Bit 2 **TIM4LPEN**: TIM4 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM4EN**: TIM4 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM4RST**: TIM4 reset

Set and cleared by software.

0: Writing 0 releases TIM4 reset. Reading 0 means that TIM4 reset is released.

1: Writing 1 asserts TIM4 reset. Reading 1 means that TIM4 reset is asserted.

20.8.103 RCC TIM5 configuration register (RCC_TIM5CFGR)

Address offset: 0x710

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM5. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM5LPEN	TIM5EN	TIM5RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM5LPEN**: TIM5 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM5EN**: TIM5 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM5RST**: TIM5 reset
Set and cleared by software.
0: Writing 0 releases TIM5 reset. Reading 0 means that TIM5 reset is released.
1: Writing 1 asserts TIM5 reset. Reading 1 means that TIM5 reset is asserted.

20.8.104 RCC TIM6 configuration register (RCC_TIM6CFGR)

Address offset: 0x714

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM6. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM6LPEN	TIM6EN	TIM6RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM6LPEN**: TIM6 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM6EN**: TIM6 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM6RST**: TIM6 reset
Set and cleared by software.
0: Writing 0 releases TIM6 reset. Reading 0 means that TIM6 reset is released.
1: Writing 1 asserts TIM6 reset. Reading 1 means that TIM6 reset is asserted.

20.8.105 RCC TIM7 configuration register (RCC_TIM7CFGR)

Address offset: 0x718

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM7. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM7LPEN	TIM7EN	TIM7RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM7LPEN**: TIM7 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM7EN**: TIM7 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM7RST**: TIM7 reset

Set and cleared by software.

0: Writing 0 releases TIM7 reset. Reading 0 means that TIM7 reset is released.

1: Writing 1 asserts TIM7 reset. Reading 1 means that TIM7 reset is asserted.

20.8.106 RCC TIM8 configuration register (RCC_TIM8CFGR)

Address offset: 0x71C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM8. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM8LPEN	TIM8EN	TIM8RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM8LPEN**: TIM8 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM8EN**: TIM8 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM8RST**: TIM8 reset

Set and cleared by software.

0: Writing 0 releases TIM8 reset. Reading 0 means that TIM8 reset is released.

1: Writing 1 asserts TIM8 reset. Reading 1 means that TIM8 reset is asserted.

20.8.107 RCC TIM10 configuration register (RCC_TIM10CFGR)

Address offset: 0x720

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM10. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM10LPEN	TIM10EN	TIM10RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM10LPEN**: TIM10 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM10EN**: TIM10 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM10RST**: TIM10 reset

Set and cleared by software.

0: Writing 0 releases TIM10 reset. Reading 0 means that TIM10 reset is released.

1: Writing 1 asserts TIM10 reset. Reading 1 means that TIM10 reset is asserted.

20.8.108 RCC TIM11 configuration register (RCC_TIM11CFGR)

Address offset: 0x724

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM11. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM11LPEN	TIM11EN	TIM11RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM11LPEN**: TIM11 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM11EN**: TIM11 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM11RST**: TIM11 reset

Set and cleared by software.

0: Writing 0 releases TIM11 reset. Reading 0 means that TIM11 reset is released.

1: Writing 1 asserts TIM11 reset. Reading 1 means that TIM11 reset is asserted.

20.8.109 RCC TIM12 configuration register (RCC_TIM12CFGR)

Address offset: 0x728

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM12. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM12LPEN	TIM12EN	TIM12RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM12LPEN**: TIM12 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM12EN**: TIM12 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM12RST**: TIM12 reset

Set and cleared by software.

0: Writing 0 releases TIM12 reset. Reading 0 means that TIM12 reset is released.

1: Writing 1 asserts TIM12 reset. Reading 1 means that TIM12 reset is asserted.

20.8.110 RCC TIM13 configuration register (RCC_TIM13CFGR)

Address offset: 0x72C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM13. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM13LPEN	TIM13EN	TIM13RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM13LPEN**: TIM13 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM13EN**: TIM13 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM13RST**: TIM13 reset

Set and cleared by software.

0: Writing 0 releases TIM13 reset. Reading 0 means that TIM13 reset is released.

1: Writing 1 asserts TIM13 reset. Reading 1 means that TIM13 reset is asserted.

20.8.111 RCC TIM14 configuration register (RCC_TIM14CFGR)

Address offset: 0x730

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM14. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM14LPEN	TIM14EN	TIM14RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM14LPEN**: TIM14 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM14EN**: TIM14 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM14RST**: TIM14 reset

Set and cleared by software.

0: Writing 0 releases TIM14 reset. Reading 0 means that TIM14 reset is released.

1: Writing 1 asserts TIM14 reset. Reading 1 means that TIM14 reset is asserted.

20.8.112 RCC TIM15 configuration register (RCC_TIM15CFGR)

Address offset: 0x734

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM15. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM15LPEN	TIM15EN	TIM15RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM15LPEN**: TIM15 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM15EN**: TIM15 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM15RST**: TIM15 reset
Set and cleared by software.
0: Writing 0 releases TIM15 reset. Reading 0 means that TIM15 reset is released.
1: Writing 1 asserts TIM15 reset. Reading 1 means that TIM15 reset is asserted.

20.8.113 RCC TIM16 configuration register (RCC_TIM16CFGR)

Address offset: 0x738

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM16. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM16LPEN	TIM16EN	TIM16RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM16LPEN**: TIM16 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM16EN**: TIM16 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM16RST**: TIM16 reset
Set and cleared by software.
0: Writing 0 releases TIM16 reset. Reading 0 means that TIM16 reset is released.
1: Writing 1 asserts TIM16 reset. Reading 1 means that TIM16 reset is asserted.

20.8.114 RCC TIM17 configuration register (RCC_TIM17CFGR)

Address offset: 0x73C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the TIM17. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIM17LPEN	TIM17EN	TIM17RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TIM17LPEN**: TIM17 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **TIM17EN**: TIM17 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **TIM17RST**: TIM17 reset

Set and cleared by software.

0: Writing 0 releases TIM17 reset. Reading 0 means that TIM17 reset is released.

1: Writing 1 asserts TIM17 reset. Reading 1 means that TIM17 reset is asserted.

20.8.115 RCC LPTIM1 configuration register (RCC_LPTIM1CFGR)

Address offset: 0x744

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the LPTIM1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPTIM1LPEN	LPTIM1EN	LPTIM1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LPTIM1LPEN**: LPTIM1 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPTIM1EN**: LPTIM1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LPTIM1RST**: LPTIM1 reset
Set and cleared by software.
0: Writing 0 releases LPTIM1 reset. Reading 0 means that LPTIM1 reset is released.
1: Writing 1 asserts LPTIM1 reset. Reading 1 means that LPTIM1 reset is asserted.

20.8.116 RCC LPTIM2 configuration register (RCC_LPTIM2CFGR)

Address offset: 0x748

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the LPTIM2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPTIM2 LPEN	LPTIM2 EN	LPTIM2 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LPTIM2LPEN**: LPTIM2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPTIM2EN**: LPTIM2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LPTIM2RST**: LPTIM2 reset
Set and cleared by software.
0: Writing 0 releases LPTIM2 reset. Reading 0 means that LPTIM2 reset is released.
1: Writing 1 asserts LPTIM2 reset. Reading 1 means that LPTIM2 reset is asserted.

20.8.117 RCC LPTIM3 configuration register (RCC_LPTIM3CFGR)

Address offset: 0x74C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-power behavior of the LPTIM3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPTIM3 LPEN	LPTIM3 EN	LPTIM3 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LPTIM3LPEN**: LPTIM3 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPTIM3EN**: LPTIM3 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LPTIM3RST**: LPTIM3 reset

Set and cleared by software.

0: Writing 0 releases LPTIM3 reset. Reading 0 means that LPTIM3 reset is released.

1: Writing 1 asserts LPTIM3 reset. Reading 1 means that LPTIM3 reset is asserted.

20.8.118 RCC LPTIM4 configuration register (RCC_LPTIM4CFGR)

Address offset: 0x750

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-power behavior of the LPTIM4. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPTIM4 LPEN	LPTIM4 EN	LPTIM4 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LPTIM4LPEN**: LPTIM4 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPTIM4EN**: LPTIM4 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LPTIM4RST**: LPTIM4 reset
Set and cleared by software.
0: Writing 0 releases LPTIM4 reset. Reading 0 means that LPTIM4 reset is released.
1: Writing 1 asserts LPTIM4 reset. Reading 1 means that LPTIM4 reset is asserted.

20.8.119 RCC LPTIM5 configuration register (RCC_LPTIM5CFGR)

Address offset: 0x754

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-power behavior of the LPTIM5. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPTIM5 LPEN	LPTIM5 EN	LPTIM5 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LPTIM5LPEN**: LPTIM5 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPTIM5EN**: LPTIM5 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LPTIM5RST**: LPTIM5 reset
Set and cleared by software.
0: Writing 0 releases LPTIM5 reset. Reading 0 means that LPTIM5 reset is released.
1: Writing 1 asserts LPTIM5 reset. Reading 1 means that LPTIM5 reset is asserted.

20.8.120 RCC SPI1 configuration register (RCC_SPI1CFGR)

Address offset: 0x758

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPI1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPI1LPEN	SPI1EN	SPI1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPI1LPEN**: SPI1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPI1EN**: SPI1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPI1RST**: SPI1 reset

Set and cleared by software.

0: Writing 0 releases SPI1 reset. Reading 0 means that SPI1 reset is released.

1: Writing 1 asserts SPI1 reset. Reading 1 means that SPI1 reset is asserted.

20.8.121 RCC SPI2 configuration register (RCC_SPI2CFGR)

Address offset: 0x75C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPI2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPI2LPEN	SPI2EN	SPI2RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPI2LPEN**: SPI2 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPI2EN**: SPI2 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPI2RST**: SPI2 reset

Set and cleared by software.

0: Writing 0 releases SPI2 reset. Reading 0 means that SPI2 reset is released.

1: Writing 1 asserts SPI2 reset. Reading 1 means that SPI2 reset is asserted.

20.8.122 RCC SPI3 configuration register (RCC_SPI3CFGR)

Address offset: 0x760

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPI3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPI3LPEN	SPI3EN	SPI3RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPI3LPEN**: SPI3 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPI3EN**: SPI3 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPI3RST**: SPI3 reset

Set and cleared by software.

0: Writing 0 releases SPI3 reset. Reading 0 means that SPI3 reset is released.

1: Writing 1 asserts SPI3 reset. Reading 1 means that SPI3 reset is asserted.

20.8.123 RCC SPI4 configuration register (RCC_SPI4CFGR)

Address offset: 0x764

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPI4. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPI4LPEN	SPI4EN	SPI4RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPI4LPEN**: SPI4 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPI4EN**: SPI4 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPI4RST**: SPI4 reset

Set and cleared by software.

0: Writing 0 releases SPI4 reset. Reading 0 means that SPI4 reset is released.

1: Writing 1 asserts SPI4 reset. Reading 1 means that SPI4 reset is asserted.

20.8.124 RCC SPI5 configuration register (RCC_SPI5CFGR)

Address offset: 0x768

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPI5. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPI5LPEN	SPI5EN	SPI5RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPI5LPEN**: SPI5 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPI5EN**: SPI5 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPI5RST**: SPI5 reset
Set and cleared by software.
0: Writing 0 releases SPI5 reset. Reading 0 means that SPI5 reset is released.
1: Writing 1 asserts SPI5 reset. Reading 1 means that SPI5 reset is asserted.

20.8.125 RCC SPI6 configuration register (RCC_SPI6CFGR)

Address offset: 0x76C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPI6. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPI6LPEN	SPI6EN	SPI6RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPI6LPEN**: SPI6 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPI6EN**: SPI6 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPI6RST**: SPI6 reset
Set and cleared by software.
0: Writing 0 releases SPI6 reset. Reading 0 means that SPI6 reset is released.
1: Writing 1 asserts SPI6 reset. Reading 1 means that SPI6 reset is asserted.

20.8.126 RCC SPDIFRX configuration register (RCC_SPDIFRXCFGR)

Address offset: 0x778

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SPDIFRX. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SPDIFRXLPEN	SPDIFRXEN	SPDIFRXRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SPDIFRXLPEN**: SPDIFRX clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SPDIFRXEN**: SPDIFRX clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SPDIFRXRST**: SPDIFRX reset

Set and cleared by software.

0: Writing 0 releases SPDIFRX reset. Reading 0 means that SPDIFRX reset is released.

1: Writing 1 asserts SPDIFRX reset. Reading 1 means that SPDIFRX reset is asserted.

20.8.127 RCC USART1 configuration register (RCC_USART1CFGR)

Address offset: 0x77C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USART1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	USART1LPEN	USART1EN	USART1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **USART1LPEN**: USART1 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USART1EN**: USART1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USART1RST**: USART1 reset
Set and cleared by software.
0: Writing 0 releases USART1 reset. Reading 0 means that USART1 reset is released.
1: Writing 1 asserts USART1 reset. Reading 1 means that USART1 reset is asserted.

20.8.128 RCC USART2 configuration register (RCC_USART2CFGR)

Address offset: 0x780

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USART2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	USART 2LPEN	USART 2EN	USART 2RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **USART2LPEN**: USART2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USART2EN**: USART2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USART2RST**: USART2 reset
Set and cleared by software.
0: Writing 0 releases USART2 reset. Reading 0 means that USART2 reset is released.
1: Writing 1 asserts USART2 reset. Reading 1 means that USART2 reset is asserted.

20.8.129 RCC USART3 configuration register (RCC_USART3CFGR)

Address offset: 0x784

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USART3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	USART 3LPEN	USART 3EN	USART 3RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **USART3LPEN**: USART3 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USART3EN**: USART3 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USART3RST**: USART3 reset

Set and cleared by software.

0: Writing 0 releases USART3 reset. Reading 0 means that USART3 reset is released.

1: Writing 1 asserts USART3 reset. Reading 1 means that USART3 reset is asserted.

20.8.130 RCC UART4 configuration register (RCC_UART4CFGR)

Address offset: 0x788

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the UART4. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UART4 LPEN	UART4 EN	UART4 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **UART4LPEN**: UART4 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **UART4EN**: UART4 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **UART4RST**: UART4 reset
Set and cleared by software.
0: Writing 0 releases UART4 reset. Reading 0 means that UART4 reset is released.
1: Writing 1 asserts UART4 reset. Reading 1 means that UART4 reset is asserted.

20.8.131 RCC UART5 configuration register (RCC_UART5CFGR)

Address offset: 0x78C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the UART5. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UART5 LPEN	UART5 EN	UART5 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **UART5LPEN**: UART5 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **UART5EN**: UART5 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **UART5RST**: UART5 reset
Set and cleared by software.
0: Writing 0 releases UART5 reset. Reading 0 means that UART5 reset is released.
1: Writing 1 asserts UART5 reset. Reading 1 means that UART5 reset is asserted.

20.8.132 RCC USART6 configuration register (RCC_USART6CFGR)

Address offset: 0x790

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USART6. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	USART 6LPEN	USART 6EN	USART 6RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **USART6LPEN**: USART6 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USART6EN**: USART6 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USART6RST**: USART6 reset

Set and cleared by software.

0: Writing 0 releases USART6 reset. Reading 0 means that USART6 reset is released.

1: Writing 1 asserts USART6 reset. Reading 1 means that USART6 reset is asserted.

20.8.133 RCC UART7 configuration register (RCC_UART7CFGR)

Address offset: 0x794

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the UART7. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UART7 LPEN	UART7 EN	UART7 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **UART7LPEN**: UART7 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **UART7EN**: UART7 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **UART7RST**: UART7 reset
Set and cleared by software.
0: Writing 0 releases UART7 reset. Reading 0 means that UART7 reset is released.
1: Writing 1 asserts UART7 reset. Reading 1 means that UART7 reset is asserted.

20.8.134 RCC LPUART1 configuration register (RCC_LPUART1CFGR)

Address offset: 0x7A0

Reset value: 0x0000 0004

This register is used to control reset, clock gating, low-power behavior of the LPUART1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LPUART1LPEN	LPUART1EN	LPUART1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LPUART1LPEN**: LPUART1 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LPUART1EN**: LPUART1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LPUART1RST**: LPUART1 reset
Set and cleared by software.
0: Writing 0 releases LPUART1 reset. Reading 0 means that LPUART1 reset is released.
1: Writing 1 asserts LPUART1 reset. Reading 1 means that LPUART1 reset is asserted.

20.8.135 RCC I2C1 configuration register (RCC_I2C1CFGR)

Address offset: 0x7A4

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the I2C1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	I2C1LPEN	I2C1EN	I2C1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I2C1LPEN**: I2C1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I2C1EN**: I2C1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I2C1RST**: I2C1 reset

Set and cleared by software.

0: Writing 0 releases I2C1 reset. Reading 0 means that I2C1 reset is released.

1: Writing 1 asserts I2C1 reset. Reading 1 means that I2C1 reset is asserted.

20.8.136 RCC I2C2 configuration register (RCC_I2C2CFGR)

Address offset: 0x7A8

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the I2C2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	I2C2LPEN	I2C2EN	I2C2RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I2C2LPEN**: I2C2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I2C2EN**: I2C2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I2C2RST**: I2C2 reset
Set and cleared by software.
0: Writing 0 releases I2C2 reset. Reading 0 means that I2C2 reset is released.
1: Writing 1 asserts I2C2 reset. Reading 1 means that I2C2 reset is asserted.

20.8.137 RCC I2C3 configuration register (RCC_I2C3CFGR)

Address offset: 0x7AC

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the I2C3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I2C3LPEN**: I2C3 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I2C3EN**: I2C3 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I2C3RST**: I2C3 reset
Set and cleared by software.
0: Writing 0 releases I2C3 reset. Reading 0 means that I2C3 reset is released.
1: Writing 1 asserts I2C3 reset. Reading 1 means that I2C3 reset is asserted.

20.8.138 RCC SAI1 configuration register (RCC_SAI1CFGR)

Address offset: 0x7C4

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SAI1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SAI1LPEN	SAI1EN	SAI1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SAI1LPEN**: SAI1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SAI1EN**: SAI1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SAI1RST**: SAI1 reset

Set and cleared by software.

0: Writing 0 releases SAI1 reset. Reading 0 means that SAI1 reset is released.

1: Writing 1 asserts SAI1 reset. Reading 1 means that SAI1 reset is asserted.

20.8.139 RCC SAI2 configuration register (RCC_SAI2CFGR)

Address offset: 0x7C8

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SAI2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SAI2LPEN	SAI2EN	SAI2RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SAI2LPEN**: SAI2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SAI2EN**: SAI2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SAI2RST**: SAI2 reset
Set and cleared by software.
0: Writing 0 releases SAI2 reset. Reading 0 means that SAI2 reset is released.
1: Writing 1 asserts SAI2 reset. Reading 1 means that SAI2 reset is asserted.

20.8.140 RCC SAI3 configuration register (RCC_SAI3CFGR)

Address offset: 0x7CC

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SAI3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SAI3LPEN	SAI3EN	SAI3RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SAI3LPEN**: SAI3 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SAI3EN**: SAI3 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SAI3RST**: SAI3 reset
Set and cleared by software.
0: Writing 0 releases SAI3 reset. Reading 0 means that SAI3 reset is released.
1: Writing 1 asserts SAI3 reset. Reading 1 means that SAI3 reset is asserted.

20.8.141 RCC SAI4 configuration register (RCC_SAI4CFGR)

Address offset: 0x7D0

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SAI4. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SAI4LPEN	SAI4EN	SAI4RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SAI4LPEN**: SAI4 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SAI4EN**: SAI4 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SAI4RST**: SAI4 reset

Set and cleared by software.

0: Writing 0 releases SAI4 reset. Reading 0 means that SAI4 reset is released.

1: Writing 1 asserts SAI4 reset. Reading 1 means that SAI4 reset is asserted.

20.8.142 RCC MDF1 configuration register (RCC_MDF1CFGR)

Address offset: 0x7D8

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the MDF1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MDF1LPEN	MDF1EN	MDF1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **MDF1LPEN**: MDF1 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **MDF1EN**: MDF1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **MDF1RST**: MDF1 reset
Set and cleared by software.
0: Writing 0 releases MDF1 reset. Reading 0 means that MDF1 reset is released.
1: Writing 1 asserts MDF1 reset. Reading 1 means that MDF1 reset is asserted.

20.8.143 RCC FDCAN configuration register (RCC_FDCANCFGR)

Address offset: 0x7E0

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the FDCAN and CANRAM.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FDCAN LPEN	FDCAN EN	FDCAN RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **FDCANLPEN**: FDCAN clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **FDCANEN**: FDCAN clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **FDCANRST**: FDCAN reset
Set and cleared by software.
0: Writing 0 releases FDCAN reset. Reading 0 means that FDCAN reset is released.
1: Writing 1 asserts FDCAN reset. Reading 1 means that FDCAN reset is asserted.

20.8.144 RCC HDP configuration register (RCC_HDPCFGR)

Address offset: 0x7E4

Reset value: 0x0000 0000

This register is used to control reset and clock gating behavior of the HDP.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HDPEN	HDPRST
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **HDPEN**: HDP clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **HDPRST**: HDP reset
Set and cleared by software.
0: Writing 0 releases HDP reset. Reading 0 means that HDP reset is released.
1: Writing 1 asserts HDP reset. Reading 1 means that HDP reset is asserted.

20.8.145 RCC ADC1 configuration register (RCC_ADC1CFGR)

Address offset: 0x7E8

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the ADC1.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	ADC1KERSEL	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ADC1LPEN	ADC1EN	ADC1RST
			rw										rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **ADC1KERSEL**: ADC1 kernel clock source select
Set and cleared by software.
0x0: Kernel source clock is ck_ker_adc1.
0x1: Kernel source clock is ck_icn_ls_mcu.

Bits 11:3 Reserved, must be kept at reset value.

Bit 2 **ADC1LPEN**: ADC1 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **ADC1EN**: ADC1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **ADC1RST**: ADC1 reset
Set and cleared by software.
0: Writing 0 releases ADC1 reset. Reading 0 means that ADC1 reset is released.
1: Writing 1 asserts ADC1 reset. Reading 1 means that ADC1 reset is asserted.

20.8.146 RCC ADC2 configuration register (RCC_ADC2CFGR)

Address offset: 0x7EC

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the ADC2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

		rw	rw										rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:12 **ADC2KERSEL[1:0]**: ADC2 kernel clock source select
Set and cleared by software.
0x0: Kernel source clock is ck_ker_adc2.
0x1: Kernel source clock is ck_icn_ls_mcu.
0x2: Kernel source clock is ck_ker_adc1.
0x3: Reserved

Bits 11:3 Reserved, must be kept at reset value.

Bit 2 **ADC2LPEN**: ADC2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **ADC2EN**: ADC2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **ADC2RST**: ADC2 reset
Set and cleared by software.
0: Writing 0 releases ADC2 reset. Reading 0 means that ADC2 reset is released.
1: Writing 1 asserts ADC2 reset. Reading 1 means that ADC2 reset is asserted.

20.8.147 RCC Ethernet 1 configuration register (RCC_ETH1CFGR)

Address offset: 0x7F0

Reset value: 0x0000 0A44

This register is used to control reset, clock gating, and low-power behavior of the Ethernet 1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	ETH1RXLPEN	ETH1RXEN	ETH1TXLPEN	ETH1TXEN	Res.	ETH1LPEN	ETH1EN	ETH1STPEN	Res.	ETH1MACLPEN	ETH1MACEN	ETH1RST
				rw	rw	rw	rw		rw	rw	rw		rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **ETH1RXLPEN**: Ethernet 1 reception clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables reception clock in CSleep. Reading 0 means that reception clock is disabled in CSleep.
1: Writing 1 enables reception clock in CSleep. Reading 1 means that reception clock is enabled in CSleep.

Bit 10 **ETH1RXEN**: Ethernet 1 reception clock enable
Set and cleared by software.
0: Writing 0 disables reception clock. Reading 0 means that reception clock is disabled.
1: Writing 1 enables reception clock. Reading 1 means that reception clock is enabled.

Bit 9 **ETH1TXLPEN**: Ethernet 1 transmission clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables transmission clock in CSleep. Reading 0 means that transmission clock is disabled in CSleep.
1: Writing 1 enables transmission clock in CSleep. Reading 1 means that transmission clock is enabled in CSleep.

Bit 8 **ETH1TXEN**: Ethernet 1 transmission clock enable
Set and cleared by software.
0: Writing 0 disables transmission clock. Reading 0 means that transmission clock is disabled.
1: Writing 1 enables transmission clock. Reading 1 means that transmission clock is enabled.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **ETH1LPEN**: Ethernet 1 kernel clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables kernel clocks in CSleep. Reading 0 means that kernel clocks are disabled in CSleep.

1: Writing 1 enables kernel clocks in CSleep. Reading 1 means that kernel clocks are enabled in CSleep.

Bit 5 **ETH1EN**: Ethernet 1 kernel clock enable

Set and cleared by software.

0: Writing 0 disables kernel clocks. Reading 0 means that kernel clocks are disabled.

1: Writing 1 enables kernel clocks. Reading 1 means that kernel clocks are enabled.

Bit 4 **ETH1STPEN**: Ethernet 1 kernel clocks enable during CStop

Set and cleared by software. This bits allows ETH1 to receive clocks coming from ETH1_TX_CLK and ETH1_RX_CLK pins during CStop.

0: Writing 0 disables ETH1 TX and RX kernel clocks in CStop. Reading 0 means that ETH1 TX and RX kernel clocks are disabled in CStop.

1: Writing 1 enables ETH1 TX and RX kernel clocks in CStop. Reading 1 means that ETH1 TX and RX kernel clocks are enabled in CStop.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **ETH1MACLPEN**: Ethernet 1 bus clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables bus clocks in CSleep. Reading 0 means that bus clocks are disabled in CSleep.

1: Writing 1 enables bus clocks in CSleep. Reading 1 means that bus clocks are enabled in CSleep.

Bit 1 **ETH1MACEN**: Ethernet 1 bus clock enable

Set and cleared by software.

0: Writing 0 disables bus clocks. Reading 0 means that bus clocks are disabled.

1: Writing 1 enables bus clocks. Reading 1 means that bus clocks are enabled.

Bit 0 **ETH1RST**: Ethernet 1 reset

Set and cleared by software.

0: Writing 0 releases ETH1 reset. Reading 0 means that ETH1 reset is released.

1: Writing 1 asserts ETH1 reset. Reading 1 means that ETH1 reset is asserted.

20.8.148 RCC Ethernet 2 configuration register (RCC_ETH2CFGR)

Address offset: 0x7F4

Reset value: 0x0000 0A44

This register is used to control reset, clock gating, and low-power behavior of the Ethernet 2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	ETH2RXLPEN	ETH2RXEN	ETH2TXLPEN	ETH2TXEN	Res.	ETH2LPEN	ETH2EN	ETH2STPEN	Res.	ETH2MACLPEN	ETH2MACEN	ETH2RST
				rw	rw	rw	rw		rw	rw	rw		rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **ETH2RXLPEN**: Ethernet 2 reception clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables reception clock in CSleep. Reading 0 means that reception clock is disabled in CSleep.

1: Writing 1 enables reception clock in CSleep. Reading 1 means that reception clock is enabled in CSleep.

Bit 10 **ETH2RXEN**: Ethernet 2 reception clock enable

Set and cleared by software.

0: Writing 0 disables reception clock. Reading 0 means that reception clock is disabled.

1: Writing 1 enables reception clock. Reading 1 means that reception clock is enabled.

Bit 9 **ETH2TXLPEN**: Ethernet 2 transmission clock enable during CSleep mode

Set and cleared by software.

0: Writing 0 disables transmission clock in CSleep. Reading 0 means that transmission clock is disabled in CSleep.

1: Writing 1 enables transmission clock in CSleep. Reading 1 means that transmission clock is enabled in CSleep.

Bit 8 **ETH2TXEN**: Ethernet 2 transmission clock enable

Set and cleared by software.

0: Writing 0 disables transmission clock. Reading 0 means that transmission clock is disabled.

1: Writing 1 enables transmission clock. Reading 1 means that transmission clock is enabled

Bit 7 Reserved, must be kept at reset value.

Bit 6 **ETH2LPEN**: Ethernet 2 kernel clocks enable during CSleep

Set and cleared by software.

0: Writing 0 disables kernel clocks in CSleep. Reading 0 means that kernel clocks are disabled in CSleep.

1: Writing 1 enables kernel clocks in CSleep. Reading 1 means that kernel clocks are enabled in CSleep.

Bit 5 **ETH2EN**: Ethernet 2 kernel clocks enable

Set and cleared by software.

0: Writing 0 disables kernel clocks. Reading 0 means that kernel clocks are disabled.

1: Writing 1 enables kernel clocks. Reading 1 means that kernel clocks are enabled.

Bit 4 **ETH2STPEN**: Ethernet 2 kernel clocks enable during CStop

Set and cleared by software. This bits allows ETH2 to receive clocks coming from ETH2_TX_CLK and ETH2_RX_CLK pins during CStop.

0: Writing 0 disables ETH2 TX and RX kernel clocks in CStop. Reading 0 means that ETH2 TX and RX kernel clocks are disabled in CStop.

1: Writing 1 enables ETH2 TX and RX kernel clocks in CStop. Reading 1 means that ETH2 TX and RX kernel clocks are enabled in CStop.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **ETH2MACLPEN**: Ethernet 2 bus clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables bus clocks in CSleep. Reading 0 means that bus clocks are disabled in CSleep.

1: Writing 1 enables bus clocks in CSleep. Reading 1 means that bus clocks are enabled in CSleep.

Bit 1 **ETH2MACEN**: Ethernet 2 bus clock enable
Set and cleared by software.
0: Writing 0 disables bus clocks. Reading 0 means that bus clocks are disabled.
1: Writing 1 enables bus clocks. Reading 1 means that bus clocks are enabled.

Bit 0 **ETH2RST**: Ethernet 2 reset
Set and cleared by software.
0: Writing 0 releases ETH2 reset. Reading 0 means that ETH2 reset is released.
1: Writing 1 asserts ETH2 reset. Reading 1 means that ETH2 reset is asserted.

20.8.149 RCC USBH configuration register (RCC_USBHCFGR)

Address offset: 0x7FC

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USBH. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	USBHLPEN	USBHEN	USBHRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **USBHLPEN**: USBH clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USBHEN**: USBH peripheral clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USBHRST**: USBH reset
Set and cleared by software.
0: Writing 0 releases USBH reset. Reading 0 means that USBH reset is released.
1: Writing 1 asserts USBH reset. Reading 1 means that USBH reset is asserted.

20.8.150 RCC USB2PHY1 configuration register (RCC_USB2PHY1CFGR)

Address offset: 0x800

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USB2PHY1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
USB2PHY1CKREFSEL	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	USB2PHY1LPEN	USB2PHY1EN	USB2PHY1RST
rw													rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **USB2PHY1CKREFSEL**: USB2PHY1 reference clock selection

Set and cleared by software.

0: USB2PHY1 reference clock is channel 57 (ck_ker_usb2phy1) of the flexclkgen (default after reset).

1: USB2PHY1 reference clock is the HSE oscillator divided by 2 (hse_div2_ck).

Bits 14:3 Reserved, must be kept at reset value.

Bit 2 **USB2PHY1LPEN**: USB2PHY1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USB2PHY1EN**: USB2PHY1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USB2PHY1RST**: USB2PHY1 reset

Set and cleared by software.

0: Writing 0 releases USB2PHY1 reset. Reading 0 means that USB2PHY1 reset is released.

1: Writing 1 asserts USB2PHY1 reset. Reading 1 means that USB2PHY1 reset is asserted.

20.8.151 RCC OTG configuration register (RCC_OTGCFGR)

Address offset: 0x808

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the OTG. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OTGLPEN	OTGEN	OTGRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **OTGLPEN**: OTG clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **OTGEN**: OTG peripheral clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **OTGRST**: OTG reset

Set and cleared by software.

0: Writing 0 releases OTG reset. Reading 0 means that OTG reset is released.

1: Writing 1 asserts OTG reset. Reading 1 means that OTG reset is asserted.

20.8.152 RCC USB2PHY2 configuration register (RCC_USB2PHY2CFGR)

Address offset: 0x80C

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the USB2PHY2.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw													rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **USB2PHY2CKREFSEL**: USB2PHY2 reference clock select
Set and cleared by software.
0: USB2PHY2 reference clock is channel 58 (ck_ker_usb2phy2) of the flexclkgen (default after reset).
1: USB2PHY2 reference clock is the HSE oscillator divided by 2 (hse_div2_ck).

Bits 14:3 Reserved, must be kept at reset value.

Bit 2 **USB2PHY2LPEN**: USB2PHY2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **USB2PHY2EN**: USB2PHY2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **USB2PHY2RST**: USB2PHY2 reset
Set and cleared by software.
0: Writing 0 releases USB2PHY2 reset. Reading 0 means that USB2PHY2 reset is released.
1: Writing 1 asserts USB2PHY2 reset. Reading 1 means that USB2PHY2 reset is asserted.

20.8.153 RCC STGEN configuration register (RCC_STGENCFGR)

Address offset: 0x824

Reset value: 0x0000 0004

This register is used to control clock gating and low-power clock mode behavior of the STGENC and STGENR.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	STGEN STPEN	Res.	STGEN LPEN	STGEN EN	Res.
											rw		rw	rw	

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **STGENSTPEN**: STGENRW and STGENRO kernel clock enable during CStop
Set and cleared by software.
0: Writing 0 disables kernel clocks in CStop. Reading 0 means that kernel clocks are disabled in CStop.
1: Writing 1 enables kernel clocks in CStop. Reading 1 means that kernel clocks are enabled in CStop.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **STGENLPEN**: STGENRW and STGENRO clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **STGENEN**: STGENRW and STGENRO clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.154 RCC SDMMC1 configuration register (RCC_SDMMC1CFGR)

Address offset: 0x830

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SDMMC1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDMMC1DLLRST
															rw

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDMMC1LPEN	SDMMC1EN	SDMMC1RST
													rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **SDMMC1DLLRST**: SDMMC1 DLL reset
Set and cleared by software.
0: Writing 0 releases DLL reset. Reading 0 means that DLL reset is released.
1: Writing 1 asserts DLL reset. Reading 1 means that DLL reset is asserted.

Bits 15:3 Reserved, must be kept at reset value.

Bit 2 **SDMMC1LPEN**: SDMMC1 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SDMMC1EN**: SDMMC1 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SDMMC1RST**: SDMMC1 reset
Set and cleared by software.
0: Writing 0 releases SDMMC1 reset. Reading 0 means that SDMMC1 reset is released.
1: Writing 1 asserts SDMMC1 reset. Reading 1 means that SDMMC1 reset is asserted.

20.8.155 RCC SDMMC2 configuration register (RCC_SDMMC2CFGR)

Address offset: 0x834

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SDMMC2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDMMC2LPEN	SDMMC2EN	SDMMC2RST
													rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **SDMMC2DLLRST**: SDMMC2 DLL reset
Set and cleared by software.
0: Writing 0 releases DLL reset. Reading 0 means that DLL reset is released.
1: Writing 1 asserts DLL reset. Reading 1 means that DLL reset is asserted.

Bits 15:3 Reserved, must be kept at reset value.

Bit 2 **SDMMC2LPEN**: SDMMC2 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SDMMC2EN**: SDMMC2 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SDMMC2RST**: SDMMC2 reset
Set and cleared by software.
0: Writing 0 releases SDMMC2 reset. Reading 0 means that SDMMC2 reset is released.
1: Writing 1 asserts SDMMC2 reset. Reading 1 means that SDMMC2 reset is asserted.

20.8.156 RCC SDMMC3 configuration register (RCC_SDMMC3CFGR)

Address offset: 0x838

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the SDMMC3. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDMMC3LPEN	SDMMC3EN	SDMMC3RST
													rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **SDMMC3DLLRST**: SDMMC3 DLL reset

Set and cleared by software.

0: Writing 0 releases DLL reset. Reading 0 means that DLL reset is released.

1: Writing 1 asserts DLL reset. Reading 1 means that DLL reset is asserted.

Bits 15:3 Reserved, must be kept at reset value.

Bit 2 **SDMMC3LPEN**: SDMMC3 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SDMMC3EN**: SDMMC3 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SDMMC3RST**: SDMMC3 block reset

Set and cleared by software.

0: Writing 0 releases SDMMC3 reset. Reading 0 means that SDMMC3 reset is released.

1: Writing 1 asserts SDMMC3 reset. Reading 1 means that SDMMC3 reset is asserted.

20.8.157 RCC LTDC configuration register (RCC_LTDCCFGR)

Address offset: 0x840

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of LTDC.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LTDCLPEN	LTDCEN	LTDCRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **LTDCLPEN**: LTDC clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **LTDCEN**: LTDC peripheral clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **LTDCRST**: LTDC reset

Set and cleared by software.

0: Writing 0 releases LTDC reset. Reading 0 means that LTDC reset is released.

1: Writing 1 asserts LTDC reset. Reading 1 means that LTDC reset is asserted.

20.8.158 RCC CSI configuration register (RCC_CSICFGR)

Address offset: 0x858

Reset value: 0x0000 0004

This register is used to control reset, clock gating, and low-power behavior of the CSI.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CSILPEN	CSIEN	CSIRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CSILPEN**: CSI clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **CSIEN**: CSI clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **CSIRST**: CSI reset

Set and cleared by software.

0: Writing 0 releases CSI reset. Reading 0 means that CSI reset is released.

1: Writing 1 asserts CSI reset. Reading 1 means that CSI reset is asserted.

20.8.159 RCC DCMIPP configuration register (RCC_DCMIPPCFGR)

Address offset: 0x85C

Reset value: 0x0000 0004

This register is used to control the reset, clock gating and low-power behavior of DCMIPP. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCMIPPLPEN	DCMIPPEN	DCMIPPRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DCMIPPLPEN**: DCMIPP clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **DCMIPPEN**: DCMIPP clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DCMIPPRST**: DCMIPP reset

Set and cleared by software.

0: Writing 0 releases DCMIPP reset. Reading 0 means that DCMIPP reset is released.

1: Writing 1 asserts DCMIPP reset. Reading 1 means that DCMIPP reset is asserted.

20.8.160 RCC DCMIPSSI configuration register (RCC_DCMIPSSICFGR)

Address offset: 0x860

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of DCMIPSSI. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCMIPSSILPEN	DCMIPSSIEN	DCMIPSSIRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DCMIPSSILPEN**: DCMIPSSI clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **DCMIPSSIEN**: DCMIPSSI clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DCMIPSSIRST**: DCMIPSSI reset

Set and cleared by software.

0: Writing 0 releases DCMIPSSI reset. Reading 0 means that DCMIPSSI reset is released.

1: Writing 1 asserts DCMIPSSI reset. Reading 1 means that DCMIPSSI reset is asserted.

20.8.161 RCC RNG1 configuration register (RCC_RNG1CFGR)

Address offset: 0x870

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of RNG1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RNG1LPEN	RNG1EN	RNG1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **RNG1LPEN**: RNG1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **RNG1EN**: RNG1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **RNG1RST**: RNG1 reset

Set and cleared by software.

0: Writing 0 releases RNG1 reset. Reading 0 means that RNG1 reset is released.

1: Writing 1 asserts RNG1 reset. Reading 1 means that RNG1 reset is asserted.

Note: The clocks of the following cryptographic peripherals must all be disabled before setting this bit: PKA, RNG1, SAES, HASH1, CRYP1.

20.8.162 RCC RNG2 configuration register (RCC_RNG2CFGR)

Address offset: 0x874

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of RNG2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RNG2LPEN	RNG2EN	RNG2RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **RNG2LPEN**: RNG2 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **RNG2EN**: RNG2 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **RNG2RST**: RNG2 reset

Set and cleared by software.

0: Writing 0 releases RNG2 reset. Reading 0 means that RNG2 reset is released.

1: Writing 1 asserts RNG2 reset. Reading 1 means that RNG2 reset is asserted.

20.8.163 RCC PKA configuration register (RCC_PKACFGR)

Address offset: 0x878

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of PKA.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PKALPEN	PKAEN	PKARST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **PKALPEN**: PKA clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **PKAEN**: PKA clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **PKARST**: PKA reset

Set and cleared by software.

0: Writing 0 releases PKA reset. Reading 0 means that PKA reset is released.

1: Writing 1 asserts PKA reset. Reading 1 means that PKA reset is asserted.

Note: The clocks of the following cryptographic peripherals must all be disabled before setting this bit: PKA, RNG1, SAES, HASH1, CRYP1.

20.8.164 RCC SAES configuration register (RCC_SAESCFGR)

Address offset: 0x87C

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of SAES.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SAESLPEN	SAESEN	SAESRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SAESLPEN**: SAES clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SAESEN**: SAES clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SAESRST**: SAES reset

Set and cleared by software.

0: Writing 0 releases SAES reset. Reading 0 means that SAES reset is released.

1: Writing 1 asserts SAES reset. Reading 1 means that SAES reset is asserted.

Note: The clocks of the following cryptographic peripherals must all be disabled before setting this bit: PKA, RNG1, SAES, HASH1, CRYP1.

20.8.165 RCC HASH1 configuration register (RCC_HASH1CFGR)

Address offset: 0x880

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of HASH1. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HASH1 LPEN	HASH1 EN	HASH1 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **HASH1LPEN**: HASH1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **HASH1EN**: HASH1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **HASH1RST**: HASH1 reset

Set and cleared by software.

0: Writing 0 releases HASH1 reset. Reading 0 means that HASH1 reset is released.

1: Writing 1 asserts HASH1 reset. Reading 1 means that HASH1 reset is asserted.

Note: The clocks of the following cryptographic peripherals must all be disabled before setting this bit: PKA, RNG1, SAES, HASH1, CRYP1.

20.8.166 RCC HASH2 configuration register (RCC_HASH2CFGR)

Address offset: 0x884

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of HASH2. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HASH2 LPEN	HASH2 EN	HASH2 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **HASH2LPEN**: HASH2 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **HASH2EN**: HASH2 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **HASH2RST**: HASH2 reset

Set and cleared by software.

0: Writing 0 releases HASH2 reset. Reading 0 means that HASH2 reset is released.

1: Writing 1 asserts HASH2 reset. Reading 1 means that HASH2 reset is asserted.

20.8.167 RCC CRYP1 configuration register (RCC_CRYP1CFGR)

Address offset: 0x888

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of CRYP1.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CRYP1 LPEN	CRYP1 EN	CRYP1 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CRYP1LPEN**: CRYP1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **CRYP1EN**: CRYP1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **CRYP1RST**: CRYP1 reset

Set and cleared by software.

0: Writing 0 releases CRYP1 reset. Reading 0 means that CRYP1 reset is released.

1: Writing 1 asserts CRYP1 reset. Reading 1 means that CRYP1 reset is asserted.

Note: The clocks of the following cryptographic peripherals must all be disabled before setting this bit: PKA, RNG1, SAES, HASH1, CRYP1.

20.8.168 RCC CRYP2 configuration register (RCC_CRYP2CFGR)

Address offset: 0x88C

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of CRYP2.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CRYP2 LPEN	CRYP2 EN	CRYP2 RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CRYP2LPEN**: CRYP2 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **CRYP2EN**: CRYP2 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **CRYP2RST**: CRYP2 reset

Set and cleared by software.

0: Writing 0 releases CRYP2 reset. Reading 0 means that CRYP2 reset is released.

1: Writing 1 asserts CRYP2 reset. Reading 1 means that CRYP2 reset is asserted.

20.8.169 RCC IWDG1 configuration register (RCC_IWDG1CFGR)

Address offset: 0x894

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of IWDG1.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IWDG1 LPEN	IWDG1 EN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IWDG1LPEN**: IWDG1 bus clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.

1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clock is enabled in CSleep.

Bit 1 **IWDG1EN**: IWDG1 bus clock enable

Set and cleared by software.

0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.

1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.170 RCC IWDG2 configuration register (RCC_IWDG2CFGR)

Address offset: 0x898

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of IWDG2.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IWDG2 LPEN	IWDG2 EN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IWDG2LPEN**: IWDG2 bus clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.
1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clock is enabled in CSleep.

Bit 1 **IWDG2EN**: IWDG2 bus clock enable
Set and cleared by software.
0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.
1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.171 RCC IWDG3 configuration register (RCC_IWDG3CFGR)

Address offset: 0x89C

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of IWDG3.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IWDG3 LPEN	IWDG3 EN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IWDG3LPEN**: IWDG3 bus clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.

1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clock is enabled in CSleep.

Bit 1 **IWDG3EN**: IWDG3 bus clock enable

Set and cleared by software.

0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.

1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.172 RCC IWDG4 configuration register (RCC_IWDG4CFGR)

Address offset: 0x8A0

Reset value: 0x0000 0004

This register is used to control clock gating and low-power behavior of IWDG4. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IWDG4 LPEN	IWDG4 EN	Res.
													rw	rw	

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IWDG4LPEN**: IWDG4 bus clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.

1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clock is enabled in CSleep.

Bit 1 **IWDG4EN**: IWDG4 bus clock enable

Set and cleared by software.

0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.

1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 Reserved, must be kept at reset value.

20.8.173 RCC WWDG1 configuration register (RCC_WWDG1CFGR)

Address offset: 0x8A4

Reset value: 0x0000 0004

This register is used to control th clock gating and low-power behavior of WWDG1.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WWDG 1LPEN	WWDG 1EN	WWDG 1RST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **WWDG1LPEN**: WWDG1 bus clock enable during CSleep
Set and cleared by software.
0: ‘Writing 0 disables APB clock in CSleep. Reading 0 means that APB clock is disabled in CSleep.
1: Writing 1 enables APB clock in CSleep. Reading 1 means that APB clock is enabled in CSleep.

Bit 1 **WWDG1EN**: WWDG1 bus clock enable
Set and cleared by software.
0: Writing 0 disables APB clock. Reading 0 means that APB clock is disabled.
1: Writing 1 enables APB clock. Reading 1 means that APB clock is enabled.

Bit 0 **WWDG1RST**: WWDG1 reset
Set and cleared by software.
0: Writing 0 releases WWDG1 reset. Reading 0 means that WWDG1 reset is released.
1: Writing 1 asserts WWDG1 reset. Reading 1 means that WWDG1 reset is asserted.

20.8.174 RCC VREFBUF configuration register (RCC_VREFCFGR)

Address offset: 0x8AC

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of VREFBUF.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VREFL PEN	VREFE N	VREFR ST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **VREFLPEN**: VREFBUF clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **VREFEN**: VREFBUF clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **VREFRST**: VREFBUF reset
Set and cleared by software.
0: Writing 0 releases VREFBUF reset. Reading 0 means that VREFBUF reset is released.
1: Writing 1 asserts VREFBUF reset. Reading 1 means that VREFBUF reset is asserted

20.8.175 RCC DTS configuration register (RCC_DTSCFGR)

Address offset: 0x8B0

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of DTS.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	DTSKERSEL[1:0]		Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DTSLPEN	DTSEN	DTSRST
		rw	rw										rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bits 13:12 **DTSKERSEL[1:0]**: DTS kernel clock selection
Set and cleared by software.
0x0: hsi_ker_ck selected
0x1: hse_ker_ck selected
0x2: msi_ker_ck selected
0x3: Reserved

Bits 11:3 Reserved, must be kept at reset value.

Bit 2 **DTSLPEN**: DTS clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **DTSEN**: DTS clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DTSRST**: DTS reset
Set and cleared by software.
0: Writing 0 releases DTS reset. Reading 0 means that DTS reset is released.
1: Writing 1 asserts DTS reset. Reading 1 means that DTS reset is asserted

20.8.176 RCC CRC configuration register (RCC_CRCCFGR)

Address offset: 0x8B4

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of CRC.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CRCLPEN	CRCEN	CRCRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CRCLPEN**: CRC clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **CRCEN**: CRC clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **CRCRST**: CRC reset
Set and cleared by software.
0: Writing 0 releases CRC reset. Reading 0 means that CRC reset is released.
1: Writing 1 asserts CRC reset. Reading 1 means that CRC reset is asserted

20.8.177 RCC SERC configuration register (RCC_SERCCFGR)

Address offset: 0x8B8

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of SERC.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SERCLPEN	SERCEN	SERCRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SERCLPEN**: SERC clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **SERCEN**: SERC clocks enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **SERCRST**: SERC reset

Set and cleared by software.

0: Writing 0 releases SERC reset. Reading 0 means that SERC reset is released.

1: Writing 1 asserts SERC reset. Reading 1 means that SERC reset is asserted

20.8.178 RCC DDRPERFM configuration register (RCC_DDRPERFMCFGR)

Address offset: 0x8C0

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of DDRPERFM.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DDRPERFMLPEN	DDRPERFMEN	DDRPERFMRST
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **DDRPERFMLPEN**: DDRPERFM clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **DDRPERFMEN**: DDRPERFM clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **DDRPERFMRST**: DDRPERFM reset

Set and cleared by software.

0: Writing 0 releases DDRPERFM reset. Reading 0 means that DDRPERFM reset is released.

1: Writing 1 asserts DDRPERFM reset. Reading 1 means that DDRPERFM reset is asserted.

20.8.179 RCC I3C1 configuration register (RCC_I3C1CFGR)

Address offset: 0x8C8

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of I3C1.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I3C1LPEN**: I3C1 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I3C1EN**: I3C1 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I3C1RST**: I3C1 reset

Set and cleared by software.

0: Writing 0 releases I3C1 reset. Reading 0 means that I3C1 reset is released.

1: Writing 1 asserts I3C1 reset. Reading 1 means that I3C1 reset is asserted.

20.8.180 RCC I3C2 configuration register (RCC_I3C2CFGR)

Address offset: 0x8CC

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of I3C2.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I3C2LPEN**: I3C2 clock enable during CSleep

Set and cleared by software.

0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.

1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I3C2EN**: I3C2 clock enable

Set and cleared by software.

0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.

1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I3C2RST**: I3C2 reset

Set and cleared by software.

0: Writing 0 releases I3C2 reset. Reading 0 means that I3C2 reset is released.

1: Writing 1 asserts I3C2 reset. Reading 1 means that I3C2 reset is asserted.

20.8.181 RCC I3C3 configuration register (RCC_I3C3CFGR)

Address offset: 0x8D0

Reset value: 0x0000 0004

This register is used to control reset, clock gating and low-power behavior of I3C3.
Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **I3C3LPEN**: I3C3 clock enable during CSleep
Set and cleared by software.
0: Writing 0 disables peripheral clocks in CSleep. Reading 0 means that peripheral clocks are disabled in CSleep.
1: Writing 1 enables peripheral clocks in CSleep. Reading 1 means that peripheral clocks are enabled in CSleep.

Bit 1 **I3C3EN**: I3C3 clock enable
Set and cleared by software.
0: Writing 0 disables peripheral clocks. Reading 0 means that peripheral clocks are disabled.
1: Writing 1 enables peripheral clocks. Reading 1 means that peripheral clocks are enabled.

Bit 0 **I3C3RST**: I3C3 reset
Set and cleared by software.
0: Writing 0 releases I3C3 reset. Reading 0 means that I3C3 reset is released.
1: Writing 1 asserts I3C3 reset. Reading 1 means that I3C3 reset is asserted.

20.8.182 RCC MUXSEL configuration register (RCC_MUXSELCFGR)

Address offset: 0x1000

Reset value: 0x0000 0000

This register is used to select reference clock for each channel in MUXSEL of flexclkgen. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	MUXSEL6[1:0]		Res.	Res.	MUXSEL5[1:0]		Res.	MUXSEL4[2:0]

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **MUXSEL6[1:0]**: PLL2 reference clock selection (ck_pll2_ref)
Set and cleared by software.
0x0: hsi_ck
0x1: hse_ck
0x2: msi_ck
0x3: Reserved

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:20 **MUXSEL5[1:0]**: PLL1 reference clock selection (ck_pll1_ref)
Set and cleared by software.
0x0: hsi_ck
0x1: hse_ck
0x2: msi_ck
0x3: Reserved

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **MUXSEL4[2:0]**: PLL8 reference clock selection
Set and cleared by software.
0x0: hsi_ck
0x1: hse_ck
0x2: msi_ck
0x5: ck_in
Others: Reserved

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **MUXSEL3[2:0]**: PLL7 reference clock selection
Set and cleared by software.
0x0: hsi_ck
0x1: hse_ck
0x2: msi_ck
0x5: ck_in
Others: Reserved

Bit 11 Reserved, must be kept at reset value.

Bits 10:8 **MUXSEL2[2:0]**: PLL6 reference clock selection
Set and cleared by software.
0x0: hsi_ck
0x1: hse_ck
0x2: msi_ck
0x5: ck_in
Others: Reserved

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **MUXSEL1[2:0]**: PLL5 reference clock selection
Set and cleared by software.
0x0: hsi_ck
0x1: hse_ck
0x2: msi_ck
0x5: ck_in
Others: Reserved

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **MUXSEL0[2:0]**: PLL4 reference clock selection
Set and cleared by software.
0x0: hsi_ck
0x1: hse_ck
0x2: msi_ck
0x5: ck_in
Others: Reserved

20.8.183 RCC cross bar x configuration register (RCC_XBARxCFGR)

Address offset: 0x1018 + 0x4 * x, (x = 0 to 63)

Reset value: 0x0000 0045

This register is used to configure channel x output of cross bar (XBAR) in flexclkgen. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number x configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

								r	rw			rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **XBARxSTS**: Cross bar channel x output status
Set and cleared by hardware to indicate channel x output status versus setting changes.
0: Channel x is aligned to given settings.
1: Indicates change ongoing.

Bit 6 **XBARxEN**: Cross bar channel x clock output enable
Set and cleared by software. It is recommended to keep the channel x enabled at cross bar stage, and to use the final divider enable bit to disable the channel x output.
0: Channel x output disabled
1: Channel x output enabled

Bits 5:4 Reserved, must be kept at reset value.

Bits 3:0 **XBARxSEL[3:0]**: Cross bar channel x input clock selection
Set and cleared by software to select the input clock for the channel x.
0x0: PLL4 FOUTPOSTDIV clock selected
0x1: PLL5 FOUTPOSTDIV clock selected
0x2: PLL6 FOUTPOSTDIV clock selected
0x3: PLL7 FOUTPOSTDIV clock selected

20.8.184 RCC pre divider x configuration register (RCC_PREDIVxCFGR)

Address offset: 0x1118 + 0x4 * x, (x = 0 to 63)

Reset value: 0x0000 0000

This register is used to configure the channel x predivider (PREDIV) stage in flexclkgen. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number x configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	PREDIVx[9:0]									
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **PREDIVx[9:0]**: Predivider channel x divider ratio

Set and cleared by software to select one div1, div2, div4 or div1024 ratio.

0x0: div1

0x1: div2

0x3: div4

0x3FF: div1024

Others: Reserved

20.8.185 RCC pre divider status register 1 (RCC_PREDIVSR1)

Address offset: 0x1218

Reset value: 0x0000 0000

This register is used to get status of first 32 channel outputs of PREDIV in flexclkgen. Word format data access only supported on this register. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

PREDIVSTS[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **PREDIVSTS[31:0]**: Predivider channel[31:0] output status

Set by hardware to indicate the status of channel output versus divide ratio changes.

0: Channel is aligned with divide ratio change.

1: Indicates that the divider is in the process of changing.

20.8.186 RCC pre divider status register 2 (RCC_PREDIVSR2)

Address offset: 0x121C

Reset value: 0x0000 0000

This register is used to get status of last 32 channel outputs of PREDIV in flexclkgen. Word format data access only supported on this register. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

PREDIVSTS[47:32]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **PREDIVSTS[63:32]**: Predivider channel[63:32] output status

Set by hardware to indicate the status of channel output versus divide ratio changes.

0: Channel is aligned with divide ratio change.

1: Indicates that the divider is in the process of changing.

20.8.187 RCC final divider x configuration register (RCC_FINDIVxCFGR)

Address offset: 0x1224 + 0x4 * x, (x = 0 to 63)

Reset value: 0x0000 0040

This register is used to configure channel x final divider (FINDIV) in flexclkgen. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number x configuration (see *Table 161* for details). Any read access is allowed.

									rw	rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **FINDIVxEN**: Final divider channel x output enable

Set and cleared by software.

0: Channel x output disabled

1: Channel x output enabled

Bits 5:0 **FINDIVx[5:0]**: Channel x divider ratio

Set and cleared by software to select one div1 up to div64 step.

20.8.188 RCC final divider status register 1 (RCC_FINDIVSR1)

Address offset: 0x1324

Reset value: 0x0000 0000

This register is used to get status of first 32 channel outputs of FINDIV in flexclkgen. Word format access only supported on this register. Any read access is allowed.

FINDIVSTS[47:32]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **FINDIVSTS[63:32]**: Final divider channel[63:32] output status

Set by hardware to indicate the status of the channel output versus divide ratio changes.

0: Channel is aligned with divide ratio change.

1: Indicates that the divider is in the process of changing.

20.8.190 RCC clock frequency calculator and observation 0 clock configuration register (RCC_FCALCOBS0CFGR)

Address offset: 0x1340

Reset value: 0x1600 0087

This register is used to configure clock frequency calculator and observation clock 0 in flexclkgen. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 65 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **CKOBSEN**: Observation clock 0 output enable
Set and cleared by software to enable the observation clock 0 output in front of the divider.
0: Observation clock 0 output disabled
1: Observation clock 0 output enabled (default after reset)

Bit 25 **FCALCCKEN**: Clock frequency calculator input clock enable
Set and cleared by software to enable the clock frequency calculator input clock.
0: Input clock disabled
1: Input clock enabled (default after reset)

Bits 24:22 **CKOBSDIV[2:0]**: Observation clock 0 divide ratio
Set and cleared by software to select the divide ratio for the observation clock 0.
000: div1 (default after reset)
001: div2
010: div4
011: div8
100: div16
101: div32
110: div64
111: div128

Bits 21:19 Reserved, must be kept at reset value.

Bit 18 **CKOBSINV**: Observation clock 0 inverter
Set and cleared by software to invert the observation clock 0 in front of the divider.
0: Observation clock 0 not inverted (default after reset)
1: Observation clock 0 inverted

Bit 17 **FCALCCKINV**: Clock frequency calculator input clock inverter

Set and cleared by software to invert THE clock frequency calculator input clock (in front of the divider).

0: Input clock not inverted (default after reset)

1: Input clock inverted

Bit 16 **CKOBSEXTSEL**: External clock source for observation clock 0

Set and cleared by software to select internal or external clocks for observation clock 0.

0: Internal clock selected for observation clock 0 (default after reset)

1: External clock selected for observation clock 0

Bit 15 **FCALCCKEXTSEL**: External clock source for clock frequency calculator input clock

Set and cleared by software to select an internal or external clock source for the clock frequency calculator input clock.

0: Internal clock selected for the clock frequency calculator input clock (default after reset)

1: External clock selected for the clock frequency calculator input clock

Bits 14:11 Reserved, must be kept at reset value.

Bits 10:8 **CKEXTSEL[2:0]**: External clock selector for clock frequency calculator and observation clock 0

Set and cleared by software to select the external clock to be calculated or observed.

000: pll1 clock divided by 42

20.8.191 RCC clock frequency calculator and observation 1 clock configuration register (RCC_FCALCOBS1CFGR)

Address offset: 0x1344

Reset value: 0x0600 0087

This register is used to configure clock frequency calculator and observation clock 1 in flexclkgen. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 65 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **FCALCRSTN**: Clock frequency calculator reset
Set and cleared by software.
0: Clock frequency calculator reset module asserted (default after reset)
1: Clock frequency calculator reset module released

Bit 26 **CKOBSEN**: Observation clock 1 output enable
Set and cleared by software to enable observation clock 1 output in front of the divider.
0: Observation clock 1 output disabled
1: Observation clock 1 output enabled (default after reset)

Bit 25 Reserved, must be kept at reset value.

Bits 24:22 **CKOBSDIV[2:0]**: Observation clock 1 divide ratio
Set and cleared by software to select the divide ratio for observation clock 1.
000: div1 (default after reset)
001: div2
010: div4
011: div8
100: div16
101: div32
110: div64
111: div128

Bits 21:19 Reserved, must be kept at reset value.

Bit 18 **CKOBSINV**: Observation clock 1 inverter
Set and cleared by software to invert observation clock 1 in front of the divider.
0: Observation clock 1 not inverted (default after reset)
1: Observation clock 1 inverted

Bit 17 Reserved, must be kept at reset value.

Bit 16 **CKOBSEXTSEL**: External clock source for the observation clock 1
Set and cleared by software to select between internal or external clocks for observation clock 1.
0: Internal clock selected for observation clock 1(default after reset)
1: External clock selected for observation clock 1

Bits 15:11 Reserved, must be kept at reset value.

Bits 10:8 **CKEXTSEL[2:0]**: External clock for observation clock 1
Set and cleared by software to select the external clock to be observed.
000: pll1 clock divided by 42

20.8.192 RCC clock frequency calculator reference clock configuration register (RCC_FCALCREFCFGR)

Address offset: 0x1348

Reset value: 0x0000 4000

This register is used to configure clock frequency calculator reference clock in flexclkgen. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 65 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FCALCREFCKSEL[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **FCALCREFCKSEL[2:0]**: Reference clock selection used by clock frequency calculator

Set and cleared by software to select clock frequency calculator reference clock used for definition of clock frequency calculation time window (see RCC_FCALCCR2).

000: PLL4 reference input clock
001: PLL5 reference input clock
010: PLL6 reference input clock
011: PLL7 reference input clock
100: PLL8 reference input clock
Others: Reserved

20.8.193 RCC clock frequency calculator control register 1 (RCC_FCALCCR1)

Address offset: 0x134C

Reset value: 0x0000 0000

This register is used to control clock frequency calculator in flexclkgen block. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 65 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FCALC RUN
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **FCALCRUN**: Clock frequency calculator run

Set and cleared by software to run the measure.

0: Clock frequency calculator off (default after reset)
1: Clock frequency calculator on

20.8.194 RCC clock frequency calculator control register 2 (RCC_FCALCCR2)

Address offset: 0x1354

Reset value: 0x0000 0000

This register is used to control the clock frequency calculator in flexclkgen. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 65 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	rw	rw	rw	rw							rw	rw			

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:17 **FCALCTYP[4:0]**: Clock frequency calculation type selection
Set and cleared by software to select the clock frequency calculation type.
0x0C: Frequency value type
Other: Reserved

Bits 16:15 Reserved, must be kept at reset value.

Bits 14:11 **FCALCTWC[3:0]**: Time window code for clock frequency calculation
Set and cleared by software to set the number of reference clock cycles used for the clock frequency calculation in application mode (see FCALCMD).
0x0: 63 cycles
0x1: 3 cycles
0x2: 7 cycles
0x3: 15 cycles
0x4: 31 cycles
0x5: 63 cycles
0x6: 127 cycles
0x7: 255 cycles
0x8: 511 cycles
0x9: 1023 cycles
0xA: 2047 cycles
0xB: 4095 cycles
0xC: 8191 cycles
0xD: 16383 cycles
0xE: 32767 cycles
0xF: 65535 cycles

Bits 10:5 Reserved, must be kept at reset value.

Bits 4:3 **FCALCMD[1:0]**: Clock frequency calculation method
Set and cleared by software to set the clock frequency calculation method.
11: Application method
Other: Reserved

Bits 2:0 Reserved, must be kept at reset value.

20.8.195 RCC clock frequency calculator status register (RCC_FCALCSR)

Address offset: 0x1358

Reset value: 0x0000 0000

This register is used to get status of clock frequency calculator in flexclkgen. Word format data access only supported on this register. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FCALCSTS	Res.	Res.	FVAL[16]
												r			r

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FVAL[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:20 Reserved, must be kept at reset value.

Bit 19 **FCALCSTS**: Clock frequency calculation status

Set by hardware to indicate the status of the clock frequency calculation.

– When FCALCRUN = 0, FCALCSTS = FVAL[16] (overflow of the register).

– When FCALCRUN = 1, FCALCSTS = 1 when the clock frequency calculation is ended.

Bits 18:17 Reserved, must be kept at reset value.

Bits 16:0 **FVAL[16:0]**: Clock frequency calculation value

Set by hardware to indicate the clock frequency calculation value.

– FVAL[16] = overflow flag of the frequency counter.

– When FCALCTYP = 0x0C, FVAL[15:0] = frequency counter value.

20.8.196 RCC PLLy configuration register 1 (RCC_PLLyCFGR1)

Address offset: 0x1360 + 0x28 * (y - 4), (y = 4 to 8)

Reset value: 0x1000 0001

This register is used to configure flexclkgen PLLy. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	CKREFST	Res.	Res.	Res.	PLLRDY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	PLLEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SSMODRST
							rw								rw

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **CKREFST**: PLLy reference clock state
Set by hardware and cleared by software. Indicates if PLLy reference clock is running.
After any reset, this bit is updated after 5 clock cycles of the selected PLL reference clock.
0: Reading 0 means that PLLy reference clock does not run. Writing 0 resets the reference clock running detector.
1: Reading 1 means that PLLy reference clock is running. Writing 1 resets the reference clock running detector.

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **PLLRDY**: PLLy clock ready flag
Set by hardware to indicate when PLLy is locked.
0: PLLy unlocked (default after reset)
1: PLLy locked

Bits 23:9 Reserved, must be kept at reset value.

Bit 8 **PLLEN**: PLLy enable
Set and cleared by software to enable PLLy.
0: PLLy off (default after reset)
1: PLLy on

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **SSMODRST**: PLLy spread-spectrum modulator reset
Set and cleared by software.
0: PLLy spread-spectrum modulator reset module released
1: PLLy spread-spectrum modulator reset module asserted (default after reset)

20.8.197 RCC PLLy configuration register 2 (RCC_PLLyCFGR2)

Address offset: 0x1364 + 0x28 * (y - 4), (y = 4 to 8)

Reset value: 0x0000 0000

This register is used to configure flexclkgen PLLy. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FREFDIV[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **FBDIV[11:0]**: PLLy VCO multiplication factor
Set and cleared by software to control VCO multiplication factor.
In integer mode, this value must be set between 16 and 640.
In fractional mode, this value must be set between 20 and 320.

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:0 **FREFDIV[5:0]**: PLLy reference input clock divide frequency ratio
Set and cleared by software.
0x0: Not applicable
0x1: FREF divided by 1 (min value)
0x2: FREF divided by 2
0x3: FREF divided by 3
...
0x3C: FREF divided by 60
0x3D: FREF divided by 61
0x3E: FREF divided by 62
0x3F: FREF divided by 63

20.8.198 RCC PLLy configuration register 3 (RCC_PLLyCFGR3)

Address offset: 0x1368 + 0x28 * (y - 4), (y = 4 to 8)

Reset value: 0x0400 0000

This register is used to configure flexclkgen PLLy. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

FRACIN[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **SSCGDIS**: PLLy spread-spectrum modulator disable
Set and cleared by software to enable the PLLy clock spreading generator.
0: PLLy spread-spectrum modulator enabled
1: PLLy spread-spectrum modulator disabled (default after reset)

Bit 25 **DACEN**: PLLy noise canceling DAC enable in fractional mode.
Set and cleared by software to enable the noise cancellation in fractional mode.
0: DAC not active (default after reset)
1: DAC active

Bit 24 **DOWNSPREAD**: PLLy VCO frequency modulation mode
Set and cleared by software to select the PLLy clock spreading mode.
0: Center-spread modulation selected (default after reset)
1: Down-spread modulation selected

Bits 23:0 **FRACIN[23:0]**: Fractional part of PLLy VCO multiplication factor
Set and cleared by software to control the VCO fractional multiplication factor.
VCO output frequency = FREF * (FBDIV + FRAC / 2^{24}) / FREFDIV

20.8.199 RCC PLLy configuration register 4 (RCC_PLLyCFGR4)

Address offset: 0x136C + 0x28 * (y - 4), (y = 4 to 8)

Reset value: 0x0000 0000

This register is used to configure flexclkgen PLLy. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	BYPASS	FOUTPOSTDIVEN	DSMEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
					rw	rw	rw								

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **BYPASS**: PLLy FOUTPOSTDIV bypass
Set and cleared by software to bypass the FOUTPOSTDIV by FREF.
0: FOUTPOSTDIV driven by POSTDIV2
1: FOUTPOSTDIV driven by FREF

Bit 9 **FOUTPOSTDIVEN**: PLLy output and post dividers enable
Set and cleared by software to enable the PLLy output and post dividers.
0: FOUTPOSTDIV output, POSTDIV1, and POSTDIV2 are powered down.
1: FOUTPOSTDIV output, POSTDIV1, and POSTDIV2 dividers are active.

Bit 8 **DSMEN**: PLLy delta-sigma modulator enable
Set and cleared by software to enable the delta-sigma modulator (DSM).
0: DSM powered down
1: DSM active

Bits 7:0 Reserved, must be kept at reset value.

20.8.200 RCC PLLy configuration register 5 (RCC_PLLyCFGR5)

Address offset: 0x1370 + 0x28 * (y - 4), (y = 4 to 8)

Reset value: 0x0000 0000

This register is used to configure flexclkgen PLLy. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DIVVAL[3:0]			
												rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **SPREAD[4:0]**: Modulation depth adjustment for PLLy
Set and cleared by software to adjust modulation depth of the clock spreading generator.

Bits 15:4 Reserved, must be kept at reset value.

Bits 3:0 **DIVVAL[3:0]**: Modulation frequency adjustment for PLLy
Set and cleared by software to adjust modulation frequency of the clock spreading generator.

20.8.201 RCC PLLy configuration register 6 (RCC_PLLyCFGR6)

Address offset: 0x1378 + 0x28 * (y - 4), (y = 4 to 8)

Reset value: 0x0000 0000

This register is used to configure flexclkgen PLLy. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	POSTDIV1[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **POSTDIV1[2:0]**: PLLy VCO frequency divide level 1
Set and cleared by software to divide the VCO frequency output.
0x0: Not applicable
0x1: FOUTVCO divided by 1 (minimum value)
0x2: FOUTVCO divided by 2
0x3: FOUTVCO divided by 3
0x4: FOUTVCO divided by 4
0x5: FOUTVCO divided by 5
0x6: FOUTVCO divided by 6
0x7: FOUTVCO divided by 7

20.8.202 RCC PLLy configuration register 7 (RCC_PLLyCFGR7)

Address offset: 0x137C + 0x28 * (y - 4), (y = 4 to 8)

Reset value: 0x0000 0000

This register is used to configure flexclkgen PLLy. Word format data access only supported on this register.

Write accesses are defined according to the RCC local resource number 64 configuration (see *Table 161* for details). Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	POSTDIV2[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **POSTDIV2[2:0]**: PLLy VCO frequency divide level 2
Set and cleared by software to divide the VCO frequency output.
0x0: Not applicable
0x1: FOUTVCO/POSTDIV1 divided by 1 (minimum value)
0x2: FOUTVCO/POSTDIV1 divided by 2
0x3: FOUTVCO/POSTDIV1 divided by 3
0x4: FOUTVCO/POSTDIV1 divided by 4
0x5: FOUTVCO/POSTDIV1 divided by 5
0x6: FOUTVCO/POSTDIV1 divided by 6
0x7: FOUTVCO/POSTDIV1 divided by 7

Note: FOUTPOSTDIV = FOUTVCO / POSTDIV1 × POSTDIV2.

20.8.203 RCC version register (RCC_VERR)

Address offset: 0xFFF4

Reset value: 0x0000 0010

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJREV[3:0]				MINREV[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major RCC revision

Bits 3:0 **MINREV[3:0]**: Minor RCC revision

20.8.204 RCC identifier register (RCC_IDR)

Address offset: 0xFFF8

Reset value: 0x0000 0003

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ID[31:0]**: RCC identifier

20.8.205 RCC size identification register (RCC_SIDR)

Address offset: 0xFFFC

Reset value: 0xA3C5 DD40

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SID[31:16]

21 Inter-processor communication controller (IPCC)

21.1 Introduction

The inter-processor communication controller (IPCC) is used for communicating data between two processors.

The IPCC block provides a nonblocking signaling mechanism to post and retrieve communication data in an atomic way. It provides the signaling for 32 channels:

- 16 channels in the direction from processor 1 to processor 2
- 16 channels in the opposite direction

It is then possible to have two different communication types in each direction.

The IPCC communication data must be located in a common memory, which is not part of the IPCC block.

21.2 IPCC main features

- Status signaling for the 32 channels
  - Channel occupied/free flag, also used as lock
- Four interrupt lines per processor
  - One nonsecure and one secure for RX channel occupied (communication data posted by sending processor)
  - One nonsecure and one secure for TX channel free (communication data retrieved by receiving processor)
- Interrupt masking per channel
  - Channel occupied mask
  - Channel free mask
- Two channel operation modes
  - Simplex (each channel has its own communication data memory location)
  - Half duplex (a single channel associated with a bidirectional communication data information memory location)
- Security support
  - Support for AHB independent secure and nonsecure IPCC channels. Protecting any secure resource (register field) from a nonsecure access
  - Generation of separate secure and nonsecure interrupt per CPU
- Privileged/unprivileged support
  - Support for AHB independent privilege and unprivileged IPCC channels. Protecting any privileged resource (register field) from an unprivileged access
- Resource isolation support
- CID-aware register access. Protecting any CID domain (register) from access by another CID domain.
  - Dedicated processor interrupt lines per CID domain and interrupt routing.

21.3 IPCC functional description

The IPCC communication data are located in a common memory, which is not part of the IPCC block. The address location of the communication data must be known or located in a known common area that, as already stated, is not part of the IPCC block.

For each communication, the IPCC block provides a channel status flag CHnF.

- When 0, the channel status flag CHnF indicates that the associated IPCC channel is free (the receiving processor has retrieved communication data), and can be accessed by the sending processor.
- When 1, the channel status flag CHnF indicates that the associated IPCC channel is occupied (the sending processor has posted communication data) and can be accessed by the receiving processor.

The channel operation mode must be known to both processors. A common parameter can be used to indicate the channel transfer mode and must also be located in a known common area. This parameter is not available from the IPCC.

21.3.1 IPCC block diagram

The IPCC (see *Figure 122*) consists of the following subblocks:

- Status block, containing the channel status
- IPCC interface block, providing AHB access to the channel status registers
- Interrupt interface block, providing control for the interrupts

Figure 122. IPCC block diagram

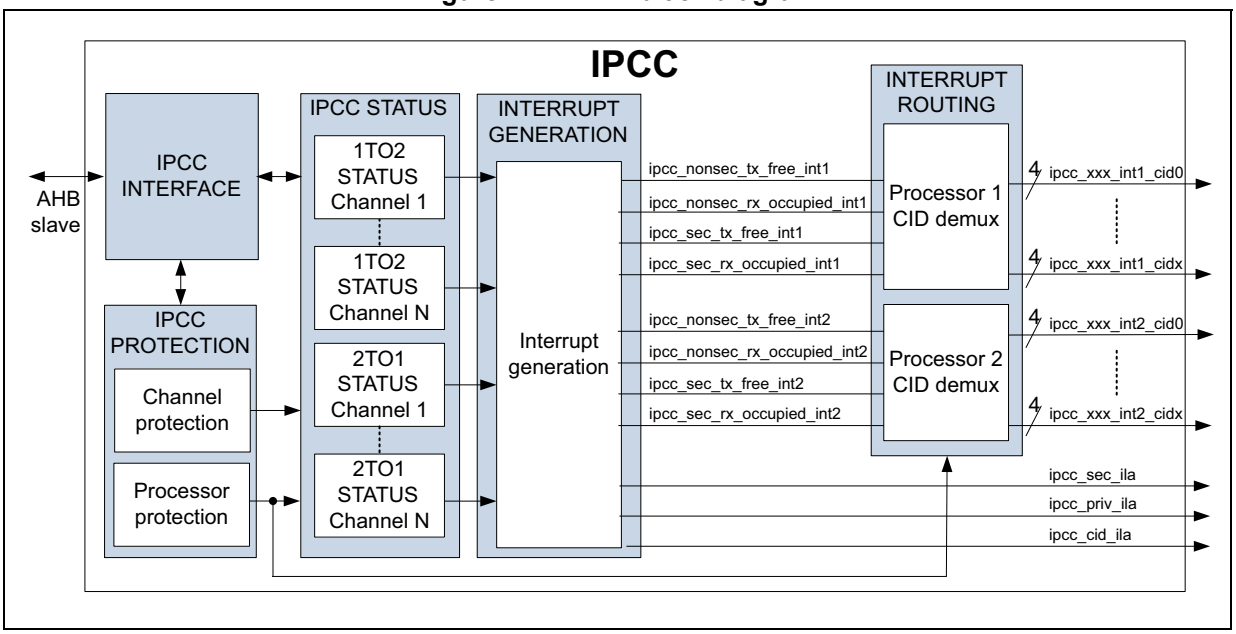

Table 163. IPCC interface signals

Signal		Description
Name	Type	
AHB slave	I/O	AHB register access bus
ipcc_nonsec_tx_free_int1_cidx	O	Nonsecure TX free interrupt to processor 1 per CID
ipcc_nonsec_rx_occupied_int1_cidx	O	Nonsecure RX occupied interrupt to processor 1 per CID
ipcc_sec_tx_free_int1_cidx	O	Secure TX free interrupt to processor 1 per CID
ipcc_sec_rx_occupied_int1_cidx	O	Secure RX occupied interrupt to processor 1 per CID
ipcc_nonsec_tx_free_int2_cidx	O	Nonsecure TX free interrupt to processor 2 per CID
ipcc_nonsec_rx_occupied_int2_cidx	O	Nonsecure RX occupied interrupt to processor 2 per CID
ipcc_sec_tx_free_int2_cidx	O	Secure TX free interrupt to processor 2 per CID
ipcc_sec_rx_occupied_int2_cidx	O	Secure RX occupied interrupt to processor 2 per CID
ipcc_sec_ila	O	Illegal secure access event
ipcc_priv_ila	O	Illegal privilege access event
ipcc_cid_ila	O	Illegal CID access event

21.3.2 IPCC Simplex channel mode

In Simplex channel mode, a dedicated memory location (used to transfer data in a single direction) is assigned to the communication data. The associated channel N control bits (see *Table 164*) are used to manage the transfer from the sending to the receiving processor.

Table 164. Bits used for the communication

Processor	A	B
SEND A = 1 RECEIVE B = 2	IPCC_C1CR.TXFIE IPCC_C1MR.CHnFM IPCC_C1SCR.CHnS IPCC_C1TOC2SR.CHnF	IPCC_C2CR.RXOIE IPCC_C2MR.CHnOM IPCC_C2SCR.CHnC
SEND A = 2 RECEIVE B = 1	IPCC_C2CR.TXFIE IPCC_C2MR.CHnFM IPCC_C2SCR.CHnS IPCC_C2TOC1SR.CHnF	IPCC_C1CR.RXOIE IPCC_C1MR.CHnOM IPCC_C1SCR.CHnC

Once the sending processor has posted the communication data in the memory, it sets the channel status flag CHnF to occupied with CHnS.

Once the receiving processor has retrieved the communication data from the memory, it clears the channel status flag CHnF back to free with CHnC.

Figure 123. IPCC Simplex channel mode transfer timing

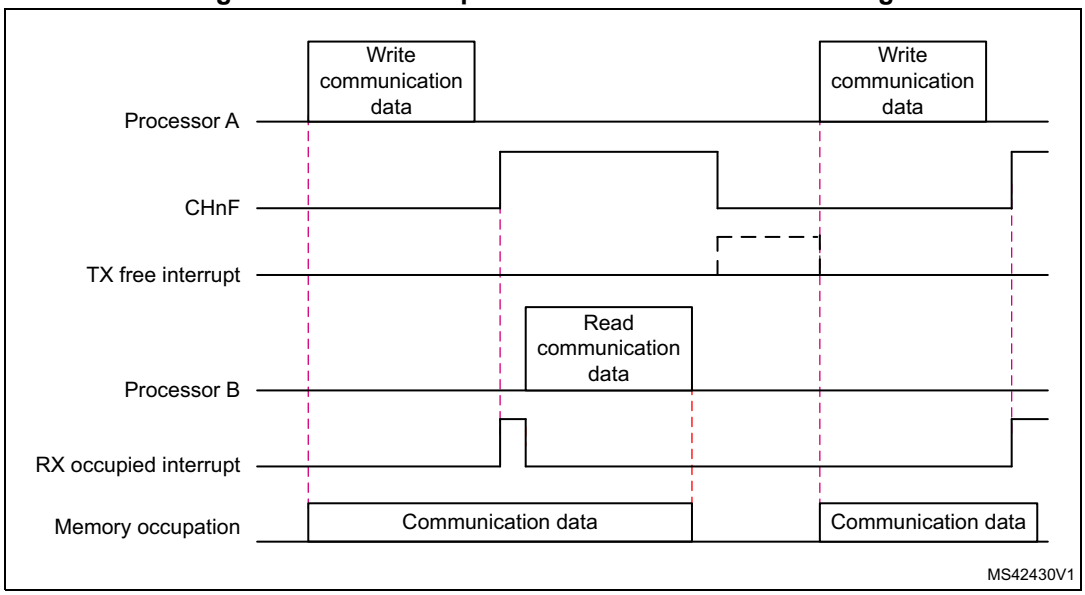

Figure 124. IPCC Simplex - Send procedure state diagram

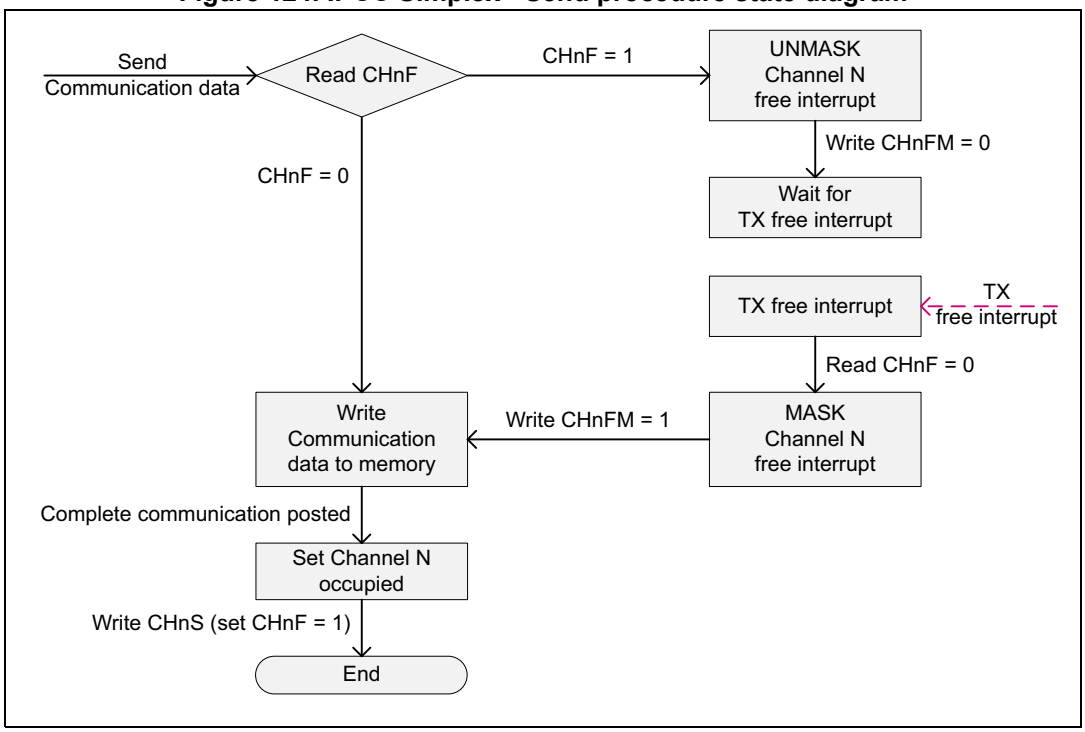
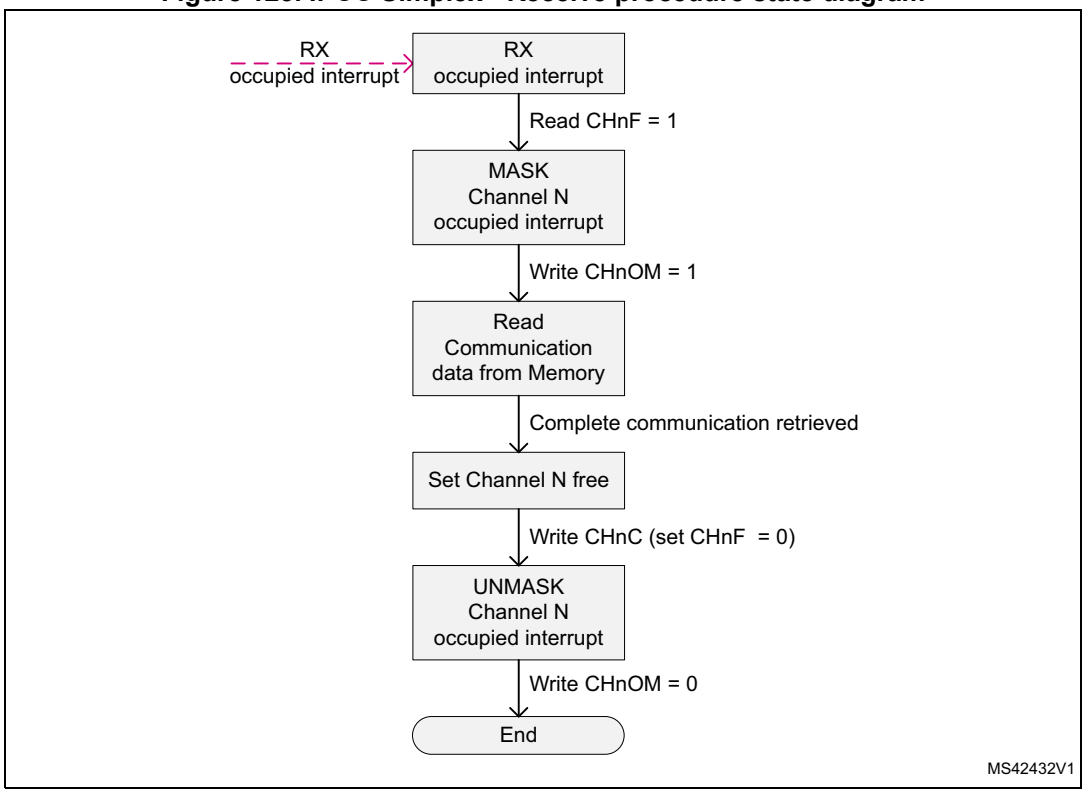


To send communication data:

- The sending processor checks the channel status flag CHnF:
  - When CHnF = 0, the channel is free (the last communication data is retrieved by the receiving processor), and the new communication data can be written.
  - When CHnF = 1, the channel is occupied (the last communication data is not retrieved by the receiving processor), and the sending processor unmasks the channel free interrupt (CHnFM = 0).
  - On a TX free interrupt, the sending processor checks which channel became free and masks the channel free interrupt (CHnFM = 1). Then the new communication can take place.
- Once the complete communication data is posted, the channel status is set to occupied with CHnS. This gives memory access to the receiving processor and generates the RX occupied interrupt.

Figure 125. IPCC Simplex - Receive procedure state diagram



To receive a communication, the channel occupied interrupt is unmasked (CHnOM = 0):

- On an RX occupied interrupt, the receiving processor checks which channel became occupied, masks the associated channel occupied interrupt (CHnOM) and reads the communication data from memory.
- Once the complete communication data is retrieved, the channel status is cleared to free with CHnC. This gives memory access back to the sending processor and may generate the TX free interrupt.
- Once the channel status is cleared, the channel occupied interrupt is unmasked (CHnOM = 0).

21.3.3 IPCC Half-duplex channel mode

The Half-duplex channel mode is used when one processor sends a communication and the other processor sends a response to each communication (ping-pong).

In Half-duplex channel mode, a single dedicated memory location is assigned to communication data and response, and is used to transfer data in both directions. The sending processor channel status flag CHnF is assigned to the channel and used by both processors (see *Table 164*).

Once the processor A posts communication data into memory, it sets the processor A channel status flag CHnF to occupied with CHnS (giving memory access to processor B).

Once the processor B retrieves communication data from memory, it does not change the channel status flags. The memory access is kept by processor B for the response.

Once the processor B posts the response into memory, it clears the channel status flag CHnF to free with CHnC (giving memory access back to processor A).

Once the processor A retrieves the response from the memory, it does not change the channel status flags. The memory location access is kept by processor A for the next communication data.

Figure 126. IPCC Half-duplex channel mode transfer timing

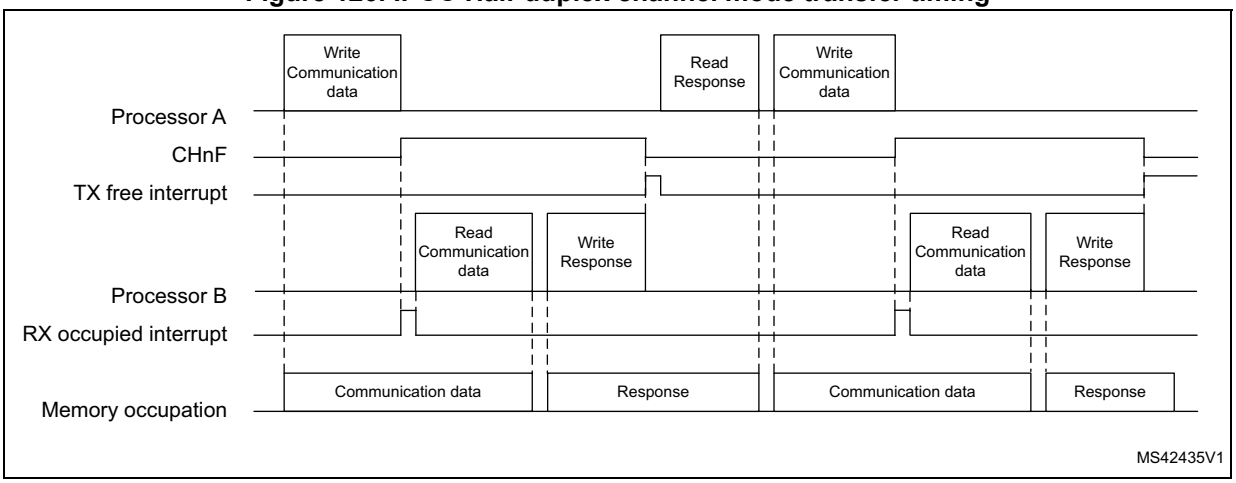


Figure 127. IPCC Half-duplex - Send procedure state diagram

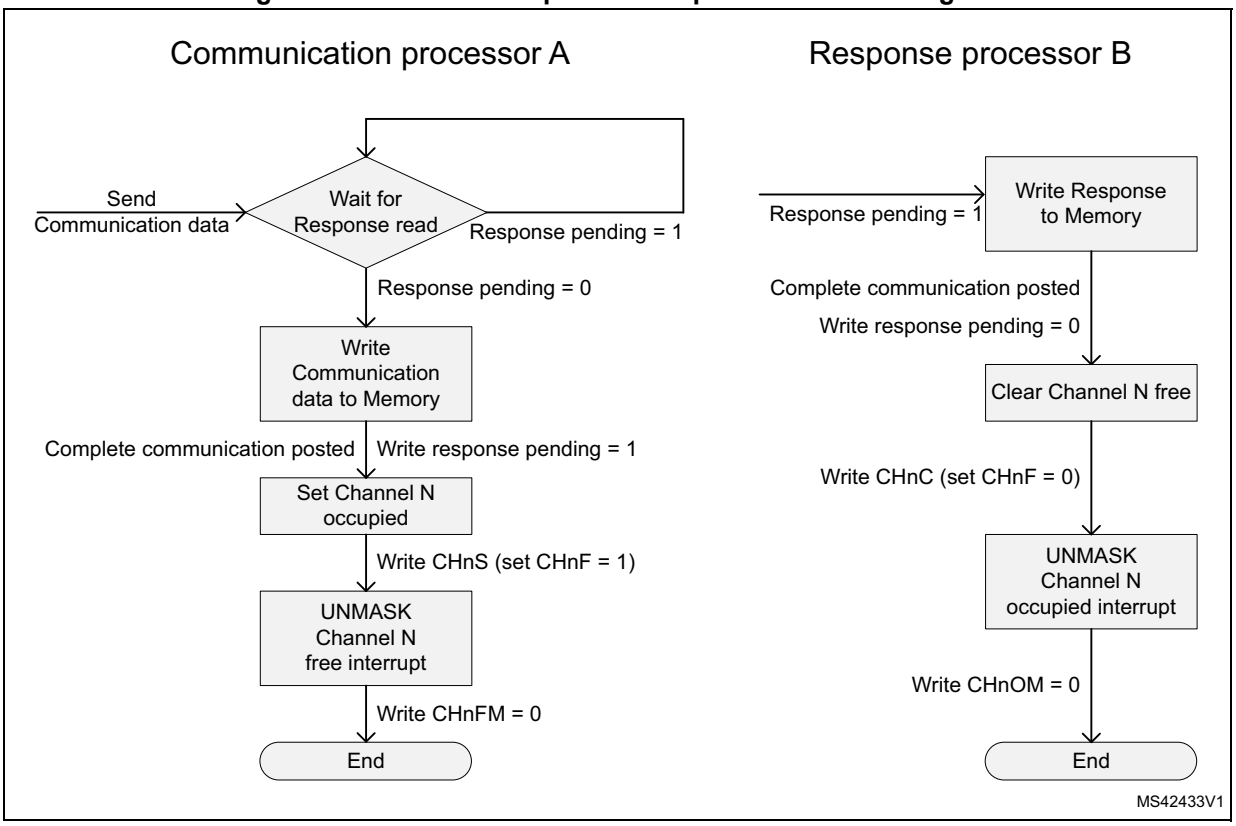


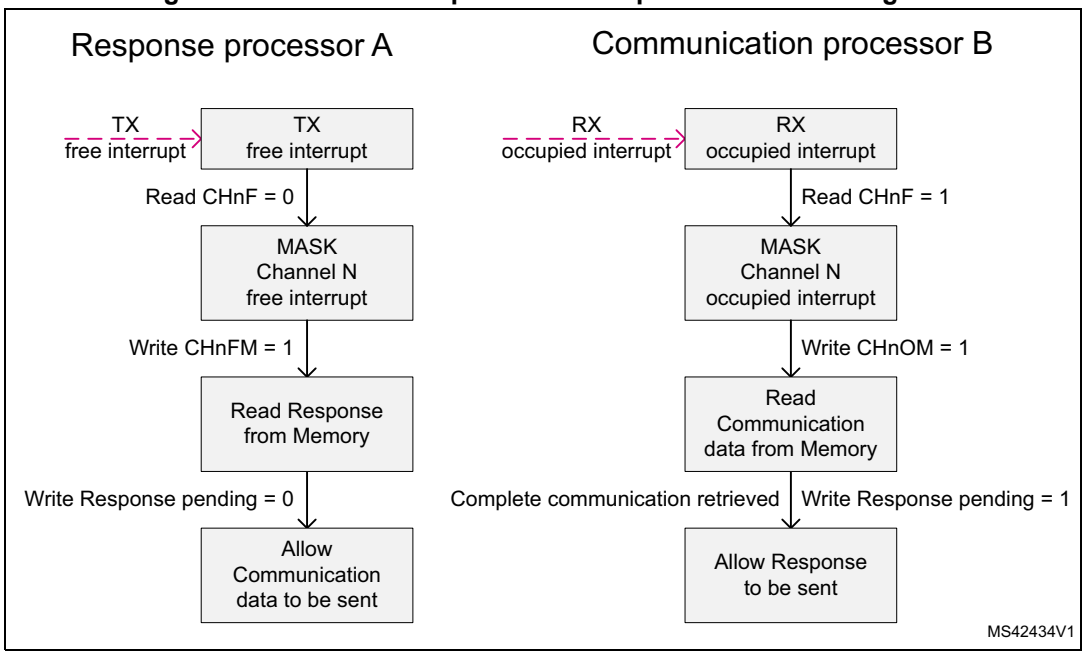
To send communication data:

- The sending processor waits for its response pending software variable to get 0.
  - Once the response pending software variable is 0 the communication data is posted.
- Once the complete communication data has been posted, the channel status flag CHnF is set to occupied with CHnS, and the response pending software variable is set to 1 (this gives memory access and generates the RX occupied interrupt to the receiving processor).
- Once the channel status flag CHnF is set, the channel free interrupt is unmasked (CHnFM = 0).

To send a response:

- The receiving processor waits for its response pending software variable to get 1.
  - Once the response pending software variable is 1, the response is posted.
- Once the complete response is posted, the channel status flag CHnF is cleared to free with CHnC, and the response pending software variable is set to 0 (this gives memory access and generates the TX free interrupt to the sending processor).
- Once the channel status flag CHnF is cleared, the channel occupied interrupt is unmasked (CHnOM = 0).

Figure 128. IPCC Half-duplex - Receive procedure state diagram



To receive communication data the channel occupied interrupt is unmasked (CHnOM = 0):

- On an RX occupied interrupt, the receiving processor checks which channel became occupied, masks the associated channel occupied interrupt (CHnOM) and reads the communication data from the memory.
- Once the complete communication data is retrieved, the response pending software variable is set. The channel status is not changed, access to the memory is kept to post the subsequent response.

To receive the response the channel free interrupt is unmasked (CHnFM = 0):

- On a TX free interrupt, the sending processor checks which channel became free, masks the associated channel free interrupt (CHnFM) and reads the response from the memory.
- Once the complete response is retrieved, the response pending software variable is cleared. The channel status is not changed, access to the memory is kept to post the subsequent communication data.

21.3.4 IPCC interrupts and events

There are eight interrupt lines per CID and security events:

- Four RX channel occupied interrupts, one nonsecure and one secure for each processor: CID compartment
  - Interrupt enable RXOIE, SECRXOIE per processor
  - Individual mask CHnOM per channel
  - Interrupt routing based on processor CID in IPCC_CxCIDCFGR
- Four TX channel free interrupts, one nonsecure and one secure for each processor CID compartment
  - Interrupt enable TXFIE, SECTXFIE per processor
  - Individual mask CHnFM per channel
  - Interrupt routing based on processor CID in IPCC_CxCIDCFGR
- Illegal access events, for security, privilege, and CID

The RX occupied interrupt is used by the receiving processor and indicates when an unmasked channel status indicates occupied (CHnF = 1).

The TX free interrupt is used by the sending processor, and indicates when an unmasked channel status indicates free (CHnF = 0).

A secure channel only generates a secure interrupt, and only in the case when the channel is secure unmasked and global secure enabled.

A nonsecure channel only generates a nonsecure interrupt, and only in the case when the channel is nonsecure unmasked and global nonsecure enabled.

Interrupt routing

When CID filtering is enabled in IPCC_CxCIDCFGR.CFEN, the associated processor x interrupt is only routed to the enabled CID.

When CID filtering is disabled in IPCC_CxCIDCFGR.CFEN, the associated processor x interrupt is broadcasted to all supported CIDs. To prevent a compartment to receive unwanted IPCC interrupts, it must be masked at the processor compartment level (in the CPU NVIC).

21.3.5 IPCC security

The IPCC provides per processor and per channel security, in the IPCC_C1SECCFGR, IPCC_C1PRIVCFGR, IPCC_C2SECCFGR and IPCC_C2PRIVCFGR registers. This makes possible to configure any channel in one of the modes detailed in *Table 165*.

Table 165. IPCC security modes

Processor 1	Processor 2	Description
Nonsecure	Nonsecure	Nonsecure / unprivileged
Nonsecure	Secure	TX secure - RX nonsecure / unprivileged
Secure	Nonsecure	TX nonsecure - RX secure / unprivileged
Secure	Secure	Full secure / unprivileged
Nonsecure privilege	Nonsecure	Nonsecure TX privilege

Table 165. IPCC security modes (continued)

Processor 1	Processor 2	Description
Nonsecure	Nonsecure privilege	Nonsecure RX privilege
Nonsecure privilege	Nonsecure privilege	Nonsecure full privilege
Nonsecure privilege	Secure	TX secure privilege - RX nonsecure
Nonsecure	Secure privilege	TX secure - RX nonsecure privilege
Nonsecure privilege	Secure privilege	TX secure - RX nonsecure / Full privilege
Secure privilege	Nonsecure	TX nonsecure privilege - RX secure
Secure	Nonsecure privilege	TX nonsecure - RX secure privilege
Secure privilege	Nonsecure privilege	TX nonsecure -RX secure/ Full privilege
Secure privilege	Secure	TX privileged - RX unprivilege / Full secure
Secure	Secure privilege	TX unprivileged - RX privilege / Full secure
Secure privilege	Secure privilege	Full secure privilege

All processor nonsecure channels generate a processor nonsecure interrupt. All processor secure channels generate an associated processor secure interrupt. Illegal accesses to the security control register and privileged control registers are signaled on the illegal access events.

Additionally, the resource isolation allows the processor 1 registers to be protected from the processor 2 accesses and vice versa, and from any other AHB bus master access. Illegal CID processor accesses are signaled on the CID illegal access event.

The channel status in IPCC_CxTOCySR registers are readable by both processors and by all secure and privileged protection levels of these processors. For this the access protection on these registers is only provided on the compartment filtering when enabled for both processor 1 and processor 2. The following table summarizes the protection on IPCC_CxTOCySR. Not having security and privileged protection allows channels to be shared between secure and nonsecure, privileged, and unprivileged compartments.

Table 166. Access to channels

IPCC_C1CIDCFGR	IPCC_C2CIDCFGR	IPCC_CxTOCySR access
CFEN = 0	CFEN = 0	No protection, access by secure, nonsecure, privileged, unprivileged and any CID.
CFEN = 1	CFEN = 0	
CFEN = 0	CFEN = 1	
CFEN = 1	CFEN = 1	Compartment isolation protected, only access by processor 1 and processor 2 CIDs with secure, nonsecure, privileged, and unprivileged. Other CID accesses are illegal.

21.4 IPCC registers

The peripheral registers must be accessed by words (32-bit). Byte (8-bit) and half-word (16-bit) accesses are not permitted and do not generate a bus error.

For any DDCID access to registers and register bits, a security and privileged policy applies. When DDEN = 0 accesses from the DDCID to CID filtered registers is ignored. When DDEN = 1 the DDCID has access to all registers regardless of any CID filtering policy.

21.4.1 IPCC processor 1 control register (IPCC_C1CR)

Address offset: 0x000

Reset value: 0x0000 0000

This register is CID-filtered depending on the CID configuration in the processor 1 IPCC_C1CIDCFGR. An illegal CID write access is discarded and a read access returns zero data, also on both illegal accesses a CID illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEC RXOIE	RXOIE
														rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **SECTXFIE**: Processor 1 transmit channel free secure interrupt enable.
Associated with IPCC_C1TOC2SR.
This bit can be accessed only with a secure access. Nonsecure write to this bit is discarded, nonsecure read returns 0 value.
1: Enable an unmasked processor 1 transmit channel free to generate a TX free secure interrupt.
0: Processor 1 TX free secure interrupt disabled.

Bit 16 **TXFIE**: Processor 1 transmit channel free nonsecure interrupt enable
Associated with IPCC_C1TOC2SR.
1: Enable an unmasked processor 1 transmit channel free to generate a nonsecure TX free interrupt.
0: Processor 1 nonsecure TX free interrupt disabled

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **SECRXOIE**: Processor 1 receive channel occupied secure interrupt enable.
Associated with IPCC_C2TOC1SR
This bit can be accessed only with a secure access. Nonsecure write to this bit is discarded, nonsecure read returns 0 value.
1: Enable an unmasked processor 1 receive channel occupied to generate an RX occupied secure interrupt.
0: Processor 1 RX occupied secure interrupt disabled.

Bit 0 **RXOIE**: Processor 1 receive channel occupied interrupt enable
Associated with IPCC_C2TOC1SR.
1: Enable an unmasked processor 1 receive channel occupied to generate an RX occupied interrupt.
0: Processor 1 RX occupied interrupt disabled

21.4.2 IPCC processor 1 mask register (IPCC_C1MR)

Address offset: 0x004

Reset value: 0xFFFF FFFF

This register is CID-filtered depending on the CID configuration in the processor 1 IPCC_C1CIDCFGR. An illegal CID write access is discarded and a read access returns zero data, also on both illegal accesses a CID illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:16 **CHnFM:** Processor 1 transmit channel n status set, (n = 16 to 1).
Associated with IPCC_C1TOC2SR.CHnF
When processor 1 CHnSEC is disabled, bit n can be accessed with secure and nonsecure access.
When processor 1 CHnSEC is enabled, bit n can be accessed only with secure access. Nonsecure write to this bit is discarded, nonsecure read returns 0 value.
When processor 1 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.
When processor 1 CHnPRIV is enabled, bit n can be accessed only with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.
1: Transmit channel n free interrupt masked.
0: Transmit channel n free interrupt not masked.

Bits 15:0 **CHnOM**: Processor 1 receive channel n status clear (n = 16 to 1).
Associated with IPCC_C2TOC1SR.CHnF
When processor 1 CHnSEC is disabled, bit n can be accessed with secure and nonsecure access.
When processor 1 CHnSEC is enabled, bit n can be accessed only with secure access. Nonsecure write to this bit is discarded, nonsecure read returns 0 value.
When processor 1 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.
When processor 1 CHnPRIV is enabled, bit n can be accessed only with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.
1: Receive channel n occupied interrupt masked.
0: Receive channel n occupied interrupt not masked.

21.4.3 IPCC processor 1 status set clear register (IPCC_C1SCR)

Address offset: 0x008

Reset value: 0x0000 0000

Reading this register always returns 0x0000 0000.

This register is CID-filtered depending on the CID configuration in the processor 1 IPCC_C1CIDCFGR. An illegal CID write access is discarded and a read access returns zero data, also on both illegal accesses a CID illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **CHnS:** Processor 1 transmit channel n status set (n = 16 to 1).
Associated with IPCC_C1TOC2SR.CHnF
When processor 1 CHnSEC is disabled, bit n can be accessed with secure and nonsecure access.
When processor 1 CHnSEC is enabled, bit n can be accessed only with secure access. Nonsecure write to this bit is discarded, nonsecure read returns 0 value.
When processor 1 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.
When processor 1 CHnPRIV is enabled, bit n can be accessed only with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.
1: Processor 1 transmit channel n status bit set.
0: No action.

Bits 15:0 **CHnC**: Processor 1 receive channel n status clear (n = 16 to 1).
Associated with IPCC_C2TOC1SR.CHnF
When processor 1 CHnSEC is disabled, bit n can be accessed with secure and nonsecure access.
When processor 1 CHnSEC is enabled, bit n can be accessed only with secure access. Nonsecure write to this bit is discarded, nonsecure read returns 0 value.
When processor 1 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.
When processor 1 CHnPRIV is enabled, bit n can be accessed only with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.
1: Processor 1 receive channel n status bit clear.
0: No action.

21.4.4 IPCC processor 1 to processor 2 status register (IPCC_C1TOC2SR)

Address offset: 0x00C

Reset value: 0x0000 0000

When processor 1 or processor 2 CID filtering is disabled, this register has no access limitations, and can be accessed by any domain CID, and any combination of secure, nonsecure, privilege, and unprivileged access.

When both processor 1 and processor 2 CID filtering is enabled. Access restriction applies and only both processors CIDs have access, other CID accesses are discarded. In this case, an illegal CID read access returns zero data. A CID illegal access event is generated also on illegal accesses.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CHnF:** Processor 1 transmit to processor 2 receive channel n status flag before masking (n = 16 to 1).

1: Channel occupied, data can be read by the receiving processor 2.
When channel is nonsecure in C2SECCFGR, generates a nonsecure RX occupied interrupt to processor 2, when unmasked and global nonsecure enabled for processor 2.
When channel is secure in C2SECCFGR, generates a secure RX occupied interrupt to processor 2, when unmasked and global secure enabled for processor 2.
0: Channel free, data can be written by the sending processor 1.
When channel is nonsecure in C1SECCFGR, generates a nonsecure TX free interrupt to processor 1, when unmasked and global nonsecure enabled for processor 1.
When channel is secure in C1SECCFGR, generates a secure TX free interrupt to processor 1, when unmasked and global secure enabled for processor 1.

21.4.5 IPCC processor 2 control register (IPCC_C2CR)

Address offset: 0x010

Reset value: 0x0000 0000

This register is CID-filtered depending on the CID configuration in the processor 2 IPCC_C2CIDCFGR. An illegal CID write access is discarded and a read access returns zero data, also on both illegal accesses a CID illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEC TXFIE	TXFIE

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEC RXOIE	RXOIE
														rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **SECTXFIE:** Processor 2 secure transmit channel free interrupt enable.
Associated with IPCC_C2TOC1SR.
This bit can be accessed only with a secure access. Nonsecure write to this bit is discarded, nonsecure read returns 0 value.
1: Enable an unmasked processor 2 transmit channel free to generate a secure TX free interrupt.
0: Processor 2 secure TX free interrupt disabled.

Bit 16 **TXFIE:** Processor 2 transmit channel free interrupt enable
Associated with IPCC_C2TOC1SR.
1: Enable an unmasked processor 2 transmit channel free to generate a TX free interrupt.
0: Processor 2 TX free interrupt disabled

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **SECRXOIE:** Processor 2 secure Receive channel occupied interrupt enable.
Associated with IPCC_C1TOC2SR.
This bit can be accessed only with a secure access. Nonsecure write to this bit is discarded, nonsecure read returns 0 value.
1: Enable an unmasked processor 2 receive channel occupied to generate an secure RX occupied interrupt.
0: Processor 2 secure RX occupied interrupt disabled.

Bit 0 **RXOIE:** Processor 2 receive channel occupied interrupt enable
Associated with IPCC_C1TOC2SR.
1: Enable an unmasked processor 2 receive channel occupied to generate an RX occupied interrupt.
0: Processor 2 RX occupied interrupt disabled

21.4.6 IPCC processor 2 mask register (IPCC_C2MR)

Address offset: 0x014

Reset value: 0xFFFF FFFF

This register is CID-filtered depending on the CID configuration in the processor 2 IPCC_C2CIDCFGR. An illegal CID write access is discarded and a read access returns zero data, also on both illegal accesses a CID illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:16 **CHnFM:** Processor 2 transmit channel n free interrupt mask (n = 16 to 1).
Associated with IPCC_C2TOC1SR.CHnF
When processor 2 CHnSEC is disabled, bit n can be accessed with secure and nonsecure access.
When processor 2 CHnSEC is enabled, bit n can be accessed only with secure access. Nonsecure write to this bit is discarded, nonsecure read returns 0 value.
When processor 2 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.
When processor 2 CHnPRIV is enabled, bit n can be accessed only with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.
1: Transmit channel n free interrupt masked.
0: Transmit channel n free interrupt not masked.

Bits 15:0 **CHnOM**: Processor 2 receive channel n occupied interrupt mask (n = 16 to 1).
Associated with IPCC_C1TOC2SR.CHnF
When processor 2 CHnSEC is disabled, bit n can be accessed with secure and nonsecure access.
When processor 2 CHnSEC is enabled, bit n can be accessed only with secure access. Nonsecure write to this bit is discarded, nonsecure read returns 0 value.
When processor 2 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.
When processor 2 CHnPRIV is enabled, bit n can be accessed only with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.
1: Receive channel n occupied interrupt masked.
0: Receive channel n occupied interrupt not masked.

21.4.7 IPCC processor 2 status set clear register (IPCC_C2SCR)

Address offset: 0x018

Reset value: 0x0000 0000

Reading this register always returns 0x0000 0000.

This register is CID-filtered depending on the CID configuration in the processor 2 IPCC_C2CIDCFGR. An illegal CID write access is discarded and a read access returns zero data, also on both illegal accesses a CID illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **CHnS:** Processor 2 transmit channel n status set (n = 16 to 1).
Associated with IPCC_C2TOC1SR.CHnF
When processor 2 CHnSEC is disabled, bit n can be accessed with secure and nonsecure access.
When processor 2 CHnSEC is enabled, bit n can be accessed only with secure access. Nonsecure write to this bit is discarded, nonsecure read returns 0 value.
When processor 2 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.
When processor 2 CHnPRIV is enabled, bit n can be accessed only with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.
1: Processor 2 transmit channel n status bit set.
0: No action.

Bits 15:0 **CHnC**: Processor 2 receive channel n status clear (n = 16 to 1).
Associated with IPCC_C1TOC2SR.CHnF
When processor 2 CHnSEC is disabled, bit n can be accessed with secure and nonsecure access.
When processor 2 CHnSEC is enabled, bit n can be accessed only with secure access. Nonsecure write to this bit is discarded, nonsecure read returns 0 value.
When processor 2 CHnPRIV is disabled, bit n can be accessed with privilege and unprivileged access.
When processor 2 CHnPRIV is enabled, bit n can be accessed only with privilege access. Unprivileged write to this bit is discarded, unprivileged read returns 0 value.
1: Processor 2 receive channel n status bit clear.
0: No action.

21.4.8 IPCC processor 2 to processor 1 status register (IPCC_C2TOC1SR)

Address offset: 0x01C

Reset value: 0x0000 0000

When processor 1 or processor 2 CID filtering is disabled, this register has no access limitations, and can be accessed by any domain CID, and by any combination of secure, nonsecure, privileged, and unprivileged access.

When both processor 1 and processor 2 CID filtering is enabled, access restriction applies and only CIDs of both processors have access, other CID accesses are discarded. In this case, an illegal CID read access returns zero data. A CID illegal access event is generated also on illegal accesses.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CHnF:** Processor 2 transmit to processor 1 receive channel n status flag before masking (n = 16 to 1)

1: Channel occupied, data can be read by the receiving processor 1.
When channel is nonsecure in C1SECCFGR, generates a nonsecure RX occupied interrupt to processor 1, when unmasked and global nonsecure enabled for processor 1.
When channel is secure in C1SECCFGR, generates a secure RX occupied interrupt to processor 1, when unmasked and global secure enabled for processor 1.
0: Channel free, data can be written by the sending processor 2.
When channel is nonsecure in C2SECCFGR, generates a nonsecure TX free interrupt to processor 2, when unmasked and global nonsecure enabled for processor 2.
When channel is secure in C2SECCFGR, generates a secure TX free interrupt to processor 2, when unmasked and global secure enabled for processor 2.

21.4.9 IPCC processor 1 security configuration register (IPCC_C1SECCFGR)

Address offset: 0x080

Reset value: 0x0000 0000

This register is CID-filtered depending on the CID configuration in the processor 1 IPCC_C1CIDCFGR. When CID filtering is enabled this register can be accessed only by the enabled CID. An illegal CID write access is discarded and a read access returns zero data, on illegal accesses a CID illegal access event is generated.

This register can only be write accessed by a secure privileged access. A nonsecure or unprivileged write access is discarded and causes the generation of an illegal access event. All CID filtered read accesses return the register data.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CHnSEC:** Processor 1 channel n security enable (n = 16 to 1).

1: Channel n processor 1 security enabled (secure)
0: Channel n processor 1 security disabled (nonsecure).

21.4.10 IPCC processor 1 privilege configuration register (IPCC_C1PRIVCFGR)

Address offset: 0x084

Reset value: 0x0000 0000

This register is CID-filtered, depending upon the CID configuration in the processor 1 IPCC_C1CIDCFGR. When CID filtering is enabled, this register can be accessed only by the enabled CID. An illegal CID write access is discarded, and a read access returns zero

data. A CID illegal access event is generated on illegal accesses.

This register can only be write accessed by a privilege access. An unprivileged write access is discarded and causes the generation of a privilege illegal access event. All CID filtered read accesses return the register data.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CHnPRIV:** Processor 1 channel n privilege enable (n = 16 to 1).
When processor 1 CHnSEC is disabled, bit n can be accessed with secure and nonsecure access.
When processor 1 CHnSEC is enabled, bit n can be accessed only with secure access. Nonsecure write to this bit is discarded.
1: Channel n processor 1 privilege enabled (privileged)
0: Channel n processor 1 privilege disabled (unprivileged).

21.4.11 IPCC processor 1 CID configuration register (IPCC_C1CIDCFGR)

Address offset: 0x088

Reset value: 0x0000 0000

This register can only be written by the secure, privilege, trusted domain CID. An illegal write access to this register generates a CID illegal access event.

This register has no read access limitations, and can be read by any domain CID, and any access protection.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

								rw	rw	rw	rw				rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **CID[3:0]:** Processor 1 CID domain identification
Processor 1 CID domain identification number:
- 0x0: Processor CID 0
- 0x1: Processor CID 1
- 0x2: Processor CID 2
- 0x3: Processor CID 3
- 0x4: Processor CID 4
- 0x5: Processor CID 5
- 0x6: Processor CID 6
- 0x7: Processor CID 7
- Others: Reserved

If CFEN = 1 these bits are used for processor 1 CID filtering and interrupt routing.
If CFEN = 0 these bits are ignored and there is no processor 1 CID filtering nor interrupt routing.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **CFEN:** CID filtering enabled for processor 1
0: disable the processor 1 CID filtering and interrupt routing, Processor 1 interrupts are broadcasted to all CIDs.
1: enable the processor 1 CID filtering and interrupt routing

21.4.12 IPCC processor 2 security configuration register (IPCC_C2SECCFGR)

Address offset: 0x090

Reset value: 0x0000 0000

This register is CID-filtered depending on the CID configuration in the processor 2 IPCC_C2CIDCFGR. When CID filtering is enabled, this register can be accessed only by the enabled CID. An illegal CID write access is discarded and a read access returns zero data, on illegal accesses a CID illegal access event is generated.

This register can be write-accessed only by a secure privileged access. A nonsecure or unprivileged write access is discarded and causes the generation of an illegal access event. All CID filtered read accesses return the register data.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CHnPRIV:** Processor 2 channel n privilege enable (n = 16 to 1).

When processor 2 CHnSEC is disabled, bit n can be accessed with secure and nonsecure access.

When processor 2 CHnSEC is enabled, bit n can be accessed only with secure access. Nonsecure write to this bit is discarded.

1: Channel n processor 2 privilege enabled (privileged)

0: Channel n processor 2 privilege disabled (unprivileged).

21.4.14 IPCC processor 2 CID configuration register (IPCC_C2CIDCFGR)

Address offset: 0x098

Reset value: 0x0000 0000

This register can only be written by the secure, privilege, trusted domain CID. An illegal write access to this register generates a CID illegal access event.

This register has no read access limitations, and can be read by any domain CID, and any access protection.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Refer to *Section 2.4 on page 184* for the register boundary addresses.

22 General-purpose I/Os (GPIO)

22.1 GPIO introduction

Each general-purpose I/O port has four 32-bit configuration registers (GPIOx_MODER, GPIOx_OTYPER, GPIOx_OSPEEDR, and GPIOx_PUPDR), two 32-bit data registers (GPIOx_IDR and GPIOx_ODR), one 16-bit reset register (GPIOx_BRR), and one 32-bit set/reset register (GPIOx_BSRR).

All GPIOs have one 32-bit locking register (GPIOx_LCKR), two couple of 32-bit advanced configuration registers (GPIOx_DELAYRL/H, GPIOx_ADVCFGRL/H), and two 32-bit alternate function selection registers (GPIOx_AFRH and GPIOx_AFRL).

The access can be restricted to each GPIO configuration bit to secure-only and/or privileged-only. These configuration bits can also be allocated to a specific CPU.

22.2 GPIO main features

- Multiple choice of configurations per I/O port:
  - Input configuration in floating, pull-up/down, or analog state
  - Analog configuration (output buffer and Schmitt trigger inputs disabled)
  - Output configuration, or alternate function configuration, in push-pull or open-drain state, with pull-up or pull-down activated
- Data present on the I/O pin sampled to GPIOx_IDR register (input configuration), or to the peripheral (alternate-function configuration)
- Output buffer on the I/O pin driven by GPIOx_ODR register (output configuration) or by the peripheral (alternate-function configuration)
- I/O data output atomic read/modify through GPIOx_ BSRR and GPIOx_BRR registers
- Speed selection for each I/O (GPIOx_OSPEEDR)
- Lock mechanism (GPIOx_LCKR) to selectively freeze the I/O port configurations
- Highly-flexible pin multiplexing allowing the use of I/O pins as GPIOs, or as one of several possible peripheral function
- Programmable delay to either the input path or the output path (GPIOx_DELAYR)
- Double-edge selection, clock inversion, and optional retime (GPIOx_ADVCFGR)
- Possibility to restrict each I/O control to secure-only, privileged-only, or to a specific CPU (using its compartment information)

22.3 GPIO functional description

Subject to the specific hardware characteristics of each I/O port listed in the datasheet, each port bit of the GPIO ports can be individually configured by software in several modes:

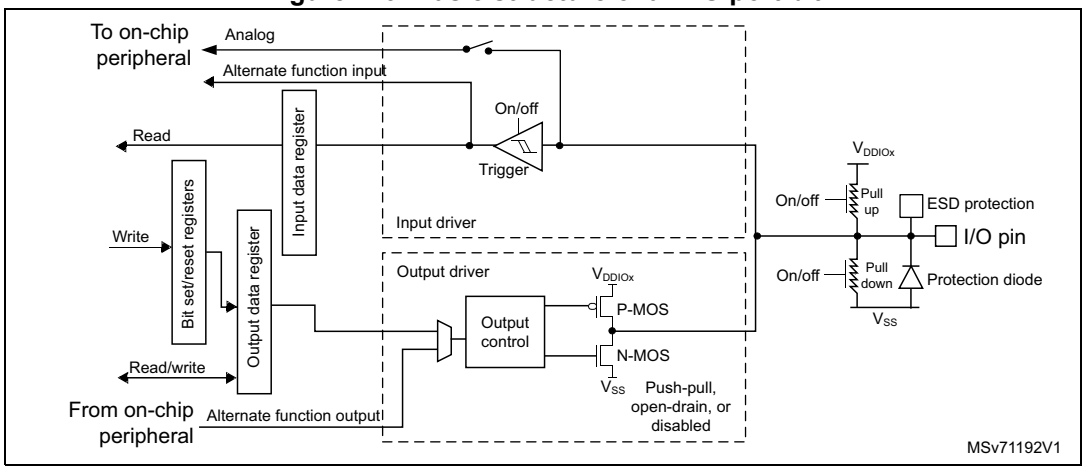
- input floating
- input pull-up
- input-pull-down
- analog
- output-open-drain with pull-up or pull-down capability

- output-push-pull with pull-up or pull-down capability
- alternate-function push-pull with pull-up or pull-down capability
- alternate-function open-drain with pull-up or pull-down capability

Each I/O port bit is freely programmable. GPIO registers must be accessed as 32-bit words, half-words, or bytes. GPIOx_BSRR and GPIOx_BRR allow atomic read/modify accesses to any of GPIOx_ODR. There is then no risk of an IRQ occurring between the read and the modify access.

The figure below shows the basic structure of a standard I/O port bit. *Table 168* gives the possible port bit configurations.

Figure 129. Basic structure of an I/O port bit



I/Os can be used at 1.8 V typ. or 3.3 V typ. (default), by selecting the VDDIOxRSEL range in PWR_CR1.

A 1.8 V I/O supply voltage and 1.8 V IO levels, with a 3.3 V I/O range setting is allowed, but results in degraded I/O performances.

A 3.3V I/O supply voltage or 3.3 V I/O levels, with a 1.8 V I/O range setting is not allowed, and may permanently damage the I/O.

Table 168. Port x bit configurations

Port x configuration bits					I/O configuration(1)	
MODEx[1:0]	OTx	OSPEEDx[1:0]	PUPDx[1:0]			
01	0	SPEED[1:0]	0	0	GP output	PP
			0	1		PP + PU
			1	0		PP + PD
			1	1	Reserved (GP output PP)	
	1		0	0	GP output (open-drain)	OD
			0	1		OD + PU
			1	0		OD + PD
			1	1	Reserved (GP output OD)	

Table 168. Port x bit configurations (continued)

Port x configuration bits					I/O configuration(1)	
MODEx[1:0]	OTx	OSPEEDx[1:0]	PUPDx[1:0]			
10	0	SPEED[1:0]	0	0	AF	PP
			0	1		PP + PU
			1	0		PP + PD
			1	1	Reserved (AF PP)	
	1		0	0	AF (open-drain)	OD
			0	1		OD + PU
			1	0		OD + PD
			1	1	Reserved (AF OD)	
00	x	x	0	0	GP input	Floating
	x	x	0	1		PU
	x	x	1	0		PD
	x	x	1	1	Reserved (input floating)	
11	x	x	0	0	Input/output	Analog
	x	x	0	1		Analog
	x	x	1	0		Analog + PD
	x	x	1	1		Analog

1. GP = general-purpose, PP = push-pull, PU = pull-up, PD = pull-down, OD = open-drain, AF = alternate function.

22.3.1 General-purpose I/O (GPIO)

During and just after a reset, alternate functions are not active, and all I/O ports are configured in analog mode, as defined through GPIOx_MODER.

When the pin is configured as output, the value written to GPIOx_ODR is output on the I/O pin. The output driver can be used in push-pull or open-drain mode (only the low level is driven, the high level is Hi-Z).

GPIOx_IDR captures the data present on the I/O pin at every AHB clock cycle.

All GPIO pins have weak internal pull-up and pull-down resistors, that can be activated or not depending on GPIOx_PUPDR value.

22.3.2 I/O pin alternate-function multiplexer and mapping

The I/O pins are connected to on-board peripherals/modules through a multiplexer that allows only one peripheral alternate function (AF) connected to an I/O pin at a time. This avoids any conflict between peripherals available on the same I/O pin.

Each I/O pin has a multiplexer with up to 16 alternate function inputs (AF0 to AF15), that can be configured through GPIOx_AFRL (for pin 0 to 7) and GPIOx_AFRH (for pin 8 to 15):

- During and just after reset, AFs are not active, and all I/O ports are configured in analog mode (through GPIOx_MODER). When active, AF0 is selected by default.

- Specific AF assignments for each I/O pin are detailed in the device datasheet.

This flexible I/O multiplexing architecture is used to optimize the number of peripherals available in smaller packages.

To use an I/O in a given configuration, the user must proceed as follows:

- GPIO modes: configure the desired I/O as output, input, or analog in GPIOx_MODER.
- Peripheral alternate function:
  - For a given peripheral function, use the device datasheet “Alternate functions” table to identify the AF to use with a given I/O. One of GPIOx_AFRL or GPIOx_AFRH must be used.
  - Configure the desired I/O as an AF in GPIOx_MODER. Select also the type, pull-up/pull-down, and output speed via GPIOx_OTYPER, GPIOx_PUPDR, and GPIOx_OSPEEDR respectively.
- Cortex-M33 alternate function (EVENTOUT)
  - The Cortex-M33 output EVENTOUT signal can be used by configuring the I/O pin to output at AF15. An event can be signaled through the configured pin after executing SEV instruction.
  - EVENTOUT signal can be used internally as a trigger for some peripherals (see *Section 24: Peripheral interconnects*).
- Additional functions:
  - In the device datasheet, the “Additional functions” table lists peripheral functions that directly select/enable its allocated I/O port(s). Typical peripherals are RTC, TAMP, PWR (WKUPx pins), or RCC (oscillator pins). These functions have priority over the configuration in standard GPIO registers.
  - For ADC peripherals, configure the desired I/O in analog mode in GPIOx_MODER and configure the required function in ADC registers.
  - As described in the device datasheet “Additional functions”, some pins/balls are directly connected to ANA0 and ANA1 ADC analog inputs.

22.3.3 I/O port control registers

Each GPIO port x has four 32-bit memory-mapped control registers to configure up to 16 I/Os:

- GPIOx_MODER is used to select the I/O mode (input, output, AF, analog).
- GPIOx_OTYPER and GPIOx_OSPEEDR are respectively used to select the output type (push-pull or open-drain) and the speed.
- GPIOx_PUPDR is used to select the pull-up/pull-down whatever the I/O direction.

22.3.4 I/O port data registers

Each GPIO port x has two 16-bit memory-mapped data registers:

- GPIOx_ODR read/writable register stores the data to be output per I/O.
- GPIOx_IDR read-only register stores the data input through each I/O.

22.3.5 I/O data bitwise handling

GPIOx_BSRR allows the application to set and reset each individual bit in GPIOx_ODR. GPIOx_BSRR has twice the size of GPIOx_ODR.

To each bit in GPIOx_ODR, correspond two control bits in GPIOx_BSRR: BS(i) and BR(i). When written to 1, BS(i) sets the corresponding ODR(i) bit. When written to 1, BR(i) resets the ODR(i) corresponding bit.

Writing any bit to 0 in GPIOx_BSRR does not have any effect on the corresponding bit in GPIOx_ODR. If there is an attempt to both set and reset a bit in GPIOx_BSRR, the set action takes priority.

Using GPIOx_BSRR to change the values of individual bits in GPIOx_ODR is a “one-shot” effect that does not lock GPIOx_ODR bits (they can always be accessed directly). GPIOx_BSRR provides a way of performing atomic-bitwise handling.

The software does not need to disable interrupts when programming GPIOx_ODR at bit level: one or more bits can be modified in a single-atomic AHB write access.

22.3.6 GPIO locking mechanism

GPIO control registers can be frozen by applying a specific write sequence to GPIOx_LCKR: each GPIOx_LCKR bit freezes the corresponding bit in GPIOx_MODER, GPIOx_OTYPER, GPIOx_OSPEEDR, GPIOx_PUPDR, GPIOx_DELAYRL/H, GPIOx_ADVCFGRL/H, and GPIOx_AFRL/H.

To write GPIOx_LCKR, a specific write/read sequence must be applied. When the right lock sequence is applied to the bit 16 in this register, LCKR[15:0] value is used to lock the I/O configuration (during the write sequence, LCKR[15:0] value must be the same). When the lock sequence is applied to a port bit, the port bit value can no longer be modified until next device or peripheral reset. Each GPIOx_LCKR bit freezes the corresponding bit in control registers (GPIOx_MODER, GPIOx_OTYPER, GPIOx_OSPEEDR, GPIOx_PUPDR, GPIOx_DELAYRL/H, GPIOx_ADVCFGRL/H, and GPIOx_AFRL/H).

The lock sequence can only be performed using a 32-bit word access to GPIOx_LCKR, due to the fact that GPIOx_LCKR bit 16 must be set at the same time as the [15:0] bits.

Note: The lock sequence aborts in the event of an AHB bus error (see Section 22.4 introduction), or insufficient access rights (see Section 22.3.15 to Section 22.3.17).

The lock sequence automatically suspends when accessing a different register from GPIOx_LCKR. It resumes with the next access to GPIOx_LCKR.

22.3.7 I/O alternate-function input/output

GPIOx_AFRL and GPIOx_AFRH registers are used to select one of the AF inputs/outputs available for each I/O. With these registers, the user can connect an AF to some other pin as required by the application.

This means that a number of possible peripheral functions are multiplexed on each GPIO using the GPIOx_AFRL and GPIOx_AFRH. The application can thus select any one of the possible functions for each I/O. The AF-selection signal being common to the AF input and AF output, a single channel is selected for the AF input/output of a given I/O.

To know which functions are multiplexed on each GPIO pin, refer to the device datasheet.

22.3.8 External interrupt/wake-up lines

All ports have an external interrupt capability. To use external interrupt lines, the port can be configured in input, output, or alternate-function mode (the port must not be configured

in analog mode). Refer to *Section 29: Extended interrupts and event controller (EXTI)* for more details.

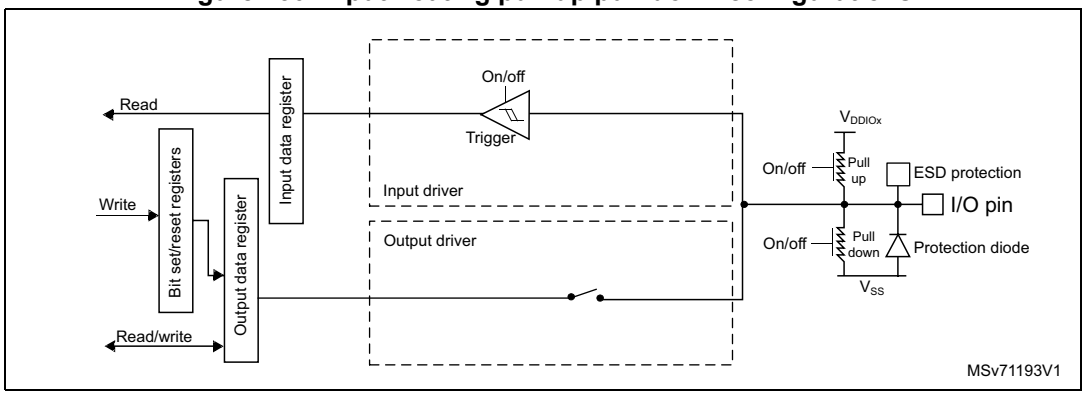
22.3.9 Input configuration

When the I/O port is programmed as input, the following happens:

- The output buffer is disabled.
- The Schmitt trigger input is activated.
- Pull-up and pull-down resistors are activated depending on GPIOx_PUPDR value.
- Data present on the I/O pin are sampled into the input data register every AHB clock cycle.
- A read access to the input data register provides the I/O state.

The figure below shows the input configuration of the I/O port bit.

Figure 130. Input floating/pull-up/pull-down configurations



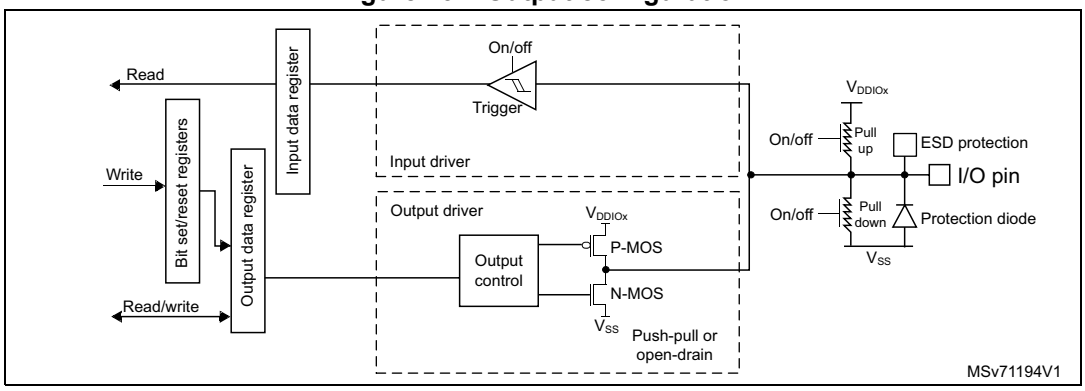
22.3.10 Output configuration

When the I/O port is programmed as output, the following happens:

- The output buffer is enabled:
  - Open-drain mode: a zero in the output register activates the N-MOS. A one in the output register leaves the port in Hi-Z (the P-MOS is never activated).
  - Push-pull mode: a zero in the output register activates the N-MOS. A one in the output register activates the P-MOS.
- The Schmitt trigger input is activated.
- Pull-up and pull-down resistors are activated depending on GPIOx_PUPDR value.
- Data present on the I/O pin are sampled into the input data register every AHB clock cycle.
- A read access to the input data register gets the I/O state.
- A read access to the output data register gets the last written value.

The figure below shows the output configuration of the I/O port bit.

Figure 131. Output configuration



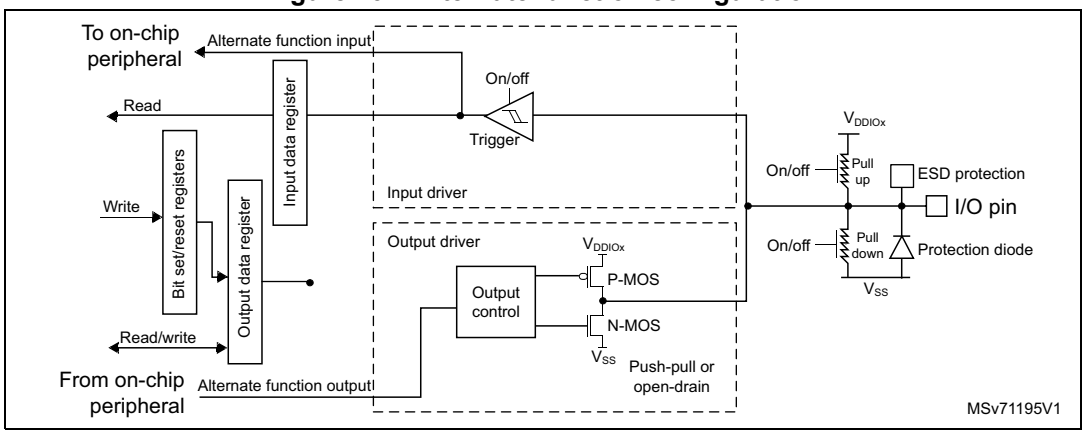
22.3.11 Alternate-function configuration

When the I/O port is programmed as alternate function, the following happens:

- The output buffer can be configured in open-drain or push-pull mode.
- The output buffer is driven by signals coming from the peripheral (transmitter enable and data).
- The Schmitt trigger input is activated.
- Weak pull-up and pull-down resistors are activated or not depending on GPIOx_PUPDR value.
- Data present on the I/O pin are sampled into the input data register every AHB clock cycle.
- A read access to the input data register gets the I/O state.

The figure below shows the alternate function configuration of the I/O port bit.

Figure 132. Alternate function configuration



22.3.12 Analog configuration

When the I/O port is programmed as analog, the following happens:

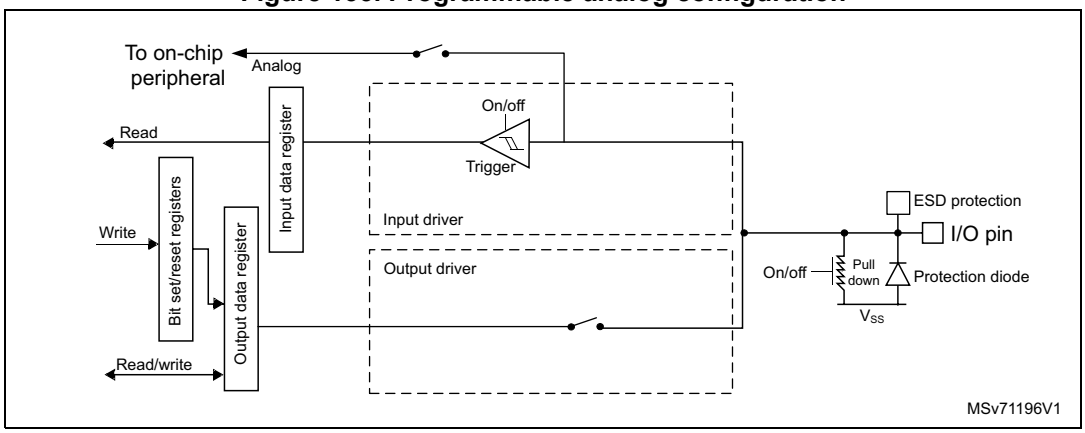
- The output buffer is disabled.

- The Schmitt trigger input is deactivated, providing zero consumption for every analog value of the I/O pin. The output of the Schmitt trigger is forced to a constant value (0).
- The weak pull-up resistor is disabled by hardware. The weak pull-down resistor is activated or not depending on GPIOx_PUPDR value.
- Read access to the input data register gets the value 0.
- The analog switch to the analog peripheral must be closed by control from the analog peripheral.

Caution: The ADC is 1.8 V only. Check the datasheet for allowed voltage on ADC input pins to avoid permanent damage to the ADC.

The figure below shows the programmable, analog-input configuration of the I/O port bits.

Figure 133. Programmable analog configuration



22.3.13 GPIO pins used in V_{SW} domain

The GPIO functionality is lost when the core supply domain is powered off. The pins are then set in analog input mode, unless one of the following conditions is met:

- The GPIO configuration is bypassed by an additional function which stays powered: for example debug, PWR (WKUP only), RTC, TAMP, or RCC (LSE only). For more information, refer to the relevant sections in this reference manual and datasheet.
- The GPIO bank stays powered (for example GPIOZ). Refer to the power supply list of GPIO table in the datasheet for the list of GPIO pins in V_{SW} domain.

22.3.14 Advanced I/O configurations

I/O compensation cell

The I/O commutation slew rate (t_{fall}/t_{rise}) can be adapted by software depending on PVT (process, voltage, and temperature) conditions, in order to reduce the I/O noise on power supply. Refer to *Section 23: System configuration controller (SYSCFG)* for more details.

I/O path configurable delay

A delay programmed in GPIOx_DELAYRL/H can be applied to either input or output path, based on DLYPATH in GPIOx_ADVCFGRL/R.

I/O data double-edge selection

Input and output data can be managed as single- or double-edge, according to DE in GPIOx_ADVCFGRL/R.

I/O data retiming

When RET is set in GPIOx_ADVCFGRL/R, input and output data are retimed to either rising or falling clock edge, depending on INVCLK value.

22.3.15 I/O pin isolation using TrustZone

As TrustZone-aware peripheral, each I/O pin of GPIO port x can be individually configured as secure through GPIOx_SECCFGR. After reset, all GPIO ports are secure.

I/Os connected to peripheral functions can be conditioned by the peripheral security configuration (see *Section 5.4: Resource isolation framework (RIF)* for more details):

- peripherals for which the I/O pin selection is done through GPIOx_AFRL/H

  If the peripheral is configured as secure, it cannot be connected to a non-secure I/O pin. If this is not respected, the input data to the secure peripheral is forced to zero (I/O input pin value ignored), and the output pin value is forced to zero. Any secure information leak through non-secure I/Os is then avoided. TrustZone-aware logic around GPIO ports is summarized in *Table 169*.
- peripherals (like ADC) that embed AFs that directly select/enable its allocated I/O ports using analog switches

  if the I/O is secure, this analog switch cannot be controlled by a non-secure peripheral. If the peripheral is configured as non-secure and the I/O is secure, the switch remains open. This prevents the redirection of secure data to a non-secure peripheral or I/O through analog path. Refer to *Section 5: System security* for the list of peripherals using this security.
- I/Os that do not have an hardware protection linked to TrustZone (see *Section 5: System security*)

  The listed signals (input and/or outputs) are not blocked when the I/O is set as secure. The associated peripheral is non secure. For each of these I/Os, the secure application must decide if a potential effect on data integrity or confidentiality is critical or not.

Refer to the ‘pin definition’ table in the device datasheet for more information about peripheral AFs (first above bullet) and additional-function mapping (last two bullets).

Table 169. Secure AF between peripherals and allocated I/Os

Security configuration		Alternate-function logic		Comment
Peripheral	Allocated I/O pin	Input	Output	
Secure	Secure	I/O data	Peripheral data	-
Non-secure				Out of reset configuration
Secure	Non-secure	Zero	Zero	-
Non-secure		I/O data	Peripheral data	

Table 170 lists the I/O port y secured bits, following the SECy setting in GPIOx_SECCFGR. For each register in the table:

- When a bit is secure, read and write operations are only allowed by a secure access. Non-secure read or write accesses on secure bits are RAZ/WI, with no illegal access event generated.
- When a bit is non-secure, there is no TrustZone restriction. Read and write operations are allowed by both secure and non-secure accesses.

Table 170. GPIO protected bits

Protected bit	Register name	Illegal access to protected bit
MODEy[1:0]	GPIOx_MODER	RAZ/WI
OTy	GPIOx_OTYPER	
OSPEEDy[1:0]	GPIOx_OSPEEDR	
PUPDy[1:0]	GPIOx_PUPDR	
IDy	GPIOx_IDR	
ODy	GPIOx_ODR	
BSy and BRy	GPIOx_BSRR	
BRy	GPIOx_BRR	
LCKy	GPIOx_LCKR	
AFSELy[3:0]	GPIOx_AFRH	
	GPIOx_AFRL	
DELAYy[3:0]	GPIOx_DELAYRL	RAZ/WI
	GPIOx_DELAYRH	
RETy, INVCLKy, DEy, DELYPATHy	GPIOx_ADVCFGRL	
	GPIOx_ADVCFGRH	

Note: GPIOx_SECCFGR is readable by any application, and writable by only secure privileged applications.

Each bit in GPIOx_SECCFGR is write locked until the next device reset when setting the corresponding bit in GPIOx_RCFGLOCKR.

22.3.16 I/O pin isolation using privilege

As RIF-aware peripheral, each I/O pin of GPIO port x can be individually configured as privileged through GPIOx_PRIVCFGR . After reset, all GPIO registers can be read and written by privileged and unprivileged accesses, if the security is enough and the CPU is allowed.

Table 170 in the previous section lists the I/O port y protected bits, following PRIVy setting in GPIOx_PRIVCFGR. For each register in the table:

- When a bit is privileged, read and write operations are only allowed by a privileged access. Unprivileged read or write accesses on privileged bits are RAZ/WI, with no illegal access event generated.
- When a bit is unprivileged, there is no privilege restriction. Read and write operations are allowed by both privileged and unprivileged accesses.

Note: GPIOx_PRIVCFGR is readable by any application, writable by only privileged applications.

Each bit in GPIOx_PRIVCFGR is write locked until the next device reset, when setting the corresponding bit in GPIOx_RCFGLOCKR.

22.3.17 I/O pin isolation using compartments

As RIF-aware peripheral, when the compartment-based filtering is active (CFEN = 1), each I/O pin y of GPIO port x can be individually configured as controlled by a unique CPU using one of the following techniques:

- A trusted-domain application keeps SEM_EN cleared, and sets the authorized compartment with SCID[1:0] in GPIOx_CIDCFGRy.
- A trusted-domain application sets SEM_EN, and sets compartments that are authorized to take the I/O pin y, by setting the corresponding SEMWLCm bits in GPIOx_CIDCFGRy. Each CPU, white-listed this way, is authorized to take SEM_MUTEX in GPIOx_SEMCRy to have the exclusive ownership on the I/O pin until this CPU clears SEM_MUTEX.

Table 170 in *Section 22.3.15* details the I/O port y protected bits following the isolation to a compartment using GPIOx_CIDCFGRy and GPIOx_SEMCRy. For each register in the table:

- For bits with compartment filtering activated: read and write operations are only allowed to the CPU with the correct compartment ID (CID), if secure and privilege of the access are enough. Other CPUs read configuration bits as zero, and writes are ignored. There is no illegal access event generated.
- For bits with compartment filtering deactivated: no restriction. Read and write operations are allowed by any CPU, if secure and privilege of the access are enough.

Note: GPIOx_CIDCFGR and GPIOx_SEMCR are readable by any application. GPIOx_CIDCFGR is writable only by the trusted-domain CPU.

GPIOx_CIDCFGRy is write locked until the next device reset, when setting RLOCKy in GPIOx_RCFGLOCKR.

For more information on RIF, compartment ID (CID) and trusted domain application, refer to *Section 5.4: Resource isolation framework (RIF)*.

22.4 GPIO registers

These registers are accessible through 32-bit word, half-word, or byte single access. Double-word and instruction-fetch accesses trigger an AHB bus error. Byte or half-word writes to GPIOx_LCKR are silently ignored (no bus error).

For any DDCID access to registers, the security and privileged policy applies like any other CIDs. Compartment filtering policy also applies to DDCID access if the debug domain is deactivated (DDEN = 0). When the debug domain is activated (DDEN = 1), the DDCID access goes through regardless of any CID filtering policy.

22.4.1 GPIO port x mode register (GPIOx_MODER) (x = A to I, Z)

Address offset:0x000

Reset value: 0xFFFF FFFF (A, D, E port)

Reset value: 0xFFFC FCFC (B port)

Reset value: 0x0FFF FFFF (C port)

Reset value: 0xCFFF FFFF (F port)

Reset value: 0xFFFF CFFF (G port)

Reset value: 0x0FFF CF00 (H port)

Reset value: 0x0003 3F0F (I port)

Reset value: 0x0000 00CF (Z port)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MODE15[1:0]		MODE14[1:0]		MODE13[1:0]		MODE12[1:0]		MODE11[1:0]		MODE10[1:0]		MODE9[1:0]		MODE8[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MODE7[1:0]		MODE6[1:0]		MODE5[1:0]		MODE4[1:0]		MODE3[1:0]		MODE2[1:0]		MODE1[1:0]		MODE0[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MODEy[1:0]:** Port x configuration I/O pin y (y = 15 to 0)

These bits are written by software to configure the I/O mode.

00: General-purpose input mode

01: General-purpose output mode

10: Alternate-function mode (refer to device datasheet for available options)

11: Analog mode (reset state)

Successful read or write to MODEy must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1, it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

22.4.2 GPIO port x output type register (GPIOx_OTYPER) (x = A to I, Z)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OT15	OT14	OT13	OT12	OT11	OT10	OT9	OT8	OT7	OT6	OT5	OT4	OT3	OT2	OT1	OT0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **OTy:** Port x configuration I/O pin y (y = 15 to 0)

These bits are written by software to configure the I/O output type.

0: Output push-pull (reset state)

1: Output open-drain

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bit, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.

If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

22.4.3 GPIO port x output speed register (GPIOx_OSPEEDR) (x = A to I, Z)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OSPEED15[1:0]		OSPEED14[1:0]		OSPEED13[1:0]		OSPEED12[1:0]		OSPEED11[1:0]		OSPEED10[1:0]		OSPEED9[1:0]		OSPEED8[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OSPEED7[1:0]		OSPEED6[1:0]		OSPEED5[1:0]		OSPEED4[1:0]		OSPEED3[1:0]		OSPEED2[1:0]		OSPEED1[1:0]		OSPEED0[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **OSPEEDy[1:0]**: Port x configuration I/O pin y (y = 15 to 0)

These bits are written by software to configure the I/O output speed.

00: Low speed

01: Medium speed

10: High speed

11: Very-high speed

Note: Refer to the device datasheet for frequency specifications, power supply, and load conditions for each speed.

Successful read or write to the bitfield OSPEEDy must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

22.4.4 GPIO port pull-up/pull-down register (GPIOx_PUPDR) (x = A to I, Z)

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PUPD15[1:0]		PUPD14[1:0]		PUPD13[1:0]		PUPD12[1:0]		PUPD11[1:0]		PUPD10[1:0]		PUPD9[1:0]		PUPD8[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PUPD7[1:0]		PUPD6[1:0]		PUPD5[1:0]		PUPD4[1:0]		PUPD3[1:0]		PUPD2[1:0]		PUPD1[1:0]		PUPD0[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **PUPDy[1:0]:** Port x configuration I/O pin y (y = 15 to 0)

These bits are written by software to configure the I/O pull-up or pull-down

00: No pull-up, pull-down

01: Pull-up

10: Pull-down

11: Reserved

Successful read or write to the bitfield PUPDy must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

22.4.5 GPIO port x input data register (GPIOx_IDR) (x = A to I, Z)

Address offset: 0x010

Reset value: 0x0000 XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID7	ID6	ID5	ID4	ID3	ID2	ID1	ID0
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **IDy:** Port x input data I/O pin y (y = 15 to 0)

These bits are read-only. They contain the input value of the corresponding I/O port.
Successful read to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.
If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read, if privilege and security of the access is sufficient. Illegal read returns zero.
Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

22.4.6 GPIO port x output data register (GPIOx_ODR) (x = A to I, Z)

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OD15	OD14	OD13	OD12	OD11	OD10	OD9	OD8	OD7	OD6	OD5	OD4	OD3	OD2	OD1	OD0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **ODy:** Port x output data I/O pin y (y = 15 to 0)

These bits can be read and written by software.

Note: For atomic bit set/reset, the OD bits can be individually set and/or reset by writing to GPIOx_BSRR or GPIOx_BRR.

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bit, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

22.4.7 GPIO port x bit set/reset register (GPIOx_BSRR) (x = A to I, Z)

Address offset: 0x018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BR15	BR14	BR13	BR12	BR11	BR10	BR9	BR8	BR7	BR6	BR5	BR4	BR3	BR2	BR1	BR0
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BS15	BS14	BS13	BS12	BS11	BS10	BS9	BS8	BS7	BS6	BS5	BS4	BS3	BS2	BS1	BS0
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:16 **BRy:** Port x reset I/O pin y (y = 15 to 0)

These bits are write-only. A read to these bits returns the value 0x0000.

0: No action on the corresponding ODx bit

1: Resets the corresponding ODx bit

Note: If both BSx and BRx are set, BSx has priority.

Successful write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can write to this bit, if privilege and security of the access is sufficient. Illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

Bits 15:0 **BS[15:0]:** Port x set I/O pin y (y = 15 to 0)

These bits are write-only. A read to these bits returns the value 0x0000.

0: No action on the corresponding ODx bit

1: Sets the corresponding ODx bit

Successful write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can write to this bit, if privilege and security of the access is sufficient. Illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

22.4.8 GPIO port x configuration lock register (GPIOx_LCKR) (x = A to I, Z)

Address offset: 0x01C

Reset value: 0x0000 0000

This register is used to lock the configuration of the port bits when a correct write sequence is applied to bit 16 (LCKK). The value of bits [15:0] is used to lock the GPIO configuration. During the lock sequence, LCKR[15:0] value can change, but only stable bits are set (for example: if LCKR[15:0] = 0x3 during the first two writes but LCKR[15:0] = 0x2 for the third write, then only LCK1 is set).

Note: Only word access (32-bit long) is allowed during this locking sequence. Byte or half-word writes are silently ignored (no bus error, no abort to lock sequence).

When the lock sequence has been applied on a port bit, this port bit value can no longer be modified until the next device or peripheral reset. Each lock bit freezes a specific configuration register (control and alternate-function registers).
See *Section 22.3.6* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LCKK
															rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LCK15	LCK14	LCK13	LCK12	LCK11	LCK10	LCK9	LCK8	LCK7	LCK6	LCK5	LCK4	LCK3	LCK2	LCK1	LCK0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **LCKK:** Lock key

This bit can be read any time. It can only be modified using the lock key write sequence.
0: Port configuration lock key not active
1: Port configuration lock key active. This register is locked until the next device or peripheral reset.
LOCK key write sequence:
WR LCKR[16] = 1 + LCKR[15:0]
WR LCKR[16] = 0 + LCKR[15:0]
WR LCKR[16] = 1 + LCKR[15:0]
RD LCKR
RD LCKR[16] = 1 (this read operation is optional but it confirms that the lock is active.)

Note: During the lock key write sequence, LCK[15:0] value must not change.
Any error in the lock sequence aborts the lock.
After the first lock sequence on any bit of the port, any read access on LCKK returns one until the next device or peripheral reset.

Bits 15:0 **LCKy:** Port x lock I/O pin y (y = 15 to 0)

These bits are read/write but can only be written when LCKK = 0.

0: Port configuration not locked

1: Port configuration locked

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bit, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

22.4.9 GPIO port x alternate function low register (GPIOx_AFRL) (x = A to I, Z)

Address offset: 0x020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **AFSELy[3:0]:** Alternate function selection for port x I/O pin y (y = 15 to 8)

These bits are written by software to configure alternate function I/Os. See GPIOx_AFRL register for details.

Successful read or write to the bitfield AFSELy must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

22.4.11 GPIO port x bit reset register (GPIOx_BRR) (x = A to I, Z)

Address offset: 0x028

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BR15	BR14	BR13	BR12	BR11	BR10	BR9	BR8	BR7	BR6	BR5	BR4	BR3	BR2	BR1	BR0
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **BRy:** Port x reset I/O pin y (y = 15 to 0)

These bits are write-only. A read to these bits returns the value 0x0000.

0: No action on the corresponding ODx bit

1: Reset the corresponding ODx bit

Successful write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can write to this bit, if privilege and security of the access is sufficient. Illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

22.4.12 GPIO port x secure configuration register (GPIOx_SECCFGR) (x = A to I, Z)

Address offset: 0x030

Reset value: 0x0000 FFFF

This register is used to configure a selected I/O as secure. Non-secure or unprivileged writes to this register are ignored, while any read is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SEC15	SEC14	SEC13	SEC12	SEC11	SEC10	SEC9	SEC8	SEC7	SEC6	SEC5	SEC4	SEC3	SEC2	SEC1	SEC0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SECy**: I/O pin y of Port x security configuration (y = 15 to 0)
0: The I/O pin y is non-secure. Secure access is also possible.
1: The I/O pin y is secure. Refer to *Table 170* for all corresponding secured bits.
If compartment filtering for this I/O pin is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (resp any compartment) can write this bit, if privilege and security of the access is sufficient.
Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGR.
If SEM_EN = 1 it is equal to SEMCID if SEM_MUTEX = 1 in GIPOx_SEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.
If RLOCKy bit is set in GPIOx_RCFGLOCKR write to this bit is ignored.

22.4.13 GPIO port x privileged configuration register (GPIOx_PRIVCFGR) (x = A to I, Z)

Address offset: 0x034

Reset value: 0x0000 0000

Unprivileged writes to this register are ignored, while any read is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PRIVy**: I/O pin y of port x privilege configuration (y = 15 to 0)

0: The I/O pin y is unprivileged. Privileged access is also possible.

1: The I/O pin y is privileged only. Refer to *Table 170* for all corresponding protected bits.

If corresponding SECy is set in GPIOx_SECCFGR, this bit can only be written by a secure privileged application.

If compartment filtering for this I/O pin is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (resp any compartment) can write this bit, if privilege and security of the access is sufficient.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGR.

If SEM_EN = 1 it is equal to SEMCID if SEM_MUTEX = 1 in GIPOx_SEMCR. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

If RLOCKy bit is set in GPIOx_RCFGLOCKR write to this bit is ignored.

22.4.14 GPIO port x resource configuration lock register (GPIOx_RCFGLOCKR) (x = A to I, Z)

Address offset: 0x038

Reset value: 0x0000 0000

Secure privileged write access only. Write only by trusted domain CID.

Any read access is allowed on this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **RLOCKy**: I/O pin y of port x resource lock (y = 15 to 0)

This bit is set to lock this I/O resource. It is cleared by default and once set it cannot be cleared until GPIOx peripheral is reset.

0: Bits SECy in GPIOx_SECCFGR and PRIVy in GPIOx_PRIVCFGR are writable. GPIOx_CIDCFGRy is also writable.

1: Writes to bits SECy in GPIOx_SECCFGR and PRIVy in GPIOx_PRIVCFGR are ignored. Writes to GPIOx_CIDCFGRy are also ignored.

22.4.15 GPIO port x delay low register (GPIOx_DELAYRL) (x = A to I, Z)

Address offset: 0x040

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DLY7[3:0]				DLY6[3:0]				DLY5[3:0]				DLY4[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DLY3[3:0]				DLY2[3:0]				DLY1[3:0]				DLY0[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DLYy[3:0]:** Port x IO pin y delay setup (y = 7 to 0)

Configure delay applied to either the input path (data IN from pad) or the output path (data OUT to pad), depending on the value of the corresponding DLYPATHy in GPIOx_ADVCFGRL.

0000: no delay
0001: delay 0.3 ns
0010: delay 0.5 ns
0011: delay 0.75 ns
0100: delay 1.0 ns
0101: delay 1.25 ns
0110: delay 1.5 ns
0111: delay 1.75 ns
1000: delay 2.0 ns
1001: delay 2.25 ns
1010: delay 2.5 ns
1011: delay 2.75 ns
1100: delay 3.0 ns
1101: delay 3.25 ns
1110 to 1111: delay 3.25 ns (maximum)

Successful read or write to the bitfield DLYy must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

22.4.16 GPIO port x delay high register (GPIOx_DELAYRH) (x = A to I, Z)

Address offset: 0x044

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DLY15[3:0]				DLY14[3:0]				DLY13[3:0]				DLY12[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DLY11[3:0]				DLY10[3:0]				DLY9[3:0]				DLY8[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DLYy[3:0]:** Port x IO pin y delay setup (y = 15 to 8)

Configure delay on input or output data related to WC prior to retiming.
See GPIOx_DELAYRL for details.

22.4.17 GPIO port x advanced configuration low register (GPIOx_ADVCFGRL) (x = A to I, Z)

Address offset: 0x048

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31, 27, 23, 19, 15, 11, 7, 3 **RETy**: Data retime selection y (y = 7 to 0)

0: Input and output data are not synchronized or retimed on clock edges.

1: Input and output data are retimed to either rising or falling clock edge depending on value of INVCLKy.

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.

If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

Bits 30, 26, 22, 18, 14, 10, 6, 2 **INVCLKy**: Clock inversion selection y (y = 7 to 0)

0: I/O clocks are not inverted. Input and output data are retimed to rising clock edge.

1: I/O clocks are inverted. Input and output data are retimed to falling clock edge.

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.

If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

Bits 29, 25, 21, 17, 13, 9, 5, 1 **DEy**: Input/Output data double edge selection y (y = 7 to 0)

0: Input and output data is single-edge (changing on rising or falling clock edge, but not both)

1: Input and output data is double-edge (changing on both rising and falling clock edges)

Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.

If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.

Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.

If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

Bits 28, 24, 20, 16, 12, 8, 4, 0 **DLYPATHy**: Controls which path contains the configurable delay, input or output y (y = 7 to 0)
0: Delay is switched into the output path, while the input path is set as pass through.
1: Delay is switched into the input path, while the output path is set as pass through.
Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.
If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.
Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

22.4.18 GPIO port x advanced configuration high register (GPIOx_ADVCFGRH) (x = A to I, Z)

Bits 31, 27, 23, 19, 15, 11, 7, 3 **RETy**: Data retime selection y (y = 15 to 8)
0: Input and output data are not synchronized or retimed on clock edges.
1: Input and output data are retimed to either rising or falling clock edge depending on value of INVCLKy.
Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.
If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.
Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

Bits 30, 26, 22, 18, 14, 10, 6, 2 **INVCLKy**: Clock inversion selection y (y = 15 to 8)
0: I/O clocks are not inverted. Input and output data are retimed to rising clock edge.
1: I/O clocks are inverted. Input and output data are retimed to falling clock edge.
Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.
If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.
Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

Bits 29, 25, 21, 17, 13, 9, 5, 1 **DEy**: Input/Output data double edge selection y (y = 15 to 8)
0: Input and output data is single-edge (changing on rising or falling clock edge, but not both)
1: Input and output data is double-edge (changing on both rising and falling clock edges)
Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.
If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.
Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

Bits 28, 24, 20, 16, 12, 8, 4, 0 **DLYPATHy**: Controls which path contains the configurable delay, input or output y (y = 15 to 8)
0: Delay is switched into the output path, while the input path is set as pass through.
1: Delay is switched into the input path, while the output path is set as pass through.
Successful read or write to this bit must be secure if SECy is set in GPIOx_SECCFGR, and must be privileged if PRIVy is set in GPIOx_PRIVCFGR.
If compartment filtering for this I/O pin y is enabled (respectively disabled) using CFEN bit in GPIOx_CIDCFGRy, only an authorized compartment (respectively any compartment) can read or write this bitfield, if privilege and security of the access is sufficient. Illegal read returns zero and illegal write is ignored.
Authorized compartment is defined as SCID if SEM_EN = 0 in GPIOx_CIDCFGRy.
If SEM_EN = 1 it is defined as SEMCID, if SEM_MUTEX = 1 in GPIOx_SEMCRy. There is no authorized compartment if SEM_EN = 1 and SEM_MUTEX = 0.

22.4.19 GPIO port x CID configuration register for I/O pin y (GPIOx_CIDCFGRy) (x = A to I, Z)

Address offset: 0x050 + 0x8 * y (y = 0 to 15)

Reset value: 0x0000 0000

Secure privileged write access only. Write only by trusted domain CID.

Any read access is allowed on this register. Any write is ignored if RLOCKy is set in GPIOx_RCFGLOCKR register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEMWLC3	SEMWLC2	SEMWLC1	SEMWLC0
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCID[1:0]		Res.	Res.	SEM_EN	CFEN
										rw	rw			rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **SEMWLCz**: Semaphore white list for compartment z (z = 3 to 0)

0: Application running in compartment z cannot get access to the I/O pin y through semaphore SEM_MUTEX.

1: Application running in compartment z can get access to the I/O pin y through semaphore SEM_MUTEX.

Each bit is not taken into account by GPIOx when semaphore is disabled (SEM_EN = 0), or compartment filtering is off (CFEN = 0) for this I/O pin.

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:4 **SCID[1:0]**: Static CID

Trusted domain application uses this bitfield to statically define which compartment has access to the I/O pin y when SEM_EN = 0.

This CID is not taken into account by GPIOx when semaphore is enabled (SEM_EN = 1) or compartment filtering is off (CFEN=0) for this I/O pin.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **SEM_EN**: Semaphore enable

0: Access to I/O pin y is granted only if CID of the access equals to SCID.

1: Access to I/O pin y is granted only if SEM_MUTEX = 1 and CID of the access equals to SEMCID in GPIOx_SEMCR.

This bit is not taken into account by GPIOx if compartment filtering is off (CFEN = 0) for this I/O pin. When this bit is cleared from 1 by trusted domain application SEM_MUTEX is cleared to zero by GPIOx.

Bit 0 **CFEN**: CID filtering enable

0: Compartment-based filtering defined in GPIOx_CIDCFGR, and optionally GPIOx_SEMCR is disabled for I/O pin y.

1: Compartment-based filtering defined in GPIOx_CIDCFGR, and optionally GPIOx_SEMCR is enabled for I/O pin y.

For any CFEN value access controls to I/O pin y defined in GPIOx_PRIVCFGR and GPIOx_SECCFGR always apply. When this bit is cleared from 1 by trusted domain application SEM_MUTEX is cleared to zero by GPIOx.

22.4.20 GPIO port x semaphore control register for I/O pin y (GPIOx_SEMCRy) (x = A to I, Z)

Address offset: 0x054 + 0x8 * y (y = 0 to 15)

Reset value: 0x0000 0000

If compartment filtering is disabled (CFEN = 0) or semaphore is disabled (SEM_EN = 0) in GPIOx_CIDCFGRy, any write to this register is ignored.

Privileged-only write if PRIVy is set in GPIOx_PRIVCFGR. Secure-only write if SECy is set in GPIOx_SECCFGR.

If compartment filtering is enabled and semaphore is enabled (CFEN and SEM_EN set in GPIOx_CIDCFGRy), only an authorized compartment can write to this register. For this register, the authorized compartment is equal to SEMCID if SEM_MUTEX = 1, else it is defined by the CID white list (SEMWLCm) in GPIOx_CIDCFGRy. There is no authorized compartment if semaphore is disabled (SEM_EN = 0).

Any read access is allowed to this register.

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:4 **SEMCID[1:0]**: Semaphore current CID

When SEM_EN and CFEN are set in GPIOx_CIDCFGRy, this read-only bitfield is updated with the CID value of the latest successful acquisition of GPIOx_SEMCRy semaphore (SEM_MUTEX = 1). In all other cases SEMCID stays unchanged.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **SEM_MUTEX**: Semaphore mutex

White listed application can set semaphore bit to get exclusive access to the I/O pin y configuration when SEM_EN is set in GPIOx_CIDCFGRy (writes are ignored otherwise).

Read 0: Semaphore is free to take

Read 1: Semaphore is taken

Write 0: Release semaphore

Write 1: Acquire semaphore

When SEM_MUTEX = 0, only applications belonging to white-listed compartments (defined with SEMWLCm bits in GPIOx_CIDCFGRy) can acquire this semaphore.

When SEM_MUTEX = 1, only applications belonging to compartment SEMCID can release this semaphore.

This bit is cleared when CFEN or SEM_EN are cleared from 1 by trusted domain application in GPIOx_CIDCFGRy.

22.4.21 GPIO port x hardware configuration register 11 (GPIOx_HWCFGR11) (x = A to I, Z)

Refer to *Section 2.4* for the register boundary addresses.

23 System configuration controller (SYSCFG)

STM32MP21xx devices feature a set of configuration registers. The main purposes of the system configuration controller are the following:

- Managing OCTOSPI1, SDMMC1, SDMMC2, and SDMMC3 delay block
- Managing system related settings
- Managing I/O compensation cells
- Managing ETH1 and ETH2 clock source selection
- Managing the selection of reference clock frequency, the control of the battery charging procedure, and the trimming of USB2PHY1/USB2PHY2 electrical parameters

23.1 SYSCFG functional description

23.1.1 I/O compensation cell

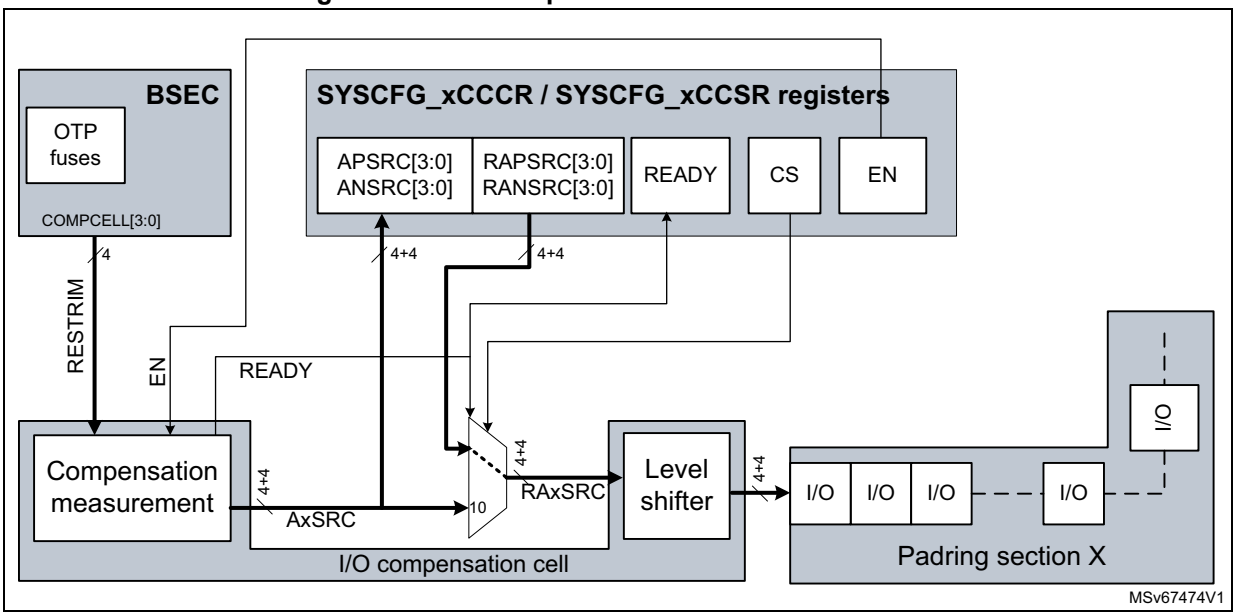
The I/O compensation cell generates an 8-bit value for the I/O buffer (4 bits for N-MOS and 4 bits for P-MOS), that depends on PVT operating conditions (process, voltage, temperature). These bits are used to control the current slew-rate and output impedance in the I/O buffer. Four compensation cells are embedded: one for the I/Os supplied by V_{DD} and three for the I/Os supplied by V_{DDIO1}, V_{DDIO2} and V_{DDIO3}.

By default, the compensation cells are disabled, and a fixed code is applied to all the I/Os. When enabled, the compensation cell tracks the PVT, and the 8-bit code APSRC and ANSRC are available in SYSCFG_xCCSR (with x = V_{DD}, V_{DDIO1}, V_{DDIO2} or V_{DDIO3}) once the corresponding READY bit is set. If CS is cleared in SYSCFG_xCCCR and READY is set in SYSCFG_xCCSR, the I/Os receive the code APSRC and ANSRC from SYSCFG_xCCSR, resulting from the compensation cell.

To optimize the trimming, the code can be adjusted using RAPSRC and RANSRC fields in SYSCFG_xCCCR. They can be selected through CS in SYSCFG_xCCCR (see *Figure 134*).

To reduce the power consumption, it is recommended to copy the code from SYSCFG_xCCSR to SYSCFG_xCCCR. After the result is ready, set CS and disable the compensation cell.

Figure 134. I/O compensation cell control overview



23.2 SYSCFG registers

23.2.1 SYSCFG boot pin status register (SYSCFG_BOOTSR)

Address offset: 0x000

Reset value: 0x0000 000X

This register is used to know the state of BOOT pins. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BOOT3	BOOT2	BOOT1	BOOT0
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **BOOT3**: BOOT3 pin value
0: (low) BOOT3 pin connected to VSS (or left open if BOOT3_PD = 0)
1: (high) BOOT3 pin connected to VDD

Bit 2 **BOOT2**: BOOT2 pin value
0: (low) BOOT2 pin connected to VSS (or left open if BOOT2_PD = 0)
1: (high) BOOT2 pin connected to VDD

Bit 1 **BOOT1**: BOOT1 pin value
0: (low) BOOT1 pin connected to VSS (or left open if BOOT1_PD = 0)
1: (high) BOOT1 pin connected to VDD

Bit 0 **BOOT0**: BOOT0 pin value
0: (low) BOOT0 pin connected to VSS (or left open if BOOT0_PD = 0)
1: (high) BOOT0 pin connected to VDD

23.2.2 SYSCFG boot pin control register (SYSCFG_BOOTCR)

Address offset: 0x004

Reset value: 0x0000 0000

Reset by any system reset.
This register is used to control pull-up to reduce the static power consumption on the pin set to high level.
Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BOOT3_PD	BOOT2_PD	BOOT1_PD	BOOT0_PD
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **BOOT3_PD**: BOOT3 pin pull-down disable
This bit is used to save power in case the BOOT3 pin is connected to VDD.
0: (enabled) pull-down enabled. BOOT3 pin can be left open and takes a value of 0 if open.
1: (disabled) pull-down disabled. BOOT3 pin must not be left open.

Bit 2 **BOOT2_PD**: BOOT2 pin pull-down disable
This bit is used to save power in case the BOOT2 pin is connected to VDD.
0: (enabled) pull-down enabled. BOOT2 pin can be left open and takes a value of 0 if open.
1: (disabled) pull-down disabled. BOOT2 pin must not be left open.

Bit 1 **BOOT1_PD**: BOOT1 pin pull-down disable
This bit is used to save power in case the BOOT1 pin is connected to VDD.
0: (enabled) pull-down enabled. BOOT1 pin can be left open and takes a value of 0 if open.
1: (disabled) pull-down disabled. BOOT1 pin must not be left open.

Bit 0 **BOOT0_PD**: BOOT0 pin pull-down disable
This bit is used to save power in case the BOOT0 pin is connected to VDD.
0: (enabled) pull-down enabled. BOOT0 pin can be left open and takes a value of 0 if open.
1: (disabled) pull-down disabled. BOOT0 pin must not be left open.

23.2.3 SYSCFG DLYBSD1 control register (SYSCFG_DLYBSD1CR)

Address offset: 0x400

Reset value: 0x0040 0000

Reset by system reset and SDMMC1 DLL software reset.

Write access according to SDMMC1 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ANTIGLITCH_EN	BYP_CMD[4:0]					BYP_EN
									rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RX_TAP_SEL[5:0]						EN
									rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **ANTIGLITCH_EN**:
1: The anti-glitch logic is enabled. This ensures that there is no glitch on the clock line when the tap value is modified.

Bits 21:17 **BYP_CMD[4:0]**: Delay unit when in DLL bypass mode
00000: Reserved
00001: 1 delay element enabled
00010: 2 delay elements enabled
...
11000: all 24 delay elements enabled
11001: all 24 delay elements enabled
...
11111: all 24 delay elements enabled

Bit 16 **BYP_EN**: DLL bypass mode enable
1: DLL bypass mode is enabled. In bypass mode the DLL is used in pure delay mode and there is no VT compensation. The command applied to every delay unit is set by DLL_BYP_CMD[4:0], and a tap value must be selected with RX_TAP_SEL[5:0]. In bypass mode, the total delay is given by (delay unit) × tap number selected.
0: DLL lock mode is selected.

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:1 **RX_TAP_SEL[5:0]**: TAP number for RX clock selection
000000: 0 tap selected
000001: 1 tap is selected
....
000010: 2 taps selected
....
011111: 31 taps selected
100000: 32 taps selected

Bit 0 **EN**:
When 1, the DLL is enabled when configured in lock mode (BYP_EN = 0).

23.2.4 SYSCFG DLYBSD1 status register (SYSCFG_DLYBSD1SR)

Address offset: 0x404

Reset value: 0x0000 0002

Reset by system reset and SDMMC1 DLL software reset.

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RX_TAP_SEL_ACK	LOCK
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **RX_TAP_SEL_ACK**:
1: The RX delay switched to the tap value specified in RX_TAP_SEL[5:0].

Bit 0 **LOCK**:
1: The DLL is locked.

23.2.5 SYSCFG SDMMC1 control register (SYSCFG_SDMMC1CR)

Address offset: 0x408

Reset value: 0x0000 0000

Reset by system reset and SDMMC1 software reset.

Write access according to SDMMC1 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDMMC1_VSEL
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **SDMMC1_VSEL**: Voltage selection

Change the value of the SDVSEL1 pin output to control the voltage on pins for external card. Need AFMUX selection.

1: Change the voltage to low-voltage range (1.8 V typ).

0: Change the voltage to high-voltage range (3.3 V typ).

Note: There must be a control circuit out of SDMMC1 to change the voltage on pins.

23.2.6 SYSCFG SDMMC1 address remapping control register (SYSCFG_SDMMC1ARCR)

Address offset: 0x40C

Reset value: 0x0000 0000

Reset by system reset.

Write access according to SDMMC1 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	AREN
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **AREN**: Address remapping enable

Enable the address remapping logic in front of the SDMMC1 AHB master. Remapping allows SDMMC1 (only 32bit addressing supported by the master) to access the 4GB of the DDR.

1: Address remapping is enabled. The 4GB address space accessible by the master starts at address 0x80000000.

0: Address remapping is not enabled. The 4GB address space accessible by the master starts at address 0x0.

23.2.7 SYSCFG DLYBSD2 control register (SYSCFG_DLYBSD2CR)

Address offset: 0x800

Reset value: 0x0040 0000

Reset by system reset and SDMMC2 DLL software reset.

Write access according to SDMMC2 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

									rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **ANTIGLITCH_EN**: Anti-glitch logic enable

1: The anti-glitch logic is enabled. This ensures that there is no glitch on the clock line when the tap value is modified.

Bits 21:17 **BYP_CMD[4:0]**: Delay unit when in DLL bypass mode
00000: Reserved
00001: 1 delay element enabled
00010: 2 delay elements enabled
...
11000: all 24 delay elements enabled
11001: all 24 delay elements enabled
...
11111: all 24 delay elements enabled

Bit 16 **BYP_EN**: DLL bypass mode enable
1: DLL bypass mode is enabled. In bypass mode, the DLL is used in pure delay mode and there is no VT compensation. The command applied to every delay unit is set by DLL_BYP_CMD[4:0], and a tap value must be selected with RX_TAP_SEL[5:0]. In bypass mode, the total delay is given by (delay unit) x tap number selected.
0: DLL lock mode is selected.

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:1 **RX_TAP_SEL[5:0]**: TAP delay for RX clock selection
000000: 0 tap selected
000001: 1 tap selected
....
000010: 2 taps selected
....
011111: 31 taps selected
100000: 32 taps selected

Bit 0 **EN**:
1: The DLL is enabled when configured in lock mode (BYP_EN = 0).

23.2.8 SYSCFG DLYBSD2 status register (SYSCFG_DLYBSD2SR)

Address offset: 0x804

Reset value: 0x0000 0002

Reset by system reset and SDMMC2 DLL software reset.

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RX_TAP_SEL_ACK	LOCK
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **RX_TAP_SEL_ACK**:
1: The RX delay switched to the tap value specified in RX_TAP_SEL[5:0].

Bit 0 **LOCK**:
1: The DLL is locked.

23.2.9 SYSCFG SDMMC2 control register (SYSCFG_SDMMC2CR)

Address offset: 0x808

Reset value: 0x0000 0000

Reset by system reset and SDMMC2 software reset.

Write access according to SDMMC2 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDMMC2_VSEL
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **SDMMC2_VSEL**: Voltage selection

Change the value of the SDVSEL2 pin output to control the voltage on pins for external card. Need AFMUX selection.

1: Change the voltage to low-voltage range (1.8 V typ).

0: Change the voltage to high-voltage range (3.3 V typ).

Note: There must be a control circuit out of SDMMC2 to change the voltage on pins.

23.2.10 SYSCFG SDMMC2 address remapping control register (SYSCFG_SDMMC2ARCR)

Address offset: 0x80C

Reset value: 0x0000 0000

Reset by system reset.

Write access according to SDMMC2 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	AREN
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **AREN**: Address remapping enable

Enable the address remapping logic in front of the SDMMC2 AHB master. Remapping allows SDMMC2 (only 32bit addressing supported by the master) to access the 4GB of the DDR.

1: Address remapping is enabled. The 4GB address space accessible by the master starts at address 0x80000000.

0: Address remapping is not enabled. The 4GB address space accessible by the master starts at address 0x0.

23.2.11 SYSCFG DLYBSD3 control register (SYSCFG_DLYBSD3CR)

Address offset: 0xC00

Reset value: 0x0040 0000

Reset by system reset and SDMMC3 DLL software reset.

Write access according to SDMMC3 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **ANTIGLITCH_EN**: Anti-glitch logic enable

1: The anti-glitch logic is enabled. This ensures that there is no glitch on the clock line when the tap value is modified.

Bits 21:17 **BYP_CMD[4:0]**: Delay unit when in DLL bypass mode

00000: Reserved

00001: 1 delay element enabled

00010: 2 delay elements enabled

...

11000: all 24 delay elements enabled

11001: all 24 delay elements enabled

...

11111: all 24 delay elements enabled

Bit 16 **BYP_EN**: DLL bypass mode enable

1: DLL bypass mode is enabled. In bypass mode the DLL is used in pure delay mode and there is no VT compensation. The command applied to every delay unit is set by DLL_BYP_CMD[4:0] and a tap value must be selected with RX_TAP_SEL[5:0]. In bypass mode, the total delay is given by (delay unit) x tap number selected.

0: DLL lock mode is selected.

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:1 **RX_TAP_SEL[5:0]**: TAP delay for RX clock selection
000000: 0 tap selected
000001: 1 tap selected
....
000010: 2 taps selected
....
011111: 31 taps selected
100000: 32 taps selected

Bit 0 **EN**:
1: The DLL is enabled when configured in lock mode (BYP_EN = 0).

23.2.12 SYSCFG DLYBSD3 status register (SYSCFG_DLYBSD3SR)

Address offset: 0xC04

Reset value: 0x0000 0002

Reset by system reset and SDMMC3 DLL software reset.

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RX_TAP_SEL_ACK	LOCK
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **RX_TAP_SEL_ACK**:
1: The RX delay has switched to the tap value specified in RX_TAP_SEL[5:0].

Bit 0 **LOCK**:
1: The DLL is locked.

23.2.13 SYSCFG SDMMC3 address remapping control register (SYSCFG_SDMMC3ARCR)

Address offset: 0xC0C

Reset value: 0x0000 0000

Reset by system reset.

Write access according to SDMMC3 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	AREN
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **AREN**: Address remapping enable

Enable the address remapping logic in front of the SDMMC3 AHB master. Remapping allows SDMMC3 (only 32bit addressing supported by the master) to access the 4GB of the DDR.

1: Address remapping is enabled. The 4GB address space accessible by the master starts at address 0x80000000.

0: Address remapping is not enabled. The 4GB address space accessible by the master starts at address 0x0.

23.2.14 SYSCFG DLYBOS1 control register (SYSCFG_DLYBOS1CR)

Address offset: 0x1000

Reset value: 0x0000 0000

Reset by system reset and OCTOSPI1 DLL software reset.

Write access according to OCTOSPI1 RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	TX_TAP_SEL[5:0]						RX_TAP_SEL[5:0]						EN
			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:17 **BYP_CMD[4:0]**: Delay unit when in DLL bypass mode
00000: Reserved
00001: 1 delay element enabled
00010: 2 delay elements enabled
...
11000: all 24 delay elements enabled
11001: all 24 delay elements enabled
...
11111: all 24 delay elements enabled

Bit 16 **BYP_EN**: DLL bypass mode enable
1: DLL bypass mode is enabled. In bypass mode the DLL is used in pure delay mode and there is no VT compensation. The command applied to every delay unit is set by DLL_BYP_CMD[4:0] and a tap value must be selected with RX_TAP_SEL[5:0]. In bypass mode, the total delay is given by (delay unit) x tap number selected.
0: DLL lock mode is selected.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:7 **TX_TAP_SEL[5:0]**: TAP delay for TX clock selection
000000: 0 tap selected
000001: 1 tap selected
....
000010: 2 taps selected
....
011111: 31 taps selected
100000: 32 taps selected

Bits 6:1 **RX_TAP_SEL[5:0]**: TAP delay for RX clock selection
000000: 0 tap selected
000001: 1 tap selected
....
000010: 2 taps selected
....
011111: 31 taps selected
100000: 32 taps selected

Bit 0 **EN**:
1: The DLL is enabled when configured in lock mode (BYP_EN = 0).

23.2.15 SYSCFG DLYBOS1 status register (SYSCFG_DLYBOS1SR)

Address offset: 0x1004

Reset value: 0x0000 0006

Reset by system reset and OCTOSPI1 DLL software reset.

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **TX_TAP_SEL_ACK**:
1: The TX delay has switched to the tap value specified in TX_TAP_SEL[5:0].

Bit 1 **RX_TAP_SEL_ACK**:
1: The RX delay has switched to the tap value specified in RX_TAP_SEL[5:0].

Bit 0 **LOCK**:
1: The DLL is locked.

23.2.16 SYSCFG potential tamper reset control register (SYSCFG_POTTAMPRSTCR)

Address offset: 0x1804

Reset value: 0x0000 0000

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	POTTAMPRESETMASK
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **POTTAMPRESETMASK**:
This bit can be set by software to mask PKA, SAES, CRYP1/2, and HASH reset in case of potential tamper.
0: PKA, SAES, CRYP1/2, and HASH reset in case of potential tamper
1: PKA, SAES, CRYP1/2, and HASH not reset in case of potential tamper

23.2.17 SYSCFG M33SS control register (SYSCFG_M33SSCR)

Address offset: 0x1C00

Reset value: 0x0000 0000

Reset by system reset.

Write access according to ICACHE_DCACHE RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FPU_IT_EN[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **LOCKSAU**:
Prevent changes to secure SAU memory regions already programmed.

Bit 19 **LOCKNSMPU**:
Prevent changes to non-secure MPU memory regions already programmed.

Bit 18 **LOCKSMPU**:
Prevent changes to programmed secure MPU memory regions.

Bit 17 **LOCKNSVTOR**:
Prevent changes to non-secure vector table base address.

Bit 16 **LOCKSVTAIRCR**:
Prevent changes to:
– secure vector table base address
– secure interrupt priority handling
– BusFault, HardFault, and NMI security target settings in the processor

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:0 **FPU_IT_EN[5:0]**: Floating point unit interrupt enable
FPU_IT_EN[5]: Input abnormal interrupt enable
FPU_IT_EN[4]: Inexact interrupt enable
FPU_IT_EN[3]: Underflow interrupt enable
FPU_IT_EN[2]: Overflow interrupt enable
FPU_IT_EN[1]: Divide-by-zero interrupt enable
FPU_IT_EN[0]: Invalid operation Interrupt enable

23.2.18 SYSCFG ICN QOS priority control register 1 (SYSCFG_ICNQPCR1)

Address offset: 0x2000

Reset value: 0xCCCB BB3E

Reset by system reset.
Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

										rw		rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bit 5 **OTG_EARLY_WR_RSP_ENABLE**: OTG early write response enable

0: Early write response disabled. The last AHB write data beat receives the AXI buffered response for the complete AHB transaction.

1: Early write response enabled. AHB-Lite write data beats receive an automatic OKAY response from the AHB-to-AXI bridge irrespective of the B-channel AXI response.

Bit 4 Reserved, must be kept at reset value.

Bit 3 **SDMMC3_EARLY_WR_RSP_ENABLE**: SDMMC3 early write response enable

0: Early write response disabled. The last AHB write data beat receives the AXI buffered response for the complete AHB transaction.

1: Early write response enabled. AHB-Lite write data beats receive an automatic OKAY response from the AHB-to-AXI bridge irrespective of the B-channel AXI response.

Bit 2 **SDMMC2_EARLY_WR_RSP_ENABLE**: SDMMC2 early write response enable

0: Early write response disabled. The last AHB write data beat receives the AXI buffered response for the complete AHB transaction.

1: Early write response enabled. AHB-Lite write data beats receive an automatic OKAY response from the AHB-to-AXI bridge irrespective of the B-channel AXI response.

Bit 1 **SDMMC1_EARLY_WR_RSP_ENABLE**: SDMMC1 early write response enable

0: Early write response disabled. The last AHB write data beat receives the AXI buffered response for the complete AHB transaction.

1: Early write response enabled. AHB-Lite write data beats receive an automatic OKAY response from the AHB-to-AXI bridge irrespective of the B-channel AXI response.

Bit 0 **USBH_EARLY_WR_RSP_ENABLE**: USBH (OHCI and EHCI) early write response enable

0: Early write response disabled. The last AHB write data beat receives the AXI buffered response for the complete AHB transaction.

1: Early write response enabled. AHB-Lite write data beats receive an automatic OKAY response from the AHB-to-AXI bridge irrespective of the B-channel AXI response.

23.2.21 SYSCFG ICN end-to-end bandwidth regulation control register (SYSCFG_ICNE2EBWRCR)

Address offset: 0x2014

Reset value: 0x0000 0052

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

						rw	rw		rw	rw	rw		rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **CFG_HPDMA_BW**:
Triple the bandwidth (BW) allowed to HPDMA1/2/3 by the regulation.
0: Normal bandwidth allocated to HPDMA1/2/3
1: Increased bandwidth allocated to HPDMA1/2/3
Note: This additional bandwidth is preempted from other peripherals, that may thus face real-time issues. Keep default setting unless ST recommendation.

Bit 8 **CFG_CPU1_BW**:
Triple the bandwidth allowed to the CPU1 by the regulation.
0: Normal bandwidth allocated to HPDMA1/2/3
1: Increased bandwidth allocated to HPDMA1/2/3
Note: This additional bandwidth is preempted from other peripherals, that may thus face real-time issues. Keep default setting unless ST recommendation.

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **CFG_ALL_TGT[2:0]**: Amount of empty CAM slots in DDR-CTRL that the regulation targets
000: 9 empty slots targeted
001: 11 empty slots targeted
010: 13 empty slots targeted
011: 15 empty slots targeted
100: 17 empty slots targeted
101: 20 empty slots targeted (default)
110: 24 empty slots targeted
111: 28 empty slots targeted

Bit 3 Reserved, must be kept at reset value.

Bits 2:1 **CFG_MODEL[1:0]**:
Defines the reactivity of the regulation feedback.
00: Slow reaction (risk of congestion if the regulation reacts too slow)
11: Fast reaction (risk of oscillation if the regulation reacts too fast)

Bit 0 **CFG_ENABLE**:

Activates the end-to-end bandwidth regulation.

0: Regulation disabled. Peripheral bus masters access without constrain into the STNoC AXI network-on-chip.

1: Regulation enabled. The regulation favors the high QoS, and limits some bandwidths.

23.2.22 SYSCFG safe reset control register (SYSCFG_SAFERSTCR)

Address offset: 0x2018

Reset value: 0x0000 0000

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CFG_ENABLE
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **CFG_ENABLE**:

Activates the safe reset connector.

0: Safe reset connector disabled

1: Safe reset connector enabled

23.2.23 SYSCFG ICN ETH bandwidth limiter control register (SYSCFG_ICNETHBWLCR)

Address offset: 0x2020

Reset value: 0x0000 1002

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MAXABW[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	BWLEN	Res.
rw	rw	rw	rw	rw	rw	rw	rw							rw	

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **MAXABW[7:0]**: Maximum allowed bandwidth

Configures the maximum allowed bandwidth for each ETH (read and write traffic) in proportion of the link throughput in one direction, 2.4 GB/s with a default clock configuration:

0: Reserved
1: Bandwidth limited at 1/128 of 2.4 GB/s.
2: Bandwidth limited at 2/128 of 2.4 GB/s.
255: Bandwidth limited at 255/128 of 2.4 GB/s.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **BWLEN**: Bandwidth limiter enable

Activates the ETHs bandwidth limiter.

0: Bandwidth limiter disabled
1: Bandwidth limiter enabled

Bit 0 Reserved, must be kept at reset value.

23.2.24 SYSCFG ICN CPU1 bandwidth limiter control register (SYSCFG_ICNCPU1BWLCR)

Address offset: 0x2028

Reset value: 0x0000 1802

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MAXABW[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	BWLEN	Res.
rw	rw	rw	rw	rw	rw	rw	rw							rw	

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **MAXABW[7:0]**: Maximum allowed bandwidth

Configures the maximum allowed bandwidth for the CPU1 (read and write traffic) in proportion of the link throughput in one direction, 9.6 GB/s with a default clock configuration:

0: Reserved
1: Bandwidth limited at 1/128 of 9.6 GB/s.
2: Bandwidth limited at 2/128 of 9.6 GB/s.
255: Bandwidth limited at 255/128 of 9.6 GB/s.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **BWLEN**: Bandwidth limiter enable

Activates the CPU1 bandwidth limiter.

0: Bandwidth limiter disabled
1: Bandwidth limiter enabled

Bit 0 Reserved, must be kept at reset value.

23.2.25 SYSCFG ICN LTDC bandwidth limiter control register (SYSCFG_ICNLTDCBWLCR)

Address offset: 0x202C

Reset value: 0x0000 1E02

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MAXABW[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	BWL EN	Res.
rw	rw	rw	rw	rw	rw	rw	rw							rw	

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **MAXABW[7:0]**: Maximum allowed bandwidth

Configures the maximum allowed bandwidth for the LTDC (read and write traffic) in proportion of the link throughput in one direction, 3.2 GB/s with a default clock configuration:

0: Reserved
1: Bandwidth limited at 1/128 of 3.2 GB/s.
2: Bandwidth limited at 2/128 of 3.2 GB/s.
255: Bandwidth limited at 255/128 of 3.2 GB/s.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **BWLEN**: Bandwidth limiter enable

Activates the LTDC bandwidth limiter.
0: Bandwidth limiter disabled
1: Bandwidth limiter enabled

Bit 0 Reserved, must be kept at reset value.

23.2.26 SYSCFG ICN DCMIPP bandwidth limiter control register (SYSCFG_ICNDCMIPPBWLCR)

Address offset: 0x2030

Reset value: 0x0000 2402

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MAXABW[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	BWL EN	Res.
rw	rw	rw	rw	rw	rw	rw	rw							rw	

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **MAXABW[7:0]**: Maximum allowed bandwidth

Configures the maximum allowed bandwidth for the DCMIPP (only write traffic) in proportion of the link throughput in one direction, 3.2 GB/s with a default clock configuration:

0: Reserved

1: Bandwidth limited at 1/128 of 3.2GB/s.

2: Bandwidth limited at 2/128 of 3.2GB/s.

255: Bandwidth limited at 255/128 of 3.2GB/s.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **BWLEN**: Bandwidth limiter enable

Activates the DCMIPP bandwidth limiter.

0: Bandwidth limiter disabled

1: Bandwidth limiter enabled

Bit 0 Reserved, must be kept at reset value.

23.2.27 SYSCFG ICN HPDMA bandwidth limiter control register (SYSCFG_ICNHPDMABWLCR)

Address offset: 0x2038

Reset value: 0x0000 4802

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MAXABW[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	BWL EN	Res.
rw	rw	rw	rw	rw	rw	rw	rw							rw	

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:8 **MAXABW[7:0]**: Maximum allowed bandwidth

Configures the maximum allowed bandwidth for the HPDMA (only write traffic) in proportion of the link throughput in one direction, 3.2 GB/s with a default clock configuration:

0: Reserved

1: Bandwidth limited at 1/128 of 3.2GB/s.

2: Bandwidth limited at 2/128 of 3.2GB/s.

255: Bandwidth limited at 255/128 of 3.2GB/s.

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **BWLEN**: Bandwidth limiter enable

Activates the HPDMA bandwidth limiter.

0: Bandwidth limiter disabled

1: Bandwidth limiter enabled

Bit 0 Reserved, must be kept at reset value.

23.2.28 SYSCFG HPDMA address remapping control register (SYSCFG_HPDMAARCR)

Address offset: 0x2050

Reset value: 0x0000 0000

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HPDMA3AREN	HPDMA2AREN	HPDMA1AREN
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **HPDMA3AREN**: Address remapping enable

Enable the address remapping logic in front of the HPDMA3 AXI master. Remapping allows HPDMA3 AXI master (only 32bit addressing supported by the master) to access the 4GB of the DDR. The AHB master is not impacted by the remapping logic.

1: Address remapping is enabled. The 4GB address space accessible by the master starts at address 0x80000000.

0: Address remapping is not enabled. The 4GB address space accessible by the master starts at address 0x0.

Bit 1 **HPDMA2AREN**: Address remapping enable

Enable the address remapping logic in front of the HPDMA2 AXI master. Remapping allows HPDMA2 AXI master (only 32bit addressing supported by the master) to access the 4GB of the DDR. The AHB master is not impacted by the remapping logic.

1: Address remapping is enabled. The 4GB address space accessible by the master starts at address 0x80000000.

0: Address remapping is not enabled. The 4GB address space accessible by the master starts at address 0x0.

Bit 0 **HPDMA1AREN**: Address remapping enable

Enable the address remapping logic in front of the HPDMA1 AXI master. Remapping allows HPDMA1 AXI master (only 32bit addressing supported by the master) to access the 4GB of the DDR. The AHB master is not impacted by the remapping logic.

1: Address remapping is enabled. The 4GB address space accessible by the master starts at address 0x80000000.

0: Address remapping is not enabled. The 4GB address space accessible by the master starts at address 0x0.

23.2.29 SYSCFG USB2PHY1 control register (SYSCFG_USB2PHY1CR)

Address offset: 0x2400

Reset value: 0x0000 0015

Reset by system reset.

Write access according to USBH RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	USB2PHY1SEL[2:0]			Res.	USB2PHY1CMN	AUTORSMENB1	RETENABLEN1
									rw	rw	rw		rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **USB2PHY1SEL[2:0]**: PHY reference clock speed setting
000: 19.2 MHz
001: 20 MHz (default)
010: 24 MHz
Others: Reserved

Bit 3 Reserved, must be kept at reset value.

Bit 2 **USB2PHY1CMN**:
Controls power down of analog blocks during Suspend and Sleep.
0: PHY clocks are kept active during Suspend and Sleep (with the exception of PHYCLK). The PLL is on. Requires to keep the PHY reference clock on.
1: PHY clocks are off during Suspend and Sleep. PLL is off (default).

Bit 1 **AUTORSMENB1**: Auto-resume mode enable
Enables auto-resume logic in femtoPHY. The PHY automatically responds to a remote wake-up without initial involvement of the Host controller.
0: Auto-resume disabled (default
1: A pulse on this bit prior to enabling the retention mode, enables the auto-resume mode.

Bit 0 **RETENABLEN1**: Retention mode enable (active low)
0: Retention mode enabled
1: Retention mode disabled (default)

23.2.30 SYSCFG USB2PHY1 battery charging control register (SYSCFG_USB2PHY1BCCR)

Address offset: 0x2404

Reset value: 0x0000 0000

Reset by system reset.

Write access according to USBH RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **H_FORCEBCMODE**:

Forces USB2PHY1 in non-driving suspend mode. This is the recommended mode to perform battery charging procedure.

0: Normal mode. SUSPENDM0 and OPMODE0 inputs of USB2PHY1 are managed by the USB2 Host controller (default).

1: OPMODE0[1:0] is forced to non-driving, and SUSPENDM0 is forced to active.

Bit 2 **H_VDMSRCEN**: Voltage source on DM for CDP port enable

0: Voltage source disabled (default)

1: Voltage source enabled

Bit 1 **H_CDPDETEN**: Voltage detector on DP for CDP port enable

0: voltage detector on DP disabled (default)

1: voltage detector on DP enabled

Bit 0 **H_CDPEN**: CDP behavior for Host port enable

0: CDP behavior disabled (Host port behaves as an SDP) (default)

1: CDP behavior enabled

23.2.31 SYSCFG USB2PHY1 battery charging status register (SYSCFG_USB2PHY1BCSR)

Address offset: 0x2408

Reset value: 0x0000 0000

Reset by system reset.

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FSVMINUS	FSVPLUS	CHGDET
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **FSVMINUS**: Voltage level on DM (also output of the comparison with VLGC threshold, as defined in BC v1.2 standard)
0: VDM < VLGC
1: VDM > VLGC

Bit 1 **FSVPLUS**: Voltage level on DP (also output of the comparison with VLGC threshold, as defined in BC v1.2 standard)
0: VDP < VLGC
1: VDP > VLGC

Bit 0 **CHGDET**: Comparison of voltage on DP with VDAT_REF threshold as defined in BC v1.2 standard
0: VDP < VDAT_REF
1: VDP > VDAT_REF

23.2.32 SYSCFG USB2PHY1 trimming 1 control register (SYSCFG_USB2PHY1TRIM1CR)

Address offset: 0x240C

Reset value: 0x299E D6F0

Reset by system reset.

Write access according to USBH RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	USB2PHY1TXRESTUNE[1:0]		USB2PHY1TXRISETUNE[1:0]		USB2PHY1TXVREFTUNE[3:0]				USB2PHY1TXFSLSTUNE[3:0]				USB2PHY1TXHSXVTUNE[1:0]		USB2PHY1OTGTUNE[2]

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:29 **USB2PHY1TXRESTUNE[1:0]**: USB source impedance adjustment

In some applications, there is significant series resistance on DP and DM paths between the transceiver and the cable. This bitfield adjusts the driver source impedance to compensate for added series resistance on the USB. Any setting other than the default one can result in source impedance variation across process, voltage and temperature that does not meet USB2.0 specifications limits.

11: Source impedance decreased by approximately 5.6 ?

10: Source impedance decreased by approximately 3.6 ?

01: Nominal

00: Source impedance increased by approximately 1.3 ?

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 28:27 **USB2PHY1TXRISETUNE[1:0]**: High-speed transmitter rise/fall time adjustment

This bitfield is used to adjust rise/fall times of the high-speed waveform.

11: -8.1%

10: -7.2%

01: Nominal

00: +5.4%

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 26:23 **USB2PHY1TXVREFTUNE[3:0]**: HS DC voltage level adjustment

This bitfield is used to adjust the high-speed (HS) DC level voltage. When the PHY is in a Host role, any adjustment of the HS transmit voltage level tune bits (TXVREFTUNE) may also request a change to the HS disconnect detection threshold (COMPDISTUNE).

1111: +24%
1110: +22%
1101: +20%
1100: +18%
1011: +16%

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 22:19 **USB2PHY1TXFSLSTUNE[3:0]**: Full-speed (FS)/low-speed (LS) source impedance adjustment

This bit field is used to adjust FS and LS single-ended source impedance while driving high. The following adjustment values are based on nominal process, voltage and temperature.

1111: -10.7%
0111: -5.6%
0011: Nominal
0001: +6.5%
0000: +14%
Other: reserved

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 18:17 **USB2PHY1TXHSXVTUNE[1:0]**: Transmitter high-speed crossover adjustment

This bitfield is used to adjust the voltage at which DP and DM signals cross while transmitting in high-speed mode.

11: Nominal
10: +15 mV
01: -15 mV
00: Reserved

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 16:14 **USB2PHY1OTGTUNE[2:0]**: V_{BUS} valid threshold adjustment

This bitfield is used to adjust the voltage level for the V_{BUS} valid threshold.

111: +12%
110: +9%
101: +6%
100: +3%
011: Nominal

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	USB2PHY1TXPREEMPPULSETUNE	USB2PHY1TXPREEMPAMPTUNE[1:0]	
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **USB2PHY1TXPREEMPPULSETUNE**: HS transmitter preemphasis duration control

This bit controls the duration for which the HS preemphasis current is sourced onto DM or DP. The HS transmitter preemphasis duration is defined in terms of unit amounts. One unit of preemphasis duration is approximately 580 ps, and is defined as 1x preemphasis duration. This bit is valid only if TXPREEMPAMPTUNE[0] or TXPREEMPAMPTUNE[1] is set to 1.

1: 1x, short pre-emphasis current duration

0: 2x, long pre-emphasis current duration

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 1:0 **USB2PHY1TXPREEMPAMPTUNE[1:0]**: HS transmitter preemphasis current control

This bitfield controls the amount of current sourced to DP and DM after a J-to-K or K-to-J transition. The HS transmitter preemphasis current is defined in terms of unit amounts. One unit amount is approximately 600 ?A, and is defined as 1x pre-emphasis current.

11: HS transmitter preemphasis circuit sources 3x preemphasis current

10: HS transmitter preemphasis circuit sources 2x preemphasis current

01: HS transmitter preemphasis circuit sources 1x preemphasis current

00: HS transmitter preemphasis disabled

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

23.2.34 SYSCFG USBH control register (SYSCFG_USBHCR)

Address offset: 0x2420

Reset value: 0x0000 0000

Reset by system reset.

Write access according to USBH RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **USB2PHY2SEL[2:0]**: PHY reference clock speed setting
000: 19.2 MHz
001: 20 MHz (default)
010: 24 MHz
Others: Reserved

Bit 3 Reserved, must be kept at reset value.

Bit 2 **USB2PHY2CMN**: Control of power down of analog blocks during Suspend and Sleep
0: PHY clocks are kept active during Suspend and Sleep (with the exception of PHYCLK). The PLL is on. Requires to keep the PHY reference clock on.
1: PHY clocks are off during Suspend and Sleep. PLL is off (default)

Bit 1 **AUTORSMENB2**: Auto-resume mode enable
This bit enables auto-resume logic in femtoPHY. The PHY automatically responds to a remote wake-up without initial involvement of the Host controller.
0: Auto-resume is disabled (default).
1: A pulse on this bit prior to enabling the retention mode, enables the auto-resume mode.

Bit 0 **RETENABLEN2**: Retention mode enable (active low)
0: Retention mode enabled
1: Retention mode disabled (default)

23.2.37 SYSCFG USB2PHY2 trimming 1 control register (SYSCFG_USB2PHY2TRIM1CR)

Address offset: 0x2808

Reset value: 0x299E D6F0

Reset by system reset.

Write access according to OTG RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:29 **USB2PHY2TXRESTUNE[1:0]**: USB source impedance adjustment

In some applications there is significant series resistance on DP and DM paths between the transceiver and the cable. This bitfield is used to adjust the driver source impedance to compensate for added series resistance on the USB. Any setting other than the default one can result in source impedance variation across process, voltage and temperature that does not meet USB2.0 specifications limits.

11: Source impedance decreased by approximately 5.6 ?

10: Source impedance decreased by approximately 3.6 ?

01: Nominal

00: Source impedance increased by approximately 1.3 ?

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 28:27 **USB2PHY2TXRISETUNE[1:0]**: HS transmitter rise/fall time adjustment

This bitfield is used to adjust the rise/fall times of the high-speed waveform.

11: -8.1%

10: -7.2%

01: Nominal

00: +5.4%

Note: A strapping option must be set prior to USB2PHY reset, and must remain static during normal operation.

Bits 26:23 **USB2PHY2TXVREFTUNE[3:0]**: HS DC voltage level adjustment

This bitfield is used to adjust the HS DC level voltage. When the PHY is in a Host role, any adjustment of the HS transmit voltage level tune bits (TXVREFTUNE) may also request a change to the HS disconnect detection threshold (COMPDISTUNE).

23.2.44 SYSCFG VDDIO3 compensation cell control register (SYSCFG_VDDIO3CCCR)

Address offset: 0x4000

Reset value: 0x0000 0078

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	LPMDIS	CS	EN	RAPSRC[3:0]				RANSRC[3:0]			
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **LPMDIS**: V_{DDIO3} I/Os Compensation cell low power mode disable.

0: IO compensation is disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes.

1: IO compensation is not disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes.

Bit 9 **CS**: I/Os supplied by V_{DDIO3} code selection

This bit selects the code to be applied for the compensation cell of I/Os supplied by V_{DDIO3}.

0: V_{DDIO3} I/O code from the cell (available in SYSCFG_VDDIO3CCSR)

1: V_{DDIO3} I/O code from RANSRC[3:0] and RAPSRC[3:0] register values

Note: CS = 0 is not taken into account until READY = 1. This means that, whenever CS, RANSRC[3:0] and RAPSRC[3:0] are used for I/O compensation when the compensation cell is not enabled (EN = 0, which is the case after a reset).

Bit 8 **EN**: I/Os supplied by V_{DDIO3} compensation cell enable

This bit enables the compensation cell of the I/Os supplied by V_{DDIO3}.

0: V_{DDIO3} I/Os compensation cell disabled

1: V_{DDIO3} I/Os compensation cell enabled

Note: The HSI oscillator must be enabled and ready (controlled in RCC) before EN can be set to 1. Similarly, the HSI oscillator can be disabled only if EN is set to 0.

Bits 7:4 **RAPSRC[3:0]**: PMOS compensation code of the I/Os supplied by V_{DDIO3}

These bits are written by software to define an I/O compensation code for PMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.

Bits 3:0 **RANSRC[3:0]**: NMOS compensation code of the I/Os supplied by V_{DDIO3}

These bits are written by software to define an I/O compensation code for NMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.

23.2.45 SYSCFG VDDIO3 compensation cell status register (SYSCFG_VDDIO3CCSR)

Address offset: 0x4004

Reset value: 0x0000 0000

Reset by system reset.

Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	READY	APSRC[3:0]				ANSRC[3:0]			
							r	r	r	r	r	r	r	r	r

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **READY**: V_{DDIO3} I/O compensation cell ready flag

This bit provides the compensation cell status of the I/Os supplied by V_{DDIO3}

0: V_{DDIO3} I/O compensation cell not ready

1: V_{DDIO3} I/O compensation cell ready

Note: The HSI clock is required for the compensation cell to work properly. The compensation cell READY bit is not set if the HSI clock is not enabled.

Bits 7:4 **APSRC[3:0]**: PMOS compensation value of the I/Os supplied by V_{DDIO3}

This value is provided by the cell and can be used by the CPU to compute an I/O compensation cell code for PMOS transistors. This code is applied to the I/O compensation cell when CS in SYSCFG_VDDIO3CCCR is reset, and READY is set.

Bits 3:0 **ANSRC[3:0]**: NMOS compensation value of the I/Os supplied by V_{DDIO3}

This value is provided by the cell and can be used by the CPU to compute an I/O compensation cell code for NMOS transistors. This code is applied to the I/O compensation cell when CS in SYSCFG_VDDIO3CCCR is reset, and READY is set.

23.2.46 SYSCFG VDD compensation cell control register (SYSCFG_VDDCCCR)

Address offset: 0x4010

Reset value: 0x0000 0078

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	LPMDIS	CS	EN	RAPSRC[3:0]				RANSRC[3:0]			
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **LPMDIS**: V_{DD} I/Os Compensation cell low power mode disable.

0: IO compensation is disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes.

1: IO compensation is not disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes.

Bit 9 **CS**: V_{DD} I/O code selection

This bit selects the code to be applied for the compensation cell of the I/Os supplied by V_{DD}.

0: V_{DD} I/O code from the cell (available in SYSCFG_VDDCCSR)

1: V_{DD} I/O code from RANSRC[3:0] and RAPSRC[3:0] values

Note: CS = 0 is not taken into account until READY = 1. This means that whenever CS, RANSRC[3:0] and RAPSRC[3:0] are used for IO compensation when the compensation cell is not enabled (EN = 0, which is the case after a reset).

Bit 8 **EN**: V_{DD} I/O compensation cell enable

This bit enables the compensation cell of the I/Os supplied by V_{DD}.

0: V_{DD} I/Os compensation cell disabled

1: V_{DD} I/Os compensation cell enabled

Note: The HSI oscillator must be enabled and ready (controlled in RCC) before EN can be set to 1. Similarly, the HSI oscillator can be disabled only if EN is set to 0.

Bits 7:4 **RAPSRC[3:0]**: PMOS compensation code of the I/Os supplied by V_{DD}

These bits are written by software to define an I/O compensation code for PMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.

Bits 3:0 **RANSRC[3:0]**: NMOS compensation code of the I/Os supplied by V_{DD}

These bits are written by software to define an I/O compensation code for NMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.

23.2.47 SYSCFG VDD compensation cell status register (SYSCFG_VDDCCSR)

Address offset: 0x4014

Reset value: 0x0000 0000

Reset by system reset.

Any read access is allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	READY	APSRC[3:0]				ANSRC[3:0]			
							r	r	r	r	r	r	r	r	r

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **READY**: V_{DD} I/O compensation cell ready flag
This bit provides the compensation cell status of the I/Os supplied by V_{DD}.
0: V_{DD} I/O compensation cell not ready
1: V_{DD} I/O compensation cell ready
Note: The HSI clock is required for the compensation cell to work properly. The compensation cell READY bit is not set if the HSI clock is not enabled.

Bits 7:4 **APSRC[3:0]**: PMOS compensation value of the I/Os supplied by V_{DD}
This value is provided by the cell and can be used by the CPU to compute an I/O compensation cell code for PMOS transistors. This code is applied to the I/O compensation cell when CS in SYSCFG_VDDCCCR is reset, and the READY bit is set.

Bits 3:0 **ANSRC[3:0]**: NMOS compensation value of the I/Os supplied by V_{DD}
This value is provided by the cell and can be used by the CPU to compute an I/O compensation cell code for NMOS transistors. This code is applied to the I/O compensation cell when CS in SYSCFG_VDDCCCR is reset, and the READY bit is set.

23.2.48 SYSCFG VDDIO2 compensation cell control register (SYSCFG_VDDIO2CCCR)

Address offset: 0x4018

Reset value: 0x0000 0078

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed on this register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **LPMDIS**: V_{DDIO2} I/Os Compensation cell low power mode disable.
0: IO compensation is disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes.
1: IO compensation is not disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes.

Bit 9 **CS**: V_{DDIO2} I/O code selection
This bit selects the code to be applied for the compensation cell of I/Os supplied by V_{DDIO2}.
0: V_{DDIO2} I/O code from the cell (available in the SYSCFG_VDDIO2CCSR)
1: V_{DDIO2} I/O code from RANSRC[3:0] and RAPSRC[3:0] register values
Note: CS = 0 is not taken into account until READY = 1. This means that whenever CS, RANSRC[3:0] and RAPSRC[3:0] are used for I/O compensation when the compensation cell is not enabled (EN = 0, which is the case after a reset).

Bit 8 **EN**: V_{DDIO2} I/O compensation cell enable
This bit enables the compensation cell of the I/Os supplied by V_{DDIO2}.
0: V_{DDIO2} I/O compensation cell disabled
1: V_{DDIO2} I/O compensation cell enabled
Note: The HSI oscillator must be enabled and ready (controlled in RCC) before EN can be set to 1. Similarly, the HSI oscillator can be disabled only if EN is set to 0.

Bits 7:4 **RAPSRC[3:0]**: PMOS compensation code of the I/Os supplied by V_{DDIO2}
These bits are written by software to define an I/O compensation code for PMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.

Bits 3:0 **RANSRC[3:0]**: NMOS compensation code of the I/Os supplied by V_{DDIO2}
These bits are written by software to define an I/O compensation code for NMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.

23.2.49 SYSCFG VDDIO2 compensation cell status register (SYSCFG_VDDIO2CCSR)

Address offset: 0x401C

Reset value: 0x0000 0000

Reset by system reset.

Any read access is allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	READY	APSRC[3:0]				ANSRC[3:0]			
							r	r	r	r	r	r	r	r	r

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **READY**: V_{DDIO2} I/O compensation cell ready flag
This bit provides the compensation cell status of the I/Os supplied by V_{DDIO2}.
0: V_{DDIO2} I/O compensation cell not ready
1: V_{DDIO2} I/O compensation cell ready
Note: The HSI clock is required for the compensation cell to work properly. The compensation cell READY bit is not set if the HSI clock is not enabled.

Bits 7:4 **APSRC[3:0]**: PMOS compensation value of the I/Os supplied by V_{DDIO2}
This value is provided by the cell and can be used by the CPU to compute an I/O compensation cell code for PMOS transistors. This code is applied to the I/O compensation cell when CS in SYSCFG_VDDIO2CCCR is reset, and the READY bit is set.

Bits 3:0 **ANSRC[3:0]**: NMOS compensation value of the I/Os supplied by V_{DDIO2}
This value is provided by the cell and can be used by the CPU to compute an I/O compensation cell code for NMOS transistors. This code is applied to the I/O compensation cell when CS in SYSCFG_VDDIO2CCCR is reset, and the READY bit is set.

23.2.50 SYSCFG VDDIO1 compensation cell control register (SYSCFG_VDDIO1CCCR)

Address offset: 0x4020

Reset value: 0x0000 0078

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	LPMDIS	CS	EN	RAPSRC[3:0]				RANSRC[3:0]			
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **LPMDIS**: V_{DDIO1} I/Os Compensation cell low power mode disable.
- 0: IO compensation is disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes.
- 1: IO compensation is not disabled by hardware when the system enters Stop, LP-Stop and LPLV-stop modes.

Bit 9 **CS**: V_{DDIO1} I/O code selection

This bit selects the code to be applied for the compensation cell of I/Os supplied by V_{DDIO1}.
- 0: V_{DDIO1} I/O code from the cell (available in SYSCFG_VDDIO1CCSR)
- 1: V_{DDIO1} I/O code from RANSRC[3:0] and RAPSRC[3:0] values

Note: CS = 0 is not taken into account until READY = 1.This means that whenever CS, RANSRC[3:0] and RAPSRC[3:0] are used for I/O compensation when the compensation cell is not enabled (EN = 0, which is the case after a reset).

Bit 8 **EN**: V_{DDIO1} I/O compensation cell enable

This bit enables the compensation cell of the I/Os supplied by V_{DDIO1}.
- 0: V_{DDIO1} I/O compensation cell disabled
- 1: V_{DDIO1} I/O compensation cell enabled

Note: The HSI oscillator must be enabled and ready (controlled in RCC) before EN can be set to 1. Similarly, the HSI oscillator can be disabled only if EN is set to 0.

Bits 7:4 **RAPSRC[3:0]**: PMOS compensation code of the I/Os supplied by V_{DDIO1}

These bits are written by software to define an I/O compensation code for PMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.

Bits 3:0 **RANSRC[3:0]**: NMOS compensation code of the I/Os supplied by V_{DDIO1}

These bits are written by software to define an I/O compensation code for NMOS transistors. This code is applied to the I/O compensation cell when the CS bit is set.

23.2.51 SYSCFG VDDIO1 compensation cell status register (SYSCFG_VDDIO1CCSR)

Address offset: 0x4024

Reset value: 0x0000 0000

Reset by system reset.

Any read access is allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	READY	APSRC[3:0]				ANSRC[3:0]			
							r	r	r	r	r	r	r	r	r

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **READY**: V_{DDIO1} I/O compensation cell ready flag

This bit provides the compensation cell status of the I/Os supplied by V_{DDIO1}.

0: V_{DDIO1} I/O compensation cell not ready

1: V_{DDIO1} I/O compensation cell ready

Note: The HSI clock is required for the compensation cell to work properly. The compensation cell READY bit is not set if the HSI clock is not enabled.

Bits 7:4 **APSRC[3:0]**: PMOS compensation value of the I/Os supplied by V_{DDIO1}

This value is provided by the cell and can be used by the CPU to compute an I/O compensation cell code for PMOS transistors. This code is applied to the I/O compensation cell when CS in SYSCFG_VDDIO1CCCR is reset, and the READY bit is set.

Bits 3:0 **ANSRC[3:0]**: NMOS compensation value of the I/Os supplied by V_{DDIO1}

This value is provided by the cell and can be used by the CPU to compute an I/O compensation cell code for NMOS transistors. This code is applied to the I/O compensation cell when CS in SYSCFG_VDDIO1CCCR is reset, and the READY bit is set.

23.2.52 SYSCFG control timer break register (SYSCFG_CBR)

Address offset: 0x4400

Reset value: 0x0000 0000

Reset by system reset.

Secure privileged write access only. Write only by trusted domain CID. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

											rwo	rwo	rwo		rwo

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **RETRAML**: RETRAM double ECC error lock

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the RETRAM double ECC error signal connection to TIM1/8/15/16/17/20 break inputs.

0: RETRAM double ECC error signal disconnected from TIM1/8/15/16/17/20 break inputs

1: RETRAM double ECC error signal connected to TIM1/8/15/16/17/20 break inputs

Bit 3 **BKRAML**: BKPSRAM double ECC error lock

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the BKPSRAM double ECC error signal connection to TIM1/8/15/16/17/20 break inputs.

0: BKPSRAM double ECC error signal disconnected from TIM1/8/15/16/17/20 break inputs

1: BKPSRAM double ECC error signal connected to TIM1/8/15/16/17/20 break inputs

Bit 2 **PVDL**: PVD lock enable

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the PVD connection to TIM1/8/15/16/17 break input, as well as th PVDEN in PWR_CR3.

0: PVD interrupt disconnected from TIM1/8/15/16/17 break input. PVDEN bits can be programmed by the application.

1: PVD interrupt connected to TIM1/8/15/16/17 break input. PVDEN bits are read only.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **CLL**: Cortex-M33 LOCKUP (HardFault) output enable

This bit is set by software and cleared only by a system reset. It can be used to enable and lock the connection of Cortex-M33 LOCKUP (HardFault) output to TIM1/8/15/16/17 break input.

0: Cortex-M33 LOCKUP output disconnected from TIM1/8/15/16/17 break inputs

1: Cortex-M33 LOCKUP output connected to TIM1/8/15/16/17 break inputs

23.2.53 SYSCFG HDP USB debug control register (SYSCFG_HDPUSBDBGCR)

Address offset: 0x5400

Reset value: 0x0000 0000

Reset by system reset.

Write access according to HDP RIFSC configuration. Debug domain can also access if the feature is activated. Any read access is allowed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Refer to *Section 2.4* for the register boundary addresses.

24 Peripheral interconnects

24.1 Introduction

Several peripherals have direct interconnections between them. This allows autonomous communication and synchronization between peripherals, saving processor resources and reducing power supply consumption.

In addition, these hardware connections remove software latency and allow the design of a predictable system.

This also saves pins and GPIOs.

Depending on the peripheral, these interconnections can operate in Run, CSleep or Stop modes.

24.2 Connection overview

There are several types of connections, as listed below.

24.2.1 Asynchronous connections (A)

The source output signal is sampled by the destination clock, leading to the possible introduction of jitter in the latency between the source output event and the destination event detection.

24.2.2 Synchronous connections (S)

Both source and destination are synchronous (they run on the same clock), and the latency from the source to the destination is deterministic. No jitter is introduced.

24.2.3 Break/fault connection for TIM outputs (B)

The source output signal disables the timer outputs through a pure combinatorial logic path, without any latency.

24.2.4 Peripherals interconnect matrix

25 High-performance direct memory access controller (HPDMA)

25.1 HPDMA introduction

The high-performance direct memory access (HPDMA) controller is a bus master and system peripheral.

The HPDMA is used to perform programmable data transfers between memory-mapped peripherals, and/or memories via linked-lists, upon the control of an off-loaded CPU.

25.2 HPDMA main features

- Single bidirectional AXI master and single bidirectional AHB master
- Memory-mapped data transfers from a source to a destination:
  - Peripheral-to-memory
  - Memory-to-peripheral
  - Memory-to-memory
  - Peripheral-to-peripheral

  Transfer arbitration based on a 4-grade programmed priority at channel level:
  - One high-priority traffic class, for time-sensitive channels (queue 3)
  - Three low-priority traffic classes, with a weighted round-robin allocation for non time-sensitive channels (queues 0, 1, 2)
- Per channel event generation, on any of the following events: transfer complete, half transfer complete, data transfer error, user setting error, link transfer error, completed suspension, and trigger overrun
- Per channel interrupt generation, with separately programmed interrupt enable per event
- 16 concurrent HPDMA channels:
  - Per channel FIFO for queuing source and destination transfers (see *Section 25.3.1*)
  - Intra-channel HPDMA transfers chaining via programmable linked-list into memory, supporting two execution modes: run-to-completion and link step mode
  - Intra-channel and inter-channel HPDMA transfers chaining via programmable HPDMA input triggers connection to HPDMA task completion events
- Per linked-list item within a channel:
  - Separately programmed source and destination transfers
  - Programmable data handling between source and destination: byte-based reordering, packing or unpacking, padding or truncation, sign extension and left/right realignment
  - Programmable number of data bytes to be transferred from the source, defining the block level and byte-based padding
  - Linear source and destination addressing: either fixed or contiguously incremented addressing, programmed at block level, between successive burst transfers

  - 2D source and destination addressing: programmable signed address offsets between successive burst transfers (non-contiguous addressing within a block, combined with programmable signed address offsets between successive blocks, at a second 2D/repeated block level, for a reduced set of channels (see *Section 25.3.1*)
  - Support for scatter-gather (multi-buffer transfers), data interleaving and deinterleaving via 2D addressing
  - Selection of programmable HPDMA request and trigger
  - Generation of programmable HPDMA half-transfer and transfer-complete event
  - Pointer to the next linked-list item and its data structure in memory, with automatic update of the HPDMA linked-list control registers
  - Channel abort and restart
  - Channel terminate with FIFO draining
- Debug:
  - Channel suspend and resume support
  - Channel status reporting, including FIFO level, and event flags
- TrustZone support:
  - Support for secure and nonsecure HPDMA transfers, independently at a first channel level, and independently at a source/destination and link sublevels
  - Secure and nonsecure interrupts reporting, resulting from any of the respectively secure and nonsecure channels
  - TrustZone-aware AHB slave port, protecting any HPDMA secure resource (register, bitfield) from a nonsecure access
- Privileged/unprivileged support:
  - Support for privileged and unprivileged HPDMA transfers, independently at channel level
  - Privileged-aware AHB slave port
- Channel isolation support:
  - Support for compartmented DMA transfers, independently at channel level, via compartment IDs (named CIDs)
  - CID-aware interrupts reporting
  - CID-aware AHB slave port, with integrated semaphores for a concurrent control, from any of the CPUs
- Identification registers, with associated peripheral revision and hardware configuration

25.3 HPDMA implementation

25.3.1 HPDMA channels

A given HPDMA channel x is implemented with the following features and intended use.

To make the best use of the HPDMA performance, the following table lists some general recommendations, allowing the user to select and allocate a channel, given its implemented FIFO size and the requested HPDMA transfer.

Table 175. Implementation of HPDMA1/2/3 channels

Channel x	Hardware parameters		Features
	dma_fifo_size[x]	dma_addressing[x]	
x = 0 to 7	4	0	Channel x (x = 0 to 7) is implemented with: a FIFO of 32 bytes, 8 words, 4 double-words fixed/contiguously incremented addressing These channels are typically allocated for HPDMA transfers between an APB or AHB peripheral, and SRAM.
x = 8 to 11	5	0	Channel x (x = 8 to 11) is implemented with: a FIFO of 64 bytes, 16 words, 8 double-words fixed/contiguously incremented addressing These channels can be used for HPDMA transfers between a demanding AHB peripheral and SRAM, or with external memories transfers.
x = 12 to 14	6	2	Channel x (x = 12 to 14) is implemented with: a FIFO of 128 bytes, 16 double-words 2D addressing with extended offsets These channels can also be used for data demanding memory-to-memory HPDMA transfers including DDR-SDRAM.
x = 15	7	2	Channel x (x = 15) is implemented with: a FIFO of 256 bytes, 32 double-words 2D addressing with extended offsets These channels can also be used for data demanding memory-to-memory HPDMA transfers including DDR-SDRAM.

25.3.2 HPDMA allowed AXI maximum burst length

For a data transfer, the user has to program:

– the source (and destination) burst length that a given channel x ideally performs, via SBL_1[5:0] (and respectively DBL_1[5:0]) field in HPDMA_CxTR1.

– the allocated master port, AXI or AHB, on which this source (or destination) data transfer must be performed, via SAP (or respectively DAP) field in HPDMA_CxTR1.

Caution: The maximum allowed AXI burst length is restricted to 16:

1. if SAP = 0 (AXI allocated port): the maximum allowed value of SBL_1[5:0] is 15.
2. if DAP = 0 (AXI allocated port): the maximum allowed value of DBL_1[5:0] is 15.

25.3.3 HPDMA in low-power modes

The HPDMA wake-up feature is implemented in the device low-power modes as per the table below.

Table 176. HPDMA1/2/3 wake-up in low-power modes

Feature	Low-power modes
Wake-up	HPDMA1/2/3 in Sleep and Stop 1 modes

25.3.4 HPDMA requests

An HPDMA request from a peripheral can be assigned to a HPDMA channel x, via REQSEL[7:0] in HPDMA_CxTR2, provided that SWREQ = 0.

The HPDMA requests mapping is specified in the table below.

Table 177. Programmed HPDMA1/2/3 request

HPDMA_CxTR2.REQSEL[7:0]	Selected HPDMA request
0	fmc_nand_txrx_dma
1	fmc_nand_bch_dma
2	octospi1_dma
3	Reserved
4	cryp1_in_dma
5	cryp1_out_dma
6	hash1_dma
7	saes_out_dma
8	saes_in_dma
9	usart1_rx_dma
10	usart1_tx_dma

25.3.5 HPDMA block requests

Some HPDMA requests must be programmed as a block request, and not as a burst request. Then BREQ in HPDMA_CxTR2 must be set for a correct HPDMA execution of the requested peripheral transfer at the hardware level.

Table 178. Programmed HPDMA1/2/3 request as a block request

25.3.6 HPDMA channels with peripheral early termination

An HPDMA channel, if implemented with this feature, can support the early termination of the data transfer from the peripheral which does also support this feature.

Table 179. HPDMA1/2/3 channel with peripheral early termination

HPDMA channel x with peripheral early termination
x = 0 to 15

This HPDMA support is activated when the channel x is programmed with HPDMA_CxTR2.PFREQ = 1. Then, the peripheral itself can initiate and request a data transfer completion, before that the HPDMA has transferred the whole block (see *Section 25.4.15* for more details).

25.3.7 HPDMA triggers

An HPDMA trigger can be assigned to an HPDMA channel x, via TRIGSEL[6:0] in HPDMA_CXTR2, provided that TRIGPOL[1:0] defines a rising or a falling edge of the selected trigger (TRIGPOL[1:0] = 01 or TRIGPOL[1:0] = 10).

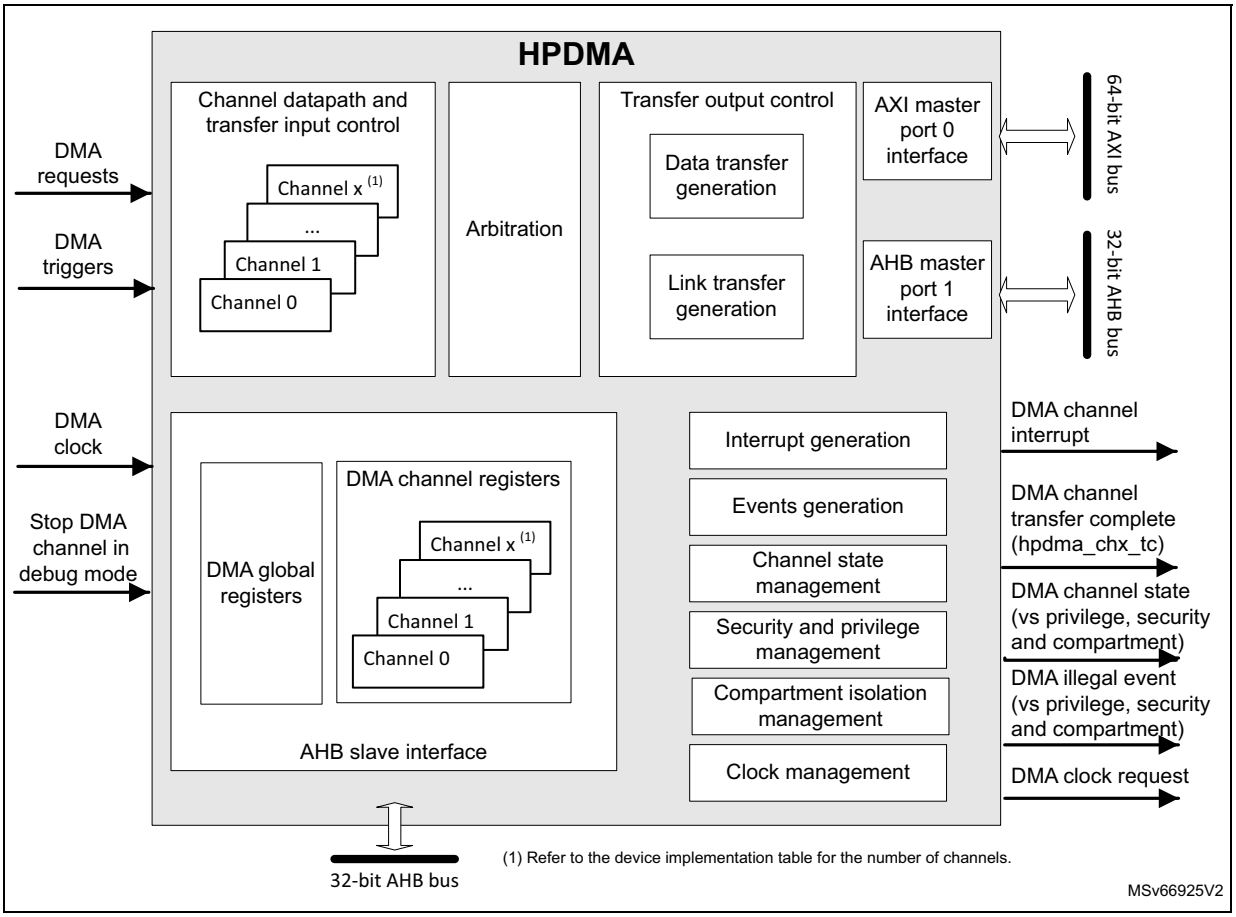
25.4 HPDMA functional description

25.4.1 HPDMA block diagram

Figure 135. HPDMA block diagram



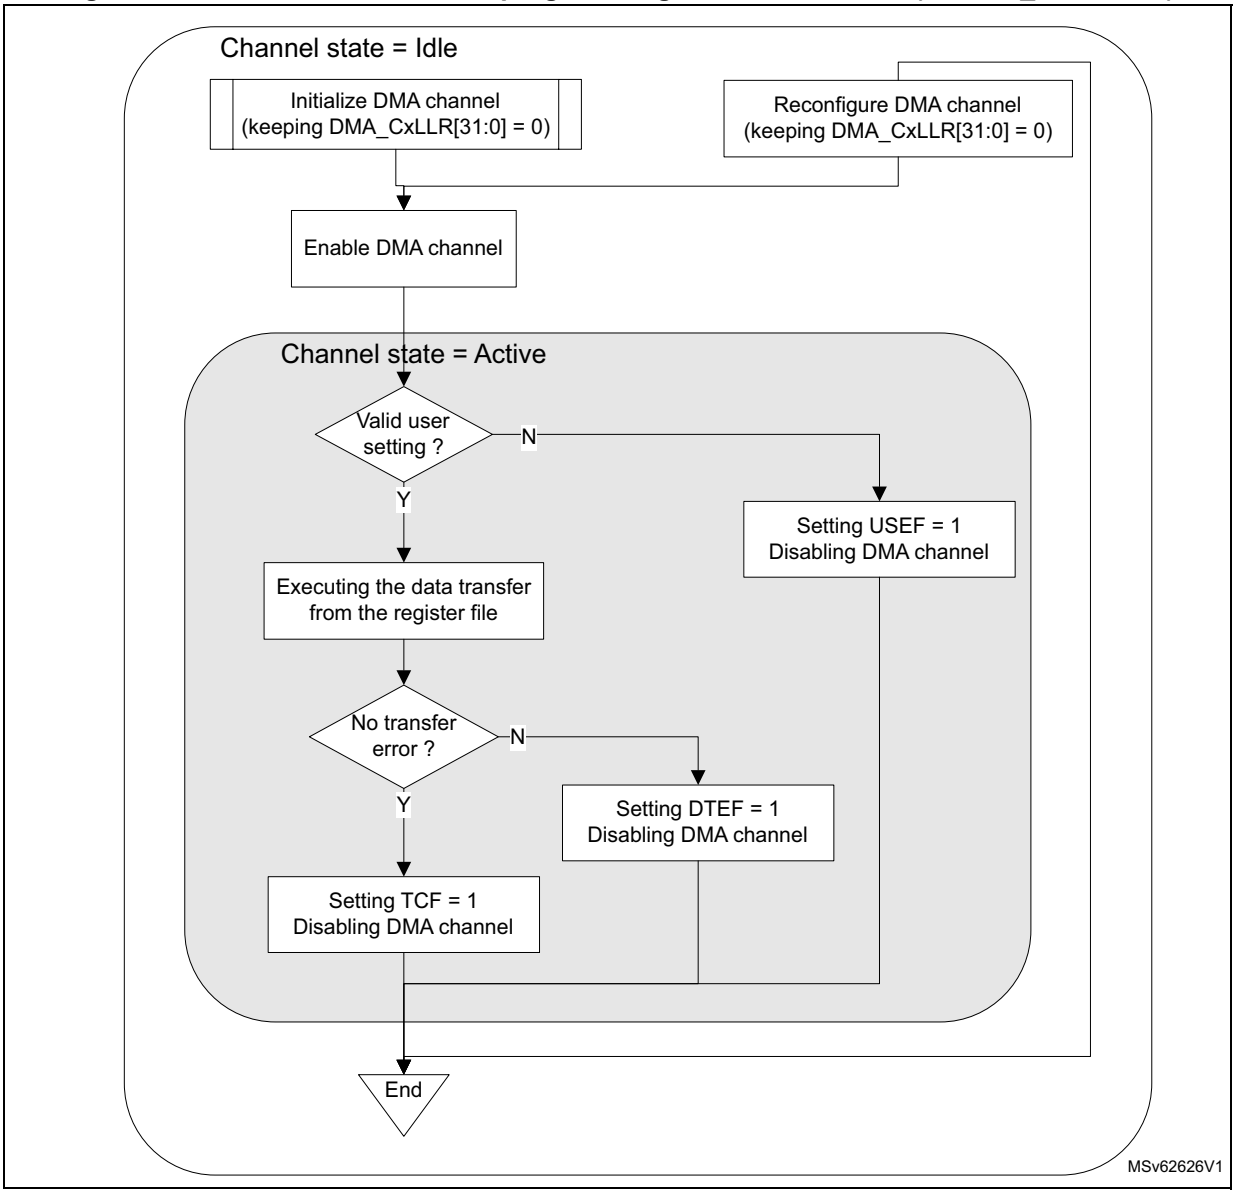
25.4.2 HPDMA channel state and direct programming without any linked-list

After an HPDMA reset, an HPDMA channel x is in idle state. When the software writes 1 into the HPDMA_CxCR.EN enable control bit, the channel takes into account the value of the different channel configuration registers (HPDMA_CxXXX), switches to the active/non-idle state, and starts to execute the corresponding requested data transfers.

After enabling/starting an HPDMA channel transfer by writing 1 into HPDMA_CxCR.EN, an HPDMA channel interrupt on a complete transfer notifies the software that the HPDMA channel is back in idle state (EN is then deasserted by hardware), and that the channel is ready to be reconfigured then enabled again.

The figure below illustrates this HPDMA direct programming without any linked-list (HPDMA_CxLLR = 0).

Figure 136. HPDMA channel direct programming without linked-list (HPDMA_CxLLR = 0)



25.4.3 HPDMA channel suspend and resume

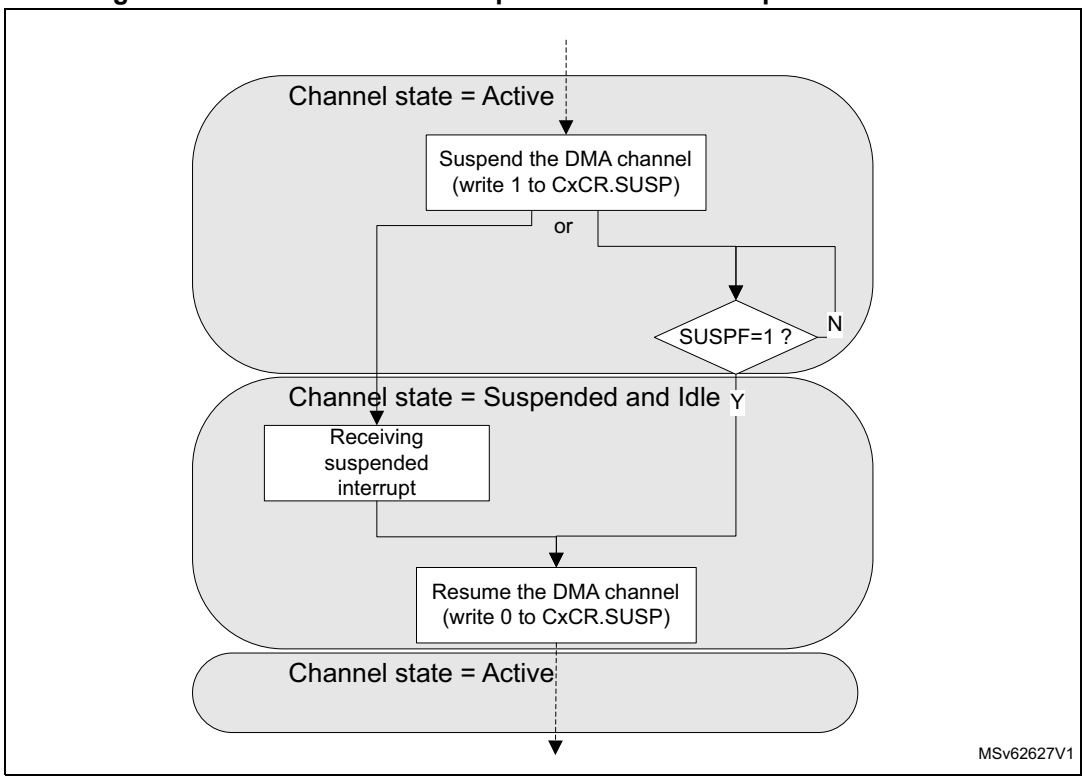
The software can suspend on its own a channel still active, with the following sequence:

1. The software writes 1 into the HPDMA_CxCR.SUSP bit.
2. The software polls the suspended flag HPDMA_CxSR.SUSPF until SUSPF = 1, or waits for an interrupt previously enabled by writing 1 to HPDMA_CxCR.SUSPIE. Wait for the channel to be effectively in suspended state means wait for the completion of any ongoing HPDMA transfer over its master ports. Then the software can observe, in a steady state, any read register or bitfield that is hardware modifiable.

Note: An ongoing HPDMA transfer can be a data transfer (a source/destination burst transfer,) or a link transfer for the internal update of the linked-list register file from the next linked-list item.

3. The software safely resumes the suspended channel by writing 0 to HPDMACxCR.SUSP.

Figure 137. HPDMA channel suspend and resume sequence



Note: A suspend and resume sequence does not impact the HPDMA_*CxCR.EN bit. Suspending a channel (transfer) does not suspend a started trigger detection.*

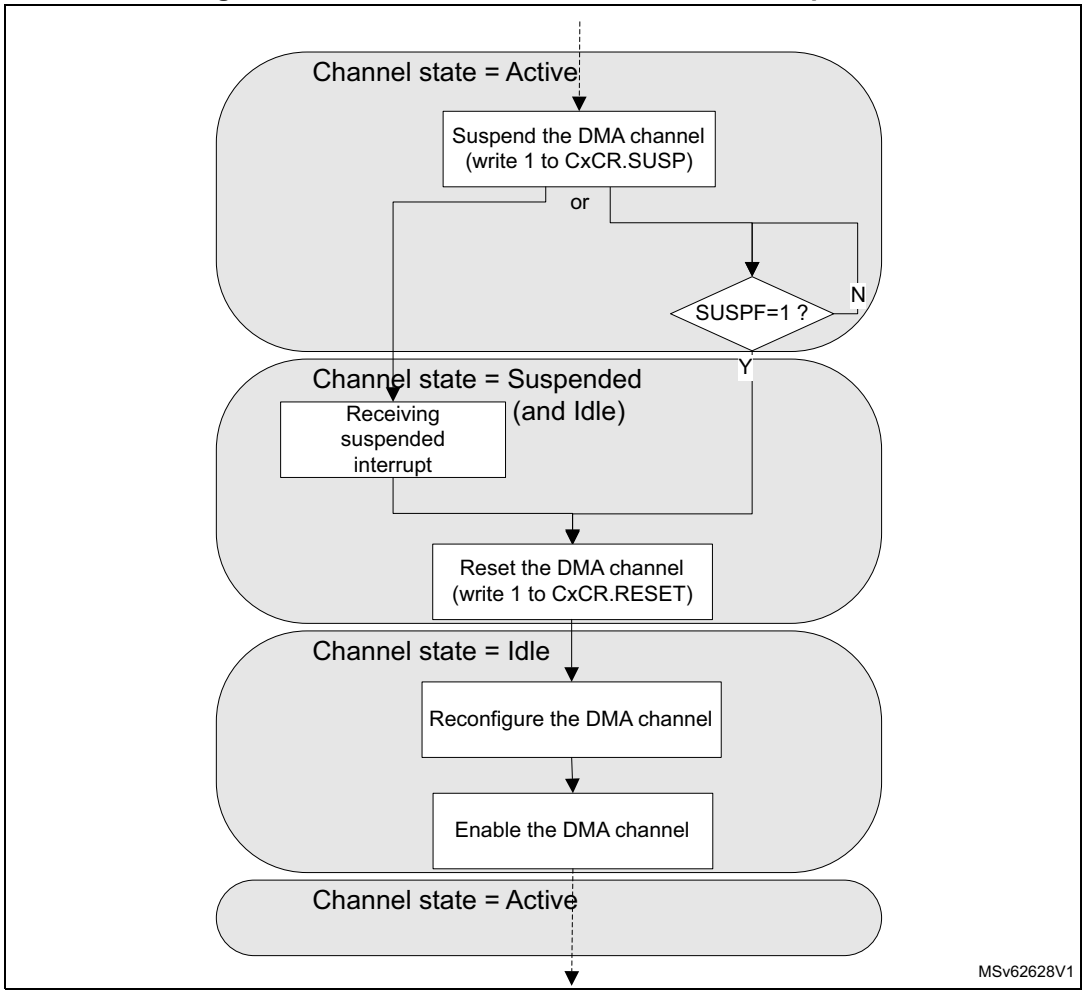
25.4.4 HPDMA channel abort and restart

Alternatively, like for aborting a continuous HPDMA transfer with a circular buffering or a double buffering, the software can abort, on its own, a still active channel with the following sequence:

1. The software writes 1 into the HPDMA_CxCR.SUSP bit.
2. The software polls suspended flag HPDMA_CxSR.SUSPF until SUSPF = 1, or waits for an interrupt previously enabled by writing 1 to HPDMA_CxCR.SUSPIE. Wait for the channel to be effectively in suspended state means wait for the completion of any ongoing HPDMA transfer over its master port.
3. The software resets the channel by writing 1 to HPDMA_CxCR.RESET. This causes the reset of the FIFO, the reset of the channel internal state, the reset of the HPDMA_CxCR.EN bit, and the reset of the HPDMA_CxCR.SUSP bit.
4. The software safely reconfigures the channel. The software must reprogram hardware-modified HPDMA_CxBR1, HPDMA_CxSAR, and HPDMA_CxDAR.

5. In order to restart the aborted then reprogrammed channel, the software enables it again by writing 1 to the HPDMA_CxCR.EN bit.

Figure 138. HPDMA channel abort and restart sequence



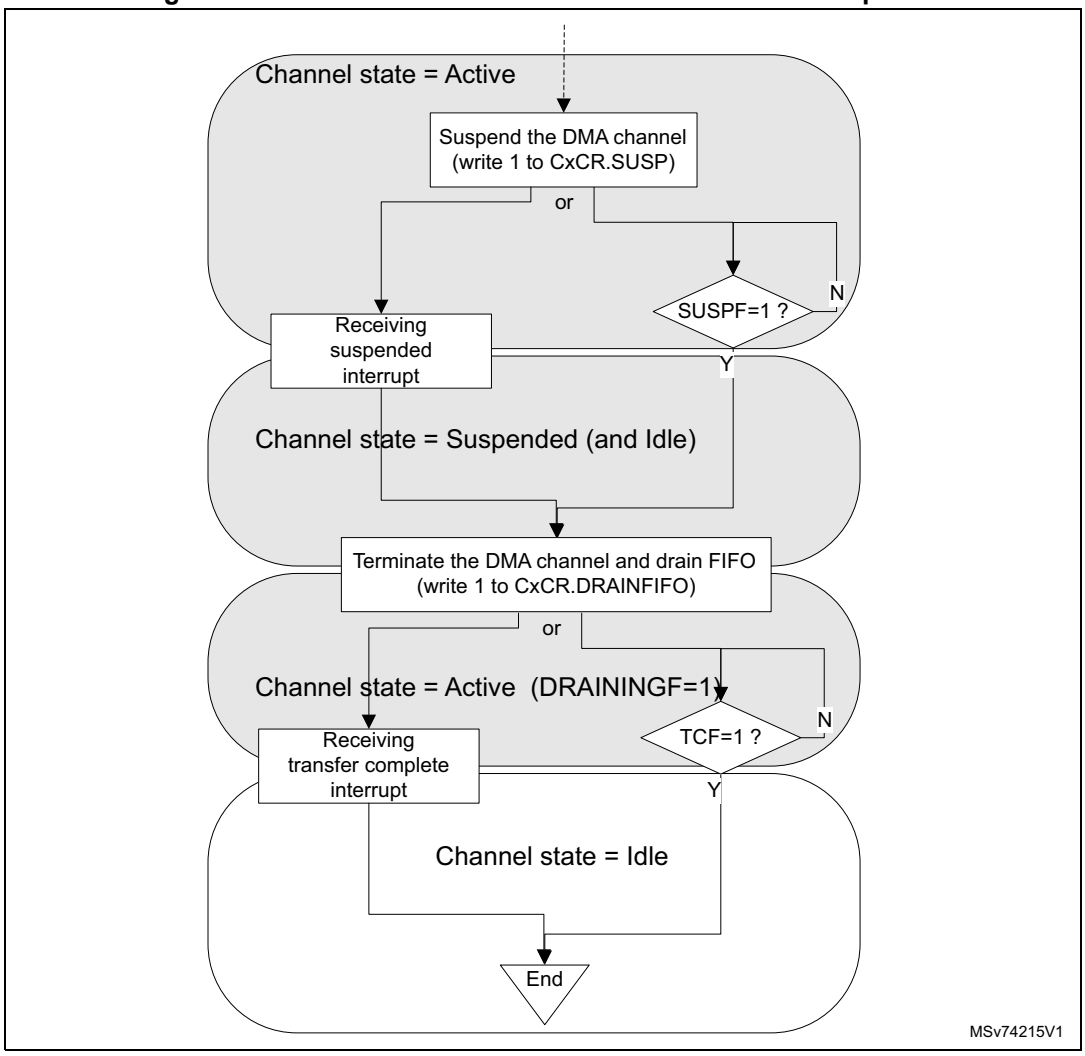
25.4.5 HPDMA channel terminate and drain FIFO

Alternatively, for terminating a continuous HPDMA transfer with a circular buffering or a double buffering, and having popped out any residual byte(s) in the channel FIFO and writing them to the destination, the software can terminate an active channel and drain the channel FIFO with the following sequence:

1. The software writes 1 into the HPDMA_CxCR.SUSP bit.
2. The software polls suspended flag HPDMA_CxSR.SUSPF until SUSPF = 1, or waits for an interrupt previously enabled by writing 1 to HPDMA_CxCR.SUSPIE. Wait for the channel to be effectively in suspended state means wait for the completion of any ongoing HPDMA transfer over its master port.
3. The software orders to drain the channel FIFO by writing 1 to HPDMA_CxCR.DRAINFIFO.
4. The software polls transfer complete flag HPDMA_CxSR.TCF until TCF = 1, or waits for an interrupt previously enabled by writing 1 to HPDMA_CxCR.TCIE. Wait for the

channel to be effectively with a drained FIFO means wait for completion of any residual write burst from the FIFO to the destination. Then the channel is disabled by hardware and in IDLE state.

Figure 139. HPDMA channel terminate and drain FIFO sequence



Note: If the softwares writes the HPDMA_CxCR register in a single shot with concurrently SUSP = 1, DRAINFIFO = 1, and RESET = 0, then the sequence for terminating and draining the FIFO also occurs.

HPDMA_CxTR2.DREQ = 1 and HPDMA_CxCR.DRAINFIFO = 1 is not supported, only peripheral-to-memory and memory-to-memory transfers are supported to be terminated with drained FIFO.

25.4.6 HPDMA linked-list data structure

Alternatively to the direct programming mode, a channel can be programmed by a list of transfers, known as a list of linked-list items (LLI). Each LLI is defined by its data structure.

For a channel x, the base address in memory of the data structure of a next LLI_{n+1} is the sum of the following:

- the link base address of the channel x (in HPDMA_CxLBAR)
- the link address offset LA[15:2] bitfield in HPDMA_CxLLR, that is the updated result from the data structure of the previous LLIn of the channel x

The data structure for each LLI can be specific.

A linked-list data structure is addressed following the value of UT1, UT2, UB1, USA, UDA, and ULL bits, plus UB2 and UT3 when present, in HPDMA_CxLLR.

In linked-list mode, each HPDMA linked-list register (HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR, HPDMA_CxDAR or HPDMA_CxLLR, plus HPDMA_CxTR3 or HPDMA_CxBR2 when present) is conditionally and automatically updated from the next linked-list data structure in the memory, following the current value of HPDMA_CxLLR that was conditionally updated from the linked-list data structure of the previous LLI.

Static linked-list data structure

For example, when the update bits (UT1, UT2, UB1, USA, UDA, and ULL, plus UB2 and UT3 when present) in HPDMA_CxLLR are all asserted, the linked-list data structure in the memory is maximal with:

- channel x, x = 0 to 11, six contiguous 32-bit locations, including HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR, HPDMA_CxDAR, and HPDMA_CxLLR (see *Figure 140*) and including the first linked-list register file (LLI_0), and the next LLIs (LLI_1, LLI_2,...) in the memory
- channel x, x = 12 to 15, eight contiguous 32-bit locations, including HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR, HPDMA_CxDAR, and HPDMA_CxLLR, plus HPDMA_CxTR3 and HPDMA_CxBR2 (see *Figure 141*), including the first linked-list register file (LLI_0), and the next LLIs (LLI_1, LLI_2,...) in the memory

Figure 140. Static linked-list data structure (all Uxx = 1) of a linear addressing channel x

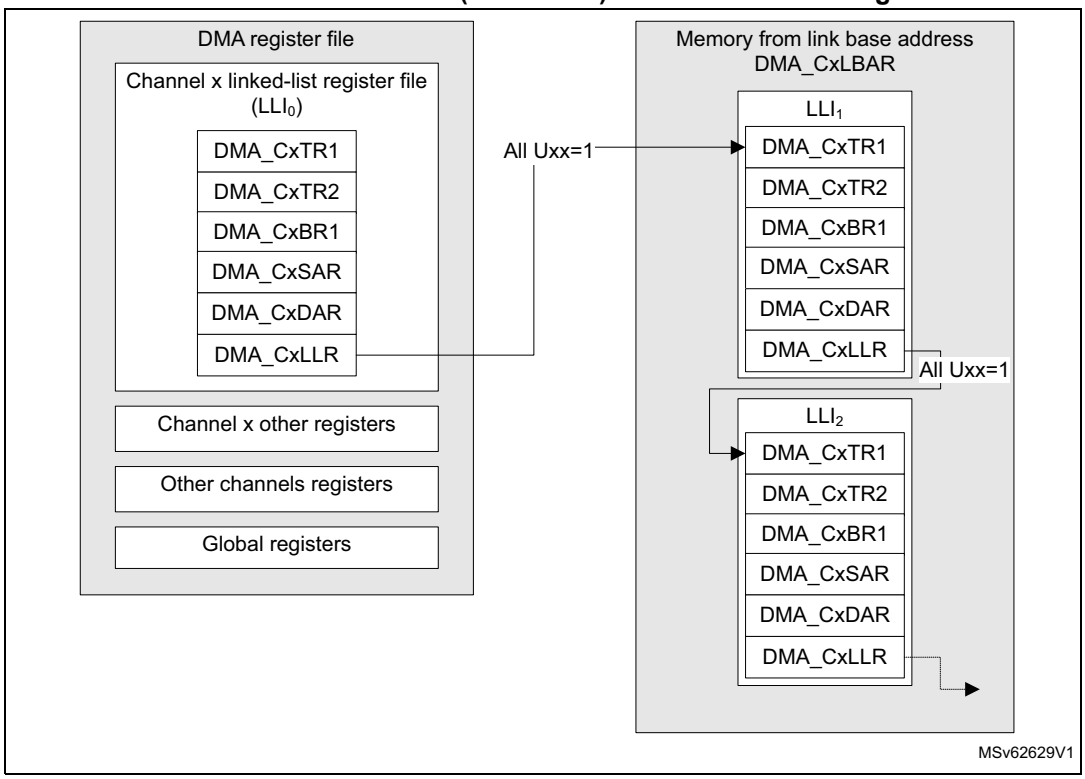


Figure 141. Static linked-list data structure (all Uxx = 1) of a 2D addressing channel x

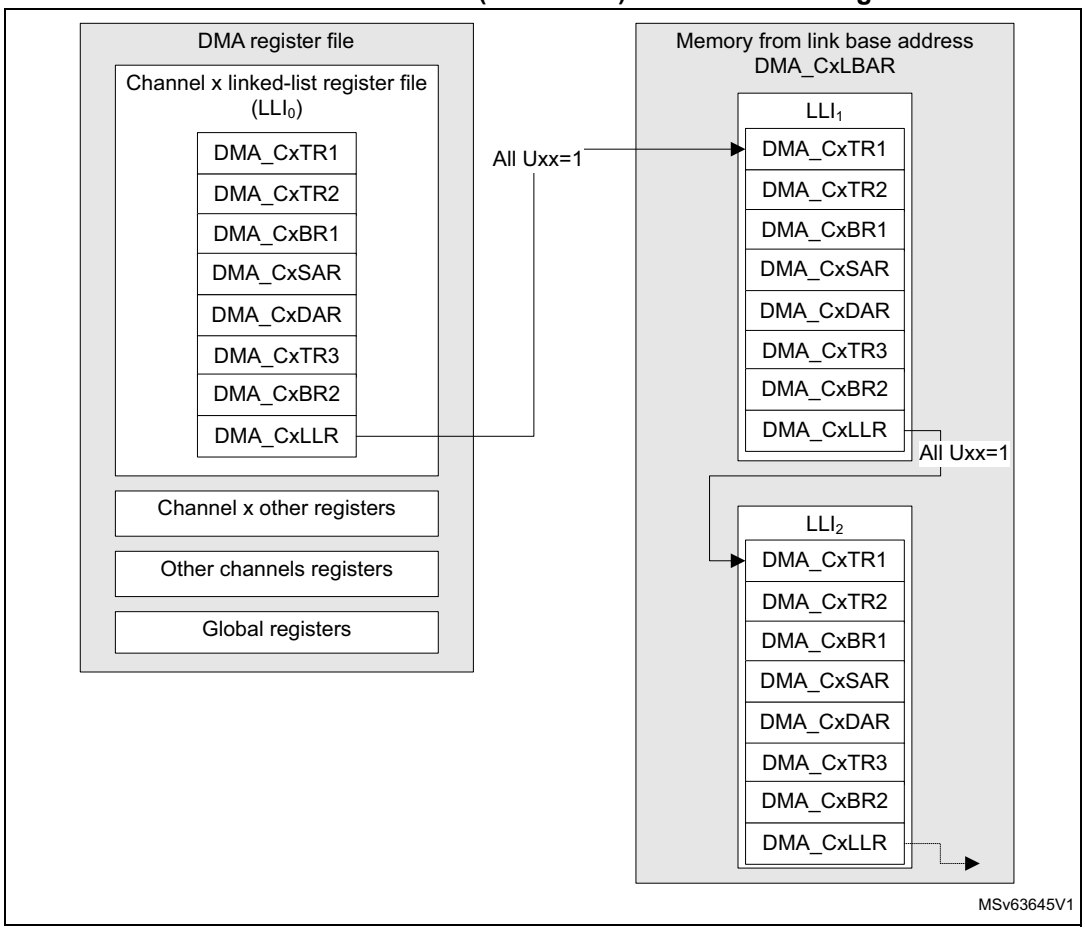

Dynamic linked-list data structure

Alternatively, the memory organization for the full list of LLIs can be compacted with specific data structure for each LLI.

If UT1 = 0 and UT2 = 1, the link address offset of HPDMA_CxLLR points to the updated value of HPDMA_CxTR2, instead of HPDMA_CxTR1 which is not to be modified (see *Figure 142*).

Example: if UT1 = UB1 = USA = 0, and if UT3 = UB2 = 0 when channel x is with 2D addressing, and if UT2 = UDA = ULL = 1, the next LLI does not contain an (updated) value for HPDMA_CxTR1, nor HPDMA_CxBR1, nor HPDMA_CxSAR, nor HPDMA_CxTR3, nor HPDMA_CxBR2 when channel x is with 2D addressing. The next LLI contains an updated value for HPDMA_CxTR2, HPDMA_CxDAR, and HPDMA_CxLLR, as shown in *Figure 143*.

Figure 142. HPDMA dynamic linked-list data structure of linear addressing channel x

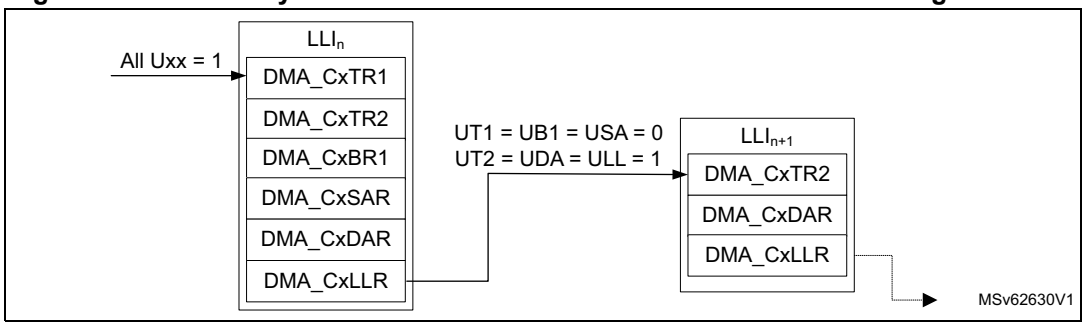

Figure 143. HPDMA dynamic linked-list data structure of a 2D addressing channel x

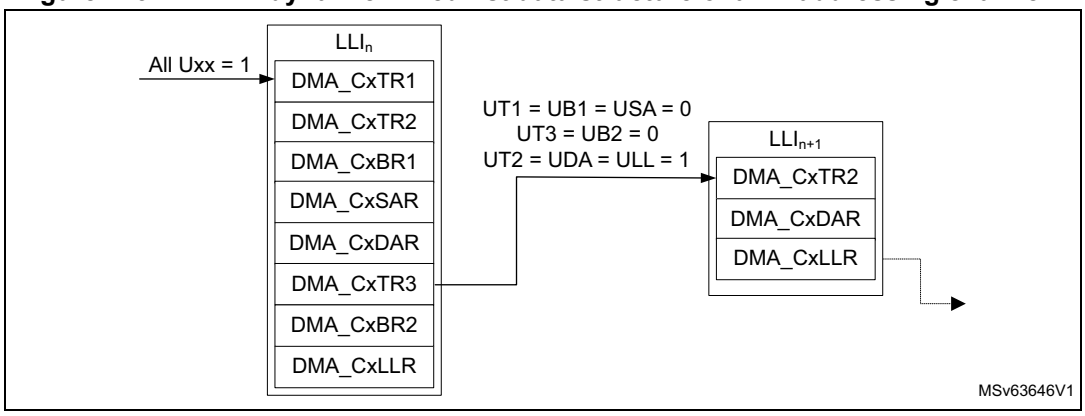


The user must program HPDMA_CxLLR for each LLI$_n$ to be 32-bit aligned, and not to exceed the 64-Kbyte addressable space pointed by HPDMA_CxLBAR.

25.4.7 Linked-list item transfer execution

An LLI$_n$ transfer is the sequence of:

1. a data transfer: the HPDMA executes the data transfer as described by the HPDMA internal register file (this data transfer can be void/null for LLI$_0$).
2. a conditional link transfer: the HPDMA automatically and conditionally updates its internal register file by the data structure of the next LLI$_{n+1}$, as defined by the HPDMA_CxLLR value of the LLI$_n$.

Note: The initial data transfer, as defined by the internal register file (LLI$_0$), can be null (HPDMA_CxBR1.BNDT[15:0] = 0 and HPDMA_CxTR2.PFREQ = 0), provided that UB1 is set in HPDMA_CxLLR (meaning there is a non-null data transfer described by the next LLI$_1$ in the memory to be executed).

Depending on the intended HPDMA use, an HPDMA channel x can be executed as described by the full linked-list (run-to-completion mode, HPDMA_CxCR.LSM = 0), or can be programmed for a single execution of a LLI (link step mode, HPDMA_CxCR.LSM = 1), as described in the next sections.

25.4.8 HPDMA channel state and linked-list programming in run-to-completion mode

When HPDMA_CxCR.LSM = 0 (in full-list execution mode, execution of the full sequence of LLIs, named run-to-completion mode), an HPDMA channel x is initially programmed, started by writing 1 to HPDMA_CxCR.EN, and after completed at channel level.
The channel transfer is:

- configured with at least the following:
  - the first LLI_0, internal linked-list register file: HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR, HPDMA_CxDAR, and HPDMA_CxLLR, plus HPDMA_CxTR3 and HPDMA_CxBR2 when present
  - the last LLI_N described by the linked-list data structure in memory, as defined by HPDMA_CxLLR reflecting the before last LLI_{N-1}
- completed when HPDMA_CxLLR[31:0] = 0 and HPDMA_CxBR1.BRC[10:0] = 0, if BRC[10:0] is present and HPDMA_CxBR1.BNDT[15:0] = 0, at the end of the last LLI_{N-1} transfer

HPDMA_CxLLR[31:0] = 0 is the condition of a linked-list based channel completion, and means the following:

- The 16 low significant bits HPDMA_CxLLR.LA[15:0] of the next link address are null.
- All bits HPDMA_CxLLR.Uxx are null (UT1, UT2, UB1, USA, UDA, and ULL, plus UB2 and UT3 when present).

The channel may never be completed when HPDMA_CxLLR.LSM = 0:

- If the last LLI_N is recursive, pointing to itself as a next LLI, in one of the following:
  - HPDMA_CxLLR.ULL = 1 and HPDMA_CxLLR.LA[15:2] is updated with the same value.
  - HPDMA_CxLLR.ULL = 0
- If LLI_N points to a previous LLI

In the regular data transfer completion at a block level, HPDMA_CxBR1.BNDT[15:0] = 0 and HPDMA_CxBR1.BRC[10:0] = 0 (if present). Alternatively, a block transfer may be early completed by a peripheral (such as an I3C in Rx mode), and then BNDT[15:0] is not null (see *Section 25.4.15* for more details).

In the typical run-to-completion mode, the allocation of an HPDMA channel, including its fine programming, is done once during the HPDMA initialization. In order to have a reserved data communication link and HPDMA service during run-time, for continuously repeated transfers (from/to a peripheral respectively to/from memory or for memory-to-memory transfers). This reserved data communication link can consist of a channel, or the channel can be shared and a repeated transfer consists of a sequence of LLIs.

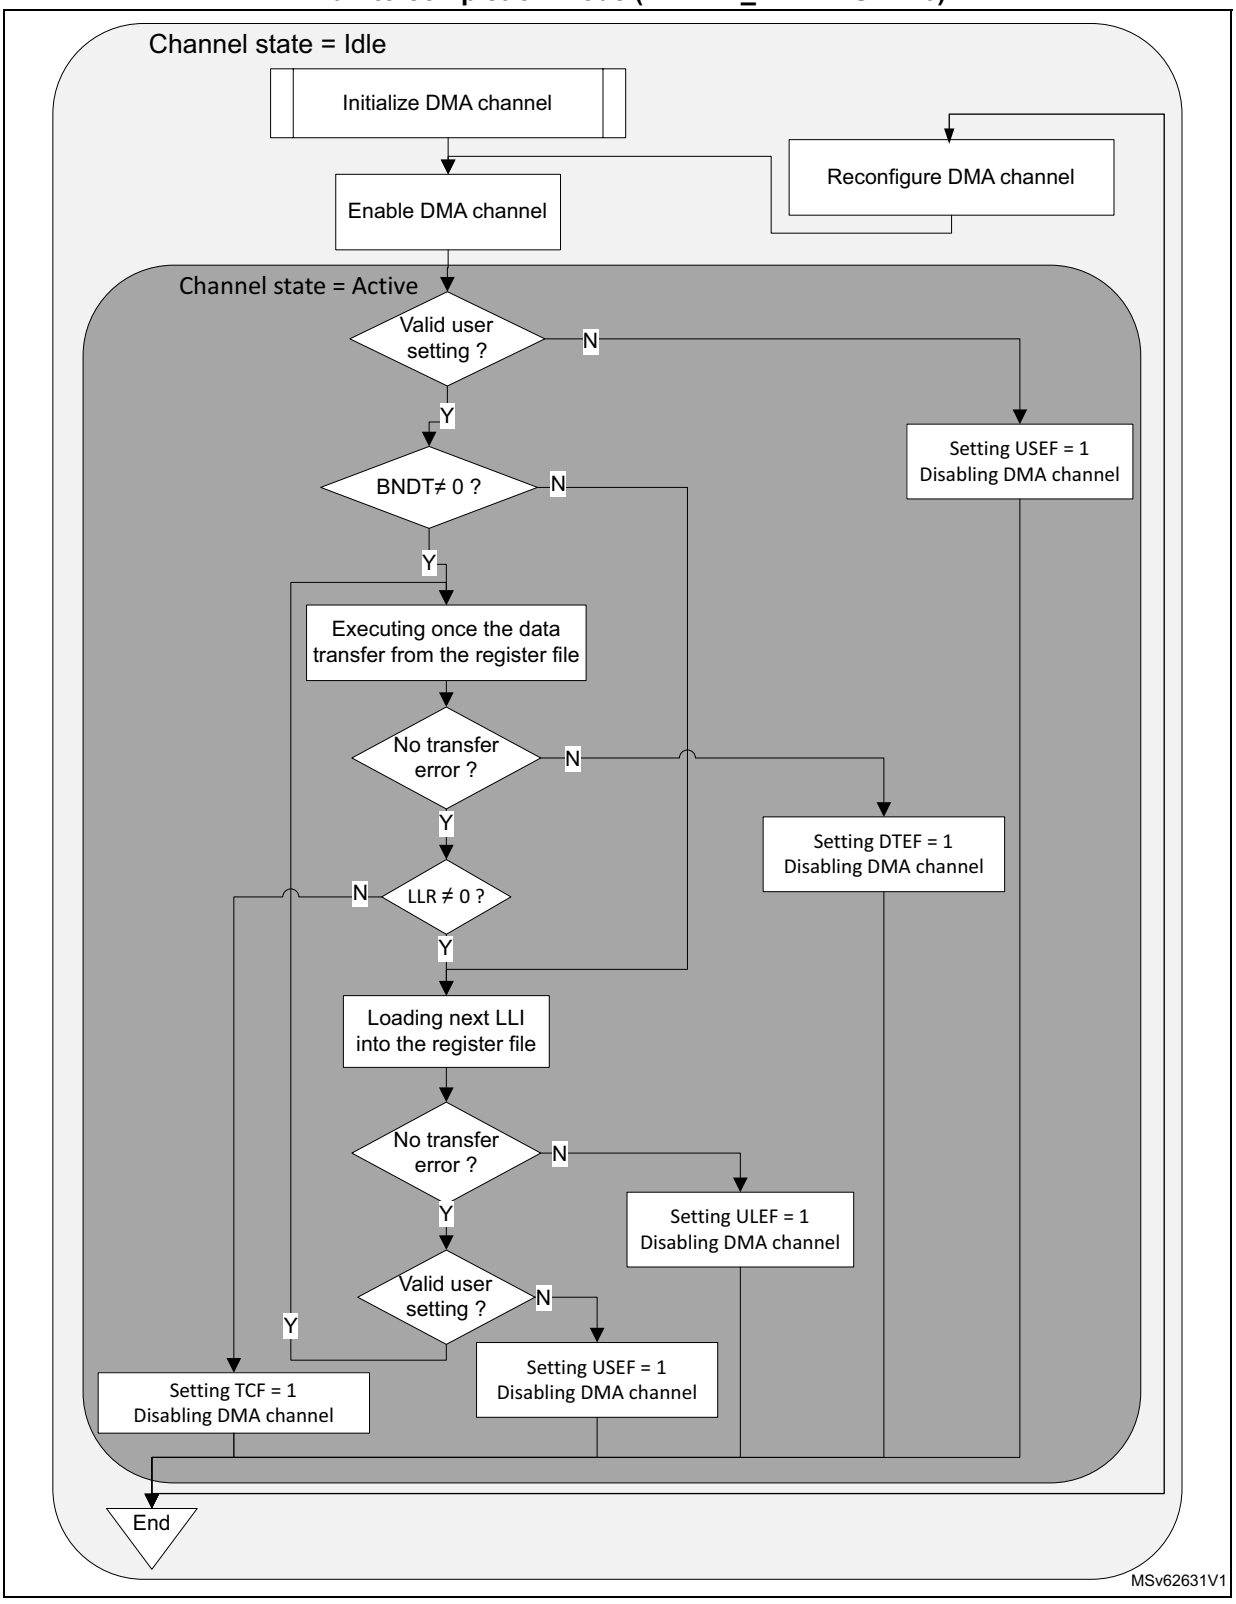
Figure 144 depicts the HPDMA channel execution and its registers programming in run-to-completion mode.

Note: Figure 144 is not intended to illustrate how often a TCEF can be raised, depending on the programmed value of TCEM[1:0] in HPDMA_CxTR2. It can be raised at (each) block completion, at (each) 2D block completion, at (each) LLI completion, or only at channel

completion. In run-to-completion mode, whatever is the value of TCEM[1:0], at the channel completion, the hardware always set TCEF = 1 and disables the channel.

In Figure 144, BNDT ≠ 0 is the typical condition for starting the first data transfer. This condition becomes (BNDT ≠ 0 and PFREQ = 1) if the peripheral requests a data transfer with early termination (see Section 25.3.6).

Figure 144. HPDMA channel execution and linked-list programming in run-to-completion mode (HPDMA_CxCR.LSM = 0)



Run-time inserting a LLI_n via an auxiliary channel, in run-to-completion mode

The start of the link transfer of the LLI_{n-1} (start of the LLI_n loading) can be conditioned by the occurrence of a trigger, when programming the following bitfields of HPDMA_CxTR2 in the data structure of the LLI_{n-1}:

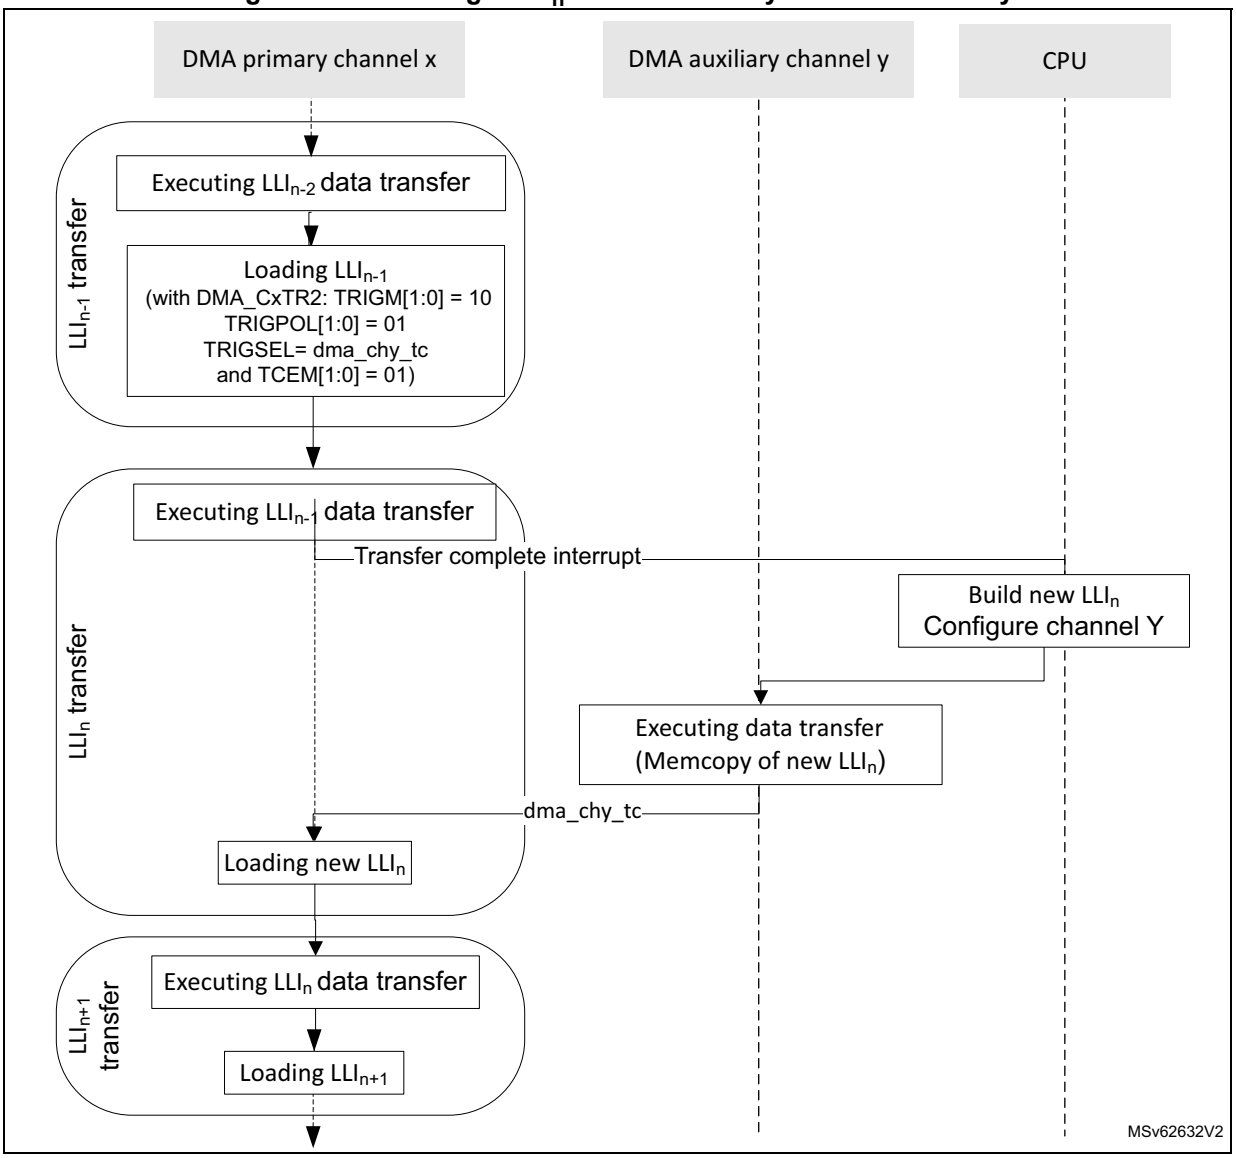
- TRIGM[1:0] = 10 (link transfer triggering mode)
- TRIGPOL[1:0] = 01 or 10 (rising or falling edge)
- TRIGSEL[6:0] (see *Section 25.3.7* for the trigger selection details)

Another auxiliary channel y can be used to store the channel x LLI_n in the memory, and to generate a transfer complete event hpdma_chy_tc. By selecting this event as the input trigger of the link transfer of the LLI_{n-1} of the channel x, the software can pause the primary channel x after its LLI_{n-1} data transfer, until it is indeed written the LLI_n.

Figure 145 depicts such a dynamic elaboration of a linked-list of a primary channel x, via another auxiliary channel y.

Caution: This use case is restricted to an application with an LLI_{n-1} data transfer that does not need a trigger. The triggering mode of this LLI_{n-1} is used to load the next LLI_n.

Figure 145. Inserting a LLI_n with an auxiliary HPDMA channel y



25.4.9 HPDMA channel state and linked-list programming in link step mode

When HPDMA_CxCR.LSM = 1 (in link step execution mode, single execution of one LLI), a channel transfer is executed and completed after each single execution of a LLI, including its (conditional) data transfer and its (conditional) link transfer.

An HPDMA channel transfer can be programmed at an LLI level, started by writing 1 into HPDMA_CxCR.EN, and after completed at LLI level:

- The current LLI_n transfer is described with the following:
  - HPDMA_CxTR1 defines the source/destination elementary single/burst transfers.
  - HPDMA_CxBR1 defines the number of bytes at a block level (BNDT[15:0]), for channel x = 12 to 15, the number of blocks at a 2D/repeated block level (BRC[10:0]+1), and the incrementing/decrementing mode for address offsets.

  - HPDMA_CxTR2 defines the input control (request, trigger), and the output control (transfer-complete event) of the transfer.
  - HPDMA_CxSAR and HPDMA_CxDAR define the source/destination transfer start address.
  - HPDMA_CxTR3 (for channel x = 12 to 15) defines the source/destination additional address offset between burst transfers.
  - HPDMA_CxBR2 (for channel x = 12 to 15) defines the source/destination additional address offset between blocks at a 2D/repeated block level.
  - HPDMA_CxLLR defines the data structure, and the address offset of the next LLI_{n+1} in the memory.
- The current LLI_n transfer is completed after the single execution of the current LLI_n:
  - after the (conditional) data transfer completion (when HPDMA_CxBR1.BRC[10:0] = 0 if BRC[10:0] is present, and HPDMA_CxBR1.BNDT[15:0] = 0)
  - after the (conditional) update of the HPDMA link register file from the data structure of the next LLI_{n+1} in memory

Note: If an LLI is recursive (pointing to itself as a next LLI, either HPDMA_CxLLR.ULL = 1 and HPDMA_CxLLR.LA[15:2] is updated with the same value, or HPDMA_CxLLR.ULL = 0), a channel in link step mode is completed after each repeated single execution of this LLI.

In the regular data transfer completion at a block level, HPDMA_CxBR1.BNDT[15:0] = 0 and HPDMA_CxBR1.BRC[10:0] = 0 (if present). Alternatively, a block transfer can be early completed by a peripheral (such as an I3C in Rx mode), and then BNDT[15:0] is not null (see *Section 25.4.15* for more details).

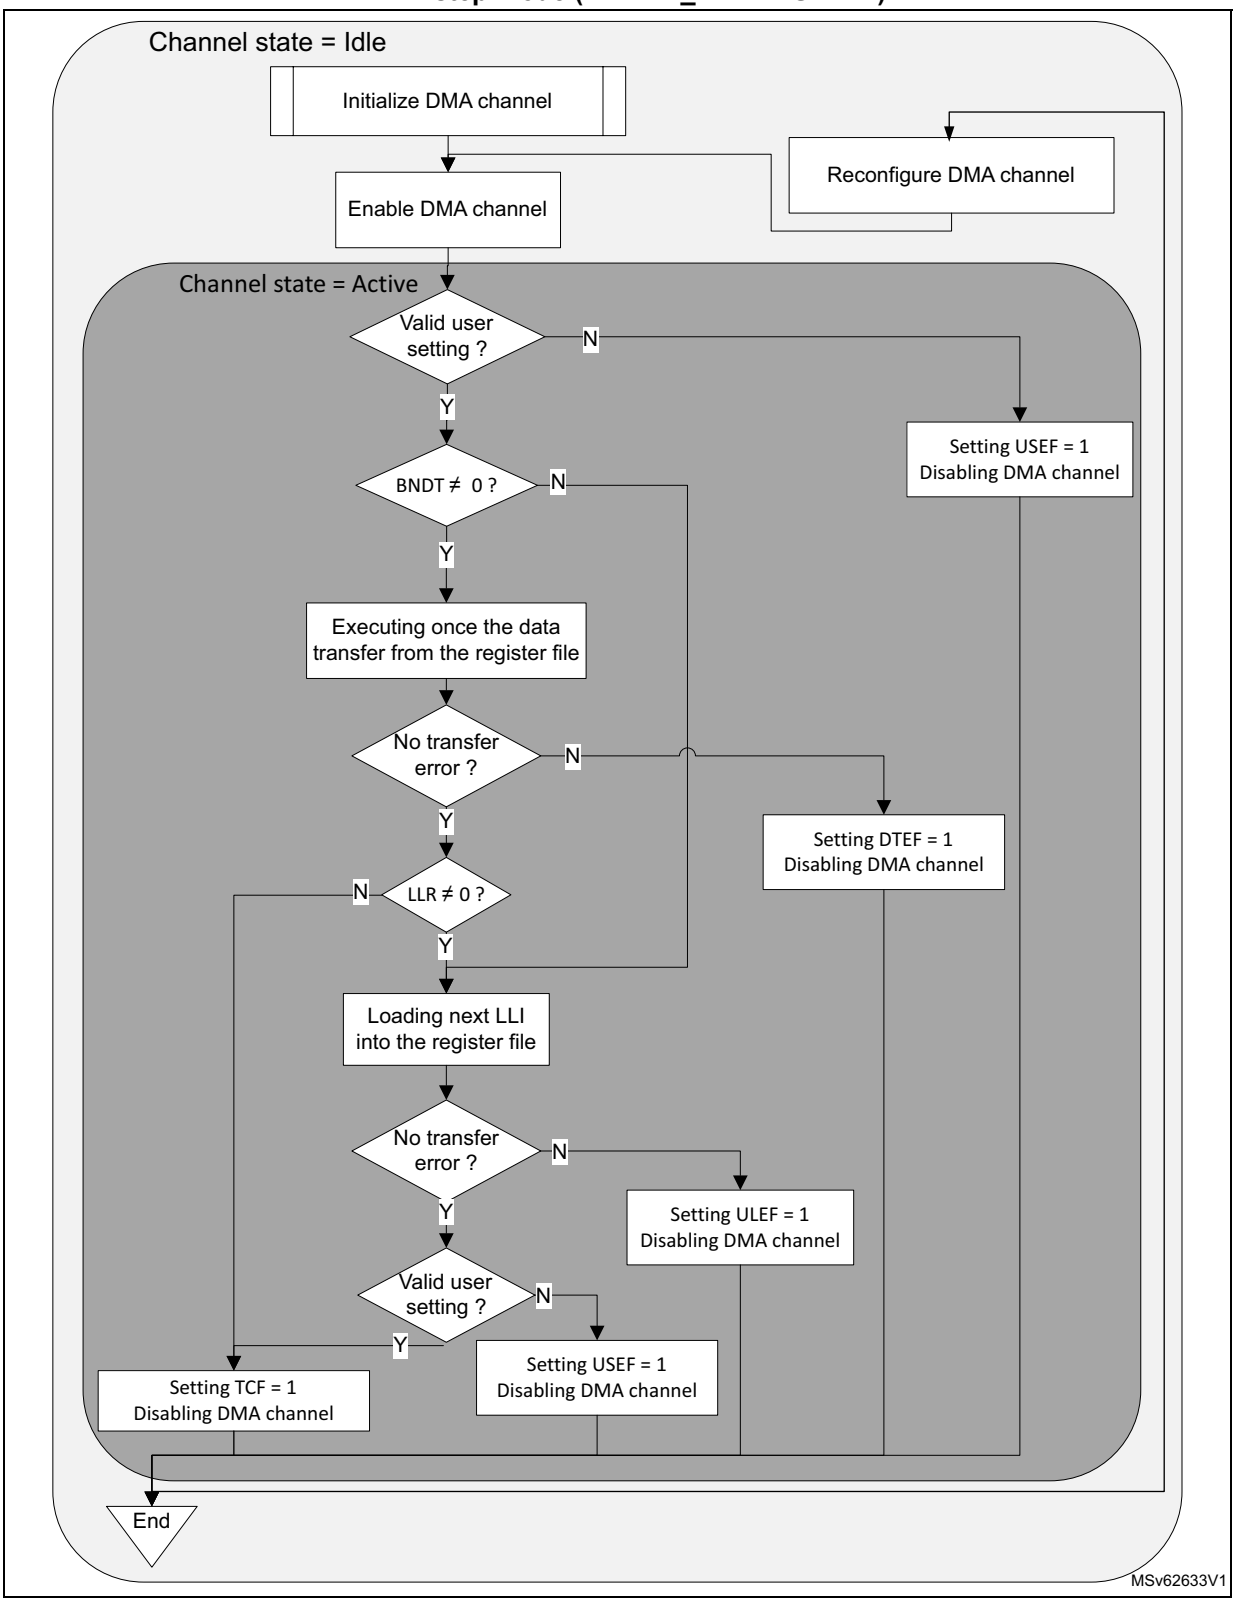
The link step mode can be used to elaborate dynamically LLIs in memory during run-time. The software can be facilitated by using a static data structure for any LLI_n (all update bits of HPDMA_CxLLR have a static value, LLI_n.LLR.LA = LLI_{n-1}.LLR.LA + constant).

Figure 146 depicts the HPDMA channel execution mode, and its programming in link step mode.

Note: Figure 146 is not intended to illustrate how often a TCEF can be raised, depending on the programmed value of TCEM[1:0] in HPDMA_CxTR2. It can be raised at (each) block completion, at (each) 2D block completion, at (each) LLI completion, or only at the last LLI data transfer completion. In link step mode, the channel is disabled after each single execution of a LLI, and depending on the value of TCEM[1:0] a TCEF is raised or not.

In Figure 146, BNDT ≠ 0 is the typical condition for starting the first data transfer. This condition becomes BNDT ≠ 0 and PFREQ = 1 if the peripheral requests a data transfer with early termination (see Section 25.3.6).

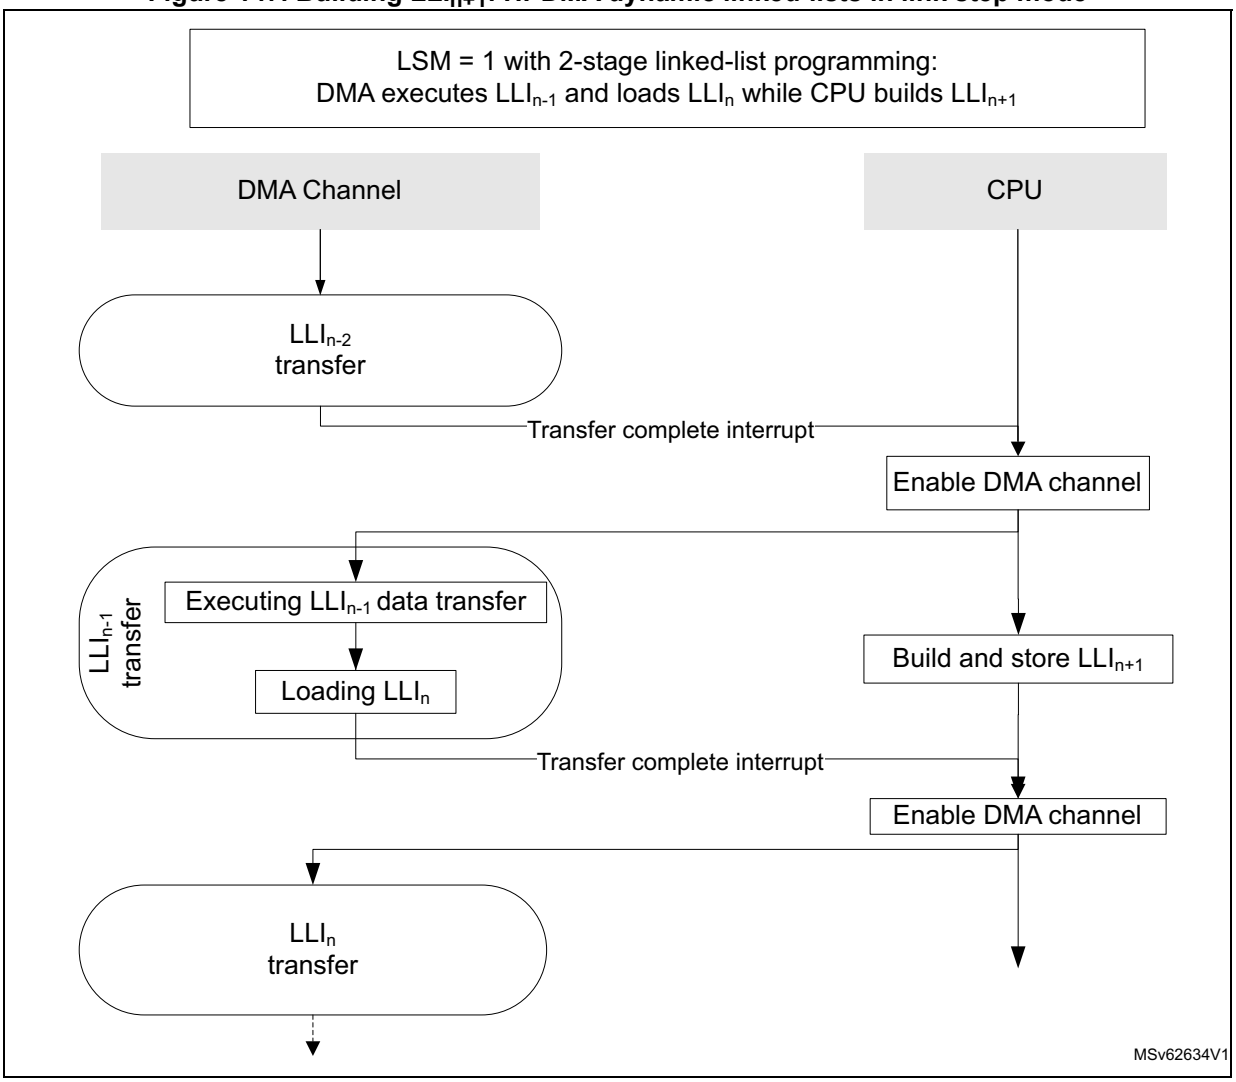
Figure 146. HPDMA channel execution and linked-list programming in link step mode (HPDMA_CxCR.LSM = 1)



Run-time adding a LLI_{n+1} in link step mode

During run-time, the software can defer the elaboration of the LLI_{n+1} (and next LLIs), until/after the HPDMA executed the transfer from the LLI_{n-1} and loaded the LLI_n from the memory, as shown in the figure below.

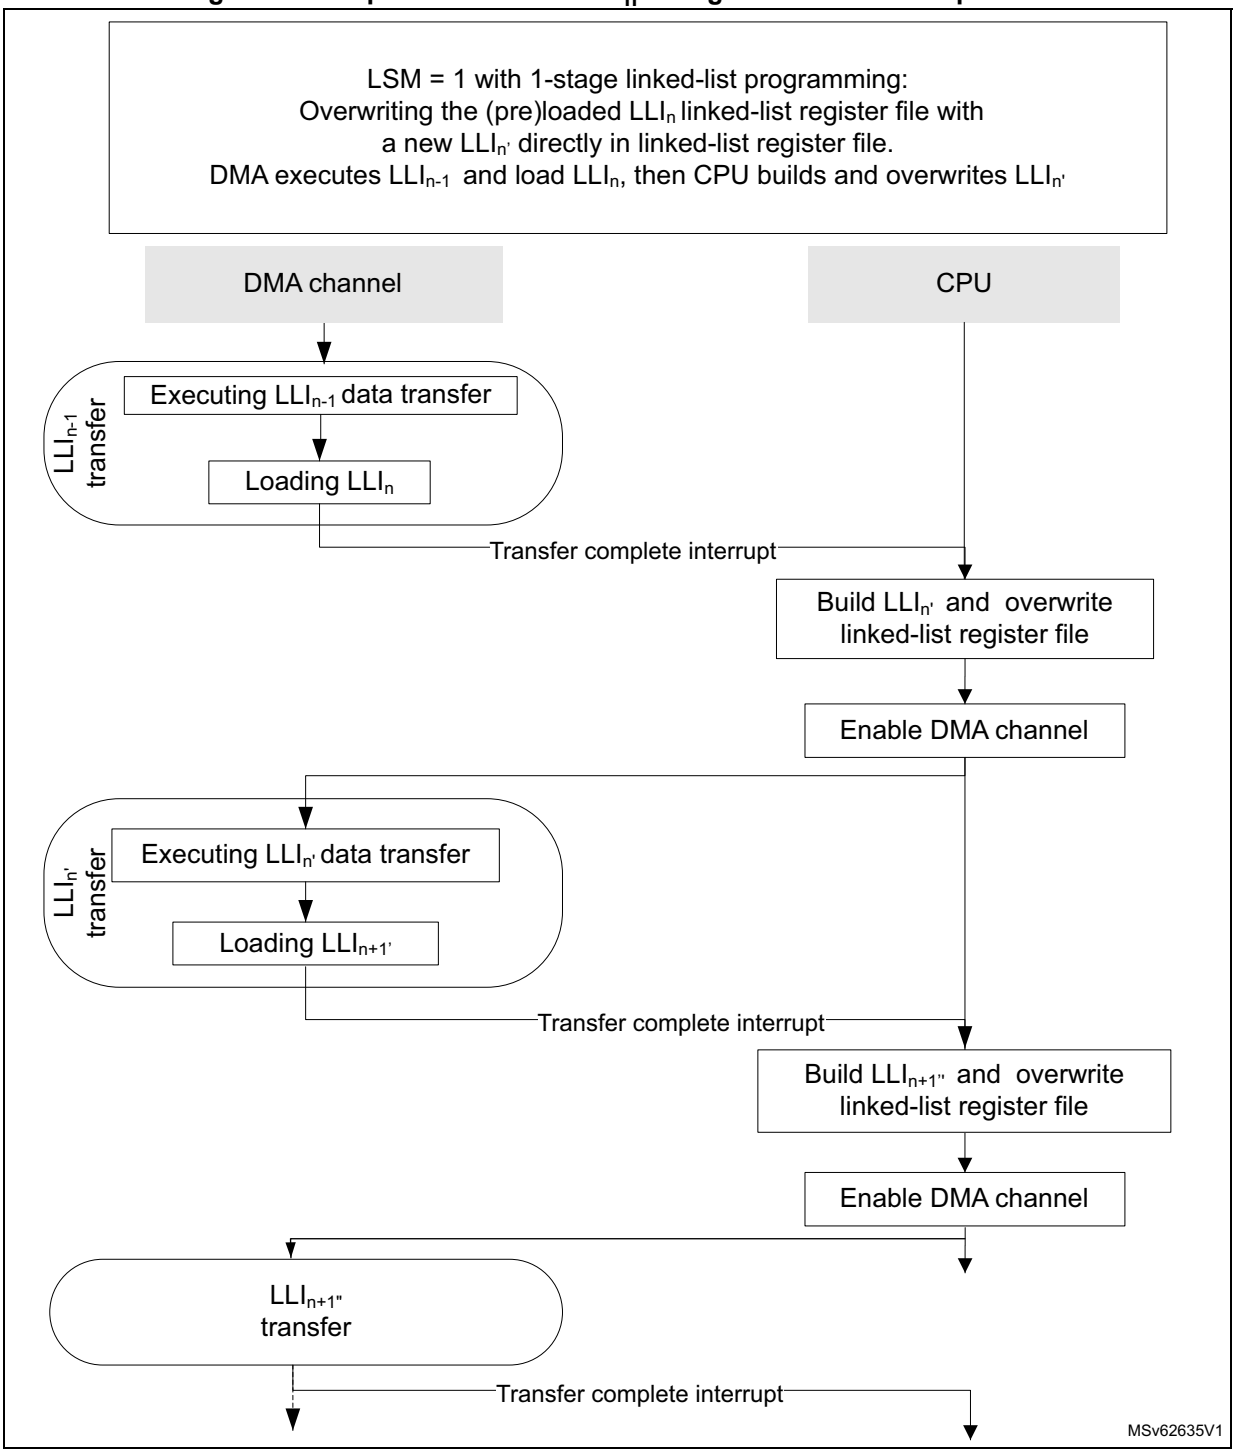
Figure 147. Building LLI_{n+1}: HPDMA dynamic linked-lists in link step mode



Run-time replacing an LLI_n with a new LLI_n', in link step mode (in linked-list register file)

In this link step mode, during run-time, the software can build and insert a new LLI_n', after the HPDMA executed the transfer from the LLI_{n-1}, and loaded a formerly elaborated LLI_n from the memory by overwriting directly the linked-list register file with the new LLI_n', as shown in *Figure 148*.

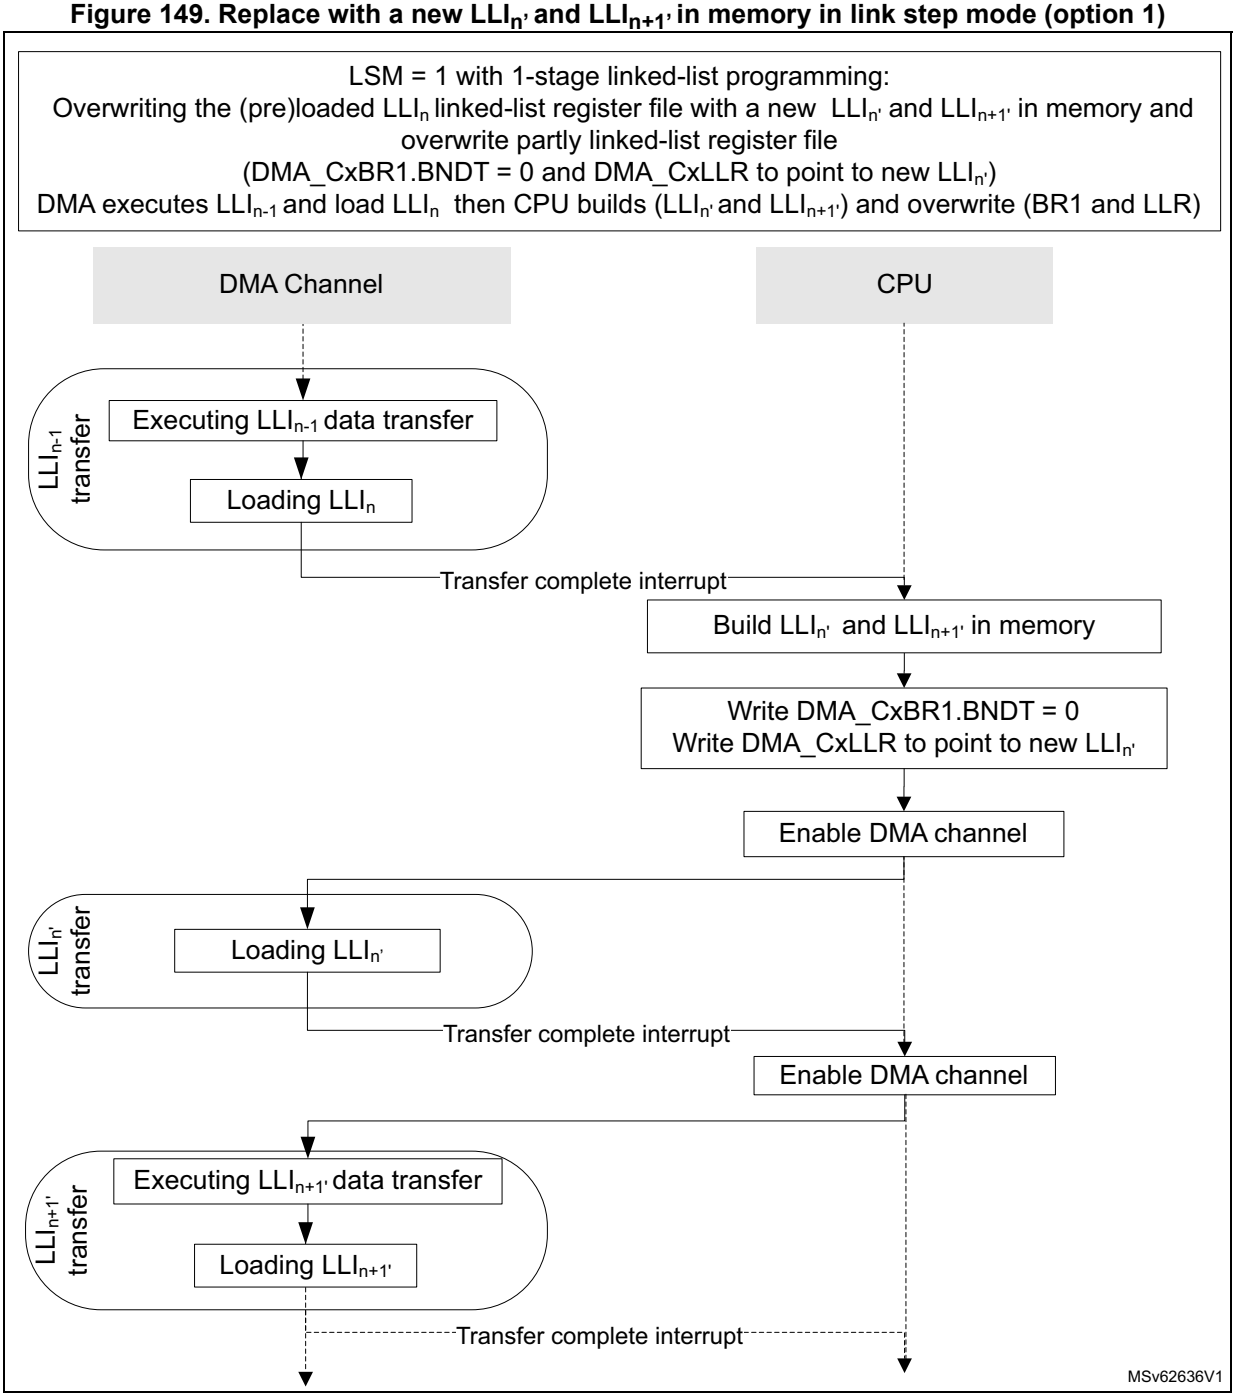
Figure 148. Replace with a new $LLI_{n'}$ in register file in link step mode



Run-time replacing an LLI_n with a new $LLI_{n'}$ in link step mode (in the memory)

The software can build and insert a new $LLI_{n'}$ and $LLI_{n+1'}$ in the memory, after HPDMA executed the transfer from the LLI_{n-1}, and loaded a formerly elaborated LLI_n from the memory, by overwriting partly the linked-list register file (HPDMA_CxBR1.BNDT[15:0] to be null, and HPDMA_CxLLR to point to new LLI_n) as shown in *Figure 149*.

Figure 149. Replace with a new $LLI_{n'}$ and $LLI_{n+1'}$ in memory in link step mode (option 1)



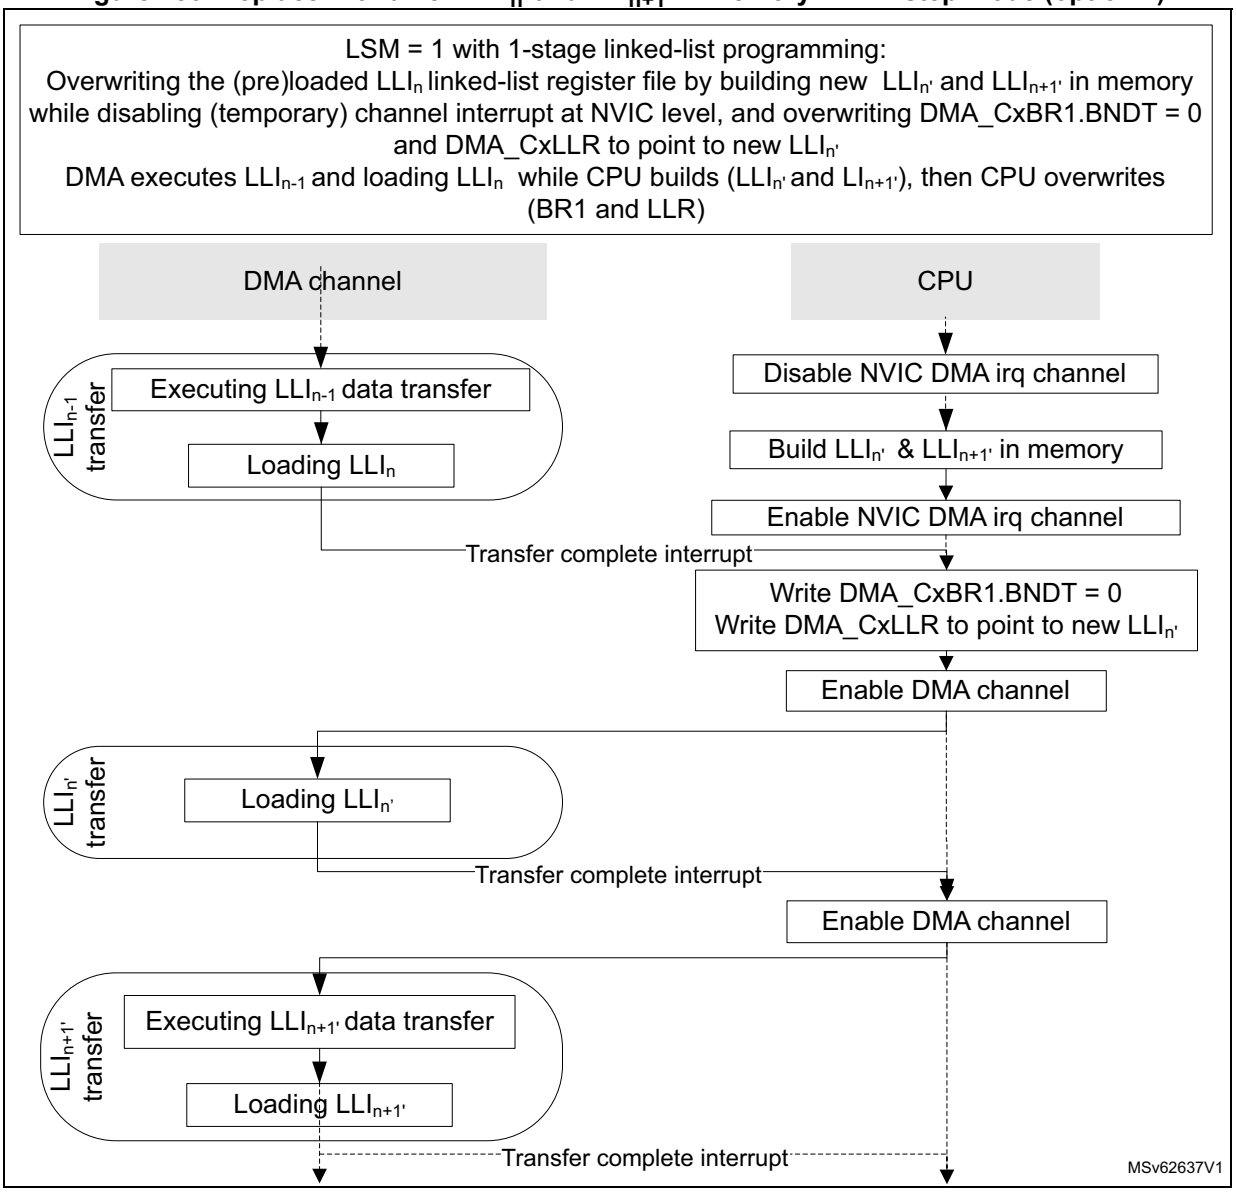
Run-time replacing a LLI_n with a new $LLI_{n'}$ in link step mode

Other software implementations exist. Meanwhile the HPDMA executes the transfer from the LLI_{n-1} and loads a formerly elaborated LLI_n from the memory (or even earlier), the software can do the following:

1. Disable the NVIC for not being interrupted by the interrupt handling.
2. Build a new $LLI_{n'}$ and a new $LLI_{n+1'}$.
3. Enable again the NVIC for the channel interrupt (transfer complete) notification.

The software in the interrupt handler for LLI_{n-1} is then restricted to overwrite HPDMA_CxBR1.BNDT[15:0] to be null and HPDMA_CxLLR to point to new $LLI_{n'}$, as shown in the figure below.

Figure 150. Replace with a new $LLI_{n'}$ and $LLI_{n+1'}$ in memory in link step mode (option 2)



25.4.10 HPDMA channel state and linked-list programming

The software can reconfigure a channel when the channel is disabled (HPDMA_CxCR.EN = 0), and update the execution mode (HPDMA_CxCR.LSM) to change from/to run-to-completion mode to/from link step mode.

In any execution mode, the software can:

- reprogram LLI_{n+1} in the memory to finally complete the channel by this LLI_{n+1} (clear the HPDMA_CxLLR of this LLI_{n+1}), before this LLI_{n+1} is loaded/used by the HPDMA channel
- abort and reconfigure the channel with an LSM update (see *Section 25.4.4*.)

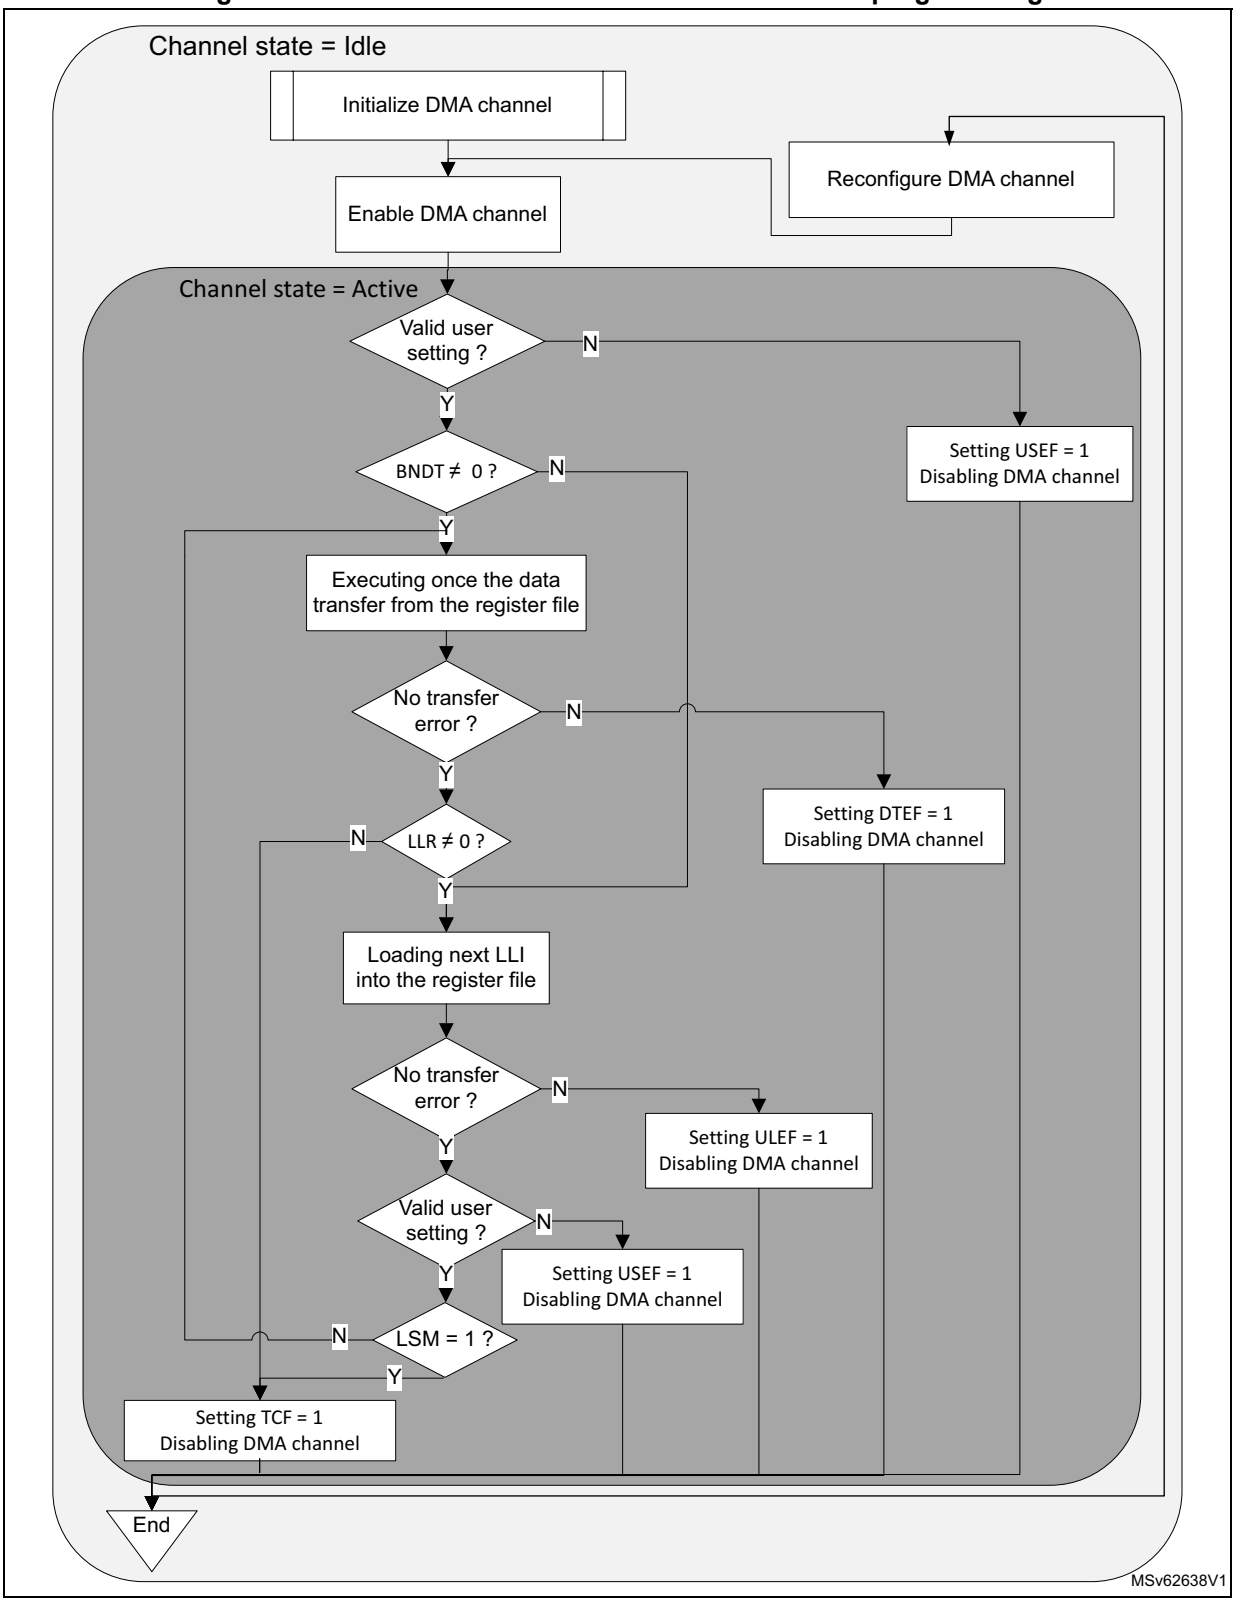
In link step mode, the software can clear LSM after each a single execution of any LLI, during LLI_{n-1}.

Figure 151 shows the overall and unified HPDMA linked-list programming, whatever is the execution mode.

Note: Figure 151 is not intended to illustrate how often a TCEF can be raised, depending on the programmed value of TCEM[1:0] in HPDMA_CxTR2. It can be raised at (each) block completion, at (each) 2D block completion, at (each) LLI completion, or only at the last LLI data transfer completion. In run-to-completion mode, whatever is the value of TCEM[1:0], at the channel completion the hardware always set TCEF = 1 and disables the channel. In link step mode, the channel is disabled after each single execution of a LLI, and depending on the value of TCEM[1:0] a TCEF is raised or not.

In Figure 151, BNDT ≠ 0 is the typical condition for starting the first data transfer. This condition becomes BNDT ≠ 0 and PFREQ = 1 if the peripheral requests a data transfer with early termination (see Section 25.3.6).

Figure 151. HPDMA channel execution and linked-list programming



25.4.11 HPDMA FIFO-based transfers

There is a single transfer operation mode: the FIFO mode. There are FIFO-based transfers. Any channel x is implemented with a dedicated FIFO whose size is defined by dma_fifo_size[x] (see *Section 25.3.1* for more details).

HPDMA burst

A programmed transfer at the lowest level is an HPDMA burst.

An HPDMA burst is a burst of data received from the source, or a burst of data sent to the destination. A source (and destination) burst is programmed with a burst length by SBL_1[5:0] (respectively DBL_1[5:0]), and with a data width defined by SDW_LOG2[1:0] (respectively DDW_LOG2[1:0]) in HPDMA_CxTR1.

The addressing mode after each data (named beat) of an HPDMA burst is defined by SINC and DINC in HPDMA_CxTR1, for source and destination respectively: either a fixed addressing or an incremented addressing with contiguous data.

The start and next addresses of an HPDMA source/destination burst (defined by HPDMA_CxSAR and HPDMA_CxDAR) must be aligned with the respective data width.

The table below lists the main characteristics of an HPDMA burst.

Table 182. Programmed HPDMA source/destination burst

SAP/DAP (allocated port)	SDW_LOG2[1:0] DDW_LOG2[1:0]	Data width (bytes)	SINC/DINC	SBL_1[5:0] DBL_1[5:0]	Burst length (data/ beats)	Next data/ beat address	Next burst address	Burst address alignment
0: AXI 1: AHB	00	1	0 (fixed)	n = 0 to 63(1)(2)	n+1	+ 0	+ 0	1
	01	2						2
	10	4						4
0: AXI	11	8						8
0: AXI 1: AHB	00	1	1 (contiguously incremented)			+ 1	+ (n + 1)	1
	01	2				+ 2	+ 2 * (n + 1)	2
	10	4				+ 4	+ 4 * (n + 1)	4
0: AXI	11	8				+ 8	+ 8 * (n + 1)	8
0: AHB	11	forbidden user setting, causing USEF generation and none burst to be issued.						

1. When S/DBL_1[5:0] = 0, burst is of length 1. Then burst can be also named as single.
2. As highlighted in *Section 25.3.2*, the maximum allowed AXI burst length is 16. The user must set SBL_1[5:0] lower or equal to 15 if the source allocated port is AXI (if SAP = 0). The user must set DBL_1[5:0] lower or equal to 15 if the destination allocated port is AXI (if DAP = 0).

The next burst address in the above table is the next source/destination default address pointed by HPDMA_CxSAR or HPDMA_CxDAR, once the programmed source/destination burst is completed. This default value refers to the fixed/contiguously incremented address.

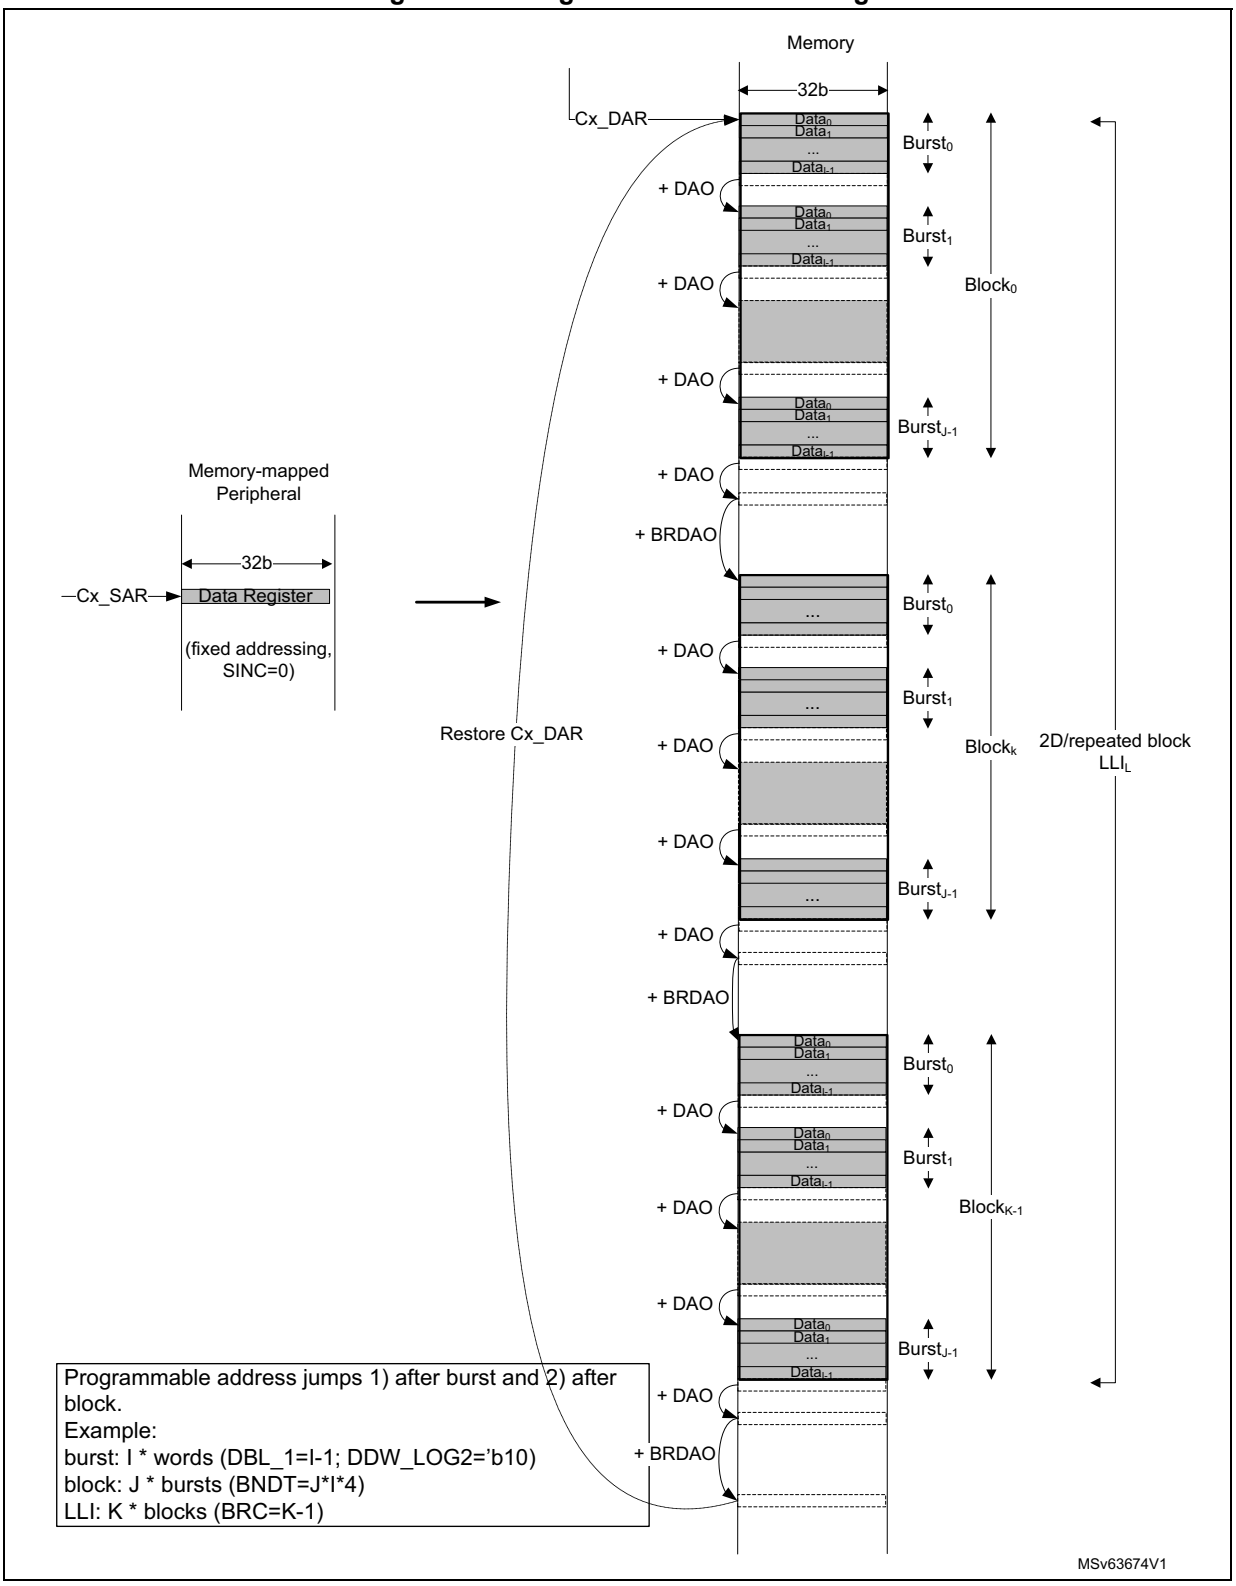
HPDMA burst with 2D addressing (channel x = 12 to 15)

When the channel has additional 2D addressing feature, this default value refers to the value without taking into account the two programmed incremented or decremented offsets. These two additional offsets (with a null default value) are applied:

- after each completed source/destination burst, as defined respectively by HPDMA_CxTR2.SAO[12:0]/DAO[12:0] and HPDMA_CxBR1.SDEC/DDEC
- after each completed block, as defined respectively by HPDMA_CxBR2.BRSAO[15:0]/BRDAO[15:0] and HPDMA_CxBR1.BRSDEC/BRDDEC)

Then, a 2D/repeated block can be addressed with a first programmed address jump after each completed burst, and with a second programmed address jump after each block, as depicted by *Figure 152* with a 2D destination buffer.

Figure 152. Programmed 2D addressing



HPDMA FIFO-based burst

In FIFO-mode, a transfer generally consists of two pipelined and separated burst transfers:

- one burst from the source to the FIFO over the allocated source master port, as defined by HPDMA_CxTR1.SAP
- one burst from the FIFO to the destination over the allocated destination master port, as defined by HPDMA_CxTR1.DAP

HPDMA source burst

The requested source burst transfer to the FIFO can be scheduled as early as possible over the allocated port, depending on the current FIFO level versus the programmed burst size (when the FIFO is ready to get one new burst from the source):

when FIFO level ≤ $2^{dma_fifo_size[x]}$ - (SBL_1[5:0]+1) * $2^{SDW_LOG2[1:0]}$

where:

- FIFO level is the current filling level of the FIFO, in bytes.
- $2^{dma_fifo_size[x]}$ is the half of the FIFO size of the channel x, in bytes (see *Section 25.3.1* for the implementation details and dma_fifo_size[x] value).
- (SBL_1[5:0]+1) * $2^{SDW_LOG2[1:0]}$ is the size of the programmed source burst transfer, in bytes.

Based on the channel priority (HPDMA_CxCR.PRIO[1:0]), this ready FIFO-based source transfer is internally arbitrated versus the other requested and active channels.

HPDMA destination burst

The requested destination burst transfer from the FIFO can be scheduled as early as possible over the allocated port, depending on the current FIFO level versus the programmed burst size (when the FIFO is ready to push one new burst to the destination):

when FIFO level ≥ (DBL_1[5:0]+1) * $2^{DDW_LOG2[1:0]}$

where:

- FIFO level is the current filling level of the FIFO, in bytes.
- (DBL_1[5:0]+1) * $2^{DDW_LOG2[1:0]}$ is the size of the programmed destination burst transfer, in bytes.

Based on the channel priority, this ready FIFO-based destination transfer is internally arbitrated versus the other requested and active channels.

HPDMA burst versus source block size, 1- or 4-Kbyte address boundary and FIFO size

The programmed source/destination HPDMA burst is implemented with an AHB/AXI burst as is, unless one of the following conditions is met:

- When half of the FIFO size of the channel x is lower than the programmed source/destination burst size, the programmed source/destination HPDMA burst is implemented with a series of singles or bursts of a lower size, each transfer being of a size that is lower or equal than half of the FIFO size, without any user constraint.
- if the source block size (HPDMA_CxBR1.BNDT[15:0]) is not a multiple of the source burst size but is a multiple of the data width of the source burst (HPDMA_CxTR1.SDW_LOG2[1:0]), the HPDMA modifies and shortens bursts into

singles or bursts of lower length, in order to transfer exactly the source block size, without any user constraint.

- if the source/destination burst transfer have crossed the 1- or 4-Kbyte address boundary on, respectively, an AHB or AXI transfer, the HPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the AHB/AXI protocol, without any user constraint.
- If the source/destination burst length exceeds 16 on a AHB transfer, or if the source/destination burst on an AXI transfer is both with fixed addressing and with a burst length which exceeds 16, the HPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the AHB/AXI protocol, without any user constraint.

In any case, the HPDMA keeps ensuring source/destination data (and address) integrity without any user constraint. The current FIFO level (software readable in HPDMA_CxSR) is compared to and updated with the effective transfer size, and the HPDMA re-arbitrates between each AHB/AXI single or burst transfer, possibly modified.

Based on the channel priority, each single or burst of a lower burst size versus the programmed burst, is internally arbitrated versus the other requested and active channels.

Note: In linked-list mode, the HPDMA read transfers related to the update of the linked-list parameters from the memory to the internal HPDMA registers, are scheduled over the link allocated port, as programmed by HPDMA_CxCR.LAP.

HPDMA data handling: byte-based reordering, packing/unpacking, padding/truncation, sign extension, and left/right alignment

The data handling is controlled by HPDMA_CxTR1. The source/destination data width of the programmed burst is byte, half-word, word, or double-word, as per SDW_LOG2[1:0] and DDW_LOG2[1:0] (see *Table 183*).

The user can configure the data handling between transferred data from the source and transfer to the destination. More specifically, programmed data handling is orderly performed with:

1. Byte-based source reordering
   - If SBX = 1 and if the source data width is a word or a double-word (for AXI source bus, SAP = 0), the two bytes of the unaligned half-word at the middle of each source data word are exchanged.
2. Data-width conversion by packing, unpacking, padding, or truncation, if destination data width is different than the source data width, depending on PAM[1:0]:
   - If destination data width > source data width, the post SBX source data is either right-aligned and padded with 0s, or sign extended up to the destination data width, or is FIFO queued and packed up to the destination data width.
   - If destination data width < source data width, the post SBX data is either right-aligned and left-truncated down to the destination data width, or is FIFO queued and unpacked and streamed down to the destination data width.

3. Byte-based destination re-ordering:
   - If DBX = 1 and if the destination data width is not a byte, the two bytes are exchanged within the aligned post PAM[1:0] half-words.
   - If DHX = 1 and if the destination data width is neither a byte nor a half-word, the two aligned half-words are exchanged within the aligned post PAM[1:0] words.
   - If DWX = 1and if the destination data width is a double-word and the destination bus is AXI (DAP = 0), the two aligned words are exchanged within aligned (post PAM[1:0]) double-words).

Note: Left-alignment with 0s-padding can be achieved by programming both a right-alignment with a 0s-padding, and a destination byte-based re-ordering.

The table below lists the possible data handling from the source to the destination.

Table 183. Programmed data handling

1. Data stream is timely ordered starting from the byte with the lowest index (B_0).
2. RA= right aligned, LA = left aligned, RT = right truncated, LT = left truncated, 0P = zero bit padding up to the destination data width, SE = sign bit extended up to the destination data width.
3. RA= right aligned. LA = left aligned. RT = right truncated. LT = left truncated.
4. 0P= zero-bit padding up to the destination data width. SE = sign bit extended up to the destination data width.
5. if DDW_LOG2[1:0] = 11 and if DAP = 0 (destination allocated port is AXI). Else if DDW_LOG2[1:0] = 11 and DAP = 1 (AHB), a user setting error (USEF) is reported.
6. if SDW_LOG2[1:0] = 11 and if SAP = 0 (source allocated source port is AXI). Else if SDW_LOG2[1:0] = 11 and SAP = 1 (AHB), a user setting error (USEF) is reported.

25.4.12 HPDMA transfer request and arbitration

HPDMA transfer request

As defined by HPDMA_CxTR2, a programmed HPDMA data transfer is requested with one of the following:

- a software request if the control bit SWREQ = 1: This is used typically by the CPU for a data transfer from a memory-mapped address to another memory mapped address (memory-to-memory, GPIO to/from memory)
- an input hardware request coming from a peripheral if SWREQ = 0: The selection of the HPDMA hardware peripheral request is driven by REQSEL[7:0] (see *Section 25.3.5*). The selected hardware request can be one of the following:
  - an hardware request from a peripheral configured in HPDMA mode (for a transfer from/to the peripheral data register respectively to/from the memory)
  - an hardware request from a peripheral for its control register update from the memory
  - an hardware request from a peripheral for a read of its status registers transferred to the memory

Caution: The user must not assign the same input hardware peripheral HPDMA request via HPDMA_CxTR.REQSEL[7:0] to two different channels, if at a given time this request is asserted by the peripheral, and each channel is ready to execute this requested data transfer. There is no user setting error reporting.

HPDMA transfer request for arbitration

A ready FIFO-based HPDMA source single/burst transfer (from the source address to the FIFO) to be scheduled over the allocated master port (HPDMA_CxTR1.SAP) is arbitrated based on the channel priority (HPDMA_CxCR.PRIO[1:0]) versus the other simultaneous requested HPDMA transfers to the same master port.

A ready FIFO-based HPDMA destination single/burst transfer (from the FIFO to the destination address) to be scheduled over the allocated master port (HPDMA_CxTR1.DAP) is arbitrated based on the channel priority (HPDMA_CxCR.PRIO[1:0]) versus the other simultaneous requested HPDMA transfers to the same master port.

An arbitrated HPDMA requested link transfer consists of one 32-bit read from the linked-list data structure in the memory to one of the linked-list registers (HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR, HPDMA_CxDAR, HPDMA_CxTR3, HPDMA_CxBR2 or HPDMA_CxLLR). Each 32-bit read from the memory is arbitrated with the same channel priority as for data transfers, in order to be scheduled over the allocated master port (HPDMA_CxCR.LAP).

Whatever the requested data transfer is programmed with a software request for a memory-to- memory transfer (HPDMA_CxTR2.SWREQ = 1), or with a hardware request (HPDMA_CxTR2.SWREQ = 0) for a memory-to-peripheral transfer or a peripheral-to-memory transfer and whatever is the hardware request type, re-arbitration occurs after each granted single/burst transfer.

When an hardware request is programmed from a destination peripheral (HPDMA_CxTR2.SWREQ = 0 and HPDMA_CxTR2.DREQ = 1), the first memory read of a (possibly 2D/repeated) block (the first ready FIFO-based source burst request), is gated by the occurrence of the corresponding and selected hardware request. This first read request

to memory is not taken into account earlier by the arbiter (not as soon as the block transfer is enabled and executable).

HPDMA arbitration

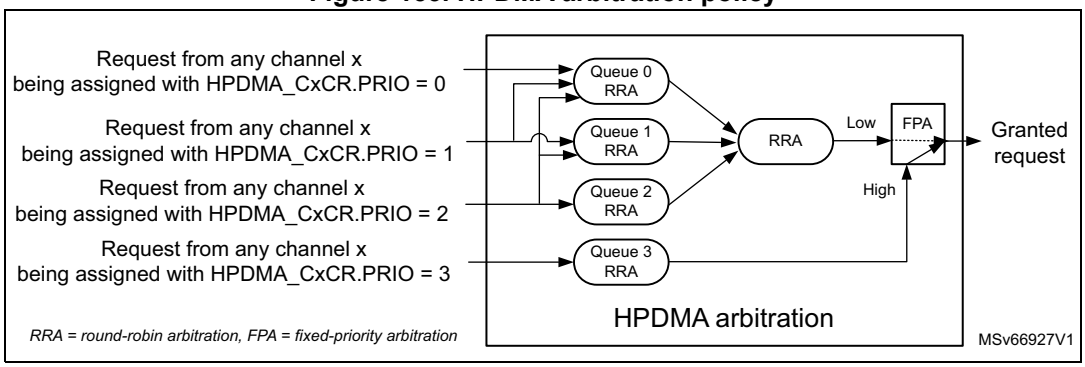
The HPDMA arbitration is directed from the 4-grade assigned channel priority (HPDMA_CxCR.PRIO[1:0]). The arbitration policy, as illustrated in *Figure 153*, is defined by:

- one high-priority traffic class (queue 3), dedicated to the assigned channels with priority 3, for time-sensitive channels

  This traffic class is granted via a fixed-priority arbitration against any other low-priority traffic class. Within this class, requested single/burst transfers are round-robin arbitrated.
- three low-priority traffic classes (queues 0, 1 or 2) for non time-sensitive channels with priority 0, 1 or 2

  Each requested single/burst transfer within this class is round-robin arbitrated, with a weight that is monotonically driven from the programmed priority:
  - Requests with priority 0 are allocated to the queue 0.
  - Requests with priority 1 are allocated and replicated to the queue 0 and queue 1.
  - Requests with priority 2 are allocated and replicated to the queue 0, queue 1, and queue 2.
  - Any queue 0, 1 or 2 equally grants any of its active input requests in a round-robin manner, provided there are simultaneous requests.
  - Additionally, there is a second stage for the low-traffic with a round-robin arbiter that fairly alternates between simultaneous selected requests from queue 0, queue 1 and queue 2.

Figure 153. HPDMA arbitration policy



HPDMA arbitration and bandwidth

With this arbitration policy, the following is guaranteed:

- equal maximum bandwidth between requests with same priority
- reserved bandwidth (noted as B_{Q3}) to the time-sensitive requests (with priority 3)
- residual weighted bandwidth between different low-priority requests (priority 0 versus priority 1 versus priority 2).

The two following examples highlight that the weighted round-robin arbitration is driven by the programmed priorities:

- **Example 1**: basic application with two non time-sensitive HPDMA requests: req0 and req1. There are the following programming possibilities:
  - If they are assigned with same priority, the allocated bandwidth by the arbiter to req0 (B_{req0}) is **equal** to the allocated bandwidth to req1(B_{req1}).

    $B_{req0} = B_{req1} = 1/2 * (1 - B_{Q3})$
  - If req0 is assigned to priority 0 and req1 to priority 1, the allocated bandwidth to req0 (B_{P0}) is **3 times less** than the allocated bandwidth to req1 (B_{P1}).

    $B_{req0} = B_{P0} = 1/2 * 1/2 * (1 - B_{Q3}) = 1/4 * (1 - B_{Q3})$

    $B_{req1} = B_{P1} = (1/2 + 1) * 1/2 * (1 - B_{Q3}) = 3/4 * (1 - B_{Q3})$
  - If req0 is assigned to priority 0 and req1 to priority 2, the allocated bandwidth to req0 (B_{P0}) is **5 times less** than the allocated bandwidth to req1 (B_{P2}).

    $B_{req0} = B_{P0} = 1/2 * 1/3 * (1 - B_{Q3}) = 1/6 * (1 - B_{Q3})$

    $B_{req1} = B_{P2} = (1/2 + 1 + 1) * 1/3 * (1 - B_{Q3}) = 5/6 * (1 - B_{Q3})$

  The above computed bandwidth calculation is based on a theoretical input request, always active for any HPDMA clock cycle. This computed bandwidth from the arbiter must be weighted by the frequency of the request given by the application, that cannot be always active and may be quite much variable from one HPDMA client (example I2C at 400 kHz) to another one (PWM at 1 kHz) than the above x3 and x5 ratios.
- **Example 2**: application where the user distributes a same non-null N number of HPDMA requests to every non time-sensitive priority 0, 1 and 2. The bandwidth calculation is then the following:
  - The allocated bandwidth to the set of requests of priority 0 (B_{P0}) is

    $B_{P0} = 1/3 * 1/3 * (1 - B_{Q3}) = 1/9 * (1 - B_{Q3})$
  - The allocated bandwidth to the set of requests of priority 1(B_{P1}) is

    $B_{P1} = (1/3 + 1/2) * 1/3 * (1 - B_{Q3}) = 5/18 * (1 - B_{Q3})$
  - The allocated bandwidth to the set of requests of priority 2(B_{P2}) is

    $B_{P2} = (1/3 + 1/2 + 1) * 1/3 * (1 - B_{Q3}) = 11/18 * (1 - B_{Q3})$
  - The allocated bandwidth to any request n ($B_{n)}$ among the N requests of that priority Pi (i = 0 to 2) is $B_n = 1/N * B_{Pi}$
  - The allocated bandwidth to any request n of priority 0i ($B_{n, Pi}$) is

    $B_{n, P0} = 1/N * 1/9 * (1 - B_{Q3})$

    $B_{n, P1} = 1/N * 5/18 * (1 - B_{Q3})$

    $B_{n, P2} = 1/N * 11/18 * (1 - B_{Q3})$

  In this example, when the master port bus bandwidth is not totally consumed by the time-sensitive queue 3, the residual bandwidth is such that 2.5 times less bandwidth is allocated to any request of priority 0 versus priority 1, and 5.5 times less bandwidth is allocated to any request of priority 0 versus priority 2.

More generally, assume that the following requests are present:

- I requests (I ≥ 0) assigned to priority 0
  If I > 0, these requests are noted from i = 0 to I-1.
- J requests (J ≥ 0) assigned to priority 1
  If J > 0, these requests are noted from j = 0 to J-1.
- K requests (K > 0) assigned to priority 2
  These requests are noted from k = 0 to K-1
- L requests (L ≥ 0) assigned to priority 3
  If L > 0, these requests are noted from l = 0 to L-1.

As B_{Q3} is the reserved bandwidth to time-sensitive requests, the bandwidth for each request L with priority 3 is:

- $B_l = B_{Q3} / L$ for L > 0 (else: $B_l = 0$)

The bandwidth for each non-time sensitive queue is:

- $B_{Q0} = 1/3 * (1 - B_{Q3})$
- $B_{Q1} = 1/3 * (1 - B_{Q3})$
- $B_{Q2} = 1/3 * (1 - B_{Q3})$

The bandwidth for the set of requests with priority 0 is:

- $B_{P0} = I / (I + J + K) * B_{Q0}$

The bandwidth for each request i with priority 0 is:

- $B_i = B_{P0} / I$ for L > 0 (else $B_{P0} = 0$)

The bandwidth for the set of requests with priority 1 and routed to queue 0 is:

- $B_{P1,Q0} = J / (I + J + K) * B_{Q0}$

The bandwidth for the set of requests with priority 1 and routed to queue 1 is:

- $B_{P1,Q1} = J / (J + K) * B_{Q1}$

The total bandwidth for the set of requests with priority 1 is:

- $B_{P1} = B_{P1,Q0} + B_{P1,Q1}$

The bandwidth for each request j with priority 1 is:

- $B_j = B_{P1} / J$ for J > 0 (else $B_j = 0$)

The bandwidth for the set of requests with priority 2 and routed to queue 0 is:

- $B_{P2,Q0} = K / (I + J + K) * B_{Q0}$

The bandwidth for the set of requests with priority 2 and routed to queue 1 is:

- $B_{P2,Q1} = K / (J + K) * B_{Q1}$

The bandwidth for the set of requests with priority 2 and routed to queue 2 is:

- $B_{P2,Q2} = B_{Q2}$

The total bandwidth for the set of requests with priority 2 is:

- $B_{P2} = B_{P2,Q0} + B_{P2,Q1} + B_{P2,Q2}$

The bandwidth for each request k with priority 2 is:

- $B_k = B_{P2} / K$ (K>0 in the general case)

Thus finally the maximum allocated residual bandwidths for any i, j, k non-time sensitive request are:

- in the general case (when there is at least one request k with a priority 2 (K > 0)):
  - $B_i = 1/I * 1/3 * I/(I + J + K) * (1 - B_{Q3})$
  - $B_j = 1/J * 1/3 *[J/(I + J + K) + J/(J + K)] * (1 - B_{Q3})$
  - $B_k = 1/K * 1/3 *[K/(I + J + K) + K/(J + K) + 1] * (1 - B_{Q3})$
- in the specific case (when there is no request k with a priority 2 (K = 0)):
  - $B_i = 1/I * 1/2 * I/(I + J) * (1 - B_{Q3})$
  - $B_j = 1/J * 1/2 *[J/(I + J) + 1] * (1 - B_{Q3})$

Consequently, the HPDMA arbiter can be used as a programmable weighted bandwidth limiter, for each queue and more generally for each request/channel. The different weights are monotonically resulting from the programmed channel priorities.

25.4.13 HPDMA triggered transfer

A programmed HPDMA transfer can be triggered by a rising/falling edge of a selected input trigger event, as defined by HPDMA_CxTR2.TRIGPOL[1:0] and HPDMA_CxTR2.TRIGSEL[6:0] (see *Section 25.3.7* for the trigger selection).

The triggered transfer, as defined by the trigger mode in HPDMA_CxTR2.TRIGM[1:0], can be at LLI data transfer level, to condition the first burst read of a block, the first burst read of a 2D/repeated block (for channel x = 12 to 15), or each programmed burst read/write. The trigger mode can also be programmed to condition the LLI link transfer (see TRIGM[1:0] in *HPDMA channel x transfer register 2 (HPDMA_CxTR2)* for more details).

Trigger hit memorization and trigger overrun flag generation

The HPDMA monitoring of a trigger for a channel x is started when the channel is enabled/loaded with a new active trigger configuration: rising or falling edge on a selected trigger (respectively TRIGPOL[1:0] = 01 or TRIGPOL[1:0] = 10).

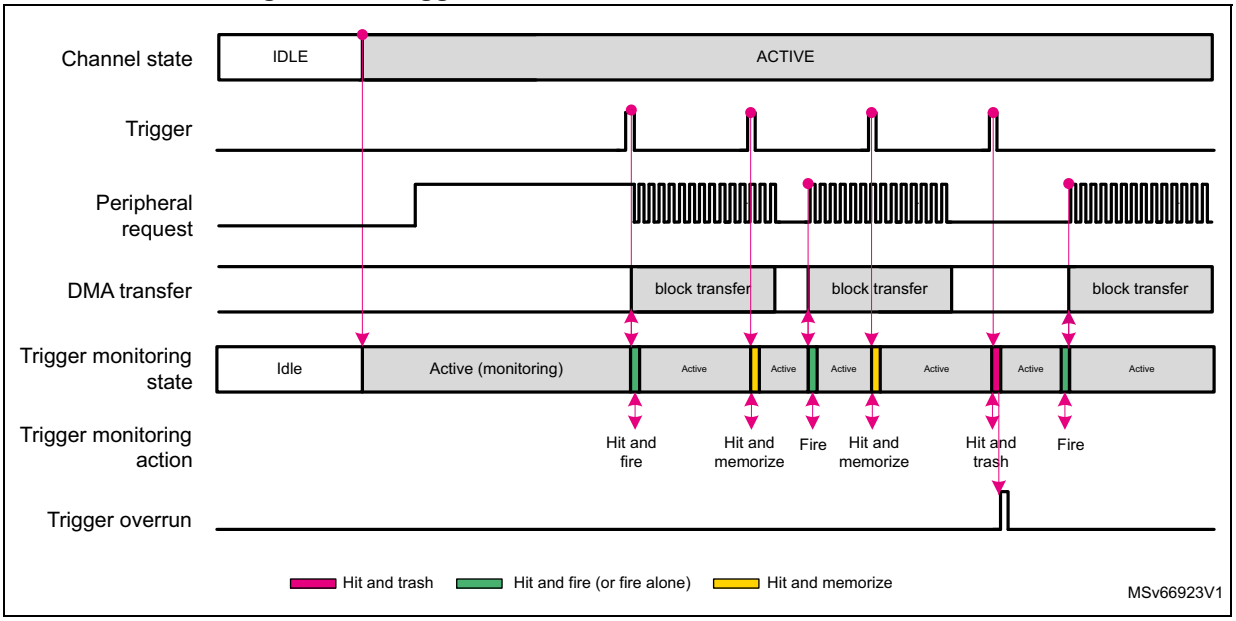
The monitoring of this trigger is kept active during the triggered and uncompleted (data or link) transfer. If a new trigger is detected, this hit is internally memorized to grant the next transfer, as long as the defined rising/falling edge and TRIGSEL[6:0] are not modified, and the channel is enabled.

Transferring a next $LLI_{n+1,}$ that updates HPDMA_CxTR2 with a new value for any of TRIGSEL[6:0] or TRIGPOL[1:0], resets the monitoring, trashing the possible memorized hit of the formerly defined LLI_n trigger.

Caution: After a first new trigger, hit_{n+1} is memorized. If another trigger hit_{n+2} is detected, and if the hit_n triggered transfer is still not completed, hit_{n+2} is lost and not memorized. A trigger overrun flag is reported (HPDMA_CxSR.TOF = 1) and an interrupt is generated if enabled (if HPDMA_CxCR.TOIE = 1). The channel is not automatically disabled by hardware due to a trigger overrun.

The figure below illustrates the trigger hit, memorization, and overrun in the configuration example with a block-level trigger mode and a rising edge trigger polarity.

Figure 154. Trigger hit, memorization and overrun waveform



Note: The user can assign the same input trigger event to different channels. This can be used to trigger different channels on a broadcast trigger event.

25.4.14 HPDMA circular buffering with linked-list programming

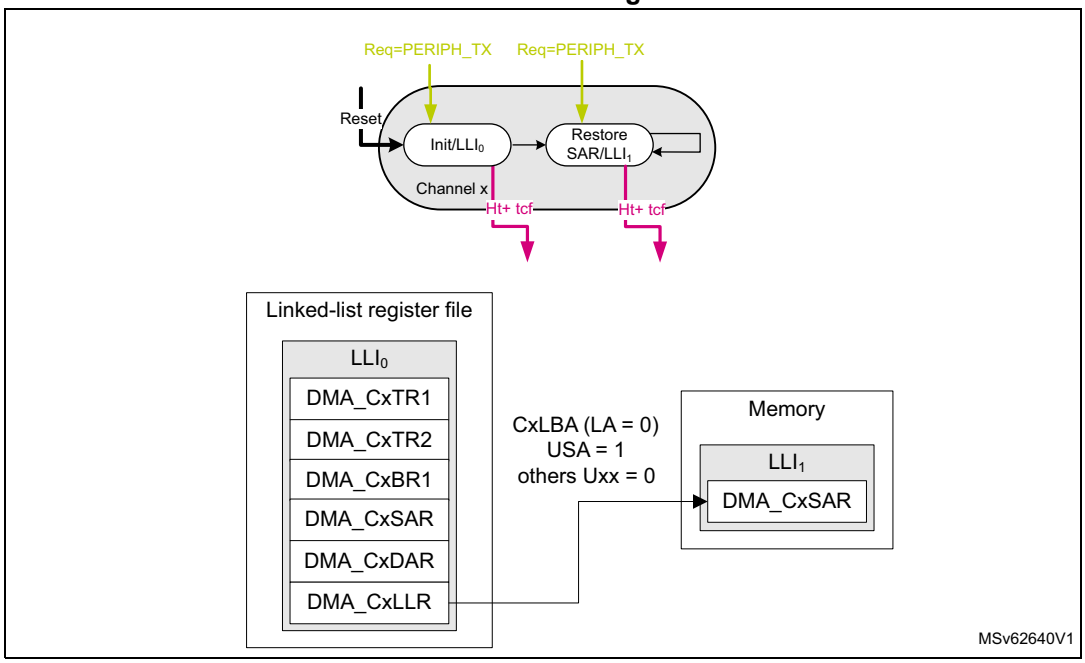
HPDMA circular buffering for memory-to-peripheral and peripheral-to-memory transfers, with a linear addressing channel

For a circular buffering, with a continuous memory-to-peripheral (or peripheral-to-memory) transfer, the software must set up a channel with half-transfer and complete-transfer event/interrupt generation (HPDMA_CxCR.HTIE = 1 and HPDMA_CxCR.TCIE = 1), in order to enable a concurrent buffer software processing.

LLI_0 is configured for the first block transfer with the linear addressing channel.
A continuously-executed LLI_1 is needed to restore the memory source (or destination) start address for the memory-to-peripheral transfer (respectively the peripheral-to-memory).
The HPDMA automatically reloads the initially programmed HPDMA_CxBR1.BNDT[15:0] when a block transfer is completed, and there is no need to restore HPDMA_CxBR1.

The figure below illustrates this programming with a linear addressing HPDMA channel and a source circular buffer.

Figure 155. HPDMA circular buffer programming: update of the memory start address with a linear addressing channel

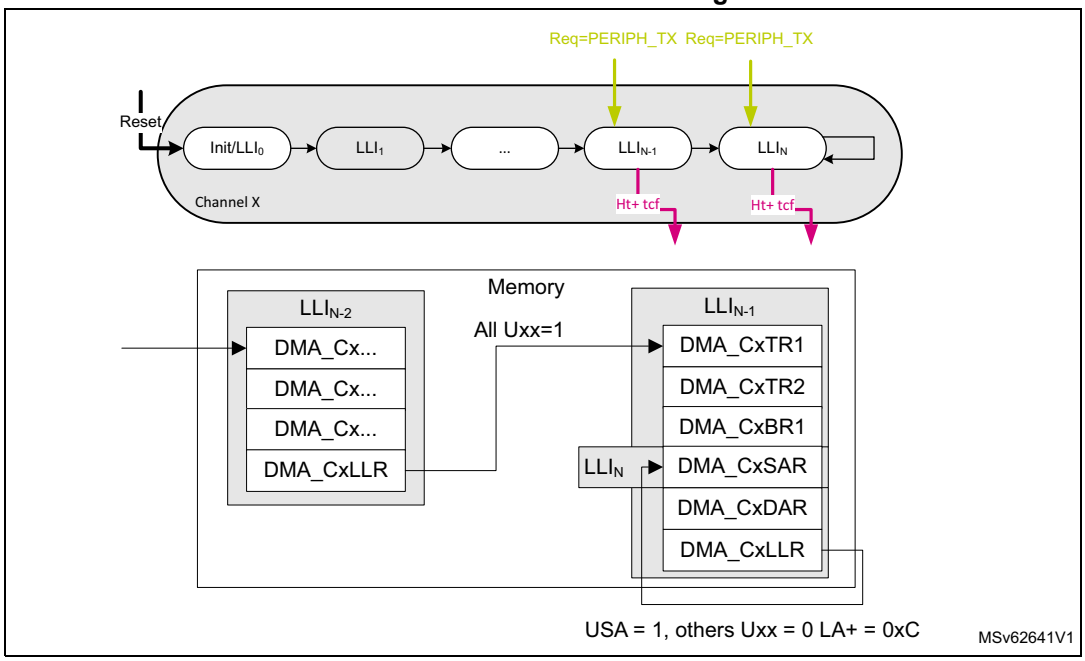


Note: With a 2D addressing channel, a single LLI can be used with HPDMA_CxBR1.BRC[10:0] = 1. The user can program a negative memory block address offset with HDMA_CxBR2 and HDMA_CxBR1, in order to jump back to the memory source or destination start address.

If the circular buffering must be executed after some other transfers over the shared HPDMA channel x, the before-last LLI_{N-1} in the memory is needed to configure the first block transfer. The last LLI_N restores the memory source (or destination) start address in memory-to-peripheral transfer (respectively in peripheral-to-memory).

The figure below illustrates this programming with a linear addressing shared HPDMA channel, and a source circular buffer.

Figure 156. Shared HPDMA channel with circular buffering: update of the memory start address with a linear addressing channel



25.4.15 HPDMA transfer in peripheral flow-control mode

A peripheral with the peripheral flow-control mode feature can decide to early terminate an HPDMA block transfer, provided that the allocated channel is implemented with this feature (see *Section 25.3.6*).

If the related HPDMA channel x is also programmed in peripheral flow-control mode (HPDMA_CxTR2.PFREQ = 1):

- The HPDMA block transfer starts as follows:
  - If HPDMA_CxBR1.BNDT[15:0] ≠ 0, the programmed value is internally taken into account by the HPDMA hardware.
  - If HPDMA_CxBR1.BNDT[15:0] = 0, the HPDMA hardware internally considers a 64-Kbyte value for the maximum source block size to be transferred.
- The HPDMA block transfer is completed as soon as the first occurrence of any of the following condition occurs:
  - when HPDMA_CxBR1.BNDT[15:0] = 0
  - when the peripheral early terminates the block. The complete transfer event is generated if programmed, depending on HPDMA_CxTR2. Then the software can read the current number of transferred bytes from the source (HPDMA_CxBR1.BNDT[15:0]), and/or read the current source or destination address of the buffer in memory (HPDMA_CxSAR[31:0] or HPDMA_CxDAR[31:0]).

In peripheral flow-control mode:

- a destination peripheral with an hardware requested transfer is not supported: memory-to-peripheral transfer is not supported.
- Data packing from a source peripheral is not supported.
- 2D/repeated block is not supported.
- HPDMA_CxBR1.BNDT[15:0] must be programmed as a multiple of the source (peripheral) burst size.

25.4.16 HPDMA byte-based padding at the block level

For a given channel x, a LLI_n data transfer consists of a block transfer and is defined by the source block size HPDMA_CxBR1.BNDT[15:0], the size of the block of data to be transfered from the source, in bytes.

During a peripheral-to-memory transfer, a peripheral may be streaming and receiving a given number of bytes (for example, via an I2C, UART/USART/LPUART, ADC, DAC) or half-words, and this block size may not be a multiple of a word or a double-word. It is important to allow the user to program any number of bytes for the HPDMA source block size independently from the source data width and the destination data width, in order to use efficiently the bandwidth of the 32-bit AHB system bus and/or the 64-bit AXI system bus when accessing and writing into memory (embedded SRAM, NVM or external memory). This enables to decrease the bus bandwidth for the memory transfers by a ratio of up to 4 in AHB and up to 8 in AXI. More generally, having the source block size independent from the source data width and the destination data width can be useful also with memory-to-peripheral transfers, and with memory-to-memory transfers (AHB from/to AXI).

A FIFO-based channel is able to perform byte-based padding on the last write(s) up to the fully transferred source block size. Then channel FIFO is empty. Data handling is performed on zero bytes in the same way as on regular data bytes from the source, as explained in *HPDMA data handling: byte-based reordering, packing/unpacking, padding/truncation, sign extension, and left/right alignment*.

There is byte-based padding at the block level:

1. If source data width is less than the destination data width, and if FIFO queuing and data packing is configured (PAM[1:0] = 1x):

- Padding with zero bytes. For example, if BNDT= 5, 8-bit reads, 32-bit writes:
  - if DBX = 0, DHX = 0: B_4,B_3,B_2,B_1,B_0 -> 000B_4, $B_3B_2B_1B_0$
  - if DBX = 0, DHX = 1: B_4,B_3,B_2,B_1,B_0 -> 0$B_4$00, $B_1B_0B_3B_2$
  - if DBX = 1, DHX = 0: B_4,B_3,B_2,B_1,B_0 -> 00$B_4$0, $B_2B_3B_0B_1$
  - if DBX = 1, DHX = 1: B_4,B_3,B_2,B_1,B_0 -> $B_4$000, $B_0B_1B_2B_3$

2. If source data width > destination data width, and if FIFO queuing and data unpacking is configured (PAM[1:0] = 1x):

- Padding with zero bytes.
- On the last read, only the number of LSB(s) up to the block size are written to the FIFO. The last written data to the destination is padded with zero bytes up to the destination data width. For example, if BNDT= 5, 32-bit reads, 16-bit writes:
  - if DBX = 0: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> 0B_4, B_3B_2, B_1B_0
  - if DBX = 1: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$, -> $B_4$0, B_2B_3, B_0B_1

3. If source data width = destination data width (and BNDT[15:0] is not a multiple of that value):

- Padding with zero bytes. For example, if BNDT= 6, 32-bit reads, 32-bit writes are configured
  - if SBX = 0, DBX = 0, DHX = 0: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> $00B_5B_4$, $B_3B_2B_1B_0$
  - if SBX = 0, DBX = 0, DHX = 1: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> B_5B_400, $B_1B_0B_3B_2$
  - if SBX = 0, DBX = 1, DHX = 0: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> $00B_4B_5$, $B_2B_3B_0B_1$
  - if SBX = 0, DBX = 1, DHX = 1: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> B_4B_500, $B_0B_1B_2B_3$
  - if SBX = 1, DBX = 0, DHX = 0: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> $000B_4$, $B_3B_1B_2B_0$
  - if SBX = 1, DBX = 0, DHX = 1: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> $0B_400$, $B_2B_0B_3B_1$
  - if SBX = 1, DBX = 1, DHX = 0: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> $00B_40$, $B_1B_3B_0B_2$
  - if SBX = 1, DBX = 1, DHX = 1: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> B_4000, $B_0B_2B_1B_3$

4. If source data width < destination data width, and if destination data is configured as right-aligned and, either configured with zero padding bytes (PAM[1:0] = 00), or configured with sign extension (PAM[1:0] = 01):

- Padding with zero bytes if PAM[1:0] = 00. For example, BNDT = 5, 8-bit reads, 32-bit writes, PAM[1:0] = 00:
  - if DBX =0, DHX = 0: B_4,B_3,B_2,B_1,B_0 -> $000B_4$, $000B_3$, $000B_2$, $000B_1$, $000B_0$
- Padding with sign extension if PAM[1:0] = 01. For example, BNDT = 5, 8-bit reads, 32-bit writes, PAM[1:0] = 01:
  - if DBX = 0, DHX = 0: B_4,B_3,B_2,B_1,B_0 -> $SSSB_4$, $SSSB_3$, $SSSB_2$, $SSSB_1$, $SSSB_0$

5. If source data width > destination data width, and if destination data is configured as right-aligned (PAM[1:0] = 00), or left-aligned (PAM[1:0] = 01):

- Padding with zero bytes. For example, BNDT = 5, 32-bit reads, 16-bit writes:
  - if SBX = 0, PAM[1:0] = 00, DBX = 0: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> $0B_4$, B_1B_0
  - if SBX = 0, PAM[1:0] = 00, DBX = 1: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> B_40, B_0B_1
  - if SBX = 0, PAM[1:0] = 01, DBX = 0: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> 00, B_3B_2
  - if SBX = 0, PAM[1:0] = 01, DBX = 1: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> 00, B_2B_3
  - if SBX = 1, PAM[1:0] = 00, DBX = 0: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> $0B_4$, B_2B_0
  - If SBX = 1, PAM[1:0] = 00, DBX = 1: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> B_40, B_0B_2
  - If SBX = 1, PAM[1:0] = 01, DBX = 0: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> 00, B_3B_1
  - If SBX = 0, PAM[1:0] = 01, DBX = 1: $B_7B_6B_5B_4$, $B_3B_2B_1B_0$ -> 00, B_1B_3

25.4.17 HPDMA secure/nonsecure channel

The HPDMA controller is compliant with the TrustZone hardware architecture at channel level, partitioning all its resources so that they exist in one of the secure and nonsecure worlds at any given time.

Any channel x is a secure or nonsecure hardware resource, as configured by HPDMA_SECCFGR.SECx.

When a channel x is configured in secure state by a secure and privileged agent, the following access control rules are applied:

- A nonsecure read access to a bitfield of this channel is forced to return 0, except for HPDMA_SECCFGR, HPDMA_PRIVCFGR, HPDMA_RCFGLOCKR, and HPDMA_CxSEMCR that are readable by a nonsecure agent.
- A nonsecure write access to a bitfield of this channel has no impact.

When a channel x is configured in secure state, a secure agent can configure separately as secure or nonsecure the HPDMA data transfer from the source (HPDMA_CxTR1.SSEC), and to the destination (HPDMA_CxTR1.DSEC).

When a channel x is configured in secure state and in linked-list mode, the loading of the next linked-list data structure from the HPDMA memory into its register file, is automatically performed with secure transfers via the HPDMA_CxCR.LAP allocated master port.

The HPDMA generates a secure bus that reflects HPDMA_SECCFGR, to keep the other peripherals informed of the secure/nonsecure state of each HPDMA channel x.

The HPDMA also generates a security illegal access pulse signal on an illegal nonsecure access to a secure HPDMA register. This signal is routed to the TrustZone interrupt controller.

When the secure software must switch a channel from a secure state to a nonsecure state, the secure software must abort the channel or wait until the secure channel is completed before switching. This is needed to dynamically re-allocate a channel to a next nonsecure transfer as a nonsecure software is not allowed to do so, and must have HPDMA_CxCR.EN = 0 before the nonsecure software can reprogram HPDMA_CxCR for a next transfer. The secure software can reset not only the channel x (HPDMA_CxCR.RESET = 1), but also the full channel x register file to its reset value.

25.4.18 HPDMA privileged/unprivileged channel

Any channel x is a privileged or unprivileged hardware resource, as configured by a privileged agent via HPDMA_PRIVCFGR.PRIVx.

When a channel x is configured in a privileged state by a privileged agent, the following access control rules are applied:

- An unprivileged read access to a bitfield of this channel is forced to return 0, except for HPDMA_PRIVCFGR, HPDMA_SECCFGR, HPDMA_CxCIDCFGR and HPDMA_CxSEMCR that are readable by an unprivileged agent.
- An unprivileged write access to a bitfield of this channel has no impact.

When a channel is configured in a privileged (or unprivileged) state, the source and destination data transfers are privileged (respectively unprivileged) transfers over the AHB/AXI master port.

When a channel is configured in a privileged (or unprivileged) state and in linked-list mode, the loading of the next linked-list data structure from the HPDMA memory into its register file, is automatically performed with privileged (respectively unprivileged) transfers, via the HPDMA_CxCR.LAP allocated master port.

The HPDMA generates a privileged bus that reflects HPDMA_PRIVCFGR, to keep the other peripherals informed of the privileged/unprivileged state of each HPDMA channel x.

Additionally, the HPDMA generates a privileged illegal access pulse signal on an illegal unprivileged access to a privileged HPDMA register. This signal can be used or not, depending on the product (see the system security section for more details).

When the privileged software must switch a channel from a privileged state to an unprivileged state, the privileged software must abort the channel, or wait until the privileged channel is completed before switching. This is needed to dynamically re-allocate a channel to a next unprivileged transfer, as an unprivileged software is not allowed to do so, and must have HPDMA_CxCR.EN = 0 before the unprivileged software can reprogram the HPDMA_CxCR for a next transfer. The privileged software can reset not only the channel x (HPDMA_CxCR.RESET = 1), but also the full channel x register file to its reset value.

HPDMA compartmented channel

The HPDMA controller performs bus transfers over its master port, under the control of a resource isolation domain identification named compartment identification (CID), at a channel level. For more details about resource isolation and CID, refer to the RIF section in the product reference manual.

25.4.19 HPDMA error management

The HPDMA can manage and report to the user a transfer error, as follows, depending on the root cause.

Data transfer error

On a bus access (as an AHB/AXI single or a burst) to the source or the destination

- The source or destination target reports an AHB/AXI error.
- The programmed channel transfer is stopped (HPDMA_CxCR.EN cleared by the HPDMA hardware). The channel status register reports an idle state (HPDMA_CxSR.IDLEF = 1) and the data error (HPDMA_CxSR.DTEF = 1).
- After an HPDMA data transfer error, the user must perform a debug session, taking care of the product-defined memory mapping of the source and destination, including the protection attributes.
- After an HPDMA data transfer error, the user must issue a channel reset (set HPDMA_CxCR.RESET) to reset the hardware HPDMA channel data path and the FIFO content, before the user enables again the same channel for a next transfer.

Link transfer error

On a tentative update of a HPDMA channel register from the programmed LLI in the memory:

- The linked-list memory reports an AHB/AXI error.
- The programmed channel transfer is stopped (HPDMA_CxCR.EN cleared by the HPDMA hardware), the channel status register reports an idle state HPDMA_CxSR.IDLEF = 1), and the link error (HPDMA_CxSR.ULEF = 1).
- After an HPDMA link error, the user must perform a debug session, taking care of the product-defined memory mapping of the linked-list data structure (HPDMA_CxLBAR and HPDMA_CxLLR), including the protection attributes.
- After an HPDMA link error, the user must explicitly write the linked-list register file (HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR,

HPDMA_CxDAR, and HPDMA_CxLLR, plus HPDMA_CxTR3 and HPDMA_CxBR2 when present), before the user enables again the same channel for a next transfer.

User setting error

On a tentative execution of an HPDMA transfer with an unauthorized user setting:

- The programmed channel transfer is disabled (HPDMA_CxCR.EN forced and cleared by the HPDMA hardware), preventing the next unauthorized programmed data transfer from being executed. The channel status register reports an idle state (HPDMA_CxSR.IDLEF = 1), and a user setting error (HPDMA_CxSR.USEF = 1).
- After an HPDMA user setting error, the user must perform a debug session, taking care of the HPDMA channel programming. A user setting error can be caused by one of the following:
  - a programmed null source block size without a programmed update of this value from the next LLI_1 (HPDMA_CxBR1.BNDT[15:0] = 0 and HPDMA_CxLLR.UB1 = 0)
  - when in packing/unpacking mode (if PAM[1] = 1), a programmed non-null source block size being not a multiple of the programmed data width of a destination burst transfer (HPDMA_CxBR1.BNDT[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0])
  - a programmed unaligned source start address being not a multiple of the programmed data width of a source burst transfer (HPDMA_CxSAR[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0])
  - for channel x =12 to 15, a programmed unaligned source address offset being not a multiple of the programmed data width of a source burst transfer (HPDMA_CxTR3.SAO[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0])
  - for channel x =12 to 15, a programmed unaligned block repeated source address offset being not a multiple of the programmed data width of a source burst transfer (HPDMA_CxBR2.BRSAO[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0])
  - a programmed unaligned destination start address, being not a multiple of the programmed data width of a destination burst transfer (HPDMA_CxDAR[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0])
  - for channel x =12 to 15, a programmed unaligned destination address offset being not a multiple of the programmed data width of a destination burst transfer (HPDMA_CxTR3.DAO[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0])
  - for channel x =12 to 15, a programmed unaligned block repeated destination address offset being not a multiple of the programmed data width of a destination burst transfer (HPDMA_CxBR2.BRDAO[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0])
  - a programmed double-word source data width and a programmed AHB source allocated port (HPDMA_CxTR1.SDW_LOG2[1:0] = 11 and HPDMA_CxTR1.SAP = 1)
  - a programmed double-word destination data width and a programmed AHB destination allocated port (HPDMA_CxTR1.DDW_LOG2[1:0] = 11 and HPDMA_CxTR1.DAP = 1)
  - a programmed linked-list item LLI_{n+1} with a null data transfer (HPDMA_CxLLR.UB1 = 1 and HPDMA_CxBR1. BNDT = 0)

25.5 HPDMA in debug mode

When the device enters debug mode (core halted), any channel x can be individually either continued (default) or suspended, depending on the programmable control bit in the DBGMCU module.

Note: In debug mode, HPDMA_CxSR.SUSPF is not altered by a suspension from the programmable control bit in the DBGMCU module. In this case, HPDMA_CxSR.IDLEF can be checked to know the completion status of the channel suspension.

25.6 HPDMA in low-power modes

Table 184. Effect of low-power modes on HPDMA

Mode	Description
Sleep	No effect. HPDMA interrupts cause the device to exit Sleep mode.
Stop(1)	The content of HPDMA registers is kept when entering Stop mode.
Standby	The HPDMA is powered down, and must be reinitialized after exiting Standby mode.

1. Refer to *Section 25.3.3* to know which Stop mode is supported.

25.7 HPDMA interrupts

There is one HPDMA interrupt line for each channel, and separately for each CPU (if several ones in the devices).

Table 185. HPDMA interrupt requests

Interrupt acronym	Interrupt event	Interrupt enable	Event flag	Event clear method
HPDMA_CHx	Transfer complete	HPDMA_CxCR.TCIE	HPDMA_CxSR.TCF	Writes 1 to HPDMA_CxFCR.TCF
	Half transfer	HPDMA_CxCR.HTIE	HPDMA_CxSR.HTF	Writes 1 to HPDMA_CxFCR.HTF
	Data transfer error	HPDMA_CxCR.DTEIE	HPDMA_CxSR.DTEF	Writes 1 to HPDMA_CxFCR.DTEF
	Update link error	HPDMA_CxCR.ULEIE	HPDMA_CxSR.ULEF	Writes 1 to HPDMA_CxFCR.ULEF
	User setting error	HPDMA_CxCR.USEIE	HPDMA_CxSR.USEF	Writes 1 to HPDMA_CxFCR.USEF
	Suspended	HPDMA_CxCR.SUSPIE	HPDMA_CxSR.SUSPF	Writes 1 to HPDMA_CxFCR.SUSPF
	Trigger overrun	HPDMA_CxCR.TOFIE	HPDMA_CxSR.TOF	Writes 1 to HPDMA_CxFCR.TOF

An HPDMA channel x event can be:

- a transfer complete
- an half-transfer complete
- a transfer error, due to either:
  - a data transfer error
  - an update link error
  - a user setting error completed suspension
- a trigger overrun

Note: When a channel x transfer complete event occurs, the output signal hpdma_chx_tc is generated as a high pulse of one clock cycle.

An interrupt is generated following any xx event, provided that both:

- the corresponding interrupt event xx is enabled (HPDMA_CxCR.xxIE = 1)
- the corresponding event flag is cleared (HPDMA_CxSR.xxF = 0). This means that, after a previous same xx event occurrence, a software agent must have written 1 into the corresponding xx flag clear control bit (write 1 into HPDMA_CxFCR.xxF).

TCF (transfer complete) and HTF (half transfer) events generation is controlled by HPDMA_CxTR2.TCEM[1:0] as follows:

- A transfer-complete event is a block transfer complete, a 2D/repeated block transfer complete, or a LLI transfer complete including the upload of the next LLI if any, or the full linked-list completion, depending on the transfer complete event mode HPDMA_CxTR2.TCEM[1:0].
- A half-transfer event is an half-block transfer, or a half 2D/repeated block transfer, depending on the transfer complete event mode HPDMA_CxTR2.TCEM[1:0].

  An half-block transfer occurs when half of the source block size bytes (rounded-up integer of HPDMA_CxBR1.BNDT[15:0] / 2) is transferred to the destination.

  An half 2D/repeated block transfer occurs when half of the repeated blocks (rounded-up integer of (HPDMA_CxBR1.BRC[10:0] + 1) / 2) is transferred to the destination.

See *HPDMA channel x transfer register 2 (HPDMA_CxTR2)* for more details.

Note: The interrupt mode must be used (not the polling mode) to be notified on an half transfer when the write data transaction has been completed over the AXI destination allocated port (written at the destination memory-mapped address), and not just before when has been issued, at HPDMA level, this AXI burst transaction.

A transfer error rises in one of the following situations:

- during a single/burst data transfer from the source or to the destination (DTEF)
- during an update of an HPDMA channel register from the programmed LLI in memory (ULEF)
- during a tentative execution of an HPDMA channel with an unauthorized setting (USEF)

  The user must perform a debug session to correct the HPDMA channel programming versus the USEF root causes list (see *Section 25.4.19*).

A trigger overrun is described in *Trigger hit memorization and trigger overrun flag generation*.

25.8 HPDMA registers

The HPDMA registers must be accessed with an aligned 32-bit word data access.

25.8.1 HPDMA secure configuration register (HPDMA_SECCFGR)

Address offset: 0x000

Reset value: 0x0000 0000

A write access to this register must be secure and privileged. A read access is secure or nonsecure, privileged, or unprivileged, and with any CID.

A write access is ignored at bit level if the corresponding channel x is locked (HPDMA_RCFGLOCKR.LOCKx = 1).

This register can mix information from different CIDs. If a channel x is configured as CID filtered (HPDMA_CxCIDCFGR.CFEN = 1), the SECx bit can be written only by an authorized CID (and secure and privileged) agent. If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be programmed at a bit level, at the initialization/closure of an HPDMA channel (when HPDMA_CxCR.EN = 0), to securely allocate individually any channel x to the secure or nonsecure world.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SECx**: Secure state of channel x (x = 15 to 0)

0: Nonsecure

1: Secure

25.8.2 HPDMA privileged configuration register (HPDMA_PRIVCFGR)

Address offset: 0x004

Reset value: 0x0000 0000

A write access to this register must be privileged. A read access can be privileged or unprivileged, secure or nonsecure, and with any CID.

This register can mix secure and nonsecure information. If a channel x is configured as secure (HPDMA_SECCFGR.SECx = 1), the PRIVx bit can be written only by a secure (and privileged) agent.

This register can mix information from different CIDs. If a channel x is configured as CID filtered (HPDMA_CxCIDCFGR.CFEN = 1), the PRIVx bit can be written only by an authorized CID (and privileged) agent. If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

A write access is ignored at bit level if the corresponding channel x is locked (HPDMA_RCFGLOCKR.LOCKx = 1).

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be programmed at a bit level, at the initialization/closure of a HPDMA channel (HPDMA_CxCR.EN = 0), to individually allocate any channel x to the privileged or unprivileged world.

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PRIVx**: Privileged state of channel x (x = 15 to 0)
0: Unprivileged
1: Privileged

25.8.3 HPDMA configuration lock register (HPDMA_RCFGLOCKR)

Address offset: 0x008

Reset value: 0x0000 0000

This register can be written by a software agent with secure privileged and trusted domain CID attributes in order to individually lock, for example at boot time, the secure privileged and CID attributes of any HPDMA channel/resource (to lock the setting of HPDMA_SECCFGR, HPDMA_PRIVCFGR, and HPDMA_CxCIDCFGR for any channel x at, for example at boot time).

A read access may be privileged or unprivileged, secure or nonsecure, and with any CID.

rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **LOCKx**: Lock of the configuration of HPDMA_SECCFGR.SECx, HPDMA_PRIVCFGR.PRIVx, and HPDMA_CxCIDCFGR until a global HPDMA reset (x = 15 to 0)

This bit is cleared after reset and, once set, it cannot be reset until a global HPDMA reset.

0: Secure privilege and CID configuration of the channel x is writable.

1: Secure privilege and CID configuration of the channel x is not writable.

25.8.4 HPDMA nonsecure masked interrupt status register (HPDMA_MISR)

Address offset: 0x00C

Reset value: 0x0000 0000

This register is a read register.

This is a nonsecure register, containing the masked interrupt status bit MISx for each nonsecure channel x (channel x configured with HPDMA_SECCFGR.SECx = 0). It is a logical OR of all the flags of HPDMA_CxSR, each source flag being enabled by the corresponding interrupt enable bit of HPDMA_CxCR.

Every bit is deasserted by hardware when writing 1 to the corresponding flag clear bit in HPDMA_CxFCR.

If a channel x is in secure state (HPDMA_SECCFGR.SECx = 1), a read access to the masked interrupt status bit MISx of this channel x returns zero.

This register can mix privileged and unprivileged information, depending on the privileged state of each channel HPDMA_PRIVCFGR.PRIVx. A privileged software can read the full nonsecure interrupt status. An unprivileged software is restricted to read the status of unprivileged (and nonsecure) channels, other privileged bitfields returning zero.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MISx**: Masked interrupt status of channel x (x = 15 to 0)

0: No interrupt occurred on channel x.

1: An interrupt occurred on channel x.

25.8.5 HPDMA secure masked interrupt status register (HPDMA_SMISR)

Address offset: 0x010

Reset value: 0x0000 0000

This is a secure read register, containing the masked interrupt status bit MISx for each secure channel x (HPDMA_SECCFGR.SECx = 1). It is a logical OR of all the HPDMA_CxSR flags, each source flag being enabled by the corresponding HPDMA_CxCR interrupt enable bit.

Every bit is deasserted by hardware when securely writing 1 to the corresponding HPDMA_CxFCR flag clear bit.

This register does not contain any information about a nonsecure channel.

This register can mix privileged and unprivileged information, depending on the privileged state of each channel HPDMA_PRIVCFGR.PRIVx. A privileged software can read the full secure interrupt status. An unprivileged software is restricted to read the status of unprivileged and secure channels, other privileged bitfields returning zero.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MISx**: Masked interrupt status of the secure channel x (x = 15 to 0)
0: No interrupt occurred on the secure channel x.
1: An interrupt occurred on the secure channel x.

25.8.6 HPDMA channel x linked-list base address register (HPDMA_CxLBAR)

Address offset: 0x050 + 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This register must be written by a privileged software. It is either privileged readable or not, depending on the privileged state of the channel x HPDMA_PRIVCFGR.PRIVx.

This register is either secure or nonsecure depending on the secure state of the channel x (HPDMA_SECCFGR.SECx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This channel-based register is the linked-list base address of the memory region, for a given channel x, from which the LLIs describing the programmed sequence of the HPDMA transfers, are conditionally and automatically updated.

This 64-Kbyte aligned channel x linked-list base address is offset by the 16-bit HPDMA_CxLLR register that defines the word-aligned address offset for each LLI.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LBA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:16 **LBA[31:16]**: Linked-list base address of HPDMA channel x

Bits 15:0 Reserved, must be kept at reset value.

25.8.7 HPDMA channel x CID register (HPDMA_CxCIDCFGR)

Address offset: 0x054+ 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This channel-based register can be written by the secure, privileged, and trusted domain CID, in order to individually configure the CID allocation of any HPDMA channel x. If the debug domain feature is activated, a read/write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register must be written when the resource configuration of the channel x is unlocked (HPDMA_RCFGLOCKR.LOCKx = 0) and when the channel is disabled (HPDMA_CxCR.EN = 0).

A read access may be privileged or unprivileged, secure or nonsecure, and with any CID.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEM_WLIST_CID2	SEM_WLIST_CID1	SEM_WLIST_CID0

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCID[1:0]		Res.	Res.	SEM_EN	CFEN
										rw	rw			rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bit 18 **SEM_WLIST_CID2**: White-listed CID2 in the CID allocation pool (for when the channel x in semaphore mode)
0: CID2 black-listed in the semaphore-based CID allocation pool
1: CID2 white-listed in the semaphore-based CID allocation pool

Bit 17 **SEM_WLIST_CID1**: White-listed CID1 in the CID allocation pool (for when the channel x in semaphore mode)
0: CID1 black-listed in the semaphore-based CID allocation pool
1: CID1 white-listed in the semaphore-based CID allocation pool

Bit 16 **SEM_WLIST_CID0**: White-listed CID0 in the CID allocation pool (for when the channel x in semaphore mode)
0: CID0 black-listed in the semaphore-based CID allocation pool
1: CID0 white-listed in the semaphore-based CID allocation pool

Bits 15:6 Reserved, must be kept at reset value.

Bits 5:4 **SCID[1:0]**: Allocation of a static/single CID to the channel x (for when the channel x CID configuration is not in semaphore mode)
00: CID0 allocated to the channel x
01: CID1 allocated to the channel x
10: CID2 allocated to the channel x
11: Reserved (write ignored)

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **SEM_EN**: Semaphore mode enable (for the CID allocation policy to the channel x)
0: Semaphore mode disabled. CID allocation policy to the channel x is defined by SCID[1:0].
1: Semaphore mode enabled. CID allocation policy to the channel x is defined by the white-listed allocation pool SEM_WLIST_CIDx and HPDMA_CxSEMCR.SEM_MUTEX.

Note: If SEM_EN = 1 and if a trusted domain or debug domain CID agent clears this bit, then the HPDMA hardware automatically clears the HPDMA_CxSEMCR.SEM_MUTEX.

Bit 0 **CFEN**: CID filtering enable of the channel x
0: CID filtering disabled for when accessing a channel x register/bitfield
1: CID filtering enabled for when accessing a channel x register/bitfield

Note: If CFEN = 1 and if a trusted domain or debug domain CID agent clears this bit, then the HPDMA hardware automatically clears the HPDMA_CxSEMCR.SEM_MUTEX.

25.8.8 HPDMA channel x semaphore control register (HPDMA_CxSEMCR)

Address offset: 0x058+ 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

When the secure, privileged and trusted domain has set up the channel x in semaphore mode (HPDMA_CxCIDCFGR.SEM_EN = 1), this register is used during run-time by an authorized white-listed CID agent, in order to take and after possibly release the control of the channel x.

A read access may be privileged or unprivileged, secure or nonsecure, and with any CID.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEM_CCID[1:0]		Res.	Res.	Res.	SEM_MUTEX
										r	r				rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:4 **SEM_CCID[1:0]**: Current CID allocated to the channel x (in semaphore mode)

This read-only bitfield is internally updated when a white-listed CID took the control of the channel x, in semaphore mode. If SEM_MUTEX = 0, this same CID also released it.

00: CID0 is the last white-listed CID that took the control of the channel x.

01: CID1 is the last white-listed CID that took the control of the channel x.

10: CID2 is the last white-listed CID that took the control of the channel x.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **SEM_MUTEX**: Mutual exclusion semaphore for the CID allocation of the channel x (in semaphore mode)

If the channel x is in secure state (HPDMA_SECCFGR.SECx = 1), this bit can only be written by a secure agent. If the channel x is in privileged state (HPDMA_PRIVCFGR.PRIVx = 1), this bit can only be written by a privileged agent.

If the channel x is CID-filtered (HPDMA_CxCIDCFGR.CFEN = 1) and in semaphore mode (HPDMA_CIDCFGR.SEM_EN = 1), this bit can only be written either by an authorized (white-listed) CID agent to take the control, or by the same (white-listed) CID agent to release the control.

Condition: write

0: Release the control of the channel x (in semaphore mode) to any white-listed CID.

1: Take the control of the channel x (in semaphore mode), from one of the white-listed CID pool.

Condition: read

0: Channel x CID-free (not currently under the control of any white-listed CID)

1: Channel x CID-allocated (currently taken and under the control of one white-listed CID)

Note: This bit must be written when HPDMA_CxCR.EN = 0. This bit is read-only when HPDMA_CxCR.EN = 1.

When SEM_EN or CFEN bit is cleared in HPDMA_CxSEMCR, the HPDMA hardware automatically clears this SEM_MUTEX bit.

25.8.9 HPDMA channel x flag clear register (HPDMA_CxFCR)

Address offset: 0x05C+ 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This is a write register, secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx) and privileged or unprivileged, depending on the privileged state of the channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

Bit 14 **TOF**: Trigger overrun flag clear
0: No effect
1: Corresponding TOF flag cleared

Bit 13 **SUSPF**: Completed suspension flag clear
0: No effect
1: Corresponding SUSPF flag cleared

Bit 12 **USEF**: User setting error flag clear
0: No effect
1: Corresponding USEF flag cleared

Bit 11 **ULEF**: Update link transfer error flag clear
0: No effect
1: Corresponding ULEF flag cleared

Bit 10 **DTEF**: Data transfer error flag clear
0: No effect
1: Corresponding DTEF flag cleared

Bit 9 **HTF**: Half transfer flag clear
0: No effect
1: Corresponding HTF flag cleared

Bit 8 **TCF**: Transfer complete flag clear
0: No effect
1: Corresponding TCF flag cleared

Bits 7:0 Reserved, must be kept at reset value.

25.8.10 HPDMA channel x status register (HPDMA_CxSR)

Address offset: 0x060 + 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0001

This is a read register, reporting the channel status.

This register is secure or nonsecure, depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of the channel (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

	r	r	r	r	r	r	r							r	r

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:16 **FIFOL[8:0]**: Monitored FIFO level (in bytes)

Number of available bytes in the FIFO.

Note: After having suspended an active transfer, the user may need to read FIFOL[8:0], additionally to HPDMA_CxBR1.BDNT[15:0] and HPDMA_CxBR1.BRC[10:0], to know how many data have been transferred to the destination. Before reading, the user may wait for the transfer to be suspended (HPDMA_CxSR.SUSPF = 1).

Bit 15 Reserved, must be kept at reset value.

Bit 14 **TOF**: Trigger overrun flag

0: No trigger overrun event

1: A trigger overrun event occurred.

Bit 13 **SUSPF**: Completed suspension flag

0: No completed suspension event

1: A completed suspension event occurred.

Bit 12 **USEF**: User setting error flag

0: No user setting error event

1: A user setting error event occurred.

Bit 11 **ULEF**: Update link transfer error flag

0: No update link transfer error event

1: A master bus error event occurred while updating a linked-list register from memory.

Bit 10 **DTEF**: Data transfer error flag

0: No data transfer error event

1: A master bus error event occurred on a data transfer.

Bit 9 **HTF**: Half transfer flag

0: No half transfer event

1: An half transfer event occurred.

An half transfer event is either an half block transfer or an half 2D/repeated block transfer, depending on the transfer complete event mode (HPDMA_CxTR2.TCEM[1:0]).

An half block transfer occurs when half of the bytes of the source block size (rounded up integer of HPDMA_CxBR1.BNDT[15:0]/2) has been transferred to the destination.

An half 2D/repeated block transfer occurs when half of the repeated blocks (rounded up integer of (HPDMA_CxBR1.BRC[10:0]+1)/2)) has been transferred to the destination.

Bit 8 **TCF**: Transfer complete flag

0: No transfer complete event

1: A transfer complete event occurred.

A transfer complete event is either a block transfer complete, a 2D/repeated block transfer complete, a LLI transfer complete including the upload of the next LLI if any, or the full linked-list completion, depending on the transfer complete event mode (HPDMA_CxTR2.TCEM[1:0]).

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **DRAININGF**: FIFO draining flag

0: No received order to drain the FIFO or channel FIFO draining completed

1: Ongoing channel FIFO draining and channel termination

This flag is asserted after that the order to drain the FIFO is received, and meanwhile that the channel is enabled and draining the FIFO and before that the channel is terminated with a drained FIFO.

This flag is deasserted by hardware when the enabled channel has been ordered to be terminated with FIFO draining, and the hardware effectively terminates.

Bit 0 **IDLEF**: Idle flag

0: Channel not in idle state

1: Channel in idle state

This idle flag is deasserted by hardware when the channel is enabled (HPDMA_CxCR.EN = 1) with a valid channel configuration (no USEF to be immediately reported).

This idle flag is asserted after hard reset or by hardware when the channel is back in idle state (in suspended or disabled state).

25.8.11 HPDMA channel x control register (HPDMA_CxCR)

Address offset: 0x064 + 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of the channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register is used to control a channel (activate, suspend, abort or disable it).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	rw	rw	rw	rw	rw	rw	rw					w	rw	w	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:22 **PRIO[1:0]:** Priority level of the channel x HPDMA transfer versus others
00: Low priority, low weight
01: Low priority, mid weight
10: Low priority, high weight
11: High priority
Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bits 21:18 Reserved, must be kept at reset value.

Bit 17 **LAP**: lLnked-list allocated port
This bit is used to allocate the master port for the update of the HPDMA linked-list registers from the memory.
0: Port 0 (AXI) allocated
1: Port 1 (AHB) allocated
Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bit 16 **LSM**: Link step mode
0: Channel executed for the full linked-list and completed at the end of the last LLI (HPDMA_CxLLR = 0). The 16 low-significant bits of the link address are null (LA[15:0] = 0) and all the update bits are null (UT1 = UB1 = UT2 = USA = UDA = ULL = 0 and UT3 = UB2 = 0 if present). Then HPDMA_CxBR1.BNDT[15:0] = 0 and HPDMA_CxBR1.BRC[10:0] = 0 if present.
1: Channel executed once for the current LLI
First the (possible 1D/repeated) block transfer is executed as defined by the current internal register file until HPDMA_CxBR1.BNDT[15:0] = 0 and HPDMA_CxBR1.BRC[10:0] = 0, if present. Secondly the next linked-list data structure is conditionally uploaded from memory as defined by HPDMA_CxLLR. Then channel execution is completed.
Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bit 15 Reserved, must be kept at reset value.

Bit 14 **TOIE**: Trigger overrun interrupt enable
0: Interrupt disabled
1: Interrupt enabled

Bit 13 **SUSPIE**: cCmpleted suspension interrupt enable
0: Interrupt disabled
1: Interrupt enabled

Bit 12 **USEIE**: User setting error interrupt enable
0: Interrupt disabled
1: Interrupt enabled

Bit 11 **ULEIE**: Update link transfer error interrupt enable
0: Interrupt disabled
1: Interrupt enabled

Bit 10 **DTEIE**: Data transfer error interrupt enable
0: Interrupt disabled
1: Interrupt enabled

Bit 9 **HTIE**: Half transfer complete interrupt enable
0: Interrupt disabled
1: Interrupt enabled

Bit 8 **TCIE**: Transfer complete interrupt enable
0: Interrupt disabled
1: Interrupt enabled

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **DRAINFIFO:** Empty FIFO
This bit is write only. Writing 0 has no impact.
Writing 1 to RESET in this register causes the hardware to deassert this DRAINFIFO bit, whatever is written into this DRAINFIFO. Else:
Software must write 1 in order to drain the channel FIFO on a suspended channel.
If the software concurrently writes 1 to DRAINFIFO and 1 to SUSP and 0 to reset, the hardware suspends the channel and drains the FIFO by popping out the residual FIFO bytes to the destination (see the programming sequence in *Figure 139*).
0: Write: no action
1: Write: drain FIFO after having suspended the channel

Bit 2 **SUSP:** Suspend
Writing 1 to RESET in this register causes the hardware to deassert this SUSP bit, whatever is written into this SUSP. Else:
Software must write 1 in order to suspend an active channel (a channel with an ongoing HPDMA transfer over its master ports).
The software must write 0 in order to resume a suspended channel, following the programming sequence detailed in *Figure 137*.
0: Write: resume channel, read: channel not suspended
1: Write: suspend channel, read: channel suspended

Bit 1 **RESET:** Reset

This bit is write only. Writing 0 has no impact. Writing 1 implies the reset of the following: the FIFO, the channel internal state, SUSP, DRAINFIFO and EN bits (whatever is written receptively in bit 3 and bit 2 and bit 0).

The reset is effective when the channel is in steady state, meaning one of the following:

- active channel in suspended state (HPDMA_CxSR.SUSPF = 1 and HPDMA_CxSR.IDLEF = HPDMA_CxCR.EN = 1 and HPDMA_CxSR.DRAININGF = 0)
- channel in disabled state (HPDMA_CxSR.IDLEF = 1 and HPDMA_CxCR.EN = 0).

After writing a RESET, to continue using this channel, the user must explicitly reconfigure the channel including the hardware-modified configuration registers (HPDMA_CxBR1, HPDMA_CxSAR and HPDMA_CxDAR) before enabling again the channel (see the programming sequence in *Figure 138*).

0: No channel reset

1: Channel reset

Bit 0 **EN:** Enable

Writing 1 to RESET in this register causes the hardware to deassert this EN bit, whatever is written into this bit 0. Else:

This bit is deasserted by hardware when there is a transfer error (master bus error or user setting error) or when there is a channel transfer complete (channel ready to be configured, for example if LSM = 1 at the end of a single execution of the LLI).

Else, this bit can be asserted by software.

Writing 0 into this EN bit is ignored.

0: Write: ignored, read: channel disabled

1: Write: enable channel, read: channel enabled

25.8.12 HPDMA channel x transfer register 1 (HPDMA_CxTR1)

Address offset: 0x090 + 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx) except for secure DSEC and SSEC, privileged or unprivileged, depending on the privileged state of the channel x in HPDMA_PRIVCFGR.PRIVx.

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when the channel is completed. Then the hardware has de-asserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by HPDMA from the memory if HPDMA_CxLLR.UT1 = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DSEC	DAP	Res.	DWX	DHX	DBX	DBL_1[5:0]						DINC	Res.	DDW_LOG2[1:0]	
rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SSEC	SAP	SBX	PAM[1:0]		Res.	SBL_1[5:0]						SINC	Res.	SDW_LOG2[1:0]	
rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw		rw	rw

Bit 31 **DSEC**: Security attribute of the HPDMA transfer to the destination

If HPDMA_SECCFGR.SECx = 1 and the access is secure:

0: HPDMA transfer nonsecure

1: HPDMA transfer secure

This is a secure register bit. This bit can only be read by a secure software. This bit must be written by a secure software when HPDMA_SECCFGR.SECx = 1. A secure write is ignored when HPDMA_SECCFGR.SECx = 0.

When HPDMA_SECCFGR.SECx is deasserted, this DSEC bit is also deasserted by hardware (on a secure reconfiguration of the channel as nonsecure), and the HPDMA transfer to the destination is nonsecure.

Bit 30 **DAP**: Destination allocated port

This bit is used to allocate the master port for the destination transfer

0: Port 0 (AXI) allocated

1: Port 1 (AHB) allocated

Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bit 29 Reserved, must be kept at reset value.

Bit 28 **DWX**: Destination word exchange

If the destination data size is not a double-word, this bit is ignored.

If the destination data size is a double-word and if destination bus is AXI (DAP = 0):

0: No word-based exchanged within double-word

1: The two consecutive (post PAM) words are exchanged in each destination double-word.

Bit 27 **DHX**: Destination half-word exchange

If the destination data size is shorter than a word, this bit is ignored.

If the destination data size is a word or double-word and if destination bus is AXI (DAP = 0):

0: No half-word-based exchanged within word

1: The two consecutive (post PAM) half-words are exchanged in each destination word.

Bit 26 **DBX**: Destination byte exchange

If the destination data size is a byte, this bit is ignored.

If the destination data size is not a byte:

0: No byte-based exchange within half-word

1: The two consecutive (post PAM) bytes are exchanged in each destination half-word.

Bits 25:20 **DBL_1[5:0]**: Destination burst length minus 1, between 0 and 63

The burst length unit is one data named beat within a burst. If DBL_1[5:0] = 0, the burst can be named as single. Each data/beat has a width defined by the destination data width DDW_LOG2[1:0].

Caution: As highlighted in *Section 25.3.2*, the maximum allowed AXI burst length is 16. The user must set DBL_1[5:0] lower or equal to 15 if the destination allocated port is AXI (if DAP = 0).

Note: If a burst transfer crossed a 1- or 4-Kbyte address boundary on respectively an AHB or AXI transfer, the HPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the AHB/AXI protocol.

If the burst length exceeds 16 on an AHB transfer, or if the burst on an AXI transfer is both with fixed addressing (DINC = 0) and with a burst length which exceeds 16, the HPDMA modifies and shortens the programmed burst into bursts of lower length, to be compliant with the AHB or AXI protocol.

If a burst transfer is of length greater than the FIFO size of the channel x, the HPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the FIFO size. Transfer performance is lower, with HPDMA re-arbitration between effective and lower singles/bursts, but the data integrity is guaranteed.

Bit 19 **DINC**: Destination incrementing burst

0: Fixed burst

1: Contiguously incremented burst

The destination address, pointed by HPDMA_CxDAR, is kept constant after a burst beat/single transfer, or is incremented by the offset value corresponding to a contiguous data after a burst beat/single transfer.

Bit 18 Reserved, must be kept at reset value.

Bits 17:16 **DDW_LOG2[1:0]**: Binary logarithm of the destination data width of a burst, in bytes
00: Byte
01: Half-word (2 bytes)
10: Word (4 bytes)
11: If DAP = 0 (AXI), double-word (8 bytes)
if DAP = 1, user setting error reported and no transfer issued

Note: A destination burst transfer must have an aligned address with its data width (start address HPDMA_CxDAR[2:0] and if present address offset HPDMA_CxTR3.DAO[2:0], versus DDW_LOG2[1:0]). Otherwise a user setting error is reported and no transfer is issued.

A burst with a double-word data width must be allocated to the AXI master port, else a user setting error is reported and none transfer is issued.

Bit 15 **SSEC**: Security attribute of the HPDMA transfer from the source
If HPDMA_SECCFGR.SECx = 1 and the access is secure:
0: HPDMA transfer nonsecure
1: HPDMA transfer secure
This is a secure register bit. This bit can only be read by a secure software. This bit must be written by a secure software when HPDMA_SECCFGR.SECx = 1. A secure write is ignored when HPDMA_SECCFGR.SECx = 0.
When HPDMA_SECCFGR.SECx is deasserted, this SSEC bit is also deasserted by hardware (on a secure reconfiguration of the channel as nonsecure), and the HPDMA transfer from the source is nonsecure.

Bit 14 **SAP**: Source allocated port
This bit is used to allocate the master port for the source transfer
0: Port 0 (AXI) allocated
1: Port 1 (AHB) allocated

Note: This bit must be written when EN = 0. This bit is read-only when EN = 1.

Bit 13 **SBX**: Source byte exchange within the unaligned half-word of each source word
If the source data width is shorter than a word, this bit is ignored.
If the source data width is a word or a double-word, and if source bus is AXI (SAP = 0):
0: No byte-based exchange within the unaligned half-word of each source word
1: The two consecutive bytes within the unaligned half-word of each source word are exchanged.

Bits 12:11 **PAM[1:0]**: Padding/alignment mode

If DDW_LOG2[1:0] = SDW_LOG2[1:0]: if the data width of a burst destination transfer is equal to the data width of a burst source transfer, these bits are ignored.

Else, in the following enumerated values, the condition PAM_1 is when destination data width is higher than source data width, and the condition PAM_2 is when source data width is higher than destination data width.

Condition: PAM_1

00: Source data is transferred as right aligned, padded with 0s up to the destination data width

01: Source data is transferred as right aligned, sign extended up to the destination data width

10-11: Successive source data are FIFO queued and packed at the destination data width, in a left (LSB) to right (MSB) order (named little endian), before a destination transfer

Condition: PAM_2

00: Source data is transferred as right aligned, left-truncated down to the destination data width

01: Source data is transferred as left-aligned, right-truncated down to the destination data width

10-11: Source data is FIFO queued and unpacked at the destination data width, to be transferred in a left (LSB) to right (MSB) order (named little endian) to the destination

Note: If the transfer from the source peripheral is configured with peripheral flow-control mode (SWREQ = 0 and PFREQ = 1 and DREQ = 0), and if the destination data width > the source data width, packing is not supported.

Bit 10 Reserved, must be kept at reset value.

Bits 9:4 **SBL_1[5:0]**: Source burst length minus 1, between 0 and 63

The burst length unit is one data named beat within a burst. If SBL_1[5:0] = 0, the burst can be named as single. Each data/beat has a width defined by the destination data width SDW_LOG2[1:0].

Caution: As highlighted in *Section 25.3.2*, the maximum allowed AXI burst length is 16. The user must set SBL_1[5:0] lower or equal to 15 if the source allocated port is AXI (if SAP = 0).

Note: If a burst transfer crossed a 1- or 4-Kbyte address boundary on respectively an AHB or an AXI transfer, the HPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the AHB protocol.

If the burst length exceeds 16 on a AHB transfer, or if the burst on a AXI transfer is both with fixed addressing (SINC = 0) and with a burst length which exceeds 16, the HPDMA modifies and shortens the programmed burst into singles or bursts of lower length, to be compliant with the FIFO size. Transfer performance is lower, with HPDMA re-arbitration between effective and lower singles/bursts, but the data integrity is guaranteed.

Bit 3 **SINC**: Source incrementing burst

0: Fixed burst

1: Contiguously incremented burst

The source address, pointed by HPDMA_CxSAR, is kept constant after a burst beat/single transfer or is incremented by the offset value corresponding to a contiguous data after a burst beat/single transfer.

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **SDW_LOG2[1:0]**: Binary logarithm of the source data width of a burst in bytes
00: Byte
01: Half-word (2 bytes)
10: Word (4 bytes)
11: If SAP = 0 (AXI), double-word (8 bytes)
if SAP = 1, user setting error reported and no transfer issued
A source burst transfer must have an aligned address with its data width (start address HPDMA_CxSAR[2:0] versus SDW_LOG2[1:0]). Otherwise, a user setting error is reported and none transfer is issued.
A burst with a double-word data width must be allocated to the AXI master port, else a user setting error is reported and none transfer is issued.

25.8.13 HPDMA channel x transfer register 2 (HPDMA_CxTR2)

Address offset: 0x094 + 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, a write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (the hardware deasserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by HPDMA from the memory, if HPDMA_CxLLR.UT2 = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TCEM[1:0]		Res.	Res.	Res.	Res.	TRIGPOL[1:0]		Res.	TRIGSEL[6:0]						
rw	rw					rw	rw		rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRIGM[1:0]		Res.	PFREQ	BREQ	DREQ	SWREQ	Res.	REQSEL[7:0]							
rw	rw		rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 **TCEM[1:0]**: Transfer complete event mode

These bits define the transfer granularity for the transfer complete and half transfer complete events generation.

00: At block level (when HPDMA_CxBR1.BNDT[15:0] = 0): The complete (and the half) transfer event is generated at the (respectively half of the) end of a block.

Note: If the initial LLI_0 data transfer is null/void (directly programmed by the internal register file with HPDMA_CxBR1.BNDT[15:0] = 0), then neither the complete transfer event nor the half transfer event is generated.

01: Channel x = 0 to 11, same as 00; channel x = 12 to 15, at 2D/repeated block level (when HPDMA_CxBR1.BRC[10:0] = 0 and HPDMA_CxBR1.BNDT[15:0] = 0), the complete (and the half) transfer event is generated at the end (respectively half of the end) of the 2D/repeated block.

Note: If the initial LLI_0 data transfer is null/void (directly programmed by the internal register file with HPDMA_CxBR1.BNDT[15:0] = 0), then neither the complete transfer event nor the half transfer event is generated.

10: At LLI level: The complete transfer event is generated at the end of the LLI transfer, including the update of the LLI if any. The half transfer event is generated at the half of the LLI data transfer (the LLI data transfer being a block transfer or a 2D/repeated block transfer for channel x = 12 to 15), if any data transfer.

Note: If the initial LLI_0 data transfer is null/void (directly programmed by the internal register file with HPDMA_CxBR1.BNDT[15:0] = 0), then the half transfer event is not generated, and the transfer complete event is generated when is completed the loading of the LLI_1.

11: At channel level: The complete transfer event is generated at the end of the last LLI transfer. The half transfer event is generated at the half of the data transfer of the last LLI. The last LLI updates the link address HPDMA_CxLLR.LA[15:2] to zero and clears all the HPDMA_CxLLR update bits (UT1, UT2, UB1, USA, UDA and ULL, plus UT3 and UB2 if present). If the channel transfer is continuous/infinite, no event is generated.

Bits 29:26 Reserved, must be kept at reset value.

Bits 25:24 **TRIGPOL[1:0]**: Trigger event polarity

These bits define the polarity of the selected trigger event input defined by TRIGSEL[6:0].

00: No trigger (masked trigger event)

01: Trigger on the rising edge

10: Trigger on the falling edge

11: Same as 00

Bit 23 Reserved, must be kept at reset value.

Bits 22:16 **TRIGSEL[6:0]**: Trigger event input selection

These bits select the trigger event input of the HPDMA transfer (as per *Section 25.3.7*), with an active trigger event if TRIGPOL[1:0] ≠ 00.

Bits 15:14 **TRIGM[1:0]**: Trigger mode

These bits define the transfer granularity for its conditioning by the trigger.

If the channel x is enabled (HPDMA_CxCR.EN asserted) with TRIGPOL[1:0] = 00 or 11, these TRIGM[1:0] bits are ignored.

Else, an HPDMA transfer is conditioned by at least one trigger hit:

00: at block level: the first burst read of each block transfer is conditioned by one hit trigger (channel x = 12 to 15, for each block if a 2D/repeated block is configured with HPDMA_CxBR1.BRC[10:0] ≠ 0).

01: channel x = 0 to 11, same as 00; channel x = 12 to 15, at 2D/repeated block level, the first burst read of a 2D/repeated block transfer is conditioned by one hit trigger.

10: at link level: a LLI link transfer is conditioned by one hit trigger. The LLI data transfer (if any) is not conditioned.

11: at programmed burst level: If SWREQ = 1, each programmed burst read is conditioned by one hit trigger. If SWREQ = 0, each programmed burst that is requested by the selected peripheral, is conditioned by one hit trigger.

– If the peripheral is programmed as a source (DREQ = 0) of the LLI data transfer, each programmed burst read is conditioned.

– If the peripheral is programmed as a destination (DREQ = 1) of the LLI data transfer, each programmed burst write is conditioned. The first memory burst read of a (possibly 2D/repeated) block, also named as the first ready FIFO-based source burst, is gated by the occurrence of both the hardware request and the first trigger hit.

The HPDMA monitoring of a trigger for channel x is started when the channel is enabled/loaded with a new active trigger configuration: rising or falling edge on a selected trigger (TRIGPOL[1:0] = 01 or respectively TRIGPOL[1:0] = 10).

The monitoring of this trigger is kept active during the triggered and uncompleted (data or link) transfer; and if a new trigger is detected then, this hit is internally memorized to grant the next transfer, as long as the defined rising or falling edge is not modified, and the TRIGSEL[5:0] is not modified, and the channel is enabled.

Transferring a next LLI_{n+1} that updates the HPDMA_CxTR2 with a new value for any of TRIGSEL[6:0] or TRIGPOL[1:0], resets the monitoring, trashing the memorized hit of the formerly defined LLI_n trigger.

After a first new trigger hit_{n+1} is memorized, if another second trigger hit_{n+2} is detected and if the hit_n triggered transfer is still not completed, hit_{n+2} is lost and not memorized. A trigger overrun flag is reported (HPDMA_CxSR.TOF = 1), and an interrupt is generated if enabled (HPDMA_CxCR.TOIE = 1). The channel is not automatically disabled by hardware due to a trigger overrun.

Note: When the source block size is not a multiple of the source burst size and is a multiple of the source data width, then the last programmed source burst is not completed and is internally shorten to match the block size. In this case, if TRIGM[1:0] = 11 and (SWREQ = 1 or (SWREQ = 0 and DREQ = 0)), the shortened burst transfer (by singles or/and by bursts of lower length) is conditioned once by the trigger.

When the programmed destination burst is internally shortened by singles or/and by bursts of lower length (versus FIFO size, versus block size, 1/4-Kbyte boundary address crossing maximum burst length versus AHB/AXI protocol): if the trigger is conditioning the programmed destination burst (if TRIGM[1:0] = 11 and SWREQ = 0 and DREQ = 1), this shortened destination burst transfer is conditioned once by the trigger.

Bit 13 Reserved, must be kept at reset value.

Bit 12 **PFREQ**: Hardware request in peripheral flow control mode

Important: If a given channel x is not implemented with this feature, this bit is reserved and PFREQ is not present (see Section 25.3.6 for the list of the implemented channels with this feature.

If the channel x is activated (HPDMA_CxCR.EN asserted) with SWREQ = 1 (software request for a memory-to-memory transfer), this bit is ignored. Else:

0: The selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol in HPDMA control mode. The HPDMA is programmed with HPDMA_CxCBR1.BNDT[15:0] and this is internally used by the hardware for the block transfer completion.

1: The selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol in peripheral control mode. The HPDMA block transfer can be early completed by the peripheral itself (see *Section 25.3.6* for more details).

Note: In peripheral flow control mode, there are the following restrictions:

- no 2D/repeated block support (HPDMA_CxBR1.BRC[10:0] must be set to 0 if present)

- the peripheral must be set as the source of the transfer (DREQ = 0).

- data packing to a wider destination width is not supported (if destination width > source data width, HPDMA_CxTR1.PAM[1] must be set to 0).

Bit 11 **BREQ**: Block hardware request

If the channel x is activated (HPDMA_CxCR.EN asserted) with SWREQ = 1 (software request for a memory-to-memory transfer), this bit is ignored. Else:

0: The selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol at a burst level.

1: The selected hardware request is driven by a peripheral with a hardware request/acknowledge protocol at a block level (see *Section 25.3.5*).

Bit 10 **DREQ**: Destination hardware request

This bit is ignored if channel x is activated (HPDMA_CxCR.EN asserted) with SWREQ = 1 (software request for a memory-to-memory transfer). Else:

0: Selected hardware request driven by a source peripheral (request signal taken into account by the HPDMA transfer scheduler over the source/read port)

1: Selected hardware request driven by a destination peripheral (request signal taken into account by the HPDMA transfer scheduler over the destination/write port)

Note: If the channel x is activated (HPDMA_CxCR.EN is asserted) with SWREQ = 0 and PFREQ = 1 (peripheral hardware request with peripheral flow-control mode), any software assertion to this DREQ bit is ignored: in peripheral flow-control mode, only a peripheral-to-memory transfer is supported.

Bit 9 **SWREQ**: Software request

This bit is internally taken into account when HPDMA_CxCR.EN is asserted.

0: No software request. The selected hardware request REQSEL[7:0] is taken into account.

1: Software request for a memory-to-memory transfer. The default selected hardware request as per REQSEL[7:0] is ignored.

Bit 8 Reserved, must be kept at reset value.

Bits 7:0 **REQSEL[7:0]**: Hardware request selection

These bits are ignored if channel x is activated (HPDMA_CxCR.EN asserted) with SWREQ = 1 (software request for a memory-to-memory transfer). Else, the selected hardware request is internally taken into account as per *Section 25.3.4*.

Caution: The user must not assign a same input hardware request (same REQSEL[7:0] value) to different active HPDMA channels (HPDMA_CxCR.EN = 1 and HPDMA_CxTR2.SWREQ = 0 for these channels). The HPDMA is not intended to hardware support the case of simultaneous enabled channels incorrectly configured with a same hardware peripheral request signal, and there is no user setting error reporting.

25.8.14 HPDMA channel x block register 1 (HPDMA_CxBR1)

Address offset: 0x098 + 0x80 * x (x = 0 to 11)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, a write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x at a block level.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when channel x is completed (then the hardware has de-asserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer:

- if HPDMA_CxLLR.UB1 = 1, this register is automatically updated by the HPDMA from the next LLI in memory.
- If HPDMA_CxLLR.UB1 = 0 and if there is at least one linked-list register to be updated from the next LLI in memory, this register is automatically and internally restored with the programmed value for the bitfield BNDT[15:0].
- If all the update bits HPDMA_CxLLR.Uxx are null and if HPDMA_CxLLR.LA[15:0] ≠ 0, the current LLI is the last one and is continuously executed: this register is automatically and internally restored with the programmed value for BNDT[15:0] after each execution of this final LLI
- If HPDMA_CxLLR = 0, this register and BNDT[15:0] are kept as null, channel x is completed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BNDT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **BNDT[15:0]**: Block number of data bytes to transfer from the source

Block size transferred from the source. When the channel is enabled, this bitfield becomes read-only and is decremented, indicating the remaining number of data items in the current source block to be transferred. BNDT[15:0] is programmed in number of bytes, maximum source block size is 64 Kbytes -1.

Once the last data transfer is completed (BNDT[15:0] = 0):

- if HPDMA_CxLLR.UB1 = 1, this bitfield is updated with the LLI in the memory.
- if HPDMA_CxLLR.UB1 = 0 and if there is at least one non null Uxx update bit, this bitfield is internally restored to the programmed value.
- if all HPDMA_CxLLR.Uxx = 0 and if HPDMA_CxLLR.LA[15:0] = 0, this bitfield is internally restored to the programmed value (infinite/continuous last LLI).
- if HPDMA_CxLLR = 0, this bitfield is kept as zero following the last LLI data transfer.

25.8.15 HPDMA channel x alternate block register 1 (HPDMA_CxBR1)

Address offset: 0x098 + 0x80 * x (x = 12 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, a write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x at a block level.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when channel x is completed (then the hardware has de-asserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer:

- if HPDMA_CxLLR.UB1 = 1, this register is automatically updated by the HPDMA from the next LLI in memory.
- If HPDMA_CxLLR.UB1 = 0 and if there is at least one linked-list register to be updated from the next LLI in memory, this register is automatically and internally restored with the programmed value for the bitfields BNDT[15:0] and BRC[10:0].
- If all the update bits HPDMA_CxLLR.Uxx are null and if HPDMA_CxLLR.LA[15:0] ≠ 0, the current LLI is the last one and is continuously executed: this register is automatically and internally restored with the programmed value for the bitfields BNDT[15:0] and BRC[10:0] after each execution of this final LLI
- If HPDMA_CxLLR = 0, BNDT[15:0] and BRC[10:0] are kept as null, channel x is completed.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BRDDEC	BRSDEC	DDEC	SDEC	Res.	BRC[10:0]										
rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BNDT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **BRDDEC**: Block repeat destination address decrement

0: At the end of a block transfer, the HPDMA_CxDAR register is updated by adding the programmed offset HPDMA_CxBR2.BRDAO to the current HPDMA_CxDAR value (current destination address)

1: At the end of a block transfer, the HPDMA_CxDAR register is updated by subtracting the programmed offset HPDMA_CxBR2.BRDAO from the current HPDMA_CxDAR value (current destination address)

Note: On top of this increment/decrement (depending on BRDDEC), HPDMA_CxDAR is in the same time also updated by the increment/decrement (depending on DDEC) of the HPDMA_CxTR3.DAO value, as it is usually done at the end of each programmed burst transfer.

Bit 30 **BRSDEC**: Block repeat source address decrement

0: At the end of a block transfer, the HPDMA_CxSAR register is updated by adding the programmed offset HPDMA_CxBR2.BRSAO to the current HPDMA_CxSAR value (current source address)

1: At the end of a block transfer, the HPDMA_CxSAR register is updated by subtracting the programmed offset HPDMA_CxBR2.BRSAO from the current HPDMA_CxSAR value (current source address)

Note: On top of this increment/decrement (depending on BRSDEC), HPDMA_CxSAR is in the same time also updated by the increment/decrement (depending on SDEC) of the HPDMA_CxTR3.SAO value, as it is done after any programmed burst transfer.

Bit 29 **DDEC**: destination address decrement

0: At the end of a programmed burst transfer to the destination, the HPDMA_CxDAR register is updated by adding the programmed offset HPDMA_CxTR3.DAO to the current HPDMA_CxDAR value (current destination address)

1: At the end of a programmed burst transfer to the destination, the HPDMA_CxDAR register is updated by subtracting the programmed offset HPDMA_CxTR3.DAO to the current HPDMA_CxDAR value (current destination address)

Bit 28 **SDEC**: source address decrement

0: At the end of a programmed burst transfer from the source, the HPDMA_CxSAR register is updated by adding the programmed offset HPDMA_CxTR3.SAO to the current HPDMA_CxSAR value (current source address)

1: At the end of a programmed burst transfer from the source, the HPDMA_CxSAR register is updated by subtracting the programmed offset HPDMA_CxTR3.SAO to the current HPDMA_CxSAR value (current source address)

Bit 27 Reserved, must be kept at reset value.

Bits 26:16 **BRC[10:0]**: Block repeat counter

This bitfield contains the number of repetitions of the current block (0 to 2047).

When the channel is enabled, this bitfield becomes read-only. After decrements, this bitfield indicates the remaining number of blocks, excluding the current one. This counter is hardware decremented for each completed block transfer.

Once the last block transfer is completed (BRC[10:0] = BNDT[15:0] = 0):

– If HPDMA_CxLLR.UB1 = 1, all HPDMA_CxBR1 bitfields are updated by the next LLI in the memory.

– If HPDMA_CxLLR.UB1 = 0 and if there is at least one not null Uxx update bit, this bitfield is internally restored to the programmed value.

– if all HPDMA_CxLLR.Uxx = 0 and if HPDMA_CxLLR.LA[15:0] ≠ 0, this bitfield is internally restored to the programmed value (infinite/continuous last LLI).

– if HPDMA_CxLLR = 0, this bitfield is kept as zero following the last LLI and data transfer.

Bits 15:0 **BNDT[15:0]**: Block number of data bytes to transfer from the source

Block size transferred from the source. When the channel is enabled, this bitfield becomes read-only and is decremented, indicating the remaining number of data items in the current source block to be transferred.

l If DMA_CxTR3.BAM[1:0] = 00, BNDT[15:0] is programmed in number of bytes. The maximum source block size is 64 Kbytes - 1.

l If DMA_CxTR3.BAM[1:0] =01, BNDT[15:0] is programmed as multiple of 16 bytes. The maximum source block size is 1 Mbyte - 16.

l If DMA_CxTR3.BAM[1:0] = 10, BNDT[15:0] is programmed as multiple of 256 bytes. The maximum source block size is 16 Mbytes - 256.

Once the last data transfer is completed (BNDT[15:0] = 0):

- if HPDMA_CxLLR.UB1 = 1, this bitfield is updated with the LLI in the memory.

- if HPDMA_CxLLR.UB1 = 0 and if there is at least one not null Uxx update bit, this bitfield is internally restored to the programmed value.

- if all HPDMA_CxLLR.Uxx = 0 and if HPDMA_CxLLR.LA[15:0] ≠ 0, this bitfield is internally restored to the programmed value (infinite/continuous last LLI).

- if HPDMA_CxLLR = 0, this bitfield is kept as zero following the last LLI data transfer.

25.8.16 HPDMA channel x source address register (HPDMA_CxSAR)

Address offset: 0x09C + 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register configures the source start address of a transfer.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1, and continuously updated by hardware, in order to reflect the address of the next burst transfer from the source.

This register must be written when the channel is completed (then the hardware has deasserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the HPDMA from the memory if HPDMA_CxLLR.USA = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **SA[31:0]**: Source address

This bitfield is the pointer to the address from which the next data is read.

During the channel activity, depending on the source addressing mode (HPDMA_CxTR1.SINC), this bitfield is kept fixed or incremented by the data width (HPDMA_CxTR1.SDW_LOG2[1:0]) after each burst source data, reflecting the next address from which data is read.

During the channel activity, this address is updated after each completed source burst, consequently to:

– the programmed source burst; either in fixed addressing mode or in contiguous-data incremented mode. If contiguously incremented (HPDMA_CxTR1.SINC = 1), then the additional address offset value is the programmed burst size, as defined by HPDMA_CxTR1.SBL_1[5:0] and HPDMA_CxTR1.SDW_LOG2[1:0]

– the additional source incremented/decremented offset value as programmed by HPDMA_CxBR1.SDEC and HPDMA_CxTR3.SAO[12:0]

– once/if completed source block transfer, for a channel x with 2D addressing capability (x = 12 to 15). additional block repeat source incremented/decremented offset value as programmed by HPDMA_CxBR1.BRSDEC and HPDMA_CxBR2.BRSAO[15:0]

In linked-list mode, after a LLI data transfer is completed, this register is automatically updated by HPDMA from the memory, provided the LLI is set with HPDMA_CxLLR.USA = 1.

Note: A source address must be aligned with the programmed data width of a source burst (SA[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0]). Else, a user setting error is reported and no transfer is issued.

When the source block size is not a multiple of the source burst size and is a multiple of the source data width, the last programmed source burst is not completed and is internally shorten to match the block size. In this case, the additional HPDMA_CxTR3.SAO[12:0] is not applied.

25.8.17 HPDMA channel x destination address register (HPDMA_CxDAR)

Address offset: 0x0A0 + 0x80 * x (x = 0 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, an access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register configures the destination start address of a transfer.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1, and continuously updated by hardware, in order to reflect the address of the next burst transfer to the destination.

This register must be written when the channel is completed (then the hardware has deasserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by HPDMA from the memory if HPDMA_CxLLR.UDA = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

DA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DA[31:0]**: destination address

This bitfield is the pointer to the address from which the next data is written.

During the channel activity, depending on the destination addressing mode (HPDMA_CxTR1.DINC), this bitfield is kept fixed or incremented by the data width (HPDMA_CxTR1.DDW_LOG2[1:0]) after each burst destination data, reflecting the next address from which data is written.

During the channel activity, this address is updated after each completed destination burst, consequently to:

– the programmed destination burst; either in fixed addressing mode or in contiguous-data incremented mode. If contiguously incremented (HPDMA_CxTR1.DINC = 1), then the additional address offset value is the programmed burst size, as defined by HPDMA_CxTR1.DBL_1[5:0] and HPDMA_CxTR1.DDW_LOG2[1:0]

– the additional destination incremented/decremented offset value as programmed by HPDMA_CxBR1.DDEC and HPDMA_CxTR3.DAO[12:0]

– once/if completed destination block transfer, for a channel x with 2D addressing capability (x = 12 to 15), the additional block repeat destination incremented/decremented offset value as programmed by HPDMA_CxBR1.BRDDEC and HPDMA_CxBR2.BRDAO[15:0]

In linked-list mode, after a LLI data transfer is completed, this register is automatically updated by the HPDMA from the memory, provided the LLI is set with HPDMA_CxLLR.UDA = 1.

Note: A destination address must be aligned with the programmed data width of a destination burst (DA[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0]). Else, a user setting error is reported and no transfer is issued.

25.8.18 HPDMA channel x transfer register 3 (HPDMA_CxTR3)

Address offset: 0x0A4 + 0x80 * x (x = 12 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, a write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (then the hardware has deasserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the HPDMA from the memory if HPDMA_CxLLR.UT3 = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BRAM[1:0]		Res.	DAO[12:0]												
rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BAM[1:0]		Res.	SAO[12:0]												
rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 **BRAM[1:0]**: Block repeated alignment mode

00: Repeated block address offset (HPDMA_CxBR2.BRSAO/BRDAO[15:0]) programmed in number of bytes. The absolute maximum repeated block address offset is 64 Kbytes - 1.

01: Repeated block address offset (HPDMA_CxBR2.BRSAO/BRDAO[15:0]) programmed in number of 16 bytes. A repeated block address offset is a multiple of 16 bytes. Absolute maximum repeated block address offset is 1 Mbytes - 16.

10-11: Repeated block address offset (HPDMA_CxBR2.BRSAO/BRDAO[15:0]) programmed in number of 256 bytes. A repeated block address offset is a multiple of 256 bytes. Absolute maximum repeated block address offset is 16 Mbytes - 256.

Bit 29 Reserved, must be kept at reset value.

Bits 28:16 **DAO[12:0]**: Destination address offset increment

The destination address, pointed by HPDMA_CxDAR, is incremented or decremented (depending on HPDMA_CxBR1.DDEC) by this offset DAO[12:0] for each programmed destination burst. This offset is not including and is added to the programmed burst size when the completed burst is addressed in incremented mode (HPDMA_CxTR1.DINC = 1).

Note: A destination address offset must be aligned with the programmed data width of a destination burst (DAO[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0]). Else, a user setting error is reported and no transfer is issued.

Bits 15:14 **BAM[1:0]**: Block alignment mode

00: Block address offset (HPDMA_CxTR3.SAO/DAO[12:0]) and block size transferred from the source (HPDMA_CxBR1.BNDT[15:0] programmed in number of bytes). Absolute maximum block address offset is 8 Kbytes - 1. Maximum source block size is 64 Kbytes - 1.

01: block address offset (HPDMA_CxTR3.SAO/DAO[12:0]) and block size transferred from the source (HPDMA_CxBR1.BNDT[15:0] programmed as a multiple of 16 bytes). Absolute maximum block address offset is 128 Kbytes - 16. Maximum source block size is 1 Mbytes - 16.

10-11: Block address offset (HPDMA_CxTR3.SAO/DAO[12:0]) and block size transferred from the source (HPDMA_CxBR1.BNDT[15:0] programmed as a multiple of 256 bytes). Absolute maximum block address offset is 2 Mbytes - 256. Maximum source block size is 16 Mbytes - 256.

Bit 13 Reserved, must be kept at reset value.

Bits 12:0 **SAO[12:0]**: Source address offset increment

The source address, pointed by HPDMA_CxSAR, is incremented or decremented (depending on HPDMA_CxBR1.SDEC) by this offset SAO[12:0] for each programmed source burst. This offset is not including and is added to the programmed burst size when the completed burst is addressed in incremented mode (HPDMA_CxTR1.SINC = 1).

Note: A source address offset must be aligned with the programmed data width of a source burst (SAO[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0]). Else a user setting error is reported and none transfer is issued.

When the source block size is not a multiple of the destination burst size and is a multiple of the source data width, then the last programmed source burst is not completed and is internally shorten to match the block size. In this case, the additional HPDMA_CxTR3.SAO[12:0] is not applied.

25.8.19 HPDMA channel x block register 2 (HPDMA_CxBR2)

Address offset: 0x0A8 + 0x80 * x (x = 12 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, a write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register controls the transfer of a channel x at a 2D/repeated block level.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (then the hardware has deasserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the HPDMA from the memory if HPDMA_CxLLR.UB2 = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BRDAO[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

BRSAO[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **BRDAO[15:0]**: Block repeated destination address offset

For a channel with 2D addressing capability, this bitfield is used to update (by addition or subtraction depending on HPDMA_CxBR1.BRDDEC) the current destination address (HPDMA_CxDAR) at the end of a block transfer.

Note: A block repeated destination address offset must be aligned with the programmed data width of a destination burst (BRDAO[2:0] versus HPDMA_CxTR1.DDW_LOG2[1:0]). Else a user setting error is reported and no transfer is issued.
BRDAO[15:0] must be set to 0 in peripheral flow-control mode (if HPDMA_CxTR2.PFREQ = 1).

Bits 15:0 **BRSAO[15:0]**: Block repeated source address offset

For a channel with 2D addressing capability, this bitfield is used to update (by addition or subtraction depending on HPDMA_CxBR1.BRSDEC) the current source address (HPDMA_CxSAR) at the end of a block transfer.

Note: A block repeated source address offset must be aligned with the programmed data width of a source burst (BRSAO[2:0] versus HPDMA_CxTR1.SDW_LOG2[1:0]). Else a user setting error is reported and no transfer is issued.
BRSAO[15:0] must be set to 0 in peripheral flow-control mode (if HPDMA_CxTR2.PFREQ = 1).

25.8.20 HPDMA channel x linked-list address register (HPDMA_CxLLR)

Address offset: 0x0CC + 0x80 * x (x = 0 to 11)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register is CID-filtered depending on the CID configuration of the channel x (HPDMA_CxCIDCFGR.CFEN = 1). If the debug domain feature is activated, a write access to this register is granted to the debug domain CID, regardless of any CID filtering.

This register configures the data structure of the next LLI in the memory and its address pointer. A channel transfer is completed when this register is null.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (then the hardware has deasserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the HPDMA from the memory if HPDMA_CxLLR.ULL = 1.

Bit 31 **UT1**: Update HPDMA_CxTR1 from memory

This bit controls the update of HPDMA_CxTR1 from the memory during the link transfer.

0: No HPDMA_CxTR1 update

1: HPDMA_CxTR1 update

Bit 30 **UT2**: Update HPDMA_CxTR2 from memory

This bit controls the update of HPDMA_CxTR2 from the memory during the link transfer.

0: No HPDMA_CxTR2 update

1: HPDMA_CxTR2 update

Bit 29 **UB1**: Update HPDMA_CxBR1 from memory

This bit controls the update of HPDMA_CxBR1 from the memory during the link transfer.
If UB1 = 0 and if HPDMA_CxLLR ≠ 0, the linked-list is not completed.
HPDMA_CxBR1.BNDT[15:0] is then restored to the programmed value after data transfer is completed and before the link transfer.

0: No HPDMA_CxBR1 update from memory (HPDMA_CxBR1.BNDT[15:0] restored if any link transfer)

1: HPDMA_CxBR1 update

Bit 28 **USA**: Update HPDMA_CxSAR from memory
This bit controls the update of HPDMA_CxSAR from the memory during the link transfer.
0: No HPDMA_CxSAR update
1: HPDMA_CxSAR update

Bit 27 **UDA**: Update HPDMA_CxDAR register from memory
This bit is used to control the update of HPDMA_CxDAR from the memory during the link transfer.
0: No HPDMA_CxDAR update
1: HPDMA_CxDAR update

Bits 26:17 Reserved, must be kept at reset value.

Bit 16 **ULL**: Update HPDMA_CxLLR register from memory
This bit is used to control the update of HPDMA_CxLLR from the memory during the link transfer.
0: No HPDMA_CxLLR update
1: HPDMA_CxLLR update

Bits 15:2 **LA[15:2]**: Pointer (16-bit low-significant address) to the next linked-list data structure
If UT1 = UT2 = UB1 = USA = UDA = ULL = 0 and if LA[15:2] = 0, the current LLI is the last one. The channel transfer is completed without any update of the linked-list HPDMA register file.
Else, this bitfield is the pointer to the memory address offset from which the next linked-list data structure is automatically fetched from, once the data transfer is completed, in order to conditionally update the linked-list HPDMA internal register file (HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR, HPDMA_CxDAR, and HPDMA_CxLLR).

Note: The user must program the pointer to be 32-bit aligned. The two low-significant bits are write ignored.

Bits 1:0 Reserved, must be kept at reset value.

25.8.21 HPDMA channel x alternate linked-list address register (HPDMA_CxLLR)

Address offset: 0x0CC + 0x80 * x (x = 12 to 15)

Reset value: 0x0000 0000

This register is secure or nonsecure depending on the secure state of channel x (HPDMA_SECCFGR.SECx), and privileged or unprivileged, depending on the privileged state of channel x (HPDMA_PRIVCFGR.PRIVx).

This register configures the data structure of the next LLI in the memory and its address pointer. A channel transfer is completed when this register is null.

This register must be written when HPDMA_CxCR.EN = 0.

This register is read-only when HPDMA_CxCR.EN = 1.

This register must be written when the channel is completed (then the hardware has deasserted HPDMA_CxCR.EN). A channel transfer can be completed and programmed at different levels: block, 2D/repeated block, LLI, or full linked-list.

In linked-list mode, during the link transfer, this register is automatically updated by the HPDMA from the memory if HPDMA_CxLLR.ULL = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit 31 **UT1**: Update HPDMA_CxTR1 from memory
This bit controls the update of HPDMA_CxTR1 from the memory during the link transfer.
0: No HPDMA_CxTR1 update
1: HPDMA_CxTR1 update

Bit 30 **UT2**: Update HPDMA_CxTR2 from memory
This bit controls the update of HPDMA_CxTR2 from the memory during the link transfer.
0: No HPDMA_CxTR2 update
1: HPDMA_CxTR2 update

Bit 29 **UB1**: Update HPDMA_CxBR1 from memory
This bit controls the update of HPDMA_CxBR1 from the memory during the link transfer.
If UB1 = 0 and if HPDMA_CxLLR ≠ 0, the linked-list is not completed.
HPDMA_CxBR1.BNDT[15:0] is then restored to the programmed value after data transfer is completed and before the link transfer.
0: No HPDMA_CxBR1 update from memory (HPDMA_CxBR1.BNDT[15:0] restored if any link transfer)
1: HPDMA_CxBR1 update

Bit 28 **USA**: Update HPDMA_CxSAR from memory
This bit controls the update of HPDMA_CxSAR from the memory during the link transfer.
0: No HPDMA_CxSAR update
1: HPDMA_CxSAR update

Bit 27 **UDA**: Update HPDMA_CxDAR register from memory
This bit is used to control the update of HPDMA_CxDAR from the memory during the link transfer.
0:No HPDMA_CxDAR update
1: HPDMA_CxDAR update

Bit 26 **UT3**: Update HPDMA_CxTR3 from memory
This bit controls the update of HPDMA_CxTR3 from the memory during the link transfer.
0: No HPDMA_CxTR3 update
1: HPDMA_CxTR3 update

Bit 25 **UB2**: Update HPDMA_CxBR2 from memory
This bit controls the update of HPDMA_CxBR2 from the memory during the link transfer.
0: No HPDMA_CxBR2 update
1: HPDMA_CxBR2 update

Bits 24:17 Reserved, must be kept at reset value.

Bit 16 **ULL**: Update HPDMA_CxLLR register from memory
This bit is used to control the update of HPDMA_CxLLR from the memory during the link transfer.
0: No HPDMA_CxLLR update
1: HPDMA_CxLLR update

Bits 15:2 **LA[15:2]**: Pointer (16-bit low-significant address) to the next linked-list data structure
If UT1 = UT2 = UB1 = USA = UDA = ULL= 0 and if LA[15:2] = 0, the current LLI is the last one. The channel transfer is completed without any update of the linked-list HPDMA register file.
Else, this bitfield is the pointer to the memory address offset from which the next linked-list data structure is automatically fetched from, once the data transfer is completed, in order to conditionally update the linked-list HPDMA internal register file (HPDMA_CxTR1, HPDMA_CxTR2, HPDMA_CxBR1, HPDMA_CxSAR, HPDMA_CxDAR and HPDMA_CxLLR).
Note: The user must program the pointer to be 32-bit aligned. The two low-significant bits are write ignored.

Bits 1:0 Reserved, must be kept at reset value.

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **G_LINKED_LIST7:** DMA transfer type for channel 7
0: No linked-list mode
1: Linked-list mode allowed

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **G_LINKED_LIST6:** DMA transfer type for channel 6
0: No linked-list mode
1: Linked-list mode allowed

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **G_LINKED_LIST5:** DMA transfer type for channel 5
0: No linked-list mode
1: Linked-list mode allowed

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **G_LINKED_LIST4:** DMA transfer type for channel 4
0: No linked-list mode
1: Linked-list mode allowed

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **G_LINKED_LIST3:** DMA transfer type for channel 3
0: No linked-list mode
1: Linked-list mode allowed

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **G_LINKED_LIST2:** DMA transfer type for channel 2
0: No linked-list mode
1: Linked-list mode allowed

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **G_LINKED_LIST1:** DMA transfer type for channel 1
0: No linked-list mode
1: Linked-list mode allowed

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **G_LINKED_LIST0:** DMA transfer type for channel 0
0: No linked-list mode
1: Linked-list mode allowed

25.8.31 HPDMA hardware configuration 6 register (HPDMA_HWCFGR6)

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:28 **G_M1_DATA_WIDTH_ENC[1:0]:** in the range 0 to 2
Master port 1 data bus width:
0: 32-bit
1: 64-bit
2: 128-bit

Bits 27:26 Reserved, must be kept at reset value.

Bits 25:24 **G_M0_DATA_WIDTH_ENC[1:0]:** in the range 0 to 2
Master port 0 data bus width:
0: 32-bit
1: 64-bit
2: 128-bit

Bits 23:20 **G_MAX_CID[3:0]:** in the range 0 to 15
Maximum compartment identification (CID):
0: No CID support, HPDMA not CID-aware
1 to 15: HPDMA is CID-aware. Any channel is a separate CID-aware resource. (support of n+1 CIDs, from CID0 up to CIDn)

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **G_TRUSTZONE:** TrustZone
0: No TrustZone
1: TrustZone support

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **G_NUM_CHANNELS[4:0]:** in the range 2 to 16
Number of HPDMA channels

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **G_PRIVILEGE:** privilege
0: No privilege
1: Privilege support

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **G_MASTER_PORTS[2:0]:** in the range 0 to 5
Master port type:
0: 1x 64-bit AXI (AXI4)
1: 1x AHB: 32-bit port 0 (AHB5)
2: 2x AHB: 32-bit port 0 and 32-bit port 1 (AHB5)
3: 1x AXI 64-bit port 0 (AXI4) + 1x AHB 32-bit port 1 (AHB5)
4: 2x AXI 64-bit port 0 and port 1 (AXI4)
5: 1x AXI 128-bit port 0 (AXI4) + 1x AHB port 1 (AHB5)

27 Nested vectored interrupt controller (NVIC)

27.1 NVIC features

The NVIC for Cortex-M33 (CPU2) includes the following features:

- 320 maskable interrupt channels (not including the 16 Cortex-M33 with FPU interrupt lines)
- 16 programmable priority levels (4 bits of interrupt priority are used)
- Low-latency exception and interrupt handling
- Power management control
- Implementation of system control registers

The NVIC and the Cortex-M33 core are closely coupled, which enables low-latency interrupt processing, and efficient processing of late arriving interrupts.

The NVIC registers are banked across secure and non-secure states.

All the interrupts including Cortex-M33 core exceptions are managed by the NVIC.

For more information on exceptions and NVIC programming, refer to *STM32 Cortex-M33 MCUs programming manual* (PM0264).

27.2 SysTick calibration value register

The Cortex-M33 with TrustZone mainline security extension embeds two SysTick timers, that are available when TrustZone is activated:

- SysTick secure instance
- SysTick non-secure instance

When TrustZone is disabled, only one SysTick timer is available.

As SysTick for Cortex-M33 does not run on a fixed frequency, there is no SysTick calibration value available.

The SysTick reload counter must be set according to the required time base, and the ck_cpu2 frequency value must be set in the RCC.

27.3 Interrupt and exception vectors

See Cortex-M33 interrupt table in *Section 26: Interrupt list*.

28 Global interrupt controller (GIC)

28.1 GIC introduction

The following Arm specifications provide additional details on the GIC:

- Arm generic interrupt controller - Architecture specification v2.0
- Cortex-A35 technical reference manual revision r0p1

28.2 GIC main features

The integrated GIC collates and arbitrates from a large number of interrupt sources. It provides:

- Masking of interrupts
- Prioritization of interrupts
- Distribution of the interrupts to the target processors
- Tracking of the status of interrupts
- Generation of interrupts by software
- Support for security extensions
- Support for virtualization extensions

28.3 GIC functional description

The GIC is a single functional unit located in the Cortex-A35. It consists of a shared distributor block, and several CPU interfaces. Each Cortex-A35 processor core embeds:

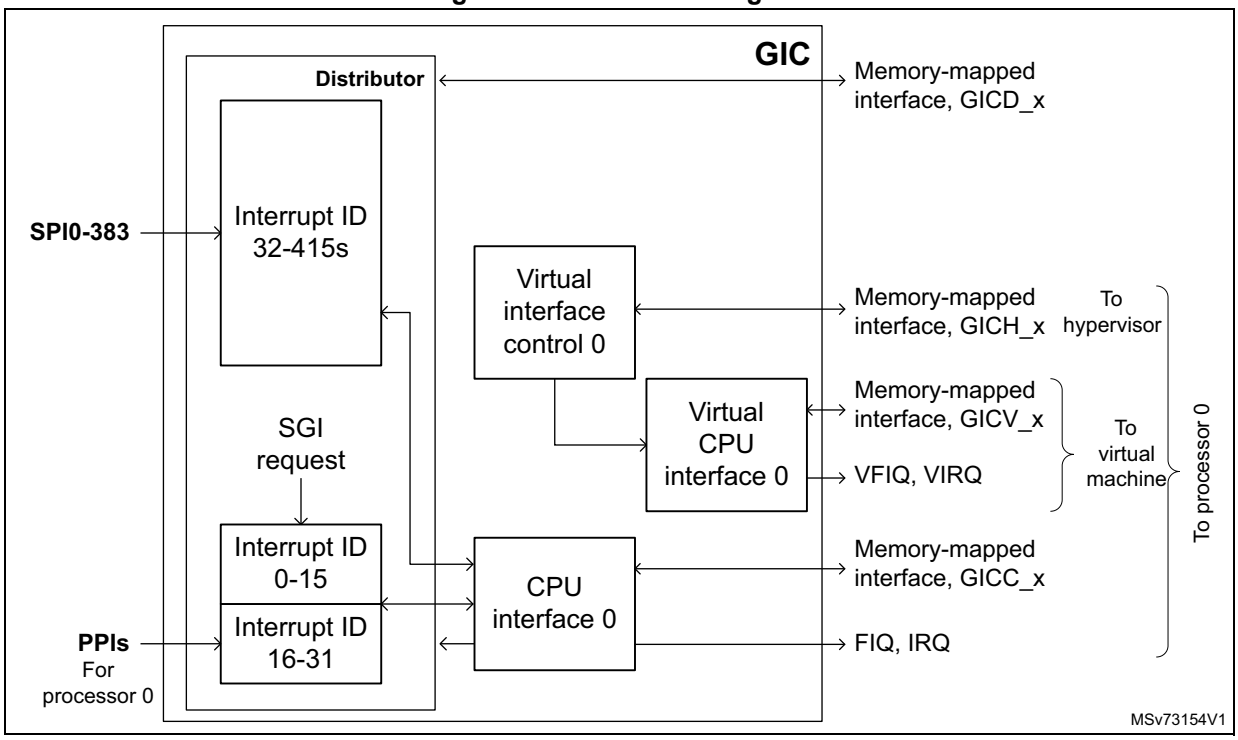
- a CPU interface
- a virtual interface control
- a virtual CPU interface

The GIC registers are memory-mapped, and the base address is visible into the configuration base address (CBAR) for each processor core in the cluster.

Memory regions used for these registers must be marked as device, or strongly-ordered in the translation tables.

Memory regions marked as normal memory cannot access any of the GIC registers: access caches or external memory as required.

Figure 157. GIC block diagram



28.4 GIC interrupt sources

All interrupt sources are identified by a unique ID. The Cortex-A35 processor interrupt sources are detailed below.

28.4.1 Software generated interrupts (SGI)

The SGIs are generated by writing to the software generated interrupt register (GICD_SGIR). Each processor interface can generate a maximum of 16 SGIs (ID0-ID15). An SGI has edge-triggered properties. The software triggering of the interrupt is equivalent to the edge transition of the interrupt signal on a peripheral input.

Note: Arm recommends to use SGI ID0-ID7 for non-secure interrupts, and SGI ID8-ID15 for secure interrupts.

28.4.2 Private peripheral interrupts (PPI)

A PPI is an interrupt generated by a peripheral that is specific to a single processor. There are six PPIs for each CPU interface:

- legacy nFIQ signal (PPI0) - not used

  When the GIC interrupt bypass is in effect (such as after reset), the external nFIQ signal bypasses the interrupt distributor logic, and directly drives the interrupt request to the corresponding processor.

  When a processor uses the GIC rather than the external nFIQ signal (by enabling its own CPU interface), the nFIQ signal is treated like other interrupt lines, and uses ID28. The interrupt is active-low-level sensitive.

- secure physical timer event (PPI1)

  This event is generated from the secure physical timer, and uses ID29. The interrupt is level sensitive.
- non-secure physical timer event (PPI2)

  This event is generated from the non-secure physical timer, and uses ID30. The interrupt is level sensitive.
- legacy nIRQ signal (PPI3) - not used

  When the GIC interrupt bypass is in effect (such as after reset), the external nIRQ signal bypasses the interrupt distributor logic, and directly drives the interrupt request to the corresponding processor.

  When a processor uses the GIC rather than the external nIRQ signal (by enabling its own CPU interface), the nIRQ signal is treated like other interrupt lines and uses ID31. The interrupt is active-low-level sensitive.
- virtual timer event (PPI4)

  This event is generated from the virtual timer, and uses ID27. The interrupt is level sensitive.
- hypervisor timer event (PPI5)

  This event is generated from the physical timer in hypervisor mode, and uses ID26. The interrupt is level-sensitive.

28.4.3 Shared peripheral interrupts (SPI)

The SPIs are triggered by events generated on associated interrupt input lines. The GIC supports up to 384 SPIs corresponding to the external IRQS signal.

The SPIs start at ID32, and can be configured to be edge-triggered or active-high-level sensitive.

28.4.4 Interrupt priority formats

The Cortex-A35 implements a 5-bit version of the interrupt priority field for 32 interrupt priority levels.

28.5 GIC distributor (GICD)

The GICD centralizes all interrupt sources, determines the priority of each interrupt, and, for each CPU interface, forwards the interrupt with the highest priority to the interface for priority masking and preemption handling.

The GICD provides a programming interface for the following actions:

- Enable globally the forwarding of interrupts to the CPU interfaces.
- Enable/disable each interrupt.
- Set the priority level of each interrupt.
- Set the target processor list of each interrupt.
- Set each peripheral interrupt to be level sensitive or edge triggered.
- Set each interrupt as either group 0 or group 1.
- Send an SGI to one or more target processor cores.
- Give visibility of the state of each interrupt.

- Provide a mechanism for software to set/clear pending state of a peripheral interrupt.

The GICD_IPRIORITYRx, GICD_ITARGETSRx, GICD_CPENDSGIRx, and GICD_SPENDSGIRx registers are byte-accessible and halfword-accessible.

All other registers are word-accessible.

28.5.1 GICD control register (GICD_CTLR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ENABLEGRP1	ENABLEGRP0
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **ENABLEGRP1:** Enable group 1 interrupts
Global enable for forwarding pending group 1 interrupts from the GICD to the CPU interfaces

Bit 0 **ENABLEGRP0**: Enable group 0 interrupts
Global enable for forwarding pending group 0 interrupts from the GICD to the CPU interfaces

28.5.2 GICD control non-secure access register (GICD_CTLRNS)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ENABLE
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **ENABLE**:
Global enable for forwarding pending group 1 interrupts from the GICD to the CPU interfaces

28.5.3 GICD interrupt controller type register (GICD_TYPER)

Address offset: 0x004

Reset value: 0x0000 FC0C

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

r	r	r	r	r	r			r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:11 **LSPI[4:0]**: Lockable shared peripheral interrupt
This bitfield returns the number of LSPIs that the interrupt controller contains. (0b1111 = 31 LSPIs, IDs 32-62).

Bit 10 **SECURITYEXTN**: Security extension
This bit indicates whether the GIC implements the security extensions. This bit always returns a value of 1, indicating that the security extensions are implemented.

Bits 9:8 Reserved, must be kept at reset value.

Bits 7:5 **CPUNUMBER[2:0]**: Number of processor interfaces
This bitfield indicates the number of implemented processor interfaces in the GIC. (0b000 = 1 processor interface)

Bits 4:0 **ITLINESNUMBER[4:0]**: Number of interrupt lines
This bitfield indicates the number of interrupts that the GIC supports. (0b01100= up to 416 interrupts, up to 384 SPI interrupts)

28.5.4 GICD implementer identification register (GICD_IIDR)

Address offset: 0x008

Reset value: 0x0202 143B

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

REVISION[3:0]				IMPLEMENTER[11:0]											
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 **PRODUCTID[7:0]**: GIC product ID

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **VARIANT[3:0]**: GIC major revision number

Bits 15:12 **REVISION[3:0]**: GIC minor revision number

Bits 11:0 **IMPLEMENTER[11:0]**: GIC implementer (0x43B Arm implementation)

28.5.5 GICD interrupt group register x (GICD_IGROUPRx)

Address offset: 0x080 + 0x4 * x, (x = 0 to 12)

Reset value: 0x0000 0000

For interrupts, ID = x * 32 to ID = x * 32 + 31.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

PPI3	PPI2	PPI1	PPI0	PPI4	PPI5	PPI6	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
r	r	r	r	r	r	r									

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **PPI3**: nIRQ (not used)

Bit 14 **PPI2**: Secure physical timer event

Bit 13 **PPI1**: Secure physical timer event

Bit 12 **PPI0**: nFIQ (not used)

Bit 11 **PPI4**: Virtual timer event

Bit 10 **PPI5**: Hypervisor timer event

Bit 9 **PPI6**: Virtual maintenance interrupt

Bits 8:0 Reserved, must be kept at reset value.

28.5.21 GICD shared peripheral interrupt register x (GICD_SPISRx)

Address offset: 0xD04 + 0x4 * x, (x = 0 to 11)

Reset value: 0x0000 0000

For interrupts, ID = SPI number + 32, from SPI = x * 32 + 31 to SPI = x * 32.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

SPISRx[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **SPISRx[31:0]**: Shared peripheral x interrupt

28.5.22 GICD software generated interrupt register (GICD_SGIR)

Address offset: 0xF00

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	TARGETLISTFILTER[1:0]		Res.	Res.	Res.	Res.	Res.	Res.	CPUTARGETLIST[1:0]	
						w	w							w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NSATT	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SGIINTID[3:0]			
w												w	w	w	w

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **TARGETLISTFILTER[1:0]**: Target list filter

This bitfield determines how the distributor must process the requested SGI.

0: Forward the interrupt to the CPU interfaces specified in the CPUTARGETLIST bitfield.

1: Forward the interrupt to all CPU interfaces except the processor which requested the interrupt.

2: Forward the interrupt only to the CPU interface of the processor which requested the interrupt.

3: Reserved

Bits 23:18 Reserved, must be kept at reset value.

Bits 17:16 **CPUTARGETLIST[1:0]**: CPU target list

When TARGETLISTFILTER = 0b00, this CPUTARGETLIST bitfield defines the CPU interfaces to which the GICD must forward the interrupt. Each bit refers to the corresponding CPU interface. If this bitfield is 0 when TARGETLISTFILTER = 0b00, the GICD does not forward the interrupt to any CPU interface.

Bit 15 **NSATT**: Non-secure attribute

this bit specifies the required security value of the SGI.

0: Forward the SGI specified in the SGIINTID bitfield to a specified CPU interface, only if the SGI is configured as group 0 on this interface.

1: Forward the SGI specified in the SGIINTID bitfield to a specified CPU interface, only if the SGI is configured as group 1 on this interface.

Note: This bit is writable only by a secure access. Any non-secure write to this register generates an SGI, only if the specified SGI is programmed as group 1.

Bits 14:4 Reserved, must be kept at reset value.

Bits 3:0 **SGIINTID[3:0]**: SGI interrupt ID

The value of this bitfield is the interrupt ID of the SGI to forward to the specified CPU interfaces, in the range 0-15 (for example: a value of 0b0011 specifies interrupt ID 3).

28.5.23 GICD SGI clear-pending register x (GICD_CPENDSGIRx)

Address offset: 0xF10 + 0x4 * x, (x = 0 to 3)

Reset value: 0x0000 0000

For SGI = x * 4 to SGI = x * 4 + 3.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

						rw	rw							rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	SGI_CLEAR_PENDING1[1:0]		Res.	Res.	Res.	Res.	Res.	Res.	SGI_CLEAR_PENDING0[1:0]	
						rw	rw							rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **SGI_CLEAR_PENDING3[1:0]**: Clear-pending state for SGI = x * 4 + 3

Writing a 1 clears the pending state of the SGI for the corresponding source processor, and no longer targets the processor performing the write.

Writing a 0 has no effect.

Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

Bits 23:18 Reserved, must be kept at reset value.

Bits 17:16 **SGI_CLEAR_PENDING2[1:0]**: Clear-pending state for SGI = x * 4 + 2

Writing a 1 clears the pending state of the SGI for the corresponding source processor, and no longer targets the processor performing the write.

Writing a 0 has no effect.

Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:8 **SGI_CLEAR_PENDING1[1:0]**:Clear-pending state for SGI = x * 4 + 1

Writing a 1 clears the pending state of the SGI for the corresponding source processor, and no longer targets the processor performing the write.
Writing a 0 has no effect.
Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

Bits 7:2 Reserved, must be kept at reset value.

Bits 1:0 **SGI_CLEAR_PENDING0[1:0]**: Clear-pending state for SGI = x * 4

Writing a 1 clears the pending state of the SGI for the corresponding source processor, and no longer targets the processor performing the write.
Writing a 0 has no effect.
Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

28.5.24 GICD SGI set-pending register x (GICD_SPENDSGIRx)

Address offset: 0xF20 + 0x4 * x, (x = 0 to 3)

Reset value: 0x0000 0000

For SGI = x * 4 to SGI = x * 4 + 3.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

						rw	rw							rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **SGI_SET_PENDING3[1:0]**: Set-pending state for SGI = x * 4 + 3

Writing a 1 sets the pending state of the SGI for the corresponding source processor. Writing a 0 has no effect.
Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

Bits 23:18 Reserved, must be kept at reset value.

Bits 17:16 **SGI_SET_PENDING2[1:0]**: Set-pending state for SGI= x * 4 + 2

Writing a 1 sets the pending state of the SGI for the corresponding source processor. Writing a 0 has no effect.
Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:8 **SGI_SET_PENDING1[1:0]**: Set-pending state for SGI = x * 4 + 1

Writing a 1 sets the pending state of the SGI for the corresponding source processor. Writing a 0 has no effect.
Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

Bits 7:2 Reserved, must be kept at reset value.

Bits 1:0 **SGI_SET_PENDING0[1:0]**: Set-pending state for SGI = x * 4
Writing a 1 sets the pending state of the SGI for the corresponding source processor.
Writing a 0 has no effect.
Reading a bit identifies whether the SGI is pending, from the corresponding source processor, on the reading processor.

28.5.25 GICD peripheral ID4 register (GICD_PIDR4)

Refer to *Section 2.4* for the register boundary addresses.

28.6 GIC CPU interface (GICC)

Each CPU interface provides a programming interface for the following actions:

- Enable the signaling of interrupt requests by the CPU interface.
- Acknowledge an interrupt.
- Indicate completion of the processing of an interrupt.
- Set an interrupt priority mask for the processor.
- Define the preemption policy for the processor.
- Determine the highest priority pending interrupt for the processor

All the registers are word-accessible.

Note: GICC offsets are provided with the default value of CA35SS_SYSCFG_GIC_CFGR (GICC set for a 64 KB granule system). Please refer to Arm documentation when set to 4 KB granule system.

28.6.1 GICC control register (GICC_CTLR)

Address offset: 0x000

Reset value: 0bXXXX XXXX XXXX XXXX XXXX X000 0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	EOIMODENS	EOIMODES	IRQBYPDISGRP1	FIQBYPDISGRP1	IRQBYPDISGRP0	FIQBYPDISGRP0	CBPR	FIQEN	ACKCTL	ENABLEGRP1	ENABLEGRP0
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **EOIMODENS**: Alias of EOIMODENS from the non-secure copy of this register.

Bit 9 **EOIMODES**:EOI mode for secure accesses

This bit controls the behavior of accesses to GICC_EOIR and GICC_DIR registers. This control applies only to secure accesses.

Bit 8 **IRQBYPDISGRP1**: Alias of IRQBYPDISGRP1 from the non-secure copy of this register.

Bit 7 **FIQBYPDISGRP1**: Alias of FIQBYPDISGRP1 from the non-secure copy of this register.

Bit 6 **IRQBYPDISGRP0**: IRQ bypass disable for group 0 interrupts

When the signaling of IRQs by the CPU interface is disabled, this bit partly controls whether the bypass IRQ signal is signaled to the processor.

Bit 5 **FIQBYPDISGRP0**: FIQ bypass disable for group 0 interrupts

When the signaling of FIQs by the CPU interface is disabled, this bit partly controls whether the bypass FIQ signal is signaled to the processor.

Bit 4 **CBPR**: BPR control

Controls whether GICC_BPR provides common control to group 0 and group 1 interrupts.

Bit 3 **FIQEN**: FIQ enable for group 0 interrupts

Controls whether the CPU interface signals group 0 interrupts to a target processor using the FIQ or the IRQ signal. The GIC always signals group 1 interrupts using the IRQ signal.

Bit 2 **ACKCTL**: Acknowledge control

When the highest priority pending interrupt is a group 1 interrupt, this bit determines both:
- whether a read of GICC_IAR acknowledges the interrupt, or returns a spurious interrupt ID
- whether a read of GICC_HPPIR returns the ID of the highest priority pending interrupt, or returns a spurious interrupt ID

Note: Arm deprecates use of this bit and strongly recommends using a software model where this bit is set to 0.

Bit 1 **ENABLEGRP1**: Enable group 1 interrupts

This bit enables the signaling of group 1 interrupts by the CPU interface to the connected processor.

Bit 0 **ENABLEGRP0**: Enable group 0 interrupts

This bit enables the signaling of group 0interrupts by the CPU interface to the connected processor.

28.6.2 GICC control non-secure access register (GICC_CTLRNS)

Address offset: 0x000

Reset value: 0bXXXX XXXX XXXX XXXX XXXX XX0X X00X XXX0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	EOIMODENS	Res.	Res.	IRQBYPDISGRP1	FIQBYPDISGRP1	Res.	Res.	Res.	Res.	ENABLEGRP1
						rw			rw	rw					rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **EOIMODENS**: EOI mode for non- secure accesses

This bit controls the behavior of accesses to GICC_EOIR and GICC_DIR registers.

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 **IRQBYPDISGRP1**: IRQ bypass for group 1 interrupts

When the signaling of IRQs by the CPU interface is disabled, this bit partly controls whether the bypass IRQ signal is signaled to the processor.

Bit 5 **FIQBYPDISGRP1**: FIQ bypass disable for group 1 interrupts

When the signaling of FIQs by the CPU interface is disabled, this bit partly controls whether the bypass FIQ signal is signaled to the processor.

Bits 4:1 Reserved, must be kept at reset value.

Bit 0 **ENABLEGRP1**: Enable group1 interrupts

This bit enables the signaling of group 1 interrupts by the CPU interface to the connected processor.

28.6.3 GICC input priority mask register (GICC_PMR)

Address offset: 0x004

Reset value: 0bXXXX XXXX XXXX XXXX XXXX XXXX 0000 0XXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIORITY[4:0]					Res.	Res.	Res.
								rw	rw	rw	rw	rw			

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:3 **PRIORITY[4:0]**: Priority mask level for the CPU interface

If the priority of an interrupt is higher than the value indicated by this bitfield, the interface signals the interrupt to the processor.

Bits 2:0 Reserved, must be kept at reset value.

28.6.4 GICC binary point register (GICC_BPR)

Address offset: 0x008

Reset value: 0bXXXX XXXX XXXX XXXX XXXX XXXX XXXX X010

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BINARY_POINT[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **BINARY_POINT[2:0]**:

This bitfield value controls how the 8-bit interrupt priority field is split into a group priority field. It is used to determine interrupt preemption and a subpriority field. Minimum value is 2.

28.6.5 GICC binary point non-secure access register (GICC_BPRNS)

Address offset: 0x008

Reset value: 0bXXXX XXXX XXXX XXXX XXXX XXXX XXXX X011

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BINARY_POINT[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **BINARY_POINT[2:0]**:

This bitfield value controls how the 8-bit interrupt priority field is split into a group priority field. It is used to determine interrupt preemption and a subpriority field. Minimum value is 3.

28.6.6 GICC interrupt acknowledge register (GICC_IAR)

Address offset: 0x00C

Reset value: 0bXXXX XXXX XXXX XXXX XXXX X011 1111 1111

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	CPUID	INTERRUPT_ID[9:0]									
					r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**: CPU requesting the interrupt

For SGIs in a multiprocessor implementation, this bit identifies the processor that requested the interrupt. It returns the number of the CPU interface that made the request.

For example, a value of 1 means the request was generated by a write to the GICD_SGIR on CPU interface 1.

Bits 9:0 **INTERRUPT_ID[9:0]**: interrupt ID

28.6.7 GICC end of interrupt register (GICC_EOIR)

Address offset: 0x010

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	CPUID	EOIINTID[9:0]									
					w	w	w	w	w	w	w	w	w	w	w

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

On a multiprocessor implementation, if the write refers to an SGI, this bit contains the CPUID value from the corresponding GICC_IAR access.

Bits 9:0 **EOIINTID[9:0]**: Interrupt ID value from the corresponding GICC_IAR access

28.6.8 GICC running priority register (GICC_RPR)

Address offset: 0x014

Reset value: 0bXXXX XXXX XXXX XXXX XXXX XXXX 1111 1111

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIORITY[4:0]					Res.	Res.	Res.
								r	r	r	r	r			

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:3 **PRIORITY[4:0]**: Current running priority on the CPU interface

Bits 2:0 Reserved, must be kept at reset value.

28.6.9 GICC highest priority pending interrupt register (GICC_HPPIR)

Address offset: 0x018

Reset value: 0bXXXX XXXX XXXX XXXX XXXX 0011 1111 1111

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	CPUID	PENDINTID[9:0]									
					r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

On a multiprocessor implementation, if the PENDINTID bitfield returns the ID of an SGI, this bit contains the CPUID value for this interrupt. This identifies the processor that generated the interrupt.

Bits 9:0 **PENDINTID[9:0]**: Interrupt ID of the highest-priority pending interrupt

28.6.10 GICC aliased binary point register (GICC_ABPR)

Address offset: 0x01C

Reset value: 0bXXXX XXXX XXXX XXXX XXXX XXXX XXXX X011

GICC_ABPR is an alias of the non-secure GICC_BPR. When CBPR is cleared to 0 in GICC_CTLR, a secure access to this register is equivalent to a non-secure access to GICC_BPR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BINARY_POINT[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **BINARY_POINT[2:0]**:

The value of this bitfield controls how the 8-bit interrupt priority field is split into a group priority field. It is used to determine interrupt preemption, and a subpriority field. Minimum value is 3.

28.6.11 GICC aliased interrupt acknowledge register (GICC_AIAR)

Address offset: 0x020

Reset value: 0bXXXX XXXX XXXX XXXX XXXX X011 1111 1111

GICC_AIAR is an alias of the non-secure view of GICC_IAR. A secure access to this register is identical to a non-secure access to GICC_IAR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	CPUID	INTERRUPT_ID[9:0]									
					r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

For SGIs in a multiprocessor implementation, this bit identifies the processor that requested the interrupt. It returns the number of the CPU interface that made the request.

For example, a value of 1 means the request was generated by a write to the GICD_SGIR on CPU interface 1.

Bits 9:0 **INTERRUPT_ID[9:0]**: Interrupt ID

28.6.12 GICC aliased end of interrupt register (GICC_AEOIR)

Address offset: 0x024

Reset value: 0xXXXX XXXX

GICC_AEOIR is an alias of the non-secure GICC_EOIR. A secure access to this register is similar to a non-secure access to GICC_EOIR, except that EOIMODES in GICC_CTLR is used.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	CPUID	EOIINTID[9:0]									
					w	w	w	w	w	w	w	w	w	w	w

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

On a multiprocessor implementation, when processing an SGI, this bit must contain the CPUID value from the corresponding GICC_AIAR, or non-secure GICC_IAR, access.

Bits 9:0 **EOIINTID[9:0]**:

This bitfield contains the interrupt ID value from the corresponding GICC_AIAR, or non-secure GICC_IAR, access.

28.6.13 GICC aliased highest priority pending interrupt register (GICC_AHPPIR)

Address offset: 0x028

Reset value: 0bXXXX XXXX XXXX XXXX XXX0 0011 1111 1111

This register is an alias of the non-secure GICC_HPPIR. A secure access to this register is equivalent to a non-secure access to GICC_HPPIR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	CPUID	PENDINTID[9:0]									
					r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

On a multiprocessor implementation, if the PENDINTID bitfield returns the ID of an SGI, this bit contains the CPUID value for that interrupt. This identifies the processor that generated the interrupt.

Bits 9:0 **PENDINTID[9:0]**: Interrupt ID of the highest-priority pending interrupt
This bitfield contains the interrupt ID of the highest-priority pending interrupt If that interrupt is a group 1 interrupt. Otherwise, its value is the spurious interrupt ID, 1023.

28.6.14 GICC active priority register (GICC_APR0)

Address offset: 0x0D0

Reset value: 0x0000 0000

Refer to *Section 2.4* for the register boundary addresses.

28.7 GIC virtual interface control, common (GICH)

The GICH registers are management ones. Configuration software on the Cortex-A35 must ensure they are accessible only by a hypervisor or similar software.

All the registers are word-accessible.

28.7.1 GICH hypervisor control register (GICH_HCR)

Address offset: 0x000

Reset value: 0b0000 0XXX XXXX XXXX XXXX XXXX 0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EOICOUNT[4:0]					Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw	rw	rw	rw	rw											
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VGRP1 DIE	VGRP1 EIE	VGRP0 DIE	VGRP0 EIE	NPIE	LRENP IE	UIE	EN
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 **EOICOUNT[4:0]**: End-of-interrupt counter

This bitfield counts the number of EOIs received that do not have a corresponding entry in the list registers. The virtual CPU interface increments this bitfield automatically when a matching EOI is received. When EOIs do not clear a bit in the active priorities register, GICH_APR does not cause an increment.

Although not possible under correct operation, if an EOI occurs when the value of this bitfield is 31, this bitfield wraps to 0.

The maintenance interrupt is asserted whenever this bitfield is non-zero, and LRENPIE = 1.

Bits 26:8 Reserved, must be kept at reset value.

Bit 7 **VGRP1DIE**: Virtual machine disable group 1 interrupt enable

This bit enables the signaling of a maintenance interrupt while signaling of group 1 interrupts from the virtual CPU interface to the connected virtual machine, is disabled.

Bit 6 **VGRP1EIE**: Virtual machine enable group 1 interrupt enable

This bit enables the signaling of a maintenance interrupt while signaling of group 1 interrupts from the virtual CPU interface to the connected virtual machine, is enabled.

Bit 5 **VGRP0DIE**: Virtual machine disable group 0 interrupt enable

This bit enables the signaling of a maintenance interrupt while signaling of group 0 interrupts from the virtual CPU interface to the connected virtual machine, is disabled.

Bit 4 **VGRP0EIE**: Virtual machine enable group 0interrupt enable

This bit enables the signaling of a maintenance interrupt while signaling of group 0 interrupts from the virtual CPU interface to the connected virtual machine, is enabled.

Bit 3 **NPIE**: No pending interrupt enable

This bit enables the signaling of a maintenance interrupt while no pending interrupts are present in the list registers.

Bit 2 **LRENPIE**: List register entry not present interrupt enable

This bit enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid list register entry for an EOI request.

Bit 1 **UIE**: Underflow interrupt enable.
This bit enables the signaling of a maintenance interrupt when the list registers are empty, or hold only one valid entry.

Bit 0 **EN**: Global enable bit for the virtual CPU interface

28.7.2 GICH VGIC type register (GICH_VTR)

Address offset: 0x004

Reset value: 0x9000 0003

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PRIBITS[2:0]			PREBITS[2:0]			Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LISTREGS[4:0]				
											r	r	r	r	r

Bits 31:29 **PRIBITS[2:0]**: Priority bits
This bitfield indicates the number of priority bits implemented, minus one.
For example, 0x4 means 5 bits of priority, and 32 priority levels.

Bits 28:26 **PREBITS[2:0]**: Preemption bits
This bitfield indicates the number of preemption bits implemented, minus one.
For example, 0x4 means 5 bits of preemption, and 32 preemption levels

Bits 25:5 Reserved, must be kept at reset value.

Bits 4:0 **LISTREGS[4:0]**: List registers
This bitfield indicates the number of implemented list registers, minus one.
For example, 0x3 means 4 list registers.

28.7.3 GICH virtual machine control register (GICH_VMCR)

Address offset: 0x008

Reset value: 0b0000 0XXX 0100 11XX XXXX XX0X XXX0 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

						rw					rw	rw	rw	rw	rw

Bits 31:27 **VMPRIMASK[4:0]**: Alias of GICV_PMR.PRIORITY

Bits 26:24 Reserved, must be kept at reset value.

Bits 23:21 **VMBP[2:0]**: Alias of GICV_BPR.BINARY_POINT

Bits 20:18 **VMABP[2:0]**: Alias of GICV_ABPR.BINARY_POINT.

Bits 17:10 Reserved, must be kept at reset value.

Bit 9 **VEM**: Alias of GICV_CTLR.EOIMODE

Bits 8:5 Reserved, must be kept at reset value.

Bit 4 **VMCBPR**: Alias of GICV_CTLR.CBPR

Bit 3 **VMFIQEN**: Alias of GICV_CTLR.FIQEN

Bit 2 **VMACKCTL**: Alias of GICV_CTLR.ACKCTL

Bit 1 **VMGRP1EN**: Alias of GICV_CTLR.ENABLEGRP1

Bit 0 **VMGRP0EN**: Alias of GICV_CTLR.ENABLEGRP0

28.7.4 GICH maintenance interrupt status register (GICH_MISR)

Address offset: 0x010

Reset value: 0bXXXX XXXX XXXX XXXX XXXX XXXX 0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **VGRP1D**: Disabled group 1 maintenance interrupt
Asserted whenever GICH_HCR.VGRP1DIE is set and GICH_VMCR.VMGRP1EN = 0.

Bit 6 **VGRP1E**: Enabled group 1 maintenance interrupt
Asserted whenever GICH_HCR.VGRP1EIE is set and GICH_VMCR.VMGRP1EN = 1.

Bit 5 **VGRP0D**: Disabled group 0 maintenance interrupt
Asserted whenever GICH_HCR.VGRP0DIE is set and GICH_VMCR.VMGRP0EN = 0.

Bit 4 **VGRP0E**: Enabled group 0 maintenance interrupt
Asserted whenever GICH_HCR.VGRP0EIE is set and GICH_VMCR.VMGRP0EN = 1.

Bit 3 **NP**: No pending maintenance interrupt
Asserted whenever GICH_HCR.NPIE = 1 and no list register is in pending state.

Bit 2 **LRENP**: List register entry not present maintenance interrupt
Asserted whenever GICH_HCR.LRENPIE = 1 and GICH_HCR.EOICOUNT is non-zero.

Bit 1 **U**: Underflow maintenance interrupt
Asserted whenever GICH_HCR.UIE is set and if none, or only one, of the list register entries are marked as a valid interrupt (if the corresponding GICH_LRx.STATE bits do not equal 0x0).

Bit 0 **EOI**: End of interrupt maintenance interrupt
Asserted whenever at least one list register asserts an EOI Interrupt, which means at least one bit at 1 in GICH_EISRx.

28.7.5 GICH end of interrupt status register (GICH_EISR0)

Address offset: 0x020

Reset value: 0bXXXX XXXX XXXX XXXX XXXX XXXX XXXX 0000

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
APR0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **APR0[31:0]**: Active priority

28.7.8 GICH list register x (GICH_LRx)

Address offset: 0x100 + 0x4 * x, (x = 0 to 3)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HW	GRP1	STATE[1:0]		PRIORITY[4:0]					Res.	Res.	Res.	PHYSICALID[9:6]			
rw	rw	rw	rw	rw	rw	rw	rw	rw				rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PHYSICALID[5:0]						VIRTUALID[9:0]									
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **HW**: Hardware interrupt

This bit indicates whether this virtual interrupt is an hardware interrupt (corresponding to a physical interrupt). Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the ID that the PHYSICALID bitfield indicates.

Bit 30 **GRP1**:

This bit indicates whether this virtual interrupt is a group 1 virtual interrupt.

Bits 29:28 **STATE[1:0]**: State of the interrupt

Bits 27:23 **PRIORITY[4:0]**: Priority of the interrupt

Bits 22:20 Reserved, must be kept at reset value.

Bits 19:10 **PHYSICALID[9:0]**: Physical ID

This bitfield function depends on the value of the GICH_LR.HW bit, as follows.

1) When GICH_LR.HW = 0, bits [9:0] have the following meanings:

- [19] EOI when this interrupt triggers an EOI maintenance interrupt
- [12:10] CPUID If the interrupt has the virtual ID for an SGI, that is, 0-15. This bitfield shows the requesting CPU ID. This appears in the relevant field of the virtual machine interrupt acknowledge register, GICV_IAR or GICV_AIAR. Otherwise, this bitfield must be set to 0.

2) When GICH_LR.HW = 1, PHYSICALID[9:0] indicates the physical interrupt ID that the hypervisor forwards to the GICD.

If this bitfield value is 0-15, or 1020-1023, behavior is unpredictable.

If this bitfield value is 16-31, it applies to the PPI associated with the same physical CPUID as the virtual CPU interface requesting the deactivation.

Bits 9:0 **VIRTUALID[9:0]**: virtual ID

This ID is returned to the guest OS when the interrupt is acknowledged through GICV_IAR. Each valid interrupt stored in the list registers must have a unique virtual ID for that virtual CPU interface.

If this bitfield value is 1020-1023, behavior is unpredictable.

28.7.9 GICH register map

Table 191. GICH register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Refer to *Section 2.4* for the register boundary addresses.

28.8 GIC virtual CPU interface (GICV)

The GICV forwards virtual interrupts to a connected Cortex-A35 processor core, subject to the normal GIC handling and prioritization rules. The virtual interface control registers control GICV operation. The GICV uses the contents of the list registers to determine when to signal virtual interrupts. When a processor core accesses the GICV, the list registers are updated.

All the registers are word-accessible.

28.8.1 GICV virtual machine control register (GICV_CTLR)

Address offset: 0x000

Reset value: 0bXXXX XXXX XXXX XXXX XXXX X000 0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	EOIMODE	Res.	Res.	Res.	Res.	CBPR	FIQEN	ACKCTL	ENABLEGRP1	ENABLEGRP0
						rw					rw	rw	rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **EOIMODE**: End of interrupt mode

This bit controls the behavior associated with GICV_EOIR, GICV_AEOIR, and GICV_DIR.

Bits 8:5 Reserved, must be kept at reset value.

Bit 4 **CBPR**: BPR control

This bit controls whether GICV_BPR controls both group 0 and group 1 virtual interrupts.

Bit 3 **FIQEN**: FIQ enable for group 0 interrupts

This bit controls whether interrupts marked as group 0 are presented as virtual FIQs.

Bit 2 **ACKCTL**: Acknowledge control

This bit controls whether a read of GICV_IAR, when the highest priority pending interrupt is a group 1 interrupt, causes the CPU interface to acknowledge the interrupt.

Note: Arm deprecates use of this bit, and strongly recommends that software is written to operate with this bit always set to 0.

Bit 1 **ENABLEGRP1**:

This bit enables the signaling of group 1 virtual interrupts by the GICV to the virtual machine.

Bit 0 **ENABLEGRP0**:

This bit enables the signaling of group 0 virtual interrupts by the GICV to the virtual machine.

28.8.2 GICV VM priority mask register (GICV_PMR)

Address offset: 0x004

Reset value: 0bXXXX XXXX XXXX XXXX XXXX XXXX 0000 0XXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIORITY[4:0]					Res.	Res.	Res.
								rw	rw	rw	rw	rw			

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:3 **PRIORITY[4:0]**: Priority mask level for the virtual CPU interface
Only virtual interrupts with higher priority than this bitfield value can be signaled to the processor core.

Bits 2:0 Reserved, must be kept at reset value.

28.8.3 GICV VM binary point register (GICV_BPR)

Address offset: 0x008

Reset value: 0bXXXX XXXX XXXX XXXX XXXX XXXX XXXX X010

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BINARY_POINT[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **BINARY_POINT[2:0]**:
This bitfield value controls how the 8-bit virtual interrupt priority field is split into a group priority field, used to determine virtual interrupt preemption, and a subpriority field. Minimum value is 2.

28.8.4 GICV VM interrupt acknowledge register (GICV_IAR)

Address offset: 0x00C

Reset value: 0bXXXX XXXX XXXX XXXX XXX0 0011 1111 1111

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	CPUID	INTERRUPT_ID[9:0]									
					r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:
If HW is cleared to 0 in GICH_LRx (indicating that the interrupt is triggered in software), the value of CPUID in GICH_LRx, that indicates the CPU ID, is returned in this bit.
Otherwise this bit is read as zero.

Bits 9:0 **INTERRUPT_ID[9:0]**: Interrupt ID

28.8.5 GICV VM end of interrupt register (GICV_EOIR)

Address offset: 0x010

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	CPUID	EOIINTID[9:0]									
					w	w	w	w	w	w	w	w	w	w	w

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

On a multiprocessor implementation, if the write refers to an SGI, this bit contains the CPUID value from the corresponding GICV_IAR access.

Bits 9:0 **EOIINTID[9:0]**:

If HW is set to 1 in GICH_LRx (indicating a hardware interrupt), a deactivate request is sent to the physical distributor, identifying the physical ID from the corresponding bitfield in the list register.

28.8.6 GICV VM running priority register (GICV_RPR)

Address offset: 0x014

Reset value: 0bXXXX XXXX XXXX XXXX XXXX XXXX 1111 1111

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRIORITY[4:0]					Res.	Res.	Res.
								r	r	r	r	r			

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:3 **PRIORITY[4:0]**: Current running priority on the virtual CPU interface

Bits 2:0 Reserved, must be kept at reset value.

28.8.7 GICV VM highest priority pending interrupt register (GICV_HPPIR)

Address offset: 0x018

Reset value: 0bXXXX XXXX XXXX XXXX XXX0 0011 1111 1111

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	CPUID	PENDINTID[9:0]									
					r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

On a multiprocessor implementation, if GICH_LRx.HW = 0, this bit contains the CPUID value for this virtual interrupt. This identifies the virtual processor that generated the virtual interrupt.

Bits 9:0 **PENDINTID[9:0]**:

The virtual interrupt ID of the highest-priority pending virtual interrupt

28.8.8 GICV VM aliased binary point register (GICV_ABPR)

Address offset: 0x01C

Reset value: 0bXXXX XXXX XXXX XXXX XXXX XXXX XXXX X011

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BINARY_POINT[2:0]		
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bits 2:0 **BINARY_POINT[2:0]**:

This bitfield value controls how the 8-bit virtual interrupt priority field is split into a group priority field, used to determine virtual interrupt preemption, and a subpriority field. Minimum value is 3.

28.8.9 GICV VM aliased interrupt register (GICV_AIAR)

Address offset: 0x020

Reset value: 0bXXXX XXXX XXXX XXXX XXX0 0011 1111 1111

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	CPUID	INTERRUPT_ID[9:0]									
					r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

If HW is cleared to 0 in GICH_LRx (indicating that the interrupt is triggered in software), the CPUID value in GICH_LRx, that indicates the CPU ID, is returned in this bit. Otherwise, this bit is read as zero.

Bits 9:0 **INTERRUPT_ID[9:0]**: interrupt ID

If GRP1 = 0 in GICH_LRx, the interrupt is group 0. The spurious interrupt ID 1023 is returned, and the interrupt is not acknowledged.

28.8.10 GICV VM aliased end of interrupt register (GICV_AEOIR)

Address offset: 0x024

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	CPUID	EOIINTID[9:0]									
					w	w	w	w	w	w	w	w	w	w	w

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

On a multiprocessor implementation, if the write refers to an SGI, this field contains the CPUID value from the corresponding GICV_IAR access.

Bits 9:0 **EOIINTID[9:0]**:

If HW is set to 1 in GICH_LRx (indicating an hardware interrupt), a deactivate request is sent to the physical distributor, identifying the physical ID from the corresponding field in the list register.

28.8.11 GICV VM aliased highest priority pending interrupt register (GICV_AHPPIR)

Address offset: 0x028

Reset value: 0bXXXX XXXX XXXX XXXX XXX0 0011 1111 1111

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	CPUID	PENDINTID[9:0]									
					r	r	r	r	r	r	r	r	r	r	r

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

If HW is set to 1 in GICH_LRx (indicating an hardware interrupt), a deactivate request is sent to the physical distributor, identifying the physical ID from the corresponding field in the list register.

Bits 9:0 **PENDINTID[9:0]**:

This bitfield contains the virtual interrupt ID of the highest-priority pending virtual interrupt, if that virtual interrupt is a group 1 virtual interrupt.

Otherwise, it contains the spurious virtual interrupt ID (1023).

28.8.12 GICV VM active priority register (GICV_APR0)

Address offset: 0x0D0

Reset value: 0x0000 0000

This register is an alias of GICH_APR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
APR0[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
APR0[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **APR0[31:0]:** Active priority

28.8.13 GICV VM CPU interface identification register (GICV_IIDR)

Address offset: 0x0FC

Reset value: 0x0202 143B

This register is an alias of GICC_IIDR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IIDR[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

IIDR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **IIDR[31:0]:** see GICC_IIDR description

28.8.14 GICV VM deactivate interrupt register (GICV_DIR)

Address offset: 0x1000

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	CPUID	INTERRUPT_ID[9:0]									
					w	w	w	w	w	w	w	w	w	w	w

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **CPUID**:

This bit identifies the processor core that requested the interrupt.

Bits 9:0 **INTERRUPT_ID[9:0]**: Interrupt ID

28.8.15 GICV register map

Table 192. GICV register map and reset values

Refer to *Section 2.4* for the register boundary addresses.

29 Extended interrupts and event controller (EXTI)

The extended interrupts and event controller (EXTI) manages the individual CPU and system wake-up through configurable and direct event inputs. It provides wake-up requests to the power control, and generates a combined secure/non-secure interrupt request to the CPUs NVIC and events to the CPUs event input. For each CPU, an additional event generation block (EVG) is needed to generate the CPU event signal.

EXTI1 and EXTI2 wake-up requests allow the system to be woken up from Stop modes, and the CPU to be woken up from CStop and CStandby modes.

The interrupt request and event request generation can also be used in Run modes.

EXTI1 and EXTI2 include the EXTI mux I/O port selection.

EXTI1: CPU1 = Cortex-A35 and CPU2 = Cortex-M33

EXTI2: CPU1 = Cortex-A35 and CPU2 = Cortex-M33

29.1 EXTI main features

The EXTI main features are the following:

- EXTI1 85, and EXTI2 64 input events supported
- EXTI1 and EXTI2 two CPUs supported
- Most event inputs allow to wake up the system.
- Some events can only be used to generate a CPU wake-up.
- Events which do not have an associated wake-up flag in the peripheral, have a flag in the EXTI, and generate a combined secure/non-secure interrupt to the CPUs from the EXTI.
- Events can be used to generate a CPU wake-up event.

The asynchronous event inputs are classified in two groups:

- configurable events (signals from I/Os or peripherals able to generate a pulse)

  These events have the following features:
  - Selectable active trigger edge
  - Interrupt pending status register bits independent for the rising and falling edge
  - Individual interrupt and event generation mask, used to condition the CPU wake-up, interrupt and event generation
  - Individual interrupt lines per CPU
  - Software trigger possibility

- direct events (interrupt and wake-up sources from peripherals having an associated flag which requires to be cleared in the peripheral)

  These events have the following features:
  - Fixed rising edge active trigger
  - No interrupt pending status register bit in the EXTI (the interrupt pending status flag is provided by the peripheral generating the event)
  - Individual interrupt and event generation mask, used to condition the CPU wake-up and event generation
  - No software trigger possibility
- Secure events
  - The access to control and configuration bits of secure input events can be made secure and or privilege.
- Resource isolation support
  - Support for CID resource identification per CPU, protecting any resource (register) from access by an other resource
- EXTI I/O port selection

29.2 EXTI implementation

Table 193. EXTI implementation

EXTI features(1)	EXTI1	EXTI2
EXTI I/O port selection	X	X
EXTI I/O port to interconnect other peripherals	X	X
Number of events	85	64
Number of CPUs	2	2
Security	X	X

1. X = supported.

29.3 EXTI block diagram

The EXTI consists of the following blocks (see *Figure 158*):

- register block accessed via an AHB interface, which contains all the EXTI registers
- event input trigger block which provides event input edge trigger logic
- masking block which provides the event input distribution to the different wake-up, interrupts, and event outputs, plus the masking of these
- EXTI mux which provides the I/O port selection on to the EXTI event signal

Figure 158. EXTI block diagram

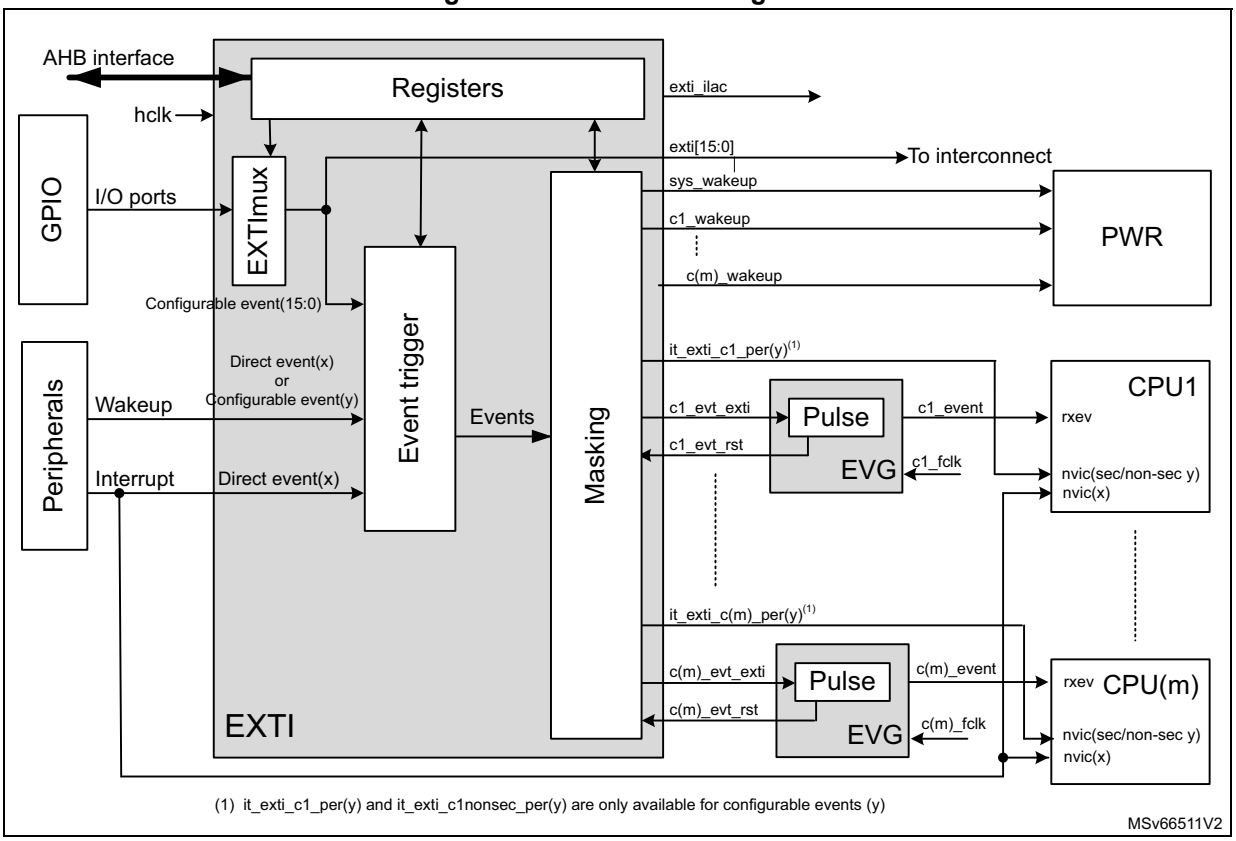

Table 194. EXTI signals

Name	I/O	Description
AHB interface	I/O	EXTI register bus interface. When one event is configured to allow security, the AHB interface support secure accesses.
hclk	I	AHB bus clock and EXTI system clock.
exti_ilac	O	Illegal access event
Configurable event(y)	I	Asynchronous wake-up events from peripherals which do not have an associated interrupt and flag in the peripheral.
Direct event(x)	I	Synchronous and Asynchronous wake-up events from peripherals which have an associated interrupt and flag in the peripheral.
I/O ports	I	GPIO I/O ports[15:0]
exti[15:0]	O	EXTI GPIO output port to trigger other peripherals (only available for EXTI2)
it_exti_c(m)_per(y)	O	Combined secure/non-secure Interrupts to the CPU1 and CPU(m) associated with Configurable event (y)
c(m)_evt_exti	O	High-level sensitive event output for CPU(m) synchronous to hclk (EXTI1: m = 2, EXTI2: m = 2)
c(m)_evt_rst	I	Asynchronous reset input to clear c(m)_evt_exti (EXTI1: m = 2, EXTI2: m = 2)

Table 194. EXTI signals (continued)

Name	I/O	Description
sys_wakeup	O	Asynchronous system wake-up request to PWR for ck_sys and hclk
c(m)_wakeup	O	Wake-up request to PWR for CPU(m), synchronous to hclk (EXTI1: m = 1 to 2, EXTI2: m = 1 to 2)

Table 195. EVG signals

Name	I/O	Description
c_fclk	I	CPU free running clock.
c_evt_in	I	High-level sensitive events input from EXTI, asynchronous to CPU clock.
c_event	O	Event pulse, synchronous to CPU clock.
c_evt_rst	O	Event reset signal, synchronous to CPU clock.

29.3.1 EXTI connections between peripherals and CPU

Peripherals able to generate wake-up or interrupt events when the system is in Stop mode or a CPU is in CStop mode, are connected to the EXTI.

Peripheral wake-up signals that generate a pulse, or which do not have an interrupt status bits in the peripheral, are connected to an EXTI configurable event input. For these events, the EXTI provides a status pending bit which requires to be cleared. It is the EXTI interrupt associated with the status bit that interrupts the CPU.

Peripheral interrupt and wake-up signals that have a status bit in the peripheral which requires to be cleared in the peripheral, are connected to an EXTI direct event input. There is no status pending bit within the EXTI. The interrupt or wake-up is cleared by the CPU in the peripheral. It is the peripheral interrupt that interrupts the CPU directly.

All GPIO ports are inputs for the EXTI multiplexer and used to select a port pin to wake up the system via a configurable event.

EXTI configurable event interrupts are connected to the respective NVIC of each CPU. A secure CPU receives both its secure and non-secure interrupts on the combined secure/non-secure it_exti_c(m)_per(y) interrupt signal. A non-secure CPU only receives its non-secure interrupts on the it_exti_c(m)_per(y) interrupt signal. Each CPU has its dedicated individual interrupt signal, which allows interrupt masking per CPU based on the EXTI_CmIMR settings.

The dedicated EXTI/EVG CPU event is connected to the respective CPU rxev input.

EXTI CPU wake-up signals are connected to the PWR, and are used to wake up the system and CPU subsystem bus clocks.

29.3.2 EXTI1 wake-up interrupt list

The wake-up sources are listed in the table below.

Some wake-up sources are able to generate an event to the CPU (see event column). The wake-up source capability to wake up a CPU is noted in wake-up column.

For CPU interrupt handling, see *Section 27: Nested vectored interrupt controller (NVIC)*.

Table 196. EXTI1 wake-up interrupts

29.4 EXTI functional description

Depending on the EXTI event input type and wake-up targets, different logic implementations are used. The applicable features are controlled from register bits:

Table 198. EXTI event input configurations and register control

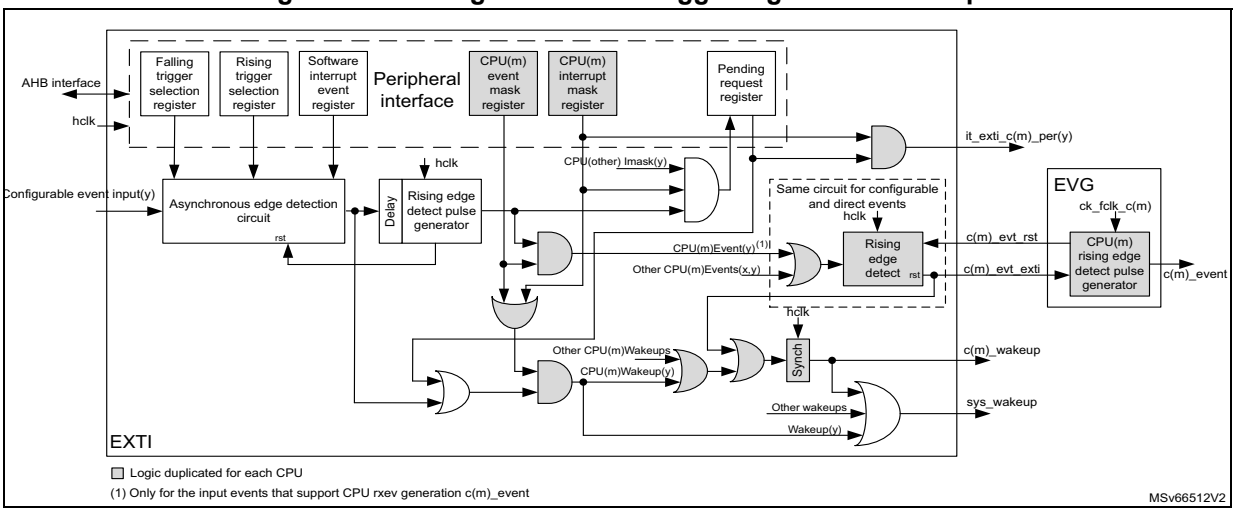
Event input type	Logic implementation	EXTI_RTSR	EXTI_FTSR	EXTI_SWIER	EXTI_RPR	EXTI_FPR	EXTI_SECCFGR	EXTI_PRIVCFGR	EXTI_CmIMR	EXTI_CmEMR(1)
Configurable	Configurable event input wake-up logic	x	x	x	x	x	x	x	x	x
Direct	Direct event input wake-up logic	-	-	-	-	-	x	x	x	x

1. Only for input events with configuration “rxev generation” enabled.

29.4.1 EXTI configurable event input wake-up

The figure below is a detailed representation of the logic associated with configurable event inputs which wake up the CPU(m) sub-system bus clocks and generate an EXTI pending flag and combined secure/non-secure interrupt to the CPU(m) and or a CPU(m) wake-up event.

Figure 159. Configurable event trigger logic CPU wake-up



The software interrupt event register is used to trigger configurable events by software, writing the corresponding register bit, irrespective of the edge selection setting.

The rising edge and falling edge selection registers are used to enable and to select the configurable event active trigger edge or both edges.

Each CPU has its dedicated wake-up (interrupt) mask register and a dedicated event mask register. The enabled event is used to generate an event on the CPU. All events for a CPU are ORed together into a single CPU event signal. The event pending registers (EXTI_RPR and EXTI_FPR) are not set for an unmasked CPU event.

The configurable events have unique interrupt pending request register bits, shared by the CPUs. The pending register is only set for an unmasked interrupt. Each configurable event provides dedicated combined secure/non-secure interrupts to all CPUs. The configurable event interrupts need to be acknowledged by software in EXTI_RPR and/or EXTI_FPR.

When a CPU(m) wake-up (interrupt) or CPU(m) event is enabled, the asynchronous edge detection circuit is reset by the clocked delay and rising edge detect pulse generator. This guarantees that the EXTI hclk clock is woken up before the asynchronous edge detection circuit is reset.

Note: A detected configurable event interrupt pending request can be cleared by any CPU with the correct access permission. The system is not able to enter into low-power modes as long as an interrupt pending request is active.

29.4.2 EXTI direct event input wake-up

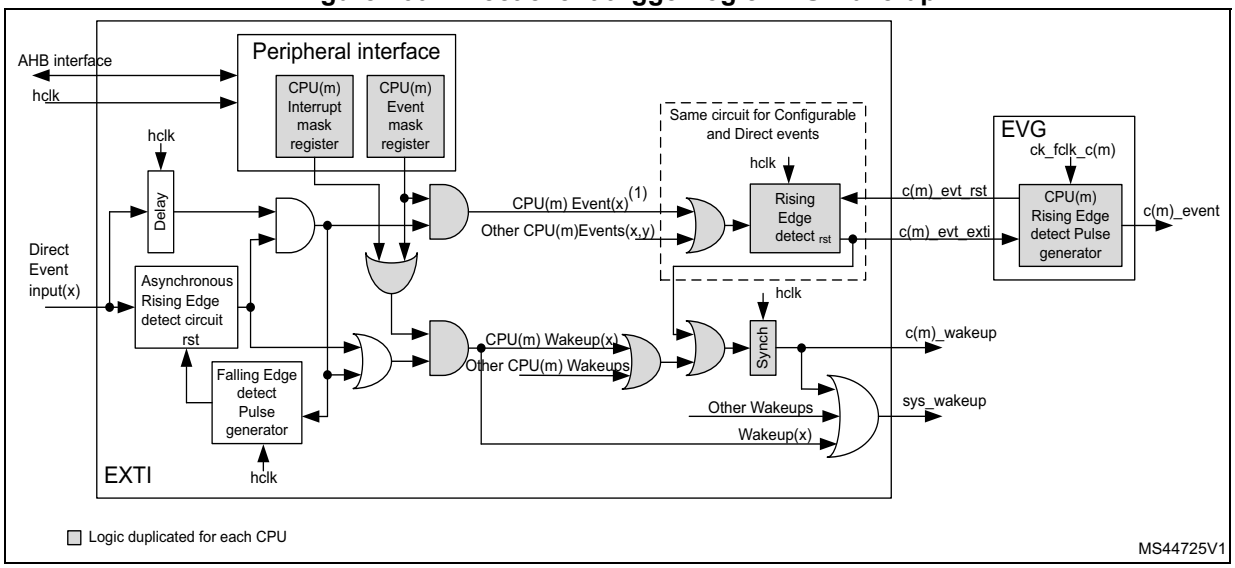
Figure 160 is a detailed representation of the logic associated with direct event inputs that wake up the system.

The direct events do not have an associated EXTI interrupt. The EXTI only wakes up the system and CPU subsystem clocks, and can generate a CPU wake-up event. The peripheral synchronous interrupt, associated with the direct wake-up event, wakes up the CPU.

The EXTI direct event is able to generate a CPU event that wakes up the CPU. The CPU event may occur before the associated peripheral interrupt flag is set.

Note: The direct events are cleared in the peripheral generating the event. When a direct event input enabled by CPU(m) is cleared by an other CPU before the CPU(m) clock is running, the CPU(m) no longer receives a CPU(m) interrupt nor CPU(m) event. The CPU(m) does not wake up. The system stays in Run mode, and generates the CPU(m) clock. For this reason, CPU(m) direct events must NOT be cleared by an other CPU.

Figure 160. Direct event trigger logic CPU wake-up

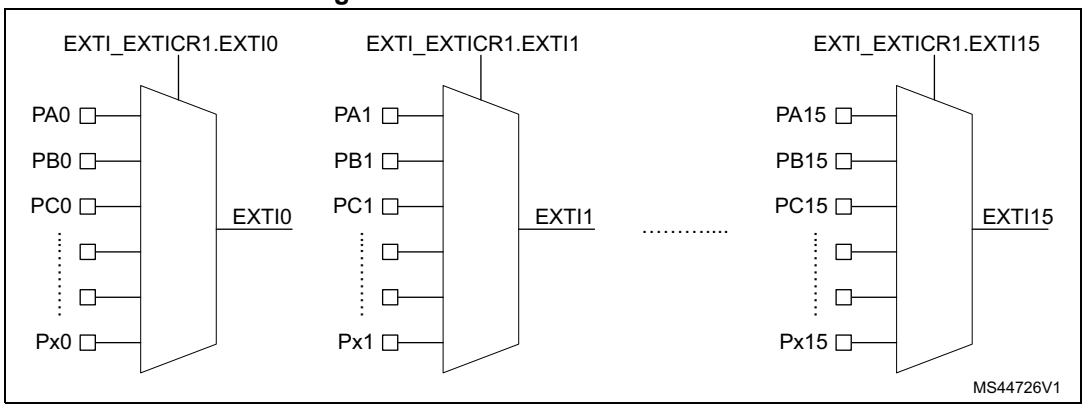


1. Only for the input events that support CPU rxev generation c(m)_event.

29.4.3 EXTI multiplexer selection

The EXTI multiplexer selection is available on EXTI1 and EXTI2. It is used to select GPIOs as interrupts and wake-up. The GPIOs are connected via 16 EXTI multiplexers to the first 16 EXTI events as configurable event. The selection of GPIO port as EXTI multiplexer output, is controlled by EXTIn_EXTICRx (x = 1 to 4).

Figure 161. EXTI mux GPIO selection



Only the EXTI mux outputs from EXTI2 are available as output signals to trigger other peripherals. The EXTI mux outputs are available independently from any masking in EXTI2_CmIMR1 and EXTI2_CmEMR1.

29.5 EXTI functional behavior

The direct event inputs are enabled in the respective peripheral generating the wake-up event. The configurable events are enabled by enabling at least one of the trigger edges.

Once an event input is enabled, the generation of a CPU(m) wake-up is conditioned by the CPU(m) interrupt mask and CPU(m) event mask.

Table 199. Masking functionality

CPU interrupt enable EXTI_CmIMR.IMn	CPU event enable EXTI_CmEMR.EMn	Configurable event inputs EXTI_RPR.RPIFn EXTI_FPR.FPIFn	exti(n) interrupt(1)	CPU(m) event	CPU(m) wake-up
0 for all CPUs	0	No	Masked	Masked	Masked
	1	No	Masked	Yes	Yes
1 for any CPU	0	Status latched	Yes	Masked	Yes(2)
	1	Status latched	Yes	Yes	Yes

1. The CPU dedicated exti(n), combined secure/non-secure interrupts, goes to each CPUs. If no interrupt is required for CPU(m), the exti(n) interrupt must be masked in EXTI_CmIMR.
2. Only if CPU(m) interrupt is enabled in EXTI_CmIMR.IMn.

For configurable event inputs, when the enabled edges occur on the event input, an event request is generated. When the associated CPU(m) interrupt is unmasked, the corresponding pending bit(s) EXTI_RPR.RPIFn and/or EXTI_FPR.FPIFn is/are set and

the CPU(m) subsystem is woken up, and the CPU combined secure/non-secure interrupt signal is activated. EXTI_RPR.RPIFn and/or EXTI_FPR.FPIFn pending bit(s) must be cleared by software (writing them to 1). This clears the CPU interrupt. An interrupt is only generated, on the CPU dedicated interrupt line, when it is enabled in the CPU associated EXTI_CmIMR register.

For direct event inputs, when enabled in the associated peripheral, an event request is generated on the rising edge only. There is no corresponding CPU pending bit in the EXTI. When the associated CPU(m) interrupt is unmasked, the corresponding CPU subsystem is woken up. The CPU is woken up (interrupted) by the peripheral synchronous interrupt.

The CPU(m) event must be unmasked to generate an event. When the enabled edge(s) occur(s) on the event input, a CPU(m) event pulse is generated. There is no event pending bit.

For the configurable event inputs, an event request can be generated by software when writing 1 in EXTI_SWIER. This generates a rising edge on the event. The rising edge event pending bit is set in EXTI_RPR, whatever the setting in EXTI_RTSR.

29.6 EXTI event protection

The EXTI is able to protect event register bits from being modified by non-secure and unprivileged accesses. The protection can individually be activated per input event, via EXTI_SECCFGRx and EXTI_PRIVCFGRx. At EXTI level, the protection consists in preventing unauthorized write access to do the foollowing:

- Change settings of secure configurable events.
- Change masking of secure input events.
- Clear pending status of secure input events.

Note: The EXTI does not differentiate protected accesses from individual CPUs. When there is no CID resource isolation, then any CPU secure access can modify the protected register bits.

Table 200. Register protection overview

Register name	Access type	Security(1)(2)(3)(4)
EXTI_RTSRx	RW	Secure and privileged can be enabled bit-wise in EXTI_SECCFGRx and EXTI_PRIVCFGRx, and CID filtering in EXTI_EnCIDCFGR.
EXTI_FTSRx	RW	
EXTI_SWIERx	RW	
EXTI_RPRx	RW	
EXTI_FPRx	RW	
EXTI_SECCFGRx	RW	Always secure and privileged, and CID filtering can bit wise be enabled in EXTI_EnCIDCFGR.
EXTI_PRIVCFGRx	RW	Always privileged, and secure can be enabled bit-wise in EXTI_SECCFGRx, and CID filtering in EXTI_EnCIDCFGR
EXTI_EXTICRx	RW	Secure and privileged can be enabled bit-wise in EXTI_SECCFGRx and EXTI_PRIVCFGRx, and CID filtering in EXTI_EnCIDCFGR.
EXTI_LOCKR	RW	Always secure and privileged trusted domain CID

Table 200. Register protection overview (continued)

Register name	Access type	Security[1][2][3][4]
EXTI_CmIMRx	RW	Secure and privilege can be enabled bit-wise in EXTI_SECCFGRx and EXTI_PRIVCFGRx, and CID filtering in EXTI_EnCIDCFGR. CPU(m) CID filtering is enabled on a register basis in EXTI_CmCIDCFGR.
EXTI_CmEMRx	RW	
EXTI_EnCIDCFGR	RW	Always secure and privileged trusted domain CID
EXTI_CmCIDCFGR	RW	Always secure and privileged trusted domain CID
EXTI_HWCFGRx	R	Non-secure unprivileged, no CID filtering.
EXTI_VER	R	
EXTI_ID	R	
EXTI_SID	R	

1. Security is enabled with EXTI_SECCFGRx registers.
2. Privilege is enabled with EXTI_PRIVCFGRx registers.
3. Resource compartment filtering is enabled with EXTI_EnCIDCFGR registers.
4. CPU(m) compartment filtering is enabled with EXTI_CmCIDCFGR registers.

29.6.1 EXTI register security protection

When security is enabled for an input event, the associated input event configuration and the control bits can only be modified and read by a secure access, a non-secure write access is discarded and a read returns 0.

When input events are non-secure, the security is disabled. The associated input event configuration and control bits can be modified and read by a secure access and non-secure access.

The security configuration in registers EXTI_SECCFGRx can be globally locked after reset by EXTI_LOCKR.GLOCK.

29.6.2 EXTI register privilege protection

When the privilege is enabled for an input event, the associated input event configuration and control bits can only be modified and read by a privilege access, an unprivileged write access is discarded and a read returns 0.

When input events are unprivileged, the privilege is disabled. The associated input event configuration and control bits can be modified and read by a privilege access and unprivileged access.

The privilege configuration in EXTI_PRIVCFGRx can be globally locked after reset by GLOCK in EXTI_LOCKR.

29.6.3 EXTI register CID protection

When the CID resource isolation is enabled for an input event, the associated input event configuration and control bits can only be modified and read by the assigned CID resource. Other CID resource write access is discarded, and a read returns 0.

When input events have no CID resource isolation, the CID filtering is disabled. Associated input event configuration and control bits can be modified and read by any access.

When the CPU CID resource isolation is enabled for a CPU, the associated CPU registers can only be modified and read by the assigned CID resource. Other CID resource write access is discarded, and a read returns 0.

When a CPU has no CID resource isolation, the CID filtering is disabled. The associated CPU registers can be modified and read by any access.

Table 201. Register protection hierarchy overview

TDCID filtered	CPU(m) CID filtered
EXTI_CmCIDCFGR = CPU(m) CID	EXTI_CmIMRn global register access
	EXTI_CmEMRn global register access
EXTI_EnCIDCFGR = CPU(m) CID	EXTI_RTSRn bit wise access filtering
	EXTI_FTSRn bit wise access filtering
	EXTI_SWIERn bit wise access filtering
	EXTI_RPRn bit wise access filtering
	EXTI_FPRn bit wise access filtering
	EXTI_SECCFGRn bit wise access filtering
	EXTI_PRIVCFGRn bit wise access filtering
	EXTI_CmIMRn bit wise access filtering
	EXTI_CmEMRn bit wise access filtering
	EXTI_EXTICRx bit filed wise access filtering

The security configuration in EXTI_EnCIDCFGRx and EXTI_CmCIDCFGR can be globally locked after reset by GLOCK in EXTI_LOCKR.

29.7 EXTIx registers

The EXTIx register map is divided in sections listed in the table below.

Table 202. EXTIx register map sections

Address offset	Description
0x000 - 0x01C	General configurable event [31:0] configuration
0x020 - 0x03C	General configurable event [63:32] configuration
0x040 - 0x05C	General configurable event [95:64] configuration
0x060 - 0x06C	EXTI I/O port mux selection
0x070	EXTI protection lock configuration
0x080 - 0x0BC	CPU1 input event configuration
0x0C0 - 0x0FC	CPU2 input event configuration
0x180 - 0x2FC	Event input CID filtering configuration
0x300 - 0x30C	CPU CID filtering configuration

All registers can be accessed with word (32-bit), half-word (16-bit), and byte (8-bit) access.

For any DDCID access to registers, security and privileged policy applies. When DDEN = 0, accesses from the DDCID to CID filtered registers are ignored. When DDEN = 1, the DDCID has access to all registers regardless of any CID filtering policy.

29.7.1 EXTI1 rising trigger selection register (EXTI1_RTSR1)

Address offset: 0x000

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RT17	RT16
														rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RT15	RT14	RT13	RT12	RT11	RT10	RT9	RT8	RT7	RT6	RT5	RT4	RT3	RT2	RT1	RT0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:0 **RTx:** Rising trigger event configuration bit of configurable event input x (x = 17 to 0)

0: Rising trigger disabled (for event and interrupt) for input line

1: Rising trigger enabled (for event and interrupt) for input line

When SECx is disabled in EXTI1_SECCFGR1, RTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR1, RTx can only be accessed with secure access. Non-secure write to RTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR1, RTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR1, RTx can only be accessed with privileged access. Unprivileged write to RTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, RTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, RTx can only be accessed by the allowed processor CID. Illegal CID write to RTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a rising edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

29.7.2 EXTI1 falling trigger selection register (EXTI1_FTSR1)

Address offset: 0x004

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FT17	FT16
														rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FT15	FT14	FT13	FT12	FT11	FT10	FT9	FT8	FT7	FT6	FT5	FT4	FT3	FT2	FT1	FT0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:0 **FTx:** Falling trigger event configuration bit of configurable event input x (x = 17 to 0)

0: Falling trigger disabled (for event and interrupt) for input line

1: Falling trigger enabled (for event and interrupt) for input line.

When SECx is disabled in EXTI1_SECCFGR1, FTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR1, FTx can only be accessed with secure access. Non-secure write to FTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR1, FTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR1, FTx can only be accessed with privileged access. Unprivileged write to FTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, FTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, FTx can only be accessed by the allowed processor CID. Dis allowed CID CID write to FTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a falling edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

29.7.3 EXTI1 software interrupt event register (EXTI1_SWIER1)

Address offset: 0x008

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWI17	SWI16
														rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SWI15	SWI14	SWI13	SWI12	SWI11	SWI10	SWI9	SWI8	SWI7	SWI6	SWI5	SWI4	SWI3	SWI2	SWI1	SWI0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:0 **SWIx:** Software interrupt on event x (x = 17 to 0)

0: Writing 0 has no effect.

1: Writing 1 to this bit triggers a rising edge event on event x (bit auto cleared by hardware).

When SECx is disabled in EXTI1_SECCFGR1, SWIx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR1, SWIx can only be accessed with secure access. Non-secure write to SWIx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR1,SWIx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR1,SWIx can only be accessed with privileged access. Unprivileged write to SWIx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, SWIx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, SWIx can only be accessed by the allowed processor CID. Dis allowed CID write to SWIx is discarded and read returns 0.

A software interrupt is generated whatever the setting in EXTI1_RTSR and EXTI1_FTSR. It always returns 0 when read.

29.7.4 EXTI1 rising edge pending register (EXTI1_RPR1)

Address offset: 0x00C

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RPIF17	RPIF16
														rc_w1	rc_w1
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RPIF15	RPIF14	RPIF13	RPIF12	RPIF11	RPIF10	RPIF9	RPIF8	RPIF7	RPIF6	RPIF5	RPIF4	RPIF3	RPIF2	RPIF1	RPIF0
rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:0 **RPIFx:** Configurable event input x rising edge pending bit (x = 17 to 0)

This bit is set when the selected rising edge event or an EXTI1_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No rising edge trigger request occurred

1: Rising edge trigger request occurred

When SECx is disabled in EXTI1_SECCFGR1, RPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR1, RPIFx can only be accessed with secure access. Non-secure write to RPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR1, RPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR1, RPIFx can only be accessed with privileged access. Unprivileged write to RPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, RPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, RPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to RPIFx is discarded, and read returns 0.

29.7.5 EXTI1 falling edge pending register (EXTI1_FPR1)

Address offset: 0x010

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FPIF17	FPIF16
														rc_w1	rc_w1
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FPIF15	FPIF14	FPIF13	FPIF12	FPIF11	FPIF10	FPIF9	FPIF8	FPIF7	FPIF6	FPIF5	FPIF4	FPIF3	FPIF2	FPIF1	FPIF0
rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:0 **FPIFx:** configurable event input x falling edge pending bit (x = 17 to 0)

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into this bit.

0: No falling edge trigger request occurred

1: Falling edge trigger request occurred

When SECx is disabled in EXTI1_SECCFGR1, FPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR1, FPIFx can only be accessed with secure access. Non-secure write to FPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR1, FPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR1, FPIFx can only be accessed with privileged access. Unprivileged write to FPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, FPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, FPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to FPIFx is discarded, and read returns 0.

29.7.6 EXTI1 security configuration register (EXTI1_SECCFGR1)

Address offset: 0x014

Reset value: 0x0000 0000

This register provides write access security and privilege. A non-secure or unprivileged write access is ignored, and causes the generation of an secure illegal access event. All read return the register data.

Write to this register is ignored if GLOCK is enabled in EXTI1_LOCKR.

This register contains only bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SEC31	SEC30	SEC29	SEC28	SEC27	SEC26	Res.	Res.	SEC23	SEC22	SEC21	Res.	SEC19	SEC18	SEC17	SEC16
rw	rw	rw	rw	rw	rw			rw	rw	rw		rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SEC15	SEC14	SEC13	SEC12	SEC11	SEC10	SEC9	SEC8	SEC7	SEC6	SEC5	SEC4	SEC3	SEC2	SEC1	SEC0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 **SECx:** Security enable on event input x (x = 31 to 26)
0: Event security disabled (non-secure)
1: Event security enabled (secure)
When CID filtering is disabled in EXTI1_ExCIDCFGR, SECx can be accessed by any processor CID.
When CID filtering is enabled in EXTI1_ExCIDCFGR, SECx can only be accessed by the allowed processor CID. Dis allowed CID write to SECx is discarded and read returns 0.

Bits 25:24 Reserved, must be kept at reset value.

Bits 23:21 **SECx:** Security enable on event input x (x = 23 to 21)

Bit 20 Reserved, must be kept at reset value.

Bits 19:0 **SECx:** Security enable on event input x (x = 19 to 0)

29.7.7 EXTI1 privilege configuration register (EXTI1_PRIVCFGR1)

Address offset: 0x018

Reset value: 0x0000 0000

This register provides privileged write access protection. An unprivileged write access is discarded, and causes the generation of a privilege illegal access event. An unprivileged read returns the register data.

Write to this register are ignored if GLOCK is enabled in EXTI1_LOCKR.

This register contains only bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
PRIV31	PRIV30	PRIV29	PRIV28	PRIV27	PRIV26	Res.	Res.	PRIV23	PRIV22	PRIV21	Res.	PRIV19	PRIV18	PRIV17	PRIV16
rw	rw	rw	rw	rw	rw			rw	rw	rw		rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PRIV15	PRIV14	PRIV13	PRIV12	PRIV11	PRIV10	PRIV9	PRIV8	PRIV7	PRIV6	PRIV5	PRIV4	PRIV3	PRIV2	PRIV1	PRIV0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 **PRIVx:** Privilege enable on event input x (x = 31 to 26)
0: Event privilege disabled (unprivileged)
1: Event privilege enabled (privileged)
When SECx is disabled in EXTI1_SECCFGR1, PRIVx can be accessed with secure and non-secure access.
When SECx is enabled in EXTI1_SECCFGR1, PRIVx can only be written with secure access. Non-secure write to PRIVx is discarded.
When CID filtering is disabled in EXTI1_ExCIDCFGR, PRIVx can be accessed by any processor CID.
When CID filtering is enabled in EXTI1_ExCIDCFGR, PRIVx can only be accessed by the allowed processor CID. Dis allowed CID write to PRIVx is discarded and read returns 0.

Bits 25:24 Reserved, must be kept at reset value.

Bits 23:21 **PRIVx:** Privilege enable on event input x (x = 23 to 21)

Bit 20 Reserved, must be kept at reset value.

Bits 19:0 **PRIVx:** Privilege enable on event input x (x = 19 to 0)

29.7.8 EXTI1 rising trigger selection register (EXTI1_RTSR2)

Address offset: 0x020

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	RT44	RT43	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
			rw	rw											

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:11 **RTx:** Rising trigger event configuration bit of configurable event input x (x = 44 to 43)

0: Rising trigger disabled (for event and Interrupt) for input line x

1: Rising trigger enabled (for event and Interrupt) for input line x

When SECx is disabled in EXTI1_SECCFGR2, RTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR2, RTx can only be accessed with secure access. Non-secure write to RTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR2, RTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR2, RTx can only be accessed with privileged access. Unprivileged write to RTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, RTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, RTx can only be accessed by the allowed processor CID. Illegal CID write to RTx is discarded and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a rising edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

Bits 10:0 Reserved, must be kept at reset value.

29.7.9 EXTI1 falling trigger selection register (EXTI1_FTSR2)

Address offset: 0x024

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	FT44	FT43	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
			rw	rw											

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:11 **FTx:** Falling trigger event configuration bit of configurable event input x (x = 44 to 43)

0: Falling trigger disabled (for event and Interrupt) for input line

1: Falling trigger enabled (for event and Interrupt) for input line.

When SECx is disabled in EXTI1_SECCFGR2, FTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR2, FTx can only be accessed with secure access. Non-secure write to FTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR2, FTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR2, FTx can only be accessed with privileged access. Unprivileged write to FTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, FTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, FTx can only be accessed by the allowed processor CID. Dis allowed CID write to FTx is discarded and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a falling edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

Bits 10:0 Reserved, must be kept at reset value.

29.7.10 EXTI1 software interrupt event register (EXTI1_SWIER2)

Address offset: 0x028

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	SWI44	SWI43	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
			rw	rw											

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:11 **SWIx:** Software interrupt on event x (x = 44 to 43)

0: Writing 0 has no effect.

1: Writing 1 to this bit triggers a rising edge event on event x (bit auto cleared by hardware).

When SECx is disabled in EXTI1_SECCFGR2, SWIx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR2, SWIx can only be accessed with secure access. Non-secure write to SWIx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR2, SWIx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR2, SWIx can only be accessed with privileged access. Unprivileged write to SWIx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, SWIx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, SWIx can only be accessed by the allowed processor CID. Dis allowed CID write to SWIx is discarded and read returns 0.

A software interrupt is generated whatever the setting in EXTI1_RTSR and EXTI1_FTSR. It always returns 0 when read.

Bits 10:0 Reserved, must be kept at reset value.

29.7.11 EXTI1 rising edge pending register (EXTI1_RPR2)

Address offset: 0x02C

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

			rc_w1	rc_w1											

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:11 **RPIFx:** Configurable event input x rising edge pending bit (x = 44 to 43)

This bit is set when the selected rising edge event or an EXTI1_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No rising edge trigger request occurred

1: Rising edge trigger request occurred

When SECx is disabled in EXTI1_SECCFGR2, RPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR2, RPIFx can only be accessed with secure access. Non-secure write to RPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR2, RPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR2, this bit can only be accessed with privileged access. Unprivileged write to RPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, RPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, this bit can only be accessed by the allowed processor CID. Dis allowed CID write to RPIFx is discarded and read returns 0.

Bits 10:0 Reserved, must be kept at reset value.

29.7.12 EXTI1 falling edge pending register (EXTI1_FPR2)

Address offset: 0x030

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

			rc_w1	rc_w1											

Bits 31:13 Reserved, must be kept at reset value.

Bits 12:11 **FPIFx:** Configurable event input x falling edge pending bit (x = 44 to 43)

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No falling edge trigger request occurred

1: Falling edge trigger request occurred

When SECx is disabled in EXTI1_SECCFGR2, FPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR2, FPIFx can only be accessed with secure access. Non-secure write to this FPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR2d, FPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR2, FPIFx can only be accessed with privileged access. Unprivileged write to FPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, FPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, this bit can only be accessed by the allowed processor CID. Dis allowed CID write to FPIFx is discarded and read returns 0.

Bits 10:0 Reserved, must be kept at reset value.

29.7.13 EXTI1 security enable register (EXTI1_SECCFGR2)

Address offset: 0x034

Reset value: 0x0000 0000

This register provides write access security and privilege. A non-secure or unprivileged write access is ignored, and causes the generation of an secure illegal access event. All read return the register data.

Write to this register is ignored if GLOCK is enabled in EXTI1_LOCKR.

This register contains only bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	SEC62	SEC61	SEC60	SEC59	Res.	SEC57	SEC56	SEC55	SEC54	SEC53	SEC52	Res.	Res.	Res.	SEC48

rw	rw		rw	rw		rw	rw	rw	rw	rw	rw				rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:27 **SECx:** Security enable on event input x (x = 62 to 59)
0: Event security disabled (non-secure)
1: Event security enabled (secure)
When CID filtering is disabled in EXTI1_ExCIDCFGR, SECx can be accessed by any processor CID.
When CID filtering is enabled in EXTI1_ExCIDCFGR, SECx can only be accessed by the allowed processor CID. Dis allowed CID write to SECx is discarded and read returns 0.

Bit 26 Reserved, must be kept at reset value.

Bits 25:20 **SECx:** Security enable on event input x (x = 57 to 52)

Bits 19:17 Reserved, must be kept at reset value.

Bits 16:14 **SECx:** Security enable on event input x (x = 48 to 46)

Bit 13 Reserved, must be kept at reset value.

Bits 12:11 **SECx:** Security enable on event input x (x = 44 to 43)

Bit 10 Reserved, must be kept at reset value.

Bits 9:4 **SECx:** Security enable on event input x (x = 41 to 36)

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **SEC32:** Security enable on event input 32

29.7.14 EXTI1 privilege enable register (EXTI1_PRIVCFGR2)

Address offset: 0x038

Reset value: 0x0000 0000

This register provides privilege write access protection. An unprivileged write access is discarded, and causes the generation of a privilege illegal access event. An unprivileged read returns the register data.

Write to this register is ignored if GLOCK is enabled in EXTI1_LOCKR.

This register contains only bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	PRIV62	PRIV61	PRIV60	PRIV59	Res.	PRIV57	PRIV56	PRIV55	PRIV54	PRIV53	PRIV52	Res.	Res.	Res.	PRIV48

rw	rw		rw	rw		rw	rw	rw	rw	rw	rw				rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:27 **PRIVx:** Privilege enable on event input x (x = 62 to 59)
0: Event privilege disabled (unprivileged)
1: Event privilege enabled (privileged)
When SECx is disabled in EXTI1_SECCFGR2, PRIVx can be accessed with secure and non-secure access.
When SECx is enabled in EXTI1_SECCFGR2, PRIVx can only be accessed with secure access. Non-secure write to PRIVx is discarded.
When CID filtering is disabled in EXTI1_ExCIDCFGR, PRIVx can be accessed by any processor CID.
When CID filtering is enabled in EXTI1_ExCIDCFGR, PRIVx can only be accessed by the allowed processor CID. Dis allowed CID write to PRIVx is discarded, and read returns 0.

Bit 26 Reserved, must be kept at reset value.

Bits 25:20 **PRIVx:** Privilege enable on event input x (x = 57 to 52)

Bits 19:17 Reserved, must be kept at reset value.

Bits 16:14 **PRIVx:** Privilege enable on event input x (x = 48 to 46)

Bit 13 Reserved, must be kept at reset value.

Bits 12:11 **PRIVx:** Privilege enable on event input x (x = 44 to 43)

Bit 10 Reserved, must be kept at reset value.

Bits 9:4 **PRIVx:** Privilege enable on event input x (x = 41 to 36)

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **PRIV32:** Privilege enable on event input 32

29.7.15 EXTI1 rising trigger selection register (EXTI1_RTSR3)

Address offset: 0x040

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	RT73	Res.	Res.	Res.	Res.	Res.	RT67	Res.	RT65	RT64
						rw						rw		rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **RT73:** Rising trigger event configuration bit of configurable event input 73

0: Rising trigger disabled (for event and interrupt) for input line

1: Rising trigger enabled (for event and interrupt) for input line

When SECx is disabled in EXTI1_SECCFGR3, RTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR3, RTx can only be accessed with secure access. Non-secure write to RTx is discarded. Non-secure read returns 0.

When PRIVx i disabled in EXTI1_PRIVCFGR3, RTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR3, RTx can only be accessed with privileged access. Unprivileged write to RTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, RTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, RTx can only be accessed by the allowed processor CID. Dis allowed CID write to RTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a rising edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

Bits 8:4 Reserved, must be kept at reset value.

Bit 3 **RT67:** Rising trigger event configuration bit of configurable event input 67

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **RTx:** Rising trigger event configuration bit of configurable event input x (x = 65 to 64)

29.7.16 EXTI1 falling trigger selection register (EXTI1_FTSR3)

Address offset: 0x044

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	FT73	Res.	Res.	Res.	Res.	Res.	FT67	Res.	FT65	FT64
						rw						rw		rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **FT73:** Falling trigger event configuration bit of configurable event input 73

0: Falling trigger disabled (for event and interrupt) for input line

1: Falling trigger enabled (for event and interrupt) for input line

When SECx is disabled in EXTI1_SECCFGR3, FTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR3, FTx can only be accessed with secure access. Non-secure write to FTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR3, FTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR3, FTx can only be accessed with privileged access. Unprivileged write to FTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, FTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, FTx can only be accessed by the allowed processor CID. Dis allowed CID write to FTx is discarded and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a falling edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

Bits 8:4 Reserved, must be kept at reset value.

Bit 3 **FT67:** Falling trigger event configuration bit of configurable event input 67

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **FTx:** Falling trigger event configuration bit of configurable event input x (x = 65 to 64)

29.7.17 EXTI1 software interrupt event register (EXTI1_SWIER3)

Address offset: 0x048

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	SWI73	Res.	Res.	Res.	Res.	Res.	SWI67	Res.	SWI65	SWI64
						rw						rw		rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **SWI73:** Software interrupt on event 73

0: Writing 0 has no effect.

1: Writing 1 to this bit triggers a rising edge event on event x (bit auto cleared by hardware).

When SECx is disabled in EXTI1_SECCFGR3, SWIx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR3, SWIx can only be accessed with secure access. Non-secure write to SWIx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR3, SWIx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR3, SWIx can only be accessed with privileged access. Unprivileged write to SWIx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, SWIx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, SWIx can only be accessed by the allowed processor CID. Dis allowed CID write to SWIx is discarded and read returns 0.

A software interrupt is generated whatever the setting in EXTI1_RTSR and EXTI1_FTSR. It always returns 0 when read.

Bits 8:4 Reserved, must be kept at reset value.

Bit 3 **SWI67:** Software interrupt on event 67.

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **SWIx:** Software interrupt on event x (x = 65 to 64)

29.7.18 EXTI1 rising edge pending register (EXTI1_RPR3)

Address offset: 0x04C

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

						rc_w1						rc_w1		rc_w1	rc_w1

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **RPIF73:** configurable event input 73 rising edge pending bit

This bit is set when the selected rising edge event or an EXTI1_SWIER Software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No rising edge trigger request occurred

1: Rising edge trigger request occurred

When SECx is disabled in EXTI1_SECCFGR3, RPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR3, RPIFx can only be accessed with secure access. Non-secure write to this RPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR3, RPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR3, RPIFx can only be accessed with privileged access. Unprivileged write to RPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, RPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, RPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to RPIFx is discarded and read returns 0.

Bits 8:4 Reserved, must be kept at reset value.

Bit 3 **RPIF67:** configurable event input 67 rising edge pending bit

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **RPIFx:** configurable event input x rising edge pending bit (x = 65 to 64)

29.7.19 EXTI1 falling edge pending register (EXTI1_FPR3)

Address offset: 0x050

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	FPIF73	Res.	Res.	Res.	Res.	Res.	FPIF67	Res.	FPIF65	FPIF64
						rc_w1						rc_w1		rc_w1	rc_w1

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **FPIF73:** configurable event input 73 falling edge pending bit

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No falling edge trigger request occurred

1: Falling edge trigger request occurred

When SECx is disabled in EXTI1_SECCFGR3, FPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR3, FPIFx can only be accessed with secure access. Non-secure write to FPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR3, FPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR3, FPIFx can only be accessed with privileged access. Unprivileged write to FPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, FPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, FPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to FPIFx is discarded and read returns 0.

Bits 8:4 Reserved, must be kept at reset value.

Bit 3 **FPIF67:** configurable 67 falling edge pending bit

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **FPIFx:** configurable event input x falling edge pending bit (x = 65 to 64)

29.7.20 EXTI1 security enable register (EXTI1_SECCFGR3)

Address offset: 0x054

Reset value: 0x0000 0000

This register provides write access security and privilege. A non-secure or unprivileged write access is ignored and causes the generation of an secure illegal access event. All reads return the register data.

Write to this register are ignored if GLOCK is enabled in EXTI1_LOCKR.

This register contains only bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEC82	SEC81	SEC80
													rw	rw	rw

rw	rw	rw	rw	rw	rw	rw	rw		rw		rw	rw		rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:8 **SECx:** Security enable on event input x (x = 82 to 72)
0: Event security disabled (non-secure)
1: Event security enabled (secure)
When CID filtering is disabled in EXTI1_ExCIDCFGR, SECx can be accessed by any processor CID.
When CID filtering is enabled in EXTI1_ExCIDCFGR, SECx can only be accessed by the allowed processor CID. Dis allowed CID write to SECx is discarded and read returns 0.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **SEC70:** Security enable on event input 70

Bit 5 Reserved, must be kept at reset value.

Bits 4:3 **SECx:** Security enable on event input x (x = 68 to 67)

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **SECx:** Security enable on event input x (x = 65 to 64)

29.7.21 EXTI1 privilege enable register (EXTI1_PRIVCFGR3)

Address offset: 0x058

Reset value: 0x0000 0000

This register provides privilege write access protection. An unprivileged write access is discarded and cause the generation of an privilege illegal access event. A unprivileged read returns the register data.

Write to this register are ignored if GLOCK is enabled in EXTI1_LOCKR.

This register contains only bits for security capable Input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw		rw		rw	rw		rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:8 **PRIVx:** Privilege enable on event input x (x = 82 to 72)

0: Event privilege disabled (unprivileged

1: Event privilege enabled (privileged)

When SECx is disabled in EXTI1_SECCFGR3, PRIVx can be accessed with secure and non-secure access.

When SECx is enabled in EXTI1_SECCFGR3, PRIVx can only be written with secure access. Non-secure write to PRIVx is discarded.

When CID filtering is disabled in EXTI1_ExCIDCFGR, PRIVx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, PRIVx can only be accessed by the allowed processor CID. Dis allowed CID write to PRIVx is discarded and read returns 0.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **PRIV70:** Privilege enable on event input 70

Bit 5 Reserved, must be kept at reset value.

Bits 4:3 **PRIVx:** Privilege enable on event input x (x = 68 to 67)

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **PRIVx:** Privilege enable on event input x (x = 65 to 64)

29.7.22 EXTI1 external interrupt selection register 1 (EXTI1_EXTICR1)

Address offset: 0x060

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **EXTI3[7:0]:** EXTI3 GPIO port selection

These bits are written by software to select the source input for EXTI3 external interrupt.
0x00: PA3 pin
0x01: PB3 pin
0x02: PC3 pin
0x03: PD3 pin
0x04: PE3 pin
0x05: PF3 pin
0x06: PG3 pin
0x07: PH3 pin
0x08: PI3 pin
0x09: PZ3 pin
Others: reserved

When SEC3 is disabled in EXTI1_SECCFGR1, this field can be accessed with non-secure and secure access.
When SEC3 is enabled in EXTI1_SECCFGR1, this field can only be accessed with secure access. Non-secure write is discarded. Non-secure read returns 0.
When PRIV3 is disabled in EXTI1_PRIVCFGR1, this field can be accessed with privileged and unprivileged access.
When PRIV3 is enabled in EXTI1_PRIVCFGR1, this field can only be accessed with privileged access. Unprivileged write to this field is discarded, and read returns 0.
When CID filtering in EXTI1_E3CIDCFGR is disabled, this field can be accessed by any processor CID.
When CID filtering in EXTI1_E3CIDCFGR is enabled, this field can only be accessed by the allowed processor CID. Dis allowed CID write to this field is discarded, and read returns 0.

Bits 23:16 **EXTI2[7:0]:** EXTI2 GPIO port selection

These bits are written by software to select the source input for EXTI2 external interrupt.
0x00: PA2 pin
0x01: PB2 pin
0x02: PC2 pin
0x03: PD2 pin
0x04: PE2 pin
0x05: PF2 pin
0x06: PG2 pin
0x07: PH2 pin
0x08: PI2 pin
0x09: PZ2 pin
Others: reserved

When SEC2 is disabled in EXTI1_SECCFGR1, this field can be accessed with non-secure and secure access.
When SEC2 is enabled in EXTI1_SECCFGR1, this field can only be accessed with secure access. Non-secure write is discarded, non-secure read returns 0.
When PRIV2 is disabled in EXTI1_PRIVCFGR1, this field can be accessed with privileged and unprivileged access.
When PRIV2 is enabled in EXTI1_PRIVCFGR1, this field can only be accessed with privileged access. Unprivileged write to this field is discarded and read returns 0.
When CID filtering in EXTI1_E2CIDCFGR is disabled, this field can be accessed by any processor CID.
When CID filtering in EXTI1_E2CIDCFGR is enabled, this field can only be accessed by the allowed processor CID. Dis allowed CID write to this field is discarded and read returns 0.

Bits 15:8 **EXTI1[7:0]:** EXTI1 GPIO port selection

These bits are written by software to select the source input for EXTI1 external interrupt.
0x00: PA1 pin
0x01: PB1 pin
0x02: PC1 pin
0x03: PD1 pin
0x04: PE1 pin
0x05: PF1 pin
0x06: PG1 pin

When SEC12 is enabled in EXTI1_SECCFGR1, this field can only be accessed with secure access. Non-secure write is discarded, non-secure read returns 0.
When PRIV12 is disabled in EXTI1_PRIVCFGR1, this field can be accessed with privileged and unprivileged access.
When PRIV12 is enabled in EXTI1_PRIVCFGR1, this field can only be accessed with privileged access. Unprivileged write to this field is discarded and read returns 0.
When CID filtering in EXTI1_E12CIDCFGR is disabled, this field can be accessed by any processor CID.
When CID filtering in EXTI1_E12CIDCFGR is enabled, this field can only be accessed by the allowed processor CID. Dis allowed CID write to this field is discarded and read returns 0.

29.7.26 EXTI1 lock register (EXTI1_LOCKR)

Address offset: 0x070

Reset value: 0x0000 0000

This register can only be written by the secure, privileged, trusted domain CID. A write access from any other protection level or domain CID is discarded and any read returns zero value. Both illegal write and read access generate an illegal access event.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GLOCK
															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **GLOCK:** Global security privilege and CID configuration registers EXTI1_SECCFGRx, EXTI1_PRIVCFGRx,EXTI1_EnCIDCFGR and EXTI1_CmCIDCFGR lock.

This bit is written once after reset.
0: Security, privilege, and CID configuration open can be modified.
1: Security, privilege, and CID configuration locked can no longer be modified.

29.7.27 EXTI1 CPUm wake-up with interrupt mask register (EXTI1_CmIMR1) (m = 1 to 2)

Address offset: Block 1: 0x080

Address offset: Block 2: 0x0C0

Reset value: 0x0000 0000

This register contains only bits for configurable events and direct events.

This register has CID resource protection, and can only be accessed by the allowed CID as defined in EXTI1_CmCIDCFGR. An illegal CID write access is discarded, and a read access return zero data, also on both illegal accesses an CID illegal access event is generated.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 31 to 26)

0: Wake-up and interrupt CPU(m) from input event x is masked.

1: Wake-up and interrupt CPU(m) from input event x is unmasked. CPU(m) wake-up event and configurable event interrupt generated.

When SECx is disabled in EXTI1_SECCFGR1, IMx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR1, IMx can only be accessed with secure access. Non-secure write to IMx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR1, IMx can be accessed with privileged and unprivileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR1, IMx can only be accessed with privileged access. Unprivileged write to IMx is discarded, and read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR IMx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR IMx can only be accessed by the allowed processor CID. Dis allowed CID write to IMx is discarded and read returns 0.

Bits 25:24 Reserved, must be kept at reset value.

Bits 23:21 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 23 to 21)

Bit 20 Reserved, must be kept at reset value.

Bits 19:0 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 19 to 0)

29.7.28 EXTI1 CPU2 wake-up with event mask register (EXTI1_C2EMR1)

Address offset: 0x0C4

Reset value: 0x0000 0000

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI1_C2CIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **EMx:** CPU2 wake-up with event on event input x (x = 15 to 0)

0: Wake-up with event request from line x is masked.

1: Wake-up with event request from line x is unmasked.

When SECx is disabled in EXTI1_SECCFGR1, EMx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI1_SECCFGR1, EMx can only be accessed with secure access. Non-secure write to EMx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI1_PRIVCFGR1, EMx can be accessed with privileged and unprivileged access.

When PRIVx is enabled in EXTI1_PRIVCFGR1, EMx can only be accessed with privileged access. Unprivileged write to EMx is discarded, and read returns 0.

When CID filtering is disabled in EXTI1_ExCIDCFGR, EMx can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_ExCIDCFGR, EMx can only be accessed by the allowed processor CID. Disallowed CID write to EMx is discarded, and read returns 0.

29.7.29 EXTI1 CPUm wake-up with interrupt mask register (EXTI1_CmIMR2) (m = 1 to 2)

Address offset: Block 1: 0x090

Address offset: Block 2: 0x0D0

Reset value: 0x0000 0000

This register contains only bits for configurable events and direct events.

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI1_CmCIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

Bits 18:8 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 82 to 72)
0: Wake-up and interrupt CPU(m) from input event x is masked
1: Wake-up and interrupt CPU(m) from input event x is unmasked. CPU(m) wake-up event and configurable event interrupt generated.
When SECx is disabled in EXTI1_SECCFGR3, IMx can be accessed with non-secure and secure access.
When SECx is enabled in EXTI1_SECCFGR3, IMx can only be accessed with secure access. Non-secure write to IMx is discarded. Non-secure read returns 0.
When PRIVx is disabled in EXTI1_PRIVCFGR3, IMx can be accessed with privileged and unprivileged access.
When PRIVx is enabled EXTI1_PRIVCFGR3, IMx can only be accessed with privileged access. Unprivileged write to IMx is discarded and read returns 0.
When CID filtering is disabled in EXTI1_ExCIDCFGR, IMx can be accessed by any processor CID.
When CID filtering is enabled in EXTI1_ExCIDCFGR, IMx can only be accessed by the allowed processor CID. Dis allowed CID write to IMx is discarded, and read returns 0.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **IM70:** CPUm wake-up with interrupt mask on event input 70.

Bit 5 Reserved, must be kept at reset value.

Bits 4:3 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 68 to 67)

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 65 to 64)

29.7.31 EXTI1 CPU2 wake-up with event mask register (EXTI1_C2EMR3)

Address offset: 0x0E4

Reset value: 0x0000 0000

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI1_C2CIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EM65	Res.
														rw	

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **EM65:** CPU2 wake-up with event mask on event input 65

0: Wake-up with event request from line 65 is masked.

1: Wake-up with event request from line 65 is unmasked.

When SEC65 is disabled in EXTI1_SECCFGR3, EM65 can be accessed with non-secure and secure access.

When SEC65 is enabled in EXTI1_SECCFGR3, EM65 can only be accessed with secure access. Non-secure write to EM65 is discarded. Non-secure read returns 0.

When PRIV65 is disabled in EXTI1_PRIVCFGR3, EM65 can be accessed with privileged and unprivileged access.

When PRIV65 is enabled in EXTI1_PRIVCFGR3, EM65 can only be accessed with privileged access. Unprivileged write to EM65 is discarded and read returns 0.

When CID filtering is disabled in EXTI1_E65CIDCFGR, EM65 can be accessed by any processor CID.

When CID filtering is enabled in EXTI1_E65CIDCFGR, EM65 can only be accessed by the allowed processor CID. Disallowed CID write to EM65 is discarded and read returns 0.

Bit 0 Reserved, must be kept at reset value.

29.7.32 EXTI1 event CID configuration register (EXTI1_EnCIDCFGR)

Valid range: n = 0 to 19, 21 to 34, 36 to 50, 52 to 57, 59 to 62, 64 to 65, 67 to 68, 70, 72 to 84

Address offset: 0x180 + 0x04 * n (n = 0 to 84)

Reset value: 0x0000 0000

This register can only be written by the secure, privileged, trusted domain CID. A write access from any other protection level or domain CID is discarded and any read returns zero value. Both illegal write and read access generate an illegal access event.

Write to these registers are ignored if GLOCK is enabled in EXTI1_LOCKR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CID[2:0]			Res.	Res.	Res.	CFEN
									rw	rw	rw				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **CID[2:0]:** EXTI event n allowed CID value

If CID filtering is disabled in CFEN, these bits are ignored, else EXTI event n allowed processor CID number.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **CFEN:** EXTI event n CID filtering enable

0: Disable EXTI event n filtering (EXTI event n can be accessed by any CIDs).

1: Enable EXTI event n filtering (EXTI event n can only be accessed by the processor with CID = CPUm CID).

29.7.33 EXTI1 processor m CID configuration register (EXTI1_CmCIDCFGR)

Address offset: 0x300 + 0x04 * (m - 1) (m = 1 to 2)

Reset value: 0x0000 0000

This register can only be written by the secure, privilege, trusted domain CID. An illegal write access to this register generates an illegal access event.

Write to these registers are ignored if GLOCK is enabled in EXTI1_LOCKR.

This registers have no read access limitations, and can be read by any domain CID, and any access protection.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CID[2:0]			Res.	Res.	Res.	CFEN
									rw	rw	rw				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **CID[2:0]:** CPUm CID domain identification
If CFEN = 0, these bits are ignored, and there is no CPUm CID filtering, else CPUm CID domain identification number.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **CFEN:** CID filtering enabled for CPUm EXTI1_CmIMRx and EXTI1_CmEMRx registers
0: Disable the CID filtering for CPUm.
1: Enable the CID filtering for CPUm.

29.7.34 EXTI1 hardware configuration registers 13 (EXTI1_HWCFGR13)

IPID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **IPID[31:0]:** EXTI1 identification

29.7.46 EXTI1 size identification register (EXTI1_SIDR)

Address offset: 0x3FC

Reset value: 0xA3C5 DD01

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **SID[31:0]:** Size identification

29.7.47 EXTI2 rising trigger selection register (EXTI2_RTSR1)

Address offset: 0x000

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RT15	RT14	RT13	RT12	RT11	RT10	RT9	RT8	RT7	RT6	RT5	RT4	RT3	RT2	RT1	RT0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **RTx:** Rising trigger event configuration bit of configurable event input x (x = 15 to 0)

0: Rising trigger disabled (for event and interrupt) for input line x

1: Rising trigger enabled (for event and interrupt) for input line x

When SECx is disabled in EXTI2_SECCFGR1, RTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR1, RTx can only be accessed with secure access. Non-secure write to RTx x is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR1, RTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR1, RTx can only be accessed with privileged access. Unprivileged write to RTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, RTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, RTx can only be accessed by the allowed processor CID. Illegal CID write to RTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a rising edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

29.7.48 EXTI2 falling trigger selection register (EXTI2_FTSR1)

Address offset: 0x004

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FT15	FT14	FT13	FT12	FT11	FT10	FT9	FT8	FT7	FT6	FT5	FT4	FT3	FT2	FT1	FT0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **FTx:** Falling trigger event configuration bit of configurable event input x (x = 15 to 0)

0: Falling trigger disabled (for event and Interrupt) for input line x

1: Falling trigger enabled (for event and Interrupt) for input line x

When SECx is disabled in EXTI2_SECCFGR1, FTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR1, FTx can only be accessed with secure access. Non-secure write to FTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR1, FTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR1, FTx can only be accessed with privileged access. Unprivileged write to FTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, FTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, FTx can only be accessed by the allowed processor CID. Dis allowed CID write to FTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a falling edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

29.7.49 EXTI2 software interrupt event register (EXTI2_SWIER1)

Address offset: 0x008

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SWI15	SWI14	SWI13	SWI12	SWI11	SWI10	SWI9	SWI8	SWI7	SWI6	SWI5	SWI4	SWI3	SWI2	SWI1	SWI0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SWIx:** Software interrupt on event x (x = 15 to 0)

0: Writing 0 has no effect.

1: Writing 1 to this bit triggers a rising edge event on event x (bit auto cleared by hardware).

When SECx is disabled in EXTI2_SECCFGR1, SWIx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR1, SWIx can only be accessed with secure access. Non-secure write to SWIx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR1, SWIx can be accessed with unprivileged and privileged access.

When PRIVx is disabled in EXTI2_PRIVCFGR1, SWIx can only be accessed with privileged access. Unprivileged write to SWIx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, SWIx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, SWIx can only be accessed by the allowed processor CID. Dis allowed CID write to SWIx is discarded, and read returns 0.

A software interrupt is generated independent from the setting in EXTI2_RTSR and EXTI2_FTSR. It always returns 0 when read.

29.7.50 EXTI2 rising edge pending register (EXTI2_RPR1)

Address offset: 0x00C

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

RPIF15	RPIF14	RPIF13	RPIF12	RPIF11	RPIF10	RPIF9	RPIF8	RPIF7	RPIF6	RPIF5	RPIF4	RPIF3	RPIF2	RPIF1	RPIF0
rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **RPIFx:** Configurable event input x rising edge pending bit (x = 15 to 0)

This bit is set when the selected rising edge event, or an EXTI2_SWIER software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No rising edge trigger request occurred

1: Rising edge trigger request occurred

When SECx is disabled in EXTI2_SECCFGR1, RPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR1, RPIFx can only be accessed with secure access. Non-secure write to RPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR1, RPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR1, RPIFx can only be accessed with privileged access. Unprivileged write to RPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, RPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, RPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to RPIFx is discarded, and read returns 0.

29.7.51 EXTI2 falling edge pending register (EXTI2_FPR1)

Address offset: 0x010

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FPIF15	FPIF14	FPIF13	FPIF12	FPIF11	FPIF10	FPIF9	FPIF8	FPIF7	FPIF6	FPIF5	FPIF4	FPIF3	FPIF2	FPIF1	FPIF0
rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **FPIFx:** Configurable event input x falling edge pending bit (x = 15 to 0)

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No falling edge trigger request occurred

1: Falling edge trigger request occurred

When SECx is disabled in EXTI2_SECCFGR1, FPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR1, FPIFx can only be accessed with secure access. Non-secure write to FPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR1, FPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR1, FPIFx can only be accessed with privileged access. Unprivileged write to FPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, FPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, FPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to FPIFx is discarded and read returns 0.

29.7.52 EXTI2 security configuration register (EXTI2_SECCFGR1)

Address offset: 0x014

Reset value: 0x0000 0000

This register provides write access security and privilege.A non-secure or unprivileged write access is ignored and causes the generation of an illegal access event. All read return the register data.

Write to this register are ignored if GLOCK is enabled in EXTI2_LOCKR.

This register contains only bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SEC31	SEC30	SEC29	Res.	Res.	SEC26	Res.	SEC24	SEC23	SEC22	SEC21	Res.	SEC19	SEC18	SEC17	SEC16
rw	rw	rw			rw		rw	rw	rw	rw		rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SEC15	SEC14	SEC13	SEC12	SEC11	SEC10	SEC9	SEC8	SEC7	SEC6	SEC5	SEC4	SEC3	SEC2	SEC1	SEC0
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 **SECx:** Security enable on event input x (x = 31 to 29)
0: Event security disabled (non-secure)
1: Event security enabled (secure)
When CID filtering is disabled in EXTI2_ExCIDCFGR, SECx can be accessed by any processor CID.
When CID filtering is enabled in EXTI2_ExCIDCFGR, SECx can only be accessed by the allowed processor CID. Dis allowed CID write to SECx is discarded and read returns 0.

Bits 28:27 Reserved, must be kept at reset value.

Bit 26 **SEC26:** Security enable on event input 26

Bit 25 Reserved, must be kept at reset value.

Bits 24:21 **SECx:** Security enable on event input x (x = 24 to 21)

Bit 20 Reserved, must be kept at reset value.

Bits 19:0 **SECx:** Security enable on event input x (x = 19 to 0)

29.7.53 EXTI2 privilege configuration register (EXTI2_PRIVCFGR1)

Address offset: 0x018

Reset value: 0x0000 0000

This register provides privilege write access protection. An unprivileged write access is discarded and causes the generation of an illegal access event. A unprivileged read returns the register data.

Write to this register are ignored if GLOCK is enabled in EXTI2_LOCKR.

This register contains only bits for security capable Input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 **PRIVx:** Privilege enable on event input x (x = 31 to 29)
0: Event privilege disabled (unprivileged)
1: Event privilege enabled (privileged)
When SECx is disabled in EXTI2_SECCFGR1, PRIVx can be accessed with secure and non-secure access.
When SECx is enabled in EXTI2_SECCFGR1, PRIVx can only be written with secure access. Non-secure write to PRIVx is discarded.
When CID filtering is disabled in EXTI2_ExCIDCFGR, PRIVx can be accessed by any processor CID.
When CID filtering is enabled in EXTI2_ExCIDCFGR, PRIVx can only be accessed by the allowed processor CID. Dis allowed CID write to PRIVx is discarded, and read returns 0.

Bits 28:27 Reserved, must be kept at reset value.

Bit 26 **PRIV26:** Privilege enable on event input 26

Bit 25 Reserved, must be kept at reset value.

Bits 24:21 **PRIVx:** Privilege enable on event input x (x = 24 to 21)

Bit 20 Reserved, must be kept at reset value.

Bits 19:0 **PRIVx:** Privilege enable on event input x (x = 19 to 0)

29.7.54 EXTI2 rising trigger selection register (EXTI2_RTSR2)

Address offset: 0x020

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RT53	RT52	RT51	Res.	Res.	Res.
										rw	rw	rw			
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RT37	RT36	RT35	RT34	Res.	Res.
										rw	rw	rw	rw		

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:19 **RTx:** Rising trigger event configuration bit of configurable event input x (x = 53 to 51)

0: Rising trigger disabled (for event and interrupt) for input line x

1: Rising trigger enabled (for event and interrupt) for input line x

When SECx is disabled in EXTI2_SECCFGR2, RTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR2, RTx can only be accessed with secure access. Non-secure write to RTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR2, RTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR2, RTx can only be accessed with privileged access. Unprivileged write to RTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, RTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, RTx can only be accessed by the allowed processor CID. Dis allowed CID write to RTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a rising edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

Bits 18:6 Reserved, must be kept at reset value.

Bits 5:2 **RTx:** Rising trigger event configuration bit of configurable event input x (x = 37 to 34)

Bits 1:0 Reserved, must be kept at reset value.

29.7.55 EXTI2 falling trigger selection register (EXTI2_FTSR2)

Address offset: 0x024

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FT53	FT52	FT51	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FT37	FT36	FT35	FT34	Res.	Res.
										rw	rw	rw	rw		

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:19 **FTx:** Falling trigger event configuration bit of configurable event input x (x = 53 to 51)

0: Falling trigger disabled (for event and interrupt) for input line x

1: Falling trigger enabled (for event and interrupt) for input line x

When SECx is disabled in EXTI2_SECCFGR2, FTx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR2, FTx can only be accessed with secure access. Non-secure write to FTx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR2, FTx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR2, FTx can only be accessed with privileged access. Unprivileged write to FTx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, FTx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, FTx can only be accessed by the allowed processor CID. Dis allowed CID write to FTx is discarded, and read returns 0.

Note: The configurable event input is edge triggered. No glitch must be generated on this input. If a rising edge on the configurable event input occurs while writing to the register, the associated pending bit is not set.

Rising and falling edge triggers can be set for the same configurable event input. In this case, both edges generate a trigger.

Bits 18:6 Reserved, must be kept at reset value.

Bits 5:2 **FTx:** Falling trigger event configuration bit of configurable event input x (x = 37 to 34)

Bits 1:0 Reserved, must be kept at reset value.

29.7.56 EXTI2 software interrupt event register (EXTI2_SWIER2)

Address offset: 0x028

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWI53	SWI52	SWI51	Res.	Res.	Res.
										rw	rw	rw			
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWI37	SWI36	SWI35	SWI34	Res.	Res.
										rw	rw	rw	rw		

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:19 **SWIx:** Software interrupt on event x (x = 53 to 51)

0: Writing 0 has no effect.

1: Writing 1 to this bit triggers a rising edge event on event x (bit auto cleared by hardware).

When SECx is disabled in EXTI2_SECCFGR2, SWIx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR2, SWIx can only be accessed with secure access. Non-secure write to SWIx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR2, SWIx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR2, SWIx can only be accessed with privileged access. Unprivileged write to SWIx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, SWIx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, SWIx can only be accessed by the allowed processor CID. Dis allowed CID write to SWIx is discarded, and read returns 0.

A software interrupt is generated independent from the setting in EXTI2_RTSR and EXTI2_FTSR. It always returns 0 when read.

Bits 18:6 Reserved, must be kept at reset value.

Bits 5:2 **SWIx:** Software interrupt on event x (x = 37 to 34)

Bits 1:0 Reserved, must be kept at reset value.

29.7.57 EXTI2 rising edge pending register (EXTI2_RPR2)

Address offset: 0x02C

Reset value: 0x0000 0000

This register contains only bits for configurable events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RPIF53	RPIF52	RPIF51	Res.	Res.	Res.

										rc_w1	rc_w1	rc_w1	rc_w1		

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:19 **RPIFx:** Configurable event input x rising edge pending bit (x = 53 to 51)

This bit is set when the selected rising edge event or an EXTI2_SWIER Software trigger arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No rising edge trigger request occurred

1: Rising edge trigger request occurred

When SECx is disabled in EXTI2_SECCFGR2, RPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR2, RPIFx can only be accessed with secure access. Non-secure write to RPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR2, RPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR2, RPIFx can only be accessed with privileged access. Unprivileged write to RPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, RPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, RPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to RPIFx is discarded, and read returns 0.

Bits 18:6 Reserved, must be kept at reset value.

Bits 5:2 **RPIFx:** Configurable event input x rising edge pending bit (x = 37 to 34)

Bits 1:0 Reserved, must be kept at reset value.

29.7.58 EXTI2 falling edge pending register (EXTI2_FPR2)

Address offset: 0x030

Reset value: 0x0000 0000

This register contains only bits for configurable events.

										rc_w1	rc_w1	rc_w1	rc_w1		

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:19 **FPIFx:** Configurable event input x pending bit (x = 53 to 51)

This bit is set when the falling edge event arrives on the configurable event line. This bit is cleared by writing a 1 into the bit.

0: No falling edge trigger request occurred

1: Falling edge trigger request occurred

When SECx is disabled in EXTI2_SECCFGR2, FPIFx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR2, FPIFx can only be accessed with secure access. Non-secure write to FPIFx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR2, FPIFx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR2, FPIFx can only be accessed with privileged access. Unprivileged write to FPIFx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, FPIFx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, FPIFx can only be accessed by the allowed processor CID. Dis allowed CID write to FPIFx is discarded, and read returns 0.

Bits 18:6 Reserved, must be kept at reset value.

Bits 5:2 **FPIFx:** Configurable event input x pending bit (x = 37 to 34)

Bits 1:0 Reserved, must be kept at reset value.

29.7.59 EXTI2 security enable register (EXTI2_SECCFGR2)

Address offset: 0x034

Reset value: 0x0000 0000

This register provides write access security and privilege. A non-secure or unprivileged write access is ignored and causes the generation of an illegal access event. All read return the register data.

Write to this register are ignored if GLOCK is enabled in EXTI2_LOCKR.

This register contains only bits for security capable input events.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SEC 63	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEC 53	SEC 52	SEC 51	SEC 50	SEC 49	Res.

					rw	rw	rw	rw		rw	rw	rw	rw		

Bit 31 **SEC63:** Security enable on event input 63

0: Event security disabled (non-secure)

1: Event security enabled (secure)

When CID filtering is disabled in EXTI2_ExCIDCFGR, SECx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, SECx can only be accessed by the allowed processor CID. Dis allowed CID write to SECx is discarded, and read returns 0.

Bits 30:22 Reserved, must be kept at reset value.

Bits 21:17 **SECx:** Security enable on event input x (x = 53 to 49)

Bits 16:11 Reserved, must be kept at reset value.

Bits 10:7 **SECx:** Security enable on event input x (x = 42 to 39)

Bit 6 Reserved, must be kept at reset value.

Bits 5:2 **SECx:** Security enable on event input x (x = 37 to 34)

Bits 1:0 Reserved, must be kept at reset value.

29.7.60 EXTI2 privilege enable register (EXTI2_PRIVCFGR2)

Address offset: 0x038

Reset value: 0x0000 0000

This register provides privilege write access protection. An unprivileged write access is discarded and causes the generation of an illegal access event. A unprivileged read returns the register data.

Write to this register are ignored if GLOCK is enabled in EXTI2_LOCKR.

This register contains only bits for security capable Input events.

					rw	rw	rw	rw		rw	rw	rw	rw		

Bit 31 **PRIV63:** Privilege enable on event input 63

0: Event privilege disabled (unprivileged)

1: Event privilege enabled (privileged)

When SECx is disabled in EXTI2_SECCFGR2, PRIVx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR2, PRIVx can only be accessed with secure access. Non-secure write to PRIVx is discarded. Non-secure read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, PRIVx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, PRIVx can only be accessed by the allowed processor CID. Dis allowed CID write to PRIVx is discarded, and read returns 0.

Bits 30:22 Reserved, must be kept at reset value.

Bits 21:17 **PRIVx:** Privilege enable on event input x (x = 53 to 49)

Bits 16:11 Reserved, must be kept at reset value.

Bits 10:7 **PRIVx:** Privilege enable on event input x (x = 42 to 39)

Bit 6 Reserved, must be kept at reset value.

Bits 5:2 **PRIVx:** Privilege enable on event input x (x = 37 to 34)

Bits 1:0 Reserved, must be kept at reset value.

When CID filtering is disabled in EXTI2_ExCIDCFGR, this field can be accessed by any processor CID.
When CID filtering is enabled in EXTI2_ExCIDCFGR, this field can only be accessed by the allowed processor CID. Dis allowed CID write to this field is discarded, and read returns 0.

29.7.65 EXTI2 lock register (EXTI2_LOCKR)

Address offset: 0x070

Reset value: 0x0000 0000

This register can only be written by the secure, privileged, trusted domain CID. A write access from any other protection level or domain CID is discarded and any read returns zero value. Both illegal write and read access generate an illegal access event.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	GLOCK
															rs

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **GLOCK:** Global security, privilege and CID configuration registers EXTI2_SECCFGRx, EXTI2_PRIVCFGRx, EXTI2_EnCIDCFGR and EXTI2_CmCIDCFGR lock

This bit is write once after reset.

0: Security and privilege configuration open, can be modified

1: Security and privilege configuration locked, can no longer be modified

29.7.66 EXTI2 CPUm wake-up with interrupt mask register (EXTI2_CmIMR1) (m = 1 to 2)

Address offset: Block 1: 0x080

Address offset: Block 2: 0x0C0

Reset value: 0x0000 0000

Contains register bits for configurable events and direct events.

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI2_CmCIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IM31	IM30	IM29	Res.	Res.	IM26	Res.	IM24	IM23	IM22	IM21	Res.	IM19	IM18	IM17	IM16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 31 to 29)

0: Wake-up and interrupt CPU(m) from input event x is masked.

1: Wake-up and interrupt CPU(m) from input event x is unmasked. CPU(m) wake-up event and configurable event interrupt generated.

When SECx is disabled in EXTI2_SECCFGR1, IMx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR1, IMx can only be accessed with secure access. Non-secure write to IMx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR1, IMx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR1, IMx can only be accessed with privileged access. Unprivileged write to IMx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, IMx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, IMx can only be accessed by the allowed processor CID. Dis allowed CID write to IMx is discarded, and read returns 0.

Bits 28:27 Reserved, must be kept at reset value.

Bit 26 **IM26:** CPUm wake-up with interrupt mask on event input 26

Bit 25 Reserved, must be kept at reset value.

Bits 24:21 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 24 to 21)

Bit 20 Reserved, must be kept at reset value.

Bits 19:0 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 19 to 0)

29.7.67 EXTI2 CPU2 wake-up with event mask register (EXTI2_C2EMR1)

Address offset: 0x0C4

Reset value: 0x0000 0000

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI2_CmCIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **EMx:** CPU(m) wake-up with event generation mask on event input x (x = 15 to 0)

0: Wake-up with event generation from line x is masked.

1: Wake-up with event generation from line x is unmasked.

When SECx is disabled in EXTI2_SECCFGR1, EMx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR1, EMx can only be accessed with secure access. Non-secure write to EMx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR1, EMx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR1, EMx can only be accessed with privileged access. Unprivileged write to EMx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, EMx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, EMx can only be accessed by the allowed processor CID. Dis allowed CID write to EMx is discarded, and read returns 0.

29.7.68 EXTI2 CPUm wake-up with interrupt mask register (EXTI2_CmIMR2) (m = 1 to 2)

Address offset: Block 1: 0x090

Address offset: Block 2: 0x0D0

Reset value: 0x0000 0000

This register contains only bits for configurable events and direct events.

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI2_CmCIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

					rw	rw	rw	rw		rw	rw	rw	rw		

Bit 31 **IM63:** CPUm wake-up with interrupt mask on event input 63

0: Wake-up and interrupt CPU(m) from input event x is masked.

1: Wake-up and interrupt CPU(m) from input event x is unmasked. CPU(m) wake-up event and configurable event interrupt generated.

When SECx is disabled in EXTI2_SECCFGR2, IMx can be accessed with non-secure and secure access.

When SECx is enabled in EXTI2_SECCFGR2, IMx can only be accessed with secure access. Non-secure write to IMx is discarded. Non-secure read returns 0.

When PRIVx is disabled in EXTI2_PRIVCFGR2, IMx can be accessed with unprivileged and privileged access.

When PRIVx is enabled in EXTI2_PRIVCFGR2, IMx can only be accessed with privileged access. Unprivileged write to IMx is discarded. Unprivileged read returns 0.

When CID filtering is disabled in EXTI2_ExCIDCFGR, IMx can be accessed by any processor CID.

When CID filtering is enabled in EXTI2_ExCIDCFGR, IMx can only be accessed by the allowed processor CID. Dis allowed CID write to IMx is discarded, and read returns 0.

Bits 30:22 Reserved, must be kept at reset value.

Bits 21:17 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 53 to 49)

Bits 16:11 Reserved, must be kept at reset value.

Bits 10:7 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 42 to 39)

Bit 6 Reserved, must be kept at reset value.

Bits 5:2 **IMx:** CPUm wake-up with interrupt mask on event input x (x = 37 to 34)

Bits 1:0 Reserved, must be kept at reset value.

29.7.69 EXTI2 CPU2 wake-up with event mask register (EXTI2_C2EMR2)

Address offset: 0x0D4

Reset value: 0x0000 0000

This register has CID resource protection and can only be accessed by the allowed CID as defined in EXTI2_CmCIDCFGR. An illegal CID write access is discarded and a read access return zero data, also on both illegal accesses an illegal access event is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:0 Reserved, must be kept at reset value.

29.7.70 EXTI2 event CID config register (EXTI2_EnCIDCFGR)

Valid range: n = 0 to 27, 29 to 31, 33 to 38, 40 to 44, 46 to 56, 59 to 70, 76

Address offset: 0x180 + 0x04 * n (n = 0 to 76)

Reset value: 0x0000 0000

This register can only be written by the secure, privileged, trusted domain CID. A write access from any other protection level or domain CID is discarded and any read returns zero value. Both illegal write and read access generate an illegal access event.

Write to these registers are ignored if GLOCK is enabled in EXTI2_LOCKR.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CID[2:0]			Res.	Res.	Res.	CFEN
									rw	rw	rw				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **CID[2:0]:** EXTI event n allowed CID value
If CID filtering is disabled in CFEN, these bits are ignored, else EXITI event n allowed processor CID number.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **CFEN:** EXTI event n CID filtering enable
0: Disable EXTI event x filtering (EXTI event x can be accessed by all CIDs).
1: Enable EXTI event x filtering (EXTI event x can only be accessed by the processor with CID = CPUm CID).

29.7.71 EXTI2 processor m CID configuration register (EXTI2_CmCIDCFGR)

Address offset: 0x300 + 0x04 * (m - 1) (m = 1 to 2)

Reset value: 0x0000 0000

This register can only be written by the secure, privilege, trusted domain CID. An illegal write access to this register generates an illegal access event.

Write to these registers are ignored if GLOCK is enabled in EXTI2_LOCKR.

This registers has no read access limitations, and can be read by any domain CID, and any access protection.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CID[2:0]			Res.	Res.	Res.	CFEN
									rw	rw	rw				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **CID[2:0]:** CPUm CID domain identification
If CFEN = 0, these bits are ignored, and there is no CPUm CID filtering, else CPUm CID domain identification number.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **CFEN:** CID filtering enabled for CPUm EXTI2_CmIMRn and EXTI2_CmEMRn registers
0: Disable the CID filtering for CPUm.
1: Enable the CID filtering for CPUm.

29.7.72 EXTI2 hardware configuration registers 13 (EXTI2_HWCFGR13)

Refer to *Section 2.4* for the register boundary addresses.

30 Cyclic redundancy check calculation unit (CRC)

30.1 CRC introduction

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code from 8-, 16- or 32-bit data word and a generator polynomial.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the functional safety standards, they offer a means of verifying the flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link time and stored at a given memory location.

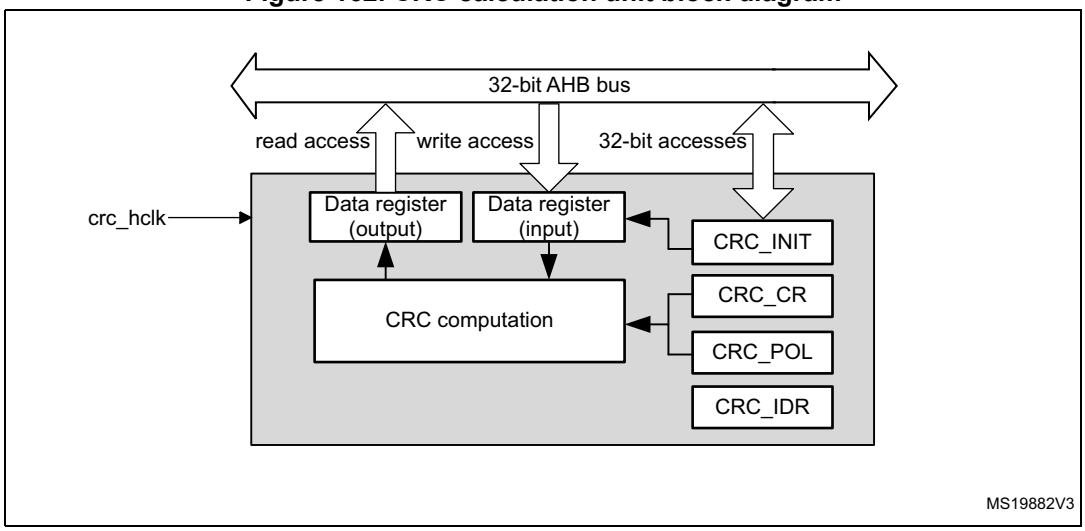
30.2 CRC main features

- Uses CRC-32 (Ethernet) polynomial: 0x4C11DB7
  $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$
- Alternatively, uses fully programmable polynomial with programmable size (7, 8, 16, 32 bits)
- Handles 8-,16-, 32-bit data size
- Programmable CRC initial value
- Single input/output 32-bit data register
- Input buffer to avoid bus stall during calculation
- CRC computation done in 4 AHB clock cycles (HCLK) for the 32-bit data size
- General-purpose 8-bit register (can be used for temporary storage)
- Reversibility options on I/O data
- Accessed through AHB slave peripheral by 32-bit words only, with the exception of CRC_DR register that can be accessed by words, right-aligned half-words and right-aligned bytes

30.3 CRC functional description

30.3.1 CRC block diagram

Figure 162. CRC calculation unit block diagram



30.3.2 CRC internal signals

Table 205. CRC internal input/output signals

Signal name	Signal type	Description
crc_hclk	Digital input	AHB clock

30.3.3 CRC operation

The CRC calculation unit has a single 32-bit read/write data register (CRC_DR). It is used to input new data (write access), and holds the result of the previous CRC calculation (read access).

Each write operation to the data register creates a combination of the previous CRC value (stored in CRC_DR) and the new one. CRC computation is done on the whole 32-bit data word or byte by byte depending on the format of the data being written.

The CRC_DR register can be accessed by word, right-aligned half-word and right-aligned byte. When the RTYPE_IN bit is set in CRC_CR, non-word accesses to CRC_DR register are ignored. For the other registers only 32-bit accesses are allowed.

The duration of the computation depends on input data width:

- 4 AHB clock cycles for 32 bits
- 2 AHB clock cycles for 16 bits
- 1 AHB clock cycles for 8 bits

An input buffer allows a second data to be immediately written without waiting for any wait-states due to the previous CRC calculation.

The data size can be dynamically adjusted to minimize the number of write accesses for a given number of bytes. For instance, a CRC for 5 bytes can be computed with a word write followed by a byte write.

The input data can be reversed to manage the various endianness schemes. The reversing operation can be performed on 8 bits, 16 bits and 32 bits depending on the REV_IN[1:0] bits in the CRC_CR register. If RTYPE_IN bit is set in this register, the input reversing operation can be performed with a byte or half-word granularity, but not with single bit granularity.

For example, with RTYPE_IN cleared, 0x1A2B3C4D input data are used for CRC calculation as:

- 0x58D43CB2 with bit-reversal done by byte (REV_IN[1:0] = 01)
- 0xD458B23C with bit-reversal done by half-word (REV_IN[1:0] = 10)
- 0xB23CD458 with bit-reversal done on the full word (REV_IN[1:0] = 11)

With RTYPE_IN set, 0x1A2B3C4D input data are used for CRC calculation as:

- 0x3C4D1A2B with half-word reversal done by word (REV_IN[1:0] = 01)
- 0x4D3C2B1A with byte-reversal done by word (REV_IN[1:0] = 10)

The output data can also be reversed by setting the REV_OUT[1:0] bits in the CRC_CR register. If RTYPE_OUT is set in this register, the output reversing operation is performed with a byte or half-word granularity, but not with single bit granularity.

With RTYPE_OUT cleared, the operation is done at bit level. For example, 0x11223344 output data are converted to 0x22CC4488.

With RTYPE_OUT set, 0x11223344 output data are converted as:

- 0x33441122 with half-word reversal done by word (REV_IN[1:0] = 01)
- 0x44332211 with byte-reversal done by word (REV_IN[1:0] = 10)

The CRC calculator can be initialized to a programmable value using the RESET control bit in the CRC_CR register (the default value is 0xFFFFFFFF).

The initial CRC value can be programmed with the CRC_INIT register. The CRC_DR register is automatically initialized upon CRC_INIT register write access.

The CRC_IDR register can be used to hold a temporary value related to CRC 7-, 8-, 16-, and 32-bit calculations. It is not affected by the RESET bit in the CRC_CR register.

Polynomial programmability

The polynomial coefficients are fully programmable through the CRC_POL register, and the polynomial size can be configured to be 7-, 8-, 16-, or 32-bits by programming the POLYSIZE[1:0] bits in the CRC_CR register. Even polynomials are not supported.

Note: The type of an even polynomial is $X+X^2+..+X^n$, while the type of an odd polynomial is $1+X+X^2+..+X^n$.

If the CRC data is less than 32-bit, its value can be read from the least significant bits of the CRC_DR register.

To obtain a reliable CRC calculation, the change on-fly of the polynomial value or size can not be performed during a CRC calculation. As a result, if a CRC calculation is ongoing, the application must either reset it or perform a CRC_DR read before changing the polynomial.

The default polynomial value is the CRC-32 (Ethernet) polynomial: 0x4C11DB7.

30.4 CRC registers

The CRC_DR register can be accessed by words, right-aligned half-words and right-aligned bytes when RTYPE bit is cleared in CRC_CR. When RTYPE is set, only word accesses are allowed. For the other registers only 32-bit accesses are allowed.

30.4.1 CRC data register (CRC_DR)

Address offset: 0x00

Reset value: 0xFFFF FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DR[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DR[31:0]:** Data register bits

This register is used to write new data to the CRC calculator.

It holds the previous CRC calculation result when it is read.

If the data size is less than 32 bits, the least significant bits are used to write/read the correct value.

30.4.2 CRC independent data register (CRC_IDR)

Address offset: 0x04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IDR[31:16]

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **IDR[31:0]**: General-purpose 32-bit data register bits

These bits can be used as a temporary storage location for four bytes.

This register is not affected by CRC resets generated by the RESET bit in the CRC_CR register

30.4.3 CRC control register (CRC_CR)

Address offset: 0x08

Reset value: 0x0000 0000

					rw	rw	rw	rw	rw	rw	rw	rw			rs

Bits 31:11 Reserved, must be kept at reset value.

Bit 10 **RTYPE_OUT**: Reverse type output
This bit controls the reversal granularity of the output data.
0: Bit level output
1: Byte or half-word level output

Bit 9 **RTYPE_IN**: Reverse type input
This bit controls the reversal granularity of the input data.
0: Bit level input
1: Byte or half-word level input

Bits 8:7 **REV_OUT[1:0]**: Reverse output data
This bitfield controls the reversal of the bit order of the output data.
00: Bit order not affected (RTYPE_OUT = 0 or 1)
01: Bit-reversed output format (RTYPE_OUT = 0) or half-word reversal done by word (RTYPE_OUT = 1)
10: Bit order not affected (RTYPE_OUT = 0) or byte reversal done by word (RTYPE_OUT = 1)
11: Bit order not affected (RTYPE_OUT = 0 or 1)

Bits 6:5 **REV_IN[1:0]**: Reverse input data
This bitfield controls the reversal of the bit order of the input data
00: Bit order not affected (RTYPE_IN = 0 or 1)
01: Bit reversal done by byte (RTYPE_IN = 0) or half-word reversal done by word (RTYPE_IN = 1)
10: Bit reversal done by half-word (RTYPE_IN = 0) or byte reversal done by word (RTYPE_IN = 1)
11: Bit reversal done by word (RTYPE_IN = 0) or bit order is not affected (RTYPE_IN = 1)

Bits 4:3 **POLYSIZE[1:0]**: Polynomial size

These bits control the size of the polynomial.

00: 32 bit polynomial

01: 16 bit polynomial

10: 8 bit polynomial

11: 7 bit polynomial

Bits 2:1 Reserved, must be kept at reset value.

Bit 0 **RESET**: RESET bit

This bit is set by software to reset the CRC calculation unit and set the data register to the value stored in the CRC_INIT register. This bit can only be set, it is automatically cleared by hardware.

30.4.4 CRC initial value (CRC_INIT)

Address offset: 0x10

Reset value: 0xFFFF FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CRC_INIT[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CRC_INIT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CRC_INIT[31:0]**: Programmable initial CRC value

This register is used to write the CRC initial value.

30.4.5 CRC polynomial (CRC_POL)

Address offset: 0x14

Reset value: 0x04C1 1DB7

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
POL[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

POL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **POL[31:0]**: Programmable polynomial

This register is used to write the coefficients of the polynomial to be used for CRC calculation.

If the polynomial size is less than 32 bits, the least significant bits have to be used to program the correct value.

30.4.6 CRC register map

Table 206. CRC register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

31 Mass storage interfaces

31.1 Overview

STM32MP21xx devices embed three types of mass storage interfaces:

- FMC interface: manages access to external parallel NOR, parallel NAND, or parallel static RAM devices.
- Octo-SPI interface: manages access to external serial NOR or serial NAND devices.
- SD/*e*.MMC interface: manages access to external SD or *e*.MMC or SDIO devices.

31.2 FMC interface

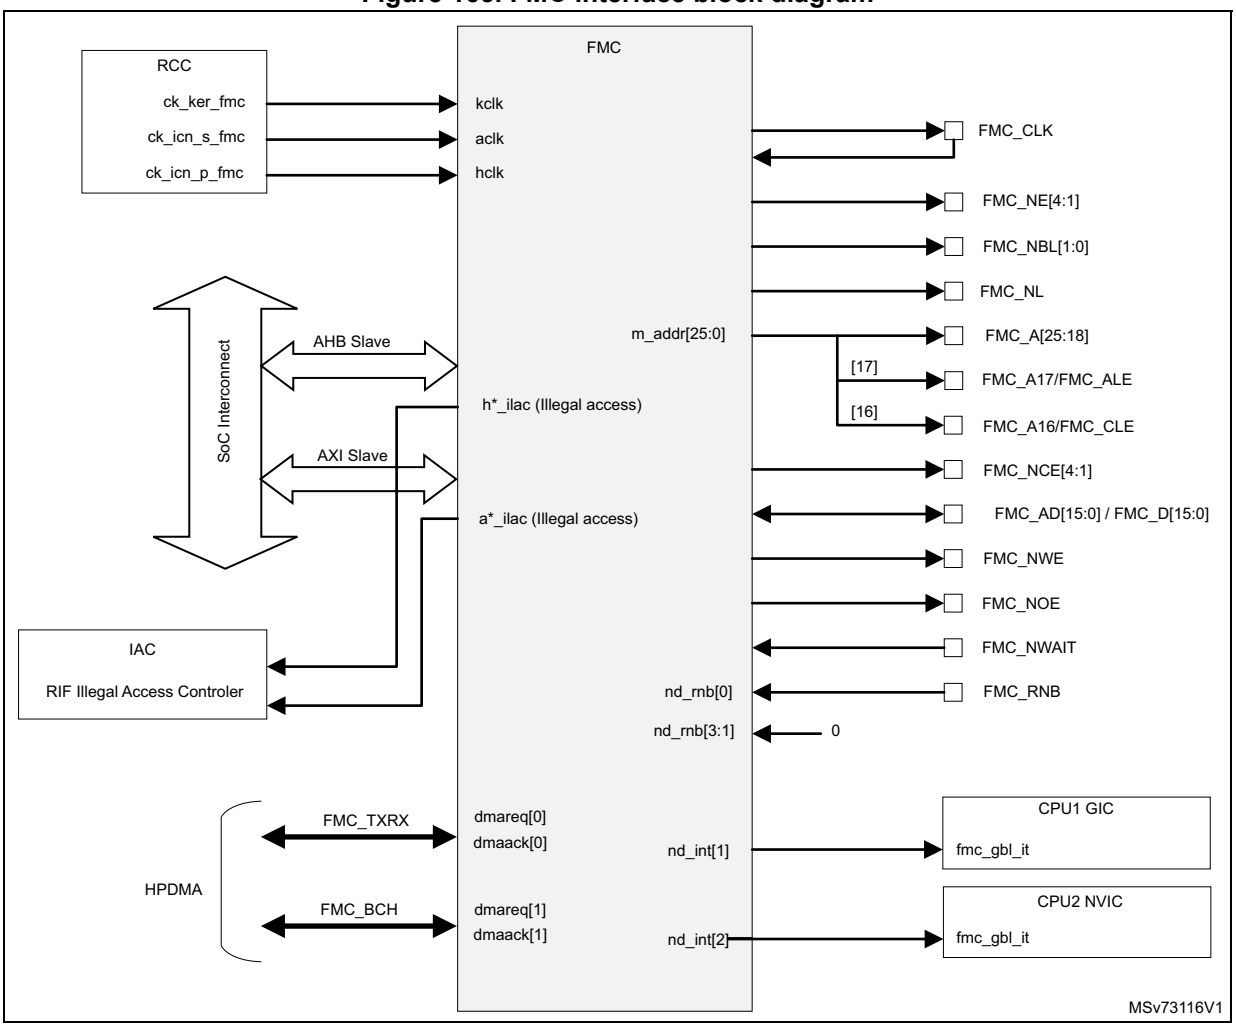
The FMC is compliant with the RIF (resource isolation framework). See *Section 32: Flexible memory controller (FMC)*.

Main features of the FMC interface

- NOR/PSRAM:
  - ‘Generic interface’ to parallel NOR/PSRAM or external device 8080 display or external FPGA
  - Parallel NOR flash memory not supported as BOOT device
  - Up to 4 regions (4 CS, 64 Mbytes each), independent memory and RIF configuration for each region
  - 8- or 16-bit data modes
  - Separate or multiplexed address and data buses
  - A clock divided from the kernel clock provided for synchronous devices
- NAND:
  - SLC NAND ONFI 1.0
  - Hamming and BCH ECC controllers
  - Supported as BOOT device
  - 4 CS + 1 RnB signals
  - 8- or 16-bit data modes
  - Hardware sequencer which can be used jointly with DMA channels to free the CPU of sequencing tasks
  - RIF compliant

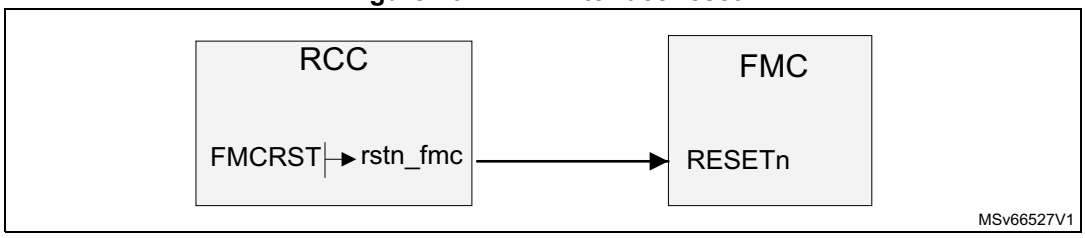
31.2.1 FMC interface block diagram

Figure 163. FMC interface block diagram



31.2.2 FMC interface reset

Figure 164. FMC interface reset



There is only one reset for the FMC interface (rstn_fmc) which is controlled by FMCRST in RCC_FMCCFGR register.

31.2.3 FMC interface interrupt

The FMC generates two interrupts, one for each CID that can be attached to the NAND controller:

- nd_int[1] generated if the CID attached to the NAND controller corresponds to CPU1
- nd_int[2] generated if the CID attached to the NAND controller corresponds to CPU2

Table 207. FMC interface interrupts

FMC signal name	CPU1 interrupt	CPU2 interrupt
nd_int[1]	fmc_gbl_it	-
nd_int[2]	-	fmc_gbl_it

31.3 Octo-SPI interface

The Octo-SPI interface offers one OCTOSPI physical port. Accesses to the OCTOSPI controller are protected by RISUP components.

31.3.1 Main features of the Octo-SPI interface

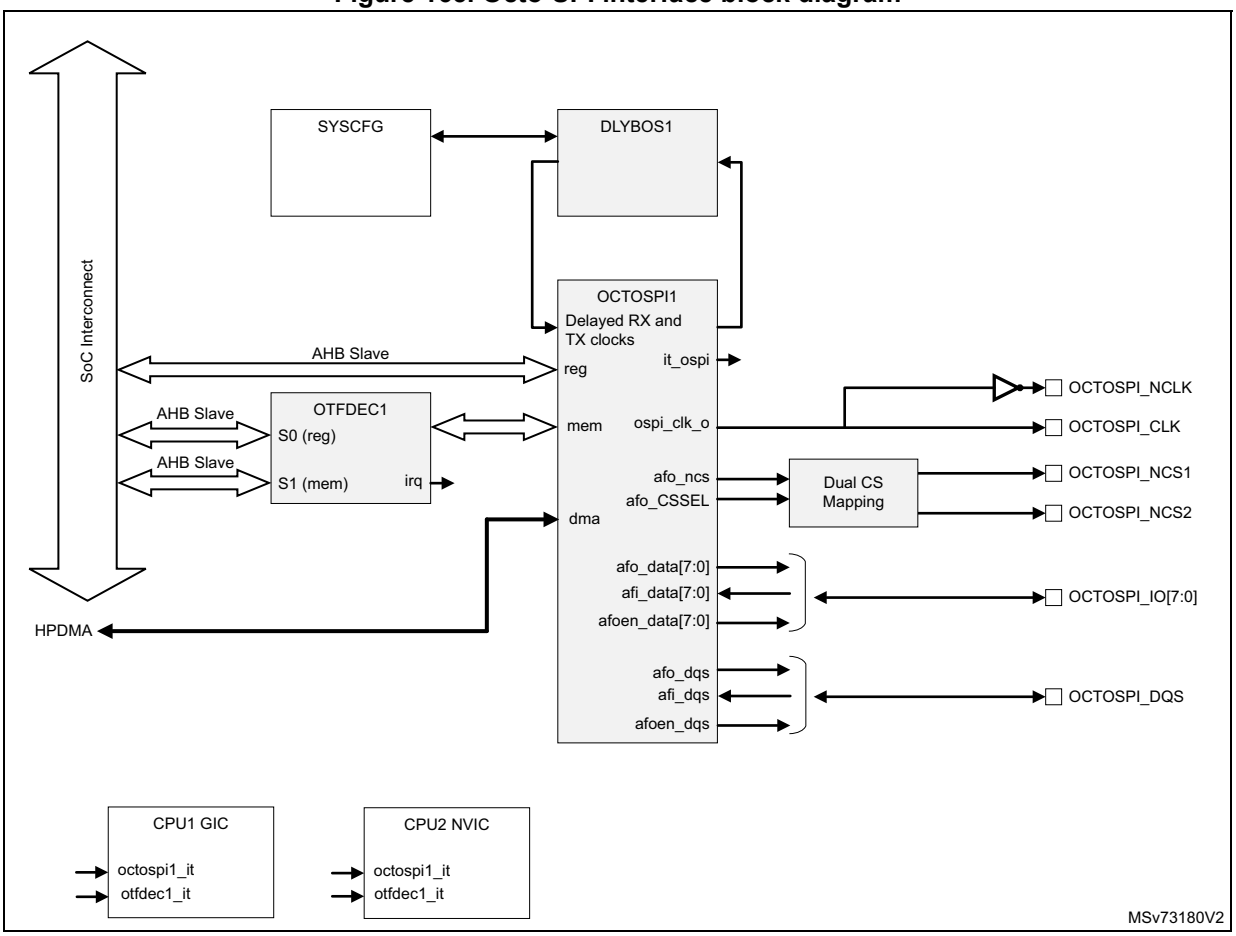
- Support sNOR and sNAND devices from different families: HyperBus™ compliant devices (HyperRAM™ and HyperFlash™ devices from Spansion, Cypress, including MCP devices which integrate both HyperRAM™ and HyperFlash™), Micron devices (Xcella family), Macronix™ devices.
- Three functional modes: indirect, automatic-status polling, memory-mapped
- Up to 4 Gbytes of external memory can be addressed in indirect mode (per physical port and per CS), and up to 256 Mbytes in memory-mapped mode (combined for both physical ports and per CS).
- Single-, dual-, quad-, and octal-SPI communication
- Dual-quad communication
- Single data rate (SDR) and double transfer rate (DTR)
- Maximum target frequency is 133 MHz for SDR and 133 MHz for DTR
- Data strobe support
- DMA channel for indirect mode
- Support for on-the-fly decryption of data read from an external flash memory:
  - Up to four regions can be defined with independent decryption attributes (execute-only and execute-never) and keys.
  - The decryption applies when the OCTOSPI controller is used in read memory-mapped mode.
- Encryption support
- Double CS mapping that can be used to address two external flash memory devices with a single OCTOSPI controller.

For a complete list of features, refer to:

- *Section 33: Octo-SPI interface (OCTOSPI)*
- *Section 51: On-the-fly decryption engine (OTFDEC)*

31.3.2 Octo-SPI interface block diagram

Figure 165. Octo-SPI interface block diagram



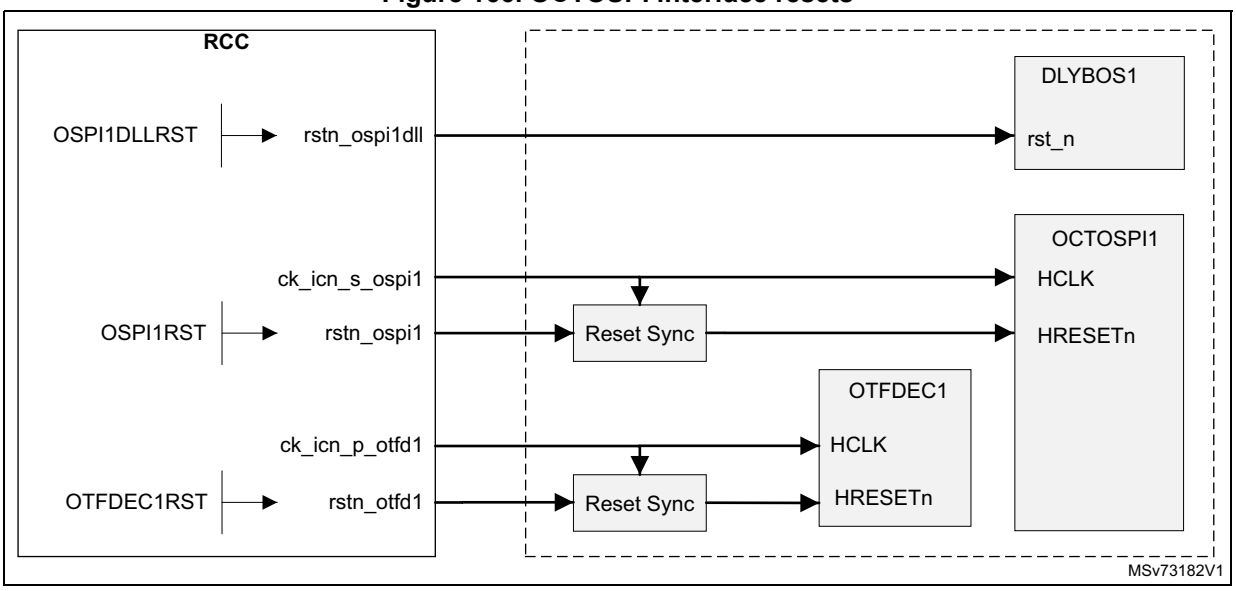
OCTOSPI1 is the memory controller. It can be accessed by either CPU1 or CPU2. It provides 1 chip select which can be mapped on OCTOSPI_NCS1 or OCTOSPI_NCS2 depending on CSSEL setting.

OTFDEC1 is in charge of on-the-fly decryption of data read from the external memory devices.

DLYBOS1 is a DLL-based programmable delay which allows to tune the phase of the RX sampling clock and the TX launch clock.

31.3.3 Octo-SPI interface resets

Figure 166. OCTOSPI interface resets



There are three independent resets for the OCTOSPI interface:

- rstn_ospi1dll which is controlled by the OSPI1DLLRST bit in RCC_OSPI1CFGR register.
- rstn_ospi1 which is controlled by the OSPI1RST bit in RCC_OSPI1CFGR register.
- rstn_otfd1 which is controlled by the OTFDEC1RST bit in RCC_OSPI1CFGR register.

When configuring the OCTOSPI interface, the reset sequence to be applied is:

1. At device reset, OSPI1DLLRST, OSPI1RST, OTFDEC1RST are all 0. DLYBOS1, OCTOSPI1, OTFDEC1 are under reset because their clocks are disabled.
2. Set OSPI1EN. This activates the peripheral clock of OCTOSPI1 and OTFDEC1 and releases their resets.
3. Configure the OCTOSPI1 controller and OTFDEC1 engine.
4. For configurations where the programmable delays must be used:
   a) Wait for the DLL to be locked. This is indicated by the bit LOCK in SYSCFG_DLYBOS1SR register.
   b) Perform a training sequence to determine which delay values correspond to the middle of the valid window for RX sampling (and possibly Tx launching)

For configurations where the programmable delay is not needed, DLYBOS1 can be maintained under reset by setting OSPI1DLLRST to 1.

31.3.4 Octo-SPI interface memory

256 MBytes are allocated in STM32MP21xx memory map for OCTOSPI1. This area is used when OCTOSPI1 is operating in memory-mapped mode.

31.3.5 OCTOSPI1 description

Refer to *Section 33: Octo-SPI interface (OCTOSPI)*.

31.3.6 OTFDEC1 description

Refer to *Section 51: On-the-fly decryption engine (OTFDEC)*.

31.3.7 DLYBOS1 description

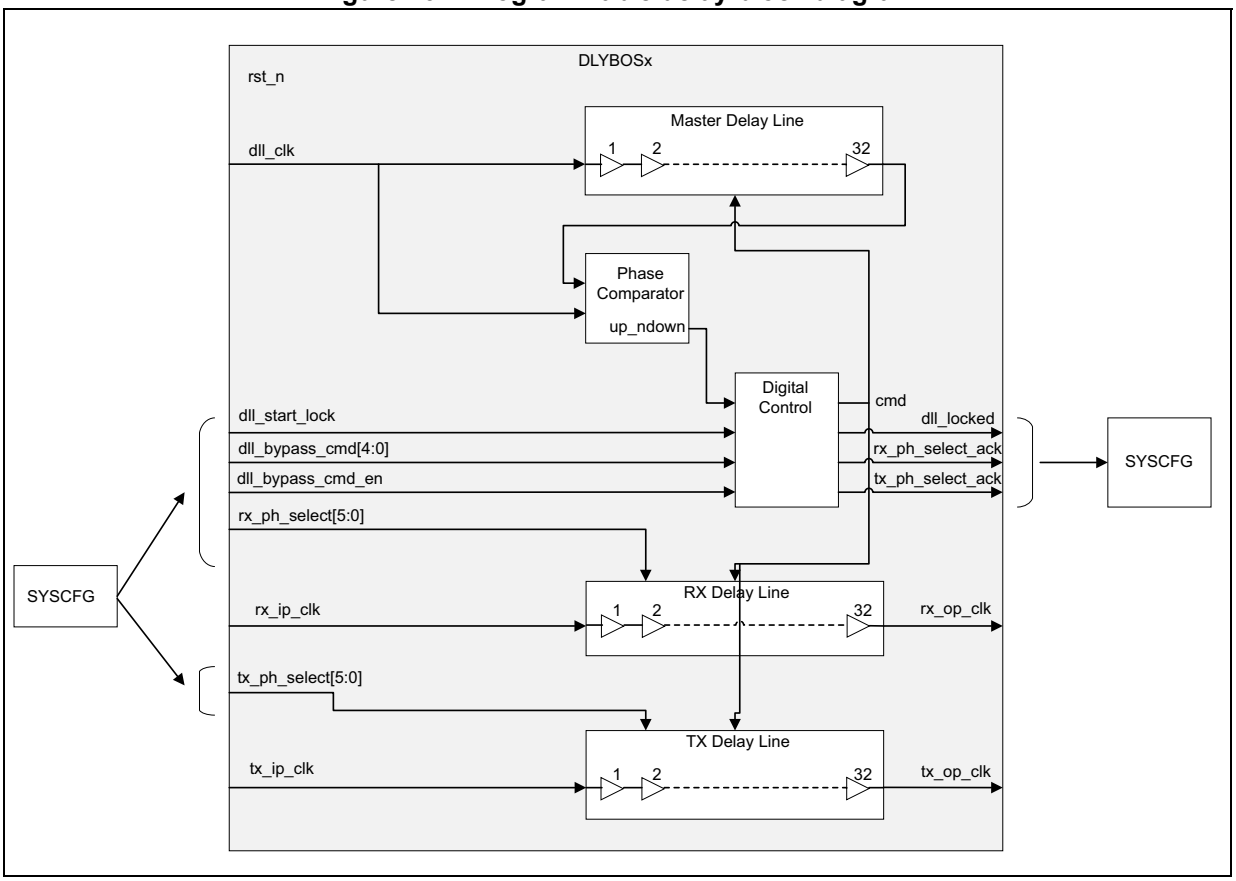
Refer to *Section 35: Delay block (DLYB)*

The programmable delay is used to tune the phase of:

- the RX sampling clock (or DQS) in order to sample the data in their valid window
- the TX launch clock in order to meet setup and hold constraints of TX signals versus the memory clock

The programmable delay block is based on a DLL that compensates for voltage and temperature variations. The DLL features 32 taps and covers the [50 MHz, 208 MHz] frequency range. The clock on which the DLL locks is a free running clock provided by the OCTOSPI. This clock is at the same frequency as the clock sent to the memory. When OCTOSPI1 interface operates below 50 MHz, either the programmable delay is not used (standard case), or it must be used in bypass mode (case of OCTOSPI devices with DQS strobe).

Figure 167. Programmable delay block diagram



The DLL architecture is based on one master delay line, and two slave delay lines (RX and TX). There are two operating modes:

- Lock mode (dll_bypass_cmd_en = 0)
  - This mode can only be used when the dll_clk frequency is in the range [50 MHz, 208 MHz].
  - The DLL is enabled by setting dll_start_lock to 1.
  - The DLL locks on the frequency of the dll_clk input clock, and compensates for voltage and temperature variations. This process determines the command to be applied to each of the 32 delay units (named tap) of the master delay line for the total master delay to represent one period of dll_clk. This command is copied to each delay unit of the RX and TX delay lines. The command varies with voltage and temperature for the DLL to remain locked. This guarantees that each delay unit of the RX and TX delay lines represents 1/32th of the input clock period.
  - Independent delay values can be selected for the RX and TX delay lines by controlling rx_ph_select[5:0] and tx_ph_select[5:0] parameters independently. The granularity of the delay is 1/32th of the input clock period.

Table 208. RX and TX delays in lock mode

rx_ph_select[5:0] (respectively tx_ph_select[5:0])	RX delay (respectively TX delay)
000000	0
000001	1/32 x T(dll_clk)
...	...
011111	31/32 x T(dll_clk)
100000	32/32 x T(dll_clk)

  - When selecting a new delay value with rx_ph_select[5:0] (respectively tx_ph_select[5:0]), an acknowledge is returned when the change takes place with rx_ph_select_ack (respectively tx_ph_select_ack).
- Bypass mode (dll_bypass_cmd_en = 1)
  - In this mode, delays in RX and TX delay lines are used as “pure” delays: without trying to lock on the frequency of the dll_clk input clock. There is therefore no voltage nor temperature compensation in this mode, and RX and TX delay values vary with the voltage and the temperature. The command applied to each delay unit of the RX and TX delay lines is controlled by dll_bypass_cmd[4:0]. Each delay unit includes 24 delay elements. The number of delay elements which are enabled in each delay unit depends on the value of dll_bypass_cmd[4:0].

Table 209. Number of delay elements enabled in each delay unit

dll_bypass_cmd[4:0]	Number of delay elements enabled
00000	reserved
00001	1 delay element is enabled
00010	2 delay elements are enabled
...	...
11000 to 11111	All 24 delay elements are enabled

- Independent delay values can be selected for the RX and TX delay lines by controlling rx_ph_select[5:0] and tx_ph_select[5:0] parameters independently. Rx_ph_select[5:0] and tx_ph_select[5:0] control the number of delay units that are enabled in the RX and TX delay lines: a value of n corresponds to n delay units enabled. The total delay inserted by the RX (respectively TX) delay line depends on rx_ph_select[5:0] (respectively tx_ph_select[5:0]) and dll_bypass_cmd[4:0] values.
- This mode is required to be able to insert a delay between the rx_ip_clk (respectively tx_ip_clk) input clock and the rx_op_clk (respectively tx_op_clk) output clock when the operating frequency is lower than the minimum frequency supported by the DLL (f <50 MHz). This is necessary to support OCTOSPI devices in DTR mode at low frequency for which DQS must be delayed to sample data.

31.3.8 Octo-SPI interface interrupts

OCTOPSI1 and OTFDEC1 generate one interrupt.

Table 210. Octo-SPI interface interrupts

Peripheral	Signal name	CPU1 interrupt	CPU2 interrupt
OCTOSPI1	it_ospi	octospi1_it	octospi1_it
OTFDEC1	irq	otfdec1_it	otfdec1_it

31.3.9 Chip select management

The chip select signal provided by the OCTOSPI controller is mapped on OCTOSPI_NCS1 or OCTOSPI_NCS2 depending on the value of CSSEL bit in OCTOSPI_CR register.

Table 211. OCTOSPI1 CS mapping

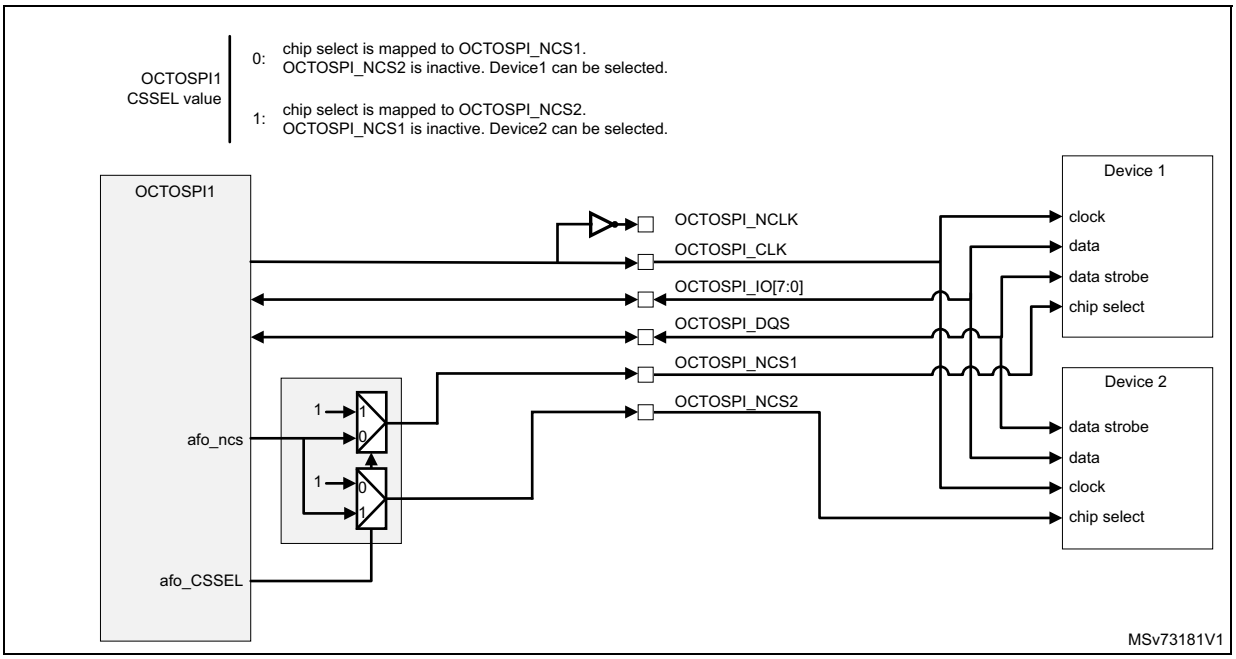
OCTOSPI1 CSSEL	OCTOSPI1 CS mapped on
0	OCTOSPI_NCS1
1	OCTOSPI_NCS2

Note: It is possible to connect 2 flash devices to the OCTOSPI interface and control them both by the OCTOSPI controller. However, the two devices cannot be used simultaneously. Switching from one device to the other requires to:

- *re-program OCTOSPI1 CSSEL to remap the chip select.*
- *re-program the OCTOSPI controller.*

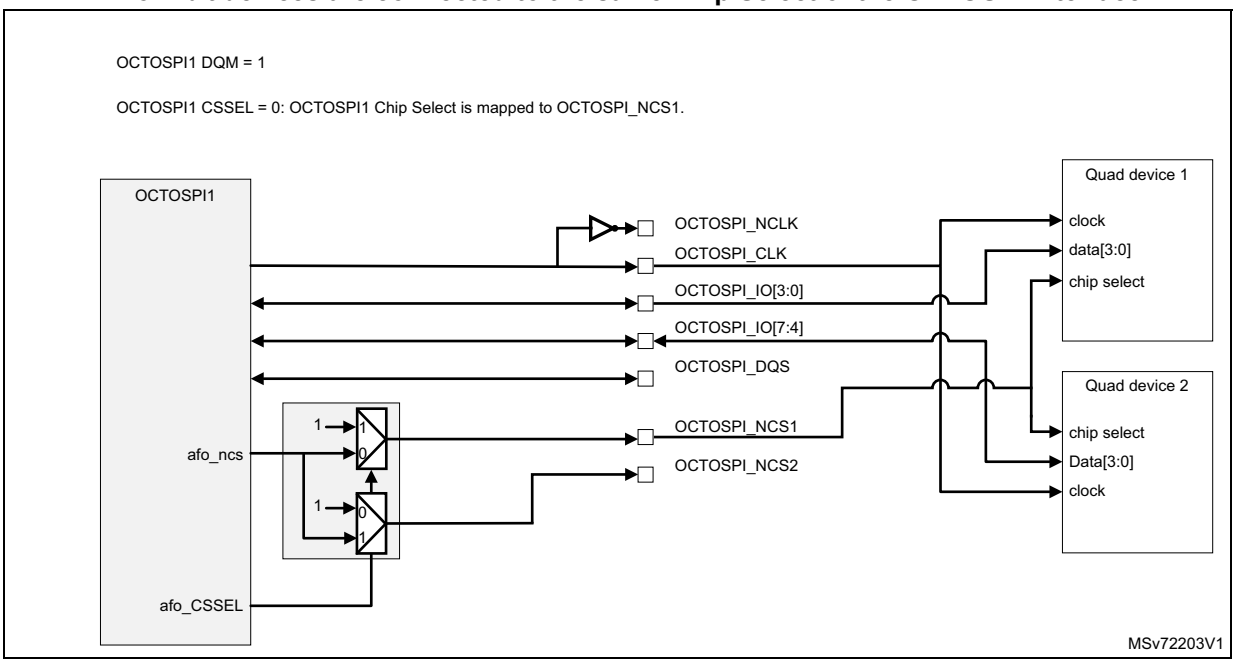
The figure below gives an example of this possibility where two 8-bit devices are attached to the OCTOSPI interface.

Figure 168. Flash configuration example:
2× 8-bit flash devices connected to the OCTOSPI interface



The OCTOSPI interface also supports dual-quad mode. In dual quad mode, two 4-bit devices are connected to the same chip select in order to provide a throughput similar to an 8-bit device. This mode is configured by the bit DQM in OCTOSPI_CR register. An example is shown in the figure below.

Figure 169. Flash configuration example: dual quad mode.
Two 4-bit devices are connected to the same Chip Select of the OCTOSPI interface



31.3.10 Octo-SPI interface programmable parameters

Octo-SPI memory area allocation in memory-mapped mode

Refer to *Section 31.3.4: Octo-SPI interface memory*.

DLYBOS1 control

The DLYBOS1 programmable delay is controlled by bits in SYSCFG_DLYBOS1CR and SYSCFG_DLYBOS1SR registers. The table below gives the correspondence between SYSCFG bitfields and the control parameters described in *Section 31.3.7*.

Table 212. DLYBOS1 SYSCFG bits

DLYBOS1 SYSCFG bits	Control input or status output in the OCTOSPI	Comment
BYP_EN	dll_bypass_cmd_en	Selection of lock or pure-delay mode
EN	dll_start_lock	Enable of DLL when configured in Lock mode
RX_TAP_SEL[5:0]	rx_ph_select[5:0]	Selection of delay in RX delay line
TX_TAP_SEL[5:0]	tx_ph_select[5:0]	Selection of delay in TX delay line
BYP_CMD[4:0]	dll_bypass_cmd[4:0]	Command applied to every delay units in RX and TX delay lines when the DLL is configured in pure-delay mode
LOCK	dll_locked	When in lock mode, indicates that the DLL has locked on the input clock frequency

Table 212. DLYBOS1 SYSCFG bits (continued)

DLYBOS1 SYSCFG bits	Control input or status output in the OCTOSPI	Comment
RX_TAP_SEL_ACK	rx_ph_select_ack	Indicates that the RX delay line has switched to the delay selected by RX_TAP_SEL[5:0]
TX_TAP_SEL_ACK	tx_ph_select_ack	Indicates that the TX delay line has switched to the delay selected by TX_TAP_SEL[5:0]

31.3.11 Select the RX sampling strobe and configure the TX clock

The table below lists the various OCTOSPI modes, and gives guidelines to select the RX sampling strobe and configure the TX clock. Some information is also given on how to enable the DLL.

Table 213. OCTOSPI modes and recommended clock configuration

OCTOSPI Mode	STR or DTR	DQS used in read ?	Max frequency	Setup/Hold constraints on memory device	Data valid Window at output of memory Device	TX clock configuration	RX sampling strobe selection
HyperBus(Cypress, Spansion)	DTR	yes	200 166 133 100 50	0.40 / 0.40 ns 0.60 / 0.60 ns 0.80 / 0.80 ns 1 / 1 ns wrt memory clock edges	1.45 ns 1.70 ns 2.37 ns 3.30 ns	if kernel clock is a multiple of memory clock, set DHQC = 1 (this automatically bypasses the TX delay). If kernel clock is equal to memory clock, set DQHC = 0. The DLL must be used for TX delay.	DQS delayed (DQSE = 1, DLYBYP = 0). The DLL must be used for RX delay.
Macronix [For instr. READ, FASTREAD, OCTAREAD-STR]	STR	no	133 100 66	2 / 2 ns 2 / 2 ns 2 / 2 ns wrt memory clock rising edge	2 ns@10pF 4 ns@15pF 7 ns@30pF	Set DQHC = 0 and configure the TX delay to minimum value.	Feedback clock delayed @133 MHz and 100 MHz (DQSE=0, DLYBYP=0). The DLL must be used for RX delay. Feedback clock @66 MHz (DQSE=0, DLYBYP=1). The DLL is not used for RX delay.
Macronix [For instr. OCTAREAD - DTR]	DTR	yes	133 100 66	0.8 / 0.8 ns 1 / 1 ns 1 / 1 ns	1.5ns@10pF 2.8ns @15pF 4.9ns @30pF	if kernel clock is a multiple of memory clock, set DHQC = 1 (this automatically bypasses the TX delay). If kernel clock is equal to memory clock, set DQHC = 0. The DLL must be used for TX delay.	DQS delayed (DQSE = 1, DLYBYP = 0). The DLL must be used for RX delay.
Micron Xcella (MT35XL01 GBBA ds)	STR	no	133	1.8 / 1.8 ns Wrt memory clock rising edge	2.8ns @12pF	Set DQHC = 0 and configure the TX delay to minimum value.	Feedback clock delayed @133 MHz and 100 MHz (DQSE=0, DLYBYP=0). The DLL must be used for RX delay. Feedback clock @66 MHz (DQSE=0, DLYBYP=1). The DLL is not used for RX delay.
Micron Xcella (MT35XL01 GBBA ds)	DTR	yes	133	0.8 / 0.8 ns Wrt memory clock edges	2 ns	if kernel clock is a multiple of memory clock, set DHQC = 1 (this automatically bypasses the TX delay). If kernel clock is equal to memory clock, set DQHC = 0. The DLL must be used for TX delay.	DQS delayed (DQSE = 1, DLYBYP = 0). The DLL must be used for RX delay.

DHQC is bit #28 in OCTOSPI_TCR register. DQSE is bit #29 in OCTOSPI_CCR register. DLYBYP is bit #3 in OCTOSPI_DCR1 register.

Enabling the DLL for frequencies greater or equal to 50 MHz (lock mode)

The DLL is enabled by setting EN = 1. The DLL lock state is reached when LOCK = 1. Once the DLL is locked, an RX delay value can be selected by programming RX_TAP_SEL[5:0], and a TX delay value can be selected by programming TX_TAP_SEL[5:0]. Each tap corresponds to 1/32th of the memory device clock period. The selected delays are applied to RX sampling strobe and TX launch clock once RX_TAP_SEL_ACK and TX_TAP_SEL_ACK are set to 1.

Enabling the DLL for frequencies lower than 50 MHz (bypass mode)

The DLL is enabled by setting BYP_EN = 1. The command applied to every DLL delay unit is defined by BYP_CMD[4:0] bits (the value 0 is reserved and must not be used). RX_TAP_SEL[5:0] and TX_TAP_SEL[5:0] define the number of elementary delays inserted on RX sampling clock and TX launch clock. For minimum delay, RX_TAP_SEL[5:0] (respectively TX_TAP_SEL[5:0]) must be set to 0.

EN, RX_TAP_SEL[5:0], TX_TAP_SEL[5:0], BYP_EN, BYP_CMD[4:0] bits are located in SYSCFG_DLYBOSnCR (n=1,2) registers. LOCK, RX_TAP_SEL_ACK, TX_TAP_SEL_ACK bits are located in SYSCFG_DLYBOSnSR (n=1,2) registers.

31.4 SD/*e*MMC interface

The SD/*e*MMC interface offers three SD/*e*MMC physical ports. The accesses to the SDMMC controllers are protected by RISUP components.

31.4.1 SD/eMMC interface main features

- SDMMC1 interface:
  - supports SD cards, eMMC memories, and SDIO devices. Alternate multiplexing is optimized for SD.
  - 1-bit, 4-bit, 8-bit modes.
  - SD: supports SD 3.01 up to UHS-1 modes (SDR104, DDR50, SDR50, DDR25) and all backward compatible modes.
  - eMMC: supports eMMC 5.1 up to HS200 (HS400 not supported)
  - SDIO: supports SDIO 4.0 and all backward compatible modes.
  - SD or eMMC devices are supported as Boot device.
  - DLL to tune the RX sampling clock.
  - SDMMC1 IO segment is in a dedicated V_{DDIO1} supply domain. Both 1V8 and 3V3 devices are supported. 1V2 is not supported.
  - 3V3 to 1V8 voltage transition for UHS-1 modes of SD card can be supported in two different ways:

    . An SDMMC1_VSEL function is mapped on a GPIO and controls an external voltage regulator to switch from 3V3 to 1V8. This voltage regulator supplies the SDMMC1 IO segment.

    . External Level Shifters are used. The enable of these Level Shifters is controlled by a GPIO and their direction is controlled by SDMMC1_CDIR, SDMMC1_D0DIR and SDMMC1_D123DIR alternate functions.
- SDMMC2 interface:
  - supports SD cards, eMMC memories and SDIO devices. Alternate multiplexing is optimized for eMMC.
  - 1-bit, 4-bit, 8-bit modes.
  - SD: supports SD 3.01 up to UHS-1 modes (SDR104, DDR50, SDR50, DDR25) and all backward compatible modes.
  - eMMC: supports eMMC 5.1 up to HS200 (HS400 not supported).
  - SDIO: supports SDIO 4.0 and all backward compatible modes.
  - SD or eMMC devices are supported as Boot device.
  - DLL to tune the RX sampling clock.
  - SDMMC2 IO segment is in a dedicated VDDEMMC supply domain. Both 1V8 and 3V3 devices are supported. 1V2 is not supported.
  - 3V3 to 1V8 voltage transition for UHS-1 modes of SD card can be supported in two different ways:

    . An SDMMC2_VSEL function is mapped on a GPIO and controls an external voltage regulator to switch from 3V3 to 1V8. This voltage regulator supplies the SDMMC2 IO segment.

    . External Level Shifters are used. The enable of these Level Shifters is controlled by a GPIO and their direction is controlled by SDMMC2_CDIR, SDMMC2_D0DIR and SDMMC2_D123DIR alternate functions.

- SDMMC3 interface:
  - supports SD cards, eMMC memories (limited to 4-bit) and SDIO devices.
  - 1-bit, 4-bit modes.
  - SD: supports SD 3.01 up to UHS-1 modes (SDR104, DDR50, SDR50, DDR25) and all backward compatible modes.
  - eMMC: supports eMMC 5.1 up to HS200 (HS400 not supported).
  - SDIO: supports up to SDIO 4.0 and all backward compatible modes.
  - DLL to tune the RX sampling clock.
  - SDMMC3 IOs do not have a dedicated supply. They are in VDD IO domain. The external device must also be in VDD IO domain or external Level Shifters must be used.
  - 3V3 to 1V8 voltage transition for UHS-1 modes of SD card can only be supported with external Level Shifters. Like for the other SDMMC interfaces, the enable of these Level Shifters is controlled by a GPIO and their direction is controlled by SDMMC3_CDIR, SDMMC3_D0DIR and SDMMC3_D123DIR alternate functions.

Refer to *Section 34: Secure digital input/output MultiMediaCard interface (SDMMC)*.

31.4.5 DLYBSD1/2 description

One programmable delay is used for each SDMMC interface. The programmable delay can be used to tune the phase of the RX sampling clock in order to sample the data in their valid window. The programmable delay has no effect on the TX path.

These programmable delays are identical to the ones used in the OCTOSPI interfaces. The clock on which the DLL locks is a free running clock provided by the SDMMC controller which is at the same frequency as the clock sent to the memory. When an SDMMC interface operates below 50 MHz, the programmable delay cannot be used. Refer to *Section 31.3.7* for a detailed description.

31.4.6 SD/eMMC interface interrupts

Each SDMMC instance generates one interrupt.

Table 214. SD/eMMC interface interrupts

Peripheral	pin name	CPU1 interrupt	CPU2 interrupt
SDMMC1	IRQ	sdmmc1_gbl_it	sdmmc1_gbl_it
SDMMC2	IRQ	sdmmc2_gbl_it	sdmmc2_gbl_it
SDMMC3	IRQ	sdmmc3_gbl_it	sdmmc3_gbl_it

31.4.7 SD/eMMC interface programmable parameters

Control of external voltage regulator

For SDMMC1 and SDMMC2 interfaces, an external voltage regulator can be used to manage the 3V3 to 1V8 voltage transition for UHS-1 modes of SD card. This external voltage regulator can be controlled by the SDMMC1_VSEL (respectively SDMMC2_VSEL) alternate function. These alternate functions are controlled by the following SYSCFG bits:

- SDMMC1 interface: SDMMC1_VSEL bit in SYSCFG_SDMMC1CR register.
- SDMMC2 interface: SDMMC2_VSEL bit in SYSCFG_SDMMC2CR register.

PWR_CR8.VDDIO1VRSEL (respectively PWR_CR7.VDDIO2VRSEL) must be controlled according to external voltage regulator transition.

DLYBSD1 control

DLYBSD1 programmable delay is controlled by bits in SYSCFG_DLYBSD1CR and SYSCFG_DLYBSD1SR registers. The table below gives the correspondence between the SYSCFG bitfields and the control parameters described in *Section 31.3.7*.

Table 215. DLYBSD1 SYSCFG bits

DLYBSD1 SYSCFG bits	Control input or status output in the SDMMC	Comment
BYP_EN	dll_bypass_cmd_en	Selection of lock or pure-delay mode
EN	dll_start_lock	Enable of DLL when configured in Lock mode
RX_TAP_SEL[5:0]	rx_ph_select[5:0]	Selection of delay in RX delay line

Table 215. DLYBSD1 SYSCFG bits (continued)

DLYBSD1 SYSCFG bits	Control input or status output in the SDMMC	Comment
BYP_CMD[4:0]	dll_bypass_cmd[4:0]	Command applied to every delay units in RX and TX delay lines when the DLL is configured in pure-delay mode
LOCK	dll_locked	When in lock mode, indicates that the DLL has locked on the input clock frequency
RX_TAP_SEL_ACK	rx_ph_select_ack	Indicates that the RX delay line has switched to the delay selected by RX_TAP_SEL[5:0]

DLYBSD2 control

DLYBSD2 programmable delay is controlled by bits in SYSCFG_DLYBSD2CR and SYSCFG_DLYBSD2SR registers. The table below gives the correspondence between the SYSCFG bitfields and the control parameters described in *Section 31.3.7*.

Table 216. DLYBSD2 SYSCFG bits

DLYBSD2 SYSCFG bits	Control input or status output in the SDMMC	Comment
BYP_EN	dll_bypass_cmd_en	Selection of lock or pure-delay mode
EN	dll_start_lock	Enable of DLL when configured in Lock mode
RX_TAP_SEL[5:0]	rx_ph_select[5:0]	Selection of delay in RX delay line
BYP_CMD[4:0]	dll_bypass_cmd[4:0]	Command applied to every delay units in RX and TX delay lines when the DLL is configured in pure-delay mode
LOCK	dll_locked	When in lock mode, indicates that the DLL has locked on the input clock frequency
RX_TAP_SEL_ACK	rx_ph_select_ack	Indicates that the RX delay line has switched to the delay selected by RX_TAP_SEL[5:0]

DLYBSD3 control

DLYBSD3 programmable delay is controlled by bits in SYSCFG_DLYBSD3CR and SYSCFG_DLYBSD3SR registers. The table below gives the correspondence between the SYSCFG bitfields and the control parameters described in *Section 31.3.7*.

Table 217. DLYBSD3 SYSCFG bits

DLYBSD3 SYSCFG bits	Control input or status output in SDMMC	Comment
BYP_EN	dll_bypass_cmd_en	Selection of lock or pure-delay mode
EN	dll_start_lock	Enable of DLL when configured in Lock mode
RX_TAP_SEL[5:0]	rx_ph_select[5:0]	Selection of delay in RX delay line
BYP_CMD[4:0]	dll_bypass_cmd[4:0]	Command applied to every delay units in RX and TX delay lines when the DLL is configured in pure-delay mode
LOCK	dll_locked	When in lock mode, indicates that the DLL has locked on the input clock frequency
RX_TAP_SEL_ACK	rx_ph_select_ack	Indicates that the RX delay line has switched to the delay selected by RX_TAP_SEL[5:0]

31.4.8 Guidelines for selecting the RX sampling clock

The tables below list the various SD/eMMC speed modes and gives guidelines to select the RX sampling clock and configure the clock control bits in the SDMMC cell. It is assumed here that no external level shifters are used. Some information is also given on how to enable the DLL.

Table 218. SD speed modes and recommended clock configuration

Speed Mode	Max card clock freq. SDMMCn_CK	IO Voltage	Setup/hold constraints on SD device	Data valid Window at output of SD Device	Kernel clock freq (SCLK)	DDR	NEGEDGE	CLKDIV	Selection of RX sampling clock (SELCLKRX)
DS (default speed)(1)	25 MHz	3V3	5ns/5ns	26ns	25 MHz	0	NA	0 (div by 1)	SDMMC_CLKio
HS (high speed)(1)	50 MHz	3V3	6ns/2ns	8.5ns	50 MHz	0	NA	0 (div by 1)	SDMMC_CLKio
SDR12(1)	25 MHz	1V8	3ns/0.8ns	27.5ns	25 MHz	0	NA	0 (div by 1)	SDMMC_CLKio
SDR25(1)	50 MHz	1V8	3ns/0.8ns	7.5ns	50 MHz	0	NA	0 (div by 1)	SDMMC_CLKio
DDR50 (2)	50 MHz	1V8	3ns/0.8ns	4.5ns	50 MHz	1	(3)	1 (div by 2)	SDMMC_CLKio
SDR50(2)	100 MHz	1V8	3ns/0.8ns	4ns	100 MHz	0	NA	0 (div by 1)	SDMMC_CLKio
SDR104	208 MHz	1V8	1.4ns/0.8ns	2,88ns	208 MHz	0	NA	0 (div by 1)	SDMMC_FB_CLK

1. For these modes, other clock configurations exist where the kernel clock frequency is a multiple of the card clock. However, considering that all three SDMMC controllers have dedicated kernel clocks, it seems more straightforward to align the kernel clock frequency with the card clock frequency.
2. For these modes, it is also possible to enable the programmable delay and select the delayed loopback clock (SDMMC_FB_CLK) as RX sampling clock if it is needed to adjust the sampling edge.
3. Value to be programmed depend on timings of the interface. For functional simulation, either value works.

Table 219. eMMC Speed modes and recommended clock configuration

Speed Mode	Max card clock freq. SDMMCn_CK	IO Voltage(1)	Setup/Hold constraints on SD device	Data valid Window at output of eMMC Device	Kernel clock freq (SCLK)	DDR	NEGEDGE	CLKDIV	Selection of RX sampling clock (SELCLKRX)
Legacy compatible(2)	26 MHz	3V3, 1V8, 1V2	3ns/3ns	20ns	26 MHz	0	NA	0 (div by 1)	SDMMC_CLKio
High speed SDR(2)	52 MHz	3V3, 1V8, 1V2	3ns/3ns	8ns	52 MHz	0	NA	0 (div by 1)	SDMMC_CLKio
High Speed DDR(3)	52 MHz	3V3, 1V8, 1V2	CMD: 3ns/3ns DATA: 2.5ns/2.5ns	CMD: 8ns DATA: 4.1ns	104 MHz	1	(4)	1 (div by 2)	SDMMC_CLKio
High speed HS200	200 MHz	1V8, 1V2	1.4ns/0.8ns	0.575 UI (2.88ns at 200 MHz)	200 MHz	0	NA	0 (div by 1)	SDMMC_FB_CLK

1. 1V2 is not supported in STM32MP21xx.
2. For these modes, other clock configurations exist where the kernel clock frequency is a multiple of the card clock. However, considering that all three SDMMC controllers have dedicated kernel clocks, it seems more straightforward to align the kernel clock frequency with the card clock frequency.
3. For this mode, it is also possible to enable the programmable delay and select the delayed loopback clock (SDMMC_FB_CLK) as RX sampling clock if it is needed to adjust the sampling edge.
4. Value to be programmed depend on timings of the interface. For functional simulation, either value works.

DDR, NEGEDGE, CLKDIV and SELCLKRX are bitfields in SDMMC_CLKCR register.

The DLL is enabled by writing BYP_EN to 0 and setting EN to 1. The DLL lock state is reached when the status bit LOCK is equal to 1. Once the DLL is locked, a delay value can be selected by programming RX_TAP_SEL[5:0]. The selected delay is applied to the RX sampling clock when the status bit RX_TAP_SEL_ACK is equal to 1. Theses control and status bits are located in the SYSCFG_DLYBSDnCR and SYSCFG_DLYBSDnSR registers (n=1,2,3).

Sequencing between SDMMC and DLL programming when the DLL is used

1. Enable in SDMMC the generation of the free running clock towards the DLL. This is done as soon as PWRCTRL is set to 0b11.
2. Once the memory frequency is increased to high speed (i.e. after the initialization sequence), reset and enable the DLL. The reset of the DLL is controlled by SDMMCnDLLRST (n=1,2,3) bit in the RCC. The enable of the DLL is controlled by EN bit in SYSCFG_DLYBSDnCR (n=1,2,3) register.
3. Once the DLL is locked (as indicated by LOCK = 1 in SYSCFG_DLYBSDnSR register), select the delayed feedback clock as the RX sampling clock by writing SELCLKRX to 0b10.
4. Select the RX delay value by programming RX_TAP_SEL[5:0] in SYSCFG_DLYBSDnCR .
5. Wait for RX_TAP_SEL_ACK bit to be set to 1 in SYSCFG_DLYBSDnSR register before reading data from memory.

At startup a tuning phase is required where steps 4 and 5 are repeated for every RX_TAP_SEL[5:0] values. This enables to determine a range of delays where data are read successfully. The delay value corresponding to the middle of this valid range must be selected for further operation.

32 Flexible memory controller (FMC)

The flexible memory controller (FMC) includes two memory controllers:

- the NOR/PSRAM memory controller
- the NAND memory controller

32.1 FMC main features

The FMC functional block makes the interface with: synchronous and asynchronous static memories, and NAND flash memory. Its main purposes are:

- to translate AXI transactions into the appropriate external device protocol
- to meet the access time requirements of the external memory devices

All external memories share the addresses, data and control signals with the controller. Each external device is accessed by means of a unique Chip Select. The FMC performs only one access at a time to an external device.

The main features of the FMC are the following:

- Interface with static-memory mapped devices including:
  - Static random access memory (SRAM)
  - NOR flash memory/One NAND flash memory
  - PSRAM (4 memory subregions)
  - Ferroelectric RAM (FRAM)
  - NAND flash memory with ECC hardware to check up to 8 Kbytes of data
- Burst mode support for faster access to synchronous devices such as NOR flash memory, PSRAM)
- Programmable continuous clock output for asynchronous and synchronous accesses
- 8-,16-bit wide data bus
- Independent chip-select control for each memory region
- Independent configuration for each memory region
- Write enable and byte lane select outputs for use with PSRAM, SRAM devices
- External asynchronous wait control
- Security and Isolation compliant with the Resource Isolation Framework (RIF)

At startup the FMC pins must be configured by the user application. The FMC input/output pins which are not used by the application can be used for other purposes.

After reset, the FMC is disabled. Once all the used memory controllers are configured, the FMC must be enabled by setting the FMCEN bit.

The FMC registers that define the external device type and associated characteristics are set at boot time and do not change until the next reset or power-up. If some registers have to be re-configured, the FMC must be disabled (FMCEN bit set to 0x0). However, only few bits can be changed on the fly:

- FMCEN bit
- ECCEN and PBEN bits in FMC_PCR register
- FMC_CSQICR and FMC_CSQIER register bits

- FMC command sequencer registers and FMC BCH registers
- WEN bit in the FMC_PCR register

If some parameters have to be modified while the FMC is enabled, the FMC must be first disabled so that no further access is allowed to any memory controller during register modification. Once all needed configurations are updated, enable the FMC as follows:

1. Disable FMC by resetting the FMCEN bit.
2. Wait ISOST[1:0] bits in FMC_SR register to be set to 0b11.
3. Wait until PEF flag is set in the FMC_SR register.
4. Program the registers with new values.
5. Enable the FMC by setting the FMCEN bit.

32.2 FMC implementation

Table 220. FMC features

Modes/features	FMC
NAND flash chip-select outputs	4
NAND flash RNBx inputs	1
NAND/NOR flash with common WAIT pin	No

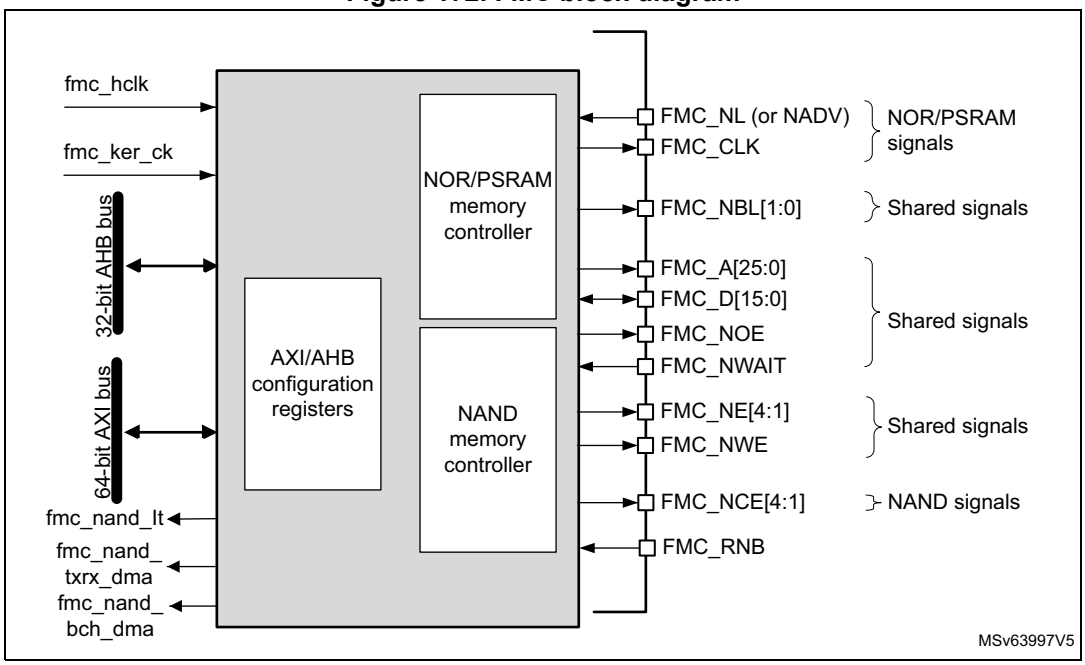
32.3 FMC block diagram

The FMC consists of the following main blocks:

- The NOR flash/PSRAM/SRAM controller
- The NAND controller
- The AXI interface
- The AHB interface (including the FMC configuration registers)

The block diagram is shown in the below figure.

Figure 172. FMC block diagram



1. The FMC features four NCEx chip select outputs.

32.4 FMC internal signals

Table 221 gives the list of FMC internal signals. FMC pins (or external signals) are described in *Section 32.10.1: External memory interface signals*.

Table 221. FMC internal signals

Names	Signal type	Description
fmc_nand_it	Digital output	FMC NAND flash interrupt
fmc_ker_ck	Digital input	FMC kernel clock
fmc_hclk	Digital input	FMC interface clock
fmc_nand_txrx_dma	Digital output	DMA request for reading or writing data from/to NAND flash memory
fmc_nand_bch_dma	Digital output	DMA request for BCH results

32.5 AHB interface

The AHB slave interface allows internal CPUs to configure the FMC registers.

The AHB clock (HCLK) is the reference clock for the FMC register accesses.

The FMC registers must be accessed by words (32 bits). For non 32-bit AHB accesses, FMC does not return an AHB bus error and the register value can be corrupted.

32.6 AXI interface

The AXI slave interface allows internal CPUs and other bus master peripherals to access the external memories.

AXI transactions are translated into the external device protocol. As the AXI data bus is 64-bit wide, the AXI transactions might be split into several consecutive 32- or 16- or 8-bit accesses according to data size accesses.

The FMC generates an AXI slave error when one of the following conditions is met:

- When reading or writing to an FMC memory region (memory region 1 to 4) which is not enabled
- When reading or writing to any FMC memory region while the FMC is disabled (FMCEN bit is reset)
- When reading or writing by the command sequencer to NAND memory region while it is disabled
- When reading or writing to the NOR flash memory region while the MBKEN bit is reset in the FMC_BCRx register

The kernel clock for the FMC is the asynchronous fmc_ker_ck clock (refer the Reset and Clock control (RCC) section for details on fmc_ker_ck clock source selection).

32.6.1 Supported memories and transactions

General transaction rules

The requested AXI transaction data size can be 8-, 16-, 32- or 64-bit wide whereas the accessed external device has a fixed data width. This may lead to inconsistent transfers.

Therefore, some simple transaction rules must be followed:

- AXI transaction size and memory data size must be equal to prevent issues from occurring.
- AXI transaction size is greater than the memory size:

  In this case, the FMC splits the AXI transaction into smaller consecutive memory accesses to meet the external data width.
- AXI transaction size is smaller than the memory size:

  The transfer may or not be consistent depending on the type of external device:
  - Accesses to devices that have the byte select feature (SRAM, ROM, PSRAM)

    In this case, the FMC allows read/write transactions and accesses the right data through its byte lanes NBL[1:0].

    Bytes to be written are addressed by NBL[1:0].

    All memory bytes are read (NBL[1:0] are driven low during read transaction) and the useless ones are discarded.
  - Accesses to devices that do not have the byte select feature (NOR and NAND flash memories)

    This situation occurs when a byte access is requested to a 16-bit wide flash memory. Since the device cannot be accessed in Byte mode (only 16-bit words can be read/written from/to the flash memory), write transactions are not allowed while read transactions are allowed (the controller reads the entire 16-bit memory word and uses only the required byte).

Wrap support for NOR flash/PSRAM

Synchronous memories must be configured in Linear burst mode of undefined length as not all masters can issue wrap transactions.

If a master generates a wrap transaction:

- The read operation is split into two linear burst transactions.
- The write operation is split into two linear burst transactions.

Configuration registers

The FMC can be configured through a set of registers. Refer to *Section 32.10.6*, for a detailed description of the NOR flash/PSRAM controller registers. Refer to *Section 32.11.9*, for a detailed description of the NAND flash registers.

32.7 External device address mapping

From the FMC point of view, the external memory is divided into fixed-size memory regions of 256 Mbytes each (see *Table 222*):

- Memory region 1 is used to address up to 4 NOR flash memories or PSRAM devices. This region is split into four NOR/PSRAM subregions with four dedicated Chip Selects, as follows:
  - Subregion 1 - NOR/PSRAM 1
  - Subregion 2 - NOR/PSRAM 2
  - Subregion 3- NOR/PSRAM 3
  - Subregion 4 - NOR/PSRAM 4

Note: The Memory region 1 type attribute must be declared as 'device'.

For each memory region, the type of memory to be used can be configured by the user application through the Configuration register.

Table 222. FMC memory regions (default mapping)

Address	Memory region	Supported memory type
0x6000 0000 - 0x6FFF FFFF	Memory region 1	NOR flash memory/PSRAM/SRAM

32.7.1 NOR/PSRAM address mapping

ADDR[27:26] bits are used to select one of the four memory subregions as shown in *Table 223*.

Table 223. NOR/PSRAM subregion selection

ADDR[27:26](1)	Selected subregion
00	Subregion 1 - NOR/PSRAM 1
01	Subregion 2 - NOR/PSRAM 2
10	Subregion 3- NOR/PSRAM 3
11	Subregion 4- NOR/PSRAM 4

1. ADDR are internal address lines that are translated to external memory.

The ADDR[25:0] bits contain the external memory address. Since ADDR is a byte address whereas the memory is addressed at word level, the address actually issued to the memory varies according to the memory data width, as shown in the following table.

Table 224. NOR/PSRAM External memory address

Memory width(1)	Data address issued to the memory	Maximum memory capacity (bits)
8-bit	ADDR[25:0]	64 Mbytes * 8 = 512 Mbit
16-bit	ADDR[25:1] >> 1	64 Mbytes/2 * 16 = 512 Mbit

1. In case of a 16-bit external memory width, the FMC internally uses ADDR[25:1] to generate the address for external memory FMC_A[24:0].
Whatever the external memory width, FMC_A[0] must be connected to external memory address A[0].

32.7.2 NAND flash memory address mapping

The 4 Kbyte NAND flash address bits are mapped according to *Table 225*.

Table 225. NAND access memory map

Address field	FMC signal name	Function	Detailed description
ADDR[11:10]	NCEx	NAND chip enable selection	00: NCE1 01: NCE2 10: NCE3 11: NCE4
ADDR[9:8]	-	Reserved	-
ADDR[7]	-	Timing selection	0: Common space, timing defined by FMC_PMEM 1: Attribute space, timing defined by FMC_PATT
ADDR[6]	-	Reserved	-
ADDR[5]	A[17]	Address (ALE)	00: Data section 01: Command section 10: Address section 11: reserved
ADDR[4](1)	A[16]	Command (CLE)	

1. Four address LSBs are don't care: each section has 16 bytes mapped to the alias region.

The application software uses the 3 sections to access the NAND flash memory:

- **To send a command to NAND flash memory**, the software must write the command value to any memory location in the command section.
- **To specify the NAND flash address that must be read or written**, the software must write the address value to any memory location in the address section. Since an address can be 4 or 5 bytes long (depending on the actual memory size), several consecutive write operations to the address section are required to specify the full address.
- **To read or write data,** the software reads or writes the data from/to any memory location in the data section.

Since the NAND flash memory automatically increments addresses, there is no need to increment the address of the data section to access consecutive memory locations.

Note: The NAND region has to be accessed as a device and not as memory. Write accesses to command and address sections must be done in Byte mode and aligned with the section base address (offset = 0).

Read and Write accesses to NAND data section must be in Byte mode for 8-bit NAND flash memories and Byte or Half-word mode for 16-bit NAND flash memories.

Read and Write bursts must start at section base address (offset = 0) and must not cross the 16-byte section boundary.

32.8 FMC security and isolation

The FMC supports security and isolation compliant with the Resource Isolation Framework (RIF). Refer to Section *Resource Isolation Framework* (RIF).

From RIF view point, the FMC is composed of several independent resources, listed below, which can be assigned to different security and compartment domains. They are referenced by an index in the RIF programming model:

- 0: Common FMC_CFGR register
- 1: NOR/PSRAM controller for Chip Select NE1, including registers and associated memory map subregion (64 Mbytes)
- 2: NOR/PSRAM controller for Chip Select NE2, including registers and associated memory map subregion (64 Mbytes)
- 3: NOR/PSRAM controller for Chip Select NE3, including registers and associated memory map subregion (64 Mbytes)
- 4: NOR/PSRAM controller for Chip Select NE4, including registers and associated memory map subregion (64 Mbytes)
- 5: NAND controller, including registers and associated memory map subregion (4 Kbytes)

Note: Only the current NAND controller owner is notified by an interrupt and able to clear it. This owner can be any CID if no filtering is used (CFEN = 0 in FMC_CIDCFGRx), SCID if filtering is used (CFEN = 1) or SEMCID if both filtering and semaphore are used (CFEN = 1 and SEMEN =1) and if SEM_MUTEX = 1. No interrupt is issued when SEM_MUTEX = 0 as there is no owner. In case of sharing with MUTEX, it is mandatory that the owner releases the NAND flash memory resource in a clean state, that is after all pending interrupts have been cleared and masked.

The FMC RIF-compliant security and isolation supports:

- Filtering of secure/non-secure accesses for each resource according to its domain definition.
- Filtering of privileged/unprivileged accesses for each resource according to its domain definition.
- Filtering of compartment identifier (CID) for each resource according to its domain definition
- CID domain definition using dedicated semaphore (optional)
- Locking of security, privilege and CID domain settings for each resource.

Resource access definition is set through dedicated registers:

- FMC_SECCFGR configures the security of local resources.
- FMC_PRIVCFGR configures the privilege of local resources.
- FMC_CIDCFGRx configures compartment access for local resources.
- FMC_SEMCRx is used to configure local semaphore (when used).

By default, all FMC resources are non-secure, unprivileged, they can be accessed in read/write mode by any master, and CID based filtering is disabled.

Trusted domain (TDCID secure, privileged) can configure compartment IDs for FMC resources through FMC_CIDCFRx registers.

RIF-compliant FMC security and Isolation also supports the following features:

- Interrupt gating: a NAND controller interrupt is sent only to the interrupt controller attached to the NAND controller compartment.
- Failed accesses are reported by the illegal access controller (IAC) without bus errors. They are silently ignored. No bus errors are generated by the FMC: failed write operations are ignored, and read operations return zero value on any bus.
- FMC kernel clock gating by RCC is not conditioned by hardware according to FMC resource state. The kernel clock can only be gated after all resources are idle, under application software responsibility.For this purpose local status register bits are read accessible by all domains.

Register accesses are defined in *Table 226*, where:

TD: written only by the trusted domain according to its TDCID

C: bitwise filtering is conditioned to the corresponding register (FMC_SECCFGR,FMC_PRIVCFGR, or FMC_CIDCFGR), all filters must pass.

Y: filtering according to security and privilege

N: no filtering is applied

Table 226. FMC RIF register properties and definitions

Registers	Security	Privilege	CID	Registers used for access definition
FMC_CFGR	C	C	C(1)	FMC_SECCFGR.SEC0, FMC_SECCFGR.PRIV0, FMC_RCFGLOCKR.LOCK0, FMC_CIDCFGR0, FMC_SEMCR0
FMC_BRCR1, FMC_BRTR1, FMC_BWTR1	C	C	C	FMC_SECCFGR.SEC1, FMC_SECCFGR.PRIV1, FMC_RCFGLOCKR.LOCK1, FMC_CIDCFGR1, FMC_SEMCR1
FMC_BRCR2, FMC_BRTR2, FMC_BWTR2	C	C	C	FMC_SECCFGR.SEC2, FMC_SECCFGR.PRIV2, FMC_RCFGLOCKR.LOCK2, FMC_CIDCFGR2, FMC_SEMCR2
FMC_BRCR3, FMC_BRTR3, FMC_BWTR3	C	C	C	FMC_SECCFGR.SEC3, FMC_SECCFGR.PRIV3, FMC_RCFGLOCKR.LOCK3, FMC_CIDCFGR3, FMC_SEMCR3

Table 226. FMC RIF register properties and definitions (continued)

Registers	Security	Privilege	CID	Registers used for access definition
FMC_BRCR4, FMC_BRTR4, FMC_BWTR4	C	C	C	FMC_SECCFGR.SEC4, FMC_SECCFGR.PRIV4, FMC_RCFGLOCKR.LOCK4, FMC_CIDCFGR4, FMC_SEMCR4

FMC_SR, FMC_HWCFGR1, FMC_HWCFGR2, FMC_HWCFGR3, FMC_VERR, FMC_IPIDR, FMC_SIDR	N	N	N	Read -only, read by all
FMC_SECCFGR	Y	Y	C	Bit write only by assigned CID according to FMC_CIDCFGR, FMC_SEMCR and by DDCID according to DDEN. Read by all.
FMC_PRIVCFGR	C	Y	C	Bit write only by assigned CID according to FMC_CIDCFGR, FMC_SEMCR and by DDCID according to DDEN and security configuration. Read by all.
FMC_RCFGLOCKR	Y	Y	TD(1)	Read by all.
FMC_CIDCFGRx	Y	Y	TD(1)	Read by all.
FMC_SEMCRx	C	C	C	Read by all.

1. The debug domain (according to DDCID and RIF DDEN signal) can access all registers when passing secure and privilege filtering.

32.9 FMC RIF registers

32.9.1 FMC security configuration register (FMC_SECCFGR)

Address offset: 0x300

Reset value: 0x0000 0000

Non-secure or unprivileged write accesses to this register are ignored. Read accesses are allowed.

If compartment filtering is enabled (respectively disabled), only trusted domain, secure debug domain (CID) or an allowed secure privileged compartment (respectively any secure privileged compartment) can write to this register.

32.9.2 FMC security configuration register (FMC_PRIVCFGR)

Address offset: 0x304

Reset value: 0x0000 0000

Non-secure or unprivileged write accesses to this register are ignored. Read accesses are allowed.

If compartment filtering is enabled (respectively disabled), only trusted domain, secure debug domain (CID) or an allowed secure privileged compartment (respectively any secure privileged compartment) can write to this register.

32.9.3 FMC CID configuration lock register (FMC_RCFGLOCKR)

Address offset: 0x308

Reset value: 0x0000 0000

Only secure privileged write accesses to this register are allowed. This register can be written only by trusted domain and debug domain (CID). Read accesses are allowed.

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 Reserved, must be kept at reset value.

Bit 5 **LOCK5:** Lock NAND controller until a global FMC reset
0: no effect
1: FMC_CIDCFGR5, SEC[5] of FMC_SECCFGR and FMC_PRIVCFGR[5] are write locked

Bit 4 **LOCK4:** Lock NOR/PSRAM controller for Chip Select NE4 until a global FMC reset
0: no effect
1: FMC_CIDCFGR4, SEC[4] of FMC_SECCFGR and FMC_PRIVCFGR[4] are write locked

Bit 3 **LOCK3:** Lock NOR/PSRAM controller for Chip Select NE3 until a global FMC reset
0: no effect
1: FMC_CIDCFGR3, SEC[3] of FMC_SECCFGR and FMC_PRIVCFGR[3] are write locked

Bit 2 **LOCK2:** Lock NOR/PSRAM controller for Chip Select NE2 until a global FMC reset
0: no effect
1: FMC_CIDCFGR2, SEC[2] of FMC_SECCFGR and FMC_PRIVCFGR[2] are write locked

Bit 1 **LOCK1:** Lock NOR/PSRAM controller for Chip Select NE1 until a global FMC reset
0: no effect
1: FMC_CIDCFGR1, SEC[1] of FMC_SECCFGR and FMC_PRIVCFGR[1] are write locked

Bit 0 **LOCK0:** Lock FMC_CFGR until a global FMC reset
0: no effect
1: FMC_CIDCFGR0, SEC[0] of FMC_SECCFGR and FMC_PRIVCFGR[0] are write locked

32.9.4 FMC resource x CID register (FMC_CIDCFGRx)

Address offset: 0x30C + 0x8 * x (x = 0 to 5)

Reset value: 0x0000 0000

x designates an FMC resource with associated registers:

x = 0: FMC common control, FMC_CFGR

x = 1: NOR/PSRAM controller for Chip Select NE1 and its memory map address space

x = 2:NOR/PSRAM controller for Chip Select NE2 and its memory map address space

x = 3: NOR/PSRAM controller for Chip Select NE3 and its memory map address space

x = 4: NOR/PSRAM controller for Chip Select NE4 and its memory map address space

x = 5: NAND controller and its memory map address space

Only secure privileged write accesses to this register are allowed. This register can be written only by trusted domain and debug domain (CID) provided LOCKx is cleared in FMC_RCFGLOCKR register.

Read accesses from this register are allowed.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SCID[2:0]			Res.	Res.	SEMEN	CFEN
									rw	rw	rw			rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **SEMWLC7:** White-listed CID in the CID allocation pool for resource x in semaphore mode
0: CID7 is black-listed in CID allocation pool
1: CID7 is white-listed in CID allocation pool

Bit 22 **SEMWLC6:** White-listed CID0 in the CID allocation pool for resource x in semaphore mode
0: CID6 is black-listed in CID allocation pool
1: CID6 is white-listed in CID allocation pool

Bit 21 **SEMWLC5:** White-listed CID0 in the CID allocation pool of resource x in semaphore mode
0: CID5 is black-listed in CID allocation pool
1: CID5 is white-listed in CID allocation pool

Bit 20 **SEMWLC4:** White-listed CID0 in the CID allocation pool of resource x in semaphore mode
0: CID4 is black-listed in CID allocation pool
1: CID4 is white-listed in CID allocation pool

Bit 19 **SEMWLC3:** White-listed CID in the CID allocation pool of resource x in semaphore mode
0: CID3 is black-listed in CID allocation pool
1: CID3 is white-listed in CID allocation pool

Bit 18 **SEMWLC2:** White-listed CID in the CID allocation pool of resource x in semaphore mode
0: CID2 is black-listed in CID allocation pool
1: CID2 is white-listed in CID allocation pool

Bit 17 **SEMWLC1:** White-listed CID0 in the CID allocation pool of resource x in semaphore mode
0: CID1 is black-listed in CID allocation pool
1: CID1 is white-listed in CID allocation pool

Bit 16 **SEMWLC0:** White-listed CID0 in the CID allocation pool of resource x in semaphore mode
0: CID0 is black-listed in CID allocation pool
1: CID0 is white-listed in CID allocation pool

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:4 **SCID[2:0]:** Static CID for resource x
Trusted domain applications use this bit to statically define which compartment has access to the resource x when SEMEN=0.
This bit is ignored if SEMEN=1 or CFEN=0.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **SEMEN:** Semaphore enable for resource x
0: disable the semaphore mode
1: enable the semaphore mode

Bit 0 **CFEN:** CID filtering enable for resource x
0: disable CID filtering
1: enable CID filtering

32.9.5 FMC resource x semaphore control register (FMC_SEMCRx)

Address offset: 0x310+ x * 0x8 (x = 0 to 5)

Reset value: 0x0000 0000

x designates an FMC resource with associated registers:

x = 0: FMC common control, FMC_SEMCR

x = 1: NOR/PSRAM controller for Chip Select NE1 and its memory map address space

x = 2:NOR/PSRAM controller for Chip Select NE2 and its memory map address space

x = 3: NOR/PSRAM controller for Chip Select NE3 and its memory map address space

x = 4: NOR/PSRAM controller for Chip Select NE4 and its memory map address space

x = 5: NAND controller and its memory map address space

When the secure, privileged and trusted domain has set up resource x in semaphore mode (SEMEN=1 in FMC_CIDCFGRx), the FMC_SEMCRx register can be used during runtime by any authorized white-listed CID agent to take and release the control of resource x.

Read accesses can be privileged or unprivileged, secure or non-secure, and with any CID.

Write accesses are ignored if CFEN = 0 or SEMEN = 0 in FMC_CIDCFGRx.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEMCID[2:0]			Res.	Res.	Res.	SEM_MUTEX
									r	r	r				rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **SEMCID[2:0]:** Current CID allocated to resource x in semaphore mode

The field is read-only. It is internally updated when a white-listed CID has taken the control of resource x, in semaphore mode. If SEM_MUTEX=0, this CID also released it.

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **SEM_MUTEX:** Mutex for the CID allocation of resource x in semaphore mode

Write access:

Write 0: Control of resource x (in semaphore mode) released to any white-listed CID

Write 1: Control of resource x (in semaphore mode) acquired by a white-listed CID

Read access:

Read 0: Resource x is CID-free, meaning that it is not (currently) under the control of any white-listed CID

Read 1: Resource x is CID-allocated, meaning that it is (currently) under the control of one white-listed CID

If resource x is in secure state (SECx=1 in FMC_SECCFGR), this bit can be written only by a secure agent.

If resource x is in privileged state (FMC_PRIVCFGR.PRIVx=1), this bit can be written only by a privileged agent.

If resource x is CID-filtered (CFEN=1 in FMC_CIDCFGRx) and in semaphore mode (FMC_CIDCFGR.SEMEN=1), this bit can be written either by an authorized (white-listed) CID agent to acquire the control or by the same (white-listed) CID agent to release the control.

32.10 NOR flash/PSRAM controller

Caution: The FMC/NOR non-muxed mode is not supported on the STM32MP21xx devices. The muxed mode is enabled by default. The ASYNCWAIT and MUXEN bits of the FMC_BCRx registers, which are not applicable in muxed mode, must be left at their default value.

The FMC generates the appropriate signal timings to drive the following types of memories:

- Asynchronous SRAM, FRAM and ROM
  - 8 bits
  - 16 bits
- PSRAM (CellularRAM™)
  - Asynchronous mode
  - Burst mode for synchronous accesses with configurable option to split burst access when crossing boundary page for CRAM 1.5.
  - Multiplexed or non-multiplexed
- NOR flash memory
  - Asynchronous mode
  - Burst mode for synchronous accesses
  - Multiplexed or non-multiplexed

The FMC outputs a unique Chip Select signal, NE[4:1], per memory region. All the other signals (addresses, data and control) are shared.

The FMC supports a wide range of devices through a programmable timings among which:

- Programmable wait-states (up to 15)
- Programmable bus turnaround cycles (up to 15)
- Programmable output enable and write enable delays (up to 15)
- Independent read and write timings and protocol to support the widest variety of memories and timings
- Programmable continuous clock (FMC_CLK) output.

The FMC output Clock (FMC_CLK) is a submultiple of the fmc_ker_ck clock. It can be delivered to the selected external device either during synchronous accesses only or during asynchronous and synchronous accesses depending on the CCKEN bit configuration in the FMC_BCR1 register:

- If the CCLKEN bit is reset, the FMC generates the clock (FMC_CLK) only during synchronous accesses (Read/write transactions).
- If the CCLKEN bit is set, the FMC generates a continuous clock during asynchronous and synchronous accesses. To generate the FMC_CLK continuous clock, memory region 1 must be configured in synchronous mode (see *Section 32.10.6: NOR/PSRAM controller registers*). Since the same clock is used for all synchronous memories, when a continuous output clock is generated and synchronous accesses are performed, the AXI data size has to be the same as the memory data width (MWID[1:0]) otherwise the FMC_CLK frequency is changed depending on AXI data transaction (refer to *Section 32.10.5: Synchronous transactions* for FMC_CLK divider ratio formula).

The size of each memory region is fixed and equal to 64 Mbytes. Each memory region is configured through dedicated registers (see *Section 32.10.6: NOR/PSRAM controller registers*).

The programmable memory parameters include access times (see *Table 227*) and support for wait management (for PSRAM and NOR flash accessed in burst mode).

Table 227. Programmable NOR/PSRAM access parameters

Parameter	Function	Access mode	Unit	Min.	Max.
Address setup	Duration of the address setup phase	Asynchronous	FMC clock cycle (fmc_ker_ck)	0	15
Address hold	Duration of the address hold phase	Asynchronous, muxed I/Os	FMC clock cycle (fmc_ker_ck)	1	15
NBL setup	Duration of the Byte lanes setup phase	Asynchronous	FMC clock cycle (fmc_ker_ck)	0	3
Data setup	Duration of the data setup phase	Asynchronous	FMC clock cycle (fmc_ker_ck)	1	256
Data hold	Duration of the data hold phase	Asynchronous	FMC clock cycle (fmc_ker_ck)	0	3
Bust turn	Duration of the bus turnaround phase	Asynchronous and synchronous read	FMC clock cycle (fmc_ker_ck)	0	15
Clock divide ratio	Number of FMC clock cycles (fmc_ker_ck) to build one memory clock cycle (CLK)	Synchronous	FMC clock cycle (fmc_ker_ck)	2	16
Data latency	Number of clock cycles to issue to the memory before the first data of the burst	Synchronous	Memory clock cycle (fmc_ker_ck)	2	17

32.10.1 External memory interface signals

Table 228, *Table 229* and *Table 230* list the signals that are typically used to interface with NOR flash memory, SRAM and PSRAM.

Note: The prefix “N” identifies the signals which are active low.

NOR flash memory, non-multiplexed I/Os

Table 228. Non-multiplexed I/O NOR flash memory

FMC signal name	I/O	Function
CLK	O	Clock (for synchronous access)
A[25:0]	O	Address bus
D[15:0]	I/O	Bidirectional data bus
NE[x]	O	Chip Select, x = 1 to 4
NOE	O	Output enable
NWE	O	Write enable
NL(=NADV)	O	Latch enable (this signal is called address valid, NADV, by some NOR flash devices)
NWAIT	I	NOR flash wait input signal to the FMC

The maximum capacity is 512 Mbits (26 address lines).

NOR flash memory, 16-bit multiplexed I/Os

Table 229. 16-bit multiplexed I/O NOR flash memory

FMC signal name	I/O	Function
CLK	O	Clock (for synchronous access)
A[25:16]	O	Address bus
AD[15:0]	I/O	16-bit multiplexed, bidirectional address/data bus (the 16-bit address A[15:0] and data D[15:0] are multiplexed on the databus)
NE[x]	O	Chip Select, x = 1 to 4
NOE	O	Output enable
NWE	O	Write enable
NL(=NADV)	O	Latch enable (this signal is called address valid, NADV, by some NOR flash devices)
NWAIT	I	NOR flash wait input signal to the FMC

The maximum capacity is 512 Mbits.

PSRAM/SRAM/FRAM, non-multiplexed I/Os

Table 230. Non-multiplexed I/Os PSRAM/SRAM

FMC signal name	I/O	Function
CLK	O	Clock (only for PSRAM synchronous access)
A[25:0]	O	Address bus
D[15:0]	I/O	Data bidirectional bus
NE[x]	O	Chip Select, x = 1 to 4 (called NCE by PSRAM (CellularRAM™, CRAM))
NOE	O	Output enable
NWE	O	Write enable
NL(= NADV)	O	Address valid only for PSRAM input (memory signal name: NADV)
NWAIT	I	PSRAM wait input signal to the FMC
NBL[1:0]	O	Byte lane output (upper and lower byte enable)

The maximum capacity is 512 Mbits.

PSRAM, 16-bit multiplexed I/Os

Table 231. 16-bit multiplexed I/O PSRAM

FMC signal name	I/O	Function
CLK	O	Clock (for synchronous access)
A[25:16]	O	Address bus

Table 231. 16-bit multiplexed I/O PSRAM (continued)

FMC signal name	I/O	Function
AD[15:0]	I/O	16-bit multiplexed, bidirectional address/data bus (the 16-bit address A[15:0] and data D[15:0] are multiplexed on the databus)
NE[x]	O	Chip Select, x = 1 to 4 (called NCE by PSRAM (CellularRAM™, CRAM))
NOE	O	Output enable
NWE	O	Write enable
NL(= NADV)	O	Address valid PSRAM input (memory signal name: NADV)
NWAIT	I	PSRAM wait input signal to the FMC
NBL[1:0]	O	Byte lane output (upper and lower byte enable)

The maximum capacity is 512 Mbits (26 address lines).

32.10.2 Supported memories and transactions

Table 232 below shows an example of the supported devices, access modes and transactions when the memory data bus is 16-bit wide for NOR flash memory, PSRAM and SRAM. The transactions not allowed (or not supported) by the FMC are shown in gray in this example.

Table 232. NOR flash/PSRAM: Example of supported memories and transactions

Device	Mode	R/W	AXI data size	Memory data size	Allowed/ not allowed	Comments
NOR flash (muxed I/Os and non-muxed I/Os)	Asynchronous	R	8	16	Y	-
	Asynchronous	W	8	16	N	-
	Asynchronous	R	16	16	Y	-
	Asynchronous	W	16	16	Y	-
	Asynchronous	R	32	16	Y	Split into 2 FMC accesses
	Asynchronous	W	32	16	Y	Split into 2 FMC accesses
	Asynchronous	R	64	16	Y	Split into 4 FMC accesses
	Asynchronous	W	64	16	Y	Split into 4 FMC accesses
	Asynchronous page	R	-	16	N	Mode is not supported
	Synchronous	R	8	16	N	-
	Synchronous	R	16	16	Y	-
	Synchronous	R	32	16	Y	-
	Synchronous	R	64	16	Y	Split into 4 FMC accesses

Table 232. NOR flash/PSRAM: Example of supported memories and transactions

Device	Mode	R/W	AXI data size	Memory data size	Allowed/ not allowed	Comments
PSRAM (multiplexed I/Os and non-multiplexed I/Os)	Asynchronous	R	8	16	Y	-
	Asynchronous	W	8	16	Y	Use of byte lanes NBL[1:0]
	Asynchronous	R	16	16	Y	-
	Asynchronous	W	16	16	Y	-
	Asynchronous	R	32	16	Y	Split into 2 FMC accesses
	Asynchronous	W	32	16	Y	Split into 2 FMC accesses
	Asynchronous	R	64	16	Y	Split into 4 FMC accesses
	Asynchronous	W	64	16	Y	Split into 4 FMC accesses
	Asynchronous page	R	-	16	N	Mode is not supported
	Synchronous	R	8	16	N	-
	Synchronous	R	16	16	Y	-
	Synchronous	R	32/64	16	Y	-
	Synchronous	W	8	16	Y	Use of byte lanes NBL[1:0]
	Synchronous	W	16/32/64	16	Y	-
SRAM and ROM	Asynchronous	R	8 / 16	16	Y	-
	Asynchronous	W	8 / 16	16	Y	Use of byte lanes NBL[1:0]
	Asynchronous	R	32	16	Y	Split into 2 FMC accesses
	Asynchronous	W	32	16	Y	Split into 2 FMC accesses
	Asynchronous	R	64	16	Y	Split into 4 FMC accesses
	Asynchronous	W	64	16	Y	Split into 4 FMC accesses

32.10.3 General timing rules

Signals synchronization

- All controller output signals change on the rising edge of the fmc_ker_ck clock
- In synchronous mode (read or write), all output signals change on the rising edge of fmc_ker_ck clock.
- NBL signals

  They are applicable to memories which support byte enable.
  - The NBL signals are driven low:

    from the start of a read memory transfer and optionally earlier according to NBLSET, when the device requires some setup time from NBL to NCE,

    for bytes to be written during data transfer and according to the first data bytes during the address transfer.
  - The NBL signals are driven high two FMC_CLK clock cycles after the completion of the read or write transfer.

32.10.4 NOR flash/PSRAM controller asynchronous transactions

Asynchronous static memories (NOR flash, PSRAM, SRAM, FRAM)

- Signals are synchronized by the internal clock fmc_ker_ck. This clock is not issued to the memory.
- The FMC always samples the data before deasserting the Chip Select signal NE. This guarantees that the memory data hold timing constraint is met (minimum chip enable high to data transition is usually 0 ns).
- If the extended mode is enabled (EXTMOD bit is set in the FMC_BCRx register), up to four extended modes (A, B, C and D) are available. It is possible to mix A, B, C and D modes for read and write operations. For example, read operation can be performed in mode A and write in mode B. The extended mode is not compatible with the muxed mode (EXTMOD bit must be kept cleared in muxed mode).
- If the extended mode is disabled (EXTMOD bit is reset in the FMC_BCRx register), the FMC can operate in mode 1 or mode 2 as follows:
  - Mode 1 is the default mode when SRAM/PSRAM memory type is selected (MTYP[1:0] = 0x0 or 0x01 in the FMC_BCRx register)
  - Mode 2 is the default mode when NOR memory type is selected (MTYP[1:0] = 0x10 in the FMC_BCRx register).

Mode 1 - SRAM/FRAM/PSRAM (CRAM)

The next figures show the read and write transactions for the supported modes followed by the required configuration of FMC_BCRx, and FMC_BTRx/FMC_BWTRx registers.

Figure 173. Mode 1 read access waveforms

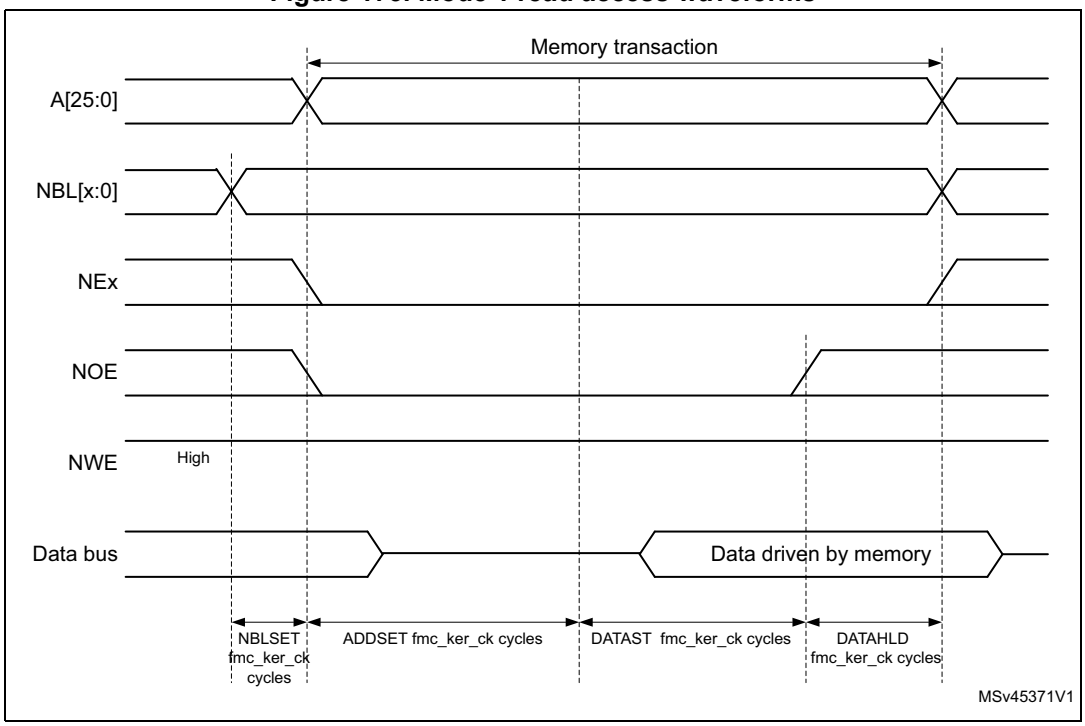

Figure 174. Mode 1 write access waveforms

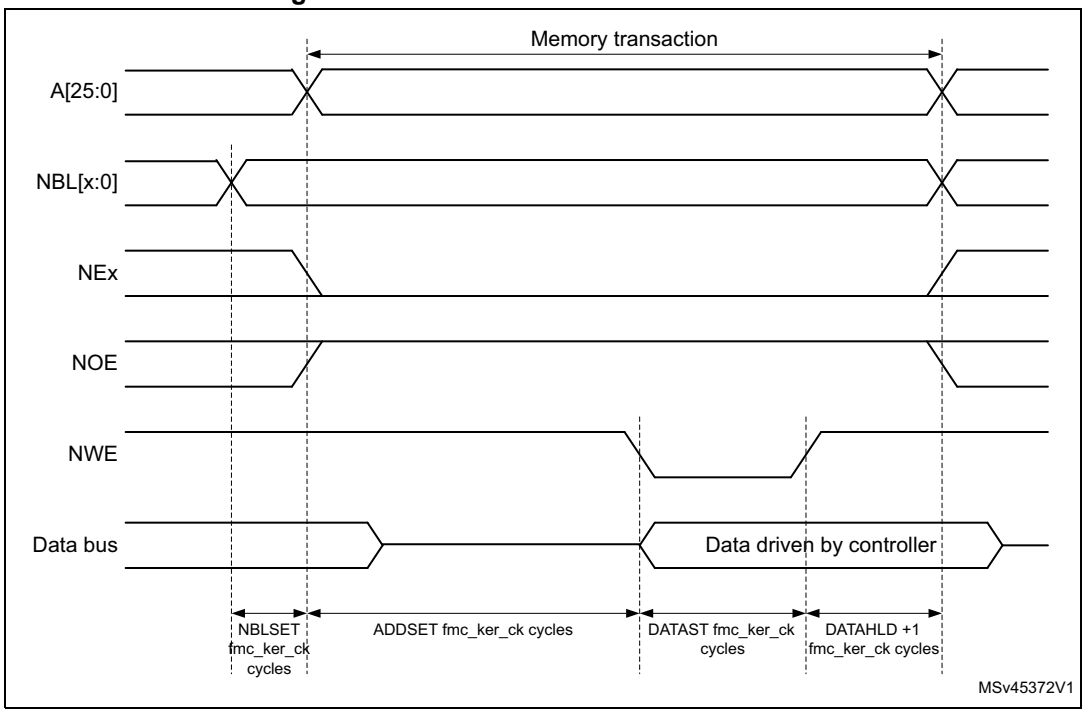

The DATAHLD time at the end of the read and write transaction guarantee the address and data hold time after the NOE/NWE rising edge. For write, the DATAST value must be greater than zero (DATAST > 0).

Table 233. FMC_BCRx bitfields (mode 1)

Bit number	Bit name	Value to set
31	Reserved	0x0
30-24	Reserved	0x000
23:22	NBLSET[1:0]	As needed
21:20	CSCOUNT	As needed
19	CBURSTRW	0x0 (no effect in asynchronous mode)
18:16	CPSIZE	0x0 (no effect in asynchronous mode)
15	ASYNCWAIT	Set if the memory supports this feature. Otherwise keep cleared.
14	EXTMOD	0x0
13	WAITEN	0x0 (no effect in asynchronous mode)
12	WREN	As needed
11	WAITCFG	Don’t care
10	Reserved	0x0
9	WAITPOL	Meaningful only if bit 15 is 1
8	BURSTEN	0x0
7	Reserved	0x1
6	Reserved	0x0
5-4	MWID[1:0]	As needed
3-2	MTYP	As needed, exclude 0x2 (NOR flash memory)
1	MUXE	0x0
0	MBKEN	0x1

Table 234. FMC_BTRx bitfields (mode 1)

Bit number	Bit name	Value to set
31:30	DATAHLD	Duration of the Data hold phase (DATAHLD fmc_ker_ck cycles) for read accesses.
29-28	ACCMOD	Don’t care
27-24	DATLAT	Don’t care
23-20	CLKDIV	Don’t care
19-16	BUSTURN	Time between NEx high to NEx low (BUSTURN fmc_ker_ck)
15-8	DATAST	Duration of the second access phase (DATAST fmc_ker_ck cycles).

Table 234. FMC_BTRx bitfields (mode 1) (continued)

Bit number	Bit name	Value to set
7-4	ADDHLD	Don't care
3-0	ADDSET	Duration of the first access phase (ADDSET fmc_ker_ck cycles). Minimum value for ADDSET is 0.

Mode A - SRAM/FRAM/PSRAM (CRAM) OE toggling

Figure 175. Mode A read access waveforms

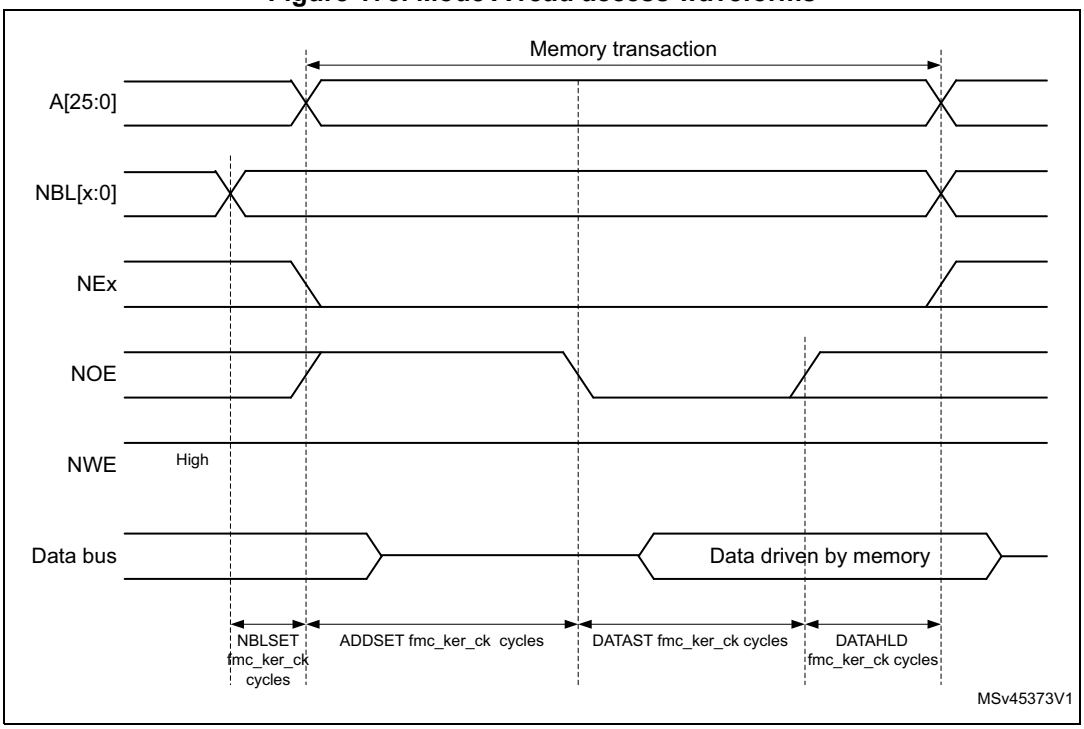

Figure 176. Mode A write access waveforms

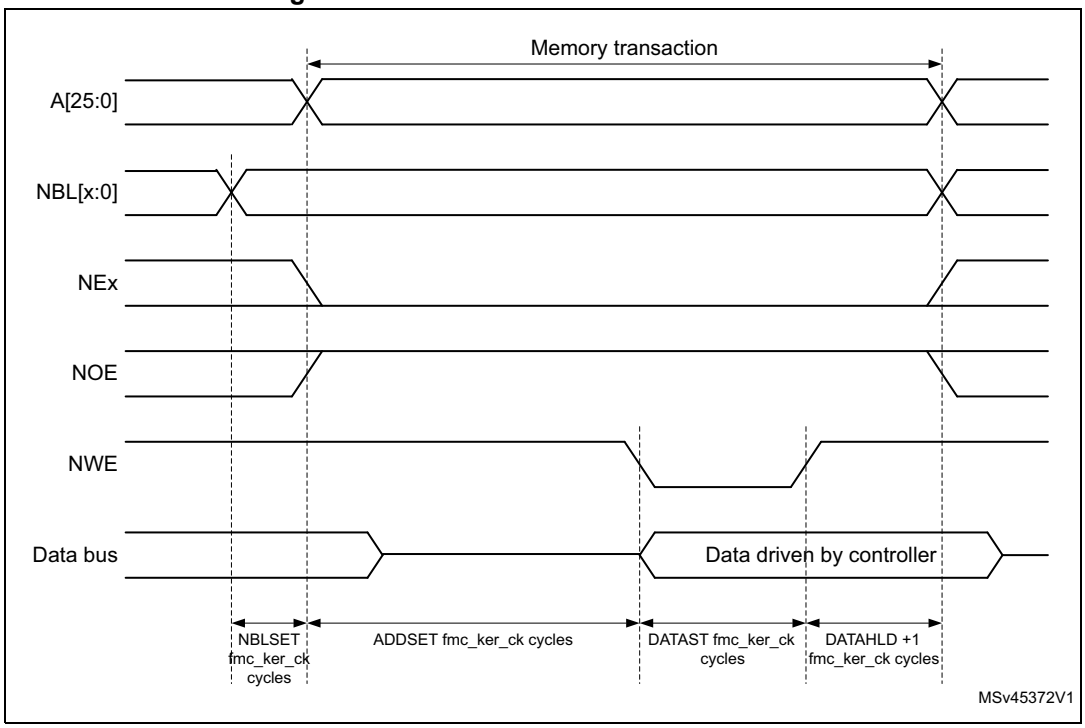

The differences compared with mode 1 are the toggling of NOE and the independent read and write timings.

Table 235. FMC_BCRx bitfields (mode A)

Bit number	Bit name	Value to set
31	Reserved	0x0
30-24	Reserved	0x000
23:22	NBLSET[1:0]	As needed
21:20	CSCOUNT	As needed

7-4	ADDHLD	Duration of the middle phase of the access (ADDHLD fmc_ker_ck cycles).
3-0	ADDSET	Duration of the first access phase (ADDSET fmc_ker_ck cycles). Minimum value for ADDSET is 1.

WAIT management for asynchronous accesses

If the asynchronous memory asserts the WAIT signal to indicate that it is not yet ready to accept or to provide data, the ASYNCWAIT bit has to be set in FMC_BCRx register.

If the WAIT signal is active (high or low depending on the WAITPOL bit), the second access phase (Data setup phase), programmed by the DATAST bits, is extended until WAIT becomes inactive. Unlike the data setup phase, the first access phases (Address setup and Address hold phases), programmed by the ADDSET and ADDHLD bits, are not WAIT sensitive and so they are not prolonged.

The data setup phase must be programmed so that WAIT can be detected 4 fmc_ker_ck cycles before the end of the memory transaction. The following cases must be considered:

1. The memory asserts the WAIT signal aligned to NOE/NWE which toggles:

$$DATAST \geq (4 \times FMCCLK) + max_wait_assertion_time$$

2. The memory asserts the WAIT signal aligned to NEx (or NOE/NWE not toggling):
   if

$$max_wait_assertion_time > address_phase + hold_phase$$

   then:

$$DATAST \geq (4 \times FMCCLK) + (max_wait_assertion_time - address_phase - hold_phase$$

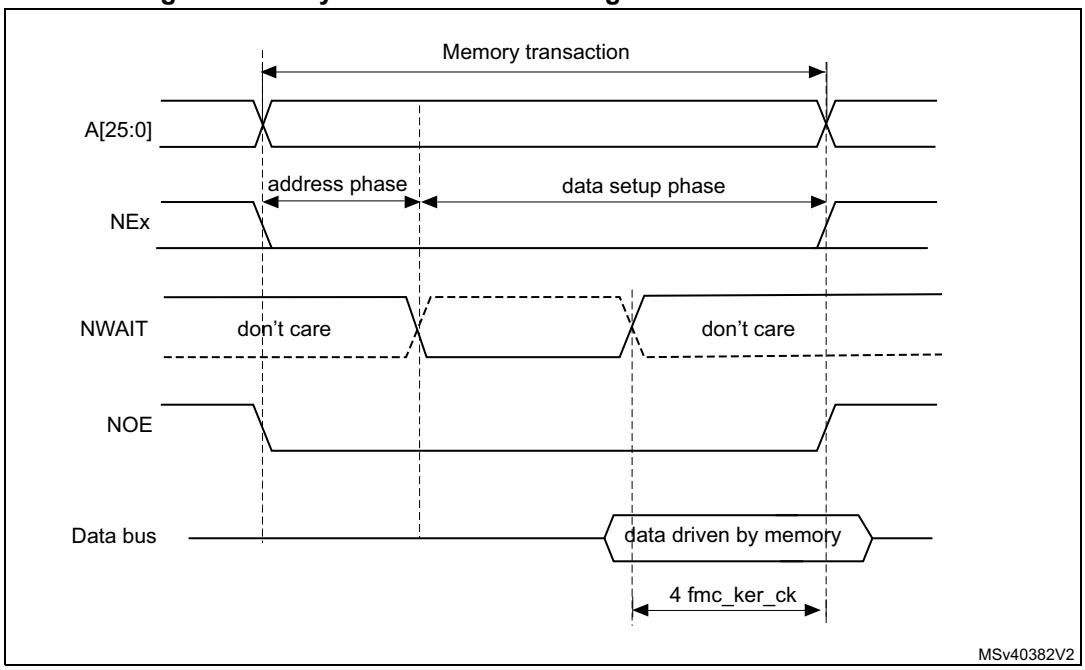
   otherwise

$$DATAST \geq 4 \times FMCCLK$$

   where max_wait_assertion_time is the maximum time taken by the memory to assert the WAIT signal once NEx/NOE/NWE is low.

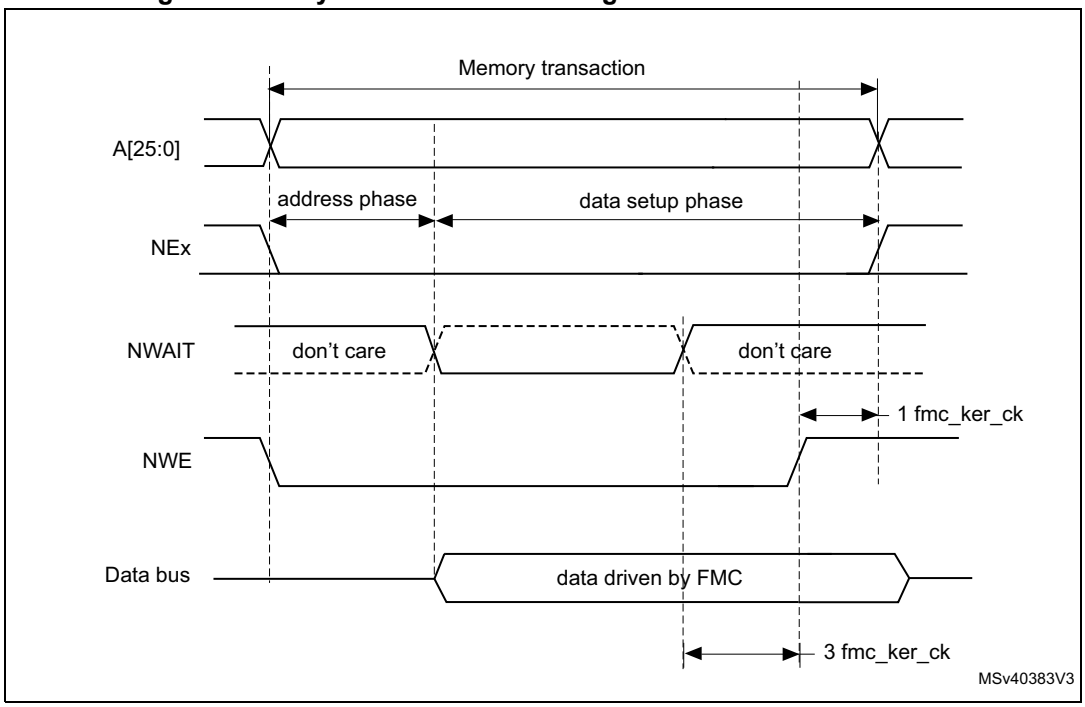
Figure 186 and *Figure 187* show the number of fmc_ker_ck clock cycles that are added to the memory access phase after WAIT is released by the asynchronous memory (independently of the above cases).

Figure 186. Asynchronous wait during a read access waveforms



1. NWAIT polarity depends on WAITPOL bit setting in FMC_BCRx register.

Figure 187. Asynchronous wait during a write access waveforms



1. NWAIT polarity depends on WAITPOL bit setting in FMC_BCRx register.

CellularRAM™ (PSRAM) refresh management

The CellularRAM™ does not allow maintaining the chip select signal (NE) low for longer than the t_{CEM} timing specified in memory device. This timing can be programmed in the FMC_CFGR register. It defines the maximum duration of the NE low pulse (expressed in fmc_ker_ck cycles) in synchronous mode for PSRAM read or write accesses.

32.10.5 Synchronous transactions

The memory clock, FMC_CLK, is a submultiple of fmc_ker_ck. It depends on the value of CLKDIV.

NOR flash memories specify a minimum time from NADV assertion to FMC_CLK high. To meet this constraint, the FMC does not issue the clock to the memory during the first internal clock cycle of the synchronous access (before NADV assertion). This guarantees that the rising edge of the memory clock occurs in the middle of the NADV low pulse.

Data latency versus NOR memory latency

The data latency is the number of cycles to wait before sampling the data. The DATLAT value must be consistent with the latency value specified in the NOR flash configuration register. The FMC does not include the clock cycle when NADV is low in the data latency count.

Caution: Some NOR flash memories include the NADV Low cycle in the data latency count, so that the exact relation between the NOR flash latency and the FMC DATLAT parameter can be either:

- NOR flash latency = (DATLAT + 2) CLK clock cycles
- or NOR flash latency = (DATLAT + 3) CLK clock cycles

Some recent memories assert NWAIT during the latency phase. In such cases DATLAT can be set to its minimum value. As a result, the FMC samples the data and waits long enough to evaluate if the data are valid. Thus the FMC detects when the memory exits latency and real data are processed.

Other memories do not assert NWAIT during latency. In this case the latency must be set correctly for both the FMC and the memory, otherwise invalid data are mistaken for good data, or valid data are lost in the initial phase of the memory access.

Single-burst transfer

When the selected memory region is configured in burst mode for synchronous accesses, if for example a single-burst transaction is requested on 16-bit memories, the FMC performs a burst transaction of length 1 (if the AXI transfer is 16 bits), or length 2 (if the AXI transfer is 32 bits) and deassert the Chip Select signal when the last data is strobed.

Such transfers are not the most efficient in terms of cycles compared to asynchronous read operations. Nevertheless, a random asynchronous access first requires to re-program the memory access mode, which altogether lasts longer.

Cross boundary page for CellularRAM™ 1.5

CellularRAM™ 1.5 does not allow burst access to cross the page boundary. The FMC allows to split automatically the burst access when the memory page size is reached by configuring the CPSIZE bits in the FMC_BCR1 register following the memory page size.

Wait management

For synchronous NOR flash memories, NWAIT is evaluated after the programmed latency period, which corresponds to (DATLAT+2) FMC_CLK clock cycles.

If NWAIT is active (low level when WAITPOL = 0, high level when WAITPOL = 1), wait-states are inserted until NWAIT is inactive (high level when WAITPOL = 0, low level when WAITPOL = 1).

When NWAIT is inactive, the data is considered valid either immediately (bit WAITCFG = 1) or on the next clock edge (bit WAITCFG = 0).

During wait-state insertion via the NWAIT signal, the controller continues to send clock pulses to the memory, keeping the Chip Select and output enable signals valid. It does not consider the data as valid.

In burst mode, there are two timing configurations for the NOR flash NWAIT signal:

- The flash memory asserts the NWAIT signal one data cycle before the wait-state (default after reset).
- The flash memory asserts the NWAIT signal during the wait-state

The FMC supports both NOR flash wait-state configurations, for each Chip Select, thanks to the WAITCFG bit in the FMC_BCRx registers (x = 0 to 3).

32.10.6 NOR/PSRAM controller registers

The peripheral registers have to be accessed by words (32-bit)

SRAM/NOR flash chip-select control register for memory region x (FMC_BCRx)

Address offset: 0x00 + 0x08 * (x - 1), (x = 1 to 4)

Reset value: 0x0000 30DB, 0x0000 30D2, 0x0000 30D2, 0x0000 30D2

This register contains the control information of each memory region, used for SRAMs, PSRAM, FRAM and NOR flash memories.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NBLSET[1:0]		CSCOUNT1	CSCOUNT0	CBURSTRW	CPSIZE[2:0]

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ASYNCWAIT	EXTMOD	WAITEN	WREN	WAITCFG	Res.	WAITPOL	BURSTEN	Res.	Res.	MWID[1:0]		MTYP[1:0]		MUXEN	MBKEN
rw	rw	rw	rw	rw		rw	rw			rw	rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:24 Reserved, must be kept at reset value.

Bits 23:22 **NBLSET[1:0]**: Byte lane (NBL) setup

These bits configure the NBL setup timing from NBLx low to Chip select NEx low.
00: NBL setup time is 0 fmc_ker_ck clock cycle.
01: NBL setup time is 1 fmc_ker_ck clock cycle.
10: NBL setup time is 2 fmc_ker_ck clock cycles.
11: NBL setup time is 3 fmc_ker_ck clock cycles.

Bits 21:20 **CSCOUNT[1:0]:** Chip Select (CS) counter

These bits define the maximum duration of Chip Select low for PSRAM synchronous mode and for each memory region.
The Chip Select counter is loaded into a timer which is decremented using the KCK_FMC while the NE is maintained low during PSRAM read or write access.
When the timer reaches 0, the PSRAM controller splits the current access and toggles NE to allow PSRAM device refresh.
The programmed counter value guarantees a maximum NE pulse width (t_{CEM}) as specified for PSRAM devices.
The counter is reloaded and starts decrementing each time a new access is triggered by a transition of NE from high to low.
0b00: Counter disabled
0b01: NEx deasserted after fmc_ker_ck clock cycle
0b10: NEx deasserted after 64 fmc_ker_ck clock cycles
0b11: NEx deasserted after 256 fmc_ker_ck clock cycles

Note: Most PSRAMs manage refresh transparently and do not require access split. CSCOUNT[1:0] must consequently be left at its default value (counter disabled), otherwise CSCOUNT[1:0] value and access split impact must be checked according to PSRAM timing parameters.

Bit 19 **CBURSTRW:** Write burst enable

For PSRAM (CRAM) operating in burst mode, the bit enables synchronous accesses during write operations. The enable bit for synchronous read accesses is the BURSTEN bit in the FMC_BCRx register.
0: Write operations are always performed in asynchronous mode
1: Write operations are performed in synchronous mode.

Bits 18:16 **CPSIZE[2:0]:** CRAM page size

These bits are used for CellularRAM™ 1.5 which does not allow burst accesses to cross the address boundaries between pages. When these bits are configured, the FMC automatically splits the burst access when the memory page size is reached (refer to memory datasheet for page size).
000: No burst split when crossing page boundary. (default after reset).
001: 128 bytes
010: 256 bytes
011: 512 bytes
100: 1024 bytes
Others: Reserved.

Bit 15 **ASYNCWAIT**: Wait signal during asynchronous transfers

This bit enables/disables wait signal usage by the FMC even during asynchronous transfers.
0: NWAIT signal not taken in to account during asynchronous transfers (default after reset)
1: NWAIT signal taken in to account during asynchronous transfers

Bit 14 **EXTMOD:** Extended mode enable

This bit enables write timing programming for asynchronous accesses inside the FMC_BWTR register, thus resulting in different timings for read and write operations.

0: Values inside FMC_BWTR register not taken into account (default after reset)

1: Values inside FMC_BWTR register taken into account

Note: When the extended mode is disabled, the FMC can operate in mode 1 or mode 2 as follows:

- *Mode 1 is the default mode when the SRAM/PSRAM memory type is selected (MTYP[1:0] =0x0 or 0x01)*
- *Mode 2 is the default mode when the NOR memory type is selected (MTYP[1:0] = 0x10).*

Bit 13 **WAITEN:** Wait enable bit

This bit enables/disables wait-state insertion via the NWAIT signal when accessing the memory in synchronous mode.

0: NWAIT signal disabled (its level not taken into account, no wait-state inserted after the programmed flash latency period)

1: NWAIT signal enabled (its level is taken into account after the programmed latency period to insert wait-states if asserted) (default after reset)

Bit 12 **WREN:** Write enable bit

This bit indicates whether write operations to the memory region by the FMC are enabled/disabled:

0: Write operations to the memory region by the FMC disabled. An AXI slave error is reported,

1: Write operations to the memory region by the FMC enabled (default after reset).

Bit 11 **WAITCFG:** Wait timing configuration

The NWAIT signal indicates whether the data from the memory are valid or if a wait-state must be inserted when accessing the memory in synchronous mode. This configuration bit determines if NWAIT is asserted by the memory one clock cycle before the wait-state or during the wait-state:

0: NWAIT signal active one data cycle before wait-state (default after reset),

1: NWAIT signal active during wait-state (not used for PSRAM).

Bit 10 Reserved, must be kept at reset value.

Bit 9 **WAITPOL:** Wait signal polarity bit

This bit defines the polarity of the wait signal from memory used for either in synchronous or asynchronous mode:

0: NWAIT active low (default after reset),

1: NWAIT active high.

Bit 8 **BURSTEN:** Burst enable bit

This bit enables/disables synchronous accesses during read operations. It is valid only for synchronous memories operating in burst mode:

0: Burst mode disabled (default after reset). Read accesses are performed in asynchronous mode.

1: Burst mode enable. Read accesses are performed in synchronous mode.

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **MWID[1:0]:** Memory data bus width
This bit defines the external memory device width, valid for all type of memories.
00: 8 bits
01: 16 bits (default after reset)
10: Reserved.
11: Reserved.

Bits 3:2 **MTYP[1:0]:** Memory type
This bit defines the type of external memory attached to the corresponding memory region:
00: SRAM/ FRAM (default after reset for memory region 2...4)
01: PSRAM (CRAM)/FRAM
10: NOR flash/OneNAND flash (default after reset for memory region 1)
11: Reserved.

Bit 1 **MUXEN:** Address/data multiplexing enable bit
When this bit is set, the address and data values are multiplexed on the data bus, valid only with NOR and PSRAM memories:
0: Address/Data non-multiplexed
1: Address/Data multiplexed on databus (default after reset)

Bit 0 **MBKEN:** Memory region enable bit
This bit enables the memory region. After reset memory region 1 is enabled, all others are disabled. Accessing a disabled memory region causes an ERROR on AXI bus.
0: Corresponding memory region is disabled
1: Corresponding memory region is enabled

SRAM/NOR flash chip-select timing registers for memory region x (FMC_BTRx)

Address offset: 0x04 + 0x8 * (x - 1), (x = 1 to 4)

Reset value: 0x0FFF FFFF

This register contains the control information of each memory region, used for SRAMs, PSRAM and NOR flash memories.If the EXTMOD bit is set in the FMC_BCRx register, then this register is partitioned for write and read access, that is, two registers are available: one to configure read accesses (this register) and one to configure write accesses (FMC_BWTRx registers).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATAHLD[1:0]		ACCMOD[1:0]		DATLAT[3:0]				CLKDIV[3:0]				BUSTURN[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATAST[7:0]								ADDHLD[3:0]				ADDSET[3:0]			
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 **DATAHLD[1:0]:** Data Hold phase duration

These bits are written by software to define the duration of the *data hold* phase in fmc_ker_ck cycles (refer to *Figure 186* to *Figure 187*), used in asynchronous accesses:
For read/write accesses:
00: DATAHLD phase duration = fmc_ker_ck clock cycle * 0 (default, read)/1 (default, write)
01: DATAHLD phase duration = fmc_ker_ck clock cycle * 1 (read)/2 (write)
10: DATAHLD phase duration = fmc_ker_ck clock cycle * 2 (read)/3 (write)
11: DATAHLD phase duration = fmc_ker_ck clock cycle * 3 (read)/4 (write)

Bits 29:28 **ACCMOD[1:0]:** Access mode

These bits specify the asynchronous access modes as shown in the timing diagrams. These bits are taken into account only when the EXTMOD bit in the FMC_BCRx register is 1.
00: Access mode A
01: Access mode B
10: Access mode C
11: Access mode D

Bits 27:24 **DATLAT[3:0]:** Data latency for synchronous memory (see note below bit descriptions)

For synchronous access with read/write burst mode enabled (BURSTEN / CBURSTRW bits set), these bits define the number of memory clock cycles (+2) to issue to the memory before reading/writing the first data.
This timing parameter is not expressed in fmc_ker_ck periods, but in FMC_CLK periods.
For asynchronous access, this value is don't care.
0000: Data latency of 2 FMC_CLK clock cycles for first burst access
1111: Data latency of 17 FMC_CLK clock cycles for first burst access (default value after reset)

Bits 23:20 **CLKDIV[3:0]:** Clock divide ratio (for FMC_CLK signal)

These bits define FMC_CLK clock output signal period, expressed in fmc_ker_ck cycles:
0000: Reserved.
0001: FMC_CLK period = 2 × fmc_ker_ck periods
0010: FMC_CLK period = 3 × fmc_ker_ck periods
1111: FMC_CLK period = 16 × fmc_ker_ck periods (default value after reset)
This value is don't care when accessing NOR flash memories, SRAM and PSRAM in asynchronous mode.

Note: Refer to Section 32.10.5: Synchronous transactions for FMC_CLK *divider ratio formula).*

Note: CLKDIV[3:0] bits are don't care when CCLKEN bit of FMC_CFGR is set. In this case FMC_CLK clock output is controlled by CLKDIV of FMC_CFGR.

Bits 19:16 **BUSTURN[3:0]:** Bus turnaround phase duration

These bits are written by software to add a delay between the end of current read or write transaction and the next transaction on the same memory region.

This delay allows matching the minimum time between consecutive transactions (t_{EHEL} from NEx high to NEx low) and the maximum time required by the memory to free the data bus after a read access ($t_{EHQZ\ f}$from chip enable high to output Hi-Z). This delay is recommended for mode D and muxed mode. For non-muxed memory, the bus turnaround delay can be set to a minimum value that respects the following condition:

(BUSTRUN + 1)fmc_ker_ck period ≥ $t_{EHELmin}$ max ($t_{EHELmin}$, $t_{EHQZmax)}$

For FRAMs, the bus turnaround delay must be configured to match the minimum precharge time (t_{PC}). This delay is inserted between all consecutive transactions on the same memory region (read/read, write/write, read/write and write/read) to match the t_{PC} memory timing, and the Chip select toggles between consecutive accesses.

(BUSTRUN + 1) fmc_ker_ck period >= t_{PCmin}

0000: BUSTURN phase duration = 1 * fmc_ker_ck clock cycle added

...

1111: BUSTURN phase duration = 16 * fmc_ker_ck clock cycles added (default value after reset)

Bits 15:8 **DATAST[7:0]:** Data-phase duration

These bits are written by software to define the duration of the data phase (refer to *Figure 186* to *Figure 187*) used in asynchronous accesses:
0000 0000: Reserved.
0000 0001: DATAST phase duration = 1 * fmc_ker_ck clock cycles
0000 0010: DATAST phase duration = 2 * fmc_ker_ck clock cycles
...
1111 1111: DATAST phase duration = 255 * fmc_ker_ck clock cycles (default value after reset)
For each memory type and access mode data-phase duration, refer to the respective figure (*Figure 186* to *Figure 187*).
Example of mode 1, write access, DATAST=1:
Data-phase duration= DATAST+1 = 2 *fmc_ker_ck clock cycles.

Note: This value is don't care in synchronous accesses.

Bits 7:4 **ADDHLD[3:0]:** Address-hold phase duration

These bits are written by software to define the duration of the *address hold* phase (refer to *Figure 182* to *Figure 185*) used in mode D or multiplexed accesses:
0000: Reserved.
0001: ADDHLD phase duration =1 * fmc_ker_ck clock cycle
0010: ADDHLD phase duration = 2 * fmc_ker_ck clock cycle
...
1111: ADDHLD phase duration = 15 * fmc_ker_ck clock cycles (default value after reset)
For each access mode address-hold phase duration, refer to the respective figure (*Figure 182* to *Figure 185*).

Note: This value is not used in synchronous accesses, and the address hold phase lasts always 1 memory clock period.

Bits 3:0 **ADDSET[3:0]:** Address setup phase duration

These bits are written by software to define the duration of the *address setup* phase (refer to *Figure 186* to *Figure 187*), used in SRAMs, ROMs and asynchronous NOR flash memories:
0000: ADDSET phase duration = 0 * fmc_ker_ck clock cycle
...
1111: ADDSET phase duration = 15 * fmc_ker_ck clock cycles (default value after reset)
For each access mode address setup phase duration, refer to the respective figure (refer to *Figure 186* to *Figure 187*).

Note: This value is don't care in synchronous accesses.
In muxed mode or mode D, the minimum value for ADDSET is 1.

Note: PSRAMs (CRAMs) have a variable latency due to internal refresh. Therefore these memories issue the NWAIT signal during the whole latency phase to extend the latency as needed.

On PSRAMs (CRAMs), DATLAT must be configured to 0 so that the FMC quickly exits its latency phase, starts sampling NWAIT from memory, and starts read or write operations when the memory is ready.

This method can be used also with the latest generation of synchronous flash memories, which, unlike older flash memories, issue the NWAIT signal (check the corresponding flash memory datasheet).

SRAM/NOR-flash write timing registers for memory region x (FMC_BWTRx)

Address offset: 0x104 + 0x8 * (x - 1), (x = 1 to 4)

Reset value: 0x000F FFFF

This register contains the control information of each memory region. It is used for SRAMs, FRAMs, PSRAMs and NOR flash memories. When the EXTMOD bit is set in the FMC_BCRx register, then this register is active for write access.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 **DATAHLD[1:0]:** Data Hold phase duration

These bits are written by software to define the duration of the *data hold* phase in fmc_ker_ck cycles (refer to *Figure 187*), used in asynchronous write accesses:

00: DATAHLD phase duration = 1 * fmc_ker_ck clock cycle (default)

01: DATAHLD phase duration = 2 * fmc_ker_ck clock cycle

10: DATAHLD phase duration = 3 * fmc_ker_ck clock cycle

11: DATAHLD phase duration = 4 * fmc_ker_ck clock cycle

Bits 29:28 **ACCMOD[1:0]:** Access mode.

These bits specify the asynchronous access modes as shown in the next timing diagrams.These bits are taken into account only when the EXTMOD bit in the FMC_BCRx register is 1.

00: Access mode A

01: Access mode B

10: Access mode C

11: Access mode D

Bits 27:20 Reserved, must be kept at reset value.

Bits 19:16 **BUSTURN[3:0]**: Bus turnaround phase duration

These bits are written by software to add a delay between the end of current write transaction and the next transaction on the same memory region.

For FRAMs, the bus turnaround delay must be configured to match the minimum precharge time (t_{PC}). The bus turnaround delay is inserted between all consecutive transactions on the same memory region (read/read, write/write, read/write and write/read), and the Chip select toggles between consecutive accesses.

(BUSTRUN + 1) fmc_ker_ck period >= t_{PCmin}

0000: BUSTURN phase duration = 1 * fmc_ker_ck clock cycle added

...

1111: BUSTURN phase duration = 16 * fmc_ker_ck clock cycles added (default value after reset)

Bits 15:8 **DATAST[7:0]:** Data-phase duration.

These bits are written by software to define the data phase duration (refer to *Figure 186* to *Figure 187*) used in asynchronous SRAM, PSRAM and NOR flash memory accesses:
0000 0000: Reserved.
0000 0001: DATAST phase duration = 1 * fmc_ker_ck clock cycles
0000 0010: DATAST phase duration = 2 * fmc_ker_ck clock cycles
...
1111 1111: DATAST phase duration = 255 * fmc_ker_ck clock cycles (default value after reset)

Bits 7:4 **ADDHLD[3:0]:** Address-hold phase duration.

These bits are written by software to define the duration of the address hold phase (refer to *Figure 184* to *Figure 185*) used in asynchronous multiplexed accesses:
0000: Reserved.
0001: ADDHLD phase duration = 1 * fmc_ker_ck clock cycle
0010: ADDHLD phase duration = 2 * fmc_ker_ck clock cycle
...
1111: ADDHLD phase duration = 15 * fmc_ker_ck clock cycles (default value after reset)

Note: In synchronous NOR flash accesses, this value is not used, and the address hold phase always lasts 1 flash clock period.

Bits 3:0 **ADDSET[3:0]:** Address setup phase duration.

These bits are written by software to define the duration of the address setup phase in fmc_ker_ck cycles (refer to *Figure 186* to *Figure 187*) used in asynchronous accesses:
0000: ADDSET phase duration = 0 * fmc_ker_ck clock cycle
...
1111: ADDSET phase duration = 15 * fmc_ker_ck clock cycles (default value after reset)

Note: In synchronous accesses, this value is not used, and the address setup phase always lasts 1 flash clock period. In muxed mode, the minimum ADDSET value is 1.

FMC common configuration register (FMC_CFGR)

Address offset: 0x020

Reset value: 0x0000 0000

This register is user to set configuration common to all controllers

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FMCEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCLKEN	CLKDIV[3:0]

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bit 31 **FMCEN:** FMC enable
This bit enables/disables the FMC.
0: FMC disabled
1: FMC enabled

Bits 30:24 Reserved, must be kept at reset value.

Bits 23:21 Reserved, must be kept at reset value.

Bit 20 **CCLKEN:** Continuous clock enable
This bit enables the FMC_CLK clock output to external memory devices.
0: The FMC_CLK is only generated during the synchronous memory access (read/write transaction). The FMC_CLK clock ratio is defined by the programmed CLKDIV value in the FMC_BCRx register (default after reset).
1: The FMC_CLK is generated continuously during asynchronous and synchronous access.
If continuous clock mode is enabled, the synchronous memories connected to all memory regions are clocked by the same clock with the clock ratio defined by CLKDIV in FMC_CFGR. The CLKDIV value in FMC_BWTRx are don't care.

Bits 19:16 **CLKDIV[3:0]:** Clock divide ratio (for FMC_CLK signal)
These bits define the FMC_CLK clock output signal period, expressed in number of fmc_ker_ck cycles:
0000: Reserved.
0001: FMC_CLK period = 2 × fmc_ker_ck periods
0010: FMC_CLK period = 3 × fmc_ker_ck periods
1111: FMC_CLK period = 16 × fmc_ker_ck periods (default value after reset)
This value is don't care when accessing NOR flash memories, SRAM and PSRAM in asynchronous mode.

Note: Refer to Section 32.10.5: Synchronous transactions for FMC_CLK divider ratio formula.

Bits 15:0 Reserved, must be kept at reset value.

FMC size identification register (FMC_SIDR)

Address offset: 0x3FC

Reset value: 0xA3C5 DD01

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r				r				r				r

Bits 31:28 **RA_LN2DPTH[3:0]:** AXI read address FIFO depth
These bits return the AXI read address FIFO depth. depth is $2^{RA_LN2DPTH}$.

Bits 27:24 **WR_LN2DPTH[3:0]:** AXI write response FIFO depth
These bits return the AXI write response FIFO depth. depth is $2^{WR_LN2DPTH}$.

Bits 23:20 **WD_LN2DPTH[3:0]:** AXI write data FIFO depth
These bits return the AXI write data FIFO depth. depth is $2^{WD_LN2DPTH}$.

Bits 19:16 **WA_LN2DPTH[3:0]:** AXI write address FIFO depth
These bits return the AXI write address FIFO depth. depth is $2^{WA_LN2DPTH}$.

Bits 15:12 **ID_SIZE[3:0]:** AXI ID width
These bits return the AXI ID width.

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **SDRAM_SEL:** SDRAM controller selection
0x0: SDRAM controller not supported
0x1: SDRAM controller supported

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **NAND_ECC:** NAND ECC
0x0: Hamming code (supported only in Legacy mode without sequencer)
0x1: Hamming and BCH code

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **NAND_SEL:** NAND Controller Selection
0x0: NAND Controller not supported
0x1: NAND Controller supported

FMC hardware configuration register 2 (FMC_HWCFGR2)

Address offset: 0x3EC

Reset value: 0x11DC 4772

The base addresses are relevant only when the FMC includes the corresponding memory controller.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **SECURE**: Support for Arm® TrustZone®

0: no TrustZone

1: Support for TrustZone

Note: Arm and TrustZone are registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **PRIVILEGE**: Support for Privileged mode

0: Privileged mode not supported

1: Privileged mode supported

Bits 23:20 **SDRAM2_BASE[3:0]:** SDRAM bank 2 base address

It returns bits [31:28] of SDRAM bank 2 base address space when the SDRAM controller is supported. It is ignored otherwise.

Bits 19:16 **SDRAM1_BASE[3:0]:** SDRAM bank 1 base address

It returns bits [31:28] of SDRAM bank 1 base address space when the SDRAM controller is supported. It is ignored otherwise.

Bits 15:12 **NAND_BASE[3:0]:** NAND base address

It returns bits [31:28] of NAND base address space

Bits 11:8 **SDRAM_RBASE[3:0]:** SDRAM remap base address

it returns bits [31:28] of SDRAM remap base address space when the SDRAM controller is supported. It is ignored otherwise.

Bits 7:4 **NOR_BASE[3:0]:** NOR base address

It returns bits [31:28] of NOR base address space

Bits 3:0 **RD_LN2DPTH[3:0]:** AXI read data FIFO depth

These bits return the AXI read data FIFO depth. depth is $2^{RD_LN2DPTH}$

FMC hardware configuration register 3 (FMC_HWCFGR3)

Address offset: 0x3E8

Reset value: 0x0000 0037

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CID_WIDTH[3:0]				MAX_CID[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **CID_WIDTH[3:0]**: CID bus width
This bitfield is relevant only when MAX_CID is not null in FMC_HWCFGR2.
0000: Width = 1
0001: Width = 2
0010: Width = 3
0011: Width = 4
Others: Reserved, must not be used.

Bits 3:0 **MAX_CID[3:0]**: Maximum compartment ID (or CID)
MAX_CID ranges from 0 to 15:
0000: no CID supported, DMA is not CID-aware
0001 to 1111: FMC is CID-aware and each channel is a separate CID-aware resource. n+1 CIDs, from CID0 up to CIDn, are supported.

32.11 NAND flash controller

The FMC generates the appropriate signal timings to drive 8- and 16-bit NAND flash memories

The NAND memory region is configured through dedicated registers (*Section 32.11.9*). The programmable memory parameters include access timings (shown in *Table 253*) and ECC configuration.

The NAND controller supports the following features:

- Programmable page size of 256, 512, 1024, 2048, 4096 or 8192 bytes
- Programmable memory timings
- Programmable Error Correction Capability using BCH code or Hamming code
- Command sequencer: a hardware accelerator for read/write accesses within a page or within a block of configurable size.
  This feature is useful when ECC computation is performed.
- Programmable address offset for ECC bytes programming using the command sequencer
- Interrupt generation on ECC error detection and page or sector transfer complete
- Support of multiple dice per package. Only one die can be selected at a time.

Table 253. Programmable NAND flash access parameters

Parameter	Function	Access mode	Unit	Min.	Max.
Memory setup time	Number of clock cycles (fmc_ker_ck) required to set up the address before the command assertion	Read/Write	FMC clock cycle (fmc_ker_ck)	1	256
Memory wait	Minimum duration (in fmc_ker_ck clock cycles) of the command assertion	Read/Write	FMC clock cycle (fmc_ker_ck)	1	256

Table 253. Programmable NAND flash access parameters (continued)

Parameter	Function	Access mode	Unit	Min.	Max.
Memory hold	Number of clock cycles (fmc_ker_ck) during which the address must be held (as well as the data if a write access is performed) after the command deassertion	Read/Write	FMC clock cycle (fmc_ker_ck)	1	256
Memory databus high-Z	Number of clock cycles (fmc_ker_ck) during which the data bus is kept in high-Z state after a write access has started	Write	FMC clock cycle (fmc_ker_ck)	1	256

32.11.1 External memory interface signals

The following tables list the typical signals that are used to interface NAND flash memory.

Note: The "N" prefix identifies the signals which are active low.

8-bit NAND flash memory

Table 254. 8-bit NAND flash memory

FMC signal name	I/O	Function
A[17]	O	NAND flash address latch enable (ALE) signal
A[16]	O	NAND flash command latch enable (CLE) signal
D[7:0]	I/O	8-bit multiplexed, bidirectional address/data bus
NCEx	O	Chip Select (x=1, 2, 3, 4)
NOE(= NRE)	O	Output enable (memory signal name: read enable, NRE)
NWE	O	Write enable
RNB	I	NAND flash Ready/Busy (RNB) input signal to the FMC

Note: Theoretically, there is no capacity limitation as the FMC can manage as many address cycles as needed.

16-bit NAND flash memory

Table 255. 16-bit NAND flash memory

FMC signal name	I/O	Function
A[17]	O	NAND flash address latch enable (ALE) signal
A[16]	O	NAND flash command latch enable (CLE) signal
D[15:0]	I/O	16-bit multiplexed, bidirectional address/data bus
NCEx	O	Chip Select (x=1, 2, 3, 4)
NOE(= NRE)	O	Output enable (memory signal name: read enable, NRE)

Table 255. 16-bit NAND flash memory (continued)

FMC signal name	I/O	Function
NWE	O	Write enable
RNB	I	NAND flash Ready/Busy (RNB) input signal to the FMC

Note: Theoretically, there is no capacity limitation as the FMC can manage as many address cycles as needed.

32.11.2 NAND flash supported memories and transactions

Table 256 shows the supported devices, access modes and transactions. Transactions not allowed (or not supported) by the NAND flash controller are shown in gray.

Table 256. Supported memories and transactions

Device	Mode	R/W	AXI data size	Memory data size	Allowed/ not allowed	Comments
NAND 8-bit	Asynchronous	R	8	8	Y	
	Asynchronous	W	8	8	Y	
	Asynchronous	R	16	8	Y	Split into 2 FMC accesses
	Asynchronous	W	16	8	Y	Split into 2 FMC accesses
	Asynchronous	R	32	8	Y	Split into 4 FMC accesses
	Asynchronous	W	32	8	Y	Split into 4 FMC accesses
	Asynchronous	R	64	8	Y	Split into 8 FMC accesses
	Asynchronous	W	64	8	Y	Split into 8 FMC accesses
NAND 16-bit	Asynchronous	R	8	16	Y	
	Asynchronous	W	8	16	N	
	Asynchronous	R	16	16	Y	
	Asynchronous	W	16	16	Y	
	Asynchronous	R	32	16	Y	Split into 2 FMC accesses
	Asynchronous	W	32	16	Y	Split into 2 FMC accesses
	Asynchronous	R	64	16	Y	Split into 4 FMC accesses
	Asynchronous	W	64	16	Y	Split into 4 FMC accesses

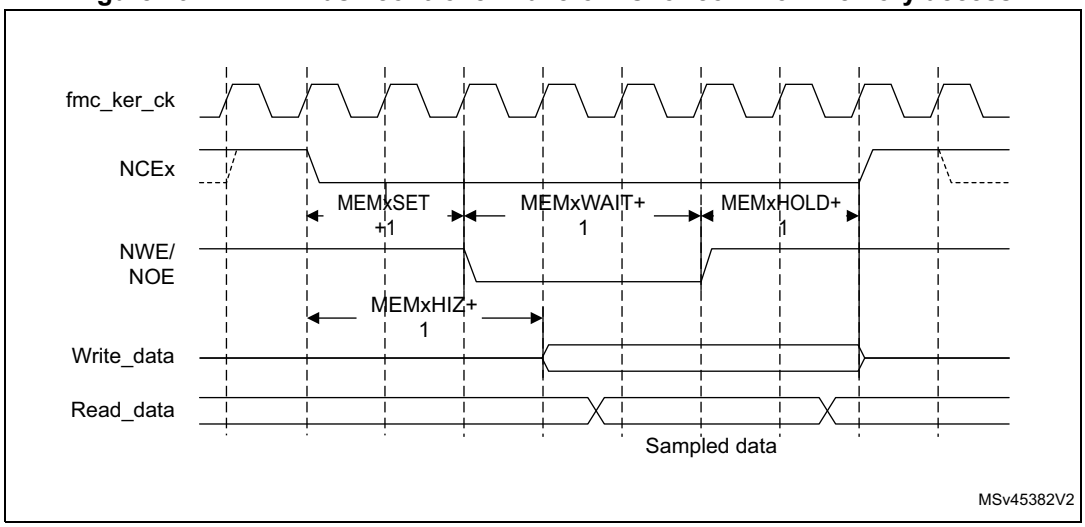
32.11.3 Timing diagrams for NAND flash memory

The NAND flash memory region is managed through a set of registers:

- Control register: FMC_PCR
- Interrupt status register: FMC_SR
- ECC register: FMC_HECCR
- Timing register for Common memory space: FMC_PMEM
- Timing register for Attribute memory space: FMC_PATT

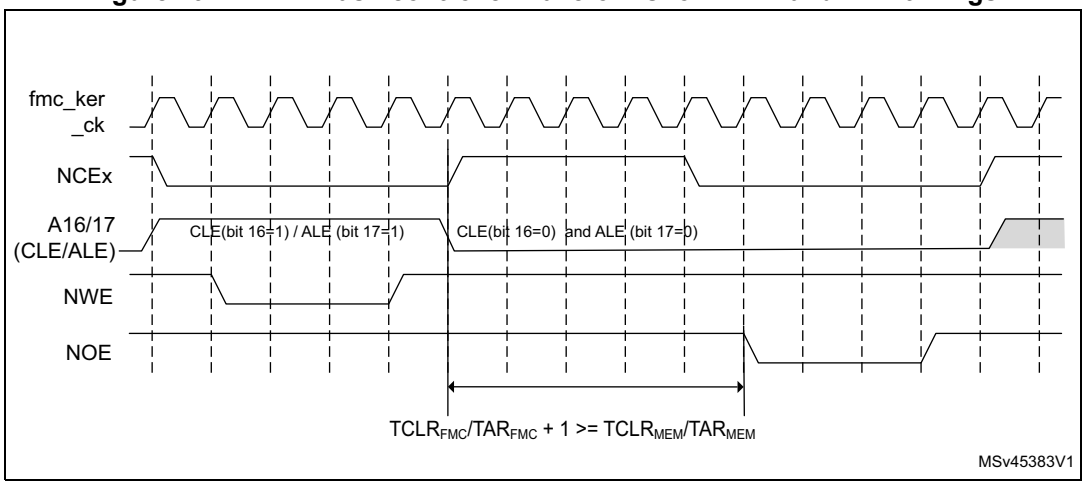
Each timing configuration register contains three parameters used to define the number of fmc_ker_ck cycles for the different phases of any NAND flash access, plus one parameter that defines the timing to start driving the data bus when a write access is performed. *Figure 191* shows the timing parameter definitions for common memory accesses, knowing that Attribute memory space access timings are similar.

Figure 191. NAND flash controller waveforms for common memory access



1. NOE remains high (inactive) during write accesses. NWE remains high (inactive) during read accesses.
2. If PWAITEN = 1, the programmed values of (MEMxSET + MEMxHOLD) must be > 1.

Figure 192. NAND flash controller waveforms for TCLR and TAR timings



1. NOE remains high (inactive) during write accesses. NWE remains high (inactive) during read accesses.

32.11.4 NAND flash operations

The command latch enable (CLE) and address latch enable (ALE) signals of the NAND flash memory device are driven by address signals from the FMC. This means that to send a command or an address to the NAND flash memory, the CPU has to perform a write to a specific address in its memory space.

A typical page read operation from the NAND flash device requires the following steps:

1. Program and enable the NAND memory region by configuring the FMC_PCR and FMC_PMEM (and for some devices, FMC_PATT, see *Section 32.11.5: NAND flash prewait function*) registers according to the characteristics of the NAND flash memory (PWID bits to configure NAND flash data bus width, PWAITEN set or cleared as needed, see *Section 32.7.2: NAND flash memory address mapping* for timing configuration).
2. The CPU performs a byte write to the common memory space, with a data byte value equal to one flash command byte (for example 0x00 for Samsung NAND flash devices). The NAND flash CLE input is active during the write strobe (low pulse on NWE), so that the written byte is interpreted as a command by the NAND flash memory. Once the command is latched by the memory device, it does not need to be written again for the following page read operations.
3. The CPU can send the start address for a read operation by writing a five-byte address to the common memory or the attribute space followed by the second read command. The NAND flash ALE input is active during the write strobe (low pulse on NWE), so that the written bytes are interpreted as the start address for read operations. Using the attribute memory space allows to use a different FMC timing configuration, which can be used to implement the prewait function required for some NAND flash memories (see details in *Section 32.11.5: NAND flash prewait function*).
4. The controller waits till the NAND flash memory is ready (RNB signal high), before starting a new access to the same memory region or to another memory region.
5. The CPU can then perform byte read operations from the common memory space to read the NAND flash page (data field + Spare field) byte by byte.
6. No CPU command or address write operation is required to read the next NAND flash page. This can be done in three different ways:
   - by simply performing the operation described in step 5,
   - a new random address can be accessed by restarting the operation at step 3,
   - a new command can be sent to the NAND flash device by restarting at step 2.

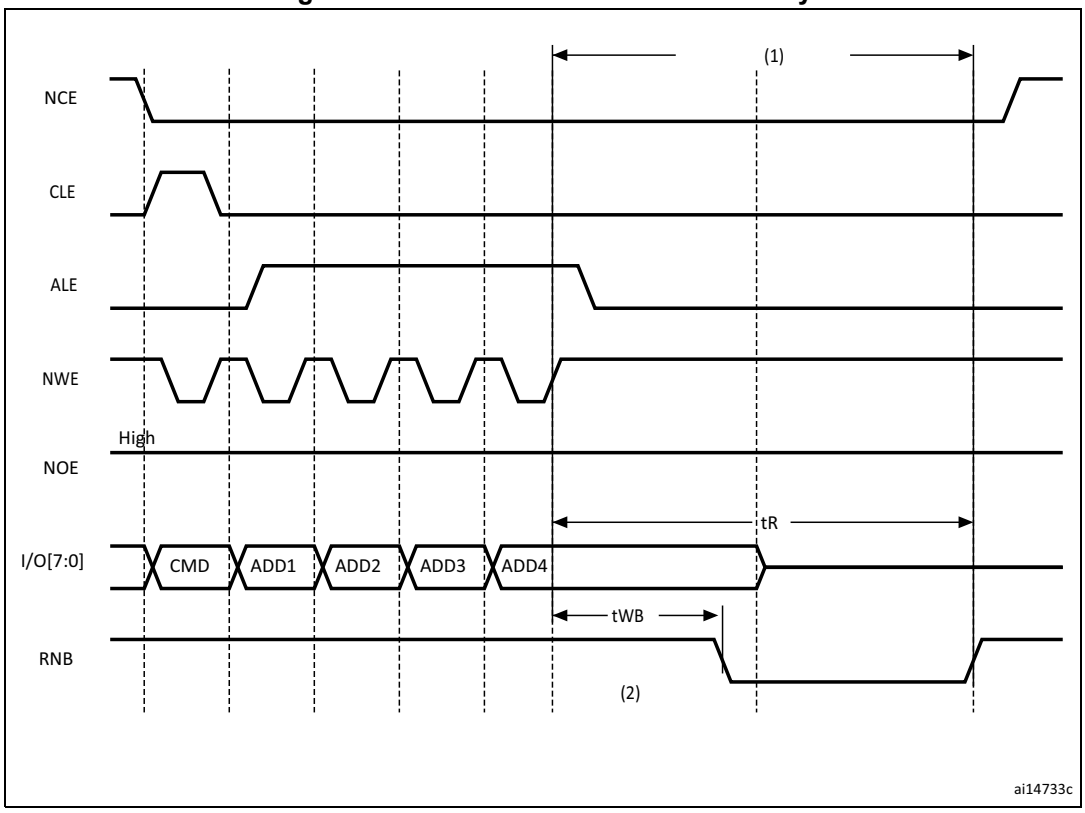
Note: Non-'CE don't care' NAND flash memories are not supported.

ONFI mode 4 and 5 EDO data output cycle timings are not supported.

32.11.5 NAND flash prewait function

The NAND controller must wait for RNB to be asserted low before sending its next command (see *Figure 193*). This timing constraint is set according to t_{WB} using MEMHOLD[7:0] bitfield in FMC_PMEM or ATTHOLD[7:0] in FMC_PATT.

Figure 193. Access to NAND flash memory



1. NCE can be deasserted for NAND flash memories since CE is don't care except for very old NAND flash devices that are not considered in this example.
2. RNB sampling can be delayed after t_{WB} by using ATTHOLD[7:0] bit of FMC_PATT. As an example, if fmc_ker_clk = 14 ns and ATTHOLD[7:0] = 7, the delay is 8*14 = 112 ns. The usual t_{WB} maximum value is 100 ns and the programmed delay must be higher than t_{WB} + 2*fmc_ker_clk.

Any CPU read or write access to the NAND flash memory has a delay of (MEMHOLD[7:0] + 1) * fmc_ker_ck cycles after the NWE signal is asserted.

The ATTHOLD[7:0] bitfield in FMC_PATT register must be determined to satisfy t_{WB} timing constraints and selectively apply larger timing constraints to the last command or address byte in CPU mode. When setting ATTHOLD[7:0], the 2 * fmc_ker_ck delay required for the sampling of RNB by NAND sequencer must also taken into account.

32.11.6 NAND ECC controller

NAND flash memories include a spare memory area (or OOB) at the end of each page. This area is typically used to store some metadata (such as Bad Block Marker information to invalidate the whole page) or for error management functions.

The FMC supports on-the-fly error correction code (ECC) computation during data read/program from/to NAND flash memory. This mechanism reduces the host CPU workload when processing the ECC by software.

The user application can select one out of two algorithms:

- Hamming code algorithm for 1-bit error code correction and 2-bit error detection per 256, 512, 1024, 2048, 4096 or 8192 bytes.
- BCH (Bose, Chaudhuri and Hocquenghem) code for 4-bit error code correction and 8-bit error detection or 8-bit error code correction and 16-bit error detection per 512 bytes.

The principle of both ECC controllers is similar: the ECC modules monitor the NAND flash data bus and read/write signals (NCE and NWE) each time the NAND flash memory region is active. The ECC controllers operate as follows:

- When accessing a NAND flash memory region, the data present on the D[7:0] or D[15:0] bus are latched and used for ECC computation.
- When accessing any other address in NAND flash memory, the ECC logic is idle, and does not perform any operation. As a result, write operations to define commands or addresses to the NAND flash memory are not taken into account for ECC computation.

Once the desired number of bytes has been read/written from/to the NAND flash memory by the host CPU or DMA, the ECC result registers are updated.

Hamming code

The Hamming code implemented can perform 1-bit error correction and 2-bit error detection per 256, 512, 1024, 2048, 4 096 or 8192 bytes read or written from/to the NAND flash memory. It consists in calculating the row and column parity. This algorithm is supported by 8-bit and 16-bit NAND flash memories.

Page write and read sequences with Hamming code are described below.

To perform a page program with Hamming ECC computation:

1. Enable the ECCEN bit in the FMC_PCR register.
2. Write data to the NAND flash memory page. While the NAND page is written, the ECC controller computes the ECC value.
3. Wait until the ECC code is ready (NWRF is set in the FMC_SR register).
4. Read the ECC value available in the FMC_HECCR register and store it in NAND flash spare area.
5. Clear the ECCEN bit and launch the page programming.

To perform a page read with Hamming ECC computation:

1. Enable the ECCEN bit in the FMC_PCR register before reading the NAND page. While the NAND page is read, the ECC block computes the ECC value.
2. Wait until the ECC code is ready (NWRF set in the FMC_SR register).
3. Read the ECC value available in the spare area as well also the ECC value, processed by Hamming controller, available in FMC_HECCR register.
4. If the two ECC values are identical, no correction is required. Otherwise an ECC error occurred, the software correction routine returns information on whether the error can be corrected or not, and corrects it when possible.

Depending on the spare area size, the page can be split into several sectors of identical size. This allows increasing the error correction capability for each page since 1 error can be corrected and 2 errors can be detected for each sector.

Example

For a NAND flash memory with 2 Kbytes + 64 bytes pages, each page can be split into 8 sectors of 256 bytes each. 3 bytes (22 bits) of ECC are required for each sector, which makes 24 bytes (8 * 3 bytes) to be stored in the spare area for the whole page. For the whole 2 Kbyte page, up to 8 errors can be corrected, respectively up to 16 errors detected, provided there is less than 1 error, respectively 2 errors, per sector.

BCH (Bose, Chaudhuri and Hocquenghem) code

To increase the error correction capability, the FMC embeds a BCH (Bose, Chaudhuri and Hocquenghem) encoder and decoder.

It supports 4-bit error code correction and 8-bit error detection or 8-bit error code correction, and 16-bit error detection per sector. BCH encoder/decoder module handles sectors of fixed size, equal to 512 bytes. Each page must consequently be split into 512-byte sectors. The number of parity bytes generated for each sector is given in *Table 257*. For 16-bit NAND flash memories, a padding is added to align parity bytes to an even number (8 bytes and 14 bytes for 4-bit and 8-bit BCH code, respectively).

Table 257. Number of ECC parity bytes per sector

Function	BCH code	
Error correction	4-bit	8-bit
Number of parity bytes	7 bytes	13 bytes

The BCH module detects errors and returns the bit position for each sector. To correct the errors, the software needs to flip the error bits at the provided bit position stored in the FMC_BCHPBRx register.

The BCH ECC controller supports 8-bit and 16-bit NAND flash memories.

During a page program operation, the BCH encoder generates the ECC bytes (7 or 13 bytes) for each sector of 512 bytes that must be written in the NAND flash spare area with a programmable offset. It must take into account some metadata at the beginning of the spare area. This operation must be executed for each sector. The BCH encoder does not process the spare area: metadata must have their own error protection mechanism.

The total number of ECC bytes (N) is given by the below equation:

$$N = \text{Number of ECC bytes /sector} \times \text{Number of sector/page}$$

Example

For an 8-bit NAND flash with 4096-byte pages and an error correction capability of 4-bit per 512 bytes, the number of sector per page is 8 (4096 / 512). The total number of ECC bytes is consequently:

$$N = 7 \times 8 = 56 \text{ bytes}$$

The user application has to make sure that the spare area is large enough to store the metadata and parity bytes.

Page program and read sequences with BCH code are described below.

To perform a page program:

1. Enable write access by setting the WEN bit in the FMC_PCR register.
2. Enable the ECC by setting the ECCEN bit in FMC_PCR register.
3. Write 512 data bytes to the sector in the NAND flash memory page. While the sector is written, the BCH encoder computes the ECC value.
4. Wait until the BCH encoder parity bits are available by monitoring EPBRF bit of FMC_BCHISR register.
5. Read the ECC value available in the FMC_BCHPBRx registers and store it in the NAND flash spare area.
6. Disable ECC by resetting the ECCEN bit in FMC_PCR register.
7. Execute again step 2 to 6 for all sectors to be written in NAND flash memory.
8. Launch the page programming.

To perform a page read:

1. Enable read access by resetting the WEN bit in the FMC_PCR register.
2. Enable the ECC by stetting the ECCEN bit in FMC_PCR register.
3. Read the NAND page sector (512 bytes).
4. Read the corresponding ECC bytes (7 or 13 bytes) from the NAND flash spare area.
5. During the read of data and parity bits, the syndrome is calculated. Then the error location search is launched.
6. Wait until the decoding error is ready (DERF bit set in the FMC_BCHISR register), then read the decoding results (errors detected if any, correctable or not, number of errors, bit position) in FMC_BCHDSR0 and FMC_BCHDSRx registers.
7. Thanks to the decoding results, the software can correct the errors in the sector (when possible).
8. Disable ECC by resetting the ECCEN bit in FMC_PCR register.
9. Execute again step 2 to 7 for all relevant sectors of the page.

32.11.7 FMC command sequencer

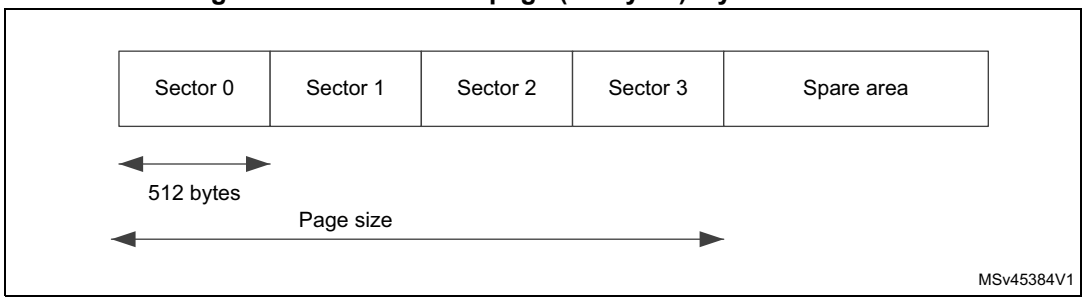
NAND flash page programming and reading can be performed by the CPU as described in the above sections.
Data sector programming/reading as well as ECC byte programming/reading can also be managed automatically by the FMC command sequencer for command and address transfers, and by DMA for data transfers.

The purpose of the command sequencer is to ease the programming/reading of NAND flash pages with ECC computation as well as free the CPU of sequencing tasks. The command sequencer enables the software to work on full NAND flash pages instead of sectors, which is more efficient and essential to achieve high throughput. The sequencer handles all the sectors in the page. It does not support sub-page read or program operations.

One DMA channel is required for write operations and two DMA channels for read operations.

A specific NAND flash page layout must be respected when using the BCH algorithm. See *Figure 194* for an example of 2Kbyte page BCH layout.

Figure 194. NAND flash page (2 Kbytes) layout with BCH



Page program sequence

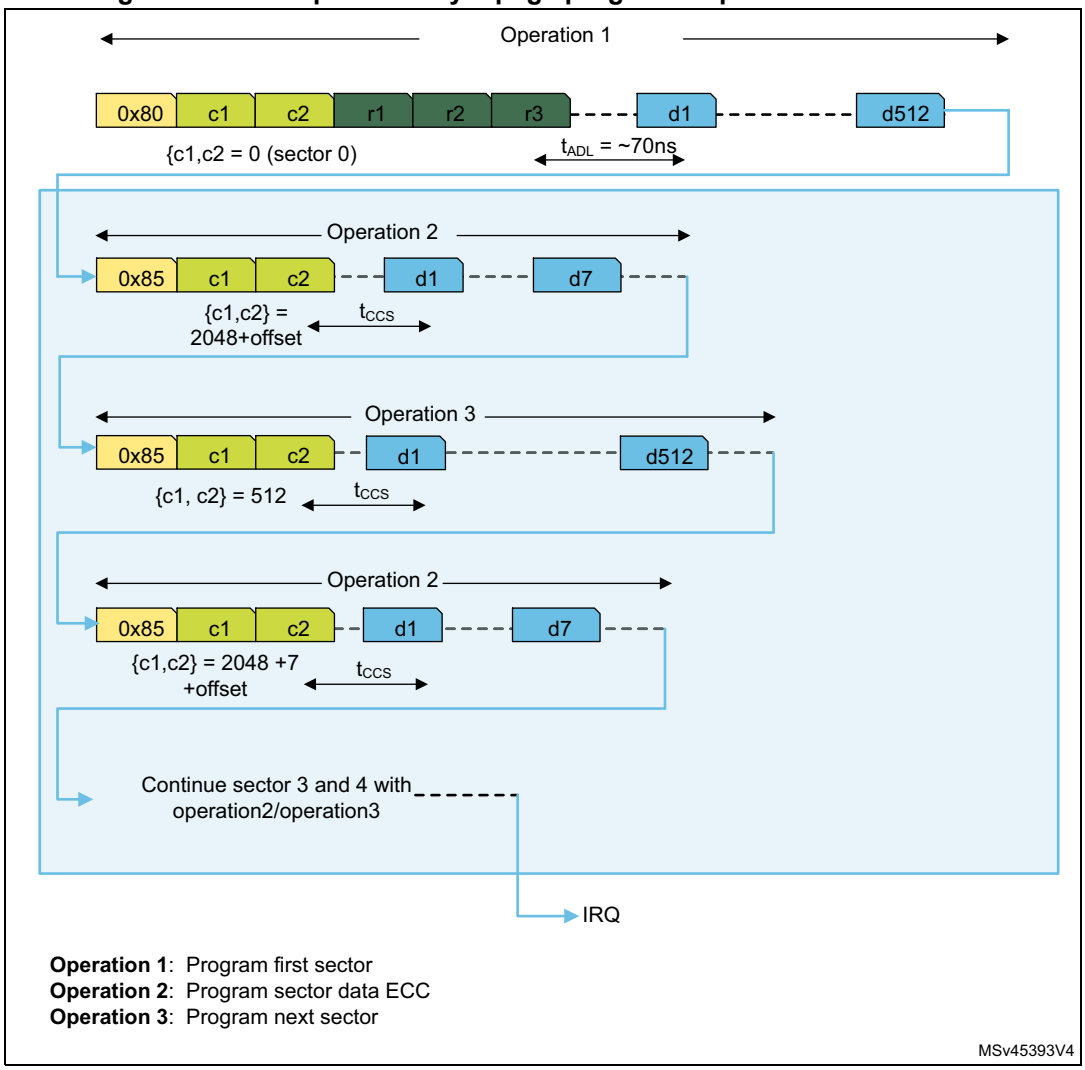
1. A data buffer located in SRAM has to be initialized with the data to be written to the NAND flash page.
2. The CPU configures the FMC command sequencer registers: page program command (0x80), address bytes, change write column command (0x85), ECC address offset, page size, sector size and sector number. It also selects the chip enable.

   It also selects the ECC algorithm (Hamming or BCH) and configures one DMA channel to transfer data from the buffer to the NAND flash page.
3. The CPU then launches the sequencer by setting the CSQSTART bit in the FMC_CSQCR register.
4. The command sequencer automatically generates the control and address cycles to the NAND flash memory, following the programmed timings configured either in FMC_PMEM or FMC_PATT register.
5. A DMA request is issued to start data transfer from the data buffer to NAND flash memory.
6. When the full sector is programmed, go to step 7 if ECC is enabled. Otherwise, jump to step 9.
7. The FMC command sequencer automatically issues a change write column command (0x85) followed by two address cycles. The command to be issued and the number of address cycles are programmed in FMC_CSQCFGR2 register. The address is automatically generated from the programmed ECC address offset.
8. Once the parity bytes are available in ECC encoder (Hamming or BCH) module, they are automatically transferred to the NAND flash spare area. The FMC command sequencer can generate a sector transfer complete interrupt if it has been previously enabled.
9. The sequencer then repeats step 4 (except that it performs only a change write column command instead of a page program command) to step 8 to program the following sectors and their corresponding ECC parity bytes. The ECC address offset is automatically incremented for each sector transfer. When ECC is disabled, the sequencer repeats step 5.
10. The FMC command sequencer can generate a transfer complete interrupt or a transfer complete error interrupt by sector or when all sectors are written.
11. The CPU can program any further metadata in the NAND flash area, taking care not to overwrite parity bytes.
12. The program command (0x10) can then be written to the command section to program the NAND flash memory.

13. An interrupt, if enabled, is generated on the rising edge of the Ready/Busy (RNB) signal to indicate that the page program operation is complete.

Refer to *Figure 195* for an overview of the page program sequence with BCH.

Figure 195. Example of 2 Kbyte page program sequence with 4-bit BCH



Page read sequence

1. A data buffer is allocated in SRAM to store the NAND flash page data. A decoding status buffer is also allocated to store result of ECC decoding.
2. The CPU programs the command sequencer registers: the page read first cycle command (0x00), address bytes, the page read second cycle command (0x30), change read column command (0x05), spare area offset, page size, sector size and sector number. It also selects the chip enable.

   It configures the ECC algorithm if required (Hamming or BCH), one DMA channel to handle data transfers from the NAND flash page to the data buffer, and a second DMA

channel to transfer ECC decoding results from ECC status registers to the RAM decoding status buffer.

3. The CPU then launches the FMC sequencer by setting the CSQSTART bit in the FMC_CSQCR register.
4. The FMC command sequencer issues the command and address cycles to the NAND flash memory.
5. The command sequencer waits for a Ready/Busy (RNB) rising edge to start data transfer.
6. It sends a DMA request to launch the data transfer from the NAND flash page to the data buffer.
7. When all sector data are read, go to step 8 if ECC is enabled, otherwise go to step 9. The FMC command sequencer can generate a sector transfer complete interrupt if it has been previously enabled.
8. When ECC status registers are empty (because the Hamming error code or the BCH error position bits of previous sector have already been read), the ECC command sequencer automatically issues a change read column command (0xE0) followed by two address cycles and by the 0xE0 command, to read ECC bytes from NAND flash memory and store them in ECC registers. These commands as well as the number of address cycles are programmed in the FMC_CSQCFGR2 register (see *Figure 196*).

   The address in spare area is extracted from the programmed ECC address offset.

   When the Hamming algorithm is used, a DMA request to the second DMA channel is send to transfer ECC codes (FMC_HPR and FMC_HECCR registers) to the decoding status buffer.

   When BCH algorithm is used, once all the parity bytes have been read, the BCH decoder first processes the syndrome to detect errors and then searches for error positions if any.

   As the BCH decoder is pipelined, it is possible to start reading a sector even if the decoding of the previous sector is not complete.

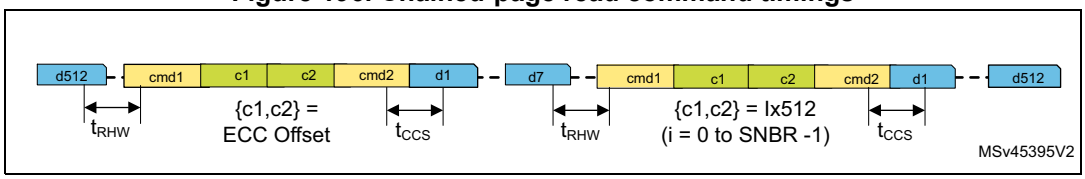
   In parallel of the following steps, when BCH sector decoding is complete, the new error status is stored in the ECC status registers (FMC_BCHDSR0) and a DMA request to the second DMA channel is sent to transfer data from the status registers to the decoding status buffer located in RAM.
9. The FMC command sequencer then repeats step 4 (except that a change read column command is issued instead of the page read first cycle command) to step 8 to read the other sectors and their corresponding ECC bytes. The addresses are issued and incremented following the page size, number of sectors, spare area address offset address and BCH code selection. When the read sequence is complete, the command sequencer waits for t_{RHWL} before issuing a new command sequence (refer to *Figure 195*). When ECC is disabled, the sequencer repeats step 6.
10. Once all sectors within a page and the status registers (FMC_BCHDSRx) are transferred by the command sequencer, the ECC controller can generate the transfer complete interrupt or transfer complete error (when enabled).
11. By reading the decoding status buffer, the CPU can start processing the errors corresponding to each sector. If no error has been detected, the page stored in RAM is validated. Otherwise the CPU corrects the error(s) before validating the page buffer in RAM. If there are too many errors, the CPU can detect the page cannot be corrected and invalidate the data buffer.

Following the selected BCH code, if the number of detected errors exceeds the number of correctable errors, this bit is not significant and the DUE bit is set. If the number of errors the detected by the BCH decoder exceeds the maximum number of detectable errors, DEN and DUE bits are not significant.

The DMA channels can also send interrupts each time a data transfer is complete. This allows the CPU to process error(s) in a sector as soon as it is available.

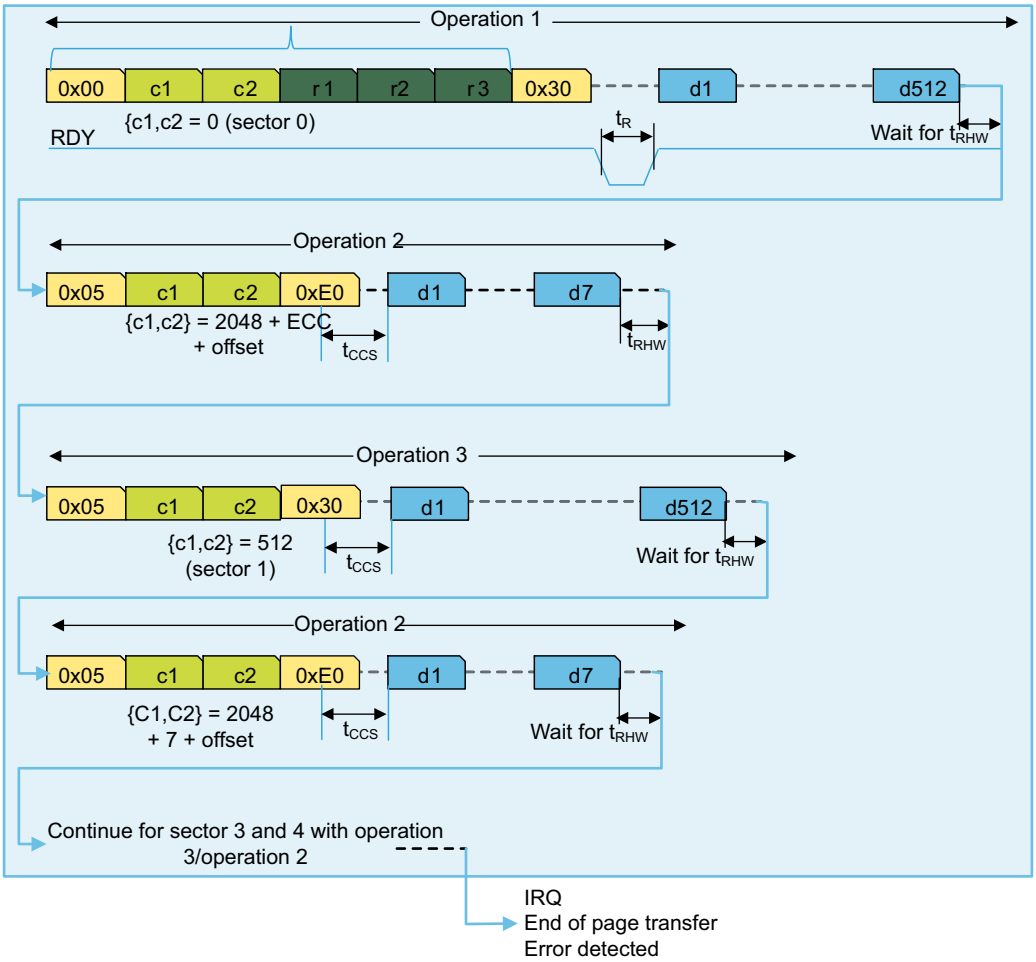
Note: When using the sequencer and DMA channels, the CPU must not read the FMC_BCHPBRx and FMC_BCHDSRx registers before data of all sectors are transferred, that is when TCF flag is set in the FMC_CSQISR register.

Figure 196. Chained-page read command timings



An example of 2 Kbyte page read sequence with BCH is described in *Figure 197*. This example corresponds to four 512-byte sectors and 7 ECC bytes per data 512 bytes.

Figure 197. Example of 2-Kbyte page read sequence with 4-bit BCH



The BCH controller resets the ECC computation whenever a page read (0x00), a page program (0x80), a random read (0x05) or a random program command ((0x85) is issued.

When only part of a page is written/read using the BCH, the command sequencer issues a random read/write command sequence only for the number of sectors to be read/written. This is done by programming the number of sector to be processed.

FMC command sequencer configuration

1. Configure the FMC_CSQCFGR1 register: program the command1 and the command 2 (in case of read access), the number of address cycles to be issued, configure the read or write sequence, and select the timings to be used.
2. Configure the address bytes in FMC_CSQAR1 and FMC_CSQAR2 register.
3. In the FMC_CSQCFGR2 register, configure the change write or change read column commands and the timings to be used for ECC. Program the address offset for the random columns in the FMC_CSQAR2 register. Enable the DMA if it is needed for ECC status register transfer.
4. Configure the number of sectors and the address cycle timings in the FMC_CSQCFGR3 register.
5. Configure the ECC sector size, and select read or write access in the FMC_PCR register.
6. Enable the SQSDTEN bit in the FMC_CSQFCGR2 register. The ECCEN bit in the FMC_PCR register kept at 0.
7. Transfer complete, and transfer error complete or sector transfer complete can be enabled through the FMC_CSQIER register.

32.11.8 NAND flash controller interrupt

An interrupt can be generated on the following events:

- RNB rising edge: an interrupt is generated when a rising edge is detected on RNB NAND flash signal
- RNB falling edge: an interrupt is generated when a falling edge is detected on RNB NAND flash signal
- RNB high-level: an interrupt is generated when a high-level is detected on RNB NAND flash signal.
- Transfer complete: an interrupt is generated when the FMC command sequencer has completed all data transfers for all sectors or when the command sequencer was aborted.
- Sector complete interrupt: an interrupt is generated when the FMC command sequencer has completed all data transfers for one sector.
- Sector error interrupt: an interrupt is generated when the FMC command sequencer has completed a sector transfer with at least one error detected.
- Sector uncorrectable error interrupt: an interrupt is generated when the FMC command sequencer has completed a sector transfer and detected an uncorrectable error.
- Command transfer complete: the command sequencer has completed the transfer of programmed commands and addresses.
- BCH encoder parity bits ready: an interrupt is generated when the BCH encoder has finished processing parity bits.
- BCH decoder syndrome ready: an interrupt is generated when the BCH decoder has finished processing the syndrome and knows if errors have been detected or not.
- BCH decoder error found: an interrupt is generated when the BCH decoder has detected an error.
- BCH decoder error ready: an interrupt is generated when the BCH decoder has finished processing errors, has identified error locations and can then correct them.
- BCH decoder uncorrectable error: an interrupt is generated when the BCH decoder has detected that the errors cannot be corrected (more than four or eight errors according to BCH error correction capability configuration).

The interrupt source can be enabled or disabled separately through the FMC_ IER, FMC_CSQIER and FMC_BCHIER registers.

Table 258. FMC NAND controller Interrupt request

Interrupt event	Event Flag	Enable control bit
Transfer complete	TCF in FMC_CSQISR	TCIE in FMC_CSQIER
Sector complete	SCF in FMC_CSQISR	SCIE in FMC_CSQIER
Sector error	SEF in FMC_CSQISR	SEIE in FMC_CSQIER
Sector uncorrectable error	SUEF in FMC_CSQISR	SUEIE in FMC_CSQIER
Command transfer complete	CMDTCF in FMC_CSQISR	CMDTCIE in FMC_CSQIER
BCH encoder parity bits ready	EPBRF in FMC_BCHISR	EPBRIE in FMC_BCHIER
BCH decoder syndrome ready	DSRF in FMC_BCHISR	DSRIE in FMC_BCHIER
BCH decoder error found	DEFF in FMC_BCHISR	DEFIE in FMC_BCHIER

Table 258. FMC NAND controller Interrupt request (continued)

Interrupt event	Event Flag	Enable control bit
BCH decoder error ready	DERF in FMC_BCHISR	DERIE in FMC_BCHIER
BCH decoder uncorrectable error	DUEF in FMC_BCHISR	DUEIE in FMC_BCHIER

32.11.9 NAND flash controller registers

NAND flash programmable control register (FMC_PCR)

Address offset: 0x80

Reset value: 0x0007 FE08

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	WEN	BCHECC	Res.	Res.	Res.	Res.	ECCSS[2:0]			TAR[3]
						rw	rw					rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TAR[2:0]			TCLR[3:0]				ECCALG	Res.	ECCEN	PWID[1:0]		Res.	PBKEN	PWAITEN	Res.
rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw		rw	rw	

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **WEN:** Write enable

This bit enables read or write access. It must be configured when using the FMC sequencer or when the ECC with BCH code is enabled. It can only be modified when ECCEN bit is reset.

0: Read access enabled

1: Write access enabled

Bit 24 **BCHECC:** BCH error correction capability

0: 4-bit BCH (4-bit error correction and 8-bit error detection per 512 bytes)

1: 8-bit BCH (8-bit error correction and 16-bit error detection per 512 bytes)

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:17 **ECCSS[2:0]:** ECC sector size (used to access spare area)

These bits define the sector size used for the ECC:

000: 256 bytes

001: 512 bytes

010: 1024 bytes

011: 2048 bytes (default)

100: 4096 bytes

101: Reserved.

11X: Reserved.

When the ECC is enabled with BCH code, the sector size must be programmed to 512 bytes.

Bits 16:13 **TAR[3:0]:** ALE to RE delay.

These bits define the time from ALE low to RE low in number of fmc_ker_ck clock cycles:
t_ar ≤ (TAR +1) × $t_{fmc_ker_ck}$
where $t_{fmc_ker_ck}$ is the FMC clock period and *t*_ar is the ALE to RE timing of NAND flash memories.
0000: 1 * fmc_ker_ck cycle
1111: 16 * fmc_ker_ck cycles (default)

Bits 12:9 **TCLR[3:0]:** CLE to RE delay.

These bits define the time from CLE low to RE low in number of fmc_ker_ck clock cycles:
t_clr ≤ (TCLR +1) × $t_{fmc_ker_ck}$
where $t_{fmc_ker_ck}$ is the FMC clock period and *t*_clr is the CLE to RE timing of NAND flash memories.
0000: 1 * fmc_ker_ck cycle
1111: 16 * fmc_ker_ck cycles (default)

Bit 8 **ECCALG:** ECC algorithm

0: Hamming code is selected (default).
1: BCH code is selected.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **ECCEN:** ECC computation logic enable bit

0: ECC logic is disabled and reset (default after reset),
1: ECC logic is enabled.
This bit must be kept reset when using the FMC sequencer

Bits 5:4 **PWID[1:0]:** Data bus width

These bits define the external memory device width.
00: 8 bits (default after reset).
01: 16 bits
1X: Reserved.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **PBKEN:** NAND flash memory region enable bit

This bit enables the memory region. Accessing a disabled memory region causes an AXI bus error.
0: Corresponding memory region is disabled (default after reset)
1: Corresponding memory region is enabled.

Note: The NAND flash memory region must be disabled only when all NAND flash controller commands are complete.

Bit 1 **PWAITEN:** Wait feature enable bit

This bit enables the Wait feature for the NAND flash memory region:
0: disabled (default)
1: enabled

Bit 0 Reserved, must be kept at reset value.

FMC status register (FMC_SR)

Address offset: 0x84

Reset value: 0x0000 0053

This register contains information about the AXI interface isolation status and the NAND write requests status. The FMC has to be disabled before modifying some registers. As requests might be pending, it is necessary to wait till the AXI interface is stable and the core of the block is totally isolated from its AXI interface before reconfiguring the registers.

The PEF and NWEF bits indicate the status of the pipe. If Hamming algorithm is used, the ECC is calculated while data are written to the memory. To read the correct ECC, the software must consequently wait until no write request to the NAND controller are pending, by polling PEF and NWRF bits.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NWRF	Res.	PEF	Res.	Res.	ISOST[1:0]	
									r		r			r	r

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **NWRF:** NAND write request flag

This bit provides the status of the write request issued to the NAND flash memory. When this bit is set, all write requests to the NAND controller are served.

0: NAND flash write requests are pending

1: No NAND flash write requests pending

Bit 5 Reserved, must be kept at reset value.

Bit 4 **PEF:** Pipe Empty Flag

This bit indicates if the pipe contains requests.

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **ISOST[1:0]:** FMC isolation state with respect to the AXI interface

00: FMC is not isolated; AXI transactions are treated by the FMC and its controllers.

01: FMC has been enabled (FMCEN = 1) and waits for the end of pending AXI transactions (which leads to error responses) before going to “non-isolated” state.

10: FMC has been disabled (FMCEN = 0) and waits for the end of pending AXI transactions before going to isolation state.

11: FMC is isolated from its AXI interface. All AXI requests lead to error responses.

FMC common memory space timing register (FMC_PMEM)

Address offset: 0x88

Reset value: 0x0A0A 0A0A

The FMC_PMEM read/write register contains NAND flash memory region timing information. This information is used to access the NAND flash common memory space for command, address write accesses or data read/write accesses.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MEMHIZ[7:0]								MEMHOLD[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MEMWAIT[7:0]								MEMSET[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **MEMHIZ[7:0]:** Common memory data bus Hi-Z time

These bits define the number of fmc_ker_ck clock cycles (+1) during which the data bus is kept Hi-Z after starting a NAND flash write access to the common memory space. This is only valid for write transactions:
0000 0000: 1 * fmc_ker_ck cycle
0000 0001: 2 * fmc_ker_ck cycles
.....
1111 1111: 256 * fmc_ker_ck cycles

Bits 23:16 **MEMHOLD[7:0]:** Common memory hold time

These bits define the number of fmc_ker_ck clock cycles (+1) during which the address is held (and data for write accesses) after the command is deasserted (NWE, NOE), during NAND flash read or write accesses to the common memory space:
0000 0000: 1 * fmc_ker_ck cycle
0000 0001: 2 * fmc_ker_ck cycles
.....
1111 1111: 256 * fmc_ker_ck cycles

Bits 15:8 **MEMWAIT[7:0]:** Common memory wait time

These bits define the minimum number of fmc_ker_ck clock cycles (+1) to assert the command (NWE, NOE), during NAND flash read or write accesses to the common memory space. The duration of command assertion is extended if the wait signal (NWAIT) is active (low) at the end of the programmed value of fmc_ker_ck:
0000 0000: 1 * fmc_ker_ck cycles (+ wait cycle introduced by deasserting NWAIT)
0000 0001: 2 * fmc_ker_ck cycles (+ wait cycle introduced by deasserting NWAIT)
.....
1111 1111: 256 * fmc_ker_ck cycles (+ wait cycle introduced by deasserting NWAIT)

Bits 7:0 **MEMSET[7:0]:** Common memory setup time

These bits define the number of fmc_ker_ck clock cycles (+1) to set up the address before the command assertion (NWE, NOE), during NAND flash read or write accesses to the common memory space:
0000 0000: 1 * fmc_ker_ck cycles
0000 0001: 2 * fmc_ker_ck cycles
.....
1111 1111: 256 * fmc_ker_ck cycles

FMC attribute memory space timing registers (FMC_PATT)

Address offset: 0x8C

Reset value: 0x0A0A 0A0A

The FMC_PATT read/write register contains NAND flash memory region timing information. It is used for 8-bit accesses to the NAND flash attribute memory space during the last address write access when the timing differs from previous accesses (for Ready/Busy management, refer to *Section 32.11.5: NAND flash prewait function*).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ATTHIZ[7:0]								ATTHOLD[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ATTWAIT[7:0]								ATTSET[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **ATTHIZ[7:0]:** Attribute memory data bus Hi-Z time

These bits define the number of fmc_ker_ck clock cycles (+1) during which the data bus is kept in Hi-Z after starting a NAND flash write access to the attribute memory space. These bits are only valid for write transactions:
0000 0000: 1 * fmc_ker_ck cycle
0000 0001: 2 * fmc_ker_ck cycle
.....
1111 1111:256 * fmc_ker_ck cycles

Bits 23:16 **ATTHOLD[7:0]:** Attribute memory hold time

These bits define the number of fmc_ker_ck clock cycles (+1) during which the address is held (and data for write access) after the command deassertion (NWE, NOE), during NAND flash read or write accesses to the attribute memory space:
0000 0000: 1 * fmc_ker_ck cycle
0000 0001: 2 * fmc_ker_ck cycle
.....
1111 1111:256 * fmc_ker_ck cycles.

Bits 15:8 **ATTWAIT[7:0]:** Attribute memory wait time

These bits define the minimum number of x fmc_ker_ck (+1) clock cycles to assert the command (NWE, NOE), during NAND flash read or write accesses to the attribute memory space. The duration of command assertion is extended if the wait signal (NWAIT) is active (low) at the end of the programmed value of fmc_ker_ck:
0000 0000: 1 * fmc_ker_ck cycle (+ wait cycle introduced by deassertion of NWAIT)
0000 0001: 2 * fmc_ker_ck cycles (+ wait cycle introduced by deassertion of NWAIT)
.....
1111 1111: 256 * fmc_ker_ck cycles (+ wait cycle introduced by deasserting NWAIT)

Bits 7:0 **ATTSET[7:0]:** Attribute memory setup time

These bits define the number of fmc_ker_ck clock cycles (+1) for address set up before the command assertion (NWE, NOE), during NAND flash read or write accesses to the attribute memory space:
0000 0000: 1 * fmc_ker_ck cycle
0000 0001: 2 * fmc_ker_ck cycle
.....
1111 1111:256 * fmc_ker_ck cycles.

FMC Hamming parity result registers (FMC_HPR)

Address offset: 0x90

Reset value: 0x0000 0000

This register is used during read accesses in conjunction with the FMC sequencer. It contains the current error correction code value computed by the FMC NAND controller Hamming module. When the FMC sequencer reads data from a NAND flash memory page at the correct address, the data read are automatically processed by the Hamming computation module. When X bytes have been read (according to the sector size ECCSS field in the FMC_PCR register), the CPU must read the computed ECC value from the FMC_HECCR register. It then verifies if these computed parity data are the same as the parity value recorded in the spare area and stored in the and the FMC_HPR, to determine whether a page is valid, and to correct it otherwise. The FMC_HPR register must be cleared after being read by setting the ECCEN bit to 0. To compute a new data block, the ECCEN bit must be set.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
HPR[31:16]

HPR[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **HPR[31:0]:** Hamming parity result

This field contains the parity value computed by the Hamming ECC computation module. *Table 259* describes the contents of these bitfields.

Table 259. HPR relevant bits

ECCSS[2:0]	Sector size in bytes	HPR bits
000	256	HPR[21:0]
001	512	HPR[23:0]
010	1024	HPR[25:0]
011	2048	HPR[27:0]
100	4096	HPR[29:0]
101	8192	HPR[31:0]

FMC Hamming code ECC result register (FMC_HECCR)

Address offset: 0x94

Reset value: 0x0000 0000

This register contain the current error correction code value computed by the FMC NAND controller Hamming module.When the CPU reads/writes data from/to a NAND flash memory page at the correct address (refer to *Section 32.11.6: NAND ECC controller*), the data read/written from/to the NAND flash memory are automatically processed by the Hamming computation module. When X bytes have been read (according to the sector size ECCSS

field in the FMC_PCR register), the CPU must read the computed ECC value from the FMC_HECCR register. It then verifies if these computed parity data are the same as the parity value recorded in the spare area, to determine whether a page is valid, and to correct it otherwise. The FMC_HECCR register must be cleared after being read by setting the ECCEN bit to 0. To compute a new data block, the ECCEN bit must be set.

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **HECC[31:0]:** ECC result

This field contains the value computed by the Hamming ECC computation logic. *Table 260* describes the contents of these bitfields.

Table 260. ECC result relevant bits(1)

ECCSS[2:0]	Sector size in bytes	HECC bits
000	256	HECC[21:0]
001	512	HECC[23:0]
010	1024	HECC[25:0]
011	2048	HECC[27:0]
100	4096	HECC[29:0]
101	8192	HECC[31:0]

1. Only the relevant bits according to the sector size are valid.

FMC NAND interrupt enable register (FMC_IER)

Address offset: 0x180

Reset value: 0x0000 0000

This register configures the interrupt capability generation when the RNB signal is connected on FMC interrupt pin. An interrupt can be generated on the rising edge, falling edge or high level detected on the RNB signal.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IFEE	IHLE	IREE
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IFEE:** Interrupt falling edge detection enable bit
0: Interrupt falling edge detection request disabled
1: Interrupt falling edge detection request enabled

Bit 1 **IHLE:** Interrupt high-level detection enable bit
0: Interrupt high-level detection request disabled
1: Interrupt high-level detection request enabled

Bit 0 **IREE:** Interrupt rising edge detection enable bit
0: Interrupt rising edge detection request disabled
1: Interrupt rising edge detection request enabled

FMC interrupt status register (FMC_ISR)

Address offset: 0x184

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IFEF	IHLF	IREF
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **IFEF:** Interrupt falling edge flag
The flag is set by hardware and cleared by setting the CFEIF bit.
0: No interrupt falling edge occurred
1: Interrupt falling edge occurred

Bit 1 **IHLF:** Interrupt high-level flag
The flag is set by hardware and cleared by setting the CHLIF bit.
0: No Interrupt high-level occurred
1: Interrupt high-level occurred

Bit 0 **IREF:** Interrupt rising edge flag
The flag is set by hardware and cleared by setting the CREIF bit.
0: No interrupt rising edge occurred
1: Interrupt rising edge occurred

FMC NAND controller interrupt clear register (FMC_ICR)

Address offset: 0x188

Reset value: 0x0000 0000

Writing 1 in one of these bits clears the corresponding flag in the interrupt status register (FMC_ISR).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CIFEF	CIHLF	CIREF
													w	w	w

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **CIFEF:** Clear Interrupt falling edge flag
0: No effect
1: Clears the IFEF flag in the FMC_ISR register

Bit 1 **CIHLF:** Clear Interrupt high-level flag
0: No effect
1: Clears the IHLF flag in the FMC_ISR register

Bit 0 **CIREF:** Clear Interrupt rising edge flag
0: No effect
1:Clear the IREF flag in the FMC_ISR register

FMC NAND command sequencer control register (FMC_CSQCR)

Address offset: 0x200

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CSQSTART
															w

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **CSQSTART**: Command Sequencer Enable
Writing 1 starts the Command sequencer.
Writing 0 has no effect.

Note: Write this bit to 1 to start the sequencer only when the FMC is enabled by setting FMCEN bit of FMC_CFGR to 1 and the NAND flash controller is activated by setting PBKEN bit of FMC_PCR to 1.

FMC NAND command sequencer configuration register 1 (FMC_CSQCFGR1)

Address offset: 0x204

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	CMD2T	CMD1T	CMD2[7:0]

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CMD1[7:0]								Res.	ACYNBR[2:0]			Res.	DMADEN	CMD2EN	Res.
rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw		rw	rw	

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **CMD2T:** Command 2 Sequencer timings

This bit specifies if the Command 2 (CMD2) is issued to the NAND flash memory with the timings defined in FMC_PMEM or FMC_PATT register.

0: CMD2 issued with the timings programmed in FMC_PMEM

1: CMD2 issued with the timings programmed in FMC_PATT

Bit 24 **CMD1T:** Command 1 Sequencer timings

This bit specifies if the Command 1 (CMD1) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or FMC_PATT register.

0: CMD1 issued with the timings programmed in FMC_PMEM

1: CMD1 issued with the timings programmed in FMC_PATT

Bits 23:16 **CMD2[7:0]:** Command 2 sequencer

These bits specify if the Command 2 is issued by the command sequencer for the command second cycle during read operations.This command is only issued when the CMD2EN bit is set.

Example: CMD2[7:0] bits must be programmed to 0x30 to issue the read column command.

Bits 15:8 **CMD1[7:0]:** Command 1 sequencer

These bits specify if the Command 1 is issued by the command sequencer for the first cycle during read or write operations.

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **ACYNBR[2:0]:** Address Cycle number

These bits define the number of address cycles to be generated by the command sequencer when issuing the command programmed in the registers.

000: No address cycle.

001: 1 address cycle

010: 2 address cycles

011: 3 address cycles

100: 4 address cycles

101: 5 address cycles

Others: Reserved.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **DMADEN:** Command sequencer DMA request data enable

When this bit is set, the command sequencer generates a DMA request to the first DMA channel, to transfer data from/to NAND flash memory.

0: No DMA request transfer

1: A DMA request transfer

Bit 1 **CMD2EN:** Command cycle 2 Enable

This bit specifies that the command cycle 2 has to be generated by the command sequencer.

0: Command cycle 2 not issued.

1: Command cycle 2 (programmed CMD2[7:0]) sent by the command sequencer to the NAND flash memory after the address cycles.

Bit 0 Reserved, must be kept at reset value.

FMC NAND command sequencer configuration register 2 (FMC_CSQCFGR2)

Address offset:0x208

Reset value: 0x0000 0000

This register is used to configure the command sequencer to issue random read/ write commands to read/ write data by sector and automatically read/write data from NAND flash memory at a programmable address offset. This is useful when performing a sector read/write operation followed by an ECC read/write operation in the NAND flash spare area.The command sequencer generates the random commands until all the sectors are read/written.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	RCMD2T	RCMD1T	RCMD2[7:0]							
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RCMD1[7:0]								Res.	Res.	Res.	Res.	Res.	DMASEN	RCMD2EN	SQSDTEN
rw	rw	rw	rw	rw	rw	rw	rw						rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **RCMD2T:** Command 1 sequencer timings

This bit specifies if the CMD1 is issued to the NAND flash memory with the timings programmed in FMC_PMEM or FMC_PATT register.

0: CMD1 issued with the timings programmed in FMC_PMEM

1: CMD1 issued with the timings programmed in FMC_PATT

Bit 24 **RCMD1T:** Command 1 sequencer timings

This bit specifies if the CMD1 is issued to the NAND flash memory with the timings flash memory in FMC_PMEM or FMC_PATT register.

0: CMD1 issued with the timings programmed in FMC_PMEM

1: CMD1 issued with the timings programmed in FMC_PATT

Bits 23:16 **RCMD2[7:0]:** Random Command 2 sequencer

These bits specify that the command 2 is issued by the command sequencer for the second cycle during read operations.This command is only issued when the RCMD2EN bit is set.
Example: the RCMD2 (0xE0) is required to issue the random read column command.

Bits 15:8 **RCMD1[7:0]:** Random Command 1 sequencer

These bits specify that the command 1 value is issued by the command sequencer for the first cycle during read or write accesses.

Bits 7:3 Reserved, must be kept at reset value.

Bit 2 **DMASEN:** Command sequencer DMA request decoding status enable

When this bit is set, the command sequencer generates a DMA request to the second DMA channel when valid bits are available in the ECC status register at the end of ECC processing (decoding).
0: No DMA request used for ECC status registers transfer
1: A DMA request used for ECC status registers transfer

Note: This bit must be set only during a page read sequence to offload the saving of the ECC results between sectors by using a second DMA channel.

Bit 1 **RCMD2EN:** Random Command 2 sequencer enable

This bit enables the command 2 to be issued by the command sequencer during read accesses. This command is issued only when the CMD2SQEN bit is set.
0: Command 2 not issued.
1: Command 2 (CMD2SQ[7:0]) issued by the command sequencer to NAND flash memory after the address cycle.

Bit 0 **SQSDTEN:** Sequencer spare data transfer enable

This bit enables the sequencer to access the spare data area after each sector transfer. It also enables the ECC when using the sequencer. ECCEN bit in FMC_PCR register must be reset.
0: ECC disabled and spare data area not accessed by the sequencer
1: ECC enabled and spare data area read or programmed by the sequencer after each sector transfer

FMC NAND sequencer configuration register 3 (FMC_CSQCFGR3)

Address offset: 0x20C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	SNBR[5:0]						Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
		rw	rw	rw	rw	rw	rw								

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **RAC2T:** Random Address cycle 2 sequencer timings

This bit specifies if the random Address cycle 2 (ADDC2) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or in FMC_PATT register.

0: Random ADDC2 issued with the timings programmed in FMC_PMEM

1: Random ADDC2 issued with the timings programmed in FMC_PATT

Bit 22 **RAC1T:** Random Address cycle 1 sequencer timings

This bit specifies if the random Address cycle 1 (ADDC1) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or in FMC_PATT register.

0: Random ADDC1 issued with the timings programmed in FMC_PMEM

1: Random ADDC1 issued with the timings programmed in FMC_PATT

Bit 21 **SDT:** Spare data transfer sequencer timings

This bit specifies if the spare data transfer for read and write operations from/to the NAND flash memory are performed with the timings programmed in FMC_PMEM or FMC_PATT register.

0: Spare data transfer issued with the timings programmed in FMC_PMEM

1: Spare data transfer issued with the timings programmed in FMC_PATT

Bit 20 **AC5T:** Address cycle 5 sequencer timings

This bit defines if the Address cycle 5(ADDC1) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or FMC_PATT register.

0: ADDC5 issued with the timings programmed in FMC_PMEM

1: ADDC5 issued with the timings programmed in FMC_PATT

Bit 19 **AC4T:** Address cycle 4sequencer timings

This bit defines if the Address cycle 4 (ADDC4) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or FMC_PATT register.

0: ADDC4 issued with the timings programmed in FMC_PMEM

1: ADDC4 issued with the timings programmed in FMC_PATT

Bit 18 **AC3T:** Address cycle 3 sequencer timings

This bit defines if the Address cycle 3 (ADDC3) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or FMC_PATT register.

0: ADDC3 issued with the timings programmed in FMC_PMEM

1: ADDC3 issued with the timings programmed in FMC_PATT

Bit 17 **AC2T:** Address cycle 2 sequencer timings

This bit defines if the Address cycle 2 (ADDC2) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or FMC_PATT register.

0: ADDC2 issued with the timings programmed in FMC_PMEM

1: ADDC2 issued with the timings programmed in FMC_PATT

Bit 16 **AC1T:** Address cycle 1 sequencer timings

This bit defines if the Address cycle 1 (ADDC1) is issued to the NAND flash memory with the timings programmed in FMC_PMEM or FMC_PATT register.

0: ADDC1 issued with the timings programmed in FMC_PMEM

1: ADDC1 issued with the timings programmed in FMC_PATT

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **SNBR[5:0]:** Number of sectors to be read/written

These bits define the number of sectors that are processed by the sequencer.
They are used to read/write part of a page or to use the ECC (in particular with the BCH code which requires 512-byte sectors):
000000: 1 sector
000001: 2 sectors
...
111111: 16 sectors
Others: Reserved.

Bits 7:0 Reserved, must be kept at reset value.

FMC NAND command sequencer address register 1 (FMC_CSQAR1)

Address offset: 0x210

Reset value: 0x0000 0000

This register is used to define the value of address cycles 1 to 4 to be issued by the command sequencer.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADDC4[7:0]								ADDC3[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

ADDC2[7:0]								ADDC1[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **ADDC4[7:0]:** Address Cycle 4

These bits define the value of address cycle 4 to be issued by the command sequencer during read or write accesses.

Bits 23:16 **ADDC3[7:0]:** Address Cycle 3

These bits define the value of address cycle 2 to be issued by the command sequencer during read or write accesses.

Bits 15:8 **ADDC2[7:0]:** Address Cycle 2

These bits define the value of address cycle 2 to be issued by the command sequencer during read or write accesses.

Bits 7:0 **ADDC1[7:0]:** Address Cycle 1

These bits define the value of address cycle 1 to be issued by the command sequencer during read or write accesses.

FMC NAND command sequencer address register 2 (FMC_CSQAR2)

Address offset: 0x214

Reset value: 0x0000 0000

This register is used to program the fifth address cycle and the address offset in spare area. It also selects the chip enable.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SAO[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Res.	Res.	Res.	Res.	NAND CEN1	NAND CEN0	Res.	Res.	ADDC5[7:0]							
				rw	rw			rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **SAO[15:0]:** Spare Area Address Offset

These bits define the offset of the first ECC byte in the spare area for the program sequence.

Note: The minimum SAQ value is 2 since the first two bytes of the spare area are reserved for Bad block marking and metadata.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:10 **NANDCEN[1:0]:** NAND flash chip enable number

These bits define the chip enable to be selected by the NAND flash command sequencer.

00: NCE1 chip enable selected

01: NCE2 chip enable selected

10: NCE3 chip enable selected

11: NCE4 chip enable selected

Bits 9:8 Reserved, must be kept at reset value.

Bits 7:0 **ADDC5[7:0]:** Address Cycle 5

These bits define the value of address cycle 5 to be issued by the command sequencer during read or write accesses.

FMC NAND command sequencer interrupt enable register (FMC_CSQIER)

Address offset: 0x220

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit 0 **TCIE:** Transfer Complete Interrupt enable
0: Transfer Complete Interrupt disable
1: Transfer Complete Interrupt enable

FMC NAND command sequencer interrupt status register (FMC_CSQISR)

Address offset: 0x224

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CMDTCF	SUEF	SEF	SCF	TCF
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CMDTCF:** Command Transfer Complete flag
This bit is set when the command sequencer has completed the transfer of programmed commands and addresses.
This bit is cleared by setting CCMDTCF bit. An interrupt can be generated if the CMDTCIE bit is set in the FMC_CSQICR register.

Note: The Sector Transfer Complete interrupt is not needed in sequencer mode.

Bit 3 **SUEF:** Sector Uncorrectable Error flag
This bit is set by hardware and cleared by writing 1 to the CSUEF bit in FMC_CSQICR.
When this bit is set, it indicates that the command sequencer detected an uncorrectable error when decoding a sector. An interrupt can be generated if the SUEIE bit is set in the FMC_CSQICR register.

Note: The SUEF bit is relevant only for BCH code to indicate uncorrectable errors. It must be ignored for Hamming code.

Bit 2 **SEF:** Sector Error flag

This bit is set by hardware and cleared by writing 1 to the CSEF bit in FMC_CSQICR.

This bit is set when the command sequencer has completed the sector data transfer with at least one error detection. An interrupt can be generated if the SEIE bit is set in the FMC_CSQICR register.

Note: The SEF bit is relevant only for BCH code to indicate that errors are present. It must be ignored for Hamming code.

Bit 1 **SCF:** Sector Complete flag

This bit is set by hardware and cleared by writing 1 to the CSCF bit in FMC_CSQICR.

This bit is set when the command sequencer has completed the sector data transfer. An interrupt can be generated if the SCIE bit is set in the FMC_CSQICR register.

Bit 0 **TCF:** Transfer Complete flag

This bit is set by hardware and cleared by writing 1 to the CTCF bit in FMC_CSQICR.

This bit is set when the command sequencer has transferred all the data for all sectors or when the command sequencer was aborted. An interrupt can be generated if the TCIE bit is set in the FMC_CSQICR register.

FMC NAND command sequencer interrupt clear register (FMC_CSQICR)

Address offset: 0x228

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCMDTCF	CSUEF	CSEF	CSCF	CTCF
											w	w	w	w	w

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CCMDTCF:** Clear Command Transfer Complete flag

Writing one clears the CMTCF flag in the FMC_CSQISR register

Bit 3 **CSUEF:** Clear Sector uncorrectable Error flag

Writing one clears the SUEF flag in the FMC_CSQISR register

Bit 2 **CSEF:** Clear Sector Error flag

Writing one clears the SEF flag in the FMC_CSQISR register

Bit 1 **CSCF:** Clear Sector Complete flag

Writing one clears the SCF flag in the FMC_CSQISR register

Bit 0 **CTCF**: Clear Transfer Complete flag

Writing one clears the TCF flag in the FMC_CSQISR register

FMC command sequencer error mapping status register (FMC_CSQEMSR)

Address offset: 0x230

Reset value: 0x0000 0000

This register holds a sector error mapping status when the whole transfer is complete.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

SEM[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SEM[15:0]:** Sector Error mapping
When SEM[i] bit (0 ≤ i ≤ 15) is set, at least one error has been detected on sector i+1.
As an example, SEM[2] and SEM[1] bits are set when errors are detected in sector 3 and 2.

FMC BCH interrupt enable register (FMC_BCHIER)

Address offset: 0x250

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **EPBRIE:** Decoder Parity Bits Ready Interrupt enable
0: Decoder Parity Bits Ready Interrupt disable
1: Decoder Parity Bits Ready Interrupt enable

Bit 3 **DSRIE:** Decoder Syndrome Ready Interrupt enable
0: Decoder Syndrome Ready Interrupt disable
1: Decoder Syndrome Ready Interrupt enable

Bit 2 **DEFIE:** Decoder Error Found Interrupt enable
0: Decoder Error Found Interrupt disable
1: Decoder Error Found Interrupt enable

Bit 1 **DERIE:** Decoder Error Ready Interrupt enable
0: Decoder Error Ready Interrupt disable
1: Decoder Error Ready Interrupt enable

Bit 0 **DUEIE:** Decoder Uncorrectable Errors Interrupt enable
0: Decoder Uncorrectable Errors Interrupt disable
1: Decoder Uncorrectable Errors Interrupt enable

FMC BCH interrupt and status register (FMC_BCHISR)

Address offset: 0x254

Reset value: 0x0000 0000

This register holds the status of BCH encoder/decoder after processing each sector. When the sequencer is used, this register is automatically cleared and the corresponding interrupt must not be enabled through FMC_BCHIER register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	EPBRF	DSRF	DEFF	DERF	DUEF
											r	r	r	r	r

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **EPBRF:** Encoder Parity Bits Ready flag
This bit is set when the BCH encoder parity bits are available in FMC_BCHPBR1 to 4.

Bit 3 **DSRF:** Decoder Syndrome Ready flag
This bit is set when the syndrome is ready and DEFF is a valid field.

Bit 2 **DEFF:** Decoder Error Found flag
This bit is set by hardware and cleared by writing 1 to CDEFF.
This bit indicates that at least one error has been detected in the sector.

Bit 1 **DERF:** Decoder Error Ready flag
This bit indicates that the decoder has finished searching errors and identifying their location. The number of errors and their location are available in FMC_BCHDSR0 and FMC_BCHDSR1 to 4, respectively.

Bit 0 **DUEF:** Decoder Uncorrectable Errors flag
This field indicates that too many errors have been detected in the sector during the BCH decoding and that the sector is uncorrectable.

FMC BCH interrupt clear register (FMC_BCHICR)

Address offset: 0x258

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CEPBRF	CDSRF	CDEFF	CDERF	CDUEF
											w	w	w	w	w

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **CEPBRF:** Clear Encoder Parity Bits Ready flag
Writing 1 clears the EPBRF flag in FMC_BCHISR.

Bit 3 **CDSRF:** Clear Decoder Syndrome Ready flag
Writing 1 clears the DSRF flag in FMC_BCHISR.

Bit 2 **CDEFF:** Clear Decoder Error Found flag
Writing 1 clears the DEFF flag in FMC_BCHISR.

Bit 1 **CDERF:** Clear Decoder Error ready flag
Writing 1 clears the DERF flag in FMC_BCHISR.

Bit 0 **CDUEF:** Clear Decoder Uncorrectable Error flag
Writing 1 clears the DUEF flag in FMC_BCHISR.

FMC BCH parity bits register 1 (FMC_BCHPBR1)

Address offset: 0x260

Reset value: 0x0000 0000

These registers contain the BCH parity bits (BCHPB). For the BCH 4-bit, only BCHPB[51:0] are significant and for the BCH 8-bit BCHPB[103:0] are significant.

FMC BCH decoder status register 0 (FMC_BCHDSR0)

Address offset: 0x27C

Reset value: 0x0000 0000

This register contains some fields already available in other registers but that require to be saved when error correction is performed on several sectors at a time (for example a whole NAND flash page). This allows a DMA channel to transfer the content of FMC_BCHDSR0 to 4 to a decoding status buffer.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DEN[3:0]				Res.	Res.	DEF	DUE
								r	r	r	r			r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **DEN[3:0]:** Decoder error number

When DEF bit is set, this field indicates the number of errors detected by the BCH decoder.
Following the selected BCH code, if the number of detected errors exceeds the number of correctable errors, this bit is not significant and DUE bit is set.
If the BCH decoder detects a number of errors that exceeds the maximum number of detectable errors, DEN is not significant.

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **DEF:** Decoder error found

This field indicates that the decoder has finished searching errors and identifying their location.
The number of errors and their location are available in FMC_BCHDSR0 and FMC_BCHDSR1 to 4, respectively.

Bit 0 **DUE:** Decoder uncorrectable error

This field indicates that too many errors have been detected in the sector during the BCH decoding and that the sector is uncorrectable.
If the BCH decoder detects a number of errors that exceeds the maximum number of detectable errors, DUE is not significant.

FMC BCH decoder status register for memory region 1 (FMC_BCHDSR1)

Address offset: 0x280

Reset value: 0x0000 0000

The maximum error correction capability of the BCH block embedded in the FMC is 8 errors. This register contains the positions of the 1st and 2nd error bits in EBP1 and EPB2 fields, respectively. If less than 8 errors are detected, the useless EPBx fields (x = 1 to 8) are “don’t care”.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

33 Octo-SPI interface (OCTOSPI)

33.1 OCTOSPI introduction

The OCTOSPI supports most external serial memories such as serial PSRAMs, serial NAND and serial NOR flash memories, HyperRAM™ and HyperFlash™ memories, with the following functional modes:

- indirect mode: all the operations are performed using the OCTOSPI registers to preset commands, addresses, data, and transfer parameters.
- automatic status-polling mode: the external memory status register is periodically read and an interrupt can be generated in case of flag setting. This feature is only available in regular-command protocol.
- memory-mapped mode: the external memory is memory mapped and it is seen by the system as if it was an internal memory, supporting both read and write operations.

The OCTOSPI supports the following protocols with associated frame formats:

- the regular-command frame format with the command, address, alternate byte, dummy cycles, and data phase
- the HyperBus™ frame format

33.2 OCTOSPI main features

- Functional modes: indirect, automatic status-polling, and memory-mapped
- Read and write support in memory-mapped mode
- External (P)SRAM memory support
- Support for single, dual, quad, and octal communication
- Dual memory configuration, where eight bits can be sent/received simultaneously by accessing two quad memories in parallel
- SDR (single-data rate) and DTR (double-transfer rate) support
- Data strobe support
- Fully programmable opcode
- Fully programmable frame format
- Support wrapped-type access to memory in read direction
- HyperBus support
- Integrated FIFO for reception and transmission
- Asynchronous bus clock versus kernel clock support
- 8-, 16-, and 32-bit data accesses allowed
- DMA protocol support
- DMA channel for indirect mode operations
- Interrupt generation on FIFO threshold, timeout, operation complete, and access error
- AHB interface with transaction acceptance limited to one: the interface accepts the next transfer on AHB bus only once the previous is completed on memory side.
- Dual chip select support

33.3 OCTOSPI implementation

33.4 OCTOSPI functional description

33.4.1 OCTOSPI block diagram

Figure 198. OCTOSPI block diagram in octal configuration

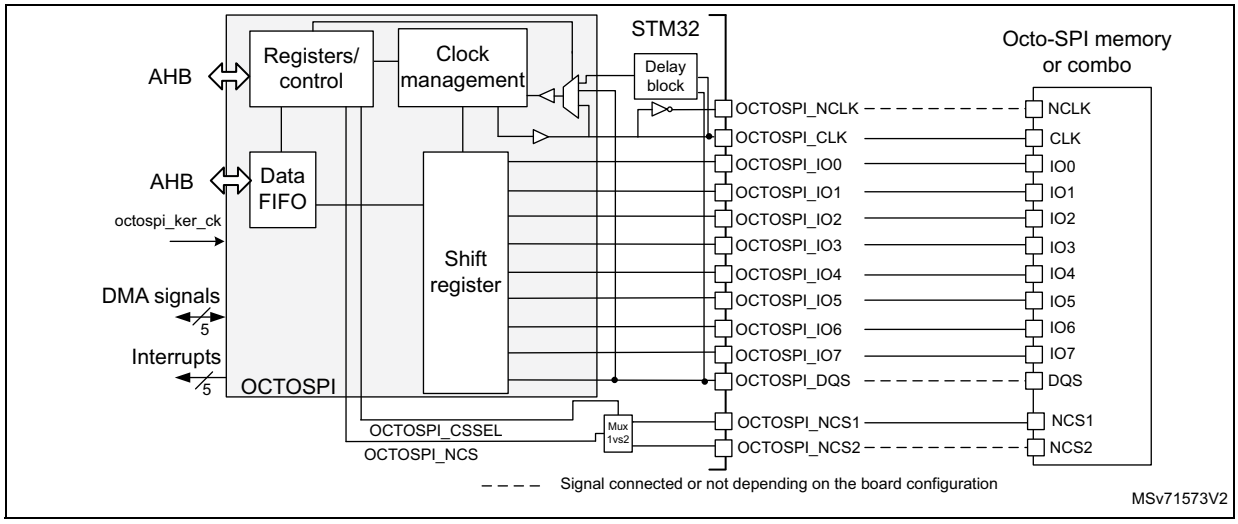

Figure 199. OCTOSPI block diagram in quad configuration

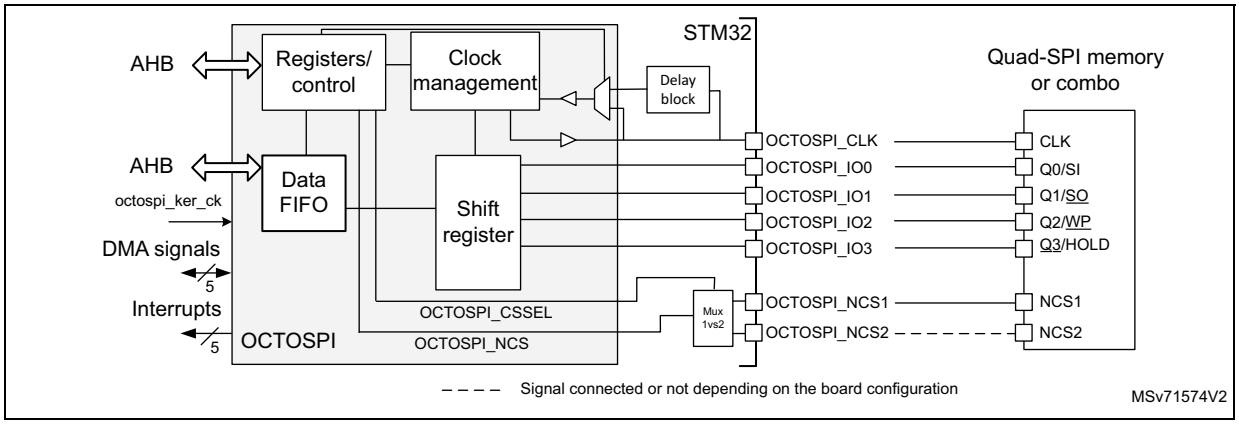

Figure 200. OCTOSPI block diagram in dual-quad configuration

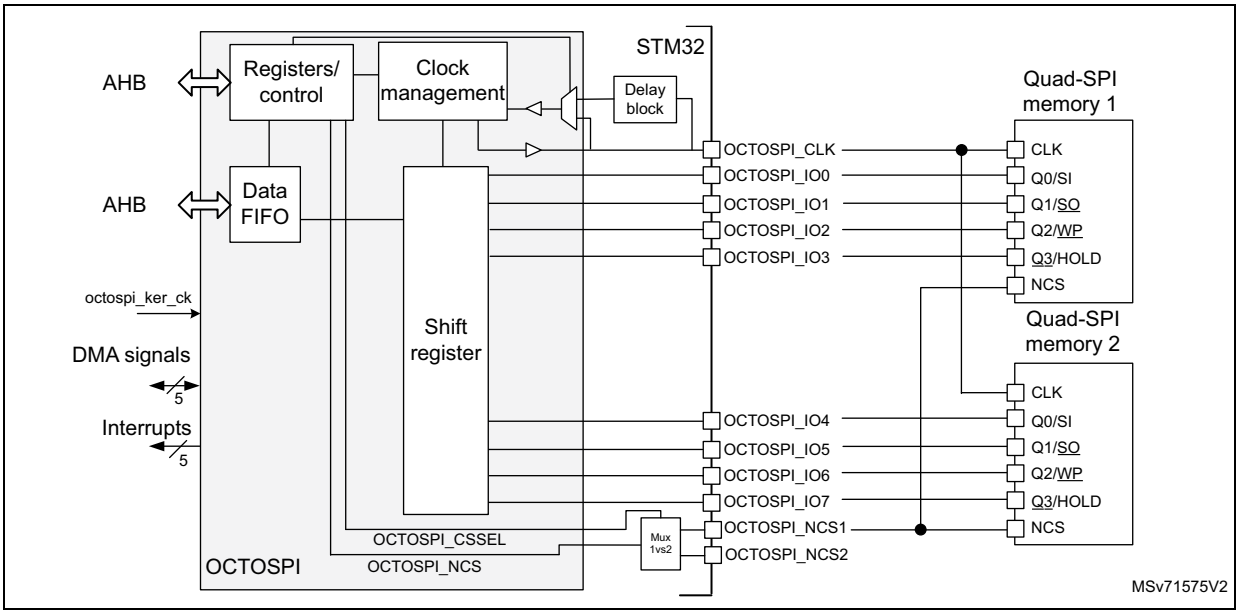


33.4.2 OCTOSPI pins and internal signals

Table 263. OCTOSPI input/output pins

Pin name	Type	Description
OCTOSPI_NCLK	Output	OCTOSPI inverted clock to support 1.8 V HyperBus protocol. The inversion must be activated only in this case, by setting the INVCLK bit in *Section 22.3.14: Advanced I/O configurations*.
OCTOSPI_CLK		OCTOSPI clock
OCTOSPI_IOn (n = 0 to 7)	Input/output	OCTOSPI data pins
OCTOSPI_NCS1,2	Output	Chip select for the memory
OCTOSPI_DQS	Input/output	Data strobe/write mask signal from/to the memory

Caution: Use the same configuration (output speed, HSLV[(a)]) for all OCTOSPI input/output pins to avoid any data corruption.

Table 264. OCTOSPI internal signals

Signal name	Type	Description
octospi_hclk	Input	OCTOSPI AHB clock
octospi_ker_ck	Input	OCTOSPI kernel clock
octospi_dma	N/A	DMA request signal
octospi_it	Output	Global interrupt line (see *Table 268* for the multiple sources of interrupt)

a. When applicable.

33.4.3 OCTOSPI interface to memory modes

The OCTOSPI supports the following protocols:

- regular-command protocol
- HyperBus protocol

The OCTOSPI uses from 6 to 12 signals to interface with a memory, depending on the functional mode:

- NCS: chip-select (in the following sections, unless otherwise specified, NCS applies for NCS1 or NCS2. Only one of these two signals is active at a given moment in time)
- CLK: communication clock
- NCLK: inverted clock used only in the 1.8 V HyperBus protocol
- DQS: data strobe used only in regular-command protocol as input only
- IO[3:0]: data bus LSB
- IO[7:4]:
  - data bus MSB used in dual-quad and octal configurations
  - data bus can be used as possible remap for quad-SPI mode

33.4.4 OCTOSPI regular-command protocol

When in regular-command protocol, the OCTOSPI communicates with the external device using commands. Each command can include the following phases:

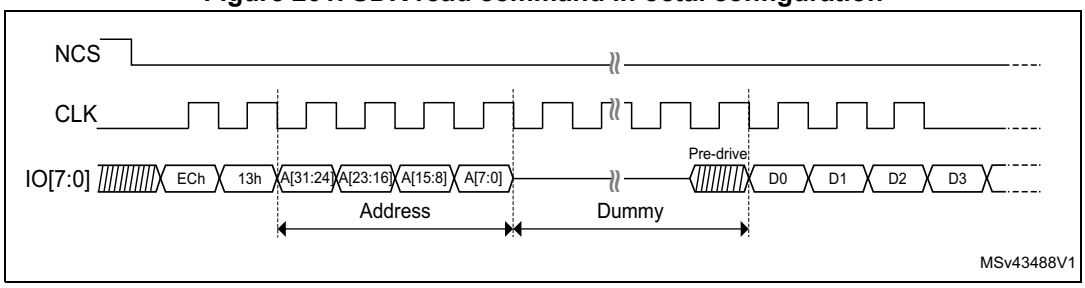
- Instruction phase
- Address phase
- Alternate-byte phase
- Dummy-cycle phase
- Data phase

Any of these phases can be configured to be skipped but, in case of single-phase command, the only use case supported is instruction-phase-only.

The NCS falls before the start of each command and rises again after each command finishes.

In memory-mapped mode, both read and write operations are supported: as a consequence, some of the configuration registers are duplicated to specify write operations (read operations are configured using regular registers).

Figure 201. SDR read command in octal configuration



The specific regular-command protocol features are configured through the registers in the 0x0100-0x01FC offset range.

Instruction phase

During this phase, a 1- to 4-byte instruction is sent to the external device specifying the type of operation to be performed. The size of the instruction to be sent is configured by ISIZE[1:0] in OCTOSPI_CCR and the instruction is programmed in INSTRUCTION[31:0] of OCTOSPI_IR.

The instruction phase can optionally send:

- 1 bit at a time (over IO0, SO single in single-SPI mode)
- 2 bits at a time (over IO0/IO1 in dual-SPI mode)
- 4 bits at a time (over IO0 to IO3 in quad-SPI mode)
- 8 bits at a time (over IO0 to IO7 in octal-SPI mode)

This can be configured using IMODE[2:0] of OCTOSPI_CCR.

The instruction can be sent in DTR mode on each rising and falling edge of the clock, by setting IDTR in OCTOSPI_CCR.

When IMODE[2:0] = 000 in OCTOSPI_CCR, the instruction phase is skipped, and the command sequence starts with the address phase, if present.

In memory-mapped mode, the instruction used for the write operation is specified in OCTOSPI_WIR, and the instruction format is specified in OCTOSPI_WCCR. The instruction used for the read operation and the instruction format are specified in OCTOSPI_IR and OCTOSPI_CCR.

Address phase

In the address phase, 1 to 4 bytes are sent to the external device, to indicate the address of the operation. The number of address bytes to be sent is configured by ADSIZE[1:0] in OCTOSPI_CCR.

In indirect and automatic status-polling modes, the address bytes to be sent are specified by ADDRESS[31:0] in OCTOSPI_AR. In memory-mapped mode, the address is given directly via the AHB (from any master in the system).

The address phase can send:

- 1 bit at a time (over IO0, SO single in single-SPI mode)
- 2 bits at a time (over IO0/IO1 in dual-SPI mode)
- 4 bits at a time (over IO0 to IO3 in quad-SPI mode)
- 8 bits at a time (over IO0 to IO7 in octal-SPI mode)

This can be configured using ADMODE[2:0] in OCTOSPI_CCR.

The address can be sent in DTR mode (on each rising and falling edge of the clock) setting ADDTR in OCTOSPI_CCR.

When ADMODE[2:0] = 000, the address phase is skipped and the command sequence proceeds directly to the next phase, if any.

In memory-mapped mode, the address format for the write operation is specified in OCTOSPI_WCCR. The address format for the read operation is specified in OCTOSPI_CCR.

Alternate-byte phase

In the alternate-byte phase, 1 to 4 bytes are sent to the external device, generally to control the mode of operation. The number of alternate bytes to be sent is configured by ABSIZE[1:0] in OCTOSPI_CCR. The bytes to be sent are specified in OCTOSPI_ABR.

The alternate-byte phase can send:

- 1 bit at a time (over IO0, SO single in single-SPI mode)
- 2 bits at a time (over IO0/IO1 in dual-SPI mode)
- 4 bits at a time (over IO0 to IO3 in quad-SPI mode)
- 8 bits at a time (over IO0 to IO7 in octal-SPI mode)

This can be configured using ABMODE[2:0] in OCTOSPI_CCR.

The alternate bytes can be sent in DTR mode (on each rising and falling edge of the clock) setting ABDTR in OCTOSPI_CCR.

When ABMODE[2:0] = 000, the alternate-byte phase is skipped and the command sequence proceeds directly to the next phase, if any.

There may be times when only a single nibble needs to be sent during the alternate-byte phase rather than a full byte, such as when the dual-SPI mode is used and only two cycles are used for the alternate bytes.

In this case, the firmware can use the quad-SPI mode (ABMODE[2:0] = 011) and send a byte with bits 7 and 3 of ALTERNATE[31:0] set to 1 (keeping the IO3 line high), and bits 6 and 2 set to 0 (keeping the IO2 line low), in OCTOSPI_IR.

The upper two bits of the nibble to be sent are then placed in bits 5:4 of ALTERNATE[31:0] while the lower two bits are placed in bits 1:0. For example, if the nibble 2 (0010) is to be sent over IO0/IO1, then ALTERNATE[31:0] must be set to 0x8A (1000_1010).

In memory-mapped mode, the alternate bytes used for the write operation are specified in OCTOSPI_WABR, and the alternate byte format is specified in OCTOSPI_WCCR. The alternate bytes used for read operation and the alternate byte format are specified in OCTOSPI_ABR and OCTOSPI_CCR.

Dummy-cycle phase (memory latency)

In the dummy-cycle phase, 1 to 31 cycles are given without any data being sent or received, in order to give the external device, the time to prepare for the data phase when higher clock frequencies are used. The number of cycles given during this phase is specified by DCYC[4:0] in OCTOSPI_TCR. In both SDR and DTR modes, the duration is specified as a number of full CLK cycles.

When DCYC[4:0] = 00000, the dummy-cycle phase is skipped, and the command sequence proceeds directly to the data phase, if present.

In order to assure enough “turn-around” time for changing the data signals from the output mode to the input mode, there must be at least one dummy cycle when using the dual-SPI, the quad-SPI, or the octal-SPI mode, to receive data from the external device.

In memory-mapped mode, the dummy cycles for the write operations are specified in OCTOSPI_WTCR. The dummy cycles for the read operation are specified in OCTOSPI_TCR.

Data phase

During the data phase, any number of bytes can be sent to or received from the external device.

In indirect mode, the number of bytes to be sent/received is specified in OCTOSPI_DLR. In this mode, the data to be sent to the external device must be written to OCTOSPI_DR, while in indirect-read mode the data received from the external device is obtained by reading OCTOSPI_DR.

In automatic status-polling mode, the number of bytes to be received is specified in OCTOSPI_DLR, and the data received from the external device can be obtained by reading OCTOSPI_DR.

In memory-mapped mode, the data read or written, is sent or received directly over the AHB to the Cortex core or to a DMA.

The data phase can send/receive:

- 1 bit at a time (over IO0/IO1 (SO/SI respectively) in single-SPI mode)
- 2 bits at a time (over IO0/IO1 in dual-SPI mode)
- 4 bits at a time (over IO0 to IO3 in quad-SPI mode)
- 8 bits at a time (over IO0 to IO7 in octal-SPI mode)

This can be configured using DMODE[2:0] in OCTOSPI_CCR.

The data can be sent or received in DTR mode (on each rising and falling edge of the clock) setting DDTR in OCTOSPI_CCR.

When DMODE[2:0] = 000, the data phase is skipped, and the command sequence finishes immediately by raising the NCS. This configuration must be used only in indirect-write mode.

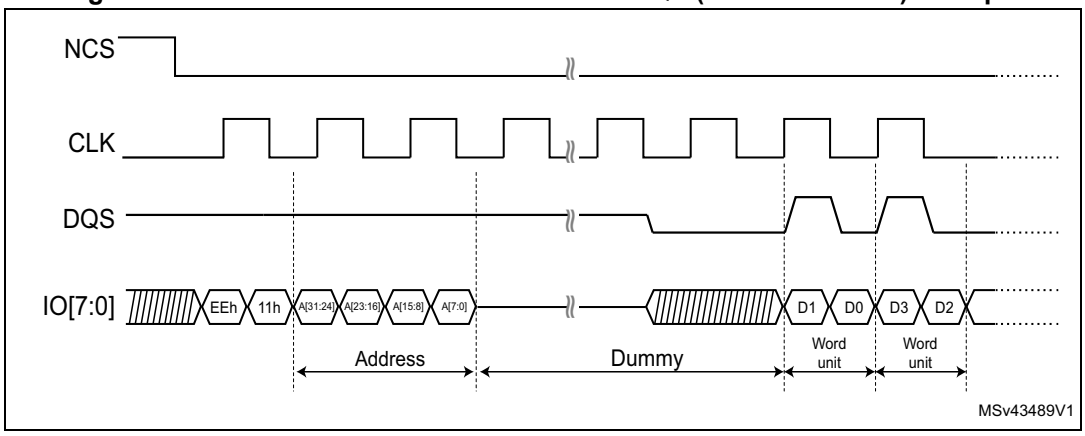
In memory-mapped mode, the data format for the write operation is specified in OCTOSPI_WCCR. The data format for the read operation is specified in OCTOSPI_CCR.

DQS use

The DQS signal can be used for data strobing during the read transactions when the device toggles the DQS aligned with the data.

The DQS management can be enabled by setting DQSE in OCTOSPI_CCR.

Figure 202. DTR read in octal-SPI mode with DQS (Macronix mode) example



33.4.5 OCTOSPI regular-command protocol signal interface

Single-SPI mode

The legacy SPI mode allows just a single bit to be sent/received serially. In this mode, the data is sent to the external device over the SO signal (Single-SPI Output) (whose I/Os are shared with IO0). The data received from the external device arrives via SI (Single-SPI Input) (whose I/Os are shared with IO1).

Compared to the SPI legacy mode, I0/SO and I1/SI are respectively equivalent to MOSI and MISO, having the OCTOSPI generating the clock.

The different phases can each be configured separately to use this single-SPI mode by setting to 001 the IMODE, ADMODE, ABMODE, and DMODE fields in OCTOSPI_CCR and OCTOSPI_WCCR.

In each phase configured in single-SPI mode:

- IO0 (SO) is in output mode.
- IO1 (SI) is in input mode (high impedance).
- IO2 is in output mode and forced to 0.
- IO3 is in output mode and forced to 1 (to deactivate the “hold” function).
- IO4 to IO7 are in output mode and forced to 0.

This is the case even for the dummy phase if DMODE[2:0] = 001.

Dual-SPI mode

In dual-SPI mode, two bits are sent/received simultaneously over the IO0/IO1 signals.

The different phases can each be configured separately to use dual-SPI mode by setting to 010 the IMODE, ADMODE, ABMODE, and DMODE fields in OCTOSPI_CCR and OCTOSPI_WCCR.

In each phase configured in dual-SPI mode:

- IO0/IO1 are at high-impedance (input) during the data phase for the read operations, and outputs in all other cases.
- IO2 is in output mode and forced to 0.
- IO3 is in output mode and forced to 1.
- IO4 to IO7 are in output mode and forced to 0.

In the dummy phase, when DMODE[2:0] = 010, IO0 and IO1 are in a high-impedance state during read transactions, and are forced to either high or low levels during write transactions.

Quad-SPI mode

In quad-SPI mode, four bits are sent/received simultaneously over the IO0/IO1/IO2/IO3 signals.

The different phases can each be configured separately to use the quad-SPI mode by setting to 011 the IMODE, ADMODE, ABMODE, and DMODE fields in OCTOSPI_CCR and OCTOSPI_WCCR.

In each phase configured in quad-SPI mode:

- IO0 to IO3 are all at high-impedance (inputs) during the data phase for the read operations, and outputs in all other cases.
- IO4 to IO7 are in output mode and forced to 0.

In the dummy phase, when DMODE[2:0] = 011, IO0 to IO3 are in a high-impedance state during read transactions, and are forced to either high or low levels during write transactions.

Octal-SPI mode

In regular octal-SPI mode, the eight bits are sent/received simultaneously over the IO[0:7] signals.

The different phases can each be configured separately to use the octal-SPI mode by setting to 100 the IMODE, ADMODE, ABMODE, and DMODE fields in OCTOSPI_CCR and OCTOSPI_WCCR.

In each phase that is configured in octal-SPI mode, IO[0:7] are all at high-impedance (input) during the data phase for read operations, and outputs in all other cases.

In the dummy phase, when DMODE[2:0] = 100, IO[0:7] are in a high-impedance state during read transactions, and are forced to either high or low levels during write transactions.

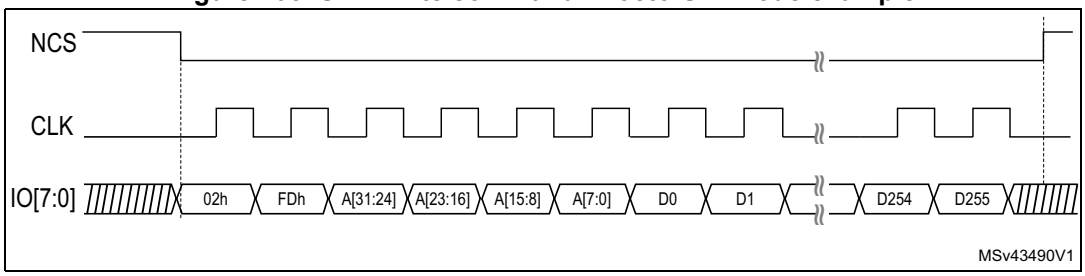
Single-data rate (SDR) mode

By default, all the phases operate in SDR mode.

In this mode, when the OCTOSPI drives the IO0/SO, IO1 to IO7 signals, these signals transition only with the falling edge of CLK.

When receiving data in SDR mode, the OCTOSPI assumes that the external devices also send the data using CLK falling edge. By default (when SSHIFT = 0 in OCTOSPI_TCR), the signals are sampled using the following (rising) edge of CLK.

Figure 203. SDR write command in octo-SPI mode example



Note: Due to internal synchronization, up to six extra dummy clock cycles may be generated by the Octo-SPI interface after the last data is read.

Double-transfer rate (DTR) mode

Each of the instruction, address, alternate-byte, and data phases can be configured to operate in DTR mode setting IDTR, ADDTR, ABDTR, and DDTR in OCTOSPI_CCR.

In memory-mapped mode, the DTR mode for each phase of the write operations is specified in OCTOSPI_WCCR. The DTR mode for each phase of the read operations is specified in OCTOSPI_CCR.

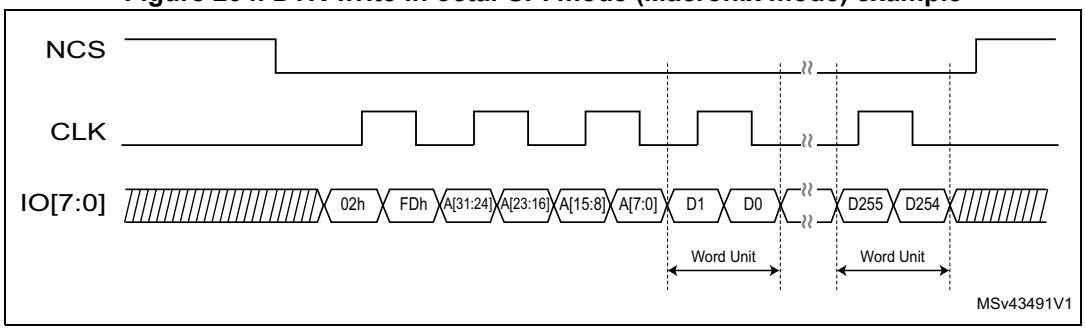
In DTR mode, when the OCTOSPI drives the IO0/SO and IO1 to IO7 signals in the instruction, address, and alternate-byte phases, a bit is sent or received on each of the falling and rising edges of CLK.

When receiving data in DTR mode, the OCTOSPI assumes that the external devices also send the data using both CLK rising and falling edges. When DDTR = 1 in OCTOSPI_CCR, the software must clear SSHIFT in OCTOSPI_TCR. Thus, the signals are sampled one half of a CLK cycle later (on the following, opposite edge).

In DTR mode, it is recommended to set DHQC of OCTOSPI_TCR, to shift the outputs by a quarter of cycle and avoid holding issues on the memory side.

Note: DHQC must not be set when the prescaler value is 0, as this action leads to unpredictable behavior.

Figure 204. DTR write in octal-SPI mode (Macronix mode) example



Note: Due to internal synchronization, up to six extra dummy clock cycles may be generated by the Octo-SPI interface after the last data is read.

Dual-quad configuration

When DMM = 1 in OCTOSPI_CR, the OCTOSPI is in dual-memory configuration: if DMODE = 011, two external Quad-SPI devices (device A and device B) are used in order to send/receive eight bits (or 16 bits in DTR mode) every cycle, effectively doubling the throughput.

Each device (A or B) uses the same CLK and NCS signals, but each has separate IO0 to IO3 signals.

The dual-quad configuration can be used in conjunction with the single-SPI, dual-SPI, and quad-SPI modes, as well as with either the SDR or DTR mode.

The device size, as specified by DEVSIZE[4:0] in OCTOSPI_DCR1, must reflect the total external device capacity that is the double of the size of one individual component.

If address X is even, then the byte that the OCTOSPI gives for address X is the byte at the address X/2 of device A, and the byte that the OCTOSPI gives for address X + 1 is the byte at the address X/2 of device B. In other words, the bytes at even addresses are all stored in device A and the bytes at odd addresses are all stored in device B.

When reading the status registers of the devices in dual-quad configuration, twice as many bytes must be read compared to the same read in regular-command protocol: if each device gives eight valid bits after the instruction for fetching the status register, then the OCTOSPI must be configured with a data length of 2 bytes (16 bits), and the OCTOSPI receives one byte from each device.

If each device gives a status of 16 bits, then the OCTOSPI must be configured to read 4 bytes to get all the status bits of both devices in dual-quad configuration. The least-significant byte of the result (in the data register) is the least-significant byte of device A status register. The next byte is the least-significant byte of device B status register. Then, the third byte of the data register is the device A second byte. The fourth byte is the device B second byte (if devices have 16-bit status registers).

An even number of bytes must always be accessed in dual-quad configuration. For this reason, bit 0 of DL[31:0] in OCTOSPI_DLR is stuck at 1 when DMM = 1.

In dual-quad configuration, the behavior of device A interface signals is basically the same as in normal mode. Device B interface signals have exactly the same waveforms as device A ones during the instruction, address, alternate-byte, and dummy-cycle phases. In other words, each device always receives the same instruction and the same address.

Then, during the data phase, the AIOx and the BIOx buses both transfer data in parallel, but the data that is sent to (or received from) device A is distinct than the one from device B.

33.4.6 HyperBus protocol

The OCTOSPI can communicate with the external device using the HyperBus protocol.

The HyperBus uses 11 to 12 pins depending on the operating voltage:

- IO[7:0] as bidirectional data bus
- DQS for read and write data strobe and latency insertion
- NCS
- CLK
- NCLK for 1.8 V operations (to support this mode, the device must be powered with 1.8 V)

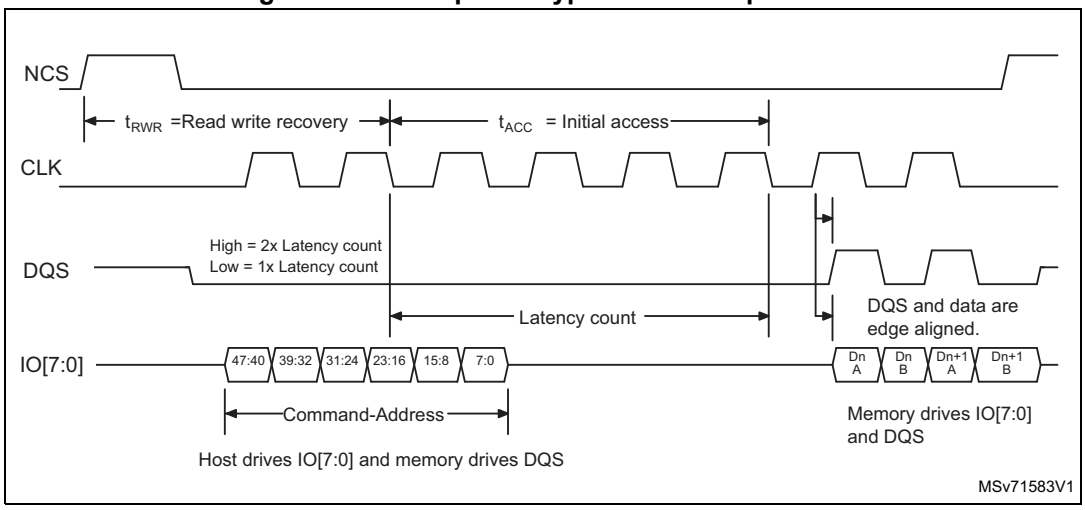
The HyperBus does not require any command specification nor any alternate bytes. As a consequence, a separate register set is used to define the timing of the transaction.

The HyperBus frame is composed of the following phases:

- Command/address phase
- Data phase

The NCS falls before the start of a transaction and rises again after each transaction finishes.

Figure 205. Example of HyperBus read operation



Note: Due to internal synchronization, up to six extra dummy clock cycles may be generated by the Octo-SPI interface after the last data is read.

The specific HyperBus features are configured through the registers in the 0x0200-0x02FC offset range.

Command/address phase

During this initial phase, the OCTOSPI sends 48 bits over IO[7:0] to specify the operations to be performed with the external device.

Table 265. Command/address phase description

CA bit	Bit name	Description
47	R/W#	Identifies the transaction as a read or a write.
46	Address space	Indicates if the transaction accesses the memory or the register space.
45	Burst type	Indicates if the burst is linear or wrapped.
44-16	Row and upper column address	Selects the row and the upper column addresses.
15-3	Reserved	-
2-0	Lower column address	Selects the starting 16-bit word within the half page.

The address space is configured through the memory type MTYP[2:0] in OCTOSPI_DCR1.

The total size of the device must be configured through DEVSIZE[4:0] of OCTOSPI_DCR1. In case of multi-chip product (MCP), the device size is the sum of all the sizes of all the MCP dies.

Read/write operation with initial latency

The HyperBus read and write operations need to respect two timings:

- t_{RWR}: minimal read/write recovery time for the device (defined by TRWR[7:0] in OCTOSPI_HLCR)
- t_{ACC}: access time for the device (defined by TACC[7:0] in OCTOSPI_HLCR) according to the memory latency

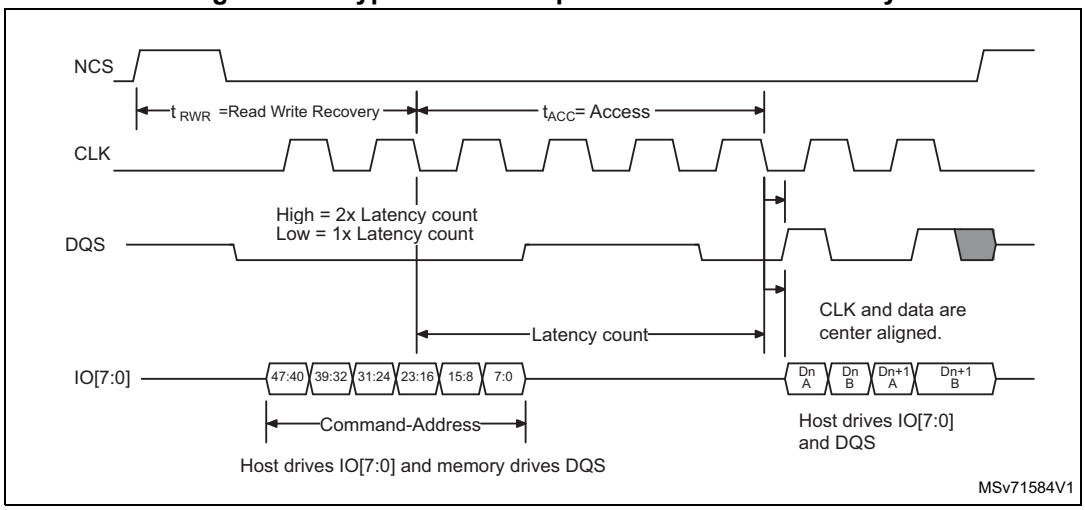
During the read operation, the DQS is used by the device, in two ways (see *Figure 205*):

- during the command/address phase, to request an additional latency
- during the data phase, for data strobing

During the write operation, the DQS is used:

- by the device, during the command/address phase, to request an additional latency.
- by the OCTOSPI, during the data phase, for write data masking.

Figure 206. HyperBus write operation with initial latency



Read/write operation with additional latency

If the device needs an additional latency (during refresh period of an SDRAM for example), DQS must be tied to one during one of the DQS signals, during the command/address phase.

An additional t_{ACC} duration is added by the OCTOSPI to meet the device request.

Figure 207. HyperBus read operation with additional latency

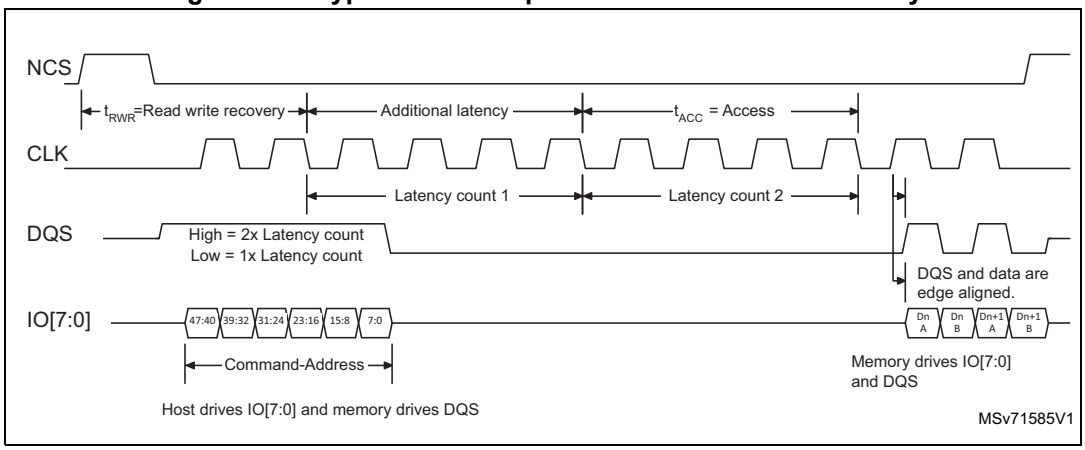


Figure 208. HyperBus write operation with additional latency

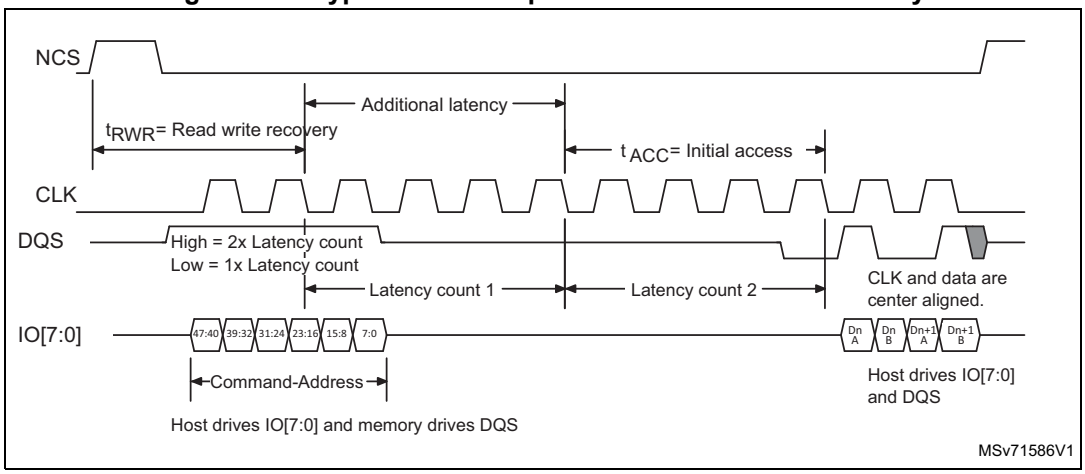


Fixed-latency mode

Some devices or some applications may not want to operate with a variable latency time as described above.

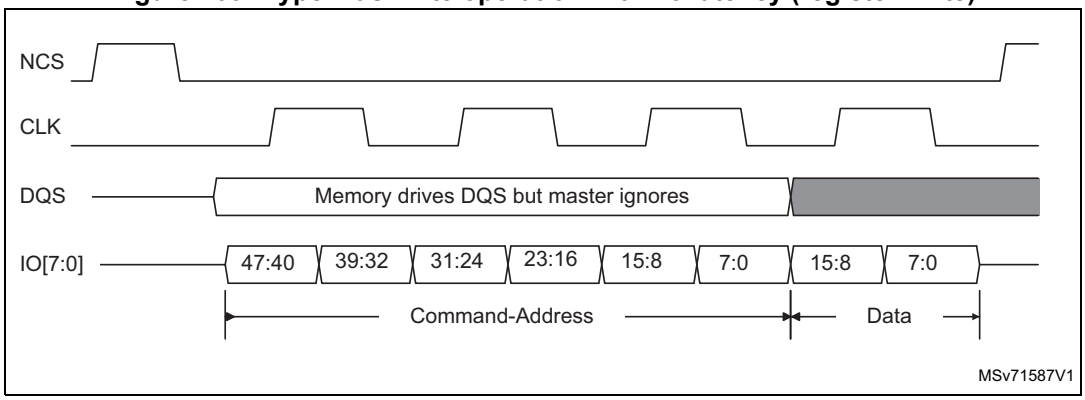
The latency can be forced to 2 x t_{ACC} by setting LM in OCTOSPI_HLCR.

In this OCTOSPI latency mode, the state of the DQS signal is not taken into account by the OCTOSPI, and an additional latency is always added, leading to a fixed 2 x t_{ACC} latency time.

Write operation with no latency

Some devices can also require a zero latency for the write operations. This write-zero latency can be forced by setting WZL in OCTOSPI_HLCR.

Figure 209. HyperBus write operation with no latency (register write)

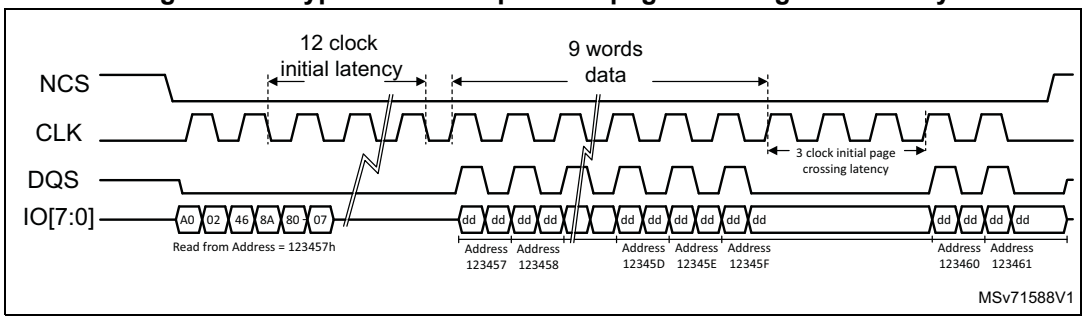


Latency on page-crossing during the read operations

An additional latency can be needed by some devices for the read operation when crossing pages.

The initial latency must be respected for any page access, as a consequence, when the first access is close to the page boundary, a latency is automatically added at the page crossing to respect the t_{ACC} time.

Figure 210. HyperBus read operation page crossing with latency



33.4.7 Specific features

The OCTOSPI supports some specific features, such as:

- Wrap support
- NCS boundary and refresh

Wrap support

The OCTOSPI supports a hybrid wrap as defined by the HyperBus protocol. A hybrid wrap is also supported in the regular-command protocol.

In hybrid wrap, the transaction can continue after the initial wrap with an incremental access.

The wrap size supported by the target memory is configured by WRAPSIZE in OCTOSPI_DCR2.

Wrap is supported only in memory-read direction and only for data size = 4 bytes. Wrapped reads are supported for both HyperBus and regular-command protocols. To enable wrapped-read accesses, the dedicated OCTOSPI_WPxxx registers must be programmed according to the wrapped-read access characteristics. These registers apply for both HyperBus and regular-command protocols.

If the target memory is not supporting the hybrid wrap, WRAPSIZE must be set to 0.

Note: Hybrid wrap requires that the nonwrapped registers (OCTOSPI_CCR, OCTOSPI_TCR, OCTOSPI_IR) are set according to the memory configuration to satisfy its correct data prefetch (initiated after the wrap command).

The wrap operation cannot be interrupted by a refresh. The refresh event is only considered after the wrap completion.

NCS boundary and refresh

Two processes can be activated to regulate the OCTOSPI transactions:

- NCS boundary
- Refresh

The NCS boundary feature limits a transaction to a boundary of aligned addresses. The size of the address to be aligned with, is configured by CSBOUND[4:0] in OCTOSPI_DCR3: it is equal to $2^{CSBOUND}$.

As an example, if CSBOUND(4:0] = 0x4, the boundary is set to 2^4 = 16 bytes. The NCS is then released each time the LSB address is equal to 0xF, and each time a new transaction is issued to address the next data.

If CSBOUND[4:0] = 0, the feature is disabled. A minimum value of three is recommended.

The NCS boundary feature cannot be used for flash memory devices in write mode since a command is necessary to program another page of the flash memory.

The refresh feature limits the duration of the transactions to the value programmed by REFRESH[31:0] in OCTOSPI_DCR4. The duration is expressed in number of cycles. This allows an external RAM to perform its internal refresh operation regularly.

The refresh value must be greater than the minimal transaction size in terms of number of cycles including the command/address/alternate/dummy phases.

If NCS boundary and refresh are enabled at the same time, the NCS is released on the first condition met.

Restarting after an interrupted transfer

When a read or write operation is interrupted by a timeout or communication regulation feature, the Octo-SPI interface, as soon as possible after getting back the port ownership, reissues the initial command sequence together with the address following the last address actually accessed before interruption. The transfer initially set goes on and ends seamlessly.

33.4.8 OCTOSPI operating mode introduction

The OCTOSPI has the following operating modes regardless of the low-level protocol used (either regular-command or HyperBus):

- indirect mode (read or write)
- automatic status-polling mode (only in regular-command protocol)
- memory-mapped mode

33.4.9 OCTOSPI indirect mode

In indirect mode, the commands are started by writing to the OCTOSPI registers, and data are transferred by writing or reading the data register, in a similar way to other communication peripherals.

When FMODE[1:0] = 00 in OCTOSPI_CR, the OCTOSPI is in indirect-write mode: bytes are sent to the external device during the data phase. Data are provided by writing to OCTOSPI_DR.

When FMODE[1:0] = 01, the OCTOSPI is in indirect-read mode: bytes are received from the external device during the data phase. Data are recovered by reading OCTOSPI_DR.

In indirect mode, when the OCTOSPI is configured in DTR mode over eight lanes with DQS disabled, the given starting address and the data length must be even.

Note: The OCTOSPI_AR register must be updated even if the start address is the same as the start address of the previous indirect access.

The number of bytes to be read/written is specified in OCTOSPI_DLR:

- If DL[31:0] = 0xFFFF FFFF, the data length is considered undefined and the OCTOSPI simply continues to transfer data until it reaches the end of the external device (as

defined by DEVSIZE). If no bytes are to be transferred, DMODE[2:0] must be set to 0 in OCTOSPI_CCR.

- If DL[31:0] = 0xFFFF FFFFF and DEVSIZE[4:0] = 0x1F (its maximum value indicating at 4-Gbyte device), the transfers continue indefinitely, stopping only after an abort request or after the OCTOSPI is disabled. After the last memory address is read (at address 0xFFFF FFFF), reading continues with address = 0x0000 0000.

When the programmed number of bytes to be transmitted or received is reached, the TCF bit is set in OCTOSPI_SR, and an interrupt is generated if TCIE = 1 in OCTOSPI_CR. In the case of an undefined number of data, TCF is set when the limit of the external SPI memory is reached, according to the device size defined in OCTOSPI_DCR1.

Triggering the start of a transfer in regular-command protocol

Depending on the OCTOSPI configuration, there are three different ways to trigger the start of a transfer in indirect mode when using the regular-command protocol. In general, the start of transfer is triggered as soon as the software gives the last information that is necessary for the command. More specifically in indirect mode, a transfer starts when one of the following sequence of events occurs:

- if no address is necessary (ADMODE[2:0] = 000) and if no data need to be provided by the software (FMODE[1:0] = 01 or DMODE[2:0] = 000), and at the moment when a write is performed to INSTRUCTION[31:0] in OCTOSPI_IR
- if an address is necessary (when ADMODE[2:0] ≠ 000) and if no data need to be provided by the software (when FMODE[1:0] = 01 or DMODE[2:0] = 000), and at the moment when a write is performed to ADDRESS[31:0] in OCTOSPI_AR
- if data need to be provided by the software (when FMODE[1:0] = 00 and DMODE[2:0] ≠ 000), and at the moment when a write is performed to DATA[31:0] in OCTOSPI_DR

A write to OCTOSPI_ABR never triggers the communication start. If alternate bytes are required, they must have been programmed before.

As soon as a command is started, the BUSY bit is automatically set in OCTOSPI_SR.

Triggering the start of a transfer in HyperBus protocol

Depending on the OCTOSPI configuration, there are different ways to trigger the start of a command in indirect mode. In general, it is triggered as soon as the firmware gives the last information that is necessary for the transfer to start, and more specifically, a communication in indirect mode is triggered by one of the following register settings, when it is the last one to be executed:

- when a write is performed to ADDRESS[31:0] (OCTOSPI_AR) with ADMODE[2:0] ≠ 000 in indirect read mode (FMODE[1:0] = 01).
- when a write is performed to DATA[31:0] (OCTOSPI_DR) in indirect-write mode (when FMODE = 00).
- when a (dummy) write is performed to INSTRUCTION[31:0] (OCTOSPI_IR) for indirect read mode (with ADMODE[2:0] = 000 and FMODE = 01).

As soon as a transfer is started, the BUSY bit (OCTOSPI_SR[5]) is automatically set.

FIFO and data management

Data in indirect mode passes through a 64-byte FIFO that is internal to the OCTOSPI. FLEVEL in OCTOSPI_SR indicates how many bytes are currently being held in the FIFO.

AHB burst transactions are supported. Data of the burst are successively written in OCTOSPI_DR, and immediately transferred in the internal FIFO.

In indirect-write mode (FMODE[1:0] = 00), the software adds data to the FIFO when it writes in OCTOSPI_DR. A word write adds 4 bytes to the FIFO, a half-word write adds 2 bytes, and a byte write adds only 1 byte. If the software adds too many bytes to the FIFO (more than indicated in DL[31:0]), the extra bytes are flushed from the FIFO at the end of the write operation (when TCF is set).

The byte/half-word accesses to OCTOSPI_DR must be done only to the least significant byte/halfword of the 32-bit register.

FTHRES is used to define a FIFO threshold after which point the FIFO threshold flag, FTF, gets set. In indirect-read mode, FTF is set when the number of valid bytes to be read from the FIFO is above the threshold. FTF is also set if there is any data left in the FIFO after the last byte is read from the external device, regardless of FTHRES setting. In indirect-write mode, the FTF is set when the number of empty bytes in the FIFO is above the threshold.

If FTIE = 1, there is an interrupt when the FTF is set. If DMAEN = 1, a DMA transfer is initiated when the FTF is set. The FTF is cleared by hardware as soon as the threshold condition is no longer true (after enough data has been transferred by the CPU or DMA).

The last data read in RX FIFO remains valid as long as there is no request for the next line. This means that, when the application reads several times in a row at the same location, the data is provided from the RX FIFO and not read again from the distant memory.

33.4.10 OCTOSPI automatic status-polling mode

In automatic status-polling mode, the OCTOSPI periodically starts a command to read a defined number of status bytes (up to four). The received bytes can be masked to isolate some status bits and an interrupt can be generated when the selected bits have a defined value. The automatic status-polling mode must be used only in regular-command protocol. For HyperBus protocol, it is not exploitable since the read status register into the HyperFlash memory must be performed in two steps (a write operation followed by a read operation).

The access to the device begins in the same manner as in indirect-read mode. BUSY in OCTOSPI_SR goes high at this point and stays high even between the periodic accesses.

The content of MASK[31:0] in OCTOSPI_PSMAR is used to mask the data from the external device in automatic status-polling mode:

- If the MASK[n] = 0, then bit n of the result is masked and not considered.
- If MASK[n] = 1, and the content of bit[n] is the same as MATCH[n] in OCTOSPI_PSMAR, then there is a match for bit n.

If PMM = 0 in OCTOSPI_CR, the AND-match mode is activated: SMF is set in OCTOSPI_SR only when there is a match on all of the unmasked bits.

If PMM = 1 in OCTOSPI_CR, the OR-match mode is activated: SMF gets set if there is a match on any of the unmasked bits.

An interrupt is called when SMF = 1 if SMIE = 1.

If APMS is set in OCTOSPI_CR, the operation stops and BUSY goes to 0 as soon as a match is detected. Otherwise, BUSY stays at 1 and the periodic accesses continue until there is an abort or until the OCTOSPI is disabled (EN = 0).

OCTOSPI_DR contains the latest received status bytes (FIFO deactivated). The content of this register is not affected by the masking used in the matching logic. FTF in OCTOSPI_SR is set as soon as a new reading of the status is complete. FTF is cleared as soon as the data is read.

In automatic status-polling mode, variable latency is not supported. The memory must then be configured in fixed latency.

33.4.11 OCTOSPI memory-mapped mode

When configured in memory-mapped mode, the external SPI device is seen as an internal memory.

Note: No more than 256 Mbytes can be addressed even if the external device capacity is larger.

If an access is made to an address outside of the range defined by DEVSIZE[4:0] but still within the 256 Mbytes range, then an AHB error is given. The effect of this error depends on the AHB master that attempted the access:

- If it is the Cortex CPU, a hard-fault interrupt is generated.
- If it is a DMA, a DMA transfer error is generated, and the corresponding DMA channel is automatically disabled.

Byte, half-word, and word access types are all supported.

A support for execute in place (XIP) operation is implemented, where the OCTOSPI continues to load the bytes to the addresses following the most recent access. If subsequent accesses are continuous to the bytes that follow, then these operations end up quickly since their results were prefetched.

By default, the OCTOSPI never stops its prefetch operation. It either keeps the previous read operation active with the NCS maintained low or it relaunches a new transfer, even if no access to the external device occurs for a long time.

Since external devices tend to consume more power when the NCS is held low, the application may want to activate the timeout counter (TCEN = 1 in OCTOSPI_CR): the NCS is released after a period defined by TIMEOUT[15:0] in OCTOSPI_LPTR, when x cycles have elapsed without access since the clock is inactive.

BUSY goes high as soon as the first memory-mapped access occurs. Because of the prefetch operations, BUSY does not fall until there is an abort, or the peripheral is disabled.

It is not recommended to program the flash memory using the memory-mapped writes. The indirect-write mode fulfills this operation.

However, if the application requires the use of the MCE for encryption (check MCE product availability), the memory-mapped write mode may be used to program encrypted data to external flash memory under the following conditions:

- Prefetch must be enabled.
- In block cipher mode, the CPU must write a complete 128-bit data block to prevent the MCE from initiating read-modify-write operations when only a few bytes need to be

programmed. This precaution avoids incorrect programming operations. There are no specific constraints to respect if the MCE is used in stream cipher mode.

- Apply the abort sequence to exit memory-mapped mode when the data linked to the page has been written in the external memory buffers. The abort sequence triggers the start of the page programming.
- Switch to the automatic status-polling mode to monitor the completion of the page programing phase.
- Relaunch the write enable command in indirect mode, then switch back to the memory-mapped mode configuration to continue to program additional pages if any.

It is recommended to add a synchronization barrier between the end of the controller registers configuration and the first memory-mapped access to the external memory when the controller is configured in memory-mapped mode.

The controller can apply an automatic address offset to simplify memory area code switching, such as during a firmware update (if the address offset feature is available in the product implementation table). To enable this feature, set the ADOFFEN bit in the XSPI_CR register and configure the offset value in the ADOFF[4:0] bitfield of the XSPI_DCR1 register. The offset is modulo 256 bytes.

33.4.12 OCTOSPI configuration introduction

The OCTOSPI configuration is done in three steps:

1. OCTOSPI system configuration
2. OCTOSPI device configuration
3. OCTOSPI mode configuration

33.4.13 OCTOSPI system configuration

The OCTOSPI is configured using OCTOSPI_CR. The user must program:

- the functional mode with FMODE[1:0]
- the automatic status-polling mode behavior if needed with PMM and APMS
- the FIFO level with FTHRES
- the DMA use with DMAEN
- the timeout counter use with TCEN
- the dual-memory configuration, if needed, with DMM

In case of an interrupt use, the respective enable bit can also be set during this phase.

If the timeout counter is used, the timeout value is programmed in OCTOSPI_LPTR.

The DMA channel must not be enabled during the OCTOSPI configuration: it must be enabled only when the operation is fully configured, to avoid any unexpected request generation.

The DMA and OCTOSPI must be configured in a coherent manner regarding data length: FTHRES value must reflect the DMA burst size.

33.4.14 OCTOSPI device configuration

The parameters related to the external device targeted are configured through OCTOSPI_DCR1 and OCTOSPI_DCR2.The user must program:

- the device size with DEVSIZE[4:0]
- the chip-select minimum high time with CSHT[5:0]
- the clock mode with FRCK and CKMODE
- the device frequency with PRESCALER[7:0]

DEVSIZE[4:0] defines the size of external memory using the following formula:

Number of bytes in the device = $2^{DEVSIZE+1}$

where DEVSIZE+1 is the number of address bits required to address the external device. The external device capacity can go up to 4 Gbytes (addressed using 32 bits) in indirect mode, but the addressable space in memory-mapped mode is limited to 256 Mbytes.

If DMM = 1, DEVSIZE[4:0] must reflect the total capacity of the two devices together considering the above formula (DEVSIZE[4:0] value is so equal to one of the two memory capacities).

When the OCTOSPI executes two commands, one immediately after the other, it raises the chip-select signal (NCS) high between the two commands for only one CLK cycle by default.

If the external device requires more time between commands, the chip-select high time CSHT[5:0] can be used to specify the minimum number of CLK cycles for which the NCS must remain high.

CKMODE indicates the level that the CLK takes between commands (when NCS = 1).

In HyperBus protocol, the device timing (t_{ACC} and t_{RWR}) and the latency mode must be configured in OCTOSPI_HLCR.

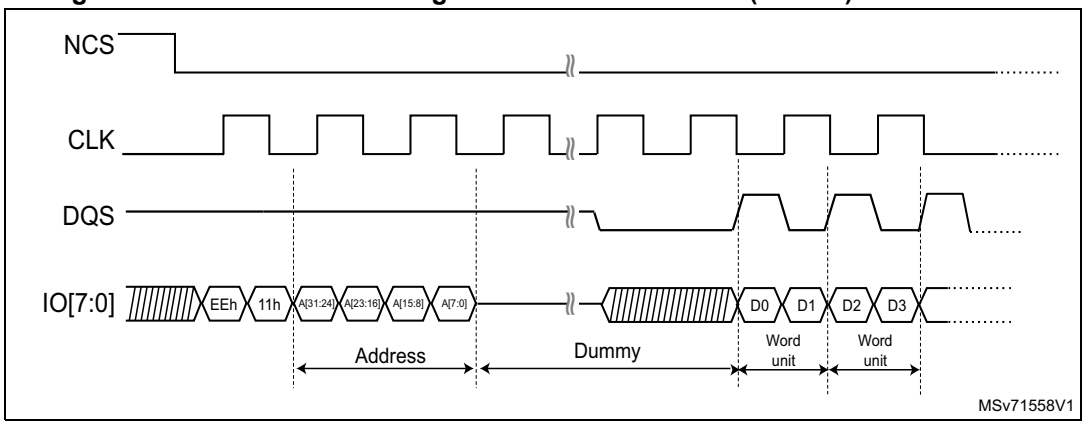
Memory types

External memory providers may present some architecture and slight data formatting differences between them. The bitfield MTYP[2:0] into the OCTOSPI_CR register allows targeting the right controller configuration depending on the associated memory type selected in the application. This is the responsibility of the software developer to align the controller configuration to fit with the targeted memory type.

The memory types are grouped in a such way:

- D0/D1 data ordering in octal-SPI data mode (DMODE[2:0] = 100) in DTR mode by configuring MTYP[2:0] = 000. For instance, Micron is using such data ordering. In this configuration, the DQS is sent with a polarity inverted respect to the clock polarity.

Figure 211. D0/D1 data ordering in octal-SPI DTR mode (Micron) - Read access



- D1/D0 data ordering in octal-SPI data mode (DMODE[2:0] = 100) in DTR mode by configuring MTYP[2:0] = 001. For instance, Macronix is using this reverse data ordering in its Octaflash portfolio (this configuration is not adapted to its OctaRAM™ memories). DQS is keeping the same polarity as the clock when reading data from the memory. Refer to *Figure 202: DTR read in octal-SPI mode with DQS (Macronix mode) example*.
- D1/D0 data ordering in octal-SPI data mode (DMODE[2:0] = 100) in DTR mode by configuring MTYP[2:0] = 011 with specific address phase built with row and column to fit with Macronix OctaRAM™ memories requirement (refer to *Table 266: OctaRAM command address bit assignment (based on 64-Mbyte OctaRAM)*. This is the controller which translates internally the targeted address provided by the software in row/column address formatting to sent to the memory. DQS is keeping the same polarity as the clock one when reading data from the memory.

Figure 212. OctaRAM read operation with reverse data ordering D1/D0

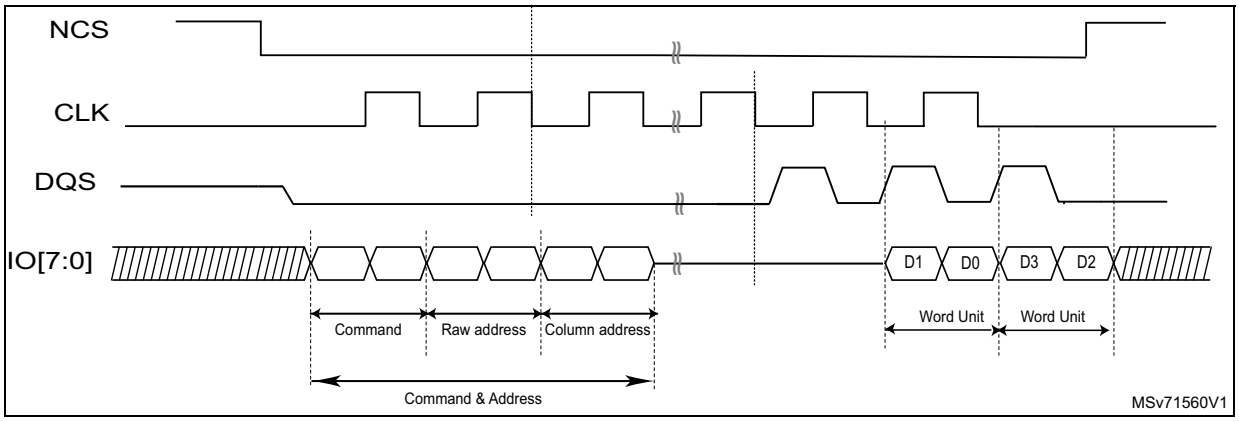


Table 266. OctaRAM command address bit assignment (based on 64-Mbyte(1) OctaRAM)

Clock	1st clock	2nd clock		3rd clock	
Function	Command	Row address		Column address	
SIO[7]	Command	Reserved	RA7	CA9	Reserved
SIO[6]		Reserved	RA6	CA8	Reserved
SIO[5]		Reserved	RA5	CA7	Reserved
SIO[4]		RA12	RA4	CA6	Reserved
SIO[3]		RA11	RA3	CA5	CA3
SIO[2]		RA10	RA2	CA4	CA2
SIO[1]		RA9	RA1	Reserved	CA1
SIO[0]		RA8	RA0	Reserved	CA0(2)

1. Example of 64-Mbyte OctaRAM address assignment:
Row Address [RA12:RA0]: 8K. Column address [CA9:CA0]: 1K. 64-Mbyte density = 8K x 1K x 8 bits
2. Column address A0 must be always 0.

- HyperBus memories need to be selected when targeted by the application. The configuration to set depends on the access type:
  - HyperBus memory mode: The protocol follows the HyperBus specification. MTYP[2:0] = 100 is the configuration to use to access the memory space.
  - HyperBus register mode (addressing register space): the memory-mapped accesses in this mode must be noncacheable, or the indirect read/write modes must be used. The configuration to be set for this particular register space access is MTYP[2:0] = 101.
- Standard mode. It is the mode to use whenever the targeted memory is not corresponding to any others configurations described in this section. MTYP[2:0] = 010 for this standard mode.

33.4.15 OCTOSPI regular-command mode configuration

Indirect mode configuration

When FMODE[1:0] = 00, the indirect-write mode is selected and data can be sent to the external device. When FMODE[1:0] = 01, the indirect-read mode is selected, and data can be read from the external device.

When the OCTOSPI is used in indirect mode, the frames are constructed in the following way:

1. Specify a number of data bytes to read or write in OCTOSPI_DLR.
2. Specify the frame timing in OCTOSPI_TCR.
3. Specify the frame format in OCTOSPI_CCR.
4. Specify the instruction in OCTOSPI_IR.
5. Specify the optional alternate byte to be sent right after the address phase in OCTOSPI_ABR.
6. Specify the targeted address in OCTOSPI_AR.

7. Enable the DMA channel if needed.
8. Read/write the data from/to the FIFO through OCTOSPI_DR (if no DMA usage).

If neither the address register (OCTOSPI_AR) nor the data register (OCTOSPI_DR) need to be updated for a particular command, then the command sequence starts as soon as OCTOSPI_IR is written. This is the case when both ADMODE[2:0] and DMODE[2:0] equal 000, or if just ADMODE[2:0] = 000 when in indirect-read mode (FMODE[1:0] = 01).

When an address is required (ADMODE[2:0] ≠ 000) and the data register does not need to be written (FMODE[1:0] = 01 or DMODE[2:0] = 000), the command sequence starts as soon as the address is updated with a write to OCTOSPI_AR.

In case of data transmission (FMODE[1:0] = 00 and DMODE[2:0] ≠ 000), the communication start is triggered by a write in the FIFO through OCTOSPI_DR.

Automatic status-polling mode configuration

The automatic status-polling mode is enabled by setting FMODE[1:0] = 10. In this mode, the programmed frame is sent and data are retrieved periodically.

The maximum amount of data read in each frame is 4 bytes. If more data is requested in OCTOSPI_DLR, it is ignored, and only 4 bytes are read. The periodicity is specified in OCTOSPI_PIR.

Once the status data has been retrieved, the following can be processed:

- Set SMF (an interrupt is generated if enabled).
- Stop automatically the periodic retrieving of the status bytes.

The received value can be masked with the value stored in OCTOSPI_PSMKR, and can be ORed or ANDed with the value stored in OCTOSPI_PSMAR.

In case of a match, SMF is set and an interrupt is generated if enabled. The OCTOSPI can be automatically stopped if AMPS is set. In any case, the latest retrieved value is available in OCTOSPI_DR.

When the OCTOSPI is used in automatic status-polling mode, the frames are constructed in the following way:

1. Specify the input mask in OCTOSPI_PSMKR.
2. Specify the comparison value in OCTOSPI_PSMAR.
3. Specify the read period in OCTOSPI_PIR.
4. Specify a number of data bytes to read in OCTOSPI_DLR.
5. Specify the frame timing in OCTOSPI_TCR.
6. Specify the frame format in OCTOSPI_CCR.
7. Specify the instruction in OCTOSPI_IR.
8. Specify the optional alternate byte to be sent right after the address phase in OCTOSPI_ABR.
9. Specify the optional targeted address in OCTOSPI_AR.

If the address register (OCTOSPI_AR) does not need to be updated for a particular command, then the command sequence starts as soon as OCTOSPI_CCR is written. This is the case when ADMODE[2:0] = 000.

When an address is required (ADMODE[2:0] ≠ 000), the command sequence starts as soon as the address is updated with a write to OCTOSPI_AR.

Memory-mapped mode configuration

In memory-mapped mode, the external device is seen as an internal memory but with some latency during accesses. Read and write operations are allowed to the external device in this mode.

It is not recommended to program the flash memory using memory-mapped writes, as the internal flags for erase or programming status have to be polled. The indirect-write mode fulfills this operation, possibly in conjunction with the automatic status-polling mode.

The memory-mapped mode is entered by setting FMODE[1:0] = 11 in OCTOSPI_CR.

The programmed instruction and frame are sent when an AHB master accesses the memory-mapped space.

The FIFO is used as a prefetch buffer to anticipate any linear reads. Any access to OCTOSPI_DR in this mode returns zero.

The data length register (OCTOSPI_DLR) has no meaning in memory-mapped mode.

When the OCTOSPI is used in memory-mapped mode, the frames are constructed in the following way:

1. Specify the frame timing in OCTOSPI_TCR for read operation.
2. Specify the frame format in OCTOSPI_CCR for read operation.
3. Specify the instruction in OCTOSPI_IR.
4. Specify the optional alternate byte to be sent right after the address phase in OCTOSPI_ABR for read operation.
5. Specify the frame timing in OCTOSPI_WTCR for write operation.
6. Specify the frame format in OCTOSPI_WCCR for write operation.
7. Specify the instruction in OCTOSPI_WIR.
8. Specify the optional alternate byte to be sent right after the address phase in OCTOSPI_WABR for write operation.

All configuration operations must be completed (ensured by checking BUSY = 0) before the first access to the memory area: any register write operation when BUSY = 1 has no effect and is not signaled with an error response. On the first access, the OCTOSPI becomes busy, and no further configuration is allowed. Then, the only way to get BUSY low is to clear the ENABLE bit or to abort by setting the ABORT bit.

OCTOSPI delayed data sampling when no DQS is used

By default, when no DQS is used, the OCTOSPI samples the data driven by the external device one half of a CLK cycle after the external device drives the signal.

In case of any external signal delays, it may be useful to sample the data later. Using SSHIFT in OCTOSPI_TCR, the sampling of the data can be shifted by half of a CLK cycle.

The firmware must clear SSHIFT when the data phase is configured in DTR mode (DDTR = 1).

OCTOSPI delayed data sampling when DQS is used

When external DQS is used as a sampling clock, it can be shifted in time to compensate the data propagation delay.

This shift is performed by a delay hardware element located outside of the controller into the RCC (RCC_DLYCFGR) or implemented on an external dedicated block delay peripheral

depending on the product (refer to the product reference manual for information about how to manage and configure the delay).

In configurations where delay does not need to be compensated, the external delay block can be bypassed by setting DLYBYP in OCTOSPI_DCR1.

33.4.16 OCTOSPI HyperBus protocol configuration

Indirect mode configuration (HyperBus)

When FMODE[1:0] = 00, the indirect-write mode is selected and data can be sent to the external device. When FMODE[1:0] = 01, the indirect-read mode is selected where data can be read from the external device. ADMODE must be configured with a value different from 000 (for instance ADMODE = 100).

When the OCTOSPI is used in indirect mode, the frames are constructed in the following way:

1. Specify a number of data bytes to read or write in OCTOSPI_DLR.
2. Specify the targeted address in OCTOSPI_AR.
3. Enable the DMA channel if needed.
4. Read/write the data from/to the FIFO through OCTOSPI_DR (if no DMA usage).

In indirect-read mode, the command sequence starts as soon as the address is updated with a write to OCTOSPI_AR.

In indirect-write mode, the communication start is triggered by a write in the FIFO through OCTOSPI_DR.

Memory-mapped mode configuration (HyperBus)

In memory-mapped mode, the external device is seen as an internal memory but with some latency during the accesses. Read and write operations are allowed to the external device in this mode.

It is not recommended to program the flash memory using the memory-mapped writes: the indirect-write mode fulfills this operation.

The memory-mapped mode is entered by setting FMODE[1:0] = 11. The programmed instruction and frame is sent when an AHB master accesses the memory-mapped space.

The FIFO is used as a prefetch buffer to anticipate any linear reads. Any access to OCTOSPI_DR in this mode returns zero.

The data length register (OCTOSPI_DLR) has no meaning in memory-mapped mode.

All the configuration operation must be completed before the first access to the memory area. On the first access, the OCTOSPI becomes busy, and no configuration is allowed. Then, the only way to get BUSY low is to clear the ENABLE bit, or to abort by setting the ABORT bit.

33.4.17 OCTOSPI error management

The following errors set the TEF flag in OCTOSPI_SR and generates an interrupt if enabled (TEIE = 1 in OCTOSPI_CR):

- in indirect or automatic status-polling mode, when a wrong address has been programmed in OCTOSPI_AR (according to the device size defined by DEVSIZE[4:0]).

- in indirect mode, if the address plus the data length exceed the device size: TEF is set as soon as the access is triggered.

In memory-mapped mode, the OCTOSPI generates an AHB slave error in the following situations, setting the BERRF flag in XSPI_SR and generating an interrupt if enabled (BERRIE = 1 in XSPI_CR) (if the Bus error bit feature is available in the product implementation table, otherwise the Slave bus error response is generated at system level as transaction response with no dedicated bit into the controller status register):

- The memory-mapped mode is disabled and an AHB read or write request occurs.
- A read or write address (including the address offset if ADOFFEN bit is set) exceeds the size of the external memory.
- An abort is received while a read or write burst is ongoing.
- The OCTOSPI is disabled while a read or write burst is requested.
- A write wrap burst is received.
- A write request is received while DQSE = 0 in OCTOSPI_WCCR in octal DTR mode, in dual-memory configuration, in HyperBus mode.
- A read or write request is received while DMODE[2:0] = 000 (no data phase), except when MTYP[2:0] is HyperBus.
- Illegal access size when wrap read burst. This means that the AHB bus transfer size (HSIZE) is different from 4 bytes (only for memory-mapped mode).
- Bit DMM is set in OCTOSPI_CR (dual-memory configuration) and octal mode is set.

33.4.18 OCTOSPI BUSY and ABORT

Once the OCTOSPI starts an operation with the external device, BUSY is automatically set in OCTOSPI_SR.

In indirect mode, BUSY is reset once the OCTOSPI has completed the requested command sequence and the FIFO is empty.

In automatic status-polling mode, BUSY goes low only after the last periodic access is complete, due to a match when APMS = 1 or due to an abort.

After the first access in memory-mapped mode, BUSY goes low only on an abort.

Any operation can be aborted by setting ABORT in OCTOSPI_CR. Once the abort is completed, BUSY and ABORT are automatically reset, and the FIFO is flushed.

Before setting ABORT, the software must ensure that all the current transactions are finished using the synchronization barriers. When DMA is enabled to handle the data read or write operations in OCTOSPI_DR, it is recommended to disable the DMA channel before aborting the OCTOSPI.

Note: Some devices may misbehave if a write operation to a status register is aborted.

33.4.19 OCTOSPI reconfiguration or deactivation

Before any OCTOSPI reconfiguration, the software must ensure that all the transactions are completed:

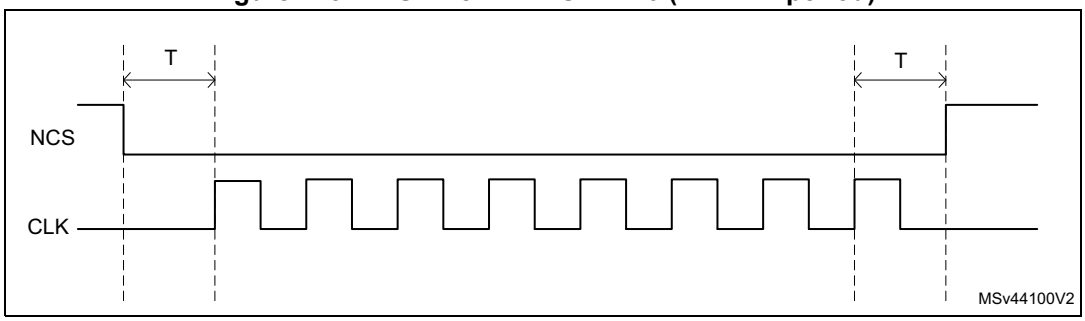
- After a memory-mapped write, the software must perform a dummy read followed by a synchronization barrier, then an abort.
- After a memory-mapped read, the software must perform a synchronization barrier than an abort.

33.4.20 NCS behavior

By default, NCS is high, deselecting the external device. NCS falls before an operation begins and rises as soon as it finishes.

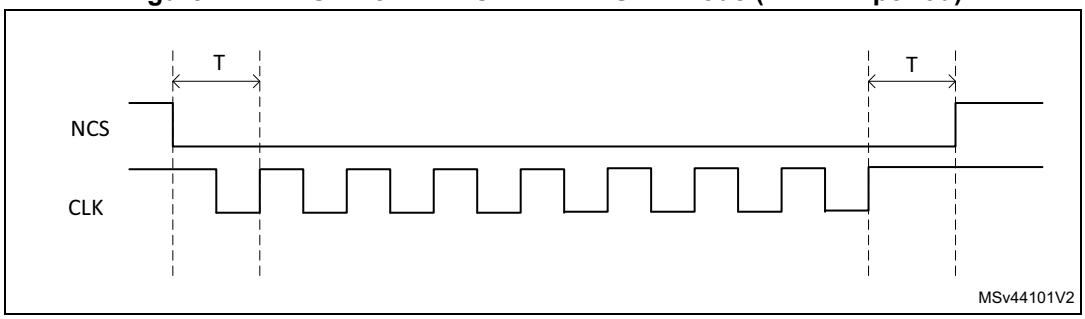
When CKMODE = 0 (clock mode 0: CLK stays low when no operation is in progress), NCS falls one CLK cycle before an operation first rising CLK edge, and NCS rises one CLK cycle after the operation final rising CLK edge (see the figure below).

Figure 213. NCS when CKMODE = 0 (T = CLK period)



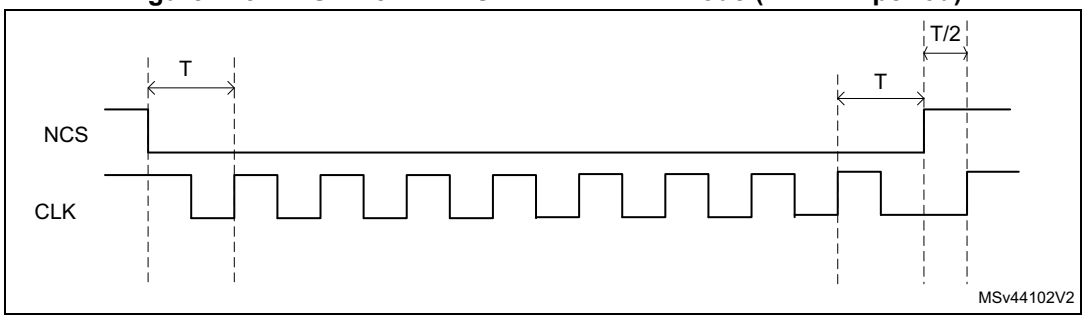
When CKMODE = 1 (clock mode 3: CLK goes high when no operation is in progress) and when in SDR mode, NCS falls one CLK cycle before an operation first rising CLK edge, and NCS rises one CLK cycle after the operation final rising CLK edge (see the figure below).

Figure 214. NCS when CKMODE = 1 in SDR mode (T = CLK period)



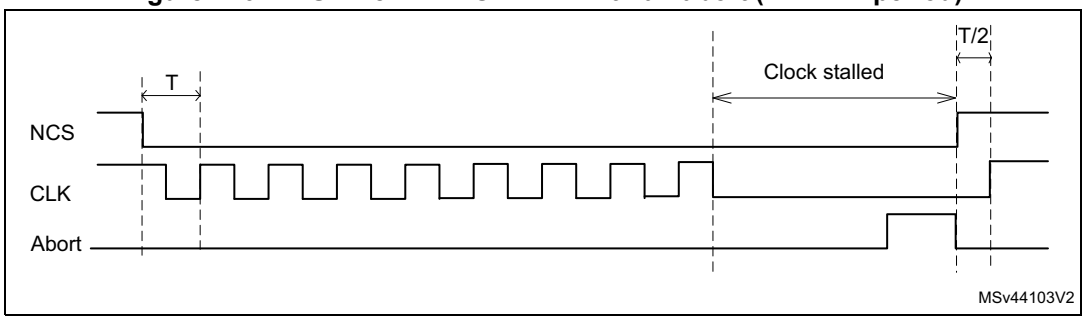
When the CKMODE = 1 (clock mode 3) and DDTR = 1 (data DTR mode), NCS falls one CLK cycle before an operation first rising CLK edge, and NCS rises one CLK cycle after the operation final active rising CLK edge (see the figure below). Because the DTR operations must finish with a falling edge, CLK is low when NCS rises, and CLK rises back up one half of a CLK cycle afterwards.

Figure 215. NCS when CKMODE = 1 in DTR mode (T = CLK period)



When the FIFO stays full during a read operation, or if the FIFO stays empty during a write operation, the operation stalls and CLK stays low until the software services the FIFO. If an abort occurs when an operation is stalled, NCS rises just after the abort is requested and then CLK rises one half of a CLK cycle later (see the figure below).

Figure 216. NCS when CKMODE = 1 with an abort (T = CLK period)

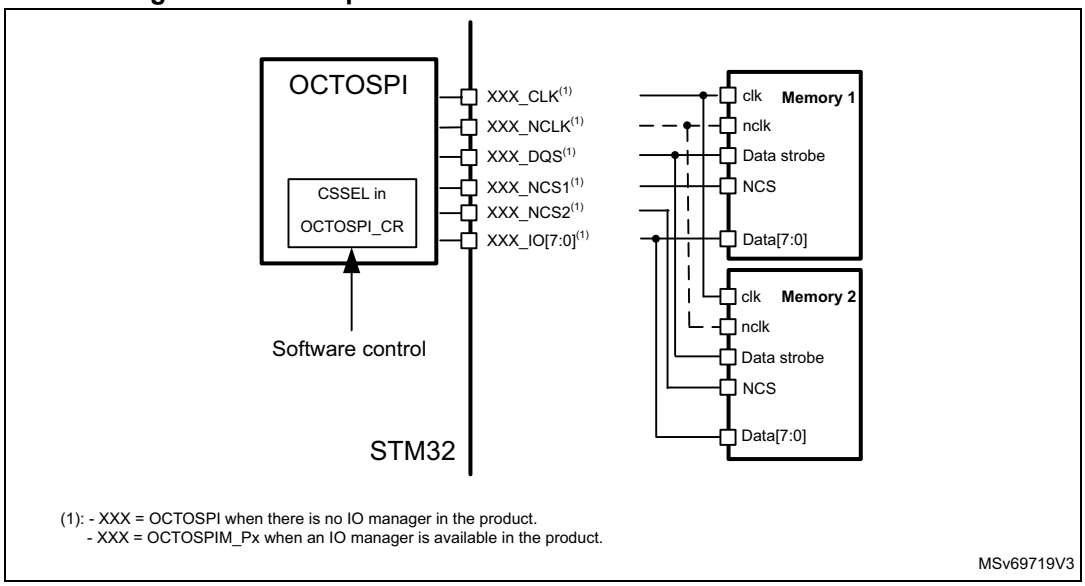


In dual memory configuration, the NCS2 behaves exactly the same as the NCS1.
The quad-SPI/octal-SPI memory 2 can then use the NCS1, and the NCS2 pin can be used for other functions.

33.4.21 Software control of two external memories

One OCTOSPI instance is able to control the generation of the two chip-select signals (NCS1 and NCS2). This allows two external memories to be connected to the same I/O port driven by the OCTOSPI. The OCTOSPI generates one NCS signal and the user defines how the NCS is directed to NCS1 or NCS2, by setting the CSSEL bit in OCTOSPI_CR. Intended operation is semistatic commutation, such as starting an application reading an external flash memory and then, for the rest of the application, use an external SRAM connected to the same I/O bus. From a memory-map point of view, these two memories are located in the same address.

Figure 217. Example of software control of two external memories



33.5 Address alignment and data number

The table below summarizes the effect of the address alignment and programmed data number depending on the use case.

Table 267. Address alignment cases

Memory type	Transaction type	Constraint on address(1)	Impact if constraint on address not respected	Constraint on number of bytes(1)	Impact if constraint on bytes not respected
Single, dual, quad flash or SRAM (DMM = 0)	IND(2) read	None	None	None	None
	MM(3) read				
	IND write				
	MM write				
Single, dual, quad flash or SRAM (DMM = 1)	IND read	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM read	None	None	None	None
	IND write	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM write	Even	Slave error	Even	Last byte is lost.
Octal flash in SDR mode	IND read	None	None	None	None
	MM read				
	IND write				
	MM write				
Octal memory in DTR mode without WDM(6)	IND read	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM read	None	None	None	None
	IND write	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM write	Even	Slave error	Even	Last byte is lost.
Octal flash or RAM in DTR mode with WDM	IND read	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM read	None	None	None	None
	IND write(7)				
	MM write				
HyperBus	IND read	Even	ADDR[0] is set to 0.(4)	Even	DLR[0] is set to 1.(5)
	MM read	None	None	None	None
	IND write(7)				
	MM write				

1. To be respected by the software.
2. IND = indirect mode.
3. MM = memory-mapped mode
4. Extra data at transfer start.
5. Extra data at transfer end.
6. WDM = write data mask.

7. If the FTHRES bitfield is set to the maximum value with DLR value greater than the data burst length, and if the DMA is enabled or the interrupt based on FIFO THRESHOLD Flag is enabled (FTF), the address must be modulo 2 aligned in DTR mode when the initiator (DMA, CPU, ...) is writing the data with a burst length equal to the FIFO size.

33.6 OCTOSPI interrupts

An interrupt can be produced on the following events:

- Timeout
- Status match
- FIFO threshold
- Transfer complete
- Transfer error

Separate interrupt enable bits are available to provide more flexibility.

Table 268. OCTOSPI interrupt requests

Interrupt event	Event flag	Enable control bit
Timeout	TOF	TOIE
Status match	SMF	SMIE
FIFO threshold	FTF	FTIE
Transfer complete	TCF	TCIE
Transfer error	TEF	TEIE

33.7 OCTOSPI registers

33.7.1 OCTOSPI control register (OCTOSPI_CR)

Address offset: 0x0000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	MSEL	FMODE[1:0]		Res.	Res.	Res.	CSSEL	PMM	APMS	BERRIE	TOIE	SMIE	FTIE	TCIE	TEIE
	rw	rw	rw				rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	FTHRES[5:0]						Res.	DMM	Res.	ADOFFEN	TCEN	DMAEN	ABORT	EN
		rw	rw	rw	rw	rw	rw		rw		rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bit 30 **MSEL**: External memory select

This bit selects the external memory to be addressed in single-, dual-, quad-SPI mode in single-memory configuration (when DMM = 0).

0: External memory 1 selected (data exchanged over IO[3:0])

1: External memory 2 selected (data exchanged over IO[7:4])

This bit is ignored when DMM = 1 or when octal-SPI mode is selected.

Note: This bit is mirrored in bit 7. This bit can be modified only when BUSY = 0.

Bits 29:28 **FMODE[1:0]**: Functional mode

This bitfield defines the OCTOSPI functional mode of operation.

00: Indirect-write mode

01: Indirect-read mode

10: Automatic status-polling mode (relevant in regular-command protocol only)

11: Memory-mapped mode

If DMAEN = 1 already, then the DMA controller for the corresponding channel must be disabled before changing the FMODE[1:0] value.

Note: This bitfield can be modified only when BUSY = 0.

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **CSSEL**: Chip-select selection

This bit indicates to OCTOSPI I/O manager if it must copy NCS to NCS1 or NCS2.

0: NCS I/O manager input is copied to NCS1 I/O manager output.

1: NCS I/O manager input is copied to NCS2 I/O manager output.

Note: This bit can be modified only when BUSY = 0.

Bit 23 **PMM**: Polling match mode

This bit indicates which method must be used to determine a match during the automatic status-polling mode.

0: AND-match mode, SMF is set if all the unmasked bits received from the device match the corresponding bits in the match register.

1: OR-match mode, SMF is set if any of the unmasked bits received from the device matches its corresponding bit in the match register.

Note: This bit can be modified only when BUSY = 0.

Bit 22 **APMS**: Automatic status-polling mode stop

This bit determines if the automatic status-polling mode is stopped after a match.

0: Automatic status-polling mode is stopped only by abort or by disabling the OCTOSPI.

1: Automatic status-polling mode stops as soon as there is a match.

Note: This bit can be modified only when BUSY = 0.

Bit 21 **BERRIE**: Bus error interrupt enable

This bit enables the bus error interrupt (if Bus error bit feature is available in the product implementation table).

0: Interrupt disabled

1: Interrupt enabled

Bit 20 **TOIE**: Timeout interrupt enable

This bit enables the timeout interrupt.

0: Interrupt disabled

1: Interrupt enabled

Bit 19 **SMIE**: Status-match interrupt enable

This bit enables the status-match interrupt.

0: Interrupt disabled

1: Interrupt enabled

Bit 18 **FTIE**: FIFO threshold interrupt enable
This bit enables the FIFO threshold interrupt.
0: Interrupt disabled
1: Interrupt enabled

Bit 17 **TCIE**: Transfer complete interrupt enable
This bit enables the transfer complete interrupt.
0: Interrupt disabled
1: Interrupt enabled

Bit 16 **TEIE**: Transfer error interrupt enable
This bit enables the transfer error interrupt.
0: Interrupt disabled
1: Interrupt enabled

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **FTHRES[5:0]**: FIFO threshold level
This fbitfield defines, in indirect mode, the threshold number of bytes in the FIFO that causes the FIFO threshold flag FTF in OCTOSPI_SR, to be set.
000000: FTF is set if there are one or more free bytes available to be written to in the FIFO in indirect-write mode, or if there are one or more valid bytes can be read from the FIFO in indirect-read mode.
000001: FTF is set if there are two or more free bytes available to be written to in the FIFO in indirect-write mode, or if there are two or more valid bytes can be read from the FIFO in indirect-read mode.
...
111111: FTF is set if there are 64 free bytes available to be written to in the FIFO in indirect-write mode, or if there are 64 valid bytes can be read from the FIFO in indirect-read mode.
Note: If DMAEN = 1, the DMA controller for the corresponding channel must be disabled before changing the FTHRES[5:0] value.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **DMM**: Dual-memory configuration
This bit activates the dual-memory configuration, where two external devices are used simultaneously to double the throughput and the capacity
0: Dual-memory configuration disabled
1: Dual-memory configuration enabled
Note: This bit can be modified only when BUSY = 0.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **ADOFFEN**: Address offset enable
An offset may be applied on the memory address. The offset value is set into ADOFF[4:0].
0: Address offset disabled
1: Address offset enabled
Note: This bit can be modified only when BUSY = 0. This bit is present only if the address offset feature is available in the product implementation table.

Bit 3 **TCEN**: Timeout counter enable

This bit is valid only when the memory-mapped mode (FMODE[1:0] = 11) is selected. This bit enables the timeout counter.

0: The timeout counter is disabled, and thus the chip-select (NCS) remains active indefinitely after an access in memory-mapped mode.

1: The timeout counter is enabled, and thus the chip-select is released in the memory-mapped mode after TIMEOUT[15:0] cycles of external device inactivity.

Note: This bit can be modified only when BUSY = 0.

Bit 2 **DMAEN**: DMA enable

In indirect mode, the DMA can be used to input or output data via OCTOSPI_DR. DMA transfers are initiated when FTF is set.

0: DMA disabled for indirect mode

1: DMA enabled for indirect mode

Note: Resetting the DMAEN bit while a DMA transfer is ongoing, breaks the handshake with the DMA. Do not write this bit during DMA operation.

Bit 1 **ABORT**: Abort request

This bit aborts the ongoing command sequence. It is automatically reset once the abort is completed. This bit stops the current transfer.

0: No abort requested

1: Abort requested

Note: This bit is always read as 0.

Bit 0 **EN**: Enable

This bit enables the OCTOSPI.

0: OCTOSPI disabled

1: OCTOSPI enabled

Note: The DMA request can be aborted without having received the ACK in case this EN bit is cleared during the operation.
In case this bit is set to 0 during a DMA transfer, the REQ signal to DMA returns to inactive state without waiting for the ACK signal from DMA to be active.

33.7.2 OCTOSPI device configuration register 1 (OCTOSPI_DCR1)

Address offset: 0x0008

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADOFF[4:0]					MTYP[2:0]			Res.	Res.	Res.	DEVSIZE[4:0]				
rw	rw	rw	rw	rw	rw	rw	rw				rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	CSHT[5:0]						Res.	Res.	Res.	Res.	DLY BYP	Res.	FRCK	CKMODE
		rw	rw	rw	rw	rw	rw					rw		rw	rw

Bits 31:27 **ADOFF[4:0]**: Address offset

This bitfield defines the memory address offset value added to the current address requested to be sent by the controller to hit the external memory using the following formula:
Offset value = $2^{[ADOFF+8]}$. (modulo 256 bytes)
Maximum allowed value is 19 since the memory-mapped mode is limited to 256 Mbytes address space. For greater value, the address offset will not be applied to the address sent by the controller.
This bitfield is relevant only if ADOFFEN is set and if FMODE[1:0] = 11 (memory-mapped mode) and if the address offset feature is available in the product implementation table.

Bits 26:24 **MTYP[2:0]**: Memory type

This bitfield indicates the type of memory to be supported.
000: Micron mode, D0/D1 ordering in DTR 8-data-bit mode. regular-command protocol in single-, dual-, quad- and octal-SPI modes.
Note: In this mode, DQS signal polarity is inverted with respect to the memory clock signal. This is the default value and care must be taken to change MTYP[2:0] for memories different from Micron.
001: Macronix mode, D1/D0 ordering in DTR 8-data-bit mode. Regular-command protocol in single-, dual-, quad-, and octal-SPI modes.
010: Standard mode
011: Macronix RAM mode, D1/D0 ordering in DTR 8-data-bit mode. Regular-command protocol in single-, dual-, quad-, and octal-SPI modes with dedicated address mapping (address is built with row and column to fit with Macronix requirements).
100: HyperBus memory mode, the protocol follows the HyperBus specification.
101: HyperBus register mode, addressing register space. The memory-mapped accesses in this mode must be noncacheable, or indirect-read/write modes must be used.
Others: Reserved

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **DEVSIZE[4:0]**: Device size

This bitfield defines the size of the external device using the following formula:
Number of bytes in device = $2^{[DEVSIZE+1]}$.
DEVSIZE + 1 is effectively the number of address bits required to address the external device. The device capacity can be up to 4 Gbytes (addressed using 32-bits) in indirect mode, but the addressable space in memory-mapped mode is limited to 256 Mbytes.
In regular-command protocol, if DMM = 1, DEVSIZE[4:0] must reflect the total capacity of the two devices together considering the above formula (DEVSIZE[4:0] value is so equal to one of the two memory capacities).

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **CSHT[5:0]**: Chip-select high time

CSHT + 1 defines the minimum number of CLK cycles where the chip-select (NCS) must remain high between commands issued to the external device.
0x0: NCS stays high for at least 1 cycle between external device commands.
0x1: NCS stays high for at least 2 cycles between external device commands.
...
0x3F: NCS stays high for at least 64 cycles between external device commands.

Bits 7:4 Reserved, must be kept at reset value.

Bit 3 **DLYBYP**: Delay block bypass

0: The internal sampling clock (called feedback clock) or the DQS data strobe external signal is delayed by the delay block (for more details on this block, refer to the dedicated section of the reference manual as it is not part of the OCTOSPI peripheral).

1: The delay block is bypassed, so the internal sampling clock or the DQS data strobe external signal is not affected by the delay block. The delay is shorter than when the delay block is not bypassed, even with the delay value set to minimum value in delay block.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **FRCK**: Free running clock

This bit configures the free running clock.

0: CLK is not free running.

1: CLK is free running (always provided).

Note: Free running clock mode is intended for delay calibration only. No memory or other device access is possible when FRCK is set. Once the bit has been set to 1, the BSY bit is set, the NCS signal remains set to 1 and the clock is sent. The only way to stop the clock is to perform an abort (which clears the BSY bit). Then, the FRCK bit must be cleared by software to allow controller transactions to take place with the external memory.

Bit 0 **CKMODE**: Clock mode 0/mode 3

This bit indicates the level taken by the CLK between commands (when NCS = 1).

0: CLK must stay low while NCS is high (chip-select released). This is referred to as clock mode 0.

1: CLK must stay high while NCS is high (chip-select released). This is referred to as clock mode 3.

33.7.3 OCTOSPI device configuration register 2 (OCTOSPI_DCR2)

Address offset: 0x000C

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	WRAPSIZE[2:0]		
													rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PRESCALER[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:19 Reserved, must be kept at reset value.

Bits 18:16 **WRAPSIZE[2:0]**: Wrap size

This bitfield indicates the wrap size to which the memory is configured. For memories which have a separate command for wrapped instructions, this bitfield indicates the wrap-size associated with the command held in the OCTOSPI1_WPIR register.

000: Wrapped reads are not supported by the memory.

010: External memory supports wrap size of 16 bytes.

011: External memory supports wrap size of 32 bytes.

100: External memory supports wrap size of 64 bytes.

101: External memory supports wrap size of 128 bytes.

Others: Reserved

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **PRESCALER[7:0]**: Clock prescaler

This bitfield defines the scaler factor for generating the CLK based on the kernel clock (value + 1).

0: $F_{CLK} = F_{KERNEL}$, kernel clock used directly as OCTOSPI CLK (prescaler bypassed). In this case, if the DTR mode is used, it is mandatory to provide to the OCTOSPI a kernel clock that has 50% duty-cycle.

1: $F_{CLK} = F_{KERNEL}/2$

2: $F_{CLK} = F_{KERNEL}/3$

...

255: $F_{CLK} = F_{KERNEL}/256$

For odd clock division factors, the CLK duty cycle is not 50 %. The clock signal remains low one cycle longer than it stays high.

33.7.4 OCTOSPI device configuration register 3 (OCTOSPI_DCR3)

Address offset: 0x0010

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CSBOUND[4:0]				
											rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **CSBOUND[4:0]**: NCS boundary

This bitfield enables the transaction boundary feature. When active, a minimum value of 3 is recommended. The NCS is released on each boundary of $2^{CSBOUND}$ bytes.

0: NCS boundary disabled

Others: NCS boundary set to $2^{CSBOUND}$ bytes

Bits 15:0 Reserved, must be kept at reset value.

33.7.5 OCTOSPI device configuration register 4 (OCTOSPI_DCR4)

Address offset: 0x0014

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
REFRESH[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REFRESH[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **REFRESH[31:0]**: Refresh rate

This bitfield enables the refresh rate feature. The NCS is released every REFRESH + 1 clock cycles for writes, and REFRESH + 4 clock cycles for reads. These two values can be extended with few clock cycles when refresh occurs during a byte transmission in single-, dual- or quad-SPI mode, because the byte transmission must be completed.

0: Refresh disabled

Others: Maximum communication length is set to REFRESH + 1 clock cycles.

Note: REFRESH count is based on the divided clock period: if OCTOSPI_DCR2 PRESCALER bitfield is changed, the REFRESH field must be updated accordingly.

33.7.6 OCTOSPI status register (OCTOSPI_SR)

Address offset: 0x0020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	FLEVEL[6:0]							Res.	BERRF	BUSY	TOF	SMF	FTF	TCF	TEF
	r	r	r	r	r	r	r		r	r	r	r	r	r	r

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:8 **FLEVEL[6:0]**: FIFO level

This bitfield gives the number of valid bytes that are being held in the FIFO. FLEVEL = 0 when the FIFO is empty, and 64 when it is full.

In automatic status-polling mode, FLEVEL is zero.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **BERRF**: Bus error flag

This bit is set when a bus error occurs. It is cleared by writing 1 to CBERRF. This bit has a meaning if Bus error bit feature is available in the product implementation table.

Bit 5 **BUSY**: Busy

This bit is set when an operation is ongoing. It is cleared automatically when the operation with the external device is finished and the FIFO is empty.

Bit 4 **TOF**: Timeout flag
This bit is set when timeout occurs. It is cleared by writing 1 to CTOF.

Bit 3 **SMF**: Status match flag
This bit is set in automatic status-polling mode when the unmasked received data matches the corresponding bits in the match register (OCTOSPI_PSMAR).
It is cleared by writing 1 to CSMF.

Bit 2 **FTF**: FIFO threshold flag
In indirect mode, this bit is set when the FIFO threshold has been reached, or if there is any data left in the FIFO after the reads from the external device are complete.
It is cleared automatically as soon as the threshold condition is no longer true.
In automatic status-polling mode, this bit is set every time the status register is read, and the bit is cleared when the data register is read.

Bit 1 **TCF**: Transfer complete flag
This bit is set in indirect mode when the programmed number of data has been transferred or in any mode when the transfer has been aborted.It is cleared by writing 1 to CTCF.

Bit 0 **TEF**: Transfer error flag
This bit is set in indirect mode when an invalid address is being accessed in indirect mode.
It is cleared by writing 1 to CTEF.

33.7.7 OCTOSPI flag clear register (OCTOSPI_FCR)

Address offset: 0x0024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CBERRF	Res.	CTOF	CSMF	Res.	CTCF	CTEF
									w		w	w		w	w

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **CBERRF**: Clear bus error flag
Writing 1 clears the BERRF flag in the XSPI_SR register (if Bus error bit feature is available in the product implementation table).

Bit 5 Reserved, must be kept at reset value.

Bit 4 **CTOF**: Clear timeout flag
Writing 1 clears the TOF flag in the OCTOSPI_SR register.

Bit 3 **CSMF**: Clear status match flag
Writing 1 clears the SMF flag in the OCTOSPI_SR register.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CTCF**: Clear transfer complete flag
Writing 1 clears the TCF flag in the OCTOSPI_SR register.

Bit 0 **CTEF**: Clear transfer error flag
Writing 1 clears the TEF flag in the OCTOSPI_SR register.

33.7.8 OCTOSPI data length register (OCTOSPI_DLR)

Address offset: 0x0040

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DL[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DL[31:0]**: Data length
Number of data to be retrieved (value+1) in indirect and automatic status-polling modes. A value not greater than three (indicating 4 bytes) must be used for automatic status-polling mode.
All 1's in indirect mode means undefined length, where OCTOSPI continues until the end of the memory, as defined by DEVSIZE.
0x0000_0000: 1 byte is to be transferred.
0x0000_0001: 2 bytes are to be transferred.
0x0000_0002: 3 bytes are to be transferred.
0x0000_0003: 4 bytes are to be transferred.
...
0xFFFF_FFFD: 4,294,967,294 (4G-2) bytes are to be transferred.
0xFFFF_FFFE: 4,294,967,295 (4G-1) bytes are to be transferred.
0xFFFF_FFFF: undefined length; all bytes, until the end of the external device, (as defined by DEVSIZE) are to be transferred. Continue reading indefinitely if DEVSIZE = 0x1F.
DL[0] is stuck at 1 in dual-memory configuration (DMM = 1) even when 0 is written to this bit, thus assuring that each access transfers an even number of bytes.
This bitfield has no effect in memory-mapped mode.

33.7.9 OCTOSPI address register (OCTOSPI_AR)

Address offset: 0x0048

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0 and FMODE ≠ 11.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADDRESS[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDRESS[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ADDRESS[31:0]**: Address

Address to be sent to the external device. In HyperBus protocol, this field must be even as this protocol is 16-bit word oriented. In dual-memory configuration, AR[0] is forced to 0.

33.7.10 OCTOSPI data register (OCTOSPI_DR)

Address offset: 0x0050

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DATA[31:0]**: Data

Data to be sent/received to/from the external SPI device

In indirect-write mode, data written to this register is stored on the FIFO before it is sent to the external device during the data phase. If the FIFO is too full, a write operation is stalled until the FIFO has enough space to accept the amount of data being written.

In indirect-read mode, reading this register gives (via the FIFO) the data that was received from the external device. If the FIFO does not have as many bytes as requested by the read operation and if BUSY = 1, the read operation is stalled until enough data is present or until the transfer is complete, whichever happens first.

In automatic status-polling mode, this register contains the last data read from the external device (without masking).

Word, half-word, and byte accesses to this register are supported. In indirect-write mode, a byte write adds 1 byte to the FIFO, a half-word write 2 bytes, and a word write 4 bytes. Similarly, in indirect-read mode, a byte read removes 1 byte from the FIFO, a halfword read 2 bytes, and a word read 4 bytes. Accesses in indirect mode must be aligned to the bottom of this register: A byte read must read DATA[7:0] and a half-word read must read DATA[15:0].

33.7.11 OCTOSPI polling status mask register (OCTOSPI_PSMKR)

Address offset: 0x0080

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MASK[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MASK[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MASK[31:0]**: Status mask

Mask to be applied to the status bytes received in automatic status-polling mode

For bit n:

0: Bit n of the data received in automatic status-polling mode is masked and its value is not considered in the matching logic.

1: Bit n of the data received in automatic status-polling mode is unmasked and its value is considered in the matching logic.

33.7.12 OCTOSPI polling status match register (OCTOSPI_PSMAR)

Address offset: 0x0088

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
MATCH[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MATCH[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **MATCH[31:0]**: Status match

Value to be compared with the masked status register to get a match

33.7.13 OCTOSPI polling interval register (OCTOSPI_PIR)

Address offset: 0x0090

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

INTERVAL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **INTERVAL[15:0]**: Polling interval

Number of CLK cycles between a read during the automatic status-polling phases

33.7.14 OCTOSPI communication configuration register (OCTOSPI_CCR)

Address offset: 0x0100

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **DQSE**: DQS enable

This bit enables the data strobe management.
0: DQS disabled
1: DQS enabled

Bit 28 Reserved, must be kept at reset value.

Bit 27 **DDTR**: Data double transfer rate

This bit sets the DTR mode for the data phase.
0: DTR mode disabled for data phase
1: DTR mode enabled for data phase

Bits 26:24 **DMODE[2:0]**: Data mode

This bitfield defines the data phase mode of operation.
000: No data
001: Data on a single line
010: Data on two lines
011: Data on four lines
100: Data on eight lines
Others: Reserved

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:20 **ABSIZE[1:0]**: Alternate-byte size

This bitfield defines the alternate-byte size.
00: 8-bit alternate bytes
01: 16-bit alternate bytes
10: 24-bit alternate bytes
11: 32-bit alternate bytes

Bit 19 **ABDTR**: Alternate- byte double transfer rate

This bit sets the DTR mode for the alternate-byte phase.
0: DTR mode disabled for the alternate-byte phase
1: DTR mode enabled for the alternate-byte phase

Bits 18:16 **ABMODE[2:0]**: Alternate-byte mode
This bitfield defines the alternate-byte phase mode of operation.
000: No alternate bytes
001: Alternate bytes on a single line
010: Alternate bytes on two lines
011: Alternate bytes on four lines
100: Alternate bytes on eight lines
Others: Reserved

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:12 **ADSIZE[1:0]**: Address size
This bitfield defines the address size.
00: 8-bit address
01: 16-bit address
10: 24-bit address
11: 32-bit address

Bit 11 **ADDTR**: Address double transfer rate
This bit sets the DTR mode for the address phase.
0: DTR mode disabled for the address phase
1: DTR mode enabled for the address phase

Bits 10:8 **ADMODE[2:0]**: Address mode
This bitfield defines the address phase mode of operation.
000: No address
001: Address on a single line
010: Address on two lines
011: Address on four lines
100: Address on eight lines
Others: Reserved

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **ISIZE[1:0]**: Instruction size
This bitfield defines instruction size.
00: 8-bit instruction
01: 16-bit instruction
10: 24-bit instruction
11: 32-bit instruction

Bit 3 **IDTR**: Instruction double transfer rate
This bit sets the DTR mode for the instruction phase.
0: DTR mode disabled for the instruction phase
1: DTR mode enabled for the instruction phase

Bits 2:0 **IMODE[2:0]**: Instruction mode
This bitfield defines the instruction phase mode of operation.
000: No instruction
001: Instruction on a single line
010: Instruction on two lines
011: Instruction on four lines
100: Instruction on eight lines
Others: Reserved

33.7.15 OCTOSPI timing configuration register (OCTOSPI_TCR)

Address offset: 0x0108

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCYC[4:0]				
											rw	rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bit 30 **SSHIFT**: Sample shift

By default, the OCTOSPI samples data 1/2 of a CLK cycle after the data is driven by the external device.
This bit allows the data to be sampled later in order to consider the external signal delays.
0: No shift
1: 1/2 cycle shift
The software must ensure that SSHIFT = 0 when the data phase is configured in DTR mode (when DDTR = 1.)

Bit 29 Reserved, must be kept at reset value.

Bit 28 **DHQC**: Delay hold quarter cycle

0: No delay hold
1: 1/4 cycle hold

Bits 27:5 Reserved, must be kept at reset value.

Bits 4:0 **DCYC[4:0]**: Number of dummy cycles

This bitfield defines the duration of the dummy phase according to the memory latency.
In both SDR and DTR modes, it specifies a number of CLK cycles (0-31).

33.7.16 OCTOSPI instruction register (OCTOSPI_IR)

Address offset: 0x0110

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
INSTRUCTION[31:16]

ALTERNATE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ALTERNATE[31:0]**: Alternate bytes
Optional data to be sent to the external SPI device right after the address.

33.7.18 OCTOSPI low-power timeout register (OCTOSPI_LPTR)

Address offset: 0x00130

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

TIMEOUT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **TIMEOUT[15:0]**: Timeout period
After each access in memory-mapped mode, the OCTOSPI prefetches the subsequent bytes and hold them in the FIFO.
This bitfield indicates how many CLK cycles the OCTOSPI waits after the clock becomes inactive and until it raises the NCS, putting the external device in a lower-consumption state.

33.7.19 OCTOSPI wrap communication configuration register (OCTOSPI_WPCCR)

Address offset: 0x0140

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

Bit 30 **SSHIFT**: Sample shift

By default, the OCTOSPI samples data 1/2 of a CLK cycle after the data is driven by the external device.
This bit allows the data to be sampled later in order to consider the external signal delays.
0: No shift
1: 1/2 cycle shift
The firmware must assure that SSHIFT=0 when the data phase is configured in DTR mode (when DDTR = 1).

Bit 29 Reserved, must be kept at reset value.

Bit 28 **DHQC**: Delay hold quarter cycle

Add a quarter cycle delay on the outputs in DTR communication to match hold requirement.
0: No quarter cycle delay
1: 1/4 cycle delay inserted

Bits 27:5 Reserved, must be kept at reset value.

Bits 4:0 **DCYC[4:0]**: Number of dummy cycles

This bitfield defines the duration of the dummy phase according to the memory latency.
In both SDR and DTR modes, it specifies a number of CLK cycles (0-31).

33.7.21 OCTOSPI wrap instruction register (OCTOSPI_WPIR)

Address offset: 0x0150

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCYC[4:0]				
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bits 4:0 **DCYC[4:0]**: Number of dummy cycles
This bitfield defines the duration of the dummy phase according to the memory latency.
In both SDR and DTR modes, it specifies a number of CLK cycles (0-31).

33.7.25 OCTOSPI write instruction register (OCTOSPI_WIR)

Address offset: 0x0190

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0. Its content has a meaning only when requesting write operations in memory-mapped mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
INSTRUCTION[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
INSTRUCTION[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **INSTRUCTION[31:0]**: Instruction

Instruction to be sent to the external SPI device

33.7.26 OCTOSPI write alternate bytes register (OCTOSPI_WABR)

Address offset: 0x01A0

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0. Its content has a meaning only when requesting write operations in memory-mapped mode.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ALTERNATE[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ALTERNATE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ALTERNATE[31:0]**: Alternate bytes

Optional data to be sent to the external SPI device right after the address

33.7.27 OCTOSPI HyperBus latency configuration register (OCTOSPI_HLCR)

Address offset: 0x0200

Reset value: 0x0000 0000

This register can be modified only when BUSY = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRWR[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TACC[7:0]								Res.	Res.	Res.	Res.	Res.	Res.	WZL	LM
rw	rw	rw	rw	rw	rw	rw	rw							rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **TRWR[7:0]:** Read-write minimum recovery time

Device read-to-write/write-to-read minimum recovery time expressed in number of communication clock cycles

Bits 15:8 **TACC[7:0]**: Access time

Device access time according to the memory latency, expressed in number of communication clock cycles

Bits 7:2 Reserved, must be kept at reset value.

Bit 1 **WZL:** Write zero latency

This bit enables zero latency on write operations.
0: Latency on write accesses
1: No latency on write accesses

Bit 0 **LM:** Latency mode

This bit selects the latency mode.
0: Variable initial latency
1: Fixed latency

33.7.28 OCTOSPI hardware configuration register 2 (OCTOSPI_HWCFGR2)

Address offset: 0x03EC

Reset value: 0x0000 0X01

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HSINT[3:0]			
												r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MEM16[3:0]				ARBM[3:0]				RDFT[3:0]				FRCK[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **HSINT[3:0]**: High-speed interface
0000: Standard interface
0001: High-speed interface
Others: Reserved

Bits 15:12 **MEM16[3:0]**: Size of the SPI memory supported
0000: 8-bit SPI memory supported
0001: 16-bit SPI memory supported
Others: Reserved

Bits 11:8 **ARBM[3:0]**: Arbitration configuration
0000: No associated OCTOSPI I/O manager
0001: This instance is OCTOSPI1.
0010: This instance is OCTOSPI2.
0011: This instance is OCTOSPI3.
Others: Reserved

Bits 7:4 **RDFT[3:0]**: Reduced features
0000: All features available
0001: Only some feature are supported (see *Section 33.3: OCTOSPI implementation*)
Others: Reserved

Bits 3:0 **FRCK[3:0]**: Free running clock
0000: The delay block does not require a free running clock.
0001: The DLL/delay block receives a free running clock from OCTOSPIs.
Others: reserved

33.7.29 OCTOSPI hardware configuration register (OCTOSPI_HWCFGR)

Address offset: 0x03F0

Reset value: 0xX130 0100

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CSSRV[3:0]				MMW[3:0]				IDL[3:0]				PRES[7:4]

PRES[3:0]				FIFO[7:0]								AXI[3:0]			
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 **CSSRV[3:0]**: CSSEL reset value
0000: CSSEL reset value is 1 (OCTOSPI2).
0001: CSSEL reset value is 0 (OCTOSPI1 or 3).
Others: Reserved

Bits 27:24 **MMW[3:0]**: Memory-mapped write
OCTOSPI memory-mapped write
0: No memory-mapped write
1: Memory-mapped write present

Bits 23:20 **IDL[3:0]**: ID Length
AXI ID Length

Bits 19:12 **PRES[7:0]**: Prescaler
Prescaler reset value

Bits 11:4 **FIFO[7:0]**: FIFO depth
FIFO size in 32-bit words

Bits 3:0 **AXI[3:0]**: OCTOSPI interface
0000: AHB interface
0001: AXI interface
Others: Reserved

33.7.30 OCTOSPI version register (OCTOSPI_VERR)

Address offset: 0x03F4

Reset value: 0x0000 0053

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

34 Secure digital input/output MultiMediaCard interface (SDMMC)

34.1 SDMMC main features

The SD/SDIO, embedded MultiMediaCard (*e*•MMC) host interface (SDMMC) provides an interface between the AHB bus and SD memory cards, SDIO cards and *e*•MMC devices.

The MultiMediaCard system specifications are available through the MultiMediaCard Association website at www.jedec.org, published by the MMCA technical committee.

SD memory card and SD I/O card system specifications are available through the SD card Association website at www.sdcard.org.

The SDMMC features include the following:

- Compliance with *Embedded MultiMediaCard System Specification Version 5.1*. Card support for three different databus modes: 1-bit (default), 4-bit and 8-bit. (HS200 SDMMC_CK speed limited to maximum allowed I/O speed)(HS400 is not supported).
- Full compatibility with previous versions of MultiMediaCards (backward compatibility).
- Full compliance with *SD memory card specifications version 6.0*. (SDR104 SDMMC_CK speed limited to maximum allowed I/O speed, SPI mode and UHS-II mode not supported).
- Full compliance with *SDIO card specification version 4.0.* Card support for two different databus modes: 1-bit (default) and 4-bit. (SDR104 SDMMC_CK speed limited to maximum allowed I/O speed, SPI mode and UHS-II mode not supported).
- Data transfer up to 208 Mbyte/s for the 8-bit mode. (depending maximum allowed I/O speed).
- Data and command output enable signals to control external bidirectional drivers.
- IDMA linked list support

The MultiMediaCard/SD bus connects cards to the host.

The current version of the SDMMC supports only one SD/SDIO/*e*•MMC card at any one time and a stack of *e*•MMC.

34.2 SDMMC implementation

Table 270. SDMMC features

SDMMC modes/features[1]	SDMMC1	SDMMC2	SDMMC3
Variable delay	X	X	X
SDMMC_CKIN	X	X	X
SDMMC_CDIR, SDMMC_D0DIR	X	X	X
SDMMC_D123DIR	X	X	X
D7:D4	X	X	-

1. X = supported.

34.3 SDMMC bus topology

Communication over the bus is based on command/response and data transfers.

The basic transaction on the SD/SDIO/*e*•MMC bus is the command/response transaction. These types of bus transaction transfer their information directly within the command or response structure. In addition, some operations have a data token.

Data transfers are done in the following ways:

- Block mode: data block(s) with block size 2^N bytes with N in the range 0-14
- SDIO multibyte mode: single data block with block size range 1-512 bytes
- *e*•MMC Stream mode: continuous data stream

Data transfers to/from *e*•MMC cards are done in data blocks or streams.

Figure 218. SDMMC "no response" and "no data" operations

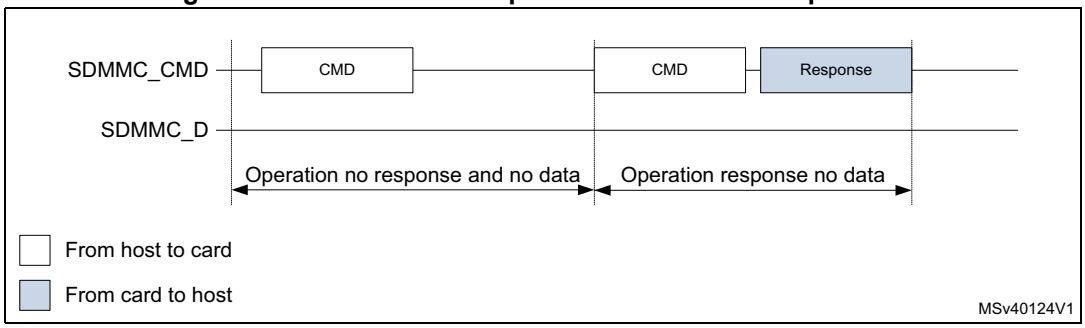

Figure 219. SDMMC (multiple) block read operation

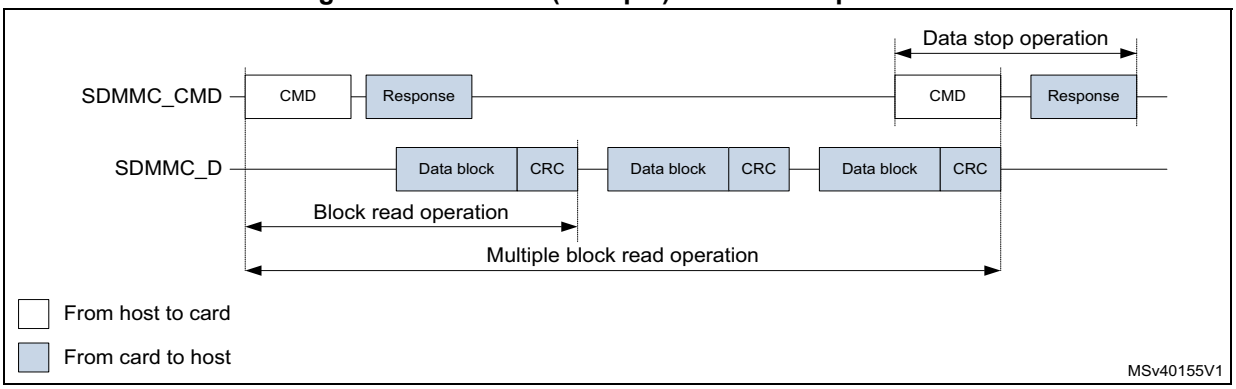
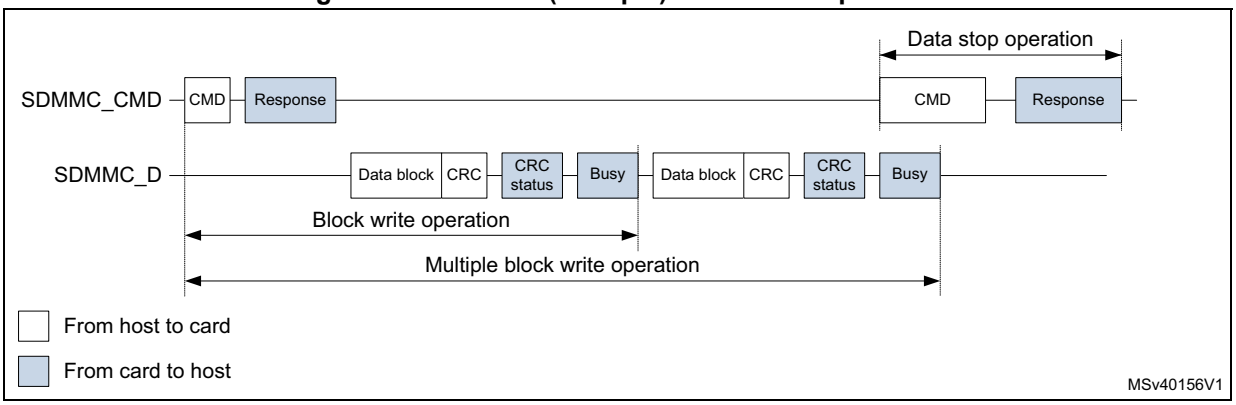


Note: The Stop Transmission command is not required at the end of a e•MMC multiple block read with predefined block count.

Figure 220. SDMMC (multiple) block write operation



Note: The Stop Transmission command is not required at the end of an e•MMC multiple block write with predefined block count.

The SDMMC does not send any data as long as the Busy signal is asserted (SDMMC_D0 pulled low).

Figure 221. SDMMC (sequential) stream read operation

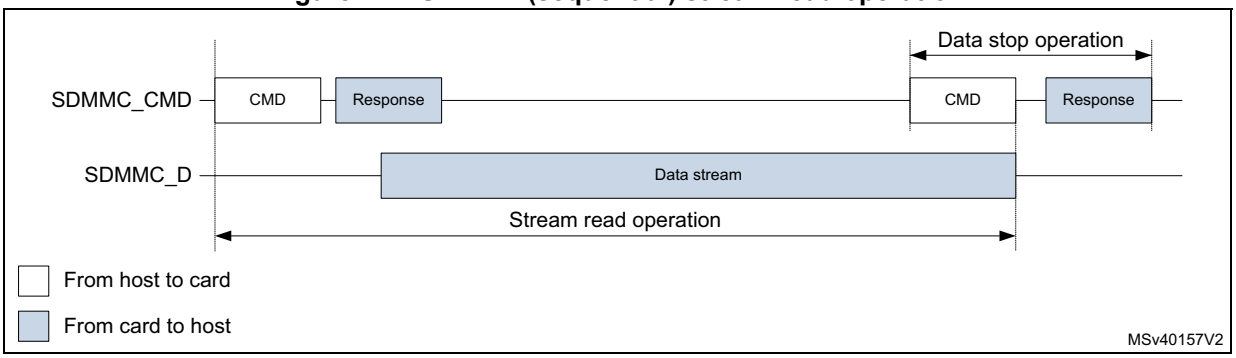


Figure 222. SDMMC (sequential) stream write operation

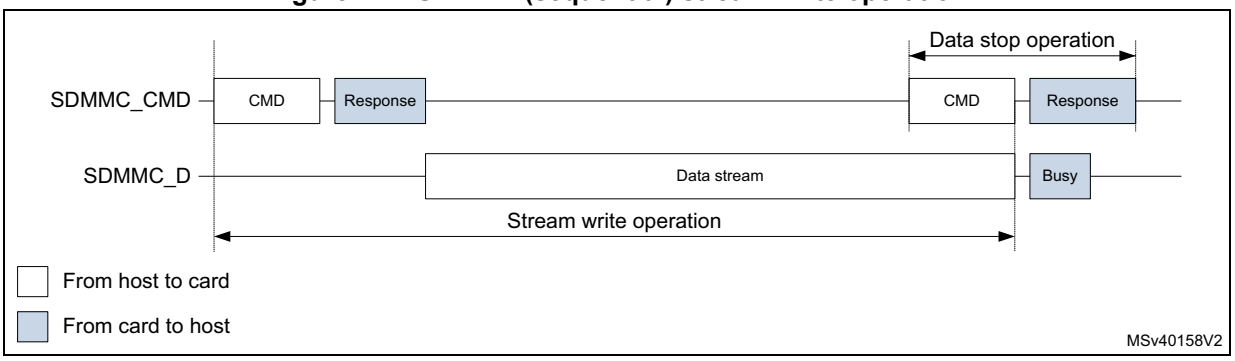


Stream data transfer operates only in a 1-bit wide bit bus configuration on SDMMC_D0 in single data rate modes (DS, HS, and SDR).

34.4 SDMMC operation modes

Table 271. SDMMC operation modes SD and SDIO

SDIO bus speed modes(1)(2)	Max bus speed (3) [Mbyte/s]	Max clock frequency [MHz](4)	Signal voltage [V]
DS (default speed)	12.5	25	3.3
HS (high speed)	25	50	3.3
SDR12	12.5	25	1.8
SDR25	25	50	1.8
DDR50	50	50	1.8
SDR50	50	100	1.8
SDR104	104	208	1.8

1. SDR single data rate signaling.
2. DDR double data rate signaling (data is sampled on both SDMMC_CK clock edges).
3. SDIO bus speed with 4-bit bus width.
4. Maximum frequency depending on maximum allowed I/O speed.

SDR104 mode requires variable delay support using sampling point tuning. The use of variable delay is optional for SDR50 mode.

Table 272. SDMMC operation modes *e*•MMC

e•MMC bus speed modes (1)(2)	Max bus speed (3) [Mbyte/s]	Max clock frequency [MHz](4)	Signal voltage [V](5)
Legacy compatible	26	26	3/1.8/1.2V
High speed SDR	52	52	3/1.8/1.2V
High speed DDR	104	52	3/1.8/1.2V
High speed HS200	200	200	1.8/1.2V

1. SDR single data rate signaling.
2. DDR double data rate signaling. (data is sampled on both SDMMC_CK clock edges).
3. *e*•MMC bus speed with 8-bit bus width.
4. Maximum frequency depending on maximum allowed I/O speed.
5. Supported signal voltage level depends on I/O port characteristics, refer to device datasheet.

HS200 mode requires variable delay support using sampling point tuning.

34.5 SDMMC functional description

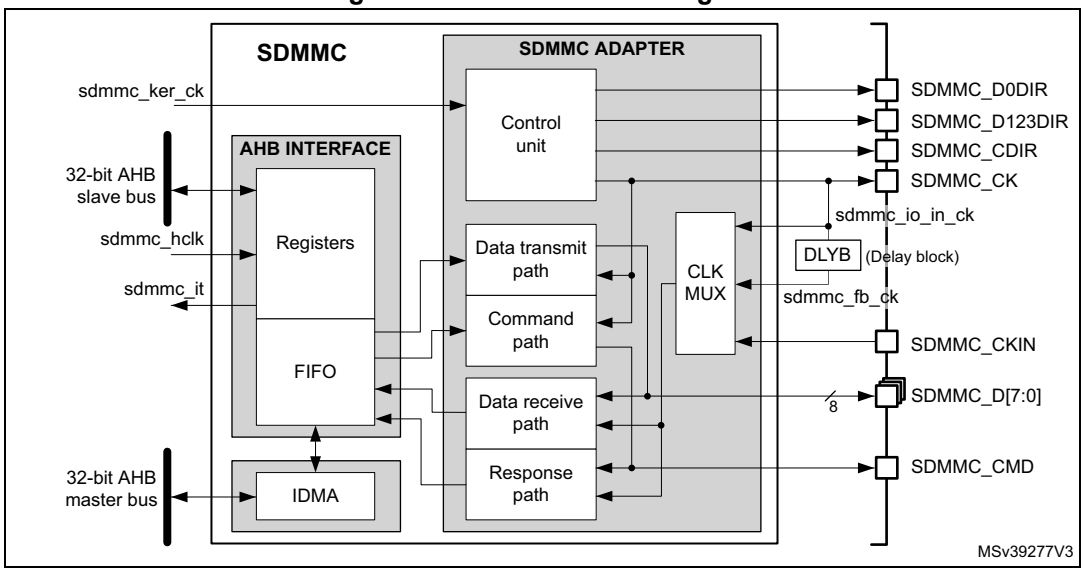
The SDMMC consists of four parts:

- The AHB slave interface accesses the SDMMC adapter registers, and generates interrupt signals and IDMA control signals.
- The SDMMC adapter block provides all functions specific to the *e*•MMC/SD/SD I/O card such as the clock generation unit, command and data transfer.
- The internal DMA (IDMA) block with its AHB master interface.
- A delay block (DLYB) taking care of the receive data sample clock alignment. The delay block is NOT part of the SDMMC. A delay block is mandatory when supporting SDR104 or HS200.

34.5.1 SDMMC block diagram

Figure 223 shows the SDMMC block diagram.

Figure 223. SDMMC block diagram



34.5.2 SDMMC pins and internal signals

Table 273 lists the SDMMC internal input/output signals, *Table 274* the SDMMC pins (alternate functions).

Table 273. SDMMC internal input/output signals

Signal name	Signal type	Description
sdmmc_ker_ck	Digital input	SDMMC kernel clock
sdmmc_hclk	Digital input	AHB clock
sdmmc_it	Digital output	SDMMC global interrupt

Table 273. SDMMC internal input/output signals (continued)

Signal name	Signal type	Description
sdmmc_io_in_ck	Digital input	SD/SDIO/*e*•MMC card feedback clock. This signal is internally connected to the SDMMC_CK pin (for DS and HS modes).
sdmmc_fb_ck	Digital input	SD/SDIO/*e*•MMC card tuned feedback clock after DLYB delay block (for SDR50, DDR50, SDR104, HS200)

Table 274. SDMMC pins

Pin name	Pin type	Description
SDMMC_CK	Digital output	Clock to SD/SDIO/*e*•MMC card
SDMMC_CKIN	Digital input	Clock feedback from an external driver for SD/SDIO/*e*•MMC card. (for SDR12, SDR25, SDR50, DDR50)
SDMMC_CMD	Digital input/output	SD/SDIO/*e*•MMC card bidirectional command/response signal.
SDMMC_CDIR	Digital output	SD/SDIO/*e*•MMC card I/O direction indication for the SDMMC_CMD signal.
SDMMC_D[7:0]	Digital input/output	SD/SDIO/*e*•MMC card bidirectional data lines.
SDMMC_D0DIR	Digital output	SD/SDIO/*e*•MMC card I/O direction indication for the SDMMC_D0 data line.
SDMMC_D123DIR	Digital output	SD/SDIO/*e*•MMC card I/O direction indication for the data lines SDMMC_D[3:1].

34.5.3 General description

The **SDMMC_D[7:0]** lines have different operating modes:

- By default, SDMMC_D0 line is used for data transfer. After initialization, the host can change the databus width.
- For an *e*•MMC, 1-bit (SDMMC_D0), 4-bit (SDMMC_D[3:0]) or 8-bit (SDMMC_D[7:0]) data bus widths can be used.
- For an SD or an SDIO card, 1-bit (SDMMC_D0) or 4-bit (SDMMC_D[3:0]) can be used. All data lines operate in push-pull mode.

To allow the connection of an external driver (a voltage switch transceiver), the direction of data flow on the data lines is indicated with I/O direction signals. The **SDMMC_D0DIR** signal indicates the I/O direction for the SDMMC_D0 data line, the **SDMMC_D123DIR** for the SDMMC_D[3:1] data lines.

SDMMC_CMD only operates in push-pull mode:

To allow the connection of an external driver (a voltage switch transceiver), the direction of data flow on the SDMMC_CMD line is indicated with the I/O direction signal **SDMMC_CDIR**.

SDMMC_CK clock to the card originates from **sdmmc_ker_ck**:

- When the sdmmc_ker_ck clock has 50 % duty cycle, it can be used even in bypass mode (CLKDIV = 0).
- When the sdmmc_ker_ck duty cycle is not 50 %, the CLKDIV must be used to divide it by 2 or more (CLKDIV > 0).
- The phase relation between the SDMMC_CMD / SDMMC_D[7:0] outputs and the SDMMC_CK can be selected through the NEGEDGE bit. The phase relation depends on the CLKDIV, NEGEDGE, and DDR settings. See *Figure 224*.

Figure 224. SDMMC Command and data phase relation

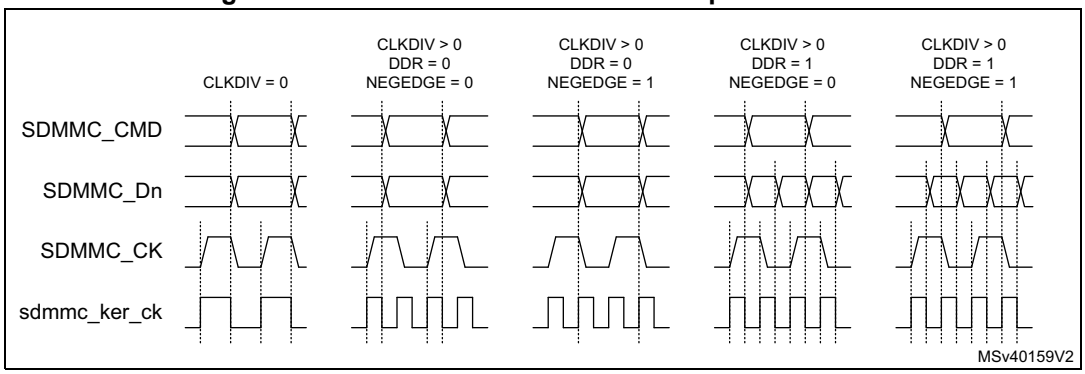


Table 275. SDMMC Command and data phase selection

CLKDIV	DDR	NEGEDGE	SDMMC_CK	Command out	Data out
0	x	x	= sdmmc_ker_ck	Generated on sdmmc_ker_ck falling edge	
>0	0	0	Generated on sdmmc_ker_ck rising edge	Generated on sdmmc_ker_ck falling edge succeeding the SDMMC_CK rising edge.	
		1		Generated on the same sdmmc_ker_ck rising edge that generates the SDMMC_CK falling edge.	
	1	0		Generated on sdmmc_ker_ck falling edge succeeding the SDMMC_CK rising edge.	Generated on sdmmc_ker_ck falling edge succeeding a SDMMC_CK edge.
		1		Generated on the same sdmmc_ker_ck rising edge that generates the SDMMC_CK falling edge.	

By default, the **sdmmc_io_in_ck** feedback clock input is selected for sampling incoming data in the SDMMC receive path. It is derived from the SDMMC_CK pin.

For tuning the phase of the sampling clock to accommodate the receive data timing, the DLYB delay block available on the device can be connected between **sdmmc_io_in_ck** signal (DLYB input dlyb_in_ck) and **sdmmc_fb_ck** clock input of SDMMC (DLYB output dlyb_out_ck). Selecting the **sdmmc_fb_ck** clock input in the receive path then enables using the phase-tuned sampling clock for the incoming data. This is required for SDMMC to support the SDR104 and HS200 operating mode and optional for SDR50 and DDR50 modes.

When using an external driver (a voltage switch transceiver), the SDMMC_CKIN feedback clock input can be selected to sample the receive data.

For an SD/SDIO/*e*•MMC card, the clock frequency can vary between 0 and 208 MHz (limited by maximum I/O speed).

Depending on the selected bus mode (SDR or DDR), one bit or two bits are transferred on SDMMC_D[7:0] lines with each clock cycle. The SDMMC_CMD line transfers only one bit per clock cycle.

34.5.4 SDMMC adapter

The SDMMC adapter (see *Figure 223: SDMMC block diagram*) is a multimedia/secure digital memory card bus master that provides an interface to a MultiMediaCard stack or to a secure digital memory card. It consists of the following subunits:

- Control unit
- Data transmit path
- Command path
- Data receive path
- Response path
- Receive data path clock multiplexer
- Delay block (DLYB), external to the SDMMC
- Adapter register block
- Data FIFO
- Internal DMA (IDMA)

Note: The adapter registers and FIFO use the AHB clock domain (sdmmc_hclk). The control unit, command path and data transmit path use the SDMMC adapter clock domain (sdmmc_ker_ck). The response path and data receive path use the SDMMC adapter feedback clock domain from the sdmmc_io_in_ck, or SDMMC_CKIN, or from the sdmmc_fb_ck generated by DLYB.

The DLYB delay block on the device can be used in conjunction with the SDMMC adapter, to tune the phase of the sampling clock for incoming data in SDMMC receive mode. It is required for the SDMMC to support the SDR104 and HS200 operating mode and optional for SDR50 and DDR50 modes.

Adapter register block

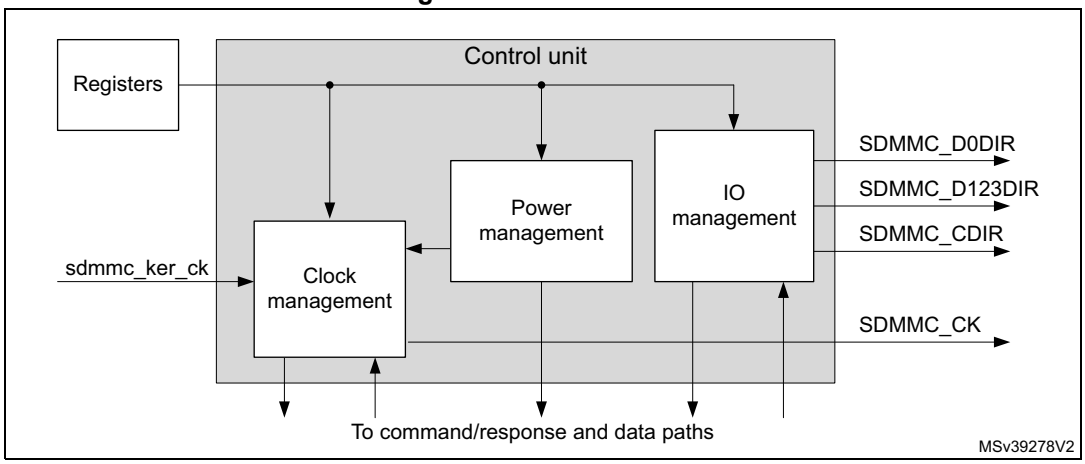
The adapter register block contains all system control registers, the SDMMC command and response registers and the data FIFO.

This block also generates the signals from the corresponding bit location in the SDMMC Clear register that clear the static flags in the SDMMC adapter.

Control unit

The control unit illustrated in *Figure 225*, contains the power management functions, the SDMMC_CK clock management with divider, and the I/O direction management.

Figure 225. Control unit



The power management subunit disables the card bus output signals during the power-off and power-up phases.

There are three power phases:

- power-off
- power-up
- power-on

The clock management subunit uses the sdmmc_ker_ck to generate the SDMMC_CK and provides the division control. It also takes care of stopping the SDMMC_CK for flow control, for example.

The clock outputs are inactive:

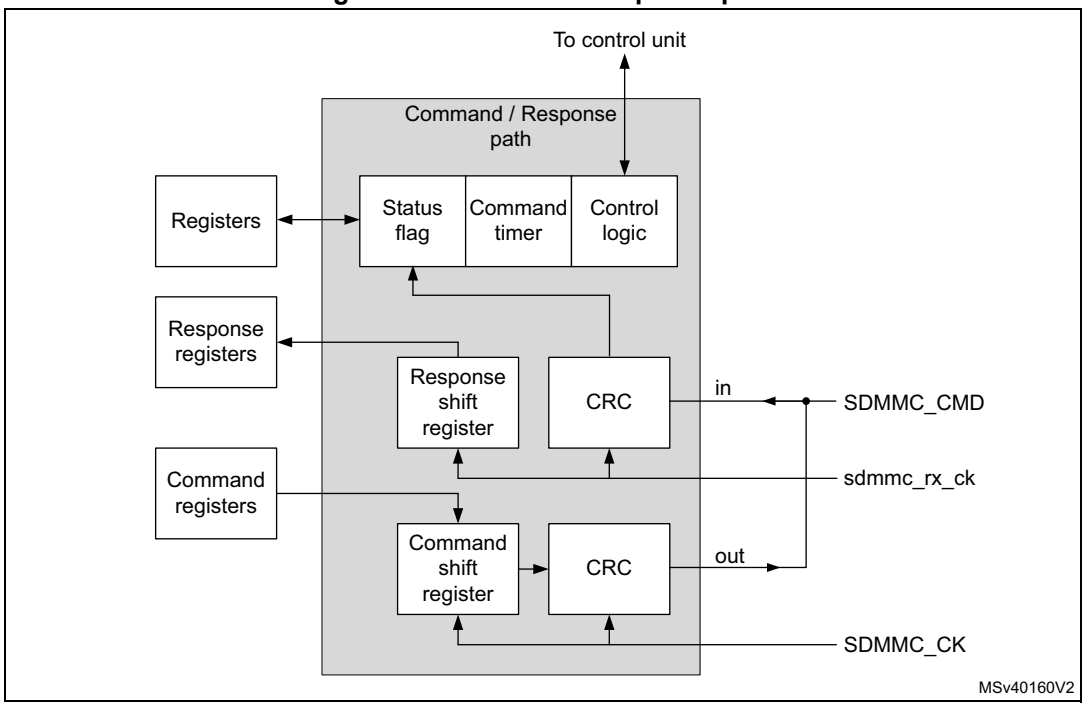
- after reset
- during the power-off or power-up phases
- if the power saving mode (register bit PWRSAV) is enabled and the card bus is in the Idle state for eight clock periods. The clock is stopped eight cycles after both the command/response CPSM and data path DPSM subunits have enter the Idle phase. The clock is restarted when the command/response CPSM or data path DPSM is activated (enabled).

The I/O management subunit takes care of the SDMMC_Dn and SDMMC_CMD I/O direction signals, which controls the external voltage transceiver.

Command/response path

The command/response path subunit transfers commands and responses on the SDMMC_CMD line. The command path is clocked on the SDMMC_CK and sends commands to the card,. The response path is clocked on the sdmmc_rx_ck and receives responses from the card.

Figure 226. Command/response path

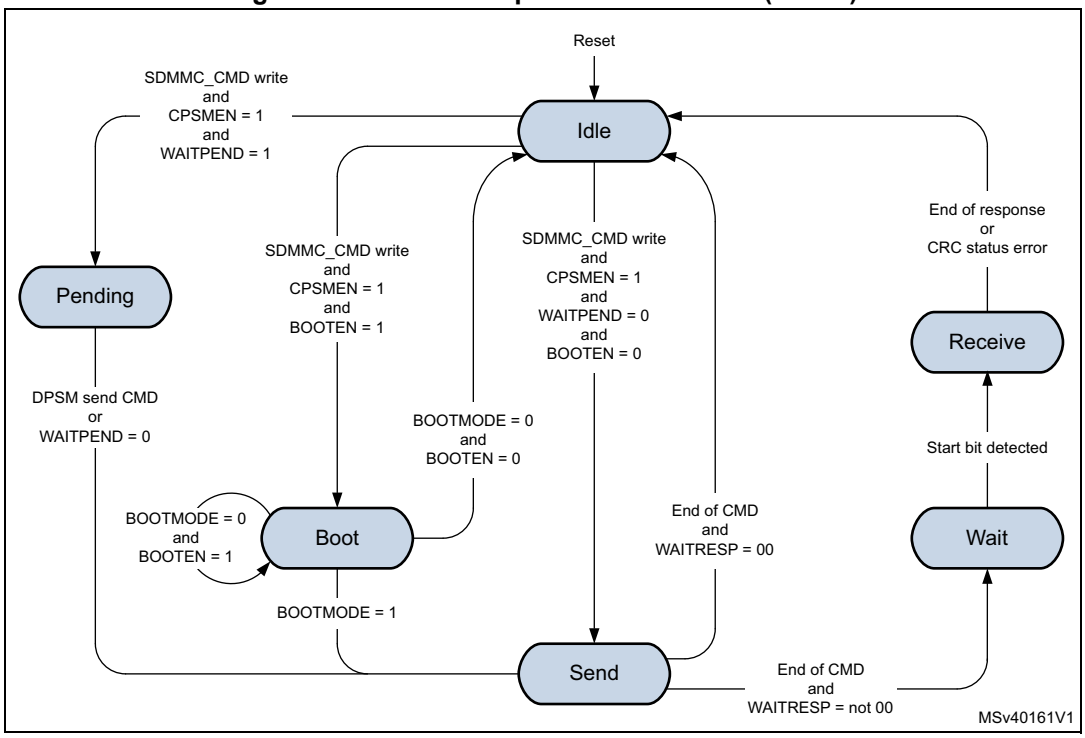


Command/response path state machine (CPSM):

- When the command register is written to and the enable bit is set, command transfer starts. When the command has been sent the CRC is appended and the command path state machine (CPSM) sets the status flags and:
  - if a response is not required enters the Idle state.
  - If a response is required, it waits for the response.
- When the response is received,
  - for a response with CRC, the received CRC code and the internally generated code are compared, and the appropriate status flag is set according the result.
  - for a response without CRC, no CRC is checked, and the appropriate status flag is not set.

When ever the CPSM is active (not in the Idle state), the CPSMACT bit is set.

Figure 227. Command path state machine (CPSM)



- **Idle**: The command path is inactive. When the command control register is written and the enable bit (CPSMEN) is set, the CPSM activates the SDMMC_CK clock (when stopped due to power save PWRSAV bit) and moves
  - to the Send state when WAITPEND = 0 and BOOTEN = 0.
  - to the Pending state when WAITPEND = 1.
  - to the Boot state when BOOTEN = 1.
- **Send**: The command is sent and the CRC is appended.
  - When CMDTRANS bit is set or when BOOTEN bit is set and BOOTMODE is alternative boot, and the DTDIR = receive, the CPSM DataEnable signal is issued to the DPSM at the end of the command.
  - When the CMDTRANS bit is set and the CMDSUSPEND bit is 0 the interrupt period is terminated at the end of the command.
  - When CMDSTOP bit is set the CPSM Abort signal is issued to the DPSM at the end of the command.
  - If no response is expected (WAITRESP = 00) the CPSM moves to the Idle state and the CMDSENT flag is set. When BOOTMODE = 1 and BOOTEN = 0 the CMDSENT flag is delayed 56 cycles after the command end bit, otherwise the

CMDSENT flag is generated immediately after the command end bit.
The RESPCMDR and RESPxR registers are not modified.

– If a command response is expected (WAITRESP = not 00) the CPSM moves to the Wait state and start the response timeout.

- **Wait**: The command path waits for a response.
  – When WAITINT bit is 0 the command timer starts running and the CPSM waits for a start bit.
  a) If a start bit is detected before the timeout the CPSM moves to the Receive state.
  b) If the timeout is reached before the CPSM detect a response start bit, the timeout flag (CTIMEOUT) is set and the CPSM moves to the Idle state.
  The RESPCMDR and RESPxR registers are not modified.
  – When WAITINT bit is 1, the timer is disabled and the CPSM waits for an interrupt request (response start bit) from one of the cards.
  a) When a start bit is detected the CPSM moves to the Receive state.
  b) When writing WAITINT to 0 (interrupt mode abort), the host sends a response by its self and on detecting the start bit the CPSM move to the Receive state.
- **Receive**: The command response is received. Depending the response mode bits WAITRESP in the command control register, the response can be either short or long, with CRC or without CRC. The received CRC code when present is verified against the internally generated CRC code.
  – When the CMDSUSPEND bit is set and the SDIO Response bit BS = 0 (response bit [39]), the interrupt period is started after the response.
  When the CMDSUSPEND bit is cleared, or the CMDSUSPEND bit is 1 and the SDIO Response bit BS = 1 (response bit [39]), there is no interrupt period started.
  – When the CMDTRANS bit is set and the CMDSUSPEND bit is set and the SDIO Response bit DF= 1 (response bit [32]) the interrupt period is terminated after the response.
  – When the CRC status passes or no CRC is present the CMDREND flag is set, the CPSM moves to the Idle state.
  The RESPCMDR and RESPxR registers are updated with received response.
  - When BOOTMODE = 1 and BOOTEN = 0 the CMDREND flag is delayed 56 cycles after the response end bit, otherwise the CMDREND flag is generated immediately after the response end bit.
  - When CMDTRANS bit is set and the DTDIR = transmit, the CPSM DataEnable signal is issued to the DPSM at the end of the command response.
  – When the CRC status fails the CCRCFAIL flag is set and the CPSM moves to the Idle state.
  The RESPCMDR and RESPxR registers are updated with received response.
- **Pending**: According the pending WAITPEND bit in the command register, the CPSM enters the pending state.
  – When DATALENGTH ≤ 5 bytes the CPSM moves to the Sent state and generates the DataEnable signal to start the data transfer aligned with the CMD12 Stop Transmission command.
  – When DATALENGTH > 5 bytes, the CPSM DataEnable signal is issued to the DPSM to start the data transfer. The CPSM waits for a send CMD signal from the

DPSM before moving to the Send state. This enables, for example, the CMD12 Stop Transmission command to be sent aligned with the data.

– When writing WAITPEND to 0, the CPSM moves to the Send state.

- **Boot**: If the BOOTEN bit is set in the command register, the CPSM enters the Boot state, and when:
  – BOOTMODE = 0 the SDMMC_CMD line is driven low and when CMDTRANS bit is set and the DTDIR = receive, the CPSM DataEnable signal is issued to the DPSM. This enables normal boot operation. This state is left at the end of the boot procedure by clearing the register bit BOOTEN, which cause the SDMMC_CMD line to be driven high and the CPSM Abort signal is issued to the DPSM, before moving to the Idle state. The CMDSENT flag is generated 56 cycles after SDMMC_CMD line is high.
  – BOOTMODE = 1, move to the Send state. This enables sending of the CMD0 (boot). Clearing BOOTEN has no effect.

Note: The CPSM remains in the Idle state for at least eight SDMMC_CK periods to meet the N_{CC} and N_{RC} timing constraints. N_{CC} is the minimum delay between two host commands, and N_{RC} is the minimum delay between the host command and the card response.

The response timeout has a fixed value of 64 SDMMC_CK clock periods.

A command is a token that starts an operation. Commands are sent from the host to either a single card (addressed command) or all connected cards (broadcast command are available for *e*•MMC V3.31 or previous). Commands are transferred serially on the SDMMC_CMD line. All commands have a fixed length of 48 bits. The general format for a command token for SD-Memory cards, SDIO cards, and *e*•MMC cards is shown in *Table 276.*

The command token data is taken from two registers, one containing a 32-bit argument and the other containing the 6-bit command index (six bits sent to a card).

Table 276. Command token format

Bit position	Width	Value	Description
47	1	0	Start bit
46	1	1	Transmission bit
[45:40]	6	x	Command index
[39:8]	32	x	Argument
[7:1]	7	x	CRC7
0	1	1	End bit

Next to the command data there are command type (WAITRESP) bits controlling the command path state machine (CPSM). These bits also determine whether the command requires a response, and whether the response is short (48 bit) or long (136 bits) long, and if a CRC is present or not.

A response is a token that is sent from an addressed card or synchronously from all connected cards to the host as an answer to a previous received command. All responses are sent via the command line SDMMC_CMD. The response transmission always starts with the left bit of the bit string corresponding to the response code word. The code length depends on the response type. Response tokens R1, R2, R3, R4, R5, and R6 have various

coding schemes, depending on their content. The general formats for the response tokens for SD-Memory cards, SDIO cards, and *e*•MMC cards are shown in *Table 277*, *Table 278* and *Table 279*.

A response always starts with a start bit (always 0), followed by the bit indicating the direction of transmission (card = 0). A value denoted by x in the tables below indicates a variable entry. Most responses, except some, are protected by a CRC. Every command code word is terminated by the end bit (always 1).

The response token data is stored in five registers, four containing the 32-bits card status, OCR register, argument or 127-bits CID or CSD register including internal CRC, and one register containing the 6-bits command index.

Table 277. Short response with CRC token format

Bit position	Width	Value	Description
47	1	0	Start bit
46	1	0	Transmission bit
[45:40]	6	x	Command index (or reserved 111111)
[39:8]	32	x	Argument
[7:1]	7	x	CRC7
0	1	1	End bit

Table 278. Short response without CRC token format

Bit position	Width	Value	Description
47	1	0	Start bit
46	1	0	Transmission bit
[45:40]	6	x	Command index (or reserved 111111)
[39:8]	32	x	Argument
[7:1]	7	1111111	(reserved 1111111)
0	1	1	End bit

Table 279. Long response with CRC token format

Bit position	Width	Value	Description
135	1	0	Start bit
134	1	0	Transmission bit
[133:128]	6	111111	Reserved
[127:1]	127:8	x	CID or CSD slices
	7:1	x	CRC7 (included in CID or CSD)
0	1	1	End bit

The command/response path operates in a half-duplex mode, so that either commands can be sent or responses can be received. If the CPSM is not in the Send state, the

SDMMC_CMD output is in the Hi-Z state. Data sent on SDMMC_CMD are synchronous with the SDMMC_CK according the NEGEDGE register bit see *Figure 224*.

The command and short response with CRC, the CRC generator calculates the CRC checksum for all 40 bits before the CRC code. This includes the start bit, transmission bit, command index, and command argument (or card status).

For the long response the CRC checksum is calculated only over the 120 bits of R2 CID or CSD. Note that the start bit, transmission bit and the six reserved bits are not used in the CRC calculation.

The CRC checksum is a 7-bit value:

CRC[6:0] = remainder $[(M(x) * x^7) / G(x)]$

$G(x) = x^7 + x^3 + 1$

$M(x) = (\text{first bit}) * x^n + (\text{second bit}) * x^{n-1} + \ldots + (\text{last bit before CRC}) * x^0$

Where n = 39 or 119.

The CPSM can send a number of specific commands to handle various operating modes when CPSMEN is set, see *Table 280*.

Table 280. Specific Commands overview

VSWITCH	BOOTEN	BOOTMOD	CMDTRAN	WAITPEND	CMDSTOP	WAITINT	Description
1	x	x	x	x	x	x	Start voltage switch sequence
0	1	x	x	x	x	x	Start normal boot
0	1	1	x	x	x	x	Start alternative boot
0	0	1	x	x	x	x	Stop alternative boot.
0	0	0	1	x	x	x	Send command with associated data transfer.
0	0	0	0	1	1	x	*e*•MMC stream data transfer, command (STOP_TRANSMISSION) pending until end of data transfer.
0	0	0	0	1	0	x	*e*•MMC stream data transfer, command different from (STOP_TRANSMISSION) pending until end of data transfer.
0	0	0	0	0	1	x	Send command (STOP_TRANSMISSION), stopping any ongoing data transmission.
0	0	0	0	0	0	1	Enter *e*•MMC wait interrupt (Wait-IRQ) mode.
0	0	0	0	0	0	0	Any other none specific command

The command/response path implements the status flags and associated clear bits shown in *Table 281*:

Table 281. Command path status flags

Flag	Description
CMDSENT	Set at the end of the command without response (CPSM moves from Send to Idle).
CMDREND	Set at the end of the command response when the CRC is OK (CPSM moves from Receive to Idle).
CCRCFAIL	Set at the end of the command response when the CRC is FAIL (CPSM moves from Receive to Idle).
CTIMEOUT	Set after the command when no response start bit received before the timeout (CPSM moves from Wait to Idle).
CKSTOP	Set after the voltage switch (VSWITCHEN = 1) command response when the CRC is OK and the SDMMC_CK is stopped (no impact on CPSM).
VSWEND	Set after the voltage switch (VSWITCH = 1) timeout of 5 ms + 1 ms (no impact on CPSM).
CPSMACT	Command transfer in progress (CPSM not in Idle state).

The command path error handling is shown in *Table 282*:

Table 282. Command path error handling

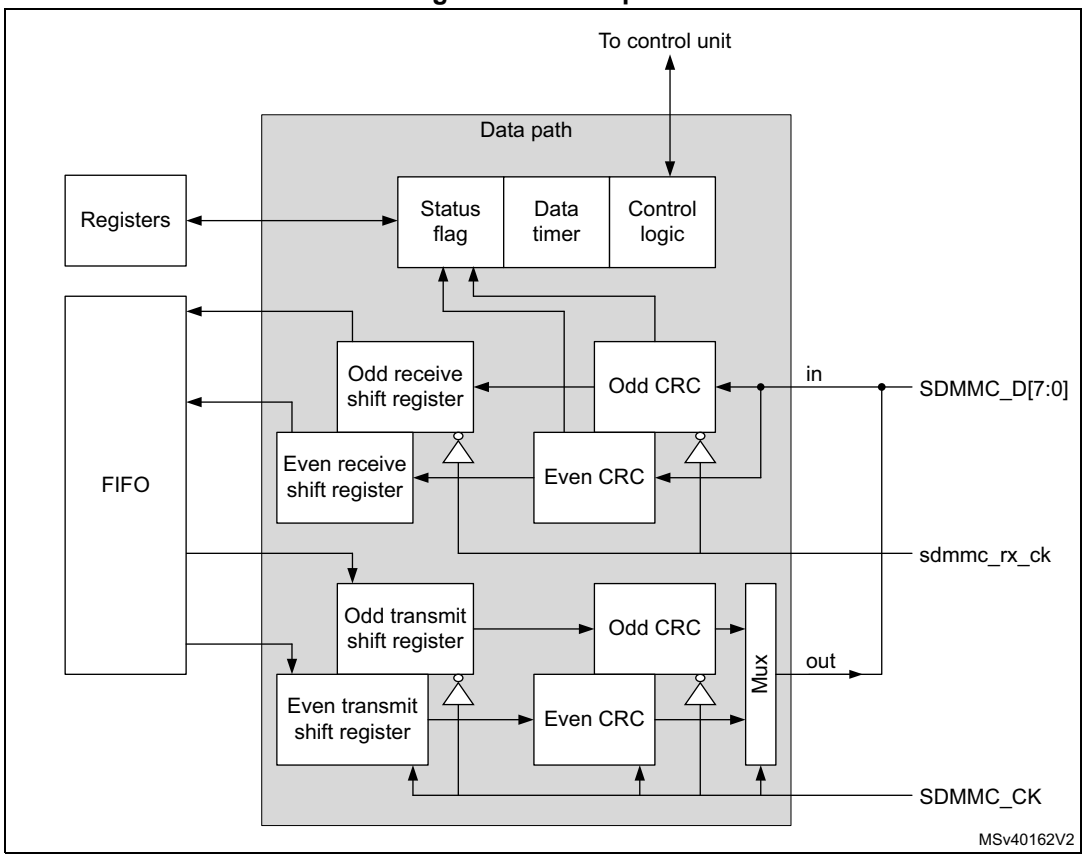
Error	CPSM state	Cause	Card action	Host action	CPSM action
Timeout	Wait	No start bit in time	Unknown	Reset or cycle power card(1)	Move to Idle
CRC status	Receive	Negative status	Command ignored	Resend command(1)	Move to Idle
		Transmission error	Command accepted	Resend command(1)	

1. When CMDTRANS is set, also a stop_transmission command must be send to move the DPSM to Idle.

Data path

The data path subunit transfers data on the SDMMC_D[7:0] lines to and from cards. The data transmit path is clocked on the SDMMC_CK and sends data to the card. The data receive path is clocked on the sdmmc_rx_ck and receives data from the card. *Figure 228* shows the data path block diagram.

Figure 228. Data path



The card data bus width can be programmed in the clock control register bits WIDBUS. The supported data bus width modes are:

- If the wide bus mode is not enabled, only one bit is transferred over SDMMC_D0.
- If the 4-bit wide bus mode is enabled, data is transferred at four bits over SDMMC_D[3:0].
- If the 8-bit wide bus mode is enabled, data is transferred at eight bits over SDMMC_D[7:0].

Next to the data bus width the data sampling mode can be programmed in the clock control register bit DDR. The supported data sampling modes are:

- Single data rate signaling (SDR), data is clocked on the rising edge of the clock.
- Double data rate signaling (DDR), data is clocked on the both edges of the clock. DDR mode is only supported in wide bus mode (4-bit wide and 8-bit wide).

Note: The data sampling mode only applies to the SDMMC_D[7:0] lines. (not applicable to the SDMMC_CMD line.)

In DDR mode, data is sampled on both edges of the SDMMC_CK according the following rules, see also *Figure 229* and *Figure 230*:

- On the rising edge of the clock odd bytes are sampled.
- On the falling edge of the clock even bytes are sampled.
- Data payload size is always a multiple of 2 bytes.
- Two CRC16 are computed per data line
  - Odd bits CRC16 clocked on the falling edge of the clock.
  - Even bits CRC16 clocked on the rising edge of the clock.
- Start, end bits and idle conditions are full cycle.
- CRC status / boot acknowledgment and busy signaling are full cycle and are only sampled on the rising edge of the clock.

In DDR mode, the SDMMC_CK clock division must be ≥ 2.

Figure 229. DDR mode data packet clocking

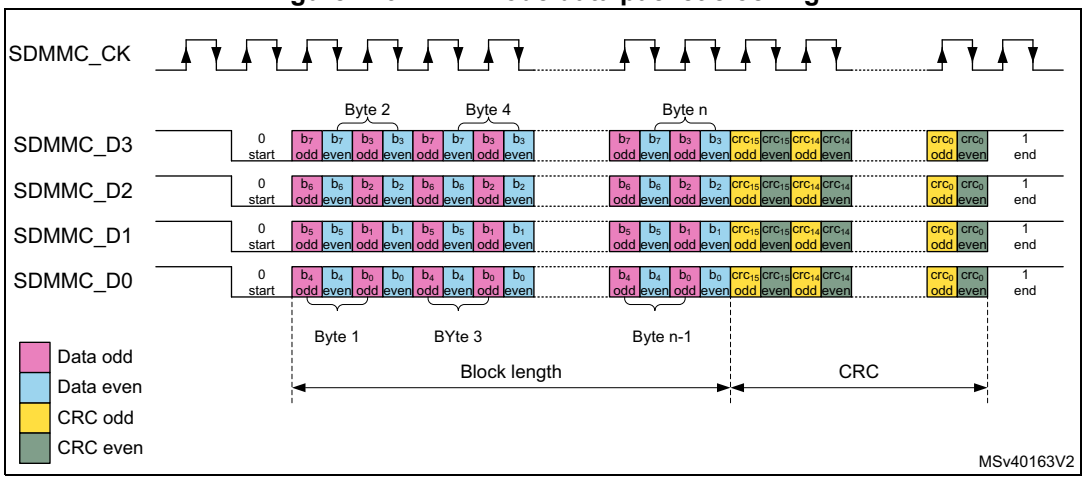


Figure 230. DDR mode CRC status / boot acknowledgment clocking

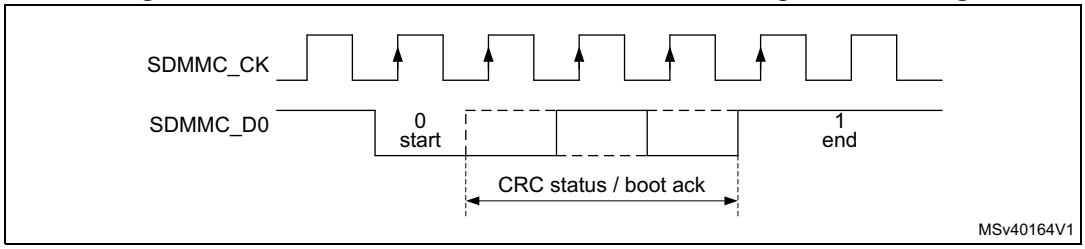


Data path state machine (DPSM)

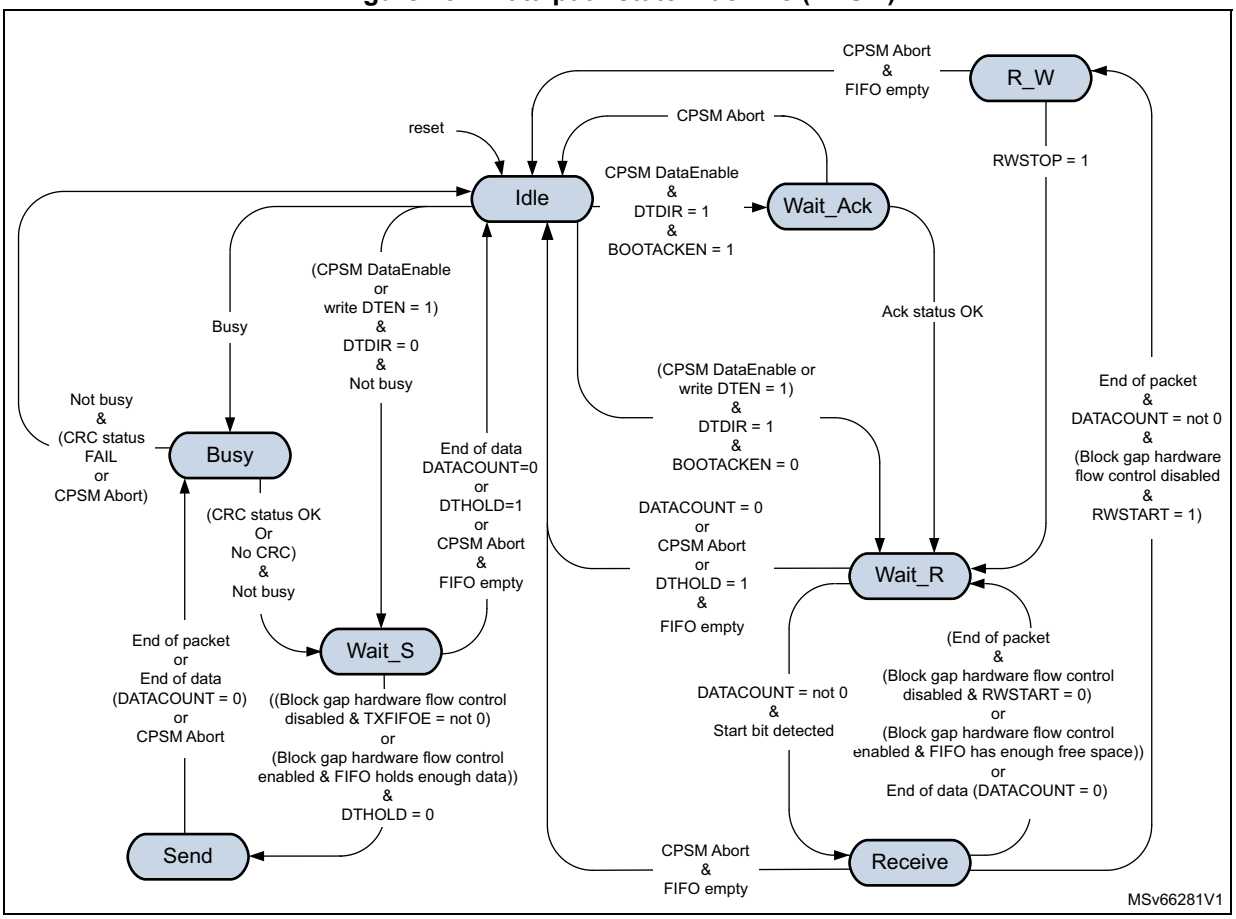
Depending on the transfer direction (send or receive), the data path state machine (DPSM) moves to the Wait_S or Wait_R state when it is enabled:

- Send: the DPSM moves to the Wait_S state. If there is data in the transmit FIFO, the DPSM moves to the Send state, and the data path subunit starts sending data to a card.
- Receive: the DPSM moves to the Wait_R state and waits for a start bit. When it receives a start bit, the DPSM moves to the Receive state, and the data path subunit starts receiving data from a card.

For boot operation with acknowledgment the DPSM moves to the Wait_Ack state and waits for the boot acknowledgment before moving to the Wait_R state.

The DPSM operates at SDMMC_CK. The DPSM has the following states, as shown in *Figure 231*. When ever the DPSM is active (not in the Idle state), the DPSMACT bit is set.

Figure 231. Data path state machine (DPSM)



- **Idle** state: the data path is inactive, and the SDMMC_D[7:0] outputs are according the PWRCTRL setting. The DPSM is activated either by sending a command with CMDTRANS bit set or by setting the DTEN bit, or by detecting Busy on SDMMC_D0 (that is, after a command with R1b response).

  When not busy, the DPSM activates the SDMMC_CK clock (when stopped due to power save PWRSAV bit), loads the data counter with a new (DATALENGTH) value and:

  – When the data direction bit (DTDIR) indicates send, moves to the Wait_S.

  – When the data direction bit (DTDIR) indicates receive, moves to the
  - Wait_R when BOOTACKEN register bit is clear.
  - Wait_Ack when BOOTACKEN register bit is set and start the acknowledgment timeout.

  When busy the DPSM keeps the SDMMC_CK clock active and move to the Busy state.

Note: DTEN must not be used to start data transfer with SD, SDIO and e•MMC cards.

- **Wait_Ack** state: the data path waits for the boot acknowledgment token.
  - The DPSM moves to the Wait_R state if it receives an error free acknowledgment before a timeout.
  - When a pattern different from the acknowledgment is received an acknowledgment status error is generated, and the ack fail status flag (ACKFAIL) is set. The DPSM stays in Wait_Ack.
  - If it reaches a timeout (ACKTIME) before it detects a start bit, it sets the timeout status flag (ACKTIMEOUT). The DPSM stays in Wait_Ack.
  - When the CPSM Abort signal is set it moves to the Idle state and sets the DABORT flag.
- **Wait_R** state: the data path, if the data counter is not zero and data is not hold, waits for a start bit on SDMMC_D[n:0]. If the data counter is zero or data is hold, wait for the FIFO to be empty.
  - In block mode, if a start bit is received before a timeout the DPSM moves to the Receive state and loads the data block counter with DBLOCKSIZE.
  - In SDIO multibyte mode, if a start bit is received before a timeout the DPSM moves to the Receive state and loads the data block counter with DATALENGTH.
  - In stream mode, if a start bit is received before a timeout the DPSM moves to the Receive state and loads the data counter with DATALENGTH.
  - if the data counter (DATACOUNT) equals zero (end of data) the DPSM moves to the Idle state when the receive FIFO is empty and the DATAEND flag is set.
  - If it reaches a timeout (DATATIME) before it detects a start bit, it sets the timeout status flag (DTIMEOUT) and the DPSM stays in the Wait_R state.
  - If the CPSM Abort signal is set:
    If DATACOUNT > 0, the DPSM moves to the Idle state when the FIFO is empty and when IDMAEN = 0 reset with FIFORST, and sets the DABORT flag.
    If DATACOUNT is zero normal operation is continued, there is no DABORT flag since the transfer has completed normally.
  - if the DTHOLD bit is set:
    - When DATACOUNT > 0, the DPSM moves to the Idle state when the receive FIFO is empty and when IDMAEN = 0 reset with FIFORST, and issues the DHOLD flag. When holding the timeout is disabled. When an CPSM Abort signal is received during holding, the transfer is aborted.

- When DATACOUNT = 0, the transfer is completed normally and there is no DHOLD flag.

– When DPSM has been started with DTEN, after an error (DTIMEOUT) the DPSM moves to the Idle state when the FIFO is empty and when IDMAEN = 0 reset with FIFORST.

- **R_W** state: the data path Read Wait the bus.
  – The DPSM moves to the Wait_R state when the Read Wait stop bit (RWSTOP) is set, and start the receive timeout.
  – If the CPSM Abort signal is set, wait for the FIFO to be empty and when IDMAEN = 0 reset with FIFORST, then moves to the Idle state and sets the DABORT flag.
- **Receive** state: the data path receives serial data from a card. Pack the data in bytes and written it to the data FIFO. Depending on the transfer mode selected in the data control register (DTMODE), the data transfer mode can be either block or stream:
  – In block mode, when the data block size (DBLOCKSIZE) number of data bytes are received, the DPSM waits until it receives the CRC code.
  – In SDIO multibyte mode, when the data block size (DATALENGTH) number of data bytes are received, the DPSM waits until it receives the CRC code.
  a) If the received CRC code matches the internally generated CRC code, the DPSM moves to the
  - R_W state when RWSTART = 1 and DATACOUNT > zero, the DBCKEND flag is set.
  - Wait_R state otherwise, either immediately when block gap hardware flow control is disabled, or after enough free area is available in the FIFO when block gap hardware flow control is enabled.
  b) If the received CRC code fails the internally generated CRC code any further data reception is prevented.
  - When not all data has been received (DATACOUNT > 0), the CRC fail status flag (DCRCFAIL) is set and the DPSM stays in the Receive state.
  - When all data has been received (DATACOUNT = 0), wait for the FIFO to be empty after which the CRC fail status flag (DCRCFAIL) is set and the DPSM moves to the Idle state.
  – In stream mode, the DPSM receives data while the data counter DATACOUNT > 0. When the counter is zero, the remaining data in the shift register is written to the data FIFO, and the DPSM moves to the Wait_R state.
  – When a FIFO overrun error occurs, the DPSM sets the FIFO overrun error flag (RXOVERR) and any further data reception is prevented. The DPSM stays in the Receive state.
  – When an CPSM Abort signal is received:
  - If the CPSM Abort signal is received before the 2 last bits of the data with DATACOUNT = 0, the transfer is aborted. The remaining data in the shift register is written to the data FIFO, wait for the FIFO to be empty and when IDMAEN = 0 reset with FIFORST, then the DPSM moves to the Idle state and the DABORT flag is set.
  - If the CPSM Abort signal is received during or after the 2 last bits of the transfer with DATACOUNT = 0, the transfer is completed normally. The DPSM stays in the Receive state no DABORT flag is generated.

  - When DPSM has been started with DTEN, after an error (DCRCFAIL when DATACOUNT > 0, or RXOVERR) the DPSM moves to the Idle state when the FIFO is empty and when IDMAEN = 0 reset with FIFORST.

- **Wait_S** state: the data path waits for data to be available from the FIFO.
  - If the data counter DATACOUNT > 0,
    - When block gap hardware flow control is disabled, waits until the data FIFO empty flag (TXFIFOE) is de-asserted and DTHOLD is not set, and moves to the Send state.
    - When block gap hardware flow control is enabled, waits until the data FIFO hold enough data and DTHOLD is not set, and moves to the Send state.
  - If the data counter (DATACOUNT) = 0 the DPSM moves to the Idle state.
    - When DTHOLD is disabled, the DATAEND flag is set.
    - When DTHOLD is enabled, the DHOLD flag is set.
  - When DTHOLD is set and the DATACOUNT > 0
    - When IDMA is enabled, the DBCKEND flag is set and subsequently the FIFO is flushed, furthermore the DPSM moves to the Idle state and the DHOLD flag is set.
    - When IDMA is disabled the DBCKEND flag is set. Wait for the FIFO to be reset by software with FIFORST, then DPSM moves to the Idle state and issues the DHOLD flag.
  - When DTHOLD is set and DATACOUNT = 0 the transfer is completed normally.
  - When receiving the CPSM Abort signal
    - If the CPSM Abort signal is received before the 2 last bits of the data with DATACOUNT = 0, the transfer is aborted, wait for the FIFO to be empty and when IDMAEN = 0 reset with FIFORST, then the DPSM moves to the Idle state and sets the DABORT flag.
    - If the CPSM Abort signal is received during or after the 2 last bits of the transfer with DATACOUNT = 0, normal operation is continued, there is no DABORT flag since the transfer has completed normally.

Note: The DPSM remains in the Wait_S state for at least two clock periods to meet the N_{WR} timing requirements, where N_{WR} is the number of clock cycles between the reception of the card response and the start of the data transfer from the host.

- **Send** state: the DPSM starts sending data to a card. Depending on the transfer mode bit in the data control register, the data transfer mode can be either block, SDIO multibyte or stream:
  - In block mode, when the data block size (DBLOCKSIZE) number of data bytes are send, the DPSM sends an internally generated CRC code and end bit, and moves to the Busy state and start the transmit timeout.
  - In SDIO multibyte mode, when the data block size (DATALENGTH) number of data bytes are send, the DPSM sends an internally generated CRC code and end bit, and moves to the Busy state and start the transmit timeout.
  - In stream mode, the DPSM sends data to a card while the data counter DATACOUNT > 0. When the data counter reaches zero moves to the Busy state and start the transmit timeout.
    Before sending the last stream byte according to DATACOUNT, the DPSM issues

a trigger on the send CMD signal. This signal is used by the CPSM to sent any pending command (CMD12 Stop Transmission command).

– If a FIFO underrun error occurs, the DPSM sets the FIFO underrun error flag (TXUNDERR). The DPSM stays in the Send state.

– When receiving the CPSM Abort signal
- If the CPSM Abort signal is received before the 2 last bits of the transfer with DATACOUNT = 0, the transfer is aborted. The DPSM sends a last data bit followed by an end bit. The FIFO is disabled/flushed, and the DPSM moves to the Busy state to wait for not busy before setting the DABORT flag.
- If the CPSM Abort signal is received during or after the 2 last bits of the transfer with DATACOUNT = 0, the transfer is completed normally, there is no DABORT flag.

- **Busy** state: the DPSM waits for the CRC status token when expected, and wait for a not busy signal:

– If a CRC status token is expected and indicate “non-erroneous transmission” or when there is no CRC expected:
- it moves to the Wait_S state when SDMMC_D0 is not low (the card is not busy).
- When the card is busy SDMMC_D0 is low it remains in the Busy state.

– If a CRC status token is expected and indicates “erroneous transmission”.
- When not all data has been send (DATACOUNT > 0). The DPSM waits for not busy after which the CRC fail status flag (DCRCFAIL) is set. The FIFO is disabled/flushed and the DPSM stays in the Busy state.
- When all data has been send (DATACOUNT = 0). The DPSM waits for not busy after which the CRC fail status flag (DCRCFAIL) is set and the DPSM moves to the Idle state.

– If a CRC status (Ncrc) timeout occurs while the DPSM is in the Busy state, it sets the data timeout flag (DTIMEOUT) and stays in the Busy state.

– If a busy timeout occurs while the DPSM is in the Busy state, it sets the data timeout flag (DTIMEOUT) and stays in the Busy state.

– When receiving the CPSM Abort signal in the Busy state:
- If the CPSM Abort signal is received before the 2 last bits of the CRC response with DATACOUNT > 0, the data transfer is aborted. The DPSM waits for not busy and the FIFO to be disabled/flushed before moving to the Idle state and the DABORT flag is set.
- If the CPSM Abort signal is received during or after the 2 last bits of the CRC response when DATACOUNT = 0 or when no CRC is expected and DATACOUNT = 0 and there has been no DTIMEOUT error, the DPSM stays in the Busy state no DABORT flag is generated, since the transfer may completed normally.
- If the CPSM Abort signal is received when a DTIMEOUT error has occurred the DPSM waits for not busy and the FIFO to be disabled/flushed before moving to the Idle state and the DABORT flag is set.

– When entering the Busy state due to an abort in the Send state, the DPSM waits for not busy before moving to the Idle state and the DABORT flag is set.

– When DPSM has been started with DTEN, after an error (DCRCFAIL when DATACOUNT > 0, or DTIMEOUT) the DPSM moves to the Idle state when the FIFO is reset.

– When the DPSM has been started due to Busy on SDMMC_D0, waits for not busy after which the Busy end status flag (BUSYD0END) is set and the DPSM moves to the Idle state.

The data timer (DATATIME) is enabled when the DPSM is in the Wait_R or Busy state 2 cycles after the data block end bit, or data read command end bit, or R1b response, and generates the data timeout error (DTIMEOUT):

- When transmitting data, the timeout occurs
  - when a CRC status is expected and no start bit is received withing 8 SDMMC_CK cycles, the DTIMEOUT flag is set.
  - when the Busy state takes longer than the programmed timeout period., the DTIMEOUT flag is set.
- When receiving data, the timeout occurs
  - when there is still data to be received DATACOUNT > 0 and no start bit is received before the programmed timeout period, the DTIMEOUT flag is set.
- After a R1b response, the timeout occurs
  - when the Busy state takes longer than the programmed timeout period., the DTIMEOUT flag is set.

When DATATIME = 0:

- In receive the start bit must be present 2 cycles after the data block end bit or data read command end bit.
- In transmit busy is timed out 2 cycles after the CRC token end bit or stream data end bit.
- After a R1b response busy is timed out 2 cycles after the response end bit.

Data can be transferred from the card to the host (transmit, send) or vice versa (receive). Data are transferred via the SDMMC_Dn data lines, they are stored in a FIFO.

Table 283. Data token format

Description	Start bit	Data(1)	CRC16	End bit	DTMODE
Block data	0	(DBLOCKSIZE, DATALENGTH)	Yes	1	00
SDIO multibyte	0	(DATALENGTH)	Yes	1	01
e•MMC stream	0	(DATALENGTH)	No	1	10

1. The total amount of data to transfer is given by DATALENGTH. Where for Block data the amount of data in each block is given by DBLOCKSIZE.

The data token format is selected with register bits DTMODE according.

The data path implements the status flags and associated clear bits shown in *Table 284*:

Table 284. Data path status flags and clear bits

Flag		Description
DATAEND	TX	Set at the end of the complete data transfer when the CRC is OK and busy has finished and both DTHOLD = 0 and DATACOUNT = 0. (DPSM moves from Wait_S to Idle)
	RX	Set at the end of the complete data transfer when the CRC is OK and all data has been read, (DATACOUNT = 0 and FIFO is empty). (DPSM moves from Wait_R to Idle)
	Boot	

Table 284. Data path status flags and clear bits (continued)

Flag		Description
DCRCFAIL	TX	Set at the end of the CRC when FAIL and busy has finished. (DPSM stay in Busy when there is still data to send and wait for CPSM Abort) (DPSM moves from Busy to Idle when all data has been sent) or DPSM has been started with DTEN
	RX	Set at the end of the CRC when FAIL and FIFO is empty. (DPSM stays in Receive when there is still data to be received and wait for CPSM Abort) (DPSM moves from Receive to Idle when all data has been received or DPSM has been started with DTEN)
	Boot	
ACKFAIL	Boot	Set at the end of the boot acknowledgment when fail. (DPSM stays in Wait_Ack and wait for CPSM Abort)
DTIMEOUT	CMD R1b	Set after the command response no end of busy received before the timeout. (DPSM stays in Busy and wait for CPSM Abort)
	TX	Set when no CRC token start bit received within Ncrc, or no end of busy received before the timeout. (DPSM stays in Busy and wait for CPSM Abort) (When DPSM has been started with DTEN move to Idle) Note: The DCRCFAIL flag may also be set when CRC failed before the busy timeout.
	RX	Set when no start bit received before the timeout. (DPSM stays in Wait_R and wait for CPSM Abort) (When DPSM has been started with DTEN move to Idle)
	Boot	
ACKTIMEOUT	Boot	Set when no start bit received before the timeout. (DPSM stays in Wait_Ack and wait for CPSM Abort)
DBCKEND	TX	When DTHOLD = 1 and IDMAEN = 0: Set at the end of data block transfer when the CRC is OK and busy has finished, when data transfer is not complete (DATACOUNT >0). (DPSM moves from Busy to Wait_S)
	RX	When RWSTART = 1: Set at the end of data block transfer when the CRC is OK, when data transfer is not complete (DATACOUNT > 0). (DPSM moves from Receive to R_W)
	Boot	
DHOLD	TX	When DTHOLD = 1: Set at the end of data block transfer when the CRC is OK and busy has finished. (DPSM moves from Wait_S to Idle)
	RX	When DTHOLD = 1: Set at the end of data block transfer when the CRC is OK and all data has been read (FIFO is empty), when data transfer is not complete (DATACOUNT >0). (DPSM moves from Wait_R to Idle)
DABORT	CMD R1b	When CPSM Abort event has been sent by the CPSM and busy has finished. (DPSM moves from Busy to Idle)
	TX	When CPSM Abort event has been sent by the CPSM before the 2 last bits of the transfer. (DPSM moves from any state to Idle)
	RX	
	Boot	
BUSYD0END	CMD R1b	Set after the command response when end of busy before the timeout. (DPSM moves from Busy to Idle)
DPSMACT		Data transfer in progress. (DPSM not in Idle state)

The data path error handling is shown in *Table 285*:

Table 285. Data path error handling

Error	DPSM state	Cause	Card action	Host action	DPSM action
Timeout	Wait_Ack	No Ack in time	unknown	Card cycle power	Stay in Wait_Ack (reset the SDMMC with the RCC.SDMMCxRST register bit)
	Wait_R	No start bit in time	unknown	Stop data reception Send stop transmission command	On CPSM Abort move to Idle
			unknown	Stop boot procedure	
	Busy	Busy too long (due to data transfer)	unknown	Stop data reception Send stop transmission command	
		Busy too long (due to R1b)	unknown	Send reset command	
CRC	Receive	transmission error	Send further data	Stop data reception Send stop transmission command	On CPSM Abort move to Idle
CRC status	Busy	Negative status	Ignore further data	Stop data transmission Send stop transmission command	On CPSM Abort move to Idle
		transmission error	wait for further data		
Ack status	Wait_Ack	transmission error	Send boot data	Stop boot procedure	On CPSM Abort move to Idle
Overrun	Receive	FIFO full	Send further data	Stop data reception Send stop transmission command	On CPSM Abort move to Idle
Underrun	Send	FIFO empty	Receive further data	Stop data transmission Send stop transmission command	On CPSM Abort move to Idle

Data FIFO

The data FIFO (first-in-first-out) subunit contains the transmit and receive data buffer. A single FIFO is used for either transmit or receive as selected by the DTDIR bit. The FIFO contain a 32-bit wide, 256-word deep data buffer and control logic. Because the data FIFO operates in the AHB clock domain (sdmmc_hclk), all signals from the subunits in the SDMMC clock domain (SDMMC_CK/sdmmc_rx_ck) are resynchronized.

The FIFO can be in one of the following states:

- The transmit FIFO refers to the transmit logic and data buffer when sending data out to the card. (DTDIR = 0)
- The receive FIFO refers to the receive logic and data buffer when receiving data in from the card. (DTDIR = 1)

The end of a correctly completed SDMMC data transfer from the FIFO is indicated by the DATAEND flags driven by the data path subunit. Any incorrect (aborted) SDMMC data transfer from the FIFO is indicated by one of the error flags (DCRCFAIL, DTIMEOUT, DABORT) driven by the data path subunit, or one of the FIFO error flags (TXUNDERR, RXOVERR) driven by the FIFO control.

The data FIFO can be accessed in the following ways, see *Table 286*.

Table 286. Data FIFO access

Data FIFO access	IDMAEN
From firmware via AHB slave interface	0
From IDMA via AHB master interface	1

Transmit FIFO:

Data can be written to the transmit FIFO when the DPSM has been activated (DPSMACT = 1).

When IDMAEN = 1 the FIFO is fully handled by the IDMA.

When IDMAEN = 0 the FIFO is controlled by firmware via the AHB slave interface. The transmit FIFO is accessible via sequential addresses. The transmit FIFO contains a data output register that holds the data word pointed to by the read pointer. When the data path subunit has loaded its shift register, it increments the read pointer and drives new data out. The transmit FIFO is handled in the following way:

1. Write the data length into DATALENGTH and the block length in DBLOCKSIZE.
   – For block data transfer (DTMODE = 0), DATALENGTH must be an integer multiple of DBLOCKSIZE.
2. Enable hardware flow control HWFC_EN.
   If bus speed SDR50, SDR104, HS200 or DDR50 is used FIFO threshold can be used to provide flow control at the receive block gap.
3. Set the SDMMC in transmit mode (DTDIR = 0).
   – Configures the FIFO in transmit mode.
4. Enable the data transfer
   – either by sending a command from the CPSM with the CMDTRANS bit set
   – or by setting DTEN bit
5. When (DPSMACT = 1) write data to the FIFO.
   – When BUSSPEED = 0: The DPSM stays in the Wait_S state until FIFO is full (TXFIFOF = 1), or the number indicated by DATALENGTH.
   - The SDMMC keeps sending data as long as FIFO is not empty, hardware flow control during data transfer is used to prevent FIFO underrun.
   – When BUSSPEED = 1 and the FIFO threshold is zero: The DPSM reads the transmit data from the FIFO.

- The SDMMC keeps transmitting data as long as FIFO is not empty, hardware flow control during the data transfer is used to prevent FIFO underrun.

– When BUSSPEED = 1 and the FIFO threshold is not zero: The DPSM reads the transmit data from the FIFO.
- The SDMMC only starts sending a new block when there is enough data in the FIFO according the threshold. Block gap hardware flow control is used to prevent FIFO underrun.

6. Write data to the FIFO.
   – When the FIFO is handled by software, wait until the FIFO is half empty (TXFIFOHE flag), write data to the FIFO until FIFO is full (TXFIFOF = 1), or last data has been written.
   – When the FIFO is handled by the IDMA, the IDMA transfers the FIFO date.
7. When last data has been written wait for end of data (DATAEND flag)
   – SDMMC has completely sent all data and the DPSM is disabled (DPSMACT = 0).

In case of a data transfer error or transfer hold when IDMAEN = 0, firmware must stop writing to the FIFO and flush and reset the FIFO with the FIFORST register bit.

The transmit FIFO status flags are listed in *Table 287*.

Table 287. Transmit FIFO status flags

Flag	Description
TXFIFOF	Set to high when all transmit FIFO words contain valid data.
TXFIFOE	Set to high when the transmit FIFO does not contain valid data.
TXFIFOHE	Set to high when half or more transmit FIFO words are empty.
TXUNDERR	Set to high when an underrun error occurs. This flag is cleared by writing to the SDMMC Clear register.

Receive FIFO:

Data can be read from the receive FIFO when the DPSM is activated (DPSMACT = 1).

When IDMAEN = 1 the FIFO is fully handled by the IDMA.

When IDMAEN = 0 the FIFO is controlled by firmware via the AHB slave interface.When the data path subunit receives a word of data, it drives the data on the write databus. The write pointer is incremented after the write operation completes. On the read side, the contents of the FIFO word pointed to by the current value of the read pointer is driven onto the read databus. The receive FIFO is accessible via sequential addresses.

The receive FIFO is handled in the following way:

1. Write the data length into DATALENGTH and the block length in DBLOCKSIZE.
   – For block data transfer (DTMODE = 0), DATALENGTH must be an integer multiple of DBLOCKSIZE.
2. Enable hardware flow control HWFC_EN.
   – If bus speed SDR50, SDR104, HS200 or DDR50 is used FIFO threshold can be used to provide flow control at the receive block gap.
3. Set the SDMMC in receive mode (DTDIR = 1).
   – Configures the FIFO in receive mode.
4. Enable the DPSM transfer
   – either by sending a command from the CPSM with the CMDTRANS bit set
   – or by setting DTEN bit.
5. When (DPSMACT = 1) the FIFO is ready to receive data.
   – When BUSSPEED = 0: The DPSM writes the received data to the FIFO.
   - The SDMMC keeps receiving data as long as FIFO is not full, hardware flow control during the data transfer is used to prevent FIFO overrun.
   – When BUSSPEED = 1 and the FIFO threshold is zero: The DPSM writes the received data to the FIFO.
   - The SDMMC keeps receiving data as long as FIFO is not full, hardware flow control during the data transfer is used to prevent FIFO overrun.
   – When BUSSPEED = 1 and the FIFO threshold is not zero: The DPSM writes the received data to the FIFO.
   - The SDMMC only starts receiving a new block when there is enough free space in the FIFO according the threshold. Block gap hardware flow control is used to prevent FIFO overrun.
6. Read data from the FIFO.
   – When the FIFO is handled by software, wait until the FIFO is half full (RXFIFOHF flag), read data from the FIFO until FIFO is empty (RXFIFOE = 1).
   - When last data has been received, read data from the FIFO until FIFO is empty (DATAEND = 1).
   – When the FIFO is handled by the IDMA, the IDMA transfers the FIFO date.
7. SDMMC has completely received all data and the DPSM is disabled (DPSMACT = 0).

In case of a data transfer hold when IDMAEN = 0, the firmware must read the remaining data until the FIFO is empty and reset the FIFO with the FIFORST register bit. This causes the DPSM to go to the Idle state (DPSMACT = 0).

In case of a data transfer error when IDMAEN = 0, the firmware must stop reading the FIFO and flush and reset the FIFO with the FIFORST register bit. This causes the DPSM to go to the Idle state (DPSMACT = 0).

The receive FIFO status flags are listed in *Table 288*.

Table 288. Receive FIFO status flags

Flag	Description
RXFIFOF	Set to high when all receive FIFO words contain valid data
RXFIFOE	Set to high when the receive FIFO does not contain valid data.
RXFIFOHF	Set to high when half or more receive FIFO words contain valid data.
RXOVERR	Set to high when an overrun error occurs. This flag is cleared by writing to the SDMMC Clear register.

CLKMUX unit

The CLKMUX selects the source for clock sdmmc_rx_ck to be used with the received data and command response. The receive data clock source can be selected by the clock control register bit SELCLKRX, between:

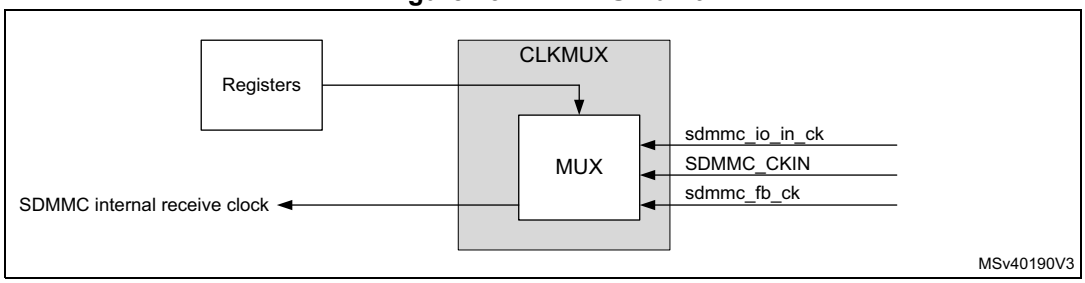
- sdmmc_io_in_ck bus master main feedback clock.
- SDMMC_CKIN external bus feedback clock.
- sdmmc_fb_ck bus tuned feedback clock.

The sdmmc_io_in_ck is selected when there is no external driver, with DS and HS.

The SDMMC_CKIN is selected when there is an external driver with SDR12, SDR25, SDR50 and DDR50.

The sdmmc_fb_ck clock input must be selected when the DLYB block on the device is used with SDR104, HS200 and optionally with SDR50 and DDR50 modes.

Figure 232. CLKMUX unit



The sdmmc_rx_ck source must be changed when the CPSM and DPSM are in the Idle state.

34.5.5 SDMMC AHB slave interface

The AHB slave interface generates the interrupt requests, and accesses the SDMMC adapter registers and the data FIFO. It consists of a data path, register decoder, and interrupt logic.

SDMMC FIFO

The FIFO access is restricted to word access only:

- In transmit FIFO mode
  - Data are written to the FIFO in words (32-bits) until all data according DATALENGTH has been transfered. When the DATALENGTH is not an integer

multiple of 4, the last remaining data (1, 2 or 3 bytes) are written with a word transfer.

- In receive FIFO mode
  - Data are read from the FIFO in words (32-bits) until all data according DATALENGTH has been transfered. When the DATALENGTH is not an integer multiple of 4, the last remaining data (1, 2 or 3 bytes) are read with a word transfer padded with 0 value bytes.

When accessing the FIFO with half word or byte accesses an AHB bus fault is generated.

SDMMC interrupts

The interrupt logic generates an interrupt request signal that is asserted when at least one of the unmasked status flags is active. A mask register is provided to allow selection of the conditions that generate an interrupt. A status flag generates the interrupt request if a corresponding mask flag is set. Some status flags require an implicit clear in the clear register.

34.5.6 SDMMC AHB master interface

The AHB master interface is used to transfer the data between a memory and the FIFO using the SDMMC IDMA.

SDMMC IDMA

Direct memory access (DMA) is used to provide high-speed transfer between the SDMMC FIFO and the memory. The AHB master optimizes the bandwidth of the system bus. The SDMMC internal DMA (IDMA) provides one channel to be used either for transmit or receive.

The IDMA is enabled by the IDMAEN bit and supports burst transfers of 16 beats.

- In transmit burst transfer mode:
  - Data are fetched in burst from memory whenever the FIFO is empty for the number of burst transfers, until all data according DATALENGTH has been transfered. When the DATALENGTH is not an integer multiple of the burst size the remaining, smaller then burst size data is transfered using single transfer mode. When the DATALENGTH is not an integer multiple of 4, the last remaining data (1, 2 or 3 bytes) are fetched with a word transfer.
- In receive burst transfer mode:
  - Data are stored in burst in to memory whenever the FIFO contains the number of burst transfers, until all data according DATALENGTH has been transfered. When the DATALENGTH is not an integer multiple of the burst transfer the remaining, smaller then burst size data, is transfered using single transfer mode. When the DATALENGTH is not an integer multiple of 4, the last remaining data (1, 2 or 3 bytes) are stored with halfword and or byte transfers.

In addition the IDMA provides the following channel configurations selected by bit IDMABMODE:

- single buffered channel
- linked list channel

Single buffered channel

In single buffer configuration the data at the memory side is accessed in a linear matter starting from the base address IDMABASE. When the IDMA has finished transferring all data the and the DPSM has completed the transfer the DATAEND flag is set.

Linked list channel

In linked list configuration, IDMAMODE = 1, the data at the memory side is subsequently accessed from linked buffers, located at base address IDMABASE. The size of the memory buffers is defined by IDMABSIZE. The buffer size must be an integer multiple of the burst size. The bit ULA is used to indicate if a new linked list buffer configuration has to be loaded from the linked list table. A new linked list configuration is loaded when the ULA bit for the current linked list item is set.

The first linked list item configuration is programmed by firmware directly in the SDMMC registers.

When the IDMA has finished transferring all the data of one linked list buffer, according IDMABSIZE, and when the linked list item ULA bit is set, the IDMA loads the new linked list item from the linked list table, and continues transferring data from the next linked list buffer. When the IDMA has finished transferring all data, according IDMABSIZE and ULA, and the DPSM has completed the transfer, according DATALENGHT, the DATAEND flag is set.

In the following cases, the linked list provides more buffer space than the data to transfer which means the current linked list buffer data has not completely be transfered:

- the ULA bit is set, and all SDMMC data according DATALENGTH has been transfered (DATAEND flag)
- a transfer error (DCRCFAIL when DATACOUNT > 0, RXOVERR, TXUNDERR) occurs
- a transfer is hold (DTHOLD)

In all above cases, the IDMA linked list is stopped and the FIFO is flushed/reset. Before starting or restarting a new SDMMC transfer, the software must initialize a new linked list with correct IDMABASE and IDMABSIZE.

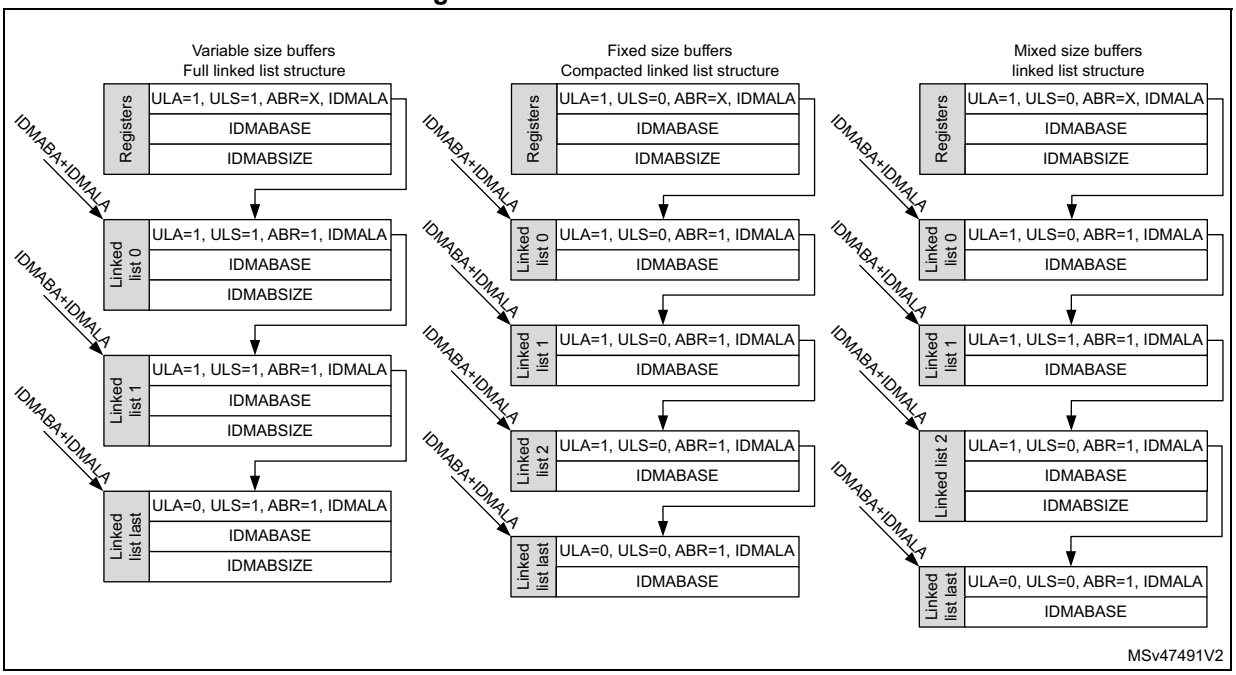
When a IDMA transfer error occurs (see *Section : IDMA transfer error management*) or when the linked list does not provide sufficient buffer space:

- the linked list ends with ULA = 0 and all last linked list buffer data has been transfered, and not all SDMMC data according DATALENGTH has been transfered. The SDMMC transfer is stopped and an IDMA transfer error is generated (see *Section : IDMA transfer error management*).

For a given linked list item, the base address is given by the linked list base IDMABA register value plus the linked list offset IDMALA register value.

The content of each linked list item can be specified by the ULS bit, which makes possible to optionally load the IDMABSIZE, resulting in a 3-word linked list structure. When the IDMABSIZE is not to be loaded (fixed size buffers) a compacted reduced 2-word linked list structure can be used containing only the IDMABASER and the IDMALAR values.

Figure 233. Linked list structures



There is no restriction on mixing both linked list item structures in a single list, this enables the IDMABSIZE to be updated only when needed.

Whenever a linked list buffer has been transfered and the current buffer ULA = 1, an end-of-linked-list-buffer-transfer-complete interrupt (IDMABTC) may be generated (if interrupt is enabled).

Linked list acknowledgment

In the case where software dynamically updates the linked list, during the SDMMC transfer, the availability of a new linked list buffer can be acknowledged by the acknowledge buffer ready (ABR) bit.

When ABR acknowledges that the new linked list buffer is ready, the IDMA continues transferring data from the new linked list buffer.

When ABR indicates that the new linked list buffer is not ready, an IDMA transfer error is generated (see *Section : IDMA transfer error management*). Depending when the IDMA transfer error occurs, it normally causes the generation of an TXUNDERR or RXOVERR error. When a linked list buffer is not acknowledged in time the SDMMC transfer is stopped.

The ABR information is “don't care” when starting the linked list from software programmed register information. The first linked list buffer must be ready to be used before starting the SDMMC transfer.

IDMA transfer error management

An IDMA transfer error can occur:

- When reading or writing a reserved address space (for data or linked list information).
- When there is no more linked list buffer space to store received SDMMC data.
- When all linked list buffer data has been transfered and still more SDMMC data needs to be sent.
- When the availability of a linked list buffer is not acknowledged.

On an IDMA transfer error subsequent IDMA transfers are disabled and an IDMATE flag is set and hardware flow control is disabled. Depending when the IDMA transfer error occurs, it normally causes the generation of a TXUNDERR or RXOVERR error.

The behavior of the IDMATE flag depend on when the IDMA transfer error occurs during the SDMMC transfer:

- An IDMA transfer error is detected before any SDMMC transfer error (TXUNDERR, RXOVERR, DCRCFAIL, or DTIMEOUT):
  - The IDMATE flag is set at the same time as the SDMMC transfer error flag.
  - The TXUNDERR, RXOVERR, DCRCFAIL, or DTIMEOUT interrupt is generated.
- An IDMA transfer error is detected during a STOP_TRANSNMISSION command:
  - The IDMATE flag is set at the same time as the DABORT flag.
  - The DABORT interrupt is generated.
- An IDMA transfer error is detected at the end of the SDMMC transfer (DHOLD, or DATAEND).
  - The IDMATE flag is set at the end of the SDMMC transfer.
  - A SDMMC transfer end interrupt is generated and a DHOLD or DATAEND flag is set.

The IDMATE is generated on an other SDMMC transfer interrupt (TXUNDERR. RXOVERR, DCRCFAIL, DTIMEOUT, DABORT, DHOLD, or DATAEND).

34.5.7 AHB and SDMMC_CK clock relation

The AHB must at least have between 1.72x and 3x more bandwidth than the SDMMC bus bandwidth i.e. for SDR50 4-bit mode (50 Mbyte/s) the minimum sdmmc_hclk frequency is 21.43 MHz (85.72 Mbyte/s).

Table 289. AHB and SDMMC_CK clock frequency relation

SDMMC bus mode	SDMMC bus width	Maximum SDMMC_CK [MHz]	Minimum AHB clock [MHz]
e•MMC DS	8	26	13
e•MMC HS	8	52	26
e•MMC DDR52	8	52	78
e•MMC HS200	8	200	100
SD DS / SDR12	4	25	5.36
SD HS / SDR25	4	50	10.72
SD DDR50	4	50	25

Table 289. AHB and SDMMC_CK clock frequency relation (continued)

SDMMC bus mode	SDMMC bus width	Maximum SDMMC_CK [MHz]	Minimum AHB clock [MHz]
SD SDR50	4	100	21.43
SD SDR104	4	208	44.58

Warning: When minimum HCLK frequency is not respected, overrun or underrun errors may occur even when hardware flow control is enabled.

34.6 Card functional description

34.6.1 SD I/O mode

The following features are SDMMC specific operations:

- SDIO interrupts
- SDIO suspend/resume operation (write and read suspend)
- SDIO Read Wait operation by stopping the clock
- SDIO Read Wait operation by SDMMC_D2 signaling

Table 290. SDIO special operation control

Operation mode	SDIOEN	RWMOD	RWSTOP	RWSTART	DTDIR
Interrupt detection	1	X	X	X	X
Suspend/Resume operation	X	X	X	X	X
Read Wait SDMMC_CK clock stop (START)	X	1	0	1	1
Read Wait SDMMC_CK clock stop (STOP)	X	1	1	1	1
Read Wait SDMMC_D2 signaling (START)	X	0	0	1	1
Read Wait SDMMC_D2 signaling (STOP)	X	0	1	1	1

SD I/O interrupts

To allow the SD I/O card to interrupt the host, an interrupt function is available on pin 8 (shared with SDMMC_D1 in 4-bit mode) on the SD interface. The use of the interrupt is optional for each card or function within a card. The SD I/O interrupt is level-sensitive, which means that the interrupt line must be held active (low) until it is either recognized and acted upon by the host or deasserted due to the end of the interrupt period. After the host has serviced the interrupt, the interrupt status bit is cleared via an I/O write to the appropriate bit in the SD I/O card internal registers. The interrupt output of all SD I/O cards is active low and the application must provide external pull-up resistors on all data lines (SDMMC_D[3:0]).

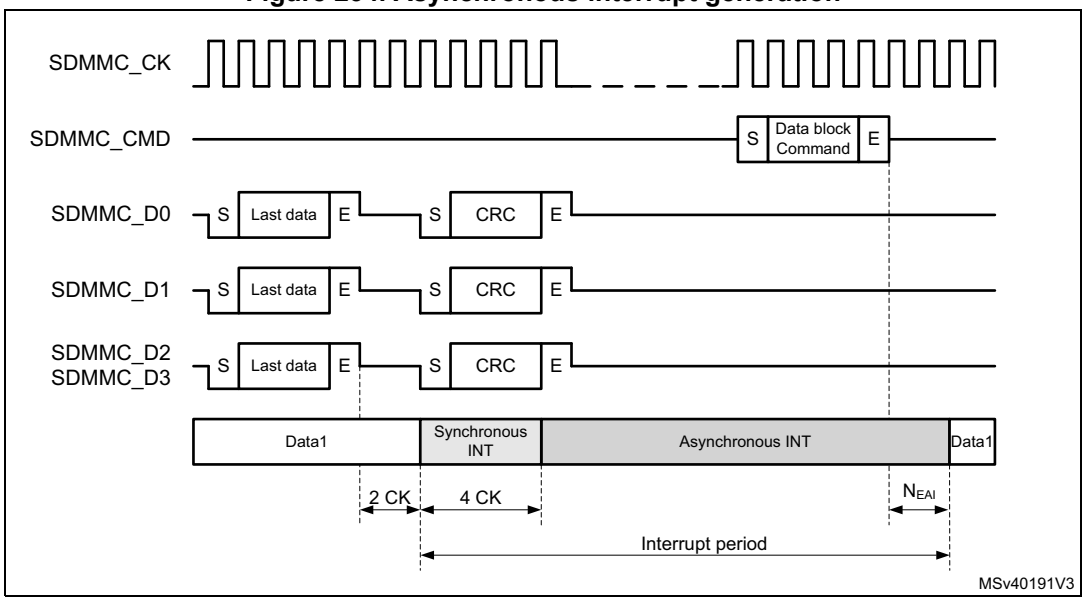
In SD 1-bit mode pin 8 is dedicated to the interrupt function (IRQ), and there are no timing constraints on interrupts.

In SD 4-bit mode the host samples the level of pin 8 (SDMMC_D1/IRQ) into the interrupt detector only during the interrupt period. At all other times, the host interrupt ignores this value. The interrupt period begins when interrupts are enabled at the card and SDIOEN bit is set see register settings in *Table 290*.

In 4-bit mode the card can generate a synchronous or asynchronous interrupt as indicated by the card CCCR register SAI and EAI bits.

- Synchronous interrupt, require the SDMMC_CK to be active.
- Asynchronous interrupt, can be generated when the SDMMC_CK is stopped, 4 cycles after the start of the card interrupt period following the last data block.

Figure 234. Asynchronous interrupt generation



The timing of the interrupt period is depending on the bus speed mode.

In DS, HS, SDR12, and SDR25 mode, selected by register bit BUSSPEED, the interrupt period is synchronous to the SD clock.

- The interrupt period ends at the next clock from the end bit of a command that transfers data block(s) (Command sent with the CMDTRANS bit is set), or when the DTEN bit is set.
- The interrupt period resumes 2 SDMMC_CK after the completion of the data block.
- At the data block gap the interrupt period is limited to 2 SDMMC_CK cycles.

Note: DTEN must not be used to start data transfer with SD and e•MMC cards.

Figure 235. Synchronous interrupt period data read

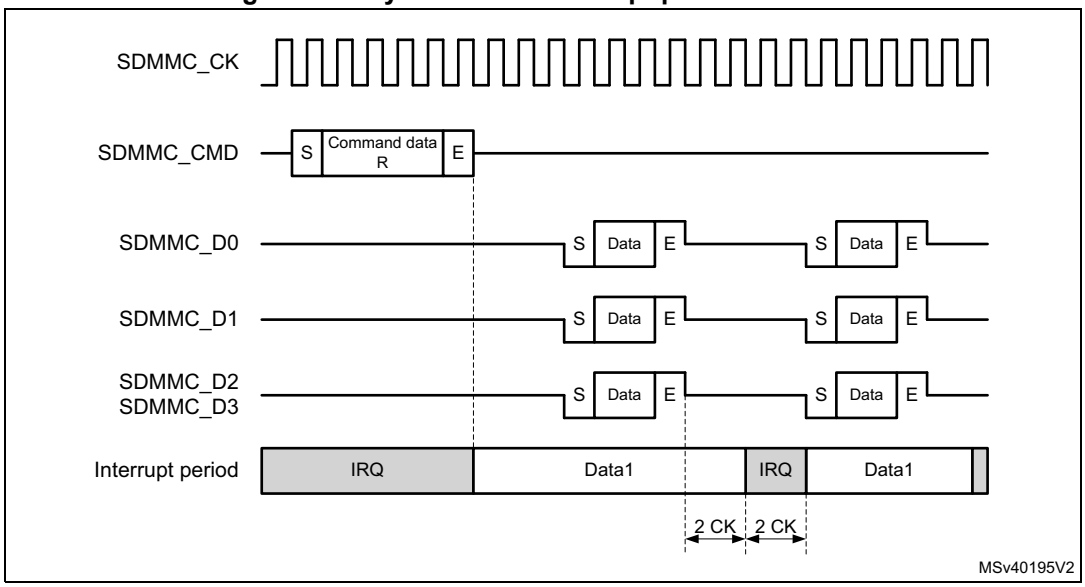


Figure 236. Synchronous interrupt period data write

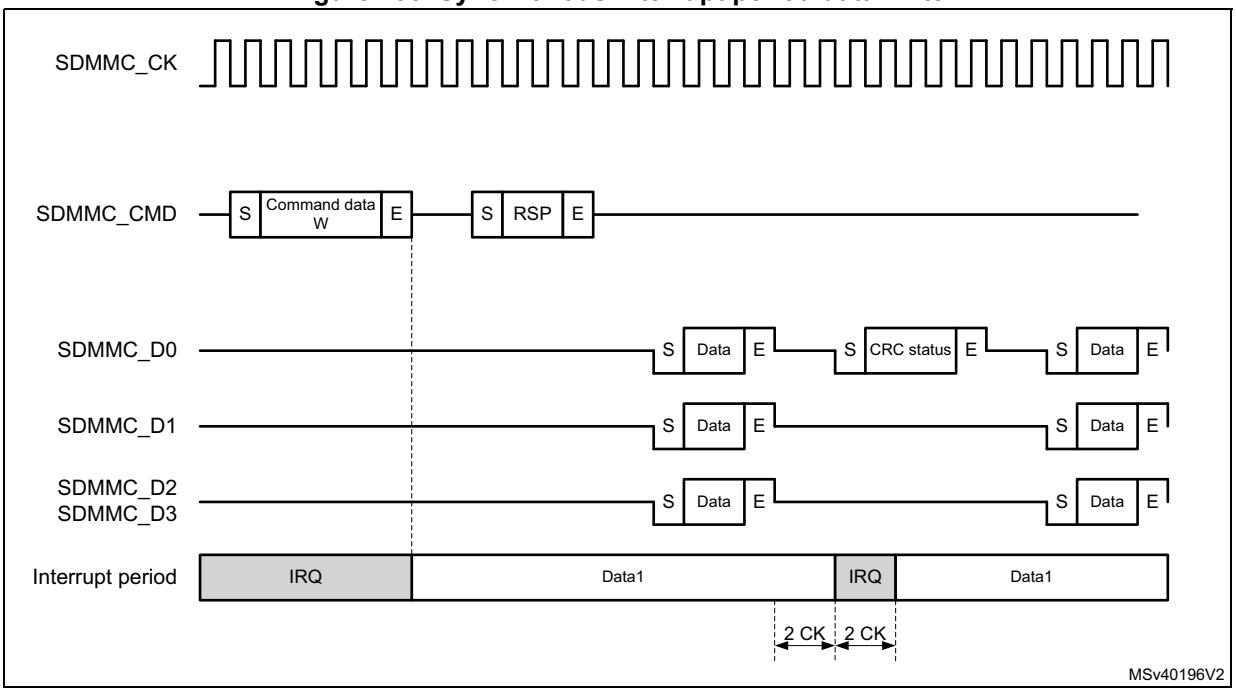

In SDR50, SDR104, and DDR50, selected by register bit BUSSPEED, due to propagation delay from the card to host, the interrupt period is asynchronous.

- The card interrupt period ends after 0 to 2 SDMMC_CK cycles after the end bit of a command that transfers data block(s) (Command sent with the CMDTRANS bit is set), or when the DTEN bit is set. At the host the interrupt period ends after the end bit of a

command that transfers data block(s). A card interrupt issued in the 1 to 2 cycles after the command end bit are not detected by the host during this interrupt period.

- The card interrupt period resumes 2 to 4 SDMMC_CK after the completion of the last data block. The host resumes the interrupt period always 2 cycles after the last data block.
- There is NO interrupt period at the data block gap.

Note: DTEN must not be used to start data transfer with SD and e•MMC cards.

Figure 237. Asynchronous interrupt period data read

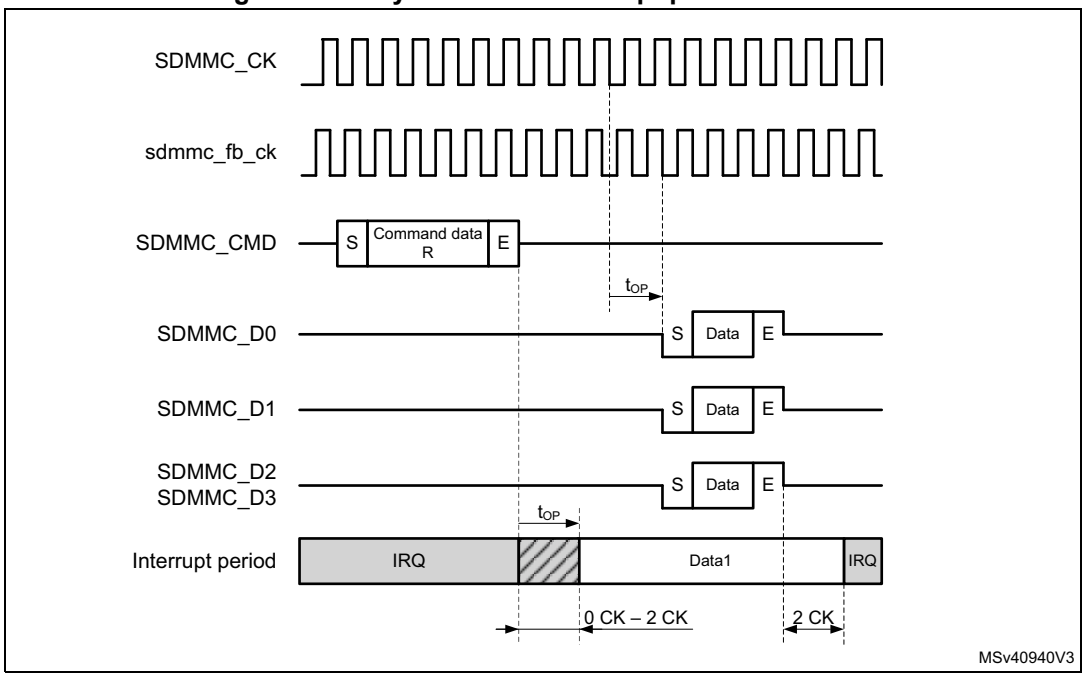

Figure 238. Asynchronous interrupt period data write

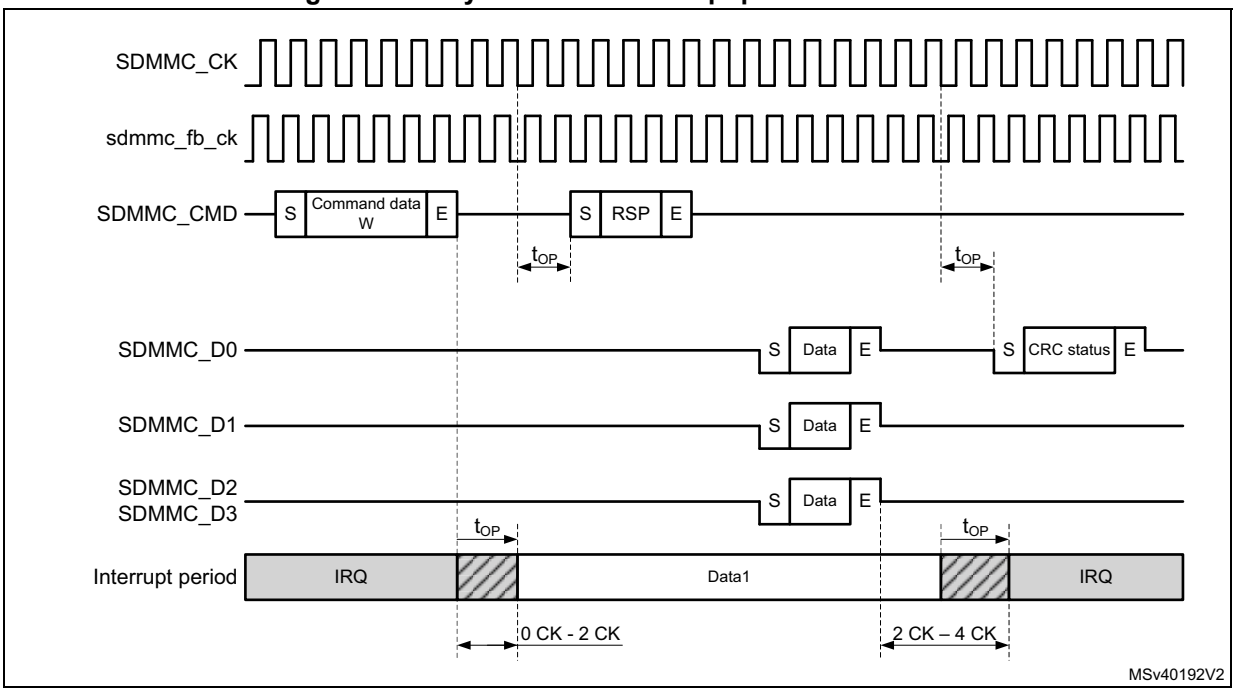


When transferring Open-ended multiple block data and using DTMODE “block data transfer ending with STOP_TRANSMISSION command”, the SDMMC masks the interrupt period after the last data block until the end of the CMD12 STOP_TRANSMISSION command.

The interrupt period is applicable for both memory and I/O operations.

In 4-bit mode interrupts can be differentiated from other signaling according *Table 291*.

Table 291. 4-bit mode Start, interrupt, and CRC-status Signaling detection

SDMMC data line	Start	Interrupt	CRC-status
SDMMC_D0	0	1 or CRC-status	0
SDMMC_D1	0	0	X
SDMMC_D2	0	1 or Read Wait	X
SDMMC_D3	0	1	X

SD I/O suspend and resume

This function is NOT supported in SDIO version 4.00 or later.

Within a multifunction SD I/O or a card with both I/O and memory functions, there are multiple devices (I/O and memory) that share access to the *e*•MMC/SD bus. To share access to the host among multiple devices, SD I/O and combo cards optionally implement the concept of suspend/resume. When a card supports suspend/resume, the host can temporarily halt (suspend) a data transfer operation to one function or memory to free the bus for a higher-priority transfer to a different function or memory. After this higher-priority transfer is complete, the original transfer is restarted (resume) where it left off.

To perform the suspend/resume operation on the bus, the host performs the following steps:

1. Determines the function currently using the SDMMC_D[3:0] line(s).
2. Requests the lower-priority or slower transaction to suspend.
3. Waits for the transaction suspension to complete.
4. Begins the higher-priority transaction.
5. Waits for the completion of the higher priority transaction.
6. Restores the suspended transaction.

The card receiving a suspend command responds with its current bus status. Only when the bus has been suspended by the card the bus status indicates suspension completed.

There are different suspend cases conditions:

- Suspend request accepted prior to the start of data transfer.
- Suspend request not accepted, (due to data being transfered at the same time), the host keeps checking the request until it is accepted (data transfer has suspended).
- Suspend request during write busy.
- Suspend request with write multiple.
- Suspend request during Read Wait.

For the host to know if the bus has been released it must check the status of the suspend request, suspension completed.

When the bus status of the suspend request response indicates suspension completed, the card has released the bus. At this time the state of the suspended operation must be saved where after an other operation can start.

The suspend command must be sent with the CMDSUSPEND bit set. This makes possible to start the interrupt period after the suspend command response when the bus is suspended (response bit BS = 0).

The hardware does not save the number of remaining data to be transfered when resuming the suspended operation. It is up to firmware to determine the data that has been transferred and resume with the correct remaining number of data bytes.

While receiving data from the card, the SDMMC can suspend the read operation after the read data block end (DPSM in Wait_R). After receiving the suspend acknowledgment response from the card the following steps must be taken by firmware:

1. The normal receive process must be stopped by setting DTHOLD bit.
   a) The remaining number of data bytes in the FIFO must be read until the receive FIFO is empty (RXFIFOE flag is set), and when IDMAEN = 0 the FIFO must be reset with FIFORST.
2. The confirmation that all data has been read from the FIFO, and that the suspend is completed is indicated by the DHOLD flag.
   a) The remaining number of data bytes (multiple of data blocks) still to be read when resuming the operation must be determined from the remaining number of bytes indicated by the DATACOUNT.

Note: When a DTIMEOUT flag occurs during the suspend procedure, this must be ignored.

To resume receiving data from the card, the following steps must be taken by firmware:

1. The remaining number of data bytes (multiple of data blocks) must be programmed in DATALENGTH.
2. The DPSM must be configured to receive data in the DTDIR bit.
3. The resume command must be sent from the CPSM, with the CMDTRANS bit set and the CMDSUSPEND bit set, which ends the interrupt period when data transfer is resumed (response bit DF = 1) and enabled the DPSM, after which the card resumes sending data.

While sending data to the card, the SDMMC can suspend the write operation after the write data block CRC status end (DPSM in Busy). Before sending the suspend command to the card the following steps must be taken by firmware:

1. Enable DHOLD flag (and DBCKEND flag when IDMAEN = 0)
2. The DPSM must be prevented from start sending a new data block by setting DTHOLD.
3. When IDMAEN = 0: When receiving the DBCKEND flag the data transfer is stopped. Firmware can stop filling the FIFO, after which the FIFO must be reset with FIFORST. Any bytes still in the FIFO need to be rewritten when resuming the operation.
4. When receiving the DHOLD flag the data transfer is stopped. The remaining number of data bytes still to be written when resuming must be determined from the remaining number of bytes indicated by the DATACOUNT.
5. To suspend the card the suspend command must be sent by the CPSM with the CMDSUSPEND bit set. This makes possible to start the interrupt period after the suspend command response when the bus is suspended (response bit BS = 0).

To resume sending data to the card, the following steps must be taken by firmware:

1. The remaining number of data bytes must be programmed in DATALENGTH.
2. The DPSM must be configured for transmission with DTDIR set and enabled by having the CPSM send the resume command with the CMDTRANS bit set and the CMDSUSPEND bit set. This ends the interrupt period and start the data transfer. The DPSM either goes to the Wait_S state when SDMMC_D0 does not signal busy, or goes to the Busy state when busy is signaled.
3. When IDMAEN = 1: The IDMA needs to be reprogrammed for the remaining bytes to be transfered.
4. When IDMAEN = 0: Firmware must start filling the FIFO with the remaining data.

SD I/O Read Wait

There are two methods to pause the data transfer during the block gap:

1. Stopping the SDMMC_CK.
2. Using Read Wait signaling on SDMMC_D2.

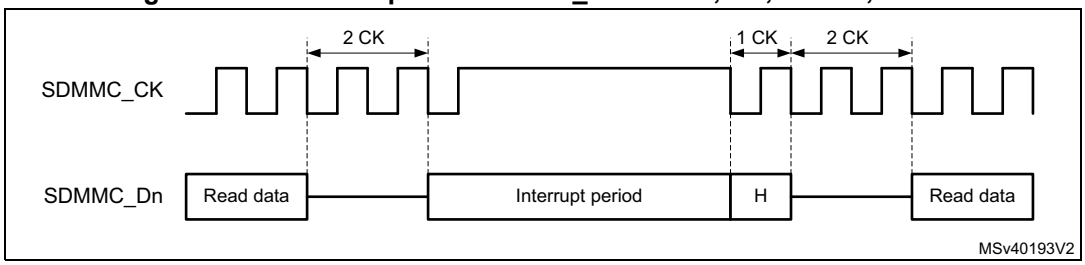
The SDMMC can perform a Read Wait with register settings according *Table 290*.

Read Wait is not available when block gap hardware flow control is enabled. (see *Section 34.7.2: Block gap hardware flow control*)

Depending the SDMMC operation mode (DS, HS, SDR12, SDR25) or (SDR50, SDR104, DDR) each method has a different characteristic.

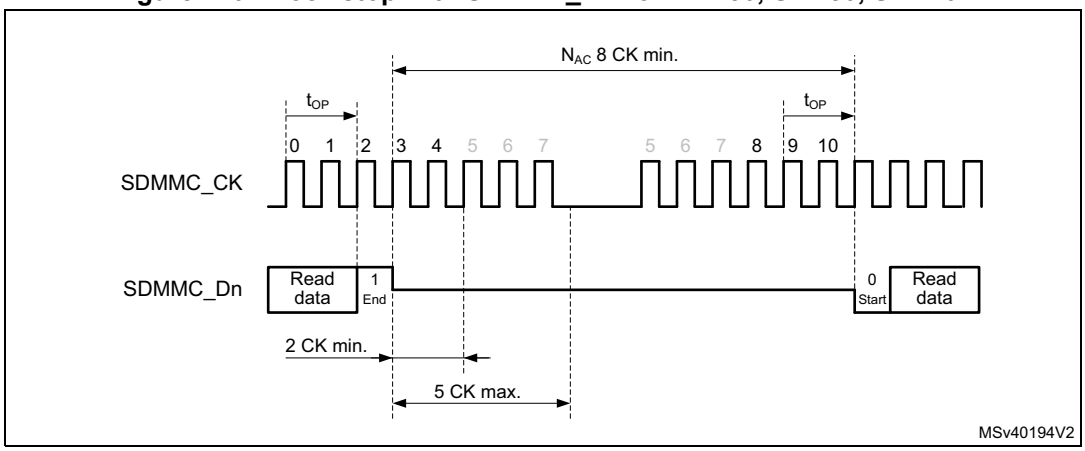
The timing for pause read operation by stopping the SDMMC_CK for DS, HS, SDR12, and SDR25, the SDMMC_CK may be stopped 2 SDMMC_CK cycles after the end bit. When ready the host resumes by restarting clock (see *Figure 239*).

Figure 239. Clock stop with SDMMC_CK for DS, HS, SDR12, SDR25



The timing for pause read operation by stopping the SDMMC_CK for SDR50, SDR104, and DDR50, the SDMMC_CK may be stopped minimum 2 SDMMC_CK cycles and maximum 5 SDMMC_CK cycles, after the end bit. When ready the host resumes by restarting clock, see *Figure 240*. (In DDR50 mode the SDMMC_CK must only be stopped after the falling edge, when the clock line is low.)

Figure 240. Clock stop with SDMMC_CK for DDR50, SDR50, SDR104



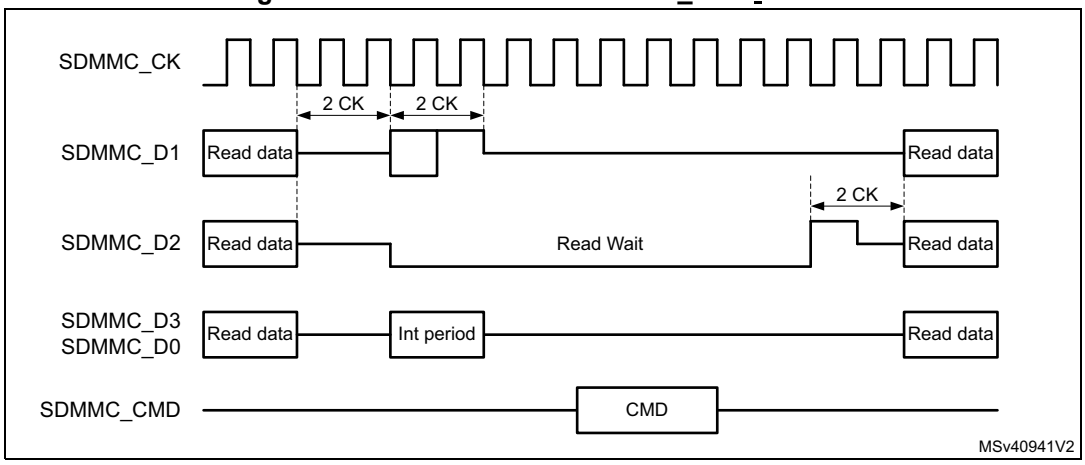
In Read Wait SDMMC_CK clock stopping, when RWSTART is set, the DSPM stops the clock after the end bit of the current received data block CRC. The clock start again after writing 1 to the RWSTOP bit, where after the DPSM waits for a start bit from the card.

As SDMMC_CK is stopped, no command can be issued to the card. During a Read Wait interval, the SDMMC can still detect SDIO interrupts on SDMMC_D1.

The optional Read Wait signaling on SDMMC_D2 (RW) operation is defined only for the SD 1-bit and 4-bit modes. The Read Wait operation enables the host to signal a card that is reading multiple registers (IO_RW_EXTENDED, CMD53) to temporarily stall the data transfer while allowing the host to send commands to any function within the SD I/O device. To determine when a card supports the Read Wait protocol, the host must test capability bits in the internal card registers.

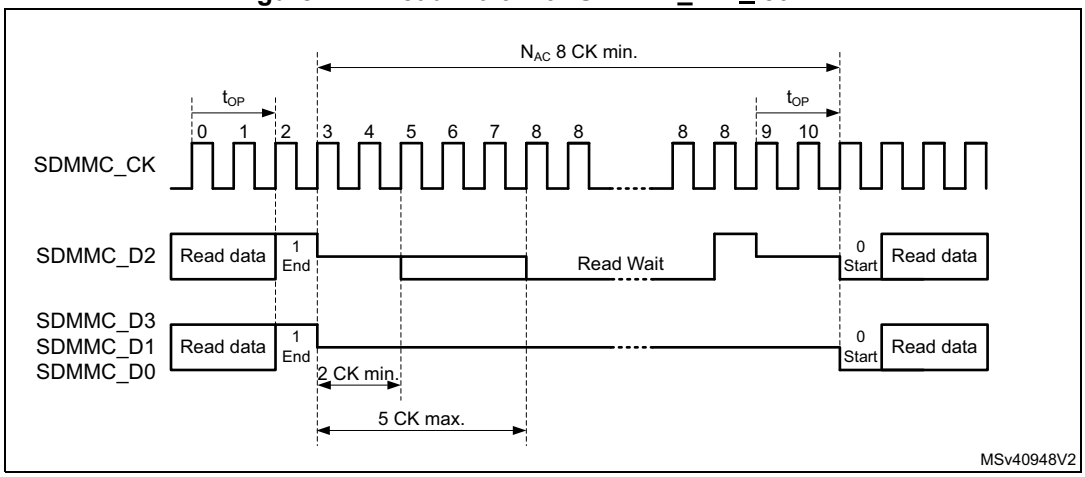
The timing for Read Wait with a SDMMC_CK less then 50MHz (DS, HS, SDR12, SDR25) is based on the interrupt period generated by the card on SDMMC_D1. The host by asserting SDMMC_D2 low during the interrupt period requests the card to enter Read Wait. To exit Read Wait the host must raise SDMMC_D2 high during one SDMMC_CK cycles before making it Hi-Z, see *Figure 241*.

Figure 241. Read Wait with SDMMC_CK < 50 MHz



For SDR50, SDR104 with a SDMMC_CK more than 50MHz, and DDR50, the card treats the Read Wait request on SDMMC_D2 as an asynchronous event. The host by asserting SDMMC_D2 low after minimum 2 SDMMC_CK cycles and maximum 5 SDMMC_CK cycles, request the card to enter Read Wait. To exit Read Wait the host must raise SDMMC_D2 high during one SDMMC_CK cycles before making it Hi-Z. The host must raise SDMMC_D2 on the SDMMC_CK clock (see *Figure 242*).

Figure 242. Read Wait with SDMMC_CK ≥ 50 MHz



In Read Wait SDMMC_D2 signaling, when RWSTART is set, the DPSM drives SDMMC_D2 after the end bit of the current received data block CRC. The Read Wait signaling on SDMMC_D2 is removed when writing 1 to the RWSTOP bit. The DPSM remains in R_W state for two more SDMMC_CK clock cycles to drive SDMMC_D2 to 1 for one clock cycle (in accordance with SDIO specification), where after the DPSM waits for a start bit from the card.

During the Read Wait signaling on SDMMC_D2 commands can be issued to the card. During the Read Wait interval, the SDMMC can detect SDIO interrupts on SDMMC_D1.

34.6.2 CMD12 send timing

CMD12 is used to stop/abort the data transfer, the card data transmission is terminated two clock cycles after the end bit of the Stop Transmission command.

Table 292. CMD12 use cases

Data operation	Stop Transmission command CMD12 Description
SDMMC stream write	The data transfer is stopped/aborted by sending the Stop Transmission command.
SDMMC open ended multiple block write	The data transfer is stopped/aborted by sending the Stop Transmission command. If the card detects an error, the host must abort the operation by sending the Stop Transmission command.
SDMMC block write with predefined block count	The Stop Transmission command is not required at the end of this type of multiple block write. (sending the Stop Transmission command after the card has received the last block is regarded as an illegal command.) If the card detects an error, the host must abort the operation by sending the Stop Transmission command.
SDMMC stream read	The data transfer is stopped/aborted by sending the Stop Transmission command.
SDMMC open ended multiple block read	The data transfer is stopped/aborted by sending the Stop Transmission command. If the card detects an error, the host must abort the operation by sending the Stop Transmission command.
SDMMC block read with predefined block count	The Stop Transmission command is not required at the end of this type of multiple block read. (sending the Stop Transmission command after the card has transmitted the last block is regarded as an illegal command.) Transaction can be aborted by sending the Stop Transmission command. If the card detects an error, the host must abort the operation by sending the Stop Transmission command.

All data write and read commands can be aborted any time by a Stop Transmission command CMD12. The following data abort procedure applies during an ongoing data transfer:

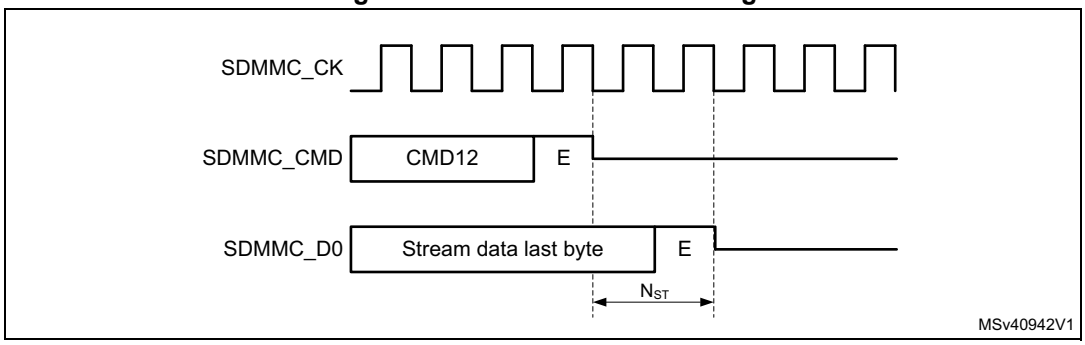
1. Load CMD12 Stop Transmission command in registers and set the CMDSTOP bit.
   – This causes the CPSM Abort signal to be generated when the command is sent to the DPSM.
2. Configure the CPSM to send a command immediately (clear WAITPEND bit).
   – The card, when sending data, stops data transfer 2 cycles after the Stop Transmission command end bit.
   The card when no data is being sent, does not start sending any new data.
   – The host, when sending data, sends one last data bit followed by an end bit after the Stop Transmission command end bit.
   The host when not sending data, does not start sending any new data.
3. When IDMAEN = 0, the FIFO need to be reset with FIFORST.
   – When writing data to the card. On the CMDREND flag, firmware must stop writing data to the FIFO. Subsequently the FIFO must be reset with FIFORST, this flushes the FIFO.
   – When reading data from the card. On the CMDREND flag, firmware must read the remaining data from the FIFO. Subsequently the FIFO must be reset with FIFORST.
4. When IDMAEN = 1, hardware takes care of the FIFO.
   – When writing data to the card. On the CPSM Abort signal, hardware stops the IDMA and subsequently the FIFO is flushed.
   – When reading data from the card. On the CPSM Abort signal, hardware instructs the IDMA to transfer the remaining data from the FIFO to RAM.
5. When the FIFO is empty/reset the DABORT flag is generated.

Stream operation and CMD12

To stop the stream transfer after the last byte to be transfered, the CMD12 end bit timing must be sent aligned with the data stream end of last byte. The following write stream data procedure applies:

1. Initialize the stream data in the DPSM, DTMODE = MCC stream data transfer.
2. Send the WRITE_DATA_STREAM command from the CPSM with CMDTRANS = 1.
3. Preload CMD12 in command registers, with the CMDSTOP bit set.
4. Configure the CPSM to send a command only after a wait pending (WAITPEND = 1) end of last data (according DATALENGTH).
5. Enabling the CPSM to send the STOP_TRANSMISSION command, the stream data end bit and command end bit are aligned.
   – When DATALENGTH > 5 bytes, Command CMD12 is waited in the CPSM to be aligned with the data transfer end bit.
   – When DATALENGHT < 5 bytes, Command CMD12 is started before and the DPSM remains in the Wait_S state to align the data transfer end with the CMD12 end bit.
6. The write stream data can be aborted any time by clearing the WAITPEND bit. This causes the Preloaded CMD12 to be sent immediately and stop the write data stream.

Figure 243. CMD12 stream timing



To stop the read stream transfer after the last byte, the CMD12 end bit timing must occur after the last data stream byte. The following read stream data procedure applies:

1. Wait for all data to be received by the DPSM and read from the FIFO (DATAEND flag).
   – The DPSM does not receive more data than indicated by DATALENGTH, even if the card is sending more data.
2. Send CMD12 by the CPSM.
   – CMD12 stops the card sending data.

Note: The SDMMC does not receive any more data from the card when DATACOUNT = 0, even when the card continues sending data.

Block operation and CMD12

To stop block transfer at the end of the data, the CMD12 end bit must be sent after the last block end bit.

When writing data to the card the CMD12 end bit must be sent after the write data block CRC token end bit. This requires the CMD12 sending to be tied to the data block transmission timing. To stop an Open-ended Multiple block write, the following procedure applies:

1. Before starting the data transfer, set DTMODE to “block data transfer ending with STOP_TRANSMISSION command”.
2. Wait for all data to be sent by the DPSM and the CRC token to be received, (DATAEND flag).
   – The DPSM does not send more data than indicated by DATALENGTH.
3. Send CMD12 by the CPSM.
   – CMD12 sets the card to Idle mode.

When reading data from the card the CMD12 end bit must be sent earliest at the same time as the card read data block last data bit. This requires the CMD12 sending to be tied to the data block reception timing. The following stop Open-ended Multiple block read data block procedure applies:

1. Before starting the data transfer, set DTMODE to “block data transfer ending with STOP_TRANSMISSION command”.
2. Wait for all data to be received by the DPSM and read from the FIFO (DATAEND flag).
   – The DPSM does not receive more data than indicated by DATALENGTH, even if the card is sending more data.
3. Send CMD12 with CMDSTOP bit set by the CPSM.
   – CMD12 stops the Card sending more data and set the card to Idle mode. Any ongoing block transfer is aborted by the Card.

Note: The SDMMC does not receive any more data from the card when DATACOUNT = 0, even when the card continues sending data.

34.6.3 Sleep (CMD5)

The *e*•MMC card may be switched between a Sleep state and a Standby state by CMD5. In the Sleep state the power consumption of the card is minimized and the Vcc power supply may be switched off.

The CMD5 (SLEEP) is used to initiate the state transition from Standby state to Sleep state. The card indicates Busy, pulling down SDMMC_D0, during the transition phase. The Sleep state is reached when the card stops pulling down the SDMMC_DO line.

To set the card into Sleep state the following procedure applies:

1. Enable interrupt on BUSYD0END.
2. Send CMD5 (SLEEP).
3. On BUSYD0END interrupt, card is in Sleep state.
4. Vcc power supply can be switched off.

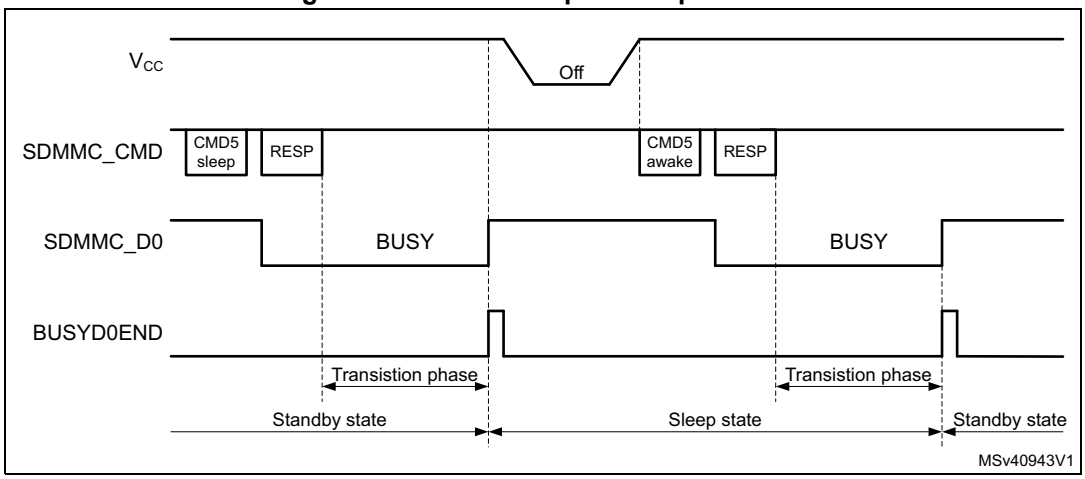
The CMD5 (AWAKE) is used to initiate the state transition from Sleep state to Standby state. The card indicates Busy, pulling down SDMMC_D0, during the transition phase. The Standby state is reached when the card stops pulling down the SDMMC_DO line.

To set the card into Sleep state the following procedure applies:

1. Switch on Vcc power supply and wait unit minimum operating level is reached.
2. Enable interrupt on BUSYD0END.
3. Send CMD5 (AWAKE).
4. On BUSYD0END interrupt card is in Standby state.

The Vcc power supply can be switched off only after the Sleep state has been reached. The Vcc supply must be reinstalled before CMD5 (AWAKE) is sent.

Figure 244. CMD5 Sleep Awake procedure



34.6.4 Interrupt mode (Wait-IRQ)

The host and card enter and exit interrupt mode (Wait-IRQ) simultaneously. In interrupt mode there is no data transfer. The only message allowed is an interrupt service request response from the card or the host. For the interrupt mode to work correctly the SDMMC_CK frequency must be set in accordance with the achievable SDMMC_CMD data rate in Open Drain mode, which depend on the capacitive load and pull-up resistor. The CLKDIV must be set >1, and the SETCLKRX must select either the sdmmc_io_in_ck or SDMMC_CLKin source.

The host must ensure that the card is in Standby state before issuing the CMD40 (GO_IRQ_STATE). While waiting for an interrupt response the SDMMC_CK clock signal must be kept active.

A card in interrupt mode (IRQ state):

- is waiting for an internal card interrupt event. Once the event occurs, the card starts to send the interrupt service request response. The response is sent in open-drain mode.
- while waiting for the internal card interrupt event, the card also monitors the SDMMC_CMD line for a start bit. Upon detection of a start bit the card aborts the interrupt mode and switch to Standby state.

The host in interrupt mode (CPSM Wait state waiting for interrupt):

- is waiting for a card interrupt service request response (start bit).
- while waiting for a card interrupt service request response the host may abort the interrupt mode (by clearing the WAITINT register bit), which causes the host to send a interrupt service request response R5 with RCA = 0x0000 in open-drain mode.

When sending the interrupt service request response, the sender bit-wise monitors the SDMMC_CMD bit stream. The sender whose interrupt service request response bit does not correspond to the bit on the SDMMC_CMD line stops sending. In the case of multiple senders only one successfully sends its full interrupt service request response. If the host sends simultaneously, it loses sending after the transmission bit.

To handle the interrupt mode, the following procedure applies:

1. Set the SDMMC_CK frequency in accordance with the achievable SDMMC_CMD data rate in Open-drain mode, CLKDIV must be set >1, and SETCLKRX must select the sdmmc_io_in_ck.
2. Load CMD40 (GO_IRQ_STATE) in the command registers.
3. Enable wait for interrupt by setting WAITINT register bit.
4. Configure the CPSM to send a command immediately.
   – This causes the CMD40 to be sent and the CPSM to be halted in the Wait state, waiting for a interrupt service request response.
5. To exit the wait for interrupt state (CPSM Wait state):
   – Upon the detection of an interrupt service request response start bit the CPSM moves to the Receive state where the response is received. The complete reception of the response is indicated by the CMDREND or the command CRC error flags.
   – To abort the interrupt mode the host clears the WAITINT register bit, which causes the host to send an interrupt service request response by itself. This moves the CPSM to the Receive state. The complete reception of the response is indicated by the CMDREND or the command CRC error flags.

Note: On a simultaneous send interrupt service request response start bit collision the host loses the bus access after the transmission bit.

34.6.5 Boot operation

In boot operation mode the host can read boot data from the card by either one of the two boot operation functions:

- Normal boot. (keeping CMD line low)
- Alternative boot (sending CMD0 with argument 0xFFFFFFFA)

The boot data can be read according the following configuration options, depending on card register settings:

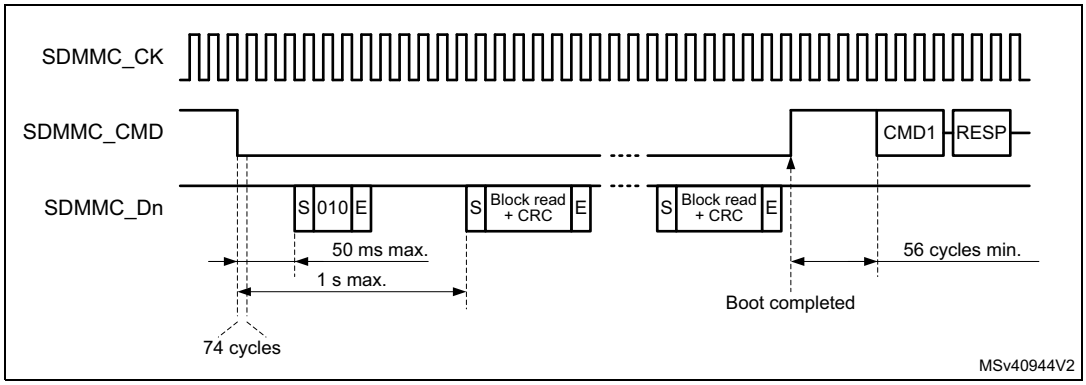
- The partition from which boot data is read (EXT_CSD Byte[179])
- The boot data size (EXT_CSD Byte[226])
- The bus configuration during boot (EXT_CSD Byte[177])
- Receiving boot acknowledgment from the card. (EXT_CSD Byte[179])

If boot acknowledgment is enabled the card send pattern 010 on SDMMC_D0 within 50ms after boot mode has been requested by either CMD line going low or after CMD0 with argument 0xFFFFFFFA. A boot acknowledgment timeout (ACKTIMEOUT) and acknowledgment status (ACKFAIL) is provided.

Normal boot operation

If the SDMMC_CMD line is held low for at least 74 clock cycles after card power-up or reset, before the first command is issued, the card recognizes that boot mode is being initiated. Within 1 second after the CMD line goes low, the card starts to sent the first boot code data on the SDMMC_Dn line(s). The host must keep the SDMMC_CMD line low until after all boot data has been read. The host can terminate boot mode by pulling the SDMMC_CMD line high.

Figure 245. Normal boot mode operation



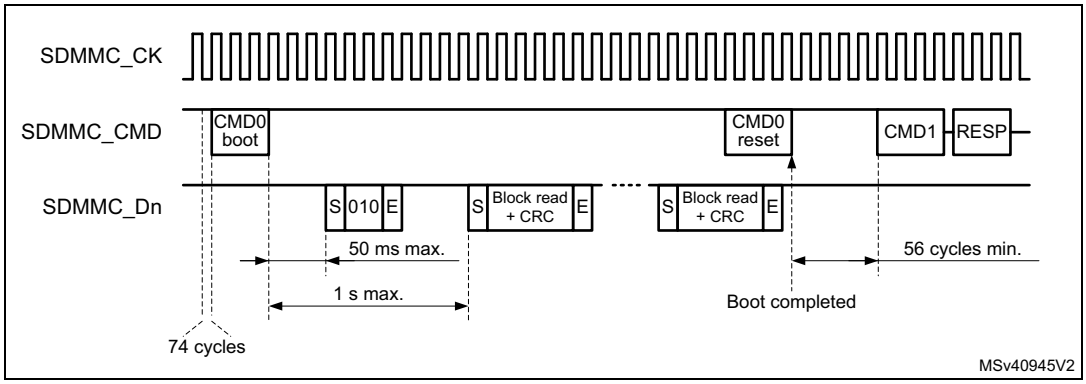
To perform the normal boot procedure the following steps needed:

1. Reset the card.
2. if a boot acknowledgment is requested enable the BOOTACKEN and set the ACKTIME and enable the ACKFAIL and ACKTIMEOUT interrupt.
3. enable the data reception by setting the DPSM in receive mode (DTDIR) and the number of data bytes to be received in DATALENGTH.
4. Enable the DTIMEOUT, DATAEND, and CMDSENT interrupts for end of boot command confirmation.
5. Select the normal boot operation mode in BOOTMODE, and enable boot in BOOTEN. The boot procedure is started by enabling the CPSM with CPSMEN.This causes:
   - the SDMMC_CMD to be driven low. (BOOTMODE = normal boot).
   - the ACK timeout to start.
   - DPSM to be enabled.
6. The incorrect reception of the boot acknowledgment can be detected with ACKFAIL flag or ACKTIMEOUT flag when enabled.
   - when an incorrect boot acknowledgment is received the ACKFAIL flag occurs.
   - when the boot acknowledgment is not received in time the ACKTIMEOUT flag occurs.
7. when all boot data has been received the DATAEND flag occurs.
   - when data CRC fails the DCRCFAIL flag is also generated.
   - when the data timeout occurs the DTIMEOUT flag is also generated.
8. When last data has been received, read data from the FIFO until FIFO is empty after which end of data DATAEND flag is generated.
   - SDMMC has completely received all data and the DPSM is disabled.
9. The boot procedure is terminated by firmware clearing BOOTEN, which causes the SDMMC_CMD line to go high. The CMDSENT flag is generated 56 cycles later to indicate that a new command can be sent.
   - If the boot procedure is aborted by firmware before all data has been received the CPSM Abort signal stops data reception and disables the DPSM which triggers an DABORT flag when enabled.
10. The CMDSENT flag signals the end of the boot procedure and the card is ready to receive a new command.

Alternative boot operation

After card power-up or reset, if the host send CMD0 with the argument 0xFFFFFFFA after 74 clock cycles before CMD0 is issued, the card recognizes that boot mode is being initiated. Within 1 second after the CMD0 with argument 0xFFFFFFFA has been sent, the card starts to send the first boot code data on the SDMMC_Dn line(s). The master terminates boot operation by sending CMD0 (Reset).

Figure 246. Alternative boot mode operation



To perform the alternative boot procedure the following steps needed:

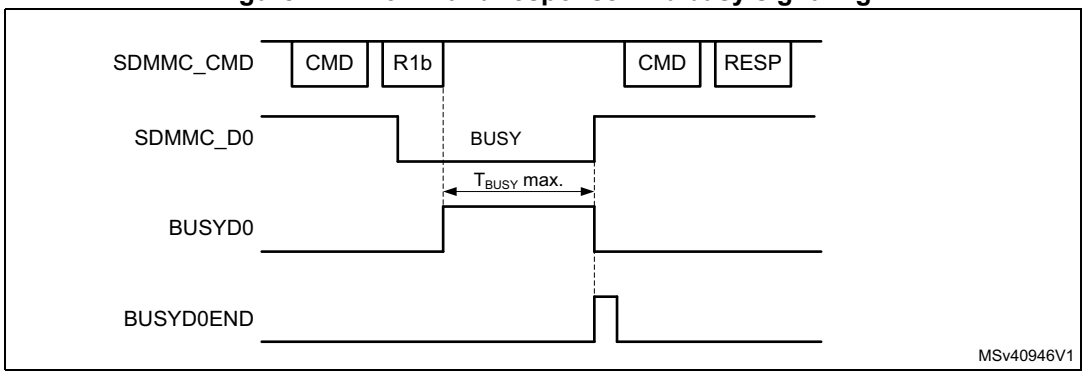
1. Move the SDMMC to power-off state, and reset the card.
2. Move the SDMMC to power-on state. This guarantees the 74 SCDMMC_CK cycles to be clocked before any command.
3. if a boot acknowledgment is requested enable the BOOTACKEN and set the ACKTIME and enable the ACKTIMEOUT flag.
4. enable the data reception by setting the DPSM in receive mode (DTDIR) and the number of data to be received in DATALENGTH. Enable the DTIMEOUT and DATAEND flags.
5. Select the alternative boot operation mode in BOOTMODE, load the CMD0 with the 0xFFFFFFFA argument in the command registers. Enable CMDSENT flag for end of boot command confirmation, and enable boot in BOOTEN. The boot procedure is started by enabling the CPSM with CPSMEN. This causes:
   - the loaded command and argument to be sent out. (BOOTMODE = alternative boot).
   - the ACK timeout to start.
   - DPSM to be enabled.
6. When the command has been sent the CMDSENT flag is generated, at which time the BOOTEN bit must be cleared.
7. the reception of the boot acknowledgment can be detected with ACKFAIL flag when enabled.
   - when the boot acknowledgment is not received in time the ACKTIMEOUT flag occurs.
8. when all boot data has been received the DATAEND flag occurs.
   - when data CRC fails the DCRCFAIL flag is also generated.
   - when the data timeout occurs the DTIMEOUT flag is also generated.

9. When last data has been received, read data from the FIFO until FIFO is empty after which end of data DATAEND flag is generated.
   – SDMMC has completely received all data and the DPSM is disabled.
10. The BOOTEN bit must be cleared, before terminating the boot procedure by sending CMD0 (Reset) with BOOTMODE = alternative boot. This causes the CMDSENT flag to occur 56 cycles after the Command.
   – if the boot procedure is aborted by firmware before all data has been received the CPSM Abort signal stops the data transfer and disable the DPSM which triggers an DABORT flag when enabled.
11. The CMDSENT flag signals the end of the boot procedure and the card is ready to receive a new command. When the RESET command has been sent successfully, the BOOTMODE control bit has to be cleared to terminate the boot operation.

34.6.6 Response R1b handling

When sending commands which have a R1b response the busy signaling is reflected in the BUSYD0 register bit and the release of busy with the BUSYD0END flag. The SDMMC_D0 line is sampled at the end of the R1b response and signaled in the BUSYD0 register bit. The BUSYD0 register bit is reset to not busy when the SDMMC_D0 line release busy, at the same time the BUSYD0END flag is generated.

Figure 247. Command response R1b busy signaling



The expected maximum busy time must be set in the DATATIME register before sending the command. When enabled, the DTIMEOUT flag is set when after the R1b response busy stays active longer then the programmed time.

To detect the SDMMC_D0 busy signaling when sending a Command with R1b response the following procedure applies:

- Enable CMDREND flag.
- Send Command through CPSM.
- On the CMDREND flag check the BUSYD0 register bit.
  – If BUSYD0 signals not busy, signal busy release to firmware
  – If BUSYD0 signals busy, wait for BUSYD0END flag
- On BUSYD0END flag signal busy released to firmware.
- On DTIMEOUT flag busy is active longer then programmed time.

34.6.7 Reset and card cycle power

Reset

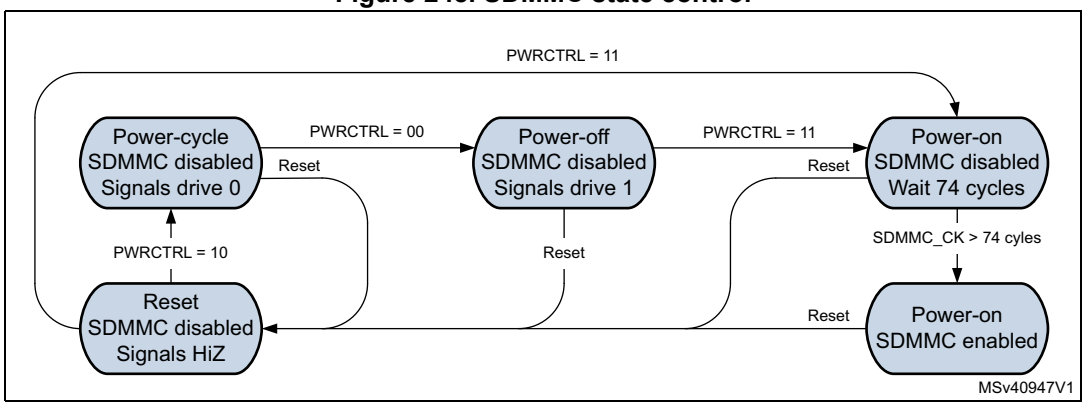
Following reset the SDMMC is in the reset state. In this state the SDMMC is disabled and no command nor data can be transfered. The SDMMC_D[7:0], and SDMMC_CMD are in HiZ and the SDMMC_CK is driven low.

Before moving to the power-on state the SDMMC must be configured.

In the power-on state the SDMMC_CK clock is running. First 74 SDMMC_CK cycles are clocked after which the SDMMC is enabled and command and data can be transfered.

The SDMMC states are controlled by Firmware with the PWRCTL register bits according *Figure 248.*.

Figure 248. SDMMC state control

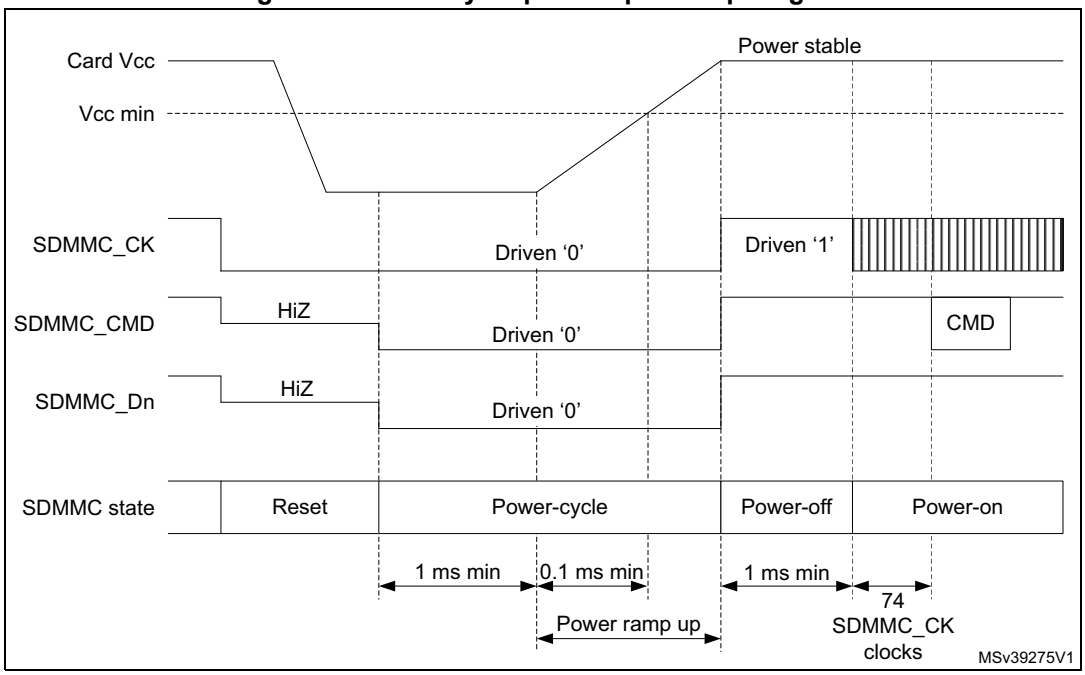


Card cycle power

To perform a card cycle power the following procedure applies:

1. Reset the SDMMC with the RCC.SDMMCxRST register bit. This resets the SDMMC to the reset state and the CPSM and DPSM to the Idle state.
2. Disable the Vcc power to the card.
3. Set the SDMMC in power-cycle state. This makes that the SDMMC_D[7:0], SDMMC_CMD and SDMMC_CK are driven low, to prevent the card from being supplied through the signal lines.
4. After minimum 1 ms enable the Vcc power to the card.
5. After the power ramp period set the SDMMC to the power-off state for minimum 1 ms. The SDMMC_D[7:0], SDMMC_CMD and SDMMC_CK are set to drive 1.
6. After the 1 ms delay set the SDMMC to power-on state in which the SDMMC_CK clock is enabled.
7. After 74 SDMMC_CK cycles the first command can be sent to the card.

Figure 249. Card cycle power / power up diagram



34.7 Hardware flow control

There are two hardware flow control mechanisms:

1. Hardware flow control during data transfer:
   - Only to be used with cycle-aligned data transfers.
2. Block gap hardware flow control:
   - Only used in mode with bus speed SDR50, SDR104, HS200 and DDR50.
   - Must be used with variable delay.

34.7.1 Hardware flow control during data transfer

The hardware flow control during data transfer functionality is used to avoid FIFO underrun (TX mode) and overrun (RX mode) errors.

The behavior is to stop SDMMC_CK during data transfer and freeze the SDMMC state machines. The data transfer is stalled when the FIFO is unable to transmit or receive data. The data transfer remains stalled until the transmit FIFO is half full or all data according DATALENGHT has been stored, or until the receive FIFO is half empty. Only state machines clocked by SDMMC_CK are frozen, the AHB interfaces are still alive. The FIFO can thus be filled or emptied even if flow control is activated.

On an IDMA linked list transfer error, the hardware flow control is disabled. As a consequence, depending on when the IDMA linked list transfer error occurs, an underrun or overrun error may also occur (see *Section : IDMA transfer error management*).

To enable hardware flow control during data transfer, the HWFC_EN register bit must be set to 1. After reset hardware flow control is disabled.

Hardware flow control during data transfer must only be used when the SDMMC_Dn data is cycle-aligned with the SDMMC_CK. Whenever the sdmmc_fb_ck from the DLYB delay block is used, i.e in the case of SDR104 mode with a t_{OP} and Dt_{OP} delay > 1 cycle, hardware flow control during data transfer can not be used and block gap hardware flow control must be used instead.

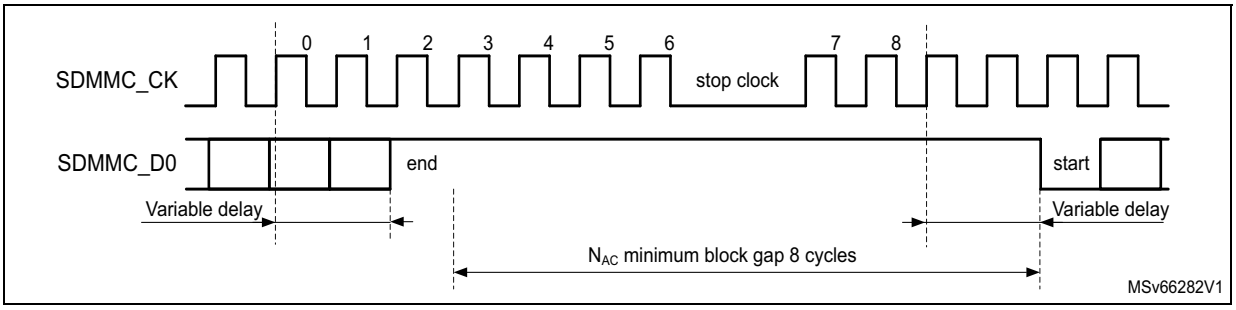
34.7.2 Block gap hardware flow control

The block gap hardware flow control functionality is used to avoid FIFO underrun (TX mode) and overrun (RX mode) errors in SDR50, SDR104, HS200 and DDR50 mode (BUSSPEED = 1).

When transmitting, the behavior is to delay the start of a new write block and freeze the SDMMC state machines. The start of a new write block is delayed until the FIFO holds enough data according to the threshold. Only the state machines clocked by SDMMC_CK are frozen, the AHB interfaces are still alive. The FIFO can thus be filled even if flow control is activated.

When receiving, the behavior is to stop SDMMC_CK during the read block gap and freeze the SDMMC state machines. The start of a new block transfer is stalled, due to stopped clock, until the FIFO has enough free space according to the threshold. Only the state machines clocked by SDMMC_CK are frozen, the AHB interfaces are still alive. The FIFO can thus be emptied even if flow control is activated.

Figure 250. Read block gap hardware flow timing



Warning: When variable delay is used and block gap hardware flow control is enabled, sending commands during multiple block read may disturb the command response reception (CMD12 is not impacted by this).

Table 293. Data block gap hardware flow control behavior

Condition (HWFC_EN = 1 and BUSSPEED = 1)	Description
Data block size ≤ FIFO threshold	New block transfer is only started when the FIFO has enough data (TX mode) / free space (RX mode) up to or more than the THR threshold. *Note: Data flow control is guaranteed. A block transfer is only stared when enough data for at least one block is available / free in the FIFO*
Data block size > FIFO threshold	New block transfer is only started when the FIFO has enough data (TX mode) / free space (RX mode) up to or more than the THR threshold. *Note: Data flow control is not guaranteed. A block transfer is started even when not enough data for one block is available / free in the FIFO. The threshold can be used to trade off transfer latency / throughput versus FIFO underrun / overrun risk.*

On an IDMA linked list transfer error, the hardware flow control is disabled. As a consequence, depending on when the IDMA linked list transfer error occurs, an underrun or overrun error may also occur (see *Section : IDMA transfer error management*).

The block gap hardware flow control is only enabled when HWFC_EN is set to 1, BUSSPEED = 1 and the THR FIFO threshold is different than 0. When BUSSPEED = 0 or FIFO threshold is set to 0, the hardware flow control is used during the data transfer. After reset, the hardware flow control is disabled.

Table 294. Hardware flow control selection

<table>
<tr><th>HWFC_EN</th><th>THR</th><th>BUSSPEED</th><th>Description</th></tr>
<tr><td>0</td><td>X</td><td rowspan="2">X</td><td>Hardware flow control disabled</td></tr>
<tr><td rowspan="3">1</td><td>0</td><td rowspan="2">Hardware flow control during data transfer enabled</td></tr>
<tr><td rowspan="2">not 0</td><td>0</td></tr>
<tr><td>1</td><td>Block gap hardware flow control enabled</td></tr>
</table>

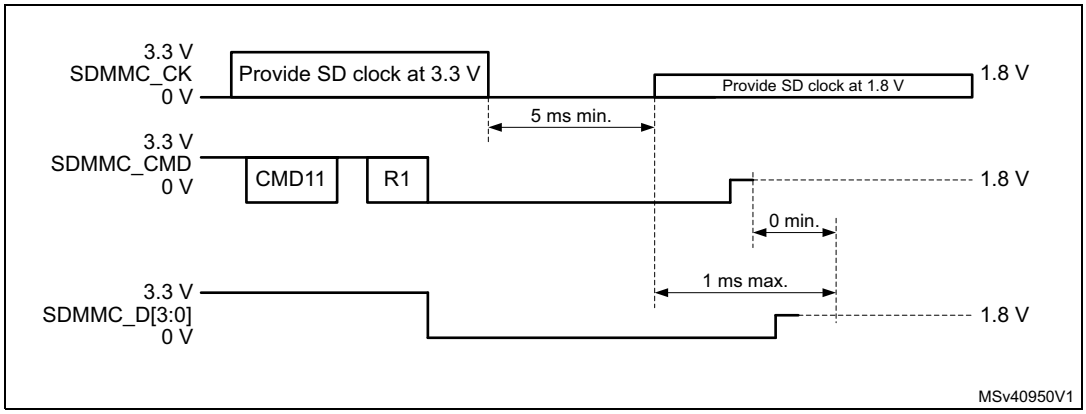
Block gap hardware flow control must be used when the SDMMC_Dn receive data are not cycle-aligned with the SDMMC_CK. This is whenever the sdmmc_fb_ck from the DLYB delay block is used, for example in the case of SDR104 receive mode with a t_{OP} and Dt_{OP} delay > 1 cycle.

34.8 Ultra-high-speed phase I (UHS-I) voltage switch

UHS-I mode (SDR12, SDR25, SDR50, SDR104, and DDR50) requires the support for 1.8 V signaling. After power up the card starts in 3.3V mode. CMD11 invokes the voltage switch

sequence to the 1.8V mode. When the voltage sequence is completed successfully the card enters UHS-I mode with default SDR12 and card input and output timings are changed.

Figure 251. CMD11 signal voltage switch sequence



To perform the signal voltage switch sequence the following steps are needed:

1. Before starting the Voltage Switch procedure, the SDMMC_CK frequency must be set in the range 100 kHz - 400 kHz.
2. The host starts the Voltage Switch procedure by setting the VSWITCHEN bit before sending the CMD11.
3. The card returns an R1 response.
   – if the response CRC is pass, the Voltage Switch procedure continues the host does no longer drive the CMD and SDMMC_D[3:0] signals until completion of the voltage switch sequence. Some cycles after the response the SDMMC_CK is stopped and the CKSTOP flag is set.
   – if the response CRC is fail (CCRCFAIL flag) or no response is received before the timeout (CTIMEOUT flag), the Voltage Switch procedure is stopped.
4. The card drives CMD and SDMMC_D[3:0] to low at the next clock after the R1 response.
5. The host, after having received the R1 response, may monitor the SDMMC_D0 line using the BUSYD0 register bit. The SDMMC_D0 line is sampled two SDMMC_CK clock cycles after the Response. The Firmware may read the BUSYD0 register bit following the CKSTOP flag.
   – When the BUSYD0 is detected low the host firmware switches the Voltage regulator to 1.8V, after which it instructs the SDMMC to start the timing critical section of the Voltage Switch sequence by setting register bit VSWITCH. The hardware continues to stop the SDMMC_CK by holding it low for at least 5 ms.
   – When the BUSYD0 is detected high the host aborts the Voltage Switch sequence and cycle power the card.
6. The card after detecting SDMMC_CK low begins switching signaling voltage to 1.8 V.
7. The host SDMMC hardware after at least 5 ms restarts the SDMMC_CK.
8. The card within 1 ms from detecting SDMMC_CK transition drives CMD and DAT[3:0] high for at least 1 SDMMC_CK cycle and then stop driving CMD and DAT[3:0].
9. The host SDMMC hardware, 1 ms after the SDMMC_CK has been restarted, the SDMMC_D0 is sampled into BUSYD0 and the VSWEND flag is set.

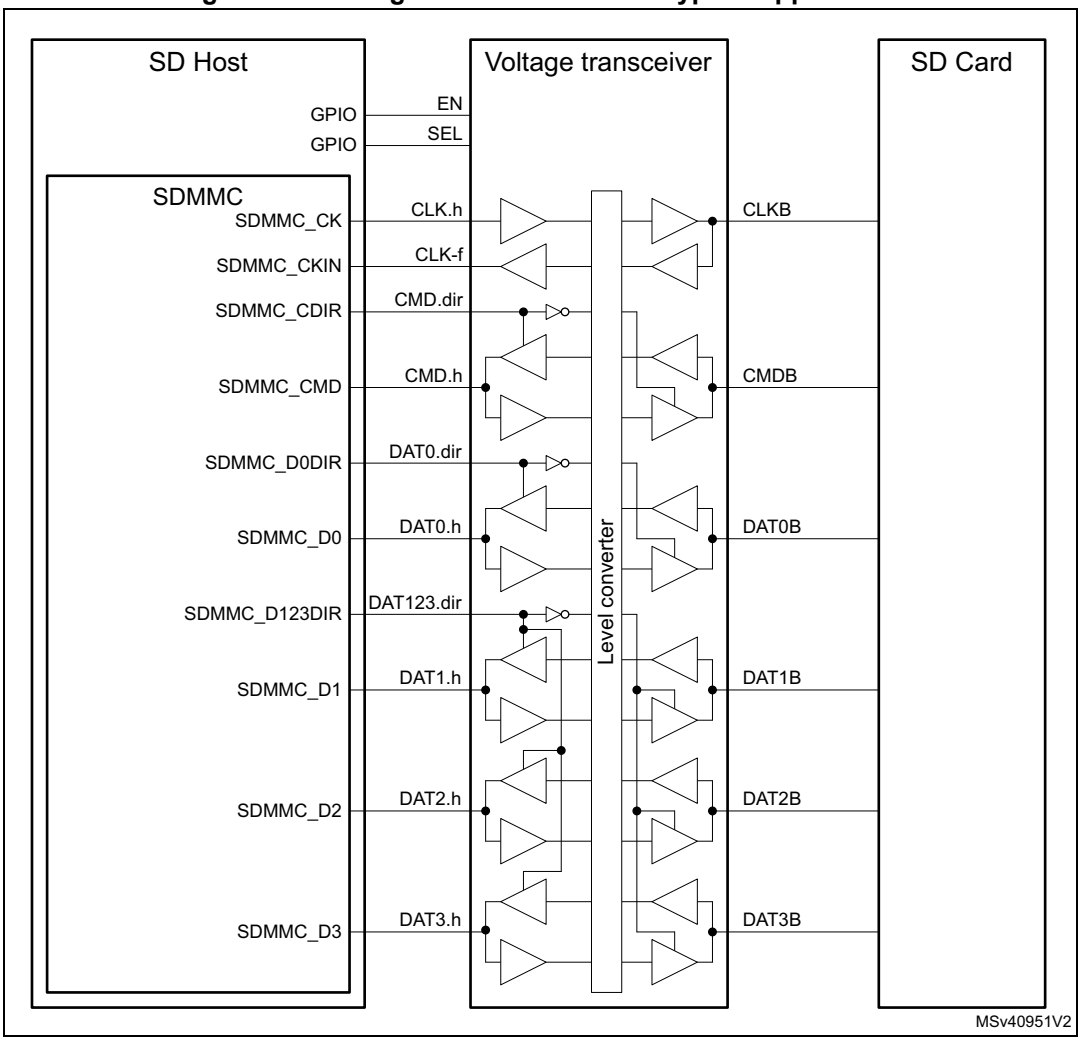
10. The host, on the VSWEND flag, checks SDMMC_D0 line using the BUSYD0 register bit, to confirm completion of voltage switch sequence:
    – When BUSYD0 is detected high, Voltage Switch has been completed successfully.
    – When BUSYD0 is detected low, Voltage Switch has failed, the host cycles the card power.

The minimum 5 ms time to stop the SDMMC_CK is derived from the internal un-gated SDMMC_CK clock, which has a maximum frequency of 25 MHz (SD mode), as set by the clock divider CLKDIV. The >5 ms time is counted by 2^{12} cycles (10.24 ms @ 400 kHz). If a lower SDMMC_CK frequency is selected by the clock divider CLKDIV the time for the SDMMC_CK clock to be stopped is longer.

The maximum 1 ms time for the card to drive the SDMMC_Dn and SDMMC_CMD lines high is derived from the internal ungated SDMMC_CK which has a maximum frequency of 25 MHz (SD mode), as set by the clock divider CLKDIV. The SDMMC checks the lines after >1 ms time which is counted by 2^9 cycles (1.28 ms @ 25 MHz). If a lower SDMMC_CK frequency is selected by the clock divider CLKDIV the time to check the lines is longer.

The signal voltage level is supported through an external voltage translation transceiver like STMicroelectronics ST6G3244ME.

Figure 252. Voltage switch transceiver typical application



To interface with an external driver (a voltage switch transceiver), next to the standard signals the SDMMC uses the following signals:

- **SDMMC_CKIN** feedback input clock
- **SDMMC_CDIR** I/O direction control for the CMD signal
- **SDMMC_D0DIR** I/O direction control for the SDMMC_D0 signal
- **SDMMC_D123DIR** I/O direction control for the SDMMC_D1, SDMMC_D2 and SDMMC_D3 signals

The voltage transceiver signals **EN** and **SEL** are to be handled through general-purpose I/O.

The polarity of the SDMMC_CDIR, SDMMC_D0DIR and SDMMC_D123DIR signals can be selected through SDMMC_POWER.DIRPOL control bit.

34.9 SDMMC interrupts

Table 295. SDMMC interrupts

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from Sleep mode
SDMMC	Command response CRC fail	CCRCFAIL	CCRCFAILIE	CCRCFAILC	Yes
SDMMC	Data block CRC fail	DCRCFAIL	DCRCFAILIE	DCRCFAILC	Yes
SDMMC	Command response timeout	CTIMEOUT	CTIMEOUTIE	CTIMEOUTC	Yes

34.10 SDMMC registers

The device communicates to the system via 32-bit control registers accessible via AHB slave interface.

The peripheral registers have to be accessed by words (32-bit). Byte (8-bit) and half-word (16-bit) accesses trigger an AHB bus error.

34.10.1 SDMMC power control register (SDMMC_POWER)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DIR POL	VSWI TCHEN	VSWI TCH	PWRCTRL[1:0]	
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **DIRPOL**: Data and command direction signals polarity selection

This bit can only be written when the SDMMC is in the power-off state (PWRCTRL = 00).

0: Voltage transceiver I/Os driven as output when direction signal is low.

1: Voltage transceiver I/Os driven as output when direction signal is high.

Bit 3 **VSWITCHEN**: Voltage switch procedure enable

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).

This bit is used to stop the SDMMC_CK after the voltage switch command response:

0: SDMMC_CK clock kept unchanged after successfully received command response.

1: SDMMC_CK clock stopped after successfully received command response.

Bit 2 **VSWITCH**: Voltage switch sequence start

This bit is used to start the timing critical section of the voltage switch sequence:

0: Voltage switch sequence not started and not active.

1: Voltage switch sequence started or active.

Bits 1:0 **PWRCTRL[1:0]**: SDMMC state control bits

These bits can only be written when the SDMMC is not in the power-on state (PWRCTRL ≠ 11).

These bits are used to define the functional state of the SDMMC signals:

00: After reset, Reset: the SDMMC is disabled and the clock to the Card is stopped, SDMMC_D[7:0], and SDMMC_CMD are HiZ and SDMMC_CK is driven low. When written 00, power-off: the SDMMC is disabled and the clock to the card is stopped, SDMMC_D[7:0], SDMMC_CMD and SDMMC_CK are driven high.

01: Reserved (When written 01, PWRCTRL value does not change)

10: Power-cycle, the SDMMC is disabled and the clock to the card is stopped, SDMMC_D[7:0], SDMMC_CMD and SDMMC_CK are driven low.

11: Power-on: the card is clocked, The first 74 SDMMC_CK cycles the SDMMC is still disabled. After the 74 cycles the SDMMC is enabled and the SDMMC_D[7:0], SDMMC_CMD and SDMMC_CK are controlled according the SDMMC operation.

Any further write is ignored, PWRCTRL value keeps 11.

34.10.2 SDMMC clock control register (SDMMC_CLKCR)

Address offset: 0x004

Reset value: 0x0000 0000

This register controls the SDMMC_CK output clock, the sdmmc_rx_ck receive clock, and the bus width.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SELCLKRX[1:0]		BUS SPEED	DDR	HWFC_EN	NEG EDGE
										rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WID BUS[1:0]		Res.	PWR SAV	Res.	Res.	CLKDIV[9:0]									
rw	rw		rw			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:20 **SELCLKRX[1:0]**: Receive clock selection

These bits can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

00: sdmmc_io_in_ck selected as receive clock

01: SDMMC_CKIN feedback clock selected as receive clock

10: sdmmc_fb_ck tuned feedback clock selected as receive clock

11: Reserved (select sdmmc_io_in_ck)

Bit 19 **BUSSPEED**: Bus speed for selection of SDMMC operating modes

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

0: DS, HS, SDR12, SDR25, Legacy compatible, High speed SDR, High speed DDR bus speed mode selected

1: SDR50, DDR50, SDR104, HS200 bus speed mode selected

Bit 18 **DDR**: Data rate signaling selection

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

DDR rate must only be selected with 4-bit or 8-bit wide bus mode. (WIDBUS > 00). DDR = 1 has no effect when WIDBUS = 00 (1-bit wide bus).

DDR rate must only be selected with clock division > 1 (CLKDIV > 0).

0: SDR Single data rate signaling

1: DDR double data rate signaling

Bit 17 **HWFC_EN**: Hardware flow control enable

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

0: Hardware flow control is disabled

1: Hardware flow control is enabled

When Hardware flow control is enabled, the meaning of the TXFIFOE and RXFIFOF flags change, see SDMMC status register definition in *Section 34.10.11*.

Bit 16 **NEGEDGE**: SDMMC_CK dephasing selection bit for data and command

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0).

When clock division = 1 (CLKDIV = 0), this bit has no effect. Data and Command change on SDMMC_CK falling edge.

0: When clock division >1 (CLKDIV > 0) and DDR = 0:

- Command and data changed on the sdmmc_ker_ck falling edge succeeding the rising edge of SDMMC_CK.
- SDMMC_CK edge occurs on sdmmc_ker_ck rising edge.

When clock division >1 (CLKDIV > 0) and DDR = 1:

- Command changed on the sdmmc_ker_ck falling edge succeeding the rising edge of SDMMC_CK.
- Data changed on the sdmmc_ker_ck falling edge succeeding a SDMMC_CK edge.
- SDMMC_CK edge occurs on sdmmc_ker_ck rising edge.

1: When clock division >1 (CLKDIV > 0) and DDR = 0:

- Command and data changed on the same sdmmc_ker_ck rising edge generating the SDMMC_CK falling edge.

When clock division >1 (CLKDIV > 0) and DDR = 1:

- Command changed on the same sdmmc_ker_ck rising edge generating the SDMMC_CK falling edge.
- Data changed on the SDMMC_CK falling edge succeeding a SDMMC_CK edge.
- SDMMC_CK edge occurs on sdmmc_ker_ck rising edge.

Bits 15:14 **WIDBUS[1:0]**: Wide bus mode enable bit

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

00: Default 1-bit wide bus mode: SDMMC_D0 used (Does not support DDR)

01: 4-bit wide bus mode: SDMMC_D[3:0] used

10: 8-bit wide bus mode: SDMMC_D[7:0] used

Bit 13 Reserved, must be kept at reset value.

Bit 12 **PWRSAV**: Power saving configuration bit

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

For power saving, the SDMMC_CK clock output can be disabled when the bus is idle by setting PWRSAV:

0: SDMMC_CK clock is always enabled

1: SDMMC_CK is only enabled when the bus is active

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:0 **CLKDIV[9:0]**: Clock divide factor

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0).

This field defines the divide factor between the input clock (sdmmc_ker_ck) and the output clock (SDMMC_CK): SDMMC_CK frequency = sdmmc_ker_ck / [2 * CLKDIV].

0x000: SDMMC_CK frequency = sdmmc_ker_ck / 1 (Does not support DDR)

0x001: SDMMC_CK frequency = sdmmc_ker_ck / 2

0x002: SDMMC_CK frequency = sdmmc_ker_ck / 4

0x0XX: ..

0x080: SDMMC_CK frequency = sdmmc_ker_ck / 256

0xXXX: ..

0x3FF: SDMMC_CK frequency = sdmmc_ker_ck / 2046

Note: While the SD/SDIO card or e•MMC is in identification mode, the SDMMC_CK frequency must be less than 400 kHz.

The clock frequency can be changed to the maximum card bus frequency when relative card addresses are assigned to all cards.

At least seven sdmmc_hclk clock periods are needed between two write accesses to this register. SDMMC_CK can also be stopped during the Read Wait interval for SD I/O cards: in this case the SDMMC_CLKCR register does not control SDMMC_CK.

34.10.3 SDMMC argument register (SDMMC_ARGR)

Address offset: 0x008

Reset value: 0x0000 0000

This register contains a 32-bit command argument, which is sent to a card as part of a command message.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CMDARG[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CMDARG[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CMDARG[31:0]**: Command argument

These bits can only be written by firmware when CPSM is disabled (CPSMEN = 0). Command argument sent to a card as part of a command message. If a command contains an argument, it must be loaded into this register before writing a command to the command register.

34.10.4 SDMMC command register (SDMMC_CMDR)

Address offset: 0x00C

Reset value: 0x0000 0000

This register contains the command index and command type bits. The command index is sent to a card as part of a command message. The command type bits control the command path state machine (CPSM).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CMD SUS PEND
															rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BOOT EN	BOOT MODE	DT HOLD	CPSM EN	WAITP END	WAIT INT	WAITRESP[1:0]		CMD STOP	CMD TRANS	CMDINDEX[5:0]					
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **CMDSUSPEND**: The CPSM treats the command as a Suspend or Resume command and signals interrupt period start/end

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).
CMDSUSPEND = 1 and CMDTRANS = 0 Suspend command, start interrupt period when response bit BS = 0.
CMDSUSPEND = 1 and CMDTRANS = 1 Resume command with data, end interrupt period when response bit DF = 1.

Bit 15 **BOOTEN**: Enable boot mode procedure

0: Boot mode procedure disabled
1: Boot mode procedure enabled

Bit 14 **BOOTMODE**: Select the boot mode procedure to be used

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0)
0: Normal boot mode procedure selected
1: Alternative boot mode procedure selected

Bit 13 **DTHOLD**: Hold new data block transmission and reception in the DPSM

If this bit is set, the DPSM does not move from the Wait_S state to the Send state or from the Wait_R state to the Receive state.

Bit 12 **CPSMEN**: Command path state machine (CPSM) enable bit

This bit is written 1 by firmware, and cleared by hardware when the CPSM enters the Idle state.
If this bit is set, the CPSM is enabled.
When DTEN = 1, no command is transfered nor boot procedure is started. CPSMEN is cleared to 0.
During Read Wait with SDMMC_CK stopped no command is sent and CPSMEN is kept 0.

Bit 11 **WAITPEND**: CPSM waits for end of data transfer (CmdPend internal signal) from DPSM

This bit when set, the CPSM waits for the end of data transfer trigger before it starts sending a command.
WAITPEND is only taken into account when DTMODE = *e*•MMC stream data transfer, WIDBUS = 1-bit wide bus mode, DPSMACT = 1 and DTDIR = from host to card.

Bit 10 **WAITINT**: CPSM waits for interrupt request

If this bit is set, the CPSM disables command timeout and waits for an card interrupt request (Response).
If this bit is cleared in the CPSM Wait state, it causes the abort of the interrupt mode.

Bits 9:8 **WAITRESP[1:0]**: Wait for response bits

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).
They are used to configure whether the CPSM is to wait for a response, and if yes, which kind of response.
00: No response, expect CMDSENT flag
01: Short response, expect CMDREND or CCRCFAIL flag
10: Short response, expect CMDREND flag (No CRC)
11: Long response, expect CMDREND or CCRCFAIL flag

Bit 7 **CMDSTOP**: The CPSM treats the command as a Stop Transmission command and signals abort to the DPSM

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).

If this bit is set, the CPSM issues the abort signal to the DPSM when the command is sent.

Bit 6 **CMDTRANS**: The CPSM treats the command as a data transfer command, stops the interrupt period, and signals DataEnable to the DPSM

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).

If this bit is set, the CPSM issues an end of interrupt period and issues DataEnable signal to the DPSM when the command is sent.

Bits 5:0 **CMDINDEX[5:0]**: Command index

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).

The command index is sent to the card as part of a command message.

Note: 1 At least seven sdmmc_hclk clock periods are needed between two write accesses to this register.

2 MultiMediaCard can send two kinds of response: short responses, 48 bits, or long responses,136 bits. SD card and SD I/O card can send only short responses, the argument can vary according to the type of response: the software distinguishes the type of response according to the send command.

34.10.5 SDMMC command response register (SDMMC_RESPCMDR)

Address offset: 0x010

Reset value: 0x0000 0000

This register contains the command index field of the last command response received. If the command response transmission does not contain the command index field (long or OCR response), the RESPCMD field is unknown, although it must contain 111111b (the value of the reserved field from the response).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RESPCMD[5:0]					
										r	r	r	r	r	r

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **RESPCMD[5:0]**: Response command index

Read-only bitfield. Contains the command index of the last command response received.

34.10.6 SDMMC response x register (SDMMC_RESPxR)

Address offset: 0x010 + 0x004 * x, (x = 1 to 4)

Reset value: 0x0000 0000

These registers contain the status of a card, which is part of the received response.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CARDSTATUS[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CARDSTATUS[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **CARDSTATUS[31:0]**: Card status according table below
See *Table 296*.

The card status size is 32 or 128 bits, depending on the response type.

Table 296. Response type and SDMMC_RESPxR registers

Register(1)	Short response	Long response
SDMMC_RESP1R	Card status[31:0]	Card status [127:96]
SDMMC_RESP2R	all 0	Card status [95:64]
SDMMC_RESP3R	all 0	Card status [63:32]
SDMMC_RESP4R	all 0	Card status [31:0](2)

1. The most significant bit of the card status is received first.
2. The SDMMC_RESP4R register LSB is always 0.

34.10.7 SDMMC data timer register (SDMMC_DTIMER)

Address offset: 0x024

Reset value: 0x0000 0000

This register contains the data timeout period, in card bus clock periods.

A counter loads the value from this register, and starts decrementing when the data path state machine (DPSM) enters the Wait_R or Busy state. If the timer reaches 0 while the DPSM is in either of these states, the timeout status flag is set.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATATIME[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATATIME[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DATATIME[31:0]**: Data and R1b busy timeout period

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0).

Data and R1b busy timeout period expressed in card bus clock periods.

Note: A data transfer must be written to the data timer register and the data length register before being written to the data control register.

34.10.8 SDMMC data length register (SDMMC_DLENR)

Address offset: 0x028

Reset value: 0x0000 0000

This register contains the number of data bytes to be transferred. The value is loaded into the data counter when data transfer starts.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	DATALENGTH[24:16]								
							rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATALENGTH[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:0 **DATALENGTH[24:0]**: Data length value

This register can only be written by firmware when DPSM is inactive (DPSMACT = 0).

Number of data bytes to be transferred.

When DDR = 1 DATALENGTH is truncated to a multiple of 2. (The last odd byte is not transfered)

When DATALENGTH = 0 no data are transfered, when requested by a CPSMEN and CMDTRANS = 1 also no command is transfered. DTEN and CPSMEN are cleared to 0.

Note: For a block data transfer, the value in the data length register must be a multiple of the block size (see SDMMC_DCTRL). A data transfer must be written to the data timer register and the data length register before being written to the data control register.

For an SDMMC multibyte transfer the value in the data length register must be between 1 and 512.

34.10.9 SDMMC data control register (SDMMC_DCTRL)

Address offset: 0x02C

Reset value: 0x0000 0000

This register controls the data path state machine (DPSM).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	FIFO RST	BOOT ACK EN	SDIO EN	RW MOD	RW STOP	RW START	DBLOCKSIZE[3:0]				DTMODE[1:0]		DTDIR	DTEN
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **FIFORST**: FIFO reset, flushes any remaining data

This bit can only be written by firmware when IDMAEN= 0 and DPSM is active (DPSMACT = 1). This bit only takes effect when a transfer error or transfer hold occurs.

0: FIFO not affected.

1: Flush any remaining data and reset the FIFO pointers. This bit is automatically cleared to 0 by hardware when DPSM gets inactive (DPSMACT = 0).

Bit 12 **BOOTACKEN**: Enable the reception of the boot acknowledgment

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).

0: Boot acknowledgment disabled, not expected to be received

1: Boot acknowledgment enabled, expected to be received

Bit 11 **SDIOEN**: SD I/O interrupt enable functions

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).

If this bit is set, the DPSM enables the SD I/O card specific interrupt operation.

Bit 10 **RWMOD**: Read Wait mode

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).

0: Read Wait control using SDMMC_D2

1: Read Wait control stopping SDMMC_CK

Bit 9 **RWSTOP**: Read Wait stop

This bit is written by firmware and auto cleared by hardware when the DPSM moves from the R_W state to the Wait_R or Idle state.

0: No Read Wait stop

1: Enable for Read Wait stop when DPSM is in the R_W state.

Bit 8 **RWSTART**: Read Wait start

If this bit is set, Read Wait operation starts.

Bits 7:4 **DBLOCKSIZE[3:0]**: Data block size

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
Define the data block length when the block data transfer mode is selected:
0000: Block length = 2^0 = 1 byte
0001: Block length = 2^1 = 2 bytes
0010: Block length = 2^2 = 4 bytes
0011: Block length = 2^3 = 8 bytes
0100: Block length = 2^4 = 16 bytes
0101: Block length = 2^5 = 32 bytes
0110: Block length = 2^6 = 64 bytes
0111: Block length = 2^7 = 128 bytes
1000: Block length = 2^8 = 256 bytes
1001: Block length = 2^9 = 512 bytes
1010: Block length = 2^{10} = 1024 bytes
1011: Block length = 2^{11} = 2048 bytes
1100: Block length = 2^{12} = 4096 bytes
1101: Block length = 2^{13} = 8192 bytes
1110: Block length = 2^{14} = 16384 bytes
1111: Reserved
When DATALENGTH is not a multiple of DBLOCKSIZE, the transfered data is truncated at a multiple of DBLOCKSIZE. (None of the remaining data are transfered.)
When DDR = 1, DBLOCKSIZE = 0000 must not be used. (No data are transfered)

Bits 3:2 **DTMODE[1:0]**: Data transfer mode selection

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
00: Block data transfer ending on block count.
01: SDIO multibyte data transfer.
10: *e*•MMC Stream data transfer. (WIDBUS must select 1-bit wide bus mode)
11: Block data transfer ending with STOP_TRANSMISSION command (not to be used with DTEN initiated data transfers).

Bit 1 **DTDIR**: Data transfer direction selection

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
0: From host to card.
1: From card to host.

Bit 0 **DTEN**: Data transfer enable bit

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0). This bit is cleared by hardware when data transfer completes.
This bit must only be used to transfer data when no associated data transfer command is used (must not be used with SD or *e*•MMC cards).
0: Do not start data transfer without CPSM data transfer command.
1: Start data transfer without CPSM data transfer command.

34.10.10 SDMMC data counter register (SDMMC_DCNTR)

Address offset: 0x030

Reset value: 0x0000 0000

This register loads the value from the data length register (see SDMMC_DLENR) when the DPSM moves from the Idle state to the Wait_R or Wait_S state. As data is transferred, the counter decrements the value until it reaches 0. The DPSM then moves to the Idle state and

when there has been no error, and no transmit data transfer hold, the data status end flag (DATAEND) is set.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	DATACOUNT[24:16]								
							r	r	r	r	r	r	r	r	r

DATACOUNT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:0 **DATACOUNT[24:0]**: Data count value

When read, the number of remaining data bytes to be transferred is returned. Write has no effect.

Note: This register must be read only after the data transfer is complete, or hold. When reading after an error event the read data count value may be different from the real number of data bytes transfered.

34.10.11 SDMMC status register (SDMMC_STAR)

Address offset: 0x034

Reset value: 0x0000 0000

This register is a read-only register. It contains two types of flag:

- Static flags (bits [28, 21, 11:0]): these bits remain asserted until they are cleared by writing to the SDMMC interrupt Clear register (see SDMMC_ICR)
- Dynamic flags (bits [20:12]): these bits change state depending on the state of the underlying logic (for example, FIFO full and empty flags are asserted and deasserted as data while written to the FIFO)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	IDMA BTC	IDMA TE	CK STOP	VSW END	ACK TIME OUT	ACK FAIL	SDIOIT	BUSY D0END	BUSY D0	RX FIFOE	TX FIFOE	RX FIFOF	TX FIFOF

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **IDMABTC**: IDMA buffer transfer complete

The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 27 **IDMATE**: IDMA transfer error

The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 26 **CKSTOP**: SDMMC_CK stopped in Voltage switch procedure

The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 25 **VSWEND**: Voltage switch critical timing section completion
The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 24 **ACKTIMEOUT**: Boot acknowledgment timeout
The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 23 **ACKFAIL**: Boot acknowledgment received (boot acknowledgment check fail)
The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 22 **SDIOIT**: SDIO interrupt received
The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 21 **BUSYD0END**: end of SDMMC_D0 Busy following a CMD response detected
This indicates only end of busy following a CMD response. This bit does not signal busy due to data transfer. Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.
0: card SDMMC_D0 signal does NOT signal change from busy to not busy.
1: card SDMMC_D0 signal changed from busy to NOT busy.

Bit 20 **BUSYD0**: Inverted value of SDMMC_D0 line (Busy), sampled at the end of a CMD response and a second time 2 SDMMC_CK cycles after the CMD response
This bit is reset to not busy when the SDMMCD0 line changes from busy to not busy. This bit does not signal busy due to data transfer. This is a hardware status flag only, it does not generate an interrupt.
0: card signals not busy on SDMMC_D0.
1: card signals busy on SDMMC_D0.

Bit 19 **RXFIFOE**: Receive FIFO empty
This is a hardware status flag only, does not generate an interrupt. This bit is cleared when one FIFO location becomes full.

Bit 18 **TXFIFOE**: Transmit FIFO empty
This bit is cleared when one FIFO location becomes full.

Bit 17 **RXFIFOF**: Receive FIFO full
This bit is cleared when one FIFO location becomes empty.

Bit 16 **TXFIFOF**: Transmit FIFO full
This is a hardware status flag only, does not generate an interrupt. This bit is cleared when one FIFO location becomes empty.

Bit 15 **RXFIFOHF**: Receive FIFO half full
There are at least half the number of words in the FIFO. This bit is cleared when the FIFO becomes half+1 empty.

Bit 14 **TXFIFOHE**: Transmit FIFO half empty
At least half the number of words can be written into the FIFO. This bit is cleared when the FIFO becomes half+1 full.

Bit 13 **CPSMACT**: Command path state machine active (not in Idle state)
This is a hardware status flag only, does not generate an interrupt.

Bit 12 **DPSMACT**: Data path state machine active (not in Idle state)
This is a hardware status flag only, does not generate an interrupt.

Bit 11 **DABORT**: Data transfer aborted by CMD12
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 10 **DBCKEND**: Data block sent/received
DBCKEND is set when:
- CRC check passed and DPSM moves to the R_W state
or
- IDMAEN = 0 and transmit data transfer hold and DATACOUNT >0 and DPSM moves to Wait_S.
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 9 **DHOLD**: Data transfer Hold
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 8 **DATAEND**: Data transfer ended correctly
DATAEND is set if data counter DATACOUNT is zero and no errors occur, and no transmit data transfer hold.
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 7 **CMDSENT**: Command sent (no response required)
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 6 **CMDREND**: Command response received (CRC check passed, or no CRC)
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 5 **RXOVERR**: Received FIFO overrun error (masked by hardware when IDMA is enabled)
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 4 **TXUNDERR**: Transmit FIFO underrun error (masked by hardware when IDMA is enabled)
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 3 **DTIMEOUT**: Data timeout
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 2 **CTIMEOUT**: Command response timeout
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.
The Command Timeout period has a fixed value of 64 SDMMC_CK clock periods.

Bit 1 **DCRCFAIL**: Data block sent/received (CRC check failed)
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 0 **CCRCFAIL**: Command response received (CRC check failed)
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Note: FIFO interrupt flags must be masked in SDMMC_MASKR when using IDMA mode.

34.10.12 SDMMC interrupt clear register (SDMMC_ICR)

Address offset: 0x038

Reset value: 0x0000 0000

This register is a write-only register. Writing a bit with 1 clears the corresponding bit in the SDMMC_STAR status register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Set by software to clear the ACKFAIL flag.
0: ACKFAIL not cleared
1: ACKFAIL cleared

Bit 22 **SDIOITC**: SDIOIT flag clear bit
Set by software to clear the SDIOIT flag.
0: SDIOIT not cleared
1: SDIOIT cleared

Bit 21 **BUSYD0ENDC**: BUSYD0END flag clear bit
Set by software to clear the BUSYD0END flag.
0: BUSYD0END not cleared
1: BUSYD0END cleared

Bits 20:12 Reserved, must be kept at reset value.

Bit 11 **DABORTC**: DABORT flag clear bit
Set by software to clear the DABORT flag.
0: DABORT not cleared
1: DABORT cleared

Bit 10 **DBCKENDC**: DBCKEND flag clear bit
Set by software to clear the DBCKEND flag.
0: DBCKEND not cleared
1: DBCKEND cleared

Bit 9 **DHOLDC**: DHOLD flag clear bit
Set by software to clear the DHOLD flag.
0: DHOLD not cleared
1: DHOLD cleared

Bit 8 **DATAENDC**: DATAEND flag clear bit
Set by software to clear the DATAEND flag.
0: DATAEND not cleared
1: DATAEND cleared

Bit 7 **CMDSENTC**: CMDSENT flag clear bit
Set by software to clear the CMDSENT flag.
0: CMDSENT not cleared
1: CMDSENT cleared

Bit 6 **CMDRENDC**: CMDREND flag clear bit
Set by software to clear the CMDREND flag.
0: CMDREND not cleared
1: CMDREND cleared

Bit 5 **RXOVERRC**: RXOVERR flag clear bit
Set by software to clear the RXOVERR flag.
0: RXOVERR not cleared
1: RXOVERR cleared

Bit 4 **TXUNDERRC**: TXUNDERR flag clear bit
Set by software to clear TXUNDERR flag.
0: TXUNDERR not cleared
1: TXUNDERR cleared

Bit 3 **DTIMEOUTC**: DTIMEOUT flag clear bit
Set by software to clear the DTIMEOUT flag.
0: DTIMEOUT not cleared
1: DTIMEOUT cleared

Bit 2 **CTIMEOUTC**: CTIMEOUT flag clear bit
Set by software to clear the CTIMEOUT flag.
0: CTIMEOUT not cleared
1: CTIMEOUT cleared

Bit 1 **DCRCFAILC**: DCRCFAIL flag clear bit
Set by software to clear the DCRCFAIL flag.
0: DCRCFAIL not cleared
1: DCRCFAIL cleared

Bit 0 **CCRCFAILC**: CCRCFAIL flag clear bit
Set by software to clear the CCRCFAIL flag.
0: CCRCFAIL not cleared
1: CCRCFAIL cleared

34.10.13 SDMMC mask register (SDMMC_MASKR)

Address offset: 0x03C

Reset value: 0x0000 0000

This register determines which status flags generate an interrupt request by setting the corresponding bit to 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **IDMABTCIE**: IDMA buffer transfer complete interrupt enable
Set and cleared by software to enable/disable the interrupt generated when the IDMA has transferred all data belonging to a memory buffer.
0: IDMA buffer transfer complete interrupt disabled
1: IDMA buffer transfer complete interrupt enabled

Bit 27 Reserved, must be kept at reset value.

Bit 26 **CKSTOPIE**: Voltage switch clock stopped interrupt enable
Set and cleared by software to enable/disable interrupt caused by voltage switch clock stopped.
0: Voltage switch clock stopped interrupt disabled
1: Voltage switch clock stopped interrupt enabled

Bit 25 **VSWENDIE**: Voltage switch critical timing section completion interrupt enable
Set and cleared by software to enable/disable the interrupt generated when voltage switch critical timing section completion.
0: Voltage switch critical timing section completion interrupt disabled
1: Voltage switch critical timing section completion interrupt enabled

Bit 24 **ACKTIMEOUTIE**: Acknowledgment timeout interrupt enable
Set and cleared by software to enable/disable interrupt caused by acknowledgment timeout.
0: Acknowledgment timeout interrupt disabled
1: Acknowledgment timeout interrupt enabled

Bit 23 **ACKFAILIE**: Acknowledgment fail interrupt enable
Set and cleared by software to enable/disable interrupt caused by acknowledgment fail.
0: Acknowledgment fail interrupt disabled
1: Acknowledgment fail interrupt enabled

Bit 22 **SDIOITIE**: SDIO mode interrupt received interrupt enable
Set and cleared by software to enable/disable the interrupt generated when receiving the SDIO mode interrupt.
0: SDIO mode interrupt received interrupt disabled
1: SDIO mode interrupt received interrupt enabled

Bit 21 **BUSYD0ENDIE**: BUSYD0END interrupt enable
Set and cleared by software to enable/disable the interrupt generated when SDMMC_D0 signal changes from busy to NOT busy following a CMD response.
0: BUSYD0END interrupt disabled
1: BUSYD0END interrupt enabled

Bits 20:19 Reserved, must be kept at reset value.

Bit 18 **TXFIFOEIE**: Tx FIFO empty interrupt enable
Set and cleared by software to enable/disable interrupt caused by Tx FIFO empty.
0: Tx FIFO empty interrupt disabled
1: Tx FIFO empty interrupt enabled

Bit 17 **RXFIFOFIE**: Rx FIFO full interrupt enable
Set and cleared by software to enable/disable interrupt caused by Rx FIFO full.
0: Rx FIFO full interrupt disabled
1: Rx FIFO full interrupt enabled

Bit 16 Reserved, must be kept at reset value.

Bit 15 **RXFIFOHFIE**: Rx FIFO half full interrupt enable
Set and cleared by software to enable/disable interrupt caused by Rx FIFO half full.
0: Rx FIFO half full interrupt disabled
1: Rx FIFO half full interrupt enabled

Bit 14 **TXFIFOHEIE**: Tx FIFO half empty interrupt enable
Set and cleared by software to enable/disable interrupt caused by Tx FIFO half empty.
0: Tx FIFO half empty interrupt disabled
1: Tx FIFO half empty interrupt enabled

Bits 13:12 Reserved, must be kept at reset value.

Bit 11 **DABORTIE**: Data transfer aborted interrupt enable
Set and cleared by software to enable/disable interrupt caused by a data transfer being aborted.
0: Data transfer abort interrupt disabled
1: Data transfer abort interrupt enabled

Bit 10 **DBCKENDIE**: Data block end interrupt enable
Set and cleared by software to enable/disable interrupt caused by data block end.
0: Data block end interrupt disabled
1: Data block end interrupt enabled

Bit 9 **DHOLDIE**: Data hold interrupt enable
Set and cleared by software to enable/disable the interrupt generated when sending new data is hold in the DPSM Wait_S state.
0: Data hold interrupt disabled
1: Data hold interrupt enabled

Bit 8 **DATAENDIE**: Data end interrupt enable
Set and cleared by software to enable/disable interrupt caused by data end.
0: Data end interrupt disabled
1: Data end interrupt enabled

Bit 7 **CMDSENTIE**: Command sent interrupt enable
Set and cleared by software to enable/disable interrupt caused by sending command.
0: Command sent interrupt disabled
1: Command sent interrupt enabled

Bit 6 **CMDRENDIE**: Command response received interrupt enable
Set and cleared by software to enable/disable interrupt caused by receiving command response.
0: Command response received interrupt disabled
1: command Response received interrupt enabled

Bit 5 **RXOVERRIE**: Rx FIFO overrun error interrupt enable
Set and cleared by software to enable/disable interrupt caused by Rx FIFO overrun error.
0: Rx FIFO overrun error interrupt disabled
1: Rx FIFO overrun error interrupt enabled

Bit 4 **TXUNDERRIE**: Tx FIFO underrun error interrupt enable
Set and cleared by software to enable/disable interrupt caused by Tx FIFO underrun error.
0: Tx FIFO underrun error interrupt disabled
1: Tx FIFO underrun error interrupt enabled

Bit 3 **DTIMEOUTIE**: Data timeout interrupt enable
Set and cleared by software to enable/disable interrupt caused by data timeout.
0: Data timeout interrupt disabled
1: Data timeout interrupt enabled

Bit 2 **CTIMEOUTIE**: Command timeout interrupt enable
Set and cleared by software to enable/disable interrupt caused by command timeout.
0: Command timeout interrupt disabled
1: Command timeout interrupt enabled

Bit 1 **DCRCFAILIE**: Data CRC fail interrupt enable
Set and cleared by software to enable/disable interrupt caused by data CRC failure.
0: Data CRC fail interrupt disabled
1: Data CRC fail interrupt enabled

Bit 0 **CCRCFAILIE**: Command CRC fail interrupt enable
Set and cleared by software to enable/disable interrupt caused by command CRC failure.
0: Command CRC fail interrupt disabled
1: Command CRC fail interrupt enabled

34.10.14 SDMMC acknowledgment timer register (SDMMC_ACKTIMER)

Address offset: 0x040

Reset value: 0x0000 0000

This register contains the acknowledgment timeout period, in SDMMC_CK bus clock periods.

A counter loads the value from this register, and starts decrementing when the data path state machine (DPSM) enters the Wait_Ack state. If the timer reaches 0 while the DPSM is in this states, the acknowledgment timeout status flag is set.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	ACKTIME[24:16]								
							rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ACKTIME[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:0 **ACKTIME[24:0]**: Boot acknowledgment timeout period
This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).
Boot acknowledgment timeout period expressed in card bus clock periods.

Note: The data transfer must be written to the acknowledgment timer register before being written to the data control register.

34.10.15 SDMMC data FIFO threshold register (SDMMC_FIFOTHRR)

Address offset: 0x044

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	THR[3:0]			
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **THR[3:0]**: FIFO threshold
This bit can only be written by software when DPSM is inactive (DPSMACT = 0).
Define the data FIFO threshold:
0b0000:threshold = 0 byte (no threshold)
Others: threshold = $2^{(N-1)}$ bytes, threshold must not be programmed bigger than the FIFO size, 256 words.
Note: When THR > DBLOCKSIZE, blocks may not be transferred.

34.10.16 SDMMC DMA control register (SDMMC_IDMACTRLR)

Address offset: 0x050

Reset value: 0x0000 0000

The receive and transmit FIFOs can be read or written as 32-bit wide registers. The FIFOs contain 32 entries on 32 sequential addresses. This enables the CPU to use its load and store multiple operands to read from/write to the FIFO.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IDMABMODE	IDMAEN
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **IDMABMODE**: Buffer mode selection
This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
0: Single buffer mode.
1: Linked list mode.

Bit 0 **IDMAEN**: IDMA enable
This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
0: IDMA disabled
1: IDMA enabled

34.10.17 SDMMC IDMA buffer size register (SDMMC_IDMABSIZER)

Address offset: 0x054

Reset value: 0x0000 0000

This register contains the buffer size when in linked list configuration.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IDMABNDT[10]
															rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDMABNDT[9:0]										Res.	Res.	Res.	Res.	Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw						

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:6 **IDMABNDT[10:0]**: Number of bytes per buffer

This 11-bit value must be multiplied by 16 to get the size of the buffer in 32-bit words and by 64 to get the size of the buffer in bytes.
Example: IDMABNDT = 0x001: buffer size = 16 words = 64 bytes.
Example: IDMABNDT = 0x400: buffer size = 16384 words = 64 Kbytes.
These bits can only be written by firmware when DPSM is inactive (DPSMACT = 0).

Bits 5:0 Reserved, must be kept at reset value.

34.10.18 SDMMC IDMA buffer base address register (SDMMC_IDMABASER)

Address offset: 0x058

Reset value: 0x0000 0000

This register contains the memory buffer base address in single buffer configuration and linked list configuration.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IDMABASE[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDMABASE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	r	r

Bits 31:0 **IDMABASE[31:0]**: Buffer memory base address bits [31:2], must be word aligned (bit [1:0] are always 0 and read only)

This register can be written by firmware when DPSM is inactive (DPSMACT = 0), and can dynamically be written by firmware when DPSM active (DPSMACT = 1).

34.10.19 SDMMC IDMA linked list address register (SDMMC_IDMALAR)

Address offset: 0x064

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ULA	ULS	ABR	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw	rw	rw													
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDMALA[13:0]														Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		

Bit 31 **ULA**: Update SDMMC_IDMALAR from linked list when in linked list mode (SDMMC_IDMACTRLR.IDMABMODE select linked list mode)
This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
0: SDMMC_IDMALAR is not to be updated, last linked list item.
1: SDMMC_IDMALAR is to be updated from linked list table.

Bit 30 **ULS**: Update SDMMC_IDMABSIZE from the next linked list when in linked list mode (SDMMC_IDMACTRLR.IDMABMODE select linked list mode and ULA = 1)
This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
0: SDMMC_IDMABSIZER is not to be updated from next linked list table.
1: SDMMC_IDMABSIZER is to be updated from next linked list table.

Bit 29 **ABR**: Acknowledge linked list buffer ready
This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
This bit is not taken into account when starting the first linked list buffer from the software programmed register information. ABR is only taken into account on subsequent loaded linked list items.
0: Loaded linked list buffer is not ready (this causes a linked list IDMA transfer error to be generated).
1: Loaded linked list buffer ready acknowledge. Linked list buffer data are transfered by IDMA.

Bits 28:16 Reserved, must be kept at reset value.

Bits 15:2 **IDMALA[13:0]**: Word aligned linked list item address offset
Linked list item offset pointer to the base of the next linked list item structure.
Linked list item base address is IDMABA + IDMALA.
These bits can only be written by firmware when DPSM is inactive (DPSMACT = 0).

Bits 1:0 Reserved, must be kept at reset value.

34.10.20 SDMMC IDMA linked list memory base register (SDMMC_IDMABAR)

Address offset: 0x068

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IDMABA[29:14]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IDMABA[13:0]														Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		

Bits 31:2 **IDMABA[29:0]**: Word aligned Linked list memory base address
Linked list memory base pointer.
These bits can only be written by firmware when DPSM is inactive (DPSMACT = 0).

Bits 1:0 Reserved, must be kept at reset value.

34.10.21 SDMMC data FIFO registers x (SDMMC_FIFORx)

Address offset: 0x080 + 0x004 * x, (x =0 to 15)

Reset value: 0x0000 0000

The receive and transmit FIFOs can be only read or written as word (32-bit) wide registers. The FIFOs contain 16 entries on sequential addresses. This enables the CPU to use its load and store multiple operands to read from/write to the FIFO. The FIFO register interface takes care of correct data alignment inside the FIFO, the FIFO register address used by the CPU does matter.

When accessing SDMMC_FIFOR with half word or byte access an AHB bus fault is generated.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FIFODATA[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FIFODATA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **FIFODATA[31:0]**: Receive and transmit FIFO data

This register can only be read or written by firmware when the DPSM is active (DPSMACT = 1).

The FIFO data occupies 16 entries of 32-bit words.

34.10.22 SDMMC hardware configuration register 1 (SDMMC_HWCFGR1)

Address offset: 0x3F0

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FIFOSIZE[3:0]			
												r	r	r	r

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:0 **FIFOSIZE[3:0]**: SDMMC FIFO size

FIFO size = 2^{N+6} bytes, with N in the range 0 to 9

For FIFO size 2^6 bytes, the transfer beat is 8 (32 bytes)

For all other FIFO sizes, the transfer beat is 16 (64 bytes)

34.10.23 SDMMC version register (SDMMC_VERR)

Address offset: 0x3F4

Reset value: 0x0000 0030

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJREV[3:0]				MINREV[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: SDMMC major revision number

Bits 3:0 **MINREV[3:0]**: SDMMC minor revision number

34.10.24 SDMMC identification register (SDMMC_IPIDR)

Address offset: 0x3F8

Reset value: 0x0014 0022

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

35 Delay block (DLYB)

35.1 DLYB introduction

The delay block (DLYB) is used to generate two output clocks that are dephased from 2 input clocks. The phase of each output clock must be programmed by the user application. The output clocks are then used to clock the data transmitted/received by another peripheral such as an SDMMC or Octo-SPI interface.

35.2 DLYB main features

The delay block has the following features:

- Frequency range for Lock mode is [50 MHz, 208 MHz]
- 32 phases (delay taps)
- Bypass mode for operation below 50 MHz

35.3 DLYB implementation

Table 298. STM32MP21xx features

DLYB associated peripheral	DLYBOS1	DLYBSD1	DLYBSD2	DLYBSD3

SDMMC1	-	X	-	-
SDMMC2	-	-	X	-
SDMMC3	-	-	-	X

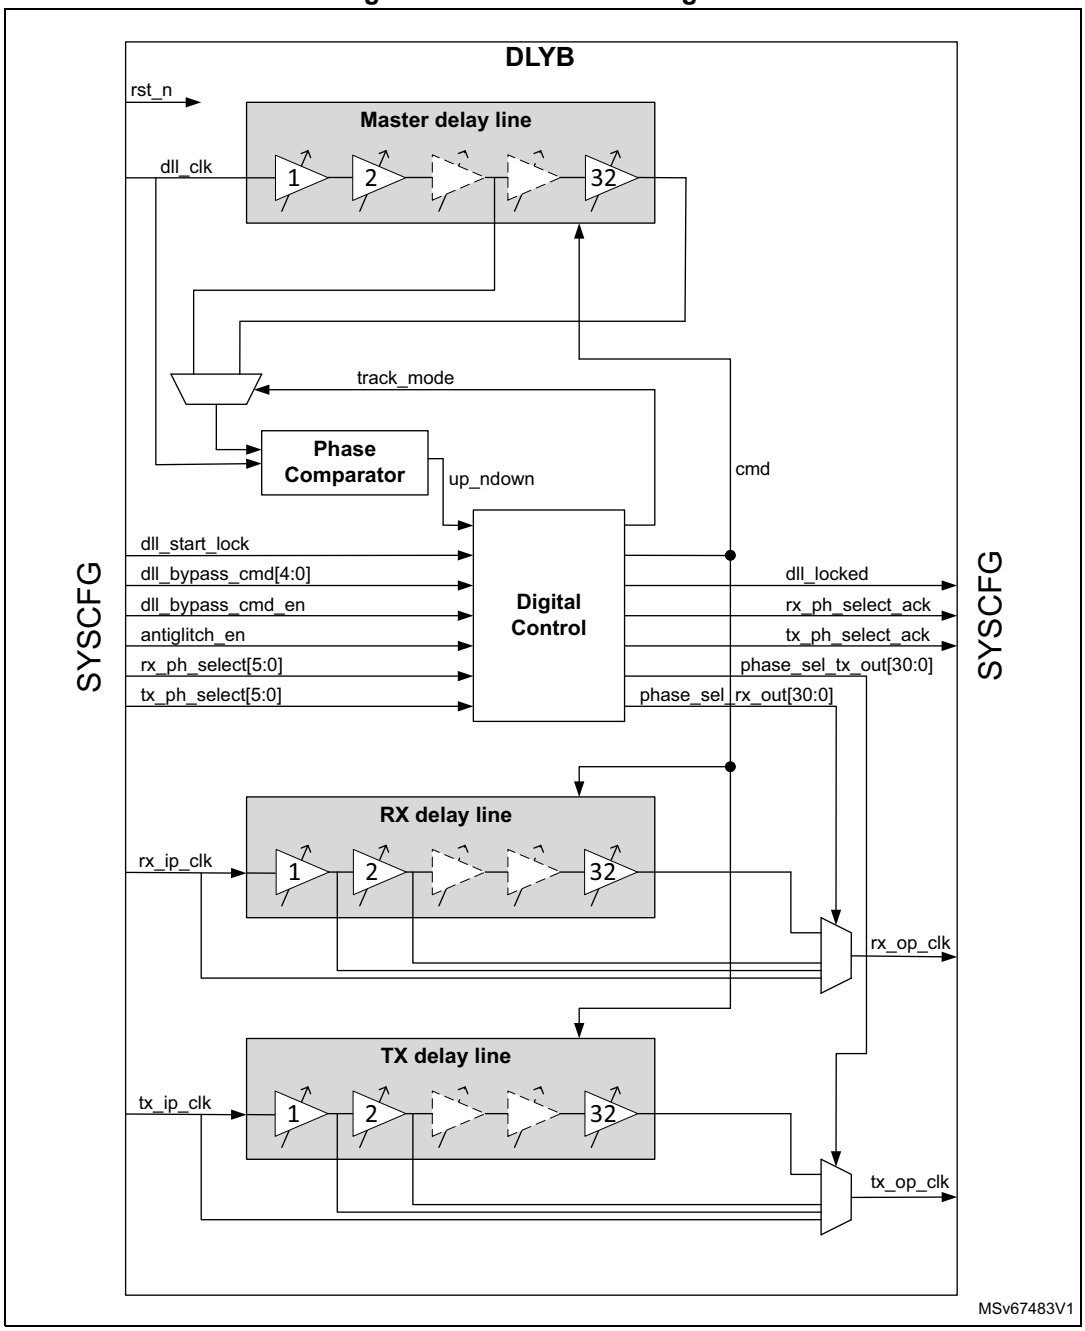
35.4 DLYB functional description

35.4.1 DLYB diagram

The delay block includes the following sub-blocks (shown in the figure below):

- Digital block to generate commands for delay lines and phase selection. This block embeds lock FSM.
- Delay line supporting the unit delays
- Output clock selection multiplexer

Figure 253. DLYB block diagram



35.4.2 DLYB internal signals

Table 299 lists the DLYB functional signals.

Table 299. DLYB functional signals

Signal name	Signal type	Description
dll_clk	Digital input	Free-running input clock used as reference clock for the Master delay line and FSM blocks
tx_ip_clk	Digital input	Input clock of the TX slave delay line
rx_ip_clk	Digital input	Input clock of the RX slave delay line
tx_op_clk	Digital output	Selected output clock of the TX slave delay line
rx_op_clk	Digital output	Selected output clock of the RX slave delay line
rst_n	Digital input	Asynchronous active low reset
dll_start_lock	Digital input	Enable of DLL when configured in Lock mode
dll_locked	Digital output	Lock indicator. When high, it indicates that the FSM has finished the lock sequence. The DLL can be used
tx_ph_select[5:0]	Digital input	Selection of the slave DLL phase shift over 33 for TX path 000000: 0 tap selection 000001: 1 tap selection 011111: 31 taps selection 1xxxxx: 32 taps selection
tx_ph_select_ack	Digital output	When high: phase selected by tx_ph_select is acknowledged When low: output clock tx_op_clk is tied low
rx_ph_select[5:0]	Digital input	Selection of the slave DLL phase shift over 33 for RX path 000000: 0 tap selection 000001: 1 tap selection 011111: 31 taps selection 1xxxxx: 32 taps selection
rx_ph_select_ack	Digital output	When high: phase selected by rx_ph_select is acknowledged When low: output clock rx_op_clk is tied low
antiglitch_en	Digital input	When high: output clocks (tx_op_clk or rx_op_clk) when minimum delay is selected (tx_ph_select = 0 or rx_ph_select=0) are gated to avoid any glitch when phase selection changes When low: output clocks (tx_op_clk or rx_op_clk) when minimum delay is selected (tx_ph_select = 0 or rx_ph_select=0) are not gated (possible glitches if input clocks (tx_ip_clk or rx_ip_clk) are enabled when phase selection changes)
dll_bypass_cmd_en	Digital input	Active high: use dll_bypass_cmd for command generation
dll_bypass_cmd[4:0]	Digital input	permits to force delays for all taps when dll_bypass_cmd_en high: 00000: not functional 00001: pass gate 0 is activated (min delay) 00010: pass gate 1 is activated 11000: pass gate 23 is activated 11001 to 11111: pass gate 23 is activated (max delay)

Table 300 lists the DLYB interconnections. The SYSCFG registers are highlighted in light gray, RCC registers in dark gray and peripheral ports in blue.

35.4.3 General description

The delay block is structured around one master delay line and two slave delay lines (RX and TX) and there are two operating modes:

- Lock mode (*dll_bypass_cmd_en* = 0)
  - This mode can only be used when the frequency of dll_clk is in the range [50 MHz, 208 MHz]
  - The delay block is enabled by setting *dll_start_lock* to ‘1’.
  - The delay block locks on the frequency of the *dll_clk* input clock and compensates for voltage and temperature variations. This process determines the command to be applied to each of the 32 delay units (a.k.a. tap) of the master delay line for the total master delay to represent one period of *dll_clk*. This command is copied to each delay unit of the RX and TX delay lines. The command varies with voltage and temperature for the DLL to remain locked. This guarantees that each delay unit of the RX and TX delay lines represents 1/32th of the input clock period.
  - Independent delay values can be selected for the RX and TX delay lines by controlling *rx_ph_select[5:0]* and *tx_ph_select[5:0]* parameters. The granularity of the delay is 1/32th of the input clock period.
- Bypass mode (*dll_bypass_cmd_en* = 1)
  - This mode is required to be able to insert a delay between the *rx_ip_clk* (resp. *tx_ip_clk*) input clock and the *rx_op_clk* (resp. *tx_op_clk*) output clock when the operating frequency is lower than the minimum frequency supported by the delay block in lock mode (frequency < 50 MHz). This is necessary to support OCTOSPI devices in DTR mode at low frequency for which DQS must be delayed to sample data.
  - In this mode, delays in the RX and TX delay lines are used as “pure” delays, i.e. without trying to lock on the frequency of the *dll_clk* input clock. There is therefore no voltage nor temperature compensation in this mode and the RX and TX delay values vary with voltage and temperature. The command applied to each delay unit of the RX and TX delay lines is controlled by *dll_bypass_cmd[4:0]*. Each delay

unit includes 24 delay elements. The number of delay elements which are enabled in each delay unit depends on the value of *dll_bypass_cmd[4:0]*.

– Independent delay values can be selected for the RX and TX delay lines by controlling *rx_ph_select[5:0]* and *tx_ph_select[5:0]* parameters. The total delay inserted by the RX (resp. TX) delay line depends on *rx_ph_select[5:0]* (resp. *tx_ph_select[5:0]*) and *dll_bypass_cmd[4:0]* values.

35.4.4 Lock mode procedure

For frequencies greater or equal to 50MHz, procedure is given below:

1. When *rst_n* is low, DLYB lock FSM is put in Idle mode. Note that *dll_start_lock* must be set to ‘0’ during hard reset.
2. Once the input signal *dll_clk* is stable (after a frequency switch for example) the lock sequence can be started by setting *dll_start_lock* to ‘1’ and maintain this value.
3. During lock sequence DLYB can not be used until *dll_locked* flag is set to ‘1’.
4. Once it is done, delay line for master and slaves are PVT compensated (tracking V and T evolution but not a frequency switch).
5. Then the phase can be programmed using *tx_ph_select[5:0]* and *rx_ph_select[5:0]* input signals. The selected delays are applied to TX output clock and RX output clock once *tx_ph_select_ack* and *rx_ph_select_ack* are set to ‘1’ respectively.
6. If another lock sequence is needed, for a frequency switch for example, *dll_start_lock* signal must go to ‘0’ and sequence can be restarted with step 2.

35.4.5 Bypass mode procedure

For frequencies lower the 50 MHz, procedure is given below:

1. When *rst_n* is low, DLYB lock FSM is put in Idle mode. Note that *dll_start_lock* must be set to ‘0’ during hard reset.
2. Delay block is enabled by setting *dll_bypass_cmd_en* to ‘1’. The command applied to every delay unit is defined by *dll_bypass_cmd[4:0]* input (the value 0 is reserved and must not be used).
3. The phase can be programmed using *tx_ph_select[5:0]* and *rx_ph_select[5:0]* input signals. The selected delays are applied to TX output clock and RX output clock once *tx_ph_select_ack* and *rx_ph_select_ack* are set to ‘1’ respectively. For minimum delay, *tx_ph_select[5:0]* (resp. *rx_ph_select[5:0]*) must be set to 0.

36 Analog-to-digital converters (ADC)

36.1 ADC introduction

This section describes the implementation of up to 2 ADCs:

- ADC1 and ADC2 are controlled independently.

Each ADC consists of one 12-bit successive approximation analog-to-digital converter.

Each ADC has up to 20 multiplexed channels. A/D conversion of the various channels can be performed in single, continuous, scan, or discontinuous mode. The result of the ADC is stored in a left-aligned or right-aligned (default configuration) 32-bit data register.

The ADCs are mapped on the AHB bus to allow fast data handling.

The analog watchdog features allow the application to detect if the input voltage goes outside the user-defined high or low thresholds.

A built-in hardware oversampler allows improving analog performances while off-loading the related computational burden from the CPU.

An efficient low-power mode is implemented to allow very low consumption at low frequency.

36.2 ADC main features

- High-performance features
  - Up to 2 ADCs
    ADC1 is connected to 18 external channels + 2 internal channels
    ADC2 is connected to 14 external channels + 5 internal channels
  - 12, 10, 8 or 6-bit configurable resolution
  - ADC conversion time independent from the AHB bus clock frequency
  - Faster conversion time by lowering resolution
  - Management of single-ended and differential inputs (programmable per channels)
  - AHB slave bus interface to allow fast data handling
  - Offset calibration support
  - Channel-wise programmable sampling time
  - Flexible sampling time control
  - Fixed latency for a trigger to start of sampling
  - Up to 4 injected channels (analog inputs assignment to regular or injected channels is fully configurable)
  - Data alignment with in-built data coherency
  - Data can be managed by DMA for regular channel conversions
  - Data can be routed to MDF for post processing
  - Four dedicated data registers for the injected channels
- Low-power features
  - Speed adaptive low-power mode to reduce ADC consumption when operating at low frequency

  - Allows slow bus frequency application while keeping optimum ADC performance
  - Provides automatic control to avoid ADC overrun in low AHB bus clock frequency application (autodelayed mode)
- Oversampler
  - 32-bit data register
  - Oversampling ratio adjustable from 2 to 1024
  - Programmable data right and left shifts
- Data preconditioning
  - Gain compensation
  - Offset compensation
- Analog input channels
  - External analog inputs (per ADC): up to 18 GPIO pads
  - 1 channel for the internal reference voltage (V_{REFINT})
  - 1 channel for monitoring the external VBAT power supply pin
  - 1 channel connected to the analog positive reference voltage V_{REF+}
  - 1 channel for monitoring V_{DDCORE} internal voltage
  - 1 channel for monitoring V_{DDCPU} internal voltage
- Start-of-conversion can be initiated:
  - By software for both regular and injected conversions
  - By hardware triggers with configurable polarity (internal timer events or GPIO input events) for both regular and injected conversions
- Conversion modes
  - Each ADC can convert a single channel or can scan a sequence of channels
  - Single mode converts selected inputs once per trigger
  - Continuous mode converts selected inputs continuously
  - Discontinuous mode
- Interrupt generation at ADC ready, the end of sampling, the end of conversion (regular or injected), end of sequence conversion (regular or injected), analog watchdog 1, 2 or 3 or overrun events
- 3 analog watchdogs per ADC
- ADC input range: $V_{SSA} \leq V_{IN} \leq V_{REF+}$

Figure 254 shows the block diagram of one ADC.

36.4.3 ADC clocks

Dual clock domain architecture

The dual clock-domain architecture means that the ADC kernel clock is independent from the AHB bus clock that is used to access ADC registers.

The adc_ker_ck input clock can be selected between different clock sources (see *Figure 255: ADC clock scheme*). This selection is done in the RCC (refer to section *Reset and clock control (RCC)* for more information):

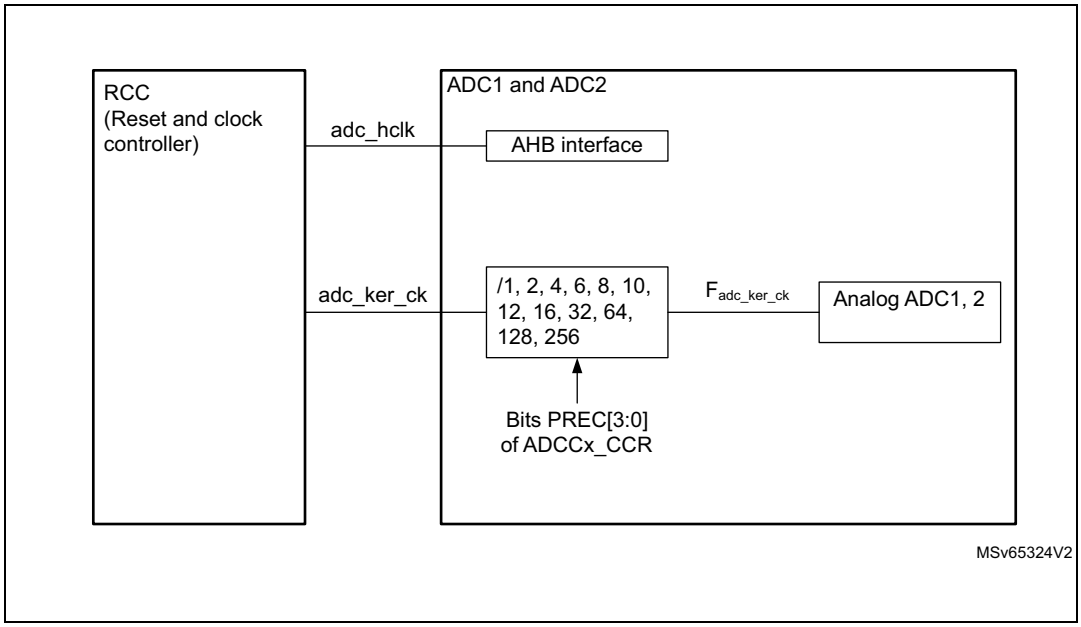
1. The ADC clock can be provided by an internal or external clock source, which is independent and asynchronous from the AHB clock.
2. The ADC clock can be derived from AHB clock (selected in RCC).

Option **1** has the advantage of achieving the maximum ADC clock frequency whatever the AHB clock scheme selected. The ADC clock can be divided by a 1, 2, 4, 6, 8, 12, 16, 32, 64, 128, or 256 ratio, using the prescaler configured through the PRESC[3:0] bits of the ADCC_CCR register.

Option **2** corresponds to a pseudosynchronous clock. This can be useful when the ADC is triggered by a timer and the application requires that the ADC is accurately triggered without any uncertainty (otherwise, an uncertainty of the trigger instant time is added by the resynchronizations between the two clock domains). This accurate trigger is supported only by trgo or trgo2 timer triggers.

The clock is configured through the RCC and must be compliant with the operating frequency specified in the device datasheet.

Figure 255. ADC clock scheme



Clock ratio constraint between ADC clock and AHB clock

There are no constraints to respect for the ratio between the ADC clock and the AHB clock. However, the ratio must be carefully chosen to avoid any overrun especially if the clock AHB is much slower than the ADC clock.

Constraints between ADC clocks

When several ADC interfaces are used simultaneously, it is mandatory to use the same clock source from the RCC block without prescaler ratio, for all ADC interfaces.

36.4.4 ADC connectivity

ADC inputs are connected to external channels as well as internal sources as described below.

Figure 256. ADC1 connectivity

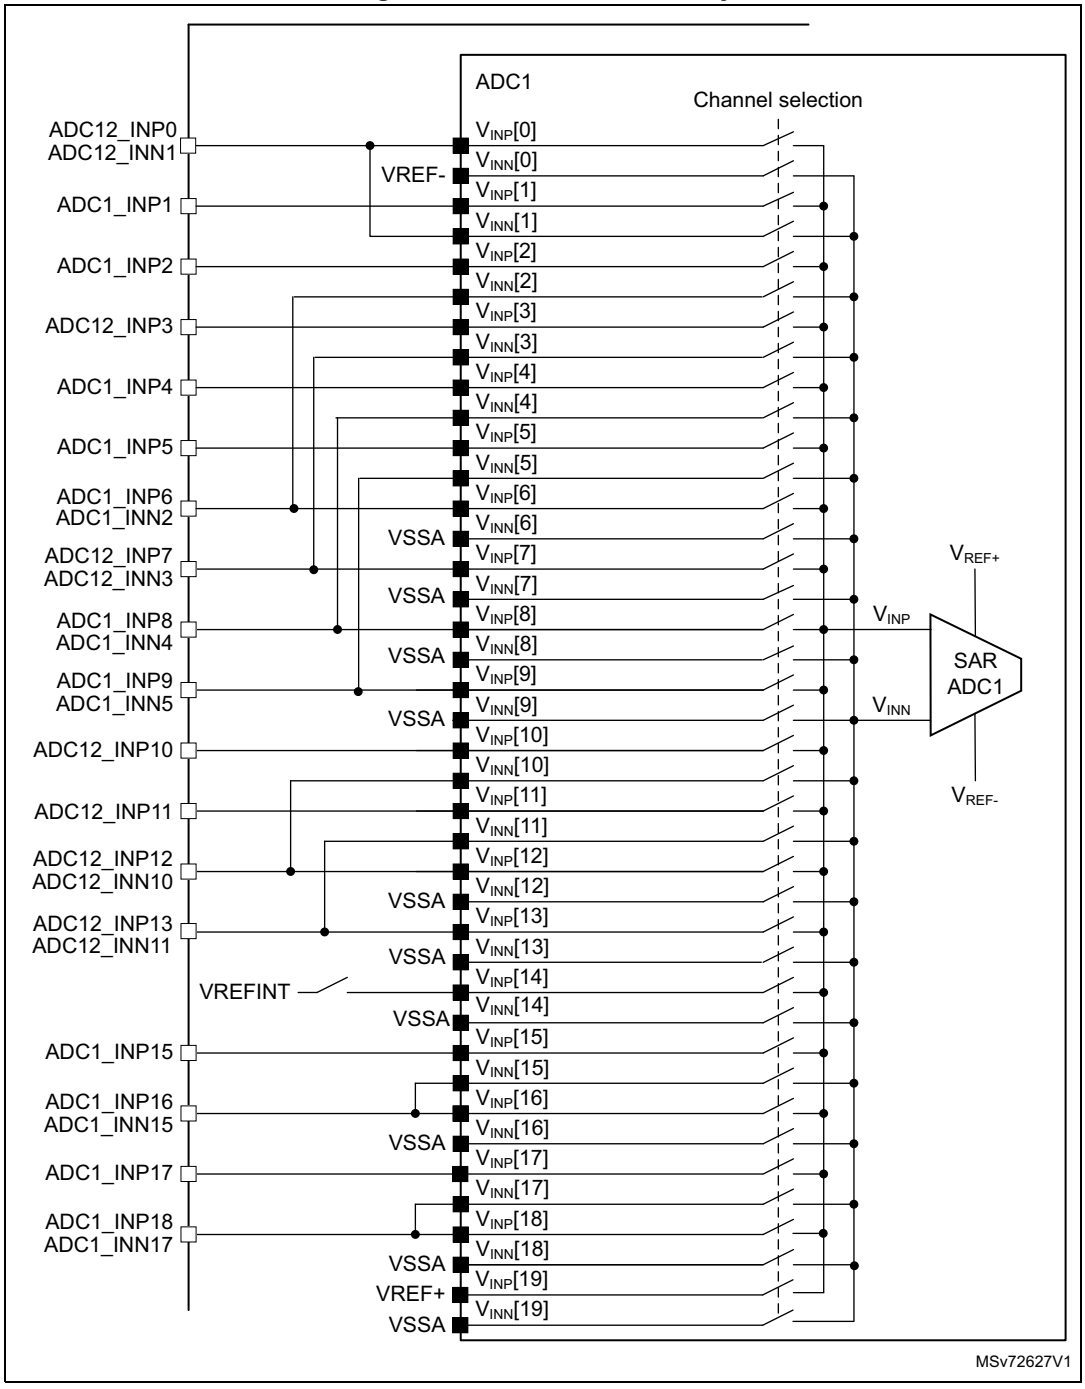


Figure 257. ADC2 connectivity

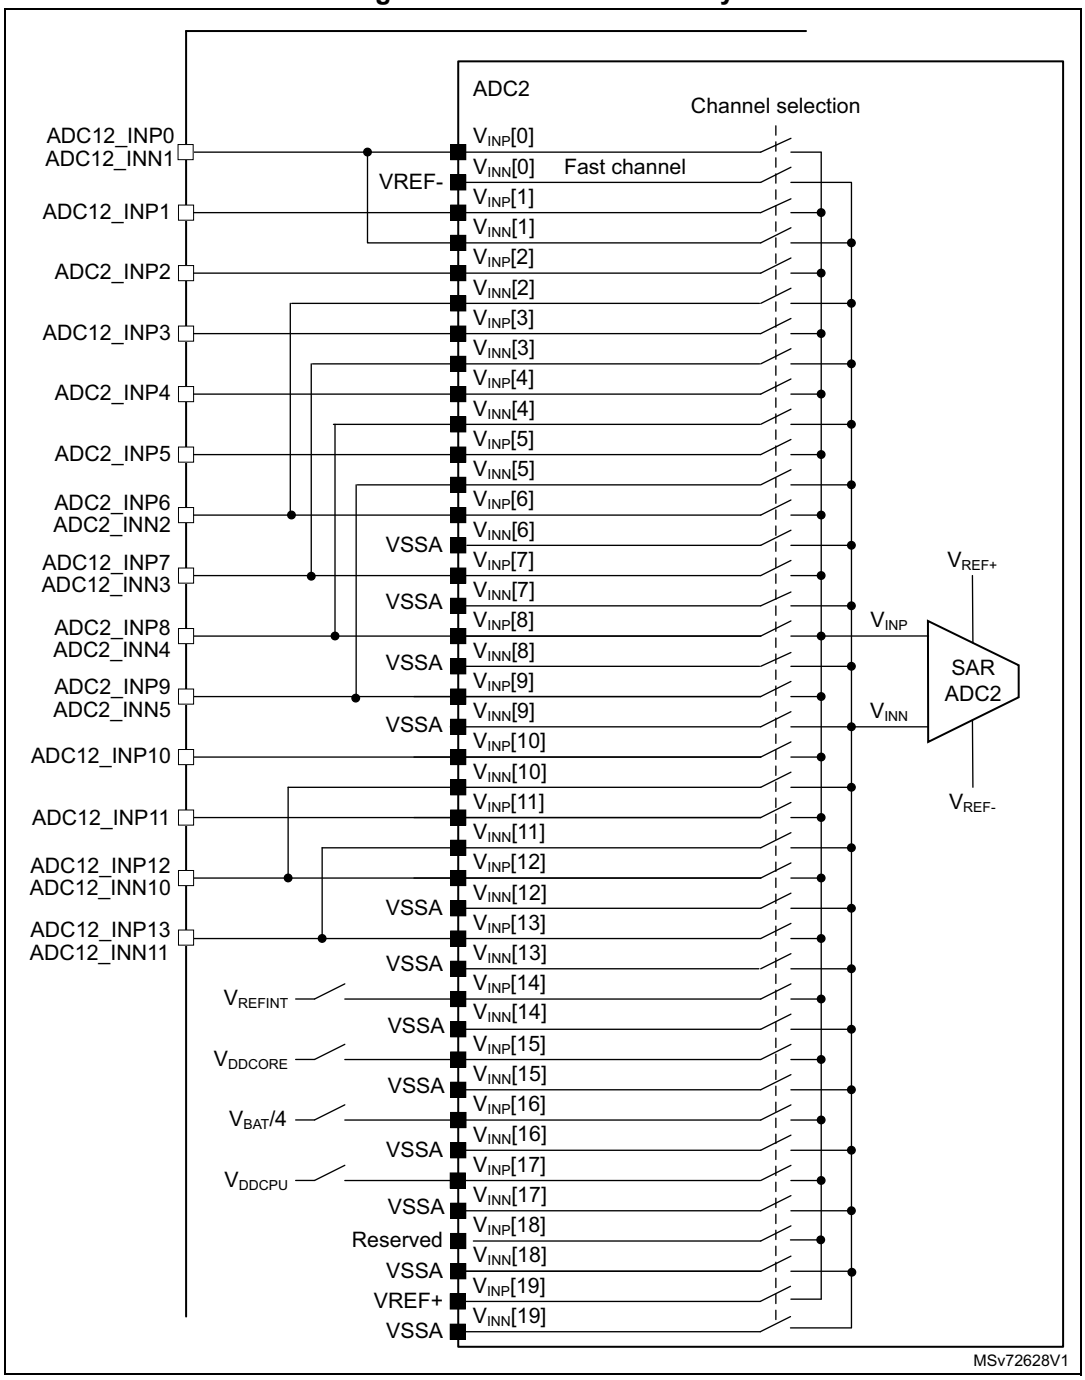


36.4.5 Slave AHB interface

The ADCs implement an AHB slave port for control/status register and data access. The features of the AHB interface are listed below:

- Word accesses
- Single cycle response
- Response to all read/write accesses to the registers with zero wait states, at the exception of ADC_ISR and ADC_AWDyLTR/HTR registers for which wait cycles are added for write operations.

The AHB slave interface does not support split/retry requests, and it can generate AHB error in case of wrong HSIZE.

36.4.6 ADC Deep-power-down mode (DEEPPWD)

By default, the ADC is in deep-power-down mode where its supply voltage is internally switched off to reduce the leakage currents (the reset state of DEEPPWD bit is 1 in the ADC_CR register).

To activate the ADC, first exit the Deep-power-down mode by clearing the DEEPPWD bit.

When ADC operations are complete, the ADC can be disabled by clearing the ADEN bit of the ADC_CR register.

Power can be saved by entering ADC Deep-power-down mode again (by setting DEEPPWD of ADC_CR register). This is particularly interesting before entering Stop mode.

36.4.7 Single-ended and differential input channels

ADC channels can be configured to be either single-ended inputs or differential inputs by programming DIFSEL[i] bits in the ADC_DIFSEL register. This configuration must be programmed when no ADC conversion is ongoing. Note that the DIFSEL[i] bits corresponding to single-ended channels must be programmed at 0.

In single-ended input mode, the analog voltage to be converted for channel "*i*" is the difference between the external voltage $V_{INP[i]}$ and V_{REF-}.

In differential input mode, the analog voltage to be converted for channel "*i*" is the difference between the external voltage $V_{INP[i]}$ (positive input) and $V_{INN[i]}$ (negative input).

In differential mode, the output data are unsigned data. When $V_{INP[i]}$ equals V_{REF-}, $V_{INN[i]}$ equals V_{REF+} and the output data is 0x000 (12-bit resolution mode). When $V_{INP[i]}$ equals V_{REF+}, $V_{INN[i]}$ equals V_{REF-} and the output data is 0xFFF.

$$\text{Converted value} = \frac{\text{ADC_Full_Scale}}{2} \times \left[1 + \frac{V_{INP} - V_{INN}}{V_{REF+}}\right]$$

When the ADC is configured in differential mode, the input signals are supposed to be differential (the common-mode voltage must be fixed at $V_{REF+}/2$ voltage).

Internal channels are used in single-ended mode only.

For a complete description of how the input channels are connected for each ADC, refer to *Section 36.4.4: ADC connectivity*.

Caution: When configuring channel "*i*" in differential input mode, its negative input voltage $V_{INN[i]}$ is connected to another channel. As a consequence, this channel is no longer usable in single-ended or differential mode, and must never be configured to be converted. Some channels are shared between ADCs: this can make the channel on the other ADCs unusable. The only exception is interleaved mode for ADC master and the slave.

36.4.8 Calibration (ADCAL, CALADDOS, ADC_CALFACT)

A software calibration is required before launching the application. During the calibration sequence, the ADC calculates a 9-bit calibration factor, which is then internally applied to the ADC. Each ADC must follow the calibration procedure to calibrate the zero offset.

The calibration removes the offset error that may vary from chip to chip due to process or bandgap variation. It is a prerequisite to any ADC operation.

The calibration factor to be applied for single-ended input conversions is different from the factor to be applied for differential input conversions:

- Clear ADCALDIF before launching a calibration that is applied for single-ended input conversions.
- Set ADCALDIF before launching a calibration that is applied for differential input conversions.

The calibration needs to be run by combinations of hardware and software. When the calibration procedure is complete, the calibration factor must be written to the CALFACT_S[8:0] bits for the single-ended calibration factor and CALFACT_D[8:0] for the differential calibration factor.

The calibration factor can be written only if the ADC is enabled and no conversion is ongoing (ADEN = 1, ADSTART = 0 and JADSTART = 0). It is recommended to calibrate again the ADC if V_{REF+} voltage changes of more than 10% (see *Section 36.4.32: Monitoring the internal voltage reference*).

Software procedure to calibrate the ADC

1. Ensure DEEPPWD = 0, ADEN = 1 and wait until the ADRDY bit is set.
2. Set ADCAL and ensure CALADDOS = 0.
3. Select the calibration input mode by clearing ADCALDIF (single-ended input).
4. Set the ADSTART bit in the ADC_CR register.
5. Wait until the ADSTART bit is cleared or the EOC flag is set.
6. Read the ADC_DR register, then copy the converted data to the memory.
7. Repeat from step 4 several times (for example eight times).
8. Average the data stored in memory by dividing the accumulated data by the number of the conversions
9. If the averaged data is zero, set CALADDOS. Repeat all steps from step 4.
10. Store the averaged data to CALFACT_S[8:0].
11. Select the calibration input mode by setting ADCALDIF (differential input).
12. Keep the same CALADDOS setting as the one obtained during the single-end calibration.
13. Repeat steps 4 to 8.
14. Subtract 0x7FF from the averaged data. If the result is positive, store it in the CALFACT_D[8:0] bitfield. If it is negative, set CALADDOS, then repeat steps from 4 to 8.
15. Subtract again 0x7FF from the new averaged data. The resulting value is positive. Store it in CALFACT_D[8:0].
16. CALADDOS is now set, so clear ADCALDIF, and repeat steps 4 to 8.
17. Store the averaged data in CALFACT_S[8:0].
18. Clear ADCAL bit.

Software procedure to reinject a calibration factor into the ADC

1. Ensure ADSTART = 0 and JADSTART = 0 (no conversion ongoing).
2. Set ADCAL.
3. Program CALADDOS, CALFACT_S and CALFACT_D with the new calibration factors.
4. Clear ADCAL.

Note: CALFACT_S and CALFACT_D limit the maximum value of the ADC digital output. For example, in single-ended mode, if CALFACT_S = 100, the maximum ADC data output is 4095 - 100 = 3995. When the CALADDOS bit is set, an analog positive offset of about 256 is internally added to the ADC input to allow the calibration of negative offset devices. The resulting calibration factor is approximately 256. The maximum ADC output is around 4095 - 256 = 3839.

Converting single-ended and differential analog inputs with a single ADC

If the ADC has to convert both differential and single-ended inputs, two calibrations must be performed, one with ADCALDIF = 0 and one with ADCALDIF = 1.

36.4.9 ADC on-off control (ADEN, ADDIS, ADRDY)

First, follow the procedure described in *Section 36.4.6: ADC Deep-power-down mode (DEEPPWD)*).

Once DEEPPWD is cleared, the ADC can be enabled. It requires a t_{STAB} stabilization time before starting converting accurately (see *Figure 258*).

Two control bits enable or disable the ADC:

- Set ADEN to enable the ADC. The ADRDY flag is set once the ADC is ready for operation.
- Set ADDIS to disable the ADC. ADEN and ADDIS are automatically deasserted by hardware as soon as the analog ADC is effectively disabled.

Regular conversions can then start either by setting ADSTART (refer to *Section 36.4.20: Conversion on external trigger and trigger polarity (EXTSEL, EXTEN, JEXTSEL, JEXTEN)*) or when an external trigger event occurs if regular triggers are enabled.

Injected conversions start by setting JADSTART or when an external injected trigger event occurs, if injected triggers are enabled.

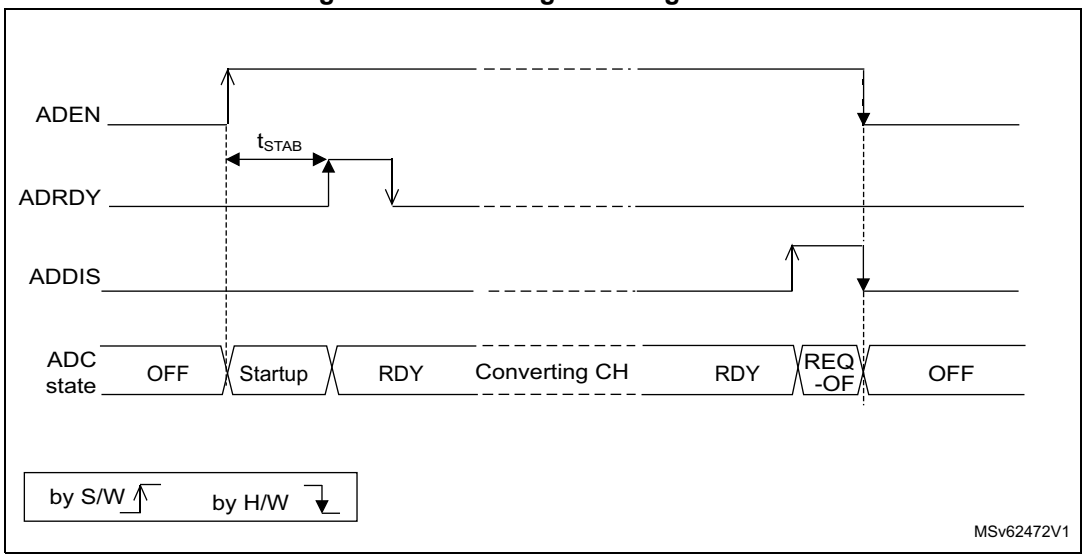
Software procedure to enable the ADC

1. Clear the ADRDY bit in the ADC_ISR register by programming it to 1.
2. Set ADEN.
3. Wait until ADRDY = 1 (ADRDY is set after the ADC startup time). This can be done by using the associated interrupt (ADRDYIE must be set).
4. Clear the ADRDY bit in the ADC_ISR register by programming it to 1 (optional).

Software procedure to disable the ADC

1. Check that both ADSTART = 0 and JADSTART = 0 to ensure that no conversion is ongoing. If required, stop all regular and injected ongoing conversions by setting ADSTP and JADSTP. Then wait until ADSTP = 0 and JADSTP = 0.
2. Set ADDIS.
3. If required by the application, wait for ADEN = 0, until the analog ADC is effectively disabled (ADDIS is automatically reset once ADEN = 0).

Figure 258. Enabling/disabling the ADC



36.4.10 Constraints when writing the ADC control bits

The software is allowed to write the RCC control bits to configure and enable the ADC clock (refer to RCC section) and configure the ADEN bit in the ADC_CR register, only if the ADC is disabled (ADEN must be cleared).

The software can write the ADSTART, JADSTART and ADDIS control bits in the ADC_CR register only if the ADC is enabled and there is no pending request to disable the ADC (ADEN must be equal to 1 and ADDIS to 0).

The following constraints apply to all the other control bits of the ADC_CFGRx, ADC_SMPRx, ADC_TRy, ADC_SQRy, ADC_JDRy, ADC_OFRy, ADC_OFCHRy and ADC_IER registers:

- For control bits related to configuration of regular conversions, the software is allowed to write them only if no regular conversions are ongoing (ADSTART must be cleared).
- For control bits related to configuration of injected conversions, the software is allowed to write them only if no injected conversions are ongoing (JADSTART must be cleared).
- ADC_TRy register thresholds can be modified when an analog-to-digital conversion is ongoing (refer to *Section 36.4.29: Analog window watchdog (AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWDCH of ADC_AWD2CR and ADC_AWD3CR, HTR, LTR, AWDFILT)* for details).
- To modify the all above control bits when the software trigger function is used, an ADSTP or JADSTP must be issued to make sure all activities are stopped, even if ADSTART and JADSTART are cleared.

The software is allowed to write the ADSTP or JADSTP control bits in the ADC_CR register only if the ADC is enabled and if there is no pending request to disable the ADC.

Note: Not all forbidden write accesses to ADC control bits are protected by hardware. In some cases, the ADC state may become unknown. To recover from this situation, the ADC must be disabled (ADEN = 0 as well as all the bits of the ADC_CR register).

36.4.11 Channel selection (ADC_SQRy, ADC_JSQR)

The ADC features up to 20 multiplexed channels per ADC, out of which:

- Up to 18 analog inputs coming from GPIO pads (ADCx_INN/INP[i]). Depending on the device, not all of them are available on GPIO pads.
- The ADC is connected to up to 5 internal analog inputs:
  - internal reference voltage (V_{REFINT})
  - V_{BAT} monitoring channel ($V_{BAT}/4$)
  - V_{REF+} positive reference voltage
  - V_{DDCORE} voltage
  - V_{DDCPU} voltage

  To convert one of the internal analog channels, the corresponding analog sources must first be enabled by programming VREFEN, VBATEN in the ADCC_CCR registers, or by enabling the corresponding bit in the *ADC option register (ADC_OR)*.

Refer to *ADC interconnection* tables in *Section 36.4.2: ADC pins and internal signals* for the connection of the above internal analog inputs to ADC pins.

The conversions can be organized in two groups: regular and injected. A group consists of a sequence of conversions that can be done on any channel and in any order. For instance, it is possible to implement the conversion sequence in the following order: ADCx_INN/INP3, ADCx_INN/INP8, ADCx_INN/INP2, ADCx_INN/INP2, ADCx_INN/INP0, ADCx_INN/INP2, and ADCx_INN/INP2.

- A **regular group** is composed of up to 16 conversions. The regular channels and their order in the conversion sequence must be selected in the ADC_SQRy registers. The total number of conversions in the regular group must be written in the LEN[3:0] bits in the ADC_SQR1 register.
- An **injected group** is composed of up to four conversions. The injected channels and their order in the conversion sequence must be selected in the ADC_JSQR register. The total number of conversions in the injected group must be written in the JLEN[1:0] bits in the ADC_JSQR register.

ADC_SQRy registers must not be modified while a regular conversion is ongoing. ADC regular conversions must consequently be stopped by setting ADSTP (refer to *Section 36.4.19: Stopping an ongoing conversion (ADSTP, JADSTP)*).

36.4.12 Channel preselection register (ADC_PCSEL)

The PCSEL bit of the ADC_PCSEL register controls the analog switch integrated in the I/O.

For each channel selected through SQRx or JSQRx bits, the corresponding PCSEL bit must be configured in advance in the ADC_PCSEL register. The ADC input multiplexer selects the ADC input according to SQRx and JSQRx configuration with very high speed. The analog switch integrated in the I/O cannot react as fast as the ADC multiplexer. To avoid the delay due to the analog switch control on the I/O, it is necessary to preselect the input channels that are selected through the SQRx and JSQRx. The selection is based on the V_{INP} of each ADC input. For example, if the ADC converts ADCx_INN/INP1, PCSEL1 bit must also be set in ADC_PCSEL register. If ADCx_INN/INP1 is configured as a differential channel, both PCSEL1 and PCSEL0 must be set, which corresponds to ADC1_INN1 and ADC2_INN1.

Note: Configuring the PCSEL bit is not necessary for the internal channels (such as V_{REFINT}).

36.4.13 Channel-wise programmable sampling time (SMPR1, SMPR2)

Before starting a conversion, the ADC must establish a direct connection between the voltage source under measurement and the embedded sampling capacitor of the ADC. This sampling time must be sufficient for the input voltage source to charge the embedded capacitor to the input voltage level.

Each channel can be sampled with a different sampling time, which is programmable through the SMP[2:0] bits of the ADC_SMPR1 and ADC_SMPR2 registers. It is therefore possible to select among the following sampling time values:

- SMP = 000: 1.5 ADC clock cycles
- SMP = 001: 2.5 ADC clock cycles
- SMP = 010: 6.5 ADC clock cycles
- SMP = 011: 11.5 ADC clock cycles
- SMP = 100: 23.5 ADC clock cycles
- SMP = 101: 46.5 ADC clock cycles
- SMP = 110: 246.5 ADC clock cycles
- SMP = 111: 1499.5 ADC clock cycles

The total conversion time is calculated as follows (12-bit mode):

$$T_{CONV} = \text{Sampling time} + 13.5 \text{ ADC clock cycles}$$

Example

With $F_{adc_ker_ck}$ = 30 MHz and a sampling time of 1.5 ADC clock cycles:

$$T_{CONV} = (1.5 + 13.5) \times \text{ADC clock cycles} = 15 \text{ ADC clock cycles} = 500 \text{ ns}$$

The ADC notifies the end of the sampling phase by asserting the EOSMP flag (only for regular conversion).

Constraints on the sampling time

For each channel, SMP[2:0] bits must be programmed to respect a minimum and a maximum sampling times as specified in the ADC characteristics section of the datasheets.

Bulb sampling mode

The bulb sampling mode enables to obtain longer sampling time.

When the BULB bit is set in the ADC_CFGR2 register, the sampling period starts immediately after the last ADC conversion. A hardware or software trigger starts the conversion after the sampling time has been programmed in ADC_SMPRx registers. The very first ADC conversion after the ADC is enabled, is performed with the sampling time programmed in SMP bits. The bulb mode is effective starting from the second conversion.

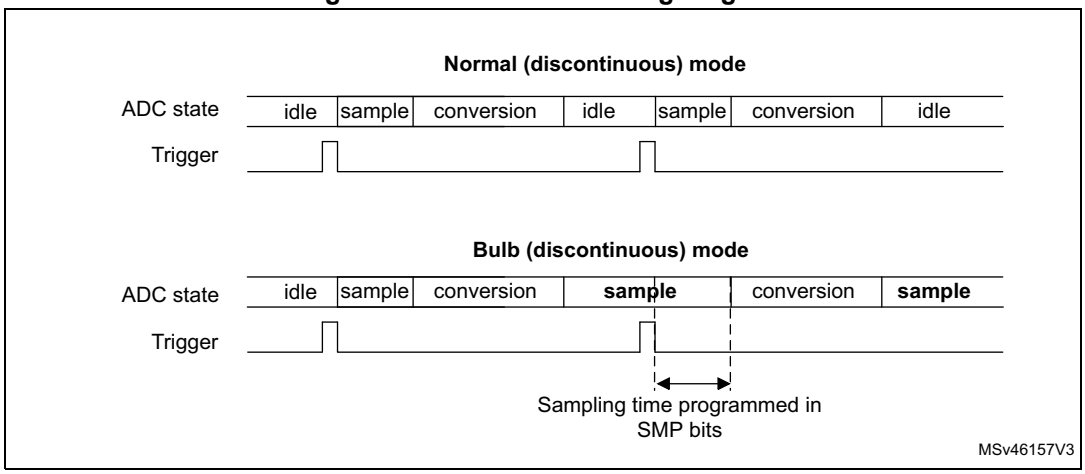
The maximum sampling time is limited (refer to the ADC characteristics section of the datasheet).

Bulb mode is supported exclusively in regular conversion; dual mode is not supported.

The BULB bit can be modified only when the ADEN bit of the ADC_CR register is cleared.

When the BULB bit is set, it is not allowed to set the SMPTRIG bit in ADC_CFGR2.

Figure 259. Bulb mode timing diagram



Sampling time control trigger mode

When the SMPTRIG bit is set, the sampling time programmed through SMPx bits is not applicable. The sampling time is controlled by the trigger signal edge.

When a hardware trigger is selected (EXTEN[1:0] = 01), each rising edge of the trigger signal starts the sampling period. A falling edge ends the sampling period and starts the conversion.

Due to the synchronization mechanism, the minimum allowed pulse width is seven adc_ker_ck periods.

When a software trigger is selected (EXTEN[1:0] = 00), the software trigger is not the ADSTART bit of ADC_CR but the SWTRIG bit. The SWTRIG bit has to be set to start the sampling period, and it has to be cleared to end the sampling period and start the conversion. In this mode, the minimum sampling time is limited to seven ADC clock cycles.

The maximum sampling time is limited (refer to the ADC characteristics section of the datasheet).

This mode is only compatible with the discontinuous mode. DISCNUM must be cleared for regular conversion mode. It is not supported for injected conversion mode and autoinjection mode.

When the SMPTRIG bit is set, setting the BULB bit is not allowed and only regular conversion is supported.

36.4.14 Single conversion mode

To enable the single conversion mode for regular channels, clear both CONT and DISCEN bits in ADC_CFGR1 register. To enable it on injected channel, clear JDISCEN bit.

In single conversion mode, the ADC performs once all the regular conversions of the programmed channels. This mode is started by one of the following events:

- ADSTART bit set in the ADC_CR register (for a regular channel)
- JADSTART bit set in the ADC_CR register (for an injected channel)
- An external hardware trigger event (for a regular or injected channel)

Inside the regular sequence, after each conversion is complete:

- The converted data are stored into the 32-bit 8-level FIFO accessible through the ADC_DR register,
- The EOC (end of regular conversion) flag is set, and
- An interrupt is generated if the EOCIE bit is set.

Inside the injected sequence, after each conversion is complete:

- The converted data are stored into one of the four 32-bit ADC_JDRy registers,
- The JEOC (end of injected conversion) flag is set, and
- An interrupt is generated if the JEOCIE bit is set.

After the regular sequence is complete:

- The EOS (end of regular sequence) flag is set, and
- An interrupt is generated if the EOSIE bit is set.

After the injected sequence is complete:

- The JEOS (end of injected sequence) flag is set, and
- An interrupt is generated if the JEOSIE bit is set.

The ADC then stops until a new external regular or injected trigger occurs or until the ADSTART or JADSTART bit is set again.

Note: To convert a single channel, program a sequence with a length of 1.

36.4.15 Continuous conversion mode (CONT = 1)

This mode applies to regular channels only.

In continuous conversion mode, when a software or hardware regular trigger event occurs, the ADC performs once all the regular conversions of the channels and then automatically restarts and continuously converts all the conversions of the sequence. This mode is started by setting the CONT bit of the ADC_CFGR1 register, either by an external trigger or by setting the ADSTART bit in the ADC_CR register.

Inside the regular sequence, after each conversion is complete:

- The converted data are stored into the eight 32-bit word FIFO accessible through the ADC_DR register.
- The EOC (end of conversion) flag is set, and
- An interrupt is generated if the EOCIE bit is set.

After the sequence of conversions is complete:

- The EOS (end of sequence) flag is set, and
- An interrupt is generated if the EOSIE bit is set.

Then, a new sequence restarts immediately and the ADC continuously repeats the conversion sequence.

Note: To convert a single channel, program a sequence with a length of 1.

It is not possible to have both discontinuous mode and continuous mode enabled, this means that it is forbidden to set both DISCEN and CONT bits.

Injected channels cannot be converted continuously. The only exception is when an injected channel is configured to be converted automatically after regular channels in continuous mode (using JAUTO bit) (refer to Section : Autoinjection mode).

36.4.16 Discontinuous mode (DISCEN, DISCNUM, JDISCEN)

Regular group mode

This mode is enabled by setting the DISCEN and CONT = 0 bit in the ADC_CFGR1 register.

It is used to convert a short sequence (subgroup) of n conversions (n ≤ 8) that is part of the sequence of conversions selected in the ADC_SQRy registers. The value of n is specified by writing to the DISCNUM[2:0] bits in the ADC_CFGR1 register.

When an external trigger occurs, it starts the next n conversions selected in the ADC_SQRy registers until all the conversions in the sequence are done. The total sequence length is defined by the LEN[3:0] bits in the ADC_SQR1 register.

Example:

- DISCEN = 1, n = 3, channels to be converted = 1, 2, 3, 6, 7, 8, 9, 10, 11
  - First trigger: channels converted are 1, 2, 3 (an EOC event is generated at the end of each conversion).
  - Second trigger: channels converted are 6, 7, 8 (an EOC event is generated at the end of each conversion).
  - Third trigger: channels converted are 9, 10, 11 (an EOC event is generated at the end of each conversion) and an EOS event is generated after the conversion of channel 11.
  - Fourth trigger: channels converted are 1, 2, 3 (an EOC event is generated at the end of each conversion).
  - ...
- DISCEN = 0, channels to be converted = 1, 2, 3, 6, 7, 8, 9, 10,11
  - First trigger: the complete sequence is converted: channel 1, then 2, 3, 6, 7, 8, 9, 10 and 11. Each conversion generates an EOC event and the last one also generates an EOS event.
  - All the next trigger events relaunch the complete sequence.

Note: The channel numbers referred to in the above example might not be available on all devices.

When a regular group is converted in discontinuous mode, no rollover occurs (the last subgroup of the sequence can have less than n conversions).

When all subgroups are converted, the next trigger starts the conversion of the first subgroup. In the example above, the fourth trigger reconverts the channels 1, 2 and 3 in the first subgroup.

It is not possible to have both discontinuous mode and continuous mode enabled. In this case (if DISCEN = 1, CONT = 1), the ADC behaves as if continuous mode was disabled.

Injected group mode

This mode is enabled by setting the JDISCEN bit in the ADC_CFGR1 register. It converts the sequence selected in the ADC_JSQR register, channel by channel, after an external injected trigger event. This is equivalent to discontinuous mode for regular channels with DISCNUM = 0.

When an external trigger occurs, it starts the next channel conversions selected in the ADC_JSQR registers until all the conversions in the sequence are done. The total sequence length is defined by the JLEN[1:0] bits in the ADC_JSQR register.

Example:

- JDISCEN = 1, channels to be converted = 1, 2, 3
  - First trigger: channel 1 converted (a JEOC event is generated)
  - Second trigger: channel 2 converted (a JEOC event is generated)
  - Third trigger: channel 3 converted and a JEOC event + a JEOS event are generated
  - ...

Note: The channel numbers referred to in the above example might not be available on all devices.

When all injected channels have been converted, the next trigger starts the conversion of the first injected channel. In the example above, the fourth trigger reconverts the first injected channel 1.

It is not possible to use both autoinjection mode and discontinuous mode simultaneously: the bits DISCEN and JDISCEN must be kept cleared by software when JAUTO is set.

36.4.17 Starting conversions (ADSTART, JADSTART)

ADC regular conversions can be started by setting ADSTART.

When ADSTART is set, the conversion starts:

- Immediately if EXTEN[1:0] = 00 (software trigger), or
- At the next active edge of the selected regular hardware trigger, if EXTEN[1:0] is not equal to 00.

The application software starts ADC injected conversions by setting JADSTART.

When JADSTART is set, the conversion starts:

- Immediately if JEXTEN[1:0] = 00 (software trigger), or
- At the next active edge of the selected injected hardware trigger, if JEXTEN[1:0] is not equal to 00.

Note: In autoinjection mode (JAUTO = 1), use the ADSTART bit to start regular conversions followed by autoinjected conversions (JADSTART must be kept cleared).

When the hardware trigger is enabled, ADSTART and JADSTART also indicate whether an ADC operation is ongoing. The ADC can be reconfigured while ADSTART and JADSTART are both cleared, indicating that the ADC is idle.

In the case of software triggering, ADSTP and/or JADSTP must be set before ADC reconfiguration.

ADSTART is deasserted by hardware:

- In single mode with software regular trigger (CONT = 0, EXTEN = 0x0): at any end of regular conversion sequence (EOS assertion)
- In discontinuous mode (CONT = 0, DISCEN = 1, DISCNUM= x): at any of subgroup sequence
- In all cases (CONT and EXTEN don't care), after execution of the ADSTP procedure asserted by the software

Note: In continuous mode (CONT = 1), ADSTART is not deasserted by hardware when EOS is asserted because the sequence is automatically relaunched.

When a hardware trigger is selected in single mode (CONT = 0 and EXTEN ≠ 0x00), ADSTART is not deasserted by hardware when EOS is asserted to help the software that does not need to reset ADSTART again for the next hardware trigger event. This ensures that no further hardware triggers are missed.

JADSTART is deasserted by hardware:

- In single mode with software injected trigger (JEXTEN = 0x0): at the end of each injected conversion sequence (JEOS assertion)
- In discontinuous mode (JDISCEN = 1): at the end of any conversion
- In all cases (JEXTEN=x), after execution of the JADSTP procedure asserted by the software

Note: When the software trigger is selected, the ADSTART bit must not be set if the EOC flag is still high.

In bulb mode (BULB = 1), the previous end-of-conversion automatically starts the sampling, then setting ADSTART starts the conversion including the programmed sampling time.

In sampling time control trigger mode (SMPTRIG = 1), SWTRIG bit must be set to start the conversion.

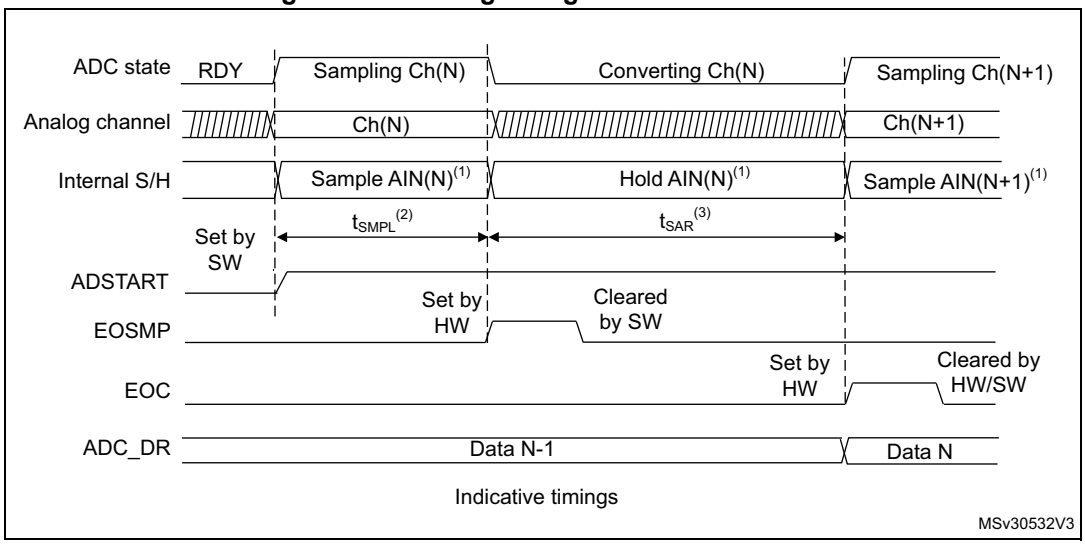
36.4.18 Timing

The elapsed time between the start of a conversion and the end of a conversion is the sum of the configured sampling time plus the successive approximation time depending on data resolution:

$T_{CONV} = T_{SMPL} + T_{SAR} = [1.5\ _{|min} + 13.5\ _{|12bit}] \times T_{ADC_CLK}$

$T_{CONV} = T_{SMPL} + T_{SAR} = 50\ ns\ _{|min} + 450\ ns\ _{|12bit} = 500\ ns$ (for $F_{adc_ker_ck} = 30\ MHz$)

Figure 260. Analog-to-digital conversion time



1. AIN represents the input voltage captured by the internal Sample and Hold (S/H) capacitor.
2. t_{SMPL} depends on SMP[2:0].
3. t_{SAR} depends on RES[2:0].

Note: The bulb and the sampling time control trigger modes are not described in Figure 260: Analog-to-digital conversion time.

36.4.19 Stopping an ongoing conversion (ADSTP, JADSTP)

The software can decide to stop ongoing regular conversions by setting ADSTP and ongoing injected conversions by setting JADSTP.

Stopping conversions resets the ongoing ADC operation. The ADC can then be reconfigured (for example by changing the channel selection or the trigger). It is then ready for a new operation.

Injected conversions can be stopped while regular conversions are still ongoing and vice versa. This allows, for instance, the reconfiguration of the injected conversion sequence and triggers while regular conversions are still ongoing (and vice versa).

When the ADSTP bit is set by software, any ongoing regular conversion is aborted with the partial result discarded (the ADC_DR register is not updated with the current conversion).

When the JADSTP bit is set by software, any ongoing injected conversion is aborted with partial result discarded (the ADC_JDRy register is not updated with the current conversion). The scan sequence is also aborted and reset (meaning that relaunching the ADC restarts a new sequence).

Once this procedure is complete, ADSTP/ADSTART bits (for regular conversion), or JADSTP/JADSTART bits (for injected conversion) are deasserted by hardware and the software must poll ADSTART (or JADSTART) until the bit is reset before assuming the ADC is completely stopped.

Note: In autoinjection mode (JAUTO = 1), setting the ADSTP bit aborts both regular and injected conversions (JADSTP must not be used).

Figure 261. Stopping ongoing regular conversions

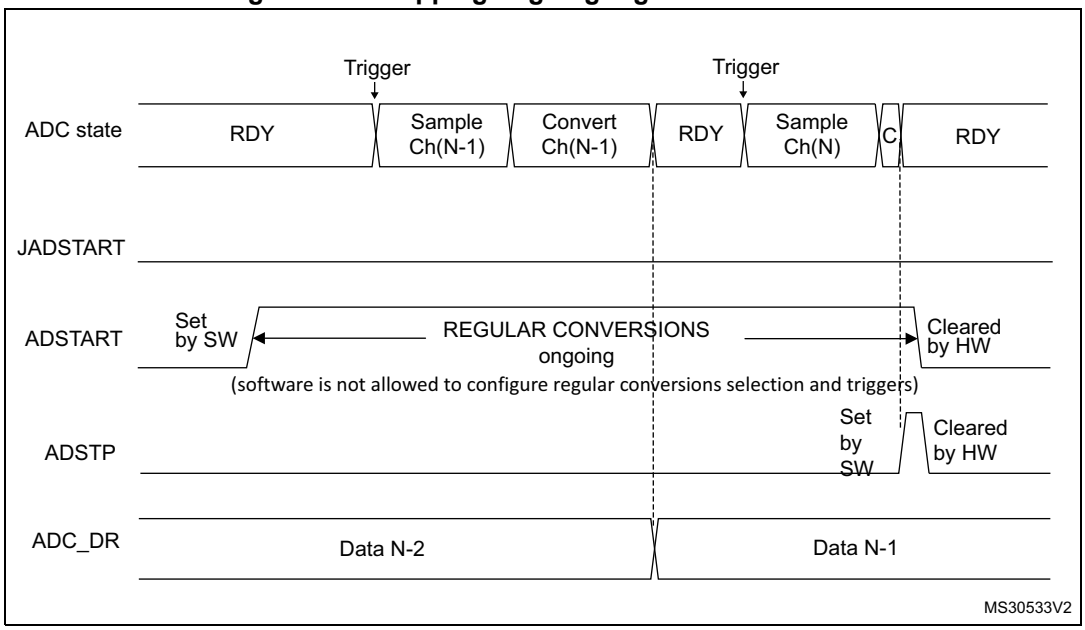


Figure 262. Stopping ongoing regular and injected conversions

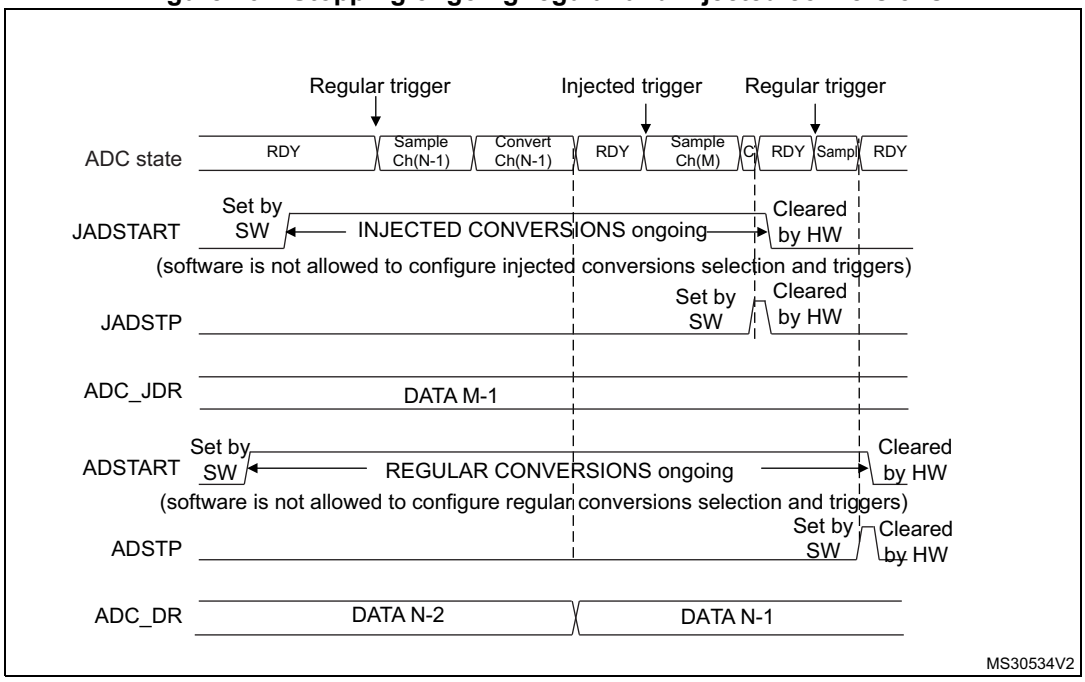


36.4.20 Conversion on external trigger and trigger polarity (EXTSEL, EXTEN, JEXTSEL, JEXTEN)

A conversion or a sequence of conversions can be triggered either by software or by an external event (for example timer capture, input pins). If the EXTEN[1:0] control bits (for a regular conversion) or JEXTEN[1:0] bits (for an injected conversion) are different from 0b00, then external events are able to trigger a conversion with the selected polarity.

The regular trigger selection is effective once the software has set ADSTART while the injected trigger selection is effective once the software has set JADSTART bit.

All hardware triggers that occur while a conversion is ongoing are ignored:

- If ADSTART = 0, regular hardware triggers are ignored.
- If JADSTART = 0, injected hardware triggers are ignored.

Table 307 provides the correspondence between the EXTEN[1:0] and JEXTEN[1:0] values and the trigger polarity.

Table 307. Configuring the trigger polarity for regular external triggers

EXTEN[1:0]	Source
00	Hardware trigger detection disabled, software trigger detection enabled
01	Hardware trigger with detection on the rising edge (sampling time controlled in SMPTRIG mode)
10	Hardware trigger with detection on the falling edge
11	Hardware trigger with detection on both the rising and falling edges

Note: The polarity of the regular trigger cannot be changed on-the-fly.

Table 308. Configuring the trigger polarity for injected external triggers

JEXTEN[1:0]	Source
00	Hardware Trigger detection disabled, software trigger detection enabled
01	Hardware Trigger with detection on the rising edge
10	Hardware Trigger with detection on the falling edge
11	Hardware Trigger with detection on both the rising and falling edges

The EXTSEL and JEXTSEL control bits select which, out of 32 possible events, can trigger the conversion of the regular and injected groups.

A regular group conversion can be interrupted by an injected trigger.

Refer to *ADC interconnection* tables in *Section 36.4.2: ADC pins and internal signals* for the list of the external triggers.

36.4.21 Injected channel management

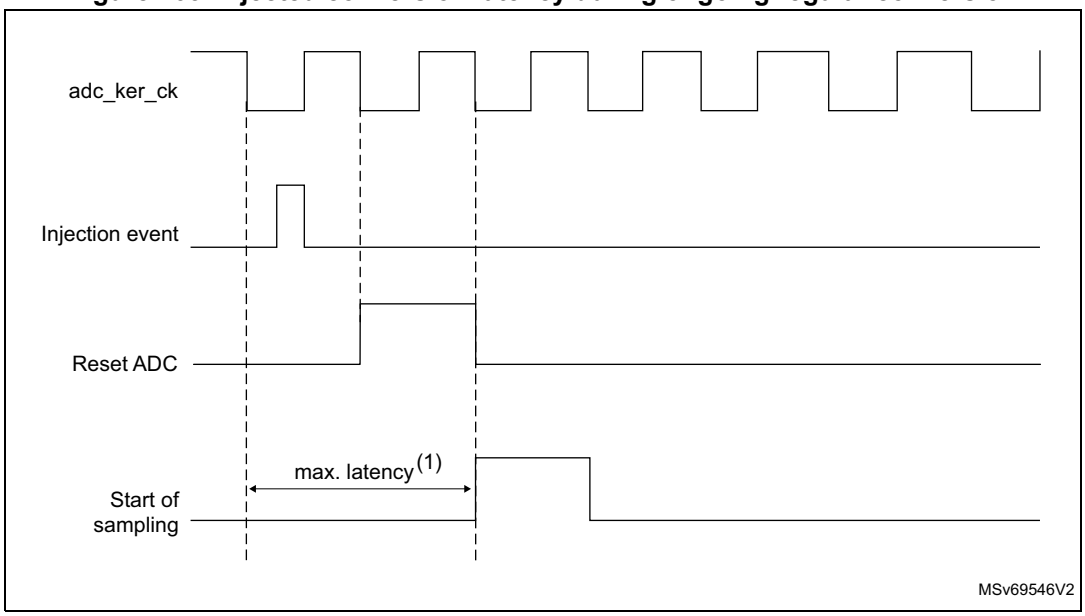
Triggered injection mode

To use triggered injection, the JAUTO bit in the ADC_CFGR1 register must be cleared.

1. Start the conversion of a group of regular channels either by an external trigger or by setting the ADSTART bit in the ADC_CR register.
2. If an external injected trigger occurs, or if the JADSTART bit in the ADC_CR register is set during the conversion of a regular group of channels, the current conversion is reset and the injected channel sequence switches are launched (all the injected channels are converted once if JDISCEN = 0).
3. Then, the regular conversion of the regular group of channels is resumed from the last interrupted regular conversion.
4. If a regular event occurs during an injected conversion, the injected conversion is not interrupted but the regular sequence is executed at the end of the injected sequence. *Figure 263* shows the corresponding timing diagram.

Note: When using triggered injection, one must ensure that the interval between trigger events is longer than the injection sequence.

Figure 263. Injected conversion latency during ongoing regular conversion



1. The maximum latency value can be found in the electrical characteristics of the device datasheet.

Autoinjection mode

If the JAUTO bit in the ADC_CFGR1 register is set, then the channels in the injected group are automatically converted after the regular group of channels. This can be used to convert a sequence of up to 20 conversions programmed in the ADC_SQRy and ADC_JSQR registers.

In this mode, the ADSTART bit in the ADC_CR register must be set to start regular conversions, followed by injected conversions (JADSTART must be kept cleared). Setting the ADSTP bit aborts both regular and injected conversions (JADSTP bit must not be used).

In this mode, external trigger on injected channels must be disabled.

Note: Autoinjection mode is compatible with discontinuous mode.

36.4.22 Programmable resolution (RES) - fast conversion mode

Faster conversions can be performed by reducing the ADC resolution.

The resolution can be configured to be either 12, 10, 8, or 6 bits by programming the RES[1:0] control bits. *Figure 268*, *Figure 269*, *Figure 270* and *Figure 271* show the conversion result format with respect to the resolution as well as to the data alignment.

Lower resolution allows faster conversion time for applications where high-data precision is not required. It reduces the conversion time spent by the successive approximation steps according to *Table 309*.

Table 309. T_{SAR} timings depending on resolution

RES (bits)	T_{SAR} (ADC clock cycles)	T_{SAR} (ns) at $F_{adc_ker_ck}$ = 30 MHz	T_{CONV} (ADC clock cycles) (with Sampling time= 1.5 ADC clock cycles)	T_{CONV} (ns) at $F_{adc_ker_ck}$ = 30 MHz
12	13.5 ADC clock cycles	450 ns	15 ADC clock cycles	500.0 ns
10	11.5 ADC clock cycles	383.33 ns	13 ADC clock cycles	433.33 ns
8	8.5 ADC clock cycles	203.33 ns	10 ADC clock cycles	333.33 ns
6	6.5 ADC clock cycles	216.67 ns	8 ADC clock cycles	266.66 ns

36.4.23 End of conversion and end of sampling phase (EOC, JEOC, EOSMP)

The ADC notifies the application at the end of each regular conversion (EOC) event and injected conversion (JEOC) event.

The ADC sets the EOC flag as soon as a new regular conversion data is available in the ADC_DR register. An interrupt can be generated if the EOCIE bit is set. The software can clear the EOC flag either by programming it to 1 or by reading ADC_DR. If ADC_DR FIFO is not emptied, the EOC flag is set again and an interrupt can be generated again.

The ADC sets the JEOC flag as soon as new injected conversion data is available in one of the ADC_JDRy registers. An interrupt can be generated if the JEOCIE bit is set. The software can clear the JEOC flag either by programming it to 1 or by reading the corresponding ADC_JDRy register.

The ADC also notifies the end of the sampling phase by setting the EOSMP flag (for regular conversions only). The EOSMP flag is cleared by software by programming it to 1. An interrupt can be generated if the EOSMPIE bit is set.

36.4.24 End of conversion sequence (EOS, JEOS)

The ADC notifies the application at the end of each regular sequence (EOS) and injected sequence (JEOS) event.

The ADC sets the EOS flag as soon as the conversion of the last data of the regular sequence is complete. An interrupt can be generated if the EOSIE bit is set. The EOS flag is cleared by the software by programming it to 1.

The ADC sets the JEOS flag as soon as the conversion of the last data of the injected sequence is complete. An interrupt can be generated if the JEOSIE bit is set. The JEOS flag is cleared by the software by programming it to 1.

36.4.26 Data management

Data register, data alignment and offset (ADC_DR, ADC_JDRy, OFFSETy, OFFSETy_CH, OVSS, LSHIFT, JOVSS[a], JLSHIFT[a], USAT, SSAT, POSOFF)

Data and alignment

At the end of each regular channel conversion (when an EOC event occurs), the result of the converted data is stored in the 32-bit wide ADC_DR data register with FIFO (when OVRMOD = 0). Since the data register has eight levels of FIFO, the EOC flag is raised again as far as the FIFO is not emptied.

At the end of each injected channel conversion (when a JEOC event occurs), the result of the converted data is stored in the 32-bit wide corresponding ADC_JDRy data register.

The OVSS[3:0], LSHIFT[3:0], JOVSS[3:0], and JLSHIFT[3:0] bitfields in the ADC_CFGR2 register select the alignment of the data stored after the conversion. By default, data are right-aligned. Refer to *Figure 268*, *Figure 269*, *Figure 270*, and *Figure 271* for examples of data alignment.

Note: The data can be aligned in normal and oversampling mode. The OVSS[3:0] bitfield is only effective in oversampling mode.

JOVSS[3:0] and JLSHIFT[3:0] is reserved for injected conversions. Their usage is the same as OVSS[3:0] and LSHIFT[3:0], unless otherwise specifically described.

Offset

An unsigned offset value y (y = 1, 2, 3, 4) can be applied to a channel by programming a value different from 0 in the OFFSET[21:0] bitfield of the ADC_OFRy register. The channel to which the offset is applied is programmed to the OFFSETy_CH[4:0] bits of ADC_OFCFGRy register. The offset can be positive or negative depending on the value of POSOFF bit. When POSOFF is cleared, the converted value is subtracted by the user-defined offset written in OFFSET[21:0] bits. The result can be a negative value. The read data is consequently signed and the SEXT bit represents the extended sign value.

The offset value must be lower than the maximum conversion value (for example the maximum offset value is 0xFFF in 12-bit mode).

The offset can be used to convert unsigned data to signed data (for example the offset value is equal to 0x800 in 12-bit mode).

The offset correction is also supported in oversampling mode. In this mode, the offset is subtracted when all the oversampling operations are complete.

Note: If the OFFSET channel is selected but the offset value is 0x0000, this offset programming is ignored. If the same OFFSET channel is programmed in different registers multiple times, the first programmed register takes priority.

Table 315 describes how the computation is performed for all the possible ADC resolutions and offset settings.

a. Only for products that include this bit.

Table 310. Offset computation versus data resolution

Resolution (RES[1:0] bits)	Subtraction between raw converted data and offset		Result	Comments
	Raw converted Data, left aligned	Offset		
00: 12-bit	DATA[11:0]	OFFSET[11:0]	Signed or unsigned 24-bit data, right aligned to [11:0]	-
01: 10-bit	DATA[11:2],00	OFFSET[11:2]	Signed or unsigned 24-bit data, right aligned to [9:0]	The user must configure OFFSET[1:0] to 0b00.
10: 8-bit	DATA[11:4],0000	OFFSET[11:4]	Signed or unsigned 24 bit data right aligned to [7:0]	The user must configure OFFSET[3:0] to 0b0000.
11: 6-bit	DATA[11:6],000000	OFFSET[11:6]	Signed or unsigned 24 bit data right aligned to [5:0]	The user must configure OFFSET[5:0] to 0b000000.

Figure 268, *Figure 269*, *Figure 270* and *Figure 271* show alignments for signed and unsigned data. JOVSS and JLSHIFT are not described here, but they behave the same as OVSS and LSHIFT.

Figure 268. Right alignment (offset disabled, unsigned value)

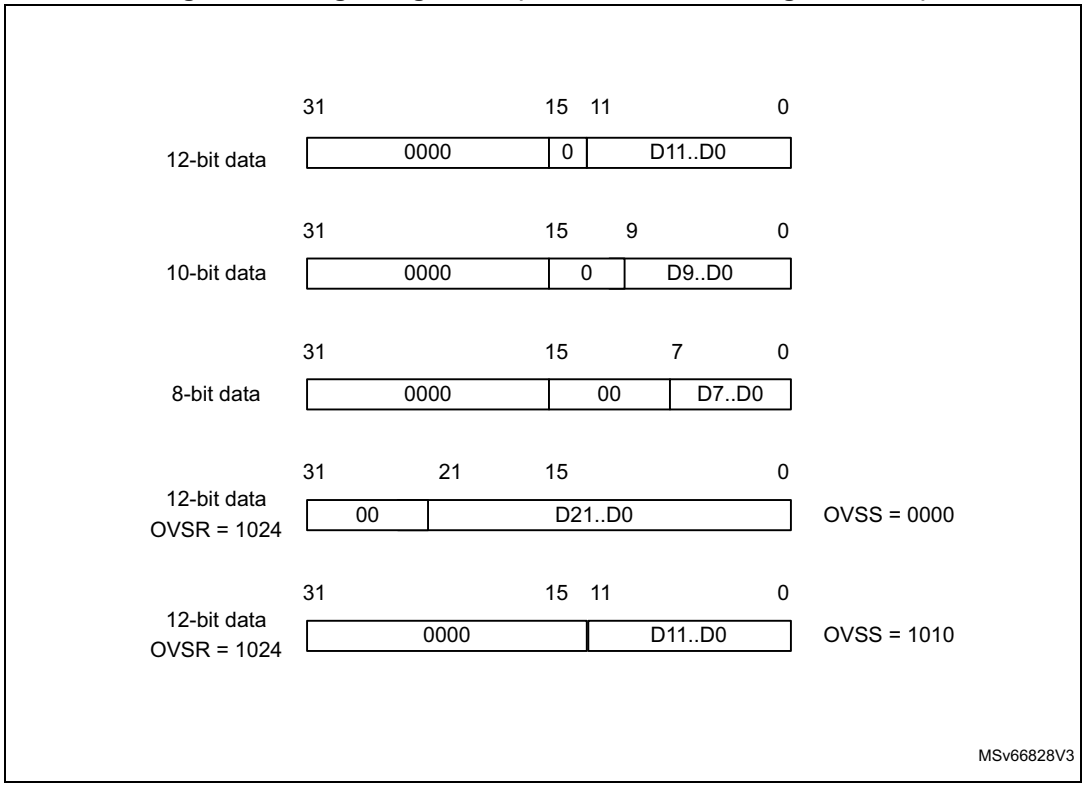

Figure 269. Right alignment (offset enabled, signed value)

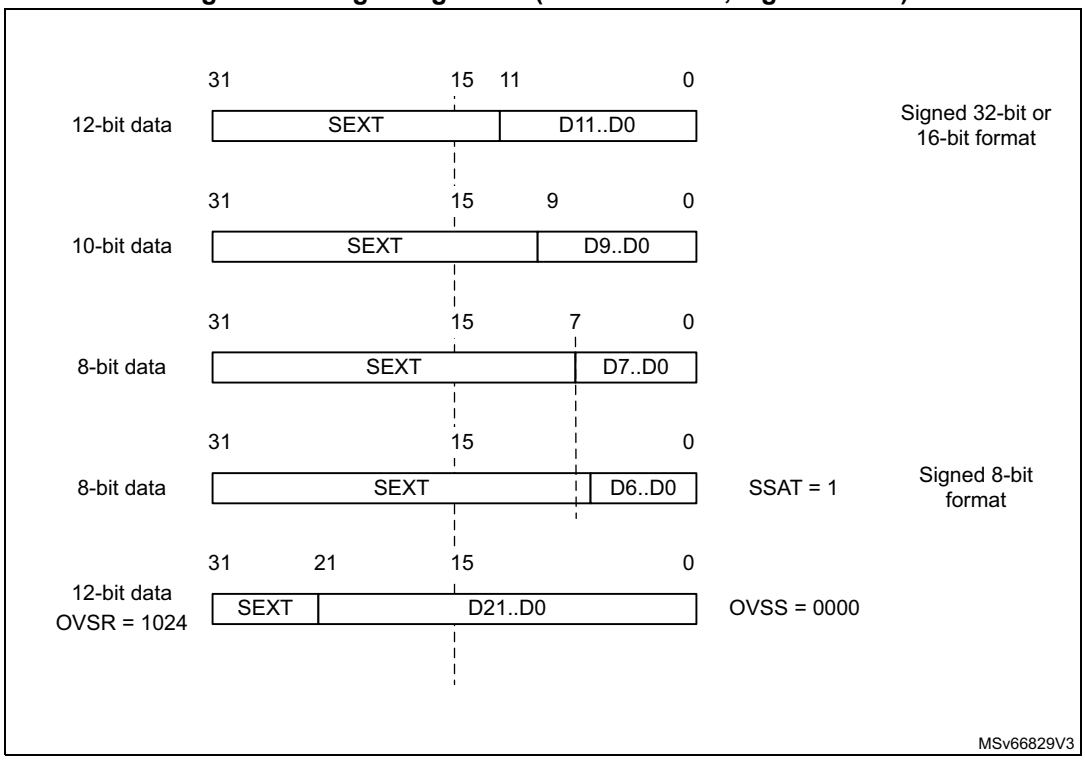

Figure 270. Left alignment (offset disabled, unsigned value)

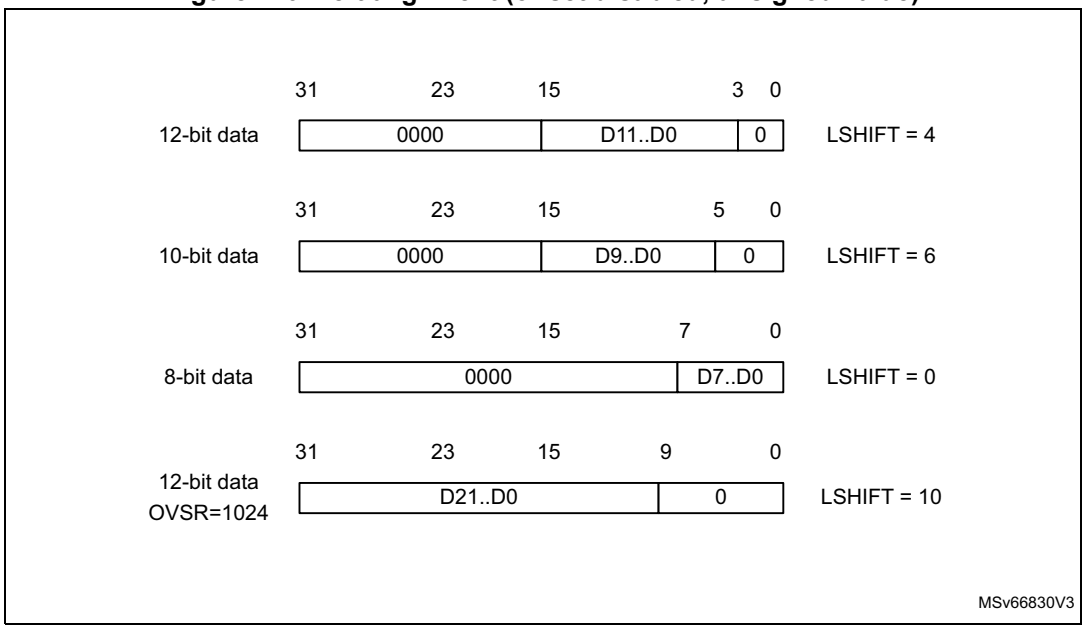

Figure 271. Left alignment (offset enabled, signed value)

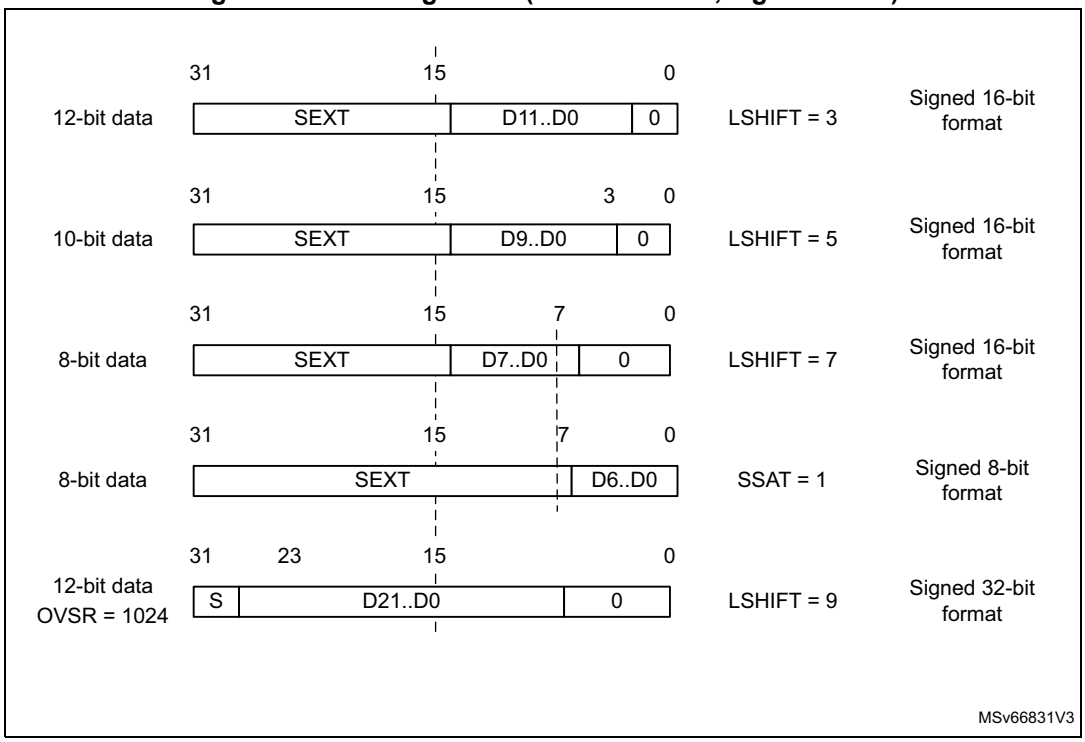

Management of signed and unsigned saturation format (SSAT, USAT)

The offset correction might result in the data width to be wider than the original data.

To limit the original data width, the data saturation can be enabled through the SSAT and USAT bits of the ADC_OFCFGRy register.

Unsigned 12-bit data can be extended to 13-bit signed data by using an offset value different from 0x800.

The original data width can be preserved by setting SSAT bit to limit the data width to 12 bits.

Unsigned data can be saturated to the original data width by setting the USAT bit.

Table 311 shows the sign-extended data format corresponding to different resolutions.

Table 311.12-bit data formats

SSAT	USAT	Format	Data range (offset =0x800)
0	0	Sign-extended 13-bit significant data: SEXT[31:13] DATA[12:0]	0x0000 07FF - 0xFFFF F800
1	0	Sign-extended 12-bit significant data: SEXT[31:12] DATA[11:0]	0x7FF - 0x800

Table 311.12-bit data formats

SSAT	USAT	Format	Data range (offset =0x800)
0	1	Unsigned saturation 12-bit signification data: DATA[11:0]	0xFFF - 0x000
1	1	Reserved	-

Table 312 provides numerical examples for four different offset values.

Table 312. Numerical examples for 32-bit or 16-bit format (POSSPFF = 0)

Raw conversion result	Offset value	Result SSAT = 0 USAT = 0	Result SSAT = 0 USAT = 1	Result SSAT = 1 USAT = 0
0xFFF	0x800	0x0000 07FF	0x07FF	0x07FF
0x800		0x0000 0000	0x0000	0x0000
0x000		0xFFFF F800	0x0000	0xF800
0xFFF	0x820	0x0000 07DF	0x07DF	0x07DF
0x800		0xFFFF FFE0	0x0000	0xFFE0
0x000		0xFFFF F7E0	0x0000	0xF7E0
0xFFF	0x7E0	0x0000 081F	0x081F	0x07FF
0x800		0x0000 0020	0x0020	0x0020
0x000		0xFFFF F820	0x0000	0xF820
0xFFF	0x020	0x0000 0FDF	0x0FDF	0x0FDF
0x800		0x0000 07E0	0x07E0	0x07E0
0x000		0xFFFF FFE0	0x0000	0xFFE0

Caution: SSAT must not be used in conjunction with USAT. No hardware check is performed to ensure that this condition is respected.

Gain compensation

When the GCOMP bit is set in the ADC_GCOMP register, the gain compensation is activated on all the converted data. After each conversion, data is calculated using the following formula.

$$DATA = DATA(\text{adc result}) \times (GCOMPCOEFF) / 4096$$

As GCOMPCOEFF can be programmed from 0 to 16383, the actual gain compensation factor can range from 0 to 3.999756.

Before storing the resulting data in RDATAx or JDATAx bitfields, the LSB - 1 value is evaluated to round up the data and minimize the error.

The gain compensation is also effective for the oversampling. When the gain compensation is used in oversampling mode, the gain calculation is performed after the accumulation and

right-shift operations to minimize the power consumption (the gain calculation is done only once and not at each conversion).

The internal multiplier width is 32 bits and the input data width for the gain compensation must be less than 18 bits. When using oversampling with injected and regular conversion mode, the ROVSM bit of the ADC_CFGR2 register must be set to resume the pending conversion with the correct value.

When the gain compensation is activated, the ADC data latency is increased by one clock cycle. In continuous and scan conversion modes, the ADC conversion rate does not change.

ADC overrun (OVR, OVRMOD)

The overrun flag (OVR) issues a notification that the regular converted data has not been read (by the CPU or the DMA) before the ADC_DR FIFO (eight stages) is overflowed, or adc_hclk clock is too slow to manage the data when OVRMOD = 0.

The OVR flag is set when a new conversion completes while ADC_DR as single register or FIFO output is full. An interrupt is generated if the OVRIE bit is set.

When an overrun condition occurs, the ADC is still operating and can continue converting unless the software decides to stop and reset the sequence by setting ADSTP. The OVR flag is cleared by software by programming it to 1.

Data can be configured to be preserved or overwritten when an overrun event occurs by programming the control bit OVRMOD:

- OVRMOD = 0

  The overrun event preserves the data register from being overwritten: the old data are maintained up to ADC_DR FIFO depth (eight data) and the new conversion is discarded and lost. If OVR remains at 1, further conversions occur but the result data is also discarded. The FIFO can be emptied through ADC_DR read access by the CPU while the OVR flag is set.
- OVRMOD = 1

  The data register is overwritten with the last conversion result and the previous unread data is lost. In this mode, ADC_DR FIFO is disabled. If OVR remains at 1, any further conversion is performed normally and the ADC_DR register always contains the latest converted data. In this mode, DMA burst mode nor MDF output mode cannot be supported.

Figure 272. Example of overrun (OVRMOD = 0)

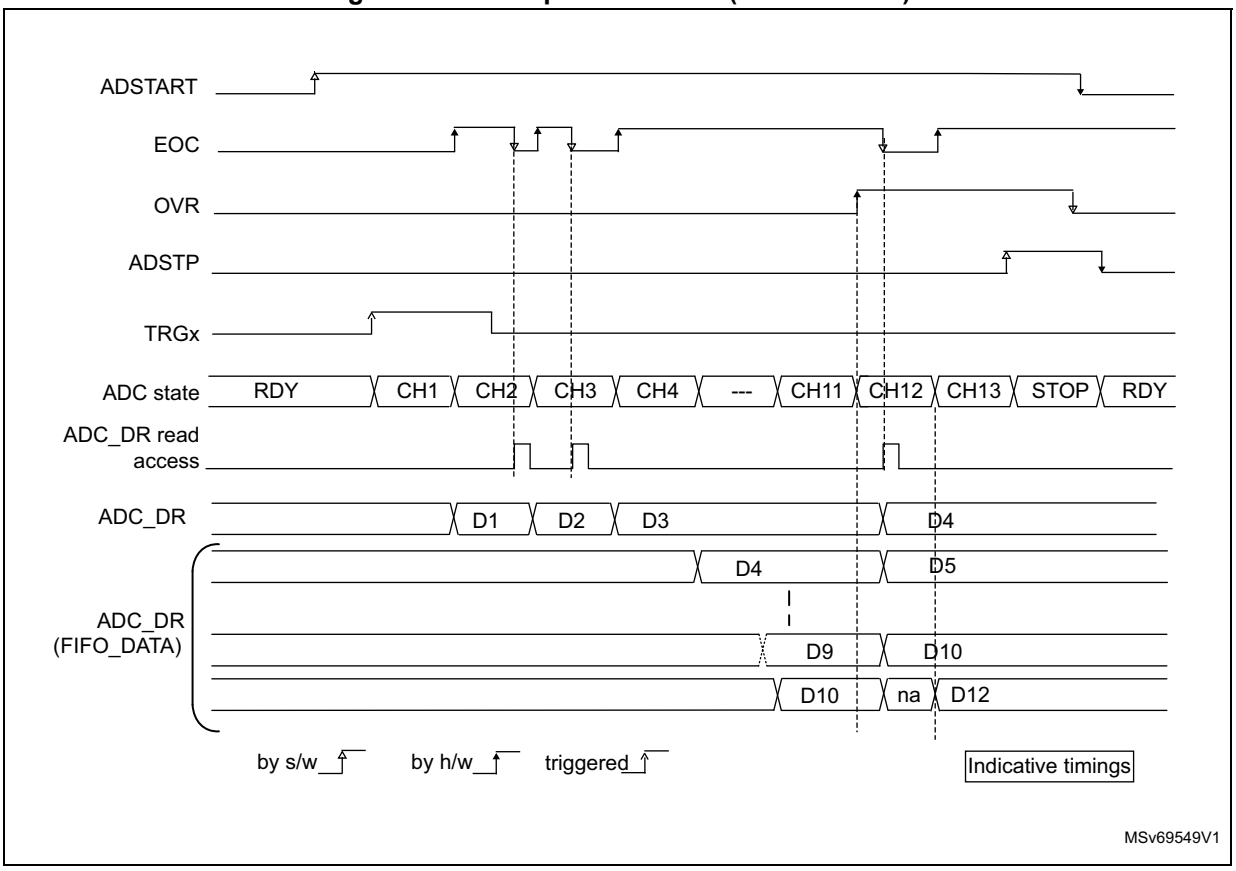

Figure 273. Example of overrun (OVRMOD = 1)

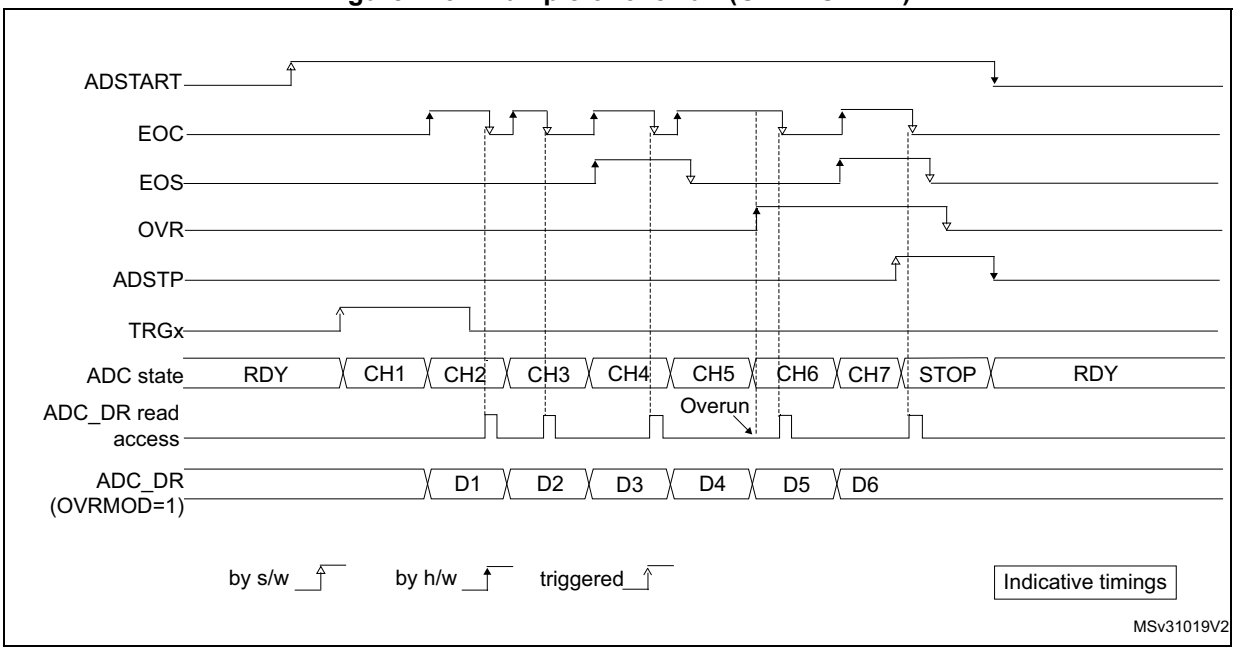


Note: Even if overrun may occur for injected channels, there is no overrun detection on these channels since there is a dedicated data register for each of the four injected channels.

Managing a sequence of conversions without using the DMA

If the conversions are slow enough, the conversion sequence can be handled by the software. In this case the software must use the EOC flag and its associated interrupt to handle each data. Each time a conversion is complete, EOC is set and the ADC_DR register can be read. OVRMOD must be configured to 0 to manage overrun events or FIFO overflow as errors.

Managing conversions without using the DMA and without overrun

It may be useful to let the ADC convert one or more channels without reading the data each time (if there is an analog watchdog for instance). In this case, the OVRMOD bit must be configured to 1 and the OVR flag must be ignored by the software. An overrun event does not prevent the ADC from continuing to convert and the ADC_DR register always contains the latest conversion.

Managing conversions using the DMA

When the DMA mode is enabled (DMNGT[1:0] = 01 or 11 in the ADC_CFGR1 register in single ADC mode), a DMA request is generated after each channel conversion. This allows the transfer of the converted data from the ADC_DR register to the destination location configured in the DMA.

Despite this, if an overrun occurs (OVR = 1) because the DMA cannot serve the DMA transfer request in time, the ADC stops generating DMA requests and the data corresponding to the new conversion is not transferred by the DMA, which means that all the data transferred to the RAM can be considered as valid. (OVRMOD = 0).

When OVRMOD = 1, even if DMA does not transfer the data immediately, new data overwrite ADC_DR, causing DMA to potentially skip data. As a result, some conversion results may be missed in the data transferred to RAM.

Depending on the configuration of the OVRMOD bit, the data are either preserved or overwritten (refer to *Section : ADC overrun (OVR, OVRMOD)*). If OVRMOD = 0 (data preserved), DMA transfer requests are blocked.

DMA can be configured through the DMNGT[1:0] bitfield of the ADC_CFGR1 register.

- DMA one-shot mode (DMNGT[1:0] = 01)

  This mode is suitable when the DMA is programmed to transfer a fixed number of data.
- DMA circular mode (DMNGT[1:0] = 11)

  This mode is suitable when programming the DMA when the number of transfers is unknown.

DMA one-shot mode (DMNGT[1:0] = 01)

In one-shot mode, the ADC generates a DMA transfer request each time a new conversion data is available and stops generating DMA requests once the DMA has reached the last DMA transfer (that is when DMA_LACK interrupt occurs, see *Direct-memory controller* section) even if a new conversion has been started.

When DMA transfers are complete (all the transfers configured in the DMA controller have been done):

- The content of the ADC data register is frozen.
- All ongoing conversions are aborted with the partial result discarded.
- The scan sequence is stopped and reset.
- The DMA and ADC are stopped.

DMA circular mode (DMNGT[1:0] = 11)

In circular mode, the ADC generates a DMA transfer request each time a new conversion data is available in the data register. This allows the configuration of the DMA in circular mode to handle a continuous analog input data stream.

DMA single-transfer or burst mode with FIFO (OVRMOD = 0)

The output data register features an eight-stage FIFO. Two different DMA requests are generated in parallel. When a data is available, an “SREQ single request” is generated. When four data are available, a “BREQ burst request” is generated. The DMA can be programmed either in single-transfer mode or in burst mode (four beats). The appropriate request line is selected by the DMA according to the mode selected. Refer to *Section Direct memory access controller* for further information.

Due to the existence of FIFO, DMA requests are generated until the FIFO is emptied. To stop DMA requests even when the FIFO is not emptied, set the ADSTP bit.

36.4.27 Managing conversions using the MDF

The ADC conversion results can be transferred directly to the MDF.

In this case, the DMNGT[1:0] bits must be set to 10.

The ADC transfers the 16 least significant bits of the regular data register to the MDF through adcx_dat[15:0] bus, which in turn resets the EOC flag once the transfer is effective.

The data format must be in 16-bit signed format:

ADC_DR[31:16] = Don’t care

ADC_DR[15] = Sign

ADC_DR[14:0] = Data

Any value above the 16-bit signed format is truncated.

To obtain a 16-bit signed format, the OFFSET function needs to be activated.

In this mode, OVRMOD = 1 is not supported.

36.4.28 Dynamic low-power features

Autodelayed conversion mode (AUTDLY)

The ADC implements an autodelayed conversion mode controlled by the AUTDLY configuration bit in ADC_CFGR1. Autodelayed conversions are useful to simplify the software as well as to optimize performance of an application clocked at low frequency where there would be risk of encountering an ADC overrun.

Regular conversion mode

When AUTDLY is set, a new conversion can start if the following conditions are met:

- The ADC_DR register is read or the EOC bit is cleared (see *Figure 274*).

This is a way to automatically adapt the speed of the ADC to the speed of the system that reads the data and prevent overrun errors.

The delay is inserted after each regular conversion.

Injected conversion mode

When AUTDLY is set, a new conversion can start only if the JEOS bit has been cleared (see *Figure 275*). Since there are four ADC_JDRy registers, the autodelay is performed at the end on the injected conversion sequence.

There is no delay inserted between each conversion of the injected sequence, except after the last one.

A hardware trigger event occurring during this delay is ignored. .

No delay is inserted between regular and injected conversions. The autodelay for regular and injected modes is managed separately:

Caution: The behavior is slightly different in autoinjection mode (JAUTO = 1) where a new regular conversion can start only when the automatic delay of the previous injected sequence of conversion has ended (when JEOS has been cleared). This is to ensure that the software can read all the data of a given sequence before starting a new sequence (see *Figure 278*).

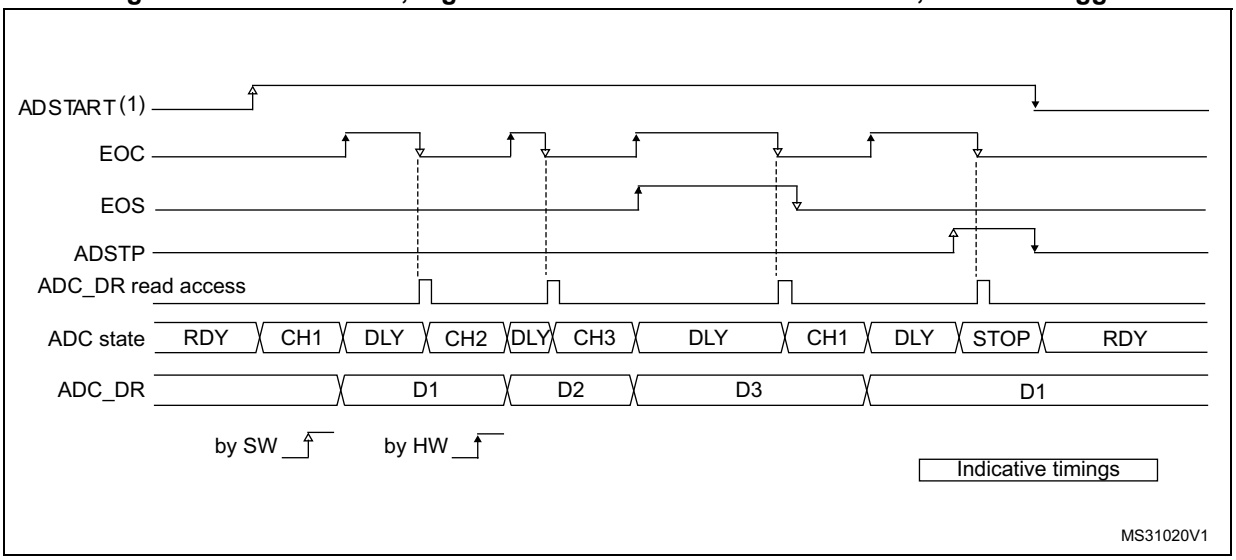
In autoinjection mode, there is no delay between the last regular conversion and the first injected conversion. The user must clear the last EOC flag before clearing the JEOS flag, otherwise the next sequence might start before EOC flag is cleared.

In autodelay mode, a hardware regular trigger event is ignored if it occurs during an already ongoing regular sequence or during the delay that follows the last regular conversion of the sequence. It is however considered pending if it occurs after this delay, even if it occurs during an injected sequence of the delay that follows it. The conversion then starts at the end of the delay of the injected sequence.

In autodelay mode with JAUTO = 0, a hardware injected trigger event is ignored if it occurs during an already ongoing injected sequence or during the delay that follows the last injected conversion of the sequence.

Note: AUTDLY mode is not supported with SMPTRIG or BULB mode.

Figure 274. AUTDLY = 1, regular conversion in continuous mode, software trigger



1. AUTDLY = 1, JAUTO = 0.
2. Regular configuration: EXTEN[1:0] = 00 (software trigger), CONT = 1, CHANNELS = 1, 2, 3.
3. Injected configuration DISABLED.

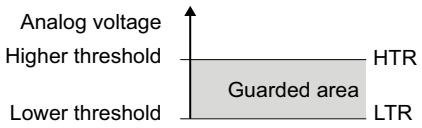
36.4.29 Analog window watchdog (AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWDCH of ADC_AWD2CR and ADC_AWD3CR, HTR, LTR, AWDFILT)

Table 313. Analog window watchdog features

Feature	AWD1	AWD2	AWD3
Enable control	AWD1EN or JAWD1EN	ADC_AWD2CR	ADC_AWD3CR
Channel selection	AWD1CH[4:0]/AWD1SGL	ADC_AWD2CR	ADC_AWD3CR
Channel selection limitation	One or all channels	Any number of channels	
	Regular or injected	-	-
Threshold control	ADC_AWD1LTR / ADC_AWD1HTR	ADC_AWD2LTR / ADC_AWD2HTR	ADC_AWD3LTR / ADC_AWD3HTR
Filter configuration	AWDFILT[2:0] in ADC_AWDyHTR		
Interrupt	AWDy in ADC_ISR		

The three AWD analog watchdogs monitor whether some channels remain within a configured voltage range (window).

Figure 279. Analog watchdog guarded area



AWDy flag and interrupt

An interrupt can be enabled for each of the three analog watchdogs by setting AWDyIE in the ADC_IER register (y = 1, 2, 3).

AWDy (y = 1, 2, 3) flag is cleared by software by writing 1 to it, or by setting ADDIS.

The ADC conversion result is compared to the lower and higher thresholds before alignment.

Description of analog watchdog 1

The AWD analog watchdog 1 is enabled by setting the AWD1EN or JAWD1EN bit in the ADC_CFGR1 register. This watchdog monitors whether either one selected channel or all enabled channels remain within a configured voltage range (window).

Table 314 shows how the ADC_CFGR1 registers must be configured to enable the analog watchdog on one or more channels.

Table 314. Analog watchdog 1 channel selection

Channels guarded by the analog watchdog	AWD1SGL bit	AWD1EN bit	JAWD1EN bit
None	x	0	0
All injected channels	0	0	1
All regular channels	0	1	0
All regular and injected channels	0	1	1
Single(1) injected channel	1	0	1
Single(1) regular channel	1	1	0
Single(1) regular or injected channel	1	1	1

1. Selected by the AWD1CH[4:0] bits. The channels must also be programmed to be converted in the appropriate regular or injected sequence.

The AWD1 analog watchdog flag is set if the analog voltage converted by the ADC is below a lower threshold or above a higher threshold.

These thresholds are programmed through HTR[22:0] bits of the ADC_AWD1HTR register and LTR[22:0] bits of the ADC_AWD1LTR register for the analog watchdog 1.

The threshold can be up to 23 bits (12-bit resolution with oversampling, OVSR = 1024, offset and gain compensation)

When converting data with a resolution of less than 12 bits (defined by RES[1:0] bits), the LSB of the programmed thresholds must be kept cleared because the internal comparison is always performed on the full 12-bit raw converted data.

Table 315 describes how the comparison is performed for all the possible resolutions and for analog watchdog 1.

Table 315. Analog watchdog 1, 2, 3 comparison

Resolution (RES[1:0] bits)	Analog watchdog comparison between:		Comments
	Raw converted data, left aligned(1)	Thresholds	
00: 12-bit	DATA[11:0]	LTR[22:0] and HTR[22:0]	-
01: 10-bit	DATA[11:2],00	LTR[22:0] and HTR[22:0]	The user must configure LTR[1:0] to 0b00 and HTR[1:0] to 0b00.
10: 8-bit	DATA[11:4],0000	LTR[22:0] and HTR[22:0]	The user must configure LTR[3:0] to 0b0000 and HTR[3:0] to 0b0000.
11: 6-bit	DATA[11:6],000000	LTR[22:0] and HTR[22:0]	The user must configure LTR[5:0] to 0b000000 and HTR[5:0] to 0b000000.

1. Refer to *Section : Gain compensation* for additional details on analog watchdog comparison.

Description of analog watchdog 2 and 3

The second and third analog watchdogs are more flexible and can guard several selected channels by programming the corresponding bits in AWDCH[19:0] (of ADC_AWD2CR and ADC_AWD3CR).

The corresponding watchdog is enabled when any bit of AWDCH[19:0] (of ADC_AWD2CR and ADC_AWD3CR) is set.

The threshold can be up to 23 bits (12-bit resolution with oversampling, OVSR = 1024 and offset compensation in signed format with gain compensation) and is programmed through the ADC_AWD2HTR, ADC_AWD2LTR, ADC_AWD3HTR and ADC_AWD3LTR registers.

When converting data with a resolution of less than 12 bits (defined by RES[1:0]) bits), the LSBs of the programmed threshold must be kept cleared, the internal comparison being performed on the full 12-bits converted data (left aligned).

ADCx_AWDy_OUT signal output generation

Each analog watchdog is associated with an internal hardware signal ADC_AWDy_OUT (*y* being the watchdog number), which is directly connected to the ETR input (external trigger) of some of the on-chip timers. Refer to the on-chip timers sections to understand how to select the ADC_AWDy_OUT signal as ETR.

ADC_AWDy_OUT is activated when the associated analog watchdog is enabled:

- ADC_AWDy_OUT is set when a guarded conversion is outside the programmed thresholds.
- ADC_AWDy_OUT is reset after the end of the next guarded conversion that is inside the programmed thresholds (It remains at 1 if the next guarded conversions are still outside the programmed thresholds).
- ADC_AWDy_OUT is also reset when disabling the ADC (when setting ADDIS). Note that stopping regular or injected conversions (by setting ADSTP or JADSTP) has no influence on the generation of ADCx_AWDy_OUT.

Note: The AWDy flag is set by hardware and reset by software: the AWDy flag has no influence on the generation of ADC_AWDy_OUT (ex: ADC_AWDy_OUT can toggle while the AWDy flag remains at 1 if the software did not clear the flag).

The AWDy flag is cleared by programming it to 1 or by set ADDIS bit. ADSTP and JADSTP bits do not reset the AWDy flag.

Figure 280. ADC_AWDy_OUT signal generation (on all regular channels)

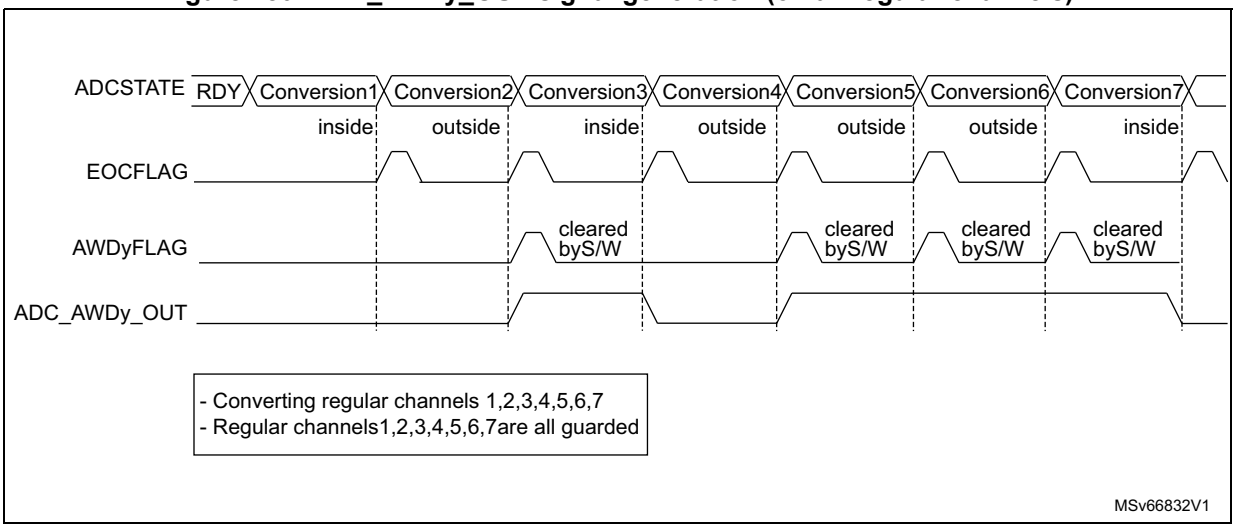


Figure 281. ADC_AWDy_OUT signal generation (AWDy flag not cleared by software)

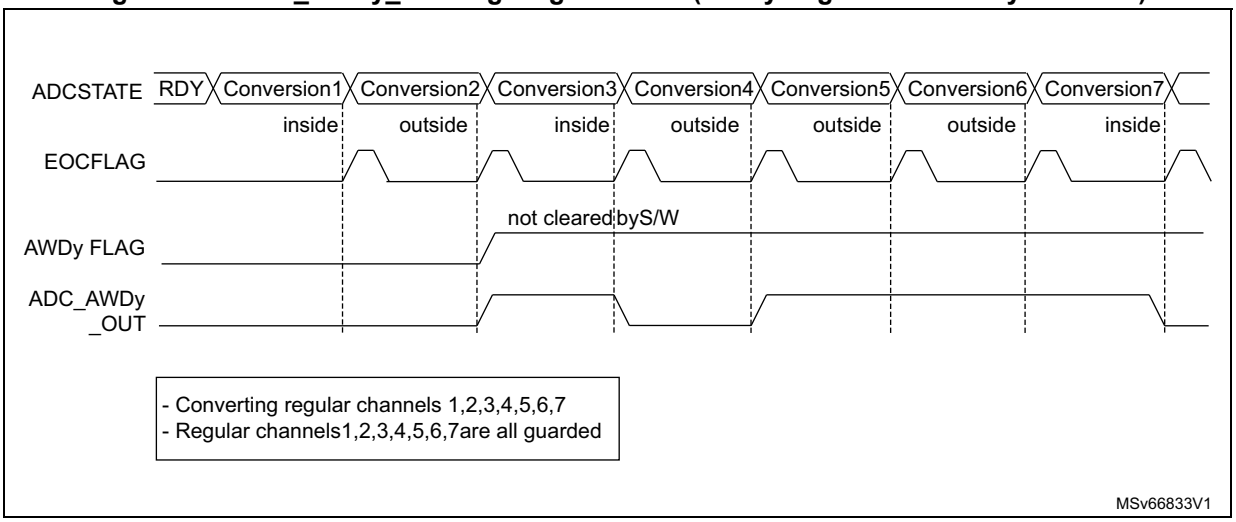

Figure 282. ADC_AWDy_OUT signal generation (on a single regular channel)

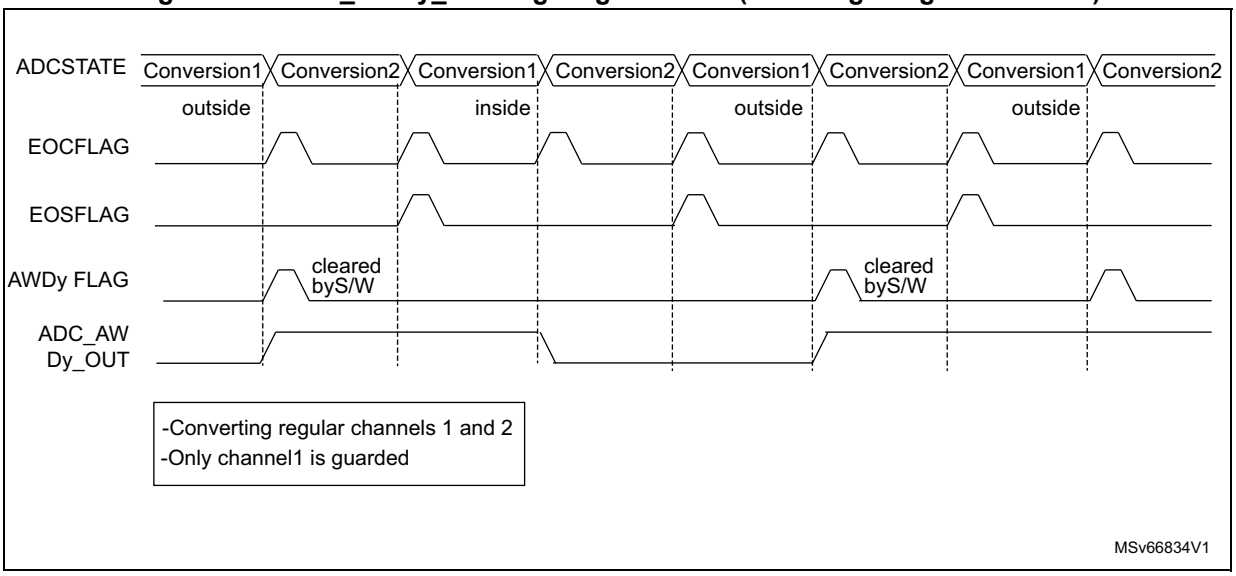

Figure 283. ADC_AWDy_OUT signal generation (on all injected channels)

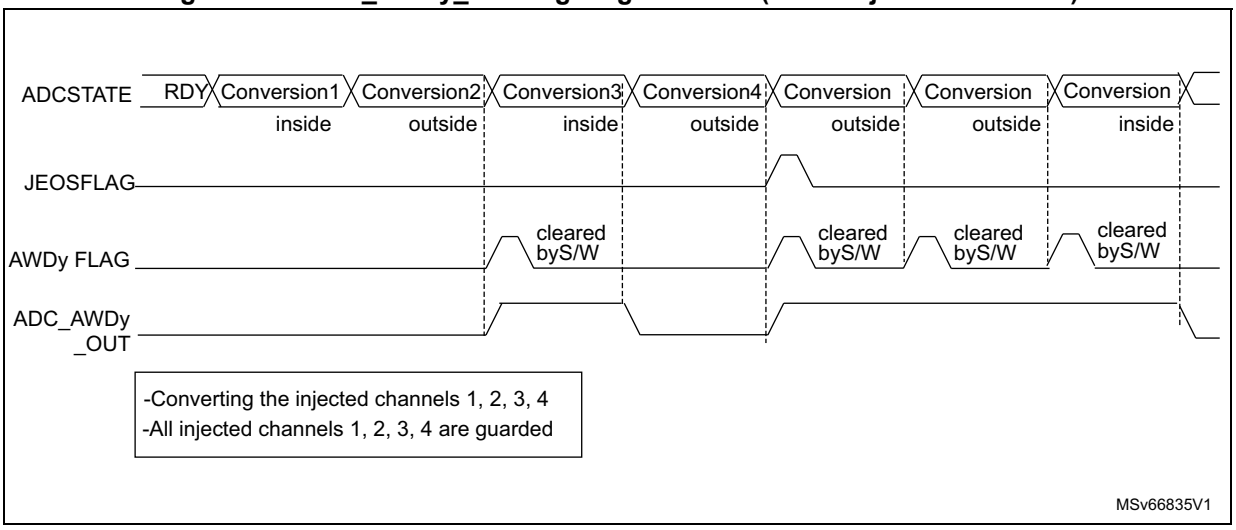

Analog watchdog threshold control on the fly

LTR[22:0] and HTR[22:0] can be changed when an analog-to-digital conversion is ongoing (that is between the start of conversion and the end of conversion of the ADC internal state). If LTR[22:0] and HTR[22:0] are updated during the ADC conversion of the ADC guarded channel, resulting in analog watchdog thresholds to be applied from the next ADC conversion. The analog watchdog comparison is performed at each end of conversion. If the current ADC data is out of the new modified threshold, no interrupt and AWDy_OUT signal are issued. The Interrupt and the AWD generation only happen at the end of the conversion that started after the threshold update. If AWDy_OUT is already asserted, programming the new thresholds does not deassert the AWDy_OUT signal. However, the watchdog threshold must not be changed twice during the four adc_ker_ck periods.

Analog watchdog filter for watchdog 1

With analog watchdog, a valid ADC conversion data range can be configured through the ADC_AWD1LTR and ADC_AWD1HTR registers. When the conversion results have consecutively passed the threshold for more than the watchdog filter value (AWDFILT[2:0] + 1), AWD1_OUT is generated as well as the AWD1 flag. Before this value is reached, AWD1 output is not activated.

Analog watchdog with gain and offset compensation

When the gain and offset compensation are enabled, the analog watchdog compares the data after the compensation.

36.4.30 Oversampler

The oversampling unit performs data preprocessing to offload the device. It is able to handle multiple conversions and average them into a single data with increased data width, up to 22 bits.

It provides a result with the following form, where N and M can be adjusted:

$$\text{Result} = \frac{1}{M} \times \sum_{n=0}^{n=N-1} \text{Conversion}(t_n)$$

It enables the following functions to be performed by hardware: averaging, data rate reduction, SNR improvement and basic filtering.

The oversampling ratio N is defined by the OVSR[9:0] bits in the ADC_CFGR2 register, or by the JOVSS[3:0] bits in the ADC_CFGR3 register for parallel injected oversampling mode. They can range from 2x to 1024x. The division coefficient *M* consists of a right bit shift up to 10 bits. It is defined through the OVSS[3:0] bits of the ADC_CFGR2 register.

The summation unit can yield a result up to 22 bits, which can be left or right shifted at the end. When the right shift is selected, it is rounded to the nearest value using the least significant bits left apart by the shifting, before being finally transferred to the ADC_DR data register.

Figure 284 gives a numerical example of the processing, from a raw 22-bit accumulated data to the final 12-bit result.

Figure 284. 12-bit result oversampling with 10-bit right shift and rounding

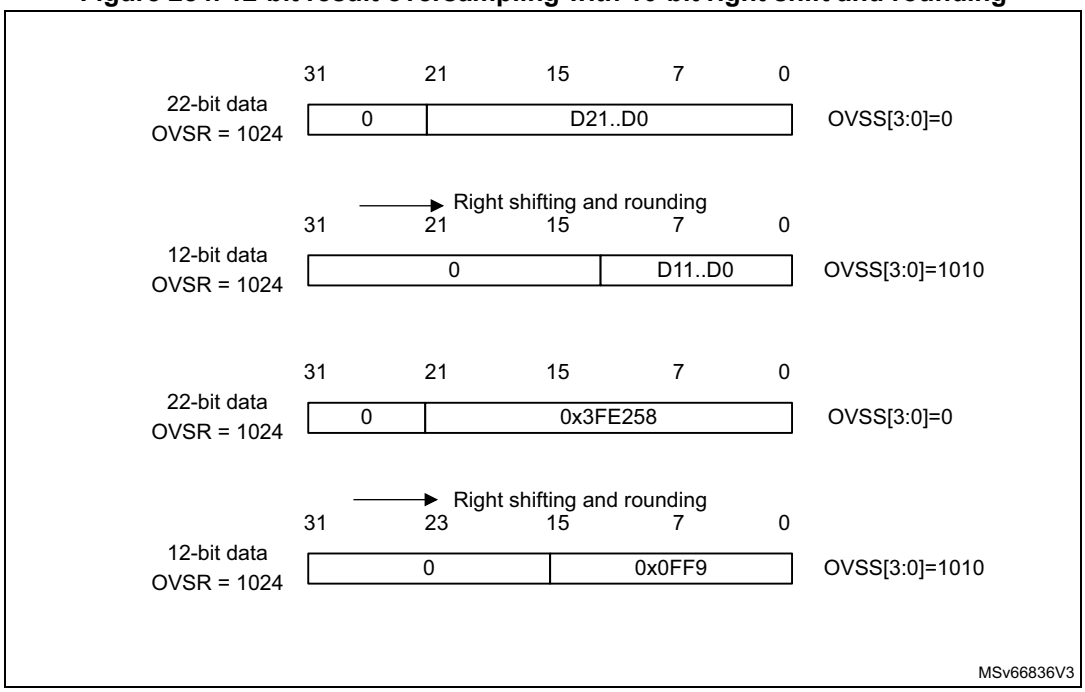

Table 272 gives data format for the various N and M combinations, for a raw conversion data equal to 0xFFF.

Table 316. Maximum output results versus N and M

Over sampling ratio	Max Raw data	No-shift OVSS = 0000	1-bit shift OVSS = 0001	2-bit shift OVSS = 0010	3-bit shift OVSS = 0011	4-bit shift OVSS = 0100	5-bit shift OVSS = 0101	6-bit shift OVSS = 0110	7-bit shift OVSS =0111	8-bit shift OVSS = 1000
x2	0x1FFE	0x1FFE	0x0FFF	0x0800	0x0400	0x0200	0x0100	0x0080	0x0040	0x0020

x256	0xFFF00	0xFFF00	0x7FF80	0x3FFC0	0x1FFE0	0xFFF0	0x7FF8	0x3FFC	0x1FFE	0x0FFF
x1024	0x3FFC00	0x3FFC00	0x1FFE00	0xFFF00	0x7FF80	0x3FFC0	0x1FFE0	0xFFF0	0x7FF8	0x3FFC

The conversion timing rate does not change in oversampling mode: the sample time is maintained equal during the whole oversampling sequence. A new data is provided every N conversion, with an equivalent delay equal to N x T_{CONV} = N x (t_{SMPL} + t_{SAR}). The flags are set as follows:

- The end of the sampling phase (EOSMP) is set after each sampling phase for regular conversion.
- The end of conversion (EOC) occurs once every N conversion, when the oversampled result is available.
- The end of sequence (EOS) occurs once the sequence of oversampled data is completed (that is after a total of N x sequence length conversions).

Unlike the conversion rate, the data latency changes in oversampling mode: each single conversion introduces an additional accumulation. As a result, an additional clock cycle is required when all the conversions are complete, after the accumulation and shift.
The EOC flag is set two additional clock cycles after the conversion is complete.

ADC operating modes supported in oversampling mode

In oversampling mode, most of the ADC operating modes are maintained:

- Single, discontinuous, or continuous conversion modes
- ADC conversions started either by software or triggers
- ADC stop during a conversion (abort)
- Data read via CPU or DMA with overrun detection
- Low-power modes (AUTDLY)
- Programmable resolution: in this case, the reduced conversion values (as per RES[1:0] bits of the ADC_CFGR1 register) are accumulated, truncated, rounded, and shifted in the same way as 12-bit conversions are.
- Autoinjected mode (JAUTO) if JOVSPAR = 0 and oversampling ratio is the same for both regular and injected channels.

Analog watchdog

The analog watchdog functionality is maintained, with the following differences:

- The RES[1:0] bits are ignored and the comparison is always done using the full 23-bit values HTR[22:0] and LTR[22:0].
- The comparison is performed on the oversampled accumulated value before shifting.

Triggered mode

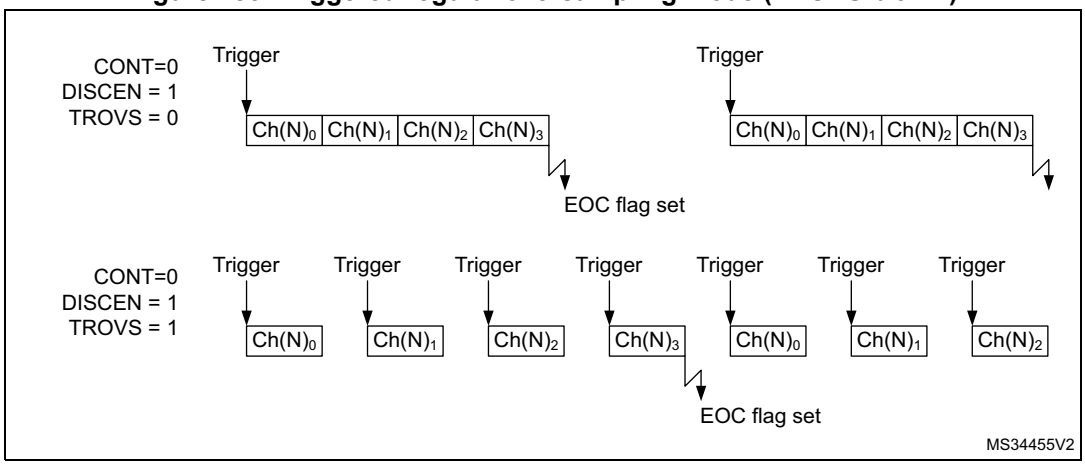
The oversampling can also be used for basic filtering purpose. Although it not a very powerful filter (slow roll-off and limited stop band attenuation), it can act as a notch filter to reject constant parasitic frequencies (typically coming from the mains or from a switched-mode power supply). For this purpose, a specific discontinuous mode can be enabled through the TROVS bit in ADC_CFGR2, to be able to achieve an oversampling frequency defined by the user and independent from the conversion time itself. The TROVS bit is supported with hardware trigger mode.

Figure 285 shows how conversions are started in response to triggers during discontinuous mode.

If the TROVS bit is set and OVSR ≠ 0, the content of the DISCEN bit is ignored and considered as 1.

If the TROVS bit is set, neither software trigger nor JAUTO is supported.

Figure 285. Triggered regular oversampling mode (TROVS bit = 1)



Injected and regular sequencer management in oversampling mode

In oversampling mode, injected and regular sequencers can have different behaviors. The oversampling can be enabled for both sequencers with some limitations if they have to be used simultaneously (this is related to a unique accumulation unit).

Oversampling regular channels only

The regular oversampling mode ROVSM bit defines how the regular oversampling sequence is resumed if it is interrupted by an injected conversion:

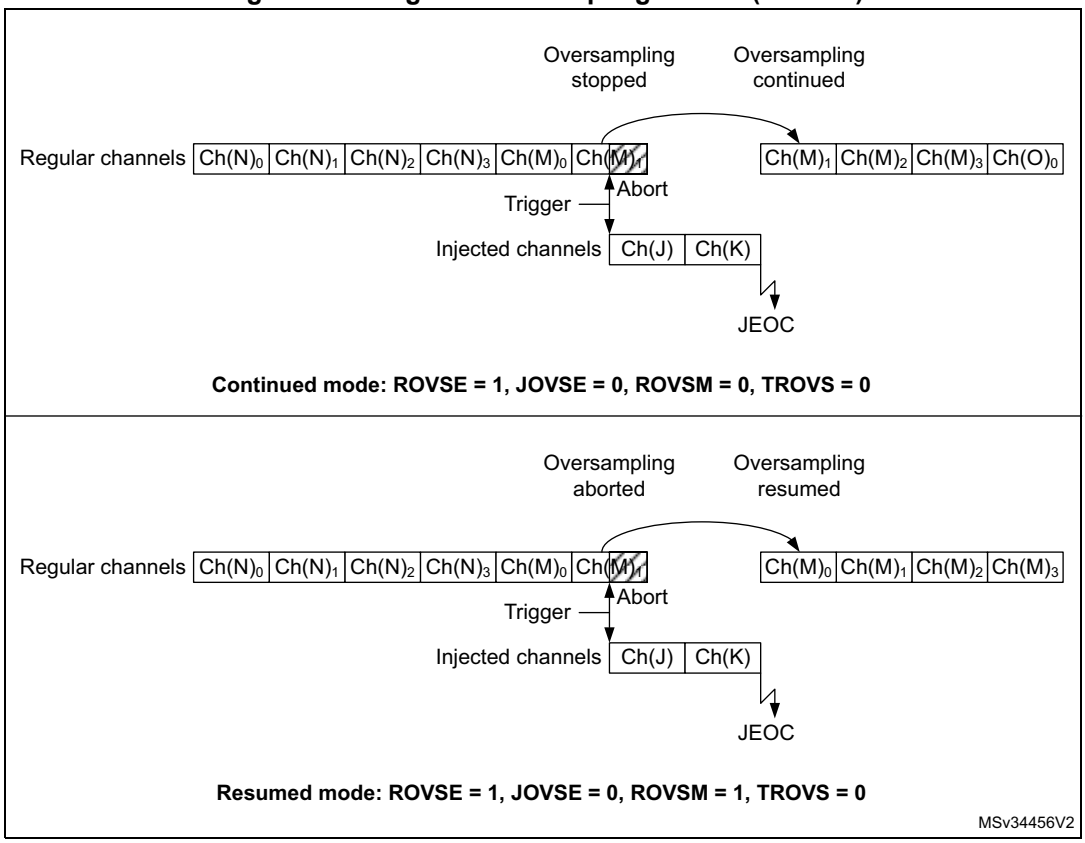
- In continuous mode (ROVSM = 0), the accumulation restarts from the last valid data (prior to the conversion abort request due to the injected trigger). This ensures that

oversampling is complete whatever the injection frequency (providing at least one regular conversion can be complete between triggers);

- In resumed mode (ROVSM = 1), the accumulation restarts from 0 (previous conversion results are ignored). This mode guarantees that all the data used for oversampling were converted back-to-back within a single time slot. Care must be taken to have a injection trigger period above the oversampling period length. If this condition is not respected, the oversampling cannot be complete and the regular sequence is blocked.

Figure 286 gives examples for a 4x oversampling ratio.

Figure 286. Regular oversampling modes (4x ratio)



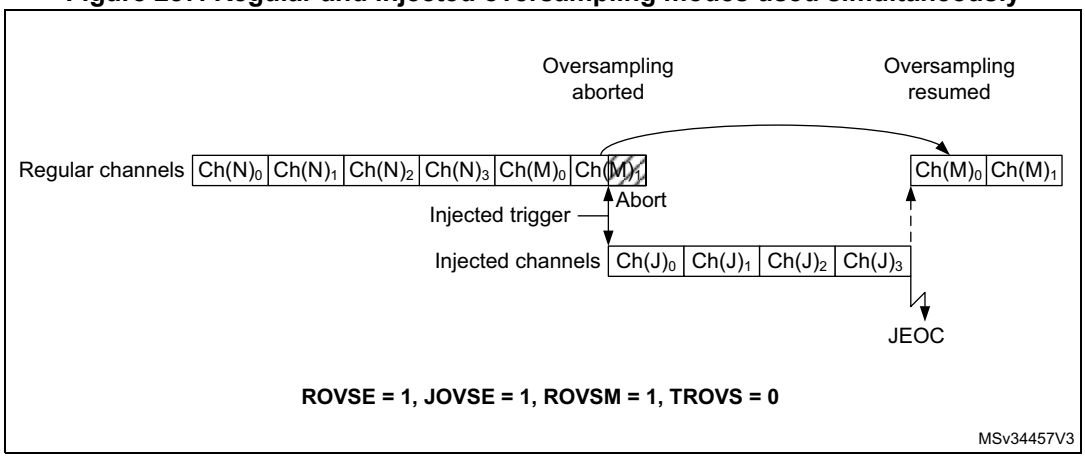
Oversampling injected channels only

The injected oversampling mode bit JOVSE enables oversampling solely for conversions in the injected sequencer.

Oversampling regular and injected channels

It is possible to have both ROVSE and JOVSE bits set. In this case, the regular oversampling must be resumed (ROVSM bit = 1), as shown in *Figure 287*. This limitation no longer applies in parallel injected oversampling mode.

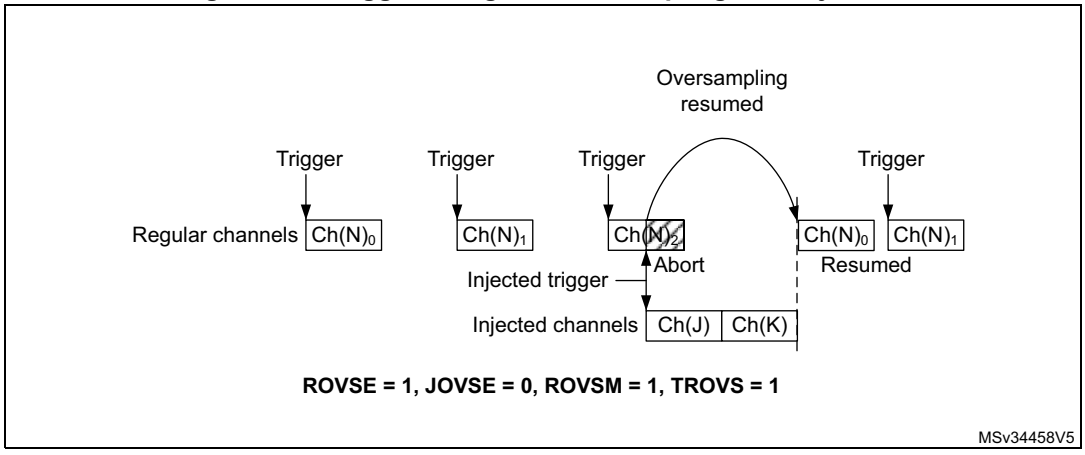
Figure 287. Regular and injected oversampling modes used simultaneously



Triggered regular oversampling with injected conversions

It is possible to have triggered regular mode with injected conversions. In this case, the injected oversampling mode must be disabled and the ROVSM bit set (the resumed mode is forced). The JOVSE bit must be reset. The behavior is shown in *Figure 288*.

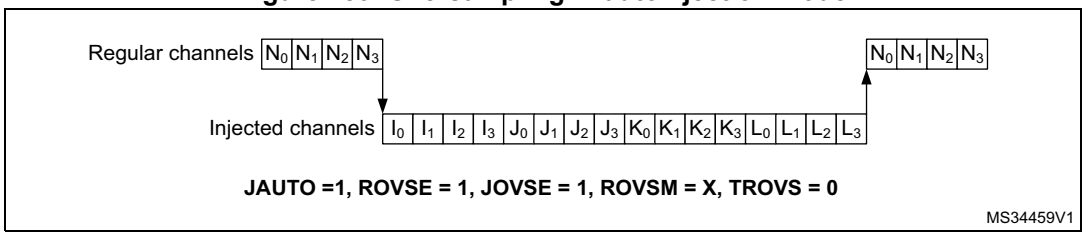
Figure 288. Triggered regular oversampling with injection



Autoinjection mode

It is possible to oversample autoinjected sequences and store all conversion results in registers. This mode is available only with both regular and injected oversampling active: JAUTO = 1, ROVSE = 1 and JOVSE = 1. Other combinations are not supported. The ROVSM bit is ignored in autoinjection mode. *Figure 289* shows how the conversions are sequenced.

Figure 289. Oversampling in autoinjection mode



Combined modes summary

Table 317 summarizes all combinations, including the modes that are not supported.

Table 317. Oversampler operating mode summary

Regular oversampling ROVSE	Injected oversampling JOVSE	Oversampler mode ROVSM 0 = continued 1 = resumed	Triggered regular mode TROVS	Comment

1. Preliminary information, subject to change.

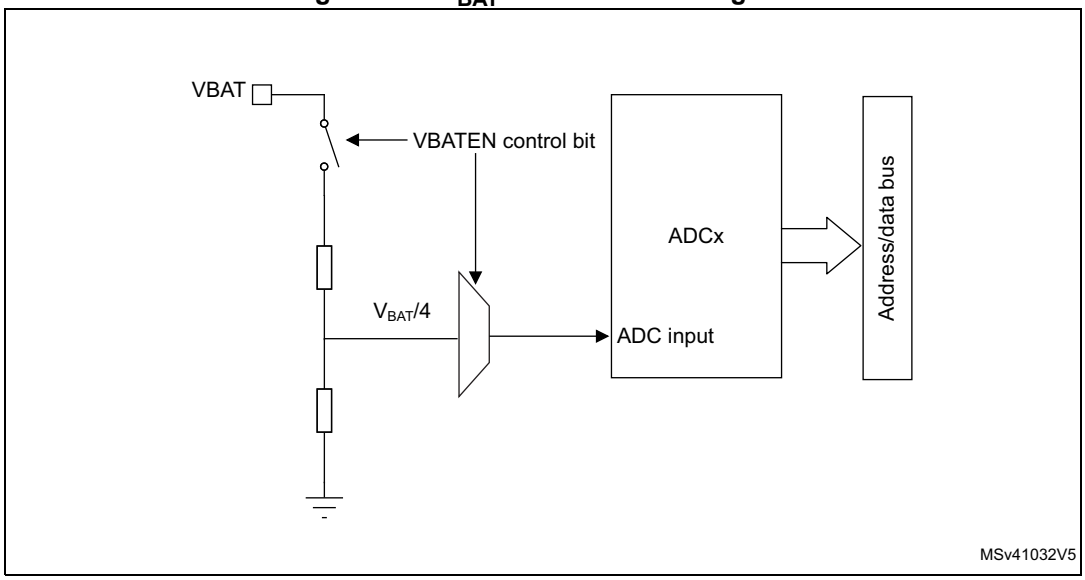
36.4.31 V_{BAT} supply monitoring

The VBATEN bit in the ADCC_CCR register is used to switch to the battery voltage. As the V_{BAT} voltage can be higher than V_{DDA}, to ensure the correct operation of the ADC, the V_{BAT} pin is internally connected to a bridge divider by 4. This bridge is automatically enabled when VBATEN is set, to connect $V_{BAT}/4$ to the ADC input channels (see *Table: ADC interconnection* in *Section 36.4.2: ADC pins and internal signals* for more details). As a consequence, the converted digital value is one fourth of the V_{BAT} voltage. To prevent any unwanted consumption on the battery, it is recommended to enable the bridge divider only when needed, for ADC conversion.

Refer to the electrical characteristics of the device datasheet for the sampling time value to be applied when converting the $V_{BAT}/4$ voltage.

Figure 290 shows the block diagram of the V_{BAT} sensing feature.

Figure 290. V_{BAT} channel block diagram



1. The VBATEN bit must be set to enable the conversion of internal channel for V_{BAT}/4.

36.4.32 Monitoring the internal voltage reference

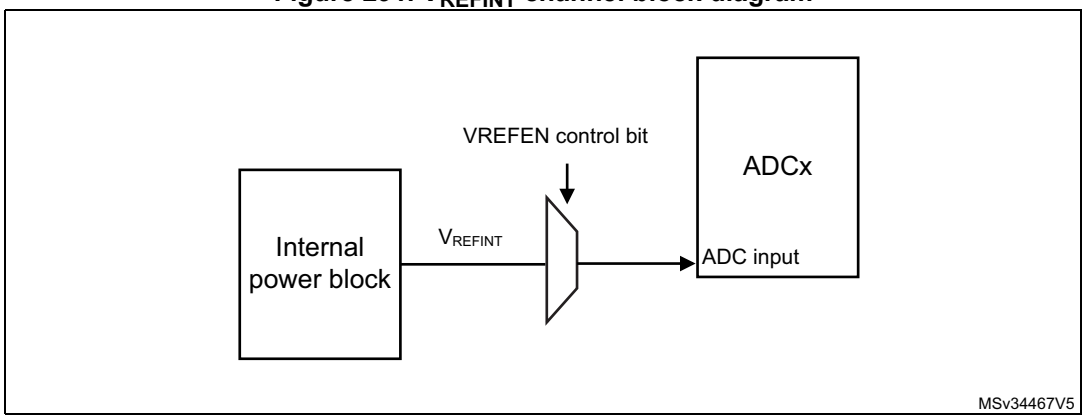
It is possible to monitor the internal voltage reference (V_{REFINT}) to have a reference point for evaluating the ADC V_{REF+} voltage level.

Refer to the *ADC interconnection* table in *Section 36.4.2: ADC pins and internal signals* for details on the ADC input channels to which the internal voltage reference is internally connected.

Refer to the electrical characteristics section of the device datasheet for the sampling time value to be applied when converting the internal voltage reference voltage.

Figure 291 shows the block diagram of the V_{REFINT} sensing feature.

Figure 291. V_{REFINT} channel block diagram



1. The VREFEN bit of the ADCC_CCR register must be set to enable the conversion of internal channels (V_{REFINT}).

Calculating the actual V_{REF+} voltage using the internal reference voltage

The power supply voltage applied to the device may be subject to variations or not precisely known. When V_{DDA} is connected to V_{REF+}, it is possible to compute the actual V_{DDA} voltage using the embedded internal reference voltage (V_{REFINT}). V_{REFINT} and its calibration data acquired by the ADC during the manufacturing process at V_{REF+} can be used to evaluate the actual V_{DDA} voltage level.

The following formula gives the actual V_{REF+} voltage supplying the device:

$$V_{REF+} = V_{REF+_Charac} \times VREFINT_CAL / VREFINT_DATA$$

Where:

- V_{REF+_Charac} is the value of V_{REF+} voltage characterized at V_{REFINT} during the manufacturing process. It is specified in the device datasheet.
- VREFINT_CAL is the VREFINT calibration value.
- VREFINT_DATA is the actual VREFINT output value converted by ADC.

Converting a supply-relative ADC measurement to an absolute voltage value

The ADC is designed to deliver a digital value corresponding to the ratio between V_{REF+} and the voltage applied on the converted channel.

For some applications, the V_{REF+} value is unknown and ADC converted values are right-aligned. In this case, it is necessary to convert this ratio into a voltage independent from V_{REF+}:

$$V_{CHANNELx} = \frac{V_{REF+}}{FULL_SCALE} \times ADC_DATA$$

By replacing V_{REF+} by the formula provided above, the absolute voltage value is given by the following formula

$$V_{CHANNELx} = \frac{V_{REF+_Charac} \times VREFINT_CAL \times ADC_DATA}{VREFINT_DATA \times FULL_SCALE}$$

For applications where V_{REF+} is known and ADC converted values are right-aligned, the absolute voltage value can be obtained by using the following formula:

$$V_{CHANNELx} = \frac{V_{REF+}}{FULL_SCALE} \times ADC_DATA$$

Where:

- VREFINT_CAL is the VREFINT calibration value.
- ADC_DATA is the value measured by the ADC on channel x (right-aligned).
- VREFINT_DATA is the actual VREFINT output value converted by the ADC.
- FULL_SCALE is the maximum digital value of the ADC output. For example with 12-bit resolution, we obtain $2^{12} - 1 = 4095$, or $2^8 - 1 = 255$ with 8-bit resolution.

Note: If ADC measurements are done using an output format other than 12-bit right-aligned, all the parameters must first be converted to a compatible format before the calculation is done.

36.4.33 Monitoring the supply voltage

The ADCs are connected to the internal supply voltage. To use the ADC to measure this voltage, enable the connection through ADC option register.

36.5 ADC interrupts

For each ADC, an interrupt can be generated:

- After ADC power-up, when the ADC is ready (ADRDY flag)
- On the end of any conversion for regular groups (EOC flag)
- On the end of a sequence of conversion for regular groups (EOS flag)
- On the end of any conversion for injected groups (JEOC flag)
- On the end of a sequence of conversion for injected groups (JEOS flag)
- When an analog watchdog detection occurs (AWD1, AWD2 and AWD3 flags)
- When the end of the sampling phase occurs (EOSMP flag)
- When the data overrun occurs (OVR flag)

Separate interrupt enable bits are available for flexibility.

Note: Interrupts are generated by the AHB clock domain. Since the ADC clock is adc_ker_ck, interrupt flags are delayed due to the synchronization between adc_ker_ck and AHB clock domains.

Table 319. ADC interrupts

Interrupt vector	Interrupt event	Event flag	Enable Control bit	Interrupt clear method	Exit from Sleep mode	Exit from Stop, Standby mode
ADC	ADC ready	ADRDY	ADRDYIE	Set by hardware and cleared by software	Yes	No
	End of conversion of a regular group	EOC	EOCIE			
	End of conversion sequence of a regular group	EOS	EOSIE			
	End of conversion of an injected group	JEOC	JEOCIE			
	End of conversion sequence of an injected group	JEOS	JEOSIE			
	Analog watchdog 1 flag is set	AWD1	AWD1IE			
	Analog watchdog 2 flag is set	AWD2	AWD2IE			
	Analog watchdog 3 flag is set	AWD3	AWD3IE			
	End of sampling phase	EOSMP	EOSMPIE			
	Overrun	OVR	OVRIE			

36.6 ADC registers (for each ADC)

Refer to *Section 1.2* for a list of abbreviations used in register descriptions.

36.6.1 ADC interrupt and status register (ADC_ISR)

Address offset: 0x000

Reset value: 0x0000 0000

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **AWD3**: Analog watchdog 3 flag

This bit is set by hardware when the converted voltage crosses the values programmed in the fields LTR[22:0] and HTR[22:0] of ADC_AWD3LTR and ADC_AWD3HTR registers. It is cleared by software writing 1 to it or when ADEN = 0.

0: No analog watchdog 3 event occurred (or the flag event was already acknowledged and cleared by software)

1: Analog watchdog 3 event occurred

Bit 8 **AWD2**: Analog watchdog 2 flag

This bit is set by hardware when the converted voltage crosses the values programmed in the fields LTR[22:0] and HTR[22:0] of ADC_AWD2LTR and ADC_AWD2HTR registers. It is cleared by software writing 1 to it or when ADEN = 0.

0: No analog watchdog 2 event occurred (or the flag event was already acknowledged and cleared by software)

1: Analog watchdog 2 event occurred

Bit 7 **AWD1**: Analog watchdog 1 flag

This bit is set by hardware when the converted voltage crosses the values programmed in the fields LTR[22:0] and HTR[22:0] of ADC_AWD1LTR and ADC_AWD1HTR registers. It is cleared by software writing 1 to it or when ADEN = 0.

0: No analog watchdog 1 event occurred (or the flag event was already acknowledged and cleared by software)

1: Analog watchdog 1 event occurred

Bit 6 **JEOS:** Injected channel end of sequence flag

This bit is set by hardware at the end of the conversions of all injected channels in the group. It is cleared by software writing 1 to it or when ADEN = 0.

0: Injected conversion sequence not complete (or the flag event was already acknowledged and cleared by software)

1: Injected conversions complete

Bit 5 **JEOC:** Injected channel end of conversion flag

This bit is set by hardware at the end of each injected conversion of a channel when a new data is available in the corresponding ADC_JDRy register. It is cleared by software writing 1 to it, when ADEN = 0, or by reading the corresponding ADC_JDRy register.

0: Injected channel conversion not complete (or the flag event was already acknowledged and cleared by software)

1: Injected channel conversion complete

Bit 4 **OVR**: ADC overrun

This bit is set by hardware when an overrun occurs on a regular channel (a new conversion has completed while the EOC flag was already set) or when adc_hclk clock is too slow to manage the data.

It is cleared by software writing 1 to it or when ADEN = 0.

0: No overrun occurred (or the flag event was already acknowledged and cleared by software)

1: Overrun has occurred

Bit 3 **EOS**: End of regular sequence flag

This bit is set by hardware at the end of the conversions of a regular sequence of channels. It is cleared by software writing 1 to it or when ADEN = 0.

0: Regular conversions sequence not complete (or the flag event was already acknowledged and cleared by software)

1: Regular conversions sequence complete

Bit 2 **EOC**: End of conversion flag

This bit is set by hardware at the end of each regular conversion of a channel when a new data is available in the ADC_DR register. It is cleared by software writing 1 to it, when ADEN = 0, or by reading the ADC_DR register.

0: Regular channel conversion not complete (or the flag event was already acknowledged and cleared by software)

1: Regular channel conversion complete

Bit 1 **EOSMP**: End of sampling flag

This bit is set by hardware during the conversion of any channel (only for regular channels), at the end of the sampling phase. It is cleared by software writing 1 or when ADEN = 0.

0: not at the end of the sampling phase (or the flag event was already acknowledged and cleared by software)

1: End of sampling phase reached

Bit 0 **ADRDY**: ADC ready

This bit is set by hardware after the ADC has been enabled (bit ADEN = 1) and when the ADC reaches a state where it is ready to accept conversion requests.

It is cleared by software writing 1 to it or when ADEN = 0.

0: ADC not yet ready to start conversion (or the flag event was already acknowledged and cleared by software)

1: ADC is ready to start conversion

36.6.2 ADC interrupt enable register (ADC_IER)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	AWD3IE	AWD2IE	AWD1IE	JEOSIE	JEOCIE	OVRIE	EOSIE	EOCIE	EOSMPIE	ADRDYIE
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:10 Reserved, must be kept at reset value.

Bit 9 **AWD3IE**: Analog watchdog 3 interrupt enable

This bit is set and cleared by software to enable/disable the analog watchdog 2 interrupt.

0: Analog watchdog 3 interrupt disabled

1: Analog watchdog 3 interrupt enabled

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 8 **AWD2IE**: Analog watchdog 2 interrupt enable

This bit is set and cleared by software to enable/disable the analog watchdog 2 interrupt.

0: Analog watchdog 2 interrupt disabled

1: Analog watchdog 2 interrupt enabled

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 7 **AWD1IE**: Analog watchdog 1 interrupt enable

This bit is set and cleared by software to enable/disable the analog watchdog 1 interrupt.

0: Analog watchdog 1 interrupt disabled

1: Analog watchdog 1 interrupt enabled

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 6 **JEOSIE**: End of injected sequence of conversions interrupt enable

This bit is set and cleared by software to enable/disable the end of injected sequence of conversions interrupt.

0: JEOS interrupt disabled

1: JEOS interrupt enabled. An interrupt is generated when the JEOS bit is set.

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Bit 5 **JEOCIE**: End of injected conversion interrupt enable

This bit is set and cleared by software to enable/disable the end of an injected conversion interrupt.

0: JEOC interrupt disabled.

1: JEOC interrupt enabled. An interrupt is generated when the JEOC bit is set.

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Bit 4 **OVRIE**: Overrun interrupt enable

This bit is set and cleared by software to enable/disable the Overrun interrupt of a regular conversion.

0: Overrun interrupt disabled

1: Overrun interrupt enabled. An interrupt is generated when the OVR bit is set.

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 3 **EOSIE**: End of regular sequence of conversions interrupt enable

This bit is set and cleared by software to enable/disable the end of regular sequence of conversions interrupt.

0: EOS interrupt disabled

1: EOS interrupt enabled. An interrupt is generated when the EOS bit is set.

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 2 **EOCIE**: End of regular conversion interrupt enable

This bit is set and cleared by software to enable/disable the end of a regular conversion interrupt.

0: EOC interrupt disabled.

1: EOC interrupt enabled. An interrupt is generated when the EOC bit is set.

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 1 **EOSMPIE**: End of sampling flag interrupt enable for regular conversions

This bit is set and cleared by software to enable/disable the end of the sampling phase interrupt for regular conversions.

0: EOSMP interrupt disabled.

1: EOSMP interrupt enabled. An interrupt is generated when the EOSMP bit is set.

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 0 **ADRDYIE**: ADC ready interrupt enable

This bit is set and cleared by software to enable/disable the ADC Ready interrupt.

0: ADRDY interrupt disabled

1: ADRDY interrupt enabled. An interrupt is generated when the ADRDY bit is set.

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

36.6.3 ADC control register (ADC_CR)

Address offset: 0x008

Reset value: 0x2000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADCAL	ADCALDIF	DEEPPWD	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rs	rw	rw													
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	JADSTP	ADSTP	JADSTART	ADSTART	ADDIS	ADEN
										rs	rs	rs	rs	rs	rs

Bit 31 **ADCAL**: ADC calibration

This bit is set by software to enter ADC calibration mode.

0: Normal mode

1: Calibration mode

Note: The software is allowed to update the calibration factor by writing ADC_CALFACT only when ADEN = 1, ADCAL = 1, ADSTART = 0 and JADSTART = 0 (ADC enabled, Calibration mode enabled and no conversion ongoing).

Bit 30 **ADCALDIF**: Differential mode for calibration

This bit is set and cleared by software to configure the single-ended or differential input mode for the calibration.

0: Single-ended input calibration mode when ADCAL = 1

1: Differential input calibration mode when ADCAL = 1

Note: The software is allowed to write this bit only when the ADC is disabled and is not calibrating (ADCAL = 0, JADSTART = 0, JADSTP = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0).

Bit 29 **DEEPPWD**: Deep-power-down enable

This bit is set and cleared by software to put the ADC in Deep-power-down mode.

0: ADC not in Deep-power down

1: ADC in Deep-power-down (default reset state)

Note: The software is allowed to write this bit only when the ADC is disabled (ADCAL = 0 and ADEN =0).

Bits 28:6 Reserved, must be kept at reset value.

Bit 5 **JADSTP**: ADC stop of injected conversion command

This bit is set by software to stop and discard an ongoing injected conversion (JADSTP command).

It is cleared by hardware when the conversion is effectively discarded and the ADC injected sequence and triggers can be reconfigured. The ADC is then ready to accept a new start of injected conversions (JADSTART command).

When a software trigger is used, JADSTART bit is cleared by hardware, but JADSTP bit must be programmed to reconfigure the ADC.

0: No ADC stop injected conversion command ongoing

1: Write 1 to stop injected conversions ongoing. Read 1 means that an ADSTP command is in progress.

Note: In autoinjection mode (JAUTO = 1), setting ADSTP bit aborts both regular and injected conversions (do not use JADSTP).

Bit 4 **ADSTP**: ADC stop of regular conversion command

This bit is set by software to stop and discard an ongoing regular conversion (ADSTP command).

It is cleared by hardware when the conversion is effectively discarded. and the ADC regular sequence and triggers can be re-configured. The ADC is then ready to accept a new start of regular conversions (ADSTART command).

When a software trigger is used, ADSTART bit is cleared by hardware. However it is necessary to write ADSTP bit to reconfigure the ADC.

0: No ADC stop regular conversion command ongoing

1: Write 1 to stop ongoing regular conversions. Read 1 means that an ADSTP command is in progress.

Note: In autoinjection mode (JAUTO = 1), setting ADSTP bit aborts both regular and injected conversions (do not use ADSTP).

Bit 3 **JADSTART**: ADC start of injected conversion

This bit is set by software to start ADC conversion of injected channels. Depending on the configuration bits JEXTEN[1:0], a conversion starts immediately (software trigger configuration) or once an injected hardware trigger event occurs (hardware trigger configuration).

- In single conversion mode when software trigger is selected (JEXTSEL = 0x0 and JDISEN = 1), this bit is cleared by hardware immediately after injected conversion starts.
- In all cases, after the execution of the JADSTP command, this bit and JADSTP are cleared by hardware simultaneously.

0: No ADC injected conversion is ongoing.

1: Write 1 to start injected conversions. Read 1 means that the ADC is operating and eventually converting an injected channel.

Note: The software is allowed to set JADSTART only when ADEN = 1, ADDIS = 0 and JAUTO = 0 (ADC is enabled and there is no pending request to disable the ADC).

Note: In autoinjection mode (JAUTO = 1), regular and autoinjected conversions are started by setting ADSTART bit (JADSTART must be kept cleared).

Bit 2 **ADSTART**: ADC start of regular conversion

This bit is set by software to start ADC conversion of regular channels. Depending on the configuration bits EXTEN[1:0], a conversion starts immediately (software trigger configuration) or once a regular hardware trigger event occurs (hardware trigger configuration).

- In single conversion mode when software trigger is selected (EXTSEL = 0x0 and DISEN = 1), this bit is cleared by hardware immediately after regular conversion starts.
- In all cases, after the execution of the ADSTP command, this bit and ADSTP are cleared by hardware simultaneously.

0: No ADC regular conversion is ongoing.

1: Write 1 to start regular conversions. Read 1 means that the ADC is operating and eventually converting a regular channel.

Note: The software is allowed to set ADSTART only when ADEN = 1 and ADDIS = 0 (ADC is enabled and there is no pending request to disable the ADC).

Note: In autoinjection mode (JAUTO = 1), regular and autoinjected conversions are started by setting ADSTART bit (JADSTART must be kept cleared)

Bit 1 **ADDIS**: ADC disable command

This bit is set by software to disable the ADC (ADDIS command) and place it into power-down state (OFF state).

It is cleared by hardware once the ADC is effectively disabled (ADEN is also cleared by hardware at this time).

0: no ADDIS command ongoing

1: Write 1 to disable the ADC. Read 1 means that an ADDIS command is in progress.

Note: The software is allowed to set ADDIS only when ADEN = 1, ADDIS = 0 and both ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 0 **ADEN**: ADC enable control

This bit is set by software to enable the ADC. The ADC is effectively ready to operate once the ADRDY flag has been set.

It is cleared by hardware when the ADC is disabled, after the execution of the ADDIS command.

0: ADC is disabled (OFF state)

1: Write 1 to enable the ADC.

Note: The software is allowed to set ADEN only when all the bits of ADC_CR registers are cleared (ADCAL = 0, JADSTART = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0).

36.6.4 ADC configuration register (ADC_CFGR1)

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	AWD1CH[4:0]					JAUTO	JAWD1EN	AWD1EN	AWD1SGL	Res.	JDISCEN	DISCNUM[2:0]			DISCEN
	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	AUTDLY	CONT	OVRMOD	EXTEN[1:0]		EXTSEL[4:0]					Res.	RES[1:0]		DMNGT[1:0]	
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:26 **AWD1CH[4:0]**: Analog watchdog 1 channel selection

These bits are set and cleared by software. They select the input channel to be guarded by the analog watchdog.

00000: ADC analog input channel 0 monitored by AWD1

00001: ADC analog input channel 1 monitored by AWD1

.....

10011: ADC analog input channel 19 monitored by AWD1

Others: reserved, must not be used

Note: Some channels are not connected physically. Keep the corresponding AWD1CH[4:0] setting to the reset value.

Note: The channel selected by AWD1CH must be also selected into the SQRi or JSQRi registers. The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 25 **JAUTO:** Automatic injected group conversion

This bit is set and cleared by software to enable/disable automatic injected group conversion after regular group conversion.

0: Automatic injected group conversion disabled

1: Automatic injected group conversion enabled

Note: The software is allowed to write this bit only when ADEN = 0.

Bit 24 **JAWD1EN**: Analog watchdog 1 enable on injected channels

This bit is set and cleared by software

0: Analog watchdog 1 disabled on injected channels

1: Analog watchdog 1 enabled on injected channels

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Bit 23 **AWD1EN**: Analog watchdog 1 enable on regular channels

This bit is set and cleared by software

0: Analog watchdog 1 disabled on regular channels

1: Analog watchdog 1 enabled on regular channels

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 22 **AWD1SGL**: Enable the watchdog 1 on a single channel or on all channels

This bit is set and cleared by software to enable the analog watchdog on the channel identified by the AWD1CH[4:0] bits or on all the channels

0: Analog watchdog 1 enabled on all channels

1: Analog watchdog 1 enabled on a single channel

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 21 Reserved, must be kept at reset value.

Bit 20 **JDISCEN:** Discontinuous mode on injected channels

This bit is set and cleared by software to enable/disable discontinuous mode on the injected channels of a group.

0: Discontinuous mode on injected channels disabled

1: Discontinuous mode on injected channels enabled

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Note: It is not possible to use autoinjection mode and discontinuous mode simultaneously: the DISCEN and JDISCEN bits must be kept cleared by software when JAUTO is set.

Bits 19:17 **DISCNUM[2:0]:** Discontinuous mode channel count

These bits are written by software to define the number of regular channels to be converted in discontinuous mode, after receiving an external trigger.

000: 1 channel

001: 2 channels

...

111: 8 channels

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 16 **DISCEN**: Discontinuous mode for regular channels

This bit is set and cleared by software to enable/disable discontinuous mode for regular channels.

0: Discontinuous mode for regular channels disabled

1: Discontinuous mode for regular channels enabled

Note: It is not possible to have both discontinuous mode and continuous mode enabled: DISCEN and CONT cannot both be set (DISCEN takes priority).

Note: It is not possible to use autoinjection mode and discontinuous mode simultaneously: the DISCEN and JDISCEN bits must be kept cleared by software when JAUTO is set.

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 15 Reserved, must be kept at reset value.

Bit 14 **AUTDLY**: Delayed conversion mode

This bit is set and cleared by software to enable/disable the autodelayed conversion mode.

0: Autodelayed conversion mode off

1: Autodelayed conversion mode on

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 13 **CONT**: Single / continuous conversion mode for regular conversions

This bit is set and cleared by software. If it is set, regular conversion takes place continuously until it is cleared.

0: Single conversion mode

1: Continuous conversion mode

Note: It is not possible to have both discontinuous mode and continuous mode enabled: DISCEN and CONT cannot both be set (DISCEN takes priority).

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 12 **OVRMOD**: Overrun mode

This bit is set and cleared by software and configure the way data overrun is managed.

0: ADC_DR register is preserved with the old data when an overrun is detected.

1: ADC_DR register is overwritten with the last conversion result when an overrun is detected.

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bits 11:10 **EXTEN[1:0]**: External trigger enable and polarity selection for regular channels

These bits are set and cleared by software to select the external trigger polarity and enable the trigger of a regular group.

00: Hardware trigger detection disabled (conversions can be launched by software)

01: Hardware trigger detection on the rising edge

10: Hardware trigger detection on the falling edge

11: Hardware trigger detection on both the rising and falling edges

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bits 9:5 **EXTSEL[4:0]**: External trigger selection for regular group

These bits select the external event used to trigger the start of conversion of a regular group:

00000: adc_ext_trg0

00001: adc_ext_trg1

00010: adc_ext_trg2

00011: adc_ext_trg3

00100: adc_ext_trg4

00101: adc_ext_trg5

00110: adc_ext_trg6

00111: adc_ext_trg7

...

11111: adc_ext_trg31

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 4 Reserved, must be kept at reset value.

Bits 3:2 **RES[1:0]**: Data resolution

These bits are written by software to select the resolution of the conversion.

00: 12-bit

01: 10-bit

10: 8-bit

11: 6-bit

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bits 1:0 **DMNGT[1:0]**: Data management configuration

These bits are set and cleared by software to select how the ADC interface output data are managed.

00: Regular conversion data stored in DR only

01: DMA one-shot mode selected

10: MDF mode selected

11: DMA circular mode selected

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no conversion is ongoing).

36.6.5 ADC configuration register 2 (ADC_CFGR2)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LSHIFT[3:0]				Res.	Res.	OVSR[9:0]									
rw	rw	rw	rw			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SMPTRIG	SWTRIG	BULB	Res.	Res.	ROVSM	TROVS	OVSS[3:0]				Res.	Res.	Res.	Res.	ROVSE
rw	rw	rw			rw	rw	rw	rw	rw	rw					rw

Bits 31:28 **LSHIFT[3:0]**: Left shift factor

This bitfield is set and cleared by software to define the left shifting applied to the final result with or without oversampling.

0000: No left shift
0001: 1-bit left shift
0010: 2-bit left shift
0011: 3-bit left shift
0100: 4-bit left shift
0101: 5-bit left shift
0110: 6-bit left shift
0111: 7-bit left shift
1000: 8-bit left shift
1001: 9-bit left shift
1010: 10-bit left shift
1011: 11-bit left shift
1100: 12-bit left shift
1101: 13-bit left shift
1110: 14-bit left shift
1111: 15-bit left shift

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no conversion is ongoing).

Bits 27:26 Reserved, must be kept at reset value.

Bits 25:16 **OVSR[9:0]**: Oversampling ratio

This bitfield is set and cleared by software to define the oversampling ratio.

0: 1x (no oversampling)
1: 2x
2: 3x
...
1023: 1024x

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no conversion is ongoing).

Bit 15 **SMPTRIG**: Sampling time control trigger mode

This bit is set and cleared by software to enable the sampling time control trigger mode.

0: Sampling time control trigger mode disabled
1: Sampling time control trigger mode enabled

If EXTEN[1:0] bits are set to 01, the sampling time starts on the trigger rising edge, and the conversion starts on the trigger falling edge.

The SMPTRIG bit must not be set when the BULB bit is set.

When EXTEN[1:0] bits are set to 00, set SWTRIG to start the sampling.

Note: The software is allowed to write this bit only when ADEN = 0. When the discontinuous mode is used, only DISCNUM[2:0] = 000 configuration is compatible with sampling time control trigger mode*.*

Bit 14 **SWTRIG**: Software trigger bit for sampling time control trigger mode

This bit is set and cleared by software to trigger the conversion in sampling time control trigger mode.

0: Software trigger starts the conversion for sampling time control trigger mode
1: Software trigger starts the sampling for *sampling time control trigger mode*

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no conversion is ongoing), SMPTRIG = 1, and EXTEN[0:1] = 00.

Bit 13 **BULB**: Bulb sampling mode

This bit is set and cleared by software to enable the bulb sampling mode.

0: Bulb sampling mode disabled

1: Bulb sampling mode enabled. The sampling period starts just after the previous end of conversion.

BULB bit must not be set when the SWTRIG bit is set.

The very first ADC conversion is performed with the sampling time specified in SMPx bits.

Note: The software is allowed to write this bit only when ADEN = 0. When the discontinuous mode is used, only DISCNUM[2:0] = 000 configuration is compatible with bulb mode.

Bits 12:11 Reserved, must be kept at reset value.

Bit 10 **ROVSM**: Regular oversampling mode

This bit is set and cleared by software to select the regular oversampling mode.

0: Continued mode: When injected conversions are triggered, the oversampling is temporary stopped and continued after the injection sequence (oversampling buffer is maintained during injected sequence)

1: Resumed mode: When injected conversions are triggered, the current oversampling is aborted and resumed from start after the injection sequence (oversampling buffer is zeroed by injected sequence start)

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no conversion is ongoing). It is recommended to clear both JOVSE and GCOMP when ROVSM = 0.

Bit 9 **TROVS**: Triggered regular oversampling

This bit is set and cleared by software to enable triggered oversampling

0: All oversampled conversions for a channel are done consecutively following a trigger

1: Each oversampled conversion for a channel needs a new trigger

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bits 8:5 **OVSS[3:0]**: Oversampling shift

This bitfield is set and cleared by software to define the right shifting applied to the raw oversampling result.

0000: No shift
0001: 1-bit shift
0010: 2-bit shift
0011: 3-bit shift
0100: 4-bit shift
0101: 5-bit shift
0110: 6-bit shift
0111: 7-bit shift
1000: 8-bit shift
1001: 9-bit shift
1010: 10-bit shift
Other: reserved, must not be used

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no conversion is ongoing).

Bits 4:1 Reserved, must be kept at reset value.

Bit 0 **ROVSE**: Regular oversampling enable

This bit is set and cleared by software to enable regular oversampling.

0: Regular oversampling disabled
1: Regular oversampling enabled

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no conversion is ongoing)

36.6.6 ADC sample time register 1 (ADC_SMPR1)

Address offset: 0x014

Reset value: 0x0000 0000

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:0 **SMPx[2:0]:** Channel x sampling time selection (x = 9 to 0)

These bits are written by software to select the sampling time individually for each channel. During sample cycles, the channel selection bits must remain unchanged.

000: 1.5 ADC clock cycles
001: 2.5 ADC clock cycles
010: 6.5 ADC clock cycles
011: 11.5 ADC clock cycles
100: 23.5 ADC clock cycles
101: 46.5 ADC clock cycles
110: 246.5 ADC clock cycles
111: 1499.5 ADC clock cycles

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Note: Some channels are not connected physically. Keep the corresponding SMPx[2:0] setting to the reset value.

36.6.7 ADC sample time register 2 (ADC_SMPR2)

Address offset: 0x018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:0 **SMPx[2:0]:** Channel x sampling time selection (x = 19 to 10)

These bits are written by software to select the sampling time individually for each channel. During sampling cycles, the channel selection bits must remain unchanged.

000: 1.5 ADC clock cycles
001: 2.5 ADC clock cycles
010: 6.5 ADC clock cycles
011: 11.5 ADC clock cycles
100: 23.5 ADC clock cycles
101: 46.5 ADC clock cycles
110: 246.5 ADC clock cycles
111: 1499.5 ADC clock cycles

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Note: Some channels are not connected physically. Keep the corresponding SMPx[2:0] setting to the reset value.

36.6.8 ADC channel preselection register (ADC_PCSEL)

Address offset: 0x01C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PCSEL[19:16]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PCSEL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **PCSEL[19:0]**: Channel i ($V_{INP[i]}$) preselection

These bits are written by software to preselect the input channel I/O to be converted.

0: Input channel i ($V_{INP[i]}$) is not preselected for conversion, the result of the ADC conversion for this channel is wrong

1: Input channel i ($V_{INP[i]}$) is preselected for conversion

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Configuring the PCSEL bit is not necessary for the internal channels (such as VREFINT).

36.6.9 ADC regular sequence register 1 (ADC_SQR1)

Address offset: 0x030

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	SQ4[4:0]					Res.	SQ3[4:0]					Res.	SQ2[4]
			rw	rw	rw	rw	rw		rw	rw	rw	rw	rw		rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SQ2[3:0]				Res.	SQ1[4:0]					Res.	Res.	LEN[3:0]			
rw	rw	rw	rw		rw	rw	rw	rw	rw			rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **SQ4[4:0]:** 4th conversion in regular sequence

These bits are written by software with the channel number (0 to 19) assigned as the 4th in the regular conversion sequence.

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 23 Reserved, must be kept at reset value.

Bits 22:18 **SQ3[4:0]:** 3rd conversion in regular sequence

These bits are written by software with the channel number (0 to 19) assigned as the 3rd in the regular conversion sequence.

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 17 Reserved, must be kept at reset value.

Bits 16:12 **SQ2[4:0]:** 2nd conversion in regular sequence

These bits are written by software with the channel number (0 to 19) assigned as the 2nd in the regular conversion sequence.

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 11 Reserved, must be kept at reset value.

Bits 10:6 **SQ1[4:0]:** 1st conversion in regular sequence

These bits are written by software with the channel number (0 to 19) assigned as the 1st in the regular conversion sequence.

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bits 5:4 Reserved, must be kept at reset value.

Bits 3:0 **LEN[3:0]:** Regular channel sequence length

These bits are written by software to define the total number of conversions in the regular channel conversion sequence.
0000: 1 conversion
0001: 2 conversions
...
1111: 16 conversions

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for conversion.

36.6.10 ADC regular sequence register 2 (ADC_SQR2)

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

SQ7[3:0]				Res.	SQ6[4:0]					Res.	SQ5[4:0]				
rw	rw	rw	rw		rw	rw	rw	rw	rw		rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **SQ9[4:0]:** 9th conversion in regular sequence

These bits are written by software with the channel number (0 to 19) assigned as the 9th in the regular conversion sequence.

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 23 Reserved, must be kept at reset value.

Bits 22:18 **SQ8[4:0]:** 8th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 8th in the regular conversion sequence
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 17 Reserved, must be kept at reset value.

Bits 16:12 **SQ7[4:0]:** 7th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 7th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 11 Reserved, must be kept at reset value.

Bits 10:6 **SQ6[4:0]:** 6th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 6th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **SQ5[4:0]:** 5th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 5th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for conversion.

36.6.11 ADC regular sequence register 3 (ADC_SQR3)

Address offset: 0x038

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

SQ12[3:0]				Res.	SQ11[4:0]					Res.	SQ10[4:0]				
rw	rw	rw	rw		rw	rw	rw	rw	rw		rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **SQ14[4:0]:** 14th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 14th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 23 Reserved, must be kept at reset value.

Bits 22:18 **SQ13[4:0]:** 13th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 13th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 17 Reserved, must be kept at reset value.

Bits 16:12 **SQ12[4:0]:** 12th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 12th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 11 Reserved, must be kept at reset value.

Bits 10:6 **SQ11[4:0]:** 11th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 11th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **SQ10[4:0]:** 10th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 10th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for conversion.

36.6.12 ADC regular sequence register 4 (ADC_SQR4)

Address offset: 0x03C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

					rw	rw	rw	rw	rw		rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:6 **SQ16[4:0]:** 16th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 16th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **SQ15[4:0]:** 15th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 15th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for conversion.

36.6.13 ADC regular data register (ADC_DR)

Address offset: 0x040

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

RDATA[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RDATA[31:0]**: Regular data converted
These bits are read-only. They contain the conversion result from the last converted regular channel. The data are left- or right-aligned as described in *Section 36.4.26: Data management*.

36.6.14 ADC injected sequence register (ADC_JSQR)

Address offset: 0x04C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
JSQ4[4:0]					Res.	JSQ3[4:0]					Res.	JSQ2[4:1]			
rw	rw	rw	rw	rw		rw	rw	rw	rw	rw		rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
JSQ2[0]	Res.	JSQ1[4:0]					JEXTEN[1:0]		JEXTSEL[4:0]					JLEN[1:0]	
rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 **JSQ4[4:0]:** 4th conversion in the injected sequence

These bits are written by software with the channel number (0 to 19) assigned as the 4th in the injected conversion sequence.

Note: The software is allowed to write these bits only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Bit 26 Reserved, must be kept at reset value.

Bits 25:21 **JSQ3[4:0]:** 3rd conversion in the injected sequence

These bits are written by software with the channel number (0 to 19) assigned as the 3rd in the injected conversion sequence.

Note: The software is allowed to write these bits only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Bit 20 Reserved, must be kept at reset value.

Bits 19:15 **JSQ2[4:0]:** 2nd conversion in the injected sequence

These bits are written by software with the channel number (0 to 19) assigned as the 2nd in the injected conversion sequence.

Note: The software is allowed to write these bits only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Bit 14 Reserved, must be kept at reset value.

Bits 13:9 **JSQ1[4:0]:** 1st conversion in the injected sequence

These bits are written by software with the channel number (0 to 19) assigned as the 1st in the injected conversion sequence.

Note: The software is allowed to write these bits only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Bits 8:7 **JEXTEN[1:0]**: External trigger enable and polarity selection for injected channels

These bits are set and cleared by software to select the external trigger polarity and enable the trigger of an injected group.

00: Hardware trigger detection disabled (conversions can be launched by software)

01: Hardware trigger detection on the rising edge

10: Hardware trigger detection on the falling edge

11: Hardware trigger detection on both the rising and falling edges

Note: The software is allowed to write these bits only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Bits 6:2 **JEXTSEL[4:0]**: External trigger selection for injected group

These bits select the external event used to trigger the start of conversion of an injected group:

00000: adc_jext_trg0

00001: adc_jext_trg1

00010: adc_jext_trg2

00011: adc_jext_trg3

00100: adc_jext_trg4

00101: adc_jext_trg5

00110: adc_jext_trg6

00111: adc_jext_trg7

...

11111: adc_jext_trg31

Note: The software is allowed to write these bits only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Bits 1:0 **JLEN[1:0]:** Injected channel sequence length

These bits are written by software to define the total number of conversions in the injected channel conversion sequence.

00: 1 conversion

01: 2 conversions

10: 3 conversions

11: 4 conversions

Note: The software is allowed to write these bits only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for conversion.

36.6.15 ADC offset y configuration register (ADC_OFCFGRy)

Address offset: 0x050 + 0x004 * (y -1), (y = 1 to 4)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OFFSET_CH[4:0]					SSAT	USAT	POS OFF	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:27 **OFFSET_CH[4:0]:** Channel selection for the data offset y

These bits are written by software to define the channel to which the offset programmed in bits OFFSET[21:0] applies.

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for the data offset y.

Bit 26 **SSAT**: Signed saturation enable

This bit is set and cleared by software to enable the signed saturation feature.(see *Section : Data register, data alignment and offset (ADC_DR, ADC_JDRy, OFFSETy, OFFSETy_CH, OVSS, LSHIFT, JOVSS, JLSHIFT[a], USAT, SSAT, POSOFF)*).

0: Offset is subtracted maintaining the data integrity and extending converted data size (13-bit signed format)

1: Offset is subtracted and result is saturated to maintain the converted data size

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 25 **USAT**: Unsigned saturation enable

This bit is set and cleared by software to enable the unsigned saturation feature.

0: Offset is subtracted maintaining the data integrity

1: Offset is subtracted and result is saturated to maintain the converted data size

Note: The software is allowed to write these bits only when ADSTART = and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 24 **POSOFF**: Positive offset enable

This bit is set and cleared by software to enable the positive offset

0: Negative offset

1: Positive offset

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bits 23:0 Reserved, must be kept at reset value.

36.6.16 ADC offset y register (ADC_OFRy)

Address offset: 0x060 + 0x004 * (y -1), (y= 1 to 4)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OFFSET[21:16]					
										rw	rw	rw	rw	rw	rw

OFFSET[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:0 **OFFSET[21:0]:** Data offset y for the channel programmed in OFFSETy_CH[4:0] bits

These bits are written by software to define the offset y to be subtracted from the raw converted data when converting a channel (can be regular or injected). The channel to which applies the data offset y must be programmed in the OFFSETy_CH[4:0] bits. The conversion result can be read from in the ADC_DR (regular conversion) or from in the ADC_JDRyi registers (injected conversion).

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

36.6.17 ADC gain compensation register (ADC_GCOMP)

Address offset: 0x070

Reset value: 0x0000 1000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
GCOMP	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	GCOMPCOEFF[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **GCOMP:** Gain compensation mode

This bit is set and cleared by software to enable the Gain compensation mode.

0: Regular ADC operation mode

1: Gain compensation enabled and applied on all channels.

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensure that no conversion is ongoing)

Bits 30:14 Reserved, must be kept at reset value.

Bits 13:0 **GCOMPCOEFF[13:0]:** Gain compensation coefficient

These bits are set and cleared by software to program the gain compensation coefficient.

00 1000 0000 0000: gain factor of 0.5

...

01 0000 0000 0000: gain factor of 1

10 0000 0000 0000: gain factor of 2

11 0000 0000 0000: gain factor of 3

...

The coefficient is divided by 4096 to get the gain factor ranging from 0 to 3.9999756

Note: This gain compensation is only applied when GCOMP bit is set.

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensure that no conversion is ongoing).

36.6.18 ADC injected channel y data register (ADC_JDRy)

Address offset: 0x080 + 0x004 * (y - 1), (y = 1 to 4)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

AWDCH[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **AWDCH[19:0]**: Analog watchdog 2 channel selection

These bits are set and cleared by software. They enable and select the input channels to be guarded by the analog watchdog 2.
AWDCH[i] = 0: ADC analog input channel i is not monitored by AWD2
AWDCH[i] = 1: ADC analog input channel i is monitored by AWD2
When AWDCH[19:0] = 000..0, the analog Watchdog 2 is disabled

Note: The channels selected by AWDCH must be also selected in the SQi or JSQi bits.

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for the analog watchdog.

36.6.20 ADC analog watchdog 3 configuration register (ADC_AWD3CR)

Address offset: 0x0A4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	AWDCH[19:16]			
												rw	rw	rw	rw

AWDCH[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **AWDCH[19:0]**: Analog watchdog 3 channel selection

These bits are set and cleared by software. They enable and select the input channels to be guarded by the analog watchdog 3.

AWDCH[i] = 0: ADC analog input channel i is not monitored by AWD3

AWDCH[i] = 1: ADC analog input channel i is monitored by AWD3

When AWDCH[19:0] = 000..0, the analog Watchdog 3 is disabled.

Note: The channels selected by AWDCH must be also selected in the SQi or JSQi bits.

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for the analog watchdog.

36.6.21 ADC analog watchdog 1 lower threshold register (ADC_AWD1LTR)

Address offset: 0x0A8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LTR[22:16]

LTR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:0 **LTR[22:0]**: Analog watchdog 1 lower threshold

These bits are set and cleared by software to define the lower threshold for analog watchdog 1.

Refer to *Section 36.4.29: Analog window watchdog (AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWDCH of ADC_AWD2CR and ADC_AWD3CR, HTR, LTR, AWDFILT)*.

36.6.22 ADC analog watchdog 1 higher threshold register (ADC_AWD1HTR)

Address offset: 0x0AC

Reset value: 0x003F FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
AWDFILT[2:0]			Res.	Res.	Res.	Res.	Res.	Res.	HTR[22:16]

HTR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 **AWDFILT[2:0]**: Analog watchdog filtering parameter

These bits are set and cleared by software.

000: No filtering, one detection generates an AWD1 flag or an interrupt

001: two consecutive detections generate an AWD1 flag or an interrupt

...

111: Eight consecutive detections generate an AWD1 flag or an interrupt

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bits 28:23 Reserved, must be kept at reset value.

Bits 22:0 **HTR[22:0]**: Analog watchdog 1 higher threshold

These bits are set and cleared by software to define the higher threshold for analog watchdog 1. Refer to *Analog windows watchdog* section.

36.6.23 ADC analog watchdog 2 lower threshold register (ADC_AWD2LTR)

Address offset: 0x0B0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:0 **HTR[22:0]**: Analog watchdog 2 higher threshold
These bits are set and cleared by software to define the higher threshold for analog watchdog 2. Refer to *Analog windows watchdog* section.

36.6.25 ADC analog watchdog 3 lower threshold register (ADC_AWD3LTR)

Address offset: 0x0B8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

HTR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:0 **HTR[22:0]**: Analog watchdog 3 higher threshold

These bits are set and cleared by software to define the higher threshold for analog watchdog 3. Refer to *Analog windows watchdog* section.

36.6.27 ADC differential mode selection register (ADC_DIFSEL)

Address offset: 0x0C0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DIFSEL[19:16]			
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DIFSEL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	r

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **DIFSEL[19:0]:** Differential mode for channels 19 to 0.

These bits are set and cleared by software. They allow to select if a channel is configured as single-ended or differential or pseudodifferential mode.

DIFSEL[i] = 0: ADC analog input channel is configured in single-ended mode

DIFSEL[i] = 1: ADC analog input channel i is configured in differential or pseudodifferential mode

Note: The DIFSEL bits corresponding to channels that are either connected to a single-ended I/O port or to an internal channel must be kept their reset value (single-ended input mode).

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

36.6.28 ADC calibration factors (ADC_CALFACT)

Address offset: 0x0C4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CALADDOS	Res.	Res.	Res.	Res.	Res.	Res.	CALFACT_D[8:0]								
rw							rw	rw	rw	rw	rw	rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	CALFACT_S[8:0]								
							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **CALADDOS**: Calibration additional offset

This bit is set by software to add a positive offset at the input stage of ADC for calibration purpose.

0: Calibration additional positive offset disabled

1: Calibration additional positive offset enabled

Note: The software is allowed to write these bits only when ADSTART = 0, and JADSTART = 0 (ADC is enabled, calibration mode is selected, and no conversion is ongoing).

Bits 30:25 Reserved, must be kept at reset value.

Bits 24:16 **CALFACT_D[8:0]**: Calibration factors in differential mode

These bits are written by hardware or by software.

Once a differential input calibration is complete, they are updated by hardware with the calibration factors.

The software can write these bits with a new calibration factor. If the new calibration factor is different from the current one stored in the analog ADC, it is applied once a new differential conversion is launched.

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (ADC is enabled, no calibration is ongoing and no conversion is ongoing).

Bits 15:9 Reserved, must be kept at reset value.

Bits 8:0 **CALFACT_S[8:0]**: Calibration factors In single-ended mode

These bits are written by hardware or by software.

Once a single-ended input calibration is complete, they are updated by hardware with the calibration factors.

The software can write these bits with a new calibration factor. If the new calibration factor is different from the current one stored in the analog ADC, it is applied once a new single-ended conversion is launched.

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (ADC is enabled, no calibration is ongoing and no conversion is ongoing).

This bit can only be cleared by a power-on reset.

36.6.29 ADC option register (ADC_OR)

Address offset: 0x0D0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OP3	OP2	OP1	OP0
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bit 3 **OP3:** Option bit 3

This bit is set and cleared by software to enable/disable the V_{DDCPU} channel.

0: V_{DDCPU} channel disabled

1: V_{DDCPU} channel enabled

Note: This bit is only available in ADC2

Bit 2 **OP2:** Option bit 2

This bit is set and cleared by software to enable/disable the V_{DDCORE} channel.

0: V_{DDCORE} channel disabled

1: V_{DDCORE} channel enabled

Note: This bit is only available in ADC2.

Bit 1 **OP1:** Option bit 1

This bit is set and cleared by software to choose the ADC bandgap source

0: ADC internal bandgap disabled

1: ADC internal bandgap enabled

Note: The software is allowed to write this bit only when ADC is disabled.

Bit 0 **OP0:** Option bit 0

This bit is set and cleared by software to enable the internal reference buffer.

0: ADC internal reference voltage buffer disabled

1: ADC internal reference voltage buffer enabled

Note: The software is allowed to write this bit only when ADC is disabled.

36.7 ADC common registers

These registers define the control and status registers common to both ADCs.

36.7.1 ADC common status register (ADCC_CSR)

Address offset: 0x000

Reset value: 0x0000 0000

This register provides an image of the flags of the different ADCs. Nevertheless it is read-only and does not allow to clear the different flags. Instead each flag must be cleared by writing 0 to it in the corresponding ADC_ISR register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	AWD3_MST	AWD2_MST	AWD1_MST	JEOS_MST	JEOC_MST	OVR_MST	EOS_MST	EOC_MST	EOSMP_MST	ADRDY_MST
						r	r	r	r	r	r	r	r	r	r

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **AWD3_MST:** Analog watchdog 3 flag of the master ADC
This bit is a copy of the AWD3 bit in the corresponding ADC_ISR register.

Bit 8 **AWD2_MST:** Analog watchdog 2 flag of the master ADC
This bit is a copy of the AWD2 bit in the corresponding ADC_ISR register.

Bit 7 **AWD1_MST:** Analog watchdog 1 flag of the master ADC
This bit is a copy of the AWD1 bit in the corresponding ADC_ISR register.

Bit 6 **JEOS_MST:** End of injected sequence flag of the master ADC
This bit is a copy of the JEOS bit in the corresponding ADC_ISR register.

Bit 5 **JEOC_MST:** End of injected conversion flag of the master ADC
This bit is a copy of the JEOC bit in the corresponding ADC_ISR register.

Bit 4 **OVR_MST:** Overrun flag of the master ADC
This bit is a copy of the OVR bit in the corresponding ADC_ISR register.

Bit 3 **EOS_MST:** End of regular sequence flag of the master ADC
This bit is a copy of the EOS bit in the corresponding ADC_ISR register.

Bit 2 **EOC_MST:** End of regular conversion of the master ADC
This bit is a copy of the EOC bit in the corresponding ADC_ISR register.

Bit 1 **EOSMP_MST:** End of sampling phase flag of the master ADC
This bit is a copy of the EOSMP bit in the corresponding ADC_ISR register.

Bit 0 **ADRDY_MST:** Master ADC ready
This bit is a copy of the ADRDY bit in the corresponding ADC_ISR register.

36.7.2 ADC common control register (ADCC_CCR)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	VBATEN	Res.	VREFEN	PRESC[3]	PRESC[2]	PRESC[1]	PRESC[0]	Res.	Res.
							rw		rw	rw	rw	rw	rw		
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **VBATEN**: V_{BAT} enable

This bit is set and cleared by software to enable/disable the V_{BAT} channel.

0: V_{BAT} channel disabled

1: V_{BAT} channel enabled

Note: V_{BAT} is not available on all ADC instances. Refer to Section 36.4.4: ADC connectivity for details.

Bit 23 Reserved, must be kept at reset value.

Bit 22 **VREFEN**: V_{REFINT} enable

This bit is set and cleared by software to enable/disable the V_{REFINT} channel.

0: V_{REFINT} channel disabled

1: V_{REFINT} channel enabled

Note: V_{REFINT} is not available on all ADC instances. Refer to Section 36.4.4: ADC connectivity for details.

Note: The software is allowed to write this bit only when ADEN = 0.

Bits 21:18 **PRESC[3:0]**: ADC prescaler

These bits are set and cleared by software to select the frequency of the clock to the ADC. The clock is common for all the ADCs.

0000: input ADC clock not divided
0001: input ADC clock divided by 2
0010: input ADC clock divided by 4
0011: input ADC clock divided by 6
0100: input ADC clock divided by 8
0101: input ADC clock divided by 10
0110: input ADC clock divided by 12
0111: input ADC clock divided by 16
1000: input ADC clock divided by 32
1001: input ADC clock divided by 64
1010: input ADC clock divided by 128
1011: input ADC clock divided by 256
Other: reserved, must not be used

Note: The software is allowed to write these bits only when the ADC is disabled (ADCAL=0, JADSTART=0, ADSTART=0, ADSTP=0, ADDIS=0 and ADEN=0).

Bits 17:0 Reserved, must be kept at reset value.

36.7.3 ADC hardware configuration register (ADCC_HWCFGR1)

Address offset: 0x0F0

Reset value: 0x0000 0241 (ADCC1)
Reset value: 0x0000 0241 (ADCC2)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bits 11:8 **ANAIP[3:0]**: Analog IP compatibility
0001: ADC12P18
0010: ADC12FF16/N12
0011: ADC12T40
0100: ADC12S40
0101: ADC12M40/E40
0110: ADC12M40/E40_2msps

Bits 7:4 **OPBITS[3:0]**: Number of option bits
0000: No option register implemented
0001: 1 option bit implemented in the ADC option register (ADC_OR) at address offset 0x0D0
0010: 2 option bits implemented in the ADC option register (ADC_OR) at address offset 0x0D0
0100: 4 option bits implemented in the ADC option register (ADC_OR) at address offset 0xD0

Bits 3:0 **ADCNUM[3:0]**: Number of ADCs implemented
0001: One ADC instance implemented
0010: Two ADC instances implemented
0011: Three ADCs instances implemented

36.7.4 ADC version register (ADCC_VERR)

Address offset: 0x0F4

Reset value: 0x0000 0011

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MAJREV[3:0]				MINREV[3:0]			
								r	r	r	r	r	r	r	r

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **MAJREV[3:0]**: Major revision
These bits returns the ADC IP major revision
0001: Major revision = 1.X
0010: Major revision = 2.X
0011: Major revision = 3.X

Bits 3:0 **MINREV[3:0]**: Minor revision
These bits returns the ADC IP minor revision
0000: Minor revision = X.0
0001: Minor revision = X.1

36.7.5 ADC identification register (ADCC_IPIDR)

Address offset: 0x0F8

Reset value: 0x0011 0008

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **ID[31:0]**: Peripheral identifier
These bits returns the ADC identifier.
ID[31:0] = 0x0011 0008: c7amba_aditf6

36.7.6 ADC size identification register (ADCC_SIDR)

Address offset: 0x0FC

Reset value: 0xA3C5 DD01

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SID[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

SID[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **SID[31:0]**: Size Identification
SID[31:8]: fixed code that characterizes the ADCx_SIDR register. This field is always read at 0xA3C5DD.
SID[7:0]: read-only numeric field that returns the address offset (in Kbytes) of the identification registers from the IP base address:
0x01: 1 Kbytes address offset
0x02: 2 Kbytes address offset
0x04: 4 Kbytes address offset
0x08: 8 Kbytes address offset

36.8 ADC register map

ADC1 and ADC2 are XXX.

Table 320. ADC register map and reset values

Offset	Register name reset value	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

37 Digital temperature sensor (DTS)

37.1 Introduction

The DTS is a high-precision low-power junction temperature sensor (TS). It is composed of a configurable controller plus a temperature sensor, TS0. The controller features a generic interface that enables the DTS to be accessed in read and write modes, through the APB bus.

37.2 DTS main features

The temperature sensor main features are the following:

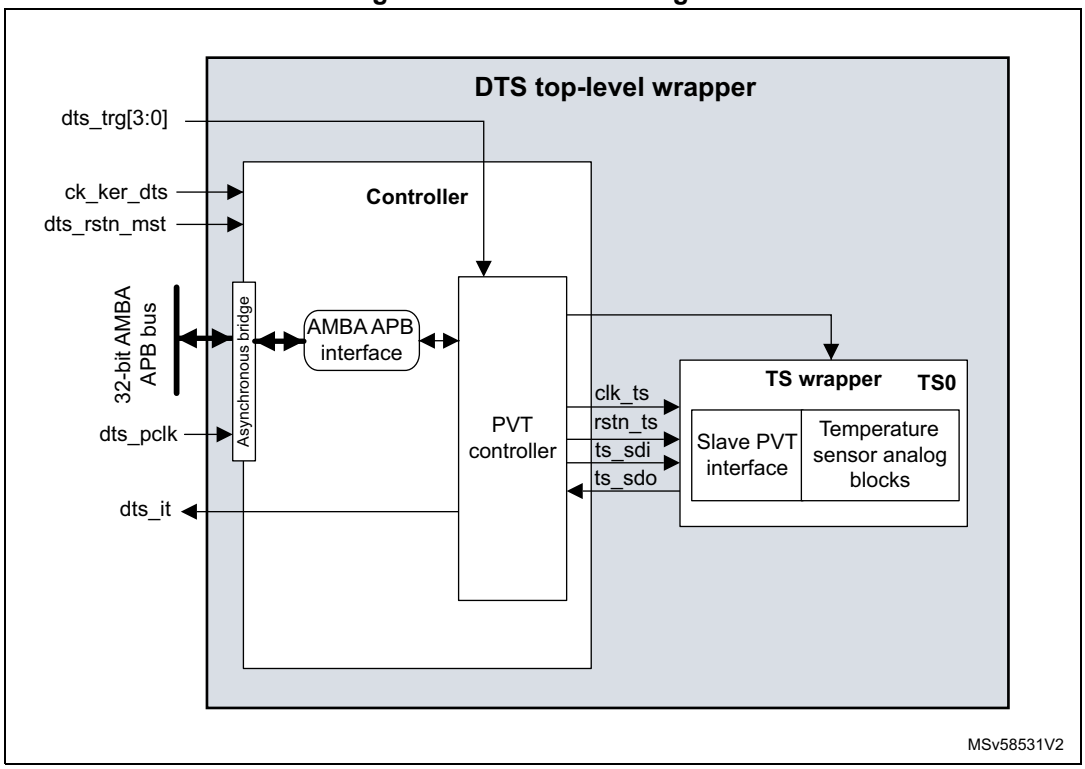
- For each sensor:
  - Two programmable (rise or fall) hardware alarms incorporating hysteresis
  - Status registers recording the minimum and maximum data values received
- A power-up timer with IRQ to support manual operation

37.3 DTS functional description

37.3.1 DTS block diagram

Figure 292 shows the DTS block diagram.

Figure 292. DTS block diagram



The DTS incorporates an APB interface configured to control the temperature sensor, TS0, through a process, voltage and temperature (PVT) controller.

37.3.2 DTS pins and internal signals

Table 322. DTS internal input/output signals

Internal signal name	Signal type	Description
dts_pclk	Input	APB bus clock
ck_ker_dts	Input	DTS main clock
dts_rstn_mst	Input	Master reset (asynchronous, active low)
AMBA APB bus	Input/output	APB Interface
dts_it	Output	IRQ interrupt from the DTS peripheral
dts_trg[3:0]	Inputs	Trigger interface
Temperature sensor (TS) interface		
clk_ts	Input	Temperature sensor SDA clock
rstn_ts	Input	Temperature sensor SDA reset (asynchronous, active low)
ts_sdi	Input	Temperature sensor SDA slave data Input
ts_sdo	Output	Temperature sensor SDA slave data output

37.3.3 DTS reset and clocks

DTS clocks

The DTS is clocked by ck_ker_dts.

The PVT controller incorporates a clock synthesizer in the TS block. The synthesizers generate the clock and timing strobes for the slave serial data adapters (SDA) and the clock for the embedded TS block (clk_ts).

The synthesizer CLK_SYNTH_HI[7:0]/CLK_SYNTH_LO[7:0] counters allow the integer division of the ck_ker_dts clock to generate the TS clock (clk_ts) at frequency ratios from 1/2 to 1/512 (see *DTS TSC clock synthesizer register (DTS_TSCCLKSYNTHR)*). Separate counters are used to generate timing control strobes that are aligned with the clk_ts clock. These timing strobes are used by the master serial adapters to control the sample point of the serial data inputs and the hold time of the serial data outputs.

The system clock ck_ker_dts frequency is determined by the RCC. CLK_SYNTH_HI[7:0] and CLK_SYNTH_LO[7:0] must be programmed so that the ratio CLK_SYNTH_HI[7:0]/CLK_SYNTH_LO[7:0] enables to obtain a clk_ts serial clock that falls within the TS operating frequency range (from 4 to 8 MHz).

The TS frequency is defined by:

$$\text{clk_ts frequency} = 1 / ((\text{CLK_SYNTH_HI[7:0]} + 1) + (\text{CLK_SYNTH_HI[7:0]} + 1)) \times \text{ck_ker_dts frequency}$$

For example:

For ck_ker_dts = 64.0 MHz and a TS operating frequency ranging between 4 and 8 MHz, setting the ck_ker_dts to clk_ts divider factor to 8:1 (CLK_SYNTH_HI[7:0] and CLK_SYNTH_LO[7:0] both programmed to 0x03), returns an TS operating frequency of 64.0 MHz / 8 = 8 MHz, which falls within the acceptable operating frequency range of 4 to 8 MHz. This enables to obtain an overall divider factor of 8 and a ck_ker_dts serial clock duty cycle of 50/50.

For ck_ker_dts = 8 MHz, the configuration must be:

CLK_SYNTH_LO[7:0] = 0x0

CLK_SYNTH_HI[7:0] = 0x0

CLK_SYNTH_HOLD[3:0]= 0x1

clk_ts = 4 MHz

clk_ts duty cycle = 50 %

The CLK_SYNTH_HOLD[3:0] value must be programmed to accommodate the worst-case serial data path propagation delays without exceeding the synthesized clock period, this means that:

$$\text{CLK_SYNTH_HOLD[3:0]} \leq \text{CLK_SYNTH_HI[7:0]} + \text{CLK_SYNTH_LO[7:0]} + 1$$

DTS reset

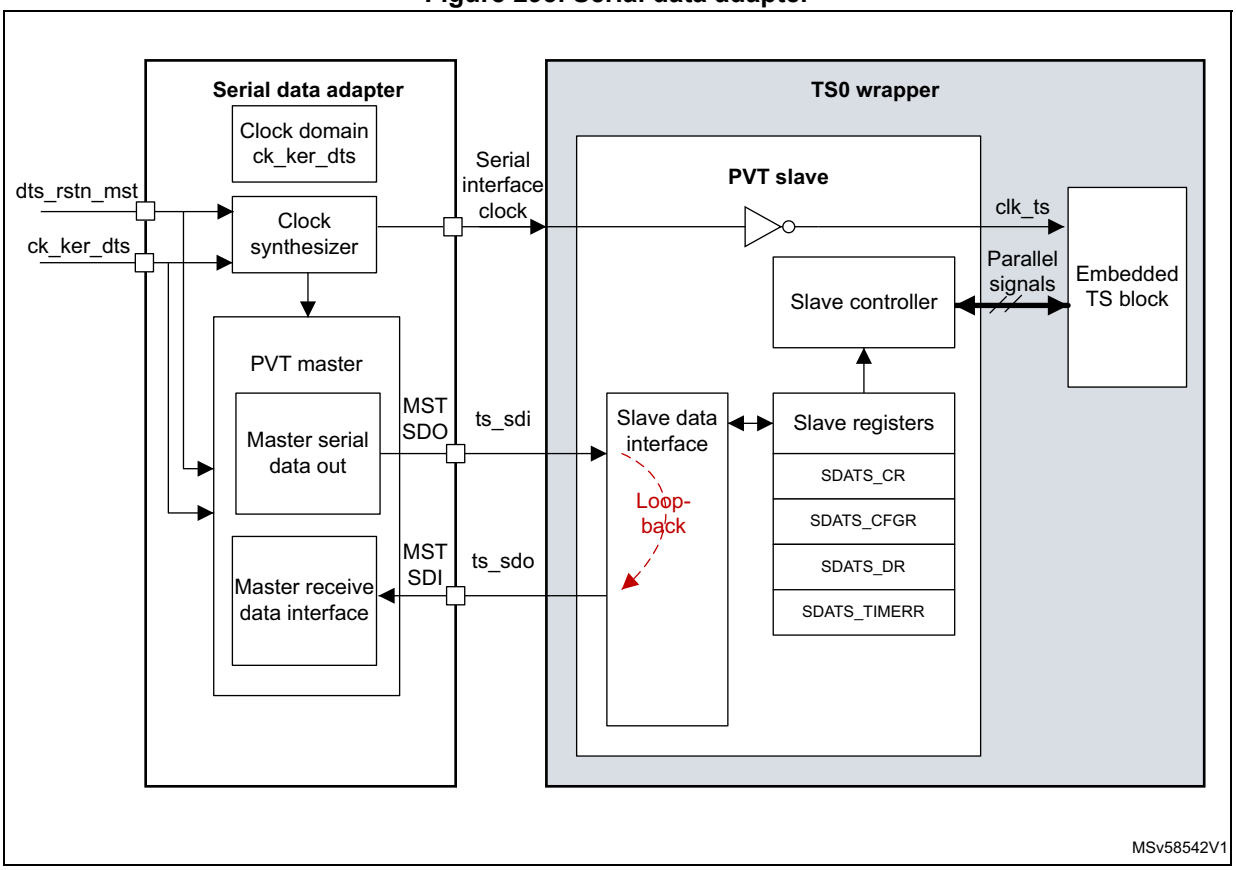
The DTS is reset using the asynchronous active-low dts_rstn_mst input.

When the master dts_rstn_mst is asserted, the entire DTS is reset, all APB internal registers and the PVT controller. It also powers down and resets the embedded TS blocks.

When de-asserted, the APB interface responds to requests after a three clock-cycle delay.

37.3.4 DTS serial data adapter (SDA)

Figure 293. Serial data adapter



The serial data adapter (SDA) allows the TS blocks to be configured and controlled via serial data interfaces (SDIF). The purpose of the SDA is to minimize the number of signals that need to be routed from the PVT controller to each TS block.

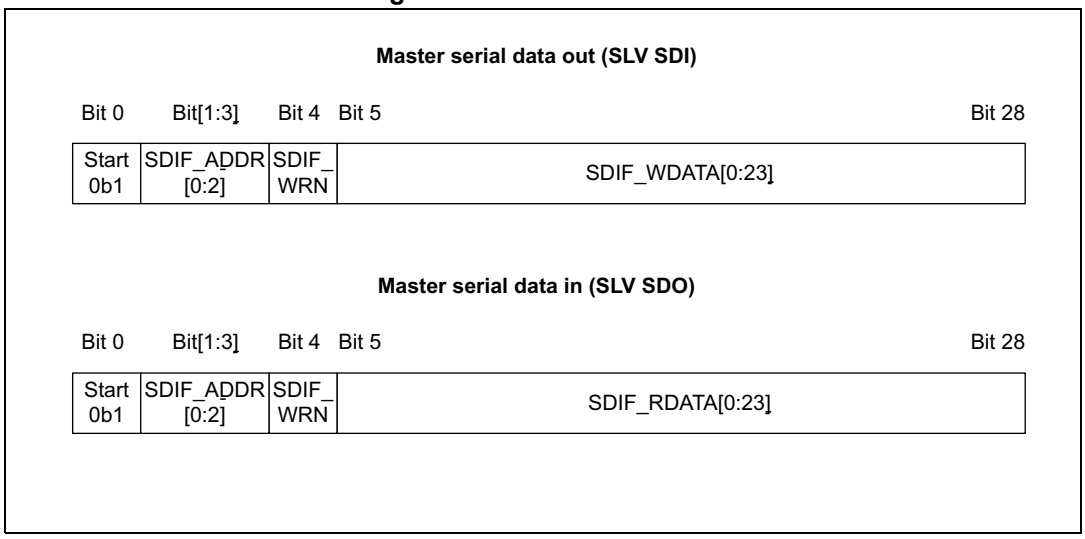
A master usually transmits data to all its active PVT slave devices. However, it is possible to inhibit the programming of one or more slaves to allow different configuration options to be applied. To achieve power saving, it is also possible to disable completely a TS block by disabling its clock and forcing reset.

The serial data interface also provides loop-back functionality (shown in red in *Figure 293*) to support system integration testing without having to power up the embedded TS block.

SDA data format

The serial data streams consist of an active-high start bit, 3-bit register address (SDIF_ADDR[2:0]), register write/not read enable (SDIF_WRN), and 24-bit data field (SDIF_WDATA[23:0]). The input and output serial data stream formats are shown in *Figure 294*. It must be noted that the serial data streams are little endian, meaning that the individual data fields are shifted LSB first.

Figure 294. SDA data format



SDA read

When reading data from the SDA slave registers (SDIF_WRN = 0), the SLV SDI bit stream is shifted to SLV SDO (delayed by one clk_ts cycle) and the register read data value is output on SDIF_RDATA[23:0]. The read data value is then made available in the PVT controller DTS_TS0SDIFRDATAR register.

SDA write

When writing data to the SDA slave registers (SDIF_WRN = 1), the SLV SDI bit stream is automatically shifted to SLV SDO and SDIF_RDATA[23:0] = SDIF_WDATA[23:0]. The write data loop-back value is then made available in the corresponding PVT controller DTS_TS0SDIFRDATAR register.

A special loop-back mode is available by writing to the (read-only) SDATS_DR register when SDIF_WRN = 1 and SDIF_ADDR[2:0] = 0x3. In this mode, the loop-back data value is also written to the PVT controller TS data registers (DTS_TS0SDIFRDATAR). When writing loop-back data to the TS data registers, the SDA TS_DATA[23:0] field **must** be set to 0x0.

The DTS_TS0SDIFRDATAR loop-back functionality can be used to verify the integrity of the serial data transfer between the PVT controller and remote PVT slave devices.

The special DTS_TS0SDIFRDATAR loop-back functionality is provided to test the PVT controller operation without having to power up the embedded TS block, for example when a fault or alarm occurs.

The loop-back functionality is disabled whenever the PVT slave is configured to automatic data recovery when the TS_AUTO bit of PVT SDATS_CR register is asserted.

SDA automatic data recovery

The automatic data recovery is enabled through TS_AUTO bit of SDATS_CR register.

In automatic data recovery mode, the SDIF_LOCK flag is set in the DTS_TSCSDIF_SR register, the SDA interface becomes write-only and all SDA read requests are ignored. In this mode, the SLV automatically streams TS_DATA[23:0] to the PVT controller each time new data samples become available, while setting SDIF_ADDR[2:0] to 0x3 and SDIF_WRN to 1. The automatically recovered data are made available in the PVT controller DTS_TS0SDIFRDATAR and DTS_TS0SDIFRDATAR register.

SDA SDIF programming

The SDA slave is accessed via the TS SDIF control register DTS_TSCSDIF_CFGR, by setting the SDIF_WDATA[23:0], the SDIF_ADDR[2:0] and the SDIF_WRN, and asserting the SDIF_PROG bit. This SDA read or write request is normally set up using a single PVT register write access.

Once a programming request has been issued, the SDIF_BUSY flag in the DTS_TSCSDIF_SR register is set, and any additional read or write programming requests is ignored until the current access completes.

SDA controller operation

The SDA slave controller features two operating modes: manual (default) and automatic. In both modes, the embedded TS block is configured through the SDATS_CFGR register.

In manual operating mode, when the TS_AUTO bit of SDATS_CR register is de-asserted, the embedded TS block is controlled directly through the SDATS_CR register fields TS_PD, TS_RSTN, TS_RUN_ONCE, TS_RUN_CONT and TS_CLOAD. In manual mode, the user is responsible for ensuring that the PD, RSTN, CLOAD and RUN signals are applied in the correct order and at appropriate times. Sample data from the TS block are captured in the SDA slave SDATS_DR register at the end of the conversion. The user must either poll the SDATS_DR register or leave sufficient time for the conversion to complete before reading the SDATS_DR register in order to recover the sample data from the slave SDA.

In automatic mode, when the TS_AUTO bit is asserted in SDATS_CR register, the embedded TS block is controlled by the slave SDA. When either TS_RUN_ONCE or TS_RUN_CONT bit of the TS_SDATS_CR register is asserted, the slave SDA sequences the PD, RSTN, CLOAD, and RUN signals that drive the TS block to perform one or more conversions. In this mode sample data from the TS block are captured in the SDA slave SDATS_DR register at the end of the conversion before being automatically streamed to the PVT controller.

In trigger mode, when a trigger is asserted at DTS top level, this value is compared to the value programmed in bits 18 to 16 (TRIG[2:0]) of the SDATS_CFGR register. If it is equal, the TS_RUN_ONCE bit is automatically asserted. Sample data from each TS block are captured in the SDA slave SDATS_DR register at the end of the conversion.

SDA slave registers

The serial data adapter registers are accessible through the SDIF interface of the PVT controller.

Table 323. SDA slave registers

SDIF_ADDR[2:0]	Reset value	Register	Description
0x0	0x000001	SDATS_CR	TS control register (see *Table 324*)
0x1	0x000000	SDATS_CFGR	TS configuration register (see *Table 325*)
0x3	0x000000	SDATS_DR	TS data / SDA loop-back register (see *Table 326*)
0x4	-	Reserved	-
0x5	0x000000	SDATS_TIMERR	TS power-up Timer register (see *Table 324*)

Table 324. SDA TS control register (SDATS_CR)

Bitfield range	Bitfield description	Access type
Bits 23:10	Reserved, must be kept at reset value.	-
Bit 9	**TS_STOP:** TS force stop This self-clearing bit immediately returns the slave TS controller to the default TS control state and terminates any serial data activity. This is not a clean shut-down and it may invalidate any data operations currently in progress. 0: TS not stopped 1: TS stopped	rs
Bit 8	**TS_AUTO:** TS automatic mode This bit is used in conjunction with TS_RUN_CONT and TS_RUN_ONCE to automatically power up the embedded TS and run conversions. Asserting TS_RUN_CONT triggers continuous conversions, while asserting TS_RUN_ONCE triggers a single conversion. If TS_AUTO is de-asserted while conversions are running, the controller waits for any active conversions to complete and then returns to the default TS control state. 0: Automatic mode disabled 1: Automatic mode enabled	rw
Bits 7:5	Reserved, must be kept at reset value.	-
Bit 4	**TS_CLOAD:** TS configuration load This self-clearing bit provides the embedded TS cload input in the default TS control state (TS automatic mode disabled). 0: TS configuration not loaded 1: TS configuration loaded	rs
Bit 3	**TS_RUN_CONT:** TS run continuous The TS_RUN_CONT control bit is ORed with TS_RUN_ONCE in order to provide the embedded TS run input in the default TS control state (TS automatic mode disabled). This bit is active high.	rw

Table 324. SDA TS control register (SDATS_CR) (continued)

Bitfield range	Bitfield description	Access type
Bit 2	**TS_RUN_ONCE:** TS run once Provided TS_RUN_CONT is not asserted, this self-clearing bit asserts the embedded TS run input for one clock cycle when it is in the default TS control state (TS automatic mode disabled). This bit is active on the rising edge.	rs
Bit 1	**TS_RSTN:** TS reset This bit provides the embedded TS rstn input in the default TS control state (TS automatic mode must be disabled). 0: TS reset 1: TS not reset	rw
Bit 0	**TS_PD:** TS power-down This bit provides the embedded TS pd input when in the default TS control state (TS automatic mode disabled). 0: No TS power-down 1: TS power-down	rw

Table 325. SDA TS configuration register (SDATS_CFGR)

Bitfield range	Bitfield description	Access type
Bits 23:20	Reserved, must be kept at reset value.	-
Bit 19	**CLKDIS:** TS clock gating disable bit 0: Clock enabled 1: Clock disabled	rw
Bits 18:16	**TRIG[2:0]:** Trigger selection bits 000: no trigger source selected 001: dts_trg[0] selected 010: dts_trg[1] selected 011: dts_trg[2] selected 100: dts_trg[3] selected Others: Reserved, must not be used Refer to *Section 37.3.7: Temperature sensor configuration* for details.	rw
Bits 15:8	Reserved, must be kept at reset value.	-

Table 325. SDA TS configuration register (SDATS_CFGR)

Bitfield range	Bitfield description	Access type
Bits 7:0	**TS0_CFG[7:0]:** TS0 configuration TS0_CFG[7:5]: TS0 resolution 000:12 bits 001:10 bits 010: 8 bits Other: reserved, must not be used TS0_CFGR[4]: TS0 output mode 0: parallel interface 1: serial interface (default) TS0_CFGR[3:0]: TS0 communication enable bit 0000: no communication 0001: communication enabled. Others: Reserved, must not be used.	rw

Table 326. SDA TS data register (SDATS_DR)

Bitfield range	Bitfield description	Access type
Bits 23:19	Reserved, must be kept at reset value.	-
Bit 18	**TS_DONE:** TS sample done flag This bit provides a way to identify when a new data sample has been recovered while manually polling the SDATS_DR register. In manually polling, the TS_DONE flag is cleared when the SDATS_DR register is read. The sample done flag is asserted when new sample data becomes available. It is automatically cleared in TS automatic mode as the SDATS_DR value is transmitted to the PVT controller. 0: No new data sample 1: New data sample	r
Bit 17	**TS_FAULT:** TS sample fault When asserted, this bit indicates that the embedded TS has signaled a fault. The TS_FAULT flag is updated when new data are received. 0: No TS sample fault 1: TS sample fault	r
Bit 16	**TS_TYPE:** TS sample type The TS_TYPE flag is updated when new data is received. 0: Indicates valid data 1 Indicates either analog access, signature select or fault debug mode	r
Bits 15:0	**TS_DATA[15:0]:** TS sample data	r

Table 327. SDA TS timer register (SDATS_TIMERR)

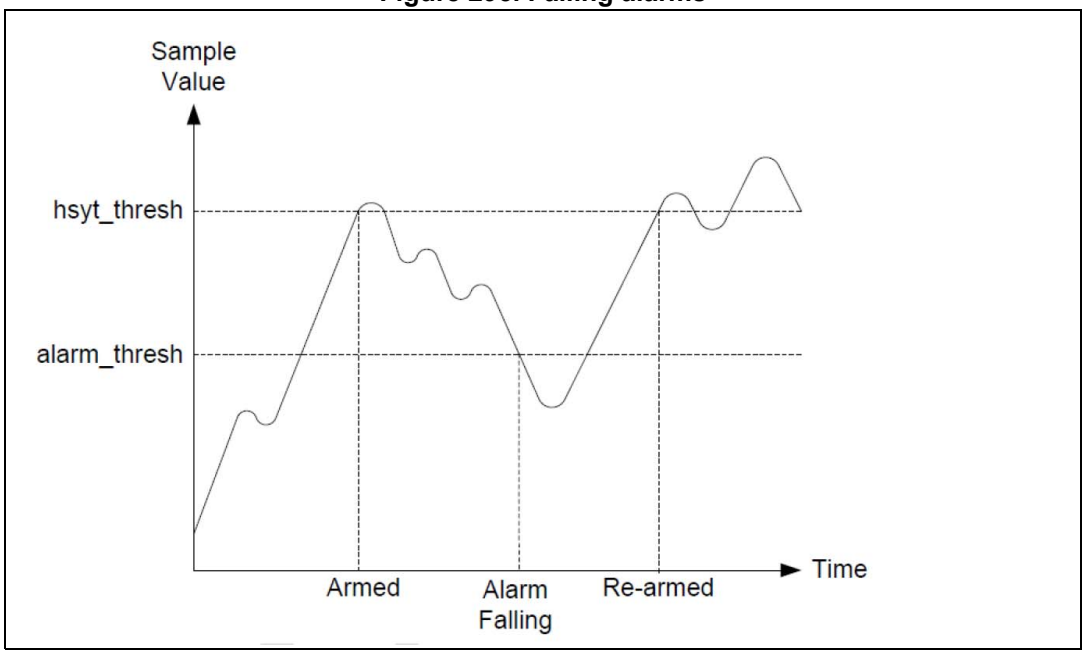
Bitfield range	Bitfield description	Access type
Bits 23:16	Reserved, must be kept at reset value.	-
Bits 15:0	**TS_PU_DLY[15:0]:** TS power-up delay The value is expressed in units of clk_ts cycles. Typical power-up delays are 256 cycles.	rw

37.3.5 Alarms

The DTS provides two alarms, alarm A and alarm B, for each TS block. The alarms feature programmable hysteresis and can be configured to detect either rising or falling sample values. They are disabled by setting the hysteresis threshold to a value that is equal to the alarm threshold (default condition). Once enabled, the alarms generate an interrupt if the value of the recovered data sample equals or exceeds the rising or falling alarm threshold. Once an alarm has been triggered, the hysteresis threshold provides a recovery window during which the alarm cannot trigger again.

Falling alarms

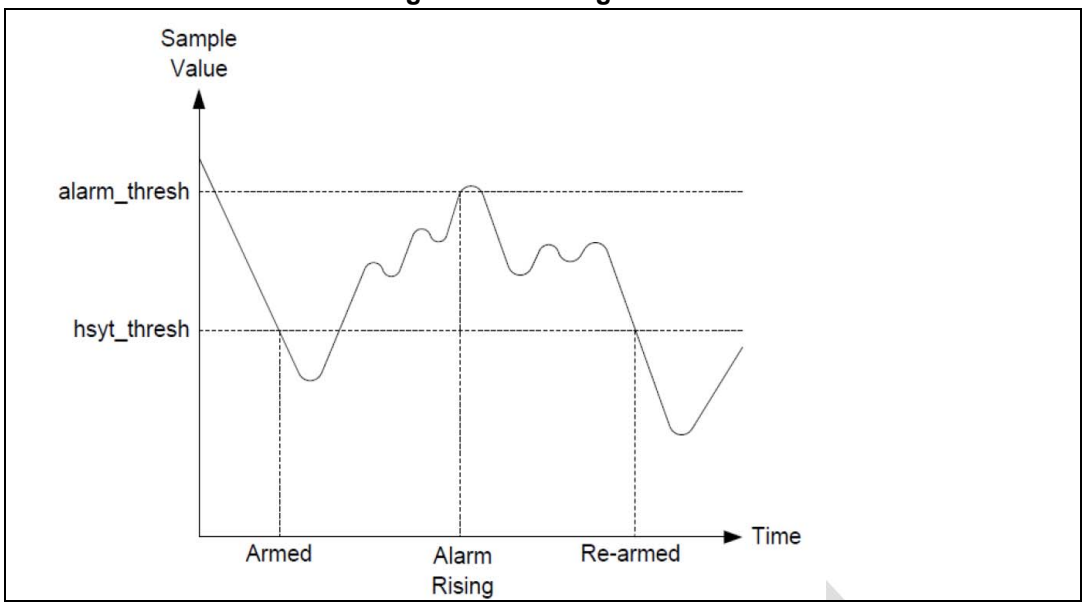
Figure 295. Falling alarms



Setting the hysteresis threshold greater than the alarm threshold creates a falling alarm. When configured as a falling alarm, the alarm is armed when the recovered sample value is greater than or equal to the hysteresis threshold. Once armed, a falling alarm triggers when the recovered sample value is less than or equal to the alarm threshold. An alarm is automatically disarmed once triggered and does not rearm until the recovered sample value is again greater than or equal to the hysteresis threshold. The alarm is also disarmed if an invalid sample value is received, that is if unexpected fault or type flags are detected.

Rising alarms

Figure 296. Rising alarms



Setting the hysteresis threshold less than the alarm threshold creates a rising alarm. When configured as a rising alarm, the alarm is armed when:

1. The associated clock synthesizer is first enabled (initial conversion).
2. The recovered sample value is less than or equal to the hysteresis threshold.
3. An invalid sample value is received, that is when an unexpected fault or type flags are detected.

Once armed, a rising alarm triggers when the recovered sample value is greater than or equal to the alarm threshold. The alarm is automatically disarmed once triggered and does not rearm until the recovered sample value is again less than or equal to the hysteresis threshold.

37.3.6 Main APB programming routines

This section gives several examples of routines to configure the PVT controller, program the SDA registers, and perform single or continuous temperature conversions.

Configure the PVT controller

1. STEP 1: Configure the PVT controller Interrupts:
   a) Write DTS_PVT_IER register:

      The timer is only intended to be used when using the TS block in bypass mode, so this interrupt must remain disabled .

   b) Write DTS_TS0_IER register:

      In the unlikely event of the TS block signaling a fault, the recovered data values are considered invalid and any active alarm is disarmed until the fault is removed. The fault IRQ is generated the first time a TS that an TS block signals a fault. If the fault is not cleared by the user, then no further interrupts are raised. It is recommended to enable always this interrupt.

2. STEP 2: Configure the PVT controller alarms:
   a) Write DTS_TS0ALARMA_CFGR register:

      Alarms are enabled when the ALARM_THRESH is not equal to the HYST_THRESH.

      When enabling alarms, make sure that the corresponding IRQ is also enabled.
   b) Write DTS_TS0ALARMB_CFGR register:

      Alarms are enabled when the ALARM_THRESH is not equal to the HYST_THRESH.

      When enabling alarms, make sure the corresponding IRQ is also enabled.
3. STEP 3: PVT sample control:
   a) Write DTS_TSCSMPL_CR register:

      When SMPL_DISCARD is set, TS data samples are temporarily discarded, but the sample counter continues to increment.

      When SMPL_CTR_HOLD is asserted, the sample counter is prevented from rolling over when the maximum sample count is reached.

      When SMPL_CTR_DISABLE is asserted, the sample counter is disabled.
4. STEP 4: PVT sample control:
   a) Write DTS_TS0HILORESETR for each TS instance.

Configure the SDA registers

1. STEP 1: Program the SDA registers:
   a) Read DTS_TSCSDIF_SR register:

      The SDIF_LOCK flag must be low, indicating that SDIF automatic mode has not been enabled.

      Before proceeding further, make sure that the serial data interface is inactive by checking that the SDIF_BUSY flag is low.
   b) Write DTS_TSCSDIF_CR register to fetch the remote slave SDA register value:

      SDIF_PROG = 0x1

      SDIF_WRN = 0x1

      SDIF_ADDR[2:0]: this bitfield selects the desired SDA register.

      SDIF_WDATA[23:0]: this bitfield provides the SDA write data value.

      Program the SDA register bits in the following order:

      SDATS_TIMERR register

      SDATS_CFGR register

      SDATS_CR register (see notes below).

Note: Setting the TS_AUTO bit and either TS_RUN_ONCE or TS_RUN_CONT bit in the SDATS_CR register initiates a conversion and sets the SDIF_LOCK flag. Once the SDIF_LOCK flag is set, the SDA registers become write-only.

The SDIF_WDATA[23:0] value is also reflected in the DTS_TS0SDIFRDATAR *registers.*

2. STEP 2: Read the SDA register values:
   a) Read DTS_TSCSDIF_SR register:
      The SDIF_LOCK flag must be low, indicating SDIF automatic mode has not been enabled.
      Before proceeding further, make sure the serial data interface is inactive by checking that the SDIF_BUSY flag is low.
   b) Write DTS_TSCSDIF_CR register to fetch the remote slave SDA register value:
      SDIF_PROG = 0x1
      SDIF_WRN = 0x0
      SDIF_ADDR[2:0]: this bitfield selects the desired SDA register.
      SDIF_WDATA[23:0]: this bitfield is not used and can be set to any value.

Note: Once the SDIF_LOCK flag is set, the SDA registers become write-only and any read requests is ignored.

The read data value (SDIF_RDATA[23:0]) is also reflected in the DTS_TS0SDIFRDATAR *register.*

   c) Read the SDA register value from the DTS_TS0SDIFRDATAR register.

Run once

1. STEP 1:
   a) Read DTS_TSCSDIF_SR register:
      The SDIF_LOCK flag is low indicating that the SDIF automatic sample mode is not enabled.
      Verify that the serial data interface is not in use by checking that the SDIF_BUSY flag is low.
   b) Write DTS_TSCSDIF_CR register:
      SDIF_PROG = 0x1
      SDIF_WRN = 0x1
      SDIF_ADDR[2:0] = 0x0 to select the SDATS_CR register
      SDIF_WDATA[23:0] = 0x000104 to assert TS_AUTO and the self-clearing TS_RUN_ONCE bits
2. STEP 2: Wait for a sample done IRQ
   a) Read the DTS_TS0SDIFDONER register:
      Verify that one or more SDATS_DR registers have been updated by checking that the SDIF_SMPL_DONE flags are set to 0x1.
   b) Read the DTS_TSCSMPLCNTR register:
      The sample counter value contained in DTS_TSCSMPLCNTR increments whenever TS data (TS_DATA[23:0]) are updated.
   c) Read the DTS_TS0SDIFRDATAR register:
      Read the TS sample data, type and fault values.
      If the fault bit is set, the sample data value is unreliable, and must be discarded.
      The SDIF_SMPL_DONE flag in the DTS_TS0SDIFDONER register is automatically cleared when the SDATS_DR register is read.

Continuous run

1. STEP 1
   a) Read DTS_TSCSDIF_SR register:
      The SDIF_LOCK flag is low to indicate that the SDIF automatic sample mode is not enabled.
      Verify that the serial data interface is not in use by checking that the SDIF_BUSY flag is low.
   b) Write DTS_TSCSDIF_CR register:
      SDIF_PROG = 0x1
      SDIF_WRN = 0x1
      SDIF_ADDR[2:0] = 0x0
      SDIF_WDATA[23:0] = 0x000108 (value to assert TS_AUTO and the run continuous TS_RUN_CONT bits)
2. STEP 2: Wait for a sample done IRQ
   a) Read the DTS_TS0SDIFDONER register:
      Verify that the SDATS_DR registers have been updated by checking that the sample done SDIF_SMPL_DONE flags are set to 0x1.
   b) Read DTS_TSCSMPLCNTR register:
      The sample counter increments whenever the DTS_TS0SDIFRDATAR value is updated.
   c) Read DTS_TS0SDIFRDATAR register:
      Read the TS sample data, type and fault values.
      If the fault bit is set, the sample data value is unreliable, and must be discarded.
      The SDIF_SMPL_DONE flag in the DTS_TS0SDIFDONER register is automatically cleared when the SDATS_DR register is read.

37.3.7 Temperature sensor configuration

The temperature sensor can be configured through the internal register *SDA TS configuration register (SDATS_CFGR)*.

Selecting the conversion mode

The sensor operates only in a single mode to read the temperature value. This mode is selected by setting SDATS_CFGR[3:0] bits to 0b0001.

The temperature value is obtained using the formula provided in *Calculating the temperature*. It does not require any calibration.

Configuring the output options

The conversion time can be configures through SDATS_CFGR[7:5] bits. It can be shortened to reduce the counter output value with the drawback of degrading the temperature measurement accuracy (see *Table 328*).

The output data are available in the TS_DATA[15:0] bitfield of the SDATS_DR register.

Data can be output in parallel or serial mode depending on the setting of SDATS_CFGR[4] bit:

- 0: parallel output

  All the data bits are sent simultaneously through TS_DATA[11:0].
- 1: serial output (default mode)

  The data are sent serially on bit 11 of the TS_DATA bitfield.

  Serial data are always 12-bit wide whatever the output options. Using a lower resolution (such as 10 bits) results in similar output values with trailing zeroes.

Table 328. Output resolution configuration

Resolution	SDATS_CFGR[7:5] bits	Accuracy degradation	Comments
12 bits	0b000	-	Temperature value available on TS_DATA[11:0]
10 bits	0b001	±0.4 °C	Temperature value available on TS_DATA[11:2]
8 bits	0b010	±1.5 °C	Temperature value available on TS_DATA[11:4]
Others not allowed	0b011	-	Not allowed
	0b1XX	-	Not allowed

Calculating the temperature

The digital output is converted to an uncalibrated temperature value by using the following formula:

$$\text{Temp (°C)} = G + H \times \text{Eqbs} + J \times F_{clk_ts}$$

Where:

Temp = Temperature in degrees Celsius

Eqbs = Nbs/Cal5 – 0.5, Nbs being the digital output, TS_DATA[11:0], latched after conversion

F_{clk_ts} = Temperature sensor SDA clock frequency (in MHz)

For G, H, J and Cal5 values, please refer to device datasheet"

Configuring the triggers

Triggers can be configured through bits 18 to 16 (TRIG[2:0]) of the SDATS_CFGR register:

TRIG[2:0] = 0b001: dts_trg[0] is selected.

TRIG[2:0] = 0b010: dts_trg[1] is selected.

TRIG[2:0] = 0b011: dts_trg[2] is selected.

TRIG[2:0] = 0b100: dts_trg[3] is selected.

Disabling the clock

The TS clock can be disabled by setting the CLKDIS of the SDATS_CFGR, when the TS is not used and it does not operate in automatic mode.

37.4 DTS interrupts

The DTS provides a single active high (level) hardware interrupt output from the controller. This is the logical OR of all the embedded TS interrupt sources and the common delay timer.

The enabling, masking, and status of the interrupts are readily available through the IRQ control registers. The interrupts from each TS instance are coalesced into a single interrupt, the status of which can be observed through the DTS_TS0_ISR register. The index number of a set bit indicates the source TS number with an interrupt condition.

Each TS block can generate an interrupt based on the following sources:

- The irq_smpl indicates that sample data have been updated for the corresponding TS instance.
- The irq_alarma indicates that the recovered sample value has exceeded the programmed alarm A threshold for the corresponding TS instance.
- The irq_alarmb indicates that the recovered sample value has exceeded the programmed alarm B threshold for the corresponding TS instance.
- The irq_fault indicates that the corresponding TS instance has signaled a fault.

When an interrupt event occurs, the rising edge is detected and the corresponding flag is set in the interrupt source register, DTS_TS0_ISR. The IRQ status bits are individually gated (logical AND) with their corresponding interrupt enabled in the DTS_TS0_IER register to generate interrupt request bits. These IRQ bits are then ORed together and registered by ck_ker_dts to generate the interrupt outputs for IRQ control registers.

Once set the interrupt source bits are sticky, they must be cleared by writing a 1 to the corresponding bit of the DTS_TS0_ICR register. This also clears the associated IRQ if it has been enabled.

Interrupt events are triggered when the following flags are asserted or the force bits in the DTS_TS0IRQTESTR register are set. The forcing allows interrupts to be manually generated for software test purposes.

- irq_smpl: asserted whenever a new TS data sample is recovered.
- irq_alarma: asserted whenever the alarm A thresholds have been reached.
- irq_alarmb: asserted whenever the alarm B thresholds have been reached.
- irq_fault: asserted whenever the TS block asserts its fault output.

Generally, the embedded temperature sensors run continuously relying on their alarms to signal out-of-bounds conditions. The user would usually disable the sample done flags for these TS types unless they wish to log every data sample.

Table 329. DTS interrupts

Interrupt event	Event flag	Enable control bit	Interrupt clear method
irq_smpl	IRQ_STATUS_DONE	IRQ_EN_DONE	IRQ_CLEAR_DONE
irq_alarma	IRQ_STATUS_ALARMA	IRQ_EN_ALARMA	IRQ_CLEAR_ALARMA

Table 329. DTS interrupts

Interrupt event	Event flag	Enable control bit	Interrupt clear method
irq_alarmb	IRQ_STATUS_ALARMB	IRQ_EN_ALARMB	IRQ_CLEAR_ALARMB
irq_fault	IRQ_STATUS_FAULT	IRQ_EN_FAULT	IRQ_CLEAR_FAULT

37.5 DTS registers

The APB interface supports 32-bit word aligned addresses (byte access is not supported).

The memory map contains a mixture of read-only, read-write, and write-only register fields. The write-only bits are self-clearing bits that are generally used to create strobes. Reserved register fields and any undefined register addresses are read-only and return zero when read.

Table 330 shows the DTS memory map overview.

Table 330. DTS register memory map

Address boundary	Register bank	Register block size	Address locations	Description
0x0000 - 0x003F	PVT common registers	0x40	16	PVT common registers
0x0040 - 0x007F	PVT interrupt registers	0x40	16	PVT interrupt registers
0x0080 - 0x00BF	TS common registers	0x40	16	TS common registers
0x00C0 - 0x00FF	TS 0 individual registers	0x40	16	TS0 dedicated registers (such as IRQ, alarms and samples)

37.5.1 DTS PVT common registers

The PVT common registers are used to configure the timer and read back the lock status.

DTS PVT register lock register (DTS_PVTREG_LOCKR)

The DTS can be locked by software using the DTS_PVTREG_LOCKR register. Any write to the register locks all DTS registers except for the PVT common registers.

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LOCK[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LOCK[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **LOCK[31:0]:** PVT software lock register
Any write to this register locks all DTS registers except for the PVT common registers. Once locked, the DTS registers are read-only. The software lock can be removed by writing 0x1ACC E551.

DTS PVT lock status register (DTS_PVTLOCK_SR)

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HW_LOCK_STATUS	SW_LOCK_STATUS
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **HW_LOCK_STATUS:** Hardware lock input status
This bit indicates the status of the hardware lock input to the PVT controller.

Bit 0 **SW_LOCK_STATUS:** Software lock input status
This bit indicates the current state of the lock register.

DTS PVT timer control register (DTS_PVTTMR_CR)

Address offset: 0x020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TMR_RUN
															rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TMR_DELAY[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **TMR_RUN:** Timer count enable bit
This bit enables the timer count function.

Bits 15:0 **TMR_DELAY[15:0]:** Timer delay
This bitfield can be used to configure the timer delay.

DTS PVT timer status register (DTS_PVTTMR_SR)

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TMR_DONE	TMR_BUSY
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **TMR_DONE:** Counter delay expiration flag
This bit is set when the counter delay has expired.

Bit 0 **TMR_BUSY:** Counter busy flag
This bit is set while the counter is active.

37.5.2 PVT IRQ registers

The PVT IRQ registers are present in all build configurations of the PVT controller.

DTS PVT IRQ enable register (DTS_PVT_IER)

Address offset: 0x040

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TS_IRQ_ENABLE	TMR_IRQ_ENABLE
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **TS_IRQ_ENABLE:** TS IRQ source enable bit
Set this bit to enable the TS IRQ to the processor.

Bit 0 **TMR_IRQ_ENABLE:** Timer IRQ source enable bit
Set this bit to enable the timer IRQ to the processor.

DTS PVT IRQ timer mask register (DTS_PVTIRQTRMASKR)

Address offset: 0x050

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TMR_IRQ_MASK
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **TMR_IRQ_MASK:** Timer IRQ source mask bit
Set this bit to mask the timer IRQ to the processor.

DTS PVT IRQ TS mask register (DTS_TS_MR)

Address offset: 0x054

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TS0_IRQ_MASK
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **TS0_IRQ_MASK:** TS0 IRQ source mask bit
Set this bit to mask TS0 IRQ to the processor.

DTS PVT IRQ timer status register (DTS_PVTTR_SR)

Address offset: 0x060

Reset value: 0x0000 0000

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TS0_IRQ_STATUS
															r

Bits 1 Reserved, must be kept at reset value.

Bit 0 **TS0_IRQ_STATUS:** TS0 IRQ status bit after masking
This bit reflects the timer IRQ status after the mask has been applied.

Note: The bit is set when the corresponding TS block has issued an IRQ interrupt to the processor.

DTS PVT IRQ timer raw status register (DTS_PVTTMRRAW_ISR)

Address offset: 0x070

Reset value: 0x0000 0000

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TS0_IRQ_RAW_STATUS
															r

Bits 1 Reserved, must be kept at reset value.

Bit 0 **TS0_IRQ_RAW_STATUS:** TS0 IRQ status bit before masking
This bit reflects the timer IRQ status before the mask is applied.

37.5.3 TS common registers

DTS TSC clock synthesizer register (DTS_TSCCLKSYNTHR)

Address offset: 0x080

Reset value: 0x0001 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	CLK_SYTH_EN	Res.	Res.	Res.	Res.	CLK_SYNTH_HOLD[3:0]			
							rw					rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CLK_SYNTH_HI[7:0]								CLK_SYNTH_LO[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **CLK_SYTH_EN:** Synthesized clk_ts enable bit
0: Disabled
1: Enabled

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **CLK_SYNTH_HOLD[3:0]:** SDA master-to-SDA slave output hold delay/SDA slave-to-SDA master input setup delay
The delay is counted from the rising edge of clk_ts. It is expressed in units of ck_ker_dts cycles. The default value is 0b0001.

Bits 15:8 **CLK_SYNTH_HI[7:0]:** Synthesized clk_ts high period
This is a zero-Indexed value expressed in units of ck_ker_dts cycles.

Bits 7:0 **CLK_SYNTH_LO[7:0]:** Synthesized clk_ts low period
This is a zero-Indexed value expressed in units of ck_ker_dts cycles.

DTS TSC SDIF interface disable register (DTS_TSCSDIFDISABLER)

Address offset: 0x084

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.		Res.	Res.	Res.	Res.	TS0_SDIF_DISABLE
															rw

Bits 1 Reserved, must be kept at reset value.

Bit 0 **TS0_SDIF_DISABLE:** TS0 serial data interface (SDIF) disable bit

When this bit is asserted, it completely disables the selected TS0 instance by forcing TS0 clock and reset low.

0: Enabled

1: Disabled

Note: Any disable action must be applied before SDIF programming begins.

DTS TSC SDIF status register (DTS_TSCSDIF_SR)

Address offset: 0x088

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDIF_LOCK	SDIF_BUSY
														r	r

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **SDIF_LOCK:** SDIF locked flag

This bit is set when the slave automatic mode is requested, to indicate that the serial data interface (SDIF) is now a write-only interface (see *Section : SDA controller operation*).

In slave automatic mode, the data register (SDATS_DR) is automatically updated within the PVT controller whenever new TS data become available

0: Unlocked

1: Locked

Bit 0 **SDIF_BUSY:** SDIF busy flag

When asserted, this bit indicates either that the serial data interface (SDIF) is busy and any SDIF programming requests are ignored, or the clock synthesizer/disable SDIF state is being updated.

0: SDIF not busy/no clock synthesizer/disable SDIF state update ongoing

1: SDIF busy/clock synthesizer/disable SDIF state update ongoing

DTS TSC SDIF register (DTS_TSCSDIF_CR)

Address offset: 0x08C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SDIF_PROG	Res.	Res.	Res.	SDIF_WRN	SDIF_ADDR[2:0]			SDIF_WDATA[23:16]							
w				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SDIF_WDATA[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **SDIF_PROG:** Serial interface program request

This self-clearing bit is ignored if the SDIF_BUSY or the SDIF_LOCK flag is set, and the request is a read request (SDIF_WRN = 0).

0: No SDIF program request

1: SDIF program requested

Bits 30:28 Reserved, must be kept at reset value.

Bit 27 **SDIF_WRN:** Serial interface write/no read control bit

0: SDIF read

1: SDIF write

Bits 26:24 **SDIF_ADDR[2:0]:** Serial interface register address

This bitfield contains the address of the target SDIF register, SDIF_ADDR[2:0].

Bits 23:0 **SDIF_WDATA[23:0]:** Serial interface write data

This bitfield contains the write data SDIF_DATA[23:0].

DTS TSC SDIF halt register (DTS_TSCSDIFHALTR)

Address offset: 0x090

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDIF_STOP
															w

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **SDIF_STOP:** Serial data interface (SDIF) stop
This self-clearing bit immediately stops all SDIF programming activity in the unlikely event of it becoming locked. It must not be required during normal operation.
0: Not stopped
1: Stopped

DTS TSC SDIF control register (DTS_TSCSDIF_CFGR)

Address offset: 0x094

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDIF_INHIBIT[1:0]	
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bits 1:0 **SDIF_INHIBIT[1:0]:** Serial data interface (SDIF) programming inhibit
When asserted, this bit inhibits the serial programming of the selected TS instance(s). The inhibition must be applied before SDIF programming begins.
00: No Inhibition
01: TS0 inhibited
10: TS0 serial programming activated (SPA)
11: TS0 inhibited

DTS TSC sample control register (DTS_TSCSMPL_CR)

Address offset: 0x0A0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SMPL_DISCARD	SMPL_CTR_HOLD	SMPL_CTR_DISABLE
													rw	rw	rw

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **SMPL_DISCARD:** Sample discard bit

This feature can be used to temporarily discard received data samples. When this bit is set, data recovery is disabled but the external TS may continue running.

0: Data samples not discarded

1: Data samples discarded

Bit 1 **SMPL_CTR_HOLD:** Sample counter hold bit

When this bit is asserted, the sample counter is prevented from rolling over when the maximum sample count is reached.

0: Counter not on hold

1: Counter on hold

Bit 0 **SMPL_CTR_DISABLE:** Sample counter disable bit

0: Sample counter enabled

1: Sample counter disabled

DTS TSC sample clear register (DTS_TSCSDIFSMPLCLRR)

Address offset: 0x0A4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SMPL_CNTER_CLEAR
															w

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **SMPL_CNTER_CLEAR:** Sample counter clear bit

The sample counter value is set to zero when this self-clearing bit is programmed to 1.

0: Counter value not cleared

1: Counter value cleared

DTS TSC sample count register (DTS_TSCSMPLCNTR)

Address offset: 0x0A8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SMPL_COUNT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **SMPL_COUNT[15:0]:** Sample counter

The 16-bit counter increments each time a new data sample is available. The counter is cleared by writing 1 to DTS_TSCSDIFSMPLCLRR. The sample counter overflow operation is determined by SMPL_CTR_HOLD.

37.5.4 TS individual registers

DTS TS0 IRQ enable register (DTS_TS0_IER)

Address offset: 0x0C0

Reset value: 0x0000 0000

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SDIF_SMPL_DONE
															r

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **SDIF_SMPL_DONE:** Sample done flag

The sample done flag is asserted when a new data sample is available. The sample done flag is automatically cleared when the associated data register is read.

0: No new data sample available

1: New data sample available

DTS TS0 SDIF data register (DTS_TS0SDIFDATAR)

Address offset: 0x0D8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **SAMPLE_FAULT:** Sample fault

This bit is set to indicate that the TS block has signaled a fault. The sample data must be discarded.

Bit 16 **SAMPLE_TYPE:** TS sample type

0: Indicates valid data

1: Indicates either analog access, signature select or fault debug mode

The TS_TYPE flag is updated when new data are received.

Bits 15:0 **SAMPLE_DATA[15:0]:** Sample data.

Reading this register clears the state of the SDIF_SMPL_DONE flag in DTS_TS0SDIFDONER register.

DTS TSn alarm A configuration register (DTS_TS0ALARMA_CFGR)

Address offset: 0x0E0 + 0x40 * n, (n = 0 to 1)

Reset value: 0x0000 0000

														w	w

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **SMPL_HI_CLR:** Sample high clear 0

All the bits of the stored sample high value are initialized to 0 when written.

Bit 0 **SMPL_LO_SET:** Sample Low Set

All the bits of the stored sample low value are initialized to 1 when written.

37.5.5 DTS register map

38 Voltage reference buffer (VREFBUF)

38.1 VREFBUF introduction

The devices embed a voltage reference buffer which can be used as voltage reference for the on-chip ADCs, and also as voltage reference for external components through the VREF+ pin.

38.2 VREFBUF implementation

The table below describes the VREFBUF voltages typical values:

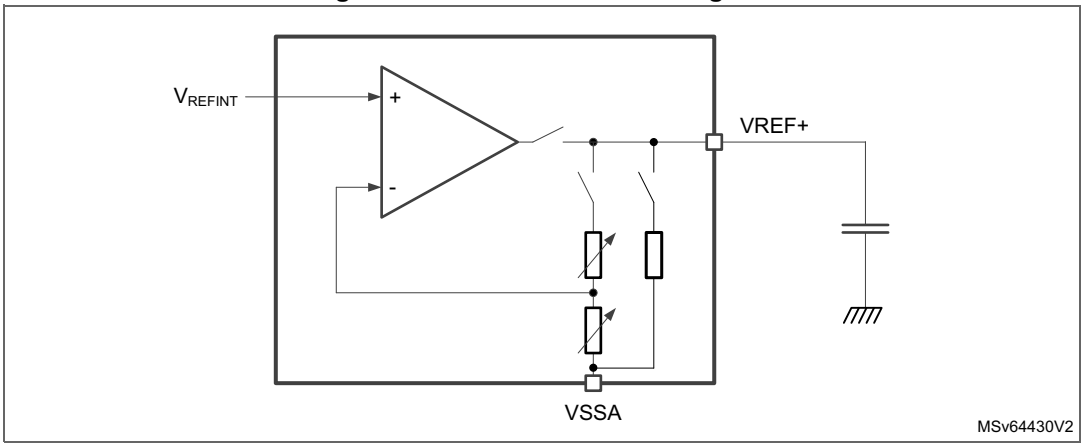
Table 335. VREFBUF typical values

Symbol	Value
VREFBUF0	1.21 V
VREFBUF1	1.5 V

Note: Refer to the product datasheet for more details.

38.3 VREFBUF functional description

Figure 297. VREFBUF block diagram



The internal voltage reference buffer is an operational amplifier, with programmable gain. The amplifier input is connected to the internal voltage reference V_{REFINT}. The VREFBUF supports four voltages[a], which are configured with VRS bits in the VREFBUF_CSR register:

- VRS = 000: VREFBUF0 voltage selected
- VRS = 001: VREFBUF1 voltage selected

The internal voltage reference can be configured in four different modes depending on ENVR and HIZ bits configuration. These modes are provided in the table below:

Table 336. VREF buffer modes

ENVR	HIZ	VREF buffer configuration
0	0	VREFBUF buffer off mode: – V_{REF+} pin pulled-down to V_{SSA}
0	1	External voltage reference mode (default value): – VREFBUF buffer off – V_{REF+} pin input mode
1	0	Internal voltage reference mode: – VREFBUF buffer on – V_{REF+} pin connected to VREFBUF buffer output
1	1	Hold mode: – VREF is enable without output buffer, VREF+ pin voltage is hold with the external capacitor – VRR detection disabled and VRR bit keeps last state

After enabling the VREFBUF by setting ENVR bit and clearing HIZ bit in the VREFBUF_CSR register, the user must wait until VRR bit is set, meaning that the voltage reference output has reached its expected value.

38.4 VREFBUF trimming

The VREFBUF output voltage is factory-calibrated by ST. At reset, and each time the VRS setting is changed, the calibration data is automatically loaded to the TRIM register.

Optionally user can trim the output voltage by changing the TRIM register bits directly. In this case, the VRS setting has no more effect on the TRIM register until the device is reset.

a. The minimum V_{DDA} voltage depends on VRS setting, refer to the product datasheet.

38.5 VREFBUF power sequence

While VREFBUF is activated, V_{DDA} supply changing from 1.8 V to 0 V can cause large current flowing from the V_{REF+} output capacitor to the V_{DDA} power domain through on-chip parasitic resistance. To avoid this current, the following procedure is required:

- While V_{DDA} is available, configure VREFBUF in buffer off mode.
- Wait for V_{REF+} to discharge (through internal pull-down) to less than 100 mV (typically 1 ms, depending on the capacitor value).
- Switch off V_{DDA} supply to 0 V.

38.6 VREFBUF registers

38.6.1 VREFBUF control and status register (VREFBUF_CSR)

Address offset: 0x00

Reset value: 0x0000 0002

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VRS[2:0]			VRR	Res.	HIZ	ENVR
									rw	rw	rw	r		rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **VRS[2:0]**: Voltage reference scale

These bits select the value generated by the voltage reference buffer.

VRS = 000: VREFBUF0 voltage selected.

VRS = 001: VREFBUF1 voltage selected.

Others: Reserved

Note: Refer to the product datasheet for each VREFBUFx voltage setting value.
The software can program this bitfield only when the VREFBUF is disabled (ENVR=0).

Bit 3 **VRR:** Voltage reference buffer ready

0: the voltage reference buffer output is not ready.

1: the voltage reference buffer output reached the requested level.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **HIZ:** High impedance mode

This bit controls the analog switch to connect or not the V_{REF+} pin.

0: V_{REF+} pin is internally connected to the voltage reference buffer output.

1: V_{REF+} pin is high impedance.

Refer to *Table 336: VREF buffer modes* for the mode descriptions depending on ENVR bit configuration.

Bit 0 **ENVR:** Voltage reference buffer mode enable

This bit is used to enable the voltage reference buffer mode.

0: Internal voltage reference mode disable (external voltage reference mode).

1: Internal voltage reference mode (reference buffer enable or hold mode) enable.

38.6.2 VREFBUF calibration control register (VREFBUF_CCR)

Address offset: 0x04

Reset value: 0x0000 00XX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRIM[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **TRIM[5:0]**: Trimming code

The TRIM code is a 6-bit unsigned data (minimum 000000, maximum 111111) that is set and updated according the mechanism described below.

Reset:

TRIM[5:0] is automatically initialized with the VRS = 0 trimming value stored in the OTP memory during the production test.

VRS change:

TRIM[5:0] is automatically initialized with the trimming value (corresponding to VRS setting) stored in the OTP memory during the production test.

Write in TRIM[5:0]:

User can modify the TRIM[5:0] with an arbitrary value. This is permanently disabling the control of the trimming value with VRS (until the device is reset).

Note: If the user application performs the trimming, the trimming code must start from 000000 to 111111 in ascending order.

38.6.3 VREFBUF register map

The following table gives the VREFBUF register map and the reset values.

Table 337. VREFBUF register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

39 Multi-function digital filter (MDF)

39.1 MDF introduction

The multi-function digital filter (MDF) is a high-performance module dedicated to the connection of external sigma-delta (ΣΔ) modulators. It is mainly targeted for the following applications:

- audio capture signals
- motor control
- metering

The MDF features 4 digital serial interfaces (SITFx) and digital filters (DFLTx) with flexible digital processing options to offer up to 24-bit final resolution.

The DFLTx of the MDF also include the filters of the audio digital filter (ADF).

The MDF can receive, via its serial interfaces, streams coming from various digital sensors.

The MDF supports the following standards allowing the connection of various ΣΔ modulator sensors:

- SPI interface
- Manchester coded 1-wire interface
- PDM interface

A flexible bitstream matrix (BSMX) allows the connection of any incoming bitstream to any filter.

The MDF converts an input data stream into clean decimated digital data words. This conversion is done thanks to low-pass digital filters and decimation blocks. In addition it is possible to insert a high-pass filter or a DC offset correction block.

The conversion speed and resolution are adjustable according to configurable parameters for digital processing: filter type, filter order, decimation ratio, integrator length. The maximum output data resolution is up to 24 bits. There are two conversion modes: single conversion and continuous modes. The data can be automatically stored in a system RAM buffer through DMA, thus reducing the software overhead.

A flexible trigger interface can be used to control the conversion start. This timing control can trigger simultaneous conversions or insert a programmable delay between conversions.

The MDF features an out-off limit detectors (OLD) function. There is one OLD for each digital filter chain. Independent programmable thresholds are available for each OLD, making it very suitable for over-current detection.

A short circuit detector (SCD) is also available for every selected bitstream. The SCD is able to detect a short-circuit condition with a very short latency. Independent programmable thresholds are offered in order to define the short circuit condition.

The digital processing is performed using only the kernel clock. The MDF requests the bus interface clock (AHB clock) only when data must be transfered or when a specific event requests the attention of the system processor.

39.2 MDF main features

- AHB interface
- 4 serial digital inputs:
  - configurable SPI interface to connect various digital sensors
  - configurable Manchester coded interface support
  - compatible with PDM interface to support digital microphones
- 2 common clocks input/output for ΣΔ modulators
- Flexible matrix (BSMX) for connection between filters and digital inputs
- 2 inputs to connect the internal ADCs
- 4 flexible digital filter paths, including:
  - A configurable CIC filter:
    - Can be split into 2 CIC filters: high-resolution filter and out-off limit detector
    - Can be configured in $Sinc^4$ filter
    - Can be configured in $Sinc^5$ filter
    - Adjustable decimation ratio
  - A reshape filter to improve the out-off band rejection and in-band ripple
  - A high-pass filter to cancel the DC offset
  - An offset error cancellation
  - Gain control
  - Saturation blocks
  - An out-off limit detector
- Short-circuit detector
- Clock absence detector
- 16- or 24-bit signed output data resolution
- Continuous or single conversion
- Possibility to delay independently each bitstream
- Various trigger possibilities
- Break generation on out-of limit or short-circuit detector events
- Autonomous functionality in Stop mode(s)
- DMA can be used to read the conversion data
- Interrupts services

39.3 MDF implementation

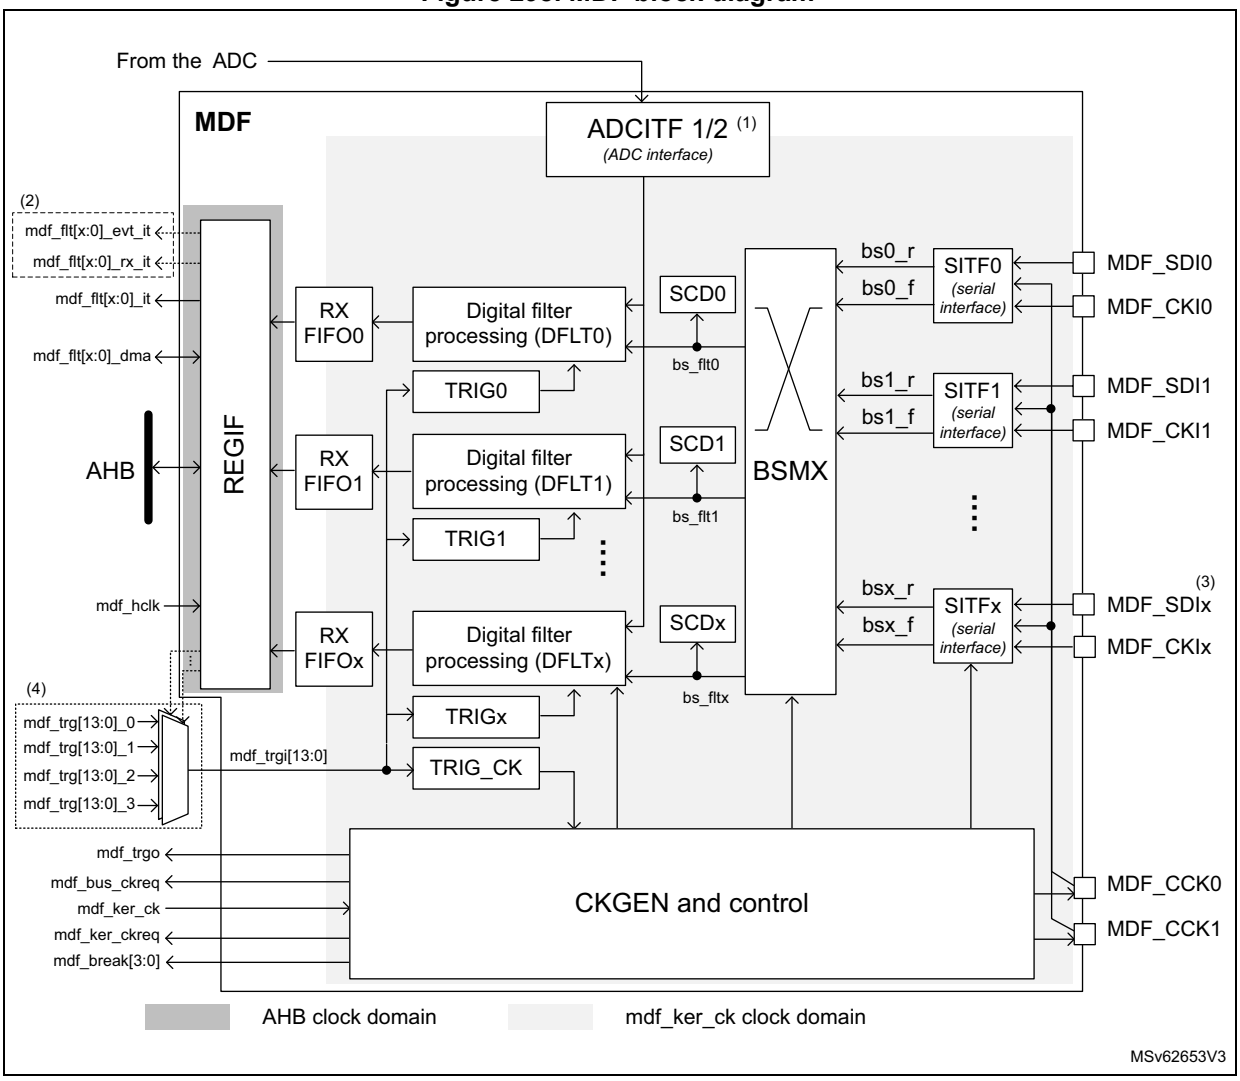
39.4 MDF functional description

39.4.1 MDF block diagram

Figure 298. MDF block diagram



1. Refer to *Section 39.3: MDF implementation* to check if the ADCITF is available, and which ADCs are connected.
2. Not always implemented, refer to the vector table of the product for details.
3. Refer to *Section 39.3: MDF implementation* to check the number of filter instances available.
4. The number of trigger inputs depends on the product. Refer to *Section 39.3: MDF implementation* for details.

39.4.2 MDF pins and internal signals

Table 339. MDF external pins

Name	Signal type	Comment
MDF_CKIy (y = 0 to 3)(1)	Input	Dedicated clock signals from external sensors
MDF_SDIy (y = 0 to 3)(1)	Input	Data signal from external sensors
MDF_CCKy (y = 0, 1)	Input/output	Clock outputs for external sensor, or common clock input from external sensors

1. The number of inputs available depends on the number of filters. Refer to *Section 39.3* for details.

Table 340. MDF internal signals

Name	Signal type	Comment
mdf_trgi[13:0]	Input	Trigger inputs in order to control the acquisition (see *Table 341: MDF trigger connections* for details)
mdf_trgo	Output	Trigger output for synchronizing several MDFs
mdf_break[3:0]	Output	Break signals event generation from over-current detector or short-circuit detector (see the next table for details)
mdf_flt[3:0]_dma(1)	Input/output	DMA request/acknowledge signals for each filter processing chain
mdf_flt[3:0]_it(1)	Output	Global interrupt signals, for each MDF filter
mdf_flt[3:0]_rx_it(1)(2)	Output	Receive interrupt signals, for each MDF filter.
mdf_flt[3:0]_evt_it(1)(2)	Output	Event interrupt signals, for each MDF filter.
mdf_bus_ckreq	Output	Bus interface clock request output
mdf_ker_ckreq	Output	Kernel clock request output
mdf_ker_ck	Input	Kernel clock input
mdf_hclk	Input	AHB bus interface clock input
mdf_adcitf1_dat[15:0]	Input	ADCITF1 data input
mdf_adcitf2_dat[15:0]	Input	ADCITF2 data input

1. The number of signals available depends on the number of filters. Refer to *Section 39.3* for details.
2. Not always connected. See the interrupt vector table for details.

The table below shows the way the trigger inputs of the MDF are connected.

Table 341. MDF trigger connections

Trigger name	Trigger source
mdf_trgi0	tim1_trgo2
mdf_trgi1	tim8_trgo2
mdf_trgi2	tim20_trgo2

39.4.3 Serial input interfaces (SITF)

The SITFx input interfaces allow the connection of the external sensors to the digital filters, via the bitstream matrix (BSMX). The SITFx serial interface can be configured in the following modes:

- LF_MASTER SPI mode (low-frequency)
- normal SPI mode

- Manchester mode

The amount of SITFx instances is equal to the amount of filters.

The data from each serial interface can be routed to any filter in order to perform:

- the PDM to PCM conversion
- the out-off limit detection
- the short detection

The serial interfaces are enabled by setting the corresponding SITFEN bit to 1. Once the interface is enabled, it receives serial data from the external ΣΔ modulator.

Note: Before enabling the serial interface, the user must insure that the mdf_proc_ck is already enabled (see Section 39.4.5 for details).

The SITFx are controlled via the *MDF serial interface control register x (MDF_SITFxCR)*.

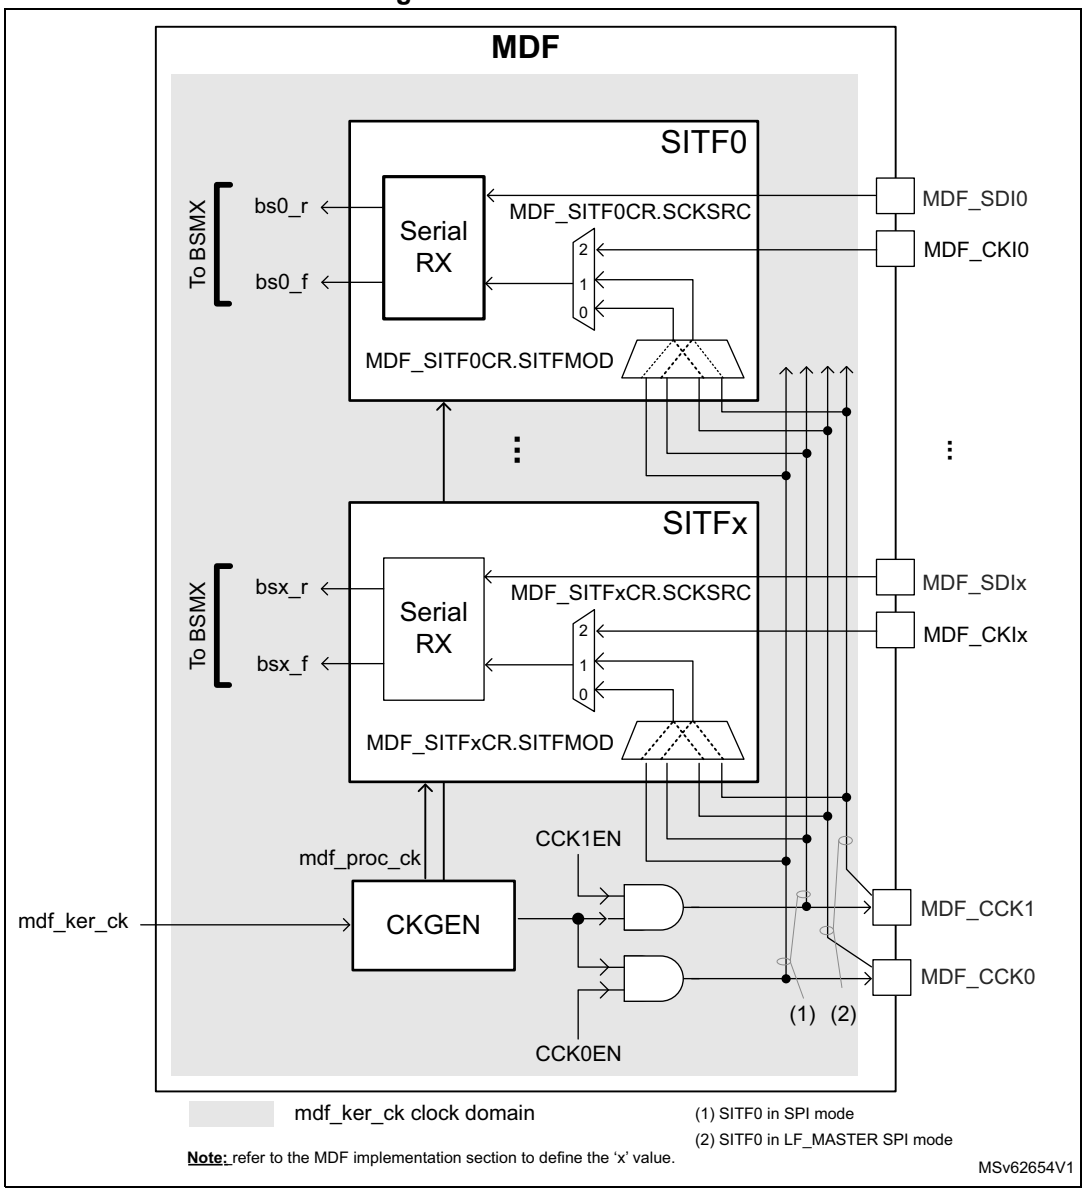
As shown in *Figure 299*, for each SITF, there is a large choice of clocking possibilities:

- If the serial interface is programmed in SPI mode, the selected clock source is a copy of the clock present on MDF_CCK0 or MDF_CCK1 or MDF_CKIx pin (see 2 in *Figure 299*).
- If the serial interface is programmed in LF_MASTER SPI mode, the selected clock source must be the clock directly provided by the CCKDIV to the MDF_CCK0 or MDF_CCK1 pin (see 1 in *Figure 299*). In this case MDF_CKIx must not be selected.

See *Table 344* for additional information.

Note: Using the common clock (MDF_CCK0 or MDF CCK1) can be helpful to share the same clock between several SITFx.

Figure 299. SITFx overview



LF_MASTER and normal SPI modes

The LF_MASTER SPI mode is a special mode allowing the usage of a mdf_proc_ck clock frequency, only two times higher than the sensor clock. This mode is dedicated to low-power use-cases, using low-speed sensors.

In LF_MASTER SPI mode, the MDF must provide the bitstream clock to the external sensors via MDF_CCK0 and MDF_CCK1 pins, and receives the bitstream data via the serial data input MDF_SDIx.

For each SITFx, the application must select the same clock than the one provided to the external sensor (MDF_CCK0 or MDF_CCK1), in order to guarantee optimal timing performances. This selection is done via SCKSRC[1:0].

Warning: The MDF_CKIx pin cannot be used in LF_MASTER SPI mode.

The normal SPI interface is a more flexible interface than the LF_MASTER SPI, but the mdf_proc_ck frequency must be at least four times higher than the sensor clock.

The application can select MDF_CCK0, MDF_CCK1 or MDF_CKIx clock for the capture of the data received via the MDF_SDIx pin.

The MDF can generate a clock to the sensors via MDF_CCK0 or MDF_CCK1 if needed.

For all SPI modes, all SITFs can share the same clock input (MDF_CCK0 or MDF_CCK1), in order to optimize the amount of requested I/Os.

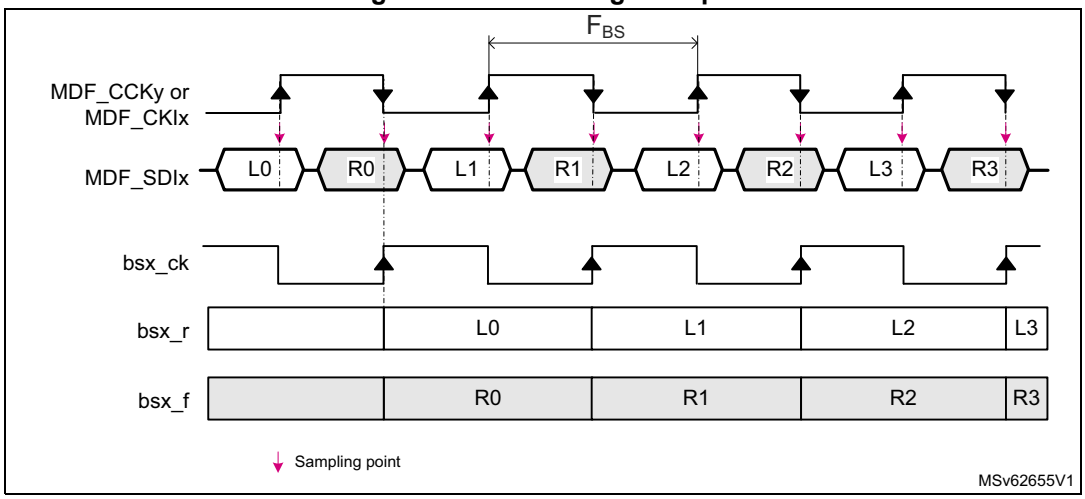
For all SPI modes, the serial data is captured using the rising and the falling edge of the selected clock. The SITFx always provides the following bitstreams:

- bitstream received using the bitstream clock falling edge (bsx_f)
- bitstream received using the bitstream clock rising edge (bsx_r)

According to the sensors connected, one of the two bitstreams may not be available.

The application can select the wanted stream via the BSMX matrix.

Figure 300. SPI timing example



To properly synchronize/receive the data stream, the frequency of the mdf_proc_ck clock must be adjusted according to the constraints listed in *Table 345*.

Clock absence detection

A no-clock-transition period may be detected when the serial interface works in normal SPI mode. This feature can be used to detect a clock failure in the SPI link.

The application can program a timeout value via the STH[4:0] bitfield of the corresponding SITFx. If the MDF does not detect clock transitions for a duration of STH[4:0] x $T_{mdf_proc_ck}$, then the CKABF flag is set.

An interrupt can be generated if CKABIE is set to 1. The STH[4:0] bitfield is in the *MDF serial interface control register x (MDF_SITFxCR)*.

When the serial interface is enabled, the CKABF flag remains to 1 until a first clock transition is detected.

To avoid spurious clock absence detection, the following sequence must be respected:

1. Configure the serial interface in normal SPI mode and enable it.
2. Clear the CKABF flag by writing CKABF bit to 1.

   If no clock transition is detected on the serial interface, the hardware immediately sets the CKABF flag to 1.
3. Read the CKABF flag:
   - If CKABF = 1, go back to step 2.
   - If CKABF i= 0, a clock has been detected. The CKABIE bit can be set to 1 if the application wants an interrupt on detection of a clock absence.

Note: The clock absence detection feature is not available in the LF_MASTER SPI mode.

Manchester mode

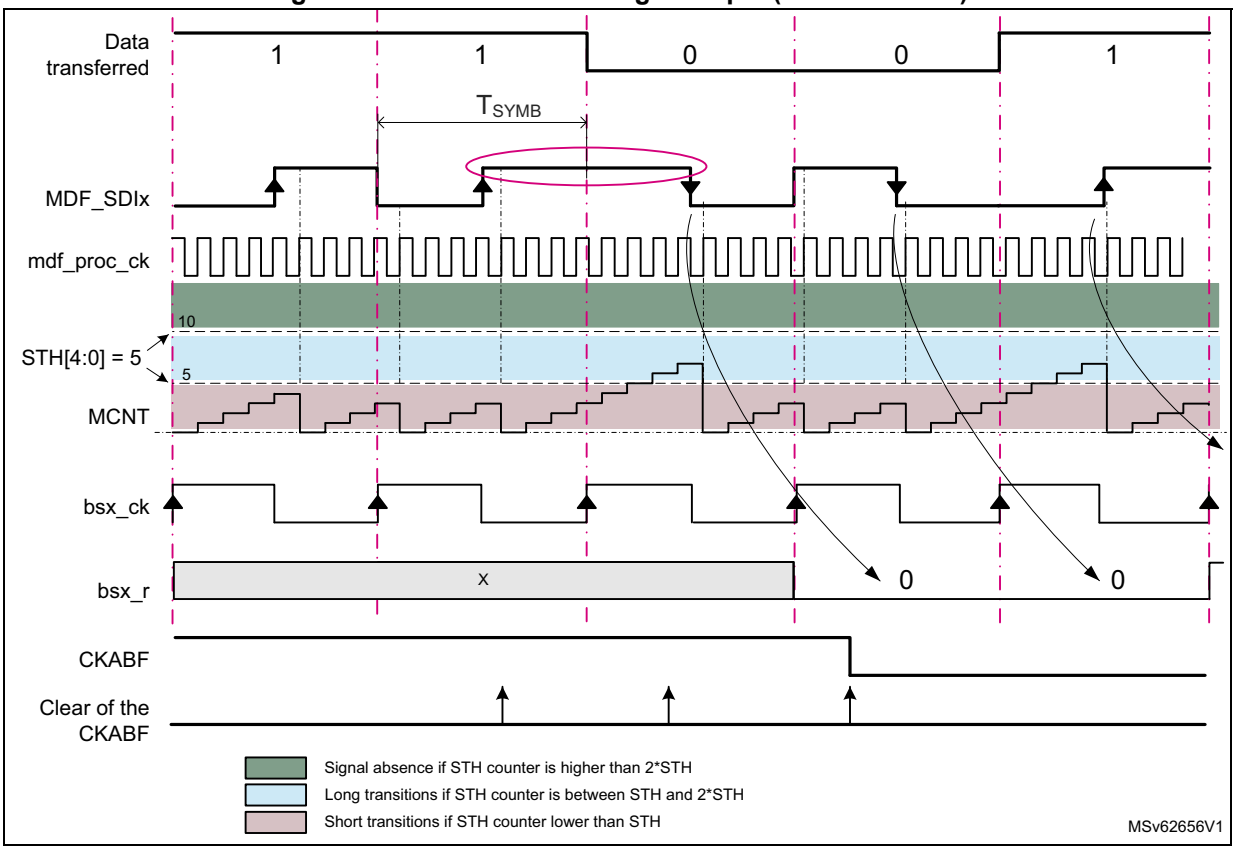
In Manchester coded format, the MDF receives data stream from the external sensor via the MDF_SDIx pin only.

The MDF_CKIx pins are not needed in this mode.

Decoded data and clock signals are recovered from serial stream after Manchester decoding. They are available on bsx_r. There are two possible settings of Manchester codings:

- signal rising edge decoded as 0 and signal falling edge decoded as 1
- signal rising edge decoded as 1 and signal falling edge decoded as 0

Figure 301. Manchester timing example (SITFMOD = 11)



To decode the incoming Manchester stream, the user must program the STH[4:0] bitfield in the *MDF serial interface control register x (MDF_SITFxCR)*. The STH[4:0] bitfield is used by the SITFx to estimate the Manchester symbol length and to detect a clock absence. An internal counter (MCNT) is restarted every time a transition is detected in the MDF_SDIx input. It is used to detect short transitions, long transitions or clock absence. A long transition indicates that the data value changed. *Figure 301* shows a case where the OVR is around height and STH[4:0] = 5.

The estimated Manchester symbol rate (T_{SYMB}) must respect the following formula:

$$(STH + 1)\times T_{mdf_proc_ck} < T_{SYMB} < (2 \times STH \times T_{mdf_proc_ck})$$

It is recommended to compute STH as follows:

$$STH[4:0] = round\left(\frac{(2 \times OVR) - 1}{3}\right)$$

where OVR represents the ratio between the mdf_proc_ck frequency and the expected Manchester symbol frequency. OVR must be higher than five, and the mdf_proc_ck clock must be adjusted according to the constraints listed in *Table 345*.

The clock absence flag CKABF is set to 1 when no transition is detected during more than 2 x STH[4:0] x $T_{mdf_proc_ck}$, or when the SITFx is not yet synchronized to the incoming Manchester stream. In addition, an interrupt can be generated if the bit CKABIE is set to 1.

When the serial interface is enabled, the MDF must first be synchronized to the incoming Manchester stream. The synchronization ends when a data transition from 0 to 1 or from 1 to 0 (pink circle in the *Figure 301*) is detected.

The end of the synchronization phase can be checked by following the software sequence:

1. Clear the CKABF flag in the *MDF DFLTx interrupt status register x (MDF_DFLTxISR)* by writing CKABF bit to 1. If the serial interface is not yet synchronized, the hardware immediately sets the CKABF flag to 1.
2. Read the CKABF flag.
   – If CKABF = 1, go back to step 1.
   – If CKABF = 0, the Manchester interface is synchronized and provides valid data.

Programming example

In the following example, the MDF kernel clock frequency ($F_{mdf_ker_ck}$) is 100 MHz and the received Manchester stream is at about 6 MHz (F_{SYMB}).

1. Provide a valid mdf_proc_ck to the SITFx.

   The mdf_proc_ck frequency must be at least six times higher than the Manchester symbol frequency (means at least 36 MHz).

   PROCDIV is programmed to 1 to perform a division by two of the kernel clock. In that case, $F_{mdf_proc_ck}$ = 50 MHz (8.33 times higher than the Manchester symbol frequency).
2. Compute STH.

   OVR is given by: OVR = $F_{mdf_proc_ck}$ / F_{SYMB} = 50 MHz / 6 MHz = 8.33.

   Then STH[4:0] = $\text{round}\left(\frac{(2 \times 8.33) - 1}{3}\right) = 5$

   The minimum allowed frequency for the Manchester stream is then:

   1 / (2 × STH × $T_{mdf_proc_ck}$) = 1 / (10 x 20 ns) = 5 MHz

   The maximum allowed frequency for the Manchester stream is then:

   1 / ((STH+1) × $T_{mdf_proc_ck}$) = 1 / (6 x 20 ns) = 8.33 MHz

39.4.4 ADC slave interface (ADCITF)

The ADCs are not always connected to the MDF. Refer to *Section 39.3* to check the situation for this product.

The MDF allows the connection of up to two ADCs to the filter path. For each filter, the DATSRC[1:0] bitfield in the *MDF digital filter configuration register x (MDF_DFLTxCICR)* allows the application to select either data from the ADCs.

Warning: The MDF does not support receiving interleaved data from one of the ADCITF input.

39.4.5 Clock generator (CKGEN)

The RCC (reset and clock controller) provides the following clocks to the MDF:

- AHB clock (mdf_hclk) used for the register interface
- kernel clock (mdf_ker_ck) mainly used by all other parts of the circuit via the CKGEN

Those clocks are not supposed to be phase locked, so all signals crossing those clock domains are re-synchronized.

The clock generator (CKGEN) is responsible of the generation of the processing clock, and the clock provided to the MDF_CCK0 and MDF_CCK1 pins. All those clocks are generated from the mdf_ker_ck.

The processing clock (mdf_proc_ck) is used to run all the signals processing and to re-sample the incoming serial or parallel stream.

Note: The reshape filter (RSFLT) needs up to 24 cycles of mdf_proc_ck clock to process a sample.

To adapt the kernel clock frequency provided by the RCC, the following dividers are available:

- PROCDIV[6:0] used to adapt the kernel clock frequency to the constraints of the parallel and serial interfaces, and to the processing blocks
- CCKDIV[3:0] used to adapt the frequency of the MDF_CCK0 and MDF_CCK1 clocks

PROCDIV[6:0] and CCKDIV[3:0] must be programmed when no clock is provided to the dividers (CKGDEN = 0).

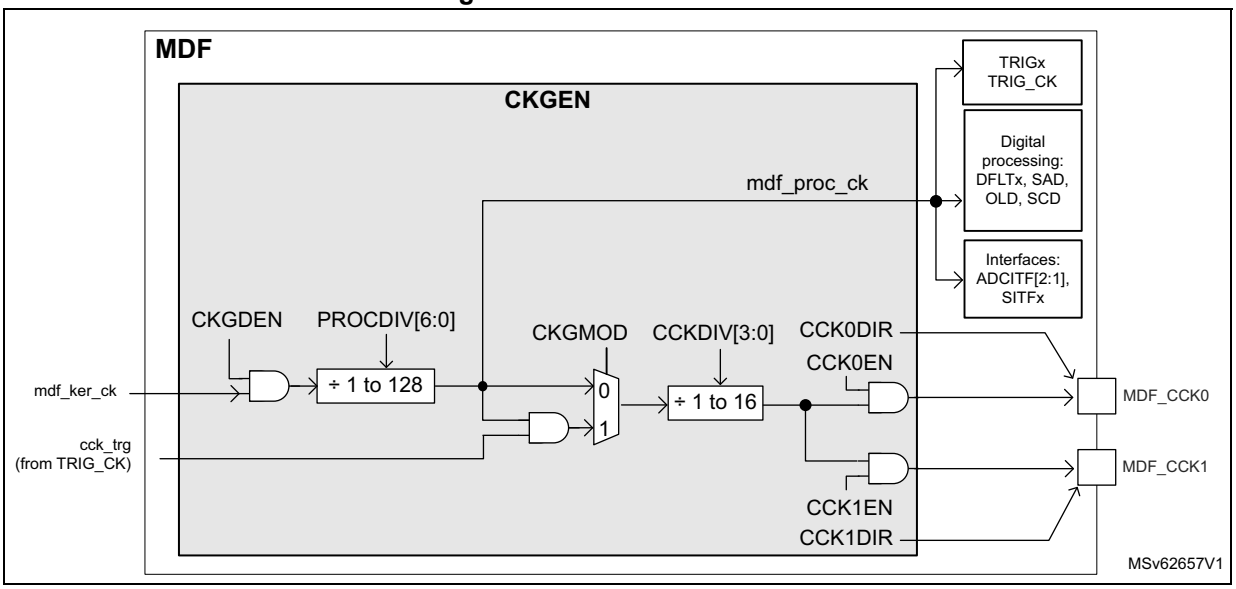
The mdf_proc_ck generation is controlled by CKGDEN.

In addition, the CKGMOD bit allows the application to define the way to trigger the CCKDIV divider:

- When CKGMOD = 0, the CCKDIV divider is started as soon as CKGDEN is set to 1.
- When CKGMOD = 1, the CCKDIV divider is started when CKGDEN is set to 1 and the programmed trigger condition occurred.

All bits and fields controlling the CKGEN are in MDF_CKGCR.

Figure 302. CKGEN overview



The trigger logic for CKGEN is handled by the TRG_CK block. As shown in *Figure 311*, the CCKDIV divider can be triggered on the rising or falling edge of one of the 16 trigger sources. When the proper trigger condition occurs, the cck_trg signal goes to high, allowing the CCKDIV divider to start. The TRG_CK logic is reset when CKGDEN is set to 0.

This feature can be helpful to synchronize the MDF_CCKy (y = 0,1) clock of several MDF instances, or to synchronize the clock generation to a timer event.

The application can control the activation of the MDF_CCK0 or MDF_CCK1 pin CCK0EN/CCK1EN and CCK0DIR/CCK1DIR bits:

- CCKyEN is used to enable the CCKDIV, and thus generates a clock for the external sensors.
- CCKyDIR is used to control the direction of the ADF_CCKy pin (input or output)

Table 344. Control of the common clock generation(1)

CCKyEN	CCKyDIR	Description
0	0	The MDF_CCKy pin is in input. An external clock can be connected to the MDF_CCKy pin and used by the SITFx in order to decode the serial stream
0	1	The MDF_CCKy pin is in output. No clock is generated, thus the MDF_CCKy pin is driven low.
1	1	The MDF_CCKy pin is in output. A clock is generated on the MDF_CCKy pin. The SITFx can use this pin as clock source in order to decode the serial stream

1. The configuration with CCKyEN = 1 and CCKyDIR = 0 must be avoided (no interest).

When CCKyDIR = 1, as soon as the CCKyEN bit is set to 1, a clock is generated to the corresponding output without any spurs.

Note: The mdf_proc_ck must be enabled (by CKGDEN = 1) before enabling other blocks (such as SITFx or DFLTx).

CKGEN activation sequence example

1. Set CKGDEN to 0.
2. Wait for CKGACTIVE = 0. If CKGDEN was previously enabled, this phase can take two periods of mdf_hclk and two periods of mdf_proc_ck.
3. Program PROCDIV[6:0], CKGMOD, CCKDIV[3:0], TRGSRC[3:0] and TRGSENS.
4. Set CKGDEN to 1.
5. Set CCKxDIR to 1 (optional).
6. Set CCKxEN to 1 (optional).

When needed, at any moment, the CCK0EN or CCK1EN value can be changed without disabling the clock generator.

Clock frequency constraints

The table below shows the frequency constraints to receive and process properly the samples.

Table 345. Clock constraints with respect to the incoming stream(1)

SITFx mode	MDF clock constraints	
	With RSFLT disabled	With RSFLT enabled
LF_MASTER SPI	F_{MDF_CCKy} max frequency limited to 5 MHz	
	$F_{mdf_proc_ck} > 2 * F_{MDF_CCKy}$ and $F_{mdf_hclk} \geq F_{mdf_proc_ck}$	$F_{mdf_proc_ck} > 24 * F_{MDF_CCKy} / (MCICD+1)$ and $F_{mdf_proc_ck} > 2 * F_{MDF_CCKy}$ and $F_{mdf_hclk} \geq F_{mdf_proc_ck}$
MASTER SPI SLAVE SPI	F_{MDF_CKx} max frequency limited to 25 MHz	
	$F_{mdf_proc_ck} > 4 * F_{MDF_CKKy}$ and F_{mdf_hclk} higher or equal to $F_{mdf_proc_ck}$	$F_{mdf_proc_ck} > 24 * F_{MDF_CKKy} / (MCICD+1)$ and $F_{mdf_proc_ck}$ higher than 4 x F_{MDF_CKKy} and F_{mdf_hclk} higher or equal to $F_{mdf_proc_ck}$
Manchester	F_{SYMB} max frequency limited to 20 MHz	
	$F_{mdf_proc_ck}$ higher than 6 * F_{SYMB} and $F_{mdf_hclk} \geq F_{mdf_proc_ck}$	$F_{mdf_proc_ck}$ higher than 24 * $F_{MDF_CKKy} / (MCICD+1)$ and $F_{mdf_proc_ck} > 6 * F_{SYMB}$ and $F_{mdf_hclk} \geq F_{mdf_proc_ck}$

1. F_{MDF_CKKy} represents the frequency of the clock received via MDF_CKIx and MDF_CCKy, or generated via MDF_CCKy.F_{SYMB} represents the frequency of the received symbol rate for Manchester mode.

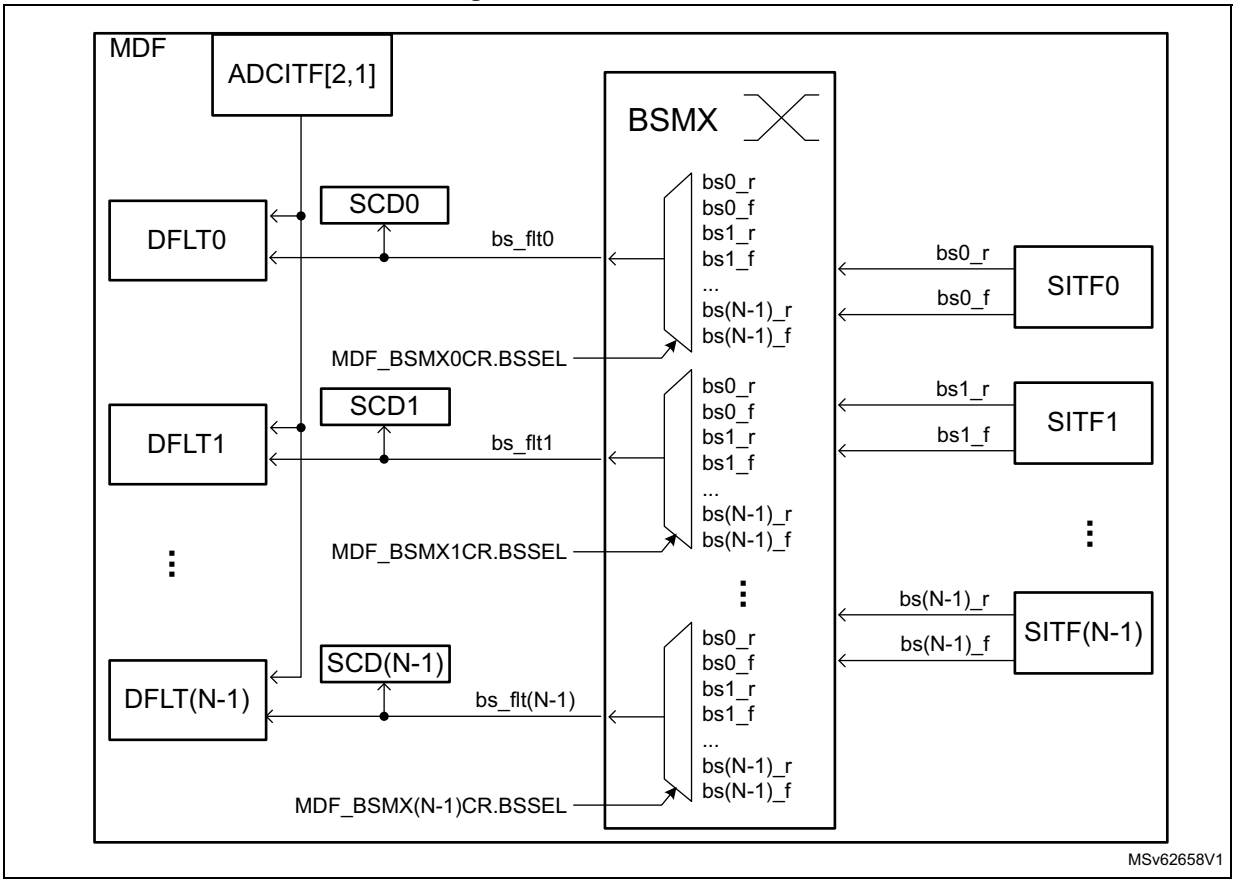
39.4.6 Bitstream matrix (BSMX)

The BSMX receives the bitstreams from all serial interfaces (SITFx) and provides the selected input to the digital filters (DFLTx) and to the short-circuit detectors (SCDx). For each filter path, any of the bitstream input can be selected.

As shown in the *Figure 299*, each SITFx block provides two bitstreams (bsx_r and bsx_f) to the BSMX.

The application to select the wanted stream via the *MDF bitstream matrix control register x (MDF_BSMXxCR)*. This selection is intended to be static.

Figure 303. BSMX overview



BSMX programming sequence example

The BSSEL[4:0] bitfield cannot be changed if the corresponding SCDx, OLDx or DFLTx is enabled. The following steps are needed to change the value of BSMX, for filter path x:

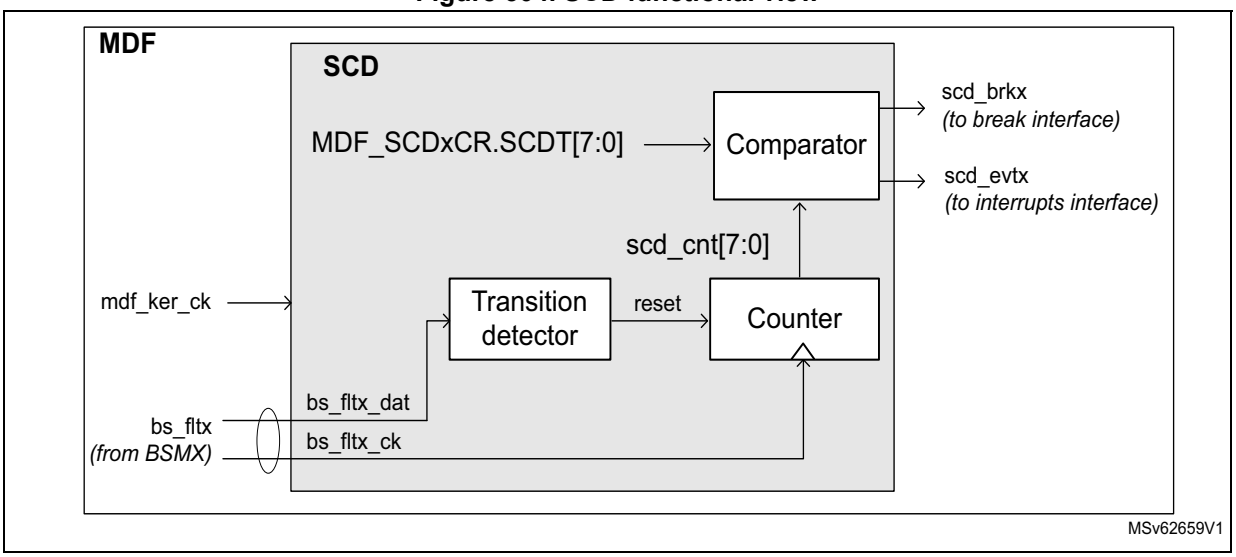
1. Set SCDEN of SCDx to 0.
2. Set DFLTEN of DFLTx to 0.
3. Set OLDEN of OLDx to 0.
4. Wait for BSMXACTIVE = 0.
5. Program BSSEL[4:0] of filter path x.
6. Set SCDEN of SCDx to 1 (optional).
7. Set DFLTEN of DFLTx to 1 (optional).
8. Set OLDEN of OLDx block to 1 (optional).

39.4.7 Short-circuit detectors (SCD)

The SCDx detects, with a very fast response time, if an analog signal reached saturated values (out-of-full scale ranges) and remained on this value for a given time.

This behavior can detect short-circuit or open-circuit errors (such as over current or over voltage). An interrupt event or/and a break signal can be generated.

Figure 304. SCD functional view

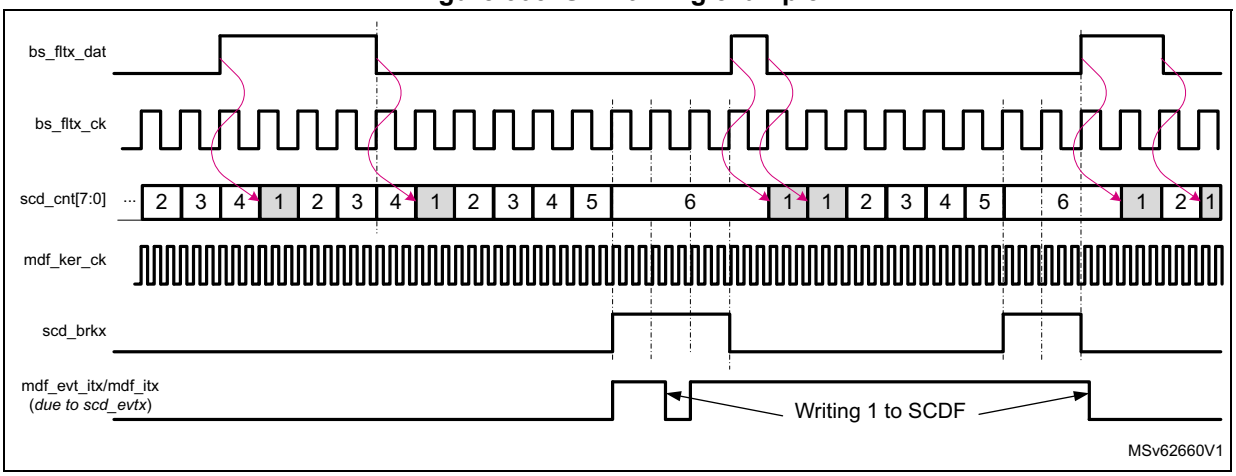


The SCDx is counting consecutive zeros or consecutive ones received from the serial interface (SITFx). A counter is restarted if there is a change in the data stream received. If this counter reaches a short-circuit threshold value (SCDT[7:0] in the *MDF short circuit detector control register x (MDF_SCDxCR)*), then a short-circuit event is invoked. Each BSMX output has its own short-circuit detector. Any BSMX output can be continuously monitored by setting the corresponding SCDEN bit to 1 in MDF_SCDxCR. Each SCD has its own threshold settings (SCDT) and its own status bit (SCDF).

The figure below shows an example where SCDT[7:0] is set to six. The break signal remains high as long as the short circuit condition is present.

No overrun event is generated when the interrupt event is pending while a new short-circuit condition is detected.

Figure 305. SCD timing example



The SCDx event generated by the SCDx block can be assigned to break output signals mdf_break[3:0]. The break signal assignment to a given short-circuit detector event is done by BKSCD[3:0] in MDF_SCDxCR. The break outputs are shared with the over-current function.

Note: SCDs cannot be used to monitor the ADC data interface (ADCITF).

SCD activation sequence example

1. Enable and configure CKGEN to generate the mdf_proc_ck.
2. Set SCDEN to 0.
3. Wait for SCDACTIVE = 0. If SCDEN was previously enabled, this phase can take two periods of mdf_hclk, and two periods of mdf_proc_ck.
4. Program BKSCD[3:0] and SCDT[7:0].
5. Set SCDEN to 1.

Note: BKSCD[3:0] and SCDT[7:0] must not be changed when SCDACTIVE = 1.

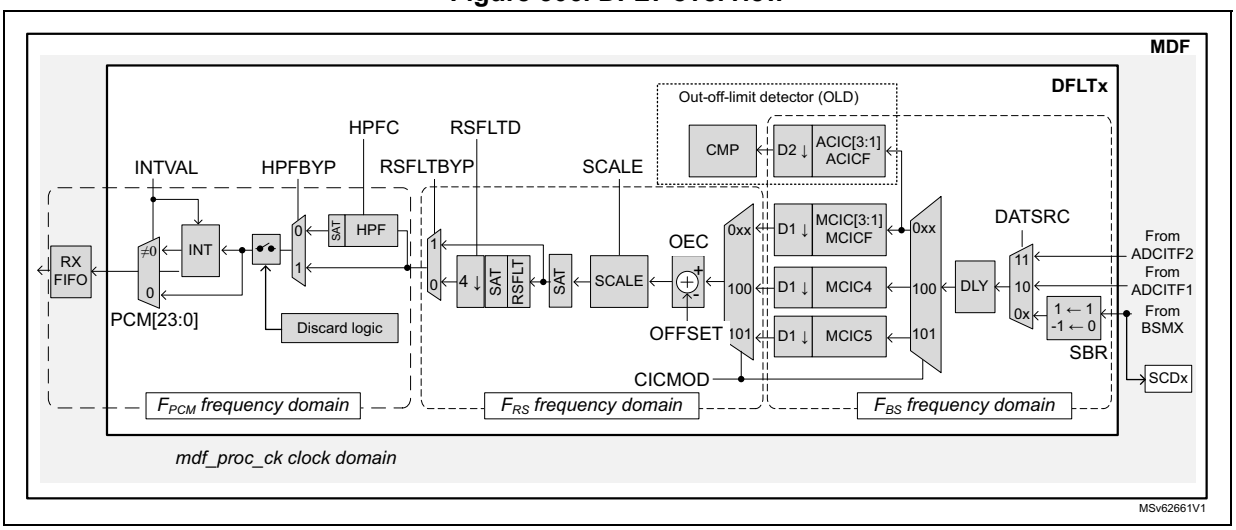
39.4.8 Digital filter processing (DFLT)

The digital filter processing includes the following sub-blocks:

- symbol remap (SBR)
- source selector
- clock skipper delay (DLY)
- CIC decimation filter that can be configured:
  - in single $Sinc^4$ or $Sinc^5$ order CIC (MCIC)
  - in two CIC filters:
    - a main filter (MCIC), high resolution
    - an auxiliary filter (ACIC), low-latency, for the out-off-limit detector (OLD)
    - both MCIC and ACIC can be configured as $Sinc^1$, $Sinc^2$, $Sinc^3$ or FastSinc
- gain control (SCALE)
- signal saturation (SAT)
- reshape filter (RSFLT)
- high-pass filter (HPF)
- integrator (INT)
- receive RXFIFO

Figure 306 shows the filter-path configuration according to CICMOD[2:0]. Several configuration bits are available to configure the digital filter to the application needs.

Figure 306. DFLT overview



Symbol remap and source selection

The symbol remap (SBR) converts the bitstream selected by the BSMX into data usable by the filter path. More especially:

- The high levels are converted into a 16-bit signed number + 1.
- The low levels are converted into a 16-bit signed number - 1.

The signal source of the digital filter can be selected via DATSRC[1:0] between the two following:

- data coming from the BSMX
- data coming from one of the ADC interfaces (ADCITF2 or 1)

Programmable micro-delay control (DLY)

The digital filter has a delay line that allows the timing adjustment of each stream with the resolution of the bitstream clock.

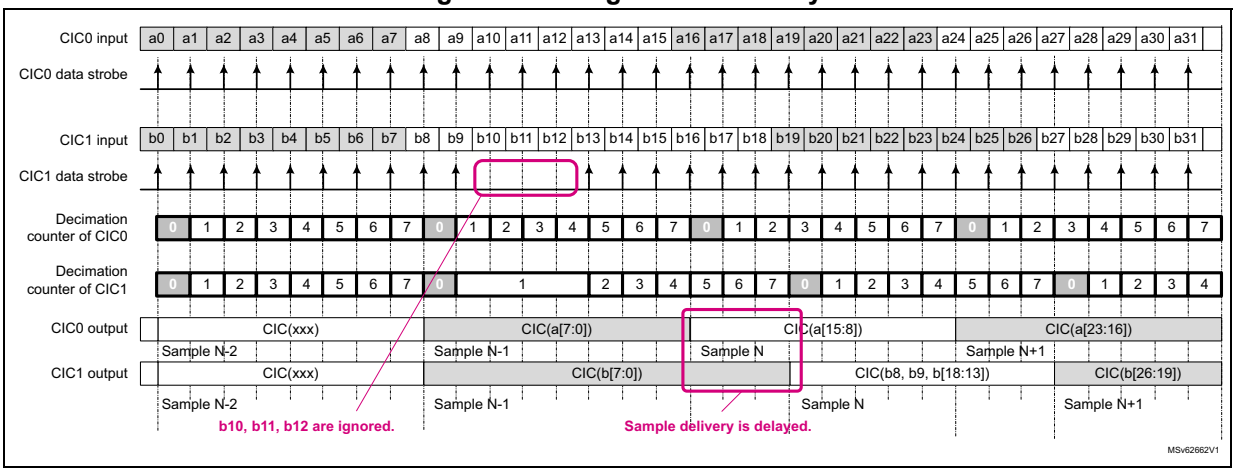
This feature is particularly helpful in the case of microphone beam forming applications where delays smaller than the final sampling rate, must be applied to the incoming stream.This feature is helpful when the MDF is synchronized with other ADF or MDF blocks for a beam forming application for example.

The delay is performed by discarding a given number of samples from the selected input stream, before samples enter into the CIC filter. This data discarding is performed by skipping a given number of data strobe, preventing the CIC filter to take into account those data.

When the wanted amount of data strobe has been skipped, the next incoming samples are strobed normally.

Figure 307 shows an example of how to apply dynamically small delay to an incoming stream. For simplification, the CIC filter performs a decimation by height in this example. CIC1 represents the CIC included in the ADF and CIC0 represents a filter from another ADF or MDF instance.

Figure 307. Programmable delay



The CIC of filter 1 (CIC1) receives a command in order to skip three incoming samples. So the input samples named b10, b11 and b12 are not processed by CIC1. As a consequence, the output sample N+1 generated by CIC0 is build from input samples a[23:16] while the sample N+1 of CIC1 is build from input samples b[26:19].

Finally, the non-skipped data stream looks delayed by three bitstream periods.

Note: When the input data strobes are skipped, the decimation counter remains frozen. As a consequence, the samples delivered by the CIC1 are a bit delayed.

Warning: It is not recommended to apply a delay bigger than the programmed decimation ratio (CIC + RSFLT decimation), especially if the MDF is programmed in interleaved acquisition mode. There is a strong risk of data misalignment inside the FIFOs.

The following steps are needed to program the amount of bitstream clock periods to be skipped:

1. Wait for SKPBF equal to 0.
2. Write SKPDLY[6:0] to the wanted number of bitstream clock periods to be skipped. The SKPBF flag goes immediately to 1, indicating that the delay value entered into SKPDLY[6:0] is under process.
   - If the corresponding DFLTx is not yet enabled (DFLTEN = 0), then the DLY logic waits for DFLTEN = 1. When the application sets DFLTEN to 1, the DLY logic starts to skip the amount of wanted data strobes.
   - If the corresponding digital filter is already enabled (DFLTEN = 1), then the DLY logic immediately starts to skip the amount of wanted data strobes.

   When the MDF skipped the amount of wanted data strobes, then SKPBF goes back to 0.
3. If the application needs to skip more data strobes, then the operation must be restarted from step 1.

The effect of the delay performed with this mechanism is cumulative as long as the MDF is enabled. In a given filter, if the application performs a D1 delay, followed by a D2 delay, then all other active filters are delayed by D1 + D2.

Data coming from ADCs can also benefit of this feature.

In interleaved acquisition mode, it is up to the application to insure that the delay applied on the different microphones is in line with the depth of the RXFIFO buffers. If the relative delay between each activated filter is less than the decimation ratio, then it costs one FIFO location.

If the interleaved acquisition mode is not used, then the delay value has no impact on the RXFIFO buffering.

Note: If SKPDLY[6:0] is written when SKPBF = 1, the write operation is ignored.

Cascaded-integrator-comb (CIC) filter

The CIC digital filters are an efficient implementation of low-pass filters, often used for decimation and interpolation. The CIC frequency response is equal to a $Sinc^N$ function, this is why they are often called Sinc filters.

The $Sinc^N$ digital filter embedded into the MDF is configurable according to the application targeted.

- For audio applications, such as speech capture from digital microphones, the application can select a high-resolution low-pass decimation filter by setting CICMOD to 100 or 101.
- If the targeted application is motor control or any other sensor capture, then the application can configure the CIC in order to offer a main filter path for acquisition (MCIC) and an auxiliary filter for fast-event generation (ACIC). This auxiliary filter can be used for example, to detect over-current conditions. This mode is selected by setting CICMOD[2:0] = 0xx.

When CICMOD[2:0] = 0xx, the following CIC filters are available:

- main filter (MCIC)
- auxiliary CIC filter (ACIC)

Both of them are configurable in FastSinc, $Sinc^1$ to $Sinc^3$.

When CICMOD[2:0] = 100, the CIC is configured into a single $Sinc^4$ and when CICMOD[2:0] = 101, the CIC is configured into a single $Sinc^5$ filter.

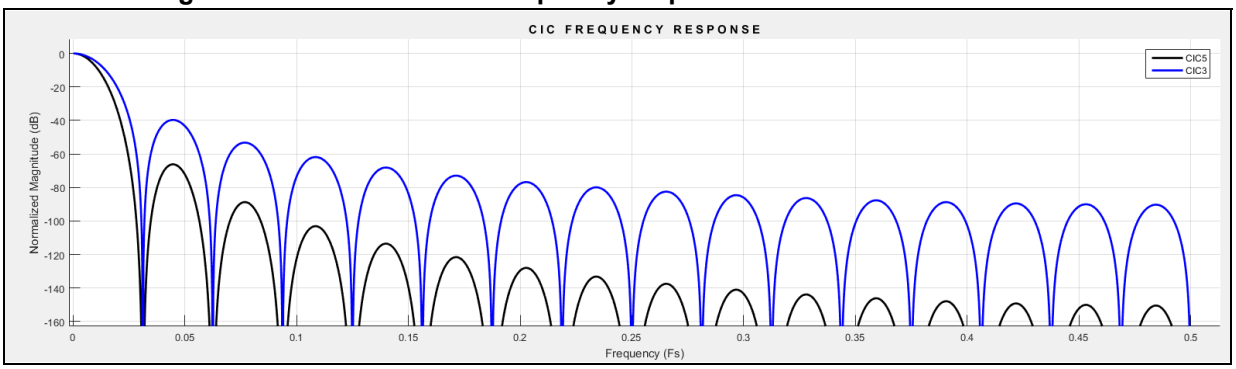
The filters have the following transfer function (impulse response in z domain):

- $Sinc^N$ filter type: $$H(z) = \left(\frac{1 - z^{-D}}{1 - z^{-1}}\right)^N$$
- FastSinc filter type: $$H(z) = \left(\frac{1 - z^{-D}}{1 - z^{-1}}\right)^2 \cdot (1 + z^{-(2 \cdot D)})$$

where N can be 1, 2, 3, 4 or 5, and D is the decimation ratio.

D is equal to MCICD+1 or ACICD+1.

Figure 308. CIC3 and CIC5 frequency response with decimation ratio = 32



CIC output data size

The size of samples delivered by the CIC (DS_{CIC}) depends on the following parameters:

- CIC order (N)
- CIC decimation ratio (D)
- data size of the input stream (DSIN)

The CIC order and decimation ratio must be programmed in order to insure that the data size does not exceed the 26-bit CIC capability.

The following formula gives the output data size (DS_{CIC}) according to the parameters above.

$$DS_{CIC} = \left(\frac{N \times Ln(D)}{Ln(2)}\right) + DS_{IN}$$

and the CIC gain is given by this formula:

$$G_{CIC} = (D)^{N}$$

The decimation ratio can be adjusted from 2 to 512 for the main CIC filter and from 1 to 32 for the auxiliary CIC filter.

The table below gives some data output size in bits for some decimation values, when the data source is a full-scale signal coming from the serial interface or from a 12-bit ADC.

Note: DS_{IN} = 1 bit for a serial bitstream but can be up to 16 bits when coming from the ADCITF.

Table 346. Data size according to CIC order and CIC decimation values

Decimation	Data size (bits) when DS_{IN} = 1 bit (data from SITFx)						Data size (bits) when DS_{IN} = 12 bits (data from ADCITF)					
	Sinc^1	Sinc^2	FastSinc	Sinc^3	Sinc^4	Sinc^5	Sinc^1	Sinc^2	FastSinc	Sinc^3	Sinc^4	Sinc^5
4	3	5	6	7	9	11	14	16	17	18	20	22
8	4	7	8	10	13	16	15	18	19	21	24	-
12	5	9	9	12	16	19	16	20	21	23	-	-
16	5	9	10	13	17	21	16	20	21	24	-	-
24	6	11	12	15	20	24	17	22	23	-	-	-
32	6	11	12	16	21	26	17	22	23	-	-	-

Table 346. Data size according to CIC order and CIC decimation values

Decimation	Data size (bits) when DS_{IN} = 1 bit (data from SITFx)						Data size (bits) when DS_{IN} = 12 bits (data from ADCITF)					
	Sinc^1	Sinc^2	FastSinc	Sinc^3	Sinc^4	Sinc^5	Sinc^1	Sinc^2	FastSinc	Sinc^3	Sinc^4	Sinc^5
64	7	13	14	19	25	-	18	24	25	-	-	-
128	8	15	16	22	-	-	19	26	-	-	-	-
256	9	17	18	25	-	-	20	-	-	-	-	-
512	10	19	20	-	-	-	21	-	-	-	-	-

The LSB part of the data provided by the CIC is not necessarily significant: it depends on the sensor performances and the ability of the CIC to reject the out-off-band noise.

The sample size at CIC output can be adjusted thanks to the SCALE block.

The table below shows the maximum allowed decimation ratio for the CIC filter, depending on the input data size. Bigger decimation ratio causes a wrap-around of the signal at CIC output, for strong input signals.

Note: The MDF cannot detect or prevent a CIC wrap-around.

Table 347. Maximum decimation ratio versus order and input data size

Filter order	Max. decimation ratio when DS_{IN} = 1 bit (SITFx)	Max. decimation ratio when DS_{IN} = 12 bits (ADCITF)	Max. decimation ratio when DS_{IN} = 16 bits (ADCITF)
Sinc^1	512	512	512
Sinc^2	512	128	32
FastSinc	512	90	22
Sinc^3	322	25	10
Sinc^4	76	11	5
Sinc^5	32	6	4

Scaling (SCALE) and saturation (SAT)

The SCALE block allows the application to adjust the amplitude of the signal provided by the CIC, by steps of 3 dB (± 0.5 dB).

The signal amplitude can be decreased by up to 8 bits (- 48.2 dB) and can be increased by up to 12 bits (+ 72.2 dB).

The gain is adjusted by the SCALE[5:0] bitfield in the *MDF digital filter configuration register x (MDF_DFLTxCICR)*.

SCALE[5:0] can be changed even if the corresponding DLFTx is enabled. During the gain transition, the signal provided by the filter is disturbed.

Due to internal resynchronization, there is a delay of some cycles of mdf_proc_ck clock between the moment where the application writes the new gain, and the moment where the gain is effectively applied to the samples. If the application attempts to write a new gain value while the previous one is not yet applied, this new gain value is ignored. Reading back SCALE[5:0] informs the application on the current gain value.

The table below shows the possible gain values.

Table 348. Possible gain values

SCALE[5:0]	Gain (dB)	SCALE[5:0]	Gain (dB)	SCALE[5:0]	Gain (dB)	SCALE[5:0]	Gain (dB)
0x20	- 48.2	0x2B	- 14.5	0x06	+ 18.1	0x11	+ 51.7
0x21	- 44.6	0x2C	- 12.0	0x07	+ 21.6	0x12	+ 54.2
0x22	- 42.1	0x2D	- 8.5	0x08	+ 24.1	0x13	+ 57.7
0x23	- 38.6	0x2E	- 6.0	0x09	+ 27.6	0x14	+ 60.2
0x24	- 36.1	0x2F	- 2.5	0x0A	+ 30.1	0x15	+ 63.7
0x25	- 32.6	0x00	0.0	0x0B	+ 33.6	0x16	+ 66.2
0x26	- 30.1	0x01	+ 3.5	0x0C	+ 36.1	0x17	+ 69.7
0x27	- 26.6	0x02	+ 6.0	0x0D	+ 39.6	0x18	+ 72.2
0x28	- 24.1	0x03	+ 9.5	0x0E	+ 42.1	-	-
0x29	- 20.6	0x04	+ 12.0	0x0F	+ 45.7	-	-
0x2A	- 18.1	0x05	+ 15.6	0x10	+ 48.2	-	-

The SAT blocks avoid having a wrap-around of the binary code when the code exceeds its maximal or minimal value.

The MDF performs saturation operations at the following levels:

- after the SCALE block (performed by the SAT block). The signal is saturated at 24 bits.
- inside the RSFLT, to insure a good filter behavior
- at the output of the HPF, to insure that the output signal does not exceed 24 bits

The SATF bit informs the application that a saturation occurred either after the SCALE, inside the RSFLT or after the HPF. In addition, an interrupt can be generated if SATIE is set to 1. As soon as a saturation is detected, the SATF flag is set to 1. It is up to the application to clear this flag in order to be able to detect a new saturation.

Those bits are in the *MDF DFLTx interrupt enable register x (MDF_DFLTxIER)* and *MDF DFLTx interrupt status register x (MDF_DFLTxISR)*.

Gain adjustment policy

To get the best MDF performances, it is important to properly adjust the gain value via SCALE[5:0].

A usual way to adjust the gain is to select the SCALE[5:0] value that gives a final signal amplitude as close as possible to the 24-bit full scale, for the maximum input signal.

A way to select the optimal gain is detailed below:

1. Check that, for the expected input signal, the data size into the CIC filter does not exceed 26 bits. This can be checked using this formula:

$$\frac{LN(SIN_{pp} \cdot D^N)}{LN(2)} < 26$$

where N represents the CIC order, D the decimation ratio and SIN_{pp} the maximum peak-to-peak amplitude of the input signal.

SIN_{pp}can take:

– a maximum peak-to-peak amplitude of 2 (± 1), for samples coming from SITF

– a maximum peak-to-peak amplitude of 4095 (+ 2047, - 2048) for samples coming from a 12-bit ADC

Example: a $Sinc^4$ can be used with a decimation ratio of 96, if the maximum input signal does not exceed ± 0.35. Indeed:

$$\frac{LN(0.7 \cdot 96^4)}{LN(2)} \sim 25.82 \text{ bits} < 26 \text{ bits}$$

2. Adjust the SCALE value.

To select the most appropriate SCALE value, the user must check if the RSFLT is used or not. If the RSFLT is used, the data size at SCALE output must not exceed 22 bits, otherwise the data size can be up to 24 bits.

The SCALE value in dB is selected using this formula:

$$SCALE_{dB} < 20 \cdot \log 10\left(\frac{2^{NB}}{SIN_{pp} \cdot D^N}\right)$$

where NB is equal to 22 if RSFLT is enabled, or 24 if RSFLT is bypassed. $SCALE_{dB}$ represents the gain value selected by SCALE[5:0].

Example: for a $Sinc^4$ with a decimation ratio of 96 and a SIN_{pp} of 0.7:

– If the RSFLT is bypassed:

$$20 \cdot \log 10\left(\frac{2^{24}}{0.7 \cdot 96^4}\right) \sim 11 \text{ dB}$$

$SCALE_{dB}$ value must be lower than - 11 dB. The closest lower value is - 12dB (SCALE[5:0] = 0x2C).

– If the RSFLT is enabled:

$$20 \cdot \log 10\left(\frac{2^{22}}{0.7 \cdot 96^4}\right) \sim 23 \text{ dB}$$

$SCALE_{dB}$ value must be lower than - 23 dB, the closest lower value is - 24.1 dB (SCALE[5:0] = 0x28).

If SCALE[5:0] is set to a higher value, then a saturation may occur. An event flag informs the user if a saturation occurred.

The table below proposes gain values for different filter configurations, when the data comes from the SITFx, according to the CIC order, and the CIC decimation ratio. This table is not exhaustive, and considers a full-scale input signal (see *Section 39.7.5* for details).

Table 349. Recommended maximum gain values versus CIC decimation ratios

CIC decimation ratio	Gain settings (dB) for configuration SITF + CICx + RSFLT (+ HPF)					Gain settings (dB) for configuration SITF + CICx (+ HPF)				
	CIC5	CIC4	CIC3	CIC2	CIC1	CIC5	CIC4	CIC3	CIC2	CIC1
8	33.6	51.7	69.7	72.2	72.2	45.7	63.7	72.2	72.2	72.2
12	18.1	39.6	60.2			30.1	51.7			
16	3.5	27.6	51.7			15.6	39.6	63.7		
20	- 6.0	21.6	48.2			6.0	33.6	60.2		
24	- 12.0	15.6	42.1	69.7		0	27.6	54.2		
28	- 20.6	9.5	36.1	66.2		- 8.5	21.6	48.2		
32	-26.6	3.5	33.6	63.7		- 14.5	15.6	45.7		
48	-	- 8.5	24.1	57.7		-	3.5	31.6	69.7	
64	-	- 20.6	15.6	51.7		-	-8.5	27.6	63.7	
128	-	-	- 2.5	39.6		-	-	9.5	51.7	
256	-	-	- 20.6	27.6		-	-	-8.5	39.6	

Reshaping filter (RSFLT)

In addition to the CIC, the MDF offers a reshaping IIR filter mainly dedicated to the audio application but also usable in other applications.

When the RSFLT is used, the sample size at its input must not exceed 22 bits.

The samples at the RSFLT output can be decimated by four or not according to the RSFLTD bit in the *MDF reshape filter configuration register x (MDF_DFLTxRSFR)*.

The RSFLT can be bypassed by setting RSFBYP to 1 in MDF_DFLTxRSFR.

The table below shows which sampling rate must be provided to the RSFLT in order to process the most common audio streams.

The RSFLT cutoff frequency (F_C) depends on the sample rates at its input (F_{RS}), and is given by the following formula:

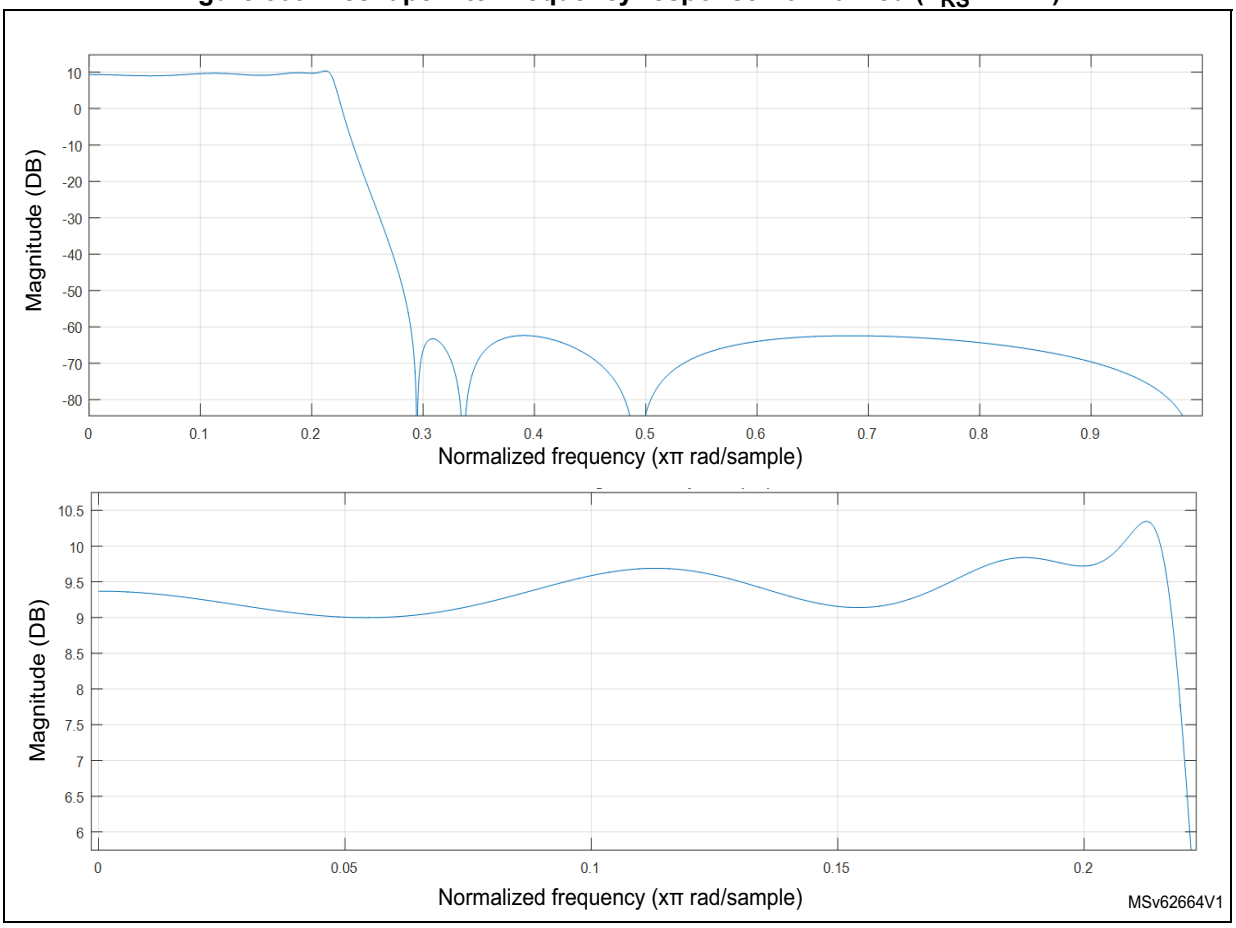
$$F_C = 0.111 \times F_{RS}$$

Table 350. Most common microphone settings

Sample rate (kHz) at RSFLT (F_{RS})	Pass band (kHz)	D2	PCM sampling rate (kHz)
32	3.55	4	8
64	7.1	4	16
128	14.2	4	32
192	21.3	4	48

The figure below shows the frequency response of the reshape filter.

Figure 309. Reshape filter frequency response normalized (F_{RS} / 2 = 1)



The RSFLT gain is about 9.3 dB, so the output data size is a little bit lower than 24 bits for a 22-bit wide input signal.

The RSFLT takes 24 clock cycles of mdf_proc_ck clock to process one sample at F_{RS}. When the RSFLT is enabled, the application must insure that the mdf_proc_ck is at least 24 times faster F_{RS}.

The RSFLT generates an event (rfovr_evt) and sets the RFOVRF flag, if the RSFLT receives a new sample while the previous one is still under processing.

When RFOVRF is set, the samples provided by the RSFLT are invalid. The application must then stop the data acquisition and provide x a faster mdf_proc_ck clock to the RSFLT.

High-pass filter (HPF)

The high-pass filter suppresses the low-frequency content from the final output data stream in case of continuous conversion mode. The high-pass filter can be enabled or disabled via HPFBYP in the *MDF reshape filter configuration register x (MDF_DFLTxRSFR)*.

The HPF is useful when there is parasitic low-frequency noise (or DC signal) in the input data source and it must be removed from the final data.

The HPF is a first order IIR filter and the cut-off frequency can be selected via HPFC[1:0] in the *MDF reshape filter configuration register x (MDF_DFLTxRSFR)*, among the following values:

- 0.000625 x F_{PCM}
- 0.00125 x F_{PCM}
- 0.00250 x F_{PCM}
- 0.00950 x F_{PCM}

Table 351. HPF 3 dB cut-off frequencies examples

HPFC	3 dB cut-off frequency for common F_{PCM} frequencies (Hz)		
	F_{PCM} = 8 kHz	F_{PCM} = 16 kHz	F_{PCM} = 48 kHz
0	5	10	30
1	10	20	60
2	20	40	120
3	76	152	456

The HPF output is saturated at 24 bits. The SATF flag is set if a sample is saturated.

Offset error compensation (OEC)

Each digital filter has its own OEC. The offset correction is performed by subtracting to the signal provided by the CIC, the OFFSET[25:0] in the *MDF offset error compensation control register x (MDF_OECxCR)*.

Due to the internal resynchronization, there is a delay of some cycles of mdf_proc_ck clock between the moment where the application writes the new offset, and the moment where the new offset value is effectively applied to the samples. If the application attempts to write a new offset value while the previous one is not yet applied, this new offset value is ignored. Reading back OFFSET[25:0] informs the application on the current offset value.

Integrator (INT)

The INT performs additional decimation and a resolution increase of data coming from the digital filter. The INT simply performs the sum of data from a digital filter for a given number of data samples from a filter.

The INT is enabled by setting INTVAL[6:0] to a value different from 0.

The amount of integrated values can be defined by INTVAL[6:0] in the range of 2 to 128.

In order to control the data width at the integrator output, the resulting data can be divided by 1, 4, 32 or 128. This feature is controlled by INTDIV[1:0].

39.4.9 Out-of-limit detector (OLD)

The OLD triggers an event when a signal reaches or crosses given maximum and minimum threshold values. The generated event can drive an interrupt or break signals (mdf_break[3:0]) when conditions are met.

The OLD can be used only if the CIC filter is configured in motor and sensing mode (CICMOD[2:0] = 0xx).

The OLD takes the input signal selected by the main filter, process it using a $Sinc^N$ or FastSinc filter (ACIC), and compares the resulting signal to programmed thresholds.

The OLD is enabled via the OLDEN bit in MDF_OLD0CR. Once enabled, the input data are continuously monitored. There is no need to have the DFLTx enabled for using the OLD function.

The MDF offers a high- and low-threshold register that are compared with given data values.

The application can generate an event if the signal is inside or outside the boundary defined by those two thresholds. This behavior is controlled via THINB in the MDF_OLD0CR.

If the application only wants to generate an event when the input signal is higher than OLDTHH, then THINB and OLDTHL must both be cleared to 0.

If the application only wants to generate an event when the input signal is lower than OLDTHH, then THINB must be set to 1 and OLDTHL must be cleared to 0.

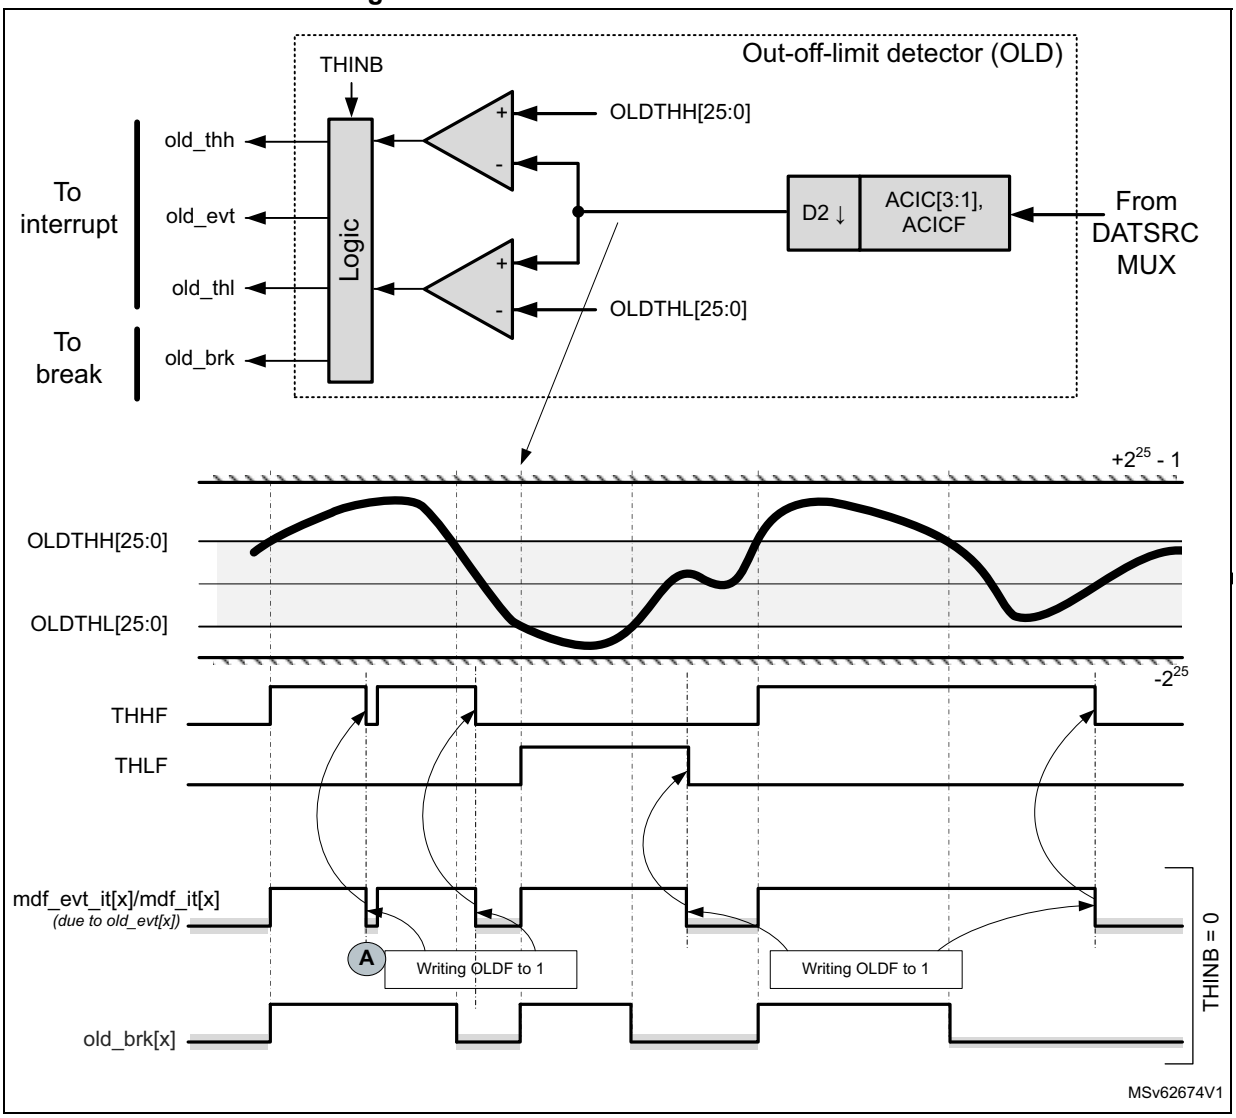
Note: It is not recommended to set a OLDTHL to a value bigger than OLDTHH.

The response time of the OLD depends on several parameters, the most important are listed hereafter:

- sampling rate frequency used by the external sensor
- ACIC decimation ratio
- ACIC order

The OLD can be used for over-current detection but also as current limiter if the PWM signal is generated by a timer receiving a old_brk signal. Generally, to get a fast response time for over-current detection, it is recommended to use the ACIC with lowest order as possible and the minimum decimation ratio. FastSinc is also a good choice for over-current detection. The application must perform a trade-off between the filter resolution and the response time.

Figure 310. Out-of-limit detector thresholds



Status flags are available in order to inform the application that an OLD event is detected. Latched events are cleared by writing 1 into the OLDF bit.

As shown in *Figure 310*, when THINB = 0, the interrupt signal remains active as long as the signal is outside the gray area. At position A, the application clears the interrupt, but the interrupt is re-asserted because the signal is still outside the gray area. When the application clears OLDF, THHF and THLF are cleared as well.

An OLD event can be assigned to one or several break output signals (mdf_break[3:0]). The break signal assignment to a given OLD event is done by BKOLD[3:0] in the *MDF out-of limit detector control register x (MDF_OLDxCR)*.

Note: The generation of break signals is independent from the interrupts generation.

OLD activation sequence example

1. Enable and configure CKGEN.
2. Set OLDEN to 0.

3. Wait for OLDACTIVE = 0. If OLDEN was previously enabled, this phase can take two periods of mdf_hclk and two periods of mdf_proc_ck.
4. Program BKOLD[3:0], ACICN[1:0], ACICD[4:0], THINB,OLDTHL[25:0] and OLDTHH[25:0].
5. Set OLDEN to 1.

39.4.10 Digital filter acquisition modes

The MDF offers the following modes to perform a data capture:

- asynchronous continuous acquisition mode
- asynchronous single-shot acquisition mode
- synchronous continuous acquisition mode
- synchronous single-shot acquisition mode
- window continuous acquisition mode
- synchronous snapshot acquisition mode

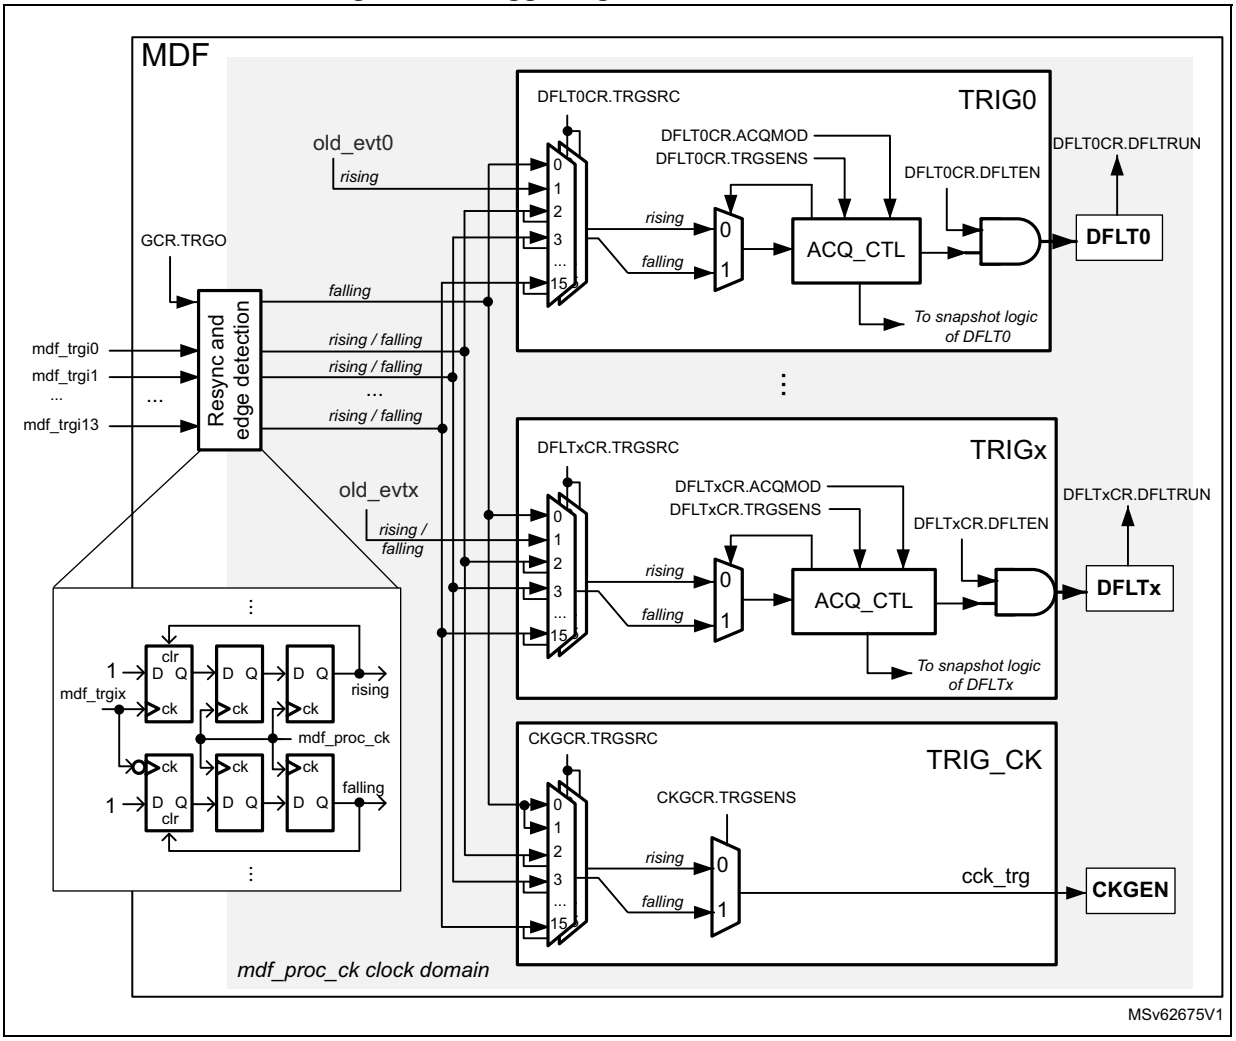
For each filter, one of these modes can be selected independently.

Note: To perform a data capture, the filters, the interfaces providing the data (SITFx or ADCITF) and the CKGEN must be enabled. If needed, MDF_CCK0 or MDF_CCK1 must be enabled as well.

The filter can be stopped immediately when DFLTEN is set to 0. This resets the filters and flushes the RXFIFO of the corresponding filter path. The DFLTACTIVE flag also goes back to 0 when the RXFIFO and the filters are reset.

The figure below shows a simplified view of the trigger logic available for each filter and for the clock generator.

Figure 311. Trigger logic for DFLT and CKGEN



A block common to all TRIG blocks performs the rising and falling edges detection and the resynchronization of the input triggers to the mdf_ker_ck clock domain. This implementation allows the application to use triggers with pulse width smaller than the mdf_ker_ck period.

In synchronous modes, the TRIG block offers the possibility to select one of the following trigger sources:

- mdf_trgi[13:0] signals (refer to *Table 341* for the trigger connections)
- TRGO bit in MDF_GCR
- OLD event of each filter path

The edge sensitivity can also be selected, except for TRGO and OLD events.

Asynchronous continuous acquisition mode

This mode allows the application to start a continuous acquisition on one or several filters by simply writing their DFLTEN bits to 1.

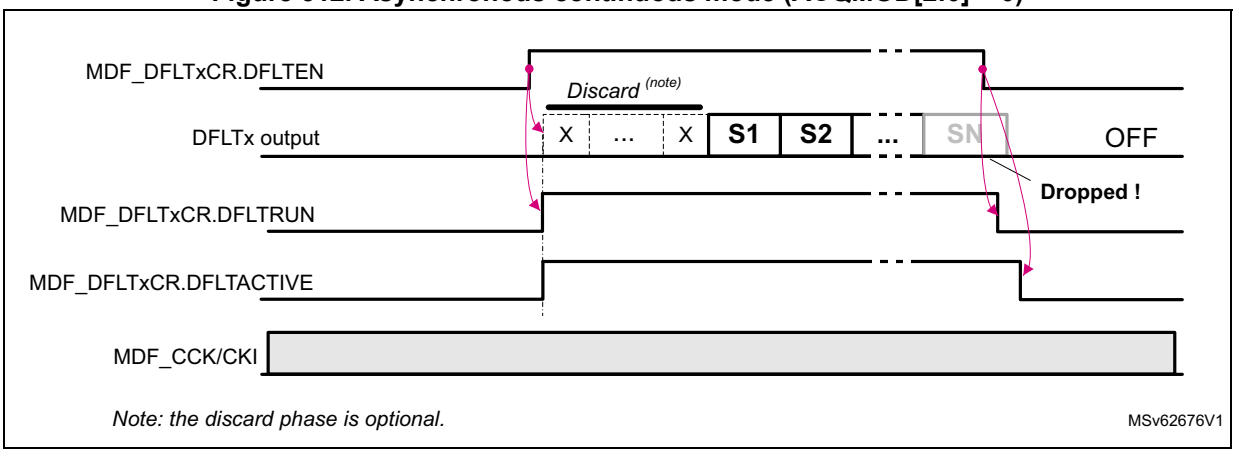
The Asynchronous continuous acquisition mode is selected when ACQMOD[2:0] = 0.

The sequence below shows the most important programming steps (assuming that DFLTEN bits of the filters are set to 0):

1. Configure and enable the clock generator (CKGEN) so that the mdf_proc_ck frequency is compatible with the targeted application (see examples in *Table 355*).
2. Enable the CKGEN (CKGDEN = 1) and, if needed, enable the MDF_CCK0 and MDF_CCK1 clocks.
3. Program the filter configuration and set the ACQMOD[2:0] to 0.
4. Set to 1 the SITFEN bit of the requested data interfaces.
5. Before setting DFLTEN to 1, wait for DFLTACTIVE = 0: it insures that the previous filter deactivation sequence terminated properly.
6. When DFLTEN is set to 1 for the filters to enable, the acquisition sequence starts immediately.

The figure below shows a simplified example of the samples generated by the DFLTx.

Figure 312. Asynchronous continuous mode (ACQMOD[2:0] = 0)



Note: The acquisition can be stopped by setting DFLTEN back to 0. This resets the filter and flushes the RXFIFO, so the samples located into the RXFIFO are lost. The ongoing DMA transfer is properly terminated. DFLTACTIVE goes back to 0 when the filter chain is reset and the RXFIFO flushed.

Asynchronous single-shot acquisition mode

This mode allows the application to start the acquisition of one sample on one or several filters by simply writing their DFLTEN bits to 1.

The Asynchronous single-shot acquisition mode is selected when ACQMOD[2:0] = 001.

The sequence below shows the most important programming steps (assuming that DFLTEN bits of the filters are cleared to 0):

1. Configure and enable the clock generator (CKGEN), so that the mdf_proc_ck frequency is compatible with the targeted application (see examples in *Table 351*).
2. Enable the CKGEN (CKGDEN = 1) and, if needed, enable the MDF_CCK0 and MDF_CCK1 clocks.
3. Program the filter configuration and set the ACQMOD[2:0] to 001.
4. Set to 1 the SITFEN bit of the requested data interfaces.

5. Before setting DFLTEN to 1, wait for DFLTACTIVE = 0: it insures that the previous filter deactivation sequence terminated properly.
6. When DFLTEN is set to 1 for the filters to enable, each selected filter provides one data to the RXFIFO and stops the acquisition.

To trigger a new acquisition, for each filter, the application must:

1. Check that the previous acquisition is completed, by waiting that DFLTRUN = 0.
2. Set again DFLTEN to 1.

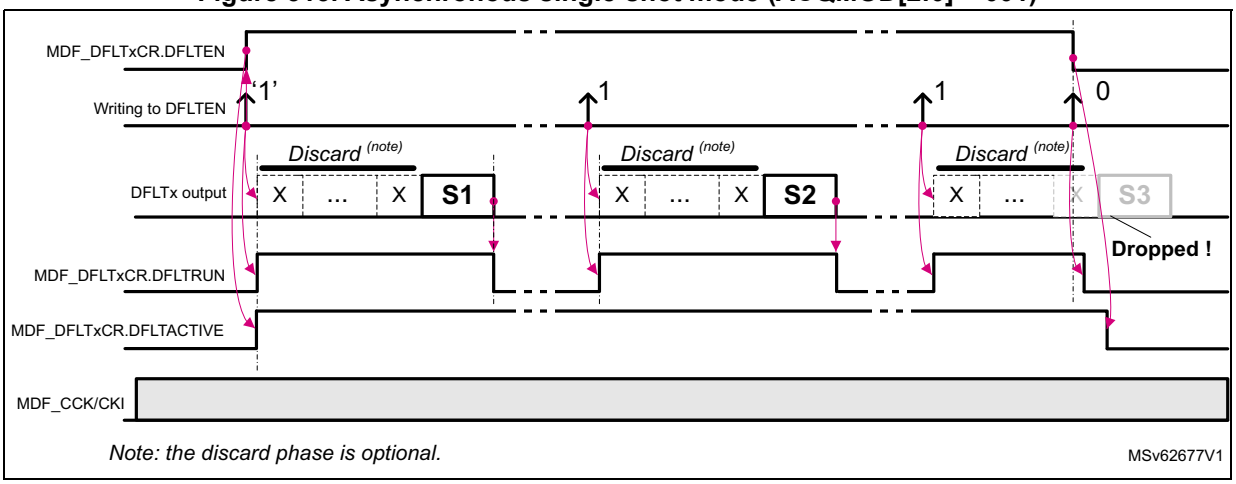
This sequence can be repeated every time a new data must be converted.

As shown in the *Figure 313*, every time DFLTEN is set to 1, an acquisition sequence is triggered. The first samples provided by the filter can be discarded if needed. At the end of each conversion, the decimation counters and filter taps are reset, and the filter is ready to start a new conversion.

If the DFLTEN is set to 0 while an acquisition is ongoing, the ongoing conversion is stopped (in the example, S3 is lost). This situation can be avoided with the following steps:

1. Wait for DFLTRUN = 0.
2. Read the sample from the RXFIFO.
3. Set DFLTEN to 0.

Figure 313. Asynchronous single-shot mode (ACQMOD[2:0] = 001)



Note: The acquisition can be stopped by setting DFLTEN back to 0. This resets the filter and flushes the RXFIFO, so the samples located into the RXFIFO are lost. The ongoing DMA transfer is properly terminated. DFLTACTIVE goes back to 0 when the filter chain is reset and the RXFIFO flushed.

Synchronous continuous acquisition mode

This mode allows the application to start a continuous acquisition on one or several filters by using the following trigger sources:

- one of the mdf_trg[13:0] signals
- OLD event of the corresponding filter
- TRGO bit

The Synchronous continuous acquisition mode is selected when ACQMOD[2:0] = 010.

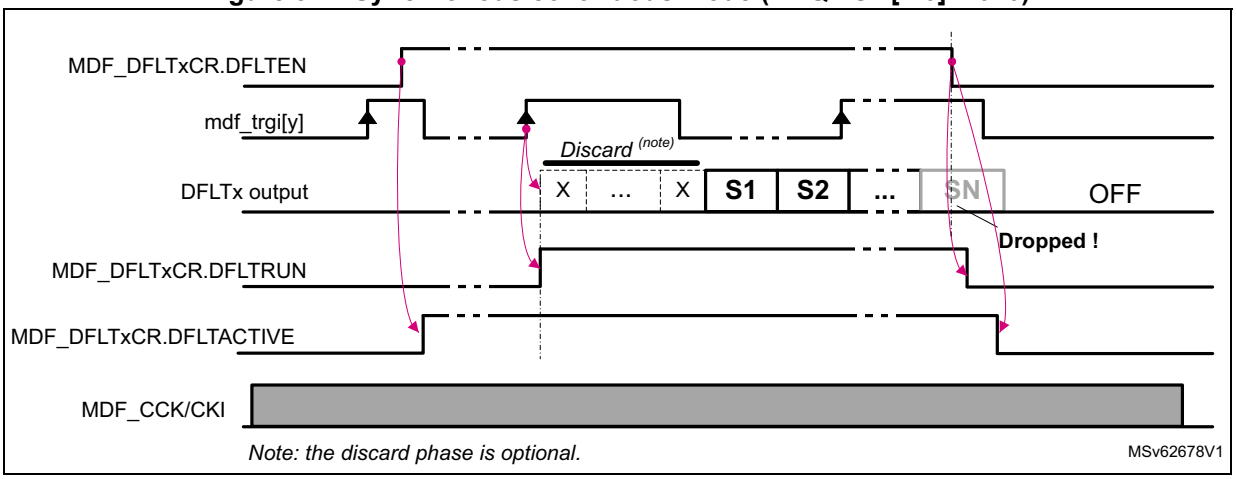
The sequence below shows the most important programming steps (assuming that DFLTEN bits of the filters are set to 0):

1. Configure and enable the clock generator (CKGEN), so that the frequency of mdf_proc_ck clock is compatible with the targeted application (see examples in *Table 351*).
2. Enable the CKGEN (CKGDEN = 1) and, if needed, enable the MDF_CCK0 and MDF_CCK1 clocks.
3. Program the filter configuration, and set the ACQMOD[2:0] to 010.
4. Set to 1 the SITFEN bit of the requested data interfaces.
5. Select the proper trigger source and sensitivity for each filter.
6. Before setting DFLTEN to 1, wait for DFLTACTIVE = 0: it insures that the previous filter deactivation sequence terminated properly.
7. Set DFLTEN to 1 for the filters to enable.
8. When the trigger condition is met, the filters start the acquisition.

The TRGSENS bit allows the selection of the trigger edge (rising or falling). The trigger is ignored if an acquisition is ongoing or if DFLTEN is set to 0.

The figure below shows a simplified example where the trigger logic is sensitive to a rising edge trigger (TRGSENS = 0). The first rising edge of the trigger signal is ignored because DFLTEN = 0. The next rising edge is taken into account and starts the acquisition. All other rising edges are ignored. The trigger logic is re-initialized when DFLTRUN goes back to 0.

Figure 314. Synchronous continuous mode (ACQMOD[2:0] = 010)



Note: The acquisition can be stopped by setting DFLTEN back to 0. This resets the filter and flushes the RXFIFO, so the samples located into the RXFIFO are lost. The ongoing DMA transfer is properly terminated. DFLTACTIVE goes back to 0 when the filter chain is reset and the RXFIFO flushed.

Synchronous single-shot acquisition mode

This mode allows the application to start a single acquisition on one or several filters by using the following trigger sources:

- one of the mdf_trg[13:0] signals
- OLD event of the corresponding filter
- TRGO bit

The Synchronous single-shot acquisition mode is selected when ACQMOD[2:0] = 011.

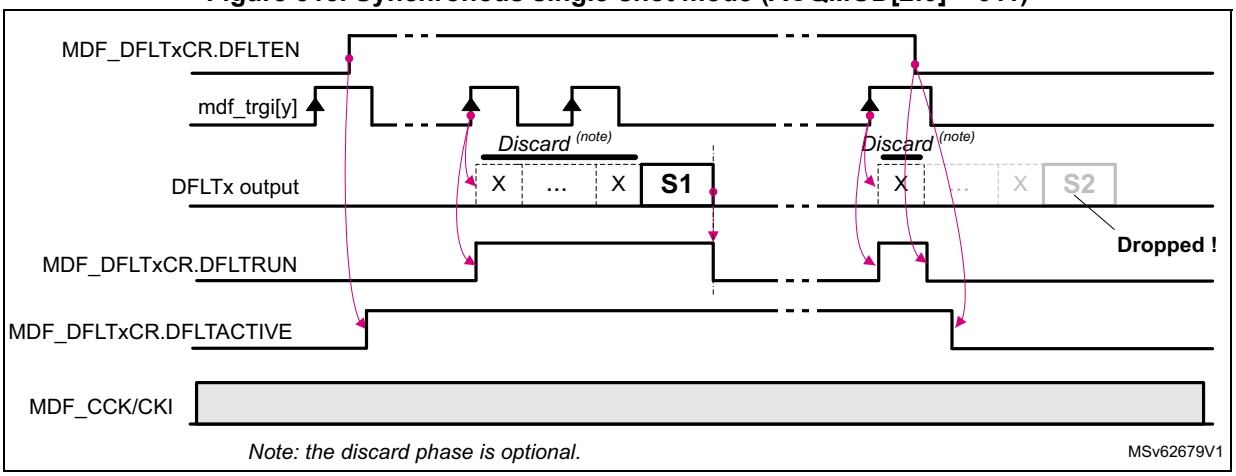
The sequence below shows the most important programming steps (assuming that DFLTEN bits of the filters are set to 0):

1. Configure and enable the clock generator (CKGEN), so that the frequency of mdf_proc_ck clock is compatible with the targeted application (see examples in *Table 351*).
2. Enable the CKGEN and, if needed, enable the MDF_CCK0 and MDF_CCK1 clocks.
3. Program the wanted filter configuration and set the ACQMOD[2:0] to 011.
4. Set to 1 the SITFEN bit of the requested data interfaces.
5. Select the proper trigger source and sensitivity for each filter.
6. Before setting DFLTEN to 1, wait for DFLTACTIVE = 0: it insures that the previous filter deactivation sequence has been properly terminated.
7. Set DFLTEN to 1 for the filters to enable.
8. Then when the trigger condition is met, the filters start the acquisition and provide one data to the RXFIFO, then the filters are ready to accept a new trigger.

TRGSENS allows the selection of the trigger edge (rising or falling). The trigger is ignored if an acquisition is ongoing or if DFLTEN is set to 0.

The figure below shows a simplified example where the trigger logic is sensitive to a rising edge trigger (TRGSENS = 0). Every time a trigger rising edge is detected with DFLTEN = 1, an acquisition sequence is triggered. The first samples provided by the filter can be discarded if needed. At the end of each conversion, the decimation counters and filter taps are reset. DFLTRUN is set to 0 and the filter is ready to start a new conversion.

Figure 315. Synchronous single-shot mode (ACQMOD[2:0] = 011)



Note: The acquisition can be stopped by setting DFLTEN back to 0. This resets the filter and flushes the RXFIFO, so the samples located into the RXFIFO are lost. The ongoing DMA transfer is properly terminated. DFLTACTIVE goes back to 0 when the filter chain is reset and the RXFIFO flushed.

Figure 315 shows a case where DFLTEN is cleared to 0 while an acquisition is ongoing: thus the sample S2 is lost. This situation can be avoided with the following steps:

1. Wait for DFLTRUN = 0.
2. Read the sample from the RXFIFO.
3. Clear DFLTEN to 0.

Note: The ongoing DMA transfer is properly terminated.

Window continuous acquisition mode

This mode allows the application to start or stop a continuous acquisition on one or several filters controlled by consecutive edges of one of the following trigger sources:

- one of the mdf_trg[13:0] signals
- TRGO bit

The window continuous acquisition mode is selected when ACQMOD[2:0] = 100.

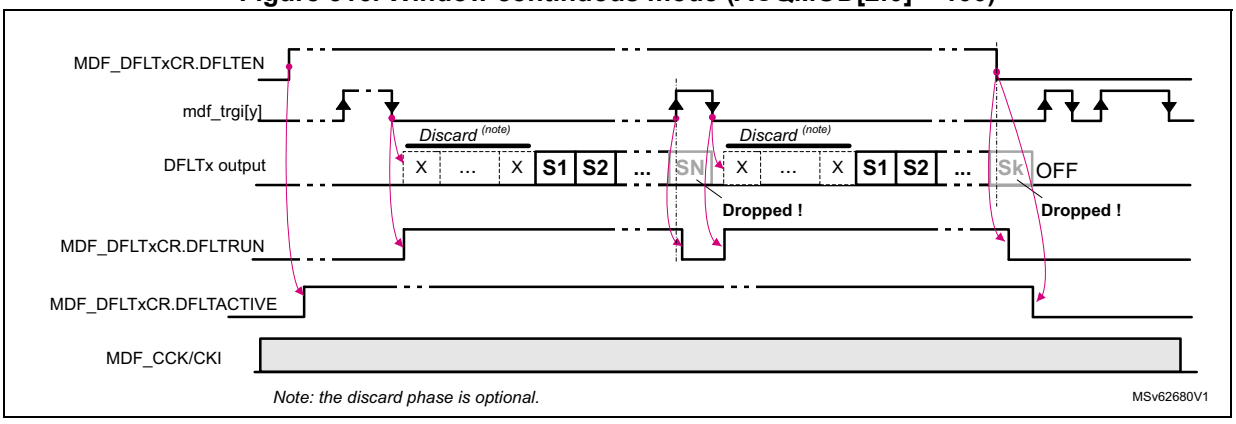
The sequence below shows the most important programming steps (assuming that DFLTEN bits of the filters are set to 0):

1. Configure and enable the clock generator (CKGEN), so that the frequency of mdf_proc_ck clock is compatible with the targeted application (see examples in *Table 351*).
2. Enable the CKGEN and, if needed, enable the MDF_CCK0 and MDF_CCK1 clocks.
3. Program the wanted filter settings and set the ACQMOD[2:0] to 100.
4. Set to 1 the SITFEN bit of the requested data interfaces.
5. Select the proper trigger source and sensitivity for each filter.
6. Before setting DFLTEN to 1, wait for DFLTACTIVE = 0: it insures that the previous filter deactivation sequence has been properly terminated.
7. Set DFLTEN to 1 for the filters to enable.
8. If TRGSENS = 0, the acquisition starts on trigger rising edge and stops on trigger falling edge. If TRGSENS = 1, the acquisition starts on trigger falling edge and stops on trigger rising edge.

Note: The acquisition may restart if the trigger condition becomes again active.

Figure 316 shows a simplified example of window continuous acquisition mode, with TRGSENS = 1. Once DFLTEN is set to 1, the MDF waits for a falling edge on the selected trigger input. When the trigger condition is met, DFLTRUN goes to 1 and the acquisition starts. The acquisition stops if the MDF detects a rising edge on the selected trigger input. If DFLTEN is still set to 1, the MDF waits again for a falling edge on the selected trigger input.

Figure 316. Window continuous mode (ACQMOD[2:0] = 100)



Note: The acquisition can be stopped by setting DFLTEN back to 0. This resets the filter and flushes the RXFIFO, so the samples located into the RXFIFO are lost. The ongoing DMA

transfer is properly terminated. DFLTACTIVE goes back to 0 when the filter chain is reset and the RXFIFO flushed.

Synchronous snapshot acquisition mode

In the acquisition modes described on previous sections, the application must wait for filters settlings time or the end of conversion before getting a new valid sample. For applications very critical in latency, the last valid sample can be get immediately, with an information on the age of this sample by using the snapshot acquisition mode.

In snapshot mode, the DFLTx is continuously acquiring the samples, but the processed samples are not stored into the RXFIFO. When a trigger occurs, the last valid sample, the current decimation value of MCIC and the sample counter of the INT are stored in MDF_SNPS0DR.

The possible trigger sources are the following:

- one of the mdf_trg[13:0] signals
- OLD event of the corresponding filter
- TRGO bit

The Synchronous snapshot acquisition mode is selected when ACQMOD[2:0] = 101.

The sequence below shows the most important programming steps (assuming that DFLTEN bits of the filters are set to 0):

1. Configure and enable the clock generator (CKGEN), so that the frequency of mdf_proc_ck clock is compatible with the targeted application (see examples in *Table 351*).
2. Enable the CKGEN and, if needed, enable the MDF_CCK0 and MDF_CCK1 clocks.
3. Program the wanted filter settings and set the ACQMOD[2:0] to 101. FTH is usually cleared to 0 to receive an interrupt as soon as the RXFIFO is not empty.
4. Set the SITFEN bit of the requested data interfaces to 1.
5. Select the proper trigger source and sensitivity for each filter.
6. Before setting DFLTEN to 1, wait for DFLTACTIVE = 0: it insures that the previous filter deactivation sequence has been properly terminated,
7. Set DFLTEN to 1 for the filters to enable.

When the trigger condition is met,

1. The MDF stores the last valid data provided by the corresponding filter, the value of the MCIC decimation counter, and the counter value of INT if selected by SNPSFMT into a shadow register.
2. The snps_evt is activated, indicating that a data is ready. If SSDRIE is set to 1, the MDF requests the AHB clock.
3. When the AHB clock is available the shadow register is stored in *MDF snapshot data register x (MDF_SNPSxDR)* and an interrupt is generated.
4. In the interrupt sub-routine, the application must do the following:
   a) Read the data located in MDF_SNPSxDR.
   b) Clear the SSDRF flag by writing it to 1.

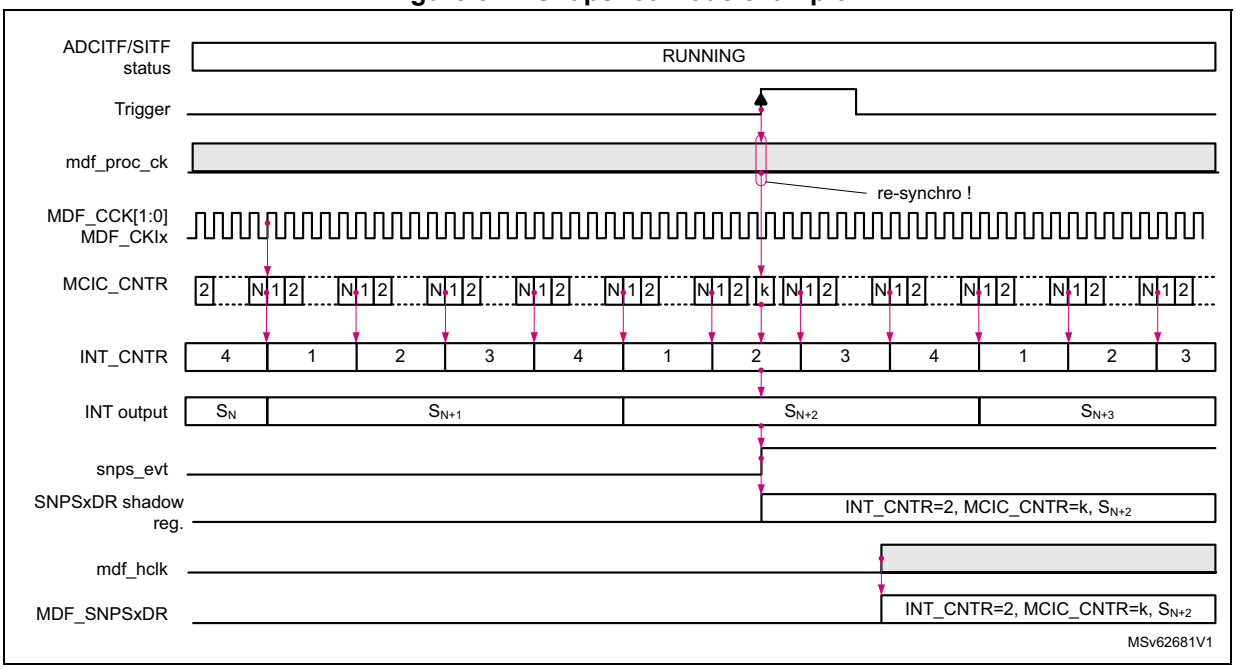
As shown in the *Figure 317*, in snapshot mode, when the trigger event occurs, it is resynchronized with the processing clock (mdf_proc_ck), the decimation counter of the MCIC (MCIC_CNTR), the integrator counter (INT_CNTR) and the last valid sample (S_{N+2}), are stored into a shadow register, and the snps_evt event is generated. When the AHB

clock is available, an interrupt is generated and the shadow register is copied in MDF_SNPSxDR. The application can read immediately the sample and the timing information.

The SSOVRF overrun flag is also available, allowing the application to check if an overrun condition occurs. A snapshot overrun condition is detected when the SSDRF flag is set to 1 while a new trigger event occurs.

In that case, the new trigger event is not taken into account. The application must clear the SSOVRF flag.

Figure 317. Snapshot mode example



Note: When an activated filter did not receive a data strobe, the filter is frozen. If the interface providing the stream is not enabled (SITF or ADCITF), the filter is frozen. Once a DFLT x is activated, CIC, HPF, IIR and INT are reinitialized. For each filter a status bit indicates if the filter is currently running or not.

Starting several filters synchronously

To start the acquisition of several filters synchronously, the following sequence must be performed (assuming that DFLTEN is set to 0):

1. Enable the CKGEN and, if needed, enable the MDF_CCK0 and MDF_CCK1 clocks.
2. Set the SITFEN bit of the requested data interfaces to 1.
3. For each filter, set the acquisition mode to synchronous (ACQMOD[2:0] = 01x).
4. For each filter, set TRGSRC[3:0] to 0 (TRGO is selected).
5. For each filter, set TRGSENS to 0 (rising edge).
6. For each filter, set DFLTEN to 1.
7. Read TRGO bit until it is read to 0.
8. Set TRGO to 1. Then the acquisition sequence for all selected filters starts immediately.

To trigger a new acquisition (in case of single-shot), the application must do the following:

1. Check that the previous acquisition is completed, by waiting DFLTRUN = 0.
2. Read TRGO until it is read to 0.
3. Set again TRGO to 1.

Discarded samples

The MDF offers the possibility to program the amount of samples to be discarded after each restart:

- to avoid capturing samples affected by the impulse response of the filter
- to delay the acquisition of filters by a specific amount of samples

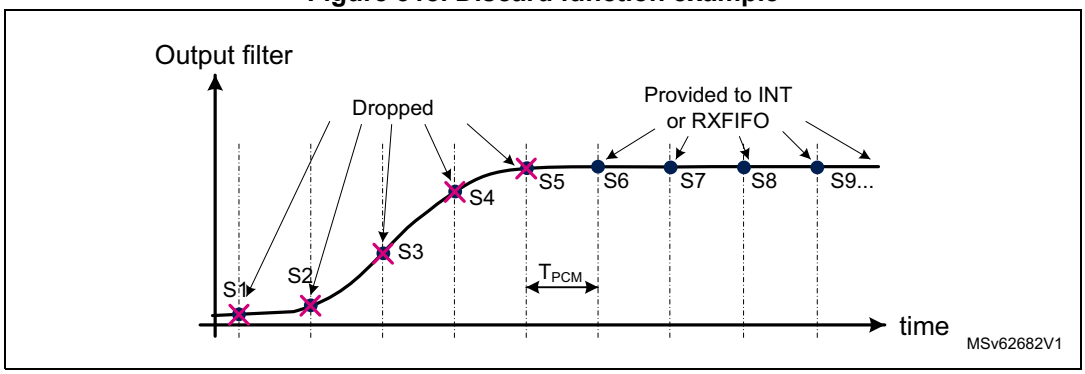
The discard function is controlled via NBDIS[7:0] as follows:

- When NBDIS[7:0] = 0, the discard function is disabled.
- When NBDIS[7:0] ≠ 0, the discard function is activated in one of the following condition:
  - when the DFLTEN bit goes to 1
  - every time an acquisition is started in (A)synchronous single-shot modes

Refer to *Figure 312* to *Figure 316*, *Figure 319* and *Figure 320*.

In the example shown in the figure below, the discard function is used to drop the first five samples provided by the digital filter (S1 to S5). The first sample transfered to the RXFIFO (or INT block if enabled) is S6.

Figure 318. Discard function example



Warning: All filters working in interleaved DMA mode must have the same NBDIS[7:0] value.

Data interface activation

The data interfaces are enabled by setting the corresponding SITFEN or ADCITFEN bit to 1. Once the digital filter is enabled, it receives the serial data from the external ΣΔ modulator or parallel internal data sources (ADC).

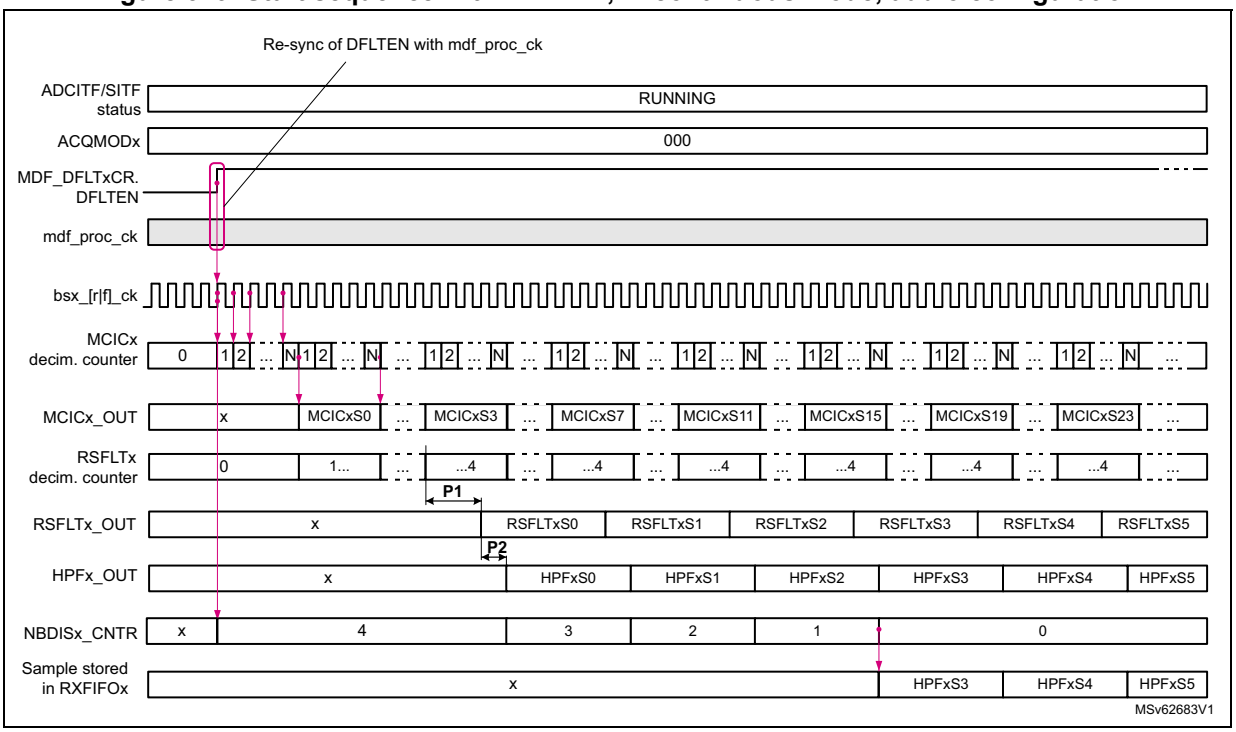
39.4.11 Start-up sequence examples

Figure 319 details an acquisition sequence start of a digital filter triggered by DFLTEN (ACQMOD[2:0] = 0), with NBDIS[7:0] = 3 (three samples to discard before acquisition).

The DFLTx is configured for audio application: MCIC, RSFLT and HPF activated.The data interface (SITFx or ADCITF) is assumed to be already activated.

Note: NBDIS[7:0] is set on purpose to a low value to simplify the drawing.

Figure 319. Start sequence with DFLTEN, in continuous mode, audio configuration



The DFLTEN bit is re-sampled into the MDF processing clock domain. When DFLTEN is detected high, the filter chain is enabled and the decimation counter of the MCIC filter is incremented at the rate of the bitstream clock.

When the MCIC decimation counter reaches its programmed value N, a sample is available for the RSFLT.

The RSFLT processes all the samples provided by the MCIC and delivers a sample to the HPF every time it processes four samples (decimation by 4) The RSFLT needs up to 24 cycles of mdf_proc_ck clock before delivering a sample (P1).

The HPF processes all the samples provided by the RSFLT, but the NBDIS function prevents the data writing in the RXFIFO as long as NBDIS_CNTR does not reach 0. This counter is decremented every time the HPF delivers a sample.

When NBDIS_CNTR reaches 0, the samples provided by the HPF are stored into the RXFIFO.

The example shown in *Figure 320* is based in a motor-control filter configuration:

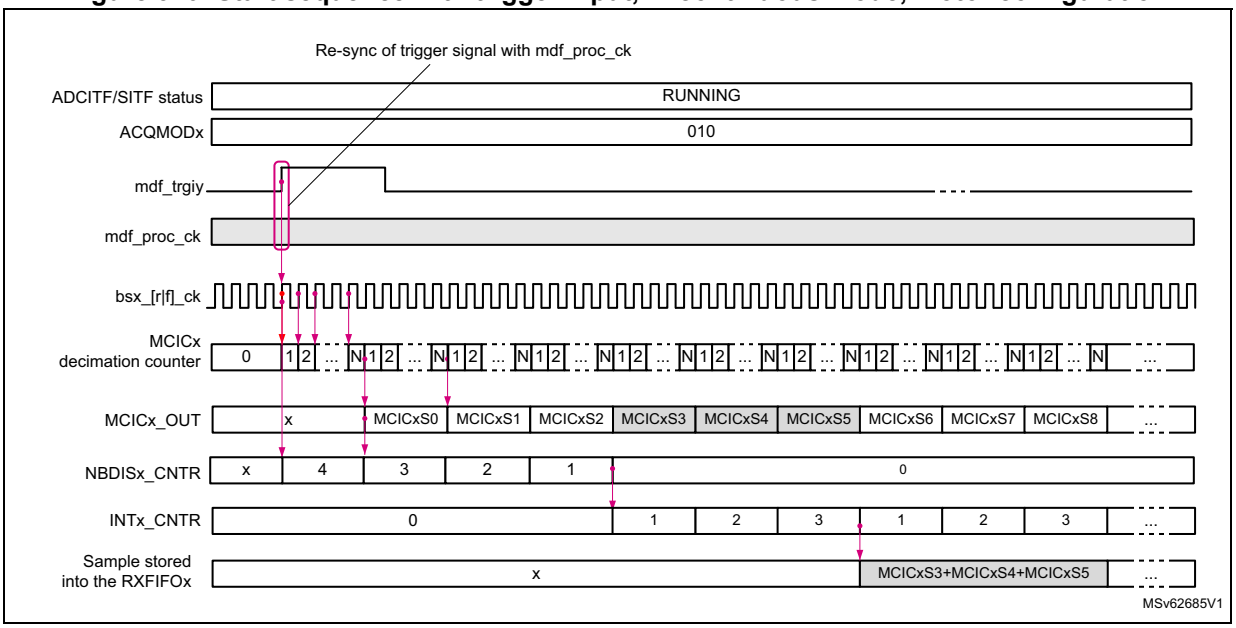
- MCIC and INT are enabled.
- SFLT and HPF are disabled.
- ACQMOD[2:0] is set to 1 and uses a mdf_trgiy input as trigger.
- NBDIS[7:0] is set to 3.
- INTVAL[6:0] is set to 2.

The mdf_trgiy input signal is re-sampled into the MDF processing clock domain to avoid any metastability issues. When the trigger condition is met (rising edge), the decimation counter of the MCIC filter is incremented at the rate of the bitstream clock.

When the MCIC decimation counter reaches its programmed value N, a sample is available. The NBDIS function prevents the samples writing in the INT as long as NBDIS_CNTR does not reach 0. This counter is decremented every time the MCIC delivers a sample.

When NBDIS_CNTR reaches 0, the new samples are provided to the INT, that performs the integration of three consecutive samples and stores them into the RXFIFO.

Figure 320. Start sequence with trigger input, in continuous mode, motor configuration

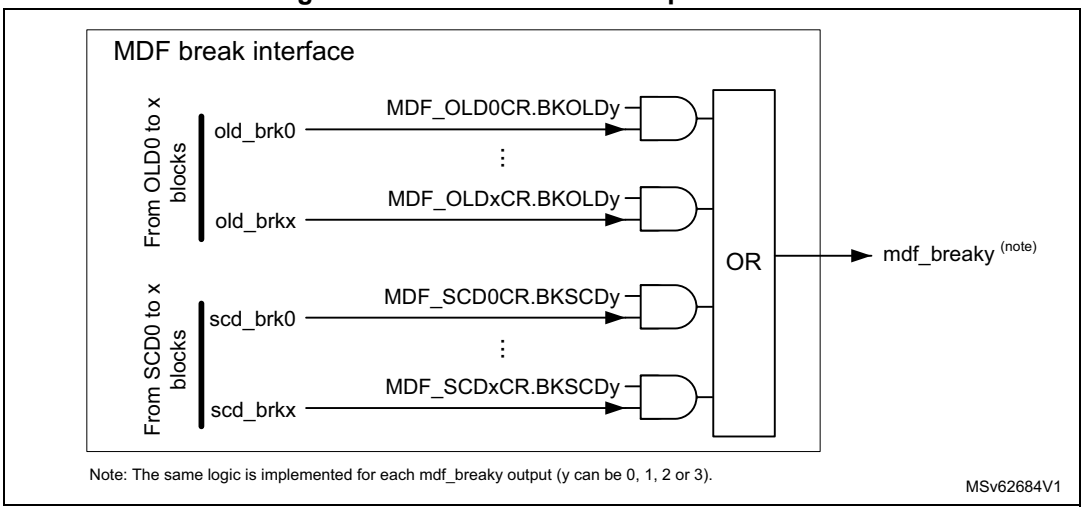


39.4.12 Break interface

The break interface merges the break events coming from the OLDx and SDCx blocks into four break signals connected to various peripherals of the product (see *Table 341* for details).

As shown in *Figure 321*, several blocks can share the same break line. A same block can also drive several break lines. The break interface is controlled via MDF_OLDxCR and MDF_SCDxCR.

Figure 321. Break interface simplified view



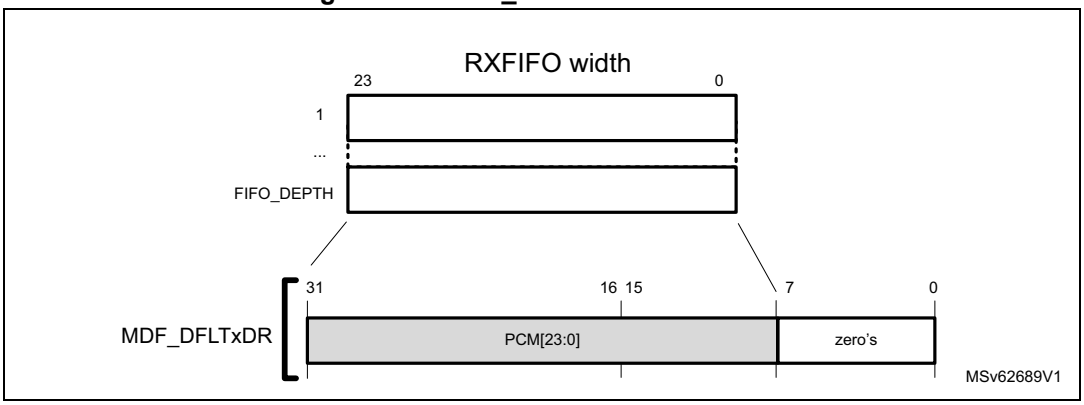
39.4.13 Data transfer to memory

Data format

The samples processed by DFLTx are stored into a RXFIFO. The application can read the samples stored into the FIFOs via the *MDF digital filter data register x (MDF_DFLTxDR)*. The samples inside this register are signed and left aligned. The bit 31 always represents the sign.

The MDF provides 24-bit left-aligned data. Performing a 16-bit access to MDF_DFLTxDR allows the application to get the 16 most significant bits. Performing a 32-bit access to MDF_DFLTxDR allows the application to get a 24-bit data size.

Figure 322. MDF_DFLTxDR data format



Data re-synchronization

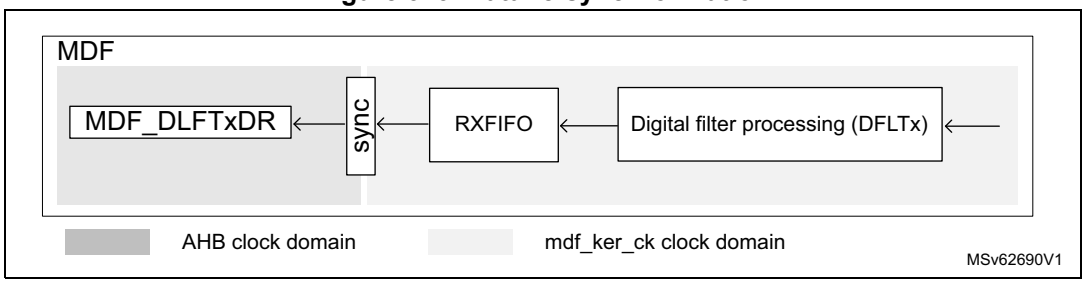
The samples stored into the RXFIFOs can be transferred into the memory by using either DMA requests or interrupt signaling.

Note: The RXFIFOs are located into the mdf_ker_ck clock domain, while MDF_DFLTxDR *are located into the mdf_hclk (AHB) clock domain.*

When the AHB clock is available, if MDF_DFLTxDR is empty and if a sample is available into the RXFIFO, this sample is transferred into MDF_DFLTxDR.

The sample transfer from the RXFIFO to MDF_DFLTxDR takes two periods of the AHB clock (mdf_hclk) and two periods of the mdf_ker_ck clock. The MDF inserts automatically wait-states if the application performs a read operation of MDF_DFLTxDR while the transfer of the new sample from the RXFIFO to MDF_DFLTxDR is not yet completed.

Figure 323. Data re-synchronization



The MDF can also combine two transfer types: the independent-transfer and the interleaved-transfer modes.

Independent-transfer mode

In this mode, each RXFIFO has its own DMA channel and its own FTHF flag event.

Both single and burst DMA transfers are supported in this mode, but the application must care about the following points:

- The RXFIFO must contain at least the same amount of samples than the burst size.
- The burst mode efficiency may be reduced due to the data re-synchronization explained in the previous section.

In addition, the application can select the RXFIFO threshold (FTH bit) to trigger the data transfer: a data transfer can be triggered as soon as the RXFIFO is not empty, or when the RXFIFO is half-full (containing depth / 2 samples).

For the DMA transfer, as soon as one of the RXFIFO reaches the threshold level, the corresponding DMA request is asserted in order to ask for data transfer. Successive DMA requests are performed as long as the corresponding RXFIFO is not empty.

The DMA mode of the RXFIFOx is enabled via the corresponding DMAEN bit in the *MDF digital filter control register x (MDF_DFLTxCR)*.

For the interrupt signaling, the following cases must be considered:

- If FTH = 0, as soon as a data is available in MDF_DFLTxDR, the corresponding FTHF is set, allowing the generation of an interrupt. FTHF is released as soon as MDF_DFLTxDR is read.
- If FTH = 1, as soon as one of the RXFIFO reaches the threshold level and a data is available into MDF_DFLTxDR, the corresponding FTHF is set, allowing the generation of an interrupt. The FTHF flag is released as soon as one data is read. FTHF is set again if the threshold condition is met again. In this mode, every time an interrupt occurs, the application is supposed to read FIFO_SIZE / 2 data.

The independent-transfer mode must be used when the sample rates provided by each filter paths are not perfectly synchronous, or when the streams are independent. This situation may occur for example:

- when SITF is in SLAVE mode and each external sensor provides its own sampling clock

- when the decimation ratios of the DFLTx are not the same
- when all the streams are not starting at the same time

Interleaved-transfer mode

This mode optimizes the DMA request resources by sharing a single DMA request with several RXFIFOs.

Only single DMA transfers are supported in this mode.

In interleaved-transfer mode, FTH cannot be used and only the FTHF of RXFIFO0 is available for the interrupt signaling.

For the DMA transfer, when all the RXFIFOs working in interleaved-transfer mode are not empty, some DMA requests are generated in order to read sequentially one sample of each RXFIFOs, via MDF_DFLT0DR.

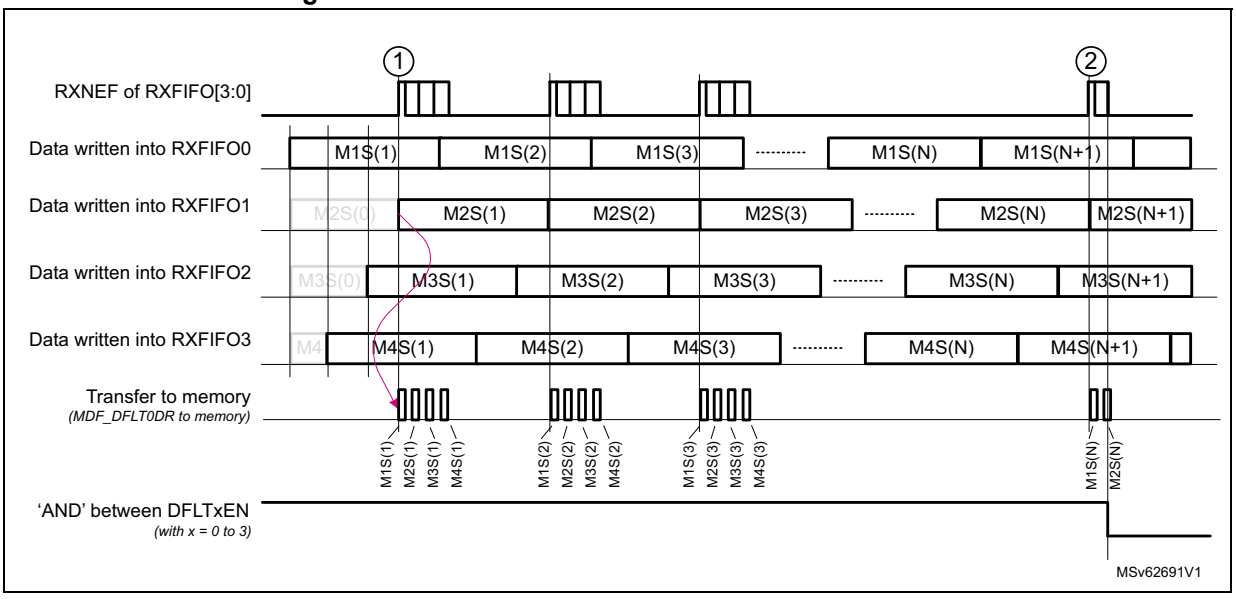
For the RXFIFOs working in interleaved-transfer mode, the DMA channel is enabled by setting to 1 DMAEN in MDF_DFLT0DR and by defining the amount of RXFIFOs working in interleaved mode via ILVNB[3:0]. DMAEN for the other RXFIFOs working in interleaved-transfer mode (RXFIFO 1 to ILVNB[3:0]) are not taken into account.

Figure 324 shows four RXFIFOs working in interleaved-transfer mode. Each RXFIFO has a delay due to the programming of the DLY block.

When all the RXFIFOs have at least one sample available (in this example the last FIFO receiving a sample is RXFIFO1), the MDF requests the data transfer to the memory (see 1 in *Figure 324*). In this figure, the DMA is assumed to be used for the data transfer to memory.

The acquisition can be simply stopped by setting DFTLEN to 0 for one of the filter configured in interleaved-transfer mode. In the example, when a DFLTEN is set to 0 (see 2 in *Figure 324*), the transfer to memory is immediately stopped. Samples M2S(N), M3S(N) and M4S(N) may be lost.

Figure 324. Data transfer in interleaved-transfer mode



In interrupt mode, when all the RXFIFOs working in interleaved-transfer mode have a data ready, the FTHF flag of RXFIFO0 is asserted to allow the interrupt generation. The application is then supposed to read sequentially one sample of each RXFIFOs, via MDF_DFLT0DR. The FTHF event is released when the first data is read.

For the RXFIFOs working in interleaved-transfer mode, the interrupt mode is enabled by setting FTHIE to 1 in MDF_DFLT0DR and by defining the amount of RXFIFOs working in interleaved-transfer mode via ILVNB[3:0]. FTHIE of the other RXFIFOs working in interleaved-transfer mode (RXFIFO1 to ILVNB[3:0]) are not taken into account.

The interleaved-transfer mode can only be applied starting at RXFIFO0 up to RXFIFOk. The number of RXFIFOs working in interleaved-transfer mode are defined by ILVNB[3:0].

When ILVNB[3:0] = 0, all RXFIFOs work in independent-transfer mode.

The interleaved-transfer mode can be used only for digital filters delivering samples perfectly synchronous each other. This is typically the case of sound capture with an array of digital microphones sharing the same bitstream clock.

Caution: To make the MDF working properly in interleaved-transfer mode, the following rules must be respected:

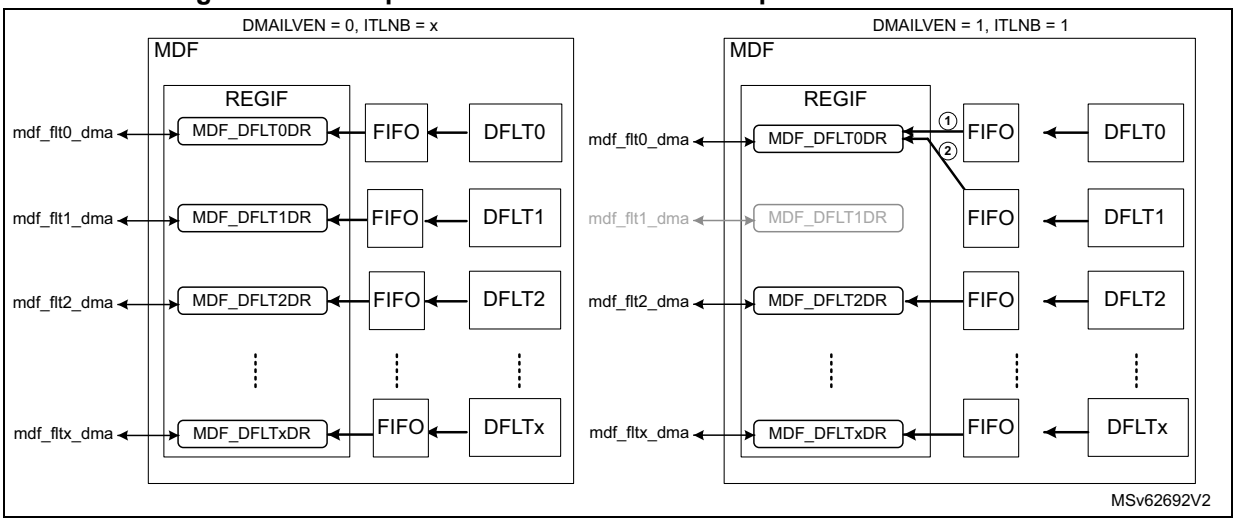
- All filters working in interleaved-transfer mode must be all synchronized together, meaning that all filters must select the same ACQMOD[2:0] (must be equal to 010 or 011), the same trigger source and the same trigger sensitivity.
- All filters working in interleaved-transfer mode must have the same configuration.
- All sensors providing the data for the filters working in interleaved-transfer mode must use the same bitstream clock frequency.
- The maximum delay difference applied with SPKDLY[6:0] for the filters working in interleaved-transfer mode must remain strictly lower than the RXFIFO depth. Normally this delay does not need to exceed one T_{PCM} period.

Note: Both independent- and interleaved-transfer modes can work in parallel: for example, the first RXFIFOs (RXFIFO0 to RXFIFOk) may work in interleaved-transfer mode when the others (RXFIFO(k+1) to RXFIFO(N)) works in independent-transfer mode.

If the AHB clock is not present when a data transfer must be performed, the MDF first requests the AHB clock (refer to Section 39.4.5: Clock generator (CKGEN) for details).

The figure below shows the data path for a configuration in independent-transfer mode (left-hand figure) and a configuration mixing both independent- and interleaved-transfer modes (right-hand figure).

Figure 325. Data path for interleaved- and independent-transfer modes



In the right-hand figure, the DFLT0 and DFLT1 filters are configured in interleaved-transfer mode. For those filters, FTH is no longer taken into account by the hardware. The samples provided by DFLT0 and DFLT1 are read from MDF_DFLT0DR. When both RXFIFOs are no longer empty, the MDF generates two DMA requests to read the sample from DFLT0 and the sample from DFLT1. If both RXFIFOs are not empty again, the same sequence is triggered.

Note: When one of the filter working in interleaved-transfer mode is disabled, the data transfer to memory of all filters in interleaved-transfer mode is stopped immediately as well.

RXFIFO overrun

A RXFIFO overrun condition is detected when the RXFIFO is full and a new sample from the DFLTx must be written.

In this case, DOVRF is set and the new sample is dropped. When the RXFIFO has at least one location available, the new incoming sample is written into the RXFIFO.

Figure 326 shows an example based on a RXFIFO depth of four words and FTH set to 1, so that FTHF goes to 1 when the RXFIFO is half-full.

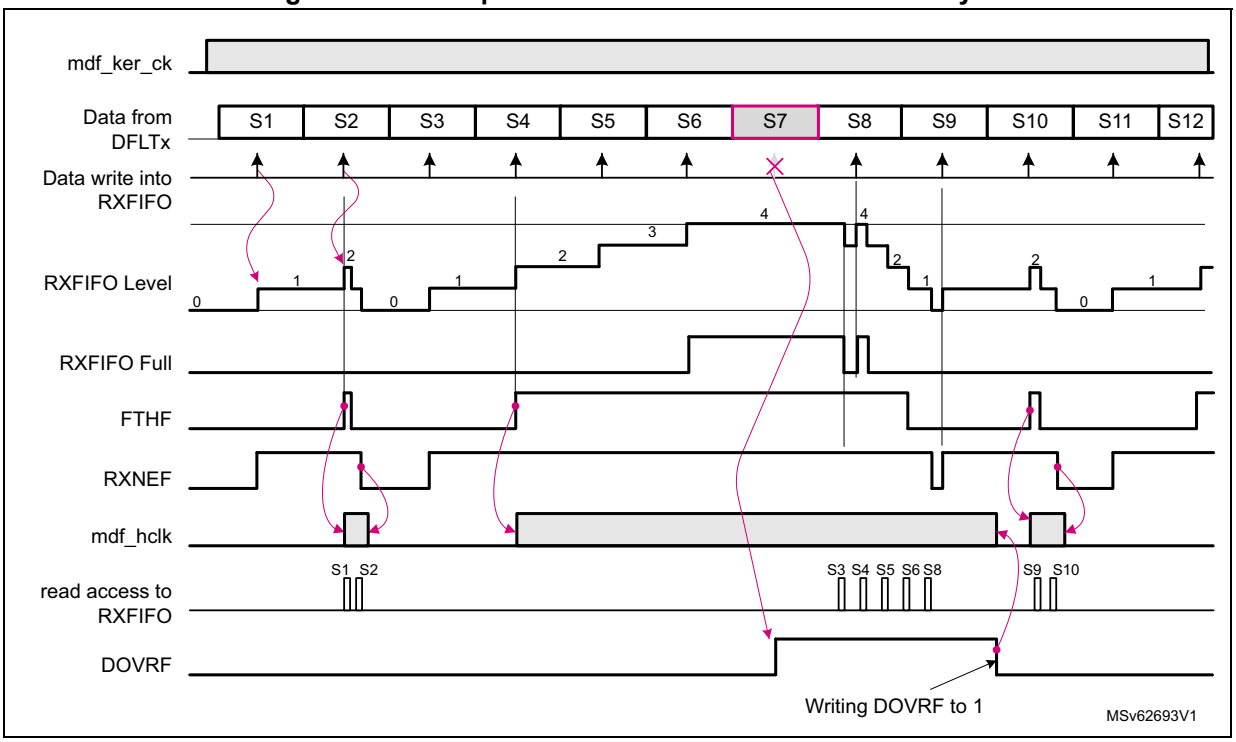
The S7 sample is lost due to an overrun: the RXFIFO is full while S7 must be written into the RXFIFO. The S7 write operation is not performed. DOVRF is set to 1 at the moment where the write operation was expected. The overflow event remains to 1 as long as it is not cleared by the application.

In this example, DOVRIE is set to 1 to have an interrupt if an overrun condition is detected.

After the S7 sample, the application manages to read data from the RXFIFO and the MDF can write the S8 sample and consecutive. Later, the application clears DOVR, allowing the detection of a new overrun situation.

In the mdf_hclk line, the gray boxes indicate that the MDF requested the AHB clock. The figure below shows the AHB clock available only when the MDF requests it. In real applications, the AHB clock may also be present if the MDF does not request it.

Figure 326. Example of overflow and transfer to memory



Note: If the MDF works in interleaved-transfer mode, the application must check the overrun status of all RXFIFOs that works in interleaved-transfer mode.

39.4.14 Autonomous mode

The MDF can work even if the AHB bus clock is not available (Stop modes). The MDF uses the AHB clock only for the register interface. All the processing part is clocked with the kernel clock.

In Stop mode, the MDF receives a kernel clock if the selected clock source is an oscillator available in Stop mode

In Stop mode, the MDF receives the AHB clock if the following conditions are met:

- The MDF autonomous mode is enabled in the RCC.
- The MDF requests the AHB clock, in the following situations:
  - when the MDF must transfer data into the memory via the DMA

    The data are directly transferred to the SRAM thanks to the DMA while the product remains in Stop mode. The AHB clock request is maintained until the DMA transfer is completed.
  - when the MDF must generate an interrupt

    An interrupt generally wakes up the device from Stop mode, as an action from the application is needed. Once the AHB clock is available, the interrupt is generated.The AHB clock request is maintained as long as an enabled interrupt

flag is active. More precisely, when an interrupt must be generated, the MDF requests the AHB clock.

39.4.15 Register protection

The MDF embeds some hardware protection to prevent invalid situations. The table below shows the list of write-protected and unprotected fields.

Table 352. Register protection summary

Registers	Unprotected fields	Write-protected fields	Write-protection condition
MDF global control register (MDF_GCR)	TRGO	ILVNB[3:0]	DFLTACTIVE0 = 1
MDF clock generator control register (MDF_CKGCR)	CKGDEN CCK0EN CCK1EN	PROCDIV[6:0], CCKDIV[3:0], CKGMOD, TRGSRC[3:0], TRGSENS, CCK[1:0]DIR	CKGACTIVE = 1
MDF serial interface control register x (MDF_SITFxCR)	SITFEN	STH[4:0], SITFMOD[1:0], SCKSRC[1:0]	SITFACTIVEx = 1
MDF bitstream matrix control register x (MDF_BSMXxCR)	-	BSSEL[4:0]	DFLTACTIVEx = 1 or SCDACTIVEx = 1 or OLDACTIVEx = 1
MDF digital filter control register x (MDF_DFLTxCR)	DFLTEN	NBDIS[7:0], TRGSRC[3:0], TRGSENS, FTH, DMAEN, SNPSFMT, ACQMOD[2:0]	DFLTACTIVEx = 1
MDF digital filter configuration register x (MDF_DFLTxCICR)	SCALE[5:0]	MCICD[8:0], CICMOD[2:0], DATSRC[1:0]	
MDF reshape filter configuration register x (MDF_DFLTxRSFR)	-	All fields	
MDF integrator configuration register x (MDF_DFLTxINTR)	-	All fields	
MDF out-of limit detector control register x (MDF_OLDxCR)	OLDEN	ACICD[4:0], ACICN[1:0],THINB BKOLD[3:0]	OLDACTIVEx = 1
MDF OLDx low threshold register x (MDF_OLDxTHLR)	-	All fields	
MDF OLDx high threshold register x (MDF_OLDxTHHR)	-	All fields	
MDF delay control register x (MDF_DLYxCR)	-	SKPDLY[6:0]	SKPBF = 1
MDF short circuit detector control register x (MDF_SCDxCR)	SCDEN	BKSCD[3:0], SCDT[7:0]	SCDACTIVEx = 1
MDF DFLTx interrupt enable register x (MDF_DFLTxIER)	All fields	-	-

Table 352. Register protection summary (continued)

Registers	Unprotected fields	Write-protected fields	Write-protection condition
MDF DFLTx interrupt status register x (MDF_DFLTxISR)	All fields	-	-
MDF offset error compensation control register x (MDF_OECxCR)	OFFSET[25:0]	-	-

All the MDF processing is performed in the mdf_proc_ck clock domain. For that reason, enabling or disabling a MDF sub-block may take some time due to the re-synchronization between the AHB clock domain and the mdf_proc_ck clock domain. XXXACTIVE flags are available to allow the application to check that the synchronization between the two clock domains is completed.

To change a write-protected bitfield, the application must follow this sequence:

1. Set the enable bit of the sub-block to 0.
2. Wait for corresponding flag XXXACTIVE = 0.
3. Modify the wanted fields.
4. Set the enable bit of the sub-block to 1.

Refer to the description of each sub-block for more details.

39.5 MDF low-power modes

Table 353. Effect of low-power modes on MDF

Mode	Description
Sleep	No effect. MDF interrupts cause the device to exit Sleep mode.
Stop(1)	The MDF registers content is kept. If the MDF is clocked by an internal oscillator available in Stop mode, the MDF remains active. The interrupts cause the device to exit Stop mode.
Standby	The MDF is powered down and must be reinitialized after exiting Standby mode.

1. Refer to *Section 39.3: MDF implementation* for details about Stop modes supported by the MDF.

39.6 MDF interrupts

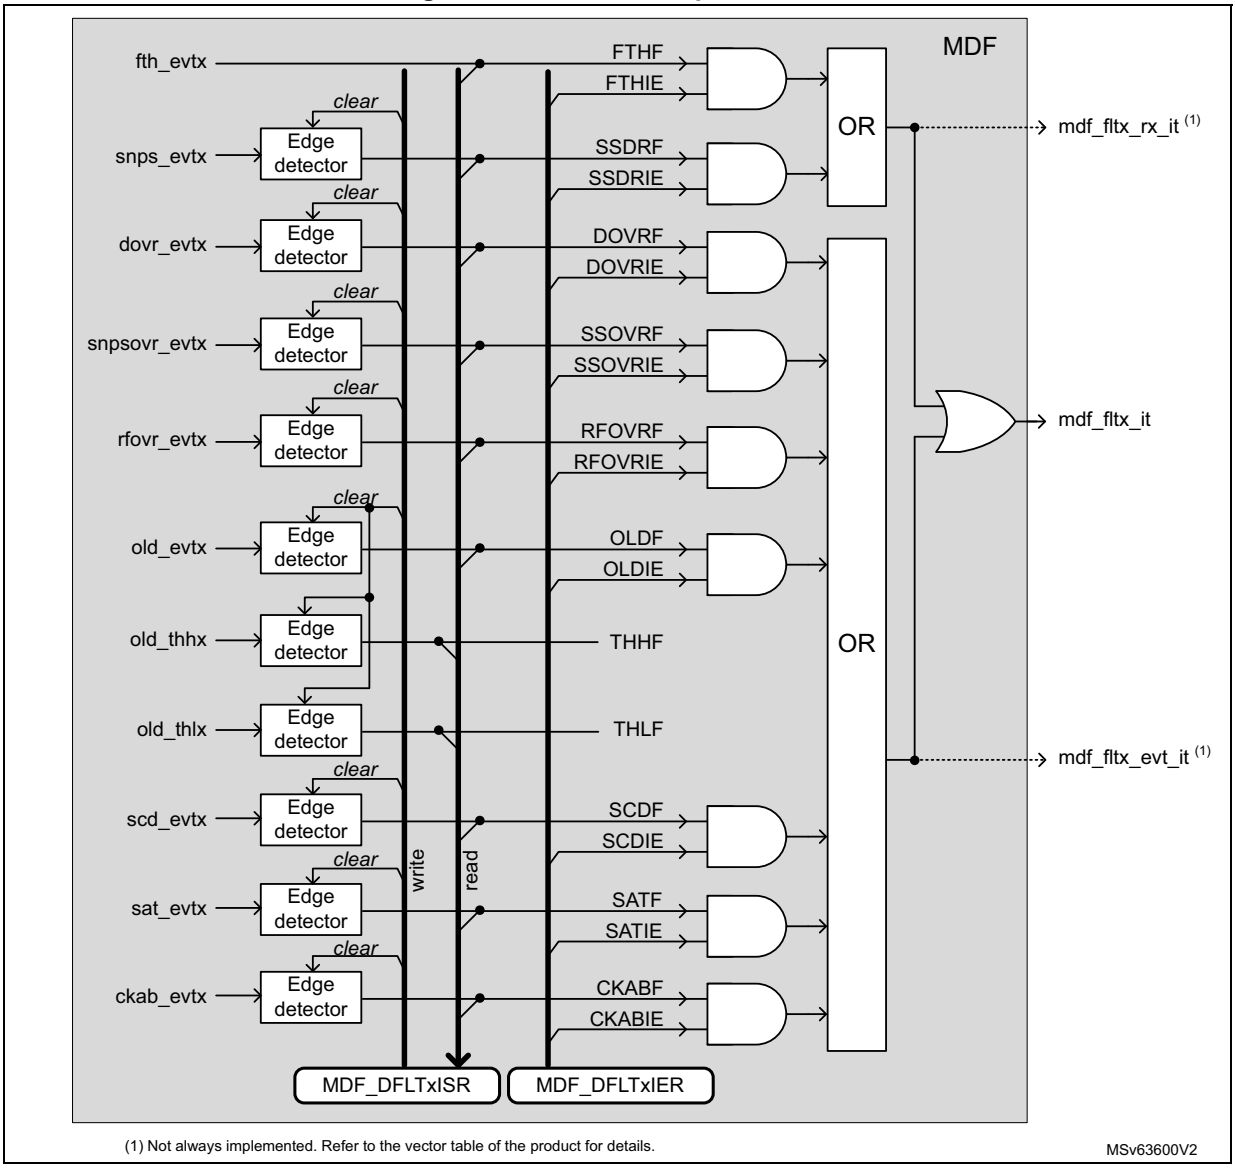
To increase the CPU performance, the MDF offers the following interrupt lines per digital filter:

- receive interrupt MDF_FLTx_RX (mdf_fltx_rx_it)
- event interrupt MDF_FLTx_EVT (mdf_fltx_evt_it)
- a combination of both interrupts MDF_FLTx (mdf_fltx_it)

Note: Interrupts are not always connected to the device (see Section 39.3: MDF implementation for more details).
The status flags are available even if the corresponding interrupt enable flag is not enabled.

The interrupt interface is controlled via the *MDF DFLTx interrupt enable register x (MDF_DFLTxIER)* and the *MDF DFLTx interrupt status register x (MDF_DFLTxISR)*.

Figure 327. MDF interrupt interface



(1) Not always implemented. Refer to the vector table of the product for details.

MSv63600V2

The table below shows which interrupt line is affected by which event, and how to clear and activate each interrupt/event.

Table 354. MDF interrupt requests

Interrupt vectors		Interrupt event	Event flag	Event/interrupt clearing method	Exit Sleep mode	Exit Stop modes[1]	Exit Standby mode
MDF_FLTx[2]	MDF_FLTx_RX[3]	RXFIFO threshold reached	FTHF	Read MDF_DFLTxDR until RXFIFO level is lower than the threshold.	Yes	Yes	No
		Snapshot data ready	SSDRF	Write SSDRF to 1.			
	MDF_FLTx_EVT[4]	Snapshot data overrun	SSOVRF	Write SSOVRF to 1.			
		RXFIFO overrun	DOVRF	Write DOVRF to 1.			
		RSFLT overrun	RFOVRF	Write RFOVRF to 1.			
		Short-circuit detector	SCDF	Write SCDF to 1.			
		Saturation detection	SATF	Write SATF to 1.			
		Channel clock absence detection	CKABF	Write CKABF to 1.			
		Out-of-limit detector	OLDF	Write OLDF to 1.			
-	-		THHF	Write OLDF to 1.	-	-	-
-	-		THLF	Write OLDF to 1.	-	-	-

1. Refer to *Section 39.3: MDF implementation* for details.
2. MDF_FLTx vector corresponds to the assertion of mdf_fltx_it signal
3. MDF_FLTx_RX vector corresponds to the assertion of mdf_fltx_rx signal.
4. MDF_FLTx_EVT vector corresponds to the assertion of mdf_fltx_evt signal.

39.7 MDF application informations

39.7.1 MDF configuration examples for audio capture

Table 355 gives some examples of the MDF settings for the digital microphones, focusing on 16 and 48 kHz output data rate. In these examples, the following is expected:

- The INT block is bypassed (INTVAL = 0).
- The offset error compensation is disabled (OFFSET = 0).

Configurations #1 and #2 are for very low-power use-cases and have a reduced signal-to-noise ratio. The user must also insure that the selected digital microphone can work properly at 512 kHz. These configurations can be used for sound detection. The RSFLT is not used to reduce as much as possible the frequency of the kernel clock (mdf_ker_ck).

Configurations #3, #4, #9, #10, #11 give signal-to-noise ratios around 115 dB, with an ideal microphone model, with a sinus signal of 997 Hz. Using the RSFLT allows a good control on the in-band ripple and a good image rejection.

Configurations #7, #8, #10 give signal-to-noise ratio around 120 dB, with an ideal microphone model, using a sinus signal of 997 Hz.

Table 355. Examples of MDF settings for microphone capture

Configuration	mdf_ker_ck (MHz)	PROCDIV + 1	CCKDIV + 1	CIC order (1)	MCICD + 1	SCALE	RSFLTBYP	RSFLTD	HPFBYP	-	mdf_proc_ck (MHz)	Total dec. ratio	F_{RS} (kHz)	F_{MDF_CCKx} (MHz)	F_{PCM} (kHz)
#1	1.024	1	2	4	64	0x2D (- 8.5 dB)	1	x	x	=>	1.024	64	-	0.512	8
#2		1	2	5	32	0x2B (- 14.5 dB)						32	-		16

1. CICMOD = 100 for CIC order equal to 4. CICMOD = 101 for CIC order equal to 5.

39.7.2 Programming examples

This example describes how to capture sound from four microphones, assuming that each microphone pair shares the same data line. The MDF_SD0 and MDF_SD2 data lines are used. The microphone clock is provided by the MDF via MDF_CCK0 pin.

Table 356. Programming sequence

Operations	Comments
Adjust the proper kernel clock frequency via the RCC block	Assuming that the RCC is programmed to provide a kernel clock (mdf_ker_ck) of 12.288 MHz
Select the proper MDF kernel clock source via the RCC block	Refer to the RCC of the product.
Enable the MDF clocks via the RCC block	Refer to the RCC of the product.
Reset the MDF via the RCC block	Refer to the RCC of the product.
AFMUX programming	Program the AFMUX to select MDF_SD0, MDF_SD2 and MDF_CCK0 function.

Table 356. Programming sequence (continued)

Operations	Comments
Enable MDF processing clock: MDF_CKGCR = 0x0103 0023	PROCDIV = 1 (division by 2): mdf_proc_ck frequency is 6.144 MHz. CCKDIV = 3 (division by 4): MDF_CCK0 clock frequency is 1.536 MHz. The MDF_CCK0 pad is set in output and generates a clock so that the microphones can exit from low-power mode.
Serial interfaces configuration: MDF_SITF0CR = 0x0000 1F01 MDF_SITF2CR = 0x0000 1F01	SCKSRC = 0 to select MDF_CCK0 as serial clock. SIFTMOD = 0 to select LF_MASTER mode. Clock absence feature is not working in this mode. The serial interfaces are enabled.
Bitstream matrix configuration: MDF_BSMX0CR = 0x0000 0000 MDF_BSMX1CR = 0x0000 0001 MDF_BSMX2CR = 0x0000 0004 MDF_BSMX3CR = 0x0000 0005	DFLT0 filter takes the bitstream of SITF0, sampled on rising edge. DFLT1 filter takes the bitstream of SITF0, sampled on falling edge. DFLT2 filter takes the bitstream of SITF2, sampled on rising edge. DFLT3 filter takes the bitstream of SITF2, sampled on falling edge.
Filters configuration (CIC): MDF_DFLT0CICR = 0x02C0 1750 MDF_DFLT1CICR = 0x02C0 1750 MDF_DFLT2CICR = 0x02C0 1750 MDF_DFLT3CICR = 0x02C0 1750	SCALE = 0x2C (- 12 dB) to avoid any saturation MCICD = 0x17 (decimation by 24) CICMOD = 5 to select a $Sinc^5$ DATSCR = 0 to select data coming from BSMX
Filters configuration (RSFLT and HPF): MDF_DFLT0RSFR = 0x0000 0100 MDF_DFLT1RSFR = 0x0000 0100 MDF_DFLT2RSFR = 0x0000 0100 MDF_DFLT3RSFR = 0x0000 0100	HPFC = 1: cut-off frequency of 16 kHz * 0.00125 = 20 Hz HPFBYP = 0: HPF not bypassed RSFLTD = 0: RSFLT decimates by 4 RSFLTBYP = 0: RSFLT is not bypassed
Filters configuration (INT): MDF_DFLT0INTR = 0x0000 0000 MDF_DFLT1INTR = 0x0000 0000 MDF_DFLT2INTR = 0x0000 0000 MDF_DFLT3INTR = 0x0000 0000	INTVAL = 0: INT filter not used Other parameter is not significant.
Micro delay adjust: MDF_DLY0CR = 0x0000 0005 MDF_DLY0CR = 0x0000 0012 MDF_DLY0CR = 0x0000 0023 MDF_DLY0CR = 0x0000 0000	Initial micro-delay for each microphone, values just given as example
Offset error correction: MDF_OEC0CR = 0x0000 0000 MDF_OEC1CR = 0x0000 0000 MDF_OEC2CR = 0x0000 0000 MDF_OEC3CR = 0x0000 0000	No correction. DC offset is removed by HPF.

Table 356. Programming sequence (continued)

Operations	Comments
Short circuit detection: MDF_SCD0CR = 0x0000 0000 MDF_SCD1CR = 0x0000 0000 MDF_SCD2CR = 0x0000 0000 MDF_SCD3CR = 0x0000 0000	SCD function for each filter is disabled.
Enable interrupt events: MDF_DFLT0IER = 0x0000 0202 MDF_DFLT1IER = 0x0000 0202 MDF_DFLT2IER = 0x0000 0202 MDF_DFLT3IER = 0x0000 0202	Enable the interrupt event the application wants to handle. In this example, the SATIE and DOVRIE bits are set to 1 to have an interrupt if a saturation or an data overflow occurs.
Digital filter control: MDF_DFLT0CR = 0x0000 0027 MDF_DFLT1CR = 0x0000 0027 MDF_DFLT2CR = 0x0000 0027 MDF_DFLT3CR = 0x0000 0027 Wait for DFLTACTIVE = 0 for the filters	NBDIS = 0: no samples discarded TRGSRC = 0: TRGO selected as trigger source TRGSENS = 0: Trigger on rising edge ACQMOD = 2: Synchronous continuous acquisition mode DMAEN = 1: DMA interface enabled DFLTEN = 1: digital filter enabled
Clear status flags: MDF_DFLT0ISR = 0x0000 0FFF MDF_DFLT1ISR = 0x0000 0FFF MDF_DFLT2ISR = 0x0000 0FFF MDF_DFLT3ISR = 0x0000 0FFF	Clear all the status flags before running the filters.
Program the DMA Enable the DMA	The DMA must be programmed in order to read the data inside MDF_DFLT0DR every time a DMA request is generated. Note that when the MDF is in interleaved acquisition mode, data of filters 0, 1, 2, and 3 are read via MDF_DFLT0DR register.
Start acquisition: MDF_GCR = 0x0000 0031	ILVNB = 3: interleaved mode with DFLT0,1,2, and 3 TRGO = 1 to trigger the acquisition of all filters waiting for TRGO rising edge event

39.7.3 Connection examples

Figure 328 shows simple connection examples of the MDF to external sensors:

- Picture on the left: four digital microphones connected to the MDF

  In this connection, DMIC1 is intended to be used alone. This is why it uses a dedicated clock (MDF_CCK0). DMIC1 is also connected to a dedicated data line in case the application intends to power-down DMIC2/3/4, when only DMIC1 is used. If the application keeps DMIC2/3/4 powered, DMIC2 and DMIC1 can share the same data line, reducing the connection to four I/Os.

  If the power consumption is not an issue, when a single microphone is used, all the microphones can be connected to the same common clock (MDF_CCK0) and each

microphone pair can share the same data line. In this case, only three I/Os are required.

In this example, the data transfer to memory can be performed either using the interleaved- or the independent-transfer mode.

- Picture in the center: sensor providing several data lines with a common clock

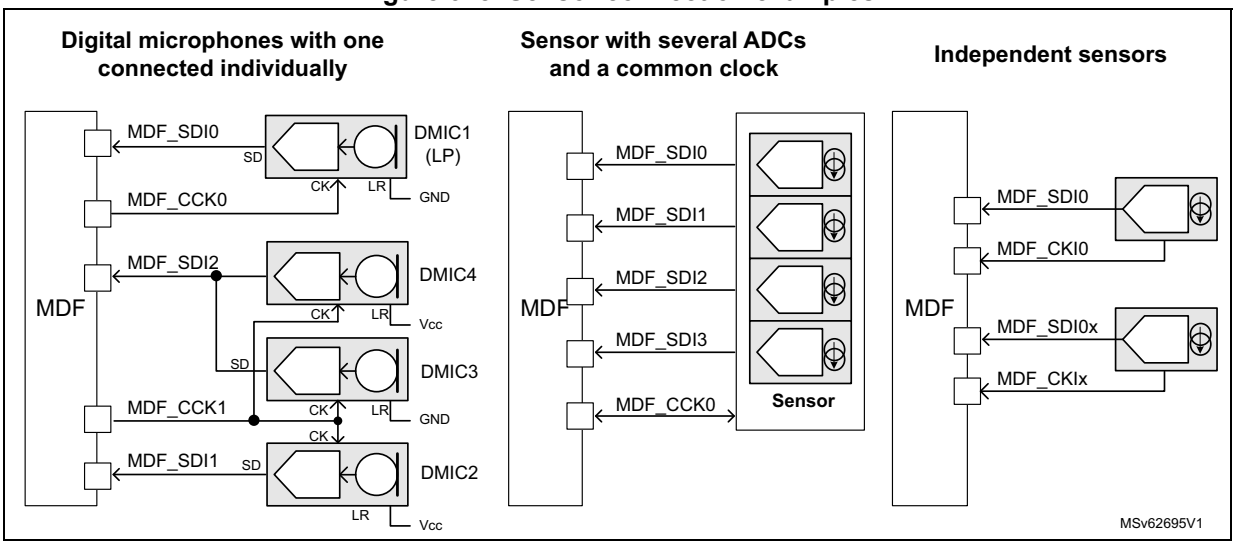
  Each data line can represent different parameters (such as current or voltage). The common clock can be provided either by the sensor or by the MDF. The data line can be shared or not by two sensors if the sensor allows it. In the figure below, the sensor does not allow the sharing of the data lines.

  In this example, the data transfer to memory can be performed either using the interleaved- or independent-transfer mode.

- Picture on the right: two independent sensors connected to the MDF

  Each of them has its dedicated clock and data lines. In this case, the data transfer to memory must use the independent-transfer mode.

Figure 328. Sensor connection examples



39.7.4 Global frequency response

Figure 329 shows the global frequency response for a 16 kHz audio signal with a digital microphone working at 1.024 MHz. The filter configuration is the following:

- CIC order 4 or 5, with a decimation ratio of 16
- RSFLT enabled, with a decimation ratio of 4
- HPF enable with a cut-off frequency of 40 Hz

The figure below shows the theoretical frequency response using a CIC4 and a CIC5.

Figure 329. Global frequency response

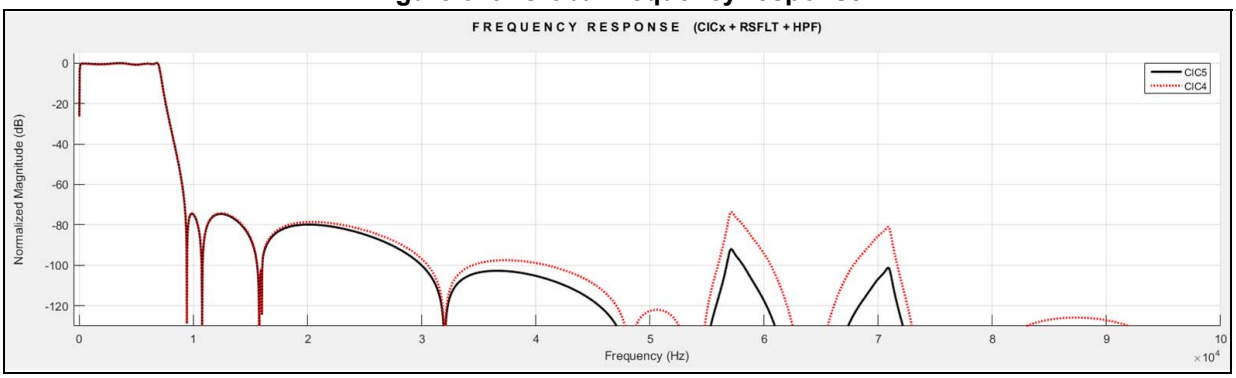


Figure 330 shows the in-band ripple for a 16 kHz audio signal with a digital microphone working at 1.024 MHz. The filter configuration is the following:

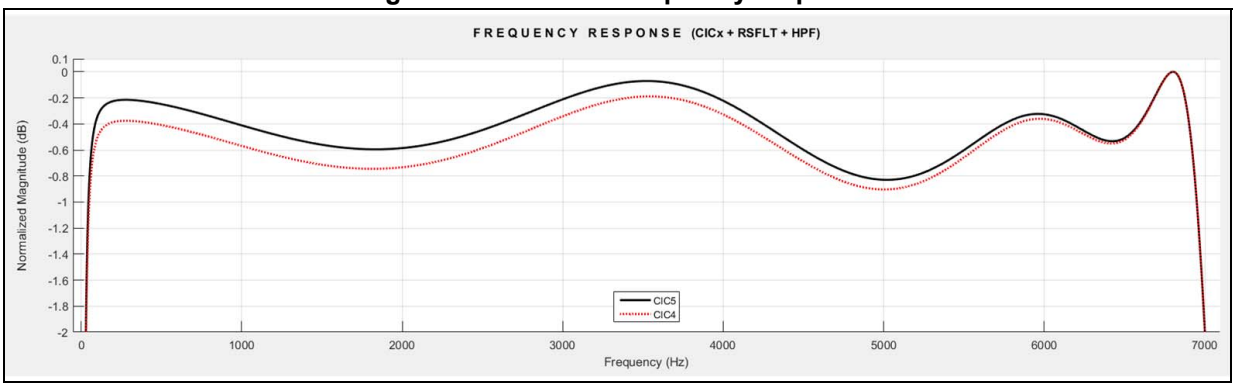
- CIC order 4 or 5, with a decimation ratio of 16
- RSFLT enabled, with a decimation ratio of 4
- HPF enable with a cut-off frequency of 20 Hz

The resulting in-band ripple is ± 0.41 dB for CIC5, and ± 0.45 for CIC4.

The -3 dB cut-off frequency is 7061 Hz.

Figure 330. Detailed frequency response



39.7.5 Total MDF gain

This section details how to compute the signal level provided by the MDF according to the filter settings. The formula does not take into account the filters transfer function.

A signal level may be expressed in dBFS (decibel full scale). A 0 dBFS level is assigned to the maximum possible digital level. For example, a signal that reaches 50 % of the maximum level, has a - 6 dBFS level (6 dB below full scale).

For example, for the MDF offering a final data width of 24 bits, a signal having an amplitude of 2 * 10^6 LSB has a level of:

$$20 \times \log_{10}\left(\frac{2 \times 10^6}{2^{(24-1)}}\right) = -12.45 \text{ dBFS}$$

In addition, the data size of a signal having an amplitude (Amp) expressed in LSB is given by:

$$DS = \left(\frac{\ln(Amp)}{\ln(2)} + 1\right) \text{ bits}$$

One bit need to be added for negative values.

So a signal having an amplitude of 2 * 10^6 LSB, has a data size of 21.9 bits.

CIC gain

The CIC gain (G_{CIC} and GdB_{CIC}) can be deduced from the following formula giving data size in bits (DS_{CIC}).

$$DS_{CIC} = (N \times \log_2(D1)) + DS_{IN}$$

And the bit growth is:

$$BG_{CIC} = (N \times \log_2(D1))$$

where N represents the CIC order (selected by CICMOD[2:0]), and D1 is the decimation ratio (given by MCICD).

DS_{IN} represents the data size (in bits) of the input signal.

Warning: DS_{CIC} is very important for CIC filters. In order to work fine, DS_{CIC} must not exceed 26 bits.

$$G_{CIC} = 2^{(BG_{CIC})} = (D1)^N$$

which gives, in decibels:

$$GdB_{CIC} = 20 \times \log_{10}((D1)^N)$$

Note: The same formulas are valid for the ACIC.

Data size at SCALE output

The data size at SCALE output (including the CIC gain) is a key information as the RSFLT starts to have some saturations if the peak-to-peak signal amplitude at SCALE output is higher than 22 bits.

If the RSFLT is bypassed, then a peak-to-peak signal amplitude of 24 bits is accepted. The resulting data size is given by:

$$DS_{SCALE} = N \times \log_2(D1) + \log_2\left(10^{\frac{GDB_{SCALE}}{20}}\right) + DS_{IN}$$

The data size at SCALE output (DS_{SCALE}) is expressed in bits and GdB_{SCALE} represents the gain selected by SCALE[5:0], in dB.

RSFLT gain

The RSFLT gain in the useful bandwidth is typically 9.5 dB, but due to ripple a margin of about ± 0.5 dB must be considered. Typically, the RSFLT increases the bit size by BG_{RSFLT}:

$$BG_{RSFLT} = 10^{\frac{9.5\ dB}{20}} = 2.98 = 1.6\ bits$$

INT gain

The INT block can also introduce a gain if the rescaling value is different from the integration value.

$$G_{INT} = \frac{IVAL}{IDIV}$$

and:

$$GdB_{INT} = 20 \times \log_{10}\left(\frac{IVAL}{IDIV}\right)$$

The bit growth of the INT is then given by the following formula:

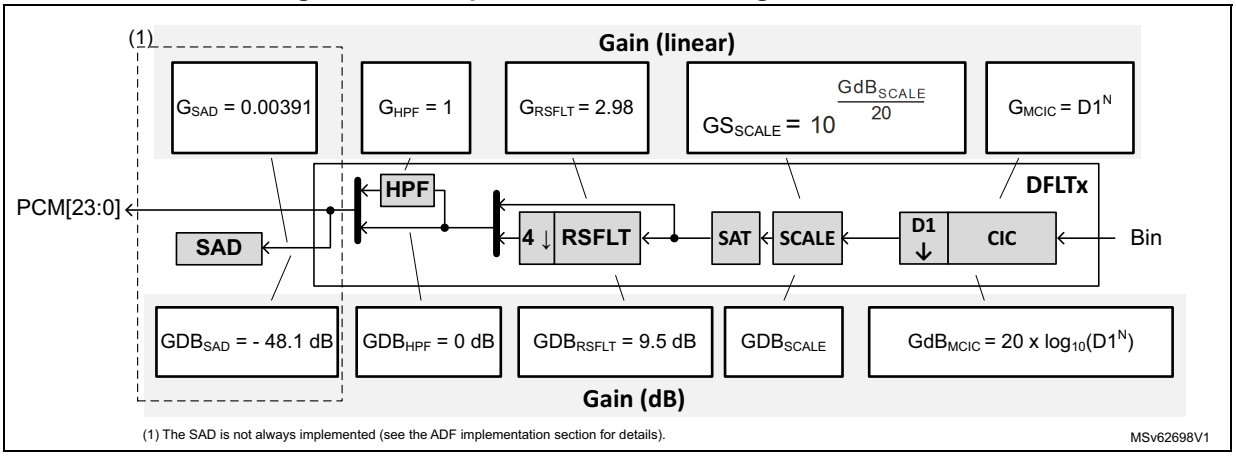
$$BG_{INT} = \log_2\left(\frac{IVAL}{IDIV}\right)$$

IVAL represents the integration value selected by INTVAL[6:0], and IDIV represents the integrator output division selected by INTDIV[1:0].

Note: The HPF filter has a gain of 0 dB.

The figure below shows a simplified view of the filter path, and gives for each significant component the expression of the bit growth and the gain.

Figure 331. Simplified DFLT view with gain information



The table below summarizes the final data size for different filter configurations.

Table 357. Output signal levels

Filter configurations	Final signal level (dBFS)	Final signal size (bits)
CIC + RSFLT (+ HPF)	$SdB_{OUT} = 20 \times \log_{10}\left(\frac{2^{DS_{OUT}}}{2^{24}}\right)$	$DS_{OUT} = DS_{SCALE} + 1.6$ bits DS_{SCALE} must be lower than 22 bits.
CIC + RSFLT (+ HPF) + INT		$DS_{OUT} = DS_{SCALE} + BG_{INT} + 1.6$ bits DS_{SCALE} must be lower than 22 bits.
CIC (+ HPF) + INT		$DS_{OUT} = DS_{SCALE} + BG_{INT}$ DS_{SCALE} must be lower than 24 bits.

Example using the main filter chain

If the MDF filter is programmed as follows:

- The input signal is coming from a serial interface (DS_{IN} = 1 bit).
- CIC order = 5 (N), with a decimation value of 24 (D1).
- SCALE[5:0] is set to -12 dB.
- RSFLT is enabled and the decimation by four is enabled.
- HPF is enabled.
- INT is disabled.

Check first the data size at CIC output:

$$DS_{CIC} = (5 \times \log_2(24)) + 1 \text{ bit} = 23.92 \text{ bits}$$

The size is lower than 26 bits, so the CIC works in good conditions.

The data size at CIC output is very close to 24 bits, so the SCALE must be adjusted in order to provide a signal 22 bits max to the RSFLT. An attenuation of 12 dB is needed.

Then the signal level provided to the RSFLT is:

$$DS_{SCALE} = DS_{CIC} + \log_2\left(10^{\frac{-12}{20}}\right) = 23.92 - 1.99 = 21.93 \text{ bits}$$

At the end, the final signal amplitude is:

$$DS_{OUT} = DS_{SCALE} + 1.6 \text{ bits} = (21.93 + 1.6) = 23.52 \text{ bits}$$

or

$$SDB_{OUT} = 20 \times \log_{10}\left(\frac{2^{23.52}}{2^{24}}\right) = -2.84 \text{ dBFS}$$

The RSFLT ripple a margin of about ± 0.41 dB (in this configuration) must be considered.

Example using the OLD filter chain

In the following example, the application wants to trigger an OLD event when the voltage coming from a shunt resistor reaches ± 200 mV.

Hypothesis:

- The ΣΔ sensor is specified to support a full-scale signal of ± 350 mV.
- The ACIC decimation ratio (D2) is fixed to 32.
- The ACIC order (N) is fixed to 3.

The ΣΔ sensor provides a full-scale digital signal (amplitude of one bit) for a signal higher or equal to ± 350 mV. If the input signal is equal 200 mV, then the digital signal amplitude provided by the sensor is 200 / 350 = 0.571.

The gain of the ACIC filter is:

$G_{CIC} = (D2)^N = 32^3 = 32768$

A signal having an amplitude of 200 mV at sensor input has then an amplitude of about 32768 * 0.571 = 18725 LSB at ACIC output.

OLDTHH must be set to 18725 and OLDTHL must be set to -18725.

39.8 MDF registers

All the MDF registers must be accessed either in word (32-bit) or half-word (16-bit) formats.

The registers are described for the MDF instance having the biggest number of filters. For registers related to filters, the number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

39.8.1 MDF global control register (MDF_GCR)

Address offset: 0x000

Reset value: 0x0000 0000

This register is used for controls common to all digital filters.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ILVNB[3:0]				Res.	Res.	Res.	TRGO
								rw	rw	rw	rw				rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **ILVNB[3:0]**: Interleaved number

This bitfield is set and reset by software. it enables or disables the interleaved-transfer mode and defines how many digital filters work in this mode.
This bitfield cannot be changed when DFLTEN = 1 in MDF_DFLT0CR.
0000: Interleaved-transfer mode disabled
0001: Data from DFLT0 and DFLT1 are interleaved.
0010: Data from DFLT0, DFLT1 and DFLT2 are interleaved.
...
1111: Data from DFLT0 to DFLT15 are interleaved.

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **TRGO**: Trigger output control

This bit is set by software and reset by hardware. It is used to start the acquisition of several filters synchronously. It is also able to synchronize several MDF together by controlling the mdf_trgo signal.
0: Write 0 has no effect. Read 0 means that the trigger can be set again to 1.
1: Write 1 generates a positive pulse on mdf_trgo signal and triggers the acquisition on the enabled filters having ACQMOD[2:0] = 0x1 and selecting TRGO as trigger. Read 1 means that the trigger pulse is still active.

39.8.2 MDF clock generator control register (MDF_CKGCR)

Address offset: 0x004

Reset value: 0x0000 0000

This register is used to control the clock generator. The mdf_proc_ck clock must be enabled before enabling other MDF parts.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CKGACTIVE	PROCDIV[6:0]							Res.	Res.	Res.	Res.	CCKDIV[3:0]			
r	rw	rw	rw	rw	rw	rw	rw					rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRGSRC[3:0]				Res.	Res.	Res.	TRGSENS	Res.	CCK1DIR	CCK0DIR	CKGMOD	Res.	CCK1EN	CCK0EN	CKGDEN
rw	rw	rw	rw				rw		rw	rw	rw		rw	rw	rw

Bit 31 **CKGACTIVE**: Clock generator active flag

This bit is set and cleared by hardware. This flag must be used by the application to check if the clock generator is effectively enabled (active) or not. The protected fields of this function can only be updated when CKGACTIVE = 0 (refer to *Section 39.4.15* for details). The delay between a transition on CKGDEN and a transition on CKGACTIVE is two periods of AHB clock and two periods of mdf_proc_ck.

0: The clock generator is not active and can be configured if needed.

1: The clock generator is active and protected fields cannot be configured.

Bits 30:24 **PROCDIV[6:0]**: Divider to control the serial interface clock

This bitfield is set and reset by software. It is used to adjust the frequency of the clock provided to the SITF.

$$F_{mdf_itf_ck} = \frac{F_{mdf_ker_ck}}{(PROCDIV + 1)}$$

This bitfield must not be changed if one of the filters is enabled (DFTEN = 1).

0: mdf_ker_ck provided to the SITF

1: mdf_ker_ck/2 provided to the SITF

2: mdf_ker_ck/3 provided to the SITF

...

127: mdf_ker_ck/128 provided to the SITF

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **CCKDIV[3:0]**: Divider to control the MDF_CCK clock

This bitfield is set and reset by software. It is used to adjust the frequency of the MDF_CCK clock. The input clock of this divider is the clock provided to the SITF. More globally, the frequency of the MDF_CCK is given by the following formula:

$$F_{MDF_CCK} = \frac{F_{mdf_ker_ck}}{(PROCDIV + 1) \times (CCKDIV + 1)}$$

This bitfield must not be changed if one of the filters is enabled (DFTEN = 1).

0000: The MDF_CCK clock is mdf_proc_ck.

0001: The MDF_CCK clock is mdf_proc_ck / 2.

0010: The MDF_CCK clock is mdf_proc_ck / 3.

...

1111: The MDF_CCK clock is mdf_proc_ck / 16.

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bits 15:12 **TRGSRC[3:0]**: Digital filter trigger signal selection

This bitfield is set and cleared by software.It is used to select which external signals trigger for the corresponding filter. This bitfield is not significant if CKGMOD = 0.

000x: TRGO selected

0010: mdf_trg[0] selected

0011: mdf_trg[1] selected

...

1111: mdf_trg[13] selected

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details.)

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **TRGSENS**: CKGEN trigger sensitivity selection

This bit is set and cleared by software. It is used to select the trigger sensitivity of the trigger signals. This bit is not significant if the CKGMOD = 0.

0: A rising edge event triggers the activation of CKGEN dividers.

1: A falling edge even triggers the activation of CKGEN dividers.

Note: When the trigger source is TRGO, TRGSENS value is not taken into account. When TRGO is selected, the sensitivity is forced to falling edge. This bit can be write-protected (refer to Section 39.4.15 for details).

Bit 7 Reserved, must be kept at reset value.

Bit 6 **CCK1DIR**: MDF_CCK1 direction

This bit is set and reset by software.It is used to control the direction of the MDF_CCK1 pin.

0: MDF_CCK1 pin direction is in input.

1: MDF_CCK1 pin direction is in output.

Note: This bit can be write-protected (refer to Section 39.4.15 for details).

Bit 5 **CCK0DIR**: MDF_CCK0 direction

This bit is set and reset by software.It is used to control the direction of the MDF_CCK0.

0: MDF_CCK0 pin direction is in input.

1: MDF_CCK0 pin direction is in output.

Note: This bit can be write-protected (refer to Section 39.4.15 for details).

Bit 4 **CKGMOD**: Clock generator mode

This bit is set and reset by software. It is used to define the way the clock generator is enabled. This bit must not be changed if one of the filters is enabled (DFTEN = 1).

0: The kernel clock is provided to the dividers as soon as CKGDEN is set to 1.

1: The kernel clock is provided to the dividers when CKGDEN is set to 1 and the trigger condition met.

Note: This bit can be write-protected (refer to Section 39.4.15 for details).

Bit 3 Reserved, must be kept at reset value.

Bit 2 **CCK1EN**: MDF_CCK1 clock enable

This bit is set and reset by software. It is used to control the generation of the bitstream clock on the MDF_CCK1 pin.

0: Bitstream clock not generated

1: Bitstream clock generated on the MDF_CCK1 pad

Bit 1 **CCK0EN**: MDF_CCK0 clock enable

This bit is set and reset by software.It is used to control the generation of the bitstream clock on the MDF_CCK0 pin.

0: Bitstream clock not generated

1: Bitstream clock generated on the MDF_CCK0 pad

Bit 0 **CKGDEN**: CKGEN dividers enable

This bit is set and reset by software. It is used to enable/disable the clock dividers of the CKGEN: PROCDIV and CCKDIV.

0: CKGEN dividers disabled

1: CKGEN dividers enabled

39.8.3 MDF serial interface control register x (MDF_SITFxCR)

Address offset: 0x080 + 0x80 * x, (x = 0 to 3)

Reset value: 0x0000 1F00

This register is used to control the serial interfaces (SITFx). The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SITFACTIVE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

			rw	rw	rw	rw	rw			rw	rw		rw	rw	rw

Bit 31 **SITFACTIVE**: Serial interface active flag

This bit is set and cleared by hardware. It is used by the application to check if the serial interface is effectively enabled (active) or not. The protected fields of this function can only be updated when the SITFACTIVE is set to 0 (refer to *Section 39.4.15* for details).

The delay between a transition on SITFEN and a transition on SITFACTIVE is two periods of AHB clock and two periods of mdf_proc_ck.

0: The serial interface is not active and can be configured if needed.

1: The serial interface is active and protected fields cannot be configured.

Bits 30:13 Reserved, must be kept at reset value.

Bits 12:8 **STH[4:0]**: Manchester symbol threshold/SPI threshold

This bitfield is set and cleared by software. It is used for Manchester mode to define the expected symbol threshold levels (refer to *Manchester mode* for details on computation).

In addition this bitfield is used to define the timeout value for the clock absence detection in Normal SPI mode. STH[4:0] values lower than four are invalid.

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **SITFMOD[1:0]**: Serial interface type

This bitfield is set and cleared by software. it is used to define the serial interface type.

00: LF_MASTER SPI mode

01: Normal SPI mode

10: Manchester mode: rising edge = logic 0, falling edge = logic 1

11: Manchester mode: rising edge = logic 1, falling edge = logic 0

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bit 3 Reserved, must be kept at reset value.

Bits 2:1 **SCKSRC[1:0]**: Serial clock source

This bitfield is set and cleared by software. it is used to select the clock source of the serial interface.

00: Serial clock source is MDF_CCK0.

01: Serial clock source is MDF_CCK1.

1x: Serial clock source is MDF_CKIx (not allowed in LF_MASTER SPI mode).

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bit 0 **SITFEN**: Serial interface enable

This bit is et and cleared by software. It is used to enable/disable the serial interface.

0: Serial interface disabled

1: Serial interface enabled

39.8.4 MDF bitstream matrix control register x (MDF_BSMXxCR)

Address offset: 0x084 + 0x80 * x, (x = 0 to 3)

Reset value: 0x0000 0000

This register is used to select the bitstream to be provided to the corresponding digital filter and to the SCD. The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BSMXACTIVE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BSSEL[4:0]				
											rw	rw	rw	rw	rw

Bit 31 **BSMXACTIVE**: BSMX active flag

This bit is set and cleared by hardware. It is used by the application to check if the BSMX is effectively enabled (active) or not. BSSEL[4:0] can only be updated when the BSMXACTIVE is set to 0. Th is BSMXACTIVE flag is a logical OR between OLDACTIVE, DFLTACTIVE, and SCDACTIVE flags. Both of them must be set to 0 in order update BSSEL[4:0] bitfield.

0: BSMX is not active and can be configured if needed.

1: BSMX is active and protected fields cannot be configured.

Bits 30:5 Reserved, must be kept at reset value.

Bits 4:0 **BSSEL[4:0]**: Bitstream Selection

This bitfield is set and cleared by software. It is used to select the bitstream to be processed for DFLTx and SCDx. The size of this bitfield depends on the number of DFLTx instantiated. If this bitfield selects a not instantiated input, the MDF selects the valid stream bsx_f having the higher index number.

00000: bs0_r provided to DFLTx and SCDx

00001: bs0_f provided to DFLTx and SCDx

00010: bs1_r provided to DFLTx and SCDx (if instantiated)

00011: bs1_f provided to DFLTx and SCDx (if instantiated)

...

11110: bs15_r provided to DFLTx and SCDx (if instantiated)

11111: bs15_f provided to DFLTx and SCDx (if instantiated)

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

39.8.5 MDF digital filter control register x (MDF_DFLTxCR)

Address offset: 0x088 + 0x80 * x, (x = 0 to 3)

Reset value: 0x0000 0000

The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw				rw		rw	rw	rw		rw	rw	w

Bit 31 **DFLTACTIVE**: Digital filter active flag

This bit is set and cleared by hardware. It indicates if the digital filter is active: can be running or waiting for events.

0: Digital filter not active (can be re-enabled again, via DFLTEN, if needed)

1: Digital filter active

Bit 30 **DFLTRUN**: Digital filter run status flag

This bit is set and cleared by hardware. It indicates if the digital filter is running or not.

0: Digital filter not running and ready to accept a new trigger event

1: Digital filter running

Bits 29:28 Reserved, must be kept at reset value.

Bits 27:20 **NBDIS[7:0]**: Number of samples to be discarded

This bitfield is set and cleared by software. it is used to define the number of samples to be discarded every time the DFLTx is re-started.

0: No sample discarded

1: 1 sample discarded

2: 2 samples discarded

...

255: 255 samples discarded

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bits 19:17 Reserved, must be kept at reset value.

Bit 16 **SNPSFMT**: Snapshot data format

This bit is set and cleared by software. It is used to select the data format for the snapshot mode.

0: Integrator counter (INT_CNT) not inserted into MDF_SNPSxDR, leaving a data resolution of 23 bits

1: Integrator counter (INT_CNT) inserted at position [15:9] of MDF_SNPSxDR, leaving a data resolution of 16 bits.

Note: This bit can be write-protected (refer to Section 39.4.15 for details).

Bits 15:12 **TRGSRC[3:0]**: Digital filter trigger signal selection

This bitfield is set and cleared by software. It is used to select which external signals trigger the corresponding filter.

0000: TRGO selected

0001: OLDx event selected

0010: mdf_trg[0] selected

...

1111: mdf_trg[13] selected

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **TRGSENS**: Digital filter trigger sensitivity selection

this bit is set and cleared by software. It is used to select the trigger sensitivity of the external signals

0: A rising edge event triggers the acquisition.

1: A falling edge even triggers the acquisition.

Note: When the trigger source is TRGO or OLDx event, TRGSENS value is not taken into account. When TRGO is selected, the sensitivity is forced to falling edge, when OLDx event is selected, the sensitivity is forced to rising edge.
This bit can be write-protected (refer to Section 39.4.15 for details).

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **ACQMOD[2:0]**: Digital filter trigger mode

This bitfield is set and cleared by software. It is used to select the filter trigger mode.

000: Asynchronous continuous acquisition mode

001: Asynchronous single-shot acquisition mode

010: Synchronous continuous acquisition mode

011: Synchronous, single-shot acquisition mode

100: Window continuous acquisition mode

101: Synchronous snapshot mode

Others: same a 000

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bit 3 Reserved, must be kept at reset value.

Bit 2 **FTH**: RXFIFO threshold selection

This bit is set and cleared by software. It is used to select the RXFIFO threshold. This bit is not significant for RXFIFOs working in interleaved-transfer mode (see *Interleaved-transfer mode* for details).

0: RXFIFO threshold event generated when the RXFIFO is not empty

1: RXFIFO threshold event generated when the RXFIFO is half-full

Note: This bit can be write-protected (refer to Section 39.4.15 for details).

Bit 1 **DMAEN**: DMA requests enable

This bit is set and cleared by software. It is used to control the generation of DMA request to transfer the processed samples into the memory.

0: DMA interface for the corresponding digital filter disabled

1: DMA interface for the corresponding digital filter enabled

Note: This bit can be write-protected (refer to Section 39.4.15 for details).

Bit 0 **DFLTEN**: Digital filter enable

This bit is set and cleared by software. It is used to control the start of acquisition of the corresponding digital filter path. This bit behavior depends on ACQMOD[2:0]and external events. The serial or parallel interface delivering the samples must be enabled as well.

0: Acquisition immediately stopped

1: Acquisition immediately started if ACQMOD[2:0] = 00x or 101, or acquisition started when the proper trigger event occurs if ACQMOD[2:0] = 01x or 100.

39.8.6 MDF digital filter configuration register x (MDF_DFLTxCICR)

Address offset: 0x08C + 0x80 * x, (x = 0 to 3)

Reset value: 0x0000 0000

This register is used to control the main CIC filter.The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	SCALE[5:0]						Res.	Res.	Res.	MCICD 8

MCICD[7:0]								Res.	CICMOD[2:0]			Res.	Res.	DATSRC[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw			rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:20 **SCALE[5:0]**: Scaling factor selection

This bitfield is set and cleared by software. It is used to select the gain to be applied at CIC output (refer to *Table 348* for details). If the application attempts to write a new gain value while the previous one is not yet applied, this new gain value is ignored. Reading back this bitfield informs the application on the current gain value.

000000: 0 dB

000001: + 3.5 dB

000010: + 6 dB or shift left by 1 bit

...

011000: + 72 dB or shift left by 12 bits

100000: - 48.2 dB or shift right by 8 bits (default value)

100001: - 44.6 dB

100010: - 42.1 dB or shift right by 7 bits

100011: - 38.6 dB

...

101110: - 6 dB or shift right by 1 bit

101111: - 2.5 dB

Others: Reserved

Bits 19:17 Reserved, must be kept at reset value.

Bits 16:8 **MCICD[8:0]**: CIC decimation ratio selection

This bitfield is set and cleared by software. It is used to select the CIC decimation ratio. A decimation ratio smaller than two is not allowed. The decimation ratio is given by (CICDEC+1).

0: Decimation ratio is 2.
1: Decimation ratio is 2.
2: Decimation ratio is 3..
3: Decimation ratio is 4
...
511: Decimation ratio is 512.

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **CICMOD[2:0]**: Select the CIC mode

This bitfield is set and cleared by software.It is used to select the configuration and the order of the MCIC. When CICMOD[2:0] = 0xx, the CIC is split into two filters: the main CIC (MCIC) and the auxiliary CIC (ACIC, used for the out-off limit detector).

000: CIC split in two filters and MCIC configured in FastSinc filter
001: CIC split in two filters and MCIC configured in $Sinc^1$ filter
010: CIC split in two filters and MCIC configured in $Sinc^2$ filter
011: CIC split in two filters and MCIC configured in $Sinc^3$ filter
100: CIC configured in single $Sinc^4$ filter
others: CIC configured in single $Sinc^5$ filter

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **DATSRC[1:0]**: Source data for the digital filter

This bitfield is set and cleared by software.
0x: Stream coming from the BSMX selected
10: Stream coming from the ADCITF1 selected
11: Stream coming from the ADCITF2 selected

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

39.8.7 MDF reshape filter configuration register x (MDF_DFLTxRSFR)

Address offset: 0x090 + 0x80 * x, (x = 0 to 3)

Reset value: 0x0000 0000

This register is used to control the reshape and HPF filters. The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

						rw	rw	rw			rw				rw

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:8 **HPFC[1:0]**: High-pass filter cut-off frequency

This bitfield is set and cleared by software. It is used to select the cut-off frequency of the high-pass filter. F_{PCM} represents the sampling frequency at HPF input.

00: Cut-off frequency = 0.000625 x F_{PCM}

01: Cut-off frequency = 0.00125 x F_{PCM}

10: Cut-off frequency = 0.00250 x F_{PCM}

11: Cut-off frequency = 0.00950 x F_{PCM}

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bit 7 **HPFBYP**: High-pass filter bypass

This bit is set and cleared by software. It is used to bypass the high-pass filter.

0: HPF not bypassed (default value)

1: HPF bypassed

Note: This bit can be write-protected (refer to Section 39.4.15 for details).

Bits 6:5 Reserved, must be kept at reset value.

Bit 4 **RSFLTD**: Reshaper filter decimation ratio

This bit is set and cleared by software. It is used to select the decimation ratio for the reshape filter.

0: Decimation ratio is 4 (default value).

1: Decimation ratio is 1.

Note: This bit can be write-protected (refer to Section 39.4.15 for details).

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **RSFLTBYP**: Reshaper filter bypass

This bit is set and cleared by software. It is used to bypass the reshape filter and its decimation block.

0: Reshape filter not bypassed (default value)

1: Reshape filter bypassed

Note: This bit can be write-protected (refer to Section 39.4.15 for details).

39.8.8 MDF integrator configuration register x (MDF_DFLTxINTR)

Address offset: 0x094 + 0x80 * x, (x = 0 to 3)

Reset value: 0x0000 0000

This register is used to the integrator (INT) settings. The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

					rw	rw	rw	rw	rw	rw	rw			rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:4 **INTVAL[6:0]**: Integration value selection

This bitfield is set and cleared by software. It is used to select the integration value.

0: The integration value is 1, meaning bypass mode (default after reset).

1: The integration value is 2.

2: The integration value is 3.

...

127: The integration value is 128.

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **INTDIV[1:0]**: Integrator output division

This bitfield is set and cleared by software. It is used to rescale the signal at the integrator output in order keep the data width lower than 24 bits.

00: The integrator data outputs are divided by 128 (default value).

01: The integrator data outputs are divided by 32.

10: The integrator data outputs are divided by 4.

11: The integrator data outputs are not divided.

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

39.8.9 MDF out-of limit detector control register x (MDF_OLDxCR)

Address offset: 0x098 + 0x80 * x, (x = 0 to 3)

Reset value: 0x0000 0000

This register is used to configure the OLDx.The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OLDACTIVE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ACICD[4:0]					Res.
r										rw	rw	rw	rw	rw	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	ACICN[1:0]		Res.	Res.	Res.	Res.	BKOLD[3:0]				Res.	Res.	THINB	OLDEN
		rw	rw					rw	rw	rw	rw			rw	rw

Bit 31 **OLDACTIVE**: OLDx active flag

This bit is set and cleared by hardware. It is used to check if the OLDx is effectively enabled (active) or not. The protected fields and registers of this function can only be updated when the OLDACTIVE is set to 0 (refer to *Section 39.4.15* for details).

The delay between a transition on OLDEN and a transition on OLDACTIVE is two periods of AHB clock and two periods of mdf_proc_ck.

0: OLDx not active and can be configured if needed

1: OLDx active and protected fields cannot be configured

Bits 30:22 Reserved, must be kept at reset value.

Bits 21:17 **ACICD[4:0]**: OLDx CIC decimation ratio selection
This bitfield is set and cleared by software. It is used to select the decimation ratio of the ACIC. It is only taken into account by the MDF when CICMOD[2:0] = 0xx. The decimation ratio is given by (ACICD + 1).
0: Decimation ratio is 1.
1: Decimation ratio is 2.
2: Decimation ratio is 3.
3: Decimation ratio is 4.
...
31: Decimation ratio is 32.
Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bits 16:14 Reserved, must be kept at reset value.

Bits 13:12 **ACICN[1:0]**: OLDx CIC order selection
This bitfield is set and cleared by software. It is used to select the ACIC type and order. It is only taken into account by the MDF when CICMOD[2:0] = 0xx.
00: FastSinc filter type
01: $Sinc^1$ filter type
10: $Sinc^2$ filter type
11: $Sinc^3$ filter type
Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bits 11:8 Reserved, must be kept at reset value.

Bits 7:4 **BKOLD[3:0]**: Break signal assignment for out-of limit detector
This bitfield is set and cleared by software.
BKOLD[i] = 0: Break signal (mdf_break[i]) not assigned to threshold event
BKOLD[i] = 1: Break signal (mdf_break[i]) assigned to threshold event
Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bits 3:2 Reserved, must be kept at reset value.

Bit 1 **THINB**: Threshold In band
This bit is set and cleared by software.
0: The OLDx generates an event if the signal is lower than OLDTHL or higher than OLDTHH (default value).
1: The OLDx generates an event if the signal is lower than OLDTHH and higher than OLDTHL.
Note: This bit can be write-protected (refer to Section 39.4.15 for details).

Bit 0 **OLDEN**: OLDx enable
This bit is set and cleared by software.
0: OLDx disabled (default value)
1: OLDx enabled, including the ACIC filter working in continuous mode

39.8.10 MDF OLDx low threshold register x (MDF_OLDxTHLR)

Address offset: 0x09C + 0x80 * x, (x = 0 to 3)

Reset value: 0x0000 0000

This register is used for the adjustment of the out-off-limit low threshold. The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:0 **OLDTHL[25:0]**: OLD low threshold value

This bitfield is set and cleared by software. OLDTHL represents a 26-bit signed value. The real threshold compared to the signal provided by the filter is OLDTHL.

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

39.8.11 MDF OLDx high threshold register x (MDF_OLDxTHHR)

Address offset: 0x0A0 + 0x80 * x, (x = 0 to 3)

Reset value: 0x0000 0000

This register is used for the adjustment of the OLDx high threshold. The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:0 **OLDTHH[25:0]**: OLDx high threshold value

This bitfield is set and cleared by software. OLDTHH represents a 26-bit signed value. The real threshold compared to the signal provided by the filter is OLDTHH.

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

39.8.12 MDF delay control register x (MDF_DLYxCR)

Address offset: 0x0A4 + 0x80 * x, (x = 0 to 3)

Reset value: 0x0000 0000

This register is used for the adjustment stream delays. The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

									rw	rw	rw	rw	rw	rw	rw

Bit 31 **SKPBF**: Skip busy flag

This bit is set and cleared by hardware. It is used to control if the delay sequence is completed.

0: MDF ready to accept a new value into SKPDLY[6:0]

1: Last valid SKPDLY[6:0] still under processing

Bits 30:7 Reserved, must be kept at reset value.

Bits 6:0 **SKPDLY[6:0]**: Delay to apply to a bitstream

This bitfield is set and cleared by software. It defines the number of input samples that are skipped. Skipping is applied immediately after writing to this bitfield, if SKPBF = 0 and the corresponding DFLTEN = 1. If SKPBF = 1, the value written into the register is ignored by the delay state machine.

0: No input sample skipped

1: 1 input sample skipped

...

127: 127 input samples skipped

39.8.13 MDF short circuit detector control register x (MDF_SCDxCR)

Address offset: 0x0A8 + 0x80 * x, (x = 0 to 3)

Reset value: 0x0000 0000

This register is used for the adjustment stream delays. The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

rw	rw	rw	rw					rw	rw	rw	rw				rw

Bit 31 **SCDACTIVE**: SCDx active flag

This bit is set and cleared by hardware. It is used to check if the SCDx is effectively enabled (active) or not. The protected fields of this function can only be updated when the SCDACTIVE is set to 0 (refer to *Section 39.4.15* for details).

The delay between a transition on SCDEN and a transition on SCDACTIVE is two periods of AHB clock and two periods of mdf_proc_ck.

0: SCDx not active and can be configured if needed

1: SCDx active and protected fields cannot be configured

Bits 30:20 Reserved, must be kept at reset value.

Bits 19:12 **SCDT[7:0]**: SCDx threshold

This bitfield is set and cleared by software. These bits are written by software to define the threshold counter for SCDx. If this value is reached, a short-circuit detector event occurs on a given input stream.

0: 2 consecutive 1's or 0's generate an event.

1: 2 consecutive 1's or 0's generate an event.

2: 3 consecutive 1's or 0's generate an event.

...

255: 256 consecutive 1's or 0's generate an event.

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bits 11:8 Reserved, must be kept at reset value.

Bits 7:4 **BKSCD[3:0]**: Break signal assignment for short circuit detector

This bitfield is set and cleared by software.

BKSCD[i] = 0: Break signal (mdf_break[i]) not assigned to this SCD event

BKSCD[i] = 1: Break signal (mdf_break[i]) assigned to this SCD event

Note: This bitfield can be write-protected (refer to Section 39.4.15 for details).

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **SCDEN**: SCDx enable

This bit is set and cleared by software.

0: SCDx disabled

1: SCDx enabled,

39.8.14 MDF DFLT0 interrupt enable register 0 (MDF_DFLT0IER)

Address offset: 0x0AC

Reset value: 0x0000 0000

This register is used for allowing or not the events to generate an interrupt.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **RFOVRIE**: Reshape filter overrun interrupt enable
This bit is set and cleared by software.
0: Reshape filter overrun interrupt disabled
1: Reshape filter overrun interrupt enabled

Bit 10 **CKABIE**: Clock absence detection interrupt enable
This bit is set and cleared by software.
0: Clock absence interrupt disabled
1: Clock absence interrupt enabled

Bit 9 **SATIE**: Saturation detection interrupt enable
This bit is set and cleared by software.
0: Saturation interrupt disabled
1: Saturation interrupt enabled

Bit 8 **SCDIE**: SCD0 interrupt enable
This bit is set and cleared by software.
0: SCD0 interrupt disabled
1: SCD0 interrupt enabled

Bit 7 **SSOVRIE**: Snapshot overrun interrupt enable
This bit is set and cleared by software.
0: Snapshot overrun interrupt disabled
1: Snapshot overrun interrupt enabled

Bits 6:5 Reserved, must be kept at reset value.

Bit 4 **OLDIE**: OLD0 interrupt enable
This bit is set and cleared by software.
0: OLD0 event interrupt disabled
1: OLD0 event interrupt enabled

Bit 3 Reserved, must be kept at reset value.

Bit 2 **SSDRIE**: Snapshot data ready interrupt enable
This bit is set and cleared by software.
0: Snapshot data ready interrupt disabled
1: Snapshot data ready interrupt enabled

Bit 1 **DOVRIE**: Data overflow interrupt enable
This bit is set and cleared by software.
0: Data overflow interrupt disabled
1: Data overflow interrupt enabled

Bit 0 **FTHIE**: RXFIFO threshold interrupt enable
This bit is set and cleared by software.
0: RXFIFO threshold interrupt disabled
1: RXFIFO threshold interrupt enabled

39.8.15 MDF DFLTx interrupt enable register x (MDF_DFLTxIER)

Address offset: 0x12C + 0x80 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

This register is used for allowing or not, the events to generate an interrupt. The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **RFOVRIE**: Reshape filter overrun interrupt enable
This bit is set and cleared by software.
0: Reshape filter overrun interrupt disabled
1: Reshape filter overrun interrupt enabled

Bit 10 **CKABIE**: Clock absence detection interrupt enable
This bit is set and cleared by software.
0: Clock absence interrupt disabled
1: Clock absence interrupt enabled

Bit 9 **SATIE**: Saturation detection interrupt enable
This bit is set and cleared by software.
0: Saturation interrupt disabled
1: Saturation interrupt enabled

Bit 8 **SCDIE**: SCDx interrupt enable
This bit is set and cleared by software.
0: SCDx interrupt disabled
1: SCDx interrupt enabled

Bit 7 **SSOVRIE**: Snapshot overrun interrupt enable
This bit is set and cleared by software.
0: Snapshot overrun interrupt disabled
1: Snapshot overrun interrupt enabled

Bits 6:5 Reserved, must be kept at reset value.

Bit 4 **OLDIE**: OLDx interrupt enable
This bit is set and cleared by software.
0: OLDx event interrupt disabled
1: OLDx event interrupt enabled

Bit 3 Reserved, must be kept at reset value.

Bit 2 **SSDRIE**: Snapshot data ready interrupt enable
This bit is set and cleared by software.
0: Snapshot data ready interrupt disabled
1: Snapshot data ready interrupt enabled

Bit 1 **DOVRIE**: Data overflow interrupt enable
This bit is set and cleared by software.
0: Data overflow interrupt disabled
1: Data overflow interrupt enabled

Bit 0 **FTHIE**: RXFIFO threshold interrupt enable
This bit is set and cleared by software.
0: RXFIFO threshold interrupt disabled
1: RXFIFO threshold interrupt enabled

39.8.16 MDF DFLT0 interrupt status register 0 (MDF_DFLT0ISR)

Address offset: 0x0B0

Reset value: 0x0000 0000

This register contains the status flags for each digital filter path.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	RFOVRF	CKABF	SATF	SCDF	SSOVRF	THHF	THLF	OLDF	RXNEF	SSDRF	DOVRF	FTHF
				rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	r	r	rc_w1	r	rc_w1	rc_w1	r

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **RFOVRF**: Reshape filter overrun detection flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no reshape filter overrun is detected. Write 0 has no effect.
1: Read 1 means that reshape filter overrun is detected. Write 1 clears this flag.

Bit 10 **CKABF**: Clock absence detection flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no clock absence is detected. Write 0 has no effect.
1: Read 1 means that a clock absence is detected. Write 1 clears this flag.

Bit 9 **SATF**: Saturation detection flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no saturation is detected. Write 0 has no effect.
1: Read 1 means that a saturation is detected. Write 1 clears this flag.

Bit 8 **SCDF**: Short-circuit detector flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no SCD0 event is detected. Write 0 has no effect.
1: Read 1 means that a SCD0 event is detected. Write 1 clears this flag.

Bit 7 **SSOVRF**: Snapshot overrun flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no snapshot overrun event is detected. Write 0 has no effect.
1: Read 1 means that a snapshot overrun event is detected. Write 1 clears this flag.

Bit 6 **THHF**: High-threshold status flag

This bit is set by hardware and cleared by software by writing this bit to 1. It indicates the status of the high-threshold comparator when the last OLD0 event occurred. This bit gives additional information on the conditions triggering the last OLD0 event. It can be cleared by writing OLDF flag to 1.

0: The signal was lower than OLDTHH when the last OLD0 event occurred.

1: The signal was higher than OLDTHH when the last OLD0 event occurred.

Bit 5 **THLF**: Low-threshold status flag

This bit is set by hardware and cleared by software by writing this bit to 1. It indicates the status of the low-threshold comparator when the last OLD0 event occurred. This bit gives additional information on the conditions triggering the last OLD0 event. It can be cleared by writing OLDF flag to 1.

0: The signal was higher than OLDTHL when the last OLD0 event occurred.

1: The signal was lower than OLDTHL when the last OLD0 event occurred.

Bit 4 **OLDF**: OLD0 flag

This bit is set by hardware and cleared by software by writing this bit to 1.

0: Read 0 means that no OLD0 event is detected. Write 0 has no effect.

1: Read 1 means that an OLD0 event is detected Write 1 clears THHF, THLF and OLDF.

Bit 3 **RXNEF**: RXFIFO not-empty flag

this bit is set and cleared by hardware according to the RXFIFO level.

0: RXFIFO empty

1: RXFIFO not empty

Bit 2 **SSDRF**: Snapshot data ready flag

This bit is set by hardware and cleared by software by writing this bit to 1.

0: Read 0 means that no data is available. Write 0 has no effect.

1: Read 1 means that a new data is available. Write 1 clears this flag.

Bit 1 **DOVRF**: Data overflow flag

This bit is set by hardware and cleared by software by writing this bit to 1.

0: Read 0 means that no overflow is detected. Write 0 has no effect.

1: Read 1 means that an overflow is detected; Write 1 clears this flag.

Bit 0 **FTHF**: RXFIFO threshold flag

This bit is set by hardware and cleared by hardware when the RXFIFO level is lower than the threshold.

0: RXFIFO threshold not reached

1: RXFIFO threshold reached

39.8.17 MDF DFLTx interrupt status register x (MDF_DFLTxISR)

Address offset: 0x130 + 0x80 * (x - 1), (x = 1 to 3)

Reset value: 0x0000 0000

This register contains the status flags for each digital filter path. The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

				rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	r	r	rc_w1	r	rc_w1	rc_w1	r

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **RFOVRF**: Reshape filter overrun detection flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no reshape filter overrun is detected. Write 0 has no effect.
1: Read 1 means that reshape filter overrun is detected. Write 1 clears this flag.

Bit 10 **CKABF**: Clock absence detection flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no clock absence is detected. Write 0 has no effect.
1: Read 1 means that a clock absence is detected. Write 1 clears this flag.

Bit 9 **SATF**: Saturation detection flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no saturation is detected. Write 0 has no effect.
1: Read 1 means that a saturation is detected. Write 1 clears this flag.

Bit 8 **SCDF**: Short-circuit detector flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no SCD event is detected. Write 0 has no effect.
1: Read 1 means that a SCD event is detected. Write 1 clears this flag.

Bit 7 **SSOVRF**: Snapshot overrun flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no snapshot overrun event is detected. Write 0 has no effect.
1: Read 1 means that a snapshot overrun event is detected. Write 1 clears this flag.

Bit 6 **THHF**: High-threshold status flag
This bit is set by hardware and cleared by software by writing this bit to 1. It indicates the status of the high-threshold comparator when the last OLDx event occurred. This bit gives additional information on the conditions triggering the last OLDx event. It can be cleared by writing OLDF flag to 1.
0: The signal was lower than OLDTHH when the last OLDx event occurred.
1: The signal was higher than OLDTHH when the last OLDx event occurred.

Bit 5 **THLF**: Low-threshold status flag

This bit is set by hardware and cleared by software by writing this bit to 1. It indicates the status of the low-threshold comparator when the last OLDx event occurred. This bit gives additional information on the conditions triggering the last OLDx event. It can be cleared by writing OLDF flag to 1.

0: The signal was higher than OLDTHL when the last OLDx event occurred.

1: The signal was lower than OLDTHL when the last OLDx event occurred.

Bit 4 **OLDF**: OLDx flag

This bit is set by hardware and cleared by software by writing this bit to 1.

0: Read 0 means that no OLDx event is detected. Write 0 has no effect.

1: Read 1 means that an OLDx event is detected Write 1 clears THHF, THLF and OLDF.

Bit 3 **RXNEF**: RXFIFO not-empty flag

this bit is set and cleared by hardware according to the RXFIFO level.

0: RXFIFO empty

1: RXFIFO not empty

Bit 2 **SSDRF**: Snapshot data ready flag

This bit is set by hardware and cleared by software by writing this bit to 1.

0: Read 0 means that no data is available. Write 0 has no effect.

1: Read 1 means that a new data is available. Write 1 clears this flag.

Bit 1 **DOVRF**: Data overflow flag

This bit is set by hardware and cleared by software by writing this bit to 1.

0: Read 0 means that no overflow is detected. Write 0 has no effect.

1: Read 1 means that an overflow is detected; Write 1 clears this flag.

Bit 0 **FTHF**: RXFIFO threshold flag

This bit is set by hardware and cleared by hardware when the RXFIFO level is lower than the threshold.

0: RXFIFO threshold not reached

1: RXFIFO threshold reached

39.8.18 MDF offset error compensation control register x (MDF_OECxCR)

Address offset: 0x0B4 + 0x80 * x, (x = 0 to 3)

Reset value: 0x0000 0000

This register contains the offset compensation value. The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	OFFSET[25:16]									
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
OFFSET[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:0 **OFFSET[25:0]**: Offset error compensation
This bitfield is set and cleared by software. If the application attempts to write a new offset value while the previous one is not yet applied, this new offset value is ignored. Reading back this bitfield informs the application on the current offset value.
This bitfield represents the value to be subtracted to the signal before going to the SCALE.

39.8.19 MDF snapshot data register x (MDF_SNPSxDR)

Address offset: 0x0EC + 0x80 * x, (x = 0 to 3)

Reset value: 0x0000 0000

This register is used to read the data processed by each digital filter in snapshot mode. The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

EXTSDR[6:0]							MCICDC[8:0]								
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 **SDR[15:0]**: Contains the 16 MSB of the last valid data processed by the digital filter.

Bits 15:9 **EXTSDR[6:0]**: Extended data size
If SNPSFMT = 0, this bitfield contains the bits 7 to 1 of the last valid data processed by the digital filter.
If SNPSFMT = 1, this bitfield contains the INT accumulator counter value when the last trigger event occurs (INT_CNT).

Bits 8:0 **MCICDC[8:0]**: Contains the MCIC decimation counter value when the last trigger event occurs (MCIC_CNT)

39.8.20 MDF digital filter data register x (MDF_DFLTxDR)

Address offset: 0x0F0 + 0x80 * x, (x = 0 to 3)

Reset value: 0x0000 0000

This register is used to read the data processed by each digital filter. The number of registers is equal to the amount of filters. Refer to *Section 39.3* for details.

40 Camera subsystem

40.1 Introduction

The camera subsystem is built around a double path:

- a low-resolution path, with the DCMI and a low-frequency parallel interface. It supports sensors up to 1 Mpixels @15 fps.
- a high-resolution path, with the DCMIPP and a high-frequency parallel interface or serial CSI-2 interface, either RGB or RawBayer. It targets sensors up to 5 Mpixels @30 fps.

When plugging a camera sensor, it is recommended to use the DCMIPP that supports more features and provides higher throughput than the DCMI.

The DCMI is recommended only in two noticeable cases:

- to get a backward compatibility with former platforms that embed also the DCMI
- to input the pixels from a second camera sensor (such as low resolution sensor for AI processing)

Note: The DCMIPP inputs pixels from one sensor via the CSI-2 interface, while the DCMI gets pixels from the second sensor via the parallel interface.

The DCMI path offers the following summarized maximum features:

- Target sensor: 24 Mpixel/s 16 bpp (limited by the DMA)
- Parallel input: 80 MHz on 14-bit input capability
- Central DMA to extract and dump its pixels
- Software extraction of its pixel data

The DCMIPP path offers the following summarized maximum features:

- Target sensors: 5 Mpixel at 30 fps max
- Parallel input: 120 MHz on 16-bit input capability
- Serial input: CSI-2 @2.5 Gbps/lane on 2 data lanes
- ISP (image signal processor): demosaicing, exposure, white-balance, contrast, bad-pixel, histograms
- Application pipes: 2 pipes with crop, downsize, gamma, YUV conversion, YUV420

Some over-target use cases are possible, but with specific constraints:

- sensors with resolution above 5 Mpixels
- sensors with pixel rate above 150 Mpixel/s
- double sensors in parallel

40.2 Camera path main features

40.2.1 DCMI path main features

The DCMI path shows the following features:

- 8-, 10-, 12- or 14-bit parallel interface at 80 MHz (no I/O ReTime)
- Embedded/external line and frame synchronization

- Continuous or snapshot mode
- Crop feature
- Following data formats supported (dumped in memory, extracted by software):
  - 8-, 10-, 12-, 14-bit progressive video, either monochrome or RawBayer
  - YCbCr 4:2:2 progressive video
  - RGB 565 progressive video
  - Compressed data: JPEG (in fact, any default/byte data)

See *Section 41: Digital camera interface (DCMI)* for more details.

40.2.2 DCMIPP path main features

The DCMIPP path groups the DCMIPP pixel pipeline block, its included parallel interface, and the abutted CSI-2-Host and PHY.

The parallel interface shows the following features:

- Input rate: 120 MHz up to 16-bit capability (with I/O ReTime)
- Pixel format: RGB565, 888, YUV422, RawBayer/Mono 8/10/12/14
- Synchronization: embedded versus external line and frame synchronization

See *Section 42: Digital camera interface pixel pipeline (DCMIPP)* for more details.

The CSI-2 serial interface shows the following features:

- Standard: MIPI CSI2 v1.3
- Input rate: 2 data lanes @ 2.5 Gbps/lane
- Pixel rate: if RGB888: up to 200 Mpixel/s, if RawBayer 10: up to 333 Mpixel/s
- Pixel format: any MIPI CSI2 v1.3: RGB565, 888, YUV422, RawBayer
- Miscellaneous: interlaced video, interleaved packets, virtual channels

See *Section 43: CSI-2 Host (CSI)* for more details.

DCMIPP sizings and limitations

- Camera target: 5 Mpixels (typ. 2560x2048 or 2688x1944) before decimation
- Pipe resolution: 4094x4094 pixels max
  - Demosaicing: 2688 pixels wide max line-buffers (decimation available ahead)
  - Downsize: 2688 pixels wide max line-buffers
  - YUV420: 2688 pixels wide max line-buffers.
- Pipe pixel rate: 333 Mpixel/s peak.
- AXI FIFO: 5 Kbytes available, with a flexible allocation between all outputs.
- AXI master: AXI-64 bits @ 400 MHz, with FIFO for latencies up to 2 µs, 16 outstanding.

The DCMIPP provides three different pipes to process data:

- Pipe0: to dump data without any processing, branched before any ISP

  It is aimed at dumping metadata or statistics as-is from the sensor, or at dumping the full picture as RawBayer data, for a potential long but optimal software processing.
- Pipe1: main full-featured pipe (such as ISP, then downsize, YUV-multi-planar)

  It provides a picture ready for any application (such as display, video encode, or neural processing).

- Pipe2: ancillary semi-featured pipe

  Same ISP as pipe1, then downsize, but no YUV-multiplanar. It provides an RGB output for a display use.

DCMIPP ISP capabilities common to pipe1 and 2, are the following:

- Flow selection: parallel-vs-CSI2, CSI virtual packets
- Test pattern generator to emulate an external camera sensor
- Capture mode: continuous versus snapshot mode
- Pixel extraction: RGB565, 888, YUV422, RawBayer/Mono 8/10/12/14.
- Statistic removal: to remove unused metadata (like statistics) from received pictures
- Bad-pixel removal: automatic detection and correction of bad pixels from sensor array
- Decimation: one pixel every 1/2/4/8, used to fit the max 2688 pixels
- Exposure control: to amplify the exposure from 0.0 to 255.99x
- Statistic extraction: average R,G,B,L values, dynamic bins
- Demosaicing: to convert RawBayer to RGB, per region histograms
- White-balance: to adapt to sensor white and global Illumination
- Contrast: to enhance the contrast, via luminance

The DCMIPP application capabilities, replicated for pipe1 and 2, are listed below:

- Cropping: to select a region of interest or stabilize the picture
- Downsize: box-filtering, with any decimal ratio, up to 8x8
- Gamma conversion: predistortion with gamma = 2.2 for display purposes
- YUV color conversion: to convert to YUV to later store a video-friendly buffer (pipe1 only).
- YUV422/420: chroma subsampling to YUV422 or YUV420

Output pixel format:

- Pipe1 and 2: 888, 565, 422-1, Y8, ARGB and RGBA (coplanar only)
- Pipe1: to adds422-2, 420-2, 420-3 (multi-planar possibility)

The full features are detailed in *Section 41: Digital camera interface (DCMI)*.

40.3 Camera subsystem implementation

40.3.1 Hardware settings

The camera subsystem is implemented with the following specific settings:

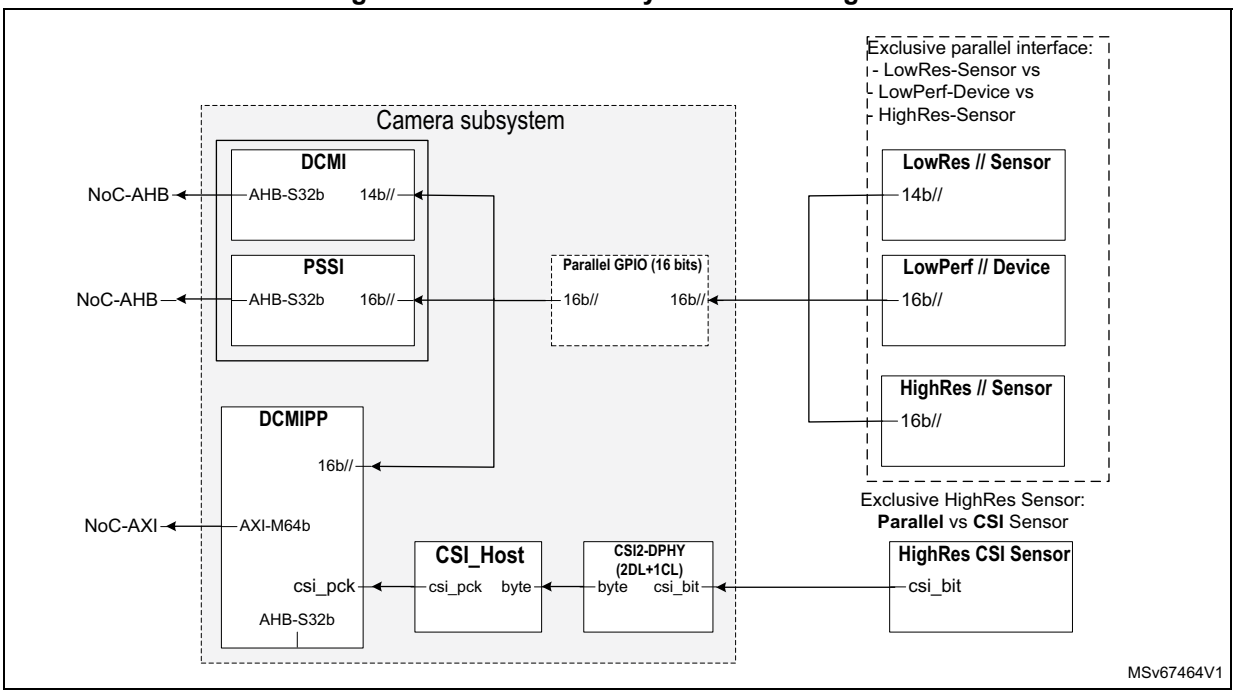
- CSI2: two data lanes (+ one clock lane) up to 2.5 Gbps/lane.
- DCMIPP FIFO: 5 Kbytes for AXI
- DCMIPP with the following subfeatures:
  - line-buffers: 2688 pixels (impacts the demosaicing, downsize, YUV420 conversion)
  - one dump pipe + two pixel pipes (pipe1 with YUV420/multi-planar only)

40.4 Camera subsystem functional description

40.4.1 Camera subsystem block diagram

The figure below shows the involved blocks in the camera subsystem.

Figure 332. Camera subsystem block diagram



Note: The PSSI is not used for camera purpose but rather for general-purpose parallel input (not described in this section).

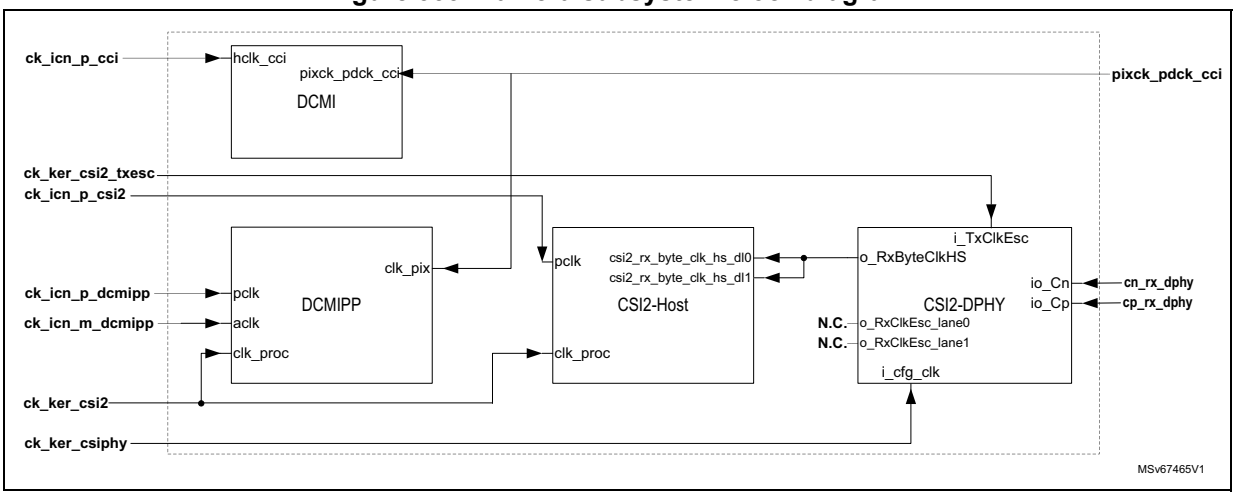
40.4.2 Camera subsystem pins and external signal interface

Details about the pins can be found in the respective block sections.

40.4.3 Camera subsystem reset and clocks

The clock diagram of the camera subsystem is shown in the figure below.

Figure 333. Camera subsystem clock diagram



The above camera subsystem has been implemented with the following clock max frequencies:

- DCMI // I/F (pixck_pdck_cci): 80 MHz (no I/O ReTime: async path from pads)
- DCMIPP // I/F (pixck_pdck_cci): 120 MHz (I/O ReTime mandatory)
- CSI2 bit clock (cn/p_rx_dphy): 1250 MHz (2.5 Gbps/lane)
- CSI2 byte clock (rxbyte_clkHS): 312.5 MHz
- CSI2 TxEsc clock (ck_ker_csi2_txesc): 20 MHz
- CSI2 Cfg clock (ck_ker_csiphy): 27 MHz
- Pixel clock (ck_ker_csi2): 333 MHz
- Register clocks (ck_icn_p_*): 150 MHz (all APB/AHB register files)
- AXI clock (ck_icn_m_dcmipp): 400 MHz

40.4.4 Camera subsystem security

The security of the camera subsystem is based on the protection of its register map, and of its master access to the system interconnect, based on default RISUP and RIMU respectively.

More information can be found in *Section 5.4: Resource isolation framework (RIF)*.

The RISUP differentiates the access right of accesses performed toward the following RIF protected peripheral ID (indexes refer to *Table 38: Indexes for non-RIF-aware peripherals (RISUP)*):

- DCMIPP: tag = DCMIPP for the configuration of pixel pipelines (index 87)
- CSI2-Host: tag = CSI2H for Host and PHY configurations (index 86)
- DCMI and PSSI: tag = DCMI for its configuration, and to retrieve pixels by DMA (index 88)

The RIMU (RIMU_AXI_DCMIPP) gives the access right to the DCMIPP AXI master:

- S and P are set using the RIF RIMC_ATTR10 register.
- CID is set either by the RISA (RISUP86 register) of directly by software.

By default, the camera subsystem is expected to work in a non-secure mode:

- DCMIPP, CSI2, DCMI, and PSSI are left unprotected, so that any OS software can configure and handle the camera subsystem.
- The AXI master of the DCMIPP inherits the CID setting from its associated register map. CID = DISP or CID = VID can be allocated to its RISUP to mention that the AXI write access of the camera subsystem contains pixels (like the display system).

For secure applications, the user can put the camera subsystem in S, P, or S-and-P mode, with the following impacts:

- As a benefit, the user is sure that the content of the dumped buffer does truly come from the camera sensor:

  The output of the DCMIPP is differentiated from other masters: only the DCMIPP can write into its buffer. This buffer content is known to come from the camera sensor, which makes impossible to fill-in (by software) a fake face to be recognized.
- The camera subsystem needs to be transfered to the secure software world (with the verification implications), or the system must make sure that the access rights of the DCMIPP cannot harm the system.

The above recommended non-protected settings are shown in *Table 359: Camera subsystem RIF peripheral ID*.

The table below lists vertically all camera subsystem blocks, and horizontally the associated RIF peripheral ID.

Table color legend for the recommended settings: gray for a permanently non-protected setting, blue for a temporarily protected versus non-protected, and pink for a permanently protected state: by default, all the settings are non-protected.

Table 359. Camera subsystem RIF peripheral ID

Subsystem	Block	Address range	Start address	RISUP - slave		
				88	87	86
				DCMI_PSSI	DCMIPP	CSI2H
Camera low resolution	DCMI	Configuration	0x0000	Y	-	-
		Pixel Rx	0x0A00	Y	-	-
		Configuration	0x0B00	Y	-	-
		Data in/out	0x0C00	Y	-	-

Table 359. Camera subsystem RIF peripheral ID (continued)

Subsystem	Block	Address range	Start address	RISUP - slave		
				88	87	86
				DCMI_PSSI	DCMIPP	CSI2H
Camera high resolution	DCMIPP	Common configuration	0x0	-	Y	-
		P1 configuration	0x0	-	Y	-
		P2 configuration	0x0	-	Y	-
		P3 configuration	0x0	-	Y	-
	CSI	Configuration control	0x0000	-	-	Y
		Configuration wrap	0x1000	-	-	Y
		CSI DPHY-Rx (no register)	-	-	-	-

40.5 Camera subsystem programmable parameters

This section describes the configuration of the various main use cases supported by the camera subsystem. Its purpose is to provide the settings that are global to the camera subsystem, and not provided by the local relevant blocks.

The use cases supported by default are the following:

- low-resolution parallel camera, using the DCMI path (see *Section 40.5.1*)
- high-resolution parallel camera, using the DCMIPP path (see *Section 40.5.2*)
- high-resolution CSI2 camera, using the DCMIPP path (see *Section 40.5.3*)

Some over-target use cases are possible, but with specific constraints:

- sensors over target-resolution (above 5 Mpixels)

  The limiting factors are
  - the clock (related to max pixel rate)
  - AXI bandwidth (related to the pixel rate and pixel format of the active pipes)
  - line buffers of the demosaicing, downsize, and YUV420 chroma decimation (when active)

  To cope with these limitations, the decimation can be used, ahead of the pipes, to reduce the width and/or height of the frame, and/or deactivate the limiting operators, the demosaicing, downsize, YUV420.
- sensors over target pixel rate (above 150 Mpixel/s)
- double sensors like 3D camera (with their left and right sensors)

40.5.1 Low-resolution parallel camera and DCMI

This use case is recommended only for backward compatibility, or to grab pictures simultaneously from two sensors (a low and a high resolution).

The steps to setup this path are the following:

- Clock and reset
  - pixck_pdck_cci is provided by the sensor (via the PCB on the input I/O, 80 MHz max).
  - The RCC provides ck_icn_p_cci, that must be ≥ 2.5x pixck_pdck_cci due to the DCMI. The default clock is 150 MHz, which allows the input clock to be at 80 MHz.
  - *Section 20: Reset and clock control (RCC)* provides the needed details.
- DMA
  - The HPDMA retrieves pixels from the DCMI, that signals to the DMA that its FIFO is full and must be read-out.
  - *Section 25* provides the needed details.

40.5.2 High-resolution parallel camera and DCMIPP

This is the default use case to grab a picture from a parallel camera (up to the target 5 Mpixels @30fps). Any RGB or RawBayer picture can be grabbed.

The steps to setup this path are the following:

- Clock and reset:
  - pixck_pdck_cci is provided by the sensor (via the PCB on the input I/O, 120 MHz max). Each pixel needs 1 to 3 cycles to get in.
  - ck_icn_p_dcmipp is provided by the RCC for the DCMIPP configuration (default is 150 MHz).
  - ck_ker_csi2 is provided by the RCC for the pixel pipelines of the DCMIPP (default is 150 MHz).
  - ck_icn_m_dcmipp is provided by the RCC for the DCMIPP AXI (default is 400 MHz).
  - *Section 20: Reset and clock control (RCC)* provides the needed details.
- DCMIPP configuration:
  - Select the parallel interface as input interface.
  - Setup the DCMIPP (parallel interface, ISP, application path, AXI-plug) as described in *Section 42: Digital camera interface pixel pipeline (DCMIPP)*.

40.5.3 High-resolution CSI2 camera and DCMIPP

This is the default use-case to grab a picture from a CSI2 camera (up to the target 5 Mpixels @30 fps). Any RGB or RawBayer picture can be grabbed.

The steps to setup this path are the following:

- Clock and reset:
  - cn/p_rx_dphy are provided by the sensor (via the PCB on the input I/O, 1.25 GHz/2.5 Gbit/s max).
  - RxByteClkHS is automatically divided (1/8) from cn/p_rx_dphy (312.5 MHz max).
  - ck_icn_p_csi2 is provided by the RCC for the CSI2-Host configuration (default 150 MHz).
  - ck_icn_p_dcmipp is provided by the RCC for the DCMIPP configuration (default 150 MHz).

  - ck_ker_csiphy is provided by the RCC for CSI2-Host in low-power (default 20 MHz).
  - ck_ker_csi2_txesc is provided by the RCC for the TxEscape mode of CSI2 (default 27 MHz).
  - ck_ker_csi2 is provided by the RCC for the pixel pipelines of the DCMIPP (default 150 MHz).
  - ck_icn_m_dcmipp is provided by the RCC for the DCMIPP AXI (default 400 MHz).
  - *Section 20: Reset and clock control (RCC)* provides the needed details.
- CSI2-Host configuration:
  - Setup the CSI2-Host (such as packet type).
- DCMIPP configuration:
  - Select the CSI2 interface as input interface.
  - Setup the DCMIPP (CSI2, ISP, application path, AXI-plug) as described in *Section 42: Digital camera interface pixel pipeline (DCMIPP)*.

40.5.4 Sensors over target resolution

The sensors over the target resolution (5 Mpixels) are supported with the following restrictions:

- CSI2 interface must be used (parallel interface quickly limited with its 120 MHz performances).
- The sensor must be able to output its bit rate onto the available two data lanes of the CSI2 link. It is recommended to use RawBayer (less bit/pixel than RGB).
- Width and height must both remain below 4094 (up to 16 Mpixels can be reached).
- Decimation is located ahead of most processing, and can be used to decrease the grabbed resolution.
- Demosaicing is limited with a max width of 2688: if demosaicing needs to be activated (RawBayer input, RGB output), then the decimation must be used to fall under that 2688 pixel limit. There is no height limit.
- Downsize and YUV420 are limited (similarly as demosaicing) to 2688, and require a decimation ahead if they need to be activated. The horizontal downsize occurs before the vertical one: the first can be used to fall below the 2688 pixels limit, before being processed by the second.
- If all demosaicing, downsize, and YUV420 are disabled. Pictures up to 4094x4094 can be received and dumped by the AXI.

After taking into account these restrictions, the configuration itself is the same as for the default high-resolution CSI2 camera, described in previous section.

40.5.5 Sensors over target pixel rate

The sensors over the target pixel rate (150 Mpixel/s average, ~200 Mpixel/s peak) are supported with the following restrictions:

- The sensor must be able to output its bit rate onto the available two data lanes of the CSI2 link.
- The peak pixel rate must remain below (with some margin) the max 333 MHz of the DCMIPP pixel clock (with a 10% margin recommended).

- DCMIPP bandwidth and FIFO allocation must be able to dump this load: it is recommended to reduce the amount of parallel dumps (best not all Pipe0, Pipe1, and Pipe2 active simultaneously). In the DCMIPP plug, more FIFO and outstanding allocation can be made in favor of the working pipe.

After taking into account these restrictions, the configuration itself is the same as for the default high-resolution CSI2 camera, described in *Section 40.5.3*.

40.5.6 Double sensors

Two sensors are simultaneously and independently supported with the following restriction:

- One sensor must be low-resolution, so that it can use the DCMI (the other sensor uses the DCMIPP).
- Two input interfaces must be available: one sensor is CSI2, and the other parallel.

The configuration of the double sensors is the same as for the default low-resolution and default high-resolution sensors, described in previous sections.

40.6 Camera subsystem interrupts

Sections for each peripheral describe in details the provided interrupts.

40.7 Camera subsystem registers

All the registers are described in sections for each peripheral.

41 Digital camera interface (DCMI)

41.1 DCMI introduction

The digital camera is a synchronous parallel interface able to receive a high-speed data flow from an external 8-, 10-, 12- or 14-bit CMOS camera module. It supports different data formats: YCbCr4:2:2/RGB565 progressive video and compressed data (JPEG).

41.2 DCMI main features

- 8-, 10-, 12- or 14-bit parallel interface
- Embedded/external line and frame synchronization
- Continuous or snapshot mode
- Crop feature
- Supports the following data formats:
  - 8/10/12/14-bit progressive video: either monochrome or raw Bayer
  - YCbCr 4:2:2 progressive video
  - RGB 565 progressive video
  - Compressed data: JPEG

41.3 DCMI functional description

The digital camera interface is a synchronous parallel interface that can receive high-speed data flows. It consists of up to 14 data lines (DCMI_D[13:0]) and a pixel clock line (DCMI_PIXCLK). The pixel clock has a programmable polarity, so that data can be captured on either the rising or the falling edge of the pixel clock.

The data are packed into a 32-bit data register (DCMI_DR) and then transferred through a general-purpose DMA channel. The image buffer is managed by the DMA, not by the camera interface.

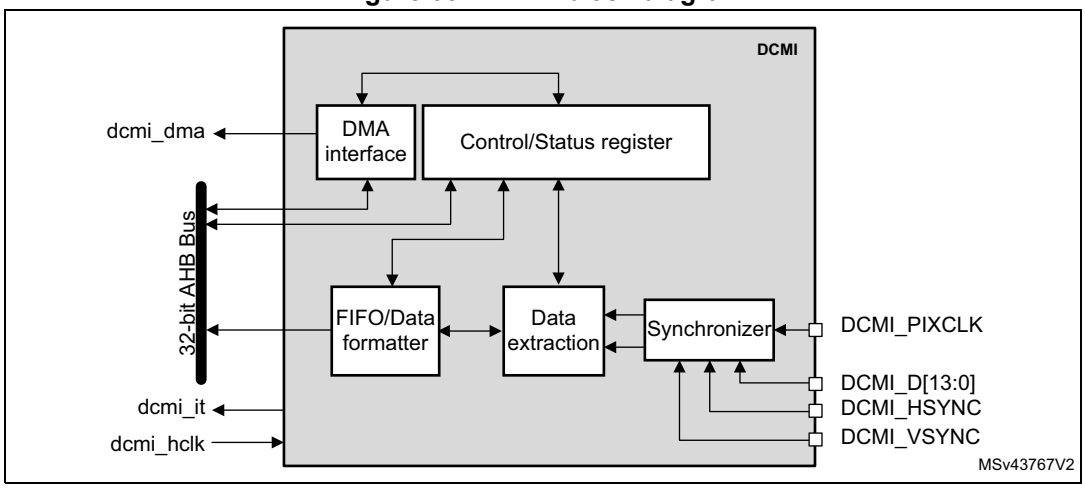
The data received from the camera can be organized in lines/frames (raw YUB/RGB/Bayer modes) or can be a sequence of JPEG images. To enable JPEG image reception, the JPEG bit (bit 3 of DCMI_CR register) must be set.

The data flow is synchronized either by hardware using the optional DCMI_HSYNC (horizontal synchronization) and DCMI_VSYNC (vertical synchronization) signals or by synchronization codes embedded in the data flow.

41.3.1 DCMI block diagram

Figure 334 shows the DCMI block diagram.

Figure 334. DCMI block diagram



41.3.2 DCMI pins and internal signals

The following table shows DCMI pins.

Table 360. DCMI input/output pins

Mode	Pin name	Signal type	Description
8 bits 10 bits 12 bits 14 bits	DCMI_D[7:0] DCMI_D[9:0] DCMI_D[11:0] DCMI_D[13:0]	Inputs	DCMI data
DCMI_PIXCLK		Input	Pixel clock
DCMI_HSYNC		Input	Horizontal synchronization / Data valid
DCMI_VSYNC		Input	Vertical synchronization

The following table shows DCMI internal signals.

Table 361. DCMI internal input/output signals

Internal signal name	Signal type	Description
dcmi_dma	Output	DCMI DMA request
dcmi_it	Output	DCMI interrupt request
dcmi_hclk	Input	DCMI interface clock

41.3.3 DCMI clocks

The digital camera interface uses two clock domains, DCMI_PIXCLK and HCLK. The signals generated with DCMI_PIXCLK are sampled on the rising edge of HCLK once they are stable. An enable signal is generated in the HCLK domain, to indicate that data coming from the camera are stable and can be sampled. The maximum DCMI_PIXCLK period must be higher than 2.5 HCLK periods.

41.3.4 DCMI DMA interface

The DMA interface is active when the CAPTURE bit of the DCMI_CR register is set. A DMA request is generated each time the camera interface receives a complete 32-bit data block in its register.

41.3.5 DCMI physical interface

The interface is composed of 11/13/15/17 inputs. Only the Slave mode is supported.

The camera interface can capture 8-bit, 10-bit, 12-bit or 14-bit data depending on the EDM[1:0] bits of the DCMI_CR register. If less than 14 bits are used, the unused input pins must be connected to ground.

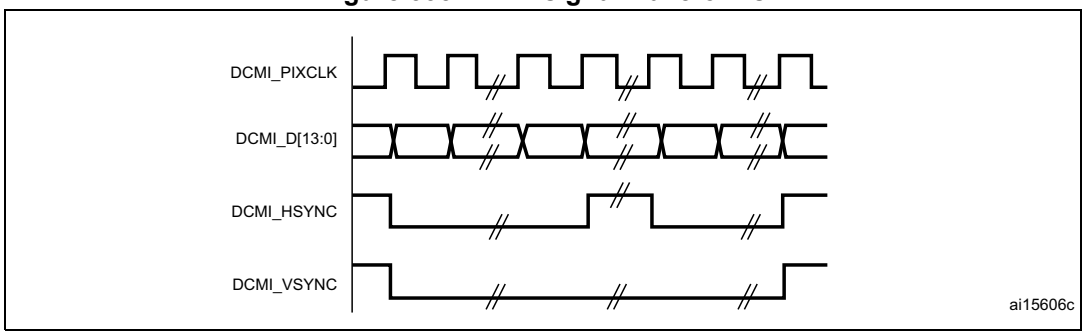
DCMI pins are shown in *Table 360*.

The data are synchronous with DCMI_PIXCLK and change on the rising/falling edge of the pixel clock depending on the polarity.

The DCMI_HSYNC signal indicates the start/end of a line.

The DCMI_VSYNC signal indicates the start/end of a frame

Figure 335. DCMI signal waveforms



1. The capture edge of DCMI_PIXCLK is the falling edge, the active state of DCMI_HSYNC and DCMI_VSYNC is 1.
2. DCMI_HSYNC and DCMI_VSYNC can change states at the same time.

8-bit data

When EDM[1:0] = 00 in DCMI_CR the interface captures 8 LSBs at its input (DCMI_D[7:0]) and stores them as 8-bit data. The DCMI_D[13:8] inputs are ignored. In this case, to capture a 32-bit word, the camera interface takes four pixel clock cycles.

The first captured data byte is placed in the LSB position in the 32-bit word and the 4th captured data byte is placed in the MSB position in the 32-bit word. The table below gives an example of the positioning of captured data bytes in two 32-bit words.

Table 362. Positioning of captured data bytes in 32-bit words (8-bit width)

Byte address	31:24	23:16	15:8	7:0
0	D_{n+3}[7:0]	D_{n+2}[7:0]	D_{n+1}[7:0]	D_n[7:0]
4	D_{n+7}[7:0]	D_{n+6}[7:0]	D_{n+5}[7:0]	D_{n+4}[7:0]

10-bit data

When EDM[1:0] = 01 in DCMI_CR, the camera interface captures 10-bit data at its input DCMI_D[9:0] and stores them as the 10 least significant bits of a 16-bit word. The remaining most significant bits of the DCMI_DR register (bits 11 to 15) are cleared to zero. So, in this case, a 32-bit data word is made up every two pixel clock cycles.

The first captured data are placed in the LSB position in the 32-bit word and the 2nd captured data are placed in the MSB position in the 32-bit word as shown in the table below.

Table 363. Positioning of captured data bytes in 32-bit words (10-bit width)

Byte address	31:26	25:16	15:10	9:0
0	0	D_{n+1}[9:0]	0	D_n[9:0]
4	0	D_{n+3}[9:0]	0	D_{n+2}[9:0]

12-bit data

When EDM[1:0] = 10 in DCMI_CR, the camera interface captures the 12-bit data at its input DCMI_D[11:0] and stores them as the 12 least significant bits of a 16-bit word. The remaining most significant bits are cleared to zero. So, in this case a 32-bit data word is made up every two pixel clock cycles.

The first captured data are placed in the LSB position in the 32-bit word and the 2nd captured data are placed in the MSB position in the 32-bit word as shown in the table below.

Table 364. Positioning of captured data bytes in 32-bit words (12-bit width)

Byte address	31:28	27:16	15:12	11:0
0	0	D_{n+1}[11:0]	0	D_n[11:0]
4	0	D_{n+3}[11:0]	0	D_{n+2}[11:0]

14-bit data

When EDM[1:0] = 11 in DCMI_CR, the camera interface captures the 14-bit data at its input DCMI_D[13:0] and stores them as the 14 least significant bits of a 16-bit word. The remaining most significant bits are cleared to zero. So, in this case a 32-bit data word is made up every two pixel clock cycles.

The first captured data are placed in the LSB position in the 32-bit word and the 2nd captured data are placed in the MSB position in the 32-bit word as shown in the table below.

Table 365. Positioning of captured data bytes in 32-bit words (14-bit width)

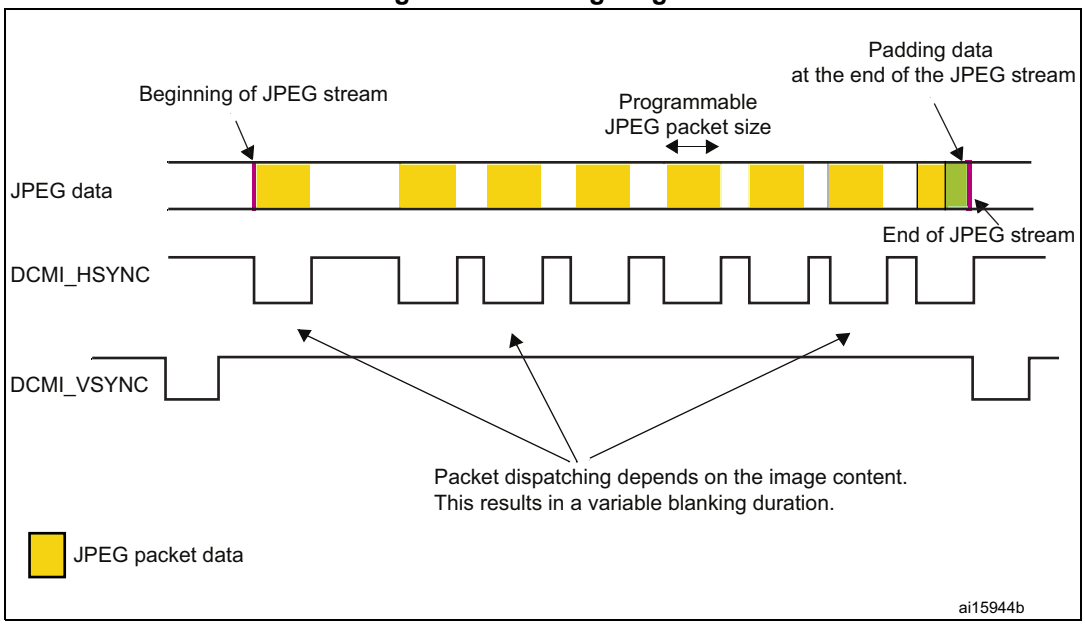
Byte address	31:30	29:16	15:14	13:0
0	0	D_{n+1}[13:0]	0	D_n[13:0]
4	0	D_{n+3}[13:0]	0	D_{n+2}[13:0]

41.3.6 DCMI synchronization

The digital camera interface supports embedded or hardware (DCMI_HSYNC and DCMI_VSYNC) synchronization. When embedded synchronization is used, it is up to the digital camera module to make sure that the 0x00 and 0xFF values are used ONLY for synchronization (not in data). Embedded synchronization codes are supported only for the 8-bit parallel data interface width (that is, in the DCMI_CR register, the EDM[1:0] bits must be cleared).

For compressed data, the DCMI supports only the hardware synchronization mode. In this case, DCMI_VSYNC is used as a start/end of the image, and DCMI_HSYNC is used as a Data Valid signal. *Figure 336* shows the corresponding timing diagram.

Figure 336. Timing diagram



Hardware synchronization mode

In hardware synchronization mode, the two synchronization signals (DCMI_HSYNC/DCMI_VSYNC) are used.

Depending on the camera module/mode, data may be transmitted during horizontal/vertical synchronization periods. The DCMI_HSYNC/DCMI_VSYNC signals act like blanking signals since all the data received during DCMI_HSYNC/DCMI_VSYNC active periods are ignored.

In order to correctly transfer images into the DMA/RAM buffer, data transfer is synchronized with the DCMI_VSYNC signal. When the hardware synchronization mode is selected, and

capture is enabled (CAPTURE bit set in DCMI_CR), data transfer is synchronized with the deactivation of the DCMI_VSYNC signal (next start of frame).

Transfer can then be continuous, with successive frames transferred by DMA to successive buffers or the same/circular buffer. To allow the DMA management of successive frames, a VSIF (Vertical synchronization interrupt flag) is activated at the end of each frame.

Embedded data synchronization mode

In this synchronization mode, the data flow is synchronized using 32-bit codes embedded in the data flow. These codes use the 0x00/0xFF values that are *not* used in data anymore. There are 4 types of codes, all with a 0xFF0000XY format. The embedded synchronization codes are supported only in 8-bit parallel data width capture (in the DCMI_CR register, the EDM[1:0] bits must be cleared). For other data widths, this mode generates unpredictable results and must not be used.

Note: Camera modules can have 8 such codes (in interleaved mode). For this reason, the interleaved mode is not supported by the camera interface (otherwise, every other half-frame would be discarded).

- Mode 2

  Four embedded codes signal the following events
  - Frame start (FS)
  - Frame end (FE)
  - Line start (LS)
  - Line end (LE)

  The XY values in the 0xFF0000XY format of the four codes are programmable (see *Section 41.5.7: DCMI embedded synchronization code register (DCMI_ESCR)*).

  A 0xFF value programmed as a “frame end” means that all the unused codes are interpreted as valid frame end codes.

  In this mode, once the camera interface has been enabled, the frame capture starts after the first occurrence of the frame end (FE) code followed by a frame start (FS) code.
- Mode 1

  An alternative coding is the camera mode 1. This mode is ITU656 compatible.

  The codes signal another set of events:
  - SAV (active line) - line start
  - EAV (active line) - line end
  - SAV (blanking) - end of line during interframe blanking period
  - EAV (blanking) - end of line during interframe blanking period

This mode can be supported by programming the following codes:

- FS $\leq$ 0xFF
- FE ≤ 0xFF
- LS ≤ SAV (active)
- LE ≤ EAV (active)

An embedded unmask code is also implemented for frame/line start and frame/line end codes. Using it, it is possible to compare only the selected unmasked bits with the programmed code. A bit can therefore be selected to compare in the embedded code and

detect a frame/line start or frame/line end. This means that there can be different codes for the frame/line start and frame/line end with the unmasked bit position remaining the same.

Example

FS = 0xA5

Unmask code for FS = 0x10

In this case the frame start code is embedded in the bit 4 of the frame start code.

41.3.7 DCMI capture modes

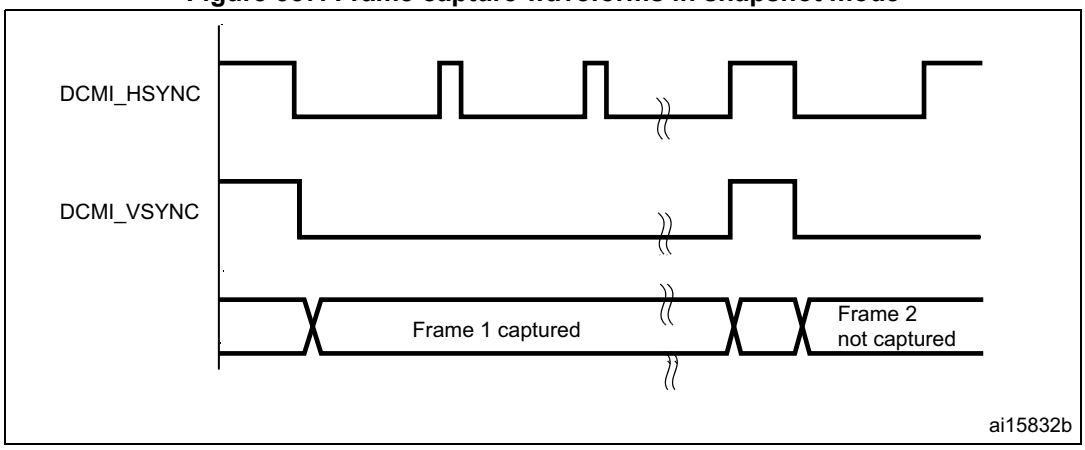
This interface supports two types of capture: snapshot (single frame) and continuous grab.

Snapshot mode (single frame)

In this mode, a single frame is captured (CM = 1 of the DCMI_CR register). After the CAPTURE bit is set in DCMI_CR, the interface waits for the detection of a start of frame before sampling the data. The camera interface is automatically disabled (CAPTURE bit cleared in DCMI_CR) after receiving the first complete frame. An interrupt is generated (IT_FRAME) if it is enabled.

In case of an overrun, the frame is lost and the CAPTURE bit is cleared.

Figure 337. Frame capture waveforms in snapshot mode

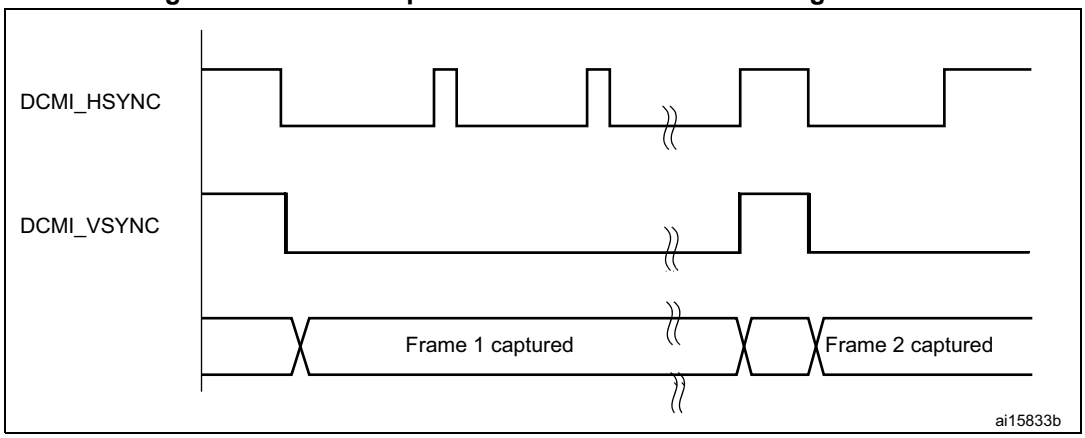


1. Here, the active state of DCMI_HSYNC and DCMI_VSYNC is 1.
2. DCMI_HSYNC and DCMI_VSYNC can change states at the same time.

Continuous grab mode

In this mode (CM bit = 0 in DCMI_CR), once the CAPTURE bit has been set in DCMI_CR, the grabbing process starts on the next DCMI_VSYNC or embedded frame start depending on the mode. The process continues until the CAPTURE bit is cleared in DCMI_CR. Once the CAPTURE bit has been cleared, the grabbing process continues until the end of the current frame.

Figure 338. Frame capture waveforms in continuous grab mode



1. Here, the active state of DCMI_HSYNC and DCMI_VSYNC is 1.
2. DCMI_HSYNC and DCMI_VSYNC can change states at the same time.

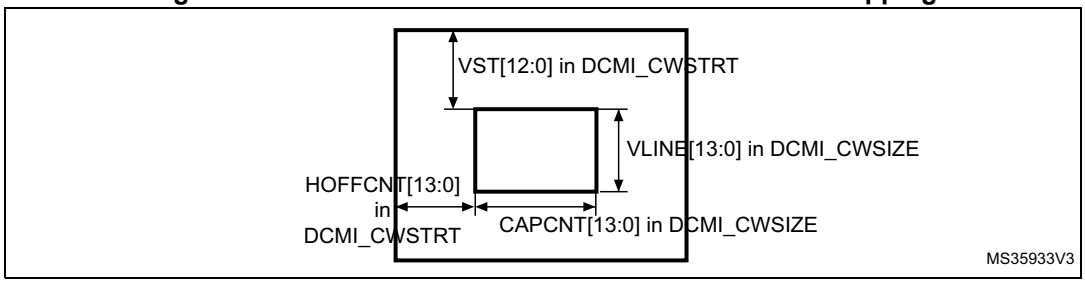
In continuous grab mode, the FCRC[1:0] bits in DCMI_CR can be configured to grab all pictures, every second picture or one out of four pictures to decrease the frame capture rate.

Note: In the hardware synchronization mode (ESS = 0 in DCMI_CR), the IT_VSYNC interrupt is generated (if enabled) even when CAPTURE = 0 in DCMI_CR so, to reduce the frame capture rate even further, the IT_VSYNC interrupt can be used to count the number of frames between 2 captures in conjunction with the Snapshot mode. This is not allowed by embedded data synchronization mode.

41.3.8 DCMI crop feature

With the crop feature, the camera interface can select a rectangular window from the received image. The start (upper left corner) coordinates and size (horizontal dimension in number of pixel clocks and vertical dimension in number of lines) are specified using two 32-bit registers (DCMI_CWSTRT and DCMI_CWSIZE). The size of the window is specified in number of pixel clocks (horizontal dimension) and in number of lines (vertical dimension).

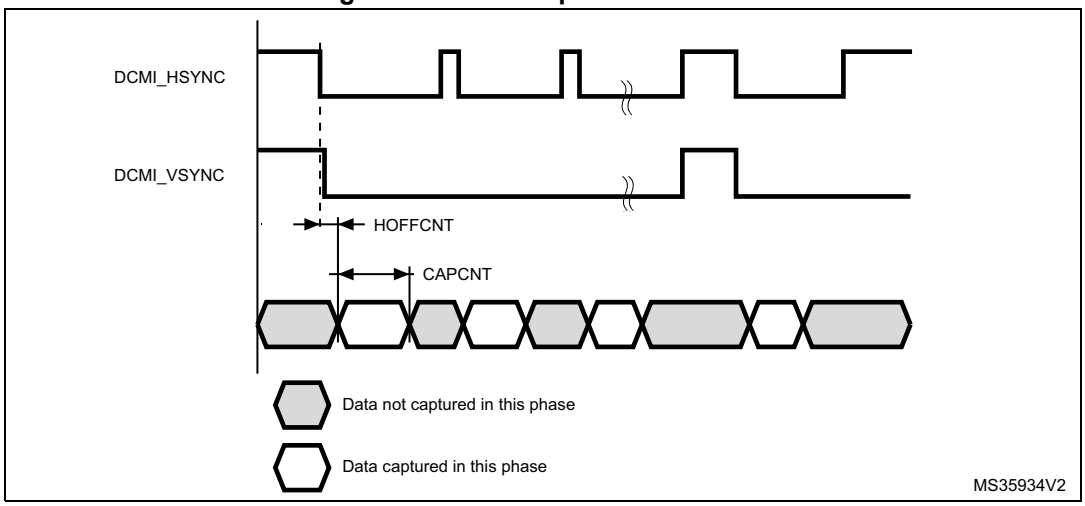
Figure 339. Coordinates and size of the window after cropping



These registers specify the coordinates of the starting point of the capture window as a line number (in the frame, starting from 0) and a number of pixel clocks (on the line, starting from 0), and the size of the window as a line number and a number of pixel clocks. The CAPCNT value can only be a multiple of 4 (two least significant bits are forced to 0) to allow the correct transfer of data through the DMA.

If the DCMI_VSYNC signal goes active before the number of lines is specified in the DCMI_CWSIZE register, then the capture stops and an IT_FRAME interrupt is generated when enabled.

Figure 340. Data capture waveforms



1. Here, the active state of DCMI_HSYNC and DCMI_VSYNC is 1.
2. DCMI_HSYNC and DCMI_VSYNC can change states at the same time.

41.3.9 DCMI JPEG format

To allow JPEG image reception, it is necessary to set the JPEG bit of the DCMI_CR register. JPEG images are not stored as lines and frames, so the DCMI_VSYNC signal is used to start the capture while DCMI_HSYNC serves as a data enable signal. The number of bytes in a line may not be a multiple of 4. This case must be carefully handled since a DMA request is generated each time a complete 32-bit word has been constructed from the captured data. When an end of frame is detected and the 32-bit word to be transferred has not been completely received, the remaining data are padded with zeros and a DMA request is generated.

The crop feature and embedded synchronization codes cannot be used in JPEG format.

41.3.10 DCMI FIFO

A 8-word FIFO is implemented to manage data rate transfers on the AHB. The DCMI features a simple FIFO controller with a read pointer incremented each time the camera interface reads from the AHB, and a write pointer incremented each time the camera interface writes to the FIFO. There is no overrun protection to prevent the data from being overwritten if the AHB interface does not sustain the data transfer rate.

In case of overrun or errors in the synchronization signals, the FIFO is reset and the DCMI interface waits for a new start of frame.

41.3.11 DCMI data format description

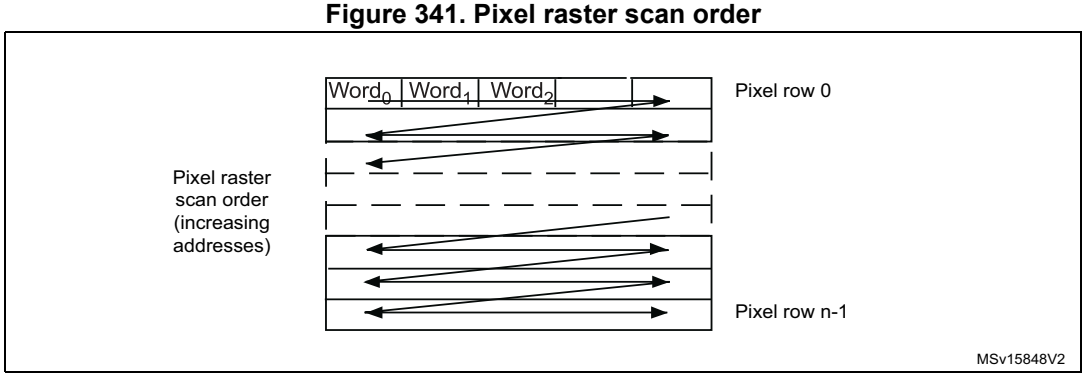
Data formats

The following types of data are supported:

- 8/10/12/14-bit progressive video: either monochrome or raw Bayer format
- YCbCr 4:2:2 progressive video
- RGB565 progressive video. A pixel coded in 16 bits (5 bits for blue, 5 bits for red, 6 bits for green) takes two clock cycles to be transferred
- compressed data: JPEG

For monochrome, RGB and YCbCr, the frame buffer is stored in raster mode. 32-bit words are used. Only the little-endian format is supported.

Figure 341. Pixel raster scan order



Monochrome format

Characteristics:

- Raster format
- 8 bits per pixel

The table below shows how the data are stored.

Table 366. Data storage in monochrome progressive video format

Byte address	31:24	23:16	15:8	7:0
0	n + 3	n + 2	n + 1	n
4	n + 7	n + 6	n + 5	n + 4

RGB format

Characteristics:

- Raster format
- RGB
- Interleaved: one buffer: R, G and B interleaved (such as BRGBRGBRG)
- Optimized for display output

The RGB planar format is compatible with standard OS frame buffer display formats.

Only 16 BPP (bits per pixel): RGB565 (2 pixels per 32-bit word) is supported.

The 24 BPP (palletized format) and gray-scale formats are not supported. Pixels are stored in a raster scan order, that is from top to bottom for pixel rows, and from left to right within a pixel row. Pixel components are R (red), G (green) and B (blue). All components have the same spatial resolution (4:4:4 format). A frame is stored in a single part, with the components interleaved on a pixel basis.

The table below shows how the data are stored.

Table 367. Data storage in RGB progressive video format

Byte address	31:27	26:21	20:16	15:11	10:5	4:0
0	Red n + 1	Green n + 1	Blue n + 1	Red n	Green n	Blue n
4	Red n + 4	Green n + 3	Blue n + 3	Red n + 2	Green n + 2	Blue n + 2

YCbCr format

Characteristics:

- Raster format
- YCbCr 4:2:2
- Interleaved: one buffer: Y, Cb and Cr interleaved (such as CbYCrYCbYCr)

Pixel components are Y (luminance or “luma”), Cb and Cr (chrominance or “chroma” blue and red). Each component is encoded in 8 bits. Luma and chroma are stored together (interleaved) as shown in the table below.

Table 368. Data storage in YCbCr progressive video format

Byte address	31:24	23:16	15:8	7:0
0	Y n + 1	Cr n	Y n	Cb n
4	Y n + 3	Cr n + 2	Y n + 2	Cb n + 2

YCbCr format - Y only

Characteristics:

- Raster format
- YCbCr 4:2:2
- The buffer only contains Y information - monochrome image

Pixel components are Y (luminance or “luma”), Cb and Cr (chrominance or “chroma” blue and red). In this mode, the chroma information is dropped. Only the luma component of each pixel, encoded in 8 bits, is stored as shown in *Table 369*.

The result is a monochrome image having the same resolution as the original YCbCr data.

Table 369. Data storage in YCbCr progressive video format - Y extraction mode

Byte address	31:24	23:16	15:8	7:0
0	Y n + 3	Y n + 2	Y n + 1	Y n
4	Y n + 7	Y n + 6	Y n + 5	Y n + 4

Half resolution image extraction

This is a modification of the previous reception modes, being applicable to monochrome, RGB or Y extraction modes.

This mode is used to only store a half resolution image. It is selected through OELS and LSM control bits.

41.4 DCMI interrupts

Five interrupts are generated. All interrupts are maskable by software. The global interrupt (dcmi_it) is the OR of all the individual interrupts. The table below gives the list of all interrupts.

Table 370. DCMI interrupts

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exits Sleep mode	Exists Stop and Standby modes
dcmi_it	End of line	LINE_RIS	LINE_IE	Set LINE_ISC	Yes	No
	End of frame capture	FRAME_RIS	FRAME_IE	Set FRAME_ISC	Yes	No
	Overrun of data reception	OVR_RIS	OVR_IE	Set OVR_ISC	Yes	No
	Synchronization frame	VSYNC_RIS	VSYNC_IE	Set VSYNC_ISC	Yes	No
	Detection of an error in the embedded synchronization frame detection	ERR_RIS	ERR_IE	Set ERR_ISC	Yes	No

41.5 DCMI registers

Refer to *Section 1.2 on page 167* for list of abbreviations used in register descriptions. All DCMI registers must be accessed as 32-bit words, otherwise a bus error occurs.

41.5.1 DCMI control register (DCMI_CR)

Address offset: 0x00

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OELS	LSM	OEBS	BSM[1:0]	
											rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	ENABLE	Res.	Res.	EDM[1:0]		FCRC[1:0]		VSPOL	HSPOL	PCKPOL	ESS	JPEG	CROP	CM	CAPTURE
	rw			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bit 20 **OELS:** Odd/Even Line Select (Line Select Start)
This bit works in conjunction with the LSM field (LSM = 1).
0: Interface captures first line after the frame start, second one being dropped.
1: Interface captures second line from the frame start, first one being dropped.

Bit 19 **LSM:** Line Select mode
0: Interface captures all received lines.
1: Interface captures one line out of two.

Bit 18 **OEBS:** Odd/Even Byte Select (Byte Select Start)
This bit works in conjunction with BSM field (BSM ≠ 00).
0: Interface captures first data (byte or double byte) from the frame/line start, second one being dropped.
1: Interface captures second data (byte or double byte) from the frame/line start, first one being dropped.

Bits 17:16 **BSM[1:0]:** Byte Select mode
00: Interface captures all received data.
01: Interface captures every other byte from the received data.
10: Interface captures one byte out of four.
11: Interface captures two bytes out of four.
Note: This mode only works for EDM[1:0] = 00. For all other EDM values, this field must be programmed to the reset value.

Bit 15 Reserved, must be kept at reset value.

Bit 14 **ENABLE:** DCMI enable
0: DCMI disabled
1: DCMI enabled
Note: The DCMI configuration registers must be programmed correctly before enabling this bit.

Bits 13:12 Reserved, must be kept at reset value.

Bits 11:10 **EDM[1:0]:** Extended data mode
00: Interface captures 8-bit data on every pixel clock.
01: Interface captures 10-bit data on every pixel clock.
10: Interface captures 12-bit data on every pixel clock.
11: Interface captures 14-bit data on every pixel clock.

Bits 9:8 **FCRC[1:0]:** Frame capture rate control
These bits define the frequency of frame capture. They are meaningful only in Continuous grab mode. They are ignored in snapshot mode.
00: All frames are captured.
01: Every alternate frame captured (50% bandwidth reduction)
10: One frame out of four captured (75% bandwidth reduction)
11: reserved

Bit 7 **VSPOL:** Vertical synchronization polarity
This bit indicates the level on the DCMI_VSYNC pin when the data are not valid on the parallel interface.
0: DCMI_VSYNC active low
1: DCMI_VSYNC active high

Bit 6 **HSPOL:** Horizontal synchronization polarity

This bit indicates the level on the DCMI_HSYNC pin when the data are not valid on the parallel interface.

0: DCMI_HSYNC active low

1: DCMI_HSYNC active high

Bit 5 **PCKPOL:** Pixel clock polarity

This bit configures the capture edge of the pixel clock.

0: Falling edge active

1: Rising edge active

Bit 4 **ESS:** Embedded synchronization select

0: Hardware synchronization data capture (frame/line start/stop) is synchronized with the DCMI_HSYNC/DCMI_VSYNC signals.

1: Embedded synchronization data capture is synchronized with synchronization codes embedded in the data flow.

Note: Valid only for 8-bit parallel data. HSPOL/VSPOL are ignored when the ESS bit is set.

This bit is disabled in JPEG mode.

Bit 3 **JPEG:** JPEG format

0: Uncompressed video format

1: This bit is used for JPEG data transfers. The DCMI_HSYNC signal is used as data enable. The crop and embedded synchronization features (ESS bit) cannot be used in this mode.

Bit 2 **CROP:** Crop feature

0: The full image is captured. In this case the total number of bytes in an image frame must be a multiple of four.

1: Only the data inside the window specified by the crop register is captured. If the size of the crop window exceeds the picture size, then only the picture size is captured.

Bit 1 **CM:** Capture mode

0: Continuous grab mode - The received data are transferred into the destination memory through the DMA. The buffer location and mode (linear or circular buffer) is controlled through the system DMA.

1: Snapshot mode (single frame) - Once activated, the interface waits for the start of frame and then transfers a single frame through the DMA. At the end of the frame, the CAPTURE bit is automatically reset.

Bit 0 **CAPTURE:** Capture enable

0: Capture disabled

1: Capture enabled

The camera interface waits for the first start of frame, then a DMA request is generated to transfer the received data into the destination memory.

In snapshot mode, the CAPTURE bit is automatically cleared at the end of the first frame received.

In continuous grab mode, if the software clears this bit while a capture is ongoing, the bit is effectively cleared after the frame end.

Note: The DMA controller and all DCMI configuration registers must be programmed correctly before enabling this bit.

41.5.2 DCMI status register (DCMI_SR)

Address offset: 0x04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FNE	VSYNC	HSYNC
													r	r	r

Bits 31:3 Reserved, must be kept at reset value.

Bit 2 **FNE**: FIFO not empty

This bit gives the status of the FIFO.
1: FIFO contains valid data.
0: FIFO empty

Bit 1 **VSYNC**: Vertical synchronization

This bit gives the state of the DCMI_VSYNC pin with the correct programmed polarity. When embedded synchronization codes are used, the meaning of this bit is the following:
0: active frame
1: synchronization between frames
In case of embedded synchronization, this bit is meaningful only if the CAPTURE bit in DCMI_CR is set.

Bit 0 **HSYNC**: Horizontal synchronization

This bit gives the state of the DCMI_HSYNC pin with the correct programmed polarity. When embedded synchronization codes are used, the meaning of this bit is the following:
0: active line
1: synchronization between lines
In case of embedded synchronization, this bit is meaningful only if the CAPTURE bit in DCMI_CR is set.

41.5.3 DCMI raw interrupt status register (DCMI_RIS)

DCMI_RIS gives the raw interrupt status and is accessible in read only. When read, this register returns the status of the corresponding interrupt before masking with the DCMI_IER register value.

Address offset: 0x08

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LINE_RIS	VSYNC_RIS	ERR_RIS	OVR_RIS	FRAME_RIS
											r	r	r	r	r

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **LINE_RIS**: Line raw interrupt status

This bit gets set when the DCMI_HSYNC signal changes from the inactive state to the active state. It goes high even if the line is not valid.

In the case of embedded synchronization, this bit is set only if the CAPTURE bit in DCMI_CR is set.

It is cleared by setting the LINE_ISC bit of the DCMI_ICR register.

Bit 3 **VSYNC_RIS**: DCMI_VSYNC raw interrupt status

This bit is set when the DCMI_VSYNC signal changes from the inactive state to the active state.

In the case of embedded synchronization, this bit is set only if the CAPTURE bit is set in DCMI_CR.

It is cleared by setting the VSYNC_ISC bit of the DCMI_ICR register.

Bit 2 **ERR_RIS**: Synchronization error raw interrupt status

0: No synchronization error detected

1: Embedded synchronization characters are not received in the correct order.

This bit is valid only in the embedded synchronization mode. It is cleared by setting the ERR_ISC bit of the DCMI_ICR register.

Note: This bit is available only in embedded synchronization mode.

Bit 1 **OVR_RIS**: Overrun raw interrupt status

0: No data buffer overrun occurred

1: A data buffer overrun occurred and the data FIFO is corrupted.

The bit is cleared by setting the OVR_ISC bit of the DCMI_ICR register.

Bit 0 **FRAME_RIS**: Capture complete raw interrupt status

0: No new capture

1: A frame has been captured.

This bit is set when a frame or window has been captured.

In case of a cropped window, this bit is set at the end of line of the last line in the crop. It is set even if the captured frame is empty (for example window cropped outside the frame).

The bit is cleared by setting the FRAME_ISC bit of the DCMI_ICR register.

41.5.4 DCMI interrupt enable register (DCMI_IER)

The DCMI_IER register is used to enable interrupts. When one of the DCMI_IER bits is set, the corresponding interrupt is enabled. This register is accessible in both read and write.

Address offset: 0x0C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LINE_IE	VSYNC_IE	ERR_IE	OVR_IE	FRAME_IE
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **LINE_IE**: Line interrupt enable
0: No interrupt generation when the line is received
1: An Interrupt is generated when a line has been completely received.

Bit 3 **VSYNC_IE**: DCMI_VSYNC interrupt enable
0: No interrupt generation
1: An interrupt is generated on each DCMI_VSYNC transition from the inactive to the active state.
The active state of the DCMI_VSYNC signal is defined by the VSPOL bit.

Bit 2 **ERR_IE**: Synchronization error interrupt enable
0: No interrupt generation
1: An interrupt is generated if the embedded synchronization codes are not received in the correct order.
Note: This bit is available only in embedded synchronization mode.

Bit 1 **OVR_IE**: Overrun interrupt enable
0: No interrupt generation
1: An interrupt is generated if the DMA was not able to transfer the last data before new data (32-bit) are received.

Bit 0 **FRAME_IE**: Capture complete interrupt enable
0: No interrupt generation
1: An interrupt is generated at the end of each received frame/crop window (in crop mode).

41.5.5 DCMI masked interrupt status register (DCMI_MIS)

This DCMI_MIS register is a read-only register. When read, it returns the current masked status value (depending on the value in DCMI_IER) of the corresponding interrupt. A bit in this register is set if the corresponding enable bit in DCMI_IER is set and the corresponding bit in DCMI_RIS is set.

Address offset: 0x10

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LINE_MIS	VSYNC_MIS	ERR_MIS	OVR_MIS	FRAME_MIS
											r	r	r	r	r

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **LINE_MIS**: Line masked interrupt status
This bit gives the status of the masked line interrupt.
0: No interrupt generation when the line is received
1: An Interrupt is generated when a line has been completely received and the LINE_IE bit is set in DCMI_IER.

Bit 3 **VSYNC_MIS**: VSYNC masked interrupt status

This bit gives the status of the masked VSYNC interrupt.

0: No interrupt is generated on DCMI_VSYNC transitions.

1: An interrupt is generated on each DCMI_VSYNC transition from the inactive to the active state and the VSYNC_IE bit is set in DCMI_IER.

The active state of the DCMI_VSYNC signal is defined by the VSPOL bit.

Bit 2 **ERR_MIS**: Synchronization error masked interrupt status

This bit gives the status of the masked synchronization error interrupt.

0: No interrupt is generated on a synchronization error.

1: An interrupt is generated if the embedded synchronization codes are not received in the correct order and the ERR_IE bit in DCMI_IER is set.

Note: This bit is available only in embedded synchronization mode.

Bit 1 **OVR_MIS**: Overrun masked interrupt status

This bit gives the status of the masked overflow interrupt.

0: No interrupt is generated on overrun.

1: An interrupt is generated if the DMA was not able to transfer the last data before new data (32-bit) are received and the OVR_IE bit is set in DCMI_IER.

Bit 0 **FRAME_MIS**: Capture complete masked interrupt status

This bit gives the status of the masked capture complete interrupt

0: No interrupt is generated after a complete capture.

1: An interrupt is generated at the end of each received frame/crop window (in crop mode) and the FRAME_IE bit is set in DCMI_IER.

41.5.6 DCMI interrupt clear register (DCMI_ICR)

The DCMI_ICR register is write-only. Setting a bit of this register clears the corresponding flag in the DCMI_RIS and DCMI_MIS registers. Writing 0 has no effect.

Address offset: 0x14

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LINE_ISC	VSYNC_ISC	ERR_ISC	OVR_ISC	FRAME_ISC
											w	w	w	w	w

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **LINE_ISC**: line interrupt status clear

Setting this bit clears the LINE_RIS flag in the DCMI_RIS register.

Bit 3 **VSYNC_ISC**: Vertical Synchronization interrupt status clear

Setting this bit clears the VSYNC_RIS flag in the DCMI_RIS register.

Bit 2 **ERR_ISC**: Synchronization error interrupt status clear

Setting this bit clears the ERR_RIS flag in the DCMI_RIS register.

Note: This bit is available only in embedded synchronization mode.

Bit 1 **OVR_ISC**: Overrun interrupt status clear
Setting this bit clears the OVR_RIS flag in the DCMI_RIS register.

Bit 0 **FRAME_ISC**: Capture complete interrupt status clear
Setting this bit clears the FRAME_RIS flag in the DCMI_RIS register.

41.5.7 DCMI embedded synchronization code register (DCMI_ESCR)

Address offset: 0x18

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FEC[7:0]								LEC[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LSC[7:0]								FSC[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **FEC[7:0]**: Frame end delimiter code
This byte specifies the code of the frame end delimiter. The code consists of 4 bytes in the form of 0xFF, 0x00, 0x00, FEC.
If FEC is programmed to 0xFF, all the unused codes (0xFF0000XY) are interpreted as frame end delimiters.

Bits 23:16 **LEC[7:0]**: Line end delimiter code
This byte specifies the code of the line end delimiter. The code consists of 4 bytes in the form of 0xFF, 0x00, 0x00, LEC.

Bits 15:8 **LSC[7:0]**: Line start delimiter code
This byte specifies the code of the line start delimiter. The code consists of 4 bytes in the form of 0xFF, 0x00, 0x00, LSC.

Bits 7:0 **FSC[7:0]**: Frame start delimiter code
This byte specifies the code of the frame start delimiter. The code consists of 4 bytes in the form of 0xFF, 0x00, 0x00, FSC.
If FSC is programmed to 0xFF, no frame start delimiter is detected. But, the first occurrence of LSC after an FEC code is interpreted as a start of frame delimiter.

41.5.8 DCMI embedded synchronization unmask register (DCMI_ESUR)

Address offset: 0x1C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FEU[7:0]								LEU[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LSU[7:0]								FSU[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 **FEU[7:0]**: Frame end delimiter unmask

This byte specifies the mask to be applied to the code of the frame end delimiter.
0: The corresponding bit in the FEC byte in DCMI_ESCR is masked while comparing the frame end delimiter with the received data.
1: The corresponding bit in the FEC byte in DCMI_ESCR is compared while comparing the frame end delimiter with the received data.

Bits 23:16 **LEU[7:0]**: Line end delimiter unmask

This byte specifies the mask to be applied to the code of the line end delimiter.
0: The corresponding bit in the LEC byte in DCMI_ESCR is masked while comparing the line end delimiter with the received data.
1: The corresponding bit in the LEC byte in DCMI_ESCR is compared while comparing the line end delimiter with the received data.

Bits 15:8 **LSU[7:0]**: Line start delimiter unmask

This byte specifies the mask to be applied to the code of the line start delimiter.
0: The corresponding bit in the LSC byte in DCMI_ESCR is masked while comparing the line start delimiter with the received data.
1: The corresponding bit in the LSC byte in DCMI_ESCR is compared while comparing the line start delimiter with the received data.

Bits 7:0 **FSU[7:0]**: Frame start delimiter unmask

This byte specifies the mask to be applied to the code of the frame start delimiter.
0: The corresponding bit in the FSC byte in DCMI_ESCR is masked while comparing the frame start delimiter with the received data.
1: The corresponding bit in the FSC byte in DCMI_ESCR is compared while comparing the frame start delimiter with the received data.

41.5.9 DCMI crop window start (DCMI_CWSTRT)

Address offset: 0x20

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	VST[12:0]												
			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	HOFFCNT[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:16 **VST[12:0]**: Vertical start line count

The image capture starts with this line number. Previous line data are ignored.
0x0000: line 1
0x0001: line 2
0x0002: line 3
....

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **HOFFCNT[13:0]**: Horizontal offset count

This value gives the number of pixel clocks to count before starting a capture.

41.5.10 DCMI crop window size (DCMI_CWSIZE)

Address offset: 0x24

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	VLINE[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	CAPCNT[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:16 **VLINE[13:0]**: Vertical line count

This value gives the number of lines to be captured from the starting point.
0x0000: 1 line
0x0001: 2 lines
0x0002: 3 lines
....

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:0 **CAPCNT[13:0]**: Capture count

This value gives the number of pixel clocks to be captured from the starting point on the same line. It value must corresponds to word-aligned data for different widths of parallel interfaces.
0x0000: 1 pixel
0x0001: 2 pixels
0x0002: 3 pixels
....

41.5.11 DCMI data register (DCMI_DR)

Address offset: 0x28

Reset value: 0x0000 0000

The digital camera Interface packages all the received data in 32-bit format before requesting a DMA transfer. A 8-word deep FIFO is available to leave enough time for DMA transfers and avoid DMA overrun conditions.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Refer to *Section 2.4: Memory organization* for the register boundary addresses.

42 Digital camera interface pixel pipeline (DCMIPP)

42.1 DCMIPP introduction

The DCMIPP is the pixel pipeline section of a high-resolution camera subsystem: it gets pixels from a parallel or a CSI interface, and after some processing (such as decimation, cropping, downsize, color conversion, gamma correction, auto-exposure) dumps them to the memory.

DCMIPP supports multiple types of external sensors, among others:

- dumb sensors (without internal ISP), which output raw Bayer pixels
- smart sensors (with an internal ISP), which usually output RGB or YUV pixels
- smart sensors with internal compression, which output a bit-stream (such as JPEG, or H264)
- sensors with interlaced video, which output their odd and even fields sequentially

The DCMIPP input interface integrates a parallel interface (up to 16 bits at 120 MHz, with internal/external synchronization), and makes it possible to abut an external CSI-2 host (one to two data lanes, up to 2.5 Gbps/lane).

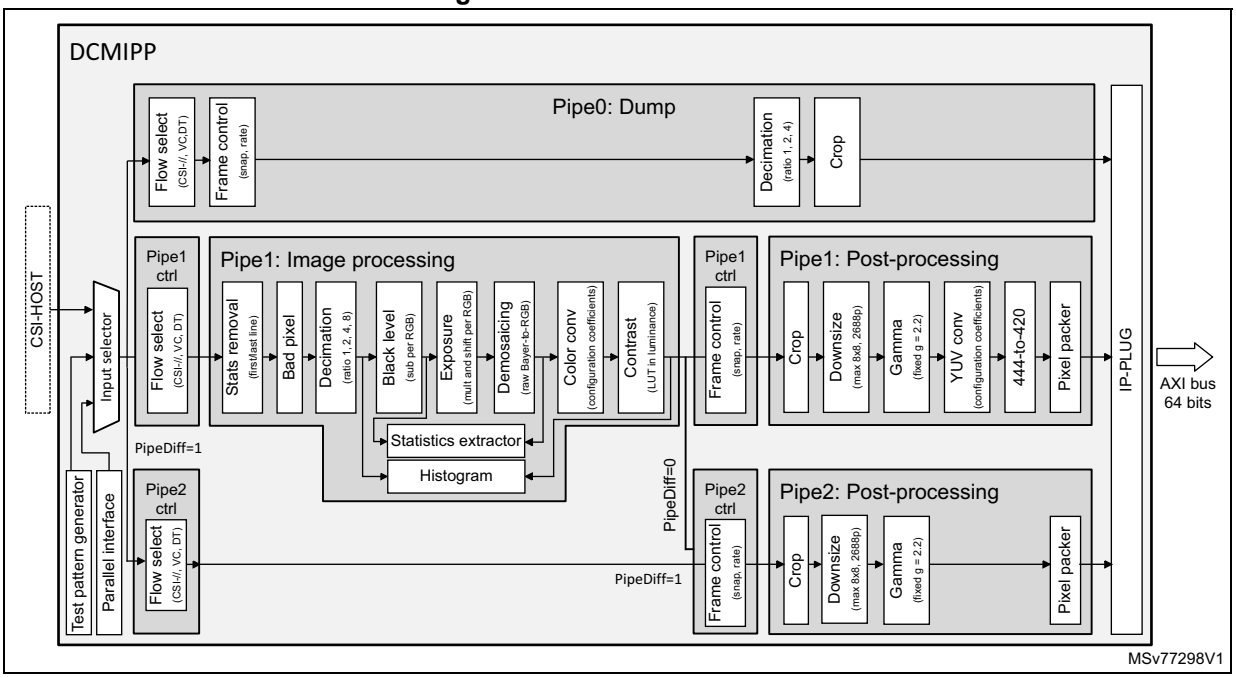
A first common part of the DCMIPP selects the input exclusively from the parallel or the CSI interfaces. Data go to dedicated pipeline(s) before they are sent to memory for further processing or display purposes.

Table 372. Available pipelines

ID	Function	Description
Pipe0	Dump pipe	Used to dump the received data as-is, without any processing (for example. without pixel extraction, no formatting), with an exception: it formats the CSI 10/12/14-bit raw Bayer components mapped unpacked into 16-bit memory words, to ease the job of a downstream application. 2D crop operation and basic decimation can be performed within this pipe.
Pipe1	Main pipe	Typically used for the main needs (such as video encode, software analysis, neural network), it allows to downsize the input, convert its color and dump to multiple pixel formats, including multi-planar ones. It can adapt the luminosity (gamma conversion) as well as auto-exposure and black level calibration based on its own embedded image processing functions, handling camera sensor without internal ISP. It can convert the raw Bayer to RGB (demosaicing). Pipe1 shares all the image processing functions with Pipe2.
Pipe2	Ancillary pipe	Typically used for ancillary needs (such as a permanent display), also allows to downsize the input and dump to several pixel formats, however restricted to coplanar ones (as specialized for display-like usage).

Figure 342 shows the DCMIPP main functions, namely the integrated parallel interface, the abutted CSI-2 host, the ISP functions in Pipe1 and shareable with Pipe2, the differentiated applicative post-processing pipelines with their crop, downsize, and pixel formatting.

Figure 342. DCMIPP overview



In the ISP processing, and therefore before the post-processing pipes (Pipe1 and Pipe2), the component dynamic is reduced to 8 bits per component. If the software intends to benefit of the wider dynamic, the input data must be dumped via Pipe0, which keeps the input pixel format (10/12/14 bpp) when storing them in memory.

Table 373. Glossary

Item	Definition
A	Alpha component, used to define transparency, opaque = 0xFF, for example ARGB.
3A (or AAA)	In ISP domain: acronym for AE-AF-AWB, algorithms automatically correcting pictures: – AE: automatic exposure control (adapts exposure or sensibility of sensor) – AF: automatic focus control (adapts the focus) – AWB: automatic white balance (adapts the color tones to have a white balance).
BPC	Bits per component (for example, RGB565 has five bits for the red component, hence 5 bpc)
BPP	Bits per pixel (for example, RGB565 has 16 bits per pixel, hence 16 bpp)
CSI	Camera serial interface, and its latest standard by MIPI®, the CSI-2 v1.3 (and v2.0)
DCMIPP_	Digital camera interface - Pixel pipeline
DT	Data type, used in the CSI-2 standard. The data type is a concept similar to the pixel format, but adds support for other data like the byte format.
Interlaced	Interlaced video: the field with odd lines is transmitted first, followed, after the last odd line, by the field with even lines. The two fields are thus consecutive but exclusive.
Interleaved	Interleaved packets, applies to CSI-2: two groups of packets transmitted by the sensor can be emitted mixed, as a packet granularity.

Table 373. Glossary (continued)

Item	Definition
ISP	Image signal processing: algorithms that retune the sensor output (through correction of pixels, demosaicing, lens-correction, light/contrast correction) to build a good quality picture.
NPU	Neural network processing engine (also known as NN, neural network).
Planar	Defines in how many sub-buffers a pixel buffer is split into: 1 (coplanar), 2 (semi-planar), 3 (full planar).
VC	Virtual channel, used in the CSI-2 standard, makes it possible to simultaneously transmit up to four parallel flows (in CSI-2 v1.3) or more (in CSI-2 v2.0).
YUV444	Pixel format, YUV color reference, all three components (Y, U, V) given per pixel.
YUV422	Pixel format, YUV color reference, chroma component (U, V) sub-sampled 1/2 in X

42.2 DCMIPP main features

- Parallel input interface:
  - Pixel rate: up to 16 bits in parallel, 100 Mpixel/s (typically 1080p30, maximum 2048x2048 on processing pipelines after decimation).
  - Pixel format: RGB565, RGB888, YUV422, raw Bayer/Mono 8/10/12/14, and ByteStream (JPEG)
- CSI-2 host input interface:
  - Pixel rate: 32 bits in parallel at 200 Mpixel/s (typically 5 MPixel x30), supports MIPI® CSI-2 v1.3
  - Pixel format: all MIPI CSI-2 v1.3, among others RGB565, RGB888, YUV422, raw Bayer (see *Table 379*)
  - Abutted CSI-2 host IP: 1-to-2 DL at up to 2.5 Gbps/lane
  - Features: Interleaved packets, four virtual channels
- Test pattern generator:
  - Color bar or square pattern, up to 16k x 16k, YUV, raw, or Mono
- Pipeline maximum resolution:
  - Dimensioned for 5 Mpixel (typically 2560 x 2048 or 2688 x 1944) before decimation
  - Maximum pipe resolution: 4094 x 4094
  - Maximum demosaicing or downsize or YUV420 width: 2688 pixels
- Pipe pixel rate: 200 Mpixel/s peak (150 Mpixel/s average + blanking)
- Maximum frame per second (fps): typical examples are defined with 30 fps, it is possible to reach higher rates (for example 120 fps) by decreasing image resolution to guarantee the maximum pixel rate constraints.
- Flow selection and frame control:
  - CSI-2 interleaved packets supported (with some restrictions)
  - Capture mode in Continuous vs. Snapshot mode
- Byte-to-pixel conversion:
  - Enables the above flexible input pixel formats to be extracted and fed to pipes
  - Non-extracted pixel formats can still be dumped via Pipe0, to allow an ad-hoc software extraction
- Statistic removal:
  - To remove unused metadata (like statistics) from received pictures
- Bad pixel removal (automatic detection and correction of bad pixels from sensor array)
- Decimation of one pixel every 1/2/4/8:
  - Decimation to fit the demosaicing (maximum 2688 pixel width)
  - Raw Bayer format support, via a decimation of components (2 by 2)
- Integrated image processing block, which makes possible to connect very low cost camera modules without any embedded ISP
  - Black level calibration
  - Statistics extraction
    - > To extract average R, G, B, L values (for auto exposure and white balance)
    - > To sort any R, G, B, L value into 12 dynamic bins (for contrast enhancement)

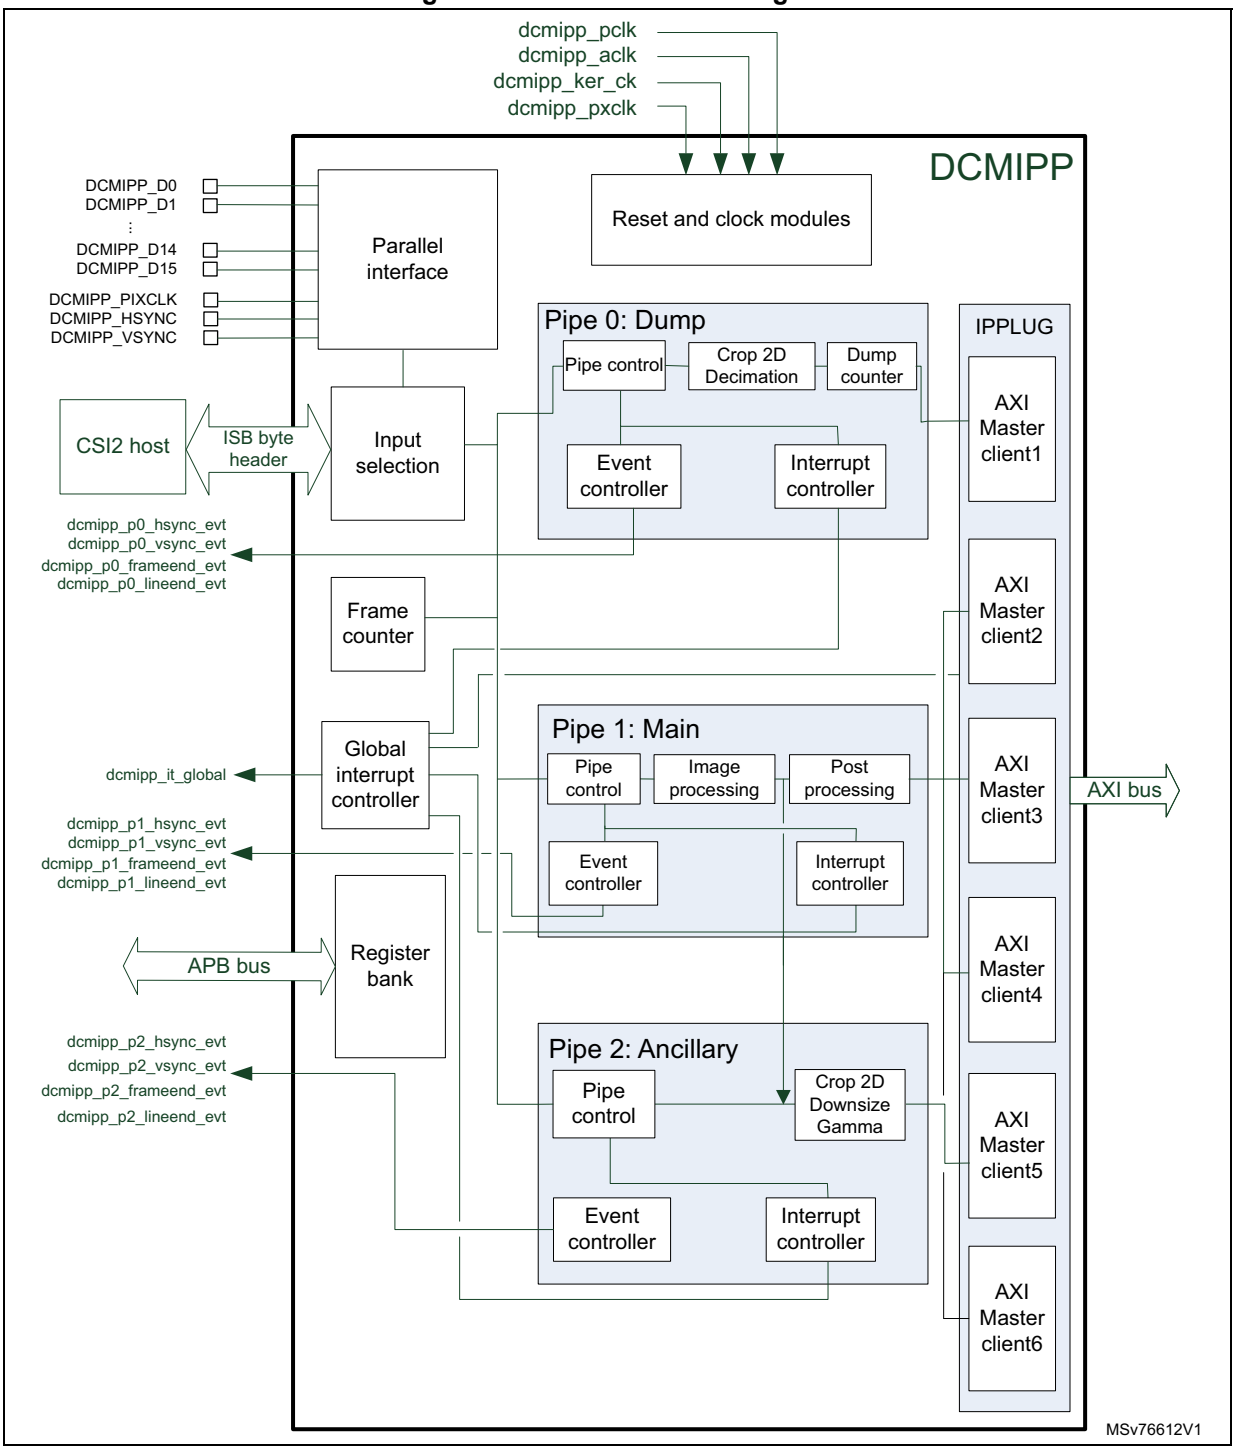
    - > Histogram extraction to extract R, Gr, Gb, B or R, G, B, L, into 4, 16, 64, or 256 bins, and from a grid (max 16x16 regions). Data are exported per frame to the system memory.
  - Exposure control (amplifies the exposure up to 256x)
    - > To smoothly adapt to dark exposures
  - Raw Bayer to RGB conversion (demosaicing)
    - > Mid quality conversion for display and software analysis purposes (high quality conversion can be done in software upon trigger, for still-image only)
    - > Algorithm with a 4 x 3 heuristic analysis matrix
  - Color conversion to adapt to the sensor and tune the illumination
    - > Configurable coefficients, to map any linear tuning
  - Contrast enhancement
    - > Non-linear luminance tuning, linearized across eight luminance segments.
- Decimation on Pipe0 (dump pipe)
  - Pure sub-sampling, ratio 1 vs. 1, 2, 4 in X and ratio 1 vs. 1, 2 in Y (no X if CSI source)
- Parallel pipelines for parallel applications:
  - Pipe0 (for data dump) for a direct dump without processing
  - Pipe1 (for main usage) with downsize, ColorConv, decimation, multi-planar
  - Pipe2 (for ancillary usage) with downsize, decimation, coplanar
- Downsize
  - Decimation, optional pre-processing, sub-sampling ratio 1 vs. 1, 2, 4, 8 in X and Y
  - Box-filtering, with any decimal ratio up to 8x8, on Pipe1 and Pipe2
- Gamma conversion for display:
  - Non-linear transform, with seven interpolated segments, with static coefficient for G = 2.2
- Color conversion 2 for RGB to YUV conversion:
  - to/from YUV: 12 coefficients (BT.601, 709, any), with optional range ext/clamp
- Output pixel format:
  - Pipe0: any data as-is, Y/Rb: 8/10/12/14 statistics, bit streams
  - Pipe2: 888, 565, 422-1, Y8, ARGB and RGBA (coplanar only)
  - Pipe1: adds 422-2, 420-2, 420-3 (multi-planar possible) to Pipe2 formats
- AXI master:
  - Output FIFOs to drain pixel/data to the memory (linked to the memory latency) from the pipe(s)
  - The unique AXI-Master interface implements one client per pipe, with semi- or multi-planar pipes using, respectively, two or three clients
- Overrun detection:
  - Notification in case of frame impacted by pixel congestion (no impact on the following frame if the congestion cause is solved)

42.3 DCMIPP functional description

42.3.1 DCMIPP block diagram

The block diagram of the DCMIPP is shown in *Figure 343*.

Figure 343. DCMIPP block diagram



42.3.2 DCMIPP pads and internal signals

Table 374. DCMIPP input/output pads

Pin name	Signal type	Description
DCMIPP_Dn (n = 0 to 15)	Input	Bit n of the parallel data bus coming from the camera sensor
DCMIPP_PIXCLK	Input	Pixel clock sent by the master (parallel camera sensor module)
DCMIPP_VSYNC	Input	VSYNC signal (vertical synchronization) coming from the camera sensor
DCMIPP_HSYNC	Input	HSYNC signal (horizontal synchronization) coming from the camera sensor

Table 375. DCMIPP input/output pins

Internal signal name	Signal type	Description
dcmipp_pclk	Input	DCMIPP APB clock (APB bus)
dcmipp_aclk	Input	DCMIPP AXI clock (AXI bus)
dcmipp_ker_ck	Input	Interface from the CSI2 host
dcmipp_it_global	Output	DCMIPP interrupts (refer to *Table 410* for the full list of interrupt sources)
dcmipp_p0_hsync_evt	Output	Pipe0 Hsync event
dcmipp_p0_vsync_evt		Pipe0 Vsync event
dcmipp_p0_frameend_evt		Pipe0 frame end event
dcmipp_p0_lineend_evt		Pipe0 line event
dcmipp_p1_hsync_evt	Output	Pipe1 Hsync event
dcmipp_p1_vsync_evt		Pipe1 Vsync event
dcmipp_p1_frameend_evt		Pipe1 frame end event
dcmipp_p1_lineend_evt		Pipe1 line event
dcmipp_p2_hsync_evt	Output	Pipe2 Hsync event
dcmipp_p2_vsync_evt		Pipe2 Vsync event
dcmipp_p2_frameend_evt		Pipe2 frame end event
dcmipp_p2_lineend_evt		Pipe2 line event

42.3.3 DCMIPP reset and clocks

Table 376. DCMIPP clocks

Domain	Clock	Maximum frequency	Comments
Parallel	dcmipp_pxclk	120 MHz	Up to 2x 120 MB/s in 16-bit mode
Pipeline	dcmipp_ker_ck	333 MHz	Up to 333 Mpixels/s (minus the blanking)
AXI bus	dcmipp_aclk	400 MHz	SoC AXI frequency
APB bus	dcmipp_pclk	200 MHz	SoC APB frequency

Table 377. DCMIPP resets

Domain	Reset type	Comments
Parallel + Pipeline	Asynchronous	Resynchronized internally on dcmipp_pxclk/dcmipp_ker_ck
AXI bus	Synchronous	Resets directly the dcmipp_aclk domain
APB bus	Synchronous	Resets directly the dcmipp_pclk domain

Clocks and pixel rate limitations

This paragraph lists the DCMIPP limitations and bottlenecks:

- The target is to sustain an average pixel rate (PixRateAvg):
  - A 5 Mpixel sensor at 30 fps requires 150 Mpixel/s (CSI-2 interface)
  - Higher resolution sensors can be supported, but with lower FPS (for example 10 Mpixels at 15 fps)
- Vertical and horizontal blanking:
  - The full system (sensor, interface, pipe, AXI) embeds limited capacity FIFOs. The idle times that the sensor inserts during its blanking periods impact all the downstream elements, including interface, pipe, and AXI. A pixel rate (PixRatePeak) higher than average must be used. The idle time due to the blanking can reach 33% of the frame duration, sometimes more (check sensor specification).
  - PixRatePeak = 1.33 * PixRateAvg = 200 Mpixel/s in our example.
- Parallel interface clock (dcmipp_pxclk):
  - On the parallel interface, pixels are received sequentially, in one, two or three cycles. The maximum implemented clock (120 MHz) constrains the peak pixel rate, depending on the ratio of cycles per pixel.
  - PixRatePeak ≤ dcmipp_pxclk / (1, 2 or 3) = 120 / (1, 2 or 3)
  - Clock frequency:
    - > dcmipp_pxclk ≤ dcmipp_ker_ck (due to resync interface between them)
    - > dcmipp_pxclk ≤ dcmipp_aclk
  - Consequences: see *Table 378*.

Table 378. Parallel interface maximum resolution (80 MHz)

Pixel		Transmission on the interface			Resolution (30 fps), including blanking	
Format	Width (bpp)	Width	Cycles/pixel	Pixel rate	Mpixel/frame	Example
Mono/raw	8	8	1	80	2.15	1080 p
	14	14	1	80	2.15	1080 p
RGB565	16	8	2	40	1.08	720 p
		16	1	80	2.15	1080 p
RGB888	24	8	3	27	0.72	qHD
		12	2	40	1.08	720 p
YUV422	16	16	1	80	2.15	1080 p
		16	2	40	1.08	720 p
YUV444	24	12	2	40	1.08	720 p
		16	2	40	1.08	720 p

  - Clock setting: dcmipp_pxclk ≥ PixRatePeak * Ratio(1,2,3)

- Pipe clock dcmipp_ker_ck (when using the CSI-2 host interface)
  - CSI-2 PHY provides data bit at the clk_bit rate, on DL parallel data lanes.
  - Rationale: internally, the CSI-2 host interface packs the serial stream on 32-bit words, resynchronized on the pipe clock (dcmipp_ker_ck).
  - Clock setting: dcmipp_ker_ck ≥ clk_bit * DL / 32 bpp = 156.25 MHz.
  - Rationale 2: The pixel pipe processes 1 pixel/clk, so that dcmipp_ker_ck must be higher than the wanted PixRatePeak.
  - Clock setting: dcmipp_ker_ck ≥ PixRatePeak.
  - For small footprint pixels (like Raw8), the DCMIPP is limited by its maximum dcmipp_ker_clk, and can be unable to handle the maximum CSI pixel rate (clk_bit * DL / 8 bpp for Raw8).
- Downsize:
  - The line buffer of the vertical downsize operator is limited to a width of 2688 pixels after the horizontal downsize operation, limiting the resolution, when the downsizing is active, to 2688 x 1944 (1944 is the usual maximum height with a width of 2688), thus 5.1 Mpixel.
  - If a camera resolution higher than 5 Mpixel is targeted, a basic decimation has to be performed to decrease the resolution to a maximum of 5 Mpixel before processing the downsizing operation.
- AXI clock:
  - The pixels must be reclocked from the processing to the AXI domain, resulting in
    > dcmipp_ker_ck ≤ dcmipp_aclk
  - The AXI bus must drain the running pipelines. The maximum footprint of pixel (or data) pipes is 32 bpp (Pipe1 and Pipe2) and 16 bpp (Pipe0). AXI is on 64 bits, with an efficiency of 8 / 9 for the typical 64-byte burst.
  - dcmipp_aclk ≥ dcmipp_ker_ck * (32 bpp + 32 bpp + 16 bpp) / (64bit / bus) * 9 / 8 (efficiency) = dcmipp_ker_ck * 1.4.

42.3.4 DCMIPP maximum resolution

The limitations related to the maximum resolution supported by the DCMIPP are:

- Maximum width and height across pipes: 4094 x 4094 pixels
  - Registers and counters are limited to 12 bits
- Maximum performance: 333 Mpixel/s on each pipe
  - Larger pixel rate can be used, but with less pipe active or lower memory latency
  - Maximum pixel rate on each pipe must remain below the pixel clock
- Maximum width on demosaicing: 2688 components wide
  - limitation related to the Line-buffer size
- Maximum width after downsize: 2688 pixels
  - limitation related to the Line-buffer size
- Maximum width for conversion to YUV420: 2688 pixels
  - limitation related to the Line-buffer size
- Max line stride: 32767 bytes
  - Registers and counters, to handle 4094 pixels x 32 bits x 2 (provision for interleaving)

42.3.5 DCMIPP minimum requirements for frame structure

DCMIPP imposes the following minimum requirements for the frame architecture:

Blanking phase

- Dump pipe
  - The minimal duration of the blanking between two frames must be an equivalent of 666 datawords of 32 bits
- Pixel pipe
  - Vertical blanking: minimum is 5 lines. If the line is less than 12 pixels, a minimum of 24 pixels equivalent for the vertical blanking parameter is requested
  - Horizontal blanking: a minimum duration of 12 pixels is required between two lines

Data image area

- Vertical image area: minimum one line (two lines if raw Bayer conversion is active)
- Horizontal image area: minimum two pixels
- The minimum total frame size is fixed to 36 pixels

42.3.6 Description of DCMIPP pixel format support

Table 379 lists the supported pixel formats in the input interfaces (parallel, CSI), as input to the pixel Pipe1 and Pipe2, and in the three output pipes.

Table 379. Supported pixel formats

Index (1)	Pixel format	BPP	Parallel input (clk/pix)(2)	CSI input	Pipe0 output (dump)	Pipe1 and Pipe2 input	Pipe1 output (main)	Pipe2 output (ancillary)
-	Bytes (CSI: long packets and user)	8	-	Y	Y	-	-	-
13(3)	Byte stream (JPEG, compressed video)	8	Y, 1	-	Y	-	-	-
14(4)	Other data	8 to 16(4)	Y, 1	-	Y	-	-	-
5	Raw6	6	(5)	Y(6)	Y(6)	-	-	-
5	Raw7	7	(5)	Y(6)	Y(6)	-	-	-
5	Raw8	8	Y, 1	Y	Y	Y	Y	Y
6	Raw10	10	Y, 1	Y	To 16 bpc	To 8 bpc	-	-
7	Raw12	12	Y, 1	Y	To 16 bpc	To 8 bpc	-	-
8	Raw14	14	Y, 1	Y	To 16 bpc	To 8 bpc	-	-
9	Mono8	8	Y, 1	-	Y	Y	Y	Y
10	Mono10	10	Y, 1	-	To 16 bpc	To 8 bpc	-	-
11	Mono12	12	Y, 1	-	To 16 bpc	To 8 bpc	-	-
12	Mono14	14	Y, 1	-	To 16 bpc	To 8 bpc	-	-
2	RGB444	12	(5)	Y	(5)	To 8 bpc	-	-
2	RGB555	15	(5)	Y	(5)	To 8 bpc	-	-

Table 379. Supported pixel formats (continued)

Index (1)	Pixel format	BPP	Parallel input (clk/pix)(2)	CSI input	Pipe0 output (dump)	Pipe1 and Pipe2 input	Pipe1 output (main)	Pipe2 output (ancillary)
2	RGB565	16	Y, 1, 2	Y	Y	To 8 bpc	Y	Y
3	RGB666	18	(5)	Y	(5)	To 8 bpc	-	-
4	RGB888 / YUV444(6)	24	Y, 2, 3	Y	Y	Y	Y	Y
-	xRGB888 / xYUV444(6)	32	-	-	Y	-	Y	Y
-	RGBx888 / YUVx444(6)	32	-	-	Y	-	Y	Y
1	YUV422-1 (YUYV)	16	Y, 1, 2	Y	Y	Y	Y	Y
-	YUV422-2	16	-	Y(6)	Y(6)	-	Y	-
-	YUV420-2 (NV21/NV12)	12	-	Y(6)	Y(6)	-	Y	-
-	YUV420-3 (YV12)	12	-	Y(6)	Y(6)	-	Y	-
-	YUV422 10 bpc	20	-	Y(6)	Y(6)	-	-	-
-	YUV420 10 bpc	15	-	Y(6)	Y(6)	-	-	-
-	Any other CSI-2	Any	-	Y(6)	Y(6)	-	-	-

1. Index is used to link the input pixel format to the DCMIPP_PRCR register. The index has a meaning only for camera connected with the parallel interface
2. Pixel formats on 16 bpp (like RGB565 or YUV422-1) can be received either on an 8-bit interface (using 2 cycles), or on a 16-bit input interface (using one cycle). Pixel formats on 24 bpp (like RGB888) can be received either on an 8-bit interface (using three cycles), or on a 12-bit input interface (using two cycles).
3. In Byte stream mode, the bytes are dumped consecutively with only a 32-bit padding (if needed) at the end of the frame (or JPEG stream). There is no 32-bit padding operation inside the stream until the VSYNC deassertion (end of frame, or end of JPEG stream).
4. If the data format is different from those in this table, user can choose “others” configuration into bit field FORMAT in the DCMIPP_PRCR register, using bit-field EDM to select how many data bits must be captured in one pixel clock. It is possible to capture two 8-bit data mapped on 16-bit parallel input data in a single cycle (for instance FORMAT = Others, EDM = 100, i.e. 16-bit capture on each pixel clock). Data are 32-bit padded at the end of a line to have a complete line aligned on 32-bit width.
5. On the parallel interface input, some sensor pixel formats are supported by the DCMIPP, by selecting a wider pixel format in DCMIPP, by mapping the sensor wires onto the MSB of the DCMIPP interface. On the input missing pins, it is recommended to replicate the sensor MSB pins onto the missing input LSB pins. This helps achieving full dynamic on the extended pixel format. The work-around can be applied on the following formats (sensor output on left, mapping on DCMIPP format on right):
   - Raw6: Raw8 with 1-cycle input, processed as a 8 bpp
   - Raw7: Raw8 with 1-cycle input, processed as a 8 bpp
   - RGB444: RGB565 with 1-cycle input, processed as a 16 bpp
   - RGB555: RGB565 with 1-cycle input, processed as a 16 bpp
   - RGB666: RGB888 with 3-cycle input, processed as a 24 bpp
6. The same bit mapping is used for the input RGB888 and YUV444, the input xRGB and xYUV, and similarly for the outputs. The difference between RGB and YUV is the color reference, set in the color conversion that occurs after the input or before the output.

42.4 DCMIPP input and flow control

This section describes the functional elements of the DCMIPP. For each, it details the features, the software configuration, and provides a software configuration example (when needed).

42.4.1 DCMIPP common configuration

The DCMIPP common configuration register (DCMIPP_CMCR) enables the selection of the input interface—either parallel DCMI or serial CSI-2—from which to fetch the input pixels. It also allows swapping the R/B color components of the incoming pixels and selecting the pipe used by the frame counter.

Table 380. DCMIPP_CMCR bit function

Bit ID	Function	Comments
INSEL	Input selection	Select the input interface to fetch pixels from. The selection is common to all pipes and must not be changed while they are active. – 0: DCMI – 1: CSI-2
PSFC	Pipe selection for the frame counter	Select which pipe the frame counter maps to.
CFC	Clear frame counter	Clear the frame counter when set.
SWAPRB	Swaps R-versus-B components (and U-versus-V) of the input pixels	Operate only on pixel pipes, not on dump pipe.

42.4.2 Parallel input interface

The parallel interface is a flexible pixel interface that clocks in a bus of 8- to 16-bit in parallel, with an externally provided clock, and adds vertical and horizontal synchronization, provided either with specific pins (external sync) or flagged via specific data (as in CCIR601).

Interface (all inputs)

- Clk: clock up to 120 MHz, internally named dcmipp_pxclk
- Data: 16 IO pins, up to 120 Mbps/pin, 8- to 16-bit, pixels potentially serialized
- HSync, VSync, but no enable (EN)

Features

- Horizontal and vertical synchronization:
  - External, via the HSync and VSync pins.
  - Internal, via the CCIR601 flagging.

  Data provided during the horizontal or vertical blanking cannot be captured.
- Input pixel format (see *Section 42.3.6*)
  - Binary stream like JPG
  - Single cycle data:
    - Raw Bayer and monochrome: 8/10/12/14 bits in parallel
    - YUV422, RGB565:16 bpp on 16 bits in parallel
  - Double-cycle data:
    - YUV422, RGB565:16 bpp on 8 bits in parallel
    - RGB888/YUV444: 24 bpp on 12 bits in parallel
  - Triple-cycle data:
    - RGB888/YUV444: 24 bpp on 8 bits in parallel
- Flexible input:
  - MSB-vs-LSB bits can be swapped to ease PCB placement
  - Cycle0-vs-Cycle1 can be swapped (for 2-cycle long pixels).
  - Red-vs-blue components can be swapped (for RGB, or U-vs-V for YUV), this last swap operates only on the pixel pipes and not the dump pipe.

Hardware synchronization mode

In this mode two synchronization signals (DCMIPP_HSYNC and DCMIPP_VSYNC) are used.

Depending on the camera module/mode, data can be transmitted during horizontal/vertical synchronization periods. DCMIPP_HSYNC/DCMIPP_VSYNC act as blanking signals, as all data received during DCMIPP_HSYNC/DCMIPP_VSYNC active periods are ignored.

To correctly transfer images in the RAM buffer, data transfer is synchronized with the DCMIPP_HSYNC/DCMIPP_VSYNC signals. When the hardware synchronization mode is selected, and capture is enabled (CPTREQ bit set in DCMIPP_PxFCTCR), data transfer is synchronized with the deassertion of the DCMIPP_VSYNC signal (next start of frame).

Transfer can then be continuous, with successive frames transferred by the IP-Plug to successive buffers or the same/circular buffer.

Embedded data synchronization mode

In this synchronization mode, the data flow is synchronized using embedded 32-bit codes, using the 0x00/0xFF values not used in data anymore.There are four types of codes, all with 0xFF00 00XY format. The embedded synchronization codes are supported only in 8-bit parallel data capture (in the DCMIPP_PRCR register, the EDM[2:0] bits must be programmed to “000”). For other data widths, this mode generates unpredictable results.

Note: Camera modules generate up to eight synchronization codes when in interleaved mode, while the DCMIPP reacts to one single code. As a consequence, an interleaved flow with an embedded synchronization has one every other frame discarded as not detected.

Mode 2

Four embedded codes signal the following events:

- Frame start (FS)
- Frame end (FE)
- Line start (LS)
- Line end (LE)

The XY values in the 0xFF00 00XY format of these codes are programmable (see *Section 42.14.9*).

A 0xFF value programmed as a frame end means that all the unused codes are interpreted as valid frame end codes.

In this mode, once the camera interface has been enabled, the frame capture starts after the first occurrence of the frame end (FE) code followed by a frame start (FS) code.

Mode 1

An alternative coding is the camera mode 1. This mode is ITU656 compatible.

The codes signal another set of events:

- SAV (active line) - Line start
- EAV (active line) - Line end
- SAV (blanking) - Start of line during interframe blanking period
- EAV (blanking) - End of line during interframe blanking period

This mode can be supported by programming the following codes:

- FS ≤ 0xFF
- FE ≤ 0xFF
- LS ≤ SAV (active)
- LE ≤ EAV (active)

An embedded unmask code is also implemented for frame/line start and frame/line end codes. Using it, it is possible to compare only the selected unmasked bits with the programmed code. User can therefore select a bit to compare in the embedded code and detect a frame/line start or frame/line end. This means that there can be different codes for the frame/line start and frame/line end with the unmasked bit position remaining the same.

Example:

- FS = 0xA5
- Unmask code for FS = 0x10

In this case the frame start code is embedded in bit 4 of the frame start code.

Note: FEC sequence must be sent before the transfer of the first frame, otherwise other codes are not decoded and the first frame can be lost after the DCMIPP has been enabled. After the first FE sequence, the following frame is captured based on FS sequence.

Error conditions

Error conditions can be detected when using the embedding synchronization data modes. Flags PRERRF in DCMIPP_CMSR2 and ERRF in DCMIPP_PRSR are used for this function. An interruption can be triggered based on error detection if bit PRERRIE in

DCMIPP_CMIER is set for the global interrupt (or bit ERRIE in DCMIPP_PRIER for a local interrupt line).

For instance, such kind of wrong sequences or values generate an error:

- FF 00 00 XY sequence detected with XY value different from the one set for FS/LS/FE/LE
- LS = 0xFF or LE = 0xFF
- If an LS or FS sequence follows an LS sequence

Software configuration

Table 381. DCMIPP_PRCR bit function

Bit ID	Function	Comments
ENABLE	Enables the parallel interface	Low-power mode when disabled.
PCKPOL	Defines clock polarity	– 0: Falling edge – 1: Rising edge
ESS	Defines if VSync and HSync synchronizations are provided by sideband (specific hardware IO) or by in-band (specific embedded codes) signals	– 0: Hardware (external) synchronization: using DCMIPP_HSYNC and DCMIPP_VSYNC pins. – 1: Embedded (internal) synchronization: using codes FSC, FEC, LSC, LEC and masks in registers DCMIPP_PRESCR and DCMIPP_PRESURy.
VSPOL, HSPOL	Defines the polarity of the IO DCMIPP_VSYNC and DCMIPP_HSYNC used for, respectively, the vertical and horizontal synchronization	– 0: Active low – 1: Active high
FORMAT	Defines the pixel format used on the IO DCMIPP_Dx	From 0 to 15
EDM	Defines the amount of valid bits received per cycle	8/10/12/14/16 bits
	The duration of a pixel is extracted by the bit-per-pixel (given by FORMAT) and bit-per-cycle (given by EDM) ratios	1, 2 or 3 cycles
SWAPBITS	Swaps the 16 bits of the parallel interface	15:0 becomes 0:15
SWAPCYCLES	Swaps, when a pixel is received in two cycles, the data from the first cycle with the data from the second cycle	Software must not activate it when a pixel is received in one or three cycles.

The embedded synchronization codes are configured by means of DCMIPP_PRESCR and DCMIPP_PRESUR registers (see *Table 382*).

Table 382. DCMIPP_PRESCR and DCMIPP_PRESUR bit function

Bit ID	Function
FSC, FEC	Frame-start and frame-end synchronization, when embedded synchronization ESS = 1
FSU, FEU	Masks for FSC and FEC codes

Table 382. DCMIPP_PRESCR and DCMIPP_PRESUR bit function (continued)

Bit ID	Function
LSC, LEC	Line-start and line-end synchronization, when embedded synchronization ESS = 1
LSU, LEU	Masks for LSC and LEC codes

42.4.3 Interface from CSI-2 host

The CSI-2 host and DPHY_RX (both external to the DCMIPP) provide the data from the CSI-2 camera sensor, forward them into the DCMIPP using the ISB byte header interface.

The ISB byte header features are:

- CSI-2 clock interface aligned with the DCMIPP processing clock (333 MHz)
- Data width: 32 bit (data and CSI headers are interleaved)
  - Frame synchronization short packet
  - Frame number, Data ID, and packet type are provided (see *Section 42.7.8*).
- Line Sync short packets are not received.
- Headers of data long packet:
  - Packet length, Data ID, and packet type are provided (see *Section 42.7.8*).
- Payloads of data long packet:
  - Data as 32-bit words, as collected by the CSI-2 host.
- Packet CRC is not received.

42.4.4 Test pattern generator (TPG)

This is a continuous frame generator that replaces the need, for a camera sensor, to test the DCMIPP and the system. It is located at the head of the DCMIPP pipelines, aside of the parallel interface, or the interface from the CSI-Host.

When active, frames are generated indefinitely, with a deterministic pattern, at the desired resolution, pixel format, and with a potential lifeline to show an evolution from frame to frame.

Functionality

- Configurable frame resolution (working at the pixel clock), with a configurable vertical blanking.
- Configurable pixel format: RGB888, RGB565, Raw8/10/12/14, mono, or YUV.
- Configurable pattern: color bars or color squares.
- Potential remapping of the colors to gray scales or to the YUV422 color domain.
- Potential lifeline, evolving from frame to frame. The lifeline is a horizontal bar that progressively shifts down, frame after frame. Its height is 1/64 of the frame height. The pixels in the lifeline have their component values inverted bitwise: 0xFF becomes 0x00, and red (0xFF, 0x00, 0x00) becomes cyan (0x00, 0xFF, 0xFF). The lifeline progresses downward at a speed of 1 line per frame, and restarts back at the top of the frame.

The test pattern generator generates one pixel (visible or blanking) per clock cycle of clk_proc for all formats, except RGB888, generated every two clock cycles.

Software configuration

The software configuration registers are not shadowed as assumed constants.

Table 383. DCMIPP_CMTPGCR1 and DCMIPP_CMTPGCR2 bit function

Bit ID	Function
WIDTH	Width of the visible pixels to generate per frame, up to 16383 pixels wide. The TPG adds an additional horizontal blanking, 1/8 of the width (with a minimum of 16 pixels), and one additional sync cycle. If FORMAT is YUV, WIDTH is rounded to the lower 16.
HEIGHT	Height of the visible lines to generate per frame, up to 16383 pixels wide. The TPG adds an additional vertical blanking of VBL lines.
VBL	Vertical blanking at the bottom of the frame.
FORMAT	Pixel format generated, among RGB565, RGB888, RAW, Mono, YUV422.
RT	Raw Bayer type: the sequence of components (RGGB, GRBG, GBRG, BGGR)
YT	YUV422 type: whether BT.601 or 709, and whether full or reduced range.
PATTERN	Defines the pattern used to fill the frame: – Can be a color bar pattern, with 8 vertical color bars generated. The colors, from left to right, are: white, yellow, cyan, green, pink, red, blue, black. – Can be a color square pattern, with the frame built of adjacent in 256x256 color squares, with a color gradient across each pixel.
GSEN	Transforms the color of the pattern to a grey scale.
LFLEN	Activates the lifeline. When active, it becomes visible, and progresses indefinitely, frame after frame.
TPGEN	Activates the TPG.

After the TPG activation with ENABLE = 1, a frame is generated with the desired resolution (WIDTH, HEIGHT) and pixel format (FORMAT). If FORMAT selects a raw Bayer format, then TYPE selects the raw Bayer sequence of component.

The frame rate (FPS) is configured using the vertical blanking (VBL). One pixel (visible or in the horizontal or vertical blanking) is generated per clock cycle at the clk_proc clock (except for the RGB888, with one pixel every two clock cycle). The relation between these items is:

FPS = clk_proc / Resolution (with blanking)

= clk_proc / (WIDTH + max (16,WIDTH/8) + 1) x (HEIGHT + VBL)).

For a usecase with a large needed visible resolution (WIDTH, HEIGHT), a needed FPS, and a given constant clock frequency clk_proc, VBL is configured as follows:

VBL = (clk_proc / FPS / (WIDTH + max(16,WIDTH/8) + 1)) - HEIGHT

Note that the RGB888 FORMAT and its pixel rate are 2x lower than those for other formats:

- When RGB888 is captured on the dump pipe (P0), it is mandatory to configure RGB888 to read RGB888 on the P0 buffer. In that case, the pixel generation is 1 pix / 2 clk.
- For all the other cases, including RGB888 used on pixel pipes, it is recommended to set FORMAT = RGB565. With TPG configured as RGB565, the pixel is converted to

RGB888 later in the pipe, resulting in a similar result in the pixel pipe. This permits to benefit of the full pixel rate, 1 pix / clk.

Configuration example

To generate an VGA frame at 30 fps, based on a clk_proc clock of 200 MHz, and with a raw Bayer 10 pixel format, with the sequence RGGB, configure:

- WIDTH: 640
- HEIGHT: 480
- VBL: 8766 = 200M / 30 fps / (640 + 80 +1) - 480
- FORMAT: 0x2B (= raw10)
- RT: 0 (RGGB)
