratio: 1.0x to 8x
  - Limited to a maximum output buffer width of 2688 pixels due to the needed linebuffer.
- Operations:
  - Increments defined with 3.13 precision (<1 pixel error after maximum width of 4094)
  - Internal computations for filter defined with 3.3 precision
  - Accumulates skipped pixels to allow ratio up to 8x with saturation on 11 bits
  - Weighting of shared pixels, to allow good quality at ratio close to 1
  - Independent H filter, then V filter
  - Init phase: left of left-most pixel is aligned on input pixel (see below Pi0, Po0)

Software configuration

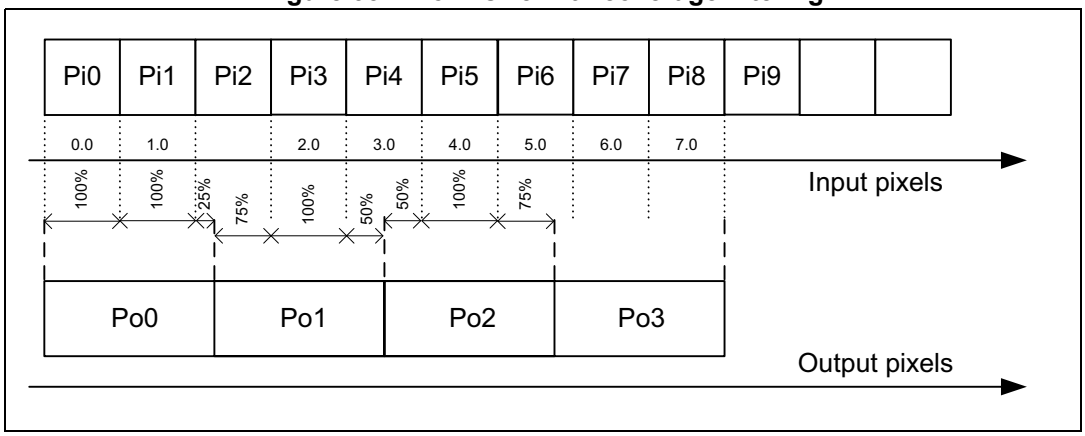
Table 401. DCMIPP_PxDSCR, DCMIPP_PxDSRTIOR, DCMIPP_PxDSSZR

Bit ID	Function	Values	Comments
ENABLE	-	– 1: Downsize active – 0: Transmission without downsize	-
HRATIO, VRATIO	Downsize ratio (respectively horizontally and vertically)	16-bit fields, used as unsigned 3 integer 13 decimal. Valid values are 8192 (= 1x) to 65535 (= 7.999x).	Key parameters that create output pixels. The optimal is computed as xRATIO = Floor (8192 * xRatioFloatingPoint), maximum value 65535 (x = H or V).
HDIV, VDIV	Inverted ratio, must be consistent with Ratio	10-bit fields, used as unsigned 10 decimal. Valid values are 128 (= inv8x) to 1023 (= inv1x).	A side parameter, impacts only the luminance of the output pixels. The optimal in function of xRATIO is xDIV = Floor((1024 * 8192 -1) / xRATIO) (x = H or V).
HSIZE, VSIZE	Final size after the downsize	-	The downsize filter clips pixels if the post-downsize size is not correct. The HSIZE and VSIZE are partially redundant vs. the cropping size divided by the downsize ratio. If VSIZE = 0 or HSIZE = 0, the filter is disabled in that dimension.

Figure 351 shows the principle of the computations:

- Po0 = (1.00 x Pi0 + 1.00 x Pi1 + 0.25 Pi2) / 2.25
- Po1 = (0.75 x Pi2 + 1.00 x Pi3 + 0.50 Pi4) / 2.25
- Po2 = (0.50 x Pi4 + 1.00 x Pi5 + 0.75 Pi6) / 2.25

Figure 351. Downsize with coverage filtering



Configuration example

- ENABLE = 1 to activate the downsize
- Downsize ratio 1x: HRATIO = VRATIO = 8192, HDIV = VDIV = 1023
- Downsize ratio 2x: HRATIO = VRATIO = 16384, HDIV = VDIV = 512
- Downsize ratio 3x: HRATIO = VRATIO = 24576, HDIV = VDIV = 341
- Downsize ratio 8x: HRATIO = VRATIO = 65535, HDIV = VDIV = 128

42.7.5 Gamma conversion

This feature implements a gamma compression on each R, G, B component, using a static gamma exponent 2.2, to store gamma-compressed pictures, as defined in the sRGB standard.

Features

- The gamma is implemented as a 7-segment linear curve.
- It crosses the following way-points, in logarithm spacing:
  - (0,0)
  - (4,39)
  - (8,53)
  - (16,72)
  - (32,99)
  - (64,136)
  - (128,186)
  - (256,256)

Software configuration

ENABLE = 1 in the DCMIPP_PxGMCR registers activate the color conversion.

42.7.6 YUV conversion

This block is a replication of the one described in *Section 42.6.9*, used to convert RGB in YUV color format (basically, since the conversion YUV to RGB is assumed to be performed by the color conversion block into the image processing main function). Bit fields are the same of the color conversion module, only the register name and the memory mapping are different. The register functions are the same, the register names are DCMIPP_P1YUVxxx instead of DCMIPP_P1CCxx.

42.7.7 Chroma down-sampling

The Chroma down-sampling module reduces the chroma resolution from its arriving YUV444 format to the potential YUV420 output, and sends them to a different channel.

Features

- Downsizes in H first, if YUV420, with (0.5 + 0.5) filter
- Downsizes in V then, if YUV420, with (0.5 + 0.5) filter
- Memory: embeds one half-line buffer for each U and V

Software configuration

Configuration is indirectly taken from the pixel packing output format, located in the DCMIPP_PxPPCR register.

- The Chroma down-sampling is active when the output pixel format is YUV422-1, YUV422-2, YUV420-2, YUV420-3.

Output

- One to three channels: RGB/Y, UV (or U) and V.

42.7.8 Pixel packing

This module works on the dump pipe (Pipe0) and pixel pipes (Pipe1 .. N), setting the arriving pixels in memory words.

Features

- Single address (single buffer base-address): if a double or triple buffer is needed, software must update the single base-address at each frame.
- Flexible pitch (line stride): width up to 4094 pixels, 32 bpp, potentially interleaved.
- Pixel format: all usual formats, as indicated in *Section 42.3.6* (Pipe1 allows semi-planar and full planar buffer, Pipe2 coplanar buffer only).
- Swap R-vs-B: swap the red vs. the blue components of the output pixel.
- Padding: MSB vs. LSB padding of 10/12/14 bit onto 16 bit. (such formats are supported only on the dump pipe).
- Header enable: allows to dump (or not) the CSI packet headers, to allow software an easier extraction of data in case of Interleaved CSI packets in the captured buffer.
- Multi-line event: event generated (for DMA and INT) at each multiple of sent lines.

Note: Some features (for example padding) are available only on the dump pipe, while others (like swap R-vs-B) are available only on the pixel pipes.

Table 402. DCMIPP_PxPPCR bit function

Bit ID	Function	Value	Comments
M0A, M1A, M2A	Base address of pixel buffer in memory, 32-bit wide, aligned on 16 bytes	-	The line alignment of the pixel buffers in memory is assumed on 16 bytes. Therefore the buffer base address (i.e. M0A, M1A, M2A) must be a multiple of 16 bytes, and similarly for line PITCH.
PITCH	Address jump from line to line, up to 32 Kbyte - 1.	-	Aligned on 16 bytes.
SWAPRB	Swaps R-vs-B components (and U-vs-V, same operation if Y mapped on G) available on pixel pipe and not on dump pipe.	-	-
HEADEREN	-	– 1: Dumps headers	Feature present only in dump pipe.

Table 402. DCMIPP_PxPPCR bit function (continued)

Bit ID	Function	Value	Comments
PAD	MSB vs. LSB padding of the raw Bayer and monochrome to 16 bpp.	– 0 (align on LSB): backward compatibility with the former DCMI IP – 1 (align on MSB): easier use by software or GPU	Applies only on the dump pipe and for the 10/12/14 (not 8)-bit pixels (the pixel pipe convert pixels into 8 bpc, and padding is therefore not relevant).
FORMAT	Output pixel format	-	– Pipe0: not defined as default input format used for dump. It allows unique formats ByteData, ByteHeader and Mono/raw Bayer 8/10/12/14. – Pipe1: adds semi- and multi-planar formats: YUV 422-2, 420-2, 420-3 if Alpha or X is dumped, they are forced at 255). – Pipe2: supports coplanar pixel formats xRGB8888 (=xYUV444), RGB888 (=YUV444), RGB565, YUV422-1 and Y8.
LINEMULT	Periodicity of the line (HSync) interrupt and event, as power of 2 of LINEMULT configuration (i.e. every 1, 2, ..,128 lines).	-	-

42.7.9 Overrun detection

This logic handles flow-control hazards: the DCMIPP is provided a continuous flow of data (via parallel or CSI2 interfaces) without any wait/hold capability, while downstream of DCMIPP, the access to memory can be temporarily stuck.

In some cases the internal FIFOs of the DCMIPP get full and pixels may be deleted. The overrun detection logic handles such hazard at best.

Features

- Software gets warned in case of an hazard:
  - Interrupt OVR is triggered at the first deletion of a pixel, repeated at every frame, as long as the overrun hazard is present.
  - It is recommended to skip / trash the impacted frame:
    > Overflowing pixels are deleted, so that when the access to memory resumes, the remaining of the line is discarded (not written out). The normal processing resumes at the start of the next line. Potentially, several full lines can get discarded.
- No Frame-to-Frame impact in case of an hazard:
  - VSync resets what is needed in the DCMIPP, so that any hazard on a previous frame has no impact at all on the pixels dumped in next frames.

Software configuration

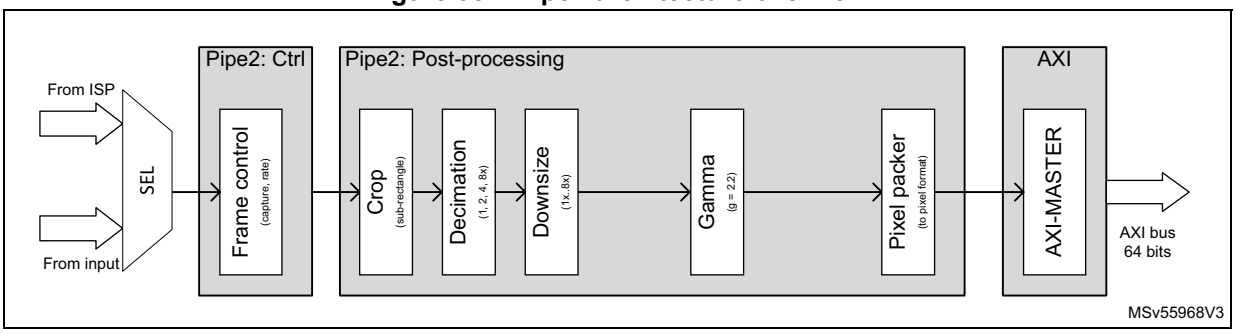
- Interrupt DCMIPP_PxSR.OVRF is warned in case of hazard.

42.8 Pipe2 (post-processing)

42.8.1 Overview

Pipe2, compared to Pipe1, is a lighter pixel pipeline offering no embedded image processing blocks. This pipe can work in standalone mode, or share the image processing functions with Pipe1 (refer to *Section 42.8.2*).

Figure 352. Pipe2 architecture overview



The main blocks (controller and post-processing general functions) of Pipe2 are almost the same as those of Pipe1. The flow selection and frame controller allow to configure Pipe2 behavior when it is used in standalone, meaning without image processing heritage from Pipe1. Refer to *Section 42.4.6* and *Section 42.4.7* for more details about the use cases and the configuration of the pipe.

The set of post-processing blocks is reduced compared to Pipe1, as neither the YUV conversion nor the down-sampling YUV444 to YUV420 are integrated in Pipe2. This pipe can have its own image crop area, its dedicated downsizing, and take benefit of the gamma correction, like Pipe1. Refer to *Section 42.7* and to its subsections for more details on how to use and configure by software these post-processing functions.

Software configuration

To use Pipe2 as a standalone pixel pipe, without any image processing functions shared with Pipe1, bit PIPEDIFF must be set in the DCMIPP_P1FSCR register. This bit has a meaning only when the flows can be differentiated, that is, when the camera connected and processed by the DCMIPP is a CSI2 camera interface.

In this non-shared mode, it is required that different flows are sent to Pipe1 and Pipe2, or a non-supported behavior can occur.

The flow to Pipe1 and the flow to Pipe2 may potentially be interleaved at packet level.

Pipe2 may be reconfigured time to time. Some events may be used to trigger the software reconfiguration routines (refer to *Section 42.13.2: Interrupts*).

It is possible also to write into the shadow registers within the processing of a frame. The values are loaded into the physical register based on the start of frame event.

42.8.2 Pipe1 and Pipe2 sharing image processing functions

Following the application, it may be interesting to share the image processing functions belonging to Pipe1 with Pipe2 when the dataflow is shared for both. One pipe may be used for display operation, and the other one used for statistics or software analysis. In this case PIPEDIFF bit of DCMIPP_P1FSCR register must be cleared.

If the CSI-2 module is connected to the DCMIPP, the VC DT and DTMODE of Pipe2 are the same as those configured into DCMIPP_P1FSCR register, making non relevant the values for these fields into the DCMIPP_P2FSCR register. However, bits CPTREQ and CPTMODE remain active into the DCMIPP_P2FCTCR register to control the flow inside Pipe2.

42.9 Application use cases

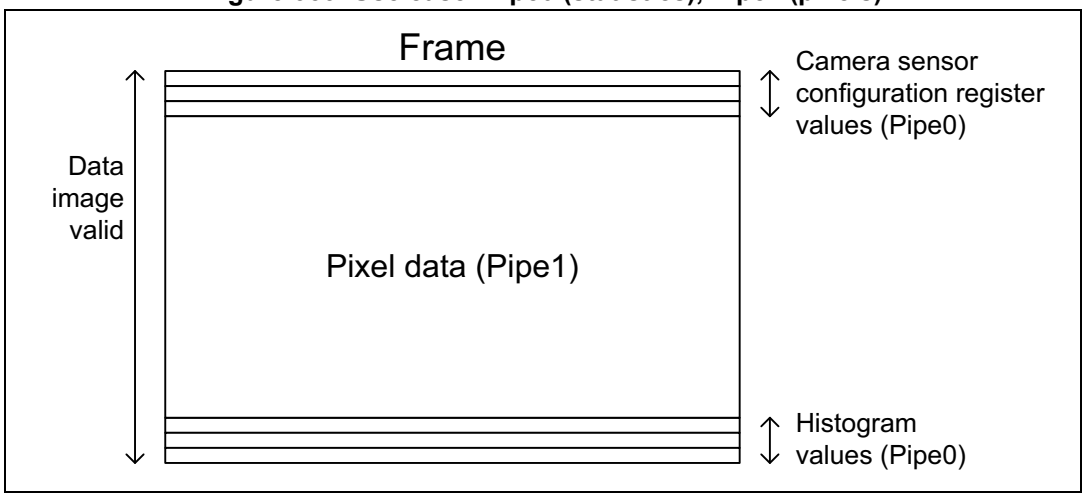
There are several application use cases that can fit the DCMIPP architecture, a few of them are described in this section.

42.9.1 Parallel interface camera sensor module

A parallel interface camera sensor can transfer images as well as statistics. It is easier to manage the software processing by splitting the statistics and the image data on different memory storages. Two pipes are used in such case, with Pipe0 extracting the statistics and Pipe1 dealing with the image data (whatever the data format supported by the DCMIPP). Both work in parallel on the same frame, frame by frame. Each output FIFO attached to the pipe conveys the data on the targeted memory for further processing.

The camera sensor module may use some lines of the frame to transfer statistics or sensor configuration data. These lines can be placed at the beginning and at the end of the frame (see *Figure 353*), even if there is no real standard.

Figure 353. Use case: Pipe0 (statistics), Pipe1 (pixels)



Software configuration

- Pipe0: select the crop area to extract statistics only
  - Configure HSTART[11:0] = 0 and VSTART[11:0] bits in the DCMIPP_P0SCSTR register from the line number corresponding to the first pixel data line (after first statistics line).
  - Configure HSIZE [11:0] (horizontal screen resolution in number of data 32-bit equivalent to the horizontal resolution of the screen in pixels) and VSIZE [11:0] to

the value corresponding to the offset line number from the first pixel data area. These bits are in the DCMIPP_P0SCSZR register.

– Set bit POSNEG of the DCMIPP_P0SCSZR register to reject data belonging to the rectangle defined, to keep the outside area of the rectangle, where the statistics are taken in this use case.

- Pipe1: Select the area to extract the statistics into DCMIPP_P1SRCR register, by configuring bit FIRSTLINEDEL[2:0] and LASTLINE[11:0] (it avoids to start the image processing on statistics data). Only the pixel data are forwarded, if needed, to the image processing blocks (for example demoisaicing, auto exposure, contrast enhancement) for further processing.

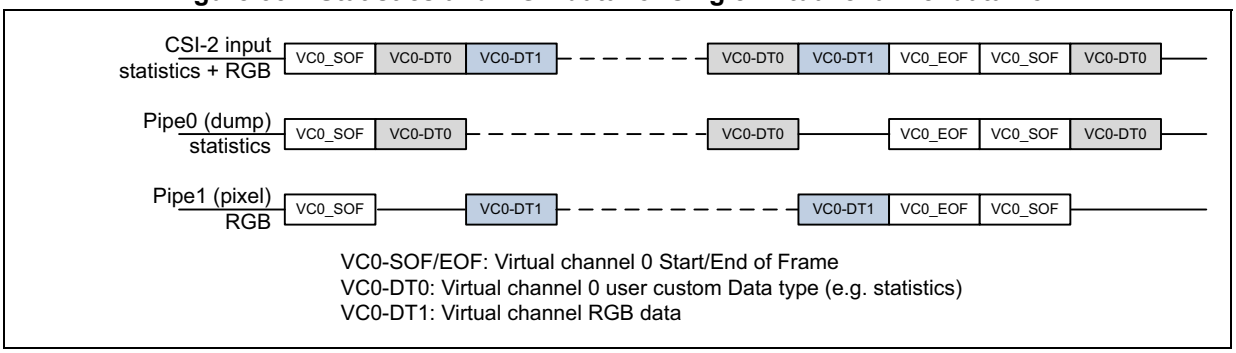
42.9.2 CSI2 camera sensor module

The CSI2 protocol allows, thanks to Datatypes, to make distinction between different data categories. The application may request to handle interlaced video as well as interleaved data flow like described below.

Single virtual channel involving two pipes (for example Pipe0 and Pipe1)

- Use case: the CSI provides two data flows in parallel, typically RGB (or raw Bayer) with its sideband statistics.
- Handling: the statistics are dumped by the dump pipe, while the pixels are sent to the pixel pipes.

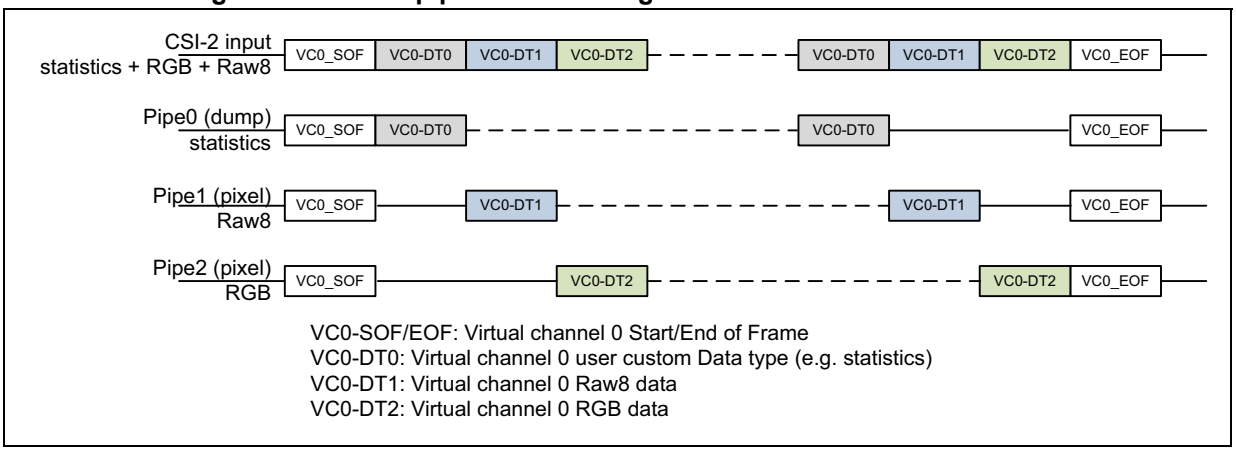
Figure 354. Statistics and RGB data for single virtual channel data flow



Single virtual channel involving three pipes (for example Pipe0, Pipe1 and Pipe2)

Another use case (*Figure 355*) employs different Datatypes in addition to the statistics within the CSI-2 flow based on a single virtual channel.

Figure 355. Three pipes within a single virtual channel in CSI2 mode



Interleaved packets (based on multiple virtual channels)

- Use case: the CSI provides two pixel flows in parallel, typically a JPG-compressed flow and an RGB888 or raw Bayer flow.
- Handling: the JPG is dumped by the dump pipe, while the pixels are sent to the pixel pipes.

Both Pipe1 and Pipe2 can process these pixels. The shared demosaicing mode can be used, hence both Pipe1 and Pipe2 benefit of the potential demosaicing conversion.

Figure 356. Handling interleaved packet

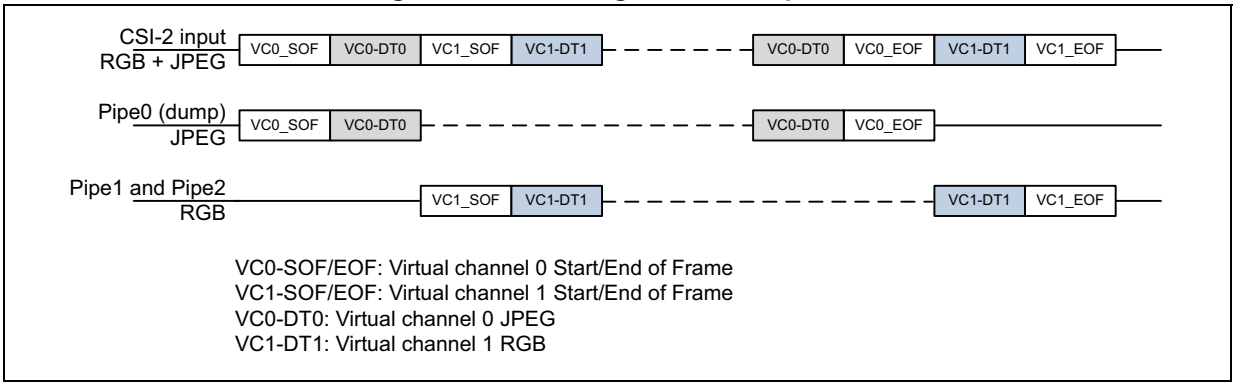


Figure 357. Handling interleaved packets across two pixel pipes

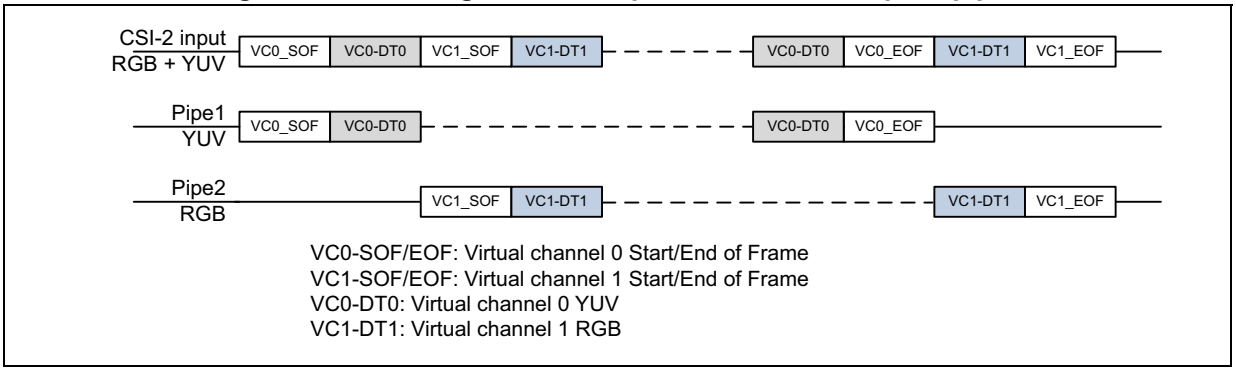

Interlaced video

- Use case: the CSI provides the odd and even frames of an interlaced video onto two different virtual channels (usually with a same data type).
- Handling: the flows of both the virtual channel of the odd field and the virtual channel of the even field are sent to the pixel pipes.
- Single pixel pipe may be configured if the image processing function is required by the application to handle both interlaced frame (refer to *Figure 358*). In such case, a pipe reconfiguration is needed frame by frame to change the virtual channel number and the address memory for the output buffer if the software distinctly keeps the odd and even frame buffers in their respective memory locations.
- Pipe1 and Pipe2 may be used if the application software does not need image processing functions (refer to *Figure 359*). Each pipe is configured with its own virtual channel and its own output buffer address in memory. The split of the odd and even frames is explicitly defined in a static way, avoiding any pipe reconfiguration between two frames.
- Interlaced video can be managed with a single virtual channel identifier, using a different data type to identify odd and even frames. In such case, the CSI2 bridge uses user Datatypes to distinguish between them.
- Limitation: the frames of the two virtual channels must be time-exclusive, by default the case for usual interlaced video sensors.

Figure 358. Interlaced video (based on single pixel pipe)

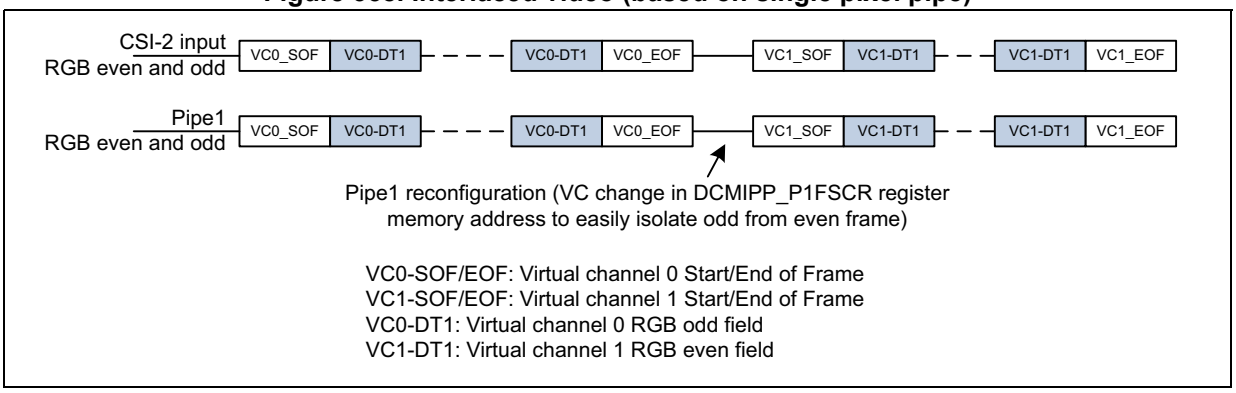

Figure 359. Interlaced video (based on two pixel pipes)

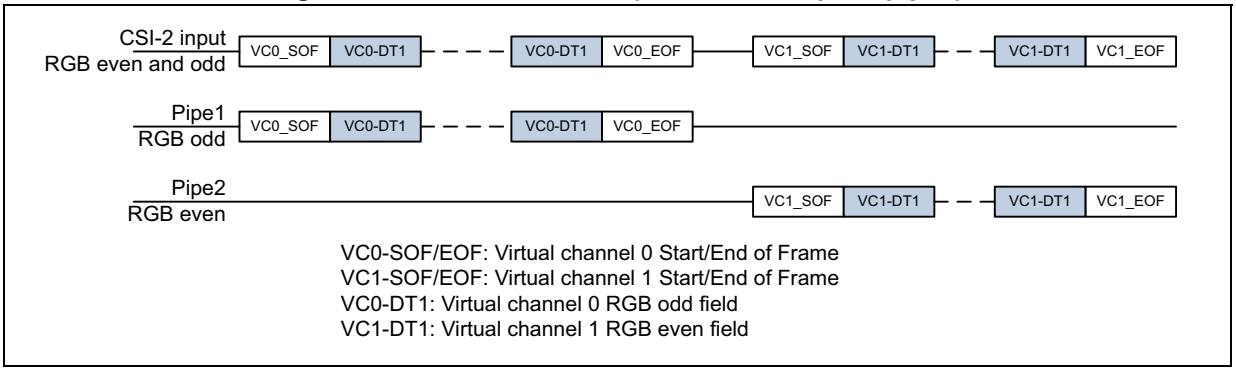


Software configuration

The following configuration must be set first into the static DCMIPP_PxFSCR and DCMIPP_CMCR registers:

- INSEL: Selects the input flow (parallel vs. CSI) in the DCMIPP_CMCR register
- DTMODE[1:0]: mode for CSI flow selection into that pipe:
  - 0: only flow VC/DTIDA is forwarded in the corresponding pipe.
  - 1: flows VC/DTIDA and/or VC/DTIDB are forwarded for Pipe0, and VC/DTIDA and VC/DTIDB for Pipe1.
  - 2: all flows, except the VCDTIDA or VCDTIDB, are forwarded in the pipe (this last setting, 3, is available only for Pipe0).
  - 3: all Datatypes from the selected virtual channel are forwarded in Pipe0. It is valid only for Pipe0 (the pixel formats that are not supported by Pixel pipes are suppressed).

  This bit field is not valid for Pipe2.
- DTIDA/DTIDB: Data type selection ID-A and ID-B for Pipe0 and Pipe1.
- DTIDA: Data type selection for the pixel Pipe2 when PIPEDIFF = 1.
- FDTFEN: Forces the value of the data type (value defined in FDTF[5:0]) to be processed by the pixel Pipe1 and Pipe2, based on the DTIDA/DTIDB detection in the flow selection block of the pipe. Not available for Pipe0.
- FDTF[5:0]: Data type value overwritten the one received by the CSI-2 physical node when equal to DTIDA/DTIDB. Not available for Pipe0.
- PIPEDIFF: Pipe2 to take same input as Pipe1 or differentiated:
  - 0: Pipe2 takes the same VC/DTIDx as well as the same FDTFEN and FDTF[5:0] configured into the DCMIPP_P1FSCR register.
  - 1: Pipe1 and Pipe2 take their own VC/DTID, FDTFEN and FDTF[5:0] values in the data flow.

After all the pipes have been configured, the processing can be activated:

- PIPEN: Set to 1 to start the frame control logic of the pipe. When reset at 0, it immediately resets the frame control logic, which results in immediately stopping an ongoing dump (CPTREQ = 0, CPTACT = 0), see *Figure 344*, *Figure 345*, *Figure 346*.
- CPTREQ: Set to 1 to activate the capture at the next start-of-frame in the DCMIPP_PxFCTCR register.

Note: To be cleanly sampled for the next frame, the VCIDA, VCIDB, DTIDA, and DTIDB fields must be updated after a VSync and after the first HSync.

Configuration example

The following list details five possible use cases, among others interlaced video and interleaved frames, and a 3D sensor (left + right eye):

- Default, with a parallel dump of statistics and processing of an image on both Pipe1 and Pipe2:
  - Image forwarded to the pixel Pipe1 and Pipe2, and processed, with the following settings:
    - Pipe1 / DTMODE = 0, to extract a single flow.
    - Pipe1 / VC / DTIDA = vv_dddddd, with VC and DTIDA matching the image flow
    - Pipe1 / PIPEDIFF = 0, to send the flow to both Pipe1 and Pipe2
  - Statistics are extracted and dumped on Pipe0 with the following config:
    - Pipe0 / DTMODE = 0, to extract a single flow.
    - Pipe0 / VC / DTIDA = vv_dddddd, with VC and DTIDA matching the statistics flow.
- Interlaced video, with the consecutive but exclusive odd and even (requiring the use of the image processing functions):
  - Interlaced video, if having differentiated VC and DT, is forwarded to the pixel Pipe1 and Pipe2, and processed, with the following settings:
    - Pipe1 / DTMODE = 0, to extract the VC /DTIDA flow
    - Pipe1 / VC/DTIDA = vv_dddddd, with VC and DTIDA matching the odd or the even field by reprogramming between two frames
    - Pipe1 / PIPEDIFF = 0, to send the flow to both Pipe1 and Pipe2
    - Pipe1 / Pipe2 / CPTMODE = 1, Snapshot mode
    - Pipe1 / Pipe2 / CPTREQ = 1 alternatively for Pipe1 and Pipe2, frame by frame
  - Any other (different) data can be potentially dumped with the following settings:
    - Pipe0 / DTMODE = 2, to extract all but flows A and B
    - Pipe0 / VCDTIDA = Pipe1 / VC / DTIDA corresponding to the odd field
    - Pipe0 / VCDTIDB = Pipe1 / VC / DTIDB corresponding to the even field

The software needs to reprogram frame to frame the DTIDx fields of the DCMIPP_P1FSCR register to select the data to process into Pipe1 or Pipe2. The software sets CPTMODE bit to work in Snapshot mode for Pipe1 and Pipe2 in the DCMIPP_P1FCTCR and DCMIPP_P2FCTCR registers. Alternatively, bit CPTREQ is set frame by frame in one pipe then in the other one to allow the acquisition of data on the allocated pipe. The data type identifying the odd or even fields needs to by updated into the DCMIPP_P1FSCR register only, as Pipe2 shares the image processing block of Pipe1.

- Interlaced video, with consecutive but exclusive odd and even (bypassing the image processing functions):
  - Interlaced video, if having differentiated VC and/or DT, is forwarded to pixel Pipe1 and Pipe2, and processed, with the following settings:
    - Pipe1 / DTMODE = 0, to extract the VC /DTIDA flow
    - Pipe1 / VC / DTIDA = vv_dddddd, with VC and DTIDA matching (for instance) the odd field data type
    - Pipe2 / DTMODE = 0, to extract the VC /DTIDA flow

> Pipe2 / VC / DTIDA = vv_dddddd, with VC and DTIDA matching (for instance) the even field data type
> Pipe1 / PIPEDIFF = 1, to consider Pipe1 and Pipe2 as totally independent
> Pipe1 / Pipe2 / CPTMODE = 0, Continuous grab mode
> Pipe1 / Pipe2 / CPTREQ = 1 to capture data corresponding to the VCDTIDA attached to the corresponding pipe

– Any other different data can be potentially dumped with the following settings:
> Pipe0 / DTMODE = 2, to extract all but flows A and B
> Pipe0 / VCDTIDA = Pipe0 / VC / DTIDA corresponding to the odd field
> Pipe0 / VCDTIDB = Pipe0 / VC / DTIDB corresponding to the even field

In this case the interlaced video must be differentiated with the data type and not with the virtual channel (since there is a single VC by pipe), if the application wants to dump data other than the odd and even frames on Pipe0.

- Interleaved flows, with a parallel dump of an RGB picture and a JPEG-encoded flow:
  – The RGB picture is extracted and forwarded to pixel Pipe1 to be processed, with the following settings:
  > Pipe1 / DTMODE = 0, to extract one flow, the RGB picture
  > Pipe1 / VC /DTIDA = vv_dddddd, with VC and DTIDA matching the RGB picture data type
  > Pipe1 / PIPEDIFF = 1, to send the RGB on Pipe1 and use Pipe2 for other purposes

  – The JPEG-encoded stream is transmitted under the CSI user-defined format, is extracted and sent to the pipe to be dumped, thanks to the following:
  > Pipe0 / DTMODE = 0, to extract one flow, the JPEG-encoded flow
  > Pipe0 / VCDTIDA = vv_dddddd, with VC and DTIDA matching the JPEG stream data type
  > Pipe0 / VCDTIDB = not used

  – Another pixel picture, like YUV, can be dumped using Pipe2, by overwriting fields:
  > Pipe2 / DTMODE = 0, to extract a second flow for the YUV picture
  > Pipe2 / VCDTIDA = vv_dddddd, with VC and DTIDA matching the YUV picture data type

- 3D sensor, with a parallel transmission of two RGB or YUV pictures: one with data type DT1 for the left eye, and one with data type DT2 for the right eye: the DCMIPP can process each eye on a different pipe (for example left eye on Pipe1 and right eye on Pipe2). Note that, as Pipe1 and Pipe2 are differentiated, the demosaicing is assigned to Pipe1 only and is not available for Pipe2. The left and right eye flows are similar (raw Bayer or RGB), hence they both need to be RGB and not raw Bayer:
  – The left eye RGB picture is extracted and forwarded to the pixel Pipe1:
  > Pipe1 / DTMODE = 0, to extract one flow, the RGB picture
  > Pipe1 / VC / DTIDA = vv_dddddd, with VC and DTIDA matching the left eye data type (DT1)
  > Pipe1 / PIPEDIFF = 1, to split and differentiate the flow between Pipe1 and Pipe2

  – The right eye RGB picture is extracted and forwarded to the pixel Pipe2:
  > Pipe2 / VC / DTIDA = vv_dddddd, with VC and DTIDA matching the right eye

data type (DT2)

  - Another flow can be dumped onto the dump pipe:
    - > Pipe0 / DTMODE = 0, to extract one flow
    - > Pipe0 / VCDTIDA = vv_dddddd, with VC and DTIDA matching the flow to dump for instance
- Sensors in 3D, with left and right image inside a unique global image:
  - If the left and right images are differentiated with a left and right part of a single image, that double image can be extracted and duplicated to both the pixel pipes, and there, cropped differently at input of Pipe1 and Pipe2 respectively
- Sensors with multiple DT:
  - The sensor is supported by sending all (or most) of the flows to the dump pipe, and dumped consecutively, inserting ahead of each dumped packet an header containing the VC, DT, and packet length. See *Section 42.7.8* for more details on the header format. One or two pixel flows can still be extracted and processed by Pipe1 and Pipe2, and potentially suppressed from the extraction of the data dump, thanks to DCMIPP_PxFSCR.DTMODE.

42.9.3 Force data type format from CSI-2 data flow (pixel pipes only)

Application may require to use a user data type in the CSI-2 data flow without specifying the format used for the pixel transfer from a camera bridge to the DCMIPP, thanks to CSI-2 interface physical link.

However, the pixel pipes need to know the data format to process them in a proper way along the pipeline. It is possible to force a data type by software thanks to bits FDTF[5:0] and FDTFEN[5:0]. Only the pixel pipes (Pipe1 and Pipe2) can benefit of this capability. Indeed, Pipe0 manages the data and not the pixel itself.

If FDTFEN bit is set in the DCMIPP_PxFSCR register, the data type set into DTIDA/DTIDB (coupled with DTMODE) is used to detect the data type to be overwritten by FDTF[5:0] value. The value used to force the data type must follow CSI-2 data type format specification to identify the CSI-2 normalized data format.

Note: The forced data type value is unique. This means that, if two data types have been selected to be propagated into Pipe1 (DTMODE = 1), both DTIDA and DTIDB detected in input of the pipe are considered by Pipe1 with the forced value FDTF[5:0] if bit FDTFEN is set.

If the virtual channel and data type values are identical between Pipe1 and Pipe2, the force value FDTF[5:0] needs to be aligned within these two pipes if the respective FDTFEN bits are set, otherwise the behavior is not guaranteed.

If PIPEDIFF = 1, any data type format linked to a raw format can be forced on Pipe2 since it is not sharing the demoisaicing block of Pipe1.

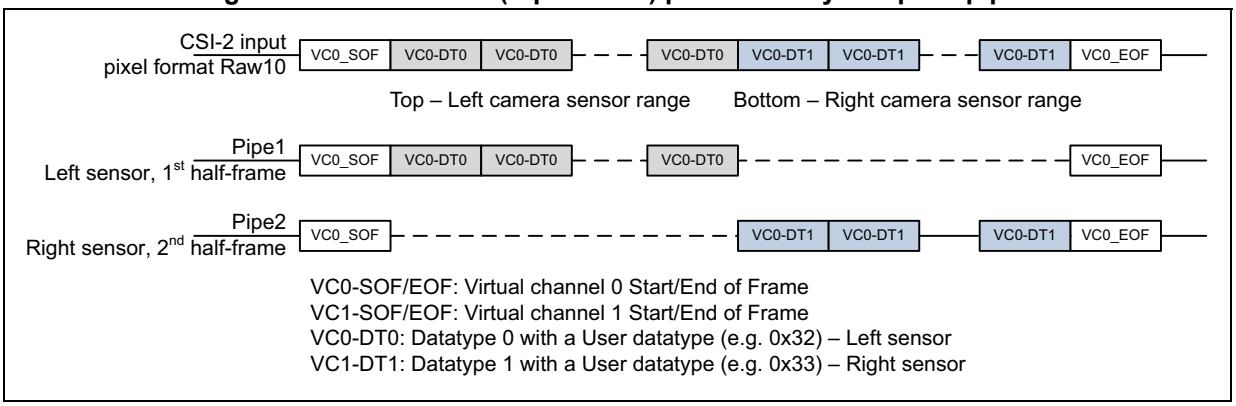
Typical application example: 3D sensors camera (top-bottom)

Some CSI-2 bridges concatenate data from left and right camera in a top-bottom approach. It means that within a frame, first half of the lines are the ones generated by the left camera, whereas the half last lines of a frame are attached to the right camera sensor. The bridge may typically make a distinction between lines coming from left camera and right camera by identifying the data type with a user data type value linked to a camera.

The user data type does not identify a pixel format, but rather a data linked to a camera. To help the pipeline process in a correct way the pixel, the software must inform the pipeline about the pixel format in input attached to the user Datatypes.

Let us imagine that the application has to separate pixels from the left camera from those of the right camera. Two pixel pipes can be configured for that, with, for instance, Pipe1 for left camera and Pipe2 dedicated to extract pixels from the right camera, as shown in *Figure 360*.

Figure 360. 3D sensors (top-bottom) processed by two pixel pipes



DCMIPP_P1FSCR configuration

- PIPEDIFF = 0, Pipe1 shares the demosaicing block with Pipe2 to transform, for instance, Raw10 in RGB888 for the output pixel format.
- VC = Virtual channel number
- DTMODE = 1, both Datatypes (0x32 and 0x33) selected to be propagated into Pipe1 through the demoisaicing, shared with Pipe2.
- DTIDA = 0x32, to let pixel data from the left camera sensor (identified by the user data type 0x32) to be processed by the demosaicing block, and further Pipe1 post processing stages (crop, downsize).
- DTIDB = 0x33, to let pixel data from the right camera sensor (identified by the user data type 0x33) to be processed by the demosaicing block, and further Pipe2 post processing stages (crop, downsize).
- FDTF[5:0] = 0x2B, to inform about the Raw10 data type normalized value in CSI-2 specification as input pixel format of the pipes.
- FDTFEN = 1, to force the user Datatypes DTIDA and DTIDB to be decoded as FDTF[5:0] input pixel format value.
- PIPEN = 1, to activate Pipe1.

Pipe1 crop registers (DCMIPP_P1CRSTR and DCMIPP_P1CRSZR) must be configured to crop only the first half lines of the frame corresponding to the pixels coming from the left camera sensor.

DCMIPP_P2FSCR configuration:

- VC / DTIDA / DTIDB / FDTF[5:0] / FDTFEN = don’t care since it is the same as the one defined in DCMIPP_P1FSCR (as PIPEDIFF = 0).
- PIPEN = 1 to activate Pipe2.

Pipe2 crop registers (DCMIPP_P2CRSTR and DCMIPP_P2CRSZR registers) must be configured to crop only the second half lines of the frame corresponding to the pixels coming from the right camera sensor.

42.10 Pixel format description

This section describes the pixel formats used in the parallel interface and in the pixel pipes and dump pipe. The CSI-2 pixel format is described in the CSI-2 v1.3 Standard.

The support for the pixel formats, per interface (parallel, CSI-2, pixel output, dump output) are summarized in *Table 403*, *Table 379*.

Note: In the following tables the components are represented with their symbolic color: red and Cr (= V) in red, blue and Cb (= U) in blue, green in green, and Y, monochrome, and all raw Bayer components in gray.

42.10.1 Parallel interface formats

This paragraph describes the input pixel format as supported by the parallel interface of the DCMIPP and the possible swap combinations.

Note: The parallel interface does not input specifically RGB444/RGB555 (and RGB666). However, a sensor with these output can connect them onto the DCMIPP, by selecting RGB565 (and RGB888), and by either connecting the missing bits with the MSB of the sensor output or by strapping them.

Table 403. Parallel interface input pixel formats

To adapt to non-standard sensors, the parallel interface is flexible and allows to swap bits, cycles, components, namely:

- Bits: LSB-vs.-MSB bits are swapped, across the whole 16-bit IO pins.
- Cycles: cycle 1/2 and cycle 2/2 are swapped. No impact for 1 or 3 cycles.
- Components: R-vs-B components are swapped (or V-vs-U if YUV).

Table 405 shows these permutations, based on the RGB565 format. It lists the sampled bits of cycles 1 and 2, on pins 0 to 7, and for each of them returns the assignation of the RGB output components.

Table 405. Parallel interface input pixel formats

1. Format identifies the value set in bitfield FORMAT[3:0] of DCMIPP_PxPPCR registers (x = 1 to 2).

42.10.3 Dump pipe formats

The dump pipe, thanks to its capability to dump, supports more formats than the pixel pipe, namely:

- CSI-2 packet headers and data
- CSI-2 raw Bayer pixels on 6/7bits (that can be dumped as-is but are not supported by the pixel pipe and hence cannot be processed as pixels).
- Monochrome and raw Bayer pixels on 10/12/14 bits, padded on 16 bpp.

Table 407 details the support for these additional pixel formats. Other formats are assumed to be pixels with the same width. The other pixel formats used by the dump pipe are similar to the pixel formats used by the pixel pipe.

Table 407. Dump pipe OUTPUT pixel formats(1)

1. PN indicates Pixel N.

42.10.4 AXI IP-Plug

The AXI IP-Plug dumps the data of the pipes (via the AXI) to the memory. It is unique, shared by all the pipes.

Features

- Pipe ID: AXI IP-Plug differentiates, via its ID, the source of the pipe. It allows to differentiate the QoS depending upon the clients.
- FIFOs: sized to handle up to 5 µs latencies (1 µs average round-trip + 4 µs memory slowdown), with, by default, at reset:
  a) Pipe0: 5 Gbps, thus up to 4 Kbytes (if ARGB)
  b) Pipe1-Y/RGB: 200 Mpixel/s peak x 8bpp / 32bpp, thus up to 4 Kbytes
  c) Pipe1-U: 200 Mpixel/s peak x 8 bpp, thus up to 1 Kbytes
  d) Pipe1-V: 200 Mpixel/s peak x 4 bpp, thus up to 0.5 Kbytes
  e) Pipe2: 200 Mpixel/s peak x 32 bpp, thus up to 4 Kbytes
  f) Stats: 320 bins of 16 bpp, thus 640 bytes
- Burst length: 64 and 128 bytes for all the pipes.
- Outstanding capability: 16 outstandings, to cope with 2 GB/s maximum bandwidth on 128 bytes bursts.
- Bandwidth limiter (via an outstanding limitation per pipe): avoids a last-line dump that would uselessly overload the memory bandwidth.
- Unique AXI-QOS: unique QOS for the DCMIPP (without differentiation between pipes that must all work correctly with their real-time constraint).
- The total FIFO size is 12160 bytes.

Common software configuration

The AXI IP-Plug has a common configuration in the DCMIPP_IPGR1/2/3/8 registers.

The common registers are writable only when the IP-Plug is in Idle mode (see PSTART below to lock it, or below for an example).

- MEMORYPAGE: for efficient handling of DRAM: bursts do not cross this module.
- PSTART: request to freeze the plug, to reconfigure it safely.
- IDLE: status to mention the plug is frozen, to reconfigure it safely.
- IPPID[7:0], ARCHIID[4:0], REVID[4:0], DID[5:0]: version IDs of the IP-Plug.

Per-client software configuration

The AXI IP-Plug has a per-client configuration in the registers DCMIPP_IPCxR1/2/3.

The client registers are writable only when the IP-Plug is in Idle mode (see PSTART in common registers above to lock it, or below for an example).

The clients (1..n) are numbered following the sequence Pipe0..m. Inside each pipe, there are several potential clients when the planar feature is needed.

For instance, the DCMIPP with its three pipes (Pipe0, Pipe1, Pipe2) and with Pipe1 allowing a full planar capability (three buffers: Y, U, V), has the IP-Plug clients, numbered as follows:

- Client1 = Pipe0
- Client2 = Pipe1Y/RGB
- Client3 = Pipe1U
- Client4 = Pipe1V
- Client5 = Pipe2
- Client6 = Statistics (dump of the histograms)

The configurable per-client features are the following:

- OTR: outstanding transactions per client (Outstanding = OTR + 1)
- TRAFFIC[2:0]: burst size: best select 128 bytes, thus TRAFFIC = 4
- WLRU[3:0]: proportion of total bandwidth: WLRU = BWi / sum (all BW)
- SVC: system virtual channel, keep SVC = 0
- DPREGSTART: local base-address of start of FIFO for this client
- DPREGEND: local base-address of end of FIFO (included word) for this client

Configuration computations

IP-Plug common configuration:

- PSTART: set to 1, to put IP-Plug idle and configure its registers G1/3, R1/3
- IDLE: read and wait till 1, to get it idle
- MEMORYPAGE: 4, to optimize for memory pages of 256 bytes

IP-Plug per-client configuration:

- OTR (client): outstanding per client, among a total of 16 outstandings.
  - The provided value (OTR) is the outstanding amount minus 1.
- DPREG size (client): RAM shared among client, among a total of 1520 x 64-bit words (80 words for the histogram)
  - DPREGSTART = 0 (or after another client location).
  - DPREGEND = 127 for ((127 - 0) + 1) x 8 B = 1 KB, as example if 1 KB is assigned to this client. The value to program is 127, as the word is included. DPREGEND is defined to include the last given word of memory, so that a FIFO of 128 words (starting at 0) has DPREGEND = 127.
- WLRU (client): Weighted Least Recently Used arbitration ratio, represents the bandwidth ratio for each client. The maximum ratio WLRU value is 16, meaning that the most demanding client will have 16 times the bandwidth of the least demanding client. The value to configure in DCMIPP_IPCxR2 is the WLRU ratio minus 1.

Each client is provided a proportion of the total FIFO size and of the total outstanding available transactions, in function of the local peak bandwidth. Indeed, the DCMIPP implements buffers to smooth the bandwidth, but they are not large enough to buffer full lines. The proportion of the peak bandwidth of each pipe is estimated as:

- PeakBandwidthProportion (= PBP) = OutputWidth (= OW) * PixelFormatSize (= PFS)
- OTR(client) = Total_OTR * PBP(client) / SumAll(PBP) - 1
- DPREG_Size(client) = Total_DPREG_Size * PBP(client) / SumAll(PBP)

As an example, an xRGB 720p display output, a VGA 422 video output (for software), and no statistics, results in:

- PBP(Display) = 1280 * 4 = 5120
- PBP(Video) = 640 * 2 = 1280
- OTR(Display) = 16 * 5120 / (5120 + 1280) - 1 = 12
- OTR(Video) = 16 * 1280 / (5120 + 1280) - 1 = 3
- DPREG_Size(Display) = 1440 * 5120 / (5120 + 1280) = 1152
- DPREG_Size(Video) = 1440 * 1280 / (5120 + 1280) = 288

Video is assigned to Pipe1 (= Client2) and display to Pipe2 (Client5):

- IP-Plug common registers:
  - DCMIPP_IPGR1.MEMORYPAGE = 2 (default, 256 bytes)
  - DCMIPP_IPGR2.PSTART = 1 (locks IP-Plug for reconfiguration)
  - DCMIPP_IPGR3.IDLE to wait until = 1 (to wait before continuing)
- Video as Pipe1, statically mapped onto IP-Plug Client2:
  - DCMIPP_IPC2R1.OTR = 3
  - DCMIPP_IPC2R1.TRAFFIC = 4 (default)
  - DCMIPP_IPC2R3.DPREGSTART = 1152
  - DCMIPP_IPC2R3.DPREGEND = 1439
- Display as Pipe2, statically mapped onto IP-Plug Client5:
  - DCMIPP_IPC5R1.OTR = 12
  - DCMIPP_IPC5R1.TRAFFIC = 4 (default)
  - DCMIPP_IPC5R3.DPREGSTART = 0
  - DCMIPP_IPC5R3.DPREGEND = 1151
- IP-Plug common registers:
  - DCMIPP_IPGR2.PSTART = 0 (unlocks IP-Plug after configuration)

Configuration example 1: Single RGB dump

It is the simplest but most usual configuration, with the DCMIPP dumping to a single xRGB buffer. It has thus a single pipe active, the dump is coplanar (no side U or V planes), and to emphasize, it does not dump separate statistics (with Pipe0), nor does use the second pixel pipe (Pipe2).

All the AXI capabilities are focused on the single active pipe, which gets all the FIFO space and outstanding capability of the DCMIPP. With this setting, a camera dump of 200 Mpixel/s peak on 32 bpp (800 MB/s bandwidth) benefits of:

- 11 Kbytes FIFO, allowing a memory peak slowdown of 13 µs (a very high value).
- 16 outstandings of 128 bytes, allowing an average memory latency of 2.5 µs (a high value).
- IP-Plug common registers:
  - DCMIPP_IPGR1.MEMORYPAGE = 2 (default, 256 bytes)
  - DCMIPP_IPGR2.PSTART = 1 (locks IP-Plug for reconfig)
  - DCMIPP_IPGR3.IDLE to wait until = 1 (to wait before continuing)
- Single dump on Pipe1 (main pipe), statically mapped onto IP-Plug Client2:
  - DCMIPP_IPC2R1.OTR = 15 (maximum assigned here)
  - DCMIPP_IPC2R1.TRAFFIC = 4 (default, 128 bytes/burst)
  - DCMIPP_IPC2R2.WLRU = 0 (not used as single client)
  - DCMIPP_IPC2R2.SVCMAPPING = 0 (non-user)
  - DCMIPP_IPC2R3.DPREGSTART = 0 (single FIFO, start at lowest)
  - DCMIPP_IPC2R3.DPREGEND = 1439 (single FIFO, end at highest)
- IP-Plug common registers:
  - DCMIPP_IPGR2.PSTART = 0 (unlocks IP-Plug after configuration)

Configuration example 2: All pipes active

This is the most flexible configuration of the DCMIPP: the six clients of the IP-Plug are configured to dump the maximum bandwidth they can receive).

Note that, as the bus capabilities are shared among the clients, that configuration is less resistant to memory latencies than the above configuration with only a single RGB dump.

The capabilities of the DCMIPP are shared among the clients with the following assumptions:

- Client1 for Pipe0: dump of raw Bayer pixels, padded to 16 bpp, BW = 2 / 13
- Client2 for Pipe1-Y: dump of ARGB pixels, on 32 bpp, BW = 4 / 13
- Client3 for Pipe1-UV: dump of UV components, on 8 bpp, BW = 1 / 13
- Client4 for Pipe1-V: dump of V component, on 4 bpp, BW = 1 / 13
- Client5 for Pipe2: dump of ARGB pixels, on 32 bpp, BW = 4 / 13
- Client6 for Stats: dump of 320 bins, on 16 bpp, BW = 1 / 13

The total bandwidth proportion, when all pipes are used, is 13. As some configurations (like the outstanding capability) are divided in other granularities, Pipe1-Y/RGB has some advantages, sometimes is used alone (as in the above simpler use case).

With these settings, a camera dump of 200 Mpixel/s peak on 32 bpp (800 MB/s bandwidth) benefits, for an average pipe like Pipe2, of:

- 4 Kbytes FIFO, allowing a memory peak slowdown of ~5 µs
- Four outstandings of 128 bytes, with an average memory latency of 0.65 µs, (acceptable but not so large): the DCMIPP must get priority to access the memory.

It results in the following register configuration:

- IP-Plug common registers:
  - DCMIPP_IPGR1.MEMORYPAGE = 2 (default, 256 bytes)
  - DCMIPP_IPGR2.PSTART = 1 (locks IP-Plug for reconfiguration)
  - DCMIPP_IPGR3.IDLE to wait until = 1 (to wait before continuing)
- Client1 for Pipe0: (raw Bayer, 16 bpp) with 2 / 13 of the BW:
  - DCMIPP_IPC1R1.OTR = 1 (2 outstandings, among 16)
  - DCMIPP_IPC1R1.TRAFFIC = 4 (default, 128 bytes/burst)
  - DCMIPP_IPC1R2.WLRU = 1 (2 parts of BW, among 13)
  - DCMIPP_IPC1R2.SVCMAPPING = 0 (non-user)
  - DCMIPP_IPC1R3.DPREGSTART = 0 (224 parts of FIFO, among 1440)
  - DCMIPP_IPC1R3.DPREGEND = 223 (224 parts of FIFO, among 1440)
- Client2 for Pipe1-Y/RGB: (ARGB, 32 bpp) with 4 / 13 of the BW:
  - DCMIPP_IPC2R1.OTR = 5 (6 outstandings, among 16)
  - DCMIPP_IPC2R1.TRAFFIC = 4 (default, 128 bytes/burst)
  - DCMIPP_IPC2R2.WLRU = 3 (4 parts of BW, among 13)
  - DCMIPP_IPC2R2.SVCMAPPING = 0 (non-user)
  - DCMIPP_IPC2R3.DPREGSTART = 224 (496 parts of FIFO, among 1440)
  - DCMIPP_IPC2R3.DPREGEND = 719 (496 parts of FIFO, among 1440)
- Client3 for Pipe1-UV: (UV, 8 bpp) with 2 / 13 of the BW:
  - DCMIPP_IPC3R1.OTR = 1 (2 outstandings, among 16)
  - DCMIPP_IPC3R1.TRAFFIC = 4 (default, 128 bytes/burst)
  - DCMIPP_IPC3R2.WLRU = 0 (1 part of BW, among 13)
  - DCMIPP_IPC3R2.SVCMAPPING = 0 (non-user)
  - DCMIPP_IPC3R3.DPREGSTART = 720 (144 parts of FIFO, among 1440)
  - DCMIPP_IPC3R3.DPREGEND = 863 (144 parts of FIFO, among 1440)
- Client4 for Pipe1-V: (V, 4 bpp) with 1 / 13 of the BW:
  - DCMIPP_IPC4R1.OTR = 1 (2 outstandings, among 16)
  - DCMIPP_IPC4R1.TRAFFIC = 4 (default, 128 bytes/burst)
  - DCMIPP_IPC4R2.WLRU = 0 (1 part of BW, among 13)
  - DCMIPP_IPC4R2.SVCMAPPING = 0 (non-user)
  - DCMIPP_IPC4R3.DPREGSTART = 864 (80 parts of FIFO, among 1440)
  - DCMIPP_IPC4R3.DPREGEND = 943 (80 parts of FIFO, among 1440)
- Client5 for Pipe2: (ARGB, 32 bpp) with 4 / 13 of the BW:
  - DCMIPP_IPC5R1.OTR = 3 (4 outstandings, among 16)
  - DCMIPP_IPC5R1.TRAFFIC = 4 (default, 128 bytes/burst)
  - DCMIPP_IPC5R2.WLRU = 3 (4 parts of BW, among 13)

  - DCMIPP_IPC5R2.SVCMAPPING = 0 (non-user)
  - DCMIPP_IPC5R3.DPREGSTART = 944 (496 parts of FIFO, among 1440)
  - DCMIPP_IPC5R3.DPREGEND = 1439 (496 parts of FIFO, among 1440)
- Client6 for statistic histograms (640 bytes):
  - DCMIPP_IPC6R1.OTR = 1 (2 outstandings among 16)
  - DCMIPP_IPC6R1.TRAFFIC = 4 (default, 128 bytes/burst)
  - DCMIPP_IPC6R2.WLRU = 0 (1 part of BW, among 13)
  - DCMIPP_IPC6R2.SVCMAPPING = 0 (non-user)
  - DCMIPP_IPC6R3.DPREGSTART = 1440 (80 parts of FIFO)
  - DCMIPP_IPC6R3.DPREGEND = 1519 (80 parts of FIFO)
- IP-Plug common registers:
  - DCMIPP_IPGR2.PSTART = 0 (unlocks IP-Plug after configuration)

42.11 Shadow registers

A dump and/or pixel pipe must have the capability to be reconfigured without stopping it. Some registers can be written in the middle of a frame without impacting the actual frame acquisition. The values are stored into some shadow registers before being written in their corresponding physical registers, based on a trigger event like described in *Table 408*.

Each physical register in the register map has its address increased by 0x200 respect to its own shadow register address.

Table 408. Shadow and physical registers

Shadow register	Physical register	Trigger event
DCMIPP_P0FSCR(1)	DCMIPP_P0CFSCR	Vsync boundaries
DCMIPP_P0FCTCR	DCMIPP_P0CFCTCR	Vsync boundaries

1. Bit PIPEN of this register is not shadowed.

It is mandatory to refresh the shadow registers within a frame to prepare the context to be ready for the next start of frame, to avoid any unpredictable behavior during the acquisition.

The software must then react to the following interrupt sources to launch the shadow registers accesses:

- At VSYNC interrupt (FrameStart at start of pipe) an interrupt is generated, and the software can update the shadow registers loaded into the physical registers at the end of the current frame (so active for the next frame). The software has an entire frame period to complete the update.
- At LINE interrupt line selection can be used also to trigger the software to update the physical registers with the new frame context to consider. The application code must ensure that the update takes place before the end of frame event (current frame). If not, the context can be partially considered from the next frame, dealing with inconsistent settings.

In any case, the software must ensure that the shadow registers are updated before the end of the current frame, to be active from the next frame. Updates started and not completed before the end of current frame result in inconsistent frame acquisition for the next frame (mixing old and new configurations).

It is recommended to change non-shadowed registers when the corresponding pipe is disabled and in an idle state (refer to *Section 42.4.9: Pipe deactivation*).

42.12 DCMIPP low power modes

This section describes the behavior of the DCMIPP versus the modes listed in *Table 409*.

Table 409. DCMIPP low power modes

Mode	Description
Stop	Peripheral content is kept. It is recommended to follow the pipe(s) disabling procedure before entering it.
Standby	Powered-down. The peripherals must be reinitialized after exiting this mode.
Sleep	No effect. DCMIPP is still working in this mode, peripheral interrupts cause the device to exit it.

42.13 DCMIPP interrupts

This section describes the DCMIPP interrupts, and more globally, the features that are related to real-time, namely:

- Free-running: DCMIPP can run without CPU involvement
- Shadow registers: relieve timing constrains from the software
- Interrupts: source of interrupt
- Multiple CPU: capability for independent CPU or driver without Mutex
- Event pins: to drive external IPs, like a DMA

42.13.1 Free-running DCMIPP

After a camera flow has been configured and established, it is able to run permanently, without any software involvement. The following features are available:

- Permanent pipe activation, for Pipe0, 1, 2: when set, the respective pipe dumps frame data, for an unlimited amount of frames.
  - DCMIPP_PxFCTCR.CPTMODE = 0
  - DCMIPP_PxSR.CPTACT = 1
  - DCMIPP_PxFCTCR.FRATE = xx (depending on desired frame subsampling rate)
- No double buffered frames: the DCMIPP defines only one BaseAddress pointer for the output buffers:
  - Software can react to the VSYNC interrupt, and can decide, before the next VSYNC event, to modify the frame BaseAddress pointer.
  - If the software does not react, the capture of a frame overwrites the previous one.

42.13.2 Interrupts

The DCMIPP handles five interrupts pins, the fifth being the OR of the first four.

A register set is associated to each interrupt to provide the following functionality:

- Unmasked events: reports an event that occurred and has not yet been cleared
- Masks: to mask unwanted events
- Masked events: not readable, any active unmasked bit triggers the interrupt pin
- Clear register: write to clear any active event

The interrupt pins are active when high: they go high when triggered by an unmasked event, and remain high until all the masked events of that interrupt are cleared.

The interrupts lines and registers are:

1. Parallel interface, with the next interrupt events handled:
   - ERR: bad embedded synchronization detected.
     > Unexpected behavior in the parallel interface, usually not triggered if no issues.
     > It is due to an unexpected sensor behavior, or to a transmission error.
2. Pipe0 (dump), with the next interrupt events handled:
   - OVR: data overflow: the memory was too slow vs. received pixels.
     > Unexpected behavior in Pipe0, usually not triggered if no issues.
     > Same recommendation as for above OVR: skip the impacted frame.
   - LIMIT: received volume is larger than the maximum allowed dump volume.
     > Unexpected behavior in Pipe0, usually not triggered if no issues.
     > The transmitted flow is too long. More space must be allocated in memory to store the transmission of a next frame.
   - VSYNC: main interrupt, where most software can sit.
     > Trigger: at VSync (mid blanking), permanent (even if no dump active).
     > Typically to reconfigure slowly the pipes (at least shadow registers) for next frame
     > Typically to trigger usage of the previously captured frame.
   - FRAME: secondary interrupt, as backup for fast-software
     > Trigger: after last data dump of this pipe, inactive if no capture has occurred.
     > Typically to quickly reconfigure non-shadow registers (during only vertical blanking)
     > Typically to trigger usage of the previously captured frame.
   - LINE: interruption for stripe-based operators trigger: after every 1/2/4/8/16/32/64/128 dumped lines and last line. It is measured and extracted at end of pipe, close to output to memory.
     > Typically to trigger fast/reactive software or hardware stripe-based operators.

Note: The LINE flag (LINEF bit) is set at the end of frame, to trigger out software event when the frame height is not a multiple of the selected number of lines for which the LINEF event is triggered. The last part of the frame can, in such case, have a lower number of lines than the selection. The event/interrupt is generated even if the number of lines is incomplete. The software must consider that this last event has a lower than expected number of lines when reaching the end of frame (FRAME event).

3. Pipe1 (main pipe)
   - Same events handled as Pipe0: OVR, VSYNC, FRAME, LINE, but no LIMIT as only pixels are captured after a potential crop.
   - STFRAME: Histogram statistics frame interrupt
     > Trigger: Histogram statistics captured and successfully written to system memory.
   - STOVR: Histogram statistics overrun interrupt
     > Trigger: The memory was too slow to receive and store the entirety of the histogram data. Statistics capture is aborted.
   - STBC: Histogram statistics bad configuration interrupt

> Trigger: An incoherent histogram configuration was detected. Statistics capture is aborted.

4. Pipe2 (ancillary pipe)
   – Same events handled as Pipe1: OVR, VSYNC, FRAME, LINE.
5. Common interrupt: groups the events of the above interrupts in a single register set and drives its own interrupt line.
   – The fifth interrupt is designed for systems where a single driver handles the whole DCMIPP: a single access to this interrupt status allows to retrieve the status of the whole DCMIPP.
   – The first four interrupts are designed for systems where a driver handles a pipe and (potentially) another one drives the parallel interface. In that case, each driver handles its own individual interrupt register set, without need for semaphores to arbitrate conflicting accesses.

   There is also a common interrupt that can be generated if enabled, when a transfer error is detected during an AXI transfer from the IP-Plug to memories. Error flag ATXERR in the DCMIPP_CMSR2 register is set and an interrupt can be generated to inform the software about this error status. There is no specific hardware action linked to this error, it is up to software to handle the transfer error situation.

   On multiple-pipe architecture, the error informs that at least one AXI client has a transfer error, but does not identify from which client.

The DCMIPP interrupts are summarized in *Table 410*. An event that generates an interrupt does it at two locations:

– once in the common interrupt register set (when driven by a single CPU)
– once in the local interrupt register set (when driven by multiple CPUs).

Table 410 provides the local (register and bit) and global (bit only, as all bits are in the same DCMIPP_CMSR2 register) locations.

Table 410. DCMIPP interrupts

Interrupt event	Local register	Local bit	Common bit in DCMIPP _CMSR2	Event flag/interrupt clearing method	Interrupt enable control bit local/common register
Synchronization error in parallel interface	DCMIPP _PRSR	ERRF	PRERRF	Write CERRF = 1 / CPRERRF = 1	ERRIE/PRERRFIE
AXI transfer error	-	-	ATXERR	Write CATXERRF = 1	ATXERRIE
Overflow in Pipe0	DCMIPP _P0SR	OVRF	P0OVRF	Write COVRF = 1 / CP0OVRF = 1	OVRIE/P0OVRIE
Limit violation in Pipe0		LIMITF	P0LIMITF	Write CLIMITF = 1 / CP0LIMITF = 1	LIMITIE/P0LIMITIE
Frame start (VSYNC) in Pipe0		VSYNC	P0VSYNC	Write CVSYNCF = 1 / CP0VCSYNCF = 1	VSYNCIE/P0VSYNCIE
Frame end (FRAME) in Pipe0		FRAMEF	P0FRAMEF	Write CFRAMEF = 1 / CP0FRAMEF = 1	FRAMEIE/P0FRAMIE
Multi-line (LINE) in Pipe0		LINEF	P0LINEF	Write CLINEF = 1 / CP0LINEF = 1	LINEFIE/P0LINEFIE

Table 410. DCMIPP interrupts (continued)

Interrupt event	Local register	Local bit	Common bit in DCMIPP_CMSR2	Event flag/interrupt clearing method	Interrupt enable control bit local/common register
Overflow in Pipe1	DCMIPP_P1SR	OVRF	P1OVRF	Write COVRF = 1 / CP1OVRF = 1	OVRIE/P1OVRIE
Frame start (VSYNC) in Pipe1		VSYNC	P1VSYNC	Write CLIMITF = 1 / CP1LIMITF = 1	LIMITIE/P1LIMITIE
Frame end (FRAME) in Pipe1		FRAMEF	P1FRAMEF	Write CVSYNCF = 1 / CP1VCSYNCF = 1	VSYNCIE/P1VSYNCIE
Multi-line (LINE) in Pipe1		LINEF	P1LINEF	Write CFRAMEF = 1 / CP1FRAMEF = 1	FRAMEIE/P1FRAMIE
Overflow in Pipe2	DCMIPP_P2SR	OVRF	P2OVRF	Write COVRF = 1 / CP2OVRF = 1	OVRIE/P2OVRIE
Frame start (VSYNC) in Pipe2		VSYNC	P2VSYNC	Write CLIMITF = 1 / CP2LIMITF = 1	LIMITIE/P2LIMITIE
Frame end (FRAME) in Pipe2		FRAMEF	P2FRAMEF	Write CVSYNCF = 1 / CP2VCSYNCF = 1	VSYNCIE/P2VSYNCIE
Multi-line (LINE) in Pipe2		LINEF	P2LINEF	Write CFRAMEF = 1 / CP2FRAMEF = 1	FRAMEIE/P2FRAMIE
Histogram statistics complete	DCMIPP_P1SR	STFRAMEF	STFRAMEF	Write CSTFRAMEF = 1	STFRAMEIE
Histogram statistics overrun		STOVRF	STOVRF	Write CSTOVRF = 1	STOVRIE
Histogram statistics bad configuration		STBCF	STBCF	Write CSTBCF = 1	STBCIE

42.13.3 Event pins

Event pins are exposed to let an ancillary HW IP, like a central DMA, to synchronize with them. The event pins are the unmasked synchronization events (VSYNC, FRAME, LINE, HSYNC) of the pipes.

An internal events generates a pulse (15 APB cycles long) on its pin.

Table 411. Event connection

Pipe	Event name	Internal signal
Pipe0	HSYNC	dcmipp_p0_hsync_evt
	VSYNC	dcmipp_p0_vsync_evt
	Frame	dcmipp_p0_frameend_evt
	Line	dcmipp_p0_lineend_evt

Table 411. Event connection (continued)

Pipe	Event name	Internal signal
Pipe1	HSYNC	dcmipp_p1_hsync_evt
	VSYNC	dcmipp_p1_vsync_evt
	Frame	dcmipp_p1_frameend_evt
	Line	dcmipp_p1_lineend_evt
Pipe2	HSYNC	dcmipp_p2_hsync_evt
	VSYNC	dcmipp_p2_vsync_evt
	Frame	dcmipp_p2_frameend_evt
	Line	dcmipp_p2_lineend_evt

42.14 DCMIPP registers

The registers are split into groups with a same prefix, as shown in *Table 412*.

Table 412. DCMIPP registers organization

Register name	Offset	Function
DCMIPP_IP	0x000	IP-Plug registers
DCMIPP_PR	0x100	Parallel interface
DCMIPP_CM	0x200	Common registers
DCMIPP_P0	0x500	Pipe0 (dump pipe) with shadow registers
	0x700	Pipe0 (dump pipe) with physical registers
DCMIPP_P1	0x800	Pipe1 image processing with shadow registers
	0x900	Pipe1 post-processing with shadow registers
	0xA00	Pipe1 image processing with physical registers
	0xB00	Pipe1 post-processing with physical registers
DCMIPP_P2	0xC00	Pipe2 image processing with shadow registers
	0xD00	Pipe2 post-processing with shadow registers
	0xE00	Pipe2 image processing with physical registers
	0xF00	Pipe2 post-processing with physical registers
DCMIPP_	0xFF0	IP version and configuration (without prefix)

42.14.1 DCMIPP IP-Plug global register 1 (DCMIPP_IPGR1)

Address offset: 0x000

Reset value: 0x0000 0002

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	QOS_MODE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
							rw								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MEMORYPAGE[2:0]		
													rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **QOS_MODE:** Quality of service
Set of functions enabling to build and configure an architecture meeting bandwidth and latency requirements.

Bits 23:3 Reserved, must be kept at reset value.

Bits 2:0 **MEMORYPAGE[2:0]:** Memory page size, as power of 2 of 64-byte units:
0x0: 64 bytes
0x1: 128 bytes
0x2: 256 bytes
0x3: 512 bytes
0x4: 1K bytes
0x5: 2K bytes
0x6: 4K bytes
0x7: 8K bytes

42.14.2 DCMIPP IP-Plug global register 2 (DCMIPP_IPGR2)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PSTART
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **PSTART:** Request to lock the IP-Plug, to allow reconfiguration.
0: No lock requested, IP-Plug runs on demand by background HW.
1: Lock requested: IP-Plug freezes shortly (see IDLE bit when lock is active).
PSTART must be reset to 0 after configuration is completed, to restart the IP-Plug.

42.14.3 DCMIPP IP-Plug global register 3 (DCMIPP_IPGR3)

Address offset: 0x008

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IDLE
															r

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **IDLE:** Status of IP-Plug
0: IP-Plug is running (on demand by background HW)
1: IP-Plug is currently locked and can be reconfigured
IDLE is set after a request by setting PSTART at 1, and reset by resetting PSTART at 0.

42.14.4 DCMIPP IP-Plug identification register (DCMIPP_IPGR8)

Address offset: 0x01C

Reset value: 0xAA04 0314

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IPPID[7:0]								Res.	Res.	Res.	ARCHIID[4:0]				
r	r	r	r	r	r	r	r				r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	REVID[4:0]					Res.	Res.	DID[5:0]					
			r	r	r	r	r			r	r	r	r	r	r

Bits 31:24 **IPPID[7:0]:** IP identifier (0xAA)

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **ARCHIID[4:0]:** Architecture identifier (0x04)

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **REVID[4:0]:** Revision identifier (0x03)

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **DID[5:0]:** Division identifier (0x14)

42.14.5 DCMIPP IP-Plug Clientx register 1 (DCMIPP_IPCxR1)

Address offset: 0x020 + 0x10 * (x - 1), (x = 1 to 6)

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	OTR[3:0]				Res.	Res.	Res.	Res.	Res.	TRAFFIC[2:0]		
				rw	rw	rw	rw						rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **OTR[3:0]:** Maximum outstanding transactions
0: Disabled. No outstanding transaction limitation (except via FIFO size)
1: Maximum two outstanding transactions ongoing.
...
15: Maximum 16 outstanding transactions ongoing.

Bits 7:3 Reserved, must be kept at reset value.

Bits 2:0 **TRAFFIC[2:0]:** Burst size as power of 2 of 8-byte units
0x0: 8 bytes
0x1: 16 bytes
0x2: 32 bytes
0x3: 64 bytes
0x4: 128 bytes
Other values: Reserved

42.14.6 DCMIPP IP-Plug Clientx register 2 (DCMIPP_IPCxR2)

Address offset: 0x024 + 0x10 * (x - 1), (x = 1 to 6)

Reset value: 0x0001 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WLRU[3:0]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **WLRU[3:0]:** Ratio for WLRU[3:0] arbitration
A client gets a portion of the total bandwidth = Ratio(client) / Sum(all ratios)
0x0: Ratio part = 1
0x1: Ratio part = 2
...
0xF: Ratio part = 16

Bits 15:0 Reserved, must be kept at reset value.

42.14.7 DCMIPP IP-Plug Clientx register 3 (DCMIPP_IPCxR3)

Address offset: 0x028 + 0x10 * (x - 1), (x = 1 to 6)

Reset value: 0x017F 0000, 0x02FF 0180, 0x03BF 0300, 0x041F 03C0, 0x059F 0420, 0x05EF 05A0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	DPREGEND[10:0]										
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	DPREGSTART[10:0]										
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 Reserved, must be kept at reset value.

Bits 26:16 **DPREGEND[10:0]:** End word (AXI width = 64 bits) of the FIFO of Clientx.
The addressed word is included in the FIFO, so that next DPREGSTART is DPREGEND + 1.

Bits 15:11 Reserved, must be kept at reset value.

Bits 10:0 **DPREGSTART[10:0]:** Start word (AXI width = 64 bits) of the FIFO of Clientx.

42.14.8 DCMIPP parallel interface control register (DCMIPP_PRCR)

Address offset: 0x104

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	SWAP BITS	SWAP CYCLES	Res.	FORMAT[7:0]							
					rw	rw		rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	ENABLE	Res.	EDM[2:0]			Res.	Res.	VSPOL	HSPOL	PCKPOL	ESS	Res.	Res.	Res.	Res.
	rw		rw	rw	rw			rw	rw	rw	rw				

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **SWAPBITS**: Swap LSB vs. MSB within each received component
0: As received
1: Swapped MSB vs. LSB

Bit 25 **SWAPCYCLES**: Swap data (cycle 0 vs. cycle 1) for pixels received on two cycles
0: Default
1: Swap active: the data of cycle 1 is used before the data of cycle 0.
The swap must not be activated by software for pixels received in one or three cycles.

Bit 24 Reserved, must be kept at reset value.

Bits 23:16 **FORMAT[7:0]**:
0x1E: YUV422
0x22: RGB565
0x24: RGB888 (= YUV444)
0x2A: RAW8
0x2B: RAW10
0x2C: RAW12
0x2D: RAW14
0x4A: monochrome 8-bit
0x4B: monochrome 10-bit
0x4C: monochrome 12-bit
0x4D: monochrome 14-bit
0x5A: byte stream (JPEG, compressed video)
Other values: data are captured and output as-is only through the data/dump pipeline (for example JPEG or byte input format).
The monochrome Y input is inserted in the pipe as YUV pixels, with the U and V components set to neutral, to represent a gray color.

Bit 15 Reserved, must be kept at reset value.

Bit 14 **ENABLE:** Parallel interface enable
0: Parallel interface disabled to lower power consumption
1: Parallel interface enabled
The parallel interface configuration registers must be correctly programmed before enabling this bit.

Bit 13 Reserved, must be kept at reset value.

Bits 12:10 **EDM[2:0]:** Extended data mode
0x0: Interface captures 8-bit data on every pixel clock
0x1: Interface captures 10-bit data on every pixel clock
0x2: Interface captures 12-bit data on every pixel clock
0x3: Interface captures 14-bit data on every pixel clock
0x4: Interface captures 16-bit data on every pixel clock
Other values: Reserved

Bits 9:8 Reserved, must be kept at reset value.

Bit 7 **VSPOL:** Vertical synchronization polarity
This bit indicates the level on the VSYNC pin when the data are not valid on the parallel interface.
0: VSYNC active low
1: VSYNC active high

Bit 6 **HSPOL:** Horizontal synchronization polarity
This bit indicates the level on the HSYNC pin when the data are not valid on the parallel interface.
0: HSYNC active low
1: HSYNC active high

Bit 5 **PCKPOL:** Pixel clock polarity
This bit configures the capture edge of the pixel clock
0: Falling edge active
1: Rising edge active

Bit 4 **ESS:** Embedded synchronization select
0: Hardware synchronization data capture (frame/line start/stop) is synchronized with the HSYNC/VSYNC signals.
1: Embedded synchronization data capture is synchronized with synchronization codes embedded in the data flow.
Valid only for 8-bit parallel data. HSPOL/VSPOL are ignored when this bit is set.

Bits 3:0 Reserved, must be kept at reset value.

42.14.9 DCMIPP parallel interface embedded synchronization code register (DCMIPP_PRESCR)

Address offset: 0x108

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FEC[7:0]								LEC[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LSC[7:0]								FSC[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **FEC[7:0]:** Frame end delimiter code

This byte specifies the code of the frame end delimiter. The code consists of four bytes in the form of 0xFF, 0x00, 0x00, FEC.

If FEC is programmed to 0xFF, all the unused codes (0xFF00 00XY) are interpreted as frame end delimiters.

Bits 23:16 **LEC[7:0]:** Line end delimiter code

This byte specifies the code of the line end delimiter. The code consists of four bytes in the form of 0xFF, 0x00, 0x00, LEC.

Bits 15:8 **LSC[7:0]:** Line start delimiter code

This byte specifies the code of the line start delimiter. The code consists of four bytes in the form of 0xFF, 0x00, 0x00, LSC.

Bits 7:0 **FSC[7:0]:** Frame start delimiter code

This byte specifies the code of the frame start delimiter. The code consists of four bytes in the form of 0xFF, 0x00, 0x00, FSC.

If FSC is programmed to 0xFF, no frame start delimiter is detected, but the first occurrence of LSC after an FEC code is interpreted as the start of frame delimiter.

42.14.10 DCMIPP parallel interface embedded synchronization unmask register (DCMIPP_PRESUR)

Address offset: 0x10C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FEU[7:0]								LEU[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LSU[7:0]								FSU[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **FEU[7:0]:** Frame end delimiter unmask

This byte specifies the mask to be applied to the code of the frame end delimiter.

0: The corresponding bit in the FEC byte in DCMIPP_ESCR is masked while comparing the frame end delimiter with the received data.

1: The corresponding bit in the FEC byte in DCMIPP_ESCR is compared while comparing the frame end delimiter with the received data

Bits 23:16 **LEU[7:0]:** Line end delimiter unmask

This byte specifies the mask to be applied to the code of the line end delimiter.

0: The corresponding bit in the LEC byte in DCMIPP_ESCR is masked while comparing the line end delimiter with the received data

1: The corresponding bit in the LEC byte in DCMIPP_ESCR is compared while comparing the line end delimiter with the received data

Bits 15:8 **LSU[7:0]:** Line start delimiter unmask

This byte specifies the mask to be applied to the code of the line start delimiter.

0: The corresponding bit in the LSC byte in DCMIPP_ESCR is masked while comparing the line start delimiter with the received data

1: The corresponding bit in the LSC byte in DCMIPP_ESCR is compared while comparing the line start delimiter with the received data

Bits 7:0 **FSU[7:0]:** Frame start delimiter unmask

This byte specifies the mask to be applied to the code of the frame start delimiter.

0: The corresponding bit in the FSC byte in DCMIPP_ESCR is masked while comparing the frame start delimiter with the received data

1: The corresponding bit in the FSC byte in DCMIPP_ESCR is compared while comparing the frame start delimiter with the received data

42.14.11 DCMIPP parallel interface interrupt enable register (DCMIPP_PRIER)

Address offset: 0x1F4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ERRIE	Res.	Res.	Res.	Res.	Res.	Res.
									rw						

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **ERRIE:** Synchronization error interrupt enable

0: No interrupt generation

1: An interrupt is generated if the embedded synchronization codes are not received in the correct order.

This bit is available only in embedded synchronization mode.

Bits 5:0 Reserved, must be kept at reset value.

42.14.12 DCMIPP parallel interface status register (DCMIPP_PRSR)

Address offset: 0x1F8

Reset value: 0x0003 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VSYNC	HSYNC
														r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ERRF	Res.	Res.	Res.	Res.	Res.	Res.
									r						

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **VSYNC:**

This bit gives the state of the VSYNC pin with the correct programmed polarity if ENABLE bit is set into the DCMIPP_PRCR register and if the pixel clock is received. It is set during the blanking period whatever the polarity selected in VPOL bit, and cleared otherwise.

When embedded synchronization codes are used:

0: Active frame

1: Synchronization between frames

In case of embedded synchronization, this bit is meaningful only if the CAPTURE bit in DCMIPP_CR is set.

Bit 16 **HSYNC:**

This bit gives the state of the HSYNC pin with the correct programmed polarity if ENABLE bit is set into the DCMIPP_PRCR register and if the pixel clock is received. It is set during the blanking period whatever the polarity selected in HPOL bit, and cleared otherwise.

When embedded synchronization codes are used:

0: Active line

1: Synchronization between lines

In case of embedded synchronization, this bit is meaningful only if the CAPTURE bit in DCMIPP_CR is set.

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **ERRF:** Synchronization error raw interrupt status

0: No synchronization error detected

1: Embedded synchronization characters are not received in the correct order.

This bit is valid only in the embedded synchronization mode. It is cleared by writing 1 to the CERRF bit in DCMIPP_PRFCR.

This bit is available only in embedded synchronization mode.

Bits 5:0 Reserved, must be kept at reset value.

42.14.13 DCMIPP parallel interface interrupt clear register (DCMIPP_PRFCR)

Address offset: 0x1FC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CERRF	Res.	Res.	Res.	Res.	Res.	Res.
									w						

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **CERRF:** Synchronization error interrupt status clear

Writing a 1 into this bit clears the ERRF bit in DCMIPP_PRSR.

This bit is available only in embedded synchronization mode.

Bits 5:0 Reserved, must be kept at reset value.

42.14.14 DCMIPP common IP HW configuration register (DCMIPP_CMHWCFGR)

Address offset: 0x200

Reset value: 0x0000 007C

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TPG	CCSI	CPAR	CPIPES[1:0]		Res.	Res.
									r	r	r	r	r		

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **TPG:** Presence of the test pattern generator
0: TPG is not implemented.
1: TPG is implemented.

Bit 5 **CCSI:** Presence of the CSI-2 host interface
0: No input from CSI-2 host.
1: Input from CSI-2 host is implemented (independently from the presence of CSI-2 host).

Bit 4 **CPAR:** Presence of the parallel interface
0: Parallel interface input is not implemented.
1: Parallel interface input is implemented.

Bits 3:2 **CPIPES[1:0]:** Amount of instantiated pipes (either dump or pixel pipes)

Bits 1:0 Reserved, must be kept at reset value.

42.14.15 DCMIPP common configuration register (DCMIPP_CMCR)

Address offset: 0x204

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWAP RB	Res.	Res.	CFC	Res.	PSFC[1:0]		INSEL
								rw			w		rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **SWAPRB**: Swap R/U and B/V
0: RGB/VYU
1: BGR/UYV
This bit is not applicable for Pipe0.

Bits 6:5 Reserved, must be kept at reset value.

Bit 4 **CFC**: Clear frame counter

When this bit is set, the frame counter associated to a pipe is cleared. It resets DCMIPP_CMFRCR register. This bit is always read at 0.

Bit 3 Reserved, must be kept at reset value.

Bits 2:1 **PSFC[1:0]**: Pipe selection for the frame counter

These bits (set and cleared by software) select on which pipe the frame counter is mapped.
00: Frame counter mapped to Pipe0
01: Frame counter mapped to Pipe1
10: Frame counter mapped to Pipe2
Other values: Reserved

Bit 0 **INSEL**: input selection

0: DCMI
1: CSI-2
This selection is common for all the pipes, meaning that the input source (DCMI or CSI) is exclusive. This bit must not be changed if one or more pipes are enabled or still in processing state after a disabling operation (corresponding CPTACT bit set into the DCMIPP_CMSR1 register).

42.14.16 DCMIPP common frame counter register (DCMIPP_CMFRCR)

Address offset: 0x208

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FRMCNT[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FRMCNT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **FRMCNT[31:0]**: Frame counter, read-only, loops around.

Incremented following VSYNC detection mapped to the pipe configured into bits PSFC[1:0] of the DCMIPP_CMCR register. The counter is cleared using clear frame counter (CFC) bit of DCMIPP_CMCR register.

42.14.17 DCMIPP common test pattern generator configuration register 1 (DCMIPP_CMTPGCR1)

Address offset: 0x210

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	HEIGHT[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	WIDTH[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:16 **HEIGHT[13:0]**: Height of the visible pixels of the generated frame
Maximum value is 16383, the minimum must comply with the limitations of the DCMIPP.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **WIDTH[13:0]**: Width of the visible pixels of the generated frame
Maximum value is 16383, the minimum is 16.

42.14.18 DCMIPP common test pattern generator configuration register 2 (DCMIPP_CMTPGCR2)

Address offset: 0x214

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
VBL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FORMAT[7:0]								RT[1:0]		YT[1:0]		PATTERN	GSEN	LFLEN	TPGEN
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **VBL[15:0]**: Amount of lines of the vertical blanking
Minimum value is 16.

Bits 15:8 **FORMAT[7:0]**: Pixel format generated:
0x1E: YUV422 (when selected, the YT field defines the YUV subformats)
0x22: RGB565
0x24: RGB888
0x2A: RAW8 (when selected, or RAW10/12/14, RT[1:0] gives the component sequence)
0x2B: RAW10
0x2C: RAW12
0x2D: RAW14
0x4A: monochrome 8-bit
0x4B: monochrome 10-bit
0x4C: monochrome 12-bit
0x4D: monochrome 14-bit
Other values: reserved

Bits 7:6 **RT[1:0]**: Raw Bayer type
Indicates the sequence of the R, G, G, B components. Taken in account when FORMAT is 0x2B, 0x2C, 0x2D:
0x0: RGGB
0x1: GRBG
0x2: GBRG
0x3: BGGR

Bits 5:4 **YT[1:0]**: YUV type
Indicates whether the YUV is defined as CCIR601 or 709, and whether its dynamic is full (0 to 255) or reduced (16 to 240) range.
0x0: BT.601 full range
0x1: BT.709 full range (standard for HDTV)
0x2: BT.601 reduced range (standard for SDTV)
0x3: BT.709 reduced range

Bit 3 **PATTERN**: Pattern selection, between color bars and color squares
0: color squares, with the frame built of adjacent 256 × 256 color squares, each with a soft color gradient across each pixel. Most of the possible colors are present.
1: color bars, with the frame divided vertically into 8 bars of the respective colors: white, yellow, cyan, green, pink, red, blue, black.

Bit 2 **GSEN**: Gray scale enable
0: disabled, with differentiated RGB colors
1: enabled, colors are converted into gray scales

Bit 1 **LFLEN**: Lifeline enable
0: disabled, the lifeline is not visible.
1: enabled, the lifeline is both visible and progressing down of one line per frame

Bit 0 **TPGEN**: Test pattern generator enable
0: disabled
1: enabled, frames are generated continuously, indefinitely

42.14.19 DCMIPP common interrupt enable register (DCMIPP_CMIER)

Address offset: 0x3F0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit 31 **P2OVRIE:** Overrun interrupt status enable for Pipe2
0: No interrupt generation
1: An interrupt is generated

Bits 30:28 Reserved, must be kept at reset value.

Bit 27 Reserved, must be kept at reset value.

Bit 26 **P2VSYNCIE:** Vertical sync interrupt enable for Pipe2
0: No interrupt generation
1: An interrupt is generated

Bit 25 **P2FRAMEIE:** Frame capture complete interrupt enable for Pipe2
0: No interrupt generation
1: An interrupt is generated

Bit 24 **P2LINEIE:** Multi-line capture complete interrupt enable for Pipe2
0: No interrupt generation
1: An interrupt is generated

Bit 23 **P1OVRIE:** Overrun interrupt enable for Pipe1

Bit 22 **STOVRIE:** Histogram statistics overrun interrupt enable
0: No interrupt generation
1: An interrupt is generated if the AXI master is unable to transfer the last data before new data (32-bit) are received

Bit 21 **STBCIE:** Histogram statistics bad configuration interrupt enable
0: No interrupt generation
1: An interrupt is generated if the software configuration is considered as non consistent

Bit 20 **STFRAMEIE:** Histogram statistics frame capture completed interrupt enable
0: No interrupt generation
1: An interrupt is generated after the full capture of the statistics of a frame

Bit 19 Reserved, must be kept at reset value.

Bit 18 **P1VSYNCIE:** Vertical sync interrupt enable for Pipe1
0: No interrupt generation
1: An interrupt is generated

Bit 17 **P1FRAMEIE:** Frame capture complete interrupt enable for Pipe1
0: No interrupt generation
1: An interrupt is generated

Bit 16 **P1LINEIE:** Multi-line capture complete interrupt status clear for Pipe1
0: No interrupt generation
1: An interrupt is generated

Bit 15 **P0OVRIE:** Overrun interrupt enable for Pipe0
0: No interrupt generation
1: An interrupt is generated

Bit 14 **P0LIMITIE:** Limit interrupt enable for Pipe0
0: No interrupt generation
1: An interrupt is generated

Bits 13:11 Reserved, must be kept at reset value.

Bit 10 **P0VSYNCIE:** Vertical sync interrupt enable for Pipe0
0: No interrupt generation
1: An interrupt is generated

Bit 9 **P0FRAMEIE:** Frame capture complete interrupt enable for Pipe0
0: No interrupt generation
1: An interrupt is generated

Bit 8 **P0LINEIE:** Multi-line capture complete interrupt enable for Pipe0
0: No interrupt generation
1: An interrupt is generated

Bit 7 Reserved, must be kept at reset value.

Bit 6 **PRERRIE:** Limit interrupt enable for the parallel Interface
0: No interrupt generation
1: An interrupt is generated

Bit 5 **ATXERRIE:** AXI transfer error interrupt enable for IP-Plug
0: No interrupt generation
1: An interrupt is generated

Bits 4:0 Reserved, must be kept at reset value.

42.14.20 DCMIPP common status register 1 (DCMIPP_CMSR1)

Address offset: 0x3F4

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
P2CPTACT	Res.	Res.	Res.	Res.	Res.	P2LSTFRM	P2LSTLINE	P1CPTACT	Res.	Res.	Res.	Res.	Res.	P1LSTFRM	P1LSTLINE

r						r	r							r	r

Bit 31 **P2CPTACT**: Active frame capture (active from start-of-frame to frame complete) for Pipe2
0: No capture currently active
1: Capture currently active

Bits 30:28 Reserved, must be kept at reset value.

Bits 27:26 Reserved, must be kept at reset value.

Bit 25 **P2LSTFRM**: Last frame LSB bit, sampled at frame capture complete event for Pipe2
The information is extracted from the frame data number that can be delivered by the camera through the CSI2 interface.

Bit 24 **P2LSTLINE**: Last line LSB bit, sampled at frame capture complete event for Pipe2
The first line of a frame is counted as 0.

Bit 23 **P1CPTACT**: Active frame capture (active from start-of-frame to frame complete) for Pipe1
0: No capture currently active
1: Capture currently active

Bits 22:20 Reserved, must be kept at reset value.

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **P1LSTFRM**: Last frame LSB bit, sampled at frame capture complete event for Pipe1
The information is extracted from the frame data number, which can be delivered by the camera through the CSI2 interface.

Bit 16 **P1LSTLINE**: Last line LSB bit, sampled at Frame capture complete event for Pipe1

Bit 15 **P0CPTACT**: Active frame capture (active from start-of-frame to frame complete) for Pipe0
0: No capture currently active
1: Capture currently active

Bits 14:12 Reserved, must be kept at reset value.

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **P0LSTFRM**: Last frame LSB bit, sampled at Frame capture complete event for Pipe0

The information is extracted from the frame data number that can be delivered by the camera through the CSI2 interface.

Bit 8 **P0LSTLINE**: Last line LSB bit, sampled at Frame capture complete event for Pipe0

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **PRVSYNC:**

This bit gives the state of the VSYNC pin with the correct programmed polarity on the parallel interface if ENABLE bit is set into the DCMIPP_PRCR register and if the pixel clock is received. It is set during the blanking period whatever the polarity selected in VPOL bit of the DCMIPP_PRCR register, and cleared otherwise.

When embedded synchronization codes are used, the meaning of this bit is the following:

0: Active frame

1: Synchronization between frames

In case of embedded synchronization, this bit is meaningful only if the CAPTURE bit in the DCMIPP_PRCR register is set.

Bit 0 **PRHSYNC:**

This bit gives the state of the HSYNC pin with the correct programmed polarity on the parallel interface if ENABLE bit is set into the DCMIPP_PRCR register and if the pixel clock is received. It is set during the blanking period whatever the polarity selected in HPOL bit of the DCMIPP_PRCR register, and cleared otherwise.

When embedded synchronization codes are used the meaning of this bit is the following:

0: Active line

1: Synchronization between lines

In case of embedded synchronization, this bit is meaningful only if the CAPTURE bit in the DCMIPP_PRCR register is set.

42.14.21 DCMIPP common status register 2 (DCMIPP_CMSR2)

Address offset: 0x3F8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r					r	r	r	r	r	r	r		r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P0 OVRF	P0 LIMITF	Res.	Res.	Res.	P0 VSYNCF	P0 FRAMEF	P0 LINEF	Res.	PR ERRF	ATX ERRF	Res.	Res.	Res.	Res.	Res.
r	r				r	r	r		r	r					

Bit 31 **P2OVRF:** Overrun raw interrupt status for Pipe2

0: No data buffer overrun occurred

1: A data buffer overrun occurred, and this frame data are corrupted

This bit is cleared by writing 1 to the CP2OVRF bit in DCMIPP_CMFCR.

Bits 30:28 Reserved, must be kept at reset value.

Bit 27 Reserved, must be kept at reset value.

Bit 26 **P2VSYNCF:** VSYNC raw interrupt status for Pipe2

This bit is set when the VSYNC signal changes from the inactive state to the active state.

In the case of embedded synchronization, this bit is set only if the CAPTURE bit is set in the DCMIPP_CR register. It is cleared by writing 1 to the CP2VSYNCF bit in the DCMIPP_CMFCR register.

Bit 25 **P2FRAMEF:** Frame capture completed raw interrupt status for Pipe2

0: No capture or ongoing capture

1: All data of a frame have been captured

This bit is set when all data of a frame or window have been captured.

In case of a cropped window, this bit is set at the end of line of the last line in the crop. It is set even if the captured frame is empty (for example window cropped outside the frame).

This bit is cleared by writing 1 to the CP2FRAMEF bit in the DCMIPP_CMFCR.

Bit 24 **P2LINEF:** Multi-line capture completed raw interrupt status for Pipe2

This bit is set when at least a line has been completed, and cleared by writing 1 to the CP2LINEF bit in the DCMIPP_CMFCR register.

The periodicity of LINEF event is configured by LINEMULT bits of the DCMIPP_P2PPCR register. When reaching end of frame, this event is triggered out to allow software action even if the LINEMULT value set is not a multiple of the total lines frame. For embedded synchronization, this bit is set only if the CAPTURE bit in the DCMIPP_CR register is set.

Bit 23 **P1OVRF:** Overrun raw interrupt status for Pipe1

0: No data buffer overrun occurred

1: A data buffer overrun occurred and this frame data are corrupted

This bit is cleared by writing 1 to the CP1OVRF bit in the DCMIPP_CMFCR register.

Bit 22 **STOVRF:** Histogram statistics overrun interrupt status

0: No overrun occurred

1: An overrun occurred

Bit 21 **STBCF:** Histogram statistics bad configuration interrupt status

0: No overrun occurred

1: An overrun occurred

Bit 20 **STFRAMEF:** Histogram statistics frame capture completed interrupt enable

0: No overrun occurred

1: An overrun occurred

Bit 19 Reserved, must be kept at reset value.

Bit 18 **P1VSYNCF:** VSYNC raw interrupt status for Pipe1

This bit is set when the VSYNC signal changes from inactive to active state. In the case of embedded synchronization, this bit is set only if the CAPTURE bit is set in the DCMIPP_CR register. It is cleared by writing 1 to the CP1VSYNCF bit in the DCMIPP_CMFCR register.

Bit 17 **P1FRAMEF:** Frame capture completed raw interrupt status for Pipe1

0: No capture or ongoing capture

1: All data of a frame have been captured

This bit is set when all data of a frame or window have been captured. In case of a cropped window, this bit is set at the end of line of the last line in the crop. It is set even if the captured frame is empty (for example window cropped outside the frame). This bit is cleared by writing 1 to the CP1FRAMEF bit in the DCMIPP_CMFCR register.

Bit 16 **P1LINEF:** Multi-line capture completed raw interrupt status for Pipe1

This bit is set when one/more lines have been completed. The periodicity of LINEF event is configured by LINEMULT bits into DCMIPP_P1PPCR register. When reaching end of frame, this event is triggered out to allow software action even if the LINEMULT value set is not a multiple of the total lines frame. In the case of embedded synchronization, this bit is set only if the CAPTURE bit in DCMIPP_CR is set. It is cleared by writing 1 to the CP1LINEF bit in the DCMIPP_CMFCR register.

Bit 15 **P0OVRF:** Overrun raw interrupt status for Pipe0

0: No data buffer overrun occurred

1: A data buffer overrun occurred and this frame data are corrupted

This bit is cleared by writing 1 to the CP0OVRF bit in the DCMIPP_CMFCR register.

Bit 14 **P0LIMITF:** Limit raw interrupt status for Pipe0

This bit is set when the data counter DCMIPP_P0DCCNT reaches its maximum value DCMIPP_P0DCLIMIT. It is cleared by writing 1 to the CP0LIMITF bit in the DCMIPP_CMFCR register.

Bits 13:11 Reserved, must be kept at reset value.

Bit 10 **P0VSYNCF:** VSYNC raw interrupt status for Pipe0

This bit is set when the VSYNC signal changes from the inactive state to the active state.

In the case of embedded synchronization, this bit is set only if the CAPTURE bit is set in DCMIPP_CR. It is cleared by writing 1 to the CP0VSYNCF bit in the DCMIPP_CMFCR register.

Bit 9 **P0FRAMEF:** Frame capture completed raw interrupt status for Pipe0

0: No capture or ongoing capture

1: All data of a frame have been captured

This bit is set when all data of a frame or window have been captured.

In case of a cropped window, this bit is set at the end of line of the last line in the crop, even if the captured frame is empty (for example window cropped outside the frame).

This bit is cleared by writing 1 to the CP0FRAMEF bit in the DCMIPP_CMFCR register.

Bit 8 **P0LINEF:** Multi-line capture completed raw interrupt status for Pipe0

This bit is set when one/more lines have been completed. The periodicity of LINEF event is configured by LINEMULT bits into DCMIPP_P0PPCR register. When reaching end of frame, this event is triggered out to allow software action even if the LINEMULT value set is not a multiple of the total lines frame.

In the case of embedded synchronization, this bit is set only if the CAPTURE bit in the DCMIPP_CR register is set. It is cleared by writing 1 to the CP0LINEF bit in the DCMIPP_CMFCR register.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **PRERRF:** Synchronization error raw interrupt status for the parallel interface.

0: No synchronization error detected

1: Embedded synchronization characters are not received in the correct order.

This bit is valid only in the embedded synchronization mode. It is cleared by writing 1 to the CPRERRF bit in the DCMIPP_CMFCR register.

This bit is available only in embedded synchronization mode.

Bit 5 **ATXERRF:** AXI transfer error interrupt status flag for the IP-Plug.

0: No AXI transfer error detected

1: AXI transfer error occurred on an AXI client. This bit signals an error on a client without any specific hardware action, the software must handle the situation (normally used when debugging software application code).

This bit is cleared by writing 1 to CATXERRF bit in the DCMIPP_CMFCR register.

Bits 4:0 Reserved, must be kept at reset value.

42.14.22 DCMIPP common interrupt clear register (DCMIPP_CMFCR)

Address offset: 0x3FC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

w	w				w	w	w		w	w					

Bit 31 **CP2OVRF:** Overrun interrupt status clear
Writing 1 into this bit clears the P2OVRF bit in the DCMIPP_CMSR2 register

Bits 30:28 Reserved, must be kept at reset value.

Bit 27 Reserved, must be kept at reset value.

Bit 26 **CP2VSYNCF:** Vertical synchronization interrupt status clear
Writing 1 into this bit clears the P2VSYNCF bit in the DCMIPP_CMSR2 register

Bit 25 **CP2FRAMEF:** Frame capture complete interrupt status clear
Writing 1 into this bit clears the P2FRAMEF bit in the DCMIPP_CMSR2 register

Bit 24 **CP2LINEF:** Multi-line capture complete interrupt status clear
Writing 1 into this bit clears P2LINEF in the DCMIPP_CMSR2 register

Bit 23 **CP1OVRF:** Overrun interrupt status clear
Writing 1 into this bit clears the P1OVRF bit in the DCMIPP_CMSR2 register

Bit 22 **CSTOVRF:** Histogram statistics overrun interrupt clear
Writing 1 into this bit clears the STOVRF bit in the DCMIPP_CMSR2 register.

Bit 21 **CSTBCF:** Histogram statistics bad configuration interrupt enable
Writing 1 into this bit clears the STBCF bit in the DCMIPP_CMSR2 register.

Bit 20 **CSTFRAMEF:** Histogram statistics frame capture completed interrupt enable
Writing 1 into this bit clears the STFRAMEF bit in the DCMIPP_CMSR2 register.

Bit 19 Reserved, must be kept at reset value.

Bit 18 **CP1VSYNCF:** Vertical synchronization interrupt status clear
Writing 1 into this bit clears the P1VSYNCF bit in the DCMIPP_CMSR2 register

Bit 17 **CP1FRAMEF:** Frame capture complete interrupt status clear
Writing 1 into this bit clears the P1FRAMEF bit in the DCMIPP_CMSR2 register

Bit 16 **CP1LINEF:** Multi-line capture complete interrupt status clear
Writing 1 into this bit clears P1LINEF in the DCMIPP_CMSR2 register

Bit 15 **CP0OVRF:** Overrun interrupt status clear
Writing 1 into this bit clears the P0OVRF bit in the DCMIPP_CMSR2 register

Bit 14 **CP0LIMITF:** limit interrupt status clear
Writing 1 into this bit clears P0LIMITF in the DCMIPP_CMSR2 register

Bits 13:11 Reserved, must be kept at reset value.

Bit 10 **CP0VSYNCF:** Vertical synchronization interrupt status clear
Writing 1 into this bit clears the P0VSYNCF bit in the DCMIPP_CMSR2 register.

Bit 9 **CP0FRAMEF:** Frame capture complete interrupt status clear
Writing 1 into this bit clears the P0FRAMEF bit in the DCMIPP_CMSR2 register.

Bit 8 **CP0LINEF:** Multi-line capture complete interrupt status clear
Writing 1 into this bit clears P0LINEF in the DCMIPP_CMSR2 register

Bit 7 Reserved, must be kept at reset value.

Bit 6 **CPRERRF:** Synchronization error interrupt status clear
Writing 1 into this bit clears the PRERRF bit in the DCMIPP_CMSR2 register.
This bit is available only in embedded synchronization mode.

Bit 5 **CATXERRF:** AXI transfer error interrupt status clear
Writing 1 into this bit clears the ATXERRF bit in the DCMIPP_CMSR2 register.

Bits 4:0 Reserved, must be kept at reset value.

42.14.23 DCMIPP Pipe0 HW configuration register (DCMIPP_P0HWCFGR)

Address offset: 0x400

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **CROI[3:0]:** Capability for ROI: defines the number of ROIs in the pipe

Bits 7:6 **CGM[1:0]:** Capability for gamma conversions
00: No gamma conversion
01: Gamma conversion with three interpolated segments
10, 11: Reserved.

Bits 5:4 **CRB[1:0]:** Capability for demosaicing
00: No demosaicing
01: Demosaicing with 2018-03 algorithm (Matrix 3 x 3 with Edge/LineHV/Peak)
10, 11: Reserved

Bit 3 **DBM:** Double buffer mode
0: No Double buffer mode supported
1: Double buffer mode supported

Bit 2 **CDS:** Capability for downsize filter
0: No downsize filter, basic decimation instead
1: Downsize filter based on a BoxFilter

Bits 1:0 **CPLA[1:0]:** Capability for planar buffers
00: Capability to dump to a coplanar buffer only
01: Capability to dump to a semi-planar buffer (i.e. YUV420-2)
10: Capability to dump to full-planar buffer (i.e. YUV420-3)
11: Reserved

42.14.24 DCMIPP Pipe0 flow selection configuration register (DCMIPP_P0FSCR)

Address offset: 0x404

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PIPEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VC[1:0]		Res.	DTMODE[1:0]	
rw											rw	rw		rw	rw

Res.	Res.	DTIDB[5:0]						Res.	Res.	DTIDA[5:0]					
		rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bit 31 **PIPEN**: Activation of PipeN
0: Pipe disabled
1: Pipe enabled, can start capturing with CPTMODE, CPTREQ, CPTACK

Note: This bit is not shadowed, differently from all other bits in this register.

Bits 30:21 Reserved, must be kept at reset value.

Bits 20:19 **VC[1:0]**: Flow selection mode
Virtual channel ID of the CSI flow to select for further processing on the pipe.

Bit 18 Reserved, must be kept at reset value.

Bits 17:16 **DTMODE[1:0]**: Flow selection mode
00: Only flow DTIDA from the selected virtual channel is forwarded in the pipe
01: Flows DTIDA and/or DTIDB from the selected virtual channel are forwarded in the pipe
10: All data types from the selected virtual channel (except the DTIDA or DTIDB) are forwarded in the pipe
11: All data types of the selected virtual channel VC are forwarded in the pipe

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **DTIDB[5:0]**: Data type selection ID B
Data type ID of the CSI flow to select.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **DTIDA[5:0]**: Data type selection ID A
Data type ID of the CSI flow to select.

42.14.25 DCMIPP Pipe0 flow control configuration register (DCMIPP_P0FCTCR)

Address offset: 0x500

Reset value: 0x0000 0000

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CPT REQ	CPT MODE	FRATE[1:0]	
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **CPTREQ:** Capture requested
0: Capture not requested for next frame
1: Capture requested for next frame
When PIPEN = 1 and CPTREQ = 1. the pipe waits for the first VSync, automatically starts a capture, and sets CPTACT = 1 to mention it.
In Snapshot mode the CPTREQ bit is cleared at the start of the first received frame.
In Continuous grab mode, the capture remains active and CPTREQ = 1 until the software clears CPTREQ: the capture stops and CPTACT is reset at the end of the ongoing frame.
The DCMI and pipe configuration registers must be correctly programmed before enabling this bit.

Bit 2 **CPTMODE:** Capture mode
0: Continuous grab mode - The received data are transferred into the destination memory through the AXI master.
1: Snapshot mode (single frame) - Once activated, the interface waits for the start of frame, and then transfers a single frame through the AXI master. At the end of the frame, the CPTACT bit is automatically reset.

Bits 1:0 **FRATE[1:0]:** Frame capture rate control
These bits define the frequency of frame capture. They are meaningful only in Continuous grab mode, ignored in Snapshot mode.
00: All frames are captured
01: one out of two frames captured (50% bandwidth reduction)
10: one out of four frames captured (75% bandwidth reduction)
11: one out of eight frames captured (87% bandwidth reduction)

42.14.26 DCMIPP Pipe0 statistic/crop start register (DCMIPP_P0SCSTR)

Address offset: 0x504

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	VSTART[11:0]

Res.	Res.	Res.	Res.	HSIZE[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **ENABLE**:

This bit is set and cleared by software.

0: Bypass. All the data are computed, if the statistic data are sent within the frame, they are sent to the processing pipe as pixels data.

1: Enable. Depending on bit POSNEG value, the rectangle defined by VSIZE, HSIZE, VSTART and HSTART can be used to extract or to remove some data (statistical extraction or removal, or basic 2D crop features).

if POSNEG = 0, the data inside the rectangle area are transmitted (it can correspond to a statistical data removal, or as a crop feature in a data valid image area).

if POSNEG = 1, the data outside of the rectangle area are transmitted (it can correspond to a statistical data extraction, rejecting all data inside the window).

This bit must be kept cleared if the input format is JPEG, to avoid unpredictable behavior of the pipe.

Bit 30 **POSNEG**:

This bit is set and cleared by software. It has a meaning only if ENABLE bit is set.

0: Positive area, the rectangle defined by VSIZE, HSIZE, and VSTART, HSTART

1: Negative area, the area excluding the rectangle defined by VSIZE, HSIZE, and VSTART, HSTART

Bits 29:28 Reserved, must be kept at reset value.

Bits 27:16 **VSIZE[11:0]**: Vertical size, from 0 to 4094 pixels high

If the value is maintained at 0 when enabling the crop by means of ENABLE bit, the crop operation is not performed on vertical direction.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **HSIZE[11:0]**: Horizontal size, from 0 to 4094 word wide (data 32-bit)
If the value is maintained at 0 when enabling the crop by means of ENABLE bit, the crop operation is not performed on horizontal direction.

42.14.28 DCMIPP Pipe0 dump counter register (DCMIPP_P0DCCNTR)

Address offset: 0x5B0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CNT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:0 **CNT[25:0]**: Number of data dumped during the frame.
The size of the data is expressed in bytes. It counts only the data selected by means of the CROP 2D function. The counter saturates at 0x3FFFFFF. Granularity is 32-bit for all the formats except for the byte stream formats (for example JPEG) having byte granularity.

42.14.29 DCMIPP Pipe0 dump limit register (DCMIPP_P0DCLMTR)

Address offset: 0x5B4

Reset value: 0x00FF FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ENABLE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LIMIT[23:16]

LIMIT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **ENABLE**:
0: Disabled, no check on the amount of 32-bit words transmitted
1: Enabled, check done versus limit

Bits 30:24 Reserved, must be kept at reset value.

Bits 23:0 **LIMIT[23:0]**: Maximum number of 32-bit data that can be dumped during a frame, after the crop 2D operation.

42.14.30 DCMIPP Pipe0 pixel packer configuration register (DCMIPP_P0PPCR)

Address offset: 0x5C0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw		rw	rw	rw	rw	rw	rw	rw					rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 Reserved, must be kept at reset value.

Bits 15:13 **LINEMULT[2:0]**: Amount of capture completed lines for LINE event and interrupt
0x0: Event after one line
0x1: Event after two lines
0x2: Event after four lines
0x3: Event after eight lines
0x4: Event after sixteen lines
0x5: Event after 32 lines
0x6: Event after 64 lines
0x7: Event after 128 lines

Bit 12 Reserved, must be kept at reset value.

Bit 11 **OELS:** Odd/even line select (line select start)
This bit works in conjunction with LSM field (LSM = 1).
0: Interface captures first line after the frame start, second one is dropped
1: Interface captures second line from the frame start, first one is dropped

Bit 10 **LSM:** Line select mode
0: Interface captures all received lines
1: Interface captures one line out of two

Bit 9 **OEBS:** Odd/even byte select (byte select start)
This bit works in conjunction with BSM field (BSM ≠ 00)
0: Interface captures the first data (byte or double byte) from the frame/line start, the second one is dropped
1: Interface captures the second data (byte or double byte) from the frame/line start, the first one is dropped
This bit has a meaning only if INSEL = 0 into the DCMIPP_CMCR register.

Bits 8:7 **BSM[1:0]:** Byte select mode
00: Interface captures all received data
01: Interface captures 1 data out of 2
10: Interface captures one byte out of four
11: Interface captures two bytes out of four
Modes 10 and 11 work only with EDM [2:0] = 000 into the DCMIPP_PRCR register.
This bit has a meaning only if INSEL = 0 into the DCMIPP_CMCR register

Bit 6 **HEADEREN:** CSI header dump enable
0: CSI-2 headers are not dumped
1: CSI-2 headers are dumped as a 32-bit word.
This setting is ignored for parallel interface mode, as there are no headers.

Bit 5 **PAD:** Pad mode for monochrome and raw Bayer 10/12/14 bpp (MSB vs. LSB alignment)
0: Aligns on LSB (and pads null bits on MSB), for backward compatibility with former DCMI.
1: Aligns on MSB (and pads null bits on LSB), for better ease of software or GPU.

Bits 4:1 Reserved, must be kept at reset value.

Bit 0 **SWAPYUV:** Swaps, within a 32-bit word, byte 0-vs-1 and byte 2-vs-3. It corresponds, for YUV422 pixels formats, to swap between UYVY and YUYV.
0: Outputs the provided words, as described in *Section 42.10: Pixel format description*.
1: Swaps the bytes from provided words, byte 0-vs.-1 and 2-vs.-3

42.14.31 DCMIPP Pipe0 pixel packer Memory0 address register 1 (DCMIPP_P0PPM0AR1)

Address offset: 0x5C4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
M0A[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

M0A[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	r	r	r	r

Bits 31:0 **M0A[31:0]**: Memory0 address
Base address of memory area 0, to whom data are written. It is assumed to be a multiple of 16, hence its bits 3:0 are always at 0x0.

42.14.32 DCMIPP Pipe0 status Memory0 address register (DCMIPP_P0STM0AR)

Address offset: 0x5D0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

M0A[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **M0A[31:0]**: Memory0 address

Base address of memory area 0, to whom data are written. It is assumed to be a multiple of 16, hence its bits 3:0 are always at 0x0.

The register returns the status of the last captured frame.

42.14.33 DCMIPP Pipe0 interrupt enable register (DCMIPP_P0IER)

Address offset: 0x5F4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OVRIE	LIMITIE	Res.	Res.	Res.	VSYNCIE	FRAMEIE	LINEIE
								rw	rw				rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **OVRIE:** Overrun interrupt enable

0: No interrupt generation

1: An interrupt is generated if the AXI master is unable to transfer the last data before new data (32-bit) are received.

Bit 6 **LIMITIE:** Limit interrupt enable

0: No interrupt generation when the limit is reached

1: An interrupt is generated when the limit is reached

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **VSYNCIE:** VSYNC interrupt enable

0: No interrupt generation

1: An interrupt is generated on each VSYNC (captured or not)

Bit 1 **FRAMEIE:** Frame capture completed interrupt enable

0: No interrupt generation

1: An interrupt is generated after the full capture of a cropped frame

Bit 0 **LINEIE:** Multi-line capture completed interrupt enable

0: No interrupt generation when the line is received

1: An interrupt is generated after the full capture of a group of lines (or last line reached)

42.14.34 DCMIPP Pipe0 status register (DCMIPP_P0SR)

Address offset: 0x5F8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CPTACT	Res.	Res.	Res.	Res.	Res.	LST FRM	LST LINE
								r						r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OVR F	LIMIT F	Res.	Res.	Res.	VSYNC F	FRAME F	LINE F
								r	r				r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **CPTACT:** Capture immediate status

0: Capture currently inactive

1: Capture currently active

This bit is automatically reset at the end of frame capture complete event (after all the data of that frame have been captured and the IP-Plug has started to emit the last burst on the AXI, usually before the next VSync).

Bits 22:20 Reserved, must be kept at reset value.

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **LSTFRM**: Last frame LSB bit, sampled at frame capture complete event.

The information is extracted from the frame data number that can be delivered by the camera through the CSI2 interface.

Bit 16 **LSTLINE**: Last line LSB bit, sampled at frame capture complete event.

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **OVRF:** Overrun raw interrupt status

0: No data buffer overrun occurred

1: A data buffer overrun occurred and this frame data are corrupted

This bit is cleared by writing 1 to the COVRF bit in the DCMIPP_P0FCR register.

Bit 6 **LIMITF:** Limit raw interrupt status

This bit is set when the data counter DCMIPP_PxDCCNTR reaches its maximum value DCMIPP_PxDCLIMITR.

It is cleared by writing 1 to the CLIMITF bit in the DCMIPP_P0FCR register.

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **VSYNCF:** VSYNC raw interrupt status

This bit is set when the VSYNC signal changes from the inactive state to the active state. In case of embedded synchronization, this bit is set only if the CAPTURE bit is set in DCMIPP_CR.

It is cleared by writing 1 to the CVSYNCF bit in the DCMIPP_P0FCR register.

Bit 1 **FRAMEF:** Frame capture completed raw interrupt status

0: No capture or ongoing capture

1: All data of a frame have been captured

This bit is set when all data of a frame or window have been captured. In case of a cropped window, this bit is set at the end of line of the last line in the crop. It is set even if the captured frame is empty (for example window cropped outside the frame).

This bit is cleared by writing 1 to the CFRAMEF bit in DCMIPP_P0FCR.

Bit 0 **LINEF:** Multi-line capture completed raw interrupt status

This bit is set when one/more lines have been completed. For the JPEG mode, this bit is raised at the end of the frame.

The periodicity of LINEF event is configured by LINEMULT bits into DCMIPP_P0PPCR register. When reaching end of frame, this event is triggered out to allow software action even if the LINEMULT value set is not a multiple of the total lines frame.

In case of embedded synchronization, this bit is set only if the CAPTURE bit in the DCMIPP_CR register is set. It is cleared by writing 1 to the CLINEF bit in the DCMIPP_P0FCR register.

42.14.35 DCMIPP Pipe0 interrupt clear register (DCMIPP_P0FCR)

Address offset: 0x5FC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

								w	w				w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **COVRF:** Overrun interrupt status clear

Writing 1 into this bit clears the OVRF bit in the DCMIPP_P0SR register.

Bit 6 **CLIMITF:** limit interrupt status clear

Writing 1 into this bit clears LIMITF in the DCMIPP_P0SR register.

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **CVSYNCF:** Vertical synchronization interrupt status clear

Writing 1 into this bit clears the VSYNCF bit in the DCMIPP_P0SR register.

Bit 1 **CFRAMEF:** Frame capture complete interrupt status clear

Writing 1 into this bit clears the FRAMEF bit in the DCMIPP_P0SR register.

Bit 0 **CLINEF:** Multi-line capture complete interrupt status clear

Writing 1 into this bit clears LINEF in the DCMIPP_P0SR register.

42.14.36 DCMIPP Pipe0 current flow selection configuration register (DCMIPP_P0CFSCR)

Address offset: 0x604

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PIPEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VC[1:0]		Res.	DTMODE[1:0]

Res.	Res.	DTIDB[5:0]						Res.	Res.	DTIDA[5:0]					
		r	r	r	r	r	r			r	r	r	r	r	r

Bit 31 **PIPEN**: Current activation of PipeN
0: Pipe disabled
1: Pipe enabled, can start capturing with CPTMODE, CPTREQ, CPTACK.

Bits 30:21 Reserved, must be kept at reset value.

Bits 20:19 **VC[1:0]**: Current flow selection mode
Virtual channel ID of the CSI flow to select for further processing on the pipe.

Bit 18 Reserved, must be kept at reset value.

Bits 17:16 **DTMODE[1:0]**: Flow selection mode
00: Only flow DTIDA from the selected virtual channel is forwarded in the pipe.
01: Flows DTIDA and/or DTIDB from the selected virtual channel are forwarded in the pipe.
10: All Datatypes from the selected virtual channel, except the DTIDA or DTIDB are forwarded into the pipe.
11: All Datatypes of the selected virtual channel VC are forwarded in the pipe.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **DTIDB[5:0]**: Current data type selection ID B
Data type ID of the CSI flow to select.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **DTIDA[5:0]**: Current data type selection ID A
Data type ID of the CSI flow to select.

42.14.37 DCMIPP Pipe0 current flow control configuration register (DCMIPP_P0CFCTCR)

Address offset: 0x700

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CPT REQ	CPT MODE	FRATE[1:0]	
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **CPTREQ:** Capture requested

0: Capture not requested for next frame.

1: Capture requested for next frame.

When PIPEN = 1, and when the CPTREQ is set to 1 the pipe waits for the first VSync, and automatically starts a capture and sets CPTACT = 1 to mention it.

In Snapshot mode the CPTREQ bit is automatically cleared at the start of the first frame received.

In continuous grab mode the capture remains active and CPTREQ = 1, until the software clears CPTREQ: the capture stops and CPTACT is reset at the end of the ongoing frame.

The DCMI and pipe configuration registers must be correctly programmed before enabling this bit.

Bit 2 **CPTMODE:** Capture mode

0: Continuous grab mode - The received data are transferred into the destination memory through the AXI master.

1: Snapshot mode (single frame) - Once activated, the interface waits for the start of frame, and then transfers a single frame through the AXI master. At the end of the frame the CPTACT bit is automatically reset.

Bits 1:0 **FRATE[1:0]:** Frame capture rate control

These bits define the frequency of frame capture. They are meaningful only in Continuous grab mode, ignored in Snapshot mode.

00: all frames are captured

01: one out of two frames captured (50% bandwidth reduction)

10: one out of four frames captured (75% bandwidth reduction)

11: one out of eight frames captured (87% bandwidth reduction)

42.14.38 DCMIPP Pipe0 current statistic/crop start register (DCMIPP_P0CSCSTR)

Address offset: 0x704

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	HSIZE[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bit 31 **ENABLE**: Current value of the ENABLE bit

0: Bypass. All data are computed, if the statistics data are sent within the frame, they are sent to the processing pipe as pixels data.

1: Enable: Depending on bit POSNEG value, the rectangle defined by the VSIZE, HSIZE, VSTART, HSTART can be used to extract or to remove certain amount of data (statistical extraction or removal, or basic 2D crop features)

if POSNEG = 0, the data inside the rectangle area are transmitted (can correspond to a statistical data removal, or as a crop feature in a data valid image area).

if POSNEG = 1, the data outside of the rectangle area are transmitted (can correspond to a statistical data extraction, rejecting all data inside the window)

Bit 30 **POSNEG**: Current value of the POSNEG bit

This bit has a meaning only if ENABLE bit is set.

0: Positive area. The rectangle defined by VSIZE,HSIZE, and VSTART, HSTART is the active area.

1: Negative area. The active area is the area excluding the rectangle defined by VSIZE, HSIZE, and VSTART, HSTART.

Bits 29:28 Reserved, must be kept at reset value.

Bits 27:16 **VSIZE[11:0]**: Current vertical size, from 0 to 4094 pixels high.

If the value is maintained at 0 when enabling the crop by means of the ENABLE bit, the value is forced internally at 0xFFE which is the maximum value.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **HSIZE[11:0]**: Current horizontal size, from 0 to 4094 word wide (data 32-bit).

If the value is maintained at 0 when enabling the crop by means of the ENABLE bit, the value is forced internally at 0xFFE, which is the maximum value.

42.14.40 DCMIPP Pipe0 current pixel packer configuration register (DCMIPP_P0CPPCR)

Address offset: 0x7C0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

LINEMULT[2:0]			Res.	OELS	LSM	OEBS	BSM[1:0]		HEADER EN	PAD	Res.	Res.	Res.	Res.	SWAP YUV
r	r	r		r	r	r	r	r	r	r					r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:13 **LINEMULT[2:0]**: Current amount of capture completed lines for LINE event and interrupt
0x0: Event after every line
0x1: Event after two lines
0x2: Event after four lines
0x3: Event after eight lines
0x4: Event after sixteen lines
0x5: Event after 32 lines
0x6: Event after 64 lines
0x7: Event after 128 lines

Bit 12 Reserved, must be kept at reset value.

Bit 11 **OELS:** Current odd/even line select (ine select start)
This bit works in conjunction with LSM field (LSM = 1)
0: Interface captures the first line after the frame start, the second one is dropped
1: Interface captures the second line from the frame start, the first one is dropped
This bit has a meaning only if INSEL = 0 in the DCMIPP_CMCR register.

Bit 10 **LSM:** Current Line select mode
0: Interface captures all received lines
1: Interface captures one line out of two
This bit has a meaning only if INSEL = 0 in the DCMIPP_CMCR register.

Bit 9 **OEBS:** Current odd/even byte select (byte select start)
This bit works in conjunction with BSM field (BSM ≠ 00)
0: Interface captures the first data (byte or double byte) from the frame/line start, the second one is dropped
1: Interface captures the second data (byte or double byte) from the frame/line start, the first one is dropped
This bit has a meaning only if INSEL = 0 in the DCMIPP_CMCR register.

Bits 8:7 **BSM[1:0]:** Current Byte select mode
00: Interface captures all received data
01: Interface captures one data out of two
10: Interface captures one byte out of four
11: Interface captures two bytes out of four
Modes 10 and 11 work only with EDM [2:0] = 000 into the DCMIPP_PRCR register.
This bit has a meaning only if INSEL = 0 into the DCMIPP_CMCR register

Bit 6 **HEADEREN:** Current CSI header dump enable
0: CSI-2 headers are not dumped.
1: CSI-2 headers are dumped as 32-bit words.
This setting is ignored for Parallel interface mode, as there are no headers.

Bit 5 **PAD:** Current Pad mode for monochrome and raw Bayer 10/12/14 bpp (MSB vs. LSB alignment)
0: Aligns on LSB (and pads null bits on MSB), for backward compatibility with former DCMI
1: Aligns on MSB (and pads null bits on LSB), for better ease of software or GPU

Bits 4:1 Reserved, must be kept at reset value.

Bit 0 **SWAPYUV:** *S*waps, within a 32-bit word, byte 0 vs. 1 and byte 2 vs. 3. It corresponds, for YUV422 pixels formats, to swap between UYVY and YUYV.
0: Outputs the provided words, as described in *Section 42.10: Pixel format description*.
1: Swaps the bytes from provided words, byte 0 vs. 1 and 2 vs. 3.

42.14.41 DCMIPP Pipe0 current pixel packer Memory0 address register 1 (DCMIPP_P0CPPM0AR1)

Address offset: 0x7C4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
M0A[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

			r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **CFOC:** Capability for focus extraction
- 0: Focus extraction not supported
- 1: Focus extraction supported

Bit 17 **CLS:** Capability for lens shading
- 0: Lens shading not supported
- 1: Lens shading supported

Bit 16 **CHS:** Capability to extract histograms
- 0: Histogram extraction not supported
- 1: Histogram extraction supported

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **CDEC:** Capability to decimate before downsize
- 0: No decimation supported
- 1: Decimation before downsize supported

Bits 11:8 **CROI[3:0]:** Capability for ROI: defines the number of ROIs in the pipe

Bits 7:6 **CGM[1:0]:** Capability for gamma conversions
00: No gamma conversion
01: Gamma conversion with seven interpolated segments
10, 11: Reserved

Bits 5:4 **CRB[1:0]:** Capability for demosaicing
00: No demosaicing
01: Demosaicing with 2018-03 algorithm (Matrix 3 x 3 with Edge/LineHV/Peak)
10, 11: Reserved

Bit 3 **DBM:** Double buffer mode
0: No Double buffer mode supported
1: Double buffer mode supported

Bit 2 **CDS:** Capability for downsize filter
0: No downsize filter, basic decimation instead
1: Downsize filter based on a BoxFilter

Bits 1:0 **CPLA[1:0]:** Capability for planar buffers
00: Capability to dump to a coplanar buffer only
01: Capability to dump to a semi-planar buffer (i.e. YUV420-2)
10: Capability to dump to full-planar buffer (i.e. YUV420-3)
11: Reserved

42.14.43 DCMIPP Pipe1 flow selection configuration register (DCMIPP_P1FSCR)

Address offset: 0x804

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PIPEN	FDTFEN	FDTF[5:0]						Res.	Res.	Res.	VC[1:0]		PIPEDIFF	DTMODE[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw				rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	DTIDB[5:0]						Res.	Res.	DTIDA[5:0]					
		rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bit 31 **PIPEN**: Activation of PipeN
0: Pipe disabled
1: Pipe enabled, can start capturing with CPTMODE, CPTREQ, CPTACK

Bit 30 **FDTFEN**: Force Datatype format enable
0: Disable force Datatype format. The Datatype format used by the pipe is the one defined into DTIDx1: Enable force Datatype format. When the Datatype DTIDx is detected by the pipe, the real pixel format considered by the pipe is the one set into the FDTF[5:0] bit field instead of the physical one received by the CSI2 Host. It allows to handle, for instance, 3D sensors camera using user data type in bottom-up approach, and to explicitly define the pixel format to be handled by the pipe. Note that the flow is first selected using the DTMODE and DTIDA/B, and then, if selected, its data type may be forced with the to FDTC using FDTFEN = 1.

Bits 29:24 **FDTF[5:0]**: Force Datatype format

Forcing the Datatype format. This Datatype overwrites the one received by the CSI2-HOST by specifying the pixel format to consider. The value must follow the CSI2 Datatype format definition in the CSI2 standard. This bit field has no meaning if the FDTFEN bit is cleared.

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:19 **VC[1:0]**: Flow selection mode

Virtual channel ID of the CSI flow to select for further processing on the pipe.

Bit 18 **PIPEDIFF:** Differentiates Pipe2 from Pipe1

0: Pipe2 receives the same data as Pipe1 (data filtered by Pipe1 configuration for VC and DTIDA/DTIDB and DTMODE mode, as well as FDTF and FDTFEN bit).

1: Pipe1 gets pixels only from VC and DT configured in Pipe1, processed by all blocks belonging to the image processing functional block (demosaicing, auto exposure, statistics, contrast enhancement). Pipe2 gets pixels only from VC/DTID and FDTFEN/FDTF bits configured in Pipe2, processed from Crop. There are no shared functions with Pipe1, fully independent.

This bit must be kept cleared when INSEL = 0 into the DCMIPP_CMCR register.

Bits 17:16 **DTMODE[1:0]**: Flow selection mode

00: Only flow DTIDA from the selected virtual channel is forwarded in the pipe

01: Flows DTIDA and/or DTIDB from the selected virtual channel are forwarded in the pipe

Other values: Reserved.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **DTIDB[5:0]**: Data type selection ID B

Data type ID of the CSI flow to select.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **DTIDA[5:0]**: Data type selection ID A

Data type ID of the CSI flow to select.

42.14.44 DCMIPP Pipe1 stat removal configuration register (DCMIPP_P1SRCR)

Address offset: 0x820

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CROP EN	FIRSTLINEDEL[2:0]			LASTLINE[11:0]											
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **CROPEN**: Crop line enable

0: No crop (all pixels are fed through)

1: Crop

Bits 14:12 **FIRSTLINEDEL[2:0]**: Amount of first lines to delete when CROPEN = 1

Bits 11:0 **LASTLINE[11:0]**: Amount of following lines to keep when CROPEN = 1.
If LASTLINE = 0 all pixels after FIRSTLINEDEL are fed through.

42.14.45 DCMIPP Pipe1 bad pixel removal control register (DCMIPP_P1BPRCR)

Address offset: 0x824

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STRENGTH[2:0]			ENABLE
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:1 **STRENGTH[2:0]**: Strength (aggressiveness) of the bad pixel detection
0x0: The filter is fairly tolerant: only a few pixels are declared bad, due to their high noise
...
0x7: The filter is very aggressive: many pixels are declared bad, even if only slightly noisy.

Bit 0 **ENABLE**:
0: Bypass: bad pixel removal is not active, all pixels are transmitted through
1: Enable: if bad pixel are detected, they are replaced by corrected pixels
Bad pixel detection must be enabled only for raw Bayer flows, as it corrupts RGB flows.

42.14.46 DCMIPP Pipe1 bad pixel removal status register (DCMIPP_P1BPRSR)

Address offset: 0x828

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	BADCNT[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **BADCNT[11:0]**: Amount of detected bad pixels
Counts the amount of bad pixels detected in each frame, and if too many, saturates at its maximum value (4095). It is reclocked at the frame end, to remain stable for reading during the next frame.

42.14.47 DCMIPP Pipe1 decimation register (DCMIPP_P1DECR)

This register controls the input decimation.

Address offset: 0x830

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VDEC[1:0]		HDEC[1:0]		ENABLE
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:3 **VDEC[1:0]**: Vertical decimation ratio

0x0: All pixels are transmitted, no vertical decimation

0x1: one line out of two transmitted (for raw Bayer data, two lines of components every four)

0x2: one line out of four transmitted (for raw Bayer data, two lines of components every eight)

0x3: one line out of eight transmitted (for raw Bayer data, two lines of components every 16)

Bits 2:1 **HDEC[1:0]**: Horizontal decimation ratio

0x0: All pixels are transmitted, no horizontal decimation

0x1: one line out of two transmitted (for raw Bayer data, two lines of components every four)

0x2: one line out of four transmitted (for raw Bayer data, two lines of components every eight)

0x3: one line out of eight transmitted (for raw Bayer data, two lines of components every 16)

Bit 0 **ENABLE**:

0: Bypass: decimation is not active, all pixels are transmitted

1: Enable: one pixel every 1, 2, 4, or 8, in H and V is transmitted, following HDEC and VDEC

42.14.48 DCMIPP Pipe1 black level calibration control register (DCMIPP_P1BLCCR)

Address offset: 0x840

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BLCR[7:0]								BLCG[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BLCB[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	Res.	ENABLE
rw	rw	rw	rw	rw	rw	rw	rw								rw

Bits 31:24 **BLCR[7:0]**: Black level calibration - Red

Value subtracted from the red input MSB component, whether it is on 8, 10, 12, 14 bits.

Bits 23:16 **BLCG[7:0]**: Black level calibration - Green

Value subtracted from the green input MSB component, whether it is on 8, 10, 12, 14 bits.

Bits 15:8 **BLCB[7:0]**: Black level calibration - Blue
Value subtracted from the blue input MSB component, whether it is on 8, 10, 12, 14 bits.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **ENABLE**: Black level calibration
0: Bypass: black level calibration is not active, all pixels are transmitted non-modified.
1: Enable: the BLC R, G, B are subtracted.

42.14.49 DCMIPP Pipe1 exposure control register 1 (DCMIPP_P1EXCR1)

Address offset: 0x844

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	SHFR[2:0]			MULTR[7:0]								Res.	Res.	Res.	Res.
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw				
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ENABLE
															rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **SHFR[2:0]**: Exposure shift - Red
0x0, 0x1, 0x2, 0x3, 0x4, 0x5, 0x6, 0x7: exposure of reds is increased, respectively, by a factor 1x, 2x, 4x, 8x, 16x, 32x, 64x, 128x.

Bits 27:20 **MULTR[7:0]**: Exposure multiplier - Red
Value that is multiplied for the red input components, whether it is on 8, 10, 12, 14 bits.
Multiplying by 64 reduces the exposure (darkens the reds) by a factor 2x.
Multiplying by 128 does not modify the exposure (keeps the reds as-is).
Multiplying by 255 increase the exposure (lightens the reds) by a factor ~2x.

Bits 19:1 Reserved, must be kept at reset value.

Bit 0 **ENABLE**: Exposure control (multiplication and shift) of all red, green and blue
0: Bypass: exposure multiplier and shift are not applied
1: Enable: the exposure multiplication and shift is applied

42.14.50 DCMIPP Pipe1 exposure control register 2 (DCMIPP_P1EXCR2)

Address offset: 0x848

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	SHFG[2:0]			MULTG[7:0]								Res.	Res.	Res.	Res.
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw				
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	SHFB[2:0]			MULTB[7:0]								Res.	Res.	Res.	Res.
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw				

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **SHFG[2:0]**: Exposure shift - Green

0x0, 0x1, 0x2, 0x3, 0x4, 0x5, 0x6, 0x7: Exposure of greens is increased, respectively, by a factor 1x, 2x, 4x, 8x, 16x, 32x, 64x, 128x.

Bits 27:20 **MULTG[7:0]**: Exposure multiplier - Green

Value that is multiplied for the green input components, whether it is on 8, 10, 12, 14 bits.
Multiplying by 64 reduces the exposure (darkens the greens) by a factor 2x.
Multiplying by 128 does not modify the exposure (keeps the greens as-is).
Multiplying by 255 increases the exposure (lightens the greens) by a factor ~2x.

Bits 19:15 Reserved, must be kept at reset value.

Bits 14:12 **SHFB[2:0]**: Exposure shift - Blue

0x0, 0x1, 0x2, 0x3, 0x4, 0x5, 0x6, 0x7: exposure of blues is increased, respectively, by a factor 1x, 2x, 4x, 8x, 16x, 32x, 64x, 128x.

Bits 11:4 **MULTB[7:0]**: Exposure multiplier - Blue

Value that is multiplied for the blue input components, whether it is on 8, 10, 12, 14 bits.
Multiplying by 64 reduces the exposure (darkens the blues) by a factor 2x.
Multiplying by 128 does not modify the exposure (keeps the blues as-is).
Multiplying by 255 increases the exposure (lightens the blues) by a factor ~2x.

Bits 3:0 Reserved, must be kept at reset value.

42.14.51 DCMIPP Pipe1 statistics1 control register (DCMIPP_P1ST1CR)

Address offset: 0x850

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MODE	SRC[2:0]			BINS[1:0]		Res.	ENABLE
								rw	rw	rw	rw	rw	rw		rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **MODE**: Statistics mode

0: Average: accumulates the 8-bit component value of the considered pixel components.
Typically used to extract the average value of R, G, B, or luminance across the picture, and to drive the exposure control and the white balance.
1: Bins: accumulates 256 for each considered pixel component fitting a bin dynamic.
Typically used to extract how many pixel components fall into the various dynamic bins, and to drive the contrast enhancement.

Bits 6:4 **SRC[2:0]**: Statistics source

0x0, 0x1, 0x2, 0x3: components are sampled after black level, and sample, respectively, red, green, blue, and luminance. For raw Bayer formats, only one component is available by pixel.
0x4, 0x5, 0x6, 0x7: components are sampled after demosaicing, and sample, respectively, red, green, blue, and luminance.

Bits 3:2 **BINS[1:0]**: Current bin definition
Condition: MODE = Bins
0x0: LowerBins: Accu0 (1, 2) is incremented of 256 if Component <4 (<8, <16)
0x1: LowMid Bins: Accu0 (1, 2) is incremented of 256 if Component <32 (<64, <128)
0x2: UpMid Bins: Accu0 (1, 2) is incremented of 256 if Component >127 (>191, >224)
0x3: UpBins: Accu0 (1, 2) is incremented of 256 if Component >239 (>247, >251)
Condition: MODE = Average
0x0: All Pixels: Accu is incremented of Component, if 0 ≤ Component < 256.
0x1: NoExt16: Accu is incremented of Component, if 16 ≤ Component < 240
0x2: NoExt32: Accu is incremented of Component, if 32 ≤ Component < 224
0x3: NoExt64: Accu is incremented of Component, if 64 ≤ Component < 192

Bit 1 Reserved, must be kept at reset value.

Bit 0 **ENABLE**:
0: Disabled: statistics are not accumulated
1: Enable: statistics are accumulated

42.14.52 DCMIPP Pipe1 statistics 2 control register (DCMIPP_P1ST2CR)

Address offset: 0x854

Reset value: 0x0000 0000

								rw	rw	rw	rw	rw	rw		rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **MODE**: Statistics mode
0: Average: accumulates the 8-bit component value of the considered pixel components.
It is typically used to extract the average value of R, G, B, or luminance across the picture, and to drive the exposure control and the white balance.
1: Bins: accumulates 256 for each considered pixel component fitting a bin dynamic.
It is typically used to extract how many pixel components fall into the various dynamic bins.
It is usually used to drive the contrast enhancement.

Bits 6:4 **SRC[2:0]**: Statistics source
0x0, 0x1, 0x2, 0x3: components are sampled after black level, and sample, respectively, the red, green, blue components, and luminance.
0x4, 0x5, 0x6, 0x7: components are sampled after the black level calibration and exposure, and sample, respectively, red, green, blue and luminance.

Bits 3:2 **BINS[1:0]**: Bin definition
Condition: MODE = Bins
0x0: LowerBins: Accu0 (1, 2) is incremented of 256 if Component < 4 (< 8, < 16)
0x1: LowMid Bins: Accu0 (1, 2) is incremented of 256 if Component < 32 (< 64, < 128)
0x2: UpMid Bins: Accu0 (1, 2) is incremented of 256 if Component > 127 (> 191, > 224)
0x3: UpBins: Accu0 (1, 2) is incremented of 256 if Component > 239 (> 247, > 251)
Condition: MODE = Average
0x0: AllPixels: Accu is incremented of Component, if 0 ≤ Component < 256.
0x1: NoExt16: Accu is incremented of Component, if 16 ≤ Component < 240.
0x2: NoExt32: Accu is incremented of Component, if 32 ≤ Component < 224.
0x3: NoExt64: Accu is incremented of Component, if 64 ≤ Component < 192.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **ENABLE**:
0: Disabled: statistics are not accumulated
1: Enabled: statistics are accumulated

42.14.53 DCMIPP Pipe1 statistics 3 control register (DCMIPP_P1ST3CR)

Address offset: 0x858

Reset value: 0x0000 0000

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:26 **BIN[1:0]**: Bin amount per histogram. All bins have the same width.
0x0: 4 bins per histogram (assuming an input with 256 values, each bin is 64-value wide)
0x1: 16 bins per histogram (assuming an input with 256 values, each bin is 16-value wide)
0x2: 64 bins per histogram (assuming an input with 256 values, each bin is 4-value wide)
0x3: 256 bins per histogram (assuming an input with 256 values, each bin is 1-value wide)

Bits 25:24 **DYN[1:0]**: Dynamic of the pixel value, when extracting the histogram

The input pixel value is assumed mapped on 14 bits, 8 are extracted from them to select the bin to update. It is possible to map non-msb bits, to focus the histogram dynamic on the darker pixels. When non-msb bits are extracted to select a bin, if the pixel value is larger than the highest bin, then the highest bin is incremented. In other words, the highest bin collects pixel values higher than the selected dynamic.

0x0: pixel[13:6], used to extract a histogram of the light pixel values (default at reset)

0x1: pixel[11:4], used to extract a histogram of the semi light pixel values

0x2: pixel[9:2], used to extract a histogram of the semi dark pixel values

0x3: pixel[7:0], used to extract a histogram of the dark pixel values

Bit 23 Reserved, must be kept at reset value.

Bits 22:20 **COMP[2:0]**: Component selected for the histograms:

Depending on the input source, respectively rawBayer, RGB, YUV, monochrome, the following components are sampled:

0x0: R, R, V, 128

0x1: Gr, G, Y, Y

0x2: B, B, U, 128

0x3: Gb, L, L, L

0x4: All color components are sampled

Other values: reserved.

Note: Gr means the green component among a green-red raw Bayer line, Gb means the green component among a green-blue raw Bayer line. The L component is the luminance, computed as the weighted average of components 0, 1, 2, with 1/4,1/2,1/4 weight. Typically L = R/4 + G/2 +B/4.

Note: If the input pixel format is YUV or monochrome, the four sampled histogram components are filled with, respectively, (V, Y, U, Y) or (128,L, 128,L).

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **VDEC[2:0]**: Vertical decimation ratio

0x0: All pixels are transmitted, no vertical decimation

0x1: one line out of 2 transmitted (if raw Bayer: 2 lines out of 4)

0x2: one line out of 4 transmitted (if raw Bayer: 2 lines out of 8)

0x3: one line out of 8 transmitted (if raw Bayer, 2 lines out of 16)

0x4: one line out of 16 transmitted (if raw Bayer, 2 lines out of 32)

Other values: reserved

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **HDEC[2:0]**: Horizontal decimation ratio

0x0: All pixels are transmitted, no vertical decimation

0x1: one line out of 2 transmitted (if raw Bayer: 2 lines out of 4)

0x2: one line out of 4 transmitted (if raw Bayer: 2 lines out of 8)

0x3: one line out of 8 transmitted (if raw Bayer, 2 lines out of 16)

0x4: one line out of 16 transmitted (if raw Bayer, 2 lines out of 32)

Other values: reserved

Bits 11:8 **VREG[3:0]**: Amount of vertical regions per frame, from which to extract the histograms:

0x0: 1 region per frame

0x1: 2 regions per frame

...

0xF: 16 regions per frame

Bits 7:4 **HREG[3:0]**: Amount of horizontal regions per frame, from which to extract the histograms
0x0: 1 region per frame
0x1: 2 regions per frame
...
0xF: 16 regions per frame

Bits 3:1 **SRC[2:0]**: Source across the pipeline, where to sample pixels and extract the histograms:
0x0: after the input decimation (and before the black level)
0x1: after the black level (and before the exposure)
0x2: after the exposure (and before the demosaicing)
0x3: after the demosaicing (and before the ColorConv)
0x4: after the ColorConv (and before the contrast)
0x5: after the contrast (and before entering the applicative pipe and its CROP)
Other values: reserved

Note: When SRC > 2 the pixel is considered RGB.

Bit 0 **EN**: Histogram enable
0: disabled
1: enabled, histograms are extracted and written out.

42.14.71 DCMIPP Pipe1 histogram window start register (DCMIPP_P1HSSTR)

Address offset: 0x8B4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	VSTART[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Res.	Res.	Res.	Res.	HSTART[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **VSTART[11:0]**: Vertical start, from 0 to 4094 pixels high.
The unit is the pixel. In case of a raw Bayer input, VSTART is rounded to even values.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **HSTART[11:0]**: Horizontal start, from 0 to 4094 pixels high.
TThe unit is the pixel. In case of a raw Bayer input, HSTART is rounded to even values.

42.14.72 DCMIPP Pipe1 histogram window size register (DCMIPP_P1HSSZR)

Address offset: 0x8B8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	VSIZE[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	HSIZE[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **VSIZE[11:0]**: Vertical size of each histogram region, from 0 to 4094 pixels high

The unit is the pixel. It must be a multiple of decimation. In case of a raw Bayer input, VSIZE is rounded to even values.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **HSIZE[11:0]**: Horizontal size of each histogram region, from 0 to 4094 pixels high

The unit is the pixel. It must be a multiple of decimation. In case of a raw Bayer input, HSIZE is rounded to even values.

42.14.73 DCMIPP Pipe1 histogram memory address register 1 (DCMIPP_P1HSMAR1)

Address offset: 0x8BC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	r	r	r	r

Bits 31:0 **MA[31:0]**: Memory address

Base address of memory area, to whom histogram data are written. It is assumed to be a multiple of 16, hence its bits 3:0 are always at 0x0.

42.14.74 DCMIPP Pipe1 histogram memory status address register 3 (DCMIPP_P1HSSMAR)

Address offset: 0x8C4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MA[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **MA[31:0]**: Memory address

Base address of memory area, to whom histogram data are written. It is assumed to be a multiple of 16, hence its bits 3:0 are always at 0x0.

This register returns the status of the last captured histogram.

42.14.75 DCMIPP Pipex flow control configuration register (DCMIPP_PxFCTCR)

Address offset: 0x900 + 0x400 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CPT REQ	CPT MODE	FRATE[1:0]	
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **CPTREQ:** Capture requested

0: Capture not requested for next frame

1: Capture requested for next frame

When PIPEN = 1, and when the CPTREQ is set to 1, the pipe waits for the first VSync, then automatically starts a capture and sets CPTACT = 1 to mention it.

In Snapshot mode, the CPTREQ bit is automatically cleared at the start of the first frame received.

In continuous grab mode, the capture remains active and CPTREQ = 1, until the software clears CPTREQ: the capture stops and CPTACT is reset at the end of the ongoing frame.

The DCMI and pipe configuration registers must be correctly programmed before enabling this bit.

Bit 2 **CPTMODE:** Capture mode

0: Continuous grab mode. The received data are transferred into the destination memory through the AXI master.

1: Snapshot mode (single frame). Once activated, the interface waits for the start of frame, and then transfers a single frame through the AXI master. At the end of the frame, the CPTACT bit is automatically reset.

Bits 1:0 **FRATE[1:0]:** Frame capture rate control

These bits define the frequency of frame capture. They are meaningful only in Continuous grab mode, ignored in Snapshot mode.

00: All frames are captured

01: one out of two frames captured (50% bandwidth reduction)

10: one out of four frames captured (75% bandwidth reduction)

11: one out of eight frames captured (87% bandwidth reduction)

42.14.76 DCMIPP Pipex crop window start register (DCMIPP_PxCRSTR)

Address offset: 0x904 + 0x400 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	HSIZE[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **ENABLE**:

0: Bypass, all pixels are transmitted through (no need to set any start and size values)

1: Enable, only the rectangle defined by VSIZE, HSIZE, VSTART, HSTART is transmitted.

Bits 30:28 Reserved, must be kept at reset value.

Bits 27:16 **VSIZE[11:0]**: Vertical size, from 0 to 4094 pixels high. If the value is maintained at 0 when enabling the crop thanks to the ENABLE bit, the value is forced internally at 0xFFE, which is the maximum value.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **HSIZE[11:0]**: Horizontal size, from 0 to 4094 pixels wide. If the value is maintained at 0 when enabling the crop by means of the ENABLE bit, the value is forced internally at 0xFFE, which is the maximum value.

42.14.78 DCMIPP Pipex decimation register (DCMIPP_PxDCCR)

This register controls decimation, prior to downsize (to complement it).

Address offset: 0x90C + 0x400 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VDEC[1:0]		HDEC[1:0]		ENABLE
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:3 **VDEC[1:0]**: Vertical decimation ratio
- 0x0: all pixels are transmitted, no vertical decimation
- 0x1: one line out of two transmitted
- 0x2: one line out of four transmitted
- 0x3: one line out of eight transmitted

Bits 2:1 **HDEC[1:0]**: Horizontal decimation ratio
- 0x0: all pixels are transmitted, no horizontal decimation
- 0x1: one line out of two transmitted
- 0x2: one line out of four transmitted
- 0x3: one line out of eight transmitted

Bit 0 **ENABLE**:
- 0: Bypass: decimation is not active, all pixels are transmitted
- 1: Enable: one pixel every 1, 2, 4 or 8, in H and V is transmitted, following HDEC and VDEC

42.14.79 DCMIPP Pipex downsize configuration register (DCMIPP_PxDSCR)

Address offset: 0x910 + 0x400 * (x - 1) (x = 1 to 2)

Reset value: 0x0000 0000

The division factor is an unsigned integer based on the source/destination ratio:

div = max(int(1024 / (source/destination)), 1023)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **ENABLE**:
0: Down scaler is bypassed
1: Down scaler is enabled

Bits 30:26 Reserved, must be kept at reset value.

Bits 25:16 **VDIV[9:0]**: Vertical division factor, from 128 (8x) to 1023 (1x)

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:0 **HDIV[9:0]**: Horizontal division factor, from 128 (8x) to 1023 (1x)

42.14.80 DCMIPP Pipex downsize ratio register (DCMIPP_PxDSRTIOR)

Address offset: 0x914 + 0x400 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

The down scale ratio is expressed in unsigned 3.13 format:

ratio = max(int((SourceSize - 1) / (DestinationSize -1)) * 8192**)**, 8 * 8192 - 1**)**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw									rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 Reserved, must be kept at reset value.

Bits 15:13 **LINEMULT[2:0]**: Amount of capture completed lines for LINE Event and Interrupt
- 0x0: Event after one line
- 0x1: Event after two lines
- 0x2: Event after four lines
- 0x3: Event after eight lines
- 0x4: Event after sixteen lines
- 0x5: Event after 32 lines
- 0x6: Event after 64 lines
- 0x7: Event after 128 lines

Bits 12:5 Reserved, must be kept at reset value.

Bit 4 **SWAPRB**: Swaps R-vs-B components if RGB, and U-vs-V components if YUV
0: No swap of R-vs-B (U-vs-V)
1: Swap active

Bits 3:0 **FORMAT[3:0]**: Memory format
0x0: RGB888 or YUV444 1-buffer
0x1: RGB565 1-buffer
0x2: ARGB8888 (with A = 0xFF)
0x3: RGBA8888 (with A = 0xFF)
0x4: monochrome Y8 or G8 1-buffer
0x5: YUV444 1-buffer (32 bpp, FOURCC = AYUV, with A = 0xFF)
0x6: YUV422 1-buffer (16 bpp, FOURCC = YUYV)
0x7: YUV422 2-buffer (16 bpp, FOURCC = none)
0x8: YUV420 2-buffer (12 bpp, FOURCC = NV21), NV12 available with SWAPRB = 1
0x9: YUV420 3-buffer (12 bpp, FOURCC = YV12)
0xA: YUV422 1-buffer (16 bpp, FOURCC = UYVY)
Other formats are reserved and not supported.

42.14.91 DCMIPP Pipe1 pixel packer Memory0 address register 1 (DCMIPP_P1PPM0AR1)

Address offset: 0x9C4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
M0A[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
M0A[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	r	r	r	r

Bits 31:0 **M0A[31:0]**: Memory0 address
Base address of memory area 0, to whom data are written. It is assumed to be a multiple of 16, hence its bits 3:0 are always at 0x0.

42.14.92 DCMIPP Pipex pixel packer Memory0 pitch register (DCMIPP_PxPPM0PR)

Address offset: 0x9CC + 0x400 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	PITCH[14:0]														
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	r	r	r	r

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:0 **PITCH[14:0]**: Number of bytes between the address of two consecutive lines.
It is assumed to be a multiple of 16, hence its bits 3:0 are always at 0x0. It ranges to 32 Kbytes, to allow a double-width buffer, containing a 4-kpixel wide 32 bpp picture.

42.14.93 DCMIPP Pipex status Memory0 address register (DCMIPP_PxSTM0AR)

Address offset: 0x9D0 + 0x400 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

								rw	rw	rw	rw		rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **OVRIE:** Overrun interrupt enable
0: No interrupt generation
1: An interrupt is generated if the AXI master is unable to transfer the last data before new data (32-bit) are received.

Bit 6 **STOVRIE:** Statistic overrun interrupt enable
0: No interrupt generation
1: An interrupt is generated if the AXI master is unable to transfer the last data before new data (32-bit) are received.

Bit 5 **STBCIE:** Statistic bad configuration interrupt enable
0: No interrupt generation
1: An interrupt is generated if the software configuration is considered inconsistent

Bit 4 **STFRAMEIE:** Statistic frame capture interrupt enable
0: No interrupt generation
1: An interrupt is generated after the full capture of the statistics of a frame

Bit 3 Reserved, must be kept at reset value.

Bit 2 **VSYNCIE:** VSYNC interrupt enable
0: No interrupt generation
1: An interrupt is generated on each VSYNC (captured or not)

Bit 1 **FRAMEIE:** Frame capture completed interrupt enable
0: No interrupt generation
1: An interrupt is generated after the full capture of a cropped frame

Bit 0 **LINEIE:** Multi-line capture completed interrupt enable
0: No interrupt generation when the line is received
1: An interrupt is generated after the full capture of a group of lines (or last line reached)

42.14.100 DCMIPP Pipe1 status register (DCMIPP_P1SR)

Address offset: 0x9F8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CPTACT	Res.	Res.	Res.	Res.	Res.	LSTFRM	LSTLINE
								r						r	r

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OVRF	STOVRF	STBCF	STFRAMEF	Res.	VSYNCF	FRAMEF	LINEF
								r	r	r	r		r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **CPTACT:** Capture immediate status
0: Capture currently inactive
1: Capture currently active
This bit is automatically reset at the end of Frame capture complete event (after all the data of that frame have been captured, usually before the next VSync).

Bits 22:20 Reserved, must be kept at reset value.

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **LSTFRM**: Last frame LSB bit, sampled at frame capture complete event. The information is extracted from the frame data number, which can be delivered by the camera through the CSI2 interface.

Bit 16 **LSTLINE**: Last line LSB bit, sampled at frame capture complete event.

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **OVRF:** Overrun raw interrupt status
0: No data buffer overrun occurred
1: A data buffer overrun occurred and this frame data are corrupted.
This bit is cleared by writing 1 to the COVRF bit in DCMIPP_P1FCR.

Bit 6 **STOVRF:** Histogram statistics overrun interrupt status
0: No interrupt occurred
1: An interrupt occurred

Bit 5 **STBCF:** Histogram statistics bad configuration interrupt status
0: No interrupt occurred
1: An interrupt occurred

Bit 4 **STFRAMEF:** Histogram statistics frame capture interrupt status
0: No interrupt occurred
1: An interrupt occurred

Bit 3 Reserved, must be kept at reset value.

Bit 2 **VSYNCF:** VSYNC raw interrupt status
This bit is set when the VSYNC signal changes from the inactive state to the active state.
In the case of embedded synchronization, this bit is set only if the CAPTURE bit is set in DCMIPP_CR.
It is cleared by writing 1 to the CVSYNCF bit in DCMIPP_P1FCR.

Bit 1 **FRAMEF:** Frame capture completed raw interrupt status
0: no capture or ongoing capture
1: all data of a frame have been captured
This bit is set when all data of a frame or window have been captured.
In case of a cropped window, this bit is set at the end of line of the last line in the crop, even if the captured frame is empty (for example window cropped outside the frame).
This bit is cleared by writing 1 to the CFRAMEF bit in DCMIPP_P1FCR.

Bit 0 **LINEF:** Multi-line capture completed raw interrupt status
This bit is set when one/more lines have been completed. The periodicity of LINEF event is configured by LINEMULT bits into DCMIPP_P1PPCR. When reaching end of frame, this event is triggered out to allow software action even if the LINEMULT value set is not a multiple of the total lines frame.
In the case of embedded synchronization, this bit is set only if the CAPTURE bit in DCMIPP_CR is set. It is cleared by writing 1 to the CLINEF bit in DCMIPP_P1FCR.

42.14.101 DCMIPP Pipe1 interrupt clear register (DCMIPP_P1FCR)

Address offset: 0x9FC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

								w	w	w	w		w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **COVRF:** Overrun interrupt status clear
Writing 1 into this bit clears the OVRF bit in the DCMIPP_P1SR register.

Bit 6 **CSTOVRF:** Histogram statistics overrun interrupt clear
Writing 1 into this bit clears the STOVRF bit in the DCMIPP_P1SR register.

Bit 5 **CSTBCF:** Histogram statistics bad configuration interrupt clear
Writing 1 into this bit clears the STBCF bit in the DCMIPP_P1SR register.

Bit 4 **CSTFRAMEF:** Histogram statistics frame capture interrupt clear
Writing 1 into this bit clears the STFRAMEF bit in the DCMIPP_P1SR register.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **CVSYNCF:** Vertical synchronization interrupt status clear
Writing 1 into this bit clears the VSYNCF bit in the DCMIPP_P1SR register.

Bit 1 **CFRAMEF:** Frame capture complete interrupt status clear
Writing 1 into this bit clears the FRAMEF bit in the DCMIPP_P1SR register.

Bit 0 **CLINEF:** Multi-line capture complete interrupt status clear
Writing 1 into this bit clears LINEF in the DCMIPP_P1SR register.

42.14.102 DCMIPP Pipe1 current flow selection configuration register (DCMIPP_P1CFSCR)

Address offset: 0xA04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PIPEN	FDTFEN	FDTF[5:0]						Res.	Res.	Res.	VC[1:0]		PIPEDIFF	DTMODE[1:0]	
r	r	r	r	r	r	r	r				r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	DTIDB[5:0]						Res.	Res.	DTIDA[5:0]					
		r	r	r	r	r	r			r	r	r	r	r	r

Bit 31 **PIPEN**: Current activation of PipeN

0: Pipe disabled

1: Pipe enabled, can start capturing with CPTMODE, CPTREQ, CPTACK.

Bit 30 **FDTFEN**: Current force data type format enable

0: Disable force data type format. The data type format used by the pipe is the one defined into DTIDx

1: Enable force data type format. When the data type DTIDx is detected by the pipe, the real pixel format considering by the pipe is the one set into the FDTF[5:0] bit field instead of the physical one received by the CSI2 host. It allows to handle, for instance, 3D sensors camera with user data type in bottom-up approach, and to explicitly define the pixel format to be handled by the pipe.

Bits 29:24 **FDTF[5:0]**: Current force data type format

Forcing the data type format. This data type overwrites the one received by the CSI2-HOST by specifying the pixel format to consider. The value must follow the CSI2 data type format definition in the CSI2 standard. This bit field has no meaning if the FDTFEN bit is cleared.

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:19 **VC[1:0]**: Current flow selection mode

Virtual channel ID of the CSI flow to select for further processing on the pipe.

Bit 18 **PIPEDIFF:** Current differentiates Pipe2 vs. Pipe1

0: Pipe2 gets Pipe1 pixels after their processing in shared Gamma, StatRemoval, Demosaicing. Pipe2 shares the same VC DTID of Pipe1 when a CSI2 camera sensor is plugged.

1: Pipe1 gets pixels from only VC/DTID configured in Pipe1, processed by all including Gamma, StatRemoval, Demosaicing. Pipe2 gets pixels from only VC/DTID configured in Pipe2, processed from Crop only (Gamma common with Pipe1, no StatRem, no demosaicing)

Bits 17:16 **DTMODE[1:0]**: Flow selection mode

00: Only flow DTID A from the selected virtual channel is forwarded in the pipe.

01: Flows DTIDA and DTIDB from the selected virtual channel are forwarded in the pipe. This combination is valid only if the FDTFEN bit is set.

Other values: Reserved.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **DTIDB[5:0]**: Current data type ID B

Data type ID of the CSI flow to select.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **DTIDA[5:0]**: Current data type ID A

Data type ID of the CSI flow to select.

42.14.103 DCMIPP Pipe1 current bad pixel removal register (DCMIPP_P1CBPRCR)

Address offset: 0xA24

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STRENGTH[2:0]			ENABLE
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:1 **STRENGTH[2:0]**: Current strength (aggressiveness) of the bad pixel detection:
0x0: the filter is fairly tolerant: only a few pixels are declared bad, due to their high noise.
0x7: the filter is very aggressive: many pixels are declared bad, even if only slightly noisy.

Bit 0 **ENABLE**: Current status of enable bit
0: Bypass: bad pixel removal is not active, all pixels are transmitted through
1: Enable: if bad pixel are detected, they are replaced by corrected pixels.
(bad pixel detection must be enabled only for raw Bayer flows, as it would corrupt RGB flows)

42.14.104 DCMIPP Pipe1 current black level calibration control register (DCMIPP_P1CBLCCR)

Address offset: 0xA40

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

BLCB[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	Res.	ENABLE
r	r	r	r	r	r	r	r								r

Bits 31:24 **BLCR[7:0]**: Current black level calibration - Red
Value that is subtracted from the red input components, whether it is on 8,10,12,14 bits.

Bits 23:16 **BLCG[7:0]**: Current black level calibration - Green
Value that is subtracted from the green input components, whether it is on 8,10,12,14 bits.

Bits 15:8 **BLCB[7:0]**: Current black level calibration - Blue
Value that is subtracted from the blue input components, whether it is on 8,10,12,14 bits.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **ENABLE**: For current black level calibration
0: Bypass: black level calibration is not active, all pixels are transmitted non-modified.
1: Enable: the BLCR, G, B are subtracted.

42.14.105 DCMIPP Pipe1 current exposure control register 1 (DCMIPP_P1CEXCR1)

Address offset: 0xA44

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	SHFR[2:0]			MULTR[7:0]								Res.	Res.	Res.	Res.
	r	r	r	r	r	r	r	r	r	r	r				
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ENABLE
															r

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **SHFR[2:0]**: Current exposure shift - Red
0x0, 0x1, 0x2, 0x3, 0x4, 0x5, 0x6, 0x7: exposure of reds is increased, respectively, by a factor 1x, 2x, 4x, 8x, 16x, 32x, 64x, 128x.

Bits 27:20 **MULTR[7:0]**: Current exposure multiplier - Red
Value that is multiplied for the red input components, whether it is on 8,10,12,14 bits.
Multiplying by 64 reduces the exposure (darkens the reds) by a factor 2x.
Multiplying by 128 does not modify the exposure (keeps the reds as-is).
Multiplying by 255 increases the exposure (lightens the reds) by a factor ~2x.

Bits 19:1 Reserved, must be kept at reset value.

Bit 0 **ENABLE**: for exposure control (multiplication and shift)
0: Bypass: exposure multiplier and shift are not applied.
1: Enable: the exposure multiplication and shift is applied.

42.14.106 DCMIPP Pipe1 current exposure control register 2 (DCMIPP_P1CEXCR2)

Address offset: 0xA48

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	SHFB[2:0]			MULTB[7:0]								Res.	Res.	Res.	Res.
	r	r	r	r	r	r	r	r	r	r	r				

Bit 31 Reserved, must be kept at reset value.

Bits 30:28 **SHFG[2:0]**: Current exposure shift - Green
0x0, 0x1, 0x2, 0x3, 0x4, 0x5, 0x6, 0x7: exposure of greens is increased, respectively, by a factor 1x, 2x, 4x, 8x, 16x, 32x, 64x, 128x.

Bits 27:20 **MULTG[7:0]**: Current exposure multiplier - Green
Value that is multiplied for the green input components, whether it is on 8,10,12,14 bits.
Multiplying by 64 reduces the exposure (darkens the greens) by a factor 2x.
Multiplying by 128 does not modify the exposure (keeps the greens as-is).
Multiplying by 255 increases the exposure (lightens the greens) by a factor ~2x.

Bits 19:15 Reserved, must be kept at reset value.

Bits 14:12 **SHFB[2:0]**: Current exposure shift - Blue

0x0, 0x1, 0x2, 0x3, 0x4, 0x5, 0x6, 0x7: exposure of blues is increased, respectively, by a factor 1x, 2x, 4x, 8x, 16x, 32x, 64x, 128x.

Bits 11:4 **MULTB[7:0]**: Current exposure multiplier - Blue

Value that is multiplied for the blue input components, whether it is on 8,10,12,14 bits.
Multiplying by 64 reduces the exposure (darkens the blues) by a factor 2x.
Multiplying by 128 does not modify the exposure (keeps the blues as-is).
Multiplying by 255 increases the exposure (lightens the blues) by a factor ~2x.

Bits 3:0 Reserved, must be kept at reset value.

42.14.107 DCMIPP Pipe1 current statistics 1 control register (DCMIPP_P1CST1CR)

Address offset: 0xA50

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ACCU[23:8]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ACCU[7:0]								MODE	SRC[2:0]			BINS[1:0]		Res.	ENABLE
r	r	r	r	r	r	r	r	r	r	r	r	r	r		r

Bits 31:8 **ACCU[23:0]**: Current accumulation result, divided by 256.

Bit 7 **MODE**: Current statistics mode

0: Average: accumulates the 8-bit component value of the considered pixel components.
It is typically used to extract the average value of R, G, B, or luminance across the picture, and to drive the exposure control and the white balance.
1: Bins: accumulates 256 for each considered pixel component fitting a bin dynamic.
It is typically used to extract how many pixel components fall into the various dynamic bins.
It is usually used to drive the contrast enhancement.

Bits 6:4 **SRC[2:0]**: Current source of statistics

0x0, 0x1, 0x2, 0x3: components are sampled before the black level calibration and exposure, and sample, respectively, the red, green, blue components, and luminance (computed as R / 4 + G / 2 + B / 4).
0x4, 0x5, 0x6, 0x7: components are sampled after the black level calibration and exposure, and sample, respectively, red, green, blue and luminance.

Bits 3:2 **BINS[1:0]**: Current bin definition

Condition: MODE = Bins
0x0: LowerBins: Accu0 (1, 2) is incremented of 256 if Component <4 (<8, <16)
0x1: LowMid Bins: Accu0 (1, 2) is incremented of 256 if Component <32 (<64, <128)
0x2: UpMid Bins: Accu0 (1, 2) is incremented of 256 if Component >127 (>191, >224)
0x3: UpBins: Accu0 (1, 2) is incremented of 256 if Component >239 (>247, >251)
Condition: MODE = Average
0x0: AllPixels: Accu is incremented of Component, if 0 ≤ Component < 256
0x1: NoExt16: Accu is incremented of Component, if 16 ≤ Component < 240
0x2: NoExt32: Accu is incremented of Component, if 32 ≤ Component < 224
0x3: NoExt64: Accu is incremented of Component, if 64 ≤ Component < 192

Bit 1 Reserved, must be kept at reset value.

Bit 0 **ENABLE**: Current enable bit value

0: Disabled: statistics are not accumulated

1: Enable: statistics are accumulated

42.14.108 DCMIPP Pipe1 current statistics 2 control register (DCMIPP_P1CST2CR)

Address offset: 0xA54

Res.	Res.	Res.	Res.	HSIZE[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bit 31 **CROPEN**: Current CROPEN bit value

0: Bypass, all pixels are used to compute the statistics.

1: Enable, only the rectangle defined by VSTART, HSTART, VSIZE, HSIZE, are used for statistics.

Bits 30:28 Reserved, must be kept at reset value.

Bits 27:16 **VSIZE[11:0]**: Current vertical size, from 0 to 4094 pixels high

If the value is maintained at 0 when enabling the crop by means of the CROPEN bit, the value is forced internally at 0xFFE, which is the maximum value.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **HSIZE[11:0]**: Current horizontal size, from 0 to 4094 pixels wide

If the value is maintained at 0 when enabling the crop by means of the CROPEN bit, the value is forced internally at 0xFFE, which is the maximum value.

42.14.112 DCMIPP Pipe1 current ColorConv configuration register (DCMIPP_P1CCCCR)

Address offset: 0xA80

Reset value: 0x0000 0000

Bit 31 Reserved, must be kept at reset value.

Bits 30:25 **LUM5[5:0]**: Luminance increase for input luminance of 160 (increase is idle with LUMx = 16)

Bits 24:23 Reserved, must be kept at reset value.

Bits 22:17 **LUM6[5:0]**: Luminance increase for input luminance of 192 (increase is idle with LUMx = 16)

Bits 16:15 Reserved, must be kept at reset value.

Bits 14:9 **LUM7[5:0]**: Luminance increase for input luminance of 224 (increase is idle with LUMx = 16)

Bits 8:7 Reserved, must be kept at reset value.

Bits 6:1 **LUM8[5:0]**: Luminance increase for input luminance of 256 (increase is idle with LUMx = 16)

Bit 0 Reserved, must be kept at reset value.

42.14.122 DCMIPP Pipe1 current histogram configuration register (DCMIPP_P1CHSCR)

Address offset: 0xAB0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	BIN[1:0]		DYN[1:0]		Res.	COMP[2:0]			Res.	VDEC[2:0]		
				r	r	r	r		r	r	r		r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	HDEC[2:0]			VREG[3:0]				HREG[3:0]				SRC[2:0]			EN
	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:26 **BIN[1:0]**: Bin amount per histogram. All bins have the same width.
0x0: 4 bins per histogram (assuming an input with 256 values, each bin is 64-value wide)
0x1: 16 bins per histogram (assuming an input with 256 values, each bin is 16-value wide)
0x2: 64 bins per histogram (assuming an input with 256 values, each bin is 4-value wide)
0x3: 256 bins per histogram (assuming an input with 256 values, each bin is 1-value wide)

Bits 25:24 **DYN[1:0]**: Dynamic of the pixel value, when extracting the histogram
The input pixel value is assumed mapped on 14 bits, 8 are extracted from them to select the bin to update. It is possible to map non-msb bits, to focus the histogram dynamic on the darker pixels. When non-msb bits are extracted to select a bin, if the pixel value is larger than the highest bin, then the highest bin is incremented. In other words, the highest bin collects pixel values higher than the selected dynamic.
0x0: pixel[13:6], used to extract a histogram of the light pixel values (default at reset)
0x1: pixel[11:4], used to extract a histogram of the semi light pixel values
0x2: pixel[9:2], used to extract a histogram of the semi dark pixel values
0x3: pixel[7:0], used to extract a histogram of the dark pixel values

Bit 23 Reserved, must be kept at reset value.

Bits 22:20 **COMP[2:0]**: Component selected for the histograms:
0x0: one histogram is extracted, from the R component (if pixel is RGB or raw Bayer)
0x1: one histogram is extracted, from the G (if pixel is RGB) or Gr (if raw Bayer) component
0x2: one histogram is extracted, from the B (if pixel is RGB) or Gb (if raw Bayer) component
0x3: one histogram is extracted, from the computed L (if pixel is RGB) or B (if raw Bayer)
0x4: four histograms are extracted in parallel, with R, G, B, L (if pixel is RGB), or R, Gr, Gb, B
Other values: reserved

Note: Gr means the green component among a green-red raw Bayer line, Gb means the green component among a green-blue raw Bayer line. L means the Luminance, extracted as (R/4 + G/2 + B/4).

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **VDEC[2:0]**: Vertical decimation ratio
0x0: all pixels are transmitted, no vertical decimation
0x1: one line out of 2 transmitted (if raw Bayer: 2 lines out of 4)
0x2: one line out of 4 transmitted (if raw Bayer: 2 lines out of 8)
0x3: one line out of 8 transmitted (if raw Bayer, 2 lines out of 16)
0x4: one line out of 16 transmitted (if raw Bayer, 2 lines out of 32)
Other values: reserved

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **HDEC[2:0]**: Horizontal decimation ratio
0x0: all pixels are transmitted, no vertical decimation
0x1: one line out of 2 transmitted (if raw Bayer: 2 lines out of 4)
0x2: one line out of 4 transmitted (if raw Bayer: 2 lines out of 8)
0x3: one line out of 8 transmitted (if raw Bayer, 2 lines out of 16)
0x4: one line out of 16 transmitted (if raw Bayer, 2 lines out of 32)
Other values: reserved

Bits 11:8 **VREG[3:0]**: Amount of vertical regions per frame, from which to extract the histograms:
0x0: 1 region per frame
0x1: 2 regions per frame
...
0xF: 16 regions per frame

Bits 7:4 **HREG[3:0]**: Amount of horizontal regions per frame, from which to extract the histograms
0x0: 1 region per frame
0x1: 2 regions per frame
...
0xF: 16 regions per frame

Bits 3:1 **SRC[2:0]**: Source across the pipeline, where to sample pixels and extract the histograms:
0x0: after the input decimation (and before the black level)
0x1: after the black level (and before the exposure)
0x2: after the exposure (and before the demosaicing)
0x3: after the demosaicing (and before the ColorConv)
0x4: after the ColorConv (and before the contrast)
0x5: after the contrast (and before entering the applicative pipe and its CROP)
Other values: reserved
Note: When SRC ? 3, the pixel is assumed RGB.

Bit 0 **EN**: Histogram enable
0: disabled
1: enabled, histograms are extracted and written out.

42.14.123 DCMIPP Pipe1 current histogram window start register (DCMIPP_P1CHSSTR)

Address offset: 0xAB4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	VSTART[11:0]

Res.	Res.	Res.	Res.	HSTART[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **VSTART[11:0]**: Vertical start, from 0 to 4094 pixels high.

The unit is the decimated period of pixel. Note that a decimation by 2x in raw Bayer counts two pixels every four, and VSIZE counts every four pixels.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **HSTART[11:0]**: Horizontal start, from 0 to 4094 pixels high.

The unit is the decimated period of pixel. Note that a decimation by 2x in raw Bayer counts two pixels every four, and HSIZE counts every four pixels.

42.14.124 DCMIPP Pipe1 current histogram window size register (DCMIPP_P1CHSSZR)

Address offset: 0xAB8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CPT REQ	CPT MODE	FRATE[1:0]	
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **CPTREQ:** Capture requested

0: Capture not requested for next frame.

1: Capture requested for next frame.

When PIPEN = 1, and when the CPTREQ is set to 1 the pipe waits for the first VSync, and automatically starts a capture and sets CPTACT= 1 to mention it.

In Snapshot mode, the CPTREQ bit is automatically cleared at the start of the first frame received.

In continuous grab mode, the capture remains active and CPTREQ = 1, until the software clears CPTREQ: the capture stops and CPTACT is reset at the end of the ongoing frame.

The DCMIPP and pipe configuration registers must be correctly programmed before enabling this bit.

Bit 2 **CPTMODE:** Capture mode

0: Continuous grab mode - Received data are transferred into the destination memory through the AXI master.

1: Snapshot mode (single frame) - Once activated, the interface waits for the start of frame and then transfers a single frame through the AXI master. At the end of the frame, the CPTACT bit is automatically reset.

Bits 1:0 **FRATE[1:0]:** Frame capture rate control
These bits define the frequency of frame capture. They are meaningful only in Continuous grab mode, ignored in Snapshot mode.
00: all frames are captured
01: one out of two frames captured (50% bandwidth reduction)
10: one out of four frames captured (75% bandwidth reduction)
11: one out of eight frames captured (87% bandwidth reduction)

42.14.127 DCMIPP Pipex current crop window start register (DCMIPP_PxCCRSTR)

Address offset: 0xB04 + 0x400 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:3 **VDEC[1:0]**: Vertical decimation ratio
0x0: All pixels are transmitted, no vertical decimation
0x1: one line out of two transmitted
0x2: one line out of four transmitted
0x3: one line out of eight transmitted

Bits 2:1 **HDEC[1:0]**: Horizontal decimation ratio
0x0: All pixels are transmitted, no horizontal decimation
0x1: one line out of two transmitted
0x2: one line out of four transmitted
0x3: one line out of eight transmitted

Bit 0 **ENABLE**:
0: Bypass: decimation is not active, all pixels are transmitted
1: Enable: one pixel every 1, 2, 4 or 8, in H and V is transmitted, following HDEC and VDEC

42.14.130 DCMIPP Pipex current downsize configuration register (DCMIPP_PxCDSCR)

Address offset: 0xB10 + 0x400 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

The division factor is an unsigned integer based on the source/destination ratio:

div = max(int(024 / (source/destination)), 1023)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:0 **PITCH[14:0]**: Current number of bytes between the address of two consecutive lines.

It is assumed to be a multiple of 16, hence its bits 3:0 are always at 0x0. It ranges to 32 Kbytes, to allow a double-width buffer, containing a 4-kpixel wide 32 bpp picture.

42.14.136 DCMIPP Pipex current pixel packer Memory1 address register 1 (DCMIPP_PxCPPM1AR1)

Address offset: 0xBD4 + 0x400 * (x - 1), (x = 1 to 1)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

M2A[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **M2A[31:0]**: Memory 2 address

Base address of current memory area 2 where data are written. It is assumed to be a multiple of 16, hence its bits [3:0] are always at 0x0.

42.14.139 DCMIPP Pipe2 flow selection configuration register (DCMIPP_P2FSCR)

Address offset: 0xC04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PIPEN	FDTFEN	FDTF[5:0]						Res.	Res.	Res.	VC[1:0]		Res.	Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw				rw	rw			
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DTIDA[5:0]					
										rw	rw	rw	rw	rw	rw

Bit 31 **PIPEN**: Activation of PipeN

0: PipeN disabled

1: PipeN enabled, can start capturing with CPTMODE, CPTREQ, CPTACK

Bit 30 **FDTFEN**: Force data type format enable

0: Disable force data type format. The data type format used by the pipe is the one defined into DTIDx

1: Enable force data type format. When the data type DTIDA is detected by the pipe, the real pixel format considered by the pipe is the one set into the FDTF[5:0] bit field instead of the physical one received by the CSI2 host.

This bit has no meaning if PIPEDIFF = 0 in the DCMIPP_P1FSCR register.

Bits 29:24 **FDTF[5:0]**: Force data type format

This data type overwrites the one received by the CSI2 Host by specifying the pixel format to consider. The value must follow the CSI2 data type format definition in the CSI2 standard.

This bit field has no meaning if the FDTFEN bit is cleared.

These bits have no meaning if PIPEDIFF = 0 in the DCMIPP_P1FSCR register.

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:19 **VC[1:0]**: Flow selection mode

Virtual channel ID of the CSI flow to select for further processing on the pipe.

These bits have no meaning if PIPEDIFF = 0 into DCMIPP_P1FSCR, hence the pipe takes the value VC[1:0] configured into the DMCIPP_P1FSCR register.

Bits 18:6 Reserved, must be kept at reset value.

Bits 5:0 **DTIDA[5:0]**: Data type ID

Data type ID of the CSI flow to select.

These bits have no meaning if PIPEDIFF = 0 into DCMIPP_P1FSCR, hence the pipe takes the value of VC and DTIDA[5:0] / DTIDB[5:0] configured into the DMCIPP_P1FSCR register.

42.14.140 DCMIPP Pipe2 pixel packer configuration register (DCMIPP_P2PPCR)

Address offset: 0xDC0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

LINEMULT[2:0]			Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWAP RB	FORMAT[3:0]			
rw	rw	rw									rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:13 **LINEMULT[2:0]**: Amount of capture completed lines for LINE event and interrupt
0x0: Event after every line
0x1: Event after two lines
0x2: Event after four lines
0x3: Event after eight lines
0x4: Event after sixteen lines
0x5: Event after 32 lines
0x6: Event after 64 lines
0x7: Event after 128 lines

Bits 12:5 Reserved, must be kept at reset value.

Bit 4 **SWAPRB**: Swaps R-vs-B components if RGB, and if YUV, swaps U-vs-V components
0: No swap of R-vs-B (U-vs-V)
1: Swap active.

Bits 3:0 **FORMAT[3:0]**: Memory format (only coplanar formats are supported in Pipe2)
0x0: RG/B888 or YUV444 1-buffer
0x1: RGB565 1-buffer
0x2: ARGB8888
0x3: RGBA8888
0x4: monochrome Y8 or G8 1-buffer
0x5: YUV444 1-buffer (FOURCC = AYUV)
0x6: YUV422 1-buffer (FOURCC = YUYV)
Other formats are reserved and not supported.

42.14.141 DCMIPP Pipe2 pixel packer Memory0 address register 1 (DCMIPP_P2PPM0AR1)

Address offset: 0xDC4

Reset value: 0x0000 0000

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OVRIE	Res.	Res.	Res.	Res.	VSYNCIE	FRAMEIE	LINEIE
								rw					rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **OVRIE:** Overrun interrupt enable

0: No interrupt generation

1: An interrupt is generated if the AXI master is unable to transfer the last data before new data (32-bit) are received

Bits 6:3 Reserved, must be kept at reset value.

Bit 2 **VSYNCIE:** VSYNC interrupt enable

0: No interrupt generation

1: An interrupt is generated on each VSYNC (captured or not)

Bit 1 **FRAMEIE:** Frame capture completed interrupt enable

0: No interrupt generation

1: An interrupt is generated after the full capture of a cropped frame

Bit 0 **LINEIE:** Multi-line capture completed interrupt enable

0: No interrupt generation when the line is received

1: An interrupt is generated after the full capture of a group of lines (or last line reached)

42.14.143 DCMIPP Pipe2 status register (DCMIPP_P2SR)

Address offset: 0xDF8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CPTACT	Res.	Res.	Res.	Res.	Res.	LSTFRM	LSTLINE
								r						r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OVRF	Res.	Res.	Res.	Res.	VSYNCF	FRAMEF	LINEF
								r					r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **CPTACT:** Capture immediate status

0: Capture currently inactive

1: Capture currently active

This bit is automatically reset at the end of frame capture complete event (after all the data of that frame have been captured, usually before the next VSync).

Bits 22:20 Reserved, must be kept at reset value.

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **LSTFRM**: Last frame LSB bit, sampled at frame capture complete event.

The information is extracted from the frame data number which can be delivered by the camera through the CSI2 interface.

Bit 16 **LSTLINE**: Last line LSB bit, sampled at frame capture complete event.

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **OVRF:** Overrun raw interrupt status

0: No data buffer overrun occurred

1: A data buffer overrun occurred and data of this frame are corrupted

This bit is cleared by writing 1 to the COVRF bit in the DCMIPP_P2FCR register.

Bits 6:3 Reserved, must be kept at reset value.

Bit 2 **VSYNCF:** VSYNC raw interrupt status

This bit is set when the VSYNC signal changes from the inactive state to the active state. In the case of embedded synchronization, this bit is set only if the CAPTURE bit is set in the DCMIPP_CR register. It is cleared by writing 1 to the CVSYNCF bit in the DCMIPP_P2FCR register.

Bit 1 **FRAMEF:** Frame capture completed raw interrupt status

0: No capture or ongoing capture

1: All data of a frame have been captured

This bit is set when all data of a frame or window have been captured.

In case of a cropped window, this bit is set at the end of line of the last line in the crop. It is set even if the captured frame is empty (for example window cropped outside the frame).

This bit is cleared by writing 1 to the CFRAMEF bit in DCMIPP_P2FCR.

Bit 0 **LINEF:** Multi-line capture completed raw interrupt status
This bit is set when one/more lines have been completed.
The periodicity of LINEF event is configured bu LINEMULT bits into DCMIPP_P1PPCR register. When reaching end of frame, this event is triggered out to allow software action even if the LINEMULT value set is not a multiple of the total lines frame.
In the case of embedded synchronization, this bit is set only if the CAPTURE bit in the DCMIPP_CR register is set.
It is cleared by writing 1 to the CLINEF bit in the DCMIPP_P2FCR register.

42.14.144 DCMIPP Pipe2 interrupt clear register (DCMIPP_P2FCR)

Address offset: 0xDFC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	COVRF	Res.	Res.	Res.	Res.	CVSYNCF	CFRAMEF	CLINEF
								w					w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **COVRF:** Overrun interrupt status clear
Writing 1 into this bit clears the OVRF bit in the DCMIPP_P2SR register.

Bits 6:3 Reserved, must be kept at reset value.

Bit 2 **CVSYNCF:** Vertical synchronization interrupt status clear
Writing 1 into this bit clears the VSYNCF bit in the DCMIPP_P2SR register.

Bit 1 **CFRAMEF:** Frame capture complete interrupt status clear
Writing 1 into this bit clears the FRAMEF bit in the DCMIPP_P2SR register.

Bit 0 **CLINEF:** Multi-line capture complete interrupt status clear
Writing 1 into this bit clears LINEF in the DCMIPP_P2SR register.

42.14.145 DCMIPP Pipe2 current flow selection configuration register (DCMIPP_P2CFSCR)

Address offset: 0xE04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PIPEN	FDTFEN	FDTF[5:0]						Res.	Res.	Res.	VC[1:0]		Res.	Res.	Res.
r	r	r	r	r	r	r	r				r	r			
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DTIDA[5:0]					
										r	r	r	r	r	r

Bit 31 **PIPEN**: Current activation of PipeN

0: Pipe disabled

1: Pipe enabled, can start capturing with CPTMODE, CPTREQ, CPTACK.

Bit 30 **FDTFEN**: Current force data type format enable

0: Disable force data type format. The data type format used by the pipe is the one defined into DTIDx

1: Enable force data type format. When data type DTIDA is detected by the pipe, the real pixel format considering by the pipe is the one set into the FDTF[5:0] bit field instead of the physical one received by the CSI2 host.

This bit has no meaning if PIPEDIFF = 0 in the DCMIPP_P1FSCR register.

Bits 29:24 **FDTF[5:0]**: Current force data type format

Forcing the data type format. This data type overwrites the one received by the CSI2-HOST by specifying the pixel format to consider. The value must follow the CSI2 data type format definition in the CSI2 standard. This bit field has no meaning if the FDTFEN bit is cleared, or if PIPEDIFF = 0 in the DCMIPP_P1FSCR register.

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:19 **VC[1:0]**: Current flow selection mode

Virtual channel ID of the CSI flow to select for further processing on the pipe. These bits have no meaning if PIPEDIFF = 0 into DCMIPP_P1FSCR. For this configuration the pipe takes the value VC[1:0] configured in the DMCIPP_P1FSCR register.

Bits 18:6 Reserved, must be kept at reset value.

Bits 5:0 **DTIDA[5:0]**: Current data type ID

Data type ID of the CSI flow to select. For this configuration the pipe takes the value DTIDA[5:0] configured in the DMCIPP_P1FSCR register.

42.14.146 DCMIPP Pipe2 current pixel packer configuration register (DCMIPP_P2CPPCR)

Address offset: 0xFC0

Reset value: 0x0000 0000

LINEMULT[2:0]			Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWAP RB	FORMAT[3:0]			
r	r	r									r	r	r	r	r

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 Reserved, must be kept at reset value.

Bits 15:13 **LINEMULT[2:0]**: Amount of capture completed lines for LINE event and interrupt
0x0: Event after every line
0x1: Event after two lines
0x2: Event after four lines
0x3: Event after eight lines
0x4: Event after sixteen lines
0x5: Event after 32 lines
0x6: Event after 64 lines
0x7: Event after 128 lines

Bits 12:5 Reserved, must be kept at reset value.

Bit 4 **SWAPRB**: Swaps R-vs-B components if RGB, and if YUV, swaps U-vs-V components
0: No swap of R-vs-B (U-vs-V)
1: Swap active.

Bits 3:0 **FORMAT[3:0]**: Memory format (only coplanar formats are supported in Pipe2)
0x0: RG/B888 or YUV444 1-buffer
0x1: RGB565 1-buffer
0x2: ARGB8888
0x3: RGBA8888
0x4: monochrome Y8 or G8 1-buffer
0x5: YUV444 1-buffer (FOURCC = AYUV)
0x6: YUV422 1-buffer (FOURCC = YUYV)
Other formats are reserved and not supported.

42.14.147 DCMIPP Pipe2 current pixel packer Memory0 address register 1 (DCMIPP_P2CPPM0AR1)

Address offset: 0xFC4

Reset value: 0x0000 0000

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **STV**: Statistic version
- 0: Statistic extraction (with three accumulators) is implemented
- 1: Statistic and histogram extractions are implemented

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **TPG**: Test pattern generator
- 0: TPG is not implemented
- 1: TPG is implemented

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **MCU**: Macroblock unit as pixel format
- 0: MCU is not implemented
- 1: MCU is implemented

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **DEC2**: Decimation on Pipe2 before downsize
- 0: Decimation is not implemented
- 1: Decimation is implemented

Bit 16 **DEC1**: Decimation on Pipe1 before downsize
0: Decimation is not implemented
1: Decimation is implemented

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **ADDMOD**: Address modulo computation to access a small buffer in streaming featured
0: Address modulo is not implemented
1: Address modulo is implemented

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **PROCCLK**: Processing clock linked to AXI clock featured
0: Independent processing clock not connected to AXI
1: Processing clock is directly the AXI

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **DBMFT**: Double buffer mode featured

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **VPFT[2:0]**: Virtual pipe function

42.14.150 DCMIPP hardware configuration register 1 (DCMIPP_HWCFGR1)

43 CSI-2 Host (CSI)

43.1 CSI introduction

The camera serial interface 2 (CSI-2) is a part of a group of communication protocols defined by the MIPI® Alliance. The MIPI® CSI-2 Host controller is a digital core that implements all protocol functions defined in the MIPI® CSI-2 specification.

It provides an interface between the system and the MIPI® D-PHY, allowing communication with a CSI-2 compliant camera.

43.2 Standard and references

- MIPI Alliance Specification for Camera Serial Interface 2 (CSI-2) v1.3 - 29 May 2014
- MIPI Alliance Specification for D-PHY v1.2 - 01 August 2014

43.3 Glossary

Table 414. Glossary of terms

Term	Definition
D-PHY_RX	D-PHY physical layer receiver
EOF	End of frame
EOT	End of transmission
ESC	Escape mode for the D-PHY_RX
HS	High speed
ISB	Imaging system bus
LLP	Low-level protocol
LP	Low power
PHY	Physical layer
PPI	Phy protocol interface
RX	Receiver
SOF	Start of frame
SOT	Start of transmission

43.4 CSI-2 Host main features

- Compliant with MIPI Alliance standard (see *Section 43.2*)
- Interface with MIPI D-PHY (see *Section 43.2*)
- Up to two D-PHY data lanes supported (up to 2.5 Gbit/s per lane in high-speed (HS) mode and 10 Mbit/s in low-power (LP) mode)
- Data transmission in HS and LP modes supported by the D-PHY
- Escape mode (ESC) and ultra-low-power state mode (ULPS) supported
- CSI-2 lane management layer connected to the D-PHY_RX to merge 1 or 2 data lanes in a single 32-bit ISB-Byte bus
- ECC and error correction capabilities
- CRC check capability
- CSI-2 virtual channel and data type filtering supporting interleaved data
  - Up to 4 virtual channels
  - Support the data formats specified into the MIPI Alliance standard for CSI-2 v1.3 (18 data formats, plus the user defined ones)
- Up to 7 independent data types
- Programmable interrupts:
  - 4 timer interrupts mapped on a selected virtual channel with starting point from SOF (start of frame) or EOF (end of frame)
  - 4 line/byte counter interrupts mapped on a selected virtual channel to trigger an event
- ISB-Byte header generation for internal connection with the DCMIPP peripheral

43.5 CSI-2 Host functional description

43.5.1 General description

The MIPI CSI-2 Host controller offers a means to connect cameras to capture and dispatch a robust header with ECC correction and data payload with checksum.
A D-PHY_RX receiver fills out the role of interfacing the external serial camera devices with the embedded CSI-2 Host controller:

- D-PHY receiver:

  This is a D-PHY_RX receiver composed of two unidirectional data lanes, and one clock lane. It operates in slave mode with HS and LP mode capabilities. The D-PHY drives a PPI interface to communicate with the CSI-2 Host.
- CSI-2 lane merger:

  Up to two data lane inputs to increase data rate while avoiding high clock rates

  The lane manager function collects incoming bytes from N (N = 1 to 2) lanes.
  It consolidates them by merging operations into a complete packet provided to the CSI-2 low-level protocol decoder (LLP), to decompose the meaning of each data packet thanks to the CSI-2 protocol specification.
- CSI-2 clock changer:

  The clock changer moves the data transfer from an input clock domain from D-PHY_RX to a clock_proc domain before being processed by the LLP.

- CSI-2 low-level protocol decoder (LLP)

  The low-level protocol is a byte-orientated packet-based protocol that supports the transport of arbitrary data using short and long packet formats.

  It generates an ISB-byte header data for further processing, with data integrity check or miscellaneous integrity checks.

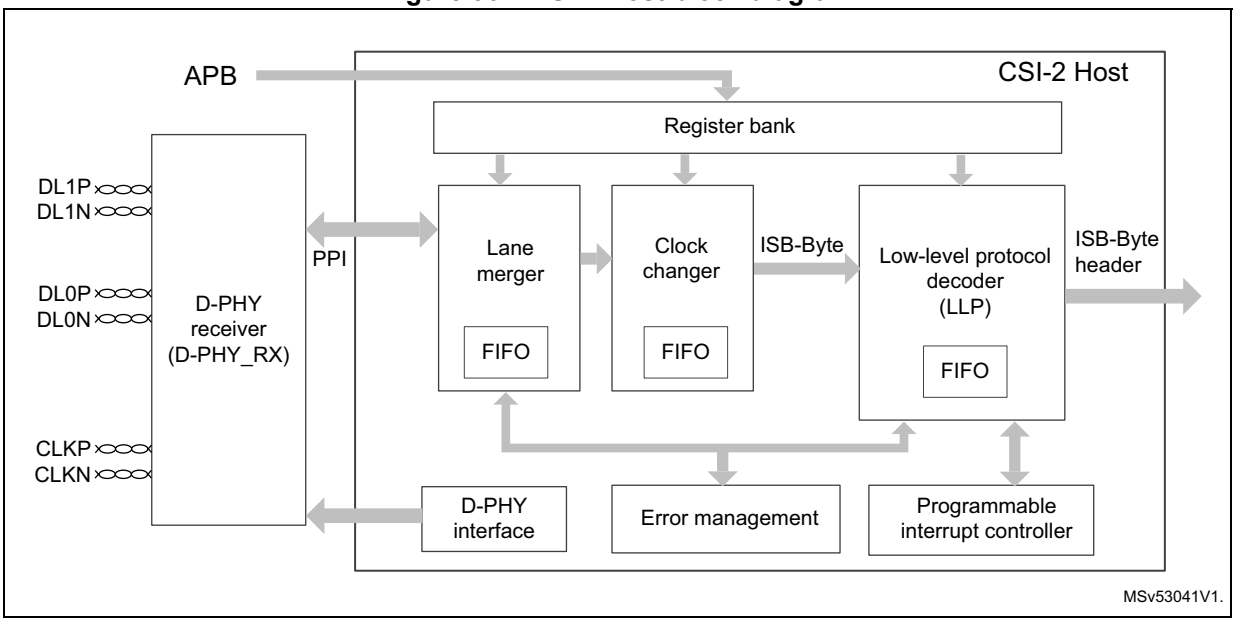
  It supports data interleaving through the support of up to four virtual channels and many data type formats.

  The LLP offers interrupt generation capability, depending on specific events such as line/byte detection within a frame, or a time-base event selected from a SOF or an EOF.

The CSI-2 Host-controller register bank is configured and accessed by the APB bus interface.

A block diagram of the CSI-2 Host is shown in the figure below.

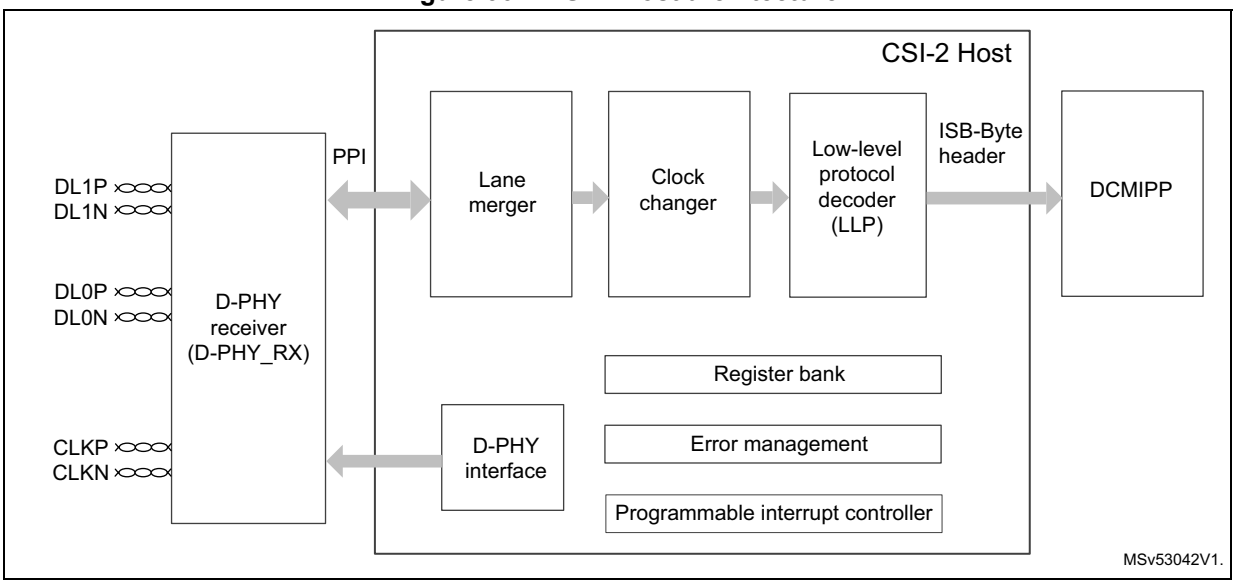
Figure 361. CSI-2 Host block diagram



43.5.2 System level architecture

The figure below shows the CSI-2 Host architecture.

Figure 362. CSI-2 Host architecture



The blocks shown have the following functions:

- D-PHY_RX is a slave receiver device that connects external serial cameras to the CSI-2 Host controller. It is based on unidirectional slave data lanes and clock lanes to handle data transmission from the CSI-2 protocol-based camera devices to subsystems for data processing (handled by the DCMIPP).
- The D-PHY interface manages D-PHY_RX register accesses. It also allows the block to be configured to raise interrupts on the detection of some errors during reception. It highlights the status of the physical lines up to the software layers.
- The lane merger module packs the data coming from the two D-PHY_RX data lanes, if required to do so for increased data rates. It generates a data flow based on an ISB-Byte protocol, which is not linked to any protocol at this point. The data is only identified as a control or a data packet for the clock changer module.
- The clock changer module manages data crossing from the D-PHY_RX clock domain to the clk_proc clock domain.
- The LLP handles data filtering to serve the data-interleaving capability of the DCMIPP. It can filter data from external devices depending on virtual channel identifiers, or on data-type format selection. It also executes, depending on the input pixel format, data reordering in order to optimize the data storage, for instance in memories.
- The CSI-2 Host manages also various errors coming (not exclusively) from the D-PHY_RX physical layer. It can detect error conditions in the received header or a short packet in a frame. ECC is implemented to correct one bit error in the header. A CRC checksum is also implemented to detect any data corruption during the data payload reception. The 16-bit CRC value is located into the packet footer.
  The CSI-2 Host also ensures that specific timings within the data reception are properly in line with the CSI-2 specification. All error conditions and associated interrupts are detailed in *Section 43.8*.

- A specific module generates interrupts following the detection of selected events in a frame. For a given virtual channel, these events may be triggers based on line- and byte-number detection within the frame, or counters from dedicated timers reaching a number of cycles (clk_proc) from an SOF or an EOF.
- Data is filtered out by the LLP, and sent to the DCMIPP in a format that is quite similar to the CSI-2 protocol, but without CRC (packet footer) and ECC information inside the packet header. The data type and the virtual channel are also sent to the DCMIPP to handle the interleaved transmission of different image data formats within the same video data stream.

43.5.3 CSI-2 Host reset and clocks

There are two reset sources:

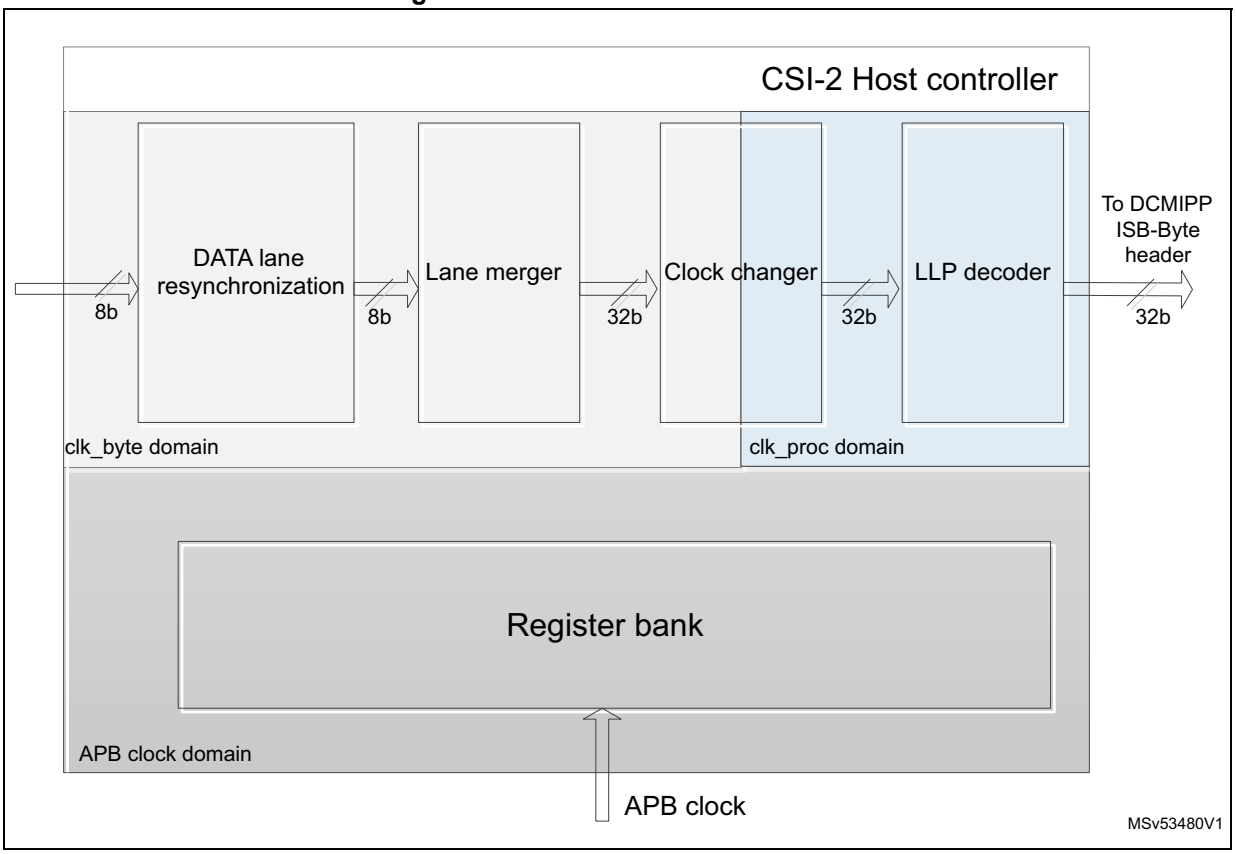
- hardware asynchronous reset which is resynchronized on clk_byte and clk_proc clock domain (processing clock) to reset the flops connected to these clock domains
- APB reset from the reset and clock controller unit to reset mainly all the registers

There are three clocks to serve the CSI-2 Host controller (see *Figure 363*):

- clk_byte: derived from the D-PHY_RX clock lane, and used by the lane merger module and the clock changer module
- clk_proc: used by the kernel of the LLP

  Resynchronization between the clk_byte domain and the clk_proc domain is handled by the clock changer module.
- PCLK clock: APB clock used to access to the register bank

Figure 363. CSI-2 Host clock domain



The D-PHY_RX supports up to 2.5 Gbit/s per data lane: the maximum frequency on the D-PHY_RX clock is 2.5 Gbits / 8 to output a byte = 312 MHz.

43.5.4 Lane merger

Applications requiring more bandwidth than the one provided by a single data lane may expand the data path to more lanes in order to increase the attainable data rate. The lane merger supports then up to two data lanes.

The lane merger module converts the D-PHY_RX PPI protocol into a byte-oriented bus to be sent to the LLP.

The lane merger parallelizes the bytes to 32 bits in parallel to build a 32-bit output as shown in the figures below. The cycle number does not account for module internal latency.

Figure 364. Lane merger input and output (one data lane)

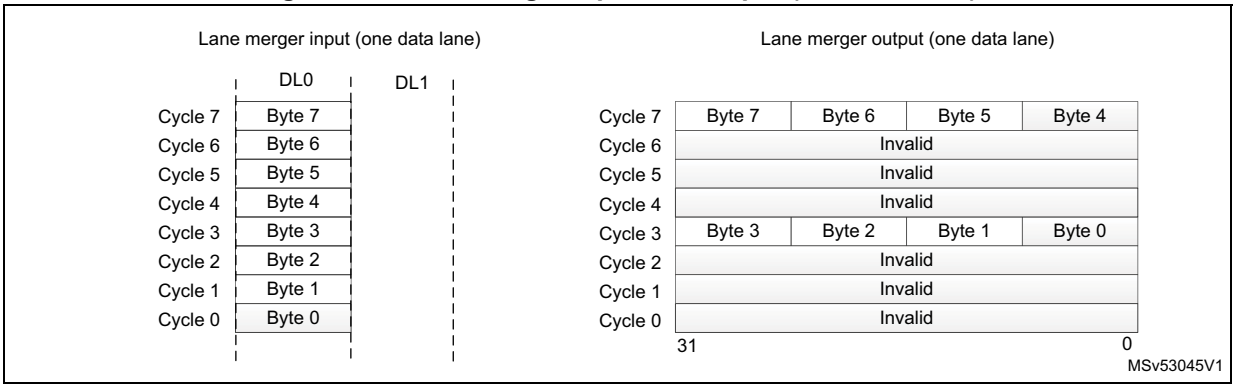


Figure 365. Lane merger input and output (two data lanes)

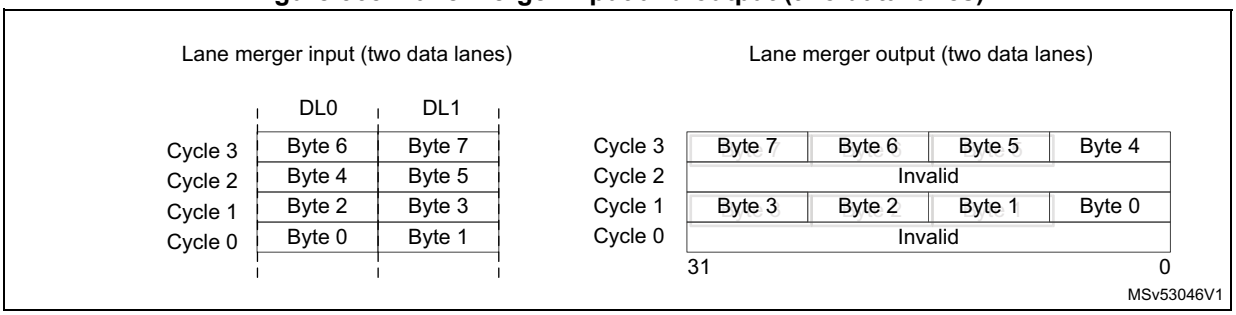
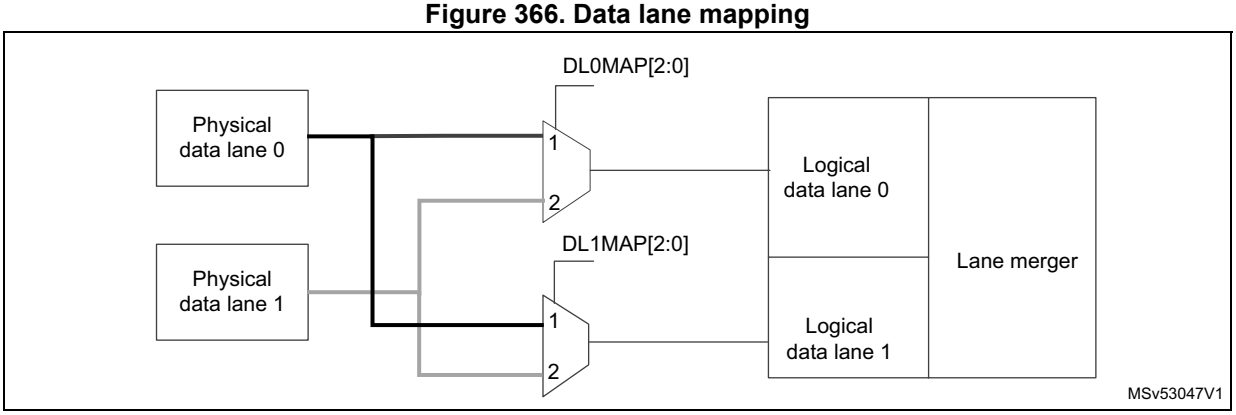


LANENB[2:0] in CSI_LMCFGR configures the number of data lanes used in the application. The software needs to map the physical data lanes input to the lane merger logical data lanes, using DL0MAP[2:0] and DL1MAP[2:0] as shown in the figure below.

Figure 366. Data lane mapping



43.5.5 Clock changer

The clock changer module changes the clock frequency from the input clock domain linked to the D-PHY_RX PPI protocol, to the output clock domain based on clk_proc clock domain (reference clock for the LLP).

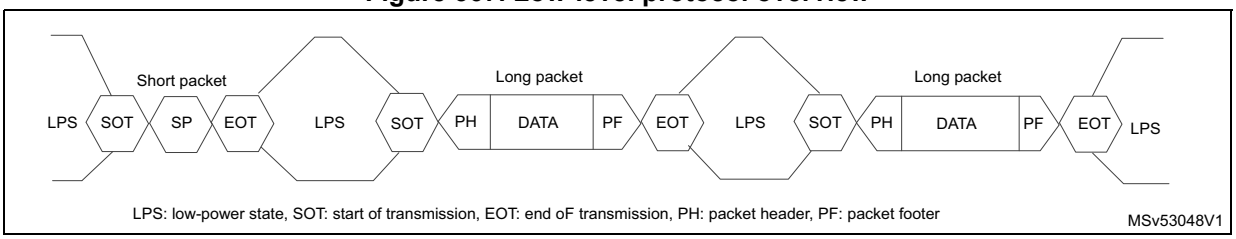
An integrated FIFO receives data from the input clock domain and realigns it to the output clock domain.

43.5.6 Low-level protocol (LLP)

The LPP module retrieves the raw data from the lane merger, and decodes the data flow respect to the CSI-2 low-level protocol. The software selects which data in the data interleaving flow need to be sent to the DCMIPP without being filtered out. The LLP is compliant with the MIPI CSI-2 specification as described in *Section 43.2*.

A data integrity check is done thanks to an ECC code for packet header error correction, and a 16-bit CRC checksum code for payload error detection. All these errors are flagged into specific registers, and may trig interruption for specific software action needs (see *Section 43.8* for more details).

Figure 367. Low-level protocol overview



The CSI-2 low-level protocol is mainly composed by short and long packets, each of them having a well identified role.

Long packet

The long packet format is presented in *Figure 368*. It contains a data ID that is composed of a virtual channel number for which the data packets are attached, and the corresponding data type. The LLP module filters data out by configuring CSI_VCxCFGRy registers (x = 0 to 3, y = 1 to 4), and VCxSTART/VCxSTOP bits in CSI_CR register.

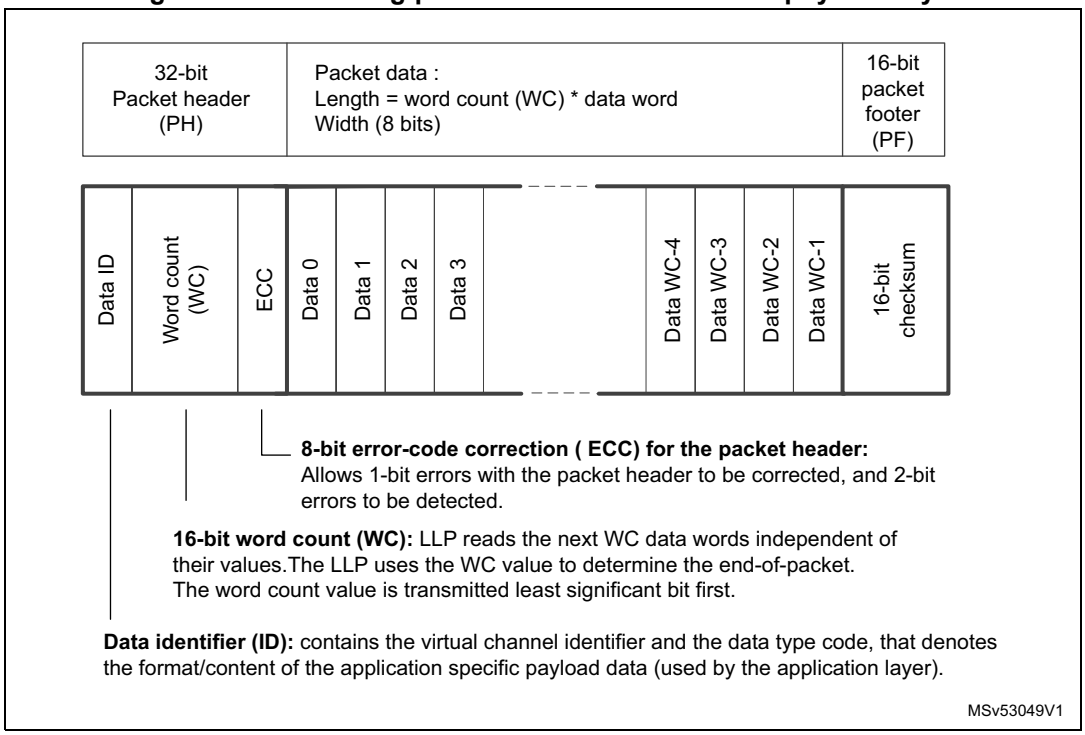
The word-count field allows the LLP to determine the data-payload width before detecting the packet footer and the EOT. This information is used to detect shorter-than-expected packets, and to trigger a corresponding error (refer to *Section 43.8*).

The ECC corrects a single erroneous bit in the packet header in the case of data corruption. An error is raised if there are two errors in total (the LLP decoder immediately stops the current frame), because only one bit can be corrected.

The packet data corresponds to the data payload for a given virtual channel and for an identified data type.

To complete the long-packet reception block, a packet footer that contains a 16-bit CRC checksum is received and compared to that which is internally calculated by the LLP, to check the data integrity of the received data payload.

Figure 368. CSI2- long-packet structure for a D-PHY physical layer

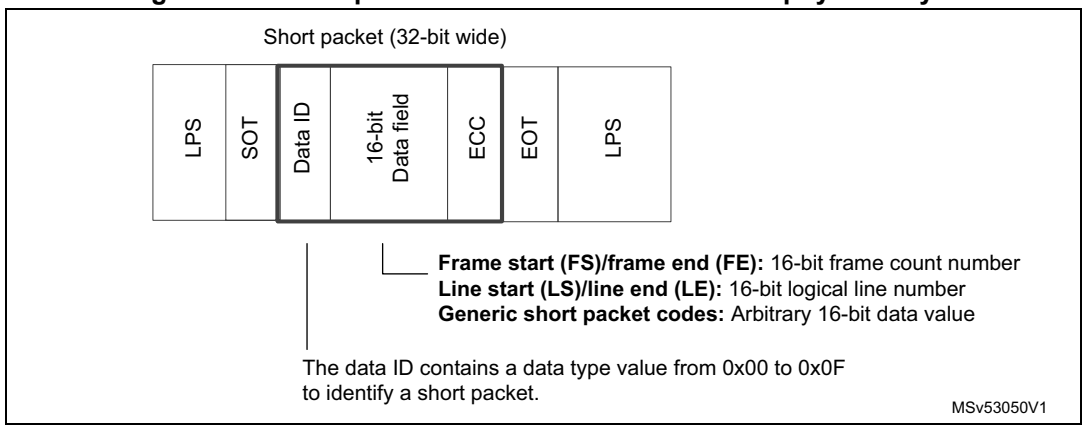


Short packet

The CSI-2 short-packet format for a D-PHY physical layer is shown in *Figure 369*.

It is similar to the long packet header, except that the word count field is replaced by a 16-bit data field. The ECC 8-bit code is present to secure headers having potential bit corruption.

Figure 369. Short-packet structure based on D-PHY physical layer

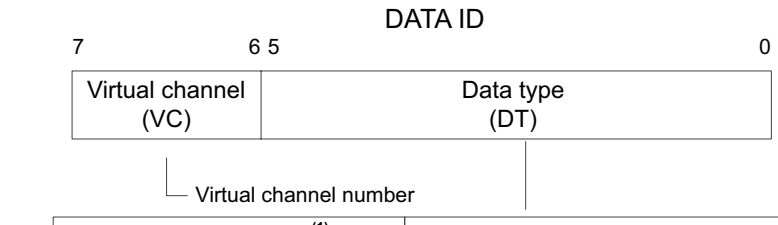


Data ID field

The 8-bit data ID field comprises 2 bits for the virtual channel number coding, and 6 bits to identify the packet data type (short or long packet), and the payload data packet format in the case of long packet reception.

The LLP filters subsequent packets depending on the user configuration indicated in the previously received data ID field (see *Figure 370*).

Figure 370. DATA ID structure in short or long packet format



Data type classes (1)	Description
0x00 to 0x07	Synchronization short packet data types
0x08 to 0x0F	Generic short packet data types
0x10 to 0x17	Generic long packet data types
0x18 to 0x1F	YUV data
0x20 to 0x27	RGB data
0x28 to 0x2F	RAW data
0x30 to 0x37	User defined byte-based data
0x38 to 0x3F	Reserved

(1) Refer to the MIPI Alliance specification for the CSI-2 to have the detail of each intermediate value not described in this table.

MSv53051V1

Data type field

The data type (DT) fields are configured by the application code to determine which data types are processed by the LLP for a given virtual channel. CSI_VCxCFGRy registers are used to configure the data types to be considered by the LLP.

Each virtual channel is managed independently, and up to seven different virtual-channel data types can be declared in parallel. All data type input to the LLP that are not defined for a given virtual channel are filtered out by the LLP module and discarded.

Data types in the video data flow are located:

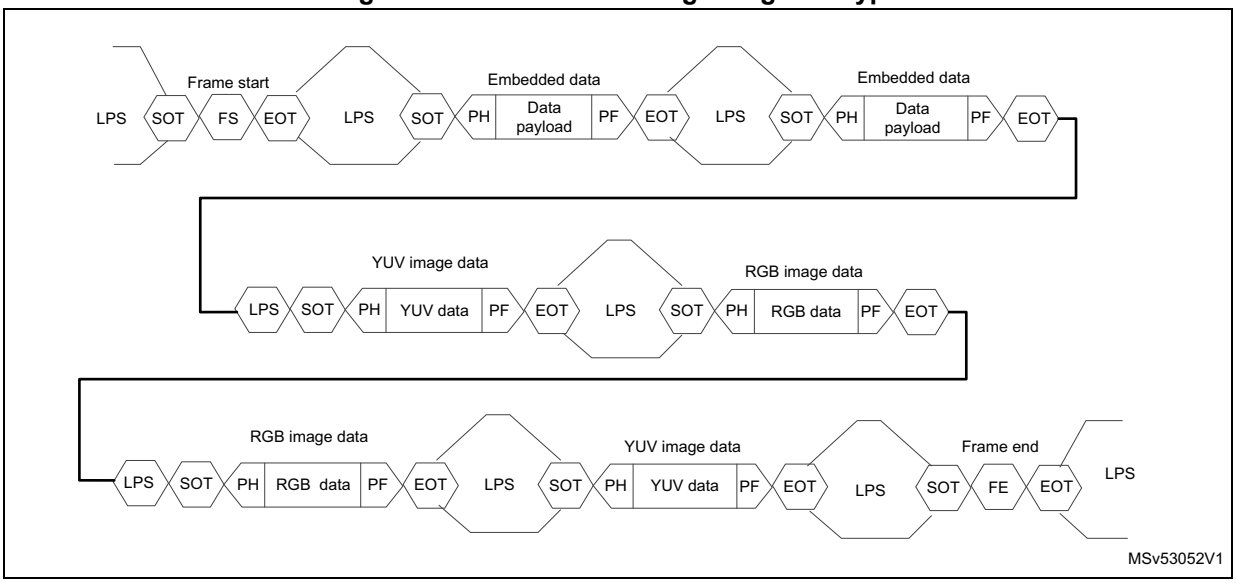
- in the data ID packet for a short packet
- in the packet header (PH) for a long packet format

Data interleaving: data-type based

In the video data flow, the transmitter can merge, on the same physical node, multi-device data transmissions having different data types. The LLP filters out these multi-device flows depending on the application configuration. A typical video data flow interleaving multiple data types is shown in *Figure 371*.

The application software must configure CSI_VCxCFGRy registers to enable data types for a virtual channel, and to set data-type formats to be processed. The LLP reorders the input data in a format that optimizes memory usage (see *Figure 371* to *Figure 379*).

Figure 371. Data interleaving using data type



Data interleaving: virtual channels

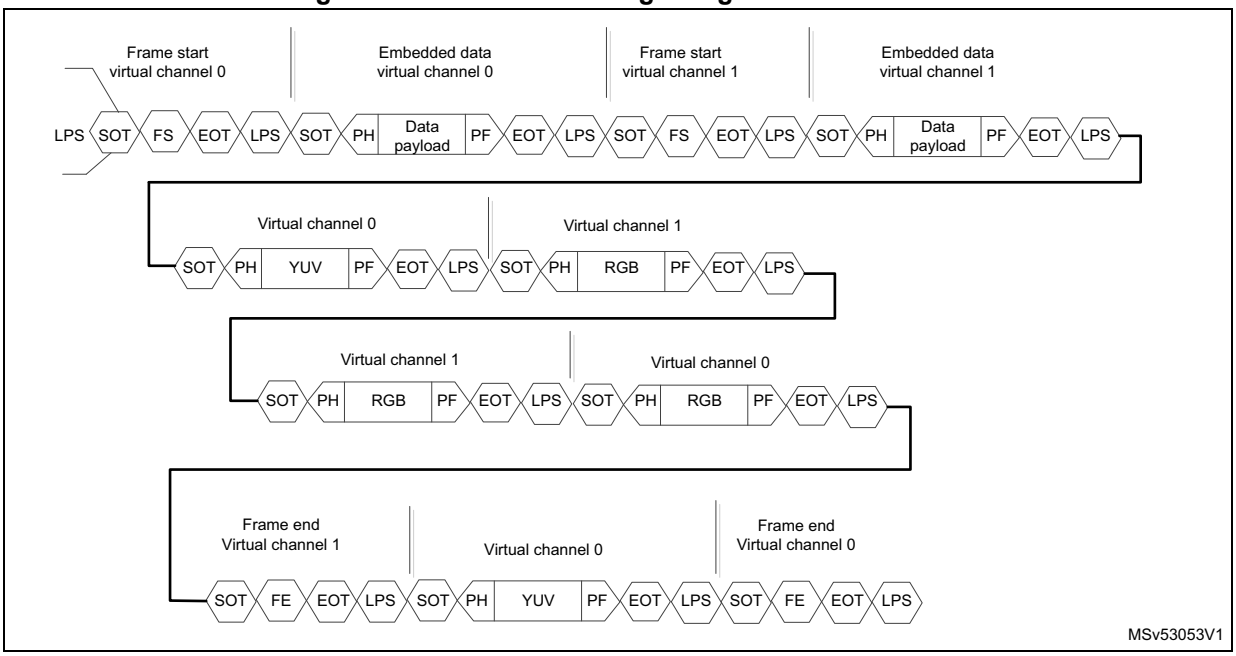
The data interleaving in the video data flow can also be managed by the virtual channel ID. Each external device can have a specific virtual channel identifier in order for the software layer or the DCMIPP to properly handle data packets belonging to a device.

The application code defines which of the virtual channels have to be considered by the LPP without any filtering operation. The CSI_CR register must be configured accordingly by activating the virtual channel (via VCxSTART), or by setting VCxSTOP to deactivate the virtual channel.

The virtual channel number is encapsulated in the data ID packet in short or long packet.

A typical data interleaving case is illustrated in *Figure 372*.

Figure 372. Data interleaving using virtual channels



Data formats

The LLP, in addition to a data-flow filter role, handles data reordering for memory optimization, storage, or post-processing purposes.

The CSI-2 Host controller is compliant with the MIPI Alliance CSI-2 specification. It mainly supports the following data formats:

- BPP6 (for example RAW6, RGB666)
- BPP7 (for example RAW7)
- BPP8 (for example RAW8, YUV 8-bits, RGB444, RGB555, RGB565, RGB888, JPEG)
- BPP10 (for example RAW10, YUV 10-bits)
- BPP12 (for example RAW12)
- BPP14 (for example RAW14)
- BPP16 (for example RAW16)

Figure 373. RAW6 (BPP6) input and output format

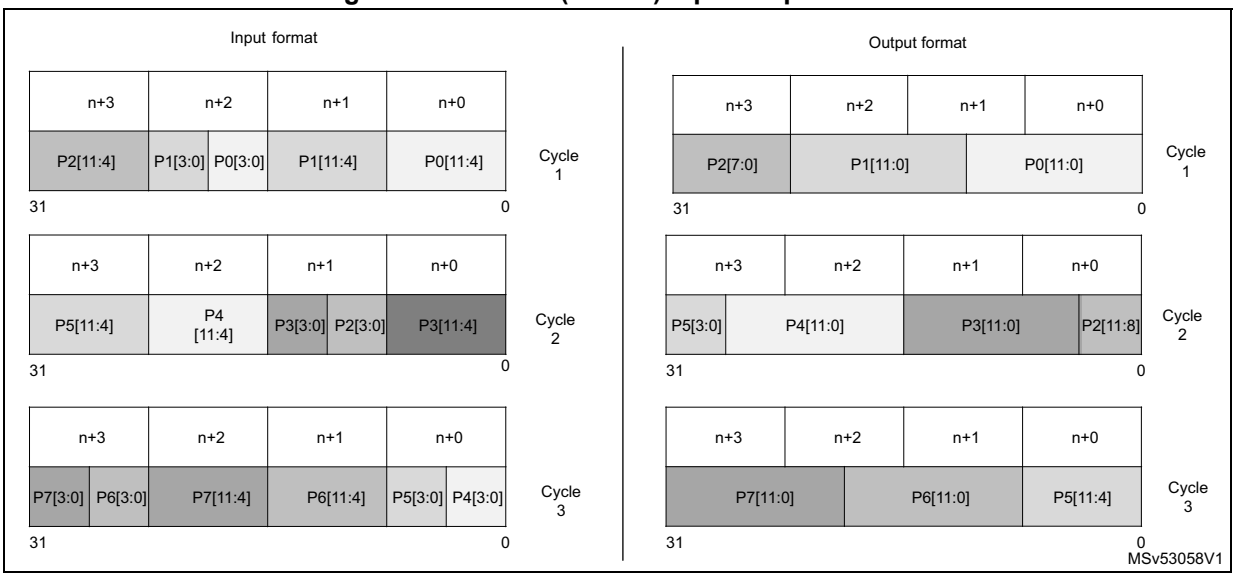

Figure 378. Raw14 (BPP14) input format

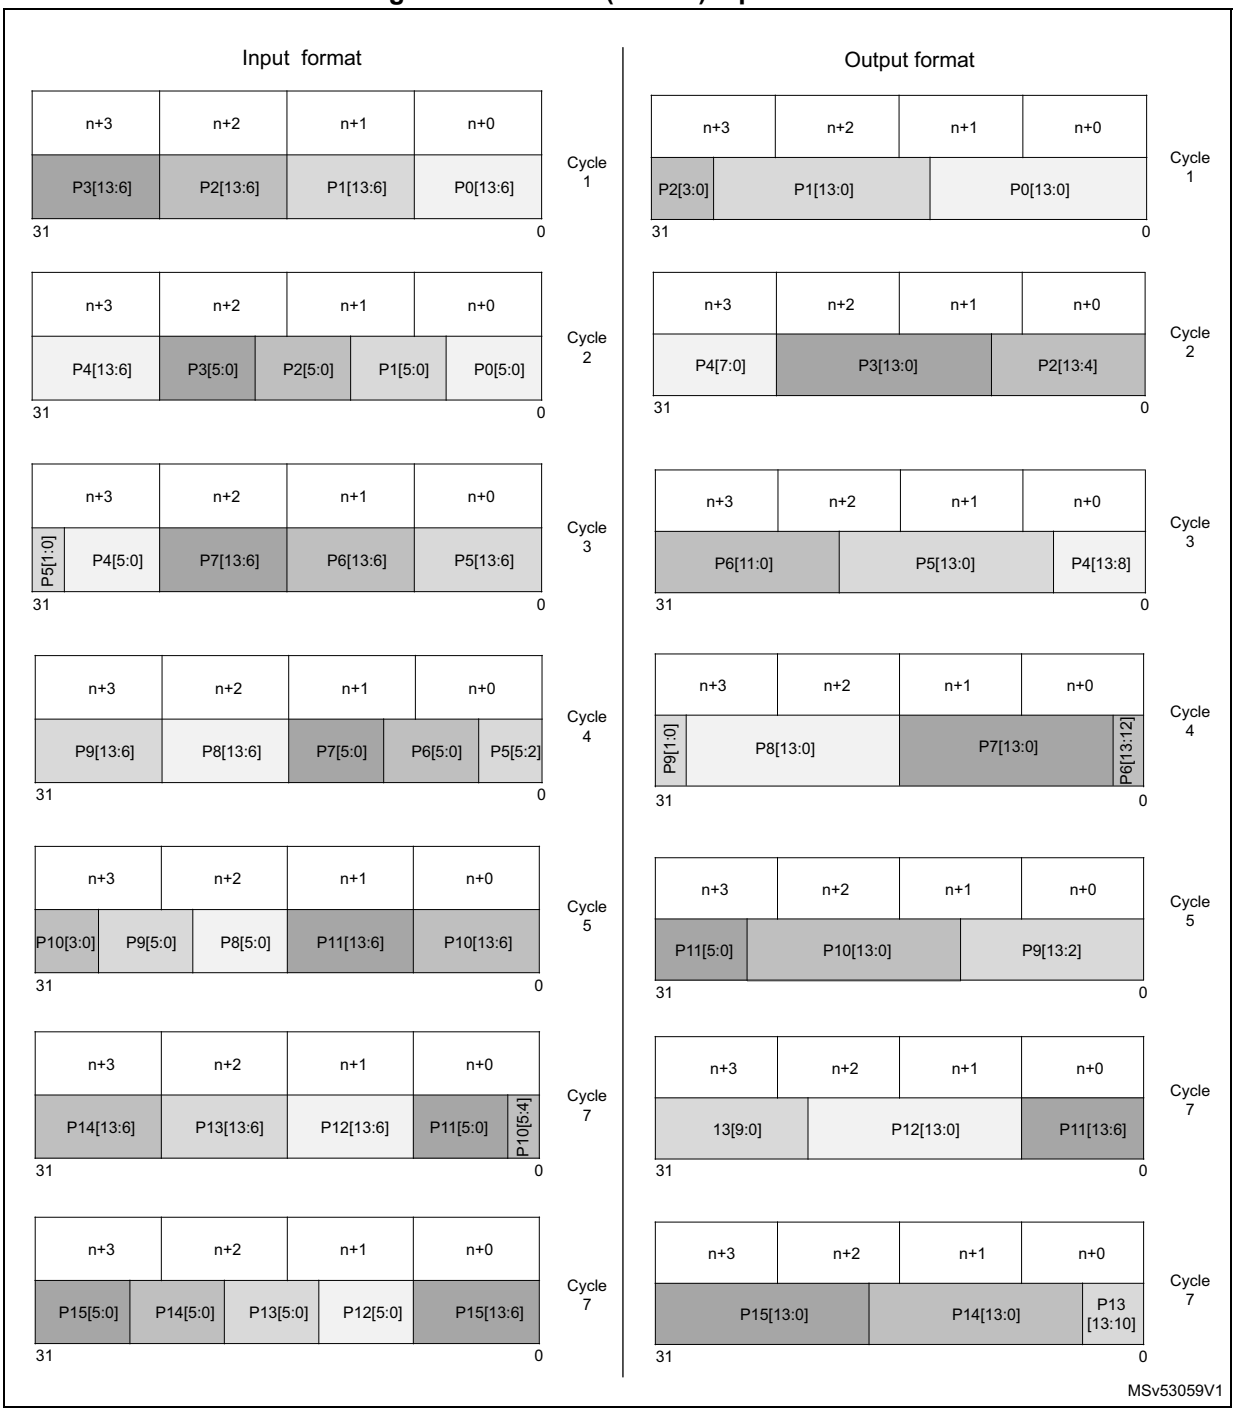

Figure 379. Raw16 (BPP16) input/output format

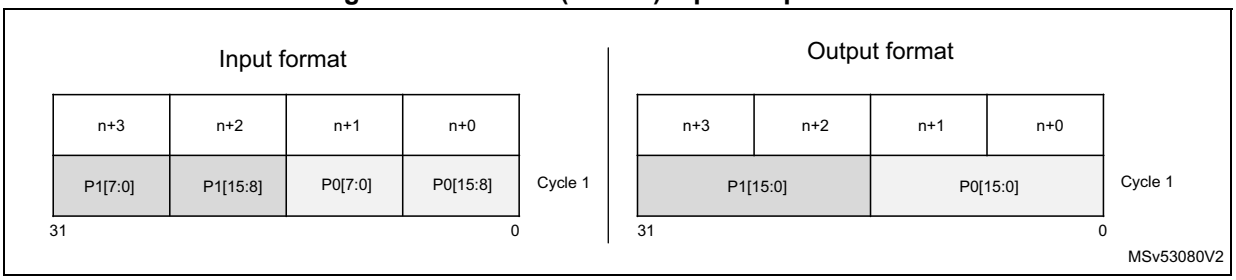

43.5.7 CSI-2 Host protocol output

The CSI-2 Host controller generates ISB-Byte header data according to CSI_VCxCFGRy. The ISB-Byte header generation respects the following rules:

- ISB-Byte header channel number is identical to the CSI-2 virtual channel and data type (LSB aligned).
- ISB-Byte header data type is identical to CSI-2 data type (LSB aligned).
- ISB-Byte header frame number is identical to the CSI-2 frame number.
- ISB-Byte header count is identical to CSI-2 word count.
- The format is updated according to CSI_VCxCFGRy configuration.

The only differences between the ISB-Byte data flow in input to the LLP and the ISB-Byte header bus at the output are listed below:

- There is no ECC information in the data corresponding to the short packet information.
- The packet footer (containing the CRC-16 value) is not transmitted, or forwarded on the output since the decoder already checked it from the input, and raised an error if the data payload is corrupted.
- The data payload output format is reordered and compared to the input data format of the LLP in order to ease pixels storage in memory for further hardware/software post-processing.
- Only identified virtual channels and their selected data types are generated on the output.

The ISB-Byte header is used by the DCMIPP peripheral to handle post-processing data from the external devices.

43.6 CSI-2 Host programming guide

43.6.1 CSI-2 PHY setup

The following actions are required to setup the CSI-2 PHY:

1. Quit the hardware reset state with PEN = 0x01 in CSI_PRCR.
2. Configure frequency settings with:
   – DLD = 0x00 in CSI_PFCR (to remain in Rx)
   – HSFR in CSI_PFCR that depends on the bit-rate expected on the data lanes
   – CCFR = RoundUp((F - 17) × 4) in CSI_PFCR (F = configuration clock frequency)
3. Configure internal registers via the test interface, with TRSEN = TCKEN = 0x0 in CSI_PTCR0.

43.6.2 CSI-2 Host controller setup and data reception start

The D-PHY RX software initialization is required to set up the CSI-2 Host controller.

Lane-merger configuration (static configuration)

The lane merger must be configured while CSIEN = 0 in CSI_CR, and when the D-PHY_RX is not streaming (when it is not providing a clock).

To map the physical data lane to the logical data lane, the lane merger needs to be configured through DL0MAP and DL1MAP in CSI_LMCFGR. In addition, the number of valid data lanes must be configured through LANENB in the same register.

LLP configuration

1. Configure the watchdog value in CSI_WDR. This corresponds to the maximum number of clock cycles between two packets before an input frame is considered erroneous and the transmission failed. It can be left at 0x0 to disable the watchdog feature.
2. Enable the CSI-2 Host controller with CSIEN = 1 in CSI_CR.
3. Configure the selected virtual channels in CSI_VCxCFGRy.

   If all data types must be captured with the same format, in CSI_VCxCFGR1:
   - Set ALLDT = 0x011.
   - Select the format with CDTFT[4:0].

   If only a few data types are to be captured, or if the format is not identical for all data types, then up to seven data types can be selected:
   - Set ALLDT = 0x0 in CSI_VCxCFGR1.
   - Set DTyEN = 0x1 (y = 0 to 6) in CSI_VCxCFGR1 for the data types used.
   - Set DTy[5:0] in CSI_VCxCFGRy to the selected data type.
   - Set DTyFT[4:0] in CSI_VCxCFGRy to the selected format.
4. Depending on application requirements, specific software actions may detect particular events in a frame, and trigger a corresponding interrupt, with the following:
   - Set LINECNT[15:0] and BYTECNT[15:0] in CSI_LBxCFGR to trigger an event when the data corresponding to a specific byte within a specific line is detected by the LLP. Up to four independent triggers can be programmed and linked to a selected virtual channel through LBxVC[1:0] in CSI_PRGITR. The selected trigger can be enabled by setting LBxEN in the same register.
   - Set COUNT[24:0] in CSI_TIMxCFGR to trigger an event after a specified number of clock cycles (clk_proc) from an SOF or an EO, depending on TIMxEOF and TIMxEN in CSI_PRGITR. Up to four independent timer triggers can be programmed and linked to a selected virtual channel through TIMxVC[1:0] in CSI_PRGITR.
5. Enable interrupt sources for which the code needs to make specific actions, by configuring CSI_IER0 and CSI_IER1 registers.
6. D-PHY_RX lanes can be enabled by setting DL0EN and/or DL1EN, and CLEN in CSI_PCR.
7. Start the virtual channel by setting VCxSTART = 0x1 in CSI_CR.

43.6.3 Data reception stop

To stop data reception, set VCxSTOP = 1 in CSI_CR. The data reception stops at the end of the current frame. The virtual channel status can be retrieved from VCxSTATEF in CSI_SR0.

Note: A virtual channel cannot start before it has been completely stopped (VCxSTATEF = 0 in CSI_SR0).

43.7 CSI-2 Host low-power modes

Table 415. Effect of low-power modes on CSI-2 Host controller

Mode	Description
Sleep	No effect. The CSI-2 host interrupts cause the device to exit the Sleep mode.
Stop	The CSI-2 host is in power-down, and must be reinitialized after exiting Stop mode.
Standby	The CSI-2 host is in power-down, and must be reinitialized after exiting Standby mode.

43.8 CSI-2 Host interrupts and errors

Few events can generate an error flag or an interrupt from the CSI-2 Host controller interrupt handler.

The table below defines the error sources flagged by the CSI-2 HOST controller.
The content of CSI_ERR1 and CSI_ERR2 registers can be used to know exactly from which virtual number and data types a particular error appeared and has been detected. It can be used as debug purpose too.

Table 416. List of errors detected by the CSI-2 Host controller

Error description	Bit name	Register
Virtual channel number on which a data ID information error is detected	IDVCERR[1:0]	CSI_ERR1
Data type for which a data ID information error is detected	IDDTERR[5:0]	
Virtual channel number for which the ECC has corrected one bit in error	CECCVCERR[1:0]	
Data type for which the ECC has corrected one bit in error	CECCDTERR[5:0]	
Virtual channel number for which a CRC error is detected	CRCVCERR[1:0]	
Data type for which a CRC error is detected	CRCDTERR[5:0]	
Virtual channel number on which the invalid synchronization has been detected	SYNCVCERR[1:0]	CSI_ERR2
Virtual channel number on which a watchdog error has been detected	WDVCERR[1:0]	
Virtual channel number on which a shorter packet than expected has been detected	SPKTVCERR[1:0]	
Data type for which the shorter packet than expected error has been detected	SPKTDTERR[5:0]	

The table below shows the interrupt sources that are triggered by the CSI-2 Host controller if the corresponding bit is enabled.

Table 417. List of events that trigger an interrupt

Interrupt flag	Register	Interrupt sources
SYNCERRF	CSI_SR0	Synchronization error. The interrupt is enabled if SYNCERRIE is set in CSI_IER0(1).
WDERRF		Watchdog error. The interrupt is enabled if WDERRIE is set in CSI_IER0(1).
SPKTERRF		Shorter packet than expected error. The interrupt is enabled if SPKTERRIE is set in CSI_IER0 register(1).
IDERRF		Data ID information error. The interrupt is enabled if IDERRIE is set in CSI_IER0(1).
CECCERRF		Corrected ECC error. The interrupt is enabled if CECCERRIE is set in CSI_IER0(1).
ECCERRF		ECC error. The interrupt is enabled if ECCERRIE is set in CSI_IER0(1).
CRCERRF		CRC error. The interrupt is enabled if CRCERRIE is set in CSI_IER0(1).
CCFIFOFF		Clock changer FIFO full event. The interrupt is enabled if CCFIFOFFIE is set in CSI_IER0(2).
SPKTF		Short packet detection. The interrupt is enabled if SPKTIE is set in CSI_IER0(2).
EOF3F		EOF on virtual channel 3. The interrupt is enabled if EOF3IE is set in CSI_IER0(2).
EOF2F		EOF on virtual channel 2. The interrupt is enabled if EOF2IE is set in CSI_IER0(2).
EOF1F		EOF on virtual channel 1. The interrupt is enabled if EOF1IE is set in CSI_IER0(2).
EOF0F		EOF on virtual channel 0. The interrupt is enabled if EOF0IE is set in CSI_IER0(2).
SOF3F		SOF on virtual channel 3. The interrupt is enabled if SOF3IE is set in CSI_IER0(2).
SOF2F		SOF on virtual channel 2. The interrupt is enabled if SOF2IE is set in CSI_IER0(2).
SOF1F		SOF on virtual channel 1. The interrupt is enabled if SOF1IE is set in CSI_IER0(2).
SOF0F		SOF on virtual channel 0. The interrupt is enabled if SOF0IE is set in CSI_IER0(2).
TIM3F		Timer 3 counter value reached. The interrupt is enabled if TIM3IE is set in CSI_IER0(2).
TIM2F		Timer 2 counter value reached. The interrupt is enabled if TIM2IE is set in CSI_IER0(2).
TIM1F		Timer 1 counter value reached. The interrupt is enabled if TIM1IE is set in CSI_IER0(2).
TIM0F		Timer 0 counter value reached. The interrupt is enabled if TIM0IE is set in CSI_IER0(2).
LB3F		Line/byte event 3 reached. The interrupt is enabled if LB3IE is set in CSI_IER0(2).
LB2F		Line/byte event 2 reached. The interrupt is enabled if LB2IE is set in CSI_IER0(2).
LB1F		Line/byte event 1 reached. The interrupt is enabled if LB1IE is set in CSI_IER0(2).
LB0F		Line/byte event 0 reached. The interrupt is enabled if LB0IE is set in CSI_IER0(2).

Table 417. List of events that trigger an interrupt (continued)

Interrupt flag	Register	Interrupt sources
ECTRLDL1F	CSI_SR1	Error control on data line 1. The interrupt is enabled if ECTRLDL1IE is set in CSI_IER1.
ESYNCESCDL1F		Low-power data transmission synchronization error on data line 1. The interrupt is enabled if ESYNCESCDL1IE is set in CSI_IER1.
EESCDL1F		Escape entry error on data line 1. The interrupt is enabled if EESCDL1IE is set in CSI_IER1.
ESOTSYNCDL1F		SOT synchronization error on data line 1. The interrupt is enabled if ESOTSYNCDL1IE is set inCSI_IER1.
ESOTDL1F		SOT error on data line 1. The interrupt is enabled if the bit ESOTDL1IE is set into CSI_IER1.
ECTRLDL0F		Error control on data line 0. The interrupt is enabled if the bit ECTRLDL0IE is set into CSI_IER1.
ESYNCESCDL0F		Low-power data transmission synchronization error on data line 0. The interrupt is enabled if the bit ESYNCESCDL0IE is set into CSI_IER1.
EESCDL0F		Escape entry error on data line 0. The interrupt is enabled if EESCDL0IE is set in CSI_IER1.
ESOTSYNCDL0F		SOT synchronization error on data line 0. The interrupt is enabled if ESOTSYNCDL0IE is set in CSI_IER1.
ESOTDL0F		SOT error on data line 0. The interrupt is enabled if ESOTDL0IE is set in CSI_IER1.

1. Refer to *Section 43.8.1: Error handling*.
2. Refer to *Section 43.8.2: Interrupt handling*.

43.8.1 Error handling

Details of the errors are given in CSI_ERR1 and CSI_ERR2.

Note: Except for data ID information, all other errors can occur during the product life, and must be handled by the software.

Corrected ECC error

When this error is detected, the CECCERR interrupt is triggered if CECCERRIE = 1 in CSI_IER0. This is an information event rather than a real error, as the CSI-2 Host controller successfully recovered the ECC error, so the frame is processed properly. Some details of the error are located in CECCVCERR and CECCDTERR in CSI_ERR1:

ECC error

When a multi-bit ECC error is detected, the ECCERR interrupt is triggered if ECCERRIE = 1 in CSI_IER0. As all virtual channels are potentially corrupted, the LPP immediately stops the current frames.

The CSI-2 Host controller restarts each enabled virtual channel on the next SOF packet of each channel. The software must perform the necessary error management (such as resetting some peripherals after this error detection). No details are available for the error as the relevant information is corrupted.

CRC error

When a CRC error is detected, the CRCERR interrupt is triggered if CRCERRIE = 1 in CSI_IER0. As the frame envelope is not corrupted, the CSI-2 Host controller does not stop the frame processing. The software must perform the necessary error management (such as reseting some peripherals, possibly including the CSI-2 Host controller). Details are available for this error in CRCVCERR and CRCDTERR in CSI_ERR1.

Data ID information

When a reserved data type is detected, the IDERR interrupt is triggered if IDERRIE = 1 in CSI_IER0. This is an information event rather than a real error, as the hardware processes this packet as for any non-erroneous packet.Details for the error are available in IDVCERR and IDDTERR in CSI_ERR1.

Invalid synchronization

When an invalid synchronization is detected, the SYNCERR interrupt is triggered if SYNCERRIE = 1 in CSI_IER0. An invalid synchronization is either an SOF short packet during a frame, or an EOF short packet during an inter-frame. It is an information event rather than a real error, as the hardware is able to handle such an error:

- An SOF short packet during a frame is interpreted as back-to-back EOF and SOF. It behaves accordingly (ISB-Byte header EOF, ISB-Byte header SOF, and so on). The SOFx interrupt is generated in addition to the SYNCERR one if SOFxIE = 1 in CSI_IER0.
- An EOF short packet during an inter-frame is ignored (no EOFx interrupt is generated whatever the state of EOFx in CSI_IER0). Details for the error are available in SYNCVCERR in CSI_ERR2.

Shorter than expected packet

When a shorter-than-expected packet is received, the SPKTERR interrupt is triggered if SPKTERRIE = 1 in CSI_IER0. The packet is padded up to its theoretical size, and the frame is processed as if no error occurred. The software must perform the necessary error management (such as reseting some peripherals, possibly including the CSI decoder). Details for the error are available in SPKTVCERR and SPKTDTERR in CSI_ERR2.

Watchdog

When the time between two packets of a given virtual channel is longer than the programmed watchdog (CNT[31:0] in CSI_WDR), the WDERR interrupt is triggered if WDERRIE = 1 in CSI_WDR. As the corresponding virtual channel stream is corrupted, the CSI2 Host controller immediately stops processing this virtual channel. The software must perform the necessary error management (such as reseting some peripherals after this error detection), before restarting the CSI-2 Host. Details for the error are available in WDVCERR in CSI_ERR2.

43.8.2 Interrupt handling

The CSI-2 Host controller offers many interrupt sources that can be activated if the associated enable bit is set. Some interrupt sources are linked to an error detection from the D-PHY physical layer or the CSI-2 Host controller (refer to *Section 43.8.1*).

Short packet interrupt

This interrupt notifies the software that a generic short packet has been received. The software can retrieve the associated data in CSI_SPDFR. This register value is overwritten with each new generic short packet.

SOF and EOF interrupts

The CSI-2 Host controller generates an SOF interrupt for each SOF short packet received. It also generates an EOF interrupt for each EOF short packet, independently for all four virtual channels. These interrupts are generated even if the virtual channel is disabled. The software must mask or ignore these interrupts if they are not needed.

Line/byte programmable interrupts

The CSI-2 Host controller provides four interrupts that can be programmed to be triggered at any point during the active data of a frame. In order to set a programmable line/byte interrupt, the software must follow these steps:

1. Select a virtual channel by setting LBxVC[1:0] in CSI_PRGITR.
2. Select the frame location at which the interrupt is triggered by setting LINECNT and BYTECNT in CSI_LBxCFGRy.
3. Enable the line/byte counting by setting LBxEN in the CSI_PGRITR register. This bit must be set only when the CSI-2 is enabled.
4. Enable the interrupt by setting LBxIE in CSI_IER0.
5. The interrupt is generated starting from the next frame on the selected virtual channel.

In order to stop a programmable interrupt, the software must reset the LBxIE bit in the CSI_IER0 register. It immediately stops the interrupt.

Note: All four line/byte programmable interrupts are independent.

Timer-based programmable interrupts

The CSI-2 Host controller provides four interrupts that can be programmed to be triggered based on a timer. In order to set a programmable timer based interrupt, the software must select a virtual channel by setting TIMxVC[1:0] in CSI_PRGITR. The following steps must be followed, while the CSI-2 is disabled:

1. Select the starting event of the timer with TIMxEOF in CSI_PRGITR.
2. Select the timer duration by setting COUNT[24:0] in CSI_TIMxCFGR.
3. Select and enable counting by setting TIMxEN in CSI_PRGITR.
4. Enable the interrupt by setting TIMxIE in CSI_IER0.
5. The interrupt is generated starting from the next frame on the selected virtual channel.

In order to stop a programmable interrupt, the software must reset the TIMxIE bit in the CSI_IER0 register. It immediately stops the interrupt.

Note: All four timer-based programmable interrupts are independent.

If the timer is set to a value longer than the frame period, the interrupt may not be generated for all frames.

Clock-changer FIFO full interrupt

The clock changer is also built around a FIFO which is never full in normal conditions. If the overall system works very slowly (for example due to the CSI-2 and DCMIPP processing clock frequency being set to an inadequate frequency, system-bus bandwidth availability, and so on), the clock-changer FIFO may become full. In this case, an interrupt is set if CCFIFOFIE = 1 in CSI_IER0.

43.9 CSI-2 Host registers

43.9.1 CSI-2 Host control register (CSI_CR)

Address offset: 0x00

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

VC3 STOP	VC3 START	Res.	Res.	VC2 STOP	VC2 START	Res.	Res.	VC1 STOP	VC1 START	Res.	Res.	VC0 STOP	VC0 START	Res.	CSIEN
w	w			w	w			w	w			w	w		rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **VC3STOP**: Virtual channel 3 stop

The CSI-2 decoder stops the virtual channel 3.

0: No effect

1: Pulse generation to stop the virtual channel 3 processing

Note: The CSI-2 decoder stops processing the virtual channel 3 after the next EOF event (or immediately if the Stop command is issued during frame blanking).

A write operation into this bit must not be simultaneous with a write into VC3START.

Reading this bit returns 0.

Bit 14 **VC3START**: Virtual channel 3 start

The CSI-2 decoder processes the virtual channel 3 according to CSI_VC3CFGRx (x = 0..3).

0: No effect

1: Pulse generation to start the virtual channel 3 processing

Note: The CSI-2 decoder starts processing the virtual channel 3 after the next SOF event.

A write operation into this bit must not be simultaneous with a write into VC3STOP.

Reading this bit returns 0.

Bits 13:12 Reserved, must be kept at reset value.

Bit 11 **VC2STOP**: Virtual channel 2 stop
The CSI-2 decoder stops the virtual channel 2.
0: No effect
1: Pulse generation to stop the virtual channel 2 processing
Note: The CSI-2 decoder stops processing the virtual channel 2 after the next EOF event (or immediately if the Stop command is issued during frame blanking).
A write operation into this bit must not be simultaneous with a write into VC2START.
Reading this bit returns 0.

Bit 10 **VC2START**: Virtual channel 2 start
The CSI-2 decoder processes the virtual channel 2 according to CSI_VC2CFGRx (x = 0..3).
0: No effect
1: Pulse generation to start the virtual channel 2 processing
Note: The CSI-2 decoder starts processing the virtual channel 2 after the next SOF event.
A write operation into this bit must not be simultaneous with a write into VC2STOP.
Reading this bit returns 0.

Bits 9:8 Reserved, must be kept at reset value.

Bit 7 **VC1STOP**: Virtual channel 1 stop
The CSI-2 decoder stops the virtual channel 1.
0: No effect
1: Pulse generation to stop the virtual channel 1 processing
Note: The CSI-2 decoder stops processing the virtual channel 1 after the next EOF event (or immediately if the Stop command is issued during frame blanking).
A write operation into this bit must not be simultaneous with a write into VC1START.
Reading this bit returns 0.

Bit 6 **VC1START**: Virtual channel 1 start
The CSI-2 decoder processes the virtual channel 1 according to CSI_VC1CFGRx (x = 0..3).
0: No effect
1: Pulse generation to start the virtual channel 1 processing
Note: The CSI-2 decoder starts processing the virtual channel 1 after the next SOF event.
A write operation into this bit must not be simultaneous with a write into VC1STOP.
Reading this bit returns 0.

Bits 5:4 Reserved, must be kept at reset value.

Bit 3 **VC0STOP**: Virtual channel 0 stop
The CSI-2 decoder stops the virtual channel 0.
0: No effect
1: Pulse generation to stop the virtual channel 0 processing
Note: The CSI-2 decoder stops processing the virtual channel 0 after the next EOF event (or immediately if the Stop command is issued during frame blanking).
A write operation into this bit must not be simultaneous with a write into VC0START.
Reading this bit returns 0.

Bit 2 **VC0START**: Virtual channel 0 start
he CSI-2 decoder processes the virtual channel 0 according to CSI_VC 0CFGRx (x = 0..3).
0: No effect
1: Pulse generation to start the virtual channel 0 processing
Note: The CSI-2 decoder starts processing the virtual channel 0after the next SOF event.
A write operation into this bit must not be simultaneous with a write into VC0STOP.
Reading this bit returns 0.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **CSIEN**: CSI-2 enable

This bit enables the CSI-2 peripheral for processing the data flow coming from the camera through the D-PHY_RX.

0: CSI-2 disabled

1: CSI-2 enabled

43.9.2 CSI-2 Host DPHY_RX control register (CSI_PCR)

Address offset: 0x04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DL1EN	DL0EN	CLEN	PWR DOWN
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **DL1EN**: D-PHY_RX data lane 1 enable

This bit enables the data lane 1 for the D-PHY_RX.

0: Data lane 1 module is in shutdown mode.

1: Enable the data lane 1 module.

Bit 2 **DL0EN**: D-PHY_RX data lane 0 enable

This bit enables the data lane 0 for the D-PHY_RX.

0: Data lane 0 module is in shutdown mode.

1: Enable the data lane 0 module.

Bit 1 **CLEN**: Clock lane enable

This bit enables the clock lane module of the D-PHY_RX.

0: Clock lanes disabled

1: Clock lanes enabled

Bit 0 **PWRDOWN**: Power down

This bit keeps the D-PHY_RX in power-down state.

0: Active state

1: Power down the D-PHY_RX

43.9.3 CSI-2 Host virtual channel x configuration register 1 (CSI_VCxCFGR1)

Address offset: 0x10 + 0x10 * x, (x = 0 to 3)

Reset value: 0x0000 0000

Any change in this register while the virtual channel x is running is ignored.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **DT0FT[4:0]**: Data type 0 format

These bits configure the input pixel format for the virtual channel x on data type 0.
00000: (BPP6) 6-bit words (for example RAW6, RGB666)
00001: (BPP7) 7-bit words (for example RAW7)
00010: (BPP8) 8-bit words (for example RAW8, YUV 8 bits, RGB888, RGB444, RGB555, RGB565, JPEG)
00011: (BPP10) 10-bit words (for example RAW10, YUV 10 bits)
00100: (BPP12) 12-bit words (for example RAW12)
00101: (BPP14) 14-bit words (for example RAW14)
00110: (BPP16) 16-bit words (for example RAW16)
Others: reserved and must not be used

Note: The format selection is valid only if ALLDT = 0 and DT0EN = 1. These bits have no effect if ALLDT = 1.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **DT0[5:0]**: Data type 0 class selection for virtual channel x

These bits select the data type 0 class and subclass for the virtual channel x according to the MIPI specification for CSI-2.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **CDTFT[4:0]**: Common format for all data types

These bits are configured to select which input pixel format is applied for all the seven data type on virtual channel x.
00000: (BPP6) 6-bit words (for example RAW6, RGB666)
00001: (BPP7) 7-bit words (for example RAW7)
00010: (BPP8) 8-bit words (for example RAW8, YUV 8 bits, RGB888, RGB444, RGB555, RGB565, JPEG)
00011: (BPP10) 10-bit words (for example RAW10, YUV 10 bits)
00100: (BPP12) 12-bit words (for example RAW12)
00101: (BPP14) 14-bit words (for example RAW14)
00110: (BPP16) 16-bit words (for example RAW16)
Others: Reserved

Note: The format selection is valid only if ALLDT = 1. These bits have no effect if ALLDT = 0.

Bit 7 **DT6EN**: Data type 6 enable

This bit enables the data type 6 for the virtual channel x. The data type format is applied with respect to the configuration of DT6[5:0] and DT6FT[4:0] in CSI_VCxCFGR4.

0: Data type 6 for virtual channel x is disabled.

1: Data type 6 for virtual channel x is enabled.

Note: This bit has no effect if ALLDT = 1.

Bit 6 **DT5EN**: Data type 5 enable

This bit enables the data type 5 for the virtual channel x. The data type format is applied with respect to the configuration of DT5[5:0] and DT5FT[4:0] in CSI_VCxCFGR4.

0: Data type 5 for virtual channel x is disabled.

1: Data type 5 for virtual channel x is enabled.

Note: This bit has no effect if ALLDT = 1.

Bit 5 **DT4EN**: Data type 4 enable

This bit enables the data type 4 for the virtual channel x. The data type format is applied with respect to the configuration of DT4[5:0] and DT4FT[4:0] in CSI_VCxCFGR3.

0: Data type 4 for virtual channel x is disabled.

1: Data type 4 for virtual channel x is enabled.

Note: This bit has no effect if ALLDT = 1.

Bit 4 **DT3EN**: Data type 3 enable

This bit enables the data type 3 for the virtual channel x. The data type format is applied with respect to the configuration of DT3[5:0] and DT3FT[4:0] in CSI_VCxCFGR3.

0: Data type 3 for virtual channel x is disabled.

1: Data type 3 for virtual channel x is enabled.

Note: This bit has no effect if ALLDT = 1.

Bit 3 **DT2EN**: Data type 2 enable

This bit enables the data type 2 for the virtual channel x. The data type format is applied with respect to the configuration of DT2[5:0] and DT2FT[4:0] in CSI_VCxCFGR2.

0: Data type 2 for virtual channel x is disabled.

1: Data type 2 for virtual channel x is enabled.

Note: This bit has no effect if ALLDT = 1.

Bit 2 **DT1EN**: Data type 1 enable

This bit enables the data type 1 for the virtual channel x. The data type format is applied with respect to the configuration of DT1[5:0] and DT1FT[4:0] in CSI_VCxCFGR2.

0: Data type 1 for virtual channel x is disabled.

1: Data type 1 for virtual channel x is enabled.

Note: This bit has no effect if ALLDT = 1.

Bit 1 **DT0EN**: Data type 0 enable

This bit enables the data type 0 for the virtual channel x. The data type format is applied with respect to the configuration of DT0[5:0] and DT0FT[4:0] in CSI_VCxCFGR1.

0: Data type 0 for virtual channel x is disabled.

1: Data type 0 for virtual channel x is enabled.

Note: This bit has no effect if ALLDT = 1.

Bit 0 **ALLDT**: All data types enable for the virtual channel x

This bit allows to capture all data types according to CDTFT[4:0] for the virtual channel x.

0: Data type capture managed individually

1: All data types captured for virtual channel x

43.9.4 CSI-2 Host virtual channel x configuration register 2 (CSI_VCxCFGR2)

Address offset: 0x14 + 0x10 * x, (x = 0 to 3)

Reset value: 0x0000 0000

Any change in this register while the virtual channel x is running is ignored.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

			rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **DT2FT[4:0]**: Data type 2 format

These bits configure the input pixel format for the virtual channel x on data type 2.
00000: (BPP6) 6-bit words (for example RAW6, RGB666)
00001: (BPP7) 7-bit words (for example RAW7)
00010: (BPP8) 8-bit words (for example RAW8, YUV 8 bits, RGB888, RGB444, RGB555, RGB565, JPEG)
00011: (BPP10) 10-bit words (for example RAW10, YUV 10 bits)
00100: (BPP12) 12-bit words (for example RAW12)
00101: (BPP14) 14-bit words (for example RAW14)
00110: (BPP16) 16-bit words (for example RAW16)
Others: Reserved and must not be used.

Note: The format selection is valid only if ALLDT = 0 and DT2EN = 1. These bits have no effect if ALLDT = 1.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **DT2[5:0]**: Data type 2 class selection for virtual channel x

These bits select the data type 2 class and subclass for the virtual channel x according to the MIPI specification for CSI- 2.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **DT1FT[4:0]**: Data type 1 format

These bits configure the input pixel format for the virtual channel x on data type 1.
00000: (BPP6) 6-bit words (for example RAW6, RGB666)
00001: (BPP7) 7 -it words (for example RAW7)
00010: (BPP8) 8 -it words (for example RAW8, YUV 8 bits, RGB888, RGB444, RGB555, RGB565, JPEG)
00011: (BPP10) 10-bit words (for example RAW10, YUV 10 bits)
00100: (BPP12) 12 -it words (for example RAW12)
00101: (BPP14) 14 -it words (for example RAW14)
00110: (BPP16) 16 -it words (for example RAW16)
Others: Reserved and must not be used.

Note: The format selection is valid only if ALLDT = 0 and DT1EN = 1. These bits have no effect if ALLDT = 1.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **DT1[5:0]**: Data type 1 class selection for virtual channel x

These bits select the data type 1 class and subclass for the virtual channel x according to the MIPI specification for CSI- 2.

43.9.5 CSI-2 Host virtual channel x configuration register 3 (CSI_VCxCFGR3)

Address offset: 0x18 + 0x10 * x, (x = 0 to 3)

Reset value: 0x0000 0000

Any change in this register while the virtual channel x is running is ignored.

00011: (BPP10) 10-bit words (for example RAW10, YUV 10 bits)
00100: (BPP12) 12-bit words (for example RAW12)
00101: (BPP14) 14-bit words (for example RAW14)
00110: (BPP16) 16-bit words (for example RAW16)
Others: Reserved and must not be used.

Note: The format selection is valid only if ALLDT = 0 and DT3EN = 1. These bits have no effect if ALLDT = 1.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **DT3[5:0]**: Data type 3 class selection for virtual channel x

These bits select the data type 3 class and subclass for the virtual channel x according to the MIPI specification for CSI-2.

43.9.6 CSI-2 Host virtual channel x configuration register 4 (CSI_VCxCFGR4)

Address offset: 0x1C + 0x10 * x, (x = 0 to 3)

Reset value: 0x0000 0000

Any change in this register while the virtual channel x is running is ignored.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	DT6FT[4:0]					Res.	Res.	DT6[5:0]					
			rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DT5FT[4:0]					Res.	Res.	DT5[5:0]					
			rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **DT6FT[4:0]**: Data type 6 format

These bits configure the input pixel format for the virtual channel x on data type 6.
00000: (BPP6) 6-bit words (for example RAW6, RGB666)
00001: (BPP7) 7-bit words (for example RAW7)
00010: (BPP8) 8-bit words (for example RAW8, YUV 8 bits, RGB888, RGB444, RGB555, RGB565, JPEG)
00011: (BPP10) 10-bit words (for example RAW10, YUV 10 bits)
00100: (BPP12) 12-bit words (for example RAW12)
00101: (BPP14) 14-bit words (for example RAW14)
00110: (BPP16) 16-bit words (for example RAW16)
Others: Reserved and must not be used.

Note: The format selection is valid only if ALLDT = 0 and DT6EN = 1. These bits have no effect if ALLDT = 1.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:16 **DT6[5:0]**: Data type 6 class selection for virtual channel x

These bits select the data type 6 class and subclass for the virtual channel x according to the MIPI specification for CSI-2.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **DT5FT[4:0]**: Data type 5 format

These bits configure the input pixel format for the virtual channel x on data type 5.
00000: (BPP6) 6-bit words (for example RAW6, RGB666)
00001: (BPP7) 7-bit words (for example RAW7)
00010: (BPP8) 8-bit words (for example RAW8, YUV 8 bits, RGB888, RGB444, RGB555, RGB565, JPEG)
00011: (BPP10) 10-bit words (for example RAW10, YUV 10 bits)
00100: (BPP12) 12-bit words (for example RAW12)
00101: (BPP14) 14-bit words (for example RAW14)
00110: (BPP16) 16-bit words (for example RAW16)
Others: Reserved.

Note: The format selection is valid only if ALLDT = 0 and DT5EN = 1. These bits have no effect if ALLDT = 1.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **DT5[5:0]**: Data type 5 class selection for virtual channel x

These bits select the data type 5 class and subclass for the virtual channel x according to the MIPI specification for Camera Serial Interface 2.

43.9.7 CSI-2 Host line byte x configuration register (CSI_LBxCFGR)

Address offset: 0x50 + 0x04 * x, (x = 0 to 3)

Reset value: 0x0000 0000

Any change in this register while LBxEN bit is set into the CSI_PRGITR is ignored.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LINECNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

BYTECNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **LINECNT[15:0]**: Line counter

These bits select the line number, associated to LINECNT[15:0], to trigger, if enabled, the corresponding line/byte interruption flag based on the selected virtual channel identified in CSI_PRGITR.

Bits 15:0 **BYTECNT[15:0]**: Byte counter

These bits select the byte number, associated to BYTECNT[15:0], to trigger, if enabled, the corresponding line/byte interruption flag based on the selected virtual channel identified in CSI_PRGITR.

43.9.8 CSI-2 Host timer x configuration register (CSI_TIMxCFGR)

Address offset: 0x60 + 0x04 * x, (x = 0 to 3)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	COUNT[24:16]

COUNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:0 **COUNT[24:0]**: Clock cycle counter

This register is used to specify how many clock cycles (clk_proc) the timer needs to count from a SOF on the considered virtual channel, before triggering the associated interrupt flag if enabled in CSI_PRGITR. The interruption is generated if TIMxIE is set in CSI_IER0.

43.9.9 CSI-2 Host lane merger configuration register (CSI_LMCFGR)

Address offset: 0x70

Reset value: 0x4321 0200

This register must not be modified while the CSI-2 is enabled.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DL1MAP[2:0]			Res.	DL0MAP[2:0]

					rw	rw	rw								

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:20 **DL1MAP[2:0]**: Physical mapping of logical data lane 1

These bits are used to map the physical data lane 1 on the logical data lane.
001: Physical data lane 1 connected to logical data lane 0
010: Physical data lane 1 connected to logical data lane 1
Others: Reserved

Note: This field value must be different from DL0MAP[2:0].

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **DL0MAP[2:0]**: Physical mapping of logical data lane 0

These bits are used to map the physical data lane 0 on the logical data lane.
001: Physical data lane 0 connected to logical data lane 0
010: Physical data lane 0 connected to logical data lane 1
Others: Reserved

Note: This field value must be different from DL1MAP[2:0].

Bits 15:11 Reserved, must be kept at reset value.

Bits 10:8 **LANENB[2:0]**: Number of lanes

These bits are used to specify the number of lanes used for the data reception.
001: 1 lane for the reception
010: 2 lanes for the reception
Others: Reserved

Bits 7:0 Reserved, must be kept at reset value.

43.9.10 CSI-2 Host program interrupt register (CSI_PRGITR)

Address offset: 0x74

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw		rw	rw	rw		rw	rw	rw		rw	rw	rw		rw	rw

Bit 31 **TIM3EN**: TIM3 base time enable

This bit is used to enable the mechanism of event generation starting from SOF or EOF depending on TIM3EOF. An interrupt is generated if TIM3IE is set int CSI_IER0.
0: Timer 3 clock cycle counter not active
1: Timer 3 clock cycle counter active

Note: Enabling this bit locks TIM3EOF and TIM3VC[1:0] values.
The counting starts from the next frame after setting this bit.
This bit must be written only when the CSI-2 is disabled.

Bit 30 **TIM3EOF**: TIM3 base time starting from the EOF

This bits is used to select the starting point of the counter on the selected virtual channel.
0: SOF selected as starting point for the counter
1: EOF selected as starting point for the counter

Note: The write access to this bit is ignored if TIM3EN = 1 in CSI_PRGITR.
This bit must be written only when the CSI-2 is disabled.

Bits 29:28 **TIM3VC[1:0]**: TIM3 base time linked to a virtual channel

These bits are used to select from which of the virtual channels the TIM3 counter is linked.
00: Virtual channel 0 used to generate the TIM3 event
01: Virtual channel 1 used to generate the TIM3 event
10: Virtual channel 2 used to generate the TIM3 event
11: Virtual channel 3 used to generate the TIM3 event

Note: The write access to these bits is ignored if TIM3EN = 1 in CSI_PRGITR.
These bits must be written only when the CSI-2 is disabled.

Bit 27 **TIM2EN**: TIM2 base time enable

This bit is used to enable the mechanism of event generation starting from SOF or EOF depending on TIM2EOF. An interrupt is generated if TIM2IE is set in CSI_IER0.

0: Timer 2 clock cycle counter not active.

1: Timer 2 clock cycle counter active

Note: Enabling this bit locks TIM2EOF and TIM2VC[1:0] values.

The counting starts from the next frame after setting this bit.

This bit must be written only when the CSI-2 is disabled.

Bit 26 **TIM2EOF**: TIM2 base time starting from the EOF

This bits is used to select the starting point of the counter on the selected virtual channel.

0: SOF selected as starting point for the counter

1: EOF selected as starting point for the counter

Note: The write access to this bit is ignored if TIM2EN = 1 in CSI_PRGITR.

This bit must be written only when the CSI-2 is disabled.

Bits 25:24 **TIM2VC[1:0]**: TIM2 base time linked to a virtual channel

These bits are used to select from which of the virtual channels the TIM2 counter is linked.

00: Virtual channel 0 used to generate the TIM2 event

01: Virtual channel 1 used to generate the TIM2 event

10: Virtual channel 2 used to generate the TIM2 event

11: Virtual channel 3 used to generate the TIM2 event

Note: The write access to these bits is ignored if TIM2EN = 1 in CSI_PRGITR.

These bits must be written only when the CSI-2 is disabled.

Bit 23 **TIM1EN**: TIM1 base time enable

This bit is used to enable the mechanism of event generation starting from SOF or EOF depending on TIM1EOF. An interrupt is generated if TIM1IE is set in CSI_IER0.

0: Timer 1 clock cycle counter not active.

1: Timer 1 clock cycle counter active

Note: Enabling this bit locks TIM1EOF and TIM1VC[1:0] values.

The counting starts from the next frame after setting this bit.

This bit must be written only when the CSI-2 is disabled.

Bit 22 **TIM1EOF**: TIM1 base time starting from the EOF

This bits is used to select the starting point of the counter on the selected virtual channel.

0: SOF selected as starting point for the counter

1: EOF selected as starting point for the counter

Note: The write access to this bit is ignored if TIM1EN = 1 in CSI_PRGITR.

This bit must be written only when the CSI-2 is disabled.

Bits 21:20 **TIM1VC[1:0]**: TIM1 base time linked to a virtual channel

These bits are used to select from which of the virtual channels the TIM1 counter is linked.

00: Virtual channel 0 used to generate the TIM1 event

01: Virtual channel 1 used to generate the TIM1 event

10: Virtual channel 2 used to generate the TIM1 event

11: Virtual channel 3 used to generate the TIM1 event

Note: The write access to these bits is ignored if TIM1EN = 1 in CSI_PRGITR.

These bits must be written only when the CSI-2 is disabled.

Bit 19 **TIM0EN**: TIM0 base time enable

This bit is used to enable the mechanism of event generation starting from SOF or EOF depending on TIM0EOF. An interrupt is generated if TIM0IE is set in CSI_IER0.

0: Timer 0 clock cycle counter not active

1: Timer 0 clock cycle counter active

Note: Enabling this bit locks TIM0EOF and TIM0VC[1:0] values.

The counting starts from the next frame after setting this bit.

This bit must be written only when the CSI-2 is disabled.

Bit 18 **TIM0EOF**: TIM0 base time starting from the EOF

This bits is used to select the starting point of the counter on the selected virtual channel.

0: SOF selected e as starting point for the counter

1: EOF selected as starting point for the counter

Note: The write access to this bit is ignored if TIM0EN = 1 in CSI_PRGITR.

This bit must be written only when the CSI-2 is disabled.

Bits 17:16 **TIM0VC[1:0]**: TIM0 base time linked to a virtual channel

These bits are used to select from which of the virtual channels the TIM0 counter is linked.

00: Virtual channel 0 used to generate the TIM0 event

01: Virtual channel 1 used to generate the TIM0 event

10: Virtual channel 2 used to generate the TIM0 event

11: Virtual channel 3 used to generate the TIM0 event

Note: The write access to these bits is ignored if TIM0EN = 1 in CSI_PRGITR.

These bits must be written only when the CSI-2 is disabled.

Bit 15 **LB3EN**: Line/byte 3 counter enable

This bit is used to enable the mechanism of event generation at any location in the frame corresponding to the value set in CSI_LB3CFGR. An interrupt is generated if LB3IE is set in CSI_IER0.

0: Line/byte 3 counter stopped

1: Line/byte 3 counter active

Note: Enabling this bit locks LB3VC[1:0] value.

The counter starts from the next frame after setting this bit.

This bit must be set only when the CSI-2 is enabled.

Bit 14 Reserved, must be kept at reset value.

Bits 13:12 **LB3VC[1:0]**: Line/byte counter 3 linked to a virtual channel

These bits are used to select from which of the virtual channels the line/byte counter 3 is linked.

00: Virtual channel 0 used to generate the line/byte counter 3 event

01: Virtual channel 1 used to generate the line/byte counter 3 event

10: Virtual channel 2 used to generate the line/byte counter 3 event

11: Virtual channel 3 used to generate the line/byte counter 3 event

Note: The write access to these bits is ignored if LB3EN = 1 in CSI_PRGITR.

Bit 11 **LB2EN**: Line/byte 2 counter enable

This bit is used to enable the mechanism of event generation at any location in the frame corresponding to the value set in CSI_LB2CFGR. An interrupt is generated if LB2IE is set in CSI_IER0.

0: Line/byte 2 counter stopped

1: Line/byte 2 counter active

Note: Enabling this bit locks LB2VC[1:0] value.

The counter starts from the next frame after setting this bit.

This bit must be set only when the CSI-2 is enabled.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **LB2VC[1:0]**: Line/byte counter 2 linked to a virtual channel

These bits are used to select from which of the virtual channels the line/byte counter 2 is linked.

00: Virtual channel 0 used to generate the line/byte counter 2 event

01: Virtual channel 1 used to generate the line/byte counter 2 event

10: Virtual channel 2 used to generate the line/byte counter 2 event

11: Virtual channel 3 used to generate the line/byte counter 2 event

Note: The write access to these bits is ignored if LB2EN = 1 in CSI_PRGITR.

Bit 7 **LB1EN**: Line/byte 1 counter enable

This bit is used to enable the mechanism of event generation at any location in the frame corresponding to the value set in CSI_LB1CFGR. An interrupt is generated if LB1IE is set in CSI_IER0.

0: Line/byte 1 counter stopped

1: Line/byte 1 counter active

Note: Enabling this bit locks LB1VC[1:0] value.

The counter starts from the next frame after setting this bit.

This bit must be set only when the CSI-2 is enabled.

Bit 6 Reserved, must be kept at reset value.

Bits 5:4 **LB1VC[1:0]**: Line/byte counter 1 linked to a virtual channel

These bits are used to select from which of the virtual channels the line/byte counter 1 is linked.

00: Virtual channel 0 used to generate the line/byte counter 1 event

01: Virtual channel 1 used to generate the line/byte counter 1 event

10: Virtual channel 2 used to generate the line/byte counter 1 event

11: Virtual channel 3 used to generate the line/byte counter 1 event

Note: The write access to these bits is ignored if LB1EN = 1 in CSI_PRGITR.

Bit 3 **LB0EN**: Line/byte 0 counter enable

This bit is used to enable the mechanism of event generation at any location in the frame corresponding to the value set in CSI_LB0CFGR. An interrupt is generated if LB0IE is set in CSI_IER0.

0: Line/byte 0 counter stopped

1: Line/byte 0 counter active

Note: Enabling this bit locks LB0VC[1:0] value.

The counter starts from the next frame after setting this bit.

This bit must be set only when the CSI-2 is enabled.

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **LB0VC[1:0]**: Line/byte counter 0 linked to a virtual channel

These bits are used to select from which of the virtual channels the line/byte counter 0 is linked.

00: Virtual channel 0 used to generate the line/byte counter 0 event

01: Virtual channel 1 used to generate the line/byte counter 0 event

10: Virtual channel 2 used to generate the line/byte counter 0 event

11: Virtual channel 3 used to generate the line/byte counter 0 event

Note: The write access to these bits is ignored if LB0EN = 1 in CSI_PRGITR.

43.9.11 CSI-2 Host watchdog register (CSI_WDR)

Address offset: 0x78

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CNT[31:0]**: Watchdog counter

These bits contains the maximum number of clock cycles (clk_proc) between an EOF and a SOF for a given channel before triggering an interrupt if WDERRIE = 1 in CSI_IER0.

The value 0x000000 disables the watchdog counter.

43.9.12 CSI-2 Host interrupt enable register 0 (CSI_IER0)

Address offset: 0x80

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bit 30 **SYNCERRIE**: Invalid synchronization error interrupt enable

This bit enables the interrupt generation when an invalid synchronization is detected.
It can be a SOF short packet during a frame, or and EOF short packet during an inter-frame.

0: Interrupt on invalid synchronization error disabled

1: Interrupt on invalid synchronization error enabled

Bit 29 **WDERRIE**: Watchdog error interrupt enable
This bit enables the interrupt generation when the time between two packets for a virtual channel is longer than the programmed watchdog.
0: Interrupt on watchdog error disabled
1: Interrupt on watchdog error enabled

Bit 28 **SPKTERRIE**: Short packet error interrupt enable
This bit enables the interrupt generation based on a reception of a shorter packet than expected.
0: Interrupt on short packet error disabled
1: Interrupt on short packet error enabled

Bit 27 **IDERRIE**: Data type ID error interrupt enable
This bit enables the interrupt generation based on a detection of a reserved data type.
0: Interrupt on reception of reserved data type disabled
1: Interrupt on reception of reserved data type enabled

Bit 26 **CECCERRIE**: Corrected ECC error interrupt enable
This bit enables the interrupt generation based on a corrected ECC error detection.
0: Interrupt on corrected ECC error detection disabled
1: Interrupt on corrected ECC error detection enabled

Bit 25 **ECCERRIE**: ECC error interrupt enable
This bit enables the interrupt generation based on an ECC error detection.
0: Interrupt on ECC error detection disabled
1: Interrupt on ECC error detection enabled

Bit 24 **CRCERRIE**: CRC error interrupt enable
This bit enables the interrupt generation based on CRC error detection on a long packet reception.
0: Interrupt on CRC error detection disabled
1: Interrupt on CRC error detection enabled

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **CCFIFOFIE**: Clock changer FIFO full interrupt enable
This bit enables the interrupt generation based on clock changer FIFO full detection.
0: Interrupt on clock changer FIFO full detection disabled
1: Interrupt on clock changer FIFO full detection enabled

Bits 20:17 Reserved, must be kept at reset value.

Bit 16 **SPKTIE**: Short packet interrupt enable
This bit generates an interrupt which notifies that a generic short packet has been received by the CSI-2 Host.
0: Short packet detection interrupt disabled
1: Short packet detection interrupt enabled

Bit 15 **EOF3IE**: EOF for virtual channel 3 interrupt enable
This bit enables the interrupt generation when the CSI-2 Host is decoding an EOF on the virtual channel 3.
0: EOF on virtual channel 3 interrupt disabled
1: EOF on virtual channel 3 interrupt enabled

Bit 14 **EOF2IE**: EOF for virtual channel 2 interrupt enable
This bit enables the interrupt generation when the CSI-2 Host is decoding an EOF on the virtual channel 2.
0: EOF on virtual channel 2 interrupt disabled
1: EOF on virtual channel 2 interrupt enabled

Bit 13 **EOF1IE**: EOF for virtual channel 1 interrupt enable
This bit enables the interrupt generation when the CSI-2 Host is decoding an EOF on the virtual channel 1.
0: EOF on virtual channel 1 interrupt disabled
1: EOF on virtual channel 1 interrupt enabled

Bit 12 **EOF0IE**: EOF for virtual channel 0 interrupt enable
This bit enables the interrupt generation when the CSI-2 Host is decoding an EOF on the virtual channel 0.
0: EOF on virtual channel 0 interrupt disabled
1: EOF on virtual channel 0 interrupt enabled

Bit 11 **SOF3IE**: SOF for virtual channel 3 interrupt enable
This bit enables the interrupt generation when the CSI-2 Host is decoding a SOF on the virtual channel 3.
0: SOF on virtual channel 3 interrupt disabled
1: SOF on virtual channel 3 interrupt enabled

Bit 10 **SOF2IE**: SOF for virtual channel 2 interrupt enable
This bit enables the interrupt generation when the CSI-2 Host is decoding a SOF on the virtual channel 2.
0: SOF on virtual channel 2 interrupt disabled
1: SOF on virtual channel 2 interrupt enabled

Bit 9 **SOF1IE**: SOF for virtual channel 1 interrupt enable
This bit enables the interrupt generation when the CSI-2 Host is decoding a SOF on the virtual channel 1.
0: SOF on virtual channel 1 interrupt disabled.
1: SOF on virtual channel 1 interrupt enabled.

Bit 8 **SOF0IE**: SOF for virtual channel 0 interrupt enable
This bit enables the interrupt generation when the CSI-2 Host is decoding a SOF on the virtual channel 0.
0: SOF on virtual channel 0 interrupt disabled
1: SOF on virtual channel 0 interrupt enabled

Bit 7 **TIM3IE**: Timer 3 interrupt enable
This bit enables the interrupt generation from the timer 3 linked to the virtual channel number configured by TIM3VC in CSI_PRGITR. The interrupt raises when the timer 3 value reaches the value configured in CSI_TIM3CFGR.
0: Timer 3 interrupt disabled
1: Timer 3 interrupt enabled

Bit 6 **TIM2IE**: Timer 2 interrupt enable
This bit enables the interrupt generation from the timer 2 linked to the virtual channel number configured by TIM2VC in CSI_PRGITR. The interrupt raises when the timer 2 value reaches the value configured in CSI_TIM2CFGR.
0: Timer 2 interrupt disabled
1: Timer 2 interrupt enabled

Bit 5 **TIM1IE**: Timer 1 interrupt enable

This bit enables the interrupt generation from the timer 1 linked to the virtual channel number configured by TIM1VC in CSI_PRGITR. The interrupt raises when the timer 1 value reaches the value configured in CSI_TIM1CFGR.

0: Timer 1 interrupt disabled

1: Timer 1 interrupt enabled

Bit 4 **TIM0IE**: Timer 0 interrupt enable

This bit enables the interrupt generation from the timer 0 linked to the virtual channel number configured by TIM0VC in CSI_PRGITR. The interrupt raises when the timer 0 value reaches the value configured in CSI_TIM0CFGR.

0: Timer 0 interrupt disabled

1: Timer 0 interrupt enabled

Bit 3 **LB3IE**: Line/byte counter 3 interrupt enable

This bit enables the interrupt generation when the active frame of the virtual channel configured by LB3VC in CSI_PRGITR reaches the line/byte number programmed in CSI_LB3CFGR.

Bit 2 **LB2IE**: Line/byte counter 2 interrupt enable

This bit enables the interrupt generation when the active frame of the virtual channel configured by LB2VC in CSI_PRGITR reaches the line/byte number programmed in CSI_LB2CFGR.

Bit 1 **LB1IE**: Line/byte counter 1 interrupt enable

This bit enables the interrupt generation when the active frame of the virtual channel configured by LB1VC in CSI_PRGITR reaches the line/byte number programmed in CSI_LB1CFGR.

Bit 0 **LB0IE**: Line/byte counter 0 interrupt enable

This bit enables the interrupt generation when the active frame of the virtual channel configured by LB0VC in CSI_PRGITR reaches the line/byte number programmed in CSI_LB0CFGR.

43.9.13 CSI-2 Host interrupt enable register 1 (CSI_IER1)

Address offset: 0x84

Reset value: 0x0000 0000

			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **ECTRLDL1IE**: D-PHY_RX lane 1 control error interrupt enable
This bit enables the D-PHY_RX control error interrupt detected on lane 1 consecutive to an incorrect line state sequence.
0: Lane 1 control error interrupt disabled
1: Lane 1 control error interrupt enabled

Bit 11 **ESYNCESCDL1IE**: D-PHY_RX lane 1 low-power data transmission synchronization error interrupt enable
This bit enables the interrupt generation when the number of bits received during a low-power data transmission is not a multiple of eight when the transmission ends on lane 1.
0: Lane 1 low-power data transmission interrupt error disabled
1: Lane 1 low-power data transmission Interrupt error enabled

Bit 10 **EESCDL1IE**: D-PHY_RX lane 1 escape entry error interrupt enable
This bit enables the interrupt generation when an unrecognized escape entry command is received on lane 1.
0: Lane 1 unrecognized escape entry command interrupt error disabled
1: Lane 1 unrecognized escape entry command interrupt error enabled

Bit 9 **ESOTSYNCDL1IE**: SOT synchronization interrupt error enable on lane 1
This bit enables the interrupt generation when the high-speed SOT leader sequence is corrupted in a such way that the proper synchronization cannot be expected.
0: Lane 1 SOT synchronization interrupt error disabled
1: Lane 1 SOT synchronization interrupt error enabled

Bit 8 **ESOTDL1IE**: SOT error interrupt enable on lane 1
This bit enables the interrupt generation when the high-speed SOT leader sequence is corrupted in a such way that the proper synchronization can still be achieved.
0: Lane 1 SOT interrupt error disabled
1: Lane 1 SOT interrupt error enabled

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **ECTRLDL0IE**: D-PHY_RX lane 0 control error interrupt enable
This bit enables the D-PHY_RX control error interrupt detected on lane 0 consecutive to an incorrect line state sequence.
0: Lane 0 control error interrupt disabled
1: Lane 0 control error interrupt enabled

Bit 3 **ESYNCESCDL0IE**: D-PHY_RX lane 0 low power data transmission synchronization error interrupt enable
This bit enables the interrupt generation when the number of bits received during a low-power data transmission is not a multiple of eight when the transmission ends on lane 1.
0: Lane 0 low-power data transmission interrupt error disabled
1: Lane 0 low-power data transmission Interrupt error enabled

Bit 2 **EESCDL0IE**: D-PHY_RX lane 0 escape entry error interrupt enable
This bit enables the interrupt generation when an unrecognized escape entry command is received on lane 0.
0: Lane 0 unrecognized escape entry command interrupt error disabled
1: Lane 0 unrecognized escape entry command interrupt error enabled

Bit 1 **ESOTSYNCDL0IE**: SOT synchronization interrupt error enable on lane 0
This bit enables the interrupt generation when the high-speed SOT leader sequence is corrupted in a such way that the proper synchronization cannot be expected.
0: Lane 0 SOT synchronization interrupt error disabled
1: Lane 0 SOT synchronization interrupt error enabled

Bit 0 **ESOTDL0IE**: SOT error interrupt enable on lane 0
This bit enables the interrupt generation when the high-speed SOT leader sequence is corrupted in a such way that the proper synchronization can still be achieved.
0: Lane 0 SOT interrupt error disabled
1: Lane 0 SOT interrupt error enabled

43.9.14 CSI-2 Host status register 0 (CSI_SR0)

Address offset: 0x90

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bit 31 Reserved, must be kept at reset value.

Bit 30 **SYNCERRF**: Invalid synchronization error flag
This bit indicates an invalid synchronization is detected. It can be a SOF short packet during a frame, or and EOF short packet during an inter-frame.

Bit 29 **WDERRF**: Watchdog error flag
This bit indicates that the time between two packets for a virtual channel is longer than the programmed watchdog.

Bit 28 **SPKTERRF**: Short packet error flag
This bit indicates a reception of a shorter packet than expected.

Bit 27 **IDERRF**: Data type ID error flag
This bit indicates a detection of a reserved data type.

Bit 26 **CECCERRF**: Corrected ECC error flag
This bit indicates a corrected ECC error detection took place in the frame.

Bit 25 **ECCERRF**: ECC error flag
This bit indicates that an ECC error has been detected.

Bit 24 **CRCERRF**: CRC error flag
This bit indicates a CRC error detection on a long packet reception.

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **CCFIFOFF**: Clock changer FIFO full flag
This bit indicates a FIFO full detection in the clock changer.

Bit 20 **VC3STATEF**: Virtual channel 3 state flag
This bit indicates the state of the virtual channel 3.
0: Virtual channel inactive
1: Virtual channel active

Bit 19 **VC2STATEF**: Virtual channel 2 state flag
This bit indicates the state of the virtual channel 2.
0: Virtual channel inactive
1: Virtual channel active

Bit 18 **VC1STATEF**: Virtual channel 1 state flag
This bit indicates the state of the virtual channel 1.
0: Virtual channel inactive
1: Virtual channel active

Bit 17 **VC0STATEF**: Virtual channel 0 state flag
This bit indicates the state of the virtual channel 0.
0: Virtual channel inactive
1: Virtual channel active

Bit 16 **SPKTF**: Short packet flag
This bit notifies that a generic short packet has been received by the CSI-2 Host.

Bit 15 **EOF3F**: EOF flag for virtual channel 3
This bit notifies that the CSI-2 Host decodes an EOF on the virtual channel 3.

Bit 14 **EOF2F**: EOF flag for virtual channel 2
This bit notifies that the CSI-2 Host is decoding an EOF on the virtual channel 2.

Bit 13 **EOF1F**:EOF flag for virtual channel 1
This bit notifies that the CSI-2 Host is decoding an EOF on the virtual channel 1.

Bit 12 **EOF0F**: EOF flag for virtual channel 0
This bit notifies that the CSI-2 Host is decoding an EOF on the virtual channel 0.

Bit 11 **SOF3F**: SOF flag for virtual channel 3
This bit notifies that the CSI-2 Host is decoding a SOF on the virtual channel 3.

Bit 10 **SOF2F**: SOF flag for virtual channel 2
This bit notifies that the CSI-2 Host is decoding a SOF on the virtual channel 2.

Bit 9 **SOF1F**: SOF flag for virtual channel 1
This bit notifies that the CSI-2 Host is decoding a sSOF on the virtual channel 1.

Bit 8 **SOF0F**: SOF flag for virtual channel 0
This bit notifies that the CSI-2 Host is decoding a SOF on the virtual channel 0.

Bit 7 **TIM3F**: Timer 3 flag
This bit indicates that the timer 3 linked to the virtual channel configured by TIM3VC in CSI_PRGITR reaches the value programmed in CSI_TIM3CFGR.

Bit 6 **TIM2F**: Timer 2 flag
This bit indicates that the timer 2 linked to the virtual channel configured by TIM2VC in CSI_PRGITR reaches the value programmed in CSI_TIM2CFGR.

Bit 5 **TIM1F**: Timer 1 flag
This bit indicates that the timer 1 linked to the virtual channel configured by TIM1VC in CSI_PRGITR reaches the value programmed in CSI_TIM1CFGR.

Bit 4 **TIM0F**: Timer 0 flag
This bit indicates that the timer 0 linked to the virtual channel configured by TIM0VC in CSI_PRGITR reaches the value programmed in CSI_TIM0CFGR.

Bit 3 **LB3F**: Line/byte counter 3 flag
This bit notifies that the active frame of the virtual channel configured by LB3VC in CSI_PRGITR has reached the line/byte number programmed in th CSI_LB3CFGR.

Bit 2 **LB2F**: Line/byte counter 2 flag
This bit notifies that the active frame of the virtual channel configured by LB2VC in CSI_PRGITR has reached the line/byte number programmed in CSI_LB2CFGR.

Bit 1 **LB1F**: Line/byte counter 1 flag
This bit notifies that the active frame of the virtual channel configured by LB1VC in CSI_PRGITR has reached the line/byte number programmed in CSI_LB1CFGR.

Bit 0 **LB0F**: Line/byte counter 0 flag
This bit notifies that the active frame of the virtual channel configured by LB0VC in CSI_PRGITR has reached the line/byte number programmed in CSI_LB0CFGR.

43.9.15 CSI-2 Host status register 1 (CSI_SR1)

Address offset: 0x94

Reset value: 0x0000 0000

			r	r	r	r	r				r	r	r	r	r

Bit 31 **ACTCLF**: D-PHY_RX receiver clock active flag
This bit indicates the status of RxClkactiveHs D-PHY_RX signal.

Bit 30 **ULPNCLF**: D-PHY_RX receiver Ultra-Low power state (not) on clock lane.
This bit indicates the status of RxUlpsClkNot D-PHY_RX signal.

Bit 29 **ULPNACTF**: D-PHY_RX receiver ULP state (not) active
This bit indicates the status of UlpsactiveNotC D-PHY_RX signal.

Bit 28 **STOPCLF**: D-PHY_RX receiver in stop state for the clock lane
This bit indicates the status of StopStateC D-PHY_RX signal.

Bit 27 Reserved, must be kept at reset value.

Bit 26 **ULPNDL1F**: D-PHY_RX receiver ultra-low-power state (not) active on data lane 1
This bit indicates the status of UlpsActiveNot_D_lane1 D-PHY_RX signal.

Bit 25 **STOPDL1F**: D-PHY_RX receiver data lane 1 in stop state
This bit indicates the status of StopState_D_lane1 D-PHY_RX signal.

Bit 24 **SKCALDL1F**: D-PHY_RX lane 1 high-speed skew calibration
This bit indicates the status of RxSkewCalHS_lane1 D-PHY_RX signal.

Bit 23 **SYNCDL1F**: D-PHY_RX lane 1 receiver synchronization observed
This bit indicates the status of RXSyncHS_lane1 D-PHY_RX signal.

Bit 22 **ACTDL1F**: D-PHY_RX lane 1 high-speed reception active
This bit indicates the status of RxActiveHS_lane1 D-PHY_RX signal.

Bit 21 Reserved, must be kept at reset value.

Bit 20 **ULPNDL0F**: D-PHY_RX receiver ultra-low-power state (not) active on data lane 0
This bit indicates the status of UlpsActiveNot_D_lane0 D-PHY_RX signal.

Bit 19 **STOPDL0F**: D-PHY_RX receiver data lane 0 in stop state
This bit indicates the status of StopState_D_lane0 D-PHY_RX signal.

Bit 18 **SKCALDL0F**: D-PHY_RX lane 0 high-speed skew calibration
This bit indicates the status of RxSkewCalHS_lane0 D-PHY_RX signal.

Bit 17 **SYNCDL0F**: D-PHY_RX lane 0 receiver synchronization observed
This bit indicates the status of RXSyncHS_lane0 D-PHY_RX signal.

Bit 16 **ACTDL0F**: D-PHY_RX lane 0 high-speed reception active
This bit indicates the status of RxActiveHS_lane0 D-PHY_RX signal.

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **ECTRLDL1F**: D-PHY_RX lane 1 control error flag
This bit indicates that the D-PHY_RX detected on lane 1 an incorrect line state sequence.

Bit 11 **ESYNCESCDL1F**: D-PHY_RX lane 1 low-power data transmission synchronization error flag
This bit notifies a synchronization error when the number of bits received during a low-power data transmission is not a multiple of eight when the transmission ends on lane 1.

Bit 10 **EESCDL1F**: D-PHY_RX lane 1 escape entry error flag
This bit notifies an escape entry error when an unrecognized escape entry command is received on lane 1.

Bit 9 **ESOTSYNCDL1F**: SOT synchronization error flag on lane 1
This bit indicates a SOT synchronization error when the high-speed SOT leader sequence is corrupted in a such way that the proper synchronization cannot be expected.

Bit 8 **ESOTDL1F**: SOT error flag on lane 1
This bit notifies a SOT error when the high-speed SOT leader sequence is corrupted in a such way that the proper synchronization can still be achieved.

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **ECTRLDL0F**: D-PHY_RX lane 0 control error flag
This bit indicates that the D-PHY_RX detected on lane 0 an incorrect line state sequence.

Bit 3 **ESYNCESCDL0F**: D-PHY_RX lane 0 low-power data transmission synchronization error flag
This bit notifies a synchronization error when the number of bits received during a low-power data transmission is not a multiple of eight when the transmission ends on lane 0.

Bit 2 **EESCDL0F**: D-PHY_RX lane 0 escape entry error flag
This bit notifies an escape entry error when an unrecognized escape entry command is received on lane 0.

Bit 1 **ESOTSYNCDL0F**: SOT synchronization error flag on lane 0
This bit indicates a SOT synchronization error when the high-speed SOT leader sequence is corrupted in a such way that the proper synchronization cannot be expected.

Bit 0 **ESOTDL0F**: SOT error flag on lane 0
This bit notifies a SOT error when the high-speed SOT leader sequence is corrupted in a such way that the proper synchronization can still be achieved.

43.9.16 CSI-2 Host flag clear register 0 (CSI_FCR0)

Address offset: 0x100

Bit 31 Reserved, must be kept at reset value.

Bit 30 **CSYNCERRF**: Clear invalid synchronization error flag
Write 1 clears SYNCERRF flag in CSI_SR0.

Bit 29 **CWDERRF**: Clear watchdog error flag
Write 1 clears WDERRF flag in CSI_SR0.

Bit 28 **CSPKTERRF**: Clear short packet error flag
Write 1 clears SPKTERRF flag in CSI_SR0.

Bit 27 **CIDERRF**: Clear data type ID error flag
Write 1 clears CIDERRF flag in CSI_SR0.

Bit 26 **CCECCERRF**: Clear corrected ECC error flag
Write 1 clears CCECCERRF flag in CSI_SR0.

Bit 25 **CECCERRF**: Clear ECC error flag
Write 1 clears CECCERRF flag in CSI_SR0.

Bit 24 **CCRCERRF**: Clear CRC error flag
Write 1 clears CRCERRF flag in CSI_SR0.

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **CCCFIFOFF**: Clear clock changer FIFO full flag
Write 1 clears CCFIFOFF flag in CSI_SR0.

Bits 20:17 Reserved, must be kept at reset value.

Bit 16 **CSPKTF**: Clear short packet flag
Write 1 clears SPKTF flag in CSI_SR0.

Bit 15 **CEOF3F**: Clear EOF flag for virtual channel 3
Write 1 clears EOF3F flag in CSI_SR0.

Bit 14 **CEOF2F**: Clear EOF flag for virtual channel 2
Write 1 clears EOF2F flag in CSI_SR0.

Bit 13 **CEOF1F**: Clear EOF flag for virtual channel 1
Write 1 clears EOF1F flag in CSI_SR0.

Bit 12 **CEOF0F**: Clear EOF flag for virtual channel 0
Write 1 clears EOF0F flag in CSI_SR0.

Bit 11 **CSOF3F**: Clear SOF flag for virtual channel 3
Write 1 clears SOF3F flag in CSI_SR0.

Bit 10 **CSOF2F**: Clear SOF flag for virtual channel 2
Write 1 clears SOF2F flag in CSI_SR0.

Bit 9 **CSOF1F**: Clear SOF flag for virtual channel 1
Write 1 clears SOF1F flag in CSI_SR0.

Bit 8 **CSOF0F**: Clear SOF flag for virtual channel 0
Write 1 clears SOF0F flag in CSI_SR0.

Bit 7 **CTIM3F**: Clear timer 3 flag
Write 1 clears TIM3F flag in CSI_SR0.

Bit 6 **CTIM2F**: Clear timer 2 flag
Write 1 clears TIM2F flag in CSI_SR0.

Bit 5 **CTIM1F**: Clear timer 1 flag
Write 1 clears TIM1F flag in CSI_SR0.

Bit 4 **CTIM0F**: Clear timer 0 flag
Write 1 clears TIM0F flag in CSI_SR0.

Bit 3 **CLB3F**: Clear line/byte counter 3 flag
Write 1 clears LB3F flag in CSI_SR0.

Bit 2 **CLB2F**: Clear line/byte counter 2 flag
Write 1 clears LB2F flag in CSI_SR0.

Bit 1 **CLB1F**: Clear line/byte counter 1 flag
Write 1 clears LB1F flag in CSI_SR0.

Bit 0 **CLB0F**: Clear line/byte counter 0 flag
Write 1 clears LB0F flag in CSI_SR0.

DATAFIELD[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:22 **VCHANNEL[1:0]**: Virtual channel
This bit indicates which is the virtual channel number decoded in the last generic short packet data field reception. Write to this bit has no effect.

Bits 21:16 **DATATYPE[5:0]**: Data type class
This bit indicates which is the data type class and subclass (according to the MIPI specification for CSI-2) decoded in the last generic short packet data field reception. Write to this bit has no effect.

Bits 15:0 **DATAFIELD[15:0]**: Data field
This bit indicates which is the current data field decoded in the last generic short packet data field reception. Write to this bit has no effect.

43.9.19 CSI-2 Host error register 1 (CSI_ERR1)

Address offset: 0x114

Reset value: 0x0000 0000

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:22 **IDVCERR[1:0]**: Virtual channel having ID error
This bit indicates for which virtual channel an ID error has been detected.
IDERRF is set in CSI_SR0 to highlight the error.

Bits 21:16 **IDDTERR[5:0]**: Data type in error
This bit indicates for which data type an ID error has been detected.
IDERRF is set in CSI_SR0 to highlight the error.

Bits 15:14 **CECCVCERR[1:0]**: Virtual channel having a corrected ECC error
This bit indicates for which virtual channel a corrected ECC error has been detected.
CECCERRF is set in CSI_SR0 to highlight the error.

Bits 13:8 **CECCDTERR[5:0]**: Data type having a corrected ECC error
This bit indicates for which data type a corrected ECC error has been detected.
CECCERRF is set in CSI_SR0 to highlight the error.

Bits 7:6 **CRCVCERR[1:0]**: Virtual channel having a CRC error
This bit indicates for which virtual channel a CRC error has been detected.
CRCERRF is set in CSI_SR0 to highlight the error.

Bits 5:0 **CRCDTERR[5:0]**: Data type having a CRC error
This bit indicates for which data type a CRC error has been detected.
CRCERRF is set in CSI_SR0 to highlight the error.

43.9.20 CSI-2 Host error register 2 (CSI_ERR2)

Address offset: 0x118

Reset value: 0x0000 0000

								r	r	r	r	r	r	r	r

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:18 **SYNCVCERR[1:0]**: Virtual channel having synchronization error

This bit indicates for which virtual channel a synchronization error has been detected. SYNCERRF is set in CSI_SR0 to highlight the error.

Bits 17:16 **WDVCERR[1:0]**: Virtual channel having a watchdog error

This bit indicates for which virtual channel a watchdog error has been detected. WDERRF is set in CSI_SR0 to highlight the error.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:6 **SPKTVCERR[1:0]**: Virtual channel having a short packet error

This bit indicates for which virtual channel a short packet error has been detected. SPKTERRF is set in CSI_SR0 to highlight the error.

Bits 5:0 **SPKTDTERR[5:0]**: Data type having a short packet error

This bit indicates for which data type a shorter packet than expected error has been detected. SPKTERRF is set in CSI_SR0 to highlight the error.

43.9.21 CSI-2 Host hardware configuration register (CSI_HHWCFGR)

Address offset: 0x0FF0

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TECHNO[3:0]			
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **TECHNO[3:0]**: Technology
This field returns the technology used.
0x0: Technology information is not provided.
0x1: Reserved for 40nm PHY
0x2: 16FF Synopsys PHY

43.9.22 CSI-2 Host version register (CSI_HVERR)

Address offset: 0x0FF4

Reset value: 0x0000 0010

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJREV[3:0]				MINREV[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision
This field returns the major revision of the CSI-2 Host.

Bits 3:0 **MINREV[3:0]**: Major revision
This field returns the minor revision of the CSI-2 Host.

43.9.23 CSI-2 Host identification register (CSI_HIPIDR)

Address offset: 0x0FF8

Reset value: 0x0016 2011

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ID[31:0]**: Identification code
This field returns the identification code of the CSI-2 Host.

43.9.24 CSI-2 Host size identification register (CSI_HSIDR)

Address offset: 0x0FFC

Reset value: 0xA3C5 DD04

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **SID[31:0]**: Size and ID

This field returns the size and the ID of the CSI-2 Host.

43.10 CSI PHY registers

43.10.1 CSI PHY reset control register (CSI_PRCR)

Address offset: 0x1000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PEN	Res.
														rw	

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **PEN**:

When set to 0, this bit places the digital section of the D-PHY in the reset state.

0: PHY is disabled (in reset state).

1: PHY is enabled (out of reset state).

Bit 0 Reserved, must be kept at reset value.

43.10.2 CSI PHY mode control register (CSI_PMCR)

Address offset: 0x1004

Reset value: 0x0001 1003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TUEXDL0
															rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	TUESDL0	Res.	Res.	Res.	RTDL0	Res.	Res.	Res.	DTDL	Res.	FTXSMDL0	FRXMDL1	FRXMDL0
			rw				rw				rw		rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **TUEXDL0**: Tx ULP exit sequence data lane 0
This bit initiates the transmission of the ULP exit sequence.

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **TUESDL0**: Tx ULP escape-mode data lane 0

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **RTDL0**: Turn-around request data lane 0
This bit is used to indicate that the protocol layer needs to turn the lane around, allowing from the other side to start transmitting the data.
0: No request
1: Request for turn-around for DL0

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **DTDL**: Disable turn-around data lane 0
This bit is used to prevent the bi-directional lane from processing a turn-around request in the lane interconnect
0: Disabled
1: Enabled

Bit 3 Reserved, must be kept at reset value.

Bit 2 **FTXSMDL0**: Force to Tx Stop mode the data lane 0
0: Disabled
1: Enabled

Bit 1 **FRXMDL1**: Force to Rx mode the data lane 1
Module 0 into receive mode/wait for stop state.
0: Disabled
1: Enabled

Bit 0 **FRXMDL0**: Force to Rx mode the data lane 0
Module 0 into receive mode/wait for stop state.
0: Disabled
1: Enabled

43.10.3 CSI PHY frequency control register (CSI_PFCR)

Address offset: 0x1008

Reset value: 0x0000 0017

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DLD
															rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	HSFR[6:0]							Res.	Res.	CCFR[5:0]					
	rw	rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **DLD**: Data lane direction of lane 0
0: Rx
1: Tx

Bit 15 Reserved, must be kept at reset value.

Bits 14:8 **HSFR[6:0]**: PHY high-speed frequency range selection
Must be set when the CSI PHY is in power-down, and must not change during operation.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:0 **CCFR[5:0]**: Configuration clock frequency range selection
Must be set at value = round (Fcfg_clk(MHz) - 17) * 4.

43.10.4 CSI PHY test control register 0 (CSI_PTCR0)

Address offset: 0x1010

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRSEN	TCKEN
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **TRSEN**: Test-interface reset enable for the TDI bus into the PHY

Bit 0 **TCKEN**: Test-interface clock enable for the TDI bus into the PHY

43.10.5 CSI PHY test control register 1 (CSI_PTCR1)

Address offset: 0x1014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TDI[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **TWM**: Test-interface write mode selector
0: Data write operation is set on the rising edge of the testclk signal.
1: Address write operation is set on the falling edge of the testclk signal.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **TDI[7:0]**: Test-interface data in

43.10.6 CSI PHY test status register (CSI_PTSR)

Address offset: 0x1018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LANES[3:0]				TECHNO[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **LANES[3:0]**: Amount of CSI data lanes (excluding the clock lane)
0x0: Lane information not provided
0x1: One CSI data lane implemented
0x2: Two CSI data lanes implemented
0x4: Four CSI data lanes implemented

Bits 3:0 **TECHNO[3:0]**: Technology
This field returns the technology used.
0x0: Technology information not provided
0x1: Reserved for 40nm PHY
0x2: 16FF Synopsys PHY.

43.10.8 CSI-2 Host version register (CSI_VERR)

Address offset: 0x1FF4

Reset value: 0x0000 0010

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJREV[3:0]				MINREV[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision
This field returns the major revision of the CSI-2 Host.

Bits 3:0 **MINREV[3:0]**: Major revision
This field returns the minor revision of the CSI-2 Host.

43.10.9 CSI-2 Host identification register (CSI_IPIDR)

Address offset: 0x1FF8

Reset value: 0x0016 2011

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ID[31:0]**: Identification code
This field returns the identification code of the CSI-2 Host.

43.10.10 CSI-2 Host size identification register (CSI_SIDR)

Address offset: 0x1FFC

Reset value: 0xA3C5 DD08

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SID[31:16]

Refer to *Section 2.4* for the register boundary addresses.

44 Parallel synchronous slave interface (PSSI)

The PSSI peripheral and the DCMI (digital camera interface) use the same circuitry. As a result, these two peripherals cannot be used at the same time: when using the PSSI, the DCMI registers cannot be accessed, and vice-versa.

In addition, the PSSI and the DCMI share the same alternate functions and interrupt vector (see *Section 44.3.2: PSSI pins and internal signals*).

44.1 PSSI introduction

The PSSI is a generic synchronous 8/16-bit parallel data input/output slave interface. It enables the transmitter to send a data valid signal that indicates when the data is valid, and the receiver to output a flow control signal that indicates when it is ready to sample the data.

44.2 PSSI main features

The PSSI peripheral main features are the following:

- Slave mode operation
- 8-bit or 16-bit parallel data input or output
- 8-word (32-byte) FIFO
- Data enable (PSSI_DE) and Ready (PSSI_RDY) alternate function

  When selected, these signals can either enable the transmitter to indicate when the data is valid, allow the receiver to indicate when it is ready to sample the data, or both.

44.3 PSSI functional description

The PSSI is a synchronous parallel slave interface that can send or receive high-speed data flows. It consists of up to 16 data lines (PSSI_D[15:0]) plus a clock line (PSSI_PDCK). The clock polarity can be configured so that data can be captured or transmitted on either the clock rising or falling edge.

Usually, a general-purpose DMA channel is used to pass 32-bit packed data via the data register (PSSI_DR).

The data flow can either be continuous or synchronized by hardware using the optional PSSI_DE (Data enable), and PSSI_RDY (Ready) signals.

Figure 380 shows the PSSI block diagram.

44.3.1 PSSI block diagram

Figure 380. PSSI block diagram

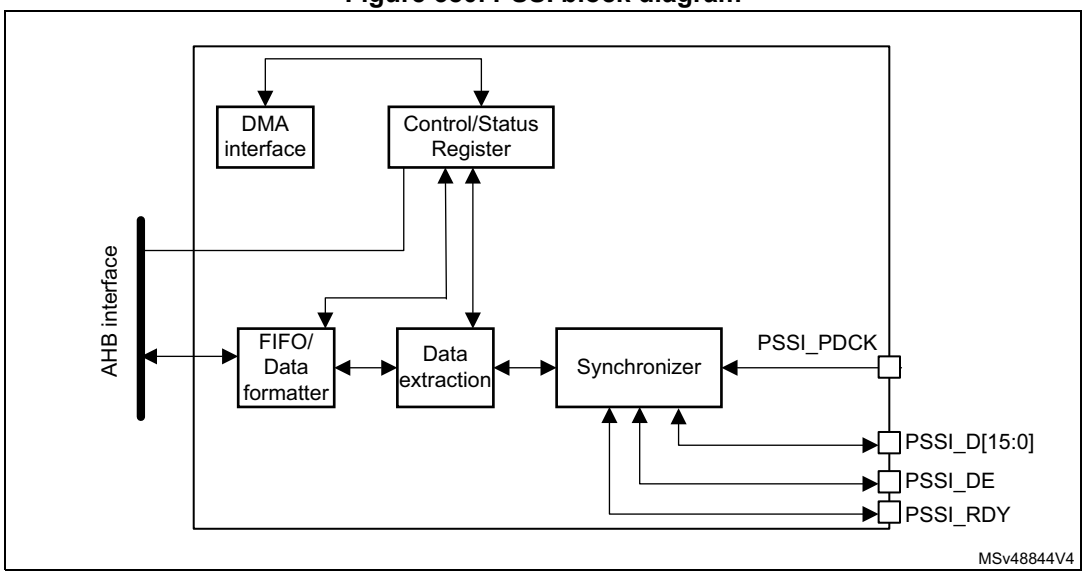

Figure 381. Top-level block diagram

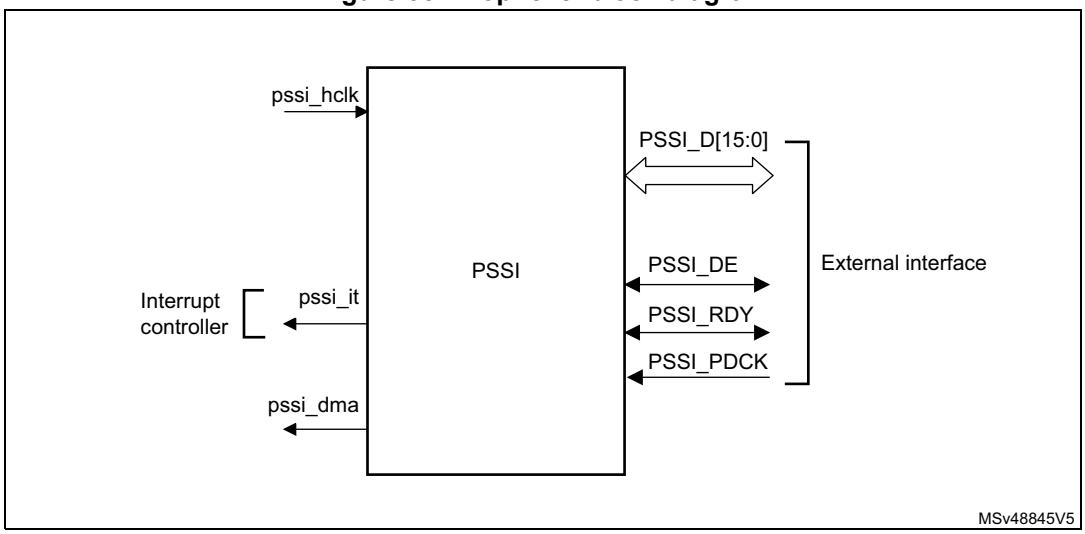


44.3.2 PSSI pins and internal signals

The PSSI interface is composed of 19 pins, though nine signals are enough to transfer parallel data. *Table 419* shows the PSSI pins.

When the PSSI ENABLE bit (bit 14 of PSSI_CR) is set to 1, the alternate functions and the interrupt vector are associated with the PSSI. Otherwise, they are associated with the DCMI. The DCMI ENABLE bit (bit 15 of DCMI_CR) and the PSSI ENABLE bit (bit 14 of PSSI_CR) must not be set to 1 at the same time. As an example, if a GPIO is configured to use the alternate function PSSI_PDCK/DCMI_PIXCK, it is the PSSI_PDCK function which becomes active if PSSI_CR/ENABLE is set to 1.

Table 419. PSSI input/output pins

PSSI signal name	DCMI signal it is shared with	Signal type	Description
PSSI_PDCK	DCMI_PIXCK	Input	Parallel data clock input
PSSI_D[15:0]	DCMI_D[13:0]	Input/output	Data output when transmitting, data input when receiving
PSSI_DE	DCMI_HSYNC	Input/output	Data enable signal
PSSI_RDY	DCMI_VSYNC	Input/output	Ready signal

Table 420 shows the PSSI internal input/output signals.

Table 420. PSSI internal input/output signals

Internal signal name	Signal type	Description
pssi_it	Output	Interrupt
pssi_dma	Output	DMA request
pssi_hclk	Input	AHB clock

44.3.3 PSSI clock

The AHB clock frequency must be at least 2.5 times higher than the PSSI_PDCK frequency. At frequency ratios lower than 2.5, data might be corrupted or lost during transfers.

Data transfers are synchronous with PSSI_PDCK. The PSSI_PDCK polarity can be configured as follows, through CKPOL bit (bit 5 of PSSI_CR):

- When CKPOL = 0
  - Input pins are sampled on PSSI_PDCK falling edge
  - Output pins are driven on PSSI_PDCK rising edge
- When CKPOL = 1
  - Input pins are sampled on PSSI_PDCK rising edge
  - Output pins are driven on PSSI_PDCK falling edge

44.3.4 PSSI data management

Data direction

The direction of data transfers is configured through the OUTEN control bit (bit 31 of PSSI_CR):

- When OUTEN is cleared to 0 (default setting), the PSSI operates in receive mode and the data is input on the data pins.
- When OUTEN is set to 1, the peripheral operates in transmit mode and the data is output on the data pins.

OUTEN can be modified only when the ENABLE bit is cleared to 0.

Data register and DMA

Data are transferred from/to the FIFO using the PSSI_DR data register:

- In receive mode, data must be read from the FIFO by reading PSSI_DR.
- In transmit mode, data must be written to the FIFO by writing into PSSI_DR.

Word (32-bit) accesses to PSSI_DR and half-word (16-bit) accesses to PSSI_DR[15:0] are permitted in all modes. Byte (8-bit) accesses to PSSI_DR[7:0] are permitted only when the PSSI is configured to transfer 8 bits at a time (EDM=00 in the PSSI_CR register).

To reduce the load on the CPU, it is recommended to use the DMA to transfer data from/to the PSSI FIFO. When it is used, the DMA must be configured to transfer data via the PSSI_DR register. Using 32-bit transfers optimizes bandwidth and reduces the bus load. However, 8-bit and 16-bit transfers are also permitted.

To use the DMA, set the PSSI DMA enable bit (DMAEN in PSSI_CR) to 1 (default setting). When DMAEN is set to 1, a DMA transfer is initiated when the FIFO is ready for a 32-bit transfer (four valid bytes in receive mode or four empty bytes in transmit mode). As a result, in receive mode, no DMA transfers are initiated if there are three bytes or fewer in the FIFO, even if the DMA is configured to perform 8-bit transfers.

The RTT4B and RTT1B status bits (PSSI_SR) are useful when the CPU directly perform transfers to and from the FIFO. RTT4B set to 1 indicates that the FIFO is ready to transfer four bytes: at least four valid bytes in the FIFO in receive mode or at least four free bytes in transmit mode. RTT1B set to 1 indicates that the FIFO is ready to transfer one byte: at least one valid byte in the FIFO in receive mode or at least one free byte in transmit mode.

8-bit data

The PSSI parallel interface can transfer either 8-bit (using D[7:0]) or 16-bit data (using D[15:0]) depending on the EDM[1:0] control bits (bits 11:10 of PSSI_CR). If the 8-bit configuration is selected (EDM[1:0] set to 00), the unused D[15:0] pins can be used for GPIO or other functions.

When EDM[1:0] in PSSI_CR are programmed to 00, the interface transfers 8 bits using the D[7:0] pins. In this case, D[15:8] are not used and four PSSI_PDCK cycles are required to transfer a 32-bit word.

The least-significant byte (bits 7:0) correspond to the first byte transferred, and the most-significant byte (bits 31:28) corresponds to the forth byte transferred. *Table 421* illustrates the positioning of the data bytes in two 32-bit words.

Table 421. Positioning of captured data bytes in 32-bit words (8-bit width)

Byte address	31:24	23:16	15:8	7:0
0	D_{n+3}[7:0]	D_{n+2}[7:0]	D_{n+1}[7:0]	D_n[7:0]
4	D_{n+7}[7:0]	D_{n+6}[7:0]	D_{n+5}[7:0]	D_{n+4}[7:0]

16-bit data

When EDM[1:0] in PSSI_CR are programmed to 11, the interface transfers 16 bits using the D[15:0] pins. In this case, two PSSI_PDCK cycles are required to transfer a 32-bit word.

The least-significant half word (bits 15:0) correspond to the first half word transferred, and the most-significant half-word (bits 31:16) corresponds to the second half word transferred. *Table 422* illustrates the positioning of the data in two 32-bit words.

Table 422. Positioning of captured data bytes in 32-bit words (16-bit width)

Byte address	31:16	15:0
0	D_{n+1}[15:0]	D_n[15:0]
4	D_{n+3}[15:0]	D_{n+2}[15:0]

FIFO data buffer and error conditions

An eight-word FIFO helps improving performance and avoids overruns and underruns.

If the ready signal (PSSI_RDY) is disabled in receive mode, an overrun error is generated when a clock active edge occurs when the FIFO is full. In this case, the input data is lost.

If the data enable signal (PSSI_DE) is disabled in transmit mode, an underrun error is generated when a clock active edge occurs when the FIFO is empty. In this case, unpredictable data are output.

The OVR_RIS status bit indicates that either an overrun or an underrun occurred. An interrupt can be generated when these events occur.

44.3.5 PSSI optional control signals

Data Enable (PSSI_DE) alternate function input

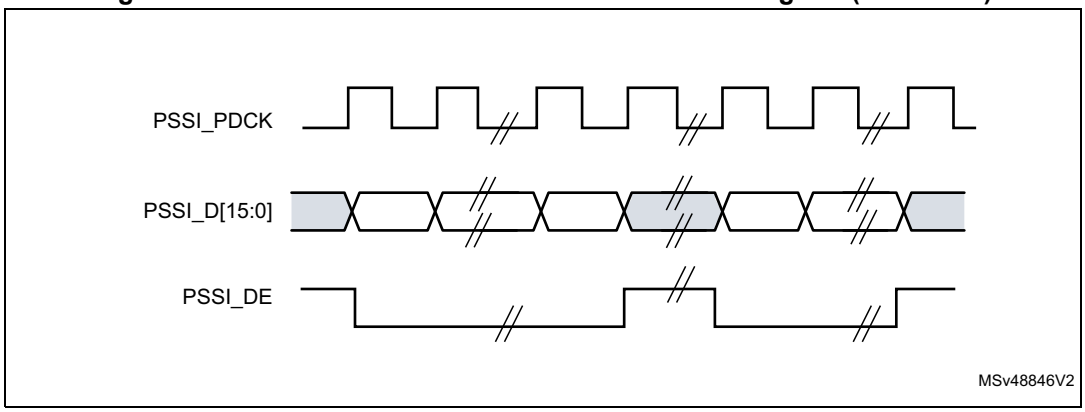
The data enable signal, PSSI_DE, is an optional signal. It is driven by the data source/transmitter in order to indicate that the data is valid to be transferred during the current cycle. When PSSI_DE is inactive, it means that the data must not be sampled by the receiver at the next clock edge.

This alternate function signal can be enabled using the DERDYCFG (bits 20:18 of PSSI_CR) control bits. PSSI_DE polarity is configured through DEPOL control bit (bit 6 of PSSI_CR). PSSI_DE is active low when DEPOL is cleared to 0, and high when DEPOL is et to 1.

The direction of the PSSI_DE signal is defined by the OUTEN value. It is the same as the data direction.

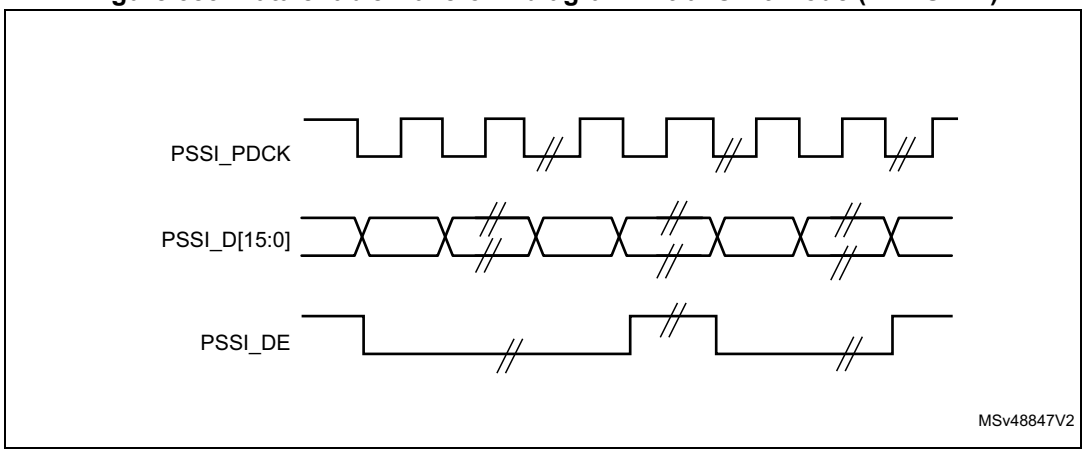
If the PSSI_DE alternate function input is enabled (through DERDYCFG) in receive mode (OUTEN cleared to 0), the PSSI samples PSSI_DE on the same PSSI_PDCK edge as the one used for sampling the data (D[15:0]). If PSSI_DE is active, the sampled data is saved in the FIFO. Otherwise, the sampled data is considered invalid and discarded. The transmitting device can use PSSI_DE as a data valid signal, driving it inactive when the data in the current cycle is not valid. This flow control function allows avoiding underrun errors.

Figure 382. Data enable in receive mode waveform diagram (CKPOL=0)



If the PSSI_DE alternate output function is enabled (through DERDYCFG) in transmit mode (OUTEN=1), the PSSI drives PSSI_DE on the same PSSI_PDCK edge that the one used to drive the data (D[15:0]). If a new 8 or 16-bit data (as programmed in the EDM[1:0] control bits in PSSI_CR) is available for transmission in the internal FIFO, this data is output on the data outputs (D[15:0]) and the PSSI_DE output becomes active on the current PSSI_PDCK edge. Otherwise (if the TX FIFO is empty), the D[15:0] outputs remains unchanged on the next clock edge and the PSSI_DE output becomes inactive.

Figure 383. Data enable waveform diagram in transmit mode (CKPOL=1)



Ready (PSSI_RDY) alternate function output

The ready signal, PSSI_RDY, is an optional signal. It is driven by the receiving device and indicates whether data is being accepted in the current cycle. When PSSI_RDY is inactive, it means that the data must not be sampled by the receiver at the next clock edge.

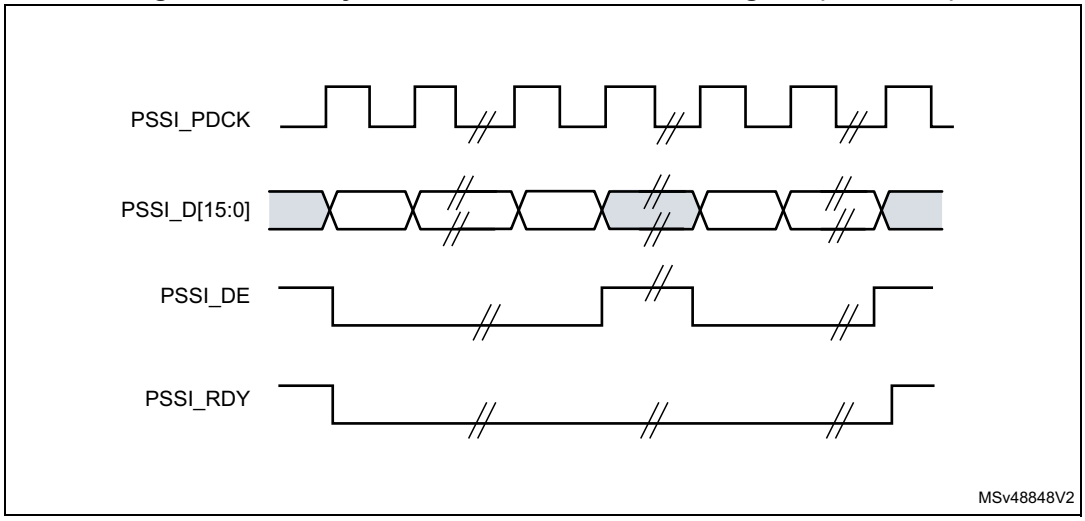
This alternate function signal can be enabled using the DERDYCFG control bits (bits 20:18 of PSSI_CR). PSSI_RDY polarity is configured through the RDYPOL control bit (bit 6 of PSSI_CR). PSSI_RDY is active low when RDYPOL is cleared to 0, and high when RDYPOL set to 1.

The direction of the PSSI_RDY signal is defined by the OUTEN (bit 31 of PSSI_CR). It is set in the opposite direction compared to the PSSI_DE and data signals.

If the PSSI_RDY alternate output function is enabled (through DERDYCFG) in receive mode (OUTEN=0), the PSSI drives PSSI_RDY one PSSI_PDCK half cycle after it samples

the data (D[15:0]). If the FIFO has enough free space to receive more data, the PSSI drives the PSSI_RDY signal active. Otherwise, if the FIFO is full and cannot accept more data, the PSSI drives the PSSI_RDY signal inactive. The transmitting device must repeat the current data in the next cycle when it detects that PSSI_RDY is inactive. This flow control function allows the PSSI to avoid overrun errors when the system (via the DMA) is unable to keep up with the data flow.

Figure 384. Ready in receive mode waveform diagram (CKPOL=0)



If the PSSI_RDY alternate input function is enabled (through DERDYCFG) in transmit mode (OUTEN=1), the PSSI samples the PSSI_RDY signal on the opposite PSSI_PDCK edge to the one at which D[15:0] are driven. If the PSSI_RDY signal is inactive, the PSSI keeps the same data (D[15:0]) and PSSI_DE signals that valid data are available during the next PSSI_PDCK clock cycle. Otherwise, if PSSI_RDY signal is sampled as active, the next data from the TX FIFO (if available) is output on the data outputs (D[15:0]). If no new data are available in the TX FIFO, the PSSI keeps the data output values and outputs the PSSI_DE signal as inactive (if enabled).

The receiving device uses the PSSI_RDY to control the data flow and avoid overrun errors when the system (via the DMA) is unable to keep up with the data flow.

Bidirectional PSSI_DE/PSSI_RDY signal

A single pin can be used for both data enable (PSSI_DE) and ready (PSSI_RDY) functions if DEPOL and RDYPOL are both set to 1 and DERDYCFG is set to 111 or 100 in the PSSI_CR register. In this case, the GPIO corresponding to selected alternate function (PSSI_DE when DERDYCFG=111 or PSSI_RDY when DERDYCFG=100) must be configured as open-drain. The other device must also be configured to drive the line as open-drain, and a weak pull-up must be applied to the line.

The signal thus becomes bidirectional. If either the sender drives the line low (to indicate that the data is not valid) or the receiver drives the line low (to indicate that it is not sampling the current data), then both devices know that the data is not being transferred in the current cycle.

Figure 385. Bidirectional PSSI_DE/PSSI_RDY waveform

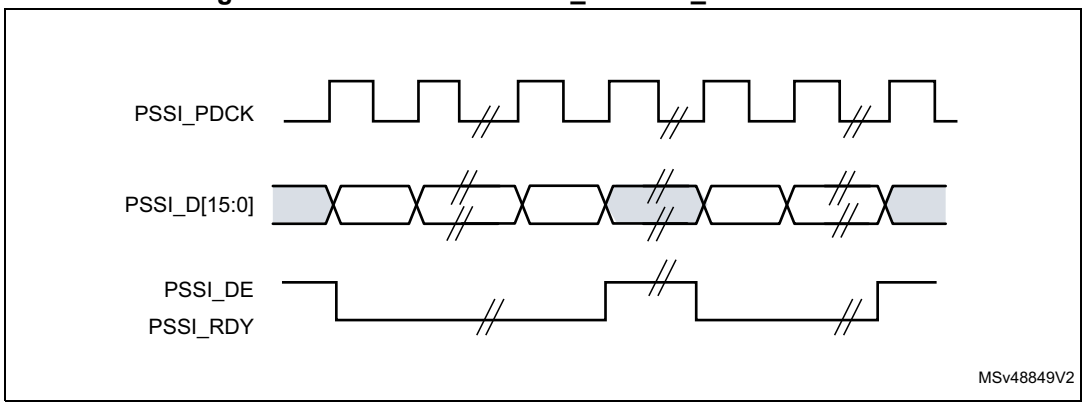


Figure 386. Bidirectional PSSI_DE/PSSI_RDY connection diagram

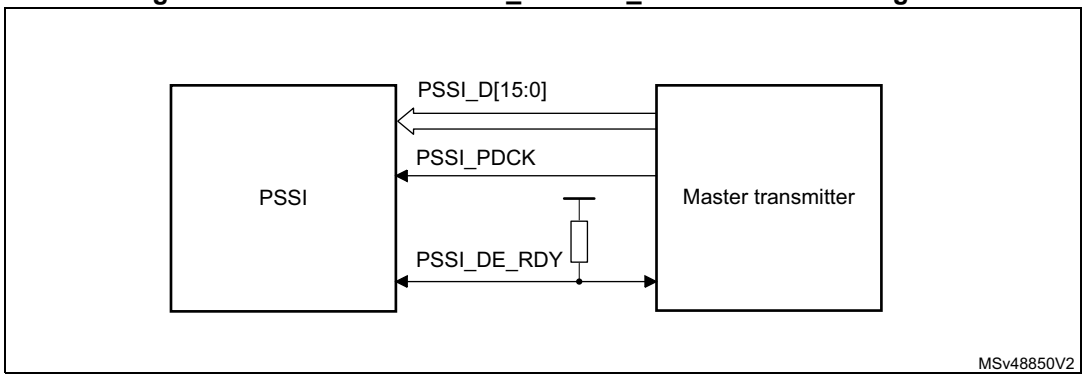

44.4 PSSI interrupts

The PSSI generates only one interrupt (IT_OVR). It is consequently equivalent to the global interrupt (pssi_it). Refer to *Table 423* for the list of interrupts.

The PSSI and the DCMI share the same interrupt vector. When the PSSI ENABLE bit (bit 14 of PSSI_CR) is set to 1, these interrupts are triggered by the PSSI. Otherwise, they are controlled by the DCMI.

The DCMI ENABLE bit (bit 14 of DCMI_CR) and PSSI ENABLE bit must not be set to 1 at the same time.

Table 423. PSSI interrupt requests

Interrupt acronym	Shared with DCMI	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from low-power mode
IT_OVR	IT_OVR	indicates overrun in receive mode or underrun in transmit mode	OVR_RIS	OVR_IE	OVR_ISC	NA

44.5 PSSI registers

An 8-bit write or a 16-bit write operation to any PSSI register besides PSSI_DR, results in a bus error. 32-bit read and write operations are permitted.

44.5.1 PSSI control register (PSSI_CR)

Address offset: 0x00

Reset value: 0x4000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OUTEN	DMAEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DERDYCFG[2:0]			Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	ENABLE	Res.	Res.	EDM[1:0]		Res.	RDYPOL	Res.	DEPOL	CKPOL	Res.	Res.	Res.	Res.	Res.
	rw			rw	rw		rw		rw	rw					

Bit 31 **OUTEN:** Data direction selection bit

0: Receive mode: data is input synchronously with PSSI_PDCK

1: Transmit mode: data is output synchronously with PSSI_PDCK

Bit 30 **DMAEN:** DMA enable bit

0: DMA transfers are disabled. The user application can directly access the PSSI_DR register when DMA transfers are disabled.

1: DMA transfers are enabled (default configuration). A DMA channel in the general-purpose DMA controller must be configured to perform transfers from/to PSSI_DR.

Bits 29:21 Reserved, must be kept at reset value.

Bits 20:18 **DERDYCFG[2:0]:** Data enable and ready configuration

000: PSSI_DE and PSSI_RDY both disabled

001: Only PSSI_RDY enabled

010: Only PSSI_DE enabled

011: Both PSSI_RDY and PSSI_DE alternate functions enabled

100: Both PSSI_RDY and PSSI_DE features enabled - bidirectional on PSSI_RDY pin (see *Bidirectional PSSI_DE/PSSI_RDY signal on page 2425*)

101: Only PSSI_RDY function enabled, but mapped to PSSI_DE pin

110: Only PSSI_DE function enabled, but mapped to PSSI_RDY pin

111: Both PSSI_RDY and PSSI_DE features enabled - bidirectional on PSSI_DE pin (see *Bidirectional PSSI_DE/PSSI_RDY signal on page 2425*)

When the PSSI_RDY function is mapped to the PSSI_DE pin (settings 101 or 111), it is still the RDYPOL bit which determines its polarity. Similarly, when the PSSI_DE function is mapped to the PSSI_RDY pin (settings 110 or 111), it is still the DEPOL bit which determines its polarity.

Bits 17:15 Reserved, must be kept at reset value.

Bit 14 **ENABLE:** PSSI enable

0: PSSI disabled

1: PSSI enabled

The contents of the FIFO are flushed when ENABLE is cleared to 0.

Note: When ENABLE=1, the content of PSSI_CR must not be changed, except for the ENABLE bit itself. All configuration bits can change as soon as ENABLE changes from 0 to 1.

The DMA controller and all PSSI configuration registers must be programmed correctly before setting the ENABLE bit to 1.

The ENABLE bit and the DCMI ENABLE bit (bit 15 of DCMI_CR) must not be set to 1 at the same time.

Bits 13:12 Reserved, must be kept at reset value.

Bits 11:10 **EDM[1:0]:** Extended data mode

00: Interface captures 8-bit data on every parallel data clock

01: Reserved, must not be selected

10: Reserved, must not be selected

11: The interface captures 16-bit data on every parallel data clock

Bit 9 Reserved, must be kept at reset value.

Bit 8 **RDYPOL:** Ready (PSSI_RDY) polarity

This bit indicates the level on the PSSI_RDY pin when the data are not valid on the parallel interface.

0: PSSI_RDY active low (0 indicates that the receiver is ready to receive)

1: PSSI_RDY active high (1 indicates that the receiver is ready to receive)

Bit 7 Reserved, must be kept at reset value.

Bit 6 **DEPOL:** Data enable (PSSI_DE) polarity

This bit indicates the level on the PSSI_DE pin when the data are not valid on the parallel interface.

0: PSSI_DE active low (0 indicates that data is valid)

1: PSSI_DE active high (1 indicates that data is valid)

Bit 5 **CKPOL:** Parallel data clock polarity

This bit configures the capture edge of the parallel clock or the edge used for driving outputs, depending on OUTEN.

0: Falling edge active for inputs or rising edge active for outputs

1: Rising edge active for inputs or falling edge active for outputs.

Bits 4:0 Reserved, must be kept at reset value.

44.5.2 PSSI status register (PSSI_SR)

Address offset: 0x04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RTT1B	RTT4B	Res.	Res.
												r	r		

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **RTT1B:** FIFO is ready to transfer one byte

1: FIFO is ready for a one byte transfer. In receive mode, this means that at least one valid data byte is in the FIFO. In transmit mode, this means that there is at least one byte free in the FIFO.

0: FIFO is not ready for a 1-byte transfer

Bit 2 **RTT4B:** FIFO is ready to transfer four bytes

1: FIFO is ready for a four-byte (32-bit) transfer. In receive mode, this means that at least four valid data bytes are in the FIFO. In transmit mode, this means that there are at least four bytes free in the FIFO.

0: FIFO is not ready for a four-byte transfer

Bits 1:0 Reserved, must be kept at reset value.

44.5.3 PSSI raw interrupt status register (PSSI_RIS)

Address offset: 0x08

Reset value: 0x0000 0000

PSSI_RIS gives the raw interrupt status. This register is read-only. When read, it returns the status of the corresponding interrupt before masking with the PSSI_IER register value.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OVR_RIS	Res.
														r	

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **OVR_RIS:** Data buffer overrun/underrun raw interrupt status

0: No overrun/underrun occurred

1: An overrun/underrun occurred: overrun in receive mode, underrun in transmit mode. This bit is cleared by writing a 1 to the OVR_ISC bit in PSSI_ICR.

Bit 0 Reserved, must be kept at reset value.

44.5.4 PSSI interrupt enable register (PSSI_IER)

Address offset: 0x0C

Reset value: 0x0000 0000

The PSSI_IER register is used to enable interrupts. When one of the PSSI_IER bits is set, the corresponding interrupt is enabled. This register is accessible both in read and write modes.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OVR_IE	Res.
														rw	

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **OVR_IE:** Data buffer overrun/underrun interrupt enable
0: No interrupt generation
1: An interrupt is generated if either an overrun or an underrun error occurred.

Bit 0 Reserved, must be kept at reset value.

44.5.5 PSSI masked interrupt status register (PSSI_MIS)

This PSSI_MIS register is read-only. When read, it returns the current masked status value of the corresponding interrupt (depending on the value in PSSI_IER). A bit in this register is set if the corresponding enable bit in PSSI_IER is set and the corresponding bit in PSSI_RIS is set.

Address offset: 0x10

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OVR_MIS	Res.
														r	

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **OVR_MIS:** Data buffer overrun/underrun masked interrupt status
This bit is set to 1 only when PSSI_IER/OVR_IE and PSSI_RIS/OVR_RIS are both set to 1.
0: No interrupt is generated when an overrun/underrun error occurs
1: An interrupt is generated if there is either an overrun or an underrun error and the OVR_IE bit is set in PSSI_IER.

Bit 0 Reserved, must be kept at reset value.

44.5.6 PSSI interrupt clear register (PSSI_ICR)

Address offset: 0x14

Reset value: 0x0000 0000

The PSSI_ICR register is write-only. Writing a 1 into a bit of this register clears the corresponding bit in the PSSI_RIS and PSSI_MIS registers. Writing a 0 has no effect. Reading this register always gives zeros.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OVR_ISC	Res.
														w	

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **OVR_ISC:** Data buffer overrun/underrun interrupt status clear
Writing this bit to 1 clears the OVR_RIS bit in PSSI_RIS.

Bit 0 Reserved, must be kept at reset value.

44.5.7 PSSI data register (PSSI_DR)

Address offset: 0x28

Reset value: 0x0000 0000

In receive mode (OUTEN = 0), the DMA controller must read the received data from this register. Write operations to PSSI_DR result in an error response. When more bytes than the number of valid bytes are read in the FIFO, the invalid bytes return zeros.

In transmit mode (OUTEN = 1), the DMA controller must write the data to be transmitted into this register. Read operations to PSSI_DR result in an error response.

32-bit, 16-bit, and 8-bit accesses are all supported for PSSI_DR. For instance, 16-bit read/write operations remove/add two bytes from/to the FIFO. However, 8-bit accesses are permitted only when the PSSI is configured to transfer 8 data bits at a time (EDM=00 in PSSI_CR). 8-bit accesses to PSSI_DR when EDM is not set to 0 result in an error response.

All accesses must include byte 0: 8-bit accesses must be performed to bits 7 to 0 and 16-bit accesses from bits 15 to 0. Accesses that do not include byte 0 results in an error response.

Accessing PSSI_DR when ENABLE bit in PSSI_CR is set to 0 results in an error response.

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

45 Display subsystem

45.1 Introduction

The display subsystem is targeted to drive up to 1080p60 display panels, through a parallel interface. It supports some on-the-fly compositions and optimizes the use of the system bandwidth: up to three layers, color conversion, blend, mirror, and a final YUV conversion.

The display subsystem can display a secure layer with data that cannot be read by non-secure application, and with the display guaranteed stable.

45.2 Display subsystem main features

The display subsystem is built around LTDC:

- LTDC: handles display composition
  - Composition: three layers
  - Input pixel format: flexible format, including YUV420 full-planar on layer L1
  - Secure layer: protected access to buffer and configuration registers.
  - Mirror: horizontal and vertical
  - Miscellaneous: color lookup-table, color keying, Gamma
  - 1080p60 max performance
- LTDC parallel interface (integrated inside the LTDC):
  - Standard: 24 bpp + Hs, Vs, De (DataEnable) synchronization signals with ReTime
  - Output rate: 150 Mpixel/s
  - Resolution: 1920x1080 at 60 fps max, with HDMI blankings
  - Pixel formats: RGB888, 666, 565, YUV422-16 bits/BT601/709

45.3 Display subsystem implementation

The implementation is described in *Section 46: LCD-TFT display controller (LTDC)*.

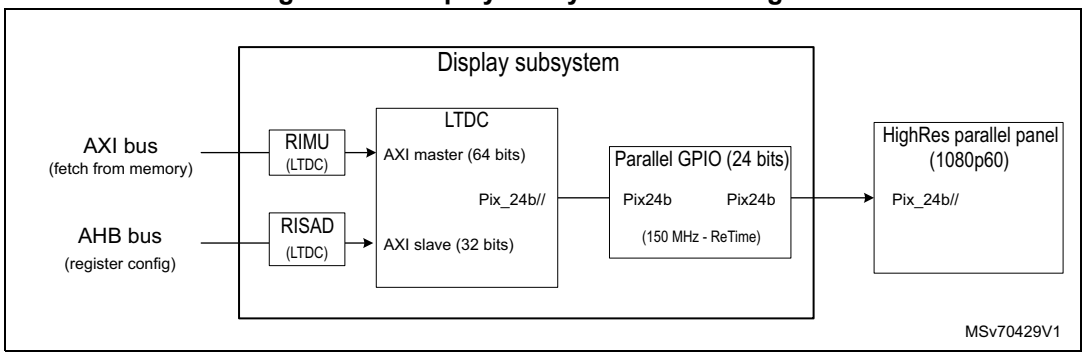
45.4 Display subsystem functional description

45.4.1 Display subsystem block diagram

Figure 387 shows the functional blocks in the display subsystem, with their instance/design names:

- LTDC: composition engine, includes a parallel interface
- Parallel GPIO: Parallel I/O-ring of the device with up to 24 bpp + H/V synchronization
- RIMU/RISAD: RIF security logic, configured for the specific display needs

Figure 387. Display subsystem block diagram

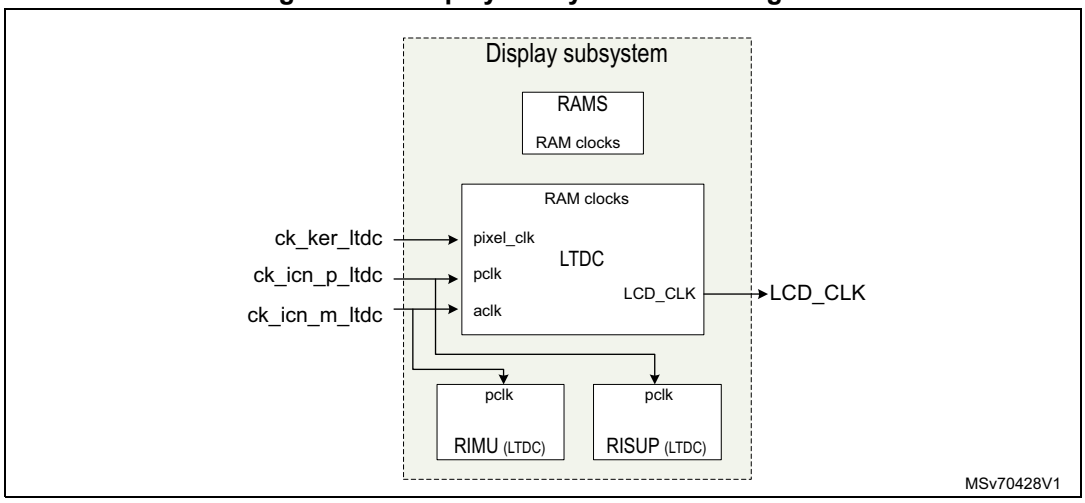


45.4.2 Display subsystem pins and external signal interface

The details of the pins and external signal interface of the display subsystem can be found in the respective functional block sections in this reference manual.

45.4.3 Display subsystem clocks

Figure 388. Display subsystem clock diagram



The display subsystem is implemented with the following clock max frequencies:

- LTDC pixel clock (pixel_clk): 150 MHz
- LTDC parallel interface (lcd_clk): 150 MHz (I/O ReTime mandatory)
- Register clocks (ck_icn_p_*): 150 MHz (all APB/AHB register files)
- AXI-Master clock (ck_icn_m_ltdc): 400 MHz

45.4.4 Display subsystem security

This section is an application of RIF security architecture (see *Section 5.4: Resource isolation framework (RIF)*). The security of the display subsystem is based on the protection of its register map and its master access to the system interconnect, based on default RISUP and RIMU respectively.

The RISUP differentiates the access right of accesses performed toward the following RIF protected peripheral ID (see *Table 38: Indexes for non-RIF-aware peripherals (RISUP)*):

- LTDC common: LTDC common registers, about panel info, synchronization, interface
- LTDC_L1L2 (layer 1 and 2): for the window of any two default applications
- LTDC_L3: LTDC layer 3, for the window of a potentially secure application, or any default application if there is no secure layer

The RIMU (RIMU_AXI_LTDC) differentiates the bus transactions emitted by the following AXI masters:

- RIMU_L1L2: read access only for layer 1 and 2, always non-protected
- RIMU_L3: read access only for layer 3, potentially protected

Security configuration of devices with never-secure display content

The security setup of devices that are never required to display any secure content is detailed below (the display subsystem works by default in a non-protected mode):

- The display subsystem configuration space is set as non-protected.

  The default operating system (OS) software has a full access and can configure/handle all peripherals of the display subsystem.
- The layer 3 (which has a hardware secure capability) can be reused as a default layer, like layer 1 and 2, and can display the content of any application.

Note: Layer 3 is not fully featured, and lacks the resize and multi-planar capabilities of layers 1/2.

- The LTDC AXI-master emits by default non-protected accesses. It inherits NP and NS modes from its associated RIF peripheral ID.

  The AXI CID = DISP can be associated to the three AXI clients, via the RIMU, to tag that the AXI transaction contains pixels.

Security configuration of devices with a temporary secure content

For devices that temporarily display a secure content, it is expected that the secure content is displayed during short periods.

The working principle of the display subsystem is to segregate configuration spaces:

- The secure layer 3 is always protected.
- Never-secure layers 1 and 2 are always non-protected.
- The intermediate common features (such as panel data, synchronization) are usually non-protected and handled by the OS (when no secure content is displayed), but temporarily protected (with no OS access) during the short period when a secure content is displayed via layer 3. Removing the access of the non-protected OS guarantees that a malware does not impact the stability of the displayed protected content.
- A few minor items get specifically protected or open, as detailed below.

The configuration of the display subsystem for a secure content is the following:

- Layer 3 is set permanently protected:
  - RIF LTDC_L3 RISUP peripheral ID must be set as protected (S and/or P flags).
  - RIF LTDC_L3 RIMU AXI-Master emits protected transactions (tagged as S a/o P), which allow it to retrieve the protected layer 3 pixels from their protected memory

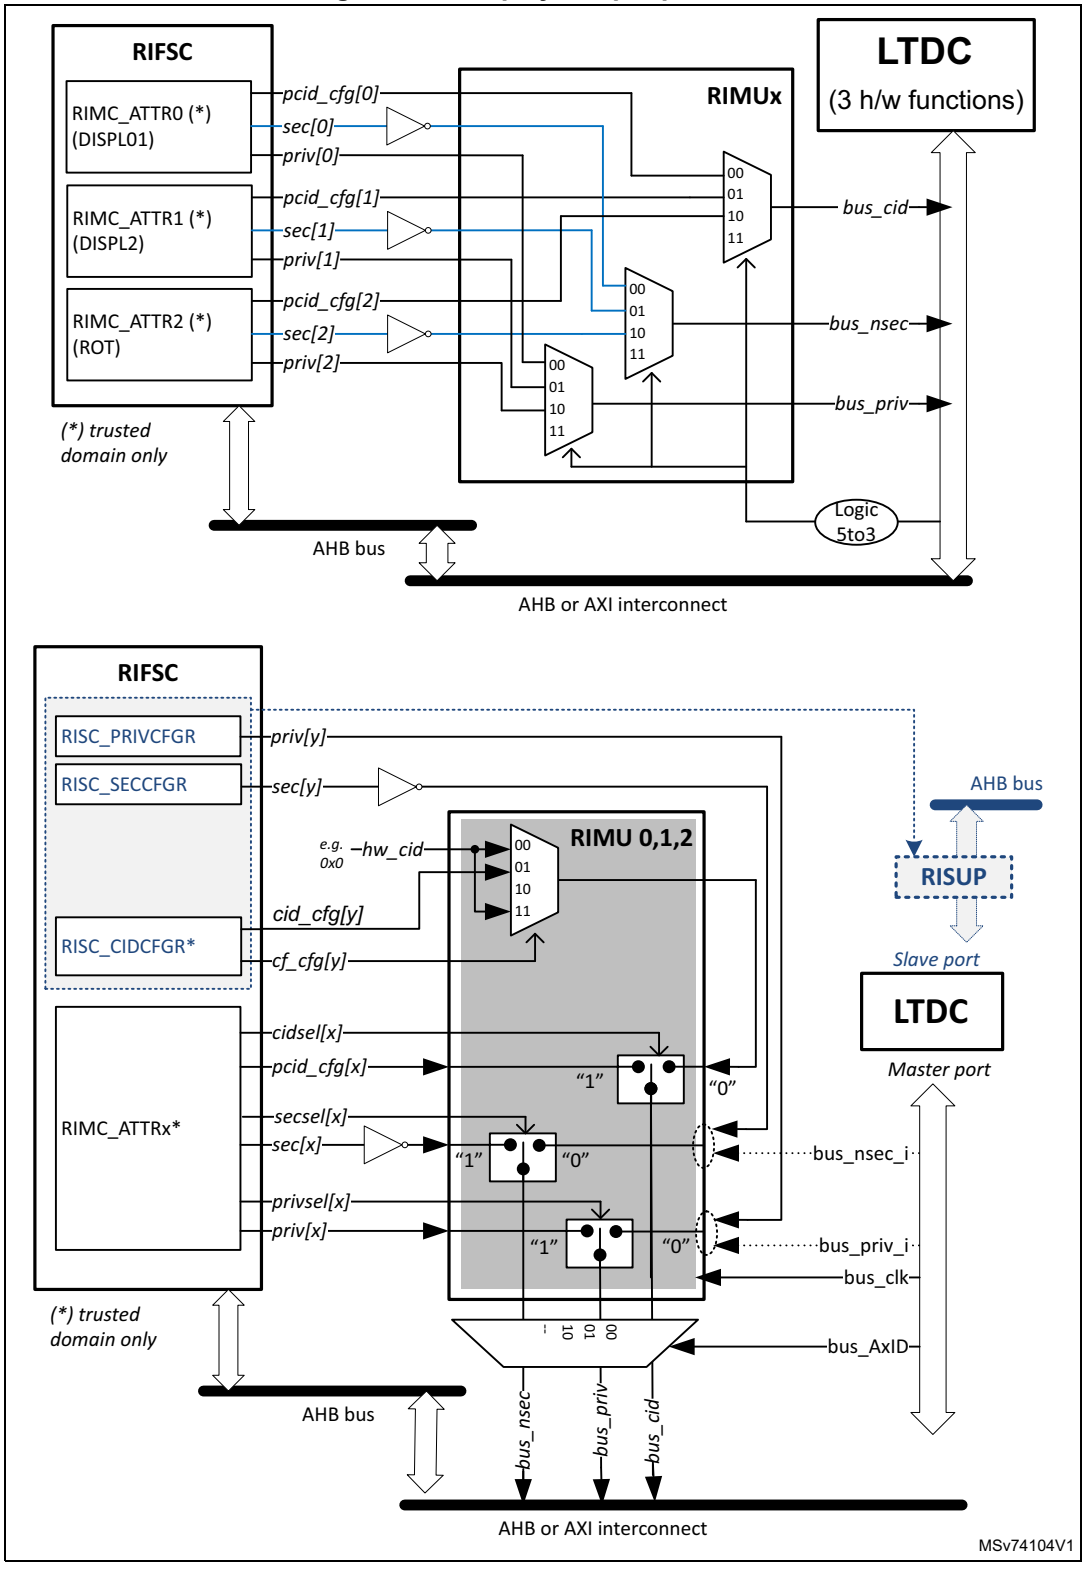
buffer. The RIMU must be updated by a trusted domain application using RIFSC_RIMC_ATTR12.

The recommendation is to use a secure, privileged (optional), and CID = 0x4 setup that is configured in RIFSC_RISC_PER120_CIDCFGR (and optionally RIFSC_RISC_PER120_SEMCR). With this secure setup, the application must make sure that CID4 has access to the secure pixels area.

  - Only a secure software is able to configure the layer 3 parameters (such as width, height, buffer address), so that the characteristics of the layer 3 are guaranteed.
  - The interrupt bank B is associated automatically with the layer 3, and gets permanently protected and devoted to the secure software handling layer 3. The secure software must thus handle and be driven by that interrupt bank B.
  - The LTDC features that must allow data-evasion get also protected (automatically, as associated with the layer 3 rights), with an access allowed only to the secure software. These features are the CRC (which allows the displayed frames to be signed mainly for test purposes), the blend-order (which is used to hide the protected content below some malware layer faking the protected content).
- Layers 1 and 2 are set permanently as non-protected:
  - RIF LTDC_L1L2 RISUP peripheral ID is set as not protected.
  - RIF LTDC_L1L2 RIMU AXI-master keeps its initial setup in RIFSC_RIMC_ATTR11, and emits only non-protected transactions which is enough to retrieve pixels from any application buffer.
  - The default OS drivers handle the layer 1 and 2 parameters (such as width, height, buffer address).
  - The interrupt bank A is associated automatically with layer 1 and 2, and keeps an non-protected open access. The OS must then handle and be driven by that Interrupt bank A to globally drive the display.
- Common registers must be set at boot as non-protected, temporarily:
  - The non-layer peripheral index RIF LTDC common is concerned.
  - This allows the default OS to boot the display subsystem, and to handle it.
- Common registers must be set as protected when displaying a protected content:
  - RIF LTDC common must be set protected before starting to display a protected content, and be unprotected after the protected content has finished to be updated. The LTDC common configuration space keeps a permanent read-access for non-secure or unprivileged software.
  - The protection restricts the write accesses only: it removes the access of the non-protected OS, and so guarantees that a malware does not impact the stability of the displayed protected content. The LTDC common configuration space keeps a permanent read-access for non-secure or unprivileged software (PRDENy bits in RISAB_CIDxRDCFGR can be used).
  - The protection does not restrict the read accesses: the OS is usually unaware of the status of the protected layer 3 that is handled by a different, secure, software. The read access capability for the OS allow the display drivers to remain. somehow stable, although the write access of the display drivers is not performed.

The above recommended settings for the device with temporary secure layer are shown in the figure below.

Figure 389. Display RIF peripheral ID



The table below lists vertically all the functional blocks of the display subsystem. It also lists horizontally the associated RIF peripheral ID.

Note: Table color legend for recommended settings:

- green for a permanently non-protected setting

- blue for a temporarily protected versus non-protected

- purple for a permanently protected state

Table 425. Display subsystem RIF peripheral ID

45.5 Display subsystem programmable parameters

Steps to configure the various main use cases supported by the display subsystem are detailed below. They provide the global picture and settings of the display subsystem (not repeating information available in the local sections).

45.5.1 Parallel-interface display

This is the default use case to drive a display panel or bridge through the parallel interface. It allows panels to be driven up to 1080p60 (150 Mpixel/s), with either RGB888 or YUV422.

The RCC provides a pixel clock that drives both the LTDC and its synchronous parallel interface. Aside, the LTDC needs an AXI-Master clock to fetch pixels, and an APB-Slave clock to get configured.

The steps to follow are detailed below:

1. Setup security settings, with or without a secure layer depending on application needs, as described in *Figure 387*.
2. Clock and reset:
   - ck_ker_ltdc clock, provided by the RCC, as output pixel clock.

     One PLL of the RCC needs to be allocated to the display subsystem to provide the clock that is exactly at the wanted pixel rate for the output display. For instance, a standard 1080p60 requires a 148,50 MHz clock.
   - DISPLAYCLKCR(1:0) setting = 0x2, to select the above ck_ker_ltdc as input for the pixel_clk of the LTDC.
   - o_clk_display_parallel, is driven automatically by the LTDC (after some gating) from its above provided pixel_clock (from the RCC ck_ker_ltdc).
   - ck_icn_p_ltdc is provided by the RCC to allow the LTDC configuration (default 150 MHz).
   - ck_icn_m_ltdc is provided by the RCC to allow the LTDC AXI to work (default 400 MHz).

   See *Section 20: Reset and clock control (RCC)* for more details.
3. LTDC configuration:
   - Setup the LTDC (such as input layers, display information, parallel interface, AXI settings) as described in the LTDC section.
4. Signal polarity:

   The polarities of the signals are impacted by the fact that the LTDC parallel interface signals are reclocked in the IO-ReTime logic, downstream of the LTDC. It results the following when configuring the polarities to match the panel on the parallel interface:
   - The clock polarity (rising-vs-falling edge) must be configured in the IO-ReTime only (see *Section 22: General-purpose I/Os (GPIO)*), and not in the LTDC output logic. The clock polarity logic in the LTDC must remain in its default post-reset state.
   - The polarity of the Vs, Hs, and De synchronization signals, unlike for the clock polarity, can be configured directly in the LDTC output stage (see *Section 46: LCD-TFT display controller (LTDC)*).
5. I/O configuration:

   Allocate an alternate GPIO bank to the display subsystem, with usually 28 pins needed: 24 pins for RGB888 and 4 others for the ancillary: HSync, VSync, DataEnable, and clock.

45.6 Display subsystem interrupts

The interrupts are described in sections of peripherals in this reference manual.

45.7 Display subsystem registers

All registers are described in *Section 46: LCD-TFT display controller (LTDC)*.

46 LCD-TFT display controller (LTDC)

46.1 LTDC introduction

The LTDC (liquid crystal display - thin film transistor) display controller provides a parallel digital RGB (Red, Green, Blue) and signals for horizontal, vertical synchronization, pixel clock and data enable as output to interface directly to a variety of LCD-TFT panels.

46.2 LTDC main features

- 3 input layers blended together to compose the display
- Cropping of layers from any input size and location
- Multiple input pixel formats:
  - Predefined ARGB formats: ARGB8888, ABGR8888, RGBA8888, BGRA8888, RGB565, BGR565, and RGB888packed
  - Flexible ARGB, allowing any width and location for A,R,G, and B components
  - Predefined YUV formats: YUV422-1L (FourCC: YUYV, Interleaved), YUV420-2L (FourCC: NV12, semi planar), YUV420-3L (FourCC: Yxx I420, full planar) with some flexibility on the component sequence
- Color look-up table (CLUT) up to 256 colors (256 x 24 bits) per layer
- Color transparency keying
- Upscaler (horizontal and vertical) with bilinear filtering, up to 8 x 8 with decimal ratios
- Composition with flexible window position and size versus output display
- Blending with flexible layer order and alpha value (per pixel or constant)
- Background underlying color
- Gamma with non-linear configurable table
- Dithering for output with less bits per component (pseudo-random on 2 bits)
- Polarity inversion for HSync, VSync, DataEnable outputs, and clock via the I/O
- Output as RGB888 24 bpp or YUV422 16 bpp (interleaved)
- Secure layer (using layer3) capability, with grouped regs and additional interrupt set
- Interrupts based on 7 different events, controlled by two independent register sets
- AXI master interface with long efficient bursts (64 or 128 bytes)

Note: The above mentioned FourCC pixel formats are described at www.fourcc.org.

46.3 LTDC implementation

The LTDC has been implemented with the following settings:

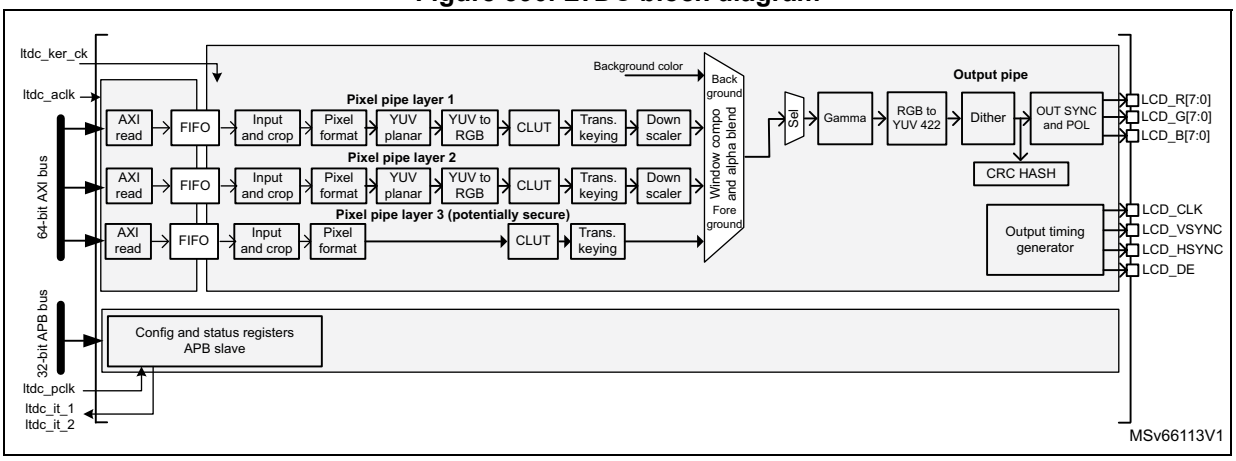
- Up to 24-bits 150 MHz pixel clock (up to 1080p60)
- AXI bandwidth: an average of up to 6 bytes per AXI cycle (2.4 Gbyte/s if 400 MHz)
- Maximum memory latency: 5 µs resilient (for 1080p60, thus 150 Mpixel/s)

These settings depend on the configured frequencies of the AXI and pixel clocks.

46.4 LTDC functional description

46.4.1 LTDC block diagram

Figure 390. LTDC block diagram



Blocks shown in the above figure are the following:

- AXI read/write: AXI DMA engines, exposing a final single read/write AXI interface
- FIFO: per-layer FIFO, sized to support large memory latencies
- Input and crop: crops any input window size from the input buffer
- Pixel format: pixel format converter, that extract 32-bit words into ARGB pixels
- YUV-to-RGB: YUV-Planar handling and YCbCr-to-RGB color conversion
- CLUT: color look-up table (256 entries) to allow indexed colors
- Transp. keying: extracts one color to define it as transparent
- Upscaler: upscaler with bilinear filtering, with decimal ratios
- Alpha blender: blending with configurable layer level and a background color
- Gamma: gamma correction, with 8-segment interpolations
- Dithering: reduces component dynamic, with pseudo-random smoothing
- RGB-to-YUV: output conversion to YCbCr, to support low-bitrate YUV422 links
- LCD-OUT: output pixel interface, with Clk, VSync, HSync, DE, RGB888
- CRC hash: CRC computation, per frame, to sign each frame and help debug
- Timing generator: handles the HSync/VSync timings and blanking
- APB registers (control, status, interrupts): accessed by APB

These operators and their configuration are described from *Section 46.5.1* to *Section 46.5.21*.

46.4.2 LTDC pins and internal signals

Table 426. LTDC pins

Pin name	Pin type	Description
LCD_CLK	Output	Clock output
LCD_HSYNC		Horizontal synchronization
LCD_VSYNC		Vertical synchronization
LCD_DE		Not data enable
LCD_R[7:0]		8-bit Red data (or U/V component, if output is YUV422)
LCD_G[7:0]		8-bit Green data (or Y component if output is YUV422)
LCD_B[7:0]		8-bit Blue data

The LTDC pins must be configured by the user application. The unused pins can be used for other purposes.

Using less pins than the default 24 bpp

The LTDC outputs the pixels on 24 pins by default (RGB888). The user can however connect the display panel using less wires, for instance 16 wires (if RGB565) or 18 wires (RGB666). If so, R (resp. G, B) wires must be connected to the MSB of the LTDC R (resp. G, B) output pins (see *Section 46.4.2*).

Example: LTDC interfacing with a RGB565 16-bit display panel. Display panel R[4:0], G[5:0] and B[4:0] wires and input pins must be connected to LTDC_R[7:3], LCD_G[7:2], and LCD_B[7:3] output pins.

46.4.3 LTDC reset and clocks

The LTDC uses the following clock domains:

- **AXI clock domain** (see ck_icn_m_ltdc in *Section 20: Reset and clock control (RCC)*)
  This domain contains the LTDC AXI master interface for data transfer from the memories to the layer FIFO and the frame buffer configuration register.
- **APB clock domain** (see ck_icn_p_ltdc in *Section 20: Reset and clock control (RCC)*)
  This domain contains the global configuration registers and the interrupt register.
- **Pixel clock domain** (see *Section 45: Display subsystem*)
  This domain contains the pixel data generation, the layer configuration register as well as the LTDC interface signal generator. The LCD_CLK output must be configured following the panel, or bridge (HDMI) requirements.

Note: For normal operation, all clocks must be provided to allow clock domain crossing for read and write operations.

The following table lists the clock domains used to store the register values.

Table 427. Clock domain for each register

LTDC register	Clock domain
LTDC_IDR	APB clock
LTDC_LCR	
LTDC_SSCR	Pixel clock
LTDC_BPCR	AXI + pixel clock
LTDC_AWCR

LTDC_LxCYR1R	
LTDC_LxFPF0R	
LTDC_LxFPR1R	

While accessing LTDC registers, the APB bus is stalled during the access for a given time period detailed in the following table.

Table 428. LTDC register access and updated durations

Access type	AXI register clock domain	APB register clock domain	Pixel register clock domain
Read	7 x ltdc_pclk + 5 x ltdc_aclk	7 x ltdc_pclk	7 x ltdc_pclk + 5 x ltdc_ker_clk
Write	6 x ltdc_pclk + 5 x ltdc_aclk	6 x ltdc_pclk	6 x ltdc_pclk + 5 x ltdc_ker_clk

The LTDC can be reset by setting the corresponding bit in the RCC, that resets the three clock domains.

46.5 LTDC configuration parameters

The LTDC configuration parameters are sequenced following the pixel flow as shown in *Figure 390*, starting at the input (AXI master that reads pixels) and ending at the pixel output.

Common controls (such as interrupts) are listed at the end.

46.5.1 AXI master

The AXI master busses perform the accesses to the memory and are driven by the internal logic. The LTDC internal per-layer FIFOs are fairly large to cope with reasonably long external memory latencies.

The LDTC generates long burst (128-byte) for higher external memory efficiency.
For more granularity, it is possible to decrease the max burst size to 64 bytes, but it is not recommended.

Parameter in LTDC_LxBLCR

BL: burst length, in 64-bit words, with a default 0 for max size

Default configuration

The default AXI burst length is set at its maximum value after reset, with BL = 0.

46.5.2 Input layer definition and cropping

The LTDC supports three layers. Each layer is defined by:

- Its base-address in the memory

  If the buffer is YUV semi-planar or full-planar, there are respectively two and three base-addresses. The first buffer is called main and stores the luminance data, while the other buffers are called auxiliary and store the chrominance data.
- A dimension in the memory
  - Width defined as its pitch (or address jump or stride): amount of bytes between the start of one line and the start of the next line
  - Height that does not need to be defined
- A dimension of the pixel rectangle that is cropped and read from the memory

  - Top-left start position: set by the base-address at exactly the byte where the top-left pixel is located
  - Width, number of bytes per line to read
    - If too few bytes versus required, a FIFO underrun interrupt is generated(FUWIF).
    - If too many bytes versus required, the useless data are discarded.
  - Height, number of lines per frame to read

Note: The pitch and number of bytes per line can be different if a sub-part of a frame is cropped to be displayed. If the full frame is displayed, the pitch and number of lines are the same.

Parameters

- LEN in LTDC_LxCR: activates this layer.
- CFBADD in LTDC_LxCFBAR: main base address, for ARGB or Y buffer
- CFBLL in LTDC_LxCFBLR: main number of bytes per line
- CFBP in LTDC_LxCFBLR: pitch between two consecutive lines of the main buffer
- CFBLNBR in LTDC_LxCFBLNR: main number of lines per frame

Specifically for multi-planar-capable layers, the following additional registers have to be configured (only required for YUV420 semi-planar and full-planar pixel formats):

- AFBADD0 in LTDC_LxAFBA0R: auxiliary address 0, for UV if semi-planar or for V if full-planar
- AFBADD1 in LTDC_LxAFBA1R: auxiliary address 1, for U if full-planar
- AFBLL in LTDC_LxAFBLR: auxiliary 0 and 1, number of bytes per line
- AFBP in LTDC_LxAFBLR: pitch for the auxiliary 0 and 1 buffers
- AFBLNBR in LTDC_LxAFBLNR: auxiliary 0 and 1 number of lines per frame

Configuration examples

- A frame buffer having the format RGB565 (2 bytes per pixel) and a width of 256 pixels (total number of bytes per line is 256 * 2 = 512), where pitch = line length requires a value of 0x02000207 to be written into this register.
- A frame buffer having the format RGB888 (3 bytes per pixel) and a width of 320 pixels (total number of bytes per line is 320 * 3 = 960), where pitch = line length requires a value of 0x03C003C7 to be written into this register.
- A frame buffer having the format CbCr (2 bytes per pixel) and a width of 256 pixels (total number of bytes per line is 256 * 2 = 512), where pitch = line length requires a value of 0x02000207 to be written into this register.
- A frame buffer having the format Cb (1 byte per pixel) and a width of 320 pixels (total number of bytes per line is 320 * 1 = 320), where pitch = line length requires a value of 0x01400147 to be written into this register.

46.5.3 Input pixel format

The LTDC reads the pixel data from memory buffers and maps it onto the internal LTDC format that is based on the definition of the input pixel format, defined per layer.

The pixel formats are grouped as follows:

- **Predefined ARGB formats:**

  ARGB8888, ABGR8888, RGBA8888, BGRA8888, RGB565, BGR565, and RGB888pack
- **Flexible ARGB format:**

  Allows a configurable width and location of each A,R,G, and B component and is used to extend the above list to any multi-component pixel format except to coplanar ARGB.
- **YUV formats:**

  Used to read YUV with a 422 coplanar, 420 semi-planar, or 420 full-planar format, and to convert the YUV color into RGB.

  The YUV option is not available for the layer 3.

Note: The LTDC hardware pipeline uses 8 bits per component: when reading and mapping a pixel format, with less than 8 bits per component. That component is extended to 8 bits by stuffing the LSB, that are recopied from its MSB. This applies mostly on RGB565.

For instance, a component on 5 bits (named: 43210) results in the following 8 bits mapped into the pipe: 43210432. A 3-bit input (named 210) results in 21021021.

Parameter when using the predefined ARGB formats

- PF in LTDC_LxPFCR: 0 to 6 to select one of the seven predefined pixel formats

Parameters when using the flexible ARGB formats

- PR in LTDC_LxPFCR: seven to activate the flexible pixel format type
- PSIZE in LTDC_LxFPF1R: defines the amount of bytes per pixel (typically 1,2,3, or 4)
- APOS/RPOS in LTDC_LxFPF0R: defines the Alpha/Red location inside a 32-bit word
- BPOS/GPOS in LTDC_LxFPF1R: defines the Blue/Green location inside a 32-bit word
- ALEN/RLEN in LTDC_LxFPF0R: defines the amount of bits for Alpha/Red components
- BLEN/GLEN in LTDC_LxFPF1R: defines the amount of bits for Blue/Green components

  Examples:

  An RGB565 pixel format is defined as follows:
  - Alpha: APOS = 0, ALEN = 0
  - Red: RPOS= 11, RLEN = 5
  - Green: GPOS = 5, GLEN = 6
  - Blue: BPOS = 0, BLEN = 5

  The BGRA8888 32 bpp pixel format is set as follows (default reset values of LTDC_LxFPF0R and LTDC_LxFPF1R):
  - Alpha: APOS = 0, ALEN = 8
  - Red: RPOS= 8, RLEN = 8
  - Green: GPOS = 16, GLEN = 8
  - Blue: BPOS = 24, BLEN = 8

Parameters when using the YUV formats

The YUV pixel format is defined and detailed in *Section 46.5.4: YUV planar* and supersedes any setting here.

The following table describes the memory mapping of the predefined ARGB pixel format.

Table 429. Pixel data mapping versus color format

ARGB8888 (PF = 000)			
@+3 A_x[7:0]	@+2 R_x[7:0]	@+1 G_x[7:0]	@ B_x[7:0]
@+7 A_{x+1}[7:0]	@+6 R_{x+1}[7:0]	@+5 G_{x+1}[7:0]	@+4 B_{x+1}[7:0]
ABGR8888 (PF = 001)			
@+3 A_x[7:0]	@+2 B_x[7:0]	@+1 G_x[7:0]	@ R_x[7:0]
@+7 A_{x+1}[7:0]	@+6 B_{x+1}[7:0]	@+5 G_{x+1}[7:0]	@+4 R_{x+1}[7:0]
RGBA8888 (PF = 010)			
@+3 R_x[7:0]	@+2 G_x[7:0]	@+1 B_x[7:0]	@ A_x[7:0]
@+7 R_{x+1}[7:0]	@+6 G_{x+1}[7:0]	@+5 B_{x+1}[7:0]	@+4 A_{x+1}[7:0]
BGRA8888 (PF = 011)			
@+3 B_x[7:0]	@+2 G_x[7:0]	@+1 R_x[7:0]	@ A_x[7:0]
@+7 B_{x+1}[7:0]	@+6 G_{x+1}[7:0]	@+5 R_{x+1}[7:0]	@+4 A_{x+1}[7:0]
RGB565 (PF = 100)			
@+3 R_{x+1}[4:0] G_{x+1}[5:3]	@+2 G_{x+1}[2:0] B_{x+1}[4:0]	@+1 R_x[4:0] G_x[5:3]	@ G_x[2:0] B_x[4:0]
@+7 R_{x+3}[4:0] G_{x+3}[5:3]	@+6 G_{x+3}[2:0] B_{x+3}[4:0]	@+5 R_{x+2}[4:0] G_{x+2}[5:3]	@+4 G_{x+2}[2:0] B_{x+2}[4:0]
BGR565 (PF = 101)			
@+3 B_{x+1}[4:0] G_{x+1}[5:3]	@+2 G_{x+1}[2:0] R_{x+1}[4:0]	@+1 B_x[4:0] G_x[5:3]	@ G_x[2:0] R_x[4:0]
@+7 B_{x+3}[4:0] G_{x+3}[5:3]	@+6 G_{x+3}[2:0] R_{x+3}[4:0]	@+5 B_{x+2}[4:0] G_{x+2}[5:3]	@+4 G_{x+2}[2:0] R_{x+2}[4:0]
RGB888 (PF = 110)			
@+3 B_{x+1}[7:0]	@+2 R_x[7:0]	@+1 G_x[7:0]	@ B_x[7:0]
@+7 G_{x+2}[7:0]	@+6 B_{x+2}[7:0]	@+5 R_{x+1}[7:0]	@+4 G_{x+1}[7:0]
The flexible format (PF = 111), not represented here, allows any above mapping.			

46.5.4 YUV planar

This operator handles the YUV planar formats, reading data from potentially several distinct buffers (Y versus Cb versus Cr) into a single pixel information. The feature is available for layer 1 and layer 2. It is not available for layer 3.

The LTDC supports the following planar formats:

- YUV422 coplanar (one buffer)
- YUV420 semi-planar (two buffers)
- YUV420 full-planar (three buffers)

Following its configuration, the LTDC reads the relevant luminance and chrominance buffers, upscales the chrominance components required to reach YUV444 pixels, and converts the color from YUV to RGB as described in *Section 46.5.5*.

The LTDC allows swapping the memory locations of the Y and Cb/Cr data and of the Cb and Cr data. It also allows inverting the endianness of the Y data. This extends the amount of supported pixel format variants.

Parameters

Pixel format parameters are stored in LTDC_LxPCR:

- YCEN: activates the YUV mode (both the planar extraction and color conversion).
- YCM: selects the input scheme (422 for coplanar, 420 for semi-planar, 420 for full-planar).
- YF: defines if either Y or Cb/Cr is provided first (from LSB).
- CBF: defines if either Cb or Cr is provided first (from LSB).
- OF: defines if either odd or even Y is provided first (from LSB).

When using a semi-planar or full-planar buffer, some additional base-address must be configured for auxiliary (chrominance) buffers, as well as the pitch of these buffers (see *Section 46.5.2*).

Configuration examples

Settings of OF, CBF, YF bits for a YCbCr 422 pixel format:

- OF = 0, CBF = 0, YF = 0 define the buffer word to containWord[31:0] = Y1-Cb-Y0-Cr.
- OF = 1, CBF = 0, YF = 0 define the buffer word to contain Word[31:0] = Y0-Cb-Y1-Cr.
- OF = 0, CBF = 1, YF = 0 define the buffer word to contain Word[31:0] = Y0-Cr-Y1-Cb.
- OF = 0, CBF = 0, YF = 1 define the buffer word to contain Word[31:0] = Cb-Y1-Cr-Y0.
- OF = 1, CBF = 1, YF = 1 define the buffer word to contain Word[31:0] = Cr-Y0-Cb-Y1.

  These settings are also valid for YCbCr 420 pixel formats.

46.5.5 YUV-to-RGB color conversion

This operator handles the YUV-to-RGB color conversion of the YUV planar pixels. Like the above operator, it is only available for layer 1 and layer 2. The color conversion is activated automatically, simultaneously with the YUV planar handling.

The color conversion is based on a semi-flexible 3x3 matrix multiplication:

- It is restricted to YUV-to-RGB conversion due to some frozen coefficients (see next).

- It handles the most used YUV references (ITU-R BT.601 and ITU-R BT.709) thanks to some configurable coefficients.
- It supports the full versus reduced dynamic of the input pixel (luminance defined either in 0 to 255, or in 16 to 235), by extending a potential reduced-range input to a full range.

Parameters

- YCEN in LTDC_LxPCR: activates the color conversion, same bit as for planar.
- YREN in LTDC_LxPCR: if active, extends a reduced range to a full range.
- CR2R in LTDC_LxCYR0R: matrix coefficient from Cr to Red
- CB2B in LTDC_LxCYR0R: matrix coefficient from Cb to Blue
- CR2G in LTDC_LxCYR0R: matrix coefficient from Cr to Green
- CB2G in LTDC_LxCYR0R: matrix coefficient from Cb to Green

The full matrix computation, to convert from YCbCr to RGB, is defined as the following:

$$\begin{pmatrix} R \\ G \\ B \end{pmatrix} = \begin{pmatrix} CR2R & 256 & 0 \\ -CR2G & 256 & -CB2G \\ 0 & 256 & CB2B \end{pmatrix} \times \begin{pmatrix} Cr - 128 \\ Y \\ Cb - 128 \end{pmatrix}$$

The CR2R, CB2B, CR2G, and CB2G coefficients are defined on 10 bits unsigned: as the operator works with 8-bit components, the coefficients are thus equivalent, in fixed-point, to 2-bit integer and 8-bit decimals.

The CR2G and CB2G coefficients are configured as unsigned positive, but are set negative in the hardware computation, as shown in the above matrix where a “-” is mentioned.

When the luminance scaling is active (YREN = 1, thus where the YCbCr input is assumed in the range of 16 to 235/240, and RGB in 0 to 255), then the Y input value is first scaled in hardware to Y’ = 255/219 * (Y - 16). That first result is then inserted as input to the above matrix multiplication.

Configuration examples

To read an ITU-R BT.601 layer and to convert its YCbCr (assuming a default reduced dynamic in 16 to 235/240) to RGB (with full dynamic in 0 to 255), the recommended coefficients are:

- YCEN = 1: to activate the conversion
- YREN = 1: to select the reduced dynamic range
- CR2R = 409: specific coefficient set for ITU-R BT.601
- CR2G = 208
- CB2G = 100
- CB2B = 516

To read an ITU-R BT.709 layer and to convert its YCbCr (assuming a default reduced dynamic in 16 to 235/240) to RGB (with full dynamic in 0 to 255), the recommended values to configure coefficients are:

- YCEN = 1: to activate the conversion
- YREN = 1: to select the reduced dynamic range
- CR2R = 459: specific following coefficient set is for ITU-R BT.709
- CR2G = 136
- CB2G = 55
- CB2B = 541

46.5.6 Horizontal or vertical mirroring

The LTDC can mirror horizontally or vertically its input layers, thus to read them from right to left, and/or from bottom to top.

It applies on both coplanar (ARGB, YUV422) and multi-planar (YUV420) pixel formats.

Parameters for horizontal mirroring

To mirror a layer horizontally, the LTDC must be configured to extract the pixels from right to left (backward), and to set the layer base-address at the right-end of the line.

The configuration bitfields are the following:

- HMEN in LTDC_LxCR: activates the horizontal mirroring.
- CFBADD in LTDC_LxCFBAR = base + (width - 1) (increase for horizontal mirror)
- AFBADD0LTDC_LxAFBA0R = base + (width - 1)
- AFBADD1 in LTDC_LxAFBA1R = base + (width - 1)

Parameters for vertical mirroring

To mirror a layer vertically, the LTDC must be configured to start reading this layer from the bottom, and line per line, to come upward. The layer base-address must be set to the start of the bottom line, and a negative line-per-line pitch must be provided.

The configuration bitfields for the base-address are (all to be set at bottom line start):

- CFBADD in LTDC_LxCFBAR: main base-address
- AFBADD0 in LTDC_LxAFBA0R: auxiliary address 0
- AFBADD1 in LTDC_LxAFBA1R: auxiliary address 1
- CFBADD in LTDC_LxCFBAR = base + (lines - 1) * pitch (increase for vertical mirror)
- AFBADD0 in LTDC_LxAFBA0R = base + (lines - 1) * pitch
- AFBADD1 in LTDC_LxAFBA1R. = base + (lines - 1) * pitch

The configuration bitfields for the pitch are (all to be set with a negative pitch):

- CFBP in LTDC_LxCFBLR: -pitch (negative line pitch for vertical mirror)
- AFBP in LTDC_LxAFBLR: - pitch

46.5.7 Default layer color

Every layer has a default color in the format ARGB8888, that is used outside the defined layer window or when a layer is disabled. This default color can be configured as active or absent.

Parameters

The default layer color parameters are:

- DCBEN in LTDC_LxCR: default color activation
- DCALPHA in LTDC_LxDCCR: default Alpha transparency setting
- DCRED in LTDC_LxDCCR: default Red component
- DCGREEN in LTDC_LxDCCR: default Green component
- DCBLUE in LTDC_LxDCCR: default Blue component

Default configuration

By default, and after reset, the default layer color is inactive (DCBEN = 0 and DCALPHA = 0.

Note: The blending of a layer is always performed even when a layer is disabled. To avoid displaying the default color when a layer is disabled, the default Alpha must be set to null (DCALPHA = 0), or the whole default color must be disabled (with DCBEN).

46.5.8 Color look-up table (CLUT)

The LTDC supports frame buffers with each pixel defined as an index to a color table, allowing a display with a set of 256 colors, but stored in memory with only 8 bpp.

The CLUT defines 256 colors and must be indexed with a maximum 8-bit pixel format (typically L8 or AL44). Such format can be extracted using the flexible RGB approach described in *Section 46.5.3*.

The CLUT table is differentiated for each layer. It must be initialized with one RGB888 value per color index, with the color index corresponding to the CLUT address:

- For L8, the CLUT must be loaded with 256 colors.
- For AL44, the CLUT must be only loaded with 16 colors. Each color address is defined by replicating the 4-bit L channel to 8 bits as follows:
  - Color L4 = 0: looks out its RGB888 from index = 0x00.
  - Color L4 = 1: looks out its RGB888 from index = 0x11.
  - Color L4 = 2: looks out its RGB888 from index = 0x22.
  - ...
  - Color L4 = 15: looks out its RGB888 from index = 0xFF.
- For ARGB, the Blue component is used as the CLUT index.

Parameters

The RGB888 values and color indices are configured through the following bitfields in LTDC_LxCLUTWR:

- CLUTADD defines the color index to update.
- RED defines the 8-bit Red component of that color index.
- GREEN defines the 8-bit Green component of that color index.

- BLUE defines the 8-bit Blue component of that color index.

46.5.9 Transparency color keying

Pixels can be defined as transparent using a color key. If the pixel RGB components equals the defined RGB color key, that pixel is considered transparent and its Alpha channel is forced null.

A pixel forced to transparent is transparent when proceeding to the later blending phase, and shows the pixel of the underlying layer.

The color key is defined as an RGB888 value, that is compared with the flowing pixel after some processing in the input format operator (where LSBs are stuffed by replication) and CLUT processing. The constant color keying parameters must take these previous processing into account.

Parameters

The color keying parameters are the following:

- CKEN in LTDC_LxCR enables the color keying.
- CKRED in LTDC_LxCKCR defines the 8-bit Red color key.
- CKGREEN in LTDC_LxCKCR defines the 8-bit Green color key.
- CKBLUE in LTDC_LxCKCR defines the 8-bit Blue color key.

Configuration example

A mid-yellow color (50 % Red + 50 % Green) is used as the transparent color key. The color keying parameters take it into account as follows:

- ARGB8888 input: The mid-yellow input is 0x808000. Set LTDC_LxCKCR = 0x808000.
- RGB565 input: The mid-yellow input is 0x8400. Set LTDC_LxCKCR = 0x848200 (due to the replication of input MSB onto the missing LSB).
- CLUT input for L8, AL88 or AL44: Set one of the palette entry to the mid-yellow color 0x808000 and set LTDC_LxCKCR = 0x808000.

46.5.10 Upscaler

Layer 1 and layer 2 can be upscaled using a bilinear filter with decimal ratios. Vertical and horizontal ratios can be differentiated.

The filter is based on a bilinear filter, that provides very good results for upscale ratios from 1x to 2x, but may provide aliasing artifacts for higher ratios.

Parameters

The upscaler parameters are the following:

- SCEN in LTDC_LxCR enables the upscale.
- SIH (SIV) in LTDC_LxSISR: input width (height)
- SOH (SOV) in LTDC_LxSOSR: output width (height)
- LTDC_LxSHSFR and LTDC_LxSHSPR: horizontal ratio and phase
- LTDC_LxSVSFR and LTDC_LxSVSPR: vertical ratio and phase

The ratio is given as the input size/output size with a 16-bit fixed-point decimal. The phase is given as the start proportion of the first pixel, with a 12-bit fixed-point decimal.

Example:

To upscale from a 720p frame (1280x720 pixels) to a 1080p frame (1920x1080 pixels), the following configuration is needed:

- SCEN in LTDC_LxCR = 1 enables the upscale.
- SIH in LTDC_LxSISR = 1280: input width
- SIV in LTDC_LxSISR = 720: input height
- SOH in LTDC_LxSOSR = 1920: output width
- SOV in LTDC_LxSOSR = 1080: output height
- SHF in LTDC_LxSHSFR = 65536 * 1280 / 1920 = 43691: horizontal scaling factor
- SVF in LTDC_LxSVSFR = 65536 * 720 / 1080 = 43691: vertical scaling factor
- SHP in LTDC_LxSHSPR: horizontal phase
- SVP in LTDC_LxSVSPR: vertical phase

Phase can be kept by default at 0, to start the upscaled layer with the left-most top-most as a native pixel (recopy from the input)

46.5.11 Display composition - windowing

When performing the display composition, every layer (after a potential upscale) can be cropped and positioned into the active display area. The window position and size are configured by defining its top-left and bottom-right corners.

Note: The locations are defined versus the internal timing generator that must take into account the potential synchronization header, the back porch size and the chosen active pixel area (as shown in Figure 391).

The mapping between the input layer and the visible window is performed as follows:

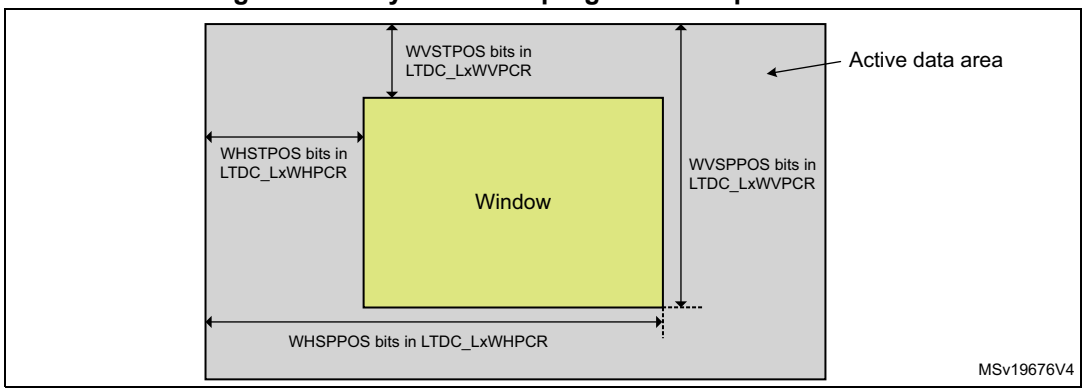
- The most top-left pixels of the input layer are mapped to the top-left of the visible window of this layer.
- If the visible window is smaller (less wide, less high) than the input layer, then the exceeding input pixels are automatically discarded from the pipe.

Parameters:

The following parameters are defined versus the top-left of the synchronization:

- WHSTPOS in LTDC_LxWHPCR: first (left) visible pixel of the layer
- WHSPPOS in LTDC_LxWHPCR: last (right) visible pixel of the layer
- WVSTPOS in LTDC_LxWVPCR: first (top) visible line of the layer
- WVSPPOS in LTDC_LxWVPCR: last (bottom) visible line of the layer

Figure 391. Layer window programmable parameters



Configuration examples

- LTDC_BPCR is configured to 0x000E0005 (AHBP[11:0] is 0xE), and LTDC_AWCR is configured to 0x028E01E5 (AAW[11:0] is 0x28E). To configure the horizontal position of a window size of 630x460, with horizontal start offset of 5 pixels in the active data area:
  - Layer window first pixel: WHSTPOS[11:0] must be programmed to 0x14 (0xE + 1 + 0x5).
  - Layer window last pixel: WHSPPOS[11:0] must be programmed to 0x28A.
- LTDC_BPCR is configured to 0x000E0005 (AVBP[11:0] is 0x5) and LTDC_AWCR is configured to 0x028E01E5 (AAH[11:0] is 0x1E5). To configure the vertical position of a window size of 630x460, with vertical start offset of eight lines in the active data area:
  - Layer window, first line: WVSTPOS[11:0] must be programmed to 0xE (0x5 + 1 + 0x8).
  - Layer window last line: WVSTPOS[11:0] must be programmed to 0x1DA.

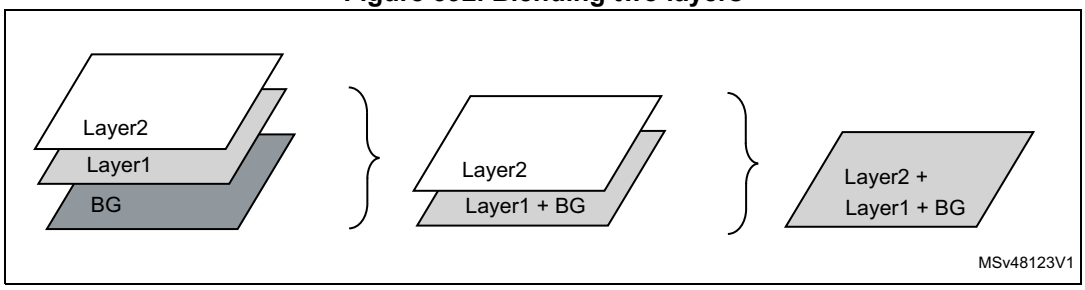
46.5.12 Display composition - blending

The Alpha blending stage is used to blend together the 3 input layers, on top of a background color.

It is possible to select the sequence of the layers (foreground, middle, and background), to apply a global multiplicative Alpha per-layer, and to define an underlying background color.

The blending computation is performed from back to front, sequentially, as shown the following figure, with only two layers for the example instead of three.

Figure 392. Blending two layers



The general formula for a 2-to-1 blending is CR = (BF1 x C1) + (BF2 x C2) where:

- CR: resulting blended color
- BF1: blending-factor of current layer
- C1: layer-color of the current layer
- BF2: blend-factor of underlying pixels
- C2: layer-color of the underlying pixels

Both blending factor, BF1 and BF2, can be defined as one of the following:

- Pure per-pixel Alpha value
- Mix of per-pixel Alpha and a global per-layer Alpha (the mix is multiplicative)

Parameters

- CONSTA in LTDC_LxCACR: global multiplicative Alpha value of the current layer
- BOR in LTDC_LxBFCR: blending order of the current layer
- BF1 in LTDC_LxBFCR: blending factor for the current layer
- BF2 in LTDC_LxBFCR: blending factor for the underlying layer

The background color is defined by the following bitfields in LTDC_BCCR:

- BCRED: background Red component
- BCGREEN: background Green component
- BCBLUE: background Blue component

Note: For secure purposes, in case of an inconsistent configuration, the blending order falls back to a fixed order, with the layer 3 on the foreground, the layer 2 in middle, and layer 1 in background, followed by the underlying background color.

The inconsistent fallback is setup to protect a potential secure layer: If a secure software configures the secure layer3 to be on the foreground, and a malware tries to place that another layer on the foreground, the inconsistency is detected, and the secure layer is automatically forced on the foreground, guaranteeing that it is visible.

Configuration example

Only layer 1 is enabled, BF1 configured to constant alpha. BF2 configured to 1 - constant alpha. The constant alpha programmed in LTDC_LxCACR is 240 (0xF0). Thus, the constant alpha value is 240 / 255 = 0.94. C: current layer color is 128. Cs: background color is 48. Layer 1 is blended with the background color.
BC = constant alpha x C + (1 - constant alpha) x Cs = 0.94 x 128 + (1 - 0.94) x 48 = 123.

Default configuration

All active layers can be made visible and blended by keeping the following configuration values after reset:

- CONSTA: keep as reset CONSTA = 255.
- BOR: keep as reset BOR (layer) = LayerID-1.
- BF1: keep as reset BF1 = 6 for default mixed Alpha.
- BF12: keep as reset BF2 = 7 for default mixed 1-Alpha.
- Background color: keep as reset (black), although any color is ok.

46.5.13 Gamma correction

The gamma correction is a non-linear operator that adapts the pixel to the non-linear display, using a compensating pre-distortion. The R, G, B components can be independently adapted, using a configurable non-linear transformation.

The non-linear transformation is implemented in the LTDC as eight independent linearly-interpolated segments: the desired non-linear transformation must thus be mapped onto the eight segments, and the shape of the eight segments configured in LTDC registers.

Parameters

- GAMEN in LTDC_GCR: activation of the gamma operator
- ADDR in LTDC_GCCR: table configuration, index (among 256) to write-in
- COMP in LTDC_GCCR: table configuration, 8-bit component to write-in
- REN in LTDC_GCCR: table configuration, active to write into the Red table
- GEN in LTDC_GCCR: table configuration, active to write into the Green table
- BEN in LTDC_GCCR: table configuration, active to write into the Blue table

Note: As the gamma correction works with eight interpolated segments. The only table indices to write-in are located at index: 0, 32, 64, 96,...,224, 255. The value to provide for index 255 contains the value for the pseudo-index 256.

Example configuration

The gamma correction is recommended to be set to pre-compensate the pixels with a gamma exponent of 2.2: Red, Green, and Blue components are compensated the same way by the Gamma. The configuration of Red, Green, and Blue tables is then usually the same.

Default configuration

The gamma correction is disabled with the default configuration after reset, with GAMEN = 0.

46.5.14 YUV output conversion

The default RGB888 24 bpp output can be converted to a YUV422 16 bpp output (coplanar), in order to reduce the bitrate or the interface width, if necessary.

The operator can convert the RGB to YUV with either ITU-R BT.601 versus BT.709 reference, and filter down the chrominance, to output the pixels as a YUV422 interface.

When the conversion is enabled, the Y is output on the LCD_G (green bits) and the Cb/Cr are output on the LCD_R (red bits).

Parameters in LTDC_EDCR

- OCYEN: activates the output conversion to YUV422.
- OCSEL: selects between a color conversion to ITU-R BT.601 versus to BT.709.
- OCYCO: defines whether Cb or Cr is output first.

The configuration must follow what is expected by the external display panel.

Default configuration

The YUV output conversion is disabled with the default configuration after reset, with OCYEN = 0, allowing a default RGB888 to be output.

46.5.15 Dithering

The dithering operator allows a clean conversion of the RGB888 output into a reduced pixel format, like RGB565 or RGB666, and so avoiding the usual artifact of flat area that occurs when no dithering is available.

The dithering is based on a LFSR (polynomial generating random) and adds pseudo-random noise on the LSB of each of the displayed component (bit 2 in case of an RGB666), and makes that the average of the local pixels represents the information content of the full 8-component value.

Parameters in LTDC_GCR

- DEN: dithering enable
- DRW: bit-id of LSB of the displayed Red component (among 8 bits)
- DGW: bit-id of LSB of the displayed Green component (among 8 bits)
- DBW: bit-id of LSB of the displayed Blue component (among 8 bits)

Example

To dither from RGB888 to RGB565 (assuming a RGB565 display panel):

- The LTDC outputs the Red component on pins LCD_R[7:0].
- The display panel probes the five MSB bits LCD_R[7:3].
- The red bit to dither, using its two following LSB as decimals, is the bit 3.
- DRW must be configured to 3.
- DGW = 2 and DBW = 3.

Similarly, a dithering to RGB666 requires DRW = DGW = DBW = 2.

Default configuration

The dithering is disabled with the default configuration after reset, with DEN = 0, allowing a default RGB888 to be output.

46.5.16 CRC hashing

The CRC operator allows a 16-bit signature to be extracted for each frame, by hashing the R,G,B components of all the frame pixels.

The computed CRC can be read in LTDC_CCRCR.

An expected CRC value can be configured: if the computed CRC does not match the expected CRC, the CRC interrupt is triggered. It allows a system test, letting the LTDC run for hours, and be warned only if a failed frame occurs.

Parameters

- CRCEN in LTDC_GCR: activates the CRC computation
- ECRC in LTDC_ECRCR: expected 16-bit CRC value
- CCRC in LTDC_CCRCR: computed 16-bit CRC value

Default configuration

The CRC hashing is disabled with the default configuration after reset, with CRCEN = 0.

46.5.17 Display timing

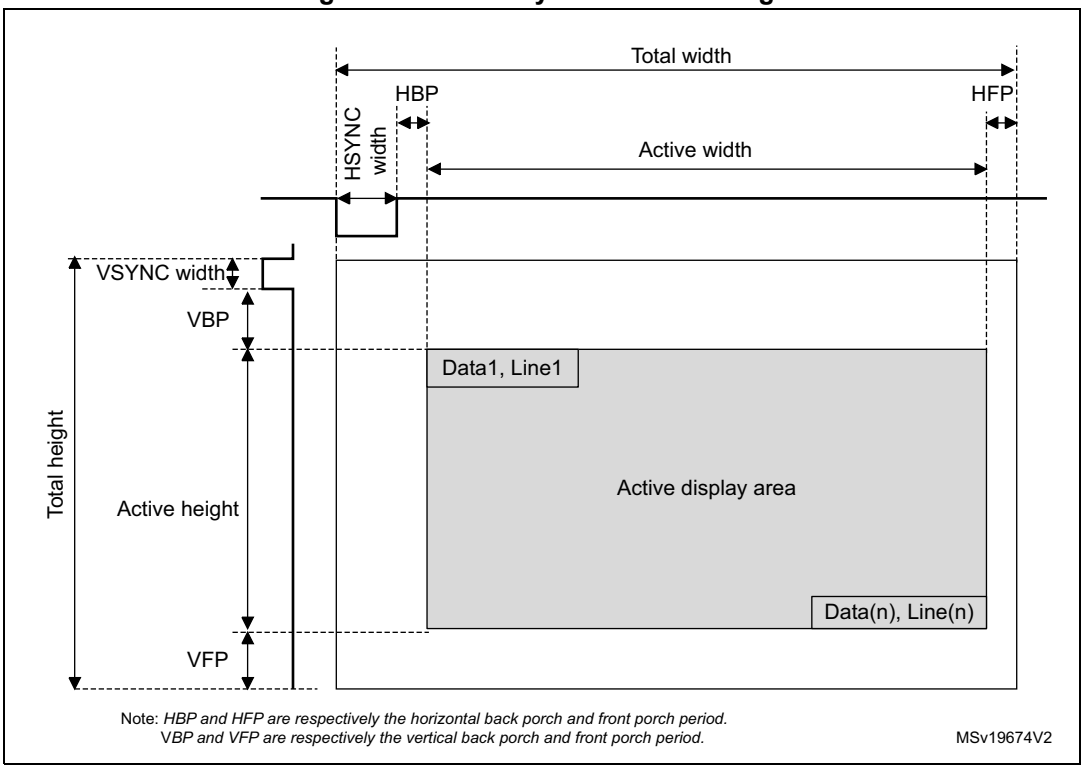
This section describes the configuration of the display timings, so that the LTDC matches what is expected by the external display panel.

The configuration defines the horizontal and vertical duration of each of the following items:

- Synchronization period (HSYNC and VSYNC)
- Back porch (HBP, VBP)
- Active display (pixels that are visible on the screen)
- Front porch (HFP, VFP)

These timings are described in the following figure.

Figure 393. LTDC synchronous timings



Note: *HBP and HFP are respectively the horizontal back porch and front porch period.*
VBP and VFP are respectively the vertical back porch and front porch period.

MSv19674V2

As a result of these timings, the LTDC samples in pixels during the active display duration, and generates the output synchronization signals (HSYNC, VSYNC), the pixel data, and the data-enable signal.

Parameters

All the timings configured next are absolute timings, computed from the display start position, and not the relative increment (or width or height) of each area.

All these bitfields indicate the last pixel of each area, and hence are subtracted 1.

- **HSYNC and VSYNC width** (horizontal and vertical synchronization width) in LTDC_SSCR:
  - HSW = HSYNC width - 1
  - VSW = VSYNC width - 1
- **HBP and VBP** (last pixel/line of the horizontal and vertical synchronization back porch) in LTDC_BPCR:
  - AHBP = HSYNC width + HBP - 1
  - AVBP = VSYNC width + VBP - 1
- **Active width and active height** (last pixel/line of the active display area) in LTDC_AWCR:
  - AAW = HSYNC width + HBP + active width - 1
  - AAW = VSYNC width + VBP + active height - 1
- **Total display width** (last pixel/line of the total display timings) in LTDC_TWCR:
  - TOTALW = HSYNC width + HBP + active width + HFP - 1
  - TOTALH = VSYNC height + VBP + active height + VFP - 1

Note: When the LTDC is enabled, timings generated start at the position (X,Y) = (0,0), and generate immediately the first horizontal synchronization pixel in the vertical synchronization, followed by the back porch, then the active display area, and finally the front porch.

When the LTDC is disabled, the timing generator block is reset to X = total width - 1, Y = total height - 1. It holds the last pixel before the vertical synchronization phase and the FIFO are flushed. Therefore, only blanking data is output continuously.

Example of synchronous timing configuration

Assume the following display panel timings (to be extracted from panel datasheet):

- Horizontal and vertical synchronization width: 0xA pixels, 0x2 lines
- Horizontal and vertical back porch: 0x14 pixels, 0x2 lines
- Active width and active height (320x240): 0x140 pixels, 0x0F0 lines
- Horizontal and vertical front porch: 0xA pixels 0x4 lines

Bitfield values to configure become:

- HSW[11:0] = 0x9 (horizontal synchro -1) in LTDC_SSCR.
- VSH[11:0] = 0x1 (vertical synchro -1) in LTDC_SSCR.
- AHBP[11:0] = 0x1D (horizontal synchro + back porch -1) in LTDC_BPCR.
- AVBP[11:0] = 0x3 (vertical synchro + back porch -1) in LTDC_BPCR.
- AAW[11:0] = 0x15D (horizontal synchro + back porch + width -1) in LTDC_AWCR.
- AAH[11:0] = 0xF3 (vertical synchro + back porch + height -1) in LTDC_AWCR.
- TOTALW[11:0] = 0x167 (horizontal synchro + back porch + width + front porch -1) in LTDC_TWCR.

- TOTALH[11:0] = 0xF7 (vertical synchro + back porch + width + front porch -1) in LTDC_TWCR.

Default configuration

There is no default configuration to propose. As display timings depend on the specific display panel and its own required timings, all these parameters must be extracted from the display panel specification.

Note: The configuration of all the above is mandatory to have the LTDC driving correctly the external display panel.

46.5.18 Output interface polarity

The polarity of the control signals of the output interface includes the clock polarity, the vertical/horizontal synchronization, and the data-enable signal.

Parameters in LTDC_GCR

- PCPOL: polarity of the output clock
- VSPOL: polarity of the vertical synchronization
- HSPOL: polarity of the vertical synchronization
- DEPOL: polarity of the data enable

Default configuration

There is not default configuration, as the configuration of the polarity depends on the display panel specifications.

The following configuration can be used to have all items working with a positive polarity:

- PCPOL = 1 (rising-edge)
- VSPOL = 1 (active high)
- HSPOL = 1 (active high)
- DEPOL = 1 (active high)

46.5.19 Shadow registers

When activated, the LTDC is expected to display continuously data, frame after frame.

The user may want to modify some settings: for example, add a new layer, modify the layer window location, or update the displayed content by updating the pointer to the buffer that is displayed.

The LTDC provides shadow registers for most of its configuration registers to allow transitions to occur cleanly synchronized during the short vertical synchronization, when nothing is displayed: while the LTDC is busy working with a copy of its configuration registers to control the ongoing display (the active set), a new version of the registers can be progressively updated by software (the shadow set). When ready, and at the exact VSync event, the shadow set is copied into the active set, ready for the next frame.

Once the shadow set is fully updated, there are two ways to transfer it in the active set:

- Immediate copy: the copy occurs immediately.
- Delayed to next VSync: the copy occurs at the next VSync.

Note: In case of delayed copy, shadow registers must not be modified again before the reload has been done.

Reading from shadow registers returns the current active value. The new written value can only be read after the reload has taken place.

The impossibility to read a temporary value in a shadow register makes impossible to perform a read-modify-write to set/reset a single bit inside a shadow register.

A register reload interrupt can be generated if enabled in LTDC_IER or LTDC_IER2.

Shadowed registers

Non-layer registers

The non-layer registers (not prefixed with LTDC_Lx) are all non-shadowed. They contain static configurations dependent mostly on the attached display panel. They do not require update during an ongoing display.

Layer registers

The layer registers are prefixed with LTDC_Lx. Most are shadowed to support a clean frame-to-frame update. The following are not shadowed, either because their shadowing would be too costly or because they are not expected to require frequent or synchronized updates:

- LTDC_LxRCR reload control
- LTDC_LxCKCR color key (assumed static)
- LTDC_LxCLUTWR CLUT (indirect access, too costly to shadow)
- All upscaler LTDC_LxSIS/SOS/SVSFR/SHSFR (assumed static)
- LTDC_LxCYR0R/R1R YUV-to-RGB color conversion (assumed static)
- LTDC_LxFPF0R/LTDC_LxFPF1R flexible pixel format (assumed static)

Parameters

The centralized reload of the shadow register is controlled with bitfields in LTDC_SRCR:

- IMR: writing 1 triggers an immediate copy.
- VBR: writing 1 triggers a copy delayed at the next blanking.

A per-layer reload control is available with bitfields in LTDC_LxRCR:

- GRMSK delegates the per-layer reload to the central reload (above).
- IMR: writing 1 triggers an immediate copy for this layer.
- VBR: writing 1 triggers a copy delayed at the next blanking.

Default configuration

For the initial LTDC configuration, when the display is inactive, the IMR mode must be used to copy the initial configuration to the active set.

When the display is active, it is recommended to use VBR to update any parameters: the parameter transition occurs then from frame-to-frame, and not inside an ongoing frame. Applying an immediate change of the LTDC configuration within a frame results in an unpredictable behavior.

46.5.20 General control

The final and mandatory step, after all the above configurations, is to trigger the display. The LTDC has two working mode:

- Continuous mode: the LTDC continuously sends frames to the display.
- Single-frame mode: the LTDC sends a single frame after a software-based trigger (generated by a software access to a register)

Parameters in LTDC_GCR

- LTDCEN: general LTDC activation
- SFEN: moves from the continuous to the single-frame mode.
- SFSWTR: software trigger, when in single-frame mode

46.5.21 Provision for a secure layer

The LTDC allows a secure layer support, with the addition of a wrapper around the LTDC that secures the access to its registers (register-per-register), and secures the access of its AXI master to the layer framebuffers.

The layer 3 can be secured thanks to the measures described in the following sub-sections.

Configuration registers

The granularity between secure versus nonsecure items is at register level:

- A secure register contains only to-be-secured bitfields.
- Nonsecure bitfields are all in open-access registers.

It allows all registers to be segregated between secure ones (with an access only by secure software) and open ones (with an access by any nonsecure software).

Interruptions

The interruption logic has been duplicated, with one secure interrupt logic (register and pin) reserved for secure software, and another open interrupt logic (second register set and second output pin) for nonsecure software.

Blending

The blending order (foreground to background) is defined in per-layer register, so that the blending order of the secure layer3 can be securely defined as foreground. If some nonsecure software defines an other layer (layer 1 or layer 2) in foreground, the integrated hardware consistency check reverses the blending order to a fixed one, forcing the secure layer to be in the foreground.

CRC

The CRC that computes a signature of the displayed frame has its configuration located in specific registers that can be defined as secure, too.

46.6 LTDC interrupts

The LTDC provides various maskable interrupts, that are grouped into two global interrupt pins: one working interrupt pin, and one error interrupt pin.

These maskable interrupts and two global output pins are duplicated for the secure software usage, resulting in a duplicated set of registers (for masking) and a duplicated set of output pin. Hence a total of four interrupt output pins: global working, global error, secure global, secure global error.

The following working interrupts on which to synchronize software are ORed together as a global working interrupt:

- Line interrupt: generated when a configured line number is reached. Its position is Configured in LTDC_LIPCR.
- Register reload interrupt: generated when a shadow-register reload is performed during the vertical blanking period.

The following error interrupts warn about some internal processing errors, and are ORed together as a global error interrupt:

- FIFO underrun warning interrupt: generated when a pixel is requested from an empty layer FIFO.
- FIFO underrun error interrupt: generated when more pixels are requested from an empty layer FIFO.
- Transfer-error interrupt: generated when an AXI bus error occurs during data transfer.
- CRC-error interrupt: generated when the CRC computed and expected are different.

The LTDC also provides an observation mean, to retrieve X and Y positions of the currently displayed pixel.

Parameters

The following nonsecure registers are used to handle the interrupts:

- LTDC_LIPCR: defines the line-number on which the line-number interrupt occurs.
- LTDC_IER demasking bit: setting each bit enables the corresponding interrupt.
- LTDC_ISR: event bit where to read if an event has occurred
- LTDC_ICR: clear bit where to write to clean an interrupt.
- LTDC_CPSR: location with X and Y of the current displayed pixel
- LTDC_FUTR: trigger from which a FIFO underrun warning becomes a FIFO underrun error, and is the amount of missed words of 64 bits

The duplicated secure registers are used to handle the interrupts (with same respective content as the nonsecure ones): LTDC_LIPCR2, LTDC_IER2, LTDC_ISR2, LTDC_ICR2.

The following table lists the bitfields of the available interrupts, and shows the four pins on which these bitfields are directed:

- Nonsecure registers drive ltdc_lo_xx interrupts. Secure registers drive ltdc_up_xx interrupts.
- Interrupts triggered by an error are suffixed with a xx_err_it. Interrupts triggered during a normal LTDC handling are suffixed with an _it only.

Table 430. LTDC interrupt requests

Registers	Interrupt event	Event bit	Enable control bit	Interrupt signal
Nonsecure registers (IER, ISR, ICR)	Line number	LIF	LIE	ltdc_lo_li
	Register reload	RRIF	RRIE	ltdc_lo_li
	FIFO underrun warning	FUWIF	FUWIE	ltdc_lo_li
	FIFO underrun error	FUIF	FUIE	ltdc_lo_err_it
	Bus transfer error	TERRIF	TERRIE	ltdc_lo_err_it
	CRC error	CRCIF	CRCIE	ltdc_lo_err_it
Secure registers (IER2, ISR2, ICR2)	Line number	LIF	LIE	ltdc_up_li
	Register reload	RRIF	RRIE	ltdc_up_li
	FIFO underrun warning	FUWIF	FUWIE	ltdc_up_li
	FIFO underrun error	FUIF	FUIE	ltdc_up_err_it
	Bus transfer error	TERRIF	TERRIE	ltdc_up_err_it
	CRC error	CRCIF	CRCIE	ltdc_up_err_it

46.7 LTDC programming procedure

The LTDC programming procedure consists to activate the clocks, to follow all the operator sequence (as listed in *Section 46.5*) from the beginning (AXI master) to the end (output interface polarity), and to configure the needed operators as described.

The minimum configuration that must be performed is the following:

1. Enable the LTDC clock in the RCC register:
   - APB slave: ck_icn_p_ltdc in the RCC
   - AXI master: ck_icn_m_ltdc in the RCC
   - Pixel clock that fits display panel requirements (resolution, blanking, frame rate)
2. Define the buffer of at least one input layer (see *Section 46.5.2*, with for example, layer base-address, size, or buffer pitch).
3. Define this layer pixel format (see *Section 46.5.3*). ARGB8888 can simply be used, depending on the stored buffer.
4. Define where this layer is inserted in the final display (see *Section 46.5.11*): typically the top-left and bottom-right corners of the display.
5. Define how this layer is blended in the final display (see *Section 46.5.12*).
6. Define timings of the display panel to drive (see *Section 46.5.17*).

7. Define polarity of the output signals (see *Section 46.5.18*).
8. Copy all above settings, once, using the immediate global reload (see *Section 46.5.19*).
9. Start the display by activating the main enable (see *Section 46.5.19*).

Note: Most layer registers are shadowed. Once a register is written, it must not be modified again before the reload has been done. A new write to the same register overrides the previous configuration if not yet reloaded. It is also not possible to read the temporary value of a shadowed register, which makes impossible to perform read-modify-write to set/reset a single bit inside a register.

46.8 LTDC registers

46.8.1 LTDC identification register (LTDC_IDR)

Address offset: 0x000

Reset value: 0x0004 0101

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJVER[7:0]

MINVER[7:0]								REV[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **MAJVER[7:0]:** LTDC major version

Bits 15:8 **MINVER[7:0]:** LTDC minor version

Bits 7:0 **REV[7:0]:** Revision

46.8.2 LDTC layer count register (LTDC_LCR)

Address offset: 0x004

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LNBR[7:0]							
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **LNBR[7:0]**: Number of layers

46.8.3 LTDC synchronization size configuration register (LTDC_SSCR)

Address offset: 0x008

Reset value: 0x0000 0000

This register defines the number of horizontal synchronization pixels minus 1, and the number of vertical synchronization lines minus 1. Refer to *Figure 393* and *Section 46.5* for a configuration example.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	HSW[11:0]

Res.	Res.	Res.	Res.	VSH[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **HSW[11:0]**: Horizontal synchronization width (in units of pixel clock period)
This bitfield defines the number of horizontal synchronization pixel minus 1.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **VSH[11:0]**: Vertical synchronization height (in units of horizontal scan line)
This bitfield defines the vertical synchronization height minus 1. It represents the number of horizontal synchronization lines.

46.8.4 LTDC back porch configuration register (LTDC_BPCR)

Address offset: 0x00C

Reset value: 0x0000 0000

This register defines the accumulated number of horizontal synchronization and back porch pixels minus 1 (HSYNC width + HBP - 1), and the accumulated number of vertical synchronization and back porch lines minus 1 (VSYNC height + VBP - 1).
Refer to *Figure 393* and *Section 46.5* for a configuration example.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	AHBP[11:0]

Res.	Res.	Res.	Res.	AVBP[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **AHBP[11:0]**: Accumulated horizontal back porch (in units of pixel clock period)
This bitfield defines the accumulated horizontal back porch width that includes the horizontal synchronization and horizontal back porch pixels minus 1.
The horizontal back porch is the period between horizontal synchronization going inactive, and the start of the active display part of the next scan line.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **AVBP[11:0]:** Accumulated Vertical back porch (in units of horizontal scan line)
This bitfield defines the accumulated vertical back porch width that includes the vertical synchronization and vertical back porch lines minus 1.
The vertical back porch is the number of horizontal scan lines at a start of frame to the start of the first active scan line of the next frame.

46.8.5 LTDC active width configuration register (LTDC_AWCR)

Address offset: 0x010

Reset value: 0x0000 0000

This register defines the accumulated number of horizontal synchronization, back porch and active pixels minus 1 (HSYNC width + HBP + active width - 1), and the accumulated number of vertical synchronization, back porch lines and active lines minus 1 (VSYNC height + BVBP + active height - 1). Refer to *Figure 393* and *Section 46.5* for a configuration example.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	AAH[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **AAW[11:0]**: Accumulated active width (in units of pixel clock period)
This bitfield defines the accumulated active width that includes the horizontal synchronization, horizontal back porch and active pixels minus 1. The active width is the number of pixels in active display area of the panel scan line.
Refer to device datasheet for the maximum active width supported following the maximum pixel clock.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **AAH[11:0]**: Accumulated active height (in units of horizontal scan line)
This bitfield defines the accumulated height that includes the vertical synchronization, vertical back porch and the active height lines minus 1. The active height is the number of active lines in the panel.
Refer to device datasheet for the maximum active height supported following the maximum pixel clock.

46.8.6 LTDC total width configuration register (LTDC_TWCR)

Address offset: 0x014

Reset value: 0x0000 0000

This register defines the accumulated number of horizontal synchronization, back porch, active and front porch pixels minus 1 (HSYNC width + HBP + active width + HFP - 1), and the accumulated number of vertical synchronization, back porch lines, active and front lines minus 1 (VSYNC height + BVBP + active height + VFP - 1). Refer to *Figure 393* and *Section 46.5* for a configuration example.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	TOTALH[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **TOTALW[11:0]**: Total width (in units of pixel clock period)

This bitfield defines the accumulated total width that includes the horizontal synchronization, horizontal back porch, active width and horizontal front porch pixels minus 1.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **TOTALH[11:0]**: Total height (in units of horizontal scan line)

This bitfield defines the accumulated height that includes the vertical synchronization, vertical back porch, the active height and vertical front porch height lines minus 1.

46.8.7 LTDC global control register (LTDC_GCR)

Address offset: 0x018

Reset value: 0x0000 2220

This register defines the LTDC global configuration.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HSPOL	VSPOL	DEPOL	PCPOL	Res.	Res.	SFSWTR	SFEN	Res.	Res.	Res.	Res.	CRCEN	Res.	Res.	DEN

	r	r	r		r	r	r		r	r	r			rw	rw

Bit 31 **HSPOL**: Horizontal synchronization polarity

This bit is set and cleared by software.

0: Horizontal synchronization polarity is active low.

1: Horizontal synchronization polarity is active high.

Bit 30 **VSPOL**: Vertical synchronization polarity

This bit is set and cleared by software.

0: Vertical synchronization is active low.

1: Vertical synchronization is active high.

Bit 29 **DEPOL**: Blanking (no data/pixel) polarity

This bit is set and cleared by software.

0: Blanking (no data/pixel) polarity is active low.

1: Blanking (no data/pixel) polarity is active high.

Bit 28 **PCPOL**: Pixel clock polarity

This bit is set and cleared by software.

0: The pixel and sync data are generated at the rising-edge of the output LCD_CLK clock.

1: The pixel and sync data are generated at the falling-edge of the output LCD_CLK clock.

Bits 27:26 Reserved, must be kept at reset value.

Bit 25 **SFSWTR**: Single-frame mode software trigger
This bit is set by software and cleared by hardware.
0: No action
1: Triggers one frame

Bit 24 **SFEN**: Single-frame mode enable
This bit is set and cleared by software.
0: Single-frame disabled: a trigger (on SFSWTR) generates a continuous flow.
1: Single-frame enabled: a trigger (on SFSWTR) generates a single frame.

Bits 23:20 Reserved, must be kept at reset value.

Bit 19 **CRCEN**: CRC enable
This bit is set and cleared by software.
0: CRC disabled
1: CRC enabled

Bits 18:17 Reserved, must be kept at reset value.

Bit 16 **DEN**: Dither enable
This bit is set and cleared by software.
0: Dither disabled
1: Dither enabled

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **DRW[2:0]**: Dither red width
This bitfield returns the dither red bits.

Bit 11 Reserved, must be kept at reset value.

Bits 10:8 **DGW[2:0]**: Dither green width
This bitfield returns the dither green bits.

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **DBW[2:0]**: Dither blue width
This bitfield returns the dither Blue bits.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **GAMEN**: Gamma correction enable
This bit is set and cleared by software.
0: Gamma correction disabled (pixels bypass the gamma operator)
1: Gamma correction enabled

Bit 0 **LTDCEN**: LTDC global enable
This bit is set and cleared by software.
0: LTDC disabled
1: LTDC enabled

46.8.8 LTDC global configuration 1 register (LTDC_GC1R)

Address offset: 0x01C

Reset value: 0x6BE4 D888

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r		r	r	r	r	r	r	r	r	r	r	r	r	r

Bit 31 **BMA**: Blind mode ability

Bit 30 **CRMA**: Configuration reading mode ability

Bit 29 **STRA**: Status register ability

Bit 28 **DWP:** Dither width programmability

Bit 27 **SPP**: Sync polarity programmability

Bit 26 Reserved, must be kept at reset value.

Bit 25 **TP**: Timing programmability

Bit 24 **LNIP**: Line-IRQ: line position programmability

Bit 23 **BBA**: Background blending ability

Bit 22 **BCP**: Background color programmability (unique color blended as background)

Bit 21 **SHRA**: Shadow register ability

Bit 20 Reserved, must be kept at reset value.

Bits 19:17 **GCT[2:0]**: Gamma correction technique implemented
000: No gamma
001: Gamma with 256 samples
010: Gamma with 8 interpolated segments
Others: Reserved

Bit 16 Reserved, must be kept at reset value.

Bits 15:14 **DT[1:0]**: Dithering technique implemented
00: No dithering
01: Ordered 4x4 Bayer
10: Ordered 4x4 custom
11: Pseudo-random LFSR

Bit 13 Reserved, must be kept at reset value.

Bit 12 **PRBA**: Precise blending ability

Bits 11:8 **WRCH[3:0]**: Width of red channel output

Bits 7:4 **WGCH[3:0]**: Width of green channel output

Bits 3:0 **WBCH[3:0]**: Width of blue channel output

46.8.9 LTDC global configuration 2 register (LTDC_GC2R)

Address offset: 0x020

Reset value: 0x0000 BB30

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

r		r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **BOA:** Blending order ability
0: Blending order fixed
1: Blending order configurable

Bit 14 Reserved, must be kept at reset value.

Bit 13 **CRCA:** CRC ability
0: CRC no computation available
1: CRC computation available

Bit 12 **SFA:** Single frame mode ability
0: Single frame not available
1: Single frame available

Bit 11 **SISA:** Second interrupt set ability
0: Second interrupt set not available
1: Second interrupt set available

Bit 10 **ROTA**: Rotation support ability

Bit 9 **AXIIDA**: AXIID ability

Bit 8 **OCA**: Output conversion ability (RGB to YCbCr)

Bit 7 **EDCA**: External display control ability

Bits 6:4 **BW[2:0]**: Bus width (log2 of number of bytes)
010: 32-bit bus
011: 64-bit bus
100: 128-bit bus
Others: Reserved

Bit 3 **DPA:** Secondary RGB output port ability

Bit 2 **DVA:** Dual-view ability

Bit 1 **STSA:** Slave timings synchronization ability

Bit 0 **BLA:** Background layer ability (pixels of background layer are read from memory)

46.8.10 LTDC shadow reload configuration register (LTDC_SRCR)

Address offset: 0x024

Reset value: 0x0000 0000

This register allows the reload, either immediately or during the vertical blanking period, of shadow register values to the active registers. Shadow registers are all layer x ones, except LTDC_L1CLUTWR and LTDC_L2CLUTWR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VBR	IMR
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **VBR**: Vertical blanking reload request

This bit is set by software and cleared only by hardware after reload (it cannot be cleared through register write once it is set).

0: No effect

1: The shadow registers are reloaded during the vertical blanking period (at the beginning of the first line after the active display area).

Bit 0 **IMR**: Immediate reload trigger

This bit is set by software and cleared only by hardware after reload.

0: No effect

1: The shadow registers are reloaded immediately.

46.8.11 LTDC gamma correction configuration register (LTDC_GCCR)

Address offset: 0x028

Reset value: 0x0000 0000

This register performs indirect access to the gamma correction R,G,B tables.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	REN	GEN	BEN
													w	w	w

COMP[7:0]								ADDR[7:0]							
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **REN**: Write trigger to the red table

0: No action

1: COMP is written at ADDR in the red table.

Bit 17 **GEN**: Write trigger to the green table

0: No action

1: COMP is written at ADDR in the green table.

Bit 16 **BEN**: Write trigger to the blue table
0: No action
1: COMP is written at ADDR in the blue table.

Bits 15:8 **COMP[7:0]**: Color component to be written, in either (or all) the R,G,B tables

Bits 7:0 **ADDR[7:0]**: Address of the R,G,B table where the COMP component is written
When LTDC_GC1R.GCT=2, the gamma is implemented with eight interpolated segment. In that case, the valid ADDR addresses are: 0, 32, 64, 96, 128, 160, 192, 224, 255.
Note: For ADDR = 255, the gamma interpolation hardware considers that the address is 256.

46.8.12 LTDC background color configuration register (LTDC_BCCR)

Address offset: 0x02C

Reset value: 0x0000 0000

This register defines the background color (RGB888).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BCRED[7:0]

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **BCRED[7:0]**: Background color red value
This bitfield configures the background red value.

Bits 15:8 **BCGREEN[7:0]**: Background color green value
This bitfield configures the background green value.

Bits 7:0 **BCBLUE[7:0]**: Background color blue value
This bitfield configures the background blue value.

46.8.13 LTDC interrupt enable register (LTDC_IER)

Address offset: 0x034

Reset value: 0x0000 0000

This register determines which status flags generate an interrupt request, by setting the corresponding bit to 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

								rw	rw			rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **CRCIE**: CRC error interrupt enable
This bit is set and cleared by software.
0: CRC error disabled
1: CRC error interrupt enabled

Bit 6 **FUIE**: FIFO underrun interrupt enable
This bit is set and cleared by software.
0: FIFO underrun interrupt disabled
1: FIFO underrun Interrupt enabled

Bits 5:4 Reserved, must be kept at reset value.

Bit 3 **RRIE**: Register reload interrupt enable
This bit is set and cleared by software.
0: Register reload interrupt disabled
1: Register reload interrupt enabled

Bit 2 **TERRIE**: Transfer error interrupt enable
This bit is set and cleared by software.
0: Transfer error interrupt disabled
1: Transfer error interrupt enabled

Bit 1 **FUWIE**: FIFO underrun warning interrupt enable
This bit is set and cleared by software.
0: FIFO underrun interrupt disabled
1: FIFO underrun Interrupt enabled

Bit 0 **LIE**: Line interrupt enable
This bit is set and cleared by software.
0: line interrupt disabled
1: line interrupt enabled

46.8.14 LTDC interrupt status register (LTDC_ISR)

Address offset: 0x038

Reset value: 0x0000 0000

This register returns the interrupt status flag.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CRCIF	FUIF	Res.	Res.	RRIF	TERRIF	FUWIF	LIF
								r	r			r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **CRCIF**: CRC error interrupt flag
0: No CRC error interrupt generated
1: CRC error interrupt generated when a bus error occurs

Bit 6 **FUIF**: FIFO underrun interrupt flag
0: No FIFO underrun interrupt generated
1: FIFO underrun interrupt generated, if one of the layer FIFOs is empty and many pixel data are read from the FIFO

Bits 5:4 Reserved, must be kept at reset value.

Bit 3 **RRIF**: Register reload interrupt flag
0: No register reload interrupt generated
1: Register reload interrupt generated when a vertical blanking reload occurs (and the first line after the active area is reached)

Bit 2 **TERRIF**: Transfer error interrupt flag
0: No transfer error interrupt generated
1: Transfer error interrupt generated when a bus error occurs

Bit 1 **FUWIF**: FIFO underrun warning interrupt flag
0: No FIFO underrun warning interrupt generated
1: FIFO underrun warning interrupt generated, if one of the layer FIFO is empty and pixel data is read from the FIFO

Bit 0 **LIF**: Line interrupt flag
0: No line interrupt generated
1: Line interrupt generated when a programmed line is reached

46.8.15 LTDC interrupt clear register (LTDC_ICR)

Address offset: 0x03C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

								w	w			w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **CCRCIF**: CRC error interrupt flag clear
0: No effect
1: Clear CRCIF flag in LTDC_ISR.

Bit 6 **CFUIF**: FIFO underrun interrupt flag clear
0: No effect
1: Clear FUIF flag in LTDC_ISR.

Bits 5:4 Reserved, must be kept at reset value.

Bit 3 **CRRIF**: Register reload interrupt flag clear
0: No effect
1: Clear RRIF flag in LTDC_ISR.

Bit 2 **CTERRIF**: Transfer error interrupt flag clear
0: No effect
1: Clear TERRIF flag in LTDC_ISR.

Bit 1 **CFUWIF**: FIFO underrun warning interrupt flag clear
0: No effect
1: Clear FUWIF flag in LTDC_ISR.

Bit 0 **CLIF**: Line-interrupt flag clear
0: No effect
1: Clear LIF flag in LTDC_ISR.

46.8.16 LTDC line interrupt position configuration register (LTDC_LIPCR)

Address offset: 0x040

Reset value: 0x0000 0000

This register defines the line interrupt position. The line value to be programmed depends on timing parameters (see *Figure 393*).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	LIPOS[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **LIPOS[11:0]**: Line interrupt position
This bitfield configures the line interrupt position.

46.8.17 LTDC current position status register (LTDC_CPSR)

Address offset: 0x044

Reset value: 0x0000 0000

This register returns the X,Y position of the currently displayed pixel.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	CXPOS[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	CYPOS[11:0]											
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **CXPOS[11:0]**: Current X position

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **CYPOS[11:0]**: Current Y position

46.8.18 LTDC current display status register (LTDC_CDSR)

Address offset: 0x048

Reset value: 0x0000 0003

This register returns the status of the current display phase that is controlled by HSYNC, VSYNC, and horizontal/vertical data-enable signals.

Example: if the current display phase is the vertical synchronization, VSYNCS is active high. If the current display phase is the horizontal synchronization, HSYNCS is active high.

The returned status does not depend on the configured polarity in LTDC_GCR: it returns the current active display phase.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HSYNCS	VSYNCS	HDES	VDES
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **HSYNCS**: Horizontal synchronization display status
0: Active low
1: Active high

Bit 2 **VSYNCS**: Vertical synchronization display status
0: Active low
1: Active high

Bit 1 **HDES**: Horizontal data enable display status
0: Active low
1: Active high

Bit 0 **VDES**: Vertical data enable display status
0: Active low
1: Active high

46.8.19 LTDC external display control register (LTDC_EDCR)

Address offset: 0x060

Reset value: 0x0000 0000

This register controls the external display interface.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	OCYCO	OCYSEL	OCYEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
				rw	rw	rw

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **OCYCO**: Output conversion to YCbCr 422
This bit defines the chrominance order (whether Cb or Cr is output first).
0: Cb is output first (Y0Cb, then Y1Cr, Y2Cb and so on).
1: Cr is output first (Y0Cr, then Y1Cb, Y2Cr and so on).

Bit 26 **OCYSEL**: Output conversion to YCbCr 422
This bit selects the set of CCIR hard-wired coefficients (ITU-R BT.601 or 709).
0: Use ITU-R BT.601 set (for typically SDTV analog-like displays).
1: Use ITU-R BT.709 set (for typically HDTV digital-like displays).

Bit 25 **OCYEN**: Output conversion to YCbCr 422 enable
0: Conversion disabled
1: Conversion enabled

Bits 24:0 Reserved, must be kept at reset value.

46.8.20 LTDC interrupt enable register 2 (LTDC_IER2)

Address offset: 0x064

Reset value: 0x0000 0000

This register determines which status flags generate an interrupt request, by setting the corresponding bit to 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

								rw	rw			rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **CRCIE**: CRC error interrupt enable
This bit is set and cleared by software.
0: CRC error disabled
1: CRC error interrupt enabled

Bit 6 **FUIE**: FIFO underrun interrupt enable
This bit is set and cleared by software.
0: FIFO underrun interrupt disabled
1: FIFO underrun Interrupt enabled

Bits 5:4 Reserved, must be kept at reset value.

Bit 3 **RRIE**: Register reload interrupt enable
This bit is set and cleared by software.
0: Register reload interrupt disabled
1: Register reload interrupt enabled

Bit 2 **TERRIE**: Transfer error interrupt enable
This bit is set and cleared by software.
0: Transfer error interrupt disabled
1: Transfer error interrupt enabled

Bit 1 **FUWIE**: FIFO underrun warning interrupt enable
This bit is set and cleared by software.
0: FIFO underrun interrupt disabled
1: FIFO underrun Interrupt enabled

Bit 0 **LIE**: Line interrupt enable
This bit is set and cleared by software.
0: Line interrupt disabled
1: Line interrupt enabled

46.8.21 LTDC interrupt status register 2 (LTDC_ISR2)

Address offset: 0x068

Reset value: 0x0000 0000

This register returns the interrupt status flag.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CRCIF	FUIF	Res.	Res.	RRIF	TERRIF	FUWIF	LIF
								r	r			r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **CRCIF**: CRC Error interrupt flag
0: No CRC error interrupt generated
1: CRC error interrupt generated when a bus error occurs

Bit 6 **FUIF**: FIFO underrun interrupt flag
0: No FIFO underrun interrupt generated.
1: FIFO underrun interrupt generated, if one of the layer FIFO is empty and many pixel data are read from the FIFO

Bits 5:4 Reserved, must be kept at reset value.

Bit 3 **RRIF**: Register reload interrupt flag
0: No register reload interrupt generated
1: Register reload interrupt generated when a vertical blanking reload occurs (and the first line after the active area is reached)

Bit 2 **TERRIF**: Transfer error interrupt flag
0: No transfer error interrupt generated
1: Transfer error interrupt generated when a bus error occurs

Bit 1 **FUWIF**: FIFO underrun warning interrupt flag
0: No FIFO underrun warning interrupt generated.
1: FIFO underrun warning interrupt generated, if one of the layer FIFO is empty and pixel data is read from the FIFO

Bit 0 **LIF**: Line interrupt flag
0: No line interrupt generated
1: Line interrupt generated when a programmed line is reached

46.8.22 LTDC interrupt clear register 2 (LTDC_ICR2)

Address offset: 0x06C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

								w	w			w	w	w	w

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **CCRCIF**: Clear the CRC error interrupt flag
0: No effect
1: Clear the CRCIF flag in LTDC_ISR2.

Bit 6 **CFUIF**: Clear the FIFO underrun interrupt flag
0: No effect
1: Clear the FUIF flag in LTDC_ISR2.

Bits 5:4 Reserved, must be kept at reset value.

Bit 3 **CRRIF**: Clear register reload interrupt flag
0: No effect
1: Clear the RRIF flag in LTDC_ISR2.

Bit 2 **CTERRIF**: Clear the transfer error interrupt flag
0: No effect
1: Clear the TERRIF flag in LTDC_ISR2.

Bit 1 **CFUWIF**: Clear the FIFO underrun warning interrupt flag
0: No effect
1: Clear the FUWIF flag in LTDC_ISR2.

Bit 0 **CLIF**: Clear the line interrupt flag
0: No effect
1: Clear the LIF flag in LTDC_ISR2.

46.8.23 LTDC line interrupt position configuration register 2 (LTDC_LIPCR2)

Address offset: 0x070

Reset value: 0x0000 0000

This register defines the line interrupt position. The line value to be programmed depends on timing parameters (see *Figure 393*).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **LIPOS[11:0]**: Line interrupt position

46.8.24 LTDC expected CRC register (LTDC_ECRCR)

Address offset: 0x078

Reset value: 0x0000 0000

This register is used to configure the expected CRC of a frame. If the computed CRC is not as expected, an interrupt CRCIF is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **ECRC[15:0]**: Expected CRC of frame

46.8.25 LTDC computed CRC register (LTDC_CCRCR)

Address offset: 0x07C

Reset value: 0x0000 0000

This register returns the computed CRC of a frame.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CCRC[15:0]**: Computed CRC of frame

46.8.26 LTDC FIFO underrun threshold register (LTDC_FUTR)

Address offset: 0x090

Reset value: 0x0000 0010

A default value for THRE[15:0] is 0x80, that represents 128 words of 64 bits, thus 256 pixels 32bpp or 1024 luminance of a YUV420 pixel.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit 31 **ARGB8888**: Pixel format, ability for argb8888

Bit 30 **ABGR8888**: Pixel format, ability for abgr8888

Bit 29 **RGBA8888**: Pixel format, ability for rgba8888

Bit 28 **BGRA888**: Pixel format, ability for bgra8888

Bit 27 **RGB565**: Pixel format, ability for rgb565

Bit 26 **BGR565**: Pixel format, ability for bgr565

Bit 25 **RGB888**: Pixel format, ability for rgb888

Bit 24 **FF**: Flexible pixel format, ability

Bit 23 **F11PC**: Blending factor 1, ability for 1.0 - (pixel_alpha * constant_alpha)

Bit 22 **F1PC**: Blending factor 1, ability for pixel_alpha * constant_alpha

Bit 21 **F11C**: Blending factor 1, ability for 1.0 - constant_alpha

Bit 20 **F1C**: Blending factor 1, ability for constant_alpha

Bit 19 **F11P**: Blending factor 1, ability for 1.0 - pixel_alpha

Bit 18 **F1P**: Blending factor 1, ability for pixel_alpha

Bit 17 **F10**: Blending factor 1,ability for 0.0

Bit 16 **F11**: Blending factor 1, ability for 1.0

Bit 15 **F21PC**: Blending factor 2, ability for 1.0 - (pixel_alpha * constant_alpha)

Bit 14 **F2PC**: Blending factor 2, ability for pixel_alpha * constant_alpha

Bit 13 **F21C**: Blending factor 2, ability for 1.0 - constant_alpha

Bit 12 **F2C**: Blending factor 2, ability for constant_alpha

Bit 11 **F21P**: Blending factor 2, ability for 1.0 - pixel_alpha

Bit 10 **F2P**: Blending factor 2, ability for pixel_alpha

Bit 9 **F20**: Blending factor 2, ability for 0.0

Bit 8 **F21**: Blending factor 2, ability for 1.0

Bit 7 **CKRA**: Color key replace ability

Bit 6 **CLUTA**: CLUT ability

Bit 5 **WINA**: Windowing ability

Bit 4 **DCP**: Default color programmability

Bit 3 **APA**: Alpha plane ability

Bit 2 **CFBPA**: Color frame buffer pitch ability

Bit 1 **CFBDA**: Color frame buffer duplication ability

Bit 0 **CKTA**: Color key transparency ability

46.8.28 LTDC layer x configuration 1 register (LTDC_LxC1R)

Address offset: 0x104 + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x8000 0007, 0x8000 0007, 0x0000 0000

													r	r	r

Bit 31 **SCA**: Scaling ability for this layer
0: Scaling not available
1: Scaling available

Bits 30:3 Reserved, must be kept at reset value.

Bit 2 **YFPA**: YCbCr 420 full-planar ability for this layer
0: Full planar not available
1: Full planar available

Bit 1 **YSPA**: YCbCr 420 semi-planar ability for this layer
0: Semi-planar not available
1: Semi-planar available

Bit 0 **YIA**: YCbCr 422 interleaved ability for this layer
0: Interleaved not available
1: Interleaved available

46.8.29 LTDC layer x reload control register (LTDC_LxRCR)

Address offset: 0x108 + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GRMSK	VBR	IMR
													rw	rw	w

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **GRMSK**: Shadow reload control, global (centralized) reload masked
This bit is set and cleared by software.
0: Global reload masked for this layer (control from LTDC_SRCR disabled)
1: Global reload active for this layer (control from LTDC_SRCR enabled)

Bit 1 **VBR**: Vertical blanking reload request
This bit is set by software and cleared only by hardware after reload (it cannot be cleared through register write once it is set).
0: No effect
1: Shadow registers are reloaded during the vertical blanking period (at the beginning of the first line after the active display area).

Bit 0 **IMR**: Immediate reload trigger
This bit is set by software and cleared only by hardware after reload.
0: No effect
1: Shadow registers are reloaded immediately.

46.8.30 LTDC layer x control register (LTDC_LxCR)

Address offset: 0x10C + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

					rw	rw	rw				rw			rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **SCEN**: Scaler enable
This bit is set and cleared by software.
0: Scaler disabled
1: Scaler enabled

Bit 9 **DCBEN**: Default color blending enable
This bit is set and cleared by software.
0: Blending disabled
1: Blending enabled

Bit 8 **HMEN**: Horizontal mirroring enable
This bit is set and cleared by software.
0: Mirror disabled
1: Mirror enabled (if so, the color frame buffer start address has to be set to the last byte of the first line, so for instance: if line is 100 pixels, 24 bpp, then address is set to 299)

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **CLUTEN**: Color look-up table enable
This bit is set and cleared by software.
0: Color look-up table disabled
1: Color look-up table enabled
The CLUT is only meaningful for L8, AL44 and AL88 pixel format.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **CKEN**: Color keying enable
This bit is set and cleared by software.
0: Color keying disabled
1: Color keying enabled: if RGB matches, then the ARGB are set to 0.

Bit 0 **LEN**: Layer enable
This bit is used to enable/disable the presence of this whole layer. it is set and cleared by software.
0: Layer disabled
1: Layer enabled

46.8.31 LTDC layer x window horizontal position configuration register (LTDC_LxWHPCR)

Address offset: 0x110 + 0x100 * (x -1), (x = 1 to 3)

Reset value: 0x0000 0000

This register defines the horizontal position (first and last pixel) of the window of layer 1/3.

The first visible pixel of a line is the programmed value of AHBP[11:0] + 1 in LTDC_BPCR.

The last visible pixel of a line is the programmed value of AAW[11:0] in LTDC_AWCR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	WHSTPOS[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **WHSPPOS[11:0]**: Window horizontal stop position
This bitfield configures the last visible pixel of a line of the layer window.
WHSPPOS[11:0] must be ≥ AHBP[11:0] bits + 1 (programmed in LTDC_BPCR).

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **WHSTPOS[11:0]**: Window horizontal start position
This bitfield configures the first visible pixel of a line of the layer window.
WHSTPOS[11:0] must be ≤ AAW[11:0] bits (programmed in LTDC_AWCR).

46.8.32 LTDC layer x window vertical position configuration register (LTDC_LxWVPCR)

Address offset: 0x114 + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

This register defines the vertical position (first and last line) of the layer 1 or 2 window.

The first visible line of a frame is the programmed value of AVBP[11:0] + 1 in LTDC_BPCR.

The last visible line of a frame is the programmed value of AAH[11:0] in LTDC_AWCR.

				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **WVSPPOS[11:0]**: Window vertical stop position
This bitfield configures the last visible line of the layer window.
WVSPPOS[11:0] must be ≥ AVBP[11:0] + 1 (programmed in LTDC_BPCR).

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **WVSTPOS[11:0]**: Window vertical start position
This bitfield configures the first visible line of the layer window.
WVSTPOS[11:0] must be ≤ AAH[11:0] (programmed in LTDC_AWCR).

46.8.33 LTDC layer x color keying configuration register (LTDC_LxCKCR)

Address offset: 0x118 + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

This register defines the color key value (RGB), that is used by the color keying.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **CKRED[7:0]**: Color key red value

Bits 15:8 **CKGREEN[7:0]**: Color key green value

Bits 7:0 **CKBLUE[7:0]**: Color key blue value

46.8.34 LTDC layer x pixel format configuration register (LTDC_LxPFCR)

Address offset: 0x11C + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

This register defines the pixel format that is used for the stored data in the frame buffer of a layer. The pixel data is read from the frame buffer and then transformed to the internal format 8888 (ARGB). When components are provided with less than 8 bits per component, they get expanded to 8 bits by replication of their MSB onto their LSB.

When the Alpha value is not defined in the input pixel format, Alpha is assumed for farther needs to be equal to 255 (opaque layer).

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PF[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **PF[2:0]**: Pixel format

This bitfield configures the pixel format.
000: ARGB8888 (32 bpp)
001: ABGR8888 (32 bpp)
010: RGBA8888 (32 bpp)
011: BGRA8888 (32 bpp)
100: RGB565 (16 bpp, A = 255)
101: BGR565 (16 bpp, A = 255)
110: RGB888 (24 bpp packed, A = 255)
111: Flexible pixel format selected (see *Section 46.8.56* and *Section 46.8.57*)

46.8.35 LTDC layer x constant alpha configuration register (LTDC_LxCACR)

Address offset: 0x120 + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 00FF

This register defines the constant alpha value (divided by 255 by hardware), that is used in the alpha blending (see LTDC_LxBFCR).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CONSTA[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **CONSTA[7:0]**: Constant alpha

This bitfield configures the constant alpha used for blending. The constant alpha is divided by 255 by hardware.
Example: if the programmed constant alpha is 0xFF, the floating alpha value is 255 / 255 = 1.

46.8.36 LTDC layer x default color configuration register (LTDC_LxDCCR)

Address offset: 0x124 + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

This register defines the default color of a layer in the format ARGB. The default color is used outside the defined layer window or when a layer is disabled. The reset value of 0x00000000 defines a transparent black color.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DCALPHA[7:0]								DCRED[7:0]

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DCGREEN[7:0]								DCBLUE[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **DCALPHA[7:0]**: Default color alpha
This bitfield configures the default alpha value.

Bits 23:16 **DCRED[7:0]**: Default color red
This bitfield configures the default red value.

Bits 15:8 **DCGREEN[7:0]**: Default color green
This bitfield configures the default green value.

Bits 7:0 **DCBLUE[7:0]**: Default color blue
This bitfield configures the default blue value.

46.8.37 LTDC layer x blending factors configuration register (LTDC_LxBFCR)

Address offset: 0x128 + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0607, 0x0001 0607, 0x0002 0607

This register defines the blending order, and the factors BF1 and BF2. The constant alpha value is the programmed value in LTDC_LxCACR, divided by 255 by hardware.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BOR[2:0]

Res.	Res.	Res.	Res.	Res.	BF1[2:0]			Res.	Res.	Res.	Res.	Res.	BF2[2:0]		
					rw	rw	rw						rw	rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:16 **BOR[2:0]**: Blending order
This bitfield selects the blending order, BOR:
000: For the most background layer (usually hidden behind others)
111: For the most foreground layer (always visible, never hidden by any other)
The BOR value is limited to the max amount of layers, minus 1. For instance, if the LTDC supports three layers (layer 1/2/3), then the BOR can be configured with only the following values: 000, 001, 010.
In case of inconsistency, like two layers sharing same BOR, the blending engine reverses to BOR[layerID] = layerID - 1, so that layer 3 gets in foreground and layer 1 is in background.
Usually, the default configuration is the following one:
BOR(layer 1) = 000
BOR(layer 2) = 001
BOR(layer 3) = 010

Bits 15:11 Reserved, must be kept at reset value.

Bits 10:8 **BF1[2:0]**: Default factor 1
This bitfield selects the blending factor F1.
100: Constant alpha
110: Pixel alpha x constant alpha
Others: Reserved

Bits 7:3 Reserved, must be kept at reset value.

Bits 2:0 **BF2[2:0]**: Blending factor 2
This bitfield selects the blending factor F2.
101: 1 - constant alpha
111: 1 - (pixel alpha x constant alpha)
Others: Reserved

46.8.38 LTDC layer x burst length configuration register (LTDC_LxBLCR)

Address offset: 0x12C + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

This register defines the length of the bursts requested by layer x.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BL[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **BL[4:0]**: Burst length
0x00: maximum burst length (16 words 64 bits, thus 128 Bytes)
0x01: 1 word (of 64 bits) per burst
0x10: 16 words (of 64 bits) per burst
Others: Reserved

46.8.39 LTDC layer x planar configuration register (LTDC_LxPCR)

Address offset: 0x130 + 0x100 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

This register defines, for layer x, the configuration when accessing planar or semi-planar buffers.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	YREN	OF	CBF	YF	YCM[1:0]		YCEN	Res.	Res.	Res.
						rw	rw	rw	rw	rw	rw	rw			

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **YREN**: Y rescale enable for the color dynamic range
When enabled, incoming Y values in range 16 to 235, are re-scaled to range 0 to 255.
0: Rescaling disabled (input component thus assumed provided in 0 to 255)
1: Rescaling enabled (input component thus assumed provided in 16 to 235).

Bit 8 **OF**: Odd pixel first
This bit defines if the byte 0 of a word (in LSB) contains the odd pixel.
0: Odd pixel disabled (thus even pixel on byte 0)
1: Odd pixel enabled (thus odd pixel on byte 0)

Bit 7 **CBF**: Cb component first
This bit defines if the byte 0 and 1 of a word (in LSB) contains the Cb component. The setting impacts only for interleaved and semi-planar modes, as it has no meaning in full-planar mode.
0: Cb disabled (thus Cr component is on byte 0 and 1)
1: Cb enabled (thus Cb component is on byte 0 and 1)

Bit 6 **YF**: Y component first
This bit defines if the byte 0 of a word (in LSB) contains the Y component.
0: Y component disabled (thus Cr or Cb component is on byte 0)
1: Y component enabled (thus Y component is on byte 0)

Bits 5:4 **YCM[1:0]**: YCbCr conversion mode
This bitfield defines the type of input that is considered and converted to a YCbCr 444.
00: Interleaved 422 (Cb and Cr component are replicated horizontally for pixels P and P+1)
01: Semi-Planar 420: (Cb and Cr component are replicated horizontally and vertically.The layer main configuration defines the access to the Y buffer, and auxiliary registers define the access to the Cb and Cr buffers).
10: Full-Planar 420: (Cb and Cr component are replicated horizontally and vertically. The layer main configuration defines the access to the Y buffer, and auxiliary registers define the access to the Cb and Cr buffers).
11: Reserved

Bit 3 **YCEN**: YCbCr-to-RGB conversion enable
0: Conversion disabled
1: YCbCr conversion enabled, using the YCM setting above

Bits 2:0 Reserved, must be kept at reset value.

46.8.40 LTDC layer x color frame buffer address register (LTDC_LxCFBAR)

Address offset: 0x134 + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

This register defines the color frame buffer start address, which has to point to the address where the pixel data of the top-left pixel of a layer is stored in the frame buffer.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CFBADD[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CFBADD[31:0]**: Color frame buffer start address
This bitfield defines the color frame buffer start address.

46.8.41 LTDC layer x color frame buffer length register (LTDC_LxCFBLR)

Address offset: 0x138 + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

This register defines the color frame buffer line length and pitch.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	CFBP[14:0]

Res.	Res.	CFBLL[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value. Upon reading, this bit returns the value of the bit 30.

Bits 30:16 **CFBP[14:0]**: Color frame buffer pitch in bytes
This bitfield defines the pitch that is the increment from the start of one line of pixels to the start of the next line in bytes.
Negative values (with MSB bit = 1) are allowed, to read the buffer from bottom to top, and thus to flip is vertically. When vertically flipped, as the address register must provide the address of the first line to be read, the address register must point to the start of the bottom line of the buffer.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **CFBLL[13:0]**: Color frame buffer line length
This bitfield defines the length of one line of pixels in bytes + 7.
The line length is computed as follows: active high width * number of bytes per pixel + 7.

46.8.42 LTDC layer x color frame buffer line number register (LTDC_LxCFBLNR)

Address offset: 0x13C + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

This register defines the number of lines in the color frame buffer. The number of lines and line-length settings define how much data are fetched per frame for every layer. If it is configured to less bytes than required, a FIFO underrun interrupt is generated if enabled. The start address and pitch settings define the correct start of every line in memory.

				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **CFBLNBR[11:0]**: Frame buffer line number

This bitfield defines the number of lines in the frame buffer that corresponds to the active high width.

46.8.43 LTDC layer x auxiliary frame buffer address 0 register (LTDC_LxAFBA0R)

Address offset: 0x140 + 0x100 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

This register defines the start address for the auxiliary 0 frame buffer. It has to point to the address where the pixel data of the top left pixel of a layer is stored in the frame buffer. The auxiliary 0 and 1 frame buffers are for YCbCr semi-planar or full-planar pixel formats: the color frame buffer is used to store the Y components, while the auxiliary buffers 0 and 1 are used to store the other one (for semi-planar) or two (for full-planar) planes of components.

Bit 31 Reserved, must be kept at reset value. Upon reading, this bit returns the value of the bit 30.

Bits 30:16 **AFBP[14:0]**: Auxiliary frame buffer pitch in bytes

This bitfield defines the pitch that is the increment from the start of one line of pixels to the start of the next line in bytes.
Negative values (with MSB bit = 1) are allowed, to read the buffer from bottom to top, and thus to flip is vertically. When vertically flipped, as the address register must provide the address of the first line to be read, the address register must point to the start of the bottom line of the buffer.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **AFBLL[13:0]**: Auxiliary frame buffer line length

This bitfield defines the length of one line of pixels in bytes + 7.
The line length is computed as follows: active high width * number of bytes per pixel + 7.

46.8.46 LTDC layer x auxiliary frame buffer line number register (LTDC_LxAFBLNR)

Address offset: 0x14C + 0x100 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

This register defines the number of lines in the auxiliary 0 and 1 frame buffers (the auxiliary 0 and 1 frame buffers are for YCbCr semi-planar or full-planar pixel formats). The number of lines and line length settings define how much data is fetched per frame for every layer. If it is configured to less bytes than required, a FIFO underrun interrupt is generated if enabled. The start address and pitch settings define the correct start of every line in memory.

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:0 **AFBLNBR[11:0]**: Auxiliary frame buffer line number
This bitfield defines the number of lines in the frame buffer that corresponds to the active high width.

46.8.47 LTDC layer x CLUT write register (LTDC_LxCLUTWR)

Address offset: 0x150 + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

This register defines the CLUT address and the RGB value. The CLUT write register must only be configured during blanking period or if the layer is disabled. The CLUT can be enabled or disabled in LTDC_LxCR. The CLUT is only meaningful for L8, AL44, and AL88 pixel format.

w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:24 **CLUTADD[7:0]**: CLUT address
This bitfield configures the CLUT address (color position within the CLUT) of each RGB value.

Bits 23:16 **RED[7:0]**: Red value
This bitfield configures the red value.

Bits 15:8 **GREEN[7:0]**: Green value
This bitfield configures the green value.

Bits 7:0 **BLUE[7:0]**: Blue value
This bitfield configures the blue value.

46.8.48 LTDC layer x scaler input size register (LTDC_LxSISR)

Address offset: 0x154 + 0x100 * (x - 1), (x = 1 to 2)

Reset value: 0x0000 0000

This register defines the scaler input size (width and height).

Res.	Res.	Res.	Res.	Res.	Res.	CR2G[9:0]									
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:16 **CB2G[9:0]**: Cb-to-Green coefficient, with bits 9:8 as positive integer and 7:0 as decimals.

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:0 **CR2G[9:0]**: Cr-to-Green coefficient, with bits 9:8 as positive integer and 7:0 as decimals.

46.8.56 LTDC layer x flexible pixel format 0 register (LTDC_LxFPF0R)

Address offset: 0x174 + 0x100 * (x - 1), (x = 1 to 3)

Reset value: 0x0002 1100

This register is one of the registers that define the flexible color format, by specifying the location and width of all A, R, G, B components in a memory word. Components A and R are defined in this specific register.

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

47 True random number generator (RNG)

47.1 RNG introduction

The RNG is a true random number generator that provides full entropy outputs to the application as 32-bit samples. It is composed of a live entropy source (analog) and an internal conditioning component.

The RNG is an NIST SP 800-90B compliant entropy source that can be used to construct a nondeterministic random bit generator (NDRBG).

The RNG true random number generator can be certified NIST SP 800-90B. It can also be tested using the German BSI statistical tests of AIS-31 (T0 to T8).

47.2 RNG main features

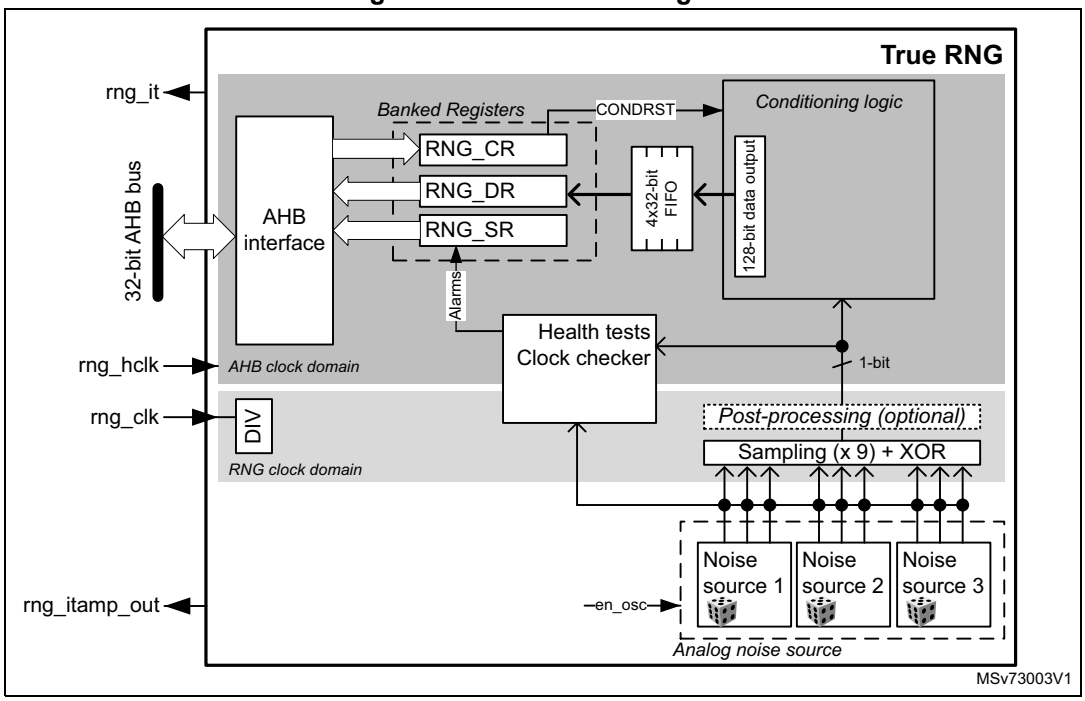
- The RNG delivers 32-bit true random numbers, produced by an analog entropy source conditioned by an NIST SP800-90B approved conditioning stage.
- It can be used as the entropy source to construct a non-deterministic random bit generator (NDRBG).
- In the NIST configuration, produces four 32-bit random samples every 412 AHB clock cycles if $f_{AHB} < f_{threshold}$ (256 RNG clock cycles otherwise).
- Embeds startup and NIST SP800-90B approved continuous health tests (repetition count and adaptive proportion tests), associated with specific error management.
- Can be disabled to reduce power consumption, or enabled with an automatic low power mode (default configuration).
- Has an AMBA® AHB slave peripheral, accessible through 32-bit word single accesses only (else an AHB bus error is generated, and the write accesses are ignored).

47.3 RNG functional description

47.3.1 RNG block diagram

Figure 394 shows the RNG block diagram.

Figure 394. RNG block diagram



47.3.2 RNG internal signals

Table 432 describes internal signals available at the RNG level, not at the STM32 product level (on pads).

Table 432. RNG internal input/output signals

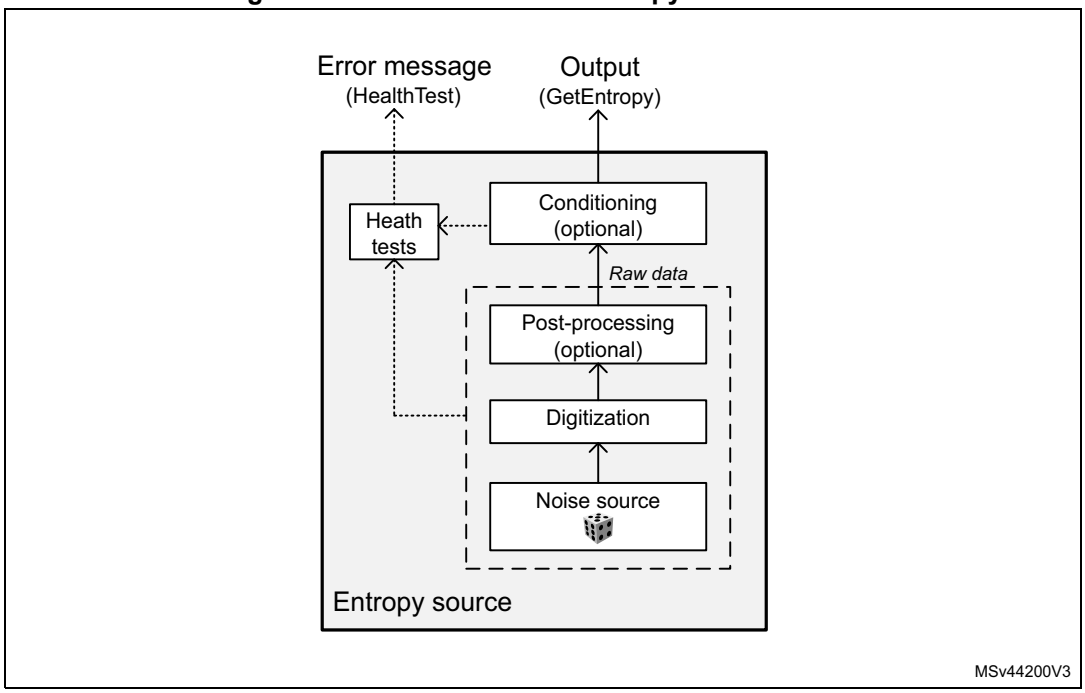
Signal name	Signal type	Description
rng_it	Digital output	RNG global interrupt request
rng_hclk	Digital input	AHB clock
rng_clk	Digital input	RNG dedicated clock, asynchronous to rng_hclk
rng_itamp_out	Digital output	RNG internal tamper event signal to TAMP (XOR-ed), triggered when an unexpected hardware fault occurs. When this signal is triggered, RNG stops delivering random samples. A reset and a new initialization are needed to use it again.

47.3.3 Random number generation

The true random number generator (RNG) delivers truly random data through its AHB interface at deterministic intervals.

Within its boundary, it integrates all the required NIST components shown in *Figure 395*: an analog noise source, a digitization stage, a conditioning algorithm, a health monitoring block, and two interfaces used to interact with the entropy source (GetEntropy and HealthTest).

Figure 395. NIST SP800-90B entropy source model



Noise source

This component contains the nondeterministic, entropy-providing activity, ultimately responsible for the uncertainty associated with the bit string output by the entropy source. This noise source provides 1-bit samples. It is composed of:

- Multiple analog noise sources (x3), each based on three XOR-ed free-running ring oscillator outputs. It is possible to disable those analog oscillators to save power, as described in *Section 47.3.8*. Multiple oscillators are also disabled for configuration A (see *Table 434*).
- The XOR-ing of all the noise sources into a single analog output.
- A sampling stage of this output is clocked by a dedicated clock input (rng_clk with integrated divider), delivering a 1-bit raw data output.

This noise source sampling is independent from the AHB interface clock frequency (rng_hclk), with the possibility, for the software, to decrease the sampling frequency by using the integrated divider.

Note: The recommended clock frequencies and associated divider value are detailed in Section 47.6.

Post processing

In the NIST configuration no post-processing is applied to the sampled noise source. In the non-NIST configuration B (as defined in *Section 47.6.2*) a normalization debiasing is applied: half of the bits are taken from the sampled noise source, the other half from the inverted sampled noise source.

Conditioning

The conditioning component in the RNG is a deterministic function that increases the entropy rate of the resulting fixed-length bit string output (128-bit). The NIST SP800-90B target is full entropy on the output (128-bit).

The time intervals required between two random number generations, and between the RNG initialization and availability of the first sample are detailed in *Section 47.5*.

Output buffer

A data output buffer can store up to four 32-bit words that have been output from the conditioning component. When four words have been read from the output FIFO through the RNG_DR register, the content of the 128-bit conditioning output register is pushed into the output FIFO, and a new conditioning round is automatically started. Four new words are added to the conditioning output register after a number of clock cycles specified in *Section 47.5*.

Whenever a random number is available through the RNG_DR register, the DRDY flag changes from 0 to 1. This flag remains high until the output buffer becomes empty after reading four words from the RNG_DR register.

Note: When the interrupts are enabled, an interrupt is generated when this flag transitions from 0 to 1. The interrupt is then cleared automatically by the RNG, as explained above.

Health checks

This component ensures that the entire entropy source (with its noise source) starts, then operates as expected, obtaining the assurance that failures are caught quickly, with high probability and reliability.

The RNG implements the following health check features in accordance with NIST SP800-90B. The described thresholds correspond to the value recommended for register RNG_HTCRx (configuration A in *Section 47.6.2*). The description below refers to the RNG_HTCR0 configuration.

1. Startup health tests, performed after reset and before the first use of the RNG as entropy source:
   - Repetition count test, flagging an error when the noise source has provided more than 42 consecutive bits at a constant value (0 or 1).
   - Adaptive proportion test running on a window of 1024 consecutive bits: the RNG verifies that the first bit on the outputs of the noise source is not repeated more than 711 times.
   - Known-answer tests, to verify the conditioning stage.
2. Continuous health tests, running indefinitely on the outputs of the noise source:
   - Repetition count test, similar to the one running in startup tests.
   - Adaptive proportion test, similar to the one running in startup tests.
3. Vendor specific continuous test:

- Real-time “too slow” sampling clock detector, flagging an error when one RNG clock cycle (before divider) is smaller than the AHB clock cycle divided by 32.

4. On-demand test of digitized noise source (raw data)
   - Supported by restarting the entropy source and rerunning the startup tests (see software reset sequence in *Section 47.3.4*). Other kinds of on-demand testing (software based) are *not supported*.

The CECS and SECS status bits in the RNG_SR register indicate when an error condition is detected, as detailed in *Section 47.3.7*.

Note: An interrupt can be generated when an error is detected.

The health test thresholds are modified by changing the value in the corresponding RNG_HTCR register. See Section 47.6 for details.

47.3.4 RNG initialization

The RNG simplified state machine is shown in *Figure 396*.

After enabling the RNG (RNGEN = 1 in RNG_CR), the following chain of events occurs:

1. The analog noise source is enabled, and by default the RNG waits 16 RNG clock cycles (before divider) before starting to sample the analog output and filling the 128-bit conditioning shift register.
2. The conditioning hardware initializes, automatically triggering the startup behavior test on the raw data samples and known-answer tests.
3. Start-up health tests are completed, with the conditioning stage ready to use.
4. The conditioning stage internal input data buffer is filled again with 128-bit and a number of conditioning rounds defined by the RNG configuration (NIST or non-NIST) is performed. The output buffer is then filled with the post processing result.
5. The output buffer is refilled automatically according to the RNG usage.

The associated initialization time can be found in *Section 47.5*.

Figure 396. RNG initialization overview

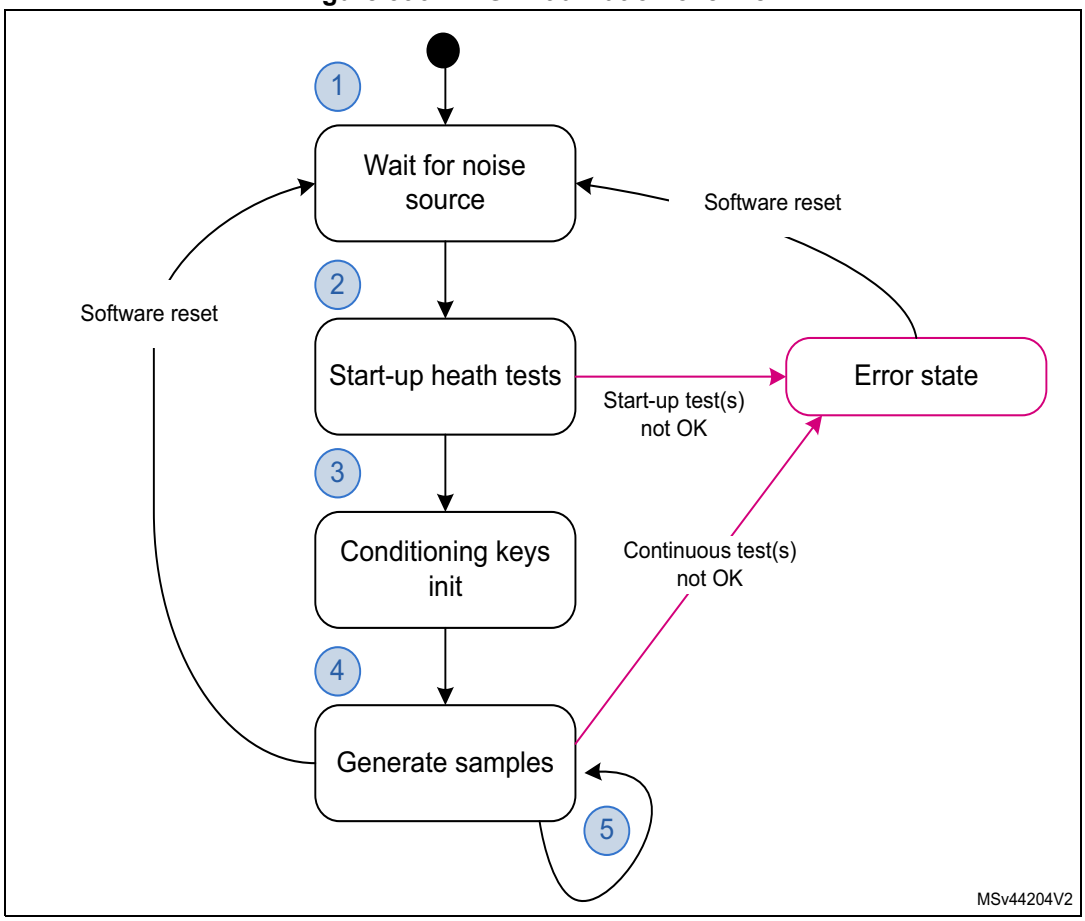


Figure 396 also highlights a possible software reset sequence, implemented by:

1. Write RNGEN = 0, then wait for BUSY = 0 in the RNG_SR register.
2. Write bits RNGEN = 0 and CONDRST = 1 in the RNG_CR register with the same RNG configuration and a new CLKDIV if needed.
3. Write RNGEN = 1 and CONDRST = 0 in the RNG_CR register.
4. Wait for a random number to be ready, after initialization completes.

Note: When the RNG is reset by RCC (hardware reset), the configuration for optimal randomness is lost in the registers. Software reset with CONFIGLOCK set preserves the configuration.

47.3.5 RNG operation

Normal operation

To run the RNG using interrupts, the following steps are recommended:

1. Check in *Section 47.6* if a specific RNG configuration is required for the application.
   – If this is the case, when bits RNGEN and BUSY=0, write in the RNG_CR register bit CONDRST = 1, together with the correct RNG configuration. Then perform a second write with bit CONDRST = 0, interrupt enable bit IE = 1, and RNG enable bit RNGEN = 1.

- If this is not the case, perform a write to the RNG_CR register with interrupt enable bit IE = 1 and RNG enable bit RNGEN = 1.

2. An interrupt is now generated when a random number is ready or when an error occurs. Therefore, at each interrupt, check that:
   - No error occurred. The SEIS and CEIS bits must be set to 0 in the RNG_SR register.
   - A random number is ready. The DRDY bit must be set to 1 in the RNG_SR register.
   - If the above two conditions are true the content of the RNG_DR register can be read up to four consecutive times. If valid data are available in the conditioning output buffer, four additional words can be read by the application (in this case the DRDY bit is still high). If one or both of the above conditions are false, the RNG_DR register must not be read. If an error occurred, the error recovery sequence described in *Section 47.3.7* must be used.

To run the RNG in polling mode the following steps are recommended:

1. Check in *Section 47.6* if a specific RNG configuration is required for the application.
   - If this is the case, when bits RNGEN and BUSY = 0, write in the RNG_CR register bit CONDRST = 1, together with the correction RNG configuration. Then perform a second write to the RNG_CR register with bit CONDRST = 0 and the RNG enable bit RNGEN = 1.
   - If this is not the case, only enable the RNG by setting the RNGEN bit to 1 in the RNG_CR register.
2. Read the RNG_SR register and check that:
   - No error occurred (the SEIS and CEIS bits must be set to 0)
   - A random number is ready (the DRDY bit must be set to 1)
3. If the above conditions are true, read the content of the RNG_DR register up to four consecutive times. If valid data are available in the conditioning output buffer, four additional words can be read by the application (in this case the DRDY bit is still high). If one or both of the above conditions are false, the RNG_DR register must not be read. If an error occurred, use the recovery sequence described in *Section 47.3.7*.

Note: When data are not ready (DRDY = 0) RNG_DR returns 0. It is recommended to verify that RNG_DR is different from 0. When this happens, a seed error occurred between RNG_SR polling and RND_DR output reading (a rare event).

If the random number generation period is a concern to the application and if NIST compliance is not required, it is possible to select a faster configuration by using the configuration B, described in *Section 47.6*. The gain in random number generation speed is summarized in *Section 47.5*.

Low-power operation

If power consumption is a concern, low-power strategies can be used, as described in *Section 47.3.8*.

Software post-processing

No specific software post-processing/conditioning is expected to meet the AIS-31 or NIST SP800-90B approvals.

Built-in health check functions are described in *Section 47.3.3*.

47.3.6 RNG clocking

The RNG runs on two different clocks: the AHB bus clock and a dedicated RNG clock.

The AHB clock is used to clock the AHB banked registers and conditioning component. The RNG clock, coupled with a programmable divider (see CLKDIV bitfield in the RNG_CR register) is used for noise source sampling. Recommended clock configurations are detailed in *Section 47.6*.

*Note: When the CED bit in the RNG_CR register is set to 0, the RNG clock frequency before the internal divider **must be higher** than the AHB clock frequency divided by 32, otherwise the clock checker flags a clock error (CECS = 1 in the RNG_SR register).*

See *Section 47.3.1* for details (AHB and RNG clock domains).

47.3.7 Error management

In parallel to random number generation a health check block verifies the correct noise source behavior and the frequency of the RNG source clock as detailed in this section. Associated error state is also described.

Clock error detection

When the clock error detection is enabled (CED = 0) and if the RNG clock frequency is too low, the RNG sets to 1 both the CEIS and CECS bits to indicate that a clock error occurred. In this case, the application must check that the RNG clock is configured correctly (see *Section 47.3.6*), and then it must clear the CEIS bit interrupt flag. The CECS bit is automatically cleared when the clocking condition is normal.

When CECS is set, values are available in the RNG_DR register, but it must not be used as described in *Section 47.3.5*.

Note: CEIS is set only when CECS is set to 1 by RNG.

Noise source error detection

When a noise source (or seed) error occurs, the RNG stops generating random numbers and sets to 1 both SEIS and SECS bits to indicate that a seed error occurred.

When SECS is set, values are available in the RNG_DR register, but it must not be used as described in *Section 47.3.5*.

When ARDIS is cleared (auto-reset enabled), clear the SEIS interrupt status bit in the RNG_SR register before drawing random numbers again.

When ARDIS is set (auto-reset disabled), the following sequence must be used to fully recover from a seed error:

1. Write CONDRST at 1 and at 0 in the RNG_CR register to reset the conditioning logic.
2. Wait for the CONDRST bit to be cleared by hardware. Then clear the SEIS interrupt status bit in the RNG_SR register.
3. If SECS is still set in RNG_SR it means a new seed error occurred (unlikely). In this case go back to step 1).

Note: After a seed error RNG restarts generating random numbers when SECS is cleared.

When the application sets the ARDIS bit in the RNG_CR register, the autoreset is disabled. CONDRST must be used in step 1.

RNG tamper errors

When an unexpected error is found by the RNG, an internal tamper event is triggered in the TAMP peripheral, and the RNG stops delivering random data.

When this event occurs, the secure application needs to reset the RNG peripheral, using the central reset management or the global SoC reset. A proper initialization of the RNG is required again.

47.3.8 RNG low-power use

If power consumption is a concern, the RNG can be disabled as soon as the DRDY bit is set to 1 by setting the RNGEN bit to 0 in the RNG_CR register. As the post-processing logic and the output buffer remain operational while the RNGEN = 0, the following features are available to the software:

- If there are valid words in the output buffer, four random numbers can still be read from the RNG_DR register.
- If there are valid bits in the conditioning output internal register, four additional random numbers can be still be read from the RNG_DR register. If it is not the case, RNG must be re-enabled by the application until the expected new noise source bits threshold is reached (128-bit in NIST mode), and a complete conditioning round is done. Four new random words are then available only if the expected number of conditioning round is reached (two if NISTC = 0). The overall time can be found in *Section 47.5*.

When disabling the RNG, the user deactivates all the analog seed generators, whose power consumption is given in the datasheet electrical characteristics section. The user also gates all the logic clocked by the RNG clock. Note that this strategy is adding latency before a random sample is available on the RNG_DR register, because of the RNG initialization time.

If the RNG block is disabled during initialization (that is well before the DRDY bit rises for the first time), the initialization sequence resumes from where it was stopped when the RNGEN bit is set to 1, unless the application resets the conditioning logic using the CONDRST bit in the RNG_CR register.

When the application wants to gate the RNG kernel clock, the software must issue the following sequence: first, disable the RNG by clearing the RNGEN bit in the RNG_CR register, then wait for the BUSY bit to be cleared in the RNG_SR, and finally, disable the RNG kernel clock using the RCC.

Before entering a power mode where RNG is deactivated (like Stop mode), the software must first disable the RNG by clearing the RNGEN bit in the RNG_CR register, then wait for the BUSY bit to be cleared in the RNG_SR.

Note: The power modes where RNG is deactivated (retained or not available) can be found in the PWR section.

47.4 RNG interrupts

In the RNG an interrupt can be produced on the following events:

- Data ready flag
- Seed error, see *Section 47.3.7*
- Clock error, see *Section 47.3.7*

Dedicated interrupt enable control bits are available as shown in *Table 433*.

Table 433. RNG interrupt requests

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method
RNG	Data ready flag	DRDY	IE	None (automatic)
	Seed error flag	SEIS	IE	Write CONDRST to 1 then to 0 unless ARDIS is cleared (see *Section 47.3.7*). Write 0 to SEIS.
	Clock error flag	CEIS	IE	Write 0 to CEIS

The user can enable or disable the above interrupt sources globally by using the general interrupt control bit IE in the RNG_CR register. The status of the individual interrupt sources can be read from the RNG_SR register.

Note: Interrupts are generated only when RNG is enabled.

47.5 RNG processing time

In the recommended configuration A or C described in *Table 434*, the time between two sets of four 32-bit data is either:

- 206 x N AHB cycles if $f_{AHB} < f_{threshold}$ (conditioning stage is limiting), or
- 128 x N RNG cycles $f_{AHB} \geq f_{threshold}$ (noise source stage is limiting).

If f_{RNG}= 48 MHz, $f_{threshold}$ = 1.6 x f_{RNG} = 77 MHz. The value of N is defined in *Section 47.6*.

Note: When CLKDIV is different from 0, f_{RNG} must take into account the internal divider ratio.

If configuration B is selected, the performance figure becomes:

- 206 AHB cycles if $f_{AHB} < f_{threshold}$ or
- 32 RNG cycles $f_{AHB} \geq f_{threshold}$

with $f_{threshold}$ = 6.5 x f_{RNG}.

47.6 RNG entropy source validation

47.6.1 Introduction

To assess the amount of entropy available from the RNG, the peripheral has been tested using the German BSI AIS-31 statistical tests (T0 to T8), and NIST SP800-90B test suite.

47.6.2 Validation conditions

The RNG true random number generator has been tested in the following conditions:

- RNG clock rng_clk = 64 MHz, with CED bit cleared in RNG_CR.
- Configurations are described in *Table 434* and *Table 435*. Only configuration A can be certified NIST SP800-90B. Refer to *Table 436* to select the best configuration for the application.
- Configuration C can be used when configuration A is not present in AN4230, or is not flagged as certified.

Table 434. RNG configurations

Configuration	RNG_CR bits					Loop number (N)	RNG_HTCR0 register	RNG_NSCR register
	NISTC bit	RNG_CONFIG1 [7:0]	CLKDIV [3:0]	RNG_CONFIG2 [2:0]	RNG_CONFIG3 [3:0](1)			
A	Refer to *NIST compliant RNG configuration* table in AN4230 available from *www.st.com*. This application note also indicates if this configuration is part of an existing NIST SP800-90B Entropy Certificate listed on *https://csrc.nist.gov/projects/cryptographic-module-validation-program.*							
B	1	0x01	0x1(2)	0x1	0x1	1	0x0000 AAC7(3)	Default
C	0	0x82		0x1	0xF	2		Default

1. RNG_CONFIG3[1:0] defines the loop number N: 0x0 corresponds to N = 1, 0x1 to N = 2, 0x2 to N = 3, and 0x3 to N = 4.
2. The noise source sampling must be 32 MHz or less. If the RNG clock is different from 64 MHz, this value of CLKDIV must be adapted. See the CLKDIV bitfield description in *Section 47.7.1* for details.
3. This value can be fixed in the RNG driver (it does not depend upon the STM32 product).

Table 435. Additional health test configurations

Configuration	RNG_HTCR1 register (oscillator set 1)	RNG_HTCR2 register (oscillator set 2)	RNG_HTCR3 register (oscillator set 3)
A	default	default	default
B and C	default	default	default

Table 436. Configuration selection

Section criteria	Configuration A	Configuration B	Configuration C
Suitable to generate NIST compliant cryptographic keys	Yes	No	
Entropy(1)	Certified	Good	Very good
Speed(2)	Baseline	Faster	Baseline

1. For configurations B and C entropy is verified using the AIS-31 test suite (T0 to T8).
2. When the speed is not enough for the application, an NIST compliant DRBG can be used to increase throughput.

For details on data collection and the running of statistical test suites refer to AN4230 "*Introduction to random number generation validation using the NIST statistical test suite for STM32 MCUs and MPUs*", available on *www.st.com*.

47.7 RNG registers

The RNG is associated with a control register, a data register, and a status register.

47.7.1 RNG control register (RNG_CR)

Address offset: 0x000

Reset value: 0x0080 0D00

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CONFIGLOCK	CONDRST	Res.	Res.	RNG_CONFIG1[7:0]								CLKDIV[3:0]			
rs	rw			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RNG_CONFIG2[2:0]			NISTC	RNG_CONFIG3[3:0]				ARDIS	Res.	CED	Res.	IE	RNGEN	Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw		rw		rw	rw		

Bit 31 **CONFIGLOCK**: RNG configuration lock

0: Writes to the RNG_NSCR, RNG_HTCR and the RNG_CR configuration bits [29:4] are allowed.

1: Writes to the RNG_NSCR, RNG_HTCR and the RNG_CR configuration bits [29:4] are ignored until the next RNG reset.

Once set, this bit can only be cleared when RNG is reset (set once bit).

Bit 30 **CONDRST**: Conditioning soft reset

Write 1 and then write 0 to reset the conditioning logic, clear all the FIFOs and start a new RNG initialization process, with RNG_SR cleared. Registers RNG_NSCR, RNG_CR and RNG_HTCR are not changed by CONDRST.

This bit must be set to 1 in the same access that sets any configuration bits [29:4]. In other words, when CONDRST bit is set to 1 correct configuration in bits [29:4] must also be written.

Before setting this bit to 1 RNGEN must be set to 0, and BUSY flag must be cleared in RNG_SR.

When CONDRST is set to 0, wait for BUSY flag to be cleared in RNG_SR. CONDRST bit then reads as 0.

Bits 29:28 Reserved, must be kept at reset value.

Bits 27:20 **RNG_CONFIG1[7:0]:** RNG configuration 1

Reserved to the RNG configuration (bitfield 1). Must be initialized using the recommended value documented in *Section 47.6*.

Writing to this bitfield is only effective when CONFIGLOCK = 0. The new value is only taken into account if CONDRST bit is set in the same access.

Bits 19:16 **CLKDIV[3:0]**: Clock divider factor

This value used to configure an internal programmable divider (from 1 to 16) acting on the incoming RNG clock. These bits can be written only when the core is disabled (RNGEN = 0).

0x0: internal RNG clock after divider is similar to incoming RNG clock.

0x1: two RNG clock cycles per internal RNG clock.

0x2: 2^2 (= 4) RNG clock cycles per internal RNG clock.

...

0xF: 2^{15} RNG clock cycles per internal clock (for example. an incoming 48 MHz RNG clock becomes a 1.5 kHz internal RNG clock)

Writing to this bitfield is only effective when CONFIGLOCK = 0. The new value is only taken into account if CONDRST bit is set in the same access.

Bits 15:13 **RNG_CONFIG2[2:0]:** RNG configuration 2

Reserved to the RNG configuration (bitfield 2). Refer to the RNG_CONFIG1 bitfield for details.

Bit 12 **NISTC**: NIST custom

0: Hardware default values for NIST compliant RNG. In this configuration for 128-bit output, two conditioning loops are performed and 256 bits of noise source are used.

1: Custom values for NIST compliant RNG. See *Section 47.6* for proposed configuration.

Writing to this bit is only effective when CONFIGLOCK = 0. The new value is only taken into account if the CONDRST bit is set in the same access.

Bits 11:8 **RNG_CONFIG3[3:0]:** RNG configuration 3

Reserved to the RNG configuration (bitfield 3). Refer to RNG_CONFIG1 bitfield for details.

If the NISTC bit is cleared in this register RNG_CONFIG3 bitfield values are ignored by RNG.

Bit 7 **ARDIS**: Auto reset disable

Set this bit to deactivate the auto-reset feature.

0: Auto-reset is enabled

1: Auto-reset is disabled

Keeping the auto-reset enabled (automatic clearance of the SECS bit) simplifies the management of noise source errors, as described in *Section 47.3.7*.

Writing to this bit is only effective when CONFIGLOCK = 0. The new value is only taken into account if the CONDRST bit is set in the same access.

Bit 6 Reserved, must be kept at reset value.

Bit 5 **CED:** Clock error detection

0: Clock error detection is enabled.

1: Clock error detection is disabled

The clock error detection cannot be enabled nor disabled on-the-fly when the RNG is enabled, that is to enable or disable CED, the RNG must be disabled.

Writing to this bit is only effective when CONFIGLOCK = 0. The new value is only taken into account if the CONDRST bit is set in the same access.

Bit 4 Reserved, must be kept at reset value.

Bit 3 **IE:** Interrupt enable

0: RNG interrupt is disabled

1: RNG interrupt is enabled. An interrupt is pending as soon as the DRDY, SEIS, or CEIS flag is set in the RNG_SR register.

Bit 2 **RNGEN:** True random number generator enable
This bit enables/disables the true random number generator.
0: True random number generator disabled.
1: True random number generator enabled.
Clearing RNGEN powers off the analog noise sources and gates the logic clocked by the RNG clock.
When clearing this bit verify that BUSY flag is cleared in RNG_SR before updating this register again.

Bits 1:0 Reserved, must be kept at reset value.

47.7.2 RNG status register (RNG_SR)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEIS	CEIS	BUSY	Res.	SECS	CECS	DRDY
									rc_w0	rc_w0	r		r	r	r

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **SEIS:** Seed error interrupt status
This bit is set at the same time as SECS. It is cleared by writing 0 (unless CONDRST is used). Writing 1 has no effect.
0: No faulty sequence detected
1: At least one faulty sequence is detected. See SECS bit description for details.
An interrupt is pending if IE = 1 in the RNG_CR register.

Bit 5 **CEIS:** Clock error interrupt status
This bit is set at the same time as CECS. It is cleared by writing 0. Writing 1 has no effect.
0: The RNG clock is correct ($f_{RNGCLK} > f_{HCLK}/32$)
1: The RNG clock before the internal divider is detected too slow ($f_{RNGCLK} < f_{HCLK}/32$)
An interrupt is pending if IE = 1 in the RNG_CR register.

Bit 4 **BUSY:** Busy
This flag indicates whether RNG is idle or busy.
0: Idle
1: Busy
RNG is flagged as busy when a conditioning soft reset (using CONDRST) is in progress. It is also flagged busy when RNG is activated by application setting RNGEN bit, or when a connected peripheral fetches randoms via the dedicated RNG hardware bus.
More information on BUSY usage can also be found in *Section 47.3.8*.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **SECS:** Seed error current status

0: No faulty sequence has currently been detected. If the SEIS bit is set, this means that a faulty sequence was detected and the situation has been recovered.

1: At least one of the following faulty sequence has been detected:

– Start-up or continuous repetition count test on noise source failed.

– Start-up or continuous adaptive proportion test on noise source failed.

– Start-up post-processing/conditioning sanity check failed.

Bit 1 **CECS:** Clock error current status

0: The RNG clock is correct ($f_{RNGCLK} > f_{HCLK}/32$). If the CEIS bit is set, this means that a slow clock was detected and the situation has been recovered.

1: The RNG clock is too slow ($f_{RNGCLK} < f_{HCLK}/32$).

CECS bit is valid only if the CED bit in the RNG_CR register is set to 0.

Bit 0 **DRDY:** Data ready

This flag is raised to indicate valid (non-0) random data available in the RNG_DR register. It is cleared by hardware upon reading the RNG_DR register (which empties the RNG buffer). The DRDY flag can also be raised upon disabling RNG (upon clearing the RNGEN bit).

0: No valid random data ready.

1: Valid random data ready.

Raising DRDY generates an interrupt if enabled with the IE bit of the RNG_CR register.

47.7.3 RNG data register (RNG_DR)

Address offset: 0x008

Reset value: 0x0000 0000

This register is a read-only register that delivers a 32-bit random value when read. The content of this register is valid when the DRDY = 1 and the value is not 0x0, even if RNGEN = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

RNDATA[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RNDATA[31:0]:** Random data

32-bit random data, valid when DRDY = 1. When DRDY = 0, the RNDATA value is 0.

The 0 value means that a seed error occurred between RNG_SR polling and RND_DR output reading (a rare event).

47.7.4 RNG noise source control register (RNG_NSCR)

Address offset: 0x00C

Reset value: 0x0000 01FF

Writing in RNG_NSCR is taken into account only if the CONDRST bit is set, and the CONFIGLOCK bit is cleared in RNG_CR. Writing to this register is ignored if CONFIGLOCK= 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bits 8:6 **EN_OSC3[2:0]:**

When the RNG is enabled (RNGEN bit set), each bit of this bitfield enables one of the three inputs from the oscillator instance number 3. The bitfield has no effect otherwise.

Bits 5:3 **EN_OSC2[2:0]:**

When the RNG is enabled (RNGEN bit set), each bit of this bitfield enables one of the three inputs from the oscillator instance number 2. The bitfield has no effect otherwise.

Bits 2:0 **EN_OSC1[2:0]:**

When the RNG is enabled (RNGEN bit set), each bit of this bitfield enables one of the three inputs from the oscillator instance number 1. The bitfield has no effect otherwise.

47.7.5 RNG health test control register x (RNG_HTCRx)

Address offset: 0x010 + 0x4 * x (x=0 to 3)

Reset value: 0x0000 72AC, 0x0003 FFFF, 0x0003 FFFF, 0x0003 FFFF

Writing in RNG_HTCR is taken into account only if the CONDRST bit is set, and the CONFIGLOCK bit is cleared in the RNG_CR. Writing to this register is ignored if CONFIGLOCK = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HTCFG[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

HTCFG[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **HTCFG[31:0]:** health test configuration

This configuration is used by RNG to configure the health tests (repetition count test, adaptive proportion test) at position x. See *Section 47.6* for the recommended value. With its default value, health tests have a very small probability of triggering any error at position x.

Note: The RNG behavior, including the read to this register, is not guaranteed if a different value from the recommended value is written.

47.7.6 RNG hardware configuration register (RNG_HWCFGR)

Address offset: 0x3F0

Reset value: 0x0000 0303

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

48 Cryptographic processor (SAES)

48.1 SAES introduction

The cryptographic processor (SAES) encrypts or decrypts data in compliance with the advanced encryption standard (AES) defined by NIST. It incorporates a protection against side-channel attacks (SCA), including differential power analysis (DPA), certified SESIP, and PSA security assurance level 3.

SAES supports ECB, CBC, CTR, GCM, GMAC, and CCM chaining modes for key sizes of 128, 192, or 256 bits.

The key wrap feature is also available, decrypting AES keys to use in SAES or in the faster CRYP1 or CRYP2 peripheral.

SAES can load, by hardware, STM32 hardware secret keys (boot hardware key BHK, and derived hardware unique key DHUK), usable but not readable by the application.

SAES supports DMA single transfers for incoming and outgoing data (two DMA channels are required).

SAES is hardware-linked with the true random number generator (TRNG) and with the CRYP1 and CRYP2 peripherals.

48.2 SAES main features

- Compliance with NIST *"Advanced encryption standard (AES)*, *FIPS publication 197*" from November 2001
- Multiple AES symmetric key block cipher operating modes:
  - Electronic codebook (ECB) mode
  - Cipher block chaining (CBC) mode
  - Counter (CTR) mode
  - Galois counter mode (GCM)
  - Galois message authentication code (GMAC) mode
  - Counter with CBC-MAC (CCM) mode
- Protection against side-channel attacks (SCA), including differential power analysis (DPA), certified SESIP and PSA security assurance level 3
- 16-byte data block processing, supporting cipher key lengths of 128, 192 and 256 bits
  - 82 or 102 clock cycle latency in ECB mode for processing one 128-bit block with, respectively, 128-bit or 256-bit key
- Hardware secret key encryption/ decryption (Wrapped-key mode)
- Using dedicated key bus; under SAES control, optional key sharing with the faster CRYP1 or CRYP2 peripheral
- Integrated key scheduler to compute the last round key for ECB/CBC decryption
- Eight 32-bit write-only registers (256 bits of information) for storing cryptographic keys
- Optional hardware loading of two hardware secret keys (BHK, DHUK) that can be XOR-ed together
- Security context enforcement for keys
- Four 32-bit registers for storing initialization vectors
- 32-bit buffer for data input and output
- Automatic data flow control supporting two direct memory access (DMA) channels, one for incoming data, one for processed data. Only single transfers are supported.
- Data-swapping logic to support 1-, 8-, 16-, or 32-bit data
- AMBA AHB target peripheral, accessible only via 32-bit single-word write accesses (other write accesses generate bus errors and are ignored); no restrictions on reads
- Ability to suspend a message by software (in CPU mode) and later resume it, except in GCM/GMAC modes. This allows SAES to process a higher-priority message.

48.3 SAES implementation

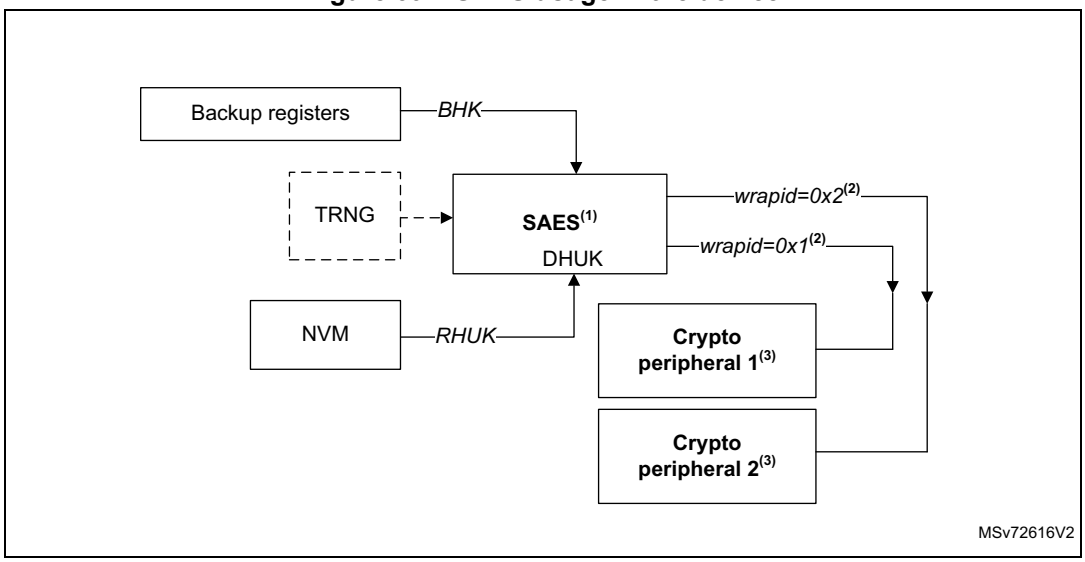
The devices have one SAES peripheral, implemented as per the following table. For comparison, the SAES key share target CRYP1 and CRYP2 peripherals are also presented.

Table 438. CRYP1 versus SAES features

Modes or features(1)	CRYP1 and CRYP2	SAES
ECB, CBC chaining	X	X
CTR, CCM, and GCM chaining	X	X
AES 128-bit ECB encryption latency in cycles	14	82
DHUK and BHK key selection	-	X
Resistance to side-channel attacks	-	X
Shared key between SAES and CRYP1 or CRYP2	X	X
Key sizes in bits	128, 192, 256	128, 192, 256

1. X = supported.

Figure 397. SAES usage in the device



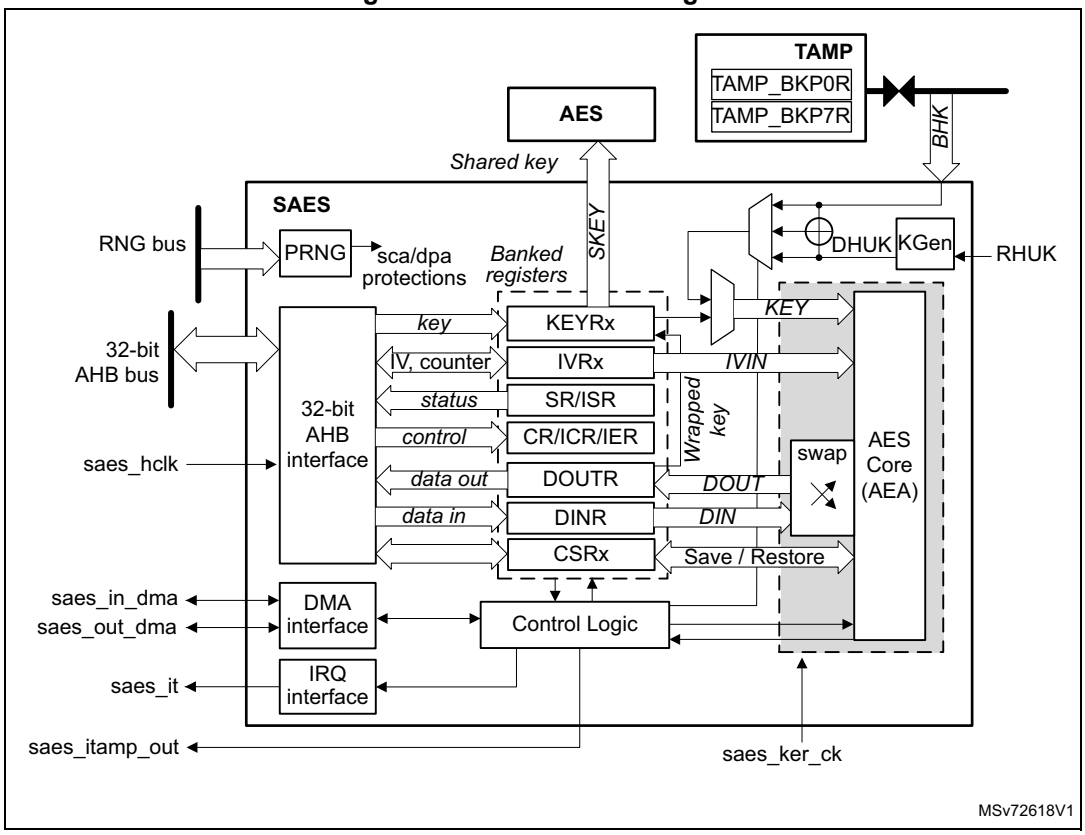
1. Protected against side-channel attack.
2. Configuration bits when WRAPEN is set.
3. Refer to *Table 438* for information on instances of crypto peripherals on the device and their names.

48.4 SAES functional description

48.4.1 SAES block diagram

Figure 398 shows the SAES block diagram.

Figure 398. SAES block diagram



1. AES represents the CRYP1 or CRYP2 peripheral.

48.4.2 SAES internal signals

Table 439 describes the user relevant internal signals interfacing the SAES peripheral.

Table 439. SAES internal input/output signals

Signal name	Signal type	Description
saes_hclk	Input	AHB bus clock
saes_ker_ck	Input	SAES kernel clock
saes_it	Output	SAES interrupt request
saes_in_dma	Input/Output	SAES incoming data DMA single request/acknowledge
saes_out_dma	Input/Output	SAES processed data DMA single request/acknowledge

Table 439. SAES internal input/output signals

Signal name	Signal type	Description
saes_itamp_out	Output	Tamper event signal to TAMP (XOR-ed), triggered when an unexpected hardware fault occurs. When this signal is triggered, SAES automatically clears key registers. A reset is required before SAES can be used again.
RHUK	Input	256-bit root hardware unique key (nonvolatile, unique per device and secret to software), used to internally compute the derived hardware unique key (DHUK)
BHK(1)	Input	256-bit boot hardware key (BHK) stored in tamper-resistant backup registers and written during boot. Once written, this key cannot be read nor written by any application until the next product reset.

1. Connected to a set of backup registers in the TAMP peripheral that are written, then read/write locked, by the application software (see *Section 48.4.17* for details).

48.4.3 SAES reset and clocks

The SAES peripheral is clocked by the AHB bus clock. It also has a dedicated kernel clock controlled through the RCC.

The SAES has a dedicated reset bit in the RCC.

48.4.4 SAES symmetric cipher implementation

The cryptographic processor (SAES) is a 32-bit AHB peripheral that encrypts or decrypts 16-byte blocks of data using the advanced encryption standard (AES). It also implements a set of approved AES symmetric key security functions summarized in *Table 440*. Those functions can be certified NIST PUB 140-3.

Table 440. SAES approved AES symmetric key functions

Operations	Algorithm	Specification	Key bit lengths	Chaining modes
Encryption, decryption	AES	FIPS PUB 197 NIST SP800-38A	128, 192, 256	ECB, CBC, CTR
Authenticated encryption or decryption		NIST SP800-38C NIST SP800-38D		GCM, CCM
Cipher-based message authentication code		NIST SP800-38D		GMAC

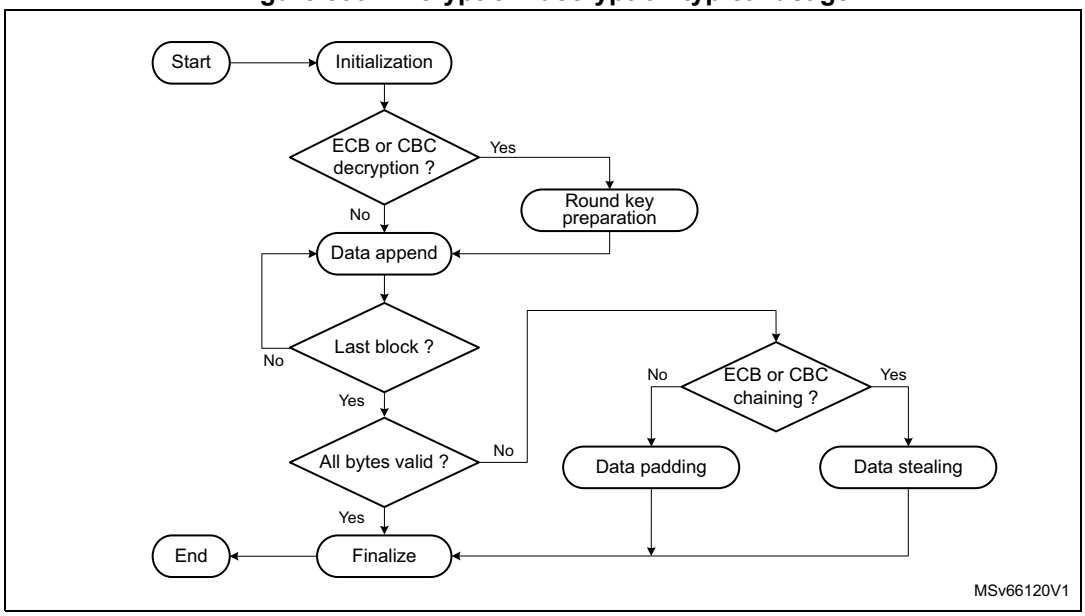
SAES can be used directly by the CPU, or indirectly using two DMA channels (one for the plaintext, one for the ciphertext).

When the CPU is used, it is possible to suspend then resume any processing by SAES (except in GCM and GMAC operating modes), following the sequence described in *Section 48.4.8*.

48.4.5 SAES encryption or decryption typical usage

The following figure shows a typical operation for encryption or decryption.

Figure 399. Encryption/ decryption typical usage



Initialization

The SAES peripheral is initialized according to the operating (chaining) mode. Refer to the sections describing the operating modes.

Data append

This section describes different ways of appending data for processing. For ECB or CBC chaining modes, refer to *Section 48.4.7: SAES ciphertext stealing and data padding* if the size of data to process is not a multiple of 16 bytes. The last block management in these cases is more complex than what is described in this section.

General conditions for data processing

For information on how to suspend a message processing to process a higher priority message, refer to *Section 48.4.8: SAES suspend and resume operations*.

Appending data via CPU polling

This method uses the CCF flag polling to control data appending through the following sequence:

1. When KEYVALID is set, enable the SAES peripheral, by setting the EN bit of the SAES_CR register (if not already done).
2. Repeat the following subsequence until the payload is entirely processed:
   a) Write one block of data (four words) into the SAES_DINR register.
   b) Wait until the status flag CCF is set in the SAES_ISR register, then read one block of data (four words) from the SAES_DOUTR register.
   c) Clear the CCF flag, by setting the CCF bit of the SAES_ICR register.

d) If the next processing block is the last block, pad (when applicable) the data with zeros to obtain a complete block, and specify the number of nonvalid bytes (using NPBLB[3:0]) in case of GCM payload encryption or CCM payload decryption (otherwise the tag computation is wrong).

3. As the data block just processed is the last block of the message, optionally discard the data that is not part of the message/payload, then disable the SAES peripheral by clearing EN.

Note: The NPBLB[3:0] bitfield is not used in a header phase of GCM, GMAC, and CCM chaining modes.

Appending data via CPU in interrupt mode

The method uses an interrupt from the SAES peripheral to control the data append, through the following sequence:

1. Enable interrupts from SAES, by setting the CCFIE bit of the SAES_IER register.
2. When KEYVALID is set, enable the SAES peripheral, by setting EN (if not already done).
3. Write the first four input data words into the SAES_DINR register.
4. Handle the data in the SAES interrupt service routine. Upon each interrupt:
   a) Read four output data words from the SAES_DOUTR register.
   b) Clear the CCF flag and thus the pending interrupt, by setting the CCF bit of the SAES_ICR register.
   c) If the next processing block is the last block of the message, pad (when applicable) the data with zeros to obtain a complete block, and specify the number of non-valid bytes (through NPBLB[3:0]) in case of GCM payload encryption or CCM payload decryption (otherwise the tag computation is wrong). Then proceed with point 4e).
   d) If the data block just processed is the last block of the message, optionally discard the data that are not part of the message/payload, then disable the SAES peripheral by clearing EN and quit the interrupt service routine.
   e) Write the next four input data words into the SAES_DINR register and quit the interrupt service routine.

SAES tolerates delays between consecutive read or write operations, allowing, for example, the system to serve an interrupt from another peripheral between two SAES computations.

Note: The NPBLB[3:0] bitfield is not used during the header phase of the GCM, GMAC, and CCM chaining modes.

Appending data via DMA

With this method, all the transfers and processing are managed by DMA and SAES. Proceed as follows:

1. If the last block of the message to process is shorter than 16 bytes, prepare the last four-word data block by padding the remainder of the block with zeros.
2. Configure the DMA controller so as to transfer the data to process from the memory to the SAES peripheral input and the processed data from the SAES peripheral output to the memory, as described in *Section 48.6: SAES DMA requests*. Configure the DMA controller so as to generate an interrupt on transfer completion. For GCM payload encryption or CCM payload decryption, the DMA transfer **must not** include the last four-word block if padded with zeros. The sequence described in *Appending data via*

CPU polling must be used instead for this last block, because the NPBLB[3:0] bitfield must be set up before processing the block, for SAES to compute a correct tag.

3. When KEYVALID is set, enable the SAES peripheral, by setting EN (if not already done).
4. Enable DMA requests, by setting DMAINEN and DMAOUTEN.
5. Upon DMA interrupt indicating the outgoing transfer completion, get the SAES-processed data from the memory.

When this method is used, suspend/resume operations are not supported (see *Section 48.4.8*).

The CCF flag has no use with this method because the reading of the SAES_DOUTR register is managed by DMA automatically, without any software action, at the end of the computation phase.

The NPBLB[3:0] bitfield is not used in the header phase of GCM, GMAC, and CCM chaining modes.

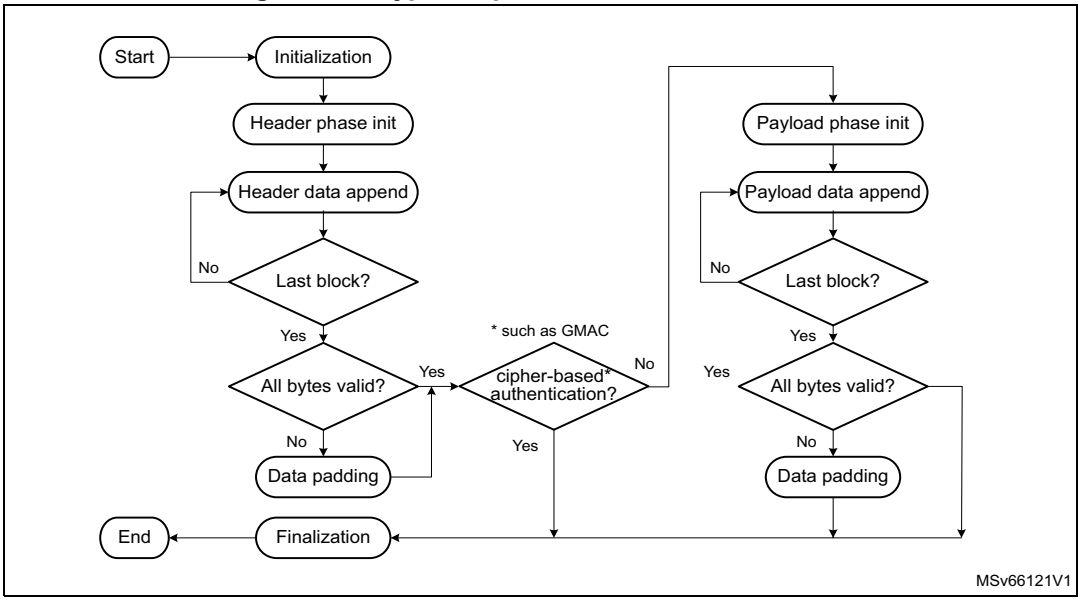
Aborting data appending process

To abort the process of appending data, set then clear the IPRST bit of the SAES_CR register.

48.4.6 SAES authenticated encryption, decryption, and cipher-based message authentication

The following figure shows a typical operation for authenticated encryption or decryption, and for cipher-based message authentication.

Figure 400. Typical operation with authentication



Section 48.4.11: SAES Galois/counter mode (GCM) and *Section 48.4.13: SAES counter with CBC-MAC (CCM)* describe detailed sequences supported by SAES.

Cipher-based message authentication flow omits the payload phase, as shown in the above figure. The detailed sequence supported by SAES is described in *Section 48.4.12: SAES Galois message authentication code (GMAC)*.

48.4.7 SAES ciphertext stealing and data padding

When using SAES in ECB or CBC modes to manage messages the size of which is not a multiple of the block size (16 bytes), the application must use ciphertext stealing techniques such as those described in NIST *Special Publication 800-38A, Recommendation for Block Cipher Modes of Operation: Three Variants of Ciphertext Stealing for CBC Mode*. Since SAES does not implement such techniques, the application must complete the *last block* of input data using data from the *second last* block.

Note: Ciphertext stealing techniques are not documented in this reference manual.

For modes other than ECB or CBC, since SAES does not implement an automatic data padding operation for the last block, the application must follow the recommendation provided in *Section 48.4.5* to manage messages whose sizes are not multiples of 16 bytes.

48.4.8 SAES suspend and resume operations

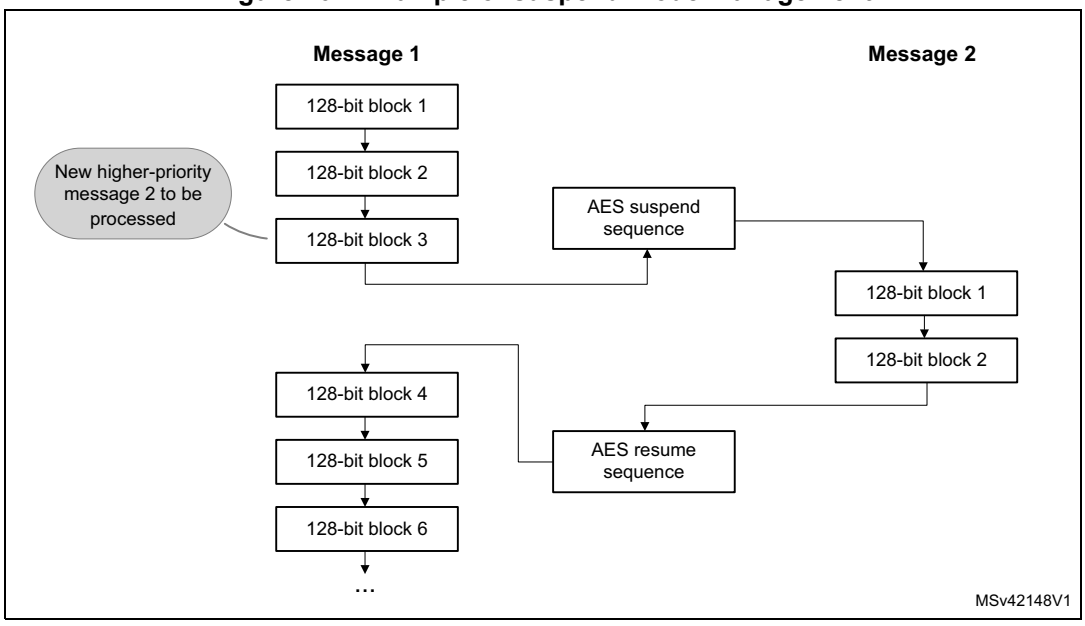
A message can be suspended to process another message with a higher priority. When the higher-priority message is sent, the suspended message can resume. This applies to both encryption and decryption mode.

Suspend and resume operations do not break the chaining operation. The message processing can resume as soon as SAES is enabled again, to receive a next data block.

Note: Suspend and resume operations are only supported when SAES is used in CPU mode.

Figure 401 gives an example of suspend and resume operations: Message 1 is suspended in order to send a shorter and higher-priority Message 2. It is recommended to set the IPRST bit of the SAES_CR register before transferring control of SAES to a potentially less secure application.

Figure 401. Example of suspend mode management



A detailed description of suspend and resume operations is provided in the sections dedicated to each chaining mode.

48.4.9 SAES basic chaining modes (ECB, CBC)

ECB is the simplest mode of operation. There are no chaining operations, and no special initialization stage. The message is divided into blocks and each block is encrypted or decrypted separately. When decrypting in ECB, a special key scheduling is required before processing the first block.

Figure 402 and *Figure 403* describe the electronic codebook (ECB) chaining implementation in encryption and in decryption, respectively. To select ECB chaining mode, write CHMOD[3:0] with 0x0.

Figure 402. ECB encryption

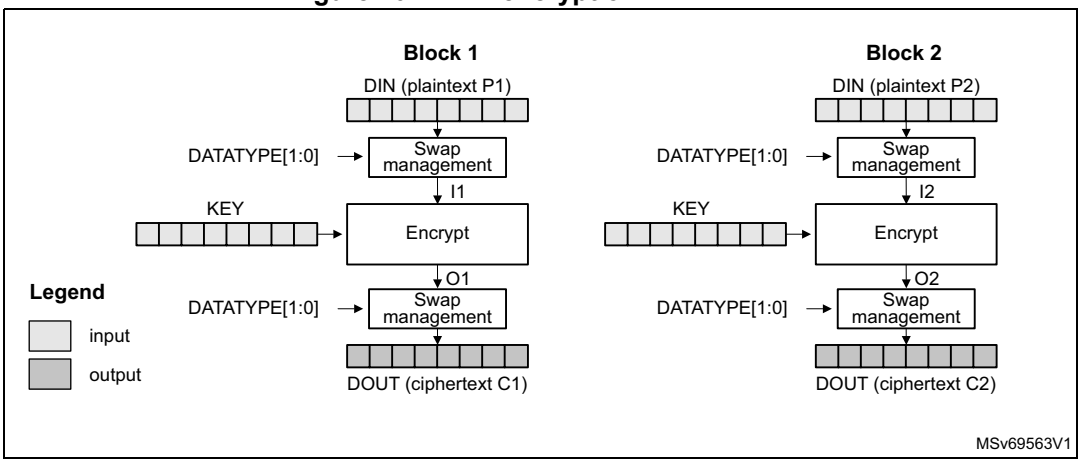


Figure 403. ECB decryption

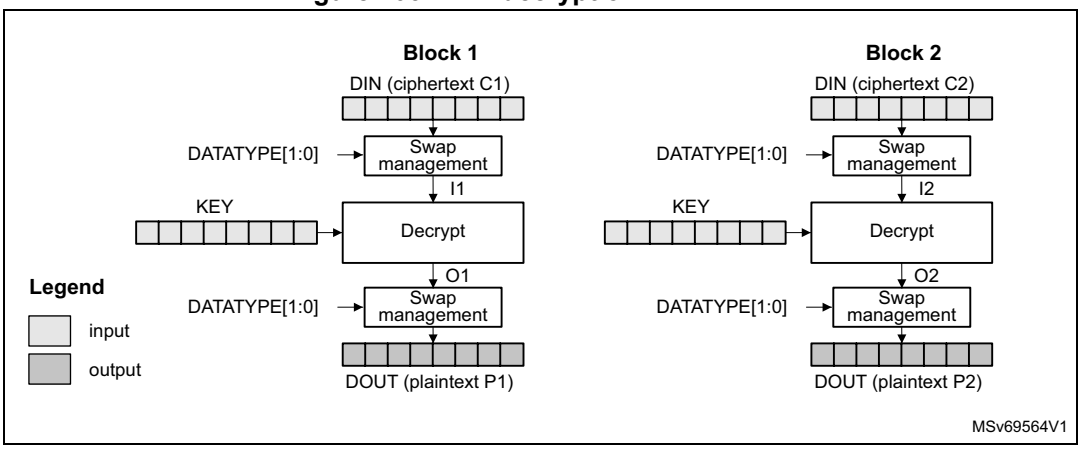

In CBC encryption mode the output of each block chains with the input of the following block. To make each message unique, an initialization vector is used during the first block processing. When decrypting in CBC, a special key scheduling is required before processing the first block.

Figure 404 and *Figure 405* describe the cipher block chaining (CBC) implementation in encryption and in decryption, respectively. To select this chaining mode, write CHMOD[3:0] with 0x1.

Figure 404. CBC encryption

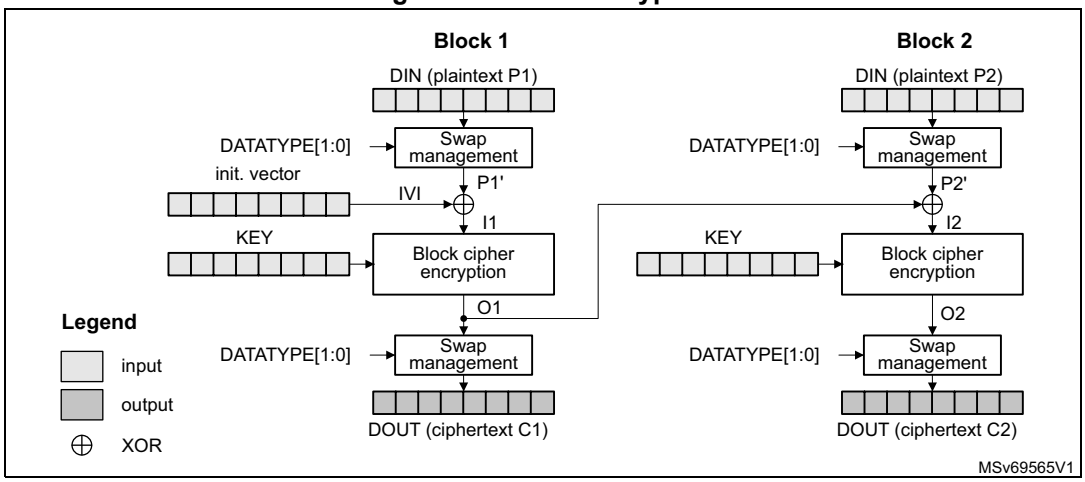

Figure 405. CBC decryption

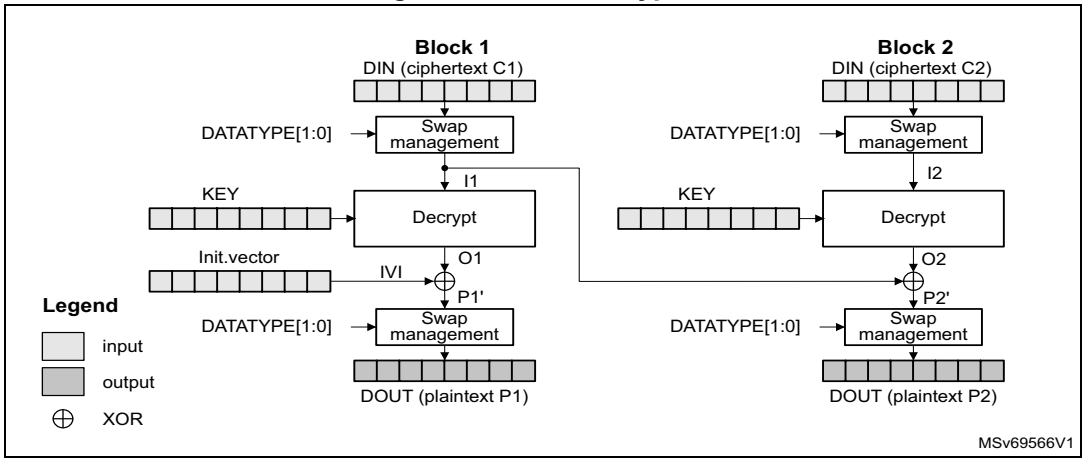


For more details, refer to NIST *Special Publication 800-38A, Recommendation for Block Cipher Modes of Operation.*

ECB and CBC encryption process

This process is described in *Section 48.4.5*, with the following sequence of events:

1. Disable the SAES peripheral, by clearing EN.
2. Wait until BUSY is cleared (indicating no RNG random number fetch in progress).
3. Initialize the SAES_CR register as follows:
   a) Select ECB or CBC chaining mode (write CHMOD[3:0] with 0x0 or 0x1) in *encryption* mode (write MODE[1:0] with 0x0).
   b) Configure the data type, through DATATYPE[1:0].
   c) Configure the key size, through KEYSIZE[1:0]. Also set KEYPROT if the key is not shared with a different security context (different secure or Compartment ID attribute).
   d) Select the key source using KEYSEL[2:0] (see step *5.*)
   e) Select normal key mode, by clearing WRAPEN. For wrapped key usage (with WRAPEN set) refer to *Section 48.4.14*.
4. Write the initialization vector into the SAES_IVRx registers if CBC mode is selected in the previous step.
5. Write the key into the SAES_KEYRx registers. Alternatively, manage the key source selected by KEYSEL[2:0] (see *Section 48.4.17: SAES key registers* for details).
6. Wait until KEYVALID is set (key loading complete).
7. Enable the SAES peripheral, by setting EN.
8. Append cleartext data:
   a) If it is the second-last or the last block and the plaintext size of the message is not a multiple of 16 bytes, follow the guidance in *Section 48.4.7*.
   b) Append the cleartext block into SAES as described in *Section 48.4.5*, then read the SAES_DOUTR register four times to save the ciphertext block.
   c) Repeat the step *b)* until the third-last plaintext block is encrypted. For the last two blocks, follow the steps *a)* and *b)*.
9. Finalize the sequence: disable the SAES peripheral, by clearing EN.

ECB/CBC decryption process

This process is described in *Section 48.4.5*, with the following sequence of events:

1. Disable the SAES peripheral, by clearing EN.
2. Wait until BUSY is cleared (indicating no RNG random number fetch in progress).
3. Initialize the SAES_CR register as follows:
   a) Select the *key derivation* mode (write MODE[1:0] with 0x1). The CHMOD[3:0] bitfield is not significant during this operation.
   b) Configure the data type, through DATATYPE[1:0].
   c) Configure the key size, through KEYSIZE[1:0]. Also set KEYPROT if the key is not shared with a different security context (different secure or Compartment ID attribute).
   d) Select the key source using KEYSEL[2:0] (see step *4.*)
   e) Select normal key mode, by clearing WRAPEN. For wrapped key usage (with WRAPEN set) refer to *Section 48.4.14*.
4. Write the key into the SAES_KEYRx registers. Alternatively, manage the key source selected by KEYSEL[2:0] (see *Section 48.4.17: SAES key registers* for details).
5. Wait until KEYVALID is set (key loading complete).
6. Enable the SAES peripheral, by setting EN. The peripheral immediately starts an AES round for key preparation.
7. Wait until the CCF flag of the SAES_ISR register is set.
8. Clear the CCF flag, by setting the CCF bit of the SAES_ICR register. The decryption key is available in the AES core and SAES is disabled automatically.
9. Select ECB or CBC chaining mode (write CHMOD[3:0] with 0x0 or 0x1) in *decryption* mode (write MODE[1:0] with 0x2). Do not change other parameters.
10. Write the initialization vector into the SAES_IVRx registers if CBC mode is selected in the previous step.
11. Enable the SAES peripheral, by setting EN.
12. Append encrypted data:
    a) If it is the second-last or the last block and the ciphertext size of the message is not a multiple of 16 bytes, follow the guidance in *Section 48.4.7*.
    b) Append the ciphertext block into SAES as described in *Section 48.4.5*, then read the SAES_DOUTR register four times to save the cleartext block.
    c) Repeat the step *b)* until the third-last ciphertext block is decrypted. For the last two blocks, follow the steps *a)* and *b)*.
13. Finalize the sequence: disable the SAES peripheral by clearing EN. Use IPRST to clear the ECB or CBC encryption key modified by the key preparation process.

Suspend/resume operations in ECB/CBC modes

The following sequences are valid for normal key mode (WRAPEN = 0).

Note: Suspend and resume operations are only supported when SAES is used in CPU mode.

To suspend the processing of a message, proceed as follows:

1. Wait until the CCF flag of the SAES_ISR register is set (computation complete).
2. Read four times the SAES_DOUTR register to save the last processed block.
3. Clear the CCF flag, by setting the CCF bit of the SAES_ICR register.

4. Save initialization vector registers (only required in CBC mode as the SAES_IVRx registers are altered during the data processing).
5. Disable the SAES peripheral, by clearing EN.
6. Save the SAES_CR register and clear the key registers if they are not needed, to process the higher-priority message.

To resume the processing of a message, proceed as follows:

1. Disable the SAES peripheral, by clearing EN.
2. Restore the SAES_CR register (with correct KEYSIZE[1:0]) then restore the SAES_KEYRx registers. Alternatively, select a key source different from key registers, using KEYSEL[2:0]. Refer to *Section 48.4.17: SAES key registers* for details.
3. Prepare the decryption key, as described in *ECB/CBC decryption process* (only required for ECB or CBC decryption).
4. Restore the SAES_IVRx registers, using the saved configuration (only required in CBC mode).
5. Enable the SAES peripheral, by setting EN.

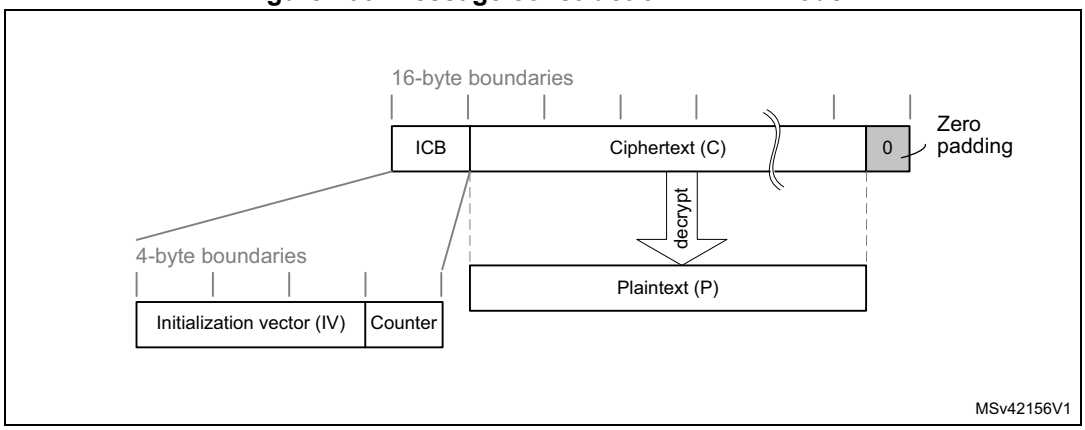
Note: It is not required to save the key registers as the application knows the original key.

48.4.10 SAES counter (CTR) mode

The CTR mode uses the AES core to generate a key stream. The keys are then XOR-ed with the plaintext to obtain the ciphertext. Unlike with ECB and CBC modes, no key scheduling is required for the CTR decryption since the AES core is always used in encryption mode.

A typical message construction in CTR mode is given in *Figure 406*.

Figure 406. Message construction in CTR mode



The structure of this message is:

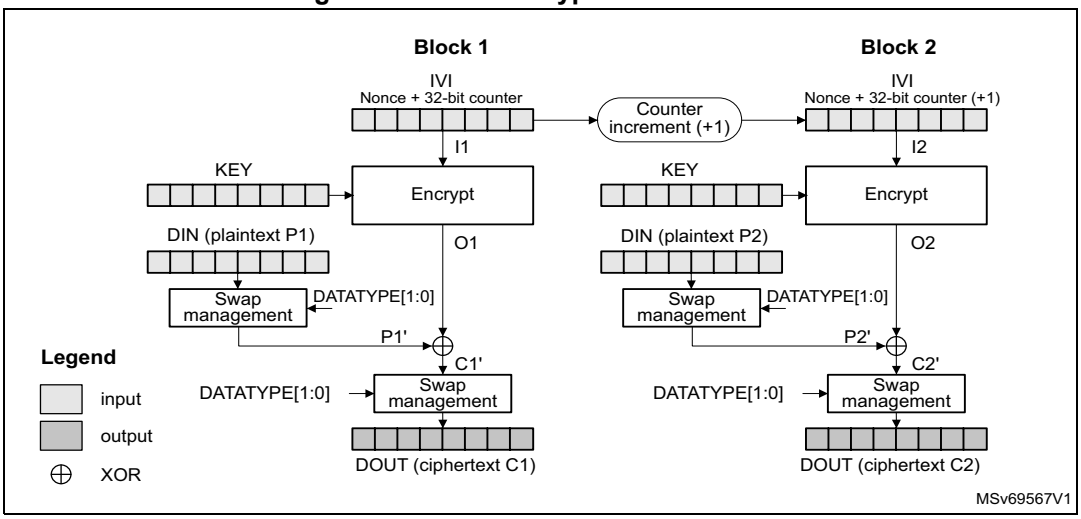
- A 16-byte initial counter block (ICB), composed of two distinct fields:
  - **Initialization vector** (IV): a 96-bit value that must be unique for each encryption cycle with a given key.
  - **Counter**: a 32-bit big-endian integer that is incremented each time a block processing is complete. The initial value of the counter is defined by the application.
- The plaintext P is encrypted as ciphertext C, with a known length. This length can be nonmultiple of 16 bytes, in which case a plaintext padding is required.

For more details, refer to NIST *Special Publication 800-38A, Recommendation for Block Cipher Modes of Operation.*

CTR encryption and decryption

Figure 407 describes the counter (CTR) chaining implementation in the SAES peripheral (encryption). To select this chaining mode, write CHMOD[3:0] with 0x2.

Figure 407. CTR encryption



Initialization vectors in SAES must be initialized as shown in *Table 441*.

Table 441. Counter mode initialization vector definition

SAES_IVR3[31:0]	SAES_IVR2[31:0]	SAES_IVR1[31:0]	SAES_IVR0[31:0]
IVI[127:96]	IVI[95:64]	IVI[63:32]	IVI[31:0] 32-bit counter

CTR encryption and decryption process

This process is described in *Section 48.4.5*, with the following sequence of events:

1. Disable the SAES peripheral, by clearing EN.
2. Wait until BUSY clears (indicating no RNG random number fetch in progress).
3. Initialize the SAES_CR register:
   a) Select CTR chaining mode (write CHMOD[3:0] with 0x2) in *encryption* or *decryption* mode (write MODE[1:0] with 0x0 or 0x2).
   b) Configure the data type, through DATATYPE[1:0].
   c) Configure the key size, through KEYSIZE[1:0]. Also set KEYPROT if the key is not shared with a different security context (different secure or Compartment ID attribute).
   d) Select the key source using KEYSEL[2:0] (see step *5.*)
   e) Select normal key mode, by clearing WRAPEN. For wrapped key usage (with WRAPEN set) refer to *Section 48.4.14*.
4. Write the initialization vector in SAES_IVRx registers according to *Table 441*.
5. Write the key into the SAES_KEYRx registers. Alternatively, manage the key source selected by KEYSEL[2:0] (see *Section 48.4.17: SAES key registers* for details).
6. Wait until KEYVALID is set (the key loading complete).
7. Enable the SAES peripheral, by setting EN.
8. Append data:
   a) If it is the last block and the plaintext (encryption) or ciphertext (decryption) size in the block is less than 16 bytes, pad the remainder of the block with zeros.
   b) Append the data block into SAES as described in *Section 48.4.5*, then read the SAES_DOUTR register four times to save the resulting block.
   c) Repeat the step *b)* until the second-last block is processed. For the last block of plaintext (encryption only), follow the steps *a)* and *b)*. For the last block, discard the bits that are not part of the message when the last block is smaller than 16 bytes.
9. Finalize the sequence: disable the SAES peripheral, by clearing EN.

Suspend/resume operations in CTR mode

Like for CBC mode, it is possible to interrupt a message to send a higher-priority message, then resume the interrupted message. Detailed CBC suspend and resume sequence is described in *Section 48.4.9: SAES basic chaining modes (ECB, CBC)*. The IV registers must be saved in suspend, then restored in resume operation, because they are altered during the data processing.

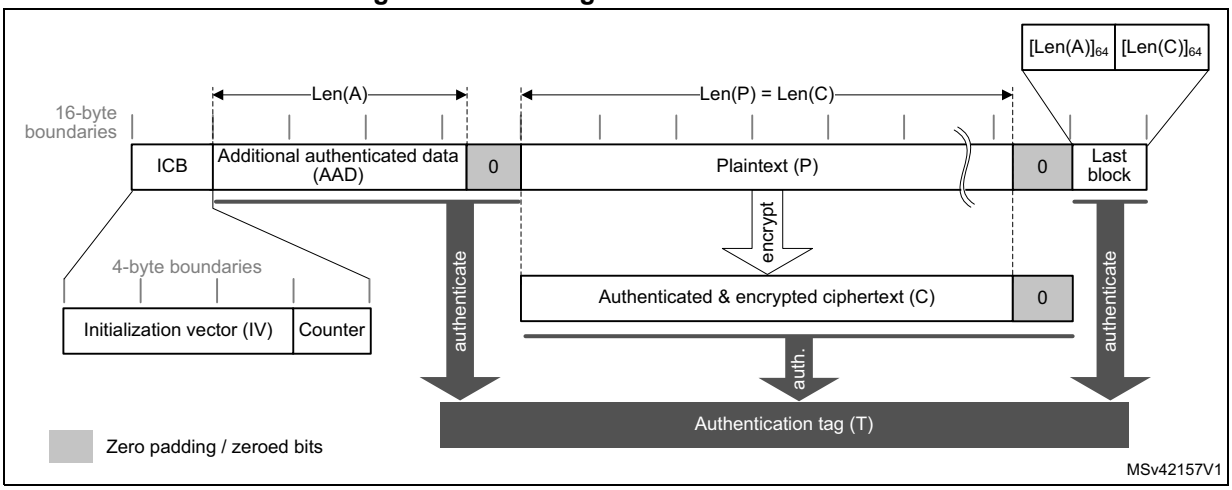
Note: Suspend and resume operations are only supported when SAES is used in CPU mode.

48.4.11 SAES Galois/counter mode (GCM)

The AES Galois/counter mode (GCM) allows encrypting and authenticating a plaintext message into the corresponding ciphertext and tag (also known as message authentication code).

GCM mode is based on AES in counter mode for confidentiality. It uses a multiplier over a fixed finite field for computing the message authentication code. The following figure shows a typical message construction in GCM mode.

Figure 408. Message construction in GCM



The message has the following structure:

- **16-byte initial counter block (ICB)**, composed of two distinct fields:
  - **Initialization vector (IV):** a 96-bit value that must be unique for each encryption cycle with a given key. The GCM standard supports IVs with less than 96 bits, but in this case strict rules apply.
  - **Counter:** a 32-bit big-endian integer that is incremented each time a block processing is complete. According to NIST specification, the counter value is 0x2 when processing the first block of payload.
- **Authenticated header AAD** (also knows as additional authentication data) has a known length Len(A) that may be a nonmultiple of 16 bytes, and must not exceed 2^{64} – 1 bits. This part of the message is only authenticated, not encrypted.
- **Plaintext message P** is both authenticated and encrypted as ciphertext C, with a known length Len(P) that may be nonmultiple of 16 bytes, and cannot exceed 2^{32} - 2 16-byte blocks.
- **Last block** contains the AAD header length (bits [32:63]) and the payload length (bits [96:127]) information, as shown in *Table 443*.

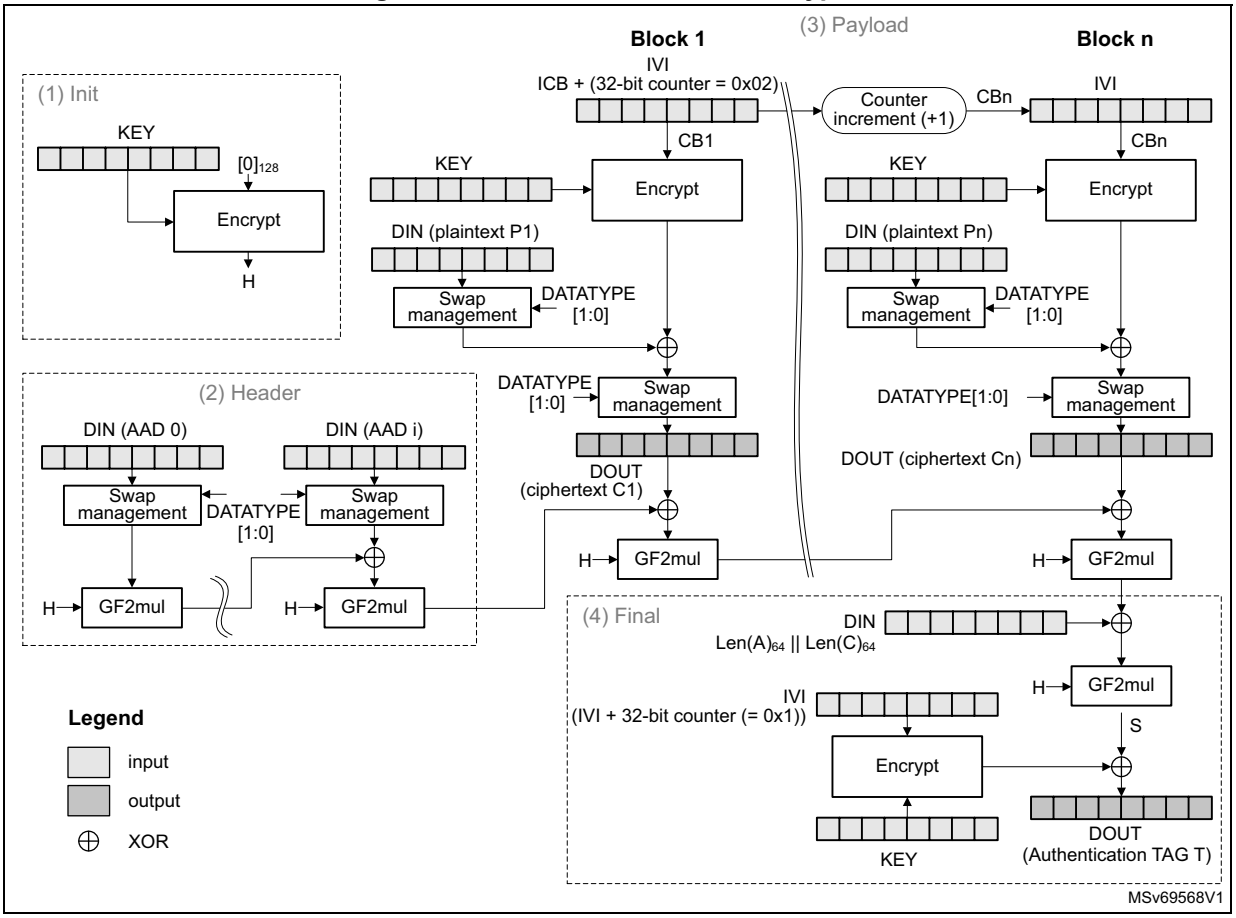
The GCM standard specifies that ciphertext C has the same bit length as the plaintext P.

When a part of the message (AAD or P) has a length that is a nonmultiple of 16 bytes a special padding scheme is required.

For more details, refer to NIST *Special Publication 800-38D, Recommendation for Block Cipher Modes of Operation - Galois/Counter Mode (GCM) and GMAC.*

Figure 409 describes the GCM chaining implementation in the SAES peripheral (encryption). To select this chaining mode, write CHMOD[3:0] with 0x3.

Figure 409. GCM authenticated encryption



The first counter block (CB1) is derived from the initial counter block ICB by the application software, as defined in *Table 442*.

Table 442. Initialization of IV registers in GCM mode

SAES_IVR3[31:0]	SAES_IVR2[31:0]	SAES_IVR1[31:0]	SAES_IVR0[31:0]
ICB[127:96]	ICB[95:64]	ICB[63:32]	ICB[31:0] 32-bit counter = 0x0002

The last block of a GCM message contains the AAD header and the payload lengths in bits, as shown in *Table 443*.

Table 443. GCM last block definition

Word order to SAES_DINR	First word	Second word	Third word	Fourth word
Input data	AAD length[63:32]	AAD length[31:0]	Payload length[63:32]	Payload length[31:0]

GCM encryption and decryption process

This process is described in *Section 48.4.6*, with the following sequence of events.

GCM initialize

1. Disable the SAES peripheral, by clearing EN.
2. Wait until BUSY clears (indicating no RNG random number fetch in progress).
3. Initialize the SAES_CR register:
   a) Select GCM chaining mode (write CHMOD[3:0] with 0x3) in encryption or decryption mode (write MODE[1:0] with 0x0 or 0x2). Do not write MODE[1:0] with 0x1.
   b) Configure the data type, through DATATYPE[1:0]
   c) Configure the key size, through KEYSIZE[1:0]. Also set KEYPROT if the key is not shared with a different security context (different secure or Compartment ID attribute).
   d) Select the key source using KEYSEL[2:0] (see step *5.*)
   e) Select normal key mode, by clearing WRAPEN. For wrapped key usage (with WRAPEN set) refer to *Section 48.4.14*.
   f) Select the GCM initialization phase, by writing CPHASE[1:0] with 0x0
4. Write the initialization vector in SAES_IVRx registers according to *Table 442*.
5. Write the key into the SAES_KEYRx registers. Alternatively, manage the key source selected by KEYSEL[2:0] (see *Section 48.4.17: SAES key registers* for details).
6. Wait until KEYVALID is set (key loading complete).
7. Set EN to start the calculation of the hash key.
8. Wait until the CCF flag is set in the SAES_ISR register, indicating that the GCM hash subkey (H) computation is complete.
9. Clear the CCF flag by setting the CCF bit of the SAES_ICR register.

GCM header phase

10. Initialize header phase:
    a) Select the GCM header phase, by writing 0x1 to CPHASE[1:0]. Do not change the other configurations written during GCM initialization.
    b) Enable the SAES peripheral, by setting EN.
11. Append header data:
    a) If it is the last block and the AAD in the block is smaller than 16 bytes, pad the remainder of the block with zeros.
    b) Append the data block into SAES as described in *Section 48.4.5*.
    c) Repeat the step *b)* until the second-last AAD data block is processed. For the last block, follow the steps *a)* and *b)*.

Note: This phase can be skipped if there is no AAD, that is, Len(A) = 0.

No data are read during header phase.

GCM payload phase

12. Initialize payload phase:
    a) Select the GCM payload phase, by writing CPHASE[1:0] with 0x2. Do not change the other configurations written during GCM initialization.
    b) If the header phase is skipped, enable the SAES peripheral by setting EN.
13. Append payload data:
    a) If it is the last block and the message in the block is smaller than 16 bytes, pad the remainder of the block with zeros.
    b) Append the data block into SAES as described in *Section 48.4.5*, then read the SAES_DOUTR register four times to save the resulting block. As mentioned in *Section 48.4.5*, the use of NPBLB[3:0] might be necessary.
    c) Repeat the step *b)* until the second-last plaintext block is encrypted or until the last block of ciphertext is decrypted. For the last block of plaintext (encryption only), follow the steps *a)* and *b)*. For the last block, discard the bits that are not part of the payload when the last block is smaller than 16 bytes.
14. Wait until the BUSY flag clears (encryption only).

Note: This phase can be skipped if there is no payload, that is, Len(C) = 0 (see GMAC mode).

GCM finalization

15. Select the GCM final phase, by writing CPHASE[1:0] with 0x3. Do not change the other configurations written during GCM initialization. If DMA was used previously, clear the DMAINEN and DMAOUTEN bits to switch to CPU mode.
16. Write the final GCM block into the SAES_DINR register. It is the concatenated AAD bit and payload bit lengths, as shown in *Table 443*.
17. Wait until the CCF flag of the SAES_ISR register is set.
18. Get the GCM authentication tag, by reading the SAES_DOUTR register four times.
19. Clear the CCF flag, by setting the CCF bit in SAES_ICR register.
20. Disable the SAES peripheral, by clearing EN. If it is an authenticated decryption, compare the generated tag with the expected tag passed with the message.

Note: In the final phase, data are written to SAES_DINR normally (no swapping), while swapping is applied to tag data read from SAES_DOUTR.

When transiting from the header or the payload phase to the final phase, the SAES peripheral must not be disabled, otherwise the result is wrong.

Suspend/resume operations in GCM mode

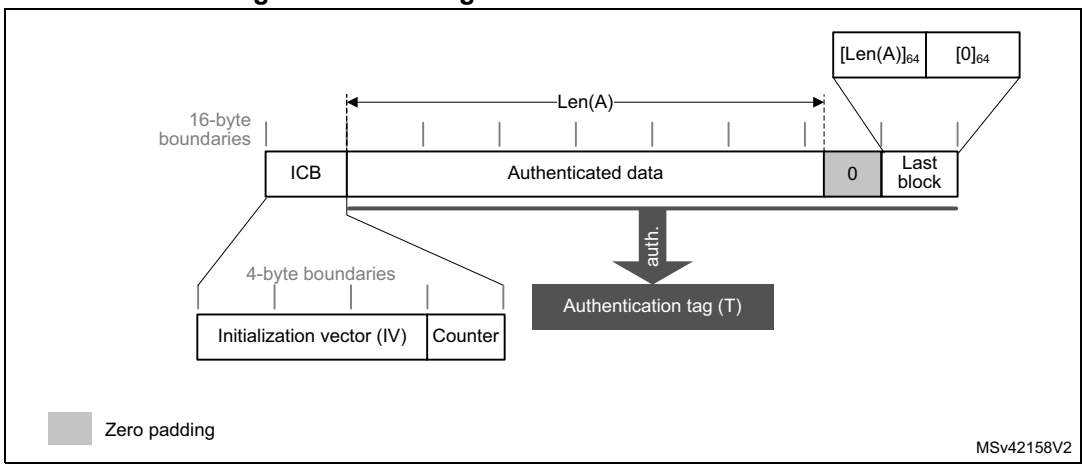
Suspend/resume operations are not supported in GCM mode.

48.4.12 SAES Galois message authentication code (GMAC)

The Galois message authentication code (GMAC) allows the authentication of a plaintext, generating the corresponding tag information (also known as message authentication code).

GMAC is similar to GCM, except that it is applied on a message composed only by plaintext authenticated data (that is, only header, no payload). The following figure shows typical message construction for GMAC.

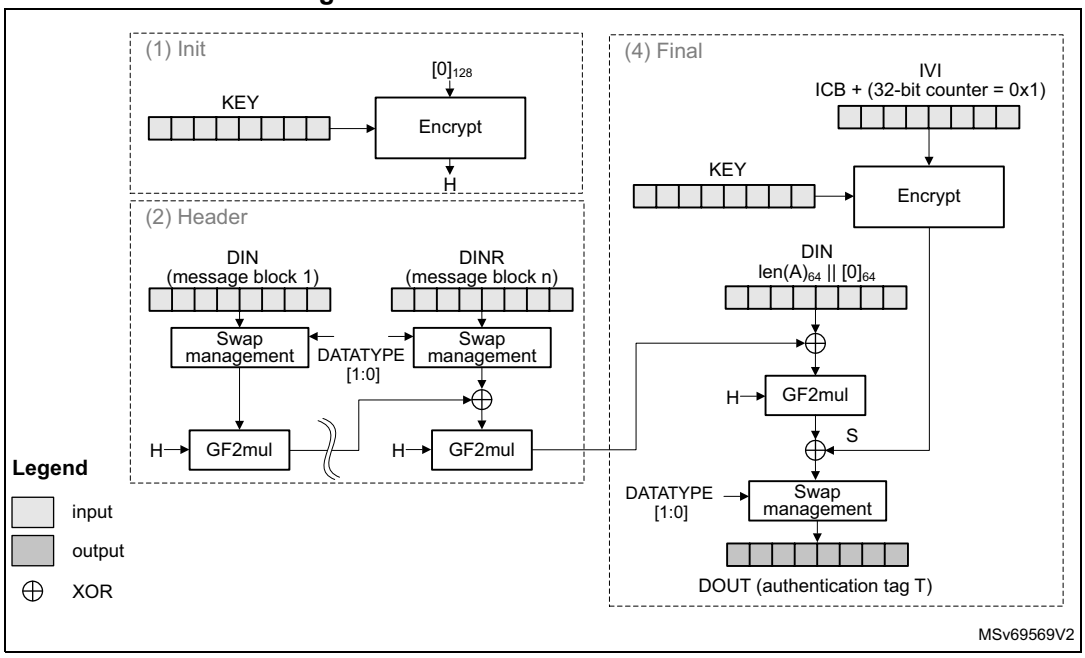
Figure 410. Message construction in GMAC mode



For more details, refer to NIST *Special Publication 800-38D, Recommendation for Block Cipher Modes of Operation - Galois/Counter Mode (GCM) and GMAC.*

Figure 411 describes the GMAC chaining implementation in the SAES peripheral. To select this chaining mode, write CHMOD[3:0] with 0x3.

Figure 411. GMAC authentication mode



The GMAC algorithm corresponds to the GCM algorithm applied on a message that only contains a header. As a consequence, all steps and settings are the same as with the GCM, except that the payload phase is omitted.

Suspend/resume operations in GMAC mode

Suspend/resume operations are not supported in GMAC mode.

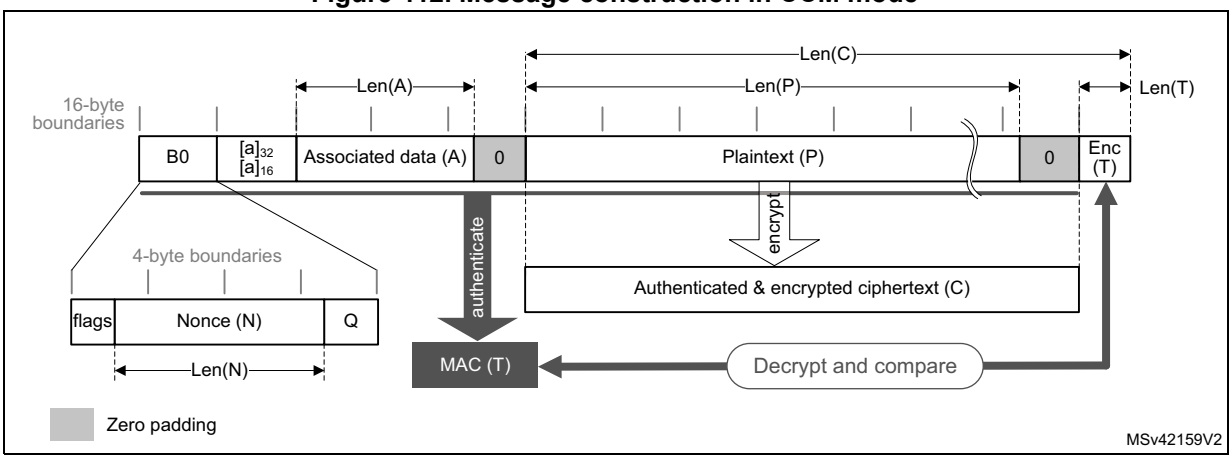
48.4.13 SAES counter with CBC-MAC (CCM)

The AES **counter with cipher block chaining-message authentication code** (CCM) algorithm allows encryption and authentication of plaintext, generating the corresponding ciphertext and tag (also known as message authentication code). To ensure confidentiality, the CCM algorithm is based on AES counter chaining mode. It uses cipher block chaining technique to generate the message authentication code. This is commonly called CBC-MAC.

Note: NIST does not approve CBC-MAC as an authentication mode outside the context of the CCM specification.

The following figure shows typical message construction for CCM.

Figure 412. Message construction in CCM mode



The structure of the message is:

- **16-byte first authentication block (B0)**, composed of three distinct fields:
  - **Q:** a bit string representation of the octet length of P (Len(P))
  - **Nonce (N):** a single-use value (that is, a new nonce must be assigned to each new communication) of Len(N) size. The sum Len(N) + Len(P) must be equal to 15 bytes.
  - **Flags:** most significant octet containing four flags for control information, as specified by the standard. It contains two 3-bit strings to encode the values **t** (MAC length expressed in bytes) and **Q** (plaintext length such that Len(P) < 2^{8Q} bytes). The counter blocks range associated to **Q** is equal to 2^{8Q-4}, that is, if the maximum value of **Q** is 8, the counter blocks used in cipher must be on 60 bits.
- **16-byte blocks (B)** associated to the associated data (A).
  This part of the message is only authenticated, not encrypted. This section has a known length Len(A) that can be a nonmultiple of 16 bytes (see *Figure 412*). The

standard also states that, on MSB bits of the first message block (B1), the associated data length expressed in bytes (a) must be encoded as follows:

– If $0 < a < 2^{16} - 2^8$, then it is encoded as $[a]_{16}$, that is, on two bytes.
– If $2^{16} - 2^8 < a < 2^{32}$, then it is encoded as 0xff || 0xfe || $[a]_{32}$, that is, on six bytes.
– If $2^{32} < a < 2^{64}$, then it is encoded as 0xff || 0xff || $[a]_{64}$, that is, on 10 bytes.

- **16-byte blocks (B)** associated to the plaintext message P, which is both authenticated and encrypted as ciphertext C, with a known length Len(P). This length can be a nonmultiple of 16 bytes (see *Figure 412*).
- **Encrypted MAC (T)** of length Len(T) appended to the ciphertext C of overall length Len(C).

When a part of the message (A or P) has a length that is a nonmultiple of 16 bytes, a special padding scheme is required.

Note: CCM chaining mode can also be used with associated data only (that is, no payload).

As an example, the C.1 section in NIST Special Publication 800-38C gives the following values (hexadecimal numbers):

N: 10111213 141516 (Len(N) is 56 bits or 7 bytes)

A: 00010203 04050607 (Len(A) is 64 bits or 8 bytes)

P: 20212223 (Len(P) is 32 bits or 4 bytes)

T: 6084341B (Len(T) is 32 bits or t = 4)

B0: 4F101112 13141516 00000000 00000004
B1: 00080001 02030405 06070000 00000000
B2: 20212223 00000000 00000000 00000000

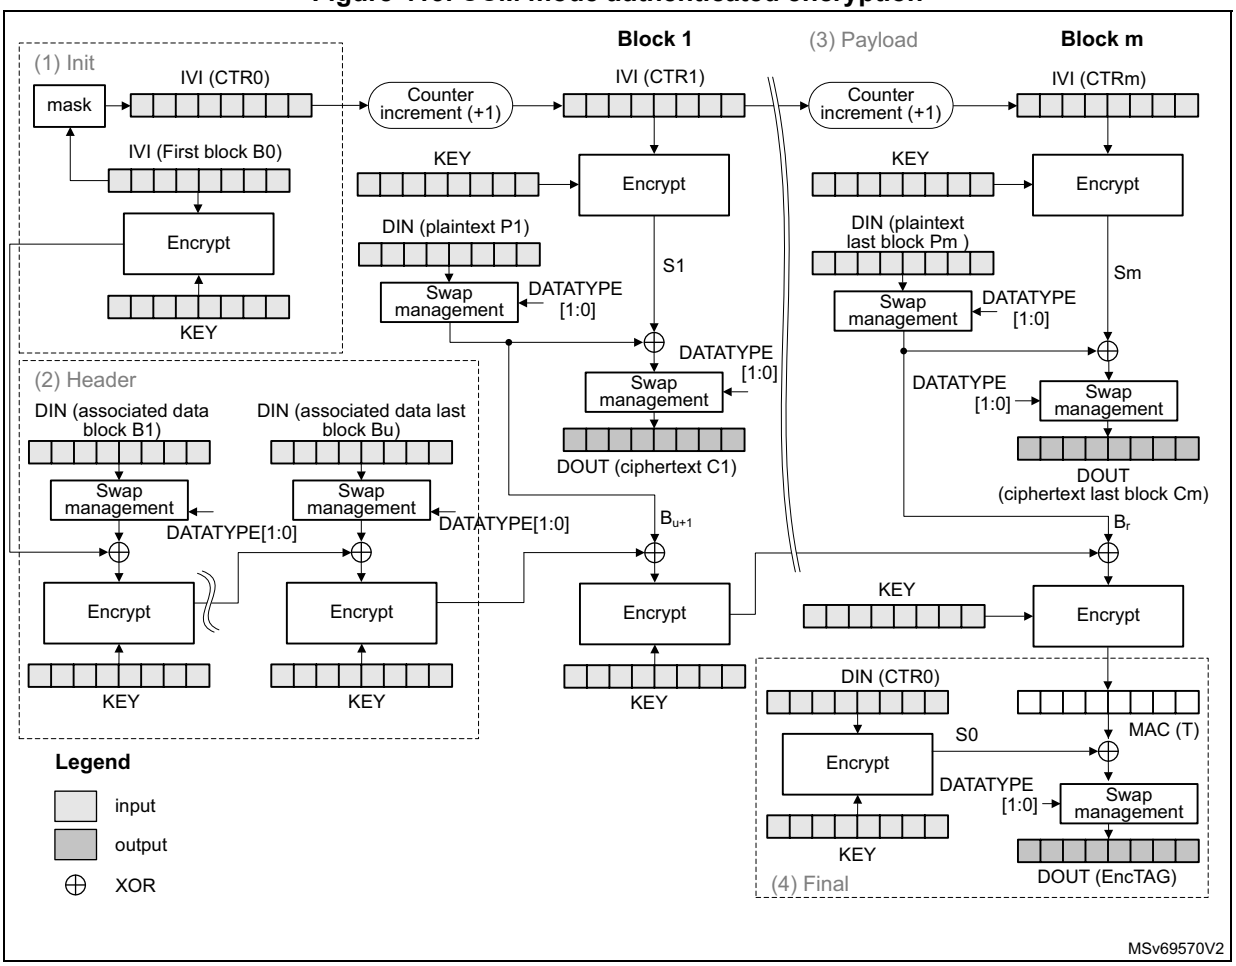
CTR0: 0710111213 141516 00000000 00000000

CTR1: 0710111213 141516 00000000 00000001

For more details, refer to NIST *Special Publication 800-38C, Recommendation for Block Cipher Modes of Operation - The CCM Mode for Authentication and Confidentiality*.

Figure 413 describes the CCM chaining implementation in the SAES peripheral (encryption). To select this chaining mode, write CHMOD[3:0] with 0x4.

Figure 413. CCM mode authenticated encryption



The first block of a CCM message (B0) must be prepared by the application as defined in *Table 444*.

Table 444. Initialization of IV registers in CCM mode

SAES_IVR3[31:0]	SAES_IVR2[31:0]	SAES_IVR1[31:0]	SAES_IVR0[31:0]
B0[127:96](1)	B0[95:64]	B0[63:32]	B0[31:0](2)

1. The five most significant bits are cleared (flag bits).
2. Q length bits are cleared, except for the bit 0 that is set.

SAES supports counters up to 64 bits, as specified by NIST.

CCM encryption and decryption process

This process is described in *Section 48.4.6*, with the following sequence of events.

CCM initialize

1. Disable the SAES peripheral, by clearing EN.
2. Wait until BUSY clears (indicating no RNG random number fetch in progress).
3. Initialize the SAES_CR register:
   a) Select CCM chaining mode (write CHMOD[3:0] with 0x4) in encryption or decryption mode (write MODE[1:0] with 0x0 or 0x2). Do not write MODE[1:0] with 0x1.
   b) Configure the data type, through DATATYPE[1:0].
   c) Configure the key size, through KEYSIZE[1:0]. Also set KEYPROT if the key is not shared with a different security context (different secure or Compartment ID attribute).
   d) Select the key source using KEYSEL[2:0] (see step *5.*)
   e) Select normal key mode, by clearing WRAPEN. For wrapped key usage (with WRAPEN set) refer to *Section 48.4.14*.
   f) Select the CCM initialization phase, by writing CPHASE[1:0] with 0x0.
4. Write the B0 data into the SAES_IVRx registers according to *Table 444*.
5. Write the key into the SAES_KEYRx registers Alternatively, manage the key source selected by KEYSEL[2:0] (see *Section 48.4.17: SAES key registers* for details).
6. Wait until KEYVALID is set (the key loading complete).
7. Set EN to start the first mask calculation. The EN bit clears automatically upon completion of the calculation.
8. Wait until the CCF flag of the SAES_ISR register is set.
9. Clear the CCF flag , by setting the CCF bit of the SAES_ICR register.

CCM header phase

10. Initialize header phase:
    a) Prepare the first block of the (B1) data associated with the message, in accordance with CCM chaining rules.
    b) Select the CCM header phase, by writing CPHASE[1:0] with 0x1. Do not change the other configurations written during the CCM initialization.
    c) Enable the SAES peripheral, by setting EN.
11. Append header data:
    a) If it is the last block and the associated data in the block is smaller than 16 bytes, pad the remainder of the block with zeros.
    b) Append the data block into SAES as described in *Section 48.4.5*.
    c) Repeat the step *b)* until the second-last associated data block is processed. For the last block, follow the steps *a)* and *b)*.

Note: This phase can be skipped if there is no associated data, that is, Len(A) = 0

No data are read during the header phase.

CCM payload phase

12. Initialize payload phase:
    a) Select the CCM payload phase, by writing CPHASE[1:0] with 0x2. Do not change the other configurations written during the CCM initialization.
    b) If the header phase is skipped, enable the SAES peripheral, by setting EN.
13. Append payload data:
    a) In encryption only, if it is the last block and the plaintext in the block is smaller than 16 bytes, pad the remainder of the block with zeros.
    b) Append the data block into SAES as described in *Section 48.4.5*, then read the SAES_DOUTR register four times to save the resulting block. As mentioned in *Section 48.4.5*, the use of NPBLB[3:0] might be necessary.
    c) Repeat the step *b)* until the second-last plaintext block is encrypted or until the last block of ciphertext is decrypted. For the last block of plaintext (encryption only), follow the steps *a)* and *b)*. For the last block, discard the bits that are not part of the payload when the last block is smaller than 16 bytes.

Note: This phase can be skipped if there is no payload, that is, Len(P) = 0 or Len(C) = Len(T).

Remove $LSB_{Len(T)}(C)$ encrypted tag information when decrypting ciphertext C.

CCM finalization

14. Select the CCM final phase, by writing CPHASE[1:0] with 0x3. Do not change the other configurations written during the CCM initialization. If DMA was used previously, clear the DMAINEN and DMAOUTEN bits to switch to CPU mode.
15. Wait until CCF flag of the SAES_ISR register is set.
16. Get the CCM authentication tag, by reading the SAES_DOUTR register four times.
17. Clear the CCF flag, by setting the CCF bit of the SAES_ICR register.
18. Disable the SAES peripheral, by clearing EN. If it is an authenticated decryption, compare the generated tag with the expected tag passed with the message. Mask the authentication tag output with tag length to obtain a valid tag.

Note: In the final phase, swapping is applied to tag data read from SAES_DOUTR register.

When transiting from the header or the payload phase to the final phase, the SAES peripheral must not be disabled, otherwise the result is wrong.

Suspend and resume operations in CCM mode

Note: Suspend and resume operations are only supported when SAES is used in CPU mode.

To suspend the processing of a message in header or payload phase, proceed as follows:

1. Wait until the CCF flag of the SAES_ISR register is set (computation complete).
2. Read the SAES_DOUTR register four times to save the last processed block.
3. Clear the CCF flag in the SAES_ISR register, by setting the CCF bit of the SAES_ICR register.
4. Save the SAES_SUSPRx registers in the memory.
5. In the payload phase, save the IV registers as they are altered during the data processing. This step is not required in the header phase.
6. Disable the SAES peripheral, by clearing EN.

7. Save the current SAES_CR configuration in the memory. Key registers do not need to be saved as the original key value is known by the application.

To resume the processing of a message, proceed as follows:

1. Disable the SAES peripheral, by clearing EN.
2. Write the suspend register values, previously saved in the memory, back into their corresponding SAES_SUSPRx registers.
3. Restore the initial setting values in the SAES_CR and SAES_KEYRx registers. Alternatively, select a key source different from the key registers, by setting KEYSEL[2:0] to a value different from 0x0. Refer to *Section 48.4.17: SAES key registers* for details.
4. In the payload phase, restore the SAES_IVRx registers using the saved configuration. In the header phase, write the initial setting values back to the SAES_IVRx registers.
5. Enable the SAES peripheral, by setting EN.

48.4.14 SAES basic operations with wrapped keys

SAES peripheral can wrap (encrypt) and unwrap (decrypt) the application keys using hardware-secret key (DHUK, BHK). With this feature, keys used in SAES can be made usable by the application software without being exposed in clear-text (unencrypted).

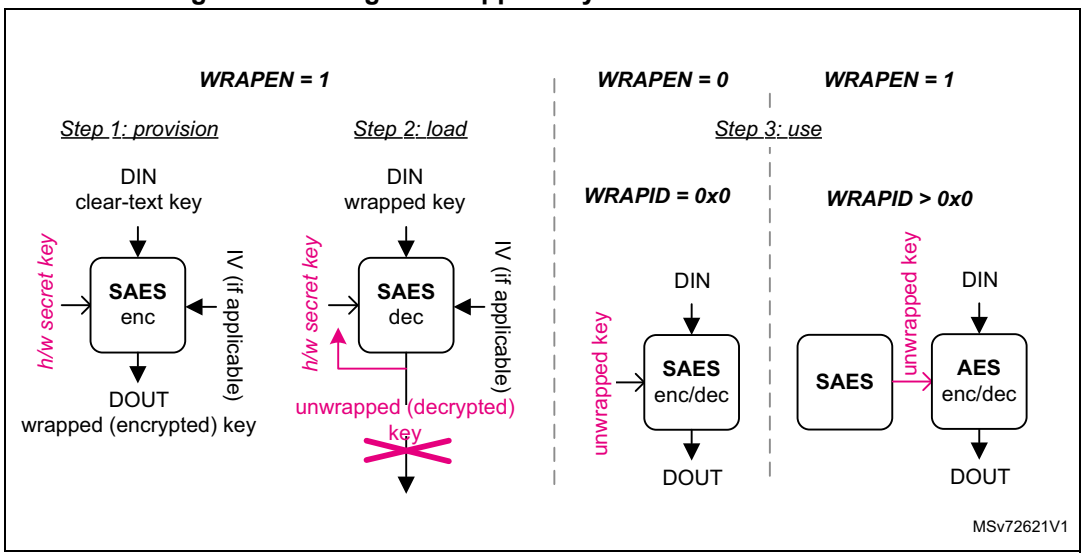
Wrapped key sequences are too small to be suspended/resumed. They also cannot be used when GCM or CCM mode are selected.

Using wrapped keys with ECB/CBC chaining modes

Figure 414 summarizes how to use wrapped keys when ECB or CBC mode are chosen.

- In Step 1, the clear-text key is encrypted once in SAES. KEYSEL[2:0] is different from zero.
- In Step 2, the encrypted key is decrypted in SAES each time the unwrapped (decrypted) key needs to be loaded in key registers.
  - Set WRAPID[2:0] to zero if the wrapped key is used in SAES
  - Set WRAPID[2:0] to a value different from zero if the wrapped key is used outside of the SAES.
- In Step 3, the target peripheral (SAES or another AES peripheral) can use the unwrapped (decrypted) key. If SAES is the target peripheral, WRAPEN must be cleared, otherwise it remains set.

Figure 414. Usage of wrapped keys in ECB and CBC modes



Provisioning wrapped keys

The recommended sequence to wrap (that is, encrypt) a key using ECB/CBC is as follows:

1. Disable the SAES peripheral, by clearing EN.
2. Wait until BUSY clears (indicating no RNG random number fetch in progress).
3. Initialize the SAES_CR register as follows:
   a) Select ECB or CBC chaining mode (CHMOD[3:0] at 0x0 or 0x1) in *encryption* mode (MODE[1:0] at 0x0).
   b) Select 32-bit data type (DATATYPE at 0x0).
   c) Configure the key size with KEYSIZE[1:0]. This information is used both for the encryption key and for the key to wrap/encrypt, unless KEYSIZE[1:0] is 0x1. In this case the encryption key is fixed to 256-bit, not 192-bit.
   d) Select the correct key source by using KEYSEL[2:0].
   e) Set WRAPEN and select the wrapped key use with WRAPID[2:0]. Refer to *Section 48.8.1* for details on WRAPID[2:0] options.
4. Write the initialization vector in SAES_IVRx registers if CBC mode is selected in the previous step.
5. If required, manage the key source selected by KEYSEL[2:0] (see *Section 48.4.17*).
6. Wait until KEYVALID is set (key loading complete).
7. Enable the SAES peripheral, by setting EN.
8. Write the SAES_DINR register four times to input the key to encrypt (MSB first).
   If KEYSIZE[1:0] is 0x1 the 128-bit MSB block of the key to encrypt is made of two MSB words of the key (as two 32-bit LSB words), with the two 32-bit MSB words made of ciphertext stealing data (for example 8-bytes MSB of the 128 least significant key block).
9. Wait until CCF flag is set in the SAES_ISR register.
10. Get the encrypted key (MSB first) by reading the SAES_DOUTR register four times. Then clear the CCF flag, by setting the CCF bit in SAES_ICR register.
11. Repeat steps 8 to 10 if KEYSIZE[1:0] is 0x1 or 0x2.
12. Disable the SAES peripheral, by clearing EN.

Note: Encryption with WRAPEN set is only supported when ECB or CBC is selected.

Unwrapping keys in appropriate target

The recommended sequence to unwrap (or decrypt) a wrapped (encrypted) key using ECB/CBC is as follows:

1. Disable the SAES peripheral, by clearing EN.
2. Wait until BUSY clears (indicating no RNG random number fetch in progress).
3. Initialize the SAES_CR register as follows:
   a) Select the *key derivation* mode, writing MODE[1:0] with 0x1. The CHMOD[3:0] bitfield must be the same as when the key were wrapped/encrypted.
   b) Select 32-bit data type (DATATYPE at 0x0).
   c) The KEYSIZE[1:0] bitfield must be the same as when the key were wrapped/encrypted. When KEYSIZE[1:0] is 0x1, the decryption key size is fixed to 256-bit, not 192-bit.
   d) Select with KEYSEL[2:0] the same key source as when the key was wrapped or encrypted.
   e) Set WRAPEN, with WRAPID[2:0] configured to match the value used when the key was wrapped or encrypted.
4. If required, manage the key source selected by KEYSEL[2:0] (see *Section 48.4.17*).
5. Wait until KEYVALID is set (key loading complete).
6. Enable the SAES peripheral, by setting EN.
7. Wait until CCF flag is set in the SAES_ISR register.
8. Clear the CCF flag, by setting the CCF bit in SAES_ICR register. The decryption key is available in the AES core, and SAES is disabled automatically.
9. Select the decryption mode, by writing MODE[1:0] with 0x2. Do not change other parameters in SAES_CR register.
10. Write in SAES_IVRx registers the same initialization vector as when the key were wrapped/encrypted, if CBC mode is selected in the previous step.
11. Enable the SAES peripheral, by setting EN.
12. Write the SAES_DINR register four times to input the key to decrypt (MSB first).
13. Wait until CCF flag is set in the SAES_ISR register. Then clear the CCF flag by setting the CCF bit in SAES_ICR register. Reading SAES_DOUTR returns zero and triggers a read error (RDERRF).
14. Repeat steps 12 and 13 if KEYSIZE[1:0]is 0x1 or 0x2.
15. Disable the SAES peripheral, by clearing EN.

At the end of this sequence, the decrypted wrapped key is immediately usable when the WRAPEN bit clears, based on the WRAPID value:

- If the WRAPID[2:0] value is zero, the key can be shared with an application running in a different security context (such as secure, nonsecure, specific CPU) if KEYPROT bit was cleared during the step *3.*
- If the WRAPID[2:0] value is nonzero, the application must load the key to the target AES engine as described in *Section 48.4.15*.
- At this stage, with WRAPEN and KEYVALID set, if WRAPID[2:0] value is changed from zero to nonzero, the SAES sets the KEIF error flag, thus clearing key registers and causing any key transfer sequence to fail (see *Section 48.4.19* for details).

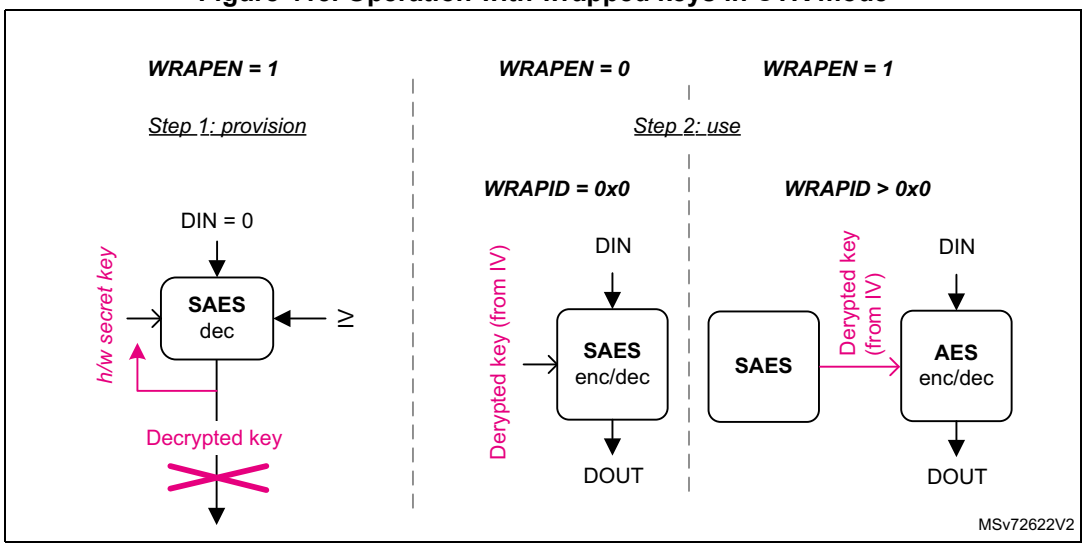
Note: When the application selects the DHUK as key source (KEYSEL[2:0] is 0x1 or 0x4), the application must use the same privilege, security, CPU, HDPL, WRAPEN/WRAPID, KEYSEL[2:0], CHMOD[3:0] and KEYSIZE[1:0] context for encryption and decryption. Otherwise, the result is incorrect.

Using wrapped keys with CTR chaining mode

Figure 415 summarizes how to use wrapped keys when CTR mode is chosen.

- In Step 1 the hardware secret key is computed in SAES each time it needs to be used (AES CTR decryption with DIN=0).
  - Set WRAPID[2:0] to zero if wrapped key is used in SAES
  - Set WRAPID[2:0] to a value different from zero if wrapped key is used outside of the SAES.
- In Step 2 the target peripheral (SAES or another AES peripheral) can use the computed key. If SAES is the target peripheral, WRAPEN must be cleared, otherwise it remains set.

Figure 415. Operation with wrapped keys in CTR mode



Recommended sequence for SAES wrapped key usage with CTR is described below:

1. Disable the SAES peripheral, clearing EN.
2. Wait until BUSY clears (indicating no RNG random number fetch in progress).
3. Initialize the SAES_CR register as follows:
   a) Select the CTR chaining mode (CHMOD[3:0] at 0x2) in *decryption* mode (MODE[1:0] at 0x2). Other MODE[1:0] values are not supported.
   b) Select 32-bit data type (DATATYPE at 0x0).
   c) Configure the required key size using KEYSIZE[1:0]. 192-bit key (KEYSIZE[1:0] is 0x1) is not supported.
   d) Select the correct key source by using KEYSEL[2:0].
   e) Set WRAPEN and select the wrapped key usage with WRAPID[2:0]. Refer to *Section 48.8.1* for details on WRAPID[2:0] options.
4. Write the initialization vector in SAES_IVRx registers. This information can be the ID of the key.
5. If required, manage the key source selected by KEYSEL[2:0] (see *Section 48.4.17*).
6. Wait until KEYVALID is set (key loading complete).
7. Enable the SAES peripheral, by setting EN.
8. Wait until CCF flag is set in the SAES_SR register. Then clear the CCF flag, by setting the CCF bit in SAES_ICR register. Reading SAES_DOUTR returns zero and triggers a read error (RDERRF).
9. Disable the SAES peripheral, by clearing EN.

At the end of this sequence, the decrypted wrapped key is immediately usable when the WRAPEN bit clears, based on the WRAPID value:

- If the WRAPID[2:0] value is zero, the key can be shared with an application running in a different security context (such as secure, nonsecure, specific CPU) if the KEYPROT bit was cleared during the step *3.*
- If WRAPID[2:0] is different from zero, the application must load the key to the target AES engine as described in next *Section 48.4.15*.
- At this stage, with WRAPEN and KEYVALID set, if WRAPID[2:0] value is changed from zero to nonzero, SAES sets KEIF error flag, thus clearing key registers and causing any key transfer sequence to fail (see *Section 48.4.19* for details).

Note: When the application selects the DHUK as key source (KEYSEL[2:0] is 0x1 or 0x4), the application must use the same privilege, security, CPU, HDPL, WRAPEN/WRAPID, KEYSEL[2:0], CHMOD[3:0] and KEYSIZE[1:0] context for encryption and decryption. Otherwise, the result is incorrect.

Setting encryption with WRAPEN set and CTR mode selected automatically clears EN bit, disabling the peripheral.

48.4.15 Wrapped key usage outside the SAES peripheral

When WRAPID[2:0] is different from zero an AES peripheral can use the unwrapped key loaded in SAES peripheral. Refer to the WRAPID[2:0] bitfield description in *Section 48.8.1* for the supported AES peripherals. The key unwrapping procedure in SAES is described in previous *Section 48.4.14*.

Once the wrapped key is decrypted in SAES key registers, it can be shared with the target AES peripheral (exclusively), while WRAPEN and KEYVALID are set in SAES. Key sharing sequence can be run multiple times in the target AES peripheral (for example, to manage a suspend/resume situation), as long as SAES is unused and duly remains in key sharing state, with WRAPEN and KEYVALID set.

If one of the CRYP1 and CRYP2 peripherals not selected by WRAPID[2:0] tries to read the unwrapped key in SAES, the key transfer sequence fails without errors.

If KEYSIZE[1:0] value in target CRYP1 or CRYP2 peripheral differs from SAES, the key transfer sequence fails with key error flag raised in both peripherals.

Note: KEYSIZE[1:0] is 0x1 (192-bit key) is not supported when WRAPEN is set and WRAPID[2:0] is greater than 0x0.

While WRAPEN and KEYVALID are set in SAES, modifying WRAPID[2:0] triggers a KEIF error, which causes the key registers to be cleared and any key transfer sequence to fail (see *Section 48.4.19* for details).

48.4.16 SAES data registers and data swapping

Data input and output

A 16-byte data block enters the SAES peripheral with four successive 32-bit word writes into the SAES_DINR register (bitfield DIN[31:0]), the most significant word (bits [127:96]) first, the least significant word (bits [31:0]) last.

A 16-byte data block is retrieved from the SAES peripheral with four successive 32-bit word reads of the SAES_DOUTR register (bitfield DOUT[31:0]), the most significant word (bits [127:96]) first, the least significant word (bits [31:0]) last.

The four 32-bit words of a 16-byte data block must be stored in the memory consecutively and in big-endian order, that is, with the most significant word on the lowest address. See *Table 446* “no swapping” option for details.

Data swapping

The SAES peripheral can be configured to perform a bit-, a byte-, a half-word-, or no swapping on the input data word in the SAES_DINR register, before loading it to the AES processing core, and on the data output from the AES processing core, before sending it to the SAES_DOUTR register. The choice depends on the type of data. For example, a byte swapping is used for an ASCII text stream.

The data swap type is selected through DATATYPE[1:0]. The selection applies to both SAES input and output, except in GCM final phase (in which data must be inserted normally).

Note: The data in the SAES key registers (SAES_KEYRx) and the initialization vector registers (SAES_IVRx) are not sensitive to the swap mode selection.

Table 446 and *Figure 416* summarize the SAES data swapping feature. As shown, the padding bytes are swapped with the data written in SAES_DINR because the padding process is completed before the data swapping.

Table 445. SAES data swapping example

DATATYPE[1:0]	Swapping performed	Data block
		System memory data (big-endian)
0x0	No swapping	Block[127..64]: 0x04EEF672 2E04CE96 Block[63..0]: 0x4E6F7720 69732074
		Address @, word[127..96]: 0x04EEF672 Address @ + 0x4, word[95..64]: 0x2E04CE96 Address @ + 0x8, word[63..32]: 0x4E6F7720 Address @ + 0xC, word[31..0]: 0x69732074
0x1	Half-word (16-bit) swapping	Block[63..0]: 0x**4E6F** 7720 **6973** 2074
		Address @, word[63..32]: 0x7720 **4E6F** Address @ + 0x4, word[31..0]: 0x2074 **6973**
0x2	Byte (8-bit) swapping	Block[63..0]: 0x**4E** 6F **77** 20 **69** 73 **20** 74
		Address @, word[63..32]: 0x20**77** 6F**4E** Address @ + 0x4, word[31..0]: 0x74**20** 73**69**

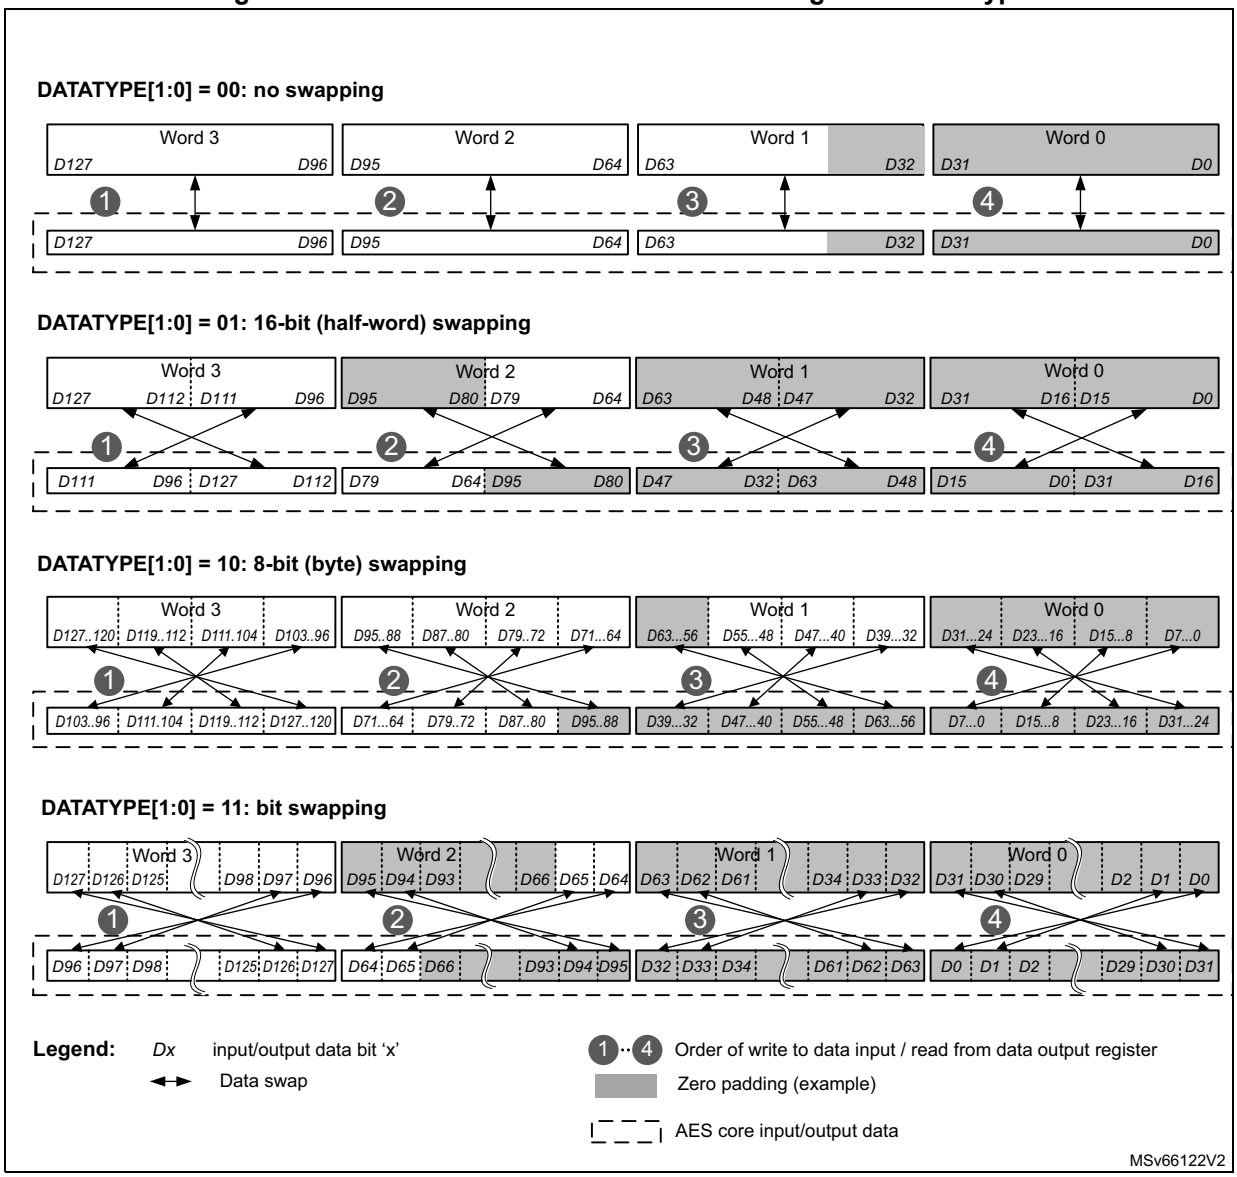
		Address @, word[63..32]: 0x04EE F672 0000 0100 1110 1110 1111 0110 0111 0010 Address @ + 0x4, word[31..0]: 0x2E04 CE96 0010 1110 0000 0100 1100 1110 1001 0110

Figure 416. 128-bit block construction according to the data type



Data padding

Figure 416 also gives an example of memory data block padding with zeros such that the zeroed bits after the data swap form a contiguous zone at the MSB end of the AES core input buffer. The example shows the padding of an input data block containing:

- 84 message bits, with DATATYPE[1:0] equal to 0x0
- 48 message bits, with DATATYPE[1:0] equal to 0x1
- 56 message bits, with DATATYPE[1:0] equal to 0x2
- 34 message bits, with DATATYPE[1:0] equal to 0x3

48.4.17 SAES key registers

The eight SAES_KEYRx write-only registers store the encryption or decryption key information, as shown on *Table 446*. Reads are not allowed for security reason.

Note: In the memory and in the SAES key registers, keys are stored in little-endian format, with most significant byte on the highest address.

Table 446. Key endianness in SAES_KEYRx registers (128/192/256-bit keys)

SAES_KEYR7 [31:0]	SAES_KEYR6 [31:0]	SAES_KEYR5 [31:0]	SAES_KEYR4 [31:0]	SAES_KEYR3 [31:0]	SAES_KEYR2 [31:0]	SAES_KEYR1 [31:0]	SAES_KEYR0 [31:0]
-	-	-	-	KEY[127:96]	KEY[95:64]	KEY[63:32]	KEY[31:0]
-	-	-	-	TAMP_BKP3R [31:0]	TAMP_BKP2R [31:0]	TAMP_BKP1R [31:0]	TAMP_BKP0R [31:0]
-	-	KEY[191:160]	KEY[159:128]	KEY[127:96]	KEY[95:64]	KEY[63:32]	KEY[31:0]
-	-	TAMP_BKP5R [31:0]	TAMP_BKP4R [31:0]	TAMP_BKP3R [31:0]	TAMP_BKP2R [31:0]	TAMP_BKP1R [31:0]	TAMP_BKP0R [31:0]
KEY[255:224]	KEY[223:192]	KEY[191:160]	KEY[159:128]	KEY[127:96]	KEY[95:64]	KEY[63:32]	KEY[31:0]
TAMP_BKP7R [31:0]	TAMP_BKP6R [31:0]	TAMP_BKP5R [31:0]	TAMP_BKP4R [31:0]	TAMP_BKP3R [31:0]	TAMP_BKP2R [31:0]	TAMP_BKP1R [31:0]	TAMP_BKP0R [31:0]

The key registers are not affected by the data swapping feature controlled by the DATATYPE[1:0] bitfield.

Write operations to the SAES_KEYRx registers are ignored when the SAES peripheral is enabled (EN bit set) and KEYSEL[2:0] is different from zero. The application must check this before modifying key registers.

The entire key must be written before starting an AES computation. With KEYSEL[2:0] at 0x0, the key registers must always be written in either ascending or descending order. The write sequence becomes:

- SAES_KEYRx (x = 0 to 3 or x = 3 to 0) for KEYSIZE[1:0] equal to 0x0
- SAES_KEYRx (x = 0 to 5 or x = 5 to 0) for KEYSIZE[1:0] equal to 0x1
- SAES_KEYRx (x = 0 to 7 or x = 7 to 0) for KEYSIZE[1:0] equal to 0x2

Note: KEYSIZE[1:0] must be written before the key. When KEYSIZE[1:0] is 0x1 and WRAPEN is set, the application must write the eight key registers (not only six).

As soon as the first key register is written, the KEYVALID flag clears. Once the key registers writing sequence is complete, KEYVALID is set and EN becomes writable. If an error occurs, KEYVALID is cleared and KEIF set (see *Section 48.4.19*).

Key selection

With KEYSEL[2:0] at 0x0, the application must write the key to the SAES_KEYRx registers.

With KEYSEL[2:0] at 0x1, a derived hardware unique key (DHUK), computed inside SAES from a nonvolatile and secret root hardware unique key, is loaded directly into key registers, based on KEYSIZE[1:0] information. Thanks to the key derivation function, secure SAES uses a secure DHUK, while nonsecure SAES uses a nonsecure DHUK.

With KEYSEL[2:0] at 0x2, the boot hardware key (BHK), stored in tamper-resistant secure backup registers, is entirely transferred into the key registers upon a secure application performing a single read in ascending order of all the TAMP_BKPxR registers (x = 0 to 3 for KEYSIZE[1:0] equal to 0x0, x = 0 to 7 for KEYSIZE[1:0] equal to 0x1 or 0x2). Refer to *Table 446*.

With KEYSEL[2:0] at 0x4, the XOR combination of DHUK and BHK is entirely transferred into key registers upon a secure application performing a single read in ascending order of all the TAMP_BKPxR registers (x = 0 to 3 for KEYSIZE[1:0] equal to 0x0, x = 0 to 7 for KEYSIZE[1:0] equal to 0x1 or 0x2). Refer to *Table 446*.

KEYVALID must be cleared when the application needs to reload a key into the key registers selected by KEYSEL[2:0], provided the value is different from zero. For example, this is necessary when switching from ECB decryption to ECB encryption using the same key. When KEYVALID is set, the recommended method to clear it is by using IPRST (see *Section 48.8.1*).

For nonzero KEYSEL[2:0] values, initiating the key-loading sequence sets the BUSY flag and clears the KEYVALID flag. Once the amount of bits defined by KEYSIZE[1:0] is transferred to the SAES_KEYRx registers, BUSY is cleared, KEYVALID set and the EN bit becomes writable. If an error occurs, BUSY and KEYVALID are cleared and KEIF set (see *Section 48.4.19*).

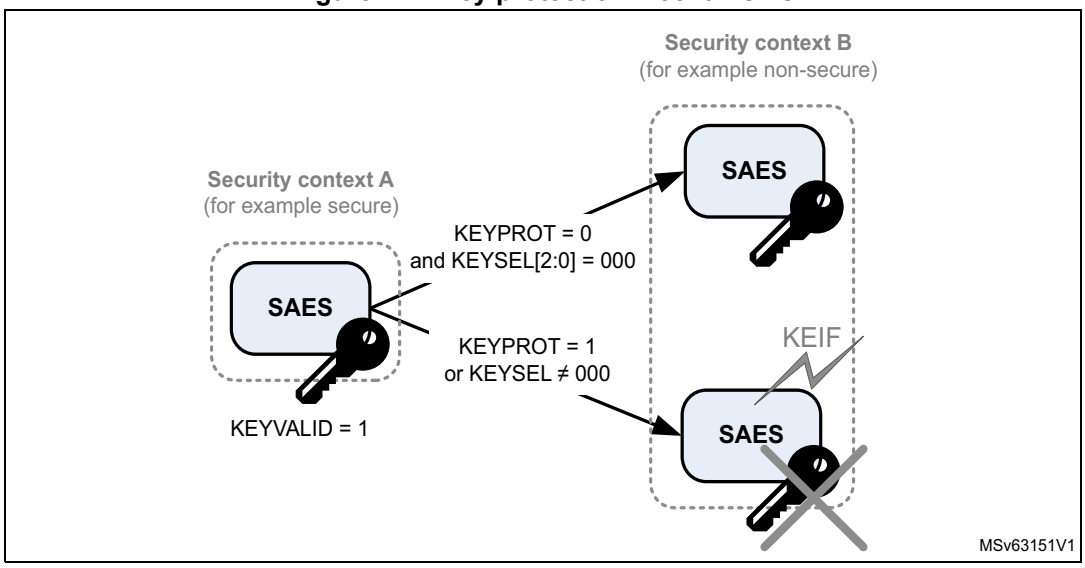
Note: DHUK, BHK and their XOR combination are not readable by any software (even secure).

Key protection

As depicted in *Figure 417*, when the application sets the KEYPROT bit before writing a key into SAES_KEYRx, any application executing in a different security context (that is, different security or Compartment ID attribute) triggers a KEIF error flag upon access to any SAES register when KEYVALID is set.

Note: KEYSEL[2:0] values different from zero (normal key) automatically protect the key registers.

Figure 417. Key protection mechanisms



48.4.18 SAES initialization vector registers

The four SAES_IVRx registers store the initialization vector (IV) information, as shown in *Table 447*. They can only be written if the SAES peripheral is disabled (EN cleared).

Note: In the memory and in the SAES IV registers, initialization vectors are stored in little-endian format, with most significant byte on the highest address.

Table 447. IVI bitfield spread over SAES_IVRx registers

SAES_IVR3[31:0]	SAES_IVR2[31:0]	SAES_IVR1[31:0]	SAES_IVR0[31:0]
IVI[127:96]	IVI[95:64]	IVI[63:32]	IVI[31:0]

Initialization vector information depends on the chaining mode selected. When used, SAES_IVRx registers are updated upon each AES computation cycle (useful for managing suspend mode).

The initialization vector registers are not affected by the data swapping feature controlled through DATATYPE[1:0].

48.4.19 SAES error management

The SAES peripheral manages the errors described in this section.

Read error flag (RDERRF)

Unexpected read attempt of the SAES_DOUTR register returns zero, setting the RDERRF flag and the RWEIF flag. RDERRF is triggered during the computation phase or during the input phase.

Note: Unless otherwise indicated, SAES is not disabled when RDERRF rises and it continues processing.

An interrupt is generated if the RWEIE bit is set. For more details, refer to *Section 48.5: SAES interrupts*.

The RDERRF and RWEIF flags are cleared by setting the RWEIF bit of the SAES_ICR register.

Write error flag (WRERRF)

Unexpected write attempt of the SAES_DINR register is ignored, setting the WRERRF and the RWEIF flags. WRERRF is triggered during the computation phase or during the output phase.

Note: Unless otherwise indicated, SAES is not disabled when WRERRF rises and it continues processing.

An interrupt is generated if the RWEIE bit is set. For more details, refer to *Section 48.5: SAES interrupts*.

The WRERRF and RWEIF flags are cleared by setting the RWEIF bit of the SAES_ICR register.

Key error interrupt flag (KEIF)

There are multiple sources of errors that set the KEIF flag of the SAES_ISR register and clear the KEYVALID bit of the SAES_SR register:

- **Key protection error:** while KEYVALID is set, if KEYPROT is set or KEYSEL[2:0] is different from zero, this error is triggered when an application executing in a security context different from the one used to load the key (that is, different security or Compartment ID attribute) accesses the SAES peripheral.
- **Key writing sequence error:** triggered upon detecting an incorrect sequence of writing key registers. See *Section 48.4.17: SAES key registers* for details.
- **Key sharing size mismatch error:** triggered when WRAPEN is set, WRAPID[2:0] is greater than 0x0, and KEYSIZE[1:0] in CRYP1 or CRYP2 peripheral does not match KEYSIZE[1:0] in the SAES peripheral.
- **Key sharing error:** triggered upon a failure to transfer the SAES shared key to the CRYP1 or CRYP2 peripheral. See *Section 48.4.15: Wrapped key usage outside the SAES peripheral* for details.
- **Hardware secret key loading error:** triggered upon failing to load DHUK or BHK into SAES. The corresponding KEYSEL[2:0] value is not functional.

The KEIF flag is cleared with corresponding bit of the SAES_ICR register. An interrupt is generated if the KEIE bit of the SAES_IER register is set. For more details, refer to *Section 48.5: SAES interrupts*. Activating interrupts on key errors is recommended, for security reason.

Upon a key selection error, use IPRST to clear KEIF and the source of error (specific value of KEYSEL[2:0] and KEYSIZE[1:0]). Persisting problems may require a power-on reset.

Upon a key sharing error, reset both CRYP1 (or CRYP2, depending on the key sharing target) and SAES peripherals through the IPRST bit of their corresponding control register, then restart the key sharing sequence.

Note: For any key error, clear KEIF flag prior to disabling and reconfiguring SAES. Clearing KEIF without updating KEYSEL[2:0] and KEYSIZE[1:0] restarts the key loading process.

RNG error interrupt flag (RNGEIF)

SAES fetches random numbers from the RNG peripheral automatically after an IP reset triggered in the RCC. SAES cannot be used when RNGEIF is set.

An error detected while fetching a random number from RNG peripheral (due to, for example, bad entropy) sets the RNGEIF flag of the SAES_ISR register. The flag is cleared by setting the corresponding bit of the SAES_ICR register. An interrupt is generated if the RNGEIE bit of the SAES_IER register is set. For more details, refer to *Section 48.5: SAES interrupts*.

Upon an RNG error:

- Verify that the RNG peripheral is properly initialized, its AHB clock is enabled and no noise source (or seed) error is pending in this peripheral.
- Clear RNGEIF or reset the peripheral by setting IPRST. The clearance of the BUSY flag then indicates the completion of the random number fetch from RNG.

Note: To avoid RNGEIF errors, it is recommended to activate the RNG AHB clock each time SAES AHB clock is activated.

About DPA errors

An unexpected error triggers an SAES internal tamper event in the TAMP peripheral, and stops any processing in SAES.

To resume normal operation, reset the SAES peripheral through RCC or global reset.

48.5 SAES interrupts

There are multiple individual maskable interrupt sources generated by the SAES peripheral to signal the following events:

- Computation complete (CCF)
- Read error (RDERRF)
- Wwrite error (WRERRF)
- Key error (KEIF)
- RNG error (RNGEIF)

See *Section 48.4.19: SAES error management* for details on SAES errors.

These sources are combined into a common interrupt signal from the SAES peripheral that connects to the Cortex® CPU interrupt controller. The application can enable or disable SAES interrupt sources individually by setting/clearing the corresponding enable bit of the SAES_IER register.

The status of the individual maskable interrupt sources can be read from the SAES_ISR register. They are cleared by setting the corresponding bit of the SAES_ICR register.

Table 448 gives a summary of the available features.

Table 448. SAES interrupt requests

Interrupt acronym	Interrupt event	Event flag	Enable bit	Interrupt clear method
SAES	computation complete flag	CCF	CCFIE	set CCF(1)
	read error flag	RWEIF, RDERRF(2)	RWEIE	set RWEIF(1)
	write error flag	RWEIF, WRERRF(2)		
	key error flag	KEIF	KEIE	set KEIF(1)
	RNG error flag	RNGEIF	RNGEIE	set RNGEIF(1)

1. Bit of the SAES_ICR register.
2. Flags in the SAES_SR register. Setting either of them also sets the RWEIF flag in the SAES_ISR register.

48.6 SAES DMA requests

The SAES peripheral provides an interface to connect to the DMA (direct memory access) controller. The DMA operation is controlled through the DMAINEN and DMAOUTEN bits of the SAES_CR register. When key derivation is selected (MODE[1:0] is at 0x1), setting those bits has no effect.

SAES only supports single DMA requests. Suspend and resume operations are not supported in DMA mode.

Detailed usage of DMA with SAES can be found in section *Appending data via DMA*.

48.6.1 Data input using DMA

Setting DMAINEN enables DMA writing into SAES. SAES then initiates, during the input phase, a set of single DMA requests for each 16-byte data block to write to the SAES_DINR register (quadruple 32-bit word, MSB first).

Note: According to the algorithm and the mode selected, special padding / ciphertext stealing might be required (see Section 48.4.7).

48.6.2 Data output using DMA

Setting DMAOUTEN enables DMA reading from SAES. SAES then initiates, during the output phase, a set of single DMA requests for each 16-byte data block to read from the SAES_DOUTR register (quadruple 32-bit word, MSB first).

After the output phase, at the end of processing of a 16-byte data block, SAES switches automatically to a new input phase for the next data block, if any.

In DMA mode, the CCF flag has no use because the reading of the SAES_DOUTR register is managed by DMA automatically at the end of the computation phase.

Note: According to the message size, extra bytes might need to be discarded by the application in the last block.

48.6.3 Stopping DMA transfers

All DMA request signals are deasserted when SAES is disabled (EN cleared) or the DMA enable bit (DMAINEN for input data, DMAOUTEN for output data) is cleared.

48.7 SAES processing latency

The following tables provide the 16-byte data block processing latency per operating mode, given in SAES AHB clock cycles.

Table 449. Processing latency for ECB, CBC and CTR

Key size	Mode of operation	Chaining algorithm	Clock cycles(1)
128-bit	Encryption or decryption(2)	ECB, CBC, CTR	**82**
	Key preparation	-	**66**
192-bit	Encryption or decryption(2)	ECB, CBC, CTR	**90**
	Key preparation	-	**82**

Table 449. Processing latency for ECB, CBC and CTR (continued)

Key size	Mode of operation	Chaining algorithm	Clock cycles(1)
256-bit	Encryption or decryption(2)	ECB, CBC, CTR	**102**
	Key preparation	-	**88**

1. SAES kernel clock.
2. Excluding key preparation time (ECB and CBC only).

Table 450. Processing latency for GCM and CCM

Key size	Mode of operation	Chaining algorithm	Initialization phase	Header phase(1)	Payload phase(1)(2)	Final phase(1)
128-bit	Mode 1: Encryption/ Mode 3: Decryption	GCM	**103**	**73**	**82**(3)	**82**
		CCM	**93**	**86**	**175**	**88**
192-bit	Mode 1: Encryption/ Mode 3: Decryption	GCM	**111**	**73**	**90**(3)	**90**
		CCM	**101**	**94**	**191**	**96**
256-bit	Mode 1: Encryption/ Mode 3: Decryption	GCM	**123**	**73**	**102**(3)	**102**
		CCM	**113**	**106**	**215**	**108**

1. Data insertion can include wait states forced by SAES on the AHB bus (maximum 3 cycles, typical 1 cycle).
2. Value given for saes_hclk = saes_ker_ck.
3. For the last block processing time is increased to 286 cycles.

48.8 SAES registers

The registers are accessible through 32-bit word single accesses only. Other access types generate an AHB error, and other than 32-bit writes may corrupt the register content.

48.8.1 SAES control register (SAES_CR)

Address offset: 0x00

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IPRST	KEYSEL[2:0]			WRAPID[2:0]			WRAPEN	NPBLB[3:0]				KEYPROT	KEYSIZE[1:0]		Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	CPHASE[1:0]		DMAOUTEN	DMAINEN	Res.	Res.	CHMOD[3:0]				MODE[1:0]		DATATYPE[1:0]		EN
	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **IPRST**: SAES software reset

Setting this bit resets the SAES peripheral, putting all registers to their default values, except the IPRST bit itself, and the RNGEIF bit. Hence, any key-relative data is lost. For this reason, it is recommended to set the bit before handing over the SAES to a less secure application.

The bit must be low while writing any configuration registers. After setting this bit, the application must clear it when BUSY clears in SAES_SR (IPRST clear is ignored otherwise).

Bits 30:28 **KEYSEL[2:0]**: Key selection

The bitfield defines the source of the key information to use in the AES cryptographic core.

0x0: Software key, loaded in key registers SAES_KEYx

0x1: Derived hardware unique key (DHUK)

0x2: Boot hardware key (BHK)

0x4: XOR of DHUK and BHK

Other: Reserved (if used, unfreeze SAES with IPRST)

When KEYSEL[2:0] is different from zero, selected key value is available in key registers when BUSY is cleared and KEYVALID set in the SAES_SR register. Otherwise, the key error flag KEIF is set. Repeated writing of KEYSEL[2:0] with the same non-zero value only triggers the loading of DHUK or BHK when KEYVALID clears.

When the application software changes the key selection by writing the KEYSEL[2:0] bitfield, the key registers are immediately erased and the KEYVALID flag cleared.

At the end of the decryption process, KEYSEL[2:0] is cleared if WRAPEN is set.

With the bitfield value other than zero and KEYVALID set, the application cannot transfer the ownership of SAES with a loaded key to an application running in another security context (such as secure, nonsecure, specific CPU). More specifically, when security or Compartment ID of an access to any register does not match the information recorded by SAES, the KEIF flag is set.

Attempts to write the bitfield are ignored when the BUSY flag of SAES_SR register is set, as well as when the EN bit of the SAES_CR register is set before the write access and it is not cleared by that write access.

Bits 27:25 **WRAPID[2:0]**: Wrap ID

This bitfield defines, at the end of a decryption process with WRAPEN set, which target can use the key stored in SAES key registers.

0x0: The SAES itself

0x1: The CRYP1 peripheral, through the key bus

0x2: The CRYP2 peripheral, through the key bus

Other: Reserved (do not use)

When WRAPEN is set and WRAPID is different from zero, the SAES key registers are shared with the peripheral selected with this bitfield after a successful decryption process. This sharing ends when either WRAPEN or KEYVALID is cleared. Changing this bitfield value when WRAPEN and KEYVALID are set triggers a key error (KEIF set in SAES_ISR), with KEYVALID automatically cleared.

Attempts to write the bitfield are ignored when BUSY is set, as well as when EN is set before the write access and it is not cleared by that write access.

Bit 24 **WRAPEN**: Wrap enable

Set this bit when manipulating wrapped (or encrypted) keys.

0: Normal key. The key registers are freely usable and no specific use or protection applies to the SAES_DINR and SAES_DOUTR registers.

1: Wrapped key. When a decryption is selected, read-as-zero SAES_DOUTR register is automatically loaded into the SAES key registers, after a successful decryption process.

When WRAPEN is set WRAPID[2:0] and KEYSIZE[1:0] must be properly initialized.

When WRAPEN is set any attempt to configure the SAES peripheral for use by an application belonging to a different security domain (such as secure or nonsecure, other CPU) results in automatic key erasure and setting of the KEIF flag.

Attempts to write this bit are ignored when BUSY is set, as well as when EN is set before the write access and it is not cleared by that write access.

Bits 23:20 **NPBLB[3:0]:** Number of padding bytes in last block

This padding information must be filled by software before processing the last block of GCM payload encryption or CCM payload decryption, otherwise authentication tag computation is incorrect.

0x0: All bytes are valid (no padding)

0x1: Padding for the last LSB byte

...

0xF: Padding for the 15 LSB bytes of last block.

Bit 19 **KEYPROT**: Key protection

When set, hardware-based key protection is enabled.

0: When KEYVALID is set and KEYSEL[2:0] is 0x0, the application can transfer the ownership of SAES, with its loaded key, to an application running in another security context (such as nonsecure, secure, specific CPU).

1: When KEYVALID is set, key error flag (KEIF) is set when an access to any registers is detected, this access having a security context (for example, secure, nonsecure, Compartment ID) that does not match the one of the application that loaded the key.

Attempts to write the bit are ignored when BUSY is set, as well as when EN is set before the write access and it is not cleared by that write access.

Bits 18:17 **KEYSIZE[1:0]**: Key size

This bitfield defines the key length in bits of the key used by SAES.

0x0: 128-bit

0x1: 192-bit

0x2: 256-bit

0x3: Reserved

When WRAPEN is set, KEYSIZE[1:0] also defines the length of the key to encrypt or decrypt.

Attempts to write the bit are ignored when BUSY is set, as well as when the EN is set before the write access and it is not cleared by that write access.

Bits 16:15 Reserved, must be kept at reset value.

Bits 14:13 **CPHASE[1:0]:** Chaining phase

This bitfield selects the phase, applicable only with GCM, GMAC or CCM chaining modes. It is ignored when ECB, CBC or CTR is selected, and WRAPEN is set.

0x0: Initialization phase

0x1: Header phase

0x2: Payload phase

0x3: Final phase

Bit 12 **DMAOUTEN**: DMA output enable

This bit enables automatic generation of DMA requests during the data phase, for outgoing data transfers from SAES via DMA.

0: Disable

1: Enable

Setting this bit is ignored when MODE[1:0] is at 0x1 (key derivation).

Bit 11 **DMAINEN**: DMA input enable

This bit enables automatic generation of DMA requests during the data phase, for incoming data transfers to SAES via DMA.

0: Disable

1: Enable

Setting this bit is ignored when MODE[1:0] is at 0x1 (key derivation).

Bits 10:9 Reserved, must be kept at reset value.

Bits 8:5 **CHMOD[3:0]**: Chaining mode

This bitfield selects the AES chaining mode in SAES.

0x0: Electronic codebook (ECB)

0x1: Cipher-Block Chaining (CBC)

0x2: Counter Mode (CTR)

0x3: Galois Counter Mode (GCM) and Galois Message Authentication Code (GMAC)

0x4: Counter with CBC-MAC (CCM)

Other: Reserved

Attempts to write the bitfield are ignored when the BUSY bit of the SAES_SR register is set, as well as when the EN bit of this register is set before the write access and it is not cleared by that write access.

Bits 4:3 **MODE[1:0]**: Operating mode

This bitfield selects the SAES operating mode:

0x0: Encryption

0x1: Key derivation (or key preparation), for ECB/CBC decryption only

0x2: Decryption

0x3: Reserved

Attempts to write the bitfield are ignored when the BUSY bit of the SAES_SR register is set, as well as when the EN bit of this register is set before the write access and it is not cleared by that write access.

Bits 2:1 **DATATYPE[1:0]**: Data type

This bitfield defines the format of data written to the SAES_DINR register or read from the SAES_DOUTR register, through selecting the mode of data swapping. This swapping is defined in *Section 48.4.16: SAES data registers and data swapping*.

0x0: No swapping (32-bit data)

0x1: Half-word swapping (16-bit data)

0x2: Byte swapping (8-bit data)

0x3: Bit-level swapping

Attempts to write the bitfield are ignored when BUSY is set, as well as when EN is set before the write access and it is not cleared by that write access.

Bit 0 **EN**: Enable

This bit enables/disables the SAES peripheral.

0: Disable

1: Enable

At any moment, clearing then setting the bit re-initializes the SAES peripheral. When the WRAPEN and the BUSY bits are set, IPRST bit is used instead.

This bit is automatically cleared by hardware upon the completion of the key preparation (MODE[1:0] at 0x1) and upon the completion of GCM/GMAC/CCM initialization phase.

The bit cannot be set as long as KEYVALID is cleared. It cannot be set either when SAES is in one of the following configurations:

– WRAPEN set, CHMOD[3:0] at 0x3 (GCM)

– WRAPEN set, CHMOD[3:0] at 0x2 (CTR), and MODE[1:0] at 0x0 (encryption).

48.8.2 SAES status register (SAES_SR)

Address offset: 0x04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	KEYVALID	WRERRF	RDERRF	BUSY	Res.	Res.	Res.	Res.
								r	r	r	r				

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **KEYVALID**: Key valid flag

This bit is set by hardware when the key of size defined by KEYSIZE[1:0] is loaded in SAES_KEYRx key registers.

0: Key not valid

1: Key valid

The EN bit can only be set when KEYVALID is set.

In normal mode when KEYSEL[2:0] is at zero, the key must be written to the key registers in the correct sequence, otherwise the KEIF flag is set and KEYVALID remains cleared.

When KEYSEL[2:0] is different from zero, the BUSY flag is automatically set by SAES. When the key is loaded successfully, BUSY is cleared and KEYVALID set. Upon an error, KEIF is set, BUSY cleared and KEYVALID remains cleared.

If set, KEIF must be cleared through the SAES_ICR register, otherwise KEYVALID cannot be set. See the KEIF flag description for more details.

For further information on key loading, refer to *Section 48.4.17: SAES key registers*.

Bit 6 **WRERRF**: Write error flag

This bit is set when an unexpected write to the SAES_DINR register occurred. When set WRERRF bit has no impact on the SAES operations.

0: No error

1: Unexpected write to SAES_DINR register occurred during computation or data output phase.

The flag setting generates an interrupt if the RWEIE bit of the SAES_IER register is set.

The flag is cleared by setting the RWEIF bit of the SAES_ICR register.

Bit 5 **RDERRF**: Read error flag

This bit is set when an unexpected read to the SAES_DOUTR register occurred. When set RDERRF bit has no impact on the SAES operations.

0: No error

1: Unexpected read to SAES_DOUTR register occurred during computation or data input phase.

The flag setting generates an interrupt if the RWEIE bit of the SAES_IER register is set.

The flag is cleared by setting the RWEIF bit of the SAES_ICR register.

Bit 4 **BUSY:** Busy

This flag indicates whether SAES is idle or busy.

0: Idle

1: Busy

SAES is flagged as idle when disabled (EN = 0) or when the last processing is complete.

SAES is flagged as busy when processing a block data, fetching random number from the RNG, transferring a shared key to the target peripheral, or preparing a key (ECB or CBC decryption only).

The GCM final phase must only be selected when BUSY is low.

Bits 3:0 Reserved, must be kept at reset value.

48.8.3 SAES data input register (SAES_DINR)

Address offset: 0x08

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DIN[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DIN[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **DIN[31:0]**: Data input

A four-fold sequential write to this bitfield during the Input phase results in writing a complete 16-bytes block of input data to the SAES peripheral. From the first to the fourth write, the corresponding data weights are [127:96], [95:64], [63:32], and [31:0]. Upon each write, the data from the 32-bit input buffer are handled by the data swap block according to the DATATYPE[1:0] bitfield, then written into the AES core 16-bytes input buffer.

Reads return zero.

48.8.4 SAES data output register (SAES_DOUTR)

Address offset: 0x0C

Reset value: 0x0000 0000

Read when WRAPEN is set while MODE[1:0] is at 0x2 and EN is set triggers a read error.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DOUT[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DOUT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **DOUT[31:0]**: Data output

This read-only bitfield fetches a 32-bit output buffer. A four-fold sequential read of this bitfield, upon the computation completion (CCF flag set), virtually reads a complete 16-byte block of output data from the SAES peripheral. Before reaching the output buffer, the data produced by the AES core are handled by the data swap block according to the DATATYPE[1:0] bitfield.
Data weights from the first to the fourth read operation are: [127:96], [95:64], [63:32], and [31:0].
Writes are ignored.

48.8.5 SAES key register 0 (SAES_KEYR0)

Address offset: 0x020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
KEY[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
KEY[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **KEY[31:0]**: Cryptographic key, bits [31:0]

These are bits [31:0] of the write-only bitfield KEY[255:0] AES encryption or decryption key, depending on the MODE[1:0] bitfield of the SAES_CR register.
Writes to SAES_KEYRx registers are ignored when SAES is enabled (EN bit set). When KEYSEL[2:0] is different from 0, writes to the key registers are ignored, and the KEIF bit in the SAES_ISR register is set without changing KEYVALID.
With WRAPEN cleared, a special writing sequence is required. In this sequence, any valid write to AES_KEYRx register clears the KEYVALID flag except for the sequence-completing write that sets it. Also refer to the description of the KEYVALID flag in the AES_SR register.

48.8.6 SAES key register 1 (SAES_KEYR1)

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
KEY[47:32]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **KEY[63:32]**: Cryptographic key, bits [63:32]

Refer to the SAES_KEYR0 register for description of the KEY[255:0] bitfield and for information relative to writing SAES_KEYRx registers.

48.8.7 SAES key register 2 (SAES_KEYR2)

Address offset: 0x028

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
KEY[95:80]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
KEY[79:64]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **KEY[95:64]**: Cryptographic key, bits [95:64]

Refer to the SAES_KEYR0 register for description of the KEY[255:0] bitfield and for information relative to writing SAES_KEYRx registers.

48.8.8 SAES key register 3 (SAES_KEYR3)

Address offset: 0x02C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
KEY[127:112]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
KEY[111:96]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **KEY[127:96]**: Cryptographic key, bits [127:96]

Refer to the SAES_KEYR0 register for description of the KEY[255:0] bitfield and for information relative to writing SAES_KEYRx registers.

48.8.9 SAES key register 4 (SAES_KEYR4)

Address offset: 0x030

Reset value: 0x0000 0000

Bits 31:0 **KEY[255:224]**: Cryptographic key, bits [255:224]

Refer to the SAES_KEYR0 register for description of the KEY[255:0] bitfield and for information relative to writing SAES_KEYRx registers.

48.8.13 SAES initialization vector register 0 (SAES_IVR0)

Address offset: 0x040

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IVI[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IVI[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **IVI[31:0]**: Initialization vector input, bits [31:0]

SAES_IVRx registers store the 128-bit initialization vector or the nonce, depending on the chaining mode selected. This value is updated by hardware after each computation round (when applicable). Write to this register is ignored when EN bit is set in SAES_CR register.

48.8.14 SAES initialization vector register 1 (SAES_IVR1)

Address offset: 0x044

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

IVI[111:96]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **IVI[127:96]**: Initialization vector input, bits [127:96]
Refer to the SAES_IVR0 register for description of the IVI[128:0] bitfield.

48.8.17 SAES context swap registers (SAES_SUSPRx)

Address offset: 0x050 + x * 0x4, (x = 0 to 7)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SUSPx[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SUSPx[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SUSPx[31:0]**: Context swap data x

SAES_SUSPRx registers contain the complete internal register states of the SAES when the CCM processing of the current task is suspended to process a higher-priority task. Refer to *Section 48.4.8: SAES suspend and resume operations* for more details.

Clearing EN bit in SAES_CR sets this register to zero.

SAES_SUSPRx registers are not used in other chaining modes than CCM, or when SAES is used in DMA mode.

48.8.18 SAES interrupt enable register (SAES_IER)

Address offset: 0x300

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RNGEIE	KEIE	RWEIE	CCFIE	Res.	Res.
										rw	rw	rw	rw		

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **RNGEIE:** RNG error interrupt enable

This bit enables or disables (masks) the SAES interrupt generation when RNGEIF (RNG error flag) is set.

0: Disabled (masked)

1: Enabled (not masked)

Bit 4 **KEIE:** Key error interrupt enable

This bit enables or disables (masks) the SAES interrupt generation when KEIF (key error flag) is set.

0: Disabled (masked)

1: Enabled (not masked)

Bit 3 **RWEIE:** Read or write error interrupt enable

This bit enables or disables (masks) the SAES interrupt generation when RWEIF (Read or write error flag) is set.

0: Disabled (masked)

1: Enabled (not masked)

Bit 2 **CCFIE:** Computation complete flag interrupt enable

This bit enables or disables (masks) the SAES interrupt generation when CCF (computation complete flag) is set.

0: Disabled (masked)

1: Enabled (not masked)

Bits 1:0 Reserved, must be kept at reset value.

48.8.19 SAES interrupt status register (SAES_ISR)

Address offset: 0x304

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RNGEIF	KEIF	RWEIF	CCF	Res.	Res.
										r	r	r	r		

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **RNGEIF:** RNG error interrupt flag

This read-only bit is set by hardware when an error is detected on RNG bus interface (for example bad entropy).

0: RNG bus is functional

1: Error detected on RNG bus interface (random seed fetching error)

The flag setting generates an interrupt if the RNGEIE bit of the SAES_IER register is set.

The flag is cleared by setting the corresponding bit of the SAES_ICR register. The clear action triggers the reload of a new random number from the RNG peripheral.

Bit 4 **KEIF:** Key error interrupt flag

This read-only bit is set by hardware when the key information fails to load into key registers or when the key register use is forbidden.

0: No key error detected

1: Key information failed to load into key registers or the key register use is forbidden

The flag setting generates an interrupt if the KEIE bit of the SAES_IER register is set. It also clears the key registers and the KEYVALID flag in SAES_SR.

The flag is cleared by setting the corresponding bit of the SAES_ICR register.

KEIF is raised upon any of the following events:

–SAES fails to load the DHUK (KEYSEL[2:0] is 0x1 or 0x4).

–SAES fails to load the BHK (KEYSEL[2:0] is 0x2 or 0x4).

–CRYP1 or CRYP2 fails to load the key shared by the SAES peripheral (WRAPEN set and WRAPID is 0x1 or 0x2, respectively).

–KEYVALID is set and either KEYPROT is set or KEYSEL[2:0] is other than 0x0. The security context of the application that loads the key (secure or nonsecure) does not match the security attribute of the access to SAES_CR or SAES_DOUT. In this case, KEYVALID and EN bits are cleared.

–SAES_KEYRx register write does not respect the correct order. (For KEYSIZE[1:0] at 0x0, SAES_KEYR0 then SAES_KEYR1 then SAES_KEYR2 then SAES_KEYR3 register, or the reverse. For KEYSIZE[1:0] at 0x2, SAES_KEYR0 then SAES_KEYR1 then SAES_KEYR2 then SAES_KEYR3 then SAES_KEYR4 then SAES_KEYR5 then SAES_KEYR6 then SAES_KEYR7, or the reverse. For KEYSIZE[1:0] at 0x1, SAES_KEYR0 then SAES_KEYR1 then SAES_KEYR2 then SAES_KEYR3 then SAES_KEYR4 then SAES_KEYR5, or the reverse).

–When WRAPEN is set, WRAPID[2:0] value is changed after KEYVALID is set.

KEIF must be cleared by the application software, otherwise KEYVALID cannot be set.

Bit 3 **RWEIF:** Read or write error interrupt flag

This read-only bit is set by hardware when a RDERRF or a WRERRF error flag is set in the SAES_SR register.

0: No read or write error detected

1: Read or write error detected

The flag setting generates an interrupt if the RWEIE bit of the SAES_IER register is set.

The flag is cleared by setting the corresponding bit of the SAES_ICR register.

The flags has no meaning when key derivation mode is selected.

See the SAES_SR register for details.

Bit 2 **CCF:** Computation complete flag

This flag indicates whether the computation is complete. It is significant only when the DMAOUTEN bit is cleared, and it may stay high when DMAOUTEN is set.

0: Not complete

1: Complete

The flag setting generates an interrupt if the CCFIE bit of the SAES_IER register is set.

The flag is cleared by setting the corresponding bit of the SAES_ICR register.

Bits 1:0 Reserved, must be kept at reset value.

48.8.20 SAES interrupt clear register (SAES_ICR)

Address offset: 0x308

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RNGEIF	KEIF	RWEIF	CCF	Res.	Res.
										w	w	w	w		

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **RNGEIF:** RNG error interrupt flag clear

Setting this bit clears the RNGEIF status bit in SAES_ISR register.

Bit 4 **KEIF:** Key error interrupt flag clear

Setting this bit clears the KEIF status bit in SAES_ISR register.

Bit 3 **RWEIF:** Read or write error interrupt flag clear

Setting this bit clears the RWEIF status bit of the SAES_ISR register, and clears both RDERRF and WRERRF flags in the SAES_SR register.

Bit 2 **CCF:** Computation complete flag clear

Setting this bit clears the CCF status bit in SAES_ISR register.

Bits 1:0 Reserved, must be kept at reset value.

48.8.21 SAES hardware configuration register (SAES_HWCFGR)

Address offset: 0x3F0

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CFG1[3:0]			
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **CFG1[3:0]**: HW Generic 1
This field returns 0x1.

48.8.22 SAES version register (SAES_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0010

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJREV[3:0]				MINREV[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision
This bitfield returns the SAES peripheral major version (0x1).

Bits 3:0 **MINREV[3:0]**: Minor revision
This bitfield returns the SAES peripheral minor version (0x0).

48.8.23 SAES identification register (SAES_IPIDR)

Address offset: 0x3F8

Reset value: 0x0017 0012

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ID[31:0]**: Identification code of the peripheral
This bitfield returns the identification code of the SAES peripheral.

48.8.24 SAES size ID register (SAES_SIDR)

Address offset: 0x3FC

Reset value: 0xA3C5 DD01

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

SID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **SID[31:0]**: Size identification code
This bitfield returns the size identification code of the SAES peripheral as defined below:
Bits[31:8] = 0xA3C5DD (fixed code)
Bits[7:0] = 0x01 (1 Kbyte address decoding)

48.8.25 SAES register map

Table 451. SAES register map and reset values

49 Cryptographic processor (CRYP)

49.1 CRYP introduction

The cryptographic processor (CRYP) encrypts or decrypts data in compliance with the advanced encryption standard (AES) defined by NIST. It is also fully compliant with the data encryption standard (DES) and Triple-DES (TDES) defined by NIST and ANSI.

CRYP supports ECB, CBC, CTR, GCM, GMAC, and CCM chaining modes for key sizes of 128, 192 or 256 bits in AES mode. In DES/TDES mode it supports ECB and CBC chaining modes for key size of 64-bit (including parity). CRYP has the possibility to load by hardware the key stored in SAES peripheral, under SAES control.

The peripheral supports both single and fixed DMA burst transfers for incoming and outgoing data (two DMA channels are required). CRYP also includes input and output FIFOs for better performance.

49.2 CRYP main features

AES features

- Compliant with NIST FIPS publication 197 *"Advanced encryption standard (AES)"* (November 2001)
- Encryption and decryption with multiple chaining modes:
  - Electronic codebook (ECB) mode
  - Cipher block chaining (CBC) mode
  - Counter (CTR) mode, with a special AES-STS variant
  - Galois counter mode (GCM)
  - Galois message authentication code (GMAC) mode
  - Counter with CBC-MAC (CCM) mode
- 16-byte data block processing, supporting cipher key lengths of 128, 192 and 256 bits
  - 14 or 18 clock cycle latency in ECB mode for processing one 16-byte block with 128-bit or 256-bit key, respectively
- Using dedicated key bus, optional key sharing with side-channel resistant SAES peripheral (shared-key mode), controlled by SAES
- Integrated key scheduler to compute the last round key for ECB/CBC decryption

DES/TDES features

- Compliant with NIST FIPS publication 46-3 *"Data Encryption Standard (DES)" and* ANSI *X9.52 "Triple Data Encryption Algorithm Modes of Operation (TDES)"*
- Encryption and decryption with support of ECB and CBC chaining modes
- 8-byte data block processing, supporting cipher key lengths of 64, 128 and 192 bits (including parity)
  - 16 (respectively 48) clock cycles for processing one 8-byte block of data in DES (respectively TDES) ECB mode
- Direct implementation of simple DES algorithms (a single key K1 is used)

Features common to DES/TDES and AES

- 256-bit of write-only registers for storing the cryptographic keys (eight 32-bit registers)
- 128-bit of registers for storing initialization vectors (four 32-bit registers)
- 32-bit input buffer associated with an internal input FIFO of eight 32-bit words, corresponding to four incoming DES blocks or two AES blocks
- 32-bit output buffer associated with an internal output FIFO of eight 32-bit words, corresponding to four processed DES blocks or two AES blocks
- Automatic data flow control supporting two direct memory access (DMA) channels, one for incoming data, one for processed data. The output FIFO supports both single and burst transfers, while the input FIFO supports only burst transfers.
- Data swapping logic to support 1-, 8-, 16- or 32-bit data
- AMBA AHB target peripheral, accessible through 32-bit word single accesses only. Other access types generates an AHB error, and write accesses are ignored.
- Possibility for software to suspend a message if CRYP needs to process another message with a higher priority, then resume the original message

49.3 CRYP implementation

The devices have one CRYP peripheral, implemented as per the following table.It can use the key generated by the SAES peripheral. For comparison, the SAES peripheral is also included in the table.

Table 452. CRYP versus SAES features

Modes or features(1)	CRYP	SAES
ECB, CBC chaining	X	X
CTR, CCM, GCM chaining	X	X
AES 128-bit ECB encryption in cycles	14	480
DHUK and BHK key selection	-	X
Resistance to side-channel attacks	-	X
Shared key between SAES and CRYP (AES mode only)	X	
Key size in bits (AES mode)	128, 192, 256	128, 256

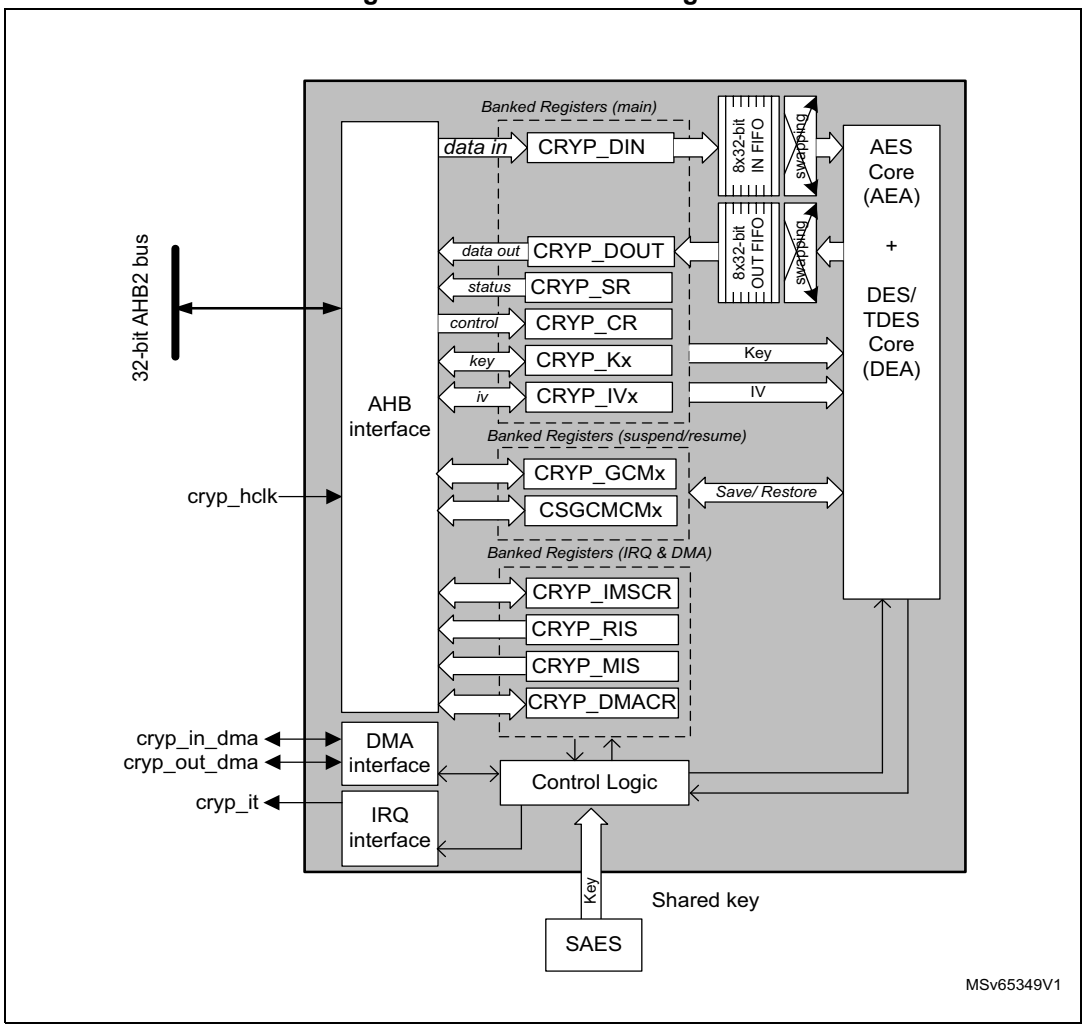
1. X = supported.

49.4 CRYP functional description

49.4.1 CRYP block diagram

The figure below shows the block diagram of the cryptographic processor.

Figure 418. CRYP block diagram



49.4.2 CRYP internal signals

Table 453 describes the user relevant internal signals interfacing the CRYP peripheral.

Table 453. CRYP internal input/output signals

Signal name	Signal type	Description
cryp_hclk	Digital input	AHB clock
cryp_it	Digital output	CRYP interrupt request
cryp_in_dma	Digital input/output	CRYP incoming data FIFO DMA request/ acknowledge
cryp_out_dma	Digital input/output	Output FIFO DMA burst request/ acknowledge (with single request for DES/TDES)

49.4.3 CRYP reset and clocks

The CRYP peripheral is clocked by the AHB clock.

The CRYP has a dedicated reset bit in the RCC.

49.4.4 CRYP symmetric cipher implementation

AES mode

The cryptographic processor (CRYP) is a 32-bit AHB peripheral that encrypts or decrypts 16-byte blocks of data using the advanced encryption standard (AES). It also implements a set of approved AES symmetric key security functions summarized in *Table 454*. Those functions can be certified NIST PUB 140-3.

Table 454. CRYP approved AES symmetric key functions

Operations	Algorithm	Specification	Key size in bits	Chaining modes
Encryption, decryption	AES	FIPS PUB 197 NIST SP800-38A	128, 192, 256	ECB, CBC, CTR
Authenticated encryption or decryption		NIST SP800-38C NIST SP800-38D		GCM, CCM
Cipher-based message authentication code		NIST SP800-38D		GMAC

DES/TDES mode

The cryptographic processor (CRYP) also encrypts or decrypts 8-byte blocks of data using the data encryption standard (DES) and the triple-DES (TDES), as summarized in *Table 455*.

Table 455. CRYP approved DES/TDES symmetric key functions

Operations	Algorithm	Specification	Key size in bits	Chaining modes
Encryption, decryption	DES	FIPS PUB 46-3 ANSI X9.52	64	ECB, CBC
	TDES		64, 128, 192	

CRYP supports three keying options:

- *Keying Option 1, or 3-key TDES: K1, K2 and K3 keys are independent.*
- *Keying Option 2, or 2-key TDES: K1 and K2 are independent and K3 is equal to K1.*
- *Keying Option 3, or 1-key TDES (equivalent to single DES): K1, K2 and K3 are equal.*

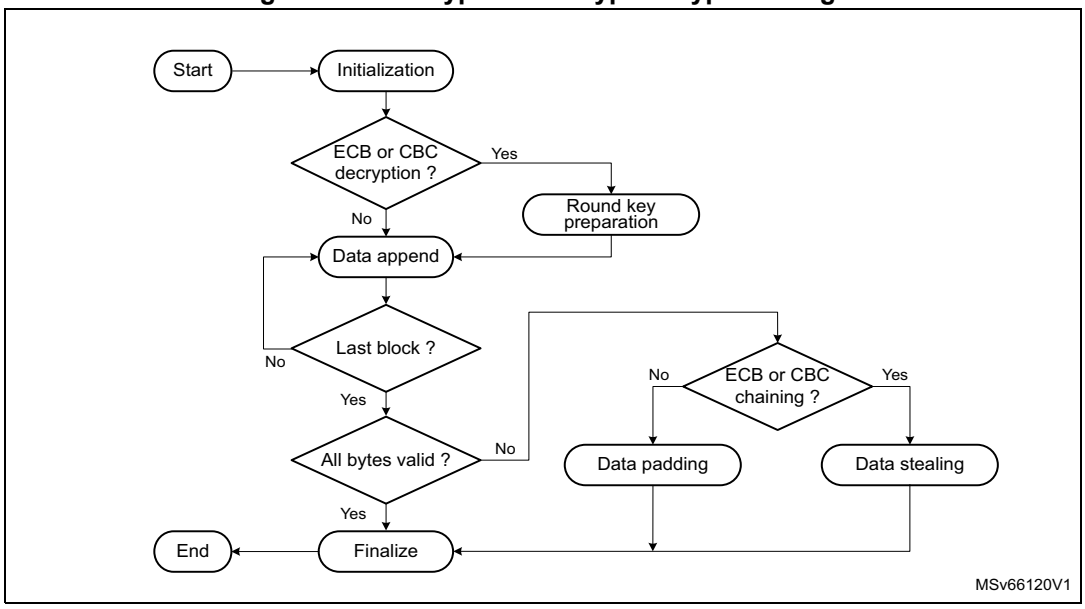
Modes common to AES and DES/TDES

CRYP can be used directly by the CPU, or indirectly using two DMA channels (one for the plaintext, one for the ciphertext).
It is possible to suspend then resume any CRYP processing, following the sequence described in *Section 49.4.8*.

49.4.5 CRYP encryption/ decryption typical usage

The following figure shows a typical operation for encryption or decryption.

Figure 419. Encryption/ decryption typical usage



Initialization

The CRYP peripheral is initialized according to the chaining mode. Refer to *Section 49.4.10: CRYP AES basic chaining modes (ECB, CBC)* and *Section 49.4.11: CRYP counter mode (AES-CTR)* for details.

Data append

This section describes different ways of appending data for processing. For ECB or CBC chaining modes, refer to *Section 49.4.7: CRYP ciphertext stealing and data padding* if the size of data to process is not a multiple of 8 bytes (for DES/TDES) or 16 bytes (for AES). The last block management in these cases is more complex than what is described in this section.

General conditions for data processing

The CRYP is busy and processing data (BUSY flag set) when all the conditions below are met:

- CRYPEN is set in CRYP_CR register.
- There are enough data in the input FIFO (at least two words for the DES/TDES algorithm mode, four words for the AES algorithm mode).
- There is enough free-space in the output FIFO (at least two word locations for DES/TDES, four for AES).

It is possible to clear the CRYPEN bit while BUSY bit is set. In this case the ongoing DES/TDES or AES processing first completes (that is, the word results are written to the output FIFO) before the BUSY bit is cleared by hardware.

When an 8-byte block is being processed in DES/TDES mode, if the output FIFO becomes full and the input FIFO contains at least one new block, then the new block is popped off the input FIFO and the BUSY bit remains high until there is enough space to store this new block into the output FIFO.

Note: If the application needs to suspend a message to process another one with a higher priority, refer to Section 49.4.8: CRYP suspend and resume operations.

Appending data using the CPU in polling mode

This method uses flag polling to control the data append through the following sequence:

1. When KEYVALID is set, enable CRYP by setting the CRYPEN bit of the CRYP_CR register (if not already done).
2. Repeat the following subsequence until the payload is entirely processed:
   a) Write data in the input FIFO (one block or until the FIFO is full).
   b) Repeat until the second last block of data has been processed:
   – Wait until the not-empty flag OFNE is set, then read the output FIFO (one block or until the FIFO is empty).
   – Wait until the not-full flag IFNF is set, then write the input FIFO (one block or until the FIFO is full), except if it is the last block.
   c) The BUSY bit is set automatically by CRYP. At the end of the processing, the BUSY bit is cleared and both FIFOs are empty (input FIFO empty flag IFEM is set, output FIFO not-empty flag OFNE is cleared).
   d) If the next processing block is the last block, pad the data with zeros to obtain a complete block (when applicable), and specify the number of non-valid bytes (using NPBLB[3:0]) in case of AES GCM payload encryption or AES CCM payload decryption (otherwise the tag computation is wrong). This operation must be performed after checking that the BUSY bit is cleared.
3. As the data block just processed is the last block of the message, optionally discard the data that is not part of the message/payload, then disable the CRYP peripheral by clearing CRYPEN.

Note: NPBLB[3:0] bitfield is not used in header phase of AES GCM, GMAC and CCM chaining modes.

Appending data using the CPU in Interrupt mode

The method uses interrupt from the CRYP peripheral to control the data append, through the following sequence:

1. Enable interrupts from CRYP, by setting the INIM and OUTIM bits of the CRYP_IMSCR register.
2. When KEYVALID is set, enable the CRYP peripheral, by setting CRYPEN (if not already done).
3. Handle the data in the CRYP interrupt service routine that manages the input FIFO. Upon each interrupt:
   a) If the next processing block is the last block of the message, pad (when applicable) the data with zeros to obtain a complete block, and specify the number of non-valid bytes (using NPBLB[3:0] bitfield) in case of AES GCM payload encryption or AES CCM payload decryption (otherwise the tag computation is wrong). This operation must be performed after checking that the BUSY bit is cleared. After that load the block into the input FIFO.
   b) If the next processing block is not the last block, load the data into the input FIFO. Application can load only one block (2 words for DES/TDES, 4 words for AES), or load data until the input FIFO is full.
   c) After the last word of data has been written, disable the input FIFO interrupts by clearing the INIM bit (if applicable), then quit the interrupt service routine.
4. Handle the data in the CRYP interrupt service routine that manages the output FIFO. Upon each interrupt:
   a) Read data from the output FIFO. Application can read only one block (2 words for DES/TDES, 4 words for AES), or read data until the FIFO is empty.
   b) When the last word of the message has been read, INIM and BUSY bits are cleared and both FIFOs are empty (IFEM is set, OFNE is cleared). Disable the output FIFO interrupt by clearing the OUTIM bit, and disable the peripheral by clearing the CRYPEN bit.
   c) If the data block just processed is the last block of the message, optionally discard the data that are not part of the message/payload, then quit the interrupt service routine.

Note: The NPBLB[3:0] bitfield is not used in the header phase of AES GCM, GMAC and CCM chaining modes.

Appending data using the DMA

With this method, all the transfers and processing are managed by DMA and CRYP. Proceed as follows:

1. If the last block of the message to process is shorter than 16 bytes, prepare the last four-word data block by padding the remainder of the block with zeros in AES mode. In DES/TDES mode refer to *Section 49.4.7* to complete the last block.
2. Configure the DMA controller so as to transfer the data to process from the memory to the CRYP peripheral input and the processed data from the CRYP peripheral output to the memory, as described in *Section 49.6: CRYP DMA requests*. Configure the DMA controller so as to generate an interrupt on transfer completion. For AES GCM payload encryption or AES CCM payload decryption, the DMA transfer **must not** include the last block. The sequence described in *Appending data using the CPU in polling mode*

must be used instead for this last block, because the NPBLB[3:0] bitfield must be set up before processing the block, for CRYP to compute a correct tag.

3. When KEYVALID is set, enable the CRYP peripheral, by setting CRYPEN (if not already done).
4. Enable DMA requests, by setting DIEN and DOEN of the CRYP_DMACR register.
5. Upon DMA interrupt indicating the transfer completion, get the CRYP-processed data from the memory. Both FIFOs are normally empty and BUSY flag is cleared.

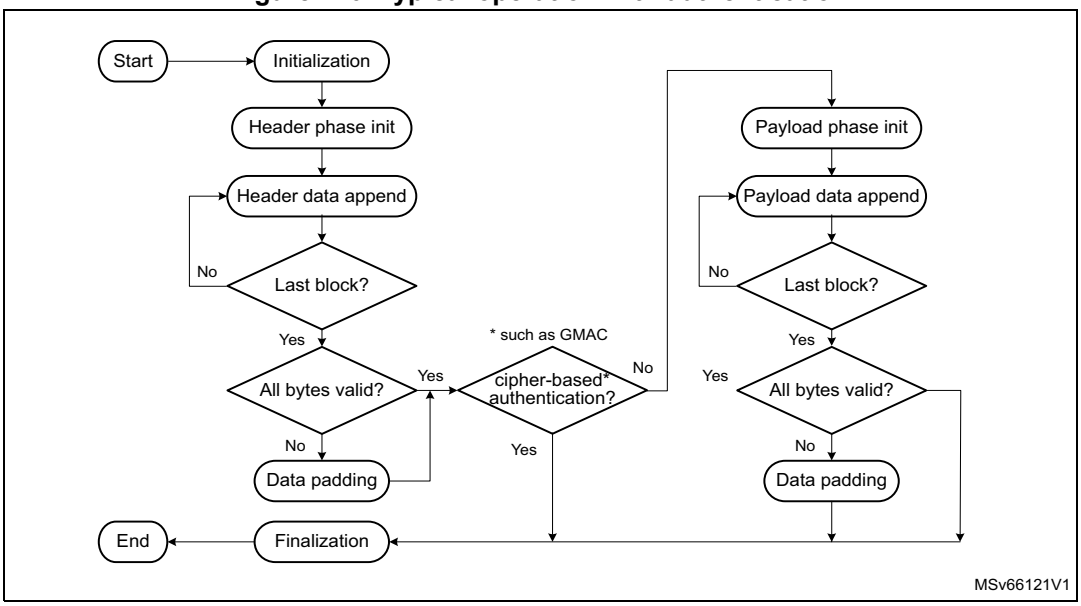
Note: The NPBLB[3:0] bitfield is not used in the header phase of AES GCM, GMAC and CCM chaining modes.

Caution: It is important that the DMA controller empties the CRYP output FIFO before filling up the CRYP input FIFO. To achieve this, the DMA controller must be configured so that the transfer from the CRYP to the memory has a higher priority than the transfer from the memory to the CRYP.

49.4.6 CRYP authenticated encryption, decryption, and cipher-based message authentication

The following figure shows a typical operation for authenticated encryption or decryption, and for cipher-based message authentication. This is not applicable to DES/TDES algorithm.

Figure 420. Typical operation with authentication



Section 49.4.12: CRYP AES Galois/counter mode (GCM) and *Section 49.4.14: CRYP AES Counter with CBC-MAC (CCM)* describe detailed sequences supported by CRYP.

Cipher-based message authentication flow omits the payload phase, as shown in the figure. Detailed sequence supported by CRYP is described in *Section 49.4.13: CRYP AES Galois message authentication code (GMAC)*.

49.4.7 CRYP ciphertext stealing and data padding

When using DES/TDES or AES algorithm in ECB or CBC modes to manage messages the size of which is not a multiple of the block size (8 bytes for DES/TDES, 16 bytes for AES), the application must use ciphertext stealing techniques such as those described in NIST *Special Publication 800-38A, Recommendation for Block Cipher Modes of Operation: Three Variants of Ciphertext Stealing for CBC Mode*. Since CRYP does not implement such techniques, the application must complete the last block of input data using data from the second last block.

Note: Ciphertext stealing techniques are not documented in this reference manual.

Similarly, when the AES algorithm is used in other modes than ECB or CBC, an incomplete input data block (that is, a block with input data shorter than 16 bytes) must be padded with zeros prior to encryption. That is, extra bits must be appended to the trailing end of the data string. After decryption, the extra bits must be discarded. Since CRYP does not implement automatic data padding operation to the last block, the application must follow the recommendation given in this document to manage messages the size of which is not a multiple of 16 bytes.

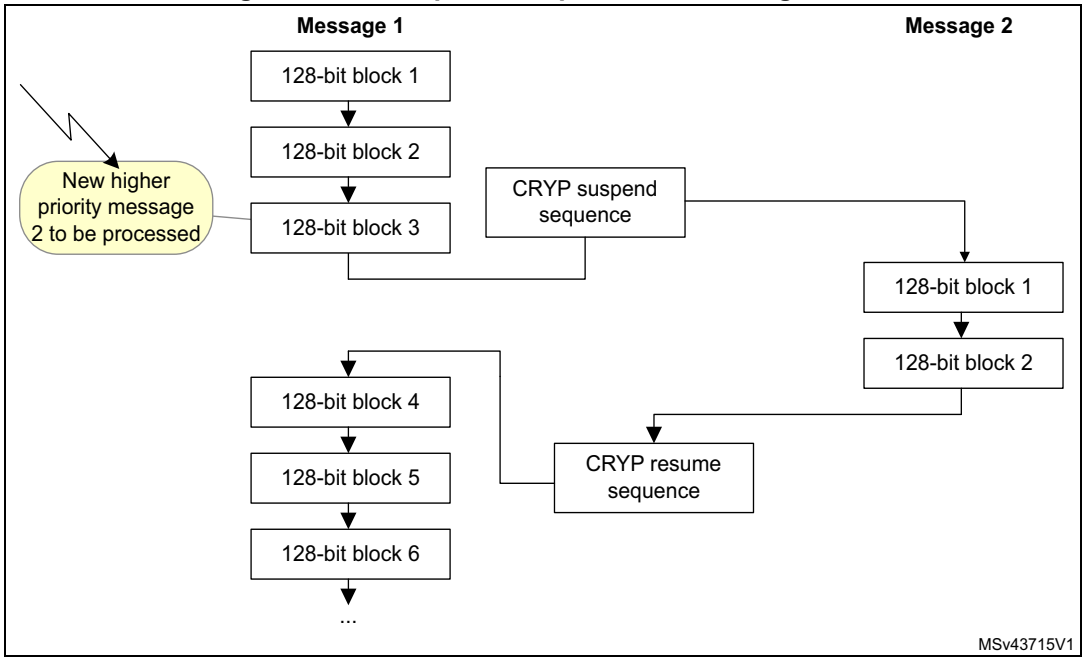
49.4.8 CRYP suspend and resume operations

A message can be suspended to process another message with a higher priority. When the higher-priority message is sent, the suspended message can resume. This applies to both encryption and decryption mode.

Suspend and resume operations do not break the chaining operation. The message processing can resume as soon as CRYP is enabled again, to receive a next data block.

Figure 421 gives an example of suspend and resume operation: message 1 is suspended in order to send a shorter and higher-priority message 2 (AES algorithm).

Figure 421. Example of suspend mode management



Detailed descriptions of suspend and resume operations are provided in the sections dedicated to each chaining mode.

49.4.9 CRYP DES/TDES basic chaining modes (ECB, CBC)

Figure 422 and *Figure 423* describe the TDES electronic codebook (ECB) chaining implementation in encryption and in decryption, respectively. To select this chaining mode, write ALGOMODE[3:0] with 0x0. For DES write ALGOMODE[3:0] with 0x2 (only K1 is used).

Figure 422. DES/TDES ECB encryption

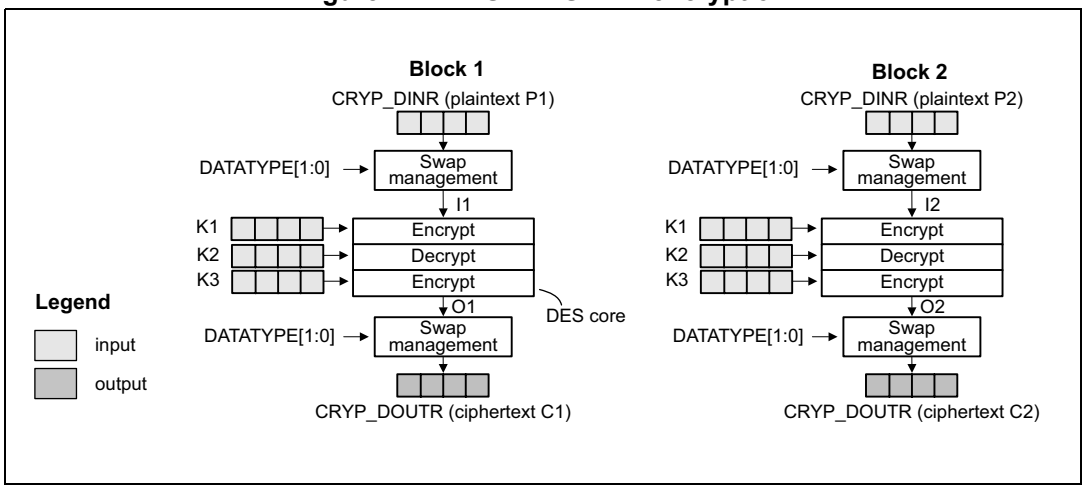


Figure 423. DES/TDES ECB decryption

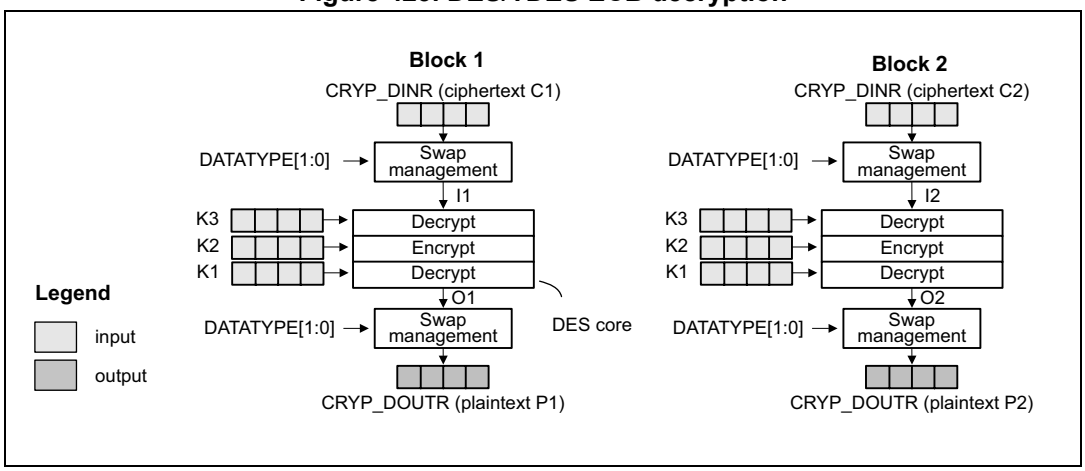

Figure 424 and *Figure 424* describe the TDES cipher block chaining (CBC) implementation in encryption and in decryption, respectively. To select this chaining mode, write ALGOMODE[3:0] with 0x1. For DES write ALGOMODE[3:0] with 0x3 (only K1 is used).

Figure 424. DES/TDES CBC encryption

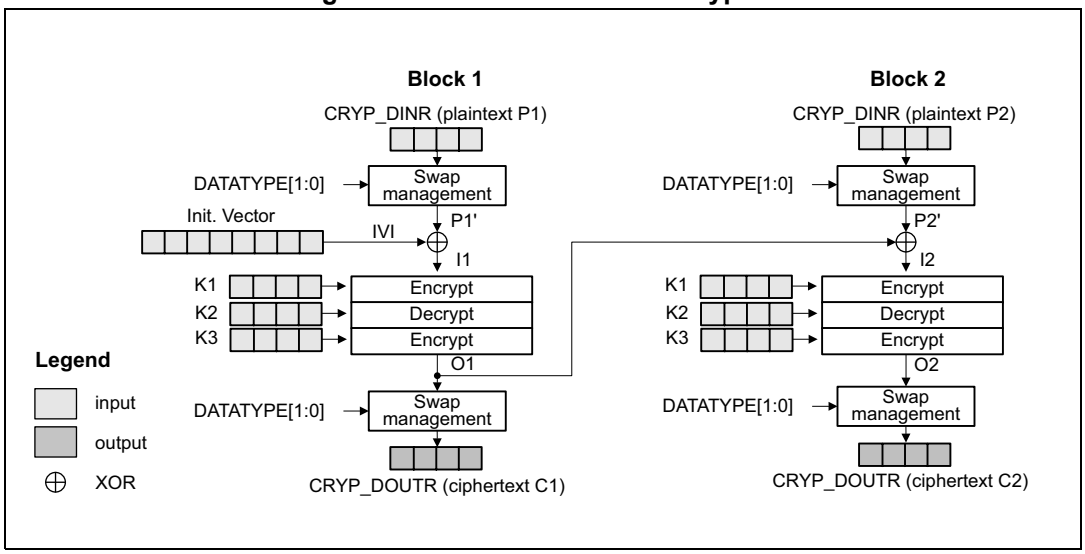

Figure 425. DES/TDES CBC decryption

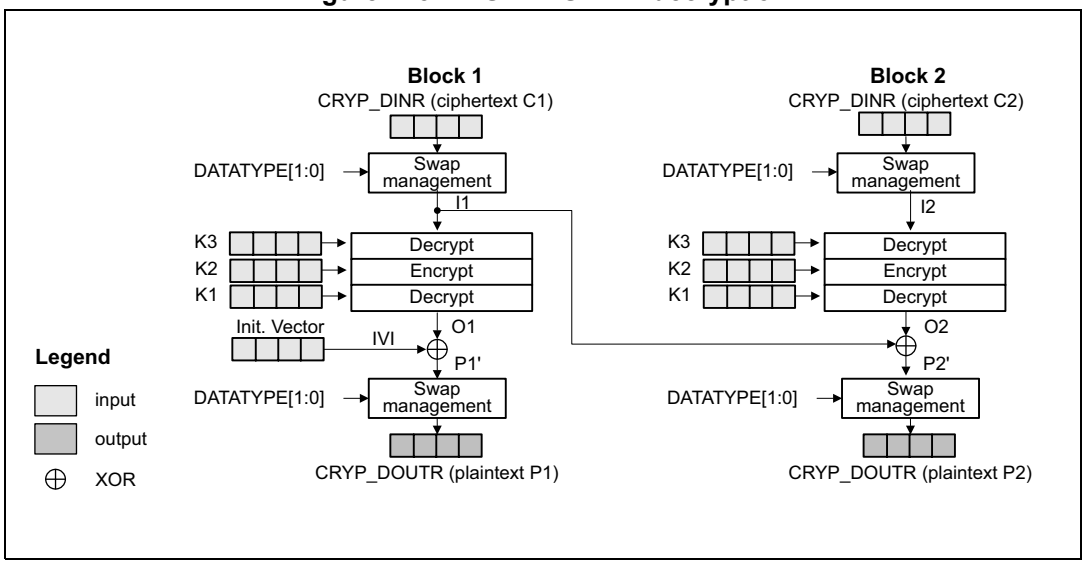

For more details refer to FIPS PUB 46-3 – 1999 and ANSI X9.52 – 1998.

DES/TDES ECB/CBC encryption and decryption process

This process is described in *Section 49.4.5*, with the following sequence of events:

1. Disable the CRYP peripheral, by clearing CRYPEN.
2. Flush the FIFOs by setting FFLUSH.
3. Initialize the CRYP_CR register as follows:
   a) For DES: select ECB or CBC chaining mode (write ALGOMODE[3:0] with 0x2 or 0x3) in encryption or decryption mode (write ALGODIR with 0 or 1).
   For TDES: select ECB or CBC chaining mode (write ALGOMODE[3:0] with 0x0 or 0x1) in encryption or decryption mode (write ALGODIR with 0 or 1).
   b) Configure the data type through DATATYPE[1:0].
   c) Configure the key size through KEYSIZE.
   d) Normal key mode must be selected (KMOD[1:0] cleared).
4. Write the initialization vector into the CRYP_IVxL/R registers if CBC mode is selected in the previous step.
5. Write the key(s) into the CRYP_KxL/R registers.
6. Enable CRYP by setting CRYPEN.
7. Append cleartext data:
   a) If it is the second-last or the last block and the plaintext size of the message is not a multiple of 16 bytes, follow the guidance in *Section 49.4.7*.
   b) Append the cleartext block into CRYP as described in *Section 49.4.5*, then read the CRYP_DOUTR register to save the ciphertext block(s), MSB first.
   c) Repeat the step *b)* until the third-last plaintext block is encrypted. For the last two blocks, follow the steps *a)* and *b)*.
8. Finalize the sequence: disable the CRYP peripheral, by clearing CRYPEN.

Suspend and resume operations in DES/TDES ECB/CBC modes

To suspend the processing of a message, proceed as follows:

1. If DMA is used, stop the CRYP DMA transfers to the input FIFO by clearing the DIEN bit of the CRYP_DMACR register.
2. Wait until both FIFOs are empty (IFEM = 1 and OFNE = 0 in CRYP_SR) and the BUSY bit is cleared. Alternatively, as the input FIFO can contain up to four unprocessed DES/TDES blocks, the application can decide for real-time reason to interrupt the CRYP without waiting for the input FIFO to be empty. In this case, the alternative is the following:
   a) Wait until output FIFO is empty (OFNE = 0).
   b) Read back the data loaded in the input FIFO that have not been processed and save them in the memory until the input FIFO is empty.
3. If DMA is used, stop the CRYP DMA transfers from the output FIFO, by clearing the DOEN bit of the CRYP_DMACR register.
4. Disable the CRYP peripheral, by clearing CRYPEN.
5. Save the CRYP_CR register and clear the key registers if they are not needed, to process the higher-priority message.
6. Save initialization vector registers (only required in CBC mode as the CRYP_IVxL/R registers are altered during the data processing).

7. If DMA is used, save the DMA controller status (pointers for CRYP input and output data transfers, number of remaining bytes, and so on).

Note: Key registers do not need to be saved as the original key value is known by the application.

To resume the processing of a message, proceed as follows:

1. If DMA is used, configure the DMA controller so as to complete the remaining input FIFO and output FIFO transfers.
2. Disable the CRYP peripheral, by clearing CRYPEN.
3. Restore the CRYP_CR register (with correct KEYSIZE), then restore the CRYP_KxL/R registers.
4. Restore the CRYP_IVxL/R registers, using the saved configuration (only required in CBC mode).
5. Optionally, write the data that were saved during context saving into the input FIFO.
6. Enable the CRYP peripheral by setting CRYPEN.
7. If DMA is used, enable CRYP DMA transfers, by setting DIEN and DOEN.

49.4.10 CRYP AES basic chaining modes (ECB, CBC)

ECB is the simplest mode of operation. There are no chaining operations, and no special initialization stage. The message is divided into blocks and each block is encrypted or decrypted separately. When decrypting in ECB mode, a special key scheduling is required before processing the first block.

Figure 426 and *Figure 427* describe the AES electronic codebook (ECB) chaining implementation in encryption and decryption, respectively. To select this chaining mode, write ALGOMODE[3:0] with 0x4.

Figure 426. AES-ECB encryption

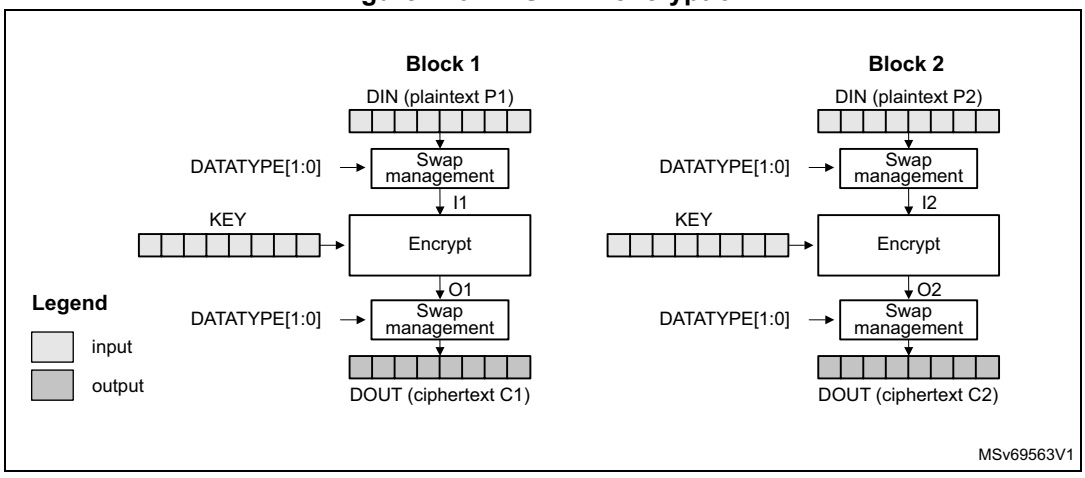

Figure 427. AES-ECB decryption

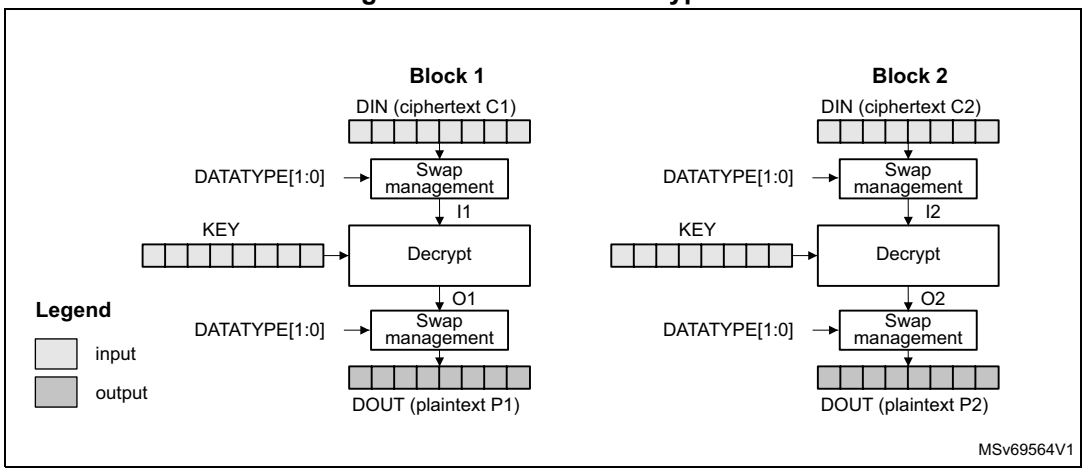

In CBC encryption mode the output of each block chains with the input of the following block. To make each message unique, an initialization vector is used during the first block processing. When decrypting in CBC mode, a special key scheduling is required before processing the first block.

Figure 428 and *Figure 429* describe the AES cipher block chaining (CBC) implementation in encryption and decryption, respectively. To select this chaining mode, write ALGOMODE[3:0] with 0x5.

Figure 428. AES-CBC encryption

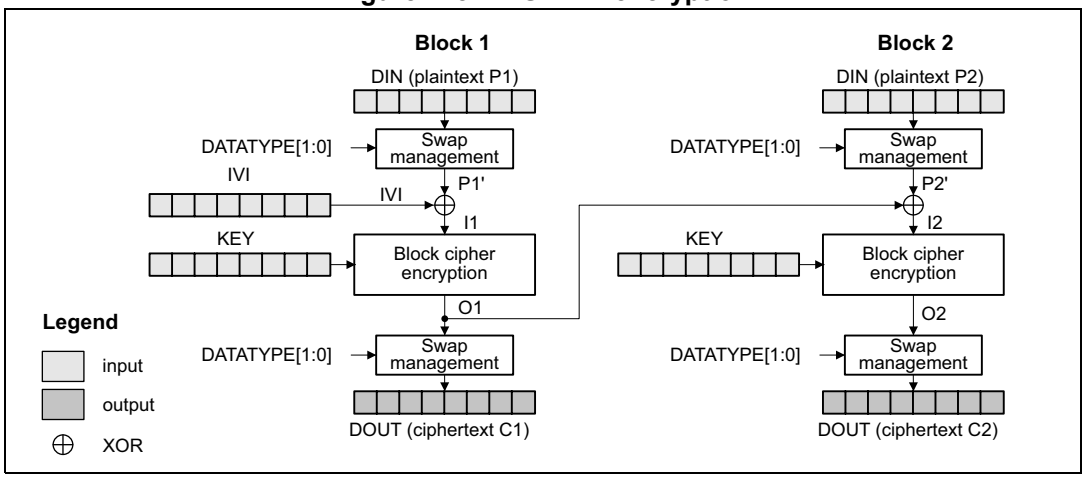

Figure 429. AES-CBC decryption

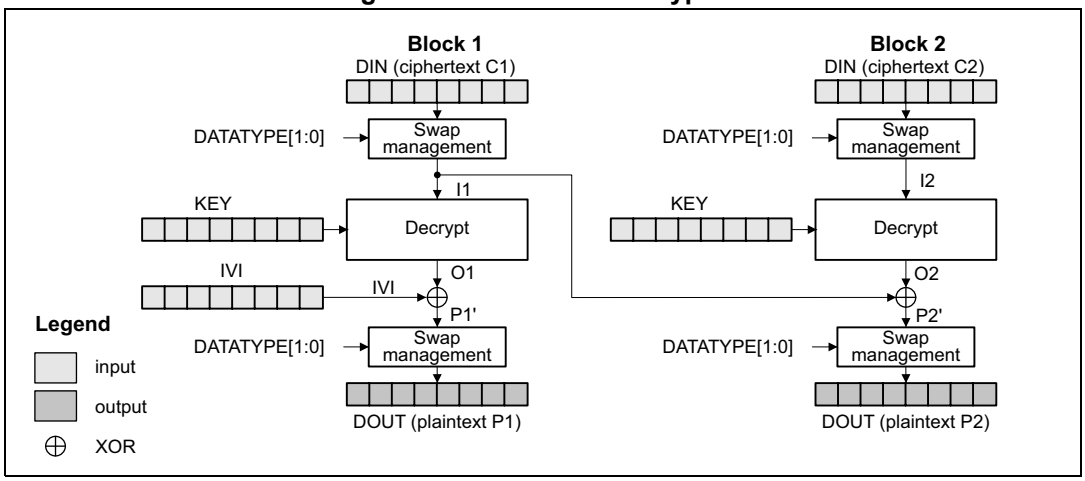


For more details, refer to NIST *Special Publication 800-38A, Recommendation for Block Cipher Modes of Operation.*

AES ECB/CBC encryption process

This process is described in *Section 49.4.5*, with the following sequence of events:

1. Disable the CRYP peripheral by clearing CRYPEN.
2. Flush the FIFOs by setting FFLUSH.
3. Initialize the CRYP_CR register as follows:
   a) Select ECB or CBC chaining mode (write ALGOMODE[3:0] with 0x4 or 0x5) in encryption mode (ALGODIR = 0).
   b) Configure the data type through DATATYPE[1:0].
   c) Configure the key size through KEYSIZE.
   d) Select the key mode using KMOD[1:0]: if the key is coming from SAES peripheral, set KMOD[1:0] to 0x2, else keep it at 0x0.
4. Write the initialization vector into the CRYP_IVxL/R registers if CBC mode is selected in the previous step.
5. Write the key into the CRYP_KxL/R registers if KMOD[1:0] is 0x0. If KMOD[1:0] = 0x2, the key is being transferred from the SAES peripheral (see *Section 49.4.15*).
6. Wait until KEYVALID is set (the key loading completed).
7. Enable CRYP by setting CRYPEN.
8. Append cleartext data:
   a) If it is the second-last or the last block and the plaintext size of the message is not a multiple of 16 bytes, follow the guidance in *Section 49.4.7*.
   b) Append the cleartext block into CRYP as described in *Section 49.4.5*, then read the CRYP_DOUTR register to save the ciphertext block(s), MSB first.
   c) Repeat the step *b)* until the third-last plaintext block is encrypted. For the last two blocks, follow the steps *a)* and *b)*.
9. Finalize the sequence: disable the CRYP peripheral, by clearing CRYPEN.

Note: KEYSIZE and ALGOMODE[3:0] must be written before the key, as explained above.

KMOD[1:0] = 0x2 (shared key) must be written after ALGOMODE[3:0] or at the same time, otherwise KERF is raised if DES or TDES is selected (for example ALGOMODE[3:0] = 0x0).

AES ECB/CBC decryption process

This process is described in *Section 49.4.5*, with the following sequence of events:

1. Disable the CRYP peripheral, by clearing CRYPEN.
2. Flush the FIFOs by setting FFLUSH.
3. Initialize the CRYP_CR register as follows:
   a) Select the key derivation mode (write ALGOMODE[3:0] with 0x7) in encryption mode (ALGODIR= 0).
   b) Configure the data type through DATATYPE[1:0].
   c) Configure the key size through KEYSIZE.
   d) Select the key mode, using KMOD[1:0]: if the key is coming from SAES peripheral set KMOD[1:0] to 0x2, else keep it at 0x0.
4. Write the key into the CRYP_KxL/R registers if KMOD[1:0] is 0x0. If KMOD[1:0]= 0x2, the key is being transferred from the SAES peripheral (see *Section 49.4.15*).
5. Wait until KEYVALID is set (the key loading completed).
6. Enable the CRYP peripheral by setting CRYPEN. The peripheral immediately starts an AES round for key preparation, setting the BUSY bit.
7. Wait until the BUSY bit is cleared, then select ECB or CBC chaining mode (write ALGOMODE[3:0] with 0x4 or 0x5) in decryption mode (ALGODIR = 1). Do not change other parameters.
8. Write the initialization vector into the CRYP_IVxL/R registers if CBC mode is selected in the previous step.
9. Enable CRYP by setting CRYPEN.
10. Append encrypted data:
    a) If it is the second-last or the last block and the ciphertext size of the message is not a multiple of 16 bytes, follow the guidance in *Section 49.4.7*.
    b) Append the ciphertext block into CRYP as described in *Section 49.4.5*, then read the CRYP_DOUTR register to save the cleartext block(s), MSB first.
    c) Repeat the step *b)* until the third-last ciphertext block is decrypted. For the last two blocks, follow the steps *a)* and *b)*.
11. Finalize the sequence: disable the CRYP peripheral, by clearing CRYPEN.

Note: KEYSIZE and ALGOMODE[3:0] must be written before the key, as explained above.

KMOD[1:0] = 0x2 (shared key) must be written after ALGOMODE[3:0] or at the same time, otherwise KERF is raised if DES or TDES is selected (for example ALGOMODE[3:0] = 0x0).

Suspend and resume operations in AES ECB/CBC modes

To suspend the processing of a message, proceed as follows:

1. If DMA is used, stop the CRYP DMA transfers to the input FIFO by clearing the DIEN bit of the CRYP_DMACR register.
2. Wait until both FIFOs are empty (IFEM = 1 and OFNE = 0 in CRYP_SR) and the BUSY bit is cleared.

3. If DMA is used, stop the CRYP DMA transfers from the output FIFO, by clearing the DOEN bit of the CRYP_DMACR register.
4. Disable the CRYP peripheral, by clearing CRYPEN.
5. Save the CRYP_CR register and clear the key registers if they are not needed, to process the higher-priority message.
6. Save initialization vector registers (only required in CBC mode as the CRYP_IVxL/R registers are altered during the data processing).
7. If DMA is used, save the DMA controller status (pointers for CRYP input and output data transfers, number of remaining bytes, and so on).

To resume the processing of a message, proceed as follows:

1. If DMA is used, configure the DMA controller so as to complete the remaining input FIFO and output FIFO transfers.
2. Disable the CRYP peripheral, by clearing CRYPEN.
3. Restore the CRYP_CR register (with correct KEYSIZE), then restore the CRYP_KxL/R registers. If KMOD[1:0] = 0x2 the key needs to be transferred again from the SAES peripheral (see *Section 49.4.15*).
4. Prepare the decryption key as described in *AES ECB/CBC decryption process* (only required for ECB or CBC decryption).
5. Restore the CRYP_IVxL/R registers, using the saved configuration (only required in CBC mode).
6. Enable the CRYP peripheral by setting CRYPEN.
7. If DMA is used, enable CRYP DMA transfers, by setting DIEN and DOEN.

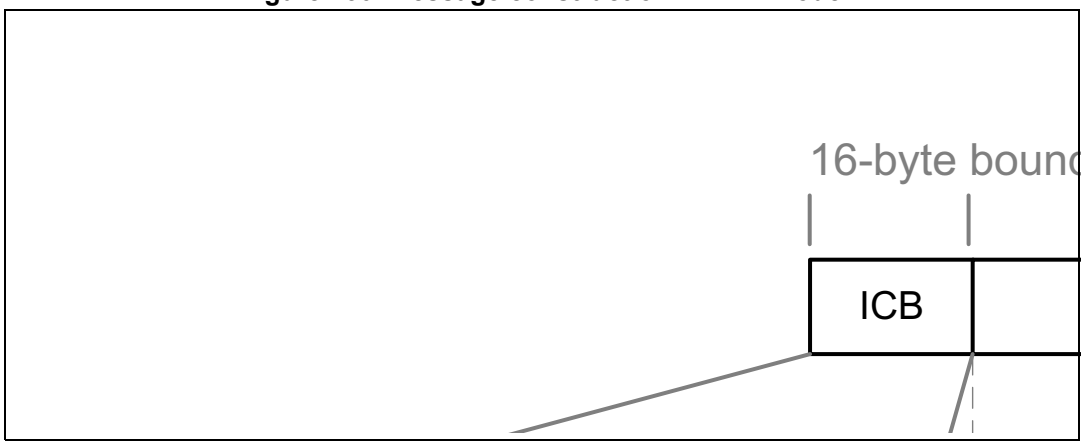
Note: Key registers do not need to be saved as the original key value is known by the application.

49.4.11 CRYP counter mode (AES-CTR)

The CTR mode uses the AES core to generate a key stream. The keys are then XOR-ed with the plaintext to obtain the ciphertext. Unlike with ECB and CBC modes, no key scheduling is required for the CTR decryption since the AES core is always used in encryption mode.

A typical message construction in CTR mode is given in *Figure 430*.

Figure 430. Message construction in CTR mode



The structure of this message is:

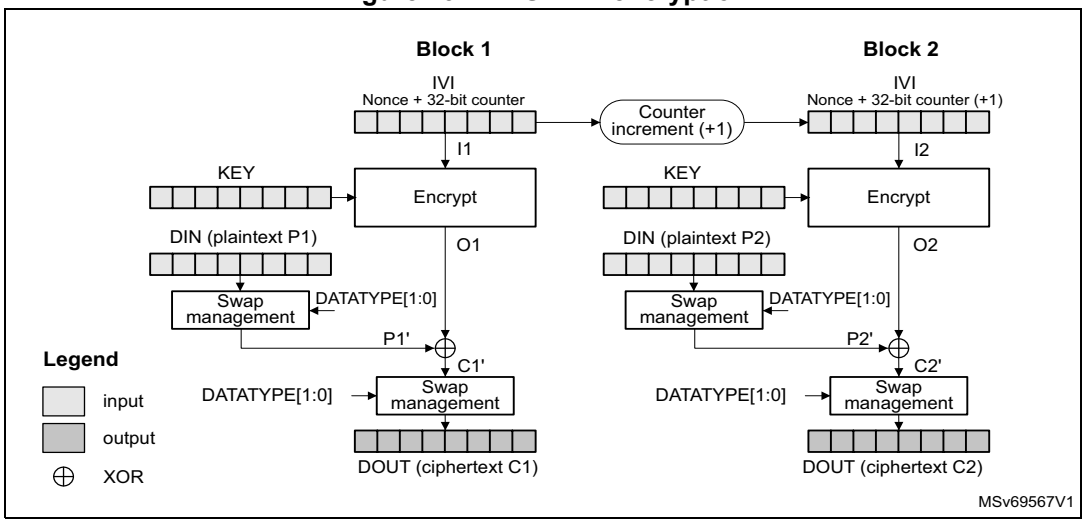
- A 16-byte initial counter block (ICB), composed of two distinct fields:
  - **Initialization vector** (IVI): a 96-bit value that must be unique for each encryption cycle with a given key.
  - **Counter**: a 32-bit big-endian integer that is incremented each time a block processing is complete. The initial value of the counter must be set.
- The plaintext P is encrypted as ciphertext C, with a known length. This length can be non-multiple of 16 bytes, in which case a plaintext padding is required.

For more details, refer to NIST *Special Publication 800-38A, Recommendation for Block Cipher Modes of Operation.*

CTR encryption and decryption

Figure 431 describes the counter (CTR) chaining implementation in the CRYP peripheral (encryption). To select this chaining mode, write ALGOMODE[3:0] with 0x6.

Figure 431. AES-CTR encryption



Initialization vectors in CRYP must be initialized as shown in *Table 456*.

Table 456. Counter mode initialization vector definition

CRYP_IV0LR[31:0]	CRYP_IV0RR[31:0]	CRYP_IV1LR[31:0]	CRYP_IV1RR[31:0]
IVI[127:96]	IVI[95:64]	IVI[63:32]	IVI[31:0] 32-bit counter = 0x1

CTR encryption and decryption process

This process is described in *Section 49.4.5*, with the following sequence of events:

1. Disable the CRYP peripheral, by clearing CRYPEN.
2. Flush the FIFOs by setting FFLUSH.
3. Initialize the CRYP_CR register as follows:
   a) Select CTR chaining mode (write ALGOMODE[3:0] with 0x6) in encryption or decryption mode (write ALGODIR with 0 or 1).
   b) Configure the data type through DATATYPE[1:0].
   c) Configure the key size through KEYSIZE.
   d) Select the key mode, using KMOD[1:0]: if the key is coming from SAES peripheral set KMOD[1:0] to 0x2 else keep it at 0x0.
4. Write the initialization vector into the CRYP_IVxL/R registers according to *Table 456*.
5. Write the key into the CRYP_KxL/R registers if KMOD[1:0] is 0x0. If KMOD[1:0]= 0x2 the key is being transferred from the SAES peripheral (see *Section 49.4.15*).
6. Wait until KEYVALID is set (the key loading completed).
7. Enable CRYP by setting CRYPEN.
8. Append data:
   a) If it is the last block and the plaintext (encryption) or ciphertext (decryption) size in the block is less than 16 bytes, pad the remainder of the block with zeros.
   b) Append the data block into CRYP as described in *Section 49.4.5*, then read the CRYP_DOUTR register to save the resulting block(s), MSB first.
   c) Repeat the step *b)* until the second-last block is processed. For the last block of plaintext (encryption only), follow the steps *a)* and *b)*. For the last block, discard the bits that are not part of the message when the last block is smaller than 16 bytes.
9. Finalize the sequence: disable the CRYP peripheral, by clearing CRYPEN.

Note: KEYSIZE and ALGOMODE[3:0] must be written before the key, as explained above.

KMOD[1:0] = 0x2 (shared key) must be written after ALGOMODE[3:0] or at the same time, otherwise KERF is raised if DES or TDES is selected (for example ALGOMODE[3:0] = 0x0).

CTR mode with DIN = 0x0 (STS mode)

When the application needs to use CTR mode with DIN always equal to zero, write ALGOMODE[3:0] with 0xE, to select the STS mode.

Note: This mode is not documented by NIST.

Suspend and resume operations in CTR mode

Like for the CBC mode, it is possible to interrupt a message to send a higher priority message, then resume the interrupted message. Detailed CBC suspend and resume sequence is described in *Section 49.4.10: CRYP AES basic chaining modes (ECB, CBC)*.

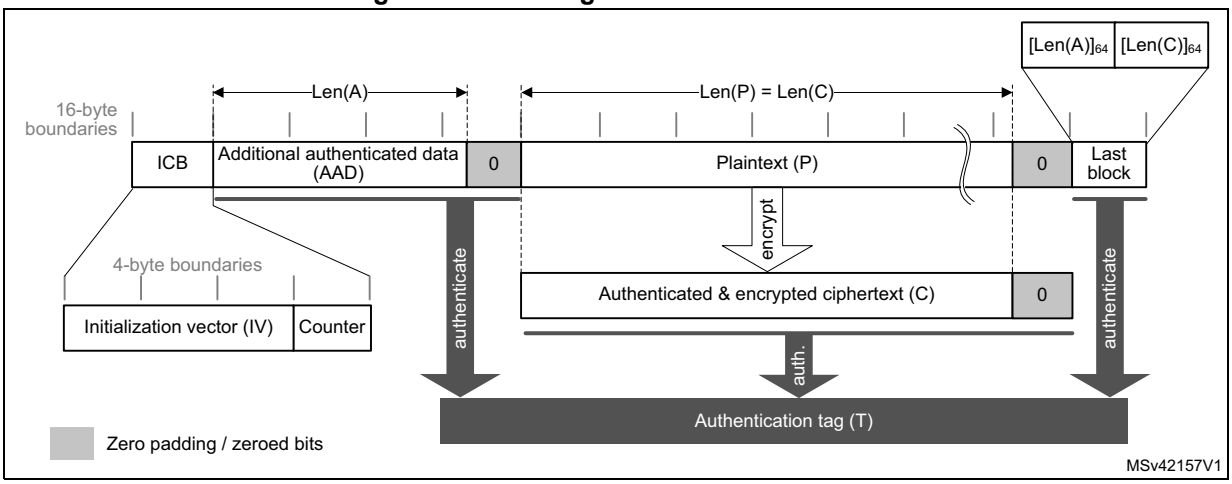
Note: Like for CBC mode, IVI registers must be reloaded during the resume operation.

49.4.12 CRYP AES Galois/counter mode (GCM)

The AES Galois/counter mode (GCM) enables encrypting and authenticating a plaintext message into the corresponding ciphertext and tag (also known as message authentication code).

GCM mode is based on AES in counter mode for confidentiality. It uses a multiplier over a fixed finite field for computing the message authentication code. The following figure shows a typical message construction in GCM mode.

Figure 432. Message construction in GCM



The structure of this message is defined as below:

- **16-byte Initial Counter Block (ICB)**, composed of two distinct fields:
  - **Initialization vector (IVI)**: a 96-bit value that must be unique for each encryption cycle with a given key. The GCM standard supports IVIs with less than 96 bits, but in this case strict rules apply.
  - **Counter***:* a 32-bit big-endian integer that is incremented each time a block processing is complete. According to NIST specification, the counter value is 0x2 when processing the first block of payload.
- **Authenticated header AAD** (also knows as additional authentication data) has a known length Len(A) that may be a non-multiple of 16 bytes, and must not exceed $2^{64} – 1$ bits. This part of the message is only authenticated, not encrypted.
- **Plaintext message P** is both authenticated and encrypted as ciphertext C, with a known length Len(P) that may be non-multiple of 16 bytes, and cannot exceed 2^{32} - 2 16-bytes blocks.
- **Last block** contains the AAD header length (bits [32:63]) and the payload length (bits [96:127]) information, as shown in *Table 458*.

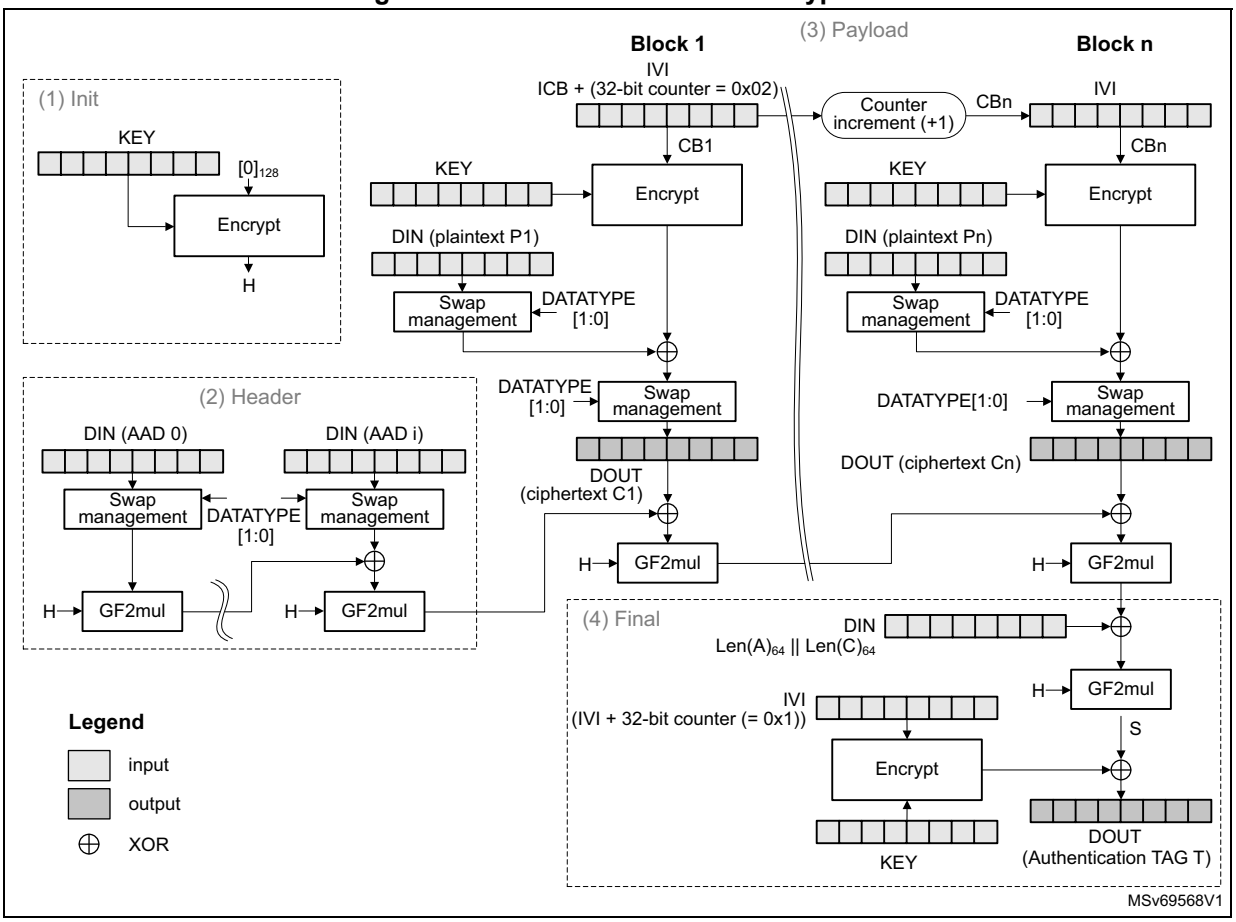
The GCM standard specifies that ciphertext C has the same bit length as the plaintext P.

A special padding scheme is required when a part of the message (AAD or P) has a length that is a non-multiple of 16-bytes.

For more details, refer to NIST *Special Publication 800-38D, Recommendation for Block Cipher Modes of Operation - Galois/Counter Mode (GCM) and GMAC.*

Figure 433 describes the GCM chaining implementation in the CRYP peripheral (encryption). To select this chaining mode, write ALGOMODE[3:0] with 0x6.

Figure 433. GCM authenticated encryption



The first counter block (CB1) is derived from the initial counter block ICB by the application software, as defined in *Table 457*.

Table 457. GCM mode IVI registers initialization

Register	CRYP_IV0LR[31:0]	CRYP_IV0RR[31:0]	CRYP_IV1LR[31:0]	CRYP_IV1RR[31:0]
Input data	ICB[127:96]	ICB[95:64]	ICB[63:32]	ICB[31:0] 32-bit counter = 0x2

The last block of a GCM message contains the AAD header length and the payload length information, as shown in *Table 458*.

Table 458. GCM last block definition

Word order to CRYP_DINR	First word	Second word	Third word	Fourth word
Input data	AAD length[63:32]	AAD length[31:0]	Payload length[63:32]	Payload length[31:0]

GCM encryption and decryption process

This process is described in *Section 49.4.6*, with the following sequence of events:

GCM initialize

1. Disable the CRYP peripheral, by clearing CRYPEN.
2. Flush the FIFOs by setting FFLUSH.
3. Initialize the CRYP_CR register:
   a) Select GCM chaining mode (write ALGOMODE[3:0] with 0x8) in encryption or decryption mode (write ALGODIR with 0 or 1).
   b) Configure the data type through DATATYPE[1:0]
   c) Configure the key size through KEYSIZE.
   d) Select the key mode, using KMOD[1:0]: if the key is coming from SAES peripheral set KMOD[1:0] to 0x2 else keep it at 0x0.
   e) Select the GCM initialization phase, by writing 0x0 to GCM_CCMPH[1:0]
4. Write the initialization vector in CRYP_IVxL/R registers according to *Table 457*.
5. Write the key in CRYP_KxL/R registers if KMOD[1:0] is 0x0. If KMOD[1:0]= 0x2, the key is being transferred from the SAES peripheral (see *Section 49.4.15*).
6. Wait until KEYVALID is set (the key loading completed).
7. Set CRYPEN to start the calculation of the hash key. CRYPEN is automatically cleared when the calculation is complete.
8. Wait for the CRYPEN bit to be cleared, indicating that the GCM hash subkey (H) computation is complete.

GCM header phase

9. Initialize header phase:
   a) Select the GCM header phase, by writing 0x1 to GCM_CCMPH[1:0]. Do not change the other configurations written during GCM initialization.
   b) Set CRYPEN to start accepting data.
10. Append header data:
    a) If it is the last block and the AAD in the block is smaller than 16 bytes, pad the remainder of the block with zeros.
    b) Append the data into CRYP as described in *Section 49.4.5*.
    c) Repeat the step *b)* until the second-last AAD data block is processed. For the last block follow the steps *a)* and *b)*.
11. Wait until the BUSY flag is cleared.

Note: This phase can be skipped if there is no AAD, that is, Len(A) = 0.

No data are read during header phase.

GCM payload phase

12. Initialize payload phase:
    a) Disable the CRYP peripheral, by clearing CRYPEN.
    b) Select the GCM payload phase, by writing GCM_CCMPH[1:0] with 0x2. Do not change the other configurations written during GCM initialization.
    c) Enable the CRYP peripheral by setting CRYPEN, to start accepting data.
13. Append payload data:
    a) If it is the last block and the message in the block is smaller than 16 bytes, pad the remainder of the block with zeros.
    b) Append the data into CRYP as described in *Section 49.4.5*, then read the CRYP_DOUTR register to save the resulting block(s).
    c) Repeat the step *b)* until the second-last plaintext block is encrypted or until the last block of ciphertext is decrypted. For the last block of plaintext (encryption only), follow the steps *a)* and *b)*. For the last block, discard the bits that are not part of the payload when the last block is smaller than 16 bytes.
14. Wait until the BUSY flag is cleared.

Note: This phase can be skipped if there is no payload, that is, Len(C) = 0 (see GMAC mode).

GCM finalization

15. Select the GCM final phase, by writing GCM_CCMPH[1:0] with 0x3, and clear the ALGODIR bit (encryption). Do not change the other configurations written during GCM initialization.
16. Write the final GCM block into the CRYP_DINR register. It is the concatenated AAD bit and payload bit lengths, as shown in *Table 458*.
17. Wait until the OFNE flag in the CRYP_SR register is set.
18. Get the GCM authentication tag, by reading the CRYP_DOUTR register four times.
19. Disable the CRYP peripheral, by clearing CRYPEN. If it is an authenticated decryption, compare the generated tag with the expected tag passed with the message.

Note: In the final phase, data are written to CRYP_DINR normally (no swapping).

Suspend and resume operations in GCM mode

To suspend the processing of a message, proceed as follows:

1. If DMA is used, stop the CRYP DMA transfers to the input FIFO, by clearing DIEN bit of the CRYP_DMACR register.
2. Wait until both FIFOs are empty (IFEM = 1 and OFNE = 0 in CRYP_SR) and the BUSY bit is cleared.
3. In the payload phase, if DMA is used, stop the CRYP DMA transfers from the output FIFO, by clearing the DOEN bit of the CRYP_DMACR register.
4. Disable the CRYP by clearing CRYPEN.
5. Save the current CRYP_CR configuration in the memory. Key registers do not need to be saved as the original key value is known by the application.
6. In the payload phase, save the CRYP_IVxL/R registers as, during the data processing, they changed from their initial values. In the header phase, this step is not required.
7. Save the CRYP_CSGCMCCMRx and CRYP_CSGCMRx registers in memory.
8. If DMA is used, save the DMA controller status (pointer for CRYP input data transfers, number of remaining bytes, and so on). In the payload phase, also save pointer for CRYP output data transfers.

To resume the processing of a message, proceed as follows:

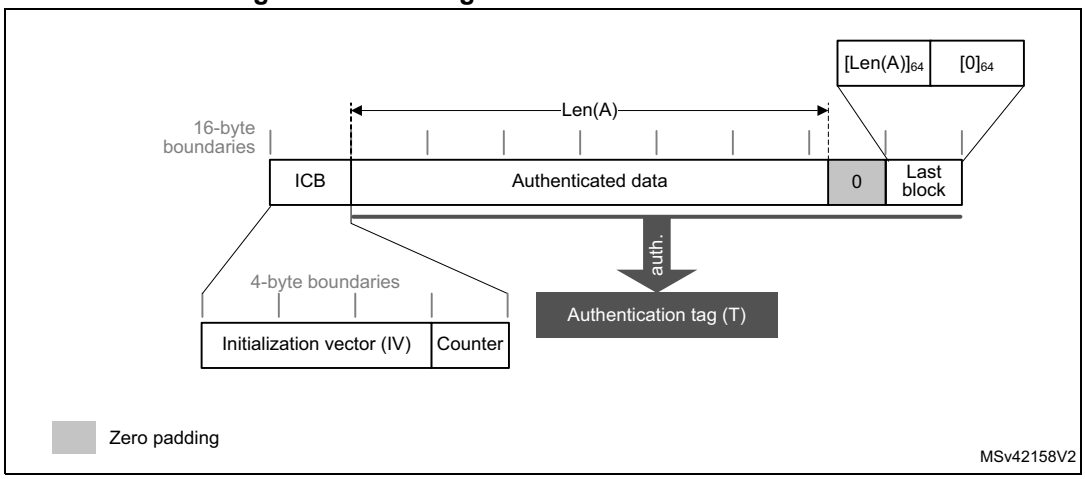
1. If DMA is used, configure the DMA controller in order to complete the remaining input FIFO transfers. In the payload phase, also configure the DMA controller for the remaining output FIFO transfers.
2. Disable the CRYP peripheral, by clearing CRYPEN.
3. Restore the initial setting values in the CRYP_CR and CRYP_KxL/R registers. If KMOD[1:0]= 0x2 the key needs to be transferred again from the SAES peripheral (see *Section 49.4.15*).
4. Write the suspend register values, previously saved in the memory, back into their corresponding CRYP_CSGCMCCMRx and CRYP_CSGCMRx registers.
5. In the payload phase, write the initialization vector register values, previously saved in the memory, back into their corresponding CRYP_IVxL/R registers. In the header phase, write initial setting values back into the CRYP_IVxL/R registers.
6. Enable the CRYP peripheral by setting CRYPEN.
7. If DMA is used, enable CRYP DMA requests, by setting DIEN (and DOEN if in payload phase).

49.4.13 CRYP AES Galois message authentication code (GMAC)

The Galois message authentication code (GMAC) enables the authentication of a plaintext, generating the corresponding tag information (also known as message authentication code).

GMAC is similar to GCM, except that it is applied on a message composed only by plaintext authenticated data (that is, only header, no payload). The following figure shows typical message construction for GMAC.

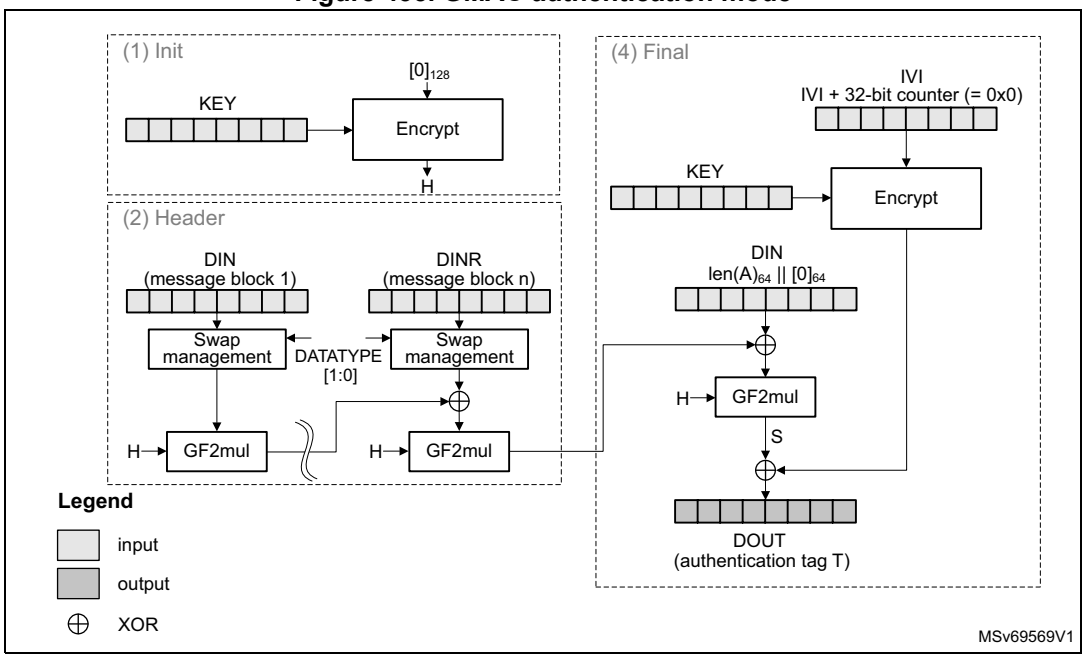
Figure 434. Message construction in GMAC mode



For more details, refer to NIST *Special Publication 800-38D, Recommendation for Block Cipher Modes of Operation - Galois/Counter Mode (GCM) and GMAC.*

Figure 435 describes the GMAC chaining implementation in the CRYP peripheral. To select this chaining mode, write ALGOMODE[3:0] with 0x6.

Figure 435. GMAC authentication mode



The GMAC algorithm corresponds to the GCM algorithm applied on a message only containing a header. As a consequence, all steps and settings are the same as for the GCM, except that the payload phase is omitted.

Suspend and resume operations in GMAC

In GMAC mode, the sequence described for the GCM applies except that only the header phase can be interrupted.

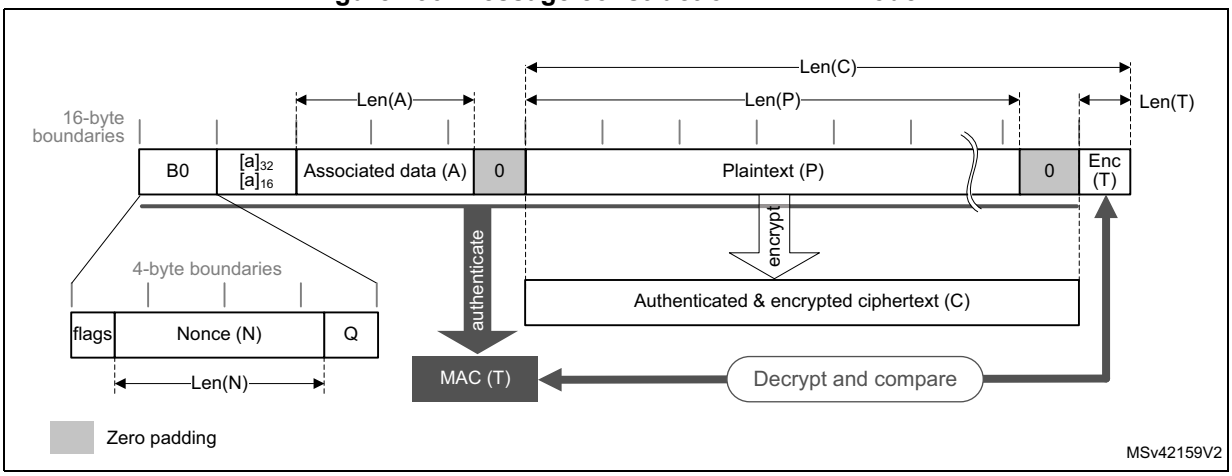
49.4.14 CRYP AES Counter with CBC-MAC (CCM)

The AES counter with cipher block chaining-message authentication code (CCM) algorithm enables encryption and authentication of plaintext, generating the corresponding ciphertext and tag (also known as message authentication code). To ensure confidentiality, the CCM algorithm is based on AES in counter mode. It uses cipher block chaining technique to generate the message authentication code. This is commonly called CBC-MAC.

Note: NIST does not approve CBC-MAC as an authentication mode outside the context of the CCM specification.

The following figure shows typical message construction for CCM.

Figure 436. Message construction in CCM mode



The structure of the message is:

- **16-byte first authentication block (B0)**, composed of three distinct fields:
  - **Q:** a bit string representation of the octet length of P (Len(P))
  - **Nonce (N):** a single-use value (that is, a new nonce must be assigned to each new communication) of Len(N) size. The sum Len(N) + Len(P) must be equal to 15 bytes.
  - **Flags:** most significant octet containing four flags for control information, as specified by the standard. It contains two 3-bit strings to encode the values **t** (MAC length expressed in bytes) and **Q** (plaintext length such that Len(P) < 2^{8Q} bytes). The counter blocks range associated to **Q** is equal to 2^{8Q-4}, that is, if the maximum value of **Q** is 8, the counter blocks used in cipher must be on 60 bits.

- **16-bytes blocks (B)** associated to the Associated Data (A).

  This part of the message is only authenticated, not encrypted. This section has a known length Len(A) that can be a non-multiple of 16 bytes (see *Figure 436*). The standard also states that, on the MSB bits of the first message block (B1), the associated data length expressed in bytes (*a*) must be encoded as follows:

  – If $0 < a < 2^{16} - 2^8$, then it is encoded as $[a]_{16}$, that is, on two bytes.

  – If $2^{16} - 2^8 < a < 2^{32}$, then it is encoded as 0xFF || 0xFE || $[a]_{32}$, that is, on six bytes.

  – If $2^{32} < a < 2^{64}$, then it is encoded as 0xFF || 0xFF || $[a]_{64}$, that is, on ten bytes.
- **16-byte blocks (B)** associated to the plaintext message P, which is both authenticated and encrypted as ciphertext C, with a known length Len(P). This length can be a non-multiple of 16 bytes (see *Figure 436*).
- **Encrypted MAC (T)** of length Len(T) appended to the ciphertext C of overall length Len(C).

When a part of the message (A or P) has a length that is a non-multiple of 16-bytes, a special padding scheme is required.

Note: CCM chaining mode can also be used with associated data only (that is, no payload).

As an example, the C.1 section in *NIST Special Publication 800-38C* gives the following values (hexadecimal numbers):

N: **10111213 141516** (Len(N) = 56 bits or 0x7 bytes)

A: **00010203 04050607** (Len(A) = 64 bits or 0x8 bytes)

P: *20212223* (Len(P) = 32 bits i.e. Q = 0x*4* bytes)

T: 6084341b (Len(T) = 32 bits or t = 4)

B0: 4f**101112 13141516** 00000000 00000004
B1: 0008**0001 02030405 0607**0000 00000000
B2: *20212223* 00000000 00000000 00000000

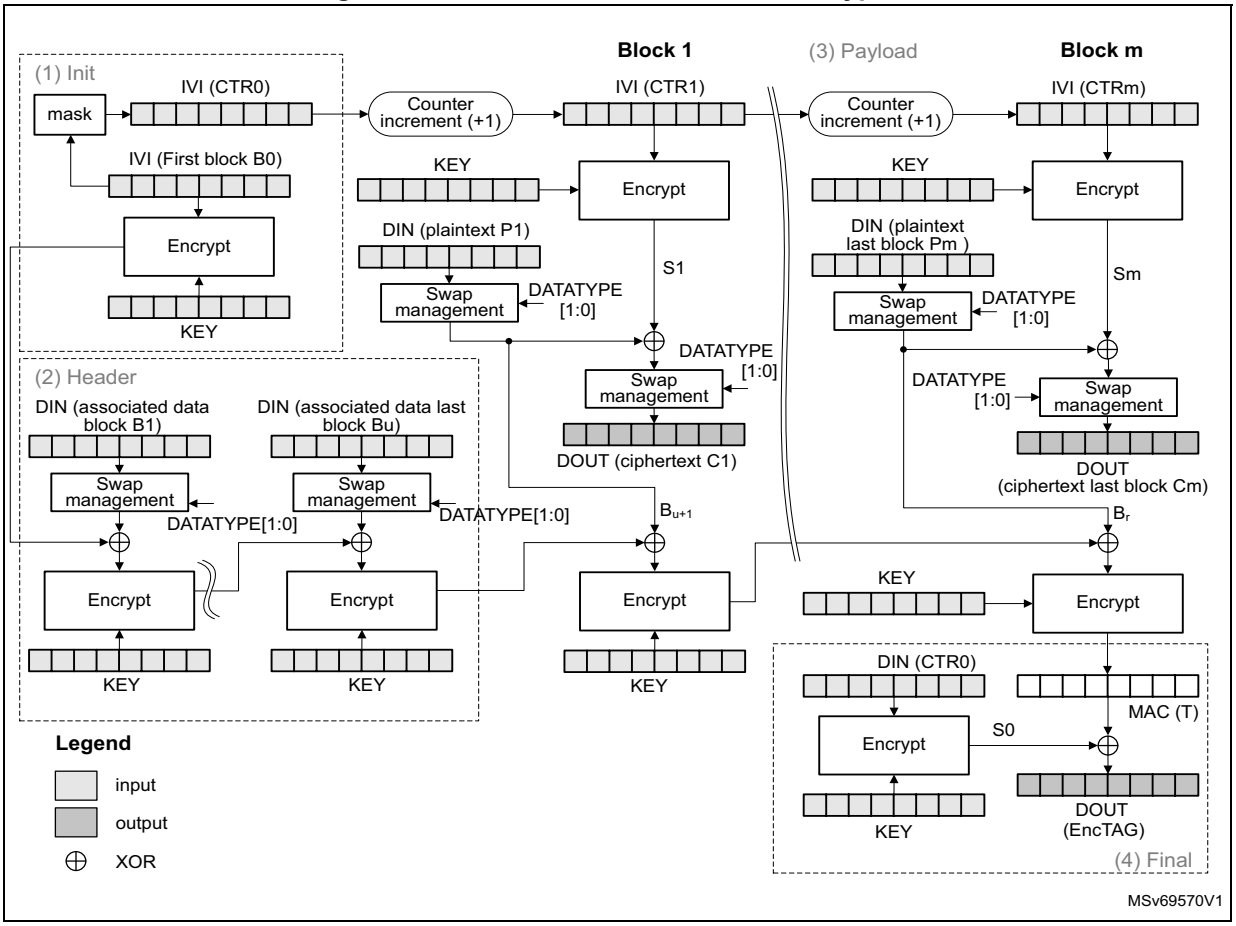
CTR0: 07**10111213 141516** 00000000 00000000

CTR1: 07**10111213 141516** 00000000 00000001

For more details, refer to NIST *Special Publication 800-38C, Recommendation for Block Cipher Modes of Operation - The CCM Mode for Authentication and Confidentiality*.

Figure 437 describes the CCM chaining implementation in the CRYP peripheral (encryption). To select this chaining mode, write ALGOMODE[3:0] with 0x9.

Figure 437. CCM mode authenticated encryption



The first block of a CCM message (B0) must be prepared by the application as defined in *Table 459*.

Table 459. CCM mode IVI registers initialization

Register	CRYP_IV0LR[31:0]	CRYP_IV0RR[31:0]	CRYP_IV1LR[31:0]	CRYP_IV1RR[31:0]
Input data	B0[127:96](1)	B0[95:64]	B0[63:32]	B0[31:0](2)

1. The 5 most significant bits are cleared (flag bits).
2. Q length bits are cleared, except for bit 0 that is set.

CRYP supports counters up to 64 bits, as specified by NIST.

CCM encryption and decryption process

This process is described in *Section 49.4.6*, with the following sequence of events:

CCM initialize

1. Disable the CRYP peripheral, by clearing CRYPEN.
2. Flush the FIFOs by setting FFLUSH.
3. Initialize the CRYP_CR register:
   a) Select CCM chaining mode (write ALGOMODE[3:0] with 0x9) in encryption or decryption mode (write ALGODIR with 0 or 1).
   b) Configure the data type through DATATYPE[1:0]
   c) Configure the key size through KEYSIZE.
   d) Select the key mode, using KMOD[1:0]: if the key is coming from SAES peripheral set KMOD[1:0] to 0x2 else keep it at 0x0.
   e) Select the CCM initialization phase, by writing 0x0 to GCM_CCMPH[1:0]
4. Write the initialization vector into the CRYP_IVxL/R registers with CTR1 information, as defined in *Table 459*
5. Write the key in CRYP_KxL/R registers if KMOD[1:0] is 0x0. If KMOD[1:0]= 0x2 the key is being transferred from the SAES peripheral (see *Section 49.4.15*).
6. Wait until KEYVALID is set (the key loading completed).
7. Enable the CRYP peripheral by setting CRYPEN.
8. Write the B0 data in CRYP_DINR registers according to *Table 459*, then wait for the CRYPEN bit to be cleared.

Note: In this initialization phase, data have to be inserted normally (no swapping).

CCM header phase

9. Initialize header phase:
   a) Prepare the first block of the (B1) data associated with the message, in accordance with CCM chaining rules.
   b) Select the GCM header phase, by writing GCM_CCMPH[1:0] with 0x1. Do not change the other configurations written during the GCM initialization.
   c) Set CRYPEN to start accepting data.
10. Append header data:
    a) If it is the last block and the associated data in the block is smaller than 16 bytes, pad the remainder of the block with zeros.
    b) Append the data into CRYP as described in *Section 49.4.5*.
    c) Repeat the step *b)* until the second-last associated data block is processed. For the last block follow the steps *a)* and *b)*.
11. Wait until the BUSY flag is cleared.

Note: This phase can be skipped if there is no associated data, that is, Len(A) = 0

No data are read during the header phase.

CCM payload phase

12. Initialize payload phase:
    a) Disable the CRYP peripheral, by clearing CRYPEN.
    b) Select the GCM payload phase, by writing GCM_CCMPH[1:0] with 0x2. Do not change the other configurations written during GCM initialization.
    c) Enable the CRYP peripheral by setting CRYPEN, to start accepting data.
13. Append payload data:
    a) In encryption only, if it is the last block and the plaintext in the block is smaller than 16 bytes, pad the remainder of the block with zeros.
    b) Append the data into CRYP as described in *Section 49.4.5*, then read the CRYP_DOUTR register to save the resulting block(s).
    c) Repeat the step *b)* until the second-last plaintext block is encrypted or until the last block of ciphertext is decrypted. For the last block of plaintext (encryption only), follow the steps *a)* and *b)*. For the last block, discard the bits that are not part of the payload when the last block is smaller than 16 bytes.
14. Wait until the BUSY flag is cleared.

Note: This phase can be skipped if there is no payload, that is, Len(P) = 0 or Len(C) = Len(T).

Remove $LSB_{Len(T)}(C)$ encrypted tag information when decrypting ciphertext C.

CCM finalization

15. Select the GCM final phase, by writing GCM_CCMPH[1:0] with 0x3, and clear the ALGODIR bit (encryption). Do not change the other configurations written during GCM initialization.
16. Write the CTR0 information into the CRYP_DINR register. CTR0 information is described in *Table 459*, with the bit[0] cleared.
17. Wait until the OFNE flag in the CRYP_SR register is set.
18. Get the CCM authentication tag, by reading the CRYP_DOUTR register four times.
19. Disable the CRYP peripheral by clearing CRYPEN. If it is an authenticated decryption, compare the generated tag with the expected tag passed with the message. Mask the authentication tag output with tag length to obtain a valid tag.

Note: In this final phase, data have to be inserted normally (no swapping).

Suspend and resume operations in CCM mode

To suspend the processing of a message in header or payload phase, proceed as follows:

1. If DMA is used, stop the CRYP DMA transfers to the input FIFO, by clearing DIEN bit of the CRYP_DMACR register.
2. Wait until both FIFOs are empty (IFEM = 1 and OFNE = 0 in CRYP_SR) and the BUSY bit is cleared.
3. In the payload phase, if DMA is used, stop the CRYP DMA transfers from the output FIFO, by clearing the DOEN bit of the CRYP_DMACR register.
4. Disable the CRYP by clearing CRYPEN.
5. Save the current CRYP_CR configuration in the memory. Key registers do not need to be saved as the original key value is known by the application.
6. In the payload phase, save the CRYP_IVxL/R registers as, during the data processing, they changed from their initial values. In the header phase, this step is not required.
7. Save the CRYP_CSGCMCCMRx registers in the memory.
8. If DMA is used, save the DMA controller status (pointer for CRYP input data transfers, number of remaining bytes, and so on). In the payload phase, also save pointer for CRYP output data transfers.

To resume the processing of a message, proceed as follows:

1. If DMA is used, configure the DMA controller in order to complete the remaining input FIFO transfers. In the payload phase, also configure the DMA controller for the remaining output FIFO transfers.
2. Disable the CRYP peripheral, by clearing CRYPEN.
3. Restore the initial setting values in the CRYP_CR and CRYP_KxL/R registers. If KMOD[1:0]= 0x2 the key needs to be transferred again from the SAES peripheral (see *Section 49.4.15*).
4. Write the suspend register values, previously saved in the memory, back into their corresponding CRYP_CSGCMCCMRx registers.
5. In the payload phase, write the initialization vector register values, previously saved in the memory, back into their corresponding CRYP_IVxL/R registers. In the header phase, write initial setting values back into the CRYP_IVxL/R registers.
6. Enable the CRYP peripheral by setting CRYPEN.
7. If DMA is used, enable CRYP DMA requests, by setting DIEN (and DOEN if in payload phase).

49.4.15 AES key sharing with secure AES co-processor

The CRYP peripheral can use the SAES peripheral as security co-processor. The secure application prepares the key in the robust SAES peripheral. When it is ready, the CRYP application can load this prepared key through a dedicated hardware key bus.

The recommended sequence is described hereafter and in section *SAES operations with shared keys* in section *Secure AES coprocessor (SAES)* of this document.

1. In SAES peripheral, the application encrypts the key to share in shared-key mode (KMOD[1:0] at 0x2). When applicable, the proper CRYP instance must be selected through KSHAREID[1:0].
2. Each time the shared key is required in the CRYP peripheral, the application decrypts it in the SAES peripheral in shared-key mode (KMOD[1:0] at 0x2). When applicable, the proper CRYP instance must be selected through KSHAREID[1:0].
3. Once the shared key is decrypted and loaded in SAES_KEYRx registers it can be shared with CRYP (only in AES mode). To load the shared key in CRYP, the application sets KEYSIZE as appropriate and writes KMOD[1:0] with 0x2. When KEYVALID is cleared, the key is automatically transfered by hardware into the CRYP_KxL/R registers and the BUSY flag in the CRYP_SR register set.
4. Once the key transfer is complete, the BUSY flag is cleared and the KEYVALID flag set in the CRYP_SR register. If KEYVALID is not set when BUSY bit is cleared, or if the KERF flag is set in the CRYP_SR register, it means that an AES algorithm has not been selected with ALGOMODE[3:0], the KEYSIZE value is incorrect or an unexpected event occurred during the transfer (such as DPA error, tamper event or KEYVALID in SAES_SR cleared before the end of the transfer). When such errors occur, reset both peripherals through their IPRST bits and restart the whole key sharing process.

When the key sharing sequence is complete, the CRYP is initialized with a valid, shared key. The application can then process data in normal key mode, by writing KMOD[1:0] with 0x0.

Note: This sequence in CRYP peripheral can be run multiple times (for example, to manage a suspend/resume situation), as long as SAES peripheral is unused and duly remains in key sharing state.

When sharing keys KEYSIZE in CRYP must be identical to SAES value (128 or 256 bits).

Caution: Avoid changing KEYSIZE or ALGOMODE[3:0] to a DES or TDES algorithm when the key registers have been initialized with a shared key. This causes key data to be lost and the KERF error to be raised.

49.4.16 CRYP data registers and data swapping

DES/TDES data input and output

A 8-byte data block enters the CRYP peripheral with two successive 32-bit word writes into the CRYP_DINR register (bitfield DIN[31:0]), the most significant word (bits [64:33]) first, the least significant word (bits [32:1]) last.

A 8-byte data block is retrieved from the CRYP peripheral with two successive 32-bit word reads of the CRYP_DOUTR register (bitfield DOUT[31:0]), the most significant word (bits [64:33]) first, the least significant word (bits [32:1]) last.

DES/TDES data swapping feature

The CRYP peripheral can be configured to perform a bit-, a byte-, a half-word-, or no swapping on the input data word in the CRYP input FIFO, before loading it to the DES processing core, and on the data output from the DES processing core, before sending it to the CRYP output FIFO. The choice depends on the type of data. For example, a byte swapping is used for an ASCII text stream.

The data swap type is selected through the DATATYPE[1:0]. The selection applies both to the input and the output of the CRYP.

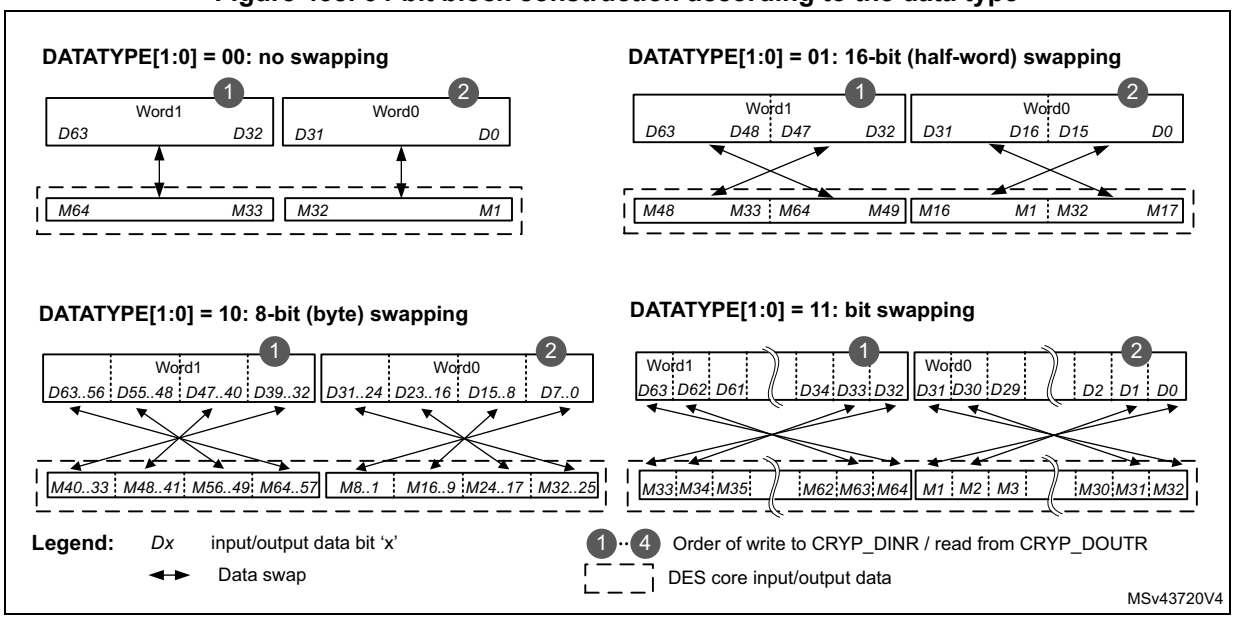
Note: The data in CRYP key registers (CRYP_KxL/R) and initialization vector registers (CRYP_IVxL/R) are not sensitive to the swap mode selection.

The CRYP data swapping feature for DES/TDES is summarized in *Table 460* and *Figure 438*.

Table 460. DES/TDES data swapping example

DATATYPE[1:0]	Swapping performed	Data block representation (64 bits)
		System memory data (big-endian)
0x0	No swapping	Block[64..1]: 0xABCD7720 6973FE01
		Address @, word[63..32]: 0xABCD 7720 Address @+0x4, word[31..0]: 0x6973 FE01
0x1	Half-word (16-bit) swapping	Block[64..1]: 0x**ABCD** 7720 **6973** FE01
		Address @, word[63..32]: 0x7720 **ABCD** Address @+0x4, word[31..0]: 0xFE01 **6973**
0x2	Byte (8-bit) swapping	Block[64..1]: 0x**AB** CD **77** 20 **69** 73 **FE** 01
		Address @, word[63..32]: 0x20**77** CD**AB** Address @+0x4, word[31..0]: 0x01**FE** 73**69**
0x3	Bit swapping	Block[64..33]: 0xABCD 7720 1010 1011 1100 1101 0111 0111 0010 0000 Block[32..1]: 0x6973 FE01 0110 1001 0111 0011 1111 1110 0000 0001
		Address @, word[63..32]: 0x04EE B3D5 0000 0100 1110 1110 1011 0011 1101 0101 Address @+4, word[31..0]: 0x807F CE96 1000 0000 0111 1111 1100 1110 1001 0110

Figure 438. 64-bit block construction according to the data type



AES data input and output

A 16-byte data block enters the CRYP peripheral with four successive 32-bit word writes into the CRYP_DINR register (bitfield DIN[31:0]), the most significant word (bits [127:96]) first, the least significant word (bits [31:0]) last.

A 16-byte data block is retrieved from the CRYP peripheral with four successive 32-bit word reads of the CRYP_DOUTR register (bitfield DOUT[31:0]), the most significant word (bits [127:96]) first, the least significant word (bits [31:0]) last.

The four 32-bit words of a 16-byte data block must be stored in the memory consecutively and in big-endian order, that is, with the most significant word on the lowest address. See *Table 461* “no swapping” option for details.

AES data swapping feature

The CRYP peripheral can be configured to perform a bit-, a byte-, a half-word-, or no swapping on the input data word in the CRYP input FIFO, before loading it to the AES processing core, and on the data output from the AES processing core, before sending it to the CRYP output FIFO. The choice depends on the type of data. For example, a byte swapping is used for an ASCII text stream.

The data swap type is selected through the DATATYPE[1:0]. The selection applies both to the input and the output of the CRYP, except in GCM/CCM final phase (data must be inserted normally).

Note: The data in CRYP key registers (CRYP_KxL/R) and initialization vector registers (CRYP_IVxL/R) are not sensitive to the swap mode selection.

The CRYP data swapping feature for AES is summarized in *Table 461* and *Figure 439*.

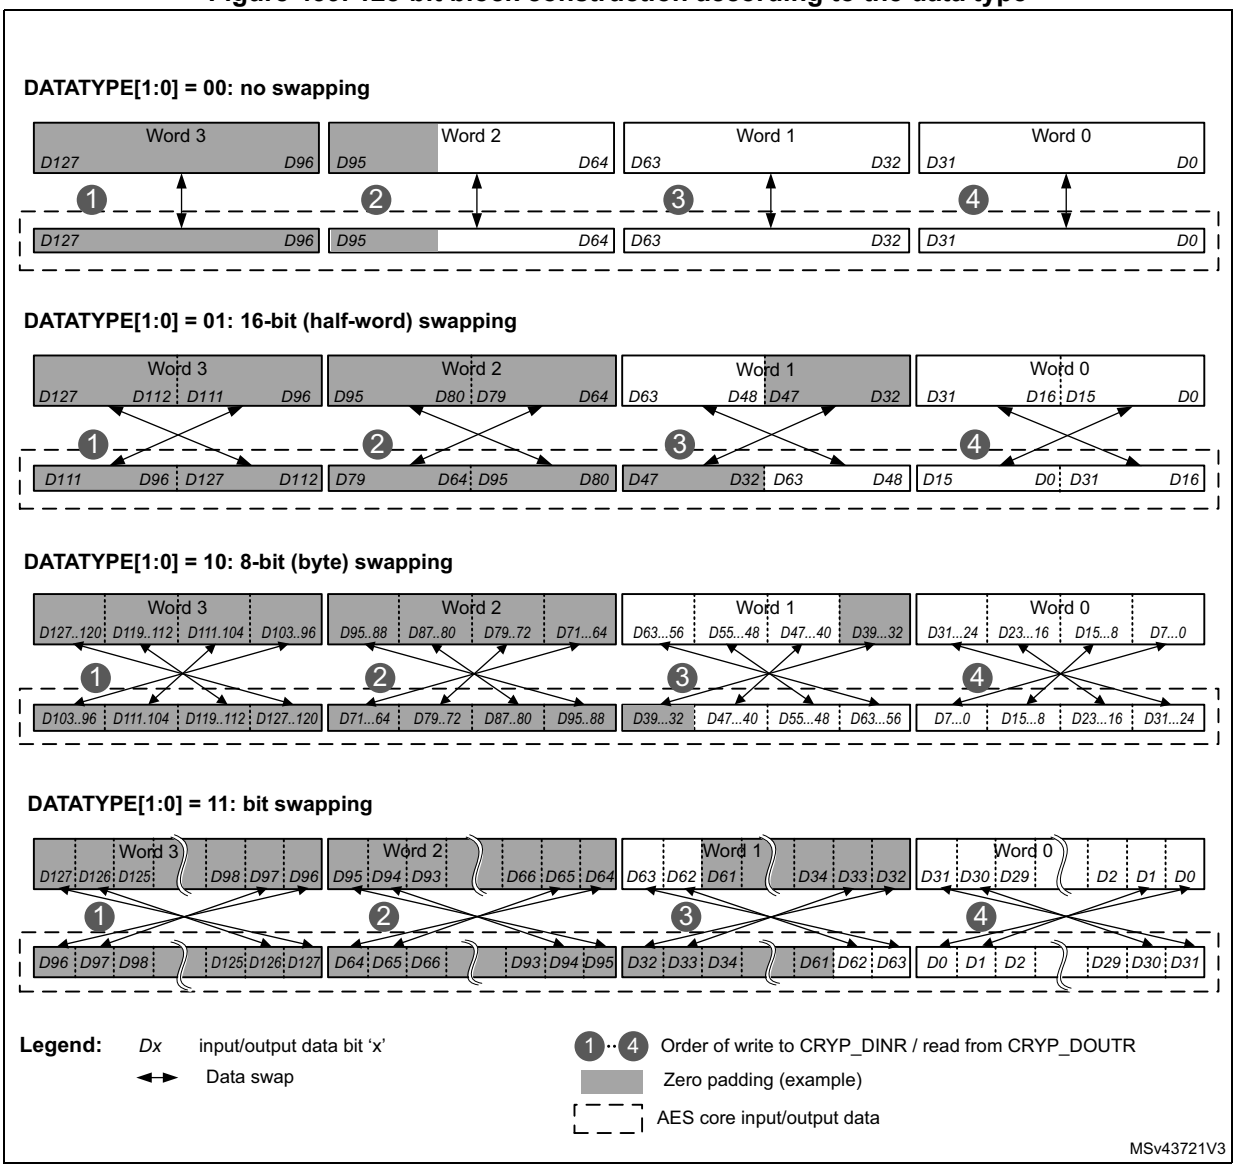
Table 461. AES data swapping example

DATATYPE[1:0]	Swapping performed	Data block
		System memory data (big-endian)
0x0	No swapping	Block[127..64]: 0x04EEF672 2E04CE96 Block[63..0]: 0x4E6F7720 69732074
		Address @, word[127..96]: 0x04EE F672 Address @ + 0x4, word[95..64]: 0x2E04 CE96 Address @ + 0x8, word[63..32]: 0x4E6F 7720 Address @ + 0xC, word[31..0]: 0x6973 2074
0x1	Half-word (16-bit) swapping	Block[63..0]: 0x**4E6F** 7720 **6973** 2074
		Address @, word[63..32]: 0x7720 **4E6F** Address @ + 0x4, word[31..0]: 0x2074 **6973**
0x2	Byte (8-bit) swapping	Block[63..0]: 0x**4E** 6F **77** 20 **69** 73 **20** 74
		Address @, word[63..32]: 0x20**77** 6F**4E** Address @ + 0x4, word[31..0]: 0x74**20** 73**69**

Table 461. AES data swapping example (continued)

DATATYPE[1:0]	Swapping performed	Data block
		System memory data (big-endian)
0x3	Bit swapping	Block[63..32]: 0x4E6F 7720 **0100 1110 0110 1111 0111 0111 0010 0000** Block[31..0]: 0x6973 2074 **0110 1001 0111 0011 0010 0000 0111 0100**
		Address @, word[63..32]: 0x04EE F672 **0000 0100 1110 1110 1111 0110 0111 0010** Address @ + 0x4, word[31..0]: 0x2E04 CE96 **0010 1110 0000 0100 1100 1110 1001 0110**

Figure 439. 128-bit block construction according to the data type



Data padding

Figure 439 also gives an example of memory data block padding with zeros such that the zeroed bits after the data swap form a contiguous zone at the MSB end of the AES core input buffer. The example shows the padding of an input data block containing:

- 84 message bits, with DATATYPE[1:0] = 0x0
- 48 message bits, with DATATYPE[1:0] = 0x1
- 56 message bits, with DATATYPE[1:0] = 0x2
- 34 message bits, with DATATYPE[1:0] = 0x3

49.4.17 CRYP key registers

The eight CRYP_KxR/LR write-only registers store the encryption or decryption key information, as shown in *Table 462* and *Table 463*. Reads are not allowed for security reason.

When TDES is selected a 3-key vector (K1, K2, and K3) is used. When DES is selected only 1-key vector (K1) is used.

Note: In memory and in CRYP *key registers, keys are stored in big-endian format, with most significant byte on the lowest address.*

Table 462. Key endianness in CRYP_KxR/LR registers (AES 128/192/256-bit keys)

K0LR[31:0]	K0RR[31:0]	K1LR[31:0]	K1RR[31:0]	K2LR[31:0]	K2RR[31:0]	K3LR[31:0]	K3RR[31:0]
-	-	-	-	k[127:96]	k[95:64]	k[63:32]	k[31:0]
K0LR[31:0]	**K0RR[31:0]**	**K1LR[31:0]**	**K1RR[31:0]**	**K2LR[31:0]**	**K2RR[31:0]**	**K3LR[31:0]**	**K3RR[31:0]**
-	-	k[191:160]	k[159:128]	k[127:96]	k[95:64]	k[63:32]	k[31:0]
K0LR[31:0]	**K0RR[31:0]**	**K1LR[31:0]**	**K1RR[31:0]**	**K2LR[31:0]**	**K2RR[31:0]**	**K3LR[31:0]**	**K3RR[31:0]**
k[255:224]	k[223:192]	k[191:160]	k[159:128]	k[127:96]	k[95:64]	k[63:32]	k[31:0]

Table 463. Key endianness in CRYP_KxR/LR registers (DES K1 and TDES K1/2/3)

K0LR[31:0]	K0RR[31:0]	K1LR[31:0]	K1RR[31:0]	K2LR[31:0]	K2RR[31:0]	K3LR[31:0]	K3RR[31:0]
-	-	K1[64:33]	K1[32:1]	-	-	-	-
-	-	K1[64:33]	K1[32:1]	K2[64:33]	K2[32:1]	K3[64:33]	K3[32:1]

Note: DES/TDES keys include 8-bit parity information that are not used by the cryptographic processor. In other words, bits 8, 16, 24, 32, 40, 48, 56 and 64 of each 64-bit key value Kx[1:64] are not used.

The key registers are not affected by the data swapping feature controlled by the DATATYPE[1:0] bitfield.

Write operations to the CRYP_KxL/R registers are ignored when BUSY bit is set. The application must check this before modifying key registers.

The entire key must be written before starting an AES computation. In normal key mode (KMOD[1:0] at 0x0), the key registers must always be written in either ascending or descending order. The write sequence becomes (in ascending order):

- K2LR, K2RR, K3LR, then K3RR registers for KEYSIZE = 0x0
- K1LR, K1RR, K2LR, K2RR, K3LR, then K3RR register for KEYSIZE = 0x1
- K0LR, K0RR, K1LR, K1RR, K2LR, K2RR, K3LR, then K3RR register for KEYSIZE = 0x2

Similarly, the entire key(s) must be written before starting a DES or TDES computation. The key registers must always be written in either ascending or descending order. The write sequence becomes (in ascending order):

- K1LR, K1RR, K2LR, K2RR, K3LR, then K3RR register for ALGOMODE[3:0] = 0x0 or 0x1
- K1LR then K1RR for ALGOMODE[3:0] = 0x2 or 0x3

Note: KEYSIZE and ALGOMODE[3:0] must be written before the key.

As soon as the first key register is written, the KEYVALID bit is cleared. Once the key registers writing sequence is complete, KEYVALID is set and CRYPEN bit becomes writable. If an error occurs, KEYVALID is cleared and KERF set (see *Section 49.4.19*).

49.4.18 CRYP initialization vector registers

The four CRYP_IVxR/LR registers store the initialization vector (IVI) information, as shown in *Table 464* and *Table 465*. They can only be written if BUSY bit is cleared.

Note: In memory and in CRYP IVI registers, initialization vectors *are stored in big-endian format, with most significant byte on the lowest address.*

Table 464. Initialization vector endianness in CRYP_IVxR registers (AES)

CRYP_IV0L[31:0]	CRYP_IV0R[31:0]	CRYP_IV1L[31:0]	CRYP_IV1R[31:0]
IVI[127:96]	IVI[95:64]	IVI[63:32]	IVI[31:0]

Table 465. Initialization vector endianness in CRYP_IVxR registers (DES/TDES)

CRYP_IV0L[31:0]	CRYP_IV0R[31:0]	CRYP_IV1L[31:0]	CRYP_IV1R[31:0]
IVI[64:32]	IVI[31:0]	-	-

Initialization vector information depend on the chaining mode selected. When used, CRYP_IVxR/LR registers are updated upon each DES/TDES or AES computation cycle (useful for managing suspend mode).

The initialization vector registers are not affected by the data swapping feature controlled by DATATYPE[1:0].

49.4.19 CRYP error management

The CRYP peripheral manages the errors described in this section.

Key error flag (KERF)

There are multiple sources of errors that set the KERF flag and clear the KEYVALID bit of the CRYP_SR register:

- **Key writing sequence error**: triggered upon detecting an incorrect sequence of writing key registers. See *Section 49.4.17: CRYP key registers* for details.
- **Key sharing size mismatch error**: triggered when KMOD[1:0] is at 0x2 and KEYSIZE in CRYP does not match KEYSIZE in SAES peripheral, or KEYSIZE is at 0x1 in CRYP_CR (192-bit key).
- **Key sharing error**: triggered upon failing transfer of SAES shared key to CRYP. See *Section 49.4.15: AES key sharing with secure AES co-processor* for details.
- **DES/TDES selection while in key sharing mode**: DES or TDES is selected with ALGOMODE[3:0], while KMOD[1:0] is 0x2 (shared-key mode).

Upon a key writing sequence error, KERF flag is cleared when a correct key writing sequence starts.

Upon a key sharing error, reset both CRYP and SAES peripherals through the IPRST bit of their corresponding control register, then restart the key sharing sequence.

Note: For any key error, clear KERF flag prior to setting CRYPEN.

49.5 CRYP interrupts

There are two individual maskable interrupt sources generated by the CRYP peripheral to signal the following events:

- Input FIFO empty (IFEM) or not full (IFNF)
- Output FIFO full (OFFU) or not empty (OFNE)

These sources are combined into a common interrupt signal from the CRYP peripheral that connects to the Arm® Cortex® interrupt controller. The application can enable or disable CRYP interrupt sources individually by setting/clearing the corresponding mask bit of the CRYP_IMSCR register. The status of the individual source of event flags can be read from the CRYP_SR register.

The global status of the two source of interrupts can be read either from the CRYP_RISR register (raw, that is unmasked), or from the CRYP_MISR register (masked).

Table 466 gives a summary of the available features.

Table 466. CRYP interrupt requests

Interrupt acronym	Interrupt event	Event flag		Enable bit	Interrupt clear method
		in CRYP_xISR(1)	in CRYP_SR		
CRYP	Output FIFO full	OUTRIS (not masked) OUTMIS (masked)	OFFU	OUTIM(2) and CRYPEN	Read one data from output FIFO
	Output FIFO not empty		OFNE		Read all data from output FIFO
	Input FIFO not full	INRIS (not masked) INMIS (masked)	IFNF	INIM(2) and CRYPEN	Write data until input FIFO is full
	Input FIFO empty		IFEM		Write at least one word in input FIFO

1. Flag of the CRYP_RISR register (unmasked or raw), or CRYP_MISR register (masked).
2. Bit of the CRYP_IMSCR register.

Output FIFO service interrupt (OUTMIS)

The output FIFO service interrupt is asserted when there is one or more (32-bit word) data items in the output FIFO. This interrupt is cleared by reading data from the output FIFO until there is no valid (32-bit) word left (that is, when the interrupt follows the state of the output FIFO not empty flag OFNE).

The output FIFO service interrupt OUTMIS is active also when CRYP is disabled. Consequently, when CRYPEN bit is cleared, the OUTMIS bit is not cleared when the output FIFO is not empty.

Input FIFO service interrupt (INMIS)

The input FIFO service interrupt is asserted when there are less than four words in the input FIFO. It is cleared by performing write operations to the input FIFO until it holds four or more words.

The input FIFO service interrupt INMIS is active only when CRYP is enabled. Consequently, when CRYPEN bit is cleared, the INMIS bit stay low even if the input FIFO is empty.

49.6 CRYP DMA requests

The CRYP peripheral provides an interface to connect to the DMA (direct memory access) controller. The DMA operation is controlled through the DIEN and DOEN bits of the CRYP_DMACR register.

Detailed usage of DMA with CRYP can be found in *Appending data using the DMA* subsection of *Section 49.4.5: CRYP encryption/ decryption typical usage*.

Data input using DMA

Setting DIEN enables DMA writing into CRYP. The CRYP then initiates, during the input phase, a DMA request for each 16-byte data block to write to the CRYP_DINR register (quadruple 32-bit word, MSB first).

The CRYP supports both single and burst DMA transfers. Recommended configuration in AES mode is fixed burst size of four words. When reading data from DDR-SDRAM memory, it is recommended to use 16-word burst transfers for better performance.

In AES mode CRYP issues a DMA transfer request to its input FIFO every time a 16-bytes block has been read from the FIFO. In DES/TDES mode it corresponds to two 8-byte blocks.

Note: According to the algorithm and the mode selected, special padding / ciphertext stealing might be required (see Section 49.4.7).

Data output using DMA

Setting DOEN enables DMA reading from CRYP. The CRYP then initiates, during the output phase, a DMA request for each 16-byte data block to read from the CRYP_DOUTR register (quadruple 32-bit word, MSB first).

The CRYP supports both single and burst DMA transfers. Recommended configuration in AES mode is fixed burst size of four words. When writing data to DDR-SDRAM memory, it is recommended to use 16-word burst transfers for better performance. When DES or TDES is selected, single DMA transfers must be used.

In AES mode CRYP issues a DMA transfer request from output FIFO every time one 16-byte block has been written into the FIFO. In DES/TDES mode CRYP issues a DMA transfer request every time a 32-bit word has been written into the FIFO.

Note: According to the message size, extra bytes might need to be discarded by application in the last block.

Stopping DMA transfers

All DMA request signals are de-asserted when CRYP is disabled (CRYPEN cleared) or the DMA enable bit (DIEN for input data, DOEN for output data) is cleared.

49.7 CRYP processing time

The following tables provide the block processing latency per operating mode. Block size is 16-byte in AES mode, 8-bytes in DES/TDES mode.

Table 467. Processing latency for ECB, CBC and CTR

Key size	Mode of operation	Chaining algorithm	Clock cycles
64 bits	DES encryption or decryption	ECD, CBC	16
3x64 bits	TDES encryption or decryption		48
128 bits	AES encryption or decryption(1)	ECD, CBC, CTR	14
	AES key preparation	-	12
192 bits	AES encryption or decryption(1)	ECD, CBC, CTR	16
	AES key preparation	-	14

Table 467. Processing latency for ECB, CBC and CTR (continued)

256 bits	AES encryption or decryption(1)	ECD, CBC, CTR	18
	AES key preparation	-	16

1. Excluding key preparation time (ECB and CBC only).

Table 468. Processing latency for GCM and CCM (in clock cycles)

Key size	Mode of operation	Chaining algorithm	Initialization phase	Header phase	Payload phase	Final phase
128 bits	AES encryption or decryption	GCM	24	10	14	14
		CCM	12	14	25	14
192 bits		GCM	28	10	16	16
		CCM	14	16	29	16
256 bits		GCM	32	10	18	18
		CCM	16	18	33	18

49.8 CRYP registers

These registers are accessible through 32-bit word single accesses only (otherwise an AHB error is generated, and write accesses are ignored).

49.8.1 CRYP control register (CRYP_CR)

Address offset: 0x00

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IPRST	Res.	Res.	Res.	Res.	Res.	KMOD[1:0]		NPBLB[3:0]				ALGOMODE[3]	Res.	GCM_CCMPH[1:0]	
rw						rw	rw	rw	rw	rw	rw	rw		rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CRYPEN	FFLUSH	Res.	Res.	Res.	Res.	KEYSIZE[1:0]		DATATYPE[1:0]		ALGOMODE[2:0]			ALGODIR	Res.	Res.
rw	rw					rw	rw	rw	rw	rw	rw	rw	rw		

Bit 31 **IPRST**: CRYP peripheral software reset

Setting the bit resets the CRYP peripheral, putting all registers to their default values, except the IPRST bit itself.

This bit must be kept cleared while writing any configuration registers.

Bits 30:26 Reserved, must be kept at reset value.

Bits 25:24 **KMOD[1:0]**: Key mode selection

This bitfield defines how the CRYP key can be used by the application. KEYSIZE must be correctly initialized when setting KMOD[1:0] different from zero.

0x0: Normal-key mode. Key registers are freely usable.

0x2: Shared-key mode. If shared-key mode is properly initialized in SAES peripheral, the CRYP peripheral automatically loads its key registers with the data stored in the SAES key registers. The key value is available in CRYP key registers when BUSY bit is cleared and KEYVALID is set in the CRYP_SR register. Key error flag KERF is set otherwise in the CRYP_SR register.

Others: Reserved

Shared-key mode can only be used in AES mode.

Attempts to write the bitfield are ignored when BUSY is set.

Bits 23:20 **NPBLB[3:0]:** Number of padding bytes in last block

This padding information must be filled by software before processing the last block of GCM payload encryption or CCM payload decryption, otherwise authentication tag computation is incorrect.

0x0: All bytes are valid (no padding)

0x1: Padding for the last LSB byte

...

0xF: Padding for the 15 LSB bytes of last block.

Attempts to write the bitfield are ignored when BUSY is set.

Bit 18 Reserved, must be kept at reset value.

Bits 17:16 **GCM_CCMPH[1:0]**: GCM or CCM phase selection

This bitfield selects the phase, applicable only with GCM, GMAC or CCM chaining modes.

0x0: Initialization phase

0x1: Header phase

0x2: Payload phase

0x3: Final phase

Attempts to write the bitfield are ignored when BUSY is set.

Bit 15 **CRYPEN:** CRYP enable

This bit enables/disables the CRYP peripheral.

0:CRYP disabled

1: CRYP enabled

This bit is automatically cleared by hardware upon the completion of the key preparation (ALGOMODE[3:0] at 0x7) and upon the completion of GCM/GMAC/CCM initialization phase.

The bit cannot be set as long as KEYVALID is cleared.

Bit 14 **FFLUSH:** FIFO flush

This bit enables/disables the flushing of CRYP input and output FIFOs. Reading this bit always returns 0.

0: No effect

1: FIFO flush enabled

When CRYPEN is cleared, writing this bit to 1 flushes both input and output FIFOs (that is read and write pointers of the FIFOs are reset).

FFLUSH bit must be set when BUSY is cleared, otherwise the FIFO is flushed, but the block being processed may be pushed into the output FIFO just after the flush operation, resulting in a non-empty FIFO condition.

Attempts to write FFLUSH are ignored when CRYPEN is set.

Bits 13:10 Reserved, must be kept at reset value.

Bits 9:8 **KEYSIZE[1:0]**: Key size selection

This bitfield defines the key length in bits of the key used by CRYP in AES mode (that is, it has no effect in the DES or TDES modes).
0x0: 128-bits
0x1: 192 bits
0x2: 256 bits
0x3: Reserved
When KEYSIZE is changed, KEYVALID bit is cleared.
Attempts to write the bitfield are ignored when BUSY is set.

Bits 7:6 **DATATYPE[1:0]**: Data type

This bitfield defines the format of data written in the CRYP_DINR register or read from the CRYP_DOUTR register, through selecting the mode of data swapping. This swapping is defined in *Section 49.4.16: CRYP data registers and data swapping*.
0x0: No swapping (32-bit data).
0x1: Half-word swapping (16-bit data).
0x2: Byte swapping (8-bit data).
0x3: Bit-level swapping.
Attempts to write the bitfield are ignored when BUSY is set.

Bits 19, 5:3 **ALGOMODE[3:0]:** Algorithm mode

This bitfield selects the algorithm/chaining mode.
0x0: TDES-ECB (triple-DES Electronic Codebook)
0x1: TDES-CBC (triple-DES Cipher Block Chaining)
0x2: DES-ECB (simple DES Electronic Codebook)
0x3: DES-CBC (simple DES Cipher Block Chaining)
0x4: AES electronic codebook (AES-ECB)
0x5: AES cipher Block Chaining (AES-CBC)
0x6: AES counter mode (AES-CTR)
0x7: AES key preparation for ECB or CBC decryption
0x8: AES Galois counter mode (AES-GCM) and Galois message authentication code (AES-GMAC)
0x9: AES counter with CBC-MAC (AES-CCM)
0xE: AES Counter mode with DIN = 0 (AES-STS)
Others: Reserved
Changing ALGOMODE[3:0] from AES algorithm to DES or TDES (or the reverse) clears KEYVALID. KEYVALID is not cleared when the algorithm type is kept between two ALGOMODE[3:0], that is between TDES-ECB and TDES-CBC or between AES-ECB and AES_CTR.
Attempts to write the bitfield are ignored when BUSY is set.

Bit 2 **ALGODIR:** Algorithm direction

This bit selects the algorithm direction.
0: Encryption
1: Decryption
Attempts to write the bitfield are ignored when BUSY is set.

Bits 1:0 Reserved, must be kept at reset value.

49.8.2 CRYP status register (CRYP_SR)

Address offset: 0x04

Reset value: 0x0000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	KEY VALID	KERF	Res.	BUSY	OFFU	OFNE	IFNF	IFEM
								r	r		r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **KEYVALID**: Key valid flag

This read-only bit is set by hardware when the key of size defined by KEYSIZE is loaded in CRYP_KxR/LR key registers. It is valid for both AES and DES/TDES algorithms.

0: Key not valid

1: Key valid

The CRYPEN bit can only be set when KEYVALID is set.

In normal mode when KMOD[1:0] is at zero, the key must be written in the key registers in the correct sequence, otherwise the KERF flag is set and KEYVALID remains cleared.

When KMOD[1:0] is different from zero, the BUSY flag is automatically set by CRYP. When the key is loaded successfully, BUSY is cleared and KEYVALID set. Upon an error, KERF is set, BUSY cleared and KEYVALID remains cleared.

If set, KERF must be cleared, otherwise KEYVALID cannot be set. For further information on key loading, refer to *Section 49.4.17: CRYP key registers*.

Bit 6 **KERF**: Key error flag

This read-only bit is set by hardware when key information failed to load into key registers.

0: No key error detected

1: Key information failed to load into key registers

KERF is triggered upon any of the following errors:

- CRYP_KxR/LR register write does not respect the correct order (refer to *Section 49.4.17: CRYP key registers* for details).
- CRYP fails to load the AES key shared by SAES peripheral (KMOD = 0x2).
- Application wrote KMOD = 0x2 with ALGOMODE[3:0] selecting either DES or TDES algorithm.

KERF must be cleared by the application software, otherwise KEYVALID cannot be set. It can be done through IPRST bit of CRYP_CR, or when a correct key writing sequence starts.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **BUSY:** Busy bit

This flag indicates whether CRYP is idle or busy.

0: Idle

1: Busy

CRYP is flagged as idle when disabled (CRYPEN = 0) or when the AES or DES core is not processing any data. It happens when the last processing has completed, or CRYP is waiting for enough data in the input FIFO or enough free space in the output FIFO (that is in each case at least 2 words in the DES, 4 words in the AES).

CRYP is flagged as busy when processing a block data, preparing a key (AES ECB or CBC decryption only), or transferring a shared key from SAES peripheral.

Bit 3 **OFFU:** Output FIFO full flag
0: Output FIFO is not full
1: Output FIFO is full

Bit 2 **OFNE:** Output FIFO not empty flag
0: Output FIFO is empty
1: Output FIFO is not empty

Bit 1 **IFNF:** Input FIFO not full flag
0: Input FIFO is full
1: Input FIFO is not full
This flag is not used when STS mode is selected in CRYP_CR register.

Bit 0 **IFEM:** Input FIFO empty flag
0: Input FIFO is not empty
1: Input FIFO is empty
This flag is not used when STS mode is selected in CRYP_CR register.

49.8.3 CRYP data input register (CRYP_DINR)

Address offset: 0x08

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DIN[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DIN[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DIN[31:0]:** Data input
In AES mode four-fold sequential write to this bitfield during the Input phase results in pushing a complete 16-byte block into the CRYP input FIFO. From the first to the fourth write, the corresponding data weights are [127:96], [95:64], [63:32], and [31:0].
In DES/TDES mode a two-fold sequential write to this bitfield during the Input phase results in pushing a complete 8-bytes block into the CRYP input FIFO. From the first to the second write, the corresponding data weights are [63:32] then [31:0].
Input FIFO can receive up to two 16-byte blocks of plaintext (when encrypting) or ciphertext (when decrypting) in AES mode. In DES/TDES mode it is up to four 8-byte blocks.
If EN bit is set in CRYP_CR register, when at least four 32-bit words have been pushed into the input FIFO (two in DES/TDES mode), and when at least four 32-bit words are free in the output FIFO (two in DES/TDES mode), the CRYP automatically starts an encryption or decryption process, setting the BUSY bit.
Reading this register pops data off the input FIFO (oldest value is returned). The data present in the input FIFO are returned only if CRYPEN is cleared (undefined value is returned otherwise). Following one or more reads the FIFO must be flushed (setting the FFLUSH bit) prior to processing new data.

49.8.4 CRYP data output register (CRYP_DOUTR)

Address offset: 0x0C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DOUT[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DOUT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **DOUT[31:0]:** Data output

In AES mode four-fold sequential read to this bitfield during the output phase results in retrieving a complete 16-byte block from the CRYP output FIFO. From the first to the fourth read, the corresponding data weights are [127:96], [95:64], [63:32], and [31:0].

In DES/TDES mode a two-fold sequential read to this bitfield during the output phase results in retrieving a complete 8-byte block from the CRYP input FIFO. From the first to the second read, the corresponding data weights are [63:32] then [31:0].

Output FIFO can store up to two 16-byte blocks of plaintext (when decrypting) or ciphertext (when encrypting) in AES mode. In DES/TDES mode it is up to four 8-byte blocks.

When the output FIFO is empty a read returns an undefined value. Writes are ignored.

49.8.5 CRYP DMA control register (CRYP_DMACR)

Address offset: 0x10

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DOEN	DIEN
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DOEN:** DMA output enable

When this bit is set, DMA requests are automatically generated by the peripheral during the output data phase.

0: Outgoing data transfer from CRYP via DMA is disabled

1: Outgoing data transfer from CRYP via DMA is enabled

Bit 0 **DIEN:** DMA input enable

When this bit is set, DMA requests are automatically generated by the peripheral during the input data phase.

0: Incoming data transfer to CRYP via DMA is disabled

1: Incoming data transfer to CRYP via DMA is enabled

49.8.6 CRYP interrupt mask set/clear register (CRYP_IMSCR)

Address offset: 0x14

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OUTIM	INIM
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **OUTIM:** Output FIFO service interrupt mask

This bit enables or disables (masks) the CRYP output FIFO service interrupt generation when OUTRIS is set.

0: Output FIFO interrupt is disabled (masked), masked interrupt status (OUTMIS) stays cleared

1: Output FIFO interrupt is enabled (not masked)

Bit 0 **INIM:** Input FIFO service interrupt mask

This bit enables or disables (masks) the CRYP input FIFO service interrupt generation when INRIS is set.

0: Input FIFO interrupt is disabled (masked), masked interrupt status (INMIS) stays cleared

1: Input FIFO interrupt is enabled (not masked)

49.8.7 CRYP raw interrupt status register (CRYP_RISR)

Address offset: 0x18

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OUTRIS	INRIS
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **OUTRIS:** Output FIFO service raw interrupt status

This read-only bit is set by hardware when an output FIFO flag (OFFU or OFNE) is set in CRYP_SR register, regardless of the OUTIM mask bit value in CRYP_IMSCR register.

0: No output FIFO event detected

1: Output FIFO full or not empty detected; an interrupt is generated if OUTIM bit is set in CRYP_IMSCR register

Bit 0 **INRIS:** Input FIFO service raw interrupt status

This read-only bit is set by hardware when an input FIFO flag (IFNF or IFEM) is set in CRYP_SR register, regardless of the INIM mask bit value in CRYP_IMSCR register.

0: No input FIFO event detected

1: Input FIFO empty or not full detected; an interrupt is generated if CRYPEN is set and if INIM bit is set in CRYP_IMSCR register

49.8.8 CRYP masked interrupt status register (CRYP_MISR)

Address offset: 0x1C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OUTMIS	INMIS
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **OUTMIS:** Output FIFO service masked interrupt status

This read-only bit is set by hardware when an output FIFO flag (OFFU or OFNE) is set in CRYP_SR register. If the OUTIM mask bit is cleared in CRYP_IMSCR register, the OUTMIS bit stays cleared (masked).

0: No output FIFO event detected or OUTIM mask cleared in CRYP_IMSCR

1: Output FIFO full or not empty detected, with an interrupt pending

The OUTMIS bit is cleared by reading data from the output FIFO until OFNE flag is cleared (output FIFO empty). It is not cleared by disabling CRYP with CRYPEN bit.

Bit 0 **INMIS:** Input FIFO service masked interrupt status

This read-only bit is set by hardware when an input FIFO flag (IFNF or IFEM) is set in CRYP_SR register. If the INIM mask bit is cleared in CRYP_IMSCR register, the INMIS bit stays cleared (masked).

0: No input FIFO event detected or INIM mask cleared in CRYP_IMSCR or CRYPEN bit cleared.

1: Input FIFO empty or not full detected, with an interrupt pending

The INMIS bit is cleared by writing data to the input FIFO until IFEM flag is cleared (there is at least one word in input FIFO), or by clearing CRYPEN,

When CRYP is disabled, INMIS bit stays low even if the input FIFO is empty.

49.8.9 CRYP key register 0L (CRYP_K0LR)

Address offset: 0x20

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
K[255:240]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
K[239:224]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **K[255:224]**: Key bit x (x = 255 to 224)

This write-only bitfield contains the bits [255:224] of the AES encryption or decryption key, depending on the operating mode. This register is not used in DES/TDES mode.

Write to CRYP_KxR/LR registers is ignored when CRYP is busy (BUSY bit set). When key is coming from the SAES peripheral (KMOD[1:0] = 0x2) in AES mode, write is also ignored. With KMOD[1:0] at 0x0, a special writing sequence is required. In this sequence, any valid write to CRYP_KxR/LR register clears the KEYVALID flag except for the sequence-completing write that sets it. Also refer to the description of the KEYVALID flag in the CRYP_SR register.

49.8.10 CRYP key register 0R (CRYP_K0RR)

Address offset: 0x24

Reset value: 0x0000 0000

K[207:192]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **K[223:192]**: Key bit x (x = 223 to 192)

This write-only bitfield contains the bits [223:192] of the AES encryption or decryption key, depending on the operating mode. This register is not used in DES/TDES mode.

Refer to the CRYP_K0LR register for information relative to writing CRYP_KxR/LR registers.

49.8.11 CRYP key register 1L (CRYP_K1LR)

Address offset: 0x28

Reset value: 0x0000 0000

K[175:160]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **K[191:160]**: Key bit x (x = 191 to 160)

This write-only bitfield contains the bits [191:160] of the AES encryption or decryption key, depending on the operating mode. In DES/TDES mode this bitfield contains the bits [64:33] of the key K1, with parity bits unused.

Refer to the CRYP_K0LR register for information relative to writing CRYP_KxR/LR registers.

49.8.12 CRYP key register 1R (CRYP_K1RR)

Address offset: 0x2C

Reset value: 0x0000 0000

Bits 31:0 **K[159:128]**: Key bit x (x = 159 to 128)

This write-only bitfield contains the bits [159:128] of the AES encryption or decryption key, depending on the operating mode. In DES/TDES mode this bitfield contains the bits [32:1] of the key K1, with parity bits unused.

Refer to the CRYP_K0LR register for information relative to writing CRYP_KxR/LR registers.

49.8.13 CRYP key register 2L (CRYP_K2LR)

Address offset: 0x30

Reset value: 0x0000 0000

IVI[111:96]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **IVI[127:96]**: Initialization vector bit x (x = 127 to 96)

This bitfield stores the initialization vector bits [127:96] for AES chaining modes other than ECB. In DES/TDES mode it corresponds to IVI bits [63:32].

The value stored in CRYP_IVxR/LR registers is updated by hardware after each computation round (when applicable).

Write to this register is ignored when CRYP is busy (BUSY bit set).

49.8.18 CRYP initialization vector register 0R (CRYP_IV0RR)

Address offset: 0x44

Reset value: 0x0000 0000

IVI[79:64]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **IVI[95:64]**: Initialization vector bit x (x = 95 to 64)

This bitfield stores the initialization vector bits [95:64] for AES chaining modes other than ECB. In DES/TDES mode it corresponds to IVI bits [31:0].

The value stored in CRYP_IVxR/LR registers is updated by hardware after each computation round (when applicable).

Write to this register is ignored when CRYP is busy (BUSY bit set).

49.8.19 CRYP initialization vector register 1L (CRYP_IV1LR)

Address offset: 0x48

Reset value: 0x0000 0000

50 Hash processor (HASH)

50.1 HASH introduction

The hash processor is a fully compliant implementation of the secure hash algorithm (SHA-1, SHA-2 family, SHA-3 family) and the HMAC (keyed-hash message authentication code) algorithm. HMAC is suitable for applications requiring message authentication.

The hash processor computes FIPS (Federal Information Processing Standards) approved digests of length of 160, 224, 256, 384 and 512 bits, for messages of any length less than 2^{64} bits (for SHA-1, SHA-224 and SHA-256) or less than 2^{128} bits (for SHA-384, SHA-512).

50.2 HASH main features

- Suitable for data authentication applications, compliant with:
  - Federal Information Processing Standards Publication FIPS PUB 180-4, *Secure Hash Standard* (SHA-1 and SHA-2 family)
  - Federal Information Processing Standards Publication FIPS PUB 186-4, *Digital Signature Standard (DSS)*
  - Internet Engineering Task Force (IETF) Request For Comments RFC 2104, *HMAC: Keyed-Hashing for Message Authentication* and Federal Information Processing Standards Publication FIPS PUB 198-1, *The Keyed-Hash Message Authentication Code (HMAC)*
  - Federal Information Processing Standards Publication FIPS PUB 202, *Secure Hash Standard* (SHA-3 family)
- Fast computation of SHA-1, SHA2-224, SHA2-256, SHA2-384, and SHA2-512
  - 82 (respectively 66) clock cycles for processing one 512-bit block of data using SHA-1 (respectively SHA-256) algorithm
  - 98 clock cycles for processing one 1024-bit block of data using either SHA2-384 or SHA2-512 algorithm
  - Support for SHA-2 truncated outputs (SHA2-512/224, SHA2-512/256)
- Support for the six Keccak-based functions defined in FIPS 202 standard
  - Fixed output length: SHA3-224, SHA3-256, SHA3-384 and SHA3-512
  - Extendable-output functions: SHAKE128 and SHAKE256
  - One cycle per Keccak round, hence 58 cycles per 1088-bit block for SHA3-256
- Support for HMAC mode with all supported algorithm
- Corresponding 32-bit words of the digest from consecutive message blocks are added to each other to form the digest of the whole message
  - Automatic 32-bit words swapping to comply with the internal little-endian representation of the input bit-string
  - Supported word swapping format: bits, bytes, half-words, and 32-bit words
- Single 32-bit, write-only, input register associated to an internal input FIFO that can receive a single data block of size depending on the selected algorithm
- Automatic padding to complete the input bit string to fit digest minimum block size
- AMBA AHB target peripheral, accessible through 32-bit word single accesses only (otherwise an AHB bus error is generated, and write accesses are ignored)

- 50 × 32-bit words (HR0 to HR41) for output message digest and general purpose SHA-3 outputs
- Automatic data flow control supporting direct memory access (DMA) using one channel.
- Support for both single and fixed DMA burst transfers of four words.
- Interruptible message digest computation, on a per-block basis
  - Reloadable digest registers
  - Hashing computation suspend/resume mechanism, including DMA

50.3 HASH implementation

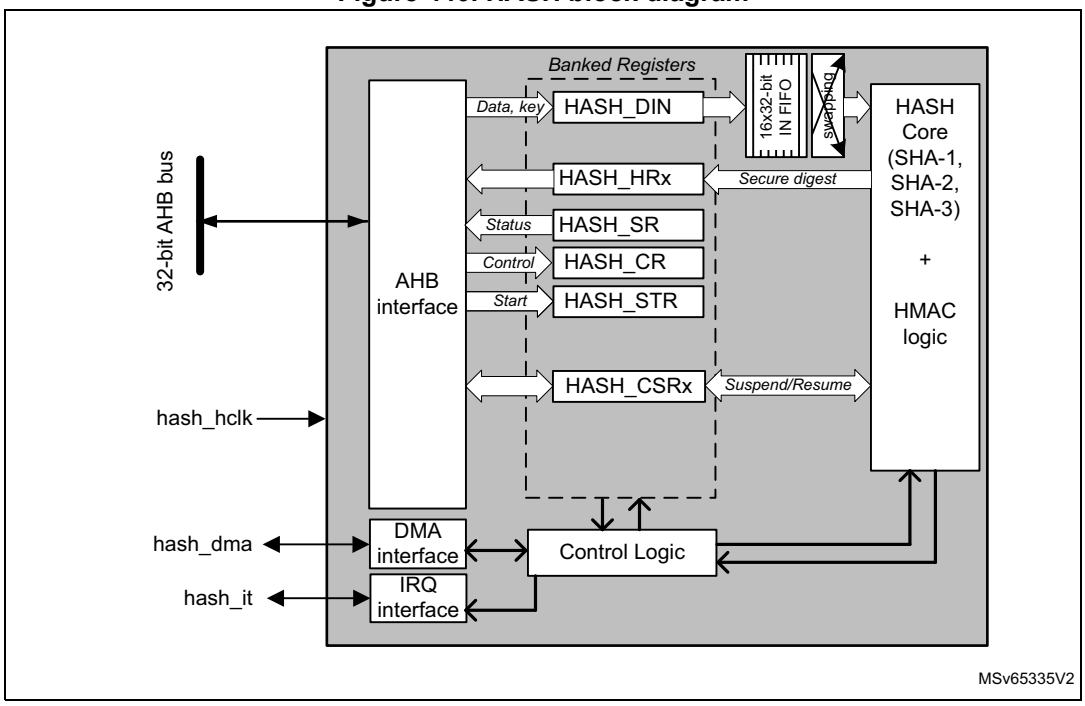
The devices have two instances of HASH peripheral.

50.4 HASH functional description

50.4.1 HASH block diagram

Figure 440 shows the block diagram of the hash processor.

Figure 440. HASH block diagram



50.4.2 HASH internal signals

Table 470 describes a list of useful to know internal signals available at HASH level, not at product level (on pads).

Table 470. HASH internal input/output signals

Signal name	Signal type	Description
hash_hclk	digital input	AHB bus clock
hash_it	digital output	Hash processor global interrupt request
hash_dma	digital input/output	DMA burst request/ acknowledge

50.4.3 About secure hash algorithms

The hash processor is a fully compliant implementation of the secure hash algorithm defined by FIPS PUB 180-4 and FIPS PUB 202 standards.

With each algorithm, the HASH computes a condensed representation of a message or data file. More specifically, when a message is presented on the input, the HASH processing core produces a fixed-length output string called a message digest (see *Table 471*).

Table 471. Information on supported hash algorithms

Algorithm	Message digest size (in bits)	Block size (in bytes)(1)	Message length	Bit string message
SHA-1	160	64	$< 2^{64}$ bits	Yes
SHA2-224	224			
SHA2-256	256			
SHA2-384	384	128	$< 2^{128}$ bits	Yes
SHA2-512	512(2)			
SHA3-224	224	144	Any length	No(3)
SHA3-256	256	136		
SHA3-384	384	104		
SHA3-512	512	72		
SHAKE128	Variable output(4)	168		
SHAKE256		136		

1. Block size = (NBWE-1) * 4 bytes. NBWE[5:0] bitfield can be read from the HASH_SR register after ALGO and INIT bits are written in the HASH_CR register.
2. Digest size is 224 bits for SHA2-512/224 and 256 bits for SHA2-512/256 (truncated modes).
3. Data is fed as byte strings, not bit strings.
4. When the expected digest length is not reached (unbounded output), a new computation is required by setting DCAL in HASH_STR register. The number of computations equals the expected digest output length divided by the block size. The block size (or input rate) represents the maximum digest output that can be read after each computation.

The message digest can then be processed with a digital signature algorithm in order to generate or verify the signature for the message.

Signing the message digest rather than the message often improves the efficiency of the process since the message digest is usually much smaller in size than the message. The verifier of a digital signature has to use the same hash algorithm as the one used by the creator of the digital signature.

The SHA-2 and SHA-3 functions supported by the hash processor are qualified as “secure” by NIST because it is computationally infeasible to find a message that corresponds to a given message digest, or to find two different messages that produce the same message digest (SHA-1 does not qualify as secure since February 2017).

An extendable output function (XOF) SHAKE generates as many bits from its sponge as requested. For example, as per the NIST standard, for a message M and an output length d:

- SHAKE128(M,d = 256) can be used as a hash function delivering a 256-bit bit stream with 128-bit security strength. Arbitrarily large lengths can be used as pseudorandom number generators.
- SHAKE256(M, d = 128) can be used as a hash function with a 128-bit length and 128-bit resistance.

In compliance with FIPS PUB 202, SHAKE sponge functions provide different levels of preimage resistance (128 bits for SHAKE128, 256 bits for SHAKE256), provided the output size is no less than 128 bits for SHAKE128, and 256 bits for SHAKE256.

When the application selects a different output size, the security level is defined as follows (capacity_size = 256 for SHAKE128, 512 for SHAKE256):

- Security target against collisions = min (capacity_size / 2, output_size / 2)
- Security target against preimage attacks = min (capacity_size / 2, output_size)

50.4.4 Message data feeding

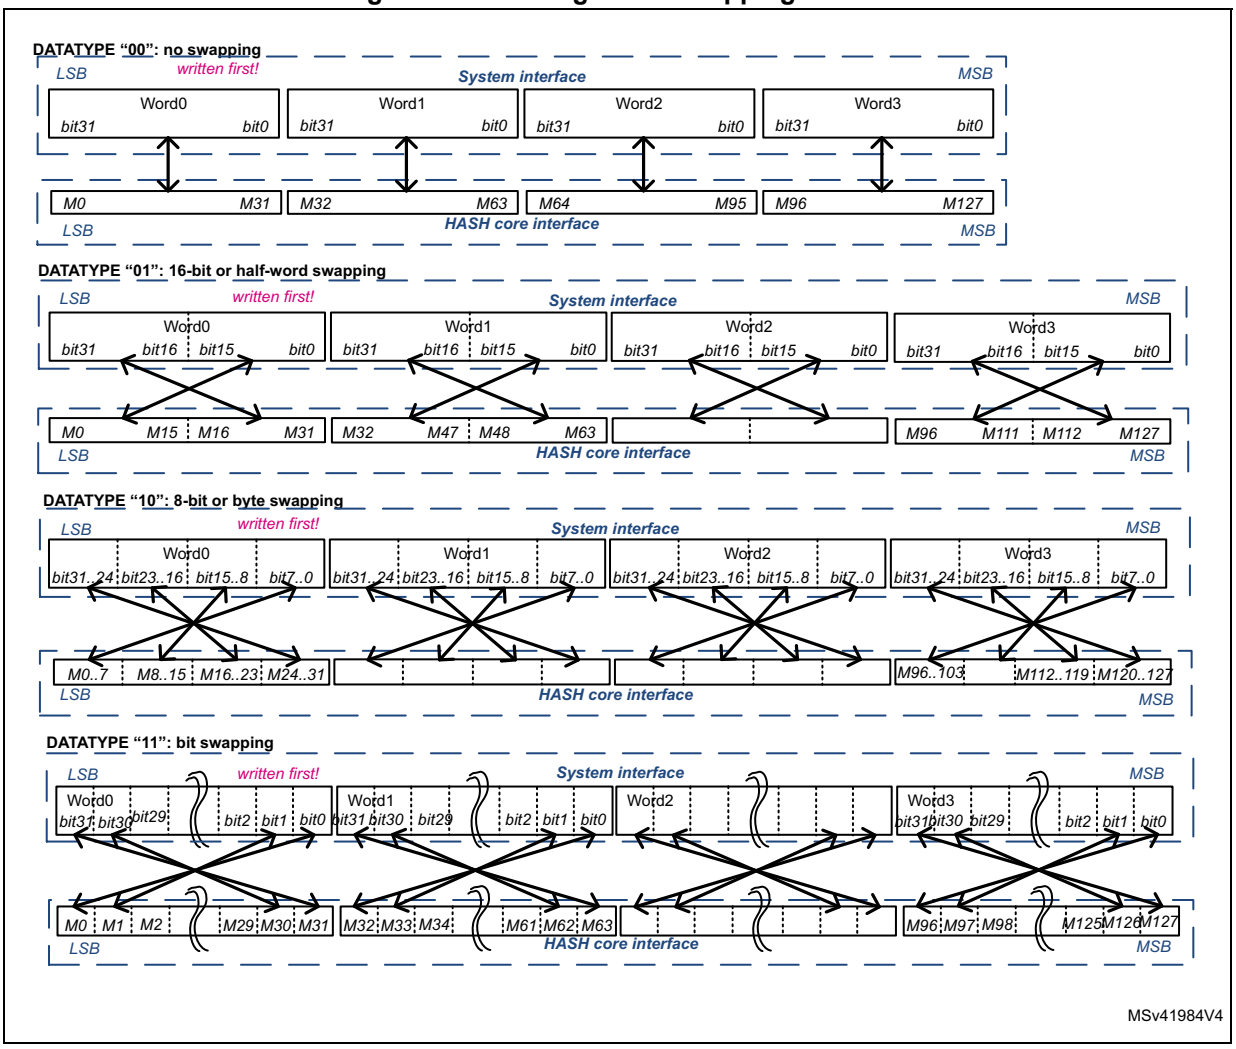
The message (or data file) to be processed by the HASH must be considered as a bit string, except for SHA-3 modes (see *Table 471*) where the message is a byte string. Per FIPS PUB 180-4 standard this message bit string grows from left to right, with hexadecimal words expressed in “big-endian” convention, so that within each word, the most significant bit is stored in the left-most bit position. For example message string “abc” with a bit string representation of “**01100001 01100010 01100011**” is represented by a 32-bit word **0x00636261**, and 8-bit words **0x61626300**.

Data are entered into the HASH one 32-bit word at a time, by writing them into the HASH_DIN register. The current contents of the HASH_DIN register are transferred to the 16 words input FIFO each time the register is written with new data. Hence, HASH_DIN and the FIFO form a seventeen 32-bit words length FIFO (named the IN buffer).

In accordance to the kind of data to be processed (for example byte swapping when data are ASCII text stream) there must be a bit, byte, half-word, or no swapping operation to be performed on data from the input FIFO before entering the little-endian hash processing core. *Figure 441* shows how the hash processing core 32-bit data block M0...31 is constructed from one 32-bit words popped into input FIFO by the driver, according to the DATATYPE bitfield in the HASH control register (HASH_CR)

HASH_DIN data endianness when bit swapping is disabled (DATATYPE = 00) can be described as following: the least significant bit of the message has to be at MSB position in the first word entered into the hash processor, the 32nd bit of the bit string has to be at MSB position in the second word entered into the hash processor and so on.

Figure 441. Message data swapping feature



50.4.5 Message digest computing

The hash processor sequentially processes several blocks when computing the message digest. Block sizes can be found in *Table 471: Information on supported hash algorithms*.

Each time the DMA or the CPU writes a block to the hash processor, the HASH automatically starts computing the message digest. This operation is known as partial digest computation.

As described in *Section 50.4.4: Message data feeding*, the message to be processed is entered into the HASH 32-bit word at a time, writing to the HASH_DIN register to fill the input FIFO. In order to perform the hash computation on this data the application must follow below sequence.

1. Initialize the hash processor using the HASH_CR register:
   – Write to the HASH_CR register to select the right algorithm using the ALGO bitfield, and set the INIT bit (other bits are kept at zero). Then read the NBWE bitfield from the HASH_SR register to deduce the algorithm block size, which equals **(NBWE-1) * 4**. This step is not required if the block size is already known (see *Table 471* for details).
   – Select the right algorithm using the ALGO[3:0] field. If needed, program the correct swapping operation on the message input words using the DATATYPE[1:0] bitfield.
   – When HMAC mode is required, set the MODE bit as well as the LKEY bit if the HMAC key size is greater than the known block size of the algorithm (otherwise keep LKEY cleared). Refer to *Section 50.4.7: HMAC operation* for details.
   – Update NBLW[4:0] in the HASH_STR register to define the number of valid bits in the last word of the message if it is different from 32 bits. NBLW information is used to correctly perform the automatic message padding before the final message digest computation.
2. Complete the initialization by setting the INIT bit in HASH_CR register. Also set the DMAE bit if data are transferred via DMA.

Caution: When programming step 2, it is important that the correct configuration values (ALGO, DATATYPE, HMAC mode, key length, NBLW) are set up before or at the same time.

3. Start filling data by writing to the HASH_DIN register, unless data are automatically transferred via DMA. Note that the processing of a block can start only once the last value of the block has entered the input FIFO. The way the partial or final digest computation is managed depends on the way data are fed into the processor:
   – Data are filled by software:

     Partial digest computations are triggered each time the application writes the first word of the next block, the block size being defined by NBWE bits in HASH_SR. Once the processor is ready again (DINIS = 1 in HASH_SR), the software can write new data to HASH_DIN. This mechanism avoids the introduction of wait states by the HASH.

     The final digest computation is triggered when the last block is entered and the software sets the DCAL bit. If the message length is not an exact multiple of the block size, the NBLW field in HASH_STR register must be written prior to writing DCAL bit (see *Section 50.4.6* for details).
   – Data are filled as a single DMA transfer (MDMAT = 0):

     Partial digest computations are triggered automatically each time the FIFO is full.

     The final digest computation is triggered automatically when the last block has been transferred to the HASH_DIN register by DMA (DCAL bit is set by hardware). If the message length is not an exact multiple of the block size, the NBLW field in HASH_STR register must be written prior to enabling the DMA (see *Section 50.4.6* for details).
   – Data are filled using multiple DMA transfers (MDMAT = 1):

     Partial digest computations are triggered as for single DMA transfers (refer to the above description). However, the final digest computation is not triggered automatically when the last block has been transferred by DMA to the HASH_DIN register (DCAL bit is not set by hardware). It enables the hash processor to receive a new DMA transfer as part of this digest computation. To launch the final digest computation, the software must clear MDMAT bit before the last DMA

transfer in order to trigger the final digest computation as it is done for single DMA transfers.

4. Once the digest calculation is completed (DCIS = 1), the resulting digest can be read from the output registers, as described in *Table 472*. When set, the DMAEN bit is automatically cleared by hardware.
5. For SHAKE128 or SHAKE256, a single computation may not be not sufficient (actual number of computation = expected output length divided by the block size). For each additional computation, execute the sequence below in CPU mode after step 4:
   a) Set DCAL in HASH_STR register.
   b) Wait for DCIS = 1, then read the new resulting digest from the same output registers. If an additional computation is required, go to step a.

Table 472. Hash processor outputs

Algorithm	Valid output registers(1)	Most significant bit	Digest size (in bits)
SHA-1	HASH_H0 to HASH_H4	HASH_H0[31]	160
SHA2-224	HASH_H0 to HASH_H6	HASH_H0[31]	224
SHA2-256	HASH_H0 to HASH_H7		256
SHA2-384	HASH_H0 to HASH_H11	HASH_H0[31]	384
SHA2-512	HASH_H0 to HASH_H15		512(2)
SHA3-224	HASH_H0 to HASH_H6	HASH_H0[31]	224
SHA3-256	HASH_H0 to HASH_H7		256
SHA3-384	HASH_H0 to HASH_H11		384
SHA3-512	HASH_H0 to HASH_H15		512
SHAKE128	HASH_H0 to HASH_H41		Variable output(3)
SHAKE256	HASH_H0 to HASH_H33		

1. Aliased HASH_HRAx registers are not used with SHA-3 or SHAKE algorithm (registers read as zero).
2. Digest size is 224 bits for SHA2-512/224 and 256 bits for SHA2-512/256 (truncated modes)
3. Unbounded in the upper limit (extendable output functions), see *Table 471*.

For more information about HMAC detailed instructions, refer to *Section 50.4.7: HMAC operation*.

Aborting HASH operation

HASH can be disabled at any time by writing 0x4 to HASH_CR, after stopping any running DMA transfer to HASH (if applicable).

50.4.6 Message padding

Overview

When computing a condensed representation of a message, the process of feeding data into the hash processor (with automatic partial digest computation every block size transfer) loops until the last bits of the original message are written to the HASH_DIN register.

As the length (number of bits) of a message can be any integer value, the last word written to the hash processor may have a valid number of bits between 1 and 32. This number of valid bits in the last word, NBLW, has to be written to the HASH_STR register, so that message padding is correctly performed before the final message digest computation.

Note: When a SHA-3 mode is selected in HASH_CR register, the message is defined as a number of bytes with the last word having a valid number of bytes between 1 and 4. Consequently NBLW bits 0 to 2 are read as zeros in HASH_STR register and writes to 1 are ignored.

Padding processing

Detailed hashing sequences with padding are described in *Section 50.4.5: Message digest computing*. As mentioned in these sequences, the padding is done automatically using the information provided in NBLW[4:0].

Hashing example

Below is an example of SHA-1 digest computation with HASH. Message processing and padding are defined in Federal Information Processing Standards PUB 180-4.

Let us assume that the original message is the ASCII binary-coded form of “abc”, of length L = 24 (‘**U**’ means don’t care):

```
byte 0    byte 1   byte 2   byte 3
01100001 01100010 01100011 UUUUUUUU
<-- 1st word written to HASH_DIN -->
```

NBLW has to be loaded with the value 24: a “**1**” is appended at bit location 24 in the bit string (starting counting from left to right in the above bit string), which corresponds to bit 31 in the HASH_DIN register (little-endian convention):

```
01100001 01100010 01100011 1UUUUUUU
```

Since L = 24, the number of bits in the above bit string is 25, and 423 “0” bits are automatically appended, making now 448 bits.

This gives in hexadecimal (byte words in big-endian format):

```
61626380 00000000 00000000 00000000
00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000
00000000 00000000
```

The message length value, **L**, in two-word format (that is 00000000 00000018) is appended. Hence, the final padded message in hexadecimal (byte words in big-endian format):

```
61626380 00000000 00000000 00000000
00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000018
```

If the hash processor is programmed to swap byte within HASH_DIN input register (DATATYPE = 10 in HASH_CR), the above message has to be entered using following sequence:

1. **0xUU636261** is written to the HASH_DIN register (where '**U**' means don't care)
2. **0x18** is written to the HASH_STR register (the number of valid bits in the last word written to the HASH_DIN register is 24, as the original message length is 24 bits)
3. **0x100** is written to the HASH_STR register to run the final digest computation.
4. The hash computing is complete with the message digest available in the HASH_HRx registers (x = 0 to 4) for the SHA-1 algorithm. For this FIPS example, the expected value is as follows:

```
HASH_HR0 = 0xA9993E36
HASH_HR1 = 0x4706816A
HASH_HR2 = 0xBA3E2571
HASH_HR3 = 0x7850C26C
HASH_HR4 = 0x9CD0D89D
```

50.4.7 HMAC operation

Overview

As specified by Internet Engineering Task Force RFC2104 and NIST FIPS PUB 198-1, the HMAC algorithm is used for message authentication by irreversibly binding the message being processed to a key chosen by the user. The algorithm consists of two nested hash operations:

```
HMAC(message)= Hash((Key | pad) XOR opad |
               Hash((Key | pad) XOR ipad | message))
```

Where:

- **opad** = $[0x5C]_n$ (outer pad) and **ipad** = $[0x36]_n$ (inner pad)
- $[X]_n$ represents a repetition of X *n* times, where *n* equal to the byte size of the underlying hash function data block (n = 64 when block size is 512 bits).
- **pad** is a sequence of zeroes needed to extend the key to the length *n* defined above. If the key length is greater than *n*, the application must first hash the key using Hash() function and then use the resultant byte string as the actual key to HMAC.
- | represents the concatenation operator.

Note: HMAC mode of the hash processor can be used with all supported algorithms, except SHAKE.

HMAC processing

Four different steps are required to compute the HMAC:

1. The software sets the INIT bit, with the MODE bit set and the ALGO bits selecting the desired algorithm. The LKEY bit must also be set if the key being used is longer than the block size. In this case, as required by HMAC specifications, the hash processor uses the hash of the key instead of the real key.
2. The software provides the key to be used for the inner hash function, using the same mechanism as the message string loading that is by writing the key data into

HASH_DIN register and then completing the transfer by setting DCAL bit and the correct NBLW to HASH_STR register.

3. Once the processor is ready again (DINIS = 1 in HASH_SR), the software can write the message string to HASH_DIN. When the last word of the last block is entered and the software sets DCAL bit in HASH_STR register, the NBLW bitfield must be programmed at the same time to a value different from zero if the message length is not an exact multiple of the block size. Note that the DMA can also be used to feed the message string, as described in *Section 50.4.5: Message digest computing*.
4. Once the processor is ready again (DINIS = 1 in HASH_SR), the software provides the key to be used for the outer hash function, writing the key data into HASH_DIN register, and then completing the transfer by setting DCAL bit and programming the correct NBLW to HASH_STR register. The HMAC result can be found in the valid output registers (HASH_HRx) as soon as DCIS bit is set.

Note: The computation latency of the HMAC primitive depends on the lengths of the keys and message, as described in Section 50.4.11: HASH processing time.

Endianness management details can be found in Section 50.4.4: Message data feeding.

HMAC example

Below is an example of HMAC SHA-1 algorithm (ALGO = 00 and MODE = 1 in HASH_CR) as specified by NIST. SHA-1 block size is 64 bytes.

Let us assume that the original message is the ASCII binary-coded form of "**`Sample message for keylen = blocklen`**", of length L = 34 bytes. If the HASH is programmed in no swapping mode (DATATYPE = 00 in HASH_CR), the following data must be loaded sequentially into HASH_DIN register:

1. **Inner hash key** input (length = 64, that is, no padding), specified by NIST. As key length = 64, LKEY bit is cleared in HASH_CR register

```
00010203 04050607 08090A0B 0C0D0E0F 10111213 14151617
18191A1B 1C1D1E1F 20212223 24252627 28292A2B 2C2D2E2F
30313233 34353637 38393A3B 3C3D3E3F
```

2. **Message** input (length = 34, that is, padding required). HASH_STR must be set to **`0x20`** to start message padding and inner hash computation (see **'U**' as don't care)

```
53616D70 6C65206D 65737361 67652066 6F72206B 65796C65
6E3D626C 6F636B6C 656EUUUU
```

3. **Outer hash key** input (length = 64, that is, no padding). A key identical to the inner hash key is entered here.
4. **Final outer hash computing** is then performed by the HASH. The HMAC-SHA1 digest result is available in the HASH_HRx registers, as shown below:

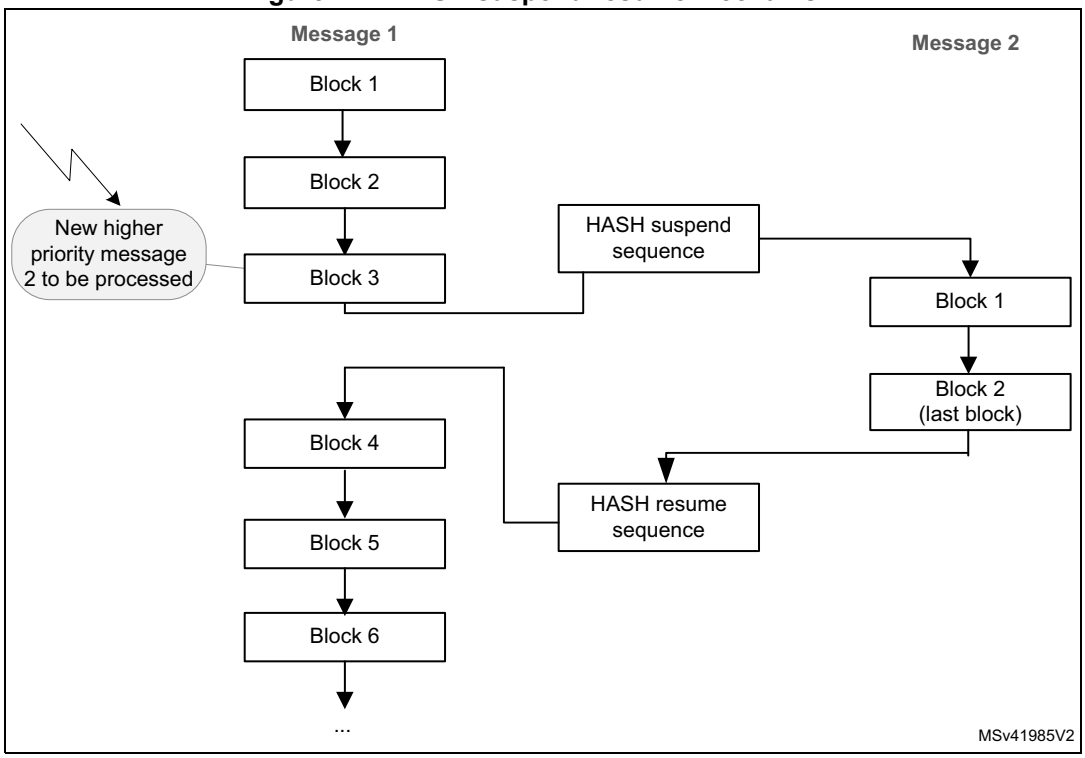
```
HASH_HR0 = 0x5FD596EE
HASH_HR1 = 0x78D5553C
HASH_HR2 = 0x8FF4E72D
HASH_HR3 = 0x266DFD19
HASH_HR4 = 0x2366DA29
```

50.4.8 HASH suspend/resume operations

Overview

It is possible to interrupt a hash/HMAC operation to perform another processing with a higher priority. The interrupted process completes later when the higher-priority task has been processed, as shown in *Figure 442*.

Figure 442. HASH suspend/resume mechanism



To do so, the context of the interrupted task must be saved from the HASH registers to memory, and then be restored from memory to the HASH registers.

The procedures where the data flow is controlled by software or by DMA are described hereafter.

Data loaded by software

When the DMA is not used to load the message into the hash processor, the context can be saved only when no block processing is ongoing.

To suspend the processing of a message, proceed as follows after writing the number of words defined in NBWE:

1. In Polling mode, wait for BUSY = 0 then poll if the DINIS status bit is set.
   In Interrupt mode, implement the next step in DINIS interrupt handler (recommended).
2. Store the contents of the following registers into memory:
   - HASH_IMR
   - HASH_STR
   - HASH_CR
   - HASH_CSR0 to HASH_CSR37, when SHA-1 or SHA2-256 is selected, plus HASH_CSR38 to HASH_CSR53 if an HMAC operation was ongoing
   - HASH_CSR0 to HASH_CSR90, when SHA2-384 or SHA2-512 (truncated or not) is selected, plus HASH_CSR91 to HASH_CSR102 if an HMAC operation was ongoing.
   - HASH_CSR0 to HASH_CSR71, when SHA-3 is selected, plus HASH_CSR72 to HASH_CSR87 if a SHA3-384 or SHA3-512 HMAC operation was ongoing.

To resume the processing of a message, proceed as follows:

1. Write the following registers with the values saved in memory: HASH_IMR, HASH_STR, HASH_CR.
2. Initialize the hash processor by setting the INIT bit in the HASH_CR register
3. Write the HASH_CSRx registers with the values saved in memory.
4. Restart the processing from the point where it has been interrupted.

Data loaded by DMA

When the DMA is used to load the message into the hash processor, it is recommended to suspend and then restore a secure digest computing as described below.

In this sequence the DMA channel allocated to the hash peripheral remains allocated to the processing of message 1 (see *Figure 442*).

To suspend the processing of a message using DMA, proceed as follows:

1. Clear the DMAE bit to disable the DMA interface. The hash peripheral automatically fetches enough data via the DMA to complete the current burst transfer.
2. Wait until the last DMA transfer is complete (DMAS = 0 in HASH_SR).
3. Disable the DMA channel.
4. In Polling or Interrupt mode (recommended), wait until the hash processor is ready (no block is being processed), that is wait for DINIS = 1 in HASH_SR. If DCIS is also set in

HASH_SR, the hash result is available and the context swapping is useless. Else go to step 5.

5. Save HASH_IMR, HASH_STR and HASH_CR registers. Also save a number of HASH_CSRx registers depending on the SHA algorithm that is used:
   - When SHA-1 or SHA2-256 is selected, save HASH_CSR0 to HASH_CSR37, plus HASH_CSR38 to HASH_CSR53 if an HMAC operation was ongoing.
   - When SHA2-384 or SHA2-512 is selected, save HASH_CSR0 to HASH_CSR90, plus HASH_CSR91 to HASH_CSR102 if an HMAC operation was ongoing.
   - When a SHA-3 algorithm is selected, save HASH_CSR0 to HASH_CSR71, plus HASH_CSR72 to HASH_CSR87 if a SHA3-384 or SHA3-512 HMAC operation was ongoing.

To resume the processing of a message using DMA, proceed as follows:

1. Reconfigure the DMA controller so that it proceeds with the transfer of the message up to the end if it is not interrupted again.
2. Program the values saved in memory to HASH_IMR, HASH_STR and HASH_CR registers.
3. Initialize the hash processor by setting the INIT bit in the HASH_CR register.
4. Program the values saved in memory to the HASH_CSRx registers.
5. Restart the processing from the point where it was interrupted by setting the DMAE bit.

50.4.9 HASH DMA interface

The HASH supports both single and fixed DMA burst transfers of four words.

The hash processor provides an interface to connect to the DMA controller. This DMA can be used to write data to the HASH by setting the DMAE bit in the HASH_CR register. When this bit is set, the HASH initiates a DMA request each time a block has to be written to the HASH_DIN register.

Once four 32-bit words have been received, the HASH automatically triggers a new request to the DMA. For more information, refer to *Section 50.4.5: Message digest computing*.

Before starting the DMA transfer, the software must program the number of valid bits in the last word that is copied into HASH_DIN register. This is done by writing in HASH_STR register the following value:

`NBLW = Len(Message)% 32` where "**`x%32`**" gives the remainder of x divided by 32.

Note: While a SHA-3 algorithm is selected in HASH_CR register bits 0 to 2 of NBLW are always zero (processing of bytes, not bits).

The DMAS bit of the HASH_SR register provides information on the DMA interface activity. This bit is set with DMAE and cleared when DMAE is cleared and no DMA transfer is ongoing.

Note: No interrupt is associated to DMAS bit.

When MDMAT is set, the size of the transfer must be a multiple of four words.

50.4.10 HASH error management

No error flags are generated by the hash processor.

50.4.11 HASH processing time

Table 473 summarizes the time required to process an intermediate block for each mode of operation.

Table 473. Processing time (in clock cycle)

Mode of operation	Block size (in bytes)	FIFO load(1)	Computation phase	Total
SHA-1	64	16	66	**82**
SHA2-224		16	50	**66**
SHA2-256				
SHA2-384	128	32	66	**98**
SHA2-512(2)				
SHA3-224	144	36	24(3)	**60**
SHA3-256	136	34		**58**
SHA3-384	104	26		**50**
SHA3-512	72	18		**42**

1. Add the time required to load the block into the processor.
2. SHA2-512 includes SHA2-512/224 and SHA2-512/256 modes.
3. One cycle per round, 24 rounds required for these operations.

The time required to process the last block of a message (or of a key in HMAC) can be longer. This time depends on the length of the last block and the size of the key (in HMAC mode).

Compared to the processing of an intermediate block, it can be increased by the factor below:

- **1 to 2.5** for a hash message
- **~2.5** for an HMAC input-key
- **1 to 2.5** for an HMAC message
- **~2.5** for an HMAC output key in case of a short key
- **3.5 to 5** for an HMAC output key in case of a long key

50.5 HASH interrupts

Two individual maskable interrupt sources are generated by the hash processor to signal the following events:

- Digest calculation completion (DCIS)
- Data input buffer ready (DINIS)

Both interrupt sources are connected to the same global interrupt request signal (hash_it), which is in turn connected to the device interrupt controller. Each interrupt source can

individually be enabled or disabled by changing the mask bits in the HASH_IMR register. Setting the appropriate mask bit enables the interrupt.

The status of each maskable interrupt source can be read from the HASH_SR register. *Table 474* gives a summary of the available features.

Table 474. HASH interrupt requests

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method
HASH	Digest computation completed	DCIS	DCIE	Clear DCIS or set INIT
	Data input buffer ready to get a new block	DINIS	DINIE	Clear DINIS or write to HASH_DIN

50.6 HASH registers

The hash core is associated with several control and status registers and several message digest registers. All these registers are accessible through 32-bit word accesses only, else an AHB error is generated.

50.6.1 HASH control register (HASH_CR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ALGO[3:0]				LKEY
											rw	rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	MDMAT	DINNE	NBW[3:0]				Res.	MODE	DATATYPE[1:0]		DMAE	INIT	Res.	Res.
		rw	r	r	r	r	r		rw	rw	rw	rw	w		

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:17 **ALGO[3:0]**: Algorithm selection

These bits select the hash algorithm. This selection is only taken into account when the INIT bit is set. Changing this bitfield during a computation has no effect

When the ALGO bitfield is updated and INIT bit is set, NBWE in HASH_SR is automatically updated to 0x11 when ALGO = 0x00XX.

0000: SHA-1
0001: reserved
0010: SHA2-224
0011: SHA2-256
1100: SHA2-384
1101: SHA2-512/224
1110: SHA2-512/256
1111: SHA2-512
0100: SHA3-224
0101: SHA3-256
0110: SHA3-384
0111: SHA3-512
1000: SHAKE128
1001: SHAKE256
Others: reserved, must not be used

Bit 16 **LKEY**: Long key selection

The application must set this bit if the HMAC key is greater than the block size corresponding to the hash algorithm (see *Table 471: Information on supported hash algorithms* for details). For example the block size is 64 bytes for SHA2-256.

This selection is only taken into account when the INIT and MODE bits are set (HMAC mode selected). Changing this bit during a computation has no effect.

0: HMAC key is shorter or equal to the block size (short key). The actual key value written in HASH_DIN is used during the HMAC computation.

1: HMAC key is longer than the block size (long key). The hash of the key is used instead of the real key during the HMAC computation.

Bit 15 Reserved, must be kept at reset value.

Bit 14 Reserved, must be kept at reset value.

Bit 13 **MDMAT**: Multiple DMA transfers

This bit is set when hashing large files when multiple DMA transfers are needed.

0: DCAL is automatically set at the end of a DMA transfer.

1: DCAL is not automatically set at the end of a DMA transfer.

Bit 12 **DINNE**: DIN not empty

Refer to DINNE bit of HASH_SR for a description of DINNE bit.

This bit is read-only.

Bits 11:8 **NBW[3:0]:** Number of words already pushed

Refer to NBWP[3:0] bitfield of HASH_SR for a description of NBW[3:0] bitfield.

This bitfield is read-only.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **MODE:** Mode selection

This bit selects the normal or the keyed HMAC mode for the selected algorithm. This selection is only taken into account when the INIT bit is set. Changing this bit during a computation has no effect.

0: Hash mode selected

1: HMAC mode selected. LKEY bit must be set if the key being used is longer than the algorithm block size.

Bits 5:4 **DATATYPE[1:0]:** Data type selection

This bitfield defines the format of the data entered into the HASH_DIN register:

00: 32-bit data. The data written into HASH_DIN are directly used by the HASH processing, without reordering.

01: 16-bit data or half-word. The data written into HASH_DIN are considered as two half-words, and are swapped before being used by the HASH processing.

10: 8-bit data or bytes. The data written into HASH_DIN are considered as four bytes, and are swapped before being used by the HASH processing.

11: bit data or bit string. The data written into HASH_DIN are considered as 32 bits (1st bit of the string at position 0), and are swapped before being used by the HASH processing (1st bit of the string at position 31).

Bit 3 **DMAE:** DMA enable

Setting this bit enables DMA transfers. After this bit is set, it is cleared by hardware while the last data of the message is written into the hash processor.

Clearing this bit while a DMA transfer is ongoing does not abort the current transfer. Instead, the DMA interface of the HASH remains internally enabled until the transfer is complete or INIT is set.

Setting INIT bit does not clear DMAE bit.

0: DMA transfers disabled

1: DMA transfers enabled. A DMA request is sent as soon as the hash core is ready to receive data.

Bit 2 **INIT:** Initialize message digest calculation

This is a write-only bit always returning zero upon reading. Setting this bit resets the hash processor core, so that HASH is ready to compute the message digest of a new message. Clearing this bit has no effect.

Bits 1:0 Reserved, must be kept at reset value.

50.6.2 HASH data input register (HASH_DIN)

Address offset: 0x004

Reset value: 0x0000 0000

HASH_DIN is the data input register. It is 32-bit wide. This register is used to enter the message by blocks defined by the hash algorithm (see *Table 471: Information on supported hash algorithms* for details). For example the block size is 64 bytes for SHA2-256.

When the HASH_DIN register is programmed, the value presented on the AHB bus is ‘pushed’ into the hash core and the register takes the new value presented on the AHB bus. To get a correct message format, the DATATYPE bits must have been previously configured in the HASH_CR register.

When a complete block has been written to the HASH_DIN register, an intermediate digest calculation is launched:

- by writing first data of the next block into the HASH_DIN register, if the DMA is not used
- automatically, if the DMA is used

When the last block has been written to the HASH_DIN register, the final digest calculation (including padding) is launched by setting the DCAL bit in the HASH_STR register (final digest calculation). This operation is automatic if the DMA is used and MDMAT bit is cleared.

Reading the HASH_DIN register returns zeros.

Note: When the HASH is busy, a write access to the HASH_DIN register might stall the AHB bus if the digest calculation (intermediate or final) is not complete.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATAIN[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATAIN[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **DATAIN[31:0]:** Data input

Writing this register pushes the current register content into the FIFO, and the register takes the new value presented on the AHB bus.
Do not write to this register when BUSY is set.
Reading this register returns zeros.

50.6.3 HASH start register (HASH_STR)

Address offset: 0x008

Reset value: 0x0000 0000

The HASH_STR register has two functions:

- It is used to define the number of valid bits in the last word of the message entered in the hash processor (that is the number of valid least significant bits in the last data written to the HASH_DIN register)
- It is used to start the processing of the last block in the message by setting the DCAL bit.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCAL	Res.	Res.	Res.	NBLW[4:0]				
							w				rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **DCAL:** Digest calculation

This is a write-only bit always returning zero upon reading. Setting this bit starts the message padding using the previously written value of NBLW, and starts the calculation of the final message digest with all the data words written to the input FIFO since the INIT bit was last set.

Do not set DCAL when BUSY is set.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **NBLW[4:0]:** Number of valid bits in the last word

When the last word of the message bit string is written to HASH_DIN register, the hash processor takes only the valid bits, specified as below, after internal data swapping.

The above mechanism is valid only if DCAL = 0. If NBLW bits are written while DCAL is set, the NBLW bitfield remains unchanged. In other words it is not possible to configure NBLW and set DCAL at the same time.

Reading NBLW bits returns the last value written to NBLW.

0x00: All the 32 bits of the last data written are valid message bits, that is M[31:0]

0x01: Only one bit of the last data written (after swapping) is valid, that is M[0]

0x02: Only two bits of the last data written (after swapping) are valid, that is M[1:0]

0x03: Only three bits of the last data written (after swapping) are valid that is M[2:0]

...

0x1F: Only 31 bits of the last data written (after swapping) are valid that is M[30:0]

Note: When the SHA-3 family is selected, bits 0 to 2 are read as zeros and writes to 1 are ignored (byte oriented input).

50.6.4 HASH digest registers

These registers contain the message digest result defined as follows:

- HASH_HR0, HASH_HR1, HASH_HR2, HASH_HR3 and HASH_HR4 registers return the SHA-1 digest result.
- HASH_HR0 to HASH_HR6 registers return the SHA2-224, SHA2-512/224 or SHA3-224 digest result.
- HASH_HR0 to HASH_HR7 registers return the SHA2-256, SHA2-512/256 or SHA3-256 digest result.
- HASH_HR0 to HASH_HR11 registers return the SHA2-384, or SHA3-384 digest result.
- HASH_HR0 to HASH_HR15 registers return the SHA2-512, or SHA3-512 digest result.
- HASH_HR0 to HASH_HR41 registers return the SHAKE128, while HASH_HR0 to HASH_HR33 registers return the SHAKE256 digest result (see for *Table 472: Hash processor outputs* for details).

In all cases, the digest most significant bit is stored in HASH_HR0[31], and unused HASH_HRx registers reads as zero.

If a read access to one of these registers is performed while the hash core is calculating an intermediate digest or a final message digest (DCIS bit equals 0), then the read operation returns zeros.

Note: When starting a digest computation for a new message (by setting the INIT bit), HASH_HRx registers are forced to their reset values.

HASH_HR0 to HASH_HR4 registers can be accessed through two different addresses (register aliasing), except when the SHA-3 or SHAKE algorithm is selected (aliased registers read as zero).

HASH aliased digest register x (HASH_HRAx)

Address offset: 0x00C + 0x4 * x, (x = 0 to 4)

Reset value: 0x0000 0000

The content of the HASH_HRAx registers is identical to the one of the HASH_HRx registers located at address offset 0x310.

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DCIE:** Digest calculation completion interrupt enable
- 0: Digest calculation completion interrupt disabled
- 1: Digest calculation completion interrupt enabled.

Bit 0 **DINIE:** Data input interrupt enable
- 0: Data input interrupt disabled
- 1: Data input interrupt enabled

50.6.6 HASH status register (HASH_SR)

Address offset: 0x024

Reset value: 0x0011 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NBWE[5:0]					
										r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DINNE	NBWP[5:0]						Res.	Res.	Res.	Res.	Res.	BUSY	DMAS	DCIS	DINIS
r	r	r	r	r	r	r						r	r	rc_w0	rc_w0

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:16 **NBWE[5:0]:** Number of words expected

This bitfield reflects the number of words in the message that must be pushed into the FIFO to trigger a partial computation. NBWE is decremented by 1 when a write access is performed to the HASH_DIN register.

NBWE is set to the expected block size +1 in words when INIT bit is set in HASH_CR. It is set to the expected block size when the partial digest calculation ends.

Bit 15 **DINNE:** DIN not empty

This bit is set when the HASH_DIN register holds valid data (that is after being written at least once). It is cleared when either the INIT bit (initialization) or the DCAL bit (completion of the previous message processing) is set.

0: No data are present in the data input buffer

1: The input buffer contains at least one word of data

Bits 14:9 **NBWP[5:0]:** Number of words already pushed

This bitfield is the exact number of words in the message that have already been pushed into the FIFO. NBWP is incremented by 1 when a write access is performed to the HASH_DIN register.

When a digest calculation starts, NBWP is updated to NBWP- block size (in words), and NBWP goes to zero when the INIT bit is set.

Bits 8:4 Reserved, must be kept at reset value.

Bit 3 **BUSY:** Busy bit

0: No block is currently being processed

1: The hash core is processing a block of data

Bit 2 **DMAS:** DMA Status

This bit provides information on the DMA interface activity. It is set with DMAE and cleared when DMAE = 0 and no DMA transfer is ongoing. No interrupt is associated with this bit.

0: DMA interface is disabled (DMAE = 0) and no transfer is ongoing

1: DMA interface is enabled (DMAE = 1) or a transfer is ongoing

Bit 1 **DCIS:** Digest calculation completion interrupt status

This bit is set by hardware when a digest becomes ready (the whole message has been processed). It is cleared by writing it to 0 or by setting the INIT bit in the HASH_CR register.

0: No digest available in the HASH_HRx registers (zeros are returned)

1: Digest calculation complete, a digest is available in the HASH_HRx registers. An interrupt is generated if the DCIE bit is set in the HASH_IMR register.

Bit 0 **DINIS:** Data input interrupt status

This bit is set by hardware when the FIFO is ready to get a new block (16 locations are free). It is cleared by writing it to 0 or by writing the HASH_DIN register.

When DINIS = 0, HASH_CSRx registers reads as zero.

0: Less than 16 locations are free in the input buffer

1: A new block can be entered into the input buffer. An interrupt is generated if the DINIE bit is set in the HASH_IMR register.

50.6.7 HASH context swap registers

These registers contain the complete internal register states of the hash processor. They are useful when a suspend/resume operation has to be performed because a high-priority task needs to use the hash processor while it is already used by another task.

When such an event occurs, the HASH_CSRx registers have to be read and the read values have to be saved in the system memory space. Then the hash processor can be used by the preemptive task. When the hash computation is complete, the saved context can be read from memory and written back into the HASH_CSRx registers.

HASH_CSRx registers can be read only when DINIS equals to 1, otherwise zeros are returned.

HASH context swap register x (HASH_CSRx)

Address offset: 0x0F8 + 0x4 * x, (x = 0 to 102)

Reset value: 0x0022 0002 (HASH_CSR0)

Reset value: 0x0000 0000 (others)

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **CFG5[3:0]**: HW generic 5
This bitfield reflects that the SHA2-384 and SHA2-512 algorithms are supported.

Bits 15:12 **CFG4[3:0]**: HW generic 4
This bitfield is read as zero.

Bits 11:8 **CFG3[3:0]**: HW generic 3
This bitfield reflects that the SHA-3 algorithm is supported.

Bits 7:4 **CFG2[3:0]**: HW generic 2
This bitfield reflects that the HMAC is supported.

Bits 3:0 **CFG1[3:0]**: HW generic 1
this bitfield reflects the DMA type connected to this HASH peripheral.

50.6.9 HASH version register (HASH_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0041

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

51 On-the-fly decryption engine (OTFDEC)

51.1 OTFDEC introduction

OTFDEC allows on-the-fly decryption of the AHB traffic based on the read request address information. Four independent and non-overlapping encrypted regions can be defined in OTFDEC.

OTFDEC uses AES-128 in counter mode to achieve the lowest possible latency. As a consequence, each time the content of one encrypted region is changed, the entire region must be re-encrypted with a different cryptographic context (key or initialization vector). This constraint makes OTFDEC suitable to decrypt read-only data or code, stored in external NOR flash.

Note: When OTFDEC is used in conjunction with OCTOSPI, it is mandatory to access the flash memory using the memory-mapped mode of the flash memory controller.

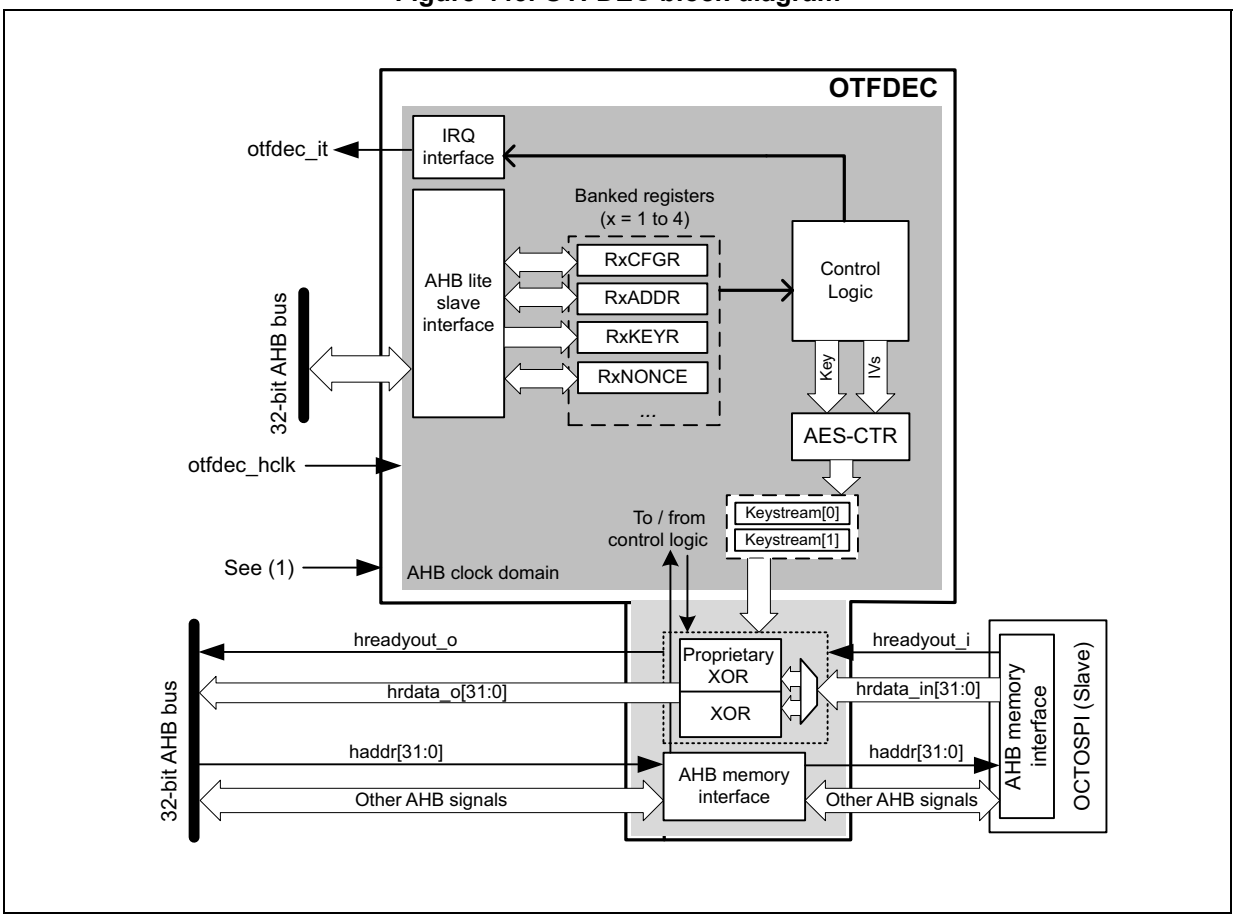
51.2 OTFDEC main features

- On-the-fly 128-bit decryption during the OCTOSPI Memory-mapped read operations (single or multiple).
  - Use of AES in counter (CTR) mode, with two 128-bit keystream buffers
  - Support for any read size
  - Physical address of the reads used for the encryption/decryption
- Up to four independent encrypted regions
  - Granularity of the region definition: 4096 bytes
  - Region configuration write-locking mechanism
  - Each region has its own 128-bit key, two bytes firmware version, and eight bytes application-defined nonce. At least one of those must be changed each time an encryption is performed by the application.
- Encryption keys confidentiality and integrity protection
  - Write-only registers, with software locking mechanism
  - Availability of 8-bit CRC as public key information
- Support for OCTOSPI pre-fetching mechanism
- Possibility to select an enhanced encryption mode to add a proprietary layer of protection on top of AES stream cipher (execute only)
- AMBA AHB slave peripheral, accessible through 32-bit word single accesses only (otherwise an AHB bus error is generated, and write accesses are ignored)
- Encryption mode

51.3 OTFDEC functional description

51.3.1 OTFDEC block diagram

Figure 443. OTFDEC block diagram



1. Empty (no signal)

51.3.2 OTFDEC internal signals

Table 476 describes a list of useful to know internal signals available at OTFDEC level, not at the product level (on pads).

Table 476. OTFDEC internal input/output signals

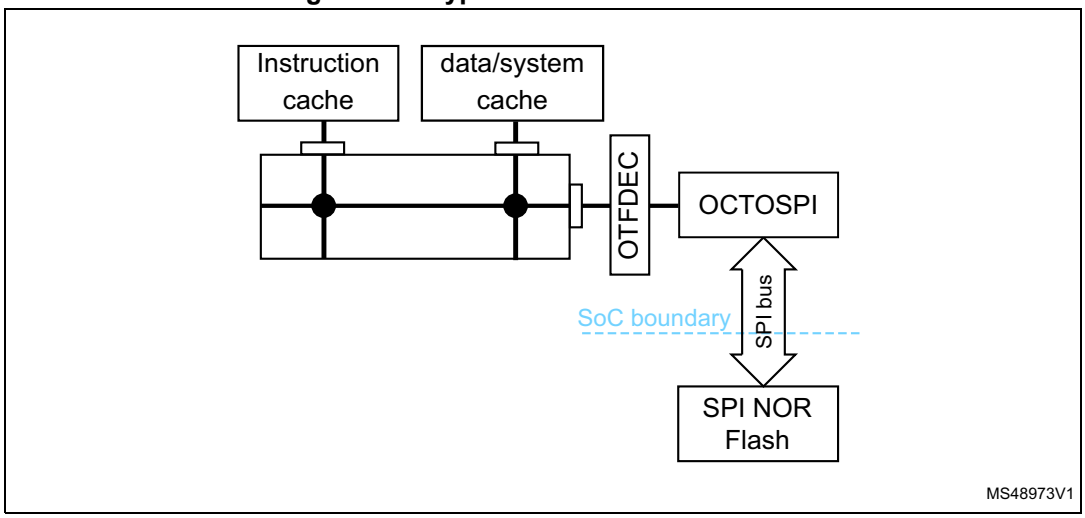
Signal name	Signal type	Description
otfdec_hclk	Digital input	AHB bus clock
otfdec_it	Digital output	OTFDEC global interrupt request

51.3.3 OTFDEC on-the-fly decryption

Introduction

Typical usage for OTFDEC is shown on *Figure 444*.

Figure 444. Typical OTFDEC use in a SoC



Original purpose of OTFDEC is to protect the confidentiality of read-only firmware libraries stored in external SPI NOR flash devices.

A special locking scheme is available in OTFDEC in order to protect the integrity of the decryption keys and also to protect the other configurations against software denial of services attacks.

When OTFDEC is used in conjunction with OCTOSPI, it is mandatory to read the flash memory using the Memory-mapped mode of the flash controller.

On top of decrypting on-the-fly, OTFDEC can also encrypt 32-bit word at a time (see *Section 51.5.3: Encrypting for OTFDEC* for more details).

OTFDEC architecture

OTFDEC analyzes all AHB read transfers on the associated AHB bus. If the read request is within one of the four regions programmed in OTFDEC, the control logic triggers a keystream computation based on AES algorithm in counter mode. This keystream is then used to decrypt on-the-fly the data present in the read transfer from the OCTOSPI AHB master, tying low the HREADYOUT signal of this master while the keystream information is being computed (this takes up to 11 cycles). Any accesses outside the enabled OTFDEC regions belong to a non-encrypted region.

Each OTFDEC region is programmed through OTFDEC_RxCFGR, OTFDEC_RxSTARTADDR, OTFDEC_RxENDADDR, OTFDEC_RxNONCER and OTFDEC_RxKEYR registers, where x = 1 to 4. In OTFDEC_RxCFGR, the MODE bits define the OTFDEC operating mode (standard or enhanced encryption).

Granularity for the region determination is 4096 bytes.

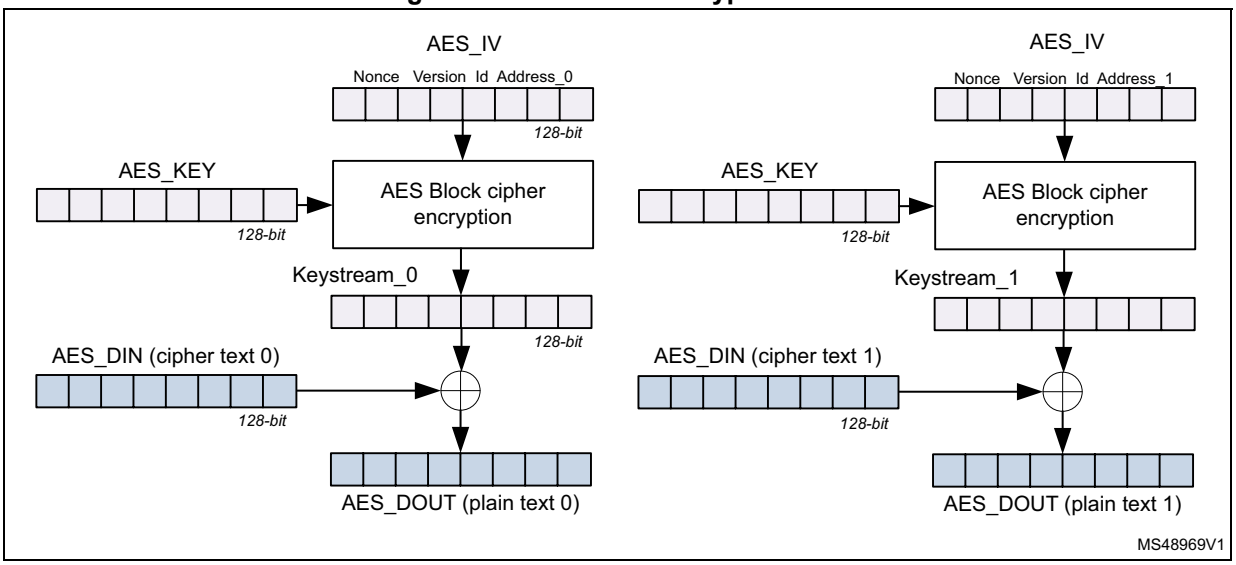
Note: Although OTFDEC does not prevent region overlapping, it is not a valid programming and it must be avoided by application software.

OTFDEC can decrypt incremental or wrap bursts only if they do not cross the 4096-byte aligned address boundaries.

51.3.4 OTFDEC usage of AES in counter mode decryption

Figure 445 shows how OTFDEC uses industry standard Advanced Encryption Standard (AES) algorithm in counter chaining mode. This mode is specified by NIST in *Special Publication 800-38A, Recommendation for Block Cipher Modes of Operation*.

Figure 445. AES CTR decryption flow



Every 128-bit data block, a special keystream information is computed using AES block cipher, as defined below:

- initialization vector AES_IV[127:0] = RxNONCER1[31:0] || RxNONCER0[31:0] || 0b0000 0000 0000 0000 || RxCFGR[31:16] || 0b00 || (x-1) || ReadAddress[31:4]
- key material AES_KEY[127:0] = R*x*KEYR3[31:0] || RxKEYR2[31:0] || R*x*KEYR1[31:0] || R*x*KEYR0[31:0]

Note: Above x is the RegionID of the selected encrypted region (x=1 to 4).
ReadAddress is the AHB address of the encrypted data block, modulo 128-bit.

Resulting 128-bit keystream is XORed with 128-bit cipher text data to produce the 128-bit clear text data.

- AES_DIN and AES_DOUT data blocks are constructed following the rule below (“|” represents a binary concatenation):
  AES_Dx[127:0]= AHB_word(@ | 0xC)[31:0] | AHB_word(@ | 0x8)[31:0] | AHB_word(@ | 0x4)[31:0] || AHB_word(@ | 0x0)[31:0], where @ is the hexadecimal address used to compute the keystream (ReadAddress[31:4] above).

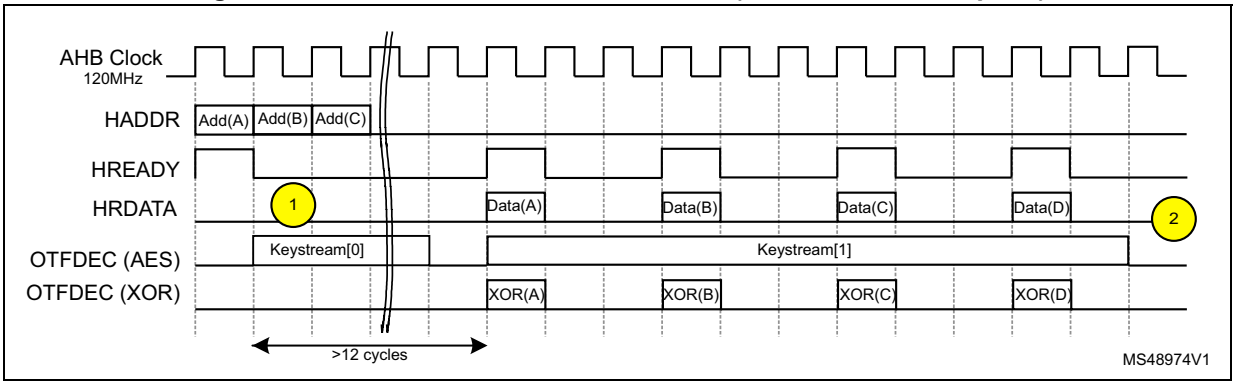
When the read request is not within an encrypted region, or the decryption is not enabled in this region, the AHB data is not changed.

Note: When the application sets the MODE bitfield to 11 in OTFDEC_RxCFGR, an additional layer of protection is added on top of the AES stream cipher. This enhanced encryption mode can only be used with instructions (execute-only region).

51.3.5 Flow control management

Figure 446 shows how OTFDEC manages one INCR4 AHB burst that corresponds to one 128-bit AES data block.

Figure 446. OTFDEC flow control overview (dual burst read request)



with the following notes:

1. OTFDEC enforces HREADY signal from the AHB master low as it is not ready to decrypt data (keystream computation).
2. Thanks to the keystream buffer, OTFDEC can be ready to process a new batch of data within 12 cycles in this configuration (120 MHz AHB clock, 104 MHz SPI bus delivering 2 bytes per SPI clock).

51.3.6 OTFDEC error management

OTFDEC automatically manages errors defined as below:

- Illegal read to OTFDEC_RxKEYR registers
- Illegal write to OTFDEC_RxKEYR registers while CONFIGLOCK or KEYLOCK = 1 in OTFDEC_RxCFGR.
- Illegal write to OTFDEC_RxCFGR, OTFDEC_RxSTARTADDR, OTFDEC_RxENDADDR or OTFDEC_RxNONCER registers while CONFIGLOCK = 1 in OTFDEC_RxCFGR (x = 1 to 4).
- Illegal read to an execute-only region (MODE[1:0] = 11). Such illegal request returns 0x0, without bus error.
- Execution request to a region while encryption is enabled (ENC = 1). The request returns 0x0, without bus error.
- Key error: read request to an encrypted region while its key registers are null or not properly initialized (KEYCRC = 0x0). Source of the error can be an incorrect key loading sequence (see KEYCRC in OTFDEC_RxCFGR) or it can be an abort event (tamper detection, unauthorized debug connection, untrusted boot, RDP level regression). Such read request returns 0x0, without bus error.

For these errors, an interrupt can be generated if the SEIE, XONEIE or KEIE bit is set in OTFDEC_IER register (see *Section 51.4*).

Note: After a key error, OTFDEC keys must be properly initialized again, and a reset of OTFDEC may be needed if registers are locked.

51.4 OTFDEC interrupts

There are three independent maskable interrupt sources generated by the OTFDEC, signaling following security events:

- Illegal read or write access to keys (SEIF flag), see *Section 51.3.6*
- Illegal write to a region configuration while CONFIGLOCK = 1 (SEIF flag), see *Section 51.3.6*
- Read access to an execute-only region (MODE[1:0] = 11), triggering the XONEIF flag
- Executing while encryption is enabled (XONEIF flag)
- Key error (encrypted regions read as zero) triggering the KEIF flag, see *Section 51.3.6*.

Interrupt sources are connected to the same global interrupt request signal.

OTFDEC interrupt sources can be enabled/disabled by setting the corresponding SEIE, XONEIE or KEIE bit in OTFDEC_IER, as described in *Table 477*. Status of the interrupt event is found in OTFDEC_ISR, and this event can be cleared using OTFDEC_ICR.

Table 477. OTFDEC interrupt requests

Interrupt acronym	Interrupt event	Event flag(1)	Enable control bit	Interrupt clear method
OTFDEC	Security error	SEIF	SEIE	Set SEIF in OTFDEC_ICR
	Execute-only Execute while encryption	XONEIF	XONEIE	Set XONEIF in OTFDEC_ICR
	Key error	KEIF	KEIE	Set KEIF in OTFDEC_ICR

1. The event flags are found in the OTFDEC_ISR register.

51.5 OTFDEC application information

51.5.1 OTFDEC initialization process

Introduction

One key aspect of OTFDEC is the trusted initialization of its registers, as it involves secret keys. Two trusted initialization schemes are recommended here below.

Note: Those sequences are for production code, as during firmware development, it is not always recommended to lock the key or the region configuration.

Writes to configuration registers are effective when the configuration locks allow it, even if the region is enabled.

Initialization scheme 1: one key for all regions

In this scheme, one entity owns the secret key used to decrypt the four protected regions. The recommended OTFDEC configuration sequence is described below:

1. For *x* = 1 to 4, write the correct MODE[1:0] value in OTFDEC_RxCFGR.
2. For *x* = 1 to 4, program OTFDEC_RxKEYR registers using the sequence described in KEYCRC (to have a valid CRC). Warning as key registers are write only.
3. For *x* = 1 to 4, check the key CRC. If OK, set KEYLOCK bit in OTFDEC_R*x*CFGR. This bit cannot be cleared (key registers in this region *x* are no more writable).
4. To do to decrypt a region x (task that does not necessarily have to be performed by the entity that owns the decryption keys):
   a) Verify if the key CRC corresponds to the encrypted binary stored in the region.
   b) Fill the detailed information corresponding to this binary (nonce, start address, end address, version number).
   c) Enable decryption of this region using REG_EN.
   d) Set CONFIGLOCK bit in OTFDEC_R*x*CFGR. This bit cannot be cleared (the region configuration is no more writable).

Caution: For a given region, when MODE bits are changed, the key registers and associated CRC are cleared by hardware. As a consequence, step 1 above must be done before step 2, and MODE bits must not be modified after step 2.

Initialization scheme 2: one key per region

In this scheme, one entity can own the secret used to decrypt one (or more) protected region. The recommended OTFDEC configuration sequence is described below:

1. To do to decrypt a region x (this task **must** be performed by the entity that owns the corresponding key):
   a) Write the correct MODE[1:0] value in OTFDEC_R*x*CFGR.
   b) Program OTFDEC_RxKEYR registers using the sequence described in KEYCRC (to have a valid CRC). Warning as key registers are write only.
   c) Check the key CRC. If OK, set KEYLOCK bit in OTFDEC_R*x*CFGR. This bit cannot be cleared (key registers are no more writable).
   d) Fill the detailed information corresponding to the protected firmware (nonce, start address, end address, version number).
   e) Enable decryption of this region using REG_EN.
   f) Set CONFIGLOCK bit in OTFDEC_R*x*CFGR. This bit cannot be cleared (the region configuration is no more writable).

Caution: For a given region, when MODE bits are changed, the key registers and associated CRC are cleared by hardware. As a consequence step a) above must be done before step b), and MODE bits must not be modified after step b).

51.5.2 OTFDEC and power management

Each time OTFDEC is reset, the correct key loading sequence described in *Section 51.5.1* must be performed (in this case KEYCRC = 0 in OTFDEC_RxCFGR).

It is recommended for application software to verify this point each time OTFDEC is reset by hardware.

51.5.3 Encrypting for OTFDEC

Code and data standard encryption

OTFDEC uses standard AES in counter mode when processing a binary stored in a protected region with MODE[1:0] = 10. When this mode is selected, any AES compatible hardware accelerator or library can be used to encrypt those protected libraries. OTFDEC can be used as well, as described in enhanced encryption section below (with MODE[1:0] = 10).

Definition and endianness of the AES inputs and outputs are defined in *Section 51.3.4: OTFDEC usage of AES in counter mode decryption*.

Enhanced encryption with OTFDEC

OTFDEC uses a proprietary layer of protection on top of the standard AES in counter mode when processing a code stored in a protected region with MODE[1:0] = 11.

Enhanced encryption mode can be used to increase the robustness against tampering.

Recommended sequence to encrypt using OTFDEC is described below:

1. The application in charge of the encryption sets the ENC bit in OTFDEC_CR.
2. Encryption application initializes OTFDEC as described in *Section 51.5.1: OTFDEC initialization process*. OCTOSPI must also be properly clocked, so that OTFDEC is fully functional in encryption mode. This step can also be done before step 1.
3. Encryption application writes 32-bit of clear-text data at the expected protected address, then reads it back encrypted at the same address to store it in RAM. Note that this data stays inside the device, as it is intercepted by OTFDEC in encryption mode.
4. Encryption application goes back to previous step (changing the address) until the whole binary is processed.
5. Encryption application clears the ENC bit in OTFDEC_CR. Another application can then take the encrypted binary and flash it to the correct address in external flash.

There are few important notes about this procedure:

- Encryption granularity is 32-bit (single 32-bit access is mandatory).
- While ENC bit is set, reads to non-encrypted regions return normal data (such as no encryption nor decryption). While in encryption mode, no access to OCTOSPI (including registers) must be done. This is because the OTFDEC cuts the communication with OCTOPSI while ENC bit is set.
- OTFDEC does not support execution while ENC = 1 (only encrypted data reads). Upon illegal execution detection a XONEIF flag is raised and zero is returned.

51.5.4 OTFDEC key CRC source code

Below is the CRC source code that can be used to compare with the result of the computation provided by OTFDEC in KEYCRC bitfield after loading the keys in OTFDEC_RxKEYR registers.

```
uint8_t getCRC(uint32_t * keyin)
{
  const uint8_t CRC7_POLY = 0x7;
  const uint32_t key_strobe[4] = {0xAA55AA55, 0x3, 0x18, 0xC0};
  uint8_t  i, j, k, crc = 0x0;
  uint32_t  keyval;

  for (j = 0; j < 4; j++)
  {
    keyval = *(keyin+j);
    if (j == 0)
    {
      keyval ^= key_strobe[0];
    }
    else
    {
      keyval ^= (key_strobe[j] << 24) | (crc << 16) | (key_strobe[j] << 8)
| crc;
    }

    for (i = 0, crc = 0; i < 32; i++)
    {
      k = (((crc >> 7) ^ (keyval >> (31-i))&0xF)) & 1;
      crc <<= 1;
      if (k)
      {
        crc ^= CRC7_POLY;
       }
    }
    crc^=0x55;
  }
  return crc;
}
```

51.6 OTFDEC registers

51.6.1 OTFDEC control register (OTFDEC_CR)

Address offset: 0x0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ENC
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **ENC**: Encryption mode bit

When this bit is set, OTFDEC is used in encryption mode, during which application can write clear text data then read back encrypted data. When this bit is cleared (default), OTFDEC is used in decryption mode, during which application only read back decrypted data. For both modes, cryptographic context (keys, nonces, firmware versions) must be properly initialized. When this bit is set, only data accesses are allowed (zeros are returned otherwise, and XONEIF is set). When MODE = 11, enhanced encryption mode is automatically selected.

0: OTFDEC working in decryption mode

1: OTFDEC working in encryption mode

Note: When ENC bit is set, no access to OCTOSPI must be done (registers and Memory-mapped region).

51.6.2 OTFDEC region x configuration register (OTFDEC_RxCFGR)

Address offset: 0x20 + 0x30 * (x - 1), (x = 1 to 4)

Reset value: 0x0000 0000

Writes are ignored if CONFIGLOCK bit is set to 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REG_VERSION[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
KEYCRC[7:0]								Res.	Res.	MODE[1:0]		Res.	KEYLOCK	CONFIGLOCK	REG_EN
r	r	r	r	r	r	r	r			rw	rw		rs	rs	rw

Bits 31:16 **REG_VERSION[15:0]**: region firmware version

This 16-bit bitfield must be correctly initialized before the region corresponding REG_EN bit is set in OTFDEC_RxCFGR.

Bits 15:8 **KEYCRC[7:0]**: region key 8-bit CRC

When KEYLOCK = 0, KEYCRC bitfield is automatically computed by hardware while loading the key of this region in this exact sequence: KEYR0 then KEYR1 then KEYR2 then finally KEYR3 (all written once). A new computation starts as soon as a new valid sequence is initiated, and KEYCRC is read as zero until a valid sequence is completed.

When KEYLOCK = 1, KEYCRC remains unchanged until the next reset.

CRC computation is an 8-bit checksum using the standard CRC-8-CCITT algorithm $X^8 + X^2 + X + 1$ (according the convention). Source code is available in *Section 51.5.4*.

This field is read only.

Note: CRC information is updated only after the last bit of the key has been written.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **MODE[1:0]**: operating mode

This bitfield selects the OTFDEC operating mode for this region:

10: All read accesses are decrypted (instruction or data).

11: Enhanced encryption mode is activated, and only instruction accesses are decrypted

Others: Reserved

When MODE ≠ 11, the standard AES encryption mode is activated.

When either of the MODE bits are changed, the region key and associated CRC are zeroed.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **KEYLOCK**: region key lock

0: Writes to this region KEYRx registers are allowed.

1: Writes to this region KEYRx registers are ignored until next OTFDEC reset. KEYCRC bitfield is locked.

Note: This bit is set once: if this bit is set, it can only be reset to 0 if the OTFDEC is reset.

Bit 1 **CONFIGLOCK**: region config lock

0: Writes to this region OTFDEC_RxCFGR, OTFDEC_RxSTARTADDR, OTFDEC_RxENDADDR and OTFDEC_RxNONCERy registers are allowed.

1: Writes to this region OTFDEC_RxCFGR, OTFDEC_RxSTARTADDR, OTFDEC_RxENDADDR and OTFDEC_RxNONCERy registers are ignored until next OTFDEC reset.

Note: This bit is set once. If this bit is set, it can only be reset to 0 if OTFDEC is reset. Setting this bit forces KEYLOCK bit to 1.

Bit 0 **REG_EN**: region on-the-fly decryption enable

0: On-the-fly decryption is disabled for this region.

1: On-the-fly decryption is enabled for this region. Data are XORed with the corresponding keystream.

Note: Garbage is decrypted if region context (version, key, nonce) is not valid when this bit is set.

51.6.3 OTFDEC region x start address register (OTFDEC_RxSTARTADDR)

Address offset: 0x24 + 0x30 * (x - 1), (x = 1 to 4)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REG_START_ADDR[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REG_START_ADDR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **REG_START_ADDR[31:0]**: Region AHB start address

This register must be written before the region corresponding REG_EN bit in the OTFDEC_RxCFGR register is set.

Writing to this register is discarded if performed while the region CONFIGLOCK bit in the OTFDEC_RxCFGR register is set.

Note: When determining the region the first 12 bits (LSB) and the last 4 bits (MSB) are ignored.

When this register is accessed in read the 4 MSB bits and the 12 LSB bits return zeros .

51.6.4 OTFDEC region x end address register (OTFDEC_RxENDADDR)

Address offset: 0x28 + 0x30 * (x - 1), (x = 1 to 4)

Reset value: 0x0000 0FFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REG_END_ADDR[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REG_END_ADDR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **REG_END_ADDR[31:0]**: Region AHB end address

This register must be written before the region corresponding REG_EN bit in the OTFDEC_RxCFGR register is set, and OTFDEC_RxENDADDR must be strictly greater than OTFDEC_RxSTARTADDR to be valid.

Writing to this register is discarded if performed while the region CONFIGLOCK bit in OTFDEC_RxCFGR is set.

Note: When determining the region the first 12 bits (LSB) and the last 4 bits (MSB) are ignored.

When this register is accessed in read the 4 MSB bits return zeros and the 12 LSB bits return ones.

51.6.5 OTFDEC region x nonce register 0 (OTFDEC_RxNONCER0)

Address offset: 0x2C + 0x30 * (x - 1), (x = 1 to 4)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REG_NONCE[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REG_NONCE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **REG_NONCE[31:0]**: Region nonce, bits [31:0]

This register must be written before the region corresponding REG_EN bit in OTFDEC_RxCFGR is set.

Writing is discarded in this register if performed while the region CONFIGLOCK bit in the OTFDEC_RxCFGR is set.

51.6.6 OTFDEC region x nonce register 1 (OTFDEC_RxNONCER1)

Address offset: 0x30 + 0x30 * (x - 1), (x = 1 to 4)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REG_NONCE[63:48]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REG_NONCE[47:32]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **REG_NONCE[63:32]**: Region nonce, bits [63:32]

Refer to the OTFDEC_RxNONCER0 register for description of the NONCE[63:0] bitfield.

51.6.7 OTFDEC region x key register 0 (OTFDEC_RxKEYR0)

Address offset: 0x34 + 0x30 * (x - 1), (x = 1 to 4)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REG_KEY[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REG_KEY[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **REG_KEY[31:0]**: Region key, bits [31:0]

This register must be written before the region corresponding REG_EN bit in OTFDEC_RxCFGR is set.

Reading this register returns a zero value. Writing to this register is discarded if performed while the region CONFIGLOCK or KEYLOCK bit is set in the OTFDEC_RxCFGR.

Note: When application successfully changes MODE bits in OTFDEC*_RxCFGR and* OTFDEC*_RxKEYR, and associated KEYCRC are erased.*

51.6.8 OTFDEC region x key register 1 (OTFDEC_RxKEYR1)

Address offset: 0x38 + 0x30 * (x - 1), (x = 1 to 4)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REG_KEY[111:96]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **REG_KEY[127:96]**: Region key, bits [127:96]

Refer to the OTFDEC_RxKEYR0 register for description of the KEY[127:0] bitfield.

51.6.11 OTFDEC interrupt status register (OTFDEC_ISR)

Address offset: 0x300

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	KEIF	XONEIF	SEIF
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **KEIF:** Key error interrupt flag status

This bit is set by hardware and read only by application. The bit is set when a read access occurs on an encrypted region, while its key registers is null or not properly initialized (KEYCRC = 0x0).

This bit is cleared when the application sets in OTFDEC_ICR the corresponding bit to 1.

0: OTFDEC operates properly.

1: Read access detected on an enabled encrypted region with its key registers null or not properly initialized (KEYCRC = 0x0). OTFDEC returns a zeroed value for the read, and an optional interrupt is generated if bit KEIE is set to 1 in OTFDEC_IER.

After KEIF is set any subsequent read to the region with bad key registers returns a zeroed value. This state remains until those key registers are properly initialized (KEYCRC not zero).

Bit 1 **XONEIF:** Execute-only execute-never error interrupt flag status

This bit is set by hardware and read only by application. This bit is set when a read access and not an instruction fetch is detected on any encrypted region with MODE bits set to 11. Lastly, XONEIF is also set when an execute access is detected while encryption mode is enabled.

This bit is cleared when application sets in OTFDEC_ICR the corresponding bit to 1.

0: No execute-only error status. No interrupt pending.

1: Read access detected on one region with MODE bits set to 11 or execute access detected while ENC = 1. OTFDEC returns a zeroed value for the illegal access, and an optional interrupt is generated if bit XONEIE is set to 1 in OTFDEC_IER.

Bit 0 **SEIF:** Security error interrupt flag status

This bit is set by hardware and read only by application. This bit is set when at least one security error has been detected.

This bit is cleared when application sets in OTFDEC_ICR the corresponding bit to 1.

0: No security error status. No interrupt pending.

1: Security error flag status, with interrupt pending. Actual interrupt generation is dependent on OTFDEC_IER corresponding bit SEIE.

51.6.12 OTFDEC interrupt clear register (OTFDEC_ICR)

Address offset: 0x304

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	KEIF	XONEIF	SEIF
													w	w	w

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **KEIF:** Key error interrupt flag clear

This bit is written by application, and always read as 0.

0: KEIF flag status is not affected.

1: KEIF flag status is cleared in OTFDEC_ISR.

Note: Clearing KEIF does not solve the source of the problem (bad key registers). To be able to access again any encrypted region, OTFDEC key registers must be properly initialized again.

Bit 1 **XONEIF:** Execute-only execute-never error interrupt flag clear

This bit is written by application, and always read as 0.

0: XONEIF flag status is not affected.

1: XONEIF flag status is cleared in OTFDEC_ISR.

Bit 0 **SEIF:** Security error interrupt flag clear

This bit is written by application, and always read as 0.

0: SEIF flag status is not affected.

1: SEIF flag status is cleared in OTFDEC_ISR.

51.6.13 OTFDEC interrupt enable register (OTFDEC_IER)

Address offset: 0x308

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	KEIE	XONEIE	SEIE
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **KEIE:** Key error interrupt enable

This bit is read and written by application. It controls the OTFDEC interrupt generation when KEIF flag status is set.

0: Interrupt generation on key error flag KEIF is disabled (masked).

1: Interrupt generation on key error flag KEIF is enabled (not masked).

Bit 1 **XONEIE:** Execute-only execute-never error interrupt enable

This bit is read and written by application. It controls the OTFDEC interrupt generation when XONEIF flag status is set.

0: Interrupt generation on execute-only error XONEIF is disabled (masked).

1: Interrupt generation on execute-only error XONEIF is enabled (not masked).

Bit 0 **SEIE:** Security error interrupt enable

This bit is read and written by application. It controls the OTFDEC interrupt generation when SEIF flag status is set.

0: Interrupt generation on security error SEIF is disabled (masked).

1: Interrupt generation on security error SEIF is enabled (not masked).

51.6.14 OTFDEC hardware configuration register (OTFDEC_HWCFGR)

Address offset: 0x3F0

Reset value: 0x0000 1B0C

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	CFG4[3:0]				CFG3[7:0]							
				r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CFG2[7:0]								CFG1[7:0]							
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **CFG4[3:0]**: Hardware Generic 4
This field returns the low_clk_freq generic value (0x00).

Bits 23:16 **CFG3[7:0]**: Hardware Generic 3
This field returns the option_bits generic value (0x00).

Bits 15:8 **CFG2[7:0]**: Hardware Generic 2
This field returns the address_region_msb generic value (0x1B).

Bits 7:0 **CFG1[7:0]**: Hardware Generic 1
This field returns the address_region_lsb generic value (0x0C).

51.6.15 OTFDEC version register (OTFDEC_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0010

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJREV[3:0]				MINREV[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision
This field returns the OTFDEC peripheral major version.

Bits 3:0 **MINREV[3:0]**: Minor revision
This field returns the OTFDEC peripheral minor version.

51.6.16 OTFDEC identification register (OTFDEC_IPIDR)

Address offset: 0x3F8

Reset value: 0x0017 0051

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ID[31:0]**: Identification code
This field returns the identification code of the OTFDEC (AHB) peripheral.

51.6.17 OTFDEC size identification register (OTFDEC_SIDR)

Address offset: 0x3FC

Reset value: 0xA3C5 DD01

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **SID[31:0]**: Size identification code

This field returns the size identification code of the OTFDEC peripheral as defined below:
Bits[31:8] = 0xA3C5DD (fixed code)
Bits[7:0] = 0x01 (1KB address decoding)

51.6.18 OTFDEC register map

Table 478. OTFDEC register map and reset values

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

52 Public key accelerator (PKA)

52.1 PKA introduction

PKA (public key accelerator) is intended for the computation of cryptographic public key primitives, specifically those related to RSA, Diffie-Hellmann or ECC (elliptic curve cryptography) over GF(p) (Galois fields). To achieve high performance at a reasonable cost, these operations are executed in the Montgomery domain.

For a given operation, all needed computations are performed within the accelerator, so no further hardware/software elaboration is needed to process the inputs or the outputs.

When manipulating secrets, the PKA incorporates a protection against side-channel attacks (SCA), including differential power analysis (DPA), certified SESIP and PSA security assurance level 3.

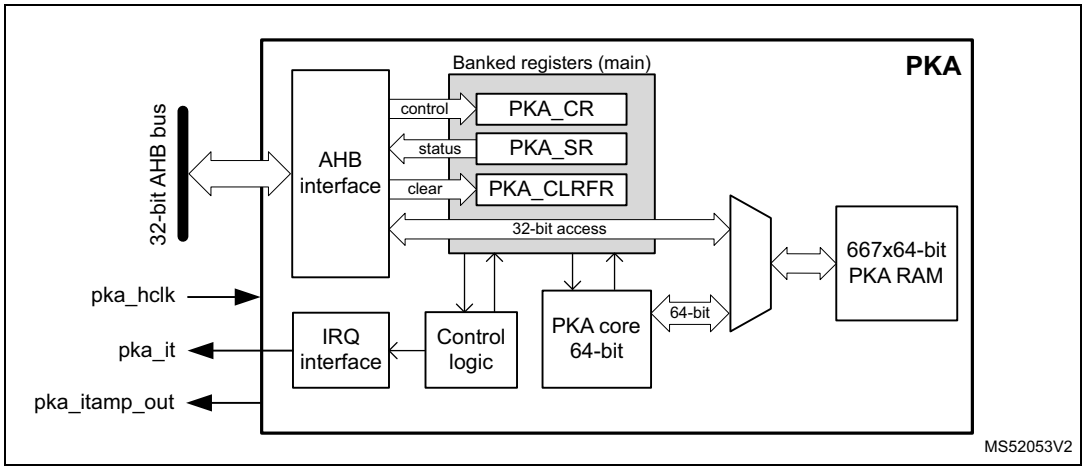
52.2 PKA main features

- Acceleration of RSA, DH and ECC over GF(p) operations, based on the Montgomery method for fast modular multiplications. More specifically:
  - RSA modular exponentiation, RSA chinese remainder theorem (CRT) exponentiation
  - ECC scalar multiplication, point on curve check, complete addition, double base ladder, projective to affine
  - ECDSA signature generation and verification
- Capability to handle operands up to 4160 bits for RSA/DH and 640 bits for ECC
- When manipulating secrets: protection against side-channel attacks (SCA), including differential power analysis (DPA), certified SESIP and PSA security assurance level 3
  - Applicable to modular exponentiation, ECC scalar multiplication and ECDSA signature generation
- Arithmetic and modular operations such as addition, subtraction, multiplication, modular reduction, modular inversion, comparison, and Montgomery multiplication
- Built-in Montgomery domain inward and outward transformations
- AMBA AHB slave peripheral, accessible through 32-bit word single accesses only (otherwise an AHB bus error is generated, and write accesses are ignored)

52.3 PKA functional description

52.3.1 PKA block diagram

Figure 447. PKA block diagram



52.3.2 PKA internal signals

Table 479 lists the internal signals available at the PKA level, not necessarily available on product bonding pads.

Table 479. Internal input/output signals

Signal name	Signal type	Description
pka_hclk	Digital input	AHB bus clock
pka_it	Digital output	Public key accelerator IP global interrupt request
pka_itamp_out	Digital output	PKA internal tamper event signal to TAMP (XOR-ed), triggered when an unexpected fault occurs while PKA manipulates secrets, or when the programmed input point is not found on the input curve (ECDSA signature and ECC scalar multiplication only). This signal is asserted as soon as a fault is detected. When asserted, read access to PKA registers are reset to 0 and writes are ignored. The signal is de-asserted when PKA memory is cleared.

52.3.3 PKA reset and clocks

PKA is clocked on the AHB bus clock. When the PKA peripheral reset signal is released PKA_RAM is cleared automatically, taking 667 clock cycles. During this time the setting of bit EN in PKA_CR register is ignored. Once EN bit is set, refer to *Section 52.3.6* for details about PKA initialization sequence.

According to the security policy applied to the device, PKA RAM can also be reset following a tamper event. Refer to *Tamper detection and response* in the System security section (if applicable to this product).

52.3.4 PKA public key acceleration

Overview

Public key accelerator (PKA) is used to accelerate Rivest, Shamir and Adleman (RSA), Diffie-Hellman (DH) as well as ECC over prime field operations. Supported operand sizes is up to 4160 bits for RSA and DH, and up to 640 bits for ECC.

The PKA supports all non-singular elliptic curves defined over prime fields, that can be described with a short Weierstrass equation $y^2 = x^3 + ax + b$ (mod p). More information can be found in *Section 52.5.1*.

Note: Binary curves, Edwards curves and Curve25519 are not supported by the PKA.

A memory of 5336 bytes (667 words of 64 bits) called PKA RAM is used to provide initial data to the PKA, and to hold the results after computation is completed. Access is done though the PKA AHB interface.

PKA operating modes

The list of operations the PKA can perform is detailed in *Table 480* and *Table 481*, respectively, for integer arithmetic functions and prime field (Fp) elliptic curve functions.

Table 480. PKA integer arithmetic functions list

PKA_CR.MODE[5:0]		Performed operation	Reference

0x07	000111	RSA CRT exponentiation	*Section 52.4.13*

Table 481. PKA prime field (Fp) elliptic curve functions list

PKA_CR.MODE[5:0]		Performed operation	Reference
Hex	Binary		
0x28	101000	Point on elliptic curve Fp check	*Section 52.4.14*
0x20	100000	ECC scalar multiplication kP (protected)	*Section 52.4.15*
0x23	100011	ECC complete addition	*Section 52.4.18*
0x24	100100	ECDSA sign (protected)	*Section 52.4.16*
0x26	100110	ECDSA verification	*Section 52.4.17*
0x27	100111	ECC double base ladder	*Section 52.4.19*
0x2F	101111	ECC projective to affine	*Section 52.4.20*

Each of these operating modes has an associated code that has to be written to the MODE field in the PKA_CR register. If the application selects any value that is not documented below the write to MODE bitfield is ignored, and an operation error (OPERRF) is triggered. When this happens, a new operation must be selected after the error is cleared.

Some operations in *Table 480* and *Table 481* are indicated as protected. Those operations are used when manipulating secret keys (modular exponentiation for RSA decryption, scalar multiplication and signature for ECC). Those secrets (protected against side channel attacks) and any intermediate values are automatically erased when PKA RAM is cleared at the end of the protected operations (BUSY goes low). They are also protected against side channel attacks.

Caution: For security reason it is very important to select protected modular exponentiation (MODE = 0x3) when performing RSA decryption.

Montgomery space and fast mode operations

For efficiency reason the PKA internally performs modular multiply operations in the Montgomery domain, automatically performing inward and outward transformations.

As Montgomery parameter computation is time consuming the application can decide to use a faster mode of operation, during which the precomputed Montgomery parameter is supplied before starting the operation. Performance improvement is detailed in *Section 52.5.2: Computation times*.

The only operation using fast mode is modular exponentiation (MODE = 0x02).

52.3.5 Typical applications for PKA

Introduction

The PKA can be used to accelerate a number of public key cryptographic functions. In particular:

- RSA encryption and decryption
- RSA key finalization
- CRT-RSA decryption
- DSA and ECDSA signature generation and verification
- DH and ECDH key agreement

Specifications of the above functions are given in following publications:

- FIPS PUB 186-4, Digital Signature Standard (DSS), July 2013 by NIST
- PKCS #1, RSA Cryptography Standard, v1.5, v2.1 and v2.2. by RSA Laboratories
- IEEE1363-2000, IEEE Standard Specifications for Public-Key Cryptography, January 2000
- ANSI X9.62-2005, Public Key Cryptography for the Financial Services Industry, The Elliptic Curve Digital Signature Algorithm (ECDSA), November 2005

The principles of the main functions are described in this section, for a more detailed description refer to the above cited documents.

RSA key pair

For the following RSA operations a public key and a private key information are defined as below:

- Alice transmits her public key (*n*, *e*) to Bob. Numbers *n* and *e* are very large positive integers.
- Alice keeps secret her private key d, also a very large positive integer. Alternatively this private key can also be represented by a quintuple (p, q, dp, dq, qInv).

For more information on the above representations refer to the RSA specification.

RSA encryption/decryption principle

As recommended by the PKCS#1 specification, Bob, to encrypt message M using Alice's public key (*n*, *e*) must go through the following steps:

1. Compute the encoded message EM = ENCODE(M), where ENCODE is an encoding method.
2. Turn EM into an integer *m*, with $0 \leq m < n$ and (*m*, *n*) being coprimes.
3. Compute ciphertext $c = m^e \bmod n$.
4. Convert the integer c into a string ciphertext C.

Alice, to decrypt ciphertext c using her private key *d*, follows the steps indicated below:

1. Convert the ciphertext C to an integer ciphertext representative c.
2. If necessary, retrieve the prime factors (p, q) using (n, e, d) information, then compute phi = (p - 1) * (q - 1). Refer to NIST SP800-56B Appendix C for details.
3. Recover plaintext $m = c^d \bmod n = (m^e)^d \bmod n$. If the private key is the quintuple (p, q, dp, dq, qInv), then plaintext *m* is obtained by performing the operations:
   a) $m_1 = c^{dp} \bmod p$
   b) $m_2 = c^{dq} \bmod q$
   c) $h = qInv\ (m_1 - m_2) \bmod p$
   d) $m = m_2 + h\ q$
4. Convert the integer message representative *m* to an encoded message EM.
5. Recover message M = DECODE(EM), where DECODE is a decoding method.

Above operations can be accelerated by PKA using *Modular exponentiation* $A^e \bmod n$ if the private key is *d*, or *RSA CRT exponentiation* if the private key is the quintuple (p, q, dp, dq, qInv).

Note: The decoding operation and the conversion operations between message and integers are specified in PKCS#1 standard.

For the decryption process protected version of modular exponentiation (MODE = 0x3) is strongly recommended for security reason. For encryption process MODE = 0x3 cannot be used, as it requires the knowledge of the private key.

Elliptic curve selection

For following ECC operations curve parameters are defined as below:

- Curve corresponds to the elliptic curve field agreed among actors (Alice and Bob). Supported curves parameters are summarized in *Section 52.5.1: Supported elliptic curves*.
- G is the chosen elliptic curve base point (also known as generator), with a large prime order n (that is, *n* x G = identity element O).

ECDSA message signature generation

ECDSA (elliptic curve digital signature algorithm) signature generation function principle is the following: Alice, to sign a message *m* using her private key integer d_A, goes through the following steps.

1. Calculate e = HASH(*m*), where HASH is a cryptographic hash function.
2. Let z be the L_n leftmost bits of e, where L_n is the bit length of the group order *n*.
3. Select a cryptographically secure random integer k where $0 < k < n$.
4. Calculate the curve point $(x_1, y_1) = k \times G$.
5. Calculate $r = x_1 \bmod n$. If $r = 0$ go back to step 3.
6. Calculate $s = k^{-1} (z + rd_A) \bmod n$. If $s = 0$ go back to step 3.
7. The signature is the pair (*r*, *s*).

Steps 4 to 7 are accelerated by PKA using:

- *ECDSA sign* or
- All of the operations below:
  - *ECC Fp scalar multiplication* k x P
  - *Modular reduction* A mod *n*
  - *Modular inversion* A^{-1} mod *n*
  - *Modular addition* and *Modular and Montgomery multiplication*

ECDSA signature verification

ECDSA (elliptic curve digital signature algorithm) signature verification function principle is the following: Bob, to authenticate Alice's signature, must have a copy of her public key curve point Q_A.

Bob can verify that Q_A is a valid curve point going through the following steps:

1. check that Q_A is not equal to the identity element O
2. check that Q_A is on the agreed curve
3. check that n x Q_A = O.

Then Bob follows the procedure detailed below:

1. verify that *r* and *s* are integer in [1, n-1]
2. calculate *e* = HASH(*m*), where HASH is the agreed cryptographic hash function
3. let z be the L_n leftmost bits of *e*
4. calculate w = s^{-1} mod *n*
5. calculate u_1 = zw mod *n* and u_2 = *rw* mod *n*
6. calculate the curve point (x_1, y_1) = u_1 x G + u_2 x Q_A
7. the signature is valid if *r* = x_1 (mod *n*), it is invalid otherwise.

Steps 4 to 7 are accelerated by PKA using *ECDSA verification*.

52.3.6 PKA procedure to perform an operation

Enabling/disabling PKA

Setting the EN bit to 1 in PKA_CR register enables the PKA peripheral. The PKA becomes available when INITOK bit is set in PKA_SR. When EN = 0, the PKA peripheral is kept under reset, with PKA memory still accessible by the application through the AHB interface.

Note: When PKA is in the process of clearing its memory EN bit cannot be set.

When setting EN bit in PKA_CR make sure that the value of MODE bitfield corresponds to an authorized PKA operation (see OPERRF in Section 52.3.7).

Clearing EN bit to 0 while a calculation is in progress causes the operation to be aborted. In this case, the content of the PKA memory is not guaranteed, with the exception of the PKA modes 0x03, 0x20 and 0x24. For these operations, the PKA memory is cleared after abort, making the memory unavailable for 667 cycles. During this clearing time only PKA registers can be accessed, with writes to EN bits ignored.

If INITOK bit stays at 0, make sure that the RNG peripheral is clocked and properly initialized, then try to enable PKA again.

Data formats

The format of the input data and the results in the PKA RAM are specified, for each operation, in *Section 52.4*.

Executing a PKA operation

Each of the supported PKA operation is executed using the following procedure:

1. Load initial data into the PKA internal RAM, which is located at address offset 0x400.
2. Write in the MODE field of PKA_CR register, specifying the operation which is to be executed and then assert the START bit, also in PKA_CR register.
3. Wait until the PROCENDF bit in the PKA_SR register is set to 1, indicating that the computation is complete.
4. Read the result data from the PKA internal RAM, then clear PROCENDF bit by setting PROCENDFC bit in PKA_CLRFR.

Note: When PKA is busy (BUSY = 1) any access by the application to PKA RAM is ignored, and the flag RAMERRF is set in PKA_SR.

Selecting an illegal or unknown operation in step *2* triggers an OPERRF error, and step *3* (PROCENDF = 1) never happens. See *Section 52.3.7* for details.

Using precomputed Montgomery parameters (PKA Fast mode)

As explained in *Section 52.3.4*, when computing many operations with the same modulus it can be beneficial for the application to compute only once the corresponding Montgomery parameter (see, for example, *Section 52.4.5*). This is know as “Fast mode”.

To manage the usage of Fast mode it is recommended to follow the procedure described below:

1. Load in PKA RAM the modulus size and value information. Such information is compiled in *Section 52.5.1*.
2. Program in PKA_CR register the PKA in *Montgomery parameter computation* mode (MODE=”0x1”) then assert the START bit.
3. Wait until the PROCENDF bit in the PKA_SR register is set to 1, then read back from PKA memory the corresponding Montgomery parameter, and then clear PROCENDF bit by setting PROCENDFC bit in PKA_CLRFR.
4. Proceed with the required PKA operation, loading on top of regular input data the Montgomery information R2 mod m. All addresses are indicated in *Section 52.4*.

52.3.7 PKA error management

When PKA is used some errors can occur:

- The access to PKA RAM falls outside the expected range. In this case the address error flag (ADDRERRF) is set in the PKA_SR register.
- An AHB access to the PKA RAM occurred while the PKA core was using it. In this case the RAM error flag (RAMERRF) is set in the PKA_SR register, reads to PKA RAM return 0, while writes are ignored.
- The selected operating mode using MODE bitfield is not listed in PKA operating modes (see bitfield description), or PKA is running in limited mode (see LMF bit in PKA_SR). In this case the operation error flag (OPERRF) is set in the PKA_SR register, and write to MODE bitfield is ignored.

For each error flag above PKA generates an interrupt if the application sets the corresponding bit in PKA_CR register (see *Section 52.6* for details).

ADDRERRF, OPERRF and RAMERRF errors are cleared by setting the corresponding bit in PKA_CLRFR.

OPERRF error must be cleared using OPERRFC bit in PKA_CLRFR before a new operation is written in PKA_CR register.

Note: The PKA can be re-initialized at any moment by resetting the EN bit in the PKA_CR register.

52.4 PKA operating modes

52.4.1 Introduction

The various operations supported by PKA are described in the following subsections, defining the format of the input data and of the results, both stored in the PKA RAM.

Warning: The validity of all input parameters to the PKA must be checked before starting any operation, as PKA assumes that all of them are valid and consistent with each other. Input parameters must not exceed the operand size specified in the operation tables.

The following information applies to all PKA operations.

- PKA core processes 64-bit words in its RAM. Hence hereafter all word size is 64-bit
- When an element is written as input in the PKA RAM, an additional word with all bits equal to zero has to be added after the most significant input word. This rule does not apply if the operand has a fixed size of 1.
- All reported RAM storage addresses refer to the least significant word of the data, and to obtain the actual address to use application must add to the indicated offset the base address of the PKA.
- Supported operand “Size” are:
  - ROS (RSA operand size): data size is (*rsa_size* / 64 + 1) words, with *rsa_size* equal to the chosen modulus length in bits. For example, when computing RSA with an operand size of 1024 bits, ROS is equal to 17 words, or 1088 bits.
  - EOS (ECC operand size): data size is (*ecc_size* / 64 + 1) words, with *ecc_size* equal to the chosen prime modulus length in bits. For example, when computing ECC with an operand size of 192 bits, EOS is equal to 4 words, or 256 bits.
  - ROS and EOS values include the required additional all 0 word.
- Unless indicated otherwise, all operands in the tables are integers.

Note: Fractional results for above formulas must be rounded up to the nearest integer since PKA core processes 64-bit words.

Note: The maximum ROS is 66 words (4160-bit max exponent size), while the maximum EOS is 11 words (640-bit max operand size).

As a first example (and to better understand the endianess in PKA memory), to prepare the operation *ECC Fp scalar multiplication*, when the application writes the x coordinate of point

P for an ECC P256 curve (EOS = 5 words), the least significant bit must be placed in bit 0 at address offset 0x578, and the most significant bit in bit 63 at address offset 0x590. Then, as mentioned above, the application must write the empty word 0x0000000000000000 at address offset 0x598.

As a second example, still to prepare the operation ECC Fp scalar multiplication, when the application need to write the information a = -3, on a curve with a modulus length of 224 bits (that is, four 64-bit words, rounded up, plus one) following data must be written in PKA memory:

```
@RAM+410  0x0000000000000001  /* curve coefficient 'a' sign without extra word */
@RAM+418  0x0000000000000011  /* value of |a| LSB
@RAM+420  0x0000000000000000  ...
@RAM+428  0x0000000000000000  ...
@RAM+430  0x0000000000000000  value of |a| MSB */
@RAM+438  0x0000000000000000  /* additional all 0 word */
```

52.4.2 Montgomery parameter computation

This function is used to compute the Montgomery parameter (R^2 mod *n*) used by PKA to convert operands into the Montgomery residue system representation. This operation can be very useful when fast mode operation is used, because in this case the Montgomery parameter is passed as input, saving the time for its computation.

Note: This operation can also be used with ECC curves. In this case prime modulus length and EOS size must be used.

Operation instructions for Montgomery parameter computation are summarized in *Table 482*.

Table 482. Montgomery parameter computation

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x01	PKA_CR	6 bits
	Modulus length	(in bits, 0 ≤ value < 4160)	RAM@0x408	64 bits
	Modulus value n	(odd integer only, n < 2^{4160})	RAM@0x1088	ROS
OUT	Result: R^2 mod n	-	RAM@0x620	

52.4.3 Modular addition

Modular addition operation consists in the computation of A + B mod *n*. Operation instructions are summarized in *Table 483*.

Table 483. Modular addition

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x0E	PKA_CR	6 bits
	Operand length	(in bits, not null)	RAM@0x408	64 bits
	Operand A	(0 ≤ A < n)	RAM@0xA50	ROS
	Operand B	(0 ≤ B < n)	RAM@0xC68	
	Modulus value n	($n < 2^{4160}$)	RAM@0x1088	
OUT	Result: A+B mod n	(0 ≤ result < n)	RAM@0xE78	

52.4.4 Modular subtraction

Modular subtraction operation consists in the following computations:

- If A ≥ B result equals A - B mod *n*
- If A < B result equals A + n - B mod *n*

Operation instructions are summarized in *Table 484*.

Table 484. Modular subtraction

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x0F	PKA_CR	6 bits
	Operand length	(in bits, not null)	RAM@0x408	64 bits
	Operand A	(0 ≤ A < n)	RAM@0xA50	ROS
	Operand B	(0 ≤ B < n)	RAM@0xC68	
	Modulus value n	($n < 2^{4160}$)	RAM@0x1088	
OUT	Result: A-B mod n	(0 ≤ result < n)	RAM@0xE78	

52.4.5 Modular and Montgomery multiplication

To be more efficient when performing a sequence of multiplications the PKA accelerates multiplication which has at least one input in the Montgomery domain. The two main uses of this operation are:

- Map a value from natural domain to Montgomery domain and vice-versa
- Perform a modular multiplication A x B mod *n*

The method to perform above operations are described below. Note that “x” function is this operation, and A, B, C operands are in the natural domain.

1. Inward (or outward) conversion into (or from) Montgomery domain
   a) Assuming that A is an integer in the natural domain:
      – Compute *r2modn* using *Montgomery parameter computation*.
      – Result AR= A x *r2modn* mod *n* is A in the Montgomery domain.
   b) Assuming that BR is an integer in the Montgomery domain:
      – Result B = BR x 1 mod *n* is B in the natural domain.
      – Similarly, above value AR computed in a) can be converted into the natural domain by computing A = AR x 1 mod *n*.
2. Simple modular multiplication A x B mod *n*
   a) Compute *r2modn* using *Montgomery parameter computation*.
   b) Compute AR = A x *r2modn* mod *n*. Output is in the Montgomery domain.
   c) Compute AB= AR x B mod *n*. Output is in natural domain.
3. Multiple modular multiplication A x B x C mod *n*
   a) Compute *r2modn* using *Montgomery parameter computation*.
   b) Compute AR = A x *r2modn* mod *n*. Output is in the Montgomery domain.
   c) Compute BR = B x *r2modn* mod *n*. Output is in the Montgomery domain.
   d) Compute ABR= AR x BR mod *n*. Output is in the Montgomery domain.
   e) Compute CR = C x *r2modn* mod *n*. Output is in the Montgomery domain.
   f) Compute ABCR= ABR x CR mod *n*. Output is in the Montgomery domain.
   g) (optional) Repeat the two steps above if more operands need to be multiplied.
   h) Compute ABC= ABCR x 1 mod *n* to retrieve the result in natural domain.

Operation instructions for Montgomery multiplication are summarized in *Table 485*.

Table 485. Montgomery multiplication

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x10	PKA_CR	6 bits
	Operand length	(in bits, not null)	RAM@0x408	64 bits
	Operand A	(0 ≤ A < n)	RAM@0xA50	ROS
	Operand B	(0 ≤ B < n)	RAM@0xC68	
	Modulus value n	(odd integer only, $n < 2^{4160}$)	RAM@0x1088	
OUT	Result: AxB mod n(1)	-	RAM@0xE78	

1. Result in Montgomery domain or in natural domain, depending upon the inputs nature (see examples *2* and *3*).

52.4.6 Modular exponentiation

Modular exponentiation operation is commonly used to perform a single-step RSA operation. It consists in the computation of A^e mod *n*.

RSA operation involving public information (RSA encryption) can use the normal or fast mode detailed on *Table 486* and *Table 487*. RSA operation involving secret information (RSA decryption) must use the protected mode detailed on *Table 488*, for security reason.

Note: Once this operation is started PKA control register and PKA memory is no more available. Access is restored once BUSY bit is set to 0 by the PKA.

When this operation completes with errors due to unexpected hardware events a PKA tamper event is triggered to TAMP peripheral, and access to PKA RAM becomes blocked until erased by hardware.

Note: When MODE = 0x03, the error code is not affected when PKA automatically clears the PKA RAM at the end of this protected operation. When the error output equals 0xD60D, the result output is not affected either.

Operation instructions for modular exponentiation are summarized in *Table 486* (normal mode), *Table 487* (fast mode) and in *Table 488* (protected mode). Fast mode usage is explained in *Section 52.3.6*.

Table 486. Modular exponentiation (normal mode)

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x00	PKA_CR	6 bits
IN	Exponent length	(in bits, not null)	RAM@0x400	64 bits
	Operand length	(in bits, not null)	RAM@0x408

IN	Exponent e	(0 ≤ e < n)	RAM@0xE78	
	Modulus value n	(odd integer only, n < 2^{4160})	RAM@0x1088	
IN/OUT	Montgomery parameter R2 mod n	(mandatory)	RAM@0x620	
OUT	Result: A^e mod n	(0 ≤ result < n)	RAM@0x838	

Table 488. Modular exponentiation (protected mode)

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x03	PKA_CR	6 bits
	Exponent e length	(in bits, not null)	RAM@0x400	64 bits
	Modulus or operand length	(in bits, not null)	RAM@0x408	
	Operand A (base of exponentiation)	(0 ≤ A < n)	RAM@0x16C8	ROS
	Exponent e	(0 ≤ e < n)	RAM@0x14B8	
	Modulus value n	(odd integer only, n < 2^{4096})	RAM@0x0838	
	Phi value(1)	-	RAM@0x0C68	
OUT	Result: A^e mod n	(0 ≤ result < n)	RAM@0x838	
ERROR	Error A^e mod n	No errors: 0xD60D Errors: 0xCBC9	RAM@0x1298	64 bits

1. Euler totient function of n^1 with phi = (p - 1) * (q - 1), where p and q are prime factors of modulus n (see NIST SP800-56B Appendix C or *RSA encryption/decryption principle* for details). As optimization it is recommended to keep phi information as part of the key pair generation. Alternative is to store the key as (*p*, *q*, *e*, *d*) instead of (*N*, *e*, *d*, *phi*), in this case, to derive *N* and *phi* using PKA arithmetic multiplier: *N* = *p* * *q*, and *phi* = (*p* - 1) * (*q* - 1).

52.4.7 Modular inversion

Modular inversion operation consists in the computation of multiplicative inverse A^{-1} mod *n*. If the modulus *n* is prime, for all values of A (1 ≤ A < *n*) modular inversion output is valid. If the modulus *n* is not prime, A has an inverse only if the greatest common divisor between A and *n* is 1.

If the operand A is a divisor of the modulus *n* the result is a multiple of a factor of *n*.

Operation instructions for modular inversion are summarized in *Table 489*.

Table 489. Modular inversion

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x08	PKA_CR	6 bits
	Operand length	(in bits, not null)	RAM@0x408	64 bits
	Operand A	(0 ≤ A < n)	RAM@0xA50	ROS
	Modulus value n	(odd integer only, n < 2^{4160})	RAM@0xC68	
OUT	Result: A^{-1} mod n	0 < result < n	RAM@0xE78	

52.4.8 Modular reduction

Modular reduction operation consists in the computation of the remainder of A divided by n. Operation instructions are summarized in *Table 490*.

Table 490. Modular reduction

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x0D	PKA_CR	6 bits
	Operand length	(in bits, not null)	RAM@0x400	64 bits
	Modulus length	(in bits, 8 < value < 4160)	RAM@0x408	
	Operand A	($0 \le A < 2n < 2^{4160}$)	RAM@0xA50	ROS
	Modulus value n	(odd integer only, $n < 2^{4160}$)	RAM@0xC68	
OUT	Result A mod n	(0 < result < n)	RAM@0xE78	

52.4.9 Arithmetic addition

Arithmetic addition operation consists in the computation of A + B. Operation instructions are summarized in *Table 491*.

Table 491. Arithmetic addition

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x09	PKA_CR	6 bits
	Operand length M	(in bits, not null)	RAM@0x408	64 bits
	Operand A	($0 \le A < 2^M$)	RAM@0xA50	ROS
	Operand B	($0 \le B < 2^M$)	RAM@0xC68	
OUT	Result: A+B	($0 \le$ result $< 2^{M+1}$)	RAM@0xE78	ROS + 1

52.4.10 Arithmetic subtraction

Arithmetic subtraction operation consists in the following computations:

- If $A \ge B$ result equals A - B
- If A < B and M/32 residue is > 0 result equals $A + 2^{int(M/32)*32+1} - B$
- If A < B and M/32 residue is 0 result equals $A + 2^{int(M/32)*32} - B$

For the last two bullets the 64-bit word following the most significant word of the output equals 0xFFFF FFFF FFFF FFFF, as result is negative.

Operation instructions are summarized in *Table 492*.

Table 492. Arithmetic subtraction

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x0A	PKA_CR	6 bits
	Operand length M	(in bits, not null)	RAM@0x408	64 bits
	Operand A	($0 \le < A < 2^M$)	RAM@0xA50	ROS
	Operand B	($0 \le < B < 2^M$)	RAM@0xC68	
OUT	Result: A-B	($0 \le$ result $< 2^M$)	RAM@0xE78	

52.4.11 Arithmetic multiplication

Arithmetic multiplication operation consists in the computation of AxB. Operation instructions are summarized in *Table 493*.

Table 493. Arithmetic multiplication

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x0B	PKA_CR	6 bits
	Operand length M	(in bits, not null)	RAM@0x408	64 bits
	Operand A	($0 \le A < 2^M$)	RAM@0xA50	ROS
	Operand B	($0 \le B < 2^M$)	RAM@0xC68	
OUT	Result: AxB	($0 \le result < 2^{2M}$)	RAM@0xE78	2xROS

52.4.12 Arithmetic comparison

Arithmetic comparison operation consists in the following computation:

- If A = B then result = 0xED2C
- If A > B then result = 0x7AF8
- If A < B then result = 0x916A

Operation instructions for arithmetic comparison are summarized in *Table 494*.

Table 494. Arithmetic comparison

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x0C	PKA_CR	6 bits
	Operand length M	(in bits, not null)	RAM@0x408	64 bits
	Operand A	($0 \le A < 2^M$)	RAM@0xA50	ROS
	Operand B	($0 \le B < 2^M$)	RAM@0xC68	
OUT	Result A = B ?	0xED2C, 0x7AF8, or 0x916A	RAM@0xE78	64 bits

52.4.13 RSA CRT exponentiation

For efficiency many popular crypto libraries such as OpenSSL RSA use the following optimization for decryption and signing based on the chinese remainder theorem (CRT):

- *p* and *q* are precomputed primes, stored as part of the private key
- $d_P = d \bmod (p - 1)$
- $d_Q = d \bmod (q - 1)$ and
- $q_{inv} = q^{-1} \bmod p$

These values allow the recipient to compute the exponentiation $m = A^d \pmod{pq}$ more efficiently as follows:

- $m_1 = A^{dP} \bmod p$
- $m_2 = A^{dQ} \bmod q$
- $h = q_{inv} (m_1 - m_2) \bmod p$, with $m_1 > m_2$
- $m = m_2 + hq \bmod pq$

Operation instructions for computing CRT exponentiation $A^d \bmod pq$ are summarized in *Table 495*.

Table 495. CRT exponentiation

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x07	PKA_CR	6 bits
IN	Operand length	(in bits, not null)	RAM@0x408	64 bits
IN	Operand d_P	$(0 < d_P < 2^{M/2})$	RAM@0x730	ROS / 2
	Operand d_Q	$(0 < d_Q < 2^{M/2})$	RAM@0xE78	
	Operand q_{inv}	$(0 < q_{inv} < 2^{M/2})$	RAM@0x948	
	Prime p(1)	$(0 < p < 2^{M/2})$	RAM@0xB60	
	Prime q(1)	$(0 < q < 2^{M/2})$	RAM@0x1088	
IN	Operand A	$(0 < A < 2^M)$	RAM@0x12A0	ROS
OUT	Result: $A^d \bmod pq$	$(0 \le \text{result} < pq)$	RAM@0x838	

1. Must be different from 2.

52.4.14 Point on elliptic curve Fp check

This operation consists in checking whether a given point P (x, y) satisfies or not the curves over prime fields equation $y^2 = (x^3 + ax + b) \bmod p$, where a and b are elements of the curve.

Operation instructions for point on elliptic curve Fp check are summarized in *Table 496*.

Table 496. Point on elliptic curve Fp check

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x28	PKA_CR	6 bits
	Modulus length	(in bits, not null, 8 < value < 640)	RAM@0x408	64 bits
	Curve coefficient *a* sign	0x0: positive 0x1: negative	RAM@0x410	
	Curve coefficient |a|	(absolute value, |a| < p)	RAM@0x418	EOS
	Curve coefficient *b*	(|b| < p)	RAM@0x520	
	Curve modulus value *p*	(odd integer prime, 0 < p < 2640)	RAM@0x470	
	Point P coordinate *x*	(x < *p*)	RAM@0x578	
	Point P coordinate *y*	(y < *p*)	RAM@0x5D0	
	Montgomery parameter R2 mod n	-	RAM@0x4C8	
OUT	Result: point P on curve	0xD60D: point on curve 0xA3B7: point not on curve 0xF946: x or y coordinate is not smaller than modulus p	RAM@0x680	64 bits

52.4.15 ECC Fp scalar multiplication

This operation consists in the computation of k x P (x_P, y_P), where P is a point on a curve over prime fields and “x” is the elliptic curve scalar point multiplication. Result of the computation is a point that belongs to the same curve or a point at infinity.

Operation instructions for ECC Fp scalar multiplication are summarized in *Table 497*.

Note: Once this operation is started PKA control register and PKA memory is no more available. Access is restored once BUSY bit is set to 0 by the PKA.

When this operation completes with errors due to unexpected hardware events, a PKA tamper event is triggered to TAMP peripheral, and access to PKA RAM becomes blocked until erased by hardware. PKA tamper is also triggered when the programmed input point is not found on the input ECC curve. PKA operation "Point on elliptic curve" can be used to avoid this.

Table 497. ECC Fp scalar multiplication

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x20	PKA_CR	6 bits
IN	Curve prime order *n* length	(in bits, not null,)	RAM@0x400	64 bits
	Curve modulus *p* length	(in bits, not null, 8 < value < 640)	RAM@0x408	
	Curve coefficient *a* sign	0x0: positive 0x1: negative	RAM@0x410	

Table 497. ECC Fp scalar multiplication (continued)

Parameters with direction		Value (note)	Storage	Size
IN	Curve coefficient |*a*|	(absolute value, |a| < p)	RAM@0x418	EOS
	Curve coefficient *b*	(positive integer)	RAM@0x520	
	Curve modulus value *p*	(odd integer prime, $0 < p < 2^{640}$)	RAM@0x1088	
	Scalar multiplier k	($0 \leq k < n$)	RAM@0x12A0	
	Point P coordinate x_P	($x < p$)	RAM@0x578	
	Point P coordinate y_P	($y < p$)	RAM@0x470	
	Curve prime order *n*	(integer prime)	RAM@0xF88	
OUT	Result: k x P coordinate *x'*	(result < *p*)	RAM@0x578	
	Result: k x P coordinate *y'*	(result < *p*)	RAM@0x5D0	
ERROR	Error k x P	No errors: 0xD60D Errors: 0xCBC9	RAM@0x680	64 bits

When performing this operation the following special cases must be noted:

- For k = 0 this function returns a point at infinity (0, 0) if curve parameter b is nonzero, (0, 1) otherwise. For k different from 0 it might happen that a point at infinity is returned. When the application detects this behavior a new computation must be carried out.
- For k < 0 (that is, a negative scalar multiplication is required) the multiplier absolute value
  k = |-k| must be provided to the PKA. After the computation completion, the formula -P = (x, -y) can be used to compute the y coordinate of the effective final result (the x coordinate remains the same).

Note: The error code is not affected when PKA automatically clears the PKA RAM at the end of this protected operation. When the error output equals 0xD60D, the result output is not affected either.

52.4.16 ECDSA sign

ECDSA signing operation (outlined in *Section 52.3.5*) is summarized in *Table 498* (input parameters) and in *Table 499* (output parameters).

The application has to check if the output error is equal to 0xD60D, if it is different a new k must be generated and the ECDSA sign operation must be repeated.

Note: Once this operation is started PKA control register and PKA memory is no more available. Access is restored once BUSY bit is set to 0 by the PKA.

When this operation completes with errors due to unexpected hardware events a PKA tamper event is triggered to TAMP peripheral, and access to PKA RAM becomes blocked until erased by hardware. PKA tamper is also triggered when the programmed input point is not found on the input ECC curve. PKA operation "Point on elliptic curve" can be used to avoid this.

Table 498. ECDSA sign - Inputs

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x24	PKA_CR	6 bits
	Curve prime order n length (*nlen*)	(in bits, not null)	RAM@0x400	64 bits
	Curve modulus p length	(in bits, 8 < value < 640)	RAM@0x408	
	Curve coefficient a sign	0x0: positive 0x1: negative	RAM@0x410	
	Curve coefficient |a|	(absolute value, |a| < p)	RAM@0x418	EOS
	Curve coefficient b	(positive integer)	RAM@0x520	
	Curve modulus value *p*	(odd integer prime, $0 < p < 2^{640}$)	RAM@0x1088	
	Integer k(1)	(0 ≤ k < n)	RAM@0x12A0	
	Curve base point G coordinate x	(x < *p*)	RAM@0x578	
	Curve base point G coordinate y	(y < *p*)	RAM@0x470	
	Hash of message z	(hash size equal to *nlen*)(2)	RAM@0xFE8	
	Private key d	(0 < d)	RAM@0xF28	
	Curve prime order n	(integer prime)	RAM@0xF88	

1. This integer is usually a cryptographically secure random number, but in some cases k can be deterministically generated.
2. Padding with zeroes or hash truncation must be used to have the hash parameter size equal to the curve prime order n length.

Table 499. ECDSA sign - Outputs

Parameters with direction		Value (note)	Storage	Size
OUT	Signature part *r*	(0 < *r* < n)	RAM@0x730	EOS
	Signature part *s*	(0 < *s* < n)	RAM@0x788	
ERROR	Result of signature	0xD60D: successful computation, no error 0xCBC9: failed computation 0xA3B7: signature part r is equal to 0 0xF946: signature part s is equal to 0	RAM@0xFE0	64 bits

Note: The error code is not affected when PKA automatically clears the PKA RAM at the end of this protected operation. When the error output equals 0xD60D, the result output is not affected either.

Extended ECDSA support

PKA also supports extended ECDSA signature, for which the inputs and the outputs are the same as ECDSA signature (*Table 498* and *Table 499*, respectively), with the addition of the coordinates of the point kG. This extra output is defined in *Table 500*.

Table 500. Extended ECDSA sign - Extra outputs

Parameters with direction		Value (note)	Storage	Size
OUT	Curve point kG coordinate x_1	($0 \le x_1 < p$)	RAM@0x1400	EOS
	Curve point kG coordinate y_1	($0 \le y_1 < p$)	RAM@0x1458	

52.4.17 ECDSA verification

ECDSA verification operation (outlined in *Section 52.3.5*) is summarized in *Table 501* (input parameters) and *Table 502* (output parameters).

The application has to check if the output error is equal to 0xD60D, if different the signature is not verified.

Table 501. ECDSA verification - Inputs

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x26	PKA_CR	6 bits
	Curve prime order n length (*nlen*)	(in bits, not null)	RAM@0x408	64 bits
	Curve modulus p length	(in bits, not null, 8 < value < 640)	RAM@0x4C8	
	Curve coefficient a sign	0x0: positive 0x1: negative	RAM@0x468	
	Curve coefficient |a|	(absolute value, |a| < p)	RAM@0x470	EOS
	Curve modulus value *p*	(odd integer prime, $0< p < 2^{640}$)	RAM@0x4D0	
	Curve base point G coordinate x	($x < p$)	RAM@0x678	
	Curve base point G coordinate y	($y < p$)	RAM@0x6D0	
	Public-key curve point Q coordinate x_Q	($x_Q < p$)	RAM@0x12F8	
	Public-key curve point Q coordinate y_Q	($y_Q < p$)	RAM@0x1350	
	Signature part *r*	($0 < r < n$)	RAM@0x10E0	
	Signature part *s*	($0 < s < n$)	RAM@0xC68	
	Hash of message *z*	(hash size equal to *nlen*)(1)	RAM@0x13A8	
	Curve prime order *n*	(integer prime)	RAM@0x1088	

1. Padding with zeroes or hash truncation must be used to have the hash parameter size equal to the curve prime order n length.

Table 502. ECDSA verification - Outputs

Parameters with direction		Value (note)	Storage	Size
OUT	Result: ECDSA verify	– 0xD60D: valid signature – 0xA3B7: invalid signature	RAM@0x5D0	64 bits
	Computed signature part *r*	– (0 < *r* < n)	RAM@0x578	EOS

52.4.18 ECC complete addition

ECC complete addition computes the addition of two given points on an elliptic curve.

Operation instructions are summarized in *Table 503*.

Note: The two input points and the resulting point are represented in Jacobian coordinates (X,Y,Z). To input a point in affine coordinates (x,y) conversion (X,Y,Z) = (x,y,1) can be used. To convert resulting point to Jacobian coordinates conversion (x,y)= (X/Z^2,Y/Z^3) can be used.

Table 503. ECC complete addition

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x23	PKA_CR	6 bits
	Curve modulus *p* length	(in bits, not null, 8 < value < 640)	RAM@0x408	64 bits
	Curve coefficient *a* sign	– 0x0: positive 0x1: negative	RAM@0x410	
	Curve modulus value *p*	(odd integer prime, $0 < p < 2^{640}$)	RAM@0x470	EOS
	Curve coefficient |*a*|	(absolute value, |a| < p)	RAM@0x418	
	First point P coordinate X	(x < *p*)	RAM@0x628	
	First point P coordinate Y	(y < *p*)	RAM@0x680	
	First point P coordinate Z	(z < *p*)	RAM@0x6D8	
	Second point Q coordinate X	(x < *p*)	RAM@0x730	
	Second point Q coordinate Y	(y < *p*)	RAM@0x788	
	Second point Q coordinate Z	(z < *p*)	RAM@0x7E0	
OUT	Result coordinate X	(x < *p*)	RAM@0xD60	
	Result coordinate Y	(y < *p*)	RAM@0xDB8	
	Result coordinate Z	(z < *p*)	RAM@0xE10	

52.4.19 ECC double base ladder

ECC double base ladder operation consists in the computation of k*P+m*Q, where (P,Q) are two points on an elliptic curve and (k,m) are two scalars. Operation instructions are summarized in *Table 504*.

If the resulting point is the point at infinity (error code 0xA3B7), resulting coordinate equals (0, 0).

Note: The two input points are represented in Jacobian coordinates (X, Y , Z). To input a point in affine coordinates (x, y) conversion (X, Y, Z) = (x, y, 1) can be used. The result is represented in affine coordinates (x ,y)

This operation requires the input point Z coordinate to be equal to 1 (input point represented in affine coordinates).

Table 504. ECC double base ladder

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x27	PKA_CR	6 bits
	Curve prime order *n* length	(in bits, not null)	RAM@0x400	64 bits
	Curve modulus *p* length	(in bits, not null, 8 < value < 640)	RAM@0x408	
	Curve coefficient *a* sign	– 0x0: positive – 0x1: negative	RAM@0x410	EOS
	Curve coefficient |*a*|	(absolute value, |a| < p)	RAM@0x418	
	Curve modulus value *p*	(odd integer prime, $0 < p < 2^{640}$)	RAM@0x470	
	Integer k	($0 < k < 2^{640}$)	RAM@0x520	
	Integer m	($0 < m < 2^{640}$)	RAM@0x578	
	First point P coordinate X	(x < *p*)	RAM@0x628	
	First point P coordinate Y	(y < *p*)	RAM@0x680	
	First point P coordinate Z	(z < *p*)	RAM@0x6D8	
	Second point Q coordinate X	(x < *p*)	RAM@0x730	
	Second point Q coordinate Y	(y < *p*)	RAM@0x788	
	Second point Q coordinate Z	(z < *p*)	RAM@0x7E0	
OUT	Result coordinate x	(x < *p*)	RAM@0x578	EOS
	Result coordinate y	(y < *p*)	RAM@0x5D0	
	Error code	– Point not at infinity: 0xD60D – Point at infinity: 0xA3B7	RAM@0x520	64 bits

52.4.20 ECC projective to affine

ECC projective to affine operation computes the conversion between the representation of a point P in homogeneous projective coordinates and the representation of the point P in affine coordinates. Namely, if the point is represented by the triple (X, Y, Z), it computes the affine coordinates (x, y) = (X/Z, Y/Z).

All the operations are performed modulo the modulus p of the curve, which the point belongs to. If the resulting point is the point at infinity (error code 0xA3B7), resulting coordinate equals (0,0).

Operation instructions are summarized in *Table 505*.

Table 505. ECC projective to affine

Parameters with direction		Value (note)	Storage	Size
IN	MODE	0x2F	PKA_CR	6 bits
	Curve modulus *p* length	(in bits, 8 < value < 640)	RAM@0x408	64 bits
	Curve modulus value p	(odd integer prime, $0 < p < 2^{640}$)	RAM@0x470	EOS
	Point P coordinate X (projective)	(x < *p*)	RAM@0xD60	
	Point P coordinate Y (projective)	(y < *p*)	RAM@0xDB8	
	Point P coordinate Z (projective)	(z < *p*)	RAM@0xE10	
	Montgomery parameter R2 mod n	-	RAM@0x4C8	
OUT	Point P coordinate x (affine)	(x < *p*)	RAM@0x578	
	Point P coordinate y (affine)	(y < *p*)	RAM@0x5D0	
ERROR	Error code	Point not at infinity: 0xD60D Point at infinity: 0xA3B7	RAM@0x680	64 bits

52.5 Example of configurations and processing times

52.5.1 Supported elliptic curves

The PKA supports all non-singular elliptic curves defined over prime fields. Those curves can be described with a short Weierstrass equation, $y^2 = x^3 + ax + b \pmod{p}$.

Note: Binary curves, Edwards curves and Curve25519 are not supported by the PKA.
The maximum supported operand size for ECC operations is 640 bits.

When publishing the ECC domain parameters of those elliptic curves, standard bodies define the following parameters:

- the prime integer *p*, used as the modulus for all point arithmetic in the finite field GF(*p*)
- the (usually prime) integer *n*, the order of the group generated by G, defined below
- the base point of the curve G, defined by its coordinates (*Gx*, *Gy*)
- the integers *a* and *b*, coefficients of the short Weierstrass equation.

For the last bullet, when standard bodies define *a* as negative, PKA supports two representations:

1. ***a* defined as *p*-|*a*|** in the finite field GF(*p*), for example **p-3**:
   Curve coefficient p = 0xFFFFFFFE FFFFFFFF FFFFFFFF FFFFFFFF FFFFFFFF 00000000 FFFFFFFF FFFFFFF**F**
   Curve coefficient a sign= 0x0 (positive)
   Curve coefficient a = 0xFFFFFFFE FFFFFFFF FFFFFFFF FFFFFFFF FFFFFFFF 00000000 FFFFFFFF FFFFFFF**C**
2. ***a* defined as negative**, for example **-3**:
   Curve coefficient p = 0xFFFFFFFE FFFFFFFF FFFFFFFF FFFFFFFF FFFFFFFF 00000000 FFFFFFFF FFFFFFFF
   Curve coefficient a sign= 0x**1** (negative)
   Curve coefficient a = 0x00000000 00000000 00000000 00000000 00000000 00000000 00000000 00000000 0000000**3**

Table 506 summarizes the family of curves supported by PKA for ECC operations.

52.5.2 Computation times

The following tables summarize the PKA computation times, expressed in AHB clock cycles.

Table 507. Modular exponentiation

Exponent length (in bits)	Mode	Modulus length (in bits)			
		1024	2048	3072	4096
3	Normal	66000	242000	310000	503000
	Fast	7000	23000	48000	82000
17	Normal	69000	253000	333000	543000
	Fast	24000	34000	72000	123000
2^{16} + 1	Normal	82000	296000	427000	705000
	Fast	23000	78000	165000	284000
1024	Protected	2960000	-	-	-
	Normal	1725000	-	-	-
	Fast	1666000	-	-	-
	CRT(1)	595000	-	-	-
2048	Protected	-	17643000	-	-
	Normal	-	11553000	-	-
	Fast	-	11334000	-	-
	CRT(1)	-	3454000	-	-
3072	Protected	-	-	53390000	-
	Normal	-	-	36280000	-
	Fast	-	-	36019000	-
	CRT(1)	-	-	10328000	-
4096	Protected	-	-	-	119824000
	Normal	-	-	-	82619000
	Fast	-	-	-	82198000
	CRT(1)	-	-	-	23061000

1. CRT stands for chinese remainder theorem optimization (MODE bitfield= 0x07).

Table 508. ECC scalar multiplication(1)

Modulus length (in bits)							
160	192	256	320	384	512	521	640
-	742000	1220000	2116000	3031000	5981000	7844000	10200000

1. These times depend on the number of 1s included in the scalar parameter, and include the computation of Montgomery parameter R2.

Table 509. ECDSA signature average computation time(1) (2)

Modulus length (in bits)							
160	**192**	**256**	**320**	**384**	**512**	**521**	**640**
-	633000	1087000	1708000	2548000	4856000	5978000	8030000

1. These values are average execution times of random moduli of given length, as they depend upon the length and the value of the modulus.
2. The execution time for the moduli that define the finite field of NIST elliptic curves is shorter than that needed for the moduli used for Brainpool elliptic curves or for random moduli of the same size.

Table 510. ECDSA verification average computation times

Modulus length (in bits)							
160	**192**	**256**	**320**	**384**	**512**	**521**	**640**
566000	676000	1221000	1957000	2967000	5825000	7096000	9773000

Table 511. ECC double base ladder average computation times

Modulus length (in bits)							
160	**192**	**256**	**320**	**384**	**512**	**521**	**640**
541000	644000	1152000	1873000	2814000	5506000	6753000	9350000

Table 512. ECC projective to affine average computation times

Modulus length (in bits)						
160	**192**	**256**	**320**	**384**	**512**	**640**
24700	32000	56000	90000	144000	271000	326000

Table 513. ECC complete addition average computation times

Modulus length (in bits)						
160	**192**	**256**	**320**	**384**	**512**	**640**
8000	8200	10500	13000	19400	29600	39000

Table 514. Point on elliptic curve Fp check average computation times

Modulus length (in bits)							
160	**192**	**256**	**320**	**384**	**512**	**521**	**640**
2200	2240	2870	3550	4400	6260	7460	8500

Table 515. Montgomery parameters average computation times(1)

Modulus length (in bits)							
192	**256**	**320**	**512**	**1024**	**2048**	**3072**	**4096**
4200	5200	5900	12600	35500	126500	290000	420000

1. The computation times depend upon the length and the value of the modulus, hence these values are average execution times of random moduli of given length.

52.6 PKA interrupts

There are four individual maskable interrupt sources generated by the public key accelerator, signaling the following events:

1. PKA unsupported operation error (OPERRF), see *Section 52.3.7*
2. Access to unmapped address (ADDRERRF), see *Section 52.3.7*
3. PKA RAM access while PKA operation is in progress (RAMERRF), see *Section 52.3.7*
4. PKA end of operation (PROCENDF)

The interrupt sources are connected to the same global interrupt request signal pka_it.

The user can enable or disable above interrupt sources individually by changing the mask bits in the *PKA control register (PKA_CR)*. Setting the appropriate mask bit to 1 enables the interrupt. The status of the individual interrupt events can be read from the PKA status register (PKA_SR), and it is cleared in PKA_CLRFR register.

Table 516 gives a summary of the available features.

Table 516. PKA interrupt requests

Acronym	Event	Event flag	Enable control bit	Clear method
PKA	Unsupported operation	OPERRF	OPERRIE	Set OPERRFC bit
	Access to unmapped address error	ADDRERRF	ADDRERRIE	Set ADDRERRFC bit
	PKA RAM access error	RAMERRF	RAMERRIE	Set RAMERRFC bit
	PKA end of operation	PROCENDF	PROCENDIE	Set PROCENDFC bit

52.7 PKA registers

52.7.1 PKA control register (PKA_CR)

Address offset: 0x00

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OPERRIE	ADDRERRIE	RAMERRIE	Res.	PROCENDIE	Res.
										rw	rw	rw		rw	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	MODE[5:0]						Res.	Res.	Res.	Res.	Res.	Res.	START	EN
		rw	rw	rw	rw	rw	rw							rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **OPERRIE**: Operation error interrupt enable
0: No interrupt is generated when OPERRF flag is set in PKA_SR.
1: An interrupt is generated when OPERRF flag is set in PKA_SR.

Bit 20 **ADDRERRIE**: Address error interrupt enable
0: No interrupt is generated when ADDRERRF flag is set in PKA_SR.
1: An interrupt is generated when ADDRERRF flag is set in PKA_SR.

Bit 19 **RAMERRIE**: RAM error interrupt enable
0: No interrupt is generated when RAMERRF flag is set in PKA_SR.
1: An interrupt is generated when RAMERRF flag is set in PKA_SR.

Bit 18 Reserved, must be kept at reset value.

Bit 17 **PROCENDIE**: End of operation interrupt enable
0: No interrupt is generated when PROCENDF flag is set in PKA_SR.
1: An interrupt is generated when PROCENDF flag is set in PKA_SR.

Bits 16:14 Reserved, must be kept at reset value.

Bits 13:8 **MODE[5:0]**: PKA operation code

000000: Montgomery parameter computation then modular exponentiation
000001: Montgomery parameter computation only
000010: Modular exponentiation only (Montgomery parameter must be loaded first)
000011: Modular exponentiation (protected, used when manipulating secrets)
100000: Montgomery parameter computation then ECC scalar multiplication (protected)
100100: ECDSA sign (protected)
100110: ECDSA verification
101000: Point on elliptic curve Fp check
000111: RSA CRT exponentiation
001000: Modular inversion
001001: Arithmetic addition
001010: Arithmetic subtraction
001011: Arithmetic multiplication
001100: Arithmetic comparison
001101: Modular reduction
001110: Modular addition
001111: Modular subtraction
010000: Montgomery multiplication
100011: ECC complete addition
100111: ECC double base ladder
101111: ECC projective to affine

When an operation not listed here is written by the application with EN bit set, OPERRF bit is set in PKA_SR register, and the write to MODE bitfield is ignored. When PKA is configured in limited mode (LMF = 1 in PKA_SR), writing a MODE different from 0x26 with EN bit to 1 triggers OPERRF bit to be set and write to MODE bit is ignored.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **START**: start the operation

Set this bit to start the operation selected by the MODE[5:0] bitfield, using the operands and data already written to the PKA RAM. This bit is always read as 0.

When an illegal operation is selected while START bit is set no operation is started, and OPERRF bit is set in PKA_SR.

Note: START is ignored if PKA is busy.

Bit 0 **EN**: PKA enable

0: Disable PKA

1: Enable PKA. PKA becomes functional when INITOK is set by hardware in PKA_SR. When an illegal operation is selected while EN = 1, OPERRF bit is set in PKA_SR. See PKA_CR.MODE bitfield for details.

Note: When EN = 0, PKA RAM can still be accessed by the application.

52.7.2 PKA status register (PKA_SR)

Address offset: 0x04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OPERRF	ADDRERRF	RAMERRF	Res.	PROCENDF	BUSY
										r	r	r		r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LMF	INITOK
														r	r

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **OPERRF**: Operation error flag

0: No event error

1: An illegal or unknown operation has been selected in PKA_CR register

This bit is cleared using OPERRFC bit in PKA_CLRFR.

Bit 20 **ADDRERRF**: Address error flag

0: No address error

1: Address access is out of range (unmapped address)

This bit is cleared using ADDRERRFC bit in PKA_CLRFR.

Bit 19 **RAMERRF**: PKA RAM error flag

0: No PKA RAM access error

1: An AHB access to the PKA RAM occurred while the PKA core was computing and using its internal RAM (AHB PKA_RAM access are not allowed while PKA operation is in progress).

This bit is cleared using RAMERRFC bit in PKA_CLRFR.

Bit 18 Reserved, must be kept at reset value.

Bit 17 **PROCENDF**: PKA end of operation flag

0: Operation in progress

1: PKA operation is completed. This flag is set when the BUSY bit is deasserted.

Bit 16 **BUSY**: Busy flag

This bit is set whenever a PKA operation is in progress (START = 1 in PKA_CR). It is automatically cleared when the computation is complete, making PKA RAM accessible again.

0: No operation is in progress (default)

1: An operation is in progress

If PKA is started with a wrong opcode, it stays busy for a couple of cycles, then it aborts automatically the operation and goes back to ready (BUSY = 0).

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **LMF**: Limited mode flag

This bit is updated when EN bit in PKA_CR is set

0: All values documented in MODE bitfield can be used.

1: Only ECDSA verification (MODE = 0x26) is supported by the PKA.

Bit 0 **INITOK**: PKA initialization OK
This bit is asserted when PKA initialization is complete.
0: PKA is not initialized correctly. START bit cannot be set.
1: PKA is initialized correctly and can be used normally.

Note: When RNG is not able to output proper random numbers or when SAES is using the RNG bus, INITOK remains at 0. If it happens, make sure the RNG peripheral is properly clocked and initialized, and the SAES peripheral is clocked with BUSY bit cleared in SAES_SR to release the RNG bus, then enable PKA again.

52.7.3 PKA clear flag register (PKA_CLRFR)

Address offset: 0x08

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OPERRFC	ADDRERRFC	RAMERRFC	Res.	PROCENDFC	Res.
										w	w	w		w	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:22 Reserved, must be kept at reset value.

Bit 21 **OPERRFC**: Clear operation error flag
0: No action
1: Clear the OPERRF flag in PKA_SR

Bit 20 **ADDRERRFC**: Clear address error flag
0: No action
1: Clear the ADDRERRF flag in PKA_SR

Bit 19 **RAMERRFC**: Clear PKA RAM error flag
0: No action
1: Clear the RAMERRF flag in PKA_SR

Bit 18 Reserved, must be kept at reset value.

Bit 17 **PROCENDFC**: Clear PKA end of operation flag
0: No action
1: Clear the PROCENDF flag in PKA_SR

Bits 16:0 Reserved, must be kept at reset value.

Note: Reading PKA_CLRFR returns all 0s.

52.7.4 PKA RAM

The PKA RAM is mapped at the offset address of 0x0400 compared to the PKA base address. Only 32-bit word single accesses are supported, through PKA.AHB interface.

RAM size is 5336 bytes (max word offset: 0x14D0)

Note: PKA RAM cannot be used just after a PKA reset or a product reset, as described in Section 52.3.3: PKA reset and clocks.

52.7.5 PKA hardware configuration register (PKA_HWCFGR)

Address offset: 0x1FF0

Reset value: 0x0000 0011

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CFG2[3:0]				CFG1[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **CFG2[3:0]**: HW Generic 2
This field returns the DPAEN generic value (0x1)

Bits 3:0 **CFG1[3:0]**: HW Generic 2
This field returns the PKA64_SEL generic value (0x1)

52.7.6 PKA version register (PKA_VERR)

Address offset: 0x1FF4

Reset value: 0x0000 0013

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJREV[3:0]				MINREV[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision
This field returns the PKA major version.

Bits 3:0 **MINREV[3:0]**: Minor revision
This field returns the PKA minor version.

52.7.7 PKA identification register (PKA_IPIDR)

Address offset: 0x1FF8

Reset value: 0x0017 0072

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ID[31:0]**: Identification code
This field returns the PKA identification code.

52.7.8 PKA size identification register (PKA_SIDR)

Address offset: 0x1FFC

Reset value: 0xA3C5 DD08

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **SID[31:0]**: Size identification code
This field returns the size identification code of the PKA as defined below:
Bits[31:8] = 0xA3C5DD (fixed code)
Bits[7:0] = 0x08 (8 KB address decoding)

52.7.9 PKA register map

Table 517. PKA register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

53 Advanced-control timers (TIM1/TIM8)

53.1 TIM1/TIM8 introduction

The advanced-control timers (TIM1/TIM8) consist of a 16-bit autoreload counter driven by a programmable prescaler.

It may be used for a variety of purposes, including measuring the pulse lengths of input signals (input capture) or generating output waveforms (output compare, PWM, complementary PWM with dead-time insertion).

Pulse lengths and waveform periods can be modulated from a few microseconds to several milliseconds using the timer prescaler and the RCC clock controller prescalers.

The advanced-control (TIM1/TIM8) and general-purpose (TIMy) timers are completely independent, and do not share any resources. They can be synchronized together as described in *Section 53.3.30: Timer synchronization*.

53.2 TIM1/TIM8 main features

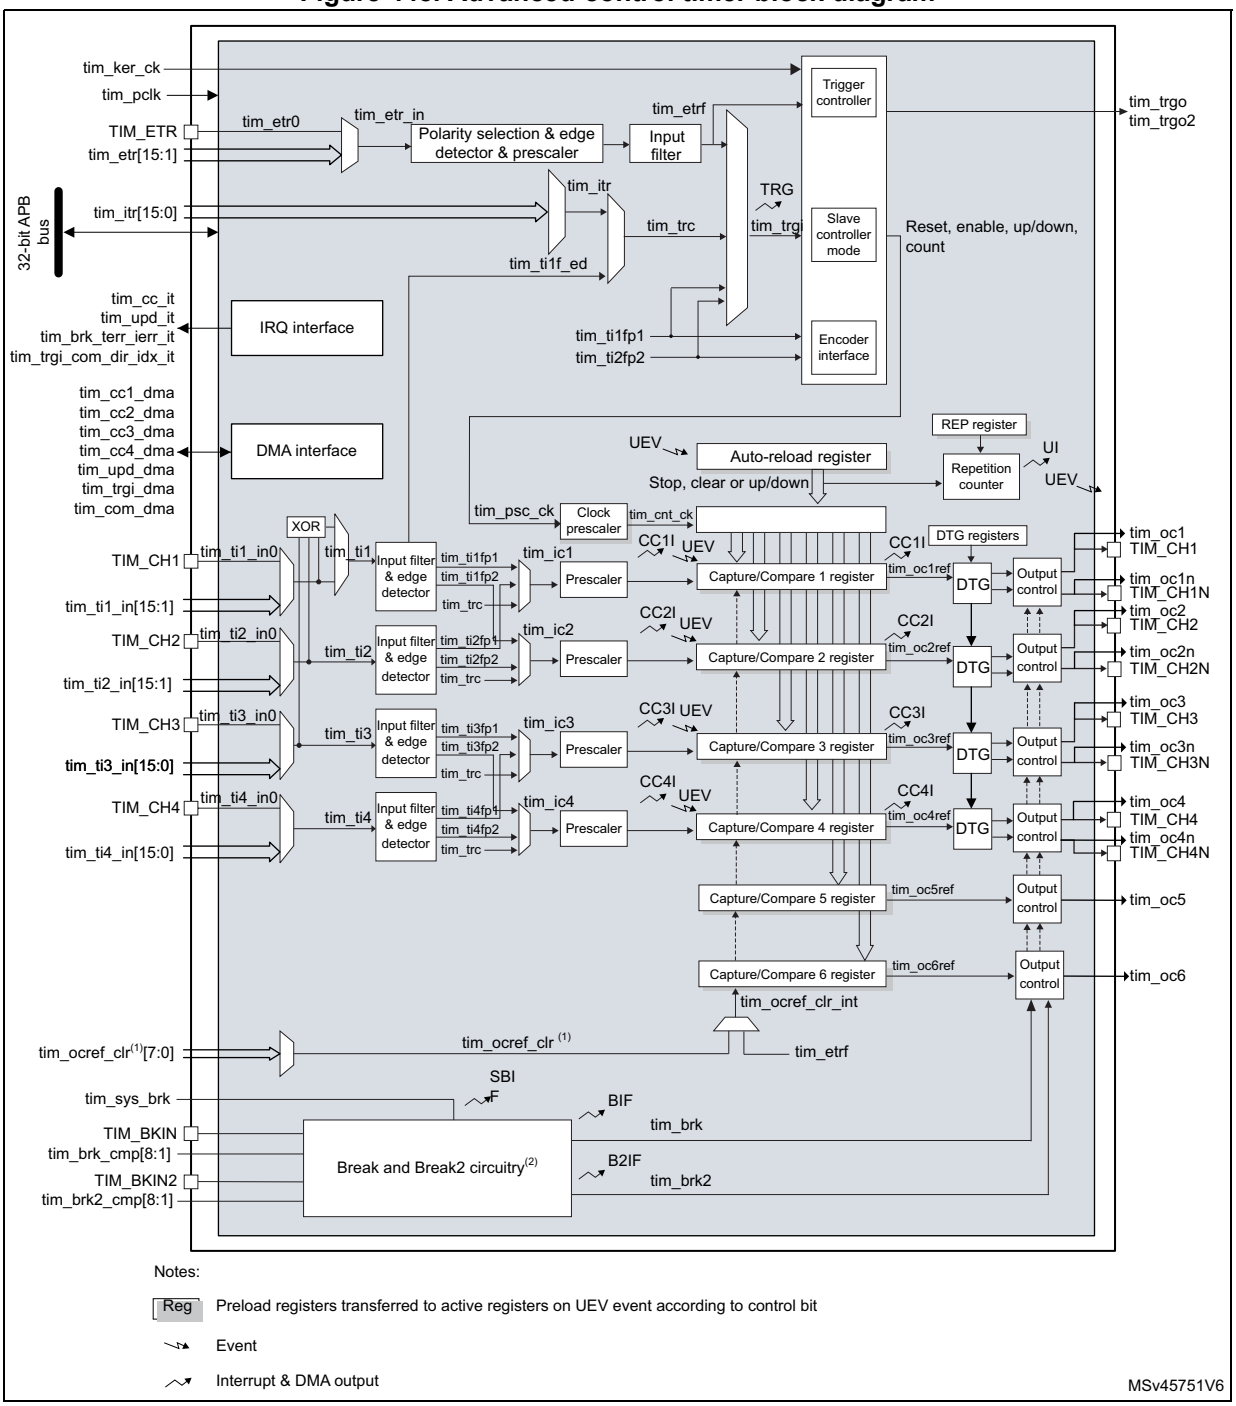
TIM1/TIM8 timer features include:

- 16-bit up, down, up/down autoreload counter.
- 16-bit programmable prescaler allowing dividing (also “on the fly”) the counter clock frequency by any factor from 1 to 65536.
- Up to six independent channels for:
  - Input capture (but channels 5 and 6)
  - Output compare
  - PWM generation (edge and center-aligned mode)
  - One-pulse mode output
- Complementary outputs with programmable dead-time
- Synchronization circuit to control the timer with external signals and to interconnect several timers together.
- Repetition counter to update the timer registers only after a given number of cycles of the counter.
- 2 break inputs to put the timer’s output signals in a safe user selectable configuration.
- Interrupt/DMA generation on the following events:
  - Update: counter overflow/underflow, counter initialization (by software or internal/external trigger)
  - Trigger event (counter start, stop, initialization, or count by internal/external trigger)
  - Input capture
  - Output compare
- Supports incremental (quadrature) encoder and hall-sensor circuitry for positioning purposes
- Trigger input for external clock or cycle-by-cycle current management

53.3 TIM1/TIM8 functional description

53.3.1 Block diagram

Figure 448. Advanced-control timer block diagram



1. This feature is not available on all timers, refer to *Section 53.3.2: TIM1/TIM8 pins and internal signals*.
2. See *Figure 495: Break and Break2 circuitry overview* for details.

53.3.2 TIM1/TIM8 pins and internal signals

The tables in this section summarize the TIM inputs and outputs

Table 518. TIM input/output pins

Pin name	Signal type	Description
TIM_CH1 TIM_CH2 TIM_CH3 TIM_CH4	Input/output	Timer multi-purpose channels. Each channel can be used for capture, compare or PWM. TIM_CH1 and TIM_CH2 can also be used as external clock (below 1/4 of the tim_ker_ck clock), external trigger and quadrature encoder inputs. TIM_CH1, TIM_CH2 and TIM_CH3 can be used to interface with digital hall effect sensors.
TIM_CH1N TIM_CH2N TIM_CH3N TIM_CH4N	Output	Timer complementary outputs, derived from TIM_CHx outputs with the possibility to have deadtime insertion.
TIM_ETR	Input	External trigger input. This input can be used as external trigger or as external clock source. This input can receive a clock with a frequency higher than the tim_ker_ck if the tim_etr_in prescaler is used.
TIM_BKIN TIM_BKIN2	Input/output	Break and Break2 inputs. These inputs can also be configured in bidirectional mode.

Table 519. TIM internal input/output signals

Internal signal name	Signal type	Description
tim_ti1_in[15:0] tim_ti2_in[15:0] tim_ti3_in[15:0] tim_ti4_in[15:0]	Input	Internal timer inputs bus. The tim_ti1_in[15:0] and tim_ti2_in[15:0] inputs can be used for capture or as external clock (below 1/4 of the tim_ker_ck clock) and for quadrature encoder signals.
tim_etr[15:0]	Input	External trigger internal input bus. These inputs can be used as trigger, external clock or for hardware cycle-by-cycle pulsewidth control. These inputs can receive clock with a frequency higher than the tim_ker_ck if the tim_etr_in prescaler is used.
tim_itr[15:0]	Input	Internal trigger input bus. These inputs can be used for the slave mode controller or as a input clock (below 1/4 of the tim_ker_ck clock).
tim_trgo/tim_trgo2	Output	Internal trigger outputs. These triggers are used by other timers and /or other peripherals.

Table 519. TIM internal input/output signals (continued)

Internal signal name	Signal type	Description
tim_ocref_clr[7:0]	Input	Timer tim_ocref_clr input bus. These inputs can be used to clear the tim ocxref signals, typically for hardware cycle-by-cycle pulsewidth control.
tim_brk_cmp[8:1]	Input	Break input for internal signals
tim_brk2_cmp[8:1]	Input	Break2 input for internal signals
tim_sys_brk[n:0]	Input	System break input. This input gathers the MCU's system level errors.
tim_pclk	Input	Timer APB clock
tim_ker_ck	Input	Timer kernel clock
tim_cc_it	Output	Timer capture/compare interrupt
tim_upd_it	Output	Timer update event interrupt
tim_brk_terr_ierr_it	Output	Timer break, break2, transition error and index error interrupt
tim_trgi_com_dir_idx_it	Output	Timer trigger, commutation, direction and index interrupt
tim_cc1_dma tim_cc2_dma tim_cc3_dma tim_cc4_dma	Output	Timer capture / compare 1..4 dma requests
tim_upd_dma	Output	Timer update dma request
tim_trgi_dma	Output	Timer trigger dma request
tim_com_dma	Output	Timer commutation dma request

Table 520, *Table 521*, *Table 522* and *Table 523* list the sources connected to the tim_ti[4:1] input multiplexers.

53.3.3 Time-base unit

The main block of the programmable advanced-control timer is a 16-bit counter with its related autoreload register. The counter can count up, down or both up and down. The counter clock can be divided by a prescaler.

The counter, the autoreload register and the prescaler register can be written or read by software, even when the counter is running.

The time-base unit includes:

- Counter register (TIMx_CNT)
- Prescaler register (TIMx_PSC)
- Autoreload register (TIMx_ARR)
- Repetition counter register (TIMx_RCR)

The autoreload register is preloaded. Writing to or reading from the autoreload register accesses the preload register. The content of the preload register are transferred into the shadow register permanently or at each update event (UEV), depending on the autoreload preload enable bit (ARPE) in TIMx_CR1 register. The update event is sent when the counter reaches the overflow (or underflow when downcounting) and if the UDIS bit equals 0 in the TIMx_CR1 register. It can also be generated by software. The generation of the update event is described in detailed for each configuration.

The counter is clocked by the prescaler output tim_cnt_ck, which is enabled only when the counter enable bit (CEN) in TIMx_CR1 register is set (refer also to the slave mode controller description to get more details on counter enabling).

Note: The counter starts counting 1 clock cycle after setting the CEN bit in the TIMx_CR1 register.

Prescaler description

The prescaler divides the counter clock frequency by any factor from 1 to 65536. It is based on a 16-bit counter controlled through a 16-bit register (in the TIMx_PSC register). It can be changed on the fly as this control register is buffered. The new prescaler ratio is taken into account at the next update event.

Figure 449 and *Figure 450* give some examples of the counter behavior when the prescaler ratio is changed on the fly.

Figure 449. Counter timing diagram with prescaler division change from 1 to 2

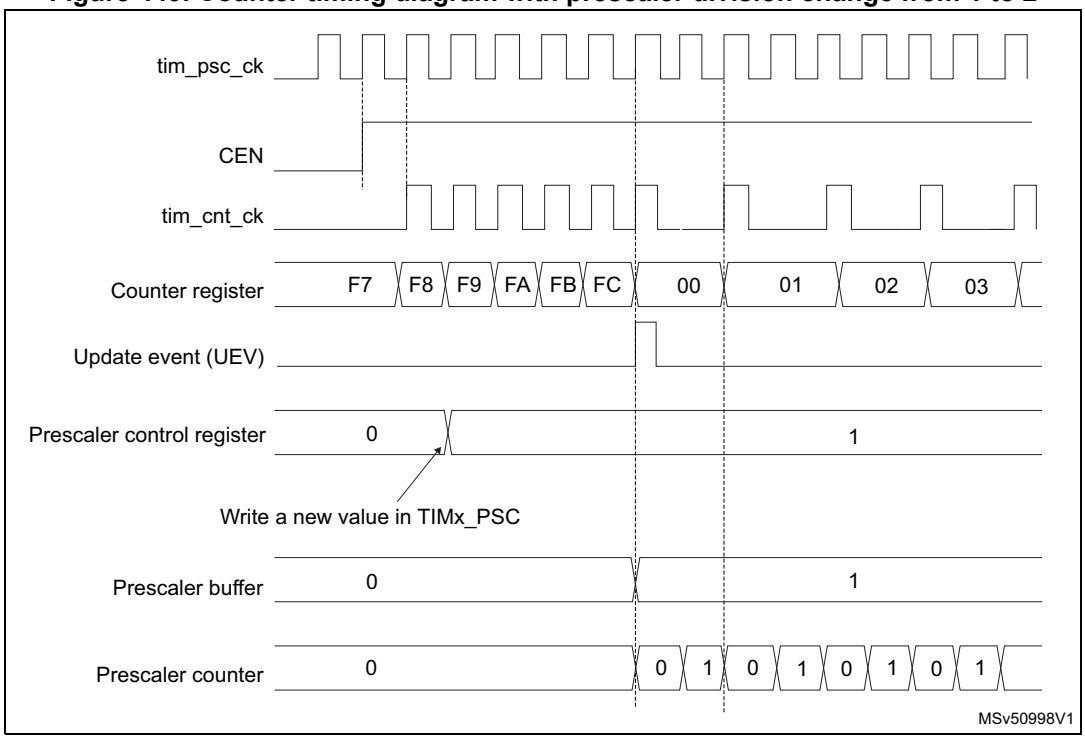

Figure 450. Counter timing diagram with prescaler division change from 1 to 4

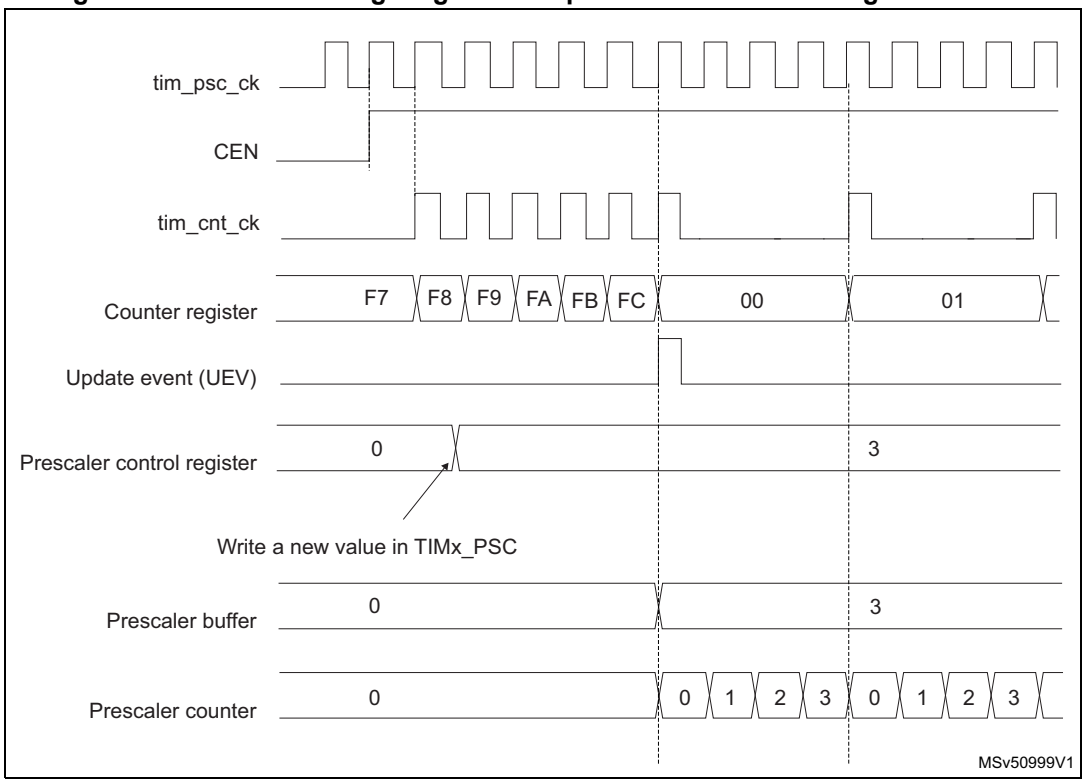

53.3.4 Counter modes

Upcounting mode

In upcounting mode, the counter counts from 0 to the autoreload value (content of the TIMx_ARR register), then restarts from 0 and generates a counter overflow event.

If the repetition counter is used, the update event (UEV) is generated after upcounting is repeated for the number of times programmed in the repetition counter register (TIMx_RCR) + 1. Else the update event is generated at each counter overflow.

Setting the UG bit in the TIMx_EGR register (by software or by using the slave mode controller) also generates an update event.

The UEV event can be disabled by software by setting the UDIS bit in the TIMx_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter restarts from 0, as well as the counter of the prescaler (but the prescale rate does not change). In addition, if the URS bit (update request selection) in TIMx_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx_SR register) is set (depending on the URS bit):

- The repetition counter is reloaded with the content of TIMx_RCR register,
- The autoreload shadow register is updated with the preload value (TIMx_ARR),
- The buffer of the prescaler is reloaded with the preload value (content of the TIMx_PSC register).

The following figures show some examples of the counter behavior for different clock frequencies when TIMx_ARR = 0x36.

Figure 451. Counter timing diagram, internal clock divided by 1

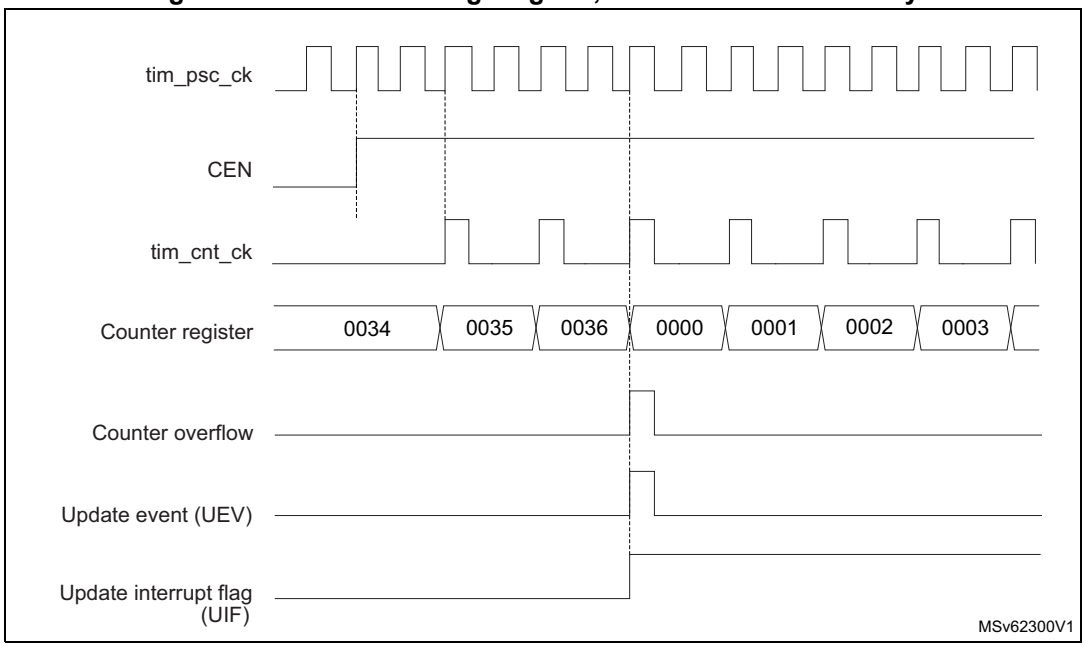

Figure 453. Counter timing diagram, internal clock divided by 4

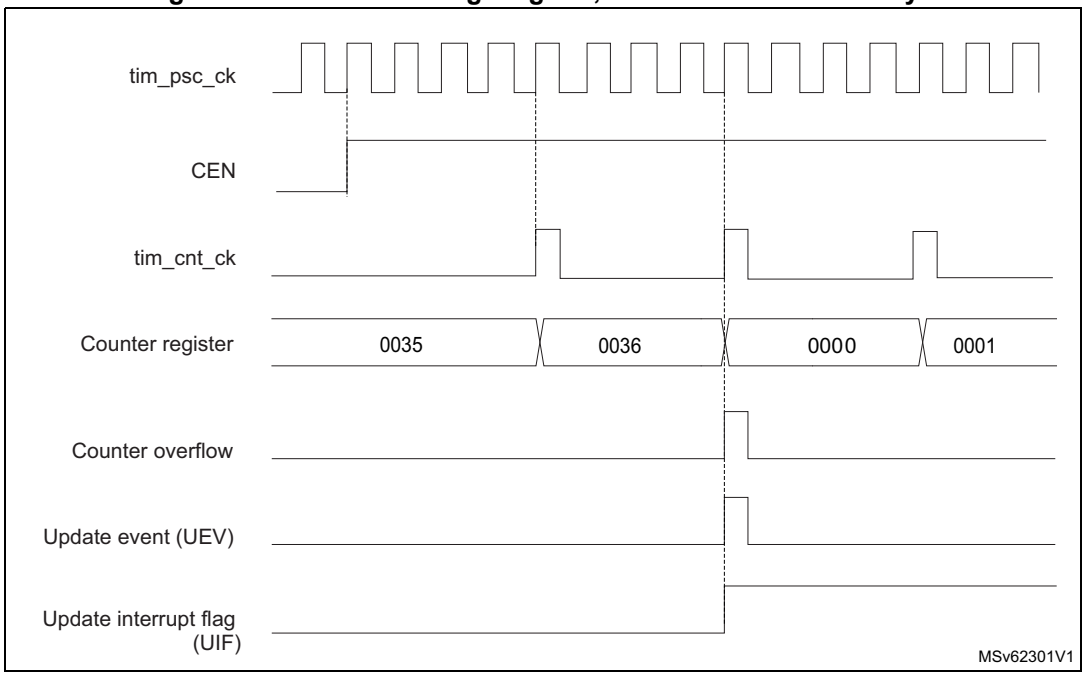

Figure 454. Counter timing diagram, internal clock divided by N

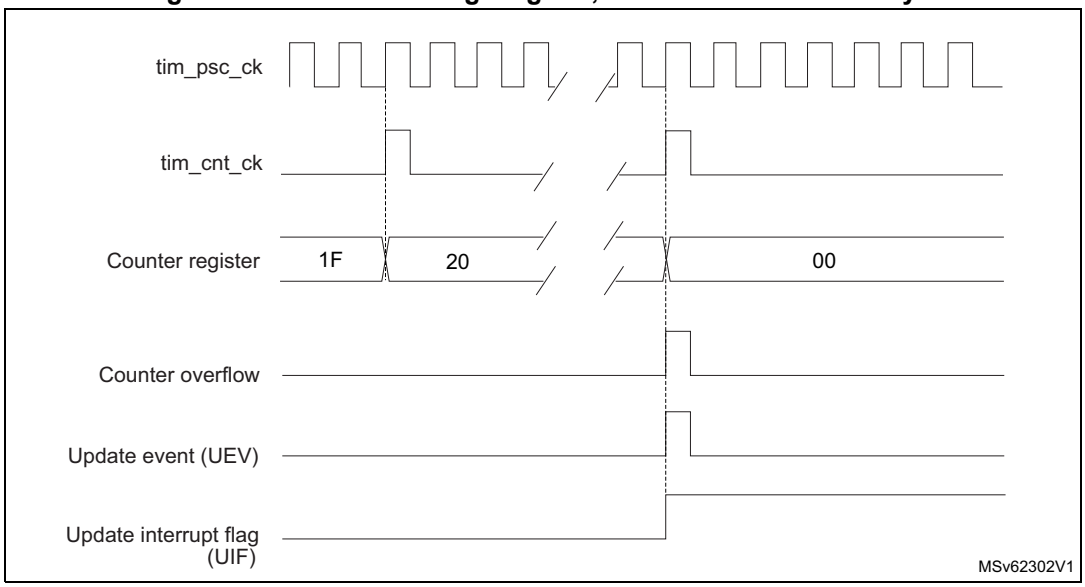

Figure 455. Counter timing diagram, update event when ARPE = 0 (TIMx_ARR not preloaded)

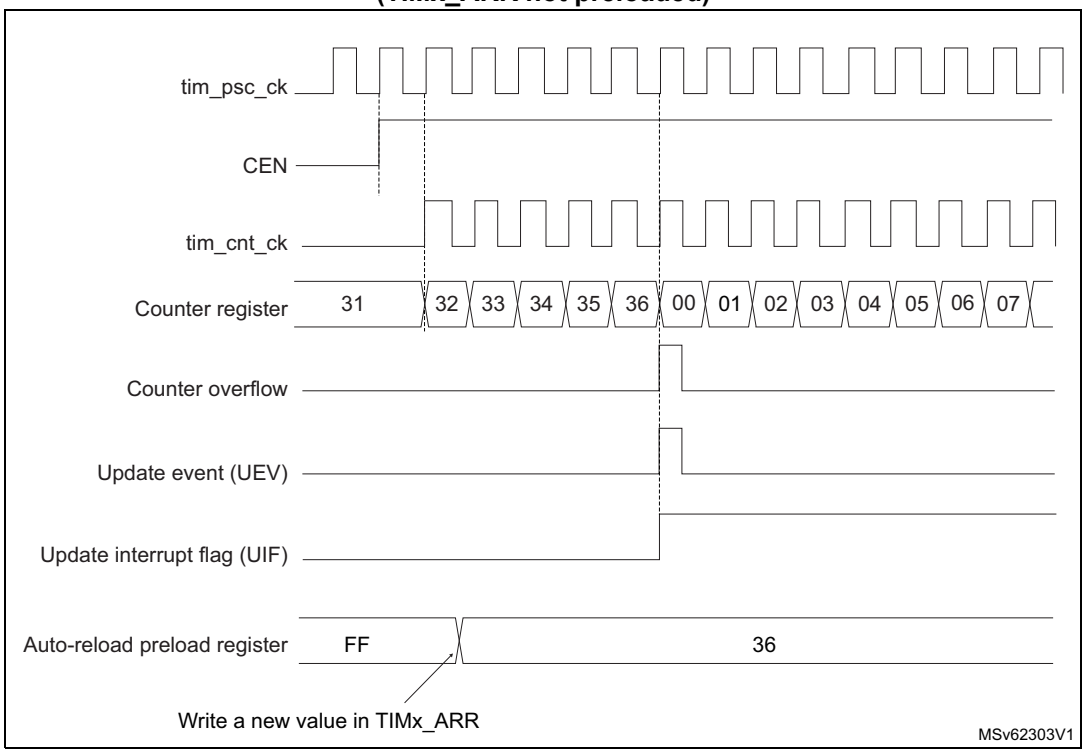

Figure 456. Counter timing diagram, update event when ARPE = 1 (TIMx_ARR preloaded)

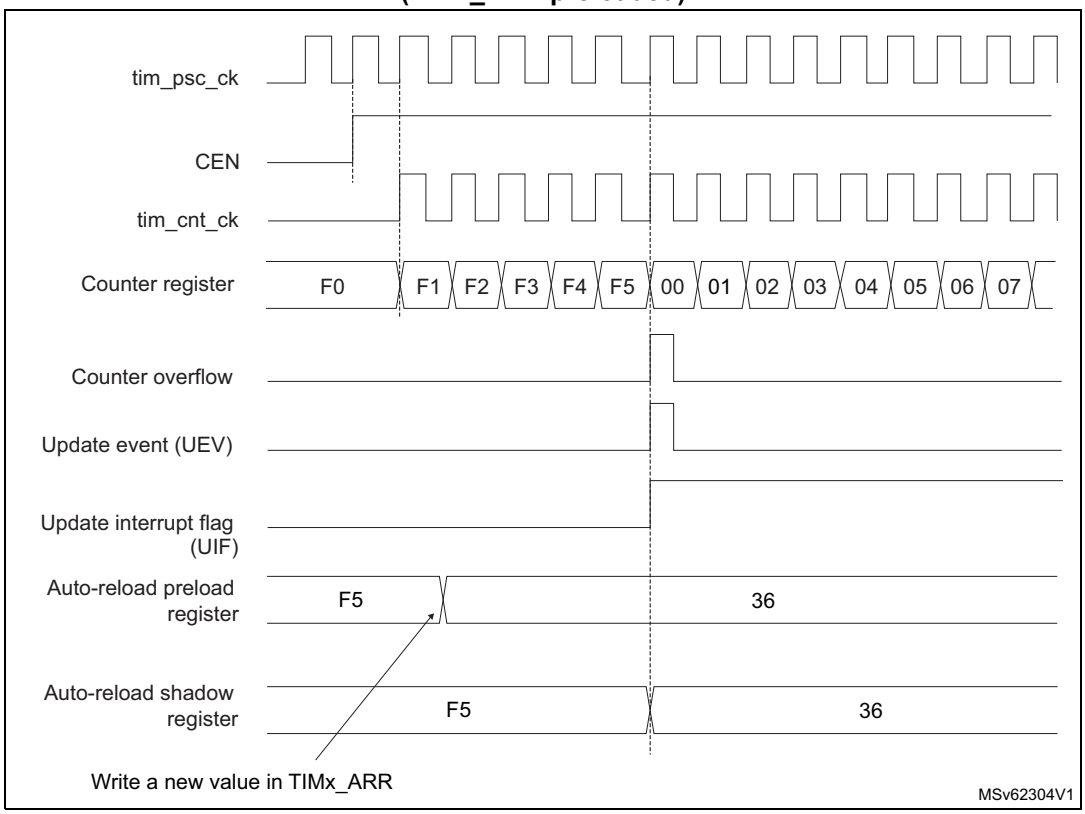

Downcounting mode

In downcounting mode, the counter counts from the autoreload value (content of the TIMx_ARR register) down to 0, then restarts from the autoreload value and generates a counter underflow event.

If the repetition counter is used, the update event (UEV) is generated after downcounting is repeated for the number of times programmed in the repetition counter register (TIMx_RCR) + 1. Else the update event is generated at each counter underflow.

Setting the UG bit in the TIMx_EGR register (by software or by using the slave mode controller) also generates an update event.

The UEV update event can be disabled by software by setting the UDIS bit in TIMx_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until UDIS bit has been written to 0. However, the counter restarts from the current autoreload value, whereas the counter of the prescaler restarts from 0 (but the prescale rate doesn't change).

In addition, if the URS bit (update request selection) in TIMx_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx_SR register) is set (depending on the URS bit):

- The repetition counter is reloaded with the content of TIMx_RCR register.
- The buffer of the prescaler is reloaded with the preload value (content of the TIMx_PSC register).
- The autoreload active register is updated with the preload value (content of the TIMx_ARR register). Note that the autoreload is updated before the counter is reloaded, so that the next period is the expected one.

The following figures show some examples of the counter behavior for different clock frequencies when TIMx_ARR = 0x36.

Figure 457. Counter timing diagram, internal clock divided by 1

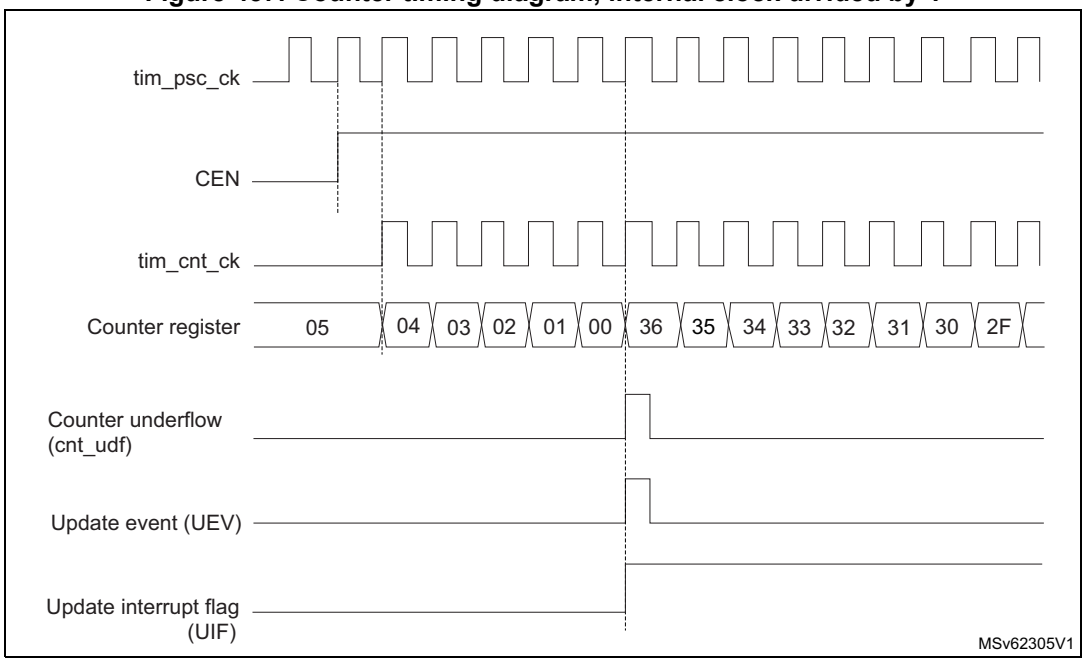

Figure 458. Counter timing diagram, internal clock divided by 2

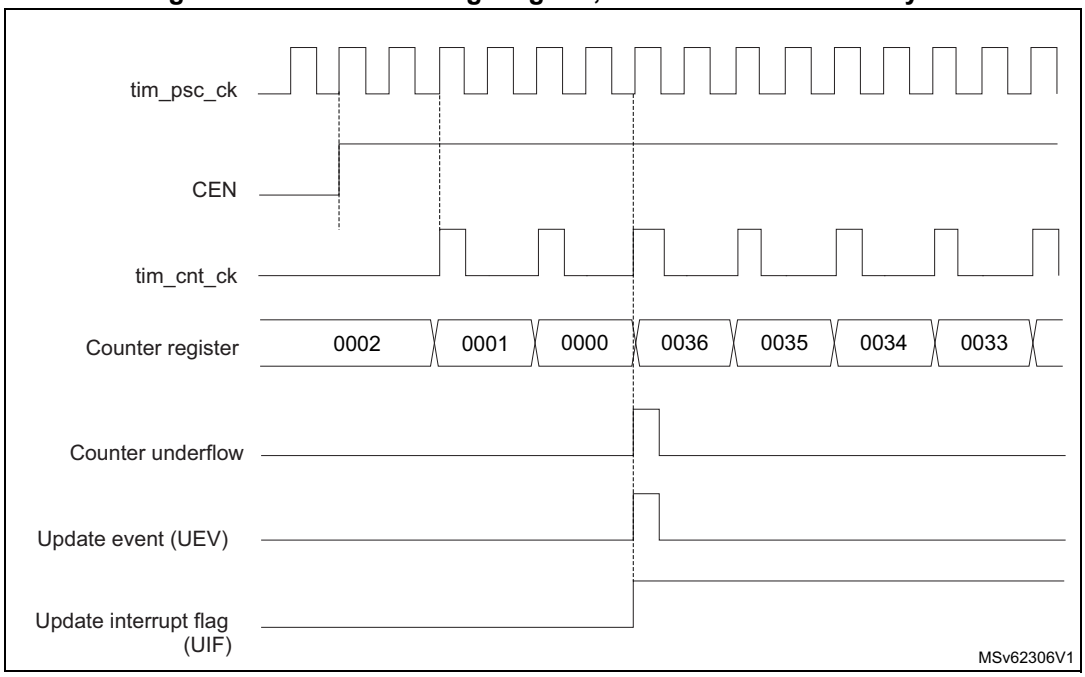

Figure 459. Counter timing diagram, internal clock divided by 4

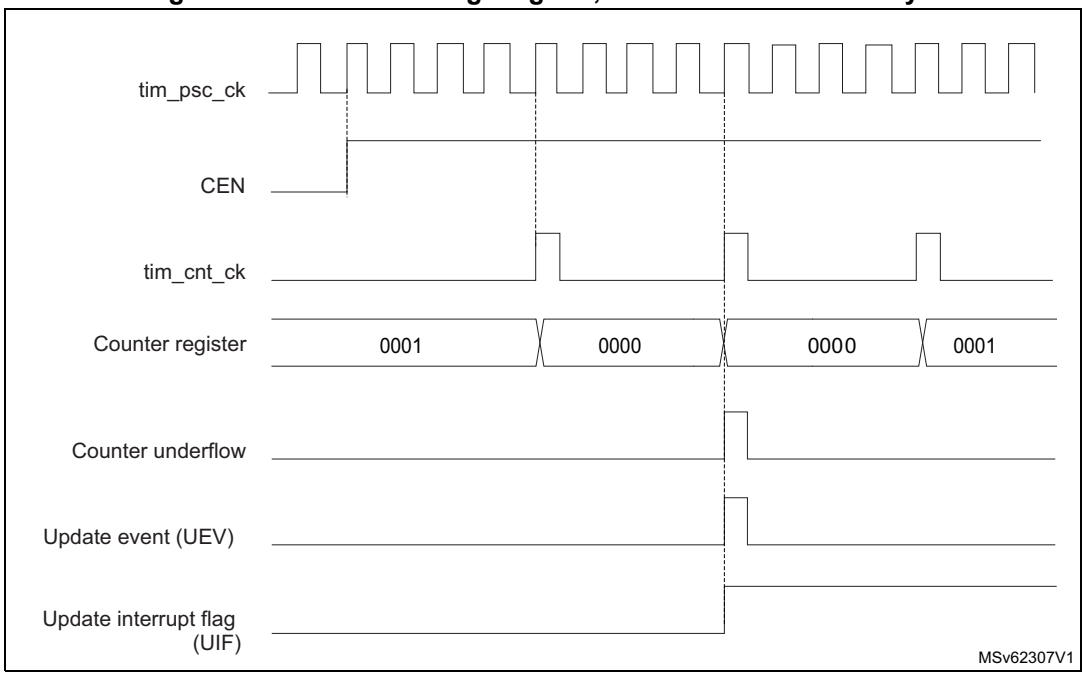

Figure 460. Counter timing diagram, internal clock divided by N

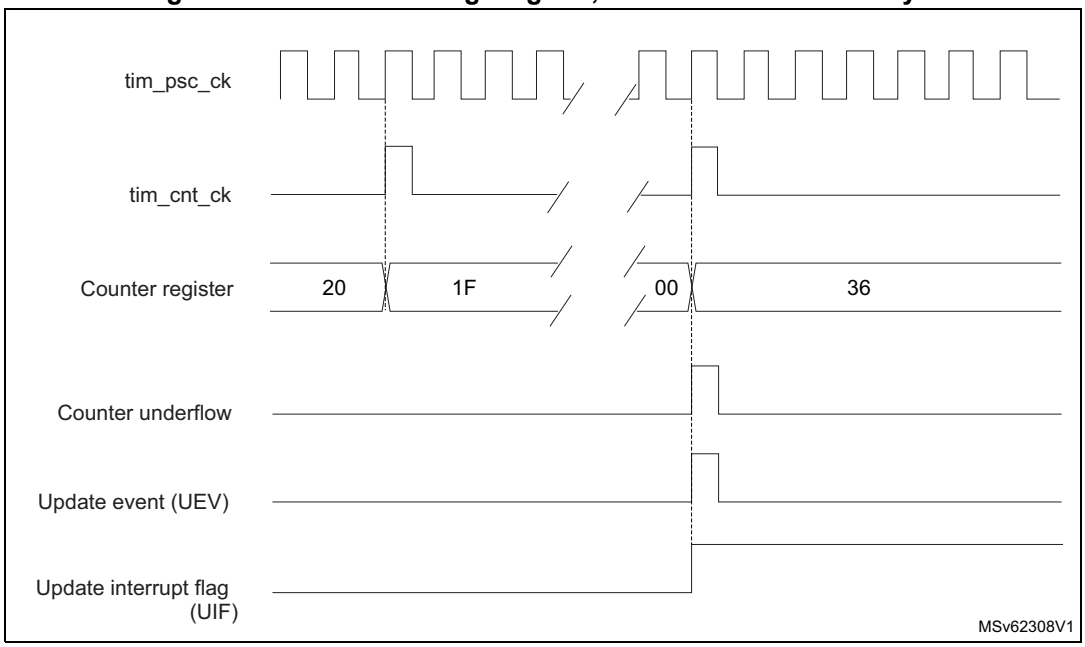

Figure 461. Counter timing diagram, update event when repetition counter is not used

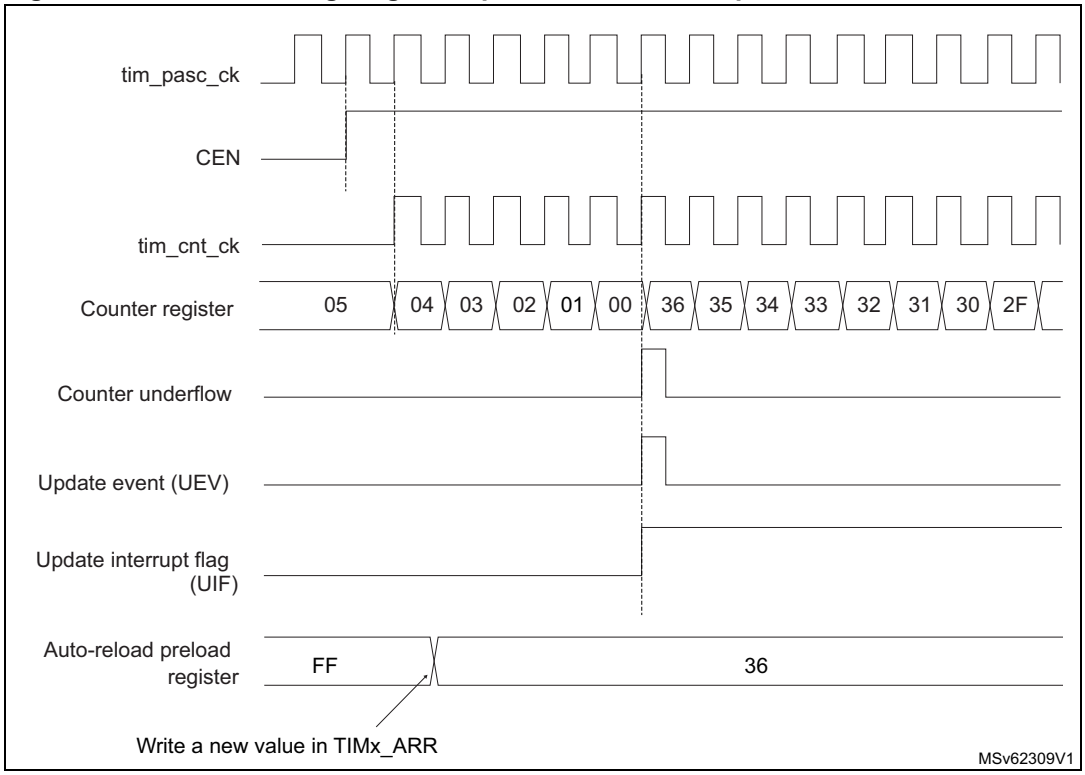

Center-aligned mode (up/down counting)

In center-aligned mode, the counter counts from 0 to the autoreload value (content of the TIMx_ARR register) – 1, generates a counter overflow event, then counts from the

autoreload value down to 1 and generates a counter underflow event. Then it restarts counting from 0.

Center-aligned mode is active when the CMS bits in TIMx_CR1 register are not equal to 00. The Output compare interrupt flag of channels configured in output is set when: the counter counts down (Center aligned mode 1, CMS = 01), the counter counts up (Center aligned mode 2, CMS = 10) the counter counts up and down (Center aligned mode 3, CMS = 11).

In this mode, the DIR direction bit in the TIMx_CR1 register cannot be written. It is updated by hardware and gives the current direction of the counter.

The update event can be generated at each counter overflow and at each counter underflow or by setting the UG bit in the TIMx_EGR register (by software or by using the slave mode controller) also generates an update event. In this case, the counter restarts counting from 0, as well as the counter of the prescaler.

The UEV update event can be disabled by software by setting the UDIS bit in the TIMx_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until UDIS bit has been written to 0. However, the counter continues counting up and down, based on the current autoreload value.

In addition, if the URS bit (update request selection) in TIMx_CR1 register is set, setting the UG bit generates an UEV update event but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx_SR register) is set (depending on the URS bit):

- The repetition counter is reloaded with the content of TIMx_RCR register
- The buffer of the prescaler is reloaded with the preload value (content of the TIMx_PSC register)
- The autoreload active register is updated with the preload value (content of the TIMx_ARR register). Note that if the update source is a counter overflow, the autoreload is updated before the counter is reloaded, so that the next period is the expected one (the counter is loaded with the new value).

The following figures show some examples of the counter behavior for different clock frequencies.

Figure 462. Counter timing diagram, internal clock divided by 1, TIMx_ARR = 0x6

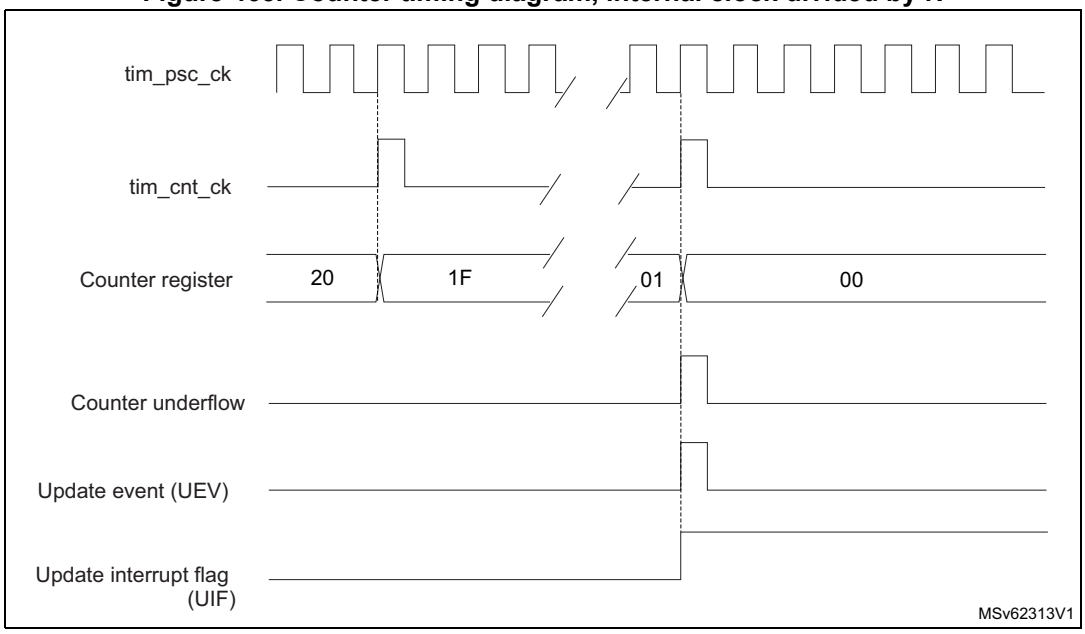

Figure 466. Counter timing diagram, update event with ARPE = 1 (counter underflow)

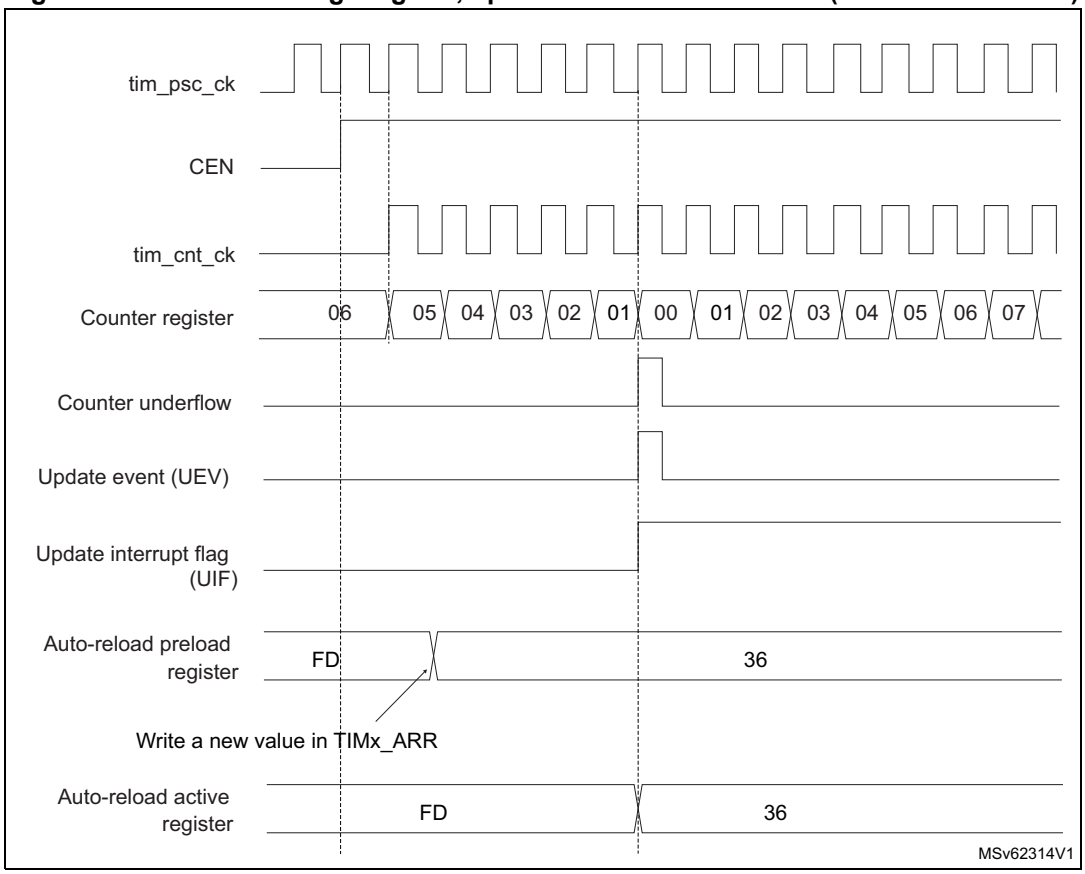

Figure 467. Counter timing diagram, Update event with ARPE = 1 (counter overflow)

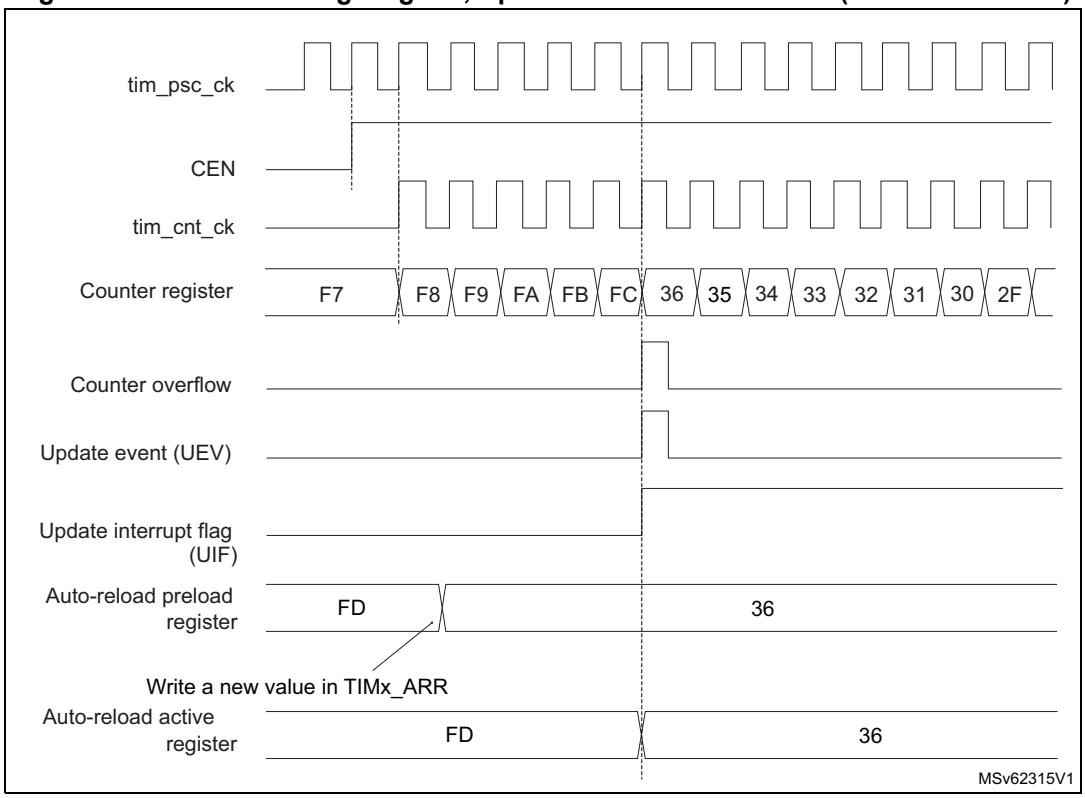


53.3.5 Repetition counter

Section 53.3.3: Time-base unit describes how the update event (UEV) is generated with respect to the counter overflows/underflows. It is actually generated only when the repetition counter has reached zero. This can be useful when generating PWM signals.

This means that data are transferred from the preload registers to the shadow registers (TIMx_ARR autoreload register, TIMx_PSC prescaler register, but also TIMx_CCRx capture/compare registers in compare mode) every N+1 counter overflows or underflows, where N is the value in the TIMx_RCR repetition counter register.

The repetition counter is decremented:

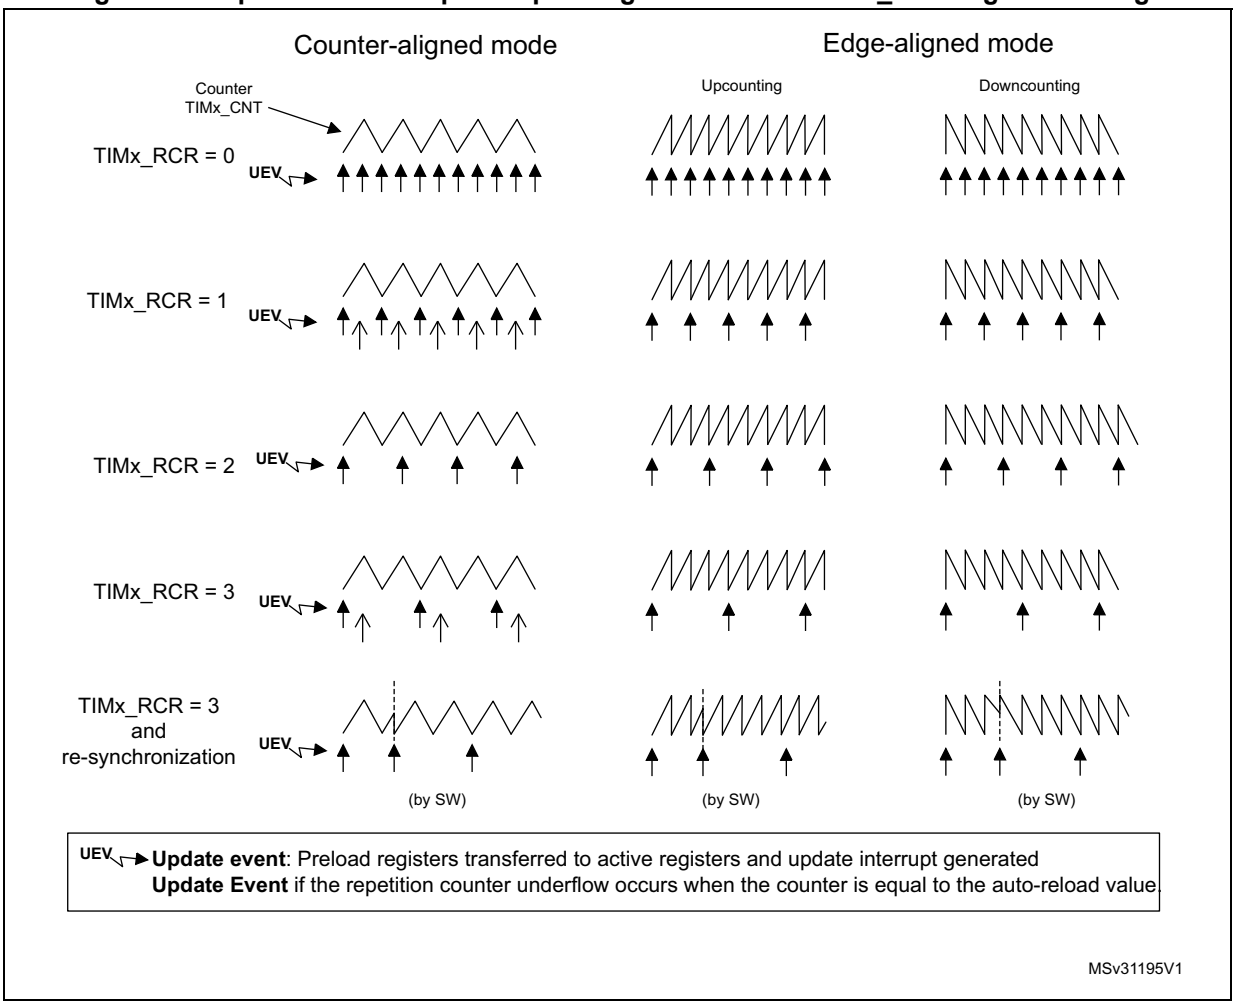
- At each counter overflow in upcounting mode,
- At each counter underflow in downcounting mode,
- At each counter overflow and at each counter underflow in center-aligned mode. Although this limits the maximum number of repetition to 32768 PWM cycles, it makes it possible to update the duty cycle twice per PWM period. When refreshing compare registers only once per PWM period in center-aligned mode, maximum resolution is $2xT_{ck}$, due to the symmetry of the pattern.

The repetition counter is an autoreload type; the repetition rate is maintained as defined by the TIMx_RCR register value (refer to *Figure 468*). When the update event is generated by software (by setting the UG bit in TIMx_EGR register) or by hardware through the slave mode controller, it occurs immediately whatever the value of the repetition counter is and the repetition counter is reloaded with the content of the TIMx_RCR register.

In Center aligned mode, for odd values of RCR, the update event occurs either on the overflow or on the underflow depending on when the RCR register was written and when the counter was launched: if the RCR was written before launching the counter, the UEV occurs on the underflow. If the RCR was written after launching the counter, the UEV occurs on the overflow.

For example, for RCR = 3, the UEV is generated each 4th overflow or underflow event depending on when the RCR was written.

Figure 468. Update rate examples depending on mode and TIMx_RCR register settings



53.3.6 External trigger input

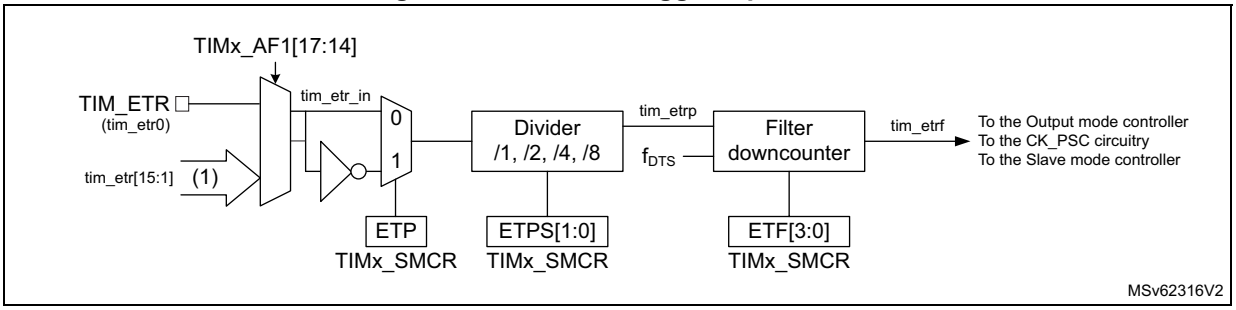
The timer features an external trigger input tim_etr_in. It can be used as:

- external clock (external clock mode 2, see *Section 53.3.7*)
- trigger for the slave mode (see *Section 53.3.30*)
- PWM reset input for cycle-by-cycle current regulation (see *Section 53.3.9*)

Figure 469 below describes the tim_etr_in input conditioning. The input polarity is defined with the ETP bit in TIMxSMCR register. The trigger can be prescaled with the divider programmed by the ETPS[1:0] bitfield and digitally filtered with the ETF[3:0] bitfield. The resulting signal (tim_etrf) is available for three purposes: as an external clock, to condition

the output (typically to reset a PWM output for a current limitation), and as a trigger for the Slave mode controller.

Figure 469. External trigger input block



The tim_etr_in input comes from multiple sources: input pins (default configuration), or internal sources. The selection is done with the ETRSEL[3:0] bitfield in the TIMx_AF1 register.

Refer to *Section 53.3.2: TIM1/TIM8 pins and internal signals* for the list of sources connected to the etr_in input in the product.

53.3.7 Clock selection

The counter clock can be provided by the following clock sources:

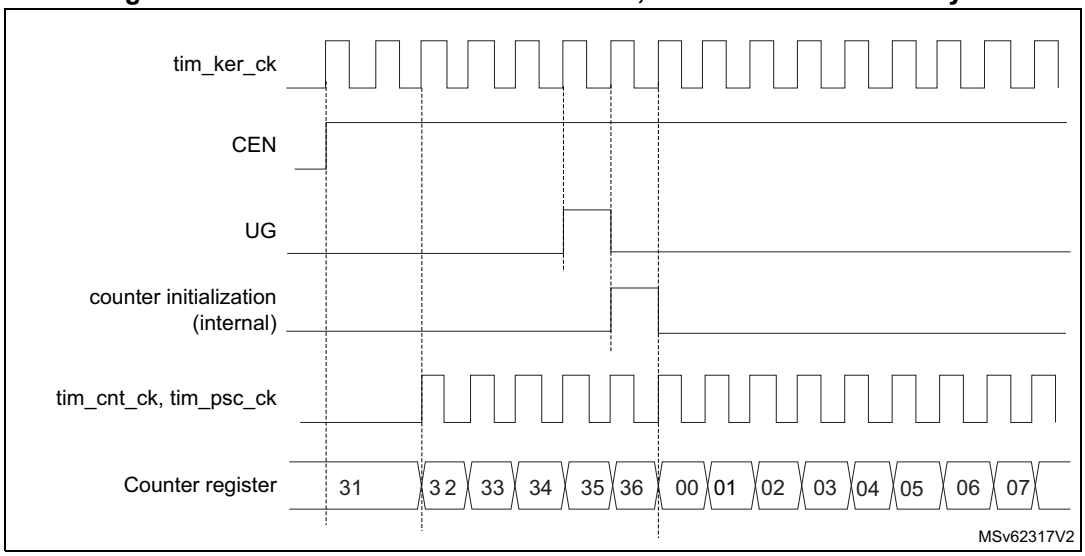
- Internal clock (tim_ker_ck)
- External clock mode1: external input pin (tim_ti1 or tim_ti2)
- External clock mode2: external trigger input (tim_etr_in)
- Encoder mode

Internal clock source (tim_ker_ck)

If the slave mode controller is disabled (SMS = 000), then the CEN, DIR (in the TIMx_CR1 register) and UG bits (in the TIMx_EGR register) are actual control bits and can be changed only by software (except UG which remains cleared automatically). As soon as the CEN bit is written to 1, the prescaler is clocked by the internal clock tim_ker_ck.

Figure 470 shows the behavior of the control circuit and the upcounter in normal mode, without prescaler.

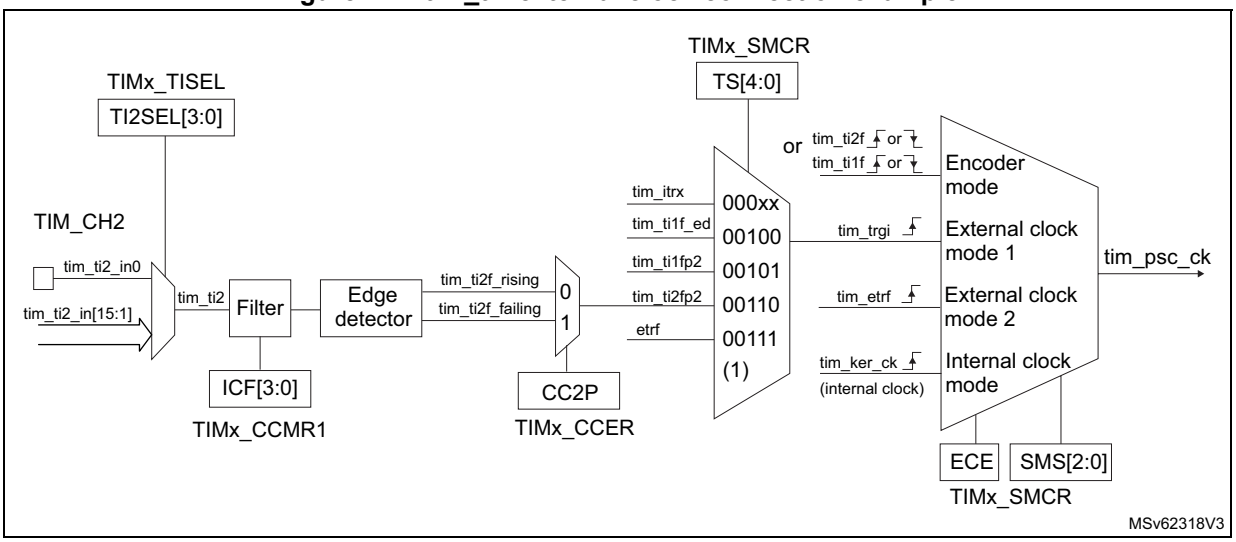
Figure 470. Control circuit in normal mode, internal clock divided by 1



External clock source mode 1

This mode is selected when SMS = 111 in the TIMx_SMCR register. The counter can count at each rising or falling edge on a selected input.

Figure 471. tim_ti2 external clock connection example



1. Codes ranging from 01000 to 11111 are reserved.

For example, to configure the upcounter to count in response to a rising edge on the tim_ti2 input, use the following procedure:

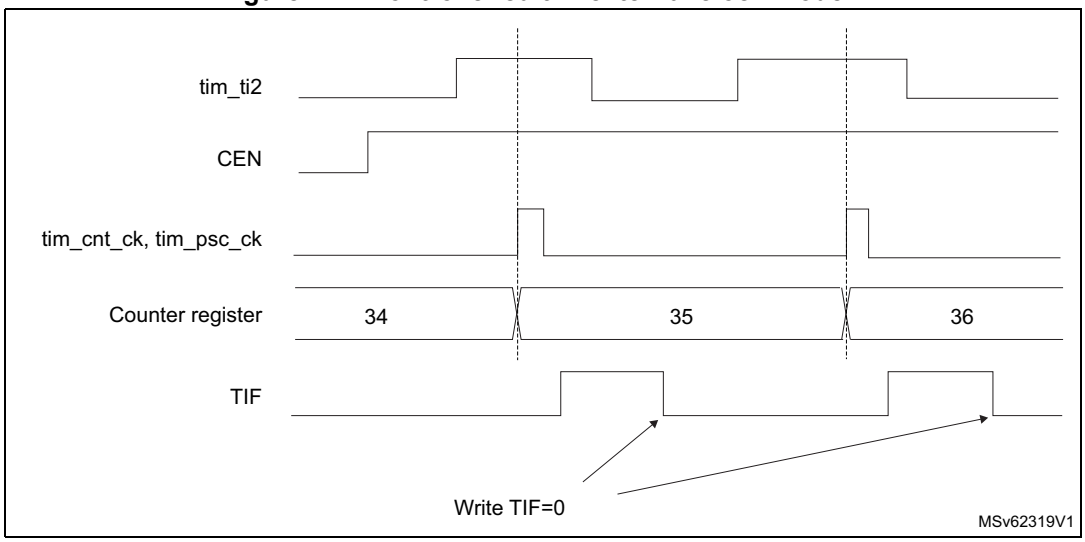
1. Configure channel 2 to detect rising edges on the tim_ti2 input by writing CC2S = 01 in the TIMx_CCMR1 register.
2. Configure the input filter duration by writing the IC2F[3:0] bits in the TIMx_CCMR1 register (if no filter is needed, keep IC2F = 0000).
3. Select rising edge polarity by writing CC2P = 0 and CC2NP = 0 in the TIMx_CCER register.
4. Configure the timer in external clock mode 1 by writing SMS = 111 in the TIMx_SMCR register.
5. Select tim_ti2 as the trigger input source by writing TS = 00110 in the TIMx_SMCR register.
6. Enable the counter by writing CEN = 1 in the TIMx_CR1 register.

Note: The capture prescaler is not used for triggering, it is not necessary to configure it.

When a rising edge occurs on tim_ti2, the counter counts once and the TIF flag is set.

The delay between the rising edge on tim_ti2 and the actual clock of the counter is due to the resynchronization circuit on tim_ti2 input.

Figure 472. Control circuit in external clock mode 1



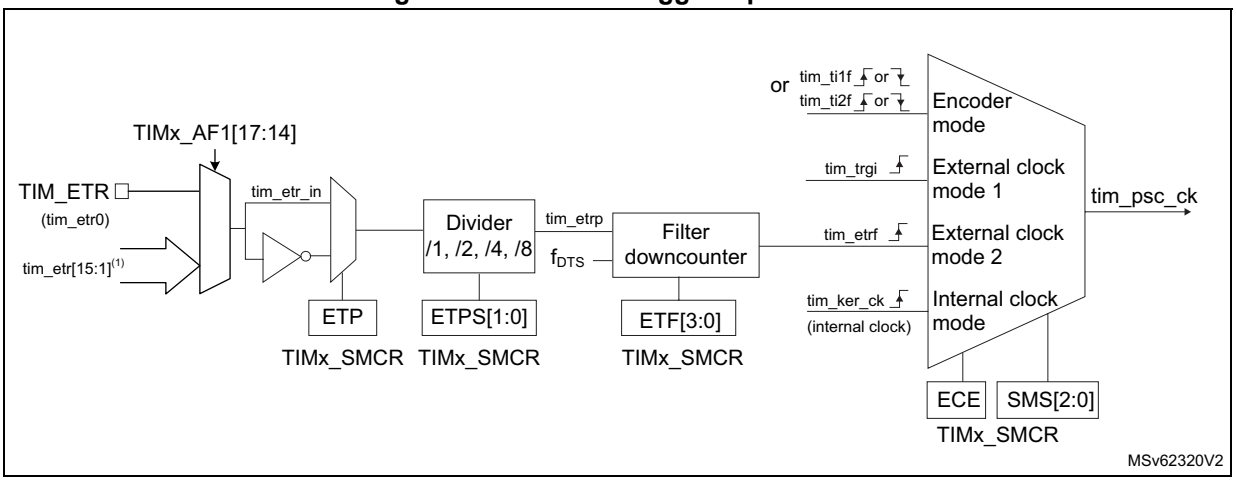
External clock source mode 2

This mode is selected by writing ECE = 1 in the TIMx_SMCR register.

The counter counts at each rising or falling edge on the external trigger input tim_etr_in.

The *Figure 473* gives an overview of the external trigger input block.

Figure 473. External trigger input block



1. Refer to *Section 53.3.2: TIM1/TIM8 pins and internal signals*.

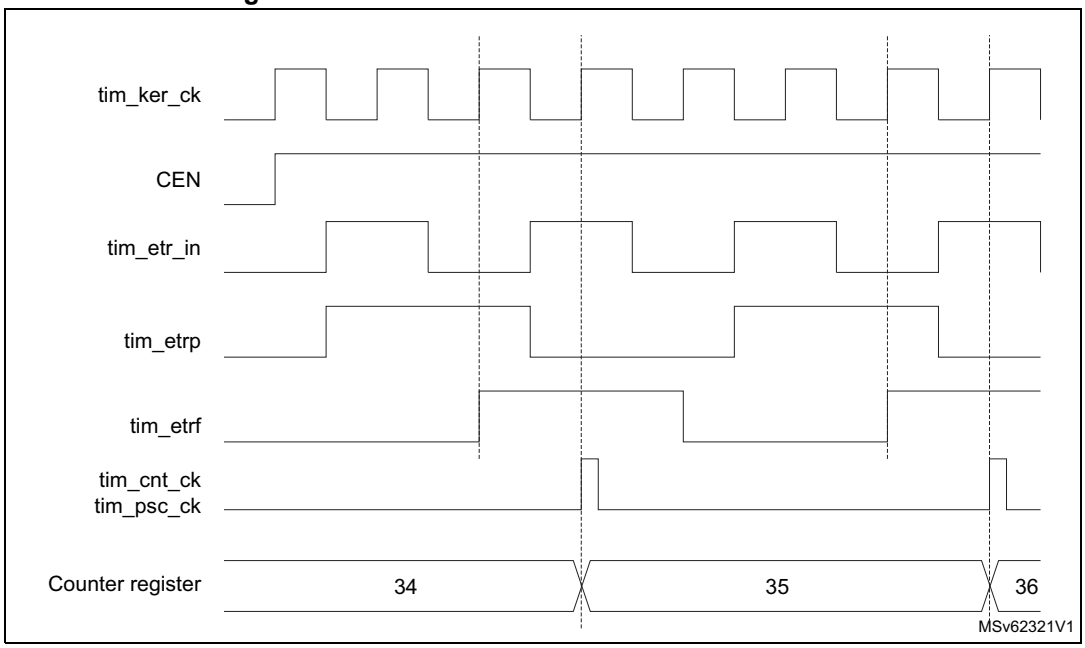
For example, to configure the upcounter to count each 2 rising edges on tim_etr_in, use the following procedure:

1. As no filter is needed in this example, write ETF[3:0] = 0000 in the TIMx_SMCR register.
2. Set the prescaler by writing ETPS[1:0] = 01 in the TIMx_SMCR register
3. Select rising edge detection on the tim_etr_in input by writing ETP = 0 in the TIMx_SMCR register
4. Enable external clock mode 2 by writing ECE = 1 in the TIMx_SMCR register.
5. Enable the counter by writing CEN = 1 in the TIMx_CR1 register.

The counter counts once each 2 tim_etr_in rising edges.

The delay between the rising edge on tim_etr_in and the actual clock of the counter is due to the resynchronization circuit on the tim_etrp signal. As a consequence, the maximum frequency which can be correctly captured by the counter is at most ¼ of tim_ker_ck frequency. When the ETRP signal is faster, the user must apply a division of the external signal by a proper ETPS prescaler setting.

Figure 474. Control circuit in external clock mode 2



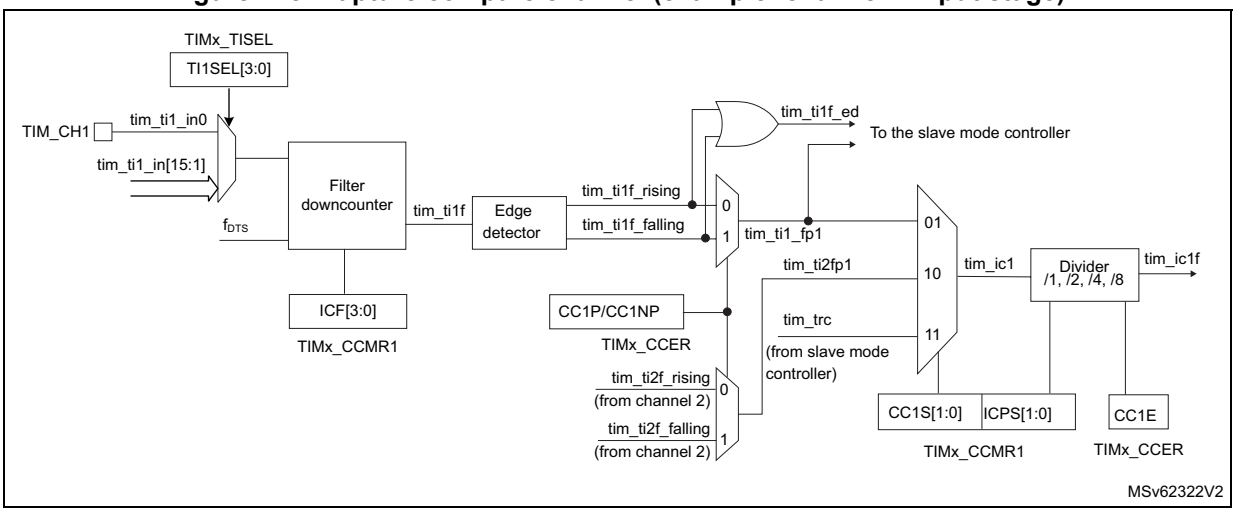
53.3.8 Capture/compare channels

Each capture/compare channel is built around a capture/compare register (including a shadow register), an input stage for capture (with digital filter, multiplexing, and prescaler, except for channels 5 and 6) and an output stage (with comparator and output control).

Figure 475 to *Figure 478* give an overview of one capture/compare channel.

The input stage samples the corresponding tim_tix input to generate a filtered signal tim_tixf. Then, an edge detector with polarity selection generates a signal (tim_tixfpy) which can be used as trigger input by the slave mode controller or as the capture command. It is prescaled before the capture register (ICxPS).

Figure 475. Capture/compare channel (example: channel 1 input stage)



The output stage generates an intermediate waveform which is then used for reference: tim_ocxref (active high). The polarity acts at the end of the chain.

Figure 476. Capture/compare channel 1 main circuit

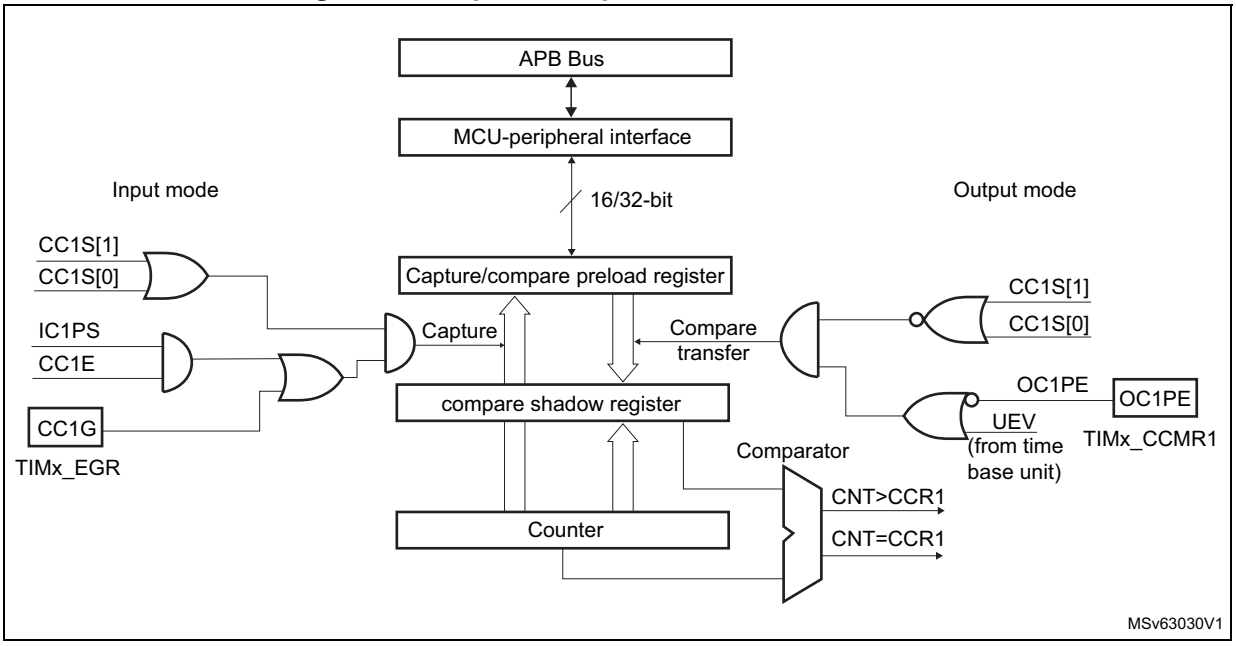


Figure 477. Output stage of capture/compare channel (channel 1, idem ch. 2, 3 and 4)

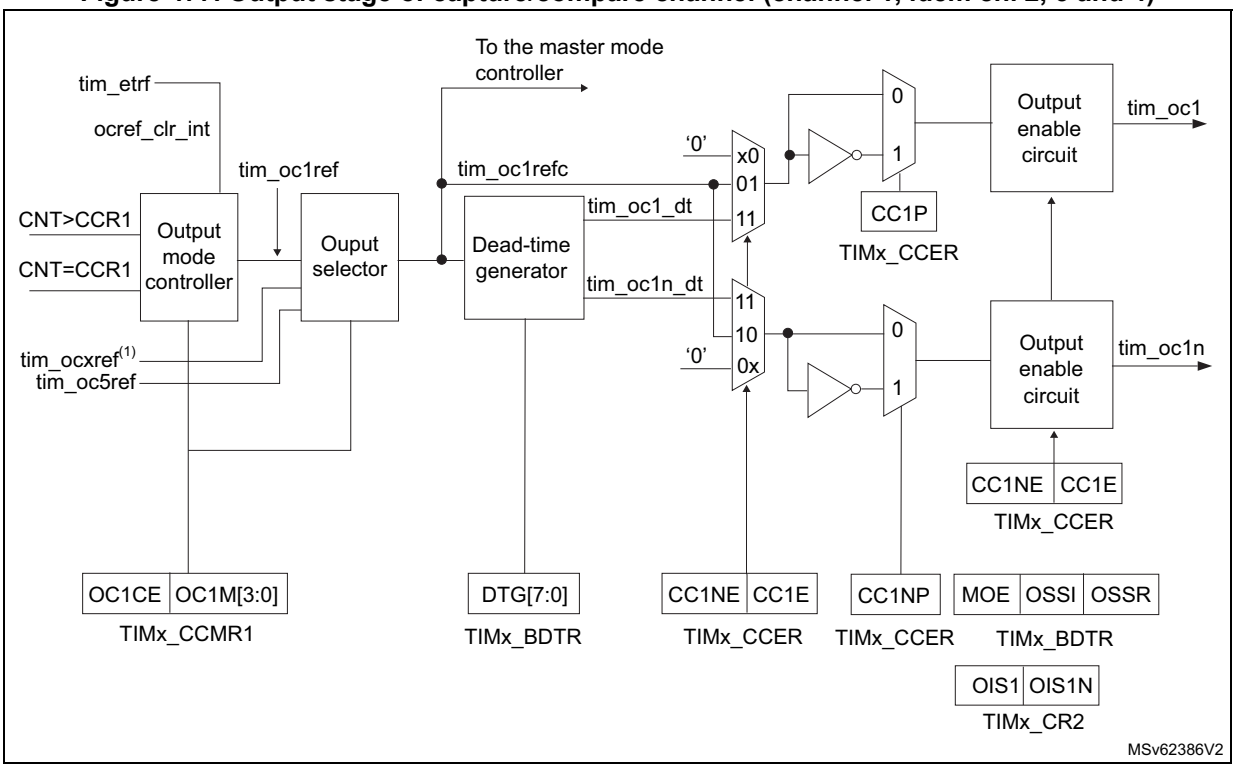
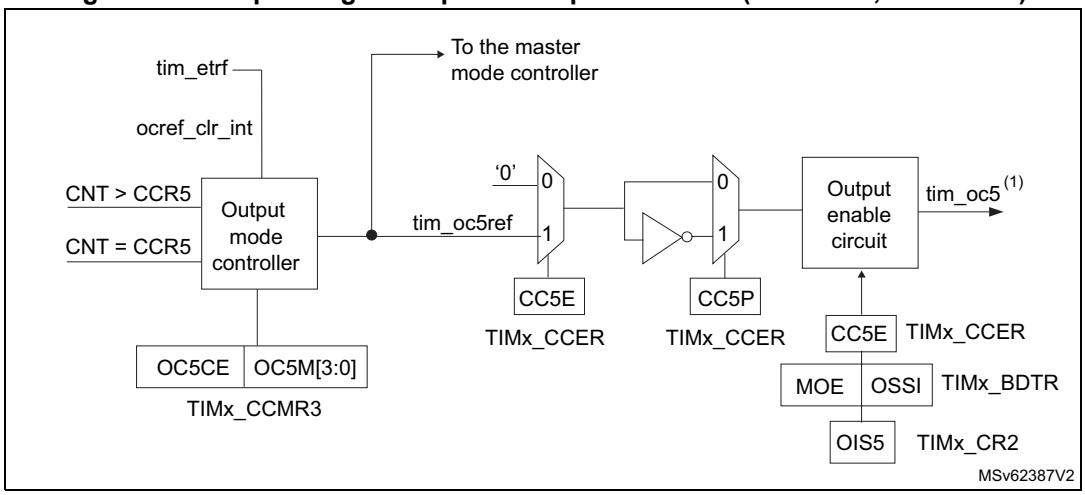


1. tim_ocxref, where x is the rank of the complementary channel

Figure 478. Output stage of capture/compare channel (channel 5, idem ch. 6)



1. Not available externally.

The capture/compare block is made of one preload register and one shadow register. Write and read always access the preload register.

In capture mode, captures are actually done in the shadow register, which is copied into the preload register.

In compare mode, the content of the preload register is copied into the shadow register which is compared to the counter.

53.3.9 Input capture mode

In Input capture mode, the capture/compare registers (TIMx_CCRx) are used to latch the value of the counter after a transition detected by the corresponding ICx signal. When a capture occurs, the corresponding CCXIF flag (TIMx_SR register) is set and an interrupt or a DMA request can be sent if they are enabled. If a capture occurs while the CCxIF flag was already high, then the overcapture flag CCxOF (TIMx_SR register) is set. CCxIF can be cleared by software by writing it to 0 or by reading the captured data stored in the TIMx_CCRx register. CCxOF is cleared when it is written with 0.

The following example shows how to capture the counter value in TIMx_CCR1 when tim_ti1 input rises. To do this, use the following procedure:

- Select the active input: TIMx_CCR1 must be linked to the tim_ti1 input, so write the CC1S bits to 01 in the TIMx_CCMR1 register. As soon as CC1S becomes different from 00, the channel is configured in input, and the TIMx_CCR1 register becomes read-only.
- Program the appropriate input filter duration in relation with the signal connected to the timer (when the input is one of the tim_tix (ICxF bits in the TIMx_CCMRx register). Let's imagine that, when toggling, the input signal is not stable during at must five internal clock cycles. We must program a filter duration longer than these five clock cycles. We can validate a transition on tim_ti1 when eight consecutive samples with the new level

have been detected (sampled at f_{DTS} frequency). Then write IC1F bits to 0011 in the TIMx_CCMR1 register.

- Select the edge of the active transition on the tim_ti1 channel by writing CC1P and CC1NP bits to 0 in the TIMx_CCER register (rising edge in this case).
- Program the input prescaler. In our example, we wish the capture to be performed at each valid transition, so the prescaler is disabled (write IC1PS bits to 00 in the TIMx_CCMR1 register).
- Enable capture from the counter into the capture register by setting the CC1E bit in the TIMx_CCER register.
- If needed, enable the related interrupt request by setting the CC1IE bit in the TIMx_DIER register, and/or the DMA request by setting the CC1DE bit in the TIMx_DIER register.

When an input capture occurs:

- The TIMx_CCR1 register gets the value of the counter on the active transition.
- CC1IF flag is set (interrupt flag). CC1OF is also set if at least two consecutive captures occurred whereas the flag was not cleared.
- An interrupt is generated depending on the CC1IE bit.
- A DMA request is generated depending on the CC1DE bit.

In order to handle the overcapture, it is recommended to read the data before the overcapture flag. This is to avoid missing an overcapture which may happen after reading the flag and before reading the data.

Note: IC interrupt and/or DMA requests can be generated by software by setting the corresponding CCxG bit in the TIMx_EGR register.

53.3.10 PWM input mode

This mode is used to measure both the period and the duty cycle of a PWM signal connected to single tim_tix input:

- The TIMx_CCR1 register holds the period value (interval between two consecutive rising edges).
- The TIM_CCR2 register holds the pulsewidth (interval between two consecutive rising and falling edges.

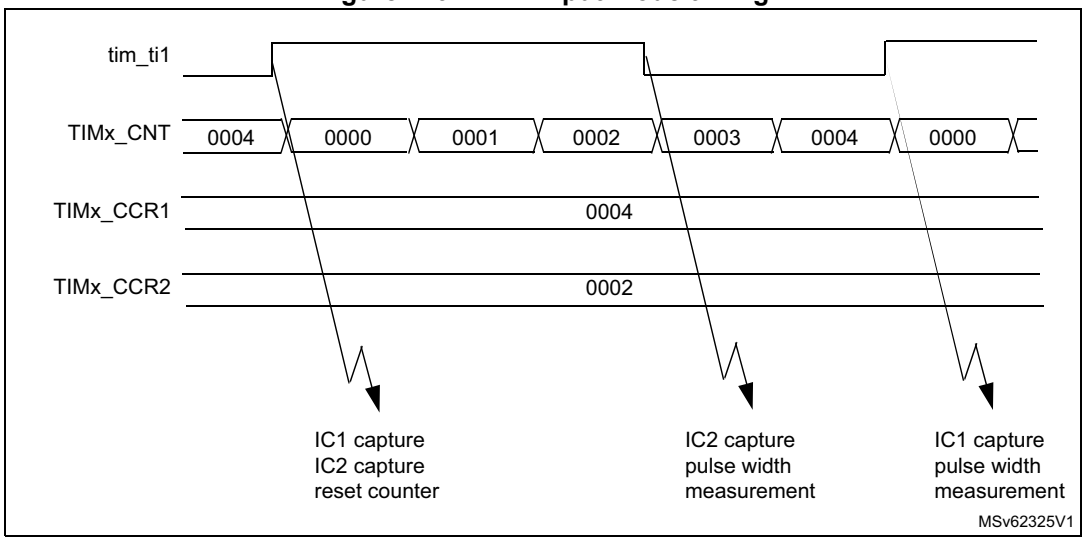
This mode is a particular case of input capture mode. The set-up procedure is similar with the following differences:

- Two ICx signals are mapped on the same tim_tixfp1 input.
- These two ICx signals are active on edges with opposite polarity.
- One of the two tim_tixfp signals is selected as trigger input and the slave mode controller is configured in reset mode.

The period and the pulsewidth of a PWM signal applied on tim_ti1 can be measured using the following procedure:

- Select the active input for TIMx_CCR1: write the CC1S bits to 01 in the TIMx_CCMR1 register (tim_ti1 selected).
- Select the active polarity for tim_ti1fp1 (used both for capture in TIMx_CCR1 and counter clear): write the CC1P and CC1NP bits to 0 (active on rising edge).
- Select the active input for TIMx_CCR2: write the CC2S bits to 10 in the TIMx_CCMR1 register (tim_ti1 selected).
- Select the active polarity for tim_ti1fp2 (used for capture in TIMx_CCR2): write the CC2P and CC2NP bits to CC2P/CC2NP = 10 (active on falling edge).
- Select the valid trigger input: write the TS bits to 00101 in the TIMx_SMCR register (tim_ti1fp1 selected).
- Configure the slave mode controller in reset mode: write the SMS bits to 0100 in the TIMx_SMCR register.
- Enable the captures: write the CC1E and CC2E bits to 1 in the TIMx_CCER register.

Figure 479. PWM input mode timing



53.3.11 Forced output mode

In output mode (CCxS bits = 00 in the TIMx_CCMRx register), each output compare signal (tim_ocxref and then tim_ocx/tim_ocxn) can be forced to active or inactive level directly by software, independently of any comparison between the output compare register and the counter.

To force an output compare signal (tim_ocxref/tim_ocx) to its active level, user just needs to write 0101 in the OCxM bits in the corresponding TIMx_CCMRx register. Thus tim_ocxref is forced high (tim_ocxref is always active high) and tim_ocx get opposite value to CCxP polarity bit.

For example: CCxP = 0 (tim_ocx active high) => tim_ocx is forced to high level.

The tim_ocxref signal can be forced low by writing the OCxM bits to 0100 in the TIMx_CCMRx register.

Anyway, the comparison between the TIMx_CCRx shadow register and the counter is still performed and allows the flag to be set. Interrupt and DMA requests can be sent accordingly. This is described in the output compare mode section below.

53.3.12 Output compare mode

This function is used to control an output waveform or indicate when a period of time has elapsed. Channels 1 to 4 can be output, while channel 5 and 6 are only available inside the microcontroller (for instance, for compound waveform generation or for ADC triggering).

When a match is found between the capture/compare register and the counter, the output compare function:

- Assigns the corresponding output pin to a programmable value defined by the output compare mode (OCxM bits in the TIMx_CCMRx register) and the output polarity (CCxP bit in the TIMx_CCER register). The output pin can keep its level (OCXM = 0000), be set active (OCxM = 0001), be set inactive (OCxM = 0010) or can toggle (OCxM = 0011) on match.
- Sets a flag in the interrupt status register (CCxIF bit in the TIMx_SR register).
- Generates an interrupt if the corresponding interrupt mask is set (CCXIE bit in the TIMx_DIER register).
- Sends a DMA request if the corresponding enable bit is set (CCxDE bit in the TIMx_DIER register, CCDS bit in the TIMx_CR2 register for the DMA request selection).

The TIMx_CCRx registers can be programmed with or without preload registers using the OCxPE bit in the TIMx_CCMRx register.

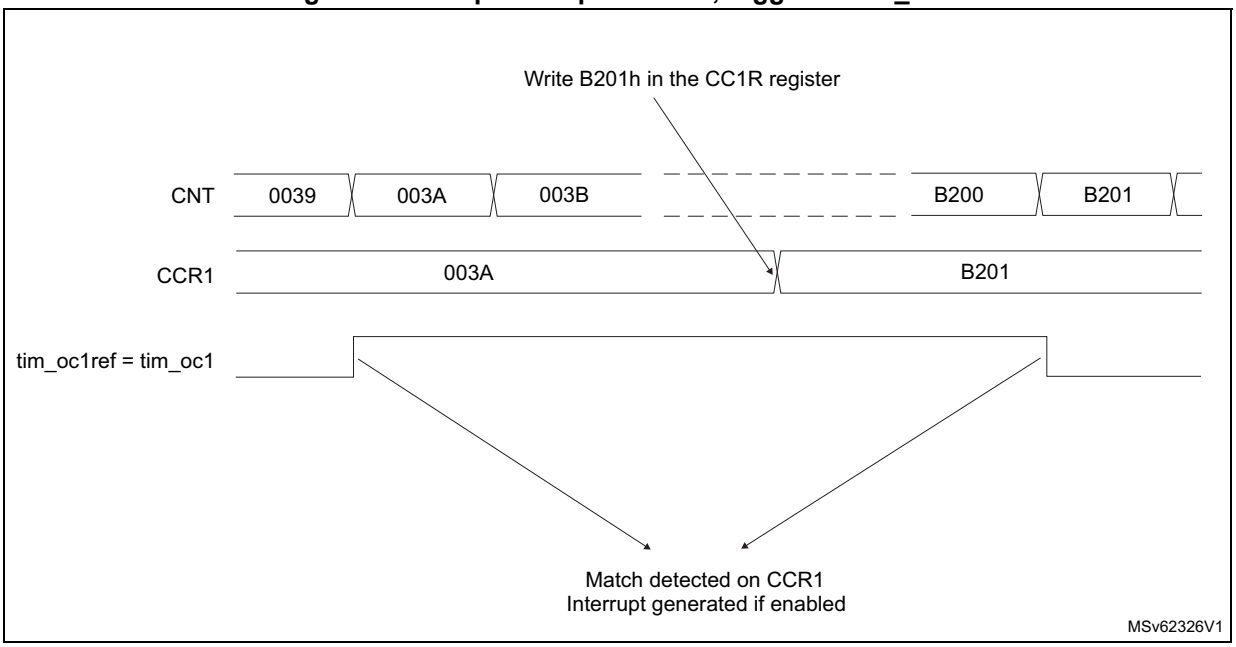
In output compare mode, the update event UEV has no effect on tim_ocxref and tim_ocx output. The timing resolution is one count of the counter. Output compare mode can also be used to output a single pulse (in One-pulse mode).

Procedure

1. Select the counter clock (internal, external, prescaler).
2. Write the desired data in the TIMx_ARR and TIMx_CCRx registers.
3. Set the CCxIE bit if an interrupt request is to be generated.
4. Select the output mode. For example:
   - Write OCxM = 0011 to toggle tim_ocx output pin when CNT matches CCRx
   - Write OCxPE = 0 to disable preload register
   - Write CCxP = 0 to select active high polarity
   - Write CCxE = 1 to enable the output
5. Enable the counter by setting the CEN bit in the TIMx_CR1 register.

The TIMx_CCRx register can be updated at any time by software to control the output waveform, provided that the preload register is not enabled (OCxPE = 0, else TIMx_CCRx shadow register is updated only at the next update event UEV). An example is given in *Figure 480*.

Figure 480. Output compare mode, toggle on tim_oc1



53.3.13 PWM mode

Pulse width modulation mode is used to generate a signal with a frequency determined by the value of the TIMx_ARR register and a duty cycle determined by the value of the TIMx_CCRx register.

The PWM mode can be selected independently on each channel (one PWM per tim_ocx output) by writing 0110 (PWM mode 1) or 0111 (PWM mode 2) in the OCxM bits in the TIMx_CCMRx register. The corresponding preload register must be enabled by setting the OCxPE bit in the TIMx_CCMRx register, and eventually the autoreload preload register (in upcounting or center-aligned modes) by setting the ARPE bit in the TIMx_CR1 register.

As the preload registers are transferred to the shadow registers only when an update event occurs, before starting the counter, all registers must be initialized by setting the UG bit in the TIMx_EGR register.

tim_ocx polarity is software programmable using the CCxP bit in the TIMx_CCER register. It can be programmed as active high or active low. tim_ocx output is enabled by a combination of the CCxE, CCxNE, MOE, OSSI, and OSSR bits (TIMx_CCER and TIMx_BDTR registers). Refer to the TIMx_CCER register description for more details.

In PWM mode (1 or 2), TIMx_CNT and TIMx_CCRx are always compared to determine whether TIMx_CCRx ≤ TIMx_CNT or TIMx_CNT ≤ TIMx_CCRx (depending on the direction of the counter).

The timer is able to generate PWM in edge-aligned mode or center-aligned mode depending on the CMS bits in the TIMx_CR1 register.

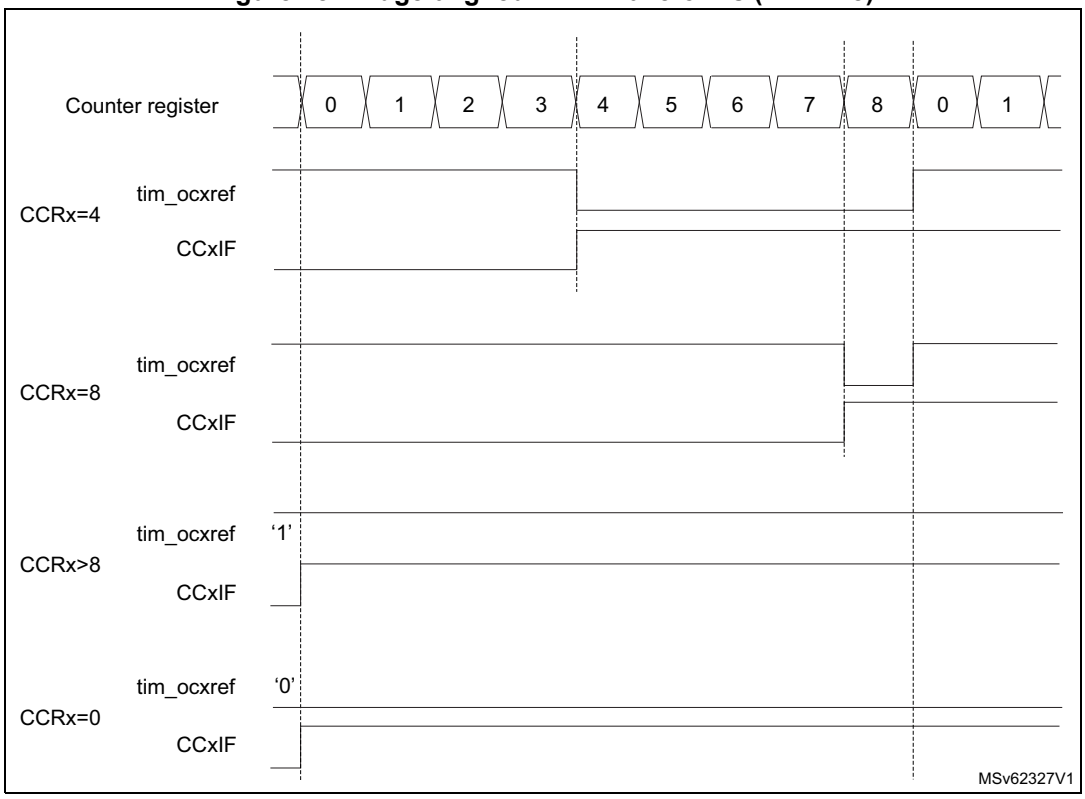
PWM edge-aligned mode

- Upcounting configuration

  Upcounting is active when the DIR bit in the TIMx_CR1 register is low. Refer to *Upcounting mode*.

  In the following example, the mode is PWM mode 1. The reference PWM signal tim_ocxref is high as long as TIMx_CNT < TIMx_CCRx else it becomes low. If the compare value in TIMx_CCRx is greater than the autoreload value (in TIMx_ARR) then tim_ocxref is held at 1. If the compare value is zero then tim_ocxref is held at 0. *Figure 481* shows some edge-aligned PWM waveforms in an example where TIMx_ARR = 8.

Figure 481. Edge-aligned PWM waveforms (ARR = 8)



- Downcounting configuration

  Downcounting is active when DIR bit in TIMx_CR1 register is high. Refer to the *Downcounting mode*

  In PWM mode 1, the reference signal tim_ocxref is low as long as TIMx_CNT > TIMx_CCRx else it becomes high. If the compare value in TIMx_CCRx is greater than the autoreload value in TIMx_ARR, then tim_ocxref is held at 1. 0% PWM is not possible in this mode.

PWM center-aligned mode

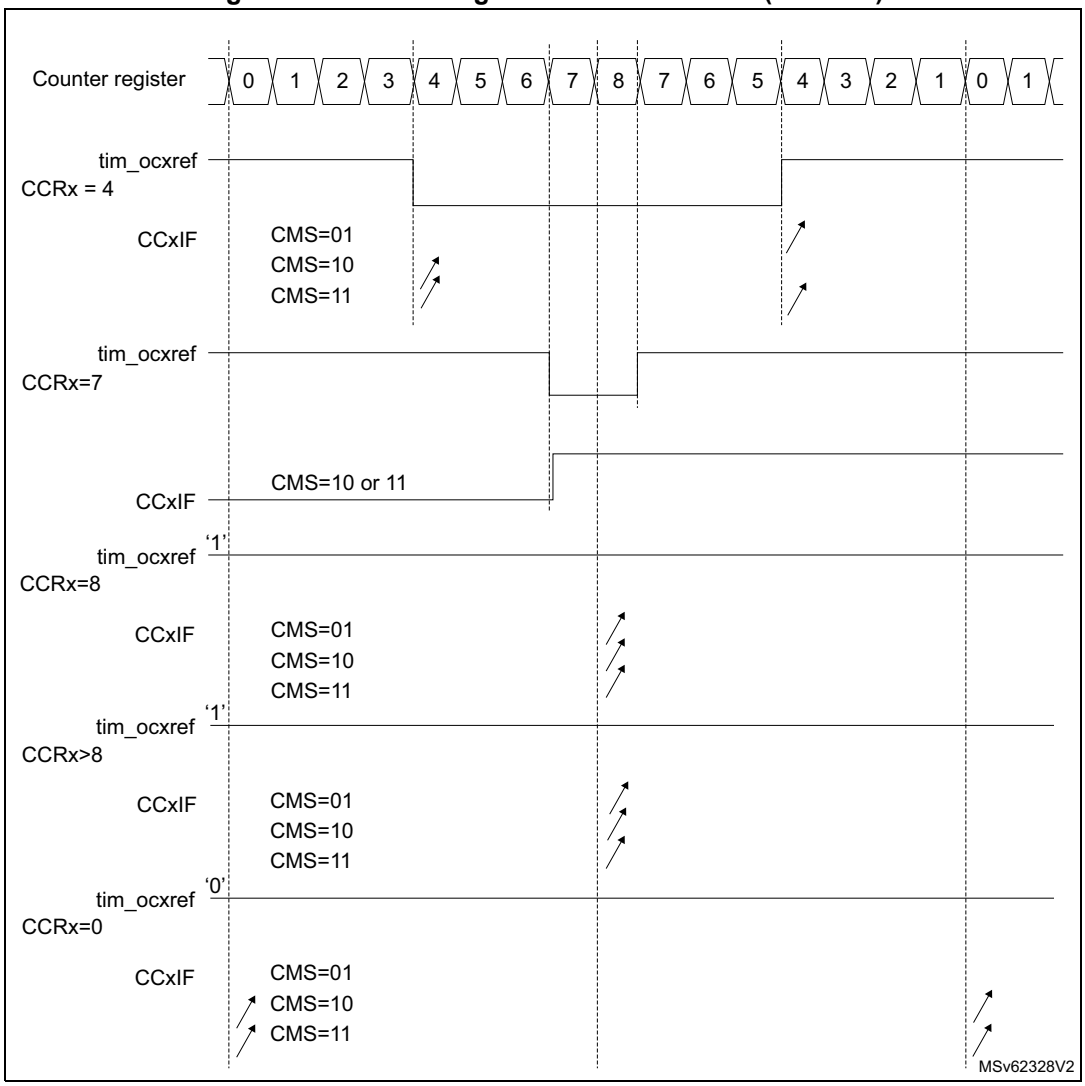
Center-aligned mode is active when the CMS bits in TIMx_CR1 register are different from 00 (all the remaining configurations having the same effect on the tim_ocxref/tim_ocx signals). The compare flag is set when the counter counts up, when it counts down or both when it counts up and down depending on the CMS bits configuration. The direction bit

(DIR) in the TIMx_CR1 register is updated by hardware and must not be changed by software. Refer to *Center-aligned mode (up/down counting)*.

Figure 482 shows some center-aligned PWM waveforms in an example where:

- TIMx_ARR = 8
- PWM mode is the PWM mode 1
- The flag is set when the counter counts down corresponding to the center-aligned mode 1 selected for CMS = 01 in TIMx_CR1 register.

Figure 482. Center-aligned PWM waveforms (ARR = 8)



Hints on using center-aligned mode:

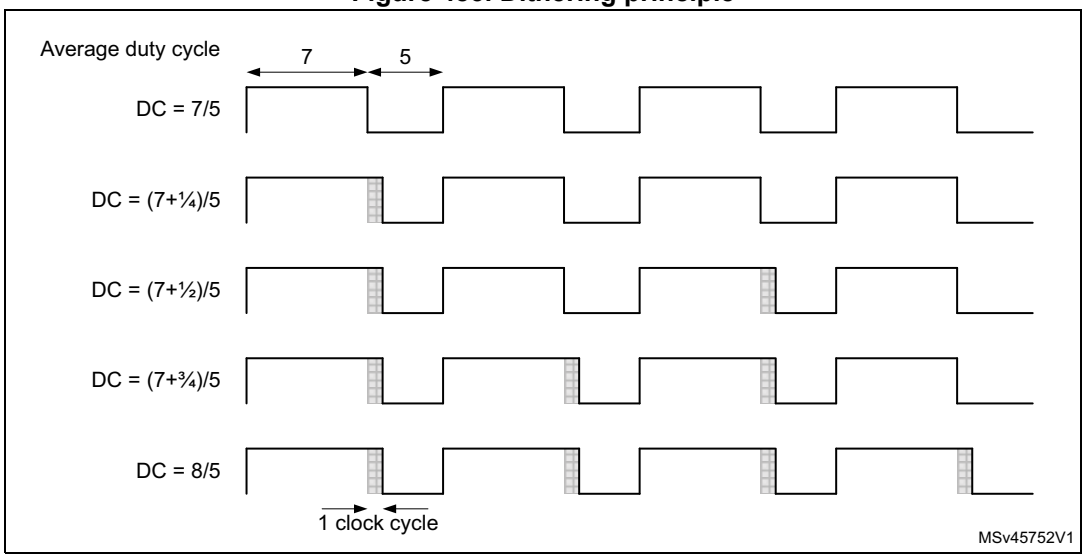
- When starting in center-aligned mode, the current up-down configuration is used. It means that the counter counts up or down depending on the value written in the DIR bit in the TIMx_CR1 register. Moreover, the DIR and CMS bits must not be changed at the same time by the software.
- Writing to the counter while running in center-aligned mode is not recommended as it can lead to unexpected results. In particular:
  - The direction is not updated if a value greater than the autoreload value is written in the counter (TIMx_CNT > TIMx_ARR). For example, if the counter was counting up, it continues to count up.
  - The direction is updated if 0 or the TIMx_ARR value is written in the counter but no update event UEV is generated.
- The safest way to use center-aligned mode is to generate an update by software (setting the UG bit in the TIMx_EGR register) just before starting the counter and not to write the counter while it is running.

Dithering mode

The PWM mode effective resolution can be increased by enabling the dithering mode, using the DITHEN bit in the TIMx_CR1 register. This applies to both the CCR (for duty cycle resolution increase) and ARR (for PWM frequency resolution increase).

The operating principle is to have the actual CCR (or ARR) value slightly changed (adding or not one timer clock period) over 16 consecutive PWM periods, with predefined patterns. This allows a 16-fold resolution increase, considering the average duty cycle or PWM period. *Figure 483* presents the dithering principle applied to four consecutive PWM cycles.

Figure 483. Dithering principle

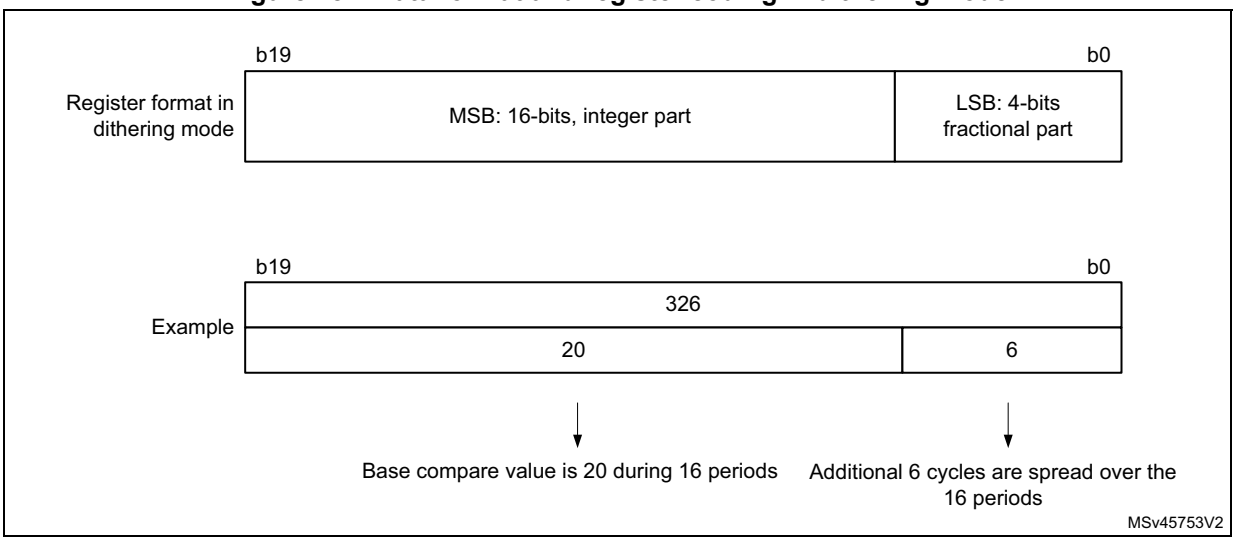


When the dithering mode is enabled, the register coding is changed as follows (see *Figure 484* for example):

- The four LSBs are coding for the enhanced resolution part (fractional part).
- The MSBs are left-shifted to the bits 19:4 and are coding for the base value.

Note: The following sequence must be followed when resetting the DITHEN bit:
1. CEN and ARPE bits must be reset.
2. The DITHEN bit must be reset.
3. The CCIF flags must be cleared.
4. The CEN bit can be set (eventually with ARPE = 1).

Figure 484. Data format and register coding in dithering mode



The minimum frequency is given by the following formula:

$$\text{Resolution} = \frac{F_{Tim}}{F_{pwm}} \Rightarrow F_{pwmMin} = \frac{F_{Tim}}{Max_{Resolution}}$$

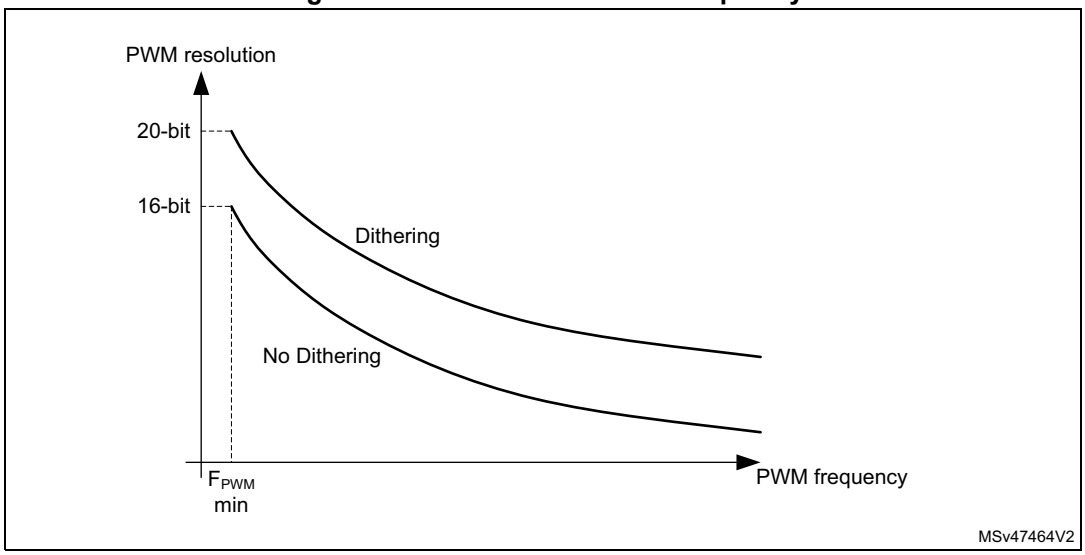
$$\text{Dithering mode disabled: } F_{pwmMin} = \frac{F_{Tim}}{65536}$$

$$\text{Dithering mode enabled: } F_{pwmMin} = \frac{F_{Tim}}{65535 + \frac{15}{16}}$$

Note: The maximum TIMx_ARR and TIMxCCRy values are limited to 0xFFFEF in dithering mode (corresponds to 65534 for the integer part and 15 for the dithered part).

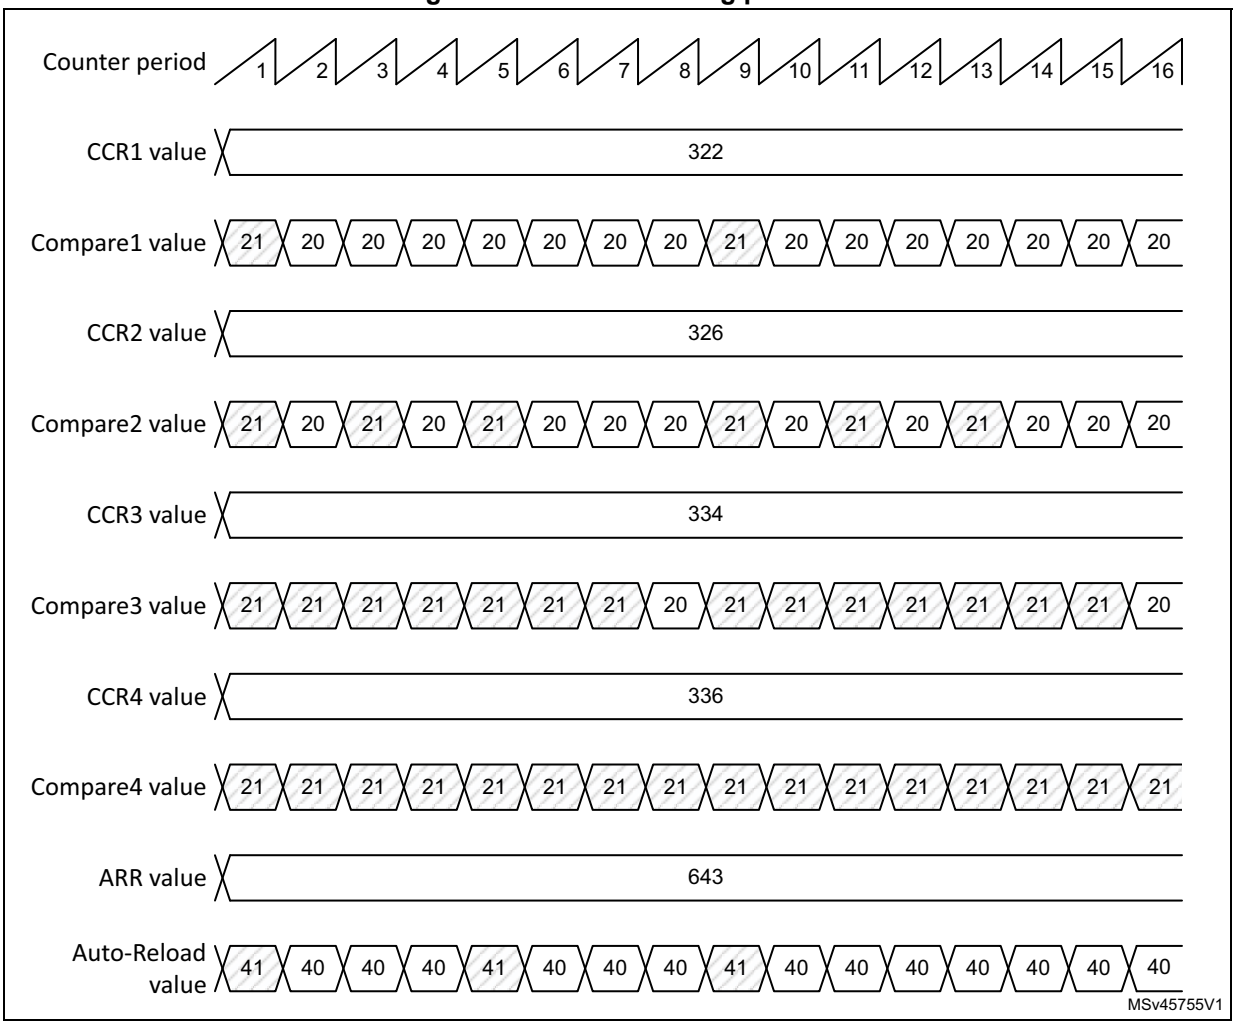
As shown on *Figure 485*, the dithering mode is used to increase the PWM resolution whatever the PWM frequency.

Figure 485. PWM resolution vs frequency



The duty cycle and/or period changes are spread over 16 consecutive periods, as described in *Figure 486*.

Figure 486. PWM dithering pattern



The autoreload and compare values increments are spread following specific patterns described in *Table 529*. The dithering sequence is done to have increments distributed as evenly as possible and minimize the overall ripple.

Table 529. CCR and ARR register change dithering pattern

LSB value	PWM period															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
0000	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

1011	+1	+1	+1	-	+1	+1	+1	-	+1	+1	+1	-	+1	-	+1	-
1100	+1	+1	+1	-	+1	+1	+1	-	+1	+1	+1	-	+1	+1	+1	-
1101	+1	+1	+1	+1	+1	+1	+1	-	+1	+1	+1	-	+1	+1	+1	-
1110	+1	+1	+1	+1	+1	+1	+1	-	+1	+1	+1	+1	+1	+1	+1	-
1111	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	-

The dithering mode is also available in center-aligned PWM mode (CMS bits in TIMx_CR1 register are not equal to 00). In this case, the dithering pattern is applied over eight consecutive PWM periods, considering the up and down counting phases as shown in *Figure 487*.

Figure 487. Dithering effect on duty cycle in center-aligned PWM mode

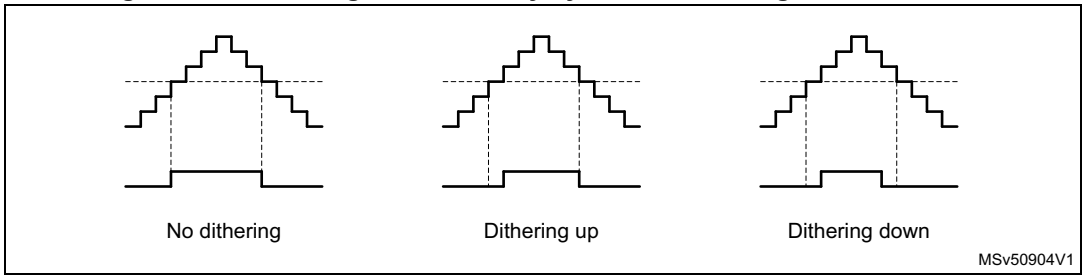

Table 530 shows how the dithering pattern is added in center-aligned PWM mode.

Table 530. CCR register change dithering pattern in center-aligned PWM mode

LSB value	PWM period

53.3.14 Asymmetric PWM mode

Asymmetric mode allows two center-aligned PWM signals to be generated with a programmable phase shift. While the frequency is determined by the value of the TIMx_ARR register, the duty cycle and the phase-shift are determined by a pair of TIMx_CCRx register. One register controls the PWM during up-counting, the second during down counting, so that PWM is adjusted every half PWM cycle:

- tim_oc1refc (or tim_oc2refc) is controlled by TIMx_CCR1 and TIMx_CCR2
- tim_oc3refc (or tim_oc4refc) is controlled by TIMx_CCR3 and TIMx_CCR4

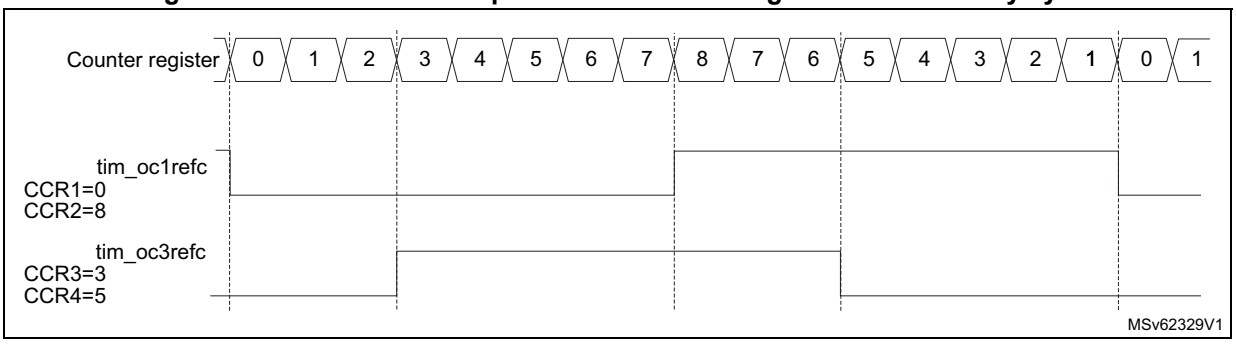
Asymmetric PWM mode can be selected independently on two channel (one tim_ocx output per pair of CCR registers) by writing 1110 (Asymmetric PWM mode 1) or 1111 (Asymmetric PWM mode 2) in the OCxM bits in the TIMx_CCMRx register.

Note: The OCxM[3:0] bitfield is split into two parts for compatibility reasons, the most significant bit is not contiguous with the three least significant ones.

When a given channel is used as asymmetric PWM channel, its complementary channel can also be used. For instance, if an tim_oc1refc signal is generated on channel 1 (Asymmetric PWM mode 1), it is possible to output either the tim_oc2ref signal on channel 2, or an tim_oc2refc signal resulting from asymmetric PWM mode 1.

Figure 488 represents an example of signals that can be generated using asymmetric PWM mode (channels 1 to 4 are configured in asymmetric PWM mode 2). Together with the deadtime generator, this allows a full-bridge phase-shifted DC to DC converter to be controlled.

Figure 488. Generation of 2 phase-shifted PWM signals with 50% duty cycle



53.3.15 Combined PWM mode

Combined PWM mode allows two edge or center-aligned PWM signals to be generated with programmable delay and phase shift between respective pulses. While the frequency is determined by the value of the TIMx_ARR register, the duty cycle and delay are determined by the two TIMx_CCRx registers. The resulting signals, tim_ocxrefc, are made of an OR or AND logical combination of two reference PWMs:

- tim_oc1refc (or tim_oc2refc) is controlled by TIMx_CCR1 and TIMx_CCR2
- tim_oc3refc (or tim_oc4refc) is controlled by TIMx_CCR3 and TIMx_CCR4

Combined PWM mode can be selected independently on two channels (one tim_ocx output per pair of CCR registers) by writing 1100 (Combined PWM mode 1) or 1101 (Combined PWM mode 2) in the OCxM bits in the TIMx_CCMRx register.

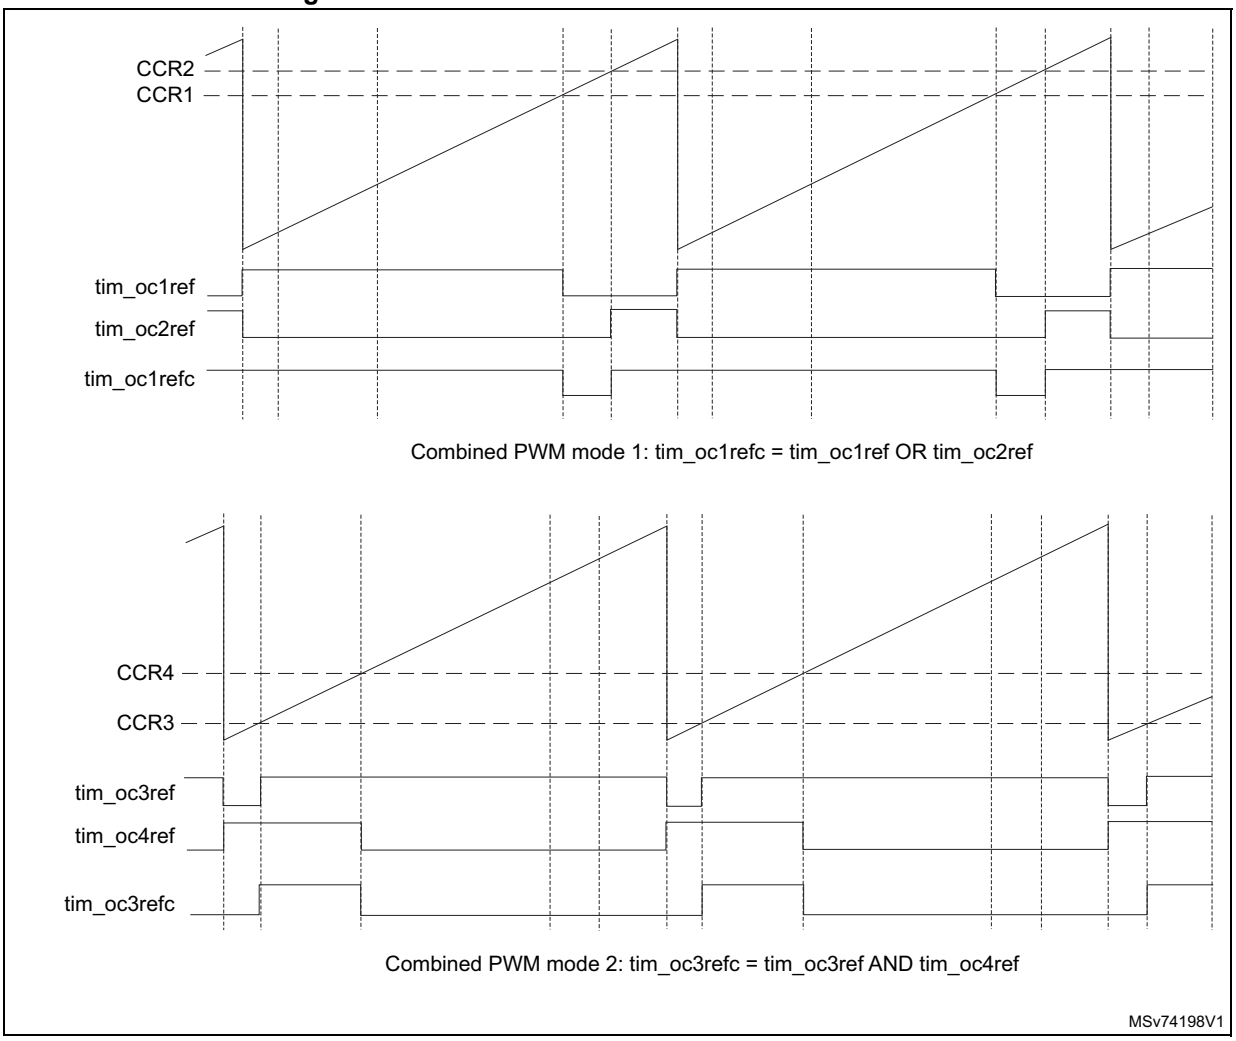
When a given channel is used as combined PWM channel, its complementary channel must be configured in the opposite PWM mode (for instance, one in Combined PWM mode 1 and the other in Combined PWM mode 2).

Note: The OCxM[3:0] bitfield is split into two parts for compatibility reasons, the most significant bit is not contiguous with the three least significant ones.

Figure 489 represents an example of signals that can be generated using combined PWM mode, obtained with the following configuration:

- Channel 1 is configured in Combined PWM mode 2.
- Channel 2 is configured in PWM mode 1.
- Channel 3 is configured in Combined PWM mode 2.
- Channel 4 is configured in PWM mode 1.

Figure 489. Combined PWM mode on channel 1 and 3



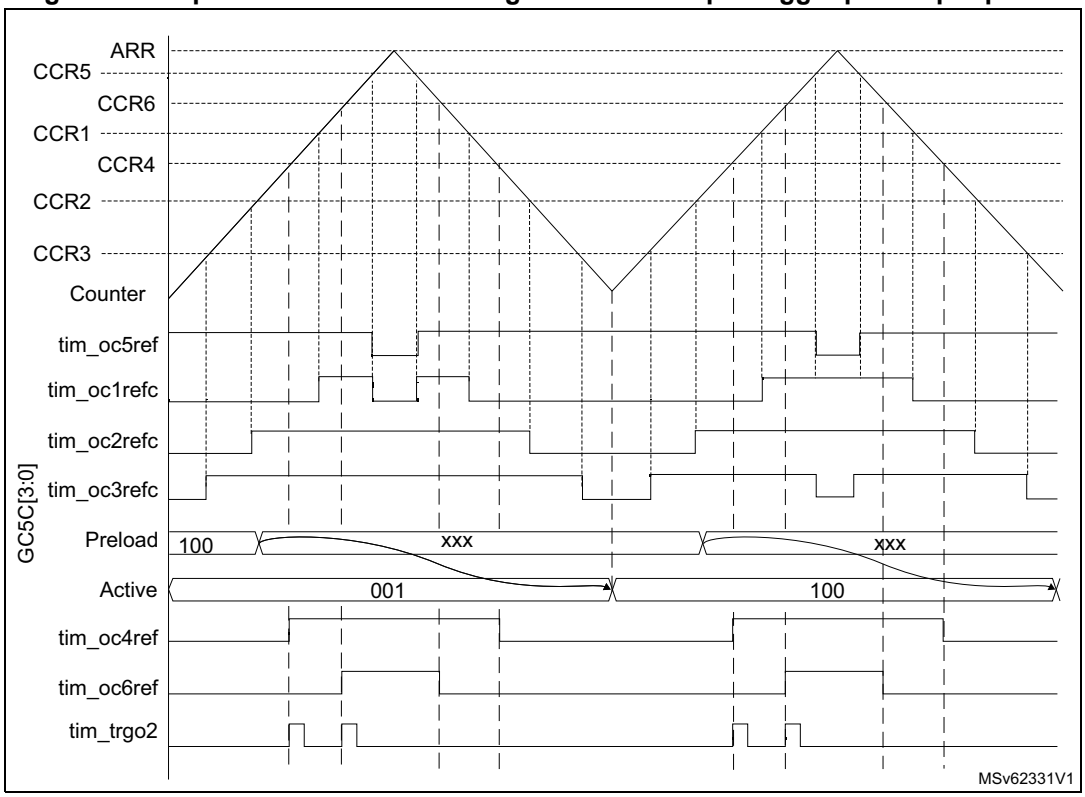
53.3.16 Combined 3-phase PWM mode

Combined 3-phase PWM mode allows one to three center-aligned PWM signals to be generated with a single programmable signal ANDed in the middle of the pulses. The tim_oc5ref signal is used to define the resulting combined signal. The 3-bits GC5C[3:1] in the TIMx_CCR5 allow selection on which reference signal the tim_oc5ref is combined. The resulting signals, tim_ocxrefc, are made of an AND logical combination of two reference PWMs:

- If GC5C1 is set, tim_oc1refc is controlled by TIMx_CCR1 and TIMx_CCR5.
- If GC5C2 is set, tim_oc2refc is controlled by TIMx_CCR2 and TIMx_CCR5.
- If GC5C3 is set, tim_oc3refc is controlled by TIMx_CCR3 and TIMx_CCR5.

Combined 3-phase PWM mode can be selected independently on channels 1 to 3 by setting at least one of the 3-bits GC5C[3:1].

Figure 490. 3-phase combined PWM signals with multiple trigger pulses per period



The tim_trgo2 waveform shows how the ADC can be synchronized on given 3-phase PWM signals. Refer to *Section 53.3.31: ADC triggers* for more details.

53.3.17 Complementary outputs and dead-time insertion

The advanced-control timers (TIM1/TIM8) can output two complementary signals and manage the switching-off and the switching-on instants of the outputs.

This time is generally known as dead-time and it has to be adjusted depending on the devices that are connected to the outputs and their characteristics (such as intrinsic delays of level-shifters, or delays due to power switches).

The polarity of the outputs (main output tim_ocx or complementary tim_ocxn) can be selected independently for each output. This is done by writing to the CCxP and CCxNP bits in the TIMx_CCER register.

The complementary signals tim_ocx and tim_ocxn are activated by a combination of several control bits: the CCxE and CCxNE bits in the TIMx_CCER register and the MOE, OISx, OISxN, OSSI, and OSSR bits in the TIMx_BDTR and TIMx_CR2 registers. Refer to *Table 538: Output control bits for complementary tim_ocx and tim_ocxn channels with break feature* for more details. In particular, the dead-time is activated when switching to the idle state (MOE falling down to 0).

Dead-time insertion is enabled by setting both CCxE and CCxNE bits, and the MOE bit if the break circuit is present. There is one 10-bit dead-time generator for each channel. From a

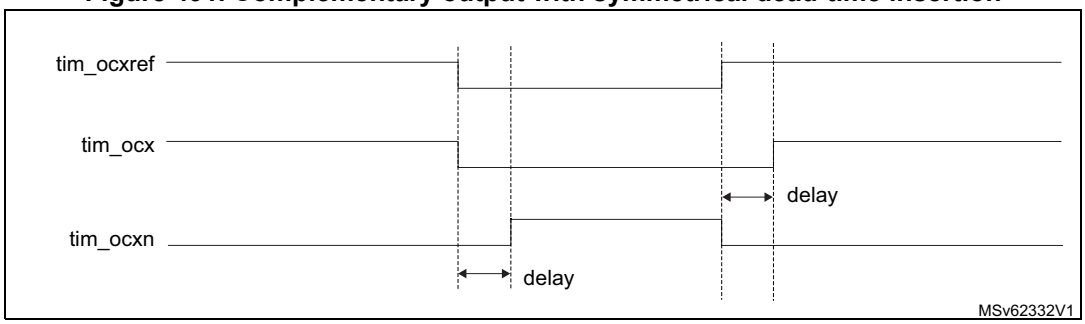
reference waveform tim_ocxref, it generates two outputs tim_ocx and tim_ocxn. If tim_ocx and tim_ocxn are active high:

- The tim_ocx output signal is the same as the reference signal except for the rising edge, which is delayed relative to the reference rising edge.
- The tim_ocxn output signal is the opposite of the reference signal except for the rising edge, which is delayed relative to the reference falling edge.

If the delay is greater than the width of the active output (tim_ocx or tim_ocxn) then the corresponding pulse is not generated.

The following figures show the relationships between the output signals of the dead-time generator and the reference signal tim_ocxref considering CCxP = 0, CCxNP = 0, MOE = 1, CCxE = 1 and CCxNE = 1 in these examples.

Figure 491. Complementary output with symmetrical dead-time insertion



The DTAE bit in the TIMx_DTR2 is used to differentiate the deadtime values for rising and falling edges of the reference signal, as shown on *Figure 492*.

In asymmetrical mode (DTAE = 1), the rising edge-referred deadtime is defined by the DTG[7:0] bitfield in the TIMx_BDTR register, while the falling edge-referred is defined by the DTGF[7:0] bitfield in the TIMx_DTR2 register. The DTAE bit must be written before enabling the counter and must not be modified while CEN = 1.

It is possible to have the deadtime value updated on-the-fly during pwm operation, using a preload mechanism. The deadtime bitfield DTG[7:0] and DTGF[7:0] are preloaded when the DTPE bit is set, in the TIMX_DTR2 register. The preload value is loaded in the active register on the next update event.

Note: If the DTPE bit is enabled while the counter is enabled, any new value written since last update is discarded and previous value is used.

Figure 492. Asymmetrical deadtime

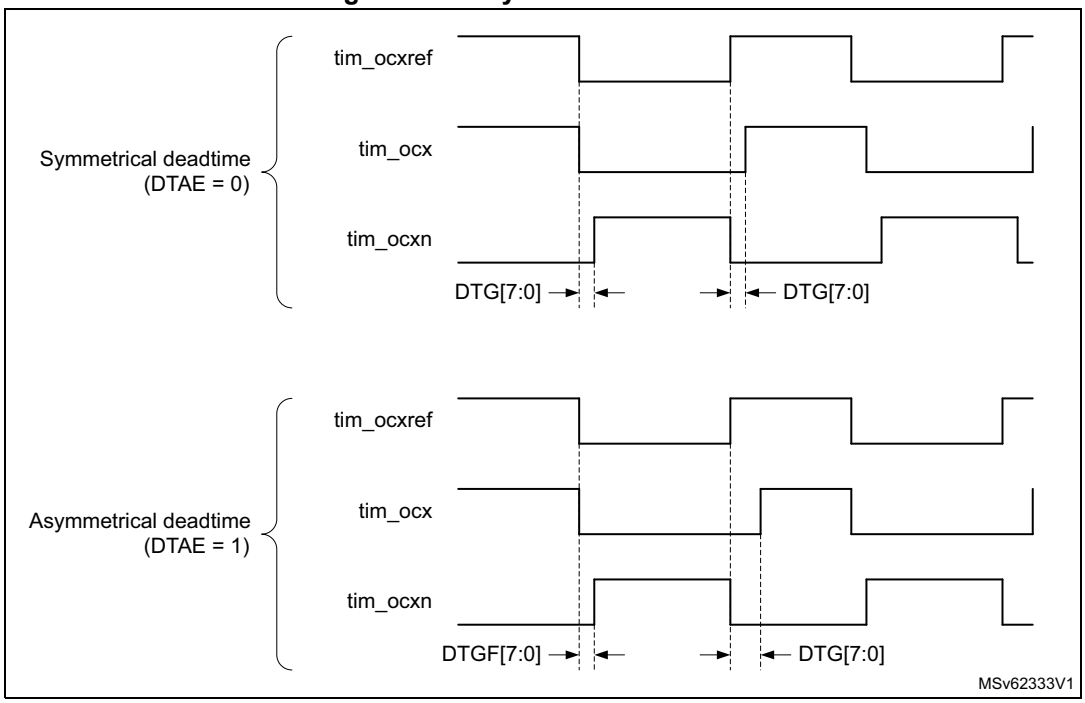


Figure 493. Dead-time waveforms with delay greater than the negative pulse

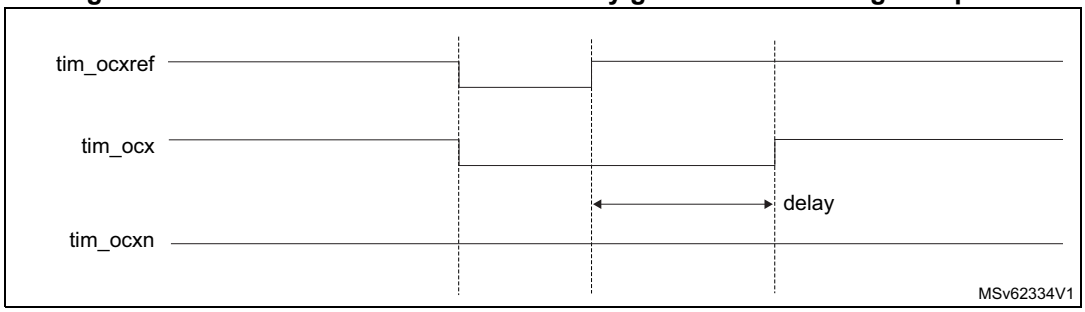

Figure 494. Dead-time waveforms with delay greater than the positive pulse

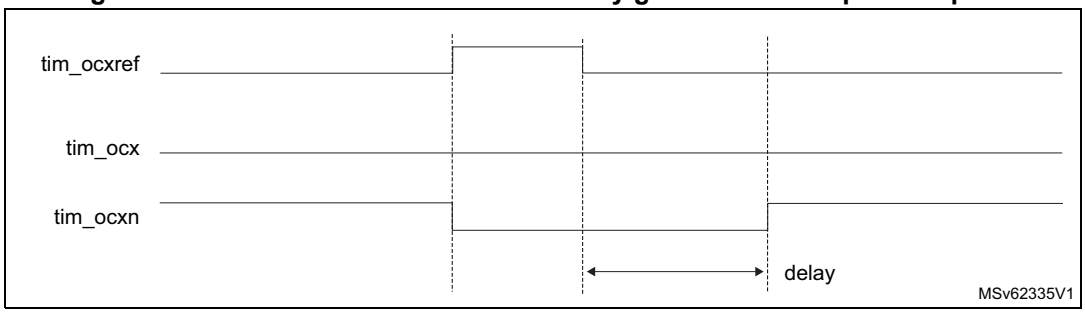


The dead-time delay is the same for each of the channels and is programmable with the DTG bits in the TIMx_BDTR register. Refer to *Section 53.6.20: TIMx break and dead-time register (TIMx_BDTR)(x = 1, 8)* for delay calculation.

Redirecting tim_ocxref to tim_ocx or tim_ocxn

In output mode (forced, output compare or PWM), tim_ocxref can be redirected to the tim_ocx output or to tim_ocxn output by configuring the CCxE and CCxNE bits in the TIMx_CCER register.

This is used to send a specific waveform (such as PWM or static active level) on one output while the complementary remains at its inactive level. Other alternative possibilities are to have both outputs at inactive level or both outputs active and complementary with dead-time.

Note: When only tim_ocxn is enabled (CCxE = 0, CCxNE = 1), it is not complemented and becomes active as soon as tim_ocxref is high. For example, if CCxNP = 0 then tim_ocxn = tim_ocxref. On the other hand, when both tim_ocx and tim_ocxn are enabled (CCxE = CCxNE = 1) tim_ocx becomes active when tim_ocxref is high whereas tim_ocxn is complemented and becomes active when tim_ocxref is low.

53.3.18 Using the break function

The purpose of the break function is to protect power switches driven by PWM signals generated with the timers. The two break inputs are usually connected to fault outputs of power stages and 3-phase inverters. When activated, the break circuitry shuts down the PWM outputs and forces them to a predefined safe state. A number of internal MCU events can also be selected to trigger an output shut-down.

The break features two channels. A break channel which gathers both system-level fault (clock failure, ECC/parity errors,...) and application fault (from input pins and built-in comparator), and can force the outputs to a predefined level (either active or inactive) after a deadtime duration. A break2 channel which only includes application faults and is able to force the outputs to an inactive state.

The output enable signal and output levels during break are depending on several control bits:

- The MOE bit in TIMx_BDTR register is used to enable/disable the outputs by software and is reset in case of break or break2 event.
- The OSSI bit in the TIMx_BDTR register defines whether the timer controls the output in inactive state or releases the control to the GPIO controller (typically to have it in Hi-Z mode)
- The OISx and OISxN bits in the TIMx_CR2 register which are setting the output shut-down level, either active or inactive. The tim_ocx and tim_ocxn outputs cannot be set both to active level at a given time, whatever the OISx and OISxN values. Refer to *Table 538: Output control bits for complementary tim_ocx and tim_ocxn channels with break feature* for more details.

When exiting from reset, the break circuit is disabled and the MOE bit is low. The break functions can be enabled by setting the BKE and BK2E bits in the TIMx_BDTR register. The break input polarities can be selected by configuring the BKP and BK2P bits in the same register. BKEx and BKPx can be modified at the same time. When the BKEx and BKPx bits are written, a delay of one APB clock cycle is applied before the writing is effective. Consequently, it is necessary to wait one APB clock period to correctly read back the bit after the write operation.

Because MOE falling edge can be asynchronous, a resynchronization circuit has been inserted between the actual signal (acting on the outputs) and the synchronous control bit (accessed in the TIMx_BDTR register). It results in some delays between the asynchronous

and the synchronous signals. In particular, if MOE is set to 1 whereas it was low, a delay must be inserted (dummy instruction) before reading it correctly. This is because the write acts on the asynchronous signal whereas the read reflects the synchronous signal.

The sources for break (tim_brk) channel are:

- External sources connected to one of the TIMx_BKIN pin (as per selection done in the GPIO alternate function selection registers), with polarity selection and optional digital filtering
- Internal sources:
  - coming from a tim_brk_cmpx input (refer to *Section 53.3.2: TIM1/TIM8 pins and internal signals* for product specific implementation)
  - coming from a system break request (refer to *Section 53.3.2: TIM1/TIM8 pins and internal signals* for product specific implementation)

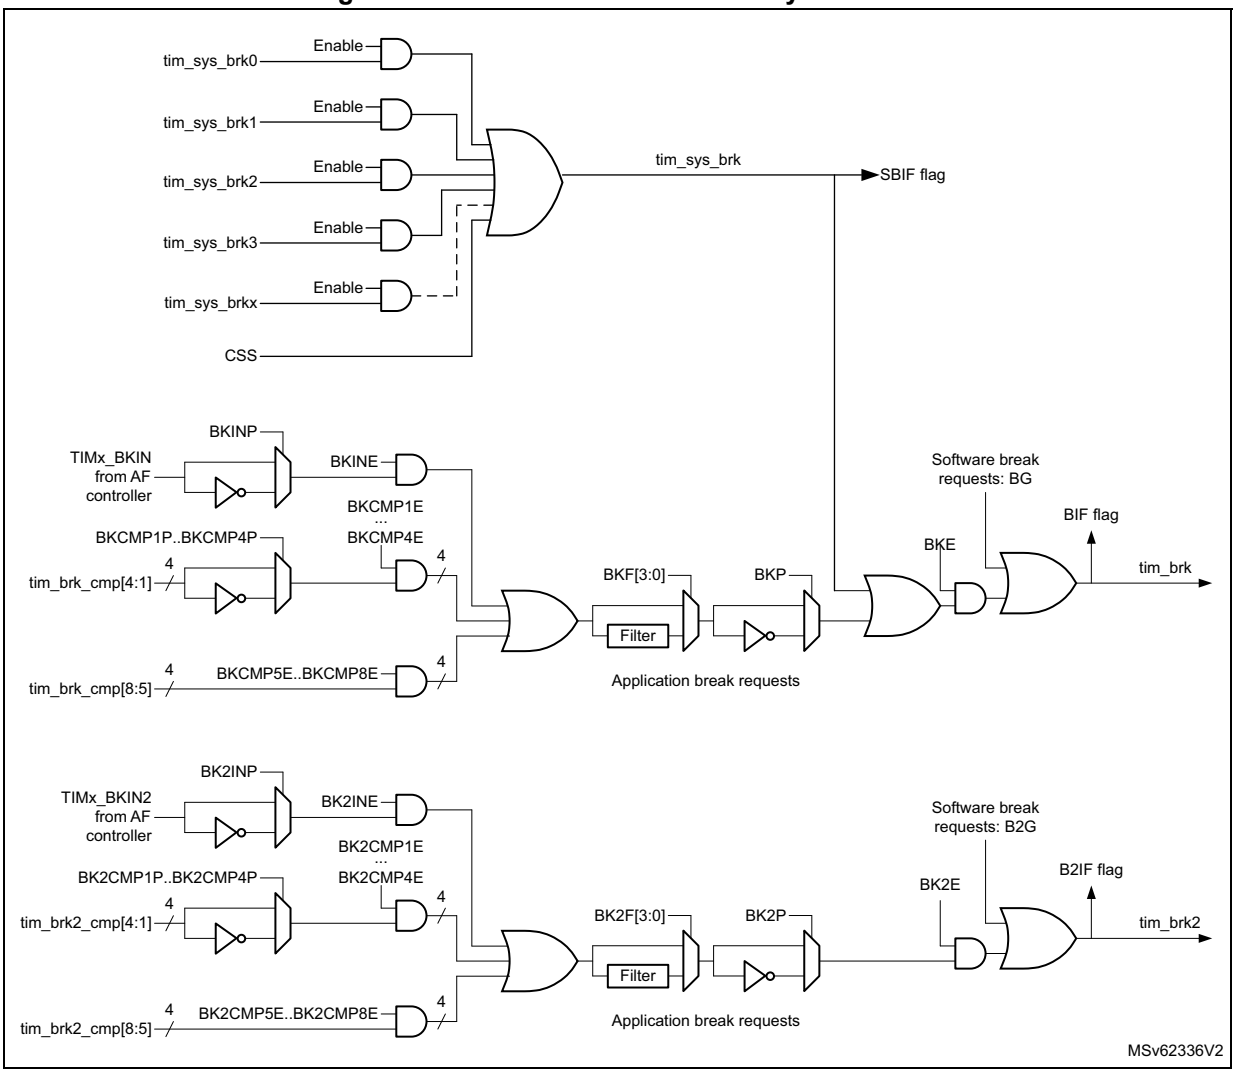
The sources for break2 (tim_brk2) are:

- External sources connected to one of the TIMx_BKIN2 pin (as per selection done in the GPIO alternate function selection registers), with polarity selection and optional digital filtering
- Internal sources coming from a tim_brk2_cmpx input (refer to *Section 53.3.2: TIM1/TIM8 pins and internal signals* for product specific implementation)

Break events can also be generated by software using BG and B2G bits in the TIMx_EGR register.

All sources are ORed before entering the timer tim_brk or tim_brk2 inputs, as per *Figure 495* below.

Figure 495. Break and Break2 circuitry overview



Note: An asynchronous (clockless) operation is only guaranteed when the programmable filter is disabled. If it is enabled, a fail safe clock mode (for example by using the internal PLL and/or the CSS) must be used to guarantee that break events are handled.

When one of the breaks occurs (selected level on one of the break inputs):

- The MOE bit is cleared asynchronously, putting the outputs in inactive state, idle state, or even releasing the control to the GPIO controller (selected by the OSSI bit). This feature is enabled even if the MCU oscillator is off.
- Each output channel is driven with the level programmed in the OISx bit in the TIMx_CR2 register as soon as MOE = 0. If OSSI = 0, the timer releases the output control (taken over by the GPIO controller), otherwise the enable output remains high.
- When complementary outputs are used:
  - The outputs are first put in inactive state (depending on the polarity). This is done asynchronously so that it works even if no clock is provided to the timer.
  - If the timer clock is still present, then the dead-time generator is reactivated in order to drive the outputs with the level programmed in the OISx and OISxN bits after a dead-time. Even in this case, tim_ocx and tim_ocxn cannot be driven to

their active level together. Note that because of the resynchronization on MOE, the dead-time duration is slightly longer than usual (around 2 tim_ker_ck clock cycles).

  - If OSSI = 0, the timer releases the output control (taken over by the GPIO controller which forces a Hi-Z state), otherwise the enable outputs remain or become high as soon as one of the CCxE or CCxNE bits is high.

- The break status flag (SBIF, BIF, and B2IF bits in the TIMx_SR register) is set. An interrupt is generated if the BIE bit in the TIMx_DIER register is set. A DMA request can be sent if the BDE bit in the TIMx_DIER register is set.
- If the AOE bit in the TIMx_BDTR register is set, the MOE bit is automatically set again at the next update event (UEV). As an example, this can be used to perform a regulation. Otherwise, MOE remains low until the application sets it to 1 again. In this case, it can be used for security and the break input can be connected to an alarm from power drivers, thermal sensors, or any security components.

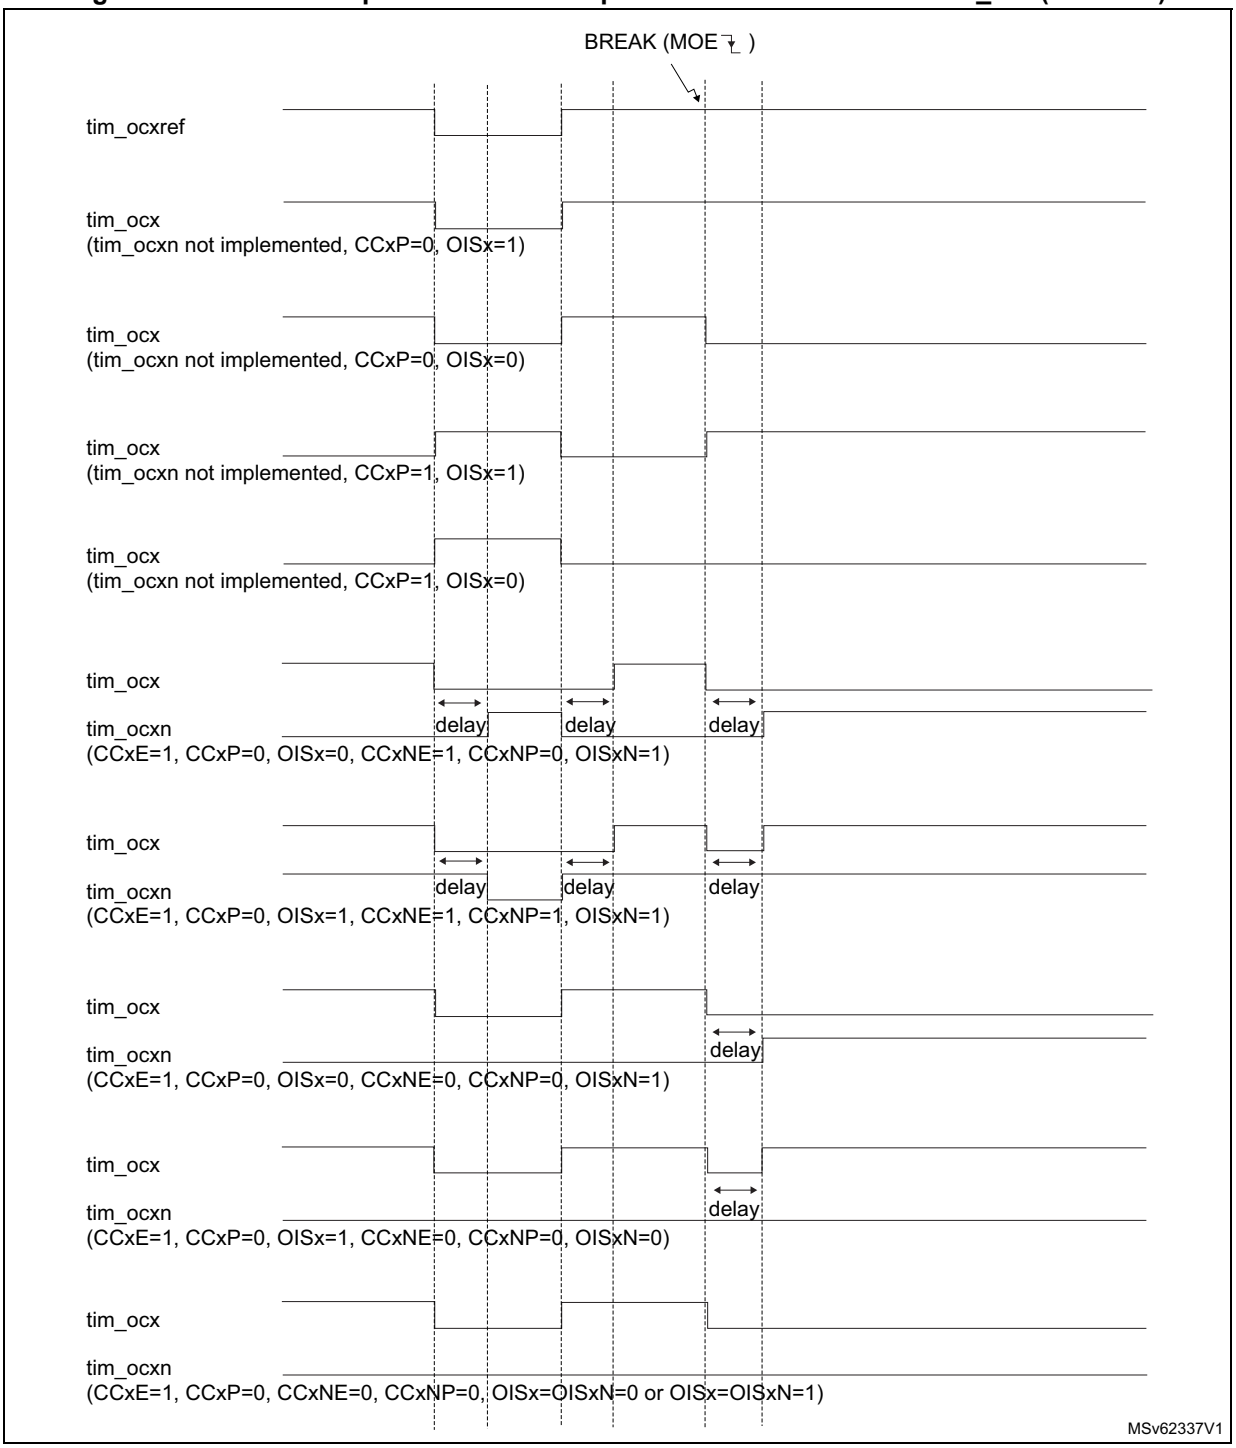
Note: If the MOE is reset by the CPU while the AOE bit is set, the outputs are in idle state and forced to inactive level or Hi-Z depending on OSSI value. If both the MOE and AOE bits are reset by the CPU, the outputs are in disabled state and driven with the level programmed in the OISx bit in the TIMx_CR2 register.

The break inputs are active on level. Thus, the MOE cannot be set while the break input is active (neither automatically nor by software). In the meantime, the status flag BIF and B2IF cannot be cleared.

In addition to the break input and the output management, a write protection has been implemented inside the break circuit to safeguard the application. It is used to freeze the configuration of several parameters (dead-time duration, tim_ocx/tim_ocxn polarities and state when disabled, OCxM configurations, break enable, and polarity). The application can choose from three levels of protection selected by the LOCK bits in the TIMx_BDTR register. Refer to *Section 53.6.20*. The LOCK bits can be written only once after an MCU reset.

Figure 496 shows an example of behavior of the outputs in response to a break.

Figure 496. Various output behavior in response to a break event on tim_brk (OSSI = 1)



The two break inputs have different behaviors on timer outputs:

- The tim_brk input can either disable (inactive state) or force the PWM outputs to a predefined safe state.
- tim_brk2 can only disable (inactive state) the PWM outputs.

The tim_brk has a higher priority than tim_brk2 input, as described in *Table 531*.

Note: tim_brk2 must only be used with OSSR = OSSI = 1.

Table 531. Behavior of timer outputs versus tim_brk/tim_brk2 inputs

tim_brk	tim_brk2	Timer outputs state	Typical use case	
			tim_ocxn output (low side switches)	tim_ocx output (high side switches)
Active	X	– Inactive then forced output state (after a deadtime) – Outputs disabled if OSSI = 0 (control taken over by GPIO logic)	ON after deadtime insertion	OFF
Inactive	Active	Inactive	OFF	OFF

Figure 497 gives an example of tim_ocx and tim_ocxn output behavior in case of active signals on tim_brk and tim_brk2 inputs. In this case, both outputs have active high polarities (CCxP = CCxNP = 0 in TIMx_CCER register).

Figure 497. PWM output state following tim_brk and tim_brk2 assertion (OSSI = 1)

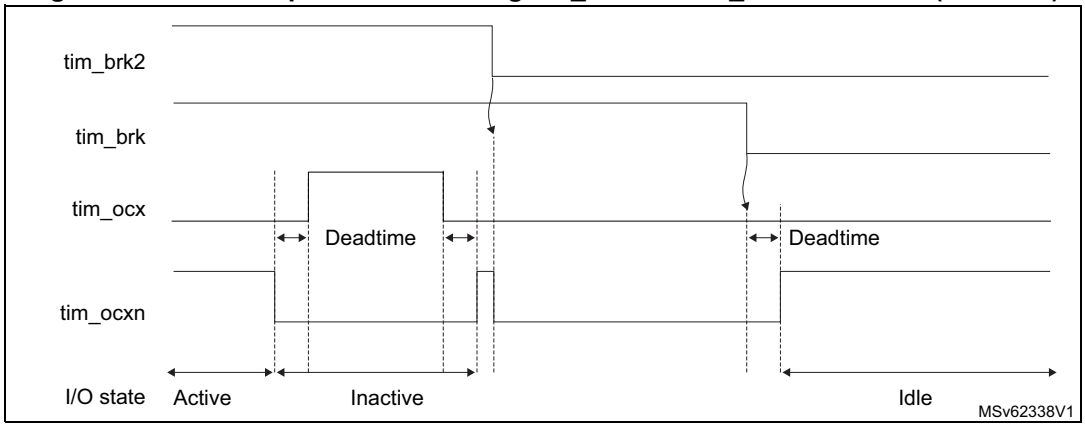


Figure 498. PWM output state following tim_brk assertion (OSSI = 0)

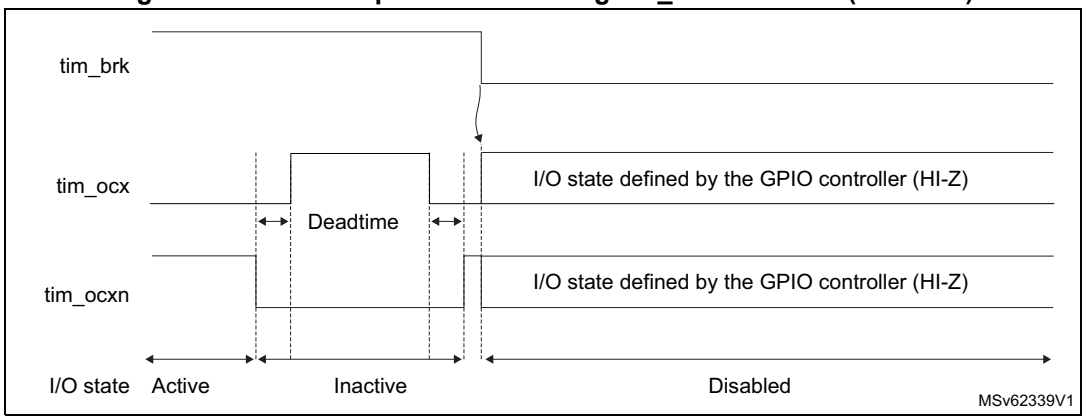


53.3.19 Bidirectional break inputs

The TIM1/TIM8 feature bidirectional break I/Os, as represented on *Figure 499*.

This provides support for:

- A board-level global break signal available for signaling faults to external MCUs or gate drivers, with a unique pin being both an input and an output status pin.
- Internal break sources and multiple external open drain sources ORed together to trigger a unique break event, when multiple internal and external break sources must be merged.

The tim_brk and tim_brk2 inputs are configured in bidirectional mode using the BKBID and BK2BID bits in the TIMxBDTR register. The BKBID programming bits can be locked in read-only mode using the LOCK bits in the TIMxBDTR register (in LOCK level 1 or above).

The bidirectional mode is available for both the tim_brk and tim_brk2 inputs, and require the I/O to be configured in open-drain mode with active low polarity (using BKINP, BKP, BK2INP and BK2P bits). Any break request coming either from system (for example CSS), from on-chip peripherals, or from break inputs forces a low level on the break input to signal the fault event. The bidirectional mode is inhibited if the polarity bits are not correctly set (active high polarity), for safety purposes.

The break software events (BG and B2G) also cause the break I/O to be forced to 0 to indicate to the external components that the timer is entered in break state. However, this is valid only if the break is enabled (BKE or B2KE = 1). When a software break event is generated with BKE or B2KE = 0), the outputs are put in safe state and the break flag is set, but there is no effect on the TIMx_BKIN and TIMx_BKIN2 I/Os.

A safe disarming mechanism prevents the system to be definitively locked-up (a low level on the break input triggers a break which enforces a low level on the same input).

When the BKDSRM (BK2DSRM) bit is set to 1, this releases the break output to clear a fault signal and to give the possibility to re-arm the system.

At no point the break protection circuitry can be disabled:

- The break input path is always active: a break event is active even if the BKDSRM (BK2DSRM) bit is set and the open drain control is released. This prevents the PWM output to be restarted as long as the break condition is present.
- The BKDSRM (BK2DSRM) bit cannot disarm the break protection as long as the outputs are enabled (MOE bit is set) (see *Table 532*).

Table 532. Break protection disarming conditions

MOE	BKBID (BK2BID)	BKDSRM (BK2DSRM)	Break protection state
0	0	X	Armed
0	1	0	Armed
0	1	1	Disarmed
1	X	X	Armed

Arming and rearming break circuitry

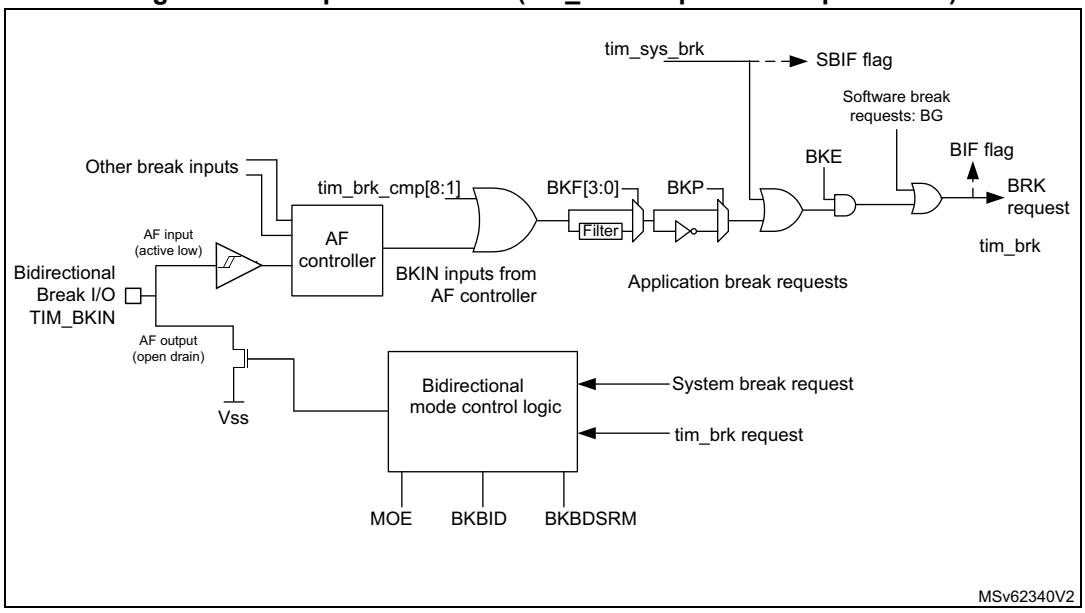
The break circuitry (in input or bidirectional mode) is armed by default (peripheral reset configuration).

The following procedure must be followed to re-arm the protection after a break (break2) event:

- The BKDSRM (BK2DSRM) bit must be set to release the output control.
- The software must wait until the system break condition disappears (if any) and clear the SBIF status flag (or clear it systematically before rearming).
- The software must poll the BKDSRM (BK2DSRM) bit until it is cleared by hardware (when the application break condition disappears).

From this point, the break circuitry is armed and active, and the MOE bit can be set to re-enable the PWM outputs.

Figure 499. Output redirection (tim_brk2 request not represented)



53.3.20 Clearing the tim_ocxref signal on an external event

The tim_ocxref signal of a given channel can be cleared when a high level is applied on the tim_ocref_clr_int input (OCxCE enable bit in the corresponding TIMx_CCMRx register set to 1). tim_ocxref remains low until the next transition to the active state, on the following PWM

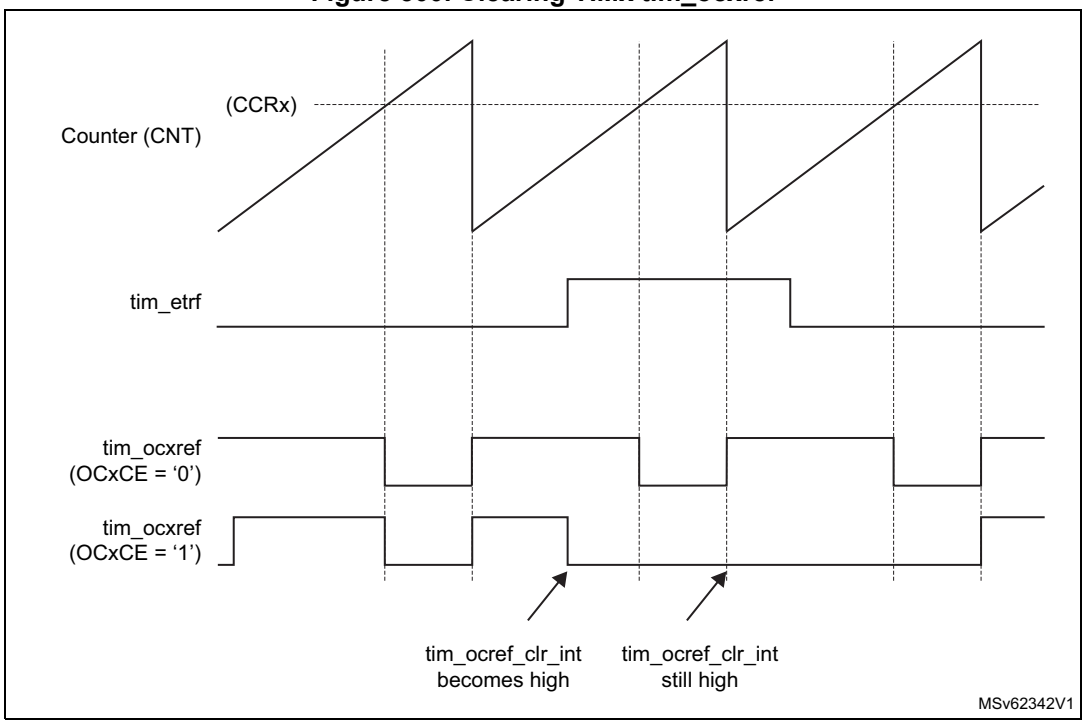
cycle. This function can only be used in Output compare and PWM modes. It does not work in Forced mode.

tim_etr_in must be configured as follows:

1. The external trigger prescaler must be kept off: bits ETPS[1:0] of the TIMx_SMCR register set to 00.
2. The external clock mode 2 must be disabled: bit ECE of the TIMx_SMCR register set to 0.
3. The external trigger polarity (ETP) and the external trigger filter (ETF) can be configured according to application needs (as per polarity of the source connected to the trigger and eventual need to remove noise using the filter).

Figure 500 shows the behavior of the tim_ocxref signal when the tim_etrf input becomes high, for both values of the enable bit OCxCE. In this example, the timer TIMx is programmed in PWM mode.

Figure 500. Clearing TIMx tim_ocxref



Note: In case of a PWM with a 100% duty cycle (if CCRx>ARR), then tim_ocxref is enabled again at the next counter overflow.

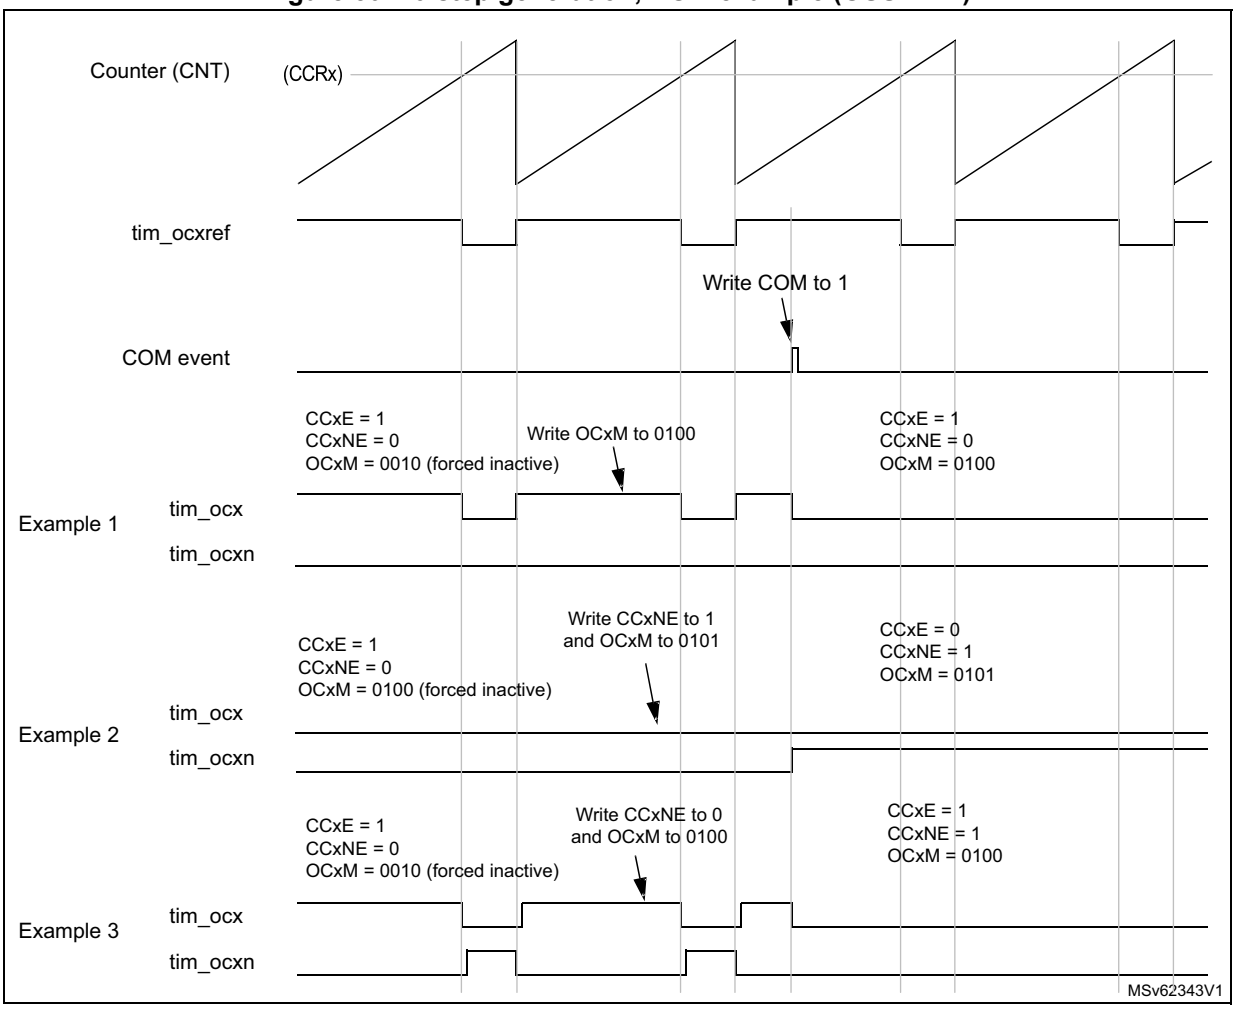
53.3.21 6-step PWM generation

When complementary outputs are used on a channel, preload bits are available on the OCxM, CCxE, and CCxNE bits. The preload bits are transferred to the shadow bits at the COM commutation event. Thus one can program in advance the configuration for the next step and change the configuration of all the channels at the same time. COM can be generated by software by setting the COM bit in the TIMx_EGR register or by hardware (on tim_trgi rising edge).

A flag is set when the COM event occurs (COMIF bit in the TIMx_SR register), which can generate an interrupt (if the COMIE bit is set in the TIMx_DIER register) or a DMA request (if the COMDE bit is set in the TIMx_DIER register).

Figure 501 describes the behavior of the tim_ocx and tim_ocxn outputs when a COM event occurs, in three different examples of programmed configurations.

Figure 501. 6-step generation, COM example (OSSR = 1)



53.3.22 One-pulse mode

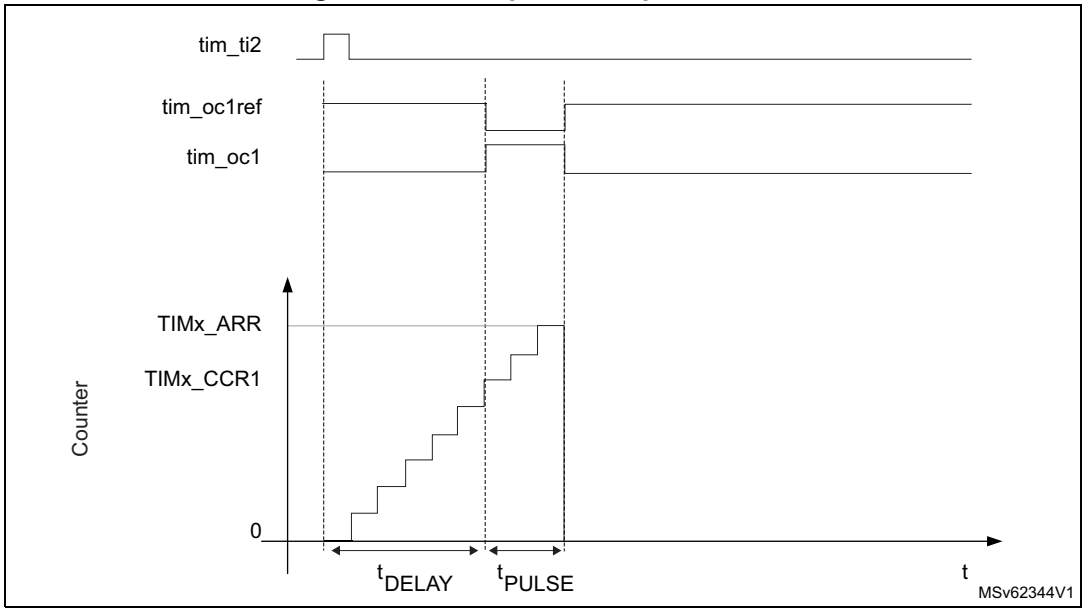
One-pulse mode (OPM) is a particular case of the previous modes. It allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length after a programmable delay.

Starting the counter can be controlled through the slave mode controller. Generating the waveform can be done in output compare mode or PWM mode. One-pulse mode is selected by setting the OPM bit in the TIMx_CR1 register. This makes the counter stop automatically at the next update event UEV.

A pulse can be correctly generated only if the compare value is different from the counter initial value. Before starting (when the timer is waiting for the trigger), the configuration must be:

- In upcounting: CNT < CCRx ≤ ARR (in particular, 0 < CCRx)
- In downcounting: CNT > CCRx

Figure 502. Example of one pulse mode.



In the following example, the user wants to generate a positive pulse on tim_oc1 with a length of t_{PULSE} and after a delay of t_{DELAY} as soon as a positive edge is detected on the tim_ti2 input pin.

Use tim_ti2fp2 as trigger 1:

- Map tim_ti2fp2 to tim_ti2 by writing CC2S = 01 in the TIMx_CCMR1 register.
- tim_ti2fp2 must detect a rising edge, write CC2P = 0 and CC2NP = 0 in the TIMx_CCER register.
- Configure tim_ti2fp2 as trigger for the slave mode controller (tim_trgi) by writing TS = 00110 in the TIMx_SMCR register.
- tim_ti2fp2 is used to start the counter by writing SMS to 110 in the TIMx_SMCR register (trigger mode).

The OPM waveform is defined by writing the compare registers (taking into account the clock frequency and the counter prescaler).

- The t_{DELAY} is defined by the value written in the TIMx_CCR1 register.
- The t_{PULSE} is defined by the difference between the autoreload value and the compare value (TIMx_ARR - TIMx_CCR1).
- Suppose the user wants to build a waveform with a transition from 0 to 1 when a compare match occurs and a transition from 1 to 0 when the counter reaches the auto-reload value. This is achieved by enabling PWM mode 2 (OC1M = 111 in TIMx_CCMR1). Optionally the preload registers can be enabled by writing OC1PE = 1 in the TIMx_CCMR1 register and ARPE in the TIMx_CR1 register. In this case one has to write the compare value in the TIMx_CCR1 register, the autoreload value in the

TIMx_ARR register, generate an update by setting the UG bit and wait for external trigger event on tim_ti2. CC1P is written to 0 in this example.

In this example, the DIR and CMS bits in the TIMx_CR1 register must be low.

Since only one pulse (Single mode) is needed, a 1 must be written in the OPM bit in the TIMx_CR1 register to stop the counter at the next update event (when the counter rolls over from the autoreload value back to 0). When OPM bit in the TIMx_CR1 register is set to 0, so the Repetitive mode is selected.

Particular case: tim_ocx fast enable:

In One-pulse mode, the edge detection on tim_tix input set the CEN bit which enables the counter. Then the comparison between the counter and the compare value makes the output toggle. But several clock cycles are needed for these operations and it limits the minimum delay t_{DELAY} min that can be achieved.

To output a waveform with the minimum delay, the OCxFE bit can be set in the TIMx_CCMRx register. Then tim_ocxref (and tim_ocx) are forced in response to the stimulus, without taking in account the comparison. Its new level is the same as if a compare match had occurred. OCxFE acts only if the channel is configured in PWM1 or PWM2 mode.

53.3.23 Retriggerable One-pulse mode

This mode allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length, but with the following differences with nonretriggerable one-pulse mode described in *Section 53.3.22*:

- The pulse starts as soon as the trigger occurs (no programmable delay).
- The pulse is extended if a new trigger occurs before the previous one is completed.

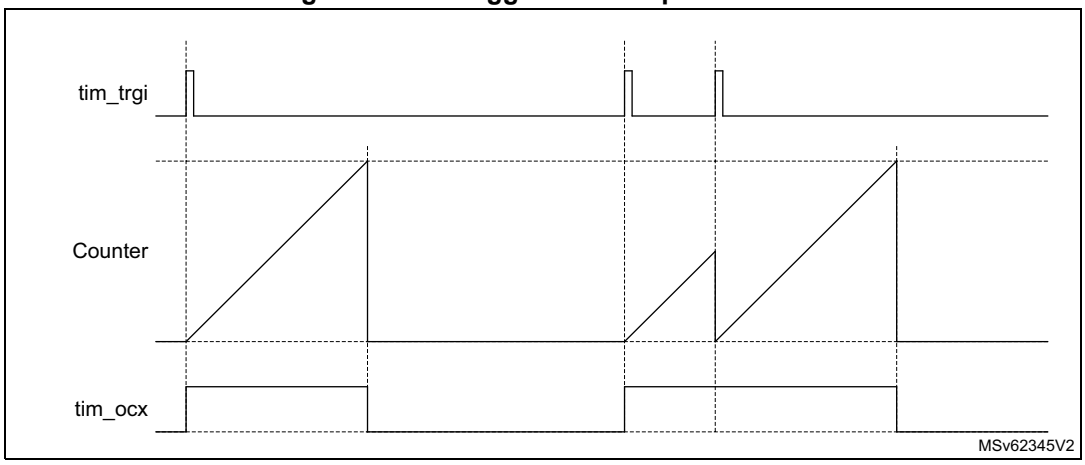
The timer must be in Slave mode, with the bits SMS[3:0] = 1000 (Combined Reset + trigger mode) in the TIMx_SMCR register, and the OCxM[3:0] bits set to 1000 or 1001 for retriggerable OPM mode 1 or 2.

If the timer is configured in Up-counting mode, the corresponding CCRx must be set to 0 (the ARR register sets the pulse length). If the timer is configured in Down-counting mode, CCRx must be above or equal to ARR.

Note: The OCxM[3:0] and SMS[3:0] bitfields are split into two parts for compatibility reasons, the most significant bit are not contiguous with the three least significant ones.

This mode must not be used with center-aligned PWM modes. It is mandatory to have CMS[1:0] = 00 in TIMx_CR1.

Figure 503. Retriggerable one-pulse mode



53.3.24 Pulse on compare mode

A pulse can be generated upon compare match event. A signal with a programmable pulsewidth generated when the counter value equals a given compare value, for debugging or synchronization purposes.

This mode is available for any slave mode selection, including encoder modes, in edge and center aligned counting modes. It is solely available for channel 3 and channel 4. The pulse generator is unique and is shared by the two channels, as shown on *Figure 504*.

Figure 504. Pulse generator circuitry

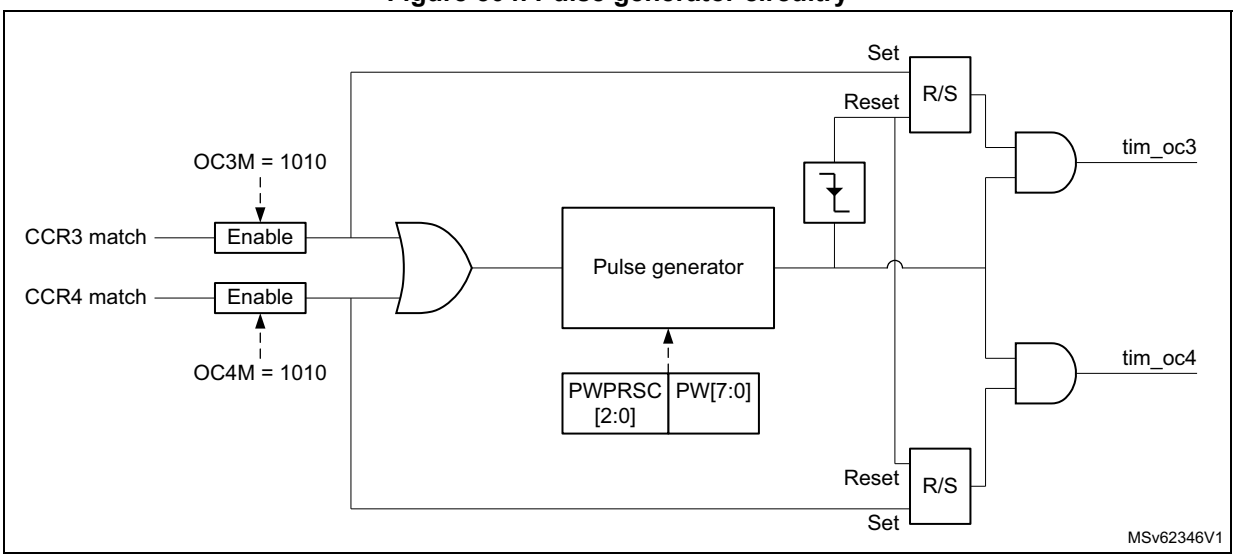


Figure 505 shows how the pulse is generated for edge-aligned and encoder operating modes.

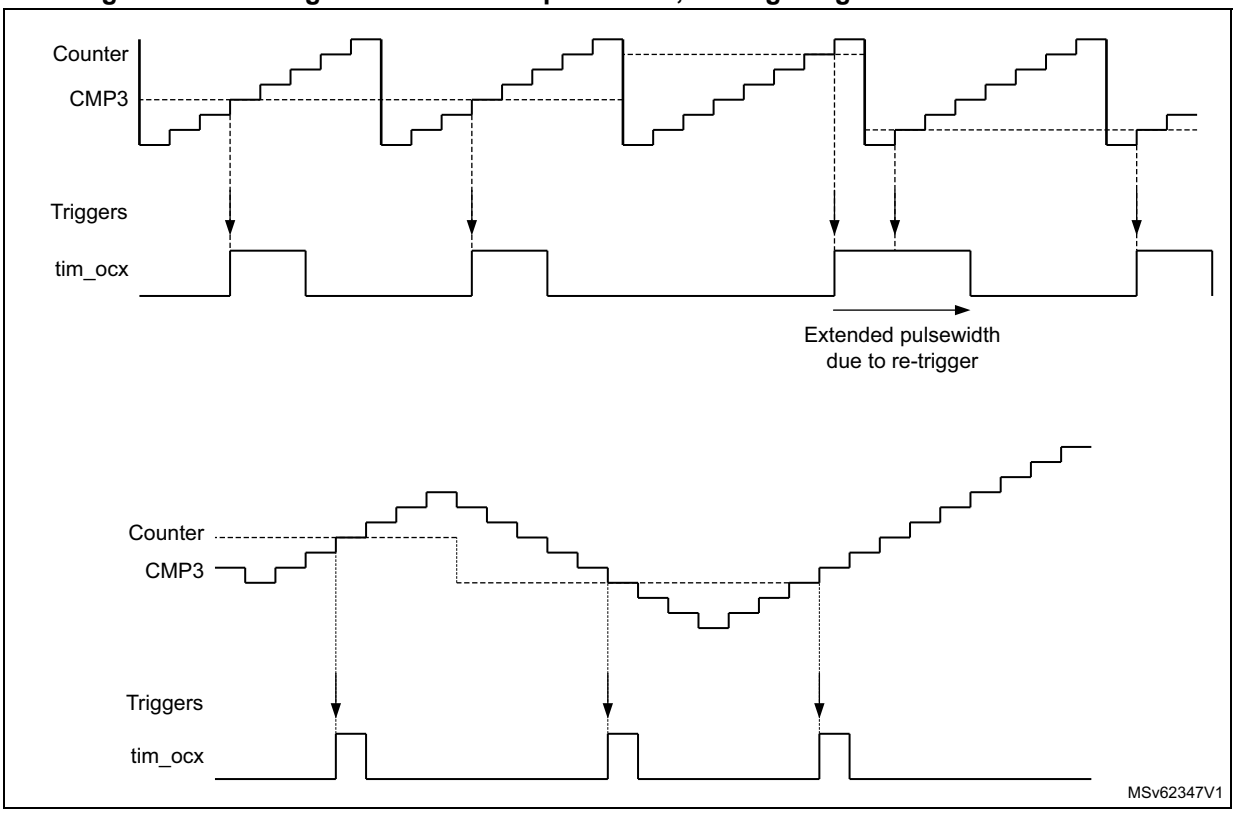
Figure 505. Pulse generation on compare event, for edge-aligned and encoder modes



This output compare mode is selected using the OC3M[3:0] and OC4M[3:0] bitfields in TIMx_CCMR2 register.

The pulsewidth is programmed using the PW[7:0] bitfield in the register, using a specific clock prescaled according to PWPRSC[2:0] bits, as follows:

t_{PW} = PW[7:0] x t_{PWG}

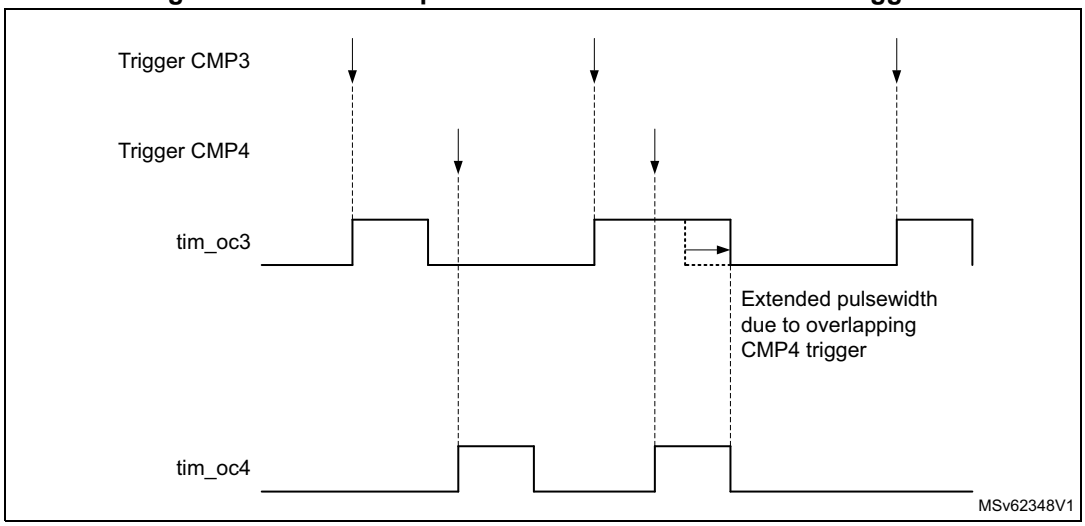
where $t_{PWG} = (2^{(PWPRSC[2:0])}) \times t_{tim_ker_ck}$

gives the resolution and maximum values depending on the prescaler value.

The pulse is retriggerable: a new trigger while the pulse is ongoing, causes the pulse to be extended.

Note: If the two channels are enabled simultaneously, the pulses are issued independently as long as the trigger on one channel is not overlapping the pulse generated on the concurrent output. On the opposite, if the two triggers are overlapping, the pulse width related to the first arriving trigger is extended (because of the retrigger), while the pulse width of the last arriving trigger is correct (as shown on Figure 506).

Figure 506. Extended pulsewidth in case of concurrent triggers



53.3.25 Encoder interface mode

Quadrature encoder

To select Encoder Interface mode write SMS = 0001 in the TIMx_SMCR register if the counter is counting on tim_ti1 edges only, SMS = 0010 if it is counting on tim_ti2 edges only and SMS = 0011 if it is counting on both tim_ti1 and tim_ti2 edges.

Select the tim_ti1 and tim_ti2 polarity by programming the CC1P and CC2P bits in the TIMx_CCER register. When needed, the input filter can be programmed as well. CC1NP and CC2NP must be kept low.

The two inputs tim_ti1 and tim_ti2 are used to interface to an quadrature encoder. Refer to *Table 533*. The counter is clocked by each valid transition on tim_ti1fp1 or tim_ti2fp2 (tim_ti1 and tim_ti2 after input filter and polarity selection, tim_ti1fp1 = tim_ti1 if not filtered and not inverted, tim_ti2fp2 = tim_ti2 if not filtered and not inverted) assuming that it is enabled (CEN bit in TIMx_CR1 register written to 1). The sequence of transitions of the two inputs is evaluated and generates count pulses as well as the direction signal. Depending on the sequence the counter counts up or down, the DIR bit in the TIMx_CR1 register is modified by hardware accordingly. The DIR bit is calculated at each transition on any input (tim_ti1 or tim_ti2), whatever the counter is counting on tim_ti1 only, tim_ti2 only or both tim_ti1 and tim_ti2.

Encoder interface mode acts simply as an external clock with direction selection. This means that the counter just counts continuously between 0 and the autoreload value in the TIMx_ARR register (0 to ARR or ARR down to 0 depending on the direction). So the TIMx_ARR must be configured before starting. In the same way, the capture, compare, prescaler, repetition counter, trigger output features continue to work as normal. Encoder mode and External clock mode 2 are not compatible and must not be selected together.

In this mode, the counter is modified automatically following the speed and the direction of the quadrature encoder and its content, therefore, always represents the encoder's position. The count direction correspond to the rotation direction of the connected sensor. The table summarizes the possible combinations, assuming tim_ti1 and tim_ti2 do not switch at the same time.

Table 533. Counting direction versus encoder signals (CC1P = CC2P = 0)

Active edge	SMS[3:0]	Level on opposite signal (tim_ti1fp1 for tim_ti2, tim_ti2fp2 for tim_ti1)	tim_ti1fp1 signal		tim_ti2fp2 signal	
			Rising	Falling	Rising	Falling
Counting on tim_ti1 only x1 mode	1110	High	Down	Up	No count	No count
		Low	No count	No count	No count	No count
Counting on tim_ti2 only x1 mode	1111	High	No count	No count	Up	Down
		Low	No count	No count	No count	No count
Counting on tim_ti1 only x2 mode	0001	High	Down	Up	No count	No count
		Low	Up	Down	No count	No count
Counting on tim_ti2 only x2 mode	0010	High	No count	No count	Up	Down
		Low	No count	No count	Down	Up
Counting on tim_ti1 and tim_ti2 x4 mode	0011	High	Down	Up	Up	Down
		Low	Up	Down	Down	Up

A quadrature encoder can be connected directly to the MCU without external interface logic. However, comparators are normally be used to convert the encoder's differential outputs to digital signals. This greatly increases noise immunity. The third encoder output which indicate the mechanical zero position, may be connected to the external trigger input and trigger a counter reset.

Figure 507 gives an example of counter operation, showing count signal generation and direction control. It also shows how input jitter is compensated where both edges are selected. This might occur if the sensor is positioned near to one of the switching points. For this example the configuration is the following:

- CC1S = 01 (TIMx_CCMR1 register, tim_ti1fp1 mapped on tim_ti1).
- CC2S = 01 (TIMx_CCMR1 register, tim_ti2fp2 mapped on tim_ti2).
- CC1P = 0 and CC1NP = 0 (TIMx_CCER register, tim_ti1fp1 noninverted, tim_ti1fp1 = tim_ti1).
- CC2P = 0 and CC2NP = 0 (TIMx_CCER register, tim_ti1fp2 noninverted, tim_ti1fp2= tim_ti2).
- SMS = 0011 (TIMx_SMCR register, both inputs are active on both rising and falling edges).
- CEN = 1 (TIMx_CR1 register, Counter enabled).

Figure 507. Example of counter operation in encoder interface mode.

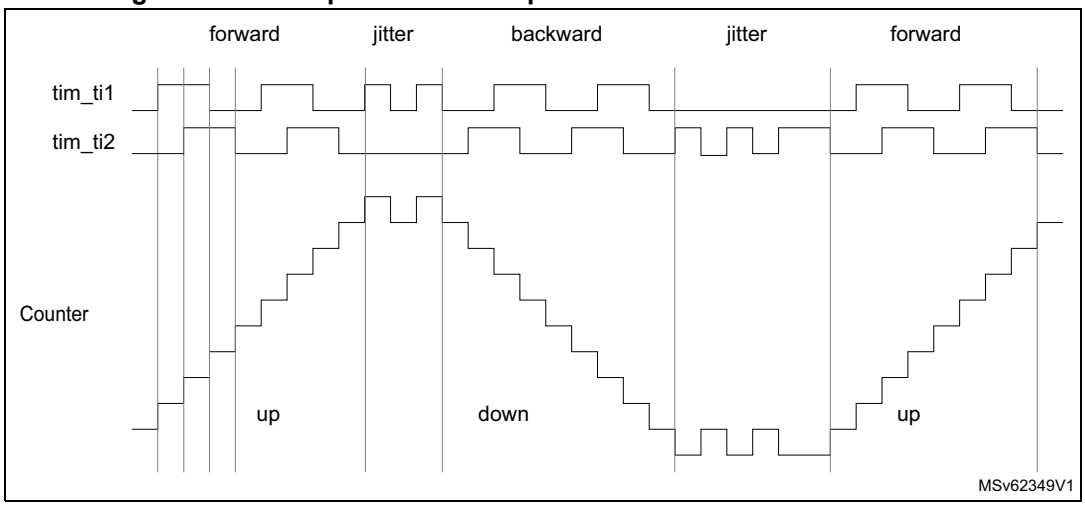


Figure 508 gives an example of counter behavior when tim_ti1fp1 polarity is inverted (same configuration as above except CC1P = 1).

Figure 508. Example of encoder interface mode with tim_ti1fp1 polarity inverted.

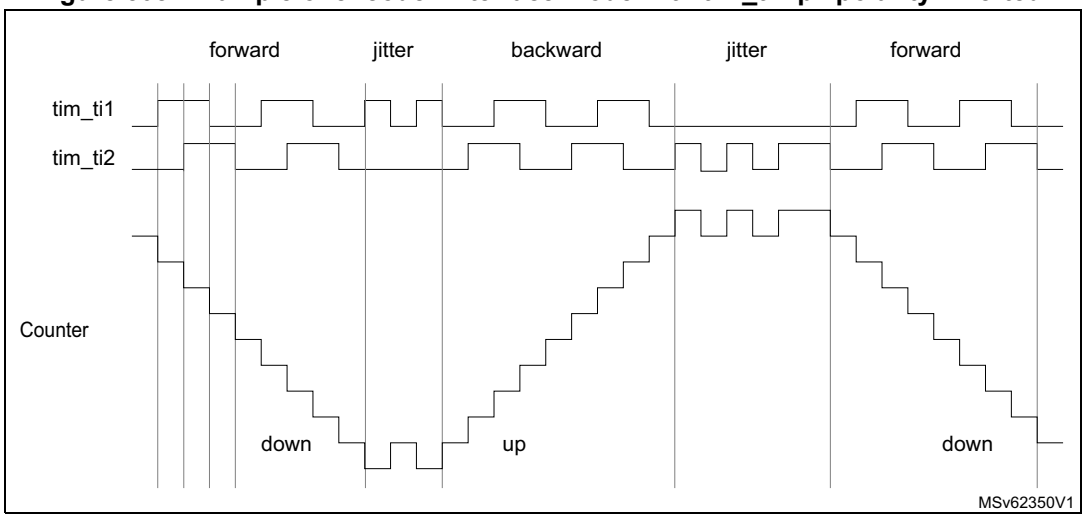

Figure 509 shows the timer counter value during a speed reversal, for various counting modes.

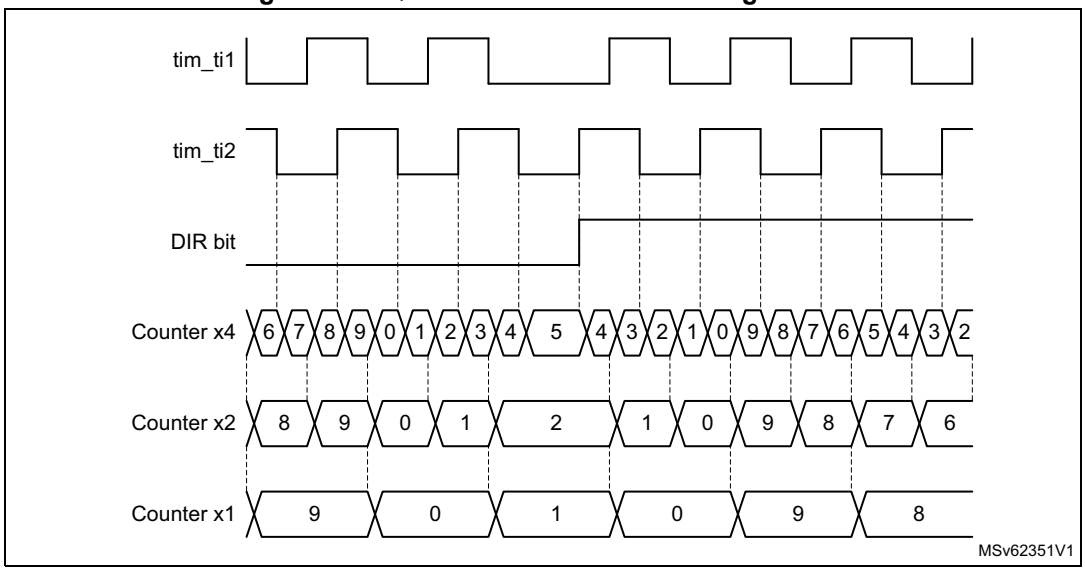
Figure 509. Quadrature encoder counting modes



The timer, when configured in Encoder Interface mode provides information on the sensor's current position. Dynamic information can be obtained (speed, acceleration, deceleration) by measuring the period between two encoder events using a second timer configured in capture mode. The output of the encoder which indicates the mechanical zero can be used for this purpose. Depending on the time between two events, the counter can also be read at regular times. This can be done by latching the counter value into a third input capture register if available (then the capture signal must be periodic and can be generated by another timer). When available, it is also possible to read its value through a DMA request.

The IUFREMAP bit in the TIMx_CR1 register forces a continuous copy of the update interrupt flag (UIF) into the timer counter register's bit 31 (TIMxCNT[31]). This allows both the counter value and a potential roll-over condition signaled by the UIFCPY flag to be read in an atomic way. It eases the calculation of angular speed by avoiding race conditions caused, for instance, by a processing shared between a background task (counter reading) and an interrupt (update interrupt).

There is no latency between the UIF and UIFCPY flag assertions.

In 32-bit timer implementations, when the IUFREMAP bit is set, bit 31 of the counter is overwritten by the UIFCPY flag upon read access (the counter's most significant bit is only accessible in write mode).

Clock plus direction encoder mode

In addition to the quadrature encoder mode, the timer offers support for other types of encoders.

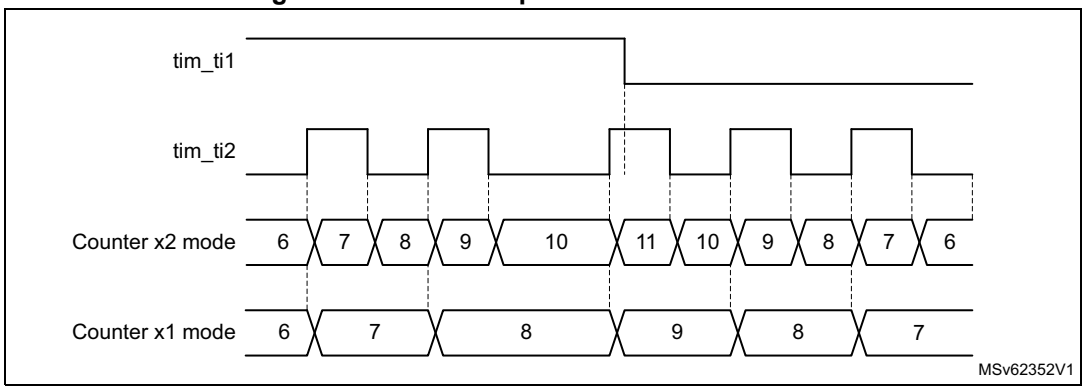
In the clock plus direction mode shown on *Figure 510*, the clock is provided on a single line, on tim_ti2, while the direction is forced using the tim_ti1 input.

This mode is enabled with the SMS[3:0] bitfield in the TIMx_SMCR register, as following:

- 1010: x2 mode, the counter is updated on both rising and falling edges of the clock
- 1011: x1 mode, the counter is updated on a single clock edge, as per CC2P bit value: CC2P = 0 corresponds to rising edge sensitivity and CC2P = 1 corresponds to falling edge sensitivity

The polarity of the direction signal on tim_ti1 is set with the CC1P bit: 0 corresponds to positive polarity (up-counting when tim_ti1 is high and down-counting when tim_ti1 is low) and CC1P = 1 corresponds to negative polarity (up-counting when tim_ti1 is low).

Figure 510. Direction plus clock encoder mode



Directional clock encoder mode

In the directional clock mode on *Figure 511*, the clocks are provided on two lines, with a single one at once, depending on the direction, so as to have one up-counting clock line and one down-counting clock line.

This mode is enabled with the SMS[3:0] bitfield in the TIMx_SMCR register, as following:

- 1100: x2 mode, the counter is updated on both rising and falling edges of any of the two clock line. The CC1P and CC2P bits are coding for the clock idle state. CCxP = 0 corresponds to high-level idle state (refer to *Figure 511*) and CCxP = 1 corresponds to low-level idle state (refer to *Figure 512*).
- 1101: x1 mode, the counter is updated on a single clock edge, as per CC1P and CC2P bit value. CCxP = 0 corresponds to falling edge sensitivity and high-level idle state (refer to *Figure 511*), CCxP = 1 corresponds to rising edge sensitivity and low-level idle state (refer to *Figure 512*).

Figure 511. Directional clock encoder mode (CC1P = CC2P = 0)

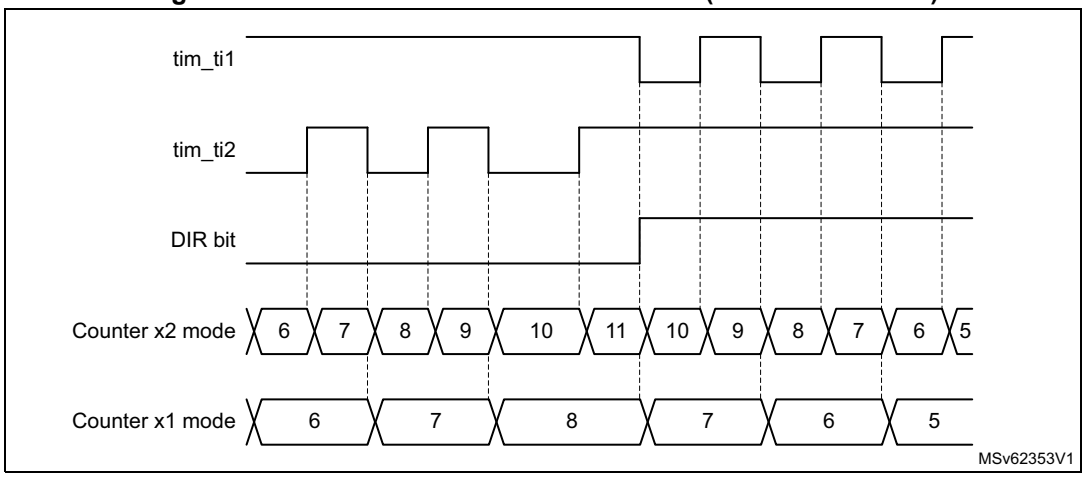


Figure 512. Directional clock encoder mode (CC1P = CC2P = 1)

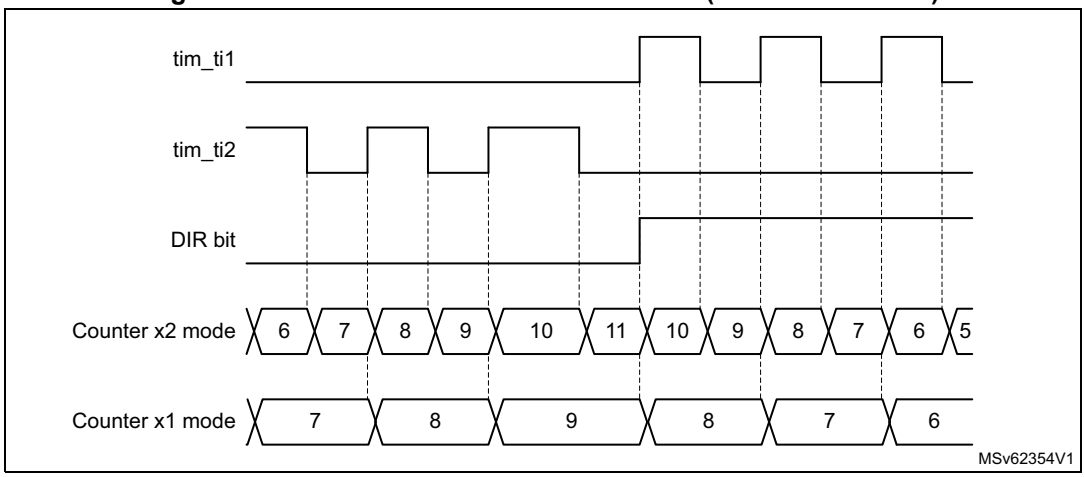

Table 534 here-below details how the directional clock mode operates, for any input transition.

Table 534. Counting direction versus encoder signals and polarity settings

Directional clock mode	SMS[3:0]	Level on opposite signal (tim_ti1fp1 for tim_ti2, tim_ti2fp2 for tim_ti1)	tim_ti1fp1 signal		tim_ti2fp2 signal	
			Rising	Falling	Rising	Falling
x2 mode CCxP = 0	1100	High	Down	Down	Up	Up
		Low	No count	No count	No count	No count
x2 mode CCxP = 1	1100	High	No count	No count	No count	No count
		Low	Down	Down	Up	Up
x1 mode CCxP = 0	1101	High	No count	Down	No count	Up
		Low	No count	No count	No count	No count
x1 mode CCxP = 1	1101	High	No count	No count	No count	No count
		Low	Down	No count	Up	No count

Index input

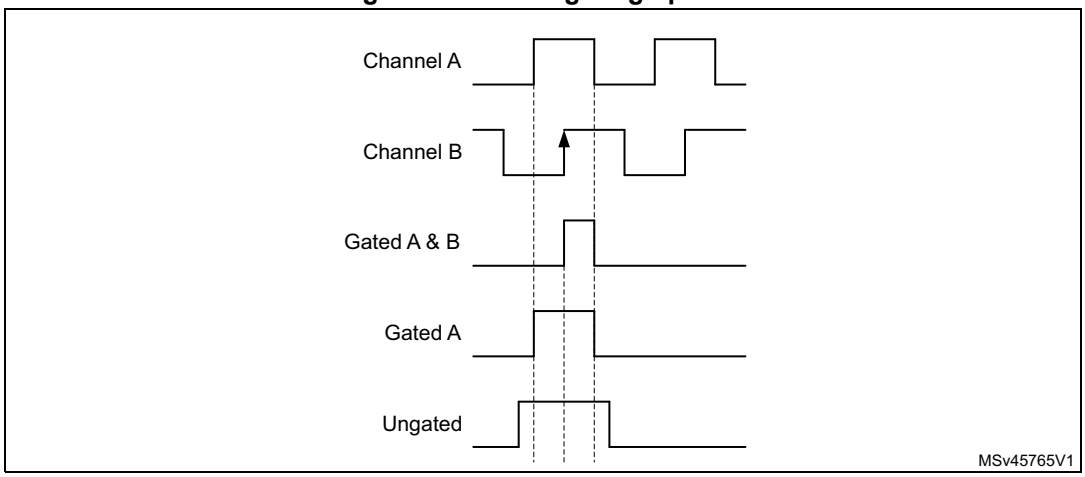
The counter can be reset by an index signal coming from the encoder, indicating an absolute reference position. The index signal must be connected to the tim_etr_in input. It can be filtered using the digital input filter.

The index functionality is enabled with the IE bit in the TIMX_ECR register. The IE bit must be set only in encoder mode, when the SMS[3:0] bitfield has the following values: 0001, 0010, 011, 1010, 1011, 1100, 1101, 1110, 1111.

Available encoders are proposed with several options for index pulse conditioning, as per *Figure 513*:

- gated with A and B: the pulsewidth is 1/4 of one channel period, aligned with both A and B edges
- gated with A (or gated with B): the pulsewidth is 1/2 of one channel period, aligned with the two edges on channel A (resp. channel B)
- ungated: the pulsewidth is up to one channel period, without any alignment to the edges

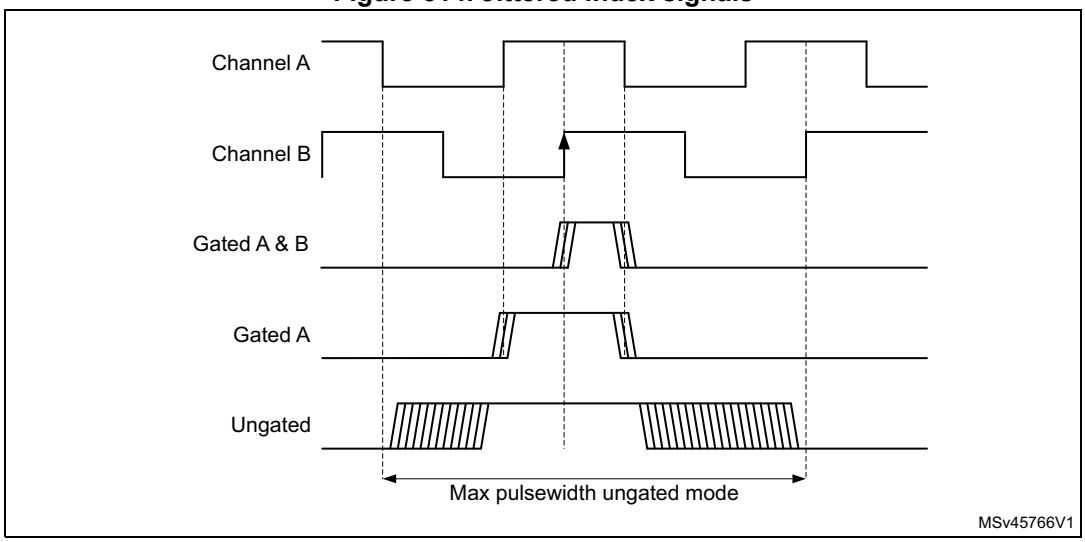
Figure 513. Index gating options



The circuitry tolerates jitter on index signal, whatever the gating mode, as show on *Figure 514*.

In ungated mode, the signal must be strictly below two encoder periods. If the pulsewidth is greater or equal to two encoder period, the counter is reset multiple times.

Figure 514. Jittered Index signals



The timer supports the three gating options identically, without any specific programming needed. It is only necessary to define on which encoder state (for example channel A and

channel B state combination) the index must be synchronized, using the IPOS[1:0] bitfield in the TIMx_ECR register.

The index detection event acts differently depending on counting direction to ensure symmetrical operation during speed reversal:

- The counter is reset during up-counting (DIR bit = 0).
- The counter is set to TIMx_ARR when down counting.

This allows the index to be generated on the very same mechanical angular position whatever the counting direction. *Figure 515* shows at which position is the index generated, for a simplistic example (an encoder providing four edges par mechanical rotation).

Figure 515. Index generation for IPOS[1:0] = 11

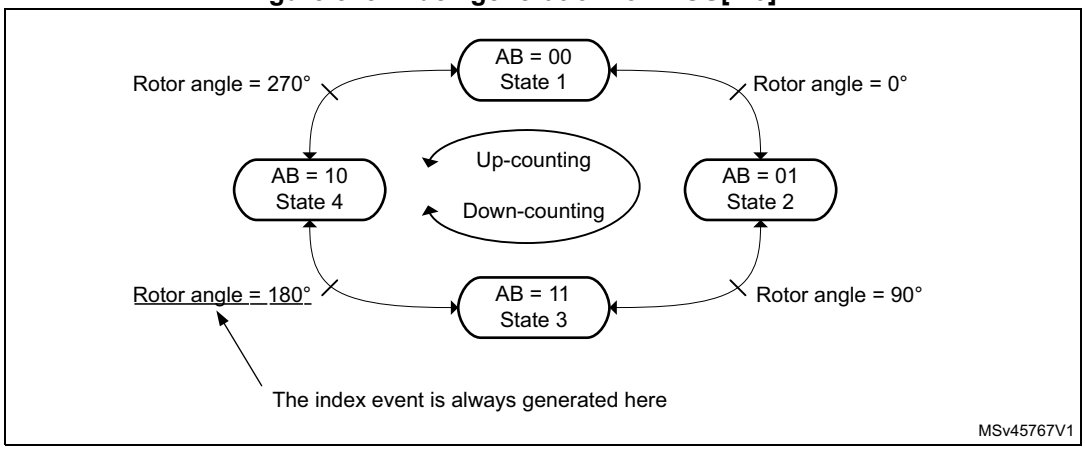


Figure 516 presents waveforms and corresponding values for IPOS[1:0] = 11. It shows that the instant at which the counter value is forced is automatically adjusted depending on the counting direction:

- Counter set to 0 when encoder state is 11 (ChA = 1, ChB = 1), when up-counting (DIR bit = 0).
- Counter set to TIMx_ARR when exiting the 11 state, when down-counting (DIR bit = 1).

An interrupt can be issued upon index detection event.

The arrows are indicating on which transition is the index event interrupt generated.

Figure 516. Counter reading with index gated on channel A (IPOS[1:0] = 11)

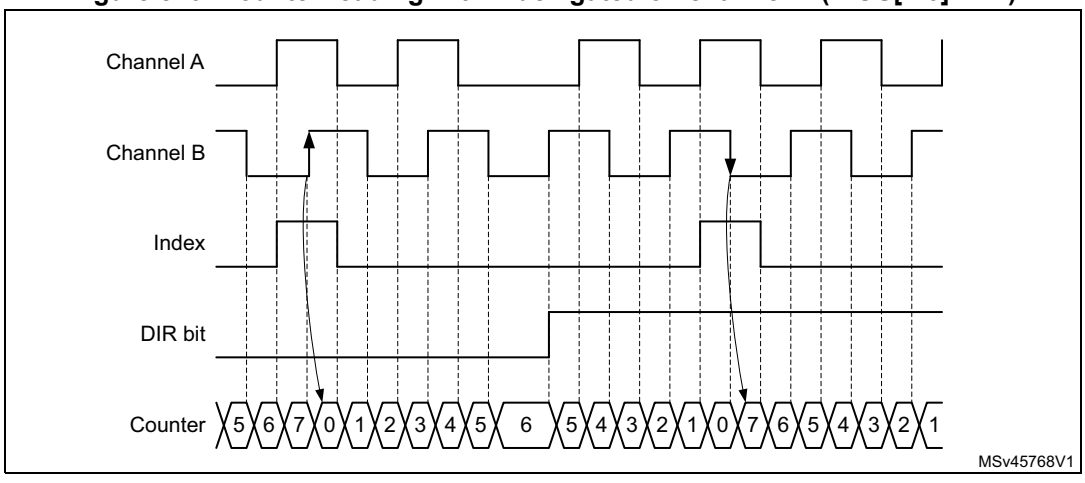

Figure 517. presents waveforms and corresponding values for the ungated mode. The arrows are indicating on which transition is the index event generated.

Figure 517. Counter reading with index ungated (IPOS[1:0] = 00)

Figure 518. Counter reading with index gated on channel A and B

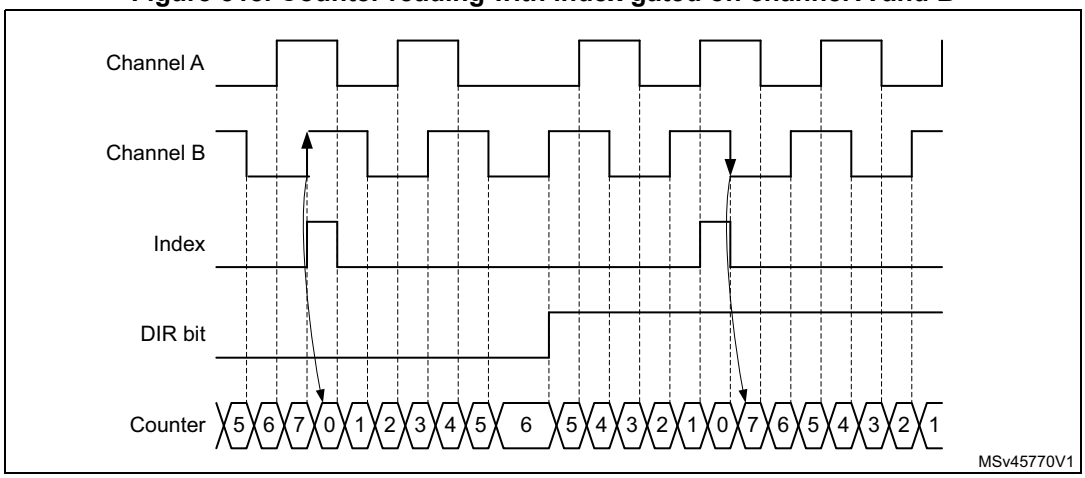

Figure 519 and *Figure 520* detail the case where the subsequent index pulse may be narrower than one quarter of the encoder clock period.

Figure 519. Encoder mode behavior in case of narrow index pulse (IPOS[1:0] = 11)

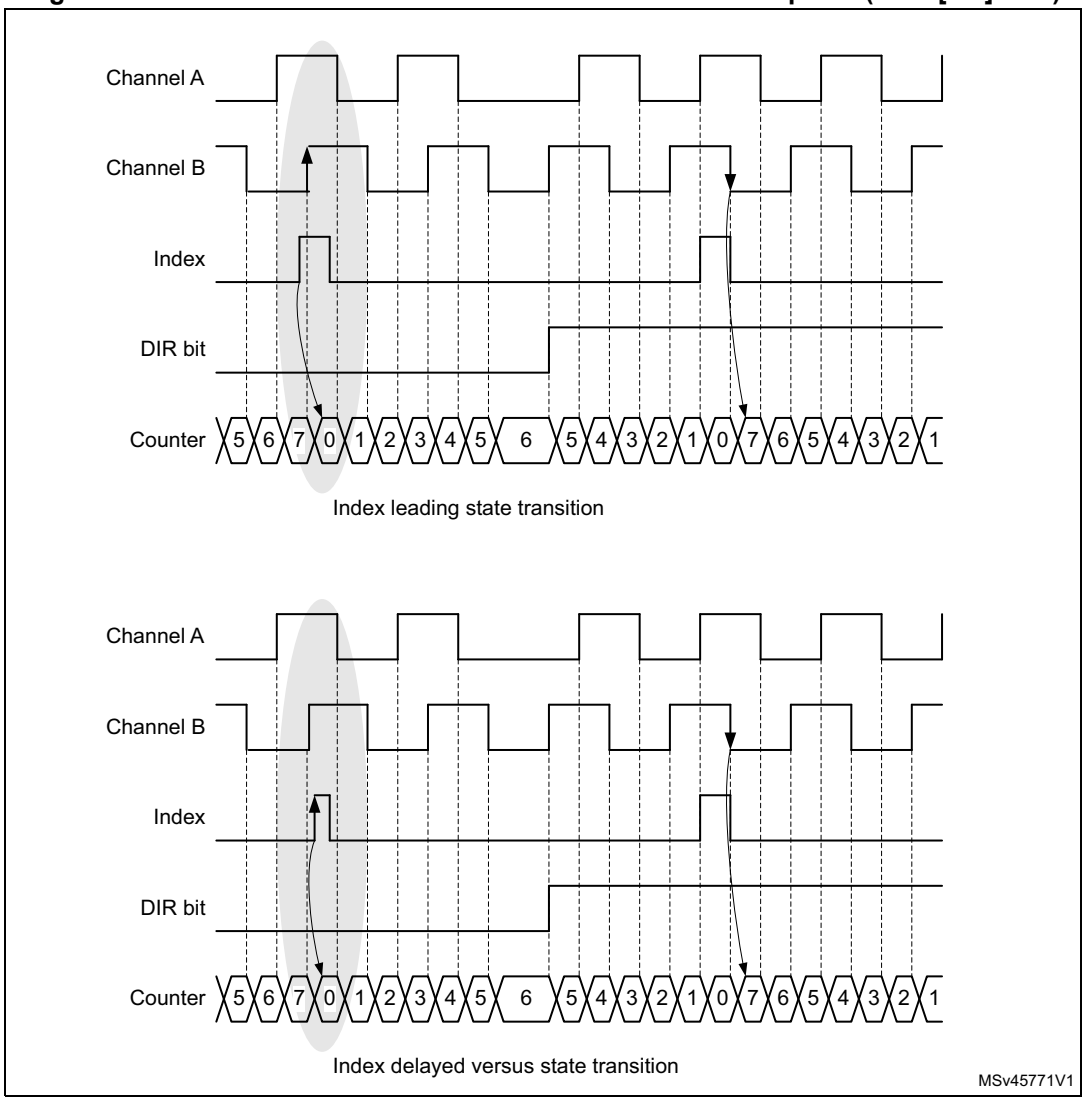

Figure 520. Counter reset Narrow index pulse (closer view, ARR = 0x07)

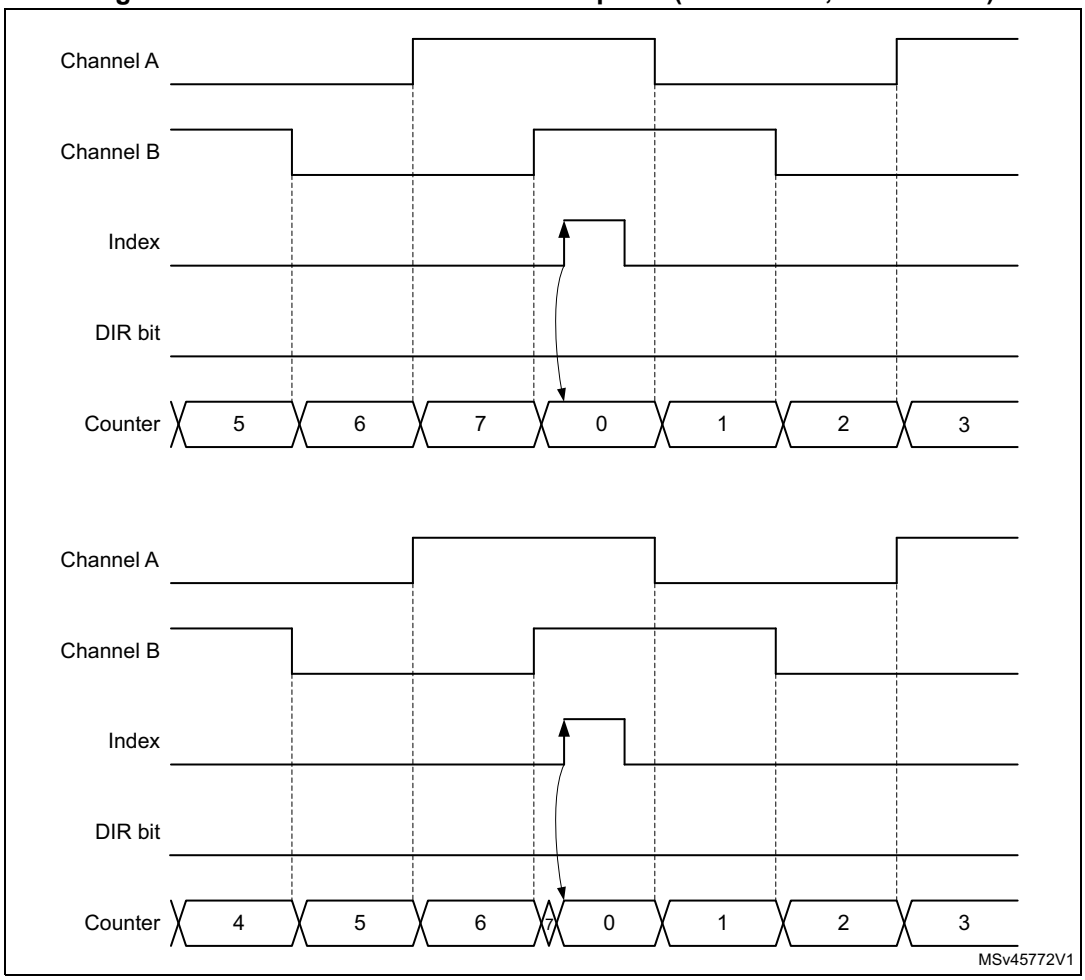

Figure 521 shows how the index is managed in x1 and x2 modes.

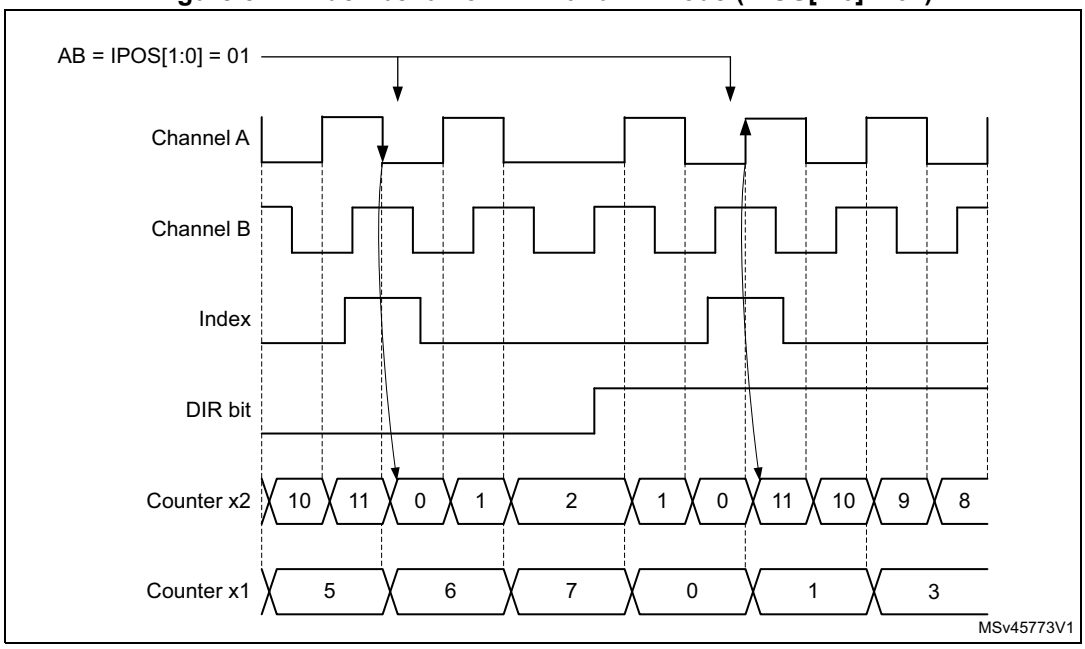
Figure 521. Index behavior in x1 and x2 mode (IPOS[1:0] = 01)

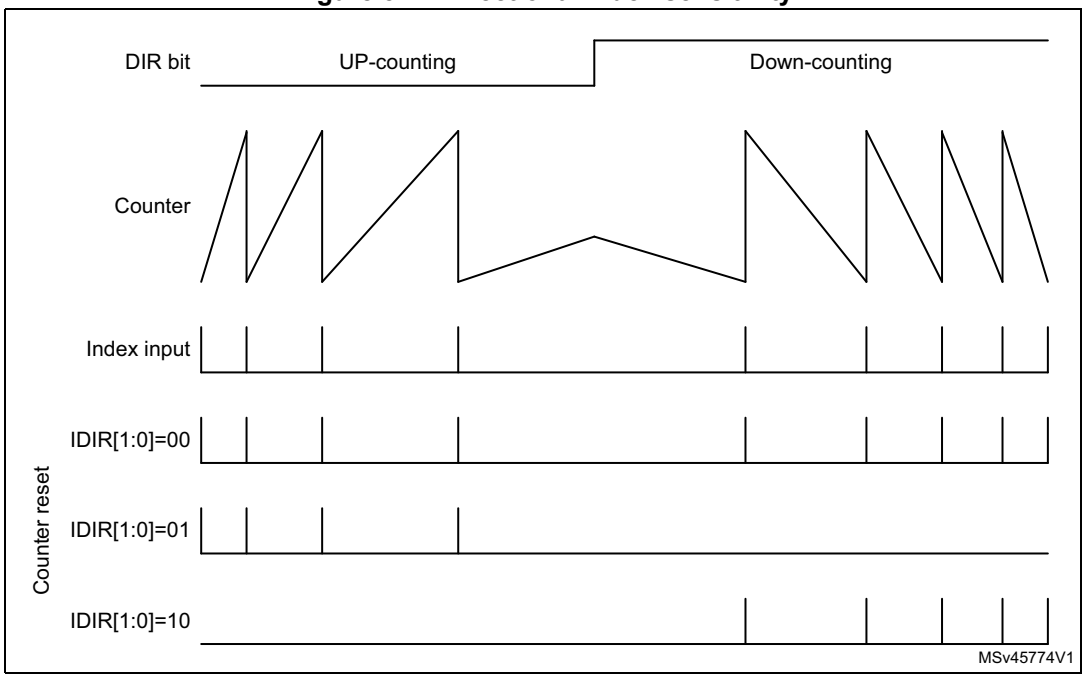


Directional index sensitivity

The IDIR[1:0] bitfield in the TIMx_ECR register allows the index to be active only in a selected counting direction.

Figure 522 shows the relationship between index and counter reset events, depending on IDIR[1:0] value.

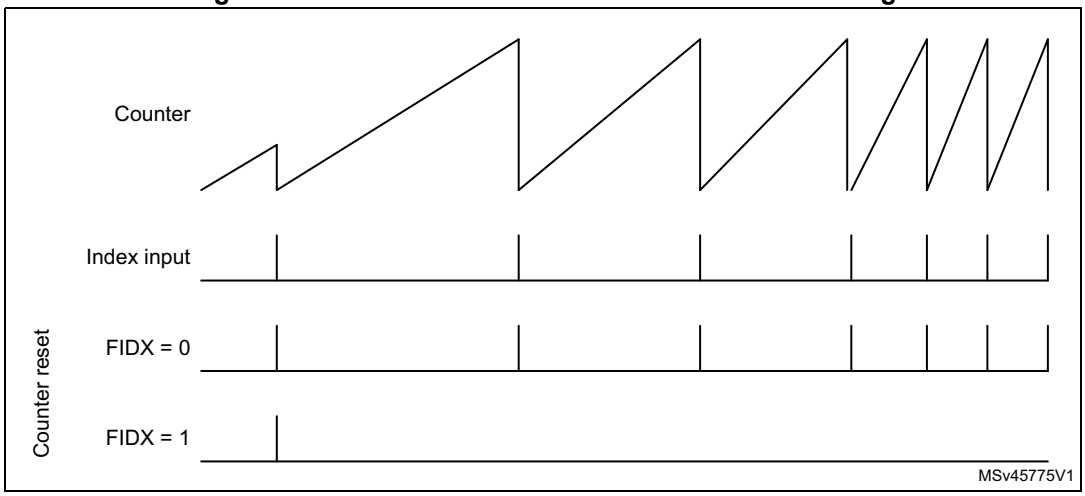
Figure 522. Directional index sensitivity



Special first index event management

The FIDX bit in the TIMx_ECR register allows the index to be taken only once, as shown on *Figure 523*. Once the first index has arrived, any subsequent index is ignored. If needed, the circuitry can be rearmed by writing the FIDX bit to 0 and setting it again to 1.

Figure 523. Counter reset as function of FIDX bit setting



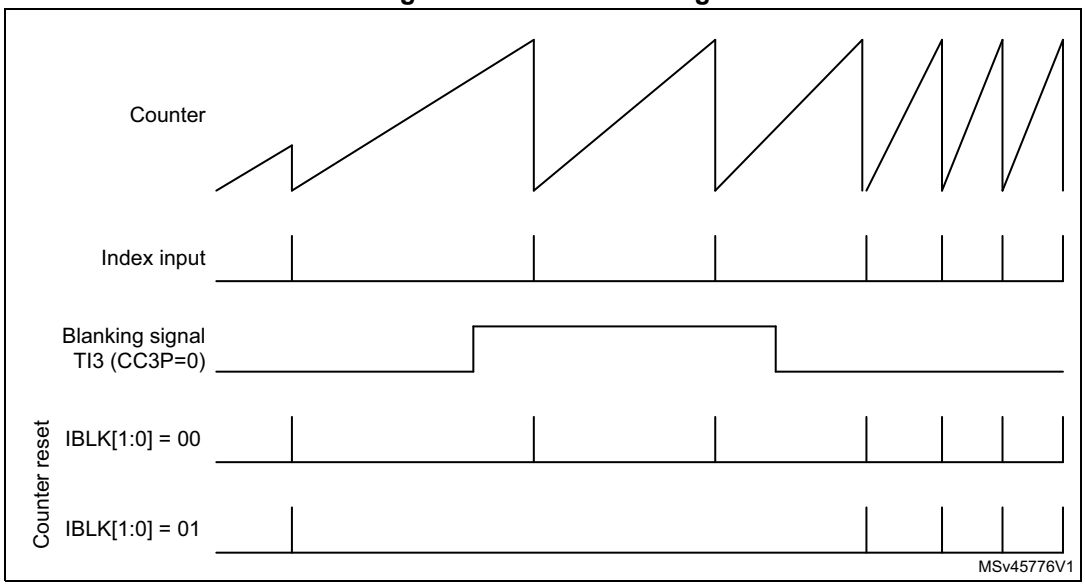
Index blanking

The index event can be blanked using the tim_ti3 or tim_ti4 inputs. During the blanking window, the index events are no longer resetting the counter, as shown on the *Figure 524* below.

This mode is enabled using the IBLK[1:0] bitfield in the TIMx_ECR register, as following:

- IBLK[1:0] = 00: Index signal always active
- IBLK[1:0] = 01: Index signal blanking on tim_ti3 input
- IBLK[1:0] = 10: Index signal blanking on tim_ti4 input

Figure 524. Index blanking



Index management in nonquadrature mode

Figure 525 and *Figure 526* detail how the index is managed in directional clock mode and clock plus direction mode, when the SMS[3:0] bitfield is equal to 1010, 1011, 1100, 1101.

For both of these modes, the index sensitivity is set with the IPOS[0] bit as following:

- IPOS[0] = 0: Index is detected on clock low level
- IPOS[0] = 1: Index is detected on clock high level

The IPOS[1] bit is not-significant.

Figure 525. Index behavior in clock + direction mode, IPOS[0] = 1

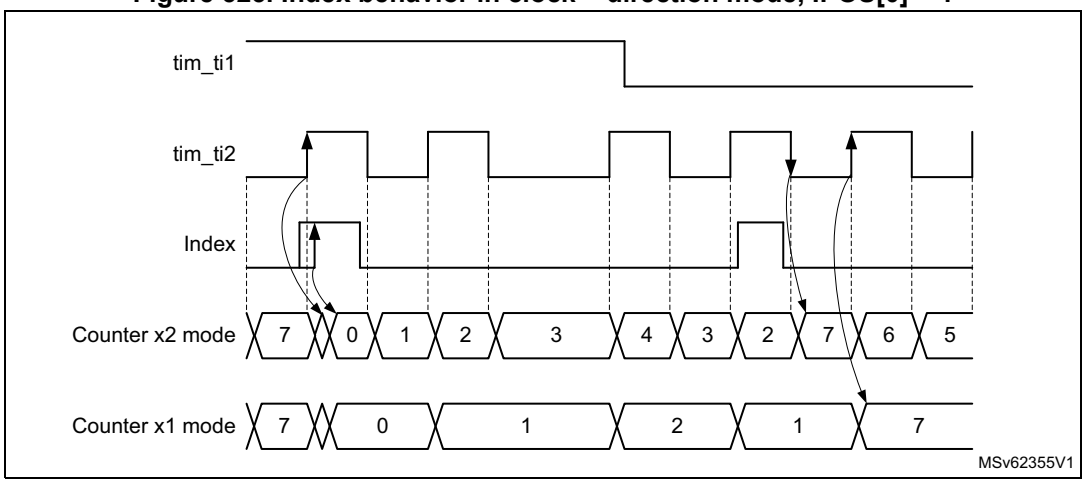


Figure 526. Index behavior in directional clock mode, IPOS[0] = 1

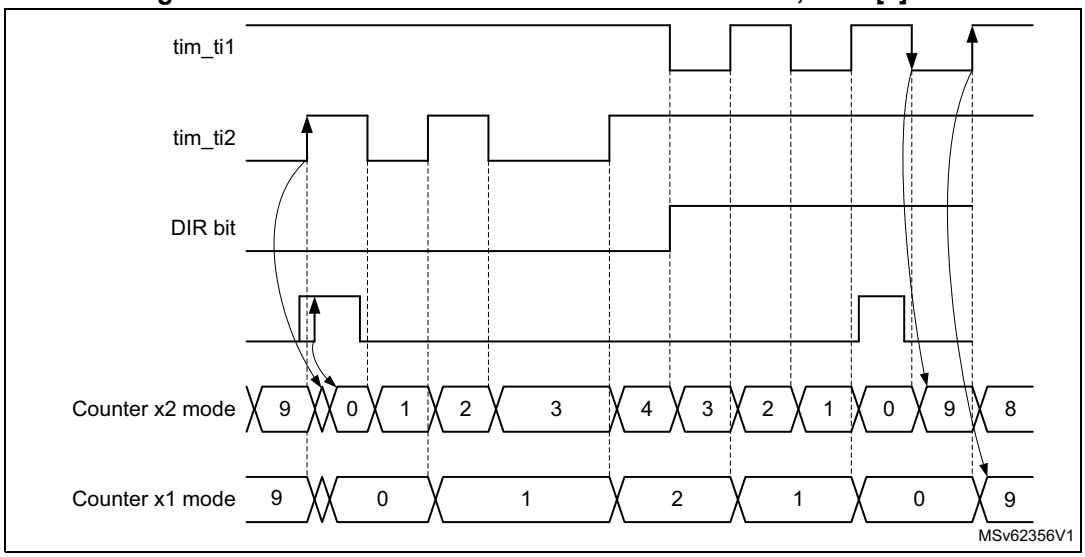
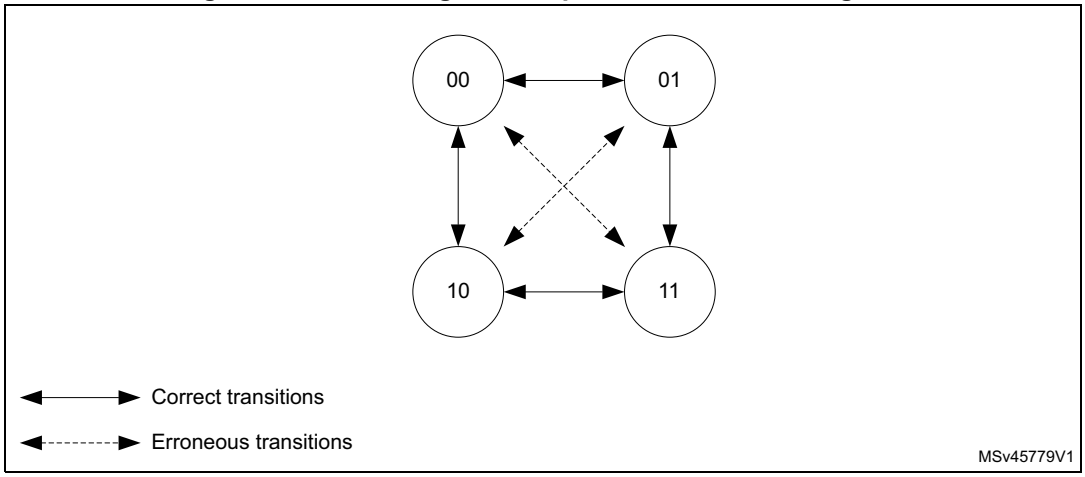


Encoder error management

For encoder configurations where two quadrature signals are available, it is possible to detect transition errors. The reading on the two inputs corresponds to a 2-bit gray code which can be represented as a state diagram, on *Figure 527.*. A single bit is expected to change at once. An erroneous transition sets the TERRF interrupt flag in the TIMx_SR

status register. A transition error interrupt is generated if the TERRIE bit is set in the TIMx_DIER register.

Figure 527. State diagram for quadrature encoded signals



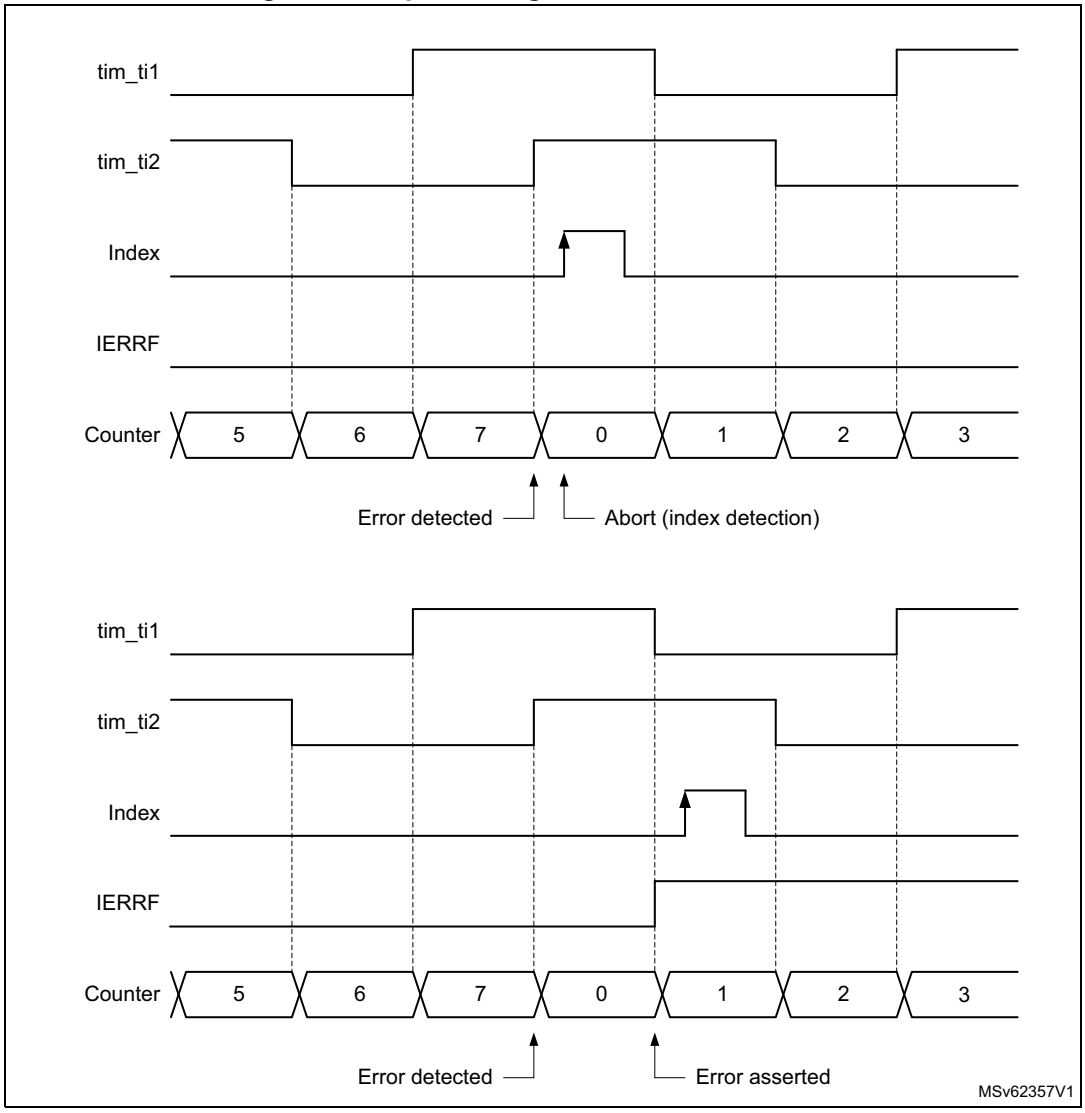
For encoder having an index signal, it is possible to detect abnormal operation resulting in an excess of pulses per revolution. An encoder with N pulses per revolution provides 4xN counts per revolution. The index signal resets the counter every 4xN clock periods.

If the counter value is incremented from TIMx_ARR to 0 or decremented from 0 to TIMxARR value without any index event, this is reported as an index position error.

The overflow threshold is programmed using the TIMx_ARR register. A 1000 lines encoder results in a counter value being between 0 and 3999 (in 4x reading mode). The overflow detection threshold must be programmed by setting TIMx_ARR = 3999 + 1 = 4000.

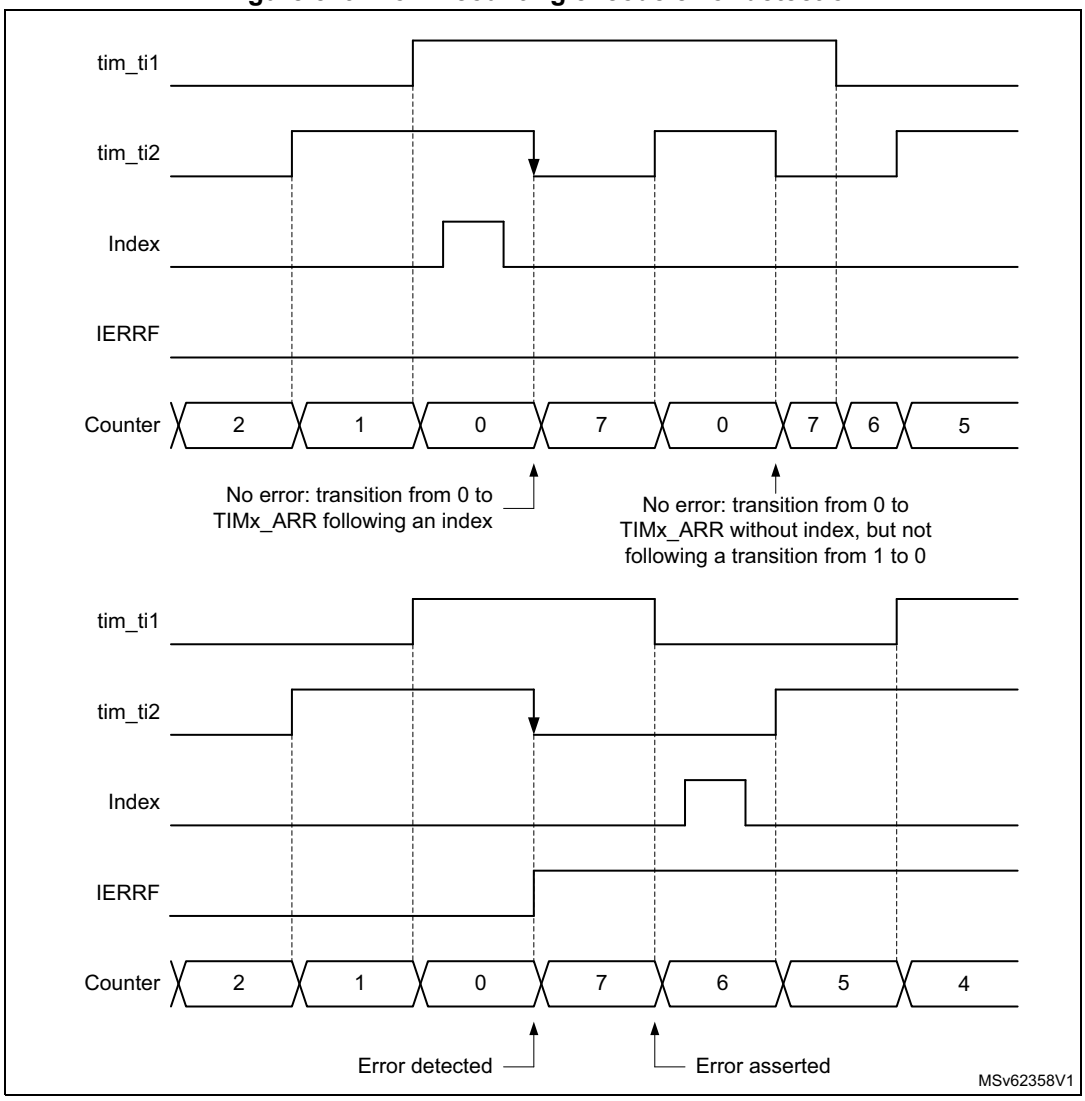
The error assertion is delayed to the transition 0 to 1 when in up-counting. This is cope with narrow index pulses in gated A and B mode, as shown on *Figure 528*.

Figure 528. Up-counting encoder error detection



In down-counting mode, the detection is conditioned by a preliminary transition from 1 to 0. This is to cope with narrow index pulses in gated A and B mode, as shown on *Figure 529*, to avoid any false error detection in case the encoder dithers between TIMx_ARR and 0 immediately after the index detection.

Figure 529. Down-counting encode error detection



An index error sets the IERRF interrupt flag in the TIMx_SR status register. An index error interrupt is generated if the IERRIE bit is set in the TIMx_DIER register.

Functional encoder interrupts

The following interrupts are also available in encoder mode

- Direction change: any change of the counting direction in encoder mode causes the DIR bit in the TIMx_CR1 register to toggle. The direction change sets the DIRF interrupt flag in the TIMx_SR status register. A direction change interrupt is generated if the DIRIE bit is set in the TIMx_DIER register.
- Index event: the index event sets the IDXF interrupt flag in the TIMx_SR status register. An index interrupt is generated if the IDXIE bit is set in the TIMx_DIER register.

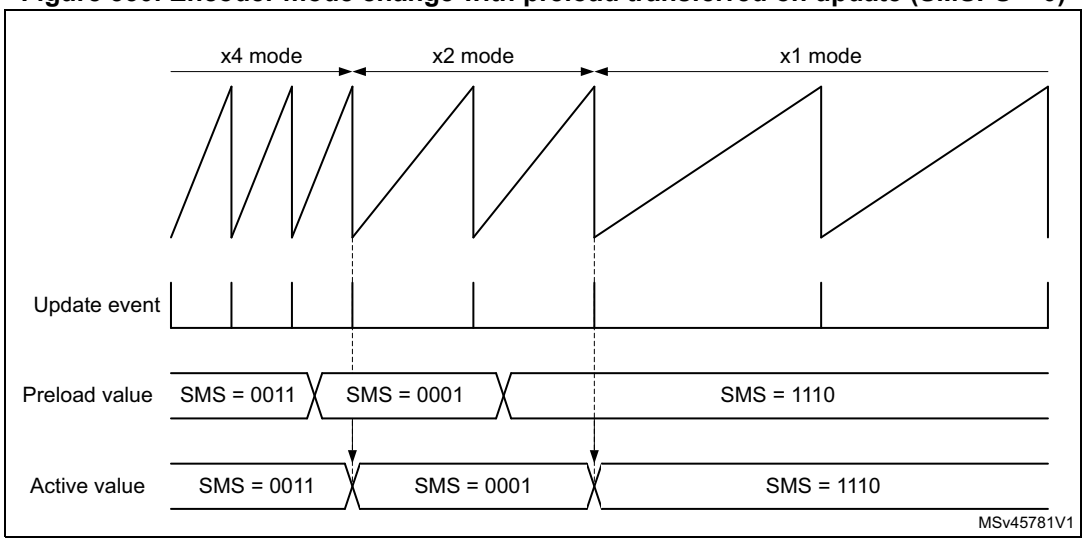
Slave mode selection preload for run-time encoder mode update

It may be necessary to switch from one encoder mode to another during run-time. This is typically done at high-speed to decrease the update interrupt rate, by switching from x4 to x2 to x1 mode, as shown on *Figure 530*.

For this purpose, the SMS[3:0] bit can be preloaded. This is enabled by setting the SMSPE enable bit in the TIMx_SMCR register. The trigger for the transfer from SMS[3:0] preload to active value can be selected with the SMSPS bit in the TIMx_SMCR register.

- SMSPS = 0: the transfer is triggered by the update event (UEV) occurring when the counter overflows when upcounting, and underflows when downcounting.
- SMSPS = 1: the transfer is triggered by the index event.

Figure 530. Encoder mode change with preload transferred on update (SMSPS = 0)



Encoder clock output

The encoder mode operating principle is not perfectly suited for high-resolution velocity measurements, at low speed, as it requires a relatively long integration time to have a sufficient number of clock edges and a precise measurement.

At low speed, a better solution is to do an edge-to-edge clock period measurement. This can be achieved using a slave timer. The timer can output the encoder clock information on the tim_trgo output. The slave timer can then perform a period measurement and provide velocity information for each and every encoder clock edge.

This mode is enabled by setting the MMS[3:0] bitfield to 1000, in the TIMx_CR2 register.It is valid for the following SMS[3:0] values: 0001, 0010, 0011, 1010, 1011, 1100, 1101, 1110, 1111. Any other SMS[3:0] code is not allowed and may lead to unexpected behavior.

53.3.26 Direction bit output

Its is possible to output a direction signal out of the timer, on the tim_oc3n and tim_oc4 output signals (copy of the DIR bit in the TIMx_CR1 register). This is achieved by setting the OC3M[3:0] or the OC4M[3:0] bitfield to 1011 in the TIMx_CCMR2 register.

This feature can be used for monitoring the counting direction (or rotation direction) in encoder mode, or to have a signal indicating the up/down phases in center-aligned PWM mode.

53.3.27 UIF bit remapping

The IUFREMAP bit in the TIMx_CR1 register forces a continuous copy of the update interrupt flag UIF into the timer counter register's bit 31 (TIMxCNT[31]). This allows both the counter value and a potential roll-over condition signaled by the UIFCPY flag to be read in an atomic way. In particular cases, it can ease the calculations by avoiding race conditions, caused for instance by a processing shared between a background task (counter reading) and an interrupt (update interrupt).

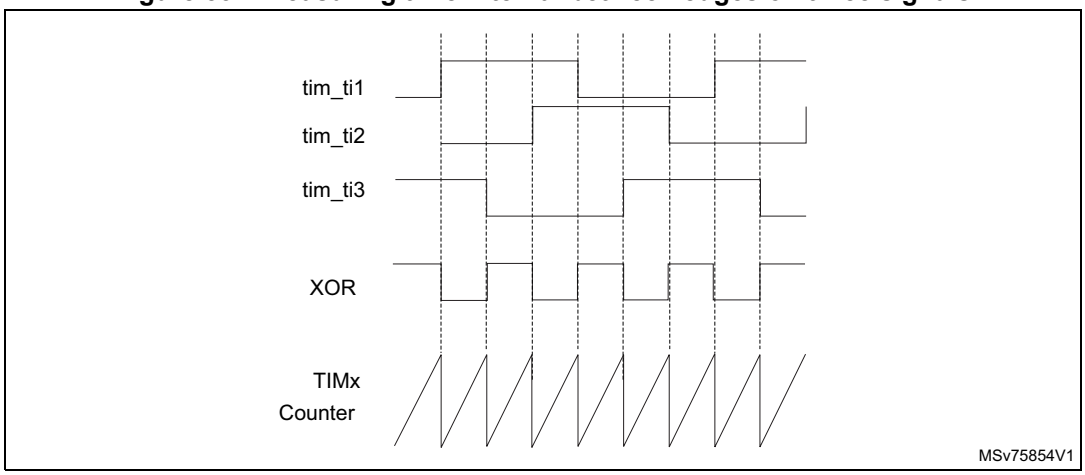
There is no latency between the UIF and UIFCPY flags assertion.

53.3.28 Timer input XOR function

The TI1S bit in the TIMx_CR2 register, allows the input filter of channel 1 to be connected to the output of an XOR gate, combining the three input pins tim_ti1, tim_ti2 and tim_ti3.

The XOR output can be used with all the timer input functions such as trigger or input capture. It is convenient to measure the interval between edges on two input signals, as per *Figure 531*.

Figure 531. Measuring time interval between edges on three signals



53.3.29 Interfacing with Hall sensors

This is done using the advanced-control timers to generate PWM signals to drive the motor and another timer TIMx referred to as "interfacing timer" in *Figure 532*. The "interfacing timer" captures the three timer input pins (tim_ti1, tim_ti2 and tim_ti3) connected through a XOR to the tim_ti1 input channel (selected by setting the TI1S bit in the TIMx_CR2 register).

The slave mode controller is configured in reset mode; the slave input is tim_ti1f_ed. Thus, each time one of the three inputs toggles, the counter restarts counting from 0. This creates a time base triggered by any change on the Hall inputs.

On the "interfacing timer", capture/compare channel 1 is configured in capture mode, capture signal is tim_trc (See *Figure 475*). The captured value, which corresponds to the time elapsed between two changes on the inputs, gives information about motor speed.

The “interfacing timer” can be used in output mode to generate a pulse which changes the configuration of the channels of the advanced-control timer (by triggering a COM event). The advanced-control timer is used to generate PWM signals to drive the motor. To do this, the interfacing timer channel must be programmed so that a positive pulse is generated after a programmed delay (in output compare or PWM mode). This pulse is sent to the advanced-control timer through the tim_trgo output.

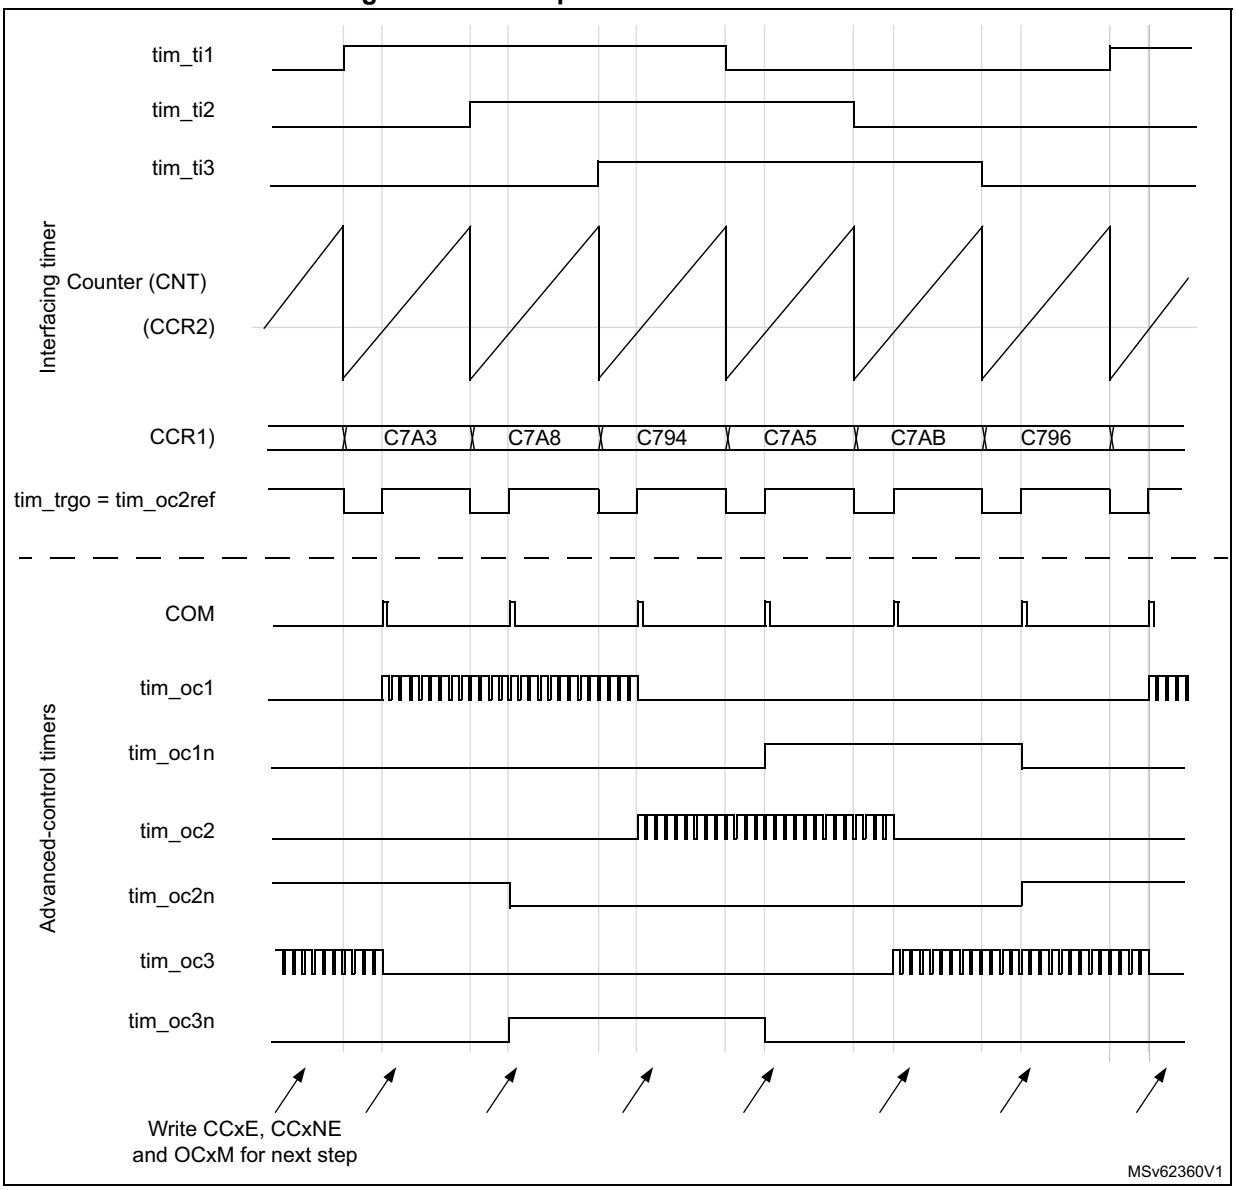
In this example the user wants to change the PWM configuration of the advanced-control timer after a programmed delay each time a change occurs on the Hall inputs connected to one of the TIMx timers.

- Configure three timer inputs ORed to the tim_ti1 input channel by writing the TI1S bit in the TIMx_CR2 register to 1.
- Program the time base: write the TIMx_ARR to the max value (the counter must be cleared by the tim_ti1 change. Set the prescaler to get a maximum counter period longer than the time between two changes on the sensors.
- Program the channel 1 in capture mode (tim_trc selected): write the CC1S bits in the TIMx_CCMR1 register to 01. The digital filter can also be programmed if needed.
- Program the channel 2 in PWM 2 mode with the desired delay: write the OC2M bits to 111 and the CC2S bits to 00 in the TIMx_CCMR1 register.
- Select tim_oc2ref as trigger output on tim_trgo: write the MMS bits in the TIMx_CR2 register to 101.

In the advanced-control timer, the right tim_itrx input must be selected as trigger input, the timer is programmed to generate PWM signals, the capture/compare control signals are preloaded (CCPC = 1 in the TIMx_CR2 register) and the COM event is controlled by the trigger input (CCUS = 1 in the TIMx_CR2 register). The PWM control bits (CCxE, OCxM) are written after a COM event for the next step (this can be done in an interrupt subroutine generated by the rising edge of tim_oc2ref).

Figure 532 describes this example.

Figure 532. Example of Hall sensor interface



53.3.30 Timer synchronization

The TIMx timers are linked together internally for timer synchronization or chaining. Refer to *Section 54.4.23: Timer synchronization* for details. They can be synchronized in several modes: Reset mode, Gated mode, Trigger mode, Reset + trigger, and gated + reset modes.

Slave mode: Reset mode

The counter and its prescaler can be reinitialized in response to an event on a trigger input. Moreover, if the URS bit from the TIMx_CR1 register is low, an update event UEV is generated. Then all the preloaded registers (TIMx_ARR, TIMx_CCRx) are updated.

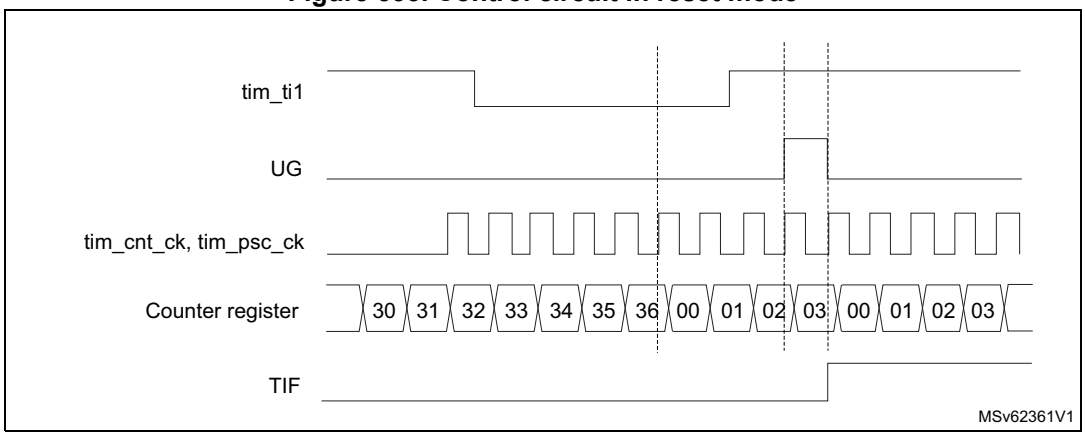
In the following example, the upcounter is cleared in response to a rising edge on tim_ti1 input:

- Configure the channel 1 to detect rising edges on tim_ti1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in the TIMx_CCMR1 register. Write CC1P = 0 and CC1NP = 0 in TIMx_CCER register to validate the polarity (and detect rising edges only).
- Configure the timer in reset mode by writing SMS = 100 in TIMx_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIMx_SMCR register.
- Start the counter by writing CEN = 1 in the TIMx_CR1 register.

The counter starts counting on the internal clock, then behaves normally until tim_ti1 rising edge. When tim_ti1 rises, the counter is cleared and restarts from 0. In the meantime, the trigger flag is set (TIF bit in the TIMx_SR register) and an interrupt request, or a DMA request can be sent if enabled (depending on the TIE and TDE bits in TIMx_DIER register).

The following figure shows this behavior when the autoreload register TIMx_ARR = 0x36. The delay between the rising edge on tim_ti1 and the actual reset of the counter is due to the resynchronization circuit on tim_ti1 input.

Figure 533. Control circuit in reset mode



Slave mode: Gated mode

The counter can be enabled depending on the level of a selected input.

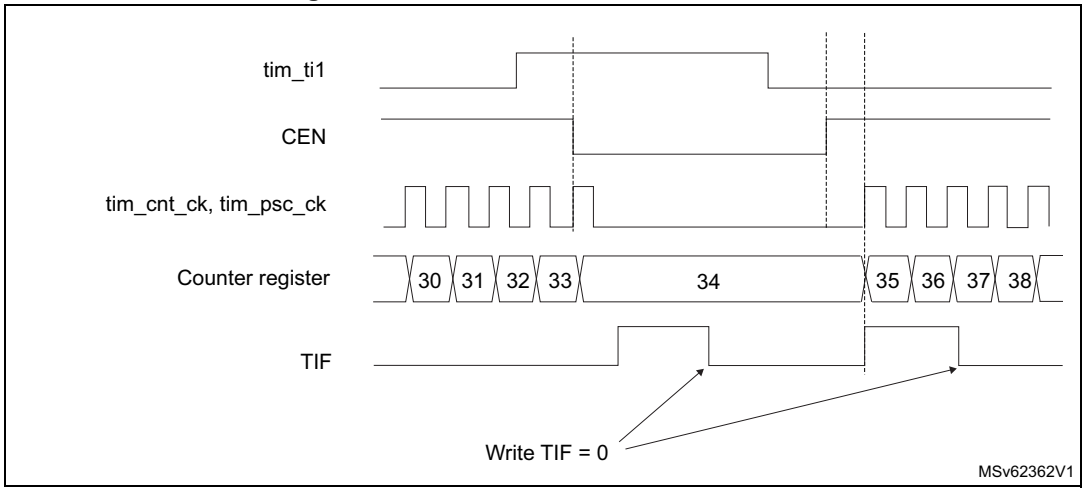
In the following example, the upcounter counts only when tim_ti1 input is low:

- Configure the channel 1 to detect low levels on tim_ti1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in TIMx_CCMR1 register. Write CC1P = 1 and CC1NP = 0 in TIMx_CCER register to validate the polarity (and detect low level only).
- Configure the timer in gated mode by writing SMS = 101 in TIMx_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIMx_SMCR register.
- Enable the counter by writing CEN = 1 in the TIMx_CR1 register (in gated mode, the counter does not start if CEN = 0, whatever is the trigger input level).

The counter starts counting on the internal clock as long as tim_ti1 is low and stops as soon as tim_ti1 becomes high. The TIF flag in the TIMx_SR register is set both when the counter starts or stops.

The delay between the rising edge on tim_ti1 and the actual stop of the counter is due to the resynchronization circuit on tim_ti1 input.

Figure 534. Control circuit in Gated mode



Slave mode: Trigger mode

The counter can start in response to an event on a selected input.

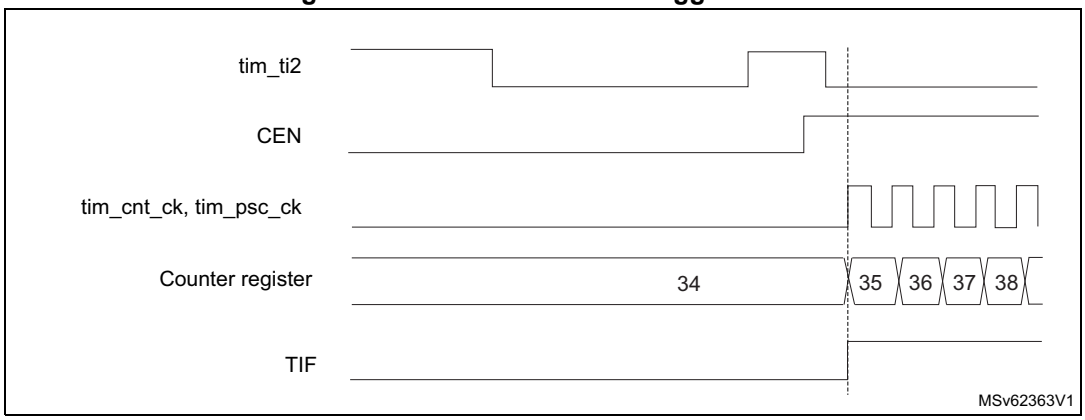
In the following example, the upcounter starts in response to a rising edge on tim_ti2 input:

- Configure the channel 2 to detect rising edges on tim_ti2. Configure the input filter duration (in this example, we do not need any filter, so we keep IC2F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC2S bits are configured to select the input capture source only, CC2S = 01 in TIMx_CCMR1 register. Write CC2P = 1 and CC2NP = 0 in TIMx_CCER register to validate the polarity (and detect low level only).
- Configure the timer in trigger mode by writing SMS = 110 in TIMx_SMCR register. Select tim_ti2 as the input source by writing TS = 00110 in TIMx_SMCR register.

When a rising edge occurs on tim_ti2, the counter starts counting on the internal clock and the TIF flag is set.

The delay between the rising edge on tim_ti2 and the actual start of the counter is due to the resynchronization circuit on tim_ti2 input.

Figure 535. Control circuit in trigger mode



Slave mode: Combined reset + trigger mode

In this case, a rising edge of the selected trigger input (tim_trgi) reinitializes the counter, generates an update of the registers, and starts the counter.

This mode is used for One-pulse mode.

Slave mode: Combined gated + reset mode

The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops and is reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

This mode is used to detect out-of-range PWM signal (duty cycle exceeding a maximum expected value).

Slave mode: external clock mode 2 + trigger mode

The external clock mode 2 can be used in addition to another slave mode (except external clock mode 1 and encoder mode). In this case, the tim_etr_in signal is used as external clock input, and another input can be selected as trigger input (in reset mode, gated mode or trigger mode). It is recommended not to select tim_etr_in as tim_trgi through the TS bits of TIMx_SMCR register.

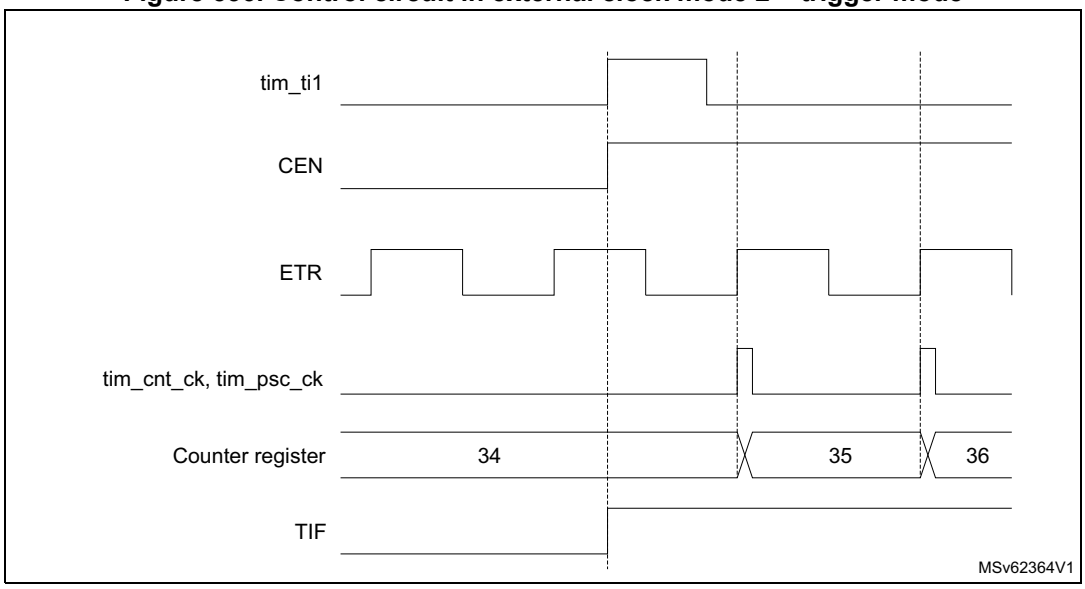
In the following example, the upcounter is incremented at each rising edge of the tim_etr_in signal as soon as a rising edge of tim_ti1 occurs:

1. Configure the external trigger input circuit by programming the TIMx_SMCR register as follows:
   - ETF = 0000: no filter
   - ETPS = 00: prescaler disabled
   - ETP = 0: detection of rising edges on tim_etr_in and ECE = 1 to enable the external clock mode 2.
2. Configure the channel 1 as follows, to detect rising edges on TI:
   - IC1F = 0000: no filter.
   - The capture prescaler is not used for triggering and does not need to be configured.
   - CC1S = 01in TIMx_CCMR1 register to select only the input capture source
   - CC1P = 0 and CC1NP = 0 in TIMx_CCER register to validate the polarity (and detect rising edge only).
3. Configure the timer in trigger mode by writing SMS = 110 in TIMx_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIMx_SMCR register.

A rising edge on tim_ti1 enables the counter and sets the TIF flag. The counter then counts on tim_etr_in rising edges.

The delay between the rising edge of the tim_etr_in signal and the actual reset of the counter is due to the resynchronization circuit on tim_etrp input.

Figure 536. Control circuit in external clock mode 2 + trigger mode



Note: The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo or the tim_trgo2 signals must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

53.3.31 ADC triggers

The timer can generate an ADC triggering event with various internal signals, such as reset, enable or compare events. It is also possible to generate a pulse issued by internal edge detectors, such as:

- Rising and falling edges of OC4ref
- Rising edge on OC5ref or falling edge on OC6ref

The triggers are issued on the tim_trgo2 internal line which is redirected to the ADC. There is a total of 16 possible events, which can be selected using the MMS2[3:0] bits in the TIMx_CR2 register.

An example of an application for 3-phase motor drives is given in *Figure 490*.

Note: The clock of the slave peripherals (timer, ADC, ...) receiving the tim_trgo or the tim_trgo2 signals must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

The clock of the ADC must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the timer.

53.3.32 DMA burst mode

The TIMx timers have the capability to generate multiple DMA requests upon a single event. The main purpose is to be able to reprogram part of the timer multiple times without software overhead, but it can also be used to read several registers in a row, at regular intervals.

The DMA controller destination is unique and must point to the virtual register TIMx_DMAR. On a given timer event, the timer launches a sequence of DMA requests (burst). Each write into the TIMx_DMAR register is actually redirected to one of the timer registers.

The DBL[4:0] bits in the TIMx_DCR register set the DMA burst length. The timer recognizes a burst transfer when a read or a write access is done to the TIMx_DMAR address), i.e. the number of transfers (either in half-words or in bytes).

The DBA[4:0] bits in the TIMx_DCR register define the DMA base address for DMA transfers (when read/write access are done through the TIMx_DMAR address). DBA is defined as an offset starting from the address of the TIMx_CR1 register:

Example:

00000: TIMx_CR1

00001: TIMx_CR2

00010: TIMx_SMCR

The DBSS[3:0] bits in the TIMx_DCR register defines the interrupt source that triggers the DMA burst transfers (see *Section 53.6.29: TIMx DMA control register (TIMx_DCR)(x = 1, 8)* for details).

As an example, the timer DMA burst feature is used to update the contents of the CCRx registers (x = 2, 3, 4) upon an update event, with the DMA transferring half words into the CCRx registers.

This is done in the following steps:

1. Configure the corresponding DMA channel as follows:
   – DMA channel peripheral address is the DMAR register address.
   – DMA channel memory address is the address of the buffer in the RAM containing the data to be transferred by DMA into CCRx registers.
   – Number of data to transfer = 3 (see note below).
   – Circular mode disabled.
2. Configure the DCR register by configuring the DBA and DBL bitfields as follows: DBL = 3 transfers, DBA = 0xE and DBSS = 1.
3. Enable the TIMx update DMA request (set the UDE bit in the DIER register).
4. Enable TIMx.
5. Enable the DMA channel.

This example is for the case where every CCRx register to be updated once. If every CCRx register is to be updated twice for example, the number of data to transfer must be 6. Let's take the example of a buffer in the RAM containing data1, data2, data3, data4, data5, and data6. The data is transferred to the CCRx registers as follows: on the first update DMA request, data1 is transferred to CCR2, data2 is transferred to CCR3, data3 is transferred to CCR4 and on the second update DMA request, data4 is transferred to CCR2, data5 is transferred to CCR3, and data6 is transferred to CCR4.

Note: A null value can be written to the reserved registers.

53.3.33 TIM1/TIM8 DMA requests

The TIM1/TIM8 can generate a DMA request, as shown in the table below.

Table 535. DMA request

DMA request signal	DMA request	Enable control bit
tim_upd_dma	Update	UDE
tim_cc1_dma	Capture/compare 1	CC1DE
tim_cc2_dma	Capture/compare 2	CC2DE
tim_cc3_dma	Capture/compare 3	CC3DE
tim_cc4_dma	Capture/compare 4	CC4DE
tim_com_dma	Commutation (COM)	COMDE
tim_trgi_dma	Trigger	TDE

53.3.34 Debug mode

When the microcontroller enters debug mode (Cortex-M33 core halted), the TIMx counter can either continue to work normally or stop, depending on DBG_TIMx_STOP configuration bit in DBG module.

The behavior in debug mode can be programmed with a dedicated configuration bit per timer in the Debug support (DBG) module.

For safety purposes, when the counter is stopped, the outputs are disabled (as if the MOE bit was reset). The outputs can either be forced to an inactive state (OSSI bit = 1), or have their control taken over by the GPIO controller (OSSI bit = 0), typically to force a Hi-Z.

For more details, refer to section Debug support (DBG).

53.4 TIM1/TIM8 low-power modes

Table 536. Effect of low-power modes on TIM1/TIM8

Mode	Description
Sleep	No effect, peripheral is active. The interrupts can cause the device to exit from Sleep mode.
Stop	The timer operation is stopped and the register content is kept. No interrupt can be generated.
Standby	The timer is powered-down and must be reinitialized after exiting the Standby mode.

53.5 TIM1/TIM8 interrupts

The TIM1/TIM8 can generate multiple interrupts, as shown in *Table 537*.

Table 537. Interrupt requests

Interrupt acronym		Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from Sleep mode	Exit from Stop and Standby mode
TIM_UPD		Update	UIF	UIE	write 0 in UIF	Yes	No
TIM_CC		Capture/compare 1	CC1IF	CC1IE	write 0 in CC1IF	Yes	No
		Capture/compare 2	CC2IF	CC2IE	write 0 in CC2IF	Yes	No
		Capture/compare 3	CC3IF	CC3IE	write 0 in CC3IF	Yes	No
		Capture/compare 4	CC4IF	CC4IE	write 0 in CC4IF	Yes	No
TIM_TRGI_COM_DIR_IDX	TIM_COM	Commutation (COM)	COMIF	COMIE	write 0 in COMIF	Yes	No
	TIM_TRGI	Trigger	TIF	TIE	write 0 in TIF	Yes	No
	TIM_IDX	Index	IDXF	IDXIE	write 0 in IDXF	Yes	No
	TIM_DIR	Direction	DIRF	DIRIE	write 0 in DIRF	Yes	No
TIM_BRK_TERR_IERR	TIM_BRK	Break	BIF	BIE	write 0 in BIF	Yes	No
		Break2	B2IF		write 0 in B2IF	Yes	No
		System Break	SBIF		write 0 in SBIF	Yes	No
	TIM_IERR	Index Error	IERRF	IERRIE	write 0 in IERRF	Yes	No
	TIM_TERR	Transition Error	TERRF	TERRIE	write 0 in TERRF	Yes	No

53.6 TIM1/TIM8 registers

Refer to *Section 1.2* for a list of abbreviations used in register descriptions.

The peripheral registers can be accessed by half-words (16-bit) or words (32-bit).

53.6.1 TIMx control register 1 (TIMx_CR1)(x = 1, 8)

Address offset: 0x000

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DITHEN	UIFREMAP	Res.	CKD[1:0]		ARPE	CMS[1:0]		DIR	OPM	URS	UDIS	CEN
			rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **DITHEN**: Dithering enable

0: Dithering disabled
1: Dithering enabled

Note: The DITHEN bit can only be modified when CEN bit is reset.

Bit 11 **UIFREMAP**: UIF status bit remapping

0: No remapping. UIF status bit is not copied to TIMx_CNT register bit 31.
1: Remapping enabled. UIF status bit is copied to TIMx_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division

This bitfield indicates the division ratio between the timer clock (tim_ker_ck) frequency and the dead-time and sampling clock (t_{DTS})used by the dead-time generators and the digital filters (tim_etr_in, tim_tix),

00: $t_{DTS} = t_{tim_ker_ck}$
01: $t_{DTS} = 2*t_{tim_ker_ck}$
10: $t_{DTS} = 4*t_{tim_ker_ck}$
11: Reserved, do not program this value

Bit 7 **ARPE**: Autoreload preload enable

0: TIMx_ARR register is not buffered
1: TIMx_ARR register is buffered

Bits 6:5 **CMS[1:0]**: Center-aligned mode selection

00: Edge-aligned mode. The counter counts up or down depending on the direction bit (DIR).
01: Center-aligned mode 1. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS = 00 in TIMx_CCMRx register) are set only when the counter is counting down.
10: Center-aligned mode 2. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS = 00 in TIMx_CCMRx register) are set only when the counter is counting up.
11: Center-aligned mode 3. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS = 00 in TIMx_CCMRx register) are set both when the counter is counting up or down.

Note: It is not allowed to switch from edge-aligned mode to center-aligned mode as long as the counter is enabled (CEN = 1)

Bit 4 **DIR**: Direction
0: Counter used as upcounter
1: Counter used as downcounter
Note: This bit is read only when the timer is configured in Center-aligned mode or Encoder mode.

Bit 3 **OPM**: One-pulse mode
0: Counter is not stopped at update event
1: Counter stops counting at the next update event (clearing the bit CEN)

Bit 2 **URS**: Update request source
This bit is set and cleared by software to select the UEV event sources.
0: Any of the following events generate an update interrupt or DMA request if enabled. These events can be:
– Counter overflow/underflow
– Setting the UG bit
– Update generation through the slave mode controller
1: Only counter overflow/underflow generates an update interrupt or DMA request if enabled.

Bit 1 **UDIS**: Update disable
This bit is set and cleared by software to enable/disable UEV event generation.
0: UEV enabled. The Update (UEV) event is generated by one of the following events:
– Counter overflow/underflow
– Setting the UG bit
– Update generation through the slave mode controller
Buffered registers are then loaded with their preload values.
1: UEV disabled. The Update event is not generated, shadow registers keep their value (ARR, PSC, CCRx). However the counter and the prescaler are reinitialized if the UG bit is set or if a hardware reset is received from the slave mode controller.

Bit 0 **CEN**: Counter enable
0: Counter disabled
1: Counter enabled
Note: External clock, gated mode and encoder mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.

53.6.2 TIMx control register 2 (TIMx_CR2)(x = 1, 8)

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw

Bits 31:26 Reserved, must be kept at reset value.

Bit 24 Reserved, must be kept at reset value.

Bits 23:20 **MMS2[3:0]**: Master mode selection 2

These bits allow the information to be sent to ADC for synchronization (tim_trgo2) to be selected. The combination is as follows:

0000: **Reset** - the UG bit from the TIMx_EGR register is used as trigger output (tim_trgo2). If the reset is generated by the trigger input (slave mode controller configured in reset mode), the signal on tim_trgo2 is delayed compared to the actual reset.

0001: **Enable** - the Counter Enable signal CNT_EN is used as trigger output (tim_trgo2). It is useful to start several timers at the same time or to control a window in which a slave timer is enabled. The Counter Enable signal is generated by a logic AND between the CEN control bit and the trigger input when configured in Gated mode. When the Counter Enable signal is controlled by the trigger input, there is a delay on tim_trgo2, except if the Master/Slave mode is selected (see the MSM bit description in TIMx_SMCR register).

0010: **Update** - the update event is selected as trigger output (tim_trgo2). For instance, a master timer can then be used as a prescaler for a slave timer.

0011: **Compare pulse** - the trigger output sends a positive pulse when the CC1IF flag is to be set (even if it was already high), as soon as a capture or compare match occurs (tim_trgo2).

0100: **Compare** - tim_oc1refc signal is used as trigger output (tim_trgo2)

0101: **Compare** - tim_oc2refc signal is used as trigger output (tim_trgo2)

0110: **Compare** - tim_oc3refc signal is used as trigger output (tim_trgo2)

0111: **Compare** - tim_oc4refc signal is used as trigger output (tim_trgo2)

1000: **Compare** - tim_oc5refc signal is used as trigger output (tim_trgo2)

1001: **Compare** - tim_oc6refc signal is used as trigger output (tim_trgo2)

1010: **Compare Pulse** - tim_oc4refc rising or falling edges generate pulses on tim_trgo2

1011: **Compare pulse** - tim_oc6refc rising or falling edges generate pulses on tim_trgo2

1100: **Compare pulse** - tim_oc4refc or tim_oc6refc rising edges generate pulses on tim_trgo2

1101: **Compare pulse** - tim_oc4refc rising or tim_oc6refc falling edges generate pulses on tim_trgo2

1110: **Compare pulse** - tim_oc5refc or tim_oc6refc rising edges generate pulses on tim_trgo2

1111: **Compare pulse** - tim_oc5refc rising or tim_oc6refc falling edges generate pulses on tim_trgo2

Note: The clock of the slave timer or ADC must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.

Bit 19 Reserved, must be kept at reset value.

Bit 18 **OIS6**: Output idle state 6 (tim_oc6 output)
Refer to OIS1 bit

Bit 17 Reserved, must be kept at reset value.

Bit 16 **OIS5**: Output idle state 5 (tim_oc5 output)
Refer to OIS1 bit

Bit 15 **OIS4N**: Output idle state 4 (tim_oc4n output)
Refer to OIS1N bit

Bit 14 **OIS4**: Output idle state 4 (tim_oc4 output)
Refer to OIS1 bit

Bit 13 **OIS3N**: Output idle state 3 (tim_oc3n output)
Refer to OIS1N bit

Bit 12 **OIS3**: Output idle state 3 (tim_oc3n output)
Refer to OIS1 bit

Bit 11 **OIS2N**: Output idle state 2 (tim_oc2n output)
Refer to OIS1N bit

Bit 10 **OIS2**: Output idle state 2 (tim_oc2 output)
Refer to OIS1 bit

Bit 9 **OIS1N**: Output idle state 1 (tim_oc1n output)
0: tim_oc1n = 0 after a dead-time when MOE = 0
1: tim_oc1n = 1 after a dead-time when MOE = 0
Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 8 **OIS1**: Output idle state 1 (tim_oc1 output)
0: tim_oc1 = 0 (after a dead-time) when MOE = 0
1: tim_oc1 = 1 (after a dead-time) when MOE = 0
Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 7 **TI1S**: tim_ti1 selection
0: The tim_ti1_in[15:0] multiplexer output is connected to tim_ti1 input
1: tim_ti1_in[15:0], tim_ti2_in[15:0] and tim_ti3_in[15:0] multiplexers outputs are XORed and connected to the tim_ti1 input

Bits 25, 6:4 **MMS[3:0]**: Master mode selection

These bits select the information to be sent in master mode to slave timers for synchronization (tim_trgo). The combination is as follows:

0000: **Reset** - the UG bit from the TIMx_EGR register is used as trigger output (tim_trgo). If the reset is generated by the trigger input (slave mode controller configured in reset mode) then the signal on tim_trgo is delayed compared to the actual reset.

0001: **Enable** - the Counter Enable signal CNT_EN is used as trigger output (tim_trgo). It is useful to start several timers at the same time or to control a window in which a slave timer is enable. The Counter Enable signal is generated by a logic AND between CEN control bit and the trigger input when configured in gated mode. When the Counter Enable signal is controlled by the trigger input, there is a delay on tim_trgo, except if the master/slave mode is selected (see the MSM bit description in TIMx_SMCR register).

0010: **Update** - The update event is selected as trigger output (tim_trgo). For instance a master timer can then be used as a prescaler for a slave timer.

0011: **Compare Pulse** - The trigger output send a positive pulse when the CC1IF flag is to be set (even if it was already high), as soon as a capture or a compare match occurred. (tim_trgo).

0100: **Compare** - tim_oc1refc signal is used as trigger output (tim_trgo)

0101: **Compare** - tim_oc2refc signal is used as trigger output (tim_trgo)

0110: **Compare** - tim_oc3refc signal is used as trigger output (tim_trgo)

0111: **Compare** - tim_oc4refc signal is used as trigger output (tim_trgo)

1000: **Encoder Clock output** - The encoder clock signal is used as trigger output (tim_trgo). This code is valid for the following SMS[3:0] values: 0001, 0010, 0011, 1010, 1011, 1100, 1101, 1110, 1111. Any other SMS[3:0] code is not allowed and may lead to unexpected behavior.

Other codes reserved

Note: The clock of the slave timer or ADC must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.

Bit 3 **CCDS**: Capture/compare DMA selection

0: CCx DMA request sent when CCx event occurs

1: CCx DMA requests sent when update event occurs

Bit 2 **CCUS**: Capture/compare control update selection

0: When capture/compare control bits are preloaded (CCPC = 1), they are updated by setting the COMG bit only

1: When capture/compare control bits are preloaded (CCPC = 1), they are updated by setting the COMG bit or when an rising edge occurs on tim_trgi

Note: This bit acts only on channels that have a complementary output.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **CCPC**: Capture/compare preloaded control

0: CCxE, CCxNE and OCxM bits are not preloaded

1: CCxE, CCxNE and OCxM bits are preloaded, after having been written, they are updated only when a commutation event (COM) occurs (COMG bit set or rising edge detected on tim_trgi, depending on the CCUS bit).

Note: This bit acts only on channels that have a complementary output.

53.6.3 TIMx slave mode control register (TIMx_SMCR)(x = 1, 8)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	SMSPS	SMSPE	Res.	Res.	TS[4:3]		Res.	Res.	Res.	SMS[3]
						rw	rw			rw	rw				rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ETP	ECE	ETPS[1:0]		ETF[3:0]				MSM	TS[2:0]			Res.	SMS[2:0]		
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **SMSPS**: SMS preload source

This bit selects whether the events that triggers the SMS[3:0] bitfield transfer from preload to active

0: The transfer is triggered by the Timer's Update event

1: The transfer is triggered by the Index event

Bit 24 **SMSPE**: SMS preload enable

This bit selects whether the SMS[3:0] bitfield is preloaded

0: SMS[3:0] bitfield is not preloaded

1: SMS[3:0] preload is enabled

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:20 **TS[4:3]**: Trigger selection - bit 4:3

Refer to TS[2:0] description - bits 6:4

Bits 19:17 Reserved, must be kept at reset value.

Bit 15 **ETP**: External trigger polarity

This bit selects whether tim_etr_in or tim_$\overline{\text{etr_in}}$ is used for trigger operations

0: tim_etr_in is non-inverted, active at high level or rising edge.

1: tim_etr_in is inverted, active at low level or falling edge.

Bit 14 **ECE**: External clock enable

This bit enables External clock mode 2.

0: External clock mode 2 disabled

1: External clock mode 2 enabled. The counter is clocked by any active edge on the tim_etrf signal.

Note: Setting the ECE bit has the same effect as selecting external clock mode 1 with tim_trgi connected to tim_etrf (SMS = 111 and TS = 00111).

It is possible to simultaneously use external clock mode 2 with the following slave modes: reset mode, gated mode and trigger mode. Nevertheless, tim_trgi must not be connected to tim_etrf in this case (TS bits must not be 00111).

If external clock mode 1 and external clock mode 2 are enabled at the same time, the external clock input is tim_etrf.

Bits 13:12 **ETPS[1:0]**: External trigger prescaler

External trigger signal tim_etrp frequency must be at most 1/4 of TIMxCLK frequency. A prescaler can be enabled to reduce tim_etrp frequency. It is useful when inputting fast external clocks on tim_etr_in.

00: Prescaler OFF
01: tim_etr_in frequency divided by 2
10: tim_etr_in frequency divided by 4
11: tim_etr_in frequency divided by 8

Bits 11:8 **ETF[3:0]**: External trigger filter

This bitfield then defines the frequency used to sample tim_etrp signal and the length of the digital filter applied to tim_etrp. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at f_{DTS}
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Bit 7 **MSM:** Master/slave mode

0: No action
1: The effect of an event on the trigger input (tim_trgi) is delayed to allow a perfect synchronization between the current timer and its slaves (through tim_trgo). It is useful if we want to synchronize several timers on a single external event.

Bits 6:4 **TS[2:0]:** Trigger selection

This bitfield is combined with TS[4:3] bits.

This bitfield selects the trigger input to be used to synchronize the counter.

00000: Internal Trigger 0 (tim_itr0)
00001: Internal Trigger 1 (tim_itr1)
00010: Internal Trigger 2 (tim_itr2)
00011: Internal Trigger 3 (tim_itr3)
00100: tim_ti1 Edge Detector (tim_ti1f_ed)
00101: Filtered Timer Input 1 (tim_ti1fp1)
00110: Filtered Timer Input 2 (tim_ti2fp2)
00111: External Trigger input (tim_etrf)
01000: Internal Trigger 4 (tim_itr4)
01001: Internal Trigger 5 (tim_itr5)
01010: Internal Trigger 6 (tim_itr6)
01011: Internal Trigger 7 (tim_itr7)
01100: Internal Trigger 8 (tim_itr8)
01101: Internal Trigger 9 (tim_itr9)
01110: Internal Trigger 10 (tim_itr10)
01111: Internal trigger 11 (tim_itr11)
10000: Internal trigger 12 (tim_itr12)
10001: Internal trigger 13 (tim_itr13)
10010: Internal trigger 14 (tim_itr14)
10011: Internal trigger 15 (tim_itr15)
Others: Reserved

See *Table 524: Internal trigger connection* for more details on tim_itrx meaning for each Timer.

Note: These bits must be changed only when they are not used (for example when SMS = 000) to avoid wrong edge detections at the transition.

Bit 3 Reserved, must be kept at reset value.

Bits 16, 2:0 **SMS[3:0]:** Slave mode selection

When external signals are selected the active edge of the trigger signal (tim_trgi) is linked to the polarity selected on the external input (refer to ETP bit in TIMx_SMCR for tim_etr_in and CCxP/CCxNP bits in TIMx_CCER register for tim_ti1fp1 and tim_ti2fp2).

0000: Slave mode disabled - if CEN = 1 then the prescaler is clocked directly by the internal clock.

0001: Quadrature encoder mode 1, x2 mode- Counter counts up/down on tim_ti1fp1 edge depending on tim_ti2fp2 level.

0010: Quadrature encoder mode 2, x2 mode - Counter counts up/down on tim_ti2fp2 edge depending on tim_ti1fp1 level.

0011: Quadrature encoder mode 3, x4 mode - Counter counts up/down on both tim_ti1fp1 and tim_ti2fp2 edges depending on the level of the other input.

0100: Reset mode - Rising edge of the selected trigger input (tim_trgi) reinitializes the counter and generates an update of the registers.

0101: Gated mode - The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops (but is not reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

0110: Trigger mode - The counter starts at a rising edge of the trigger tim_trgi (but it is not reset). Only the start of the counter is controlled.

0111: External Clock mode 1 - Rising edges of the selected trigger (tim_trgi) clock the counter.

1000: Combined reset + trigger mode - Rising edge of the selected trigger input (tim_trgi) reinitializes the counter, generates an update of the registers and starts the counter.

1001: Combined gated + reset mode - The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops and is reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

1010: Encoder mode: Clock plus direction, x2 mode.

1011: Encoder mode: Clock plus direction, x1 mode, tim_ti2fp2 edge sensitivity is set by CC2P

1100: Encoder mode: Directional Clock, x2 mode.

1101: Encoder mode: Directional Clock, x1 mode, tim_ti1fp1 and tim_ti2fp2 edge sensitivity is set by CC1P and CC2P.

1110: Quadrature encoder mode: x1 mode, counting on tim_ti1fp1 edges only, edge sensitivity is set by CC1P.

1111: Quadrature encoder mode: x1 mode, counting on tim_ti2fp2 edges only, edge sensitivity is set by CC2P.

Note: The gated mode must not be used if tim_ti1f_ed is selected as the trigger input (TS = 00100). Indeed, tim_ti1f_ed outputs 1 pulse for each transition on TI1F, whereas the gated mode checks the level of the trigger signal.

Note: The clock of the slave peripherals (timer, ADC, ...) receiving the tim_trgo or the tim_trgo2 signals must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

53.6.4 TIMx DMA/interrupt enable register (TIMx_DIER)(x = 1, 8)

Address offset: 0x00C

Reset value: 0x0000 0000

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **TERRF**: Transition error interrupt flag
This flag is set by hardware when a transition error is detected in encoder mode. It is cleared by software by writing it to 0.
0: No encoder transition error has been detected.
1: An encoder transition error has been detected

Bit 22 **IERRF**: Index error interrupt flag
This flag is set by hardware when an index error is detected. It is cleared by software by writing it to 0.
0: No index error has been detected.
1: An index error has been detected

Bit 21 **DIRF**: Direction change interrupt flag
This flag is set by hardware when the direction changes in encoder mode (DIR bit value in TIMx_CR is changing). It is cleared by software by writing it to 0.
0: No direction change
1: Direction change

Bit 20 **IDXF**: Index interrupt flag
This flag is set by hardware when an index event is detected. It is cleared by software by writing it to 0.
0: No index event occurred.
1: An index event has occurred

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **CC6IF**: Compare 6 interrupt flag
Refer to CC1IF description
Note: Channel 6 can only be configured as output.

Bit 16 **CC5IF**: Compare 5 interrupt flag
Refer to CC1IF description
Note: Channel 5 can only be configured as output.

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **SBIF**: System break interrupt flag
This flag is set by hardware as soon as the system break input goes active. It can be cleared by software if the system break input is not active.
This flag must be reset to re-start PWM operation.
0: No break event occurred.
1: An active level has been detected on the system break input. An interrupt is generated if BIE = 1 in the TIMx_DIER register.

Bit 12 **CC4OF**: Capture/compare 4 overcapture flag
Refer to CC1OF description

Bit 11 **CC3OF**: Capture/compare 3 overcapture flag
Refer to CC1OF description

Bit 10 **CC2OF**: Capture/compare 2 overcapture flag
Refer to CC1OF description

Bit 9 **CC1OF**: Capture/compare 1 overcapture flag

This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to 0.

0: No overcapture has been detected.

1: The counter value has been captured in TIMx_CCR1 register while CC1IF flag was already set

Bit 8 **B2IF**: Break 2 interrupt flag

This flag is set by hardware as soon as the break 2 input goes active. It can be cleared by software if the break 2 input is not active.

0: No break event occurred.

1: An active level has been detected on the break 2 input. An interrupt is generated if BIE = 1 in the TIMx_DIER register.

Bit 7 **BIF**: Break interrupt flag

This flag is set by hardware as soon as the break input goes active. It can be cleared by software if the break input is not active.

0: No break event occurred.

1: An active level has been detected on the break input. An interrupt is generated if BIE = 1 in the TIMx_DIER register.

Bit 6 **TIF**: Trigger interrupt flag

This flag is set by hardware on the TRG trigger event (active edge detected on tim_trgi input when the slave mode controller is enabled in all modes but gated mode. It is set when the counter starts or stops when gated mode is selected. It is cleared by software.

0: No trigger event occurred.

1: Trigger interrupt pending.

Bit 5 **COMIF**: COM interrupt flag

This flag is set by hardware on COM event (when capture/compare Control bits - CCxE, CCxNE, OCxM - have been updated). It is cleared by software.

0: No COM event occurred.

1: COM interrupt pending.

Bit 4 **CC4IF**: Capture/compare 4 interrupt flag

Refer to CC1IF description

Bit 3 **CC3IF**: Capture/compare 3 interrupt flag

Refer to CC1IF description

Bit 2 **CC2IF**: Capture/compare 2 interrupt flag
Refer to CC1IF description

Bit 1 **CC1IF**: Capture/compare 1 interrupt flag
This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIMx_CCR1 register (input capture mode only).
0: No compare match / No input capture occurred
1: A compare match or an input capture occurred
If channel CC1 is configured as output: this flag is set when the content of the counter TIMx_CNT matches the content of the TIMx_CCR1 register. When the content of TIMx_CCR1 is greater than the content of TIMx_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in downcounting mode). There are 3 possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIMx_CR1 register for the full description.
If channel CC1 is configured as input: this bit is set when counter value has been captured in TIMx_CCR1 register (an edge has been detected on IC1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIMx_CCER).

Bit 0 **UIF**: Update interrupt flag
This bit is set by hardware on an update event. It is cleared by software.
0: No update occurred.
1: Update interrupt pending. This bit is set by hardware when the registers are updated:
–At overflow or underflow regarding the repetition counter value (update if repetition counter = 0) and if the UDIS = 0 in the TIMx_CR1 register.
–When CNT is reinitialized by software using the UG bit in TIMx_EGR register, if URS = 0 and UDIS = 0 in the TIMx_CR1 register.
–When CNT is reinitialized by a trigger event (refer to *Section 53.6.3: TIMx slave mode control register (TIMx_SMCR)(x = 1, 8)*), if URS = 0 and UDIS = 0 in the TIMx_CR1 register.

53.6.6 TIMx event generation register (TIMx_EGR)(x = 1, 8)

Address offset: 0x014

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	B2G	BG	TG	COMG	CC4G	CC3G	CC2G	CC1G	UG
							w	w	w	w	w	w	w	w	w

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **B2G**: Break 2 generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: A break 2 event is generated. MOE bit is cleared and B2IF flag is set. Related interrupt can occur if enabled.

Bit 7 **BG**: Break generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: A break event is generated. MOE bit is cleared and BIF flag is set. Related interrupt or DMA transfer can occur if enabled.

Bit 6 **TG**: Trigger generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: The TIF flag is set in TIMx_SR register. Related interrupt or DMA transfer can occur if enabled.

Bit 5 **COMG**: Capture/compare control update generation
This bit can be set by software, it is automatically cleared by hardware
0: No action
1: CCxE, CCxNE and OCxM bits update (providing CCPC bit is set)
Note: This bit acts only on channels having a complementary output.

Bit 4 **CC4G**: Capture/compare 4 generation
Refer to CC1G description

Bit 3 **CC3G**: Capture/compare 3 generation
Refer to CC1G description

Bit 2 **CC2G**: Capture/compare 2 generation
Refer to CC1G description

Bit 1 **CC1G**: Capture/compare 1 generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: A capture/compare event is generated on channel 1:
If channel CC1 is configured as output:
CC1IF flag is set, Corresponding interrupt or DMA request is sent if enabled.
If channel CC1 is configured as input:
The current value of the counter is captured in TIMx_CCR1 register. The CC1IF flag is set, the corresponding interrupt or DMA request is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation
This bit can be set by software, it is automatically cleared by hardware.
0: No action
1: Reinitialize the counter and generates an update of the registers. Note that the prescaler counter is cleared too (anyway the prescaler ratio is not affected). The counter is cleared if the center-aligned mode is selected or if DIR = 0 (upcounting), else it takes the autoreload value (TIMx_ARR) if DIR = 1 (downcounting).

53.6.7 TIMx capture/compare mode register 1 (TIMx_CCMR1) (x = 1, 8)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IC2F[3:0]				IC2PSC[1:0]		CC2S[1:0]		IC1F[3:0]				IC1PSC[1:0]		CC1S[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Input capture mode:

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC2F[3:0]**: Input capture 2 filter

Bits 11:10 **IC2PSC[1:0]**: Input capture 2 prescaler

Bits 9:8 **CC2S[1:0]**: Capture/compare 2 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output

01: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti2

10: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti1

11: CC2 channel is configured as input, tim_ic2 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)

Note: CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIMx_CCER).

Bits 7:4 **IC1F[3:0]**: Input capture 1 filter

This bitfield defines the frequency used to sample tim_ti1 input and the length of the digital filter applied to tim_ti1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at f_{DTS}
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Bits 3:2 **IC1PSC[1:0]**: Input capture 1 prescaler

This bitfield defines the ratio of the prescaler acting on CC1 input (tim_ic1). The prescaler is reset as soon as CC1E = 0 (TIMx_CCER register).

00: no prescaler, capture is done each time an edge is detected on the capture input
01: capture is done once every 2 events
10: capture is done once every 4 events
11: capture is done once every 8 events

Bits 1:0 **CC1S[1:0]**: Capture/compare 1 Selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output
01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1
10: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti2
11: CC1 channel is configured as input, tim_ic1 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx_CCER).

53.6.8 TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 1, 8)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

OC2 CE	OC2M[2:0]			OC2 PE	OC2 FE	CC2S[1:0]		OC1 CE	OC1M[2:0]			OC1 PE	OC1 FE	CC1S[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Output compare mode:

Bits 31:25 Reserved, must be kept at reset value.

Bits 23:17 Reserved, must be kept at reset value.

Bit 15 **OC2CE:** Output compare 2 clear enable

Bits 24, 14:12 **OC2M[3:0]**: Output compare 2 mode

Bit 11 **OC2PE**: Output compare 2 preload enable

Bit 10 **OC2FE**: Output compare 2 fast enable

Bits 9:8 **CC2S[1:0]**: Capture/compare 2 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output

01: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti2

10: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti1

11: CC2 channel is configured as input, tim_ic2 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through the TS bit (TIMx_SMCR register)

Note: CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIMx_CCER).

Bit 7 **OC1CE:** Output compare 1 clear enable

0: tim_oc1ref is not affected by the tim_ocref_clr_int signal

1: tim_oc1ref is cleared as soon as a High level is detected on tim_ocref_clr_int signal (tim_ocref_clr input or tim_etrf input)

Bits 16, 6:4 **OC1M[3:0]**: Output compare 1 mode

These bits define the behavior of the output reference signal tim_oc1ref from which tim_oc1 and tim_oc1n are derived. tim_oc1ref is active high whereas tim_oc1 and tim_oc1n active level depends on CC1P and CC1NP bits.

0000: Frozen - The comparison between the output compare register TIMx_CCR1 and the counter TIMx_CNT has no effect on the outputs.This mode can be used when the timer serves as a software timebase. When the frozen mode is enabled during timer operation, the ouput keeps the state (active or inactive) it had before entering the frozen state.

0001: Set channel 1 to active level on match. tim_oc1ref signal is forced high when the counter TIMx_CNT matches the capture/compare register 1 (TIMx_CCR1).

0010: Set channel 1 to inactive level on match. tim_oc1ref signal is forced low when the counter TIMx_CNT matches the capture/compare register 1 (TIMx_CCR1).

0011: Toggle - tim_oc1ref toggles when TIMx_CNT = TIMx_CCR1.

0100: Force inactive level - tim_oc1ref is forced low.

0101: Force active level - tim_oc1ref is forced high.

0110: PWM mode 1 - In upcounting, channel 1 is active as long as TIMx_CNT<TIMx_CCR1 else inactive. In downcounting, channel 1 is inactive (tim_oc1ref = 0) as long as TIMx_CNT>TIMx_CCR1 else active (tim_oc1ref = 1).

0111: PWM mode 2 - In upcounting, channel 1 is inactive as long as TIMx_CNT<TIMx_CCR1 else active. In downcounting, channel 1 is active as long as TIMx_CNT>TIMx_CCR1 else inactive.

1000: Retrigerrable OPM mode 1 - In up-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update. In down-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update.

1001: Retrigerrable OPM mode 2 - In up-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update. In down-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

1010: Reserved,

1011: Reserved,

1100: Combined PWM mode 1 - tim_oc1ref has the same behavior as in PWM mode 1. tim_oc1refc is the logical OR between tim_oc1ref and tim_oc2ref.

1101: Combined PWM mode 2 - tim_oc1ref has the same behavior as in PWM mode 2. tim_oc1refc is the logical AND between tim_oc1ref and tim_oc2ref.

1110: Asymmetric PWM mode 1 - tim_oc1ref has the same behavior as in PWM mode 1. tim_oc1refc outputs tim_oc1ref when the counter is counting up, tim_oc2ref when it is counting down.

1111: Asymmetric PWM mode 2 - tim_oc1ref has the same behavior as in PWM mode 2. tim_oc1refc outputs tim_oc1ref when the counter is counting up, tim_oc2ref when it is counting down.

Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIMx_BDTR register) and CC1S = 00 (the channel is configured in output).

Note: In PWM mode, the OCREF level changes when the result of the comparison changes, when the output compare mode switches from “frozen” mode to “PWM” mode and when the output compare mode switches from “force active/inactive” mode to “PWM” mode.

Note: On channels having a complementary output, this bitfield is preloaded. If the CCPC bit is set in the TIMx_CR2 register then the OC1M active bits take the new value from the preloaded bits only when a COM event is generated.

Bit 3 **OC1PE**: Output compare 1 preload enable

0: Preload register on TIMx_CCR1 disabled. TIMx_CCR1 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIMx_CCR1 enabled. Read/Write operations access the preload register. TIMx_CCR1 preload value is loaded in the active register at each update event.

Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIMx_BDTR register) and CC1S = 00 (the channel is configured in output).

Bit 2 **OC1FE**: Output compare 1 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIMx_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

0: CC1 behaves normally depending on counter and CCR1 values even when the trigger is ON. The minimum delay to activate CC1 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC1 output. Then, OC is set to the compare level independently from the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to 3 clock cycles. OCFE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1

10: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti2

11: CC1 channel is configured as input, tim_ic1 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx_CCER).

53.6.9 TIMx capture/compare mode register 2 (TIMx_CCMR2) (x = 1, 8)

Address offset: 0x01C

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 3 in input capture mode and channel 4 in output compare mode).

Input capture mode

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC4F[3:0]**: Input capture 4 filter

Bits 11:10 **IC4PSC[1:0]**: Input capture 4 prescaler

Bits 9:8 **CC4S[1:0]**: Capture/compare 4 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC4 channel is configured as output
01: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti4
10: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti3
11: CC4 channel is configured as input, tim_ic4 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)

Note: CC4S bits are writable only when the channel is OFF (CC4E = 0 in TIMx_CCER).

Bits 7:4 **IC3F[3:0]**: Input capture 3 filter

Bits 3:2 **IC3PSC[1:0]**: Input capture 3 prescaler

Bits 1:0 **CC3S[1:0]**: Capture/compare 3 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC3 channel is configured as output
01: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti3
10: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti4
11: CC3 channel is configured as input, tim_ic3 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)

Note: CC3S bits are writable only when the channel is OFF (CC3E = 0 in TIMx_CCER).

53.6.10 TIMx capture/compare mode register 2 [alternate] (TIMx_CCMR2)(x = 1, 8)

Address offset: 0x01C

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 3 in input capture mode and channel 4 in output compare mode).

Output compare mode

Bits 31:25 Reserved, must be kept at reset value.

Bits 23:17 Reserved, must be kept at reset value.

Bit 15 **OC4CE**: Output compare 4 clear enable

Bits 24, 14:12 **OC4M[3:0]**: Output compare 4 mode
Refer to OC3M[3:0] bit description

Bit 11 **OC4PE**: Output compare 4 preload enable

Bit 10 **OC4FE**: Output compare 4 fast enable

Bits 9:8 **CC4S[1:0]**: Capture/compare 4 selection
This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC4 channel is configured as output
01: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti4
10: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti3
11: CC4 channel is configured as input, tim_ic4 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)
Note: CC4S bits are writable only when the channel is OFF (CC4E = 0 in TIMx_CCER).

Bit 7 **OC3CE:** Output compare 3 clear enable

Bits 16, 6:4 **OC3M[3:0]**: Output compare 3 mode

These bits define the behavior of the output reference signal tim_oc3ref from which tim_oc3 and tim_oc3n are derived. tim_oc3ref is active high whereas tim_oc3 and tim_oc3n active level depends on CC3P and CC3NP bits.

0000: Frozen - The comparison between the output compare register TIMx_CCR3 and the counter TIMx_CNT has no effect on the outputs.(this mode is used to generate a timing base).

0001: Set channel 3 to active level on match. tim_oc3ref signal is forced high when the counter TIMx_CNT matches the capture/compare register 3 (TIMx_CCR3).

0010: Set channel 3 to inactive level on match. tim_oc3ref signal is forced low when the counter TIMx_CNT matches the capture/compare register 3 (TIMx_CCR3).

0011: Toggle - tim_oc3ref toggles when TIMx_CNT = TIMx_CCR3.

0100: Force inactive level - tim_oc3ref is forced low.

0101: Force active level - tim_oc3ref is forced high.

0110: PWM mode 1 - In upcounting, channel 3 is active as long as TIMx_CNT<TIMx_CCR3 else inactive. In downcounting, channel 3 is inactive (tim_oc3ref = 0) as long as TIMx_CNT>TIMx_CCR3 else active (tim_oc3ref = 1).

0111: PWM mode 2 - In upcounting, channel 3 is inactive as long as TIMx_CNT<TIMx_CCR3 else active. In downcounting, channel 3 is active as long as TIMx_CNT>TIMx_CCR3 else inactive.

1000: Retrigerrable OPM mode 1 - In up-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update. In down-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update.

1001: Retrigerrable OPM mode 2 - In up-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update. In down-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

1010: Pulse on compare: a pulse is generated on tim_oc3ref upon CCR3 match event, as per PWPRSC[2:0] and PW[7:0] bitfields programming in TIMxECR.

1011: Direction output. The tim_oc3ref signal is overridden by a copy of the DIR bit.

1100: Combined PWM mode 1 - tim_oc3ref has the same behavior as in PWM mode 1. tim_oc3refc is the logical OR between tim_oc3ref and tim_oc4ref.

1101: Combined PWM mode 2 - tim_oc3ref has the same behavior as in PWM mode 2. tim_oc3refc is the logical AND between tim_oc3ref and tim_oc4ref.

1110: Asymmetric PWM mode 1 - tim_oc3ref has the same behavior as in PWM mode 1. tim_oc3refc outputs tim_oc3ref when the counter is counting up, tim_oc4ref when it is counting down.

1111: Asymmetric PWM mode 2 - tim_oc3ref has the same behavior as in PWM mode 2. tim_oc3refc outputs tim_oc3ref when the counter is counting up, tim_oc4ref when it is counting down.

Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIMx_BDTR register) and CC1S = 00 (the channel is configured in output).

Note: In PWM mode, the OCREF level changes only when the result of the comparison changes or when the output compare mode switches from “frozen” mode to “PWM” mode.

On channels having a complementary output, this bitfield is preloaded. If the CCPC bit is set in the TIMx_CR2 register then the OC3M active bits take the new value from the preloaded bits only when a COM event is generated.

Bit 3 **OC3PE**: Output compare 3 preload enable

Bit 2 **OC3FE**: Output compare 3 fast enable

Bits 1:0 **CC3S[1:0]**: Capture/compare 3 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC3 channel is configured as output

01: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti3

10: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti4

11: CC3 channel is configured as input, tim_ic3 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)

Note: CC3S bits are writable only when the channel is OFF (CC3E = 0 in TIMx_CCER).

53.6.11 TIMx capture/compare enable register (TIMx_CCER)(x = 1, 8)

Address offset: 0x020

Bit 21 **CC6P**: Capture/compare 6 output polarity
Refer to CC1P description

Bit 20 **CC6E**: Capture/compare 6 output enable
Refer to CC1E description

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **CC5P**: Capture/compare 5 output polarity
Refer to CC1P description

Bit 16 **CC5E**: Capture/compare 5 output enable
Refer to CC1E description

Bit 15 **CC4NP**: Capture/compare 4 complementary output polarity
Refer to CC1NP description

Bit 14 **CC4NE**: Capture/compare 4 complementary output enable
Refer to CC1NE description

Bit 13 **CC4P**: Capture/compare 4 output polarity
Refer to CC1P description

Bit 12 **CC4E**: Capture/compare 4 output enable
Refer to CC1E description

Bit 11 **CC3NP**: Capture/compare 3 complementary output polarity
Refer to CC1NP description

Bit 10 **CC3NE**: Capture/compare 3 complementary output enable
Refer to CC1NE description

Bit 9 **CC3P**: Capture/compare 3 output polarity
Refer to CC1P description

Bit 8 **CC3E**: Capture/compare 3 output enable
Refer to CC1E description

Bit 7 **CC2NP**: Capture/compare 2 complementary output polarity
Refer to CC1NP description

Bit 6 **CC2NE**: Capture/compare 2 complementary output enable
Refer to CC1NE description

Bit 5 **CC2P**: Capture/compare 2 output polarity
Refer to CC1P description

Bit 4 **CC2E**: Capture/compare 2 output enable
Refer to CC1E description

Bit 3 **CC1NP**: Capture/compare 1 complementary output polarity
CC1 channel configured as output:
0: tim_oc1n active high.
1: tim_oc1n active low.
CC1 channel configured as input:
This bit is used in conjunction with CC1P to define the polarity of tim_ti1fp1 and tim_ti2fp1.
Refer to CC1P description.

Note: This bit is not writable as soon as LOCK level 2 or 3 has been programmed (LOCK bits in TIMx_BDTR register) and CC1S = 00 (channel configured as output).

Note: On channels having a complementary output, this bit is preloaded. If the CCPC bit is set in the TIMx_CR2 register then the CC1NP active bit takes the new value from the preloaded bit only when a Commutation event is generated.

Bit 2 **CC1NE**: Capture/compare 1 complementary output enable
0: Off - tim_oc1n is not active. tim_oc1n level is then function of MOE, OSSI, OSSR, OIS1, OIS1N and CC1E bits.
1: On - tim_oc1n signal is output on the corresponding output pin depending on MOE, OSSI, OSSR, OIS1, OIS1N and CC1E bits.

Note: On channels having a complementary output, this bit is preloaded. If the CCPC bit is set in the TIMx_CR2 register then the CC1NE active bit takes the new value from the preloaded bit only when a Commutation event is generated.

Bit 1 **CC1P**: Capture/compare 1 output polarity

0: OC1 active high (output mode) / Edge sensitivity selection (input mode, see below)

1: OC1 active low (output mode) / Edge sensitivity selection (input mode, see below)

When CC1 channel is configured as input, both CC1NP/CC1P bits select the active polarity of TI1FP1 and TI2FP1 for trigger or capture operations.

CC1NP = 0, CC1P = 0:non-inverted/rising edge. The circuit is sensitive to TIxFP1 rising edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode or encoder mode).

CC1NP = 0, CC1P = 1:inverted/falling edge. The circuit is sensitive to TIxFP1 falling edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is inverted (trigger operation in gated mode or encoder mode).

CC1NP = 1, CC1P = 1: non-inverted/both edges/ The circuit is sensitive to both TIxFP1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), TIxFP1is not inverted (trigger operation in gated mode). This configuration must not be used in encoder mode.

CC1NP = 1, CC1P = 0:the configuration is reserved, it must not be used.

Note: This bit is not writable as soon as LOCK level 2 or 3 has been programmed (LOCK bits in TIMx_BDTR register).

Note: On channels having a complementary output, this bit is preloaded. If the CCPC bit is set in the TIMx_CR2 register then the CC1P active bit takes the new value from the preloaded bit only when a Commutation event is generated.

Bit 0 **CC1E**: Capture/compare 1 output enable

0: Capture mode disabled / OC1 is not active (see below)

1: Capture mode enabled / OC1 signal is output on the corresponding output pin

When CC1 channel is configured as output, the OC1 level depends on MOE, OSSI, OSSR, OIS1, OIS1N and CC1NE bits, regardless of the CC1E bits state. Refer to *Table 538* for details.

Note: On channels having a complementary output, this bit is preloaded. If the CCPC bit is set in the TIMx_CR2 register then the CC1E active bit takes the new value from the preloaded bit only when a Commutation event is generated.

Table 538. Output control bits for complementary tim_ocx and tim_ocxn channels with break feature

Control bits					Output states[1]	
MOE bit	OSSI bit	OSSR bit	CCxE bit	CCxNE bit	tim_ocx output state	tim_ocxn output state
1	X	X	0	0	Output disabled (not driven by the timer: Hi-Z) tim_ocx = 0, tim_ocxn = 0	
		0	0	1	Output disabled (not driven by the timer: Hi-Z) tim_ocx = 0	tim_ocxref + Polarity tim_ocxn = tim_ocxref xor CCxNP
		0	1	0	tim_ocxref + Polarity tim_ocx = tim_ocxref xor CCxP	Output Disabled (not driven by the timer: Hi-Z) tim_ocxn = 0
		X	1	1	OCREF + Polarity + dead-time	Complementary to OCREF (not OCREF) + Polarity + dead-time
		1	0	1	Off-State (output enabled with inactive state) tim_ocx = CCxP	tim_ocxref + Polarity tim_ocxn = tim_ocxref x or CCxNP
		1	1	0	tim_ocxref + Polarity tim_ocx = tim_ocxref xor CCxP	Off-State (output enabled with inactive state) tim_ocxn = CCxNP
0	0	X	X	X	Output disabled (not driven by the timer: Hi-Z).	
	1		0	0		
			0	1	Off-State (output enabled with inactive state) Asynchronously: tim_ocx = CCxP, tim_ocxn = CCxNP (if tim_brk or tim_brk2 is triggered).	
			1	0		
			1	1	Then (this is valid only if tim_brk is triggered), if the clock is present: tim_ocx = OISx and tim_ocxn = OISxN after a dead-time, assuming that OISx and OISxN do not correspond to OCX and tim_ocxn both in active state (may cause a short circuit when driving switches in half-bridge configuration). *Note: tim_brk2 can only be used if OSSI = OSSR = 1.*	

1. When both outputs of a channel are not used (control taken over by GPIO), the OISx, OISxN, CCxP and CCxNP bits must be kept cleared.

Note: The state of the external I/O pins connected to the complementary tim_ocx and tim_ocxn channels depends on the tim_ocx and tim_ocxn channel state and the GPIO registers.

53.6.12 TIMx counter (TIMx_CNT)(x = 1, 8)

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UIF CPY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
r															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **UIFCPY**: UIF copy

This bit is a read-only copy of the UIF bit of the TIMx_ISR register. If the UIFREMAP bit in the TIMxCR1 is reset, bit 31 is reserved and read at 0.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]**: Counter value

Non-dithering mode (DITHEN = 0)

The register holds the counter value.

Dithering mode (DITHEN = 1)

The register only holds the non-dithered part in CNT[15:0]. The fractional part is not available.

53.6.13 TIMx prescaler (TIMx_PSC)(x = 1, 8)

Address offset: 0x028

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PSC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **PSC[15:0]**: Prescaler value

The counter clock frequency ($f_{tim_cnt_ck}$) is equal to $f_{tim_psc_ck}$ / (PSC[15:0] + 1).
PSC contains the value to be loaded in the active prescaler register at each update event (including when the counter is cleared through UG bit of TIMx_EGR register or through trigger controller when configured in “reset mode”).

53.6.14 TIMx autoreload register (TIMx_ARR)(x = 1, 8)

Address offset: 0x02C

Reset value: 0x0000 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ARR[19:16]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **ARR[19:0]**: Autoreload value

ARR is the value to be loaded in the actual autoreload register.

Refer to the *Section 53.3.3: Time-base unit* for more details about ARR update and behavior.

The counter is blocked while the autoreload value is null.

Non-dithering mode (DITHEN = 0)

The register holds the autoreload value.

Dithering mode (DITHEN = 1)

The register holds the integer part in ARR[19:4]. The ARR[3:0] bitfield contains the dithered part.

53.6.15 TIMx repetition counter register (TIMx_RCR)(x = 1, 8)

Address offset: 0x030

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REP[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **REP[15:0]**: Repetition counter reload value

This bitfield defines the update rate of the compare registers (i.e. periodic transfers from preload to active registers) when preload registers are enable. It also defines the update interrupt generation rate, if this interrupt is enable.

When the repetition down-counter reaches zero, an update event is generated and it restarts counting from REP value. As the repetition counter is reloaded with REP value only at the repetition update event UEV, any write to the TIMx_RCR register is not taken in account until the next repetition update event.

It means in PWM mode (REP+1) corresponds to:

– the number of PWM periods in edge-aligned mode

– the number of half PWM period in center-aligned mode.

53.6.16 TIMx capture/compare register 1 (TIMx_CCR1)(x = 1, 8)

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCR1[19:16]

CCR1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR1[19:0]**: Capture/compare 1 value

If channel CC1 is configured as output: CCR1 is the value to be loaded in the actual capture/compare 1 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIMx_CCMR1 register (bit OC1PE). Else the preload value is copied in the active capture/compare 1 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx_CNT and signaled on tim_oc1 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value in CCR1[15:0]. The CCR1[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR1[19:4]. The CCR1[3:0] bitfield contains the dithered part.

If channel CC1 is configured as input: CR1 is the counter value transferred by the last input capture 1 event (tim_ic1). The TIMx_CCR1 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value in CCR1[15:0]. The CCR1[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR1[19:4]. The CCR1[3:0] bits are reset.

53.6.17 TIMx capture/compare register 2 (TIMx_CCR2)(x = 1, 8)

Address offset: 0x038

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CCR2[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR2[19:0]**: Capture/compare 2 value

If channel CC2 is configured as output: CCR2 is the value to be loaded in the actual capture/compare 2 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIMx_CCMR1 register (bit OC2PE). Else the preload value is copied in the active capture/compare 2 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx_CNT and signaled on tim_oc2 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value in CCR2[15:0]. The CCR2[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR2[19:4]. The CCR2[3:0] bitfield contains the dithered part.

If channel CC2 is configured as input: CCR2 is the counter value transferred by the last input capture 2 event (tim_ic2). The TIMx_CCR2 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value in CCR2[15:0]. The CCR2[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR2[19:4]. The CCR2[3:0] bits are reset.

53.6.18 TIMx capture/compare register 3 (TIMx_CCR3)(x = 1, 8)

Address offset: 0x03C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR3[19:0]**: Capture/compare value

If channel CC3 is configured as output: CCR3 is the value to be loaded in the actual capture/compare 3 register (preload value).
It is loaded permanently if the preload feature is not selected in the TIMx_CCMR2 register (bit OC3PE). Else the preload value is copied in the active capture/compare 3 register when an update event occurs.
The active capture/compare register contains the value to be compared to the counter TIMx_CNT and signaled on tim_oc3 output.
Non-dithering mode (DITHEN = 0)
The register holds the compare value in CCR3[15:0]. The CCR3[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the integer part in CCR3[19:4]. The CCR3[3:0] bitfield contains the dithered part.
If channel CC3 is configured as input: CCR3 is the counter value transferred by the last input capture 3 event (tim_ic3). The TIMx_CCR3 register is read-only and cannot be programmed.
Non-dithering mode (DITHEN = 0)
The register holds the capture value in CCR3[15:0]. The CCR3[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the capture in CCR3[19:4]. The CCR3[3:0] bits are reset.

53.6.19 TIMx capture/compare register 4 (TIMx_CCR4)(x = 1, 8)

Address offset: 0x040

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR4[19:0]**: Capture/compare value

If channel CC4 is configured as output: CCR4 is the value to be loaded in the actual capture/compare 4 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIMx_CCMR2 register (bit OC4PE). Else the preload value is copied in the active capture/compare 4 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx_CNT and signalled on tim_oc4 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value in CCR4[15:0]. The CCR4[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR4[19:4]. The CCR4[3:0] bitfield contains the dithered part.

If channel CC4 is configured as input: CCR4 is the counter value transferred by the last input capture 4 event (tim_ic4). The TIMx_CCR4 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value in CCR4[15:0]. The CCR4[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR4[19:4]. The CCR4[3:0] bits are reset.

53.6.20 TIMx break and dead-time register (TIMx_BDTR)(x = 1, 8)

Address offset: 0x044

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	BK2BID	BKBID	BK2 DSRM	BK DSRM	BK2P	BK2E	BK2F[3:0]				BKF[3:0]			
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MOE	AOE	BKP	BKE	OSSR	OSSI	LOCK[1:0]		DTG[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Note: As the bits BKBID/BK2BID/BK2P, BK2E, BK2F[3:0], BKF[3:0], AOE, BKP, BKE, OSSI, OSSR, and DTG[7:0] can be write-locked depending on the LOCK configuration, it can be necessary to configure all of them during the first write access to the TIMx_BDTR register.

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **BK2BID**: Break2 bidirectional
Refer to BKBID description

Bit 28 **BKBID**: Break bidirectional
0: Break input tim_brk in input mode
1: Break input tim_brk in bidirectional mode
In the bidirectional mode (BKBID bit set to 1), the break input is configured both in input mode and in open drain output mode. Any active break event asserts a low logic level on the Break input to indicate an internal break event to external devices.
Note: This bit cannot be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).
Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bit 27 **BK2DSRM**: Break2 disarm
Refer to BKDSRM description

Bit 26 **BKDSRM**: Break disarm
0: Break input tim_brk is armed
1: Break input tim_brk is disarmed
This bit is cleared by hardware when no break source is active.
The BKDSRM bit must be set by software to release the bidirectional output control (open-drain output in Hi-Z state) and then be polled it until it is reset by hardware, indicating that the fault condition has disappeared.
Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bit 25 **BK2P**: Break 2 polarity
0: Break input tim_brk2 is active low
1: Break input tim_brk2 is active high
Note: This bit cannot be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).
Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bit 24 **BK2E**: Break 2 enable
This bit enables the complete break 2 protection, see *Figure 495: Break and Break2 circuitry overview*).
0: Break2 function disabled
1: Break2 function enabled
Note: The BRKIN2 must only be used with OSSR = OSSI = 1.
Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).
Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bits 23:20 **BK2F[3:0]**: Break 2 filter

This bitfield defines the frequency used to sample tim_brk2 input and the length of the digital filter applied to tim_brk2. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, tim_brk2 acts asynchronously
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bits 19:16 **BKF[3:0]**: Break filter

This bitfield defines the frequency used to sample tim_brk input and the length of the digital filter applied to tim_brk. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, tim_brk acts asynchronously
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 15 **MOE**: Main output enable

This bit is cleared asynchronously by hardware as soon as one of the break inputs is active (tim_brk or tim_brk2). It is set by software or automatically depending on the AOE bit. It is acting only on the channels which are configured in output.

0: In response to a break 2 event. OC and OCN outputs are disabled
In response to a break event or if MOE is written to 0: OC and OCN outputs are disabled or forced to idle state depending on the OSSI bit.

1: OC and OCN outputs are enabled if their respective enable bits are set (CCxE, CCxNE in TIMx_CCER register).
See OC/OCN enable description for more details (*Section 53.6.11: TIMx capture/compare enable register (TIMx_CCER)(x = 1, 8)*).

Bit 14 **AOE**: Automatic output enable

0: MOE can be set only by software

1: MOE can be set by software or automatically at the next update event (if none of the break inputs tim_brk and tim_brk2 is active)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 13 **BKP**: Break polarity

0: Break input tim_brk is active low

1: Break input tim_brk is active high

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bit 12 **BKE**: Break enable

This bit enables the complete break protection (including all sources connected to tim_sys_brk and BKIN sources, as per *Figure 495: Break and Break2 circuitry overview*).

0: Break function disabled

1: Break function enabled

Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bit 11 **OSSR**: Off-state selection for Run mode

This bit is used when MOE = 1 on channels having a complementary output which are configured as outputs. OSSR is not implemented if no complementary output is implemented in the timer.

See OC/OCN enable description for more details (*Section 53.6.11: TIMx capture/compare enable register (TIMx_CCER)(x = 1, 8)*).

0: When inactive, OC/OCN outputs are disabled (the timer releases the output control which is taken over by the GPIO logic, which forces a Hi-Z state).

1: When inactive, OC/OCN outputs are enabled with their inactive level as soon as CCxE = 1 or CCxNE = 1 (the output is still controlled by the timer).

Note: This bit can not be modified as soon as the LOCK level 2 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 10 **OSSI**: Off-state selection for idle mode

This bit is used when MOE = 0 due to a break event or by a software write, on channels configured as outputs.
See OC/OCN enable description for more details (*Section 53.6.11: TIMx capture/compare enable register (TIMx_CCER)(x = 1, 8)*).

0: When inactive, OC/OCN outputs are disabled (the timer releases the output control which is taken over by the GPIO logic and which imposes a Hi-Z state).

1: When inactive, OC/OCN outputs are first forced with their inactive level then forced to their idle level after the deadtime. The timer maintains its control over the output.

Note: This bit can not be modified as soon as the LOCK level 2 has been programmed (LOCK bits in TIMx_BDTR register).

Bits 9:8 **LOCK[1:0]**: Lock configuration

These bits offer a write protection against software errors.

00: LOCK OFF - No bit is write protected.

01: LOCK Level 1 = DTG bits in TIMx_BDTR register, OISx and OISxN bits in TIMx_CR2 register and BKBID/BK2BID/BKE/BKP/AOE bits in TIMx_BDTR register can no longer be written.

10: LOCK Level 2 = LOCK Level 1 + CC Polarity bits (CCxP/CCxNP bits in TIMx_CCER register, as long as the related channel is configured in output through the CCxS bits) as well as OSSR and OSSI bits can no longer be written.

11: LOCK Level 3 = LOCK Level 2 + CC Control bits (OCxM and OCxPE bits in TIMx_CCMRx registers, as long as the related channel is configured in output through the CCxS bits) can no longer be written.

Note: The LOCK bits can be written only once after the reset. Once the TIMx_BDTR register has been written, their content is frozen until the next reset.

Bits 7:0 **DTG[7:0]**: Dead-time generator setup

This bitfield defines the duration of the dead-time inserted between the complementary outputs. DT correspond to this duration.
DTG[7:5] = 0xx => DT = DTG[7:0]x t_{dtg} with $t_{dtg} = t_{DTS}$.
DTG[7:5] = 10x => DT = (64+DTG[5:0])xt_{dtg} with $T_{dtg} = 2xt_{DTS}$.
DTG[7:5] = 110 => DT = (32+DTG[4:0])xt_{dtg} with $T_{dtg} = 8xt_{DTS}$.
DTG[7:5] = 111 => DT = (32+DTG[4:0])xt_{dtg} with $T_{dtg} = 16xt_{DTS}$.
Example if T_{DTS} = 125 ns (8 MHz), dead-time possible values are:
0 to 15875 ns by 125 ns steps,
16 µs to 31750 ns by 250 ns steps,
32 µs to 63 µs by 1 µs steps,
64 µs to 126 µs by 2 µs steps

Note: This bitfield can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx_BDTR register).

53.6.21 TIMx capture/compare register 5 (TIMx_CCR5)(x = 1, 8)

Address offset: 0x048

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
GC5C3	GC5C2	GC5C1	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCR5[19:16]

CCR5[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **GC5C3**: Group channel 5 and channel 3
Distortion on channel 3 output:
0: No effect of tim_oc5ref on tim_oc3refc
1: tim_oc3refc is the logical AND of tim_oc3ref and tim_oc5ref
This bit can either have immediate effect or be preloaded and taken into account after an update event (if preload feature is selected in TIMxCCMR2).
Note: it is also possible to apply this distortion on combined PWM signals.

Bit 30 **GC5C2**: Group channel 5 and channel 2
Distortion on channel 2 output:
0: No effect of tim_oc5ref on tim_oc2refc
1: tim_oc2refc is the logical AND of tim_oc2ref and tim_oc5ref
This bit can either have immediate effect or be preloaded and taken into account after an update event (if preload feature is selected in TIMxCCMR1).
Note: it is also possible to apply this distortion on combined PWM signals.

Bit 29 **GC5C1**: Group channel 5 and channel 1
Distortion on channel 1 output:
0: No effect of oc5ref on oc1refc
1: oc1refc is the logical AND of oc1ref and oc5ref
This bit can either have immediate effect or be preloaded and taken into account after an update event (if preload feature is selected in TIMxCCMR1).
Note: it is also possible to apply this distortion on combined PWM signals.

Bits 28:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR5[19:0]**: Capture/compare 5 value
CCR5 is the value to be loaded in the actual capture/compare 5 register (preload value).
It is loaded permanently if the preload feature is not selected in the TIMx_CCMR3 register (bit OC5PE). Else the preload value is copied in the active capture/compare 5 register when an update event occurs.
The active capture/compare register contains the value to be compared to the counter TIMx_CNT and signaled on tim_oc5 output.
Non-dithering mode (DITHEN = 0)
The register holds the compare value in CCR5[15:0]. The CCR5[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the integer part in CCR5[19:4]. The CCR5[3:0] bitfield contains the dithered part.

53.6.22 TIMx capture/compare register 6 (TIMx_CCR6)(x = 1, 8)

Address offset: 0x04C

Reset value: 0x0000 0000

CCR6[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR6[19:0]**: Capture/compare 6 value

CCR6 is the value to be loaded in the actual capture/compare 6 register (preload value).
It is loaded permanently if the preload feature is not selected in the TIMx_CCMR3 register (bit OC6PE). Else the preload value is copied in the active capture/compare 6 register when an update event occurs.
The active capture/compare register contains the value to be compared to the counter TIMx_CNT and signaled on tim_oc6 output.
Non-dithering mode (DITHEN = 0)
The register holds the compare value in CCR6[15:0]. The CCR6[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the integer part in CCR6[19:4]. The CCR6[3:0] bitfield contains the dithered part.

53.6.23 TIMx capture/compare mode register 3 (TIMx_CCMR3) (x = 1, 8)

Address offset: 0x050

Reset value: 0x0000 0000

Refer to the above CCMR1 register description. Channels 5 and 6 can only be configured in output.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:25 Reserved, must be kept at reset value.

Bits 23:17 Reserved, must be kept at reset value.

Bit 15 **OC6CE**: Output compare 6 clear enable

Bits 24, 14:12 **OC6M[3:0]**: Output compare 6 mode

Bit 11 **OC6PE**: Output compare 6 preload enable

Bit 10 **OC6FE**: Output compare 6 fast enable

Bits 9:8 Reserved, must be kept at reset value.

Bit 7 **OC5CE:** Output compare 5 clear enable

Bits 16, 6:4 **OC5M[3:0]**: Output compare 5 mode

Bit 3 **OC5PE**: Output compare 5 preload enable

Bit 2 **OC5FE**: Output compare 5 fast enable

Bits 1:0 Reserved, must be kept at reset value.

53.6.24 TIMx timer deadtime register 2 (TIMx_DTR2)(x = 1, 8)

Address offset: 0x054

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DTPE	DTAE

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DTGF[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **DTPE**: Deadtime preload enable

0: Deadtime value is not preloaded

1: Deadtime value preload is enabled

Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 16 **DTAE**: Deadtime asymmetric enable

0: Deadtime on rising and falling edges are identical, and defined with DTG[7:0] register

1: Deadtime on rising edge is defined with DTG[7:0] register and deadtime on falling edge is defined with DTGF[7:0] bits.

Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx_BDTR register).

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **DTGF[7:0]**: Dead-time falling edge generator setup

This bitfield defines the duration of the dead-time inserted between the complementary outputs, on the falling edge.

DTGF[7:5] = 0xx => DTF = DTGF[7:0]x t_{dtg} with $t_{dtg} = t_{DTS}$.

DTGF[7:5] = 10x => DTF = (64+DTGF[5:0])xt_{dtg} with $T_{dtg} = 2xt_{DTS}$.

DTGF[7:5] = 110 => DTF = (32+DTGF[4:0])xt_{dtg} with $T_{dtg} = 8xt_{DTS}$.

DTGF[7:5] = 111 => DTF = (32+DTGF[4:0])xt_{dtg} with $T_{dtg} = 16xt_{DTS}$.

Example if T_{DTS} = 125 ns (8 MHz), dead-time possible values are:

0 to 15875 ns by 125 ns steps,

16 µs to 31750 ns by 250 ns steps,

32 µs to 63 µs by 1 µs steps,

64 µs to 126 µs by 2 µs steps

Note: This bitfield can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx_BDTR register).

53.6.25 TIMx timer encoder control register (TIMx_ECR)(x = 1, 8)

Address offset: 0x058

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	PWPRSC[2:0]			PW[7:0]							
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IPOS[1:0]		FIDX	IBLK[1:0]		IDIR[1:0]		IE
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 Reserved, must be kept at reset value.

Bits 26:24 **PWPRSC[2:0]**: Pulse width prescaler

This bitfield sets the clock prescaler for the pulse generator, as following:

$t_{PWG} = (2^{(PWPRSC[2:0])}) \times t_{tim_ker_ck}$

Bits 23:16 **PW[7:0]**: Pulse width

This bitfield defines the pulse duration, as following:

$t_{PW} = PW[7:0] \times t_{PWG}$

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:6 **IPOS[1:0]**: Index positioning

In quadrature encoder mode (SMS[3:0] = 0001, 0010, 0011, 1110, 1111), this bit indicates in which AB input configuration the Index event resets the counter.

00: Index resets the counter when AB = 00
01: Index resets the counter when AB = 01
10: Index resets the counter when AB = 10
11: Index resets the counter when AB = 11

In directional clock mode or clock plus direction mode (SMS[3:0] = 1010, 1011, 1100, 1101), these bits indicates on which level the Index event resets the counter. In bidirectional clock mode, this applies for both clock inputs.

x0: Index resets the counter when clock is 0
x1: Index resets the counter when clock is 1

Note: IPOS[1] bit is not significant

Bit 5 **FIDX**: First index

This bit indicates if the first index only is taken into account

0: Index is always active
1: the first Index only resets the counter

Bits 4:3 **IBLK[1:0]**: Index blanking
This bit indicates if the Index event is conditioned by the tim_ti3 or tim_ti4 input
00: Index always active
01: Index disabled when tim_ti3 input is active, as per CC3P bitfield
10: Index disabled when tim_ti4 input is active, as per CC4P bitfield
11: Reserved

Bits 2:1 **IDIR[1:0]**: Index direction
This bit indicates in which direction the Index event resets the counter.
00: Index resets the counter whatever the direction
01: Index resets the counter when up-counting only
10: Index resets the counter when down-counting only
11: Reserved

Bit 0 **IE**: Index enable
This bit indicates if the Index event resets the counter.
0: Index disabled
1: Index enabled

53.6.26 TIMx timer input selection register (TIMx_TISEL)(x = 1, 8)

Address offset: 0x05C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

				rw	rw	rw	rw					rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **TI4SEL[3:0]**: Selects tim_ti4[15:0] input
0000: tim_ti4_in0: TIMx_CH4
0001: tim_ti4_in1
...
1111: tim_ti4_in15
Refer to *Section 53.3.2: TIM1/TIM8 pins and internal signals* for interconnects list.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **TI3SEL[3:0]**: Selects tim_ti3[15:0] input
0000: tim_ti3_in0: TIMx_CH2
0001: tim_ti3_in1
...
1111: tim_ti3_in15
Refer to *Section 53.3.2: TIM1/TIM8 pins and internal signals* for interconnects list.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **TI2SEL[3:0]**: Selects tim_ti2[15:0] input
0000: tim_ti2_in0: TIMx_CH2
0001: tim_ti2_in1
...
1111: tim_ti2_in15
Refer to *Section 53.3.2: TIM1/TIM8 pins and internal signals* for interconnects list.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **TI1SEL[3:0]**: Selects tim_ti1[15:0] input
0000: tim_ti1_in0: TIMx_CH1
0001: tim_ti1_in1
...
1111: tim_ti1_in15
Refer to *Section 53.3.2: TIM1/TIM8 pins and internal signals* for interconnects list.

53.6.27 TIMx alternate function option register 1 (TIMx_AF1)(x = 1, 8)

Address offset: 0x060

Reset value: 0x0000 0001

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:14 **ETRSEL[3:0]**: etr_in source selection
These bits select the etr_in input source.
0000: tim_etr0: TIMx_ETR input
0001: tim_etr1
...
1111: tim_etr15
Refer to *Section 53.3.2: TIM1/TIM8 pins and internal signals* for product specific implementation.

Note: These bits can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 13 **BKCMP4P**: tim_brk_cmp4 input polarity
This bit selects the tim_brk_cmp4 input sensitivity. It must be programmed together with the BKP polarity bit.
0: tim_brk_cmp4 input polarity is not inverted (active low if BKP = 0, active high if BKP = 1)
1: tim_brk_cmp4 input polarity is inverted (active high if BKP = 0, active low if BKP = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 12 **BKCMP3P**: tim_brk_cmp3 input polarity

This bit selects the tim_brk_cmp3 input sensitivity. It must be programmed together with the BKP polarity bit.

0: tim_brk_cmp3 input polarity is not inverted (active low if BKP = 0, active high if BKP = 1)

1: tim_brk_cmp3 input polarity is inverted (active high if BKP = 0, active low if BKP = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 11 **BKCMP2P**: tim_brk_cmp2 input polarity

This bit selects the tim_brk_cmp2 input sensitivity. It must be programmed together with the BKP polarity bit.

0: tim_brk_cmp2 input polarity is not inverted (active low if BKP = 0, active high if BKP = 1)

1: tim_brk_cmp2 input polarity is inverted (active high if BKP = 0, active low if BKP = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 10 **BKCMP1P**: tim_brk_cmp1 input polarity

This bit selects the tim_brk_cmp1 input sensitivity. It must be programmed together with the BKP polarity bit.

0: tim_brk_cmp1 input polarity is not inverted (active low if BKP = 0, active high if BKP = 1)

1: tim_brk_cmp1 input polarity is inverted (active high if BKP = 0, active low if BKP = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 9 **BKINP**: TIMx_BKIN input polarity

This bit selects the TIMx_BKIN alternate function input sensitivity. It must be programmed together with the BKP polarity bit.

0: TIMx_BKIN input polarity is not inverted (active low if BKP = 0, active high if BKP = 1)

1: TIMx_BKIN input polarity is inverted (active high if BKP = 0, active low if BKP = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 8 **BKCMP8E**: tim_brk_cmp8 enable

This bit enables the tim_brk_cmp8 for the timer's tim_brk input. tim_brk_cmp8 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp8 input disabled

1: tim_brk_cmp8 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 7 **BKCMP7E**: tim_brk_cmp7 enable

This bit enables the tim_brk_cmp7 for the timer's tim_brk input. tim_brk_cmp7 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp7 input disabled

1: tim_brk_cmp7 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 6 **BKCMP6E**: tim_brk_cmp6 enable

This bit enables the tim_brk_cmp6 for the timer's tim_brk input. tim_brk_cmp6 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp6 input disabled

1: tim_brk_cmp6 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 5 **BKCMP5E**: tim_brk_cmp5 enable

This bit enables the tim_brk_cmp5 for the timer's tim_brk input. tim_brk_cmp5 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp5 input disabled

1: tim_brk_cmp5 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 4 **BKCMP4E**: tim_brk_cmp4 enable

This bit enables the tim_brk_cmp4 for the timer's tim_brk input. tim_brk_cmp4 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp4 input disabled

1: tim_brk_cmp4 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 3 **BKCMP3E**: tim_brk_cmp3 enable

This bit enables the tim_brk_cmp3 for the timer's tim_brk input. tim_brk_cmp3 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp3 input disabled

1: tim_brk_cmp3 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 2 **BKCMP2E**: tim_brk_cmp2 enable

This bit enables the tim_brk_cmp2 for the timer's tim_brk input. tim_brk_cmp2 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp2 input disabled

1: tim_brk_cmp2 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 1 **BKCMP1E**: tim_brk_cmp1 enable

This bit enables the tim_brk_cmp1 for the timer's tim_brk input. tim_brk_cmp1 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp1 input disabled

1: tim_brk_cmp1 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 0 **BKINE**: TIMx_BKIN input enable

This bit enables the TIMx_BKIN alternate function input for the timer's tim_brk input. TIMx_BKIN input is 'ORed' with the other tim_brk sources.

0: TIMx_BKIN input disabled

1: TIMx_BKIN input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Note: Refer to Section 53.3.2: TIM1/TIM8 pins and internal signals for product specific implementation.

53.6.28 TIMx alternate function register 2 (TIMx_AF2)(x = 1, 8)

Address offset: 0x064

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:16 **OCRSEL[2:0]**: ocref_clr source selection

These bits select the ocref_clr input source.

000: tim_ocref_clr0

001: tim_ocref_clr1

...

111: tim_ocref_clr7

Refer to *Section 53.3.2: TIM1/TIM8 pins and internal signals* for product specific information.

Note: These bits can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **BK2CMP4P**: tim_brk2_cmp4 input polarity

This bit selects the tim_brk2_cmp4 input sensitivity. It must be programmed together with the BK2P polarity bit.

0: tim_brk2_cmp4 input polarity is not inverted (active low if BK2P = 0, active high if BK2P = 1)

1: tim_brk2_cmp4 input polarity is inverted (active high if BK2P = 0, active low if BK2P = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 12 **BK2CMP3P**: tim_brk2_cmp3 input polarity

This bit selects the tim_brk2_cmp3 input sensitivity. It must be programmed together with the BK2P polarity bit.

0: tim_brk2_cmp3 input polarity is not inverted (active low if BK2P = 0, active high if BK2P = 1)

1: tim_brk2_cmp3 input polarity is inverted (active high if BK2P = 0, active low if BK2P = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 11 **BK2CMP2P**: tim_brk2_cmp2 input polarity

This bit selects the tim_brk2_cmp2 input sensitivity. It must be programmed together with the BK2P polarity bit.

0: tim_brk2_cmp2 input polarity is not inverted (active low if BK2P = 0, active high if BK2P = 1)

1: tim_brk2_cmp2 input polarity is inverted (active high if BK2P = 0, active low if BK2P = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 10 **BK2CMP1P**: tim_brk2_cmp1 input polarity

This bit selects the tim_brk2_cmp1 input sensitivity. It must be programmed together with the BK2P polarity bit.

0: tim_brk2_cmp1 input polarity is not inverted (active low if BK2P = 0, active high if BK2P = 1)

1: tim_brk2_cmp1 input polarity is inverted (active high if BK2P = 0, active low if BK2P = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 9 **BK2INP**: TIMx_BKIN2 input polarity

This bit selects the TIMx_BKIN2 alternate function input sensitivity. It must be programmed together with the BK2P polarity bit.

0: TIMx_BKIN2 input polarity is not inverted (active low if BK2P = 0, active high if BK2P = 1)

1: TIMx_BKIN2 input polarity is inverted (active high if BK2P = 0, active low if BK2P = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 8 **BK2CMP8E**: tim_brk2_cmp8 enable

This bit enables the tim_brk2_cmp8 for the timer's tim_brk2 input. tim_brk2_cmp8 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp8 input disabled

1: tim_brk2_cmp8 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 7 **BK2CMP7E**: tim_brk2_cmp7 enable

This bit enables the tim_brk2_cmp7 for the timer's tim_brk2 input. tim_brk2_cmp7 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp7 input disabled

1: tim_brk2_cmp7 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 6 **BK2CMP6E**: tim_brk2_cmp6 enable

This bit enables the tim_brk2_cmp6 for the timer's tim_brk2 input. tim_brk2_cmp6 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp6 input disabled

1: tim_brk2_cmp6 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 5 **BK2CMP5E**: tim_brk2_cmp5 enable

This bit enables the tim_brk2_cmp5 for the timer's tim_brk2 input. tim_brk2_cmp5 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp5 input disabled

1: tim_brk2_cmp5 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 4 **BK2CMP4E**: tim_brk2_cmp4 enable

This bit enables the tim_brk2_cmp4 for the timer's tim_brk2 input. tim_brk2_cmp4 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp4 input disabled

1: tim_brk2_cmp4 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 3 **BK2CMP3E**: tim_brk2_cmp3 enable

This bit enables the tim_brk2_cmp3 for the timer's tim_brk2 input. tim_brk2_cmp3 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp3 input disabled

1: tim_brk2_cmp3 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 2 **BK2CMP2E**: tim_brk2_cmp2 enable

This bit enables the tim_brk2_cmp2 for the timer's tim_brk2 input. tim_brk2_cmp2 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp2 input disabled

1: tim_brk2_cmp2 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 1 **BK2CMP1E**: tim_brk2_cmp1 enable

This bit enables the tim_brk2_cmp1 for the timer's tim_brk2 input. tim_brk2_cmp1 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp1 input disabled

1: tim_brk2_cmp1 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 0 **BK2INE**: TIMx_BKIN2 input enable

This bit enables the TIMx_BKIN2 alternate function input for the timer's tim_brk2 input. TIMx_BKIN2 input is 'ORed' with the other tim_brk2 sources.

0: TIMx_BKIN2 input disabled

1: TIMx_BKIN2 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Note: Refer to Section 53.3.2: TIM1/TIM8 pins and internal signals for product specific implementation.

53.6.29 TIMx DMA control register (TIMx_DCR)(x = 1, 8)

Address offset: 0x3DC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBSS[3:0]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DBL[4:0]					Res.	Res.	Res.	DBA[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **DBSS[3:0]**: DMA burst source selection

This bitfield defines the interrupt source that triggers the DMA burst transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIMx_DMAR address).

0000: Reserved
0001: Update
0010: CC1
0011: CC2
0100: CC3
0101: CC4
0110: COM
0111: Trigger
Others: reserved

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **DBL[4:0]**: DMA burst length

This 5-bit vector defines the length of DMA transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIMx_DMAR address), i.e. the number of transfers. Transfers can be in half-words or in bytes (see example below).

00000: 1 transfer
00001: 2 transfers
00010: 3 transfers
...
11010: 26 transfers

Example: Let us consider the following transfer: DBL = 7 bytes & DBA = TIM2_CR1.

–If DBL = 7 bytes and DBA = TIM2_CR1 represents the address of the byte to be transferred, the address of the transfer is given by the following equation:

(TIMx_CR1 address) + DBA + (DMA index), where DMA index = DBL

In this example, 7 bytes are added to (TIMx_CR1 address) + DBA, which gives us the address from/to which the data are copied. In this case, the transfer is done to 7 registers starting from the following address: (TIMx_CR1 address) + DBA

According to the configuration of the DMA Data Size, several cases may occur:

–If the DMA Data Size is configured in half-words, 16-bit data are transferred to each of the 7 registers.

–If the DMA Data Size is configured in bytes, the data are also transferred to 7 registers: the first register contains the first MSB byte, the second register, the first LSB byte and so on. So with the transfer Timer, one also has to specify the size of data transferred by DMA.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **DBA[4:0]**: DMA base address

This 5-bits vector defines the base-address for DMA transfers (when read/write access are done through the TIMx_DMAR address). DBA is defined as an offset starting from the address of the TIMx_CR1 register.

Example:

00000: TIMx_CR1
00001: TIMx_CR2
00010: TIMx_SMCR
...

53.6.30 TIMx DMA address for full transfer (TIMx_DMAR)(x = 1, 8)

Address offset: 0x3E0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DMAB[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DMAB[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DMAB[31:0]**: DMA register for burst accesses

A read or write operation to the DMAR register accesses the register located at the address (TIMx_CR1 address) + (DBA + DMA index) x 4

where TIMx_CR1 address is the address of the control register 1, DBA is the DMA base address configured in TIMx_DCR register, DMA index is automatically controlled by the DMA transfer, and ranges from 0 to DBL (DBL configured in TIMx_DCR).

53.6.31 TIMx hardware configuration 2 register (TIMx_HWCFGR2)(x = 1, 8)

Address offset: 0x3EC

Reset value: 0x0000 1011

This read register identifies the hardware configuration parameters of the instantiated IP.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

54 General-purpose timers (TIM2/TIM3/TIM4/TIM5)

54.1 TIM2/TIM3/TIM4/TIM5 introduction

The general-purpose timers consist of a 16-bit or 32-bit autoreload counter driven by a programmable prescaler.

They can be used for a variety of purposes, including measuring the pulse lengths of input signals (*input capture*) or generating output waveforms (*output compare and PWM*).

Pulse lengths and waveform periods can be modulated from a few microseconds to several milliseconds using the timer prescaler and the RCC clock controller prescalers.

The timers are completely independent, and do not share any resources. They can be synchronized together as described in *Section 54.4.23: Timer synchronization*.

54.2 TIM2/TIM3/TIM4/TIM5 main features

General-purpose TIMx timer features include:

- 16-bit or 32-bit up, down, up/down autoreload counter.
- 16-bit programmable prescaler used to divide (also “on the fly”) the counter clock frequency by any factor between 1 and 65535.
- Up to four independent channels for:
  - Input capture.
  - Output compare.
  - PWM generation (edge- and center-aligned modes).
  - One-pulse mode output.
- Synchronization circuit to control the timer with external signals and to interconnect several timers.
- Interrupt/DMA generation on the following events:
  - Update: counter overflow/underflow, counter initialization (by software or internal/external trigger).
  - Trigger event (counter start, stop, initialization, or count by internal/external trigger).
  - Input capture.
  - Output compare.
- Supports incremental (quadrature) encoder and hall-sensor circuitry for positioning purposes.
- Trigger input for external clock or cycle-by-cycle current management.

54.3 TIM2/TIM3/TIM4/TIM5 implementation

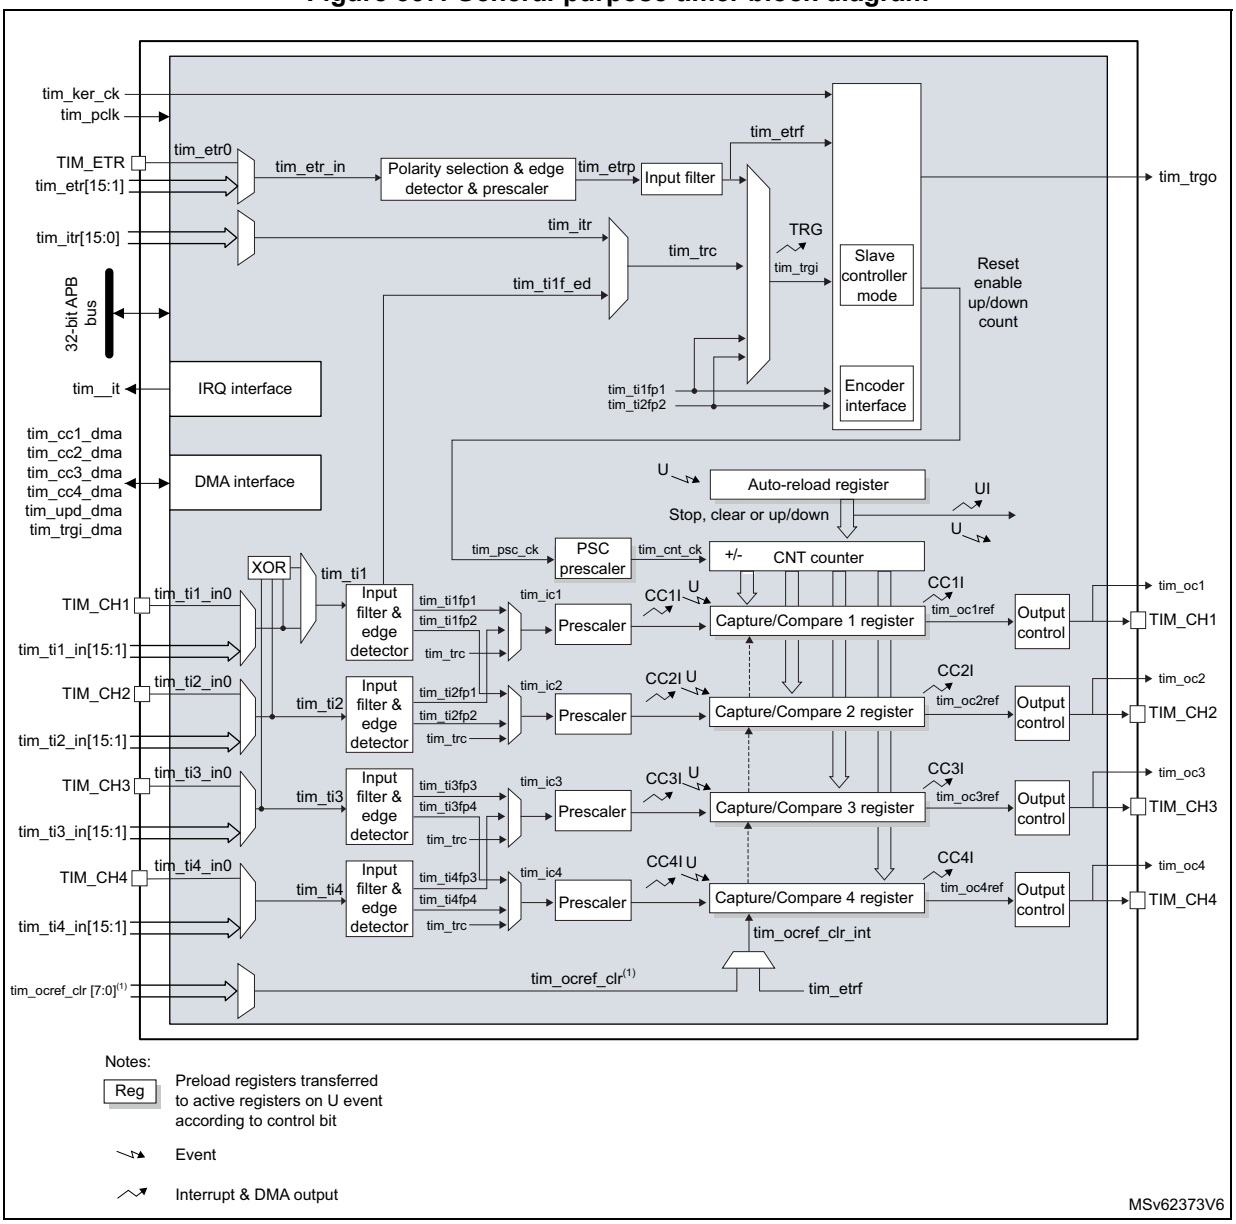
54.4.1 Block diagram

Figure 537. General-purpose timer block diagram



1. This feature is not available on all timers, refer to *Section 54.3: TIM2/TIM3/TIM4/TIM5 implementation*.

54.4.2 TIM2/TIM3/TIM4/TIM5 pins and internal signals

Table 541 and *Table 542* in this section summarize the TIM inputs and outputs.

Table 541. TIM input/output pins

Pin name	Signal type	Description
TIM_CH1 TIM_CH2 TIM_CH3 TIM_CH4	Input/Output	Timer multi-purpose channels. Each channel be used for capture, compare, or PWM. TIM_CH1 and TIM_CH2 can also be used as external clock (below 1/4 of the tim_ker_ck clock) , external trigger and quadrature encoder inputs. TIM_CH1, TIM_CH2 and TIM_CH3 can be used to interface with digital hall effect sensors.
TIM_ETR	Input	External trigger input. This input can be used as external trigger or as external clock source. This input can receive a clock with a frequency higher than the tim_ker_ck if the tim_etr_in prescaler is used.

Table 542. TIM internal input/output signals

Internal signal name	Signal type	Description
tim_ti1_in[15:0] tim_ti2_in[15:0] tim_ti3_in[15:0] tim_ti4_in[15:0]	Input	Internal timer inputs bus. The tim_ti1_in[15:0] and tim_ti2_in[15:0] inputs can be used for capture or as external clock (below 1/4 of the tim_ker_ck clock) and for quadrature encoder signals.
tim_etr[15:0]	Input	External trigger internal input bus. These inputs can be used as trigger, external clock or for hardware cycle-by-cycle pulse width control. These inputs can receive clock with a frequency higher than the tim_ker_ck if the tim_etr_in prescaler is used.
tim_itr[15:0]	Input	Internal trigger input bus. These inputs can be used for the slave mode controller or as a input clock (below 1/4 of the tim_ker_ck clock).
tim_trgo	Output	Internal trigger output. This trigger can trigger other on-chip peripherals.
tim_ocref_clr[7:0]	Input	Timer tim_ocref_clr input bus. These inputs can be used to clear the tim_ocxref signals, typically for hardware cycle-by-cycle pulse width control.
tim_pclk	Input	Timer APB clock.
tim_ker_ck	Input	Timer kernel clock

Table 542. TIM internal input/output signals (continued)

Internal signal name	Signal type	Description
tim_it	Output	Global Timer interrupt, gathering capture/compare, update and break trigger requests.
tim_cc1_dma tim_cc2_dma tim_cc3_dma tim_cc4_dma	Output	Timer capture/compare [4:1] dma requests.
tim_upd_dma	Output	Timer update dma request.
tim_trgi_dma	Output	Timer trigger dma request.

54.4.3 Time-base unit

The main block of the programmable timer is a 16-bit/32-bit counter with its related autoreload register. The counter can count up, down or both up and down. The counter clock can be divided by a prescaler.

The counter, the autoreload register and the prescaler register can be written or read by software. This is true even when the counter is running.

The time-base unit includes:

- Counter register (TIMx_CNT)
- Prescaler register (TIMx_PSC)
- Autoreload register (TIMx_ARR).

The autoreload register is preloaded. Writing to or reading from the autoreload register accesses the preload register. The content of the preload register is transferred into the shadow register permanently or at each update event (UEV), depending on the autoreload preload enable bit (ARPE) in TIMx_CR1 register. The update event is sent when the counter reaches the overflow (or underflow when down-counting) and if the UDIS bit equals 0 in the TIMx_CR1 register. It can also be generated by software. The generation of the update event is described in detail for each configuration.

The counter is clocked by the prescaler output tim_cnt_ck, which is enabled only when the counter enable bit (CEN) in TIMx_CR1 register is set (refer also to the slave mode controller description to get more details on counter enabling).

Note that the actual counter enable signal CNT_EN is set one clock cycle after CEN.

Prescaler description

The prescaler can divide the counter clock frequency by any factor between 1 and 65536. It is based on a 16-bit counter controlled through a 16-bit/32-bit register (in the TIMx_PSC

register). It can be changed on the fly as this control register is buffered. The new prescaler ratio is taken into account at the next update event.

Figure 538 and *Figure 539* give some examples of the counter behavior when the prescaler ratio is changed on the fly:

Figure 538. Counter timing diagram with prescaler division change from 1 to 2

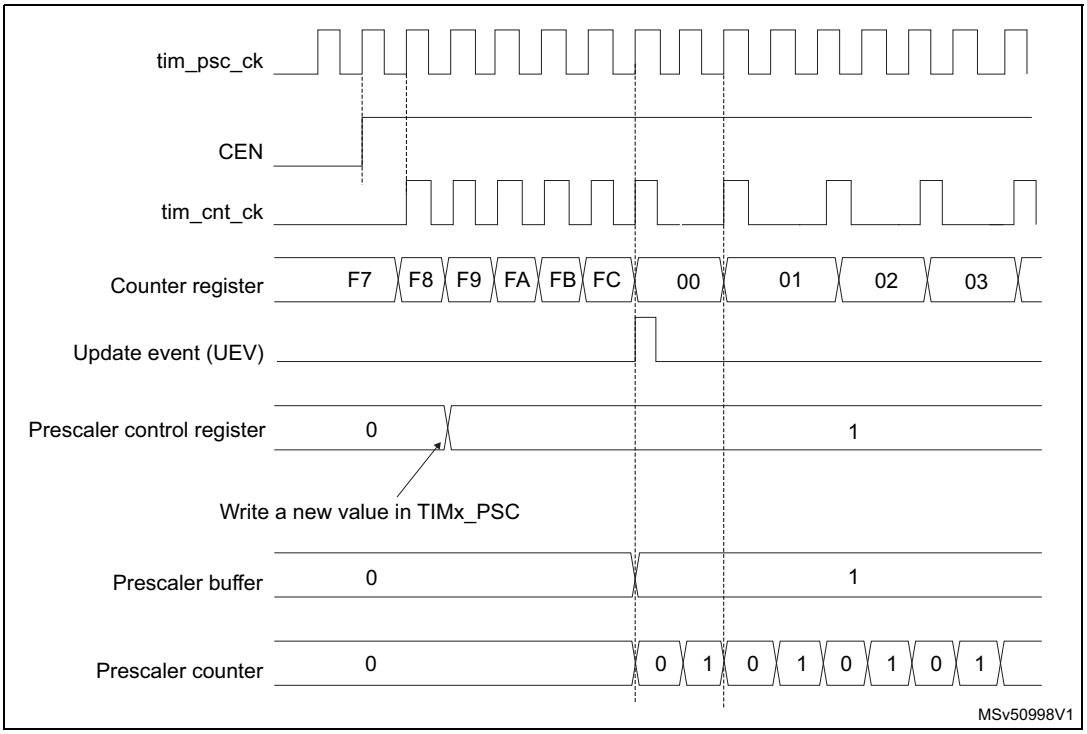

Figure 539. Counter timing diagram with prescaler division change from 1 to 4

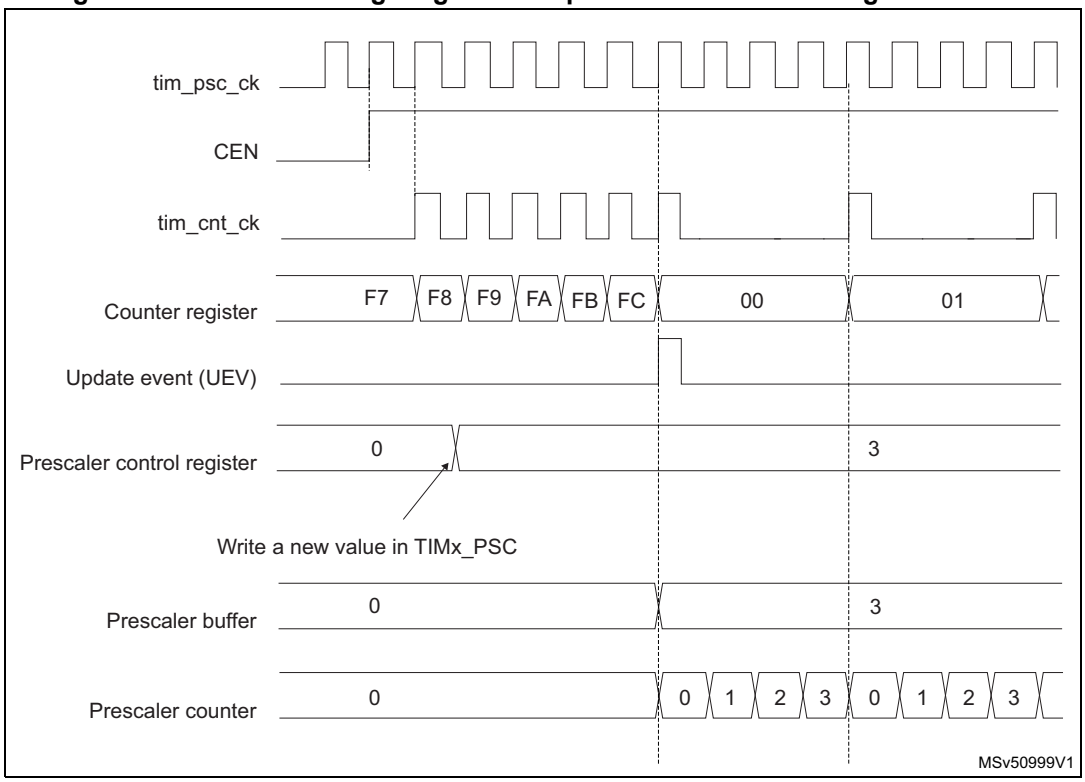

54.4.4 Counter modes

Up-counting mode

In up-counting mode, the counter counts from 0 to the autoreload value (content of the TIMx_ARR register), then restarts from 0 and generates a counter overflow event.

An update event can be generated at each counter overflow or by setting the UG bit in the TIMx_EGR register (by software or by using the slave mode controller).

The UEV event can be disabled by software by setting the UDIS bit in TIMx_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter restarts from 0, as well as the counter of the prescaler (but the prescale rate does not change). In addition, if the URS bit (update request selection) in TIMx_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx_SR register) is set (depending on the URS bit):

- The buffer of the prescaler is reloaded with the preload value (content of the TIMx_PSC register).
- The autoreload shadow register is updated with the preload value (TIMx_ARR).

The following figures show some examples of the counter behavior for different clock frequencies when TIMx_ARR = 0x36.

Figure 540. Counter timing diagram, internal clock divided by 1

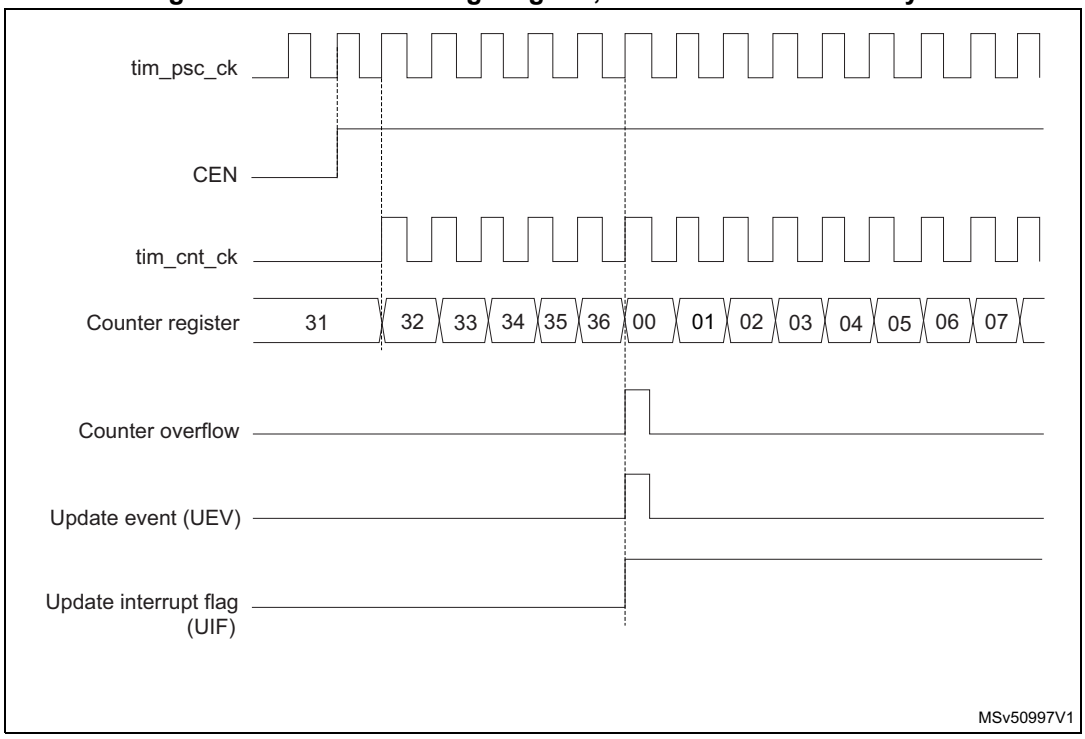

Figure 541. Counter timing diagram, internal clock divided by 2

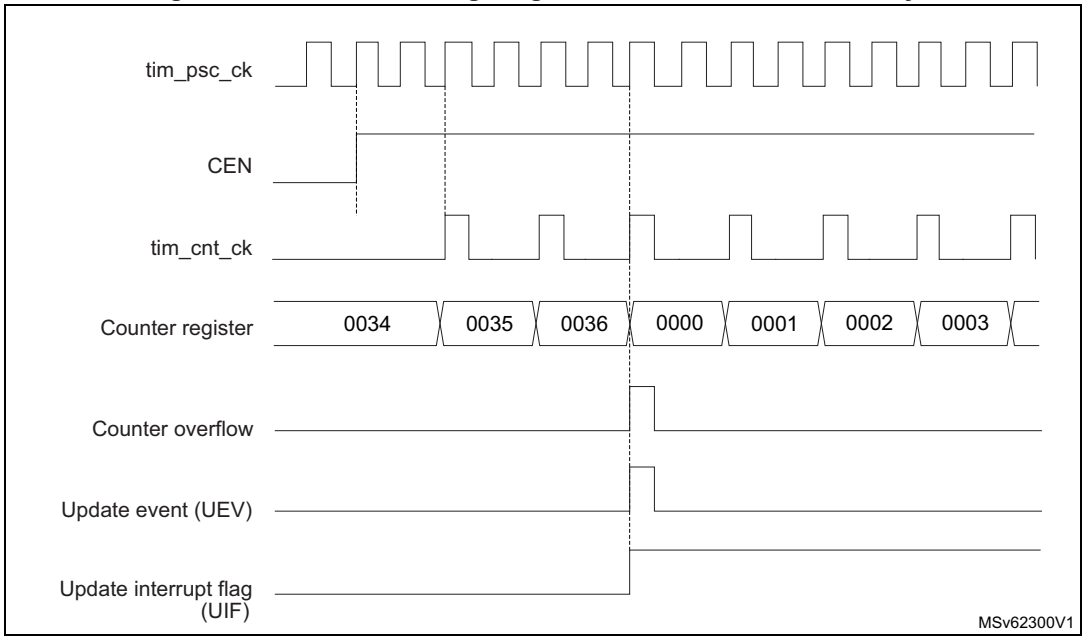

Figure 542. Counter timing diagram, internal clock divided by 4

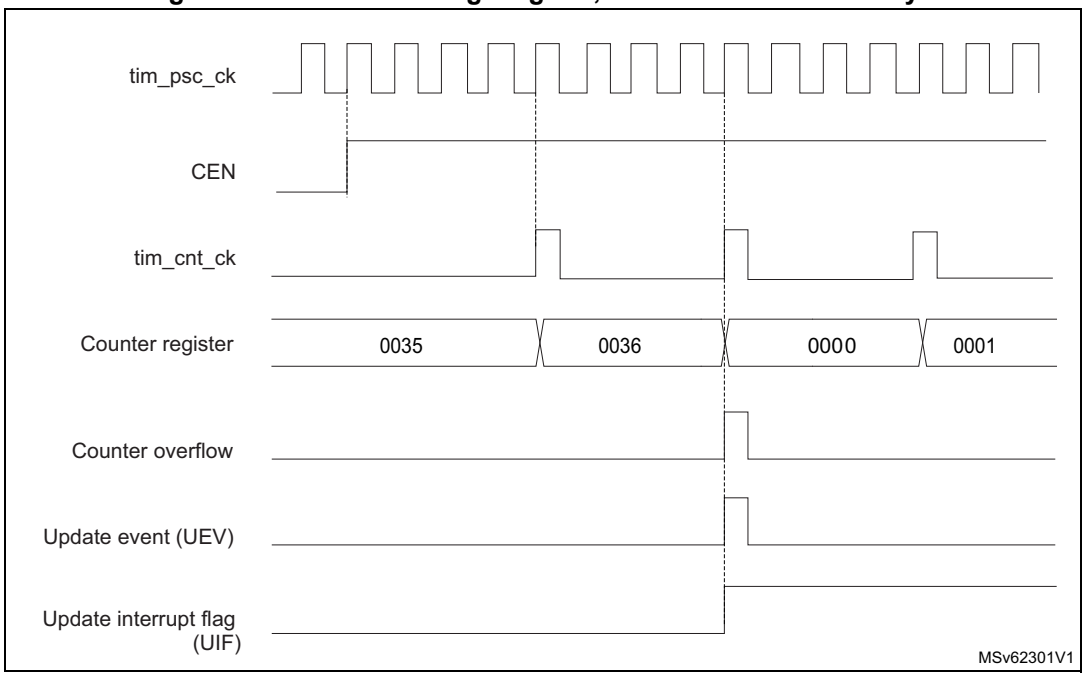

Figure 543. Counter timing diagram, internal clock divided by N

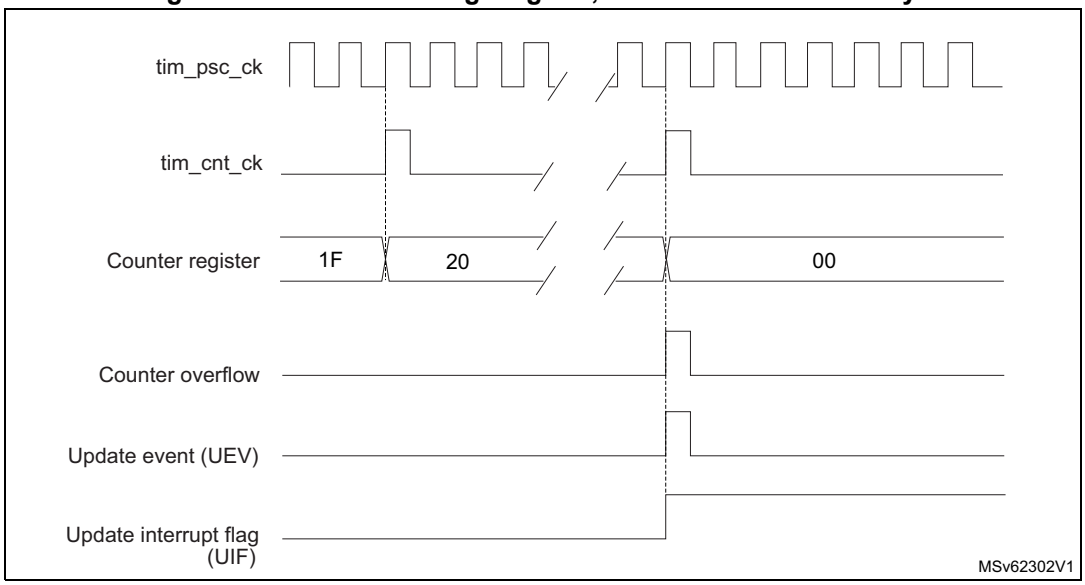

Figure 544. Counter timing diagram, Update event when ARPE = 0 (TIMx_ARR not preloaded)

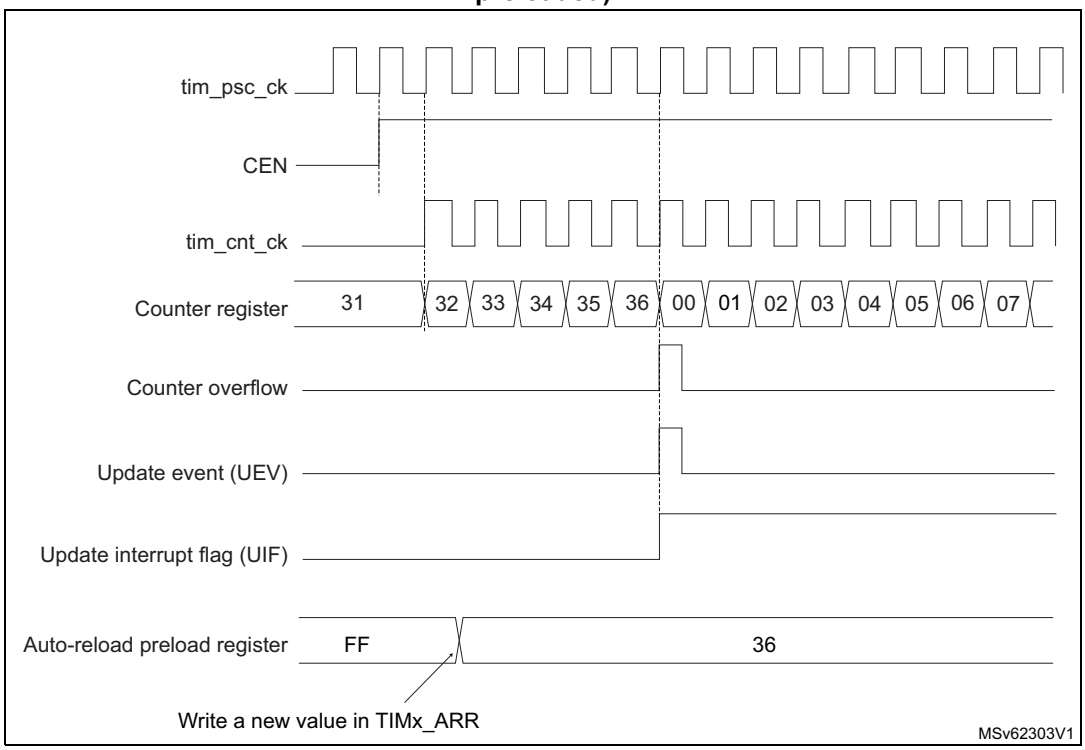

Figure 545. Counter timing diagram, Update event when ARPE = 1 (TIMx_ARR preloaded)

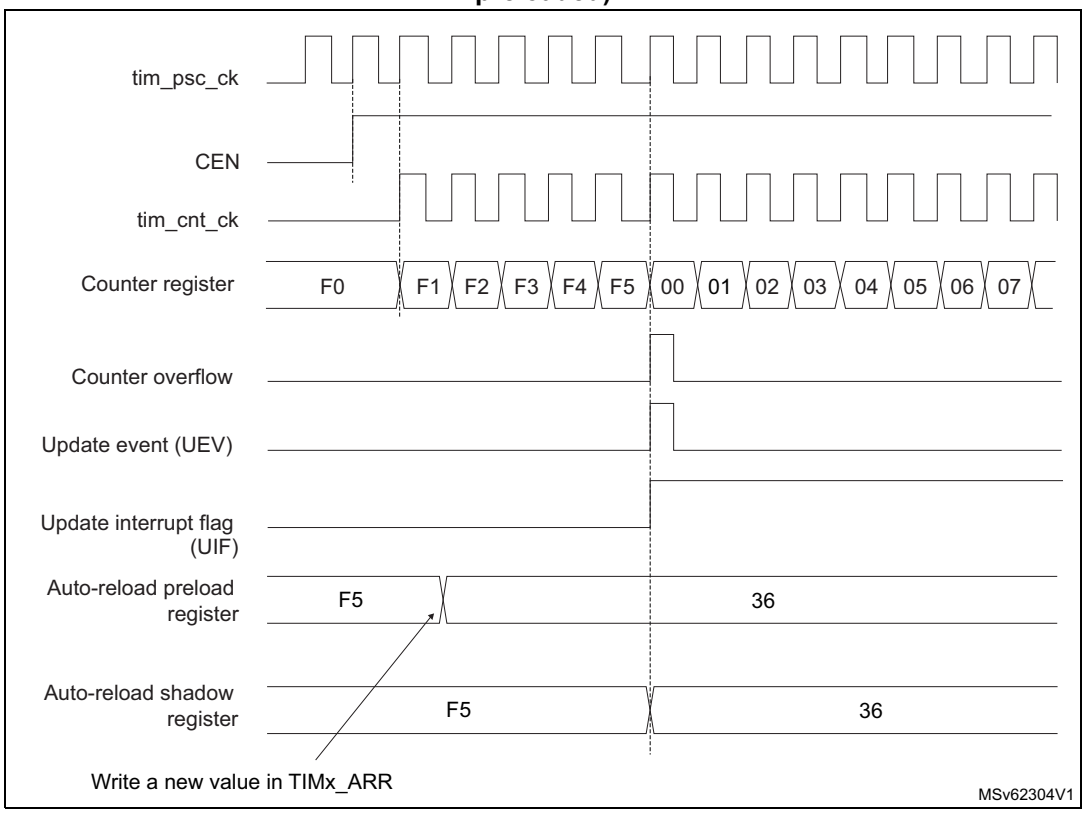

Down-counting mode

In down-counting mode, the counter counts from the autoreload value (content of the TIMx_ARR register) down to 0, then restarts from the autoreload value and generates a counter underflow event.

An update event can be generated at each counter underflow or by setting the UG bit in the TIMx_EGR register (by software or by using the slave mode controller)

The UEV update event can be disabled by software by setting the UDIS bit in TIMx_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until UDIS bit has been written to 0. However, the counter restarts from the current autoreload value, whereas the counter of the prescaler restarts from 0 (but the prescale rate does not change).

In addition, if the URS bit (update request selection) in TIMx_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx_SR register) is set (depending on the URS bit):

- The buffer of the prescaler is reloaded with the preload value (content of the TIMx_PSC register).
- The autoreload active register is updated with the preload value (content of the TIMx_ARR register). Note that the autoreload is updated before the counter is reloaded, so that the next period is the expected one.

The following figures show some examples of the counter behavior for different clock frequencies when TIMx_ARR = 0x36.

Figure 546. Counter timing diagram, internal clock divided by 1

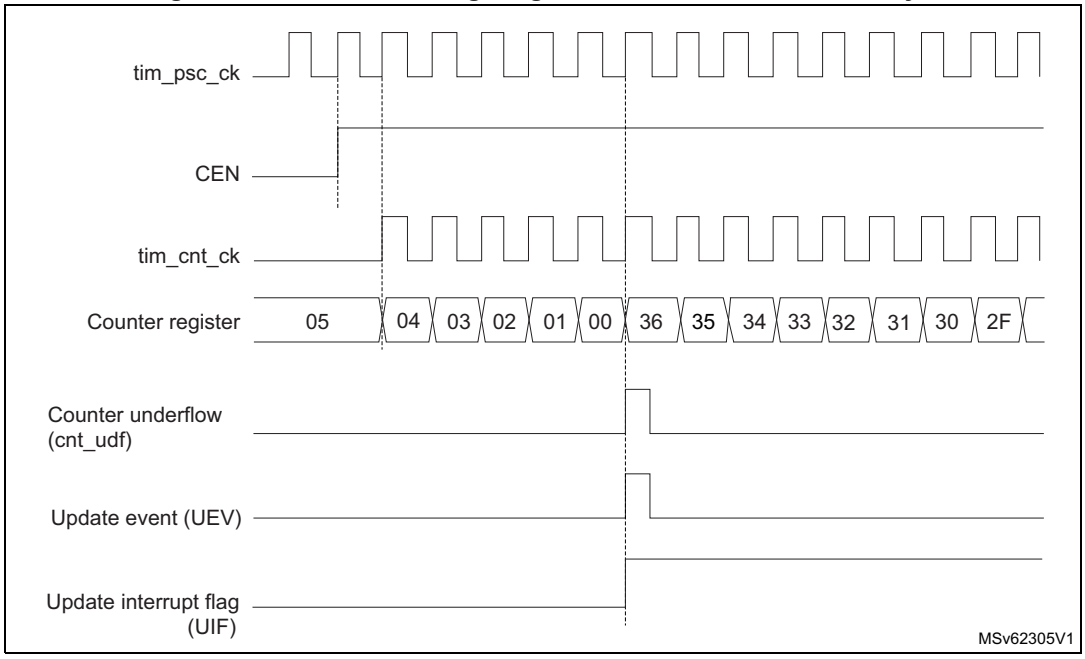

Figure 547. Counter timing diagram, internal clock divided by 2

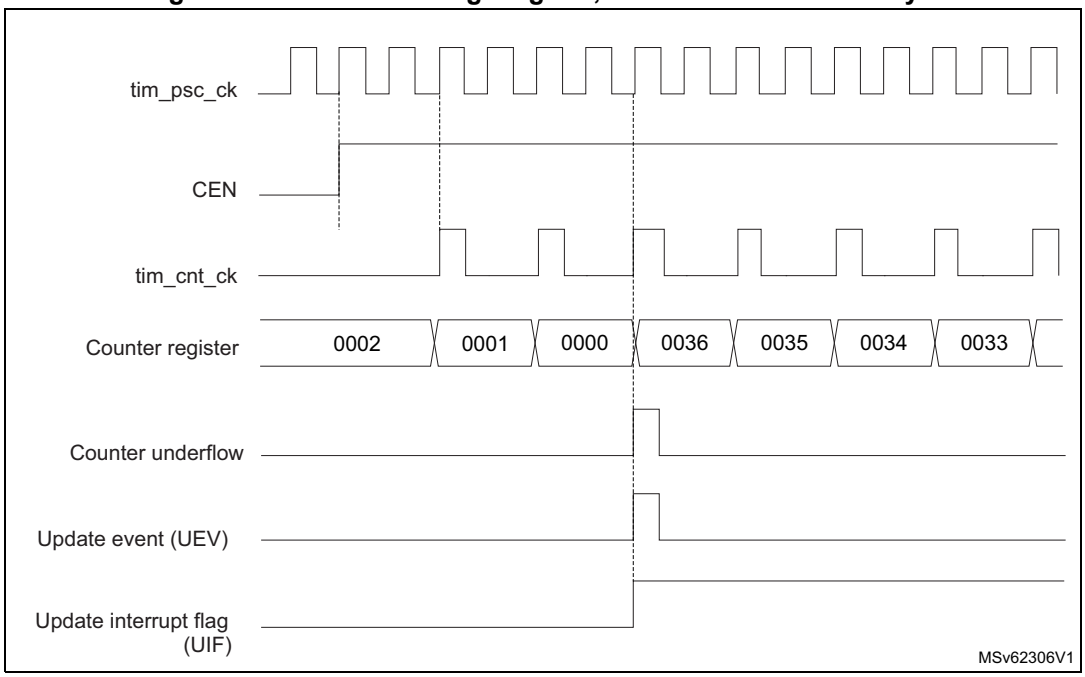

Figure 548. Counter timing diagram, internal clock divided by 4

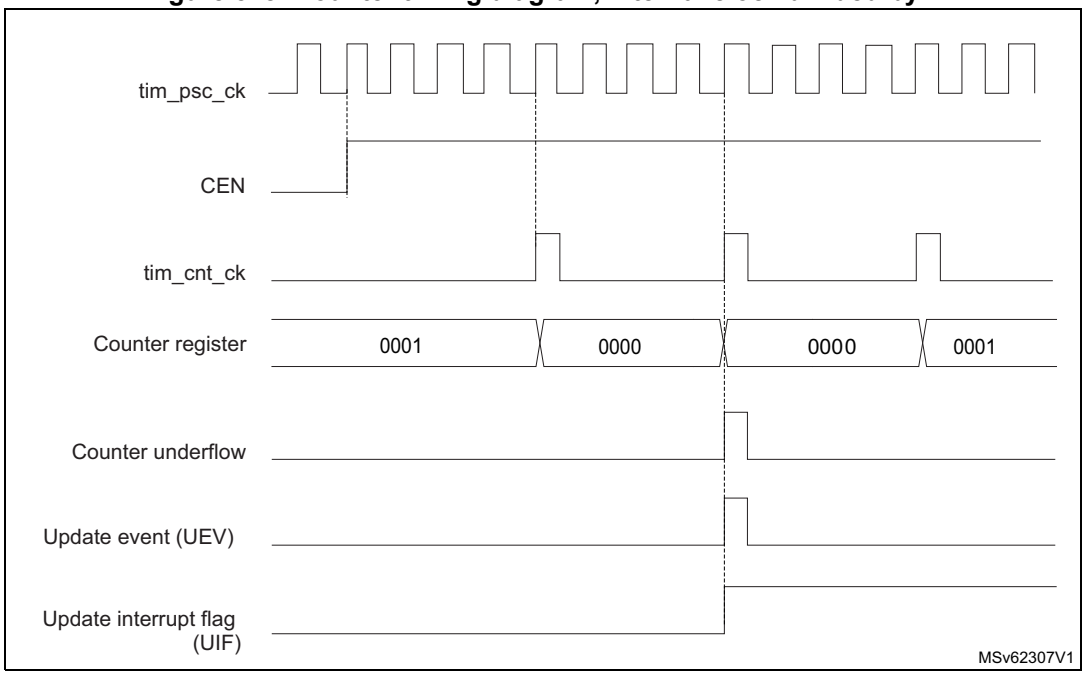

Figure 549. Counter timing diagram, internal clock divided by N

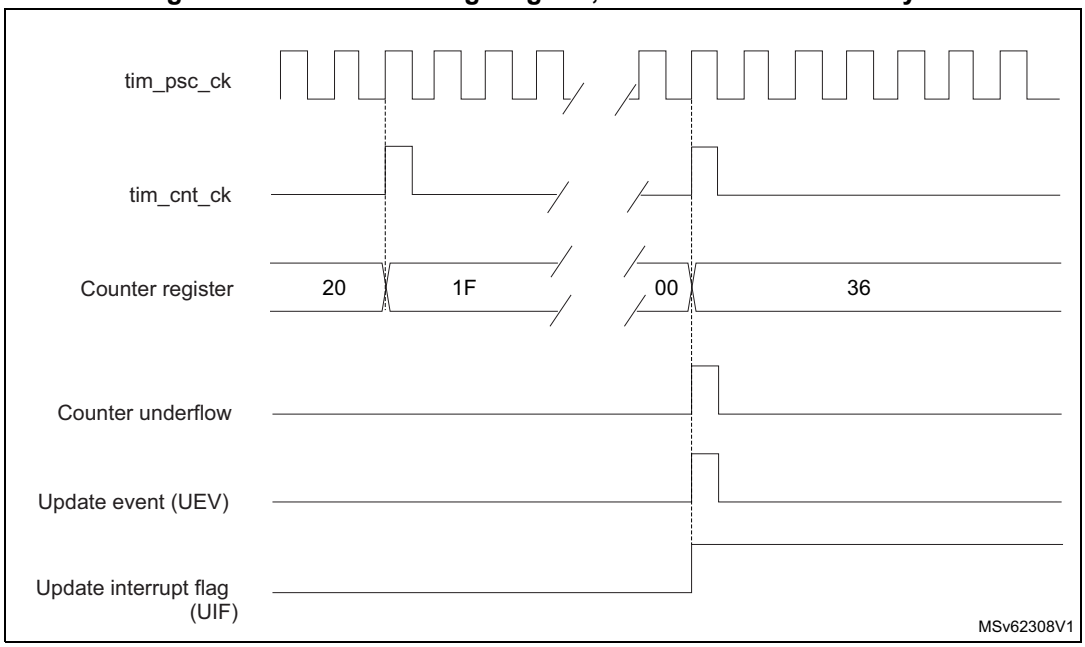

Figure 550. Counter timing diagram, Update event

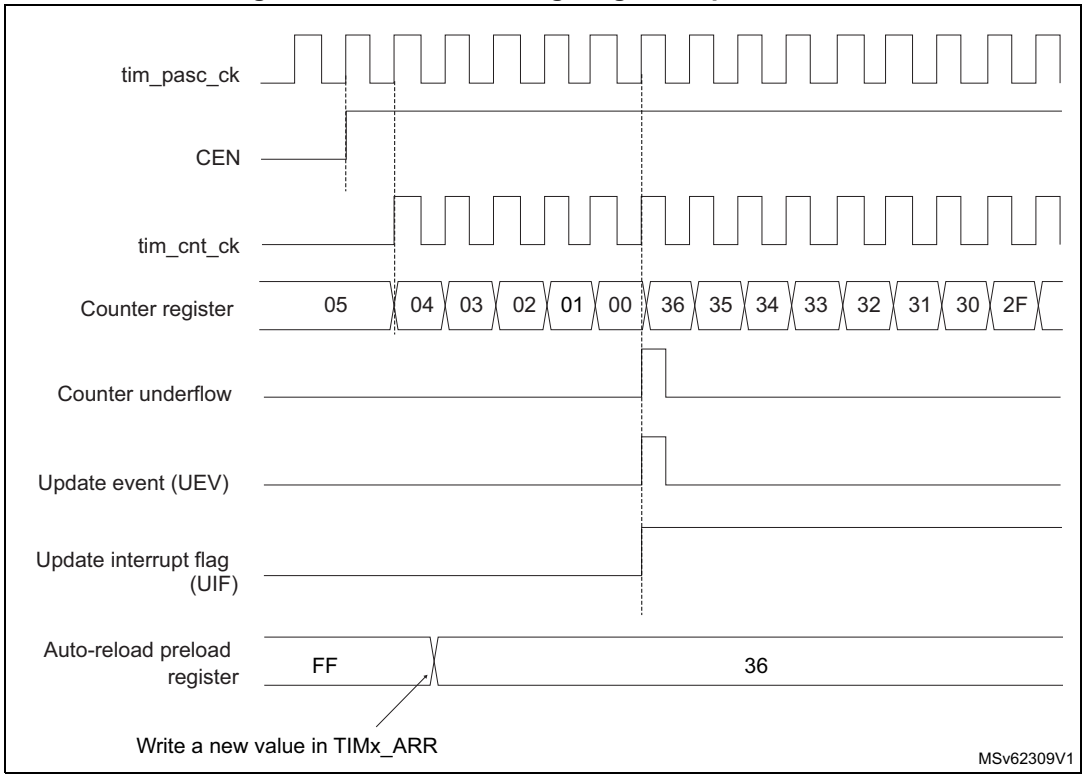


Center-aligned mode (up/down-counting)

In center-aligned mode, the counter counts from 0 to the autoreload value (content of the TIMx_ARR register) – 1, generates a counter overflow event, then counts from the

autoreload value down to 1 and generates a counter underflow event. Then it restarts counting from 0.

Center-aligned mode is active when the CMS bits in TIMx_CR1 register are not equal to 00. The output compare interrupt flag of channels configured in output is set when: the counter counts down (Center aligned mode 1, CMS = 01), the counter counts up (Center aligned mode 2, CMS = 10) the counter counts up and down (Center aligned mode 3, CMS = 11).

In this mode, the direction bit (DIR from TIMx_CR1 register) cannot be written. It is updated by hardware and gives the current direction of the counter.

The update event can be generated at each counter overflow and at each counter underflow or by setting the UG bit in the TIMx_EGR register (by software or by using the slave mode controller) also generates an update event. In this case, the counter restarts counting from 0, as well as the counter of the prescaler.

The UEV update event can be disabled by software by setting the UDIS bit in TIMx_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter continues counting up and down, based on the current autoreload value.

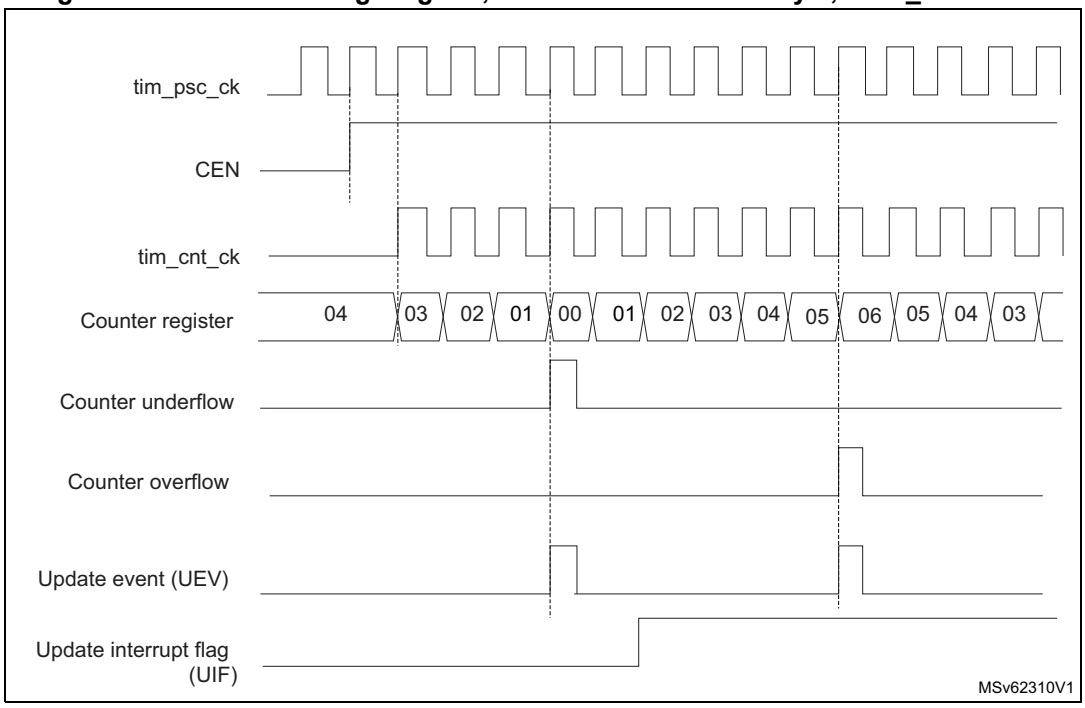
In addition, if the URS bit (update request selection) in TIMx_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx_SR register) is set (depending on the URS bit):

- The buffer of the prescaler is reloaded with the preload value (content of the TIMx_PSC register).
- The autoreload active register is updated with the preload value (content of the TIMx_ARR register). Note that if the update source is a counter overflow, the autoreload is updated before the counter is reloaded, so that the next period is the expected one (the counter is loaded with the new value).

The following figures show some examples of the counter behavior for different clock frequencies.

Figure 551. Counter timing diagram, internal clock divided by 1, TIMx_ARR = 0x6



1. Here, center-aligned mode 1 is used (for more details refer to *Section 54.5.1: TIMx control register 1 (TIMx_CR1)(x = 2 to 5)*).

Figure 552. Counter timing diagram, internal clock divided by 2

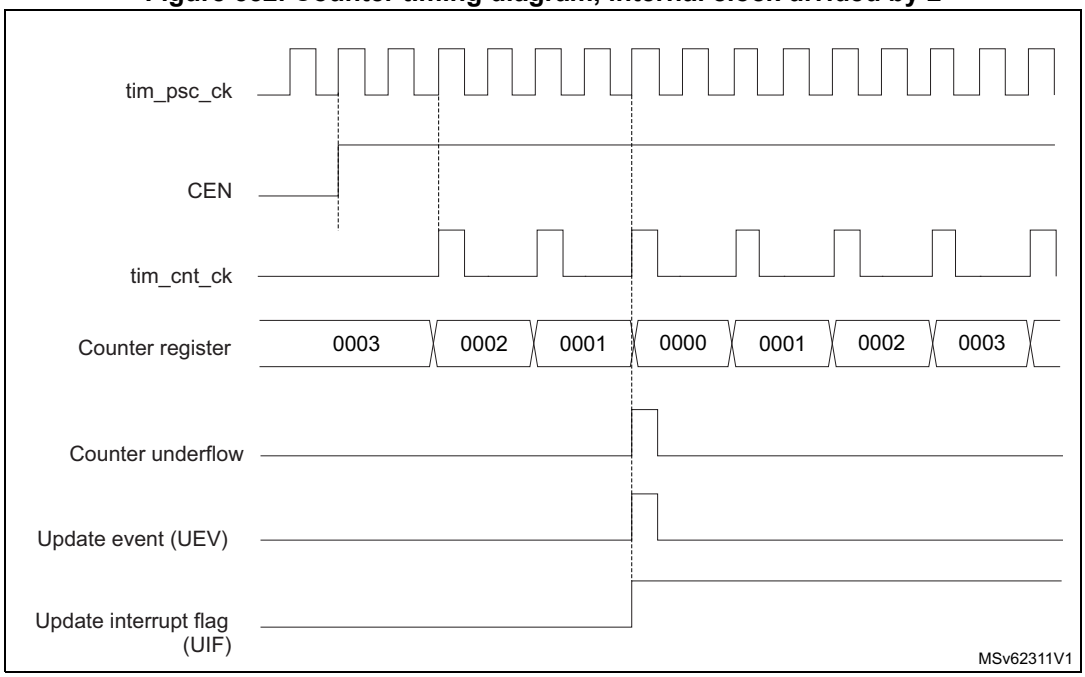


Figure 553. Counter timing diagram, internal clock divided by 4, TIMx_ARR = 0x36

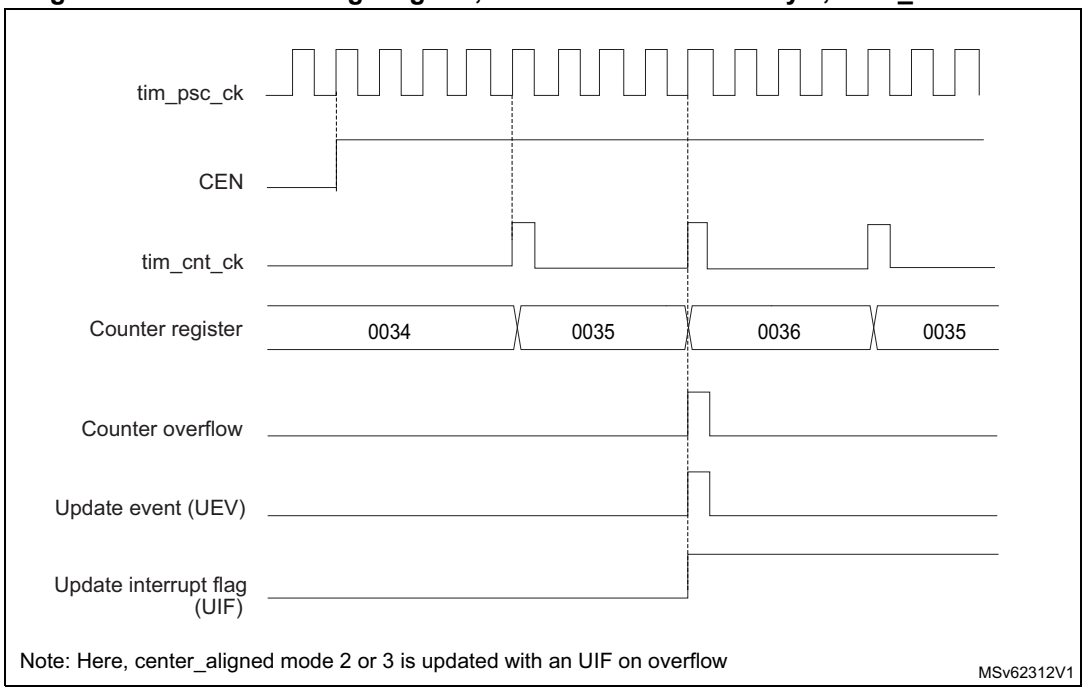

1. Center-aligned mode 2 or 3 is used with a UIF on overflow.

Figure 554. Counter timing diagram, internal clock divided by N

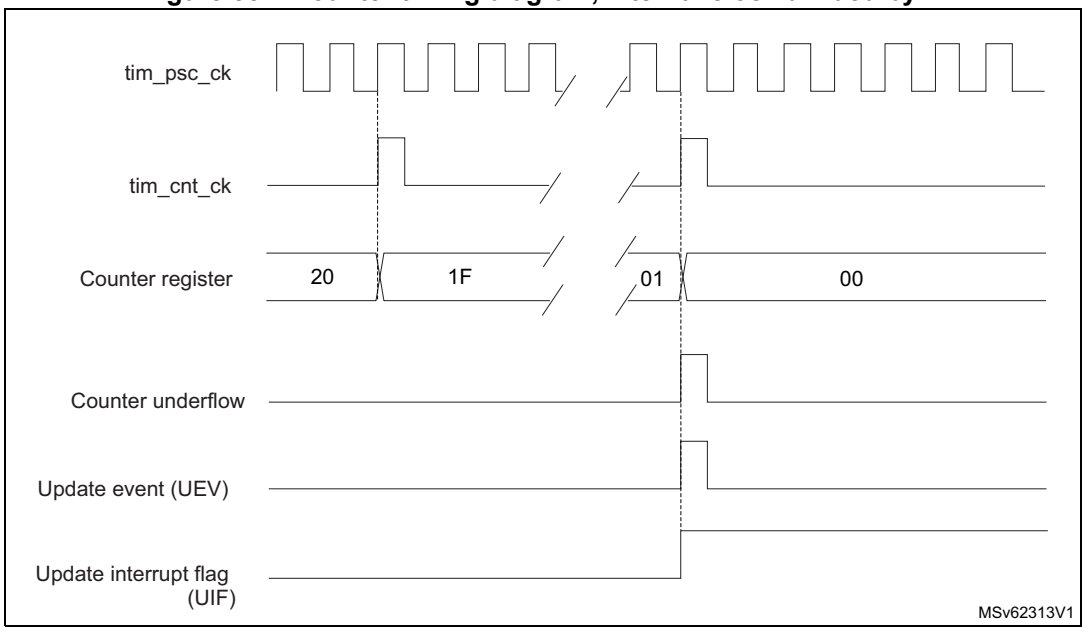

Figure 555. Counter timing diagram, Update event with ARPE = 1 (counter underflow)

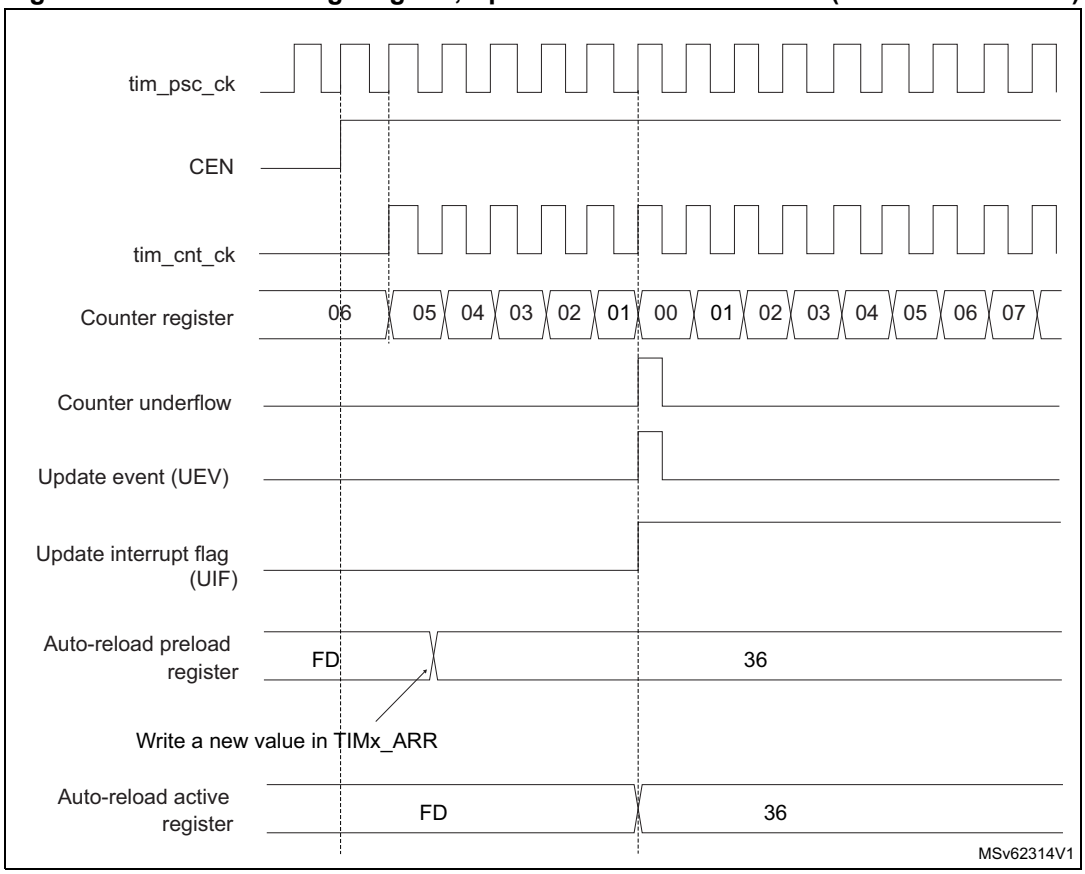

Figure 556. Counter timing diagram, Update event with ARPE = 1 (counter overflow)

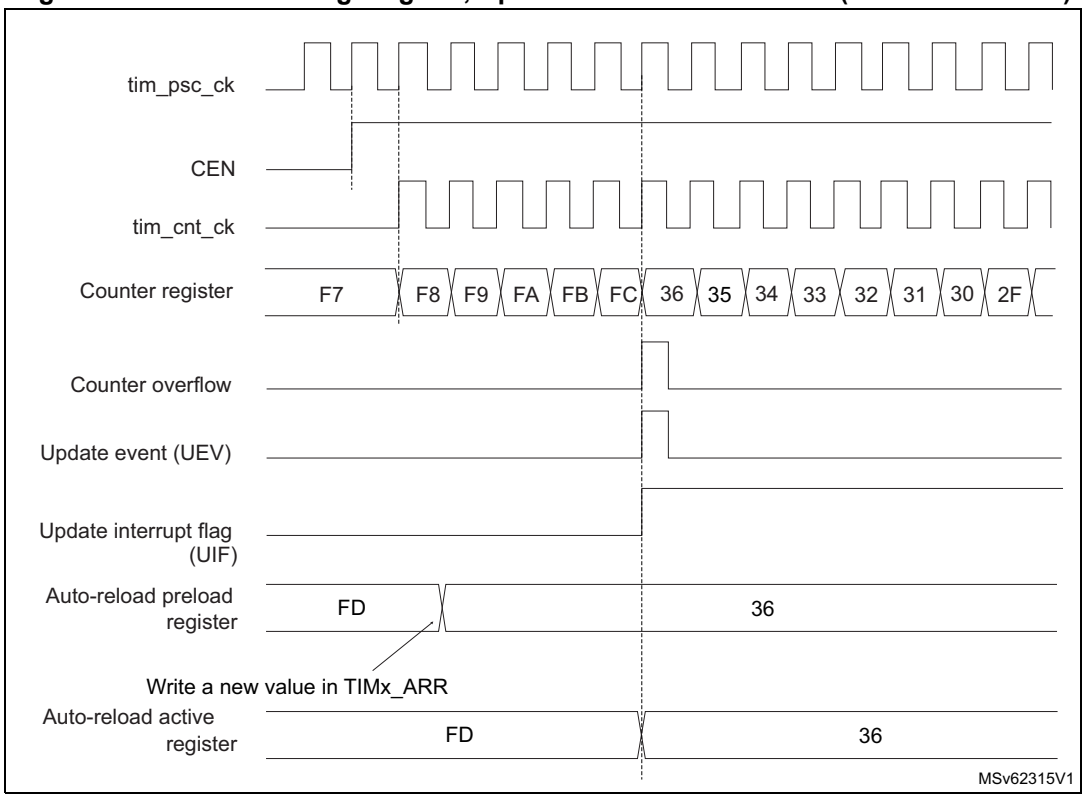


54.4.5 Clock selection

The counter clock can be provided by the following clock sources:

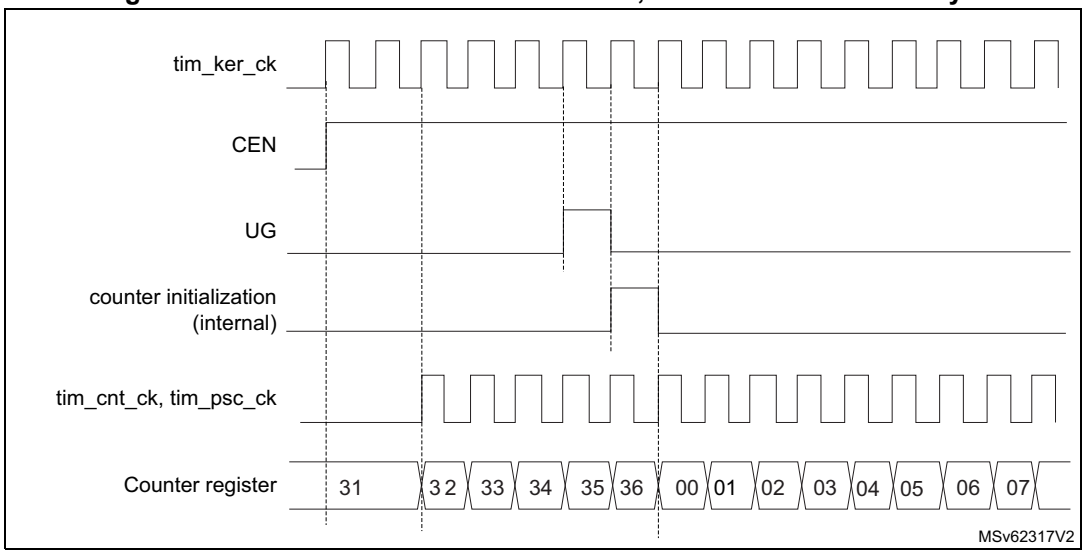
- Internal clock (tim_ker_ck).
- External clock mode1: external input pin (tim_ti1 or tim_ti2).
- External clock mode2: external trigger input (tim_etr_in).
- Internal trigger inputs (tim_itr): using one timer as prescaler for another timer, for example, timer 1 can be configured to act as a prescaler for timer 2. Refer to *Using one timer as prescaler for another timer* for more details.

Internal clock source (tim_ker_ck)

If the slave mode controller is disabled (SMS = 000 in the TIMx_SMCR register), then the CEN, DIR (in the TIMx_CR1 register), and UG bits (in the TIMx_EGR register) are actual control bits and can be changed only by software (except UG which remains cleared automatically). As soon as the CEN bit is written to 1, the prescaler is clocked by the internal clock tim_ker_ck.

Figure 557 shows the behavior of the control circuit and the upcounter in normal mode, without prescaler.

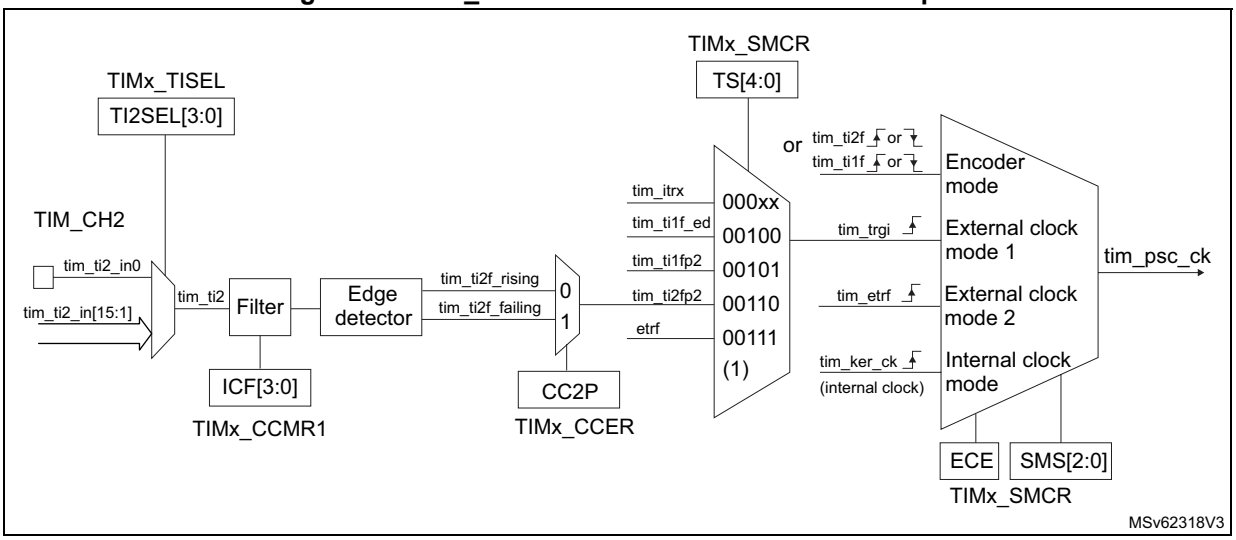
Figure 557. Control circuit in normal mode, internal clock divided by 1



External clock source mode 1

This mode is selected when SMS = 111 in the TIMx_SMCR register. The counter can count at each rising or falling edge on a selected input.

Figure 558. tim_ti2 external clock connection example



1. Codes ranging from 01000 to 11111: tim_itr[15:0].

For example, to configure the upcounter to count in response to a rising edge on the tim_ti2 input, use the following procedure:

1. Select the proper tim_ti2_in[15:0] source (internal or external) with the TI2SEL[3:0] bits in the TIMx_TISEL register.
2. Configure channel 2 to detect rising edges on the tim_ti2 input by writing CC2S= 01 in the TIMx_CCMR1 register.
3. Configure the input filter duration by writing the IC2F[3:0] bits in the TIMx_CCMR1 register (if no filter is needed, keep IC2F = 0000).

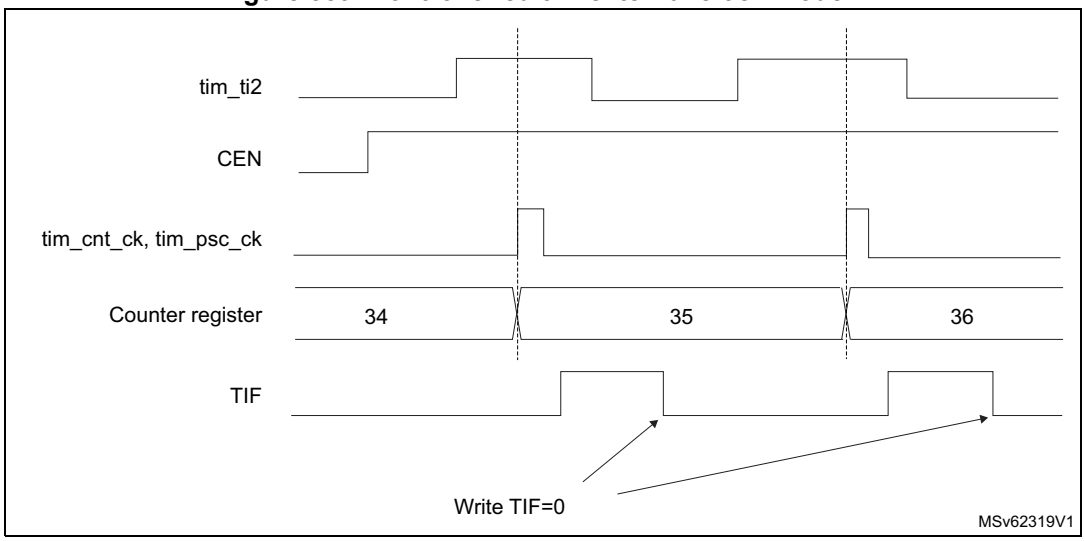
Note: The capture prescaler is not used for triggering, so it does not need to be configured.

4. Select rising edge polarity by writing CC2P = 0 and CC2NP = 0 in the TIMx_CCER register.
5. Configure the timer in external clock mode 1 by writing SMS = 111 in the TIMx_SMCR register.
6. Select tim_ti2 as the input source by writing TS = 00110 in the TIMx_SMCR register.
7. Enable the counter by writing CEN = 1 in the TIMx_CR1 register.

When a rising edge occurs on tim_ti2, the counter counts once and the TIF flag is set.

The delay between the rising edge on tim_ti2 and the actual clock of the counter is due to the resynchronization circuit on tim_ti2 input.

Figure 559. Control circuit in external clock mode 1



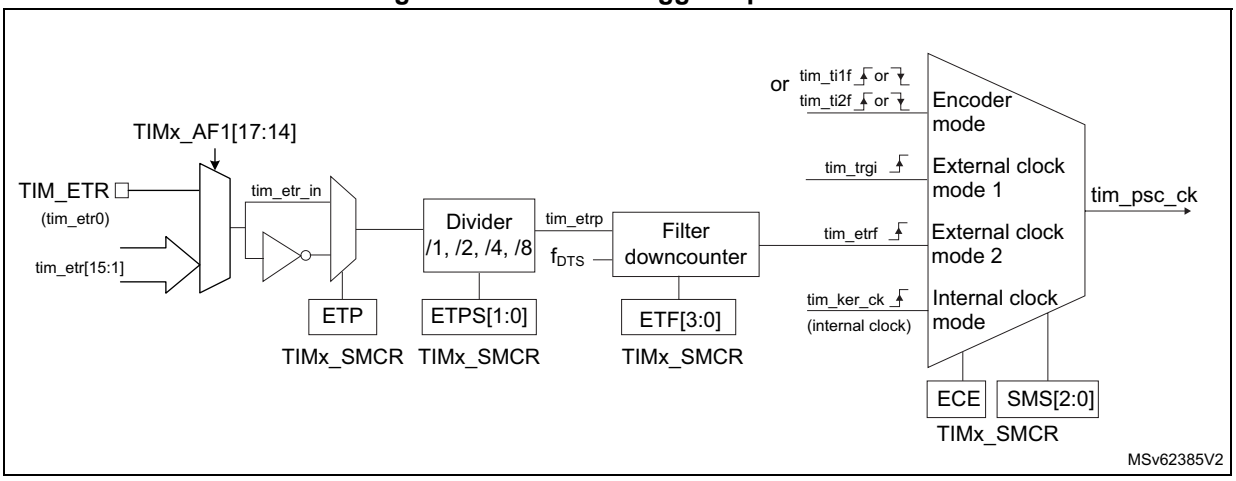
External clock source mode 2

This mode is selected by writing ECE = 1 in the TIMx_SMCR register.

The counter can count at each rising or falling edge on the external trigger input tim_etr_in.

Figure 560 gives an overview of the external trigger input block.

Figure 560. External trigger input block



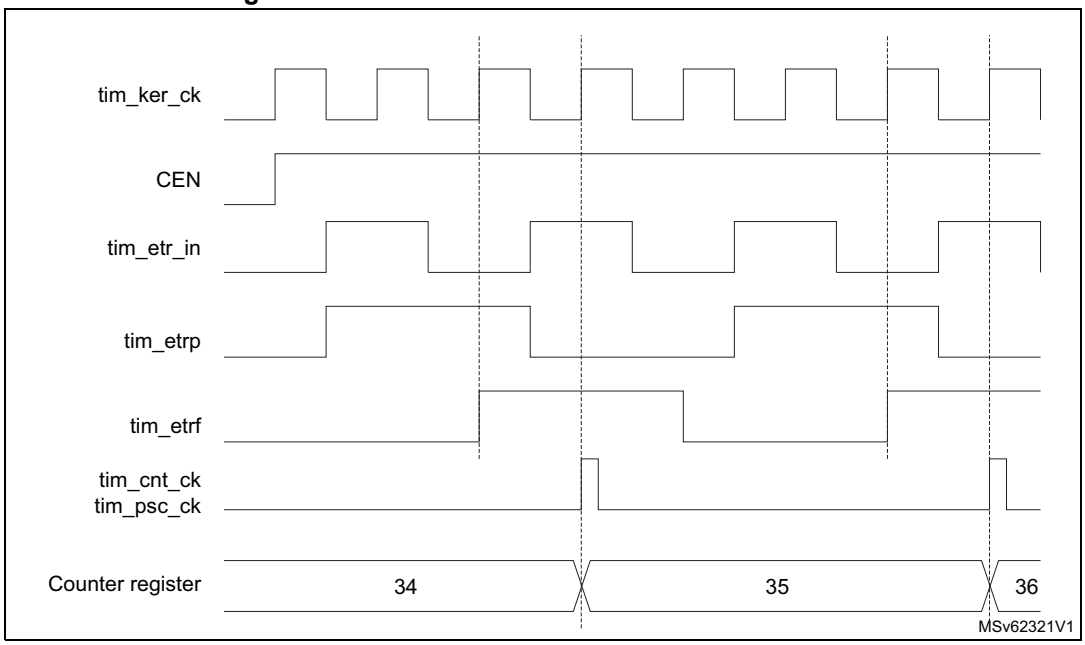
For example, to configure the upcounter to count each two rising edges on tim_etr_in, use the following procedure:

1. Select the proper tim_etr_in source (internal or external) with the ETRSEL[3:0] bits in the TIMx_AF1 register.
2. As no filter is needed in this example, write ETF[3:0] = 0000 in the TIMx_SMCR register.
3. Set the prescaler by writing ETPS[1:0] = 01 in the TIMx_SMCR register.
4. Select rising edge detection on the tim_etr_in by writing ETP = 0 in the TIMx_SMCR register.
5. Enable external clock mode 2 by writing ECE = 1 in the TIMx_SMCR register.
6. Enable the counter by writing CEN = 1 in the TIMx_CR1 register.

The counter counts once each two tim_etr_in rising edges.

The delay between the rising edge on tim_etr_in and the actual clock of the counter is due to the resynchronization circuit on the tim_etrp signal. As a consequence, the maximum frequency that can be correctly captured by the counter is at most ¼ of tim_ker_ck frequency. When the ETRP signal is faster, the user must apply a division of the external signal by a proper ETPS prescaler setting.

Figure 561. Control circuit in external clock mode 2



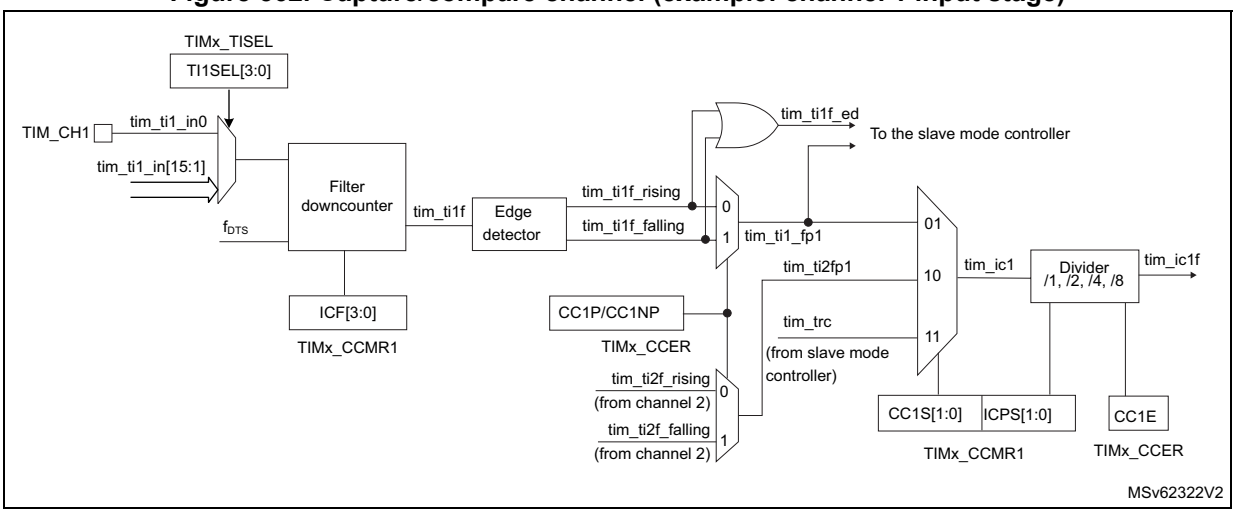
54.4.6 Capture/compare channels

Each Capture/Compare channel is built around a capture/compare register (including a shadow register), an input stage for capture (with digital filter, multiplexing and prescaler) and an output stage (with comparator and output control).

The following figure gives an overview of one Capture/Compare channel.

The input stage samples the corresponding tim_tix input to generate a filtered signal tim_tixf. Then, an edge detector with polarity selection generates a signal (tim_tixfpy) which can be used as trigger input by the slave mode controller or as the capture command. It is prescaled before the capture register (ICxPS).

Figure 562. Capture/compare channel (example: channel 1 input stage)



The output stage generates an intermediate waveform which is then used for reference: tim_ocxref (active high). The polarity acts at the end of the chain.

Figure 563. Capture/compare channel 1 main circuit

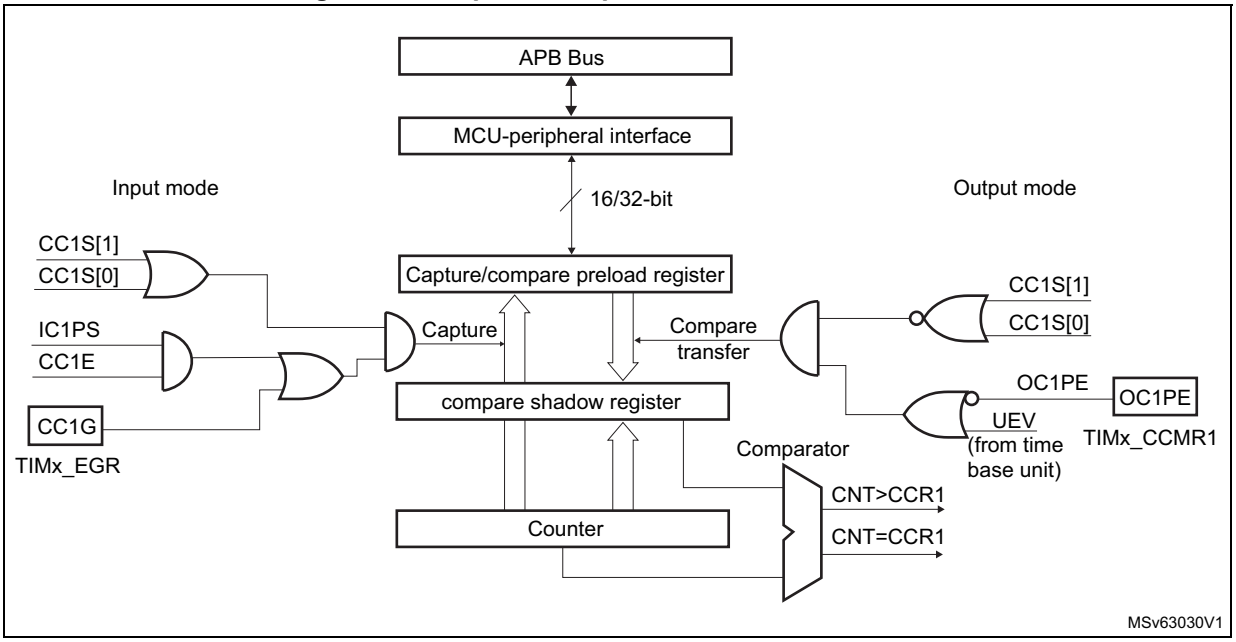


Figure 564. Output stage of capture/compare channel (channel 1, idem ch.2, 3 and 4)

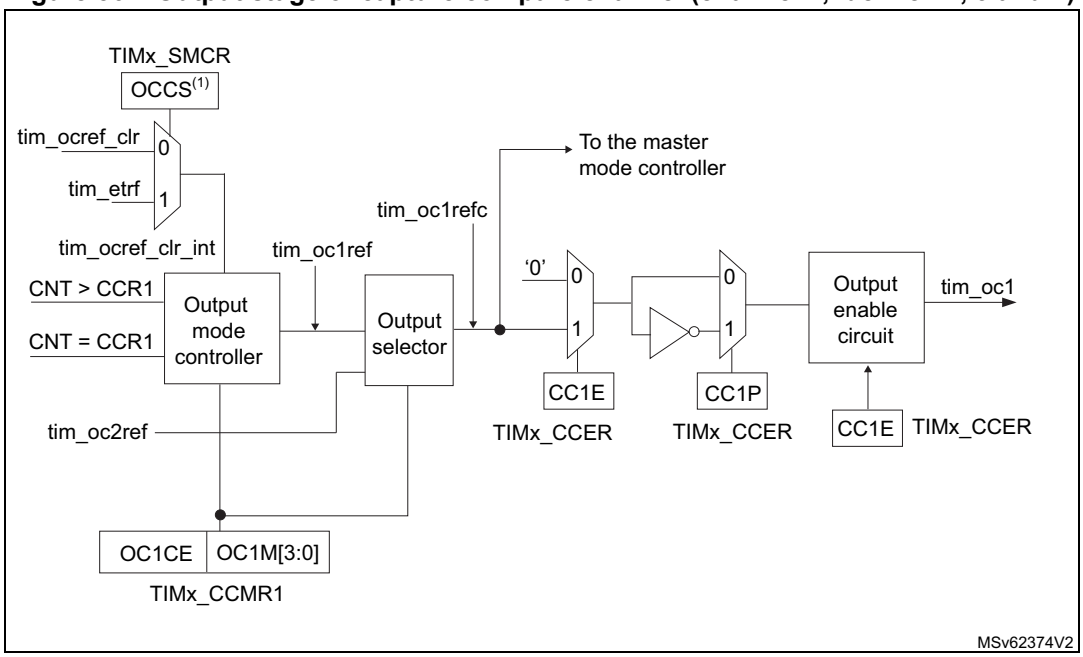


1. Available on some instances only. If not available, tim_etrf is directly connected to tim_ocref_clr_int.

The capture/compare block is made of one preload register and one shadow register. Write and read always access the preload register.

In capture mode, captures are actually done in the shadow register, which is copied into the preload register.

In compare mode, the content of the preload register is copied into the shadow register which is compared to the counter.

54.4.7 Input capture mode

In input capture mode, the capture/compare registers (TIMx_CCRx) are used to latch the value of the counter after a transition detected by the corresponding ICx signal. When a capture occurs, the corresponding CCXIF flag (TIMx_SR register) is set and an interrupt or a DMA request can be sent if they are enabled. If a capture occurs while the CCxIF flag was already high, then the overcapture flag CCxOF (TIMx_SR register) is set. CCxIF can be cleared by software by writing it to 0 or by reading the captured data stored in the TIMx_CCRx register. CCxOF is cleared when it is written with 0.

The following example shows how to capture the counter value in TIMx_CCR1 when tim_ti1 input rises. To do this, use the following procedure:

1. Select the proper tim_tix_in[15:0] source (internal or external) with the TI1SEL[3:0] bits in the TIMx_TISEL register.
2. Select the active input: TIMx_CCR1 must be linked to the tim_ti1 input, so write the CC1S bits to 01 in the TIMx_CCMR1 register. As soon as CC1S becomes different from 00, the channel is configured in input and the TIMx_CCR1 register becomes read-only.
3. Program the needed input filter duration in relation with the signal connected to the timer (when the input is one of the tim_tix (ICxF bits in the TIMx_CCMRx register). Let's imagine that, when toggling, the input signal is not stable during at most five internal clock cycles. We must program a filter duration longer than these five clock cycles. We can validate a transition on tim_ti1 when eight consecutive samples with the new level have been detected (sampled at f_{DTS} frequency). Then write IC1F bits to 0011 in the TIMx_CCMR1 register.
4. Select the edge of the active transition on the tim_ti1 channel by writing the CC1P and CC1NP bits to 000 in the TIMx_CCER register (rising edge in this case).
5. Program the input prescaler. In this example, the capture is to be performed at each valid transition, so the prescaler is disabled (write IC1PS bits to 00 in the TIMx_CCMR1 register).
6. Enable capture from the counter into the capture register by setting the CC1E bit in the TIMx_CCER register.
7. If needed, enable the related interrupt request by setting the CC1IE bit in the TIMx_DIER register, and/or the DMA request by setting the CC1DE bit in the TIMx_DIER register.

When an input capture occurs:

- The TIMx_CCR1 register gets the value of the counter on the active transition.
- CC1IF flag is set (interrupt flag). CC1OF is also set if at least two consecutive captures occurred whereas the flag was not cleared.
- An interrupt is generated depending on the CC1IE bit.
- A DMA request is generated depending on the CC1DE bit.

In order to handle the overcapture, it is recommended to read the data before the overcapture flag. This is to avoid missing an overcapture which may happen after reading the flag and before reading the data.

Note: IC interrupt and/or DMA requests can be generated by software by setting the corresponding CCxG bit in the TIMx_EGR register.

54.4.8 PWM input mode

This mode is used to measure both the period and the duty cycle of a PWM signal connected to single tim_tix input:

- The TIMx_CCR1 register holds the period value (interval between two consecutive rising edges).
- The TIMx_CCR2 register holds the pulse width (interval between two consecutive rising and falling edges).

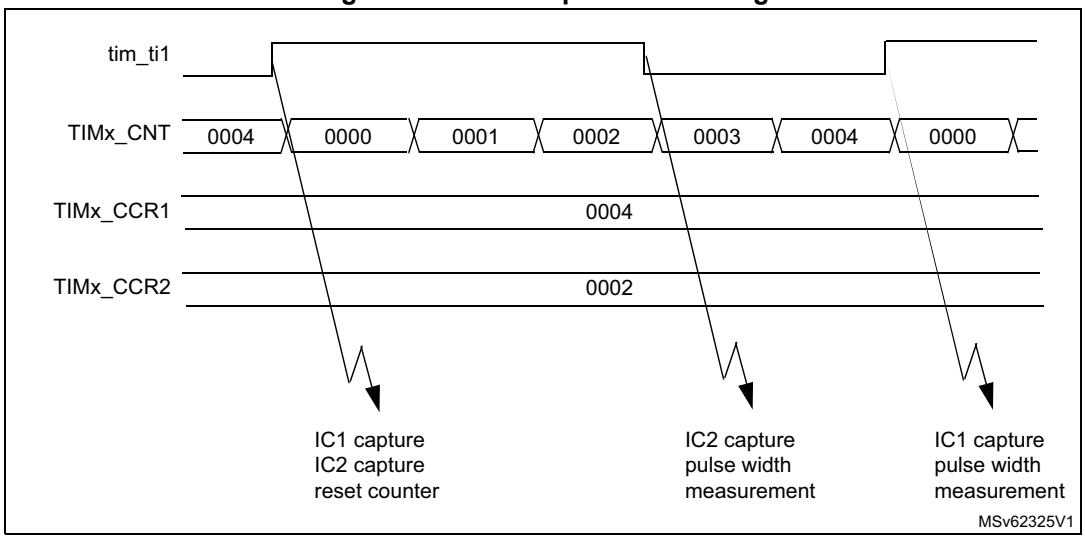
This mode is a particular case of input capture mode. The set-up procedure is similar with the following differences:

- Two ICx signals are mapped on the same tim_tix input.
- These two ICx signals are active on edges with opposite polarity.
- One of the two TIxFP signals is selected as trigger input and the slave mode controller is configured in reset mode.

The period and the pulse width of a PWM signal applied on tim_ti1 can be measured using the following procedure:

1. Select the proper tim_tix_in[15:0] source (internal or external) with the TI1SEL[3:0] bits in the TIMx_TISEL register.
2. Select the active input for TIMx_CCR1: write the CC1S bits to 01 in the TIMx_CCMR1 register (tim_ti1 selected).
3. Select the active polarity for tim_ti1fp1 (used both for capture in TIMx_CCR1 and counter clear): write the CC1P to 0 and the CC1NP bit to 0 (active on rising edge).
4. Select the active input for TIMx_CCR2: write the CC2S bits to 10 in the TIMx_CCMR1 register (tim_ti1 selected).
5. Select the active polarity for tim_ti1fp2 (used for capture in TIMx_CCR2): write the CC2P bit to 1 and the CC2NP bit to 0 (active on falling edge).
6. Select the valid trigger input: write the TS bits to 00101 in the TIMx_SMCR register (tim_ti1fp1 selected).
7. Configure the slave mode controller in reset mode: write the SMS bits to 100 in the TIMx_SMCR register.
8. Enable the captures: write the CC1E and CC2E bits to 1 in the TIMx_CCER register.

Figure 565. PWM input mode timing



1. The PWM input mode can be used only with the TIMx_CH1/TIMx_CH2 signals due to the fact that only tim_ti1fp1 and tim_ti2fp2 are connected to the slave mode controller.

54.4.9 Forced output mode

In output mode (CCxS bits = 00 in the TIMx_CCMRx register), each output compare signal (tim_ocxref and then tim_ocx) can be forced to active or inactive level directly by software, independently of any comparison between the output compare register and the counter.

To force an output compare signal (tim_ocxref/tim_ocx) to its active level, the user just needs to write 101 in the OCxM bits in the corresponding TIMx_CCMRx register. Thus tim_ocxref is forced high (tim_ocxref is always active high) and tim_ocx get opposite value to CCxP polarity bit.

For example: CCxP = 0 (tim_ocx active high) => tim_ocx is forced to high level.

tim_ocxref signal can be forced low by writing the OCxM bits to 100 in the TIMx_CCMRx register.

Anyway, the comparison between the TIMx_CCRx shadow register and the counter is still performed and allows the flag to be set. Interrupt and DMA requests can be sent accordingly. This is described in the Output Compare mode section.

54.4.10 Output compare mode

This function is used to control an output waveform or indicating when a period of time has elapsed.

When a match is found between the capture/compare register and the counter, the output compare function:

- Assigns the corresponding output pin to a programmable value defined by the output compare mode (OCxM bits in the TIMx_CCMRx register) and the output polarity (CCxP bit in the TIMx_CCER register). The output pin can keep its level (OCXM = 000), be set

active (OCxM = 001), be set inactive (OCxM = 010) or can toggle (OCxM = 011) on match.

- Sets a flag in the interrupt status register (CCxIF bit in the TIMx_SR register).
- Generates an interrupt if the corresponding interrupt mask is set (CCXIE bit in the TIMx_DIER register).
- Sends a DMA request if the corresponding enable bit is set (CCxDE bit in the TIMx_DIER register, CCDS bit in the TIMx_CR2 register for the DMA request selection).

The TIMx_CCRx registers can be programmed with or without preload registers using the OCxPE bit in the TIMx_CCMRx register.

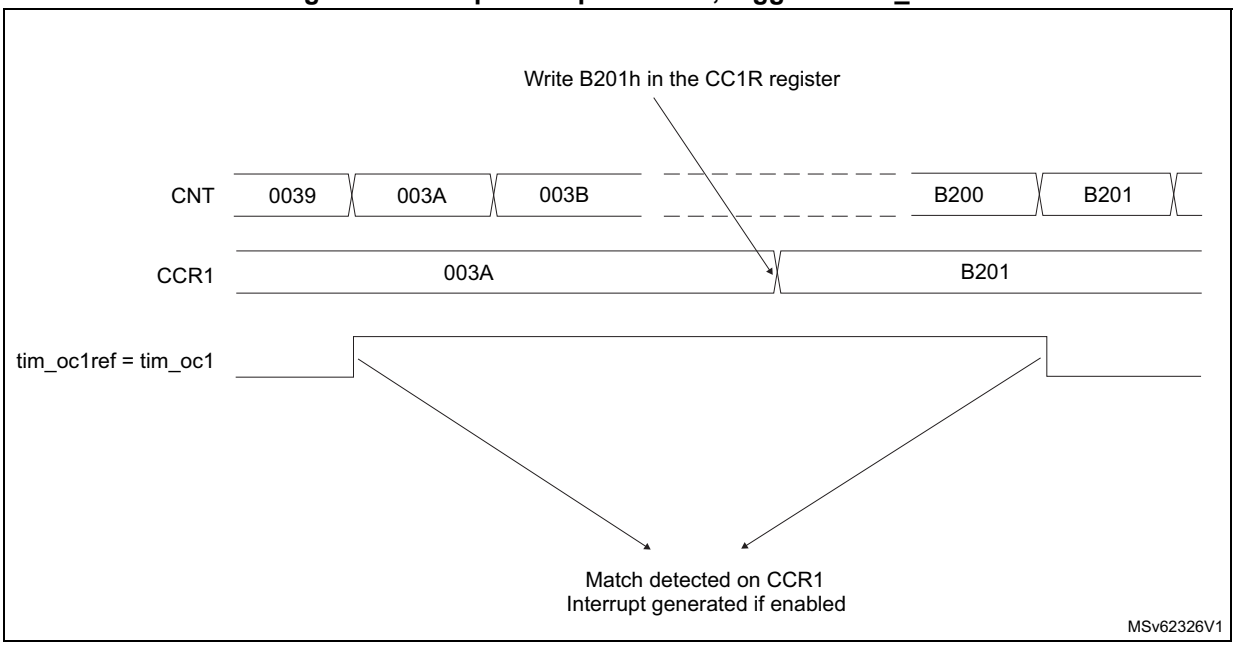
In output compare mode, the update event UEV has no effect on tim_ocxref and tim_ocx output. The timing resolution is one count of the counter. Output compare mode can also be used to output a single pulse (in One-pulse mode).

Procedure

1. Select the counter clock (internal, external, prescaler).
2. Write the desired data in the TIMx_ARR and TIMx_CCRx registers.
3. Set the CCxIE and/or CCxDE bits if an interrupt and/or a DMA request is to be generated.
4. Select the output mode. For example:
   a) Write OCxM = 0011 to toggle tim_ocx output pin when CNT matches CCRx.
   b) Write OCxPE = 0 to disable preload register.
   c) Write CCxP = 0 to select active high polarity.
   d) Write CCxE = 1 to enable the output.
5. Enable the counter by setting the CEN bit in the TIMx_CR1 register.

The TIMx_CCRx register can be updated at any time by software to control the output waveform, provided that the preload register is not enabled (OCxPE = 0, else TIMx_CCRx shadow register is updated only at the next update event UEV). An example is given in *Figure 566*.

Figure 566. Output compare mode, toggle on tim_oc1



54.4.11 PWM mode

Pulse width modulation mode is used to generate a signal with a frequency determined by the value of the TIMx_ARR register and a duty cycle determined by the value of the TIMx_CCRx register.

The PWM mode can be selected independently on each channel (one PWM per tim_ocx output) by writing 110 (PWM mode 1) or 111 (PWM mode 2) in the OCxM bits in the TIMx_CCMRx register. The corresponding preload register must be enabled by setting the OCxPE bit in the TIMx_CCMRx register, and eventually the autoreload preload register (in up-counting or center-aligned modes) by setting the ARPE bit in the TIMx_CR1 register.

As the preload registers are transferred to the shadow registers only when an update event occurs, before starting the counter, all registers must be initialized by setting the UG bit in the TIMx_EGR register.

tim_ocx polarity is software programmable using the CCxP bit in the TIMx_CCER register. It can be programmed as active high or active low. tim_ocx output is enabled by the CCxE bit in the TIMx_CCER register. Refer to the TIMx_CCERx register description for more details.

In PWM mode (1 or 2), TIMx_CNT and TIMx_CCRx are always compared to determine whether TIMx_CCRx ≤ TIMx_CNT or TIMx_CNT ≤ TIMx_CCRx (depending on the direction of the counter). The tim_ocref_clr can be cleared by an external event through the tim_etr_in or the tim_oceref_clr signals. In this case the tim_ocref_clr signal is asserted only:

- After a compare match event.
- When the output compare mode (OCxM bits in TIMx_CCMRx register) switches from the “frozen” configuration (no comparison, OCxM = 000) to one of the PWM modes (OCxM = 110 or 111). This forces the PWM by software while the timer is running.

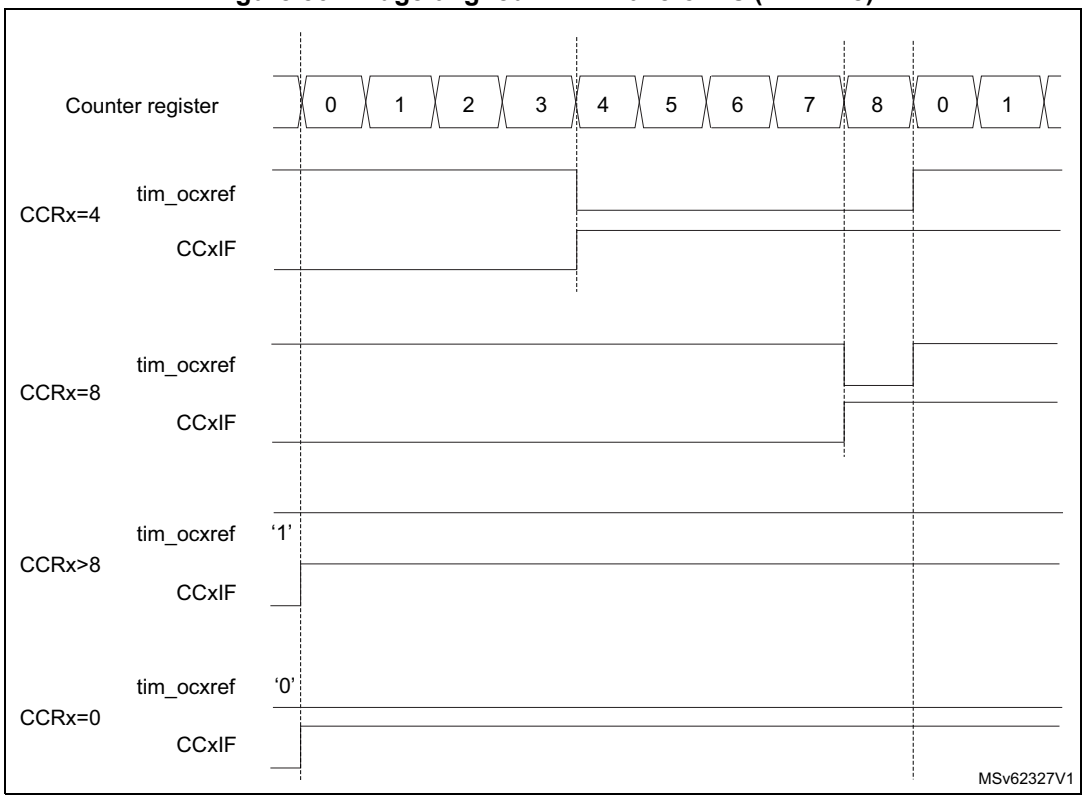
The timer is able to generate PWM in edge-aligned mode or center-aligned mode depending on the CMS bits in the TIMx_CR1 register.

PWM edge-aligned mode

- Up-counting configuration
- Up-counting is active when the DIR bit in the TIMx_CR1 register is low. Refer to *Up-counting mode*.

  In the following example, we consider PWM mode 1. The reference PWM signal tim_ocxref is high as long as TIMx_CNT <TIMx_CCRx else it becomes low. If the compare value in TIMx_CCRx is greater than the autoreload value (in TIMx_ARR) then tim_ocxref is held at 1. If the compare value is 0 then tim_ocxref is held at 0. *Figure 567* shows some edge-aligned PWM waveforms in an example where TIMx_ARR = 8.

Figure 567. Edge-aligned PWM waveforms (ARR = 8)



Down-counting configuration

- Down-counting is active when DIR bit in TIMx_CR1 register is high. Refer to *Down-counting mode*.

  In PWM mode 1, the reference signal tim_ocxref is low as long as TIMx_CNT>TIMx_CCRx else it becomes high. If the compare value in TIMx_CCRx is greater than the autoreload value in TIMx_ARR, then tim_ocxref is held at 100%. PWM is not possible in this mode.

PWM center-aligned mode

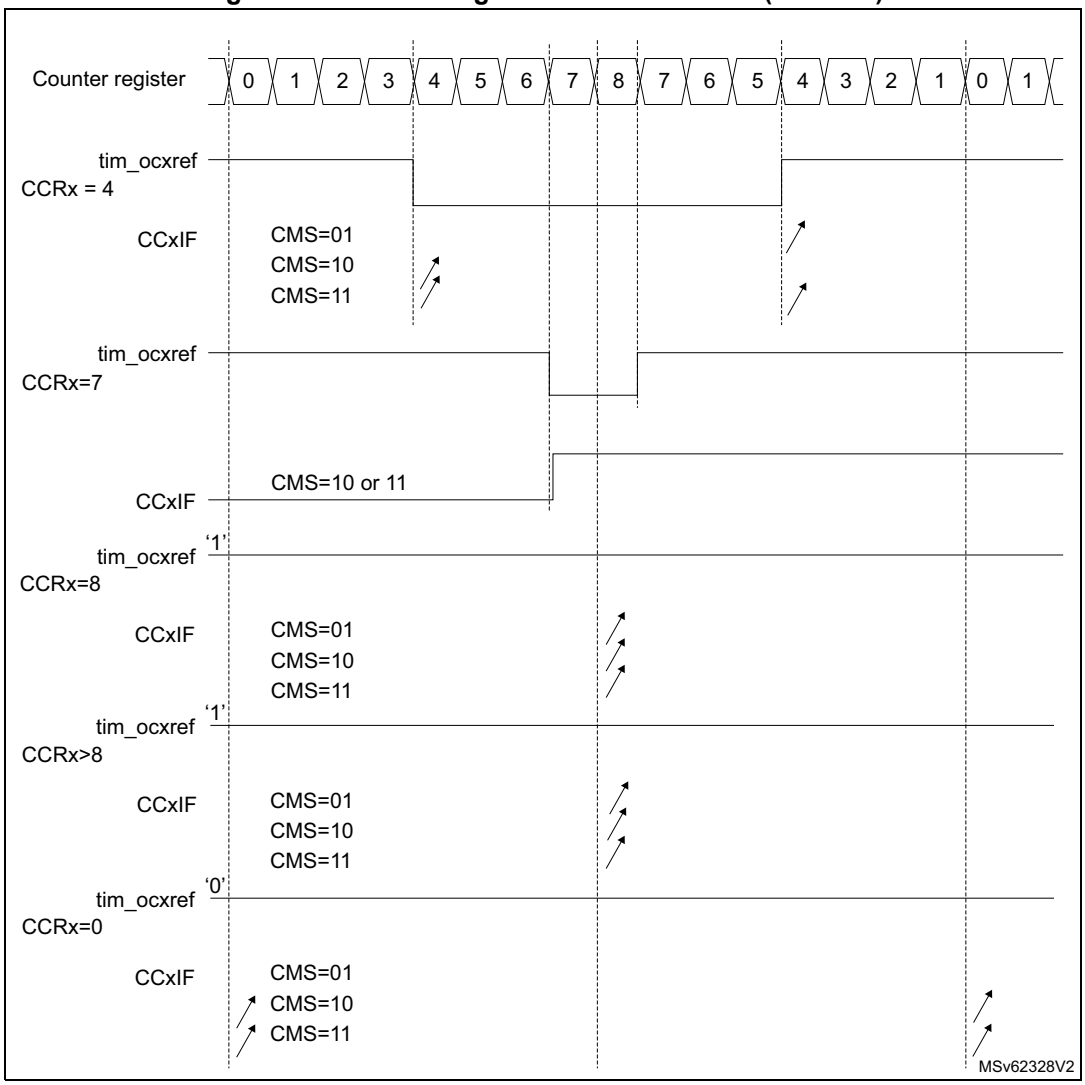
Center-aligned mode is active when the CMS bits in TIMx_CR1 register are different from 00 (all the remaining configurations having the same effect on the tim_ocxref/tim_ocx signals). The compare flag is set when the counter counts up, when it counts down or both when it counts up and down depending on the CMS bits configuration. The direction bit

(DIR) in the TIMx_CR1 register is updated by hardware and must not be changed by software. Refer to *Center-aligned mode (up/down-counting)*.

Figure 568 shows some center-aligned PWM waveforms in an example where:

- TIMx_ARR = 8.
- PWM mode is the PWM mode 1.
- The flag is set when the counter counts down corresponding to the center-aligned mode 1 selected for CMS = 01 in TIMx_CR1 register.

Figure 568. Center-aligned PWM waveforms (ARR = 8)



Hints on using center-aligned mode:

- When starting in center-aligned mode, the current up-down configuration is used. It means that the counter counts up or down depending on the value written in the DIR bit

in the TIMx_CR1 register. Moreover, the DIR and CMS bits must not be changed at the same time by the software.

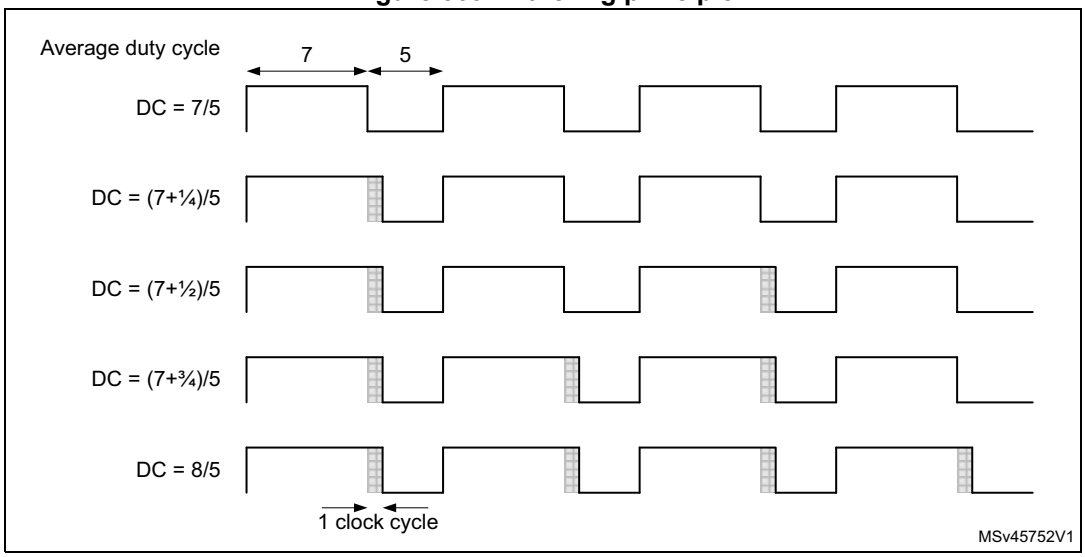
- Writing to the counter while running in center-aligned mode is not recommended as it can lead to unexpected results. In particular:
  - The direction is not updated if a value greater than the autoreload value is written in the counter (TIMx_CNT>TIMx_ARR). For example, if the counter was counting up, it continues to count up.
  - The direction is updated if 0 or the TIMx_ARR value is written in the counter but no update event UEV is generated.
- The safest way to use center-aligned mode is to generate an update by software (setting the UG bit in the TIMx_EGR register) just before starting the counter and not to write the counter while it is running.

Dithering mode

The PWM mode effective resolution can be increased by enabling the dithering mode, using the DITHEN bit in the TIMx_CR1 register. This applies to both the CCR (for duty cycle resolution increase) and ARR (for PWM frequency resolution increase).

The operating principle is to have the actual CCR (or ARR) value slightly changed (adding or not one timer clock period) over 16 consecutive PWM periods, with predefined patterns. This allows a 16-fold resolution increase, considering the average duty cycle or PWM period. *Figure 569* presents the dithering principle applied to four consecutive PWM cycles.

Figure 569. Dithering principle



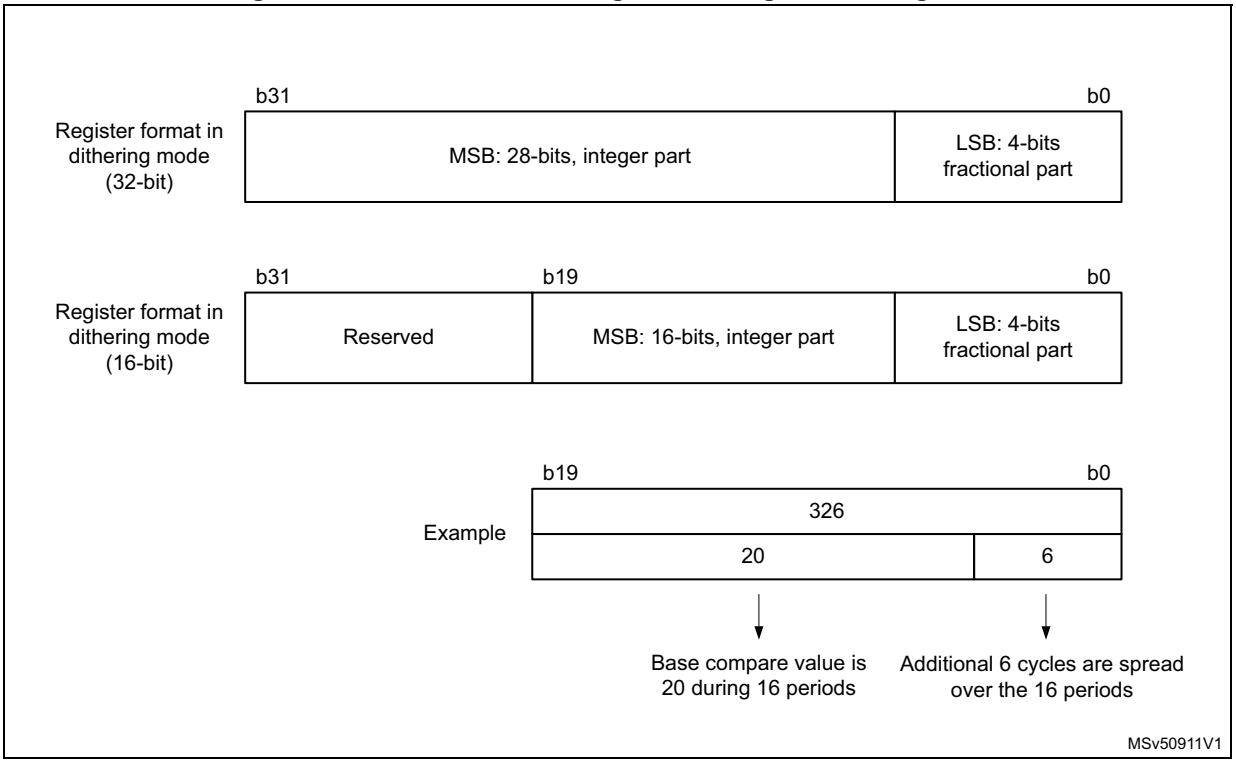
When the dithering mode is enabled, the register coding is changed as following (see *Figure 570* for example):

- The four LSBs are coding for the enhanced resolution part (fractional part).
- The MSBs are left-shifted by four places and are coding for the base value. In 16-bit mode, the 16-bit format is maintained.

Note: The following sequence must be followed when resetting the DITHEN bit:

1. *CEN and ARPE bits must be reset.*
2. *The DITHEN bit must be reset.*
3. *The CCIF flags must be cleared.*
4. *The CEN bit can be set (eventually with ARPE = 1).*

Figure 570. Data format and register coding in dithering mode



The minimum frequency is given by the following formula:

$$\text{Resolution} = \frac{F_{Tim}}{F_{pwm}} \Rightarrow F_{pwmMin} = \frac{F_{Tim}}{Max_{Resolution}}$$

$$\text{Dithering mode disabled: } F_{pwmMin} = \frac{F_{Tim}}{65536}$$

$$\text{Dithering mode (16-bit timer): } F_{pwmMin} = \frac{F_{Tim}}{65535 + \frac{15}{16}}$$

$$\text{Dithering mode (32-bit timer): } F_{pwmMin} = \frac{F_{Tim}}{268435454 + \frac{15}{16}}$$

Note: For 16-bit timers, the maximum TIMx_ARR and TIMx_CCRy values are limited to 0xFFFEF in dithering mode (corresponds to 65534 for the integer part and 15 for the dithered part). For 32-bit timers, the maximum TIMx_ARR and TIMx_CCRy values are limited to

0xFFFFFFEF in dithering mode (corresponds to 264435454 for the integer part and 15 for the dithered part).

As shown on *Figure 571* and *Figure 572*, the dithering mode is used to increase the PWM resolution.

Figure 571. PWM resolution vs frequency (16-bit mode)

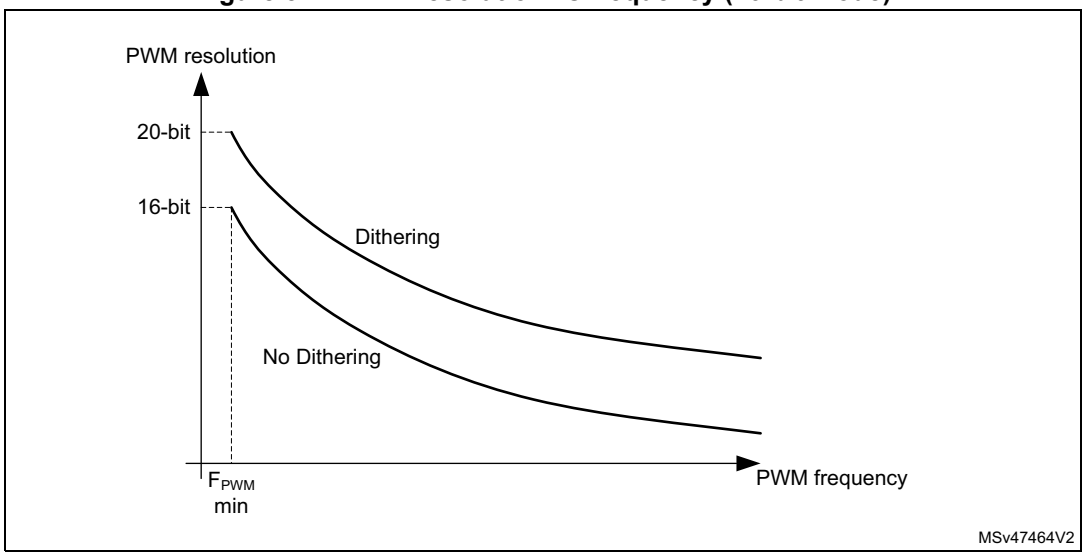


Figure 572. PWM resolution vs frequency (32-bit mode)

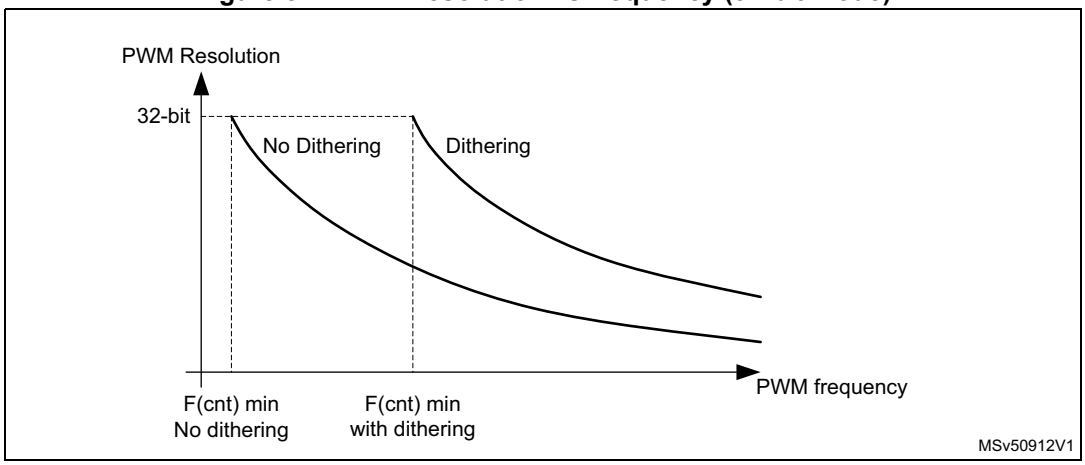
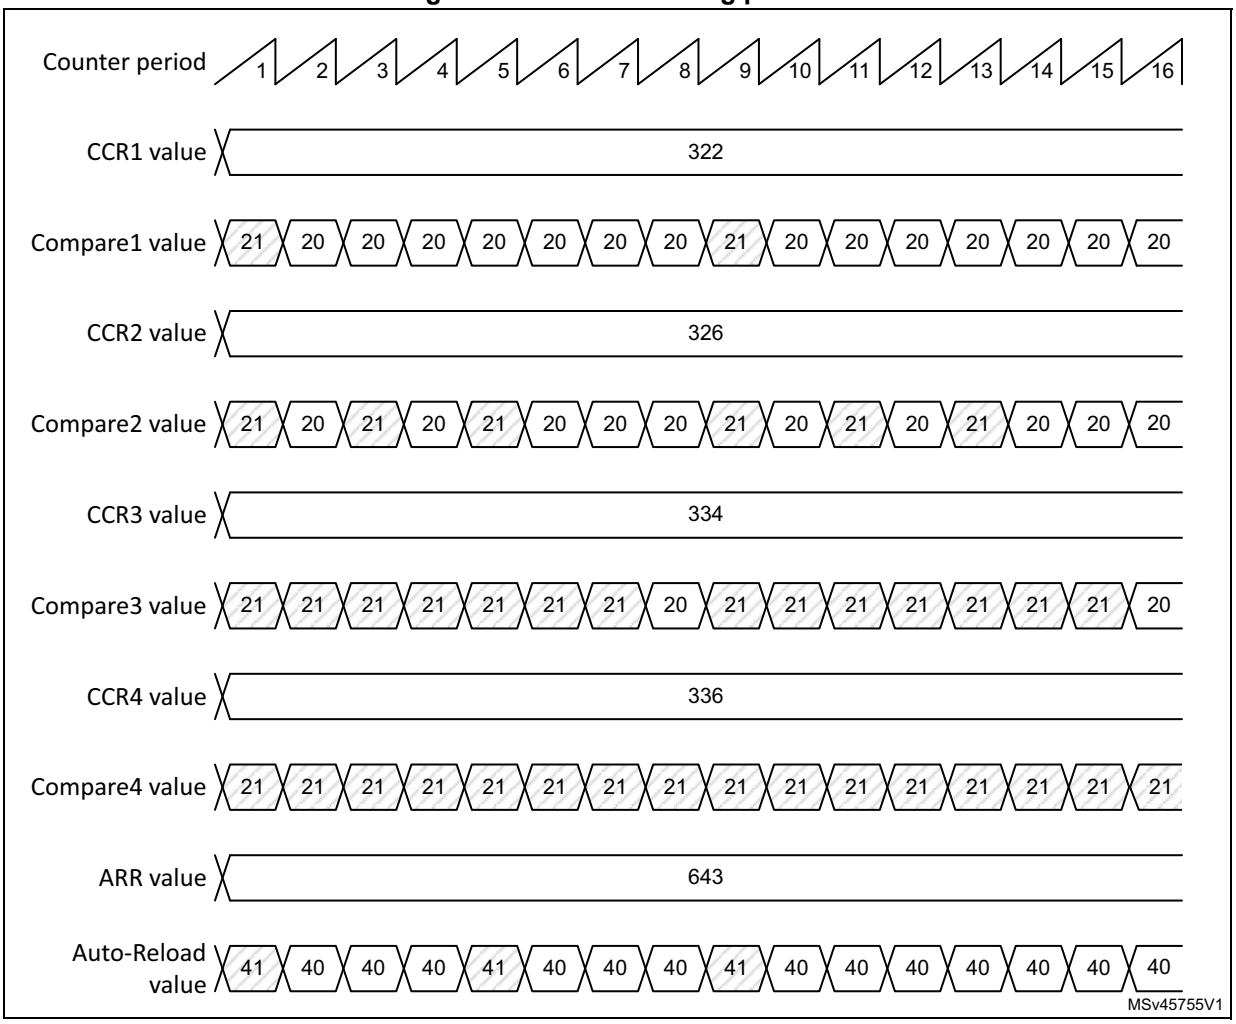


The duty cycle and/or period changes are spread over 16 consecutive periods, as described in *Figure 573*.

Figure 573. PWM dithering pattern



The autoreload and compare values increments are spread following specific patterns described in *Table 549*. The dithering sequence is done to have increments distributed as evenly as possible and minimize the overall ripple.

Table 549. CCR and ARR register change dithering pattern

LSB value	PWM period															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
0000	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
0001	+1	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
0010	+1	-	-	-	-	-	-	-	+1	-	-	-	-	-	-	-
0011	+1	-	-	-	+1	-	-	-	+1	-	-	-	-	-	-	-
0100	+1	-	-	-	+1	-	-	-	+1	-	-	-	+1	-	-	-
0101	+1	-	+1	-	+1	-	-	-	+1	-	-	-	+1	-	-	-
0110	+1	-	+1	-	+1	-	-	-	+1	-	+1	-	+1	-	-	-
0111	+1	-	+1	-	+1	-	+1	-	+1	-	+1	-	+1	-	-	-
1000	+1	-	+1	-	+1	-	+1	-	+1	-	+1	-	+1	-	+1	-
1001	+1	+1	+1	-	+1	-	+1	-	+1	-	+1	-	+1	-	+1	-
1010	+1	+1	+1	-	+1	-	+1	-	+1	+1	+1	-	+1	-	+1	-
1011	+1	+1	+1	-	+1	+1	+1	-	+1	+1	+1	-	+1	-	+1	-
1100	+1	+1	+1	-	+1	+1	+1	-	+1	+1	+1	-	+1	+1	+1	-
1101	+1	+1	+1	+1	+1	+1	+1	-	+1	+1	+1	-	+1	+1	+1	-
1110	+1	+1	+1	+1	+1	+1	+1	-	+1	+1	+1	+1	+1	+1	+1	-
1111	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	-

The dithering mode is also available in center-aligned PWM mode (CMS bits in TIMx_CR1 register are not equal to 00). In this case, the dithering pattern is applied over eight consecutive PWM periods, considering the up and down-counting phases as shown in *Figure 574*.

Figure 574. Dithering effect on duty cycle in center-aligned PWM mode

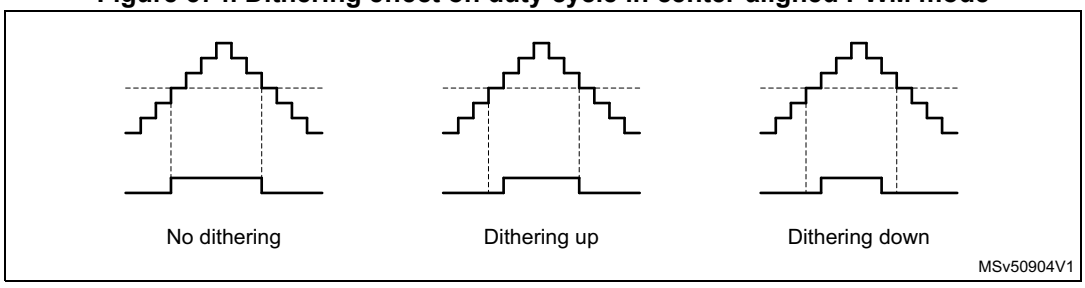


Table 550 shows how the dithering pattern is added in center-aligned PWM mode.

Table 550. CCR register change dithering pattern in center-aligned PWM mode

LSB value	PWM period															
	1		2		3		4		5		6		7		8	
	Up	Dn	Up	Dn	Up	Dn	Up	Dn	Up	Dn	Up	Dn	Up	Dn	Up	Dn

54.4.12 Asymmetric PWM mode

Asymmetric mode allows two center-aligned PWM signals to be generated with a programmable phase shift. While the frequency is determined by the value of the TIMx_ARR register, the duty cycle and the phase-shift are determined by a pair of TIMx_CCRx registers. One register controls the PWM during up-counting, the second during down-counting, so that PWM is adjusted every half PWM cycle:

- tim_oc1refc (or tim_oc2refc) is controlled by TIMx_CCR1 and TIMx_CCR2.
- tim_oc3refc (or tim_oc4refc) is controlled by TIMx_CCR3 and TIMx_CCR4.

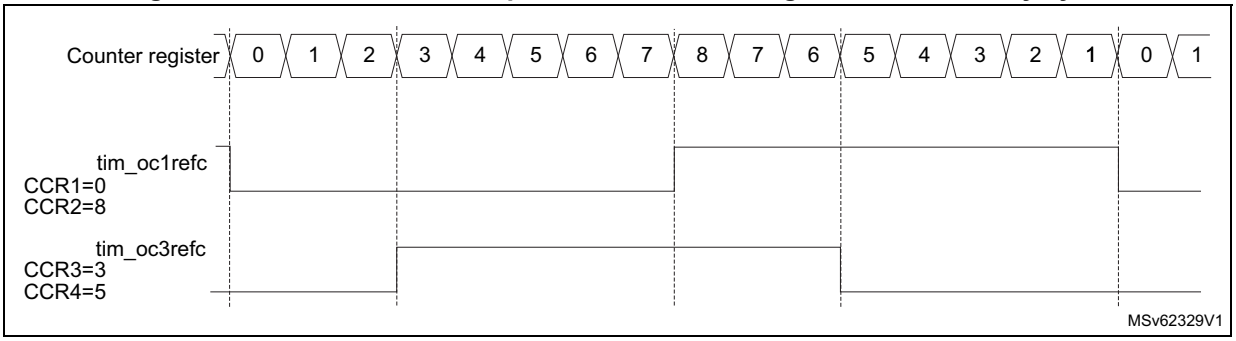
Asymmetric PWM mode can be selected independently on two channels (one tim_ocx output per pair of CCR registers) by writing 1110 (Asymmetric PWM mode 1) or 1111 (Asymmetric PWM mode 2) in the OCxM bits in the TIMx_CCMRx register.

Note: The OCxM[3:0] bitfield is split into two parts for compatibility reasons, the most significant bit is not contiguous with the three least significant ones.

When a given channel is used as asymmetric PWM channel, its secondary channel can also be used. For instance, if an tim_oc1refc signal is generated on channel 1 (Asymmetric PWM mode 1), it is possible to output either the tim_oc2ref signal on channel 2, or an tim_oc2refc signal resulting from asymmetric PWM mode 2.

Figure 575 shows an example of signals that can be generated using asymmetric PWM mode (channels 1 to 4 are configured in asymmetric PWM mode 2).

Figure 575. Generation of two phase-shifted PWM signals with 50% duty cycle



54.4.13 Combined PWM mode

Combined PWM mode allows two edge or center-aligned PWM signals to be generated with programmable delay and phase shift between respective pulses. While the frequency is determined by the value of the TIMx_ARR register, the duty cycle and delay are determined by the two TIMx_CCRx registers. The resulting signals, tim_ocxrefc, are made of an OR or AND logical combination of two reference PWMs:

- tim_oc1refc (or tim_oc2refc) is controlled by TIMx_CCR1 and TIMx_CCR2
- tim_oc3refc (or tim_oc4refc) is controlled by TIMx_CCR3 and TIMx_CCR4

Combined PWM mode can be selected independently on two channels (one tim_ocx output per pair of CCR registers) by writing 1100 (Combined PWM mode 1) or 1101 (Combined PWM mode 2) in the OCxM bits in the TIMx_CCMRx register.

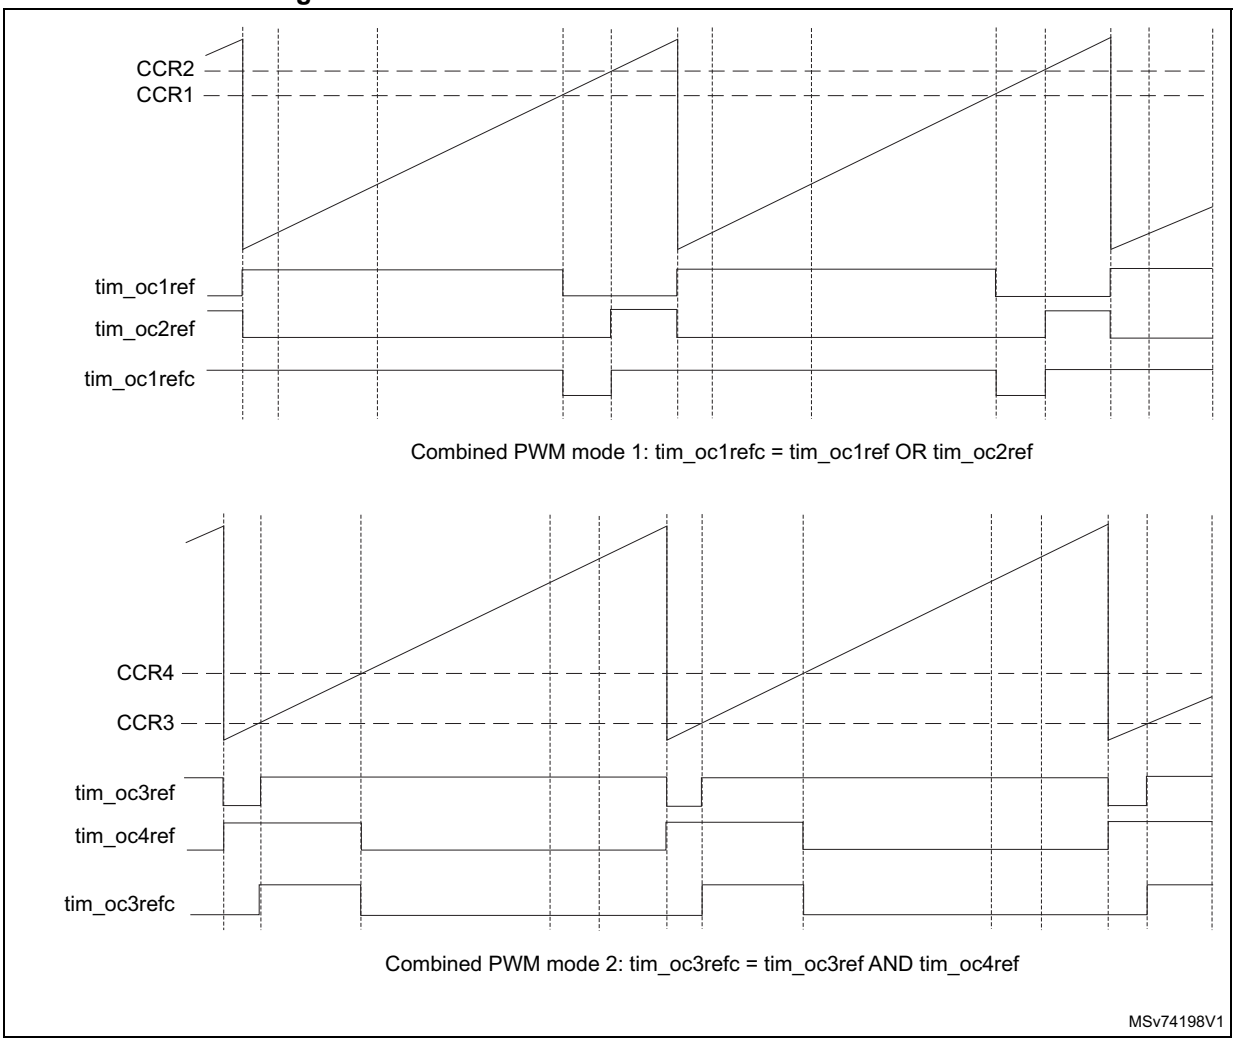
When a given channel is used as combined PWM channel, its secondary channel must be configured in the opposite PWM mode (for instance, one in Combined PWM mode 1 and the other in Combined PWM mode 2).

Note: The OCxM[3:0] bitfield is split into two parts for compatibility reasons, the most significant bit is not contiguous with the three least significant ones.

Figure 576 shows an example of signals that can be generated using combined PWM mode, obtained with the following configuration:

- Channel 1 is configured in Combined PWM mode 1.
- Channel 2 is configured in PWM mode 2.
- Channel 3 is configured in Combined PWM mode 2.
- Channel 4 is configured in PWM mode 1.

Figure 576. Combined PWM mode on channels 1 and 3



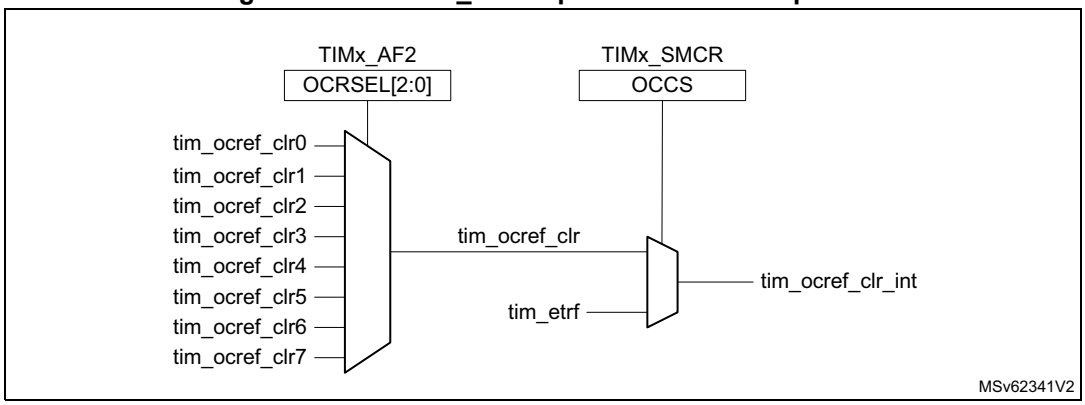
54.4.14 Clearing the tim_ocxref signal on an external event

The tim_ocxref signal of a given channel can be cleared when a high level is applied on the tim_ocref_clr_int input (OCxCE enable bit in the corresponding TIMx_CCMRx register set to 1). tim_ocxref remains low until the next transition to the active state, on the following PWM cycle. This function can only be used in Output compare and PWM modes. It does not work in Forced mode.

The tim_ocref_clr_int source depends on the OCREF clear selection feature implementation, refer to *Section 54.3: TIM2/TIM3/TIM4/TIM5 implementation*.

If the OCREF clear selection feature is implemented, the tim_ocref_clr_int can be selected between the tim_ocref_clr input and the tim_etrf input (tim_etr_in after the filter) by configuring the OCCS bit in the TIMx_SMCR register. The tim_ocref_clr input can be selected among several tim_ocref_clr[7:0] inputs, using the OCRSEL[2:0] bitfield in the TIMx_AF2 register, as shown in *Figure 577*.

Figure 577. OCREF_CLR input selection multiplexer



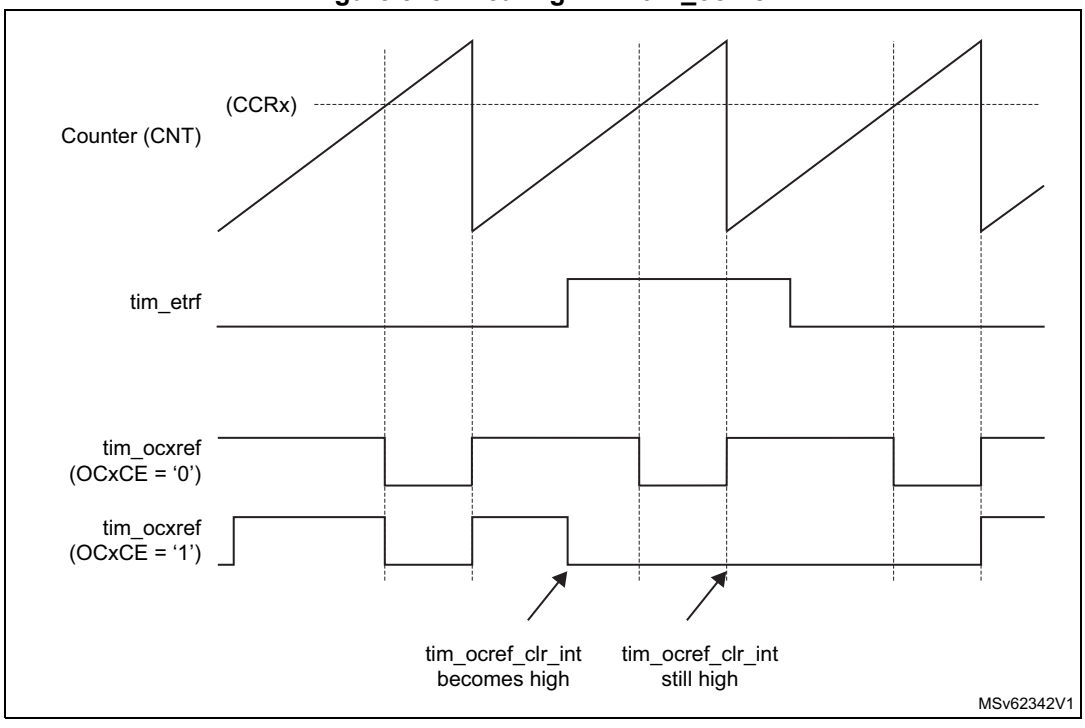
If the OCREF clear selection feature is not implemented, the tim_ocref_clr_int input is directly connected to the tim_etrf input.

For example, the tim_ocref_clr_int signal can be connected to the output of a comparator to be used for current handling. In this case, tim_etr_in must be configured as follows:

1. The external trigger prescaler must be kept off: bits ETPS[1:0] in the TIMx_SMCR register are cleared to 00.
2. The external clock mode 2 must be disabled: bit ECE in the TIMx_SMCR register is cleared to 0.
3. The external trigger polarity (ETP) and the external trigger filter (ETF) can be configured according to the application's needs.

Figure 578 shows the behavior of the tim_ocxref signal when the tim_etrf input becomes high, for both values of the OCxCE enable bit. In this example, the timer TIMx is programmed in PWM mode.

Figure 578. Clearing TIMx tim_ocxref



Note: In case of a PWM with a 100% duty cycle (if CCRx>ARR), tim_ocxref is enabled again at the next counter overflow.

54.4.15 One-pulse mode

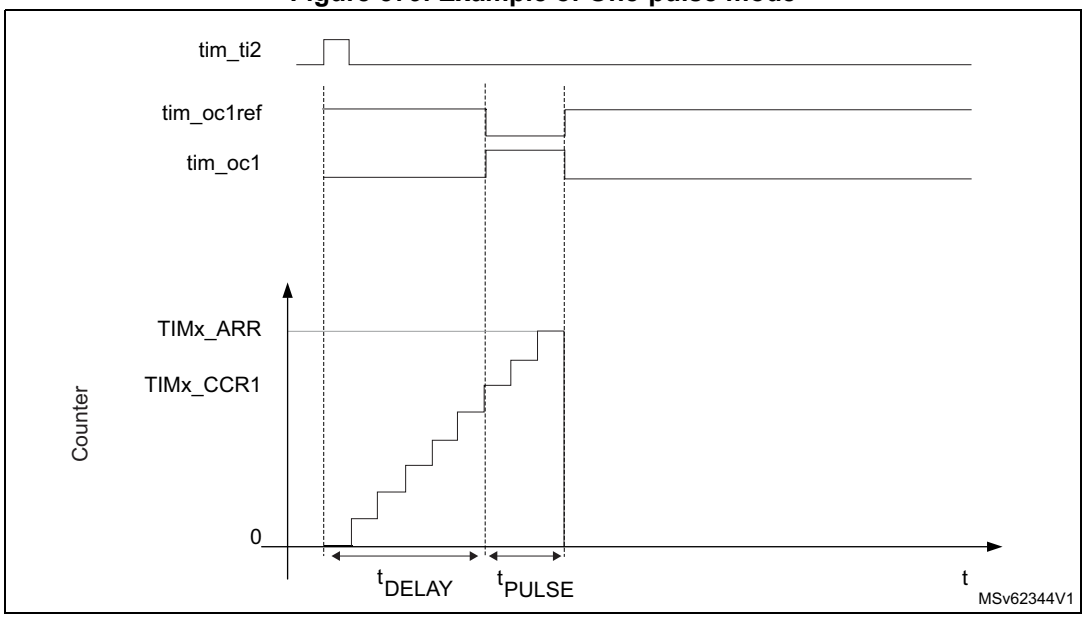
One-pulse mode (OPM) is a particular case of the previous modes. It allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length after a programmable delay.

Starting the counter can be controlled through the slave mode controller. Generating the waveform can be done in output compare mode or PWM mode. One-pulse mode is selected by setting the OPM bit in the TIMx_CR1 register. This makes the counter stop automatically at the next update event UEV.

A pulse can be correctly generated only if the compare value is different from the counter initial value. Before starting (when the timer is waiting for the trigger), the configuration must be:

CNT<CCRx ≤ ARR (in particular, 0<CCRx).

Figure 579. Example of One-pulse mode



For example if the user wants to generate a positive pulse on tim_oc1 with a length of t_{PULSE} and after a delay of t_{DELAY} as soon as a positive edge is detected on the tim_ti2 input pin.

Use tim_ti2fp2 as trigger 1:

1. Select the proper tim_ti2_in[15:0] source (internal or external) with the TI2SEL[3:0] bits in the TIMx_TISEL register.
2. Map tim_ti2fp2 on tim_ti2 by writing CC2S = 01 in the TIMx_CCMR1 register.
3. tim_ti2fp2 must detect a rising edge, write CC2P = 0 and CC2NP = 0 in the TIMx_CCER register.
4. Configure tim_ti2fp2 as trigger for the slave mode controller (tim_trgi) by writing TS = 00110 in the TIMx_SMCR register.
5. tim_ti2fp2 is used to start the counter by writing SMS to 110 in the TIMx_SMCR register (trigger mode).

The OPM waveform is defined by writing the compare registers (taking into account the clock frequency and the counter prescaler).

- The t_{DELAY} is defined by the value written in the TIMx_CCR1 register.
- The t_{PULSE} is defined by the difference between the autoreload value and the compare value (TIMx_ARR - TIMx_CCR1).
- Suppose the user wants to build a waveform with a transition from 0 to 1 when a compare match occurs and a transition from 1 to 0 when the counter reaches the autoreload value. To do this PWM mode 2 must be enabled by writing OC1M = 111 in the TIMx_CCMR1 register. Optionally the preload registers can be enabled by writing OC1PE = 1 in the TIMx_CCMR1 register and ARPE in the TIMx_CR1 register. In this case one has to write the compare value in the TIMx_CCR1 register, the autoreload value in the TIMx_ARR register, generate an update by setting the UG bit and wait for external trigger event on tim_ti2. CC1P is written to 0 in this example.

In this example, the DIR and CMS bits in the TIMx_CR1 register must be low.

Since only one pulse (Single mode) is needed, a one must be written in the OPM bit in the TIMx_CR1 register to stop the counter at the next update event (when the counter rolls over from the autoreload value back to 0). When OPM bit in the TIMx_CR1 register is set to 0, so the Repetitive mode is selected.

Particular case: tim_ocx fast enable:

In One-pulse mode, the edge detection on tim_tix input set the CEN bit which enables the counter. Then the comparison between the counter and the compare value makes the output toggle. But several clock cycles are needed for these operations and it limits the minimum delay t_{DELAY} min we can get.

If one wants to output a waveform with the minimum delay, the OCxFE bit can be set in the TIMx_CCMRx register. Then tim_ocxref (and tim_ocx) is forced in response to the stimulus, without taking in account the comparison. Its new level is the same as if a compare match had occurred. OCxFE acts only if the channel is configured in PWM1 or PWM2 mode.

54.4.16 Retriggerable one-pulse mode

This mode allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length, but with the following differences with non-retriggerable one-pulse mode described in *Section 54.4.15*:

- The pulse starts as soon as the trigger occurs (no programmable delay).
- The pulse is extended if a new trigger occurs before the previous one is completed.

The timer must be in Slave mode, with the bits SMS[3:0] = 1000 (Combined Reset + trigger mode) in the TIMx_SMCR register, and the OCxM[3:0] bits set to 1000 or 1001 for Retriggerable OPM mode 1 or 2.

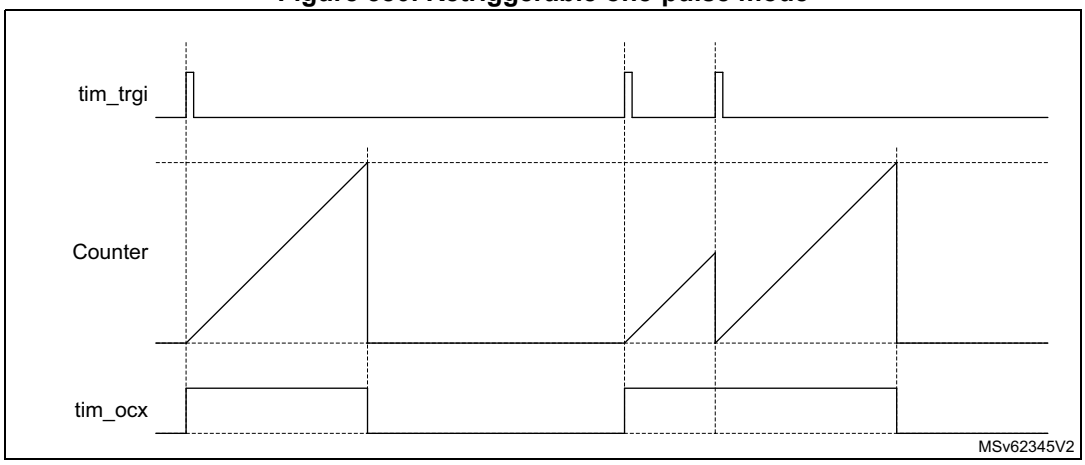
If the timer is configured in Up-counting mode, the corresponding CCRx must be set to 0 (the ARR register sets the pulse length). If the timer is configured in down-counting mode CCRx must be above or equal to ARR.

Note: In Retriggerable one-pulse mode, the CCxIF flag is not significant.

The OCxM[3:0] and SMS[3:0] bitfields are split into two parts for compatibility reasons, the most significant bit is not contiguous with the three least significant ones.

This mode must not be used with center-aligned PWM modes. It is mandatory to have CMS[1:0] = 00 in TIMx_CR1.

Figure 580. Retriggerable one-pulse mode



54.4.17 Pulse on compare mode

A pulse can be generated upon compare match event. A signal with a programmable pulse width generated when the counter value equals a given compare value, for debugging or synchronization purposes.

This mode is available for any slave mode selection, including encoder modes, in edge and center aligned counting modes. It is solely available for channel 3 and channel 4. The pulse generator is unique and is shared by the two channels, as shown on *Figure 581*.

Figure 581. Pulse generator circuitry

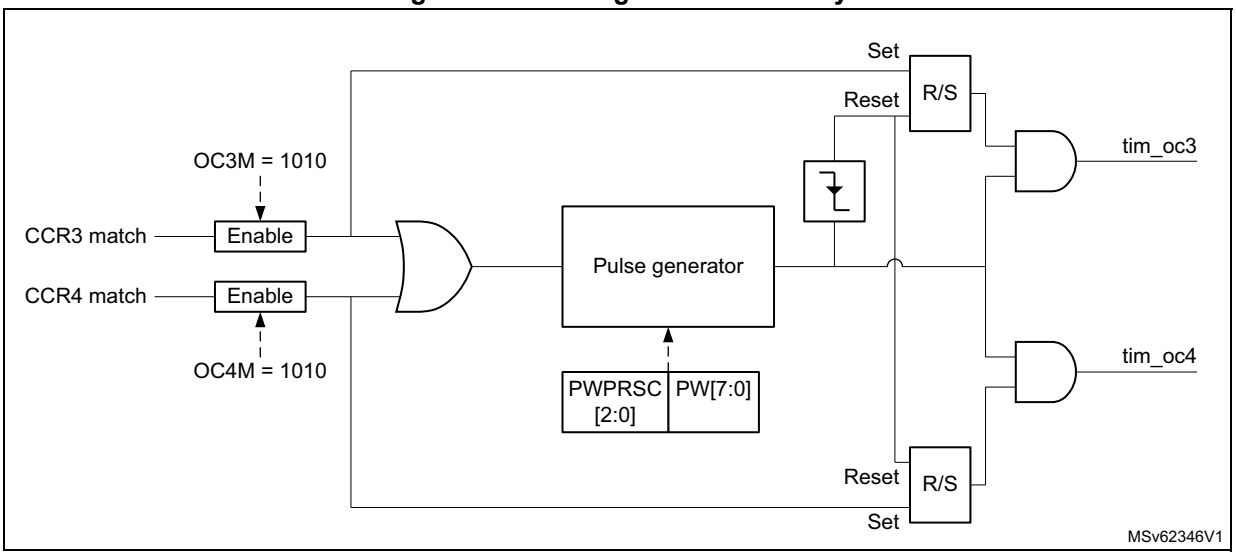


Figure 582 shows how the pulse is generated for edge-aligned and encoder operating modes.

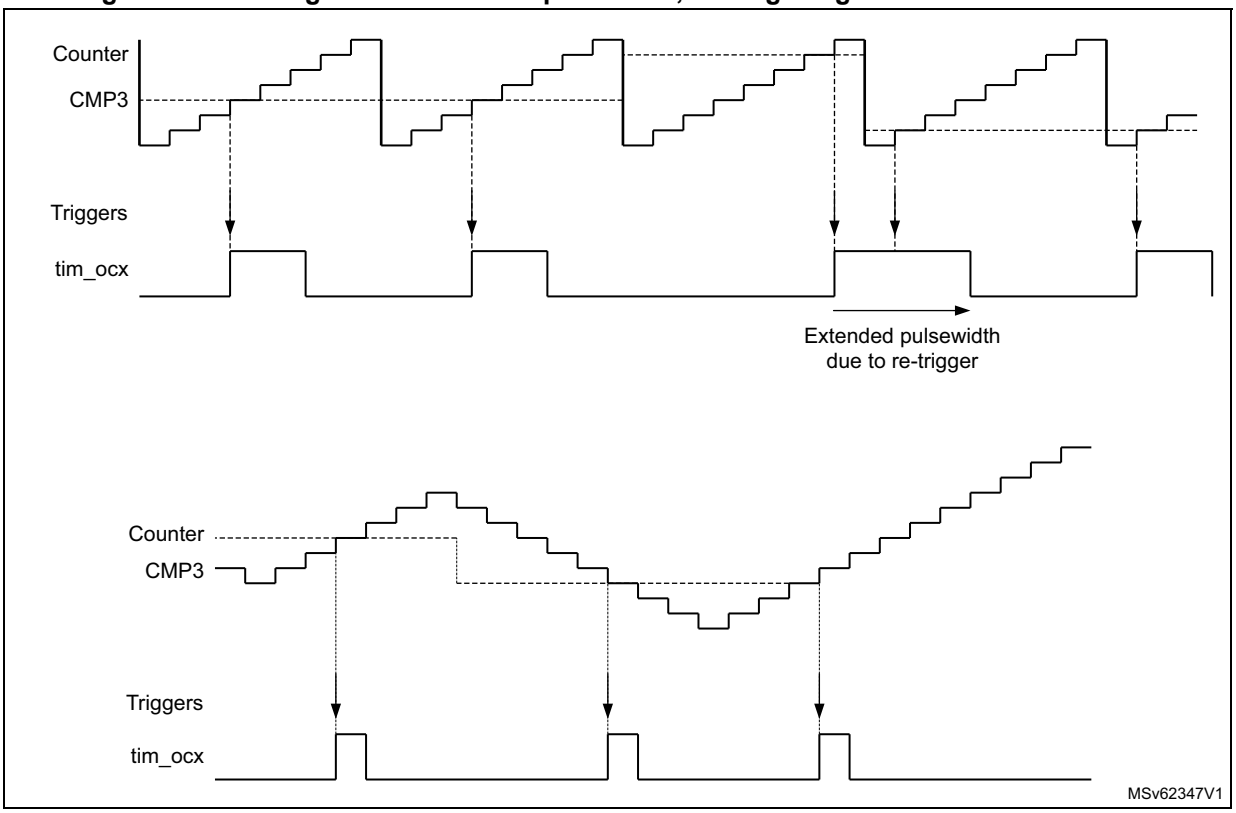
Figure 582. Pulse generation on compare event, for edge-aligned and encoder modes



This output compare mode is selected using the OC3M[3:0] and OC4M[3:0] bitfields in TIMx_CCMR2 register.

The pulse width is programmed using the PW[7:0] bitfield in the register, using a specific clock prescaled according to PWPRSC[2:0] bits, as follows:

$t_{PW} = PW[7:0] \times t_{PWG}$

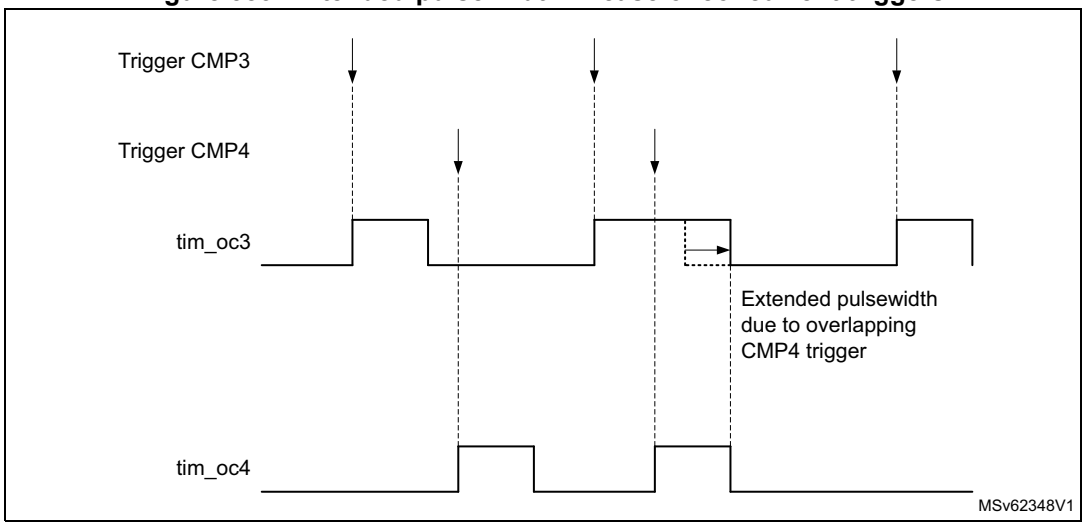
where $t_{PWG} = (2^{(PWPRSC[2:0])}) \times t_{tim_ker_ck}$.

gives the resolution and maximum values depending on the prescaler value.

The pulse is retriggerable: a new trigger while the pulse is ongoing, causes the pulse to be extended.

Note: If the two channels are enabled simultaneously, the pulses are issued independently as long as the trigger on one channel is not overlapping the pulse generated on the concurrent output. On the opposite, if the two triggers are overlapping, the pulse width related to the first arriving trigger is extended (because of the retrigger), while the pulse width of the last arriving trigger is correct (as shown on Figure 583).

Figure 583. Extended pulse width in case of concurrent triggers



54.4.18 Encoder interface mode

Quadrature encoder

To select Encoder interface mode write SMS = 0001 in the TIMx_SMCR register if the counter is counting on tim_ti1 edges only, SMS = 0010 if it is counting on tim_ti2 edges only and SMS = 0011 if it is counting on both tim_ti1 and tim_ti2 edges.

Select the tim_ti1 and tim_ti2 polarity by programming the CC1P and CC2P bits in the TIMx_CCER register. CC1NP and CC2NP must be kept cleared. When needed, the input filter can be programmed as well.

The two inputs tim_ti1 and tim_ti2 are used to interface to an incremental encoder. Refer to *Table 551*. The counter is clocked by each valid transition on tim_ti1fp1 or tim_ti2fp2 (tim_ti1 and tim_ti2 after input filter and polarity selection, tim_ti1fp1 = tim_ti1 if not filtered and not inverted, tim_ti2fp2 = tim_ti2 if not filtered and not inverted) assuming that it is enabled (CEN bit in TIMx_CR1 register written to 1). The sequence of transitions of the two inputs is evaluated and generates count pulses as well as the direction signal. Depending on the sequence the counter counts up or down, the DIR bit in the TIMx_CR1 register is modified by hardware accordingly. The DIR bit is calculated at each transition on any input (tim_ti1 or

tim_ti2), whatever the counter is counting on tim_ti1 only, tim_ti2 only or both tim_ti1 and tim_ti2.

Encoder interface mode acts simply as an external clock with direction selection. This means that the counter just counts continuously between 0 and the autoreload value in the TIMx_ARR register (0 to ARR or ARR down to 0 depending on the direction). So the TIMx_ARR must be configured before starting. In the same way, the capture, compare, prescaler, trigger output features continue to work as normal. Encoder mode and External clock mode 2 are not compatible and must not be selected together.

In this mode, the counter is modified automatically following the speed and the direction of the quadrature encoder and its content, therefore, always represents the encoder's position. The count direction corresponds to the rotation direction of the connected sensor. The table summarizes the possible combinations, assuming tim_ti1 and tim_ti2 do not switch at the same time.

Table 551. Counting direction versus encoder signals(CC1P = CC2P = 0)

Active edge	SMS[3:0]	Level on opposite signal (tim_ti1fp1 for tim_ti2, tim_ti2fp2 for tim_ti1)	tim_ti1fp1 signal		tim_ti2fp2 signal	
			Rising	Falling	Rising	Falling
Counting on tim_ti1 only x1 mode	1110	High	Down	Up	No count	No count
		Low	No count	No count	No count	No count
Counting on tim_ti2 only x1 mode	1111	High	No count	No count	Up	Down
		Low	No count	No count	No count	No count
Counting on tim_ti1 only x2 mode	0001	High	Down	Up	No count	No count
		Low	Up	Down	No count	Down
Counting on tim_ti2 only x2 mode	0010	High	No count	No count	Up	Down
		Low	No count	No count	Down	Up
Counting on tim_ti1 and tim_ti2 x4 mode	0011	High	Down	Up	Up	Down
		Low	Up	Down	Down	Up

A quadrature encoder can be connected directly to the MCU without external interface logic. However, comparators are normally be used to convert the encoder's differential outputs to digital signals. This greatly increases noise immunity. The third encoder output which indicates the mechanical zero position, can be connected to the external trigger input and trigger a counter reset.

Figure 584 gives an example of counter operation, showing count signal generation and direction control. It also shows how input jitter is compensated where both edges are

selected. This might occur if the sensor is positioned near to one of the switching points. For this example we assume that the configuration is the following:

- CC1S = 01 (TIMx_CCMR1 register, tim_ti1fp1 mapped on tim_ti1).
- CC2S = 01 (TIMx_CCMR1 register, tim_ti2fp2 mapped on tim_ti2).
- CC1P and CC1NP = 0 (TIMx_CCER register, tim_ti1fp1 noninverted, tim_ti1fp1 = tim_ti1).
- CC2P and CC2NP = 0 (TIMx_CCER register, tim_ti2fp2 noninverted, tim_ti2fp2 = tim_ti2).
- SMS = 0011 (TIMx_SMCR register, both inputs are active on both rising and falling edges).
- CEN = 1 (TIMx_CR1 register, counter is enabled).

Figure 584. Example of counter operation in encoder interface mode

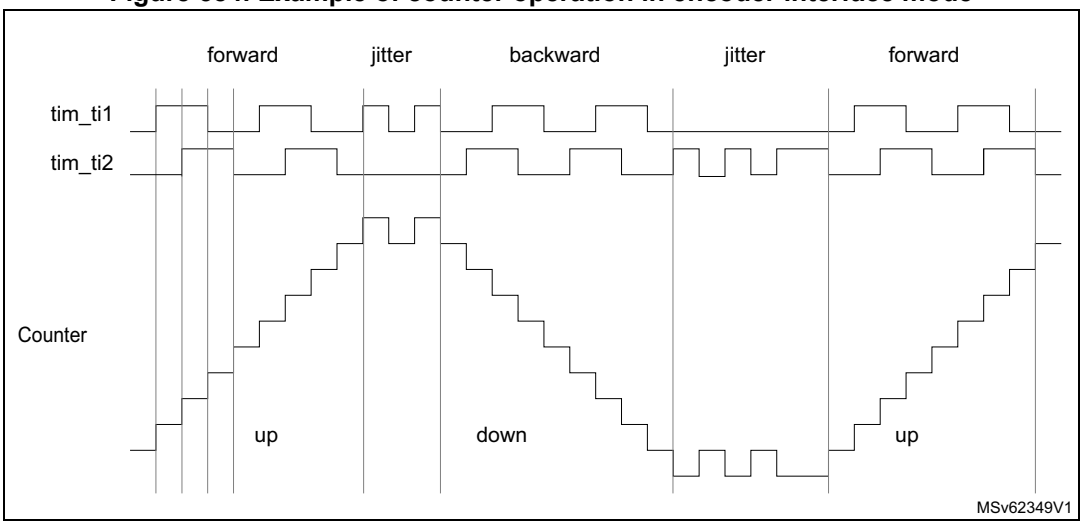


Figure 585 gives an example of counter behavior when tim_ti1fp1 polarity is inverted (same configuration as above except CC1P = 1).

Figure 585. Example of encoder interface mode with tim_ti1fp1 polarity inverted

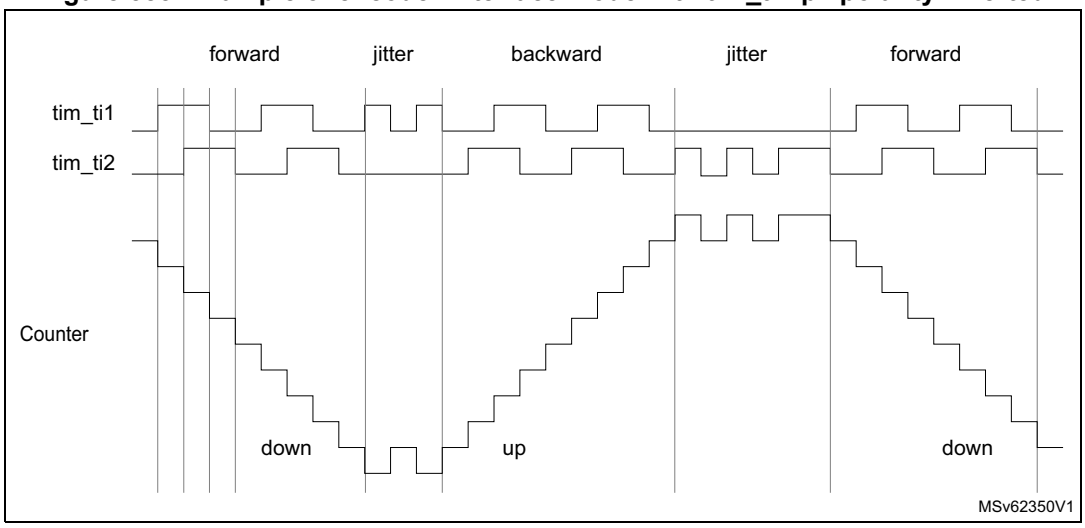

Figure 586 shows the timer counter value during a speed reversal, for various counting modes.

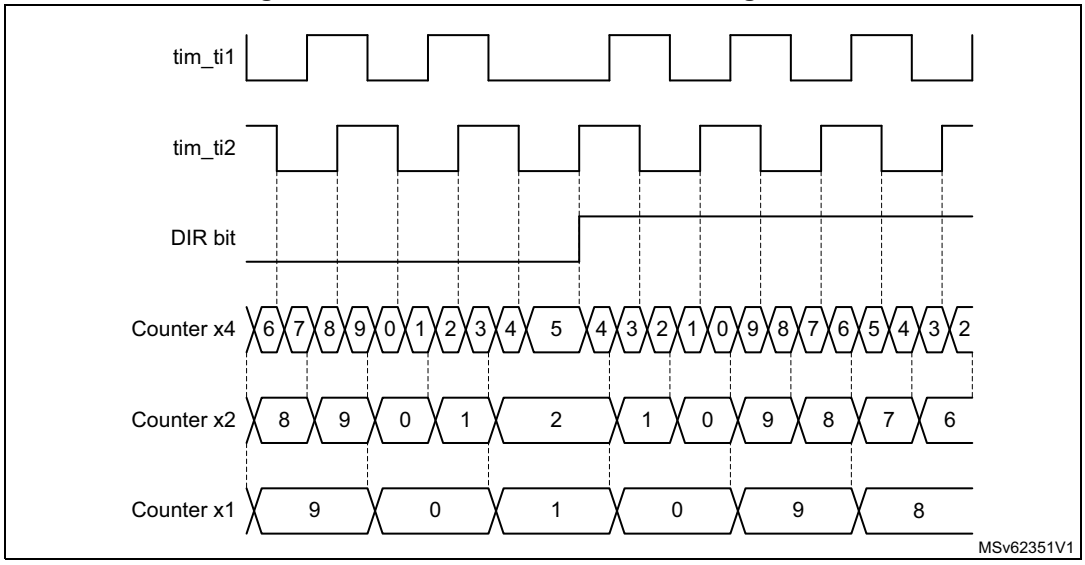
Figure 586. Quadrature encoder counting modes



The timer, when configured in Encoder Interface mode provides information on the sensor's current position. Dynamic information can be obtained (speed, acceleration, deceleration) by measuring the period between two encoder events using a second timer configured in capture mode. The output of the encoder which indicates the mechanical zero can be used for this purpose. Depending on the time between two events, the counter can also be read at regular times. This can be done by latching the counter value into a third input capture register if available (then the capture signal must be periodic and can be generated by another timer). When available, it is also possible to read its value through a DMA request.

The IUFREMAP bit in the TIMx_CR1 register forces a continuous copy of the update interrupt flag (UIF) into the timer counter register's bit 31 (TIMx_CNT[31]). This allows both the counter value and a potential roll-over condition signaled by the UIFCPY flag to be read in an atomic way. It eases the calculation of angular speed by avoiding race conditions caused, for instance, by a processing shared between a background task (counter reading) and an interrupt (update interrupt).

There is no latency between the UIF and UIFCPY flag assertions.

In 32-bit timer implementations, when the IUFREMAP bit is set, bit 31 of the counter is overwritten by the UIFCPY flag upon read access (the counter's most significant bit is only accessible in write mode).

Clock plus direction encoder mode

In addition to the quadrature encoder mode, the timer offers support for other types of encoders.

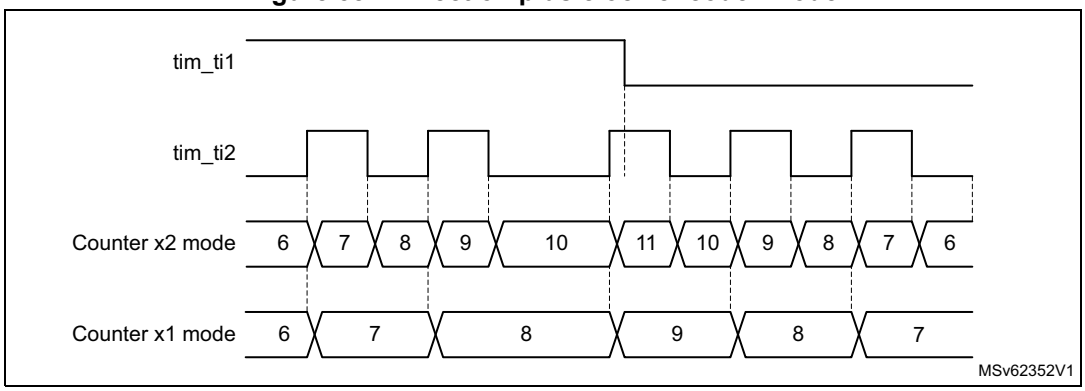
In the "clock plus direction" mode shown on *Figure 587*, the clock is provided on a single line, on tim_ti2, while the direction is forced using the tim_ti1 input.

This mode is enabled with the SMS[3:0] bitfield in the TIMx_SMCR register, as following:

- 1010: x2 mode, the counter is updated on both rising and falling edges of the clock.
- 1011: x1 mode, the counter is updated on a single clock edge, as per CC2P bit value: CC2P = 0 corresponds to rising edge sensitivity and CC2P = 1 corresponds to falling edge sensitivity.

The polarity of the direction signal on tim_ti1 is set with the CC1P bit: 0 corresponds to positive polarity (up-counting when tim_ti1 is high and down-counting when tim_ti1 is low) and CC1P = 1 corresponds to negative polarity (up-counting when tim_ti1 is low).

Figure 587. Direction plus clock encoder mode



Directional clock encoder mode

In the “directional clock” mode on *Figure 588*, the clocks are provided on two lines, with a single one at once, depending on the direction, so as to have one up-counting clock line and one down-counting clock line.

This mode is enabled with the SMS[3:0] bitfield in the TIMx_SMCR register, as following:

- 1100: x2 mode, the counter is updated on both rising and falling edges of any of the two clock lines. The CC1P and CC2P bits are coding for the clock idle state. CCxP = 0 corresponds to high-level idle state (refer to *Figure 588*) and CCxP = 1 corresponds to low-level idle state (refer to *Figure 589*).
- 1101: x1 mode, the counter is updated on a single clock edge, as per CC1P and CC2P bit value. CCxP = 0 corresponds to falling edge sensitivity and high-level idle state (refer to *Figure 588*), CCxP = 1 corresponds to rising edge sensitivity and low-level idle state (refer to *Figure 589*).

Figure 588. Directional clock encoder mode (CC1P = CC2P = 0)

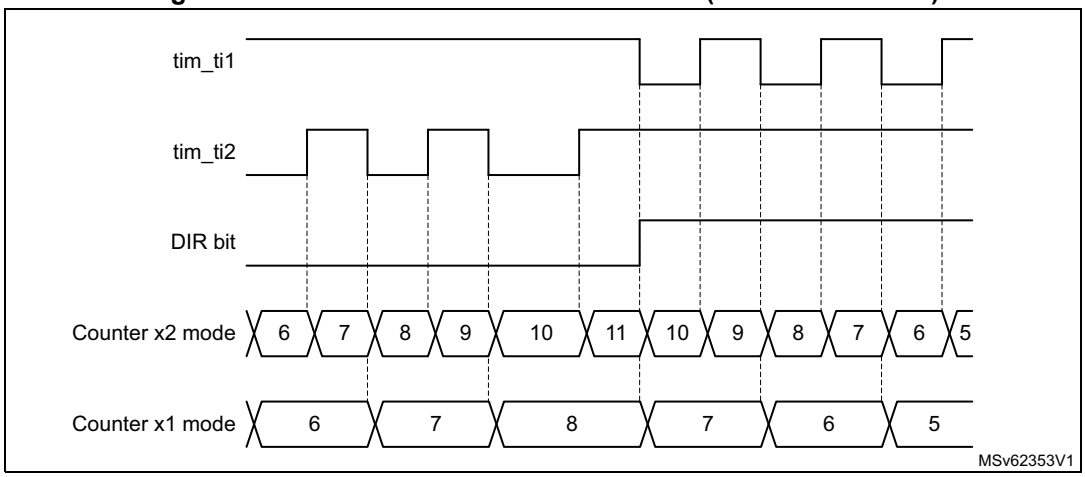


Figure 589. Directional clock encoder mode (CC1P = CC2P = 1)

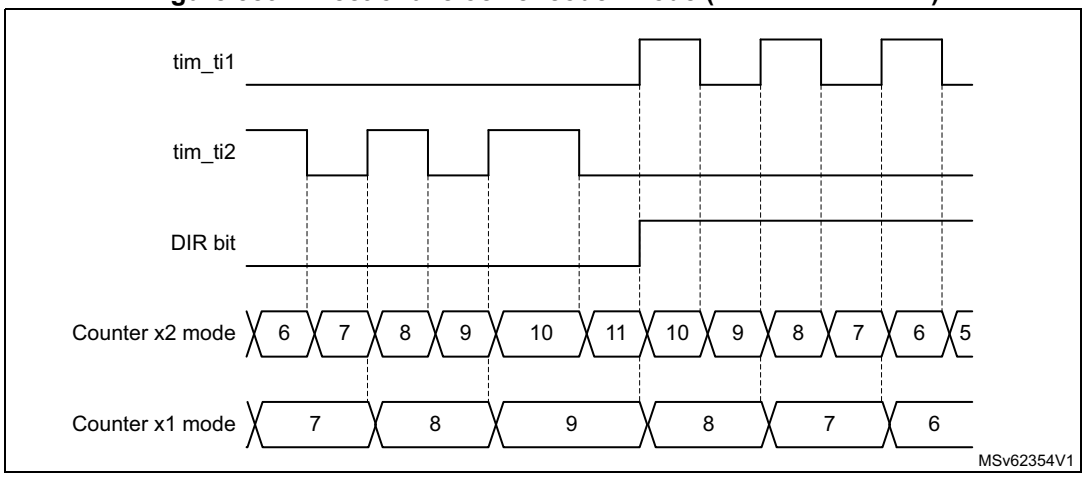

Table 552 details how the directional clock mode operates, for any input transition.

Table 552. Counting direction versus encoder signals and polarity settings

Directional clock mode	SMS[3:0]	Level on opposite signal (tim_ti1fp1 for tim_ti2, tim_ti2fp2 for tim_ti1)	tim_ti1fp1 signal		tim_ti2fp2 signal	
			Rising	Falling	Rising	Falling
x2 mode CCxP = 0	1100	High	Down	Down	Up	Up
		Low	No count	No count	No count	No count
x2 mode CCxP = 1	1100	High	No count	No count	No count	No count
		Low	Down	Down	Up	Up
x1 mode CCxP = 0	1101	High	No count	Down	No count	Up
		Low	No count	No count	No count	No count
x1 mode CCxP = 1	1101	High	No count	No count	No count	No count
		Low	Down	No count	Up	No count

Index input

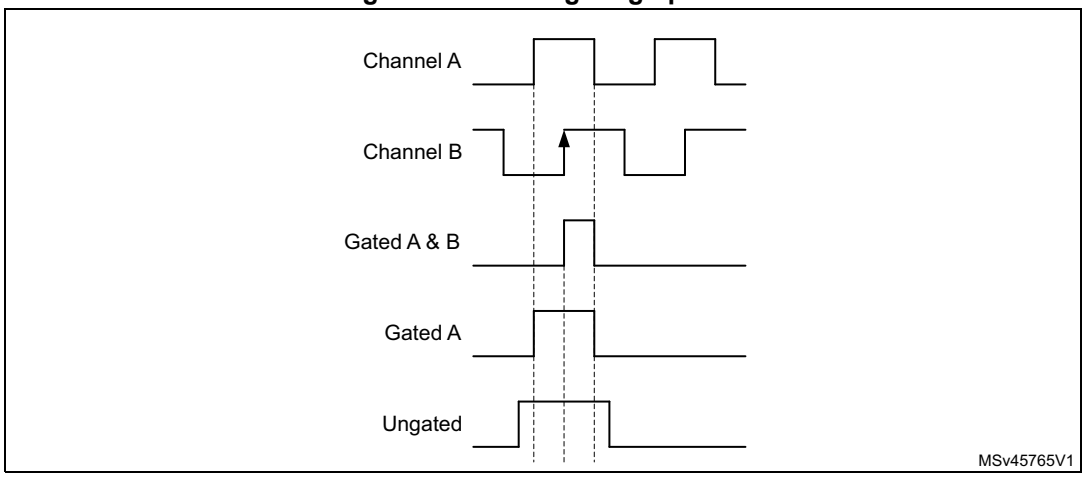
The counter can be reset by an index signal coming from the encoder, indicating an absolute reference position. The index signal must be connected to the tim_etr_in input. It can be filtered using the digital input filter.

The index functionality is enabled with the IE bit in the TIMx_ECR register. The IE bit must be set only in encoder mode, when the SMS[3:0] bitfield has the following values: 0001, 0010, 011, 1010, 1011, 1100, 1101, 1110, 1111.

Available encoders are proposed with several options for index pulse conditioning, as per *Figure 590*:

- Gated with A and B: the pulse width is 1/4 of one channel period, aligned with both A and B edges.
- Gated with A (or gated with B): the pulse width is 1/2 of one channel period, aligned with the two edges on channel A (resp. channel B).
- Ungated: the pulse width is up to one channel period, without any alignment to the edges.

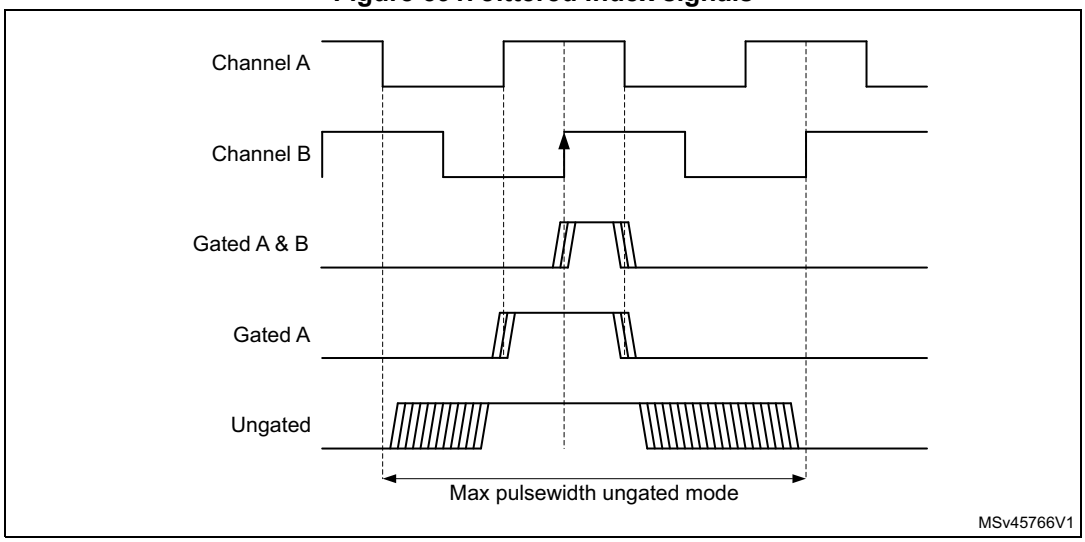
Figure 590. Index gating options



The circuitry tolerates jitter on index signal, whatever the gating mode, as shown on *Figure 591*.

In ungated mode, the signal must be strictly below two encoder periods. If the pulse width is greater or equal to two encoder period, the counter is reset multiple times.

Figure 591. Jittered Index signals



The timer supports the three gating options identically, without any specific programming needed. It is only necessary to define on which encoder state (for example channel A and channel B state combination) the index must be synchronized, using the IPOS[1:0] bitfield in the TIMx_ECR register.

The index detection event acts differently depending on counting direction to ensure symmetrical operation during speed reversal:

- The counter is reset during up-counting (DIR bit = 0).
- The counter is set to TIMx_ARR when down-counting.

This allows the index to be generated on the very same mechanical angular position whatever the counting direction. *Figure 592* shows at which position is the index generated, for a simplistic example (an encoder providing four edges par mechanical rotation).

Figure 592. Index generation for IPOS[1:0] = 11

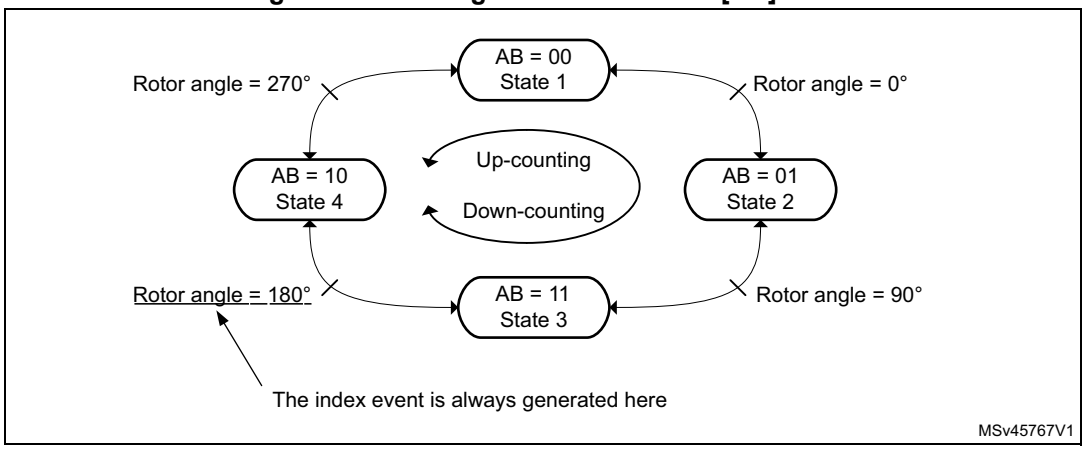


Figure 593 presents waveforms and corresponding values for IPOS[1:0] = 11. It shows that the instant at which the counter value is forced is automatically adjusted depending on the counting direction:

- Counter set to 0 when encoder state is 11 (ChA = 1, ChB = 1), when up-counting (DIR bit = 0).
- Counter set to TIMx_ARR when exiting the 11 state, when down-counting (DIR bit = 1).

An interrupt can be issued upon index detection event.

The arrows are indicating on which transition is the index event interrupt generated.

Figure 593. Counter reading with index gated on channel A (IPOS[1:0] = 11)

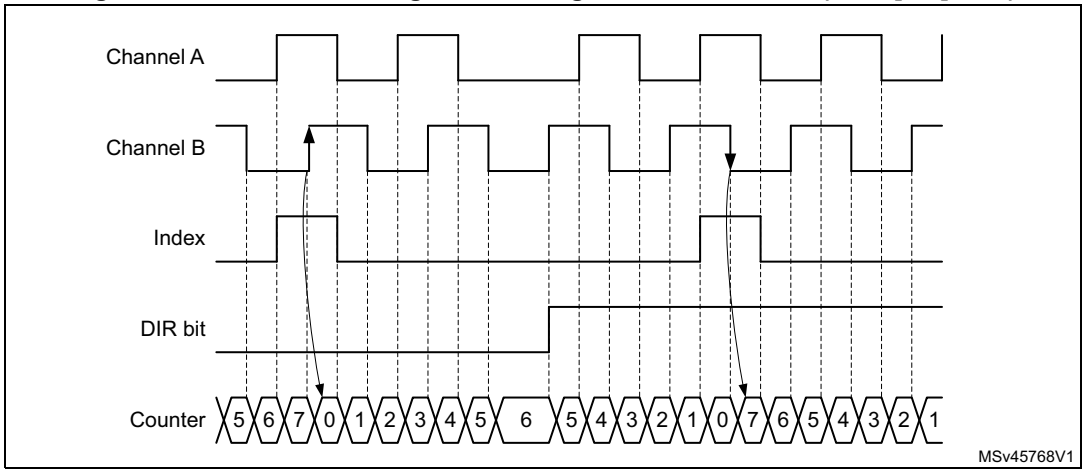

Figure 594 presents waveforms and corresponding values for the ungated mode. The arrows are indicating on which transition is the index event generated.

Figure 594. Counter reading with index ungated (IPOS[1:0] = 00)

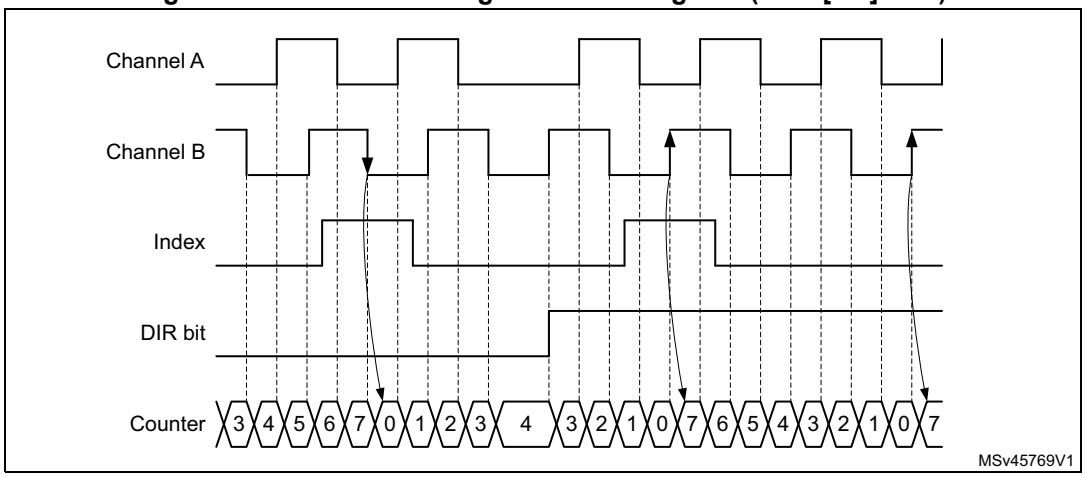

Figure 595 shows how the gated on A & B mode is handled, for various pulse alignment scenarios. The arrows are indicating on which transition is the index event generated.

Figure 595. Counter reading with index gated on channel A and B

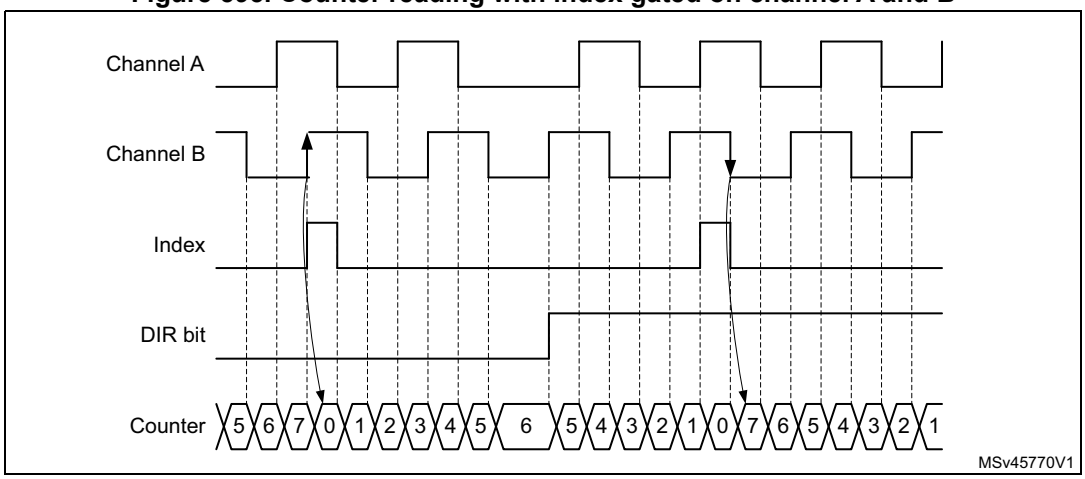

Figure 596 and *Figure 597* detail the case where the subsequent index pulse may be narrower than one quarter of the encoder clock period.

Figure 596. Encoder mode behavior in case of narrow index pulse (IPOS[1:0] = 11)

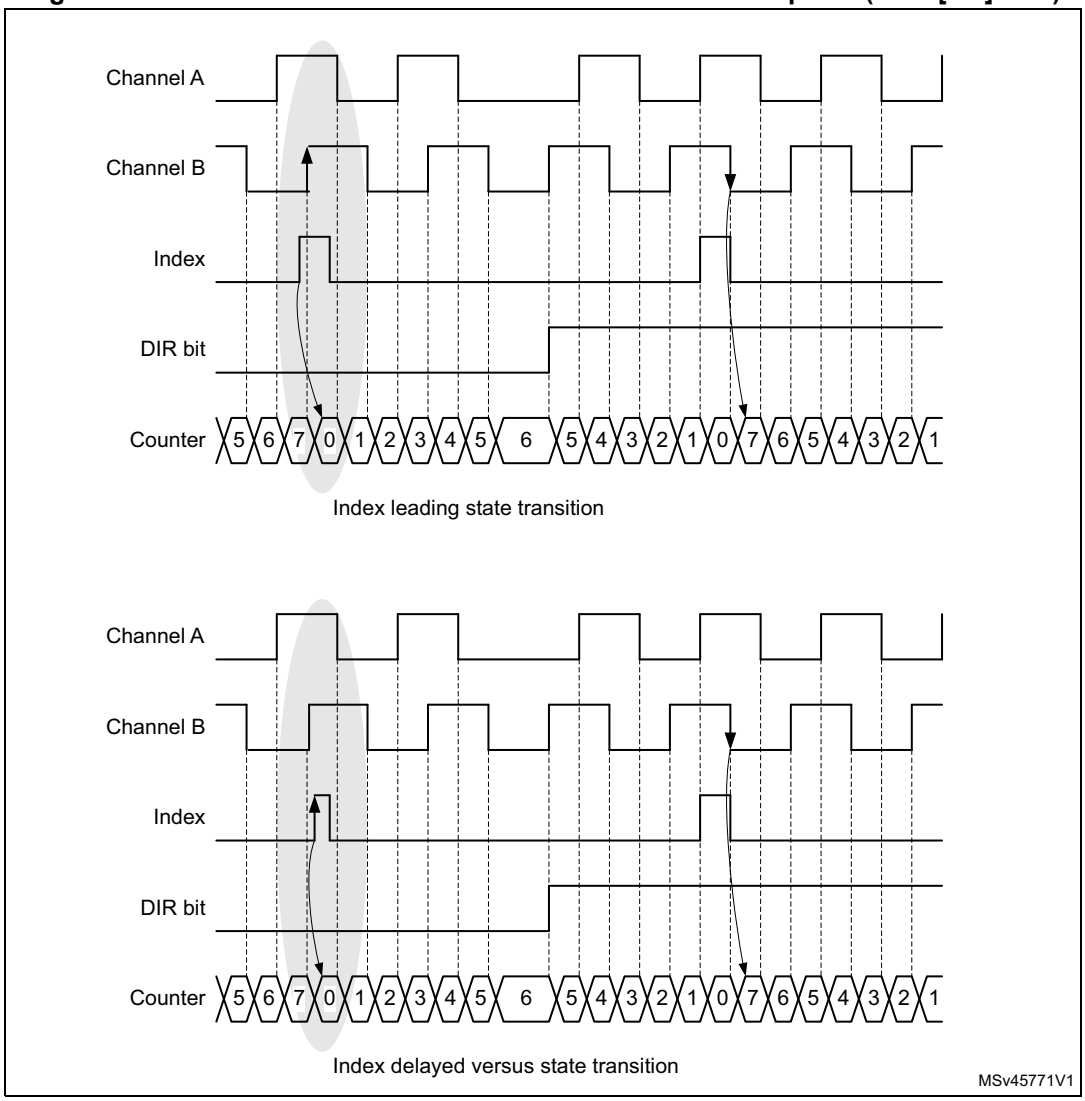

Figure 597. Counter reset Narrow index pulse (closer view, ARR = 0x07)

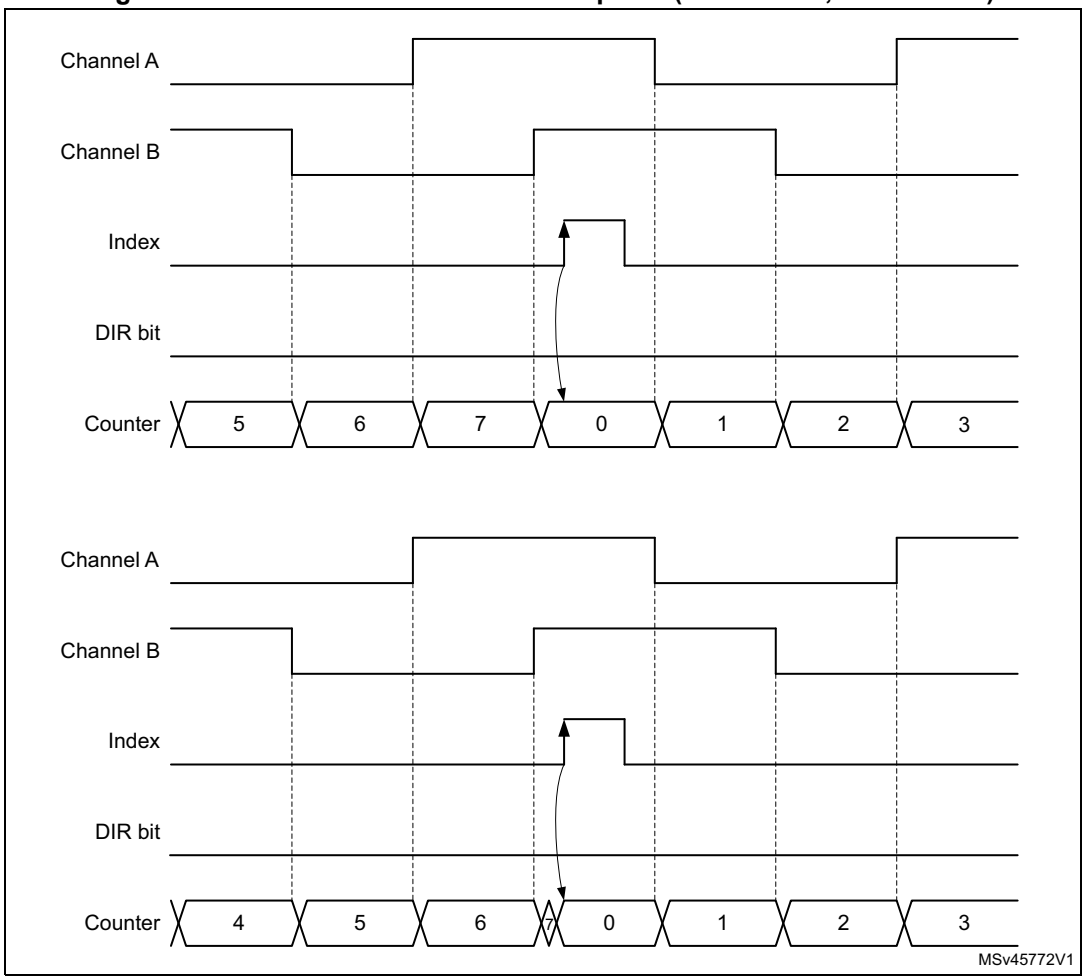

Figure 598 shows how the index is managed in x1 and x2 modes.

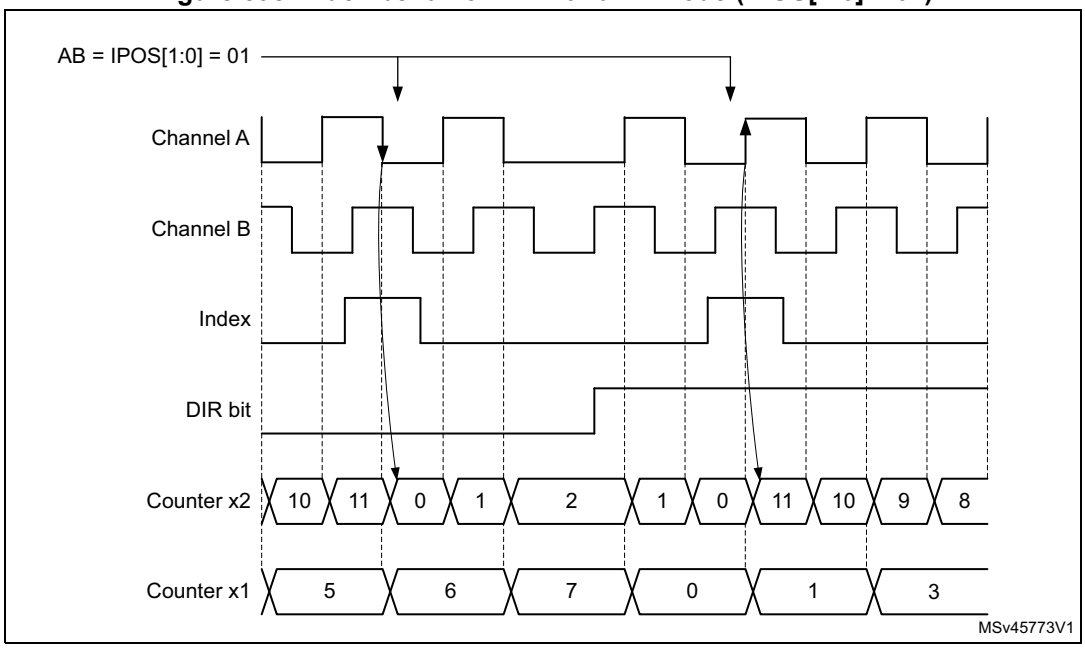
Figure 598. Index behavior in x1 and x2 mode (IPOS[1:0] = 01)

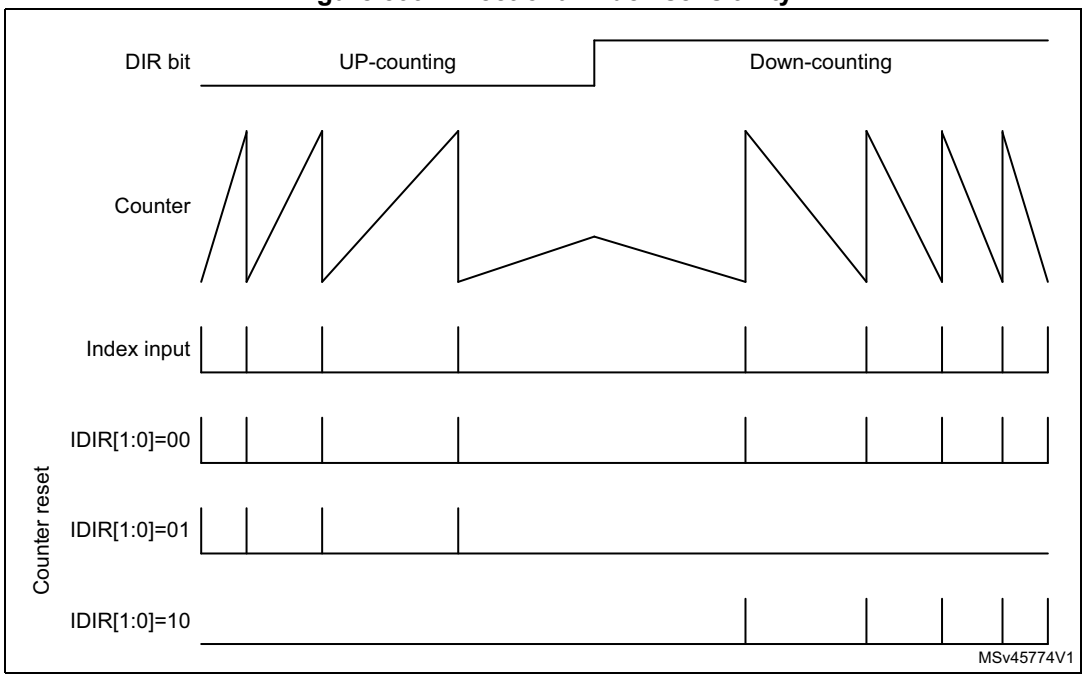


Directional index sensitivity

The IDIR[1:0] bitfield in the TIMx_ECR register allows the index to be active only in a selected counting direction.

Figure 599 shows the relationship between index and counter reset events, depending on IDIR[1:0] value.

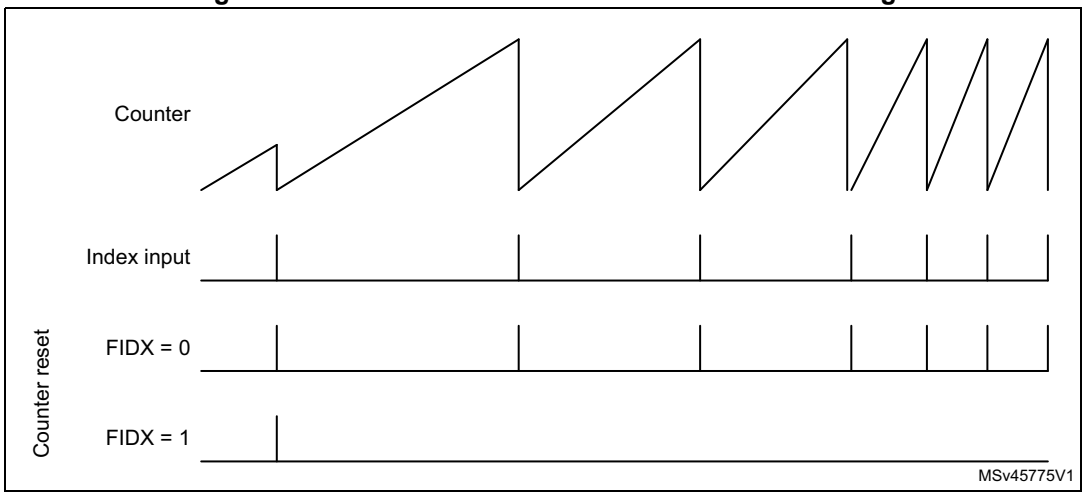
Figure 599. Directional index sensitivity



Special first index event management

The FIDX bit in the TIMx_ECR register allows the index to be taken only once, as shown on *Figure 600*. Once the first index has arrived, any subsequent index is ignored. If needed, the circuitry can be rearmed by writing the FIDX bit to 0 and setting it again to 1.

Figure 600. Counter reset as function of FIDX bit setting



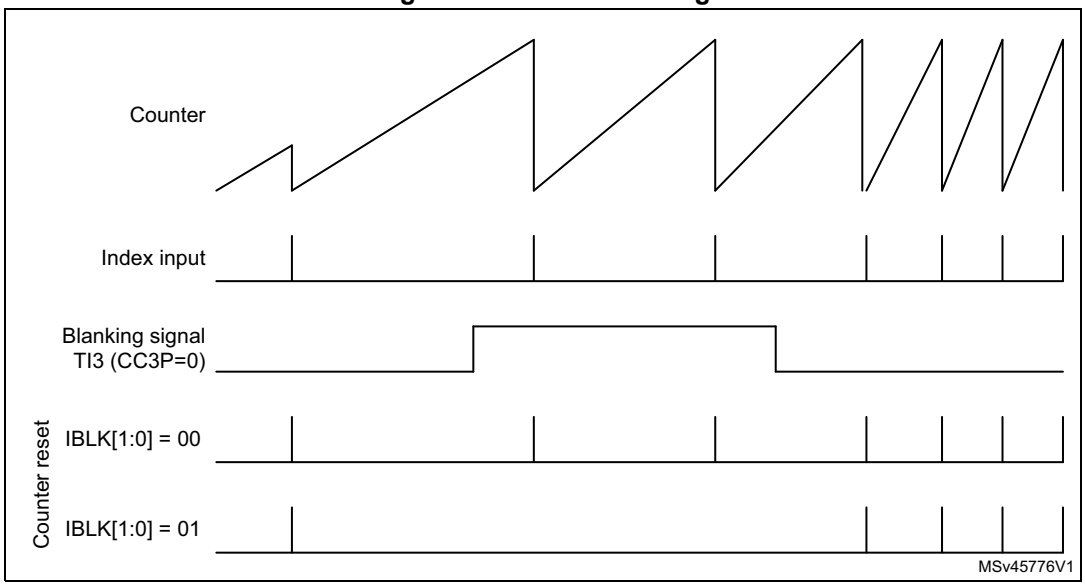
Index blanking

The index event can be blanked using the tim_ti3 or tim_ti4 inputs. During the blanking window, the index events are no longer resetting the counter, as shown on *Figure 601*.

This mode is enabled using the IBLK[1:0] bitfield in the TIMx_ECR register, as following:

- IBLK[1:0] = 00: Index signal always active.
- IBLK[1:0] = 01: Index signal blanking on tim_ti3 input.
- IBLK[1:0] = 10: Index signal blanking on tim_ti4 input.

Figure 601. Index blanking



Index management in nonquadrature mode

Figure 602 and *Figure 603* detail how the index is managed in directional clock mode and clock plus direction mode, when the SMS[3:0] bitfield is equal to 1010, 1011, 1100, 1101.

For both of these modes, the index sensitivity is set with the IPOS[0] bit as following:

- IPOS[0] = 0: Index is detected on clock low level.
- IPOS[0] = 1: Index is detected on clock high level.

The IPOS[1] bit is not-significant.

Figure 602. Index behavior in clock + direction mode, IPOS[0] = 1

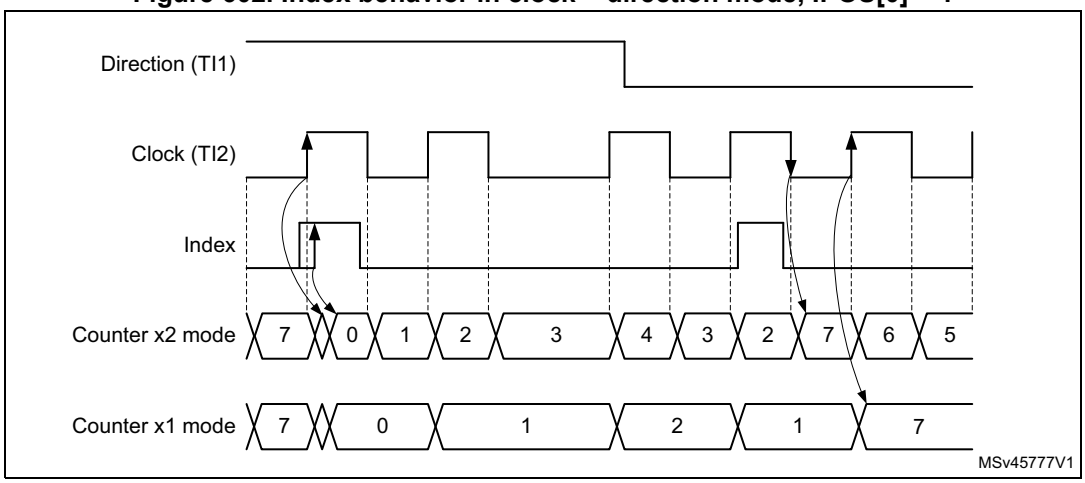


Figure 603. Index behavior in directional clock mode, IPOS[0] = 1

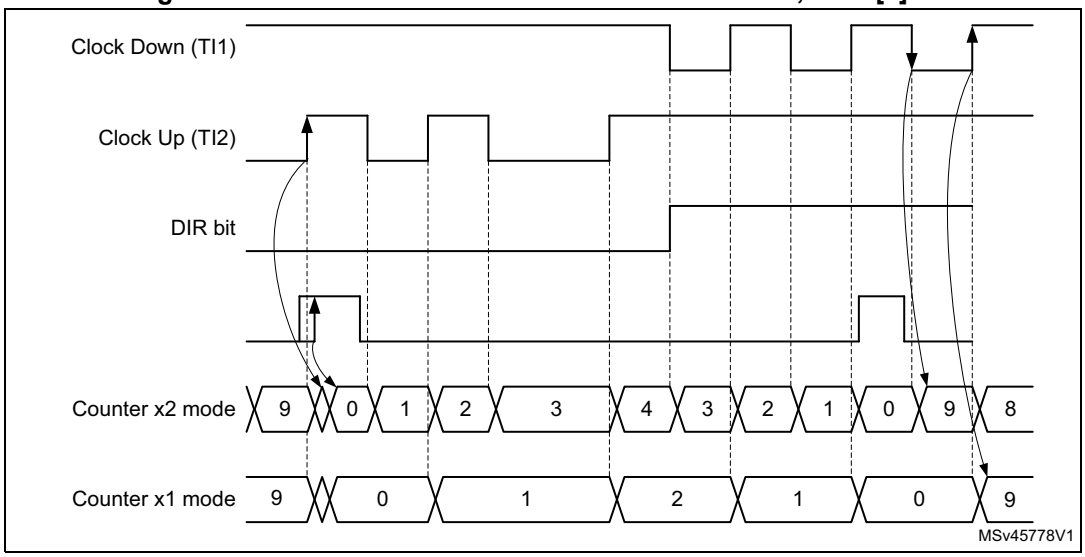
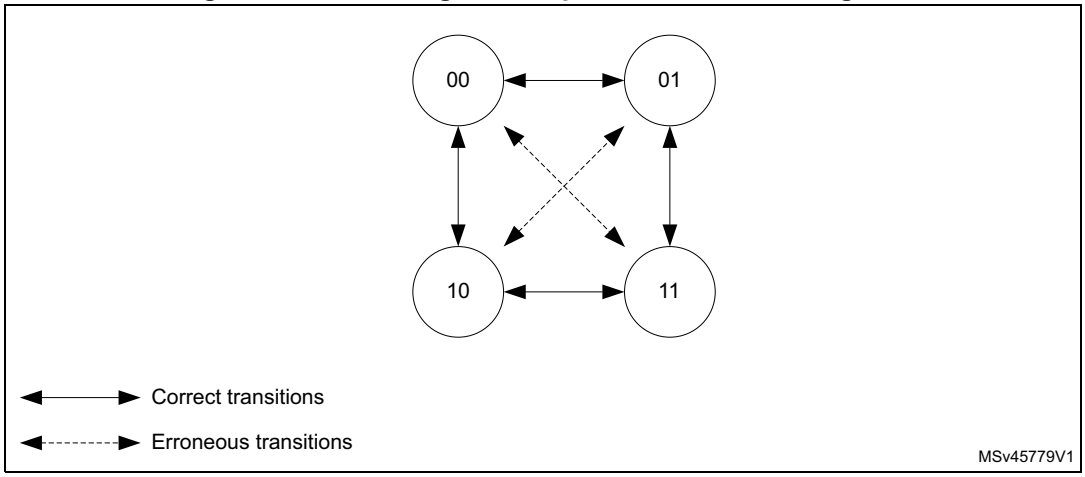


Encoder error management

For encoder configurations where two quadrature signals are available, it is possible to detect transition errors. The reading on the two inputs corresponds to a 2-bit gray code which can be represented as a state diagram, on *Figure 604*. A single bit is expected to change at once. An erroneous transition sets the TERRF interrupt flag in the TIMx_SR

status register. A transition error interrupt is generated if the TERRIE bit is set in the TIMx_DIER register.

Figure 604. State diagram for quadrature encoded signals



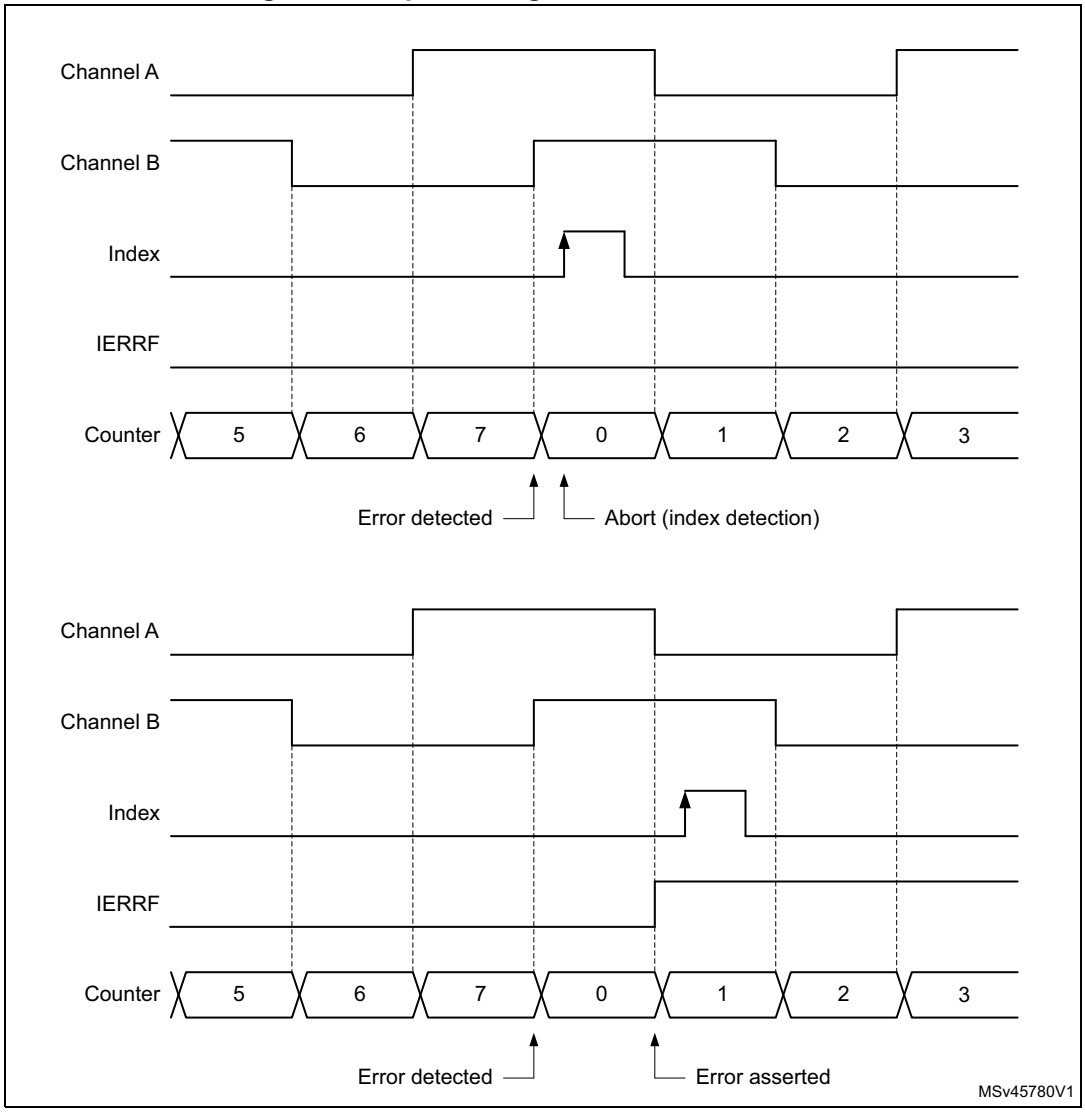
For encoder having an index signal, it is possible to detect abnormal operation resulting in an excess of pulses per revolution. An encoder with N pulses per revolution provides 4xN counts per revolution. The index signal resets the counter every 4xN clock periods.

If the counter value is incremented from TIMx_ARR to 0 or decremented from 0 to TIMx_ARR value without any index event, this is reported as an index position error.

The overflow threshold is programmed using the TIMx_ARR register. A 1000 lines encoder results in a counter value being between 0 and 3999 (in 4x reading mode). The overflow detection threshold must be programmed by setting TIMx_ARR = 3999 + 1 = 4000.

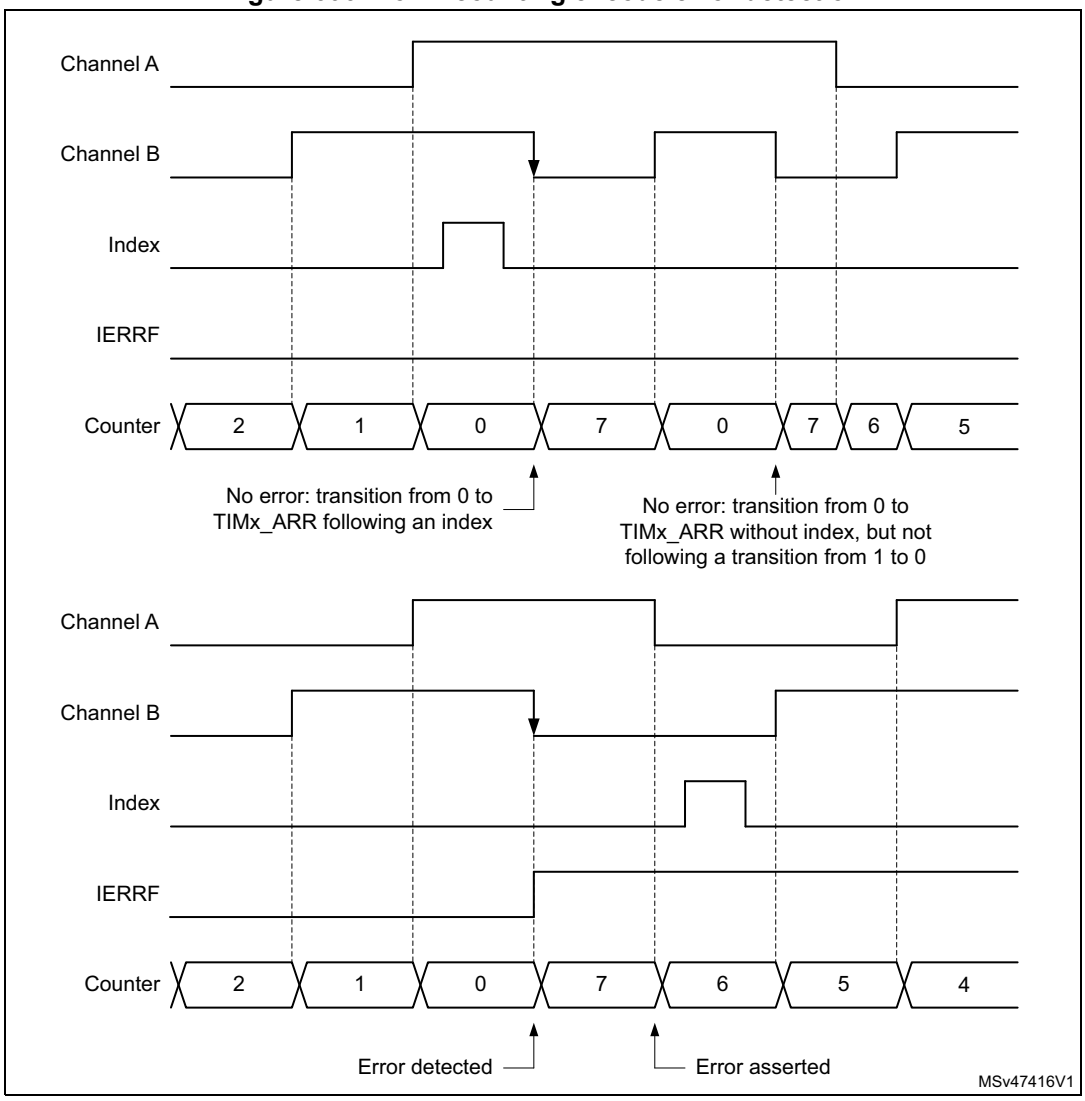
The error assertion is delayed to the transition 0 to 1 when in up-counting. This is to cope with narrow index pulses in gated A and B mode, as shown on *Figure 605*.

Figure 605. Up-counting encoder error detection



In down-counting mode, the detection is conditioned by a preliminary transition from 1 to 0. This is to cope with narrow index pulses in gated A and B mode, as shown on *Figure 606*, to avoid any false error detection in case the encoder dithers between TIMx_ARR and 0 immediately after the index detection.

Figure 606. Down-counting encode error detection



An index error sets the IERRF interrupt flag in the TIMx_SR status register. An index error interrupt is generated if the IERRIE bit is set in the TIMx_DIER register.

Functional encoder interrupts

The following interrupts are also available in encoder mode

- Direction change: any change of the counting direction in encoder mode causes the DIR bit in the TIMx_CR1 register to toggle. The direction change sets the DIRF interrupt flag in the TIMx_SR status register. A direction change interrupt is generated if the DIRIE bit is set in the TIMx_DIER register.
- Index event: the index event sets the IDXF interrupt flag in the TIMx_SR status register. An index interrupt is generated if the IDXIE bit is set in the TIMx_DIER register.

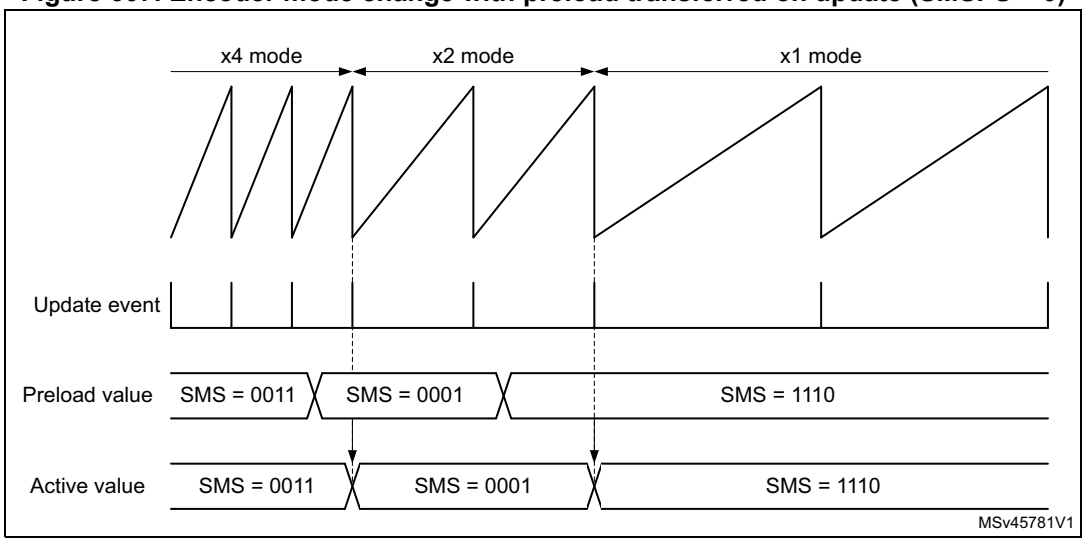
Slave mode selection preload for run-time encoder mode update

It can be necessary to switch from one encoder mode to another during run-time. This is typically done at high-speed to decrease the update interrupt rate, by switching from x4 to x2 to x1 mode, as shown on *Figure 607*.

For this purpose, the SMS[3:0] bit can be preloaded. This is enabled by setting the SMSPE enable bit in the TIMx_SMCR register. The trigger for the transfer from SMS[3:0] preload to active value can be selected with the SMSPS bit in the TIMx_SMCR register.

- SMSPS = 0: the transfer is triggered by the update event (UEV) occurring when the counter overflows when up-counting, and underflows when down-counting.
- SMSPS = 1: the transfer is triggered by the index event.

Figure 607. Encoder mode change with preload transferred on update (SMSPS = 0)



Encoder clock output

The encoder mode operating principle is not perfectly suited for high-resolution velocity measurements, at low speed, as it requires a relatively long integration time to have a sufficient number of clock edges and a precise measurement.

At low speed, a better solution is to do an edge-to-edge clock period measurement. This can be achieved using a slave timer. The timer can output the encoder clock information on the tim_trgo output. The slave timer can then perform a period measurement and provide velocity information for each and every encoder clock edge.

This mode is enabled by setting the MMS[3:0] bitfield to 1000, in the TIMx_CR2 register. It is valid for the following SMS[3:0] values: 0001, 0010, 0011, 1010, 1011, 1100, 1101, 1110, 1111. Any other SMS[3:0] code is not allowed and may lead to unexpected behavior.

54.4.19 Direction bit output

It is possible to output a direction signal out of the timer, on the tim_oc3 and tim_oc4 output signals (copy of the DIR bit in the TIMx_CR1 register). This is achieved by setting the OC3M[3:0] or the OC4M[3:0] bitfield to 1011 in the TIMx_CCMR2 register.

This feature can be used for monitoring the counting direction (or rotation direction) in encoder mode, or to have a signal indicating the up/down phases in center-aligned PWM mode.

54.4.20 UIF bit remapping

The IUFREMAP bit in the TIMx_CR1 register forces a continuous copy of the update interrupt flag (UIF) into bit 31 of the timer counter register's bit 31 (TIMx_CNT[31]). This is used to atomically read both the counter value and a potential roll-over condition signaled by the UIFCPY flag. It eases the calculation of angular speed by avoiding race conditions caused, for instance, by a processing shared between a background task (counter reading) and an interrupt (update interrupt).

There is no latency between the UIF and UIFCPY flag assertions.

In 32-bit timer implementations, when the IUFREMAP bit is set, bit 31 of the counter is overwritten by the UIFCPY flag upon read access (the counter's most significant bit is only accessible in write mode).

54.4.21 Timer input XOR function

The TI1S bit in the TIMx_CR2 register, allows the input filter of channel 1 to be connected to the output of an XOR gate, combining the three input pins tim_ti1, tim_ti2 and tim_ti3.

The XOR output can be used with all the timer input functions such as trigger or input capture.

An example of this feature used to interface Hall sensors is given in *Section 53.3.29: Interfacing with Hall sensors*.

54.4.22 Timers and external trigger synchronization

The TIMx timers can be synchronized with an external trigger in several modes: Reset mode, Gated mode, Trigger mode, Reset + trigger and gated + reset modes.

Slave mode: Reset mode

The counter and its prescaler can be reinitialized in response to an event on a trigger input. Moreover, if the URS bit from the TIMx_CR1 register is low, an update event UEV is generated. Then all the preloaded registers (TIMx_ARR, TIMx_CCRx) are updated.

In the following example, the upcounter is cleared in response to a rising edge on tim_ti1 input:

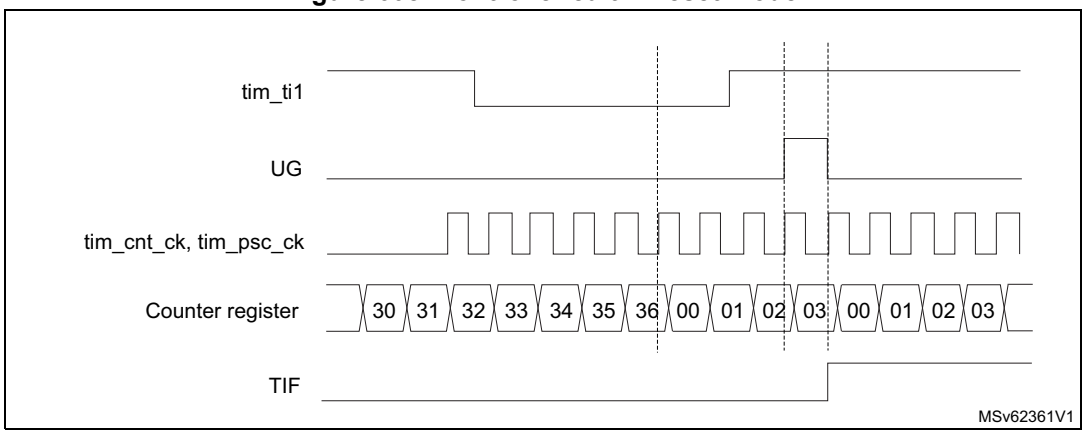
1. Configure the channel 1 to detect rising edges on tim_ti1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in the TIMx_CCMR1 register. Write CC1P = 0 and CC1NP = 0 in TIMx_CCER register to validate the polarity (and detect rising edges only).
2. Configure the timer in reset mode by writing SMS = 100 in TIMx_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIMx_SMCR register.
3. Start the counter by writing CEN = 1 in the TIMx_CR1 register.

The counter starts counting on the internal clock, then behaves normally until tim_ti1 rising edge. When tim_ti1 rises, the counter is cleared and restarts from 0. In the meantime, the

trigger flag is set (TIF bit in the TIMx_SR register) and an interrupt request, or a DMA request can be sent if enabled (depending on the TIE and TDE bits in TIMx_DIER register).

The following figure shows this behavior when the autoreload register TIMx_ARR = 0x36. The delay between the rising edge on tim_ti1 and the actual reset of the counter is due to the resynchronization circuit on tim_ti1 input.

Figure 608. Control circuit in reset mode



Slave mode: Gated mode

The counter can be enabled depending on the level of a selected input.

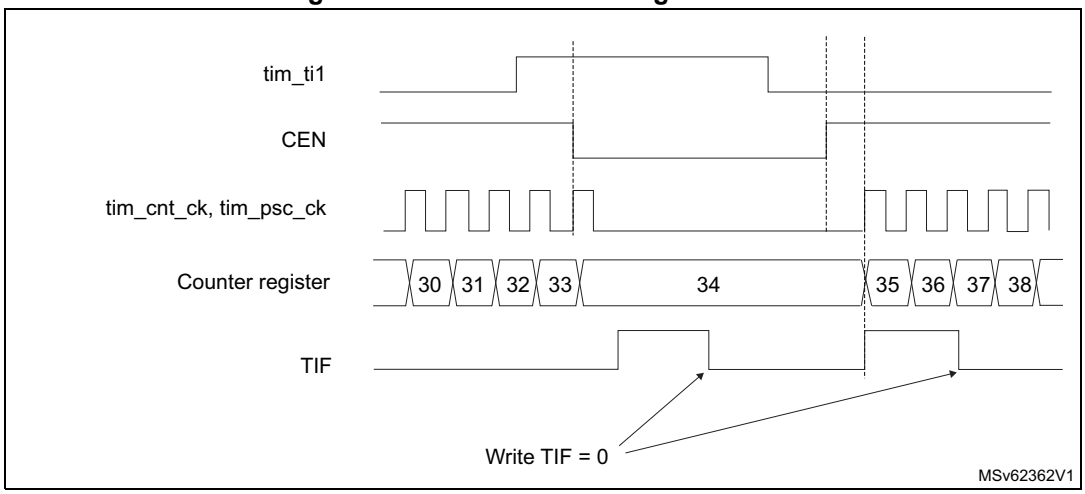
In the following example, the upcounter counts only when tim_ti1 input is low:

1. Configure the channel 1 to detect low levels on tim_ti1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in TIMx_CCMR1 register. Write CC1P = 1 and CC1NP = 0 in TIMx_CCER register to validate the polarity (and detect low level only).
2. Configure the timer in gated mode by writing SMS = 101 in TIMx_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIMx_SMCR register.
3. Enable the counter by writing CEN = 1 in the TIMx_CR1 register (in gated mode, the counter does not start if CEN = 0, whatever is the trigger input level).

The counter starts counting on the internal clock as long as tim_ti1 is low and stops as soon as tim_ti1 becomes high. The TIF flag in the TIMx_SR register is set both when the counter starts or stops.

The delay between the rising edge on tim_ti1 and the actual stop of the counter is due to the resynchronization circuit on tim_ti1 input.

Figure 609. Control circuit in gated mode



Note: The configuration "CCxP = CCxNP = 1" (detection of both rising and falling edges) does not have any effect in gated mode because gated mode acts on a level and not on an edge.

Slave mode: Trigger mode

The counter can start in response to an event on a selected input.

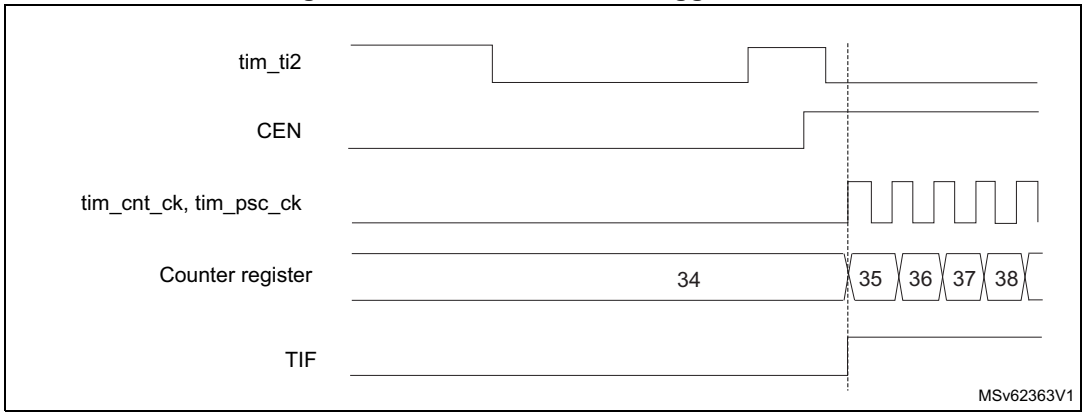
In the following example, the upcounter starts in response to a rising edge on tim_ti2 input:

1. Configure the channel 2 to detect rising edges on tim_ti2. Configure the input filter duration (in this example, we do not need any filter, so we keep IC2F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. CC2S bits are selecting the input capture source only, CC2S = 01 in TIMx_CCMR1 register. Write CC2P = 1 and CC2NP = 0 in TIMx_CCER register to validate the polarity (and detect low level only).
2. Configure the timer in trigger mode by writing SMS = 110 in TIMx_SMCR register. Select tim_ti2 as the input source by writing TS = 00110 in TIMx_SMCR register.

When a rising edge occurs on tim_ti2, the counter starts counting on the internal clock and the TIF flag is set.

The delay between the rising edge on tim_ti2 and the actual start of the counter is due to the resynchronization circuit on tim_ti2 input.

Figure 610. Control circuit in trigger mode



Slave mode selection preload for run-time encoder mode update

The SMS[3:0] bit can be preloaded. This is enabled by setting the SMSPE enable bit in the TIMx_SMCR register. The trigger for the transfer from SMS[3:0] preload to active value is the update event (UEV) occurring when the counter overflows.

Slave mode – combined reset + trigger mode

In this case, a rising edge of the selected trigger input (tim_trgi) reinitializes the counter, generates an update of the registers, and starts the counter.

This mode is used for one-pulse mode.

Slave mode – combined gated + reset mode

The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops and is reset as soon as the trigger becomes low. Both start and stop of the counter are controlled.

This mode is used to detect out-of-range PWM signal (duty cycle exceeding a maximum expected value).

Slave mode – external clock mode 2 + trigger mode

The external clock mode 2 can be used in addition to another slave mode (except external clock mode 1 and encoder mode). In this case, the tim_etr_in signal is used as external clock input, and another input can be selected as trigger input when operating in reset mode, gated mode, or trigger mode. It is recommended not to select tim_etr_in as tim_trgi through the TS bits of TIMx_SMCR register.

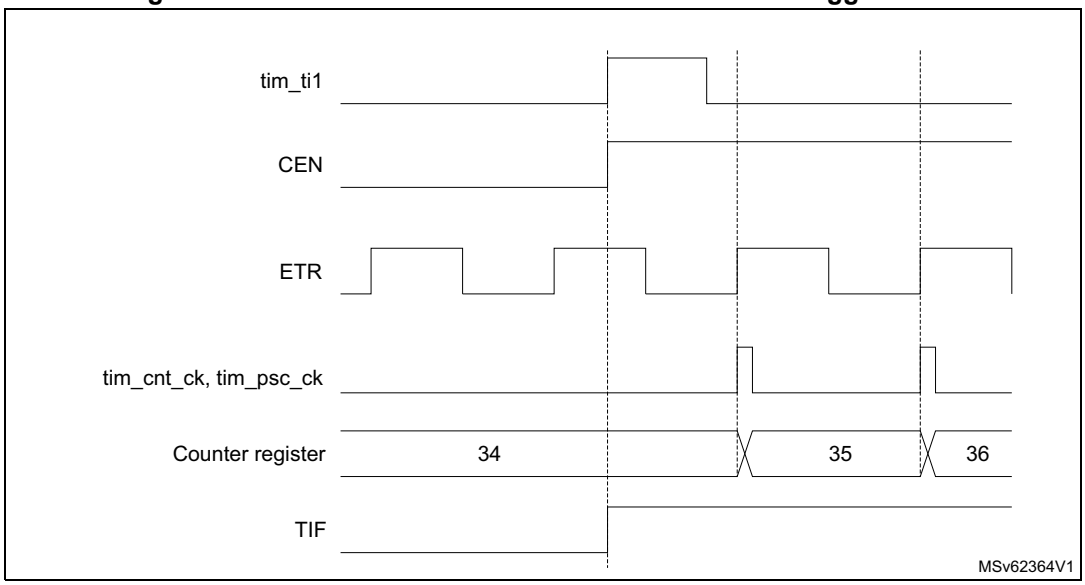
In the following example, the upcounter is incremented at each rising edge of the tim_etr_in signal as soon as a rising edge of tim_ti1 occurs:

1. Configure the external trigger input circuit by programming the TIMx_SMCR register as follows:
   - ETF = 0000: no filter.
   - ETPS = 00: prescaler disabled.
   - ETP = 0: detection of rising edges on tim_etr_in and ECE = 1 to enable the external clock mode 2.
2. Configure the channel 1 as follows, to detect rising edges on TI:
   - IC1F = 0000: no filter.
   - The capture prescaler is not used for triggering and does not need to be configured.
   - CC1S = 01in TIMx_CCMR1 register to select only the input capture source.
   - CC1P = 0 and CC1NP = 0 in TIMx_CCER register to validate the polarity (and detect rising edge only).
3. Configure the timer in trigger mode by writing SMS = 110 in TIMx_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIMx_SMCR register.

A rising edge on tim_ti1 enables the counter and sets the TIF flag. The counter then counts on tim_etr_in rising edges.

The delay between the rising edge of the tim_etr_in signal and the actual reset of the counter is due to the resynchronization circuit on tim_etrp input.

Figure 611. Control circuit in external clock mode 2 + trigger mode



54.4.23 Timer synchronization

The TIMx timers are linked together internally for timer synchronization or chaining. When one timer is configured in Master mode, it can reset, start, stop, or clock the counter of another timer configured in Slave mode.

Figure 612 and *Figure 613* show examples of master/slave timer connections.

Figure 612. Master/Slave timer example

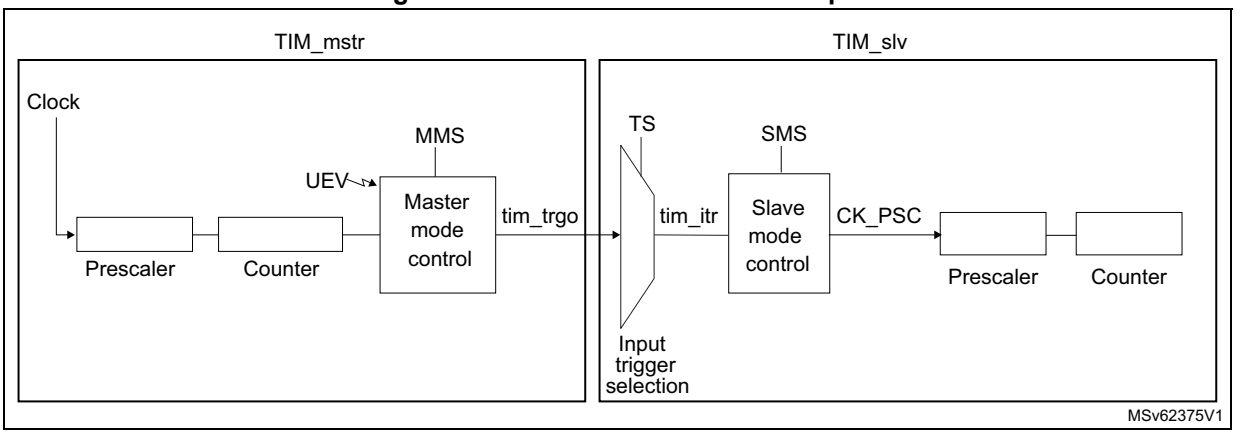


Figure 613. Master/slave connection example with 1 channel only timers

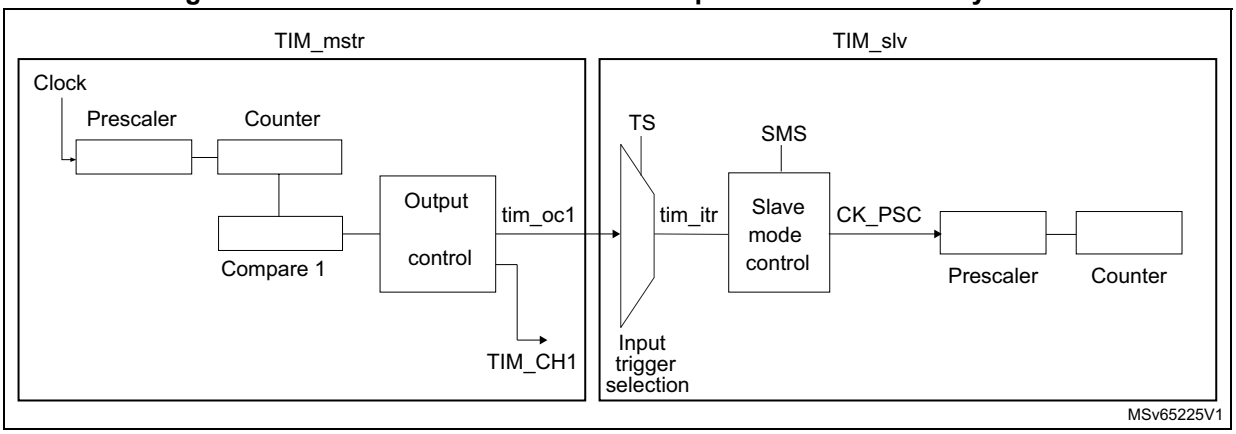


Note: The timers with one channel only (see Figure 613) do not feature a master mode. However, the tim_oc1 output signal can serve as trigger for slave timer (see TIMx internal trigger connection table in Section 54.4.2: TIM2/TIM3/TIM4/TIM5 pins and internal signals).
The tim_oc1 signal pulse width must be programmed to be at least two clock cycles of the destination timer, to make sure the slave timer detects the trigger.
For instance, if the destination timer tim_ker_ck clock is four times slower than the source timer, the OC1 pulse width must be eight clock cycles.

Using one timer as prescaler for another timer

For example, TIM_mstr can be configured to act as a prescaler for TIM_slv. Refer to *Figure 612*. To do this:

1. Configure TIM_mstr in master mode so that it outputs a periodic trigger signal on each update event UEV. If MMS = 010 is written in the TIM_mstr_CR2 register, a rising edge is output on tim_trgo each time an update event is generated.
2. To connect the tim_trgo output of TIM_mstr to TIM_slv, TIM_slv must be configured in slave mode using ITR2 as internal trigger. This is selected through the TS bits in the TIM_slv_SMCR register (writing TS = 00010).
3. Then the slave mode controller must be put in external clock mode 1 (write SMS = 111 in the TIM_slv_SMCR register). This causes TIM_slv to be clocked by the rising edge of the periodic TIM_mstr trigger signal (which correspond to the TIM_mstr counter overflow).
4. Finally both timers must be enabled by setting their respective CEN bits (TIMx_CR1 register).

Note: If tim_ocx is selected on TIM_mstr as the trigger output (MMS = 1xx), its rising edge is used to clock the counter of TIM_slv.

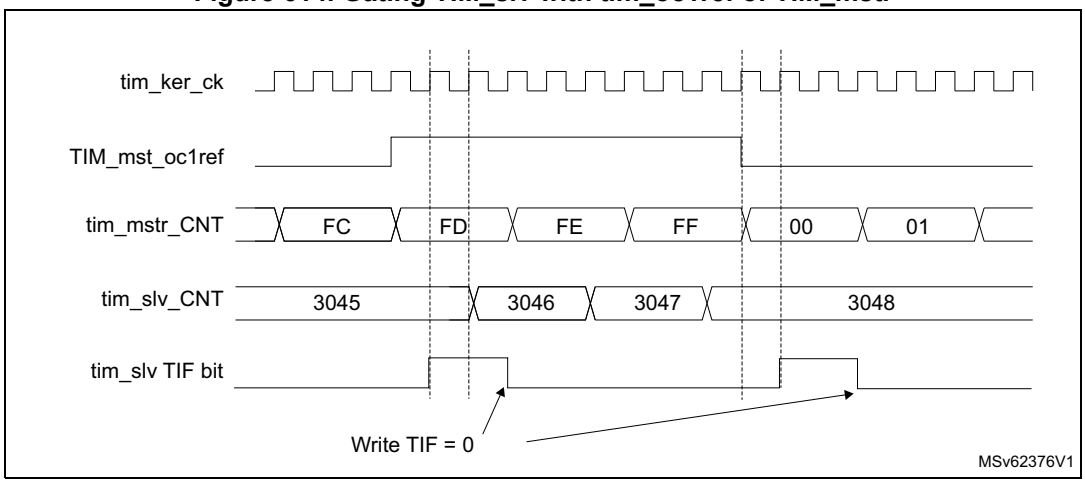
Using one timer to enable another timer

In this example, we control the enable of TIM_slv with the output compare 1 of TIM_mstr. Refer to *Figure 612* for connections. TIM_slv counts on the divided internal clock only when tim_oc1ref of TIM_mstr is high. Both counter clock frequencies are divided by 3 by the prescaler compared to tim_ker_ck ($f_{tim_cnt_ck} = f_{tim_ker_ck}/3$).

1. Configure TIM_mstr master mode to send its output compare 1 reference (tim_oc1ref) signal as trigger output (MMS = 100 in the TIM_mstr_CR2 register).
2. Configure the TIM_mstr tim_oc1ref waveform (TIM_mstr_CCMR1 register).
3. Configure TIM_slv to get the input trigger from TIM_mstr (TS = 00010 in the TIM_slv_SMCR register).
4. Configure TIM_slv in gated mode (SMS = 101 in TIM_slv_SMCR register).
5. Enable TIM_slv by writing 1 in the CEN bit (TIM_slv_CR1 register).
6. Start TIM_mstr by writing 1 in the CEN bit (TIM_mstr_CR1 register).

Note: The slave timer counter clock is not synchronized with the master timer counter clock, this mode only affects the TIM_slv counter enable signal.

Figure 614. Gating TIM_slv with tim_oc1ref of TIM_mstr

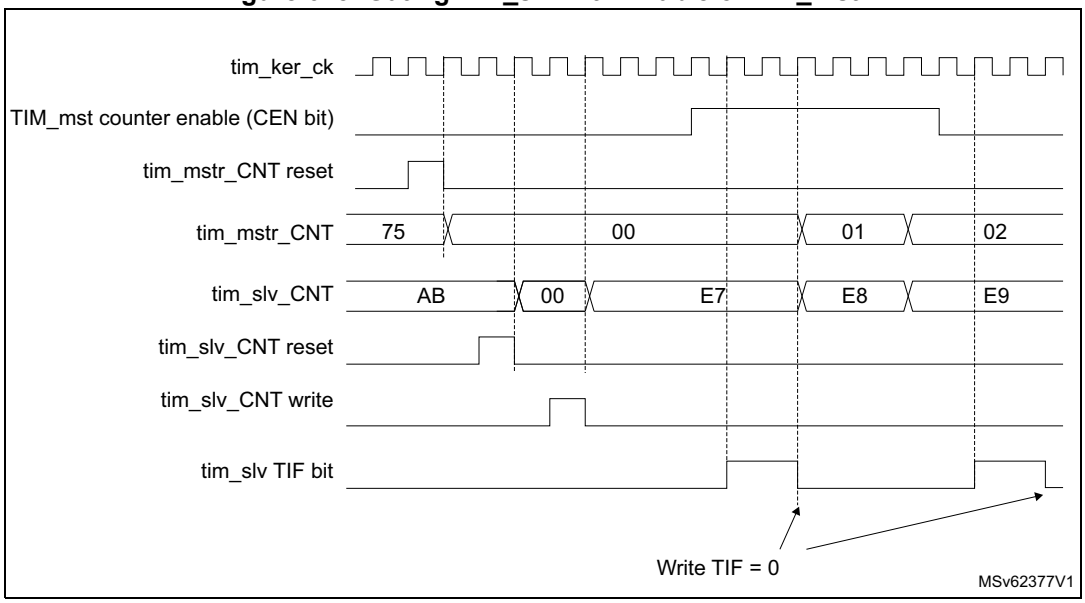


In the example in *Figure 614*, the TIM_slv counter and prescaler are not initialized before being started. So they start counting from their current value. It is possible to start from a given value by resetting both timers before starting TIM_mstr. Then any value can be written in the timer counters. The timers can easily be reset by software using the UG bit in the TIMx_EGR registers.

In the next example (refer to *Figure 615*), we synchronize TIM_mstr and TIM_slv. TIM_mstr is the master and starts from 0. TIM_slv is the slave and starts from 0xE7. The prescaler ratio is the same for both timers. TIM_slv stops when TIM_mstr is disabled by writing 0 to the CEN bit in the TIM_mstr_CR1 register:

1. Configure TIM_mstr master mode to send its output compare 1 reference (tim_oc1ref) signal as trigger output (MMS = 100 in the TIM_mstr_CR2 register).
2. Configure the TIM_mstr tim_oc1ref waveform (TIM_mstr_CCMR1 register).
3. Configure TIM_slv to get the input trigger from TIM_mstr (TS = 00010 in the TIM_slv_SMCR register).
4. Configure TIM_slv in gated mode (SMS = 101 in TIM_slv_SMCR register).
5. Reset TIM_mstr by writing 1 in UG bit (TIM_mstr_EGR register).
6. Reset TIM_slv by writing 1 in UG bit (TIM_slv_EGR register).
7. Initialize TIM_slv to 0xE7 by writing 0xE7 in the TIM_slv counter (TIM_slv_CNT).
8. Enable TIM_slv by writing 1 in the CEN bit (TIM_slv_CR1 register).
9. Start TIM_mstr by writing 1 in the CEN bit (TIM_mstr_CR1 register).
10. Stop TIM_mstr by writing 0 in the CEN bit (TIM_mstr_CR1 register).

Figure 615. Gating TIM_slv with Enable of TIM_mstr

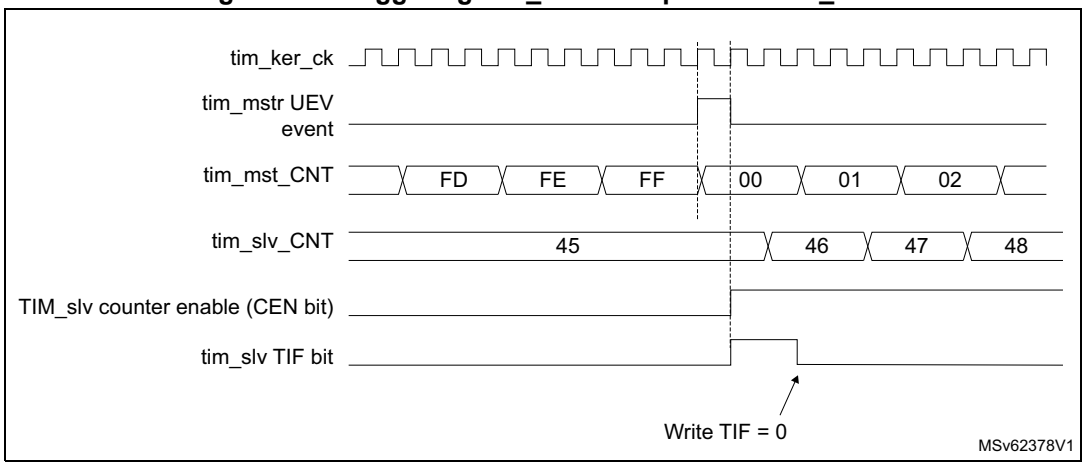


Using one timer to start another timer

In this example, we set the enable of TIM_slv with the update event of TIM_mstr. Refer to *Figure 612* for connections. TIM_slv starts counting from its current value (which can be nonzero) on the divided internal clock as soon as the update event is generated by TIM_mstr. When TIM_slv receives the trigger signal its CEN bit is automatically set and the counter counts until we write 0 to the CEN bit in the TIM_slv_CR1 register. Both counter clock frequencies are divided by 3 by the prescaler compared to tim_ker_ck ($f_{tim_cnt_ck} = f_{tim_ker_ck}/3$).

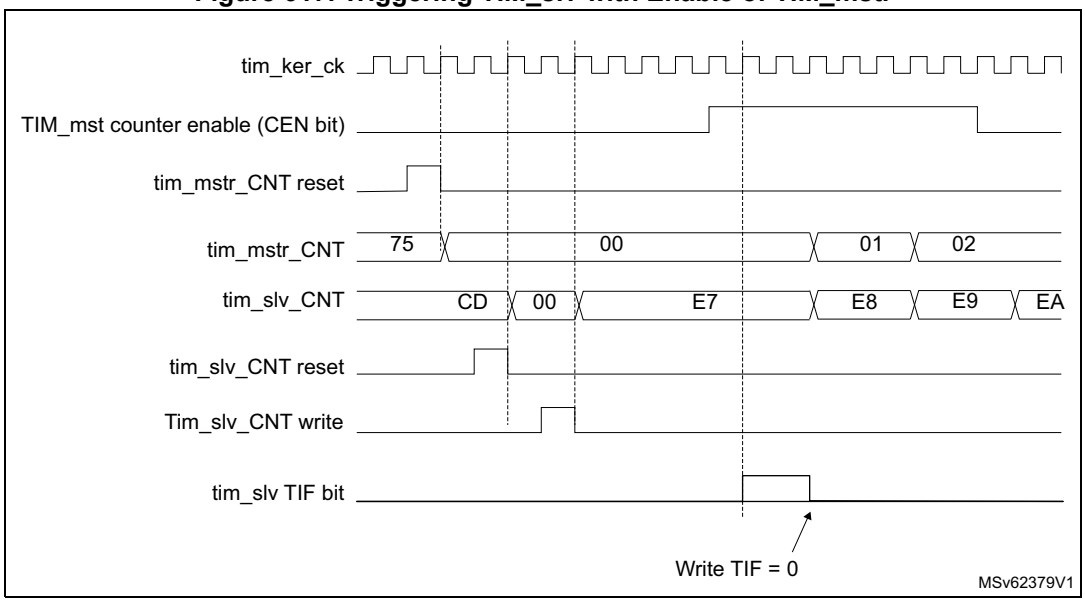
1. Configure TIM_mstr master mode to send its update event (UEV) as trigger output (MMS = 010 in the TIM_mstr_CR2 register).
2. Configure the TIM_mstr period (TIM_mstr_ARR registers).
3. Configure TIM_slv to get the input trigger from TIM_mstr (TS = 00010 in the TIM_slv_SMCR register).
4. Configure TIM_slv in trigger mode (SMS = 110 in TIM_slv_SMCR register).
5. Start TIM_mstr by writing 1 in the CEN bit (TIM_mstr_CR1 register).

Figure 616. Triggering TIM_slv with update of TIM_mstr



As in the previous example, both counters can be initialized before starting counting. *Figure 617* shows the behavior with the same configuration as in *Figure 616* but in trigger mode (SMS = 110 in the TIM_slv_SMCR register) instead of gated mode.

Figure 617. Triggering TIM_slv with Enable of TIM_mstr



Starting two timers synchronously in response to an external trigger

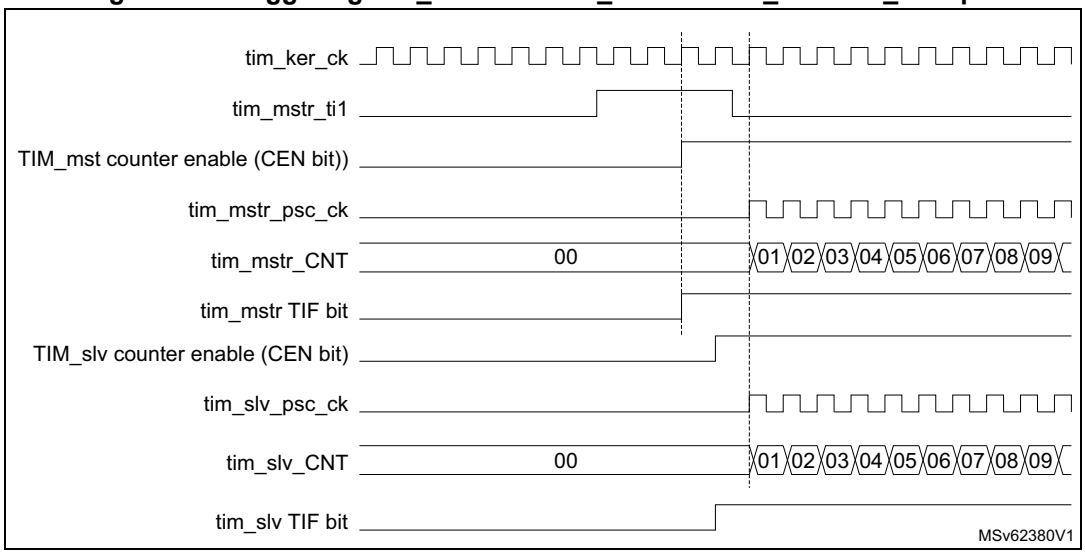
In this example, we set the enable of TIM_mstr when its tim_ti1 input rises, and the enable of TIM_slv with the enable of TIM_mstr. Refer to *Figure 612* for connections. To ensure the counters are aligned, TIM_mstr must be configured in Master/Slave mode (slave with respect to tim_ti1, master with respect to TIM_slv):

1. Configure TIM_mstr master mode to send its enable as trigger output (MMS = 001 in the TIM_mstr_CR2 register).
2. Configure TIM_mstr slave mode to get the input trigger from tim_ti1 (TS = 00100 in the TIM_mstr_SMCR register).
3. Configure TIM_mstr in trigger mode (SMS = 110 in the TIM_mstr_SMCR register).
4. Configure the TIM_mstr in Master/Slave mode by writing MSM = 1 (TIM_mstr_SMCR register).
5. Configure TIM_slv to get the input trigger from TIM_mstr (TS = 00000 in the TIM_slv_SMCR register).
6. Configure TIM_slv in trigger mode (SMS = 110 in the TIM_slv_SMCR register).

When a rising edge occurs on tim_ti1 (TIM_mstr), both counters start counting synchronously on the internal clock and both TIF flags are set.

Note: In this example both timers are initialized before starting (by setting their respective UG bits). Both counters starts from 0, but an offset can easily be inserted between them by writing any of the counter registers (TIMx_CNT). One can see that the master/slave mode inserts a delay between CNT_EN and CK_PSC on TIM_mstr.

Figure 618. Triggering TIM_mstr and TIM_slv with TIM_mstr tim_ti1 input



Note: The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo signal must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

54.4.24 ADC triggers

The timer can generate an ADC triggering event with various internal signals, such as reset, enable or compare events.

Note: The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo signal must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

54.4.25 DMA burst mode

The TIMx timers have the capability to generate multiple DMA requests upon a single event. The main purpose is to be able to reprogram part of the timer multiple times without software overhead, but it can also be used to read several registers in a row, at regular intervals.

The DMA controller destination is unique and must point to the virtual register TIMx_DMAR. On a given timer event, the timer launches a sequence of DMA requests (burst). Each write into the TIMx_DMAR register is actually redirected to one of the timer registers.

The DBL[4:0] bits in the TIMx_DCR register set the DMA burst length. The timer recognizes a burst transfer when a read or a write access is done to the TIMx_DMAR address), i.e. the number of transfers (either in half-words or in bytes).

The DBA[4:0] bits in the TIMx_DCR registers define the DMA base address for DMA transfers (when read/write accesses are done through the TIMx_DMAR address). DBA is defined as an offset starting from the address of the TIMx_CR1 register:

Example:

00000: TIMx_CR1

00001: TIMx_CR2

00010: TIMx_SMCR

The DBSS[3:0] bits in the TIMx_DCR register defines the interrupt source that triggers the DMA burst transfers (see *Section 54.5.23: TIMx DMA control register (TIMx_DCR)(x = 2 to 5)* for details).

As an example, the timer DMA burst feature is used to update the contents of the CCRx registers (x = 2, 3, 4) upon an update event, with the DMA transferring half words into the CCRx registers.

This is done in the following steps:

1. Configure the corresponding DMA channel as follows:
   - DMA channel peripheral address is the DMAR register address.
   - DMA channel memory address is the address of the buffer in the RAM containing the data to be transferred by DMA into CCRx registers.
   - Number of data to transfer = 3 (See note below).
   - Circular mode disabled.
2. Configure the DCR register by configuring the DBA and DBL bitfields as follows: DBL = 3 transfers, DBA = 0xE and DBSS = 1.
3. Enable the TIMx update DMA request (set the UDE bit in the DIER register).
4. Enable TIMx.
5. Enable the DMA channel.

This example is for the case where every CCRx register has to be updated once. If every CCRx register is to be updated twice for example, the number of data to transfer must be 6. Let's take the example of a buffer in the RAM containing data1, data2, data3, data4, data5,

and data6. The data is transferred to the CCRx registers as follows: on the first update DMA request, data1 is transferred to CCR2, data2 is transferred to CCR3, data3 is transferred to CCR4 and on the second update DMA request, data4 is transferred to CCR2, data5 is transferred to CCR3, and data6 is transferred to CCR4.

Note: A null value can be written to the reserved registers.

54.4.26 TIM2/TIM3/TIM4/TIM5 DMA requests

The TIM2/TIM3/TIM4/TIM5 can generate a DMA requests, as shown in *Table 553*.

Table 553. DMA request

DMA request signal	DMA request	Enable control bit
tim_upd_dma	Update	UDE
tim_cc1_dma	Capture/compare 1	CC1DE
tim_cc2_dma	Capture/compare 2	CC2DE
tim_cc3_dma	Capture/compare 3	CC3DE
tim_cc4_dma	Capture/compare 4	CC4DE
tim_trgi_dma	Trigger	TDE

Note: Some timer's DMA requests may not be connected to the DMA controller. Refer to the DMA section(s) for more details.

54.4.27 Debug mode

When the microcontroller enters debug mode (Cortex-M33 core halted), the TIMx counter can either continue to work normally or stops.

The behavior in debug mode can be programmed with a dedicated configuration bit per timer in the Debug support (DBG) module.

For more details, refer to section Debug support (DBG).

54.4.28 TIM2/TIM3/TIM4/TIM5 low-power modes

Table 554. Effect of low-power modes on TIM2/TIM3/TIM4/TIM5

Mode	Description
Sleep	No effect, peripheral is active. The interrupts can cause the device to exit from Sleep mode.
Stop	The timer operation is stopped and the register content is kept. No interrupt can be generated.
Standby	The timer is powered-down and must be reinitialized after exiting the Standby mode.

54.4.29 TIM2/TIM3/TIM4/TIM5 interrupts

The TIM2/TIM3/TIM4/TIM5 can generate multiple interrupts, as shown in *Table 555*.

Table 555. Interrupt requests

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from Sleep mode	Exit from Stop and Standby mode
TIM_UP	Update	UIF	UIE	write 0 in UIF	Yes	No
TIM_CC	Capture/compare 1	CC1IF	CC1IE	write 0 in CC1IF	Yes	No
	Capture/compare 2	CC2IF	CC2IE	write 0 in CC2IF	Yes	No
	Capture/compare 3	CC3IF	CC3IE	write 0 in CC3IF	Yes	No
	Capture/compare 4	CC4IF	CC4IE	write 0 in CC4IF	Yes	No
TIM_TRG	Trigger	TIF	TIE	write 0 in TIF	Yes	No
TIM_DIR_IDX	Index	IDXF	IDXIE	write 0 in IDXF	Yes	No
	Direction	DIRF	DIRIE	write 0 in DIRF	Yes	No
TIM_IERR	Index Error	IERRF	IERRIE	write 0 in IERRF	Yes	No
TIM_TER	Transition Error	TERRF	TERRIE	write 0 in TERRF	Yes	No

54.5 TIM2/TIM3/TIM4/TIM5 registers

Refer to *Section 1.2* for a list of abbreviations used in register descriptions.

The peripheral registers can be accessed by half-words (16-bit) or words (32-bit).

54.5.1 TIMx control register 1 (TIMx_CR1)(x = 2 to 5)

Address offset: 0x000

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DITHEN	UIFREMAP	Res.	CKD[1:0]		ARPE	CMS[1:0]		DIR	OPM	URS	UDIS	CEN
			rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **DITHEN**: Dithering Enable

0: Dithering disabled

1: Dithering enabled

Note: The DITHEN bit can only be modified when CEN bit is reset.

Bit 11 **UIFREMAP**: UIF status bit remapping

0: No remapping. UIF status bit is not copied to TIMx_CNT register bit 31.

1: Remapping enabled. UIF status bit is copied to TIMx_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division

This bitfield indicates the division ratio between the timer clock (tim_ker_ck) frequency and sampling clock used by the digital filters (tim_etr_in, tim_tix),

00: $t_{DTS} = t_{tim_ker_ck}$

01: $t_{DTS} = 2 \times t_{tim_ker_ck}$

10: $t_{DTS} = 4 \times t_{tim_ker_ck}$

11: Reserved

Bit 7 **ARPE**: Autoreload preload enable

0: TIMx_ARR register is not buffered

1: TIMx_ARR register is buffered

Bits 6:5 **CMS[1:0]**: Center-aligned mode selection

00: Edge-aligned mode. The counter counts up or down depending on the direction bit (DIR).

01: Center-aligned mode 1. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS = 00 in TIMx_CCMRx register) are set only when the counter is counting down.

10: Center-aligned mode 2. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS = 00 in TIMx_CCMRx register) are set only when the counter is counting up.

11: Center-aligned mode 3. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS = 00 in TIMx_CCMRx register) are set both when the counter is counting up or down.

Note: It is not allowed to switch from edge-aligned mode to center-aligned mode as long as the counter is enabled (CEN = 1)

Bit 4 **DIR**: Direction

0: Counter used as upcounter

1: Counter used as downcounter

Note: This bit is read only when the timer is configured in Center-aligned mode or Encoder mode.

Bit 3 **OPM**: One-pulse mode

0: Counter is not stopped at update event

1: Counter stops counting at the next update event (clearing the bit CEN)

Bit 2 **URS**: Update request source

This bit is set and cleared by software to select the UEV event sources.

0: Any of the following events generate an update interrupt or DMA request if enabled. These events can be:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

1: Only counter overflow/underflow generates an update interrupt or DMA request if enabled.

Bit 1 **UDIS**: Update disable

This bit is set and cleared by software to enable/disable UEV event generation.

0: UEV enabled. The Update (UEV) event is generated by one of the following events:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

Buffered registers are then loaded with their preload values.

1: UEV disabled. The Update event is not generated, shadow registers keep their value (ARR, PSC, CCRx). However the counter and the prescaler are reinitialized if the UG bit is set or if a hardware reset is received from the slave mode controller.

Bit 0 **CEN**: Counter enable

0: Counter disabled

1: Counter enabled

Note: External clock, gated mode and encoder mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.

CEN is cleared automatically in one-pulse mode, when an update event occurs.

54.5.2 TIMx control register 2 (TIMx_CR2)(x = 2 to 5)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	MMS[3]	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
						rw									
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TI1S	MMS[2:0]			CCDS	Res.	Res.	Res.
								rw	rw	rw	rw	rw			

Bits 31:26 Reserved, must be kept at reset value.

Bits 24:8 Reserved, must be kept at reset value.

Bit 7 **TI1S**: tim_ti1 selection

0: The tim_ti1_in[15:0] multiplexer output is to tim_ti1 input
1: The tim_ti1_in[15:0], tim_ti2_in[15:0] and tim_ti3_in[15:0] multiplexers outputs are XORed and connected to the tim_ti1 input. See also *Section 53.3.29: Interfacing with Hall sensors*.

Bits 25, 6, 5, 4 **MMS[3:0]**: Master mode selection

These bits are used to select the information to be sent in master mode to slave timers for synchronization (tim_trgo). The combination is as follows:

0000: **Reset** - the UG bit from the TIMx_EGR register is used as trigger output (tim_trgo). If the reset is generated by the trigger input (slave mode controller configured in reset mode) then the signal on tim_trgo is delayed compared to the actual reset.

0001: **Enable** - the Counter enable signal, CNT_EN, is used as trigger output (tim_trgo). It is useful to start several timers at the same time or to control a window in which a slave timer is enabled. The Counter Enable signal is generated by a logic AND between CEN control bit and the trigger input when configured in gated mode.
When the Counter Enable signal is controlled by the trigger input, there is a delay on tim_trgo, except if the master/slave mode is selected (see the MSM bit description in TIMx_SMCR register).

0010: **Update** - The update event is selected as trigger output (tim_trgo). For instance a master timer can then be used as a prescaler for a slave timer.

0011: **Compare Pulse** - The trigger output send a positive pulse when the CC1IF flag is to be set (even if it was already high), as soon as a capture or a compare match occurred (tim_trgo).

0100: **Compare** - tim_oc1refc signal is used as trigger output (tim_trgo)

0101: **Compare** - tim_oc2refc signal is used as trigger output (tim_trgo)

0110: **Compare** - tim_oc3refc signal is used as trigger output (tim_trgo)

0111: **Compare** - tim_oc4refc signal is used as trigger output (tim_trgo)

1000: **Encoder clock output** - The encoder clock signal is used as trigger output (tim_trgo). This code is valid for the following SMS[3:0] values: 0001, 0010, 0011, 1010, 1011, 1100, 1101, 1110, 1111. Any other SMS[3:0] code is not allowed and may lead to unexpected behavior.

Others: Reserved

Note: The clock of the slave timer or ADC must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.

Bit 3 **CCDS**: Capture/compare DMA selection

0: CCx DMA request sent when CCx event occurs
1: CCx DMA requests sent when update event occurs

Bits 2:0 Reserved, must be kept at reset value.

54.5.3 TIMx slave mode control register (TIMx_SMCR)(x = 2 to 5)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	SMSPS	SMSPE	Res.	Res.	TS[4:3]		Res.	Res.	Res.	SMS[3]
						rw	rw			rw	rw				rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ETP	ECE	ETPS[1:0]		ETF[3:0]				MSM	TS[2:0]			OCCS	SMS[2:0]		
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **SMSPS**: SMS preload source

This bit selects whether the events that triggers the SMS[3:0] bitfield transfer from preload to active

0: The transfer is triggered by the Timer's Update event

1: The transfer is triggered by the Index event

Bit 24 **SMSPE**: SMS preload enable

This bit selects whether the SMS[3:0] bitfield is preloaded

0: SMS[3:0] bitfield is not preloaded

1: SMS[3:0] preload is enabled

Bits 23:22 Reserved, must be kept at reset value.

Bits 19:17 Reserved, must be kept at reset value.

Bit 15 **ETP**: External trigger polarity

This bit selects whether tim_etr_in or $\overline{\text{tim_etr_in}}$ is used for trigger operations

0: tim_etr_in is non-inverted, active at high level or rising edge

1: tim_etr_in is inverted, active at low level or falling edge

Bit 14 **ECE**: External clock enable

This bit enables External clock mode 2.

0: External clock mode 2 disabled

1: External clock mode 2 enabled. The counter is clocked by any active edge on the tim_etrf signal.

Note: Setting the ECE bit has the same effect as selecting external clock mode 1 with tim_trgi connected to tim_etrf (SMS = 111 and TS = 00111).
It is possible to simultaneously use external clock mode 2 with the following slave modes: reset mode, gated mode and trigger mode. Nevertheless, tim_trgi must not be connected to tim_etrf in this case (TS bits must not be 00111).
If external clock mode 1 and external clock mode 2 are enabled at the same time, the external clock input is tim_etrf.

Bits 13:12 **ETPS[1:0]**: External trigger prescaler

External trigger signal tim_etrp frequency must be at most 1/4 of tim_ker_ck frequency. A prescaler can be enabled to reduce tim_etrp frequency. It is useful when inputting fast external clocks on tim_etr_in.

00: Prescaler OFF

01: tim_etrp frequency divided by 2

10: tim_etrp frequency divided by 4

11: tim_etrp frequency divided by 8

Bits 11:8 **ETF[3:0]**: External trigger filter

This bitfield then defines the frequency used to sample tim_etrp signal and the length of the digital filter applied to tim_etrp. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at f_{DTS}
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Bit 7 **MSM**: Master/Slave mode

0: No action
1: The effect of an event on the trigger input (tim_trgi) is delayed to allow a perfect synchronization between the current timer and its slaves (through tim_trgo). It is useful if we want to synchronize several timers on a single external event.

Bits 21, 20, 6, 5, 4 **TS[4:0]**: Trigger selection

This bitfield selects the trigger input to be used to synchronize the counter.

00000: Internal trigger 0 (tim_itr0)
00001: Internal trigger 1 (tim_itr1)
00010: Internal trigger 2 (tim_itr2)
00011: Internal trigger 3 (tim_itr3)
00100: tim_ti1 edge detector (tim_ti1f_ed)
00101: Filtered timer input 1 (tim_ti1fp1)
00110: Filtered timer input 2 (tim_ti2fp2)
00111: External trigger input (tim_etrf)
01000: Internal trigger 4 (tim_itr4)
01001: Internal trigger 5 (tim_itr5)
01010: Internal trigger 6 (tim_itr6)
01011: Internal trigger 7 (tim_itr7)
01100: Internal trigger 8 (tim_itr8)
01101: Internal trigger 9 (tim_itr9)
01110: Internal trigger 10 (tim_itr10)
01111: Internal trigger 11 (tim_itr11)
10000: Internal trigger 12 (tim_itr12)
10001: Internal trigger 13 (tim_itr13)
10010: Internal trigger 14 (tim_itr14)
10011: Internal trigger 15 (tim_itr15)
Others: Reserved

See *Section 54.4.2: TIM2/TIM3/TIM4/TIM5 pins and internal signals* for product specific implementation details.

Note: These bits must be changed only when they are not used (for example when SMS = 000) to avoid wrong edge detections at the transition.

Bit 3 **OCCS**: OCREF clear selection

This bit is used to select the OCREF clear source
0: tim_ocref_clr_int is connected to the tim_ocref_clr input
1: tim_ocref_clr_int is connected to tim_etrf

Note: If the OCREF clear selection feature is not supported, this bit is reserved and forced by hardware to 0. Section 54.3: TIM2/TIM3/TIM4/TIM5 implementation.

Bits 16, 2, 1, 0 **SMS[3:0]**: Slave mode selection

When external signals are selected the active edge of the trigger signal (tim_trgi) is linked to the polarity selected on the external input (refer to ETP bit in TIMx_SMCR for tim_etr_in and CCxP/CCxNP bits in TIMx_CCER register for tim_ti1fp1 and tim_ti2fp2).

0000: Slave mode disabled - if CEN = 1 then the prescaler is clocked directly by the internal clock.

0001: Encoder mode 1 - Counter counts up/down on tim_ti1fp1 edge depending on tim_ti2fp2 level.

0010: Encoder mode 2 - Counter counts up/down on tim_ti2fp2 edge depending on tim_ti1fp1 level.

0011: Encoder mode 3 - Counter counts up/down on both tim_ti1fp1 and tim_ti2fp2 edges depending on the level of the other input.

0100: Reset mode - Rising edge of the selected trigger input (tim_trgi) reinitializes the counter and generates an update of the registers.

0101: Gated mode - The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops (but is not reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

0110: Trigger mode - The counter starts at a rising edge of the trigger tim_trgi (but it is not reset). Only the start of the counter is controlled.

0111: External clock mode 1 - Rising edges of the selected trigger (tim_trgi) clock the counter.

1000: Combined reset + trigger mode - Rising edge of the selected trigger input (tim_trgi) reinitializes the counter, generates an update of the registers and starts the counter.

1001: Combined gated + reset mode - The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops and is reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

1010: Encoder mode: Clock plus direction, x2 mode.

1011: Encoder mode: Clock plus direction, x1 mode, tim_ti2fp2 edge sensitivity is set by CC2P.

1100: Encoder mode: Directional clock, x2 mode.

1101: Encoder mode: Directional clock, x1 mode, tim_ti1fp1 and tim_ti2fp2 edge sensitivity is set by CC1P and CC2P.

1110: Quadrature encoder mode: x1 mode, counting on tim_ti1fp1 edges only, edge sensitivity is set by CC1P.

1111: Quadrature encoder mode: x1 mode, counting on tim_ti2fp2 edges only, edge sensitivity is set by CC2P.

Note: The gated mode must not be used if tim_ti1f_ed is selected as the trigger input (TS = 00100). Indeed, tim_ti1f_ed outputs 1 pulse for each transition on tim_ti1f, whereas the gated mode checks the level of the trigger signal.

Note: The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo signal must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

54.5.4 TIMx DMA/Interrupt enable register (TIMx_DIER)(x = 2 to 5)

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	CC4OF	CC3OF	CC2OF	CC1OF	Res.	Res.	TIF	Res.	CC4IF	CC3IF	CC2IF	CC1IF	UIF
			rc_w0	rc_w0	rc_w0	rc_w0			rc_w0		rc_w0	rc_w0	rc_w0	rc_w0	rc_w0

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **TERRF**: Transition error interrupt flag
This flag is set by hardware when a transition error is detected in encoder mode. It is cleared by software by writing it to 0.
0: No encoder transition error has been detected.
1: An encoder transition error has been detected

Bit 22 **IERRF**: Index error interrupt flag
This flag is set by hardware when an index error is detected. It is cleared by software by writing it to 0.
0: No index error has been detected.
1: An index error has been detected

Bit 21 **DIRF**: Direction change interrupt flag
This flag is set by hardware when the direction changes in encoder mode (DIR bit value in TIMx_CR is changing). It is cleared by software by writing it to 0.
0: No direction change
1: Direction change

Bit 20 **IDXF**: Index interrupt flag
This flag is set by hardware when an index event is detected. It is cleared by software by writing it to 0.
0: No index event occurred.
1: An index event has occurred

Bits 19:13 Reserved, must be kept at reset value.

Bit 12 **CC4OF**: Capture/Compare 4 overcapture flag
refer to CC1OF description

Bit 11 **CC3OF**: Capture/Compare 3 overcapture flag
refer to CC1OF description

Bit 10 **CC2OF**: Capture/compare 2 overcapture flag
refer to CC1OF description

Bit 9 **CC1OF**: Capture/Compare 1 overcapture flag
This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to 0.
0: No overcapture has been detected.
1: The counter value has been captured in TIMx_CCR1 register while CC1IF flag was already set

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 **TIF**: Trigger interrupt flag
This flag is set by hardware on the TRG trigger event (active edge detected on tim_trgi input) when the slave mode controller is enabled in all modes but gated mode. It is set when the counter starts or stops when gated mode is selected. It is cleared by software.
0: No trigger event occurred.
1: Trigger interrupt pending.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **CC4IF**: Capture/Compare 4 interrupt flag
Refer to CC1IF description

Bit 3 **CC3IF**: Capture/Compare 3 interrupt flag
Refer to CC1IF description

Bit 2 **CC2IF**: Capture/Compare 2 interrupt flag
Refer to CC1IF description

Bit 1 **CC1IF**: Capture/compare 1 interrupt flag
This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIMx_CCR1 register (input capture mode only).
0: No compare match / No input capture occurred
1: A compare match or an input capture occurred
If channel CC1 is configured as output: this flag is set when the content of the counter TIMx_CNT matches the content of the TIMx_CCR1 register. When the content of TIMx_CCR1 is greater than the content of TIMx_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in down-counting mode). There are three possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIMx_CR1 register for the full description.
If channel CC1 is configured as input: this bit is set when counter value has been captured in TIMx_CCR1 register (an edge has been detected on IC1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIMx_CCER).

Bit 0 **UIF**: Update interrupt flag
This bit is set by hardware on an update event. It is cleared by software.
0: No update occurred
1: Update interrupt pending. This bit is set by hardware when the registers are updated:
At overflow or underflow and if UDIS = 0 in the TIMx_CR1 register.
When CNT is reinitialized by software using the UG bit in TIMx_EGR register, if URS = 0 and UDIS = 0 in the TIMx_CR1 register.
When CNT is reinitialized by a trigger event (refer to the synchro control register description), if URS = 0 and UDIS = 0 in the TIMx_CR1 register.

54.5.6 TIMx event generation register (TIMx_EGR)(x = 2 to 5)

Address offset: 0x014

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TG	Res.	CC4G	CC3G	CC2G	CC1G	UG
									w		w	w	w	w	w

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **TG**: Trigger generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: The TIF flag is set in TIMx_SR register. Related interrupt or DMA transfer can occur if enabled.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **CC4G**: Capture/compare 4 generation
Refer to CC1G description

Bit 3 **CC3G**: Capture/compare 3 generation
Refer to CC1G description

Bit 2 **CC2G**: Capture/compare 2 generation
Refer to CC1G description

Bit 1 **CC1G**: Capture/compare 1 generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: A capture/compare event is generated on channel 1:
If channel CC1 is configured as output:
CC1IF flag is set, Corresponding interrupt or DMA request is sent if enabled.
If channel CC1 is configured as input:
The current value of the counter is captured in TIMx_CCR1 register. The CC1IF flag is set, the corresponding interrupt or DMA request is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation
This bit can be set by software, it is automatically cleared by hardware.
0: No action
1: Re-initialize the counter and generates an update of the registers. Note that the prescaler counter is cleared too (anyway the prescaler ratio is not affected). The counter is cleared if the center-aligned mode is selected or if DIR = 0 (up-counting), else it takes the autoreload value (TIMx_ARR) if DIR = 1 (down-counting).

54.5.7 TIMx capture/compare mode register 1 (TIMx_CCMR1)(x = 2 to 5)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Input capture mode

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC2F[3:0]**: Input capture 2 filter

Bits 11:10 **IC2PSC[1:0]**: Input capture 2 prescaler

Bits 9:8 **CC2S[1:0]**: Capture/compare 2 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output.

01: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti2.

10: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti1.

11: CC2 channel is configured as input, tim_ic2 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)

Note: CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIMx_CCER).

Bits 7:4 **IC1F[3:0]**: Input capture 1 filter

This bitfield defines the frequency used to sample tim_ti1 input and the length of the digital filter applied to tim_ti1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at f_{DTS}

0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2

0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4

0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8

0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6

0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8

0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6

0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8

1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6

1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8

1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5

1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6

1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8

1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5

1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6

1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Bits 3:2 **IC1PSC[1:0]**: Input capture 1 prescaler

This bitfield defines the ratio of the prescaler acting on CC1 input (tim_ic1). The prescaler is reset as soon as CC1E = 0 (TIMx_CCER register).

00: no prescaler, capture is done each time an edge is detected on the capture input

01: capture is done once every 2 events

10: capture is done once every 4 events

11: capture is done once every 8 events

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1

10: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti2

11: CC1 channel is configured as input, tim_ic1 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx_CCER).

54.5.8 TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 2 to 5)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

Output compare mode

Bits 31:25 Reserved, must be kept at reset value.

Bits 23:17 Reserved, must be kept at reset value.

Bit 15 **OC2CE**: Output compare 2 clear enable

Bits 24, 14:12 **OC2M[3:0]**: Output compare 2 mode
refer to OC1M description on bits 6:4

Bit 11 **OC2PE**: Output compare 2 preload enable

Bit 10 **OC2FE**: Output compare 2 fast enable

Bits 9:8 **CC2S[1:0]**: Capture/Compare 2 selection
This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC2 channel is configured as output
01: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti2
10: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti1
11: CC2 channel is configured as input, tim_ic2 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through the TS bit (TIMx_SMCR register)
Note: CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIMx_CCER).

Bit 7 **OC1CE**: Output compare 1 clear enable
0: tim_oc1ref is not affected by the tim_ocref_clr_int input
1: tim_oc1ref is cleared as soon as a High level is detected on tim_ocref_clr_int input

Bits 16, 6:4 **OC1M[3:0]**: Output compare 1 mode

These bits define the behavior of the output reference signal tim_oc1ref from which tim_oc1 is derived. tim_oc1ref is active high whereas tim_oc1 active level depends on CC1P bit.

0000: Frozen - The comparison between the output compare register TIMx_CCR1 and the counter TIMx_CNT has no effect on the outputs. This mode can be used when the timer serves as a software timebase. When the frozen mode is enabled during timer operation, the ouput keeps the state (active or inactive) it had before entering the frozen state.

0001: Set channel 1 to active level on match. tim_oc1ref signal is forced high when the counter TIMx_CNT matches the capture/compare register 1 (TIMx_CCR1).

0010: Set channel 1 to inactive level on match. tim_oc1ref signal is forced low when the counter TIMx_CNT matches the capture/compare register 1 (TIMx_CCR1).

0011: Toggle - tim_oc1ref toggles when TIMx_CNT = TIMx_CCR1.

0100: Force inactive level - tim_oc1ref is forced low.

0101: Force active level - tim_oc1ref is forced high.

0110: PWM mode 1 - In up-counting, channel 1 is active as long as TIMx_CNT<TIMx_CCR1 else inactive. In down-counting, channel 1 is inactive (tim_oc1ref = 0) as long as TIMx_CNT>TIMx_CCR1 else active (tim_oc1ref = 1).

0111: PWM mode 2 - In up-counting, channel 1 is inactive as long as TIMx_CNT<TIMx_CCR1 else active. In down-counting, channel 1 is active as long as TIMx_CNT>TIMx_CCR1 else inactive.

1000: Retriggerable OPM mode 1 - In up-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update. In down-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update.

1001: Retriggerable OPM mode 2 - In up-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update. In down-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

1010: Reserved.

1011: Reserved.

1100: Combined PWM mode 1 - tim_oc1ref has the same behavior as in PWM mode 1. tim_oc1refc is the logical OR between tim_oc1ref and tim_oc2ref.

1101: Combined PWM mode 2 - tim_oc1ref has the same behavior as in PWM mode 2. tim_oc1refc is the logical AND between tim_oc1ref and tim_oc2ref.

1110: Asymmetric PWM mode 1 - tim_oc1ref has the same behavior as in PWM mode 1. tim_oc1refc outputs tim_oc1ref when the counter is counting up, tim_oc2ref when it is counting down.

1111: Asymmetric PWM mode 2 - tim_oc1ref has the same behavior as in PWM mode 2. tim_oc1refc outputs tim_oc1ref when the counter is counting up, tim_oc2ref when it is counting down.

Note: In PWM mode, the OCREF level changes when the result of the comparison changes, when the output compare mode switches from “frozen” mode to “PWM” mode and when the output compare mode switches from “force active/inactive” mode to “PWM” mode.

Bit 3 **OC1PE**: Output compare 1 preload enable

0: Preload register on TIMx_CCR1 disabled. TIMx_CCR1 can be written at anytime, the new value is taken in account immediately.
1: Preload register on TIMx_CCR1 enabled. Read/Write operations access the preload register. TIMx_CCR1 preload value is loaded in the active register at each update event.

Bit 2 **OC1FE**: Output compare 1 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIMx_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.
0: CC1 behaves normally depending on counter and CCR1 values even when the trigger is ON. The minimum delay to activate CC1 output when an edge occurs on the trigger input is 5 clock cycles.
1: An active edge on the trigger input acts like a compare match on CC1 output. Then, OC is set to the compare level independently from the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to three clock cycles. OCFE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC1 channel is configured as output.
01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1.
10: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti2.
11: CC1 channel is configured as input, tim_ic1 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx_CCER).

54.5.9 TIMx capture/compare mode register 2 (TIMx_CCMR2)(x = 2 to 5)

Address offset: 0x01C

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

Input capture mode

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC4F[3:0]**: Input capture 4 filter

Bits 11:10 **IC4PSC[1:0]**: Input capture 4 prescaler

Bits 9:8 **CC4S[1:0]**: Capture/Compare 4 selection
This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC4 channel is configured as output
01: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti4
10: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti3
11: CC4 channel is configured as input, tim_ic4 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)
Note: CC4S bits are writable only when the channel is OFF (CC4E = 0 in TIMx_CCER).

Bits 7:4 **IC3F[3:0]**: Input capture 3 filter

Bits 3:2 **IC3PSC[1:0]**: Input capture 3 prescaler

Bits 1:0 **CC3S[1:0]**: Capture/Compare 3 selection
This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC3 channel is configured as output
01: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti3
10: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti4
11: CC3 channel is configured as input, tim_ic3 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)
Note: CC3S bits are writable only when the channel is OFF (CC3E = 0 in TIMx_CCER).

54.5.10 TIMx capture/compare mode register 2 [alternate] (TIMx_CCMR2)(x = 2 to 5)

Address offset: 0x01C

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

Output compare mode

Bits 31:25 Reserved, must be kept at reset value.

Bits 23:17 Reserved, must be kept at reset value.

Bit 15 **OC4CE**: Output compare 4 clear enable

Bits 24, 14:12 **OC4M[3:0]**: Output compare 4 mode
Refer to OC3M[3:0]

Bit 11 **OC4PE**: Output compare 4 preload enable

Bit 10 **OC4FE**: Output compare 4 fast enable

Bits 9:8 **CC4S[1:0]**: Capture/Compare 4 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC4 channel is configured as output

01: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti4

10: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti3

11: CC4 channel is configured as input, tim_ic4 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)

Note: CC4S bits are writable only when the channel is OFF (CC4E = 0 in TIMx_CCER).

Bit 7 **OC3CE**: Output compare 3 clear enable

Bits 16, 6:4 **OC3M[3:0]**: Output compare 3 mode

These bits define the behavior of the output reference signal tim_oc3ref from which tim_oc3 and tim_oc3n are derived. tim_oc3ref is active high whereas tim_oc3 and tim_oc3n active level depends on CC3P and CC3NP bits.

0000: Frozen - The comparison between the output compare register TIMx_CCR3 and the counter TIMx_CNT has no effect on the outputs.(this mode is used to generate a timing base).

0001: Set channel 3 to active level on match. tim_oc3ref signal is forced high when the counter TIMx_CNT matches the capture/compare register 3 (TIMx_CCR3).

0010: Set channel 3 to inactive level on match. tim_oc3ref signal is forced low when the counter TIMx_CNT matches the capture/compare register 3 (TIMx_CCR3).

0011: Toggle - tim_oc3ref toggles when TIMx_CNT = TIMx_CCR3.

0100: Force inactive level - tim_oc3ref is forced low.

0101: Force active level - tim_oc3ref is forced high.

0110: PWM mode 1 - In up-counting, channel 3 is active as long as TIMx_CNT<TIMx_CCR3 else inactive. In down-counting, channel 3 is inactive (tim_oc3ref = 0) as long as TIMx_CNT>TIMx_CCR3 else active (tim_oc3ref = 1).

0111: PWM mode 2 - In up-counting, channel 3 is inactive as long as TIMx_CNT<TIMx_CCR3 else active. In down-counting, channel 3 is active as long as TIMx_CNT>TIMx_CCR3 else inactive.

1000: Retrigerrable OPM mode 1 - In up-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update. In down-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update.

1001: Retrigerrable OPM mode 2 - In up-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update. In down-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

1010: Pulse on compare: a pulse is generated on tim_oc3ref upon CCR3 match event, as per PWPRSC[2:0] and PW[7:0] bitfields programming in TIMx_ECR.

1011: Direction output. The tim_oc3ref signal is overridden by a copy of the DIR bit.

1100: Combined PWM mode 1 - tim_oc3ref has the same behavior as in PWM mode 1. tim_oc3refc is the logical OR between tim_oc3ref and tim_oc4ref.

1101: Combined PWM mode 2 - tim_oc3ref has the same behavior as in PWM mode 2. tim_oc3refc is the logical AND between tim_oc3ref and tim_oc4ref.

1110: Asymmetric PWM mode 1 - tim_oc3ref has the same behavior as in PWM mode 1. tim_oc3refc outputs tim_oc3ref when the counter is counting up, tim_oc4ref when it is counting down.

1111: Asymmetric PWM mode 2 - tim_oc3ref has the same behavior as in PWM mode 2. tim_oc3refc outputs tim_oc3ref when the counter is counting up, tim_oc4ref when it is counting down.

Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIMx_BDTR register) and CC1S = 00 (the channel is configured in output).

Note: In PWM mode, the OCREF level changes only when the result of the comparison changes or when the output compare mode switches from “frozen” mode to “PWM” mode.

On channels having a complementary output, this bitfield is preloaded. If the CCPC bit is set in the TIMx_CR2 register then the OC3M active bits take the new value from the preloaded bits only when a COM event is generated.

Bit 3 **OC3PE**: Output compare 3 preload enable

Bit 2 **OC3FE**: Output compare 3 fast enable

Bits 1:0 **CC3S[1:0]**: Capture/Compare 3 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC3 channel is configured as output
01: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti3
10: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti4
11: CC3 channel is configured as input, tim_ic3 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)

Note: CC3S bits are writable only when the channel is OFF (CC3E = 0 in TIMx_CCER).

54.5.11 TIMx capture/compare enable register (TIMx_CCER)(x = 2 to 5)

Address offset: 0x020

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

rw		rw	rw	rw		rw	rw	rw		rw	rw	rw		rw	rw

Bit 15 **CC4NP**: *Capture/Compare 4 output Polarity.*
Refer to CC1NP description

Bit 14 Reserved, must be kept at reset value.

Bit 13 **CC4P**: *Capture/Compare 4 output Polarity.*
Refer to CC1P description

Bit 12 **CC4E**: *Capture/Compare 4 output enable.*
refer to CC1E description

Bit 11 **CC3NP**: *Capture/Compare 3 output Polarity.*
Refer to CC1NP description

Bit 10 Reserved, must be kept at reset value.

Bit 9 **CC3P**: *Capture/Compare 3 output Polarity.*
Refer to CC1P description

Bit 8 **CC3E**: *Capture/Compare 3 output enable.*
Refer to CC1E description

Bit 7 **CC2NP**: *Capture/Compare 2 output Polarity.*
Refer to CC1NP description

Bit 6 Reserved, must be kept at reset value.

Bit 5 **CC2P**: *Capture/Compare 2 output Polarity.*
refer to CC1P description

Bit 4 **CC2E**: *Capture/Compare 2 output enable.*
Refer to CC1E description

Bit 3 **CC1NP**: *Capture/Compare 1 output Polarity.*

CC1 channel configured as output: CC1NP must be kept cleared in this case.

CC1 channel configured as input: This bit is used in conjunction with CC1P to define tim_ti1fp1/tim_ti2fp1 polarity. refer to CC1P description.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CC1P**: *Capture/Compare 1 output Polarity.*

0: OC1 active high (output mode) / Edge sensitivity selection (input mode, see below)

1: OC1 active low (output mode) / Edge sensitivity selection (input mode, see below)

When CC1 channel is configured as input, both CC1NP/CC1P bits select the active polarity of TI1FP1 and TI2FP1 for trigger or capture operations.

CC1NP = 0, CC1P = 0: non-inverted/rising edge. The circuit is sensitive to TIxFP1 rising edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode or encoder mode).

CC1NP = 0, CC1P = 1: inverted/falling edge. The circuit is sensitive to TIxFP1 falling edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is inverted (trigger operation in gated mode or encoder mode).

CC1NP = 1, CC1P = 1: non-inverted/both edges. The circuit is sensitive to both TIxFP1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), TIxFP1is not inverted (trigger operation in gated mode). This configuration must not be used in encoder mode.

CC1NP = 1, CC1P = 0: this configuration is reserved, it must not be used.

Bit 0 **CC1E**: *Capture/Compare 1 output enable.*

0: Capture mode disabled / OC1 is not active

1: Capture mode enabled / OC1 signal is output on the corresponding output pin

Table 556. Output control bit for standard tim_ocx channels

CCxE bit	tim_ocx output state
0	Output disabled (not driven by the timer: Hi-Z)
1	Output enabled (tim_ocx = tim_ocxref + Polarity)

Note: The state of the external IO pins connected to the standard tim_ocx channels depends only on the GPIO registers when CCxE = 0.

54.5.12 TIMx counter (TIMx_CNT)(x = 2 to 5)

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UIFCPY_CNT[31]	CNT[30:16]														
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **UIFCPY_CNT[31]**: Value depends on IUFREMAP in TIMx_CR1.
If UIFREMAP = 0
CNT[31]: Most significant bit of counter value
If UIFREMAP = 1
UIFCPY: UIF Copy
This bit is a read-only copy of the UIF bit of the TIMx_ISR register

Bits 30:0 **CNT[30:0]**: Least significant part of counter value
Non-dithering mode (DITHEN = 0)
The register holds the counter value.
Dithering mode (DITHEN = 1)
The register holds the non-dithered part in CNT[30:0]. The fractional part is not available.

54.5.13 TIMx prescaler (TIMx_PSC)(x = 2 to 5)

Address offset: 0x028

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PSC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **PSC[15:0]**: Prescaler value
The counter clock frequency tim_cnt_ck is equal to $f_{tim_psc_ck}$ / (PSC[15:0] + 1).
PSC contains the value to be loaded in the active prescaler register at each update event (including when the counter is cleared through UG bit of TIMx_EGR register or through trigger controller when configured in “reset mode”).

54.5.14 TIMx autoreload register (TIMx_ARR)(x = 2 to 5)

Address offset: 0x02C

Reset value: 0xFFFF FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ARR[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ARR[31:0]**: Autoreload value

ARR is the value to be loaded in the actual autoreload register.

Refer to the *Section 54.4.3: Time-base unit* for more details about ARR update and behavior.

The counter is blocked while the autoreload value is null.

Non-dithering mode (DITHEN = 0)

The register holds the autoreload value.

Dithering mode (DITHEN = 1)

The register holds the integer part in ARR[31:4]. The ARR[3:0] bitfield contains the dithered part.

54.5.15 TIMx capture/compare register 1 (TIMx_CCR1)(x = 2 to 5)

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CCR1[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CCR1[31:0]**: Capture/compare 1 value

If channel CC1 is configured as output:

CCR1 is the value to be loaded in the actual capture/compare 1 register (preload value). It is loaded permanently if the preload feature is not selected in the TIMx_CCMR1 register (bit OC1PE). Else the preload value is copied in the active capture/compare 1 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx_CNT and signaled on tim_oc1 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR1[31:4]. The CCR1[3:0] bitfield contains the dithered part.

If channel CC1 is configured as input:

CCR1 is the counter value transferred by the last input capture 1 event (tim_ic1). The TIMx_CCR1 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR1[31:0]. The CCR1[3:0] bits are reset.

54.5.16 TIMx capture/compare register 2 (TIMx_CCR2)(x = 2 to 5)

Address offset: 0x038

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CCR2[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CCR2[31:0]**: Capture/compare 2 value

If channel CC2 is configured as output:

CCR2 is the value to be loaded in the actual capture/compare 2 register (preload value). It is loaded permanently if the preload feature is not selected in the TIMx_CCMR2 register (bit OC2PE). Else the preload value is copied in the active capture/compare 2 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx_CNT and signaled on tim_oc2 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR2[31:4]. The CCR2[3:0] bitfield contains the dithered part.

If channel CC2 is configured as input:

CCR2 is the counter value transferred by the last input capture 2 event (tim_ic2). The TIMx_CCR2 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR2[31:0]. The CCR2[3:0] bits are reset.

54.5.17 TIMx capture/compare register 3 (TIMx_CCR3)(x = 2 to 5)

Address offset: 0x03C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CCR3[31:0]**: Capture/compare 3 value

If channel CC3 is configured as output:

CCR3 is the value to be loaded in the actual capture/compare 3 register (preload value). It is loaded permanently if the preload feature is not selected in the TIMx_CCMR3 register (bit OC3PE). Else the preload value is copied in the active capture/compare 3 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx_CNT and signaled on tim_oc3 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR3[31:4]. The CCR3[3:0] bitfield contains the dithered part.

If channel CC3 is configured as input:

CCR3 is the counter value transferred by the last input capture 3 event (tim_ic3). The TIMx_CCR3 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR3[31:0]. The CCR3[3:0] bits are reset.

54.5.18 TIMx capture/compare register 4 (TIMx_CCR4)(x = 2 to 5)

Address offset: 0x040

Reset value: 0x0000 0000

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CCR4[31:0]**: Capture/compare 4 value

If channel CC4 is configured as output:

CCR4 is the value to be loaded in the actual capture/compare 4 register (preload value). It is loaded permanently if the preload feature is not selected in the TIMx_CCMR4 register (bit OC4PE). Else the preload value is copied in the active capture/compare 4 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx_CNT and signaled on tim_oc4 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR4[31:4]. The CCR4[3:0] bitfield contains the dithered part.

If channel CC4 is configured as input:

CCR4 is the counter value transferred by the last input capture 4 event (tim_ic4). The TIMx_CCR4 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR4[31:0]. The CCR4[3:0] bits are reset.

54.5.19 TIMx timer encoder control register (TIMx_ECR)(x = 2 to 5)

Address offset: 0x058

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	PWPRSC[2:0]			PW[7:0]

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IPOS[1:0]		FIDX	IBLK[1:0]		IDIR[1:0]		IE
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 Reserved, must be kept at reset value.

Bits 26:24 **PWPRSC[2:0]**: Pulse width prescaler

This bitfield sets the clock prescaler for the pulse generator, as following:

$t_{PWG} = (2^{(PWPRSC[2:0])}) \times t_{tim_ker_ck}$

Bits 23:16 **PW[7:0]**: Pulse width

This bitfield defines the pulse duration, as following:

$t_{PW} = PW[7:0] \times t_{PWG}$

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:6 **IPOS[1:0]**: Index positioning

In quadrature encoder mode (SMS[3:0] = 0001, 0010, 0011, 1110, 1111), this bit indicates in which AB input configuration the Index event resets the counter.

00: Index resets the counter when AB = 00
01: Index resets the counter when AB = 01
10: Index resets the counter when AB = 10
11: Index resets the counter when AB = 11

In directional clock mode or clock plus direction mode (SMS[3:0] = 1010, 1011, 1100, 1101), these bits indicates on which level the Index event resets the counter. In bidirectional clock mode, this applies for both clock inputs.

x0: Index resets the counter when clock is 0
x1: Index resets the counter when clock is 1

Note: IPOS[1] bit is not significant

Bit 5 **FIDX**: First index

This bit indicates if the first index only is taken into account

0: Index is always active
1: the first Index only resets the counter

Bits 4:3 **IBLK[1:0]**: Index blanking

This bit indicates if the Index event is conditioned by the tim_ti3 input

00: Index always active
01: Index disabled hen tim_ti3 input is active, as per CC3P bitfield
10: Index disabled when tim_ti4 input is active, as per CC4P bitfield
11: Reserved

Bits 2:1 **IDIR[1:0]**: Index direction

This bit indicates in which direction the Index event resets the counter.

00: Index resets the counter whatever the direction
01: Index resets the counter when up-counting only
10: Index resets the counter when down-counting only
11: Reserved

Bit 0 **IE**: Index enable

This bit indicates if the Index event resets the counter.

0: Index disabled
1: Index enabled

54.5.20 TIMx timer input selection register (TIMx_TISEL)(x = 2 to 5)

Address offset: 0x05C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	DBL[4:0]					Res.	Res.	Res.	DBA[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **DBSS[3:0]**: DMA burst source selection

This bitfield defines the interrupt source that triggers the DMA burst transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIMx_DMAR address).

0000: Reserved
0001: Update
0010: CC1
0011: CC2
0100: CC3
0101: CC4
0110: COM
0111: Trigger
Others: reserved

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **DBL[4:0]**: DMA burst length

This 5-bit vector defines the length of DMA transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIMx_DMAR address), i.e. the number of transfers. Transfers can be in half-words or in bytes (see example below).

00000: 1 transfer
00001: 2 transfers
00010: 3 transfers
...
11010: 26 transfers

Example: Let us consider the following transfer: DBL = 7 bytes & DBA = TIM2_CR1.

–If DBL = 7 bytes and DBA = TIM2_CR1 represents the address of the byte to be transferred, the address of the transfer is given by the following equation:

(TIMx_CR1 address) + DBA + (DMA index), where DMA index = DBL

In this example, 7 bytes are added to (TIMx_CR1 address) + DBA, which gives us the address from/to which the data are copied. In this case, the transfer is done to 7 registers starting from the following address: (TIMx_CR1 address) + DBA

According to the configuration of the DMA Data Size, several cases may occur:

–If the DMA Data Size is configured in half-words, 16-bit data are transferred to each of the 7 registers.

–If the DMA Data Size is configured in bytes, the data are also transferred to 7 registers: the first register contains the first MSB byte, the second register, the first LSB byte and so on. So with the transfer Timer, one also has to specify the size of data transferred by DMA.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **DBA[4:0]**: DMA base address

This 5-bits vector defines the base-address for DMA transfers (when read/write access are done through the TIMx_DMAR address). DBA is defined as an offset starting from the address of the TIMx_CR1 register.

Example:
00000: TIMx_CR1,
00001: TIMx_CR2,
00010: TIMx_SMCR,
...

54.5.24 TIMx DMA address for full transfer (TIMx_DMAR)(x = 2 to 5)

Address offset: 0x3E0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

DMAB[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DMAB[31:0]**: DMA register for burst accesses

A read or write operation to the DMAR register accesses the register located at the address

(TIMx_CR1 address) + (DBA + DMA index) x 4

where TIMx_CR1 address is the address of the control register 1, DBA is the DMA base address configured in TIMx_DCR register, DMA index is automatically controlled by the DMA transfer, and ranges from 0 to DBL (DBL configured in TIMx_DCR).

54.5.25 TIMx hardware configuration 2 register (TIMx_HWCFGR2)(x = 2 to 5)

Address offset: 0x3EC

Reset value: 0x0000 2011

This read register identifies the hardware configuration parameters of the instantiated IP.

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

55 Basic timers (TIM6/TIM7)

55.1 TIM6/TIM7 introduction

The basic timers TIM6/TIM7 consist in a 16-bit autoreload counter driven by a programmable prescaler.

They can be used as generic timers for time-base generation.

The basic timer can also be used for triggering the digital-to-analog converter. This is done with the trigger output of the timer.

The timers are completely independent, and do not share any resources.

55.2 TIM6/TIM7 main features

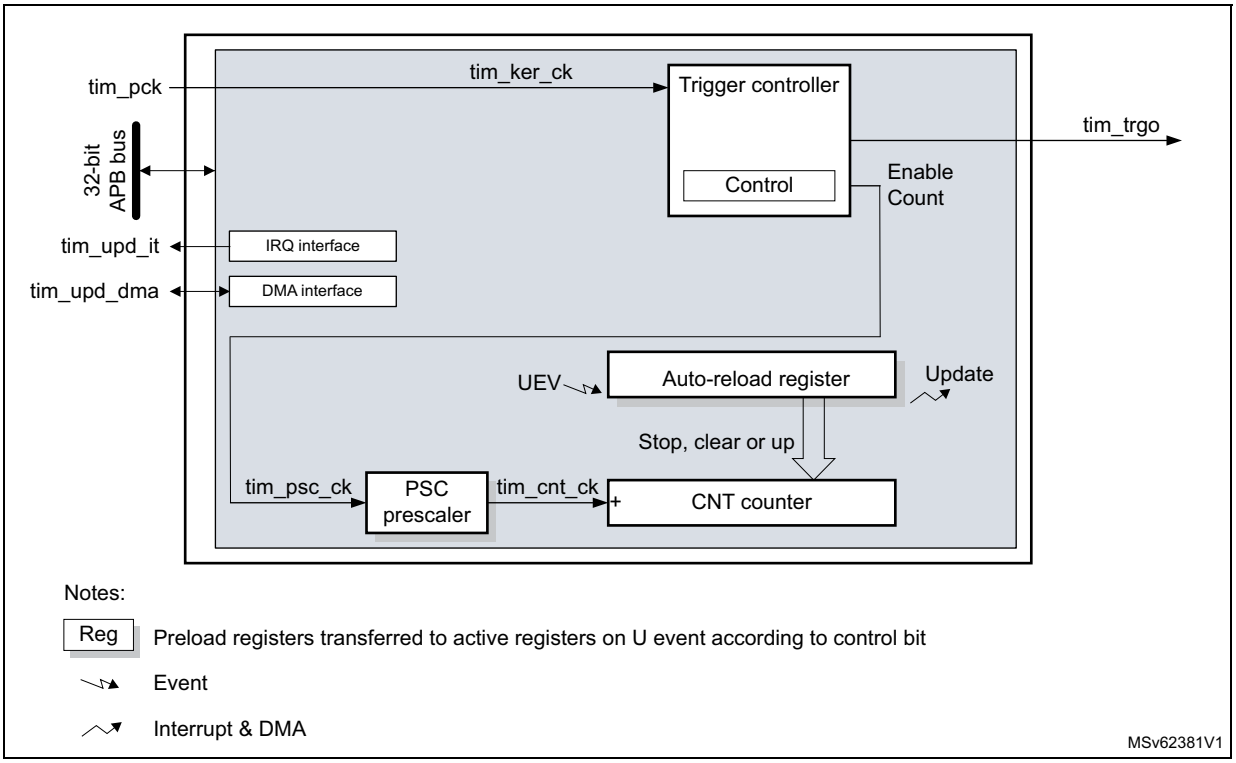
Basic timer (TIM6/TIM7) features include:

- 16-bit autoreload upcounter.
- 16-bit programmable prescaler used to divide (also “on the fly”) the counter clock frequency by any factor between 1 and 65535.
- Synchronization circuit to trigger the DAC.
- Interrupt/DMA generation on the update event: counter overflow.

55.3 TIM6/TIM7 functional description

55.3.1 TIM6/TIM7 block diagram

Figure 619. Basic timer block diagram



55.3.2 TIM6/TIM7 internal signals

The table in this section summarizes the TIM inputs and outputs.

Table 558. TIM internal input/output signals

Internal signal name	Signal type	Description
tim_pclk	Input	Timer APB clock
tim_ker_ck	Input	Timer kernel clock. This clock must be synchronous with tim_pclk (derived from the same source). The clock ratio tim_ker_ck/tim_pclk must be an integer: 1, 2, 3,..., 16 (maximum value)
tim_trgo	Output	Internal trigger output. This trigger can trigger other on-chip peripherals (DAC).
tim_upd_it	Output	Timer update event interrupt
tim_upd_dma	Output	Timer update dma request

55.3.3 TIM6/TIM7 clocks

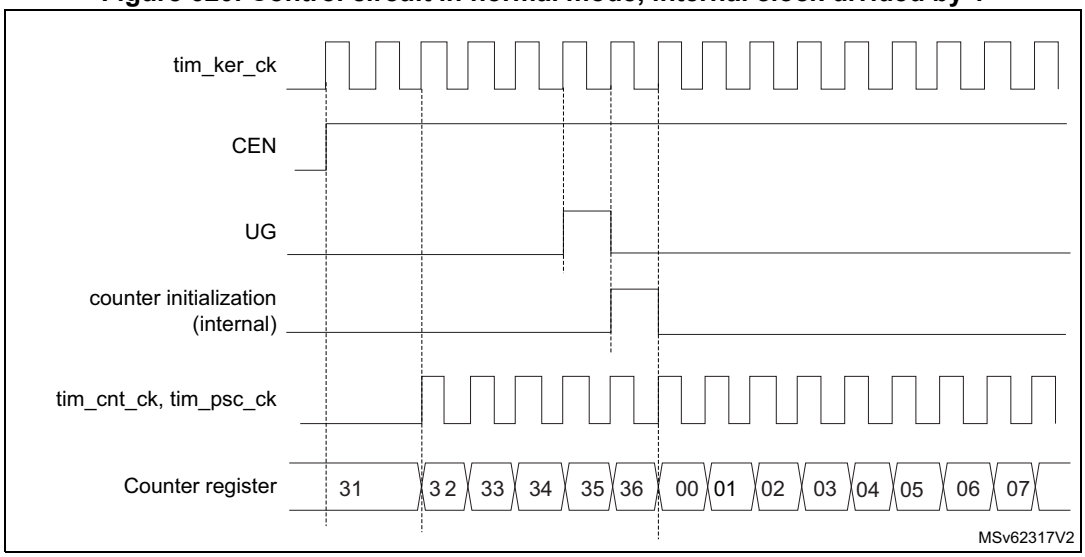
The timer bus interface is clocked by the tim_pclk APB clock.

The counter clock tim_ker_ck is connected to the tim_pclk input.

The CEN (in the TIMx_CR1 register) and UG bits (in the TIMx_EGR register) are actual control bits and can be changed only by software (except for UG that remains cleared automatically). As soon as the CEN bit is written to 1, the prescaler is clocked by the internal clock tim_ker_ck.

Figure 620 shows the behavior of the control circuit and the upcounter in normal mode, without prescaler.

Figure 620. Control circuit in normal mode, internal clock divided by 1



55.3.4 Time-base unit

The main block of the programmable timer is a 16-bit upcounter with its related autoreload register. The counter clock can be divided by a prescaler.

The counter, the autoreload register and the prescaler register can be written or read by software. This is true even when the counter is running.

The time-base unit includes:

- Counter register (TIMx_CNT)
- Prescaler register (TIMx_PSC)
- Auto-Reload register (TIMx_ARR).

The autoreload register is preloaded. The preload register is accessed each time an attempt is made to write or read the autoreload register. The contents of the preload register are transferred into the shadow register permanently or at each update event UEV, depending on the autoreload preload enable bit (ARPE) in the TIMx_CR1 register. The update event is sent when the counter reaches the overflow value and if the UDIS bit equals 0 in the TIMx_CR1 register. It can also be generated by software. The generation of the update event is described in detail for each configuration.

The counter is clocked by the prescaler output tim_cnt_ck, which is enabled only when the counter enable bit (CEN) in the TIMx_CR1 register is set.

Note that the actual counter enable signal tim_cnt_en is set one clock cycle after CEN bit set.

Prescaler description

The prescaler can divide the counter clock frequency by any factor between 1 and 65536. It is based on a 16-bit counter controlled through a 16-bit register (in the TIMx_PSC register). It can be changed on the fly as the TIMx_PSC control register is buffered. The new prescaler ratio is taken into account at the next update event.

Figure 621 and *Figure 622* give some examples of the counter behavior when the prescaler ratio is changed on the fly.

Figure 621. Counter timing diagram with prescaler division change from 1 to 2

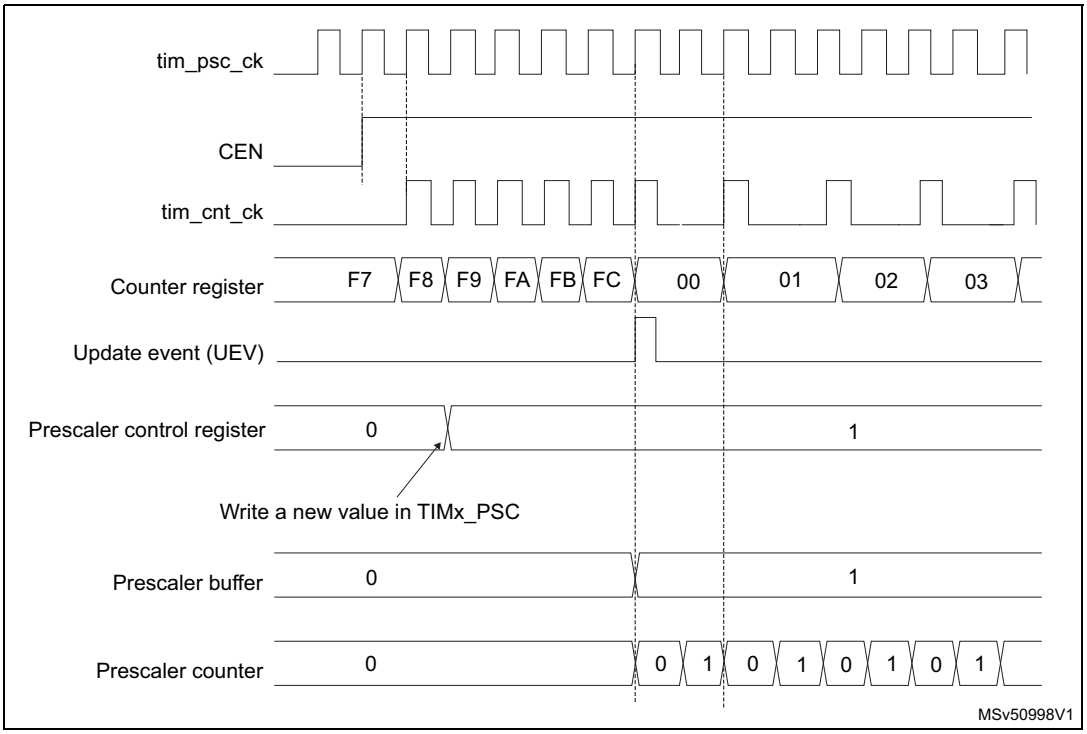


Figure 622. Counter timing diagram with prescaler division change from 1 to 4

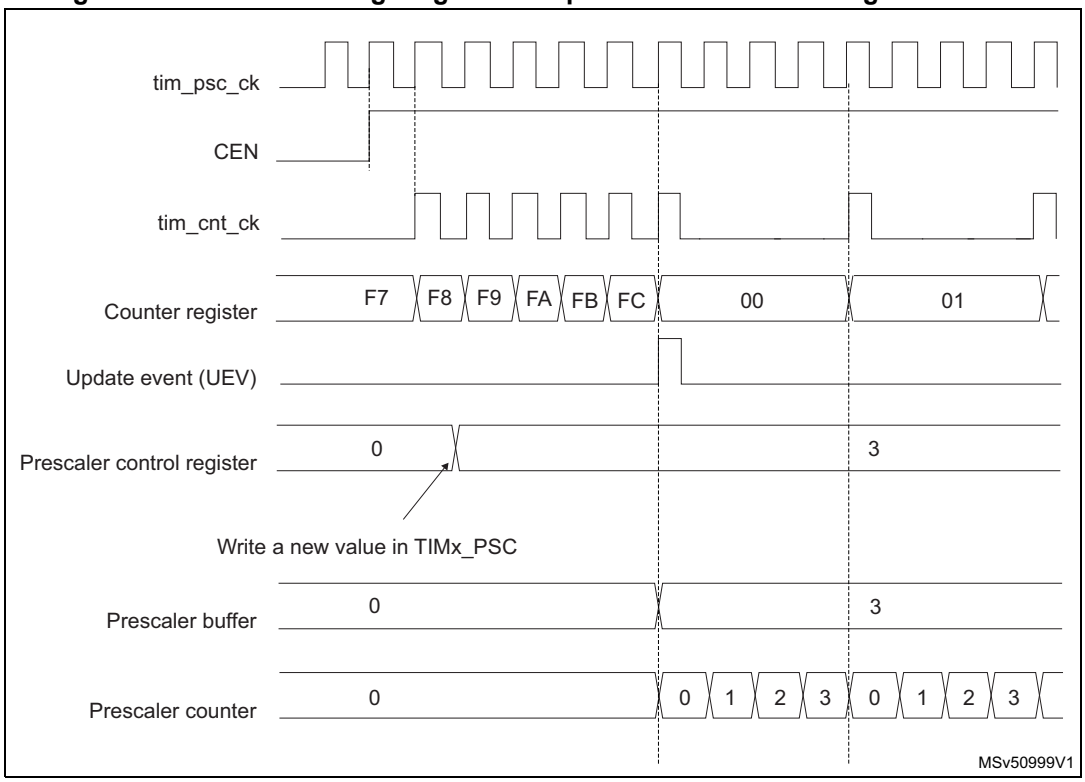

55.3.5 Counting mode

The counter counts from 0 to the autoreload value (contents of the TIMx_ARR register), then restarts from 0 and generates a counter overflow event.

An update event can be generate at each counter overflow or by setting the UG bit in the TIMx_EGR register (by software or by using the slave mode controller).

The UEV event can be disabled by software by setting the UDIS bit in the TIMx_CR1 register. This avoids updating the shadow registers while writing new values into the preload registers. In this way, no update event occurs until the UDIS bit has been written to 0, however, the counter and the prescaler counter both restart from 0 (but the prescale rate does not change). In addition, if the URS (update request selection) bit in the TIMx_CR1 register is set, setting the UG bit generates an update event UEV, but the UIF flag is not set (so no interrupt or DMA request is sent).

When an update event occurs, all the registers are updated and the update flag (UIF bit in the TIMx_SR register) is set (depending on the URS bit):

- The buffer of the prescaler is reloaded with the preload value (contents of the TIMx_PSC register).
- The autoreload shadow register is updated with the preload value (TIMx_ARR).

The following figures show some examples of the counter behavior for different clock frequencies when TIMx_ARR = 0x36.

Figure 623. Counter timing diagram, internal clock divided by 1

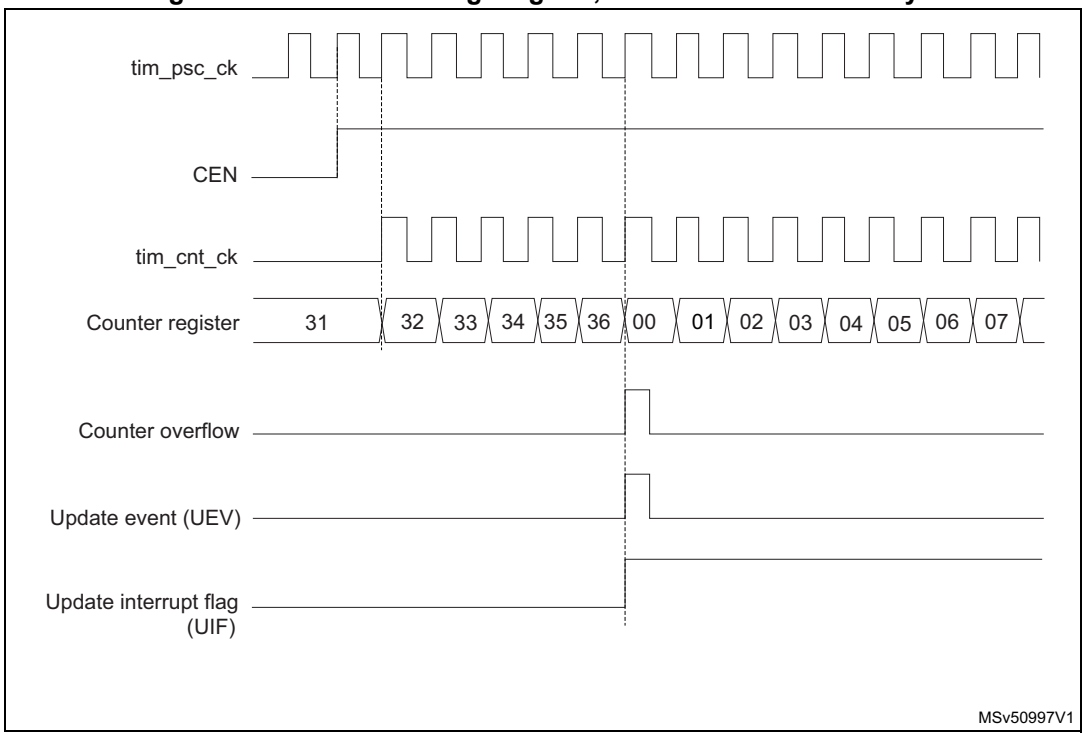

Figure 624. Counter timing diagram, internal clock divided by 2

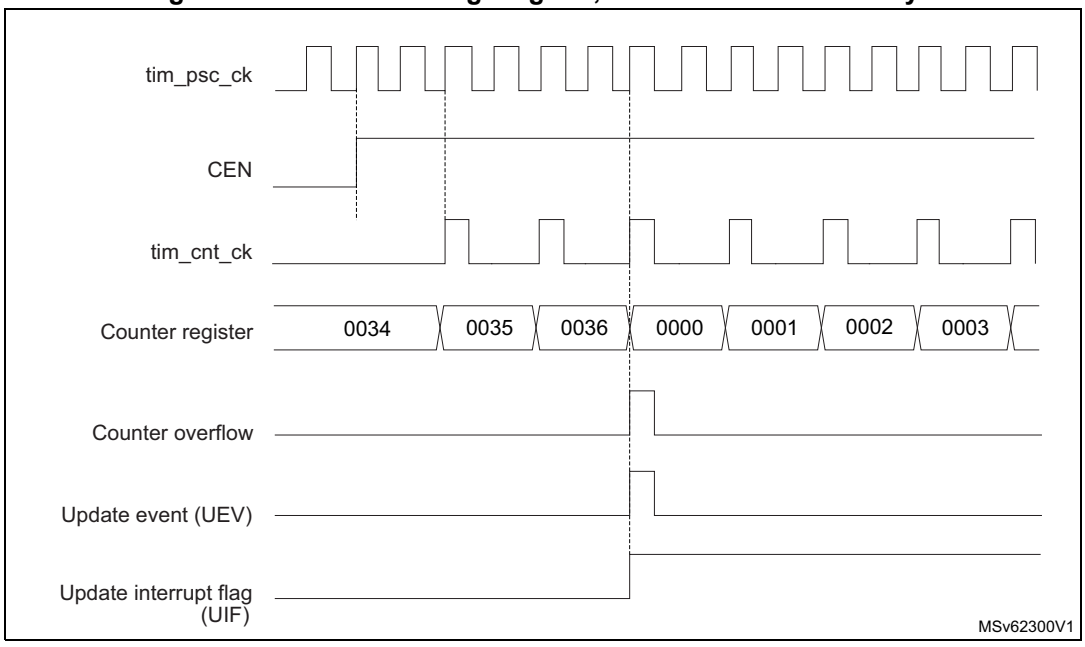

Figure 625. Counter timing diagram, internal clock divided by 4

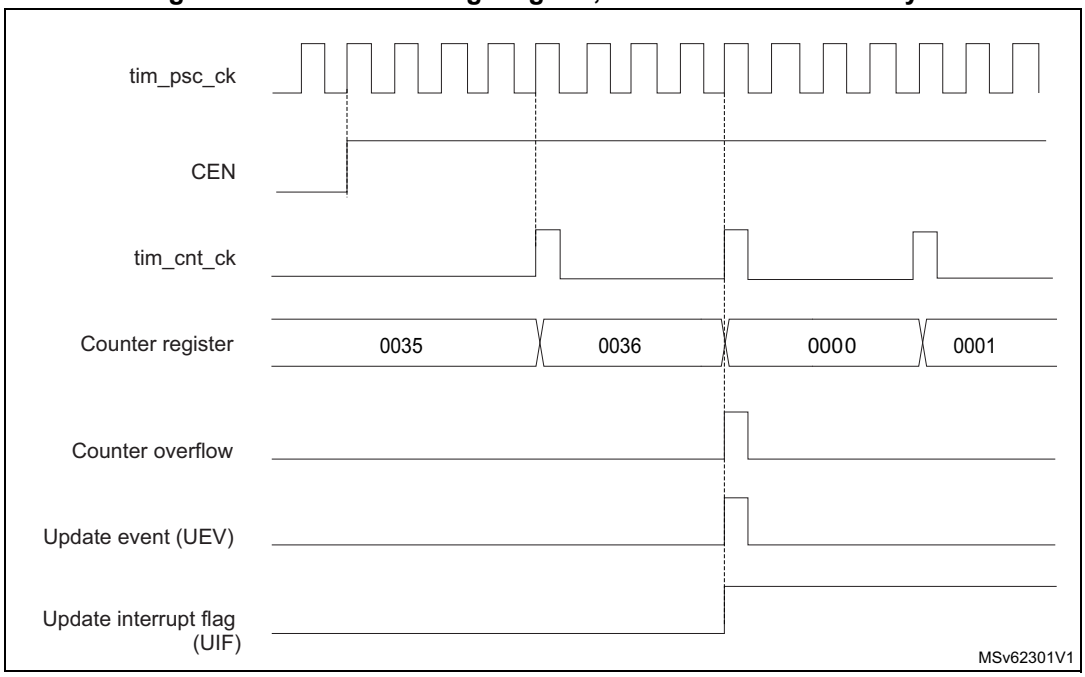

Figure 626. Counter timing diagram, internal clock divided by N

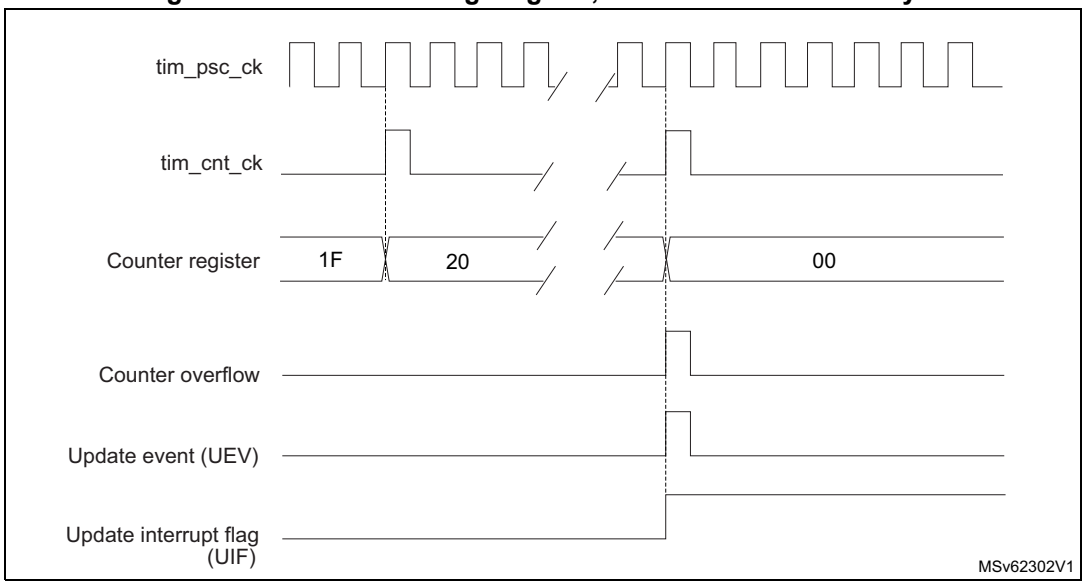

Figure 627. Counter timing diagram, update event when ARPE = 0 (TIMx_ARR not preloaded)

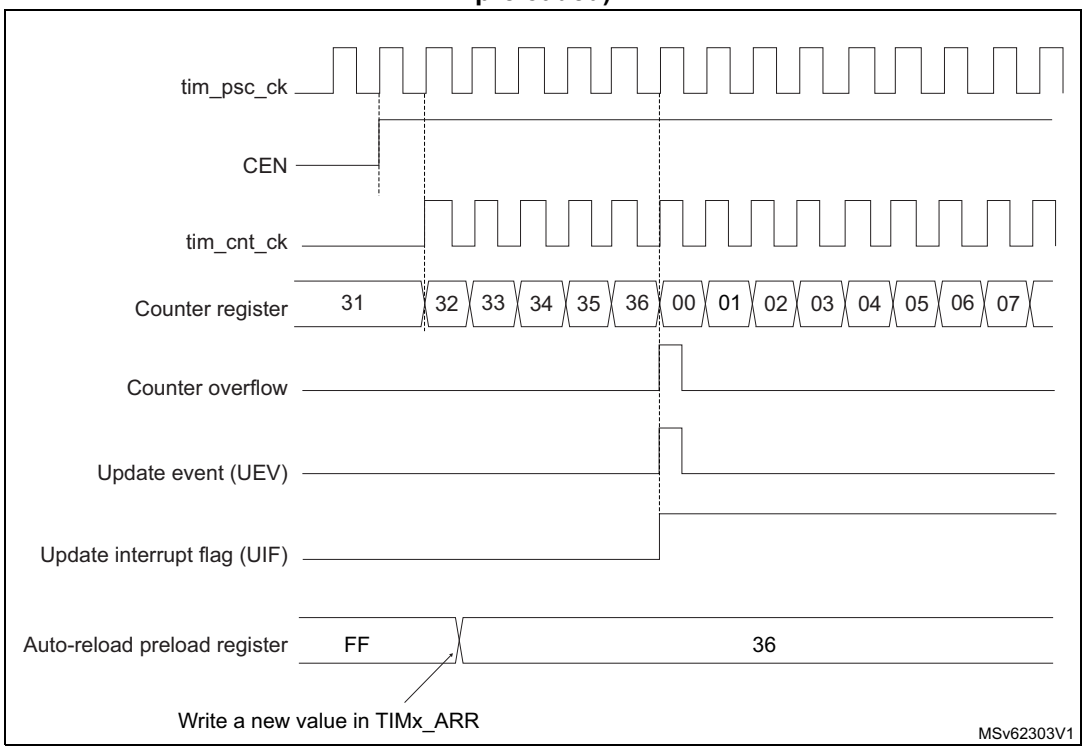

Figure 628. Counter timing diagram, update event when ARPE = 1 (TIMx_ARR preloaded)

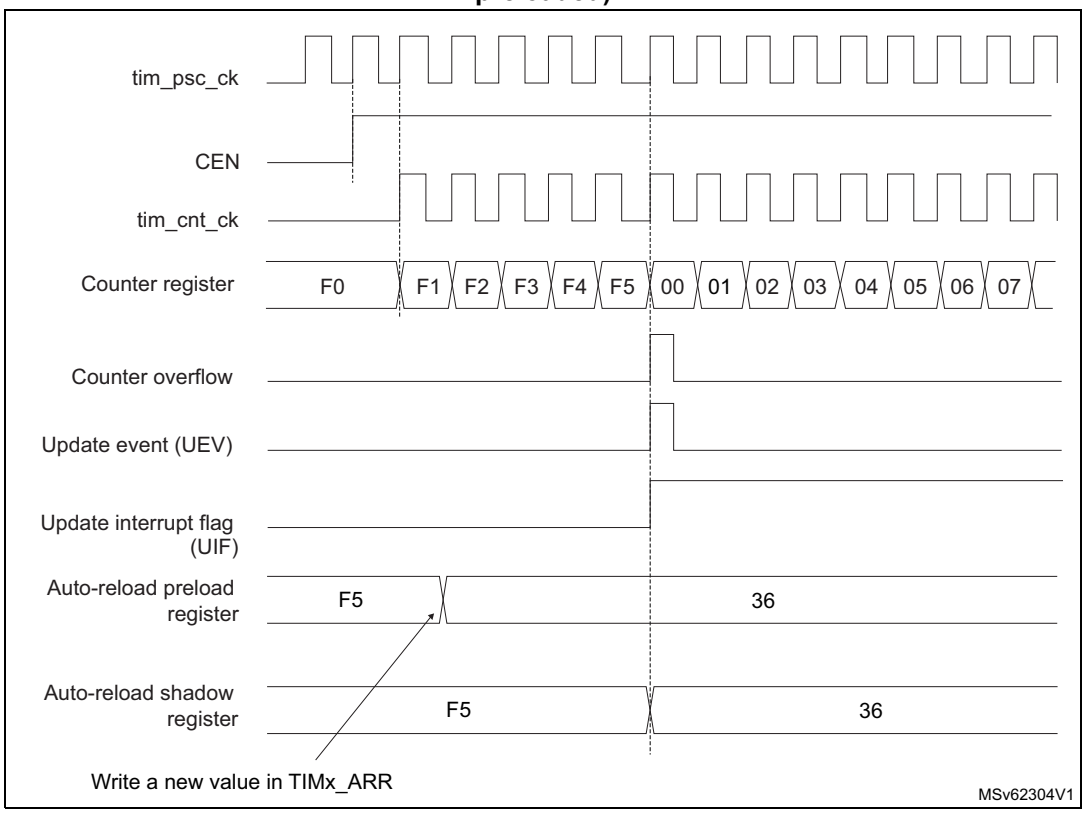


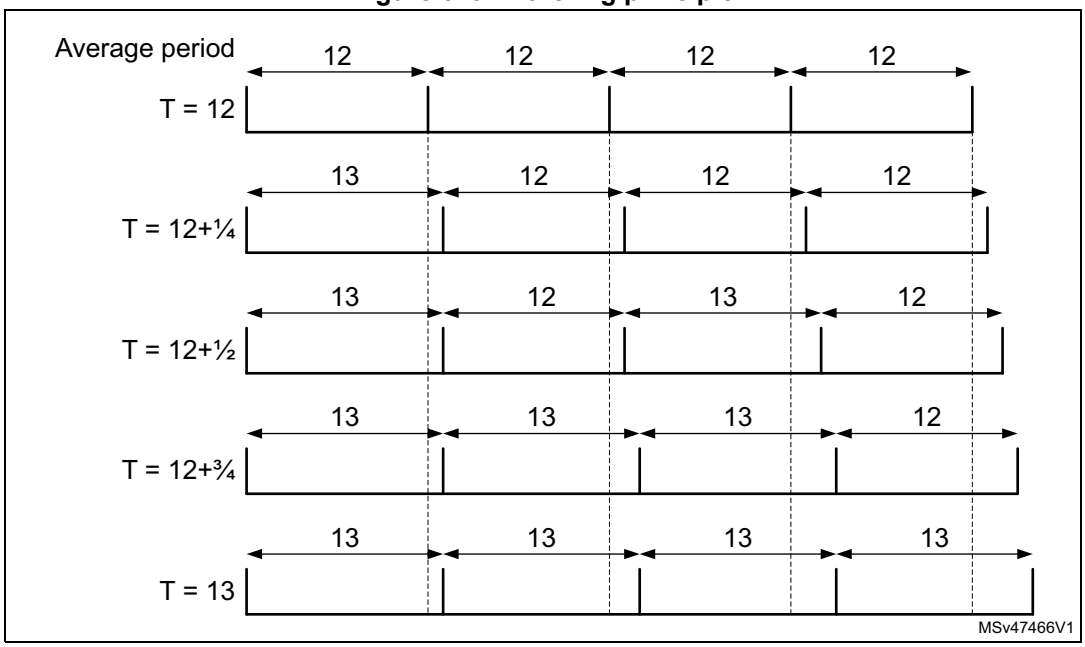
Dithering mode

The time base effective resolution can be increased by enabling the dithering mode, using the DITHEN bit in the TIMx_CR1 register. This affects the way the TIMx_ARR is behaving, and is useful for adjusting the average counter period when the timer is used as a trigger (typically for a DAC).

The operating principle is to have the actual ARR value slightly changed (adding or not one timer clock period) over 16 consecutive counting periods, with predefined patterns. This allows a 16-fold resolution increase, considering the average counting period.

Figure 629 presents the dithering principle applied to four consecutive counting periods.

Figure 629. Dithering principle

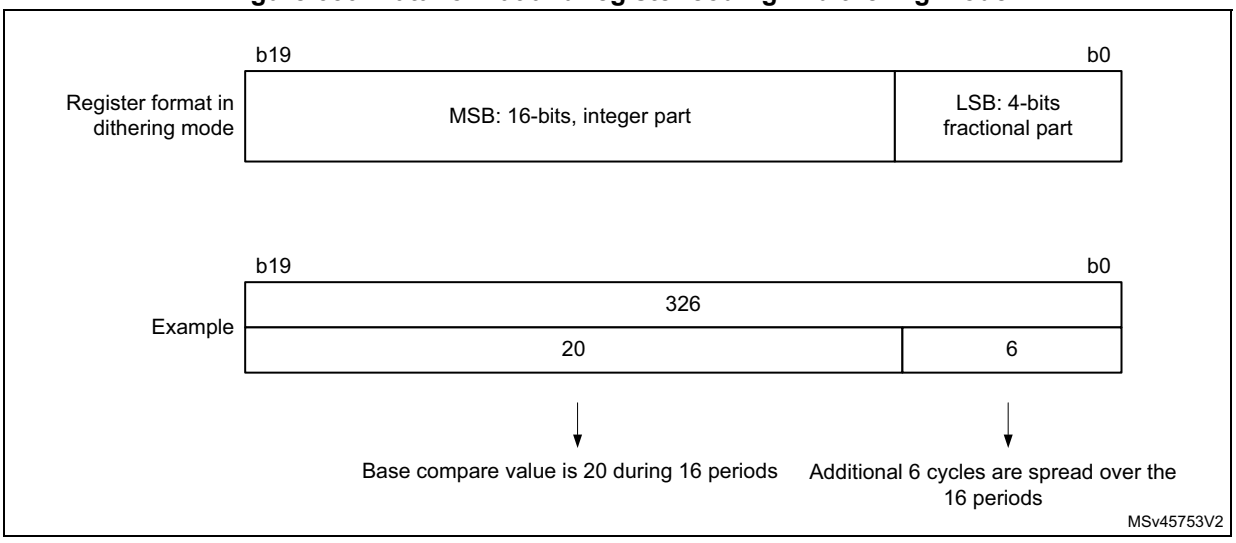


When the dithering mode is enabled, the register coding is changed as follows (see *Figure 630* for example):

- The four LSBs are coding for the enhanced resolution part (fractional part).
- The MSBs are left-shifted to the bits 19:4 and are coding for the base value.

Note: The following sequence must be followed when resetting the DITHEN bit:
1. CEN and ARPE bits must be reset
2. The DITHEN bit must be reset
3. The CEN bit can be set (eventually with ARPE = 1).

Figure 630. Data format and register coding in dithering mode



The minimum frequency is given by the following formula:

$$\text{Resolution} = \frac{F_{Tim}}{F_{pwm}} \Rightarrow F_{pwmMin} = \frac{F_{Tim}}{Max_{Resolution}}$$

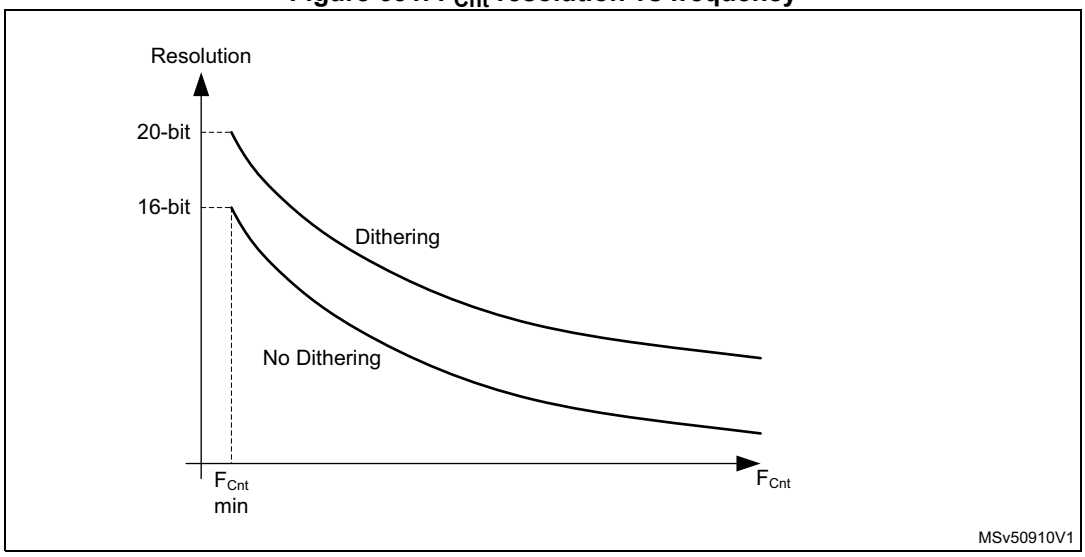
$$\text{Dithering mode disabled: } F_{pwmMin} = \frac{F_{Tim}}{65536}$$

$$\text{Dithering mode enabled: } F_{pwmMin} = \frac{F_{Tim}}{65535 + \frac{15}{16}}$$

Note: The maximum TIMx_ARR value is limited to 0xFFFEF in dithering mode (corresponds to 65534 for the integer part and 15 for the dithered part).

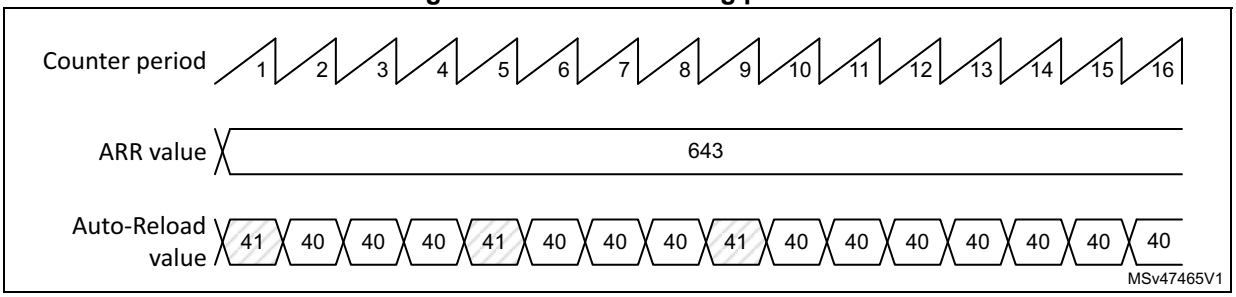
As shown on *Figure 631*, the dithering mode is used to increase the PWM resolution whatever the PWM frequency.

Figure 631. F_{Cnt} resolution vs frequency



The period changes are spread over 16 consecutive periods, as described in *Figure 632*.

Figure 632. PWM dithering pattern



The autoreload and compare values increments are spread following the specific patterns described in *Table 559*. The dithering sequence is done to have increments distributed as evenly as possible and minimize the overall ripple.

Table 559. TIMx_ARR register change dithering pattern

55.3.6 UIF bit remapping

The IUFREMAP bit in the TIMx_CR1 register forces a continuous copy of the update interrupt flag UIF into the timer counter register's bit 31 (TIMxCNT[31]). This is used to atomically read both the counter value and a potential roll-over condition signaled by the UIFCPY flag. In particular cases, it can ease the calculations by avoiding race conditions caused for instance by a processing shared between a background task (counter reading) and an interrupt (update interrupt).

There is no latency between the assertions of the UIF and UIFCPY flags.

55.3.7 ADC triggers

The timer can generate an ADC triggering event with various internal signals, such as reset, enable or compare events.

Note: The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo signal must be enabled prior to receiving events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

55.3.8 TIM6/TIM7 DMA requests

The TIM6/TIM7 can generate a single DMA request, as shown in *Table 560*.

Table 560. DMA request

DMA acronym	DMA request	Enable control bit
tim_upd_dma	Update	UDE

55.3.9 Debug mode

When the microcontroller enters debug mode (Cortex-M33 core halted), the TIMx counter can either continue to work normally or be stopped.

The behavior in debug mode can be programmed with a dedicated configuration bit per timer in the Debug support (DBG) module.

For more details, refer to section Debug support (DBG).

55.3.10 TIM6/TIM7 low-power modes

Table 561. Effect of low-power modes on TIM6/TIM7

Mode	Description
Sleep	No effect, peripheral is active. The interrupts can cause the device to exit from Sleep mode.
Stop	The timer operation is stopped and the register content is kept. No interrupt can be generated.
Standby	The timer is powered-down and must be reinitialized after exiting the Standby mode.

55.3.11 TIM6/TIM7 interrupts

The TIM6/TIM7 can generate a single interrupt, as shown in *Table 562*.

Table 562. Interrupt request

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from Sleep mode	Exit from Stop and Standby mode
TIM6 TIM7	Update	UIF	UIE	write 0 in UIF	Yes	No

55.4 TIM6/TIM7 registers

Refer to *Section 1.2* for a list of abbreviations used in register descriptions.

The peripheral registers can be accessed by half-words (16-bit) or words (32-bit).

55.4.1 TIMx control register 1 (TIMx_CR1)(x = 6 to 7)

Address offset: 0x00

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DITHEN	UIFREMAP	Res.	Res.	Res.	ARPE	Res.	Res.	Res.	OPM	URS	UDIS	CEN
			rw	rw				rw				rw	rw	rw	rw

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **DITHEN**: Dithering enable
0: Dithering disabled
1: Dithering enabled
Note: The DITHEN bit can only be modified when CEN bit is reset.

Bit 11 **UIFREMAP**: UIF status bit remapping
0: No remapping. UIF status bit is not copied to TIMx_CNT register bit 31.
1: Remapping enabled. UIF status bit is copied to TIMx_CNT register bit 31.

Bits 10:8 Reserved, must be kept at reset value.

Bit 7 **ARPE**: Auto-reload preload enable
0: TIMx_ARR register is not buffered.
1: TIMx_ARR register is buffered.

Bits 6:4 Reserved, must be kept at reset value.

Bit 3 **OPM**: One-pulse mode
0: Counter is not stopped at update event
1: Counter stops counting at the next update event (clearing the CEN bit).

Bit 2 **URS**: Update request source

This bit is set and cleared by software to select the UEV event sources.

0: Any of the following events generates an update interrupt or DMA request if enabled. These events can be:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

1: Only counter overflow/underflow generates an update interrupt or DMA request if enabled.

Bit 1 **UDIS**: Update disable

This bit is set and cleared by software to enable/disable UEV event generation.

0: UEV enabled. The Update (UEV) event is generated by one of the following events:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

Buffered registers are then loaded with their preload values.

1: UEV disabled. The Update event is not generated, shadow registers keep their value (ARR, PSC). However the counter and the prescaler are reinitialized if the UG bit is set or if a hardware reset is received from the slave mode controller.

Bit 0 **CEN**: Counter enable

0: Counter disabled

1: Counter enabled

CEN is cleared automatically in one-pulse mode, when an update event occurs.

55.4.2 TIMx control register 2 (TIMx_CR2)(x = 6 to 7)

Address offset: 0x04

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MMS[2:0]			Res.	Res.	Res.	Res.
									rw	rw	rw				

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:4 **MMS[2:0]**: Master mode selection

These bits are used to select the information to be sent in master mode to slave timers for synchronization (TRGO). The combination is as follows:

000:**Reset** - the UG bit from the TIMx_EGR register is used as a trigger output (tim_trgo).

001:**Enable** - the Counter enable signal, tim_cnt_en, is used as a trigger output (tim_trgo). It is useful to start several timers at the same time or to control a window in which a slave timer is enabled. The Counter Enable signal is generated when the CEN control bit is written.

010:**Update** - The update event is selected as a trigger output (tim_trgo). For instance a master timer can then be used as a prescaler for a slave timer.

Note: The clock of the slave timer or he peripheral receiving the tim_trgo must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.

Bits 3:0 Reserved, must be kept at reset value.

55.4.3 TIMx DMA/Interrupt enable register (TIMx_DIER)(x = 6 to 7)

Address offset: 0x0C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	UDE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UIE
							rw								rw

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **UDE**: Update DMA request enable

0: Update DMA request disabled.
1: Update DMA request enabled.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **UIE**: Update interrupt enable

0: Update interrupt disabled.
1: Update interrupt enabled.

55.4.4 TIMx status register (TIMx_SR)(x = 6 to 7)

Address offset: 0x10

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UIF
															rc_w0

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **UIF**: Update interrupt flag

This bit is set by hardware on an update event. It is cleared by software.

0: No update occurred.

1: Update interrupt pending. This bit is set by hardware when the registers are updated:

–On counter overflow if UDIS = 0 in the TIMx_CR1 register.

–When CNT is reinitialized by software using the UG bit in the TIMx_EGR register, if URS = 0 and UDIS = 0 in the TIMx_CR1 register.

55.4.5 TIMx event generation register (TIMx_EGR)(x = 6 to 7)

Address offset: 0x14

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UG
															w

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **UG**: Update generation

This bit can be set by software, it is automatically cleared by hardware.

0: No action.

1: Re-initializes the timer counter and generates an update of the registers. Note that the prescaler counter is cleared too (but the prescaler ratio is not affected).

55.4.6 TIMx counter (TIMx_CNT)(x = 6 to 7)

Address offset: 0x24

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UIF CPY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
r															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **UIFCPY**: UIF copy

This bit is a read-only copy of the UIF bit of the TIMx_ISR register. If the UIFREMAP bit in TIMx_CR1 is reset, bit 31 is reserved and read as 0.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]**: Counter value

Non-dithering mode (DITHEN = 0)

The register holds the counter value.

Dithering mode (DITHEN = 1)

The register only holds the non-dithered part in CNT[15:0]. The fractional part is not available.

55.4.7 TIMx prescaler (TIMx_PSC)(x = 6 to 7)

Address offset: 0x28

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PSC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **PSC[15:0]**: Prescaler value

The counter clock frequency $f_{tim_cnt_ck}$ is equal to $f_{tim_psc_ck}$ / (PSC[15:0] + 1).

PSC contains the value to be loaded into the active prescaler register at each update event. (including when the counter is cleared through UG bit of TIMx_EGR register.

55.4.8 TIMx autoreload register (TIMx_ARR)(x = 6 to 7)

Address offset: 0x2C

Reset value: 0x0000 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ARR[19:16]			
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **ARR[19:0]**: Auto-reload value

ARR is the value to be loaded into the actual auto-reload register.

Refer to *Section 55.3.4: Time-base unit* for more details about ARR update and behavior.

The counter is blocked while the auto-reload value is null.

Non-dithering mode (DITHEN = 0)

The register holds the auto-reload value in ARR[15:0]. The ARR[19:16] bits are reserved.

Dithering mode (DITHEN = 1)

The register holds the integer part in ARR[19:4]. The ARR[3:0] bitfield contains the dithered part.

55.4.9 TIMx hardware configuration 2 register (TIMx_HWCFGR2)(x = 6 to 7)

Address offset: 0x3EC

Reset value: 0x0000 1011

This read register identifies the hardware configuration parameters of the instantiated IP.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OPTIONREG_OUT[7:0]

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **OPTIONREG_OUT[7:0]**: Option register number (0 to 16).

Bits 15:8 **CNT_WIDTH[7:0]**: Counter width
0x08: 8-bits
0x10: 16-bits
0x20: 32-bits
Others: Reserved

Bits 7:4 **PSC_WIDTH16[3:0]**: Prescaler width
0x0: 7 (by power of 2) /8 (linear) -bit counter
0x1: 15 (by power of 2) /16 (linear) -bit counter
Others: Reserved

Bits 3:0 **PSC_LINEAR[3:0]**: Prescaler linear
0x0: prescaler by power of 2 (division by 1, 2, 4, 8...)
0x1: prescaler is linear (division by 1, 2, 3, 4, 5...)
Others: Reserved

55.4.10 TIMx hardware configuration 1 register (TIMx_HWCFGR1)(x = 6 to 7)

Address offset: 0x3F0

Reset value: 0x1100 0100

This read register identifies the hardware configuration parameters of the instantiated IP.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:28 **CNT_DIR[3:0]**: Counter direction
0x0: Down-counter only
0x1: Up-counter only
0x2: Up/Down counter allowing center-aligned mode
Others: Reserved

Bits 27:24 **DMA_IMPL[3:0]**: DMA features implementation
0x0: DMA requests are not possible
0x1: Single DMA requests possible
0x2: All DMA features implemented
Others: Reserved

Bits 23:20 **BK_IMPL[3:0]**: Break circuit implementation
0x0: no break implemented
0x1: break1 implemented without filter (tim_brk + tim_sys_brk connected)
0x2: break1 implemented with filter (tim_brk + tim_sys_brk connected)
0x3: break 1 and 2 implemented (tim_brk + tim_sys_brk + brk2)
Others: Reserved

Bits 19:16 **ETR_IMPL[3:0]**: External trigger implementation
0x0:External trigger circuit not implemented, tim_ocrefx cleared by tim_ocref_clr input
0x1:External trigger circuit implemented, tim_ocrefx cleared by tim_ocref_clr input
0x2:External trigger circuit implemented, tim_ocrefx cleared by tim_etrf signal
0x3:External trigger circuit implemented, tim_ocrefx cleared by tim_ocref_clr or tim_etrf (1 control bit “OCCS” added in GPT_SMCR)
Others: Reserved

Bits 15:12 **RCR_IMPL[3:0]**: Repetition counter implementation
0x0: repetition counter not implemented
0x1: 8-bit repetition counter implemented
0x2: 16-bit repetition counter implemented
Others: Reserved

Bits 11:8 **NB_OF_SM[3:0]**: Number of synchronization module
0x0: synchronization module not implemented
0x1: 1 synchronization module implemented
Others: Reserved

Bits 7:4 **NB_OF_DT[3:0]**: Number of complementary outputs and dead-time generators
0x0
0x1
0x2
0x3
0x4
Others: Reserved

Bits 3:0 **NB_OF_CC[3:0]**: Number of capture / compare channel
0x0: no capture/compare channel implemented
0x1: only CC1 channel is implemented
0x2: CC1 and CC2 channels are implemented
0x3: CC1, CC2 and CC3 channels are implemented
0x4: CC1, CC2, CC3 and CC4 channels are implemented
0x5: CC1, CC2, CC3, CC4 and CC5 channels are implemented
0x6: CC1, CC2, CC3, CC4, CC5 and CC6 channels are implemented
Others: Reserved

55.4.11 TIMx IP version register (TIMx_VERR)(x = 6 to 7)

Address offset: 0x3F4

Reset value: 0x0000 0043

56 General-purpose timers (TIM10/TIM11/TIM12/TIM13/TIM14)

56.1 TIM10/TIM11/TIM12/TIM13/TIM14 introduction

The TIM10/TIM11/TIM12/TIM13/TIM14 general-purpose timers consist in a 16-bit autoreload counter driven by a programmable prescaler.

They may be used for a variety of purposes, including measuring the pulse lengths of input signals (input capture) or generating output waveforms (output compare, PWM).

Pulse lengths and waveform periods can be modulated from a few microseconds to several milliseconds using the timer prescaler and the RCC clock controller prescalers.

The TIM10/TIM11/TIM12/TIM13/TIM14 timers are completely independent, and do not share any resources. They can be synchronized together as described in *Section 56.4.20: Timer synchronization (TIM12 only)*.

56.2 TIM12 main features

The features of the TIM12 general-purpose timer include:

- 16-bit autoreload upcounter
- 16-bit programmable prescaler used to divide the counter clock frequency by any factor between 1 and 65536 (can be changed “on the fly”)
- Up to two independent channels for:
  - Input capture
  - Output compare
  - PWM generation (edge-aligned mode)
  - One-pulse mode output
- Synchronization circuit to control the timer with external signals and to interconnect several timers together
- Interrupt generation on the following events:
  - Update: counter overflow, counter initialization (by software or internal trigger)
  - Trigger event (counter start, stop, initialization, or count by internal trigger)
  - Input capture
  - Output compare

56.3 TIM10/TIM11/TIM13/TIM14 main features

The features of general-purpose timers TIM10/TIM11/TIM13/TIM14 include:

- 16-bit autoreload upcounter
- 16-bit programmable prescaler used to divide the counter clock frequency by any factor between 1 and 65536 (can be changed “on the fly”)
- Independent channel for:
  - Input capture
  - Output compare
  - PWM generation (edge-aligned mode)
  - One-pulse mode output
- Interrupt generation on the following events:
  - Update: counter overflow, counter initialization (by software)
  - Input capture
  - Output compare

56.4 TIM10/TIM11/TIM12/TIM13/TIM14 functional description

56.4.1 Block diagram

Figure 633. General-purpose timer block diagram (TIM12)

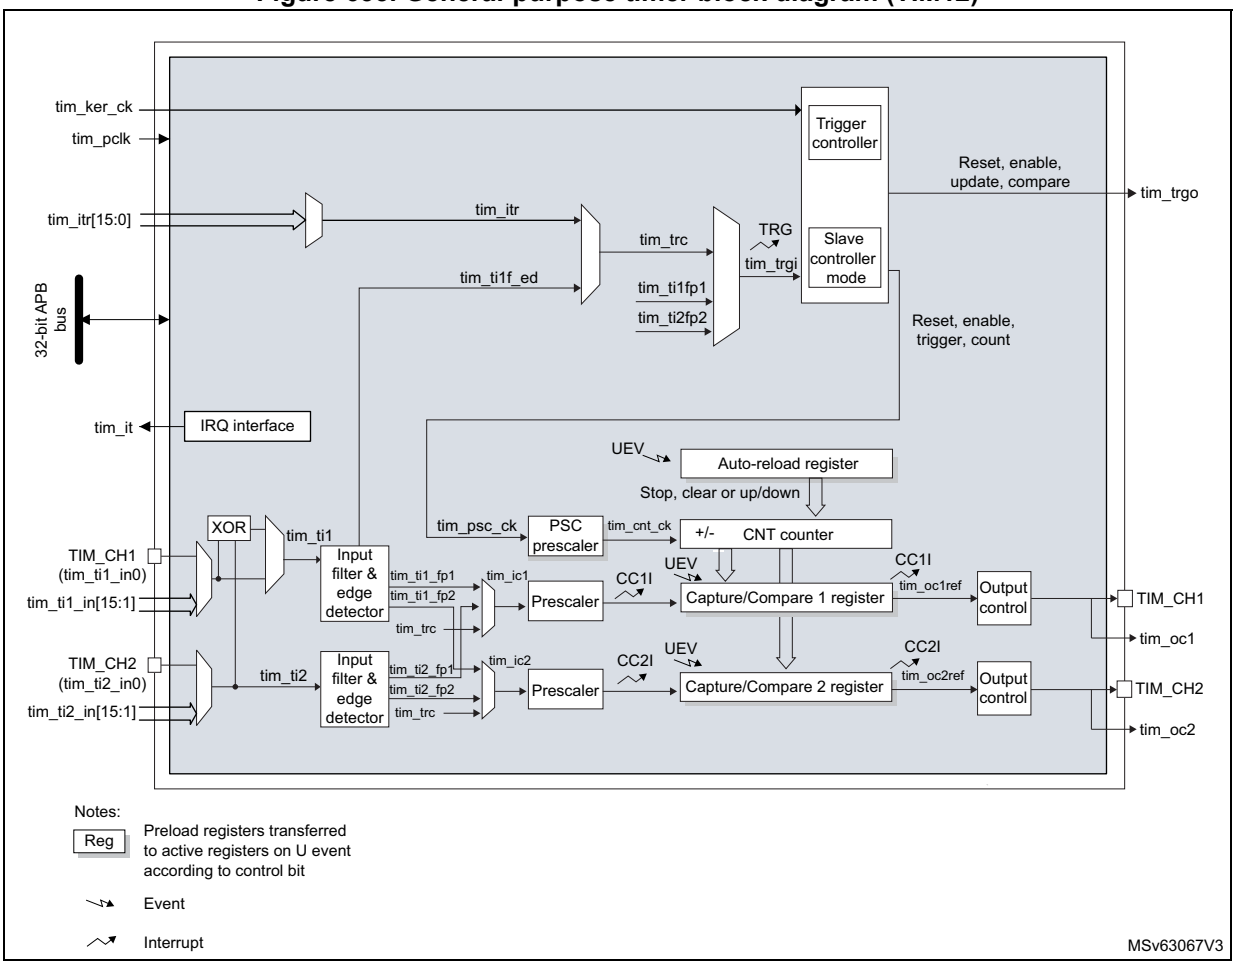

Figure 634. General-purpose timer block diagram (TIM10/TIM11/TIM13/TIM14)

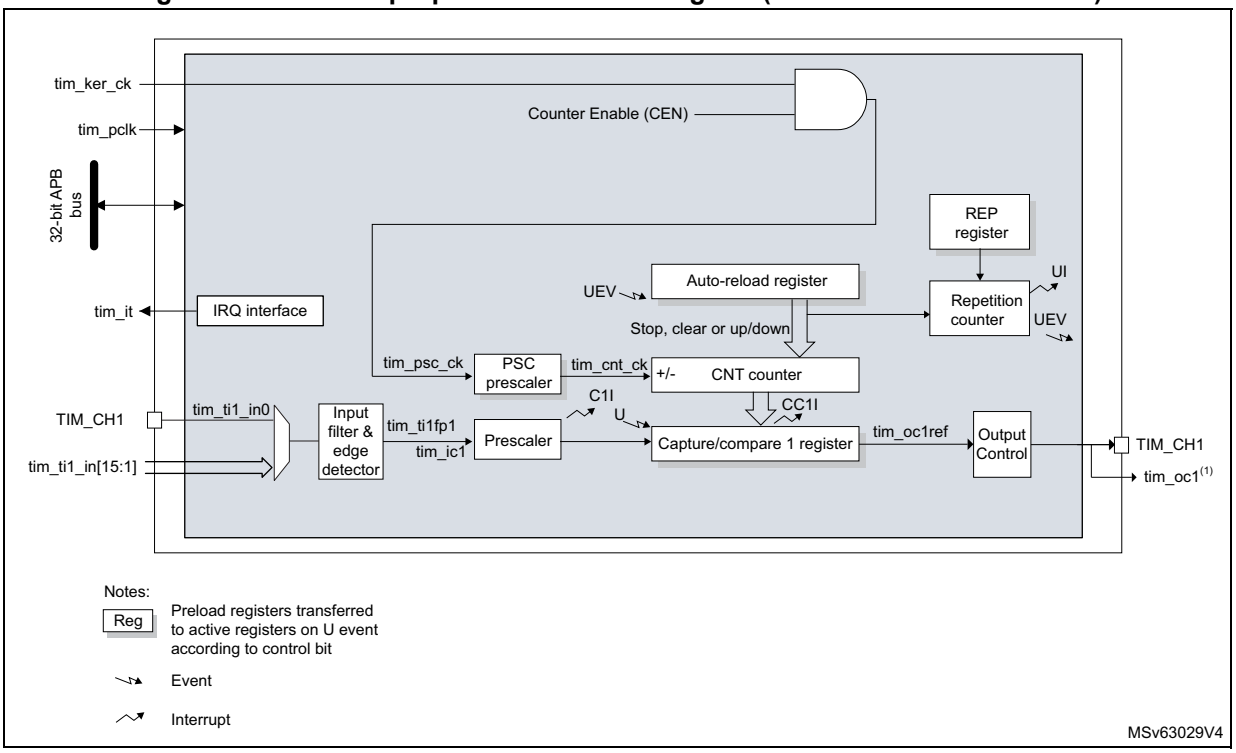

1. This signal can be used as trigger for some slave timer (see internal trigger connection table in next section). See *Section 56.4.21: Using timer output as trigger for other timers (TIM10/TIM11/TIM13/TIM14 only)* for details.

56.4.2 TIM10/TIM11/TIM12/TIM13/TIM14 pins and internal signals

Table 564 and *Table 565* in this section summarize the TIM inputs and outputs.

Table 564. TIM input/output pins

Pin name	Signal type	Description
TIM_CH1 TIM_CH2(1)	Input/Output	Timer multi-purpose channels. Each channel be used for capture, compare, or PWM. TIM_CH1 and TIM_CH2 can also be used as external clock (below 1/4 of the tim_ker_ck clock) and external trigger inputs.

1. Available for TIM12 only.

Table 565. TIM internal input/output signals

Internal signal name	Signal type	Description
tim_ti1_in[15:0] tim_ti2_in[15:0](1)	Input	Internal timer inputs bus. These inputs can be used for capture or as external clock (below 1/4 of the tim_ker_ck clock).
tim_itr[15:0](1)	Input	Internal trigger input bus. These inputs can be used for the slave mode controller or as a input clock (below 1/4 of the tim_ker_ck clock).
tim_oc1 tim_oc2(1)	Output	Internal timer output. Can be used for triggering other timers or the ADC(s).

Table 565. TIM internal input/output signals (continued)

Internal signal name	Signal type	Description
tim_trgo(1)	Output	Internal trigger output. This trigger can trigger other on-chip peripherals.
tim_pclk	Input	Timer APB clock
tim_ker_ck	Input	Timer kernel clock. This clock must be synchronous with tim_pclk (derived from the same source). The clock ratio tim_ker_ck/tim_pclk must be an integer:1, 2, 3,..., 16 (maximum value)
tim_it	Output	Global Timer interrupt, gathering capture/compare, update, break trigger and commutation requests

1. Available for TIM12 only.

Table 566 and *Table 567* list the sources connected to the tim_ti[2:1] input multiplexers.

Table 566. Interconnect to the tim_ti1 input multiplexer

56.4.3 Time-base unit

The main block of the timer is a 16-bit up-counter with its related autoreload register. The counter clock can be divided by a prescaler.

The counter, the autoreload register and the prescaler register can be written or read by software. This is true even when the counter is running.

The time-base unit includes:

- Counter register (TIMx_CNT)
- Prescaler register (TIMx_PSC)
- Autoreload register (TIMx_ARR).

The autoreload register is preloaded. Writing to or reading from the auto-reload register accesses the preload register. The content of the preload register is transferred into the shadow register permanently or at each update event (UEV), depending on the autoreload preload enable bit (ARPE) in TIMx_CR1 register. The update event is sent when the counter reaches the overflow and if the UDIS bit equals 0 in the TIMx_CR1 register. It can also be generated by software. The generation of the update event is described in details for each configuration.

The counter is clocked by the prescaler output tim_cnt_ck, which is enabled only when the counter enable bit (CEN) in TIMx_CR1 register is set (refer also to the slave mode controller description to get more details on counter enabling).

Note that the counter starts counting one clock cycle after setting the CEN bit in the TIMx_CR1 register.

Prescaler description

The prescaler can divide the counter clock frequency by any factor between 1 and 65536. It is based on a 16-bit counter controlled through a 16-bit register (in the TIMx_PSC register). It can be changed on the fly as this control register is buffered. The new prescaler ratio is taken into account at the next update event.

Figure 635 and *Figure 636* give some examples of the counter behavior when the prescaler ratio is changed on the fly.

Figure 635. Counter timing diagram with prescaler division change from 1 to 2

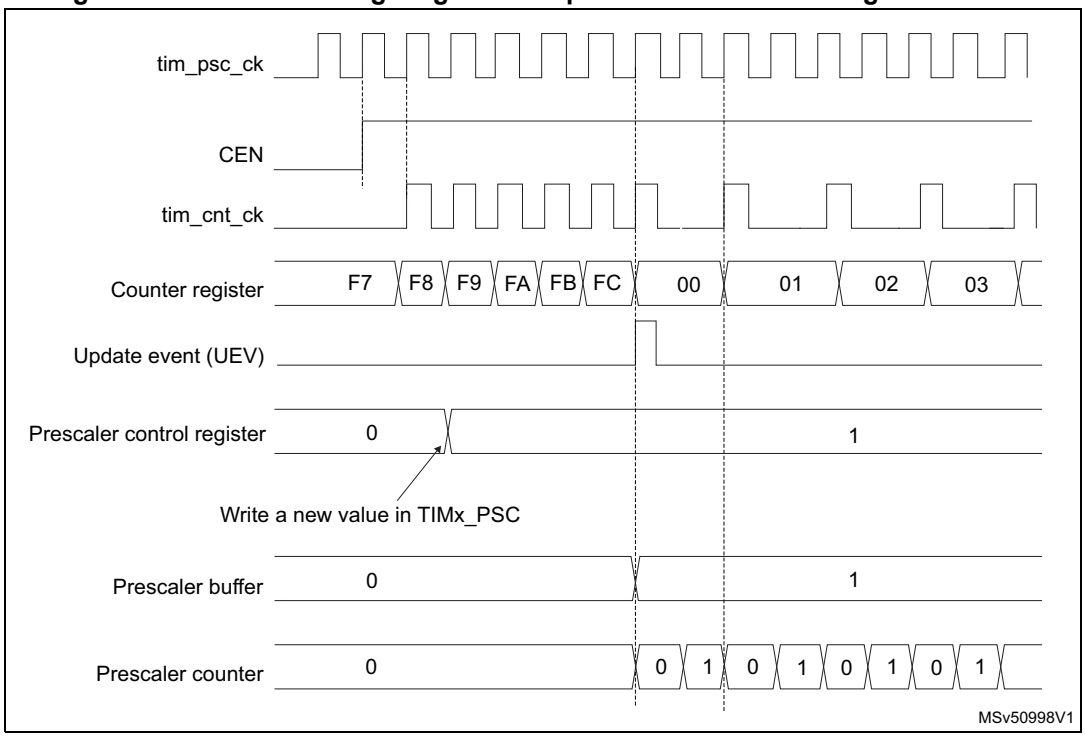

Figure 636. Counter timing diagram with prescaler division change from 1 to 4

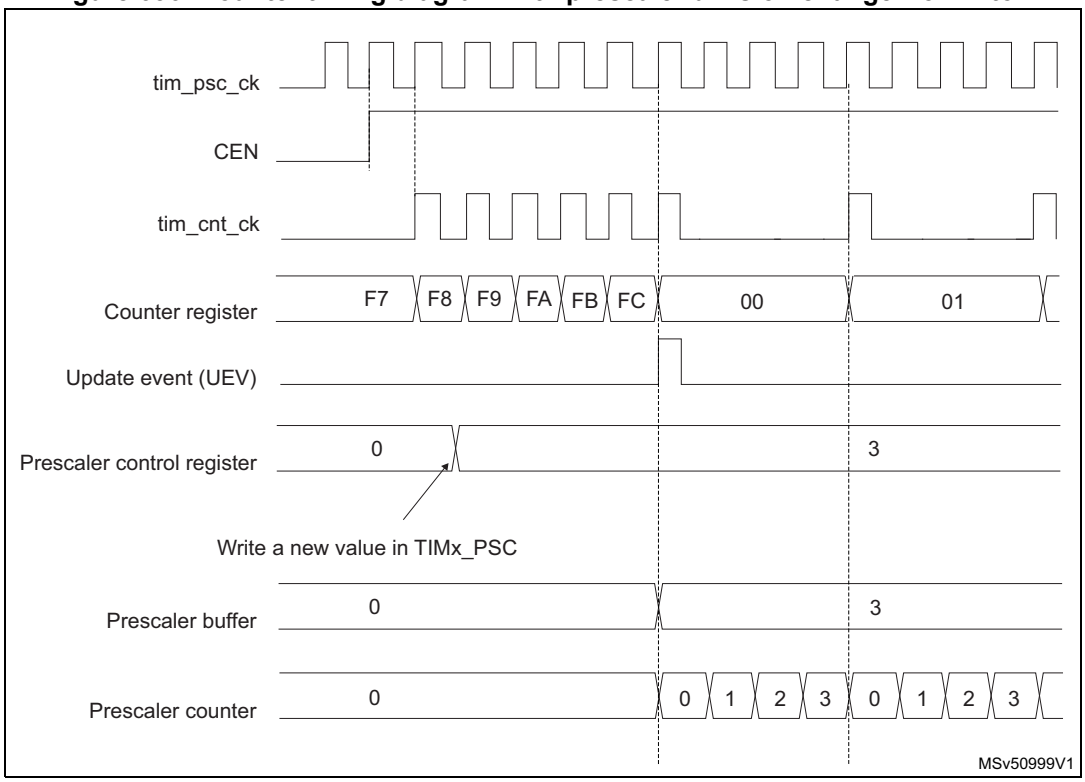

56.4.4 Counter modes

Upcounting mode

In upcounting mode, the counter counts from 0 to the autoreload value (content of the TIMx_ARR register), then restarts from 0 and generates a counter overflow event.

Setting the UG bit in the TIMx_EGR register (by software or by using the slave mode controller on TIM12) also generates an update event.

The UEV event can be disabled by software by setting the UDIS bit in the TIMx_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter restarts from 0, as well as the counter of the prescaler (but the prescale rate does not change). In addition, if the URS bit (update request selection) in TIMx_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx_SR register) is set (depending on the URS bit):

- The autoreload shadow register is updated with the preload value (TIMx_ARR).
- The buffer of the prescaler is reloaded with the preload value (content of the TIMx_PSC register).

The following figures show some examples of the counter behavior for different clock frequencies when TIMx_ARR = 0x36.

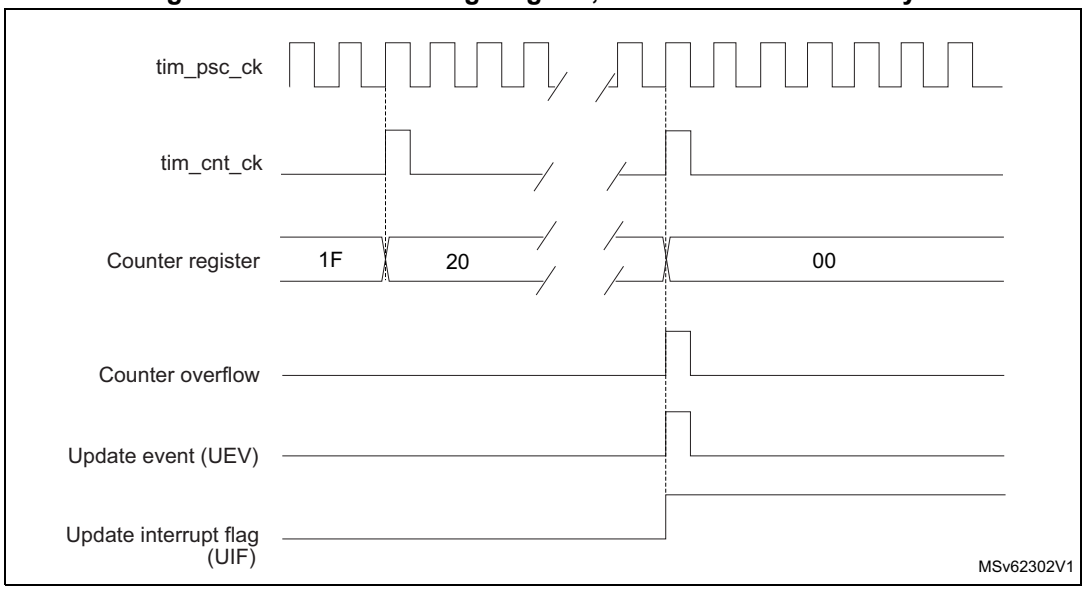

Figure 641. Counter timing diagram, update event when ARPE = 0 (TIMx_ARR not preloaded)

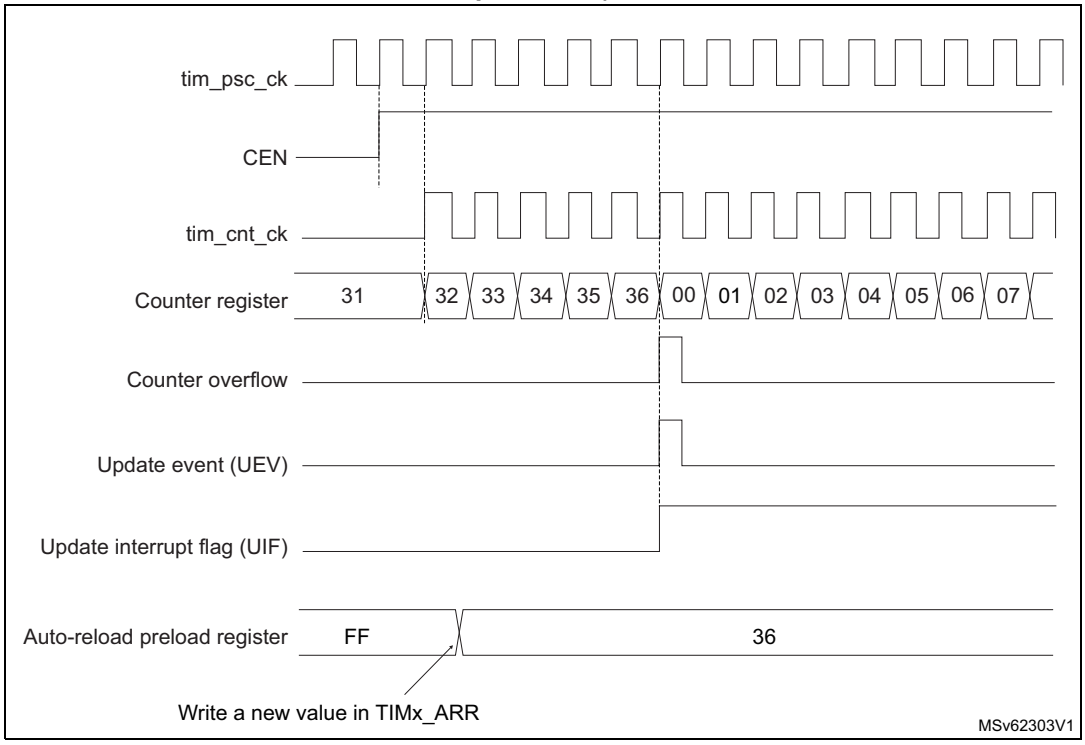

Figure 642. Counter timing diagram, update event when ARPE = 1 (TIMx_ARR preloaded)

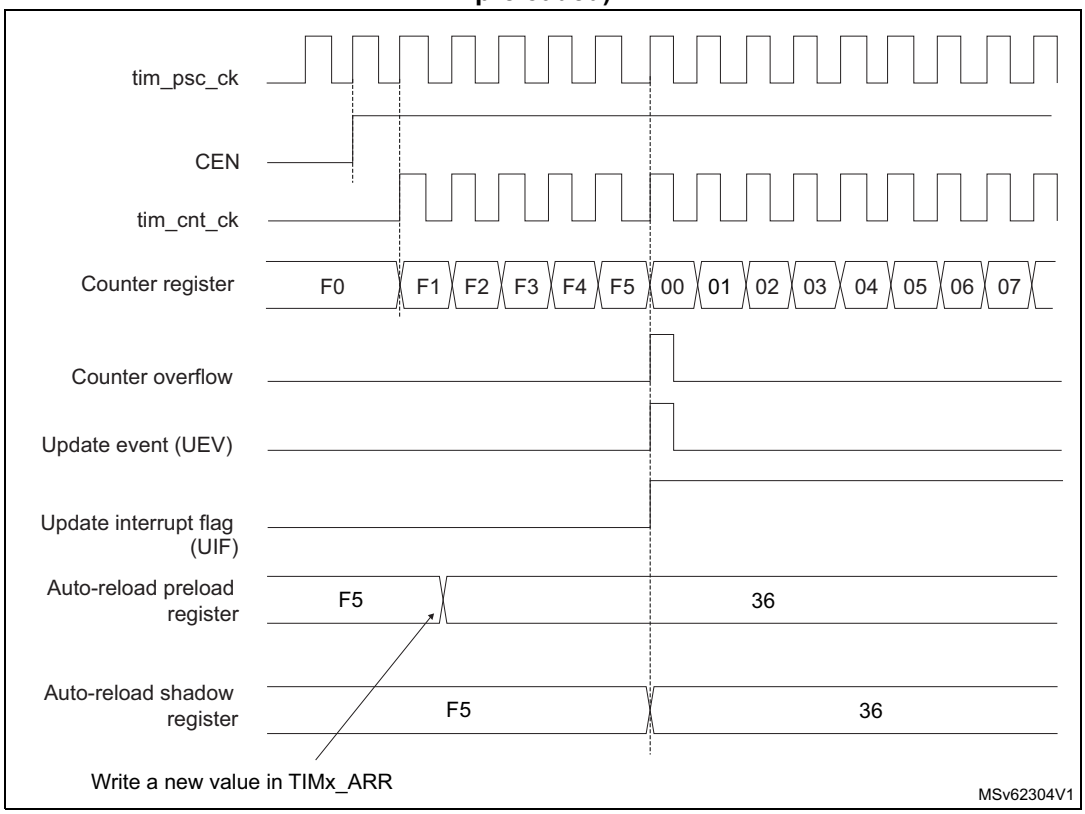


56.4.5 Clock selection

The counter clock can be provided by the following clock sources:

- Internal clock (tim_ker_ck)
- External clock mode1 (for TIM12): external input pin (tim_ti1 or tim_ti2, if available)
- Internal trigger inputs (tim_itrx) (for TIM12): connecting the trigger output from another timer. For instance, another timer can be configured as a prescaler for TIM12. Refer to *Section : Using one timer as prescaler for another timer* for more details.

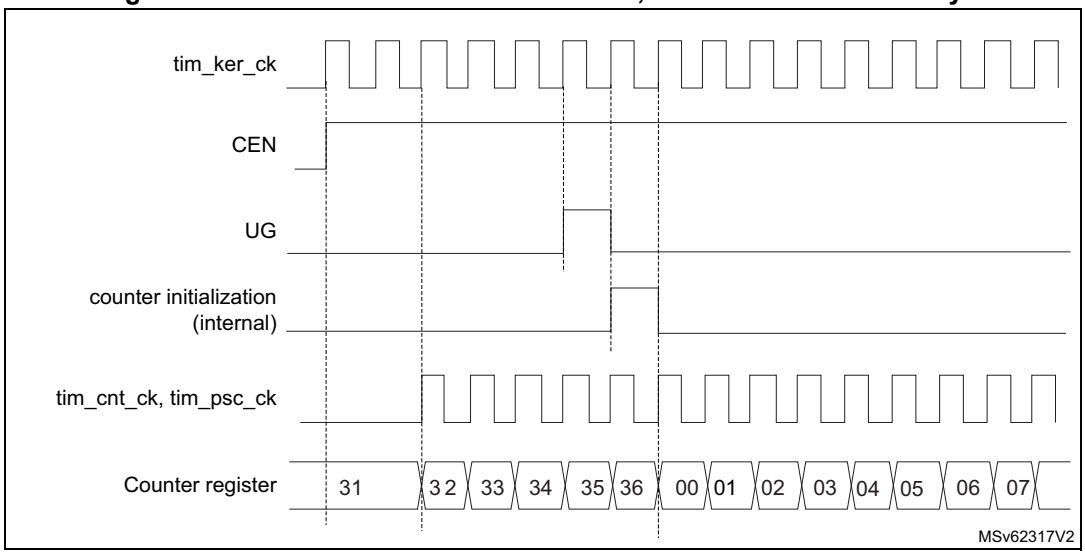
Internal clock source (tim_ker_ck)

The internal clock source is the default clock source for TIM10/TIM11/TIM13/TIM14.

For TIM12, the internal clock source is selected when the slave mode controller is disabled (SMS = 000). The CEN bit in the TIMx_CR1 register and the UG bit in the TIMx_EGR register are then used as control bits and can be changed only by software (except for UG which remains cleared). As soon as the CEN bit is programmed to 1, the prescaler is clocked by the internal clock tim_ker_ck.

Figure 643 shows the behavior of the control circuit and the upcounter in normal mode, without prescaler.

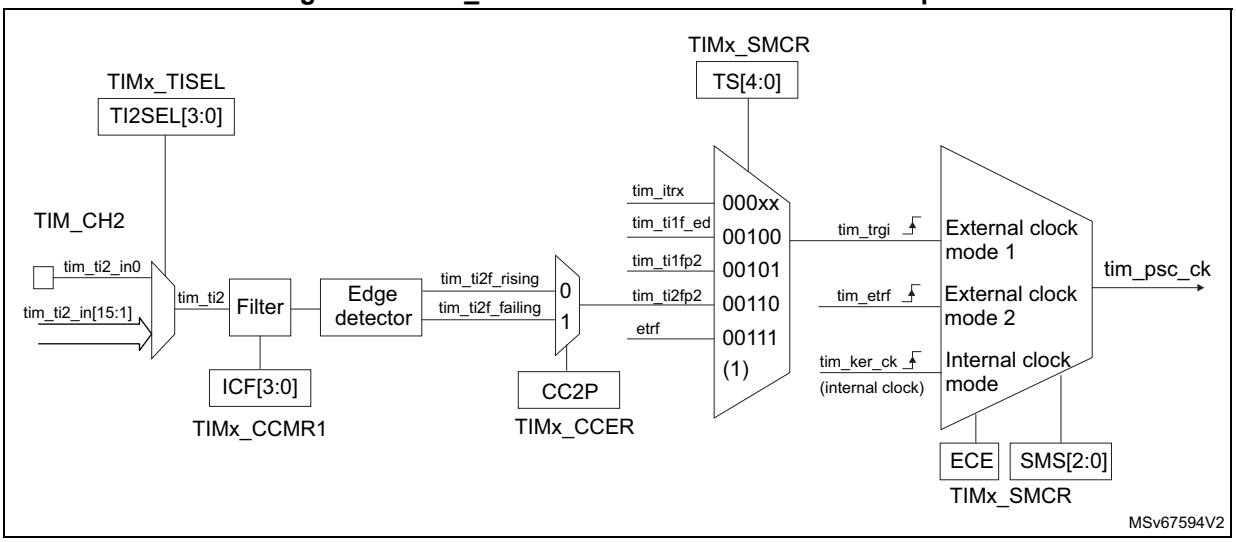
Figure 643. Control circuit in normal mode, internal clock divided by 1



External clock source mode 1

This mode is selected when SMS = 111 in the TIMx_SMCR register. The counter can count at each rising or falling edge on a selected input.

Figure 644. tim_ti2 external clock connection example



For example, to configure the upcounter to count in response to a rising edge on the tim_ti2 input, use the following procedure:

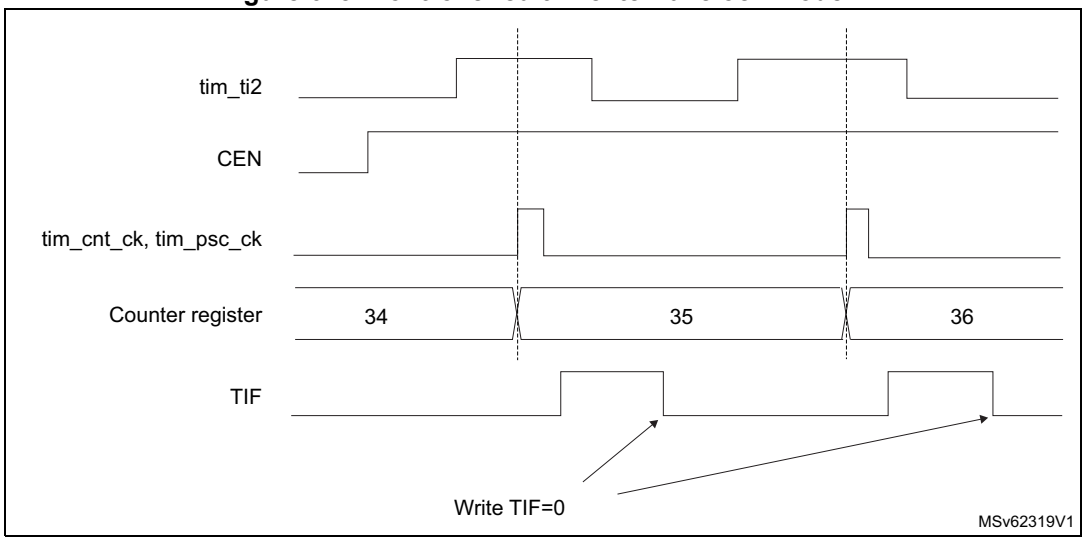
1. Select the proper tim_ti2_in[15:0] source (internal or external) with the TI2SEL[3:0] bits in the TIMx_TISEL register.
2. Configure channel 2 to detect rising edges on the tim_ti2 input by writing CC2S = 01 in the TIMx_CCMR1 register.
3. Configure the input filter duration by writing the IC2F[3:0] bits in the TIMx_CCMR1 register (if no filter is needed, keep IC2F = 0000).
4. Select the rising edge polarity by writing CC2P = 0 and CC2NP = 0 in the TIMx_CCER register.
5. Configure the timer in external clock mode 1 by writing SMS = 111 in the TIMx_SMCR register.
6. Select tim_ti2 as the trigger input source by writing TS = 110 in the TIMx_SMCR register.
7. Enable the counter by writing CEN = 1 in the TIMx_CR1 register.

Note: The capture prescaler is not used for triggering, it is not necessary to configure it.

When a rising edge occurs on tim_ti2, the counter counts once and the TIF flag is set.

The delay between the rising edge on tim_ti2 and the actual clock of the counter is due to the resynchronization circuit on tim_ti2 input.

Figure 645. Control circuit in external clock mode 1



56.4.6 Capture/compare channels

Each Capture/Compare channel is built around a capture/compare register (including a shadow register), an input stage for capture (with digital filter, multiplexing and prescaler), and an output stage (with comparator and output control).

Figure 646, *Figure 647*, *Figure 648* and *Figure 649* give an overview of a capture/compare channel.

The input stage samples the corresponding tim_tix input to generate a filtered signal tim_tixf. Then, an edge detector with polarity selection generates a signal (tim_tixfpy) which

can be used as trigger input by the slave mode controller or as the capture command. It is prescaled before the capture register (ICxPS).

Figure 646. Capture/compare channel 1 input stage (TIM10/TIM11/TIM13/TIM14)

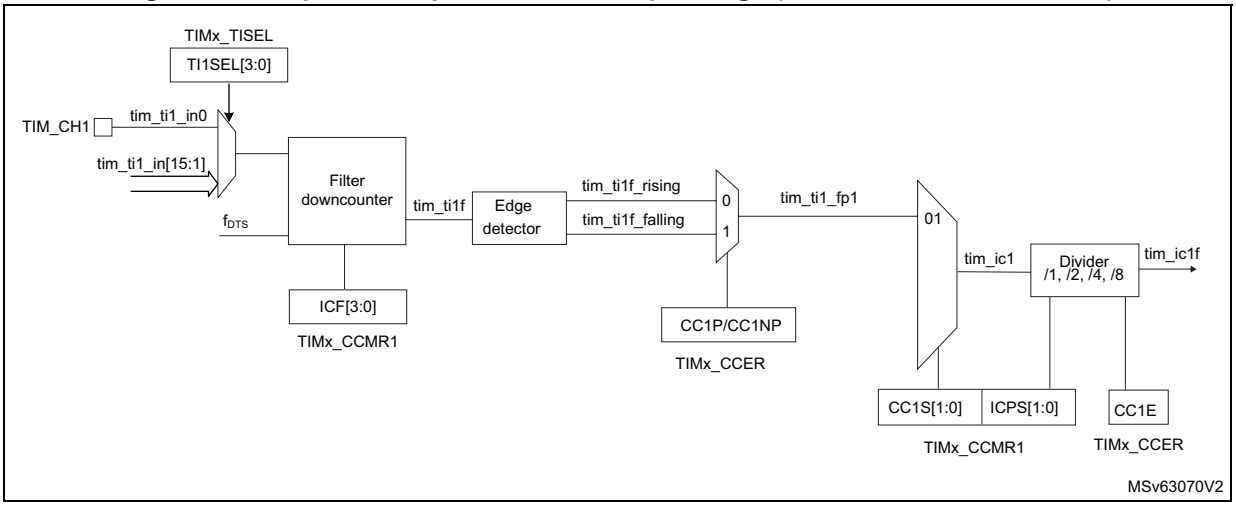


Figure 647. Capture/compare channel 1 input stage (TIM12)

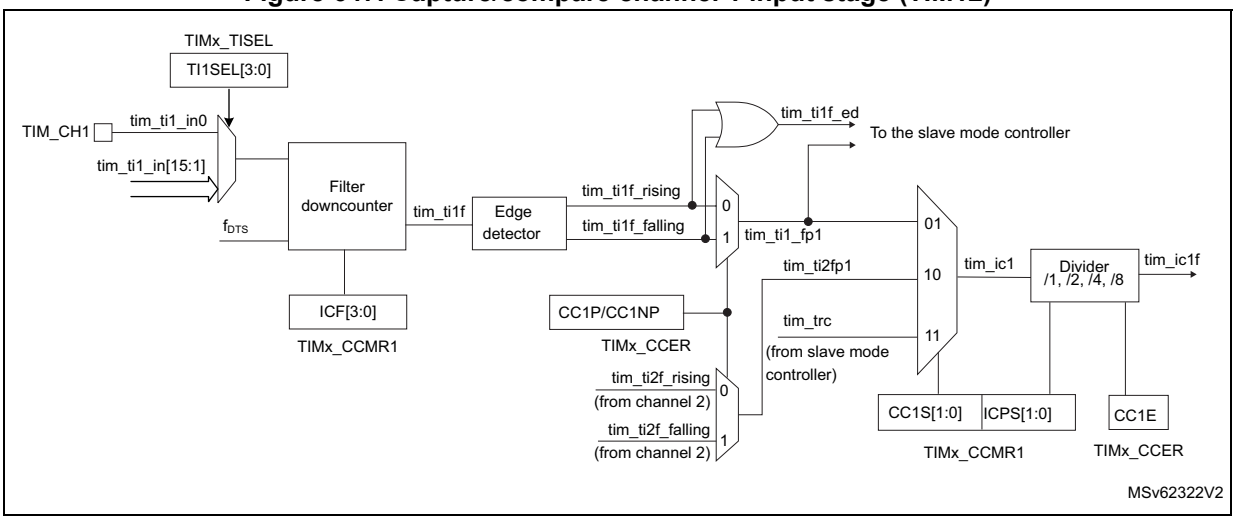

The output stage generates an intermediate waveform which is then used for reference: tim_ocxref (active high). The polarity acts at the end of the chain.

Figure 648. Capture/compare channel 1 main circuit

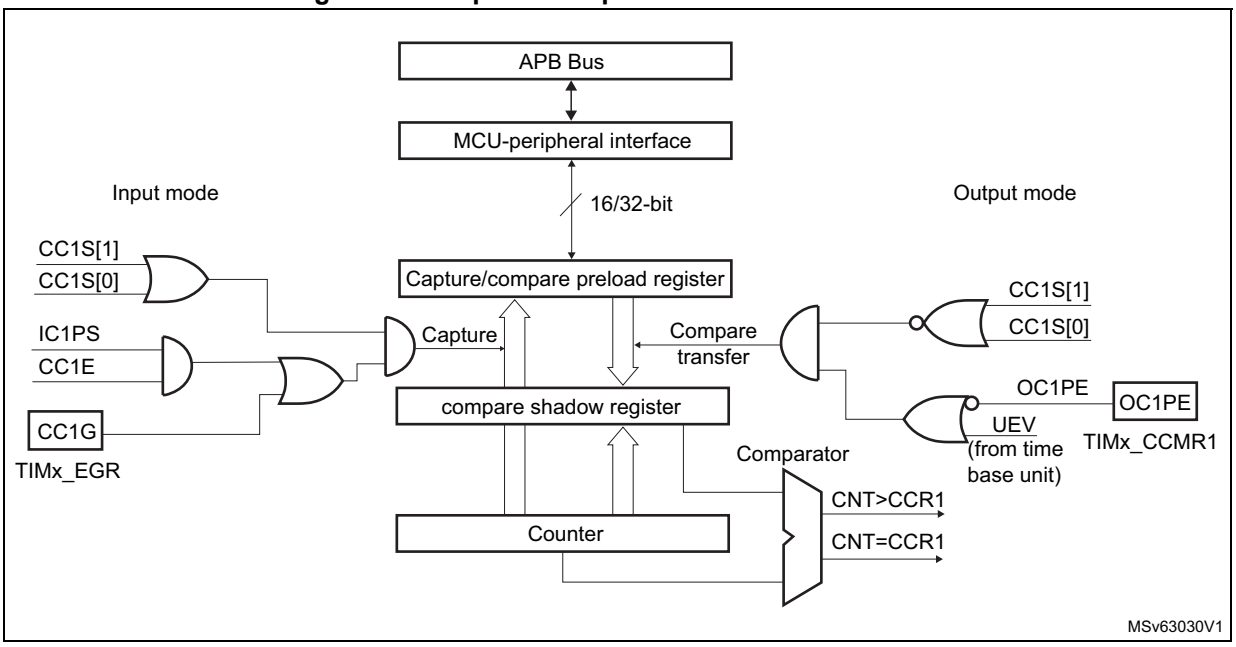

Figure 649. Output stage of capture/compare channel 1

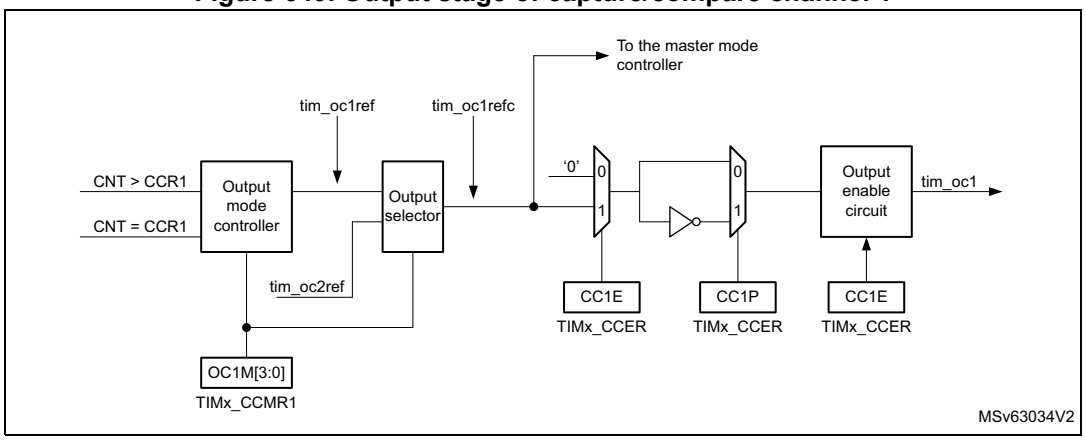


The capture/compare block is made of one preload register and one shadow register. Write and read always access the preload register.

In capture mode, captures are actually done in the shadow register, which is copied into the preload register.

In compare mode, the content of the preload register is copied into the shadow register which is compared to the counter.

56.4.7 Input capture mode

In Input capture mode, the capture/compare registers (TIMx_CCRx) are used to latch the value of the counter after a transition detected by the corresponding tim_icx signal. When a capture occurs, the corresponding CCXIF flag (TIMx_SR register) is set and an interrupt request can be sent if they are enabled. If a capture occurs while the CCxIF flag was already high, then the overcapture flag CCxOF (TIMx_SR register) is set. CCxIF can be

cleared by software by writing it to 0 or by reading the captured data stored in the TIMx_CCRx register. CCxOF is cleared when it is written with 0.

The following example shows how to capture the counter value in TIMx_CCR1 when tim_ti1 input rises. To do this, use the following procedure:

1. Select the proper tim_ti1_in[15:0] source (internal or external) with the TI1SEL[3:0] bits in the TIMx_TISEL register.
2. Select the active input: TIMx_CCR1 must be linked to the tim_ti1 input, so write the CC1S bits to 01 in the TIMx_CCMR1 register. As soon as CC1S becomes different from 00, the channel is configured in input mode, and the TIMx_CCR1 register becomes read-only.
3. Program the appropriate input filter duration in relation with the signal connected to the timer (by programming the ICxF bits in the TIMx_CCMRx register if the input is one of the tim_tix inputs). Let's imagine that, when toggling, the input signal is not stable during at most five internal clock cycles. The user must program a filter duration longer than these five clock cycles. The user can validate a transition on tim_ti1 when eight consecutive samples with the new level have been detected (sampled at f_{DTS} frequency). Then write IC1F bits to 0011 in the TIMx_CCMR1 register.
4. Select the edge of the active transition on the tim_ti1 channel by programming CC1P and CC1NP bits to 00 in the TIMx_CCER register (rising edge in this case).
5. Program the input prescaler. In this example, the user wishes the capture to be performed at each valid transition, so the prescaler is disabled (write IC1PS bits to 00 in the TIMx_CCMR1 register).
6. Enable capture from the counter into the capture register by setting the CC1E bit in the TIMx_CCER register.
7. If needed, enable the related interrupt request by setting the CC1IE bit in the TIMx_DIER register.

When an input capture occurs:

- The TIMx_CCR1 register gets the value of the counter on the active transition.
- CC1IF flag is set (interrupt flag). CC1OF is also set if at least two consecutive captures occurred whereas the flag was not cleared.
- An interrupt is generated depending on the CC1IE bit.

In order to handle the overcapture, it is recommended to read the data before the overcapture flag. This is to avoid missing an overcapture which may happen after reading the flag and before reading the data.

Note: IC interrupt requests can be generated by software by setting the corresponding CCxG bit in the TIMx_EGR register.

56.4.8 PWM input mode (TIM12 only)

This mode is used to measure both the period and the duty cycle of a PWM signal connected to single tim_tix input:

- The TIMx_CCR1 register holds the period value (interval between two consecutive rising edges).
- The TIM_CCR2 register holds the pulse width (interval between two consecutive rising and falling edges.

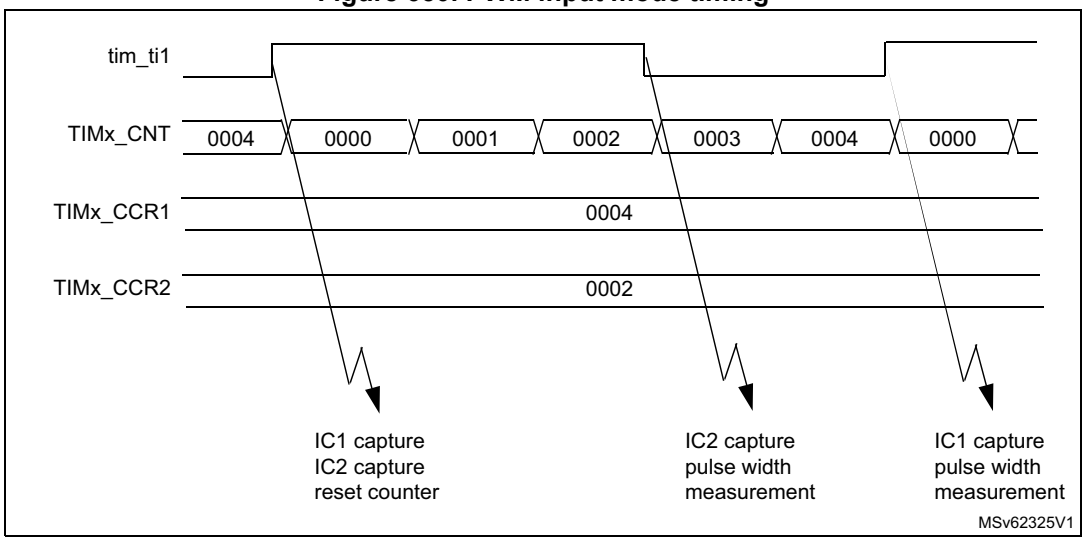
This mode is a particular case of input capture mode. The set-up procedure is similar with the following differences:

- Two tim_icx signals are mapped on the same tim_tix input.
- These two tim_icx signals are active on edges with opposite polarity.
- One of the two tim_tixfpy signals is selected as trigger input and the slave mode controller is configured in reset mode.

For example, one can measure the period (in TIMx_CCR1 register) and the duty cycle (in TIMx_CCR2 register) of the PWM applied on tim_ti1 using the following procedure (depending on tim_ker_ck frequency and prescaler value):

1. Select the proper tim_ti1_in[15:0] source (internal or external) with the TI1SEL[3:0] bits in the TIMx_TISEL register.
2. Select the active input for TIMx_CCR1: write the CC1S bits to 01 in the TIMx_CCMR1 register (tim_ti1 selected).
3. Select the active polarity for tim_ti1fp1 (used both for capture in TIMx_CCR1 and counter clear): program the CC1P and CC1NP bits to 00 (active on rising edge).
4. Select the active input for TIMx_CCR2: write the CC2S bits to 10 in the TIMx_CCMR1 register (tim_ti1 selected).
5. Select the active polarity for tim_ti1fp2 (used for capture in TIMx_CCR2): program the CC2P and CC2NP bits to 10 (active on falling edge).
6. Select the valid trigger input: write the TS bits to 00101 in the TIMx_SMCR register (tim_ti1fp1 selected).
7. Configure the slave mode controller in reset mode: write the SMS bits to 100 in the TIMx_SMCR register.
8. Enable the captures: write the CC1E and CC2E bits to 1 in the TIMx_CCER register.

Figure 650. PWM input mode timing



56.4.9 Forced output mode

In output mode (CCxS bits = 00 in the TIMx_CCMRx register), each output compare signal (tim_ocxref and then tim_ocx) can be forced to active or inactive level directly by software, independently of any comparison between the output compare register and the counter.

To force an output compare signal (tim_ocxref/tim_ocx) to its active level, one just needs to write 0101 in the OCxM bits in the corresponding TIMx_CCMRx register. Thus tim_ocxref is forced high (tim_ocxref is always active high) and tim_ocx get opposite value to CCxP polarity bit.

For example: CCxP = 0 (tim_ocx active high) => tim_ocx is forced to high level.

The tim_ocxref signal can be forced low by writing the OCxM bits to 0100 in the TIMx_CCMRx register.

Anyway, the comparison between the TIMx_CCRx shadow register and the counter is still performed and allows the flag to be set. Interrupt requests can be sent accordingly. This is described in the output compare mode section below.

56.4.10 Output compare mode

This function is used to control an output waveform or indicating when a period of time has elapsed.

When a match is found between the capture/compare register and the counter, the output compare function:

1. Assigns the corresponding output pin to a programmable value defined by the output compare mode (OCxM bits in the TIMx_CCMRx register) and the output polarity (CCxP bit in the TIMx_CCER register). The output pin can keep its level (OCxM = 0000), be set active (OCxM = 0001), be set inactive (OCxM = 0010) or can toggle (OCxM = 0011) on match.
2. Sets a flag in the interrupt status register (CCxIF bit in the TIMx_SR register).
3. Generates an interrupt if the corresponding interrupt mask is set (CCXIE bit in the TIMx_DIER register).

The TIMx_CCRx registers can be programmed with or without preload registers using the OCxPE bit in the TIMx_CCMRx register.

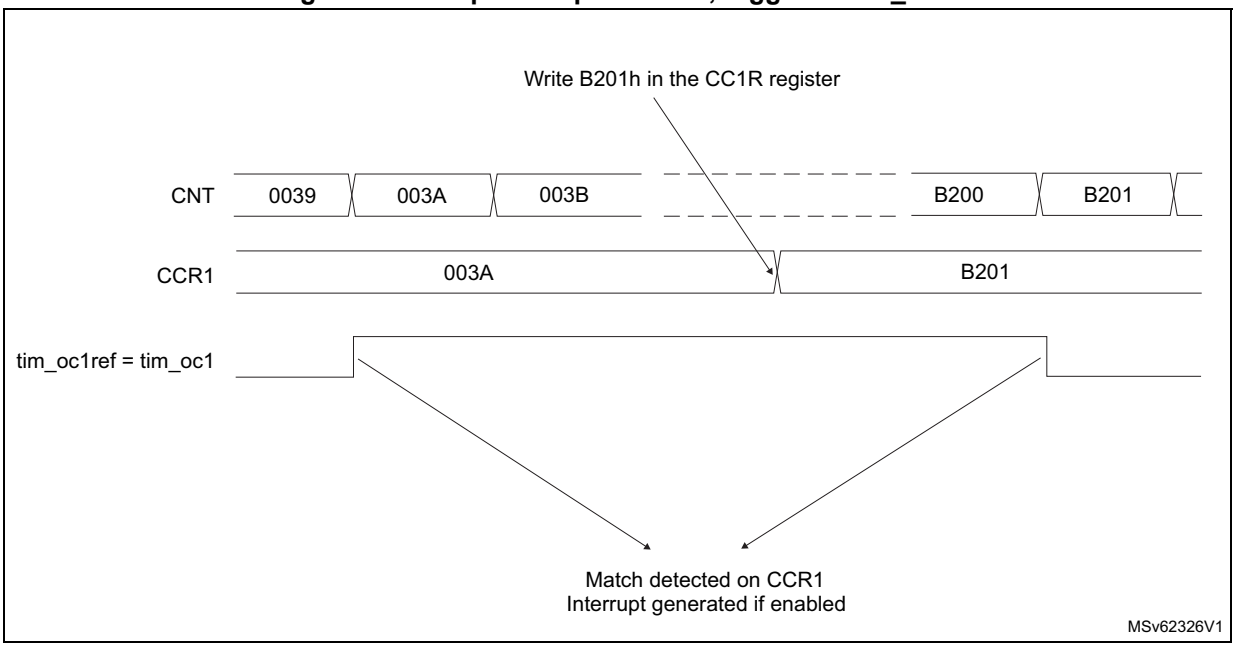
In output compare mode, the update event UEV has no effect on tim_ocxref and tim_ocx output. The timing resolution is one count of the counter. Output compare mode can also be used to output a single pulse (in One-pulse mode).

Procedure:

1. Select the counter clock (internal, external, prescaler).
2. Write the desired data in the TIMx_ARR and TIMx_CCRx registers.
3. Set the CCxIE bit if an interrupt request is to be generated.
4. Select the output mode. For example:
   - Write OCxM = 0011 to toggle tim_ocx output pin when CNT matches CCRx
   - Write OCxPE = 0 to disable preload register
   - Write CCxP = 0 to select active high polarity
   - Write CCxE = 1 to enable the output
5. Enable the counter by setting the CEN bit in the TIMx_CR1 register.

The TIMx_CCRx register can be updated at any time by software to control the output waveform, provided that the preload register is not enabled (OCxPE = 0, else TIMx_CCRx shadow register is updated only at the next update event UEV). An example is given in *Figure 651*.

Figure 651. Output compare mode, toggle on tim_oc1.



56.4.11 PWM mode

Pulse width modulation mode is used to generate a signal with a frequency determined by the value of the TIMx_ARR register and a duty cycle determined by the value of the TIMx_CCRx register.

The PWM mode can be selected independently on each channel (one PWM per tim_ocx output) by writing 0110 (PWM mode 1) or 0111 (PWM mode 2) in the OCxM bits in the TIMx_CCMRx register. The corresponding preload register must be enabled by setting the OCxPE bit in the TIMx_CCMRx register, and eventually the autoreload preload register (in upcounting or center-aligned modes) by setting the ARPE bit in the TIMx_CR1 register.

As the preload registers are transferred to the shadow registers only when an update event occurs, before starting the counter, all registers must be initialized by setting the UG bit in the TIMx_EGR register.

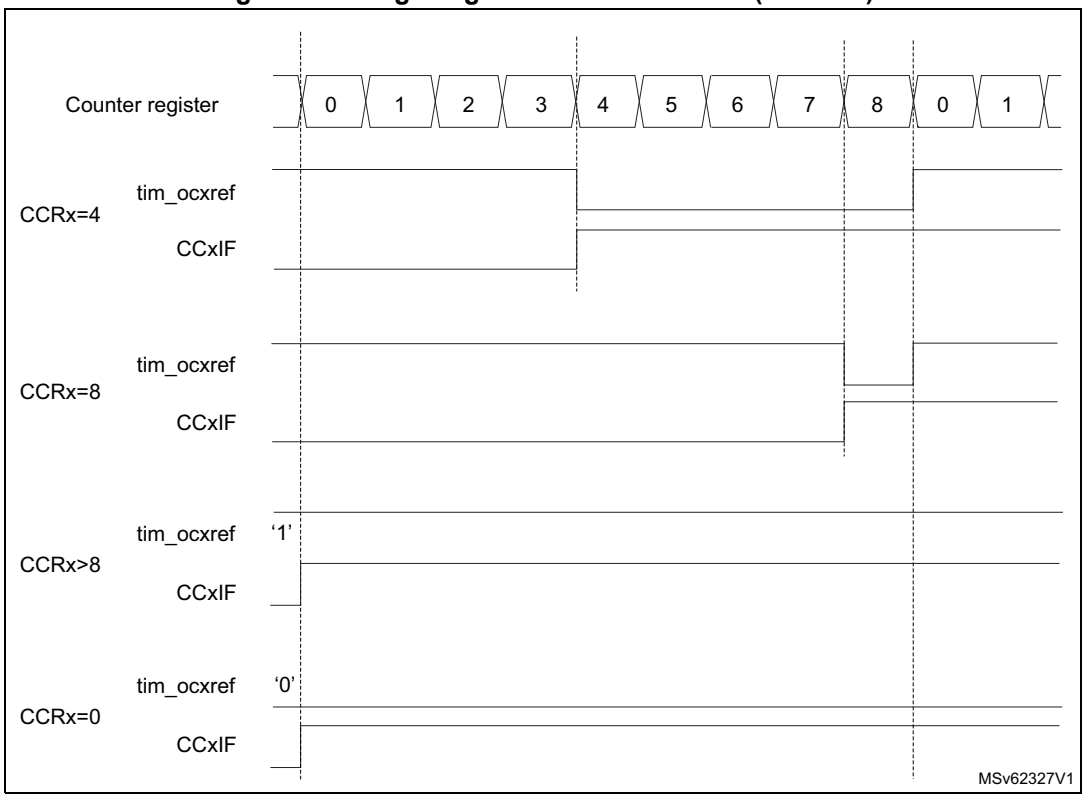
The tim_ocx polarity is software programmable using the CCxP bit in the TIMx_CCER register. It can be programmed as active high or active low. The tim_ocx output is enabled by the CCxE bit in the TIMx_CCER register. Refer to the TIMx_CCERx register description for more details.

In PWM mode (1 or 2), TIMx_CNT and TIMx_CCRx are always compared to determine whether TIMx_CNT ≤ TIMx_CCRx.

The timer is able to generate PWM in edge-aligned mode only since the counter is upcounting.

In the following example, the user considers PWM mode 1. The reference PWM signal tim_ocxref is high as long as TIMx_CNT < TIMx_CCRx else it becomes low. If the compare value in TIMx_CCRx is greater than the autoreload value (in TIMx_ARR) then tim_ocxref is held at 1. If the compare value is 0 then tim_ocxref is held at 0. *Figure 652* shows some edge-aligned PWM waveforms in an example where TIMx_ARR = 8.

Figure 652. Edge-aligned PWM waveforms (ARR = 8)

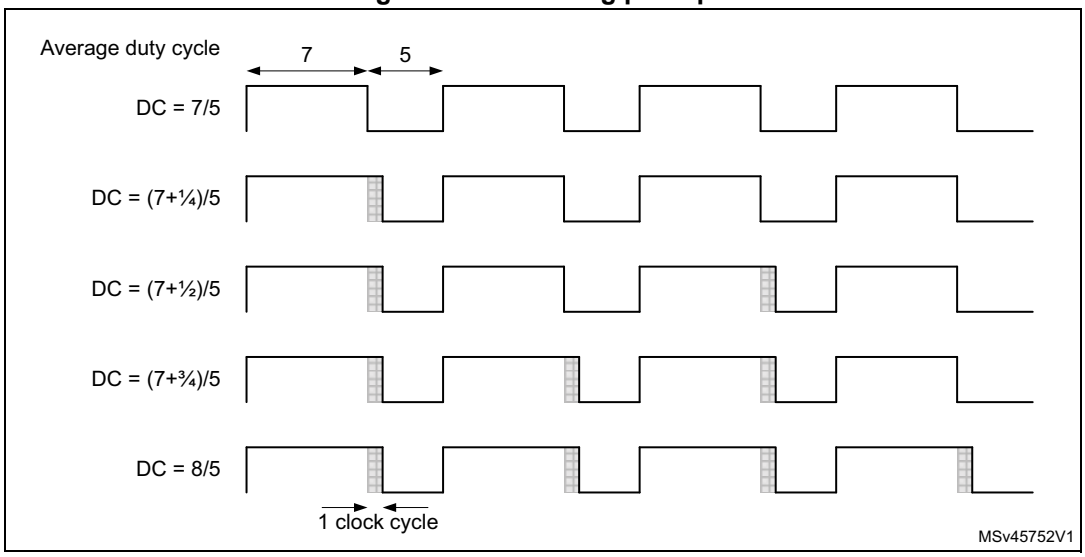


Dithering mode

The PWM mode effective resolution can be increased by enabling the dithering mode, using the DITHEN bit in the TIMx_CR1 register. This applies to both the CCR (for duty cycle resolution increase) and ARR (for PWM frequency resolution increase).

The operating principle is to have the actual CCR (or ARR) value slightly changed (adding or not one timer clock period) over 16 consecutive PWM periods, with predefined patterns. This allows a 16-fold resolution increase, considering the average duty cycle or PWM period. *Figure 653* presents the dithering principle applied to four consecutive PWM cycles.

Figure 653. Dithering principle

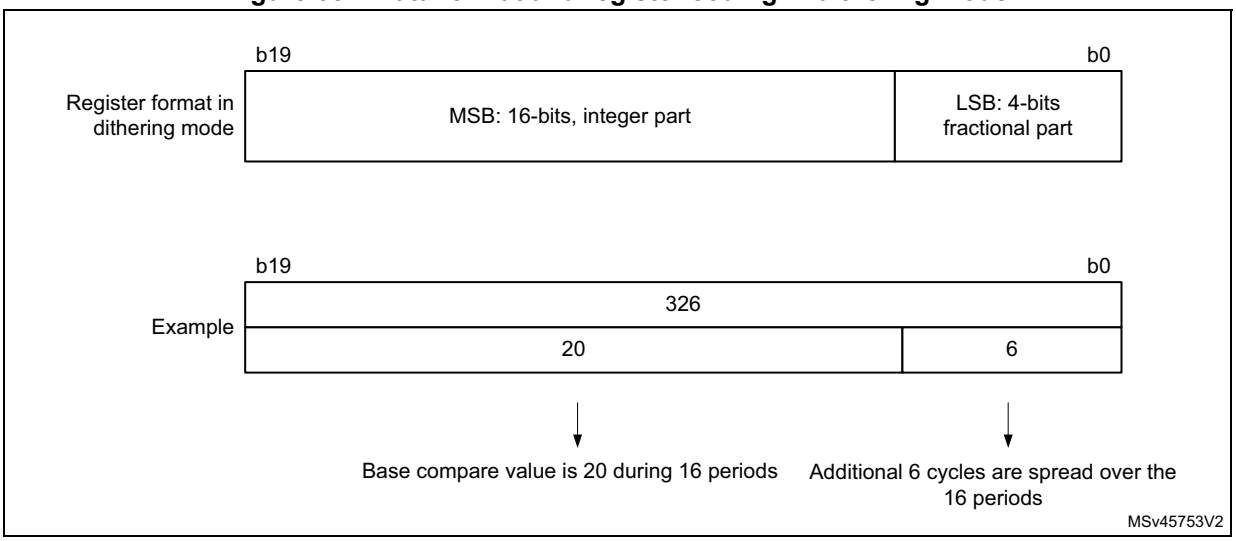


When the dithering mode is enabled, the register coding is changed as follows (see *Figure 654* for example):

- The four LSBs are coding for the enhanced resolution part (fractional part).
- The MSBs are left-shifted to the bits 19:4 and are coding for the base value.

Note: The following sequence must be followed when resetting the DITHEN bit:
1. CEN and ARPE bits must be reset
2. The DITHEN bit must be reset
3. The CCIF flags must be cleared
4. The CEN bit can be set (eventually with ARPE = 1).

Figure 654. Data format and register coding in dithering mode



The minimum frequency is given by the following formula:

$$\text{Resolution} = \frac{F_{Tim}}{F_{pwm}} \Rightarrow F_{pwmMin} = \frac{F_{Tim}}{Max_{Resolution}}$$

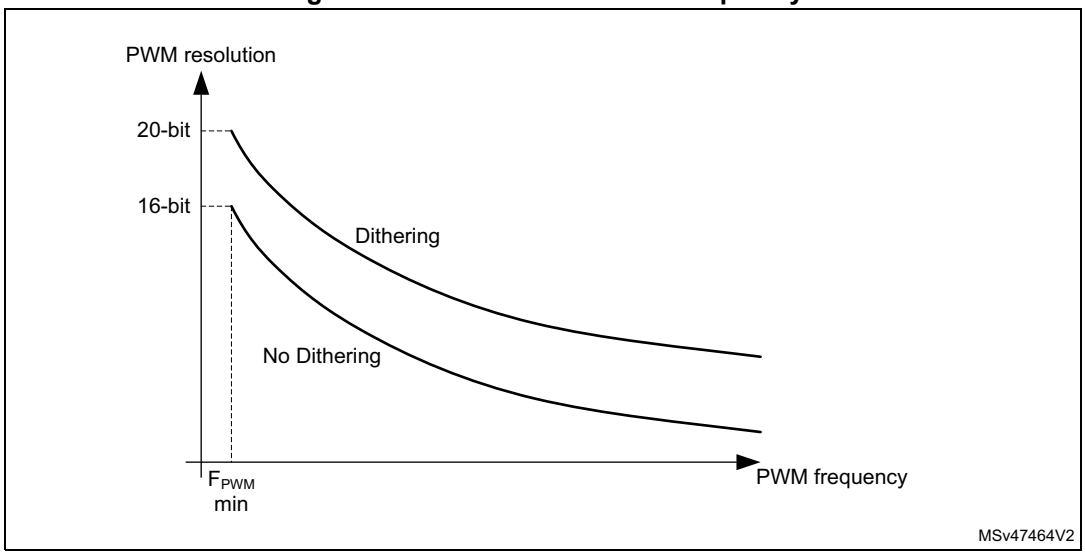
$$\text{Dithering mode disabled: } F_{pwmMin} = \frac{F_{Tim}}{65536}$$

$$\text{Dithering mode enabled: } F_{pwmMin} = \frac{F_{Tim}}{65535 + \frac{15}{16}}$$

Note: The maximum TIMx_ARR and TIMxCCRy values are limited to 0xFFFEF in dithering mode (corresponds to 65534 for the integer part and 15 for the dithered part).

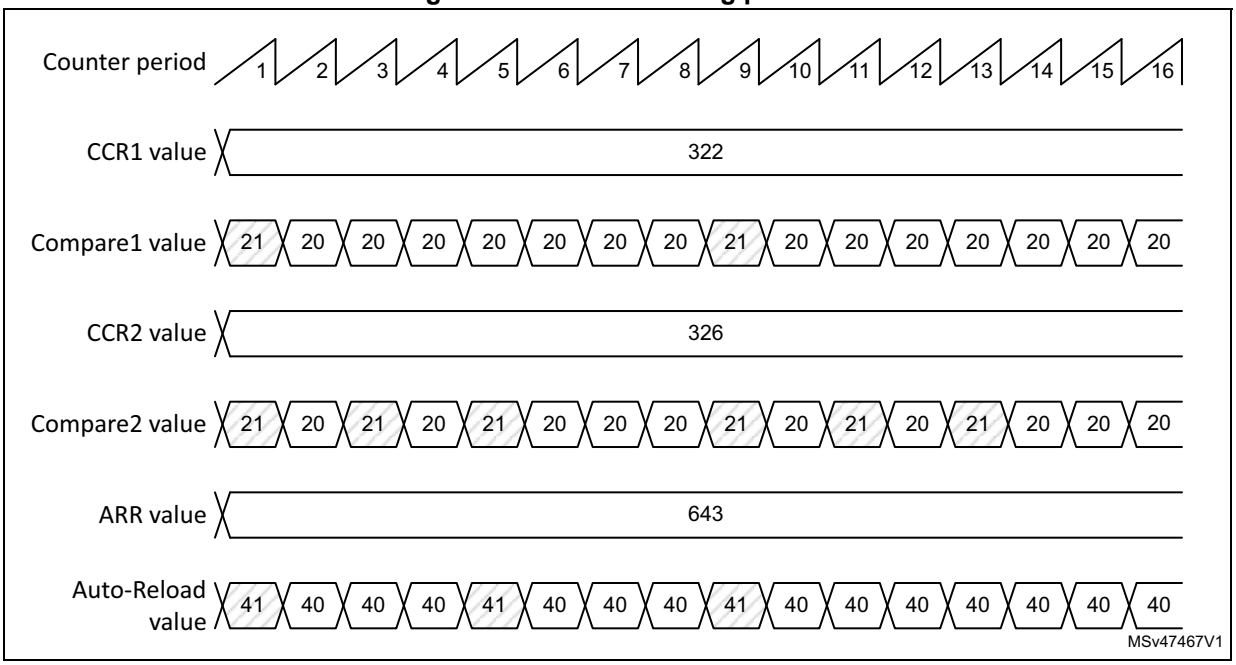
As shown on *Figure 655*, the dithering mode is used to increase the PWM resolution whatever the PWM frequency.

Figure 655. PWM resolution vs frequency



The duty cycle and/or period changes are spread over 16 consecutive periods, as described in *Figure 656*.

Figure 656. PWM dithering pattern



The autoreload and compare values increments are spread following specific patterns described in *Table 569*. The dithering sequence is done to have increments distributed as evenly as possible and minimize the overall ripple.

56.4.12 Combined PWM mode (TIM12 only)

Combined PWM mode allows two edge or center-aligned PWM signals to be generated with programmable delay and phase shift between respective pulses. While the frequency is determined by the value of the TIMx_ARR register, the duty cycle and delay are determined by the two TIMx_CCRx registers. The resulting signals, tim_ocxrefc, are made of an OR or AND logical combination of two reference PWMs:

- tim_oc1refc (or tim_oc2refc) is controlled by the TIMx_CCR1 and TIMx_CCR2 registers.

Combined PWM mode can be selected independently on two channels (one tim_ocx output per pair of CCR registers) by writing 1100 (Combined PWM mode 1) or 1101 (Combined PWM mode 2) in the OCxM bits in the TIMx_CCMRx register.

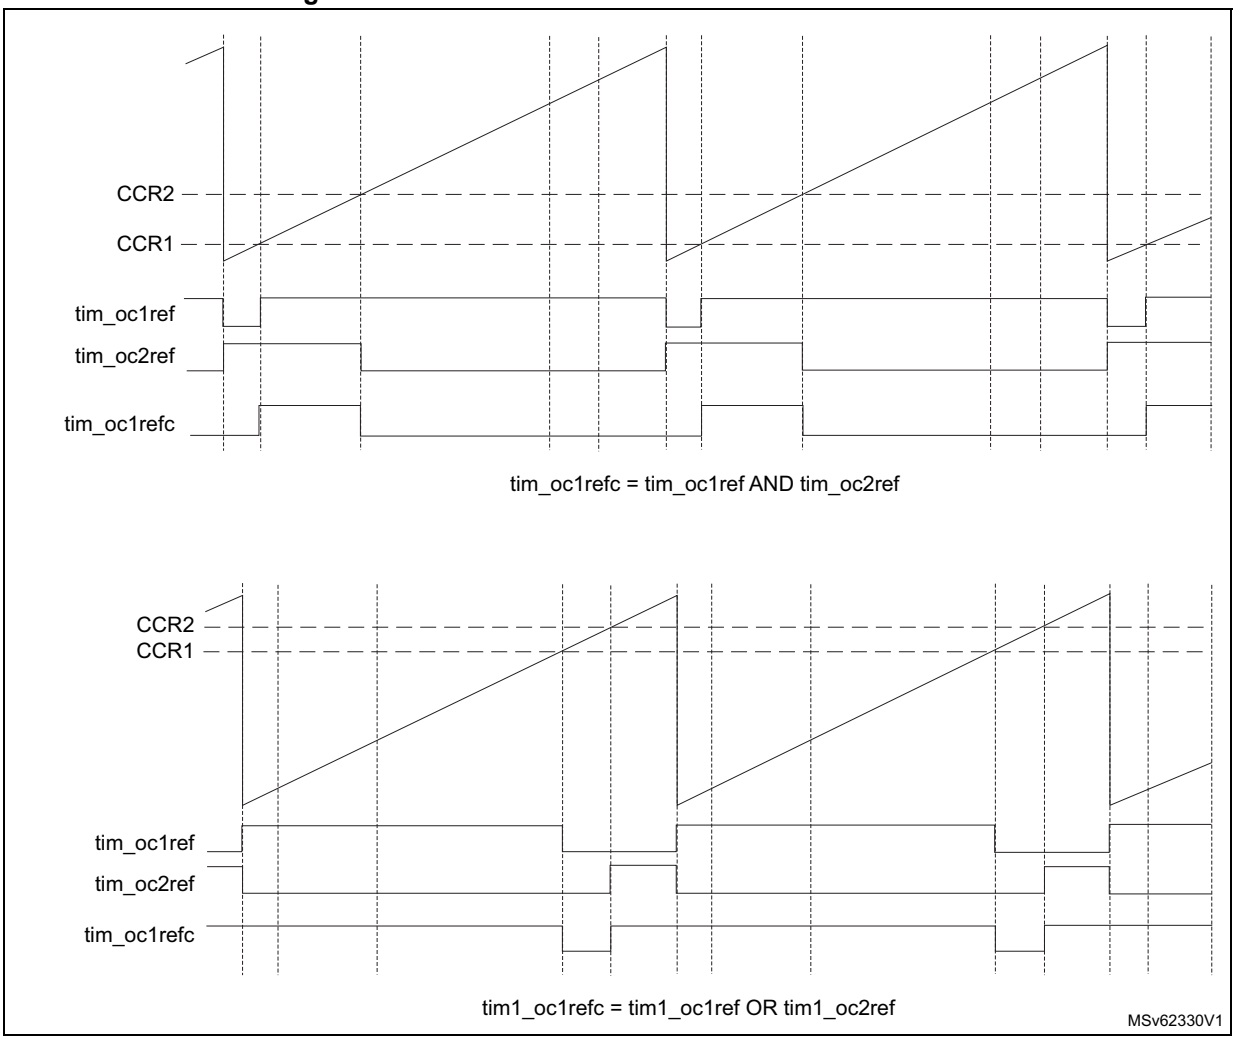
When a given channel is used as a combined PWM channel, its complementary channel must be configured in the opposite PWM mode (for instance, one in Combined PWM mode 1 and the other in combined PWM mode 2).

Note: The OCxM[3:0] bitfield is split into two parts for compatibility reasons, the most significant bit is not contiguous with the three least significant ones.

Figure 657 represents an example of signals that can be generated using combined PWM mode, obtained with the following configuration:

- Channel 1 is configured in combined PWM mode 2.
- Channel 2 is configured in PWM mode 1.

Figure 657. Combined PWM mode on channel 1 and 2



56.4.13 One-pulse mode

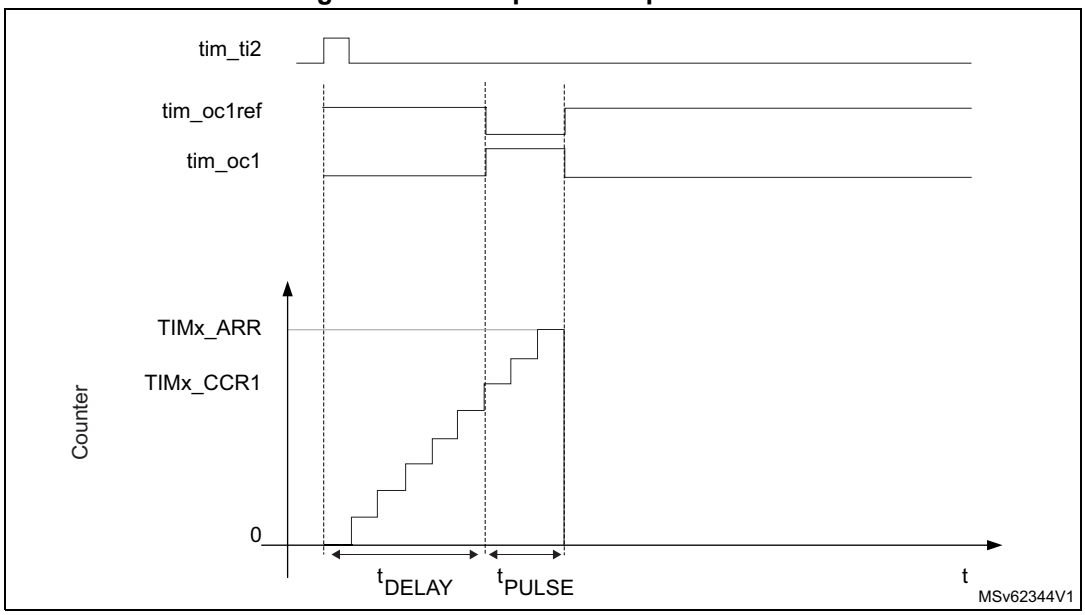
One-pulse mode (OPM) is a particular case of the previous modes. It allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length after a programmable delay.

Starting the counter can be controlled through the slave mode controller. Generating the waveform can be done in output compare mode or PWM mode. One-pulse mode is selected by setting the OPM bit in the TIMx_CR1 register. This makes the counter stop automatically at the next update event UEV.

A pulse can be correctly generated only if the compare value is different from the counter initial value. Before starting (when the timer is waiting for the trigger), the configuration must be as follows:

CNT < CCRx ≤ ARR (in particular, 0 < CCRx)

Figure 658. Example of one pulse mode



For example one may want to generate a positive pulse on tim_oc1 with a length of tPULSE and after a delay of tDELAY as soon as a positive edge is detected on the tim_ti2 input pin.

Use tim_ti2fp2 as trigger 1:

1. Select the proper tim_ti2_in[15:0] source (internal or external) with the TI2SEL[3:0] bits in the TIMx_TISEL register.
2. Map tim_ti2fp2 to tim_ti2 by writing CC2S = 01 in the TIMx_CCMR1 register.
3. tim_ti2fp2 must detect a rising edge, write CC2P = 0 and CC2NP = 0 in the TIMx_CCER register.
4. Configure tim_ti2fp2 as trigger for the slave mode controller (tim_trgi) by writing TS = 00110 in the TIMx_SMCR register.
5. tim_ti2fp2 is used to start the counter by writing SMS to 110 in the TIMx_SMCR register (trigger mode).

The OPM waveform is defined by writing the compare registers (taking into account the clock frequency and the counter prescaler).

- The t_{DELAY} is defined by the value written in the TIMx_CCR1 register.
- The t_{PULSE} is defined by the difference between the autoreload value and the compare value (TIMx_ARR - TIMx_CCR1).
- Assuming the user wants to build a waveform with a transition from 0 to 1 when a compare match occurs and a transition from 1 to 0 when the counter reaches the autoreload value. To do this PWM mode 2 must be enabled by writing OC1M = 0111 in the TIMx_CCMR1 register. Optionally the preload registers can be enabled by writing OC1PE = 1 in the TIMx_CCMR1 register and ARPE in the TIMx_CR1 register. In this case one has to write the compare value in the TIMx_CCR1 register, the autoreload value in the TIMx_ARR register, generate an update by setting the UG bit and wait for external trigger event on tim_ti2. CC1P is written to 0 in this example.

Since only one pulse (Single mode) is needed, a 1 must be written in the OPM bit in the TIMx_CR1 register to stop the counter at the next update event (when the counter rolls over

from the autoreload value back to 0). When OPM bit in the TIMx_CR1 register is set to 0, so the Repetitive mode is selected.

Particular case: tim_ocx fast enable

In One-pulse mode, the edge detection on tim_tix input set the CEN bit which enables the counter. Then the comparison between the counter and the compare value makes the output toggle. But several clock cycles are needed for these operations and it limits the minimum delay t_{DELAY} min that can be obtained.

If one wants to output a waveform with the minimum delay, the OCxFE bit can be set in the TIMx_CCMRx register. Then tim_ocxref (and tim_ocx) are forced in response to the stimulus, without taking in account the comparison. Its new level is the same as if a compare match had occurred. OCxFE acts only if the channel is configured in PWM1 or PWM2 mode.

56.4.14 Retriggerable one pulse mode (TIM12 only)

This mode allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length, but with the following differences with nonretriggerable one pulse mode described in *Section 56.4.13: One-pulse mode*:

- The pulse starts as soon as the trigger occurs (no programmable delay).
- The pulse is extended if a new trigger occurs before the previous one is completed.

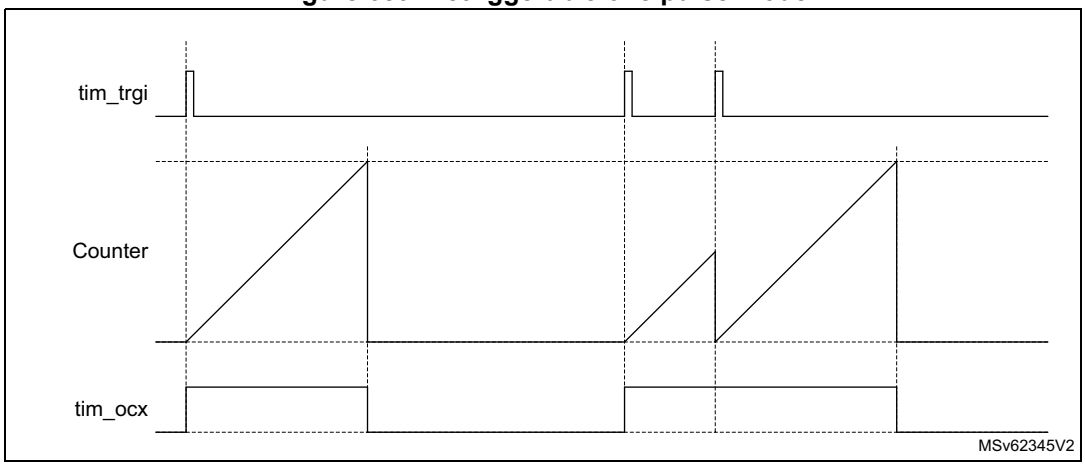
The timer must be in Slave mode, with the bits SMS[3:0] = 1000 (Combined reset + trigger mode) in the TIMx_SMCR register, and the OCxM[3:0] bits set to 1000 or 1001 for retriggerable OPM mode 1 or 2.

If the timer is configured in up-counting mode, the corresponding CCRx must be set to 0 (the ARR register sets the pulse length). If the timer is configured in down-counting mode, CCRx must be above or equal to ARR.

Note: The OCxM[3:0] and SMS[3:0] bit fields are split into two parts for compatibility reasons, the most significant bit are not contiguous with the three least significant ones.

This mode must not be used with center-aligned PWM modes. It is mandatory to have CMS[1:0] = 00 in TIMx_CR1.

Figure 659. Retriggerable one pulse mode



56.4.15 UIF bit remapping

The IUFREMAP bit in the TIMx_CR1 register forces a continuous copy of the update interrupt flag UIF into bit 31 of the timer counter register (TIMxCNT[31]). This is used to atomically read both the counter value and a potential roll-over condition signaled by the UIFCPY flag. In particular cases, it can ease the calculations by avoiding race conditions caused for instance by a processing shared between a background task (counter reading) and an interrupt (update interrupt).

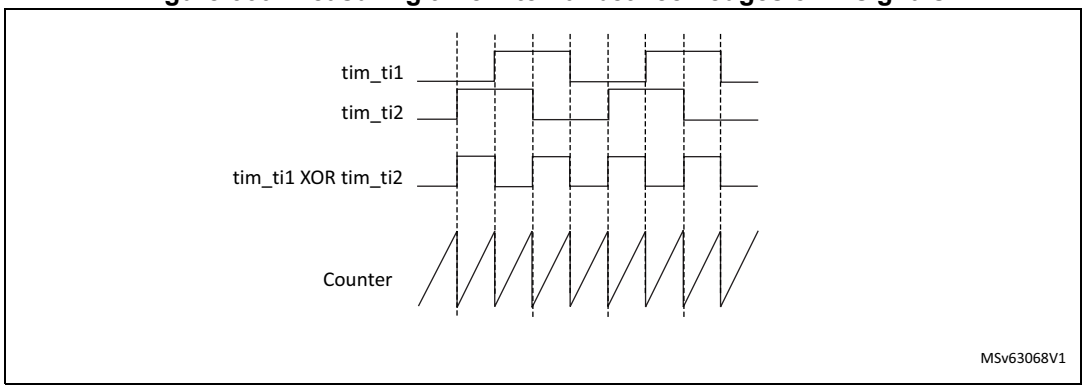
There is no latency between the assertions of the UIF and UIFCPY flags.

56.4.16 Timer input XOR function

The TI1S bit in the TIMx_CR2 register, allows the input filter of channel 1 to be connected to the output of an XOR gate, combining the two input pins tim_ti1 and tim_ti2.

The XOR output can be used with all the timer input functions such as trigger or input capture. It is useful for measuring the interval between the edges on two input signals, as shown in *Figure 660*.

Figure 660. Measuring time interval between edges on 2 signals



56.4.17 TIM12 external trigger synchronization

The TIM12 timer can be synchronized with an external trigger in several modes: Reset mode, Gated mode, Trigger mode, Reset + trigger, and Gated + reset mode.

Slave mode: Reset mode

The counter and its prescaler can be reinitialized in response to an event on a trigger input. Moreover, if the URS bit from the TIMx_CR1 register is low, an update event UEV is generated. Then all the preloaded registers (TIMx_ARR, TIMx_CCRx) are updated.

In the following example, the upcounter is cleared in response to a rising edge on tim_ti1 input:

1. Configure the channel 1 to detect rising edges on tim_ti1. Configure the input filter duration (in this example, the user does not need any filter, so the user keeps IC1F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in the

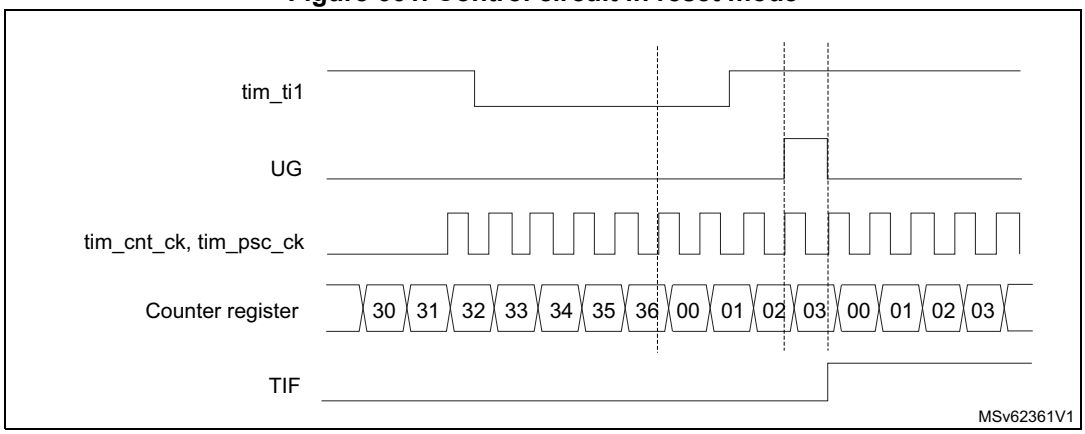
TIMx_CCMR1 register. Program CC1P and CC1NP to 00 in TIMx_CCER register to validate the polarity (and detect rising edges only).

2. Configure the timer in reset mode by writing SMS = 100 in TIMx_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIMx_SMCR register.
3. Start the counter by writing CEN = 1 in the TIMx_CR1 register.

The counter starts counting on the internal clock, then behaves normally until tim_ti1 rising edge. When tim_ti1 rises, the counter is cleared and restarts from 0. In the meantime, the trigger flag is set (TIF bit in the TIMx_SR register) and an interrupt request can be sent if enabled (depending on the TIE bit in TIMx_DIER register).

The following figure shows this behavior when the autoreload register TIMx_ARR = 0x36. The delay between the rising edge on tim_ti1 and the actual reset of the counter is due to the resynchronization circuit on tim_ti1 input.

Figure 661. Control circuit in reset mode



Slave mode: Gated mode

The counter can be enabled depending on the level of a selected input.

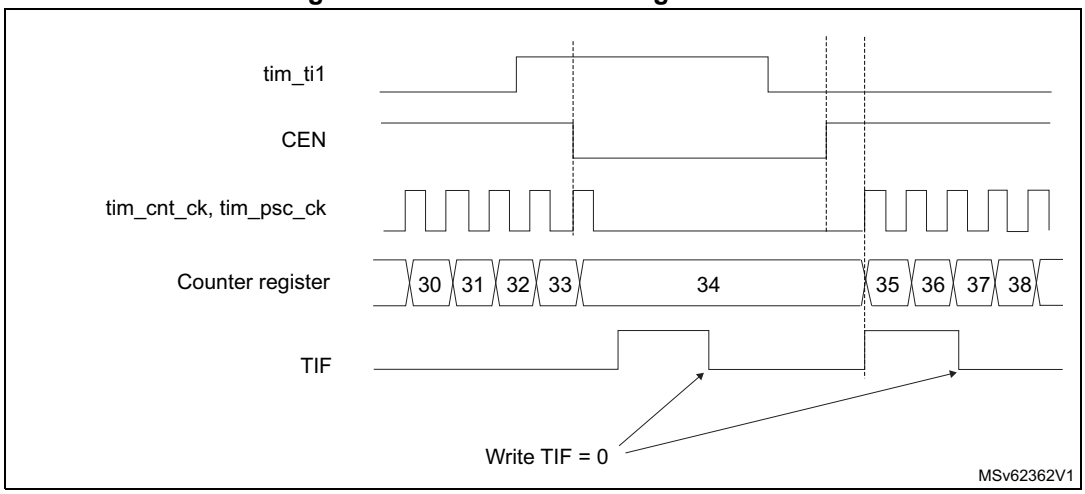
In the following example, the upcounter counts only when tim_ti1 input is low:

1. Configure the channel 1 to detect low levels on tim_ti1. Configure the input filter duration (in this example, the user does not need any filter, so the user keeps IC1F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in TIMx_CCMR1 register. Program CC1P = 1 and CC1NP = 0 in TIMx_CCER register to validate the polarity (and detect low level only).
2. Configure the timer in gated mode by writing SMS = 101 in TIMx_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIMx_SMCR register.
3. Enable the counter by writing CEN = 1 in the TIMx_CR1 register (in gated mode, the counter does not start if CEN = 0, whatever is the trigger input level).

The counter starts counting on the internal clock as long as tim_ti1 is low and stops as soon as tim_ti1 becomes high. The TIF flag in the TIMx_SR register is set both when the counter starts or stops.

The delay between the rising edge on tim_ti1 and the actual stop of the counter is due to the resynchronization circuit on tim_ti1 input.

Figure 662. Control circuit in gated mode



Slave mode: Trigger mode

The counter can start in response to an event on a selected input.

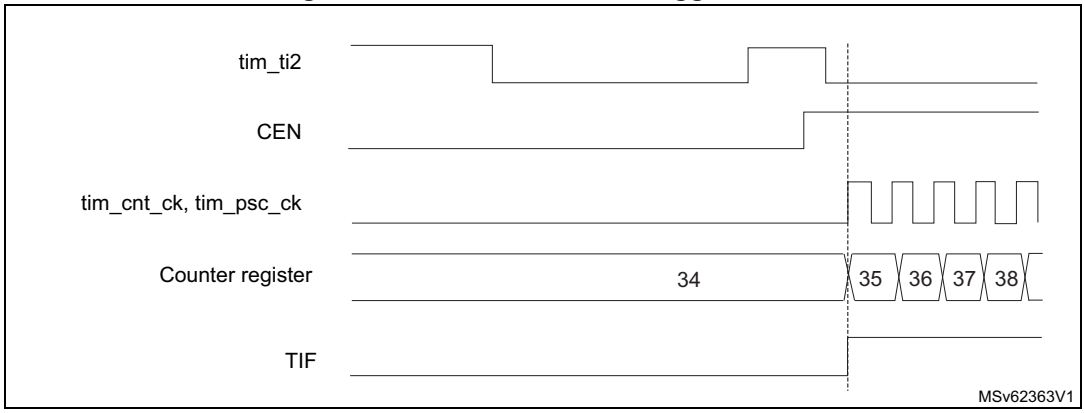
In the following example, the upcounter starts in response to a rising edge on tim_ti2 input:

1. Configure the channel 2 to detect rising edges on tim_ti2. Configure the input filter duration (in this example, the user does not need any filter, so the user keeps IC2F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC2S bits are configured to select the input capture source only, CC2S = 01 in TIMx_CCMR1 register. Program CC2P = 1 and CC2NP = 0 in TIMx_CCER register to validate the polarity (and detect low level only).
2. Configure the timer in trigger mode by writing SMS = 110 in TIMx_SMCR register. Select tim_ti2 as the input source by writing TS = 00110 in TIMx_SMCR register.

When a rising edge occurs on tim_ti2, the counter starts counting on the internal clock and the TIF flag is set.

The delay between the rising edge on tim_ti2 and the actual start of the counter is due to the resynchronization circuit on tim_ti2 input.

Figure 663. Control circuit in trigger mode



56.4.18 Slave mode – combined reset + trigger mode

In this case, a rising edge of the selected trigger input (tim_trgi) reinitializes the counter, generates an update of the registers, and starts the counter.

This mode is used for one-pulse mode.

56.4.19 Slave mode – combined reset + gated mode

The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops and is reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

56.4.20 Timer synchronization (TIM12 only)

The TIMx timers are linked together internally for timer synchronization or chaining. Refer to *Section 54.4.23: Timer synchronization* for details.

Note: The clock of the slave timer must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.

56.4.21 Using timer output as trigger for other timers (TIM10/TIM11/TIM13/TIM14 only)

The timers with one channel only do not feature a master mode. However, the OC1 output signal can be used to trigger some other timers (including timers described in other sections of this document). Check the “TIMx internal trigger connection” table of any timer on the device to identify which timers can be targeted as slave.

The OC1 signal pulse width must be programmed to be at least two clock cycles of the destination timer, to make sure the slave timer detects the trigger.

For instance, if the destination's timer CK_INT clock is four times slower than the source timer, the OC1 pulse width must be eight clock cycles.

56.4.22 ADC triggers (TIM12 only)

The timer can generate an ADC triggering event with various internal signals, such as reset, enable or compare events.

Note: The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo signal must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

56.4.23 Debug mode

When the microcontroller enters debug mode (Cortex-M33 core halted), the TIMx counter can either continue to work normally or stop.

The behavior in debug mode can be programmed with a dedicated configuration bit per timer in the Debug support (DBG) module.

For more details, refer to the debug section.

56.5 TIM10/TIM11/TIM12/TIM13/TIM14 low-power modes

Table 570. Effect of low-power modes on TIM10/TIM11/TIM12/TIM13/TIM14

Mode	Description
Sleep	No effect, peripheral is active. The interrupts can cause the device to exit from Sleep mode.
Stop	The timer operation is stopped and the register content is kept. No interrupt can be generated.
Standby	The timer is powered-down and must be reinitialized after exiting the Standby mode.

56.6 TIM10/TIM11/TIM12/TIM13/TIM14 interrupts

The TIM10/TIM11/TIM12/TIM13/TIM14 can generate multiple interrupts, as shown in *Table 571*.

Table 571. Interrupt requests

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from Sleep mode	Exit from Stop and Standby mode
TIM	Update	UIF	UIE	write 0 in UIF	Yes	No
	Capture/compare 1	CC1IF	CC1IE	write 0 in CC1IF	Yes	No
TIM	Capture/compare 2(1)	CC2IF	CC2IE	write 0 in CC2IF	Yes	No
	Trigger(1)	TIF	TIE	write 0 in TIF	Yes	No

1. Available for TIM12 only.

56.7 TIM12 registers

Refer to *Section 1.2* for a list of abbreviations used in register descriptions.

The peripheral registers have to be written by half-words (16 bits) or words (32 bits). Read accesses can be done by bytes (8 bits), half-words (16 bits), or words (32 bits).

56.7.1 TIM12 control register 1 (TIM12_CR1)

Address offset: 0x000

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DITHEN	UIFREMAP	Res.	CKD[1:0]		ARPE	Res.	Res.	Res.	OPM	URS	UDIS	CEN
			rw	rw		rw	rw	rw				rw	rw	rw	rw

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **DITHEN**: Dithering enable
0: Dithering disabled
1: Dithering enabled
Note: The DITHEN bit can only be modified when CEN bit is reset.

Bit 11 **UIFREMAP**: UIF status bit remapping
0: No remapping. UIF status bit is not copied to TIMx_CNT register bit 31.
1: Remapping enabled. UIF status bit is copied to TIMx_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division
This bitfield indicates the division ratio between the timer clock (tim_ker_ck) frequency and sampling clock used by the digital filters (tim_tix),
00: $t_{DTS} = t_{tim_ker_ck}$
01: $t_{DTS} = 2 \times t_{tim_ker_ck}$
10: $t_{DTS} = 4 \times t_{tim_ker_ck}$
11: Reserved

Bit 7 **ARPE**: Auto-reload preload enable
0: TIMx_ARR register is not buffered.
1: TIMx_ARR register is buffered.

Bits 6:4 Reserved, must be kept at reset value.

Bit 3 **OPM**: One-pulse mode
0: Counter is not stopped on the update event
1: Counter stops counting on the next update event (clearing the CEN bit).

Bit 2 **URS**: Update request source
This bit is set and cleared by software to select the UEV event sources.
0: Any of the following events generates an update interrupt if enabled. These events can be:
– Counter overflow
– Setting the UG bit
– Update generation through the slave mode controller
1: Only counter overflow generates an update interrupt if enabled.

Bit 1 **UDIS**: Update disable
This bit is set and cleared by software to enable/disable update event (UEV) generation.
0: UEV enabled. An UEV is generated by one of the following events:
– Counter overflow
– Setting the UG bit
Buffered registers are then loaded with their preload values.
1: UEV disabled. No UEV is generated, shadow registers keep their value (ARR, PSC, CCRx). The counter and the prescaler are reinitialized if the UG bit is set.

Bit 0 **CEN**: Counter enable
0: Counter disabled
1: Counter enabled
CEN is cleared automatically in one-pulse mode, when an update event occurs.
Note: External clock and gated mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.

56.7.2 TIM12 control register 2 (TIM12_CR2)

Address offset: 0x004

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TI1S	MMS[2:0]			Res.	Res.	Res.	Res.
								rw	rw	rw	rw				

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **TI1S**: tim_ti1 selection

0: The tim_ti1_in[15:0] multiplexer output is connected to tim_ti1 input

1: The tim_ti1_in[15:0] and tim_ti2_in[15:0] multiplexers output are connected to the tim_ti1 input (XOR combination)

Bits 6:4 **MMS[2:0]**: Master mode selection

These bits allow to select the information to be sent in master mode to slave timers for synchronization (tim_trgo). The combination is as follows:

000: Reset - the UG bit from the TIMx_EGR register is used as trigger output (tim_trgo). If the reset is generated by the trigger input (slave mode controller configured in reset mode) then the signal on tim_trgo is delayed compared to the actual reset.

001: Enable - the Counter Enable signal CNT_EN is used as trigger output (tim_trgo). It is useful to start several timers at the same time or to control a window in which a slave timer is enable. The Counter Enable signal is generated by a logic AND between CEN control bit and the trigger input when configured in gated mode. When the Counter Enable signal is controlled by the trigger input, there is a delay on tim_trgo, except if the master/slave mode is selected (see the MSM bit description in TIMx_SMCR register).

010: Update - The update event is selected as trigger output (tim_trgo). For instance a master timer can then be used as a prescaler for a slave timer.

011: Compare Pulse - The trigger output send a positive pulse when the CC1IF flag is to be set (even if it was already high), as soon as a capture or a compare match occurred (tim_trgo).

100: Compare - tim_oc1refc signal is used as trigger output (tim_trgo).

101: Compare - tim_oc2refc signal is used as trigger output (tim_trgo).

Bits 3:0 Reserved, must be kept at reset value.

56.7.3 TIM12 slave mode control register (TIM12_SMCR)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TS[4:3]		Res.	Res.	Res.	SMS[3]
										rw	rw				rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MSM	TS[2:0]			Res.	SMS[2:0]		
								rw	rw	rw	rw		rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 19:17 Reserved, must be kept at reset value.

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **MSM:** Master/Slave mode

0: No action

1: The effect of an event on the trigger input (tim_trgi) is delayed to allow a perfect synchronization between the current timer and its slaves (through tim_trgo). It is useful in order to synchronize several timers on a single external event.

Bits 21, 20, 6, 5, 4 **TS[4:0]:** Trigger selection

This TS[4:0] bitfield selects the trigger input to be used to synchronize the counter.

00000: Internal Trigger 0 (tim_itr0)
00001: Internal Trigger 1 (tim_itr1)
00010: Internal Trigger 2 (tim_itr2)
00011: Internal Trigger 3 (tim_itr3)
00100: tim_ti1 Edge Detector (tim_ti1f_ed)
00101: Filtered Timer Input 1 (tim_ti1fp1)
00110: Filtered Timer Input 2 (tim_ti2fp2)
01000: Internal Trigger 4 (tim_itr4)
01001: Internal Trigger 5 (tim_itr5)
01010: Internal Trigger 6 (tim_itr6)
01011: Internal Trigger 7 (tim_itr7)
01100: Internal Trigger 8 (tim_itr8)
01101: Internal Trigger 9 (tim_itr9)
01110: Internal Trigger 10 (tim_itr10)
01111: Internal Trigger 10 (tim_itr11)
10000: Internal Trigger 10 (tim_itr12)
10001: Internal Trigger 10 (tim_itr13)
10010: Internal Trigger 10 (tim_itr14)
10011: Internal Trigger 10 (tim_itr15)
Others: Reserved

See *Table 568: TIMx internal trigger connection* for more details on the meaning of tim_itrx for each timer.

Note: These bits must be changed only when they are not used (for example when SMS = 000) to avoid wrong edge detections at the transition.

Bit 3 Reserved, must be kept at reset value.

Bits 16, 2, 1, 0 **SMS[3:0]:** Slave mode selection

When external signals are selected the active edge of the trigger signal (tim_trgi) is linked to the polarity selected on the external input (see input control register and control register description.

0000: Slave mode disabled - if CEN = 1 then the prescaler is clocked directly by the internal clock.

0001: Reserved

0010: Reserved

0011: Reserved

0100: Reset mode - Rising edge of the selected trigger input (tim_trgi) reinitializes the counter and generates an update of the registers.

0101: Gated mode - The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops (but is not reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

0110: Trigger mode - The counter starts at a rising edge of the trigger tim_trgi (but it is not reset). Only the start of the counter is controlled.

0111: External clock mode 1 - Rising edges of the selected trigger (tim_trgi) clock the counter.

1000: Combined reset + trigger mode - Rising edge of the selected trigger input (tim_trgi) reinitializes the counter, generates an update of the registers and starts the counter.

1001: Combined gated + reset mode - The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops and is reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

Other codes: reserved.

Note: The gated mode (including gated + reset mode) must not be used if tim_ti1f_ed is selected as the trigger input (TS = 00100). Indeed, tim_ti1f_ed outputs 1 pulse for each transition on tim_ti1f, whereas the gated mode checks the level of the trigger signal.

The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo signals must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.

56.7.4 TIM12 interrupt enable register (TIM12_DIER)

Address offset: 0x00C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIE	Res.	Res.	Res.	CC2IE	CC1IE	UIE
									rw				rw	rw	rw

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **TIE**: Trigger interrupt enable

0: Trigger interrupt disabled.

1: Trigger interrupt enabled.

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **CC2IE**: Capture/Compare 2 interrupt enable
0: CC2 interrupt disabled.
1: CC2 interrupt enabled.

Bit 1 **CC1IE**: Capture/Compare 1 interrupt enable
0: CC1 interrupt disabled.
1: CC1 interrupt enabled.

Bit 0 **UIE**: Update interrupt enable
0: Update interrupt disabled.
1: Update interrupt enabled.

56.7.5 TIM12 status register (TIM12_SR)

Address offset: 0x010

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	CC2OF	CC1OF	Res.	Res.	TIF	Res.	Res.	Res.	CC2IF	CC1IF	UIF
					rc_w0	rc_w0			rc_w0				rc_w0	rc_w0	rc_w0

Bits 15:11 Reserved, must be kept at reset value.

Bit 10 **CC2OF**: Capture/compare 2 overcapture flag
refer to CC1OF description

Bit 9 **CC1OF**: Capture/Compare 1 overcapture flag
This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to 0.
0: No overcapture has been detected.
1: The counter value has been captured in TIMx_CCR1 register while CC1IF flag was already set

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 **TIF**: Trigger interrupt flag
This flag is set by hardware on the TRG trigger event (active edge detected on tim_trgi input when the slave mode controller is enabled in all modes but gated mode. It is set when the counter starts or stops when gated mode is selected. It is cleared by software.
0: No trigger event occurred.
1: Trigger interrupt pending.

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **CC2IF**: Capture/Compare 2 interrupt flag
refer to CC1IF description

Bit 1 **CC1IF**: Capture/compare 1 interrupt flag
This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIMx_CCR1 register (input capture mode only).
0: No compare match / No input capture occurred
1: A compare match or an input capture occurred.
If channel CC1 is configured as output: this flag is set when he content of the counter TIMx_CNT matches the content of the TIMx_CCR1 register. When the content of TIMx_CCR1 is greater than the content of TIMx_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in down-counting mode). There are 3 possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIMx_CR1 register for the full description.
If channel CC1 is configured as input: this bit is set when counter value has been captured in TIMx_CCR1 register (an edge has been detected on tim_ic1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIMx_CCER).

Bit 0 **UIF**: Update interrupt flag
This bit is set by hardware on an update event. It is cleared by software.
0: No update occurred.
1: Update interrupt pending. This bit is set by hardware when the registers are updated:
– At overflow and if UDIS = 0 in the TIMx_CR1 register.
– When CNT is reinitialized by software using the UG bit in TIMx_EGR register, if URS = 0 and UDIS = 0 in the TIMx_CR1 register.
– When CNT is reinitialized by a trigger event (refer to *Section 56.7.3: TIM12 slave mode control register (TIM12_SMCR)*), if URS = 0 and UDIS = 0 in the TIMx_CR1 register.

56.7.6 TIM12 event generation register (TIM12_EGR)

Address offset: 0x014

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TG	Res.	Res.	Res.	CC2G	CC1G	UG
									w				w	w	w

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **TG**: Trigger generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: The TIF flag is set in the TIMx_SR register. Related interrupt can occur if enabled

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **CC2G**: Capture/compare 2 generation
refer to CC1G description

Bit 1 **CC1G**: Capture/compare 1 generation
This bit is set by software to generate an event, it is automatically cleared by hardware.
0: No action
1: A capture/compare event is generated on channel 1:
If channel CC1 is configured as output:
the CC1IF flag is set, the corresponding interrupt is sent if enabled.
If channel CC1 is configured as input:
The current counter value is captured in the TIMx_CCR1 register. The CC1IF flag is set, the corresponding interrupt is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation
This bit can be set by software, it is automatically cleared by hardware.
0: No action
1: Re-initializes the counter and generates an update of the registers. The prescaler counter is also cleared and the prescaler ratio is not affected. The counter is cleared.

56.7.7 TIM12 capture/compare mode register 1 (TIM12_CCMR1)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits in this register have different functions in input and output modes.

Input capture mode:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IC2F[3:0]				IC2PSC[1:0]		CC2S[1:0]		IC1F[3:0]				IC1PSC[1:0]		CC1S[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC2F[3:0]**: Input capture 2 filter

Bits 11:10 **IC2PSC[1:0]**: Input capture 2 prescaler

Bits 9:8 **CC2S[1:0]**: Capture/compare 2 selection
This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC2 channel is configured as output
01: CC2 channel is configured as input, IC2 is mapped on tim_ti2
10: CC2 channel is configured as input, IC2 is mapped on tim_ti1
11: CC2 channel is configured as input, IC2 is mapped on tim_trc. This mode works only if an internal trigger input is selected through the TS bit (TIMx_SMCR register)
Note: The CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIMx_CCER).

Bits 7:4 **IC1F[3:0]**: Input capture 1 filter

This bitfield defines the frequency used to sample the tim_ti1 input and the length of the digital filter applied to tim_ti1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at f_{DTS}
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Bits 3:2 **IC1PSC[1:0]**: Input capture 1 prescaler

This bitfield defines the ratio of the prescaler acting on the CC1 input (tim_ic1).
The prescaler is reset as soon as CC1E = 0 (TIMx_CCER register).
00: no prescaler, capture is done each time an edge is detected on the capture input
01: capture is done once every 2 events
10: capture is done once every 4 events
11: capture is done once every 8 events

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC1 channel is configured as output
01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1
10: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti2
11: CC1 channel is configured as input, tim_ic1 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIMx_SMCR register)

Note: The CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx_CCER).

56.7.8 TIM12 capture/compare mode register 1 [alternate] (TIM12_CCMR1)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits in this register have different functions in input and output modes.

Output compare mode:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	OC2M [3]	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OC1M [3]
							rw								rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	OC2M[2:0]			OC2PE	OC2FE	CC2S[1:0]		Res.	OC1M[2:0]			OC1PE	OC1FE	CC1S[1:0]	
	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bits 23:17 Reserved, must be kept at reset value.

Bit 15 Reserved, must be kept at reset value.

Bits 24, 14:12 **OC2M[3:0]**: Output compare 2 mode
Refer to OC1M[3:0] for bit description.

Bit 11 **OC2PE**: Output compare 2 preload enable

Bit 10 **OC2FE**: Output compare 2 fast enable

Bits 9:8 **CC2S[1:0]**: Capture/Compare 2 selection
This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC2 channel is configured as output
01: CC2 channel is configured as input, IC2 is mapped on tim_ti2
10: CC2 channel is configured as input, IC2 is mapped on tim_ti1
11: CC2 channel is configured as input, IC2 is mapped on tim_trc. This mode works only if an internal trigger input is selected through the TS bit (TIMx_SMCR register
Note: The CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIMx_CCER).

Bit 7 Reserved, must be kept at reset value.

Bits 16, 6:4 **OC1M[3:0]**: Output compare 1 mode (refer to bit 16 for OC1M[3])

These bits define the behavior of the output reference signal tim_oc1ref from which tim_oc1 is derived. tim_oc1ref is active high whereas the active level of tim_oc1 depends on the CC1P.

0000: Frozen - The comparison between the output compare register TIMx_CCR1 and the counter TIMx_CNT has no effect on the outputs. This mode can be used when the timer serves as a software timebase. When the frozen mode is enabled during timer operation, the ouput keeps the state (active or inactive) it had before entering the frozen state.

0001: Set channel 1 to active level on match. The tim_oc1ref signal is forced high when the TIMx_CNT counter matches the capture/compare register 1 (TIMx_CCR1).

0010: Set channel 1 to inactive level on match. The tim_oc1ref signal is forced low when the TIMx_CNT counter matches the capture/compare register 1 (TIMx_CCR1).

0011: Toggle - tim_oc1ref toggles when TIMx_CNT = TIMx_CCR1

0100: Force inactive level - tim_oc1ref is forced low

0101: Force active level - tim_oc1ref is forced high

0110: PWM mode 1 - channel 1 is active as long as TIMx_CNT<TIMx_CCR1 else it is inactive

0111: PWM mode 2 - channel 1 is inactive as long as TIMx_CNT<TIMx_CCR1 else it is active

1000: Retrigerrable OPM mode 1 - The channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

1001: Retrigerrable OPM mode 2 - The channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update.

1010: Reserved,

1011: Reserved,

1100: Combined PWM mode 1 - tim_oc1ref has the same behavior as in PWM mode 1. tim_oc1refc is the logical OR between tim_oc1ref and tim_oc2ref.

1101: Combined PWM mode 2 - tim_oc1ref has the same behavior as in PWM mode 2. tim_oc1refc is the logical AND between tim_oc1ref and tim_oc2ref.

1110: Reserved,

1111: Reserved

Note: In PWM mode, the OCREF level changes when the result of the comparison changes, when the output compare mode switches from “frozen” mode to “PWM” mode and when the output compare mode switches from “force active/inactive” mode to “PWM” mode.

Bit 3 **OC1PE**: Output compare 1 preload enable

0: Preload register on TIMx_CCR1 disabled. TIMx_CCR1 can be written at anytime, the new value is taken into account immediately

1: Preload register on TIMx_CCR1 enabled. Read/Write operations access the preload register. TIMx_CCR1 preload value is loaded into the active register at each update event

Bit 2 **OC1FE**: Output compare 1 fast enable

This bit is used to accelerate the effect of an event on the trigger in input on the CC output.

0: CC1 behaves normally depending on the counter and CCR1 values even when the trigger is ON. The minimum delay to activate the CC1 output when an edge occurs on the trigger input is 5 clock cycles

1: An active edge on the trigger input acts like a compare match on the CC1 output. Then, OC is set to the compare level independently of the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to 3 clock cycles. OC1FE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00:CC1 channel is configured as output

01:CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1

10:CC1 channel is configured as input, tim_ic1 is mapped on tim_ti2

11:CC1 channel is configured as input, tim_ic1 is mapped on tim_trc. This mode works only if an internal trigger input is selected through the TS bit (TIMx_SMCR register)

Note: The CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx_CCER).

56.7.9 TIM12 capture/compare enable register (TIM12_CCER)

Address offset: 0x020

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CC2NP	Res.	CC2P	CC2E	CC1NP	Res.	CC1P	CC1E
								rw		rw	rw	rw		rw	rw

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **CC2NP**: Capture/Compare 2 output Polarity

Refer to CC1NP description

Bit 6 Reserved, must be kept at reset value.

Bit 5 **CC2P**: Capture/Compare 2 output Polarity

Refer to CC1P description

Bit 4 **CC2E**: Capture/Compare 2 output enable

Refer to CC1E description

Bit 3 **CC1NP**: Capture/Compare 1 complementary output Polarity

CC1 channel configured as output: CC1NP must be kept cleared

CC1 channel configured as input: CC1NP is used in conjunction with CC1P to define tim_ti1fp1/tim_ti2fp1 polarity (refer to CC1P description).

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CC1P**: Capture/Compare 1 output Polarity.

0: tim_oc1 active high (output mode) / Edge sensitivity selection (input mode, see below)

1: tim_oc1 active low (output mode) / Edge sensitivity selection (input mode, see below)

When CC1 channel is configured as input, both CC1NP/CC1P bits select the active polarity of tim_ti1fp1 and tim_ti2fp1 for trigger or capture operations.

CC1NP = 0, CC1P = 0: non-inverted/rising edge. The circuit is sensitive to tim_tixfp1 rising edge (capture or trigger operations in reset, external clock or trigger mode), tim_tixfp1 is not inverted (trigger operation in gated mode).

CC1NP = 0, CC1P = 1: inverted/falling edge. The circuit is sensitive to tim_tixfp1 falling edge (capture or trigger operations in reset, external clock or trigger mode), tim_tixfp1 is inverted (trigger operation in gated mode).

CC1NP = 1, CC1P = 1: non-inverted/both edges/ The circuit is sensitive to both tim_tixfp1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), tim_tixfp1 is not inverted (trigger operation in gated mode).

CC1NP = 1, CC1P = 0: This configuration is reserved, it must not be used.

Bit 0 **CC1E**: Capture/Compare 1 output enable.

0: Capture mode disabled / tim_oc1 is not active

1: Capture mode enabled / tim_oc1 signal is output on the corresponding output pin

Table 572. Output control bit for standard tim_ocx channels

CCxE bit	tim_ocx output state
0	Output disabled (not driven by the timer: Hi-Z)
1	Output enabled (tim_ocx = tim_ocxref + Polarity)

Note: The states of the external I/O pins connected to the standard tim_ocx *channels depend on the state of the* tim_ocx *channel and on the GPIO registers.*

56.7.10 TIM12 counter (TIM12_CNT)

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UIF CPY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **UIFCPY**: UIF Copy
This bit is a read-only copy of the UIF bit in the TIMx_ISR register.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]**: Counter value
Non-dithering mode (DITHEN = 0)
The register holds the counter value.
Dithering mode (DITHEN = 1)
The register only holds the non-dithered part in CNT[15:0]. The fractional part is not available.

56.7.11 TIM12 prescaler (TIM12_PSC)

Address offset: 0x028

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PSC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **PSC[15:0]**: Prescaler value
The counter clock frequency tim_cnt_ck is equal to $f_{tim_psc_ck}$ / (PSC[15:0] + 1).
PSC contains the value to be loaded into the active prescaler register at each update event. (including when the counter is cleared through UG bit of TIMx_EGR register or through trigger controller when configured in “reset mode”).

56.7.12 TIM12 autoreload register (TIM12_ARR)

Address offset: 0x02C

Reset value: 0x0000 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ARR[19:16]			
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **ARR[19:0]**: Auto-reload value
ARR is the value to be loaded in the actual auto-reload register.
Refer to the *Section 56.4.3: Time-base unit* for more details about ARR update and behavior.
The counter is blocked while the auto-reload value is null.
Non-dithering mode (DITHEN = 0)
The register holds the auto-reload value in ARR[15:0]. The ARR[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the integer part in ARR[19:4]. The ARR[3:0] bitfield contains the dithered part.

56.7.13 TIM12 capture/compare register 1 (TIM12_CCR1)

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCR1[19:16]			
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR1[19:0]**: Capture/compare 1 value

If channel CC1 is configured as output:

CCR1 is the value to be loaded in the actual capture/compare 1 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIMx_CCMR1 register (bit OC1PE). Else the preload value is copied in the active capture/compare 1 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx_CNT and signaled on tim_oc1 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value in CCR1[15:0]. The CCR1[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR1[19:4]. The CCR1[3:0] bitfield contains the dithered part.

If channel CC1 is configured as input:

CR1 is the counter value transferred by the last input capture 1 event (tim_ic1). The TIMx_CCR1 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value in CCR1[15:0]. The CCR1[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR1[19:4]. The CCR1[3:0] bits are reset.

56.7.14 TIM12 capture/compare register 2 (TIM12_CCR2)

Address offset: 0x038

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCR2[19:16]			
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR2[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR2[19:0]**: Capture/compare 2 value

If channel CC2 is configured as output:

CCR2 is the value to be loaded in the actual capture/compare 2 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIMx_CCMR2 register (bit OC2PE). Else the preload value is copied in the active capture/compare 2 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx_CNT and signalled on tim_oc2 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value in CCR2[15:0]. The CCR2[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR2[19:4]. The CCR2[3:0] bitfield contains the dithered part.

If channel CC2 is configured as input:

CCR2 is the counter value transferred by the last input capture 1 event (tim_ic2). The TIMx_CCR2 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value in CCR2[15:0]. The CCR2[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR2[19:4]. The CCR2[3:0] bits are reset.

56.7.15 TIM12 timer input selection register (TIM12_TISEL)

Address offset: 0x05C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	TI2SEL[3:0]				Res.	Res.	Res.	Res.	TI1SEL[3:0]			
				rw	rw	rw	rw					rw	rw	rw	rw

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **TI2SEL[3:0]**: selects tim_ti2_in[15:0] input

0000: TIMx_CH2 input (tim_ti2_in0)

0001: tim_ti2_in1

...

0100: tim_ti2_in15

Refer to *Table 567: Interconnect to the tim_ti2 input multiplexer* for interconnects list.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **TI1SEL[3:0]**: selects tim_ti1_in[15:0] input

0000: TIMx_CH1 input (tim_ti1_in0)

0001: tim_ti1_in1

...

1111: tim_ti1_in15

Refer to *Table 566: Interconnect to the tim_ti1 input multiplexer* for interconnects list.

56.7.16 TIM12 hardware configuration 2 register (TIM12_HWCFGR2)

Address offset: 0x3EC

Reset value: 0x0000 1011

This read register identifies the hardware configuration parameters of the instantiated IP.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OPTIONREG_OUT[7:0]

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **OPTIONREG_OUT[7:0]**: Option register number (0 to 16).

Bits 15:8 **CNT_WIDTH[7:0]**: Counter width
0x08: 8-bits
0x10: 16-bits
0x20: 32-bits
Others: Reserved

Bits 7:4 **PSC_WIDTH16[3:0]**: Prescaler width
0x0: 7 (by power of 2) /8 (linear) -bit counter
0x1: 15 (by power of 2) /16 (linear) -bit counter
Others: Reserved

Bits 3:0 **PSC_LINEAR[3:0]**: Prescaler linear
0x0: prescaler by power of 2 (division by 1, 2, 4, 8...)
0x1: prescaler is linear (division by 1, 2, 3, 4, 5...)
Others: Reserved

56.7.17 TIM12 hardware configuration 1 register (TIM12_HWCFGR1)

Address offset: 0x3F0

Reset value: 0x1000 0102

This read register identifies the hardware configuration parameters of the instantiated IP.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CNT_DIR[3:0]				DMA_IMPL[3:0]				BK_IMPL[3:0]				ETR_IMPL[3:0]

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

56.8 TIM10/TIM11/TIM13/TIM14 registers

The peripheral registers have to be written by half-words (16 bits) or words (32 bits). Read accesses can be done by bytes (8 bits), half-words (16 bits), or words (32 bits).

56.8.1 TIMx control register 1 (TIMx_CR1)(x = 10, 11, 13, 14)

Address offset: 0x000

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DITHEN	UIFREMAP	Res.	CKD[1:0]		ARPE	Res.	Res.	Res.	OPM	URS	UDIS	CEN
			rw	rw		rw	rw	rw				rw	rw	rw	rw

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **DITHEN**: Dithering enable
0: Dithering disabled
1: Dithering enabled
Note: The DITHEN bit can only be modified when CEN bit is reset.

Bit 11 **UIFREMAP**: UIF status bit remapping
0: No remapping. UIF status bit is not copied to TIMx_CNT register bit 31.
1: Remapping enabled. UIF status bit is copied to TIMx_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division
This bitfield indicates the division ratio between the timer clock (tim_ker_ck) frequency and sampling clock used by the digital filters (tim_tix),
00: $t_{DTS} = t_{tim_ker_ck}$
01: $t_{DTS} = 2 \times t_{tim_ker_ck}$
10: $t_{DTS} = 4 \times t_{tim_ker_ck}$
11: Reserved

Bit 7 **ARPE**: Auto-reload preload enable
0: TIMx_ARR register is not buffered
1: TIMx_ARR register is buffered

Bits 6:4 Reserved, must be kept at reset value.

Bit 3 **OPM**: One-pulse mode
0: Counter is not stopped on the update event
1: Counter stops counting on the next update event (clearing the CEN bit).

Bit 2 **URS**: Update request source

This bit is set and cleared by software to select the update interrupt (UEV) sources.

0: Any of the following events generate an UEV if enabled:

– Counter overflow

– Setting the UG bit

1: Only counter overflow generates an UEV if enabled.

Bit 1 **UDIS**: Update disable

This bit is set and cleared by software to enable/disable update interrupt (UEV) event generation.

0: UEV enabled. An UEV is generated by one of the following events:

– Counter overflow

– Setting the UG bit.

Buffered registers are then loaded with their preload values.

1: UEV disabled. No UEV is generated, shadow registers keep their value (ARR, PSC, CCRx). The counter and the prescaler are reinitialized if the UG bit is set.

Bit 0 **CEN**: Counter enable

0: Counter disabled

1: Counter enabled

Note: External clock and gated mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.

56.8.2 TIMx interrupt enable register (TIMx_DIER)(x = 10, 11, 13, 14)

Address offset: 0x00C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CC1IE	UIE
														rw	rw

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **CC1IE**: Capture/Compare 1 interrupt enable

0: CC1 interrupt disabled

1: CC1 interrupt enabled

Bit 0 **UIE**: Update interrupt enable

0: Update interrupt disabled

1: Update interrupt enabled

56.8.3 TIMx status register (TIMx_SR)(x = 10, 11, 13, 14)

Address offset: 0x010

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	CC1OF	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CC1IF	UIF
						rc_w0								rc_w0	rc_w0

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **CC1OF**: Capture/Compare 1 overcapture flag

This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to 0.

0: No overcapture has been detected.

1: The counter value has been captured in TIMx_CCR1 register while CC1IF flag was already set

Bits 8:2 Reserved, must be kept at reset value.

Bit 1 **CC1IF**: Capture/compare 1 interrupt flag

This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIMx_CCR1 register (input capture mode only).

0: No compare match / No input capture occurred

1: A compare match or an input capture occurred.

If channel CC1 is configured as output: this flag is set when he content of the counter TIMx_CNT matches the content of the TIMx_CCR1 register. When the content of TIMx_CCR1 is greater than the content of TIMx_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in down-counting mode). There are 3 possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIMx_CR1 register for the full description.

If channel CC1 is configured as input: this bit is set when counter value has been captured in TIMx_CCR1 register (an edge has been detected on tim_ic1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIMx_CCER).

Bit 0 **UIF**: Update interrupt flag

This bit is set by hardware on an update event. It is cleared by software.

0: No update occurred.

1: Update interrupt pending. This bit is set by hardware when the registers are updated:

- At overflow and if UDIS = 0 in the TIMx_CR1 register.
- When CNT is reinitialized by software using the UG bit in TIMx_EGR register, if URS = 0 and UDIS = 0 in the TIMx_CR1 register.

56.8.4 TIMx event generation register (TIMx_EGR)(x = 10, 11, 13, 14)

Address offset: 0x014

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CC1G	UG
														w	w

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **CC1G**: Capture/compare 1 generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: A capture/compare event is generated on channel 1:
If channel CC1 is configured as output:
CC1IF flag is set, Corresponding interrupt or is sent if enabled.
If channel CC1 is configured as input:
The current value of the counter is captured in TIMx_CCR1 register. The CC1IF flag is set, the corresponding interrupt is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation

This bit can be set by software, it is automatically cleared by hardware.
0: No action
1: Re-initialize the counter and generates an update of the registers. Note that the prescaler counter is cleared too (anyway the prescaler ratio is not affected). The counter is cleared.

56.8.5 TIMx capture/compare mode register 1 (TIMx_CCMR1)(x = 10, 11, 13, 14)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function in input and in output mode.

Input capture mode:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IC1F[3:0]				IC1PSC[1:0]		CC1S[1:0]	
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **IC1F[3:0]**: Input capture 1 filter

This bitfield defines the frequency used to sample tim_ti1 input and the length of the digital filter applied to tim_ti1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at f_{DTS}
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Bits 3:2 **IC1PSC[1:0]**: Input capture 1 prescaler

This bitfield defines the ratio of the prescaler acting on CC1 input (tim_ic1).
The prescaler is reset as soon as CC1E = 0 (TIMx_CCER register).
00: no prescaler, capture is done each time an edge is detected on the capture input
01: capture is done once every 2 events
10: capture is done once every 4 events
11: capture is done once every 8 events

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC1 channel is configured as output
01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1
10: Reserved
11: Reserved

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx_CCER).

56.8.6 TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 10, 11, 13, 14)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function in input and in output mode.

Output compare mode:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OC1M [3]
															rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OC1M[2:0]			OC1PE	OC1FE	CC1S[1:0]	
									rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bits 15:7 Reserved, must be kept at reset value.

Bits 16, 6:4 **OC1M[3:0]**: Output compare 1 mode (refer to bit 16 for OC1M[3])

These bits define the behavior of the output reference signal tim_oc1ref from which tim_oc1 is derived. tim_oc1ref is active high whereas tim_oc1 active level depends on CC1P bit.

0000: Frozen. The comparison between the output compare register TIMx_CCR1 and the counter TIMx_CNT has no effect on the outputs. This mode can be used when the timer serves as a software timebase. When the frozen mode is enabled during timer operation, the output keeps the state (active or inactive) it had before entering the frozen state.

0001: Set channel 1 to active level on match. tim_oc1ref signal is forced high when the counter TIMx_CNT matches the capture/compare register 1 (TIMx_CCR1).

0010: Set channel 1 to inactive level on match. tim_oc1ref signal is forced low when the counter TIMx_CNT matches the capture/compare register 1 (TIMx_CCR1).

0011: Toggle - tim_oc1ref toggles when TIMx_CNT = TIMx_CCR1.

0100: Force inactive level - tim_oc1ref is forced low.

0101: Force active level - tim_oc1ref is forced high.

0110: PWM mode 1 - Channel 1 is active as long as TIMx_CNT < TIMx_CCR1 else inactive.

0111: PWM mode 2 - Channel 1 is inactive as long as TIMx_CNT < TIMx_CCR1 else active

Others: Reserved

Note: In PWM mode, the OCREF level changes when the result of the comparison changes, when the output compare mode switches from “frozen” mode to “PWM” mode and when the output compare mode switches from “force active/inactive” mode to “PWM” mode.

Bit 3 **OC1PE**: Output compare 1 preload enable

0: Preload register on TIMx_CCR1 disabled. TIMx_CCR1 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIMx_CCR1 enabled. Read/Write operations access the preload register. TIMx_CCR1 preload value is loaded in the active register at each update event.

Bit 2 **OC1FE**: Output compare 1 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIMx_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

0: CC1 behaves normally depending on counter and CCR1 values even when the trigger is ON. The minimum delay to activate CC1 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC1 output. OC is then set to the compare level independently of the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to 3 clock cycles. OC1FE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output.

01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1.

10: Reserved.

11: Reserved.

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx_CCER).

56.8.7 TIMx capture/compare enable register (TIMx_CCER)(x = 10, 11, 13, 14)

Address offset: 0x020

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CC1NP	Res.	CC1P	CC1E
												rw		rw	rw

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **CC1NP**: Capture/Compare 1 complementary output Polarity.

CC1 channel configured as output: CC1NP must be kept cleared.

CC1 channel configured as input: CC1NP bit is used in conjunction with CC1P to define tim_ti1fp1 polarity (refer to CC1P description).

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CC1P**: Capture/Compare 1 output Polarity.
0: tim_oc1 active high (output mode) / Edge sensitivity selection (input mode, see below)
1: tim_oc1 active low (output mode) / Edge sensitivity selection (input mode, see below)
When CC1 channel is configured as input, both CC1NP/CC1P bits select the active polarity of tim_ti1fp1 for capture operations.
CC1NP = 0, CC1P = 0: non-inverted/rising edge. The circuit is sensitive to tim_ti1fp1 rising edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode).
CC1NP = 0, CC1P = 1: inverted/falling edge. The circuit is sensitive to tim_ti1fp1 falling edge (capture or trigger operations in reset, external clock or trigger mode), tim_ti1fp1 is inverted (trigger operation in gated mode).
CC1NP = 1, CC1P = 1: non-inverted/both edges/ The circuit is sensitive to both tim_ti1fp1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), tim_ti1fp1 not inverted (trigger operation in gated mode).
CC1NP = 1, CC1P = 0: This configuration is reserved, it must not be used.

Bit 0 **CC1E**: Capture/Compare 1 output enable.
0: Capture mode disabled / tim_oc1 is not active
1: Capture mode enabled / tim_oc1 signal is output on the corresponding output pin

Table 574. Output control bit for standard tim_ocx channels

CCxE bit	tim_ocx output state
0	Output Disabled (tim_ocx = 0)
1	tim_ocx = tim_ocxref + Polarity

Note: The state of the external I/O pins connected to the standard tim_ocx channels depends on the tim_ocx channel state and the GPIO registers.

56.8.8 TIMx counter (TIMx_CNT)(x = 10, 11, 13, 14)

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UIF CPY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **UIFCPY**: UIF Copy

This bit is a read-only copy of the UIF bit in the TIMx_ISR register.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]**: Counter value

Non-dithering mode (DITHEN = 0)

The register holds the counter value.

Dithering mode (DITHEN = 1)

The register only holds the non-dithered part in CNT[15:0]. The fractional part is not available.

56.8.9 TIMx prescaler (TIMx_PSC)(x = 10, 11, 13, 14)

Address offset: 0x028

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PSC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **PSC[15:0]**: Prescaler value

The counter clock frequency tim_cnt_ck is equal to $f_{tim_psc_ck}$ / (PSC[15:0] + 1).

PSC contains the value to be loaded in the active prescaler register at each update event.

(including when the counter is cleared through UG bit of TIMx_EGR register or through trigger controller when configured in “reset mode”).

56.8.10 TIMx autoreload register (TIMx_ARR)(x = 10, 11, 13, 14)

Address offset: 0x02C

Reset value: 0x0000 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ARR[19:16]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **ARR[19:0]**: Auto-reload value

ARR is the value to be loaded in the actual auto-reload register.

Refer to the *Section 56.4.3: Time-base unit* for more details about ARR update and behavior.

The counter is blocked while the auto-reload value is null.

Non-dithering mode (DITHEN = 0)

The register holds the auto-reload value in ARR[15:0]. The ARR[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in ARR[19:4]. The ARR[3:0] bitfield contains the dithered part.

56.8.11 TIMx capture/compare register 1 (TIMx_CCR1)(x = 10, 11, 13, 14)

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCR1[19:16]			
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR1[19:0]**: Capture/compare 1 value

If channel CC1 is configured as output:

CCR1 is the value to be loaded in the actual capture/compare 1 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIMx_CCMR1 register (bit OC1PE). Else the preload value is copied in the active capture/compare 1 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIMx_CNT and signaled on tim_oc1 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value in CCR1[15:0]. The CCR1[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR1[19:4]. The CCR1[3:0] bitfield contains the dithered part.

If channel CC1 is configured as input:

CR1 is the counter value transferred by the last input capture 1 event (tim_ic1). The TIMx_CCR1 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value in CCR1[15:0]. The CCR1[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR1[19:4]. The CCR1[3:0] bits are reset.

56.8.12 TIMx timer input selection register (TIMx_TISEL)(x = 10, 11, 13, 14)

Address offset: 0x05C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TI1SEL[3:0]			
												rw	rw	rw	rw

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **TI1SEL[3:0]**: selects tim_ti1_in[15:0] input
0000: TIMx_CH1 input (tim_ti1_in0)
0001: tim_ti1_in1
...
1111: tim_ti1_in15
Refer to *Table 566: Interconnect to the tim_ti1 input multiplexer* for interconnects list.

56.8.13 TIMx hardware configuration 2 register (TIMx_HWCFGR2) (x = 10, 11, 13, 14)

Address offset: 0x3EC

Reset value: 0x0000 1011

This read register identifies the hardware configuration parameters of the instantiated IP.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OPTIONREG_OUT[7:0]

CNT_WIDTH[7:0]								PSC_WIDTH16[3:0]				PSC_LINEAR[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **OPTIONREG_OUT[7:0]**: Option register number (0 to 16).

Bits 15:8 **CNT_WIDTH[7:0]**: Counter width
0x08: 8-bits
0x10: 16-bits
0x20: 32-bits
Others: Reserved

Bits 7:4 **PSC_WIDTH16[3:0]**: Prescaler width
0x0: 7 (by power of 2) /8 (linear) -bit counter
0x1: 15 (by power of 2) /16 (linear) -bit counter
Others: Reserved

Bits 3:0 **PSC_LINEAR[3:0]**: Prescaler linear
0x0: prescaler by power of 2 (division by 1, 2, 4, 8...)
0x1: prescaler is linear (division by 1, 2, 3, 4, 5...)
Others: Reserved

56.8.14 TIMx hardware configuration 1 register (TIMx_HWCFGR1) (x = 10, 11, 13, 14)

Address offset: 0x3F0

Reset value: 0x1000 0001

This read register identifies the hardware configuration parameters of the instantiated IP.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:28 **CNT_DIR[3:0]**: Counter direction
- 0x0: Down-counter only
- 0x1: Up-counter only
- 0x2: Up/Down counter allowing center-aligned mode
- Others: Reserved

Bits 27:24 **DMA_IMPL[3:0]**: DMA features implementation
- 0x0: DMA requests are not possible
- 0x1: Single DMA requests possible
- 0x2: All DMA features implemented
- Others: Reserved

Bits 23:20 **BK_IMPL[3:0]**: Break circuit implementation
- 0x0: no break implemented
- 0x1: break1 implemented without filter (tim_brk + tim_sys_brk connected)
- 0x2: break1 implemented with filter (tim_brk + tim_sys_brk connected)
- 0x3: break 1 and 2 implemented (tim_brk + tim_sys_brk + brk2)
- Others: Reserved

Bits 19:16 **ETR_IMPL[3:0]**: External trigger implementation
- 0x0: External trigger circuit not implemented, ocrefx cleared by ocref_clr input
- 0x1: External trigger circuit implemented, ocrefx cleared by ocref_clr input
- 0x2: External trigger circuit implemented, ocrefx cleared by etrf signal
- 0x3: External trigger circuit implemented, ocrefx cleared by ocref_clr or etrf (1 control bit "OCCS" added in GPT_SMCR)
- Others: Reserved

Bits 15:12 **RCR_IMPL[3:0]**: Repetition counter implementation
- 0x0: repetition counter not implemented
- 0x1: 8-bit repetition counter implemented
- 0x2: 16-bit repetition counter implemented
- Others: Reserved

Bits 11:8 **NB_OF_SM[3:0]**: Number of synchronization module
0x0: synchronization module not implemented
0x1: 1 synchronization module implemented
Others: Reserved

Bits 7:4 **NB_OF_DT[3:0]**: Number of complementary outputs and dead-time generators
0x0
0x1
0x2
0x3
0x4
Others: Reserved

Bits 3:0 **NB_OF_CC[3:0]**: Number of capture / compare channel
0x0: no capture/compare channel implemented
0x1: only CC1 channel is implemented
0x2: CC1 and CC2 channels are implemented
0x3: CC1, CC2 and CC3 channels are implemented
0x4: CC1, CC2, CC3 and CC4 channels are implemented
0x5: CC1, CC2, CC3, CC4 and CC5 channels are implemented
0x6: CC1, CC2, CC3, CC4, CC5 and CC6 channels are implemented
Others: Reserved

56.8.15 TIMx IP version register (TIMx_VERR)(x = 10, 11, 13, 14)

Address offset: 0x3F4

Reset value: 0x0000 0043

57 General purpose timers (TIM15/TIM16/TIM17)

57.1 TIM15/TIM16/TIM17 introduction

The TIM15/TIM16/TIM17 timers consist of a 16-bit autoreload counter driven by a programmable prescaler.

They may be used for a variety of purposes, including measuring the pulse lengths of input signals (input capture) or generating output waveforms (output compare, PWM, complementary PWM with dead-time insertion).

Pulse lengths and waveform periods can be modulated from a few microseconds to several milliseconds using the timer prescaler and the RCC clock controller prescalers.

The TIM15/TIM16/TIM17 timers are completely independent, and do not share any resources. TIM15 can be synchronized as described in *Section 57.4.26: Timer synchronization (TIM15 only)*.

57.2 TIM15 main features

TIM15 includes the following features:

- 16-bit autoreload upcounter
- 16-bit programmable prescaler used to divide (also “on the fly”) the counter clock frequency by any factor between 1 and 65535
- Up to two independent channels for:
  - Input capture
  - Output compare
  - PWM generation (edge mode)
  - One-pulse mode output
- Complementary outputs with programmable dead-time (for channel 1 only)
- Synchronization circuit to control the timer with external signals and to interconnect several timers together
- Repetition counter to update the timer registers only after a given number of cycles of the counter
- Break input to put the timer’s output signals in the reset state or a known state
- Interrupt/DMA generation on the following events:
  - Update: counter overflow counter initialization (by software or internal/external trigger)
  - Trigger event (counter start, stop, initialization, or count by internal/external trigger)
  - Input capture
  - Output compare
  - Break input (interrupt request)

57.3 TIM16/TIM17 main features

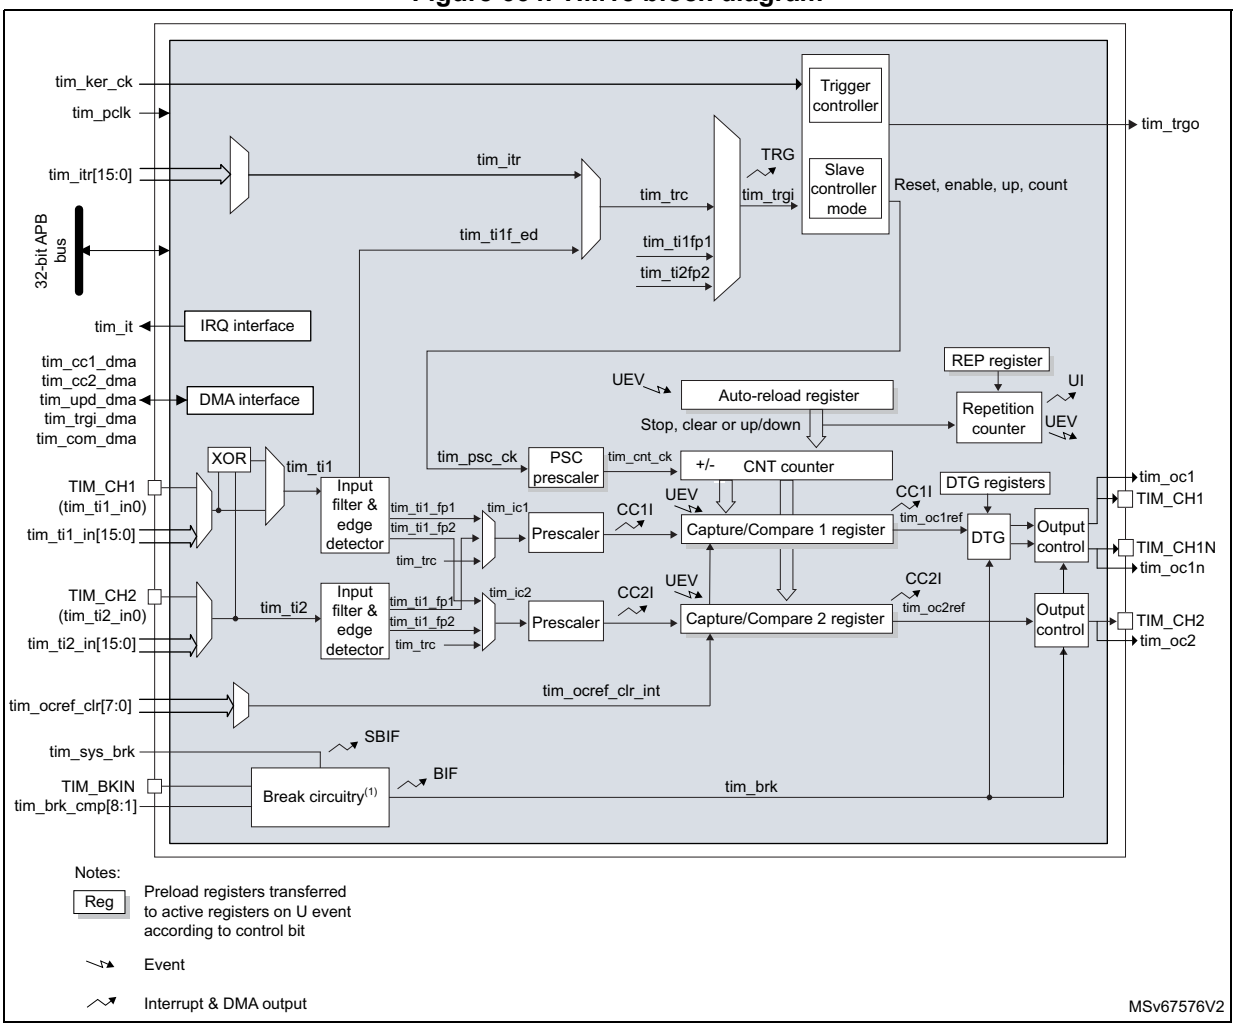
The TIM16/TIM17 timers include the following features:

- 16-bit autoreload upcounter
- 16-bit programmable prescaler used to divide (also “on the fly”) the counter clock frequency by any factor between 1 and 65535
- One channel for:
  - Input capture
  - Output compare
  - PWM generation (edge-aligned mode)
  - One-pulse mode output
- Complementary outputs with programmable dead-time
- Repetition counter to update the timer registers only after a given number of cycles of the counter
- Break input to put the timer’s output signals in the reset state or a known state
- Interrupt/DMA generation on the following events:
  - Update: counter overflow
  - Input capture
  - Output compare
  - Break input

57.4 TIM15/TIM16/TIM17 functional description

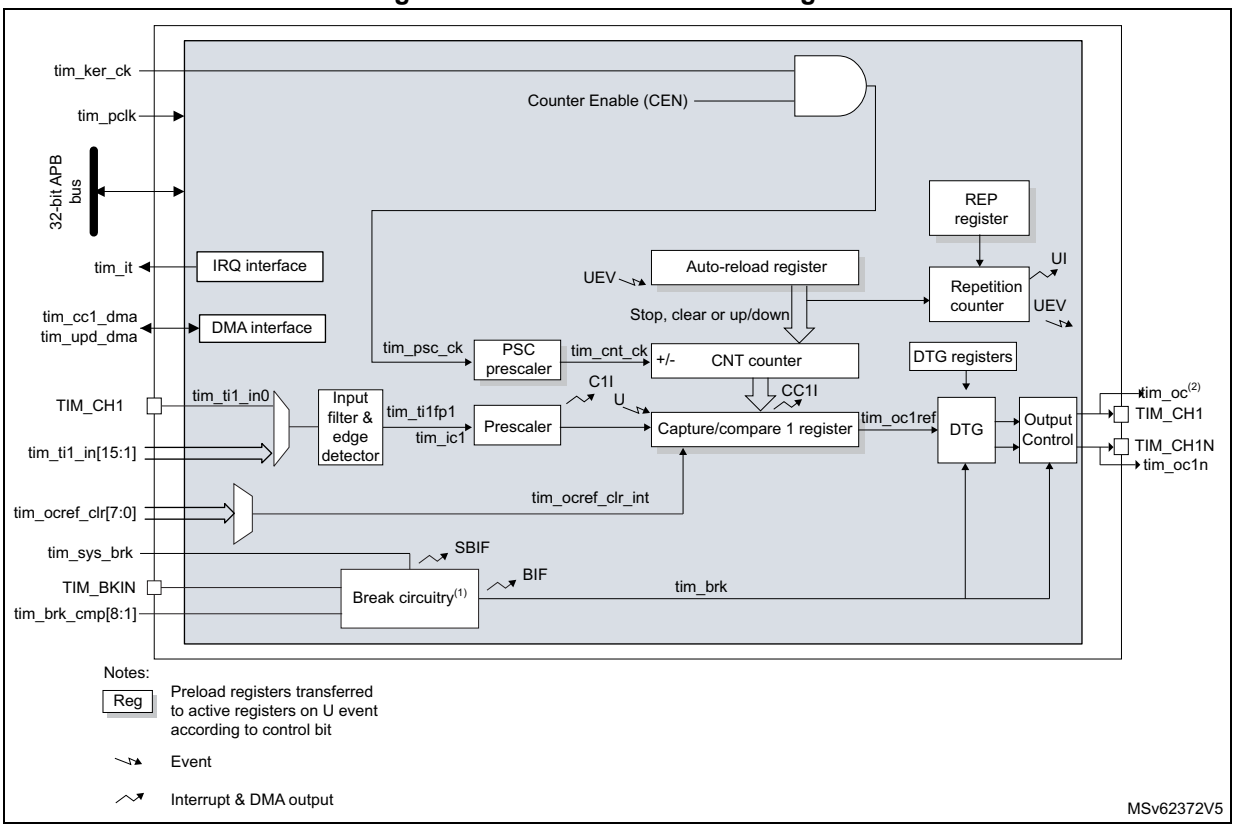
57.4.1 Block diagram

Figure 664. TIM15 block diagram



1. Refer to *Section 57.4.15: Using the break function* for details.

Figure 665. TIM16/TIM17 block diagram



1. Refer to *Section 57.4.15: Using the break function* for details.
2. This signal can be used as trigger for some slave timer (see internal trigger connection table in next section). See *Section 57.4.27: Using timer output as trigger for other timers (TIM16/TIM17 only)* for details.

57.4.2 TIM15/TIM16/TIM17 pins and internal signals

Table 576 and *Table 577* in this section summarize the TIM inputs and outputs.

Table 576. TIM input/output pins

Pin name	Signal type	Description
TIM_CH1 TIM_CH2(1)	Input/Output	Timer multi-purpose channels. Each channel be used for capture, compare, or PWM. TIM_CH1 and TIM_CH2 can also be used as external clock (below 1/4 of the tim_ker_ck clock) and external trigger inputs.
TIM_CH1N	Output	Timer complementary outputs, derived from TIM_CH1 output with the possibility to have deadtime insertion.
TIM_BKIN	Input / Output	Break input. This input can also be configured in bidirectional mode.

1. Available for TIM15 only.

Table 577. TIM internal input/output signals

Internal signal name	Signal type	Description
tim_ti1_in[15:0] tim_ti2_in[15:0](1)	Input	Internal timer inputs bus. These inputs can be used for capture or as external clock (below 1/4 of the tim_ker_ck clock).
tim_itr[15:0](1)	Input	Internal trigger input bus. These inputs can be used for the slave mode controller or as a input clock (below 1/4 of the tim_ker_ck clock).
tim_trgo(1)	Output	Internal trigger output. This trigger can trigger other on-chip peripherals.
tim_ocref_clr[7:0]	Input	Timer tim_ocref_clr input bus. These inputs can be used to clear the tim_ocxref signals, typically for hardware cycle-by-cycle pulsewidth control.
tim_brk_cmp[8:1]	Input	Break input for internal signals
tim_sys_brk[n:0]	Input	System break input. This input gathers the MCU's system level errors.
tim_pclk	Input	Timer APB clock
tim_ker_ck	Input	Timer kernel clock. This clock must be synchronous with tim_pclk (derived from the same source). The clock ratio tim_ker_ck/tim_pclk must be an integer:1, 2, 3,..., 16 (maximum value)
tim_it	Output	Global Timer interrupt, gathering capture/compare, update, break trigger and commutation requests
tim_cc1_dma	Output	Timer capture / compare 1 dma request
tim_cc2_dma	Output	Timer capture / compare 2 dma request
tim_upd_dma	Output	Timer update dma request
tim_trgi_dma	Output	Timer trigger dma request
tim_com_dma	Output	Timer commutation dma request

1. Available for TIM15 only.

57.4.3 Time-base unit

The main block of the programmable advanced-control timer is a 16-bit upcounter with its related autoreload register. The counter clock can be divided by a prescaler.

The counter, the autoreload register and the prescaler register can be written or read by software. This is true even when the counter is running.

The time-base unit includes:

- Counter register (TIMx_CNT)
- Prescaler register (TIMx_PSC)
- Autoreload register (TIMx_ARR)
- Repetition counter register (TIMx_RCR)

The autoreload register is preloaded. Writing to or reading from the autoreload register accesses the preload register. The content of the preload register is transferred into the shadow register permanently or at each update event (UEV), depending on the autoreload preload enable bit (ARPE) in TIMx_CR1 register. The update event is sent when the counter reaches the overflow and if the UDIS bit equals 0 in the TIMx_CR1 register. It can also be generated by software. The generation of the update event is described in detailed for each configuration.

The counter is clocked by the prescaler output tim_cnt_ck, which is enabled only when the counter enable bit (CEN) in TIMx_CR1 register is set (refer also to the slave mode controller description to get more details on counter enabling).

Note that the counter starts counting one clock cycle after setting the CEN bit in the TIMx_CR1 register.

Prescaler description

The prescaler can divide the counter clock frequency by any factor between 1 and 65536. It is based on a 16-bit counter controlled through a 16-bit register (in the TIMx_PSC register). It can be changed on the fly as this control register is buffered. The new prescaler ratio is taken into account at the next update event.

Table 676 and *Table 667* give some examples of the counter behavior when the prescaler ratio is changed on the fly:

Figure 666. Counter timing diagram with prescaler division change from 1 to 2

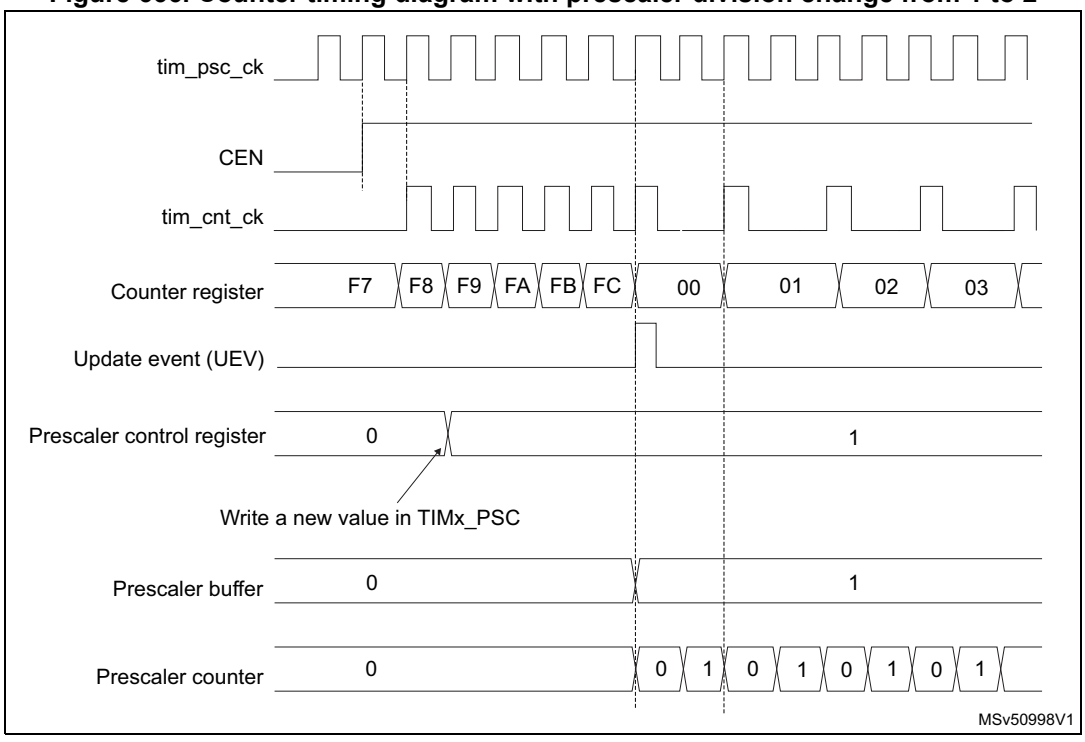

Figure 667. Counter timing diagram with prescaler division change from 1 to 4

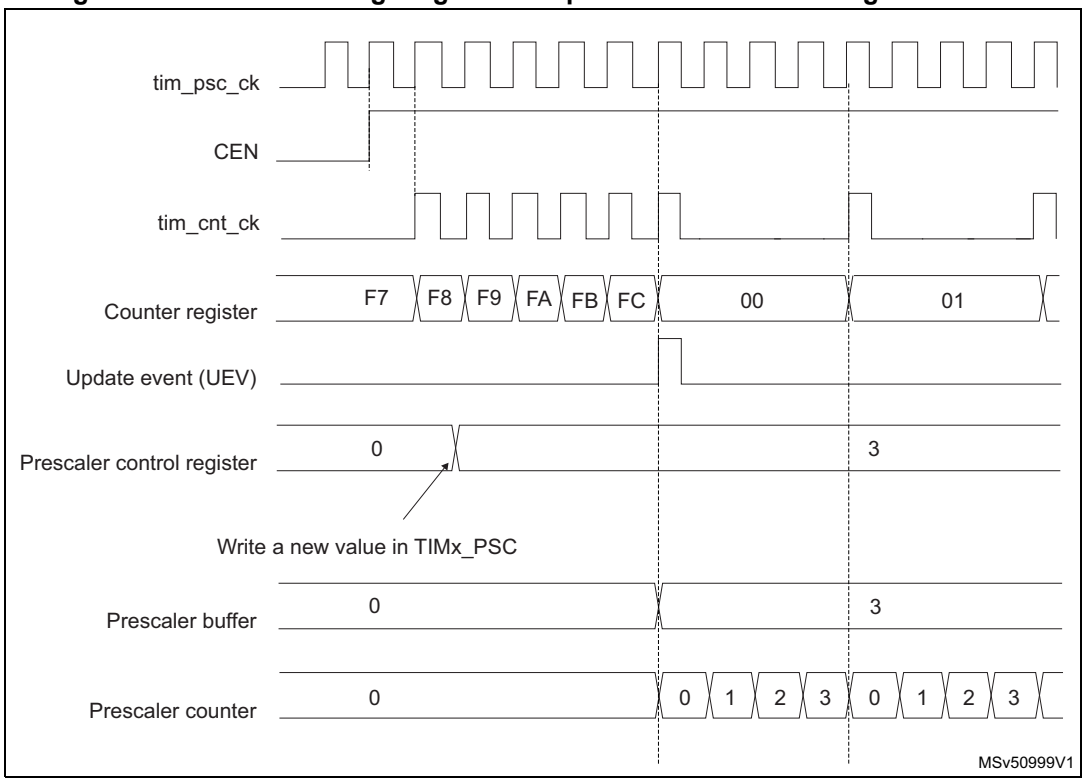

57.4.4 Counter modes

Upcounting mode

In upcounting mode, the counter counts from 0 to the autoreload value (content of the TIMx_ARR register), then restarts from 0 and generates a counter overflow event.

If the repetition counter is used, the update event (UEV) is generated after upcounting is repeated for the number of times programmed in the repetition counter register (TIMx_RCR). Else the update event is generated at each counter overflow.

Setting the UG bit in the TIMx_EGR register (by software or by using the slave mode controller) also generates an update event.

The UEV event can be disabled by software by setting the UDIS bit in the TIMx_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter restarts from 0, as well as the counter of the prescaler (but the prescale rate does not change). In addition, if the URS bit (update request selection) in TIMx_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIMx_SR register) is set (depending on the URS bit):

- The repetition counter is reloaded with the content of TIMx_RCR register,
- The autoreload shadow register is updated with the preload value (TIMx_ARR),
- The buffer of the prescaler is reloaded with the preload value (content of the TIMx_PSC register).

The following figures show some examples of the counter behavior for different clock frequencies when TIMx_ARR = 0x36.

Figure 668. Counter timing diagram, internal clock divided by 1

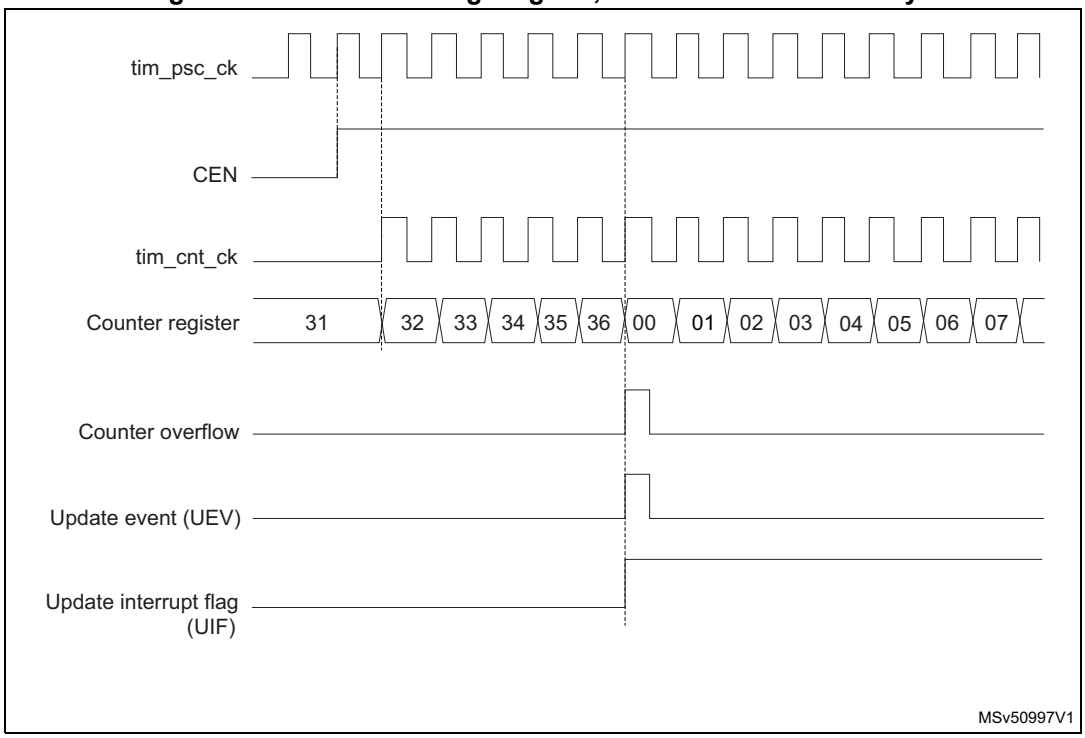

Figure 669. Counter timing diagram, internal clock divided by 2

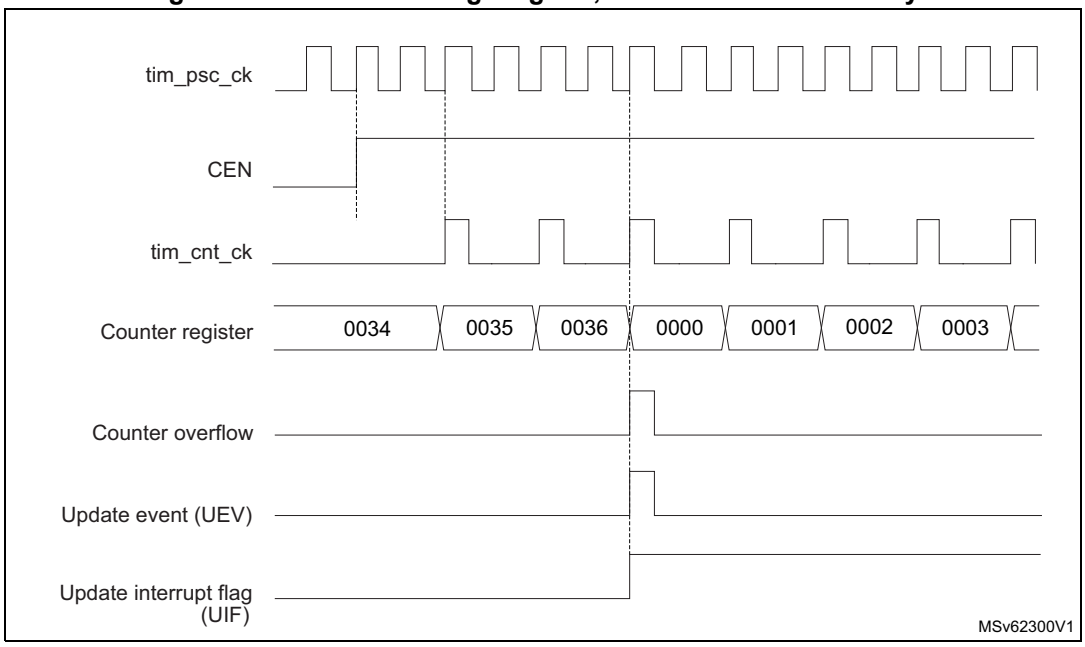

Figure 670. Counter timing diagram, internal clock divided by 4

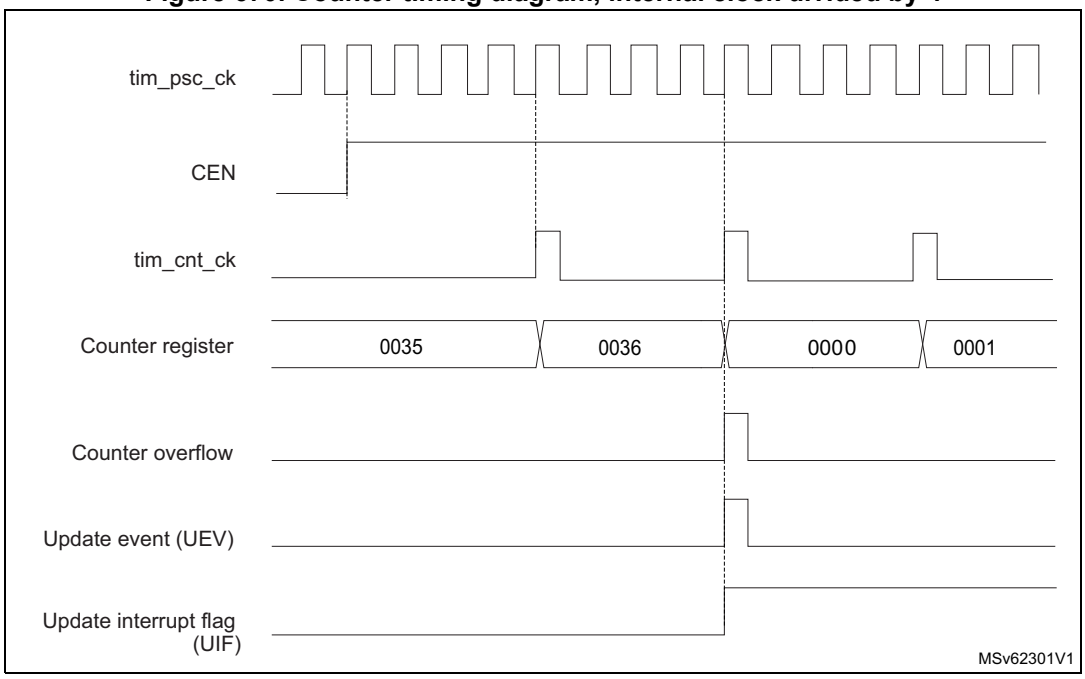

Figure 671. Counter timing diagram, internal clock divided by N

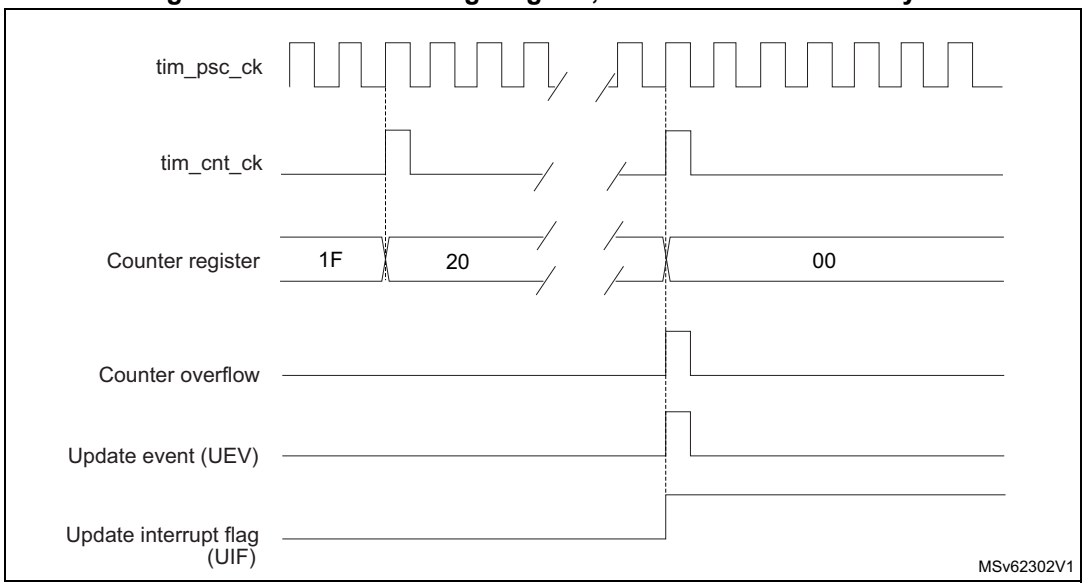

Figure 672. Counter timing diagram, update event when ARPE = 0 (TIMx_ARR not preloaded)

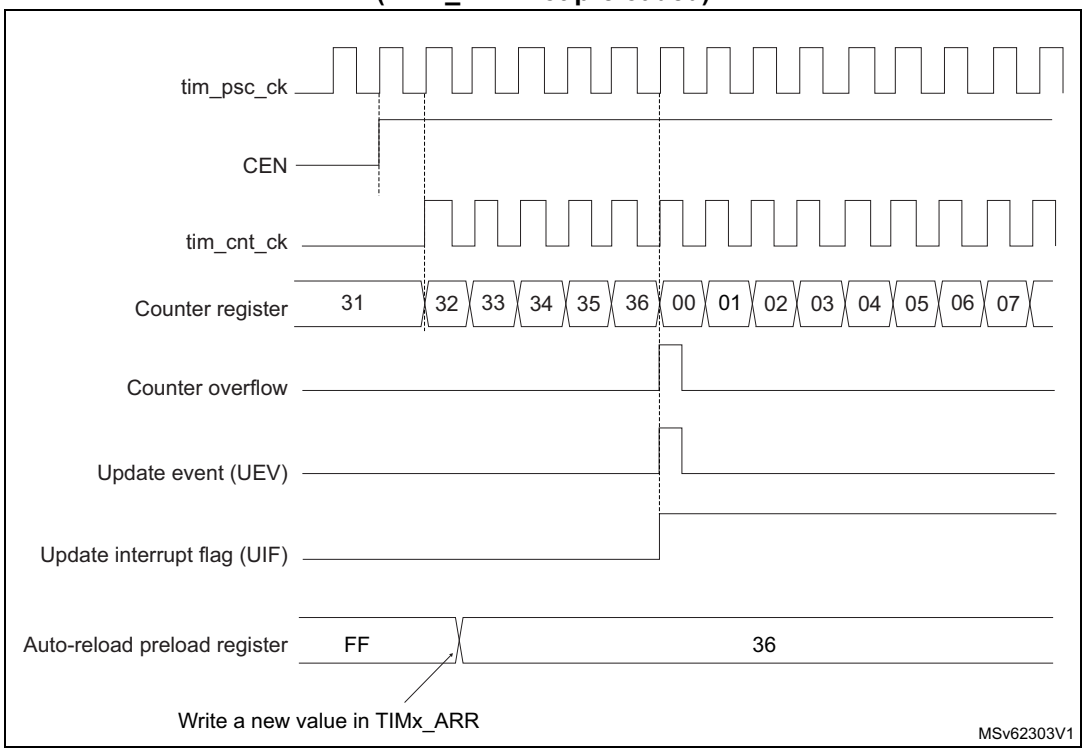

Figure 673. Counter timing diagram, update event when ARPE = 1 (TIMx_ARR preloaded)

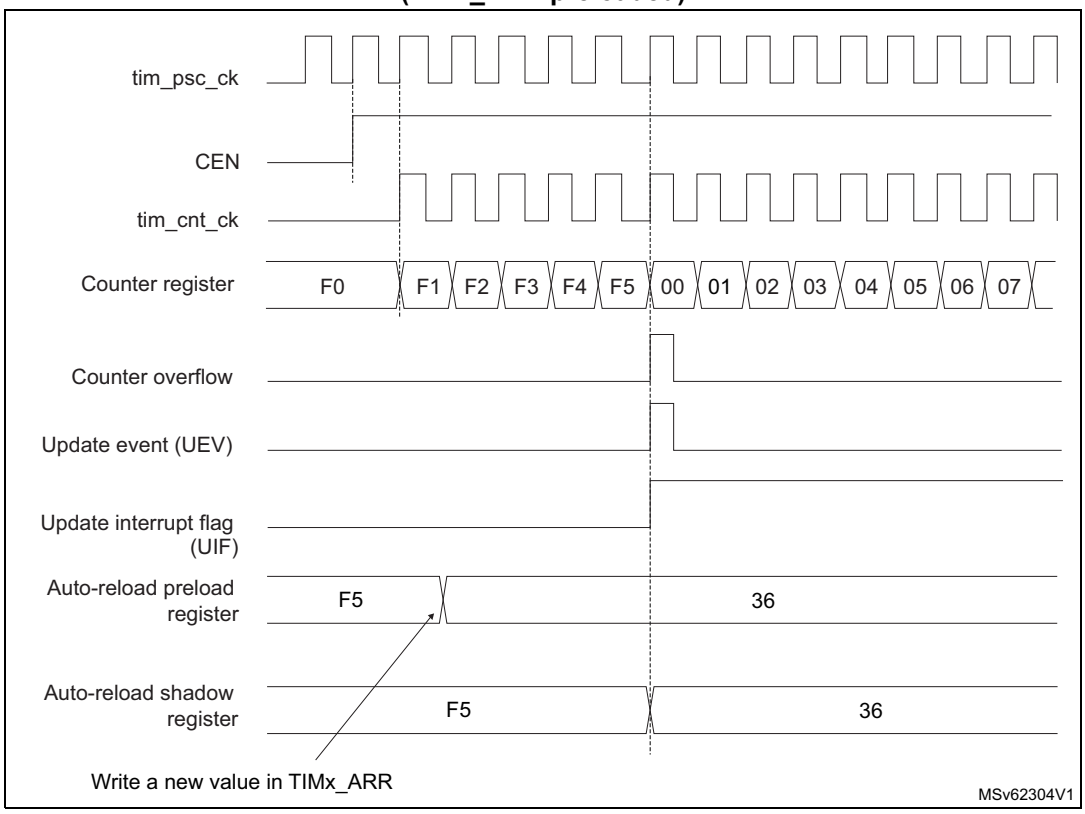


57.4.5 Repetition counter

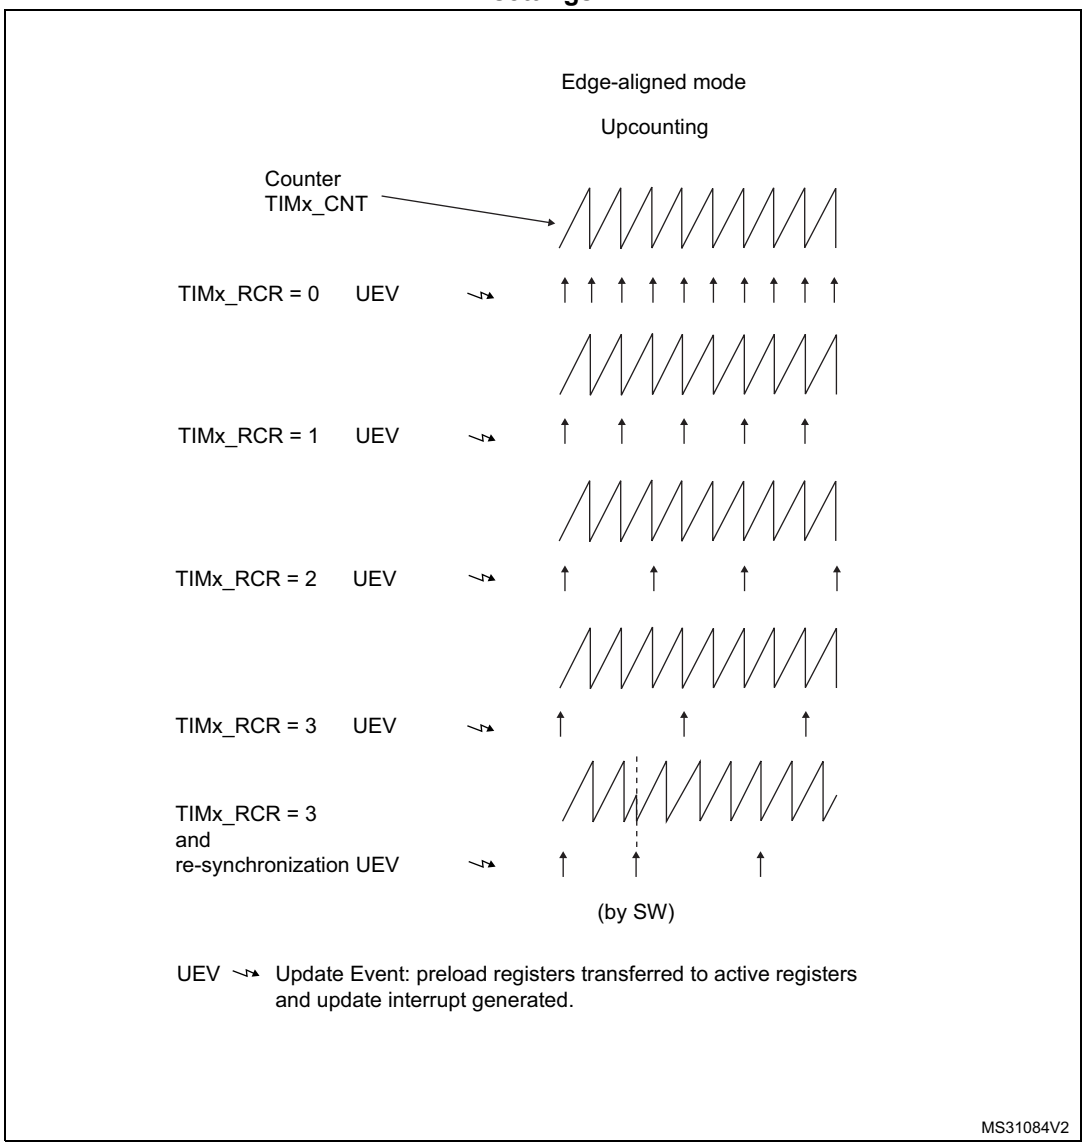
Section 57.4.3: Time-base unit describes how the update event (UEV) is generated with respect to the counter overflows. It is actually generated only when the repetition counter has reached zero. This can be useful when generating PWM signals.

This means that data are transferred from the preload registers to the shadow registers (TIMx_ARR autoreload register, TIMx_PSC prescaler register, but also TIMx_CCRx capture/compare registers in compare mode) every N counter overflows, where N is the value in the TIMx_RCR repetition counter register.

The repetition counter is decremented at each counter overflow.

The repetition counter is an autoreload type; the repetition rate is maintained as defined by the TIMx_RCR register value (refer to *Figure 674*). When the update event is generated by software (by setting the UG bit in TIMx_EGR register) or by hardware through the slave mode controller, it occurs immediately whatever the value of the repetition counter is and the repetition counter is reloaded with the content of the TIMx_RCR register.

Figure 674. Update rate examples depending on mode and TIMx_RCR register settings



57.4.6 Clock selection

The counter clock can be provided by the following clock sources:

- Internal clock (tim_ker_ck)
- External clock mode1: external input pin (tim_ti1 or tim_ti2, if available)
- Internal trigger inputs (tim_itrx) (only for TIM15): using one timer as the prescaler for another timer, for example, TIM1 can be configured to act as a prescaler for TIM15. Refer to *Using one timer as prescaler for another timer* for more details.

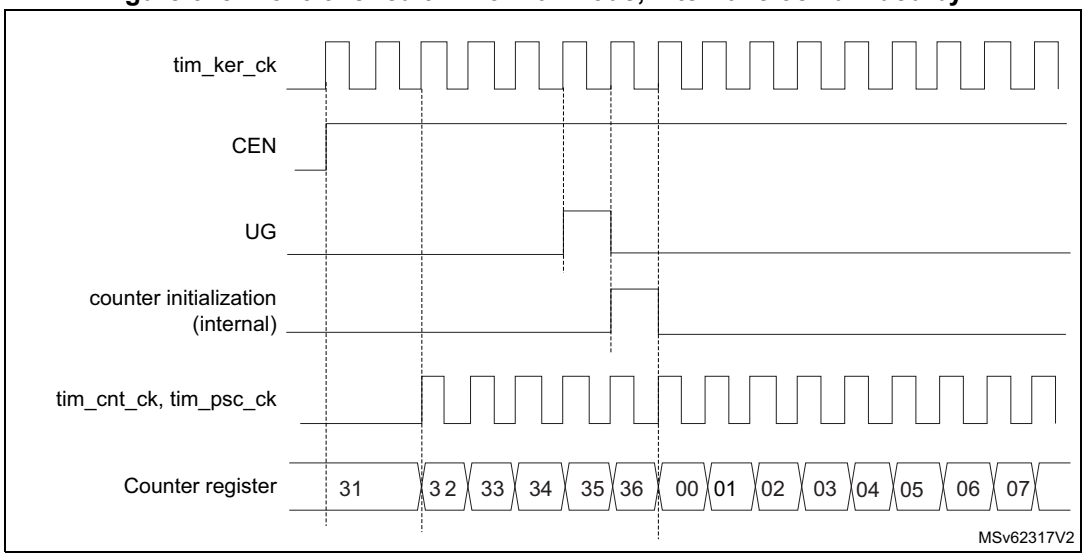
Internal clock source (tim_ker_ck)

If the slave mode controller is disabled (SMS = 000), then the CEN (in the TIMx_CR1 register) and UG bits (in the TIMx_EGR register) are actual control bits and can be changed

only by software (except UG which remains cleared automatically). As soon as the CEN bit is written to 1, the prescaler is clocked by the internal clock tim_ker_ck.

Figure 675 shows the behavior of the control circuit and the upcounter in normal mode, without prescaler.

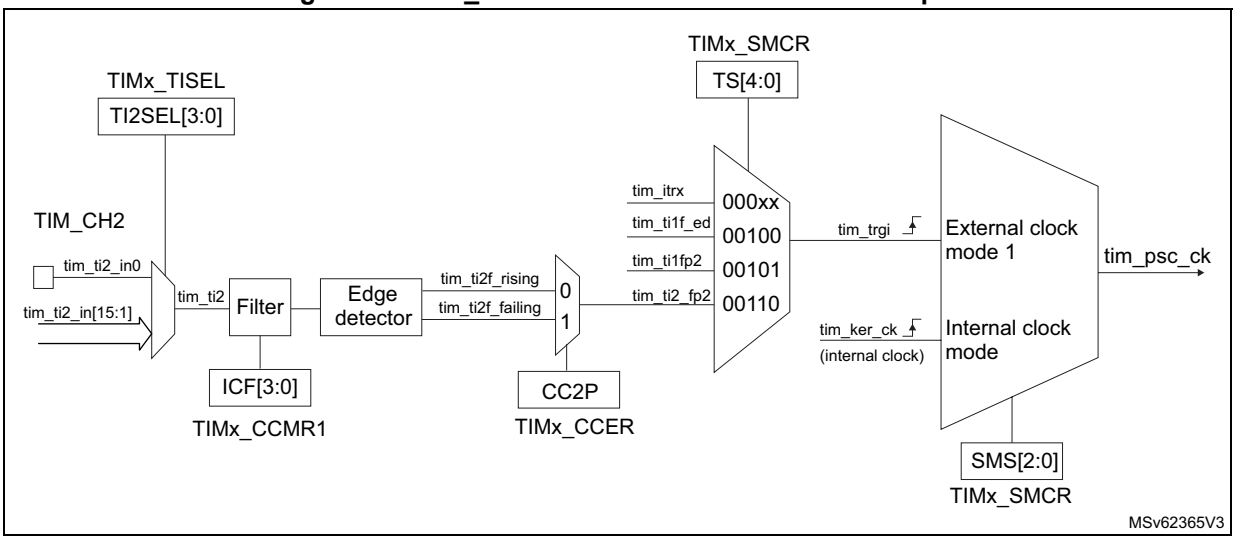
Figure 675. Control circuit in normal mode, internal clock divided by 1



External clock source mode 1

This mode is selected when SMS = 111 in the TIMx_SMCR register. The counter can count at each rising or falling edge on a selected input.

Figure 676. tim_ti2 external clock connection example



For example, to configure the upcounter to count in response to a rising edge on the tim_ti2 input, use the following procedure:

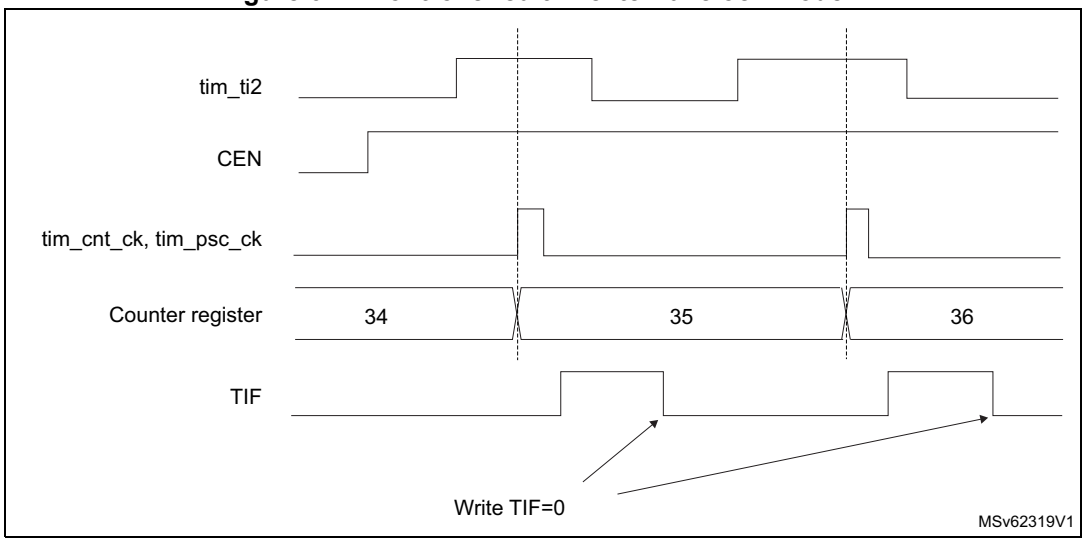
1. Select the proper tim_ti2_in[15:0] source (internal or external) with the TI2SEL[3:0] bits in the TIMx_TISEL register.
2. Configure channel 2 to detect rising edges on the tim_ti2 input by writing CC2S = 01 in the TIMx_CCMR1 register.
3. Configure the input filter duration by writing the IC2F[3:0] bits in the TIMx_CCMR1 register (if no filter is needed, keep IC2F = 0000).
4. Select rising edge polarity by writing CC2P = 0 in the TIMx_CCER register.
5. Configure the timer in external clock mode 1 by writing SMS = 111 in the TIMx_SMCR register.
6. Select tim_ti2 as the trigger input source by writing TS = 00110 in the TIMx_SMCR register.
7. Enable the counter by writing CEN = 1 in the TIMx_CR1 register.

Note: The capture prescaler is not used for triggering, it is not necessary to configure it.

When a rising edge occurs on tim_ti2, the counter counts once and the TIF flag is set.

The delay between the rising edge on tim_ti2 and the actual clock of the counter is due to the resynchronization circuit on tim_ti2 input.

Figure 677. Control circuit in external clock mode 1



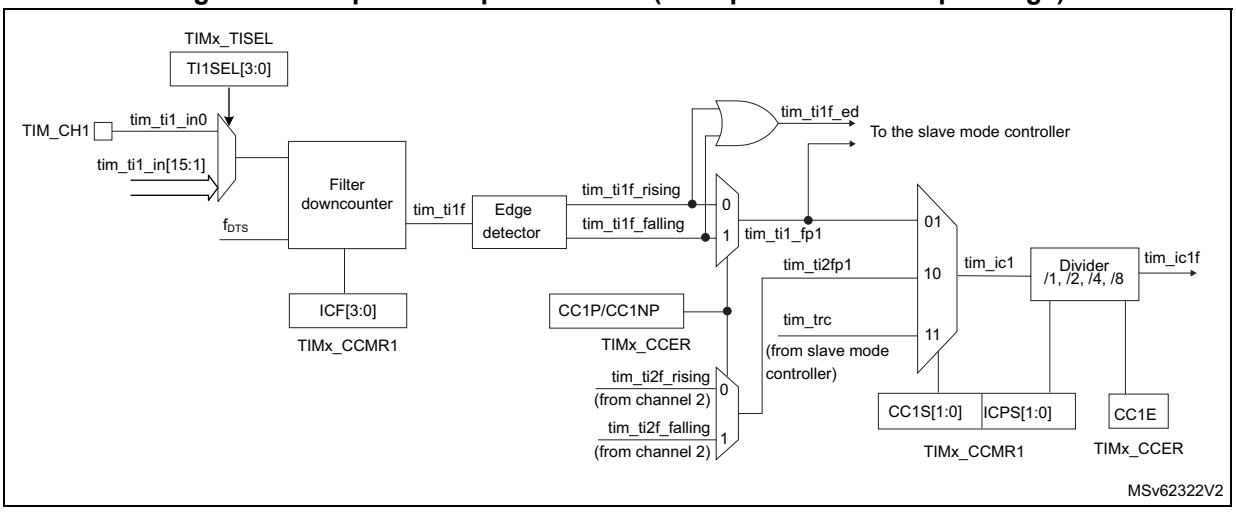
57.4.7 Capture/compare channels

Each Capture/Compare channel is built around a capture/compare register (including a shadow register), a input stage for capture (with digital filter, multiplexing and prescaler) and an output stage (with comparator and output control).

Figure 678 to *Figure 681* give an overview of one Capture/Compare channel.

The input stage samples the corresponding tim_tix input to generate a filtered signal tim_tixf. Then, an edge detector with polarity selection generates a signal (tim_tixfpy) which can be used as trigger input by the slave mode controller or as the capture command. It is prescaled before the capture register (ICxPS).

Figure 678. Capture/compare channel (example: channel 1 input stage)



The output stage generates an intermediate waveform which is then used for reference: tim_ocxref (active high). The polarity acts at the end of the chain.

Figure 679. Capture/compare channel 1 main circuit

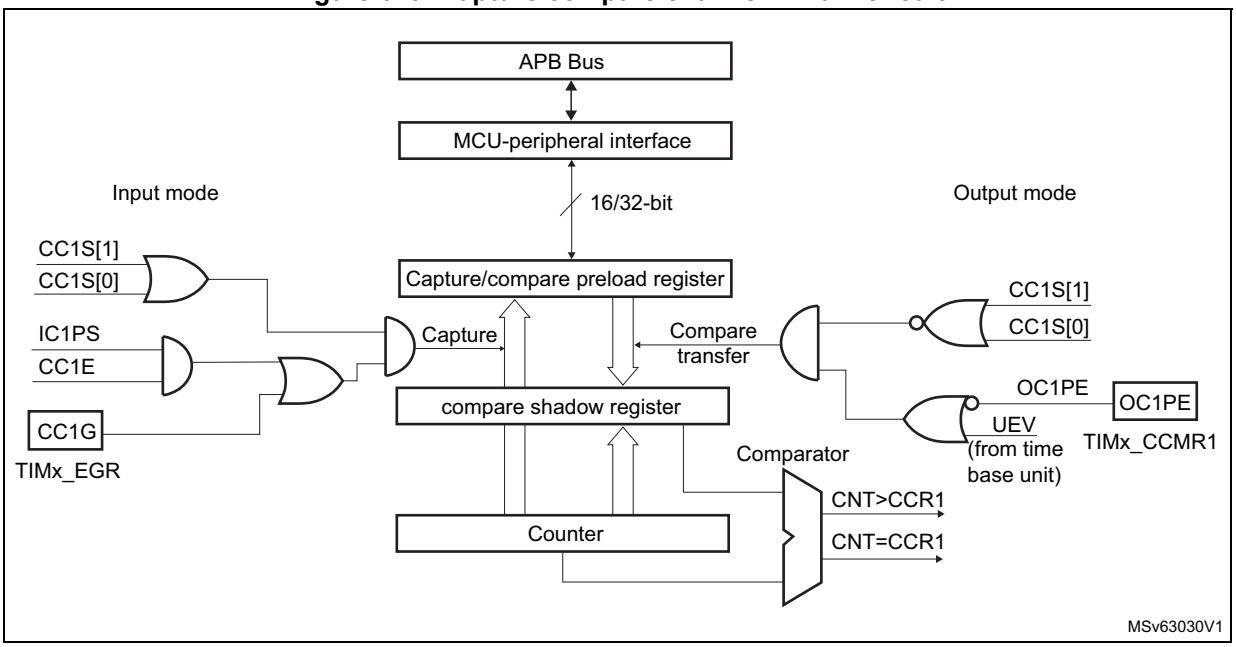


Figure 680. Output stage of capture/compare channel (channel 1)

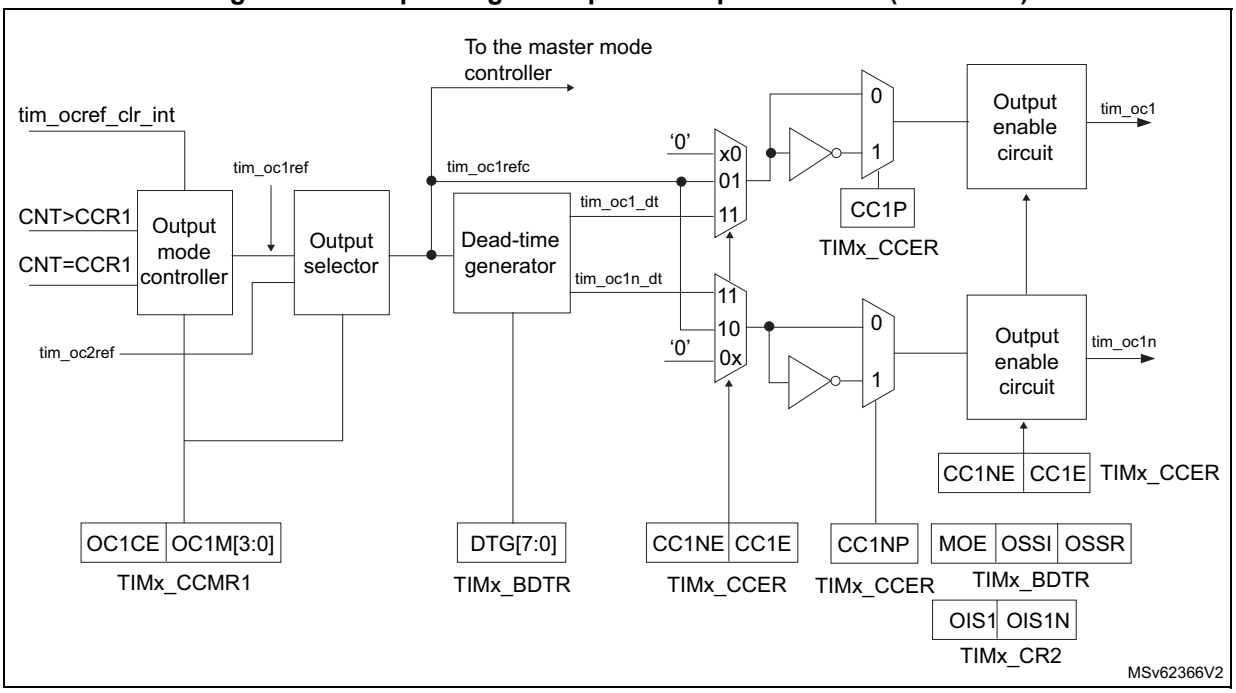

Figure 681. Output stage of capture/compare channel (channel 2 for TIM15)

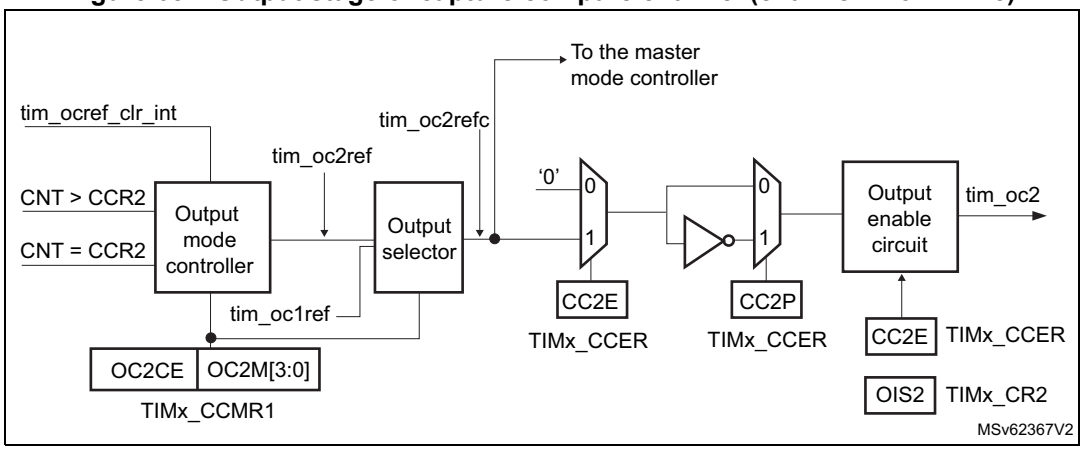


The capture/compare block is made of one preload register and one shadow register. Write and read always access the preload register.

In capture mode, captures are actually done in the shadow register, which is copied into the preload register.

In compare mode, the content of the preload register is copied into the shadow register which is compared to the counter.

57.4.8 Input capture mode

In Input capture mode, the capture/compare registers (TIMx_CCRx) are used to latch the value of the counter after a transition detected by the corresponding tim_icx signal. When a capture occurs, the corresponding CCXIF flag (TIMx_SR register) is set and an interrupt or a DMA request can be sent if they are enabled. If a capture occurs while the CCxIF flag was

already high, then the overcapture flag CCxOF (TIMx_SR register) is set. CCxIF can be cleared by software by writing it to 0 or by reading the captured data stored in the TIMx_CCRx register. CCxOF is cleared when it is written with 0.

The following example shows how to capture the counter value in TIMx_CCR1 when tim_ti1 input rises. To do this, use the following procedure:

1. Select the proper tim_ti1_in[15:1] source (internal or external) with the TI1SEL[3:0] bits in the TIMx_TISEL register.
2. Select the active input: TIMx_CCR1 must be linked to the tim_ti1 input, so write the CC1S bits to 01 in the TIMx_CCMR1 register. As soon as CC1S becomes different from 00, the channel is configured in input, and the TIMx_CCR1 register becomes read-only.
3. Program the appropriate input filter duration in relation with the signal connected to the timer (when the input is one of the tim_tix (ICxF bits in the TIMx_CCMRx register). Let's imagine that, when toggling, the input signal is not stable during at least 5 internal clock cycles. The user must program a filter duration longer than these five clock cycles. The user can validate a transition on tim_ti1 when eight consecutive samples with the new level have been detected (sampled at f_{DTS} frequency). Then write IC1F bits to 0011 in the TIMx_CCMR1 register.
4. Select the edge of the active transition on the tim_ti1 channel by writing CC1P bit to 0 in the TIMx_CCER register (rising edge in this case).
5. Program the input prescaler. In this example, the user wants the capture to be performed at each valid transition, so the prescaler is disabled (write IC1PS bits to 00 in the TIMx_CCMR1 register).
6. Enable capture from the counter into the capture register by setting the CC1E bit in the TIMx_CCER register.
7. If needed, enable the related interrupt request by setting the CC1IE bit in the TIMx_DIER register, and/or the DMA request by setting the CC1DE bit in the TIMx_DIER register.

When an input capture occurs:

- The TIMx_CCR1 register gets the value of the counter on the active transition.
- CC1IF flag is set (interrupt flag). CC1OF is also set if at least two consecutive captures occurred whereas the flag was not cleared.
- An interrupt is generated depending on the CC1IE bit.
- A DMA request is generated depending on the CC1DE bit.

In order to handle the overcapture, it is recommended to read the data before the overcapture flag. This is to avoid missing an overcapture which may happen after reading the flag and before reading the data.

Note: IC interrupt and/or DMA requests can be generated by software by setting the corresponding CCxG bit in the TIMx_EGR register.

57.4.9 PWM input mode (only for TIM15)

This mode is used to measure both the period and the duty cycle of a PWM signal connected to single tim_tix input:

- The TIMx_CCR1 register holds the period value (interval between two consecutive rising edges)
- The TIMx_CCR2 register holds the pulse width (interval between two consecutive rising and falling edges)

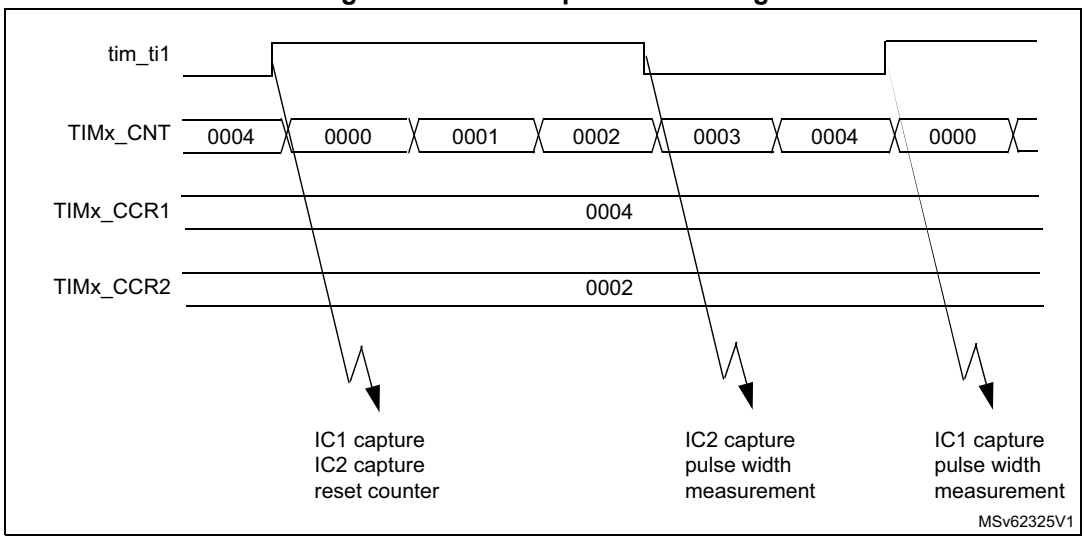
This mode is a particular case of input capture mode. The set-up procedure is similar with the following differences:

- Two tim_icx signals are mapped on the same tim_tix input.
- These two tim_icx signals are active on edges with opposite polarity.
- One of the two tim_tixfpy signals is selected as trigger input and the slave mode controller is configured in reset mode.

For example, one can measure the period (in TIMx_CCR1 register) and the duty cycle (in TIMx_CCR2 register) of the PWM applied on tim_ti1 using the following procedure (depending on tim_ker_ck frequency and prescaler value):

1. Select the proper tim_ti1_in[15:0] source (internal or external) with the TI1SEL[3:0] bits in the TIMx_TISEL register.
2. Select the active input for TIMx_CCR1: write the CC1S bits to 01 in the TIMx_CCMR1 register (tim_ti1 selected).
3. Select the active polarity for tim_ti1fp1 (used both for capture in TIMx_CCR1 and counter clear): write the CC1P and CC1NP bits to 0 (active on rising edge).
4. Select the active input for TIMx_CCR2: write the CC2S bits to 10 in the TIMx_CCMR1 register (tim_ti1 selected).
5. Select the active polarity for tim_ti1fp2 (used for capture in TIMx_CCR2): write the CC2P and CC2NP bits to 10 (active on falling edge).
6. Select the valid trigger input: write the TS bits to 00101 in the TIMx_SMCR register (tim_ti1fp1 selected).
7. Configure the slave mode controller in reset mode: write the SMS bits to 100 in the TIMx_SMCR register.
8. Enable the captures: write the CC1E and CC2E bits to 1 in the TIMx_CCER register.

Figure 682. PWM input mode timing



1. The PWM input mode can be used only with the TIMx_CH1/TIMx_CH2 signals due to the fact that only tim_ti1fp1 and tim_ti2fp2 are connected to the slave mode controller.

57.4.10 Forced output mode

In output mode (CCxS bits = 00 in the TIMx_CCMRx register), each output compare signal (tim_ocxref and then tim_ocx/tim_ocxn) can be forced to active or inactive level directly by software, independently of any comparison between the output compare register and the counter.

To force an output compare signal (tim_ocxref/tim_ocx) to its active level, one just needs to write 101 in the OCxM bits in the corresponding TIMx_CCMRx register. Thus tim_ocxref is forced high (tim_ocxref is always active high) and tim_ocx get opposite value to CCxP polarity bit.

For example: CCxP = 0 (tim_ocx active high) → tim_ocx is forced to high level.

The tim_ocxref signal can be forced low by writing the OCxM bits to 100 in the TIMx_CCMRx register.

Anyway, the comparison between the TIMx_CCRx shadow register and the counter is still performed and allows the flag to be set. Interrupt and DMA requests can be sent accordingly. This is described in the output compare mode section below.

57.4.11 Output compare mode

This function is used to control an output waveform or indicating when a period of time has elapsed.

When a match is found between the capture/compare register and the counter, the output compare function:

- Assigns the corresponding output pin to a programmable value defined by the output compare mode (OCxM bits in the TIMx_CCMRx register) and the output polarity (CCxP bit in the TIMx_CCER register). The output pin can keep its level (OCXM = 000), be set

active (OCxM = 001), be set inactive (OCxM = 010) or can toggle (OCxM = 011) on match.

- Sets a flag in the interrupt status register (CCxIF bit in the TIMx_SR register).
- Generates an interrupt if the corresponding interrupt mask is set (CCXIE bit in the TIMx_DIER register).
- Sends a DMA request if the corresponding enable bit is set (CCxDE bit in the TIMx_DIER register, CCDS bit in the TIMx_CR2 register for the DMA request selection).

The TIMx_CCRx registers can be programmed with or without preload registers using the OCxPE bit in the TIMx_CCMRx register.

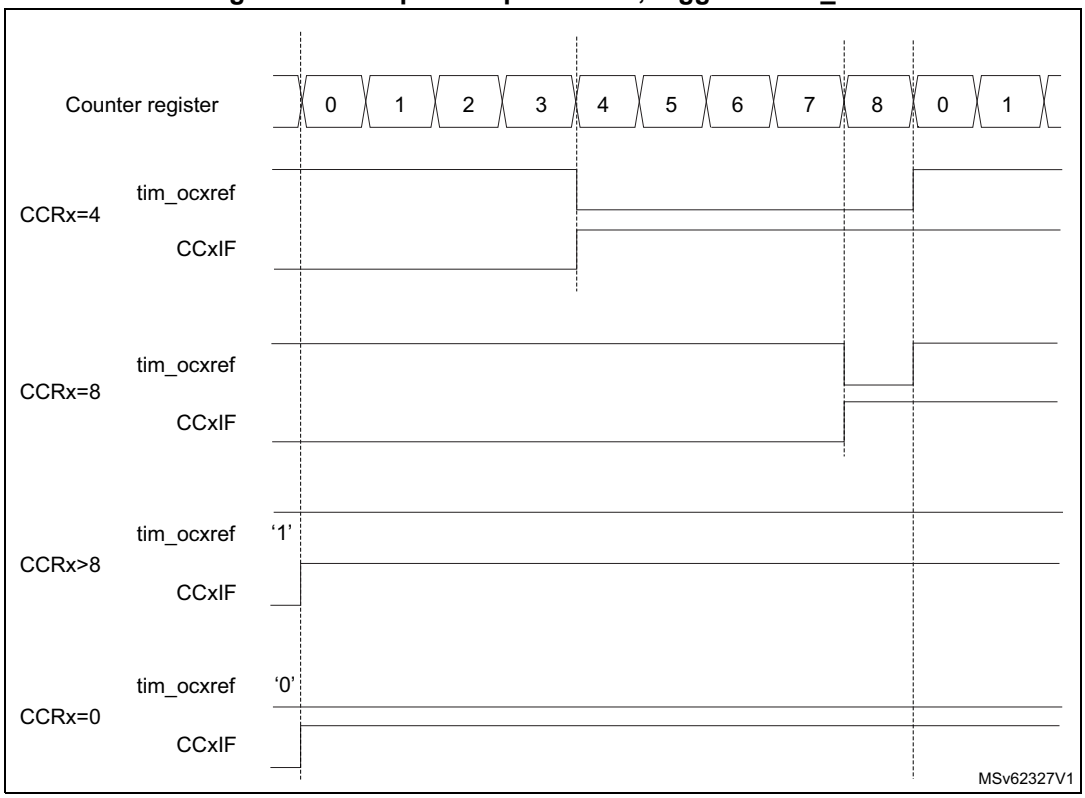
In output compare mode, the update event UEV has no effect on tim_ocxref and tim_ocx output. The timing resolution is one count of the counter. Output compare mode can also be used to output a single pulse (in One-pulse mode).

Procedure

1. Select the counter clock (internal, external, prescaler).
2. Write the desired data in the TIMx_ARR and TIMx_CCRx registers.
3. Set the CCxIE bit if an interrupt request is to be generated.
4. Select the output mode. For example:
   - Write OCxM = 011 to toggle tim_ocx output pin when CNT matches CCRx
   - Write OCxPE = 0 to disable preload register
   - Write CCxP = 0 to select active high polarity
   - Write CCxE = 1 to enable the output
5. Enable the counter by setting the CEN bit in the TIMx_CR1 register.

The TIMx_CCRx register can be updated at any time by software to control the output waveform, provided that the preload register is not enabled (OCxPE = 0, else TIMx_CCRx shadow register is updated only at the next update event UEV). An example is given in *Figure 683*.

Figure 683. Output compare mode, toggle on tim_oc1



57.4.12 PWM mode

Pulse width modulation mode is used to generate a signal with a frequency determined by the value of the TIMx_ARR register and a duty cycle determined by the value of the TIMx_CCRx register.

The PWM mode can be selected independently on each channel (one PWM per tim_ocx output) by writing 110 (PWM mode 1) or 111 (PWM mode 2) in the OCxM bits in the TIMx_CCMRx register. The corresponding preload register must be enabled by setting the OCxPE bit in the TIMx_CCMRx register, and eventually the autoreload preload register (in upcounting or center-aligned modes) by setting the ARPE bit in the TIMx_CR1 register.

As the preload registers are transferred to the shadow registers only when an update event occurs, before starting the counter, all registers must be initialized by setting the UG bit in the TIMx_EGR register.

tim_ocx polarity is software programmable using the CCxP bit in the TIMx_CCER register. It can be programmed as active high or active low. tim_ocx output is enabled by a combination of the CCxE, CCxNE, MOE, OSSI, and OSSR bits (TIMx_CCER and TIMx_BDTR registers). Refer to the TIMx_CCER register description for more details.

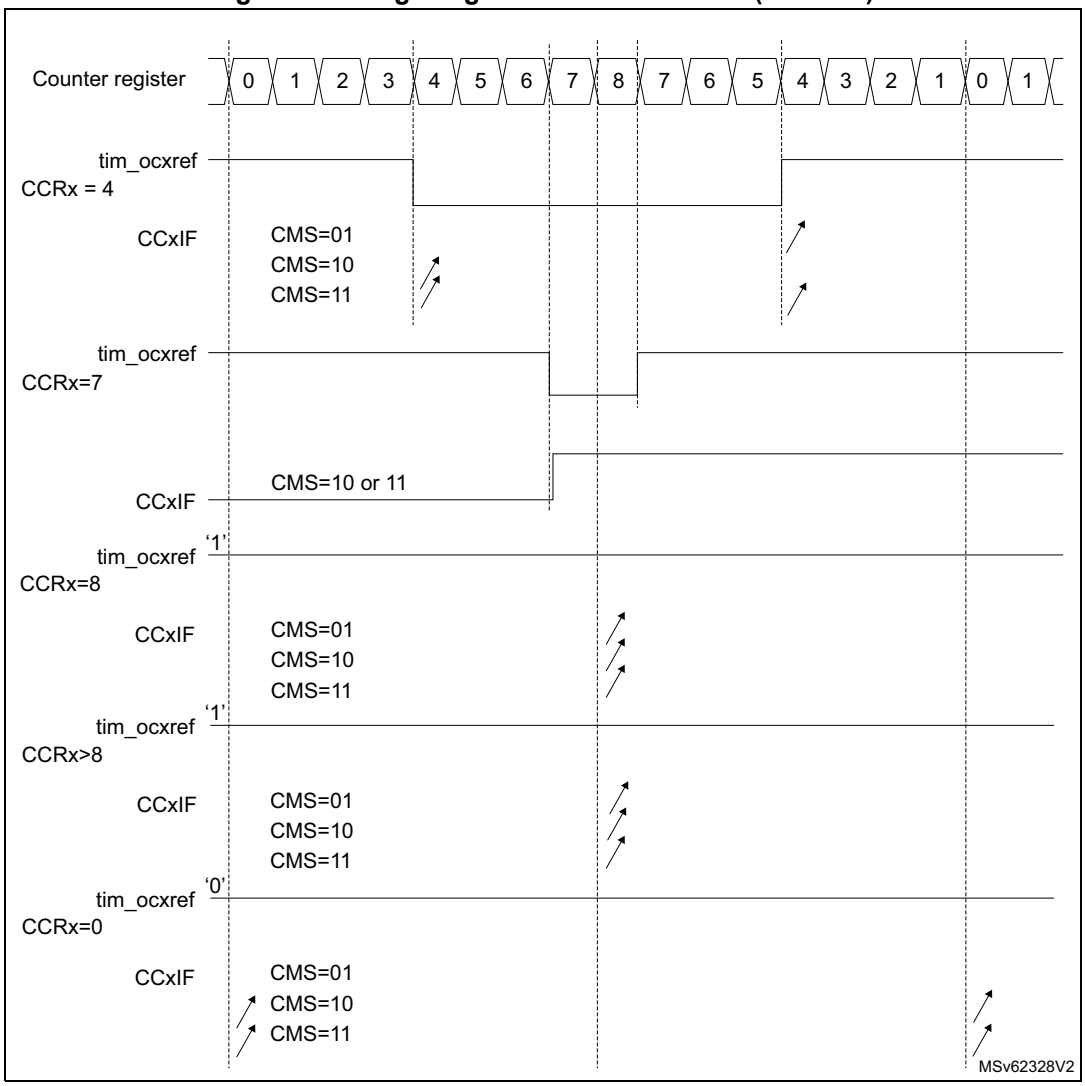
In PWM mode (1 or 2), TIMx_CNT and TIMx_CCRx are always compared to determine whether TIMx_CCRx ≤ TIMx_CNT or TIMx_CNT ≤ TIMx_CCRx (depending on the direction of the counter).

The TIM15/TIM16/TIM17 are capable of upcounting only. Refer to *Upcounting mode*.

In the following example applies to PWM mode 1. The reference PWM signal tim_ocxref is high as long as TIMx_CNT < TIMx_CCRx else it becomes low. If the compare value in

TIMx_CCRx is greater than the autoreload value (in TIMx_ARR) then tim_ocxref is held at 1. If the compare value is 0 then tim_ocxref is held at 0. *Figure 684* shows some edge-aligned PWM waveforms in an example where TIMx_ARR = 8.

Figure 684. Edge-aligned PWM waveforms (ARR = 8)

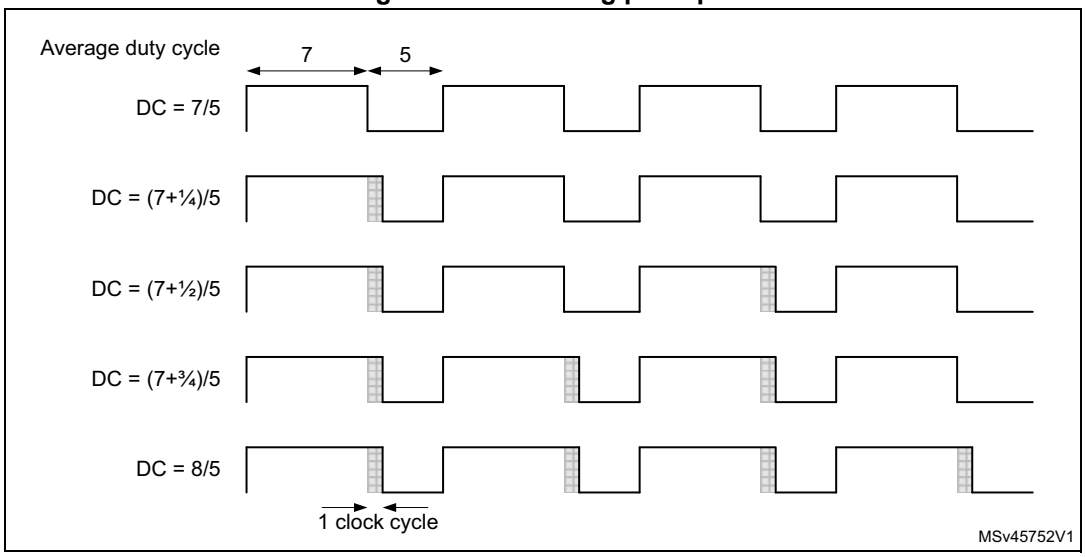


Dithering mode

The PWM mode effective resolution can be increased by enabling the dithering mode, using the DITHEN bit in the TIMx_CR1 register. This applies to both the CCR (for duty cycle resolution increase) and ARR (for PWM frequency resolution increase).

The operating principle is to have the actual CCR (or ARR) value slightly changed (adding or not one timer clock period) over 16 consecutive PWM periods, with predefined patterns. This allows a 16-fold resolution increase, considering the average duty cycle or PWM period. The *Figure 685* below presents the dithering principle applied to four consecutive PWM cycles.

Figure 685. Dithering principle

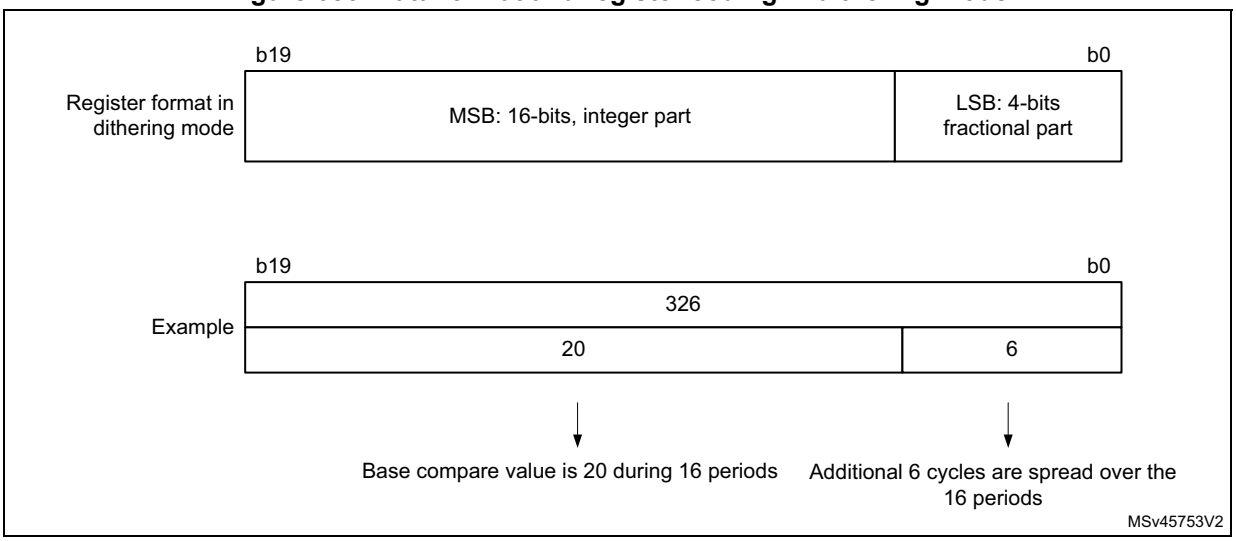


When the dithering mode is enabled, the register coding is changed as follows (see *Figure 686* for example):

- The four LSBs are coding for the enhanced resolution part (fractional part).
- The MSBs are left-shifted to the bits 19:4 and are coding for the base value.

Note: The following sequence must be followed when resetting the DITHEN bit:
1. CEN and ARPE bits must be reset
2. The ARR[3:0] bits must be reset
3. The CCIF flags must be cleared
4. The CEN bit can be set (eventually with ARPE = 1).

Figure 686. Data format and register coding in dithering mode



The minimum frequency is given by the following formula:

$$\text{Resolution} = \frac{F_{Tim}}{F_{pwm}} \Rightarrow F_{pwmMin} = \frac{F_{Tim}}{Max_{Resolution}}$$

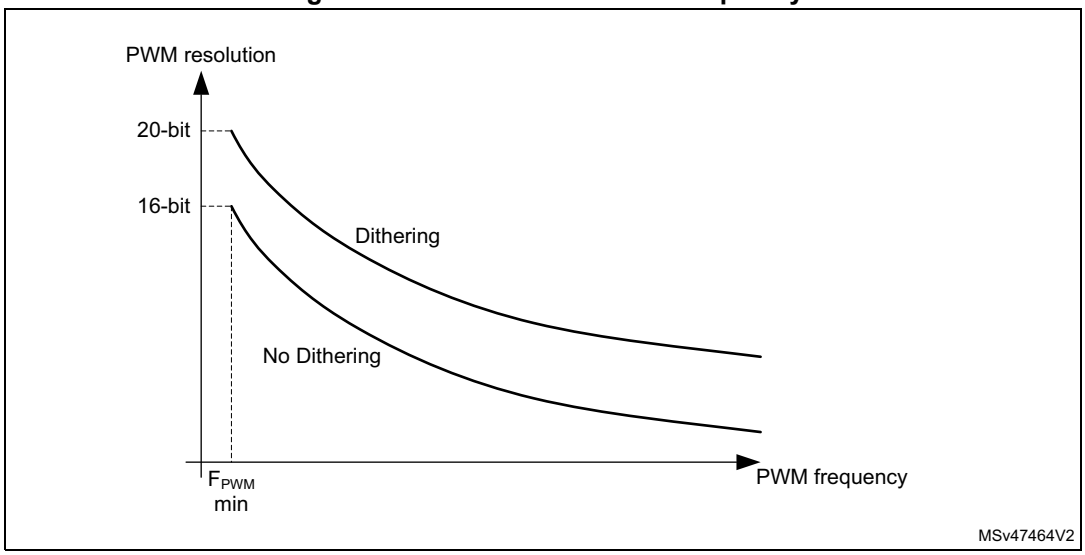
$$\text{Dithering mode disabled: } F_{pwmMin} = \frac{F_{Tim}}{65536}$$

$$\text{Dithering mode enabled: } F_{pwmMin} = \frac{F_{Tim}}{65535 + \frac{15}{16}}$$

Note: The maximum TIMx_ARR and TIMx_CCRy values are limited to 0xFFFEF in dithering mode (corresponds to 65534 for the integer part and 15 for the dithered part).

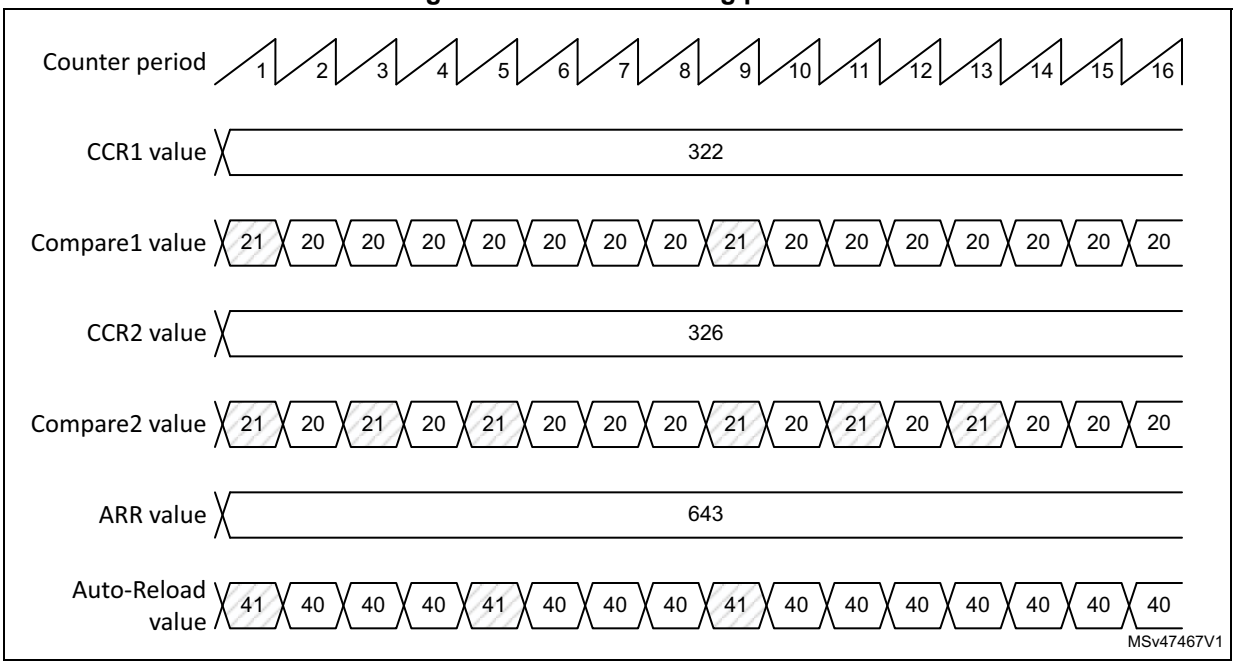
As shown on the *Figure 687* below, the dithering mode is used to increase the PWM resolution whatever the PWM frequency.

Figure 687. PWM resolution vs frequency



The duty cycle and/or period changes are spread over 16 consecutive periods, as described in the *Figure 688* below.

Figure 688. PWM dithering pattern



The autoreload and compare values increments are spread following specific patterns described in the *Table 583* below. The dithering sequence is done to have increments distributed as evenly as possible and minimize the overall ripple.

Table 583. CCR and ARR register change dithering pattern

57.4.13 Combined PWM mode (TIM15 only)

Combined PWM mode allows two edge or center-aligned PWM signals to be generated with programmable delay and phase shift between respective pulses. While the frequency is determined by the value of the TIMx_ARR register, the duty cycle and delay are determined by the two TIMx_CCRx registers. The resulting signals, tim_ocxrefc, are made of an OR or AND logical combination of two reference PWMs:

- tim_oc1refc (or tim_oc2refc) is controlled by the TIMx_CCR1 and TIMx_CCR2 registers.

Combined PWM mode can be selected independently on two channels (one tim_ocx output per pair of CCR registers) by writing 1100 (Combined PWM mode 1) or 1101 (Combined PWM mode 2) in the OCxM bits in the TIMx_CCMRx register.

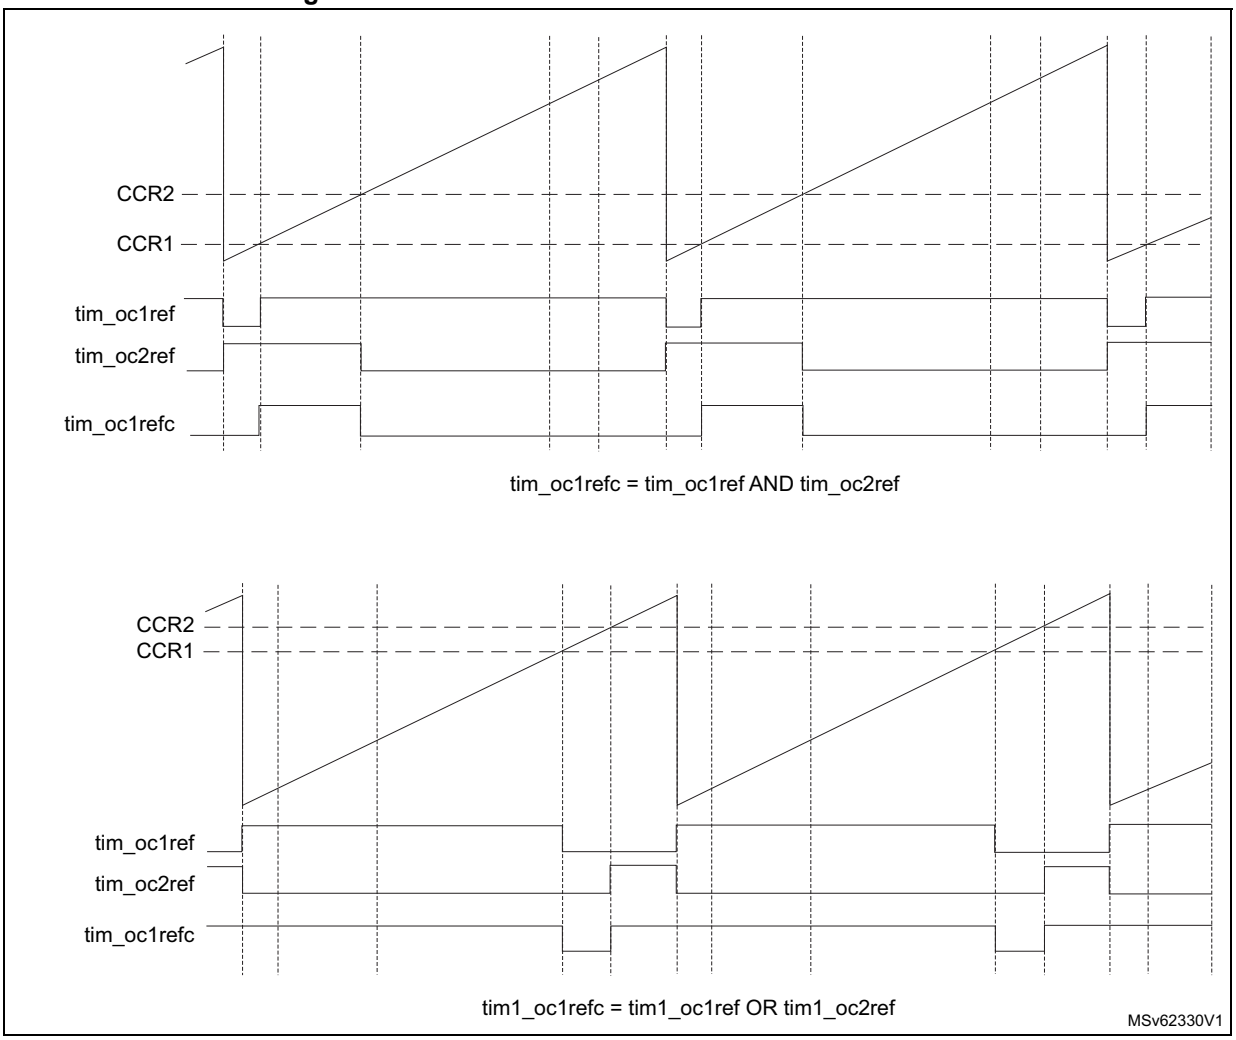
When a given channel is used as a combined PWM channel, its complementary channel must be configured in the opposite PWM mode (for instance, one in Combined PWM mode 1 and the other in Combined PWM mode 2).

Note: The OCxM[3:0] bitfield is split into two parts for compatibility reasons, the most significant bit is not contiguous with the three least significant ones.

Table 689 represents an example of signals that can be generated using Combined PWM mode, obtained with the following configuration:

- Channel 1 is configured in Combined PWM mode 2.
- Channel 2 is configured in PWM mode 1.

Figure 689. Combined PWM mode on channel 1 and 2



57.4.14 Complementary outputs and dead-time insertion

The TIM15/TIM16/TIM17 general-purpose timers can output one complementary signal and manage the switching-off and switching-on of the outputs.

This time is generally known as dead-time and it has to be adjusted depending on the devices that are connected to the outputs and their characteristics (such as intrinsic delays of level-shifters and delays due to power switches)

The polarity of the outputs (main output tim_ocx or complementary tim_ocxn) can be selected independently for each output. This is done by writing to the CCxP and CCxNP bits in the TIMx_CCER register.

The complementary signals tim_ocx and tim_ocxn are activated by a combination of several control bits: the CCxE and CCxNE bits in the TIMx_CCER register and the MOE, OISx, OISxN, OSSI and OSSR bits in the TIMx_BDTR and TIMx_CR2 registers. Refer to *Table 590: Output control bits for complementary tim_oc1 and tim_oc1n channels with break feature (TIM16/TIM17)* for more details. In particular, the dead-time is activated when switching to the idle state (MOE falling down to 0).

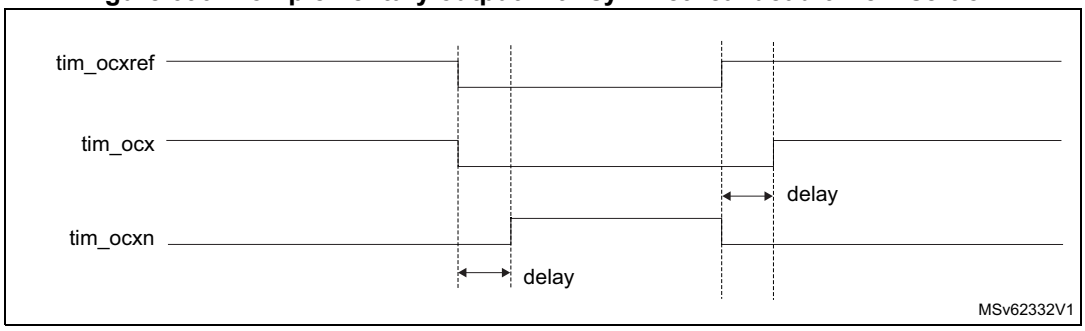
Dead-time insertion is enabled by setting both CCxE and CCxNE bits, and the MOE bit if the break circuit is present. There is one 10-bit dead-time generator for each channel. From a reference waveform tim_ocxref, it generates two outputs tim_ocx and tim_ocxn. If tim_ocx and tim_ocxn are active high:

- The tim_ocx output signal is the same as the reference signal except for the rising edge, which is delayed relative to the reference rising edge.
- The tim_ocxn output signal is the opposite of the reference signal except for the rising edge, which is delayed relative to the reference falling edge.

If the delay is greater than the width of the active output (tim_ocx or tim_ocxn) then the corresponding pulse is not generated.

The following figures show the relationships between the output signals of the dead-time generator and the reference signal tim_ocxref. (in these examples CCxP = 0, CCxNP = 0, MOE = 1, CCxE = 1 and CCxNE = 1)

Figure 690. Complementary output with symmetrical dead-time insertion.



The DTAE bit in the TIMx_DTR2 is used to differentiate the deadtime values for rising and falling edges of the reference signal, as shown on *Figure 691*.

In asymmetrical mode (DTAE = 1), the rising edge-referred deadtime is defined by the DTG[7:0] bitfield in the TIMx_BDTR register, while the falling edge-referred is defined by the DTGF[7:0] bitfield in the TIMx_DTR2 register. The DTAE bit must be written before enabling the counter and must not be modified while CEN = 1.

It is possible to have the deadtime value updated on-the-fly during pwm operation, using a preload mechanism. The deadtime bitfield DTG[7:0] and DTGF[7:0] are preloaded when the DTPE bit is set in the TIMX_DTR2 register. The preload value is loaded in the active register on the next update event.

Note: If the DTPE bit is enabled while the counter is enabled, any new value written since last update is discarded and previous value is used.

Figure 691. Asymmetrical deadtime

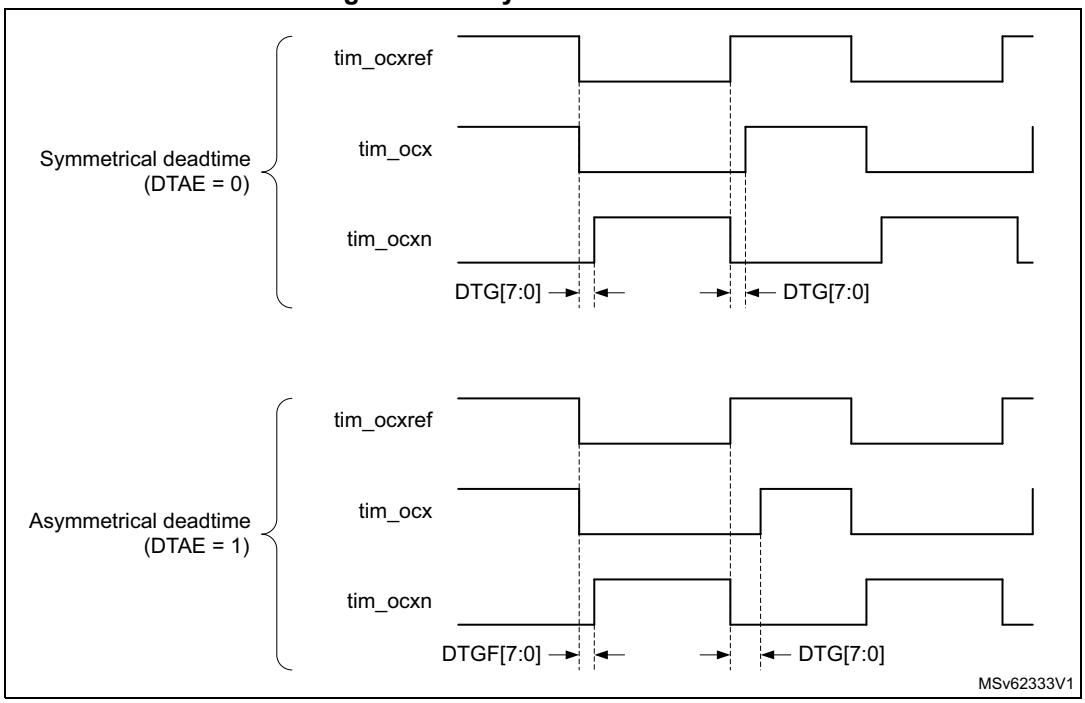


Figure 692. Dead-time waveforms with delay greater than the negative pulse.

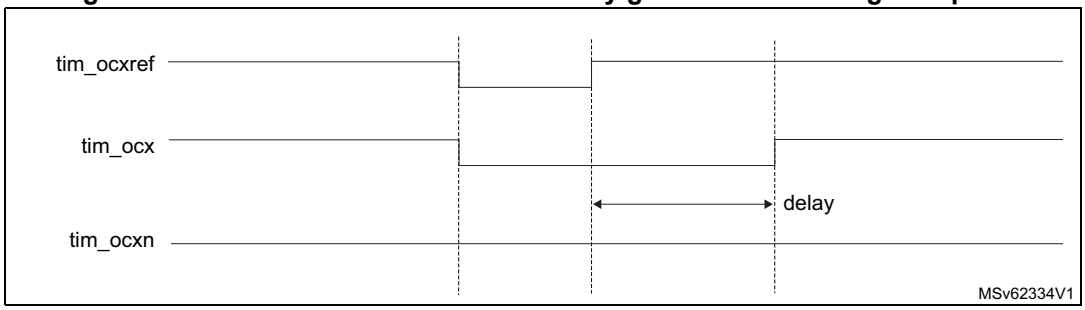

Figure 693. Dead-time waveforms with delay greater than the positive pulse.

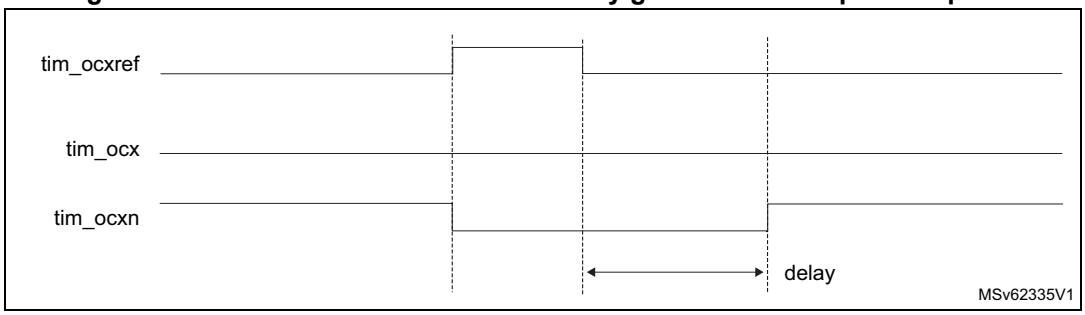


The dead-time delay is the same for each of the channels and is programmable with the DTG bits in the TIMx_BDTR register. Refer to *Section 57.8.14: TIMx break and dead-time register (TIMx_BDTR)(x = 16 to 17)* for delay calculation.

Redirecting tim_ocxref to tim_ocx or tim_ocxn

In output mode (forced, output compare or PWM), tim_ocxref can be redirected to the tim_ocx output or to tim_ocxn output by configuring the CCxE and CCxNE bits in the TIMx_CCER register.

This is used to send a specific waveform (such as PWM or static active level) on one output while the complementary remains at its inactive level. Other alternative possibilities are to have both outputs at inactive level or both outputs active and complementary with dead-time.

Note: When only tim_ocxn is enabled (CCxE = 0, CCxNE = 1), it is not complemented and becomes active as soon as tim_ocxref is high. For example, if CCxNP = 0 then tim_ocxn = tim_ocxref. On the other hand, when both tim_ocx and tim_ocxn are enabled (CCxE = CCxNE = 1) tim_ocx becomes active when tim_ocxref is high whereas tim_ocxn is complemented and becomes active when tim_ocxref is low.

57.4.15 Using the break function

The purpose of the break function is to protect power switches driven by PWM signals generated with the timers. The break input is usually connected to fault outputs of power stages and 3-phase inverters. When activated, the break circuitry shuts down the PWM outputs and forces them to a predefined safe state.

The break channel gathers both system-level fault (such as clock failure, ECC/parity, and errors) and application fault (from input pins and built-in comparator), and can force the outputs to a predefined level (either active or inactive) after a deadtime duration.

The output enable signal and output levels during break are depending on several control bits:

- The MOE bit in TIMx_BDTR register is used to enable /disable the outputs by software and is reset in case of break or break2 event.
- The OSSI bit in the TIMx_BDTR register defines whether the timer controls the output in inactive state or releases the control to the GPIO controller (typically to have it in Hi-Z mode).
- The OISx and OISxN bits in the TIMx_CR2 register which are setting the output shut-down level, either active or inactive. The tim_ocx and tim_ocxn outputs cannot be set both to active level at a given time, whatever the OISx and OISxN values. Refer to *Table 590: Output control bits for complementary tim_oc1 and tim_oc1n channels with break feature (TIM16/TIM17)* for more details.

When exiting from reset, the break circuit is disabled and the MOE bit is low. The break function is enabled by setting the BKE bit in the TIMx_BDTR register. The break input polarity can be selected by configuring the BKP bit in the same register. BKE and BKP can be modified at the same time. When the BKE and BKP bits are written, a delay of one APB clock cycle is applied before the writing is effective. Consequently, it is necessary to wait one APB clock period to correctly read back the bit after the write operation.

Because MOE falling edge can be asynchronous, a resynchronization circuit has been inserted between the actual signal (acting on the outputs) and the synchronous control bit (accessed in the TIMx_BDTR register). It results in some delays between the asynchronous and the synchronous signals. In particular, if MOE is set to 1 whereas it was low, a delay must be inserted (dummy instruction) before reading it correctly. This is because the write acts on the asynchronous signal whereas the read reflects the synchronous signal.

The break is generated by the tim_brk inputs which have:

- Programmable polarity (BKP bit in the TIMx_BDTR register).
- Programmable enable bit (BKE bit in the TIMx_BDTR register).
- Programmable filter (BKF[3:0] bits in the TIMx_BDTR register) to avoid spurious events.

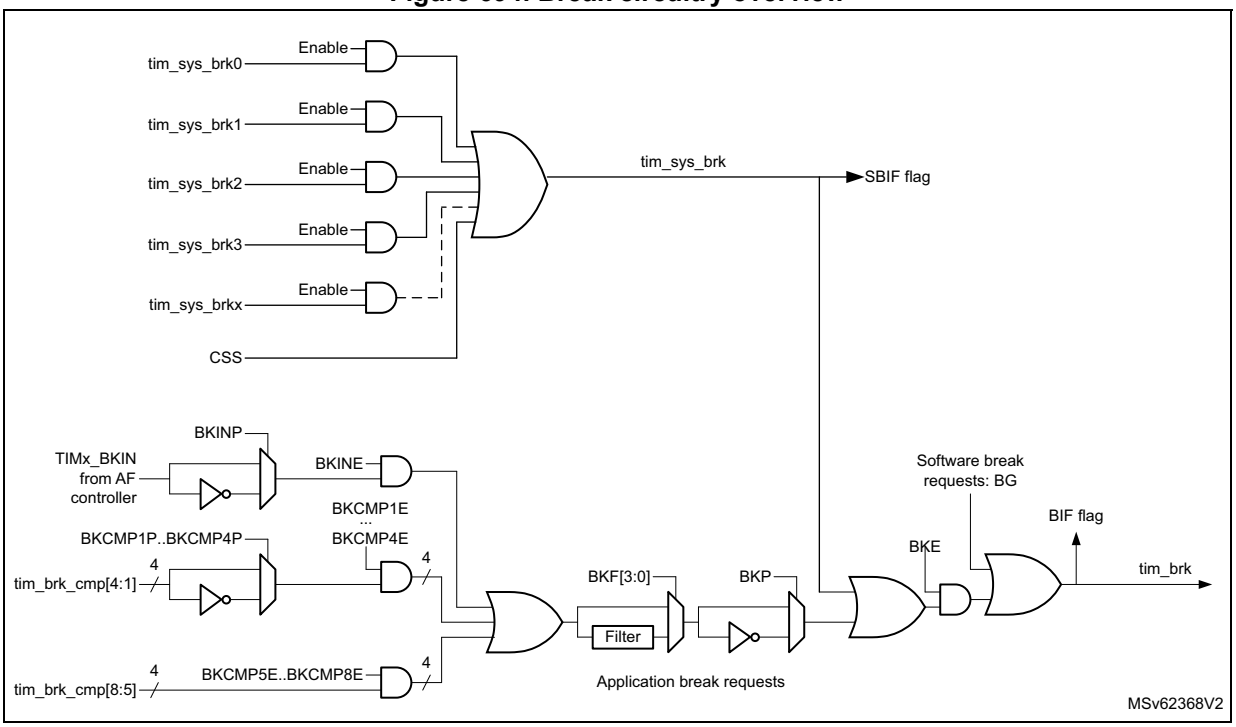
The break can be generated from multiple sources which can be individually enabled and with programmable edge sensitivity, using the TIMx_AF1 register.

The sources for break (tim_brk) channel are:

- External sources connected to one of the TIM_BKIN pins (as per selection done in the GPIO alternate function selection registers), with polarity selection and optional digital filtering.
- Internal sources:
  - Coming from a tim_brk_cmpx input (refer to *Section 57.4.2: TIM15/TIM16/TIM17 pins and internal signals* for product specific implementation).
  - Coming from a system break request on the tim_sys_brk inputs (refer to *Section 57.4.2: TIM15/TIM16/TIM17 pins and internal signals* for product specific implementation).

Break events can also be generated by software using BG bit in the TIMx_EGR register. All sources are ORed before entering the timer tim_brk inputs, as per *Figure 694* below.

Figure 694. Break circuitry overview



Caution: An asynchronous (clockless) operation is only guaranteed when the programmable filter is disabled. If it is enabled, a fail-safe clock mode (for example, using the internal PLL and/or the CSS) must be used to guarantee that break events are handled.

When a break occurs (selected level on the break input):

- The MOE bit is cleared asynchronously, putting the outputs in inactive state, idle state, or even releasing the control to the GPIO (selected by the OSSI bit). This feature functions even if the MCU oscillator is off.
- Each output channel is driven with the level programmed in the OISx bit in the TIMx_CR2 register as soon as MOE = 0. If OSSI = 0, the timer releases the output control (taken over by the GPIO) else the enable output remains high.
- When complementary outputs are used:
  - The outputs are first put in reset state inactive state (depending on the polarity). This is done asynchronously so that it works even if no clock is provided to the timer.
  - If the timer clock is still present, then the dead-time generator is reactivated in order to drive the outputs with the level programmed in the OISx and OISxN bits after a dead-time. Even in this case, tim_ocx and tim_ocxn cannot be driven to their active level together. Note that because of the resynchronization on MOE, the dead-time duration is a bit longer than usual (around 2 tim_ker_ck clock cycles).
  - If OSSI = 0 then the timer releases the enable outputs (taken over by the GPIO which forces a Hi-Z state) else the enable outputs remain or become high as soon as one of the CCxE or CCxNE bits is high.
- The break status flag (BIF bit in the TIMx_SR register) is set. An interrupt can be generated if the BIE bit in the TIMx_DIER register is set. A DMA request can be sent if the BDE bit in the TIMx_DIER register is set.
- If the AOE bit in the TIMx_BDTR register is set, the MOE bit is automatically set again at the next update event UEV. This can be used to perform a regulation, for instance. Else, MOE remains low until it is written with 1 again. In this case, it can be used for security and the break input can be connected to an alarm from power drivers, thermal sensors or any security components.

Note: If the MOE is reset by the CPU while the AOE bit is set, the outputs are in idle state and forced to inactive level or Hi-Z depending on OSSI value. If both the MOE and AOE bits are reset by the CPU, the outputs are in disabled state and driven with the level programmed in the OISx bit in the TIMx_CR2 register.

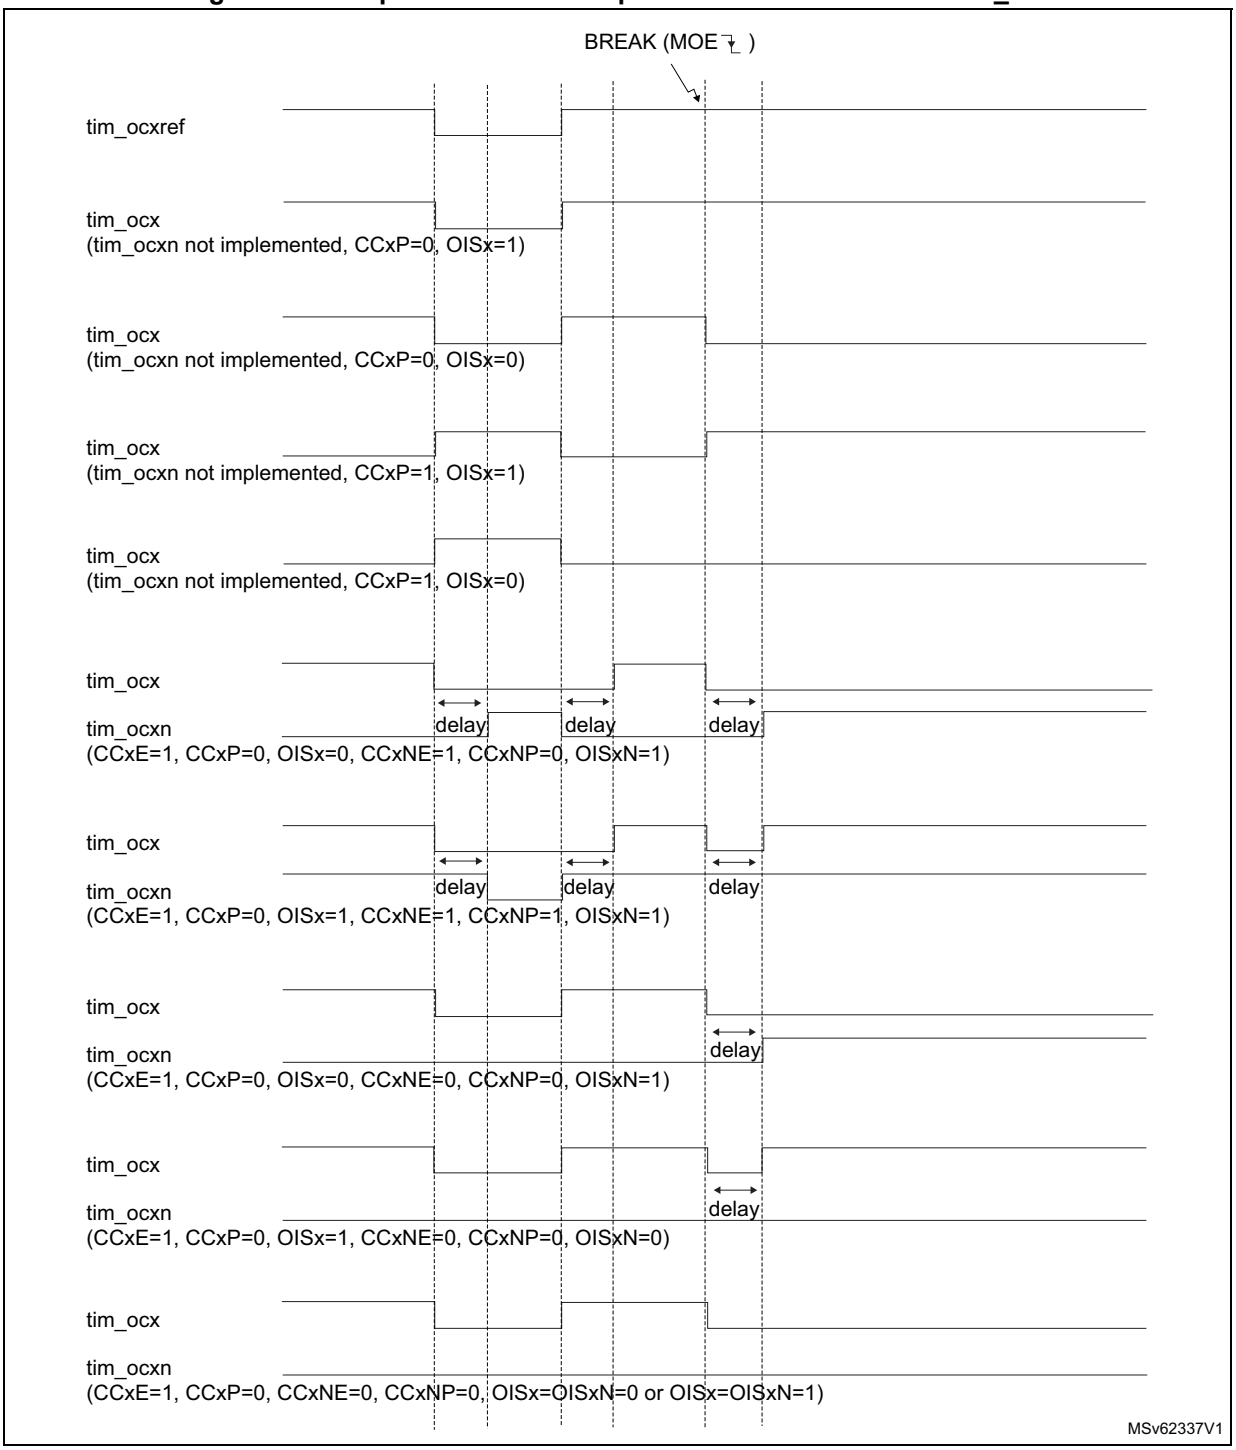
The break inputs are acting on level. Thus, the MOE cannot be set while the break input is active (neither automatically nor by software). In the meantime, the status flag BIF cannot be cleared.

The break can be generated by the tim_brk input which has a programmable polarity and an enable bit BKE in the TIMx_BDTR register.

In addition to the break input and the output management, a write protection has been implemented inside the break circuit to safeguard the application. It is used to freeze the configuration of several parameters (dead-time duration, tim_ocx/tim_ocxn polarities and state when disabled, OCxM configurations, break enable, and polarity). The protection can be selected among 3 levels with the LOCK bits in the TIMx_BDTR register. Refer to *Section 57.8.14: TIMx break and dead-time register (TIMx_BDTR)(x = 16 to 17)*. The LOCK bits can be written only once after an MCU reset.

The *Figure 695* shows an example of behavior for the outputs in response to a break.

Figure 695. Output behavior in response to a break event on tim_brk



57.4.16 Bidirectional break input

The TIM15/TIM16/TIM17 are featuring bidirectional break I/Os, as represented on *Figure 696*.

They are used to have:

- A board-level global break signal available for signaling faults to external MCUs or gate drivers, with a unique pin being both an input and an output status pin.
- Internal break sources and multiple external open drain sources ORed together to trigger a unique break event, when multiple internal and external break sources must be merged.

The tim_brk input is configured in bidirectional mode using the BKBID bit in the TIMx_BDTR register. The BKBID programming bit can be locked in read-only mode using the LOCK bits in the TIMx_BDTR register (in LOCK level 1 or above).

The bidirectional mode requires the I/O to be configured in open-drain mode with active low polarity (using BKINP and BKP bits). Any break request coming either from system (for example CSS), from on-chip peripherals, or from break inputs forces a low level on the break input to signal the fault event. The bidirectional mode is inhibited if the polarity bits are not correctly set (active high polarity), for safety purposes.

The break software event (triggered by setting the BG bit) also causes the break I/O to be forced to '0' to indicate to the external components that the timer has entered in break state. However, this is valid only if the break is enabled (BKE = 1). When a software break event is generated with BKE = 0, the outputs are put in safe state and the break flag is set, but there is no effect on the TIM_BKIN I/O.

A safe disarming mechanism prevents the system to be definitively locked-up (a low level on the break input triggers a break which enforces a low level on the same input).

When the BKDSRM bit is set to 1, this releases the break output to clear a fault signal and to give the possibility to re-arm the system.

At no point the break protection circuitry can be disabled:

- The break input path is always active: a break event is active even if the BKDSRM bit is set and the open drain control is released. This prevents the PWM output to be restarted as long as the break condition is present.
- The BKDSRM bit cannot disarm the break protection as long as the outputs are enabled (MOE bit is set) (see *Table 584*).

Table 584. Break protection disarming conditions

MOE	BKBID	BKDSRM	Break protection state
0	0	X	Armed
0	1	0	Armed
0	1	1	Disarmed
1	X	X	Armed

Arming and rearming break circuitry

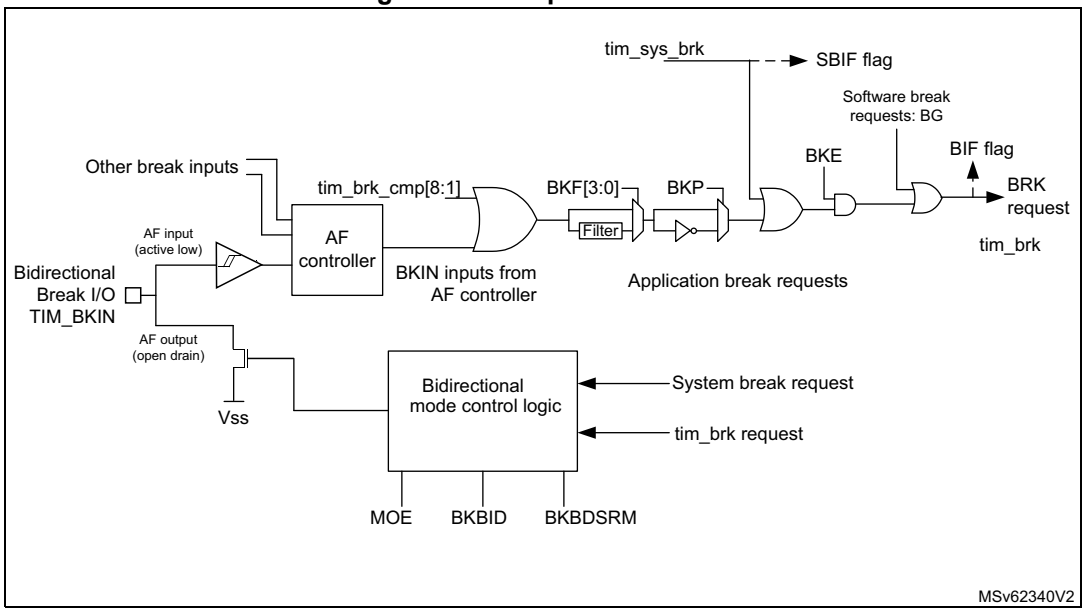
The break circuitry (in input or bidirectional mode) is armed by default (peripheral reset configuration).

The following procedure must be followed to re-arm the protection after a break event:

- The BKDSRM bit must be set to release the output control.
- The software must wait until the system break condition disappears (if any) and clear the SBIF status flag (or clear it systematically before rearming).
- The software must poll the BKDSRM bit until it is cleared by hardware (when the application break condition disappears).

From this point, the break circuitry is armed and active, and the MOE bit can be set to re-enable the PWM outputs.

Figure 696. Output redirection

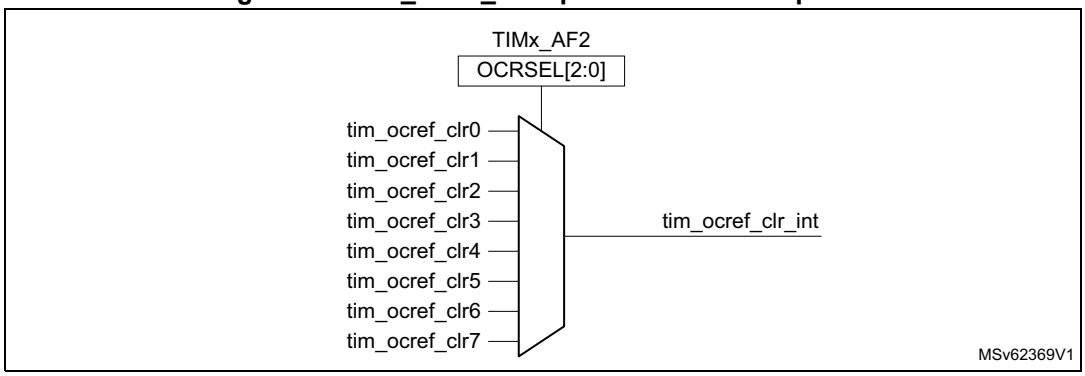


57.4.17 Clearing the tim_ocxref signal on an external event

The tim_ocxref signal of a given channel can be cleared when a high level is applied on the tim_ocref_clr_int input (OCxCE enable bit in the corresponding TIMx_CCMRx register set to 1). tim_ocxref remains low until the next transition to the active state, on the following PWM cycle. This function can only be used in Output compare and PWM modes. It does not work in Forced mode.

The tim_ocref_clr_int input can be selected among several inputs, as shown on *Figure 509* below.

Figure 697. tim_ocref_clr input selection multiplexer



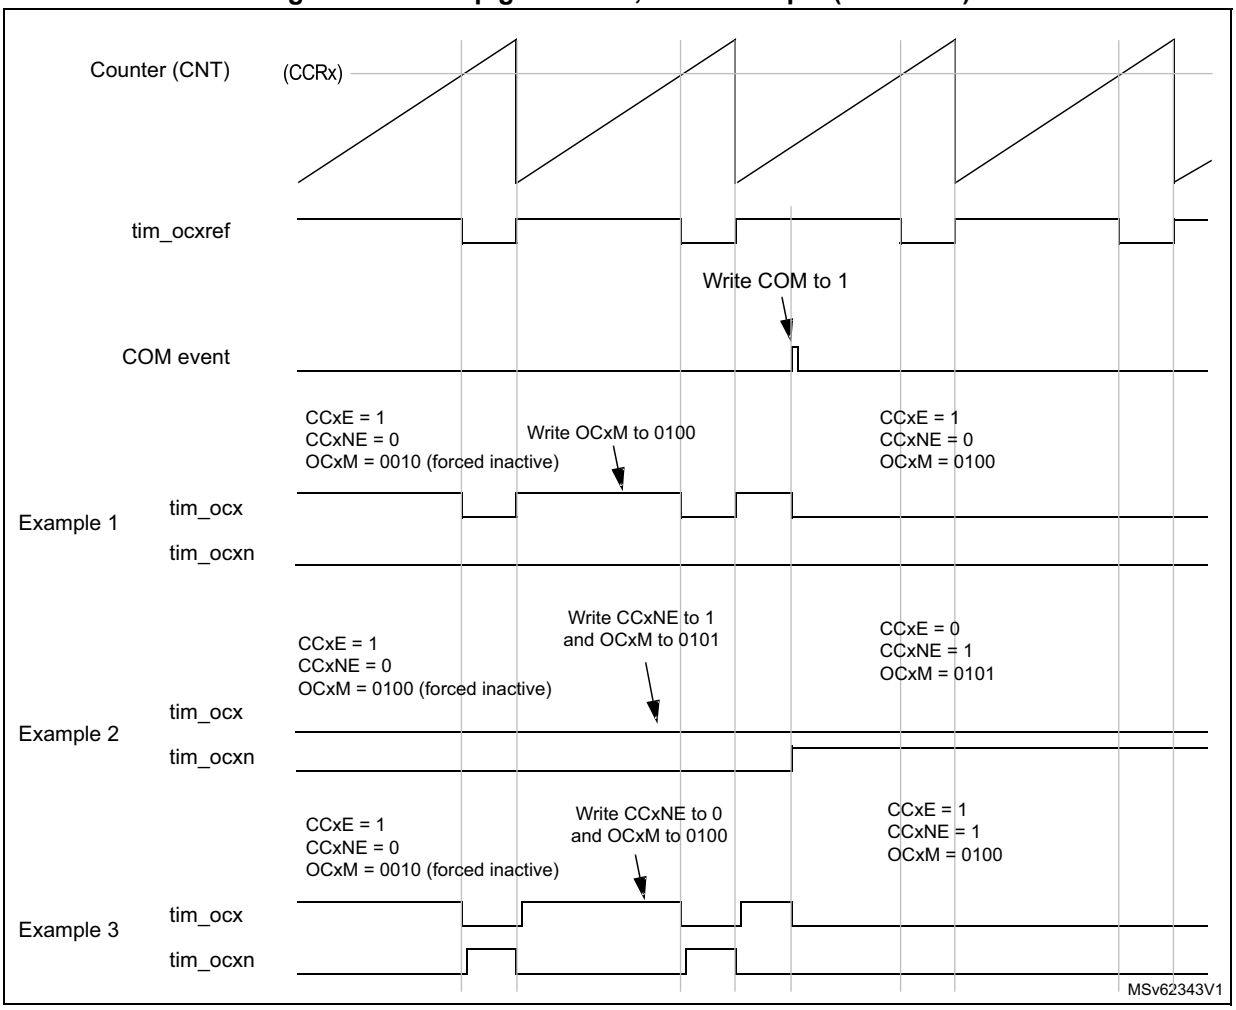
57.4.18 6-step PWM generation

When complementary outputs are used on a channel, preload bits are available on the OCxM, CCxE, and CCxNE bits. The preload bits are transferred to the shadow bits at the COM commutation event. Thus one can program in advance the configuration for the next step and change the configuration of all the channels at the same time. COM can be generated by software by setting the COM bit in the TIMx_EGR register or by hardware (on tim_trgi rising edge).

A flag is set when the COM event occurs (COMIF bit in the TIMx_SR register), which can generate an interrupt (if the COMIE bit is set in the TIMx_DIER register) or a DMA request (if the COMDE bit is set in the TIMx_DIER register).

The *Figure 698* describes the behavior of the tim_ocx and tim_ocxn outputs when a COM event occurs, in 3 different examples of programmed configurations.

Figure 698. 6-step generation, COM example (OSSR = 1)



57.4.19 One-pulse mode

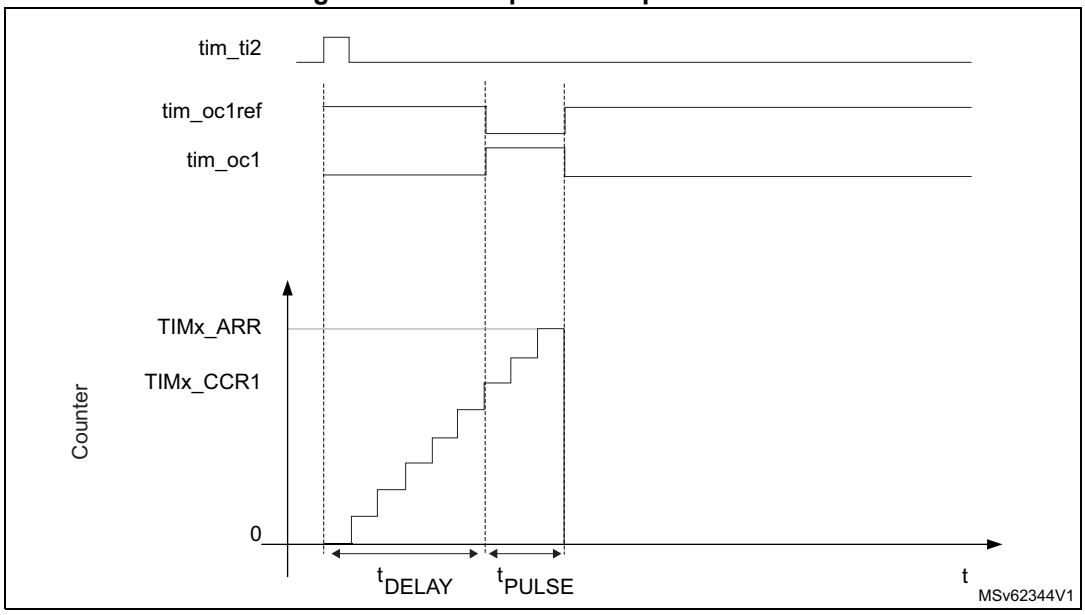
One-pulse mode (OPM) is a particular case of the previous modes. It allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length after a programmable delay.

Starting the counter can be controlled through the slave mode controller. Generating the waveform can be done in output compare mode or PWM mode. One-pulse mode is selected by setting the OPM bit in the TIMx_CR1 register. This makes the counter stop automatically at the next update event UEV.

A pulse can be correctly generated only if the compare value is different from the counter initial value. Before starting (when the timer is waiting for the trigger), the configuration must be:

- CNT < CCRx ≤ ARR (in particular, 0 < CCRx).

Figure 699. Example of one pulse mode.



For example one may want to generate a positive pulse on tim_oc1 with a length of t_{PULSE} and after a delay of t_{DELAY} as soon as a positive edge is detected on the tim_ti2 input pin.

Let's use tim_ti2fp2 as trigger 1:

1. Select the proper tim_ti2_in[15:1] source (internal or external) with the TI2SEL[3:0] bits in the TIMx_TISEL register.
2. Map tim_ti2fp2 to tim_ti2 by writing CC2S = 01 in the TIMx_CCMR1 register.
3. tim_ti2fp2 must detect a rising edge, write CC2P = 0 and CC2NP = 0 in the TIMx_CCER register.
4. Configure tim_ti2fp2 as trigger for the slave mode controller (tim_trgi) by writing TS = 00110 in the TIMx_SMCR register.
5. tim_ti2fp2 is used to start the counter by writing SMS to 110 in the TIMx_SMCR register (trigger mode).

The OPM waveform is defined by writing the compare registers (taking into account the clock frequency and the counter prescaler).

- The t_{DELAY} is defined by the value written in the TIMx_CCR1 register.
- The t_{PULSE} is defined by the difference between the autoreload value and the compare value (TIMx_ARR - TIMx_CCR1).
- Let's say one want to build a waveform with a transition from 0 to 1 when a compare match occurs and a transition from 1 to 0 when the counter reaches the autoreload value. To do this PWM mode 2 must be enabled by writing OC1M = 111 in the TIMx_CCMR1 register. Optionally the preload registers can be enabled by writing OC1PE = 1 in the TIMx_CCMR1 register and ARPE in the TIMx_CR1 register. In this case one has to write the compare value in the TIMx_CCR1 register, the autoreload value in the TIMx_ARR register, generate an update by setting the UG bit and wait for external trigger event on tim_ti2. CC1P is written to 0 in this example.

Since only one pulse is needed, a 1 must be written in the OPM bit in the TIMx_CR1 register to stop the counter at the next update event (when the counter rolls over from the autoreload value back to 0).

Particular case: tim_ocx fast enable

In One-pulse mode, the edge detection on tim_tix input set the CEN bit which enables the counter. Then the comparison between the counter and the compare value makes the output toggle. But several clock cycles are needed for these operations and it limits the minimum delay t_{DELAY} min that can be obtained.

If one wants to output a waveform with the minimum delay, the OCxFE bit can be set in the TIMx_CCMRx register. Then tim_ocxref (and tim_ocx) are forced in response to the stimulus, without taking in account the comparison. Its new level is the same as if a compare match had occurred. OCxFE acts only if the channel is configured in PWM1 or PWM2 mode.

57.4.20 Retriggerable one pulse mode (TIM15 only)

This mode allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length, but with the following differences with non-retriggerable one pulse mode described in *Section 57.4.19*:

- The pulse starts as soon as the trigger occurs (no programmable delay)
- The pulse is extended if a new trigger occurs before the previous one is completed

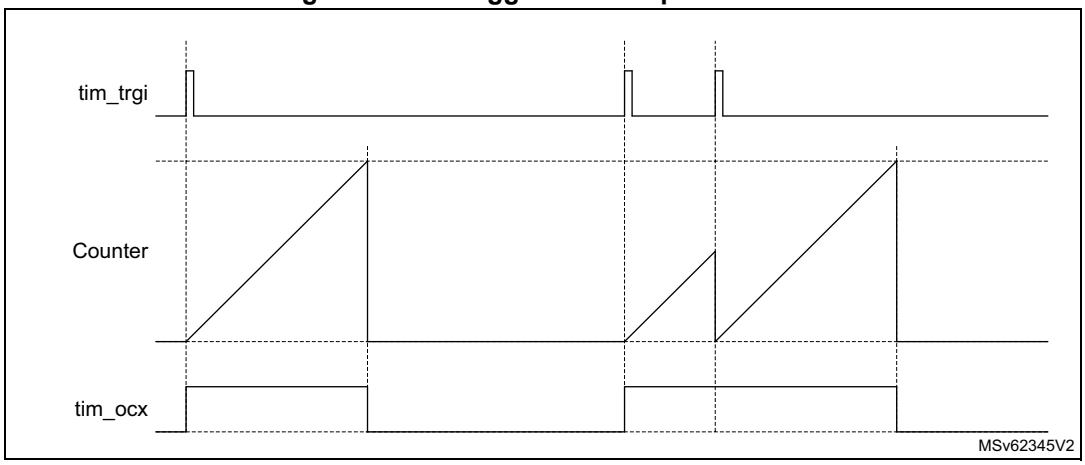
The timer must be in Slave mode, with the bits SMS[3:0] = 1000 (Combined reset + trigger mode) in the TIMx_SMCR register, and the OCxM[3:0] bits set to 1000 or 1001 for Retriggerable OPM mode 1 or 2.

If the timer is configured in Up-counting mode, the corresponding CCRx must be set to 0 (the ARR register sets the pulse length). If the timer is configured in Down-counting mode, CCRx must be above or equal to ARR.

Note: The OCxM[3:0] and SMS[3:0] bit fields are split into two parts for compatibility reasons, the most significant bit are not contiguous with the three least significant ones.

This mode must not be used with center-aligned PWM modes. It is mandatory to have CMS[1:0] = 00 in TIMx_CR1.

Figure 700. Retriggerable one pulse mode



57.4.21 UIF bit remapping

The IUFREMAP bit in the TIMx_CR1 register forces a continuous copy of the update interrupt flag UIF into bit 31 of the timer counter register (TIMx_CNT[31]). This is used to atomically read both the counter value and a potential roll-over condition signaled by the UIFCPY flag. In particular cases, it can ease the calculations by avoiding race conditions caused for instance by a processing shared between a background task (counter reading) and an interrupt (update interrupt).

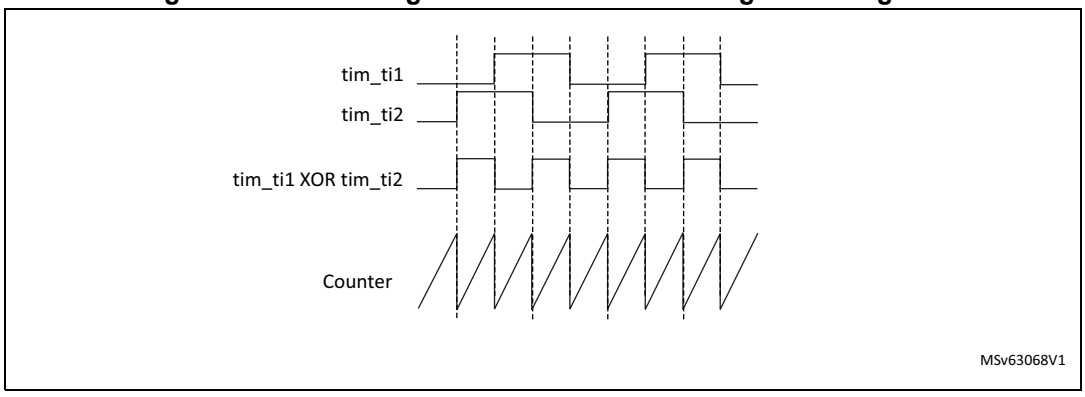
There is no latency between the assertions of the UIF and UIFCPY flags.

57.4.22 Timer input XOR function (TIM15 only)

The TI1S bit in the TIMx_CR2 register, allows the input filter of channel 1 to be connected to the output of a XOR gate, combining the two input pins tim_ti1 and tim_ti2.

The XOR output can be used with all the timer input functions such as trigger or input capture. It is useful for measuring the interval between the edges on two input signals, as shown in *Figure 701*.

Figure 701. Measuring time interval between edges on 2 signals



57.4.23 External trigger synchronization (TIM15 only)

The TIM timers are linked together internally for timer synchronization or chaining.

The TIM15 timer can be synchronized with an external trigger in several modes: Reset mode, Gated mode, Trigger mode, Reset + trigger, and gated + reset modes.

Slave mode: Reset mode

The counter and its prescaler can be reinitialized in response to an event on a trigger input. Moreover, if the URS bit from the TIMx_CR1 register is low, an update event UEV is generated. Then all the preloaded registers (TIMx_ARR, TIMx_CCRx) are updated.

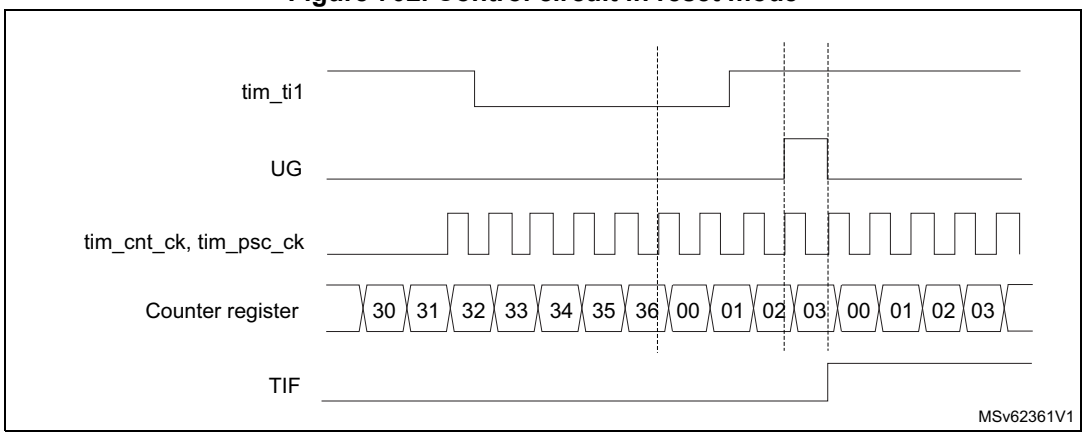
In the following example, the upcounter is cleared in response to a rising edge on tim_ti1 input:

1. Configure the channel 1 to detect rising edges on tim_ti1. Configure the input filter duration (in this example, no need for any filter, so IC1F is kept at 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in the TIMx_CCMR1 register. Write CC1P = 0 and CC1NP = 0 in the TIMx_CCER register to validate the polarity (and detect rising edges only).
2. Configure the timer in reset mode by writing SMS = 100 in TIMx_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIMx_SMCR register.
3. Start the counter by writing CEN = 1 in the TIMx_CR1 register.

The counter starts counting on the internal clock, then behaves normally until tim_ti1 rising edge. When tim_ti1 rises, the counter is cleared and restarts from 0. In the meantime, the trigger flag is set (TIF bit in the TIMx_SR register) and an interrupt request, or a DMA request can be sent if enabled (depending on the TIE and TDE bits in TIMx_DIER register).

The following figure shows this behavior when the autoreload register TIMx_ARR = 0x36. The delay between the rising edge on tim_ti1 and the actual reset of the counter is due to the resynchronization circuit on tim_ti1 input.

Figure 702. Control circuit in reset mode



Slave mode: Gated mode

The counter can be enabled depending on the level of a selected input.

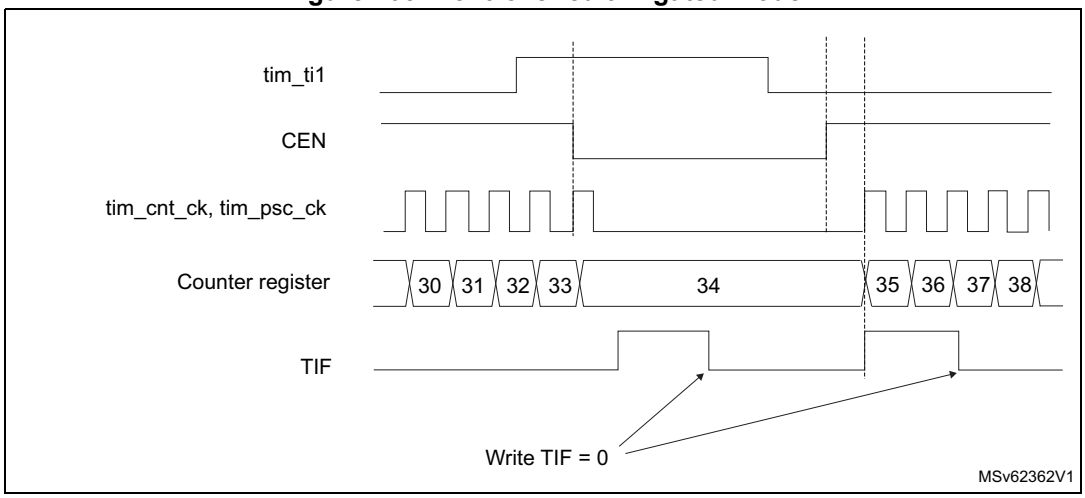
In the following example, the upcounter counts only when tim_ti1 input is low:

1. Configure the channel 1 to detect low levels on tim_ti1. Configure the input filter duration (in this example, no need for any filter, so IC1F is kept at 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in TIMx_CCMR1 register. Write CC1P = 1 and CC1NP = 0 in the TIMx_CCER register to validate the polarity (and detect low level only).
2. Configure the timer in gated mode by writing SMS = 101 in TIMx_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIMx_SMCR register.
3. Enable the counter by writing CEN = 1 in the TIMx_CR1 register (in gated mode, the counter does not start if CEN = 0, whatever is the trigger input level).

The counter starts counting on the internal clock as long as tim_ti1 is low and stops as soon as tim_ti1 becomes high. The TIF flag in the TIMx_SR register is set both when the counter starts or stops.

The delay between the rising edge on tim_ti1 and the actual stop of the counter is due to the resynchronization circuit on tim_ti1 input.

Figure 703. Control circuit in gated mode



Slave mode: Trigger mode

The counter can start in response to an event on a selected input.

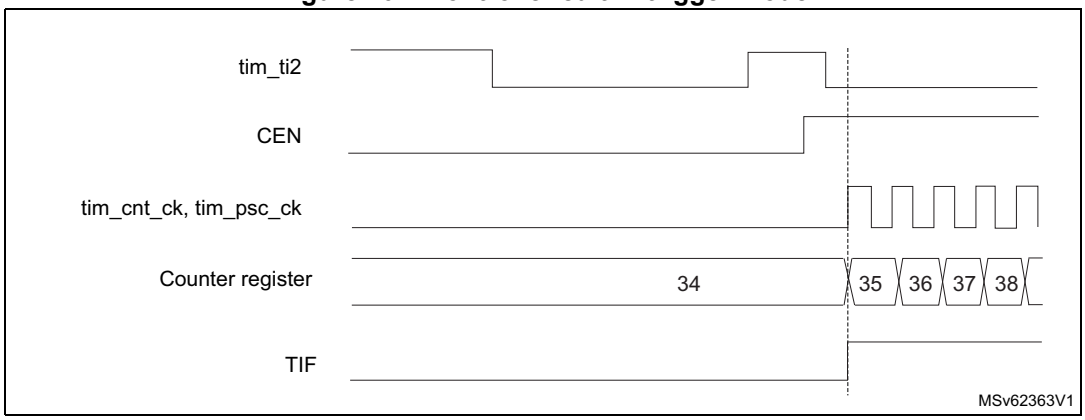
In the following example, the upcounter starts in response to a rising edge on tim_ti2 input:

1. Configure the channel 2 to detect rising edges on tim_ti2. Configure the input filter duration (in this example, no need for any filter, so IC2F is kept at 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC2S bits are configured to select the input capture source only, CC2S = 01 in TIMx_CCMR1 register. Write CC2P = 1 and CC2NP = 0 in the TIMx_CCER register to validate the polarity (and detect low level only).
2. Configure the timer in trigger mode by writing SMS = 110 in the TIMx_SMCR register. Select tim_ti2 as the input source by writing TS = 00110 in the TIMx_SMCR register.

When a rising edge occurs on tim_ti2, the counter starts counting on the internal clock and the TIF flag is set.

The delay between the rising edge on tim_ti2 and the actual start of the counter is due to the resynchronization circuit on tim_ti2 input.

Figure 704. Control circuit in trigger mode



Slave mode selection preload for run-time update

The SMS[3:0] bit can be preloaded. This is enabled by setting the SMSPE enable bit in the TIMx_SMCR register. The trigger for the transfer from SMS[3:0] preload to active value is the update event (UEV) occurring when the counter overflows.

57.4.24 Slave mode – combined reset + trigger mode (TIM15 only)

In this case, a rising edge of the selected trigger input (tim_trgi) reinitializes the counter, generates an update of the registers, and starts the counter.

This mode is used for one-pulse mode.

57.4.25 Slave mode – combined reset + gated mode (TIM15 only)

The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops and is reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

This mode is used to detect out-of-range PWM signal (duty cycle exceeding a maximum expected value).

57.4.26 Timer synchronization (TIM15 only)

The TIMx timers are linked together internally for timer synchronization or chaining. Refer to *Section 54.4.23: Timer synchronization* for details.

Note: The clock of the slave peripherals (such as timer and ADC) receiving the tim_trgo signal must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

57.4.27 Using timer output as trigger for other timers (TIM16/TIM17 only)

The timers with one channel only do not feature a master mode. However, the OC1 output signal can be used to trigger some other timers (including timers described in other sections of this document). Check the “TIMx internal trigger connection” table of any timer on the device to identify which timers can be targeted as slave.

The OC1 signal pulse width must be programmed to be at least two clock cycles of the destination timer, to make sure the slave timer detects the trigger.

For instance, if the destination's timer CK_INT clock is four times slower than the source timer, the OC1 pulse width must be eight clock cycles.

57.4.28 ADC triggers (TIM15 only)

The timer can generate an ADC triggering event with various internal signals, such as reset, enable or compare events.

Note: The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo signal must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

57.4.29 DMA burst mode

The TIMx timers have the capability to generate multiple DMA requests on a single event. The main purpose is to be able to reprogram several timer registers multiple times without software overhead, but it can also be used to read several registers in a row, at regular intervals.

The DMA controller destination is unique and must point to the virtual register TIMx_DMAR. On a given timer event, the timer launches a sequence of DMA requests (burst). Each write into the TIMx_DMAR register is actually redirected to one of the timer registers.

The DBL[4:0] bits in the TIMx_DCR register set the DMA burst length. The timer recognizes a burst transfer when a read or a write access is done to the TIMx_DMAR address), i.e. the number of transfers (either in half-words or in bytes).

The DBA[4:0] bits in the TIMx_DCR registers define the DMA base address for DMA transfers (when read/write accesses are done through the TIMx_DMAR address). DBA is defined as an offset starting from the address of the TIMx_CR1 register.

Example:

00000: TIMx_CR1

00001: TIMx_CR2

00010: TIMx_SMCR

The DBSS[3:0] bits in the TIMx_DCR register defines the interrupt source that triggers the DMA burst transfers (see *Section 57.8.19: TIMx DMA control register (TIMx_DCR)(x = 16 to 17)* for details).

For example, the timer DMA burst feature can be used to update the contents of the CCRx registers (x = 2, 3, 4) on an update event, with the DMA transferring half words into the CCRx registers.

This is done in the following steps:

1. Configure the corresponding DMA channel as follows:
   - DMA channel peripheral address is the DMAR register address
   - DMA channel memory address is the address of the buffer in the RAM containing the data to be transferred by DMA into the CCRx registers.
   - Number of data to transfer = 3 (See note below).
   - Circular mode disabled.
2. Configure the DCR register by configuring the DBA and DBL bit fields as follows: DBL = 3 transfers, DBA = 0xE and DBSS = 1.
3. Enable the TIMx update DMA request (set the UDE bit in the DIER register).
4. Enable TIMx
5. Enable the DMA channel

This example is for the case where every CCRx register is to be updated once. If every CCRx register is to be updated twice for example, the number of data to transfer must be 6. Let's take the example of a buffer in the RAM containing data1, data2, data3, data4, data5, and data6. The data is transferred to the CCRx registers as follows: on the first update DMA request, data1 is transferred to CCR2, data2 is transferred to CCR3, data3 is transferred to CCR4 and on the second update DMA request, data4 is transferred to CCR2, data5 is transferred to CCR3, and data6 is transferred to CCR4.

Note: A null value can be written to the reserved registers.

57.4.30 TIM15/TIM16/TIM17 DMA requests

The TIM15/TIM16/TIM17 can generate a DMA request, as shown in *Table 585*.

Table 585. DMA request

DMA request signal	DMA request	Enable control bit
tim_upd_dma	Update	UDE
tim_cc1_dma	Capture/compare 1	CC1DE
tim_cc2_dma	Capture/compare 2	CC2DE
tim_com_dma(1)	Commutation (COM)	COMDE
tim_trgi_dma(1)	Trigger	TDE

1. Available for TIM15 only.

57.4.31 Debug mode

When the microcontroller enters debug mode (Cortex-M33 core halted), the TIMx counter can either continue to work normally or stop.

The behavior in debug mode can be programmed with a dedicated configuration bit per timer in the Debug support (DBG) module.

For safety purposes, when the counter is stopped, the outputs are disabled (as if the MOE bit was reset). The outputs can either be forced to an inactive state (OSSI bit = 1), or have their control taken over by the GPIO controller (OSSI bit = 0) to force them to Hi-Z.

For more details, refer to the debug section.

57.5 TIM15/TIM16/TIM17 low-power modes

Table 586. Effect of low-power modes on TIM15/TIM16/TIM17

Mode	Description
Sleep	No effect, peripheral is active. The interrupts can cause the device to exit from Sleep mode.
Stop	The timer operation is stopped and the register content is kept. No interrupt can be generated.
Standby	The timer is powered-down and must be reinitialized after exiting the Standby mode.

57.6 TIM15/TIM16/TIM17 interrupts

The TIM15/TIM16/TIM17 can generate multiple interrupts, as shown in *Table 587*.

Table 587. Interrupt requests

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from Sleep mode	Exit from Stop and Standby mode
TIM	Update	UIF	UIE	write 0 in UIF	Yes	No
	Capture/compare 1	CC1IF	CC1IE	write 0 in CC1IF	Yes	No
	Capture/compare 2(1)	CC2IF	CC2IE	write 0 in CC2IF	Yes	No
	Commutation (COM)	COMIF	COMIE	write 0 in COMIF	Yes	No
	Trigger(1)	TIF	TIE	write 0 in TIF	Yes	No
	Break	BIF	BIE	write 0 in BIF	Yes	No

1. Available for TIM15 only.

57.7 TIM15 registers

Refer to *Section 1.2* for a list of abbreviations used in register descriptions.

The peripheral registers can be accessed by half-words (16-bit) or words (32-bit).

57.7.1 TIM15 control register 1 (TIM15_CR1)

Address offset: 0x00

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DITHEN	UIFREMAP	Res.	CKD[1:0]		ARPE	Res.	Res.	Res.	OPM	URS	UDIS	CEN
			rw	rw		rw	rw	rw				rw	rw	rw	rw

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 DITHEN: Dithering enable
0: Dithering disabled
1: Dithering enabled
Note: The DITHEN bit can only be modified when CEN bit is reset.

Bit 11 **UIFREMAP**: UIF status bit remapping
0: No remapping. UIF status bit is not copied to TIM15_CNT register bit 31.
1: Remapping enabled. UIF status bit is copied to TIM15_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division
This bitfield indicates the division ratio between the timer clock (tim_ker_ck) frequency and the dead-time and sampling clock (t_{DTS}) used by the dead-time generators and the digital filters (tim_tix)
00: $t_{DTS} = t_{tim_ker_ck}$
01: $t_{DTS} = 2*t_{tim_ker_ck}$
10: $t_{DTS} = 4*t_{tim_ker_ck}$
11: Reserved

Bit 7 **ARPE**: Auto-reload preload enable
0: TIM15_ARR register is not buffered
1: TIM15_ARR register is buffered

Bits 6:4 Reserved, must be kept at reset value.

Bit 3 **OPM**: One-pulse mode
0: Counter is not stopped at update event
1: Counter stops counting at the next update event (clearing the bit CEN)

Bit 2 **URS**: Update request source

This bit is set and cleared by software to select the UEV event sources.

0: Any of the following events generate an update interrupt if enabled. These events can be:

– Counter overflow/underflow

– Setting the UG bit

– Update generation through the slave mode controller

1: Only counter overflow/underflow generates an update interrupt if enabled

Bit 1 **UDIS**: Update disable

This bit is set and cleared by software to enable/disable UEV event generation.

0: UEV enabled. The Update (UEV) event is generated by one of the following events:

– Counter overflow/underflow

– Setting the UG bit

– Update generation through the slave mode controller

Buffered registers are then loaded with their preload values.

1: UEV disabled. The Update event is not generated, shadow registers keep their value (ARR, PSC, CCRx). However the counter and the prescaler are reinitialized if the UG bit is set or if a hardware reset is received from the slave mode controller.

Bit 0 **CEN**: Counter enable

0: Counter disabled

1: Counter enabled

Note: External clock and gated mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.

57.7.2 TIM15 control register 2 (TIM15_CR2)

Address offset: 0x04

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	OIS2	OIS1N	OIS1	TI1S	MMS[2:0]			CCDS	CCUS	Res.	CCPC
					rw	rw	rw	rw	rw	rw	rw	rw	rw		rw

Bits 15:11 Reserved, must be kept at reset value.

Bit 10 **OIS2:** Output idle state 2 (tim_oc2 output)

0: tim_oc2 = 0 when MOE = 0

1: tim_oc2 = 1 when MOE = 0

Note: This bit cannot be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in the TIM15_BKR register).

Bit 9 **OIS1N**: Output Idle state 1 (tim_oc1n output)

0: tim_oc1n = 0 after a dead-time when MOE = 0

1: tim_oc1n = 1 after a dead-time when MOE = 0

Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM15_BKR register).

Bit 8 **OIS1**: Output Idle state 1 (tim_oc1 output)

0: tim_oc1 = 0 after a dead-time when MOE = 0

1: tim_oc1 = 1 after a dead-time when MOE = 0

Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM15_BKR register).

Bit 7 **TI1S**: tim_ti1 selection

0: The tim_ti1_in[15:0] multiplexer output is connected to tim_ti1 input

1: The tim_ti1_in[15:0] and tim_ti2_in[15:0] multiplexers output are connected to the tim_ti1 input (XOR combination)

Bits 6:4 **MMS[2:0]**: Master mode selection

These bits are used to select the information to be sent in master mode to slave timers for synchronization (tim_trgo). The combination is as follows:

000: **Reset** - the UG bit from the TIM15_EGR register is used as trigger output (tim_trgo). If the reset is generated by the trigger input (slave mode controller configured in reset mode) then the signal on tim_trgo is delayed compared to the actual reset.

001: **Enable** - the Counter Enable signal CNT_EN is used as trigger output (tim_trgo). It is useful to start several timers at the same time or to control a window in which a slave timer is enable. The Counter Enable signal is generated by a logic AND between CEN control bit and the trigger input when configured in gated mode. When the Counter Enable signal is controlled by the trigger input, there is a delay on tim_trgo, except if the master/slave mode is selected (see the MSM bit description in TIM15_SMCR register).

010: **Update** - The update event is selected as trigger output (tim_trgo). For instance a master timer can then be used as a prescaler for a slave timer.

011: **Compare Pulse** - The trigger output send a positive pulse when the CC1IF flag is to be set (even if it was already high), as soon as a capture or a compare match occurred (tim_trgo).

100: **Compare** - tim_oc1refc signal is used as trigger output (tim_trgo).

101: **Compare** - tim_oc2refc signal is used as trigger output (tim_trgo).

Bit 3 **CCDS**: Capture/compare DMA selection

0: CCx DMA request sent when CCx event occurs

1: CCx DMA requests sent when update event occurs

Bit 2 **CCUS**: Capture/compare control update selection

0: When capture/compare control bits are preloaded (CCPC = 1), they are updated by setting the COMG bit only.

1: When capture/compare control bits are preloaded (CCPC = 1), they are updated by setting the COMG bit or when an rising edge occurs on tim_trgi.

Note: This bit acts only on channels that have a complementary output.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **CCPC**: Capture/compare preloaded control

0: CCxE, CCxNE and OCxM bits are not preloaded

1: CCxE, CCxNE and OCxM bits are preloaded, after having been written, they are updated only when a commutation event (COM) occurs (COMG bit set or rising edge detected on tim_trgi, depending on the CCUS bit).

Note: This bit acts only on channels that have a complementary output.

57.7.3 TIM15 slave mode control register (TIM15_SMCR)

Address offset: 0x08

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	SMSPE	Res.	Res.	TS[4:3]		Res.	Res.	Res.	SMS[3]
							rw			rw	rw				rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MSM	TS[2:0]			Res.	SMS[2:0]		
								rw	rw	rw	rw		rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **SMSPE:** SMS preload enable

This bit selects whether the SMS[3:0] bitfield is preloaded.

0: SMS[3:0] bitfield is not preloaded

1: SMS[3:0] preload is enabled

Bits 23:22 Reserved, must be kept at reset value.

Bits 19:17 Reserved, must be kept at reset value.

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **MSM:** Master/slave mode

0: No action

1: The effect of an event on the trigger input (tim_trgi) is delayed to allow a perfect synchronization between the current timer and its slaves (through tim_trgo). It is useful if the user wants to synchronize several timers on a single external event.

Bits 21, 20, 6, 5, 4 **TS[4:0]:** Trigger selection

This bitfield selects the trigger input to be used to synchronize the counter.

00000: Internal Trigger 0 (tim_itr0)
00001: Internal Trigger 1 (tim_itr1)
00010: Internal Trigger 2 (tim_itr2)
00011: Internal Trigger 3 (tim_itr3)
00100: tim_ti1 Edge Detector (tim_ti1f_ed)
00101: Filtered Timer Input 1 (tim_ti1fp1)
00110: Filtered Timer Input 2 (tim_ti2fp2)
00111: Reserved
01000: Internal Trigger 4 (tim_itr4)
01001: Internal Trigger 5 (tim_itr5)
01010: Internal Trigger 6 (tim_itr6)
01011: Internal Trigger 7 (tim_itr7)
01100: Internal Trigger 8 (tim_itr8)
01101: Internal Trigger 9 (tim_itr9)
01110: Internal Trigger 10 (tim_itr10)
10000: Internal trigger 12 (tim_itr12)
10001: Internal trigger 13 (tim_itr13)
10010: Internal trigger 14 (tim_itr14)
10011: Internal trigger 15 (tim_itr15)
Others: Reserved

See *Section 57.4.2: TIM15/TIM16/TIM17 pins and internal signals* for more details on tim_itrx meaning for each timer.

Note: These bits must be changed only when they are not used (for example when SMS = 000) to avoid wrong edge detections at the transition.

Bit 3 Reserved, must be kept at reset value.

Bits 16, 2, 1, 0 **SMS[3:0]:** Slave mode selection

When external signals are selected the active edge of the trigger signal (tim_trgi) is linked to the polarity selected on the external input (refer to ETP bit in TIMx_SMCR for tim_etr_in and CCxP/CCxNP bits in TIMx_CCER register for tim_ti1fp1 and tim_ti2fp2).

0000: Slave mode disabled - if CEN = 1 then the prescaler is clocked directly by the internal clock.

0001: Reserved

0010: Reserved

0011: Reserved

0100: Reset mode - Rising edge of the selected trigger input (tim_trgi) reinitializes the counter and generates an update of the registers.

0101: Gated mode - The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops (but is not reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

0110: Trigger mode - The counter starts at a rising edge of the trigger tim_trgi (but it is not reset). Only the start of the counter is controlled.

0111: External Clock mode 1 - Rising edges of the selected trigger (tim_trgi) clock the counter.

1000: Combined reset + trigger mode - Rising edge of the selected trigger input (tim_trgi) reinitializes the counter, generates an update of the registers and starts the counter.

1001: Combined gated + reset mode - The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops and is reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

Others: Reserved.

Note: The gated mode must not be used if tim_ti1f_ed is selected as the trigger input (TS = 00100). Indeed, tim_ti1f_ed outputs 1 pulse for each transition on tim_ti1f, whereas the gated mode checks the level of the trigger signal.

The clock of the slave peripherals (such as timer and ADC) receiving the tim_trgo signal must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

57.7.4 TIM15 DMA/interrupt enable register (TIM15_DIER)

Address offset: 0x0C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	TDE	COMDE	Res.	Res.	CC2DE	CC1DE	UDE	BIE	TIE	COMIE	Res.	Res.	CC2IE	CC1IE	UIE
	rw	rw			rw	rw	rw	rw	rw	rw			rw	rw	rw

Bit 15 Reserved, must be kept at reset value.

Bit 14 **TDE**: Trigger DMA request enable

0: Trigger DMA request disabled

1: Trigger DMA request enabled

Bit 13 **COMDE**: COM DMA request enable

0: COM DMA request disabled

1: COM DMA request enabled

Bits 12:11 Reserved, must be kept at reset value.

Bit 10 **CC2DE**: Capture/Compare 2 DMA request enable
0: CC2 DMA request disabled
1: CC2 DMA request enabled

Bit 9 **CC1DE**: Capture/Compare 1 DMA request enable
0: CC1 DMA request disabled
1: CC1 DMA request enabled

Bit 8 **UDE**: Update DMA request enable
0: Update DMA request disabled
1: Update DMA request enabled

Bit 7 **BIE**: Break interrupt enable
0: Break interrupt disabled
1: Break interrupt enabled

Bit 6 **TIE**: Trigger interrupt enable
0: Trigger interrupt disabled
1: Trigger interrupt enabled

Bit 5 **COMIE:** COM interrupt enable
0: COM interrupt disabled
1: COM interrupt enabled

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **CC2IE**: Capture/Compare 2 interrupt enable
0: CC2 interrupt disabled
1: CC2 interrupt enabled

Bit 1 **CC1IE**: Capture/Compare 1 interrupt enable
0: CC1 interrupt disabled
1: CC1 interrupt enabled

Bit 0 **UIE**: Update interrupt enable
0: Update interrupt disabled
1: Update interrupt enabled

57.7.5 TIM15 status register (TIM15_SR)

Address offset: 0x10

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	CC2OF	CC1OF	Res.	BIF	TIF	COMIF	Res.	Res.	CC2IF	CC1IF	UIF
					rc_w0	rc_w0		rc_w0	rc_w0	rc_w0			rc_w0	rc_w0	rc_w0

Bits 15:11 Reserved, must be kept at reset value.

Bit 10 **CC2OF**: Capture/Compare 2 overcapture flag
Refer to CC1OF description

Bit 9 **CC1OF**: Capture/Compare 1 overcapture flag
This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to 0.
0: No overcapture has been detected
1: The counter value has been captured in TIM15_CCR1 register while CC1IF flag was already set

Bit 8 Reserved, must be kept at reset value.

Bit 7 **BIF**: Break interrupt flag
This flag is set by hardware as soon as the break input goes active. It can be cleared by software if the break input is not active.
0: No break event occurred
1: An active level has been detected on the break input

Bit 6 **TIF**: Trigger interrupt flag
This flag is set by hardware on the TRG trigger event (active edge detected on tim_trgi input when the slave mode controller is enabled in all modes but gated mode, both edges in case gated mode is selected). It is set when the counter starts or stops when gated mode is selected. It is cleared by software.
0: No trigger event occurred
1: Trigger interrupt pending

Bit 5 **COMIF:** COM interrupt flag
This flag is set by hardware on a COM event (once the capture/compare control bits –CCxE, CCxNE, OCxM– have been updated). It is cleared by software.
0: No COM event occurred
1: COM interrupt pending

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **CC2IF**: Capture/Compare 2 interrupt flag
refer to CC1IF description

Bit 1 **CC1IF**: Capture/Compare 1 interrupt flag
This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIMx_CCR1 register (input capture mode only).
0: No compare match / No input capture occurred
1: A compare match or an input capture occurred
If channel CC1 is configured as output: this flag is set when the content of the counter TIMx_CNT matches the content of the TIMx_CCR1 register. When the content of TIMx_CCR1 is greater than the content of TIMx_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in downcounting mode). There are 3 possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIMx_CR1 register for the full description.
If channel CC1 is configured as input: this bit is set when counter value has been captured in TIMx_CCR1 register (an edge has been detected on IC1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIMx_CCER).

Bit 0 **UIF**: Update interrupt flag
This bit is set by hardware on an update event. It is cleared by software.
0: No update occurred.
1: Update interrupt pending. This bit is set by hardware when the registers are updated:
– At overflow regarding the repetition counter value (update if repetition counter = 0) and if the UDIS = 0 in the TIM15_CR1 register.
– When CNT is reinitialized by software using the UG bit in TIM15_EGR register, if URS = 0 and UDIS = 0 in the TIM15_CR1 register.
– When CNT is reinitialized by a trigger event (refer to *Section 57.7.3: TIM15 slave mode control register (TIM15_SMCR)*), if URS = 0 and UDIS = 0 in the TIM15_CR1 register.

57.7.6 TIM15 event generation register (TIM15_EGR)

Address offset: 0x14

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BG	TG	COMG	Res.	Res.	CC2G	CC1G	UG
								w	w	rw			w	w	w

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **BG**: Break generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: A break event is generated. MOE bit is cleared and BIF flag is set. Related interrupt or DMA transfer can occur if enabled.

Bit 6 **TG**: Trigger generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: The TIF flag is set in TIM15_SR register. Related interrupt or DMA transfer can occur if enabled

Bit 5 **COMG:** Capture/Compare control update generation
This bit can be set by software, it is automatically cleared by hardware.
0: No action
1: When the CCPC bit is set, it is possible to update the CCxE, CCxNE and OCxM bits
Note: This bit acts only on channels that have a complementary output.

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **CC2G**: Capture/Compare 2 generation
Refer to CC1G description

Bit 1 **CC1G**: Capture/Compare 1 generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1 A capture/compare event is generated on channel 1:
If channel CC1 is configured as output:
CC1IF flag is set, Corresponding interrupt or DMA request is sent if enabled.
If channel CC1 is configured as input:
The current value of the counter is captured in TIM15_CCR1 register. The CC1IF flag is set, the corresponding interrupt or DMA request is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation
This bit can be set by software, it is automatically cleared by hardware.
0: No action
1: Reinitialize the counter and generates an update of the registers. Note that the prescaler counter is cleared too (anyway the prescaler ratio is not affected).

57.7.7 TIM15 capture/compare mode register 1 (TIM15_CCMR1)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

IC2F[3:0]				IC2PSC[1:0]		CC2S[1:0]		IC1F[3:0]				IC1PSC[1:0]		CC1S[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Input capture mode

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC2F[3:0]**: Input capture 2 filter

Bits 11:10 **IC2PSC[1:0]**: Input capture 2 prescaler

Bits 9:8 **CC2S[1:0]**: Capture/Compare 2 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output

01: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti2

10: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti1

11: CC2 channel is configured as input, tim_ic2 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM15_SMCR register)

Note: CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIM15_CCER).

Bits 7:4 **IC1F[3:0]**: Input capture 1 filter

This bitfield defines the frequency used to sample tim_ti1 input and the length of the digital filter applied to tim_ti1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at f_{DTS}

0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2

0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4

0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8

0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6

0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8

0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6

0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8

1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6

1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8

1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5

1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6

1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8

1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5

1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6

1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Bits 3:2 **IC1PSC[1:0]**: Input capture 1 prescaler

This bitfield defines the ratio of the prescaler acting on CC1 input (tim_ic1). The prescaler is reset as soon as CC1E = 0 (TIM15_CCER register).

00: no prescaler, capture is done each time an edge is detected on the capture input

01: capture is done once every 2 events

10: capture is done once every 4 events

11: capture is done once every 8 events

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1

10: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti2

11: CC1 channel is configured as input, tim_ic1 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM15_SMCR register)

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIM15_CCER).

57.7.8 TIM15 capture/compare mode register 1 [alternate] (TIM15_CCMR1)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Output compare mode:

Bits 31:25 Reserved, must be kept at reset value.

Bits 23:17 Reserved, must be kept at reset value.

Bit 15 **OC2CE**: Output compare 2 clear enable

Bits 24, 14:12 **OC2M[3:0]**: Output compare 2 mode

Bit 11 **OC2PE**: Output compare 2 preload enable

Bit 10 **OC2FE**: Output compare 2 fast enable

Bits 9:8 **CC2S[1:0]**: Capture/Compare 2 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output.

01: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti2.

10: C2 channel is configured as input, tim_ic2 is mapped on tim_ti1.

11: CC2 channel is configured as input, tim_ic2 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through the TS bit (TIM15_SMCR register)

Note: CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIM15_CCER).

Bit 7 **OC1CE**: Output compare 1 clear enable

0: tim_oc1ref is not affected by the tim_ocref_clr_int input.

1: tim_oc1ref is cleared as soon as a High level is detected on tim_ocref_clr_int input.

Bits 16, 6:4 **OC1M[3:0]**: Output compare 1 mode

These bits define the behavior of the output reference signal tim_oc1ref from which tim_oc1 and tim_oc1n are derived. tim_oc1ref is active high whereas tim_oc1 and tim_oc1n active level depends on CC1P and CC1NP bits.

0000: Frozen - The comparison between the output compare register TIM15_CCR1 and the counter TIM15_CNT has no effect on the outputs. This mode can be used when the timer serves as a software timebase. When the frozen mode is enabled during timer operation, the output keeps the state (active or inactive) it had before entering the frozen state.

0001: Set channel 1 to active level on match. tim_oc1ref signal is forced high when the counter TIM15_CNT matches the capture/compare register 1 (TIM15_CCR1).

0010: Set channel 1 to inactive level on match. tim_oc1ref signal is forced low when the counter TIM15_CNT matches the capture/compare register 1 (TIM15_CCR1).

0011: Toggle - tim_oc1ref toggles when TIM15_CNT = TIM15_CCR1.

0100: Force inactive level - tim_oc1ref is forced low.

0101: Force active level - tim_oc1ref is forced high.

0110: PWM mode 1 - Channel 1 is active as long as TIM15_CNT<TIM15_CCR1 else inactive.

0111: PWM mode 2 - Channel 1 is inactive as long as TIM15_CNT<TIM15_CCR1 else active.

1000: Retrigerrable OPM mode 1 - In up-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update. In down-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update.

1001: Retrigerrable OPM mode 2 - In up-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update. In down-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

1010: Reserved

1011: Reserved

1100: Combined PWM mode 1 - tim_oc1ref has the same behavior as in PWM mode 1. tim_oc1refc is the logical OR between tim_oc1ref and tim_oc2ref.

1101: Combined PWM mode 2 - tim_oc1ref has the same behavior as in PWM mode 2. tim_oc1refc is the logical AND between tim_oc1ref and tim_oc2ref.

1110: Reserved,

1111: Reserved,

Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIM15_BDTR register) and CC1S = 00 (the channel is configured in output).

In PWM mode, the OCREF level changes when the result of the comparison changes, when the output compare mode switches from “frozen” mode to “PWM” mode and when the output compare mode switches from “force active/inactive” mode to “PWM” mode.

On channels that have a complementary output, this bitfield is preloaded. If the CCPC bit is set in the TIM15_CR2 register then the OC1M active bits take the new value from the preloaded bits only when a COM event is generated.

Bit 3 **OC1PE**: Output Compare 1 preload enable

0: Preload register on TIM15_CCR1 disabled. TIM15_CCR1 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIM15_CCR1 enabled. Read/Write operations access the preload register. TIM15_CCR1 preload value is loaded in the active register at each update event.

Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIM15_BDTR register) and CC1S = 00 (the channel is configured in output).

Bit 2 **OC1FE**: Output Compare 1 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIMx_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

0: CC1 behaves normally depending on counter and CCR1 values even when the trigger is ON. The minimum delay to activate CC1 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC1 output. Then, tim_ocx is set to the compare level independently of the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to 3 clock cycles. OCFE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output.

01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1.

10: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti2.

11: CC1 channel is configured as input, tim_ic1 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM15_SMCR register)

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIM15_CCER).

57.7.9 TIM15 capture/compare enable register (TIM15_CCER)

Address offset: 0x20

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CC2NP	Res.	CC2P	CC2E	CC1NP	CC1NE	CC1P	CC1E
								rw		rw	rw	rw	rw	rw	rw

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **CC2NP**: Capture/Compare 2 complementary output polarity
Refer to CC1NP description

Bit 6 Reserved, must be kept at reset value.

Bit 5 **CC2P**: Capture/Compare 2 output polarity
Refer to CC1P description

Bit 4 **CC2E**: Capture/Compare 2 output enable
Refer to CC1E description

Bit 3 **CC1NP**: Capture/Compare 1 complementary output polarity

CC1 channel configured as output:

0: tim_oc1n active high

1: tim_oc1n active low

CC1 channel configured as input:

This bit is used in conjunction with CC1P to define the polarity of tim_ti1fp1 and tim_ti2fp1. Refer to CC1P description.

Note: This bit is not writable as soon as LOCK level 2 or 3 has been programmed (LOCK bits in TIM15_BDTR register) and CC1S = 00 (the channel is configured in output).

On channels that have a complementary output, this bit is preloaded. If the CCPC bit is set in the TIM15_CR2 register then the CC1NP active bit takes the new value from the preloaded bit only when a Commutation event is generated.

Bit 2 **CC1NE**: Capture/Compare 1 complementary output enable

0: Off - tim_oc1n is not active. tim_oc1n level is then function of MOE, OSSI, OSSR, OIS1, OIS1N and CC1E bits.

1: On - tim_oc1n signal is output on the corresponding output pin depending on MOE, OSSI, OSSR, OIS1, OIS1N and CC1E bits.

Bit 1 **CC1P**: Capture/Compare 1 output polarity

CC1 channel configured as output:

0: OC1 active high (output mode) / Edge sensitivity selection (input mode, see below)

1: OC1 active low (output mode) / Edge sensitivity selection (input mode, see below)

When CC1 channel is configured as input, both CC1NP/CC1P bits select the active polarity of TI1FP1 and TI2FP1 for trigger or capture operations.

CC1NP = 0, CC1P = 0: non-inverted/rising edge. The circuit is sensitive to TIxFP1 rising edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode).

CC1NP = 0, CC1P = 1: inverted/falling edge. The circuit is sensitive to TIxFP1 falling edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is inverted (trigger operation in gated mode).

CC1NP = 1, CC1P = 1: non-inverted/both edges/ The circuit is sensitive to both TIxFP1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), TIxFP1is not inverted (trigger operation in gated mode).

CC1NP = 1, CC1P = 0: this configuration is reserved, it must not be used.

Note: This bit is not writable as soon as LOCK level 2 or 3 has been programmed (LOCK bits in TIM15_BDTR register).

On channels that have a complementary output, this bit is preloaded. If the CCPC bit is set in the TIM15_CR2 register then the CC1P active bit takes the new value from the preloaded bit only when a Commutation event is generated.

Bit 0 **CC1E**: Capture/Compare 1 output enable

0: Capture mode disabled / OC1 is not active (see below)

1: Capture mode enabled / OC1 signal is output on the corresponding output pin

When CC1 channel is configured as output, the OC1 level depends on MOE, OSSI, OSSR, OIS1, OIS1N and CC1NE bits, regardless of the CC1E bits state. Refer to *Table 588* for details.

Table 588. Output control bits for complementary tim_ocx and tim_ocxn channels with break feature (TIM15)

Control bits					Output states(1)	
MOE bit	OSSI bit	OSSR bit	CCxE bit	CCxNE bit	tim_ocx output state	tim_ocxn output state
1	X	X	0	0	Output Disabled (not driven by the timer: Hi-Z) tim_ocx = 0 tim_ocxn = 0	
		0	0	1	Output Disabled (not driven by the timer: Hi-Z) tim_ocx = 0	tim_ocxref + Polarity tim_ocxn = tim_ocxref XOR CCxNP
		0	1	0	tim_ocxref + Polarity tim_ocx = tim_ocxref XOR CCxP	Output Disabled (not driven by the timer: Hi-Z) tim_ocxn = 0
		X	1	1	tim_ocxref + Polarity + dead-time	Complementary to tim_ocxref (not OCREF) + Polarity + dead-time
		1	0	1	Off-State (output enabled with inactive state) tim_ocx = CCxP	tim_ocxref + Polarity tim_ocxn = tim_ocxref XOR CCxNP
		1	1	0	tim_ocxref + Polarity tim_ocx = tim_ocxref xor CCxP	Off-State (output enabled with inactive state) tim_ocxn = CCxNP
0	0	X	X	X	Output disabled (not driven by the timer: Hi-Z)	
	1		0	0		
			0	1	Off-State (output enabled with inactive state) Asynchronously: tim_ocx = CCxP, tim_ocxn = CCxNP Then if the clock is present: tim_ocx = OISx and tim_ocxn = OISxN after a dead-time, assuming that OISx and OISxN do not correspond to tim_ocx and tim_ocxn both in active state	
			1	0		
			1	1		

1. When both outputs of a channel are not used (control taken over by GPIO controller), the OISx, OISxN, CCxP and CCxNP bits must be kept cleared.

Note: The state of the external I/O pins connected to the complementary tim_ocx and tim_ocxn channels depends on the tim_ocx and tim_ocxn channel state and GPIO control and alternate function selection registers.

57.7.10 TIM15 counter (TIM15_CNT)

Address offset: 0x24

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **UIFCPY**: UIF Copy
This bit is a read-only copy of the UIF bit in the TIM15_ISR register.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]**: Counter value
Non-dithering mode (DITHEN = 0)
The register holds the counter value.
Dithering mode (DITHEN = 1)
The register only holds the non-dithered part in CNT[15:0]. The fractional part is not available.

57.7.11 TIM15 prescaler (TIM15_PSC)

Address offset: 0x28

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PSC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **PSC[15:0]**: Prescaler value
The counter clock frequency ($f_{tim_cnt_ck}$) is equal to $f_{tim_psc_ck}$ / (PSC[15:0] + 1).
PSC contains the value to be loaded in the active prescaler register at each update event (including when the counter is cleared through UG bit of TIM15_EGR register or through trigger controller when configured in “reset mode”).

57.7.12 TIM15 autoreload register (TIM15_ARR)

Address offset: 0x2C

Reset value: 0x0000 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ARR[19:16]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **ARR[19:0]**: Auto-reload value

ARR is the value to be loaded in the actual auto-reload register.

Refer to the *Section 57.4.3: Time-base unit* for more details about ARR update and behavior.

The counter is blocked while the auto-reload value is null.

Non-dithering mode (DITHEN = 0)

The register holds the auto-reload value in ARR[15:0]. The ARR[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in ARR[19:4]. The ARR[3:0] bitfield contains the dithered part.

57.7.13 TIM15 repetition counter register (TIM15_RCR)

Address offset: 0x30

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	REP[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **REP[7:0]**: Repetition counter reload value

This bitfield defines the update rate of the compare registers (i.e. periodic transfers from preload to active registers) when preload registers are enable. It also defines the update interrupt generation rate, if this interrupt is enable.

When the repetition down-counter reaches zero, an update event is generated and it restarts counting from REP value. As the reptition counter is reloaded with REP value only at the repetition update event UEV, any write to the TIM15_RCR register is not taken in account until the next repetition update event.

It means in PWM mode (REP+1) corresponds to the number of PWM periods in edge-aligned mode:

– The number of PWM periods in edge-aligned mode.
– The number of half PWM period in center-aligned mode.

57.7.14 TIM15 capture/compare register 1 (TIM15_CCR1)

Address offset: 0x34

Reset value: 0x0000 0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR1[19:0]**: Capture/compare 1 value

If channel CC1 is configured as output:

CCR1 is the value to be loaded in the actual capture/compare 1 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIM15_CCMR1 register (bit OC1PE). Else the preload value is copied in the active capture/compare 1 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIM15_CNT and signaled on tim_oc1 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value in CCR1[15:0]. The CCR1[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR1[19:4]. The CCR1[3:0] bitfield contains the dithered part.

If channel CC1 is configured as input:

CR1 is the counter value transferred by the last input capture 1 event (tim_ic1). The TIMx_CCR1 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value in CCR1[15:0]. The CCR1[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR1[19:4]. The CCR1[3:0] bits are reset.

57.7.15 TIM15 capture/compare register 2 (TIM15_CCR2)

Address offset: 0x38

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCR2[19:16]			
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR2[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR2[19:0]**: Capture/compare 2 value

If channel CC2 is configured as output:

CCR2 is the value to be loaded in the actual capture/compare 2 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIM15_CCMR2 register (bit OC2PE). Else the preload value is copied in the active capture/compare 2 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIM15_CNT and signalled on tim_oc2 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value in CCR2[15:0]. The CCR2[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR2[19:4]. The CCR2[3:0] bitfield contains the dithered part.

If channel CC2 is configured as input:

CCR2 is the counter value transferred by the last input capture 1 event (tim_ic2). The TIMx_CCR2 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value in CCR2[15:0]. The CCR2[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR2[19:4]. The CCR2[3:0] bits are reset.

57.7.16 TIM15 break and dead-time register (TIM15_BDTR)

Address offset: 0x44

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	BKBID	Res.	BK DSRM	Res.	Res.	Res.	Res.	Res.	Res.	BKF[3:0]			
			rw		rw							rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MOE	AOE	BKP	BKE	OSSR	OSSI	LOCK[1:0]		DTG[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Note: As the BKBID, BKDSRM, BKF[3:0], AOE, BKP, BKE, OSSI, OSSR, and DTG[7:0] bits may be write-locked depending on the LOCK configuration, it may be necessary to configure all of them during the first write access to the TIM15_BDTR register.

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **BKBID**: Break bidirectional

0: Break input tim_brk in input mode
1: Break input tim_brk in bidirectional mode
In the bidirectional mode (BKBID bit set to 1), the break input is configured both in input mode and in open drain output mode. Any active break event asserts a low logic level on the Break input to indicate an internal break event to external devices.

Note: This bit cannot be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bit 27 Reserved, must be kept at reset value.

Bit 26 **BKDSRM**: Break disarm

0: Break input tim_brk is armed
1: Break input tim_brk is disarmed
This bit is cleared by hardware when no break source is active.
The BKDSRM bit must be set by software to release the bidirectional output control (open-drain output in Hi-Z state) and then be polled until it is reset by hardware, indicating that the fault condition has disappeared.

Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bits 25:20 Reserved, must be kept at reset value.

Bits 19:16 **BKF[3:0]**: Break filter

This bitfield defines the frequency used to sample the tim_brk input signal and the length of the digital filter applied to tim_brk. The digital filter is made of an event counter in which N events are needed to validate a transition on the output:
0000: No filter, tim_brk acts asynchronously
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 15 **MOE**: Main output enable

This bit is cleared asynchronously by hardware as soon as the tim_brk input is active. It is set by software or automatically depending on the AOE bit. It is acting only on the channels which are configured in output.

0: tim_ocx and tim_ocxn outputs are disabled or forced to idle state depending on the OSSI bit.

1: tim_ocx and tim_ocxn outputs are enabled if their respective enable bits are set (CCxE, CCxNE in TIM15_CCER register)

See tim_ocx/tim_ocxn enable description for more details (*Section 57.7.9: TIM15 capture/compare enable register (TIM15_CCER) on page 3145*).

Bit 14 **AOE**: Automatic output enable

0: MOE can be set only by software

1: MOE can be set by software or automatically at the next update event (if the break input is not be active)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 13 **BKP**: Break polarity

0: Break input tim_brk is active low

1: Break input tim_brk is active high

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bit 12 **BKE**: Break enable

0: Break inputs (tim_brk and tim_sys_brk clock failure event) disabled

1; Break inputs (tim_brk and tim_sys_brk clock failure event) enabled

This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bit 11 **OSSR**: Off-state selection for Run mode

This bit is used when MOE = 1 on channels that have a complementary output which are configured as outputs. OSSR is not implemented if no complementary output is implemented in the timer.

See tim_ocx/tim_ocxn enable description for more details (*Section 57.7.9: TIM15 capture/compare enable register (TIM15_CCER) on page 3145*).

0: When inactive, tim_ocx/tim_ocxn outputs are disabled (the timer releases the output control which is taken over by the GPIO, which forces a Hi-Z state)

1: When inactive, tim_ocx/tim_ocxn outputs are enabled with their inactive level as soon as CCxE = 1 or CCxNE = 1 (the output is still controlled by the timer).

Note: This bit can not be modified as soon as the LOCK level 2 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 10 **OSSI**: Off-state selection for Idle mode

This bit is used when MOE = 0 on channels configured as outputs.

See tim_ocx/tim_ocxn enable description for more details (*Section 57.7.9: TIM15 capture/compare enable register (TIM15_CCER) on page 3145*).

0: When inactive, tim_ocx/tim_ocxn outputs are disabled (tim_ocx/tim_ocxn enable output signal = 0)

1: When inactive, tim_ocx/tim_ocxn outputs are forced first with their idle level as soon as CCxE = 1 or CCxNE = 1. tim_ocx/tim_ocxn enable output signal = 1)

Note: This bit can not be modified as soon as the LOCK level 2 has been programmed (LOCK bits in TIM15_BDTR register).

Bits 9:8 **LOCK[1:0]**: Lock configuration

These bits offer a write protection against software errors.

00: LOCK OFF - No bit is write protected

01: LOCK Level 1 = DTG bits in TIM15_BDTR register, OISx and OISxN bits in TIM15_CR2 register and BKBID/BKE/BKP/AOE bits in TIM15_BDTR register can no longer be written

10: LOCK Level 2 = LOCK Level 1 + CC Polarity bits (CCxP/CCxNP bits in TIM15_CCER register, as long as the related channel is configured in output through the CCxS bits) as well as OSSR and OSSI bits can no longer be written.

11: OCK Level 3 = LOCK Level 2 + CC Control bits (OCxM and OCxPE bits in TIM15_CCMRx registers, as long as the related channel is configured in output through the CCxS bits) can no longer be written.

Note: The LOCK bits can be written only once after the reset. Once the TIM15_BDTR register has been written, their content is frozen until the next reset.

Bits 7:0 **DTG[7:0]**: Dead-time generator setup

This bitfield defines the duration of the dead-time inserted between the complementary outputs. DT correspond to this duration.

DTG[7:5] = 0xx → DT = DTG[7:0]x t_{dtg} with $t_{dtg} = t_{DTS}$

DTG[7:5] = 10x → DT = (64+DTG[5:0])xt_{dtg} with $T_{dtg} = 2xt_{DTS}$

DTG[7:5] = 110 → DT = (32+DTG[4:0])xt_{dtg} with $T_{dtg} = 8xt_{DTS}$

DTG[7:5] = 111 → DT = (32+DTG[4:0])xt_{dtg} with $T_{dtg} = 16xt_{DTS}$

Example if T_{DTS} = 125 ns (8MHz), dead-time possible values are:

0 to 15875 ns by 125 ns steps,

16 µs to 31750 ns by 250 ns steps,

32 µs to 63 µs by 1 µs steps,

64 µs to 126 µs by 2 µs steps

Note: This bitfield can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM15_BDTR register).

57.7.17 TIM15 timer deadtime register 2 (TIM15_DTR2)

Address offset: 0x054

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DTGF[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **DTPE**: Deadtime preload enable

0: Deadtime value is not preloaded

1: Deadtime value preload is enabled

Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 16 **DTAE**: Deadtime asymmetric enable
0: Deadtime on rising and falling edges are identical, and defined with DTG[7:0] register
1: Deadtime on rising edge is defined with DTG[7:0] register and deadtime on falling edge is defined with DTGF[7:0] bits.
Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM15_BDTR register).

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **DTGF[7:0]**: Dead-time falling edge generator setup
This bitfield defines the duration of the dead-time inserted between the complementary outputs, on the falling edge.
DTGF[7:5] = 0xx → DTF = DTGF[7:0]x t_{dtg} with $t_{dtg} = t_{DTS}$.
DTGF[7:5] = 10x → DTF = (64+DTGF[5:0])xt_{dtg} with $T_{dtg} = 2xt_{DTS}$.
DTGF[7:5] = 110 → DTF = (32+DTGF[4:0])xt_{dtg} with $T_{dtg} = 8xt_{DTS}$.
DTGF[7:5] = 111 → DTF = (32+DTGF[4:0])xt_{dtg} with $T_{dtg} = 16xt_{DTS}$.
Example if T_{DTS} = 125 ns (8 MHz), dead-time possible values are:
0 to 15875 ns by 125 ns steps,
16 µs to 31750 ns by 250 ns steps,
32 µs to 63 µs by 1 µs steps,
64 µs to 126 µs by 2 µs steps
Note: This bitfield can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM15_BDTR register).

57.7.18 TIM15 input selection register (TIM15_TISEL)

Address offset: 0x5C

Reset value: 0x0000 0000

		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Refer to *Section 57.4.2: TIM15/TIM16/TIM17 pins and internal signals* for product specific implementation.

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **BKCMP4P**: tim_brk_cmp4 input polarity

This bit selects the tim_brk_cmp4 input sensitivity. It must be programmed together with the BKP polarity bit.

0: tim_brk_cmp4 input is active high

1: tim_brk_cmp4 input is active low

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 12 **BKCMP3P**: tim_brk_cmp3 input polarity

This bit selects the tim_brk_cmp3 input sensitivity. It must be programmed together with the BKP polarity bit.

0: tim_brk_cmp3 input is active high

1: tim_brk_cmp3 input is active low

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 11 **BKCMP2P**: tim_brk_cmp2 input polarity

This bit selects the tim_brk_cmp2 input sensitivity. It must be programmed together with the BKP polarity bit.

0: tim_brk_cmp2 input is active high

1: tim_brk_cmp2 input is active low

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 10 **BKCMP1P**: tim_brk_cmp1 input polarity

This bit selects the tim_brk_cmp1 input sensitivity. It must be programmed together with the BKP polarity bit.

0: tim_brk_cmp1 input is active high

1: tim_brk_cmp1 input is active low

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 9 **BKINP**: TIMx_BKIN input polarity

This bit selects the TIMx_BKIN alternate function input sensitivity. It must be programmed together with the BKP polarity bit.

0: TIMx_BKIN input is active high

1: TIMx_BKIN input is active low

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 8 **BKCMP8E**: tim_brk_cmp8 enable

This bit enables the tim_brk_cmp8 for the timer's tim_brk input. tim_brk_cmp8 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp8 input disabled

1: tim_brk_cmp8 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 7 **BKCMP7E**: tim_brk_cmp7 enable

This bit enables the tim_brk_cmp7 for the timer's tim_brk input. tim_brk_cmp7 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp7 input disabled

1: tim_brk_cmp7 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 6 **BKCMP6E**: tim_brk_cmp6 enable

This bit enables the tim_brk_cmp6 for the timer's tim_brk input. tim_brk_cmp6 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp6 input disabled

1: tim_brk_cmp6 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 5 **BKCMP5E**: tim_brk_cmp5 enable

This bit enables the tim_brk_cmp5 for the timer's tim_brk input. tim_brk_cmp5 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp5 input disabled

1: tim_brk_cmp5 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 4 **BKCMP4E**: tim_brk_cmp4 enable

This bit enables the tim_brk_cmp4 for the timer's tim_brk input. tim_brk_cmp4 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp4 input disabled

1: tim_brk_cmp4 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 3 **BKCMP3E**: tim_brk_cmp3 enable

This bit enables the tim_brk_cmp3 for the timer's tim_brk input. tim_brk_cmp3 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp3 input disabled

1: tim_brk_cmp3 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 2 **BKCMP2E**: tim_brk_cmp2 enable

This bit enables the tim_brk_cmp2 for the timer's tim_brk input. tim_brk_cmp2 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp2 input disabled

1: tim_brk_cmp2 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 1 **BKCMP1E**: tim_brk_cmp1 enable

This bit enables the tim_brk_cmp1 for the timer's tim_brk input. tim_brk_cmp1 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp1 input disabled

1: tim_brk_cmp1 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

Bit 0 **BKINE**: TIMx_BKIN input enable

This bit enables the TIMx_BKIN alternate function input for the timer's tim_brk input. TIMx_BKIN input is 'ORed' with the other tim_brk sources.

0: TIMx_BKIN input disabled

1: TIMx_BKIN input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM15_BDTR register).

57.7.20 TIM15 alternate function register 2 (TIM15_AF2)

Address offset: 0x064

Reset value: 0x0000 0000

			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **DBSS[3:0]**: DMA burst source selection

This bitfield defines the interrupt source that triggers the DMA burst transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIMx_DMAR address).

0000: Reserved

0001: Update

0010: CC1

0011: CC2

0110: COM

0111: Trigger

Other: reserved

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **DBL[4:0]**: DMA burst length

This 5-bitfield defines the length of DMA transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIM15_DMAR address).

00000: 1 transfer,
00001: 2 transfers,
00010: 3 transfers,
...
10001: 18 transfers.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **DBA[4:0]**: DMA base address

This 5-bitfield defines the base-address for DMA transfers (when read/write access are done through the TIM15_DMAR address). DBA is defined as an offset starting from the address of the TIM15_CR1 register.

Example:

00000: TIM15_CR1,
00001: TIM15_CR2,
00010: TIM15_SMCR,
...

57.7.22 TIM15 DMA address for full transfer (TIM15_DMAR)

Address offset: 0x3E0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DMAB[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DMAB[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DMAB[31:0]**: DMA register for burst accesses

A read or write operation to the DMAR register accesses the register located at the address

(TIM15_CR1 address) + (DBA + DMA index) x 4

where TIM15_CR1 address is the address of the control register 1, DBA is the DMA base address configured in TIM15_DCR register, DMA index is automatically controlled by the DMA transfer, and ranges from 0 to DBL (DBL configured in TIM15_DCR).

57.7.23 TIM15 hardware configuration 2 register (TIM15_HWCFGR2)

Address offset: 0x3EC

Reset value: 0x0000 1011

This read register identifies the hardware configuration parameters of the instantiated IP.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OPTIONREG_OUT[7:0]

CNT_WIDTH[7:0]								PSC_WIDTH16[3:0]				PSC_LINEAR[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **OPTIONREG_OUT[7:0]**: Option register number (0 to 16).

Bits 15:8 **CNT_WIDTH[7:0]**: Counter width

0x08: 8-bits
0x10: 16-bits
0x20: 32-bits
Others: Reserved

Bits 7:4 **PSC_WIDTH16[3:0]**: Prescaler width

0x0: 7 (by power of 2) /8 (linear) -bit counter
0x1: 15 (by power of 2) /16 (linear) -bit counter
Others: Reserved

Bits 3:0 **PSC_LINEAR[3:0]**: Prescaler linear

0x0: prescaler by power of 2 (division by 1, 2, 4, 8...)
0x1: prescaler is linear (division by 1, 2, 3, 4, 5...)
Others: Reserved

57.7.24 TIM15 hardware configuration 1 register (TIM15_HWCFGR1)

Address offset: 0x3F0

Reset value: 0x1220 1112

This read register identifies the hardware configuration parameters of the instantiated IP.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 **CNT_DIR[3:0]**: Counter direction
- 0x0: Down-counter only
- 0x1: Up-counter only
- 0x2: Up/Down counter allowing center-aligned mode
- Others: Reserved

Bits 27:24 **DMA_IMPL[3:0]**: DMA features implementation
- 0x0: DMA requests are not possible
- 0x1: Single DMA requests possible
- 0x2: All DMA features implemented
- Others: Reserved

Bits 23:20 **BK_IMPL[3:0]**: Break circuit implementation
- 0x0: no break implemented
- 0x1: break1 implemented without filter (tim_brk + tim_sys_brk connected)
- 0x2: break1 implemented with filter (tim_brk + tim_sys_brk connected)
- 0x3: break 1 and 2 implemented (tim_brk + tim_sys_brk + brk2)
- Others: Reserved

Bits 19:16 **ETR_IMPL[3:0]**: External trigger implementation
- 0x0: External trigger circuit not implemented, ocrefx cleared by ocref_clr input
- 0x1: External trigger circuit implemented, ocrefx cleared by ocref_clr input
- 0x2: External trigger circuit implemented, ocrefx cleared by etrf signal
- 0x3: External trigger circuit implemented, ocrefx cleared by ocref_clr or etrf (1 control bit “OCCS” added in GPT_SMCR)
- Others: Reserved

Bits 15:12 **RCR_IMPL[3:0]**: Repetition counter implementation
- 0x0: repetition counter not implemented
- 0x1: 8-bit repetition counter implemented
- 0x2: 16-bit repetition counter implemented
- Others: Reserved

Bits 11:8 **NB_OF_SM[3:0]**: Number of synchronization module
0x0: synchronization module not implemented
0x1: 1 synchronization module implemented
Others: Reserved

Bits 7:4 **NB_OF_DT[3:0]**: Number of complementary outputs and dead-time generators
0x0
0x1
0x2
0x3
0x4
Others: Reserved

Bits 3:0 **NB_OF_CC[3:0]**: Number of capture / compare channel
0x0: no capture/compare channel implemented
0x1: only CC1 channel is implemented
0x2: CC1 and CC2 channels are implemented
0x3: CC1, CC2 and CC3 channels are implemented
0x4: CC1, CC2, CC3 and CC4 channels are implemented
0x5: CC1, CC2, CC3, CC4 and CC5 channels are implemented
0x6: CC1, CC2, CC3, CC4, CC5 and CC6 channels are implemented
Others: Reserved

57.7.25 TIM15 IP version register (TIM15_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0043

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

57.8 TIM16/TIM17 registers

Refer to *Section 1.2* for a list of abbreviations used in register descriptions.

The peripheral registers can be accessed by half-words (16-bit) or words (32-bit).

57.8.1 TIMx control register 1 (TIMx_CR1)(x = 16 to 17)

Address offset: 0x00

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DITHEN	UIFREMAP	Res.	CKD[1:0]		ARPE	Res.	Res.	Res.	OPM	URS	UDIS	CEN
			rw	rw		rw	rw	rw				rw	rw	rw	rw

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **DITHEN**: Dithering enable
0: Dithering disabled
1: Dithering enabled
Note: The DITHEN bit can only be modified when CEN bit is reset.

Bit 11 **UIFREMAP**: UIF status bit remapping
0: No remapping. UIF status bit is not copied to TIMx_CNT register bit 31.
1: Remapping enabled. UIF status bit is copied to TIMx_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division
This bitfield indicates the division ratio between the timer clock (tim_ker_ck) frequency and the dead-time and sampling clock (t_{DTS})used by the dead-time generators and the digital filters (tim_tix),
00: $t_{DTS} = t_{tim_ker_ck}$
01: $t_{DTS} = 2*t_{tim_ker_ck}$
10: $t_{DTS} = 4*t_{tim_ker_ck}$
11: Reserved

Bit 7 **ARPE**: Auto-reload preload enable
0: TIMx_ARR register is not buffered
1: TIMx_ARR register is buffered

Bits 6:4 Reserved, must be kept at reset value.

Bit 3 **OPM**: One pulse mode
0: Counter is not stopped at update event
1: Counter stops counting at the next update event (clearing the bit CEN)

Bit 2 **URS**: Update request source
This bit is set and cleared by software to select the UEV event sources.
0: Any of the following events generate an update interrupt or DMA request if enabled. These events can be:
– Counter overflow/underflow
– Setting the UG bit
– Update generation through the slave mode controller
1: nly counter overflow/underflow generates an update interrupt or DMA request if enabled.

Bit 1 **UDIS**: Update disable

This bit is set and cleared by software to enable/disable UEV event generation.

0: UEV enabled. The Update (UEV) event is generated by one of the following events:

– Counter overflow/underflow

– Setting the UG bit

– Update generation through the slave mode controller

Buffered registers are then loaded with their preload values.

1: UEV disabled. The Update event is not generated, shadow registers keep their value (ARR, PSC, CCRx). However the counter and the prescaler are reinitialized if the UG bit is set or if a hardware reset is received from the slave mode controller.

Bit 0 **CEN**: Counter enable

0: Counter disabled

1: Counter enabled

Note: External clock and gated mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.

57.8.2 TIMx control register 2 (TIMx_CR2)(x = 16 to 17)

Address offset: 0x04

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	OIS1N	OIS1	Res.	Res.	Res.	Res.	CCDS	CCUS	Res.	CCPC
						rw	rw					rw	rw		rw

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **OIS1N**: Output Idle state 1 (tim_oc1n output)

0: tim_oc1n = 0 after a dead-time when MOE = 0

1: tim_oc1n = 1 after a dead-time when MOE = 0

Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx_BKR register).

Bit 8 **OIS1**: Output Idle state 1 (tim_oc1 output)

0: tim_oc1 = 0 after a dead-time when MOE = 0

1: tim_oc1 = 1 after a dead-time when MOE = 0

Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx_BKR register).

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **CCDS**: Capture/compare DMA selection

0: CCx DMA request sent when CCx event occurs

1: CCx DMA requests sent when update event occurs

Bit 2 **CCUS**: Capture/compare control update selection

0: When capture/compare control bits are preloaded (CCPC = 1), they are updated by setting the COMG bit only.

1: When capture/compare control bits are preloaded (CCPC = 1), they are updated by setting the COMG bit or when a rising edge occurs on tim_trgi (if available).

Note: This bit acts only on channels that have a complementary output.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **CCPC**: Capture/compare preloaded control
0: CCxE, CCxNE and OCxM bits are not preloaded
1: CCxE, CCxNE and OCxM bits are preloaded, after having been written, they are updated only when COM bit is set.
Note: This bit acts only on channels that have a complementary output.

57.8.3 TIMx DMA/interrupt enable register (TIMx_DIER)(x = 16 to 17)

Address offset: 0x0C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	CC1DE	UDE	BIE	Res.	COMIE	Res.	Res.	Res.	CC1IE	UIE
						rw	rw	rw		rw				rw	rw

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **CC1DE**: Capture/Compare 1 DMA request enable
0: CC1 DMA request disabled
1: CC1 DMA request enabled

Bit 8 **UDE**: Update DMA request enable
0: Update DMA request disabled
1: Update DMA request enabled

Bit 7 **BIE**: Break interrupt enable
0: Break interrupt disabled
1: Break interrupt enabled

Bit 6 Reserved, must be kept at reset value.

Bit 5 **COMIE:** COM interrupt enable
0: COM interrupt disabled
1: COM interrupt enabled

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **CC1IE**: Capture/Compare 1 interrupt enable
0: CC1 interrupt disabled
1: CC1 interrupt enabled

Bit 0 **UIE**: Update interrupt enable
0: Update interrupt disabled
1: Update interrupt enabled

57.8.4 TIMx status register (TIMx_SR)(x = 16 to 17)

Address offset: 0x10

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	CC1OF	Res.	BIF	Res.	COMIF	Res.	Res.	Res.	CC1IF	UIF
						rc_w0		rc_w0		rc_w0				rc_w0	rc_w0

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **CC1OF**: Capture/Compare 1 overcapture flag

This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to 0.

0: No overcapture has been detected

1: The counter value has been captured in TIMx_CCR1 register while CC1IF flag was already set

Bit 8 Reserved, must be kept at reset value.

Bit 7 **BIF**: Break interrupt flag

This flag is set by hardware as soon as the tim_brk input goes active. It can be cleared by software if the break input is not active.

0: No break event occurred

1: An active level has been detected on the break input

Bit 6 Reserved, must be kept at reset value.

Bit 5 **COMIF:** COM interrupt flag

This flag is set by hardware on a COM event (once the capture/compare control bits –CCxE, CCxNE, OCxM– have been updated). It is cleared by software.

0: No COM event occurred

1: COM interrupt pending

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **CC1IF**: Capture/Compare 1 interrupt flag

This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIMx_CCR1 register (input capture mode only).

0: No compare match / No input capture occurred

1: A compare match or an input capture occurred

If channel CC1 is configured as output: this flag is set when the content of the counter TIMx_CNT matches the content of the TIMx_CCR1 register. When the content of TIMx_CCR1 is greater than the content of TIMx_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in down-counting mode). There are 3 possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIMx_CR1 register for the full description.

If channel CC1 is configured as input: this bit is set when counter value has been captured in TIMx_CCR1 register (an edge has been detected on IC1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIMx_CCER).

Bit 0 **UIF**: Update interrupt flag

This bit is set by hardware on an update event. It is cleared by software.

0: No update occurred.

1: Update interrupt pending. This bit is set by hardware when the registers are updated:

– At overflow regarding the repetition counter value (update if repetition counter = 0) and if the UDIS = 0 in the TIMx_CR1 register.

– When CNT is reinitialized by software using the UG bit in TIMx_EGR register, if URS = 0 and UDIS = 0 in the TIMx_CR1 register.

57.8.5 TIMx event generation register (TIMx_EGR)(x = 16 to 17)

Address offset: 0x14

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BG	Res.	COMG	Res.	Res.	Res.	CC1G	UG
								w		w				w	w

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **BG**: Break generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action.

1: A break event is generated. MOE bit is cleared and BIF flag is set. Related interrupt or DMA transfer can occur if enabled.

Bit 6 Reserved, must be kept at reset value.

Bit 5 **COMG:** Capture/Compare control update generation

This bit can be set by software, it is automatically cleared by hardware.

0: No action

1: When the CCPC bit is set, it is possible to update the CCxE, CCxNE and OCxM bits

Note: This bit acts only on channels that have a complementary output.

Bits 4:2 Reserved, must be kept at reset value.

Bit 1 **CC1G**: Capture/Compare 1 generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action.

1: A capture/compare event is generated on channel 1:

If channel CC1 is configured as output:

CC1IF flag is set, Corresponding interrupt or DMA request is sent if enabled.

If channel CC1 is configured as input:

The current value of the counter is captured in TIMx_CCR1 register. The CC1IF flag is set, the corresponding interrupt or DMA request is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation

This bit can be set by software, it is automatically cleared by hardware.

0: No action.

1: Reinitialize the counter and generates an update of the registers. Note that the prescaler counter is cleared too (anyway the prescaler ratio is not affected).

57.8.6 TIMx capture/compare mode register 1 (TIMx_CCMR1) (x = 16 to 17)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

								rw	rw	rw	rw	rw	rw	rw	rw

Input capture mode

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **IC1F[3:0]**: Input capture 1 filter

This bitfield defines the frequency used to sample tim_ti1 input and the length of the digital filter applied to tim_ti1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at f_{DTS}
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N =
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Bits 3:2 **IC1PSC[1:0]**: Input capture 1 prescaler

This bitfield defines the ratio of the prescaler acting on CC1 input (tim_ic1).
The prescaler is reset as soon as CC1E = 0 (TIMx_CCER register).
00: no prescaler, capture is done each time an edge is detected on the capture input.
01: capture is done once every 2 events
10: capture is done once every 4 events
11: capture is done once every 8 events

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1

Others: Reserved

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx_CCER).

57.8.7 TIMx capture/compare mode register 1 [alternate] (TIMx_CCMR1)(x = 16 to 17)

Address offset: 0x18

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OC1M[3]
															rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OC1CE	OC1M[2:0]			OC1PE	OC1FE	CC1S[1:0]	
								rw	rw	rw	rw	rw	rw	rw	rw

Output compare mode:

Bits 31:17 Reserved, must be kept at reset value.

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **OC1CE**: Output Compare 1 clear enable

0: tim_oc1ref is not affected by the tim_ocref_clr input.

1: tim_oc1ref is cleared as soon as a High level is detected on tim_ocref_clr input.

Bits 16, 6:4 **OC1M[3:0]**: Output Compare 1 mode

These bits define the behavior of the output reference signal tim_oc1ref from which tim_oc1 and tim_oc1n are derived. tim_oc1ref is active high whereas tim_oc1 and tim_oc1n active level depends on CC1P and CC1NP bits.

0000: Frozen - The comparison between the output compare register TIMx_CCR1 and the counter TIMx_CNT has no effect on the outputs. This mode can be used when the timer serves as a software timebase. When the frozen mode is enabled during timer operation, the output keeps the state (active or inactive) it had before entering the frozen state.

0001: Set channel 1 to active level on match. tim_oc1ref signal is forced high when the counter TIMx_CNT matches the capture/compare register 1 (TIMx_CCR1).

0010: Set channel 1 to inactive level on match. tim_oc1ref signal is forced low when the counter TIMx_CNT matches the capture/compare register 1 (TIMx_CCR1).

0011: Toggle - tim_oc1ref toggles when TIMx_CNT = TIMx_CCR1.

0100: Force inactive level - tim_oc1ref is forced low.

0101: Force active level - tim_oc1ref is forced high.

0110: PWM mode 1 - Channel 1 is active as long as TIMx_CNT<TIMx_CCR1 else inactive.

0111: PWM mode 2 - Channel 1 is inactive as long as TIMx_CNT<TIMx_CCR1 else active.

Others: Reserved

Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIMx_BDTR register) and CC1S = 00 (the channel is configured in output).

In PWM mode, the OCREF level changes when the result of the comparison changes, when the output compare mode switches from “frozen” mode to “PWM” mode and when the output compare mode switches from “force active/inactive” mode to “PWM” mode.

Bit 3 **OC1PE**: Output Compare 1 preload enable

0: Preload register on TIMx_CCR1 disabled. TIMx_CCR1 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIMx_CCR1 enabled. Read/Write operations access the preload register. TIMx_CCR1 preload value is loaded in the active register at each update event.

Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIMx_BDTR register) and CC1S = 00 (the channel is configured in output).

Bit 2 **OC1FE**: Output Compare 1 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIMx_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

0: CC1 behaves normally depending on counter and CCR1 values even when the trigger is ON. The minimum delay to activate CC1 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC1 output. Then, tim_ocx is set to the compare level independently of the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to 3 clock cycles. OC1FE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1

Others: Reserved

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIMx_CCER).

57.8.8 TIMx capture/compare enable register (TIMx_CCER)(x = 16 to 17)

Address offset: 0x20

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CC1NP	CC1NE	CC1P	CC1E
												rw	rw	rw	rw

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **CC1NP**: Capture/Compare 1 complementary output polarity

CC1 channel configured as output:

0: tim_oc1n active high

1: tim_oc1n active low

CC1 channel configured as input:

This bit is used in conjunction with CC1P to define the polarity of tim_ti1fp1. Refer to the description of CC1P.

Note: This bit is not writable as soon as LOCK level 2 or 3 has been programmed (LOCK bits in TIMx_BDTR register) and CC1S = 00 (the channel is configured in output).

On channels that have a complementary output, this bit is preloaded. If the CCPC bit is set in the TIMx_CR2 register then the CC1NP active bit takes the new value from the preloaded bit only when a commutation event is generated.

Bit 2 **CC1NE**: Capture/Compare 1 complementary output enable

0: Off - tim_oc1n is not active. tim_oc1n level is then function of MOE, OSSI, OSSR, OIS1, OIS1N and CC1E bits.

1: On - tim_oc1n signal is output on the corresponding output pin depending on MOE, OSSI, OSSR, OIS1, OIS1N and CC1E bits.

Bit 1 **CC1P**: Capture/Compare 1 output polarity

0: OC1 active high (output mode) / Edge sensitivity selection (input mode, see below)

1: OC1 active low (output mode) / Edge sensitivity selection (input mode, see below)

When CC1 channel is configured as input, both CC1NP/CC1P bits select the active polarity of TI1FP1 and TI2FP1 for trigger or capture operations.

CC1NP = 0, CC1P = 0: non-inverted/rising edge. The circuit is sensitive to TIxFP1 rising edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode).

CC1NP = 0, CC1P = 1: inverted/falling edge. The circuit is sensitive to TIxFP1 falling edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is inverted (trigger operation in gated mode).

CC1NP = 1, CC1P = 1: non-inverted/both edges/ The circuit is sensitive to both TIxFP1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), TIxFP1is not inverted (trigger operation in gated mode).

CC1NP = 1, CC1P = 0: this configuration is reserved, it must not be used.

Note: This bit is not writable as soon as LOCK level 2 or 3 has been programmed (LOCK bits in TIMx_BDTR register).

On channels that have a complementary output, this bit is preloaded. If the CCPC bit is set in the TIMx_CR2 register then the CC1P active bit takes the new value from the preloaded bit only when a Commutation event is generated.

Bit 0 **CC1E**: Capture/Compare 1 output enable

0: Capture mode disabled / OC1 is not active (see below)

1: Capture mode enabled / OC1 signal is output on the corresponding output pin

When CC1 channel is configured as output, the OC1 level depends on MOE, OSSI, OSSR, OIS1, OIS1N and CC1NE bits, regardless of the CC1E bits state. Refer to *Table 590* for details.

Table 590. Output control bits for complementary tim_oc1 and tim_oc1n channels with break feature (TIM16/TIM17)

Control bits					Output states(1)	
MOE bit	OSSI bit	OSSR bit	CC1E bit	CC1NE bit	tim_oc1 output state	tim_oc1n output state
1	X	X	0	0	Output Disabled (not driven by the timer: Hi-Z) tim_oc1 = 0 tim_oc1n = 0	
		0	0	1	Output Disabled (not driven by the timer: Hi-Z) tim_oc1 = 0	tim_oc1ref + Polarity tim_oc1n = tim_oc1ref XOR CC1NP
		0	1	0	tim_oc1ref + Polarity tim_oc1 = tim_oc1ref XOR CC1P	Output Disabled (not driven by the timer: Hi-Z) tim_oc1n = 0
		X	1	1	tim_oc1ref + Polarity + dead-time	Complementary to tim_oc1ref (not tim_oc1ref) + Polarity + dead-time
		1	0	1	Off-State (output enabled with inactive state) tim_oc1 = CC1P	tim_oc1ref + Polarity tim_oc1n = tim_oc1ref XOR CC1NP
		1	1	0	tim_oc1ref + Polarity tim_oc1 = tim_oc1ref XOR CC1P	Off-State (output enabled with inactive state) tim_oc1n = CC1NP
0	0	X	X	X	Output disabled (not driven by the timer: Hi-Z)	
	1		0	0		
			0	1	Off-State (output enabled with inactive state) Asynchronously: tim_oc1 = CC1P, tim_oc1n = CC1NP Then if the clock is present: tim_oc1 = OIS1 and tim_oc1n = OIS1N after a dead-time, assuming that OIS1 and OIS1N do not correspond to tim_oc1 and tim_oc1n both in active state	
			1	0		
			1	1		

1. When both outputs of a channel are not used (control taken over by the GPIO controller), the OIS1, OIS1N, CC1P and CC1NP bits must be kept cleared.

Note: The state of the external I/O pins connected to the complementary tim_oc1 and tim_oc1n channels depends on the tim_oc1 and tim_oc1n channel state and GPIO control and alternate function selection registers.

57.8.9 TIMx counter (TIMx_CNT)(x = 16 to 17)

Address offset: 0x24

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **UIFCPY**: UIF Copy

This bit is a read-only copy of the UIF bit of the TIMx_ISR register. If the UIFREMAP bit in TIMx_CR1 is reset, bit 31 is reserved.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]**: Counter value

Non-dithering mode (DITHEN = 0)

The register holds the counter value.

Dithering mode (DITHEN = 1)

The register only holds the non-dithered part in CNT[15:0]. The fractional part is not available.

57.8.10 TIMx prescaler (TIMx_PSC)(x = 16 to 17)

Address offset: 0x28

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PSC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **PSC[15:0]**: Prescaler value

The counter clock frequency (tim_cnt_ck) is equal to $f_{tim_psc_ck}$ / (PSC[15:0] + 1).

PSC contains the value to be loaded in the active prescaler register at each update event (including when the counter is cleared through UG bit of TIMx_EGR register or through trigger controller when configured in “reset mode”).

57.8.11 TIMx auto-reautoreload register (TIMx_ARR)(x = 16 to 17)

Address offset: 0x2C

Reset value: 0x0000 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ARR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **ARR[19:0]**: Auto-reload value

ARR is the value to be loaded in the actual auto-reload register.

Refer to the *Section 57.4.3: Time-base unit on page 3090* for more details about ARR update and behavior.

The counter is blocked while the auto-reload value is null.

Non-dithering mode (DITHEN = 0)

The register holds the auto-reload value in ARR[15:0]. The ARR[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in ARR[19:4]. The ARR[3:0] bitfield contains the dithered part.

57.8.12 TIMx repetition counter register (TIMx_RCR)(x = 16 to 17)

Address offset: 0x30

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	REP[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **REP[7:0]**: Repetition counter reload value

This bitfield defines the update rate of the compare registers (i.e. periodic transfers from preload to active registers) when preload registers are enable. It also defines the update interrupt generation rate, if this interrupt is enable.

When the repetition down-counter reaches zero, an update event is generated and it restarts counting from REP value. As the repetition counter is reloaded with REP value only at the repetition update event UEV, any write to the TIMx_RCR register is not taken in account until the next repetition update event.

It means in PWM mode (REP+1) corresponds to the number of PWM periods in edge-aligned mode:

– The number of PWM periods in edge-aligned mode.
– The number of half PWM period in center-aligned mode.

57.8.13 TIMx capture/compare register 1 (TIMx_CCR1)(x = 16 to 17)

Address offset: 0x34

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCR1[19:16]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR1[19:0]**: Capture/Compare 1 value

If channel CC1 is configured as output:
CCR1 is the value to be loaded in the actual capture/compare 1 register (preload value).
It is loaded permanently if the preload feature is not selected in the TIMx_CCMR1 register (bit OC1PE). Else the preload value is copied in the active capture/compare 1 register when an update event occurs.
The active capture/compare register contains the value to be compared to the counter TIMx_CNT and signaled on tim_oc1 output.
Non-dithering mode (DITHEN = 0)
The register holds the compare value in CCR1[15:0]. The CCR1[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the integer part in CCR1[19:4]. The CCR1[3:0] bitfield contains the dithered part.
If channel CC1 is configured as input:
CCR1 is the counter value transferred by the last input capture 1 event (tim_ic1).
Non-dithering mode (DITHEN = 0)
The register holds the capture value in CCR1[15:0]. The CCR1[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the capture in CCR1[19:4]. The CCR1[3:0] bits are reset.

57.8.14 TIMx break and dead-time register (TIMx_BDTR)(x = 16 to 17)

Address offset: 0x44

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	BKBID	Res.	BK DSRM	Res.	Res.	Res.	Res.	Res.	Res.	BKF[3:0]			
			rw		rw							rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MOE	AOE	BKP	BKE	OSSR	OSSI	LOCK[1:0]		DTG[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Note: As the BKBID, BKDSRM, BKF[3:0], AOE, BKP, BKE, OSSI, OSSR, and DTG[7:0] bits may be write-locked depending on the LOCK configuration, it may be necessary to configure all of them during the first write access to the TIMx_BDTR register.

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **BKBID**: Break Bidirectional

0: Break input tim_brk in input mode
1: Break input tim_brk in bidirectional mode
In the bidirectional mode (BKBID bit set to 1), the break input is configured both in input mode and in open drain output mode. Any active break event asserts a low logic level on the Break input to indicate an internal break event to external devices.

Note: This bit cannot be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bit 27 Reserved, must be kept at reset value.

Bit 26 **BKDSRM**: Break Disarm

0: Break input tim_brk is armed
1: Break input tim_brk is disarmed
This bit is cleared by hardware when no break source is active.
The BKDSRM bit must be set by software to release the bidirectional output control (open-drain output in Hi-Z state) and then be polled it until it is reset by hardware, indicating that the fault condition has disappeared.

Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bits 25:20 Reserved, must be kept at reset value.

Bits 19:16 **BKF[3:0]**: Break filter

This bitfield defines the frequency used to sample tim_brk input and the length of the digital filter applied to tim_brk. The digital filter is made of an event counter in which N events are needed to validate a transition on the output:

0000: No filter, tim_brk acts asynchronously
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 15 **MOE**: Main output enable

This bit is cleared asynchronously by hardware as soon as the tim_brk input is active. It is set by software or automatically depending on the AOE bit. It is acting only on the channels which are configured in output.

0: tim_oc1 and tim_oc1n outputs are disabled or forced to idle state depending on the OSSI bit.

1: tim_oc1 and tim_oc1n outputs are enabled if their respective enable bits are set (CC1E, CC1NE in TIMx_CCER register)

See tim_oc1/tim_oc1n enable description for more details (*Section 57.8.8: TIMx capture/compare enable register (TIMx_CCER)(x = 16 to 17)*).

Bit 14 **AOE**: Automatic output enable

0: MOE can be set only by software

1: MOE can be set by software or automatically at the next update event (if the tim_brk input is not active)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 13 **BKP**: Break polarity

0: Break input tim_brk is active low
1: Break input tim_brk is active high

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bit 12 **BKE**: Break enable

0: Break inputs (tim_brk and tim_sys_brk event) disabled
1; Break inputs (tim_brk and tim_sys_brk event) enabled

Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bit 11 **OSSR**: Off-state selection for Run mode

This bit is used when MOE = 1 on channels that have a complementary output which are configured as outputs. OSSR is not implemented if no complementary output is implemented in the timer.

See tim_oc1/tim_oc1n enable description for more details (*Section 57.8.8: TIMx capture/compare enable register (TIMx_CCER)(x = 16 to 17)*).

0: When inactive, tim_oc1/tim_oc1n outputs are disabled (the timer releases the output control which is taken over by the GPIO, which forces a Hi-Z state)

1: When inactive, tim_oc1/tim_oc1n outputs are enabled with their inactive level as soon as CC1E = 1 or CC1NE = 1 (the output is still controlled by the timer).

Note: This bit can not be modified as soon as the LOCK level 2 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 10 **OSSI**: Off-state selection for Idle mode

This bit is used when MOE = 0 on channels configured as outputs.

See tim_oc1/tim_oc1n enable description for more details (*Section 57.8.8: TIMx capture/compare enable register (TIMx_CCER)(x = 16 to 17)*).

0: When inactive, tim_oc1/tim_oc1n outputs are disabled (tim_oc1/tim_oc1n enable output signal = 0)

1: When inactive, tim_oc1/tim_oc1n outputs are forced first with their idle level as soon as CC1E = 1 or CC1NE = 1. tim_oc1/tim_oc1n enable output signal = 1)

Note: This bit can not be modified as soon as the LOCK level 2 has been programmed (LOCK bits in TIMx_BDTR register).

Bits 9:8 **LOCK[1:0]**: Lock configuration

These bits offer a write protection against software errors.

00: LOCK OFF - No bit is write protected

01: LOCK Level 1 = DTG bits in TIMx_BDTR register, OISx and OISxN bits in TIMx_CR2 register and BKBID/BKE/BKP/AOE bits in TIMx_BDTR register can no longer be written.

10: LOCK Level 2 = LOCK Level 1 + CC Polarity bits (CCxP/CCxNP bits in TIMx_CCER register, as long as the related channel is configured in output through the CCxS bits) as well as OSSR and OSSI bits can no longer be written.

11: LOCK Level 3 = LOCK Level 2 + CC Control bits (OCxM and OCxPE bits in TIMx_CCMRx registers, as long as the related channel is configured in output through the CCxS bits) can no longer be written.

Note: The LOCK bits can be written only once after the reset. Once the TIMx_BDTR register has been written, their content is frozen until the next reset.

Bits 7:0 **DTG[7:0]**: Dead-time generator setup

This bitfield defines the duration of the dead-time inserted between the complementary outputs. DT correspond to this duration.

DTG[7:5] = 0xx → DT = DTG[7:0]x t_{dtg} with $t_{dtg} = t_{DTS}$

DTG[7:5] = 10x → DT = (64+DTG[5:0])xt_{dtg} with $T_{dtg} = 2xt_{DTS}$

DTG[7:5] = 110 → DT = (32+DTG[4:0])xt_{dtg} with $T_{dtg} = 8xt_{DTS}$

DTG[7:5] = 111 → DT = (32+DTG[4:0])xt_{dtg} with $T_{dtg} = 16xt_{DTS}$

Example if T_{DTS}=125 ns (8 MHz), dead-time possible values are:

0 to 15875 ns by 125 ns steps,

16 µs to 31750 ns by 250 ns steps,

32 µs to 63 µs by 1 µs steps,

64 µs to 126 µs by 2 µs steps

Note: This bitfield can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx_BDTR register).

57.8.15 TIMx timer deadtime register 2 (TIMx_DTR2)(x = 16 to 17)

Address offset: 0x054

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DTPE	DTAE

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DTGF[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **DTPE**: Deadtime preload enable

0: Deadtime value is not preloaded

1: Deadtime value preload is enabled

Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 16 **DTAE**: Deadtime asymmetric enable

0: Deadtime on rising and falling edges are identical, and defined with DTG[7:0] register

1: Deadtime on rising edge is defined with DTG[7:0] register and deadtime on falling edge is defined with DTGF[7:0] bits.

Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx_BDTR register).

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **DTGF[7:0]**: Dead-time falling edge generator setup

This bitfield defines the duration of the dead-time inserted between the complementary outputs, on the falling edge.

DTGF[7:5] = 0xx → DTF = DTGF[7:0]x t_{dtg} with $t_{dtg} = t_{DTS}$.

DTGF[7:5] = 10x → DTF = (64+DTGF[5:0])xt_{dtg} with $T_{dtg} = 2xt_{DTS}$.

DTGF[7:5] = 110 → DTF = (32+DTGF[4:0])xt_{dtg} with $T_{dtg} = 8xt_{DTS}$.

DTGF[7:5] = 111 → DTF = (32+DTGF[4:0])xt_{dtg} with $T_{dtg} = 16xt_{DTS}$.

Example if T_{DTS} = 125 ns (8 MHz), dead-time possible values are:

0 to 15875 ns by 125 ns steps,

16 µs to 31750 ns by 250 ns steps,

32 µs to 63 µs by 1 µs steps,

64 µs to 126 µs by 2 µs steps

Note: This bitfield can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIMx_BDTR register).

57.8.16 TIMx input selection register (TIMx_TISEL)(x = 16 to 17)

Address offset: 0x5C

Reset value: 0x0000 0000

		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Refer to *Section 57.4.2: TIM15/TIM16/TIM17 pins and internal signals* for product specific implementation.

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **BKCMP4P**: tim_brk_cmp4 input polarity
This bit selects the tim_brk_cmp4 input sensitivity. It must be programmed together with the BKP polarity bit.
0: tim_brk_cmp4 input is active high
1: tim_brk_cmp4 input is active low

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 12 **BKCMP3P**: tim_brk_cmp3 input polarity

This bit selects the tim_brk_cmp3 input sensitivity. It must be programmed together with the BKP polarity bit.

0: tim_brk_cmp3 input is active high

1: tim_brk_cmp3 input is active low

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 11 **BKCMP2P**: tim_brk_cmp2 input polarity

This bit selects the tim_brk_cmp2 input sensitivity. It must be programmed together with the BKP polarity bit.

0: tim_brk_cmp2 input is active high

1: tim_brk_cmp2 input is active low

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 10 **BKCMP1P**: tim_brk_cmp1 input polarity

This bit selects the tim_brk_cmp1 input sensitivity. It must be programmed together with the BKP polarity bit.

0: tim_brk_cmp1 input is active high

1: tim_brk_cmp1 input is active low

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 9 **BKINP**: TIMx_BKIN input polarity

This bit selects the TIMx_BKIN alternate function input sensitivity. It must be programmed together with the BKP polarity bit.

0: TIMx_BKIN input is active high

1: TIMx_BKIN input is active low

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 8 **BKCMP8E**: tim_brk_cmp8 enable

This bit enables the tim_brk_cmp8 for the timer's tim_brk input. tim_brk_cmp8 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp8 input disabled

1: tim_brk_cmp8 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 7 **BKCMP7E**: tim_brk_cmp7 enable

This bit enables the tim_brk_cmp7 for the timer's tim_brk input. tim_brk_cmp7 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp7 input disabled

1: tim_brk_cmp7 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 6 **BKCMP6E**: tim_brk_cmp6 enable

This bit enables the tim_brk_cmp6 for the timer's tim_brk input. tim_brk_cmp6 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp6 input disabled

1: tim_brk_cmp6 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 5 **BKCMP5E**: tim_brk_cmp5 enable

This bit enables the tim_brk_cmp5 for the timer's tim_brk input. tim_brk_cmp5 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp5 input disabled

1: tim_brk_cmp5 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 4 **BKCMP4E**: tim_brk_cmp4 enable

This bit enables the tim_brk_cmp4 for the timer's tim_brk input. tim_brk_cmp4 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp4 input disabled

1: tim_brk_cmp4 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 3 **BKCMP3E**: tim_brk_cmp3 enable

This bit enables the tim_brk_cmp3 for the timer's tim_brk input. tim_brk_cmp3 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp3 input disabled

1: tim_brk_cmp3 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 2 **BKCMP2E**: tim_brk_cmp2 enable

This bit enables the tim_brk_cmp2 for the timer's tim_brk input. tim_brk_cmp2 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp2 input disabled

1: tim_brk_cmp2 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 1 **BKCMP1E**: tim_brk_cmp1 enable

This bit enables the tim_brk_cmp1 for the timer's tim_brk input. tim_brk_cmp1 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp1 input disabled

1: tim_brk_cmp1 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bit 0 **BKINE**: TIMx_BKIN input enable

This bit enables the TIMx_BKIN alternate function input for the timer's tim_brk input. TIMx_BKIN input is 'ORed' with the other tim_brk sources.

0: TIMx_BKIN input disabled

1: TIMx_BKIN input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

57.8.18 TIMx alternate function register 2 (TIMx_AF2)(x = 16 to 17)

Address offset: 0x064

Reset value: 0x0000 0000

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:16 **OCRSEL[2:0]**: tim_ocref_clr source selection

These bits select the tim_ocref_clr input source.

000: tim_ocref_clr0

001: tim_ocref_clr1

010: tim_ocref_clr2

011: tim_ocref_clr3

100: tim_ocref_clr4

101: tim_ocref_clr5

110: tim_ocref_clr6

111: tim_ocref_clr7

Refer to *Section 57.4.2: TIM15/TIM16/TIM17 pins and internal signals* for product specific implementation.

Note: These bits can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIMx_BDTR register).

Bits 15:0 Reserved, must be kept at reset value.

57.8.19 TIMx DMA control register (TIMx_DCR)(x = 16 to 17)

Address offset: 0x3DC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBSS[3:0]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DBL[4:0]					Res.	Res.	Res.	DBA[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **DBSS[3:0]**: DMA burst source selection

This bitfield defines the interrupt source that triggers the DMA burst transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIMx_DMAR address).

0000: Reserved

0001: Update

0010: CC1

Other: reserved

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **DBL[4:0]**: DMA burst length

This 5-bitfield defines the length of DMA transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIMx_DMAR address), i.e. the number of transfers. Transfers can be in half-words or in bytes (see example below).

00000: 1 transfer,
00001: 2 transfers,
00010: 3 transfers,
...
10001: 18 transfers.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **DBA[4:0]**: DMA base address

This 5-bitfield defines the base-address for DMA transfers (when read/write access are done through the TIMx_DMAR address). DBA is defined as an offset starting from the address of the TIMx_CR1 register.

Example:
00000: TIMx_CR1,
00001: TIMx_CR2,
00010: TIMx_SMCR,
...

Example: Let us consider the following transfer: DBL = 7 transfers and DBA = TIMx_CR1. In this case the transfer is done to/from 7 registers starting from the TIMx_CR1 address.

57.8.20 TIM16/TIM17 DMA address for full transfer (TIMx_DMAR)(x = 16 to 17)

Address offset: 0x3E0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DMAB[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DMAB[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DMAB[31:0]**: DMA register for burst accesses

A read or write operation to the DMAR register accesses the register located at the address

(TIMx_CR1 address) + (DBA + DMA index) x 4

where TIMx_CR1 address is the address of the control register 1, DBA is the DMA base address configured in TIMx_DCR register, DMA index is automatically controlled by the DMA transfer, and ranges from 0 to DBL (DBL configured in TIMx_DCR).

57.8.21 TIMx hardware configuration 2 register (TIMx_HWCFGR2) (x = 16 to 17)

Address offset: 0x3EC

Reset value: 0x0000 1011

This read register identifies the hardware configuration parameters of the instantiated IP.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **OPTIONREG_OUT[7:0]**: Option register number (0 to 16).

Bits 15:8 **CNT_WIDTH[7:0]**: Counter width

0x08: 8-bits
0x10: 16-bits
0x20: 32-bits
Others: Reserved

Bits 7:4 **PSC_WIDTH16[3:0]**: Prescaler width

0x0: 7 (by power of 2) /8 (linear) -bit counter
0x1: 15 (by power of 2) /16 (linear) -bit counter
Others: Reserved

Bits 3:0 **PSC_LINEAR[3:0]**: Prescaler linear

0x0: prescaler by power of 2 (division by 1, 2, 4, 8...)
0x1: prescaler is linear (division by 1, 2, 3, 4, 5...)
Others: Reserved

57.8.22 TIMx hardware configuration 1 register (TIMx_HWCFGR1) (x = 16 to 17)

Address offset: 0x3F0

Reset value: 0x1220 1011

This read register identifies the hardware configuration parameters of the instantiated IP.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 **CNT_DIR[3:0]**: Counter direction
- 0x0: Down-counter only
- 0x1: Up-counter only
- 0x2: Up/Down counter allowing center-aligned mode
- Others: Reserved

Bits 27:24 **DMA_IMPL[3:0]**: DMA features implementation
- 0x0: DMA requests are not possible
- 0x1: Single DMA requests possible
- 0x2: All DMA features implemented
- Others: Reserved

Bits 23:20 **BK_IMPL[3:0]**: Break circuit implementation
- 0x0: no break implemented
- 0x1: break1 implemented without filter (tim_brk + tim_sys_brk connected)
- 0x2: break1 implemented with filter (tim_brk + tim_sys_brk connected)
- 0x3: break 1 and 2 implemented (tim_brk + tim_sys_brk + brk2)
- Others: Reserved

Bits 19:16 **ETR_IMPL[3:0]**: External trigger implementation
- 0x0: External trigger circuit not implemented, ocrefx cleared by ocref_clr input
- 0x1: External trigger circuit implemented, ocrefx cleared by ocref_clr input
- 0x2: External trigger circuit implemented, ocrefx cleared by etrf signal
- 0x3: External trigger circuit implemented, ocrefx cleared by ocref_clr or etrf (1 control bit “OCCS” added in GPT_SMCR)
- Others: Reserved

Bits 15:12 **RCR_IMPL[3:0]**: Repetition counter implementation
- 0x0: repetition counter not implemented
- 0x1: 8-bit repetition counter implemented
- 0x2: 16-bit repetition counter implemented
- Others: Reserved

Bits 11:8 **NB_OF_SM[3:0]**: Number of synchronization module
0x0: synchronization module not implemented
0x1: 1 synchronization module implemented
Others: Reserved

Bits 7:4 **NB_OF_DT[3:0]**: Number of complementary outputs and dead-time generators
0x0
0x1
0x2
0x3
0x4
Others: Reserved

Bits 3:0 **NB_OF_CC[3:0]**: Number of capture / compare channel
0x0: no capture/compare channel implemented
0x1: only CC1 channel is implemented
0x2: CC1 and CC2 channels are implemented
0x3: CC1, CC2 and CC3 channels are implemented
0x4: CC1, CC2, CC3 and CC4 channels are implemented
0x5: CC1, CC2, CC3, CC4 and CC5 channels are implemented
0x6: CC1, CC2, CC3, CC4, CC5 and CC6 channels are implemented
Others: Reserved

57.8.23 TIMx IP version register (TIMx_VERR)(x = 16 to 17)

Address offset: 0x3F4

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

58 Low-power timer (LPTIM)

58.1 LPTIM introduction

The LPTIM is a 16-bit timer that benefits from the ultimate developments in power consumption reduction. Thanks to its diversity of clock sources, the LPTIM is able to keep running in all power modes except for Standby mode. Given its capability to run even with no internal clock source, the LPTIM can be used as a “Pulse Counter” which can be useful in some applications. The LPTIM capability to wake up the system from low-power modes, makes it suitable to realize “Timeout functions” with extremely low power consumption.

The LPTIM introduces a flexible clock scheme that provides the needed functionalities and performance, while minimizing the power consumption.

58.2 LPTIM main features

- 16-bit upcounter
- 3-bit prescaler with 8 possible dividing factors (1,2,4,8,16,32,64,128)
- Selectable clock
  - Internal clock sources: configurable internal clock source (see RCC section)
  - External clock source over LPTIM input (working with no LP oscillator running, used by pulse counter application)
- 16-bit ARR autoreload register
- 16-bit capture/compare register
- Continuous/One-shot mode
- Selectable software/hardware input trigger
- Programmable digital glitch filter
- Configurable output: Pulse, PWM
- Configurable I/O polarity
- Encoder mode
- Repetition counter
- Up to 2 independent channels for:
  - Input capture
  - PWM generation (edge-aligned mode)
  - One-pulse mode output
- Interrupt generation on 10 events
- DMA request generation on the following events:
  - Update event
  - Input capture

58.3 LPTIM implementation

Table 592 describes LPTIM implementation on STM32MP21xx devices. The full set of features is implemented in LPTIM1 and LPTIM2 while LPTIM3, LPTIM4 and LPTIM5 support a smaller set of features.

Table 592. STM32MP21xx LPTIM features

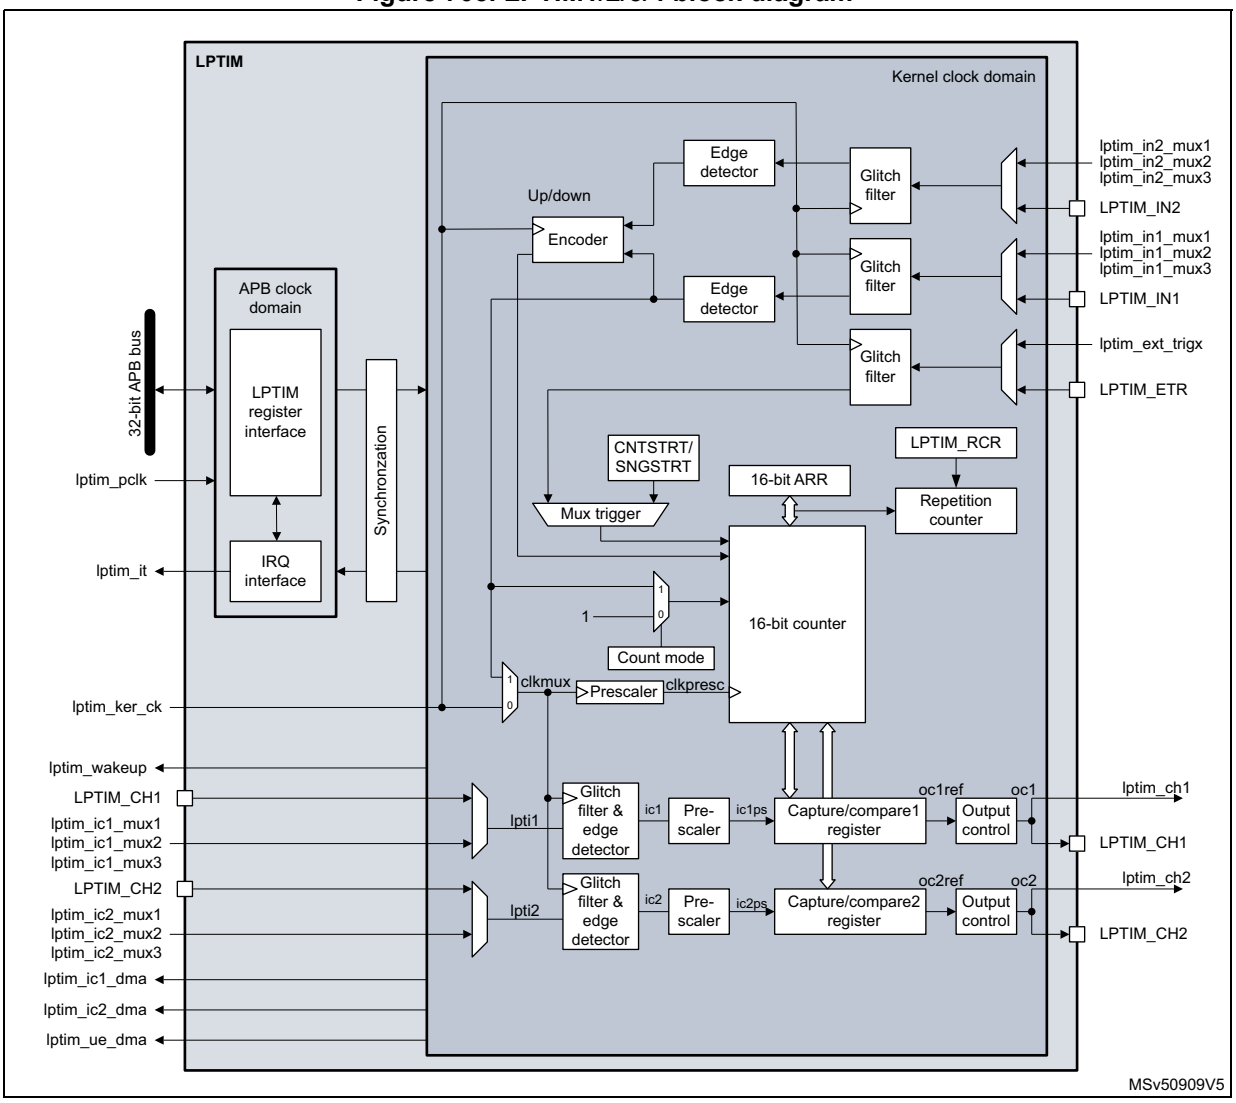
LPTIM modes/features(1)	LPTIM1	LPTIM2	LPTIM3(2)	LPTIM4	LPTIM5
Encoder mode	X	X	-	-	-
PWM mode	X	X	X	X	X
Input Capture	X	X	X	X	-
Number of channels	2	2	2	2	0
Number of DMA requests	3	3	3	3	0
Wake-up in Stop1/2 modes	X	X	X	X	X
Autonomous in LP-Stop1/2, LPLV-Stop1/2, Standby modes	X	X	X	X	-

1. X = supported.
2. LPTIM3_IN1 and LPTIM3_CH2 are only available on same GPIO and so cannot be used together.

58.4 LPTIM functional description

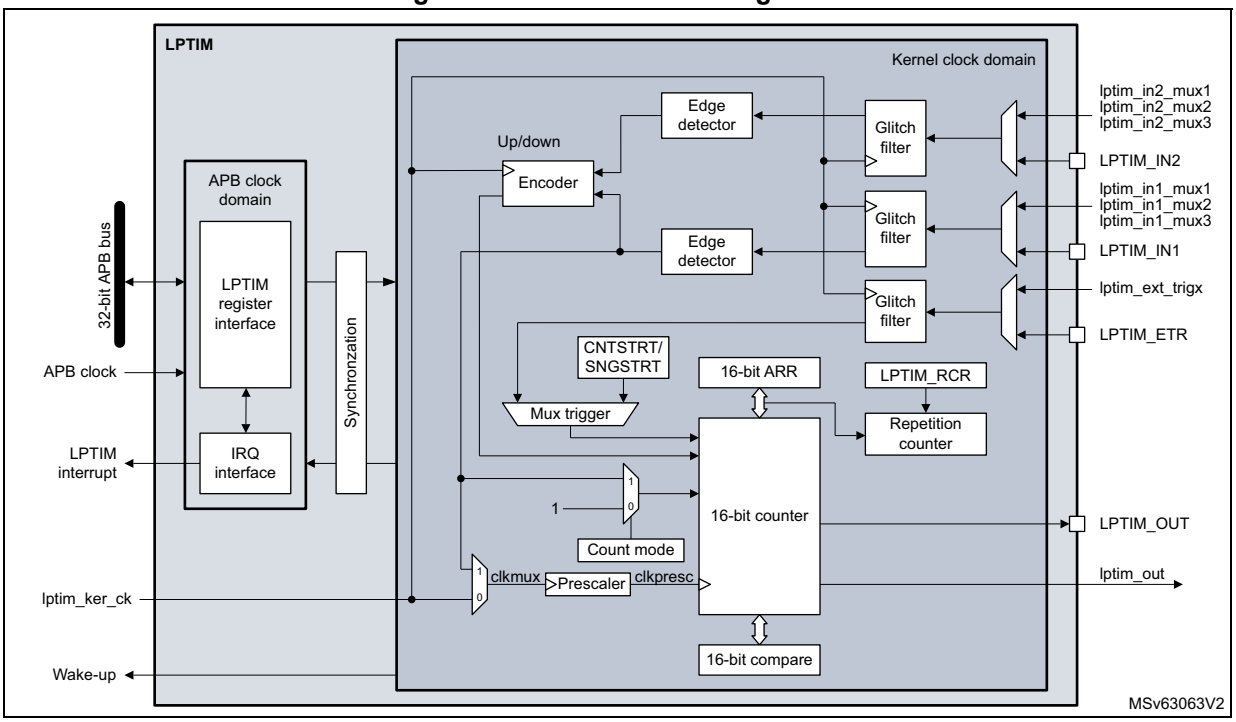
58.4.1 LPTIM block diagram

Figure 705. LPTIM1/2/3/4 block diagram(1)



1. Some I/Os may not be available, refer to *Section 58.4.2: LPTIM pins and internal signals*.

Figure 706. LPTIM5 block diagram(1)



1. Some I/Os may not be available, refer to *Section 58.4.2: LPTIM pins and internal signals*.

58.4.2 LPTIM pins and internal signals

The following tables provide the list of LPTIM pins and internal signals, respectively.

Table 593. LPTIM1/2/3/4 input/output pins

Pin name	Pin type	Description
LPTIM_IN1	Digital input	LPTIM Input 1 from GPIO pin on mux input 0
LPTIM_IN2(1)	Digital input	LPTIM Input 2 from GPIO pin on mux input 0
LPTIM_ETR	Digital input	LPTIM external trigger GPIO pin
LPTIM_CH1	Digital input/output	LPTIM channel 1 input/output GPIO pin
LPTIM_CH2	Digital input/output	LPTIM channel 2 input/output GPIO pin

1. LPTIM3/4 have only the input IN1, no input IN2.

Table 594. LPTIM5 input/output pins

Pin name	Pin type	Description
LPTIM_IN1	Digital input	LPTIM Input 1 from GPIO pin on mux input 0
LPTIM_ETR	Digital input	LPTIM external trigger GPIO pin
LPTIM_OUT	Digital output	LPTIM output GPIO pin

Table 595. LPTIM1/2/3/4 internal signals

Signal name	Signal type	Description
lptim_pclk	Digital input	LPTIM APB clock domain
lptim_ker_ck	Digital input	LPTIM kernel clock
lptim_in1_mux1	Digital input	Internal LPTIM input 1 connected to mux input 1
lptim_in1_mux2	Digital input	Internal LPTIM input 1 connected to mux input 2
lptim_in1_mux3	Digital input	Internal LPTIM input 1 connected to mux input 3
lptim_in2_mux1(1)	Digital input	Internal LPTIM input 2 connected to mux input 1
lptim_in2_mux2(1)	Digital input	Internal LPTIM input 2 connected to mux input 2
lptim_in2_mux3(1)	Digital input	Internal LPTIM input 2 connected to mux input 3
lptim_ic1_mux1	Digital input	Internal LPTIM input capture 1 connected to mux input 1
lptim_ic1_mux2	Digital input	Internal LPTIM input capture 1 connected to mux input 2
lptim_ic1_mux3	Digital input	Internal LPTIM input capture 1 connected to mux input 3
lptim_ic2_mux1	Digital input	Internal LPTIM input capture 2 connected to mux input 1
lptim_ic2_mux2	Digital input	Internal LPTIM input capture 2 connected to mux input 2
lptim_ic2_mux3	Digital input	Internal LPTIM input capture 2 connected to mux input 3
lptim_ext_trigx	Digital input	LPTIM external trigger input x
lptim_it	Digital output	LPTIM global interrupt
lptim_wakeup	Digital output	LPTIM wake-up event
lptim_ic1_dma	Digital output	LPTIM input capture 1 DMA request
lptim_ic2_dma	Digital output	LPTIM input capture 2 DMA request
lptim_ue_dma	Digital output	LPTIM update event DMA request

1. LPTIM3/4/5 have only the input 1 (no input 2).

Table 596. LPTIM5 internal signals

Signal name	Signal type	Description
lptim_pclk	Digital input	LPTIM APB clock domain
lptim_ker_ck	Digital input	LPTIM kernel clock
lptim_in1_mux1	Digital input	Internal LPTIM input 1 connected to mux input 1
lptim_in1_mux2	Digital input	Internal LPTIM input 1 connected to mux input 2
lptim_in1_mux3	Digital input	Internal LPTIM input 1 connected to mux input 3
lptim_ext_trigx	Digital input	LPTIM external trigger input x
lptim_out	Digital output	LPTIM counter output
lptim_it	Digital output	LPTIM global interrupt
lptim_wakeup	Digital output	LPTIM wake-up event

58.4.3 LPTIM input and trigger mapping

The LPTIM external trigger and input connections are detailed hereafter.

Table 597. LPTIM1/2/3/4/5 external trigger connections

TRIGSEL	External trigger

58.4.4 LPTIM reset and clocks

The LPTIM can be clocked using several clock sources. It can be clocked using an internal clock signal which can be any configurable internal clock source selectable through the RCC (see RCC section for more details). Also, the LPTIM can be clocked using an external clock signal injected on its external Input1. When clocked with an external clock source, the LPTIM can run in one of the following configurations:

- The first configuration is when the LPTIM is clocked by an external signal but in the same time an internal clock signal is provided to the LPTIM from configurable internal clock source (see RCC section).
- The second configuration is when the LPTIM is solely clocked by an external clock source through its external Input1. This configuration is the one used to realize Timeout function or pulse counter function when all the embedded oscillators are turned off after entering a low-power mode.

Programming the CKSEL and COUNTMODE bits allows controlling whether the LPTIM uses an external clock source or an internal one.

When configured to use an external clock source, the CKPOL bits are used to select the external clock signal active edge. If both edges are configured to be active ones, an internal clock signal must also be provided (first configuration). In this case, the internal clock signal frequency must be at least four times higher than the external clock signal frequency.

58.4.5 Glitch filter

The LPTIM inputs, either external (mapped to GPIOs) or internal (mapped on the chip-level to other embedded peripherals), are protected with digital filters that prevent any glitches and noise perturbations to propagate inside the LPTIM. This is in order to prevent spurious counts or triggers.

Before activating the digital filters, an internal clock source must first be provided to the LPTIM. This is necessary to guarantee the proper operation of the filters.

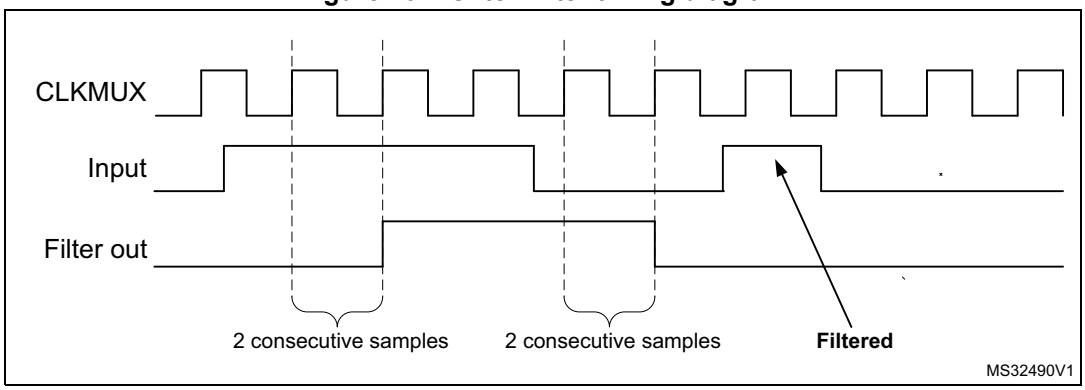
The digital filters are divided into three groups:

- The first group of digital filters protects the LPTIM internal or external inputs. The digital filters sensitivity is controlled by the CKFLT bits
- The second group of digital filters protects the LPTIM internal or external trigger inputs. The digital filters sensitivity is controlled by the TRGFLT bits.
- The third group of digital filters protects the LPTIM internal or external input captures. The digital filters sensitivity is controlled by the ICxF bits.

Note: The digital filters sensitivity is controlled by groups. It is not possible to configure each digital filter sensitivity separately inside the same group.

The filter sensitivity acts on the number of consecutive equal samples that is detected on one of the LPTIM inputs to consider a signal level change as a valid transition. *Figure 707* shows an example of glitch filter behavior in case of a two consecutive samples programmed.

Figure 707. Glitch filter timing diagram



Note: In case no internal clock signal is provided, the digital filter must be deactivated by setting the CKFLT, ICxF and TRGFLT bits to 0. In this case, an external analog filter can be used to protect the LPTIM external inputs against glitches.

58.4.6 Prescaler

The LPTIM 16-bit counter is preceded by a configurable power-of-2 prescaler. The prescaler division ratio is controlled by the PRESC[2:0] field. The table below lists all the possible division ratios:

Table 602. Prescaler division ratios

Programming	Dividing factor
000	/1
001	/2
010	/4
011	/8
100	/16
101	/32
110	/64
111	/128

58.4.7 Trigger multiplexer

The LPTIM counter can be started either by software or after the detection of an active edge on one of the eight trigger inputs.

TRIGEN[1:0] is used to determine the LPTIM trigger source:

- When TRIGEN[1:0] equals 00, the LPTIM counter is started as soon as one of the CNTSTRT or the SNGSTRT bits is set by software. The three remaining possible

values for the TRIGEN[1:0] are used to configure the active edge used by the trigger inputs. The LPTIM counter starts as soon as an active edge is detected.

- When TRIGEN[1:0] is different than 00, TRIGSEL[2:0] is used to select which of the eight trigger inputs is used to start the counter.

The external triggers are considered asynchronous signals for the LPTIM. After a trigger detection, a two-counter-clock period latency is needed before the timer starts running due to the synchronization.

If a new trigger event occurs when the timer is already started it is ignored (unless timeout function is enabled).

Note: The timer must be enabled before setting the SNGSTRT/CNTSTRT bits. Any write on these bits when the timer is disabled is discarded by hardware.

Note: When starting the counter by software (TRIGEN[1:0] = 00), there is a delay of 3 kernel clock cycles between the LPTIM_CR register update (set one of SNGSTRT or CNTSTRT bits) and the effective start of the counter.

58.4.8 Operating mode

The LPTIM features two operating modes:

- Continuous mode: the timer is free running, the timer is started from a trigger event and never stops until the timer is disabled
- One-shot mode: the timer is started from a trigger event and stops when an LPTIM update event is generated.

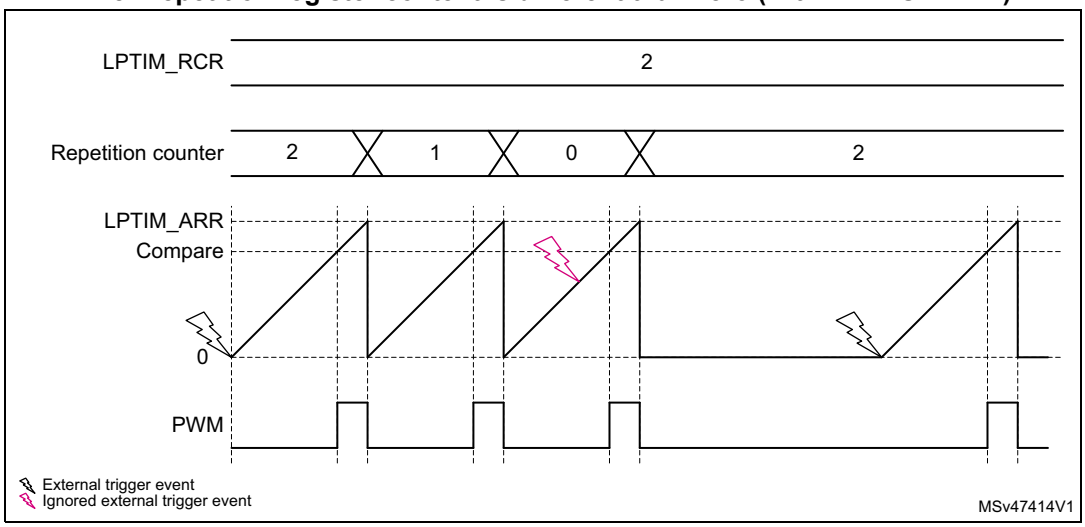
One-shot mode

To enable the one-shot counting, the SNGSTRT bit must be set.

A new trigger event re-starts the timer. Any trigger event occurring after the counter starts and before the next LPTIM update event, is discarded.

In case an external trigger is selected, each external trigger event arriving after the SNGSTRT bit is set, and after the repetition counter has stopped (after the update event), and if the repetition register content is different from zero, the repetition counter gets reloaded with the value already contained by the repetition register and a new one-shot counting cycle is started as shown in *Figure 708*.

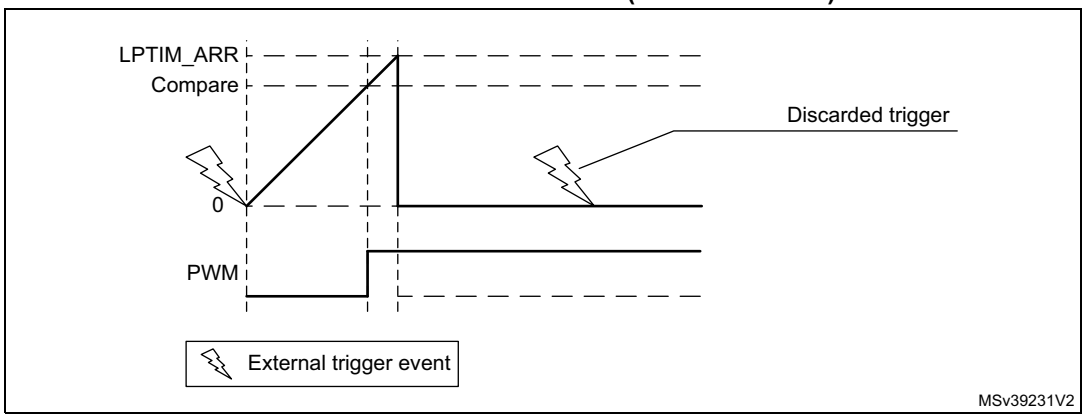
Figure 708. LPTIM output waveform, single-counting mode configuration when repetition register content is different than zero (with PRELOAD = 1)



- Set-once mode activated:

Note that when the WAVE bitfield in the LPTIM_CFGR register is set, the Set-once mode is activated. In this case, the counter is only started once following the first trigger, and any subsequent trigger event is discarded as shown in *Figure 709*.

Figure 709. LPTIM output waveform, single-counting mode configuration and Set-once mode activated (WAVE bit is set)



In case of software start (TRIGEN[1:0] = 00), the SNGSTRT setting starts the counter for one-shot counting.

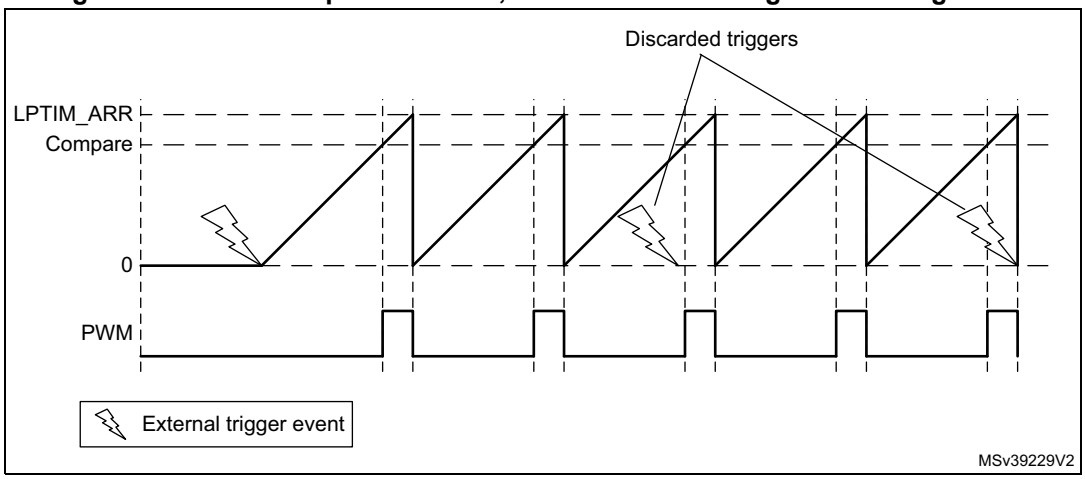
Continuous mode

To enable the continuous counting, the CNTSTRT bit must be set.

In case an external trigger is selected, an external trigger event arriving after CNTSTRT is set, starts the counter for continuous counting. Any subsequent external trigger event is discarded as shown in *Figure 710*.

In case of software start (TRIGEN[1:0] = 00), setting CNTSTRT starts the counter for continuous counting.

Figure 710. LPTIM output waveform, Continuous counting mode configuration



SNGSTRT and CNTSTRT bits can only be set when the timer is enabled (ENABLE bit set to 1). It is possible to change “on the fly” from One-shot mode to Continuous mode.

If the Continuous mode was previously selected, setting SNGSTRT switches the LPTIM to the One-shot mode. The counter (if active) stops as soon as an LPTIM update event is generated.

If the One-shot mode was previously selected, setting CNTSTRT switches the LPTIM to the Continuous mode. The counter (if active) restarts as soon as it reaches ARR.

58.4.9 Timeout function

The detection of an active edge on one selected trigger input can be used to reset the LPTIM counter. This feature is controlled through the TIMOUT bit.

The first trigger event starts the timer, any successive trigger event resets the LPTIM counter and the repetition counter and the timer restarts.

A low-power timeout function can be realized. The timeout value corresponds to the compare value; if no trigger occurs within the expected time frame, the MCU is waked-up by the compare match event.

58.4.10 Waveform generation

Two 16-bit registers, the LPTIM_ARR (autoreload register) and LPTIM_CCRx (capture/compare register), are used to generate several different waveforms on LPTIM output

The timer can generate the following waveforms:

- The PWM mode: the LPTIM output is set as soon as the counter value in LPTIM_CNT exceeds the compare value in LPTIM_CCRx. The LPTIM output is reset as soon as a match occurs between the LPTIM_ARR and the LPTIM_CNT register. For more details see *Section 58.4.19: PWM mode*.
- The One-pulse mode: the output waveform is similar to the one of the PWM mode for the first pulse, then the output is permanently reset
- The Set-once mode: the output waveform is similar to the One-pulse mode except that the output is kept to the last signal level (depends on the output configured polarity).

The above described modes require the LPTIM_ARR register value to be strictly greater than the LPTIM_CCRx register value.

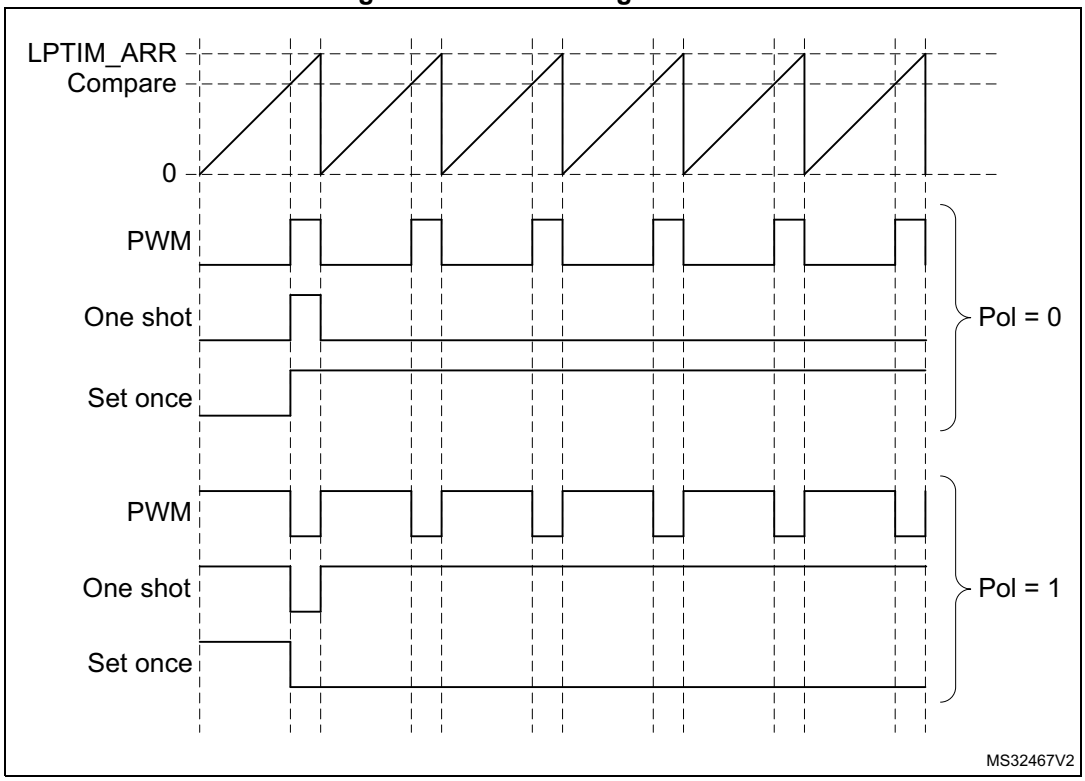
The LPTIM output waveform can be configured through the WAVE bit as follow:

- Resetting the WAVE bit to 0 forces the LPTIM to generate either a PWM waveform or a One pulse waveform depending on which bit is set: CNTSTRT or SNGSTRT.
- Setting the WAVE bit to 1 forces the LPTIM to generate a Set-once mode waveform.

The WAVPOL/CCxP bit controls the LPTIM output polarity. The change takes effect immediately, so the output default value changes immediately after the polarity is re-configured, even before the timer is enabled.

Signals with frequencies up to the LPTIM clock frequency divided by two can be generated. *Figure 711* below shows the three possible waveforms that can be generated on the LPTIM output. Also, it shows the effect of the polarity change using the WAVPOL/CCxP bit.

Figure 711. Waveform generation



58.4.11 Register update

The LPTIM_ARR register, the LPTIM_RCR register and the LPTIM_CCRx register are updated immediately after the APB bus write operation or in synchronization with the next LPTIM update event if the timer is already started.

The PRELOAD bit controls how the LPTIM_ARR, the LPTIM_RCR and the LPTIM_CCRx registers are updated:

- When the PRELOAD bit is reset to 0, the LPTIM_ARR, the LPTIM_RCR and the LPTIM_CCRx registers are immediately updated after any write access.
- When the PRELOAD bit is set to 1, the LPTIM_ARR, the LPTIM_RCR and the LPTIM_CCRx registers are updated at next LPTIM update event, if the timer has been already started.

The LPTIM APB interface and the LPTIM kernel logic use different clocks, so there is some latency between the APB write and the moment when these values are available to the counter comparator. Within this latency period, any additional write into these registers must be avoided.

The ARROK flag, the REPOK flag and the CMPxOK flag in the LPTIM_ISR register indicate when the write operation is completed to respectively the LPTIM_ARR register, the LPTIM_RCR register and the LPTIM_CCRx register.

After a write to the LPTIM_ARR, the LPTIM_RCR or the LPTIM_CCRx register, a new write operation to the same register can only be performed when the previous write operation is completed. Any successive write before respectively the ARROK flag, the REPOK flag or the CMPxOK flag be set, leads to unpredictable results.

58.4.12 Counter mode

The LPTIM counter can be used to count external events on the LPTIM input1 or it can be used to count internal clock cycles. The CKSEL and COUNTMODE bits control which source is used for updating the counter.

In case the LPTIM is configured to count external events on Input1, the counter can be updated following a rising edge, falling edge or both edges depending on the value written to the CKPOL[1:0] bits.

The count modes below can be selected, depending on CKSEL and COUNTMODE values:

- CKSEL = 0: the LPTIM is clocked by an internal clock source
  - COUNTMODE = 0

    The LPTIM is configured to be clocked by an internal clock source and the LPTIM counter is configured to be updated following each internal clock pulse.
  - COUNTMODE = 1

    The LPTIM external Input1 is sampled with the internal clock provided to the LPTIM.

    Consequently, in order not to miss any event, the frequency of the changes on the external Input1 signal must never exceed the frequency of the internal clock provided to the LPTIM. Also, the internal clock provided to the LPTIM must not be prescaled (PRESC[2:0] = 000).
- CKSEL = 1: the LPTIM is clocked by an external clock source

  COUNTMODE value is don’t care.

  In this configuration, the LPTIM has no need for an internal clock source (except if the glitch filters are enabled). The signal injected on the LPTIM external input1 is used as

system clock for the LPTIM. This configuration is suitable for operation modes where no embedded oscillator is enabled.

For this configuration, the LPTIM counter can be updated either on rising edges or falling edges of the input1 clock signal but not on both rising and falling edges.

Since the signal injected on the LPTIM external input1 is also used to clock the LPTIM kernel logic, there is some initial latency (after the LPTIM is enabled) before the counter is incremented. More precisely, the first five active edges on the LPTIM external Input1 (after LPTIM is enable) are lost.

58.4.13 Timer enable

The ENABLE bit located in the LPTIM_CR register is used to enable/disable the LPTIM kernel logic. After setting the ENABLE bit, a delay of two counter clock cycles is needed before the LPTIM is actually enabled.

The LPTIM_CFGR register must be modified only when the LPTIM is disabled.

58.4.14 Timer counter reset

In order to reset the content of LPTIM_CNT register, two reset mechanisms are implemented:

- The synchronous reset mechanism: the synchronous reset is controlled by the COUNTRST bit in the LPTIM_CR register. After setting the COUNTRST bitfield to '1', the reset signal is propagated in the LPTIM kernel clock domain. So it is important to note that a few clock pulses of the LPTIM kernel logic elapse before the reset is taken into account. This makes the LPTIM counter count few extra pluses between the time when the reset is triggered and it become effective. Since the COUNTRST bit is located in the APB clock domain and the LPTIM counter is located in the LPTIM kernel clock domain, a delay of 3 clock cycles of the kernel clock is needed to synchronize the reset signal issued by the APB clock domain when writing '1' to the COUNTRST bit.

Note: The software ensures that COUNRST bit is '0' before generating every synchronous reset.

- The asynchronous reset mechanism: the asynchronous reset is controlled by the RSTARE bit located in the LPTIM_CR register. When this bit is set to '1', any read access to the LPTIM_CNT register resets its content to zero. Asynchronous reset must be triggered within a timeframe in which no LPTIM core clock is provided. For example when LPTIM Input1 is used as external clock source, the asynchronous reset must be applied only when there is enough insurance that no toggle occurs on the LPTIM Input1.
  To read reliably the content of the LPTIM_CNT register two successive read accesses must be performed and compared. A read access can be considered reliable when the value of the two read accesses is equal. Unfortunately when asynchronous reset is enabled there is no possibility to read twice the LPTIM_CNT register.

Warning: There is no mechanism inside the LPTIM that prevents the two reset mechanisms from being used simultaneously. The developer must make sure that these two mechanisms are used exclusively.

58.4.15 Encoder mode

This mode allows handling signals from quadrature encoders used to detect angular position of rotary elements. Encoder interface mode acts simply as an external clock with direction selection. This means that the counter just counts continuously between 0 and the auto-reload value programmed into the LPTIM_ARR register (0 up to ARR or ARR down to 0 depending on the direction). Therefore LPTIM_ARR must be configured before starting the counter. From the two external input signals, Input1 and Input2, a clock signal is generated to clock the LPTIM counter. The phase between those two signals determines the counting direction.

The Encoder mode is only available when the LPTIM is clocked by an internal clock source. The signals frequency on both Input1 and Input2 inputs must not exceed the LPTIM internal clock frequency divided by 4. This is mandatory in order to guarantee a proper operation of the LPTIM.

Direction change is signalized by the two down and up flags in the LPTIM_ISR register. An interrupt can be generated for both direction change events if enabled through the DOWNIE bit.

To activate the Encoder mode the ENC bit has to be set to 1. The LPTIM must first be configured in Continuous mode.

When Encoder mode is active, the LPTIM counter is modified automatically following the speed and the direction of the incremental encoder. Therefore, its content always represents the encoder's position. The count direction, signaled by the Up and Down flags, correspond to the rotation direction of the encoder rotor.

According to the edge sensitivity configured using the CKPOL[1:0] bits, different counting scenarios are possible. The following table summarizes the possible combinations, assuming that Input1 and Input2 do not switch at the same time.

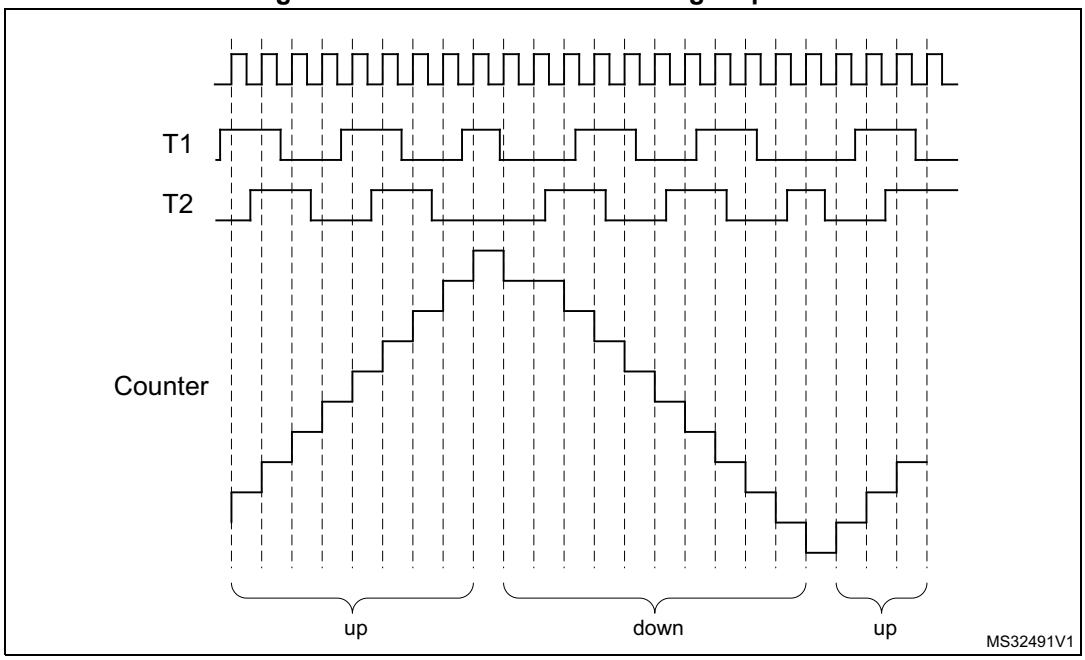
Table 603. Encoder counting scenarios

Active edge	Level on opposite signal (Input1 for Input2, Input2 for Input1)	Input1 signal		Input2 signal	
		Rising	Falling	Rising	Falling
Rising Edge (Encoder sub-mode 1)	High	Down	No count	Up	No count
	Low	Up	No count	Down	No count
Falling Edge (Encoder sub-mode 2)	High	No count	Up	No count	Down
	Low	No count	Down	No count	Up
Both Edges (Encoder sub-mode 3)	High	Down	Up	Up	Down
	Low	Up	Down	Down	Up

The following figure shows a counting sequence for Encoder mode where both-edge sensitivity is configured.

Caution: In this mode the LPTIM must be clocked by an internal clock source, so the CKSEL bit must be maintained to its reset value which is equal to 0. Also, the prescaler division ratio must be equal to its reset value which is 1 (PRESC[2:0] bits must be 000).

Figure 712. Encoder mode counting sequence



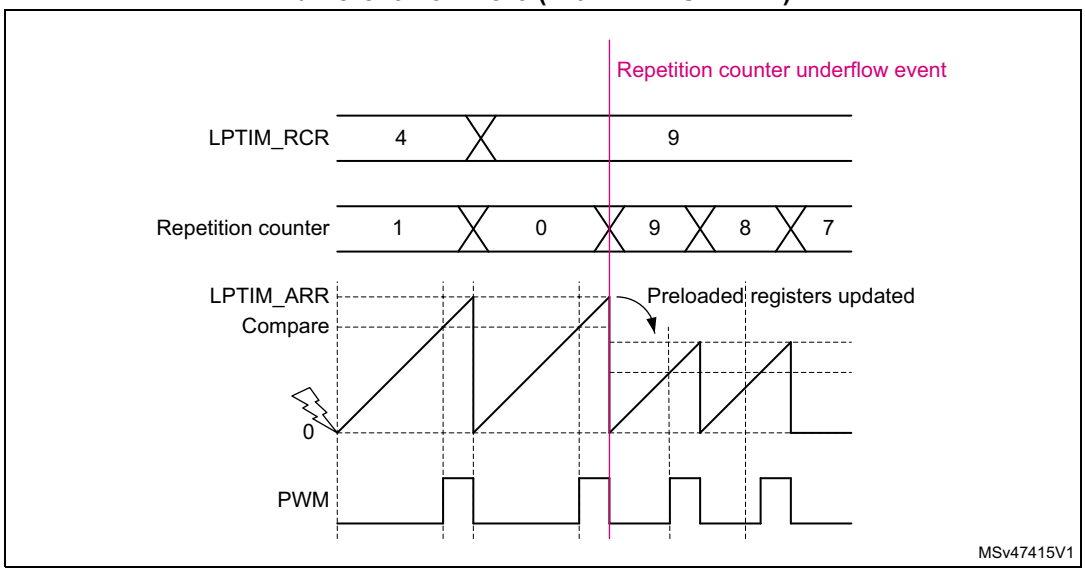
58.4.16 Repetition counter

The LPTIM features a repetition counter that decrements by 1 each time an LPTIM counter overflow event occurs. A repetition counter underflow event is generated when the repetition counter contains zero and the LPTIM counter overflows. Next to each repetition counter underflow event, the repetition counter gets loaded with the content of the REP[7:0] bitfield which belongs to the repetition register LPTIM_RCR.

A repetition underflow event is generated on each and every LPTIM counter overflow when the REP[7:0] register is set to 0.

When PRELOAD = 1, writing to the REP[7:0] bitfield has no effect on the content of the repetition counter until the next repetition underflow event occurs. The repetition counter continues to decrement each LPTIM counter overflow event and only when a repetition underflow event is generated, the new value written into REP[7:0] is loaded into the repetition counter. This behavior is depicted in *Figure 713*.

Figure 713. Continuous counting mode when repetition register LPTIM_RCR different from zero (with PRELOAD = 1)



A repetition counter underflow event is systematically associated with LPTIM preloaded registers update (refer to *Section 58.4.11: Register update* for more information).

Repetition counter underflow event is signaled to the software through the update event (UE) flag mapped into the LPTIM_ISR register. When set, the UE flag can trigger an LPTIM interrupt if its respective update event interrupt enable (UEIE) control bit, mapped to the LPTIM_DIER register, is set.

The repetition register LPTIM_RCR is located in the APB bus interface clock domain where the repetition counter itself is located in the LPTIM kernel clock domain. Each time a new value is written to the LPTIM_RCR register, this new content is propagated from the APB bus interface clock domain to the LPTIM kernel clock domain. The new written value is then loaded to the repetition counter immediately after a repetition counter underflow event. The synchronization delay for the new written content is four APB clock cycles plus three LPTIM kernel clock cycles and it is signaled by the REPOK flag located in the LPTIM_ISR register when it is elapsed. When the LPTIM kernel clock cycle is relatively slow, for instance when the LPTIM kernel is being clocked by the LSI clock source, it can be lengthy to keep polling on the REPOK flag by software to detect that the synchronization of the LPTIM_RCR register content is finished. For that reason, the REPOK flag, when set, can generate an interrupt if its associated REPOKIE control bit in the LPTIM_DIER register is set.

Note: After a write to the LPTIM_RCR register, a new write operation to the same register can only be performed when the previous write operation is completed. Any successive writes before the REPOK flag is set, lead to unpredictable results.

Caution: When using repetition counter with PRELOAD = 0, LPTIM_RCR register must be changed at least five counter cycles before the autoreload match event, otherwise an unpredictable behavior may occur.

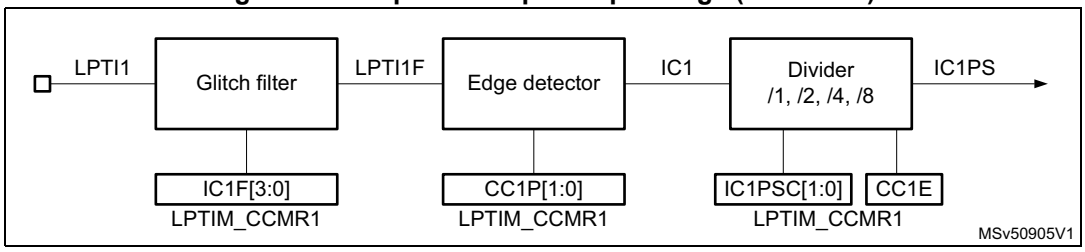
58.4.17 Capture/compare channels

Each capture/compare channel is built around a capture/compare register, an input stage for capture (with digital filter, multiplexing and prescaler) and an output stage (with comparator and output control) for PWM.

Input stage

The input stage samples the corresponding LPTIx input to generate a filtered signal LPTIxF. Then, an edge detector with polarity selection generates ICx signal used as the capture command. It is prescaled to generate the capture command signal (ICxPS).

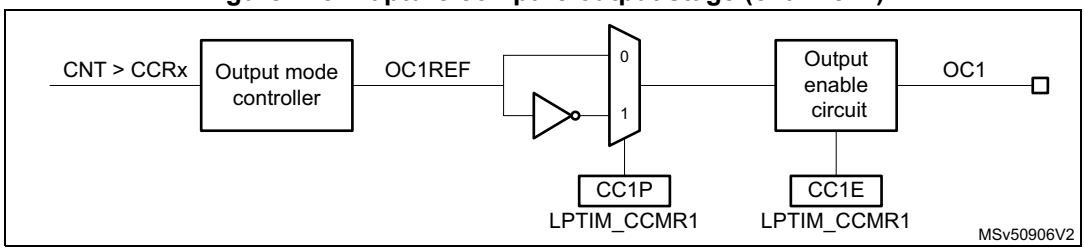
Figure 714. Capture/compare input stage (channel 1)



Output stage

The output stage generates an intermediate waveform which is then used for reference: OCxREF (active high). The polarity acts at the end of the chain.

Figure 715. Capture/compare output stage (channel 1)



58.4.18 Input capture mode

In Input capture mode, the capture/compare registers (LPTIM_CCRx) are used to latch the value of the counter after a transition detected by the corresponding ICx signal. Assuming input capture is enabled on a channel x (CCxE set) and when a capture occurs, the corresponding CCxIF flag (LPTIM_ISR register) is set and an interrupt or a DMA request can be sent if they are enabled. If a capture occurs while the CCxIF flag was already high, then the over-capture flag CCxOF (LPTIM_ISR register) is set. CCxIF can be cleared by software by writing the CCxICF to 1 or by reading the captured data stored in the LPTIM_CCRx register. CCxOF is cleared by writing CCxOCF to 1.

Note: In DMA mode, the input capture channel have to be enabled (set CCxE bit) the last, after enabling the DMA request and after starting the counter. This is in order to prevent generating an input capture DMA request when the counter is not started yet.

Input capture Glitch filter latency

When a trigger event arrives on channel x input (LPTIx) and depending on the configured glitch filter (ICxF[1:0] field in CCMRx register) and on the kernel clock prescaler value (PRESC[2:0] field in CFGR register), there is a variable latency that leads to a systematic offset (see *Table 604*) between the captured value stored in the CCRx register and the real value corresponding to the capture trigger.

This offset has no impact on pulse width measurement as it is systematic and compensated between two captures.

The real capture value corresponding to the input capture trigger can be calculated using the below formula:

Real capture value = captured(LPTIM_CCRx) - offset

The relevant offset must be used depending on the glitch filter and on the kernel clock prescaler value (PRESC field in CFGR register)

Example: determining the real capture value when PRESC[2:0] = 0x2 and ICxF = 0x3.

For this configuration (PRESC[2:0] = 0x2 and ICxF = 0x3) and according to the *Table 604*, the offset is 5.

Assuming that the captured value in CCRx is 9 (LPTIM_CNT = 9), this means that the capture trigger occurred when the LPTIM_CNT was equal to 9 - 5 = 4.

Table 604. Input capture Glitch filter latency (in counter step unit)

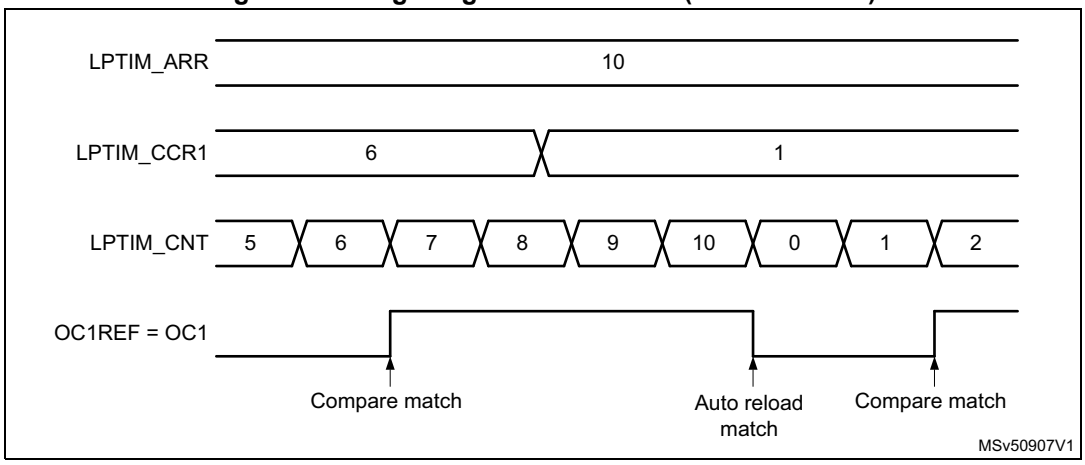
58.4.19 PWM mode

The PWM mode enables to generate a signal with a frequency determined by the value of the LPTIM_ARR register and a duty cycle determined by the value of the LPTIM_CCRx register. The LPTIM is able to generate PWM in edge-aligned mode.

OCx polarity is software programmable using the CCxP bit in the LPTIM_CCMRx register. It can be programmed as active high or active low. OCx output is enabled by the CCxE bit in the LPTIM_CCMRx register. Refer to the LPTIM_CCMRx register description for more details.

Figure 716 gives an example where the LPTIM channel 1 is configured in PWM mode with LPTIM_CCR1 = 6 then 1 and LPTIM_ARR=10.

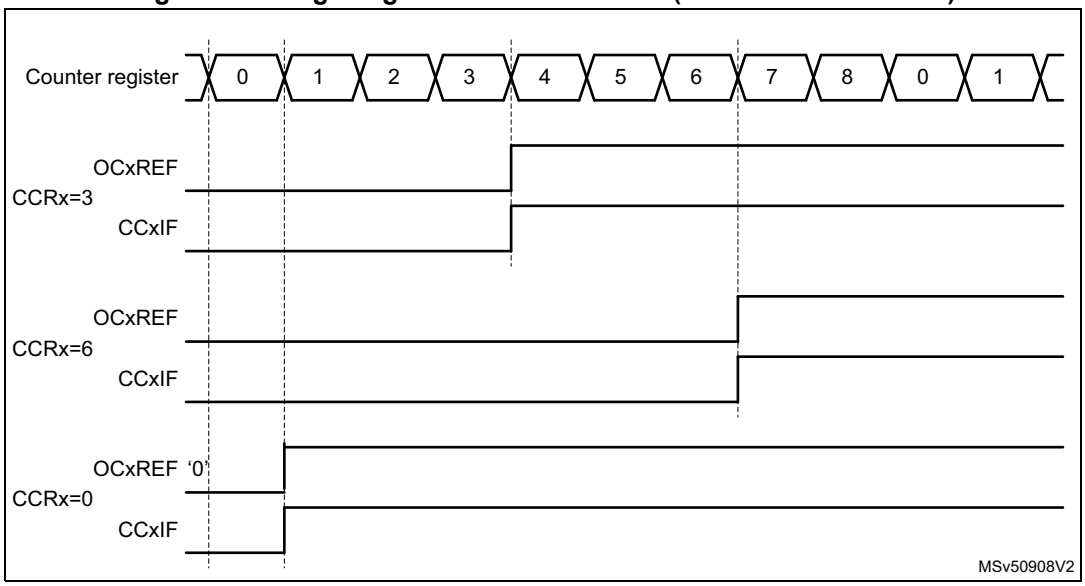
Figure 716. Edge-aligned PWM mode (PRELOAD = 1)



In the following example the reference PWM signal OCxREF is low as long as LPTIM_CNT ≤ LPTIM_CCRx else it becomes high.

Figure 717 shows some edge-aligned PWM waveforms in an example where LPTIM_ARR = 8.

Figure 717. Edge-aligned PWM waveforms (ARR=8 and CCxP = 0)



PWM mode with immediate update PRELOAD = 0

The PWM mode with PRELOAD = 0 enables the early change of the output level within the current PWM cycle. Based on the immediate update (PRELOAD = 0) of the LPTIM_CCRx register and on the continuous comparison of LPTIM_CNT and LPTIM_CCRx registers, it permits to have a new duty cycle value applied as soon as possible within the current PWM cycle, without having to wait for the completion of the current PWM period.

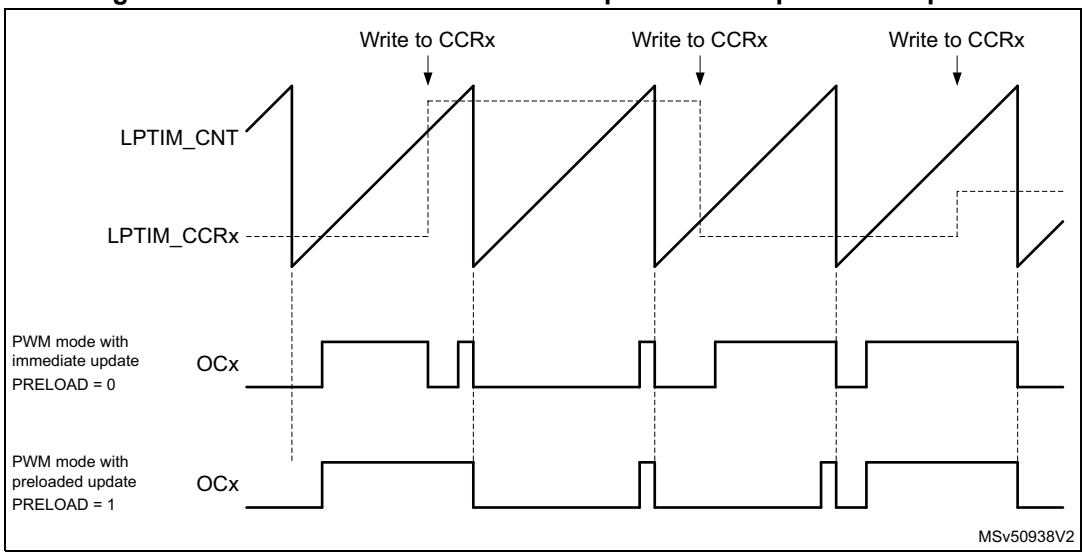
When the (PRELOAD = 0), the OCxREF signal level can be changed on-the-fly by software (or DMA) by updating the compare value in the LPTIM_CCRx register.

Depending on the written compare value and on the current counter and compare values, the OCxREF level is re-assigned as illustrated below:

- If the new compare value does not exceed the current counter value and the current compare value exceeds the counter, OCxREF level is re-assigned high as soon as the new compare value is written.
- If the new compare value exceeds the counter value and the current compare value does not exceed the counter, OCxREF level is re-assigned low as soon as the new compare value is written.

The output reference signal OCxREF level is left unchanged when none of the new compare value and the current compare value exceed the counter. *Figure 718* illustrates the behavior of the OCxREF signal level when PRELOAD = 0 and PRELOAD = 1.

Figure 718. PWM mode with immediate update versus preloaded update



Note: For both PWM modes, the compare match, auto-reload match, and the update event flags are set one LPTIM counter cycle later after the corresponding event, the OCxREF level is also changed one LPTIM counter cycle later after the corresponding event. For instance when the LPTIM_CCRx is set to 3 the CCxIF is set when the LPTIM_CNT = 4. Figure 716 illustrates this behavior.

58.4.20 Autonomous mode

When clocked by oscillators available in this mode (refer to RCC), the LPTIM can operate in autonomous mode, remaining then fully functional in Stop mode where the APB clock is stopped. The APB clock is requested by the peripheral each time a data must be transferred from or to the SRAM. Once the APB clock is received by the peripheral, either an interrupt or a DMA request is generated, depending on the LPTIM configuration.

In order to offload the CPU (in Run mode) or to avoid to wake it up when in Stop mode, it is possible to use LPTIM DMA requests to transfer the captured values when in input capture mode or to update LPTIM registers when in PWM mode.

When in Stop mode, the LPTIM counter can be automatically started after the detection of an active edge on one of its external input triggers.

Input capture mode

To operate autonomously in Stop mode, the input capture DMA request must be enabled by setting the CCxDE bit in the LPTIM_DIER register.

Each time a counter value is captured and available in the LPTIM_CCRx register, the APB clock is requested by the peripheral and a DMA request is generated. The captured value is then transferred to the SRAM. The CCxIF flag is automatically cleared by hardware once the captured value is read by APB (can be any bus master like CPU or DMA).

PWM mode

The LPTIM can be configured to autonomously change, at each update event, the output waveform pulse width and/or the duty cycle without any CPU intervention. To enable this autonomous mode, the corresponding UEDE bit must be set in the LPTIM_DIER register.

At each update event, the APB clock is requested by the peripheral and a DMA request is generated. DMA direction must be configured as memory-to-peripheral which enables updating LPTIM registers, at each DMA request, with values stored in SRAM.

The UE flag is automatically cleared by hardware once the LPTIM_ARR register is written by any bus master like CPU or DMA. Thus, to enable automatic hardware clearing of UE flag, the application must configure the LPTIM_ARR register to be the last one to be written (at the end of list). For instance, if LPTIM_CCR1 and LPTIM_RCR registers need to be updated in Stop mode by DMA, the update sequence must be: LPTIM_CCR1, LPTIM_RCR then LPTIM_ARR.

The UE flag can also be cleared over its corresponding clear bit UECF in the LPTIM_ICR register, this can be done by configuring the DMA to write the LPTIM_ICR register at the end of register update.

58.4.21 DMA requests

The LPTIM can generate two categories of DMA requests:

- DMA requests used to retrieve the input-capture counter values
- DMA update requests used to re-program part of the LPTIM, multiple times, at regular intervals, without software overhead

Input capture DMA request

Each LPTIM channel has its dedicated input capture DMA request. A DMA request is generated (if CCxDE bit is set in LPTIM_DIER) and CCxIF is set each time a capture is ready in the LPTIM_CCRx register. The captured values in LPTIM_CCRx can then be transferred regularly by DMA to the desired memory destination. The CCxIF is automatically cleared by hardware when the captured value in LPTIM_CCRx register is read.

Note: The ICx DMA request signal lptim_icx_dma is reset in the following conditions:

- *if the corresponding DMA request is disabled (clear CCxDE bit in the LPTIM_DIER register)*
- *or if the channel x is disabled (clear CCxE bit)*
- *or if the LPTIM is disabled (clear the ENABLE bit in the LPTIM_CR register)*

Update event DMA request

A DMA request is generated (if UEDE is set in LPTIM_DIER) and the UE flag is set at each update event. DMA request can be used to regularly update the LPTIM_ARR, the LPTIM_RCR or the LPTIM_CCRx registers permitting to generate custom PWM waveforms.

The UE is automatically cleared by hardware upon any bus master (like CPU or DMA) write access to the LPTIM_ARR register.

Note: The UE DMA request signal lptim_ue_dma is reset in the following conditions:

- *if the corresponding DMA request is disabled (clear UEDE bit in the LPTIM_DIER register)*
- *or if the LPTIM is disabled (clear the ENABLE bit in the LPTIM_CR register)*
- *or if the channel x is disabled (clear CCxE bit) and all the other channels are already disabled*

58.4.22 Debug mode

When the microcontroller enters debug mode (core halted), the LPTIM counter either continues to work normally or stops, depending on the timer dedicated bit configuration in the debug support (DBG) peripheral.

For further details, refer to section debug support (DBG).

58.5 LPTIM low-power modes

58.6 LPTIM interrupts

The following events generate an interrupt/wake-up event, if they are enabled through the LPTIM_DIER register:

- Compare match
- Auto-reload match (whatever the direction if Encoder mode)
- External trigger event
- Autoreload register write completed
- Compare register write completed
- Direction change (Encoder mode), programmable (up / down / both).
- Update Event
- Repetition register update OK
- Input capture occurred
- Over-capture occurred
- Interrupt enable register update OK

Note: If any bit in the LPTIM_DIER register is set after that its corresponding flag in the LPTIM_ISR register (status register) is set, the interrupt is not asserted.

Table 605. Interrupt events

Interrupt vector	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from Sleep mode	Exit from Stop mode(1)
LPTIMx	Compare match	CCxIF	CCxIE	Write 1 to CCxCF	Yes	Yes
	Input capture(2)	CCxIF	CCxIE	Write 1 to CCxCF	Yes	Yes
	Over-capture(2)	CCxOF	CCxOIE	Write 1 to CCxOCF	Yes	Yes
	Auto-reload match	ARRM	ARRMIE	Write 1 to ARRMCF	Yes	Yes
	External trigger event	EXTTRIG	EXTTRIGIE	Write 1 to EXTTRIGCF	Yes	Yes
	Auto-reload register update OK	ARROK	ARROKIE	Write 1 to ARROKCF	Yes	Yes
	Capture/compare register update OK	CMPxOK	CMPxOKIE	Write 1 to CMPxOKCF	Yes	Yes
	Direction change to up(3)	UP	UPIE	Write 1 to UPCF	Yes	Yes
	Direction change to down(3)	DOWN	DOWNIE	Write 1 to DOWNCF	Yes	Yes
	Update event	UE	UEIE	Write 1 to UECF	Yes	Yes
	Repetition register update OK	REPOK	REPOKIE	Write 1 to REPOKCF	Yes	Yes

1. Each LPTIM event can wake up the device from Stop mode only if the LPTIM instance supports the wake-up from Stop mode feature. Refer to *Section 58.3: LPTIM implementation*.
2. If LPTIM does not implement any channel this event does not exist. Refer to *Section 58.3: LPTIM implementation*.
3. If LPTIM does not support Encoder mode feature, this event does not exist. Refer to *Section 58.3: LPTIM implementation*.

58.7 LPTIM registers

Refer to *Section 1.2: List of abbreviations for registers on page 167* for a list of abbreviations used in register descriptions.

The peripheral registers can only be accessed by words (32-bit).

58.7.1 LPTIM5 interrupt and status register (LPTIM5_ISR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	DIER OK	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
							r								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	REP OK	UE	DOWN	UP	ARR OK	CMP1 OK	EXT TRIG	ARRM	CC1IF
							r	r	r	r	r	r	r	r	r

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **DIEROK:** Interrupt enable register update OK

DIEROK is set by hardware to inform application that the APB bus write operation to the LPTIM_DIER register has been successfully completed. DIEROK flag can be cleared by writing 1 to the DIEROKCF bit in the LPTIM_ICR register.

Bits 23:9 Reserved, must be kept at reset value.

Bit 8 **REPOK**: Repetition register update OK

REPOK is set by hardware to inform application that the APB bus write operation to the LPTIM_RCR register has been successfully completed. REPOK flag can be cleared by writing 1 to the REPOKCF bit in the LPTIM_ICR register.

Bit 7 **UE**: LPTIM update event occurred

UE is set by hardware to inform application that an update event was generated. UE flag can be cleared by writing 1 to the UECF bit in the LPTIM_ICR register.

Bit 6 **DOWN**: Counter direction change up to down

In Encoder mode, DOWN bit is set by hardware to inform application that the counter direction has changed from up to down. DOWN flag can be cleared by writing 1 to the DOWNCF bit in the LPTIM_ICR register.

Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3: LPTIM implementation.

Bit 5 **UP**: Counter direction change down to up

In Encoder mode, UP bit is set by hardware to inform application that the counter direction has changed from down to up. UP flag can be cleared by writing 1 to the UPCF bit in the LPTIM_ICR register.

Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3: LPTIM implementation.

Bit 4 **ARROK**: Autoreload register update OK

ARROK is set by hardware to inform application that the APB bus write operation to the LPTIM_ARR register has been successfully completed. ARROK flag can be cleared by writing 1 to the ARROKCF bit in the LPTIM_ICR register.

Bit 3 **CMP1OK**: Compare register 1 update OK

CMP1OK is set by hardware to inform application that the APB bus write operation to the LPTIM_CCR1 register has been successfully completed. CMP1OK flag can be cleared by writing 1 to the CMP1OKCF bit in the LPTIM_ICR register.

Bit 2 **EXTTRIG**: External trigger edge event

EXTTRIG is set by hardware to inform application that a valid edge on the selected external trigger input has occurred. If the trigger is ignored because the timer has already started, then this flag is not set. EXTTRIG flag can be cleared by writing 1 to the EXTTRIGCF bit in the LPTIM_ICR register.

Bit 1 **ARRM**: Autoreload match

ARRM is set by hardware to inform application that LPTIM_CNT register's value reached the LPTIM_ARR register's value. ARRM flag can be cleared by writing 1 to the ARRMCF bit in the LPTIM_ICR register.

Bit 0 **CC1IF**: Compare 1 interrupt flag

The CC1IF flag is set by hardware to inform application that LPTIM_CNT register value matches the compare register's value. The CC1IF flag can be cleared by writing 1 to the CC1CF bit in the LPTIM_ICR register.

0: No match

1: The content of the counter LPTIM_CNT register value has matched the LPTIM_CCR1 register's value

58.7.2 LPTIMx interrupt and status register [alternate] (LPTIMx_ISR) (x = 1 to 4)

This description of the register can only be used for output compare mode. See next section for input capture mode.

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	DIER OK	Res.	Res.	Res.	Res.	CMP2 OK	Res.	Res.	Res.
							r					r			
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

						r	r	r	r	r	r	r	r	r	r

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **DIEROK:** Interrupt enable register update OK

DIEROK is set by hardware to inform application that the APB bus write operation to the LPTIM_DIER register has been successfully completed. DIEROK flag can be cleared by writing 1 to the DIEROKCF bit in the LPTIM_ICR register.

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 Reserved, must be kept at reset value.

Bit 20 Reserved, must be kept at reset value.

Bit 19 **CMP2OK**: Compare register 2 update OK

CMP2OK is set by hardware to inform application that the APB bus write operation to the LPTIM_CCR2 register has been successfully completed. CMP2OK flag can be cleared by writing 1 to the CMP2OKCF bit in the LPTIM_ICR register.

Note: If LPTIM does not implement at least 2 channels this bit is reserved. Refer to Section 58.3.

Bits 18:12 Reserved, must be kept at reset value.

Bit 11 Reserved, must be kept at reset value.

Bit 10 Reserved, must be kept at reset value.

Bit 9 **CC2IF**: Compare 2 interrupt flag

If channel CC2 is configured as output:

The CC2IF flag is set by hardware to inform application that LPTIM_CNT register value matches the compare register's value. CC2IF flag can be cleared by writing 1 to the CC2CF bit in the LPTIM_ICR register.

0: No match

1: The content of the counter LPTIM_CNT register value has matched the LPTIM_CCR2 register's value

Note: If LPTIM does not implement at least 2 channels this bit is reserved. Refer to Section 58.3.

Bit 8 **REPOK**: Repetition register update OK

REPOK is set by hardware to inform application that the APB bus write operation to the LPTIM_RCR register has been successfully completed. REPOK flag can be cleared by writing 1 to the REPOKCF bit in the LPTIM_ICR register.

Bit 7 **UE**: LPTIM update event occurred

UE is set by hardware to inform application that an update event was generated. The corresponding interrupt or DMA request is generated if enabled. UE flag can be cleared by writing 1 to the UECF bit in the LPTIM_ICR register. The UE flag is automatically cleared by hardware once the LPTIM_ARR register is written by any bus master like CPU or DMA.

Bit 6 **DOWN**: Counter direction change up to down

In Encoder mode, DOWN bit is set by hardware to inform application that the counter direction has changed from up to down. DOWN flag can be cleared by writing 1 to the DOWNCF bit in the LPTIM_ICR register.

Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 5 **UP**: Counter direction change down to up

In Encoder mode, UP bit is set by hardware to inform application that the counter direction has changed from down to up. UP flag can be cleared by writing 1 to the UPCF bit in the LPTIM_ICR register.

Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 4 **ARROK**: Autoreload register update OK

ARROK is set by hardware to inform application that the APB bus write operation to the LPTIM_ARR register has been successfully completed. ARROK flag can be cleared by writing 1 to the ARROKCF bit in the LPTIM_ICR register.

Bit 3 **CMP1OK**: Compare register 1 update OK

CMP1OK is set by hardware to inform application that the APB bus write operation to the LPTIM_CCR1 register has been successfully completed. CMP1OK flag can be cleared by writing 1 to the CMP1OKCF bit in the LPTIM_ICR register.

Bit 2 **EXTTRIG**: External trigger edge event

EXTTRIG is set by hardware to inform application that a valid edge on the selected external trigger input has occurred. If the trigger is ignored because the timer has already started, then this flag is not set. EXTTRIG flag can be cleared by writing 1 to the EXTTRIGCF bit in the LPTIM_ICR register.

Bit 1 **ARRM**: Autoreload match

ARRM is set by hardware to inform application that LPTIM_CNT register's value reached the LPTIM_ARR register's value. ARRM flag can be cleared by writing 1 to the ARRMCF bit in the LPTIM_ICR register.

Bit 0 **CC1IF**: Compare 1 interrupt flag

If channel CC1 is configured as output:

The CC1IF flag is set by hardware to inform application that LPTIM_CNT register value matches the compare register's value. CC1IF flag can be cleared by writing 1 to the CC1CF bit in the LPTIM_ICR register.

0: No match

1: The content of the counter LPTIM_CNT register value has matched the LPTIM_CCR1 register's value

58.7.3 LPTIMx interrupt and status register [alternate] (LPTIMx_ISR) (x = 1 to 4)

This description of the register can only be used for input capture mode. See previous section for output compare mode.

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

		r	r			r	r	r	r	r	r		r	r	r

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **DIEROK:** Interrupt enable register update OK

DIEROK is set by hardware to inform application that the APB bus write operation to the LPTIM_DIER register has been successfully completed. DIEROK flag can be cleared by writing 1 to the DIEROKCF bit in the LPTIM_ICR register.

Bits 23:16 Reserved, must be kept at reset value.

Bit 15 Reserved, must be kept at reset value.

Bit 14 Reserved, must be kept at reset value.

Bit 13 **CC2OF**: Capture 2 over-capture flag

This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing 1 to the CC2OCF bit in the LPTIM_ICR register.

0: No over-capture has been detected.

1: The counter value has been captured in LPTIM_CCR2 register while CC2IF flag was already set.

Note: If LPTIM does not implement at least 2 channels this bit is reserved. Refer to Section 58.3.

Bit 12 **CC1OF**: Capture 1 over-capture flag

This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing 1 to the CC1OCF bit in the LPTIM_ICR register.

0: No over-capture has been detected.

1: The counter value has been captured in LPTIM_CCR1 register while CC1IF flag was already set.

Note: If LPTIM does not implement at least 1 channel this bit is reserved. Refer to Section 58.3.

Bit 11 Reserved, must be kept at reset value.

Bit 10 Reserved, must be kept at reset value.

Bit 9 **CC2IF**: Capture 2 interrupt flag

If channel CC2 is configured as input:

CC2IF is set by hardware to inform application that the current value of the counter is captured in LPTIM_CCR2 register. The corresponding interrupt or DMA request is generated if enabled. The CC2OF flag is set if the CC2IF flag was already high.

0: No input capture occurred

1: The counter value has been captured in the LPTIM_CCR2 register. (An edge has been detected on IC2 which matches the selected polarity). The CC2IF flag is automatically cleared by hardware once the captured value is read (CPU or DMA). The CC2IF flag can be cleared by writing 1 to the CC2CF bit in the LPTIM_ICR register.

Note: If LPTIM does not implement at least 2 channels this bit is reserved. Refer to Section 58.3.

Bit 8 **REPOK**: Repetition register update OK

REPOK is set by hardware to inform application that the APB bus write operation to the LPTIM_RCR register has been successfully completed. REPOK flag can be cleared by writing 1 to the REPOKCF bit in the LPTIM_ICR register.

Bit 7 **UE**: LPTIM update event occurred

UE is set by hardware to inform application that an update event was generated. The corresponding interrupt or DMA request is generated if enabled. The UE flag can be cleared by writing 1 to the UECF bit in the LPTIM_ICR register. The UE flag is automatically cleared by hardware once the LPTIM_ARR register is written by any bus master like CPU or DMA.

Bit 6 **DOWN**: Counter direction change up to down

In Encoder mode, DOWN bit is set by hardware to inform application that the counter direction has changed from up to down. DOWN flag can be cleared by writing 1 to the DOWNCF bit in the LPTIM_ICR register.

Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 5 **UP**: Counter direction change down to up

In Encoder mode, UP bit is set by hardware to inform application that the counter direction has changed from down to up. UP flag can be cleared by writing 1 to the UPCF bit in the LPTIM_ICR register.

Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 4 **ARROK**: Autoreload register update OK

ARROK is set by hardware to inform application that the APB bus write operation to the LPTIM_ARR register has been successfully completed. ARROK flag can be cleared by writing 1 to the ARROKCF bit in the LPTIM_ICR register.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **EXTTRIG**: External trigger edge event

EXTTRIG is set by hardware to inform application that a valid edge on the selected external trigger input has occurred. If the trigger is ignored because the timer has already started, then this flag is not set. EXTTRIG flag can be cleared by writing 1 to the EXTTRIGCF bit in the LPTIM_ICR register.

Bit 1 **ARRM**: Autoreload match

ARRM is set by hardware to inform application that LPTIM_CNT register's value reached the LPTIM_ARR register's value. ARRM flag can be cleared by writing 1 to the ARRMCF bit in the LPTIM_ICR register.

Bit 0 **CC1IF**: capture 1 interrupt flag

If channel CC1 is configured as input:

CC1IF is set by hardware to inform application that the current value of the counter is captured in LPTIM_CCR1 register. The corresponding interrupt or DMA request is generated if enabled. The CC1OF flag is set if the CC1IF flag was already high.

0: No input capture occurred

1: The counter value has been captured in the LPTIM_CCR1 register. (An edge has been detected on IC1 which matches the selected polarity). The CC1IF flag is automatically cleared by hardware once the captured value is read (CPU or DMA).CC1IF flag can be cleared by writing 1 to the CC1CF bit in the LPTIM_ICR register.

58.7.4 LPTIM5 interrupt clear register (LPTIM5_ICR)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

							w	w	w	w	w	w	w	w	w

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **DIEROKCF:** Interrupt enable register update OK clear flag

Writing 1 to this bit clears the DIEROK flag in the LPTIM_ISR register.

Bits 23:9 Reserved, must be kept at reset value.

Bit 8 **REPOKCF**: Repetition register update OK clear flag

Writing 1 to this bit clears the REPOK flag in the LPTIM_ISR register.

Bit 7 **UECF**: Update event clear flag

Writing 1 to this bit clear the UE flag in the LPTIM_ISR register.

Bit 6 **DOWNCF**: Direction change to down clear flag

Writing 1 to this bit clear the DOWN flag in the LPTIM_ISR register.

Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 5 **UPCF**: Direction change to UP clear flag

Writing 1 to this bit clear the UP flag in the LPTIM_ISR register.

Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 4 **ARROKCF**: Autoreload register update OK clear flag
Writing 1 to this bit clears the ARROK flag in the LPTIM_ISR register

Bit 3 **CMP1OKCF**: Compare register 1 update OK clear flag
Writing 1 to this bit clears the CMP1OK flag in the LPTIM_ISR register.

Bit 2 **EXTTRIGCF**: External trigger valid edge clear flag
Writing 1 to this bit clears the EXTTRIG flag in the LPTIM_ISR register

Bit 1 **ARRMCF**: Autoreload match clear flag
Writing 1 to this bit clears the ARRM flag in the LPTIM_ISR register

Bit 0 **CC1CF**: Capture/compare 1 clear flag
Writing 1 to this bit clears the CC1IF flag in the LPTIM_ISR register.

58.7.5 LPTIMx interrupt clear register [alternate] (LPTIMx_ICR) (x = 1 to 4)

This description of the register can only be used for output compare mode. See next section for input capture compare mode.

Address offset: 0x004

Reset value: 0x0000 0000

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **DIEROKCF:** Interrupt enable register update OK clear flag
Writing 1 to this bit clears the DIEROK flag in the LPTIM_ISR register.

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 Reserved, must be kept at reset value.

Bit 20 Reserved, must be kept at reset value.

Bit 19 **CMP2OKCF**: Compare register 2 update OK clear flag
Writing 1 to this bit clears the CMP2OK flag in the LPTIM_ISR register.
Note: If LPTIM does not implement at least 2 channels this bit is reserved. Refer to Section 58.3.

Bits 18:12 Reserved, must be kept at reset value.

Bit 11 Reserved, must be kept at reset value.

Bit 10 Reserved, must be kept at reset value.

Bit 9 **CC2CF**: Capture/compare 2 clear flag
Writing 1 to this bit clears the CC2IF flag in the LPTIM_ISR register.
Note: If LPTIM does not implement at least 2 channels this bit is reserved. Refer to Section 58.3.

Bit 8 **REPOKCF**: Repetition register update OK clear flag
Writing 1 to this bit clears the REPOK flag in the LPTIM_ISR register.

Bit 7 **UECF**: Update event clear flag
Writing 1 to this bit clear the UE flag in the LPTIM_ISR register.

Bit 6 **DOWNCF**: Direction change to down clear flag
Writing 1 to this bit clear the DOWN flag in the LPTIM_ISR register.
Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 5 **UPCF**: Direction change to UP clear flag
Writing 1 to this bit clear the UP flag in the LPTIM_ISR register.
Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 4 **ARROKCF**: Autoreload register update OK clear flag
Writing 1 to this bit clears the ARROK flag in the LPTIM_ISR register

Bit 3 **CMP1OKCF**: Compare register 1 update OK clear flag
Writing 1 to this bit clears the CMP1OK flag in the LPTIM_ISR register.

Bit 2 **EXTTRIGCF**: External trigger valid edge clear flag
Writing 1 to this bit clears the EXTTRIG flag in the LPTIM_ISR register

Bit 1 **ARRMCF**: Autoreload match clear flag
Writing 1 to this bit clears the ARRM flag in the LPTIM_ISR register

Bit 0 **CC1CF**: Capture/compare 1 clear flag
Writing 1 to this bit clears the CC1IF flag in the LPTIM_ISR register.

58.7.6 LPTIMx interrupt clear register [alternate] (LPTIMx_ICR) (x = 1 to 4)

This description of the register can only be used for input capture mode. See previous section for output compare mode.

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **DIEROKCF:** Interrupt enable register update OK clear flag
Writing 1 to this bit clears the DIEROK flag in the LPTIM_ISR register.

Bits 23:16 Reserved, must be kept at reset value.

Bit 15 Reserved, must be kept at reset value.

Bit 14 Reserved, must be kept at reset value.

Bit 13 **CC2OCF**: Capture/compare 2 over-capture clear flag
Writing 1 to this bit clears the CC2OF flag in the LPTIM_ISR register.
Note: If LPTIM does not implement at least 2 channels this bit is reserved. Refer to Section 58.3.

Bit 12 **CC1OCF**: Capture/compare 1 over-capture clear flag
Writing 1 to this bit clears the CC1OF flag in the LPTIM_ISR register.
Note: If LPTIM does not implement at least 1 channel this bit is reserved. Refer to Section 58.3.

Bit 11 Reserved, must be kept at reset value.

Bit 10 Reserved, must be kept at reset value.

Bit 9 **CC2CF**: Capture/compare 2 clear flag
Writing 1 to this bit clears the CC2IF flag in the LPTIM_ISR register.
Note: If LPTIM does not implement at least 2 channels this bit is reserved. Refer to Section 58.3.

Bit 8 **REPOKCF**: Repetition register update OK clear flag
Writing 1 to this bit clears the REPOK flag in the LPTIM_ISR register.

Bit 7 **UECF**: Update event clear flag
Writing 1 to this bit clear the UE flag in the LPTIM_ISR register.

Bit 6 **DOWNCF**: Direction change to down clear flag
Writing 1 to this bit clear the DOWN flag in the LPTIM_ISR register.
Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 5 **UPCF**: Direction change to UP clear flag
Writing 1 to this bit clear the UP flag in the LPTIM_ISR register.
Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 4 **ARROKCF**: Autoreload register update OK clear flag
Writing 1 to this bit clears the ARROK flag in the LPTIM_ISR register

Bit 3 Reserved, must be kept at reset value.

Bit 2 **EXTTRIGCF**: External trigger valid edge clear flag
Writing 1 to this bit clears the EXTTRIG flag in the LPTIM_ISR register

Bit 1 **ARRMCF**: Autoreload match clear flag
Writing 1 to this bit clears the ARRM flag in the LPTIM_ISR register

Bit 0 **CC1CF**: Capture/compare 1 clear flag
Writing 1 to this bit clears the CC1IF flag in the LPTIM_ISR register.

58.7.7 LPTIM5 interrupt enable register (LPTIM5_DIER)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	REPOKIE	UEIE	DOWNIE	UPIE	ARROKIE	CMP1OKIE	EXTTRIGIE	ARRMIE	CC1IE
							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **REPOKIE**: Repetition register update OK interrupt Enable
0: Repetition register update OK interrupt disabled
1: Repetition register update OK interrupt enabled

Bit 7 **UEIE**: Update event interrupt enable
0: Update event interrupt disabled
1: Update event interrupt enabled

Bit 6 **DOWNIE**: Direction change to down Interrupt Enable
0: DOWN interrupt disabled
1: DOWN interrupt enabled
Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 5 **UPIE**: Direction change to UP Interrupt Enable
0: UP interrupt disabled
1: UP interrupt enabled
Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 4 **ARROKIE**: Autoreload register update OK Interrupt Enable
0: ARROK interrupt disabled
1: ARROK interrupt enabled

Bit 3 **CMP1OKIE**: Compare register 1 update OK interrupt enable
0: CMPOK register 1 interrupt disabled
1: CMPOK register 1 interrupt enabled

Bit 2 **EXTTRIGIE**: External trigger valid edge Interrupt Enable
0: EXTTRIG interrupt disabled
1: EXTTRIG interrupt enabled

Bit 1 **ARRMIE**: Autoreload match Interrupt Enable
0: ARRM interrupt disabled
1: ARRM interrupt enabled

Bit 0 **CC1IE**: Capture/compare 1 interrupt enable
0: Capture/compare 1 interrupt disabled
1: Capture/compare 1 interrupt enabled

Caution: The LPTIMx_DIER register must only be modified when the LPTIM is enabled (ENABLE bit set to 1). After a write to the LPTIMx_DIER register, a new write operation to the same register can only be performed when the previous write operation is completed. Any successive write before the DIEROK flag is set, leads to unpredictable results.

58.7.8 LPTIMx interrupt enable register [alternate] (LPTIMx_DIER) (x = 1 to 4)

This description of the register can only be used for output compare mode. See next section for input capture compare mode.

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **UEDE**: Update event DMA request enable
0: UE DMA request disabled. Writing '0' to the UEDE bit resets the associated ue_dma_req signal.
1: UE DMA request enabled
Note: If LPTIM does not implement at least 1 channel this bit is reserved. Refer to Section 58.3.

Bit 22 Reserved, must be kept at reset value.

Bit 21 Reserved, must be kept at reset value.

Bit 20 Reserved, must be kept at reset value.

Bit 19 **CMP2OKIE**: Compare register 2 update OK interrupt enable
0: CMPOK register 2 interrupt disabled
1: CMPOK register 2 interrupt enabled
Note: If LPTIM does not implement at least 2 channels this bit is reserved. Refer to Section 58.3.

Bits 18:12 Reserved, must be kept at reset value.

Bit 11 Reserved, must be kept at reset value.

Bit 10 Reserved, must be kept at reset value.

Bit 9 **CC2IE**: Capture/compare 2 interrupt enable
0: Capture/compare 2 interrupt disabled
1: Capture/compare 2 interrupt enabled
Note: If LPTIM does not implement at least 2 channels this bit is reserved. Refer to Section 58.3.

Bit 8 **REPOKIE**: Repetition register update OK interrupt Enable
0: Repetition register update OK interrupt disabled
1: Repetition register update OK interrupt enabled

Bit 7 **UEIE**: Update event interrupt enable
0: Update event interrupt disabled
1: Update event interrupt enabled

Bit 6 **DOWNIE**: Direction change to down Interrupt Enable
0: DOWN interrupt disabled
1: DOWN interrupt enabled
Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 5 **UPIE**: Direction change to UP Interrupt Enable
0: UP interrupt disabled
1: UP interrupt enabled
Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 4 **ARROKIE**: Autoreload register update OK Interrupt Enable
0: ARROK interrupt disabled
1: ARROK interrupt enabled

Bit 3 **CMP1OKIE**: Compare register 1 update OK interrupt enable
0: CMPOK register 1 interrupt disabled
1: CMPOK register 1 interrupt enabled

Bit 2 **EXTTRIGIE**: External trigger valid edge Interrupt Enable
0: EXTTRIG interrupt disabled
1: EXTTRIG interrupt enabled

Bit 1 **ARRMIE**: Autoreload match Interrupt Enable
0: ARRM interrupt disabled
1: ARRM interrupt enabled

Bit 0 **CC1IE**: Capture/compare 1 interrupt enable
0: Capture/compare 1 interrupt disabled
1: Capture/compare 1 interrupt enabled

Caution: The LPTIMx_DIER register must only be modified when the LPTIM is enabled (ENABLE bit set to 1). After a write to the LPTIMx_DIER register, a new write operation to the same register can only be performed when the previous write operation is completed. Any successive write before the DIEROK flag is set, leads to unpredictable results.

58.7.9 LPTIMx interrupt enable register [alternate] (LPTIMx_DIER) (x = 1 to 4)

This description of the register can only be used for input capture mode. See previous section for output compare mode.

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 Reserved, must be kept at reset value.

Bit 26 Reserved, must be kept at reset value.

Bit 25 **CC2DE**: Capture/compare 2 DMA request enable
0: CC2 DMA request disabled. Writing '0' to the CC2DE bit resets the associated ic2_dma_req signal.
1: CC2 DMA request enabled
Note: If LPTIM does not implement at least 2 channels this bit is reserved. Refer to Section 58.3.

Bit 24 Reserved, must be kept at reset value.

Bit 23 **UEDE**: Update event DMA request enable
0: UE DMA request disabled. Writing '0' to the UEDE bit resets the associated ue_dma_req signal.
1: UE DMA request enabled
Note: If LPTIM does not implement at least 1 channel this bit is reserved. Refer to Section 58.3.

Bits 22:17 Reserved, must be kept at reset value.

Bit 16 **CC1DE**: Capture/compare 1 DMA request enable
0: CC1 DMA request disabled. Writing '0' to the CC1DE bit resets the associated ic1_dma_req signal.
1: CC1 DMA request enabled
Note: If LPTIM does not implement at least 1 channel this bit is reserved. Refer to Section 58.3.

Bit 15 Reserved, must be kept at reset value.

Bit 14 Reserved, must be kept at reset value.

Bit 13 **CC2OIE**: Capture/compare 2 over-capture interrupt enable
0: CC2 over-capture interrupt disabled
1: CC2 over-capture interrupt enabled
Note: If LPTIM does not implement at least 2 channels this bit is reserved. Refer to Section 58.3.

Bit 12 **CC1OIE**: Capture/compare 1 over-capture interrupt enable
0: CC1 over-capture interrupt disabled
1: CC1 over-capture interrupt enabled
Note: If LPTIM does not implement at least 1 channel this bit is reserved. Refer to Section 58.3.

Bit 11 Reserved, must be kept at reset value.

Bit 10 Reserved, must be kept at reset value.

Bit 9 **CC2IE**: Capture/compare 2 interrupt enable
0: Capture/compare 2 interrupt disabled
1: Capture/compare 2 interrupt enabled
Note: If LPTIM does not implement at least 2 channels this bit is reserved. Refer to Section 58.3.

Bit 8 **REPOKIE**: Repetition register update OK interrupt Enable
0: Repetition register update OK interrupt disabled
1: Repetition register update OK interrupt enabled

Bit 7 **UEIE**: Update event interrupt enable
0: Update event interrupt disabled
1: Update event interrupt enabled

Bit 6 **DOWNIE**: Direction change to down Interrupt Enable
0: DOWN interrupt disabled
1: DOWN interrupt enabled
Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 5 **UPIE**: Direction change to UP Interrupt Enable
0: UP interrupt disabled
1: UP interrupt enabled
Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 4 **ARROKIE**: Autoreload register update OK Interrupt Enable
0: ARROK interrupt disabled
1: ARROK interrupt enabled

Bit 3 Reserved, must be kept at reset value.

Bit 2 **EXTTRIGIE**: External trigger valid edge Interrupt Enable
0: EXTTRIG interrupt disabled
1: EXTTRIG interrupt enabled

Bit 1 **ARRMIE**: Autoreload match Interrupt Enable
0: ARRM interrupt disabled
1: ARRM interrupt enabled

Bit 0 **CC1IE**: Capture/compare 1 interrupt enable
0: Capture/compare 1 interrupt disabled
1: Capture/compare 1 interrupt enabled

Caution: The LPTIMx_DIER register must only be modified when the LPTIM is enabled (ENABLE bit set to 1). After a write to the LPTIMx_DIER register, a new write operation to the same register can only be performed when the previous write operation is completed. Any successive write before the DIEROK flag is set, leads to unpredictable results.

58.7.10 LPTIM configuration register (LPTIM_CFGR)

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	ENC	COUNT MODE	PRE LOAD	WAV POL	WAVE	TIMOUT	TRIGEN[1:0]		Res.
							rw	rw	rw	rw	rw	rw	rw	rw	

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRIGSEL[2:0]			Res.	PRESC[2:0]			Res.	TRGFLT[1:0]		Res.	CKFLT[1:0]		CKPOL[1:0]		CKSEL
rw	rw	rw		rw	rw	rw		rw	rw		rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 Reserved, must be kept at reset value.

Bits 28:25 Reserved, must be kept at reset value.

Bit 24 **ENC**: Encoder mode enable
The ENC bit controls the Encoder mode
0: Encoder mode disabled
1: Encoder mode enabled
Note: If the LPTIM does not support Encoder mode feature, this bit is reserved. Refer to Section 58.3.

Bit 23 **COUNTMODE**: counter mode enabled
The COUNTMODE bit selects which clock source is used by the LPTIM to clock the counter:
0: The counter is incremented following each internal clock pulse
1: The counter is incremented following each valid clock pulse on the LPTIM external Input1

Bit 22 **PRELOAD**: Registers update mode
The PRELOAD bit controls the LPTIM_ARR, LPTIM_RCR and the LPTIM_CCRx registers update modality
0: Registers are updated after each APB bus write access
1: Registers are updated at the end of the current LPTIM period

Bit 21 **WAVPOL**: Waveform shape polarity
The WAVPOL bit controls the output polarity
0: The LPTIM output reflects the compare results between LPTIM_CNT and LPTIM_CCRx registers
1: The LPTIM output reflects the inverse of the compare results between LPTIM_CNT and LPTIM_CCRx registers
Note: If the LPTIM implements at least one capture/compare channel, this bit is reserved. Refer to Section 58.3.

Bit 20 **WAVE**: Waveform shape
The WAVE bit controls the output shape
0: Deactivate Set-once mode
1: Activate the Set-once mode

Bit 19 **TIMOUT**: Timeout enable
The TIMOUT bit controls the Timeout feature
0: A trigger event arriving when the timer is already started is ignored
1: A trigger event arriving when the timer is already started resets and restarts the LPTIM counter and the repetition counter

Bits 18:17 **TRIGEN[1:0]**: Trigger enable and polarity
The TRIGEN bits controls whether the LPTIM counter is started by an external trigger or not. If the external trigger option is selected, three configurations are possible for the trigger active edge:
00: Software trigger (counting start is initiated by software)
01: Rising edge is the active edge
10: Falling edge is the active edge
11: Both edges are active edges

Bit 16 Reserved, must be kept at reset value.

Bits 15:13 **TRIGSEL[2:0]**: Trigger selector

The TRIGSEL bits select the trigger source that serves as a trigger event for the LPTIM among the below 8 available sources:

000: lptim_ext_trig0
001: lptim_ext_trig1
010: lptim_ext_trig2
011: lptim_ext_trig3
100: lptim_ext_trig4
101: lptim_ext_trig5
110: lptim_ext_trig6
111: lptim_ext_trig7

See *Section 58.4.3: LPTIM input and trigger mapping* for details.

Bit 12 Reserved, must be kept at reset value.

Bits 11:9 **PRESC[2:0]:** Clock prescaler

The PRESC bits configure the prescaler division factor. It can be one among the following division factors:

000: /1
001: /2
010: /4
011: /8
100: /16
101: /32
110: /64
111: /128

Bit 8 Reserved, must be kept at reset value.

Bits 7:6 **TRGFLT[1:0]:** Configurable digital filter for trigger

The TRGFLT value sets the number of consecutive equal samples that are detected when a level change occurs on an internal trigger before it is considered as a valid level transition. An internal clock source must be present to use this feature

00: Any trigger active level change is considered as a valid trigger
01: Trigger active level change must be stable for at least 2 clock periods before it is considered as valid trigger.
10: Trigger active level change must be stable for at least 4 clock periods before it is considered as valid trigger.
11: Trigger active level change must be stable for at least 8 clock periods before it is considered as valid trigger.

Bit 5 Reserved, must be kept at reset value.

Bits 4:3 **CKFLT[1:0]:** Configurable digital filter for external clock

The CKFLT value sets the number of consecutive equal samples that are detected when a level change occurs on an external clock signal before it is considered as a valid level transition. An internal clock source must be present to use this feature

00: Any external clock signal level change is considered as a valid transition
01: External clock signal level change must be stable for at least 2 clock periods before it is considered as valid transition.
10: External clock signal level change must be stable for at least 4 clock periods before it is considered as valid transition.
11: External clock signal level change must be stable for at least 8 clock periods before it is considered as valid transition.

Bits 2:1 **CKPOL[1:0]:** Clock polarity

When the LPTIM is clocked by an external clock source, CKPOL bits is used to configure the active edge or edges used by the counter:

00: The rising edge is the active edge used for counting.
If the LPTIM is configured in Encoder mode (ENC bit is set), the Encoder sub-mode 1 is active.

01: The falling edge is the active edge used for counting.
If the LPTIM is configured in Encoder mode (ENC bit is set), the Encoder sub-mode 2 is active.

10: Both edges are active edges. When both external clock signal edges are considered active ones, the LPTIM must also be clocked by an internal clock source with a frequency equal to at least four times the external clock frequency.
If the LPTIM is configured in Encoder mode (ENC bit is set), the Encoder sub-mode 3 is active.

11: Not allowed

Refer to *Section 58.4.15: Encoder mode* for more details about Encoder sub-modes.

Bit 0 **CKSEL:** Clock selector

The CKSEL bit selects which clock source the LPTIM uses:

0: LPTIM is clocked by internal clock source (APB clock or any of the embedded oscillators)

1: LPTIM is clocked by an external clock source through the LPTIM external Input1

Caution: The LPTIM_CFGR register must only be modified when the LPTIM is disabled (ENABLE bit reset to 0).

58.7.11 LPTIM control register (LPTIM_CR)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RSTARE	COUNTRST	CNTSTRT	SNGSTRT	ENABLE
											rw	rs	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **RSTARE:** Reset after read enable

This bit is set and cleared by software. When RSTARE is set to '1', any read access to LPTIM_CNT register asynchronously resets LPTIM_CNT register content.
This bit can be set only when the LPTIM is enabled.

Bit 3 **COUNTRST:** Counter reset

This bit is set by software and cleared by hardware. When set to '1' this bit triggers a synchronous reset of the LPTIM_CNT counter register. Due to the synchronous nature of this reset, it only takes place after a synchronization delay of 3 LPTimer core clock cycles (LPTimer core clock can be different from APB clock).
This bit can be set only when the LPTIM is enabled. It is automatically reset by hardware.

Caution: COUNTRST must never be set to '1' by software before it is already cleared to '0' by hardware. Software must consequently check that COUNTRST bit is already cleared to '0' before attempting to set it to '1'.

Bit 2 **CNTSTRT:** Timer start in Continuous mode

This bit is set by software and cleared by hardware.

In case of software start (TRIGEN[1:0] = 00), setting this bit starts the LPTIM in Continuous mode.

If the software start is disabled (TRIGEN[1:0] different than 00), setting this bit starts the timer in Continuous mode as soon as an external trigger is detected.

If this bit is set when a single pulse mode counting is ongoing, then the timer does not stop at the next match between the LPTIM_ARR and LPTIM_CNT registers and the LPTIM counter keeps counting in Continuous mode.

This bit can be set only when the LPTIM is enabled. It is automatically reset by hardware.

Bit 1 **SNGSTRT:** LPTIM start in Single mode

This bit is set by software and cleared by hardware.

In case of software start (TRIGEN[1:0] = 00), setting this bit starts the LPTIM in single pulse mode.

If the software start is disabled (TRIGEN[1:0] different than 00), setting this bit starts the LPTIM in single pulse mode as soon as an external trigger is detected.

If this bit is set when the LPTIM is in continuous counting mode, then the LPTIM stops at the following match between LPTIM_ARR and LPTIM_CNT registers.

This bit can only be set when the LPTIM is enabled. It is automatically reset by hardware.

Bit 0 **ENABLE:** LPTIM enable

The ENABLE bit is set and cleared by software.

0: LPTIM is disabled. Writing '0' to the ENABLE bit resets all the DMA request signals (input capture and update event DMA requests).

1: LPTIM is enabled

58.7.12 LPTIM compare register 1 (LPTIM_CCR1)

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CCR1[15:0]**: Capture/compare 1 value

If channel CC1 is configured as output:

CCR1 is the value to be loaded in the capture/compare 1 register.

Depending on the PRELOAD option, the CCR1 register is immediately updated if the PRELOAD bit is reset and updated at next LPTIM update event if PREOAD bit is reset.

The capture/compare register 1 contains the value to be compared to the counter LPTIM_CNT and signaled on OC1 output.

If channel CC1 is configured as input:

CCR1 becomes read-only, it contains the counter value transferred by the last input capture 1 event. The LPTIM_CCR1 register is read-only and cannot be programmed.

If LPTIM does not implement any channel:

The compare register 1 contains the value to be compared to the counter LPTIM_CNT and signaled on LPTIM output.

Caution: The LPTIM_CCR1 register must only be modified when the LPTIM is enabled (ENABLE bit set to 1).

58.7.13 LPTIM autoreload register (LPTIM_ARR)

Address offset: 0x018

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **ARR[15:0]:** Auto reload value
ARR is the autoreload value for the LPTIM.
This value must be strictly greater than the CCRx[15:0] value.

Caution: The LPTIM_ARR register must only be modified when the LPTIM is enabled (ENABLE bit set to 1).

58.7.14 LPTIM counter register (LPTIM_CNT)

Address offset: 0x01C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CNT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]:** Counter value
When the LPTIM is running, reading the LPTIM_CNT register may return unreliable values. In this case it is necessary to perform consecutive reads until two returned values are identical.

58.7.15 LPTIM1 option register (LPTIM1_OR)

Address offset: 0x020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OR_0
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **OR_0**: Option register bit 0
0: LPTIM1 channel1 output is connected to I/O or other function
1: LPTIM1 channel1 output is connected to TAMP

58.7.16 LPTIM configuration register 2 (LPTIM_CFGR2)

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IC2SEL[1:0]		Res.	Res.	IC1SEL[1:0]

										rw	rw			rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:20 **IC2SEL[1:0]**: LPTIM input capture 2 selection
The IC2SEL bits control the LPTIM Input capture 2 multiplexer, which connects LPTIM Input capture 2 to one of the available inputs.
00: lptim_ic2_mux0
01: lptim_ic2_mux1
10: lptim_ic2_mux2
11: lptim_ic2_mux3
For connection details refer to *Section 58.4.3: LPTIM input and trigger mapping*.

Bits 19:18 Reserved, must be kept at reset value.

Bits 17:16 **IC1SEL[1:0]**: LPTIM input capture 1 selection
The IC1SEL bits control the LPTIM Input capture 1 multiplexer, which connects LPTIM Input capture 1 to one of the available inputs.
00: lptim_ic1_mux0
01: lptim_ic1_mux1
10: lptim_ic1_mux2
11: lptim_ic1_mux3
For connection details refer to *Section 58.4.3: LPTIM input and trigger mapping*.

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:4 **IN2SEL[1:0]**: LPTIM input 2 selection
The IN2SEL bits control the LPTIM input 2 multiplexer, which connects LPTIM input 2 to one of the available inputs.
00: lptim_in2_mux0
01: lptim_in2_mux1
10: lptim_in2_mux2
11: lptim_in2_mux3
For connection details refer to *Section 58.4.3: LPTIM input and trigger mapping*.

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **IN1SEL[1:0]**: LPTIM input 1 selection
The IN1SEL bits control the LPTIM input 1 multiplexer, which connects LPTIM input 1 to one of the available inputs.
00: lptim_in1_mux0
01: lptim_in1_mux1
10: lptim_in1_mux2
11: lptim_in1_mux3
For connection details refer to *Section 58.4.3: LPTIM input and trigger mapping*.

58.7.17 LPTIM repetition register (LPTIM_RCR)

Address offset: 0x028

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	REP[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **REP[7:0]**: Repetition register value
REP is the repetition value for the LPTIM.

Caution: The LPTIM_RCR register must only be modified when the LPTIM is enabled (ENABLE bit set to 1). When using repetition counter with PRELOAD = 0, LPTIM_RCR register must be changed at least five counter cycles before the auto reload match event, otherwise an unpredictable behavior may occur.

58.7.18 LPTIM capture/compare mode register 1 (LPTIM_CCMR1)

Address offset: 0x02C

Reset value: 0x0000 0000

The channels can be used in input (capture mode) or in output (PWM mode). The direction of a channel is defined by configuring the corresponding CCxSEL bits.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	IC2F[1:0]		Res.	Res.	IC2PSC[1:0]		Res.	Res.	Res.	Res.	CC2P[1:0]		CC2E	CC2 SEL
		rw	rw			rw	rw					rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	IC1F[1:0]		Res.	Res.	IC1PSC[1:0]		Res.	Res.	Res.	Res.	CC1P[1:0]		CC1E	CC1 SEL
		rw	rw			rw	rw					rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:28 **IC2F[1:0]**: Input capture 2 filter

This bitfield defines the number of consecutive equal samples that are detected when a level change occurs on an external input capture signal before it is considered as a valid level transition. An internal clock source must be present to use this feature.

00: Any external input capture signal level change is considered as a valid transition

01: External input capture signal level change must be stable for at least 2 clock periods before it is considered as valid transition.

10: External input capture signal level change must be stable for at least 4 clock periods before it is considered as valid transition.

11: External input capture signal level change must be stable for at least 8 clock periods before it is considered as valid transition.

Bits 27:26 Reserved, must be kept at reset value.

Bits 25:24 **IC2PSC[1:0]**: Input capture 2 prescaler

This bitfield defines the ratio of the prescaler acting on the CC2 input (IC2).

00: No prescaler, capture is done each time an edge is detected on the capture input

01: Capture is done once every 2 events

10: Capture is done once every 4 events

11: Capture is done once every 8 events

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:18 **CC2P[1:0]**: Capture/compare 2 output polarity.

Condition: CC2 as output

Only bit2 is used to set polarity when output mode is enabled, bit3 is don't care.

0: OC2 active high

1: OC2 active low

Condition: CC2 as input

This field is used to select the IC2 polarity for capture operations.

00: Rising edge, circuit is sensitive to IC2 rising edge

01: Falling edge, circuit is sensitive to IC2 falling edge

10: Reserved, do not use this configuration.

11: Both edges, circuit is sensitive to both IC2 rising and falling edges.

Bit 17 **CC2E**: Capture/compare 2 output enable.

Condition: CC2 as output

0: Off - OC2 is not active. Writing '0' to the CC2E bit resets the ue_dma_req signal only if all the other LPTIM channels are disabled.

1: On - OC2 signal is output on the corresponding output pin

Condition: CC2 as input

This bit determines if a capture of the counter value can actually be done into the input capture/compare register 2 (LPTIM_CCR2) or not.

0: Capture disabled. Writing '0' to the CC2E bit resets the associated ic2_dma_req signal.

1: Capture enabled.

Bit 16 **CC2SEL**: Capture/compare 2 selection

This bitfield defines the direction of the channel, input (capture) or output mode.

0: CC2 channel is configured in output PWM mode

1: CC2 channel is configured in input capture mode

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:12 **IC1F[1:0]**: Input capture 1 filter

This bitfield defines the number of consecutive equal samples that are detected when a level change occurs on an external input capture signal before it is considered as a valid level transition. An internal clock source must be present to use this feature.

00: Any external input capture signal level change is considered as a valid transition

01: External input capture signal level change must be stable for at least 2 clock periods before it is considered as valid transition.

10: External input capture signal level change must be stable for at least 4 clock periods before it is considered as valid transition.

11: External input capture signal level change must be stable for at least 8 clock periods before it is considered as valid transition.

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:8 **IC1PSC[1:0]**: Input capture 1 prescaler

This bitfield defines the ratio of the prescaler acting on the CC1 input (IC1).

00: No prescaler, capture is done each time an edge is detected on the capture input

01: Capture is done once every 2 events

10: Capture is done once every 4 events

11: Capture is done once every 8 events

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:2 **CC1P[1:0]**: Capture/compare 1 output polarity.

Condition: CC1 as output

Only bit2 is used to set polarity when output mode is enabled, bit3 is don't care.

0: OC1 active high, the LPTIM output reflects the compare results between LPTIM_ARR and LPTIM_CCRx registers

1: OC1 active low, the LPTIM output reflects the inverse of the compare results between LPTIM_ARR and LPTIM_CCRx registers

Condition: CC1 as input

This field is used to select the IC1 polarity for capture operations.

00: Rising edge, circuit is sensitive to IC1 rising edge

01: Falling edge, circuit is sensitive to IC1 falling edge

10: Reserved, do not use this configuration.

11: Both edges, circuit is sensitive to both IC1 rising and falling edges.

Bit 1 **CC1E**: Capture/compare 1 output enable.

Condition: CC1 as output

0: Off - OC1 is not active. Writing '0' to the CC1E bit resets the ue_dma_req signal only if all the other LPTIM channels are disabled.

1: On - OC1 signal is output on the corresponding output pin

Condition: CC1 as input

This bit determines if a capture of the counter value can actually be done into the input capture/compare register 1 (LPTIM_CCR1) or not.

0: Capture disabled. Writing '0' to the CC1E bit resets the associated ic1_dma_req signal.

1: Capture enabled.

Bit 0 **CC1SEL**: Capture/compare 1 selection

This bitfield defines the direction of the channel input (capture) or output mode.

0: CC1 channel is configured in output PWM mode

1: CC1 channel is configured in input capture mode

Caution: After a write to the LPTIM_CCMRx register, a new write operation to the same register can only be performed after a delay that must be equal or greater than the value of (PRESC × 3) kernel clock cycles, PRESC[2:0] being the clock decimal division factor (1, 2, 4,..128). Any successive write violating this delay, leads to unpredictable results.

Caution: The CCxSEL, ICxF[1:0], CCxP[1:0] and ICxPSC[1:0] fields must only be modified when the channel x is disabled (CCxE bit reset to 0).

If LPTIM does not implement any channel this register is reserved. Refer to Section 58.3.

58.7.19 LPTIM compare register 2 (LPTIM_CCR2)

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR2[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CCR2[15:0]**: Capture/compare 2 value

If channel CC2 is configured as output:

CCR2 is the value to be loaded in the capture/compare 2 register.

Depending on the PRELOAD option, the CCR2 register is immediately updated if the PRELOAD bit is reset and updated at next LPTIM update event if PREOAD bit is reset.

The capture/compare register 2 contains the value to be compared to the counter LPTIM_CNT and signaled on OC2 output.

If channel CC2 is configured as input:

CCR2 becomes read-only, it contains the counter value transferred by the last input capture 2 event. The LPTIM_CCR2 register is read-only and cannot be programmed.

Caution: The LPTIM_CCR2 register must only be modified when the LPTIM is enabled (ENABLE bit set to 1).

Note: If the LPTIM implements less than 2 channels this register is reserved. Refer to *Section 58.3: LPTIM implementation*.

58.7.20 LPTIM peripheral hardware configuration register 2 (LPTIM_HWCFGR2)

Address offset: 0x3EC

Reset value: 0x0001 0402 (for LPTIM1/2/3/4)

Reset value: 0x0000 0400 (for LPTIM5)

r	r	r	r	r	r	r	r					r	r	r	r

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **CFG3[16]**: peripheral hardware configuration 3

This is read only bitfield and is read as CFG3[16] = autonomous mode.

0: disabled

1: enabled

Bits 15:8 **CFG2[7:0]**: peripheral hardware configuration 2

This is read only bitfield and is read as CFG2[7:0] = input capture multiplexer size.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **CFG1[3:0]**: peripheral hardware configuration 1

This is read only bitfield and is read as CFG1[3:0] = channel number.

58.7.21 LPTIM peripheral hardware configuration register 1 (LPTIM_HWCFGR1)

Address offset: 0x3F0

Reset value: 0x0101 0804 (for LPTIM1)

Reset value: 0x0001 0804 (for LPTIM2)

Reset value: 0x0000 0804 (for LPTIM3/4/5)

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 **CFG4[7:0]**: peripheral hardware configuration 4
This is read only bitfield and is read as CFG4[7:0] = option register.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **CFG3[3:0]**: peripheral hardware configuration 3
This is read only bitfield and is read as CFG3[3:0] = Encoder mode (1: enabled, 0: disabled).

Bits 15:8 **CFG2[7:0]**: peripheral hardware configuration 2
This is read only bitfield and is read as CFG2[7:0] = trigger number.

Bits 7:0 **CFG1[7:0]**: peripheral hardware configuration 1
This is read only bitfield and is read as CFG1[7:0] = input multiplexer size.

58.7.22 LPTIM peripheral version identification register (LPTIM_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0023

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJREV[7:4]				MINREV[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[7:4]**: Major revision
This is read only bitfield and is read as MAJREV[7:4] = 2.

Bits 3:0 **MINREV[3:0]**: Minor revision
This is a read only bitfield and is read as MINREV[3:0] = 3.

58.7.23 LPTIM peripheral type identification register (LPTIM_PIDR)

Address offset: 0x3F8

Reset value: 0x0012 0011

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

P_ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **P_ID[31:0]**: Peripheral type identifier

This a read only register and is always read as P_ID[31:0] = 0x00120011.

58.7.24 LPTIM registers map size identification register (LPTIM_SIDR)

Address offset: 0x3FC

Reset value: 0xA3C5 DD01

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
S_ID[31:16]

S_ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **S_ID[31:0]**: Registers map size identifier

This a read only register and is always read as S_ID[31:0] = 0xA3C5DD01.

This register identifies the size of the memory region allocated to the LPTIM registers. The size of this memory region is 1 KB.

58.7.25 LPTIM register map

The following table summarizes the LPTIM registers.

Table 606. LPTIM register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
