- When the sdmmc_ker_ck duty cycle is not 50 %, the CLKDIV must be used to divide it by 2 or more (CLKDIV > 0).
- The phase relation between the SDMMC_CMD / SDMMC_D[7:0] outputs and the SDMMC_CK can be selected through the NEGEDGE bit. The phase relation depends on the CLKDIV, NEGEDGE, and DDR settings. See *Figure 254*.

Figure 254. SDMMC Command and data phase relation

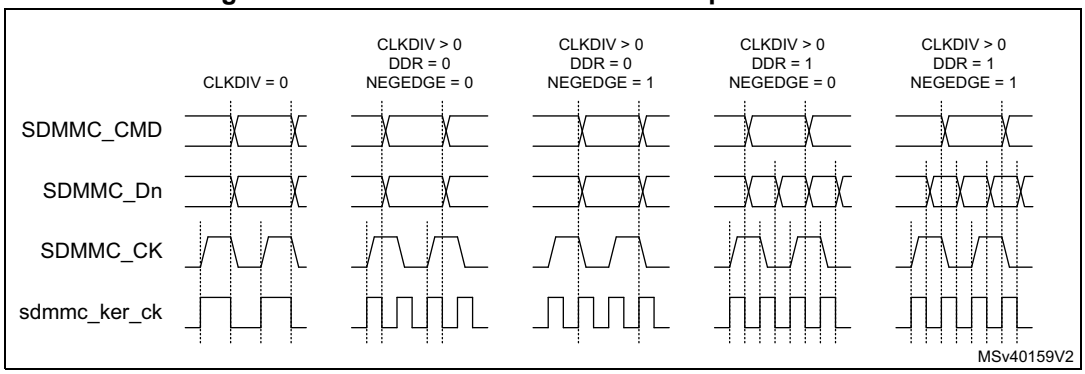

Table 212. SDMMC Command and data phase selection

CLKDIV	DDR	NEGEDGE	SDMMC_CK	Command out	Data out
0	x	x	= sdmmc_ker_ck	Generated on sdmmc_ker_ck falling edge	
>0	0	0	Generated on sdmmc_ker_ck rising edge	Generated on sdmmc_ker_ck falling edge succeeding the SDMMC_CK rising edge.	
		1		Generated on the same sdmmc_ker_ck rising edge that generates the SDMMC_CK falling edge.	
	1	0		Generated on sdmmc_ker_ck falling edge succeeding the SDMMC_CK rising edge.	Generated on sdmmc_ker_ck falling edge succeeding a SDMMC_CK edge.
		1		Generated on the same sdmmc_ker_ck rising edge that generates the SDMMC_CK falling edge.	

By default, the **sdmmc_io_in_ck** feedback clock input is selected for sampling incoming data in the SDMMC receive path. It is derived from the SDMMC_CK pin.

For tuning the phase of the sampling clock to accommodate the receive data timing, the DLYB delay block available on the device can be connected between **sdmmc_io_in_ck** signal (DLYB input dlyb_in_ck) and **sdmmc_fb_ck** clock input of SDMMC (DLYB output dlyb_out_ck). Selecting the **sdmmc_fb_ck** clock input in the receive path then enables using the phase-tuned sampling clock for the incoming data. This is required for SDMMC to support the SDR104 and HS200 operating mode and optional for SDR50 and DDR50 modes.

When using an external driver (a voltage switch transceiver), the SDMMC_CKIN feedback clock input can be selected to sample the receive data.

For an SD/SDIO/*e*•MMC card, the clock frequency can vary between 0 and 208 MHz (limited by maximum I/O speed).

Depending on the selected bus mode (SDR or DDR), one bit or two bits are transferred on SDMMC_D[7:0] lines with each clock cycle. The SDMMC_CMD line transfers only one bit per clock cycle.

23.5.4 SDMMC adapter

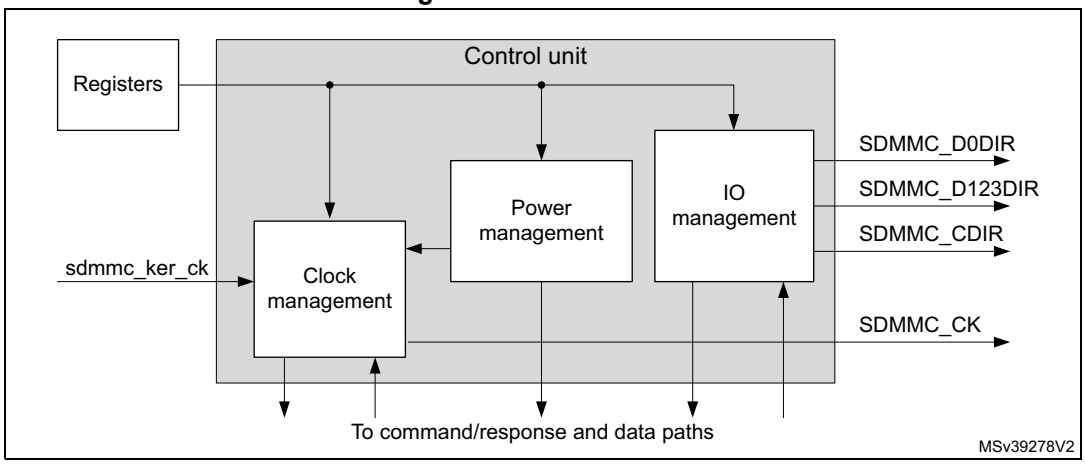
The SDMMC adapter (see *Figure 253: SDMMC block diagram*) is a multimedia/secure digital memory card bus master that provides an interface to a MultiMediaCard stack or to a secure digital memory card. It consists of the following subunits:

- Control unit
- Data transmit path
- Command path
- Data receive path
- Response path
- Receive data path clock multiplexer
- Delay block (DLYB), external to the SDMMC
- Adapter register block
- Data FIFO
- Internal DMA (IDMA)

Note: The adapter registers and FIFO use the AHB clock domain (sdmmc_hclk). The control unit, command path and data transmit path use the SDMMC adapter clock domain (sdmmc_ker_ck). The response path and data receive path use the SDMMC adapter feedback clock domain from the sdmmc_io_in_ck, or SDMMC_CKIN, or from the sdmmc_fb_ck generated by DLYB.

The DLYB delay block on the device can be used in conjunction with the SDMMC adapter, to tune the phase of the sampling clock for incoming data in SDMMC receive mode. It is required for the SDMMC to support the SDR104 and HS200 operating mode and optional for SDR50 and DDR50 modes.

Adapter register block



The adapter register block contains all system control registers, the SDMMC command and response registers and the data FIFO.

This block also generates the signals from the corresponding bit location in the SDMMC Clear register that clear the static flags in the SDMMC adapter.

Control unit

The control unit illustrated in *Figure 255*, contains the power management functions, the SDMMC_CK clock management with divider, and the I/O direction management.

Figure 255. Control unit

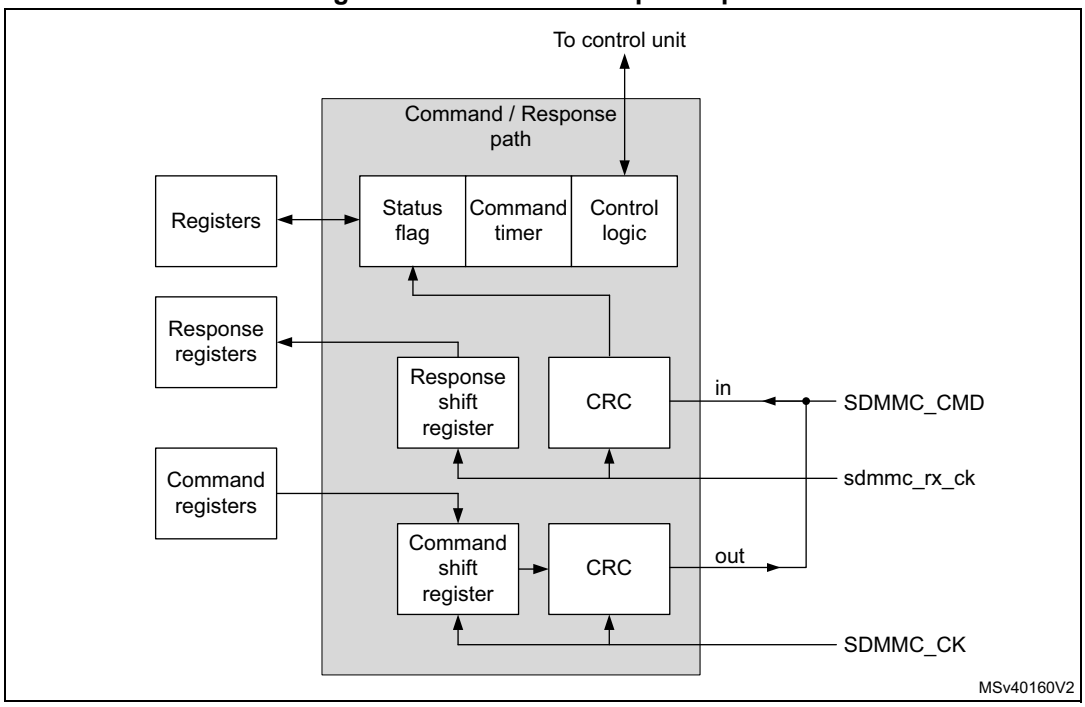
The power management subunit disables the card bus output signals during the power-off and power-up phases.

There are three power phases:

- power-off
- power-up
- power-on

The clock management subunit uses the sdmmc_ker_ck to generate the SDMMC_CK and provides the division control. It also takes care of stopping the SDMMC_CK for flow control, for example.

The clock outputs are inactive:



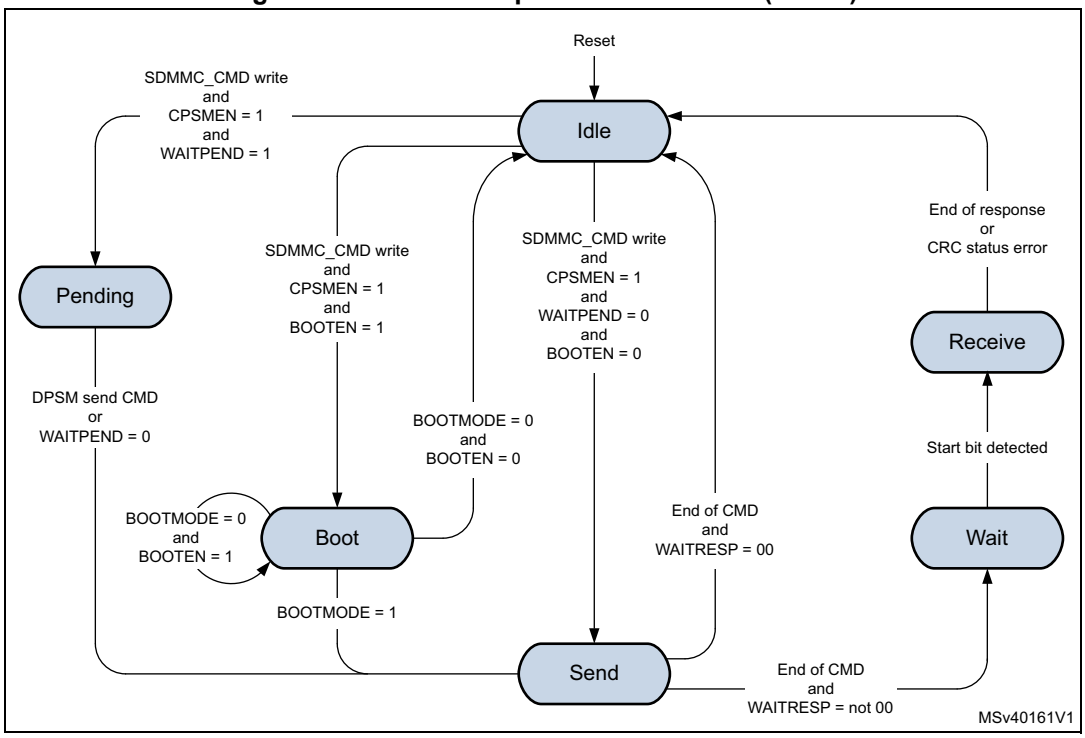
- after reset
- during the power-off or power-up phases
- if the power saving mode (register bit PWRSAV) is enabled and the card bus is in the Idle state for eight clock periods. The clock is stopped eight cycles after both the command/response CPSM and data path DPSM subunits have enter the Idle phase. The clock is restarted when the command/response CPSM or data path DPSM is activated (enabled).

The I/O management subunit takes care of the SDMMC_Dn and SDMMC_CMD I/O direction signals, which controls the external voltage transceiver.

Command/response path

The command/response path subunit transfers commands and responses on the SDMMC_CMD line. The command path is clocked on the SDMMC_CK and sends commands to the card,. The response path is clocked on the sdmmc_rx_ck and receives responses from the card.

Figure 256. Command/response path



Command/response path state machine (CPSM):

- When the command register is written to and the enable bit is set, command transfer starts. When the command has been sent the CRC is appended and the command path state machine (CPSM) sets the status flags and:
  - if a response is not required enters the Idle state.
  - If a response is required, it waits for the response.
- When the response is received,
  - for a response with CRC, the received CRC code and the internally generated code are compared, and the appropriate status flag is set according the result.
  - for a response without CRC, no CRC is checked, and the appropriate status flag is not set.

When ever the CPSM is active (not in the Idle state), the CPSMACT bit is set.

Figure 257. Command path state machine (CPSM)

- **Idle**: The command path is inactive. When the command control register is written and the enable bit (CPSMEN) is set, the CPSM activates the SDMMC_CK clock (when stopped due to power save PWRSAV bit) and moves
  - to the Send state when WAITPEND = 0 and BOOTEN = 0.
  - to the Pending state when WAITPEND = 1.
  - to the Boot state when BOOTEN = 1.
- **Send**: The command is sent and the CRC is appended.
  - When CMDTRANS bit is set or when BOOTEN bit is set and BOOTMODE is alternative boot, and the DTDIR = receive, the CPSM DataEnable signal is issued to the DPSM at the end of the command.
  - When the CMDTRANS bit is set and the CMDSUSPEND bit is 0 the interrupt period is terminated at the end of the command.
  - When CMDSTOP bit is set the CPSM Abort signal is issued to the DPSM at the end of the command.
  - If no response is expected (WAITRESP = 00) the CPSM moves to the Idle state and the CMDSENT flag is set. When BOOTMODE = 1 and BOOTEN = 0 the CMDSENT flag is delayed 56 cycles after the command end bit, otherwise the

CMDSENT flag is generated immediately after the command end bit.
The RESPCMDR and RESPxR registers are not modified.

– If a command response is expected (WAITRESP = not 00) the CPSM moves to the Wait state and start the response timeout.

- **Wait**: The command path waits for a response.
  – When WAITINT bit is 0 the command timer starts running and the CPSM waits for a start bit.
  a) If a start bit is detected before the timeout the CPSM moves to the Receive state.
  b) If the timeout is reached before the CPSM detect a response start bit, the timeout flag (CTIMEOUT) is set and the CPSM moves to the Idle state.
  The RESPCMDR and RESPxR registers are not modified.
  – When WAITINT bit is 1, the timer is disabled and the CPSM waits for an interrupt request (response start bit) from one of the cards.
  a) When a start bit is detected the CPSM moves to the Receive state.
  b) When writing WAITINT to 0 (interrupt mode abort), the host sends a response by its self and on detecting the start bit the CPSM move to the Receive state.
- **Receive**: The command response is received. Depending the response mode bits WAITRESP in the command control register, the response can be either short or long, with CRC or without CRC. The received CRC code when present is verified against the internally generated CRC code.
  – When the CMDSUSPEND bit is set and the SDIO Response bit BS = 0 (response bit [39]), the interrupt period is started after the response.
  When the CMDSUSPEND bit is cleared, or the CMDSUSPEND bit is 1 and the SDIO Response bit BS = 1 (response bit [39]), there is no interrupt period started.
  – When the CMDTRANS bit is set and the CMDSUSPEND bit is set and the SDIO Response bit DF= 1 (response bit [32]) the interrupt period is terminated after the response.
  – When the CRC status passes or no CRC is present the CMDREND flag is set, the CPSM moves to the Idle state.
  The RESPCMDR and RESPxR registers are updated with received response.
  - When BOOTMODE = 1 and BOOTEN = 0 the CMDREND flag is delayed 56 cycles after the response end bit, otherwise the CMDREND flag is generated immediately after the response end bit.
  - When CMDTRANS bit is set and the DTDIR = transmit, the CPSM DataEnable signal is issued to the DPSM at the end of the command response.
  – When the CRC status fails the CCRCFAIL flag is set and the CPSM moves to the Idle state.
  The RESPCMDR and RESPxR registers are updated with received response.
- **Pending**: According the pending WAITPEND bit in the command register, the CPSM enters the pending state.
  – When DATALENGTH ≤ 5 bytes the CPSM moves to the Sent state and generates the DataEnable signal to start the data transfer aligned with the CMD12 Stop Transmission command.
  – When DATALENGTH > 5 bytes, the CPSM DataEnable signal is issued to the DPSM to start the data transfer. The CPSM waits for a send CMD signal from the

DPSM before moving to the Send state. This enables, for example, the CMD12 Stop Transmission command to be sent aligned with the data.

– When writing WAITPEND to 0, the CPSM moves to the Send state.

- **Boot**: If the BOOTEN bit is set in the command register, the CPSM enters the Boot state, and when:
  – BOOTMODE = 0 the SDMMC_CMD line is driven low and when CMDTRANS bit is set and the DTDIR = receive, the CPSM DataEnable signal is issued to the DPSM. This enables normal boot operation. This state is left at the end of the boot procedure by clearing the register bit BOOTEN, which cause the SDMMC_CMD line to be driven high and the CPSM Abort signal is issued to the DPSM, before moving to the Idle state. The CMDSENT flag is generated 56 cycles after SDMMC_CMD line is high.
  – BOOTMODE = 1, move to the Send state. This enables sending of the CMD0 (boot). Clearing BOOTEN has no effect.

Note: The CPSM remains in the Idle state for at least eight SDMMC_CK periods to meet the N_{CC} and N_{RC} timing constraints. N_{CC} is the minimum delay between two host commands, and N_{RC} is the minimum delay between the host command and the card response.

The response timeout has a fixed value of 64 SDMMC_CK clock periods.

A command is a token that starts an operation. Commands are sent from the host to either a single card (addressed command) or all connected cards (broadcast command are available for *e*•MMC V3.31 or previous). Commands are transferred serially on the SDMMC_CMD line. All commands have a fixed length of 48 bits. The general format for a command token for SD-Memory cards, SDIO cards, and *e*•MMC cards is shown in *Table 213.*

The command token data is taken from two registers, one containing a 32-bit argument and the other containing the 6-bit command index (six bits sent to a card).

Table 213. Command token format

Bit position	Width	Value	Description
47	1	0	Start bit
46	1	1	Transmission bit
[45:40]	6	x	Command index
[39:8]	32	x	Argument
[7:1]	7	x	CRC7
0	1	1	End bit

Next to the command data there are command type (WAITRESP) bits controlling the command path state machine (CPSM). These bits also determine whether the command requires a response, and whether the response is short (48 bit) or long (136 bits) long, and if a CRC is present or not.

A response is a token that is sent from an addressed card or synchronously from all connected cards to the host as an answer to a previous received command. All responses are sent via the command line SDMMC_CMD. The response transmission always starts with the left bit of the bit string corresponding to the response code word. The code length depends on the response type. Response tokens R1, R2, R3, R4, R5, and R6 have various

coding schemes, depending on their content. The general formats for the response tokens for SD-Memory cards, SDIO cards, and *e*•MMC cards are shown in *Table 214*, *Table 215* and *Table 216*.

A response always starts with a start bit (always 0), followed by the bit indicating the direction of transmission (card = 0). A value denoted by x in the tables below indicates a variable entry. Most responses, except some, are protected by a CRC. Every command code word is terminated by the end bit (always 1).

The response token data is stored in five registers, four containing the 32-bits card status, OCR register, argument or 127-bits CID or CSD register including internal CRC, and one register containing the 6-bits command index.

Table 214. Short response with CRC token format

Bit position	Width	Value	Description
47	1	0	Start bit
46	1	0	Transmission bit
[45:40]	6	x	Command index (or reserved 111111)
[39:8]	32	x	Argument
[7:1]	7	x	CRC7
0	1	1	End bit

Table 215. Short response without CRC token format

Bit position	Width	Value	Description
47	1	0	Start bit
46	1	0	Transmission bit
[45:40]	6	x	Command index (or reserved 111111)
[39:8]	32	x	Argument
[7:1]	7	1111111	(reserved 1111111)
0	1	1	End bit

Table 216. Long response with CRC token format

Bit position	Width	Value	Description
135	1	0	Start bit
134	1	0	Transmission bit
[133:128]	6	111111	Reserved
[127:1]	127:8	x	CID or CSD slices
	7:1	x	CRC7 (included in CID or CSD)
0	1	1	End bit

The command/response path operates in a half-duplex mode, so that either commands can be sent or responses can be received. If the CPSM is not in the Send state, the

SDMMC_CMD output is in the Hi-Z state. Data sent on SDMMC_CMD are synchronous with the SDMMC_CK according the NEGEDGE register bit see *Figure 254*.

The command and short response with CRC, the CRC generator calculates the CRC checksum for all 40 bits before the CRC code. This includes the start bit, transmission bit, command index, and command argument (or card status).

For the long response the CRC checksum is calculated only over the 120 bits of R2 CID or CSD. Note that the start bit, transmission bit and the six reserved bits are not used in the CRC calculation.

The CRC checksum is a 7-bit value:

CRC[6:0] = remainder [(M(x) * x^7) / G(x)]

G(x) = $x^7 + x^3 + 1$

M(x) = (first bit) * x^n + (second bit) * x^{n-1}+... + (last bit before CRC) * x^0

Where n = 39 or 119.

The CPSM can send a number of specific commands to handle various operating modes when CPSMEN is set, see *Table 217*.

Table 217. Specific Commands overview

VSWITCH	BOOTEN	BOOTMOD	CMDTRAN	WAITPEND	CMDSTOP	WAITINT	Description
1	x	x	x	x	x	x	Start voltage switch sequence
0	1	x	x	x	x	x	Start normal boot
0	1	1	x	x	x	x	Start alternative boot
0	0	1	x	x	x	x	Stop alternative boot.
0	0	0	1	x	x	x	Send command with associated data transfer.
0	0	0	0	1	1	x	*e*•MMC stream data transfer, command (STOP_TRANSMISSION) pending until end of data transfer.
0	0	0	0	1	0	x	*e*•MMC stream data transfer, command different from (STOP_TRANSMISSION) pending until end of data transfer.
0	0	0	0	0	1	x	Send command (STOP_TRANSMISSION), stopping any ongoing data transmission.
0	0	0	0	0	0	1	Enter *e*•MMC wait interrupt (Wait-IRQ) mode.
0	0	0	0	0	0	0	Any other none specific command

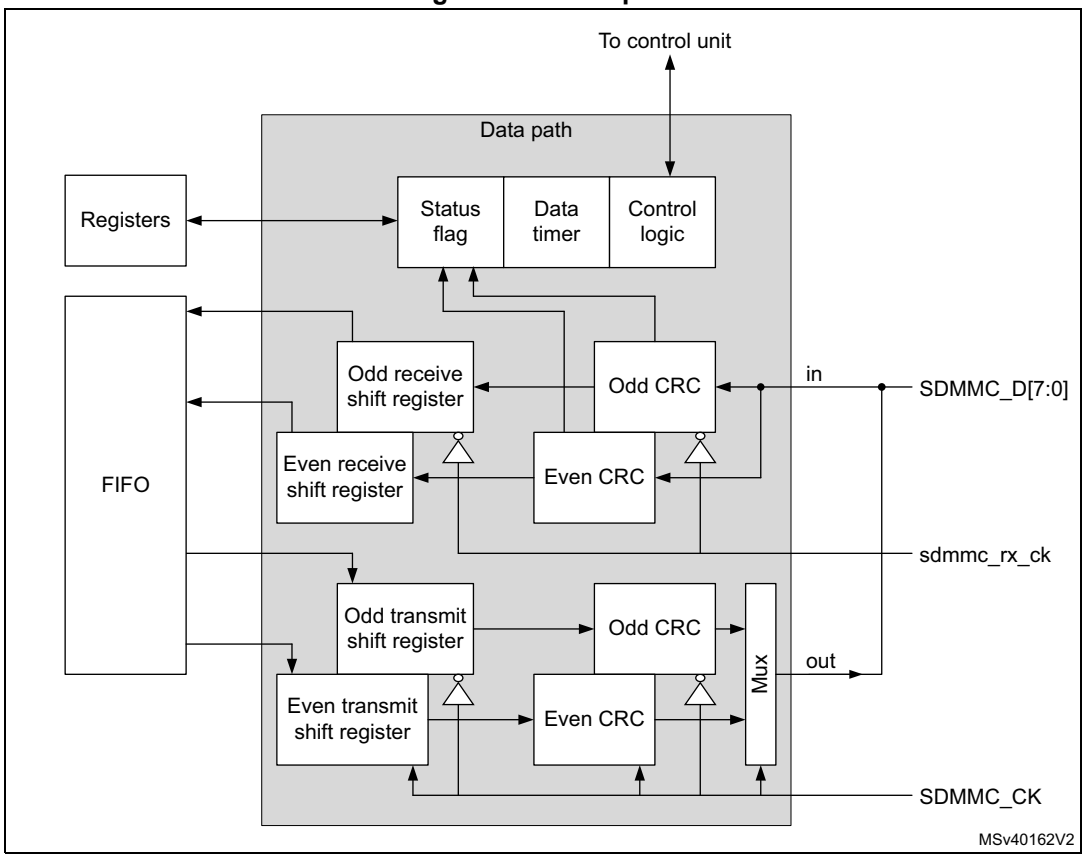
The command/response path implements the status flags and associated clear bits shown in *Table 218*:

Table 218. Command path status flags

Flag	Description
CMDSENT	Set at the end of the command without response (CPSM moves from Send to Idle).
CMDREND	Set at the end of the command response when the CRC is OK (CPSM moves from Receive to Idle).
CCRCFAIL	Set at the end of the command response when the CRC is FAIL (CPSM moves from Receive to Idle).
CTIMEOUT	Set after the command when no response start bit received before the timeout (CPSM moves from Wait to Idle).
CKSTOP	Set after the voltage switch (VSWITCHEN = 1) command response when the CRC is OK and the SDMMC_CK is stopped (no impact on CPSM).
VSWEND	Set after the voltage switch (VSWITCH = 1) timeout of 5 ms + 1 ms (no impact on CPSM).
CPSMACT	Command transfer in progress (CPSM not in Idle state).

The command path error handling is shown in *Table 219*:

Table 219. Command path error handling



Error	CPSM state	Cause	Card action	Host action	CPSM action
Timeout	Wait	No start bit in time	Unknown	Reset or cycle power card(1)	Move to Idle
CRC status	Receive	Negative status	Command ignored	Resend command(1)	Move to Idle
		Transmission error	Command accepted	Resend command(1)	

1. When CMDTRANS is set, also a stop_transmission command must be send to move the DPSM to Idle.

Data path

The data path subunit transfers data on the SDMMC_D[7:0] lines to and from cards. The data transmit path is clocked on the SDMMC_CK and sends data to the card. The data receive path is clocked on the sdmmc_rx_ck and receives data from the card. *Figure 258* shows the data path block diagram.

Figure 258. Data path

The card data bus width can be programmed in the clock control register bits WIDBUS. The supported data bus width modes are:

- If the wide bus mode is not enabled, only one bit is transferred over SDMMC_D0.
- If the 4-bit wide bus mode is enabled, data is transferred at four bits over SDMMC_D[3:0].
- If the 8-bit wide bus mode is enabled, data is transferred at eight bits over SDMMC_D[7:0].

Next to the data bus width the data sampling mode can be programmed in the clock control register bit DDR. The supported data sampling modes are:

- Single data rate signaling (SDR), data is clocked on the rising edge of the clock.
- Double data rate signaling (DDR), data is clocked on the both edges of the clock. DDR mode is only supported in wide bus mode (4-bit wide and 8-bit wide).

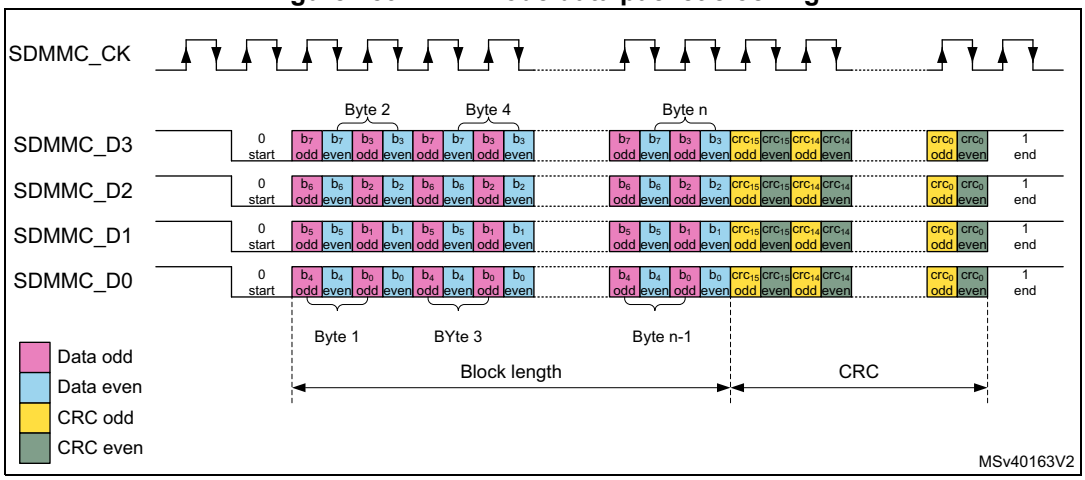
Note: The data sampling mode only applies to the SDMMC_D[7:0] lines. (not applicable to the SDMMC_CMD line.)

In DDR mode, data is sampled on both edges of the SDMMC_CK according the following rules, see also *Figure 259* and *Figure 260*:

- On the rising edge of the clock odd bytes are sampled.
- On the falling edge of the clock even bytes are sampled.
- Data payload size is always a multiple of 2 bytes.
- Two CRC16 are computed per data line
  - Odd bits CRC16 clocked on the falling edge of the clock.
  - Even bits CRC16 clocked on the rising edge of the clock.
- Start, end bits and idle conditions are full cycle.
- CRC status / boot acknowledgment and busy signaling are full cycle and are only sampled on the rising edge of the clock.

In DDR mode, the SDMMC_CK clock division must be ≥ 2.

Figure 259. DDR mode data packet clocking



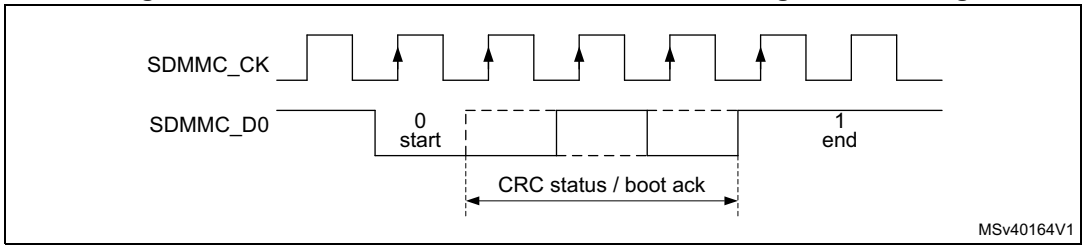


Figure 260. DDR mode CRC status / boot acknowledgment clocking

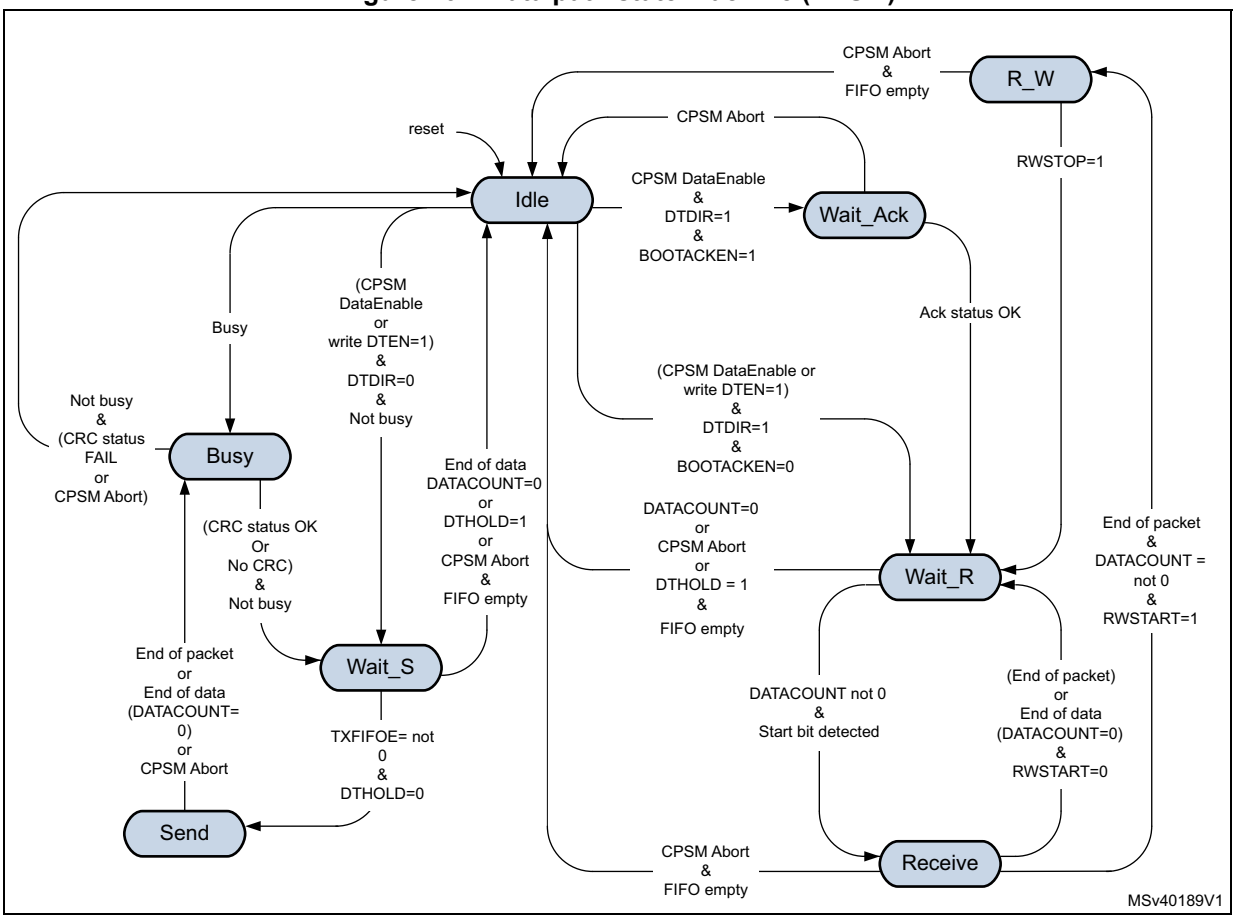
Data path state machine (DPSM)



Depending on the transfer direction (send or receive), the data path state machine (DPSM) moves to the Wait_S or Wait_R state when it is enabled:

- Send: the DPSM moves to the Wait_S state. If there is data in the transmit FIFO, the DPSM moves to the Send state, and the data path subunit starts sending data to a card.
- Receive: the DPSM moves to the Wait_R state and waits for a start bit. When it receives a start bit, the DPSM moves to the Receive state, and the data path subunit starts receiving data from a card.

For boot operation with acknowledgment the DPSM moves to the Wait_Ack state and waits for the boot acknowledgment before moving to the Wait_R state.

The DPSM operates at SDMMC_CK. The DPSM has the following states, as shown in *Figure 261*. When ever the DPSM is active (not in the Idle state), the DPSMACT bit is set.

Figure 261. Data path state machine (DPSM)

- **Idle** state: the data path is inactive, and the SDMMC_D[7:0] outputs are according the PWRCTRL setting. The DPSM is activated either by sending a command with CMDTRANS bit set or by setting the DTEN bit, or by detecting Busy on SDMMC_D0 (that is, after a command with R1b response).

  When not busy, the DPSM activates the SDMMC_CK clock (when stopped due to power save PWRSAV bit), loads the data counter with a new (DATALENGTH) value and:

  – When the data direction bit (DTDIR) indicates send, moves to the Wait_S.

  – When the data direction bit (DTDIR) indicates receive, moves to the
  - Wait_R when BOOTACKEN register bit is clear.
  - Wait_Ack when BOOTACKEN register bit is set and start the acknowledgment timeout.

  When busy the DPSM keeps the SDMMC_CK clock active and move to the Busy state.

Note: DTEN must not be used to start data transfer with SD, SDIO and e•MMC cards.

- **Wait_Ack** state: the data path waits for the boot acknowledgment token.
  - The DPSM moves to the Wait_R state if it receives an error free acknowledgment before a timeout.
  - When a pattern different from the acknowledgment is received an acknowledgment status error is generated, and the ack fail status flag (ACKFAIL) is set. The DPSM stays in Wait_Ack.
  - If it reaches a timeout (ACKTIME) before it detects a start bit, it sets the timeout status flag (ACKTIMEOUT). The DPSM stays in Wait_Ack.
  - When the CPSM Abort signal is set it moves to the Idle state and sets the DABORT flag.
- **Wait_R** state: the data path, if the data counter is not zero and data is not hold, waits for a start bit on SDMMC_D[n:0]. If the data counter is zero or data is hold, wait for the FIFO to be empty.
  - In block mode, if a start bit is received before a timeout the DPSM moves to the Receive state and loads the data block counter with DBLOCKSIZE.
  - In SDIO multibyte mode, if a start bit is received before a timeout the DPSM moves to the Receive state and loads the data block counter with DATALENGTH.
  - In stream mode, if a start bit is received before a timeout the DPSM moves to the Receive state and loads the data counter with DATALENGTH.
  - if the data counter (DATACOUNT) equals zero (end of data) the DPSM moves to the Idle state when the receive FIFO is empty and the DATAEND flag is set.
  - If it reaches a timeout (DATATIME) before it detects a start bit, it sets the timeout status flag (DTIMEOUT) and the DPSM stays in the Wait_R state.
  - If the CPSM Abort signal is set:
    If DATACOUNT > 0, the DPSM moves to the Idle state when the FIFO is empty and when IDMAEN = 0 reset with FIFORST, and sets the DABORT flag.
    If DATACOUNT is zero normal operation is continued, there is no DABORT flag since the transfer has completed normally.
  - if the DTHOLD bit is set:
    - When DATACOUNT > 0, the DPSM moves to the Idle state when the receive FIFO is empty and when IDMAEN = 0 reset with FIFORST, and issues the DHOLD flag. When holding the timeout is disabled. When an CPSM Abort signal is received during holding, the transfer is aborted.
    - When DATACOUNT = 0, the transfer is completed normally and there is no DHOLD flag.
  - When DPSM has been started with DTEN, after an error (DTIMEOUT) the DPSM moves to the Idle state when the FIFO is empty and when IDMAEN = 0 reset with FIFORST.

- **R_W** state: the data path Read Wait the bus.
  - The DPSM moves to the Wait_R state when the Read Wait stop bit (RWSTOP) is set, and start the receive timeout.
  - If the CPSM Abort signal is set, wait for the FIFO to be empty and when IDMAEN = 0 reset with FIFORST, then moves to the Idle state and sets the DABORT flag.
- **Receive** state: the data path receives serial data from a card. Pack the data in bytes and written it to the data FIFO. Depending on the transfer mode selected in the data control register (DTMODE), the data transfer mode can be either block or stream:
  - In block mode, when the data block size (DBLOCKSIZE) number of data bytes are received, the DPSM waits until it receives the CRC code.
  - In SDIO multibyte mode, when the data block size (DATALENGTH) number of data bytes are received, the DPSM waits until it receives the CRC code.

  a) If the received CRC code matches the internally generated CRC code, the DPSM moves to the
  - R_W state when RWSTART = 1 and DATACOUNT > zero, the DBCKEND flag is set.
  - Wait_R state otherwise.

  b) If the received CRC code fails the internally generated CRC code any further data reception is prevented.
  - When not all data has been received (DATACOUNT > 0), the CRC fail status flag (DCRCFAIL) is set and the DPSM stays in the Receive state.
  - When all data has been received (DATACOUNT = 0), wait for the FIFO to be empty after which the CRC fail status flag (DCRCFAIL) is set and the DPSM moves to the Idle state.

  - In stream mode, the DPSM receives data while the data counter DATACOUNT > 0. When the counter is zero, the remaining data in the shift register is written to the data FIFO, and the DPSM moves to the Wait_R state.
  - When a FIFO overrun error occurs, the DPSM sets the FIFO overrun error flag (RXOVERR) and any further data reception is prevented. The DPSM stays in the Receive state.
  - When an CPSM Abort signal is received:
  - If the CPSM Abort signal is received before the 2 last bits of the data with DATACOUNT = 0, the transfer is aborted. The remaining data in the shift register is written to the data FIFO, wait for the FIFO to be empty and when IDMAEN = 0 reset with FIFORST, then the DPSM moves to the Idle state and the DABORT flag is set.
  - If the CPSM Abort signal is received during or after the 2 last bits of the transfer with DATACOUNT = 0, the transfer is completed normally. The DPSM stays in the Receive state no DABORT flag is generated.
  - When DPSM has been started with DTEN, after an error (DCRCFAIL when DATACOUNT > 0, or RXOVERR) the DPSM moves to the Idle state when the FIFO is empty and when IDMAEN = 0 reset with FIFORST.

- **Wait_S** state: the data path waits for data to be available from the FIFO.
  - If the data counter DATACOUNT > 0, waits until the data FIFO empty flag (TXFIFOE) is de-asserted and DTHOLD is not set, and moves to the Send state.
  - If the data counter (DATACOUNT) = 0 the DPSM moves to the Idle state.
    - When DTHOLD is disabled, the DATAEND flag is set.
    - When DTHOLD is enabled, the DHOLD flag is set.
  - When DTHOLD is set and the DATACOUNT > 0
    - When IDMA is enabled, the DBCKEND flag is set and subsequently the FIFO is flushed, furthermore the DPSM moves to the Idle state and the DHOLD flag is set.
    - When IDMA is disabled the DBCKEND flag is set. Wait for the FIFO to be reset by software with FIFORST, then DPSM moves to the Idle state and issues the DHOLD flag.
  - When DTHOLD is set and DATACOUNT = 0 the transfer is completed normally.
  - When receiving the CPSM Abort signal
    - If the CPSM Abort signal is received before the 2 last bits of the data with DATACOUNT = 0, the transfer is aborted, wait for the FIFO to be empty and when IDMAEN = 0 reset with FIFORST, then the DPSM moves to the Idle state and sets the DABORT flag.
    - If the CPSM Abort signal is received during or after the 2 last bits of the transfer with DATACOUNT = 0, normal operation is continued, there is no DABORT flag since the transfer has completed normally.

Note: The DPSM remains in the Wait_S state for at least two clock periods to meet the N_{WR} timing requirements, where N_{WR} is the number of clock cycles between the reception of the card response and the start of the data transfer from the host.

- **Send** state: the DPSM starts sending data to a card. Depending on the transfer mode bit in the data control register, the data transfer mode can be either block, SDIO multibyte or stream:
  - In block mode, when the data block size (DBLOCKSIZE) number of data bytes are send, the DPSM sends an internally generated CRC code and end bit, and moves to the Busy state and start the transmit timeout.
  - In SDIO multibyte mode, when the data block size (DATALENGTH) number of data bytes are send, the DPSM sends an internally generated CRC code and end bit, and moves to the Busy state and start the transmit timeout.
  - In stream mode, the DPSM sends data to a card while the data counter DATACOUNT > 0. When the data counter reaches zero moves to the Busy state and start the transmit timeout.
    Before sending the last stream byte according to DATACOUNT, the DPSM issues a trigger on the send CMD signal. This signal is used by the CPSM to sent any pending command (CMD12 Stop Transmission command).
  - If a FIFO underrun error occurs, the DPSM sets the FIFO underrun error flag (TXUNDERR). The DPSM stays in the Send state.
  - When receiving the CPSM Abort signal
    - If the CPSM Abort signal is received before the 2 last bits of the transfer with DATACOUNT = 0, the transfer is aborted. The DPSM sends a last data bit followed by an end bit. The FIFO is disabled/flushed, and the DPSM moves to the Busy state to wait for not busy before setting the DABORT flag.
    - If the CPSM Abort signal is received during or after the 2 last bits of the transfer

with DATACOUNT = 0, the transfer is completed normally, there is no DABORT flag.

- **Busy** state: the DPSM waits for the CRC status token when expected, and wait for a not busy signal:
  - If a CRC status token is expected and indicate “non-erroneous transmission” or when there is no CRC expected:
    - it moves to the Wait_S state when SDMMC_D0 is not low (the card is not busy).
    - When the card is busy SDMMC_D0 is low it remains in the Busy state.
  - If a CRC status token is expected and indicates “erroneous transmission”.
    - When not all data has been send (DATACOUNT > 0). The DPSM waits for not busy after which the CRC fail status flag (DCRCFAIL) is set. The FIFO is disabled/flushed and the DPSM stays in the Busy state.
    - When all data has been send (DATACOUNT = 0). The DPSM waits for not busy after which the CRC fail status flag (DCRCFAIL) is set and the DPSM moves to the Idle state.
  - If a CRC status (Ncrc) timeout occurs while the DPSM is in the Busy state, it sets the data timeout flag (DTIMEOUT) and stays in the Busy state.
  - If a busy timeout occurs while the DPSM is in the Busy state, it sets the data timeout flag (DTIMEOUT) and stays in the Busy state.
  - When receiving the CPSM Abort signal in the Busy state:
    - If the CPSM Abort signal is received before the 2 last bits of the CRC response with DATACOUNT > 0, the data transfer is aborted. The DPSM waits for not busy and the FIFO to be disabled/flushed before moving to the Idle state and the DABORT flag is set.
    - If the CPSM Abort signal is received during or after the 2 last bits of the CRC response when DATACOUNT = 0 or when no CRC is expected and DATACOUNT = 0 and there has been no DTIMEOUT error, the DPSM stays in the Busy state no DABORT flag is generated, since the transfer may completed normally.
    - If the CPSM Abort signal is received when a DTIMEOUT error has occurred the DPSM waits for not busy and the FIFO to be disabled/flushed before moving to the Idle state and the DABORT flag is set.
  - When entering the Busy state due to an abort in the Send state, the DPSM waits for not busy before moving to the Idle state and the DABORT flag is set.
  - When DPSM has been started with DTEN, after an error (DCRCFAIL when DATACOUNT > 0, or DTIMEOUT) the DPSM moves to the Idle state when the FIFO is reset.
  - When the DPSM has been started due to Busy on SDMMC_D0, waits for not busy after which the Busy end status flag (BUSYD0END) is set and the DPSM moves to the Idle state.

The data timer (DATATIME) is enabled when the DPSM is in the Wait_R or Busy state 2 cycles after the data block end bit, or data read command end bit, or R1b response, and generates the data timeout error (DTIMEOUT):

- When transmitting data, the timeout occurs
  - when a CRC status is expected and no start bit is received withing 8 SDMMC_CK cycles, the DTIMEOUT flag is set.
  - when the Busy state takes longer than the programmed timeout period., the DTIMEOUT flag is set.
- When receiving data, the timeout occurs
  - when there is still data to be received DATACOUNT > 0 and no start bit is received before the programmed timeout period, the DTIMEOUT flag is set.
- After a R1b response, the timeout occurs
  - when the Busy state takes longer than the programmed timeout period., the DTIMEOUT flag is set.

When DATATIME = 0:

- In receive the start bit must be present 2 cycles after the data block end bit or data read command end bit.
- In transmit busy is timed out 2 cycles after the CRC token end bit or stream data end bit.
- After a R1b response busy is timed out 2 cycles after the response end bit.

Data can be transferred from the card to the host (transmit, send) or vice versa (receive). Data are transferred via the SDMMC_Dn data lines, they are stored in a FIFO.

Table 220. Data token format

Description	Start bit	Data(1)	CRC16	End bit	DTMODE
Block data	0	(DBLOCKSIZE, DATALENGTH)	Yes	1	00
SDIO multibyte	0	(DATALENGTH)	Yes	1	01
e•MMC stream	0	(DATALENGTH)	No	1	10

1. The total amount of data to transfer is given by DATALENGTH. Where for Block data the amount of data in each block is given by DBLOCKSIZE.

The data token format is selected with register bits DTMODE according.

The data path implements the status flags and associated clear bits shown in *Table 221*:

Table 221. Data path status flags and clear bits

Flag		Description
DATAEND	TX	Set at the end of the complete data transfer when the CRC is OK and busy has finished and both DTHOLD = 0 and DATACOUNT = 0. (DPSM moves from Wait_S to Idle)
	RX	Set at the end of the complete data transfer when the CRC is OK and all data has been read, (DATACOUNT = 0 and FIFO is empty). (DPSM moves from Wait_R to Idle)
	Boot	

Table 221. Data path status flags and clear bits (continued)

Flag		Description
DCRCFAIL	TX	Set at the end of the CRC when FAIL and busy has finished. (DPSM stay in Busy when there is still data to send and wait for CPSM Abort) (DPSM moves from Busy to Idle when all data has been sent) or DPSM has been started with DTEN
	RX	Set at the end of the CRC when FAIL and FIFO is empty. (DPSM stays in Receive when there is still data to be received and wait for CPSM Abort) (DPSM moves from Receive to Idle when all data has been received or DPSM has been started with DTEN)
	Boot	
ACKFAIL	Boot	Set at the end of the boot acknowledgment when fail. (DPSM stays in Wait_Ack and wait for CPSM Abort)
DTIMEOUT	CMD R1b	Set after the command response no end of busy received before the timeout. (DPSM stays in Busy and wait for CPSM Abort)
	TX	Set when no CRC token start bit received within Ncrc, or no end of busy received before the timeout. (DPSM stays in Busy and wait for CPSM Abort) (When DPSM has been started with DTEN move to Idle) Note: The DCRCFAIL flag may also be set when CRC failed before the busy timeout.
	RX	Set when no start bit received before the timeout. (DPSM stays in Wait_R and wait for CPSM Abort) (When DPSM has been started with DTEN move to Idle)
	Boot	
ACKTIMEOUT	Boot	Set when no start bit received before the timeout. (DPSM stays in Wait_Ack and wait for CPSM Abort)
DBCKEND	TX	When DTHOLD = 1 and IDMAEN = 0: Set at the end of data block transfer when the CRC is OK and busy has finished, when data transfer is not complete (DATACOUNT >0). (DPSM moves from Busy to Wait_S)
	RX	When RWSTART = 1: Set at the end of data block transfer when the CRC is OK, when data transfer is not complete (DATACOUNT > 0). (DPSM moves from Receive to R_W)
	Boot	
DHOLD	TX	When DTHOLD = 1: Set at the end of data block transfer when the CRC is OK and busy has finished. (DPSM moves from Wait_S to Idle)
	RX	When DTHOLD = 1: Set at the end of data block transfer when the CRC is OK and all data has been read (FIFO is empty), when data transfer is not complete (DATACOUNT >0). (DPSM moves from Wait_R to Idle)
DABORT	CMD R1b	When CPSM Abort event has been sent by the CPSM and busy has finished. (DPSM moves from Busy to Idle)
	TX	When CPSM Abort event has been sent by the CPSM before the 2 last bits of the transfer. (DPSM moves from any state to Idle)
	RX	
	Boot	
BUSYD0END	CMD R1b	Set after the command response when end of busy before the timeout. (DPSM moves from Busy to Idle)
DPSMACT		Data transfer in progress. (DPSM not in Idle state)

The data path error handling is shown in *Table 222*:

Table 222. Data path error handling

Error	DPSM state	Cause	Card action	Host action	DPSM action
Timeout	Wait_Ack	No Ack in time	unknown	Card cycle power	Stay in Wait_Ack (reset the SDMMC with the RCC.SDMMCxRST register bit)
	Wait_R	No start bit in time	unknown	Stop data reception Send stop transmission command	On CPSM Abort move to Idle
			unknown	Stop boot procedure	
	Busy	Busy too long (due to data transfer)	unknown	Stop data reception Send stop transmission command	
		Busy too long (due to R1b)	unknown	Send reset command	
CRC	Receive	transmission error	Send further data	Stop data reception Send stop transmission command	On CPSM Abort move to Idle
CRC status	Busy	Negative status	Ignore further data	Stop data transmission Send stop transmission command	On CPSM Abort move to Idle
		transmission error	wait for further data		
Ack status	Wait_Ack	transmission error	Send boot data	Stop boot procedure	On CPSM Abort move to Idle
Overrun	Receive	FIFO full	Send further data	Stop data reception Send stop transmission command	On CPSM Abort move to Idle
Underrun	Send	FIFO empty	Receive further data	Stop data transmission Send stop transmission command	On CPSM Abort move to Idle

Data FIFO

The data FIFO (first-in-first-out) subunit contains the transmit and receive data buffer. A single FIFO is used for either transmit or receive as selected by the DTDIR bit. The FIFO contain a 32-bit wide, 16-word deep data buffer and control logic. Because the data FIFO operates in the AHB clock domain (sdmmc_hclk), all signals from the subunits in the SDMMC clock domain (SDMMC_CK/sdmmc_rx_ck) are resynchronized.

The FIFO can be in one of the following states:

- The transmit FIFO refers to the transmit logic and data buffer when sending data out to the card. (DTDIR = 0)
- The receive FIFO refers to the receive logic and data buffer when receiving data in from the card. (DTDIR = 1)

The end of a correctly completed SDMMC data transfer from the FIFO is indicated by the DATAEND flags driven by the data path subunit. Any incorrect (aborted) SDMMC data transfer from the FIFO is indicated by one of the error flags (DCRCFAIL, DTIMEOUT, DABORT) driven by the data path subunit, or one of the FIFO error flags (TXUNDERR, RXOVERR) driven by the FIFO control.

The data FIFO can be accessed in the following ways, see *Table 223*.

Table 223. Data FIFO access

Data FIFO access	IDMAEN
From firmware via AHB slave interface	0
From IDMA via AHB master interface	1

Transmit FIFO:

Data can be written to the transmit FIFO when the DPSM has been activated (DPSMACT = 1).

When IDMAEN = 1 the FIFO is fully handled by the IDMA.

When IDMAEN = 0 the FIFO is controlled by firmware via the AHB slave interface. The transmit FIFO is accessible via sequential addresses. The transmit FIFO contains a data output register that holds the data word pointed to by the read pointer. When the data path subunit has loaded its shift register, it increments the read pointer and drives new data out. The transmit FIFO is handled in the following way:

1. Write the data length into DATALENGTH and the block length in DBLOCKSIZE.
   – For block data transfer (DTMODE = 0), DATALENGTH must be an integer multiple of DBLOCKSIZE.
2. Set the SDMMC in transmit mode (DTDIR = 0).
   – Configures the FIFO in transmit mode.
3. Enable the data transfer
   – either by sending a command from the CPSM with the CMDTRANS bit set
   – or by setting DTEN bit
4. When (DPSMACT = 1) write data to the FIFO.
   – The DPSM stays in the Wait_S state until FIFO is full (TXFIFOF = 1), or the number indicated by DATALENGTH.

- The SDMMC keeps sending data as long as FIFO is not empty, hardware flow control during data transfer is used to prevent FIFO underrun.

5. Write data to the FIFO.
   – When the FIFO is handled by software, wait until the FIFO is half empty (TXFIFOHE flag), write data to the FIFO until FIFO is full (TXFIFOF = 1), or last data has been written.
   – When the FIFO is handled by the IDMA, the IDMA transfers the FIFO date.
6. When last data has been written wait for end of data (DATAEND flag)
   – SDMMC has completely sent all data and the DPSM is disabled (DPSMACT = 0).

In case of a data transfer error or transfer hold when IDMAEN = 0, firmware must stop writing to the FIFO and flush and reset the FIFO with the FIFORST register bit.

The transmit FIFO status flags are listed in *Table 224*.

Table 224. Transmit FIFO status flags

Flag	Description
TXFIFOF	Set to high when all transmit FIFO words contain valid data.
TXFIFOE	Set to high when the transmit FIFO does not contain valid data.
TXFIFOHE	Set to high when half or more transmit FIFO words are empty.
TXUNDERR	Set to high when an underrun error occurs. This flag is cleared by writing to the SDMMC Clear register.

Receive FIFO:

Data can be read from the receive FIFO when the DPSM is activated (DPSMACT = 1).

When IDMAEN = 1 the FIFO is fully handled by the IDMA.

When IDMAEN = 0 the FIFO is controlled by firmware via the AHB slave interface.When the data path subunit receives a word of data, it drives the data on the write databus. The write pointer is incremented after the write operation completes. On the read side, the contents of the FIFO word pointed to by the current value of the read pointer is driven onto the read databus. The receive FIFO is accessible via sequential addresses.

The receive FIFO is handled in the following way:

1. Write the data length into DATALENGTH and the block length in DBLOCKSIZE.
   – For block data transfer (DTMODE = 0), DATALENGTH must be an integer multiple of DBLOCKSIZE.
2. Set the SDMMC in receive mode (DTDIR = 1).
   – Configures the FIFO in receive mode.
3. Enable the DPSM transfer
   – either by sending a command from the CPSM with the CMDTRANS bit set
   – or by setting DTEN bit.
4. When (DPSMACT = 1) the FIFO is ready to receive data.
   – The DPSM writes the received data to the FIFO.
   - The SDMMC keeps receiving data as long as FIFO is not full, hardware flow control during the data transfer is used to prevent FIFO overrun.
5. Read data from the FIFO.
   – When the FIFO is handled by software, wait until the FIFO is half full (RXFIFOHF flag), read data from the FIFO until FIFO is empty (RXFIFOE = 1).
   - When last data has been received, read data from the FIFO until FIFO is empty (DATAEND = 1).
   – When the FIFO is handled by the IDMA, the IDMA transfers the FIFO date.
6. SDMMC has completely received all data and the DPSM is disabled (DPSMACT = 0).

In case of a data transfer hold when IDMAEN = 0, the firmware must read the remaining data until the FIFO is empty and reset the FIFO with the FIFORST register bit. This causes the DPSM to go to the Idle state (DPSMACT = 0).

In case of a data transfer error when IDMAEN = 0, the firmware must stop reading the FIFO and flush and reset the FIFO with the FIFORST register bit. This causes the DPSM to go to the Idle state (DPSMACT = 0).

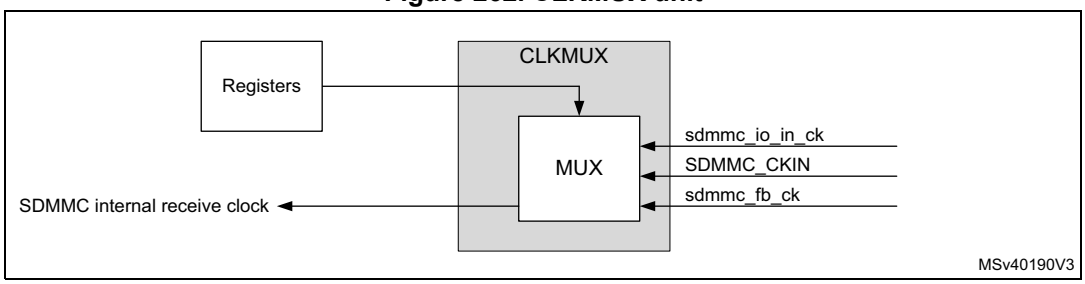
The receive FIFO status flags are listed in *Table 225*.

Table 225. Receive FIFO status flags

Flag	Description
RXFIFOF	Set to high when all receive FIFO words contain valid data
RXFIFOE	Set to high when the receive FIFO does not contain valid data.
RXFIFOHF	Set to high when half or more receive FIFO words contain valid data.
RXOVERR	Set to high when an overrun error occurs. This flag is cleared by writing to the SDMMC Clear register.

CLKMUX unit

The CLKMUX selects the source for clock sdmmc_rx_ck to be used with the received data and command response. The receive data clock source can be selected by the clock control register bit SELCLKRX, between:



- sdmmc_io_in_ck bus master main feedback clock.
- SDMMC_CKIN external bus feedback clock.
- sdmmc_fb_ck bus tuned feedback clock.

The sdmmc_io_in_ck is selected when there is no external driver, with DS and HS.

The SDMMC_CKIN is selected when there is an external driver with SDR12, SDR25, SDR50 and DDR50.

The sdmmc_fb_ck clock input must be selected when the DLYB block on the device is used with SDR104, HS200 and optionally with SDR50 and DDR50 modes.

Figure 262. CLKMUX unit

The sdmmc_rx_ck source must be changed when the CPSM and DPSM are in the Idle state.

23.5.5 SDMMC AHB slave interface

The AHB slave interface generates the interrupt requests, and accesses the SDMMC adapter registers and the data FIFO. It consists of a data path, register decoder, and interrupt logic.

SDMMC FIFO

The FIFO access is restricted to word access only:

- In transmit FIFO mode
  - Data are written to the FIFO in words (32-bits) until all data according DATALENGTH has been transfered. When the DATALENGTH is not an integer multiple of 4, the last remaining data (1, 2 or 3 bytes) are written with a word transfer.
- In receive FIFO mode
  - Data are read from the FIFO in words (32-bits) until all data according DATALENGTH has been transfered. When the DATALENGTH is not an integer multiple of 4, the last remaining data (1, 2 or 3 bytes) are read with a word transfer padded with 0 value bytes.

When accessing the FIFO with half word or byte accesses an AHB bus fault is generated.

SDMMC interrupts

The interrupt logic generates an interrupt request signal that is asserted when at least one of the unmasked status flags is active. A mask register is provided to allow selection of the conditions that generate an interrupt. A status flag generates the interrupt request if a corresponding mask flag is set. Some status flags require an implicit clear in the clear register.

23.5.6 SDMMC AHB master interface

The AHB master interface is used to transfer the data between a memory and the FIFO using the SDMMC IDMA.

SDMMC IDMA

Direct memory access (DMA) is used to provide high-speed transfer between the SDMMC FIFO and the memory. The AHB master optimizes the bandwidth of the system bus. The SDMMC internal DMA (IDMA) provides one channel to be used either for transmit or receive.

The IDMA is enabled by the IDMAEN bit and supports burst transfers of 8 beats.

- In transmit burst transfer mode:
  - Data are fetched in burst from memory whenever the FIFO is empty for the number of burst transfers, until all data according DATALENGTH has been transfered. When the DATALENGTH is not an integer multiple of the burst size the remaining, smaller then burst size data is transfered using single transfer mode. When the DATALENGTH is not an integer multiple of 4, the last remaining data (1, 2 or 3 bytes) are fetched with a word transfer.
- In receive burst transfer mode:
  - Data are stored in burst in to memory whenever the FIFO contains the number of burst transfers, until all data according DATALENGTH has been transfered. When the DATALENGTH is not an integer multiple of the burst transfer the remaining, smaller then burst size data, is transfered using single transfer mode. When the DATALENGTH is not an integer multiple of 4, the last remaining data (1, 2 or 3 bytes) are stored with halfword and or byte transfers.

In addition the IDMA provides the following channel configurations selected by bit IDMABMODE:

- single buffered channel
- linked list channel

Single buffered channel

In single buffer configuration the data at the memory side is accessed in a linear matter starting from the base address IDMABASE. When the IDMA has finished transferring all data the and the DPSM has completed the transfer the DATAEND flag is set.

Linked list channel

In linked list configuration, IDMAMODE = 1, the data at the memory side is subsequently accessed from linked buffers, located at base address IDMABASE. The size of the memory buffers is defined by IDMABSIZE. The buffer size must be an integer multiple of the burst size. The bit ULA is used to indicate if a new linked list buffer configuration has to be loaded from the linked list table. A new linked list configuration is loaded when the ULA bit for the current linked list item is set.

The first linked list item configuration is programmed by firmware directly in the SDMMC registers.

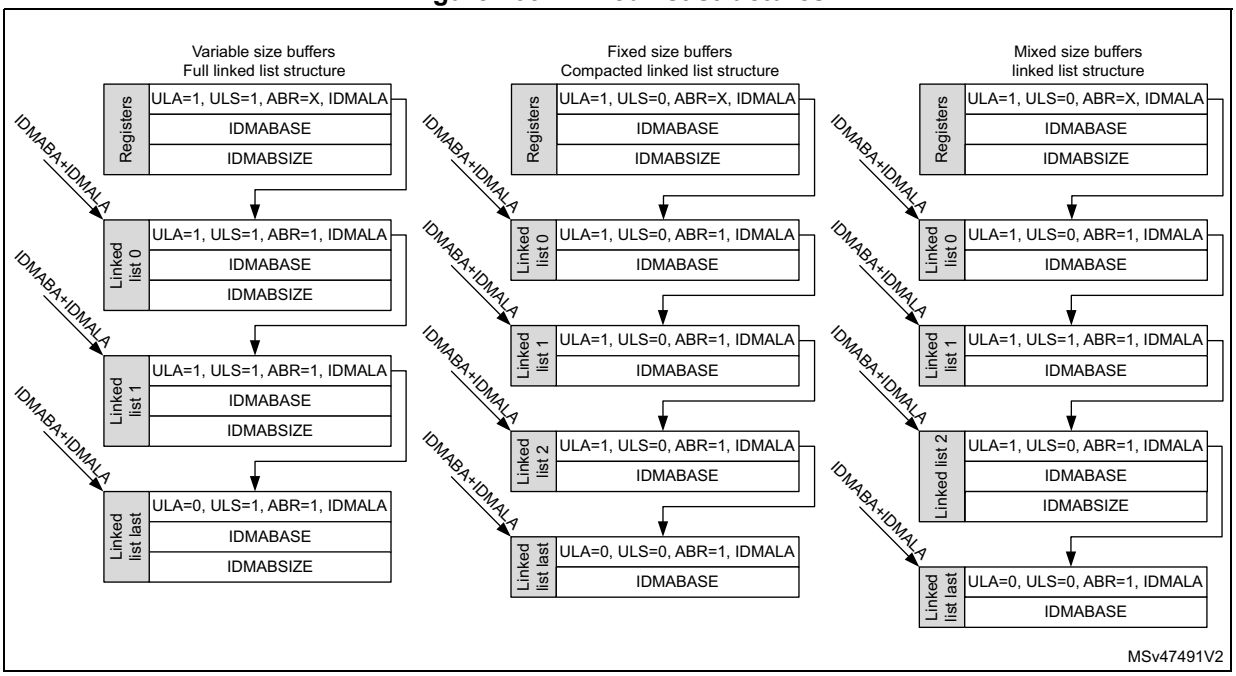
When the IDMA has finished transferring all the data of one linked list buffer, according IDMABSIZE, and when the linked list item ULA bit is set, the IDMA loads the new linked list item from the linked list table, and continues transferring data from the next linked list buffer.

When the IDMA has finished transferring all data, according IDMABSIZE and ULA, and the DPSM has completed the transfer, according DATALENGTH, the DATAEND flag is set.

In the following cases, the linked list provides more buffer space than the data to transfer which means the current linked list buffer data has not completely be transfered:

- the ULA bit is set, and all SDMMC data according DATALENGTH has been transfered (DATAEND flag)
- a transfer error (DCRCFAIL when DATACOUNT > 0, RXOVERR, TXUNDERR) occurs
- a transfer is hold (DTHOLD)

In all above cases, the IDMA linked list is stopped and the FIFO is flushed/reset. Before starting or restarting a new SDMMC transfer, the software must initialize a new linked list with correct IDMABASE and IDMABSIZE.



When a IDMA transfer error occurs (see *Section : IDMA transfer error management*) or when the linked list does not provide sufficient buffer space:

- the linked list ends with ULA = 0 and all last linked list buffer data has been transfered, and not all SDMMC data according DATALENGTH has been transfered. The SDMMC transfer is stopped and an IDMA transfer error is generated (see *Section : IDMA transfer error management*).

For a given linked list item, the base address is given by the linked list base IDMABA register value plus the linked list offset IDMALA register value.

The content of each linked list item can be specified by the ULS bit, which makes possible to optionally load the IDMABSIZE, resulting in a 3-word linked list structure. When the IDMABSIZE is not to be loaded (fixed size buffers) a compacted reduced 2-word linked list structure can be used containing only the IDMABASER and the IDMALAR values.

Figure 263. Linked list structures

There is no restriction on mixing both linked list item structures in a single list, this enables the IDMABSIZE to be updated only when needed.

Whenever a linked list buffer has been transfered and the current buffer ULA = 1, an end-of-linked-list-buffer-transfer-complete interrupt (IDMABTC) may be generated (if interrupt is enabled).

Linked list acknowledgment

In the case where software dynamically updates the linked list, during the SDMMC transfer, the availability of a new linked list buffer can be acknowledged by the acknowledge buffer ready (ABR) bit.

When ABR acknowledges that the new linked list buffer is ready, the IDMA continues transferring data from the new linked list buffer.

When ABR indicates that the new linked list buffer is not ready, an IDMA transfer error is generated (see *Section : IDMA transfer error management*). Depending when the IDMA transfer error occurs, it normally causes the generation of an TXUNDERR or RXOVERR error. When a linked list buffer is not acknowledged in time the SDMMC transfer is stopped.

The ABR information is “don't care” when starting the linked list from software programmed register information. The first linked list buffer must be ready to be used before starting the SDMMC transfer.

IDMA transfer error management

An IDMA transfer error can occur:

- When reading or writing a reserved address space (for data or linked list information).
- When there is no more linked list buffer space to store received SDMMC data.
- When all linked list buffer data has been transfered and still more SDMMC data needs to be sent.
- When the availability of a linked list buffer is not acknowledged.

On an IDMA transfer error subsequent IDMA transfers are disabled and an IDMATE flag is set and hardware flow control is disabled. Depending when the IDMA transfer error occurs, it normally causes the generation of a TXUNDERR or RXOVERR error.

The behavior of the IDMATE flag depend on when the IDMA transfer error occurs during the SDMMC transfer:

- An IDMA transfer error is detected before any SDMMC transfer error (TXUNDERR, RXOVERR, DCRCFAIL, or DTIMEOUT):
  - The IDMATE flag is set at the same time as the SDMMC transfer error flag.
  - The TXUNDERR, RXOVERR, DCRCFAIL, or DTIMEOUT interrupt is generated.
- An IDMA transfer error is detected during a STOP_TRANSNMISSION command:
  - The IDMATE flag is set at the same time as the DABORT flag.
  - The DABORT interrupt is generated.
- An IDMA transfer error is detected at the end of the SDMMC transfer (DHOLD, or DATAEND).
  - The IDMATE flag is set at the end of the SDMMC transfer.
  - A SDMMC transfer end interrupt is generated and a DHOLD or DATAEND flag is set.

The IDMATE is generated on an other SDMMC transfer interrupt (TXUNDERR. RXOVERR, DCRCFAIL, DTIMEOUT, DABORT, DHOLD, or DATAEND).

23.5.7 AHB and SDMMC_CK clock relation

The AHB must at least have 3x more bandwidth than the SDMMC bus bandwidth: for example, for SDR50 4-bit mode (50 Mbyte/s), the minimum sdmmc_hclk frequency is 37.5 MHz (150 Mbyte/s).

Table 226. AHB and SDMMC_CK clock frequency relation

SDMMC bus mode	SDMMC bus width	Maximum SDMMC_CK [MHz]	Minimum AHB clock [MHz]
e•MMC DS	8	26	19.5
e•MMC HS	8	52	39
e•MMC DDR52	8	52	78
e•MMC HS200	8	200	150
SD DS / SDR12	4	25	9.4
SD HS / SDR25	4	50	18.8
SD DDR50	4	50	37.5
SD SDR50	4	100	37.5
SD SDR104	4	208	78

23.6 Card functional description

23.6.1 SD I/O mode

The following features are SDMMC specific operations:

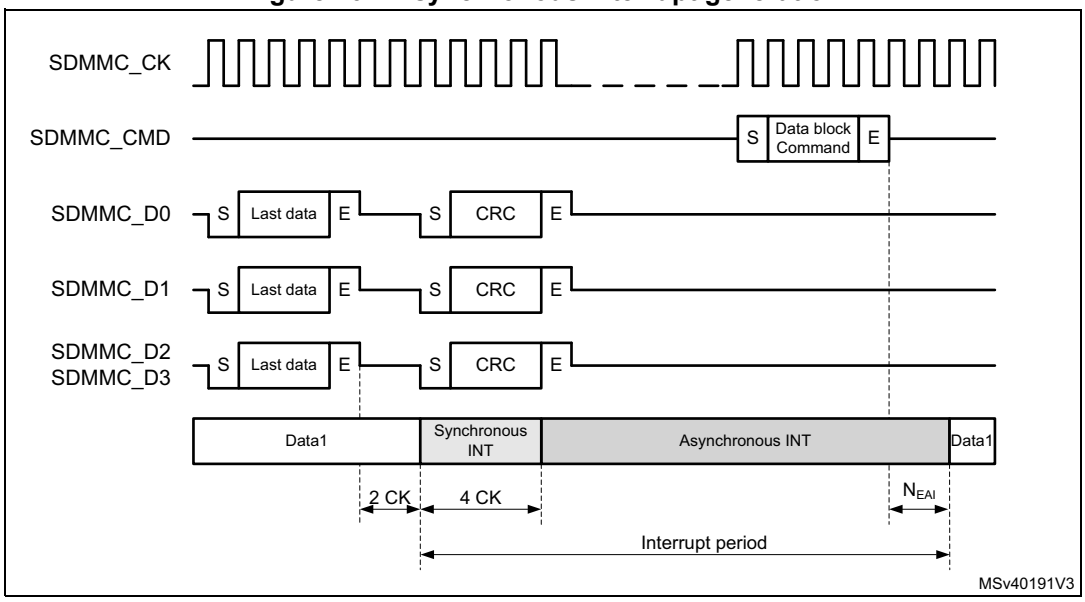
- SDIO interrupts
- SDIO suspend/resume operation (write and read suspend)
- SDIO Read Wait operation by stopping the clock
- SDIO Read Wait operation by SDMMC_D2 signaling

Table 227. SDIO special operation control

Operation mode	SDIOEN	RWMOD	RWSTOP	RWSTART	DTDIR
Interrupt detection	1	X	X	X	X
Suspend/Resume operation	X	X	X	X	X
Read Wait SDMMC_CK clock stop (START)	X	1	0	1	1
Read Wait SDMMC_CK clock stop (STOP)	X	1	1	1	1
Read Wait SDMMC_D2 signaling (START)	X	0	0	1	1
Read Wait SDMMC_D2 signaling (STOP)	X	0	1	1	1

SD I/O interrupts

To allow the SD I/O card to interrupt the host, an interrupt function is available on pin 8 (shared with SDMMC_D1 in 4-bit mode) on the SD interface. The use of the interrupt is optional for each card or function within a card. The SD I/O interrupt is level-sensitive, which means that the interrupt line must be held active (low) until it is either recognized and acted upon by the host or deasserted due to the end of the interrupt period. After the host has serviced the interrupt, the interrupt status bit is cleared via an I/O write to the appropriate bit in the SD I/O card internal registers. The interrupt output of all SD I/O cards is active low and the application must provide external pull-up resistors on all data lines (SDMMC_D[3:0]).



In SD 1-bit mode pin 8 is dedicated to the interrupt function (IRQ), and there are no timing constraints on interrupts.

In SD 4-bit mode the host samples the level of pin 8 (SDMMC_D1/IRQ) into the interrupt detector only during the interrupt period. At all other times, the host interrupt ignores this value. The interrupt period begins when interrupts are enabled at the card and SDIOEN bit is set see register settings in *Table 227*.

In 4-bit mode the card can generate a synchronous or asynchronous interrupt as indicated by the card CCCR register SAI and EAI bits.

- Synchronous interrupt, require the SDMMC_CK to be active.
- Asynchronous interrupt, can be generated when the SDMMC_CK is stopped, 4 cycles after the start of the card interrupt period following the last data block.

Figure 264. Asynchronous interrupt generation

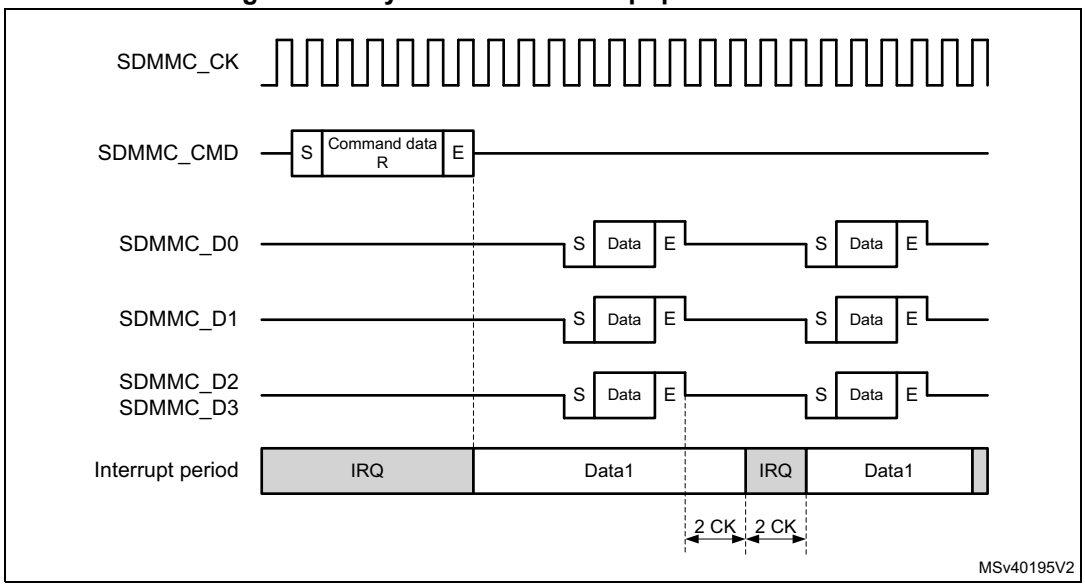
The timing of the interrupt period is depending on the bus speed mode.

In DS, HS, SDR12, and SDR25 mode, selected by register bit BUSSPEED, the interrupt period is synchronous to the SD clock.

- The interrupt period ends at the next clock from the end bit of a command that transfers data block(s) (Command sent with the CMDTRANS bit is set), or when the DTEN bit is set.
- The interrupt period resumes 2 SDMMC_CK after the completion of the data block.
- At the data block gap the interrupt period is limited to 2 SDMMC_CK cycles.

Note: DTEN must not be used to start data transfer with SD and e•MMC cards.

Figure 265. Synchronous interrupt period data read



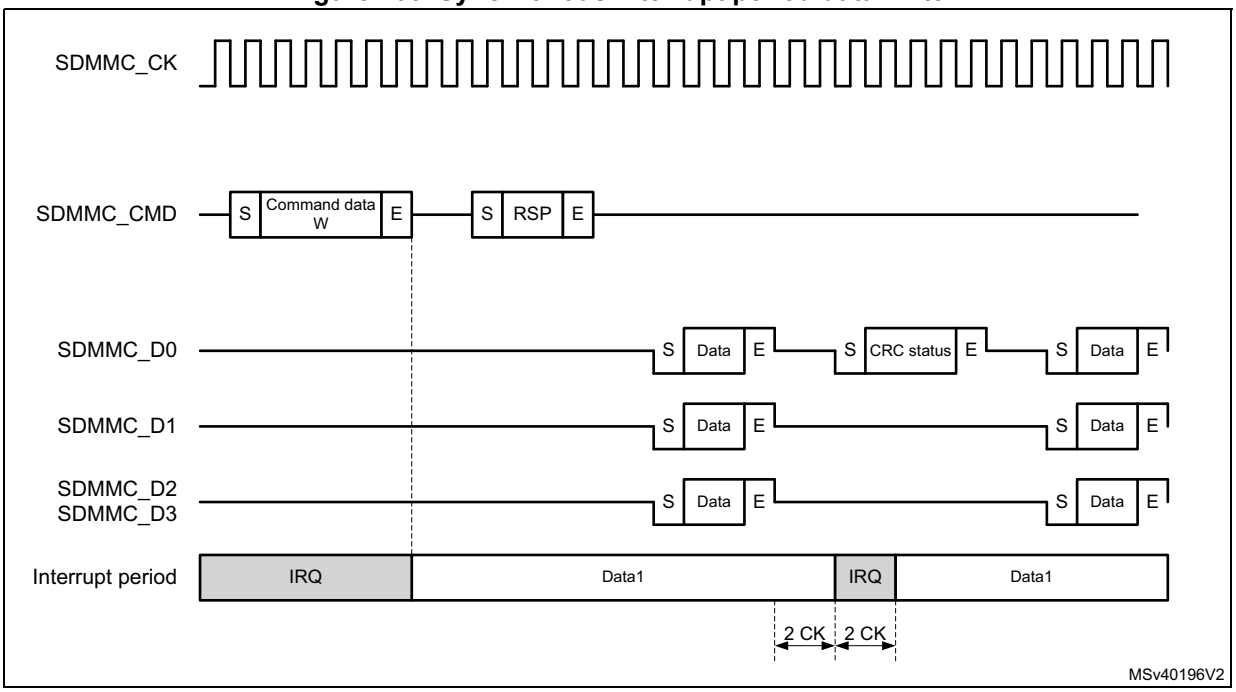


Figure 266. Synchronous interrupt period data write

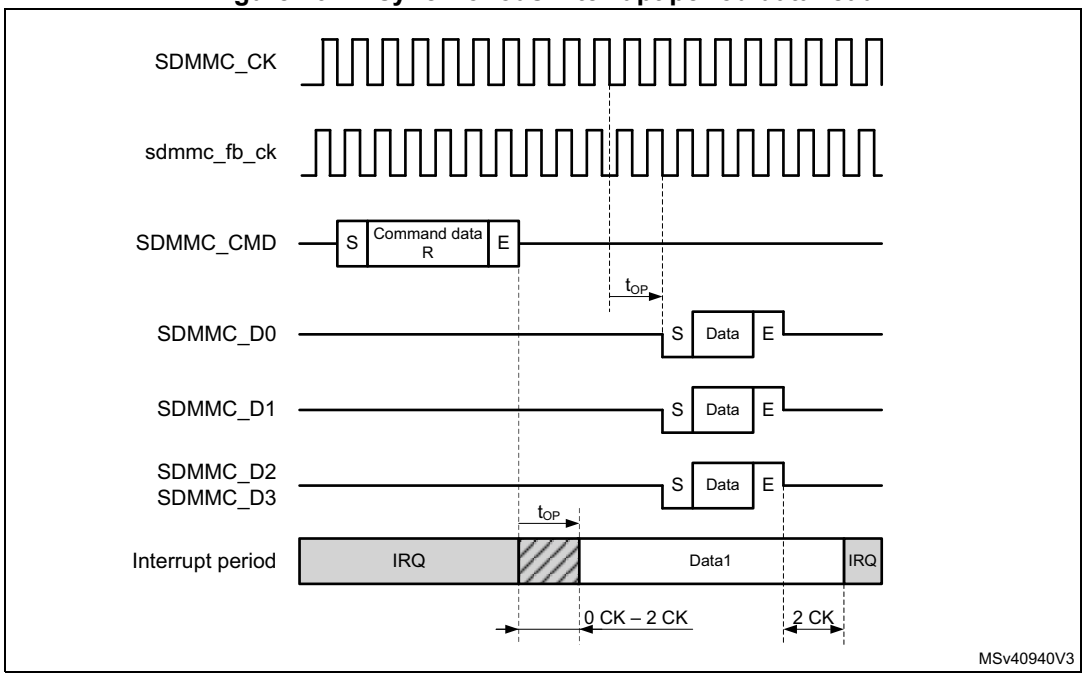
In SDR50, SDR104, and DDR50, selected by register bit BUSSPEED, due to propagation delay from the card to host, the interrupt period is asynchronous.

- The card interrupt period ends after 0 to 2 SDMMC_CK cycles after the end bit of a command that transfers data block(s) (Command sent with the CMDTRANS bit is set), or when the DTEN bit is set. At the host the interrupt period ends after the end bit of a command that transfers data block(s). A card interrupt issued in the 1 to 2 cycles after the command end bit are not detected by the host during this interrupt period.
- The card interrupt period resumes 2 to 4 SDMMC_CK after the completion of the last data block. The host resumes the interrupt period always 2 cycles after the last data block.
- There is NO interrupt period at the data block gap.

Note: DTEN must not be used to start data transfer with SD and e•MMC cards.

Figure 267. Asynchronous interrupt period data read



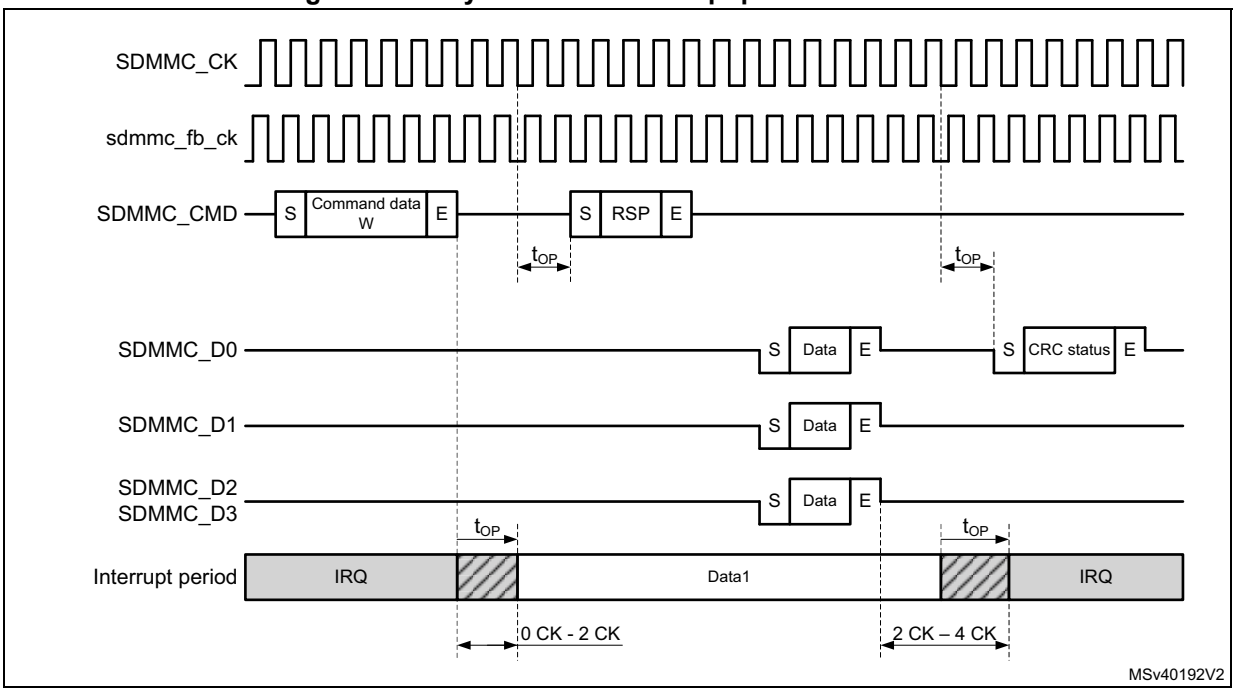


Figure 268. Asynchronous interrupt period data write

When transferring Open-ended multiple block data and using DTMODE “block data transfer ending with STOP_TRANSMISSION command”, the SDMMC masks the interrupt period after the last data block until the end of the CMD12 STOP_TRANSMISSION command.

The interrupt period is applicable for both memory and I/O operations.

In 4-bit mode interrupts can be differentiated from other signaling according *Table 228*.

Table 228. 4-bit mode Start, interrupt, and CRC-status Signaling detection

SDMMC data line	Start	Interrupt	CRC-status
SDMMC_D0	0	1 or CRC-status	0
SDMMC_D1	0	0	X
SDMMC_D2	0	1 or Read Wait	X
SDMMC_D3	0	1	X

SD I/O suspend and resume

This function is NOT supported in SDIO version 4.00 or later.

Within a multifunction SD I/O or a card with both I/O and memory functions, there are multiple devices (I/O and memory) that share access to the *e*•MMC/SD bus. To share access to the host among multiple devices, SD I/O and combo cards optionally implement the concept of suspend/resume. When a card supports suspend/resume, the host can temporarily halt (suspend) a data transfer operation to one function or memory to free the bus for a higher-priority transfer to a different function or memory. After this higher-priority transfer is complete, the original transfer is restarted (resume) where it left off.

To perform the suspend/resume operation on the bus, the host performs the following steps:

1. Determines the function currently using the SDMMC_D[3:0] line(s).
2. Requests the lower-priority or slower transaction to suspend.
3. Waits for the transaction suspension to complete.
4. Begins the higher-priority transaction.
5. Waits for the completion of the higher priority transaction.
6. Restores the suspended transaction.

The card receiving a suspend command responds with its current bus status. Only when the bus has been suspended by the card the bus status indicates suspension completed.

There are different suspend cases conditions:

- Suspend request accepted prior to the start of data transfer.
- Suspend request not accepted, (due to data being transfered at the same time), the host keeps checking the request until it is accepted (data transfer has suspended).
- Suspend request during write busy.
- Suspend request with write multiple.
- Suspend request during Read Wait.

For the host to know if the bus has been released it must check the status of the suspend request, suspension completed.

When the bus status of the suspend request response indicates suspension completed, the card has released the bus. At this time the state of the suspended operation must be saved where after an other operation can start.

The suspend command must be sent with the CMDSUSPEND bit set. This makes possible to start the interrupt period after the suspend command response when the bus is suspended (response bit BS = 0).

The hardware does not save the number of remaining data to be transfered when resuming the suspended operation. It is up to firmware to determine the data that has been transferred and resume with the correct remaining number of data bytes.

While receiving data from the card, the SDMMC can suspend the read operation after the read data block end (DPSM in Wait_R). After receiving the suspend acknowledgment response from the card the following steps must be taken by firmware:

1. The normal receive process must be stopped by setting DTHOLD bit.
   a) The remaining number of data bytes in the FIFO must be read until the receive FIFO is empty (RXFIFOE flag is set), and when IDMAEN = 0 the FIFO must be reset with FIFORST.
2. The confirmation that all data has been read from the FIFO, and that the suspend is completed is indicated by the DHOLD flag.
   a) The remaining number of data bytes (multiple of data blocks) still to be read when resuming the operation must be determined from the remaining number of bytes indicated by the DATACOUNT.

Note: When a DTIMEOUT flag occurs during the suspend procedure, this must be ignored.

To resume receiving data from the card, the following steps must be taken by firmware:

1. The remaining number of data bytes (multiple of data blocks) must be programmed in DATALENGTH.
2. The DPSM must be configured to receive data in the DTDIR bit.
3. The resume command must be sent from the CPSM, with the CMDTRANS bit set and the CMDSUSPEND bit set, which ends the interrupt period when data transfer is resumed (response bit DF = 1) and enabled the DPSM, after which the card resumes sending data.

While sending data to the card, the SDMMC can suspend the write operation after the write data block CRC status end (DPSM in Busy). Before sending the suspend command to the card the following steps must be taken by firmware:

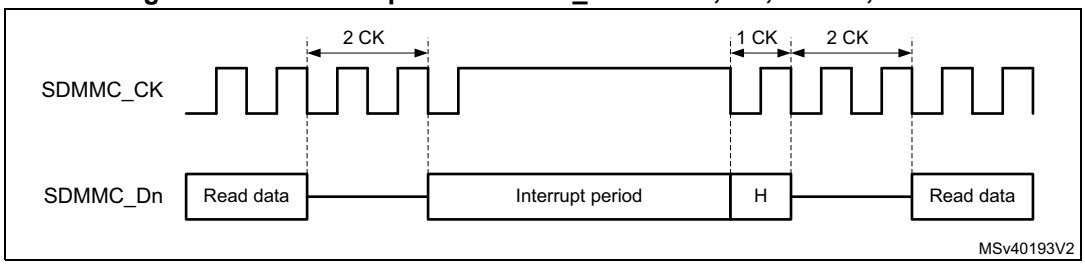
1. Enable DHOLD flag (and DBCKEND flag when IDMAEN = 0)
2. The DPSM must be prevented from start sending a new data block by setting DTHOLD.
3. When IDMAEN = 0: When receiving the DBCKEND flag the data transfer is stopped. Firmware can stop filling the FIFO, after which the FIFO must be reset with FIFORST. Any bytes still in the FIFO need to be rewritten when resuming the operation.
4. When receiving the DHOLD flag the data transfer is stopped. The remaining number of data bytes still to be written when resuming must be determined from the remaining number of bytes indicated by the DATACOUNT.
5. To suspend the card the suspend command must be sent by the CPSM with the CMDSUSPEND bit set. This makes possible to start the interrupt period after the suspend command response when the bus is suspended (response bit BS = 0).

To resume sending data to the card, the following steps must be taken by firmware:

1. The remaining number of data bytes must be programmed in DATALENGTH.
2. The DPSM must be configured for transmission with DTDIR set and enabled by having the CPSM send the resume command with the CMDTRANS bit set and the CMDSUSPEND bit set. This ends the interrupt period and start the data transfer. The DPSM either goes to the Wait_S state when SDMMC_D0 does not signal busy, or goes to the Busy state when busy is signaled.
3. When IDMAEN = 1: The IDMA needs to be reprogrammed for the remaining bytes to be transfered.
4. When IDMAEN = 0: Firmware must start filling the FIFO with the remaining data.

SD I/O Read Wait

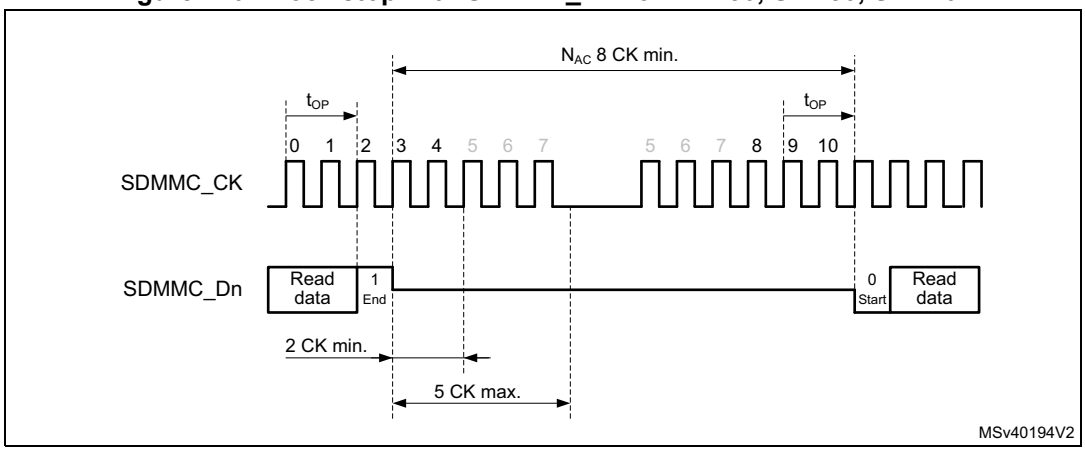
There are two methods to pause the data transfer during the block gap:



1. Stopping the SDMMC_CK.
2. Using Read Wait signaling on SDMMC_D2.

The SDMMC can perform a Read Wait with register settings according *Table 227*.

Depending the SDMMC operation mode (DS, HS, SDR12, SDR25) or (SDR50, SDR104, DDR) each method has a different characteristic.

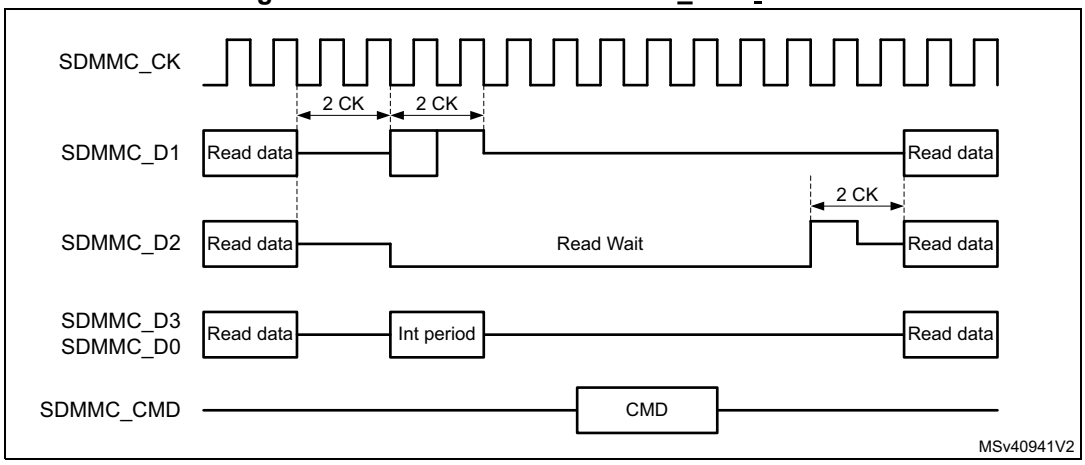


The timing for pause read operation by stopping the SDMMC_CK for DS, HS, SDR12, and SDR25, the SDMMC_CK may be stopped 2 SDMMC_CK cycles after the end bit. When ready the host resumes by restarting clock (see *Figure 269*).

Figure 269. Clock stop with SDMMC_CK for DS, HS, SDR12, SDR25

The timing for pause read operation by stopping the SDMMC_CK for SDR50, SDR104, and DDR50, the SDMMC_CK may be stopped minimum 2 SDMMC_CK cycles and maximum 5 SDMMC_CK cycles, after the end bit. When ready the host resumes by restarting clock, see *Figure 270*. (In DDR50 mode the SDMMC_CK must only be stopped after the falling edge, when the clock line is low.)

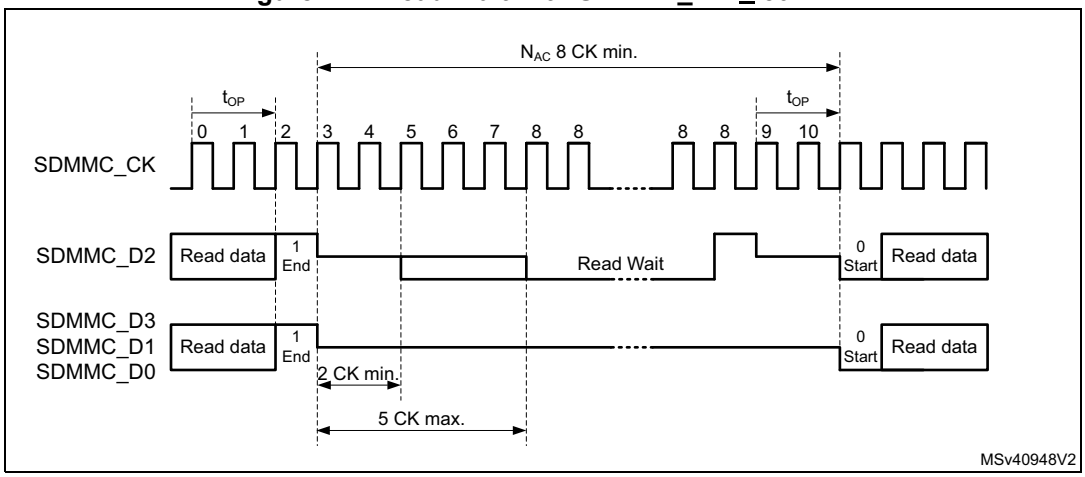
Figure 270. Clock stop with SDMMC_CK for DDR50, SDR50, SDR104



In Read Wait SDMMC_CK clock stopping, when RWSTART is set, the DSPM stops the clock after the end bit of the current received data block CRC. The clock start again after writing 1 to the RWSTOP bit, where after the DPSM waits for a start bit from the card.

As SDMMC_CK is stopped, no command can be issued to the card. During a Read Wait interval, the SDMMC can still detect SDIO interrupts on SDMMC_D1.

The optional Read Wait signaling on SDMMC_D2 (RW) operation is defined only for the SD 1-bit and 4-bit modes. The Read Wait operation enables the host to signal a card that is reading multiple registers (IO_RW_EXTENDED, CMD53) to temporarily stall the data transfer while allowing the host to send commands to any function within the SD I/O device. To determine when a card supports the Read Wait protocol, the host must test capability bits in the internal card registers.



The timing for Read Wait with a SDMMC_CK less then 50MHz (DS, HS, SDR12, SDR25) is based on the interrupt period generated by the card on SDMMC_D1. The host by asserting SDMMC_D2 low during the interrupt period requests the card to enter Read Wait. To exit Read Wait the host must raise SDMMC_D2 high during one SDMMC_CK cycles before making it Hi-Z, see *Figure 271*.

Figure 271. Read Wait with SDMMC_CK < 50 MHz

For SDR50, SDR104 with a SDMMC_CK more than 50MHz, and DDR50, the card treats the Read Wait request on SDMMC_D2 as an asynchronous event. The host by asserting SDMMC_D2 low after minimum 2 SDMMC_CK cycles and maximum 5 SDMMC_CK cycles, request the card to enter Read Wait. To exit Read Wait the host must raise SDMMC_D2 high during one SDMMC_CK cycles before making it Hi-Z. The host must raise SDMMC_D2 on the SDMMC_CK clock (see *Figure 272*).

Figure 272. Read Wait with SDMMC_CK ≥ 50 MHz

In Read Wait SDMMC_D2 signaling, when RWSTART is set, the DPSM drives SDMMC_D2 after the end bit of the current received data block CRC. The Read Wait signaling on SDMMC_D2 is removed when writing 1 to the RWSTOP bit. The DPSM remains in R_W state for two more SDMMC_CK clock cycles to drive SDMMC_D2 to 1 for one clock cycle (in accordance with SDIO specification), where after the DPSM waits for a start bit from the card.

During the Read Wait signaling on SDMMC_D2 commands can be issued to the card. During the Read Wait interval, the SDMMC can detect SDIO interrupts on SDMMC_D1.

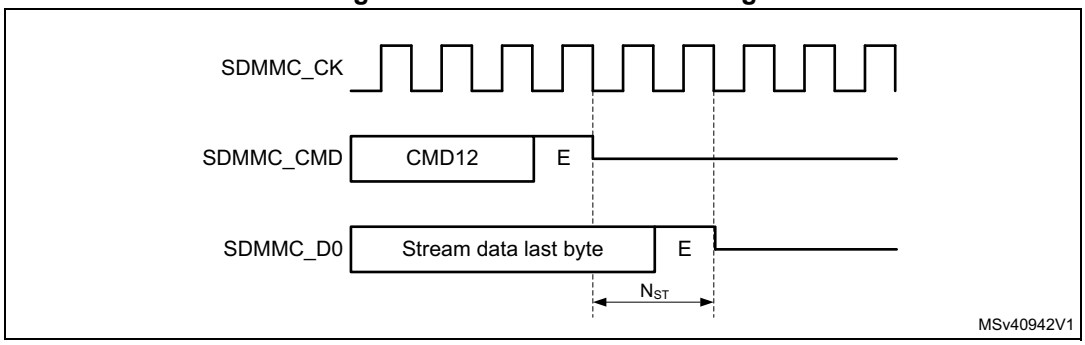
23.6.2 CMD12 send timing

CMD12 is used to stop/abort the data transfer, the card data transmission is terminated two clock cycles after the end bit of the Stop Transmission command.

Table 229. CMD12 use cases

Data operation	Stop Transmission command CMD12 Description
SDMMC stream write	The data transfer is stopped/aborted by sending the Stop Transmission command.
SDMMC open ended multiple block write	The data transfer is stopped/aborted by sending the Stop Transmission command. If the card detects an error, the host must abort the operation by sending the Stop Transmission command.
SDMMC block write with predefined block count	The Stop Transmission command is not required at the end of this type of multiple block write. (sending the Stop Transmission command after the card has received the last block is regarded as an illegal command.) If the card detects an error, the host must abort the operation by sending the Stop Transmission command.
SDMMC stream read	The data transfer is stopped/aborted by sending the Stop Transmission command.
SDMMC open ended multiple block read	The data transfer is stopped/aborted by sending the Stop Transmission command. If the card detects an error, the host must abort the operation by sending the Stop Transmission command.
SDMMC block read with predefined block count	The Stop Transmission command is not required at the end of this type of multiple block read. (sending the Stop Transmission command after the card has transmitted the last block is regarded as an illegal command.) Transaction can be aborted by sending the Stop Transmission command. If the card detects an error, the host must abort the operation by sending the Stop Transmission command.

All data write and read commands can be aborted any time by a Stop Transmission command CMD12. The following data abort procedure applies during an ongoing data transfer:



1. Load CMD12 Stop Transmission command in registers and set the CMDSTOP bit.
   – This causes the CPSM Abort signal to be generated when the command is sent to the DPSM.
2. Configure the CPSM to send a command immediately (clear WAITPEND bit).
   – The card, when sending data, stops data transfer 2 cycles after the Stop Transmission command end bit.
   The card when no data is being sent, does not start sending any new data.
   – The host, when sending data, sends one last data bit followed by an end bit after the Stop Transmission command end bit.
   The host when not sending data, does not start sending any new data.
3. When IDMAEN = 0, the FIFO need to be reset with FIFORST.
   – When writing data to the card. On the CMDREND flag, firmware must stop writing data to the FIFO. Subsequently the FIFO must be reset with FIFORST, this flushes the FIFO.
   – When reading data from the card. On the CMDREND flag, firmware must read the remaining data from the FIFO. Subsequently the FIFO must be reset with FIFORST.
4. When IDMAEN = 1, hardware takes care of the FIFO.
   – When writing data to the card. On the CPSM Abort signal, hardware stops the IDMA and subsequently the FIFO is flushed.
   – When reading data from the card. On the CPSM Abort signal, hardware instructs the IDMA to transfer the remaining data from the FIFO to RAM.
5. When the FIFO is empty/reset the DABORT flag is generated.

Stream operation and CMD12

To stop the stream transfer after the last byte to be transfered, the CMD12 end bit timing must be sent aligned with the data stream end of last byte. The following write stream data procedure applies:

1. Initialize the stream data in the DPSM, DTMODE = MCC stream data transfer.
2. Send the WRITE_DATA_STREAM command from the CPSM with CMDTRANS = 1.
3. Preload CMD12 in command registers, with the CMDSTOP bit set.
4. Configure the CPSM to send a command only after a wait pending (WAITPEND = 1) end of last data (according DATALENGTH).
5. Enabling the CPSM to send the STOP_TRANSMISSION command, the stream data end bit and command end bit are aligned.
   – When DATALENGTH > 5 bytes, Command CMD12 is waited in the CPSM to be aligned with the data transfer end bit.
   – When DATALENGTH < 5 bytes, Command CMD12 is started before and the DPSM remains in the Wait_S state to align the data transfer end with the CMD12 end bit.
6. The write stream data can be aborted any time by clearing the WAITPEND bit. This causes the Preloaded CMD12 to be sent immediately and stop the write data stream.

Figure 273. CMD12 stream timing

To stop the read stream transfer after the last byte, the CMD12 end bit timing must occur after the last data stream byte. The following read stream data procedure applies:

1. Wait for all data to be received by the DPSM and read from the FIFO (DATAEND flag).
   – The DPSM does not receive more data than indicated by DATALENGTH, even if the card is sending more data.
2. Send CMD12 by the CPSM.
   – CMD12 stops the card sending data.

Note: The SDMMC does not receive any more data from the card when DATACOUNT = 0, even when the card continues sending data.

Block operation and CMD12

To stop block transfer at the end of the data, the CMD12 end bit must be sent after the last block end bit.

When writing data to the card the CMD12 end bit must be sent after the write data block CRC token end bit. This requires the CMD12 sending to be tied to the data block transmission timing. To stop an Open-ended Multiple block write, the following procedure applies:

1. Before starting the data transfer, set DTMODE to “block data transfer ending with STOP_TRANSMISSION command”.
2. Wait for all data to be sent by the DPSM and the CRC token to be received, (DATAEND flag).
   – The DPSM does not send more data than indicated by DATALENGTH.
3. Send CMD12 by the CPSM.
   – CMD12 sets the card to Idle mode.

When reading data from the card the CMD12 end bit must be sent earliest at the same time as the card read data block last data bit. This requires the CMD12 sending to be tied to the data block reception timing. The following stop Open-ended Multiple block read data block procedure applies:

1. Before starting the data transfer, set DTMODE to “block data transfer ending with STOP_TRANSMISSION command”.
2. Wait for all data to be received by the DPSM and read from the FIFO (DATAEND flag).
   – The DPSM does not receive more data than indicated by DATALENGTH, even if the card is sending more data.
3. Send CMD12 with CMDSTOP bit set by the CPSM.
   – CMD12 stops the Card sending more data and set the card to Idle mode. Any ongoing block transfer is aborted by the Card.

Note: The SDMMC does not receive any more data from the card when DATACOUNT = 0, even when the card continues sending data.

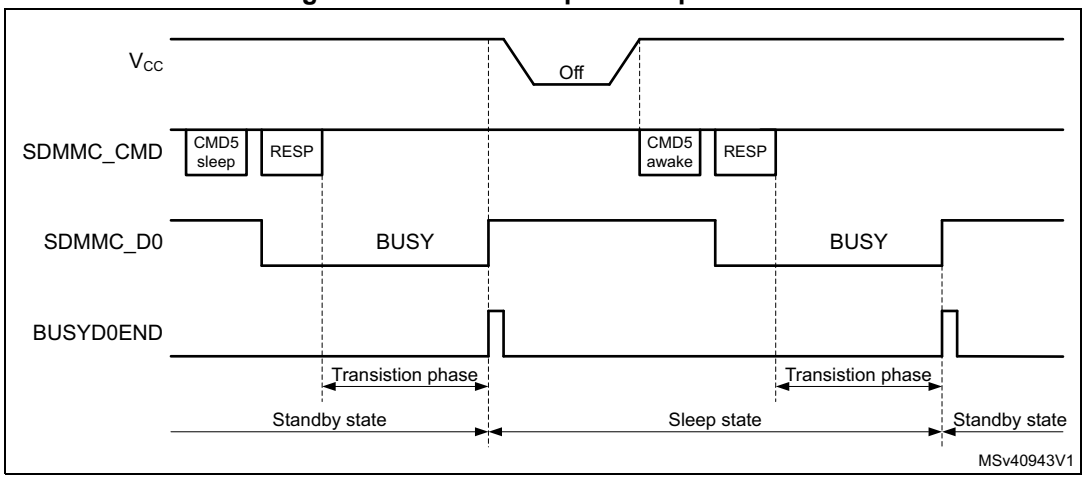
23.6.3 Sleep (CMD5)

The *e*•MMC card may be switched between a Sleep state and a Standby state by CMD5. In the Sleep state the power consumption of the card is minimized and the Vcc power supply may be switched off.

The CMD5 (SLEEP) is used to initiate the state transition from Standby state to Sleep state. The card indicates Busy, pulling down SDMMC_D0, during the transition phase. The Sleep state is reached when the card stops pulling down the SDMMC_DO line.

To set the card into Sleep state the following procedure applies:

1. Enable interrupt on BUSYD0END.
2. Send CMD5 (SLEEP).
3. On BUSYD0END interrupt, card is in Sleep state.
4. Vcc power supply can be switched off.



The CMD5 (AWAKE) is used to initiate the state transition from Sleep state to Standby state. The card indicates Busy, pulling down SDMMC_D0, during the transition phase. The Standby state is reached when the card stops pulling down the SDMMC_DO line.

To set the card into Sleep state the following procedure applies:

1. Switch on Vcc power supply and wait unit minimum operating level is reached.
2. Enable interrupt on BUSYD0END.
3. Send CMD5 (AWAKE).
4. On BUSYD0END interrupt card is in Standby state.

The Vcc power supply can be switched off only after the Sleep state has been reached. The Vcc supply must be reinstalled before CMD5 (AWAKE) is sent.

Figure 274. CMD5 Sleep Awake procedure

23.6.4 Interrupt mode (Wait-IRQ)

The host and card enter and exit interrupt mode (Wait-IRQ) simultaneously. In interrupt mode there is no data transfer. The only message allowed is an interrupt service request response from the card or the host. For the interrupt mode to work correctly the SDMMC_CK frequency must be set in accordance with the achievable SDMMC_CMD data rate in Open Drain mode, which depend on the capacitive load and pull-up resistor. The CLKDIV must be set >1, and the SETCLKRX must select either the sdmmc_io_in_ck or SDMMC_CLKin source.

The host must ensure that the card is in Standby state before issuing the CMD40 (GO_IRQ_STATE). While waiting for an interrupt response the SDMMC_CK clock signal must be kept active.

A card in interrupt mode (IRQ state):

- is waiting for an internal card interrupt event. Once the event occurs, the card starts to send the interrupt service request response. The response is sent in open-drain mode.
- while waiting for the internal card interrupt event, the card also monitors the SDMMC_CMD line for a start bit. Upon detection of a start bit the card aborts the interrupt mode and switch to Standby state.

The host in interrupt mode (CPSM Wait state waiting for interrupt):

- is waiting for a card interrupt service request response (start bit).
- while waiting for a card interrupt service request response the host may abort the interrupt mode (by clearing the WAITINT register bit), which causes the host to send a interrupt service request response R5 with RCA = 0x0000 in open-drain mode.

When sending the interrupt service request response, the sender bit-wise monitors the SDMMC_CMD bit stream. The sender whose interrupt service request response bit does not correspond to the bit on the SDMMC_CMD line stops sending. In the case of multiple senders only one successfully sends its full interrupt service request response. If the host sends simultaneously, it loses sending after the transmission bit.

To handle the interrupt mode, the following procedure applies:

1. Set the SDMMC_CK frequency in accordance with the achievable SDMMC_CMD data rate in Open-drain mode, CLKDIV must be set >1, and SETCLKRX must select the sdmmc_io_in_ck.
2. Load CMD40 (GO_IRQ_STATE) in the command registers.
3. Enable wait for interrupt by setting WAITINT register bit.
4. Configure the CPSM to send a command immediately.
   – This causes the CMD40 to be sent and the CPSM to be halted in the Wait state, waiting for a interrupt service request response.
5. To exit the wait for interrupt state (CPSM Wait state):
   – Upon the detection of an interrupt service request response start bit the CPSM moves to the Receive state where the response is received. The complete reception of the response is indicated by the CMDREND or the command CRC error flags.
   – To abort the interrupt mode the host clears the WAITINT register bit, which causes the host to send an interrupt service request response by itself. This moves the CPSM to the Receive state. The complete reception of the response is indicated by the CMDREND or the command CRC error flags.

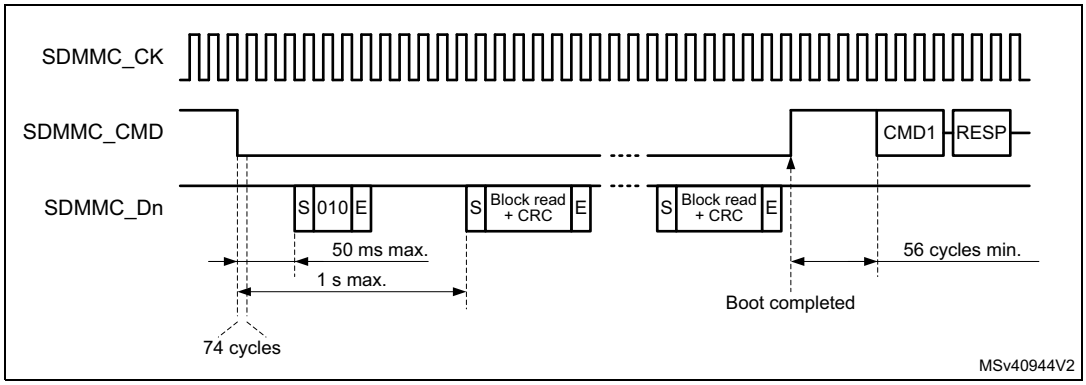
Note: On a simultaneous send interrupt service request response start bit collision the host loses the bus access after the transmission bit.

23.6.5 Boot operation

In boot operation mode the host can read boot data from the card by either one of the two boot operation functions:

- Normal boot. (keeping CMD line low)
- Alternative boot (sending CMD0 with argument 0xFFFFFFFA)

The boot data can be read according the following configuration options, depending on card register settings:



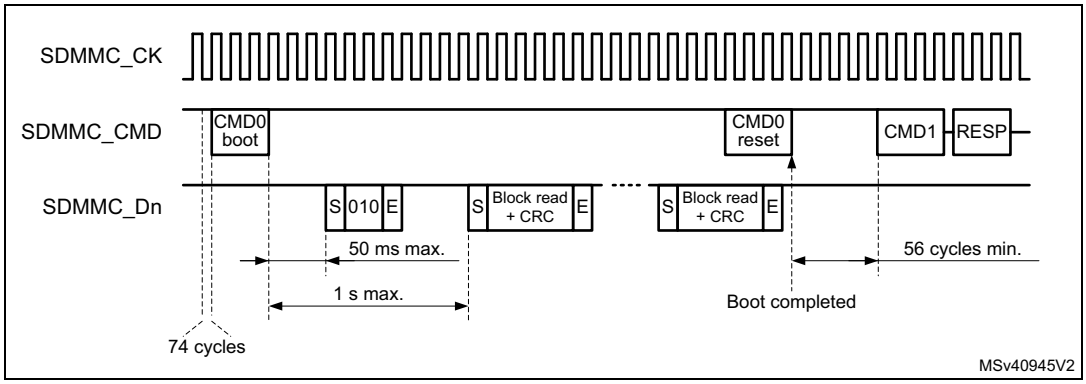
- The partition from which boot data is read (EXT_CSD Byte[179])
- The boot data size (EXT_CSD Byte[226])
- The bus configuration during boot (EXT_CSD Byte[177])
- Receiving boot acknowledgment from the card. (EXT_CSD Byte[179])

If boot acknowledgment is enabled the card send pattern 010 on SDMMC_D0 within 50ms after boot mode has been requested by either CMD line going low or after CMD0 with argument 0xFFFFFFFA. A boot acknowledgment timeout (ACKTIMEOUT) and acknowledgment status (ACKFAIL) is provided.

Normal boot operation

If the SDMMC_CMD line is held low for at least 74 clock cycles after card power-up or reset, before the first command is issued, the card recognizes that boot mode is being initiated. Within 1 second after the CMD line goes low, the card starts to sent the first boot code data on the SDMMC_Dn line(s). The host must keep the SDMMC_CMD line low until after all boot data has been read. The host can terminate boot mode by pulling the SDMMC_CMD line high.

Figure 275. Normal boot mode operation



To perform the normal boot procedure the following steps needed:

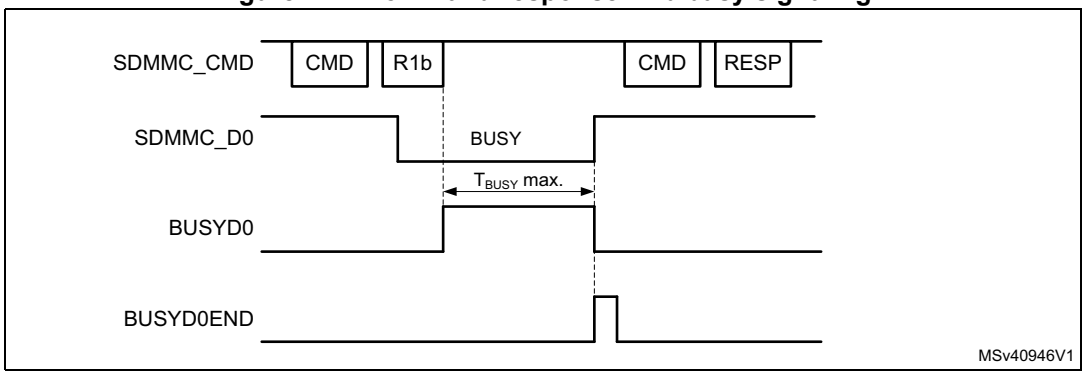
1. Reset the card.
2. if a boot acknowledgment is requested enable the BOOTACKEN and set the ACKTIME and enable the ACKFAIL and ACKTIMEOUT interrupt.
3. enable the data reception by setting the DPSM in receive mode (DTDIR) and the number of data bytes to be received in DATALENGTH.
4. Enable the DTIMEOUT, DATAEND, and CMDSENT interrupts for end of boot command confirmation.
5. Select the normal boot operation mode in BOOTMODE, and enable boot in BOOTEN. The boot procedure is started by enabling the CPSM with CPSMEN.This causes:
   – the SDMMC_CMD to be driven low. (BOOTMODE = normal boot).
   – the ACK timeout to start.
   – DPSM to be enabled.
6. The incorrect reception of the boot acknowledgment can be detected with ACKFAIL flag or ACKTIMEOUT flag when enabled.
   – when an incorrect boot acknowledgment is received the ACKFAIL flag occurs.
   – when the boot acknowledgment is not received in time the ACKTIMEOUT flag occurs.
7. when all boot data has been received the DATAEND flag occurs.
   – when data CRC fails the DCRCFAIL flag is also generated.
   – when the data timeout occurs the DTIMEOUT flag is also generated.
8. When last data has been received, read data from the FIFO until FIFO is empty after which end of data DATAEND flag is generated.
   – SDMMC has completely received all data and the DPSM is disabled.
9. The boot procedure is terminated by firmware clearing BOOTEN, which causes the SDMMC_CMD line to go high. The CMDSENT flag is generated 56 cycles later to indicate that a new command can be sent.
   – If the boot procedure is aborted by firmware before all data has been received the CPSM Abort signal stops data reception and disables the DPSM which triggers an DABORT flag when enabled.
10. The CMDSENT flag signals the end of the boot procedure and the card is ready to receive a new command.

Alternative boot operation

After card power-up or reset, if the host send CMD0 with the argument 0xFFFFFFFA after 74 clock cycles before CMD0 is issued, the card recognizes that boot mode is being initiated. Within 1 second after the CMD0 with argument 0xFFFFFFFA has been sent, the card starts to send the first boot code data on the SDMMC_Dn line(s). The master terminates boot operation by sending CMD0 (Reset).

Figure 276. Alternative boot mode operation

To perform the alternative boot procedure the following steps needed:



1. Move the SDMMC to power-off state, and reset the card.
2. Move the SDMMC to power-on state. This guarantees the 74 SCDMMC_CK cycles to be clocked before any command.
3. if a boot acknowledgment is requested enable the BOOTACKEN and set the ACKTIME and enable the ACKTIMEOUT flag.
4. enable the data reception by setting the DPSM in receive mode (DTDIR) and the number of data to be received in DATALENGTH. Enable the DTIMEOUT and DATAEND flags.
5. Select the alternative boot operation mode in BOOTMODE, load the CMD0 with the 0xFFFFFFFA argument in the command registers. Enable CMDSENT flag for end of boot command confirmation, and enable boot in BOOTEN. The boot procedure is started by enabling the CPSM with CPSMEN. This causes:
   - the loaded command and argument to be sent out. (BOOTMODE = alternative boot).
   - the ACK timeout to start.
   - DPSM to be enabled.
6. When the command has been sent the CMDSENT flag is generated, at which time the BOOTEN bit must be cleared.
7. the reception of the boot acknowledgment can be detected with ACKFAIL flag when enabled.
   - when the boot acknowledgment is not received in time the ACKTIMEOUT flag occurs.
8. when all boot data has been received the DATAEND flag occurs.
   - when data CRC fails the DCRCFAIL flag is also generated.
   - when the data timeout occurs the DTIMEOUT flag is also generated.

9. When last data has been received, read data from the FIFO until FIFO is empty after which end of data DATAEND flag is generated.
   – SDMMC has completely received all data and the DPSM is disabled.
10. The BOOTEN bit must be cleared, before terminating the boot procedure by sending CMD0 (Reset) with BOOTMODE = alternative boot. This causes the CMDSENT flag to occur 56 cycles after the Command.
   – if the boot procedure is aborted by firmware before all data has been received the CPSM Abort signal stops the data transfer and disable the DPSM which triggers an DABORT flag when enabled.
11. The CMDSENT flag signals the end of the boot procedure and the card is ready to receive a new command. When the RESET command has been sent successfully, the BOOTMODE control bit has to be cleared to terminate the boot operation.

23.6.6 Response R1b handling

When sending commands which have a R1b response the busy signaling is reflected in the BUSYD0 register bit and the release of busy with the BUSYD0END flag. The SDMMC_D0 line is sampled at the end of the R1b response and signaled in the BUSYD0 register bit. The BUSYD0 register bit is reset to not busy when the SDMMC_D0 line release busy, at the same time the BUSYD0END flag is generated.

Figure 277. Command response R1b busy signaling

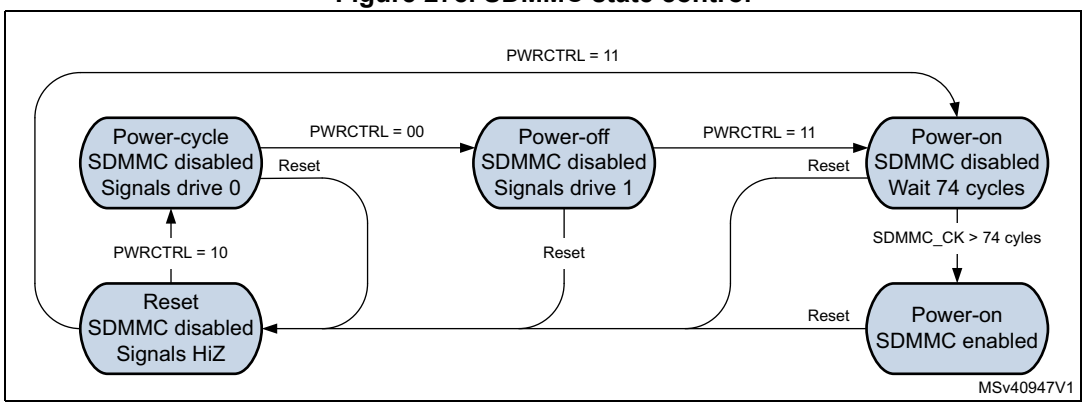
The expected maximum busy time must be set in the DATATIME register before sending the command. When enabled, the DTIMEOUT flag is set when after the R1b response busy stays active longer then the programmed time.

To detect the SDMMC_D0 busy signaling when sending a Command with R1b response the following procedure applies:

- Enable CMDREND flag.
- Send Command through CPSM.
- On the CMDREND flag check the BUSYD0 register bit.
  – If BUSYD0 signals not busy, signal busy release to firmware
  – If BUSYD0 signals busy, wait for BUSYD0END flag
- On BUSYD0END flag signal busy released to firmware.
- On DTIMEOUT flag busy is active longer then programmed time.

23.6.7 Reset and card cycle power

Reset



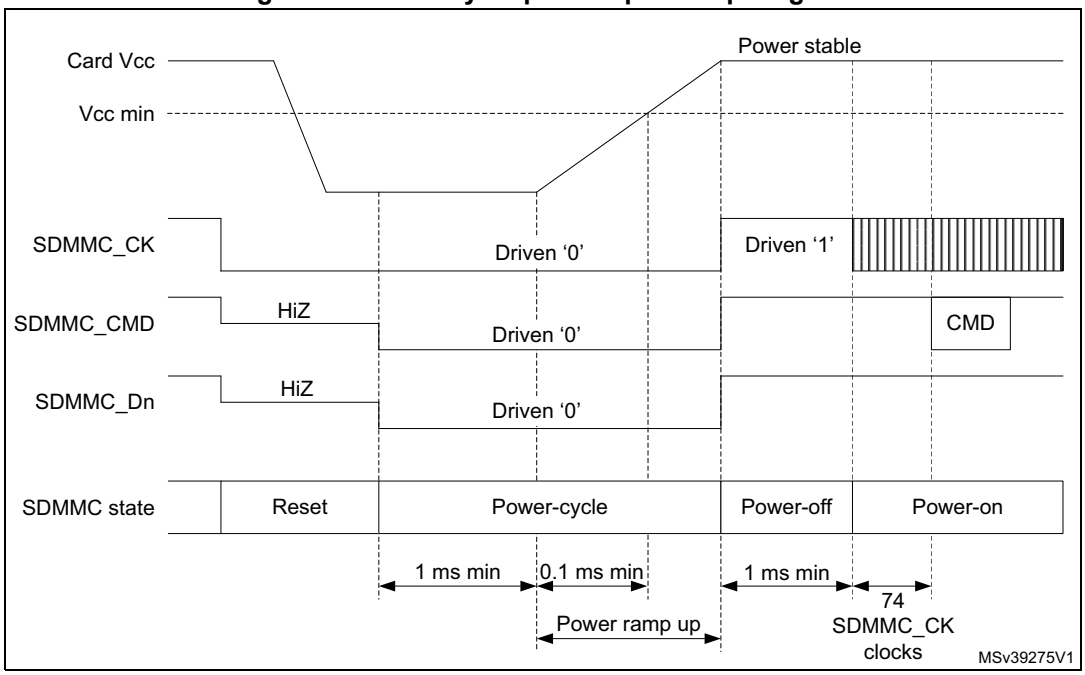
Following reset the SDMMC is in the reset state. In this state the SDMMC is disabled and no command nor data can be transfered. The SDMMC_D[7:0], and SDMMC_CMD are in HiZ and the SDMMC_CK is driven low.

Before moving to the power-on state the SDMMC must be configured.

In the power-on state the SDMMC_CK clock is running. First 74 SDMMC_CK cycles are clocked after which the SDMMC is enabled and command and data can be transfered.

The SDMMC states are controlled by Firmware with the PWRCTL register bits according *Figure 278.*.

Figure 278. SDMMC state control



Card cycle power

To perform a card cycle power the following procedure applies:

1. Reset the SDMMC with the RCC.SDMMCxRST register bit. This resets the SDMMC to the reset state and the CPSM and DPSM to the Idle state.
2. Disable the Vcc power to the card.
3. Set the SDMMC in power-cycle state. This makes that the SDMMC_D[7:0], SDMMC_CMD and SDMMC_CK are driven low, to prevent the card from being supplied through the signal lines.
4. After minimum 1 ms enable the Vcc power to the card.
5. After the power ramp period set the SDMMC to the power-off state for minimum 1 ms. The SDMMC_D[7:0], SDMMC_CMD and SDMMC_CK are set to drive 1.
6. After the 1 ms delay set the SDMMC to power-on state in which the SDMMC_CK clock is enabled.
7. After 74 SDMMC_CK cycles the first command can be sent to the card.

Figure 279. Card cycle power / power up diagram

23.7 Hardware flow control

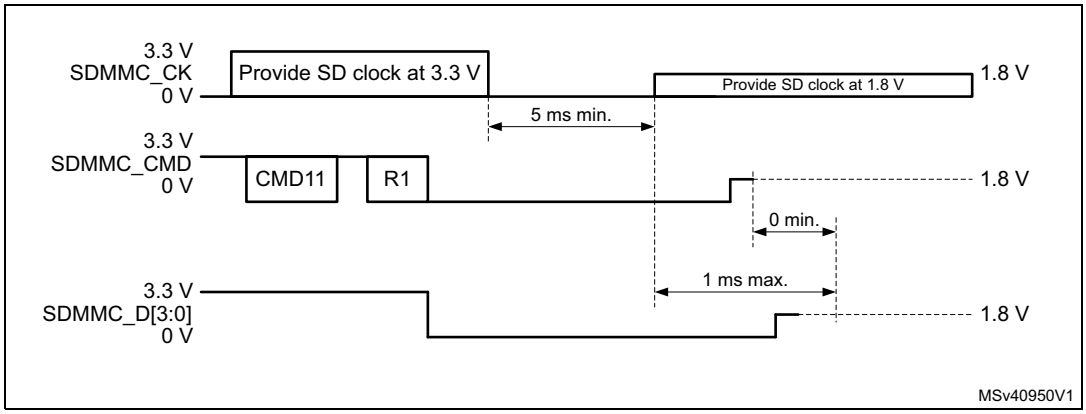
The hardware flow control during data transfer functionality is used to avoid FIFO underrun (TX mode) and overrun (RX mode) errors.

The behavior is to stop SDMMC_CK during data transfer and freeze the SDMMC state machines. The data transfer is stalled when the FIFO is unable to transmit or receive data. The data transfer remains stalled until the transmit FIFO is half full or all data according DATALENGTH has been stored, or until the receive FIFO is half empty. Only state machines clocked by SDMMC_CK are frozen, the AHB interfaces are still alive. The FIFO can thus be filled or emptied even if flow control is activated.

On an IDMA linked list transfer error, the hardware flow control is disabled. As a consequence, depending on when the IDMA linked list transfer error occurs, an underrun or overrun error may also occur (see *Section : IDMA transfer error management*).

To enable hardware flow control during data transfer, the HWFC_EN register bit must be set to 1. After reset hardware flow control is disabled.

Hardware flow control must only be used when the SDMMC_Dn receive data is cycle-aligned with the SDMMC_CK or when sending data. When receiving data and the sdmmc_fb_ck from the DLYB delay block is used. In the case of SDR104 receive mode with a t_{OP} and Dt_{OP} delay > 1 cycle, hardware flow control can not be used.



Warning: When variable delay is used and hardware flow control is enabled, sending commands during data transfer may disturb the command response reception. (CMD12 is not

impacted by this, except when CMD12 is used to abort during data transfer.)

23.8 Ultra-high-speed phase I (UHS-I) voltage switch

UHS-I mode (SDR12, SDR25, SDR50, SDR104, and DDR50) requires the support for 1.8 V signaling. After power up the card starts in 3.3V mode. CMD11 invokes the voltage switch sequence to the 1.8V mode. When the voltage sequence is completed successfully the card enters UHS-I mode with default SDR12 and card input and output timings are changed.

Figure 280. CMD11 signal voltage switch sequence

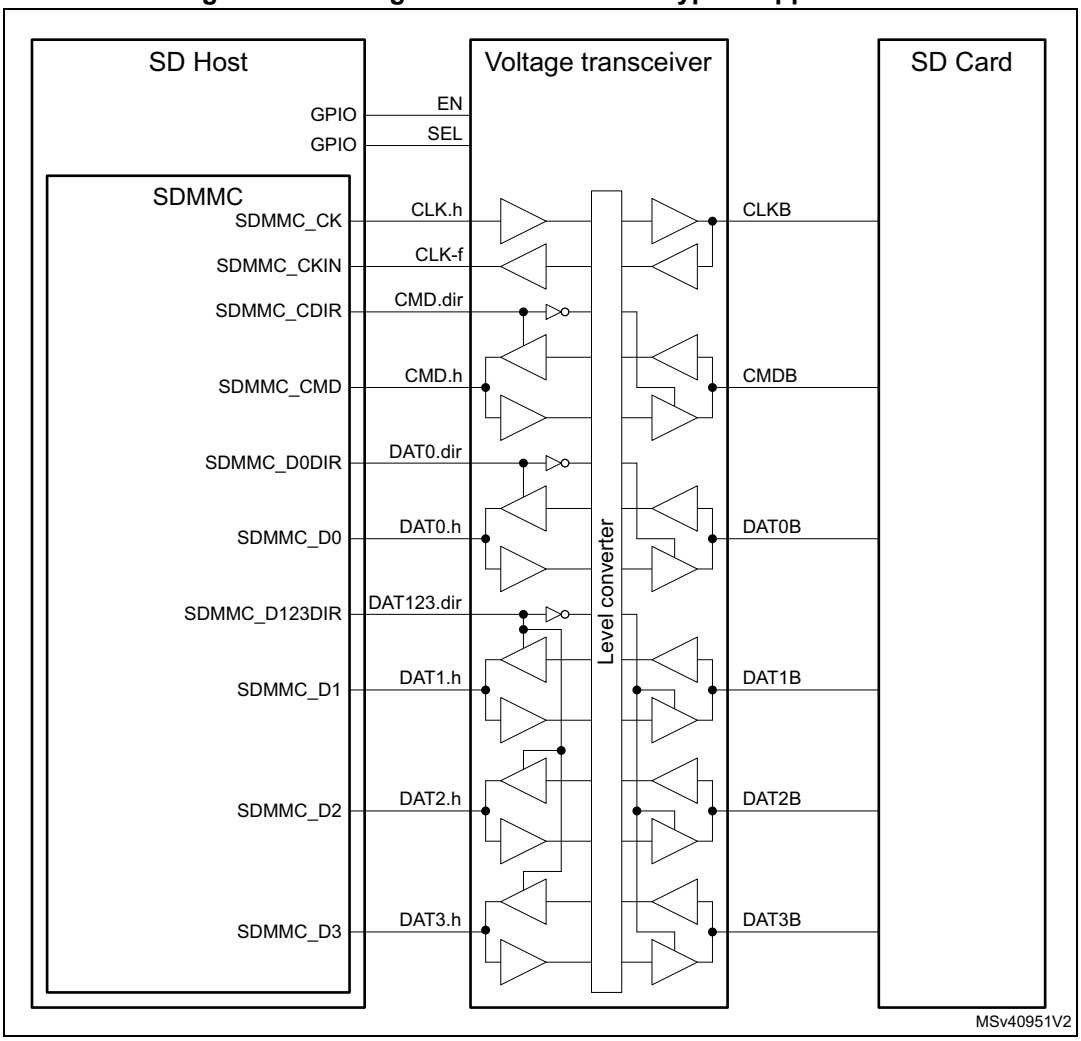
To perform the signal voltage switch sequence the following steps are needed:

1. Before starting the Voltage Switch procedure, the SDMMC_CK frequency must be set in the range 100 kHz - 400 kHz.
2. The host starts the Voltage Switch procedure by setting the VSWITCHEN bit before sending the CMD11.
3. The card returns an R1 response.
   - if the response CRC is pass, the Voltage Switch procedure continues the host does no longer drive the CMD and SDMMC_D[3:0] signals until completion of the voltage switch sequence. Some cycles after the response the SDMMC_CK is stopped and the CKSTOP flag is set.
   - if the response CRC is fail (CCRCFAIL flag) or no response is received before the timeout (CTIMEOUT flag), the Voltage Switch procedure is stopped.
4. The card drives CMD and SDMMC_D[3:0] to low at the next clock after the R1 response.
5. The host, after having received the R1 response, may monitor the SDMMC_D0 line using the BUSYD0 register bit. The SDMMC_D0 line is sampled two SDMMC_CK clock cycles after the Response. The Firmware may read the BUSYD0 register bit following the CKSTOP flag.
   - When the BUSYD0 is detected low the host firmware switches the Voltage regulator to 1.8V, after which it instructs the SDMMC to start the timing critical

section of the Voltage Switch sequence by setting register bit VSWITCH. The hardware continues to stop the SDMMC_CK by holding it low for at least 5 ms.

– When the BUSYD0 is detected high the host aborts the Voltage Switch sequence and cycle power the card.

6. The card after detecting SDMMC_CK low begins switching signaling voltage to 1.8 V.
7. The host SDMMC hardware after at least 5 ms restarts the SDMMC_CK.
8. The card within 1 ms from detecting SDMMC_CK transition drives CMD and DAT[3:0] high for at least 1 SDMMC_CK cycle and then stop driving CMD and DAT[3:0].
9. The host SDMMC hardware, 1 ms after the SDMMC_CK has been restarted, the SDMMC_D0 is sampled into BUSYD0 and the VSWEND flag is set.
10. The host, on the VSWEND flag, checks SDMMC_D0 line using the BUSYD0 register bit, to confirm completion of voltage switch sequence:
    – When BUSYD0 is detected high, Voltage Switch has been completed successfully.
    – When BUSYD0 is detected low, Voltage Switch has failed, the host cycles the card power.



The minimum 5 ms time to stop the SDMMC_CK is derived from the internal un-gated SDMMC_CK clock, which has a maximum frequency of 25 MHz (SD mode), as set by the clock divider CLKDIV. The >5 ms time is counted by 2^{12} cycles (10.24 ms @ 400 kHz). If a lower SDMMC_CK frequency is selected by the clock divider CLKDIV the time for the SDMMC_CK clock to be stopped is longer.

The maximum 1 ms time for the card to drive the SDMMC_Dn and SDMMC_CMD lines high is derived from the internal ungated SDMMC_CK which has a maximum frequency of 25 MHz (SD mode), as set by the clock divider CLKDIV. The SDMMC checks the lines after >1 ms time which is counted by 2^9 cycles (1.28 ms @ 25 MHz). If a lower SDMMC_CK frequency is selected by the clock divider CLKDIV the time to check the lines is longer.

The signal voltage level switch is supported through an external voltage translation transceiver.

Note: For external devices not needing a signal voltage level switch the signal voltage level can be kept static for all SDMMC operations, including UHS-I.

Figure 281. Voltage switch transceiver typical application

To interface with an external driver (a voltage switch transceiver), next to the standard signals the SDMMC uses the following signals:

- **SDMMC_CKIN** feedback input clock
- **SDMMC_CDIR** I/O direction control for the CMD signal
- **SDMMC_D0DIR** I/O direction control for the SDMMC_D0 signal
- **SDMMC_D123DIR** I/O direction control for the SDMMC_D1, SDMMC_D2 and SDMMC_D3 signals

The voltage transceiver signals **EN** and **SEL** are to be handled through general-purpose I/O.

The polarity of the SDMMC_CDIR, SDMMC_D0DIR and SDMMC_D123DIR signals can be selected through SDMMC_POWER.DIRPOL control bit.

23.9 SDMMC interrupts

Table 230. SDMMC interrupts

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from Sleep mode
SDMMC	Command response CRC fail	CCRCFAIL	CCRCFAILIE	CCRCFAILC	Yes
SDMMC	Data block CRC fail	DCRCFAIL	DCRCFAILIE	DCRCFAILC	Yes
SDMMC	Command response timeout	CTIMEOUT	CTIMEOUTIE	CTIMEOUTC	Yes
SDMMC	Data timeout	DTIMEOUT	DTIMEOUTIE	DTIMEOUTC	Yes
SDMMC	Transmit FIFO underrun	TXUNDERR	TXUNDERRIE	TXUNDERRC	Yes
SDMMC	Receive FIFO overrun	RXOVERR	RXOVERRIE	RXOVERRC	Yes
SDMMC	Command reponse received	CMDREND	CMDRENDIE	CMDRENDC	Yes
SDMMC	Comand sent	CMDSENT	CMDSENTIE	CMDSENTC	Yes
SDMMC	Data transfer ended	DATAEND	DATAENDIE	DATAENDC	Yes
SDMMC	Data transfer hold	DHOLD	DHOLDIE	DHOLDC	Yes
SDMMC	Data block sent or received	DBCKEND	DBCKENDIE	DBCKENDC	Yes
SDMMC	Data transfer aborted	DABORT	DABORTIE	DABORTC	Yes
SDMMC	Transmit FIFO half empty	TXFIFOHE	TXFIFOHEIE	N/A	Yes
SDMMC	Receive FIFO half full	RXFIFOHF	RXFIFOHFIE	N/A	Yes
SDMMC	Transmit FIFO full	TXFIFOF	N/A	N/A	Yes
SDMMC	Receive FIFO full	RXFIFOF	RXFIFOFIE	N/A	Yes
SDMMC	Transmit FIFO empty	TXFIFOE	TXFIFOEIE	N/A	Yes
SDMMC	Receive FIFO empty	RXFIFOE	N/A	N/A	Yes
SDMMC	Command response end of busy	BUSYD0END	BUSYD0ENDIE	BUSYD0ENDC	Yes
SDMMC	SDIO interrupt	SDIOIT	SDIOITIE	SDIOITC	Yes
SDMMC	Boot acknowledgment fail	ACKFAIL	ACKFAILIE	ACKFAILC	Yes
SDMMC	Boot acknowledgment timeout	ACKTIMEOUT	ACKTIMEOUTIE	ACKTIMEOUTC	Yes
SDMMC	Voltage switch timing	VSWEND	VSWENDIE	VSWENDC	Yes
SDMMC	SDMM_CK stopped in voltage switch	CKSTOP	CKSTOPIE	CKSTOPC	Yes
SDMMC	IDMA transfer error	IDMATE	IDMATEIE	IDMATEC	Yes
SDMMC	IDMA buffer transfer complete	IDMABTC	IDMABTCIE	IDMABTCC	Yes

23.10 SDMMC registers

The device communicates to the system via 32-bit control registers accessible via AHB slave interface.

The peripheral registers have to be accessed by words (32-bit). Byte (8-bit) and half-word (16-bit) accesses trigger an AHB bus error.

23.10.1 SDMMC power control register (SDMMC_POWER)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DIR POL	VSWI TCHEN	VSWI TCH	PWRCTRL[1:0]	
											rw	rw	rw	rw	rw

Bits 31:5 Reserved, must be kept at reset value.

Bit 4 **DIRPOL**: Data and command direction signals polarity selection

This bit can only be written when the SDMMC is in the power-off state (PWRCTRL = 00).

0: Voltage transceiver I/Os driven as output when direction signal is low.

1: Voltage transceiver I/Os driven as output when direction signal is high.

Bit 3 **VSWITCHEN**: Voltage switch procedure enable

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).

This bit is used to stop the SDMMC_CK after the voltage switch command response:

0: SDMMC_CK clock kept unchanged after successfully received command response.

1: SDMMC_CK clock stopped after successfully received command response.

Bit 2 **VSWITCH**: Voltage switch sequence start

This bit is used to start the timing critical section of the voltage switch sequence:

0: Voltage switch sequence not started and not active.

1: Voltage switch sequence started or active.

Bits 1:0 **PWRCTRL[1:0]**: SDMMC state control bits

These bits can only be written when the SDMMC is not in the power-on state (PWRCTRL ≠ 11).

These bits are used to define the functional state of the SDMMC signals:

00: After reset, Reset: the SDMMC is disabled and the clock to the Card is stopped, SDMMC_D[7:0], and SDMMC_CMD are HiZ and SDMMC_CK is driven low. When written 00, power-off: the SDMMC is disabled and the clock to the card is stopped, SDMMC_D[7:0], SDMMC_CMD and SDMMC_CK are driven high.

01: Reserved (When written 01, PWRCTRL value does not change)

10: Power-cycle, the SDMMC is disabled and the clock to the card is stopped, SDMMC_D[7:0], SDMMC_CMD and SDMMC_CK are driven low.

11: Power-on: the card is clocked, The first 74 SDMMC_CK cycles the SDMMC is still disabled. After the 74 cycles the SDMMC is enabled and the SDMMC_D[7:0], SDMMC_CMD and SDMMC_CK are controlled according the SDMMC operation.

Any further write is ignored, PWRCTRL value keeps 11.

23.10.2 SDMMC clock control register (SDMMC_CLKCR)

Address offset: 0x004

Reset value: 0x0000 0000

This register controls the SDMMC_CK output clock, the sdmmc_rx_ck receive clock, and the bus width.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SELCLKRX[1:0]		BUS SPEED	DDR	HWFC_EN	NEG EDGE
										rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
WID BUS[1:0]		Res.	PWR SAV	Res.	Res.	CLKDIV[9:0]									
rw	rw		rw			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:20 **SELCLKRX[1:0]**: Receive clock selection

These bits can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

00: sdmmc_io_in_ck selected as receive clock

01: SDMMC_CKIN feedback clock selected as receive clock

10: sdmmc_fb_ck tuned feedback clock selected as receive clock

11: Reserved (select sdmmc_io_in_ck)

Bit 19 **BUSSPEED**: Bus speed for selection of SDMMC operating modes

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

0: DS, HS, SDR12, SDR25, Legacy compatible, High speed SDR, High speed DDR bus speed mode selected

1: SDR50, DDR50, SDR104, HS200 bus speed mode selected

Bit 18 **DDR**: Data rate signaling selection

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

DDR rate must only be selected with 4-bit or 8-bit wide bus mode. (WIDBUS > 00). DDR = 1 has no effect when WIDBUS = 00 (1-bit wide bus).

DDR rate must only be selected with clock division > 1 (CLKDIV > 0).

0: SDR Single data rate signaling

1: DDR double data rate signaling

Bit 17 **HWFC_EN**: Hardware flow control enable

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

0: Hardware flow control is disabled

1: Hardware flow control is enabled

When Hardware flow control is enabled, the meaning of the TXFIFOE and RXFIFOF flags change, see SDMMC status register definition in *Section 23.10.11*.

Bit 16 **NEGEDGE**: SDMMC_CK dephasing selection bit for data and command

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0).

When clock division = 1 (CLKDIV = 0), this bit has no effect. Data and Command change on SDMMC_CK falling edge.

0: When clock division >1 (CLKDIV > 0) and DDR = 0:

- Command and data changed on the sdmmc_ker_ck falling edge succeeding the rising edge of SDMMC_CK.
- SDMMC_CK edge occurs on sdmmc_ker_ck rising edge.

When clock division >1 (CLKDIV > 0) and DDR = 1:

- Command changed on the sdmmc_ker_ck falling edge succeeding the rising edge of SDMMC_CK.
- Data changed on the sdmmc_ker_ck falling edge succeeding a SDMMC_CK edge.
- SDMMC_CK edge occurs on sdmmc_ker_ck rising edge.

1: When clock division >1 (CLKDIV > 0) and DDR = 0:

- Command and data changed on the same sdmmc_ker_ck rising edge generating the SDMMC_CK falling edge.

When clock division >1 (CLKDIV > 0) and DDR = 1:

- Command changed on the same sdmmc_ker_ck rising edge generating the SDMMC_CK falling edge.
- Data changed on the SDMMC_CK falling edge succeeding a SDMMC_CK edge.
- SDMMC_CK edge occurs on sdmmc_ker_ck rising edge.

Bits 15:14 **WIDBUS[1:0]**: Wide bus mode enable bit

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

00: Default 1-bit wide bus mode: SDMMC_D0 used (Does not support DDR)

01: 4-bit wide bus mode: SDMMC_D[3:0] used

10: 8-bit wide bus mode: SDMMC_D[7:0] used

Bit 13 Reserved, must be kept at reset value.

Bit 12 **PWRSAV**: Power saving configuration bit

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0)

For power saving, the SDMMC_CK clock output can be disabled when the bus is idle by setting PWRSAV:

0: SDMMC_CK clock is always enabled

1: SDMMC_CK is only enabled when the bus is active

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:0 **CLKDIV[9:0]**: Clock divide factor

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0).

This field defines the divide factor between the input clock (sdmmc_ker_ck) and the output clock (SDMMC_CK): SDMMC_CK frequency = sdmmc_ker_ck / [2 * CLKDIV].

0x000: SDMMC_CK frequency = sdmmc_ker_ck / 1 (Does not support DDR)

0x001: SDMMC_CK frequency = sdmmc_ker_ck / 2

0x002: SDMMC_CK frequency = sdmmc_ker_ck / 4

0x0XX: ..

0x080: SDMMC_CK frequency = sdmmc_ker_ck / 256

0xXXX: ..

0x3FF: SDMMC_CK frequency = sdmmc_ker_ck / 2046

Note: While the SD/SDIO card or e•MMC is in identification mode, the SDMMC_CK frequency must be less than 400 kHz.

The clock frequency can be changed to the maximum card bus frequency when relative card addresses are assigned to all cards.

At least seven sdmmc_hclk clock periods are needed between two write accesses to this register. SDMMC_CK can also be stopped during the Read Wait interval for SD I/O cards: in this case the SDMMC_CLKCR register does not control SDMMC_CK.

23.10.3 SDMMC argument register (SDMMC_ARGR)

Address offset: 0x008

Reset value: 0x0000 0000

This register contains a 32-bit command argument, which is sent to a card as part of a command message.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CMDARG[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CMDARG[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CMDARG[31:0]**: Command argument

These bits can only be written by firmware when CPSM is disabled (CPSMEN = 0). Command argument sent to a card as part of a command message. If a command contains an argument, it must be loaded into this register before writing a command to the command register.

23.10.4 SDMMC command register (SDMMC_CMDR)

Address offset: 0x00C

Reset value: 0x0000 0000

This register contains the command index and command type bits. The command index is sent to a card as part of a command message. The command type bits control the command path state machine (CPSM).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CMD SUS PEND
															rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BOOT EN	BOOT MODE	DT HOLD	CPSM EN	WAITP END	WAIT INT	WAITRESP[1:0]		CMD STOP	CMD TRANS	CMDINDEX[5:0]					
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **CMDSUSPEND**: The CPSM treats the command as a Suspend or Resume command and signals interrupt period start/end

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).
CMDSUSPEND = 1 and CMDTRANS = 0 Suspend command, start interrupt period when response bit BS = 0.
CMDSUSPEND = 1 and CMDTRANS = 1 Resume command with data, end interrupt period when response bit DF = 1.

Bit 15 **BOOTEN**: Enable boot mode procedure

0: Boot mode procedure disabled
1: Boot mode procedure enabled

Bit 14 **BOOTMODE**: Select the boot mode procedure to be used

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0)
0: Normal boot mode procedure selected
1: Alternative boot mode procedure selected

Bit 13 **DTHOLD**: Hold new data block transmission and reception in the DPSM

If this bit is set, the DPSM does not move from the Wait_S state to the Send state or from the Wait_R state to the Receive state.

Bit 12 **CPSMEN**: Command path state machine (CPSM) enable bit

This bit is written 1 by firmware, and cleared by hardware when the CPSM enters the Idle state.
If this bit is set, the CPSM is enabled.
When DTEN = 1, no command is transfered nor boot procedure is started. CPSMEN is cleared to 0.
During Read Wait with SDMMC_CK stopped no command is sent and CPSMEN is kept 0.

Bit 11 **WAITPEND**: CPSM waits for end of data transfer (CmdPend internal signal) from DPSM

This bit when set, the CPSM waits for the end of data transfer trigger before it starts sending a command.
WAITPEND is only taken into account when DTMODE = *e*•MMC stream data transfer, WIDBUS = 1-bit wide bus mode, DPSMACT = 1 and DTDIR = from host to card.

Bit 10 **WAITINT**: CPSM waits for interrupt request

If this bit is set, the CPSM disables command timeout and waits for an card interrupt request (Response).
If this bit is cleared in the CPSM Wait state, it causes the abort of the interrupt mode.

Bits 9:8 **WAITRESP[1:0]**: Wait for response bits

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).
They are used to configure whether the CPSM is to wait for a response, and if yes, which kind of response.
00: No response, expect CMDSENT flag
01: Short response, expect CMDREND or CCRCFAIL flag
10: Short response, expect CMDREND flag (No CRC)
11: Long response, expect CMDREND or CCRCFAIL flag

Bit 7 **CMDSTOP**: The CPSM treats the command as a Stop Transmission command and signals abort to the DPSM

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).

If this bit is set, the CPSM issues the abort signal to the DPSM when the command is sent.

Bit 6 **CMDTRANS**: The CPSM treats the command as a data transfer command, stops the interrupt period, and signals DataEnable to the DPSM

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).

If this bit is set, the CPSM issues an end of interrupt period and issues DataEnable signal to the DPSM when the command is sent.

Bits 5:0 **CMDINDEX[5:0]**: Command index

This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).

The command index is sent to the card as part of a command message.

Note: 1 At least seven sdmmc_hclk clock periods are needed between two write accesses to this register.

2 MultiMediaCard can send two kinds of response: short responses, 48 bits, or long responses,136 bits. SD card and SD I/O card can send only short responses, the argument can vary according to the type of response: the software distinguishes the type of response according to the send command.

23.10.5 SDMMC command response register (SDMMC_RESPCMDR)

Address offset: 0x010

Reset value: 0x0000 0000

This register contains the command index field of the last command response received. If the command response transmission does not contain the command index field (long or OCR response), the RESPCMD field is unknown, although it must contain 111111b (the value of the reserved field from the response).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RESPCMD[5:0]					
										r	r	r	r	r	r

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **RESPCMD[5:0]**: Response command index

Read-only bitfield. Contains the command index of the last command response received.

23.10.6 SDMMC response x register (SDMMC_RESPxR)

Address offset: 0x010 + 0x004 * x, (x = 1 to 4)

Reset value: 0x0000 0000

These registers contain the status of a card, which is part of the received response.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CARDSTATUS[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CARDSTATUS[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **CARDSTATUS[31:0]**: Card status according table below
See *Table 231*.

The card status size is 32 or 128 bits, depending on the response type.

Table 231. Response type and SDMMC_RESPxR registers

Register(1)	Short response	Long response
SDMMC_RESP1R	Card status[31:0]	Card status [127:96]
SDMMC_RESP2R	all 0	Card status [95:64]
SDMMC_RESP3R	all 0	Card status [63:32]
SDMMC_RESP4R	all 0	Card status [31:0](2)

1. The most significant bit of the card status is received first.
2. The SDMMC_RESP4R register LSB is always 0.

23.10.7 SDMMC data timer register (SDMMC_DTIMER)

Address offset: 0x024

Reset value: 0x0000 0000

This register contains the data timeout period, in card bus clock periods.

A counter loads the value from this register, and starts decrementing when the data path state machine (DPSM) enters the Wait_R or Busy state. If the timer reaches 0 while the DPSM is in either of these states, the timeout status flag is set.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATATIME[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATATIME[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DATATIME[31:0]**: Data and R1b busy timeout period

This bit can only be written when the CPSM and DPSM are not active (CPSMACT = 0 and DPSMACT = 0).

Data and R1b busy timeout period expressed in card bus clock periods.

Note: A data transfer must be written to the data timer register and the data length register before being written to the data control register.

23.10.8 SDMMC data length register (SDMMC_DLENR)

Address offset: 0x028

Reset value: 0x0000 0000

This register contains the number of data bytes to be transferred. The value is loaded into the data counter when data transfer starts.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	DATALENGTH[24:16]								
							rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATALENGTH[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:0 **DATALENGTH[24:0]**: Data length value

This register can only be written by firmware when DPSM is inactive (DPSMACT = 0).

Number of data bytes to be transferred.

When DDR = 1 DATALENGTH is truncated to a multiple of 2. (The last odd byte is not transfered)

When DATALENGTH = 0 no data are transfered, when requested by a CPSMEN and CMDTRANS = 1 also no command is transfered. DTEN and CPSMEN are cleared to 0.

Note: For a block data transfer, the value in the data length register must be a multiple of the block size (see SDMMC_DCTRL). A data transfer must be written to the data timer register and the data length register before being written to the data control register.

For an SDMMC multibyte transfer the value in the data length register must be between 1 and 512.

23.10.9 SDMMC data control register (SDMMC_DCTRL)

Address offset: 0x02C

Reset value: 0x0000 0000

This register controls the data path state machine (DPSM).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	FIFO RST	BOOT ACK EN	SDIO EN	RW MOD	RW STOP	RW START	DBLOCKSIZE[3:0]				DTMODE[1:0]		DTDIR	DTEN
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **FIFORST**: FIFO reset, flushes any remaining data

This bit can only be written by firmware when IDMAEN= 0 and DPSM is active (DPSMACT = 1). This bit only takes effect when a transfer error or transfer hold occurs.

0: FIFO not affected.

1: Flush any remaining data and reset the FIFO pointers. This bit is automatically cleared to 0 by hardware when DPSM gets inactive (DPSMACT = 0).

Bit 12 **BOOTACKEN**: Enable the reception of the boot acknowledgment

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).

0: Boot acknowledgment disabled, not expected to be received

1: Boot acknowledgment enabled, expected to be received

Bit 11 **SDIOEN**: SD I/O interrupt enable functions

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).

If this bit is set, the DPSM enables the SD I/O card specific interrupt operation.

Bit 10 **RWMOD**: Read Wait mode

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).

0: Read Wait control using SDMMC_D2

1: Read Wait control stopping SDMMC_CK

Bit 9 **RWSTOP**: Read Wait stop

This bit is written by firmware and auto cleared by hardware when the DPSM moves from the R_W state to the Wait_R or Idle state.

0: No Read Wait stop

1: Enable for Read Wait stop when DPSM is in the R_W state.

Bit 8 **RWSTART**: Read Wait start

If this bit is set, Read Wait operation starts.

Bits 7:4 **DBLOCKSIZE[3:0]**: Data block size

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
Define the data block length when the block data transfer mode is selected:
0000: Block length = 2^0 = 1 byte
0001: Block length = 2^1 = 2 bytes
0010: Block length = 2^2 = 4 bytes
0011: Block length = 2^3 = 8 bytes
0100: Block length = 2^4 = 16 bytes
0101: Block length = 2^5 = 32 bytes
0110: Block length = 2^6 = 64 bytes
0111: Block length = 2^7 = 128 bytes
1000: Block length = 2^8 = 256 bytes
1001: Block length = 2^9 = 512 bytes
1010: Block length = 2^{10} = 1024 bytes
1011: Block length = 2^{11} = 2048 bytes
1100: Block length = 2^{12} = 4096 bytes
1101: Block length = 2^{13} = 8192 bytes
1110: Block length = 2^{14} = 16384 bytes
1111: Reserved
When DATALENGTH is not a multiple of DBLOCKSIZE, the transfered data is truncated at a multiple of DBLOCKSIZE. (None of the remaining data are transfered.)
When DDR = 1, DBLOCKSIZE = 0000 must not be used. (No data are transfered)

Bits 3:2 **DTMODE[1:0]**: Data transfer mode selection

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
00: Block data transfer ending on block count.
01: SDIO multibyte data transfer.
10: *e*•MMC Stream data transfer. (WIDBUS must select 1-bit wide bus mode)
11: Block data transfer ending with STOP_TRANSMISSION command (not to be used with DTEN initiated data transfers).

Bit 1 **DTDIR**: Data transfer direction selection

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
0: From host to card.
1: From card to host.

Bit 0 **DTEN**: Data transfer enable bit

This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0). This bit is cleared by hardware when data transfer completes.
This bit must only be used to transfer data when no associated data transfer command is used (must not be used with SD or *e*•MMC cards).
0: Do not start data transfer without CPSM data transfer command.
1: Start data transfer without CPSM data transfer command.

23.10.10 SDMMC data counter register (SDMMC_DCNTR)

Address offset: 0x030

Reset value: 0x0000 0000

This register loads the value from the data length register (see SDMMC_DLENR) when the DPSM moves from the Idle state to the Wait_R or Wait_S state. As data is transferred, the counter decrements the value until it reaches 0. The DPSM then moves to the Idle state and

when there has been no error, and no transmit data transfer hold, the data status end flag (DATAEND) is set.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	DATACOUNT[24:16]

DATACOUNT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:0 **DATACOUNT[24:0]**: Data count value

When read, the number of remaining data bytes to be transferred is returned. Write has no effect.

Note: This register must be read only after the data transfer is complete, or hold. When reading after an error event the read data count value may be different from the real number of data bytes transfered.

23.10.11 SDMMC status register (SDMMC_STAR)

Address offset: 0x034

Reset value: 0x0000 0000

This register is a read-only register. It contains two types of flag:

- Static flags (bits [28, 21, 11:0]): these bits remain asserted until they are cleared by writing to the SDMMC interrupt Clear register (see SDMMC_ICR)
- Dynamic flags (bits [20:12]): these bits change state depending on the state of the underlying logic (for example, FIFO full and empty flags are asserted and deasserted as data while written to the FIFO)

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **IDMABTC**: IDMA buffer transfer complete

The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 27 **IDMATE**: IDMA transfer error

The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 26 **CKSTOP**: SDMMC_CK stopped in Voltage switch procedure

The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 25 **VSWEND**: Voltage switch critical timing section completion
The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 24 **ACKTIMEOUT**: Boot acknowledgment timeout
The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 23 **ACKFAIL**: Boot acknowledgment received (boot acknowledgment check fail)
The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 22 **SDIOIT**: SDIO interrupt received
The interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 21 **BUSYD0END**: end of SDMMC_D0 Busy following a CMD response detected
This indicates only end of busy following a CMD response. This bit does not signal busy due to data transfer. Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.
0: card SDMMC_D0 signal does NOT signal change from busy to not busy.
1: card SDMMC_D0 signal changed from busy to NOT busy.

Bit 20 **BUSYD0**: Inverted value of SDMMC_D0 line (Busy), sampled at the end of a CMD response and a second time 2 SDMMC_CK cycles after the CMD response
This bit is reset to not busy when the SDMMCD0 line changes from busy to not busy. This bit does not signal busy due to data transfer. This is a hardware status flag only, it does not generate an interrupt.
0: card signals not busy on SDMMC_D0.
1: card signals busy on SDMMC_D0.

Bit 19 **RXFIFOE**: Receive FIFO empty
This is a hardware status flag only, does not generate an interrupt. This bit is cleared when one FIFO location becomes full.

Bit 18 **TXFIFOE**: Transmit FIFO empty
This bit is cleared when one FIFO location becomes full.

Bit 17 **RXFIFOF**: Receive FIFO full
This bit is cleared when one FIFO location becomes empty.

Bit 16 **TXFIFOF**: Transmit FIFO full
This is a hardware status flag only, does not generate an interrupt. This bit is cleared when one FIFO location becomes empty.

Bit 15 **RXFIFOHF**: Receive FIFO half full
There are at least half the number of words in the FIFO. This bit is cleared when the FIFO becomes half+1 empty.

Bit 14 **TXFIFOHE**: Transmit FIFO half empty
At least half the number of words can be written into the FIFO. This bit is cleared when the FIFO becomes half+1 full.

Bit 13 **CPSMACT**: Command path state machine active (not in Idle state)
This is a hardware status flag only, does not generate an interrupt.

Bit 12 **DPSMACT**: Data path state machine active (not in Idle state)
This is a hardware status flag only, does not generate an interrupt.

Bit 11 **DABORT**: Data transfer aborted by CMD12
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 10 **DBCKEND**: Data block sent/received
DBCKEND is set when:
- CRC check passed and DPSM moves to the R_W state
or
- IDMAEN = 0 and transmit data transfer hold and DATACOUNT >0 and DPSM moves to Wait_S.
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 9 **DHOLD**: Data transfer Hold
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 8 **DATAEND**: Data transfer ended correctly
DATAEND is set if data counter DATACOUNT is zero and no errors occur, and no transmit data transfer hold.
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 7 **CMDSENT**: Command sent (no response required)
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 6 **CMDREND**: Command response received (CRC check passed, or no CRC)
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 5 **RXOVERR**: Received FIFO overrun error (masked by hardware when IDMA is enabled)
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 4 **TXUNDERR**: Transmit FIFO underrun error (masked by hardware when IDMA is enabled)
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 3 **DTIMEOUT**: Data timeout
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 2 **CTIMEOUT**: Command response timeout
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.
The Command Timeout period has a fixed value of 64 SDMMC_CK clock periods.

Bit 1 **DCRCFAIL**: Data block sent/received (CRC check failed)
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Bit 0 **CCRCFAIL**: Command response received (CRC check failed)
Interrupt flag is cleared by writing corresponding interrupt clear bit in SDMMC_ICR.

Note: FIFO interrupt flags must be masked in SDMMC_MASKR when using IDMA mode.

23.10.12 SDMMC interrupt clear register (SDMMC_ICR)

Address offset: 0x038

Reset value: 0x0000 0000

This register is a write-only register. Writing a bit with 1 clears the corresponding bit in the SDMMC_STAR status register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Set by software to clear the ACKFAIL flag.
0: ACKFAIL not cleared
1: ACKFAIL cleared

Bit 22 **SDIOITC**: SDIOIT flag clear bit
Set by software to clear the SDIOIT flag.
0: SDIOIT not cleared
1: SDIOIT cleared

Bit 21 **BUSYD0ENDC**: BUSYD0END flag clear bit
Set by software to clear the BUSYD0END flag.
0: BUSYD0END not cleared
1: BUSYD0END cleared

Bits 20:12 Reserved, must be kept at reset value.

Bit 11 **DABORTC**: DABORT flag clear bit
Set by software to clear the DABORT flag.
0: DABORT not cleared
1: DABORT cleared

Bit 10 **DBCKENDC**: DBCKEND flag clear bit
Set by software to clear the DBCKEND flag.
0: DBCKEND not cleared
1: DBCKEND cleared

Bit 9 **DHOLDC**: DHOLD flag clear bit
Set by software to clear the DHOLD flag.
0: DHOLD not cleared
1: DHOLD cleared

Bit 8 **DATAENDC**: DATAEND flag clear bit
Set by software to clear the DATAEND flag.
0: DATAEND not cleared
1: DATAEND cleared

Bit 7 **CMDSENTC**: CMDSENT flag clear bit
Set by software to clear the CMDSENT flag.
0: CMDSENT not cleared
1: CMDSENT cleared

Bit 6 **CMDRENDC**: CMDREND flag clear bit
Set by software to clear the CMDREND flag.
0: CMDREND not cleared
1: CMDREND cleared

Bit 5 **RXOVERRC**: RXOVERR flag clear bit
Set by software to clear the RXOVERR flag.
0: RXOVERR not cleared
1: RXOVERR cleared

Bit 4 **TXUNDERRC**: TXUNDERR flag clear bit
Set by software to clear TXUNDERR flag.
0: TXUNDERR not cleared
1: TXUNDERR cleared

Bit 3 **DTIMEOUTC**: DTIMEOUT flag clear bit
Set by software to clear the DTIMEOUT flag.
0: DTIMEOUT not cleared
1: DTIMEOUT cleared

Bit 2 **CTIMEOUTC**: CTIMEOUT flag clear bit
Set by software to clear the CTIMEOUT flag.
0: CTIMEOUT not cleared
1: CTIMEOUT cleared

Bit 1 **DCRCFAILC**: DCRCFAIL flag clear bit
Set by software to clear the DCRCFAIL flag.
0: DCRCFAIL not cleared
1: DCRCFAIL cleared

Bit 0 **CCRCFAILC**: CCRCFAIL flag clear bit
Set by software to clear the CCRCFAIL flag.
0: CCRCFAIL not cleared
1: CCRCFAIL cleared

23.10.13 SDMMC mask register (SDMMC_MASKR)

Address offset: 0x03C

Reset value: 0x0000 0000

This register determines which status flags generate an interrupt request by setting the corresponding bit to 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **IDMABTCIE**: IDMA buffer transfer complete interrupt enable
Set and cleared by software to enable/disable the interrupt generated when the IDMA has transferred all data belonging to a memory buffer.
0: IDMA buffer transfer complete interrupt disabled
1: IDMA buffer transfer complete interrupt enabled

Bit 27 Reserved, must be kept at reset value.

Bit 26 **CKSTOPIE**: Voltage switch clock stopped interrupt enable
Set and cleared by software to enable/disable interrupt caused by voltage switch clock stopped.
0: Voltage switch clock stopped interrupt disabled
1: Voltage switch clock stopped interrupt enabled

Bit 25 **VSWENDIE**: Voltage switch critical timing section completion interrupt enable
Set and cleared by software to enable/disable the interrupt generated when voltage switch critical timing section completion.
0: Voltage switch critical timing section completion interrupt disabled
1: Voltage switch critical timing section completion interrupt enabled

Bit 24 **ACKTIMEOUTIE**: Acknowledgment timeout interrupt enable
Set and cleared by software to enable/disable interrupt caused by acknowledgment timeout.
0: Acknowledgment timeout interrupt disabled
1: Acknowledgment timeout interrupt enabled

Bit 23 **ACKFAILIE**: Acknowledgment fail interrupt enable
Set and cleared by software to enable/disable interrupt caused by acknowledgment fail.
0: Acknowledgment fail interrupt disabled
1: Acknowledgment fail interrupt enabled

Bit 22 **SDIOITIE**: SDIO mode interrupt received interrupt enable
Set and cleared by software to enable/disable the interrupt generated when receiving the SDIO mode interrupt.
0: SDIO mode interrupt received interrupt disabled
1: SDIO mode interrupt received interrupt enabled

Bit 21 **BUSYD0ENDIE**: BUSYD0END interrupt enable
Set and cleared by software to enable/disable the interrupt generated when SDMMC_D0 signal changes from busy to NOT busy following a CMD response.
0: BUSYD0END interrupt disabled
1: BUSYD0END interrupt enabled

Bits 20:19 Reserved, must be kept at reset value.

Bit 18 **TXFIFOEIE**: Tx FIFO empty interrupt enable
Set and cleared by software to enable/disable interrupt caused by Tx FIFO empty.
0: Tx FIFO empty interrupt disabled
1: Tx FIFO empty interrupt enabled

Bit 17 **RXFIFOFIE**: Rx FIFO full interrupt enable
Set and cleared by software to enable/disable interrupt caused by Rx FIFO full.
0: Rx FIFO full interrupt disabled
1: Rx FIFO full interrupt enabled

Bit 16 Reserved, must be kept at reset value.

Bit 15 **RXFIFOHFIE**: Rx FIFO half full interrupt enable
Set and cleared by software to enable/disable interrupt caused by Rx FIFO half full.
0: Rx FIFO half full interrupt disabled
1: Rx FIFO half full interrupt enabled

Bit 14 **TXFIFOHEIE**: Tx FIFO half empty interrupt enable
Set and cleared by software to enable/disable interrupt caused by Tx FIFO half empty.
0: Tx FIFO half empty interrupt disabled
1: Tx FIFO half empty interrupt enabled

Bits 13:12 Reserved, must be kept at reset value.

Bit 11 **DABORTIE**: Data transfer aborted interrupt enable
Set and cleared by software to enable/disable interrupt caused by a data transfer being aborted.
0: Data transfer abort interrupt disabled
1: Data transfer abort interrupt enabled

Bit 10 **DBCKENDIE**: Data block end interrupt enable
Set and cleared by software to enable/disable interrupt caused by data block end.
0: Data block end interrupt disabled
1: Data block end interrupt enabled

Bit 9 **DHOLDIE**: Data hold interrupt enable
Set and cleared by software to enable/disable the interrupt generated when sending new data is hold in the DPSM Wait_S state.
0: Data hold interrupt disabled
1: Data hold interrupt enabled

Bit 8 **DATAENDIE**: Data end interrupt enable
Set and cleared by software to enable/disable interrupt caused by data end.
0: Data end interrupt disabled
1: Data end interrupt enabled

Bit 7 **CMDSENTIE**: Command sent interrupt enable
Set and cleared by software to enable/disable interrupt caused by sending command.
0: Command sent interrupt disabled
1: Command sent interrupt enabled

Bit 6 **CMDRENDIE**: Command response received interrupt enable
Set and cleared by software to enable/disable interrupt caused by receiving command response.
0: Command response received interrupt disabled
1: command Response received interrupt enabled

Bit 5 **RXOVERRIE**: Rx FIFO overrun error interrupt enable
Set and cleared by software to enable/disable interrupt caused by Rx FIFO overrun error.
0: Rx FIFO overrun error interrupt disabled
1: Rx FIFO overrun error interrupt enabled

Bit 4 **TXUNDERRIE**: Tx FIFO underrun error interrupt enable
Set and cleared by software to enable/disable interrupt caused by Tx FIFO underrun error.
0: Tx FIFO underrun error interrupt disabled
1: Tx FIFO underrun error interrupt enabled

Bit 3 **DTIMEOUTIE**: Data timeout interrupt enable
Set and cleared by software to enable/disable interrupt caused by data timeout.
0: Data timeout interrupt disabled
1: Data timeout interrupt enabled

Bit 2 **CTIMEOUTIE**: Command timeout interrupt enable
Set and cleared by software to enable/disable interrupt caused by command timeout.
0: Command timeout interrupt disabled
1: Command timeout interrupt enabled

Bit 1 **DCRCFAILIE**: Data CRC fail interrupt enable
Set and cleared by software to enable/disable interrupt caused by data CRC failure.
0: Data CRC fail interrupt disabled
1: Data CRC fail interrupt enabled

Bit 0 **CCRCFAILIE**: Command CRC fail interrupt enable
Set and cleared by software to enable/disable interrupt caused by command CRC failure.
0: Command CRC fail interrupt disabled
1: Command CRC fail interrupt enabled

23.10.14 SDMMC acknowledgment timer register (SDMMC_ACKTIMER)

Address offset: 0x040

Reset value: 0x0000 0000

This register contains the acknowledgment timeout period, in SDMMC_CK bus clock periods.

A counter loads the value from this register, and starts decrementing when the data path state machine (DPSM) enters the Wait_Ack state. If the timer reaches 0 while the DPSM is in this states, the acknowledgment timeout status flag is set.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	ACKTIME[24:16]								
							rw	rw	rw	rw	rw	rw	rw	rw	rw

ACKTIME[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bits 24:0 **ACKTIME[24:0]**: Boot acknowledgment timeout period
This bit can only be written by firmware when CPSM is disabled (CPSMEN = 0).
Boot acknowledgment timeout period expressed in card bus clock periods.

Note: The data transfer must be written to the acknowledgment timer register before being written to the data control register.

23.10.15 SDMMC DMA control register (SDMMC_IDMACTRLR)

Address offset: 0x050

Reset value: 0x0000 0000

The receive and transmit FIFOs can be read or written as 32-bit wide registers. The FIFOs contain 32 entries on 32 sequential addresses. This enables the CPU to use its load and store multiple operands to read from/write to the FIFO.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IDMAB MODE	IDMA EN
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **IDMABMODE**: Buffer mode selection
This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
0: Single buffer mode.
1: Linked list mode.

Bit 0 **IDMAEN**: IDMA enable
This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
0: IDMA disabled
1: IDMA enabled

23.10.16 SDMMC IDMA buffer size register (SDMMC_IDMABSIZER)

Address offset: 0x054

Reset value: 0x0000 0000

This register contains the buffer size when in linked list configuration.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IDMABNDT[11]

IDMABNDT[10:0]											Res.	Res.	Res.	Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw					

Bits 31:17 Reserved, must be kept at reset value.

Bits 16:5 **IDMABNDT[11:0]**: Number of bytes per buffer
This 12-bit value must be multiplied by 8 to get the size of the buffer in 32-bit words and by 32 to get the size of the buffer in bytes.
Example: IDMABNDT = 0x001: buffer size = 8 words = 32 bytes.
Example: IDMABNDT = 0x800: buffer size = 16384 words = 64 Kbyte.
These bits can only be written by firmware when DPSM is inactive (DPSMACT = 0).

Bits 4:0 Reserved, must be kept at reset value.

23.10.17 SDMMC IDMA buffer base address register (SDMMC_IDMABASER)

Address offset: 0x058

Reset value: 0x0000 0000

This register contains the memory buffer base address in single buffer configuration and linked list configuration.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
IDMABASE[31:16]

IDMABASE[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	r	r

Bits 31:0 **IDMABASE[31:0]**: Buffer memory base address bits [31:2], must be word aligned (bit [1:0] are always 0 and read only)

This register can be written by firmware when DPSM is inactive (DPSMACT = 0), and can dynamically be written by firmware when DPSM active (DPSMACT = 1).

23.10.18 SDMMC IDMA linked list address register (SDMMC_IDMALAR)

Address offset: 0x064

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit 31 **ULA**: Update SDMMC_IDMALAR from linked list when in linked list mode (SDMMC_IDMACTRLR.IDMABMODE select linked list mode)
This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
0: SDMMC_IDMALAR is not to be updated, last linked list item.
1: SDMMC_IDMALAR is to be updated from linked list table.

Bit 30 **ULS**: Update SDMMC_IDMABSIZE from the next linked list when in linked list mode (SDMMC_IDMACTRLR.IDMABMODE select linked list mode and ULA = 1)
This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
0: SDMMC_IDMABSIZER is not to be updated from next linked list table.
1: SDMMC_IDMABSIZER is to be updated from next linked list table.

Bit 29 **ABR**: Acknowledge linked list buffer ready
This bit can only be written by firmware when DPSM is inactive (DPSMACT = 0).
This bit is not taken into account when starting the first linked list buffer from the software programmed register information. ABR is only taken into account on subsequent loaded linked list items.
0: Loaded linked list buffer is not ready (this causes a linked list IDMA transfer error to be generated).
1: Loaded linked list buffer ready acknowledge. Linked list buffer data are transfered by IDMA.

Bits 28:16 Reserved, must be kept at reset value.

Bits 15:2 **IDMALA[13:0]**: Word aligned linked list item address offset
Linked list item offset pointer to the base of the next linked list item structure.
Linked list item base address is IDMABA + IDMALA.
These bits can only be written by firmware when DPSM is inactive (DPSMACT = 0).

Bits 1:0 Reserved, must be kept at reset value.

23.10.19 SDMMC IDMA linked list memory base register (SDMMC_IDMABAR)

Address offset: 0x068

Reset value: 0x0000 0000

Bits 31:2 **IDMABA[29:0]**: Word aligned Linked list memory base address
Linked list memory base pointer.
These bits can only be written by firmware when DPSM is inactive (DPSMACT = 0).

Bits 1:0 Reserved, must be kept at reset value.

23.10.20 SDMMC data FIFO registers x (SDMMC_FIFORx)

Address offset: 0x080 + 0x004 * x, (x =0 to 15)

Reset value: 0x0000 0000

The receive and transmit FIFOs can be only read or written as word (32-bit) wide registers. The FIFOs contain 16 entries on sequential addresses. This enables the CPU to use its load and store multiple operands to read from/write to the FIFO. The FIFO register interface takes care of correct data alignment inside the FIFO, the FIFO register address used by the CPU does matter.

When accessing SDMMC_FIFOR with half word or byte access an AHB bus fault is generated.

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

24 Delay block (DLYB)

24.1 DLYB introduction

The delay block (DLYB) is used to generate an output clock that is dephased from the input clock. The phase of the output clock must be programmed by the user application. The output clock is then used to clock the data received by another peripheral such as an SDMMC or XSPI interface.

The delay is voltage- and temperature-dependent, that may require the application to re-configure and recenter the output clock phase with the receive data.

24.2 DLYB main features

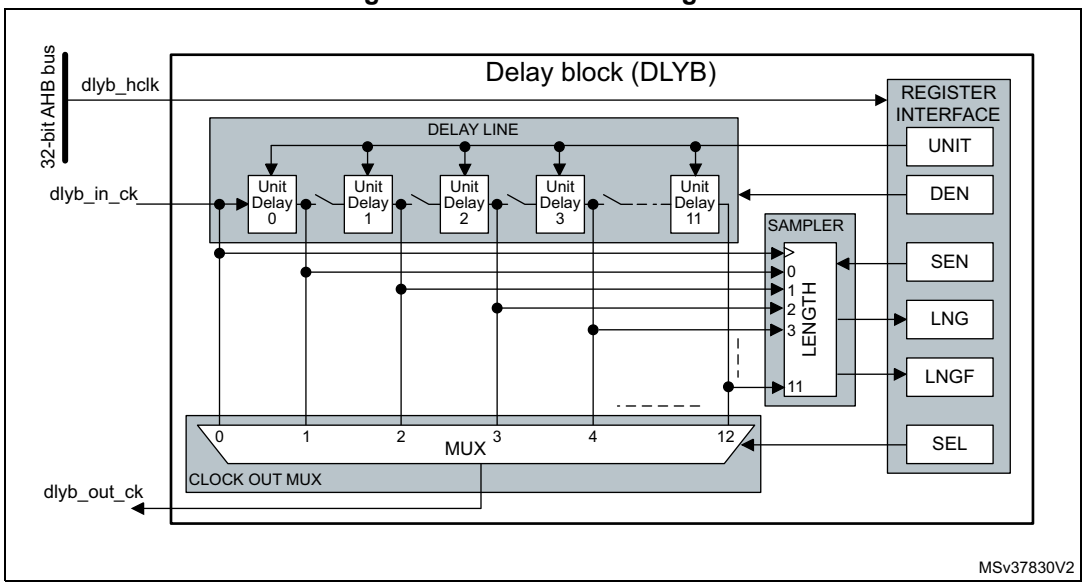
The delay block has the following features:

- Input clock frequency ranging from 25 MHz to the maximum frequency supported by the communication interface (see datasheet)
- Up to 12 oversampling phases.

24.3 DLYB implementation

Table 233. STM32H7Pxxx features

DLYB associated peripheral	DLYBXS1	DLYBSD1
XSPI1	X	-
SDMMC1	-	X



24.4 DLYB functional description

24.4.1 DLYB diagram

The delay block includes the following sub-blocks (shown in the figure below):

- register interface block providing AHB access to the DLYB registers
- delay line supporting the unit delays
- delay line length sampling
- output clock selection multiplexer

Figure 282. DLYB block diagram

24.4.2 DLYB pins and internal signals

Table 234 lists the DLYB internal signals.

Table 234. DLYB internal input/output signals

Signal name	Signal type	Description
dlyb_hclk	Digital input	Delay block register interface clock
dlyb_in_ck	Digital input	Delay block input clock
dlyb_out_ck	Digital output	Delay block output clock

Table 235. DLYB interconnection

Signal name	Source/destination	
	SDMMC1	XSPI1
dlyb_in_ck	sdmmc_io_in_ck	DQS
dlyb_out_ck	sdmmc_fb_ck	DQS delayed for data sampling

24.4.3 General description

The delay block is enabled by setting the DEN bit in the DLYB control register (DLYB_CR). The length sampler is enabled through the SEN bit in DLYB_CR register.

When the delay block is enabled, the delay added by a unit delay is defined by the UNIT[6:0] field in the DLYB configuration register (DLYB_CFGR).

Note: UNIT[6:0] can be programmed only when the output clock is disabled (SEN = 1).

When the delay block is enabled, the output clock phase is selected through the SEL[3:0] field in DLYB_CFGR register.

Note: SEL can be programmed only when the output clock is disabled (SEN = 1).

The output clock can be de-phased over one input clock period by configuring the delay line length to span one period. The delay line length can be configured by enabling the length sampler through the SEN bit, that gives access to the delay line length (LNG[11:0]) and length valid flag (LNGF) in DLYB_CFGR.

If an output clock delay smaller than one input clock period is needed the delay line length can be reduced. This allows a smaller unit delay providing higher resolution.

Once the delay line length is configured, a dephased output clock can be selected by the output clock multiplexer. This is done through SEL[3:0]. The output clock is only available on the selected phase when SEN is set to 0.

The table below gives a summary of the delay block control.

Table 236. Delay block control

DEN	SEN	UNIT	SEL	LNG	LNGF	Output clock
0	0	Don’t care	Don’t care	Don’t care	Don’t care	Enabled (= Input clock)
x	1	Unit delay	Output clock phase	Length	Length flag	Disabled
1	0	Unit delay(1)	Output clock phase(2)	Don’t care	Don’t care	Enabled (= selected phase)

1. The unit delay can only be changed when SEN = 1.
2. The output clock phase can only be changed when SEN = 1.

24.4.4 Delay line length configuration procedure

LNG[11:0] is used to determine the delay line length with respect to the input clock period. The length must be configured so that one full input clock period is covered by the delay line length.

Note that despite the delay line has 12 unit delay elements, the following procedure description returns a length between 0 and 10, as the upper delay output value is used to ensure that the delay is calibrated over one full input clock cycle. Depending on the clock frequency and UNIT value, unit delay element 10 may also be truncated from the clock cycle length.

A clock input (free running clock) must be present during the whole tuning procedure.

To configure the delay line length to one period of the Input clock, follow the sequence below:

1. Enable the delay block by setting DEN bit to 1.
2. Enable the length sampling by setting SEN bit to 1.
3. Enable all delay cells by setting SEL[3:0] to 12.
4. For UNIT[6:0] = 0 to 127 (this step must be repeated until the delay line length is configured):
   a) Update the UNIT[6:0] value and wait till the length flag LNGF is set to 1.
   b) Read LNG[11:0].

   If (LNG[10:0] > 0) and (LNG[11] or LNG[10] = 0), the delay line length is configured to one input clock period.
5. Determine how many unit delays (N) span one input clock period: for N = 0 to 10, if LNG[N] = 1, the number of unit delays spanning the input clock period = N.
6. Disable the length sampling by clearing SEN to 0.

If an output clock delay smaller than one input clock period is needed the delay line length can be reduced smaller than one input clock period. This allows a smaller unit delay, providing a higher resolution spanning a shorter time interval.

24.4.5 Output clock phase configuration procedure

When the delay line length is configured to one input clock period, the output clock phase can be selected between the unit delays spanning one Input clock period.

Follow the steps below to select the output clock phase:

1. Disable the output clock and enable the access to the phase selection SEL[3:0] bits by setting SEN bit to 1.
2. Program SEL[3:0] with the desired output clock phase value.
3. Enable the output clock on the selected phase by clearing SEN to 0.

XSPI use case:

The delay block is used in conjunction with XSPI interface to allow shifting the input data sampling signal. This sampling signal can be the feedback clock or the data strobe (DQS) signal, which is delivered by certain type of devices. Note that in case DQS is used, the calibration procedure must be performed beforehand with a free running clock, as DQS is a discontinuous signal.

In case of SDR (single data rate) mode the user must typically shift the sampling signal by half period, so that the sampling edges are positioned in the middle of the valid data phase.

In case of DDR (dual data rate) mode, for which data are transitioning at start and middle of period, typical value must be close to N/4, once the calibration is completed.

In case of high frequencies and tight timing constraints, the delay setting granularity (10) might be too coarse. Since in most cases it is not necessary to have a possible delay value covering the whole sampling clock period, the "Unit" value can be overridden by application in order to improve the accuracy of the sampling edge position (example: providing a twice as small “Unit” gives twice better timing accuracy. The counterpart being that the maximum possible delay is divided by 2).

SDMMC use case:

The delay block is used in conjunction with SDMMC interface variable delay. For correct sampling point tuning the delay value must cover a whole SDMMC_CK clock period. After having tuned the delay line length the individual delays are used in the sampling point tuning to find the optimal sampling point.

24.5 DLYB registers

All registers can be accessed in word, half-word and byte access.

24.5.1 DLYB control register (DLYB_CR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEN	DEN
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **SEN:** Sampler length enable bit

0: Sampler length and register access to UNIT[6:0] and SEL[3:0] disabled, output clock enabled.

1: Sampler length and register access to UNIT[6:0] and SEL[3:0] enabled, output clock disabled.

Bit 0 **DEN:** Delay block enable bit

0: DLYB disabled.

1: DLYB enabled.

24.5.2 DLYB configuration register (DLYB_CFGR)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LNGF	Res.	Res.	Res.	LNG[11:0]											
r				r	r	r	r	r	r	r	r	r	r	r	r

Res.	UNIT[6:0]							Res.	Res.	Res.	Res.	SEL[3:0]			
	rw	rw	rw	rw	rw	rw	rw					rw	rw	rw	rw

Bit 31 **LNGF:** Length valid flag
This flag indicates when the delay line length value contained in LNG[11:0] is valid after UNIT[6:0] bits changed.
0: Length value in LNG is not valid.
1: Length value in LNG is valid.

Bits 30:28 Reserved, must be kept at reset value.

Bits 27:16 **LNG[11:0]:** Delay line length value
These bits reflect the 12 unit delay values sampled at the rising edge of the input clock.
The value is only valid when LNGF = 1.

Bit 15 Reserved, must be kept at reset value.

Bits 14:8 **UNIT[6:0]:** Delay of a unit delay cell.
These bits can only be written when SEN = 1.
Unit delay = initial delay + UNIT[6:0] x delay step

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **SEL[3:0]:** Phase for the output clock.
These bits can only be written when SEN = 1.
Output clock phase = input clock + SEL[3:0] x unit delay

24.5.3 DLYB register map

Table 237. DLYB register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

25 Analog-to-digital converters (ADC)

25.1 ADC introduction

This section describes the implementation of up to 4 ADCs:

- ADC1 and ADC2 are tightly coupled and can operate in dual mode (ADC1 is master).
- ADC3 and ADC4 are tightly coupled and can operate in dual mode (ADC3 is master).

Each ADC consists of one 12-bit successive approximation analog-to-digital converter.

Each ADC has up to 20 multiplexed channels. A/D conversion of the various channels can be performed in single, continuous, scan, or discontinuous mode. The result of the ADC is stored in a left-aligned or right-aligned (default configuration) 32-bit data register.

The ADCs are mapped on the AHB bus to allow fast data handling.

The analog watchdog features allow the application to detect if the input voltage goes outside the user-defined high or low thresholds.

A built-in hardware oversampler allows improving analog performances while off-loading the related computational burden from the CPU.

An efficient low-power mode is implemented to allow very low consumption at low frequency.

25.2 ADC main features

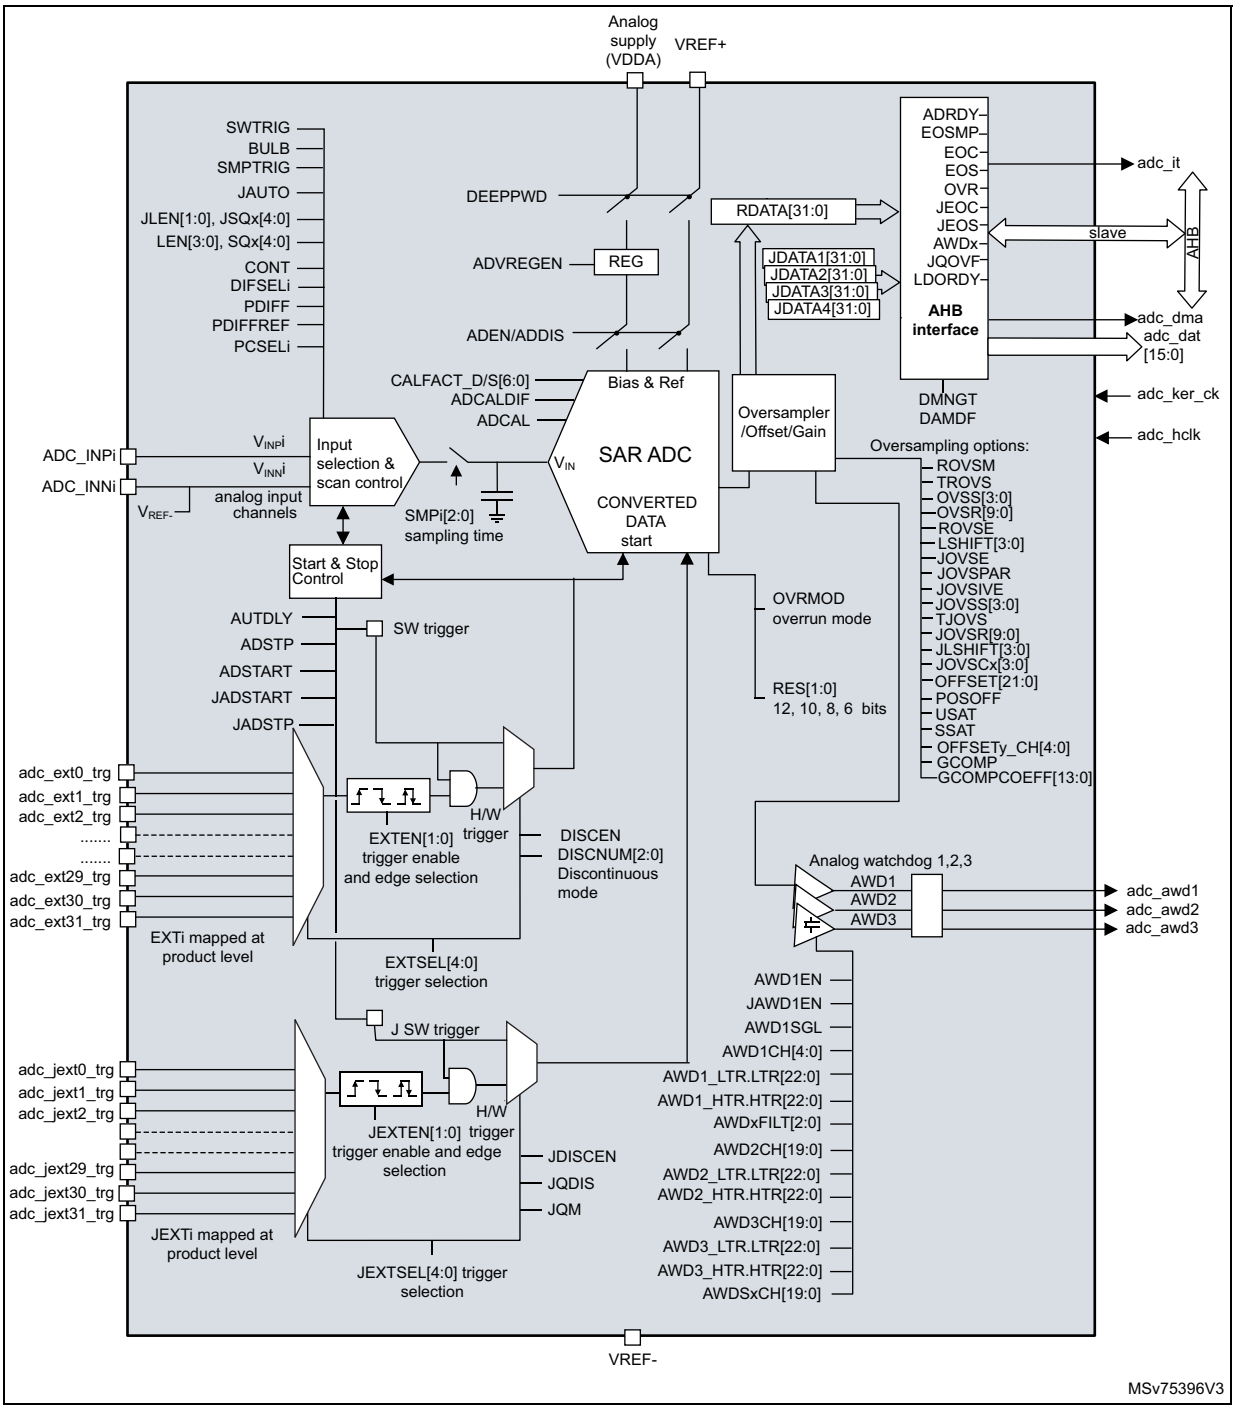
- High-performance features
  - Up to 4 ADCs: ADC1/2 and ADC3/4 can operate in dual mode
    ADC1 is connected to 16 external channels + 4 internal channels
    ADC2 is connected to 18 external channels + 2 internal channels
    ADC3 is connected to 17 external channels + 3 internal channels
    ADC4 is connected to 18 external channels + 2 internal channels
  - 12, 10, 8 or 6-bit configurable resolution
  - ADC conversion time independent from the AHB bus clock frequency
  - Faster conversion time by lowering resolution
  - Management of single-ended, pseudodifferential, and differential inputs (programmable per channels)
  - AHB slave bus interface to allow fast data handling
  - Channel-wise programmable sampling time
  - Flexible sampling time control
  - Fixed latency for a trigger to start of sampling
  - Up to 4 injected channels (analog inputs assignment to regular or injected channels is fully configurable)
  - Hardware assistant to prepare the context of the injected channels to allow fast context switching
  - Data alignment with in-built data coherency
  - Data can be managed by DMA for regular channel conversions
  - Data can be routed to ADF for post processing
  - Four dedicated data registers for the injected channels
- Low-power features
  - Speed adaptive low-power mode to reduce ADC consumption when operating at low frequency
  - Allows slow bus frequency application while keeping optimum ADC performance
  - Provides automatic control to avoid ADC overrun in low AHB bus clock frequency application (autodelayed mode)
- Oversampler
  - 32-bit data register
  - Oversampling ratio adjustable from 2 to 1024
  - Programmable data right and left shifts
  - Dedicated accumulator for each regular and injected channel
  - Parallel oversampling mode for injected channels (access to the intermediate oversampling result)
- Data preconditioning
  - Gain compensation
  - Offset compensation
- Analog input channels
  - External analog inputs (per ADC): up to 18 GPIO pads

  - 4 channels for the internal reference voltage (V_{REFINT})
  - 1 channel for the internal temperature sensor (V_{SENSE})
  - 1 channel for monitoring the external VBAT power supply pin
  - 1 channel for monitoring V_{DDCORE} internal voltage
  - Connection to DAC internal channels
- Start-of-conversion can be initiated:
  - By software for both regular and injected conversions
  - By hardware triggers with configurable polarity (internal timer events or GPIO input events) for both regular and injected conversions
- Conversion modes
  - Each ADC can convert a single channel or can scan a sequence of channels
  - Single mode converts selected inputs once per trigger
  - Continuous mode converts selected inputs continuously
  - Discontinuous mode
- Interrupt generation at ADC ready, the end of sampling, the end of conversion (regular or injected), end of sequence conversion (regular or injected), analog watchdog 1, 2 or 3 or overrun events
- 3 analog watchdogs per ADC, with filters
- ADC input range: $V_{SSA} \leq V_{IN} \leq V_{REF+}$

Figure 283 shows the block diagram of one ADC.

25.3 ADC implementation

Table 238. ADC features



ADC modes/features	ADC1, ADC2	ADC3, ADC4
Resolution	12 bits	
Maximum sampling speed	5 Msps (12-bit resolution)	
Dual mode operation	X	
Offset calibration	X	
Single-end input	X	
Differential input	X	
Injected channel conversion	X	
Oversampling	up to x1024	
Data register	32 bits	
DMA support	X	
Parallel data output to ADF	X	-
Offset compensation	X	
Gain compensation	X	
Number of analog watchdog	3	

25.4 ADC functional description

25.4.1 ADC block diagram

Figure 283 shows the ADC block diagram and *Table 239* gives the ADC pin description.

Figure 283. ADC block diagram

25.4.2 ADC pins and internal signals

Table 239. ADC input/output pins

Pin name	Signal type	Description
VDDA	Input, analog supply	Analog power supply
VSSA	Input, analog supply ground	Ground for analog power supply, equal to V_{SS}.
VREF+	Input, analog reference positive	The higher/positive reference voltage for the ADC.
VREF-	Input, analog reference negative	The lower/negative reference voltage for the ADC.
ADCx_INNi/INPi	Negative/positive external analog input signals	20 negative/positive external analog input channels (refer to *Section 25.4.4: ADC connectivity* for details).

Table 240. ADC internal input/output signals

Internal signal name	Signal type	Description
$V_{INP}i$	Positive analog input channels	Positive internal analog input channels connected either to ADCx_INP*i* external channels or to internal channels.
$V_{INN}i$	Negative analog input channels	Negative internal analog input channels connected either to ADCx_INN*i* external channels or to internal channels.
adc_ext_trgi	Inputs	ADC external trigger inputs for regular conversions.These inputs are shared between the ADC master and the ADC slave.
adc_jext_trgi	Inputs	ADC external trigger inputs for the injected conversions. These inputs are shared between the ADC master and the ADC slave.
adc_awdy	Output	Internal analog watchdog output signal connected to on-chip timers. (y = Analog watchdog number 1,2,3).
adc_ker_ck	Input	ADC kernel clock
adc_hclk	Input	ADC peripheral clock
adc_it	Output	ADC interrupt
adc_dma	Output	ADC DMA request
adc_dat[15:0]	Output	ADC data outputs

Table 241. ADC1/2/3/4 interconnection

Signal name	Source/destination

1. This input can be selected through the option register.

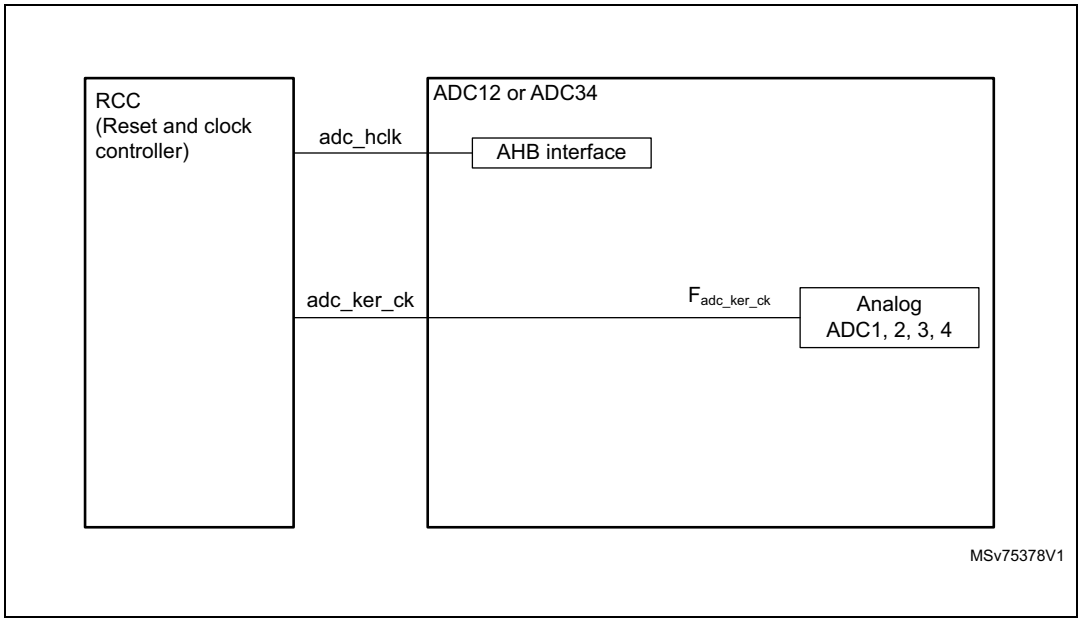
25.4.3 ADC clocks

Dual clock domain architecture

The dual clock-domain architecture means that the ADC kernel clock is independent from the AHB bus clock that is used to access ADC registers.

The adc_ker_ck input clock can be selected between different clock sources (see *Figure 284: ADC clock scheme*). This selection is done in the RCC (refer to section *Reset and clock control (RCC)* for more information):

1. The ADC clock can be provided by an internal or external clock source, which is independent and asynchronous from the AHB clock.
2. The ADC clock can be derived from AHB clock (selected in RCC).



Option **1** has the advantage of achieving the maximum ADC clock frequency whatever the AHB clock scheme selected.

Option **2** corresponds to a pseudosynchronous clock. This can be useful when the ADC is triggered by a timer and the application requires that the ADC is accurately triggered without any uncertainty (otherwise, an uncertainty of the trigger instant time is added by the resynchronizations between the two clock domains). This accurate trigger is supported only by trgo or trgo2 timer triggers.

For further details on the synchronization between ADC and timers, refer to section *ADC synchronization* in each timer section, and to section *Peripheral clock distribution* in the RCC section.

The clock is configured through the RCC and must be compliant with the operating frequency specified in the device datasheet.

Figure 284. ADC clock scheme

Clock ratio constraint between ADC clock and AHB clock

There are no constraints to respect for the ratio between the ADC clock and the AHB clock. However, the ratio must be carefully chosen to avoid any overrun especially if the clock AHB is much slower than the ADC clock.

When adc_hclk operates at a higher frequency than adc_ker_ck, writing to the AHB register does not immediately update the ADC configuration due to clock domain crossing delays. To guarantee that the configuration is properly applied within the adc_ker_ck domain, it is necessary to wait for four adc_ker_ck clock cycles after the AHB register update.

25.4.4 ADC connectivity

ADC inputs are connected to external channels as well as internal sources as described below.

Figure 285. ADC1 connectivity

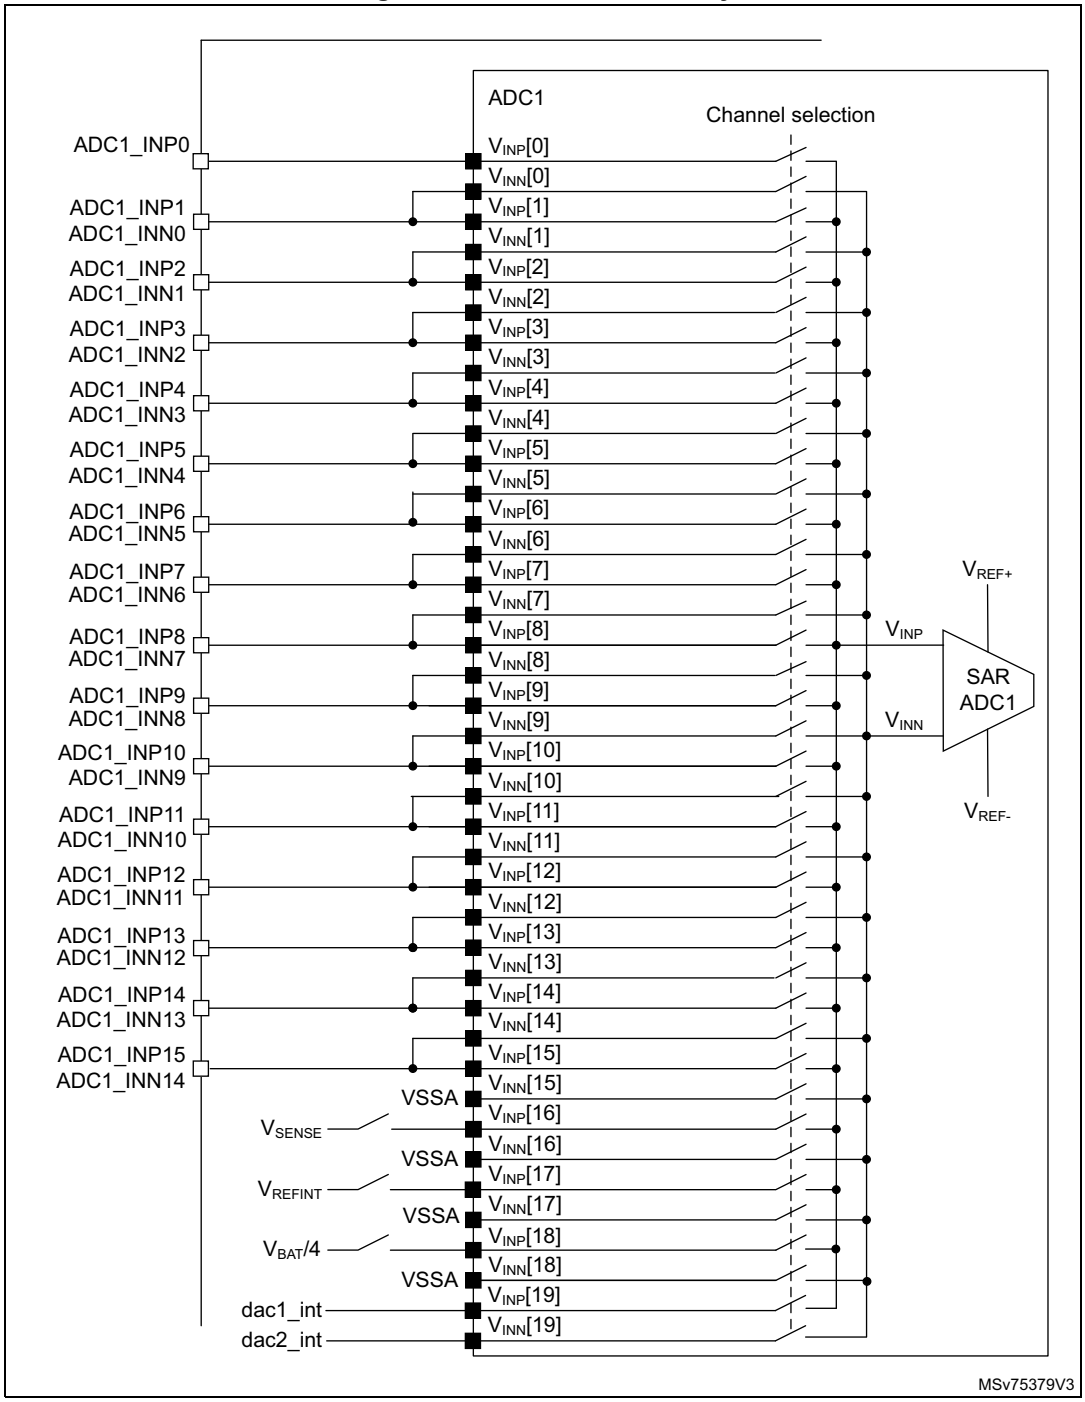


Figure 286. ADC2 connectivity

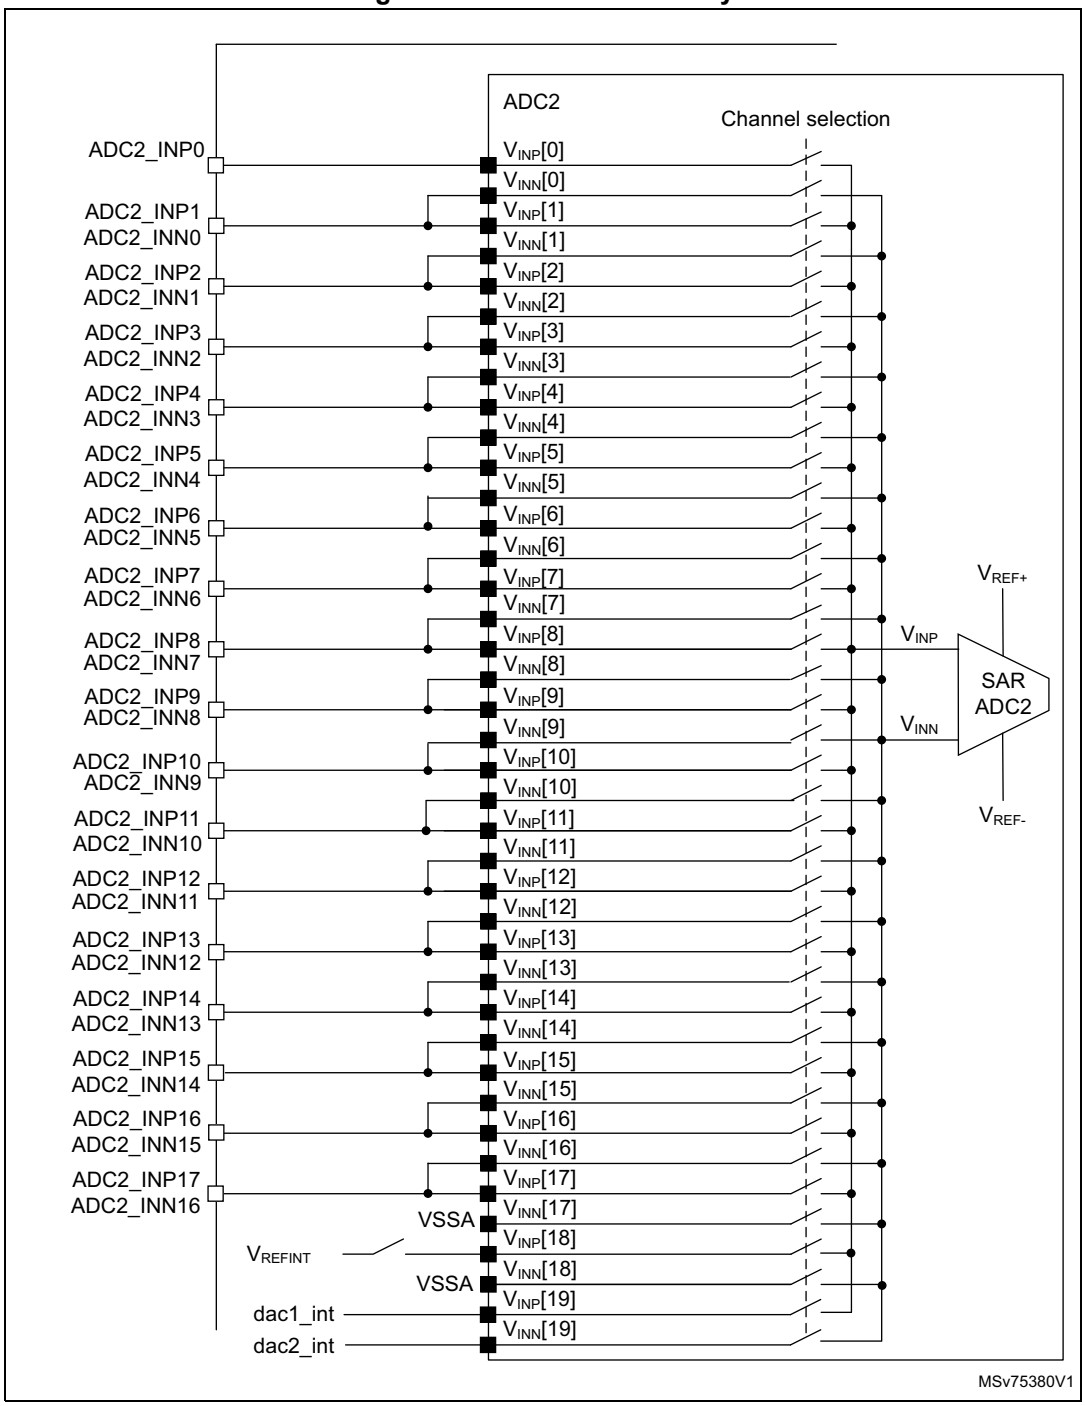

Figure 287. ADC3 connectivity

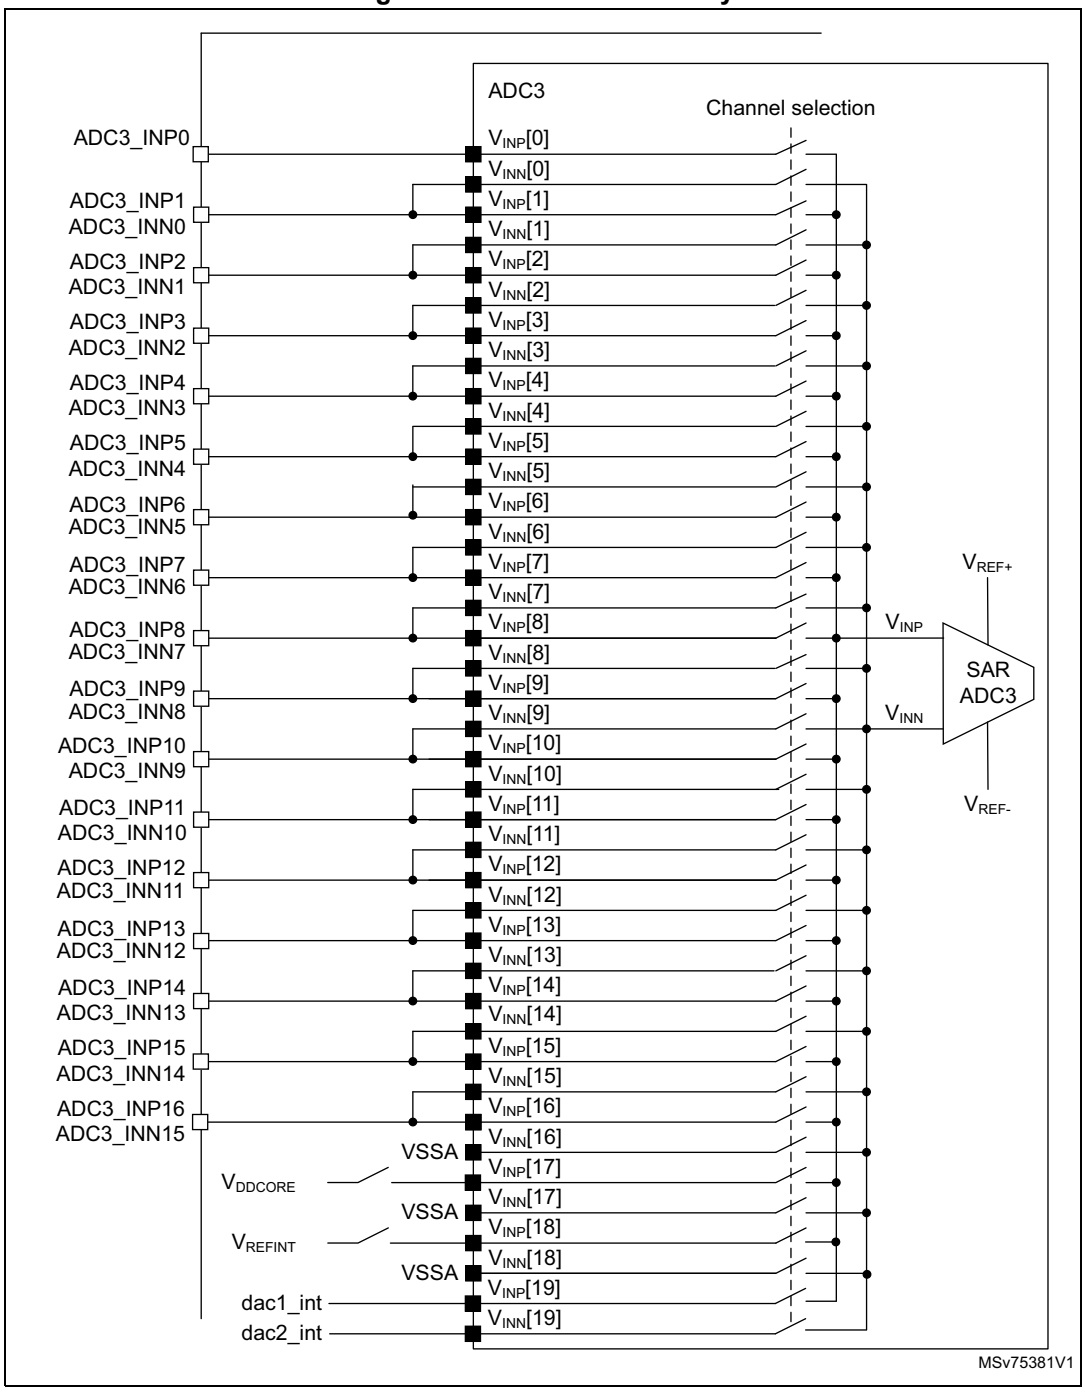

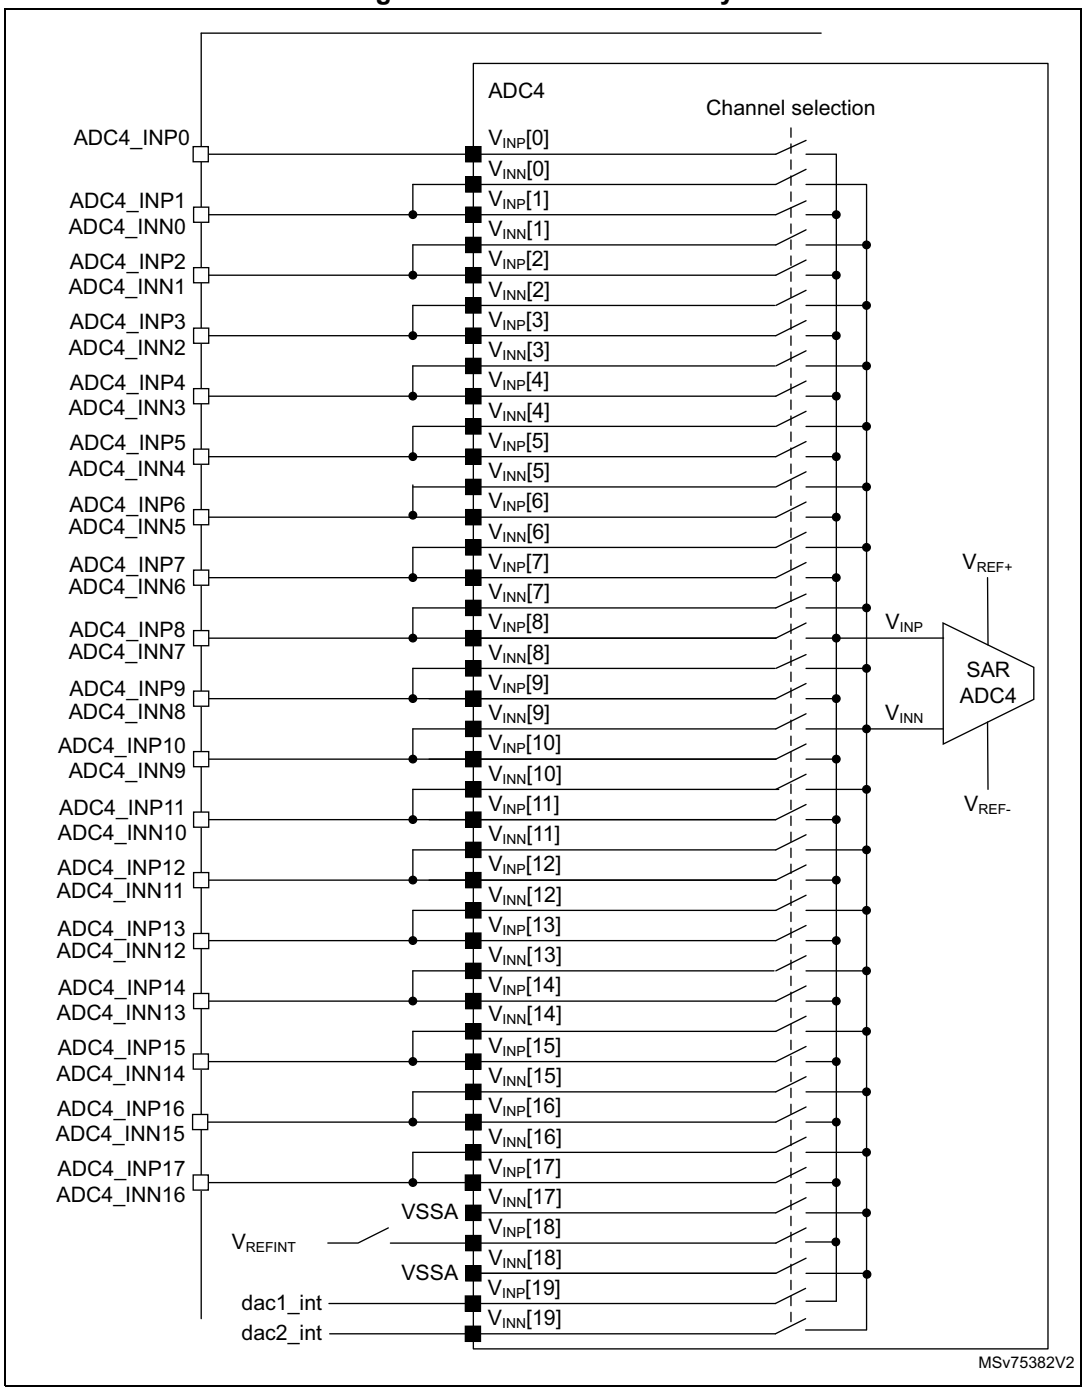

Figure 288. ADC4 connectivity

25.4.5 Slave AHB interface

The ADCs implement an AHB slave port for control/status register and data access. The features of the AHB interface are listed below:

- Word accesses
- Single cycle response
- Response to all read/write accesses to the registers with zero wait states.

The AHB slave interface does not support split/retry requests, and it can generate AHB error in case of wrong HSIZE.

25.4.6 ADC Deep-power-down mode (DEEPPWD)

By default, the ADC is in deep-power-down mode where its supply voltage is internally switched off to reduce the leakage currents (the reset state of DEEPPWD bit is 1 in the ADC_CR register).

To activate the ADC, first exit the Deep-power-down mode by clearing the DEEPPWD bit.

When ADC operations are complete, the ADC can be disabled by clearing the ADEN bit of the ADC_CR register.

Power can be saved by entering ADC Deep-power-down mode again (by setting DEEPPWD of ADC_CR register). This is particularly interesting before entering Stop mode.

25.4.7 Single-ended and differential input channels

ADC channels can be configured to be either single-ended inputs or differential inputs by programming DIFSEL[i] bits in the ADC_DIFSEL register. This configuration must be programmed when no ADC conversion is ongoing. Note that the DIFSEL[i] bits corresponding to single-ended channels must be programmed at 0.

In single-ended input mode, the analog voltage to be converted for channel "*i*" is the difference between the external voltage $V_{INP[i]}$ and V_{REF-}.

In differential input mode, the analog voltage to be converted for channel "*i*" is the difference between the external voltage $V_{INP[i]}$ (positive input) and $V_{INN[i]}$ (negative input).

In differential mode, the output data are unsigned data. When $V_{INP[i]}$ equals V_{REF-}, $V_{INN[i]}$ equals V_{REF+} and the output data is 0x000 (12-bit resolution mode). When $V_{INP[i]}$ equals V_{REF+}, $V_{INN[i]}$ equals V_{REF-} and the output data is 0xFFF.

$$\text{Converted value} = \frac{\text{ADC_Full_Scale}}{2} \times \left[1 + \frac{V_{INP} - V_{INN}}{V_{REF+}}\right]$$

When the ADC is configured in differential mode, the input signals are supposed to be differential (the common-mode voltage must be fixed at $V_{REF+}/2$ voltage).

Internal channels are used in single-ended mode only.

For a complete description of how the input channels are connected for each ADC, refer to *Section 25.4.4: ADC connectivity*.

Caution: When configuring channel "*i*" in differential input mode, its negative input voltage $V_{INN[i]}$ is connected to another channel. As a consequence, this channel is no longer usable in single-ended or differential mode, and must never be configured to be converted. Some channels

are shared between ADCs: this can make the channel on the other ADCs unusable. The only exception is interleaved mode for ADC master and the slave.

25.4.8 Pseudodifferential mode

The ADC can operate in pseudodifferential mode instead of differential modes when DIFSELx = 1. In this mode, differential inputs are supported but the negative input $V_{INN[i]}$ is fixed to V_{REF-} or to $V_{REF+}/2$ voltage.

The pseudodifferential mode is selected by setting the PDIFF bit of the ADC_CFGR2 register. This changes the behavior of the differential channel selected via the ADC_DIFSEL register. In addition, the negative input reference voltage can be selected between V_{REF-} and $V_{REF+}/2$ through the PDIFFREF bit of the ADC_CFGR2 register.

When the ADC is configured in pseudodifferential mode:

- When $V_{INP[i]}$ equals 0 V, the output data is 0x000.
- When $V_{INP[i]}$ equals V_{REF+}, the output data is 0xFFF,

Note: The behavior is the same as in single-ended mode except that $V_{INN[i]}$ is fixed to 0 V or $V_{REF+}/2$.

The pseudodifferential mode can be used to reject the common mode noise that exists between the ADC shunt resistor bottom voltage (ground) and top voltage (voltage to be converted by the ADC).

The pseudodifferential mode does not affect single-end channel conversions.

The pseudodifferential and standard differential modes cannot be used simultaneously in the same scan conversion sequence. If pseudodifferential or differential conversion is required, stop and disable the ADC to change the PDIFF setting.

25.4.9 Calibration (ADCAL, ADCALDIF, ADC_CALFACT)

Each ADC provides an automatic calibration procedure that drives all the calibration sequences including the power-on/off sequence of the ADC. During the procedure, the ADC calculates a calibration factor, which is 7-bit wide and is applied internally to the ADC until the next ADC power-off. During the calibration procedure, the application must not use the ADC and must wait until calibration is complete.

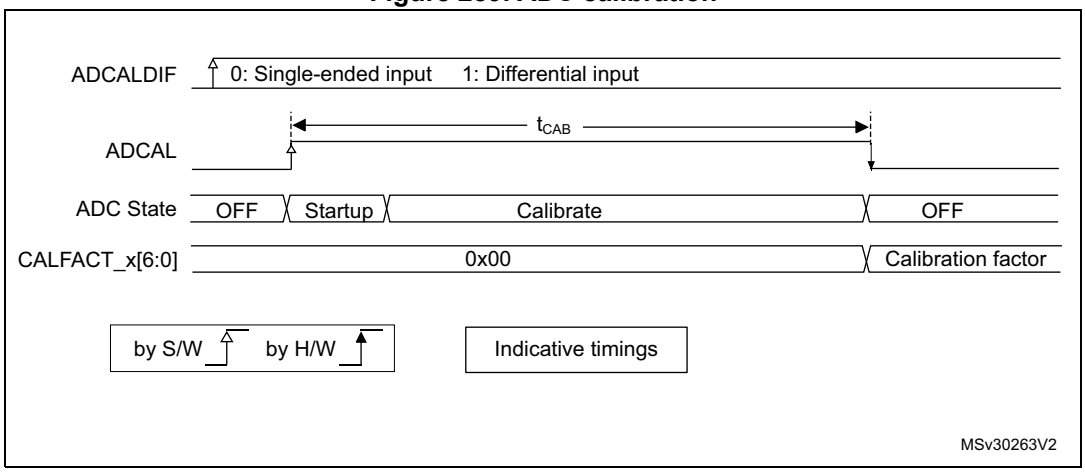
Calibration is preliminary to any ADC operation. It removes the offset error which may vary from chip to chip due to process or bandgap variation.

The calibration factor to be applied for single-ended input conversions is different from the factor to be applied for differential input conversions:

- Clear ADCALDIF before launching a calibration that is applied for single-ended input conversions.
- Set ADCALDIF before launching a calibration that is applied for differential input conversions.

The calibration is then initiated by software by setting bit ADCAL = 1. Calibration can only be initiated when the ADC is disabled (when ADEN = 0). The ADCAL bit stays at 1 during all the calibration sequence. It is then cleared by hardware as soon the calibration completes. At this time, the associated calibration factor is stored internally in the analog ADC and also in the bits CALFACT_S[6:0] or CALFACT_D[6:0] of the ADC_CALFACT register (depending on single-ended or differential input calibration)

The internal analog calibration is kept if the ADC is disabled (ADEN = 0). However, if the ADC is disabled for extended periods, then it is recommended that a new calibration cycle is run before reenabling the ADC.



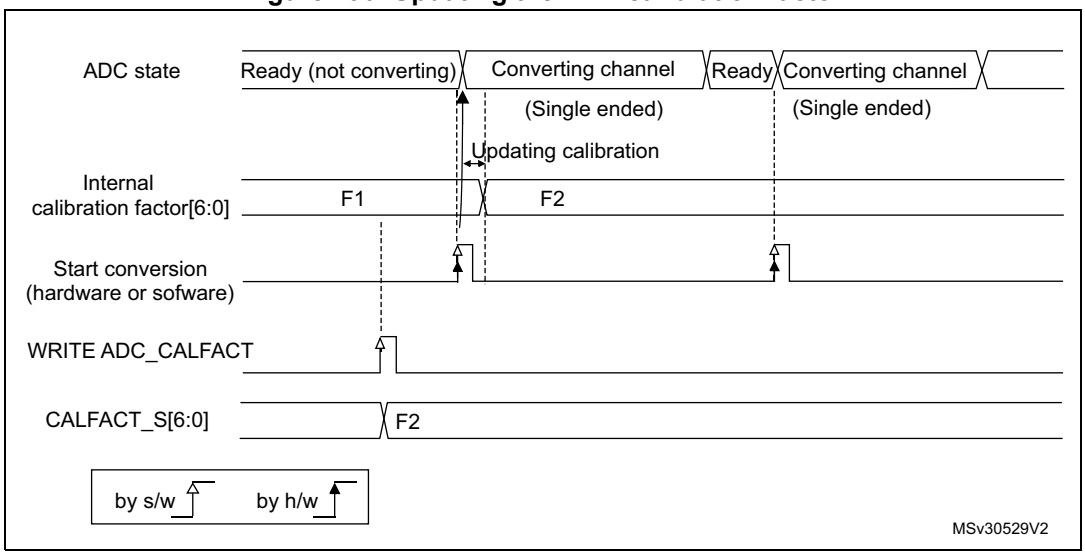
The internal analog calibration is lost each time the power of the ADC is removed (for example, when the product enters Standby). In this case, to avoid spending time recalibrating the ADC, it is possible to rewrite the calibration factor into the ADC_CALFACT register without recalibrating, supposing that the software has previously saved the calibration factor delivered during the previous calibration.

The calibration factor can be written if the ADC is enabled but not converting (ADEN = 1 and ADSTART = 0 and JADSTART = 0). Then, at the next start of conversion, the calibration factor is automatically injected into the analog ADC. This loading is transparent and does not add any cycle latency to the start of the conversion. It is recommended to recalibrate when the V_{REF+} voltage changed more than 10% (see *Section 25.4.37: Monitoring the internal voltage reference*).

Software procedure to calibrate the ADC

1. Ensure DEEPPWD = 0, ADVREGEN = 1 and that ADC voltage regulator startup time has elapsed.
2. Ensure that ADEN = 0.
3. Select the input mode for this calibration by clearing ADCALDIF (single-ended input) or by setting ADCALDIF (differential input).
4. Set ADCAL.
5. Wait until ADCAL = 0.
6. The calibration factor can be read from the ADC_CALFACT register.

Figure 289. ADC calibration

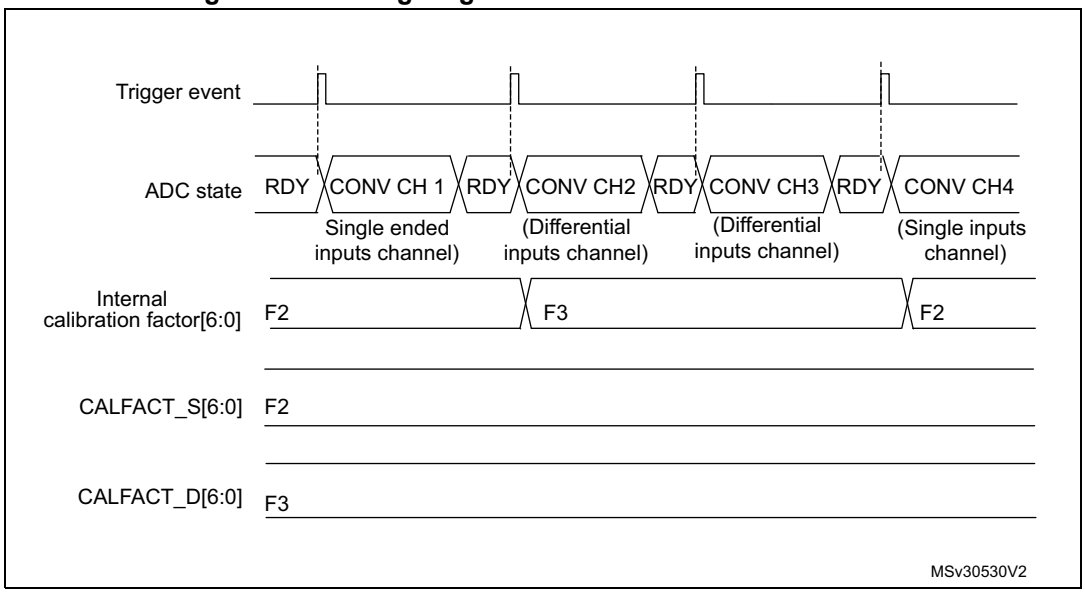


Software procedure to reinject a calibration factor into the ADC

1. Ensure ADSTART = 0 and JADSTART = 0 (no conversion is ongoing).
2. Write CALFACT_S and CALFACT_D with the new calibration factors.
3. When a conversion is launched, the calibration factor is injected into the analog ADC only if the internal analog calibration factor differs from the one stored in bits CALFACT_S for single-ended input channel or bits CALFACT_D for differential input channel.

Note: In pseudodifferential mode, only the CALFACT_D calibration factor is used.

Figure 290. Updating the ADC calibration factor



Converting single-ended and differential analog inputs with a single ADC

If the ADC is supposed to convert both differential and single-ended inputs, two calibrations must be performed, one with ADCALDIF = 0 and one with ADCALDIF = 1. The procedure is the following:

1. Disable the ADC.
2. Calibrate the ADC in single-ended input mode (with ADCALDIF = 0). This updates the register CALFACT_S[6:0].
3. Calibrate the ADC in differential input modes (with ADCALDIF = 1). This updates the register CALFACT_D[6:0].
4. Enable the ADC, configure the channels and launch the conversions. Each time there is a switch from a single-ended to a differential input channel (and vice versa), the calibration is automatically injected into the analog ADC.

Figure 291. Mixing single-ended and differential channels

Note: The offset calibration in pseudodifferential mode is controlled by the CALFACF_D register.

25.4.10 ADC on-off control (ADEN, ADDIS, ADRDY)

First, follow the procedure described in *Section 25.4.6: ADC Deep-power-down mode (DEEPPWD)*).

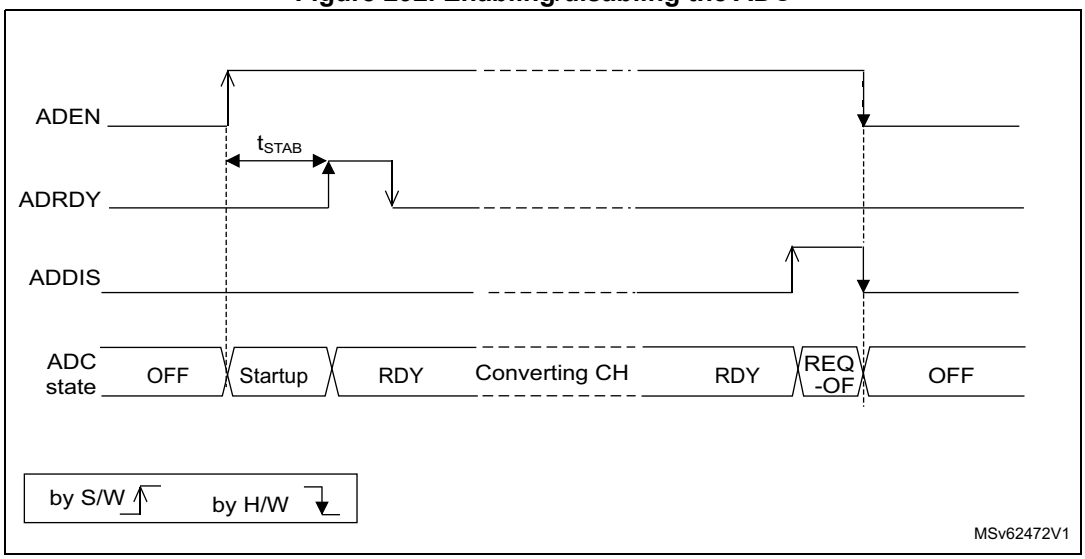
Once DEEPPWD is cleared, the ADC can be enabled. It requires a t_{STAB} stabilization time before starting converting accurately (see *Figure 292*).

Two control bits enable or disable the ADC:

- Set ADEN to enable the ADC. The ADRDY flag is set once the ADC is ready for operation.
- Set ADDIS to disable the ADC. ADEN and ADDIS are automatically deasserted by hardware as soon as the analog ADC is effectively disabled.

Regular conversions can then start either by setting ADSTART (refer to *Section 25.4.21: Conversion on external trigger and trigger polarity (EXTSEL, EXTEN, JEXTSEL, JEXTEN)*) or when an external trigger event occurs if regular triggers are enabled.

Injected conversions start by setting JADSTART or when an external injected trigger event occurs, if injected triggers are enabled.



Software procedure to enable the ADC

1. Clear the ADRDY bit in the ADC_ISR register by programming it to 1.
2. Set ADEN.
3. Wait until ADRDY = 1 (ADRDY is set after the ADC startup time). This can be done by using the associated interrupt (ADRDYIE must be set).
4. Clear the ADRDY bit in the ADC_ISR register by programming it to 1 (optional).

Software procedure to disable the ADC

1. Check that both ADSTART = 0 and JADSTART = 0 to ensure that no conversion is ongoing. If required, stop all regular and injected ongoing conversions by setting ADSTP and JADSTP. Then wait until ADSTP = 0 and JADSTP = 0.
2. Set ADDIS.
3. If required by the application, wait for ADEN = 0, until the analog ADC is effectively disabled (ADDIS is automatically reset once ADEN = 0).

Figure 292. Enabling/disabling the ADC

25.4.11 Constraints when writing the ADC control bits

The software is allowed to write the RCC control bits to configure and enable the ADC clock (refer to RCC section) and configure the ADEN bit in the ADC_CR register, only if the ADC is disabled (ADEN must be cleared).

The software can modify the PDIFF and PDIFFREF of the ADC_CFGR2 only when ADEN is cleared.

The software can write the ADSTART, JADSTART and ADDIS control bits in the ADC_CR register only if the ADC is enabled and there is no pending request to disable the ADC (ADEN must be equal to 1 and ADDIS to 0).

The following constraints apply to all the other control bits of the ADC_CFGRx, ADC_SMPRx, ADC_TRy, ADC_SQRy, ADC_JDRy, ADC_OFRy, ADC_OFCHRy and ADC_IER registers:

- For control bits related to configuration of regular conversions, the software is allowed to write them only if no regular conversions are ongoing (ADSTART must be cleared).
- For control bits related to configuration of injected conversions, the software is allowed to write them only if no injected conversions are ongoing (JADSTART must be cleared).
- ADC_TRy register thresholds can be modified when an analog-to-digital conversion is ongoing (refer to *Section 25.4.31: Analog window watchdog (AWD1EN, JAWD1EN,*

AWD1SGL, AWD1CH, AWDCH of ADC_AWD2CR and ADC_AWD3CR, HTR, LTR, AWDFILT) for details).

- To modify the all above control bits when the software trigger function is used, an ADSTP or JADSTP must be issued to make sure all activities are stopped, even if ADSTART and JADSTART are cleared.

The software is allowed to write the ADSTP or JADSTP control bits in the ADC_CR register only if the ADC is enabled and if there is no pending request to disable the ADC. In addition, the software can write the ADC_JSQR register, when injected queue are disabled by JQDIS = 1, only if JADSTART is cleared and no injected conversion is ongoing. Refer to *Section 25.6.14: ADC injected sequence register (ADC_JSQR)* for additional details.

Note: Not all forbidden write accesses to ADC control bits are protected by hardware. In some cases, the ADC state may become unknown. To recover from this situation, the ADC must be disabled (ADEN = 0 as well as all the bits of the ADC_CR register).

25.4.12 Channel selection (ADC_SQRy, ADC_JSQR)

The ADC features up to 20 multiplexed channels per ADC, out of which:

- Up to 18 analog inputs coming from GPIO pads (ADCx_INN/INP[i]). Depending on the device, not all of them are available on GPIO pads.
- The ADC is connected to up to 6 internal analog inputs:
  - internal reference voltage (V_{REFINT})
  - Internal temperature sensor (V_{SENSE})
  - V_{BAT} monitoring channel ($V_{BAT}/4$)
  - V_{DDCORE} voltage
  - DAC internal channel

  To convert one of the internal analog channels, the corresponding analog sources must first be enabled by programming VREFEN, TSEN, VBATEN in the ADCC_CCR registers, or by enabling the corresponding bit in the *ADC option register (ADC_OR)*.

Refer to *ADC interconnection* tables in *Section 25.4.2: ADC pins and internal signals* for the connection of the above internal analog inputs to ADC pins.

The conversions can be organized in two groups: regular and injected. A group consists of a sequence of conversions that can be done on any channel and in any order. For instance, it is possible to implement the conversion sequence in the following order: ADCx_INN/INP3, ADCx_INN/INP8, ADCx_INN/INP2, ADCx_INN/INP2, ADCx_INN/INP0, ADCx_INN/INP2, and ADCx_INN/INP2.

- A **regular group** is composed of up to 16 conversions. The regular channels and their order in the conversion sequence must be selected in the ADC_SQRy registers. The total number of conversions in the regular group must be written in the LEN[3:0] bits in the ADC_SQR1 register.
- An **injected group** is composed of up to four conversions. The injected channels and their order in the conversion sequence must be selected in the ADC_JSQR register. The total number of conversions in the injected group must be written in the JLEN[1:0] bits in the ADC_JSQR register.

ADC_SQRy registers must not be modified while a regular conversion is ongoing. ADC regular conversions must consequently be stopped by setting ADSTP (refer to *Section 25.4.20: Stopping an ongoing conversion (ADSTP, JADSTP)*).

In addition, the ADC_JSQR register must not be modified while an injected conversion is ongoing. ADC injected conversions must consequently be stopped by setting JADSTP, except when JQDIS is cleared.

25.4.13 Channel preselection register (ADC_PCSEL)

The PCSEL bit of the ADC_PCSEL register controls the analog switch integrated in the I/O.

For each channel selected through SQRx or JSQRx bits, the corresponding PCSEL bit must be configured in advance in the ADC_PCSEL register. The ADC input multiplexer selects the ADC input according to SQRx and JSQRx configuration with very high speed. The analog switch integrated in the I/O cannot react as fast as the ADC multiplexer. To avoid the delay due to the analog switch control on the I/O, it is necessary to preselect the input channels that are selected through the SQRx and JSQRx. The selection is based on the V_{INP} of each ADC input. For example, if the ADC converts ADCx_INN/INP1, PCSEL1 bit must also be set in ADC_PCSEL register. If ADCx_INN/INP1 is configured as a differential channel, both PCSEL1 and PCSEL0 must be set, which corresponds to ADC1_INN1 and ADC2_INN1.

Note: Configuring the PCSEL bit is not necessary for the internal channels (such as V_{REFINT}).

25.4.14 Channel-wise programmable sampling time (SMPR1, SMPR2)

Before starting a conversion, the ADC must establish a direct connection between the voltage source under measurement and the embedded sampling capacitor of the ADC. This sampling time must be sufficient for the input voltage source to charge the embedded capacitor to the input voltage level.

Each channel can be sampled with a different sampling time, which is programmable through the SMP[2:0] bits of the ADC_SMPR1 and ADC_SMPR2 registers. It is therefore possible to select among the following sampling time values:

- SMP = 000: 2.5 ADC clock cycles
- SMP = 001: 4.5 ADC clock cycles
- SMP = 010: 7.5 ADC clock cycles
- SMP = 011: 12.5 ADC clock cycles
- SMP = 100: 24.5 ADC clock cycles
- SMP = 101: 47.5 ADC clock cycles
- SMP = 110: 256.5 ADC clock cycles
- SMP = 111: 848.5 ADC clock cycles

The total conversion time is calculated as follows (12-bit mode):

$$T_{CONV} = \text{Sampling time} + 13 \text{ ADC clock cycles}$$

Example

With $F_{adc_ker_ck}$ = 32 MHz and a sampling time of 3 ADC clock cycles:

$$T_{CONV} = (3 + 13) \times \text{ADC clock cycles} = 16 \text{ ADC clock cycles} = 500 \text{ ns}$$

The ADC notifies the end of the sampling phase by asserting the EOSMP flag (only for regular conversion).

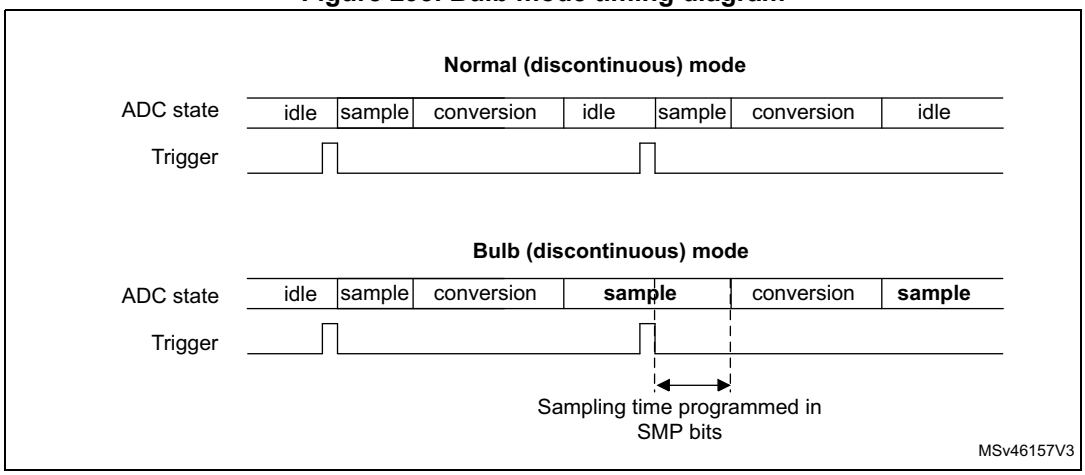
Constraints on the sampling time

For each channel, SMP[2:0] bits must be programmed to respect a minimum and a maximum sampling times as specified in the ADC characteristics section of the datasheets.

Bulb sampling mode

The bulb sampling mode enables to obtain longer sampling time.

When the BULB bit is set in the ADC_CFGR2 register, the sampling period starts immediately after the last ADC conversion. A hardware or software trigger starts the conversion after the sampling time has been programmed in ADC_SMPRx registers. The very first ADC conversion after the ADC is enabled, is performed with the sampling time programmed in SMP bits. The bulb mode is effective starting from the second conversion.



The maximum sampling time is limited (refer to the ADC characteristics section of the datasheet).

Bulb mode is supported exclusively in regular conversion; dual mode is not supported.

The BULB bit can be modified only when the ADEN bit of the ADC_CR register is cleared.

When the BULB bit is set, it is not allowed to set the SMPTRIG bit in ADC_CFGR2.

Figure 293. Bulb mode timing diagram

Sampling time control trigger mode

When the SMPTRIG bit is set, the sampling time programmed through SMPx bits is not applicable. The sampling time is controlled by the trigger signal edge.

When a hardware trigger is selected (EXTEN[1:0] = 01), each rising edge of the trigger signal starts the sampling period. A falling edge ends the sampling period and starts the conversion.

Due to the synchronization mechanism, the minimum allowed pulse width is seven adc_ker_ck periods.

When a software trigger is selected (EXTEN[1:0] = 00), the software trigger is not the ADSTART bit of ADC_CR but the SWTRIG bit. The SWTRIG bit has to be set to start the sampling period, and it has to be cleared to end the sampling period and start the conversion. In this mode, the minimum sampling time is limited to seven ADC clock cycles.

The maximum sampling time is limited (refer to the ADC characteristics section of the datasheet).

This mode is only compatible with the discontinuous mode. DISCNUM must be cleared for regular conversion mode. It is not supported for injected conversion mode and autoinjection mode.

When the SMPTRIG bit is set, setting the BULB bit is not allowed and only regular conversion is supported.

The sampling time control trigger mode is not compatible with the following dual modes: DUAL[4:0] = 0b00010, 0b00011, 0b00101, 0b00110, 0b00111, and 0b01001.

I/O analog switch voltage booster

The resistance of the I/O analog switches increases when V_{DDA} voltage is too low. The sampling time must consequently be adapted accordingly (refer to the device datasheet for the corresponding electrical characteristics). This resistance can be minimized at low V_{DDA} voltage by enabling an internal voltage booster through the BOOSTEN or BOOSTVDDSEL bit of the SBS_PMCR register.

25.4.15 Single conversion mode

To enable the single conversion mode for regular channels, clear both CONT and DISCEN bits in ADC_CFGR1 register. To enable it on injected channel, clear JDISCEN bit.

In single conversion mode, the ADC performs once all the regular conversions of the programmed channels. This mode is started by one of the following events:

- ADSTART bit set in the ADC_CR register (for a regular channel)
- JADSTART bit set in the ADC_CR register (for an injected channel)
- An external hardware trigger event (for a regular or injected channel)

Inside the regular sequence, after each conversion is complete:

- The converted data are stored into the 32-bit 8-level FIFO accessible through the ADC_DR register,
- The EOC (end of regular conversion) flag is set, and
- An interrupt is generated if the EOCIE bit is set.

Inside the injected sequence, after each conversion is complete:

- The converted data are stored into one of the four 32-bit ADC_JDRy registers,
- The JEOC (end of injected conversion) flag is set, and
- An interrupt is generated if the JEOCIE bit is set.

After the regular sequence is complete:

- The EOS (end of regular sequence) flag is set, and
- An interrupt is generated if the EOSIE bit is set.

After the injected sequence is complete:

- The JEOS (end of injected sequence) flag is set, and
- An interrupt is generated if the JEOSIE bit is set.

The ADC then stops until a new external regular or injected trigger occurs or until the ADSTART or JADSTART bit is set again.

Note: To convert a single channel, program a sequence with a length of 1.

25.4.16 Continuous conversion mode (CONT = 1)

This mode applies to regular channels only.

In continuous conversion mode, when a software or hardware regular trigger event occurs, the ADC performs once all the regular conversions of the channels and then automatically restarts and continuously converts all the conversions of the sequence. This mode is started by setting the CONT bit of the ADC_CFGR1 register, either by an external trigger or by setting the ADSTART bit in the ADC_CR register.

Inside the regular sequence, after each conversion is complete:

- The converted data are stored into the eight 32-bit word FIFO accessible through the ADC_DR register.
- The EOC (end of conversion) flag is set, and
- An interrupt is generated if the EOCIE bit is set.

After the sequence of conversions is complete:

- The EOS (end of sequence) flag is set, and
- An interrupt is generated if the EOSIE bit is set.

Then, a new sequence restarts immediately and the ADC continuously repeats the conversion sequence.

Note: To convert a single channel, program a sequence with a length of 1.

It is not possible to have both discontinuous mode and continuous mode enabled, this means that it is forbidden to set both DISCEN and CONT bits.

Injected channels cannot be converted continuously. The only exception is when an injected channel is configured to be converted automatically after regular channels in continuous mode (using JAUTO bit) (refer to Section : Autoinjection mode).

25.4.17 Discontinuous mode (DISCEN, DISCNUM, JDISCEN)

Regular group mode

This mode is enabled by setting the DISCEN and CONT = 0 bit in the ADC_CFGR1 register.

It is used to convert a short sequence (subgroup) of n conversions (n ≤ 8) that is part of the sequence of conversions selected in the ADC_SQRy registers. The value of n is specified by writing to the DISCNUM[2:0] bits in the ADC_CFGR1 register.

When an external trigger occurs, it starts the next n conversions selected in the ADC_SQRy registers until all the conversions in the sequence are done. The total sequence length is defined by the LEN[3:0] bits in the ADC_SQR1 register.

Example:

- DISCEN = 1, n = 3, channels to be converted = 1, 2, 3, 6, 7, 8, 9, 10, 11
  - First trigger: channels converted are 1, 2, 3 (an EOC event is generated at the end of each conversion).
  - Second trigger: channels converted are 6, 7, 8 (an EOC event is generated at the end of each conversion).
  - Third trigger: channels converted are 9, 10, 11 (an EOC event is generated at the end of each conversion) and an EOS event is generated after the conversion of channel 11.

  - Fourth trigger: channels converted are 1, 2, 3 (an EOC event is generated at the end of each conversion).
  - ...
- DISCEN = 0, channels to be converted = 1, 2, 3, 6, 7, 8, 9, 10,11
  - First trigger: the complete sequence is converted: channel 1, then 2, 3, 6, 7, 8, 9, 10 and 11. Each conversion generates an EOC event and the last one also generates an EOS event.
  - All the next trigger events relaunch the complete sequence.

Note: The channel numbers referred to in the above example might not be available on all devices.

When a regular group is converted in discontinuous mode, no rollover occurs (the last subgroup of the sequence can have less than n conversions).

When all subgroups are converted, the next trigger starts the conversion of the first subgroup. In the example above, the fourth trigger reconverts the channels 1, 2 and 3 in the first subgroup.

It is not possible to have both discontinuous mode and continuous mode enabled. In this case (if DISCEN = 1, CONT = 1), the ADC behaves as if continuous mode was disabled.

Injected group mode

This mode is enabled by setting the JDISCEN bit in the ADC_CFGR1 register. It converts the sequence selected in the ADC_JSQR register, channel by channel, after an external injected trigger event. This is equivalent to discontinuous mode for regular channels with DISCNUM = 0.

When an external trigger occurs, it starts the next channel conversions selected in the ADC_JSQR registers until all the conversions in the sequence are done. The total sequence length is defined by the JLEN[1:0] bits in the ADC_JSQR register.

Example:

- JDISCEN = 1, channels to be converted = 1, 2, 3
  - First trigger: channel 1 converted (a JEOC event is generated)
  - Second trigger: channel 2 converted (a JEOC event is generated)
  - Third trigger: channel 3 converted and a JEOC event + a JEOS event are generated
  - ...

Note: The channel numbers referred to in the above example might not be available on all devices.

When all injected channels have been converted, the next trigger starts the conversion of the first injected channel. In the example above, the fourth trigger reconverts the first injected channel 1.

It is not possible to use both autoinjection mode and discontinuous mode simultaneously: the bits DISCEN and JDISCEN must be kept cleared by software when JAUTO is set.

25.4.18 Starting conversions (ADSTART, JADSTART)

ADC regular conversions can be started by setting ADSTART.

When ADSTART is set, the conversion starts:

- Immediately if EXTEN[1:0] = 00 (software trigger), or
- At the next active edge of the selected regular hardware trigger, if EXTEN[1:0] is not equal to 00.

The application software starts ADC injected conversions by setting JADSTART.

When JADSTART is set, the conversion starts:

- Immediately if JEXTEN[1:0] = 00 (software trigger), or
- At the next active edge of the selected injected hardware trigger, if JEXTEN[1:0] is not equal to 00.

Note: In autoinjection mode (JAUTO = 1), use the ADSTART bit to start regular conversions followed by autoinjected conversions (JADSTART must be kept cleared).

When the hardware trigger is enabled, ADSTART and JADSTART also indicate whether an ADC operation is ongoing. The ADC can be reconfigured while ADSTART and JADSTART are both cleared, indicating that the ADC is idle.

In the case of software triggering, ADSTP and/or JADSTP must be set before ADC reconfiguration.

ADSTART is deasserted by hardware:

- In single mode with software regular trigger (CONT = 0, EXTEN = 0x0): at any end of regular conversion sequence (EOS assertion)
- In discontinuous mode (CONT = 0, DISCEN = 1, DISCNUM= x): at any of subgroup sequence
- In all cases (CONT and EXTEN don’t care), after execution of the ADSTP procedure asserted by the software

Note: In continuous mode (CONT = 1), ADSTART is not deasserted by hardware when EOS is asserted because the sequence is automatically relaunched.

When a hardware trigger is selected in single mode (CONT = 0 and EXTEN ≠ 0x00), ADSTART is not deasserted by hardware when EOS is asserted to help the software that does not need to reset ADSTART again for the next hardware trigger event. This ensures that no further hardware triggers are missed.

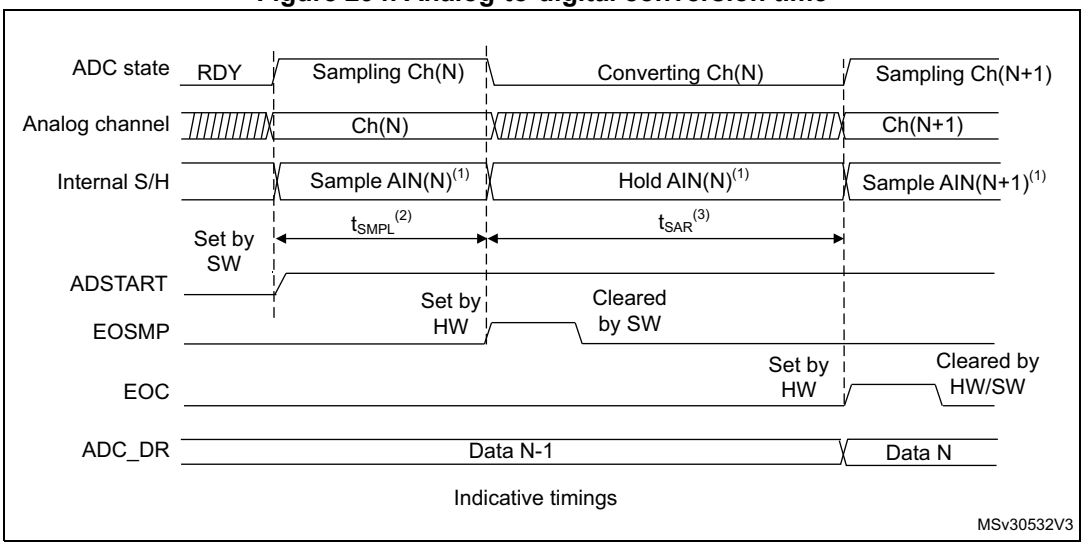
JADSTART is deasserted by hardware:

- In single mode with software injected trigger (JEXTEN = 0x0): at the end of each injected conversion sequence (JEOS assertion)
- In discontinuous mode (JDISCEN = 1): at the end of any conversion
- In all cases (JEXTEN=x), after execution of the JADSTP procedure asserted by the software

Note: When the software trigger is selected, the ADSTART bit must not be set if the EOC flag is still high.

In bulb mode (BULB = 1), the previous end-of-conversion automatically starts the sampling, then setting ADSTART starts the conversion including the programmed sampling time.

In sampling time control trigger mode (SMPTRIG = 1), SWTRIG bit must be set to start the conversion.



25.4.19 Timing

The elapsed time between the start of a conversion and the end of a conversion is the sum of the configured sampling time plus the successive approximation time depending on data resolution:

$T_{CONV} = T_{SMPL} + T_{SAR} = [3\ _{|min} + 13\ _{|12bit}] \times T_{ADC_CLK}$

$T_{CONV} = T_{SMPL} + T_{SAR} = 93.75\ ns\ _{|min} + 406.25\ ns\ _{|12bit} = 500\ ns$ (for $F_{adc_ker_ck} = 32$ MHz)

Figure 294. Analog-to-digital conversion time

1. AIN represents the input voltage captured by the internal Sample and Hold (S/H) capacitor.
2. t_{SMPL} depends on SMP[2:0].
3. t_{SAR} depends on RES[2:0].

Note: The bulb and the sampling time control trigger modes are not described in Figure 294: Analog-to-digital conversion time.

25.4.20 Stopping an ongoing conversion (ADSTP, JADSTP)

The software can decide to stop ongoing regular conversions by setting ADSTP and ongoing injected conversions by setting JADSTP.

Stopping conversions resets the ongoing ADC operation. The ADC can then be reconfigured (for example by changing the channel selection or the trigger). It is then ready for a new operation.

Injected conversions can be stopped while regular conversions are still ongoing and vice versa. This allows, for instance, the reconfiguration of the injected conversion sequence and triggers while regular conversions are still ongoing (and vice versa).

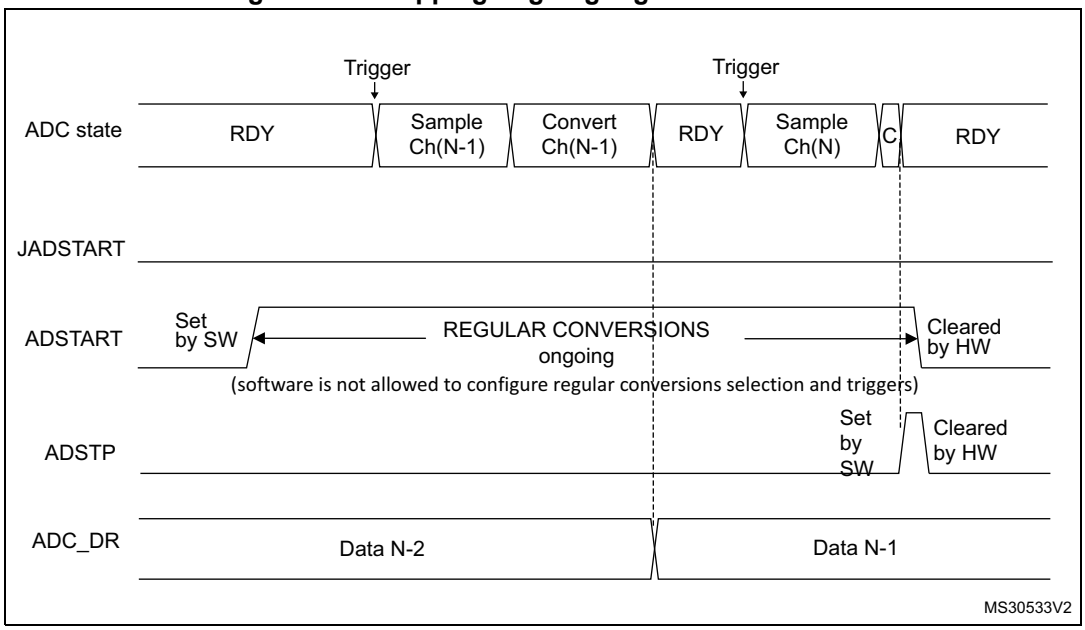
When the ADSTP bit is set by software, any ongoing regular conversion is aborted with the partial result discarded (the ADC_DR register is not updated with the current conversion).

When the JADSTP bit is set by software, any ongoing injected conversion is aborted with partial result discarded (the ADC_JDRy register is not updated with the current conversion). The scan sequence is also aborted and reset (meaning that relaunching the ADC restarts a new sequence).

Once this procedure is complete, ADSTP/ADSTART bits (for regular conversion), or JADSTP/JADSTART bits (for injected conversion) are deasserted by hardware and the software must poll ADSTART (or JADSTART) until the bit is reset before assuming the ADC is completely stopped.

Note: In autoinjection mode (JAUTO = 1), setting the ADSTP bit aborts both regular and injected conversions (JADSTP must not be used).

Figure 295. Stopping ongoing regular conversions



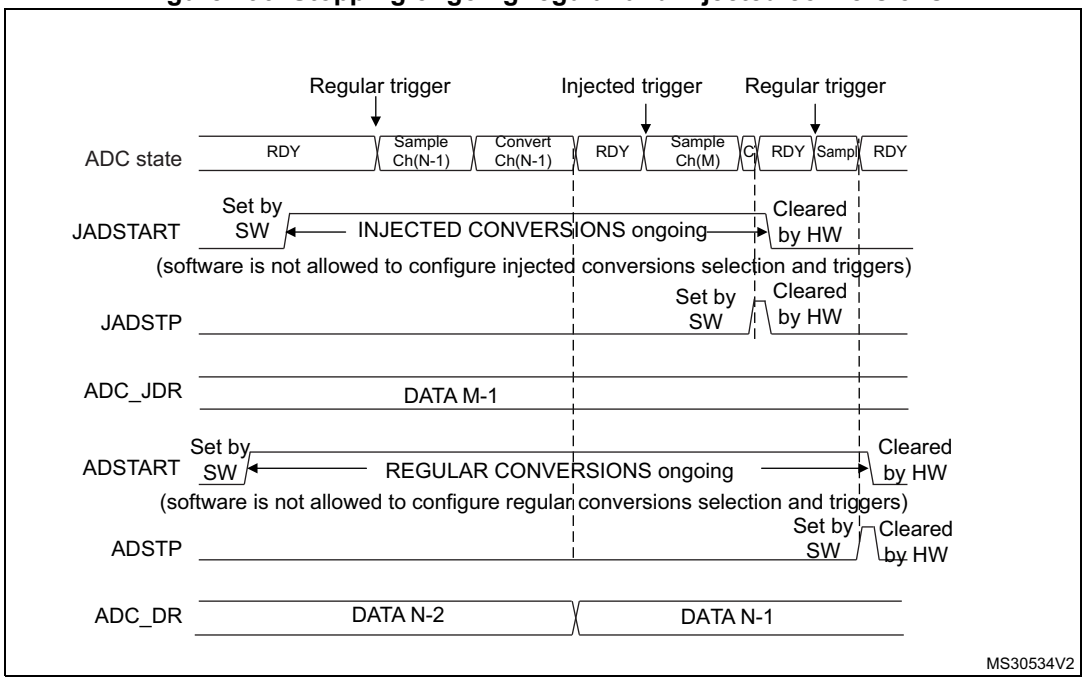


Figure 296. Stopping ongoing regular and injected conversions

25.4.21 Conversion on external trigger and trigger polarity (EXTSEL, EXTEN, JEXTSEL, JEXTEN)

A conversion or a sequence of conversions can be triggered either by software or by an external event (for example timer capture, input pins). If the EXTEN[1:0] control bits (for a regular conversion) or JEXTEN[1:0] bits (for an injected conversion) are different from 0b00, then external events are able to trigger a conversion with the selected polarity.

The regular trigger selection is effective once the software has set ADSTART while the injected trigger selection is effective once the software has set JADSTART bit.

All hardware triggers that occur while a conversion is ongoing are ignored:

- If ADSTART = 0, regular hardware triggers are ignored.
- If JADSTART = 0, injected hardware triggers are ignored.

Table 242 provides the correspondence between the EXTEN[1:0] and JEXTEN[1:0] values and the trigger polarity.

Table 242. Configuring the trigger polarity for regular external triggers

EXTEN[1:0]	Source
00	Hardware trigger detection disabled, software trigger detection enabled
01	Hardware trigger with detection on the rising edge (sampling time controlled in SMPTRIG mode)
10	Hardware trigger with detection on the falling edge
11	Hardware trigger with detection on both the rising and falling edges

Note: The polarity of the regular trigger cannot be changed on-the-fly.

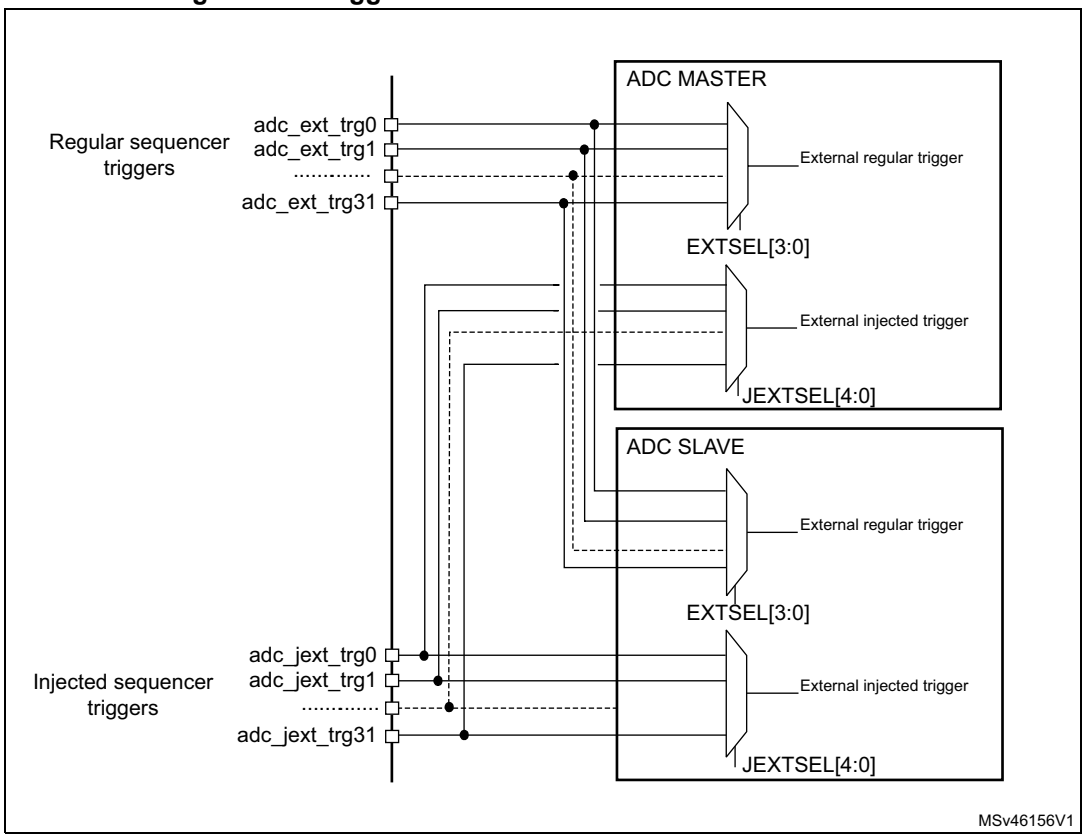

Table 243. Configuring the trigger polarity for injected external triggers

JEXTEN[1:0]	Source
00	Hardware Trigger detection disabled, software trigger detection enabled
01	Hardware Trigger with detection on the rising edge
10	Hardware Trigger with detection on the falling edge
11	Hardware Trigger with detection on both the rising and falling edges

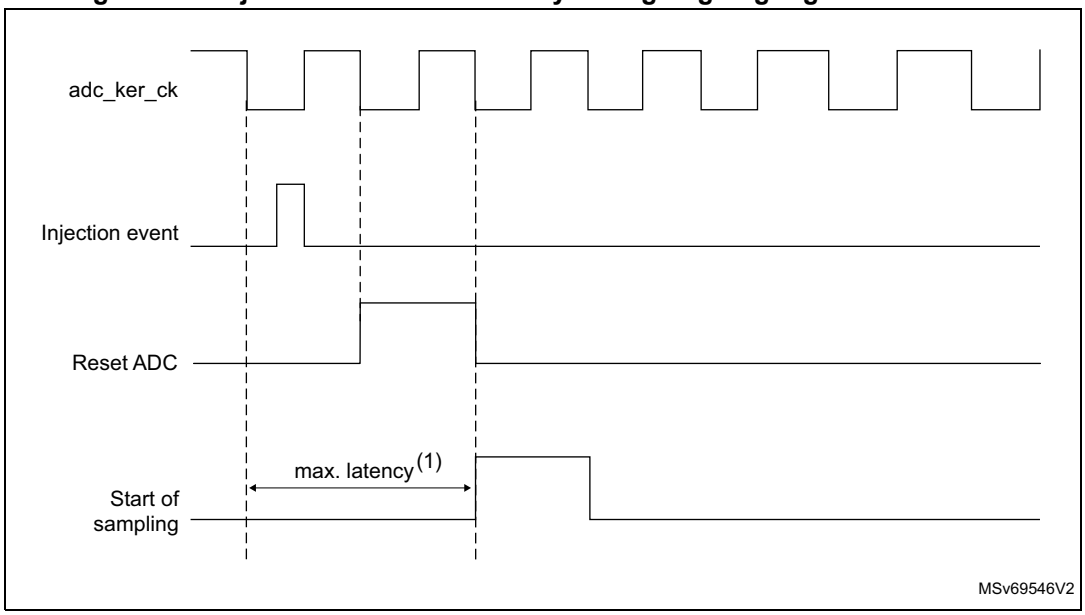
The EXTSEL and JEXTSEL control bits select which, out of 32 possible events, can trigger the conversion of the regular and injected groups.

A regular group conversion can be interrupted by an injected trigger.

Figure 297. Triggers shared between ADC master and slave

Refer to *ADC interconnection* tables in *Section 25.4.2: ADC pins and internal signals* for the list of the external triggers.

25.4.22 Injected channel management



Triggered injection mode

To use triggered injection, the JAUTO bit in the ADC_CFGR1 register must be cleared.

1. Start the conversion of a group of regular channels either by an external trigger or by setting the ADSTART bit in the ADC_CR register.
2. If an external injected trigger occurs, or if the JADSTART bit in the ADC_CR register is set during the conversion of a regular group of channels, the current conversion is reset and the injected channel sequence switches are launched (all the injected channels are converted once if JDISCEN = 0).
3. Then, the regular conversion of the regular group of channels is resumed from the last interrupted regular conversion.
4. If a regular event occurs during an injected conversion, the injected conversion is not interrupted but the regular sequence is executed at the end of the injected sequence. *Figure 298* shows the corresponding timing diagram.

Note: When using triggered injection, one must ensure that the interval between trigger events is longer than the injection sequence.

Figure 298. Injected conversion latency during ongoing regular conversion

1. The maximum latency value can be found in the electrical characteristics of the device datasheet.

Autoinjection mode

If the JAUTO bit in the ADC_CFGR1 register is set, then the channels in the injected group are automatically converted after the regular group of channels. This can be used to convert a sequence of up to 20 conversions programmed in the ADC_SQRy and ADC_JSQR registers.

In this mode, the ADSTART bit in the ADC_CR register must be set to start regular conversions, followed by injected conversions (JADSTART must be kept cleared). Setting the ADSTP bit aborts both regular and injected conversions (JADSTP bit must not be used).

In this mode, external trigger on injected channels must be disabled.

Note: Autoinjection mode is compatible with discontinuous mode.

25.4.23 Queue of context for injected conversions

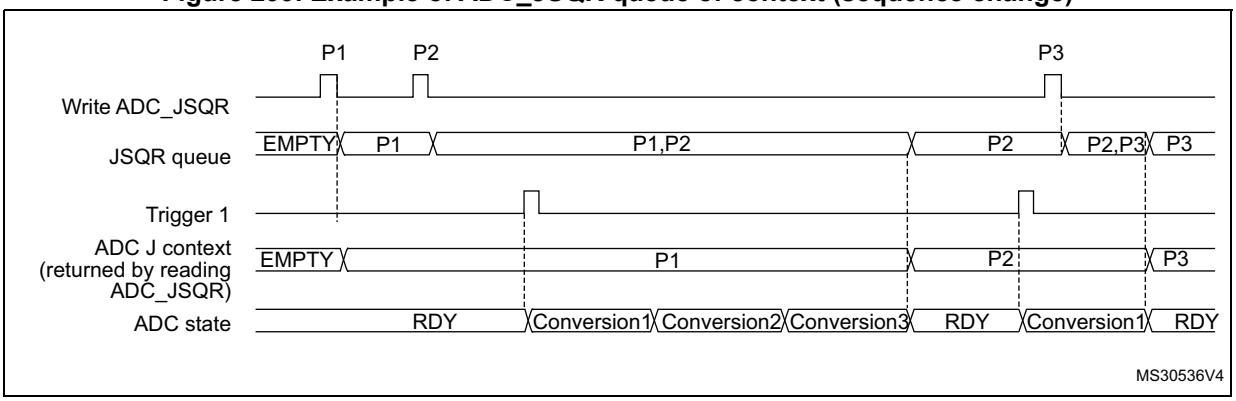
A queue of context is implemented to anticipate up to two contexts for the next injected sequence of conversions. JQDIS bit of the ADC_CFGR1 register must be reset to enable this feature. Only hardware-triggered conversions are possible when the context queue is enabled. The queue of context is not supported in dual modes or in auto delay mode.

This context consists of:

- Configuration of the injected triggers (bits JEXTEN[1:0] and JEXTSEL bits in the ADC_JSQR register)
- Definition of the injected sequence (bits JSQx[4:0] and JLEN[1:0] in the ADC_JSQR register)

All the parameters of the context are defined in a single register ADC_JSQR and this register implements a queue of two buffers, allowing the bufferization of up to two sets of parameters:

- The ADC_JSQR register can be written at any moment even when injected conversions are ongoing.
- Each data written to the ADC_JSQR register is stored into the queue of context.
- At the beginning, the queue is empty and the first write access to the ADC_JSQR register defines the first context and the ADC is ready to receive injected triggers if JADSTART = 1.
- Once an injected sequence is complete, the queue is consumed and the context changes according to the next ADC_JSQR parameters stored in the queue. This new context is applied for the next injected sequence of conversions.
- A queue overflow occurs when writing to the ADC_JSQR register while the queue is full. This overflow is signaled by the assertion of the flag JQOVF. When an overflow occurs, the write access of ADC_JSQR register which has created the overflow is ignored and the queue of context is unchanged. An interrupt can be generated if bit JQOVFIE is set.
- Two behaviors are possible when the queue becomes empty, depending on the value of the JQM control bit of the ADC_CFGR1 register:
  - If JQM = 0, the queue is empty just after enabling the ADC, but then it can never be empty during run operations: the queue always maintains the last active.
  - If JQM = 1, the queue becomes empty when end of injected sequence of last context occurs or if the queue is flushed by JADSTP = 1. When this occurs, there is no more context in the queue and software needs to write new injected context in the ADC_JSQR register.
- Reading the ADC_JSQR register returns the current the ADC_JSQR context which is active at that moment. If JQM = 0, when the ADC_JSQR context is empty, the JSQi is read as 0x00.
- The queue is flushed when stopping injected conversions by setting JADSTP or when disabling the ADC by setting ADDIS:
  - If JQM = 0, the queue is flushed, but the last active context is maintained (ADC_JSQR register kept last value).
  - If JQM = 1, the queue becomes empty.



Note: When discontinuous mode (bit JDISCEN = 1) is configured, only JEOS, which marks the end of injected sequence, triggers the transfer of the queue to the active context (JSQR register). See example below (length = 3 for both contexts):

- *First trigger, discontinuous. Sequence 1: context 1, first conversion carried out.*
- *Second trigger, discontinuous. Sequence 1: context 1, second conversion carried out.*
- *Third trigger, discontinuous. Sequence 1: context 1, third conversion carried out. Then context change occurs to context 2.*
- *Fourth trigger, discontinuous. Sequence 2: context 2, first conversion carried out.*
- *Fifth trigger, discontinuous. Sequence 2: context 2, second conversion carried out.*
- *Sixth trigger, discontinuous. Sequence 2: context 2, third conversion carried out. Then context change occurs to next context.*

Behavior when changing the trigger or sequence context

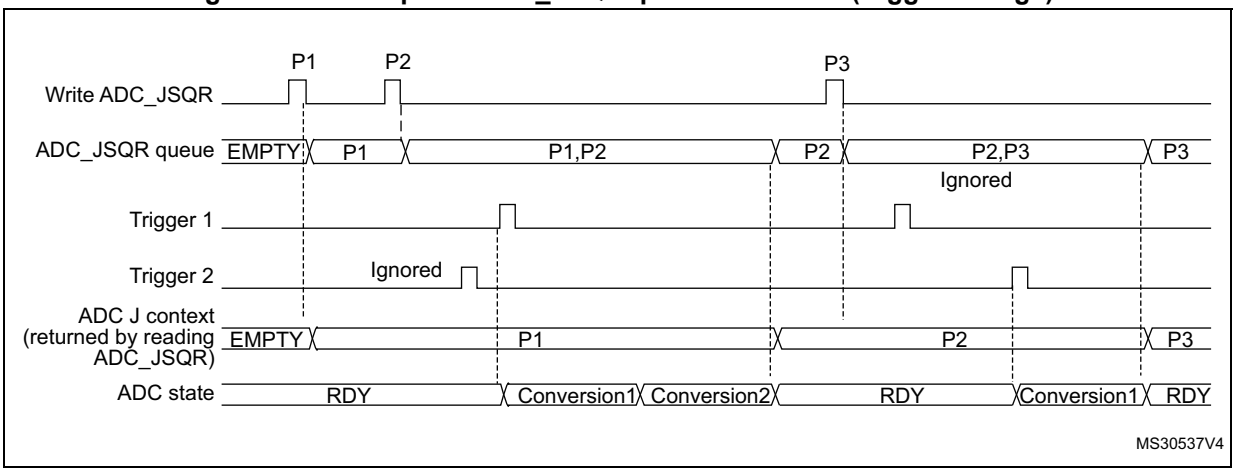


Figure 299 and *Figure 300* show the behavior of the context queue when changing the sequence or the triggers.

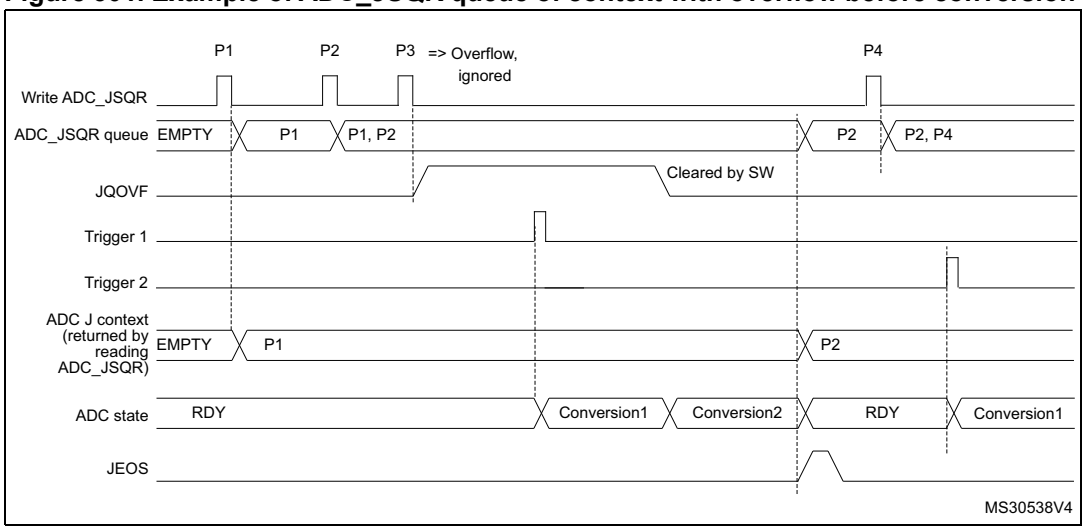
Figure 299. Example of ADC_JSQR queue of context (sequence change)

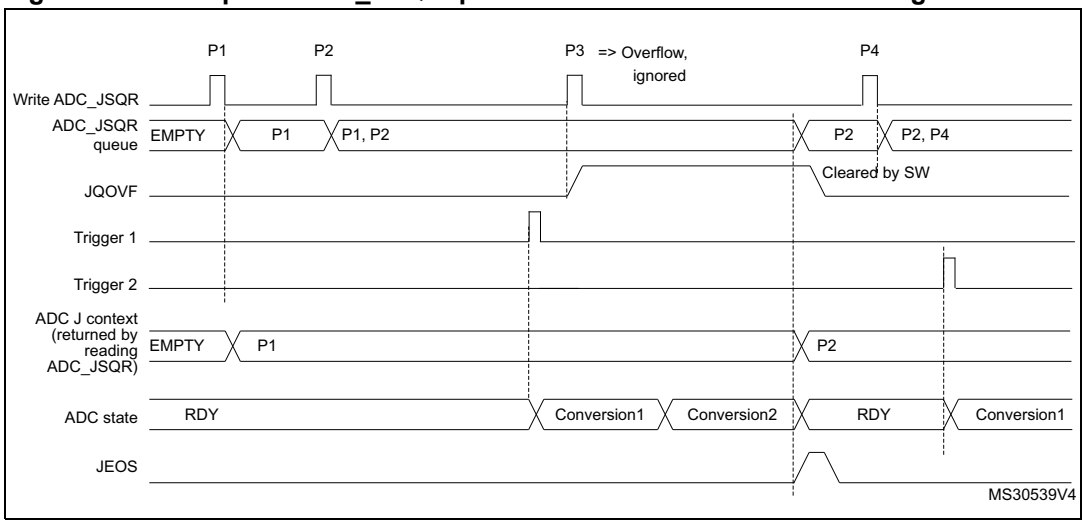
1. Parameters:
   P1: sequence of 3 conversions, hardware trigger 1
   P2: sequence of 1 conversion, hardware trigger 1
   P3: sequence of 4 conversions, hardware trigger 1

Figure 300. Example of ADC_JSQR queue of context (trigger change)



1. Parameters:
   P1: sequence of 2 conversions, hardware trigger 1
   P2: sequence of 1 conversion, hardware trigger 2
   P3: sequence of 4 conversions, hardware trigger 1

Queue of context: Behavior when a queue overflow occurs



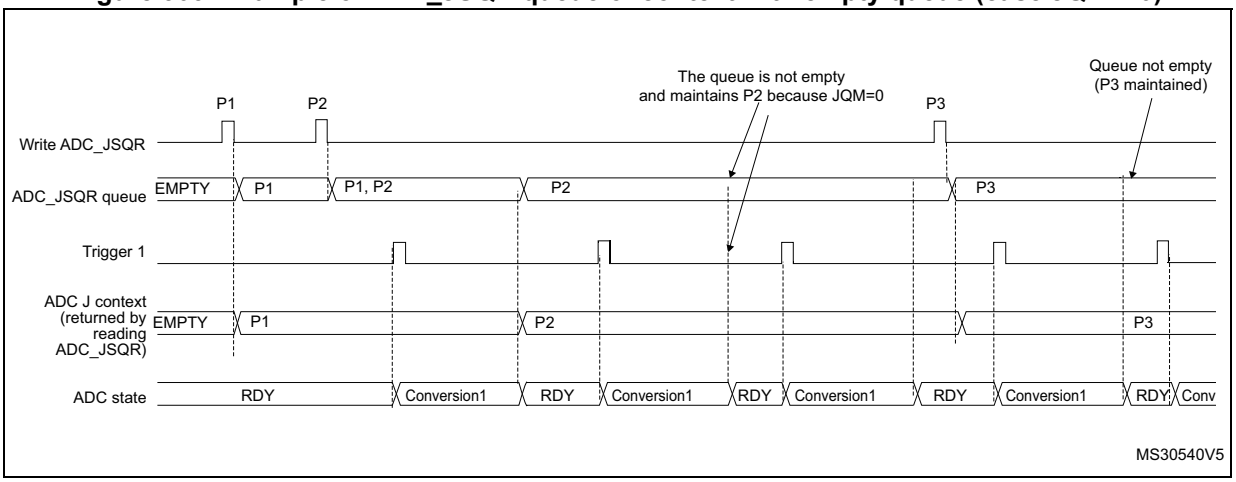
The *Figure 301* and *Figure 302* show the behavior of the context queue if an overflow occurs before or during a conversion.

Figure 301. Example of ADC_JSQR queue of context with overflow before conversion

1. Parameters:
   P1: sequence of 2 conversions, hardware trigger 1
   P2: sequence of 1 conversion, hardware trigger 2
   P3: sequence of 3 conversions, hardware trigger 1
   P4: sequence of 4 conversions, hardware trigger 1

Figure 302. Example of ADC_JSQR queue of context with overflow during conversion

1. Parameters:
   P1: sequence of 2 conversions, hardware trigger 1
   P2: sequence of 1 conversion, hardware trigger 2
   P3: sequence of 3 conversions, hardware trigger 1
   P4: sequence of 4 conversions, hardware trigger 1



It is recommended to manage the queue overflows as described below:

- After each P context write to the ADC_JSQR register, the JQOVF flag shows if the write has been ignored or not (an interrupt can be generated).
- Avoid queue overflows by writing the third context (P3) only once the flag JEOS of P1 is generated, then the previous context P2 has been set. This ensures that the previous context has been consumed and that the queue is not full.

Queue of context: Behavior when the queue becomes empty

Figure 303 and *Figure 304* show the behavior of the context queue when the queue becomes empty in both cases JQM = 0 or 1.

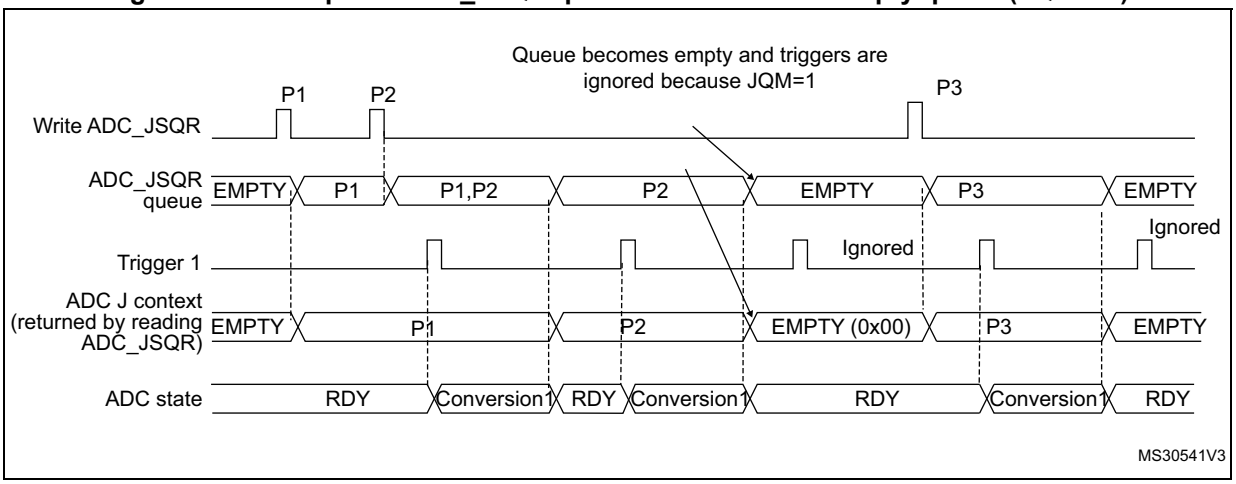


Figure 303. Example of ADC_JSQR queue of context with empty queue (case JQM = 0)

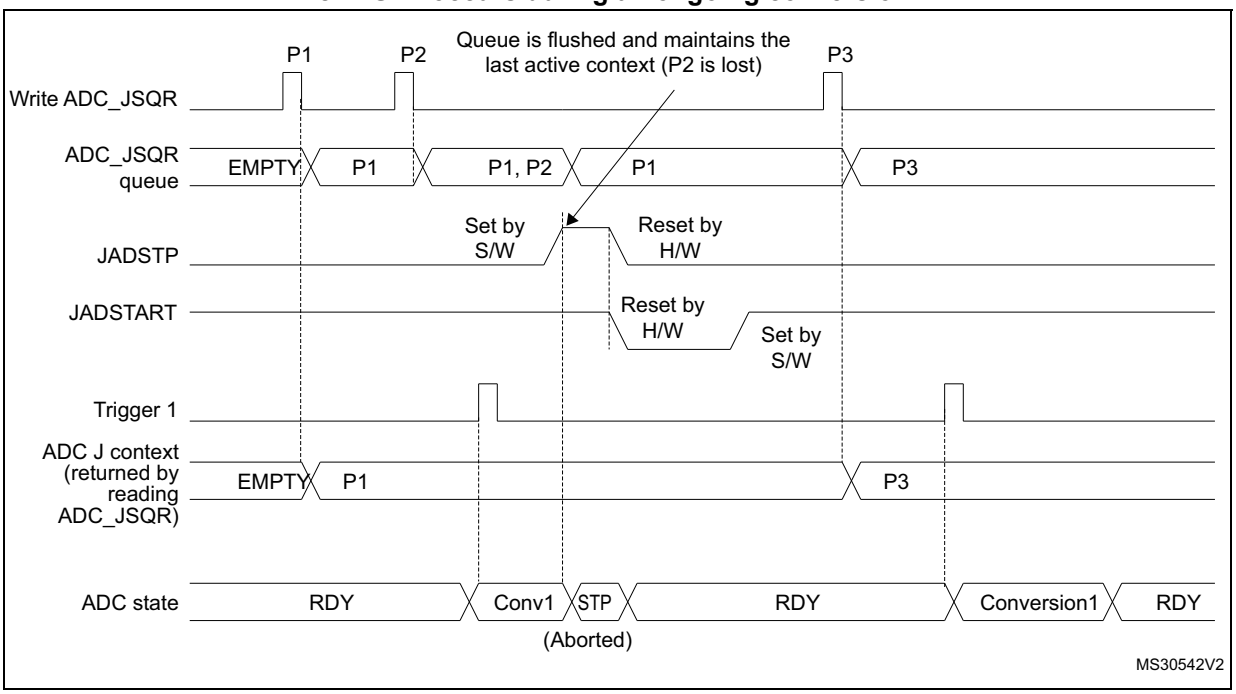
1. Parameters:
   P1: sequence of 1 conversion, hardware trigger 1
   P2: sequence of 1 conversion, hardware trigger 1
   P3: sequence of 1 conversion, hardware trigger 1

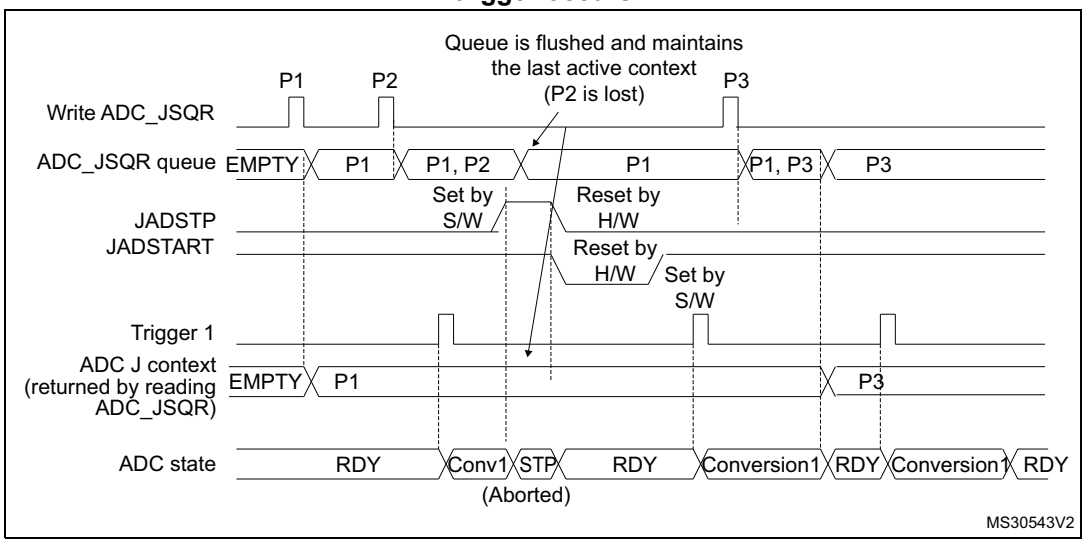
Note: When writing P3, the context changes immediately as the context of P2 is already converted (JEOS is generated). However, because of internal resynchronization, there is a latency and if a trigger occurs just after or before writing P3, it can happen that the conversion is launched considering the context P2. To avoid this situation, the user must ensure that there is no ADC trigger happening when writing a new context that applies immediately. It is recommended to program the new context before the JEOS timing, otherwise the previous context is used.

Figure 304. Example of ADC_JSQR queue of context with empty queue (JQM = 1)



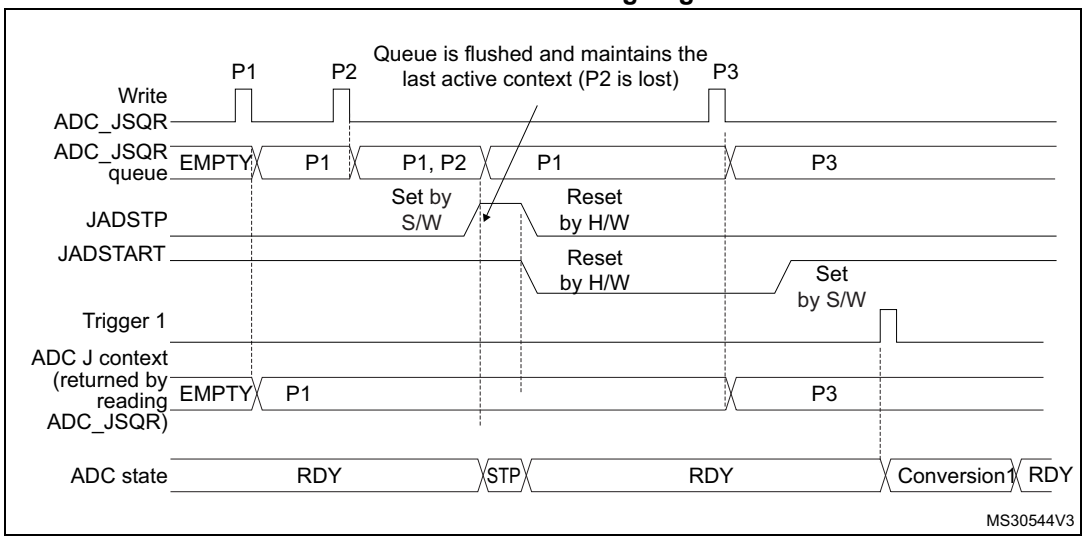
1. Parameters:
   P1: sequence of 1 conversion, hardware trigger 1
   P2: sequence of 1 conversion, hardware trigger 1
   P3: sequence of 1 conversion, hardware trigger 1

Flushing the queue of context



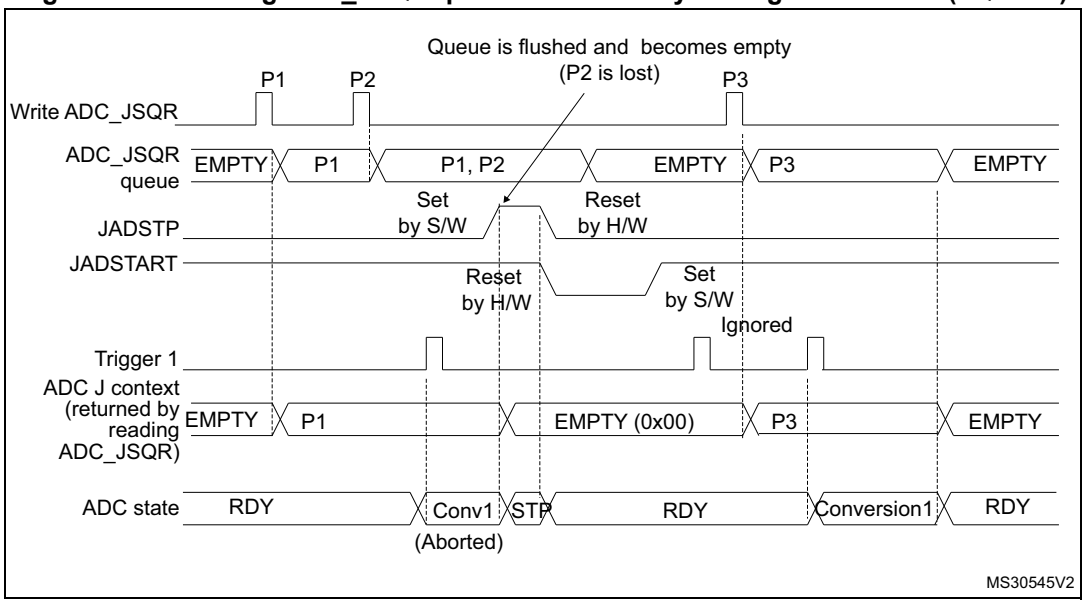
The figures below show the behavior of the context queue in various situations when the queue is flushed.

Figure 305. Flushing ADC_JSQR queue of context by setting JADSTP = 1 (JQM = 0) - JADSTP occurs during an ongoing conversion.



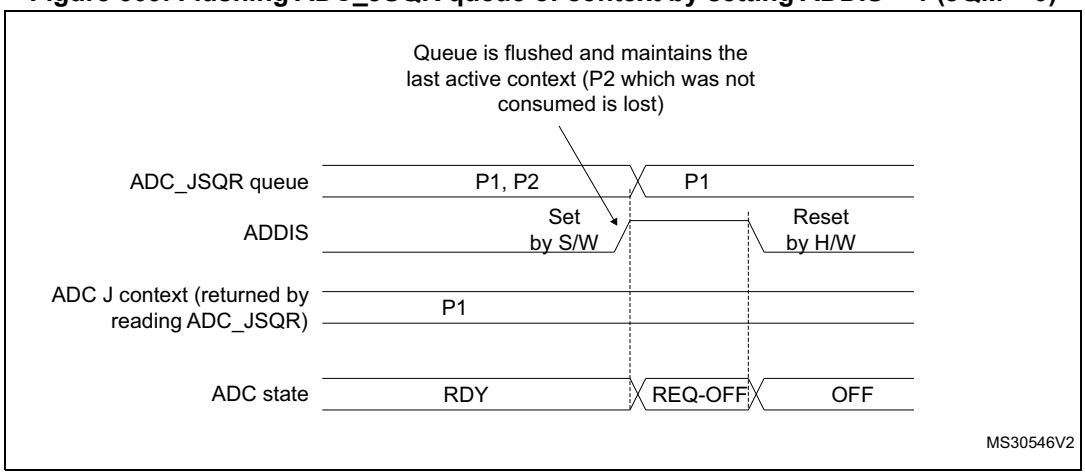
1. Parameters:
   P1: sequence of 1 conversion, hardware trigger 1
   P2: sequence of 1 conversion, hardware trigger 1
   P3: sequence of 1 conversion, hardware trigger 1

Figure 306. Flushing ADC_JSQR queue of context by setting JADSTP = 1 (JQM = 0) - JADSTP occurs during an ongoing conversion and a new trigger occurs



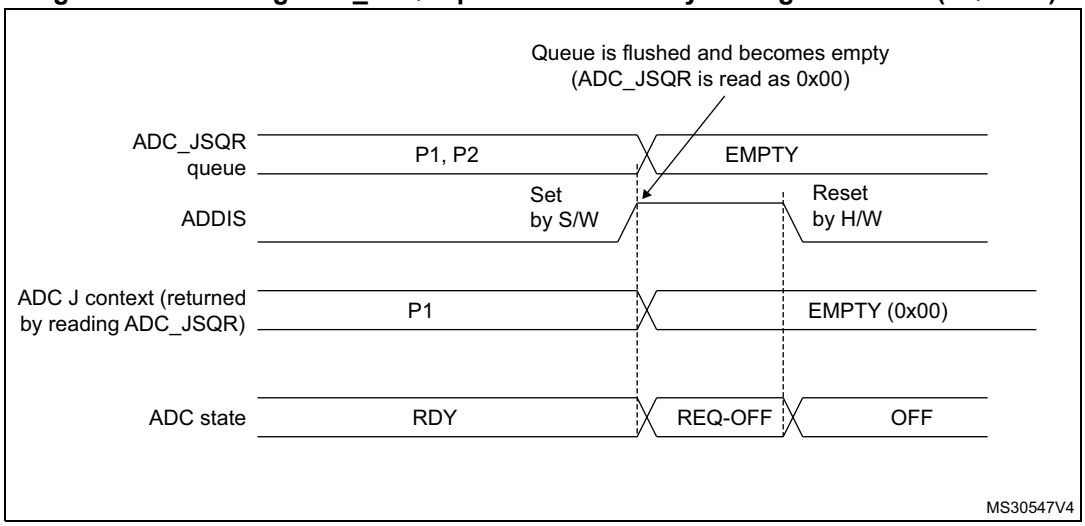
1. Parameters:
   P1: sequence of 1 conversion, hardware trigger 1
   P2: sequence of 1 conversion, hardware trigger 1
   P3: sequence of 1 conversion, hardware trigger 1

Figure 307. Flushing ADC_JSQR queue of context by setting JADSTP = 1 (JQM = 0) - JADSTP occurs outside an ongoing conversion



1. Parameters:
   P1: sequence of 1 conversion, hardware trigger 1
   P2: sequence of 1 conversion, hardware trigger 1
   P3: sequence of 1 conversion, hardware trigger 1

Figure 308. Flushing ADC_JSQR queue of context by setting JADSTP = 1 (JQM = 1)



1. Parameters:
   P1: sequence of 1 conversion, hardware trigger 1
   P2: sequence of 1 conversion, hardware trigger 1
   P3: sequence of 1 conversion, hardware trigger 1

Figure 309. Flushing ADC_JSQR queue of context by setting ADDIS = 1 (JQM = 0)

1. Parameters:
   P1: sequence of 1 conversion, hardware trigger 1
   P2: sequence of 1 conversion, hardware trigger 1
   P3: sequence of 1 conversion, hardware trigger 1

Figure 310. Flushing ADC_JSQR queue of context by setting ADDIS = 1 (JQM = 1)

1. Parameters:
   P1: sequence of 1 conversion, hardware trigger 1
   P2: sequence of 1 conversion, hardware trigger 1
   P3: sequence of 1 conversion, hardware trigger 1

Queue of context: Clear the context

- Setting JQDIS to 0 and then to 1 clears the context.
- Setting JADSTP to 0, writing a new context, and then setting JADSTART to 1 clears the previous context.

Disabling the queue

It is possible to disable the queue by setting the JQDIS bit of the ADC_CFGR1 register.

To clear the context queue, write 0 to JQDIS first, then write 1.

25.4.24 Programmable resolution (RES) - fast conversion mode

Faster conversions can be performed by reducing the ADC resolution.

The resolution can be configured to be either 12, 10, 8, or 6 bits by programming the RES[1:0] control bits. *Figure 315*, *Figure 316*, *Figure 317* and *Figure 318* show the conversion result format with respect to the resolution as well as to the data alignment.

Lower resolution allows faster conversion time for applications where high-data precision is not required. It reduces the conversion time spent by the successive approximation steps according to *Table 244*.

Table 244. T_{SAR} timings depending on resolution

RES (bits)	T_{SAR} (ADC clock cycles)	T_{SAR} (ns) at $F_{adc_ker_ck}$ = 32 MHz	T_{CONV} (ADC clock cycles) (with Sampling time= 2.5 ADC clock cycles)	T_{CONV} (ns) at $F_{adc_ker_ck}$ = 32 MHz
12	13.5 ADC clock cycles	421.875 ns	16 ADC clock cycles	500.0 ns
10	11.5 ADC clock cycles	359.375 ns	14 ADC clock cycles	433.33 ns

Table 244. T_{SAR} timings depending on resolution (continued)

RES (bits)	T_{SAR} (ADC clock cycles)	T_{SAR} (ns) at $F_{adc_ker_ck}$ = 32 MHz	T_{CONV} (ADC clock cycles) (with Sampling time= 2.5 ADC clock cycles)	T_{CONV} (ns) at $F_{adc_ker_ck}$ = 32 MHz
8	9.5 ADC clock cycles	296.875 ns	12 ADC clock cycles	366.67 ns
6	7.5 ADC clock cycles	156.25 ns	10 ADC clock cycles	300 ns

25.4.25 End of conversion and end of sampling phase (EOC, JEOC, EOSMP)

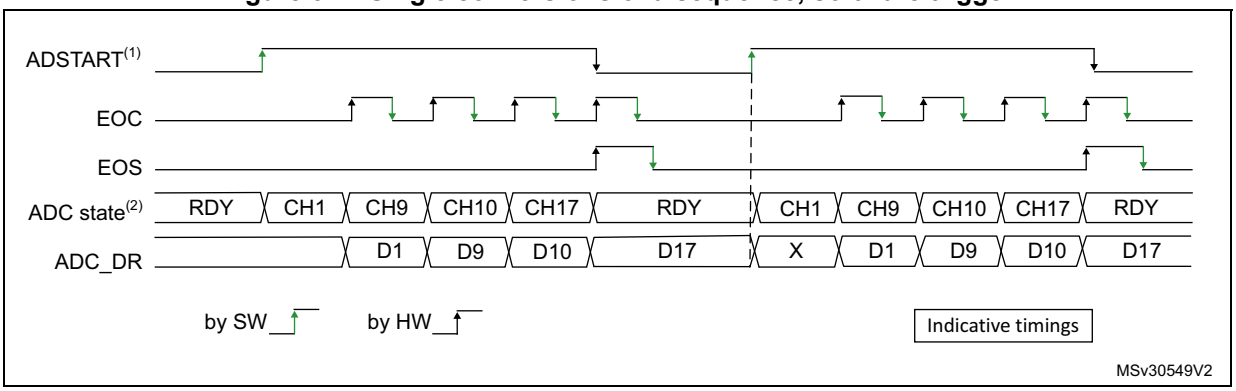
The ADC notifies the application at the end of each regular conversion (EOC) event and injected conversion (JEOC) event.

The ADC sets the EOC flag as soon as a new regular conversion data is available in the ADC_DR register. An interrupt can be generated if the EOCIE bit is set. The software can clear the EOC flag either by programming it to 1 or by reading ADC_DR. If ADC_DR FIFO is not emptied, the EOC flag is set again and an interrupt can be generated again.

The ADC sets the JEOC flag as soon as new injected conversion data is available in one of the ADC_JDRy registers. An interrupt can be generated if the JEOCIE bit is set. The software can clear the JEOC flag either by programming it to 1 or by reading the corresponding ADC_JDRy register.

The ADC also notifies the end of the sampling phase by setting the EOSMP flag (for regular conversions only). The EOSMP flag is cleared by software by programming it to 1. An interrupt can be generated if the EOSMPIE bit is set.

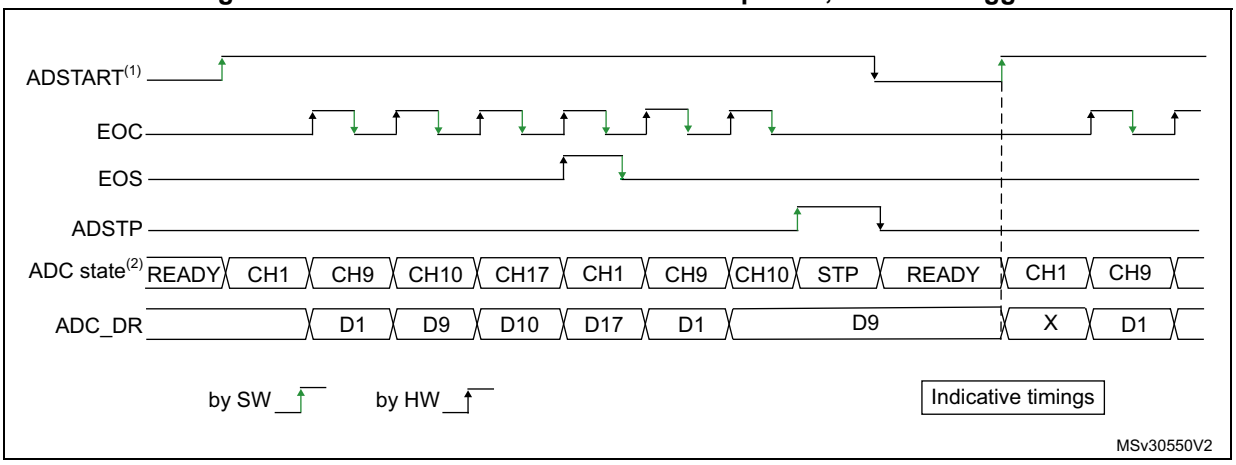
25.4.26 End of conversion sequence (EOS, JEOS)



The ADC notifies the application at the end of each regular sequence (EOS) and injected sequence (JEOS) event.

The ADC sets the EOS flag as soon as the conversion of the last data of the regular sequence is complete. An interrupt can be generated if the EOSIE bit is set. The EOS flag is cleared by the software by programming it to 1.

The ADC sets the JEOS flag as soon as the conversion of the last data of the injected sequence is complete. An interrupt can be generated if the JEOSIE bit is set. The JEOS flag is cleared by the software by programming it to 1.



25.4.27 Timing diagram examples (single/continuous modes, hardware/software triggers)

Figure 311. Single conversions of a sequence, software trigger

1. TRGx is selected as trigger source, EXTEN[1:0] = 10, CONT = 1.
2. Channels selected = 1, 2, 3, 4; AUTDLY = 0.

25.4.28 Data management

Data register, data alignment and offset (ADC_DR, ADC_JDRy, OFFSETy, OFFSETy_CH, OVSS, LSHIFT, JOVSS[a], JLSHIFT[a], USAT, SSAT, POSOFF)

Data and alignment

At the end of each regular channel conversion (when an EOC event occurs), the result of the converted data is stored in the 32-bit wide ADC_DR data register with FIFO (when OVRMOD = 0). Since the data register has eight levels of FIFO, the EOC flag is raised again as far as the FIFO is not emptied.

At the end of each injected channel conversion (when a JEOC event occurs), the result of the converted data is stored in the 32-bit wide corresponding ADC_JDRy data register.

The OVSS[3:0], LSHIFT[3:0], JOVSS[3:0], and JLSHIFT[3:0] bitfields in the ADC_CFGR2 register select the alignment of the data stored after the conversion. By default, data are right-aligned. Refer to *Figure 315*, *Figure 316*, *Figure 317*, and *Figure 318* for examples of data alignment.

Note: The data can be aligned in normal and oversampling mode. The OVSS[3:0] bitfield is only effective in oversampling mode.

JOVSS[3:0] and JLSHIFT[3:0] is reserved for injected conversions. Their usage is the same as OVSS[3:0] and LSHIFT[3:0], unless otherwise specifically described.

Offset

An unsigned offset value y (y = 1, 2, 3, 4) can be applied to a channel by programming a value different from 0 in the OFFSET[21:0] bitfield of the ADC_OFRy register. The channel to which the offset is applied is programmed to the OFFSETy_CH[4:0] bits of ADC_OFCFGRy register. The offset can be positive or negative depending on the value of POSOFF bit. When POSOFF is cleared, the converted value is subtracted by the user-defined offset written in OFFSET[21:0] bits. The result can be a negative value. The read data is consequently signed and the SEXT bit represents the extended sign value.

The offset value must be lower than the maximum conversion value (for example the maximum offset value is 0xFFF in 12-bit mode).

The offset can be used to convert unsigned data to signed data (for example the offset value is equal to 0x800 in 12-bit mode).

The offset correction is also supported in oversampling mode. In this mode, the offset is subtracted when all the oversampling operations are complete.

Note: If the OFFSET channel is selected but the offset value is 0x0000, this offset programming is ignored. If the same OFFSET channel is programmed in different registers multiple times, the first programmed register takes priority.

Table 250 describes how the computation is performed for all the possible ADC resolutions and offset settings.

a. Only for products that include this bit.

Table 245. Offset computation versus data resolution

Resolution (RES[1:0] bits)	Subtraction between raw converted data and offset		Result	Comments
	Raw converted Data, left aligned	Offset		
00: 12-bit	DATA[11:0]	OFFSET[11:0]	Signed or unsigned 24-bit data, right aligned to [11:0]	-
01: 10-bit	DATA[11:2],00	OFFSET[11:2]	Signed or unsigned 24-bit data, right aligned to [9:0]	The user must configure OFFSET[1:0] to 0b00.
10: 8-bit	DATA[11:4],0000	OFFSET[11:4]	Signed or unsigned 24 bit data right aligned to [7:0]	The user must configure OFFSET[3:0] to 0b0000.
11: 6-bit	DATA[11:6],000000	OFFSET[11:6]	Signed or unsigned 24 bit data right aligned to [5:0]	The user must configure OFFSET[5:0] to 0b000000.

Figure 315, *Figure 316*, *Figure 317* and *Figure 318* show alignments for signed and unsigned data. JOVSS and JLSHIFT are not described here, but they behave the same as OVSS and LSHIFT.

Figure 315. Right alignment (offset disabled, unsigned value)

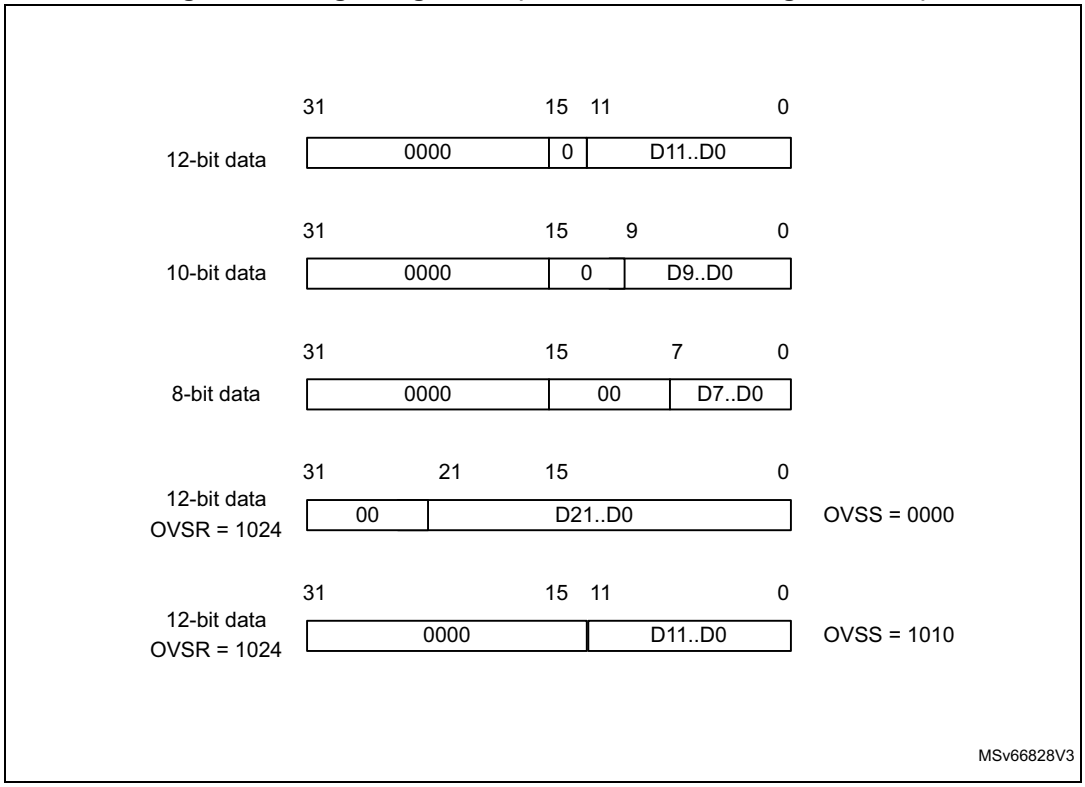

Figure 316. Right alignment (offset enabled, signed value)

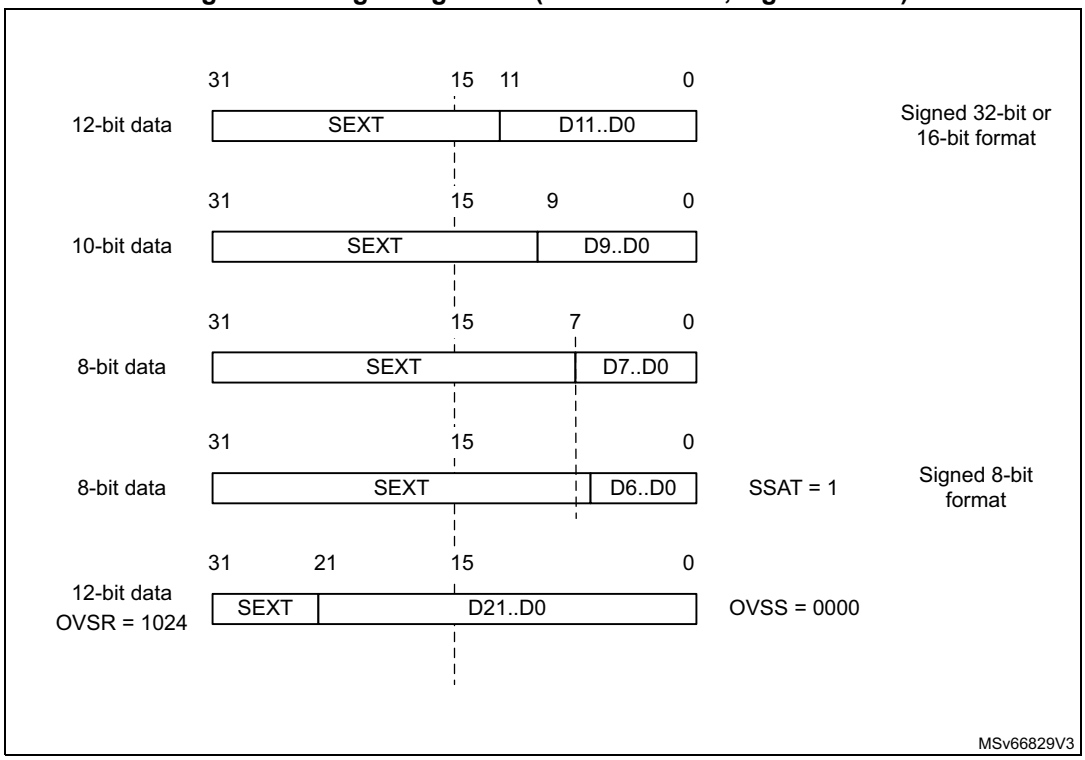

Figure 317. Left alignment (offset disabled, unsigned value)

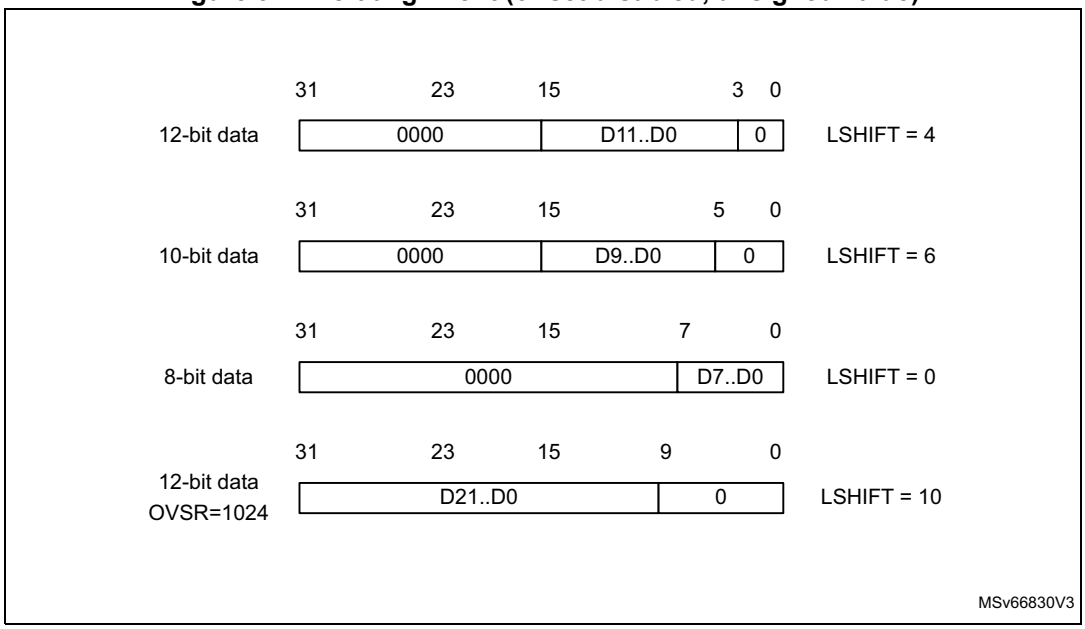

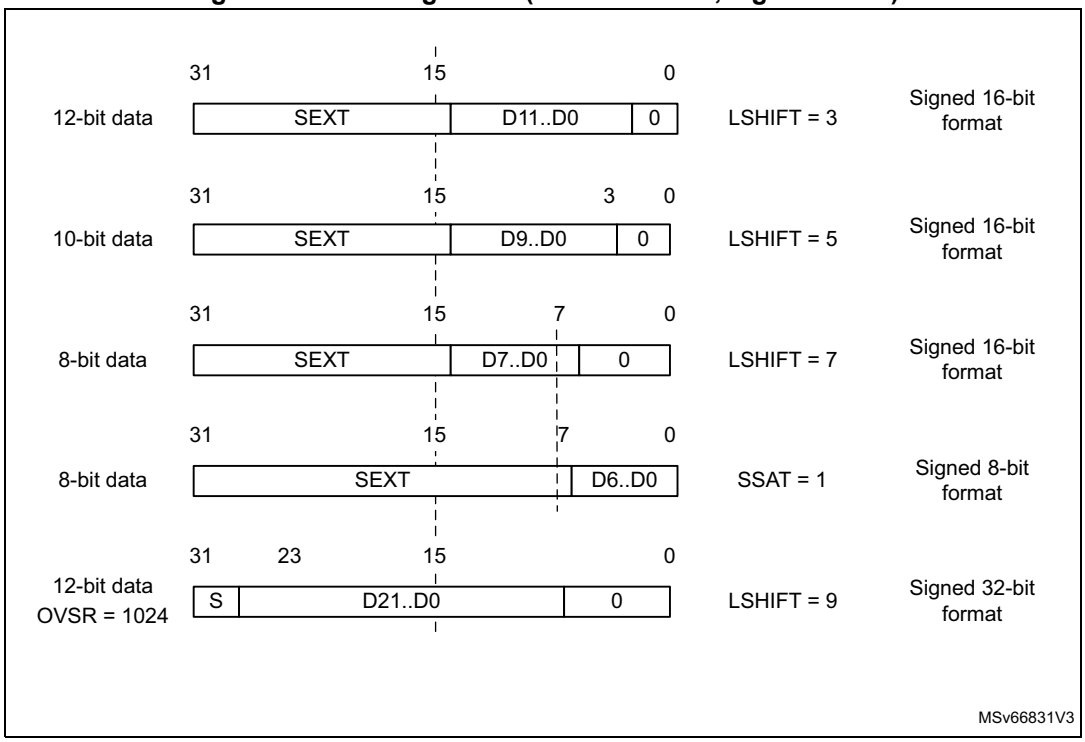

Figure 318. Left alignment (offset enabled, signed value)

Management of signed and unsigned saturation format (SSAT, USAT)

The offset correction might result in the data width to be wider than the original data.

To limit the original data width, the data saturation can be enabled through the SSAT and USAT bits of the ADC_OFCFGRy register.

Unsigned 12-bit data can be extended to 13-bit signed data by using an offset value different from 0x800.

The original data width can be preserved by setting SSAT bit to limit the data width to 12 bits.

Unsigned data can be saturated to the original data width by setting the USAT bit.

Table 246 shows the sign-extended data format corresponding to different resolutions.

Table 246.12-bit data formats

SSAT	USAT	Format	Data range (offset =0x800)
0	0	Sign-extended 13-bit significant data: SEXT[31:13] DATA[12:0]	0x0000 07FF - 0xFFFF F800
1	0	Sign-extended 12-bit significant data: SEXT[31:12] DATA[11:0]	0x7FF - 0x800

Table 246.12-bit data formats

SSAT	USAT	Format	Data range (offset =0x800)
0	1	Unsigned saturation 12-bit signification data: DATA[11:0]	0xFFF - 0x000
1	1	Reserved	-

Table 247 provides numerical examples for four different offset values.

Table 247. Numerical examples for 32-bit or 16-bit format (POSSPFF = 0)

Raw conversion result	Offset value	Result SSAT = 0 USAT = 0	Result SSAT = 0 USAT = 1	Result SSAT = 1 USAT = 0
0xFFF	0x800	0x0000 07FF	0x07FF	0x07FF
0x800		0x0000 0000	0x0000	0x0000
0x000		0xFFFF F800	0x0000	0xF800
0xFFF	0x820	0x0000 07DF	0x07DF	0x07DF
0x800		0xFFFF FFE0	0x0000	0xFFE0
0x000		0xFFFF F7E0	0x0000	0xF7E0
0xFFF	0x7E0	0x0000 081F	0x081F	0x07FF
0x800		0x0000 0020	0x0020	0x0020
0x000		0xFFFF F820	0x0000	0xF820
0xFFF	0x020	0x0000 0FDF	0x0FDF	0x0FDF
0x800		0x0000 07E0	0x07E0	0x07E0
0x000		0xFFFF FFE0	0x0000	0xFFE0

Caution: SSAT must not be used in conjunction with USAT. No hardware check is performed to ensure that this condition is respected.

Gain compensation

When the GCOMP bit is set in the ADC_GCOMP register, the gain compensation is activated on all the converted data. After each conversion, data is calculated using the following formula.

$$DATA = DATA(\text{adc result}) \times (GCOMPCOEFF) / 4096$$

As GCOMPCOEFF can be programmed from 0 to 16383, the actual gain compensation factor can range from 0 to 3.999756.

Before storing the resulting data in RDATAx or JDATAx bitfields, the LSB - 1 value is evaluated to round up the data and minimize the error.

The gain compensation is also effective for the oversampling. When the gain compensation is used in oversampling mode, the gain calculation is performed after the accumulation and

right-shift operations to minimize the power consumption (the gain calculation is done only once and not at each conversion).

The internal multiplier width is 32 bits and the input data width for the gain compensation must be less than 18 bits. When using oversampling with injected and regular conversion mode, the ROVSM bit of the ADC_CFGR2 register must be set to resume the pending conversion with the correct value.

When the gain compensation is activated, the ADC data latency is increased by one clock cycle. In continuous and scan conversion modes, the ADC conversion rate does not change.

ADC overrun (OVR, OVRMOD)

The overrun flag (OVR) issues a notification that the regular converted data has not been read (by the CPU or the DMA) before the ADC_DR FIFO (eight stages) is overflowed, or adc_hclk clock is too slow to manage the data. If the CPU clears the EOC flag without reading the data register, the OVR flag may still be triggered.

The OVR flag is set when a new conversion completes while ADC_DR as single register or FIFO output is full. An interrupt is generated if the OVRIE bit is set.

When an overrun condition occurs, the ADC is still operating and can continue converting unless the software decides to stop and reset the sequence by setting ADSTP. The OVR flag is cleared by software by programming it to 1.

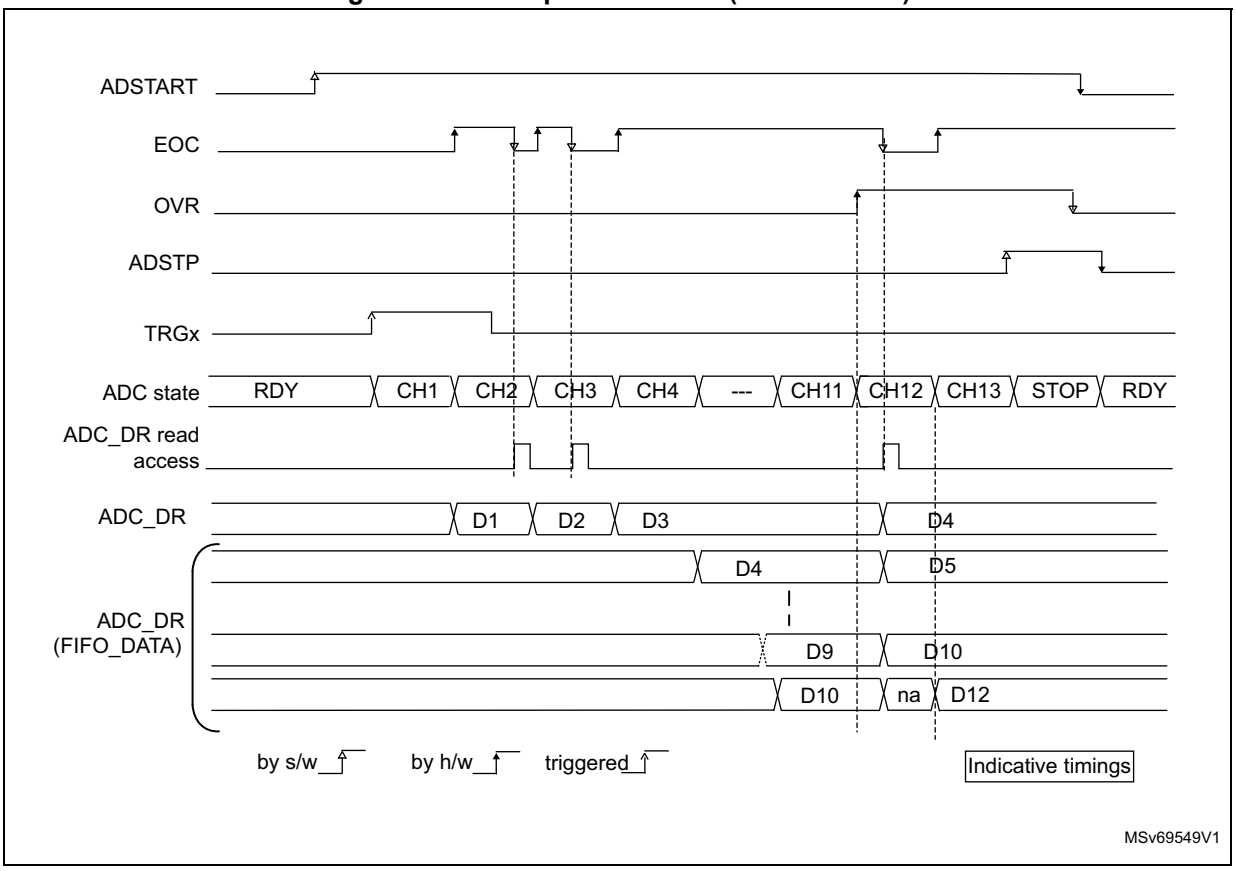
Data can be configured to be preserved or overwritten when an overrun event occurs by programming the control bit OVRMOD:

- OVRMOD = 0

  The overrun event preserves the data register from being overwritten: the old data are maintained up to ADC_DR FIFO depth (eight data) and the new conversion is discarded and lost. If OVR remains at 1, further conversions occur but the result data is also discarded. The FIFO can be emptied through ADC_DR read access by the CPU while the OVR flag is set.
- OVRMOD = 1

  The data register is overwritten with the last conversion result and the previous unread data is lost. In this mode, ADC_DR FIFO is disabled. If OVR remains at 1, any further conversion is performed normally and the ADC_DR register always contains the latest converted data. In this mode, DMA burst mode nor ADF output mode cannot be supported.

Figure 319. Example of overrun (OVRMOD = 0)



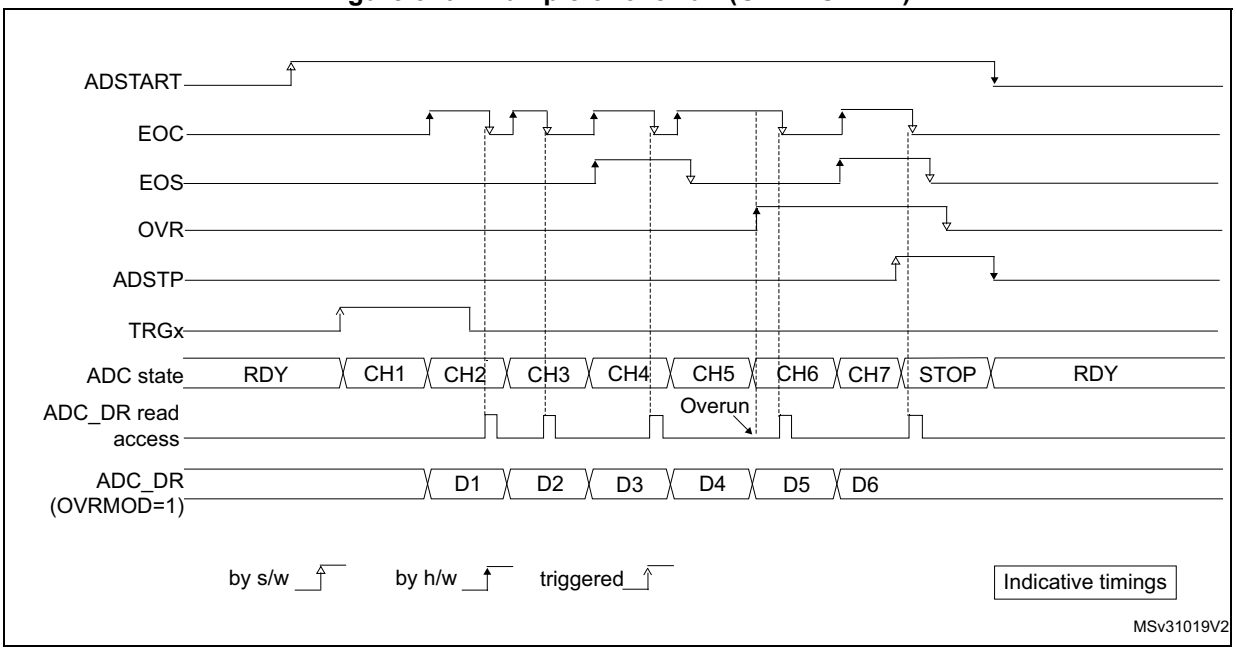


Figure 320. Example of overrun (OVRMOD = 1)

Note: Even if overrun may occur for injected channels, there is no overrun detection on these channels since there is a dedicated data register for each of the four injected channels.

Managing a sequence of conversions without using the DMA

If the conversions are slow enough, the conversion sequence can be handled by the software. In this case the software must use the EOC flag and its associated interrupt to handle each data. Each time a conversion is complete, EOC is set and the ADC_DR register can be read. OVRMOD must be configured to 0 to manage overrun events or FIFO overflow as errors.

Managing conversions without using the DMA and without overrun

It may be useful to let the ADC convert one or more channels without reading the data each time (if there is an analog watchdog for instance). In this case, the OVRMOD bit must be configured to 1 and the OVR flag must be ignored by the software. An overrun event does not prevent the ADC from continuing to convert and the ADC_DR register always contains the latest conversion.

Managing conversions using the DMA

When the DMA mode is enabled (DMNGT[1:0] = 01 or 11 in the ADC_CFGR1 register in single ADC mode), a DMA request is generated after each channel conversion. This allows the transfer of the converted data from the ADC_DR register to the destination location configured in the DMA.

Despite this, if an overrun occurs (OVR = 1) because the DMA cannot serve the DMA transfer request in time, the ADC stops generating DMA requests and the data corresponding to the new conversion is not transferred by the DMA, which means that all the data transferred to the RAM can be considered as valid. (OVRMOD = 0).

When OVRMOD = 1, even if DMA does not transfer the data immediately, new data overwrite ADC_DR, causing DMA to potentially skip data. As a result, some conversion results may be missed in the data transferred to RAM.

Depending on the configuration of the OVRMOD bit, the data are either preserved or overwritten (refer to *Section : ADC overrun (OVR, OVRMOD)*). If OVRMOD = 0 (data preserved), DMA transfer requests are blocked.

DMA can be configured through the DMNGT[1:0] bitfield of the ADC_CFGR1 register. Refer to *Section 25.4.34: Dual ADC modes* for information on DMA usage with dual ADC mode.

- DMA one-shot mode (DMNGT[1:0] = 01)

  This mode is suitable when the DMA is programmed to transfer a fixed number of data.
- DMA circular mode (DMNGT[1:0] = 11)

  This mode is suitable when programming the DMA when the number of transfers is unknown.

DMA one-shot mode (DMNGT[1:0] = 01)

In one-shot mode, the ADC generates a DMA transfer request each time a new conversion data is available and stops generating DMA requests once the DMA has reached the last DMA transfer (that is when DMA_LACK interrupt occurs, see *Direct-memory controller* section) even if a new conversion has been started.

When DMA transfers are complete (all the transfers configured in the DMA controller have been done):

- The content of the ADC data register is frozen.
- All ongoing conversions are aborted with the partial result discarded.
- The scan sequence is stopped and reset.
- The DMA and ADC are stopped.

DMA circular mode (DMNGT[1:0] = 11)

In circular mode, the ADC generates a DMA transfer request each time a new conversion data is available in the data register. This allows the configuration of the DMA in circular mode to handle a continuous analog input data stream.

DMA single-transfer or burst mode with FIFO (OVRMOD = 0)

The output data register features an eight-stage FIFO. Two different DMA requests are generated in parallel. When a data is available, an “SREQ single request” is generated. When four data are available, a “BREQ burst request” is generated. The DMA can be programmed either in single-transfer mode or in burst mode (four beats). The appropriate request line is selected by the DMA according to the mode selected. Refer to *Section Direct memory access controller* for further information.

Due to the existence of FIFO, DMA requests are generated until the FIFO is emptied. To stop DMA requests even when the FIFO is not emptied, set the ADSTP bit.

DMA for dual mode

Refer to *Section 25.4.34: Dual ADC modes*.

25.4.29 Managing conversions using the ADF

The ADC conversion results can be transferred directly to the ADF.

In this case, the DMNGT[1:0] bits must be set to 10.

The ADC transfers the 16 least significant bits of the regular data register to the ADF through adcx_dat[15:0] bus, which in turn resets the EOC flag once the transfer is effective.

The data format must be in 16-bit signed format:

ADC_DR[31:16] = Don’t care

ADC_DR[15] = Sign

ADC_DR[14:0] = Data

Any value above the 16-bit signed format is truncated.

To obtain a 16-bit signed format, the OFFSET function needs to be activated.

In this mode, OVRMOD = 1 is not supported.

25.4.30 Dynamic low-power features

Autodelayed conversion mode (AUTDLY)

The ADC implements an autodelayed conversion mode controlled by the AUTDLY configuration bit in ADC_CFGR1. Autodelayed conversions are useful to simplify the software as well as to optimize performance of an application clocked at low frequency where there is a risk of encountering an ADC overrun.

Regular conversion mode

When AUTDLY is set, a new conversion can start if the following conditions are met:

- The ADC_DR register is read or the EOC bit is cleared (see *Figure 321*).

This is a way to automatically adapt the speed of the ADC to the speed of the system that reads the data and prevent overrun errors.

The delay is inserted after each regular conversion.

Injected conversion mode

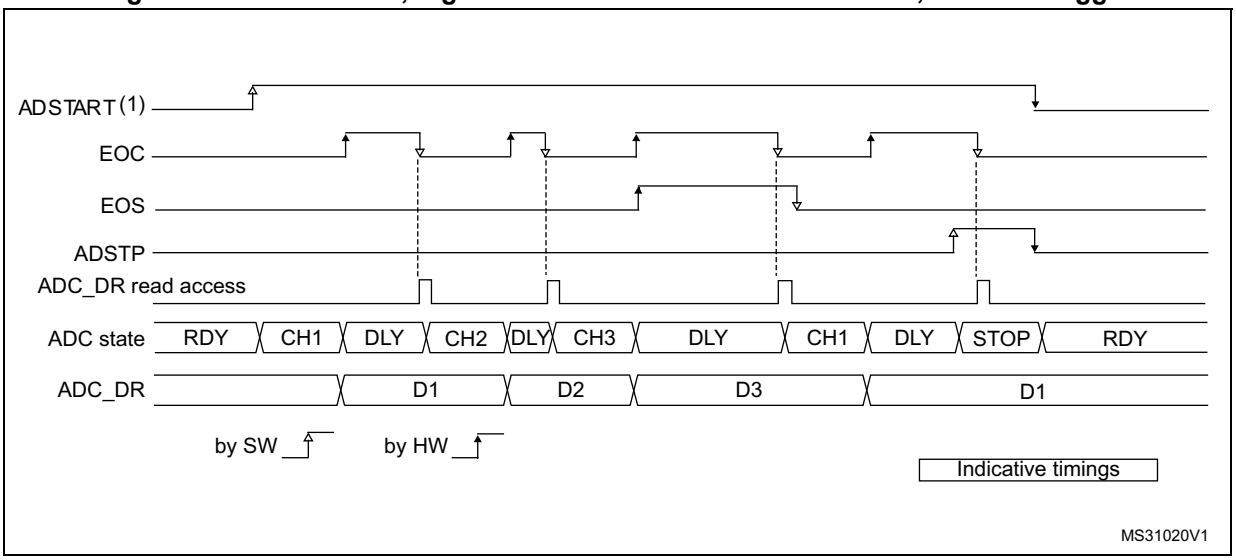
When AUTDLY is set, a new conversion can start only if the JEOS bit has been cleared (see *Figure 322*). Since there are four ADC_JDRy registers, the autodelay is performed at the end on the injected conversion sequence.

There is no delay inserted between each conversion of the injected sequence, except after the last one.

A hardware trigger event occurring during this delay is ignored.

No delay is inserted between regular and injected conversions. The autodelay for regular and injected modes is managed separately.

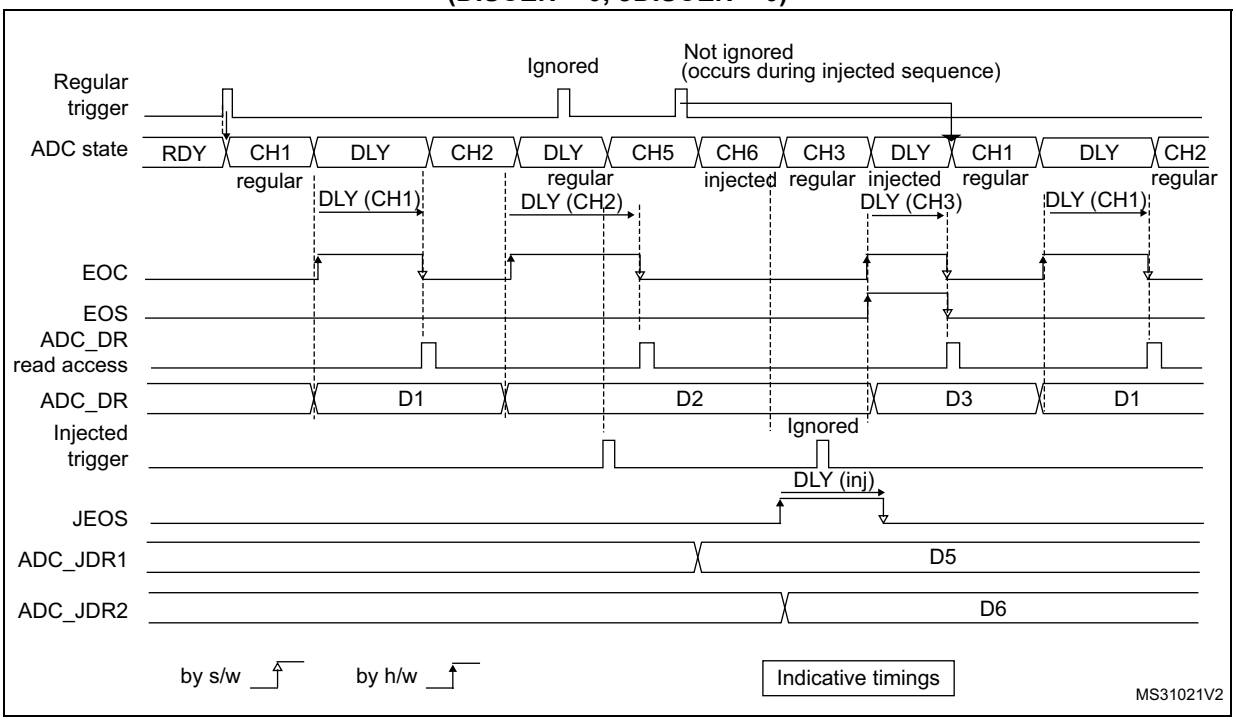
Caution: The behavior is slightly different in autoinjection mode (JAUTO = 1) where a new regular conversion can start only when the automatic delay of the previous injected sequence of conversion has ended (when JEOS has been cleared). This is to ensure that the software can read all the data of a given sequence before starting a new sequence (see *Figure 325*).



In autoinjection mode, there is no delay between the last regular conversion and the first injected conversion. The user must clear the last EOC flag before clearing the JEOS flag, otherwise the next sequence might start before EOC flag is cleared.

In autodelay mode, a hardware regular trigger event is ignored if it occurs during an already ongoing regular sequence or during the delay that follows the last regular conversion of the sequence. It is however considered pending if it occurs after this delay, even if it occurs during an injected sequence of the delay that follows it. The conversion then starts at the end of the delay of the injected sequence.

In autodelay mode with JAUTO = 0, a hardware injected trigger event is ignored if it occurs during an already ongoing injected sequence or during the delay that follows the last injected conversion of the sequence.



Note: AUTDLY mode is not supported with injected queue, SMPTRIG, or BULB mode.

Filter configuration	AWDFILT[2:0] in ADC_AWDyHTR		
Interrupt	AWDy in ADC_ISR		

The three AWD analog watchdogs monitor whether some channels remain within a configured voltage range (window).

Figure 326. Analog watchdog guarded area

AWDy flag and interrupt

An interrupt can be enabled for each of the three analog watchdogs by setting AWDyIE in the ADC_IER register (y = 1, 2, 3).

AWDy (y = 1, 2, 3) flag is cleared by software by writing 1 to it, or by setting ADDIS.

The ADC conversion result is compared to the lower and higher thresholds before alignment.

AWD source channel register

The software can identify which ADC channel has generated the AWDy flag by reading the AWDS_CH[19:0] bitfield of the ADC_AWDySR register: AWDS_CH*i* bit is set to indicate that channel *i* has generated the flag. It is cleared by writing 1 to it or by disabling the ADC through setting the ADDIS bit.

Description of analog watchdog 1

The AWD analog watchdog 1 is enabled by setting the AWD1EN or JAWD1EN bit in the ADC_CFGR1 register. This watchdog monitors whether either one selected channel or all enabled channels remain within a configured voltage range (window).

Table 249 shows how the ADC_CFGR1 registers must be configured to enable the analog watchdog on one or more channels.

Table 249. Analog watchdog 1 channel selection

Channels guarded by the analog watchdog	AWD1SGL bit	AWD1EN bit	JAWD1EN bit
None	x	0	0
All injected channels	0	0	1
All regular channels	0	1	0
All regular and injected channels	0	1	1
Single(1) injected channel	1	0	1
Single(1) regular channel	1	1	0
Single(1) regular or injected channel	1	1	1

1. Selected by the AWD1CH[4:0] bits. The channels must also be programmed to be converted in the appropriate regular or injected sequence.

The AWD1 analog watchdog flag is set if the analog voltage converted by the ADC is below a lower threshold or above a higher threshold.

These thresholds are programmed through HTR[22:0] bits of the ADC_AWD1HTR register and LTR[22:0] bits of the ADC_AWD1LTR register for the analog watchdog 1.

The threshold can be up to 23 bits (12-bit resolution with oversampling, OVSR = 1024, offset and gain compensation)

When converting data with a resolution of less than 12 bits (defined by RES[1:0] bits), the LSB of the programmed thresholds must be kept cleared because the internal comparison is always performed on the full 12-bit raw converted data.

Table 250 describes how the comparison is performed for all the possible resolutions and for analog watchdog 1.

Table 250. Analog watchdog 1, 2, 3 comparison

Resolution (RES[1:0] bits)	Analog watchdog comparison between:		Comments
	Raw converted data, left aligned(1)	Thresholds	
00: 12-bit	DATA[11:0]	LTR[22:0] and HTR[22:0]	-
01: 10-bit	DATA[11:2],00	LTR[22:0] and HTR[22:0]	The user must configure LTR[1:0] to 0b00 and HTR[1:0] to 0b00.
10: 8-bit	DATA[11:4],0000	LTR[22:0] and HTR[22:0]	The user must configure LTR[3:0] to 0b0000 and HTR[3:0] to 0b0000.
11: 6-bit	DATA[11:6],000000	LTR[22:0] and HTR[22:0]	The user must configure LTR[5:0] to 0b000000 and HTR[5:0] to 0b000000.

1. Refer to *Section : Gain compensation* for additional details on analog watchdog comparison.

Description of analog watchdog 2 and 3

The second and third analog watchdogs are more flexible and can guard several selected channels by programming the corresponding bits in AWDCH[19:0] (of ADC_AWD2CR and ADC_AWD3CR).

The corresponding watchdog is enabled when any bit of AWDCH[19:0] (of ADC_AWD2CR and ADC_AWD3CR) is set.

The threshold can be up to 23 bits (12-bit resolution with oversampling, OVSR = 1024 and offset compensation in signed format with gain compensation) and is programmed through the ADC_AWD2HTR, ADC_AWD2LTR, ADC_AWD3HTR and ADC_AWD3LTR registers.

When converting data with a resolution of less than 12 bits (defined by RES[1:0]) bits), the LSBs of the programmed threshold must be kept cleared, the internal comparison being performed on the full 12-bits converted data (left aligned).

ADCx_AWDy_OUT signal output generation

Each analog watchdog is associated with an internal hardware signal ADC_AWDy_OUT (*y* being the watchdog number), which is directly connected to the ETR input (external trigger) of some of the on-chip timers. Refer to the on-chip timers sections to understand how to select the ADC_AWDy_OUT signal as ETR.

ADC_AWDy_OUT is activated when the associated analog watchdog is enabled:

- ADC_AWDy_OUT is set when a guarded conversion is outside the programmed thresholds.
- ADC_AWDy_OUT is reset after the end of the next guarded conversion that is inside the programmed thresholds (It remains at 1 if the next guarded conversions are still outside the programmed thresholds).
- ADC_AWDy_OUT is also reset when disabling the ADC (when setting ADDIS). Note that stopping regular or injected conversions (by setting ADSTP or JADSTP) has no influence on the generation of ADCx_AWDy_OUT.

Note: The AWDy flag is set by hardware and reset by software: the AWDy flag has no influence on the generation of ADC_AWDy_OUT (ex: ADC_AWDy_OUT can toggle while the AWDy flag remains at 1 if the software did not clear the flag).

The AWDy flag is cleared by programming it to 1 or by set ADDIS bit. ADSTP and JADSTP bits do not reset the AWDy flag.

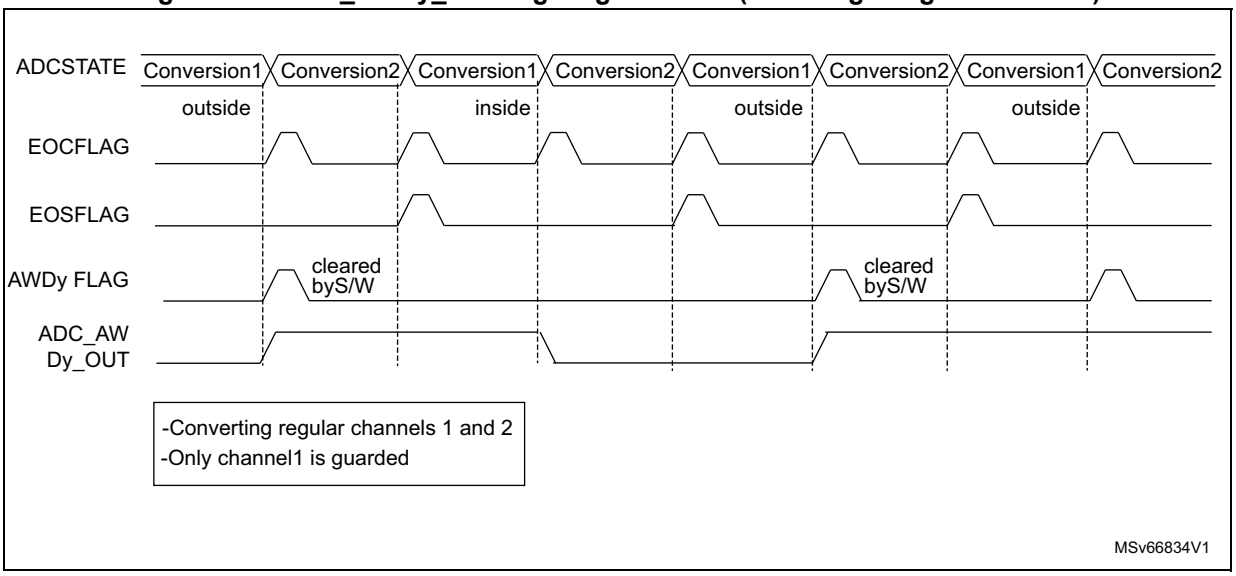

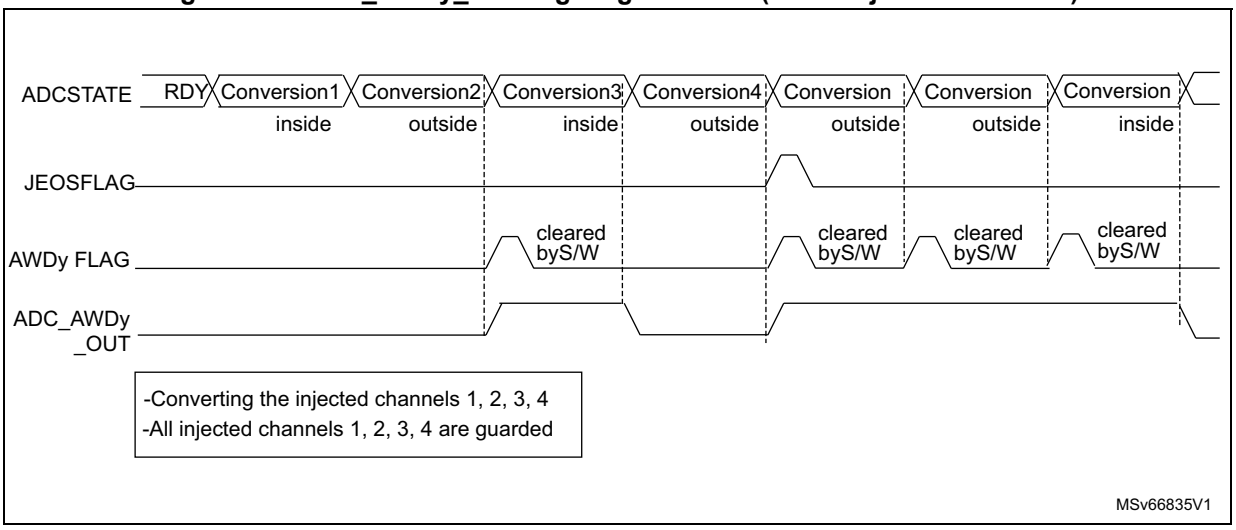

Figure 330. ADC_AWDy_OUT signal generation (on all injected channels)

Analog watchdog threshold control on the fly

LTR[22:0] and HTR[22:0] can be changed when an analog-to-digital conversion is ongoing (that is between the start of conversion and the end of conversion of the ADC internal state). If LTR[22:0] and HTR[22:0] are updated during the ADC conversion of the ADC guarded channel, resulting in analog watchdog thresholds to be applied from the next ADC conversion. The analog watchdog comparison is performed at each end of conversion. If the current ADC data is out of the new modified threshold, no interrupt and AWDy_OUT signal are issued. The Interrupt and the AWD generation only happen at the end of the conversion that started after the threshold update. If AWDy_OUT is already asserted, programming the new thresholds does not deassert the AWDy_OUT signal. However, the watchdog threshold must not be changed twice during the four adc_ker_ck periods.

Analog watchdog filter

With analog watchdog, a valid ADC conversion data range can be configured through the ADC_AWDxLTR and ADC_AWDxHTR registers. When the conversion results have consecutively passed the threshold for more than the watchdog filter value (AWDFILT[2:0] + 1), AWDx_OUT is generated as well as the AWDx flag. Before this value is reached, AWDx output is not activated. The analog watchdog filter can be used only when a single channel is selected for an AWD.

Analog watchdog with gain and offset compensation

When the gain and offset compensation are enabled, the analog watchdog compares the data after the compensation.

25.4.32 Oversampler

The oversampling unit performs data preprocessing to offload the device. It is able to handle multiple conversions and average them into a single data with increased data width, up to 22 bits.

It provides a result with the following form, where N and M can be adjusted:

$$\text{Result} = \frac{1}{M} \times \sum_{n=0}^{n=N-1} \text{Conversion}(t_n)$$

It enables the following functions to be performed by hardware: averaging, data rate reduction, SNR improvement and basic filtering.

The oversampling ratio N is defined by the OVSR[9:0] bits in the ADC_CFGR2 register for regular conversion, or by the JOVSR[3:0] bits in the ADC_CFGR3 register for injected conversion. They can range from 2x to 1024x. The division coefficient *M* consists of a right bit shift up to 10 bits. It is defined through the OVSS[3:0] bits of the ADC_CFGR2 register, for regular conversion or JOVSS[3:0] bits of the ADC_CFGR3 for injected conversion.

The summation unit can yield a result up to 22 bits, which can be left or right shifted at the end. When the right shift is selected, it is rounded to the nearest value using the least significant bits left apart by the shifting, before being finally transferred to the ADC_DR data register.

In this section, OVSS, LSHIFT, and OVSR are used to explain the functionality; however, the same descriptions also apply to JOVSS, JLSHIFT, and JOVSR for injected conversions.

Figure 331 gives a numerical example of the processing, from a raw 22-bit accumulated data to the final 12-bit result.

Figure 331. 12-bit result oversampling with 10-bit right shift and rounding

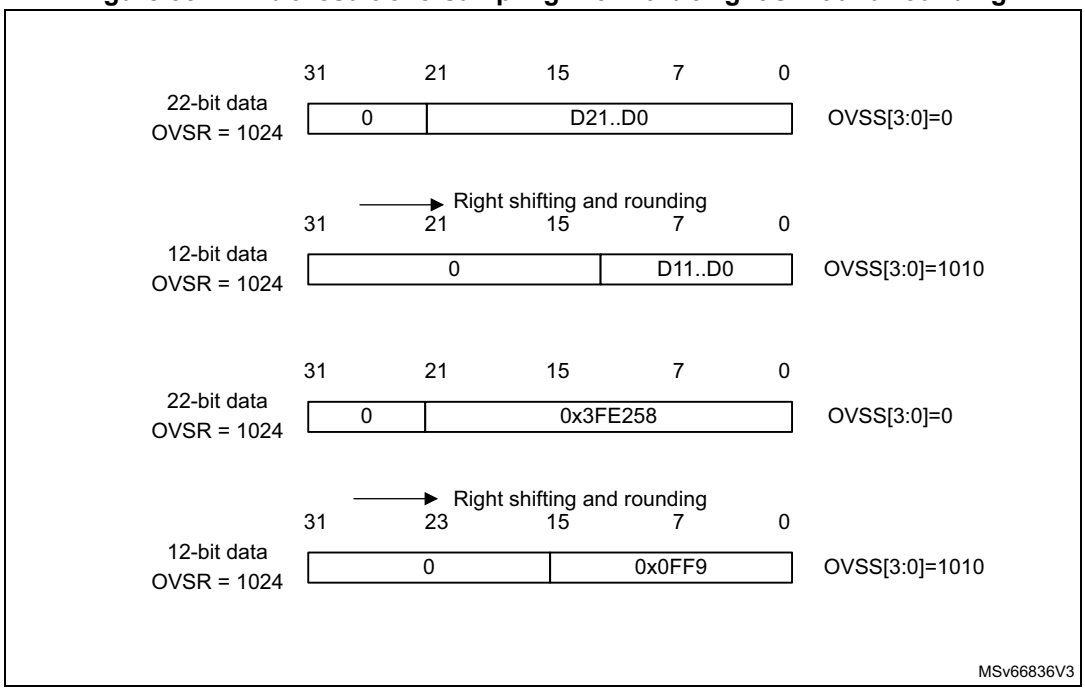

Table 319 gives data format for the various N and M combinations, for a raw conversion data equal to 0xFFF.

Table 251. Maximum output results versus N and M

Over sampling ratio	Max Raw data	No-shift OVSS = 0000	1-bit shift OVSS = 0001	2-bit shift OVSS = 0010	3-bit shift OVSS = 0011	4-bit shift OVSS = 0100	5-bit shift OVSS = 0101	6-bit shift OVSS = 0110	7-bit shift OVSS =0111	8-bit shift OVSS = 1000

x1024	0x3FFC00	0x3FFC00	0x1FFE00	0xFFF00	0x7FF80	0x3FFC0	0x1FFE0	0xFFF0	0x7FF8	0x3FFC

The conversion timing rate does not change in oversampling mode: the sample time is maintained equal during the whole oversampling sequence. A new data is provided every N conversion, with an equivalent delay equal to N x T_{CONV} = N x (t_{SMPL} + t_{SAR}). The flags are set as follows:

- The end of the sampling phase (EOSMP) is set after each sampling phase for regular conversion.
- The end of conversion (EOC) occurs once every N conversion, when the oversampled result is available.
- The end of sequence (EOS) occurs once the sequence of oversampled data is completed (that is after a total of N x sequence length conversions).

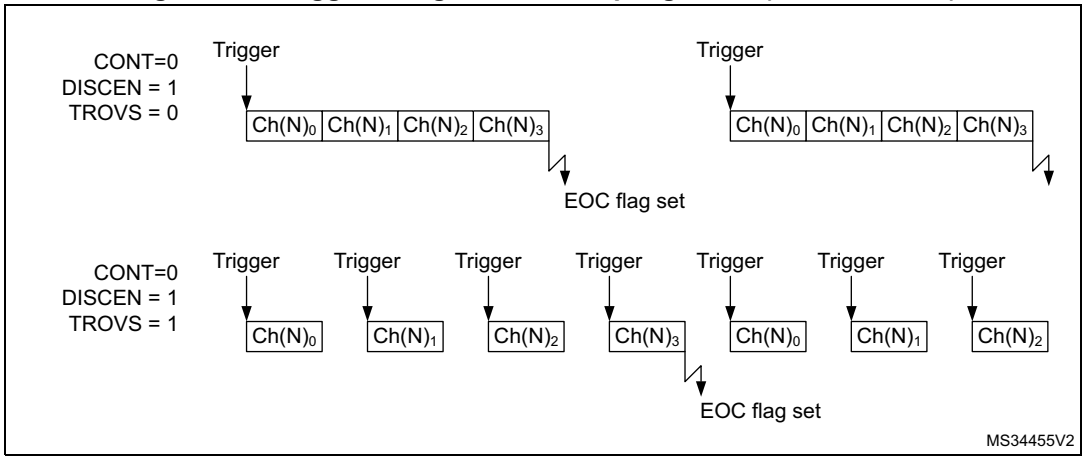
Unlike the conversion rate, the data latency changes in oversampling mode: each single conversion introduces an additional accumulation. As a result, an additional clock cycle is required when all the conversions are complete, after the accumulation and shift.
The EOC flag is set two additional clock cycles after the conversion is complete.

Analog watchdog

The analog watchdog functionality is maintained, with the following differences:

- The RES[1:0] bits are ignored and the comparison is always done using the full 23-bit values HTR[22:0] and LTR[22:0].
- The comparison is performed on the oversampled accumulated value before shifting.

Triggered mode



The oversampling can also be used for basic filtering purpose. Although it not a very powerful filter (slow roll-off and limited stop band attenuation), it can act as a notch filter to reject constant parasitic frequencies (typically coming from the mains or from a switched-mode power supply). For this purpose, a specific discontinuous mode can be enabled through the TROVS bit in ADC_CFGR2, to be able to achieve an oversampling frequency defined by the user and independent from the conversion time itself. The TROVS bit is supported with hardware trigger mode.

Figure 332 shows how conversions are started in response to triggers during discontinuous mode.

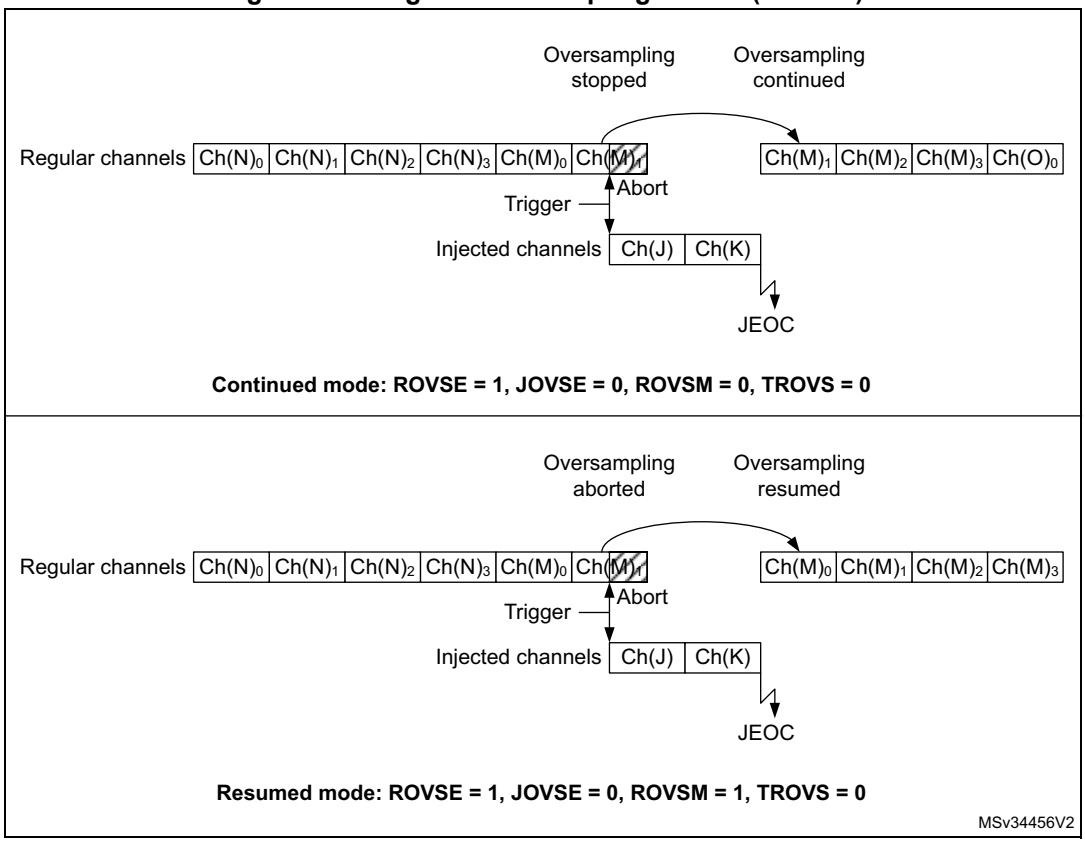
If the TROVS bit is set and OVSR ≠ 0, the content of the DISCEN bit is ignored and considered as 1.

If the TROVS bit is set, neither software trigger nor JAUTO is supported.

Figure 332. Triggered regular oversampling mode (TROVS bit = 1)

Injected and regular sequencer management in oversampling mode

In oversampling mode, injected and regular sequencers can have different behaviors. The oversampling can be enabled for both sequencers with some limitations if they have to be used simultaneously.



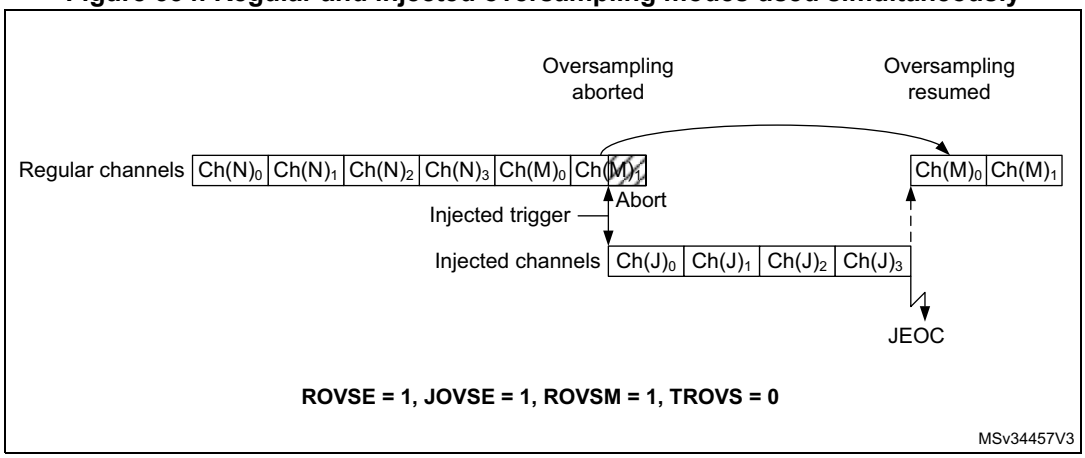
Oversampling regular channels only

The regular oversampling mode ROVSM bit defines how the regular oversampling sequence is resumed if it is interrupted by an injected conversion:

- In continuous mode (ROVSM = 0), the accumulation restarts from the last valid data (prior to the conversion abort request due to the injected trigger). This ensures that oversampling is complete whatever the injection frequency (providing at least one regular conversion can be complete between triggers);
- In resumed mode (ROVSM = 1), the accumulation restarts from 0 (previous conversion results are ignored). This mode guarantees that all the data used for oversampling were converted back-to-back within a single time slot.

Figure 333 gives examples for a 4x oversampling ratio.

Figure 333. Regular oversampling modes (4x ratio)



Oversampling injected channels only

The injected oversampling mode bit JOVSE enables oversampling solely for conversions in the injected sequencer.

Oversampling regular and injected channels

It is possible to have both ROVSE and JOVSE bits set. In this case, the regular oversampling must be resumed (ROVSM bit = 1), as shown in *Figure 334*. This limitation no longer applies in parallel injected oversampling mode.

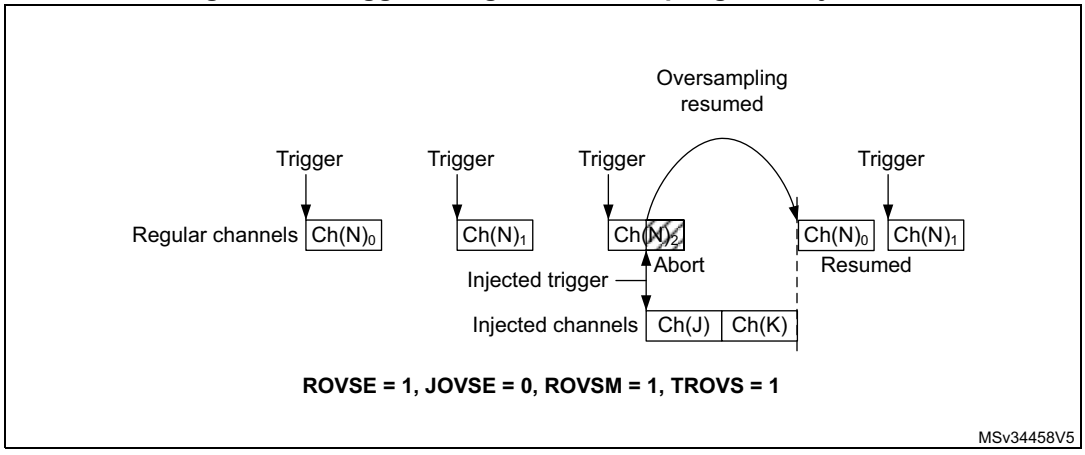


Figure 334. Regular and injected oversampling modes used simultaneously

Triggered regular oversampling with injected conversions

It is possible to have triggered regular mode with injected conversions. In this case, the injected oversampling mode must be disabled and the ROVSM bit set (the resumed mode is forced). The JOVSE bit must be reset. The behavior is shown in *Figure 335*.

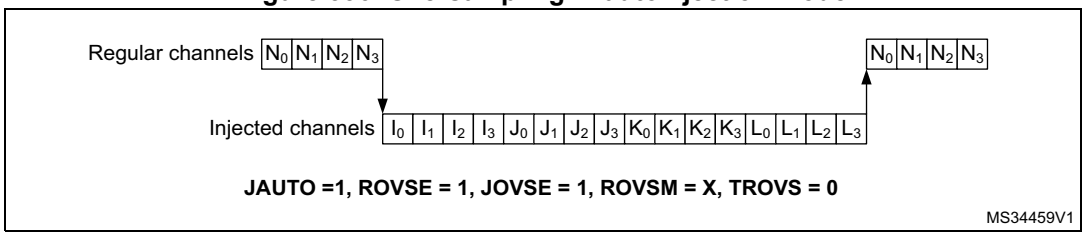

Figure 335. Triggered regular oversampling with injection

Autoinjection mode

It is possible to oversample autoinjected sequences and store all conversion results in registers. This mode is available only with both regular and injected oversampling active: JAUTO = 1, ROVSE = 1 and JOVSE = 1. Other combinations are not supported. The ROVSM bit is ignored in autoinjection mode. *Figure 336* shows how the conversions are sequenced.

Figure 336. Oversampling in autoinjection mode

Combined modes summary

Table 252 summarizes all combinations, including the modes that are not supported.

Table 252. Oversampler operating mode summary

Regular oversampling ROVSE	Injected oversampling JOVSE	Oversampler mode ROVSM 0 = continued 1 = resumed	Triggered regular mode TROVS	Comment
1	0	0	0	Regular continued mode
1	0	0	1	Not supported
1	0	1	0	Regular resumed mode
1	0	1	1	Triggered regular resumed mode
1	1	0	X	Not supported
1	1	1	0	Injected and regular resumed mode
1	1	1	1	Not supported
0	1	X	X	Injected oversampling

25.4.33 Parallel injected oversampling mode

The parallel injected oversampling mode is enabled by setting the JOVSPAR bit of the ADC_CFGR3 register.

To support parallel injected oversampling mode, four dedicated accumulators are implemented for injected conversions, one associated with each JDRy register.

This changes the injected and regular conversion sequences in oversampling mode described in *Section 25.4.32: Oversampler*, because the oversampling can be enabled simultaneously for all injected channels by setting the JOVSPAR bit.

For example, when the oversampling is enabled on two injected channels for scan conversion, the ADC performs the injected conversion (CH1[0], CH2[0], ... CH1[N-1], CH2[N-1]), then each channel is accumulated to ADC_JDR1 and ADC_JDR2 register.

The TJOVS bit of the ADC_CFGR3 register controls each individual conversion:

- When TJOVS is cleared, all conversions in the injected sequence are performed until the oversampling counter is reached.
- When TJOVS is set, each conversion requires an individual trigger.

TJOVS and TJOVSIVE can be used only when JOVSPAR = 1 and TJOVS is compatible with JDISCEN. When the JOVSIVE bit is set in the ADC_CFGR3 register, all intermediate accumulated values stored in the ADC_JDRy registers can be accessed.

When the JADSTP command is executed, the ADC_JDRy registers contain the intermediate accumulated data, and the JOVSCy[9:0] bitfield in the ADC_JOVSCRy register indicates how many accumulations have been performed.

The accumulation counter decrements from the selected ratio value minus one down to 0. Therefore, a value of 0 means that injected oversampling has completed the programmed number of accumulations. The initial counter value is 0, meaning no oversampling has been performed yet.

As long as the intermediate accumulated data count has not reached 0, the oversampling sequence is not complete, and the conversion data available in JDRy corresponds to the raw accumulated value without any right bit shift. The right bit shift is applied only once the oversampling sequence is fully completed.

If for any reason the injected oversampling needs to be stopped, the software can retrieve the intermediate data and the accumulation count, and calculate the data based on oversampling data divided by the accumulation counter.

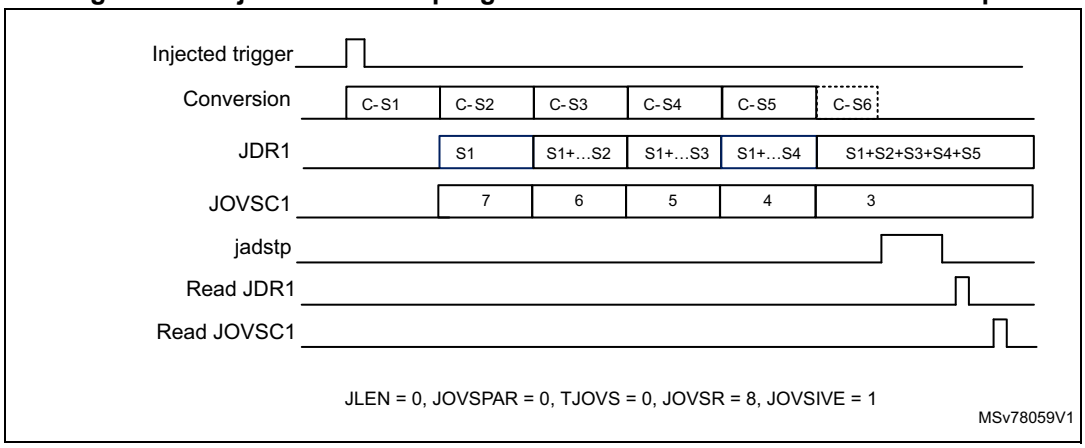

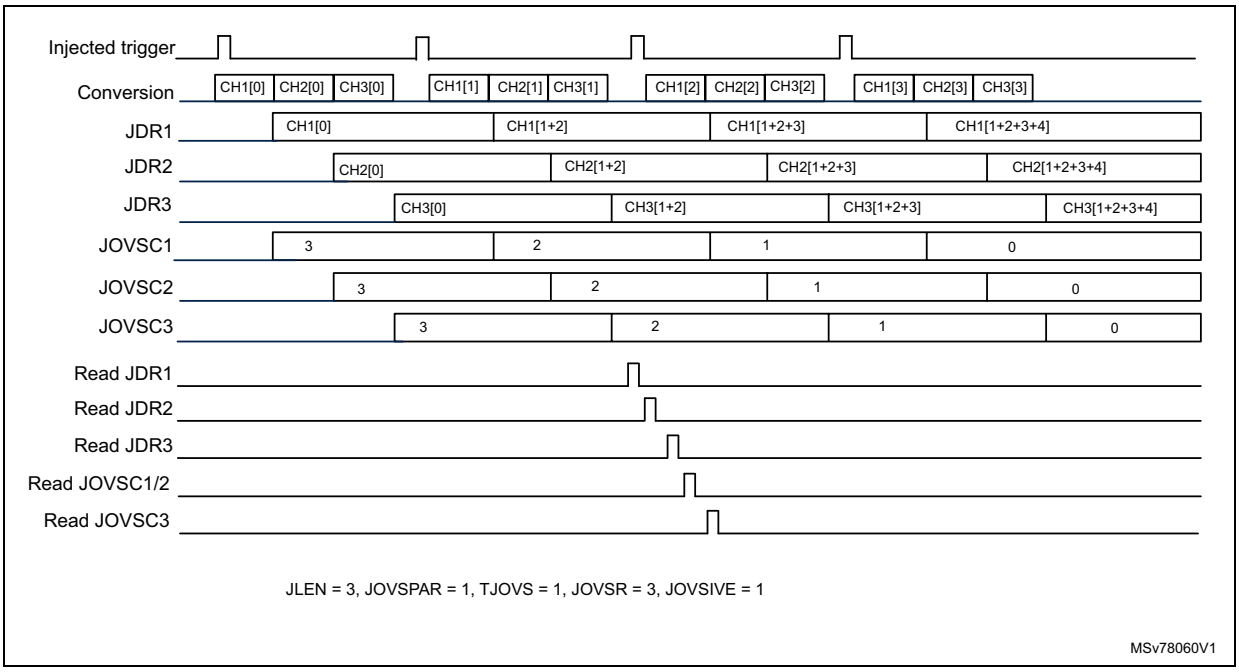

Figure 339. Triggered injected parallel oversampling for 3 channels with accumulated data example

25.4.34 Dual ADC modes

Dual ADC modes can be used in devices with two ADCs or more (see *Figure 340*).

In dual ADC mode the start of conversion is triggered alternately or simultaneously by the ADC master to the ADC slave, depending on the mode selected by the bits DUAL[4:0] in the ADCC_CCR register.

Four possible modes are implemented:

- Injected simultaneous mode
- Regular simultaneous mode
- Interleaved mode
- Alternate trigger mode

It is also possible to use these modes combined in the following ways:

- Injected simultaneous mode + regular simultaneous mode
- Regular simultaneous mode + alternate trigger mode
- Injected simultaneous mode + interleaved mode

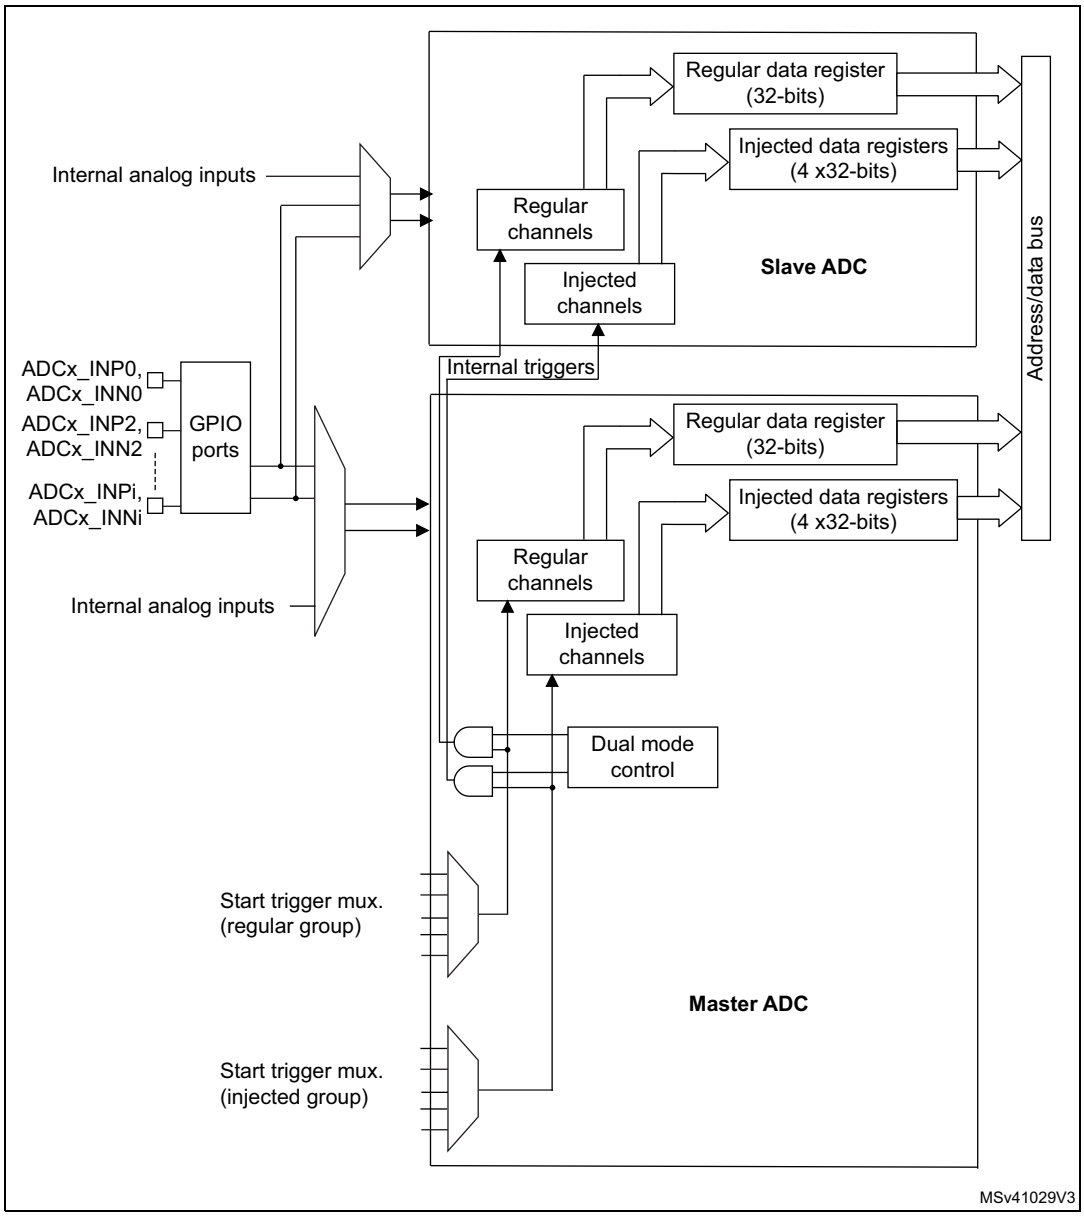
In dual ADC mode (when the DUAL[4:0] bits in the ADCC_CCR register are not equal to zero), the following bits are shared between the master and slave ADCs, with the slave ADC bits being ignored and always applying to the corresponding bits of the master ADC:

- ADC_CFGR1 register: DMNGT[2:0], RES[1:0], EXTEN[1:0], OVRMOD, AUTDLY, DISCEN, DISCNUM[2:0], JDISCEN, JAUTO, JDISCEN.
- ADC_CFGR2 register: ROVSE, JOVSE, TROVS, ROVSM, BULB, SWTRIG, SMPTRIG, OVSR[9:0].
- ADC_GCOMP register: GCOMP.
- ADC_CR register: ADSTART, ADSTP, JADSTART, JADSTP.
- ADC_CFGR1 register: CONT, DISCEN, DISCNUM[2:0].
- ADC_SQR1 register: LEN (for the regular conversion).
- ADC_JSQR register: JLEN[1:0], JEXTSEL[4:0], JEXTEN[1:0] (for the injected conversion).
- ADC_CFGR3 register: JOVSPAR, JOVSE, JOVSIVE, TJOVS, JOVSR[9:0] (for the injected conversion).

For dual mode usage, the sampling time of the master and slave channels must be equal.

To start a conversion in dual mode, the user must program the EXTEN[1:0], EXTSEL, JEXTEN[1:0] and JEXTSEL bits of the master ADC only to configure a software or hardware trigger and a regular or injected trigger. The EXTEN[1:0], JEXTEN[1:0], and JEXTSEL bits of the slave ADC are don’t care).

In regular simultaneous or interleaved modes, once the user sets the ADSTART or ADSTP bit of the master ADC, the corresponding bit of the slave ADC is automatically set. However, ADSTART or ADSTP bit of the slave ADC is not necessarily cleared at the same time as the master ADC bit.



In injected simultaneous or alternate trigger modes, once the user sets the JADSTART or JADSTP bit of the master ADC, the corresponding bit of the slave ADC is automatically set. However, JADSTART or JADSTP bit of the slave ADC is not necessarily cleared at the same time as the master ADC bit.

In dual ADC mode, the converted data of the master and slave ADC can be read in parallel, by reading the ADC common data register (ADCC_CDR). The flags can also be read in parallel by reading the dual-mode status register (ADCC_CSR).

Note: In dual mode, BULB, JAUTO, SMPTRIG, and the injected queue are not supported.

During ADC calibration, the DUAL[4:0] bits must be set to 00000.

Figure 340. Dual ADC block diagram

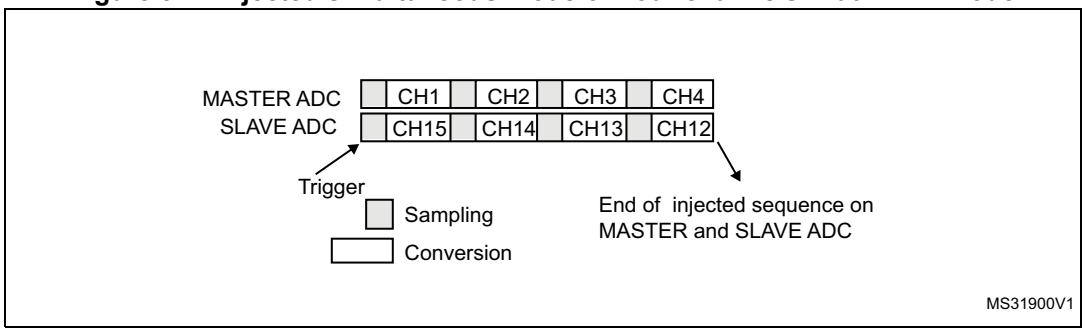
1. External triggers also exist on slave ADC but are not shown for the purposes of this diagram.
2. The ADC common data register (ADCC_CDR) contains both the master and slave ADC regular converted data.

Injected simultaneous mode with independent regular conversion

The injected simultaneous mode is selected by programming DUAL[4:0] bits to 0b00101.

This mode converts an injected group of channels. The external trigger source comes from the injected group multiplexer of the master ADC (selected by the JEXTSEL bits in the ADC_JSQR register).

Note: Do not convert the same channel on the two ADCs (no overlapping sampling times for the two ADCs when converting the same channel).



In simultaneous mode, the user software must convert sequences with the same length. Sampling times for channels with the same sequence number must be equal.

Regular conversions can be performed on one or all ADCs. In that case, they are independent of each other and are interrupted when an injected event occurs. They are resumed at the end of the injected conversion group.

The software is notified by interrupts when it can read the data:

- If the duration of the master-injected sequence is equal to the duration of the slave injected one (as shown in *Figure 341*), the software can enable only one of the two JEOS interrupts (for example the master JEOS) and read both converted data (from master ADC_JDRy and slave ADC_JDRy registers).

Figure 341. Injected simultaneous mode on four channels: Dual ADC mode

If JDISCEN is set, each simultaneous conversion of the injected sequence requires an injected trigger event to occur.

This mode can be combined with the AUTDLY mode:

- Once a simultaneous injected sequence of conversions has ended, a new injected trigger event is accepted only if both JEOS bits of the master and the slave ADC have been cleared (delay phase). Any new injected trigger events occurring during the ongoing injected sequence and the associated delay phase are ignored.
- Once a regular sequence of conversions of the master ADC has ended, a new regular trigger event of the master ADC is accepted only if the master data register (ADC_DR) has been read. Any new regular trigger events occurring for the master ADC during the ongoing regular sequence and the associated delay phases are ignored.
  There is the same behavior for regular sequences occurring on the slave ADC.

In this mode, the following register bits are shared between the master and slave ADCs:

JADSTART, JADSTP, JDISCEN, JOVSE, JLEN, JEXTEN, JEXTSEL, and GCOMPEN, JOVSPAR, JOVSIVE, JOVSE, and TJOVS.

Regular simultaneous mode with independent injected conversions

The regular simultaneous mode is selected by programming DUAL[4:0] bits to 0b00110.

This mode applies to a regular group of channels. The external trigger source comes from the regular group multiplexer of the master ADC (selected by the EXTSEL bits in the ADC_CFGR1 register). A simultaneous trigger is provided to the slave ADC.

In this mode, independent injected conversions are supported. An injection request (either on the master or on the slave) aborts the current simultaneous conversions both for master and slave. They are restarted once the injected conversion is completed.

Note: Do not convert the same channel on the two ADCs (no overlapping sampling times for the two ADCs when converting the same channel).

In regular simultaneous mode, the user software must convert sequences with the same length. Sampling times for channels with the same sequence number must be equal.

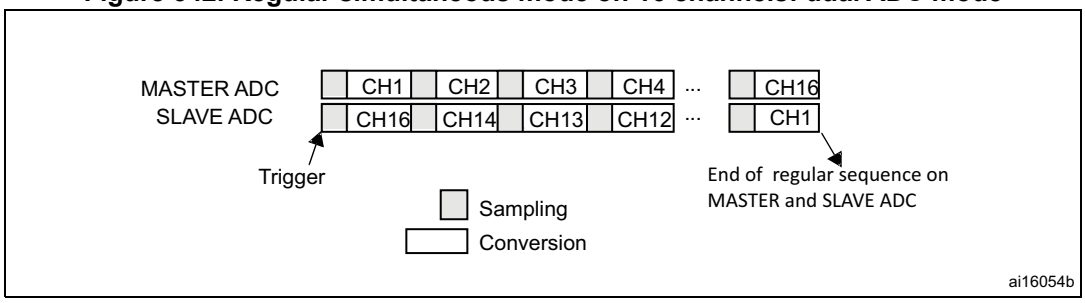
The software is notified by interrupts when it can read the data:

- As the duration of the master regular sequence is equal to the duration of the slave one (as shown in *Figure 342*), the software can enable only one of the two EOC interrupts (for example the master EOC) and read both converted data from the common data register (ADCC_CDR).
  The user can read data from either ADCC_CDR or ADCC_CDR2. Once software selects one of these registers, it must continue using the same register until the ADSTP procedure is executed.

The regular data can also be read using the DMA. Several methods are possible:

- Use two DMA channels (one for the master and one for the slave). In this case DAMDF[1:0] bits must be kept cleared:
  a) Configure the DMA master ADC channel to read ADC_DR from the master. DMA requests are generated at each EOC event of the master ADC.
  b) Configure the DMA slave ADC channel to read ADC_DR from the slave. DMA requests are generated at each EOC event of the slave ADC.
- Configure the dual ADC mode data format DAMDF[1:0] bits, which leaves one DMA channel free for other uses:
  a) Set DAMDF[1:0] = 0b10 or 0b11 (depending on resolution).
  b) A single DMA channel is used (the one corresponding to the master). Configure the DMA master ADC channel to read the common ADC data register (ADCC_CDR or ADCC_CDR2).
  c) A single DMA request is generated each time both the master and slave EOC events occur. At that moment:
  – The slave ADC converted data is available in the upper half-word of the 32-bit ADCC_CDR register
  – The master ADC converted data is available in the lower half-word of the ADCC_CDR register.

Alternatively, data can be read from ADCC_CDR2:



– The first read returns the master ADC data.

– The second read returns the slave ADC data.
After these reads, a DMA request is generated. The DMA transfers the slave data from the same data register and handles two transfers for dual mode operation.

d) Both EOC flags are cleared when the DMA reads the ADCC_CDR register.

Note: When DAMDF[1:0] = 0b10 or 0b11, the user must program the same number of conversions in the master and in the slave sequence. Otherwise, the remaining conversions do not generate a DMA request.

Figure 342. Regular simultaneous mode on 16 channels: dual ADC mode

If the DISCEN bit is set, each "*n*" simultaneous conversion of the regular sequence require a regular trigger event to occur ("n" is defined by DISCNUM).

This mode can be combined with the AUTDLY mode:

- Once a simultaneous conversion of the sequence has completed, the next conversion in the sequence starts only after the EOC flag of both the master and the slave are cleared.
- Once a simultaneous regular sequence of conversions has completed, a new regular trigger event is accepted only after the EOC flag of both the master and the slave are cleared. Any new regular trigger events occurring during the ongoing regular sequence and the associated delay phases are ignored.

The DMA can be used to handle data in regular simultaneous mode combined with AUTDLY mode, assuming that multi-DMA mode is used: bits DAMDF must be set to 0b10 or 0b11.

Interleaved mode with independent injected conversions

This mode is selected by programming DUAL[4:0] bits to 0b00111.

It can be started only on a regular group (usually one channel). The external trigger source comes from the regular channel multiplexer of the master ADC.

After an external trigger occurs:

- The master ADC starts immediately,
- The slave ADC starts after a delay of several ADC clock cycles after the sampling phase of the master ADC has completed (during the master ADC conversion period).

The minimum delay between two conversions in interleaved mode is configured in the DELAY bits in the ADCC_CCR register (see *Table DELAY bits versus ADC resolution*). This delay starts counting one half cycle after the end of the sampling phase of the master

conversion. This way, an ADC cannot start a conversion if the complementary ADC is still sampling its input (only one ADC can sample the input signal at a given time).

- The minimum possible DELAY is 1 to ensure that there is at least one cycle time between the opening of the analog switch of the master ADC sampling phase and the closing of the analog switch of the slave ADC sampling phase.
- The maximum DELAY is equal to the number of cycles corresponding to the selected resolution. However, the user must properly calculate this delay to ensure that an ADC does not start a conversion while the other ADC is still sampling its input.

As the CONT bit is set on both the master and slave ADCs, the selected regular channels of both ADCs are continuously converted.

The software is notified by interrupts when it can read the data at the end of each conversion event (EOC) on the master or slave ADC. A slave and master EOC interrupts are generated (if EOCIE is enabled) and the software can read the ADC_DR of the slave/master ADC.

Table 253. DELAY bits versus ADC resolution

DELAY bits	12-bit resolution	10-bit resolution	8-bit resolution	6-bit resolution
0000	1 * $T_{adc_ker_ck}$	1 * $T_{adc_ker_ck}$	1 * $T_{adc_ker_ck}$	1 * $T_{adc_ker_ck}$
0001	2 * $T_{adc_ker_ck}$	2 * $T_{adc_ker_ck}$	2 * $T_{adc_ker_ck}$	2 * $T_{adc_ker_ck}$
0010	3 * $T_{adc_ker_ck}$	3 * $T_{adc_ker_ck}$	3 * $T_{adc_ker_ck}$	3 * $T_{adc_ker_ck}$

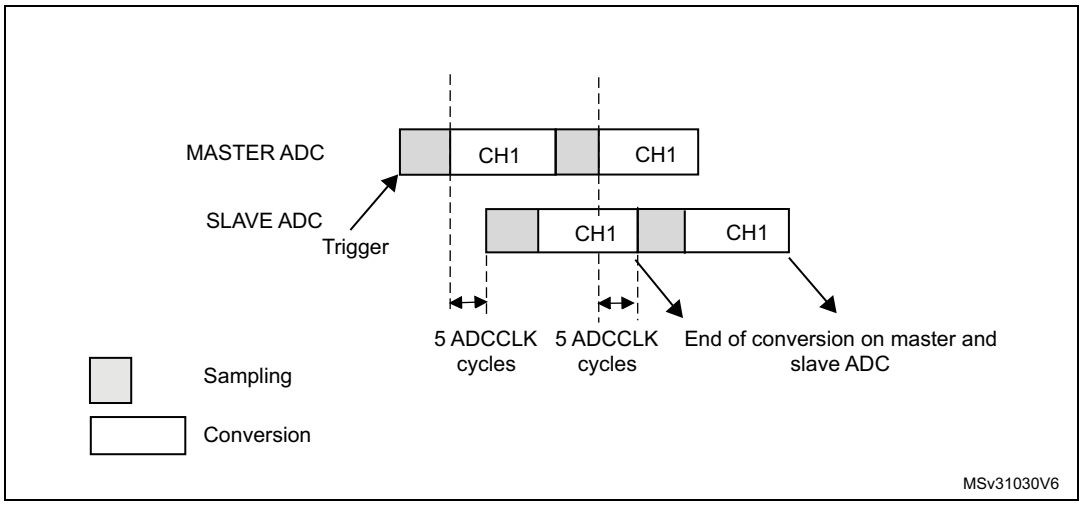
Figure 343. Interleaved mode on 1 channel in continuous conversion mode: Dual ADC mode



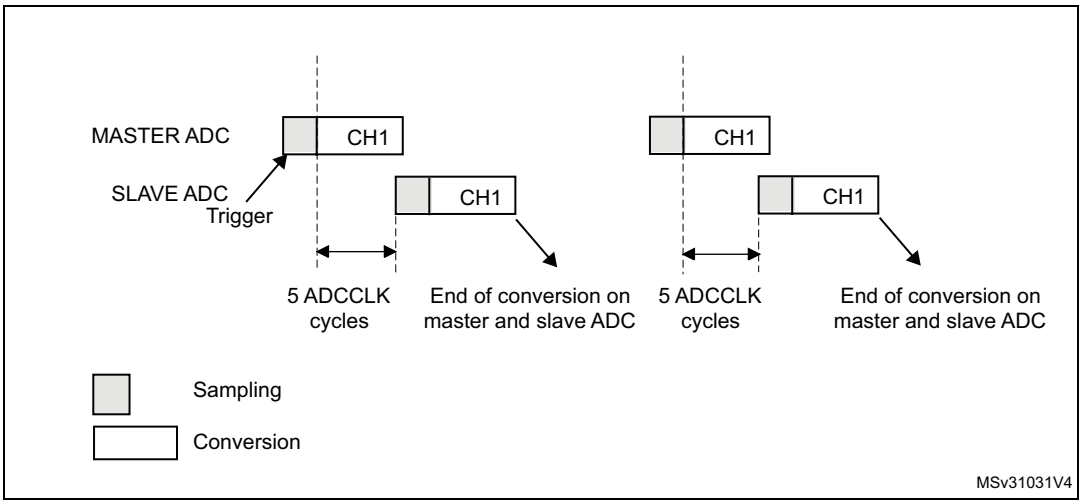


Figure 344. Interleaved mode on 1 channel in single conversion mode: Dual ADC mode

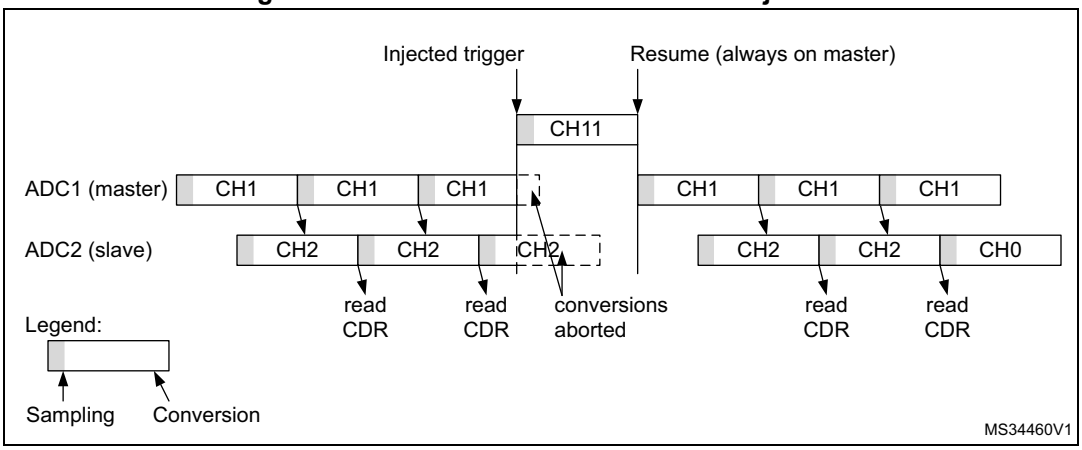


If the DISCEN bit is set, each "*n*" simultaneous conversion ("*n*" is defined by DISCNUM) of the regular sequence require a regular trigger event to occur.

In interleaved mode, injected conversions are supported. When injection is done (either on master or slave), both master and the slave regular conversions are aborted and the sequence is restarted from the master (see *Figure 345*).

Note: In interleaved mode, the ADCx_AWDy_OUT signal for the master ADC is synchronized with the EOC of the master ADC, but the interrupt flag is synchronized with the EOC/JEOC flag of the slave ADC.

In addition, the ROVSM = 0 setting is not supported in oversampling mode.

Figure 345. Interleaved conversion with injection

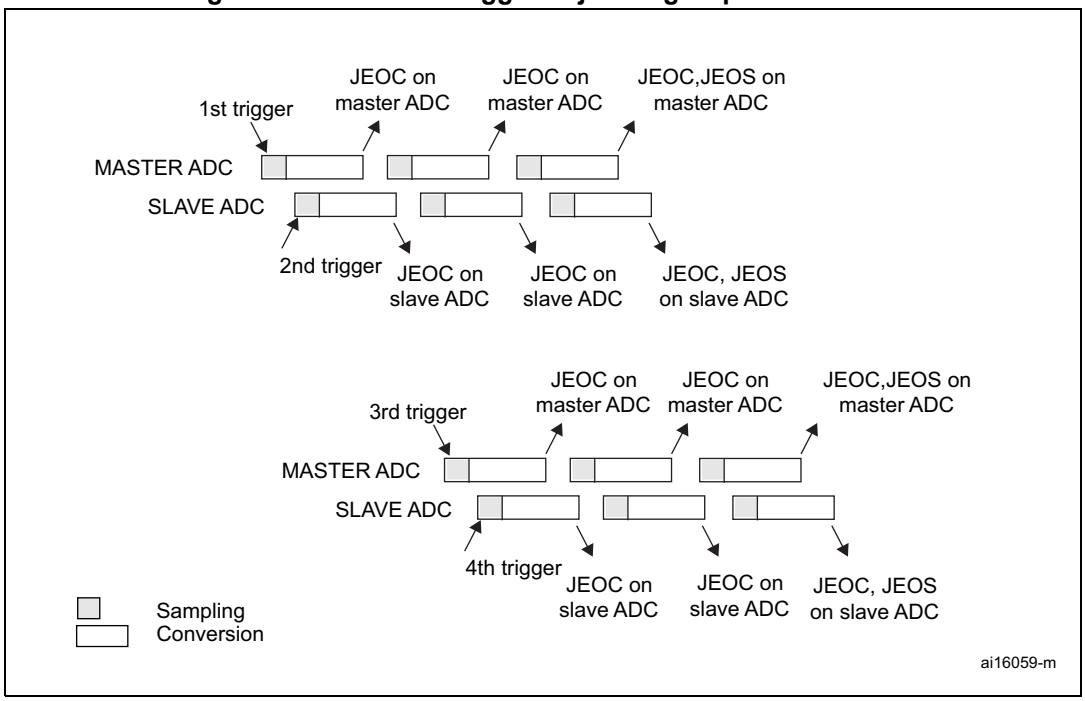
Alternate trigger mode with independent regular conversions

The alternate trigger mode is selected by programming DUAL[4:0] bits to 0b01001.

This mode can only be started on an injected group. The source of the external trigger comes from the multiplexer injected group of the master ADC.

This mode is only possible when selecting hardware triggers: JEXTEN[1:0] must not be 0x0.

Injected discontinuous mode disabled (JDISCEN = 0)



1. When the first trigger occurs, all injected master ADC channels in the group are converted.
2. When the second trigger occurs, all injected slave ADC channels in the group are converted.
3. And so on...

A JEOS interrupt, if enabled, is generated after all injected channels of the master ADC in the group have been converted.

A JEOS interrupt, if enabled, is generated after all injected channels of the slave ADC in the group have been converted.

JEOC interrupts, if enabled, can also be generated after each injected conversion.

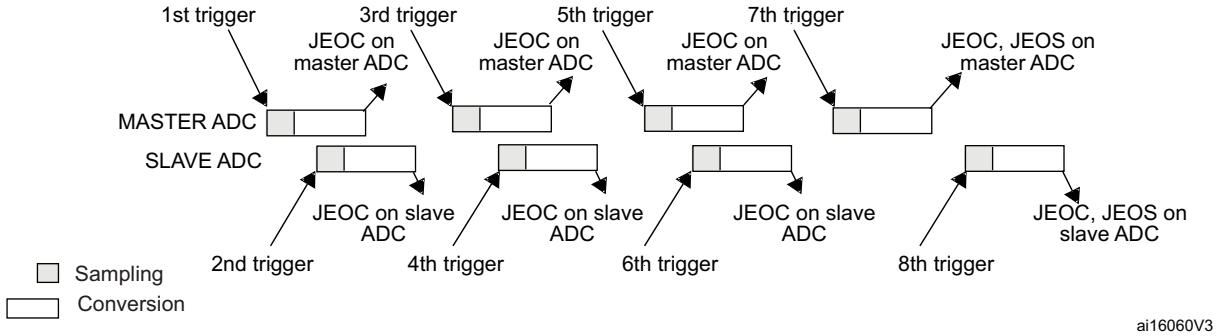
Figure 346. Alternate trigger: injected group of each ADC

Note: Regular conversions can be enabled on one or all ADCs. In this case, the regular conversions are independent of each other. A regular conversion is interrupted when the ADC has to perform an injected conversion. It is resumed when the injected conversion is finished.

The time interval between two trigger events must be greater than or equal to one ADC clock period. The minimum time interval between two trigger events that start conversions on the same ADC is the same as in the single ADC mode.

Injected discontinuous mode enabled (JDISCEN = 1)

If the injected discontinuous mode is enabled for both master and slave ADCs:



1. When the first trigger occurs, the first injected channel of the master ADC is converted.
2. When the second trigger occurs, the first injected channel of the slave ADC is converted.
3. And so on...

A JEOS interrupt, if enabled, is generated after all injected channels of the master ADC in the group have been converted.

A JEOS interrupt, if enabled, is generated after all injected channels of the slave ADC in the group have been converted.

JEOC interrupts, if enabled, can also be generated after each injected conversion.

Figure 347. Alternate trigger: 4 injected channels (each ADC) in discontinuous mode

Combined regular/injected simultaneous mode

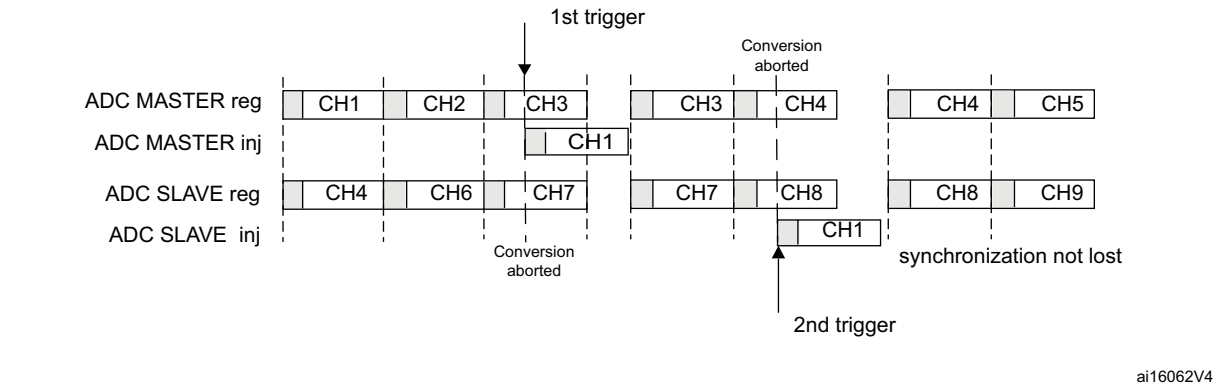
This mode is selected by programming DUAL[4:0] bits to 0b00001.

The simultaneous conversion of a regular group can be interrupted to start the simultaneous conversion of an injected group.

Note: In combined regular/injected simultaneous mode, the user software must convert sequences with the same length.

Combined regular simultaneous and alternate trigger mode

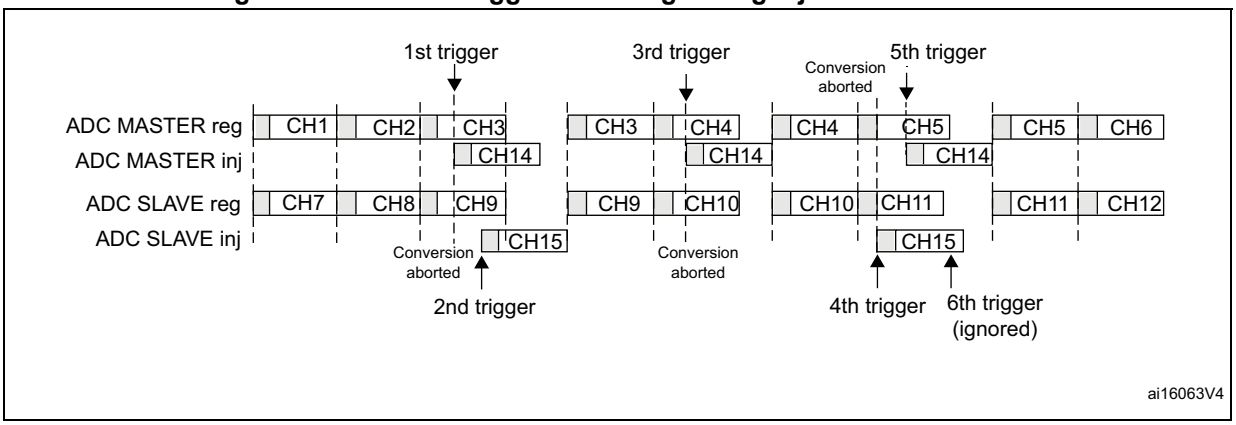
This mode is selected by programming DUAL[4:0] bits to 0b00010.



The simultaneous conversion of a regular group can be interrupted to start the alternate trigger conversion of an injected group. *Figure 348* shows the behavior of an alternate trigger interrupting a simultaneous regular conversion.

The injected alternate conversion immediately starts after the injected event. If a regular conversion is already running, in order to ensure synchronization after the injected conversion, the regular conversion of all (master/slave) ADCs is stopped and resumed synchronously at the end of the injected conversion.

Note: In combined regular simultaneous + alternate trigger mode, the user software must convert sequences with the same length.



The software trigger is not supported for injected conversions.

Figure 348. Alternate + regular simultaneous

If a trigger occurs during an injected conversion that has interrupted a regular conversion, the alternate trigger is served. *Figure 349* shows the behavior in this case (note that the sixth trigger is ignored because the associated alternate conversion is not complete).

Figure 349. Case of trigger occurring during injected conversion

Combined injected simultaneous and interleaved mode

This mode is selected by programming DUAL[4:0] bits to 0b00011.

An interleaved conversion can be interrupted with a simultaneous injected event.

In this case, the interleaved conversion is immediately interrupted and the simultaneous injected conversion starts. At the end of the injected sequence, the interleaved conversion is resumed. When the interleaved regular conversion resumes, the first regular conversion which is performed is always the master's one. *Figure 350*, *Figure 351*, and *Figure 352* show examples of this behavior.

Note: In this mode, the ROVSM = 0 setting is not supported in oversampling mode.

Figure 350. Interleaved single channel CH0 with injected sequence CH11, CH12

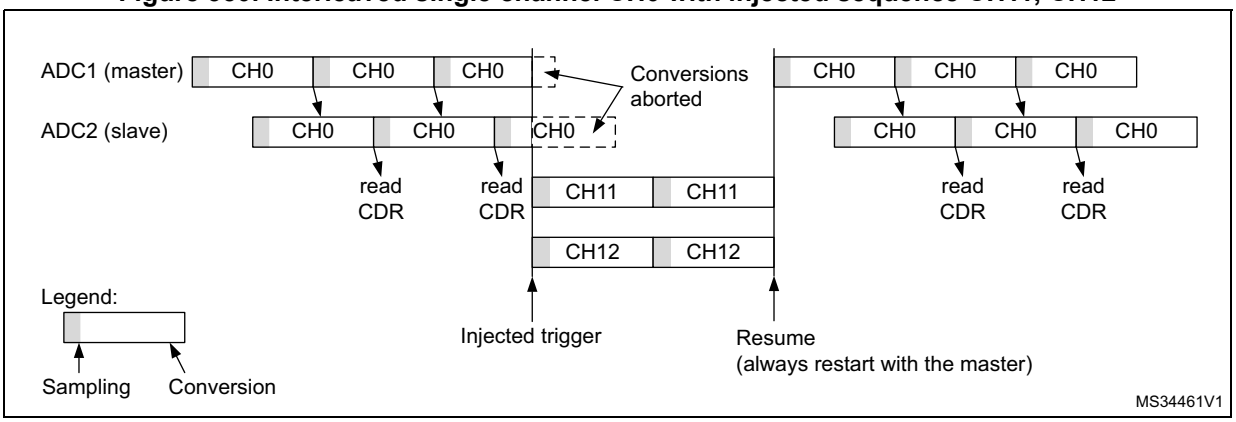


Figure 351. Two interleaved channels (CH1, CH2) with injected sequence CH11, CH12 case 1: Master interrupted first

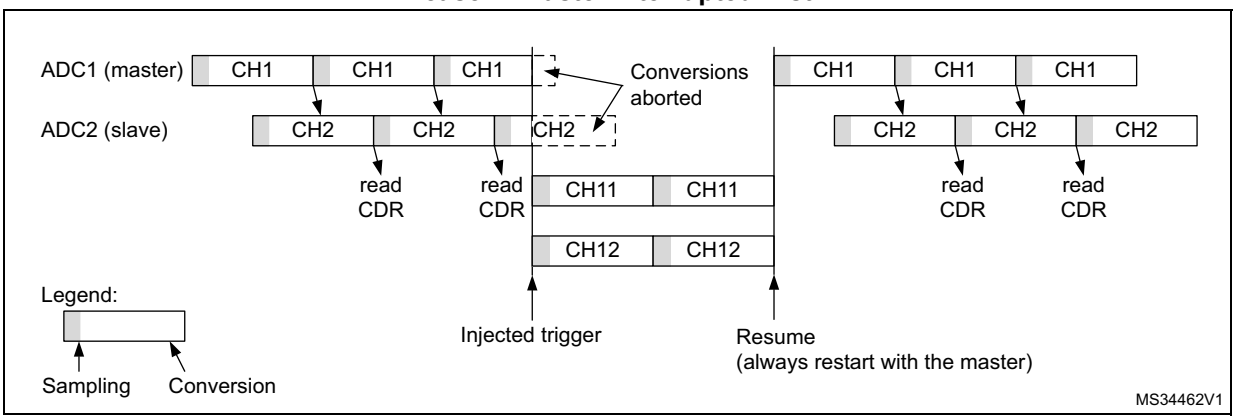

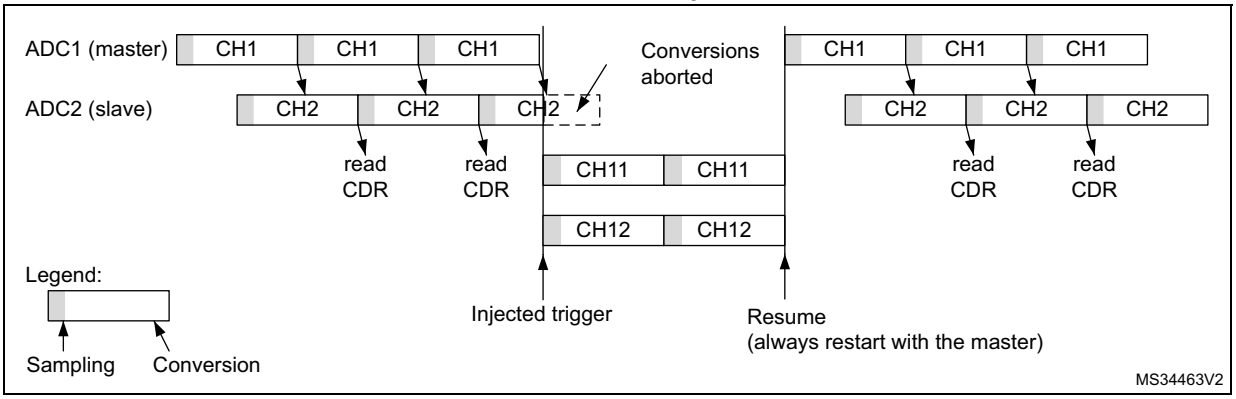

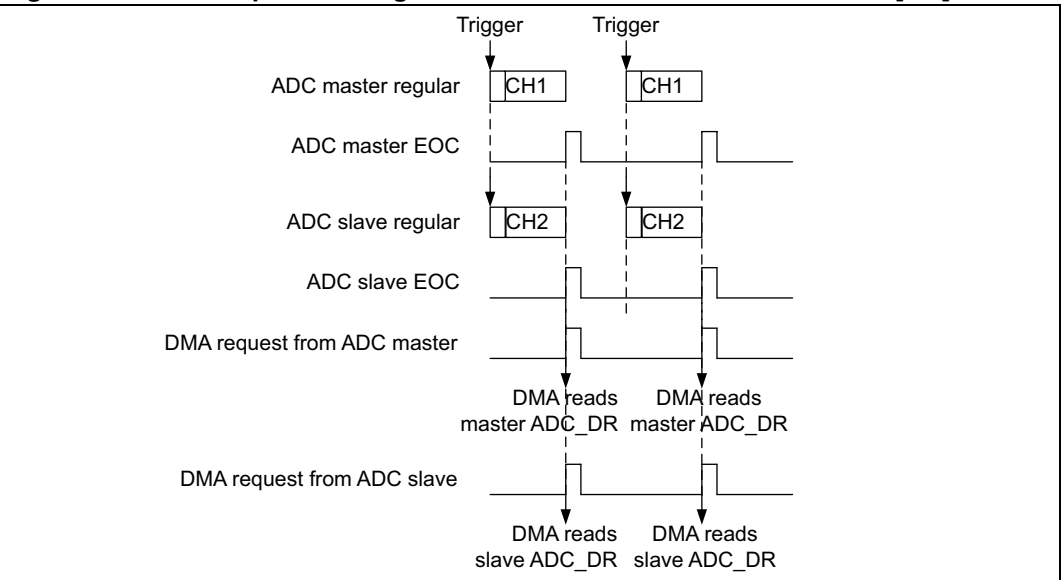

Figure 352. Two interleaved channels (CH1, CH2) with injected sequence CH11, CH12 case 2: Slave interrupted first

DMA requests in dual ADC mode

In all dual ADC modes, it is possible to use two DMA channels (one for the master, one for the slave) to transfer the data, like in single mode (refer to *Figure 353: DMA requests in regular simultaneous mode when DAMDF[1:0] = 0b00*).

Figure 353. DMA requests in regular simultaneous mode when DAMDF[1:0] = 0b00

Configuration where each sequence contains only one conversion. Master and slave timings are equal.

MSv31032V3

In interleaved mode or in simultaneous regular mode, it is also possible to save one DMA channel and transfer both data using a single DMA channel. To do this, the DAMDF[1:0] bits must be configured in the ADCC_CCR register:

- **DAMDF[1:0] = 0b10, 32-bit format:**

  A DMA request is generated alternatively after the master and slave EOC events have occurred. At that time, the data are alternatively available in the 32-bit register ADCC_CDR2 32-bit register.

  This mode is used when the data width is above 16 bits (conversion data width can exceed 16 bits when functions such as oversampling, compensation and left-bit shift, are used).

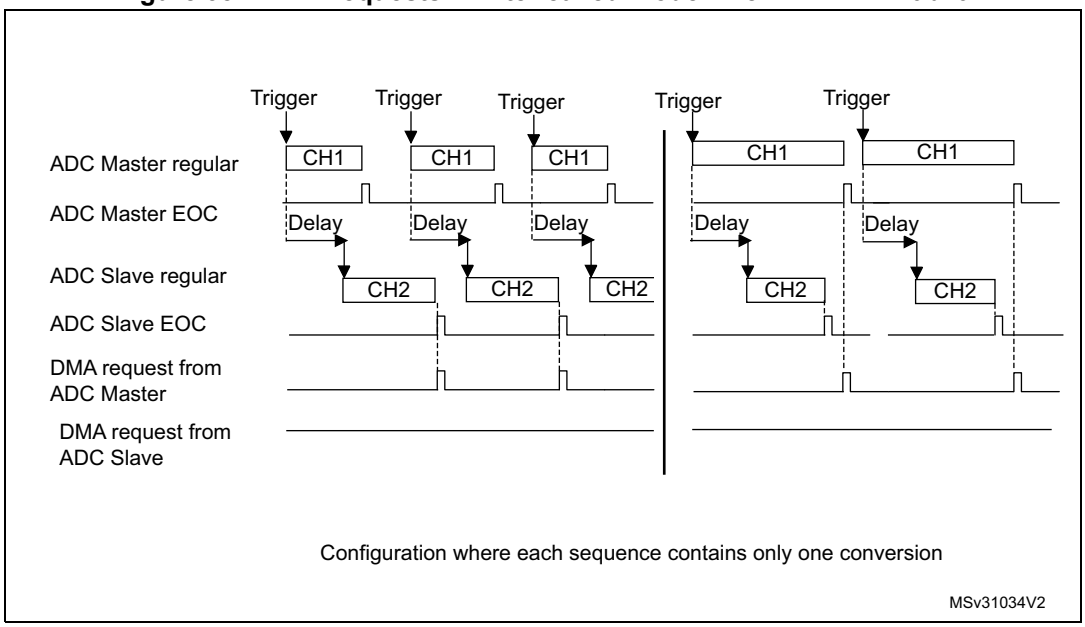
  Behavior: A DMA request is generated each time a new 32-bit data is available:

  – First DMA request: ADCC_CDR2[31:0] = MST_ADC_DR[31:0]

  – Second DMA request: ADCC_CDR2[31:0] = SLV_ADC_DR[31:0]

- **DAMDF[1:0] = 0b10, 16-bit format**:

  A DMA request is generated alternatively after the master and slave EOC events have occurred. At that time, two data items are available and the 32-bit register ADCC_CDR contains the two half-words representing two ADC-converted data. The slave ADC data takes the upper half-word and the master ADC data takes the lower half-word. DMA transfers two data by one request.



Any value above 16-bit in the master or the slave-converted data is truncated to the least 16 significant bits.

Behavior: A DMA request is generated each time a new 32-bit data is available:

– First DMA request:
ADCC_CDR[31:0] = (SLV_ADC_DR[15:0] << 16) | MST_ADC_DR[15:0]

– Second DMA request:
ADCC_CDR[31:0] = SLV_ADC_DR[15:0] | MST_ADC_DR[15:0]

Figure 354. DMA requests in interleaved mode when DAMDF = 0b10

Note: When using dual ADC mode, the user must take care to configure properly the duration of the master and slave conversions so that a DMA request is generated and served for reading both data (master + slave) before a new conversion data is available.

- **DAMDF[1:0] = 0b11**:

  This mode is similar to the DAMDF[1:0] = 0b10 configuration. The only difference is that on each DMA request (two data are available), two bytes representing two ADC converted data are transferred as a half-word.

  This mode is used when the resolution is 6 bits or 8 bits and data are not signed.

  Behavior: A DMA request is generated each time two data items are available:

  – First DMA request:
  ADCC_CDR[15:0] = (SLV_ADC_DR[7:0] << 8)| MST_ADC_DR[7:0]

  – Second DMA request:
  ADCC_CDR[15:0] = SLV_ADC_DR[7:0] | MST_ADC_DR[7:0]

Note: DMA burst mode is not supported in ADC dual mode.

Overrun detection when OVRMOD = 0

In dual ADC mode (when DUAL[4:0] is not equal to b00000), if an overrun is detected on one of the ADCs, DMA requests are no longer issued to ensure that all the data transferred to the RAM are valid (this behavior occurs whatever the DAMDF configuration). The EOC bit

corresponding to one ADC might remains set because the data register of this ADC contains valid data.

Overrun detection when OVRMOD = 1

In dual ADC mode, if an overrun occurs on either ADC, the data register is overwritten, causing continuous DMA requests. This results in loss of data coherency.

DMA one-shot mode/ DMA circular mode when multi-ADC mode is selected

When DAMDF mode is selected (0b10 or 0b11), DMNGT[1:0] bits of the ADCC_CCR register must also be configured to select between DMA one-shot mode and circular mode, as explained in section *Section : Managing conversions using the DMA*

Stopping the conversions in dual ADC modes

In dual ADC mode, the user software must set the ADSTP/JADSTP control bits in the master ADC to stop the conversions of both ADC. The other ADSTP control bit on the slave ADC has no effect in dual ADC mode.

Once both ADCs are effectively stopped, the ADSTART/JADSTART bits on the master and slave ADCs are both deasserted by hardware.

Analog watchdog in dual mode

The analog watchdog is supported in all dual modes.

Disabling the ADC in dual mode

During a dual-mode operation, the master ADC shares the ADC clock with the slave ADC. To disable the ADC correctly through the ADDIS bit of ADC_CR, set the ADSTP (or JADSP) bit on the master ADC. Once ADSTP (or JADSTP) becomes 0 both for the master and slave ADCs, set the ADDIS bit on the master ADC, then set the ADDIS bit on the slave ADC.

Autoinjection mode in dual mode

Autoinjection mode is not supported when DUAL[4:0] equals 0b00010, 0b00011, 0b00101, 0b00110, 0b00111, or 0b01001.

Additionally, parallel injected oversampling mode is not supported in autoinjection mode.

ADF mode in dual ADC interleaved mode

In dual ADC interleaved modes (DUAL[4:0] = 0b00011 or DUAL[4:0] = 0b00111), the ADC conversion results can be transferred directly to the ADF.

This mode is enabled by setting DMNGT[1:0] bits to 0b10 in the master ADC ADC_CFGR1 register.

The ADC transfers alternatively the 16 least significant bits of the regular data register from the master and the slave converter to a single channel of the ADF. Each transfer resets the EOC flag of each channel once the transfer is complete.

The data format must be 16-bit signed:

ADC_DR[15:12] = Sign extended

ADC_DR[11] = Sign

ADC_DR[10:0] = Data

To obtain 16-bit signed format, the software must configure OFFSET[11:0] bits to 0x800 with OFFSETy_CH[4:0] selecting the target channel set.

Only right aligned data can be set as ADF input format (see *Figure 316: Right alignment (offset enabled, signed value)*).

ADF mode in dual ADC simultaneous mode

It is not mandatory to use the ADF in dual ADC simultaneous mode since conversion data are handled by each individual channel. Single mode with same trigger source results in simultaneous conversion with ADF interface.

Dual ADC modes supported in oversampling mode

It is possible to have oversampling enabled when working in dual ADC configuration. In this case, the two ADCs must be programmed with the very same settings (including oversampling).

All other dual ADC modes are not supported when either regular or injected oversampling is enabled (that means when ROVSE = 1 or JOVSE = 1).

25.4.35 Temperature sensor

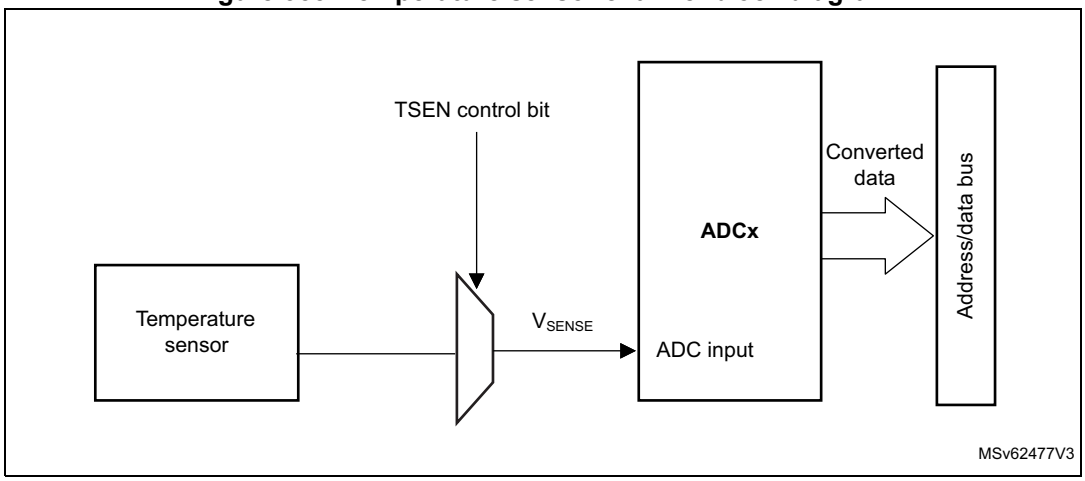
The temperature sensor can be used to measure the junction temperature (T_J) of the device.

The temperature sensor is internally connected to the ADC input channels, which are used to convert the sensor output voltage to a digital value (see *Table: ADC interconnection* in *Section 25.4.2: ADC pins and internal signals* for more details). When not in use, the sensor can be put in power-down mode. It supports the temperature range specified in the product datasheet.

Figure 355 shows the block diagram of connections between the temperature sensor and the ADC.

The temperature sensor output voltage changes linearly with temperature. The offset of this line varies from chip to chip due to process variation (up to 45 °C from one chip to another).

The uncalibrated internal temperature sensor is more suited for applications that detect temperature variations instead of absolute temperatures. To improve the accuracy of the temperature sensor measurement, calibration values are stored in system memory for each device by ST during production.



During the manufacturing process, the calibration data of the temperature sensor and the internal voltage reference are stored in the system memory area. The user application can then read them and use them to improve the accuracy of the temperature sensor or the internal reference (refer to the datasheet for additional information).

The temperature sensor is internally connected to the ADC input channel, which is used to convert the sensor's output voltage to a digital value. Refer to the electrical characteristics section of the device datasheet for the sampling time value to be applied when converting the internal temperature sensor.

When not in use, the sensor can be put in power-down mode.

Figure 355 shows the block diagram of the temperature sensor.

Figure 355. Temperature sensor channel block diagram

Reading the temperature

To use the sensor:

1. Select the ADC input channel that is connected to V_{SENSE}.
2. Program with the appropriate sampling time (refer to the electrical characteristics section of the device datasheet).
3. Set the TSEN bit in the ADCC_CCR register to wake up the temperature sensor from power-down mode.
4. Start the ADC conversion.
5. Read the resulting V_{SENSE} data in the ADC data register.
6. Calculate the actual temperature using the following formula:

$$\text{Temperature (in °C)} = \frac{\text{TS_CAL2_TEMP} - \text{TS_CAL1_TEMP}}{\text{TS_CAL2} - \text{TS_CAL1}} \times (\text{TS_DATA} - \text{TS_CAL1}) + \text{TS_CAL1_TEMP}$$

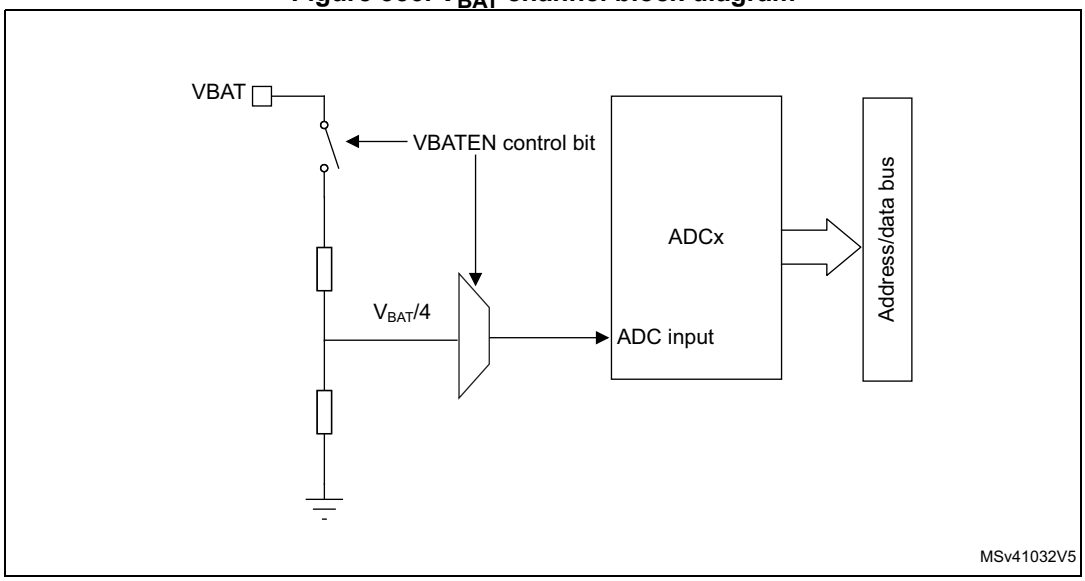
Where:

- TS_CAL2 is the temperature sensor calibration value acquired at TS_CAL2_TEMP.
- TS_CAL1 is the temperature sensor calibration value acquired at TS_CAL1_TEMP.
- TS_DATA is the actual temperature sensor output value converted by ADC.

  Refer to the device datasheet for more information about TS_CAL1 and TS_CAL2 calibration points.

Caution: The above formula is valid only if the V_{REF+} condition specified in the table *Temperature sensor calibration values* of the datasheet are respected.

Note: The sensor has a startup time after waking from power-down mode before it can output V_{SENSE} at the correct level. The ADC also has a startup time after power-on, so to minimize the delay, the ADEN, and TSEN bits must be set simultaneously.



25.4.36 V_{BAT} supply monitoring

The VBATEN bit in the ADCC_CCR register is used to switch to the battery voltage. As the V_{BAT} voltage can be higher than V_{DDA}, to ensure the correct operation of the ADC, the V_{BAT} pin is internally connected to a bridge divider by 4. This bridge is automatically enabled when VBATEN is set, to connect $V_{BAT}/4$ to the ADC input channels (see *Table: ADC interconnection* in *Section 25.4.2: ADC pins and internal signals* for more details). As a consequence, the converted digital value is one fourth of the V_{BAT} voltage. To prevent any unwanted consumption on the battery, it is recommended to enable the bridge divider only when needed, for ADC conversion.

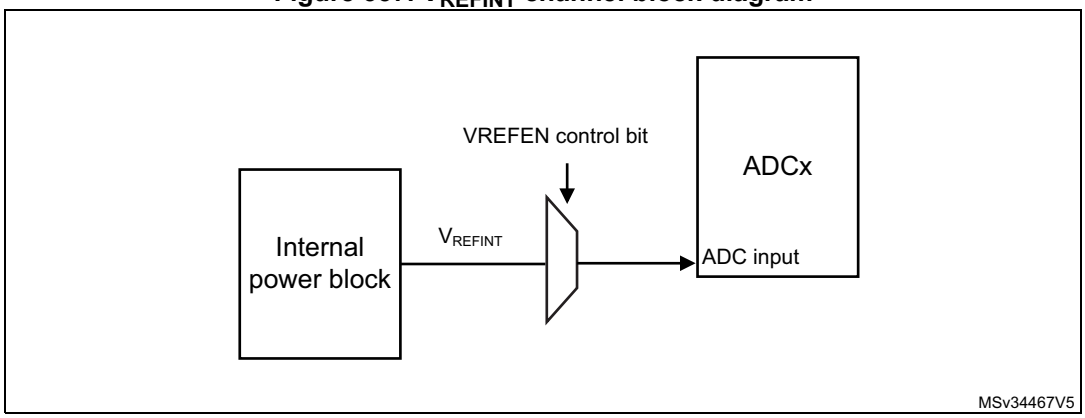
Refer to the electrical characteristics of the device datasheet for the sampling time value to be applied when converting the $V_{BAT}/4$ voltage.

Figure 356 shows the block diagram of the V_{BAT} sensing feature.

Figure 356. V_{BAT} channel block diagram

1. The VBATEN bit must be set to enable the conversion of internal channel for $V_{BAT}/4$.

25.4.37 Monitoring the internal voltage reference



It is possible to monitor the internal voltage reference (V_{REFINT}) to have a reference point for evaluating the ADC V_{REF+} voltage level.

Refer to the *ADC interconnection* table in *Section 25.4.2: ADC pins and internal signals* for details on the ADC input channels to which the internal voltage reference is internally connected.

Refer to the electrical characteristics section of the device datasheet for the sampling time value to be applied when converting the internal voltage reference voltage.

Figure 357 shows the block diagram of the V_{REFINT} sensing feature.

Figure 357. V_{REFINT} channel block diagram

1. The VREFEN bit of the ADCC_CCR register must be set to enable the conversion of internal channels (V_{REFINT}).

Calculating the actual V_{REF+} voltage using the internal reference voltage

The power supply voltage applied to the device may be subject to variations or not precisely known. When V_{DDA} is connected to V_{REF+}, it is possible to compute the actual V_{DDA} voltage using the embedded internal reference voltage (V_{REFINT}). V_{REFINT} and its calibration data acquired by the ADC during the manufacturing process at V_{REF+} can be used to evaluate the actual V_{DDA} voltage level.

The following formula gives the actual V_{REF+} voltage supplying the device:

$$V_{REF+} = V_{REF+_Charac} \times VREFINT_CAL / VREFINT_DATA$$

Where:

- V_{REF+_Charac} is the value of V_{REF+} voltage characterized at V_{REFINT} during the manufacturing process. It is specified in the device datasheet.
- VREFINT_CAL is the VREFINT calibration value.
- VREFINT_DATA is the actual VREFINT output value converted by ADC.

Converting a supply-relative ADC measurement to an absolute voltage value

The ADC is designed to deliver a digital value corresponding to the ratio between V_{REF+} and the voltage applied on the converted channel.

For some applications, the V_{REF+} value is unknown and ADC converted values are right-aligned. In this case, it is necessary to convert this ratio into a voltage independent from V_{REF+}:

$$V_{CHANNELx} = \frac{V_{REF+}}{FULL_SCALE} \times ADC_DATA$$

By replacing V_{REF+} by the formula provided above, the absolute voltage value is given by the following formula

$$V_{CHANNELx} = \frac{V_{REF+_Charac} \times VREFINT_CAL \times ADC_DATA}{VREFINT_DATA \times FULL_SCALE}$$

For applications where V_{REF+} is known and ADC converted values are right-aligned, the absolute voltage value can be obtained by using the following formula:

$$V_{CHANNELx} = \frac{V_{REF+}}{FULL_SCALE} \times ADC_DATA$$

Where:

- VREFINT_CAL is the VREFINT calibration value.
- ADC_DATA is the value measured by the ADC on channel x (right-aligned).
- VREFINT_DATA is the actual VREFINT output value converted by the ADC.
- FULL_SCALE is the maximum digital value of the ADC output. For example with 12-bit resolution, we obtain $2^{12} – 1 = 4095$, or $2^8 – 1 = 255$ with 8-bit resolution.

Note: If ADC measurements are done using an output format other than 12-bit right-aligned, all the parameters must first be converted to a compatible format before the calculation is done.

25.4.38 Monitoring the DAC output voltage

The ADC is connected to a DAC internal channel. To measure the DAC output voltage, enable the DAC internal channel through DAC registers.

25.4.39 Monitoring the supply voltage

The ADCs are connected to the internal supply voltage. To use the ADC to measure this voltage, enable the connection through ADC option register.

25.5 ADC interrupts

For each ADC, an interrupt can be generated:

- After ADC power-up, when the ADC is ready (ADRDY flag)
- On the end of any conversion for regular groups (EOC flag)
- On the end of a sequence of conversion for regular groups (EOS flag)
- On the end of any conversion for injected groups (JEOC flag)
- On the end of a sequence of conversion for injected groups (JEOS flag)
- When an analog watchdog detection occurs (AWD1, AWD2, and AWD3 flags)
- When the end of the sampling phase occurs (EOSMP flag)
- When the data overrun occurs (OVR flag)
- When the ADC internal voltage regulator output is ready (LDORDY flag)
- When the injected sequence context queue overflows (JQOVF flag)

Separate interrupt enable bits are available for flexibility.

Note: Interrupts are generated by the AHB clock domain. Since the ADC clock is adc_ker_ck, interrupt flags are delayed due to the synchronization between adc_ker_ck and AHB clock domains.

Table 254. ADC interrupts

Interrupt vector	Interrupt event	Event flag	Enable Control bit	Interrupt clear method	Exit from Sleep mode	Exit from Stop, Standby mode
ADC	ADC ready	ADRDY	ADRDYIE	Set by hardware and cleared by software	Yes	No
	End of conversion of a regular group	EOC	EOCIE			
	End of conversion sequence of a regular group	EOS	EOSIE			
	End of conversion of an injected group	JEOC	JEOCIE			
	End of conversion sequence of an injected group	JEOS	JEOSIE			
	Analog watchdog 1 flag is set	AWD1	AWD1IE			
	Analog watchdog 2 flag is set	AWD2	AWD2IE			
	Analog watchdog 3 flag is set	AWD3	AWD3IE			
	End of sampling phase	EOSMP	EOSMPIE			
	Overrun	OVR	OVRIE			
	ADC internal voltage regulator ready	LDORDY	LDORDYIE			
	Injected context queue overflows	JQOVF	JQOVFIE			

25.6 ADC registers (for each ADC)

Refer to *Section 1.2* for a list of abbreviations used in register descriptions.

25.6.1 ADC interrupt and status register (ADC_ISR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	LDORDY	Res.	JQOVF	AWD3	AWD2	AWD1	JEOS	JEOC	OVR	EOS	EOC	EOSMP	ADRDY
			rc_w1		rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1	rc_w1

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **LDORDY**: ADC internal voltage regulator output ready flag

This bit is set by hardware and cleared by software. It indicates that the ADC internal voltage regulator output is ready and that the ADC can be enabled or calibrated.

0: ADC LDO internal voltage regulator disabled

1: ADC LDO internal voltage regulator enabled

Bit 11 Reserved, must be kept at reset value.

Bit 10 **JQOVF**: Injected context queue overflow

This bit is set by hardware when an overflow of the injected queue of context occurs. It is cleared by software writing 1 to it or when ADEN = 0.

Refer to *Section 25.4.23: Queue of context for injected conversions* for more information.

0: No injected context queue overflow occurred (or the flag event was already acknowledged and cleared by software)

1: Injected context queue overflow has occurred

Bit 9 **AWD3**: Analog watchdog 3 flag

This bit is set by hardware when the converted voltage crosses the values programmed in the fields LTR[22:0] and HTR[22:0] of ADC_AWD3LTR and ADC_AWD3HTR registers. It is cleared by software writing 1 to it or when ADEN = 0.

0: No analog watchdog 3 event occurred (or the flag event was already acknowledged and cleared by software)

1: Analog watchdog 3 event occurred

Bit 8 **AWD2**: Analog watchdog 2 flag

This bit is set by hardware when the converted voltage crosses the values programmed in the fields LTR[22:0] and HTR[22:0] of ADC_AWD2LTR and ADC_AWD2HTR registers. It is cleared by software writing 1 to it or when ADEN = 0.

0: No analog watchdog 2 event occurred (or the flag event was already acknowledged and cleared by software)

1: Analog watchdog 2 event occurred

Bit 7 **AWD1**: Analog watchdog 1 flag

This bit is set by hardware when the converted voltage crosses the values programmed in the fields LTR[22:0] and HTR[22:0] of ADC_AWD1LTR and ADC_AWD1HTR registers. It is cleared by software writing 1 to it or when ADEN = 0.

0: No analog watchdog 1 event occurred (or the flag event was already acknowledged and cleared by software)

1: Analog watchdog 1 event occurred

Bit 6 **JEOS:** Injected channel end of sequence flag

This bit is set by hardware at the end of the conversions of all injected channels in the group. It is cleared by software writing 1 to it or when ADEN = 0.

0: Injected conversion sequence not complete (or the flag event was already acknowledged and cleared by software)

1: Injected conversions complete

Bit 5 **JEOC:** Injected channel end of conversion flag

This bit is set by hardware at the end of each injected conversion of a channel when a new data is available in the corresponding ADC_JDRy register. It is cleared by software writing 1 to it, when ADEN = 0, or by reading the corresponding ADC_JDRy register.

0: Injected channel conversion not complete (or the flag event was already acknowledged and cleared by software)

1: Injected channel conversion complete

Bit 4 **OVR**: ADC overrun

This bit is set by hardware when an overrun occurs on a regular channel (a new conversion has completed while the EOC flag was already set) or when adc_hclk clock is too slow to manage the data.

It is cleared by software writing 1 to it or when ADEN = 0.

0: No overrun occurred (or the flag event was already acknowledged and cleared by software)

1: Overrun has occurred

Bit 3 **EOS**: End of regular sequence flag

This bit is set by hardware at the end of the conversions of a regular sequence of channels. It is cleared by software writing 1 to it or when ADEN = 0.

0: Regular conversions sequence not complete (or the flag event was already acknowledged and cleared by software)

1: Regular conversions sequence complete

Bit 2 **EOC**: End of conversion flag

This bit is set by hardware at the end of each regular conversion of a channel when a new data is available in the ADC_DR register. It is cleared by software writing 1 to it, when ADEN = 0, or by reading the ADC_DR register.

0: Regular channel conversion not complete (or the flag event was already acknowledged and cleared by software)

1: Regular channel conversion complete

Bit 1 **EOSMP**: End of sampling flag

This bit is set by hardware during the conversion of any channel (only for regular channels), at the end of the sampling phase. It is cleared by software writing 1 or when ADEN = 0.

0: not at the end of the sampling phase (or the flag event was already acknowledged and cleared by software)

1: End of sampling phase reached

Bit 0 **ADRDY**: ADC ready

This bit is set by hardware after the ADC has been enabled (bit ADEN = 1) and when the ADC reaches a state where it is ready to accept conversion requests.

It is cleared by software writing 1 to it or when ADEN = 0.

0: ADC not yet ready to start conversion (or the flag event was already acknowledged and cleared by software)

1: ADC is ready to start conversion

25.6.2 ADC interrupt enable register (ADC_IER)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	LDORDYIE	Res.	JQOVFIE	AWD3IE	AWD2IE	AWD1IE	JEOSIE	JEOCIE	OVRIE	EOSIE	EOCIE	EOSMPIE	ADRDYIE
			rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **LDORDYIE**: ADC internal voltage regulator interrupt enable

This bit is set and cleared by software to enable/disable the ADC internal voltage regulator interrupt.

0: Internal voltage regulator interrupt disabled

1: Internal voltage regulator interrupt enabled

Note: The software is allowed to write this bit only when ADEN = 0.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **JQOVFIE**: Injected context queue overflow interrupt enable

This bit is set and cleared by software to enable/disable the injected context queue overflow interrupt.

0: Injected context queue overflow interrupt disabled

1: Injected context queue overflow interrupt enabled. An interrupt is generated when the JQOVF bit is set.

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Bit 9 **AWD3IE**: Analog watchdog 3 interrupt enable

This bit is set and cleared by software to enable/disable the analog watchdog 2 interrupt.

0: Analog watchdog 3 interrupt disabled

1: Analog watchdog 3 interrupt enabled

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 8 **AWD2IE**: Analog watchdog 2 interrupt enable

This bit is set and cleared by software to enable/disable the analog watchdog 2 interrupt.

0: Analog watchdog 2 interrupt disabled

1: Analog watchdog 2 interrupt enabled

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 7 **AWD1IE**: Analog watchdog 1 interrupt enable

This bit is set and cleared by software to enable/disable the analog watchdog 1 interrupt.

0: Analog watchdog 1 interrupt disabled

1: Analog watchdog 1 interrupt enabled

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 6 **JEOSIE**: End of injected sequence of conversions interrupt enable

This bit is set and cleared by software to enable/disable the end of injected sequence of conversions interrupt.

0: JEOS interrupt disabled

1: JEOS interrupt enabled. An interrupt is generated when the JEOS bit is set.

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Bit 5 **JEOCIE**: End of injected conversion interrupt enable

This bit is set and cleared by software to enable/disable the end of an injected conversion interrupt.

0: JEOC interrupt disabled.

1: JEOC interrupt enabled. An interrupt is generated when the JEOC bit is set.

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Bit 4 **OVRIE**: Overrun interrupt enable

This bit is set and cleared by software to enable/disable the Overrun interrupt of a regular conversion.

0: Overrun interrupt disabled

1: Overrun interrupt enabled. An interrupt is generated when the OVR bit is set.

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 3 **EOSIE**: End of regular sequence of conversions interrupt enable

This bit is set and cleared by software to enable/disable the end of regular sequence of conversions interrupt.

0: EOS interrupt disabled

1: EOS interrupt enabled. An interrupt is generated when the EOS bit is set.

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 2 **EOCIE**: End of regular conversion interrupt enable

This bit is set and cleared by software to enable/disable the end of a regular conversion interrupt.

0: EOC interrupt disabled.

1: EOC interrupt enabled. An interrupt is generated when the EOC bit is set.

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 1 **EOSMPIE**: End of sampling flag interrupt enable for regular conversions

This bit is set and cleared by software to enable/disable the end of the sampling phase interrupt for regular conversions.

0: EOSMP interrupt disabled.

1: EOSMP interrupt enabled. An interrupt is generated when the EOSMP bit is set.

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 0 **ADRDYIE**: ADC ready interrupt enable

This bit is set and cleared by software to enable/disable the ADC Ready interrupt.

0: ADRDY interrupt disabled

1: ADRDY interrupt enabled. An interrupt is generated when the ADRDY bit is set.

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

25.6.3 ADC control register (ADC_CR)

Address offset: 0x008

Reset value: 0x2000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ADCAL	ADCALDIF	DEEPPWD	ADVREGEN	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rs	rw	rw	rw												
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	JADSTP	ADSTP	JADSTART	ADSTART	ADDIS	ADEN
										rs	rs	rs	rs	rs	rs

Bit 31 **ADCAL**: ADC calibration

This bit is set by software to start the calibration of the ADC. Program first the bit ADCALDIF to determine if this calibration applies for single-ended or differential inputs mode.

It is cleared by hardware after calibration is complete.

0: Calibration complete

1: Write 1 to calibrate the ADC. Read at 1 means that a calibration in progress.

Note: The software is allowed to launch a calibration by setting ADCAL only when ADEN = 0.

The software is allowed to update the calibration factor by writing ADC_CALFACT only when ADEN = 1 and ADSTART = 0 and JADSTART = 0 (ADC enabled and no conversion is ongoing)

Bit 30 **ADCALDIF**: Differential mode for calibration

This bit is set and cleared by software to configure the single-ended or differential input mode for the calibration.

0: Single-ended input calibration mode when ADCAL = 1

1: Differential input calibration mode when ADCAL = 1

Note: The software is allowed to write this bit only when the ADC is disabled and is not calibrating (ADCAL = 0, JADSTART = 0, JADSTP = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0).

Bit 29 **DEEPPWD**: Deep-power-down enable

This bit is set and cleared by software to put the ADC in Deep-power-down mode.

0: ADC not in Deep-power down

1: ADC in Deep-power-down (default reset state)

Note: The software is allowed to write this bit only when the ADC is disabled (ADCAL = 0 and ADEN =0).

Bit 28 **ADVREGEN**: ADC internal voltage regulator enable

This bits is set by software to enable the ADC internal voltage regulator.

Before performing any operation such as launching a calibration or enabling the ADC, the ADC voltage regulator must first be enabled and the software must wait for the regulator start-up time.

0: ADC internal voltage regulator disabled

1: ADC internal voltage regulator enabled.

For more details about the ADC voltage regulator enable and disable sequences, refer to *Section 25.4.6: ADC Deep-power-down mode (DEEPPWD)*.

The software can program this bit field only when the ADC is disabled (ADCAL = 0, JADSTART=0, ADSTART=0, ADSTP=0, ADDIS=0 and ADEN=0).

Bits 27:6 Reserved, must be kept at reset value.

Bit 5 **JADSTP**: ADC stop of injected conversion command

This bit is set by software to stop and discard an ongoing injected conversion (JADSTP command).

It is cleared by hardware when the conversion is effectively discarded and the ADC injected sequence and triggers can be reconfigured. The ADC is then ready to accept a new start of injected conversions (JADSTART command).

When a software trigger is used, JADSTART bit is cleared by hardware, but JADSTP bit must be programmed to reconfigure the ADC.

0: No ADC stop injected conversion command ongoing

1: Write 1 to stop injected conversions ongoing. Read 1 means that an ADSTP command is in progress.

Note: In autoinjection mode (JAUTO = 1), setting ADSTP bit aborts both regular and injected conversions (do not use JADSTP).

Bit 4 **ADSTP**: ADC stop of regular conversion command

This bit is set by software to stop and discard an ongoing regular conversion (ADSTP command).

It is cleared by hardware when the conversion is effectively discarded. and the ADC regular sequence and triggers can be re-configured. The ADC is then ready to accept a new start of regular conversions (ADSTART command).

When a software trigger is used, ADSTART bit is cleared by hardware. However it is necessary to write ADSTP bit to reconfigure the ADC.

0: No ADC stop regular conversion command ongoing

1: Write 1 to stop ongoing regular conversions. Read 1 means that an ADSTP command is in progress.

Note: In autoinjection mode (JAUTO = 1), setting ADSTP bit aborts both regular and injected conversions (do not use ADSTP).

Bit 3 **JADSTART**: ADC start of injected conversion

This bit is set by software to start ADC conversion of injected channels. Depending on the configuration bits JEXTEN[1:0], a conversion starts immediately (software trigger configuration) or once an injected hardware trigger event occurs (hardware trigger configuration).

- In single conversion mode when software trigger is selected (JEXTSEL = 0x0 and JDISEN = 1), this bit is cleared by hardware immediately after injected conversion starts.
- In all cases, after the execution of the JADSTP command, this bit and JADSTP are cleared by hardware simultaneously.

0: No ADC injected conversion is ongoing.

1: Write 1 to start injected conversions. Read 1 means that the ADC is operating and eventually converting an injected channel.

Note: The software is allowed to set JADSTART only when ADEN = 1, ADDIS = 0 and JAUTO = 0 (ADC is enabled and there is no pending request to disable the ADC).

Note: In autoinjection mode (JAUTO = 1), regular and autoinjected conversions are started by setting ADSTART bit (JADSTART must be kept cleared).

Bit 2 **ADSTART**: ADC start of regular conversion

This bit is set by software to start ADC conversion of regular channels. Depending on the configuration bits EXTEN[1:0], a conversion starts immediately (software trigger configuration) or once a regular hardware trigger event occurs (hardware trigger configuration).

- In single conversion mode when software trigger is selected (EXTSEL = 0x0 and DISEN = 1), this bit is cleared by hardware immediately after regular conversion starts.
- In all cases, after the execution of the ADSTP command, this bit and ADSTP are cleared by hardware simultaneously.

0: No ADC regular conversion is ongoing.

1: Write 1 to start regular conversions. Read 1 means that the ADC is operating and eventually converting a regular channel.

Note: The software is allowed to set ADSTART only when ADEN = 1 and ADDIS = 0 (ADC is enabled and there is no pending request to disable the ADC).

Note: In autoinjection mode (JAUTO = 1), regular and autoinjected conversions are started by setting ADSTART bit (JADSTART must be kept cleared)

Bit 1 **ADDIS**: ADC disable command

This bit is set by software to disable the ADC (ADDIS command) and place it into power-down state (OFF state).

It is cleared by hardware once the ADC is effectively disabled (ADEN is also cleared by hardware at this time).

0: no ADDIS command ongoing

1: Write 1 to disable the ADC. Read 1 means that an ADDIS command is in progress.

Note: The software is allowed to set ADDIS only when ADEN = 1, ADDIS = 0 and both ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 0 **ADEN**: ADC enable control

This bit is set by software to enable the ADC. The ADC is effectively ready to operate once the ADRDY flag has been set.

It is cleared by hardware when the ADC is disabled, after the execution of the ADDIS command.

0: ADC is disabled (OFF state)

1: Write 1 to enable the ADC.

Note: The software is allowed to set ADEN only when all the bits of ADC_CR registers are cleared (ADCAL = 0, JADSTART = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0), except for ADVREGEN bit which must be set. In addition, the software must wait for the startup time of the voltage regulator.

25.6.4 ADC configuration register (ADC_CFGR1)

Address offset: 0x00C

Reset value: 0x8000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
JQDIS	AWD1CH[4:0]					JAUTO	JAWD1EN	AWD1EN	AWD1SGL	JQM	JDISCEN	DISCNUM[2:0]			DISCEN
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	AUTDLY	CONT	OVRMOD	EXTEN[1:0]		EXTSEL[4:0]					Res.	RES[1:0]		DMNGT[1:0]	
	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw

Bit 31 **JQDIS**: Injected queue disable

This bit is set and cleared by software to disable the injected queue mechanism:

0: Injected queue enabled

1: Injected queue disabled

Note: The software is allowed to write this bit only when ADEN = 0, ADSTART = 0, and JADSTART = 0.

Note: A set or reset of JQDIS bit causes the injected queue to be flushed and the ADC_JSQR register is cleared.

Bits 30:26 **AWD1CH[4:0]**: Analog watchdog 1 channel selection

These bits are set and cleared by software. They select the input channel to be guarded by the analog watchdog.

00000: ADC analog input channel 0 monitored by AWD1

00001: ADC analog input channel 1 monitored by AWD1

.....

10011: ADC analog input channel 19 monitored by AWD1

Others: reserved, must not be used

Note: Some channels are not connected physically. Keep the corresponding AWD1CH[4:0] setting to the reset value.

Note: The channel selected by AWD1CH must be also selected into the SQRi or JSQRi registers.

The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 25 **JAUTO:** Automatic injected group conversion

This bit is set and cleared by software to enable/disable automatic injected group conversion after regular group conversion.

0: Automatic injected group conversion disabled

1: Automatic injected group conversion enabled

Note: The software is allowed to write this bit only when ADEN = 0.

Bit 24 **JAWD1EN**: Analog watchdog 1 enable on injected channels

This bit is set and cleared by software

0: Analog watchdog 1 disabled on injected channels

1: Analog watchdog 1 enabled on injected channels

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Bit 23 **AWD1EN**: Analog watchdog 1 enable on regular channels

This bit is set and cleared by software

0: Analog watchdog 1 disabled on regular channels

1: Analog watchdog 1 enabled on regular channels

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 22 **AWD1SGL**: Enable the watchdog 1 on a single channel or on all channels

This bit is set and cleared by software to enable the analog watchdog on the channel identified by the AWD1CH[4:0] bits or on all the channels

0: Analog watchdog 1 enabled on all channels

1: Analog watchdog 1 enabled on a single channel

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 21 **JQM**: ADC_JSQR queue mode

This bit is set and cleared by software.

It defines how an empty Queue is managed.

0: ADC_JSQR mode 0: The Queue is never empty and maintains the last written configuration to ADC_JSQR.

1: ADC_JSQR mode 1: The Queue can be empty and when this occurs, the software and hardware triggers of the injected sequence are both internally disabled just after the completion of the last valid injected sequence.

Refer to *Section 25.4.23: Queue of context for injected conversions* for more information.

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Bit 20 **JDISCEN:** Discontinuous mode on injected channels

This bit is set and cleared by software to enable/disable discontinuous mode on the injected channels of a group.

0: Discontinuous mode on injected channels disabled

1: Discontinuous mode on injected channels enabled

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no injected conversion is ongoing).

Note: It is not possible to use autoinjection mode and discontinuous mode simultaneously: the DISCEN and JDISCEN bits must be kept cleared by software when JAUTO is set.

Note: When dual mode is enabled (DUAL bits of ADCC_CCR register are not equal to zero), the JDISCEN bit of the slave ADC is not valid and controlled by the JDISCEN bit of the master ADC.

Bits 19:17 **DISCNUM[2:0]:** Discontinuous mode channel count

These bits are written by software to define the number of regular channels to be converted in discontinuous mode, after receiving an external trigger.

000: 1 channel

001: 2 channels

...

111: 8 channels

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Note: When dual mode is enabled (DUAL bits in ADCC_CCR register are not equal to zero), the DISCNUM[2:0] bits of the slave ADC are not valid and controlled by the DISCNUM[2:0] bits of the master ADC.

Bit 16 **DISCEN**: Discontinuous mode for regular channels

This bit is set and cleared by software to enable/disable discontinuous mode for regular channels.

0: Discontinuous mode for regular channels disabled

1: Discontinuous mode for regular channels enabled

Note: It is not possible to have both discontinuous mode and continuous mode enabled: DISCEN and CONT cannot both be set (DISCEN takes priority).

Note: It is not possible to use autoinjection mode and discontinuous mode simultaneously: the DISCEN and JDISCEN bits must be kept cleared by software when JAUTO is set.

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Note: When regular dual mode is enabled (DUAL bits in ADCC_CCR register are not equal to zero), the DISCEN bit of the slave ADC is not valid and controlled by the DISCEN bit of the master ADC.

Bit 15 Reserved, must be kept at reset value.

Bit 14 **AUTDLY**: Delayed conversion mode

This bit is set and cleared by software to enable/disable the autodelayed conversion mode.

0: Autodelayed conversion mode off

1: Autodelayed conversion mode on

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Note: When dual mode is enabled (DUAL bits in ADCC_CCR register are not equal to zero), the AUTDLY bit of the slave ADC is not valid and controlled by the AUTDLY bit of the master ADC.

Bit 13 **CONT**: Single/continuous conversion mode for regular conversions

This bit is set and cleared by software. If it is set, regular conversion takes place continuously until it is cleared.

0: Single conversion mode

1: Continuous conversion mode

Note: It is not possible to have both discontinuous mode and continuous mode enabled: DISCEN and CONT cannot both be set (DISCEN takes priority).

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Note: When regular dual mode is enabled (DUAL bits in ADCC_CCR register are not equal to zero), the CONT bit of the slave ADC is not valid and controlled by the CONT bit of the master ADC.

Bit 12 **OVRMOD**: Overrun mode

This bit is set and cleared by software and configure the way data overrun is managed.

0: ADC_DR register is preserved with the old data when an overrun is detected.

1: ADC_DR register is overwritten with the last conversion result when an overrun is detected.

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bits 11:10 **EXTEN[1:0]**: External trigger enable and polarity selection for regular channels

These bits are set and cleared by software to select the external trigger polarity and enable the trigger of a regular group.

00: Hardware trigger detection disabled (conversions can be launched by software)

01: Hardware trigger detection on the rising edge

10: Hardware trigger detection on the falling edge

11: Hardware trigger detection on both the rising and falling edges

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bits 9:5 **EXTSEL[4:0]**: External trigger selection for regular group

These bits select the external event used to trigger the start of conversion of a regular group:

00000: adc_ext_trg0
00001: adc_ext_trg1
00010: adc_ext_trg2
00011: adc_ext_trg3
00100: adc_ext_trg4
00101: adc_ext_trg5
00110: adc_ext_trg6
00111: adc_ext_trg7
...
11111: adc_ext_trg31

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 4 Reserved, must be kept at reset value.

Bits 3:2 **RES[1:0]**: Data resolution

These bits are written by software to select the resolution of the conversion.

00: 12-bit
01: 10-bit
10: 8-bit
11: 6-bit

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bits 1:0 **DMNGT[1:0]**: Data management configuration

These bits are set and cleared by software to select how the ADC interface output data are managed.

00: Regular conversion data stored in DR only
01: DMA one-shot mode selected
10: ADF mode selected
11: DMA circular mode selected

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no conversion is ongoing).

25.6.5 ADC configuration register 2 (ADC_CFGR2)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
LSHIFT[3:0]				Res.	Res.	OVSR[9:0]									
rw	rw	rw	rw			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SMPTRIG	SWTRIG	BULB	Res.	Res.	ROVSM	TROVS	OVSS[3:0]				Res.	PDIFFREF	PDIFF	Res.	ROVSE
rw	rw	rw			rw	rw	rw	rw	rw	rw		rw	rw		rw

Bits 31:28 **LSHIFT[3:0]**: Left shift factor

This bitfield is set and cleared by software to define the left shifting applied to the final result with or without oversampling.

0000: No left shift
0001: 1-bit left shift
0010: 2-bit left shift
0011: 3-bit left shift
0100: 4-bit left shift
0101: 5-bit left shift
0110: 6-bit left shift
0111: 7-bit left shift
1000: 8-bit left shift
1001: 9-bit left shift
1010: 10-bit left shift
1011: 11-bit left shift
1100: 12-bit left shift
1101: 13-bit left shift
1110: 14-bit left shift
1111: 15-bit left shift

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no conversion is ongoing).

Bits 27:26 Reserved, must be kept at reset value.

Bits 25:16 **OVSR[9:0]**: Oversampling ratio

This bitfield is set and cleared by software to define the oversampling ratio.

0: 1x (no oversampling)
1: 2x
2: 3x
...
1023: 1024x

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no conversion is ongoing).

Bit 15 **SMPTRIG**: Sampling time control trigger mode

This bit is set and cleared by software to enable the sampling time control trigger mode.

0: Sampling time control trigger mode disabled
1: Sampling time control trigger mode enabled

If EXTEN[1:0] bits are set to 01, the sampling time starts on the trigger rising edge, and the conversion starts on the trigger falling edge.

The SMPTRIG bit must not be set when the BULB bit is set.

When EXTEN[1:0] bits are set to 00, set SWTRIG to start the sampling.

Note: The software is allowed to write this bit only when ADEN = 0. When the discontinuous mode is used, only DISCNUM[2:0] = 000 configuration is compatible with sampling time control trigger mode*.*

Bit 14 **SWTRIG**: Software trigger bit for sampling time control trigger mode

This bit is set and cleared by software to trigger the conversion in sampling time control trigger mode.

0: Software trigger starts the conversion for sampling time control trigger mode
1: Software trigger starts the sampling for *sampling time control trigger mode*

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no conversion is ongoing), SMPTRIG = 1, and EXTEN[0:1] = 00.

Bit 13 **BULB**: Bulb sampling mode

This bit is set and cleared by software to enable the bulb sampling mode.

0: Bulb sampling mode disabled

1: Bulb sampling mode enabled. The sampling period starts just after the previous end of conversion.

BULB bit must not be set when the SWTRIG bit is set.

The very first ADC conversion is performed with the sampling time specified in SMPx bits.

Note: The software is allowed to write this bit only when ADEN = 0. When the discontinuous mode is used, only DISCNUM[2:0] = 000 configuration is compatible with bulb mode.

Bits 12:11 Reserved, must be kept at reset value.

Bit 10 **ROVSM**: Regular oversampling mode

This bit is set and cleared by software to select the regular oversampling mode.

0: Continued mode: When injected conversions are triggered, the oversampling is temporary stopped and continued after the injection sequence (oversampling buffer is maintained during injected sequence)

1: Resumed mode: When injected conversions are triggered, the current oversampling is aborted and resumed from start after the injection sequence (oversampling buffer is zeroed by injected sequence start)

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no conversion is ongoing). It is recommended to clear both JOVSE and GCOMP when ROVSM = 0.

Bit 9 **TROVS**: Triggered regular oversampling

This bit is set and cleared by software to enable triggered oversampling

0: All oversampled conversions for a channel are done consecutively following a trigger

1: Each oversampled conversion for a channel needs a new trigger

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bits 8:5 **OVSS[3:0]**: Oversampling shift

This bitfield is set and cleared by software to define the right shifting applied to the raw oversampling result.

0000: No shift

0001: 1-bit shift

0010: 2-bit shift

0011: 3-bit shift

0100: 4-bit shift

0101: 5-bit shift

0110: 6-bit shift

0111: 7-bit shift

1000: 8-bit shift

1001: 9-bit shift

1010: 10-bit shift

Other: reserved, must not be used

Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no conversion is ongoing).

Bit 4 Reserved, must be kept at reset value.

Bit 3 **PDIFFREF**: Pseudodifferential mode reference voltage selection
This bit is set and cleared by software to select the reference voltage used in pseudodifferential mode.
0: V_{REF-}
1: $V_{REF+}/2$
Note: The software is allowed to write this bit only when ADEN = 0.

Bit 2 **PDIFF**: Pseudodifferential mode enable
This bit is set and cleared by software to enable/disable the pseudodifferential mode.
0: Standard differential mode selected
1: Pseudodifferential mode selected
Note: The software is allowed to write this bit only when ADEN = 0.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **ROVSE**: Regular oversampling enable
This bit is set and cleared by software to enable regular oversampling.
0: Regular oversampling disabled
1: Regular oversampling enabled
Note: The software is allowed to write this bit only when ADSTART = 0 (which ensures that no conversion is ongoing)

25.6.6 ADC sample time register 1 (ADC_SMPR1)

Address offset: 0x014

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	SMP9[2:0]			SMP8[2:0]			SMP7[2:0]			SMP6[2:0]			SMP5[2:1]	
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:0 **SMPx[2:0]:** Channel x sampling time selection (x = 9 to 0)
These bits are written by software to select the sampling time individually for each channel. During sample cycles, the channel selection bits must remain unchanged.
000: 2.5 ADC clock cycles
001: 4.5 ADC clock cycles
010: 7.5 ADC clock cycles
011: 12.5 ADC clock cycles
100: 24.5 ADC clock cycles
101: 47.5 ADC clock cycles
110: 256.5 ADC clock cycles
111: 848.5 ADC clock cycles
Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).
Note: Some channels are not connected physically. Keep the corresponding SMPx[2:0] setting to the reset value.

25.6.7 ADC sample time register 2 (ADC_SMPR2)

Address offset: 0x018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:0 **SMPx[2:0]:** Channel x sampling time selection (x = 19 to 10)

These bits are written by software to select the sampling time individually for each channel. During sampling cycles, the channel selection bits must remain unchanged.

000: 2.5 ADC clock cycles
001: 4.5 ADC clock cycles
010: 7.5 ADC clock cycles
011: 12.5 ADC clock cycles
100: 24.5 ADC clock cycles
101: 47.5 ADC clock cycles
110: 256.5 ADC clock cycles
111: 848.5 ADC clock cycles

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Note: Some channels are not connected physically. Keep the corresponding SMPx[2:0] setting to the reset value.

25.6.8 ADC channel preselection register (ADC_PCSEL)

Address offset: 0x01C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	PCSEL[19:16]			
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PCSEL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **PCSEL[19:0]**: Channel i ($V_{INP[i]}$) preselection

These bits are written by software to preselect the input channel I/O to be converted.

0: Input channel i ($V_{INP[i]}$) is not preselected for conversion, the result of the ADC conversion for this channel is wrong

1: Input channel i ($V_{INP[i]}$) is preselected for conversion

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Configuring the PCSEL bit is not necessary for the internal channels (such as VREFINT).

25.6.9 ADC regular sequence register 1 (ADC_SQR1)

Address offset: 0x030

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	SQ4[4:0]					Res.	SQ3[4:0]					Res.	SQ2[4]
			rw	rw	rw	rw	rw		rw	rw	rw	rw	rw		rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SQ2[3:0]				Res.	SQ1[4:0]					Res.	Res.	LEN[3:0]			
rw	rw	rw	rw		rw	rw	rw	rw	rw			rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **SQ4[4:0]:** 4th conversion in regular sequence

These bits are written by software with the channel number (0 to 19) assigned as the 4th in the regular conversion sequence.

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 23 Reserved, must be kept at reset value.

Bits 22:18 **SQ3[4:0]:** 3rd conversion in regular sequence

These bits are written by software with the channel number (0 to 19) assigned as the 3rd in the regular conversion sequence.

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 17 Reserved, must be kept at reset value.

Bits 16:12 **SQ2[4:0]:** 2nd conversion in regular sequence

These bits are written by software with the channel number (0 to 19) assigned as the 2nd in the regular conversion sequence.

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 11 Reserved, must be kept at reset value.

Bits 10:6 **SQ1[4:0]:** 1st conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 1st in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bits 5:4 Reserved, must be kept at reset value.

Bits 3:0 **LEN[3:0]:** Regular channel sequence length
These bits are written by software to define the total number of conversions in the regular channel conversion sequence.
0000: 1 conversion
0001: 2 conversions
...
1111: 16 conversions
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for conversion.

25.6.10 ADC regular sequence register 2 (ADC_SQR2)

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw		rw	rw	rw	rw	rw		rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **SQ9[4:0]:** 9th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 9th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 23 Reserved, must be kept at reset value.

Bits 22:18 **SQ8[4:0]:** 8th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 8th in the regular conversion sequence
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 17 Reserved, must be kept at reset value.

Bits 16:12 **SQ7[4:0]:** 7th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 7th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 11 Reserved, must be kept at reset value.

Bits 10:6 **SQ6[4:0]:** 6th conversion in regular sequence

These bits are written by software with the channel number (0 to 19) assigned as the 6th in the regular conversion sequence.

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **SQ5[4:0]:** 5th conversion in regular sequence

These bits are written by software with the channel number (0 to 19) assigned as the 5th in the regular conversion sequence.

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for conversion.

25.6.11 ADC regular sequence register 3 (ADC_SQR3)

Address offset: 0x038

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

SQ12[3:0]				Res.	SQ11[4:0]					Res.	SQ10[4:0]				
rw	rw	rw	rw		rw	rw	rw	rw	rw		rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **SQ14[4:0]:** 14th conversion in regular sequence

These bits are written by software with the channel number (0 to 19) assigned as the 14th in the regular conversion sequence.

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 23 Reserved, must be kept at reset value.

Bits 22:18 **SQ13[4:0]:** 13th conversion in regular sequence

These bits are written by software with the channel number (0 to 19) assigned as the 13th in the regular conversion sequence.

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 17 Reserved, must be kept at reset value.

Bits 16:12 **SQ12[4:0]:** 12th conversion in regular sequence

These bits are written by software with the channel number (0 to 19) assigned as the 12th in the regular conversion sequence.

Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 11 Reserved, must be kept at reset value.

Bits 10:6 **SQ11[4:0]:** 11th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 11th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **SQ10[4:0]:** 10th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 10th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for conversion.

25.6.12 ADC regular sequence register 4 (ADC_SQR4)

Address offset: 0x03C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

					rw	rw	rw	rw	rw		rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:6 **SQ16[4:0]:** 16th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 16th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Bit 5 Reserved, must be kept at reset value.

Bits 4:0 **SQ15[4:0]:** 15th conversion in regular sequence
These bits are written by software with the channel number (0 to 19) assigned as the 15th in the regular conversion sequence.
Note: The software is allowed to write these bits only when ADSTART = 0 (which ensures that no regular conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for conversion.

25.6.13 ADC regular data register (ADC_DR)

Address offset: 0x040

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RDATA[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

RDATA[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RDATA[31:0]**: Regular data converted

These bits are read-only. They contain the conversion result from the last converted regular channel. The data are left- or right-aligned as described in *Section 25.4.28: Data management*.

25.6.14 ADC injected sequence register (ADC_JSQR)

Address offset: 0x04C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
JSQ4[4:0]					Res.	JSQ3[4:0]					Res.	JSQ2[4:1]			
rw	rw	rw	rw	rw		rw	rw	rw	rw	rw		rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
JSQ2[0]	Res.	JSQ1[4:0]					JEXTEN[1:0]		JEXTSEL[4:0]					JLEN[1:0]	
rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 **JSQ4[4:0]:** 4th conversion in the injected sequence

These bits are written by software with the channel number (0 to 19) assigned as the 4th in the injected conversion sequence.

Note: The software is allowed to write these bits only when JQDIS = 0 or when JADSTART = 0 and JQDIS = 1 (which ensures that no injected conversion is ongoing).

Bit 26 Reserved, must be kept at reset value.

Bits 25:21 **JSQ3[4:0]:** 3rd conversion in the injected sequence

These bits are written by software with the channel number (0 to 19) assigned as the 3rd in the injected conversion sequence.

Note: The software is allowed to write these bits only when JQDIS = 0 or when JADSTART = 0 and JQDIS = 1 (which ensures that no injected conversion is ongoing).

Bit 20 Reserved, must be kept at reset value.

Bits 19:15 **JSQ2[4:0]:** 2nd conversion in the injected sequence

These bits are written by software with the channel number (0 to 19) assigned as the 2nd in the injected conversion sequence.

Note: The software is allowed to write these bits only when JQDIS = 0 or when JADSTART = 0 and JQDIS = 1 (which ensures that no injected conversion is ongoing).

Bit 14 Reserved, must be kept at reset value.

Bits 13:9 **JSQ1[4:0]:** 1st conversion in the injected sequence

These bits are written by software with the channel number (0 to 19) assigned as the 1st in the injected conversion sequence.

Note: The software is allowed to write these bits only when JQDIS = 0 or when JADSTART = 0 and JQDIS = 1 (which ensures that no injected conversion is ongoing).

Bits 8:7 **JEXTEN[1:0]**: External trigger enable and polarity selection for injected channels

These bits are set and cleared by software to select the external trigger polarity and enable the trigger of an injected group.

00: Hardware trigger detection disabled (conversions can be launched by software)

01: Hardware trigger detection on the rising edge

10: Hardware trigger detection on the falling edge

11: Hardware trigger detection on both the rising and falling edges

Note: The software is allowed to write these bits only when JQDIS = 0 or when JADSTART = 0 and JQDIS = 1 (which ensures that no injected conversion is ongoing).

Bits 6:2 **JEXTSEL[4:0]**: External trigger selection for injected group

These bits select the external event used to trigger the start of conversion of an injected group:

00000: adc_jext_trg0

00001: adc_jext_trg1

00010: adc_jext_trg2

00011: adc_jext_trg3

00100: adc_jext_trg4

00101: adc_jext_trg5

00110: adc_jext_trg6

00111: adc_jext_trg7

...

11111: adc_jext_trg31

Note: The software is allowed to write these bits only when JQDIS = 0 or when JADSTART = 0 and JQDIS = 1 (which ensures that no injected conversion is ongoing).

Bits 1:0 **JLEN[1:0]:** Injected channel sequence length

These bits are written by software to define the total number of conversions in the injected channel conversion sequence.

00: 1 conversion

01: 2 conversions

10: 3 conversions

11: 4 conversions

Note: The software is allowed to write these bits only when JQDIS = 0 or when JADSTART = 0 and JQDIS = 1 (which ensures that no injected conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for conversion.

25.6.15 ADC offset y configuration register (ADC_OFCFGRy)

Address offset: 0x050 + 0x004 * (y -1), (y = 1 to 4)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
OFFSET_CH[4:0]					SSAT	USAT	POS OFF	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Bits 31:27 **OFFSET_CH[4:0]:** Channel selection for the data offset y

These bits are written by software to define the channel to which the offset programmed in bits OFFSET[21:0] applies.

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for the data offset y.

Bit 26 **SSAT**: Signed saturation enable

This bit is set and cleared by software to enable the signed saturation feature.(see *Section : Data register, data alignment and offset (ADC_DR, ADC_JDRy, OFFSETy, OFFSETy_CH, OVSS, LSHIFT, JOVSS, JLSHIFT[a], USAT, SSAT, POSOFF)*).

0: Offset is subtracted maintaining the data integrity and extending converted data size (13-bit signed format)

1: Offset is subtracted and result is saturated to maintain the converted data size

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 25 **USAT**: Unsigned saturation enable

This bit is set and cleared by software to enable the unsigned saturation feature.

0: Offset is subtracted maintaining the data integrity

1: Offset is subtracted and result is saturated to maintain the converted data size

Note: The software is allowed to write these bits only when ADSTART = and JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 24 **POSOFF**: Positive offset enable

This bit is set and cleared by software to enable the positive offset

0: Negative offset

1: Positive offset

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bits 23:0 Reserved, must be kept at reset value.

25.6.16 ADC offset y register (ADC_OFRy)

Address offset: 0x060 + 0x004 * (y -1), (y= 1 to 4)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OFFSET[21:16]

OFFSET[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 21:0 **OFFSET[21:0]:** Data offset y for the channel programmed in OFFSETy_CH[4:0] bits

These bits are written by software to define the offset y to be subtracted from the raw converted data when converting a channel (can be regular or injected). The channel to which applies the data offset y must be programmed in the OFFSETy_CH[4:0] bits. The conversion result can be read from in the ADC_DR (regular conversion) or from in the ADC_JDRyi registers (injected conversion).

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

25.6.17 ADC gain compensation register (ADC_GCOMP)

Address offset: 0x070

Reset value: 0x0000 1000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
G COMP	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	GCOMPCOEFF[13:0]													
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **GCOMP:** Gain compensation mode

This bit is set and cleared by software to enable the Gain compensation mode.

0: Regular ADC operation mode

1: Gain compensation enabled and applied on all channels.

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensure that no conversion is ongoing)

Bits 30:14 Reserved, must be kept at reset value.

Bits 13:0 **GCOMPCOEFF[13:0]:** Gain compensation coefficient

These bits are set and cleared by software to program the gain compensation coefficient.

00 1000 0000 0000: gain factor of 0.5

...

01 0000 0000 0000: gain factor of 1

10 0000 0000 0000: gain factor of 2

11 0000 0000 0000: gain factor of 3

...

The coefficient is divided by 4096 to get the gain factor ranging from 0 to 3.9999756

Note: This gain compensation is only applied when GCOMP bit is set.

Note: The software is allowed to write this bit only when ADSTART = 0 and JADSTART = 0 (which ensure that no conversion is ongoing).

25.6.18 ADC analog watchdog y source channel register (ADC_AWDySR)

Address offset: 0x070 + 0x004 * (y -1), (y = 1 to 3)

Reset value: 0x0000 0000

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **AWDS_CH[19:0]:** Analog watchdog source for channel *i* (V_{INP}[i])

These bits are set by hardware when channel *i* has generated the flag. They are cleared by software by writing 1 to it, or by setting the ADDIS bit. Each bit corresponds to the input channel that created the analog watchdog flag.

25.6.19 ADC injected channel y data register (ADC_JDRy)

Address offset: 0x080 + 0x004 * (y - 1), (y = 1 to 4)

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
JDATA[31:16]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
JDATA[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **JDATA[31:0]:** Injected data

These bits are read-only. They contain the conversion result from injected channel y. The data are left- or right-aligned as described in *Section 25.4.28: Data management*.

25.6.20 ADC configuration register 3 (ADC_CFGR3)

Address offset: 0x090

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
JLSHIFT[3:0]				Res.	Res.	JOVSR[9:0]									
rw	rw	rw	rw			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	TJOVS	JOVSS[3:0]				Res.	Res.	JOVSIVE	JOVSE	JOVSPAR
						rw	rw	rw	rw	rw			rw	rw	rw

Bits 31:28 **JLSHIFT[3:0]**: Left shift factor

This bitfield is set and cleared by software to define the left shifting applied to the final result with or without oversampling.

0000: No left shift
0001: 1-bit left shift
0010: 2-bit left shift
0011: 3-bit left shift
0100: 4-bit left shift
0101: 5-bit left shift
0110: 6-bit left shift
0111: 7-bit left shift
1000: 8-bit left shift
1001: 9-bit left shift
1010: 10-bit left shift
1011: 11-bit left shift
1100: 12-bit left shift
1101: 13-bit left shift
1110: 14-bit left shift
1111: 15-bit left shift

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no conversion is ongoing).

Bits 27:26 Reserved, must be kept at reset value.

Bits 25:16 **JOVSR[9:0]**: Injected channel oversampling ratio

This bitfield is set and cleared by software to define the injected channel oversampling ratio.

00 0000 0000: 1x (no oversampling)

00 0000 0001-11 1111 1111: {val+1}x

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no conversion is ongoing).

Bits 15:10 Reserved, must be kept at reset value.

Bit 9 **TJOVS**: Triggered injected channel oversampling

This bit is set and cleared by software to enable triggered injected channel oversampling.

0: All oversampled conversions for a channel are done consecutively following a trigger
1: Each oversampled conversion for a channel needs a new trigger

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no conversion is ongoing).

Bits 8:5 **JOVSS[3:0]**: Injected channel oversampling shift

This bitfield is set and cleared by software to define the right shifting applied to the raw oversampling result.

0000: No shift
0001: Shift 1-bit
0010: Shift 2-bits
0011: Shift 3-bits
0100: Shift 4-bits
0101: Shift 5-bits
0110: Shift 6-bits
0111: Shift 7-bits
1000: Shift 8-bits
Others: reserved

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no conversion is ongoing).

Bits 4:3 Reserved, must be kept at reset value.

Bit 2 **JOVSIVE**: Injected oversampling intermediate value enable

This bit is set and cleared by software to enable the access to the injected oversampling intermediate value on JDATA register.

0: Injected oversampling intermediate data not available on JDATA
1: Injected oversampling intermediate data available on JDATA

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 1 **JOVSE**: Injected oversampling enable

This bit is set and cleared by software to enable injected oversampling.

0: Injected oversampling disabled
1: Injected oversampling enabled

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no conversion is ongoing).

Bit 0 **JOVSPAR**: Parallel injected oversampling enable

This bit is set and cleared by software to enable parallel injected oversampling.

0: Parallel Injected oversampling disabled
1: Parallel Injected oversampling enabled

Note: The software is allowed to write this bit only when JADSTART = 0 (which ensures that no conversion is ongoing), it is necessary to set JOVSE bit when JOVSPAR bit set.

25.6.21 ADC injected oversampling counter register 1 (ADC_JOVSCR1)

Address offset: 0x094

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	JOVSC2[9:0]

Res.	Res.	Res.	Res.	Res.	Res.	JOVSC1[9:0]									
						r	r	r	r	r	r	r	r	r	r

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:16 **JOVSC2[9:0]:** Oversampling counter number for injected channel 2
This bitfield is set by hardware and cleared by hardware when JADSTART or ADDIS is set.
00 0000 0000: No oversampling or oversampling conversion finished
00 0000 0001 - 11 1111 1111: Number of remaining conversions to complete the oversampling

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:0 **JOVSC1[9:0]:** Oversampling counter number for injected channel 1
This bitfield is set by hardware and cleared by hardware when JADSTART or ADDIS is set.
00 0000 0000: No oversampling or oversampling conversion finished
00 0000 0001 - 11 1111 1111: Number of remaining conversions to complete the oversampling

25.6.22 ADC injected oversampling counter register 2 (ADC_JOVSCR2)

Address offset: 0x098

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	JOVSC4[9:0]

Res.	Res.	Res.	Res.	Res.	Res.	JOVSC3[9:0]									
						r	r	r	r	r	r	r	r	r	r

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:16 **JOVSC4[9:0]:** Oversampling counter number for injected channel 4
This bitfield is set by hardware and cleared by hardware when JADSTART or ADDIS is set.
00 0000 0000: Number of remaining conversions to complete the oversampling
00 0000 0001 - 11 1111 1111: Number of remaining conversions to complete the oversampling

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:0 **JOVSC3[9:0]:** Oversampling counter number for injected channel 3
This bitfield is set by hardware and cleared by hardware when JADSTART or ADDIS is set.
00 0000 0000: No oversampling or oversampling conversion finished
00 0000 0001 - 11 1111 1111: Number of remaining conversions to complete the oversampling

25.6.23 ADC analog watchdog 2 configuration register (ADC_AWD2CR)

Address offset: 0x0A0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	AWDCH[19:16]			
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
AWDCH[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **AWDCH[19:0]**: Analog watchdog 2 channel selection

These bits are set and cleared by software. They enable and select the input channels to be guarded by the analog watchdog 2.

AWDCH[i] = 0: ADC analog input channel i is not monitored by AWD2

AWDCH[i] = 1: ADC analog input channel i is monitored by AWD2

When AWDCH[19:0] = 000..0, the analog Watchdog 2 is disabled

Note: The channels selected by AWDCH must be also selected in the SQi or JSQi bits.

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for the analog watchdog.

25.6.24 ADC analog watchdog 3 configuration register (ADC_AWD3CR)

Address offset: 0x0A4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
AWDCH[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **AWDCH[19:0]**: Analog watchdog 3 channel selection

These bits are set and cleared by software. They enable and select the input channels to be guarded by the analog watchdog 3.

AWDCH[i] = 0: ADC analog input channel i is not monitored by AWD3

AWDCH[i] = 1: ADC analog input channel i is monitored by AWD3

When AWDCH[19:0] = 000..0, the analog Watchdog 3 is disabled.

Note: The channels selected by AWDCH must be also selected in the SQi or JSQi bits.

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Note: Some channels are not connected physically and must not be selected for the analog watchdog.

25.6.25 ADC analog watchdog 1 lower threshold register (ADC_AWD1LTR)

Address offset: 0x0A8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LTR[22:16]						
									rw	rw	rw	rw	rw	rw	rw

LTR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:0 **LTR[22:0]**: Analog watchdog 1 lower threshold

These bits are set and cleared by software to define the lower threshold for analog watchdog 1.
Refer to *Section 25.4.31: Analog window watchdog (AWD1EN, JAWD1EN, AWD1SGL, AWD1CH, AWDCH of ADC_AWD2CR and ADC_AWD3CR, HTR, LTR, AWDFILT)*.

25.6.26 ADC analog watchdog 1 higher threshold register (ADC_AWD1HTR)

Address offset: 0x0AC

Reset value: 0x003F FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
AWDFILT[2:0]			Res.	Res.	Res.	Res.	Res.	Res.	HTR[22:16]

HTR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 **AWDFILT[2:0]**: Analog watchdog filtering parameter

These bits are set and cleared by software.
000: No filtering, one detection generates an AWD1 flag or an interrupt
001: two consecutive detections generate an AWD1 flag or an interrupt
...
111: Eight consecutive detections generate an AWD1 flag or an interrupt

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bits 28:23 Reserved, must be kept at reset value.

Bits 22:0 **HTR[22:0]**: Analog watchdog 1 higher threshold

These bits are set and cleared by software to define the higher threshold for analog watchdog 1.
Refer to *Analog windows watchdog* section.

25.6.27 ADC analog watchdog 2 lower threshold register (ADC_AWD2LTR)

Address offset: 0x0B0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

HTR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 **AWDFILT[2:0]**: Analog watchdog filtering parameter

These bits are set and cleared by software.

000: No filtering, one detection generates an AWD2 flag or an interrupt

001: two consecutive detections generate an AWD2 flag or an interrupt

...

111: Eight consecutive detections generate an AWD2 flag or an interrupt

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bits 28:23 Reserved, must be kept at reset value.

Bits 22:0 **HTR[22:0]**: Analog watchdog 2 higher threshold

These bits are set and cleared by software to define the higher threshold for analog watchdog 2. Refer to *Analog windows watchdog* section.

25.6.29 ADC analog watchdog 3 lower threshold register (ADC_AWD3LTR)

Address offset: 0x0B8

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

HTR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:29 **AWDFILT[2:0]**: Analog watchdog filtering parameter

These bits are set and cleared by software.

000: No filtering, one detection generates an AWD3 flag or an interrupt

001: two consecutive detections generate an AWD3 flag or an interrupt

...

111: Eight consecutive detections generate an AWD3 flag or an interrupt

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

Bits 28:23 Reserved, must be kept at reset value.

Bits 22:0 **HTR[22:0]**: Analog watchdog 3 higher threshold

These bits are set and cleared by software to define the higher threshold for analog watchdog 3. Refer to *Analog windows watchdog* section.

25.6.31 ADC differential mode selection register (ADC_DIFSEL)

Address offset: 0x0C0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DIFSEL[19:16]			
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DIFSEL[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	r

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **DIFSEL[19:0]:** Differential mode for channels 19 to 0.

These bits are set and cleared by software. They allow to select if a channel is configured as single-ended or differential or pseudodifferential mode.

DIFSEL[i] = 0: ADC analog input channel is configured in single-ended mode

DIFSEL[i] = 1: ADC analog input channel i is configured in differential or pseudodifferential mode

Note: The DIFSEL bits corresponding to channels that are either connected to a single-ended I/O port or to an internal channel must be kept their reset value (single-ended input mode).

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (which ensures that no conversion is ongoing).

25.6.32 ADC calibration factors (ADC_CALFACT)

Address offset: 0x0C4

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CALFACT_D[6:0]						
									rw	rw	rw	rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CALFACT_S[6:0]						
									rw	rw	rw	rw	rw	rw	rw

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:16 **CALFACT_D[6:0]**: Calibration factors in differential mode

These bits are written by hardware or by software.

Once a differential input calibration is complete, they are updated by hardware with the calibration factors.

The software can write these bits with a new calibration factor. If the new calibration factor is different from the current one stored in the analog ADC, it is applied once a new differential conversion is launched.

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (ADC is enabled, no calibration is ongoing and no conversion is ongoing).

Bits 15:7 Reserved, must be kept at reset value.

Bits 6:0 **CALFACT_S[6:0]**: Calibration factors In single-ended mode

These bits are written by hardware or by software.

Once a single-ended input calibration is complete, they are updated by hardware with the calibration factors.

The software can write these bits with a new calibration factor. If the new calibration factor is different from the current one stored in the analog ADC, it is applied once a new single-ended conversion is launched.

Note: The software is allowed to write these bits only when ADSTART = 0 and JADSTART = 0 (ADC is enabled, no calibration is ongoing and no conversion is ongoing).

This bit can only be cleared by a power-on reset.

25.6.33 ADC option register (ADC_OR)

Address offset: 0x0D0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OP7	OP6	OP5	OP4	OP3	OP2	OP1	OP0
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bit 7 **OP7**: Option bit 7

This bit is set and cleared by software to enable/disable the internal reference buffer dynamic biasing.

0: Enable VCM dynamic biasing

1: Disable VCM dynamic biasing

Note: The software is allowed to write this bit only when the ADC is disabled.

Bit 6 **OP6:** Option bit 6

This bit is set and cleared by software to select the redundancy bit.

0: Redundancy on bit 5

1:Redundancy on bit 3

Note: The software is allowed to write this bit only when the ADC is disabled.

Bit 5 **OP5:** Option bit 5

This bit is set and cleared by software to enabled/disable the redundancy.

0: Redundancy disabled

1:Redundancy enabled

Note: The software is allowed to write this bit only when the ADC is disabled.

Bit 4 **OP4:** Option bit 4

This bit is set and cleared by software to select the optional trigger source

Condition: ADC1 and ADC2

0: Reserved

1: Reserved

Condition: ADC3 and ADC4

0: adc_jext_trg9 = tim8_oc4

1: adc_jext_trg9 = tim4_trgo

Note: If one of the OP4 bit is set in ADC3 or ADC4, tim4_trgo is selected for both ADC3 and ADC4.

Note: The software is allowed to write this bit only when the JADSTART = 0.

Bit 3 **OP3:** Option bit 3

This bit is set and cleared by software to select the optional trigger source.
Condition: ADC1 and ADC2
0: adc_jext_trg9 = tim3_trgo
1: adc_jext_trg9 = tim4_trgo

Note: If one of the OP3 bit is set in ADC1 or ADC2, tim4_trgo is selected for both ADC1 and ADC2.

Condition: ADC3 and ADC4
0: adc_jext_trg8 = tim8_oc2
1: adc_jext_trg8 = tim4_oc3

Note: If one of the OP3 bit is set in ADC3 or ADC4, tim4_oc3 is selected for both ADC3 and ADC4.

Note: The software is allowed to write this bit only when the JADSTART = 0.

Bit 2 **OP2:** Option bit 2

This bit is set and cleared by software to select the optional trigger source.
Condition: ADC1 and ADC2
0: adc_ext_trg9 = tim3_trgo
1: adc_ext_trg9 = tim4_trgo

Note: If one of the OP2 bit is set in ADC1 or ADC2, tim4_trgo is selected for both ADC1 and ADC2.

Condition: ADC3 and ADC4
0: adc_ext_trg9 = tim3_trgo
1: adc_ext_trg9 = tim4_trgo

Note: If one of the OP2 bit is set in ADC3 or ADC4, tim4_trgo is selected for both ADC3 and ADC4.

Note: The software is allowed to write this bit only when the ADSTART = 0 and no regular conversion is ongoing.

Bit 1 **OP1:** Option bit 1

This bit is set and cleared by software to select the optional trigger source
Condition: ADC1 and ADC2
0: adc_ext_trg8 = tim3_oc4
1: adc_ext_trg8 = tim4_oc4

Note: If one of the OP1 bit is set in ADC1 or ADC2, tim4_oc4 is selected for both ADC1 and ADC2.

Condition: ADC3 and ADC4
0: adc_ext_trg8 = tim3_oc2
1: adc_ext_trg8 = tim4_oc1

Note: If one of the OP1 bit is set in ADC3 or ADC4, tim4_oc1 is selected for both ADC3 and ADC4.

Note: The software is allowed to write this bit only when the ADSTART = 0 and no regular conversion is ongoing.

Bit 0 **OP0:** Option bit 0

This bit is set and cleared by software to enable/disable the V_{DDCORE} channel.
Condition: ADC1 and ADC2 and ADC4
0: Reserved
1: Reserved
Condition: ADC3
0: V_{DDCORE} disabled
1: V_{DDCORE} enabled

25.7 ADC common registers

These registers define the control and status registers common to master and slave ADCs.

25.7.1 ADC common status register (ADCC_CSR)

Address offset: 0x000

Reset value: 0x0000 0000

This register provides an image of the flags of the different ADCs. Nevertheless it is read-only and does not allow to clear the different flags. Instead each flag must be cleared by writing 0 to it in the corresponding ADC_ISR register.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

			r		r	r	r	r	r	r	r	r	r	r	r

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **LDORDY_SLV:** ADC internal voltage regulator flag of the slave ADC
This bit is a copy of the LDORDY bit in the corresponding ADC_ISR register.

Bit 27 Reserved, must be kept at reset value.

Bit 26 **JQOVF_SLV:** Injected context queue overflow flag of the slave ADC
This bit is a copy of the JQOVF bit in the corresponding ADC_ISR register.

Bit 25 **AWD3_SLV:** Analog watchdog 3 flag of the slave ADC
This bit is a copy of the AWD3 bit in the corresponding ADC_ISR register.

Bit 24 **AWD2_SLV:** Analog watchdog 2 flag of the slave ADC
This bit is a copy of the AWD2 bit in the corresponding ADC_ISR register.

Bit 23 **AWD1_SLV:** Analog watchdog 1 flag of the slave ADC
This bit is a copy of the AWD1 bit in the corresponding ADC_ISR register.

Bit 22 **JEOS_SLV:** End of injected sequence flag of the slave ADC
This bit is a copy of the JEOS bit in the corresponding ADC_ISR register.

Bit 21 **JEOC_SLV:** End of injected conversion flag of the slave ADC
This bit is a copy of the JEOC bit in the corresponding ADC_ISR register.

Bit 20 **OVR_SLV:** Overrun flag of the slave ADC
This bit is a copy of the OVR bit in the corresponding ADC_ISR register.

Bit 19 **EOS_SLV:** End of regular sequence flag of the slave ADC. This bit is a copy of the EOS bit in the corresponding ADC_ISR register.

Bit 18 **EOC_SLV:** End of regular conversion of the slave ADC
This bit is a copy of the EOC bit in the corresponding ADC_ISR register.

Bit 17 **EOSMP_SLV:** End of sampling phase flag of the slave ADC
This bit is a copy of the EOSMP2 bit in the corresponding ADC_ISR register.

Bit 16 **ADRDY_SLV:** Slave ADC ready
This bit is a copy of the ADRDY bit in the corresponding ADC_ISR register.

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **LDORDY_MST:** ADC internal voltage regulator flag of the master ADC
This bit is a copy of the LDORDY bit in the corresponding ADC_ISR register.

Bit 11 Reserved, must be kept at reset value.

Bit 10 **JQOVF_MST:** Injected context queue overflow flag of the master ADC
This bit is a copy of the JQOVF bit in the corresponding ADC_ISR register.

Bit 9 **AWD3_MST:** Analog watchdog 3 flag of the master ADC
This bit is a copy of the AWD3 bit in the corresponding ADC_ISR register.

Bit 8 **AWD2_MST:** Analog watchdog 2 flag of the master ADC
This bit is a copy of the AWD2 bit in the corresponding ADC_ISR register.

Bit 7 **AWD1_MST:** Analog watchdog 1 flag of the master ADC
This bit is a copy of the AWD1 bit in the corresponding ADC_ISR register.

Bit 6 **JEOS_MST:** End of injected sequence flag of the master ADC
This bit is a copy of the JEOS bit in the corresponding ADC_ISR register.

Bit 5 **JEOC_MST:** End of injected conversion flag of the master ADC
This bit is a copy of the JEOC bit in the corresponding ADC_ISR register.

Bit 4 **OVR_MST:** Overrun flag of the master ADC
This bit is a copy of the OVR bit in the corresponding ADC_ISR register.

Bit 3 **EOS_MST:** End of regular sequence flag of the master ADC
This bit is a copy of the EOS bit in the corresponding ADC_ISR register.

Bit 2 **EOC_MST:** End of regular conversion of the master ADC
This bit is a copy of the EOC bit in the corresponding ADC_ISR register.

Bit 1 **EOSMP_MST:** End of Sampling phase flag of the master ADC
This bit is a copy of the EOSMP bit in the corresponding ADC_ISR register.

Bit 0 **ADRDY_MST:** Master ADC ready
This bit is a copy of the ADRDY bit in the corresponding ADC_ISR register.

25.7.2 ADC common control register (ADCC_CCR)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	VBATEN	TSEN	VREFEN	Res.	Res.	Res.	Res.	Res.	Res.
							rw	rw	rw						

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DAMDF[1:0]		Res.	Res.	DELAY[3:0]				Res.	Res.	Res.	DUAL[4:0]				
rw	rw			rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **VBATEN**: VBAT enable

This bit is set and cleared by software to enable/disable the V_{BAT} channel.

0: V_{BAT} channel disabled

1: V_{BAT} channel enabled

Note: V_{BAT} is not available on all ADC instances. Refer to Section 25.4.4: ADC connectivity for details.

Bit 23 **TSEN**: Temperature sensor voltage enable

This bit is set and cleared by software to control V_{SENSE} channel.

0: Temperature sensor channel disabled

1: Temperature sensor channel enabled

Note: The temperature sensor is not available on all ADC instances. Refer to Section 25.4.4: ADC connectivity for details.

Note: The software is allowed to write this bit only when ADEN = 0.

Bit 22 **VREFEN**: V_{REFINT} enable

This bit is set and cleared by software to enable/disable the V_{REFINT} channel.

0: V_{REFINT} channel disabled

1: V_{REFINT} channel enabled

Note: V_{REFINT} is not available on all ADC instances. Refer to Section 25.4.4: ADC connectivity for details.

Note: The software is allowed to write this bit only when ADEN = 0.

Bits 21:16 Reserved, must be kept at reset value.

Bits 15:14 **DAMDF[1:0]:** Dual ADC mode data format

This bitfield are set and cleared by software. It specifies the data format in the common data register ADCC_CDR and ADCC_CDR2.

00: Dual ADC mode without data packing (ADCC_CDR and ADCC_CDR2 registers not used).

01: Reserved

10: Data formatting mode for any data width (ADCC_CDR data register is used when the data width is less than 16 bits, otherwise ADCC_CDR2 register is used)

11: Data formatting mode for data width lower that 8 bits (ADCC_CDR data register is used)

Note: The software is allowed to write these bits only when ADEN = 0 (ADC is disabled).

Bit 13 Reserved, must be kept at reset value.

Bit 12 Reserved, must be kept at reset value.

Bits 11:8 **DELAY[3:0]:** Delay between two sampling phases

These bits are set and cleared by software. These bits are used in dual interleaved modes. Refer to *Table 253* for the value of ADC resolution versus DELAY bits values.

Note: The software is allowed to write these bits only when the ADCs are disabled (ADCAL = 0, JADSTART = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0).

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **DUAL[4:0]:** Dual ADC mode selection

These bits are written by software to select the operating mode.
All the ADCs independent:
00000: Independent mode
The following settings apply to dual mode, master and slave ADCs working together
00001: Combined regular simultaneous + Injected simultaneous mode
00010: Combined regular simultaneous + Alternate trigger mode
00011: Combined interleaved mode + Injected simultaneous mode
00101: Injected simultaneous mode only
00110: Regular simultaneous mode only
00111: Interleaved mode only
01001: Alternate trigger mode only
Others: Reserved
All other combinations are reserved and must not be programmed

Note: The software is allowed to write these bits only when the ADCs are disabled (ADCAL = 0, JADSTART = 0, ADSTART = 0, ADSTP = 0, ADDIS = 0 and ADEN = 0).

25.7.3 ADC common regular data register for dual mode (ADCC_CDR)

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RDATA_SLV[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RDATA_MST[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:16 **RDATA_SLV[15:0]:** Regular data of the slave ADC

In dual mode, these bits contain the regular data of the slave ADC. Refer to *Section 25.4.34: Dual ADC modes*.

The data alignment is applied as described in *Data register, data alignment and offset (ADC_DR, ADC_JDRy, OFFSETy, OFFSETy_CH, OVSS, LSHIFT, JOVSS, JLSHIFT[a], USAT, SSAT, POSOFF)*)

Bits 15:0 **RDATA_MST[15:0]**: Regular data of the master ADC.

In dual mode, these bits contain the regular data of the master ADC. Refer to *Section 25.4.34: Dual ADC modes*.

The data alignment is applied as described in *Data register, data alignment and offset (ADC_DR, ADC_JDRy, OFFSETy, OFFSETy_CH, OVSS, LSHIFT, JOVSS, JLSHIFT[a], USAT, SSAT, POSOFF)*)

In MDMA=0b11 mode, bits 15:8 contains SLV_ADC_DR[7:0], bits 7:0 contains MST_ADC_DR[7:0].

25.7.4 ADC common regular data register for dual mode (ADCC_CDR2)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
RDATA_ALT[31:16]

RDATA_ALT[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RDATA_ALT[31:0]**: Regular data of the master/slave alternated ADCs.

In dual mode, these bits contain the regular 32-bit data of the master and the slave ADC. Refer to *Section 25.4.34: Dual ADC modes*.

The data alignment is applied as described in *Data register, data alignment and offset (ADC_DR, ADC_JDRy, OFFSETy, OFFSETy_CH, OVSS, LSHIFT, JOVSS, JLSHIFT[a], USAT, SSAT, POSOFF)*)

25.8 ADC register map

ADC1 and ADC3 are master ADCs.

ADC2 and ADC4 operate as slave from ADC1 and ADC3, respectively.

Table 255. ADC register map and reset values for each ADC

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

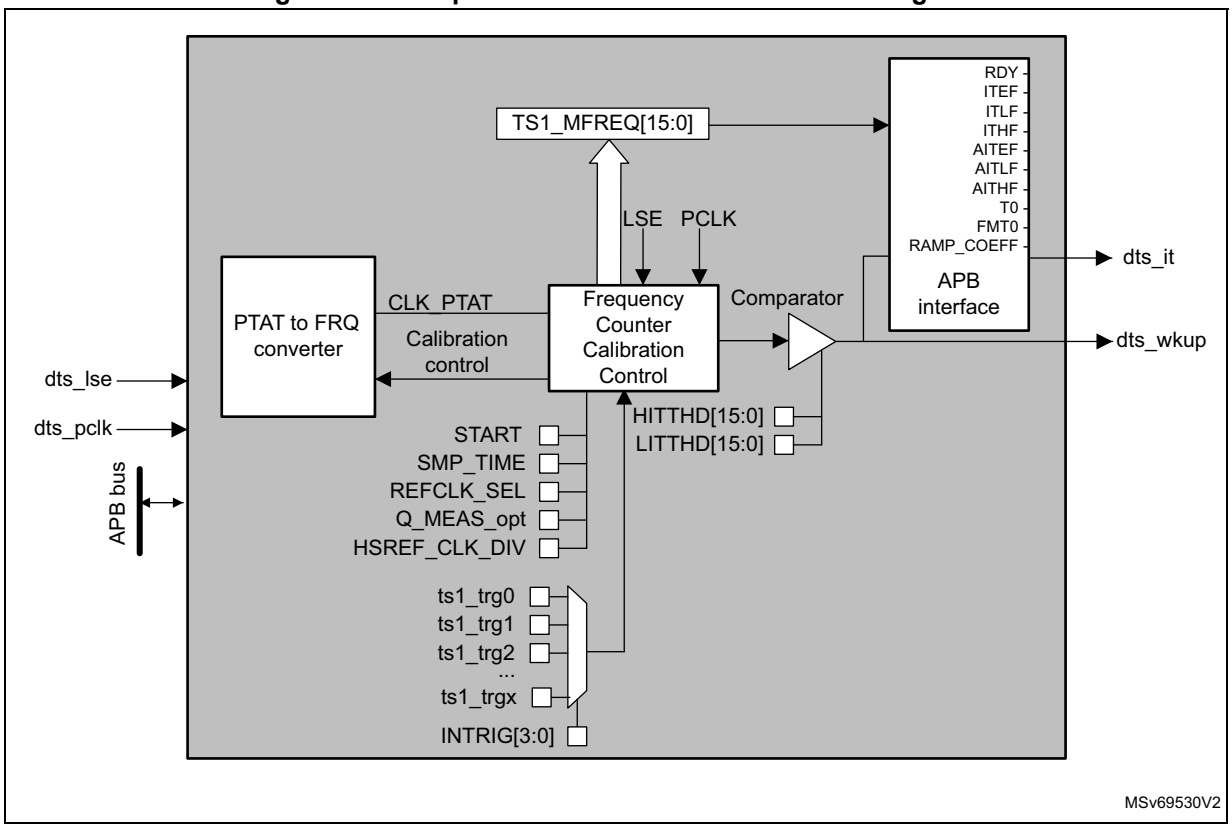
26 Digital temperature sensor (DTS)

26.1 DTS introduction

The device embeds a sensor that converts the temperature into a square wave which frequency is proportional to the temperature. The frequency is measured either with the PCLK or the LSE clock.

26.2 DTS main features

The temperature sensor block main features are the following:



- Start of measurement triggered by software or 4 hardware sources
- Programmable sampling time to increase temperature measurement precision
- Counter synchronized on LSE or PCLK clock
- Temperature watchdog on low and high threshold
- Interrupt generation when the temperature is lower or higher than predefined thresholds and at the end of measurement.
- Asynchronous wake-up signal generation when the temperature is higher/lower than a predefined threshold (LSE mode only)
- Quick measurement using LSE clock

26.3 DTS functional description

26.3.1 DTS block diagram

The temperature sensor block diagram is shown in *Figure 358*.

Figure 358. Temperature sensor functional block diagram

26.3.2 DTS internal signals

Table 257. DTS internal input/output signals

Signal name	Signal type	Description
dts_lse	Digital input	LSE clock
dts_pclk	Digital input	APB clock
dts_it	Digital output	Temperature sensor interrupt
dts_wkup	Digital output	Temperature sensor wake-up

26.3.3 DTS block operation

The analog part of the temperature sensor outputs a frequency that is proportional to the absolute temperature (CLK_PTAT). The frequency measurement is based on the PCLK or the LSE clock.

Before each measurement, the temperature sensor performs a calibration of the frequency generation blocks.

26.3.4 Operating modes

Several operating modes can be selected by setting the REFCLK_SEL bit in *Temperature sensor configuration register 1 (DTS_CFGR1)*:

- PCLK only (REFCLK_SEL = 0)

  The temperature sensor registers can be accessed. The interface can consequently be reconfigured and the measurement sequence is performed using PCLK clock
- PCLK and LSE (REFCLK_SEL = 1)

  The temperature sensor registers can be accessed. The interface can consequently be reconfigured and the measurement sequence is performed using the LSE clock.
- LSE only (REFCLK_SEL = 1) and PCLK OFF

  The registers cannot be accessed. The measurement can be performed using the LSE clock. This mode is used to exit from Sleep mode by using hardware triggers and the asynchronous interrupt line.

26.3.5 Calibration

The temperature sensor must run the calibration prior to any frequency measurement. The calibration is performed automatically when the temperature measurement is triggered except for quick measurement mode (Q_MEAS_OPT set to 1 in DTS_CFGR1).

26.3.6 Prescaler

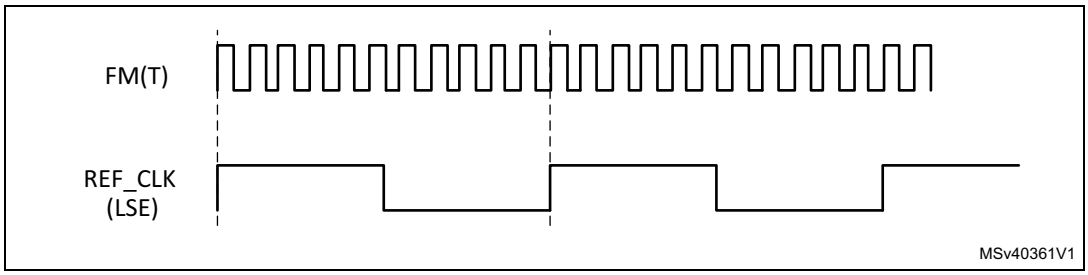
When a calibration is ongoing, the counter clock must be slower than 1 MHz. This is achieved by the PCLK clock prescaler embedded in the temperature sensor.

During the temperature measurement period, the prescaler is bypassed.

- When PCLK is used as reference clock (REFCLK_SEL set to 0 in DTS_CFGR1), a prescaler is used. Its division ratio must be configured up to 127 (refer to the HSREF_CLK_DIV[6:0] register definition for the divider setting).
- When LSE is used as reference clock (REFCLK_SEL set to 1 in DTS_CFGR1), the timebase is equal to 2 LSE periods. In this case, no prescaler is used.

26.3.7 Temperature measurement principles

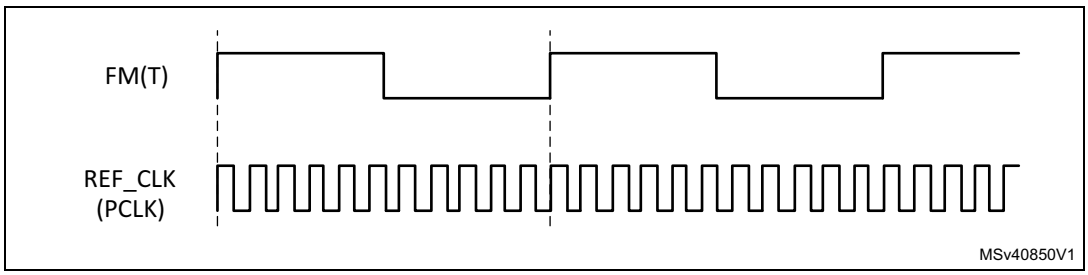
The analog part of temperature sensor outputs a signal (CLK_PTAT) which FM(T) frequency is temperature-dependent.



Either PCLK or LSE can be selected as reference clock (REF_CLK) through the REFCLK_SEL bit in DTS_CFGR1.

The counting method depends on the REF_CLK frequency. This is due to the fact that two counters are implemented in the temperature sensor block:

- For low REF_CLK frequencies, a counting of FM(T) cycles is performed during one or several REF_CLK cycles.
- For high REF_CLK frequencies, a counting of REF_CLK cycles is performed during one or several FM(T) cycles.



This counter behavior is shown in *Figure 359* and *Figure 360*.

Figure 359. Method for low REF_CLK frequencies

1. To increase the precision, FM(T) measurement can be done on several LSE periods.

Figure 360. Method for high REF_CLK frequencies

1. To increase the precision, PCLK measurement can be done on several FM(T) periods.

The counting result is stored in the DTS_DR register (see *Temperature sensor data register (DTS_DR)*.

Once the FM(T) frequency has been obtained, the corresponding temperature can be calculated by software using the following formula:

- When PCLK is used:

$$T = T_0 + ((F_{PCLK} / TS1_MFREQ) \times TS1_SMP_TIME - 100 \times TS1_FMT0) / TS1_RAMP_COEFF$$

where

T0 (factory calibration temperature) is equal to 30 °C.

TS1_FMT0 is measured and stored in the DTS_T0VALR1 register. It is expressed in hundreds of Hertz.

TS1_RAMP_COEFF is measured during tests in factory and stored in DTS_RAMPVALR register. This value is expressed in Hz/°C.

- When the LSE clock is used

$$T = T_0 + ((F_{LSE} \times TS1_MFREQ / TS1_SMP_TIME) - (100 \times TS1_FMT0)) / TS1_RAMP_COEFF$$

26.3.8 Sampling time

The sampling period can be increased to improve measurement accuracy. This is useful when the reference frequency (REF_CLK) is close to the FM(T) frequency. The default value is one REF_CLK cycle in LSE mode, and one FM(T) cycle in PCLK mode.

The sampling time is configured through TS1_SMP_TIME bits in DTS_CFGR1 register (see *Table 258*).

Table 258. Sampling time configuration

TS1_SMP_TIME[3:0]	LSE or FM(T) clock cycle(s)
0000	1
0001	1
0010	2
0011	3
0100	4
0101	5
0110	6
0111	7
1000	8
1001	9
1010	10
1011	11
1100	12
1101	13
1110	14
1111	15

26.3.9 Quick measurement mode

If a high precision is not required, the calibration step included in each measurement sequence can be skipped by setting Q_MEAS_OPT to 1 in the DTS_CFGR1 register. This method must used only when the LSE clock is selected as reference clock (LSREF_CLK set to 1). This mode can reduce the measurement time.

26.3.10 Trigger input

The temperature measurement can be triggered either by software or by an external event. The trigger source can be selected through TS1_INTRIG[3:0] bits in DTS_CFGR1.

Table 259. Trigger configuration

Name	TS1_INTRIG[3:0]				Comment
N.A	0	0	0	0	No hardware trigger
ts1_trg0	0	0	0	1	lptim4_out
ts1_trg1	0	0	1	0	lptim2_ch1
ts1_trg2	0	0	1	1	lptim3_ch1
ts1_trg3	0	1	0	0	exti13
ts1_trg4	0	1	0	1	Reserved
ts1_trg5	0	1	1	0	
ts1_trg6	0	1	1	1	
ts1_trg7	1	0	0	0	
ts1_trg8	1	0	0	1	
ts1_trg9	1	0	1	0	
ts1_trg10	1	0	1	1	
ts1_trg11	1	1	0	0	
ts1_trg12	1	1	0	1	
ts1_trg13	1	1	1	0	
ts1_trg14	1	1	1	1	

Note: Hardware triggers are active only on the rising edge.

The temperature sensor can only capture a hardware trigger rising edge when TS1_RDY bit is set (see Section 26.3.11: On-off control and ready flag), otherwise the trigger is ignored.

If a trigger source changes on-the-fly, the new trigger source signal must be low. If the new source signal is high, the temperature sensor detects a rising edge and start the measurement sequence.

26.3.11 On-off control and ready flag

The DTS block can be enabled by setting TS1_EN bit in DTS_CFGR1 register. The TS1_RDY flag in the *Temperature sensor status register (DTS_SR)* indicate that the DTS block is ready for temperature measurement: when TS1_RDY bit is set to 1, the measurement can be started. Once a measurement has started, TS1_RDY bit is reset. New measurement requests are then ignored. Once the measurement is finished, TS1_RDY bit is set again to indicate the sensor is ready to start a new measurement.

26.3.12 Temperature measurement sequence

Start of measurement can be triggered by software or hardware.

Software trigger

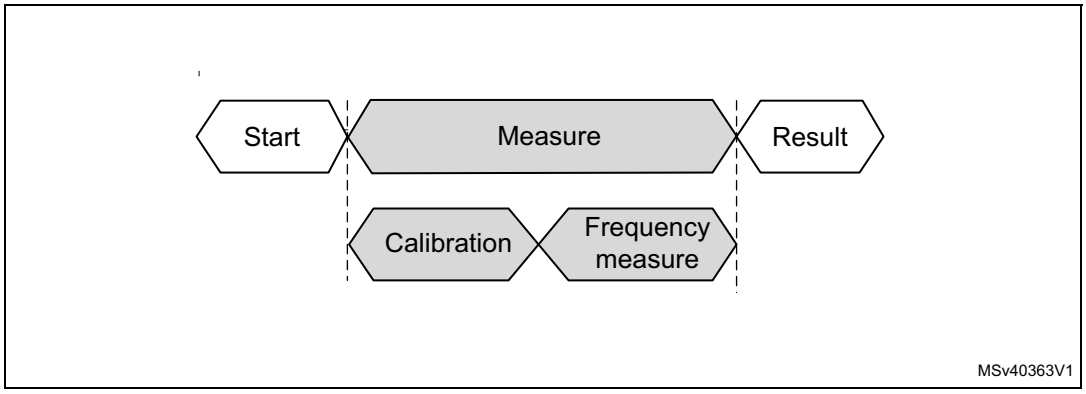
The software trigger is selected when TS1_INTRIG_SEL[3:0] is set to ‘0000’ in DTS_CFGR1.

If TS1_RDY is set to 1, writing TS1_START bit to 1 in DTS_CFGR1 starts the measurement.

If TS1_RDY equals 0, the software trigger does not start until TS1_RDY is set.

If TS1_START bit is kept at 1 once the measurement is finished, then the TS1_RDY flag become 1 and the measurement restarts.

Hardware trigger



TS1_INTRIG_SEL[3:0] bits allow selecting one hardware trigger out of 4. If TS1_RDY is set to 1, a rising edge on the trigger signal starts the measurement. When TS1_RDY is 0, the rising edge is ignored.

Temperature measurement sequence

One measurement contains two steps: the calibration of the analog blocks and the measurement. The calibration automatically starts when the measurement is triggered (see *Section 26.3.5: Calibration*). The measurement period depends on the following DTS_CFGR1 bits:

- the reference clock selected through REFCLK_SEL bit
- the divider ratio configured by HSREF_CLK_DIV bits
- the sampling time defined by TS1_SMP_TIME bits.

Figure 361. Temperature sensor sequence

26.4 DTS low-power modes

Table 260. Temperature sensor behavior in low-power modes

Mode	Description
Sleep	Only works in LSE mode. DTS interrupt causes the device to exit from Sleep mode.
Stop	Only works in LSE mode. DTS interrupt cause the device to exit from Stop mode.

26.5 DTS interrupts

There are two ways to use the DTS block as an interrupt source.The DTS interrupt line can be connected to the EXTI controller (see *Section 26.5.3: Asynchronous wake-up*) or to the CPU NVIC (see *Section 26.5.2: Synchronous interrupt*).

26.5.1 Temperature window comparator

The DTS_ITR1 register allows defining the high and low threshold that are used for temperature comparison. If the temperature data is equal or higher than TS1_HITTHD, or equal or lower than TS1_LITTHD bit, an interrupt is generated and the corresponding flag, TS1_ ITLF, TS1_ITHF, TS1_AITLF and TS1_AITHF, is set in the DTS_SR register (see *Section 26.6.6*).

26.5.2 Synchronous interrupt

A global interrupt output line is available on the DTS block. The interrupt can be generated at the end of measurement and/or when the measurement result is equal/higher or equal/lower than a predefined threshold (see *Section 26.5.1: Temperature window comparator*).

Three interrupt events can be select via 3 bits in DTS_ITENR register (see *Section 26.6.7*). All combinations of interrupts are allowed.

The TS1_ITEF, TS1_ITLF and TS1_ITHF flags in the DTS_SR register reflect the interrupt event. They can be reset with the correspond bits of the DTS_ICIFR register (see *Section 26.6.8*).

26.5.3 Asynchronous wake-up

The DTS block also provides an asynchronous interrupt line. It is used only when the LSE is selected as reference clock (REFCLK_SEL=1).

This line can generate a signal that wakes up the system from Sleep mode at the end of measurement and/or when the measurement result is equal/higher or equal/lower than a predefined threshold (see *Section 26.5.1: Temperature window comparator*).

Three asynchronous wake-up events can be selected via 3 bits in DTS_ITENR register. All combination of interrupts are allowed.

The TS1_AITEF, TS1_AITLF and TS1_AITHF flags in the DTS_SR register reflect the interrupt status. They can be reset with the correspond bits of the DTS_ICIFR register.

The following table shows the interrupt bits an the their description.

26.6 DTS registers

The registers of this peripheral can only be accessed by-word (32-bit).

26.6.1 Temperature sensor configuration register 1 (DTS_CFGR1)

DTS_CFGR1 is the configuration register for temperature sensor 1.

Address offset: 0x00

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

				rw	rw	rw	rw				rw				rw

Bit 31 Reserved, must be kept at reset value.

Bits 30:24 **HSREF_CLK_DIV[6:0]**: High speed clock division ratio

These bits are set and cleared by software. They can be used to define the division ratio for the main clock in order to obtain the internal frequency lower than 1 MHz required for the calibration. They are applicable only for calibration when PCLK is selected as reference clock (REFCLK_SEL=0).

0000000: No divider

0000001: No divider

0000010: 1/2 division ratio

...

1111111: 1/127 division ratio

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **Q_MEAS_OPT**: Quick measurement option bit

This bit is set and cleared by software. It is used to increase the measurement speed by suppressing the calibration step. It is effective only when the LSE clock is used as reference clock (REFCLK_SEL=1).

0: Measurement with calibration

1: Measurement without calibration

Bit 20 **REFCLK_SEL**: Reference clock selection bit

This bit is set and cleared by software. It indicates whether the reference clock is the high speed clock (PCLK) or the low speed clock (LSE).

0: High speed reference clock (PCLK)

1: Low speed reference clock (LSE)

Bits 19:16 **TS1_SMP_TIME[3:0]**: Sampling time for temperature sensor 1
These bits allow increasing the sampling time to improve measurement precision.
When the PCLK clock is selected as reference clock (REFCLK_SEL = 0), the measurement is performed at TS1_SMP_TIME period of CLK_PTAT.
When the LSE is selected as reference clock (REFCLK_SEL = 1), the measurement is performed at TS1_SMP_TIME period of LSE.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **TS1_INTRIG_SEL[3:0]**: Input trigger selection bit for temperature sensor 1
These bits are set and cleared by software. They select which input triggers a temperature measurement. Refer to *Section 26.3.10: Trigger input*.

Bits 7:5 Reserved, must be kept at reset value.

Bit 4 **TS1_START:** Start frequency measurement on temperature sensor 1
This bit is set and cleared by software.
0: No software trigger.
1: Software trigger for a frequency measurement. (only if TS1 is ready).

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **TS1_EN:** Temperature sensor 1 enable bit
This bit is set and cleared by software.
0: Temperature sensor 1 disabled
1: Temperature sensor 1 enabled

Note: Once enabled, the temperature sensor is active after a specific delay time. The TS1_RDY flag is set when the sensor is ready.

26.6.2 Temperature sensor T0 value register 1 (DTS_T0VALR1)

DTS_T0VALR1 contains the value of the factory calibration temperature (T0) for temperature sensor 1. The reset value is factory trimmed.

Address offset: 0x08

Reset value: 0x000X XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:18 Reserved, must be kept at reset value.

Bits 17:16 **TS1_T0[1:0]**: Engineering value of the T0 temperature for temperature sensor 1.
00: 30 °C
01: 140 °C
Others: Reserved, must not be used.

Bits 15:0 **TS1_FMT0[15:0]**: Engineering value of the frequency measured at T0 for temperature sensor 1
This value is expressed in 0.1 kHz.

26.6.3 Temperature sensor ramp value register (DTS_RAMPVALR)

The DTS_RAMPVALR is the ramp coefficient for the temperature sensor. The reset value is factory trimmed.

Address offset: 0x10

Reset value: 0xXXXX XXXX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **TS1_HITTHD[15:0]:** High interrupt threshold for temperature sensor 1

These bits are set and cleared by software. They indicate the highest value than can be reached before raising an interrupt signal.

Bits 15:0 **TS1_LITTHD[15:0]:** Low interrupt threshold for temperature sensor 1

These bits are set and cleared by software. They indicate the lowest value than can be reached before raising an interrupt signal.

26.6.5 Temperature sensor data register (DTS_DR)

The DTS_DR contains the number of REF_CLK cycles used to compute the FM(T) frequency.

Address offset: 0x1C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **TS1_RDY:** Temperature sensor 1 ready flag
This bit is set and reset by hardware.
It indicates that a measurement is ongoing.
0: Temperature sensor 1 busy
1: Temperature sensor 1 ready

Bits 14:7 Reserved, must be kept at reset value.

Bit 6 **TS1_AITHF:** Asynchronous interrupt flag for high threshold on temperature sensor 1
This bit is set by hardware when the high threshold is reached.
It is cleared by software by writing 1 to the TS1_CAITHF bit in the DTS_ICIFR register.
0: High threshold not reached on temperature sensor 1
1: High threshold reached on temperature sensor 1
Note: This bit is active only when the TS1_AITHFEN bit is set

Bit 5 **TS1_AITLF:** Asynchronous interrupt flag for low threshold on temperature sensor 1
This bit is set by hardware when the low threshold is reached.
It is cleared by software by writing 1 to the TS1_CAITLF bit in the DTS_ICIFR register.
0: Low threshold not reached on temperature sensor 1
1: Low threshold reached on temperature sensor 1
Note: This bit is active only when the TS1_AITLFEN bit is set

Bit 4 **TS1_AITEF:** Asynchronous interrupt flag for end of measure on temperature sensor 1
This bit is set by hardware when a temperature measure is done.
It is cleared by software by writing 1 to the TS1_CAITEF bit in the DTS_ICIFR register.
0: End of measure not detected on temperature sensor 1
1: End of measure detected on temperature sensor 1
Note: This bit is active only when the TS1_AITEFEN bit is set

Bit 3 Reserved, must be kept at reset value.

Bit 2 **TS1_ITHF:** Interrupt flag for high threshold on temperature sensor 1, synchronized on PCLK
This bit is set by hardware when the high threshold is set and reached.
It is cleared by software by writing 1 to the TS1_CITHF bit in the DTS_ICIFR register.
0: High threshold not reached on temperature sensor 1
1: High threshold reached on temperature sensor 1
Note: This bit is active only when the TS1_ITHFEN bit is set

Bit 1 **TS1_ITLF:** Interrupt flag for low threshold on temperature sensor 1, synchronized on PCLK.
This bit is set by hardware when the low threshold is set and reached.
It is cleared by software by writing 1 to the TS1_CITLF bit in the DTS_ICIFR register.
0: Low threshold not reached on temperature sensor 1
1: Low threshold reached on temperature sensor 1
Note: This bit is active only when the TS1_ITLFEN bit is set

Bit 0 **TS1_ITEF:** Interrupt flag for end of measurement on temperature sensor 1, synchronized on PCLK.
This bit is set by hardware when a temperature measure is done.
It is cleared by software by writing 1 to the TS2_CITEF bit in the DTS_ICIFR register.
0: No end of measurement detected on temperature sensor 1
1: End of measure detected on temperature sensor 1
Note: This bit is active only when the TS1_ITEFEN bit is set

26.6.7 Temperature sensor interrupt enable register (DTS_ITENR)

Address offset: 0x24

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

									rw	rw	rw		rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **TS1_AITHEN:** Asynchronous interrupt enable flag on high threshold for temperature sensor 1.
This bit are set and cleared by software.
It enables the asynchronous interrupt when the temperature is above the high threshold (only when REFCLK_SEL= 1")
0: Asynchronous interrupt on high threshold disabled for temperature sensor 1
1: Asynchronous interrupt on high threshold enabled for temperature sensor 1

Bit 5 **TS1_AITLEN:** Asynchronous interrupt enable flag for low threshold on temperature sensor 1.
This bit are set and cleared by software.
It enables the asynchronous interrupt when the temperature is below the low threshold (only when REFCLK_SEL= 1)
0: Asynchronous interrupt on low threshold disabled for temperature sensor 1
1: Asynchronous interrupt on low threshold enabled for temperature sensor 1

Bit 4 **TS1_AITEEN:** Asynchronous interrupt enable flag for end of measurement on temperature sensor 1
This bit are set and cleared by software.
It enables the asynchronous interrupt for end of measurement (only when REFCLK_SEL = 1).
0: Asynchronous interrupt for end of measurement disabled on temperature sensor 1
1: Asynchronous interrupt for end of measurement enabled on temperature sensor 1

Bit 3 Reserved, must be kept at reset value.

Bit 2 **TS1_ITHEN:** Interrupt enable flag for high threshold on temperature sensor 1, synchronized on PCLK.
This bit are set and cleared by software.
It enables the interrupt when the measure reaches or is above the high threshold.
0: Synchronous interrupt for high threshold disabled on temperature sensor 1
1: Synchronous interrupt for high threshold enabled on temperature sensor 1

Bit 1 **TS1_ITLEN:** Interrupt enable flag for low threshold on temperature sensor 1, synchronized on PCLK.
This bit are set and cleared by software.
It enables the synchronous interrupt when the measure reaches or is below the low threshold.
0: Synchronous interrupt for low threshold disabled on temperature sensor 1
1: Synchronous interrupt for low threshold enabled on temperature sensor 1

Bit 0 **TS1_ITEEN:** Interrupt enable flag for end of measurement on temperature sensor 1, synchronized on PCLK.
This bit are set and cleared by software.
It enables the synchronous interrupt for end of measurement.
0: Synchronous interrupt for end of measurement disabled on temperature sensor 1
1: Synchronous interrupt for end of measurement enabled on temperature sensor 1

26.6.8 Temperature sensor clear interrupt flag register (DTS_ICIFR)

DTS_ICIFR is the control register for the interrupt flags.

Address offset: 0x28

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TS1_ CAITHF	TS1_ CAITLF	TS1_ CAITEF	Res.	TS1_ CITHF	TS1_ CITLF	TS1_ CITEF
									rc_w1	rc_w1	rc_w1		rc_w1	rc_w1	rc_w1

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **TS1_CAITHF:** Asynchronous interrupt clear flag for high threshold on temperature sensor 1
Writing 1 to this bit clears the TS1_AITHF flag in the DTS_SR register.

Bit 5 **TS1_CAITLF:** Asynchronous interrupt clear flag for low threshold on temperature sensor 1
Writing 1 to this bit clears the TS1_AITLF flag in the DTS_SR register.

Bit 4 **TS1_CAITEF:** Write once bit. Clear the asynchronous IT flag for End Of Measure for thermal sensor 1.
Writing 1 clears the TS1_AITEF flag of the DTS_SR register.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **TS1_CITHF:** Interrupt clear flag for high threshold on temperature sensor 1
Writing this bit to 1 clears the TS1_ITHF flag in the DTS_SR register.

Bit 1 **TS1_CITLF:** Interrupt clear flag for low threshold on temperature sensor 1
Writing 1 to this bit clears the TS1_ITLF flag in the DTS_SR register.

Bit 0 **TS1_CITEF:** Interrupt clear flag for end of measurement on temperature sensor 1
Writing 1 to this bit clears the TS1_ITEF flag in the DTS_SR register.

26.6.9 Temperature sensor option register (DTS_OR)

The DTS_OR contains general-purpose option bits.

Address offset: 0x2C

Reset value: 0x0000 0000

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

27 Digital-to-analog converter (DAC)

27.1 DAC introduction

The DAC module is a 12-bit, voltage output digital-to-analog converter. The DAC can be configured in 8- or 12-bit mode and may be used in conjunction with the DMA controller. In 12-bit mode, the data can be left- or right-aligned. The DAC features two output channels, each with its own converter. In dual DAC channel mode, conversions can be done independently or simultaneously when both channels are grouped together for synchronous update operations. Two input reference pins, VREFDAC+ and VREFDAC-, are available for better resolution.

The DACx_OUTy pin can be used as general purpose input/output (GPIO) when the DAC output is disconnected from output pad and connected to on chip peripheral. The DAC output buffer can be optionally enabled to obtain a high drive output current. An individual calibration can be applied on each DAC output channel. The DAC output channels support a low power mode, the sample and hold mode.

27.2 DAC main features

The DAC main features are the following (see *Figure 362: Dual-channel DAC block diagram*):

- Up to four DAC interfaces, maximum two output channels each
- Left or right data alignment in 12-bit mode
- Synchronized update capability
- Noise-wave and Triangular-wave generation
- Sawtooth wave generation
- Extended sawtooth wave generation
- Dual DAC channel for independent or simultaneous conversions
- DMA capability for each channel including DMA underrun error detection
- Double data DMA capability to reduce the bus activity
- External triggers for conversion
- DAC output channel buffered/unbuffered modes
- Buffer offset calibration
- Each DAC output can be disconnected from the DACx_OUTy output pin
- DAC output connection to on-chip peripherals
- Sample and hold mode for low power operation in Stop mode
- Input voltage reference from VREFDAC+ and VREFDAC- pins

Figure 362 shows the block diagram of a DAC channel and *Table 263* gives the pin description.

27.3 DAC implementation

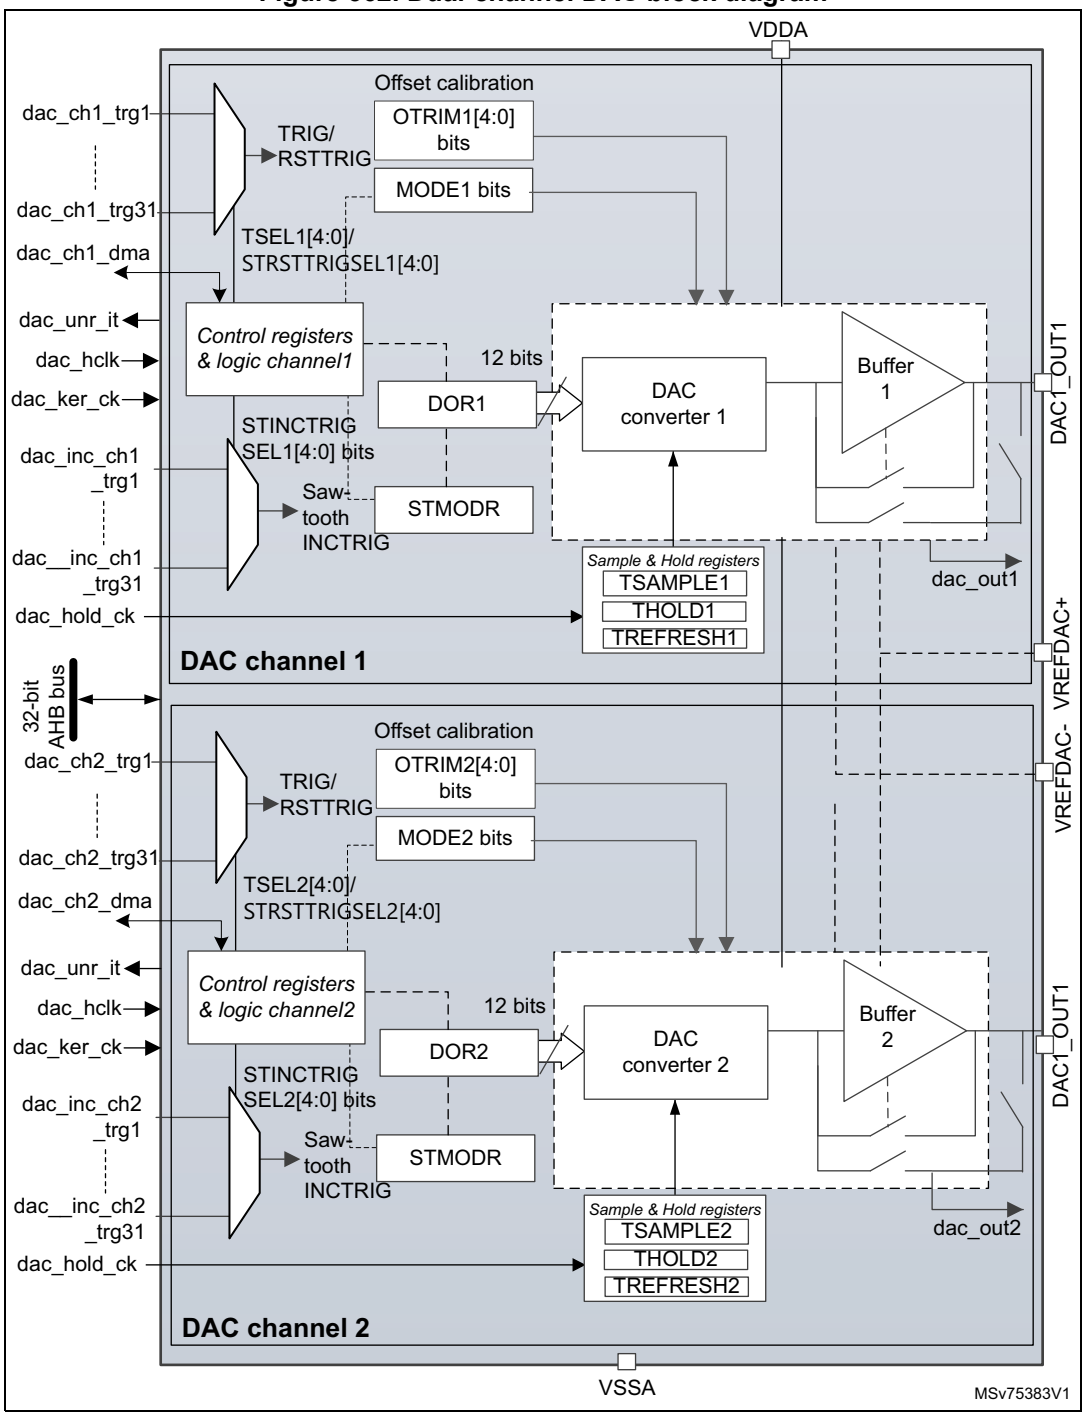

Table 262. DAC features

DAC features	DAC1	DAC2/3/4
Dual channel	-	
Output buffer	X	-
I/O connection	DAC1_OUT1 on PA4 DAC1_OUT2 on PA5	-
Maximum sampling time	1 Msps	15 Msps
Autonomous mode	-	
VREFDAC+ pin	X	
Extended sawtooth wave generation	X	
Sample and hold mode	X	-
Option register	-	X

27.4 DAC functional description

27.4.1 DAC block diagram

Figure 362. Dual-channel DAC block diagram

1. MODEx bits in the DAC_MCR control the output mode and allow switching between the normal mode in buffer/unbuffered configuration and the sample and hold mode.
2. DAC1_OUT1 and DAC1_OUT2 are available only on DAC1.

27.4.2 DAC pins and internal signals

The DAC includes:

- Up to two output channels
- The DACx_OUTy can be disconnected from the output pin and used as an ordinary GPIO
- The dac_outx can use an internal pin connection to on-chip peripherals such as comparator, operational amplifier and ADC (if available).
- DAC output channel buffered or non buffered
- Sample and hold block and registers operational in Stop mode, using the LSI/LSE clock source (dac_hold_ck) for static conversion.

The DAC includes up to two separate output channels. Each output channel can be connected to on-chip peripherals such as comparator, operational amplifier and ADC (if available). In this case, the DAC output channel can be disconnected from the DACx_OUTy output pin and the corresponding GPIO can be used for another purpose.

The DAC output can be buffered or not. The sample and hold block and its associated registers can run in Stop mode using the LSI/LSE clock source (dac_hold_ck).

Table 263. DAC input/output pins

Pin name	Signal type	Remarks
VREFDAC+	Input, analog positive reference	The higher/positive reference voltage for the DAC, $V_{REFDAC+} \leq V_{DDAmax}$ (refer to the product datasheet)
VREFDAC-	Input, analog negative reference	The lower/negative reference voltage for the DAC.
DACx_OUTy	Analog output signal	DACx channely analog output

Table 264. DAC internal input/output signals

Internal signal name	Signal type	Description
dac_ch1_dma	Bidirectional	DAC channel1 DMA request/acknowledge
dac_ch2_dma	Bidirectional	DAC channel2 DMA request/acknowledge
dac_ch1_trgx (x = 1 to 31)	Inputs	DAC channel1 trigger inputs
dac_ch2_trgx (x = 1 to 31)	Inputs	DAC channel2 trigger inputs
dac_unr_it	Output	DAC underrun interrupt
dac_hclk	Input	DAC peripheral clock
dac_ker_ck	Input	DAC kernel clock
dac_hold_ck	Input	DAC low-power clock used in sample and hold mode
dac_out1	Analog output	DAC channel1 output for on-chip peripherals
dac_out2	Analog output	DAC channel2 output for on-chip peripherals

27.4.3 DAC channel enable

Each DAC channel can be powered on by setting its corresponding ENx bit in the DAC_CR register. The DAC channel is then enabled after a t_{WAKEUP} startup time.

DACxRDY bit is set in the DAC_SR register when the DAC interface is ready to accept data. Writing new data or asserting the trigger is not allowed when ENx bit is set while DACxRDY signal is reset.

Note: The ENx bit enables the analog DAC channelx only. The DAC channelx digital interface is enabled even if the ENx bit is reset.

27.4.4 DAC data format

Depending on the selected configuration mode, the data have to be written into the specified register as described below:

- Single DAC channel

  There are three possibilities:

  – 8-bit right alignment: the software has to load data into the DAC_DHR8Rx[7:0] bits (stored into the DHRx[11:4] bits)

  – 12-bit left alignment: the software has to load data into the DAC_DHR12Lx[15:4] bits (stored into the DHRx[11:0] bits)

  – 12-bit right alignment: the software has to load data into the DAC_DHR12Rx[11:0] bits (stored into the DHRx[11:0] bits)

Depending on the loaded DAC_DHRyyyx register, the data written by the user is shifted and stored into the corresponding DAC_DHRx (data holding registerx, which are internal non-memory-mapped registers). The DAC_DHRx register is then loaded into the DAC_DORx register either automatically, by software trigger or by an external event trigger.

Figure 363. Data registers in single DAC channel mode

- Dual DAC channels (when available)

  There are three possibilities:

  – 8-bit right alignment: data for DAC channel1 to be loaded into the DAC_DHR8RD [7:0] bits (stored into the DHR1[11:4] bits) and data for DAC channel2 to be loaded into the DAC_DHR8RD [15:8] bits (stored into the DHR2[11:4] bits)

  – 12-bit left alignment: data for DAC channel1 to be loaded into the DAC_DHR12LD [15:4] bits (stored into the DHR1[11:0] bits) and data for DAC channel2 to be loaded into the DAC_DHR12LD [31:20] bits (stored into the DHR2[11:0] bits)

  – 12-bit right alignment: data for DAC channel1 to be loaded into the DAC_DHR12RD [11:0] bits (stored into the DHR1[11:0] bits) and data for DAC channel2 to be loaded into the DAC_DHR12RD [27:16] bits (stored into the DHR2[11:0] bits)

Depending on the loaded DAC_DHRyyyD register, the data written by the user is shifted and stored into DHR1 and DHR2 (data holding registers, which are internal non-memory-mapped registers). The DHR1 and DHR2 registers are then loaded into the DAC_DOR1 and DOR2 registers, respectively, either automatically, by software trigger or by an external event trigger.

Figure 364. Data registers in dual DAC channel mode

Signed/unsigned data

DAC input data are unsigned: 0x000 corresponds to the minimum value and 0xFFF to the maximum value for 12-bit mode.

The DAC can also handle signed input data in 2's complement format. This is done by setting SINFORMATx bit in the DAC_MCR register.

When SINFORMATx bit is set, the MSB of the data written to DAC_DHRx registers is inverted when it is copied to the DAC_DORx register, and the DAC interface can accept signed data (Q1.15, Q1.11 or Q1.7 format). DAC_DHR12Lx register can be used to store 16-bit signed data in the data holding registers. The 12 MSBs of 16-bit data are used for the DAC output data and the MSB is inverted. The four LSBs are simply ignored.

Table 266. Data format (case of 12-bit data)

SINFORMATx bit	DATA written to DAC_DHRx register	DATA transfered to DAC_DORx register
0	0x000	0x000
0	0xFFF	0xFFF
1	0x7FF	0xFFF
1	0x000	0x800
1	0xFFF	0x7FF
1	0x800	0x000

27.4.5 DAC conversion

The DAC_DORx cannot be written directly and any data transfer to the DAC channelx must be performed by loading the DAC_DHRx register (write operation to DAC_DHR8Rx, DAC_DHR12Lx, DAC_DHR12Rx, DAC_DHR8RD, DAC_DHR12RD or DAC_DHR12LD).

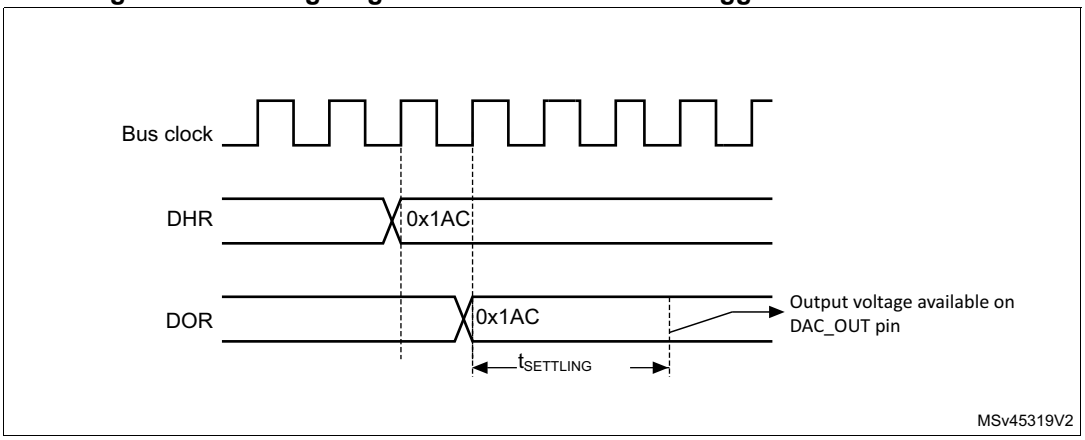
Data stored in the DAC_DHRx register are automatically transferred to the DAC_DORx register after one dac_ker_ck clock cycle, if no hardware trigger is selected (TENx bit in DAC_CR register is reset). However, when a hardware trigger is selected (TENx bit in DAC_CR register is set) and a trigger occurs, the transfer is performed three dac_ker_ck clock cycles after the trigger signal.

When DAC_DORx is loaded with the DAC_DHRx contents, the analog output voltage becomes available after a time $t_{SETTLING}$ that depends on the power supply voltage and the analog output load.

HFSEL bits of DAC_MCR must be set when dac_ker_ck clock speed is faster than 80 MHz.

Refer to Table *HFSEL description* below for the limitation of the DAC_DORx update rate depending on HFSEL bits and clock frequency.

If the data is updated or a software/hardware trigger event occurs during the non-allowed period, the peripheral behavior is unpredictable.



The above timing is only related to the limitation of the DAC interface. Refer also to the $t_{SETTLING}$ parameter value in the product datasheet.

Table 267. HFSEL description

HFSEL[2:0]	dac_ker_ck frequency	Latency using dac_ker_ck clock	Function
000	< 80 MHz	4	DAC_DOR update rate up to 4 dac_ker_ck cycles.
001	≥ 80 MHz(1)	5	DAC_DOR update rate up to 5 dac_ker_ck cycles.
010	≥ 160 MHz	6	DAC_DOR update rate up to 6 dac_ker_ck cycles.

1. Refer to the device datasheet for the value of the maximum kernel clock frequency.

Figure 365. Timing diagram for conversion with trigger disabled TEN = 0

27.4.6 DAC output voltage

Digital inputs are converted to output voltages on a linear conversion between $V_{REFDAC-}$ and $V_{REFDAC+}$.

The analog output voltage on the DAC channel pin is determined by the following equation:

$$\text{DAC output} = V_{REFDAC} \times \frac{DOR}{4096}$$

where all voltages are expressed in Volt.

$$V_{REFDAC} = V_{REFDAC+} - V_{REFDAC-}$$

27.4.7 DAC trigger selection

If the TENx control bit is set, the conversion can then be triggered by an external event (timer counter, external interrupt line). The TSELx[4:0] control bits determine which out of 32 possible events triggers the conversion as shown in TSELx[4:0] bits of the DAC_CR register. These events can be either the software trigger or hardware triggers.

Each time a DAC interface detects a rising edge on the selected trigger source (refer to the table below), the last data stored into the DAC_DHRx register are transferred into the DAC_DORx register. The DAC_DORx register is updated three dac_ker_ck cycles after the trigger occurs.

If the software trigger is selected, the conversion starts once the SWTRIG bit is set. SWTRIG is reset by hardware once the DAC_DORx register has been loaded with the DAC_DHRx register contents.

The reset trigger selection and the increment trigger selection of the sawtooth generation are performed through STRSTTRIGSELx and STINCTRIGSELx control bits, respectively. STRSTTRIGSELx mapping is similar to TSELx. Refer to the *Section 27.4.2: DAC pins and internal signals* for TSELx, STRSTTRIGSELx, and STINCTRIGSELx mappings.

Note: TSELx[4:0] bit cannot be changed when the ENx bit is set.

When software trigger is selected, the transfer from the DAC_DHRx register to the DAC_DORx register takes only one dac_ker_ck clock cycle.

27.4.8 DMA requests

Each DAC channel has a DMA capability. Two DMA channels are used to service DAC channel DMA requests.

When an external trigger (but not a software trigger) occurs while the DMAENx bit is set, the value of the DAC_DHRx register is transferred into the DAC_DORx register when the transfer is complete, and a DMA request is generated.

In dual mode, if both DMAENx bits are set, two DMA requests are generated. If only one DMA request is needed, only the corresponding DMAENx bit must be set. In this way, the application can manage both DAC channels in dual mode by using one DMA request and a unique DMA channel.

As DAC_DHRx to DAC_DORx data transfer occurred before the DMA request, the very first data has to be written to the DAC_DHRx before the first trigger event occurs.

DMA underrun

The DAC DMA request is not queued so that if a second external trigger arrives before the acknowledgment for the first external trigger is received (first request), then no new request is issued and the DMA channelx underrun flag DMAUDRx in the DAC_SR register is set, reporting the error condition. The DAC channelx continues to convert old data.

The software must clear the DMAUDRx flag by writing 1, clear the DMAEN bit of the used DMA stream and re-initialize both DMA and DAC channelx to restart the transfer correctly. The software must modify the DAC trigger conversion frequency or lighten the DMA workload to avoid a new DMA underrun. Finally, the DAC conversion can be resumed by enabling both DMA data transfer and conversion trigger.

For each DAC channelx, an interrupt is also generated if its corresponding DMAUDRIEx bit in the DAC_CR register is enabled.

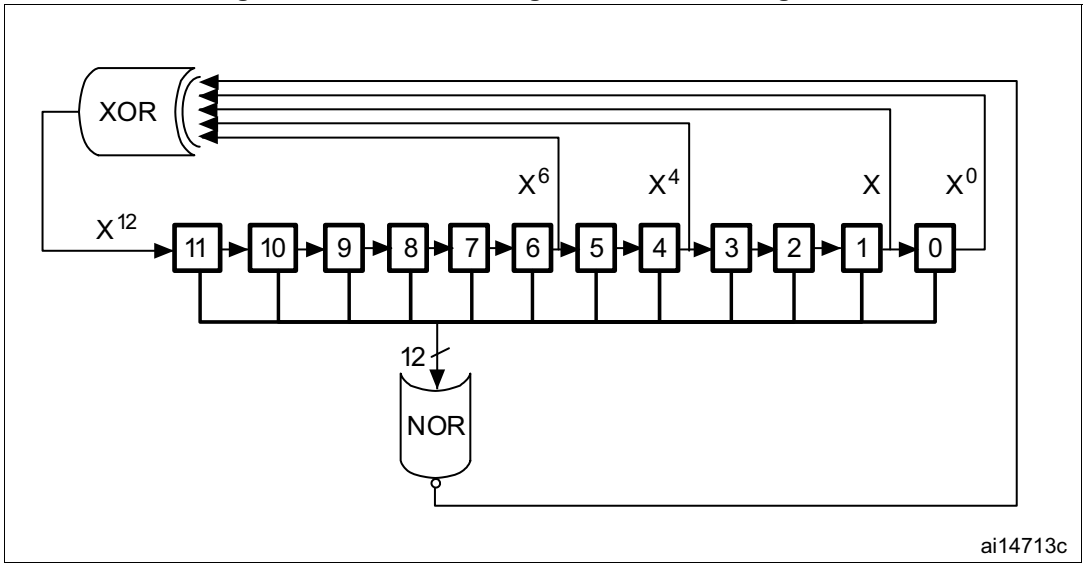
DMA double data mode

When the DMA controller is used in normal mode, only 12-bit (or 8-bit) data are transferred by a DMA request. As the AHB width is 32 bits, two 12-bit data may be transferred simultaneously. To use this mode, set the DMADOUBLEx bit of DAC_MCR register.

A DAC DMA request is generated every two external triggers (except for software triggers) when the DMAENx bit is set:

1. When the first trigger is detected, the value of the DAC_DHRx and DAC_DHRBx registers are transferred into the DAC_DORx and DAC_DORBx registers. The actual DAC data is loaded into the DAC_DORx register. A DMA request is then generated. The DMA writes the new data to the DAC_DHRx and DAC_DHRBx data registers.
2. When the next trigger is detected, the actual DAC data is loaded into the DAC_DHRBx register. This second trigger does not generate any DMA request. The DORSTATx bit indicates which DOR data is actually loaded into the analog DAC input.

DMA underrun function is also supported in DMA double data mode.



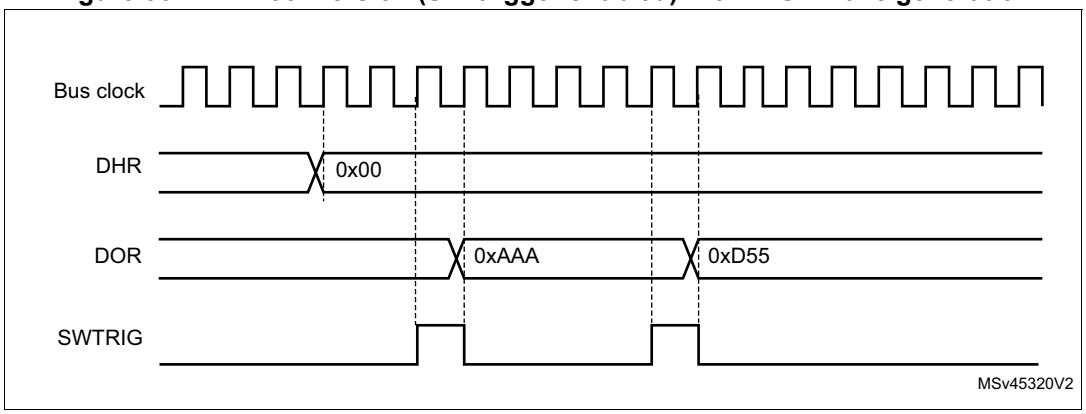
The following conditions must be met to change from double data to single data mode or vice versa:

- The DAC must be disabled.
- DMAEN bit must be cleared (ENx = 0 and DMAEN = 0).

27.4.9 Noise generation

In order to generate a variable-amplitude pseudonoise, an LFSR (linear feedback shift register) is available. DAC noise generation is selected by setting WAVEx[1:0] to 01. The preloaded value in LFSR is 0xAAA. This register is updated three dac_ker_ck clock cycles after each trigger event, following a specific calculation algorithm.

Figure 366. DAC LFSR register calculation algorithm



The LFSR value, that may be masked partially or totally by means of the MAMPx[3:0] bits in the DAC_CR register, is added up to the DAC_DHRx contents without overflow and this value is then transferred into the DAC_DORx register.

If LFSR is 0x0000, a 1 is injected into it (antilock-up mechanism).

It is possible to reset LFSR wave generation by resetting the WAVEx[1:0] bits.

Figure 367. DAC conversion (SW trigger enabled) with LFSR wave generation

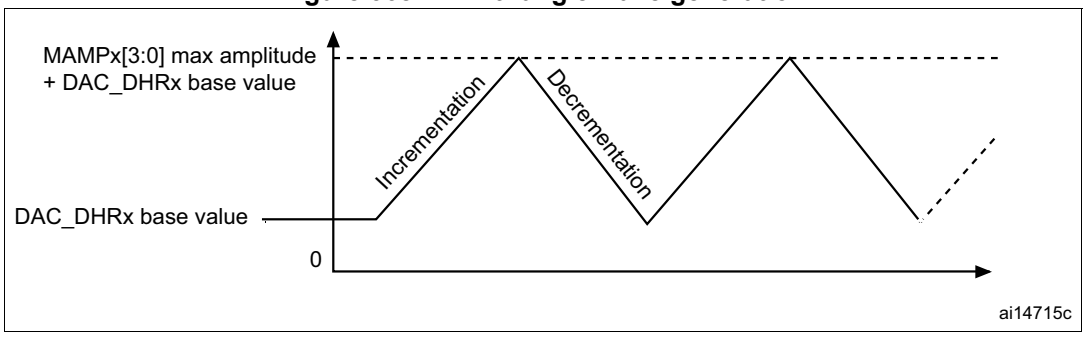
Note: The DAC trigger must be enabled for noise generation by setting the TENx bit in the DAC_CR register.

27.4.10 Triangle-wave generation

It is possible to add a small-amplitude triangular waveform on a DC or slowly varying signal. DAC triangle-wave generation is selected by setting WAVEx[1:0] to 10. The amplitude is configured through the MAMPx[3:0] bits in the DAC_CR register. An internal triangle counter is incremented three dac_ker_ck clock cycles after each trigger event. The value of this counter is then added to the DAC_DHRx register without overflow and the sum is transferred into the DAC_DORx register. The triangle counter is incremented as long as it is less than the maximum amplitude defined by the MAMPx[3:0] bits. Once the configured amplitude is reached, the counter is decremented down to 0, then incremented again and so on.

It is possible to reset triangle wave generation by resetting the WAVEx[1:0] bits.

Figure 368. DAC triangle wave generation



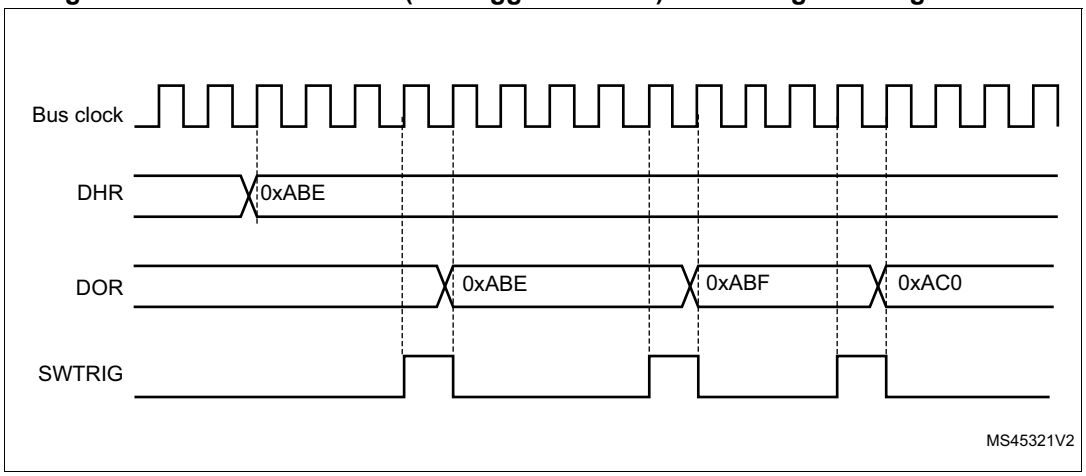


Figure 369. DAC conversion (SW trigger enabled) with triangle wave generation

Note: The DAC trigger must be enabled for triangle wave generation by setting the TENx bit in the DAC_CR register.

The MAMPx[3:0] bits must be configured before enabling the DAC, otherwise they cannot be changed.

27.4.11 DAC sawtooth wave generation

The DAC can generate a sawtooth waveform. Specific register settings for the initial value, increment value and direction control are required:

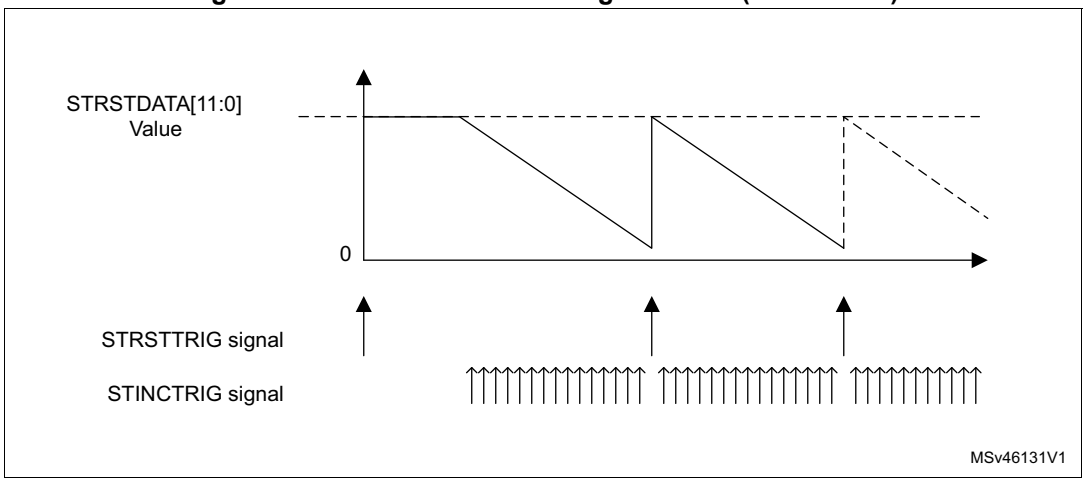
- DAC sawtooth wave generation is selected by setting WAVEx[1:0] to 11 in the DAC_CR register.
- The sawtooth counter initial value (reset value) is configured through STRSTDATAx[11:0] bits in the DAC_STRx register.
- The increment value is defined by the STINCDATAx[15:0] bits in the DAC_STRx register.
- The sawtooth direction is defined by STDIRx bit in the DAC_STRx register.

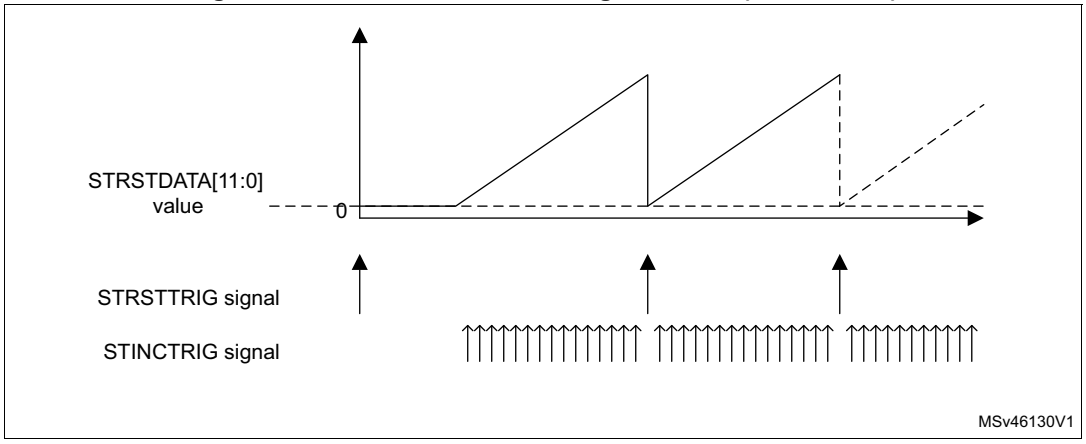
The sawtooth counter starts from STRSTDATAx[11:0] (bits 12 to 15 are set to 0b0000), each increment trigger then increments (or decrements) STINCDATAx[15:0] value.

The DAC output is used from 12 MSBs of those counter value. When the counter reaches 0x0000 or 0xFFFF, the value is saturated. The sawtooth reset trigger signal initializes the counter value to the STRSTDATAx[11:0] (bits 12 to 15 are set to 0b0000) value.

The increment trigger (STINCTRIG) and reset trigger (STRSTTRIG) must be selected through the STINCTRIGSELx[3:0] and the STRSTTRIGSELx[3:0] bits.

Figure 370. DAC sawtooth wave generation (STDIRx = 0)





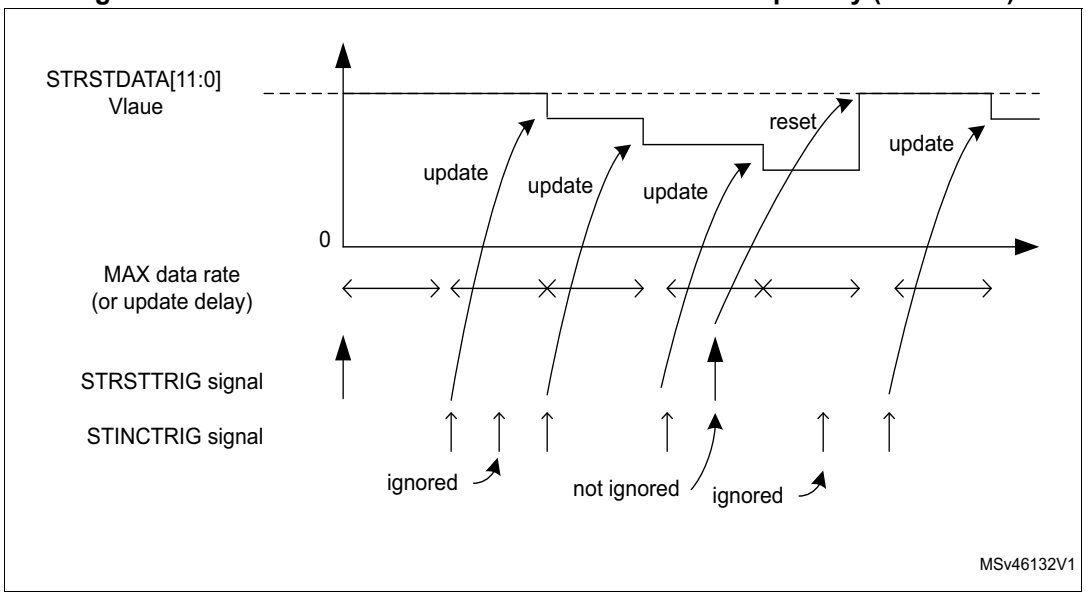


Figure 371. DAC sawtooth wave generation (STDIRx = 1)

The STRSTTRIG signal has higher priority than STINCTRIG. The trigger signal cannot be faster than the DAC_DORx update rate (see *Table HFSEL description - if available - for details)*. If STINCTRIG is asserted faster than the allowed data update rate, the STINCTRIG trigger is ignored. If the STRSTTRIG signal is applied after the STINCTRIG and before DAC_DORx update rate constraints, STRSTTRIG is put on hold. Then, immediately after the data increment, the reset trigger is applied.

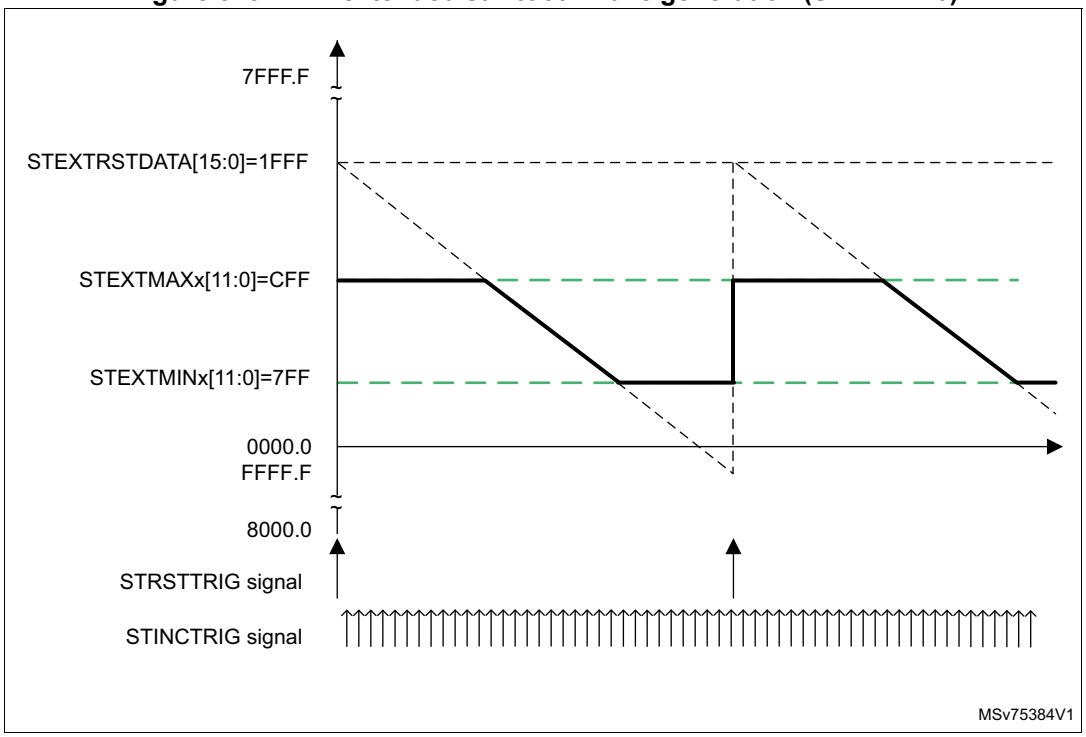
Figure 372. DAC sawtooth STINCTRIG and STRSTTRIG priority (STDIR = 0)

27.4.12 DAC extended sawtooth wave generation

The extended sawtooth wave generation is more flexible than the standard sawtooth wave generation described in *Section 27.4.11: DAC sawtooth wave generation*:

- It is possible to define the minimum and maximum output values.
- The extended sawtooth is managed by a signed 20-bit internal counter, enabling to convert data in 16.4 format.

  The first MSB is the sign bit, the second to the forth MSBs contain the overflow part, the middle 12 bits (5 to 16 MSBs) are used for the DAC output data, and the four LSBs consist of the fractional part. When the four MSBs equal 0b0000, the counter value is transferred to the DAC output. Otherwise, the DAC output value is saturated at 0x000, 0xFFF, or at the minimum or maximum value, programmed in the DAC_STEXTMMx register.



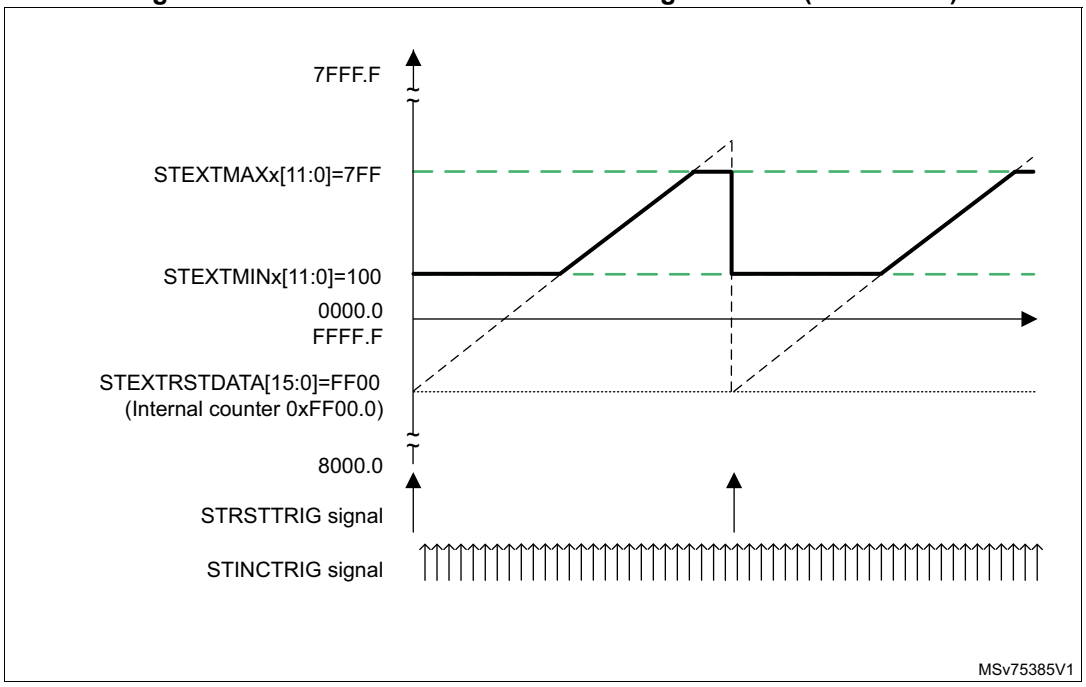
The following sequence is required to configure and start the extended sawtooth generation:

1. Clear the ENx bit of the DAC_CR register.
2. Activated the extended sawtooth mode by setting the STEXTx bit of the DAC_STRx register.
3. Configure the sawtooth counter initial value (reset value) through the STEXTRSTDATAx[15:0] bitfield of the DAC_STEXTRST register.
4. Configure the increment value through the STINCDATAx[15:0] bitfield of the DAC_STRx register whose four LSBs correspond to the fractional part.
5. Configure the sawtooth minimum and maximum values through the STEXTMINx[11:0] and STEXTMAXx[11:0] bitfield of the DAC_STEXTMMx register
6. Configure the sawtooth direction through the STDIR1 bit of the DAC_STR1 register.
7. Select the sawtooth reset and increment trigger through the STRSTTRIGSELx[3:0] and STINCTRIGSELx[3:0] bitfields.
8. Set WAVEx[1:0] to 0b11 and ENx to 1.
9. Generate a sawtooth reset trigger to start the sawtooth generation.

When STDIR1 is cleared (decrement case), the internal counter operates as follows:

- When the STRSTTRIG is applied, the counter 16 MSBs are reset to the signed 20-bit STEXTRSTDATAx[15:0] value, and the four LSBs are reset to 0b0000.
- When the STINCTRIG is applied, the counter is subtracted from STINCDATAx[15:0].
- When the counter four MSBs are greater than or equal to 0b0001, the DAC output is saturated at the STEXTMAXx[11:0] value.
- When the counter four MSBs are equal to 0b0000, the counter middle 12-bit value is evaluated. If it is lower than STEXTMAXx[11:0] and greater than STEXTMINx[11:0], the value is transferred to the DAC output.
- When the counter middle 12-bit value is lower than STEXTMINx[11:0], the DAC output value is saturated at STEXTMINx[11:0].
- When the counter value reaches 0x0000.0, the counter continues down-counting below the negative value 0xFFFFF. If the value reaches 0x8000.0, the internal counter value is saturated at 0x8000.0.

Figure 373. DAC extended sawtooth wave generation (STDIRx = 0)



1. The line in bold represents the DAC output, the dashed line in black the internal counter value, and the dashed lines in green the extended sawtooth minimum and maximum values.

When STDIRx is set (increment case), the internal counter operates as follows:

- When the STRSTTRIG is applied, the counter 16 MSBs are reset to STEXTRSTDATAx[15:0] value, and the four LSBs are reset to 0x0.
- When the STINCTRIG is applied, the counter is added to STINCDATA1[15:0].
- When the counter is negative (MSB = 1), the DAC output is saturated at the STEXTMINx[11:0] value.
- When the counter four MSBs are equal to 0b0000, the counter middle 12-bit value is evaluated. If it is lower than STEXTMAXx[11:0] and greater than STEXTMINx[11:0], the value is transferred to the DAC output.
- When the counter middle 12-bit value is greater than the STEXTMAXx[11:0] value, the DAC output value is saturated at STEXTMAXx[11:0].
- When the value reaches 0x7FFF.F, the counter is saturated.

Figure 374. DAC extended sawtooth wave generation (STDIRx = 1)

1. The line in bold represents the DAC output, the dashed line in black the internal counter value, and the dashed lines in green the extended sawtooth minimum and maximum values.

Dynamic modification of the extended sawtooth parameters

The STEXTRSTDATAx[15:0] bitfield can be modified while an extended sawtooth generation is ongoing. The new value is taken into account when a new STRSTTRIG is triggered.

When STINCDATAx[15:0] and/or STDIRx are modified, the new value is applied when a new STINCTRIG is triggered.

When either or both of STEXTMAXx[11:0] and STEXTMINx[11:0] are modified, the new value is applied when the next STRSTTRIG or STINCTRIG is triggered. To ensure STEXTMAXx[11:0] is always greater than STEXTMINx[11:0], it is recommended to program them simultaneously through the DAC_STEXTMMx register.

Since all the extended sawtooth parameters are stored in registers located in the AHB domain, and the DAC operates from the kernel clock, if an STRSTTRIG or an STINCTRIG

signal arrives while a sawtooth parameter is being updated, the old value may be taken into account instead of the new one. To prevent this issue from occurring, the extended sawtooth parameters must be written much before the next trigger.

27.4.13 DAC channel modes

Each DAC channel can be configured in normal mode or sample and hold mode. The output buffer can be enabled to obtain a high drive capability. Before enabling output buffer, the voltage offset needs to be calibrated. This calibration is performed at the factory (loaded after reset) and can be adjusted by software during application operation.

Normal mode

In normal mode, there are four combinations, by changing the buffer state and by changing the DACx_OUTy pin interconnections.

To enable the output buffer, the MODEx[2:0] bits in DAC_MCR register must be:

- 000: DAC is connected to the external pin
- 001: DAC is connected to external pin and to on-chip peripherals

To disable the output buffer, the MODEx[2:0] bits in DAC_MCR register must be:

- 010: DAC is connected to the external pin
- 011: DAC is connected to on-chip peripherals

Sample and hold mode

In sample and hold mode, the DAC core converts data on a triggered conversion, and then holds the converted voltage on a capacitor. When not converting, the DAC cores and buffer are completely turned off between samples and the DAC output is tri-stated, therefore reducing the overall power consumption. A stabilization period, which value depends on the buffer state, is required before each new conversion.

In this mode, the DAC core and all corresponding logic and registers are driven by the LSI/LSE low-speed clock (dac_hold_ck) in addition to the dac_ker_ck clock, allowing using the DAC channels in deep low power modes such as Stop mode.

The LSI/LSE low-speed clock (dac_hold_ck) must not be stopped when the sample and hold mode is enabled.

The sample/hold mode operations can be divided into three phases:

1. Sample phase: the sample/hold element is charged to the desired voltage. The charging time depends on capacitor value (internal or external, selected by the user). The sampling time is configured with the TSAMPLEx[9:0] bits in DAC_SHSRx register. During the write of the TSAMPLEx[9:0] bits, the BWSTx bit in DAC_SR register is set to 1 to synchronize between both clocks domains (AHB and low speed clock) and allowing the software to change the value of sample phase during the DAC channel operation
2. Hold phase: the DAC output channel is tri-stated, the DAC core and the buffer are turned off, to reduce the current consumption. The hold time is configured with the THOLDx[9:0] bits in DAC_SHHR register
3. Refresh phase: the refresh time is configured with the TREFRESHx[7:0] bits in DAC_SHRR register

The timings for the three phases above are in units of LSI/LSE clock periods. As an example, to configure a sample time of 350 µs, a hold time of 2 ms and a refresh time of 100 µs assuming LSI/LSE ~32 KHz is selected:

- 12 cycles are required for sample phase: TSAMPLEx[9:0] = 11.
- 62 cycles are required for hold phase: THOLDx[9:0] = 62.
- and 4 cycles are required for refresh period: TREFRESHx[7:0] = 4.

In this example, the power consumption is reduced by almost a factor of 15 versus normal modes.

The formulas to compute the right sample and refresh timings are described in the table below, the Hold time depends on the leakage current.

Table 268. Sample and refresh timings

Buffer State	t_{SAMP} (1)(2)	$t_{REFRESH}$ (2)(3)
Enable	7 µs + (10*R_{BON}*C_{SH})	7 µs + (R_{BON}*C_{SH})*ln(2*N_{LSB})
Disable	3 µs + (10*R_{BOFF}*C_{SH})	3 µs + (R_{BOFF}*C_{SH})*ln(2*N_{LSB})

1. In the above formula, the settling to the desired code value with ½ LSB or accuracy requires 10 constant time for 12 bits resolution. For 8-bit resolution, the settling time is 7 constant time.
2. C_{SH} is the capacitor in sample and hold mode.
3. The tolerated voltage drop during the hold phase “Vd” is represented by the number of LSBs after the capacitor discharging with the output leakage current. The settling back to the desired value with ½ LSB error accuracy requires ln(2*Nlsb) constant time of the DAC.

Example of the sample and refresh time calculation with output buffer on

The values used in the example below are provided as indication only (refer to the datasheet for product data):

C_{SH} = 100 nF

$V_{REFDAC+}$ = 3.0 V

Sampling phase:

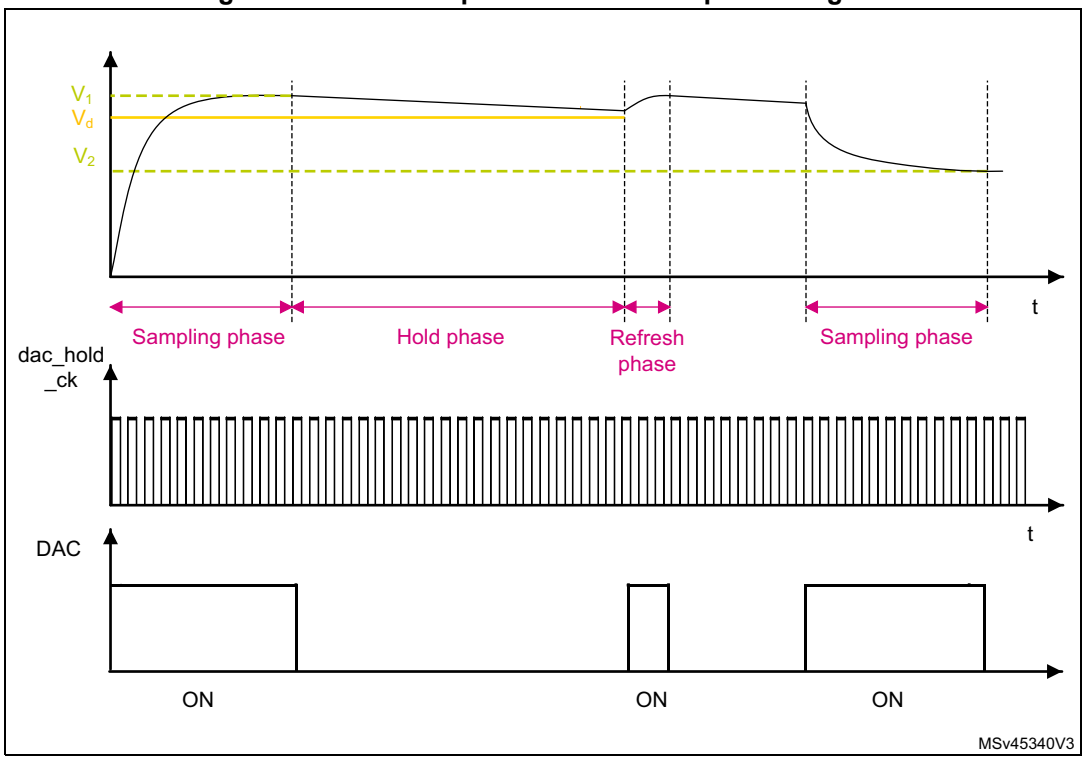
t_{SAMP} = 7 µs + (10 * 2000 * 100 * 10^{-9}) = 2.007 ms

(where R_{BON} = 2 kΩ)

Refresh phase:

$t_{REFRESH}$ = 7 µs + (2000 * 100 * 10^{-9}) * ln(2*10) = 606.1 µs

(where N_{LSB} = 10 (10 LSB drop during the hold phase)



Hold phase:

D_v = i_{leak} * t_{hold} / C_{SH} = 0.0073 V (10 LSB of 12bit at 3 V)

i_{leak} = 150 nA (worst case on the IO leakage on all the temperature range)

t_{hold} = 0.0073 * 100 * 10^{-9} / (150 * 10^{-9}) = 4.867 ms

Figure 375. DAC sample and hold mode phase diagram

Like in normal mode, the sample and hold mode has different configurations.

To enable the output buffer, MODEx[2:0] bits in DAC_MCR register must be set to:

- 100: DAC is connected to the external pin
- 101: DAC is connected to external pin and to on chip peripherals

To disabled the output buffer, MODEx[2:0] bits in DAC_MCR register must be set to:

- 110: DAC is connected to external pin and to on chip peripherals
- 111: DAC is connected to on chip peripherals

  When MODEx[2:0] bits are equal to 111, an internal capacitor, C_{Lint}, holds the voltage output of the DAC core and then drive it to on-chip peripherals.

All sample and hold phases are interruptible, and any change in DAC_DHRx immediately triggers a new sample phase.

Note: The sawtooth wave generation is not supported in sample and hold mode operation.

Table 269. Channel output modes summary

MODEx[2:0]			Mode	Buffer	Output connections
0	0	0	Normal mode	Enabled	Connected to external pin
0	0	1			Connected to external pin and to on chip-peripherals (such as comparators)
0	1	0		Disabled	Connected to external pin
0	1	1			Connected to on chip peripherals (such as comparators)

Table 269. Channel output modes summary (continued)

MODEx[2:0]			Mode	Buffer	Output connections
1	0	0	Sample and hold mode	Enabled	Connected to external pin
1	0	1			Connected to external pin and to on chip peripherals (such as comparators)
1	1	0		Disabled	Connected to external pin and to on chip peripherals (such as comparators)
1	1	1			Connected to on chip peripherals (such as comparators)

27.4.14 DAC channel buffer calibration

The transfer function for an N-bit digital-to-analog converter (DAC) is:

$$V_{out} = ((D / 2^N) \times G \times V_{REFDAC}) + V_{OS}$$

Where V_{OUT} is the analog output, D is the digital input, G is the gain, V_{REFDAC} is the nominal full-scale voltage, and V_{OS} is the offset voltage. For an ideal DAC channel, G = 1 and V_{OS} = 0.

Due to output buffer characteristics, the voltage offset may differ from part-to-part and introduce an absolute offset error on the analog output. To compensate the V_{OS}, a calibration is required by a trimming technique.

The calibration is only valid when the DAC channelx is operating with buffer enabled (MODEx[2:0] = 0b000 or 0b001 or 0b100 or 0b101). if applied in other modes when the buffer is off, it has no effect. During the calibration:

- The buffer output is disconnected from the pin internal/external connections and put in tristate mode (HiZ).
- The buffer acts as a comparator to sense the middle-code value 0x800 and compare it to V_{REFDAC}/2 signal through an internal bridge, then toggle its output signal to 0 or 1 depending on the comparison result (CAL_FLAGx bit).

Two calibration techniques are provided:

- Factory trimming (default setting)

  The DAC buffer offset is factory trimmed. The default value of OTRIMx[4:0] bits in DAC_CCR register is the factory trimming value and it is loaded once DAC digital interface is reset.
- User trimming

  The user trimming can be done when the operating conditions differs from nominal factory trimming conditions and in particular when V_{DDA} voltage, temperature, V_{REFDAC} values change and can be done at any point during application by software.

Note: Refer to the datasheet for more details of the nominal factory trimming conditions.

In addition, when V_{DD} is removed (example the device enters in Standby or VBAT modes) the calibration is required.

The steps to perform a user trimming calibration are as below:

1. If the DAC channel is active, write 0 to ENx bit in DAC_CR to disable the channel.
2. Select a mode where the buffer is enabled, by writing to DAC_MCR register, MODEx[2:0] = 0b000 or 0b001 or 0b100 or 0b101.
3. Start the DAC channelx calibration, by setting the CENx bit in DAC_CR register to 1.
4. Apply a trimming algorithm:
   a) Write a code into OTRIMx[4:0] bits, starting by 0b00000.
   b) Wait for t_{TRIM} delay.
   c) Check if CAL_FLAGx bit in DAC_SR is set to 1.
   d) Until the CAL_FLAGx is read as 1 or the maximum trimming code is reached, increment OTRIMx[4:0] and repeat substeps from (b) to (d).

The software algorithm may use either a successive approximation or dichotomy techniques to compute and set the content of OTRIMx[4:0] bits in a faster way.

Note: A t_{TRIM} delay must be respected between the write to the OTRIMx[4:0] bits and the read of the CAL_FLAGx bit in DAC_SR register in order to get a correct value.This parameter is specified into datasheet electrical characteristics section.

If V_{DDA}, V_{REFDAC} and temperature conditions do not change during device operation while it enters more often in Standby and VBAT modes, the software may store the OTRIMx[4:0] bits found in the first user calibration in the flash or in back-up registers. then to load/write them directly when the device power is back again thus avoiding to wait for a new calibration time.

When CENx bit is set, it is not allowed to set ENx bit.

27.4.15 DAC channel conversion modes

Four conversion modes are possible.

Independent trigger without wave generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the DAC channel trigger enable bit, TENx.
2. Configure the trigger sources by setting different values in the TSELx[4:0] bits.
3. Load the DAC channel data into the desired DHR registers (DAC_DHR12R1, DAC_DHR12L1 or DAC_DHR8R1).

When a DAC channel trigger arrives, the DHRx register is transferred into DAC_DORx (three dac_ker_ck clock cycles later).

Independent trigger with single LFSR generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the DAC channel trigger enable bit, TENx.
2. Configure the trigger sources by setting different values in the TSELx[4:0] bits.
3. Configure the DAC channel WAVEx[1:0] bits as 01 and the same LFSR mask value in the MAMPx[3:0] bits.
4. Load the DAC channel data into the desired DHR register (DAC_DHR12R1, DAC_DHR12L1 or DAC_DHR8R1).

When a DAC channel trigger arrives, the LFSR1 counter, with the same mask, is added to the DHR1 register and the sum is transferred into DAC_DOR1 (three dac_ker_ck clock cycles later). Then the LFSR1 counter is updated.

Independent trigger with single triangle generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the DAC channel trigger enable bits, TENx.
2. Configure the trigger sources by setting different values in the TSELx[4:0] bits.
3. Configure the DAC channel WAVEx[1:0] bits as 1x and the same maximum amplitude value in the MAMPx[3:0] bits.
4. Load the DAC channel data into the desired DHR register (DAC_DHR12R1, DAC_DHR12L1 or DAC_DHR8R1).

When a DAC channel trigger arrives, the DAC channel triangle counter, with the same triangle amplitude, is added to the DHRx register and the sum is transferred into DAC_DOR1 (three dac_ker_ck clock cycles later). The DAC channel triangle counter is then updated.

Independent trigger with single sawtooth generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Configure the trigger sources by setting different values in STRSTTRIGSELx[3:0] and STINCTRIGSELx[3:0] bits.
2. Configure the DAC channel WAVEx[1:0] bits to 11 and set the same STRSTDATAx[11:0], STINCDATAx[15:0] and STDIRx values for each register.

When a DAC channel trigger arrives, the DAC channel sawtooth counter updates the DHRx register and transfers it into DAC_DOR1 (three AHB clock cycles later).

27.4.16 Dual DAC channel conversion modes (if dual channels are available)

To efficiently use the bus bandwidth in applications that require the two DAC channels at the same time, three dual registers are implemented: DHR8RD, DHR12RD and DHR12LD. A unique register access is then required to drive both DAC channels at the same time. For the wave generation, no accesses to DHRxxxD registers are required. As a result, two output channels can be used either independently or simultaneously.

15 conversion modes are possible using the two DAC channels and these dual registers. All the conversion modes can nevertheless be obtained using separate DAC_DHRx registers if needed.

All modes are described in the paragraphs below.

Independent trigger without wave generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure different trigger sources by setting different values in the TSEL1 and TSEL2 bitfields.
3. Load the dual DAC channel data into the desired DHR register (DAC_DHR12RD, DAC_DHR12LD or DAC_DHR8RD).

When a DAC channel1 trigger arrives, the DHR1 register is transferred into DAC_DOR1 (three dac_ker_ck clock cycles later).

When a DAC channel2 trigger arrives, the DHR2 register is transferred into DAC_DOR2 (three dac_ker_ck clock cycles later).

Independent trigger with single LFSR generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure different trigger sources by setting different values in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 01 and the same LFSR mask value in the MAMPx[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC_DHR12RD, DAC_DHR12LD or DAC_DHR8RD).

When a DAC channel1 trigger arrives, the LFSR1 counter, with the same mask, is added to the DHR1 register and the sum is transferred into DAC_DOR1 (three dac_ker_ck clock cycles later). Then the LFSR1 counter is updated.

When a DAC channel2 trigger arrives, the LFSR2 counter, with the same mask, is added to the DHR2 register and the sum is transferred into DAC_DOR2 (three dac_ker_ck clock cycles later). Then the LFSR2 counter is updated.

Independent trigger with different LFSR generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure different trigger sources by setting different values in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 01 and set different LFSR masks values in the MAMP1[3:0] and MAMP2[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC_DHR12RD, DAC_DHR12LD or DAC_DHR8RD).

When a DAC channel1 trigger arrives, the LFSR1 counter, with the mask configured by MAMP1[3:0], is added to the DHR1 register and the sum is transferred into DAC_DOR1 (three dac_ker_ck clock cycles later). Then the LFSR1 counter is updated.

When a DAC channel2 trigger arrives, the LFSR2 counter, with the mask configured by MAMP2[3:0], is added to the DHR2 register and the sum is transferred into DAC_DOR2 (three dac_ker_ck clock cycles later). Then the LFSR2 counter is updated.

Independent trigger with single triangle generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure different trigger sources by setting different values in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 1x and the same maximum amplitude value in the MAMPx[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC_DHR12RD, DAC_DHR12LD or DAC_DHR8RD).

When a DAC channel1 trigger arrives, the DAC channel1 triangle counter, with the same triangle amplitude, is added to the DHR1 register and the sum is transferred into DAC_DOR1 (three dac_ker_ck clock cycles later). The DAC channel1 triangle counter is then updated.

When a DAC channel2 trigger arrives, the DAC channel2 triangle counter, with the same triangle amplitude, is added to the DHR2 register and the sum is transferred into DAC_DOR2 (three dac_ker_ck clock cycles later). The DAC channel2 triangle counter is then updated.

Independent trigger with different triangle generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure different trigger sources by setting different values in the TSEL1 and TSEL2 bits.
3. Configure the two DAC channel WAVEx[1:0] bits as 1x and set different maximum amplitude values in the MAMP1[3:0] and MAMP2[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC_DHR12RD, DAC_DHR12LD or DAC_DHR8RD).

When a DAC channel1 trigger arrives, the DAC channel1 triangle counter, with a triangle amplitude configured by MAMP1[3:0], is added to the DHR1 register and the sum is transferred into DAC_DOR1 (three dac_ker_ck clock cycles later). The DAC channel1 triangle counter is then updated.

When a DAC channel2 trigger arrives, the DAC channel2 triangle counter, with a triangle amplitude configured by MAMP2[3:0], is added to the DHR2 register and the sum is transferred into DAC_DOR2 (three dac_ker_ck clock cycles later). The DAC channel2 triangle counter is then updated.

Independent trigger with single sawtooth generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Configure different trigger sources by setting different values in STRSTTRIGSEL1[3:0], STRSTTRIGSEL2[3:0], STINCTRIGSEL2[3:0] and STINCTRIGSEL1[3:0] bits.
2. Configure the two DAC channel WAVEx[1:0] bits to 11 and set the same STRSTDATAx[11:0], STINCDATAx[15:0] and STDIRx values for each register.

When a DAC channel1 trigger arrives, the DAC channel1 sawtooth counter updates the DHR1 register and transfers it into DAC_DOR1 (three AHB clock cycles later).

When a DAC channel2 trigger arrives, the DAC channel2 sawtooth counter updates the DHR1 register and transfers it into DAC_DOR1 (three AHB clock cycles later).

Independent trigger with different sawtooth wave generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Configure different trigger sources by setting different values in the STRSTTRIGSEL1[23:0], STRSTTRIGSEL2[23:0], STINCTRIGSEL2[3:0] and STINCTRIGSEL1[3:0] bits.
2. Configure the two DAC channel WAVEx[1:0] bits as 11 and set different STRSTDATAx[11:0], STINCDATAx[15:0] and STDIRx value for each register.

When a DAC channel1 trigger arrives, the DAC channel1 sawtooth counter updates the DHR1 register and loads it into DAC_DOR1 (three AHB clock cycles later).

When a DAC channel2 trigger arrives, the DAC channel2 sawtooth counter updates the DHR2 register and loads it into DAC_DOR1 (three AHB clock cycles later).

Simultaneous software start

To configure the DAC in this conversion mode, the following sequence is required:

- Load the dual DAC channel data to the desired DHR register (DAC_DHR12RD, DAC_DHR12LD or DAC_DHR8RD).

In this configuration, one dac_ker_ck clock cycle later, the DHR1 and DHR2 registers are transferred into DAC_DOR1 and DAC_DOR2, respectively.

Simultaneous trigger without wave generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2.
2. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
3. Load the dual DAC channel data to the desired DHR register (DAC_DHR12RD, DAC_DHR12LD or DAC_DHR8RD).

When a trigger arrives, the DHR1 and DHR2 registers are transferred into DAC_DOR1 and DAC_DOR2, respectively (after three dac_ker_ck clock cycles).

Simultaneous trigger with single LFSR generation

1. To configure the DAC in this conversion mode, the following sequence is required:
2. Set the two DAC channel trigger enable bits TEN1 and TEN2.
3. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
4. Configure the two DAC channel WAVEx[1:0] bits as 01 and the same LFSR mask value in the MAMPx[3:0] bits.
5. Load the dual DAC channel data to the desired DHR register (DHR12RD, DHR12LD or DHR8RD).

When a trigger arrives, the LFSR1 counter, with the same mask, is added to the DHR1 register and the sum is transferred into DAC_DOR1 (three dac_ker_ck clock cycles later). The LFSR1 counter is then updated. At the same time, the LFSR2 counter, with the same

mask, is added to the DHR2 register and the sum is transferred into DAC_DOR2 (three dac_ker_ck clock cycles later). The LFSR2 counter is then updated.

Simultaneous trigger with different LFSR generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2
2. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 01 and set different LFSR mask values using the MAMP1[3:0] and MAMP2[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC_DHR12RD, DAC_DHR12LD or DAC_DHR8RD).

When a trigger arrives, the LFSR1 counter, with the mask configured by MAMP1[3:0], is added to the DHR1 register and the sum is transferred into DAC_DOR1 (three dac_ker_ck clock cycles later). The LFSR1 counter is then updated.
At the same time, the LFSR2 counter, with the mask configured by MAMP2[3:0], is added to the DHR2 register and the sum is transferred into DAC_DOR2 (three dac_ker_ck clock cycles later). The LFSR2 counter is then updated.

Simultaneous trigger with single triangle generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2
2. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 1x and the same maximum amplitude value using the MAMPx[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC_DHR12RD, DAC_DHR12LD or DAC_DHR8RD).

When a trigger arrives, the DAC channel1 triangle counter, with the same triangle amplitude, is added to the DHR1 register and the sum is transferred into DAC_DOR1 (three dac_ker_ck clock cycles later). The DAC channel1 triangle counter is then updated.

At the same time, the DAC channel2 triangle counter, with the same triangle amplitude, is added to the DHR2 register and the sum is transferred into DAC_DOR2 (three dac_ker_ck clock cycles later). The DAC channel2 triangle counter is then updated.

Simultaneous trigger with different triangle generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Set the two DAC channel trigger enable bits TEN1 and TEN2
2. Configure the same trigger source for both DAC channels by setting the same value in the TSEL1 and TSEL2 bitfields.
3. Configure the two DAC channel WAVEx[1:0] bits as 1x and set different maximum amplitude values in the MAMP1[3:0] and MAMP2[3:0] bits.
4. Load the dual DAC channel data into the desired DHR register (DAC_DHR12RD, DAC_DHR12LD or DAC_DHR8RD).

When a trigger arrives, the DAC channel1 triangle counter, with a triangle amplitude configured by MAMP1[3:0], is added to the DHR1 register and the sum is transferred into

DAC_DOR1 (three AHB clock cycles later). Then the DAC channel1 triangle counter is updated.

At the same time, the DAC channel2 triangle counter, with a triangle amplitude configured by MAMP2[3:0], is added to the DHR2 register and the sum is transferred into DAC_DOR2 (three dac_ker_ck clock cycles later). Then the DAC channel2 triangle counter is updated.

Simultaneous trigger with single sawtooth wave generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Configure the same trigger source for both DAC channels by setting the same value in STRSTTRIGSEL1[3:0],STRSTTRIGSEL2[3:0], STINCTRIGSEL2[3:0] and STINCTRIGSEL1[3:0] bits.
2. Configure the two DAC channel WAVEx[1:0] bits to 11 and set the same STRSTDATAx[11:0], STINCDATAx[15:0] and STDIRx value for each register.

When a trigger arrives, the DAC channel1/2 sawtooth counter updates DHR1 and DHR2 registers and loads them into DAC_DOR1/2 (three AHB clock cycles later).

Simultaneous trigger with different sawtooth wave generation

To configure the DAC in this conversion mode, the following sequence is required:

1. Configure the same trigger source for both DAC channels by setting the same value in STRSTTRIGSEL1[3:0], STRSTTRIGSEL2[3:0], STINCTRIGSEL2[3:0] bits and STINCTRIGSEL1[3:0] bits.
2. Configure the two DAC channel WAVEx[1:0] bits to 11 and set different STRSTDATAx[11:0], STINCDATAx[15:0], STDIRx values for each register.

When a trigger arrives, DAC channel1/2 sawtooth counter updates the DHR1 and DHR2 registers and loads them independently into DAC_DOR1/2 (three AHB clock cycles later).

27.5 DAC in low-power modes

Table 270. Effect of low-power modes on DAC

Mode	Description
Sleep	No effect, DAC used with DMA.
Stop(1)	The DAC remains active with a static value. The sample and hold mode can be selected using LSE/LSI clock.
Standby	The DAC peripheral is powered down and must be reinitialized after exiting Standby mode.

1. Refer to *Section 27.3: DAC implementation* for information on the Stop modes supported by the DAC peripheral.

27.6 DAC interrupts

Table 271. DAC interrupts

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit Sleep mode	Exit Stop mode	Exit Standby mode
DAC	DMA underrun	DMAUDRx	DMAUDRIEx	Write DMAUDRx = 1	Yes	No	No

27.7 DAC registers

Refer to *Section 1* for a list of abbreviations used in register descriptions.

The peripheral registers have to be accessed by words (32-bit).

27.7.1 DAC control register (DAC_CR)

Address offset: 0x00

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TSEL2[4]	CEN2	DMAUDRIE2	DMAEN2	MAMP2[3:0]				WAVE2[1:0]		TSEL2[3:0]				TEN2	EN2
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TSEL1[4]	CEN1	DMAUDRIE1	DMAEN1	MAMP1[3:0]				WAVE1[1:0]		TSEL1[3:0]				TEN1	EN1
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 30 **CEN2**: DAC channel2 calibration enable

This bit is set and cleared by software to enable/disable DAC channel2 calibration, it can be written only if EN2 bit is set to 0 into DAC_CR (the calibration mode can be entered/exit only when the DAC channel is disabled) Otherwise, the write operation is ignored.

0: DAC channel2 in normal operating mode

1: DAC channel2 in calibration mode

Note: This bit is available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bit 29 **DMAUDRIE2**: DAC channel2 DMA underrun interrupt enable

This bit is set and cleared by software.

0: DAC channel2 DMA underrun interrupt disabled

1: DAC channel2 DMA underrun interrupt enabled

Note: This bit is available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bit 28 **DMAEN2**: DAC channel2 DMA enable

This bit is set and cleared by software.

0: DAC channel2 DMA mode disabled

1: DAC channel2 DMA mode enabled

Note: This bit is available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bits 27:24 **MAMP2[3:0]**: DAC channel2 mask/amplitude selector

These bits are written by software to select mask in wave generation mode or amplitude in triangle generation mode.

0000: Unmask bit0 of LFSR/ triangle amplitude equal to 1
0001: Unmask bits[1:0] of LFSR/ triangle amplitude equal to 3
0010: Unmask bits[2:0] of LFSR/ triangle amplitude equal to 7
0011: Unmask bits[3:0] of LFSR/ triangle amplitude equal to 15
0100: Unmask bits[4:0] of LFSR/ triangle amplitude equal to 31
0101: Unmask bits[5:0] of LFSR/ triangle amplitude equal to 63
0110: Unmask bits[6:0] of LFSR/ triangle amplitude equal to 127
0111: Unmask bits[7:0] of LFSR/ triangle amplitude equal to 255
1000: Unmask bits[8:0] of LFSR/ triangle amplitude equal to 511
1001: Unmask bits[9:0] of LFSR/ triangle amplitude equal to 1023
1010: Unmask bits[10:0] of LFSR/ triangle amplitude equal to 2047
≥ 1011: Unmask bits[11:0] of LFSR/ triangle amplitude equal to 4095

Note: These bits are available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bits 23:22 **WAVE2[1:0]**: DAC channel2 noise/triangle wave generation enable

These bits are set/reset by software.

00: wave generation disabled
01: Noise wave generation enabled
10: Triangle wave generation enabled
11: Sawtooth wave generation enabled

Note: Only used if bit TEN2 = 1 (DAC channel2 trigger enabled)
These bits are available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bits 31, 21:18 **TSEL2[4:0]**: DAC channel2 trigger selection

These bits select the external event used to trigger DAC channel2

00000: SWTRIG2
00001: dac_ch2_trg1
00010: dac_ch2_trg2
...
11111: dac_ch2_trg31

For details on trigger configuration and mapping, refer to *Section 27.4.2: DAC pins and internal signals*.

Note: Only used if bit TEN2 = 1 (DAC channel2 trigger enabled).
These bits are available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bit 17 **TEN2**: DAC channel2 trigger enable

This bit is set and cleared by software to enable/disable DAC channel2 trigger

0: DAC channel2 trigger disabled and data written into the DAC_DHR2 register are transferred one dac_ker_ck clock cycle later to the DAC_DOR2 register
1: DAC channel2 trigger enabled and data from the DAC_DHR2 register are transferred three dac_ker_ck clock cycles later to the DAC_DOR2 register

Note: When software trigger is selected, the transfer from the DAC_DHR2 register to the DAC_DOR2 register takes only one dac_ker_ck clock cycle.
These bits are available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bit 16 **EN2**: DAC channel2 enable

This bit is set and cleared by software to enable/disable DAC channel2.

0: DAC channel2 disabled

1: DAC channel2 enabled

Note: These bits are available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bit 14 **CEN1**: DAC channel1 calibration enable

This bit is set and cleared by software to enable/disable DAC channel1 calibration, it can be written only if bit EN1 = 0 into DAC_CR (the calibration mode can be entered/exit only when the DAC channel is disabled) Otherwise, the write operation is ignored.

0: DAC channel1 in normal operating mode

1: DAC channel1 in calibration mode

Bit 13 **DMAUDRIE1**: DAC channel1 DMA Underrun Interrupt enable

This bit is set and cleared by software.

0: DAC channel1 DMA Underrun Interrupt disabled

1: DAC channel1 DMA Underrun Interrupt enabled

Bit 12 **DMAEN1**: DAC channel1 DMA enable

This bit is set and cleared by software.

0: DAC channel1 DMA mode disabled

1: DAC channel1 DMA mode enabled

Bits 11:8 **MAMP1[3:0]**: DAC channel1 mask/amplitude selector

These bits are written by software to select mask in wave generation mode or amplitude in triangle generation mode.

0000: Unmask bit0 of LFSR/ triangle amplitude equal to 1

0001: Unmask bits[1:0] of LFSR/ triangle amplitude equal to 3

0010: Unmask bits[2:0] of LFSR/ triangle amplitude equal to 7

0011: Unmask bits[3:0] of LFSR/ triangle amplitude equal to 15

0100: Unmask bits[4:0] of LFSR/ triangle amplitude equal to 31

0101: Unmask bits[5:0] of LFSR/ triangle amplitude equal to 63

0110: Unmask bits[6:0] of LFSR/ triangle amplitude equal to 127

0111: Unmask bits[7:0] of LFSR/ triangle amplitude equal to 255

1000: Unmask bits[8:0] of LFSR/ triangle amplitude equal to 511

1001: Unmask bits[9:0] of LFSR/ triangle amplitude equal to 1023

1010: Unmask bits[10:0] of LFSR/ triangle amplitude equal to 2047

≥ 1011: Unmask bits[11:0] of LFSR/ triangle amplitude equal to 4095

Bits 7:6 **WAVE1[1:0]**: DAC channel1 noise/triangle wave generation enable

These bits are set and cleared by software.

00: wave generation disabled

01: Noise wave generation enabled

10: Triangle wave generation enabled

11: Sawtooth wave generation enabled

Only used if bit TEN1 = 1 (DAC channel1 trigger enabled).

Bits 15, 5:2 **TSEL1[4:0]**: DAC channel1 trigger selection
These bits select the external event used to trigger DAC channel1
00000: SWTRIG1
00001: dac_ch1_trg1
00010: dac_ch1_trg2
...
11111: dac_ch1_trg31
For details on trigger configuration and mapping, refer to *Section 27.4.2: DAC pins and internal signals*.

Note: Only used if bit TEN1 = 1 (DAC channel1 trigger enabled).

Bit 1 **TEN1**: DAC channel1 trigger enable
This bit is set and cleared by software to enable/disable DAC channel1 trigger.
0: DAC channel1 trigger disabled and data written into the DAC_DHR1 register are transferred one dac_ker_ck clock cycle later to the DAC_DOR1 register
1: DAC channel1 trigger enabled and data from the DAC_DHR1 register are transferred three dac_ker_ck clock cycles later to the DAC_DOR1 register

Note: When software trigger is selected, the transfer from the DAC_DHR1 *register to the DAC_DOR1 register takes only one dac_ker_ck clock cycle.*

Bit 0 **EN1**: DAC channel1 enable
This bit is set and cleared by software to enable/disable DAC channel1.
0: DAC channel1 disabled
1: DAC channel1 enabled

27.7.2 DAC software trigger register (DAC_SWTRGR)

Address offset: 0x04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWTRIGB2	SWTRIGB1
														w	w

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SWTRIG2	SWTRIG1
														w	w

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **SWTRIGB2**: DAC channel2 software trigger B

This bit is set by software to trigger the DAC in software trigger mode (sawtooth generation) It is cleared by hardware.

0: No trigger

1: Trigger for sawtooth increment

Note: This bit is available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bit 16 **SWTRIGB1**: DAC channel1 software trigger B

This bit is set by software to trigger the DAC in software trigger mode (sawtooth generation) It is cleared by hardware.

0: No trigger

1: Trigger for sawtooth increment

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **SWTRIG2**: DAC channel2 software trigger

This bit is set by software to trigger the DAC in software trigger mode, or software reset trigger mode for the sawtooth wave generation.

0: No trigger

1: Trigger

Note: This bit is cleared by hardware (one dac_ker_ck clock cycle later) once the DAC_DHR2 register value has been loaded into the DAC_DOR2 register.

This bit is available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bit 0 **SWTRIG1**: DAC channel1 software trigger

This bit is set by software to trigger the DAC in software trigger mode, or software reset trigger mode for the sawtooth wave generation.

0: No trigger

1: Trigger

Note: This bit is cleared by hardware (one dac_ker_ck clock cycle later) once the DAC_DHR1 register value has been loaded into the DAC_DOR1 register.

27.7.3 DAC channel1 12-bit right-aligned data holding register (DAC_DHR12R1)

Address offset: 0x08

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	DACC1DHRB[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	DACC1DHR[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **DACC1DHRB[11:0]**: DAC channel1 12-bit right-aligned data B
These bits are written by software. They specify 12-bit data for DAC channel1 when the DAC operates in double data mode.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **DACC1DHR[11:0]**: DAC channel1 12-bit right-aligned data
These bits are written by software. They specify 12-bit data for DAC channel1.

27.7.4 DAC channel1 12-bit left aligned data holding register (DAC_DHR12L1)

Address offset: 0x0C

Reset value: 0x0000 0000

Bits 31:20 **DACC1DHRB[11:0]**: DAC channel1 12-bit left-aligned data B
These bits are written by software. They specify 12-bit data for DAC channel1 when the DAC operates in double data mode.

Bits 19:16 Reserved, must be kept at reset value.

Bits 15:4 **DACC1DHR[11:0]**: DAC channel1 12-bit left-aligned data
These bits are written by software.
They specify 12-bit data for DAC channel1.

Bits 3:0 Reserved, must be kept at reset value.

27.7.5 DAC channel1 8-bit right aligned data holding register (DAC_DHR8R1)

Address offset: 0x10

Reset value: 0x0000 0000

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **DACC2DHRB[11:0]**: DAC channel2 12-bit right-aligned data
These bits are written by software. They specify 12-bit data for DAC channel2 when the DAC operates in DMA double data mode.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **DACC2DHR[11:0]**: DAC channel2 12-bit right-aligned data
These bits are written by software. They specify 12-bit data for DAC channel2.

27.7.7 DAC channel2 12-bit left aligned data holding register (DAC_DHR12L2)

This register is available only on dual-channel DACs. Refer to *Section 27.3: DAC implementation*.

Address offset: 0x18

Reset value: 0x0000 0000

				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **DACC1DORB[11:0]**: DAC channel1 data output
These bits are read-only. They contain data output for DAC channel1 B.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **DACC1DOR[11:0]**: DAC channel1 data output
These bits are read-only, they contain data output for DAC channel1.

27.7.13 DAC channel2 data output register (DAC_DOR2)

This register is available only on dual-channel DACs. Refer to *Section 27.3: DAC implementation*.

Address offset: 0x30

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **DACC2DORB[11:0]**: DAC channel2 data output
These bits are read-only. They contain data output for DAC channel2 B.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **DACC2DOR[11:0]**: DAC channel2 data output
These bits are read-only, they contain data output for DAC channel2.

27.7.14 DAC status register (DAC_SR)

Address offset: 0x34

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BWST2	CAL_FLAG2	DMAUDR2	DORSTAT2	DAC2RDY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
r	r	rc_w1	r	r											
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

r	r	rc_w1	r	r											

Bit 31 **BWST2**: DAC channel2 busy writing sample time flag

This bit is systematically set just after sample and hold mode enable. It is set each time the software writes the register DAC_SHSR2, It is cleared by hardware when the write operation of DAC_SHSR2 is complete. (It takes about 3 LSI/LSE periods of synchronization).

0:There is no write operation of DAC_SHSR2 ongoing: DAC_SHSR2 can be written

1:There is a write operation of DAC_SHSR2 ongoing: DAC_SHSR2 cannot be written

Note: This bit is available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bit 30 **CAL_FLAG2**: DAC channel2 calibration offset status

This bit is set and cleared by hardware

0: calibration trimming value is lower than the offset correction value

1: calibration trimming value is equal or greater than the offset correction value

Note: This bit is available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bit 29 **DMAUDR2**: DAC channel2 DMA underrun flag

This bit is set by hardware and cleared by software (by writing it to 1).

0: No DMA underrun error condition occurred for DAC channel2

1: DMA underrun error condition occurred for DAC channel2 (the currently selected trigger is driving DAC channel2 conversion at a frequency higher than the DMA service capability rate).

Note: This bit is available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bit 28 **DORSTAT2**: DAC channel2 output register status bit

This bit is set and cleared by hardware. It is applicable only when the DAC operates in double data mode.

0: DOR[11:0] is used actual DAC output

1: DORB[11:0] is used actual DAC output

Note: This bit is available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bit 27 **DAC2RDY**: DAC channel2 ready status bit

This bit is set and cleared by hardware.

0: DAC channel2 is not yet ready to accept the trigger nor output data

1: DAC channel2 is ready to accept the trigger or output data

Note: This bit is available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bits 26:16 Reserved, must be kept at reset value.

Bit 15 **BWST1**: DAC channel1 busy writing sample time flag

This bit is systematically set just after sample and hold mode enable and is set each time the software writes the register DAC_SHSR1, It is cleared by hardware when the write operation of DAC_SHSR1 is complete. (It takes about 3 LSI/LSE periods of synchronization).

0:There is no write operation of DAC_SHSR1 ongoing: DAC_SHSR1 can be written

1:There is a write operation of DAC_SHSR1 ongoing: DAC_SHSR1 cannot be written

Bit 14 **CAL_FLAG1**: DAC channel1 calibration offset status

This bit is set and cleared by hardware

0: calibration trimming value is lower than the offset correction value

1: calibration trimming value is equal or greater than the offset correction value

Bit 13 **DMAUDR1**: DAC channel1 DMA underrun flag

This bit is set by hardware and cleared by software (by writing it to 1).

0: No DMA underrun error condition occurred for DAC channel1

1: DMA underrun error condition occurred for DAC channel1 (the currently selected trigger is driving DAC channel1 conversion at a frequency higher than the DMA service capability rate)

Bit 12 **DORSTAT1**: DAC channel1 output register status bit

This bit is set and cleared by hardware. It is applicable only when the DAC operates in double data mode.

0: DOR[11:0] is used actual DAC output

1: DORB[11:0] is used actual DAC output

Bit 11 **DAC1RDY**: DAC channel1 ready status bit

This bit is set and cleared by hardware.

0: DAC channel1 is not yet ready to accept the trigger nor output data

1: DAC channel1 is ready to accept the trigger or output data

Bits 10:0 Reserved, must be kept at reset value.

27.7.15 DAC calibration control register (DAC_CCR)

Address offset: 0x38

Reset value: 0x00XX 00XX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OTRIM1[4:0]				
											rw	rw	rw	rw	rw

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **OTRIM2[4:0]**: DAC channel2 offset trimming value

These bits are available only on dual-channel DACs. Refer to *Section 27.3: DAC implementation*.

Bits 15:5 Reserved, must be kept at reset value.

Bits 4:0 **OTRIM1[4:0]**: DAC channel1 offset trimming value

27.7.16 DAC mode control register (DAC_MCR)

Address offset: 0x3C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	SINFORMAT2	DMADOUBLE2	Res.	Res.	Res.	Res.	Res.	MODE2[2:0]		
						rw	rw						rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

rw	rw	rw				rw	rw						rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **SINFORMAT2**: Enable signed format for DAC channel2

This bit is set and cleared by software.

0: Input data is in unsigned format

1: Input data is in signed format (2's complement). The MSB bit represents the sign.

Note: This bit is available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bit 24 **DMADOUBLE2**: DAC channel2 DMA double data mode

This bit is set and cleared by software.

0: DMA normal mode selected

1: DMA double data mode selected

Note: This bit is available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bits 23:19 Reserved, must be kept at reset value.

Bits 18:16 **MODE2[2:0]:** DAC channel2 mode

These bits can be written only when the DAC is disabled and not in the calibration mode (when bit EN2 = 0 and bit CEN2 = 0 in the DAC_CR register). If EN2 = 1 or CEN2 = 1 the write operation is ignored.

They can be set and cleared by software to select the DAC channel2 mode:

– DAC channel2 in normal mode

000: DAC channel2 is connected to external pin with Buffer enabled

001: DAC channel2 is connected to external pin and to on chip peripherals with buffer enabled

010: DAC channel2 is connected to external pin with buffer disabled

011: DAC channel2 is connected to on chip peripherals with Buffer disabled

– DAC channel2 in sample and hold mode

100: DAC channel2 is connected to external pin with Buffer enabled

101: DAC channel2 is connected to external pin and to on chip peripherals with Buffer enabled

110: DAC channel2 is connected to external pin and to on chip peripherals with Buffer disabled

111: DAC channel2 is connected to on chip peripherals with Buffer disabled

Note: This register can be modified only when EN2 = 0.

Refer to Section 27.3: DAC implementation for the availability of DAC channel2.

Bits 15:13 **HFSEL[2:0]**: High frequency interface mode selection
000: High frequency interface mode disabled
001: High frequency interface mode enabled for 80 MHz ≤ dac_ker_ck ≤ 160 MHz
010: High frequency interface mode enabled for 160 MHz ≤ dac_ker_ck
Others: Reserved, must not be used.

Bits 12:10 Reserved, must be kept at reset value.

Bit 9 **SINFORMAT1**: Enable signed format for DAC channel1
This bit is set and cleared by software.
0: Input data is in unsigned format
1: Input data is in signed format (2's complement). The MSB bit represents the sign.

Bit 8 **DMADOUBLE1**: DAC channel1 DMA double data mode
This bit is set and cleared by software.
0: DMA normal mode selected
1: DMA double data mode selected

Bits 7:3 Reserved, must be kept at reset value.

Bits 2:0 **MODE1[2:0]:** DAC channel1 mode
These bits can be written only when the DAC is disabled and not in the calibration mode (when bit EN1 = 0 and bit CEN1 = 0 in the DAC_CR register). If EN1 = 1 or CEN1 = 1 the write operation is ignored.
They can be set and cleared by software to select the DAC channel1 mode:
– DAC channel1 in normal mode
000: DAC channel1 is connected to external pin with Buffer enabled
001: DAC channel1 is connected to external pin and to on chip peripherals with Buffer enabled
010: DAC channel1 is connected to external pin with Buffer disabled
011: DAC channel1 is connected to on chip peripherals with Buffer disabled
– DAC channel1 in sample & hold mode
100: DAC channel1 is connected to external pin with Buffer enabled
101: DAC channel1 is connected to external pin and to on chip peripherals with Buffer enabled
110: DAC channel1 is connected to external pin and to on chip peripherals with Buffer disabled
111: DAC channel1 is connected to on chip peripherals with Buffer disabled
Note: This register can be modified only when EN1 = 0.

27.7.17 DAC channel1 sample and hold sample time register (DAC_SHSR1)

Address offset: 0x40

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	Res.	Res.	Res.	Res.	Res.	TSAMPLE1[9:0]									
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:0 **TSAMPLE1[9:0]:** DAC channel1 sample time (only valid in sample and hold mode)

These bits can be written when the DAC channel1 is disabled or also during normal operation. in the latter case, the write can be done only when BWST1 of DAC_SR register is low, If BWST1 = 1, the write operation is ignored.

*Note: It represents the number of LSI/LSE clocks to perform a sample phase. Sampling time = (*TSAMPLE1[9:0] + 1) x *LSI/LSE clock period.*

27.7.18 DAC channel2 sample and hold sample time register (DAC_SHSR2)

This register is available only on dual-channel DACs. Refer to *Section 27.3: DAC implementation*.

Address offset: 0x44

Reset value: 0x0000 0000

						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:16 **THOLD2[9:0]:** DAC channel2 hold time (only valid in sample and hold mode).
Hold time = (THOLD[9:0]) x LSI/LSE clock period
These bits are available only on dual-channel DACs. Refer to *Section 27.3: DAC implementation*.
Note: This register can be modified only when EN2 = 0.

Bits 15:10 Reserved, must be kept at reset value.

Bits 9:0 **THOLD1[9:0]:** DAC channel1 hold time (only valid in sample and hold mode)
Hold time = (THOLD[9:0]) x LSI/LSE clock period
Note: This register can be modified only when EN1 = 0.

Note: These bits can be written only when the DAC channel is disabled and in normal operating mode (when bit ENx = 0 and bit CENx = 0 in the DAC_CR register). If ENx = 1 or CENx = 1 the write operation is ignored.

27.7.20 DAC sample and hold refresh time register (DAC_SHRR)

Address offset: 0x4C

Reset value: 0x0001 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TREFRESH2[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TREFRESH1[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **TREFRESH2[7:0]:** DAC channel2 refresh time (only valid in sample and hold mode)
Refresh time = (TREFRESH[7:0]) x LSI/LSE clock period
These bits are available only on dual-channel DACs. Refer to *Section 27.3: DAC implementation*.
Note: This register can be modified only when EN2 = 0.

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **TREFRESH1[7:0]:** DAC channel1 refresh time (only valid in sample and hold mode)
Refresh time = (TREFRESH[7:0]) x LSI/LSE clock period
Note: This register can be modified only when EN1 = 0.

Note: These bits can be written only when the DAC channel is disabled and in normal operating mode (when bit ENx = 0 and bit CENx = 0 in the DAC_CR register). If ENx = 1 or CENx = 1 the write operation is ignored.

27.7.21 DAC channel1 sawtooth register (DAC_STR1)

Address offset: 0x58

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
STINCDATA1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	STEXT1	STDIR1	STRSTDATA1[11:0]											
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **STINCDATA1[15:0]:** DAC channel1 sawtooth increment value (12.4 bit format)

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **STEXT1**: DAC channel1 sawtooth extended setting
0: Sawtooth reset value defined by STRSTDATA[11:0]
1: Sawtooth reset value defined by STEXTRSTDATA[15:0]

Bit 12 **STDIR1:** DAC channel1 sawtooth direction setting
This bit is written by software to select the direction of sawtooth step direction:
0: Decrement
1: Increment

Bits 11:0 **STRSTDATA1[11:0]:** DAC channel1 sawtooth reset value

27.7.22 DAC channel2 sawtooth register (DAC_STR2)

This register is available only on dual-channel DACs. Refer to *Section 27.3: DAC implementation*.

Address offset: 0x5C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
STINCDATA2[15:0]

Res.	Res.	STEXT2	STDIR2	STRSTDATA2[11:0]											
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **STINCDATA2[15:0]:** DAC channel2 Sawtooth increment value (12.4 bit format)

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **STEXT2:** DAC channel2 sawtooth extended setting
0: Sawtooth reset value defined by STRSTDATA[11:0]
1: Sawtooth reset value defined by STEXTRSTDATA[15:0]

Bit 12 **STDIR2:** DAC channel2 sawtooth direction setting
This bit is written by software to select the direction of sawtooth step direction
0: Decrement
1: Increment

Bits 11:0 **STRSTDATA2[11:0]:** DAC channel2 sawtooth reset value

27.7.23 DAC sawtooth mode register (DAC_STMODR)

Address offset: 0x60

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	STINCTRIGSEL2[4:0]					Res.	Res.	Res.	STRSTTRIGSEL2[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Res.	Res.	Res.	STINCTRIGSEL1[4:0]					Res.	Res.	Res.	STRSTTRIGSEL1[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:24 **STINCTRIGSEL2[4:0]:** DAC channel2 sawtooth increment trigger (STINCTRIG) selection
For details on trigger configuration and mapping, refer to *Section 27.4.2: DAC pins and internal signals*.
00000: SWTRIGB2
00001: dac_inc_ch2_trg1
....
11111: dac_inc_ch2_trg31

Note: These bits are available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **STRSTTRIGSEL2[4:0]:** DAC channel2 sawtooth reset trigger (STRSTTRIG) selection
For details on trigger configuration and mapping, refer to *Section 27.4.2: DAC pins and internal signals*.
00000: SWTRIGB2
00001: dac_ch2_trg1
....
11111: dac_ch2_trg31
The mapping is the same as for TSEL2[4:0].

Note: These bits are available only on dual-channel DACs. Refer to Section 27.3: DAC implementation.

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **STINCTRIGSEL1[4:0]:** DAC channel1 sawtooth increment trigger (STINCTRIG) selection
For details on trigger configuration and mapping, refer to *Section 27.4.2: DAC pins and internal signals*.
00000: SWTRIGB1
00001: dac_inc_ch1_trg1
....
11111: dac_inc_ch1_trg31

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **STRSTTRIGSEL1[4:0]:** DAC channel1 sawtooth reset trigger (STRSTTRIG) selection
For details on trigger configuration and mapping, refer to *Section 27.4.2: DAC pins and internal signals*.
00000: SWTRIG1
00001: dac_ch1_trg1
....
11111: dac_ch1_trg31
The mapping is the same as for TSEL1[4:0].

27.7.24 DAC extended sawtooth reset control register (DAC_STEXTRST)

Address offset: 0x64

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
STEXTRSTDATA2[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

STEXTRSTDATA1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 **STEXTRSTDATA2[15:0]:** DAC channel2 extended sawtooth reset value
This bitfield contains the extended sawtooth value programmed at reset, in 2's complement signed format.

Bits 15:0 **STEXTRSTDATA1[15:0]:** DAC channel1 extended sawtooth reset value
This bitfield contains the extended sawtooth value programmed at reset, in 2's complement signed format.

27.7.25 DAC extended sawtooth minimum and maximum value register (DAC_STEXTMM1)

Address offset: 0x68

Reset value: 0x0FFF 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	STEXTMAX1[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Res.	Res.	Res.	Res.	STEXTMIN1[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **STEXTMAX1[11:0]:** DAC channel1 extended sawtooth maximum value
This bitfield contains the extended sawtooth maximum out value.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **STEXTMIN1[11:0]:** DAC channel1 extended sawtooth minimum value
This bitfield contains the extended sawtooth minimum out value.

27.7.26 DAC extended sawtooth minimum and maximum value register (DAC_STEXTMM2)

Address offset: 0x6C

Reset value: 0x0FFF 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	STEXTMAX2[11:0]

Res.	Res.	Res.	Res.	STEXTMIN2[11:0]											
				rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:16 **STEXTMAX2[11:0]:** DAC channel2 extended sawtooth maximum value
This bitfield contains the extended sawtooth maximum out value.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:0 **STEXTMIN2[11:0]:** DAC channel2 extended sawtooth minimum value
This bitfield contains the extended sawtooth minimum out value.

27.7.27 DAC option register (DAC_OR)

Address offset: 0x3EC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OP[3:2]		OP[1:0]	
												rw	rw	rw	rw

Bits 31:4 Reserved, must be kept at reset value.

Bits 3:2 **OP[3:2]:** Option bits
For DAC2, 3, 4
00: Output glitch control disabled for dac_out2 channel
01: Output glitch control forced to the reverse direction level for dac_out2 channel
10: Output glitch control forced to the forward direction for dac_out2 channel
11: Reserved, must not be used.

Bits 1:0 **OP[1:0]:** Option bits
For DAC2, 3, 4
00: Output glitch control disabled for dac_out1 channel
01: Output glitch control forced to the reverse direction for dac_out1 channel
10: Output glich control forced to the forward direction for dac_out1 channel
11: Reserved, must not be used.

27.7.28 DAC register map

Table 272 summarizes the DAC registers.

28 Voltage reference buffer (VREFBUF)

28.1 VREFBUF introduction

The devices embed a voltage reference buffer which can be used as voltage reference for the on-chip ADCs, and also as voltage reference for external components through the VREF+ pin.

28.2 VREFBUF implementation

The table below describes the VREFBUF voltage typical values:

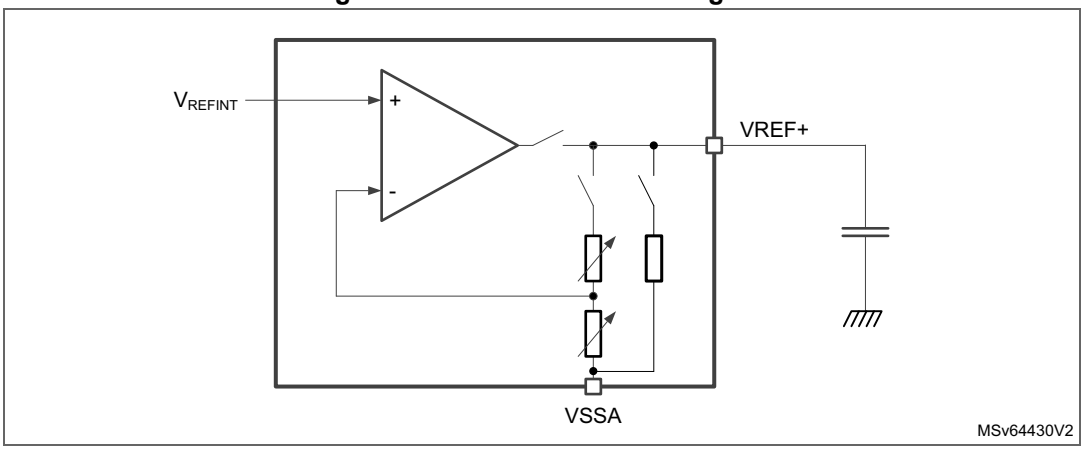

Table 273. VREFBUF typical values

Symbol	Value
$V_{REFBUF0}$	2.9 V
$V_{REFBUF1}$	2.5 V
$V_{REFBUF2}$	2.048 V
$V_{REFBUF3}$	1.8 V

Note: Refer to the product datasheet for more details.

28.3 VREFBUF functional description

Figure 376. VREFBUF block diagram

The internal voltage reference buffer is an operational amplifier, with programmable gain. The amplifier input is connected to the internal voltage reference V_{REFINT}. The VREFBUF supports four voltages[a], which are configured with VRS bits in the VREFBUF_CSR register:

- VRS = 000: $V_{REFBUF0}$ voltage selected
- VRS = 001: $V_{REFBUF1}$ voltage selected
- VRS = 010: $V_{REFBUF2}$ voltage selected
- VRS = 011: $V_{REFBUF3}$ voltage selected

The internal voltage reference can be configured in four different modes depending on ENVR and HIZ bits configuration. These modes are provided in the table below:

Table 274. VREF buffer modes

ENVR	HIZ	VREF buffer configuration
0	0	VREFBUF buffer off mode: – VREF+ pin pulled-down to V_{SSA}
0	1	External voltage reference mode (default value): – VREFBUF buffer off – VREF+ pin input mode
1	0	Internal voltage reference mode: – VREFBUF buffer on – VREF+ pin connected to VREFBUF buffer output
1	1	Hold mode: – VREF is enable without output buffer, VREF+ pin voltage is hold with the external capacitor – VRR detection disabled and VRR bit keeps last state

After enabling the VREFBUF by setting ENVR bit and clearing HIZ bit in the VREFBUF_CSR register, the user must wait until VRR bit is set, meaning that the voltage reference output has reached its expected value.

a. The minimum V_{DDA} voltage depends on VRS setting, refer to the product datasheet.

28.4 VREFBUF trimming

The VREFBUF output voltage is factory-calibrated by ST. At reset, the calibration data for the VRS=0 setting is automatically loaded to the TRIM register. If the VRS setting is changed, the software must copy the trimming data from the read-only system memory area (flash memory) to the TRIM[5:0] field of the VREFBUF_CCR register.

The system memory address of the trimming data for each VRS voltage setting is given in *Table 275*. Software must copy the six LSBs of data from the corresponding address to the TRIM[5:0] field when the VRS setting is changed.

Optionally, the user can trim the output voltage by changing the TRIM[5:0] register bits directly.

Table 275. VREFBUF trimming data

Calibration value name	Description	Memory address
V_{REF_VS0}	VREFBUF trimming value for VRS=0	0x5200 2435
V_{REF_VS1}	VREFBUF trimming value for VRS=1	0x08FF F81C
V_{REF_VS2}	VREFBUF trimming value for VRS=2	0x08FF F820
V_{REF_VS3}	VREFBUF trimming value for VRS=3	0x08FF F824

28.5 VREFBUF registers

28.5.1 VREFBUF control and status register (VREFBUF_CSR)

Address offset: 0x00

Reset value: 0x0000 0002

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	VRS[2:0]			VRR	Res.	HIZ	ENVR
									rw	rw	rw	r		rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bits 6:4 **VRS[2:0]**: Voltage reference scale

These bits select the value generated by the voltage reference buffer.

VRS = 000: $V_{REFBUF0}$ voltage selected.
VRS = 001: $V_{REFBUF1}$ voltage selected.
VRS = 010: $V_{REFBUF2}$ voltage selected.
VRS = 011: $V_{REFBUF3}$ voltage selected.
Others: Reserved

Note: Refer to the product datasheet for each $V_{REFBUFx}$ voltage setting value.
The software can program this bitfield only when the VREFBUF is disabled (ENVR=0).

Bit 3 **VRR:** Voltage reference buffer ready

0: the voltage reference buffer output is not ready.
1: the voltage reference buffer output reached the requested level.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **HIZ:** High impedance mode

This bit controls the analog switch to connect or not the VREF+ pin.
0: VREF+ pin is internally connected to the voltage reference buffer output.
1: VREF+ pin is high impedance.
Refer to *Table 274: VREF buffer modes* for the mode descriptions depending on ENVR bit configuration.

Bit 0 **ENVR:** Voltage reference buffer mode enable

This bit is used to enable the voltage reference buffer mode.
0: Internal voltage reference mode disable (external voltage reference mode).
1: Internal voltage reference mode (reference buffer enable or hold mode) enable.

28.5.2 VREFBUF calibration control register (VREFBUF_CCR)

Address offset: 0x04

Reset value: 0x0000 00XX

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRIM[5:0]					
										rw	rw	rw	rw	rw	rw

Bits 31:6 Reserved, must be kept at reset value.

Bits 5:0 **TRIM[5:0]**: Trimming code

These bits are automatically initialized after reset with the trimming value for VRS=0 stored in the flash memory during the production test.

When the VRS value is changed, the software must copy the trimming data from the read-only system memory area (flash memory) to the TRIM[5:0] bitfield. Writing into these bits allows the tuning of the internal reference buffer voltage. If VRS is reset to 0 from another value, the trimming data for VRS=0 must be copied again.

Note: If the user application performs the trimming, the trimming code must start from 000000 to 111111 in ascending order.

28.5.3 VREFBUF register map

The following table gives the VREFBUF register map and the reset values.

Table 276. VREFBUF register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0x04	VREFBUF_CCR	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRIM[5:0]					
	Reset value																											X	X	X	X	X	X

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

29 Comparator (COMP)

29.1 COMP introduction

The comparator can be used for a variety of functions including:

- Wake up from a low-power mode triggered by an analog signal
- Analog signal conditioning
- Cycle-by-cycle current control loop when combined with a PWM output from a timer

29.2 COMP main features

- Selectable inverting analog inputs:
  - Multiplexed I/O pins
  - DAC channels
  - Internal reference voltage and three submultiple values (1/4, 1/2, 3/4) provided by the scaler (buffered voltage divider)
- Mapping of outputs to I/Os
- Interrupt generation capability with wake up from Sleep and Stop modes (through the EXTI controller)
- Direct interrupt output to the CPU
- Programmable speed/power mode
- Programmable hysteresis
- Programmable digital filtering
- Redirection of outputs to timer inputs for triggering:
  - Capture events
  - Cycle-by-cycle current control
  - Break events for fast PWM shutdowns
- Output blanking for immunity to switching noise
- Window paired comparator
- Deglitcher

29.3 Implementation

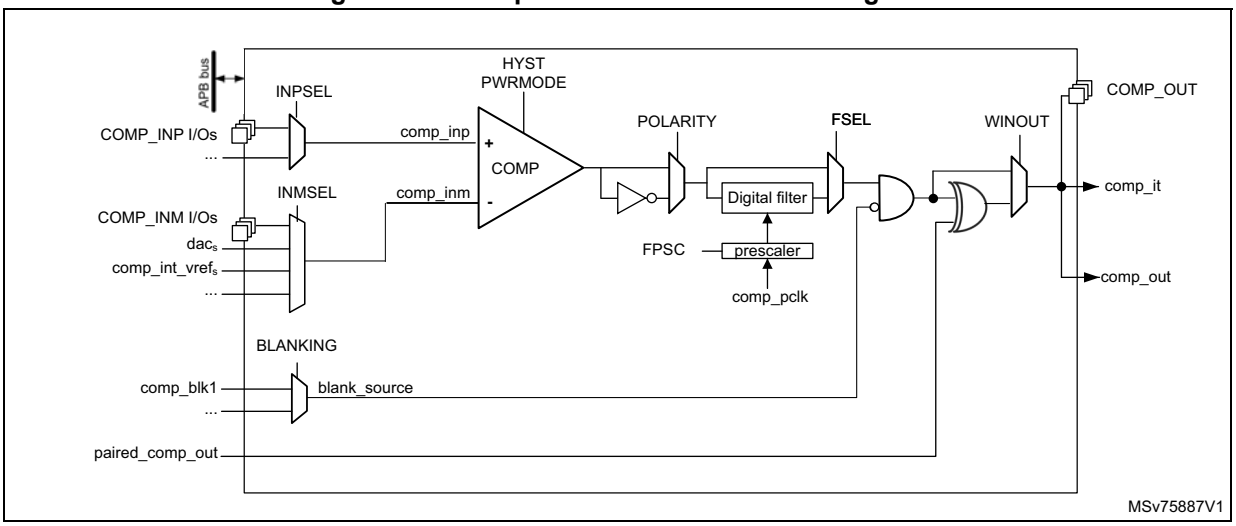
Table 277. COMP implementation(1)

COMP features	COMP1	COMP2	COMP3	COMP4	COMP5	COMP6	COMP7	COMP8
Window mode	X	X	X	X	X	X	X	X
Hysteresis	X	X	X	X	X	X	X	X
Power/speed	-	-	-	-	-	-	-	-
Deglitcher	X	X	X	X	X	X	X	X
Digital filtering	X	X	X	X	X	X	X	X
Interrupt through NVIC	X	X	X	X	X	X	X	X
Option register	-	-	-	-	-	-	-	-

1. 'X' = supported, '-' = not supported.

The following table lists the paired comparators required for the window mode.

Table 278. Window paired comparators



Window comparator	#1	#2	#3	#4	#5	#6	#7	#8
Upper threshold comparator	COMP1	COMP2	COMP3	COMP4	COMP5	COMP6	COMP7	COMP8
Lower threshold comparator	COMP2	COMP1	COMP4	COMP3	COMP6	COMP5	COMP8	COMP7

29.4 COMP functional description

29.4.1 COMP block diagram

The block diagram of the comparators is shown in *Figure 377*.

Figure 377. Comparator functional block diagram

29.4.2 COMP pins and internal signals

The I/Os used as comparator inputs must be configured in analog mode in the GPIO registers.

The comparator outputs can be connected to the I/Os through their alternate functions (refer to the product datasheet).

The outputs can also be internally redirected to a variety of timer inputs for the following purposes:

- Emergency shut-down of PWM signals, using BKIN and BKIN2 inputs
- Cycle-by-cycle current control, using ETR inputs of timers
- Input capture for timing measurements

The comparator output can be routed simultaneously internally and to the I/O pins.

Table 279. COMP input/output pins

Pin name	Signal type	Description
VDDA	Input, analog supply	Analog power supply and positive reference voltage for the comparator
VSSA	Input, analog supply ground	Ground for analog power supply, equal to VSS.
COMP_INMy/INPy	external analog input signal	Comparator Inverting and Non-inverting analog input channels
COMP_OUT	external digital output signal	Comparator digital output

Table 280. COMP input/output internal signals

Signal name	Signal type	Description
comp_inm$_y$	Analog inputs	Inverting COMP input sources
comp_inp$_y$	Analog inputs	Non-inverting COMP input sources
comp_blk$_x$	Digital inputs	COMP blanking sources
comp_pclk	Digital input	COMP peripheral clock
comp_out	Digital output	COMP output
comp_it	Digital output	COMP interrupt
dac	Analog inputs	internal dac signals
comp_int_vref	Analog inputs	comparator internal reference signals from scaler
paired_comp_out	Digital input	window paired comparator signal

1111	-	-	-	-

29.4.3 COMP startup stabilization time

The comparator parameters and its output are undefined after the COMP enable (power-on) for a period defined as startup stabilization time, see the product datasheet for more details.

If the comparator output is driving any critical stage of the design, it is recommended to redirect the comparator output to the device I/O through the GPIO alternate function or through IP configuration (such as timers) after the stabilization time elapses.

29.4.4 COMP power and speed modes

When the comparator has the power/speed feature, PWRMODE[1:0] is used to adjust power consumption versus propagation delay (refer to product datasheet) to have the optimum trade-off for a given application.

29.4.5 COMP reset and clocks

The clock comp_pclk provided by the clock controller is synchronous with the APB clock.

Note: ***Important:*** *The polarity selection logic and the output redirection to the port work independently from the APB clock. This allows the comparator to work even in Stop mode. The interrupt line, connected to the NVIC of the CPU, requires the APB clock (comp_pclk) to work. In the absence of the APB clock, the interrupt signal comp_it cannot be generated.*

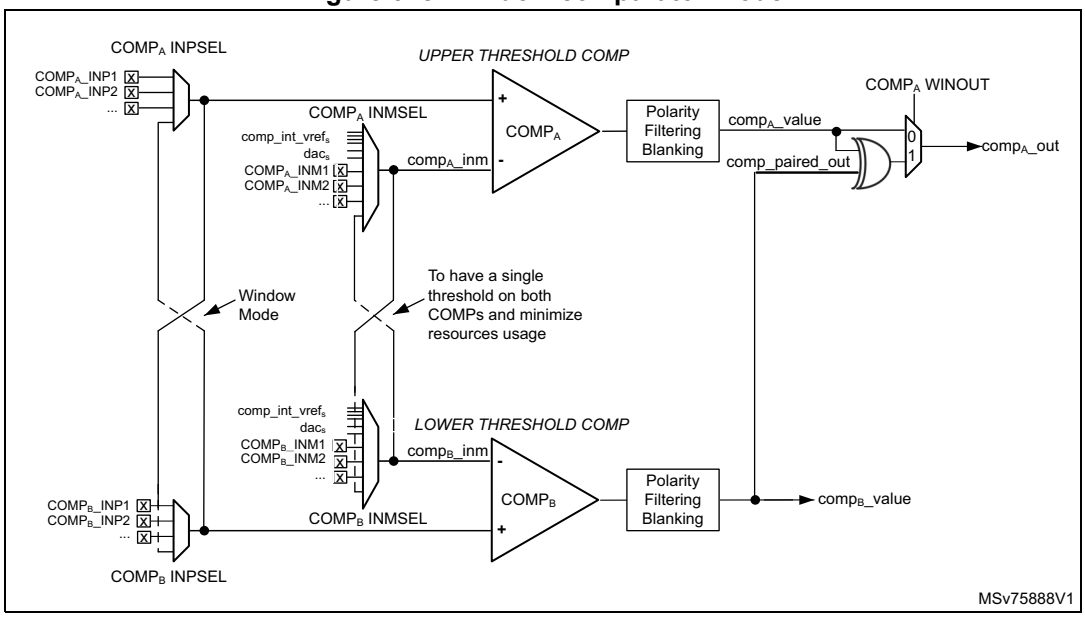
29.4.6 COMP LOCK mechanism

The comparators can be used for safety purposes, such as overcurrent or thermal protection. For applications with specific functional safety requirements, the comparator configuration can be protected against undesired alteration that could happen, for example, at program counter corruption.

For this purpose, the comparator configuration registers can be write-protected (read-only).

Upon configuring a comparator, its LOCK bit is set to 1. This causes the whole register set of the comparator to become read only, including the LOCK bit itself.

The write protection can only be removed through the MCU reset.



29.4.7 COMP window mode

When the feature is available, the window mode uses two paired comparators ($COMP_A$ and paired $COMP_B$) to create a window comparator (refer to *Table 278: Window paired comparators*). It can be used to monitor if the analog voltage is within the voltage range defined by the lower and upper threshold,

The monitored analog voltage is connected to the noninverting inputs of the paired comparators. The upper and lower threshold voltages are connected to the inverting inputs of the comparators to define the window voltage.

The output of the window comparator is selected with the control bit WINOUT.

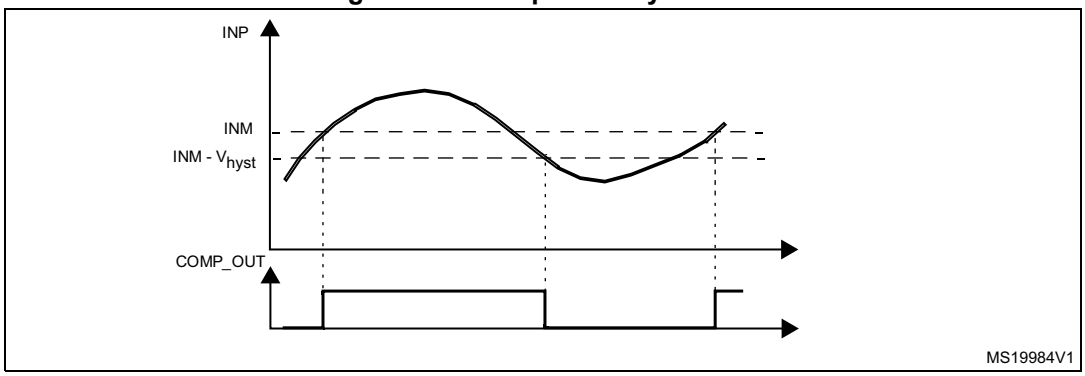


Figure 378. Window comparator mode

29.4.8 COMP hysteresis

When the hysteresis feature is available, the HYST[2:0] bitfield can be programmed to select the hysteresis voltage and avoid spurious output transitions in case of noisy signals. The hysteresis can be disabled if it is not needed.

Figure 379. Comparator hysteresis

29.4.9 COMP deglitcher

When the deglitcher feature is available, it complements the programmable hysteresis: the hysteresis filters a voltage amplitude, the deglitcher filters high frequency noise on the comparator input signal. The embedded deglitcher analog feature is enabled with the DGLT control bit. Use of the deglitcher increases the comparator propagation delay by a few nanoseconds (refer to product datasheet).

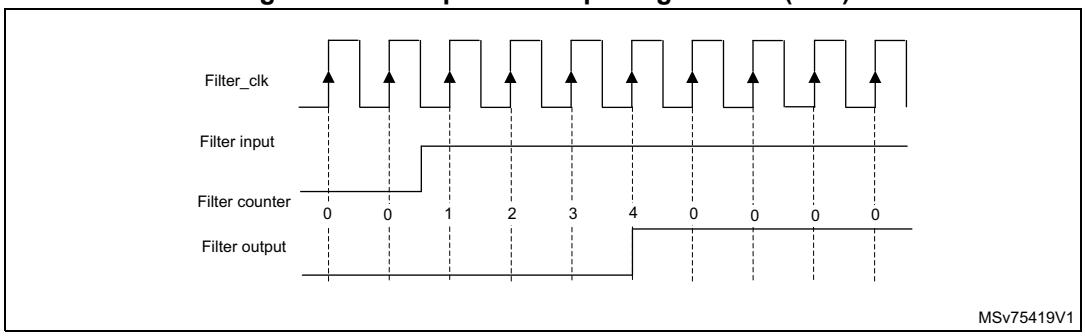
High-speed comparators are highly sensitive to noise. As a result, the comparator output can oscillate at low input signal slopes, even with hysteresis enabled. The deglitcher is an analog function that removes these oscillations from the comparator output. The advantage is that the solution is purely analog: no need of extra digital circuitry and high-speed clock, no extra latency due to digital filtering, negligible power consumption. It is recommended to use the deglitcher coupled with hysteresis.

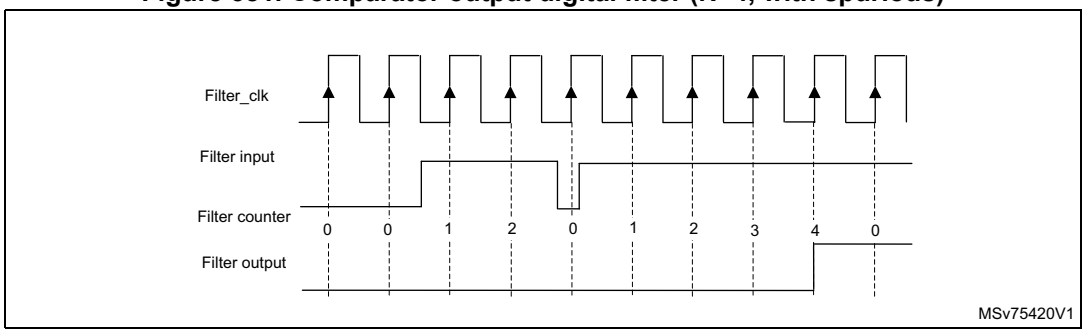
29.4.10 COMP digital signal filter

When the digital signal filter feature is available, it complements the programmable hysteresis and the deglitcher. The comparator low frequency noise on input signal can be filtered with the digital signal filter. Based on an internal counter clocked by filter_clk (divided from comp_pclk): the output of the comparator is filtered based on the assumption that the logic level is stable for a programmable number of consecutive periods. If the input value changes before the counter has reached the value N, the counter is reset and the transition is discarded (considered as a spurious event).

If the counter reaches N, the transition is considered as valid and transmitted as a correct external event. Consequently, the digital filter adds a latency to the external events being filtered, depending on the sampling clock and on the filter length (number of valid samples expected). In the FLTR register, FSEL[3:0] register allows the selection of various filter_clk divider ratios and N value while FPSC[1:0] register controls the prescaler ratio from comp_pclk to filter_clk.

Figure 380. Comparator output digital filter (N=4)





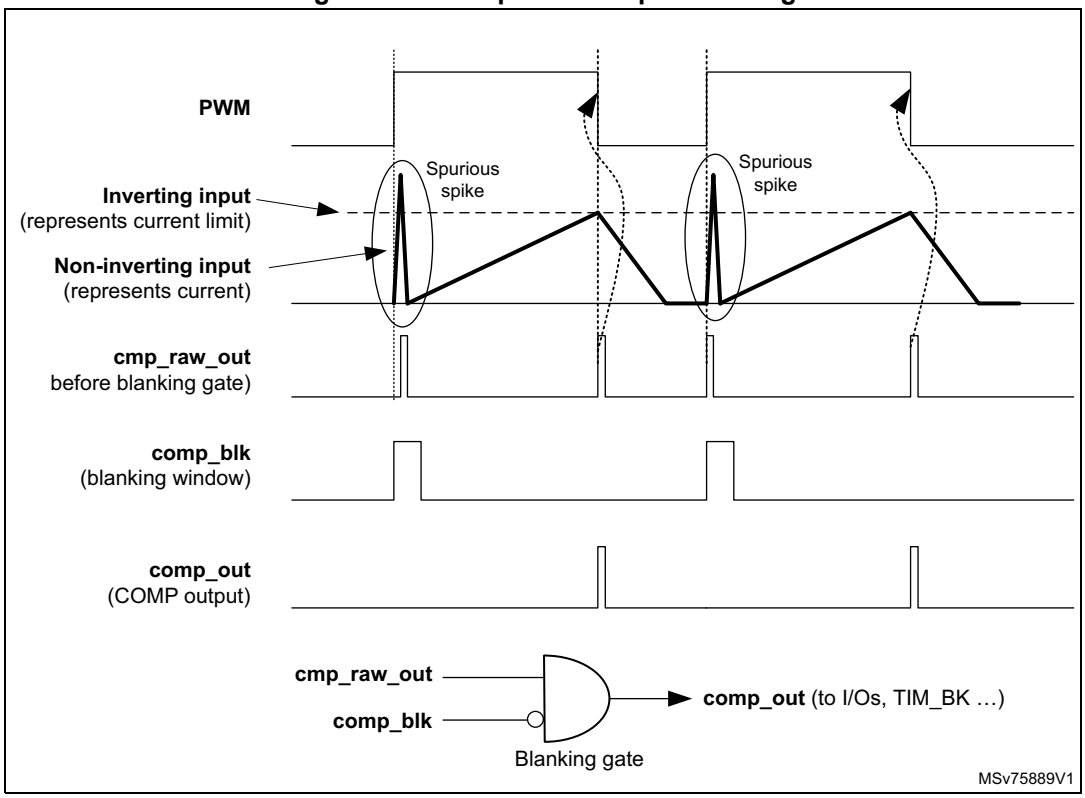


Figure 381. Comparator output digital filter (N=4, with spurious)

29.4.11 COMP output blanking function

The purpose of the blanking function is to prevent the current regulation from being triggered upon short current spikes at the beginning of the PWM period (typically the recovery current in power switches antiparallel diodes). It uses a blanking window defined with a timer output compare signal. Refer to the register description for selectable blanking signals. The blanking signal gates the internal comparator output to clean the comp_out of spurious pulses due to current spikes, as depicted in *Figure 382*.

Figure 382. Comparator output blanking

29.4.12 COMP option register

When the option register feature is available, it can be used for various controls like comparator output mapping or interconnect with other peripherals such as touch sensing. Refer to the register description for detailed information.

29.5 COMP low-power modes

Table 287. Comparator behavior in the low-power modes

Mode	Description
Sleep	No effect on the comparators. Comparator interrupts cause the device to exit the Sleep mode(1).
Stop	No effect on the comparators. Comparator interrupts cause the device to exit the Stop mode(1).
Standby	The COMP registers are powered down and must be reinitialized after exiting.

1. The comparators cannot be used to exit the device from Sleep or Stop mode when the internal reference voltage is switched off.

29.6 COMP interrupts

There are two ways to use the comparator as an interrupt source.

The comparator outputs are internally connected to the extended interrupt and event controller. Each comparator has its own EXTI line and can generate either interrupts or events to make the device exit low-power modes.

When the comparator has the interrupt through NVIC feature, it also provides an interrupt line to the NVIC of the CPU. This functionality is used when the CPU is active to handle low latency interrupt. It requires the APB clock running.

29.6.1 Interrupt through the EXTI block

Refer to *Section 15: Nested vectored interrupt controller (NVIC)* and *Section 16: Extended interrupt and event controller (EXTI)* for more details.

Sequence to enable the COMP interrupt through EXTI block:

1. Enable the COMPx and wait for stabilization.
2. Configure the EXTI line, receiving the compx_wkup signal, in interrupt mode, select the rising, falling, or either-edge sensitivity, and enable the EXTI line.
3. Configure and enable the NVIC IRQ channel mapped to the corresponding EXTI lines.

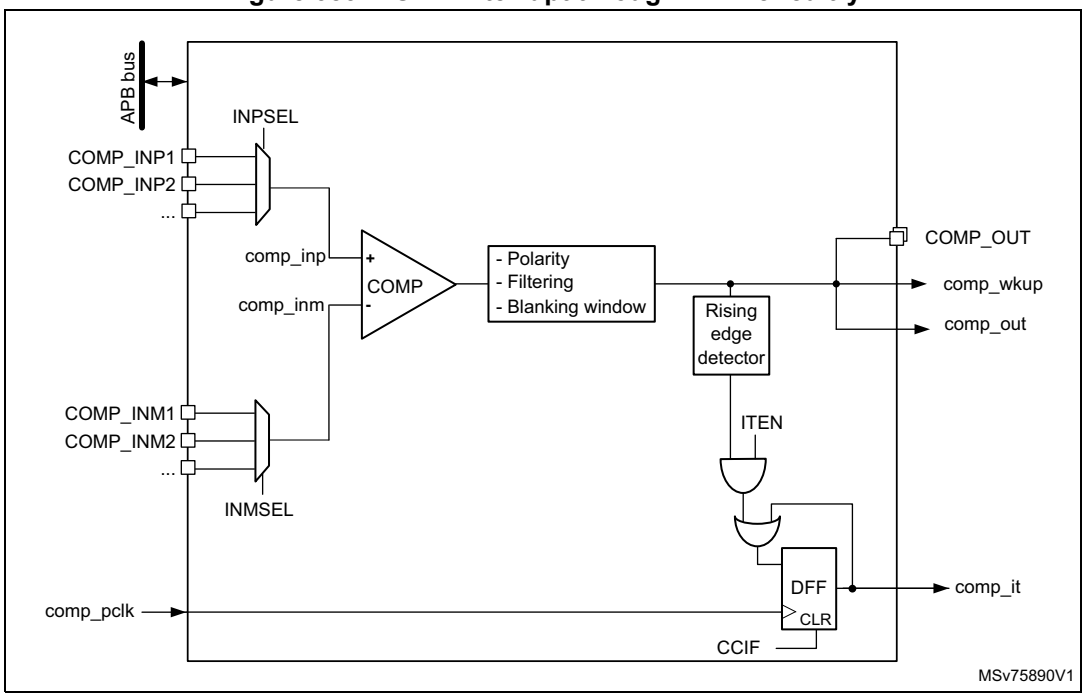

Table 288. Interrupt control bits

Interrupt event	Event flag	Enable control bit	Exit from Sleep mode	Exit from Stop modes	Exit from Standby mode
comp_wkup	through EXTI	through EXTI	Yes	Yes	N/A

29.6.2 Direct interrupt

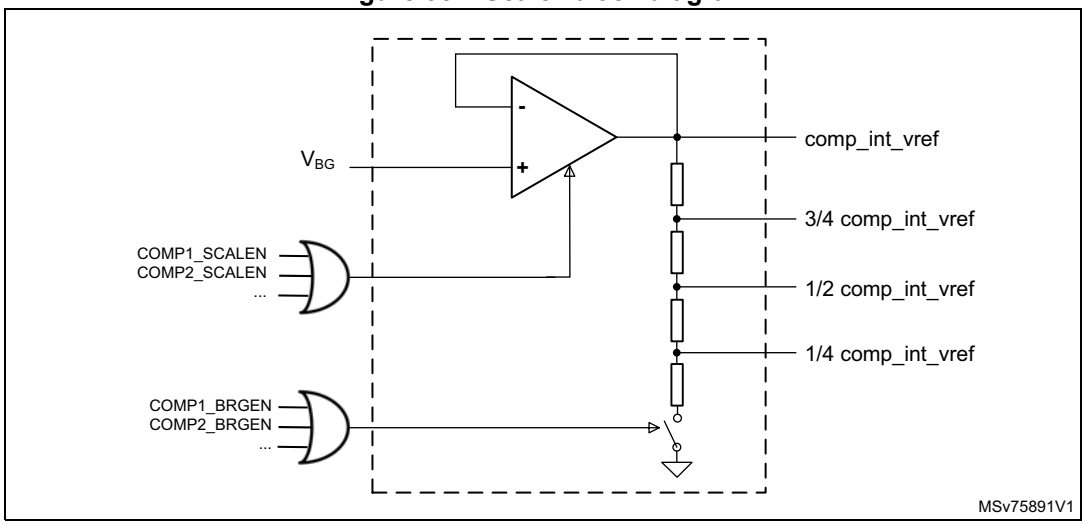
Refer to *Section 15: Nested vectored interrupt controller (NVIC)* for more details.

Figure 383. COMP interrupt through NVIC circuitry

Sequence to enable the COMP direct interrupt to NVIC of the CPU:

1. Enable the COMP and wait for stabilization.
2. Configure and enable the NVIC IRQ channel mapped to the comp_it line.
3. Configure and enable the ITEN in COMP_CFGRx.
4. The comp_it signal is set when the rising edge is detected from the comparator output.

Table 289. Interrupt control bits



Interrupt event	Interrupt flag	Enable control bit	Interrupt clear bit	Exit from Sleep mode	Exit from Stop modes
comp_it	CIF in COMP_SR	ITEN in COMP_CFGR	CCIF in COMP_IFCR	Yes (With APB clock)	no

Note: It is mandatory to enable the APB clock to use this interrupt. If the clock is not enabled, an interrupt is not generated.

29.7 SCALER function

The scaler block is available to provide the different voltage reference levels to the comparator input. It is based on an amplifier driving a resistor bridge. The amplifier input V_{BG} is connected to an internal voltage reference (refer to product datasheet).

Figure 384. Scaler block diagram

1. The scaler and amplifier is common for all comparators and their enable control bits are logical OR with all comparators.

The amplifier and the resistor bridge can be enabled separately. The amplifier is enabled by the SCALEN bit of the COMP_CFGR register. The resistor bridge is enabled by the BRGEN bit of the COMP_CFGR register.

If SCALEN and BRGEN are set, the four scaler outputs provide the following levels:

- comp_int_vref
- 3/4 comp_int_vref
- 1/2 comp_int_vref
- 1/4 comp_int_vref

If SCALEN is set and BRGEN is reset, all four scaler outputs provide the same level comp_int_vref.

When the resistor divided voltage is not used, the resistor bridge can be disconnected in order to reduce the consumption. When it is disconnected, the four scaler outputs provide the same level comp_int_vref.

29.8 COMP registers

29.8.1 Comparator status register (COMP_SR)

The COMP_SR is the comparator status register.

Address offset: 0x00

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

															r

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **CIF**: COMP interrupt flag

This bit is set by hardware when the COMP output is set.
This bit is cleared by software writing 1 to the CCIF bit in the COMP_IFCR register.

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **CVAL:** COMP output status bit

This bit is read-only. It reflects the current COMP output taking into account POLARITY and BLANKING bits effect.

29.8.2 Comparator interrupt clear flag register (COMP_ICFR)

The COMP_ICFR is the comparator interrupt clear flag register.

Address offset: 0x04

Reset value: 0x0000 0004

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCIF

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **CCIF**: Clear COMP interrupt flag

Writing 1 clears the CIF flag in the COMP_SR register.

Bits 15:0 Reserved, must be kept at reset value.

29.8.3 Comparator configuration register (COMP_CFGR)

The COMP_CFGR is the COMP configuration register.

Address offset: 0x08

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

		rw	rw	rw	rw	rw	rw		rw		rw	rw	rw	rw	rw

Bit 31 **LOCK:** Lock bit

This bit is set by software and cleared by a hardware system reset. It locks the whole content of the COMP configuration register COMP_CFGR[31:0] and COMP_FLTR register.
0: COMP_CFGR, COMP_FLTR register is read/write
1: COMP_CFGR, COMP_FLTR and COMP_OR registers are read-only

Bits 30:28 Reserved, must be kept at reset value.

Bits 27:24 **BLANKING[3:0]:** COMP channel blanking source selection bits

Bits of this field are set and cleared by software (only if LOCK is not set).
The field selects the input source for COMP channel output blanking, see *Table 285: COMP blanking internal input signals (COMP1, COMP2, COMP3, COMP4)* and *Table 286: COMP blanking internal input signals (COMP5, COMP6, COMP7, COMP8)*.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:20 **INPSEL[1:0]**: COMP channel non-inverting input selection bit

This bit is set and cleared by software (only if LOCK is not set), see *Table 281: COMP_INP non-inverting input signals (COMP1, COMP2, COMP3, COMP4)* and *Table 282: COMP_INP non-inverting input signals (COMP5, COMP6, COMP7, COMP8)*.

Bits 19:16 **INMSEL[3:0]**: COMP channel inverting input selection field

These bits are set and cleared by software (only if LOCK is not set). They select which input is connected to the minus input of COMP channel, see *Table 283: COMP_INM inverting input signals (COMP1, COMP2, COMP3, COMP4)* and *Table 284: COMP_INM inverting input signals (COMP5, COMP6, COMP7, COMP8)*.

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:12 **PWRMODE[1:0]**: COMP power mode selector

This bitfield is controlled by software (only if LOCK is not set). It selects the power consumption and, as a result, the speed of the comparator (refer to product datasheet).

Bit 11 **DGLT**: DEGLITCHER enable

This bit is controlled by software (only if LOCK not set). It enables the operation of the deglicher.
0: Disable
1: Enable

Bits 10:8 **HYST[2:0]:** COMP channel hysteresis selection bits

These bits are set and cleared by software (only if LOCK is not set). They select the hysteresis voltage of the COMP channel (refer to product datasheet).

Bit 7 Reserved, must be kept at reset value.

Bit 6 **ITEN:** COMP channel interrupt enable

This bit is set and cleared by software (only if LOCK is not set). This bit enables the interrupt generation of the COMP channel.

0: Interrupt generation disabled for COMP channel

1: Interrupt generation enabled for COMP channel

Bit 5 Reserved, must be kept at reset value.

Bit 4 **WINOUT**: COMP output selector

This bit is controlled by the software (only if LOCK is not set). It selects the comparator window mode output.

0: comp_out = comp_value

1: comp_out = winout (window mode output)

Bit 3 **POLARITY:** COMP polarity selection bit

This bit is set and cleared by software (only if LOCK is not set). It inverts COMP polarity.

0: COMP output is not inverted

1: COMP output is inverted

Bit 2 **SCALEN**: Voltage scaler enable bit

This bit is set and cleared by software (only if LOCK is not set). This bit enables the comp_int_vref scaler.

0: comp_int_vref scaler disabled

1: comp_int_vref scaler enabled

Bit 1 **BRGEN:** Scaler bridge enable

This bit is set and cleared by software (only if LOCK is not set). This bit enables the bridge of the scaler.

0: comp_int_vref scaler resistor bridge disabled

1: comp_int_vref scaler resistor bridge enabled

Bit 0 **EN:** COMP channel enable bit

This bit is set and cleared by software (only if LOCK is not set). It enables the COMP channel.

0: Disable

1: Enable

29.8.4 Comparator filter configuration register (COMP_FLTR)

Address offset: 0x0C

Reset value: 0x0000 0000

30 Audio digital filter (ADF)

30.1 ADF introduction

The audio digital filter (ADF) is a high-performance module dedicated to the connection of external sigma-delta (∑Δ) modulators. It is mainly targeted for the following applications:

- audio capture signals
- metering

The ADF features one digital serial interface (SITF0) and one digital filter (DFLT0) with flexible digital processing options in order to offer up to 24-bit final resolution.

The ADF serial interface supports several standards allowing the connection of various ∑Δ modulator sensors:

- SPI interface
- Manchester coded 1-wire interface
- PDM interface

The ADF converts an input data stream into clean decimated digital data words. This conversion is done thanks to low-pass digital filters and decimation blocks. In addition, it is possible to insert a high-pass filter.

The conversion speed and resolution are adjustable according to configurable parameters for digital processing: filter bypass, filter order, decimation ratio. The maximum output data resolution is up to 24 bits. There are two conversion modes: single conversion and continuous modes. The data can be automatically stored in a system RAM buffer through DMA, thus reducing the software overhead.

A sound activity detector (SAD) is available for the detection of sounds or voice signals. The SAD is connected at the output of the DFLT0. Several parameters can be programmed in order to adjust properly the SAD to the sound environment. The SAD strongly reduces the power consumption by preventing the storage of samples into the system memory, as long as the observed signal does not match the programmed criteria.

The digital processing is performed using only the kernel clock. The ADF requests the bus interface clock (AHB clock) only when data must be transfered or when a specific event requests the attention of the system processor.

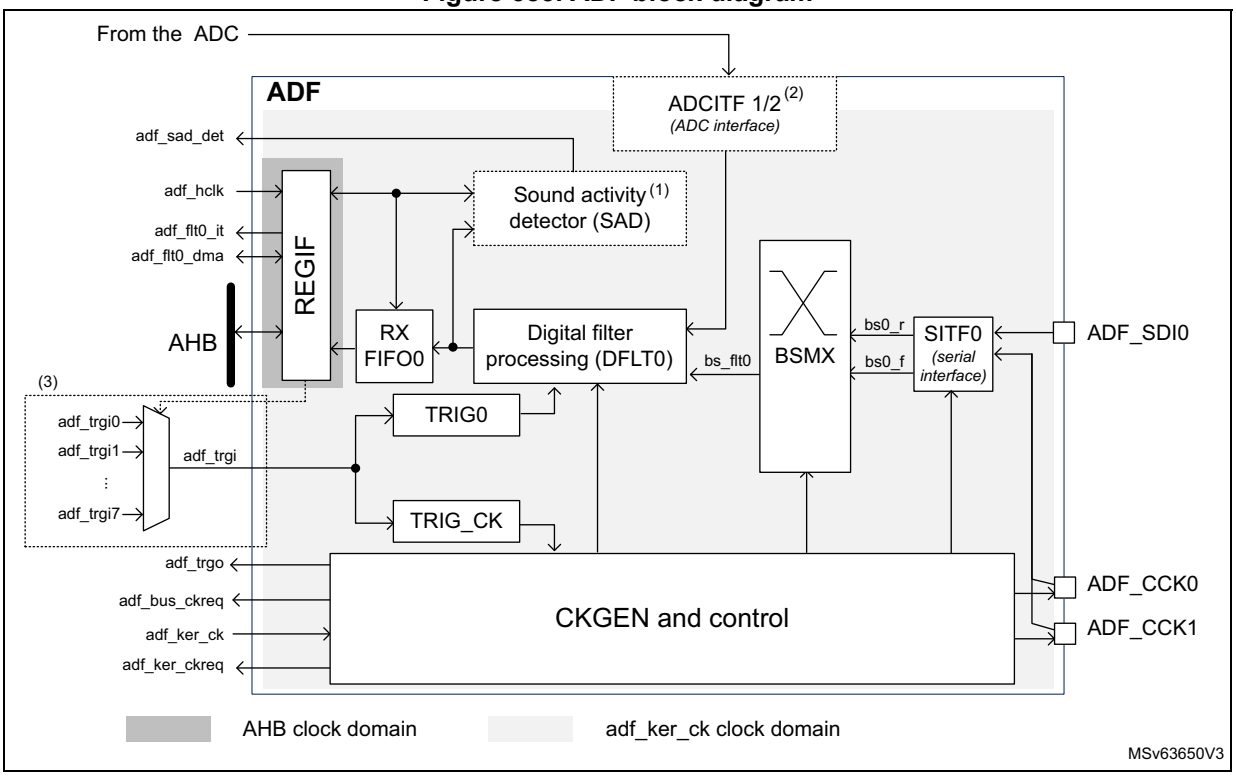
30.2 ADF main features

- AHB Interface
- 1 serial digital input:
  - configurable SPI interface to connect various digital sensors
  - configurable Manchester coded interface support
  - compatible with PDM interface to support digital microphones
- 2 common clocks input/output for ∑Δ modulators
- 1 flexible digital filter path including:
  - A MCIC filter configurable in $Sinc^4$ or $Sinc^5$ filter with an adjustable decimation ratio
  - A reshape filter to improve the out-off band rejection and in-band ripple

  - A high-pass filter to cancel the DC offset
  - Gain control
  - Saturation blocks
- Clock absence detector
- Sound activity detector
- 24-bit signed output data resolution
- Continuous or single conversion
- Possibility to delay the selected bitstream
- One trigger input
- Autonomous functionality in Stop mode(s)
- DMA can be used to read the conversion data
- Interrupts services

30.3 ADF implementation

Table 291. ADF features(1)



Mode or feature	ADF1
Number of filters (DFLTx) and serial interfaces (SITFx)	1
MDF_CKIy/ADF_CKI0 connected to pins	-
Sound activity detection (SAD)	X
RXFIFO depth (number of 24-bit words)	4
ADC connected to ADCITF1	ADC1
ADC connected to ADCITF2	ADC2
Motor dedicated features (SCD, OLD, OEC, INT, snapshot, break)	-
Main path with CIC4, CIC5	X
Main path with CIC1,2, 3 or FastSinc	-
RSFLT, HPF, SAT, SCALE, DLY, Discard functions	X
Autonomous in Stop modes	X(2)

1. ‘X’ = supported, ‘-’ = not supported.
2. Only Stop 0 and Stop 1 modes.

30.4 ADF functional description

30.4.1 ADF block diagram

Figure 385. ADF block diagram

1. Refer to *Section 30.3: ADF implementation* to check if the SAD is available.
2. Refer to *Section 30.3: ADF implementation* to check if the ADCITF is available, and which ADCs are connected.
3. The number of trigger inputs depends on the product. Refer to *Table 294* for details.

30.4.2 ADF pins and internal signals

Table 292. ADF external pins

Pin name	Pin type	Remarks
ADF_SDI0	Input	Data signal from external sensors
ADF_CCKy (y = 0,1)	Input/output	Clock outputs for external sensor, or common clock input from external sensors

Table 293. ADF internal signals

Signal name	Signal type	Remarks
adf_trgi	Input	Trigger inputs to control the acquisition (see *Table 294: ADF trigger connections* for details)
adf_trgo	Output	Trigger output for synchronizing with other MDF instances

Table 293. ADF internal signals (continued)

Signal name	Signal type	Remarks
adf_flt0_dma	Input/output	DMA request/acknowledge signals for the ADF processing chain
adf_flt0_it	Output	Global interrupt signals
adf_bus_ckreq	Output	Bus interface clock request output
adf_ker_ckreq	Output	Kernel clock request output
adf_ker_ck	Input	Kernel clock input
adf_hclk	Input	AHB bus interface clock input
adf_sad_det	Output	SAD sound detection: 1 means that detecting sound
adf_adcitf1_dat[15:0]	Input	ADCITF1 data input
adf_adcitf2_dat[15:0]	Input	ADCITF2 data input

Table 294. ADF trigger connections

Trigger name	Direction	Trigger source/destination
adf_trgi0	Input	exti15
adf_sad_det	Output	hsp1_trg_in19

Table 295. MDF ADC data connections

ADC data bus name	ADC source
mdf_adcitf1_dat[15:0]	adc1_dat
mdf_adcitf2_dat[15:0]	adc2_dat

30.4.3 Serial input interface (SITF)

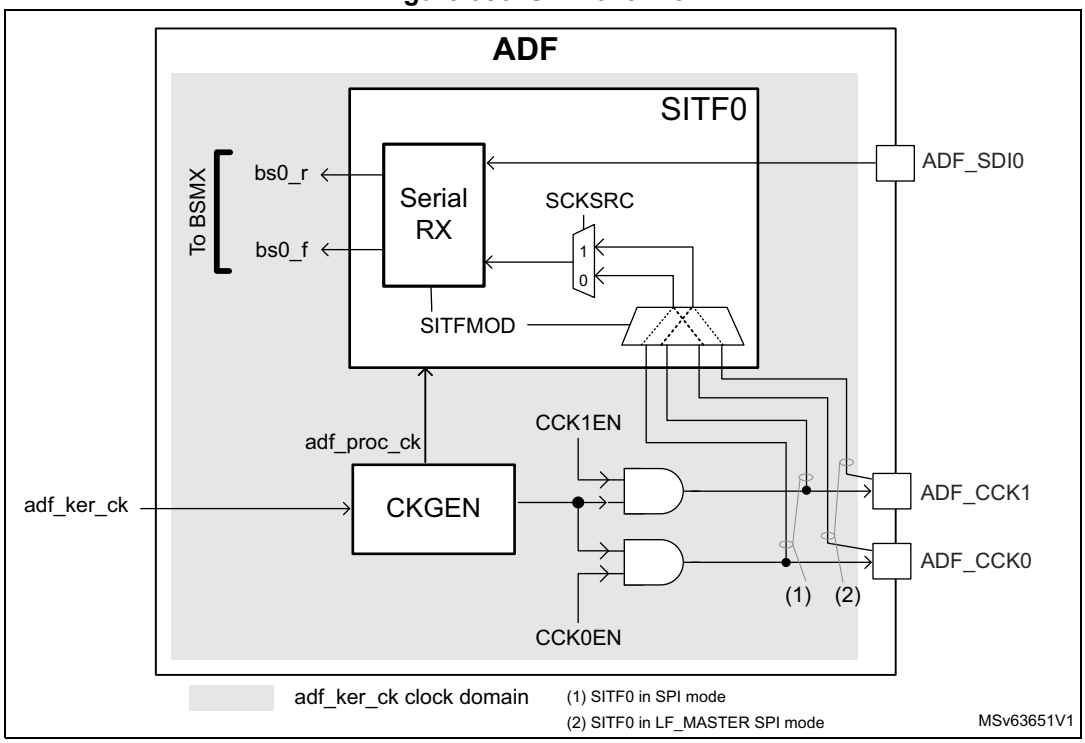
The SITF0 input interface allows the connection of the external sensor to the digital filter via the bitstream matrix (BSMX). The SITF0 can be configured in the following modes:

- LF_MASTER SPI mode (low-frequency)
- normal SPI mode
- Manchester mode

The data from the serial interface is routed to the filter in order to perform the PDM to PCM conversion and the sound activity detection.

The serial interface is enabled by setting the SITFEN bit to 1. Once the interface is enabled, it receives serial data from the external ∑Δ modulator.

Note: Before enabling the *serial interface, the user must insure that the adf_proc_ck is already enabled (see Section 30.4.5: Clock generator (CKGEN) for details).*



The SITF0 is controlled via the *ADF serial interface control register 0 (ADF_SITF0CR)*.

As shown in the *Figure 386*, ADF_CCK0 or ADF_CCK1 can be selected as clock source, in order to sample the incoming bitstream:

- If the serial interface is programmed in SPI mode, the selected clock source is a copy of the clock present on the ADF_CCK0 or ADF_CCK1 pin.
- If the serial interface is programmed in LF_MASTER SPI mode, the selected clock source is the clock directly provided by the CCKDIV to the ADF_CCK0 or ADF_CCK1 pin.

See *Table 296* for additional information.

Figure 386. SITF overview

LF_MASTER and normal SPI modes

The LF_MASTER SPI mode is a special mode allowing the use of an adf_proc_ck clock frequency, only two times bigger than the sensor clock. This mode is dedicated to low-power use-cases, using low-speed sensors.

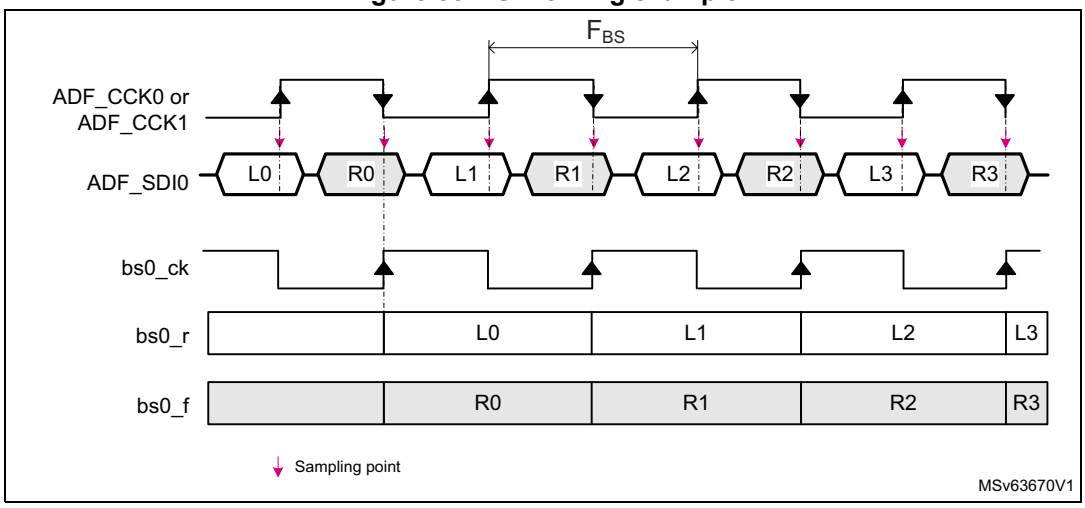
In LF_MASTER SPI mode, the ADF must provide the bitstream clock to the external sensors via ADF_CCK0 and ADF_CCK1 pins. The ADF receives the bitstream data via the serial data input ADF_SDI0.

For the SITF0, the application must select the same clock than the one provided to the external sensor (ADF_CCK0 or ADF_CCK1), in order to guarantee optimal timing performances. This selection is done via SCKSRC[1:0].

The normal SPI interface is a more flexible interface than the LF_MASTER SPI, but the adf_proc_ck frequency must be at least four times higher than the sensor clock.

The application can select ADF_CCK0 or ADF_CCK1 clock for the capture of the data received via the ADF_SDI0 pin.

The ADF can generate a clock to the sensors via ADF_CCK0 or ADF_CCK1 if needed.



For all SPI modes, the serial data is captured using the rising and the falling edge of the selected clock. The SITF0 always provides the following bitstreams:

- bitstream received using the bitstream clock falling edge (bs0_f)
- bitstream received using the bitstream clock rising edge (bs0_r)

According to the sensors connected, one of the two bitstreams may not be available.

The application can select the wanted stream via the BSMX matrix.

Figure 387. SPI timing example

To properly synchronize/receive the data stream, the adf_proc_ck frequency must be adjusted according to the constraints listed in *Table 297*.

Clock absence detection

A no-clock-transition period may be detected when the serial interface works in normal SPI mode. This feature can be used to detect a clock failure in the SPI link.

The application can program a timeout value via the STH[4:0] bitfield of the SITF0. If the ADF does not detect clock transitions for a duration of STH[4:0] x $T_{adf_proc_ck}$, then the CKABF flag is set.

An interrupt can be generated if CKABIE is set to 1. The STH[4:0] bitfield is in the *ADF serial interface control register 0 (ADF_SITF0CR)*.

When the serial interface is enabled, the CKABF flag remains to 1 until a first clock transition is detected.

To avoid spurious clock absence detection, the following sequence must be respected:

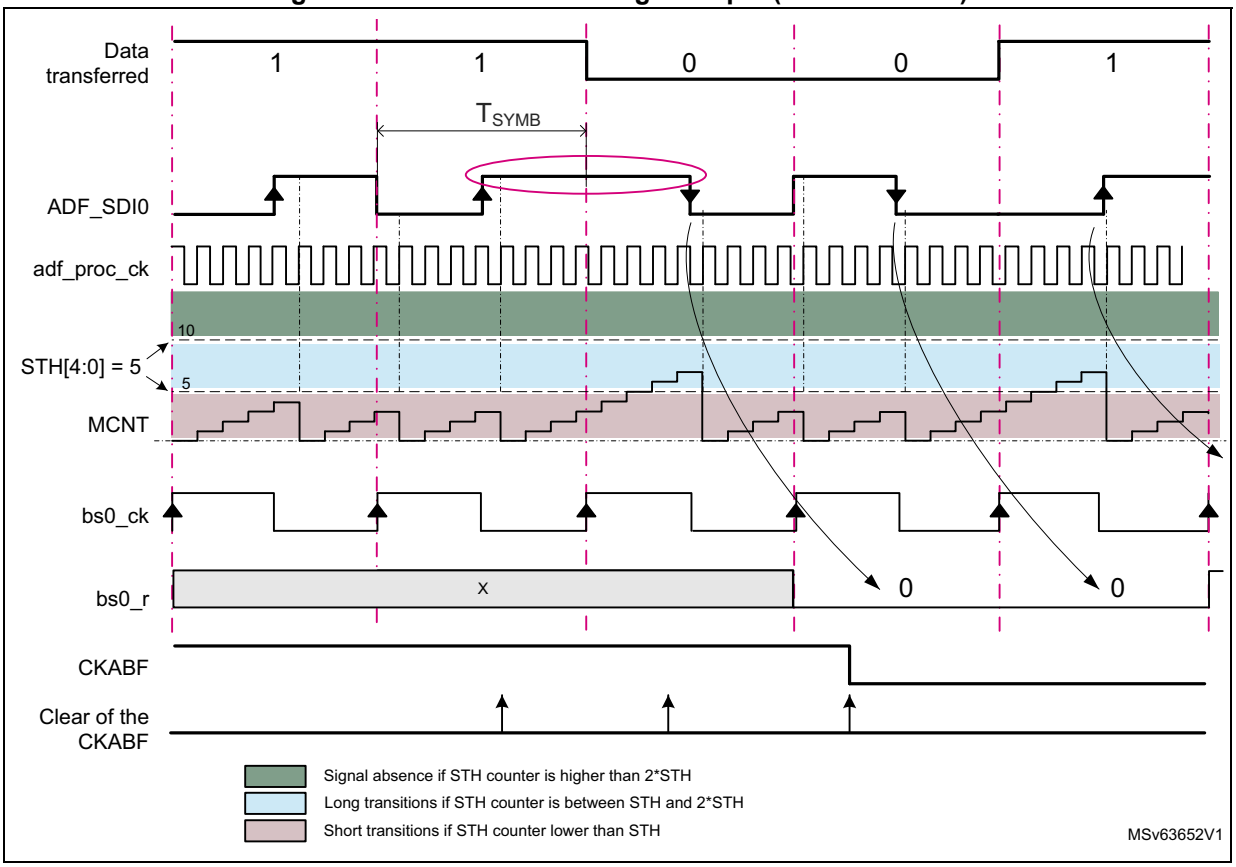
1. Configure the serial interface in normal SPI mode and enable it.
2. Clear the CKABF flag by writing CKABF bit to 1.

   If no clock transition is detected on the serial interface, the hardware immediately sets the CKABF flag to 1.

3. Read the CKABF flag:
   – If CKABF = 1, go back to step 2.
   – If CKABF = 0, a clock has been detected. The CKABIE bit can be set to 1 if the application wants an interrupt on detection of a clock absence.

Note: The clock absence detection feature is not available in the LF_MASTER SPI mode.

Manchester mode



In Manchester coded format, the ADF receives data stream from the external sensor via the ADF_SDI0 pin only.

The ADF_CCK0 and ADF_CCK1 pins are not needed in this mode.

Decoded data and clock signals are recovered from serial stream after Manchester decoding. They are available on bs0_r. There are two possible settings of Manchester codings:

- signal rising edge decoded as 0 and signal falling edge decoded as 1
- signal rising edge decoded as 1 and signal falling edge decoded as 0

Figure 388. Manchester timing example (SITFMOD = 11)

To decode the incoming Manchester stream, the user must program STH[4:0] in the *ADF serial interface control register 0 (ADF_SITF0CR)*. The STH[4:0] bitfield is used by the SITF0 to estimate the Manchester symbol length and to detect a clock absence. An internal counter (MCNT) is restarted every time a transition is detected in the ADF_SDI0 input. It is used to detect short transitions, long transitions or clock absence. A long transition indicates

that the data value changed. *Figure 388* shows a case where the OVR is around height and STH[4:0] = 5.

The estimated Manchester symbol rate (T_{SYMB}) must respect the following formula:

$$(STH + 1) \times T_{adf_proc_ck} < T_{SYMB} < (2 \times STH \times T_{adf_proc_ck})$$

It is recommended to compute STH as follows:

$$STH[4:0] = round\left(\frac{(2 \times OVR) - 1}{3}\right)$$

where OVR represents the ratio between the adf_proc_ck frequency and the expected Manchester symbol frequency. OVR must be higher than five, and the adf_proc_ck clock must be adjusted according to the constraints listed in *Table 297*.

The clock absence flag CKABF is set to 1 when no transition is detected during more than 2 x STH[4:0] x $T_{adf_proc_ck}$, or when the SITF0 is not yet synchronized to the incoming Manchester stream. In addition, an interrupt can be generated if the bit CKABIE is set to 1.

When the serial interface is enabled, the ADF must first be synchronized to the incoming Manchester stream. The synchronization ends when a data transition from 0 to 1 or from 1 to 0 (pink circle in the *Figure 388*) is detected.

The end of the synchronization phase can be checked by following the software sequence:

1. Clear the CKABF flag in the *ADF DFLT0 interrupt status register 0 (ADF_DFLT0ISR)* by writing CKABF bit to 1. If the serial interface is not yet synchronized the hardware immediately set the CKABF flag to 1.
2. Read the CKABF flag:
   – If CKABF= 1, go back to step 1.
   – If CKABF = 0, the Manchester interface is synchronized and provides valid data.

Programming example

In the following example, the ADF kernel clock frequency ($F_{adf_ker_ck}$) is 100 MHz and the received Manchester stream is at about 6 MHz (F_{SYMB}):

1. Provide a valid adf_proc_ck to the SITF0.

   The adf_proc_ck frequency must be at least six times higher than the Manchester symbol frequency (means at least 36 MHz).

   PROCDIV is programmed to 1 to perform a division by two of the kernel clock. In that case, $F_{adf_proc_ck}$ = 50 MHz (8.33 times higher than the Manchester symbol frequency).
2. Compute STH.

   OVR is given by: OVR = $F_{adf_proc_ck}$ / F_{SYMB} = 50 MHz / 6 MHz = 8.33.

   Then $STH[4:0] = round\left(\frac{(2 \times 8.33) - 1}{3}\right) = 5$

   The minimum allowed frequency for the Manchester stream is then:

   1 / (2 × STH × $T_{adf_proc_ck}$) = 1 / (10 x 20 ns) = 5 MHz

   The maximum allowed frequency for the Manchester stream is then:

   1 / ((STH+1) × $T_{adf_proc_ck}$) = 1 / (6 x 20 ns) = 8.33 MHz

30.4.4 ADC slave interface (ADCITF)

The ADCs are not always connected to the ADF. Refer to *Section 30.3* to check the situation for this product.

The ADF allows the connection of up to two ADCs to the filter path. For the filter, the DATSRC[1:0] bitfield in the *ADF digital filer configuration register 0 (ADF_DFLT0CICR)* allows the application to select data from the ADCs.

Warning: The ADF does not support receiving interleaved data from one of the ADCITF input.

30.4.5 Clock generator (CKGEN)

The RCC (reset and clock controller) provides the following clocks to the ADF:

- AHB clock (adf_hclk) used for the register interface
- kernel clock (adf_ker_ck) mainly used by all other parts of the circuit via the CKGEN

These clocks are not supposed to be phase locked, so all signals crossing those clock domains are resynchronized.

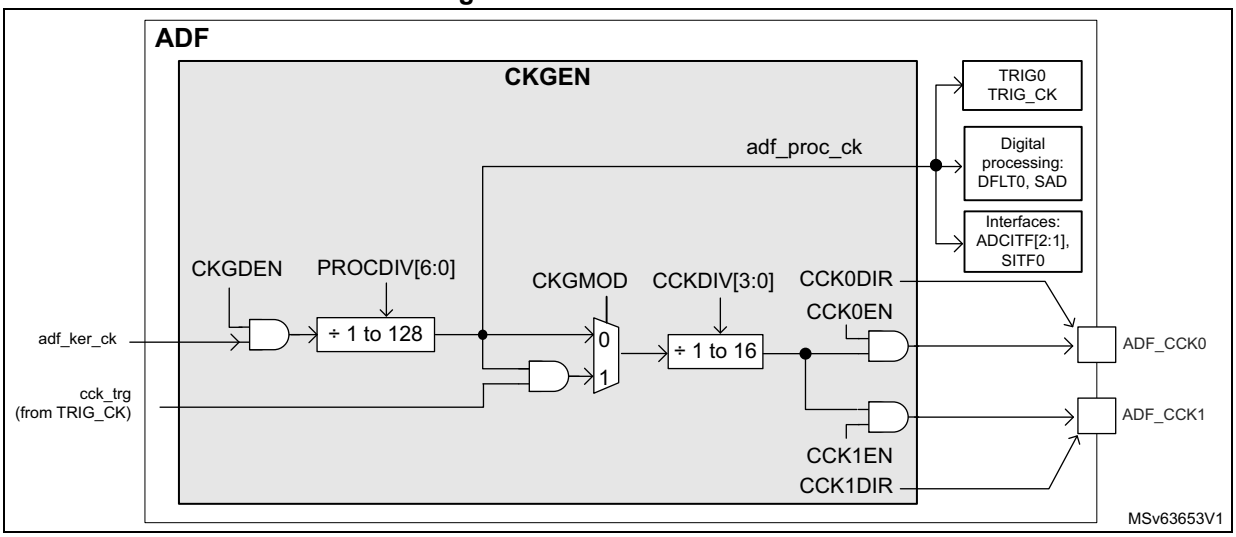
The clock generator (CKGEN) is responsible of the generation of the processing clock, and the clock provided to the ADF_CCK0 and ADF_CCK1 pins. All those clocks are generated from the adf_ker_ck.

The processing clock (adf_proc_ck) is used to run all the signal processing and to re-sample the incoming serial or parallel stream.

To adapt the kernel clock frequency provided by the RCC, the following dividers are available:

- PROCDIV[6:0] used to adapt the kernel clock frequency to the constraints of the parallel and serial interfaces, and to the processing blocks
- CCKDIV[3:0] used to adapt the frequency of the ADF_CCK0 and ADF_CCK1 clocks

PROCDIV[6:0] and CCKDIV[3:0] must be programmed when no clock is provided to the dividers (CKGDEN = 0).



The adf_proc_ck generation is controlled by CKGDEN.

In addition, the CKGMOD bit allows the application to define the way to trigger the CCKDIV divider:

- When CKGMOD = 0, the CCKDIV divider is started as soon as CKGDEN is set to 1.
- When CKGMOD = 1, the CCKDIV divider is started when CKGDEN is set to 1 and the programmed trigger condition occurred.

All the bits and fields controlling the CKGEN are in the *ADF clock generator control register (ADF_CKGCR)*.

Figure 389. CKGEN overview

The trigger logic for CKGEN is handled by the block TRG_CK. As shown in *Figure 394*, the CCKDIV divider can be triggered on the rising or falling edge of an external trigger source. When the proper trigger condition occurs, the cck_trg signal goes to high, allowing the CCKDIV divider to start. The TRG_CK logic is reset when CKGDEN is set to 0.

This feature can be helpful to synchronize the ADF_CCKy (y = 0,1) clock of several ADF instances, or to synchronize the clock generation to a timer event.

The application can control the activation of the ADF_CCK0 or ADF_CCK1 pin thanks to CCK0EN/CCK1EN and CCK0DIR/CCK1DIR bits:

- CCKyEN is used to enable the CCKDIV, and thus generates a clock for the external sensors.
- CCKyDIR is used to control the direction of the ADF_CCKy pin (input or output)

Table 296. Control of the common clock generation(1)

CCKyEN	CCKyDIR	Description
0	0	The ADF_CCKy pin is in input. An external clock can be connected to the ADF_CCKy pin and used by the SITF0 in order to decode the serial stream
0	1	The ADF_CCKy pin is in output. No clock is generated. The ADF_CCKy pin is driven low.
1	1	The ADF_CCKy pin is in output. A clock is generated on the ADF_CCKy pin. The SITF0 can use this pin as clock source in order to decode the serial stream

1. The configuration with CCKyEN = 1 and CCyDIR = 0 is not shown must be avoided (no interest).

Note: The adf_proc_ck must be enabled (by CKGDEN = 1) before enabling other blocks (such as SITF0 or DFLT0).

CKGEN activation sequence example

1. Set CKGDEN to 0.
2. Wait for CKGACTIVE = 0. If CKGDEN was previously enabled, this phase can take two periods of adf_hclk, and two periods of adf_proc_ck.
3. Program PROCDIV[6:0], CKGMOD, CCKDIV[3:0], TRGSRC[3:0], TRGSENS, CCK1EN and CCK0EN.
4. Set CKGDEN to 1.

When needed, at any moment, CCK[1:0]EN bitfield value can be changed without disabling the clock generator.

Clock frequency constraints

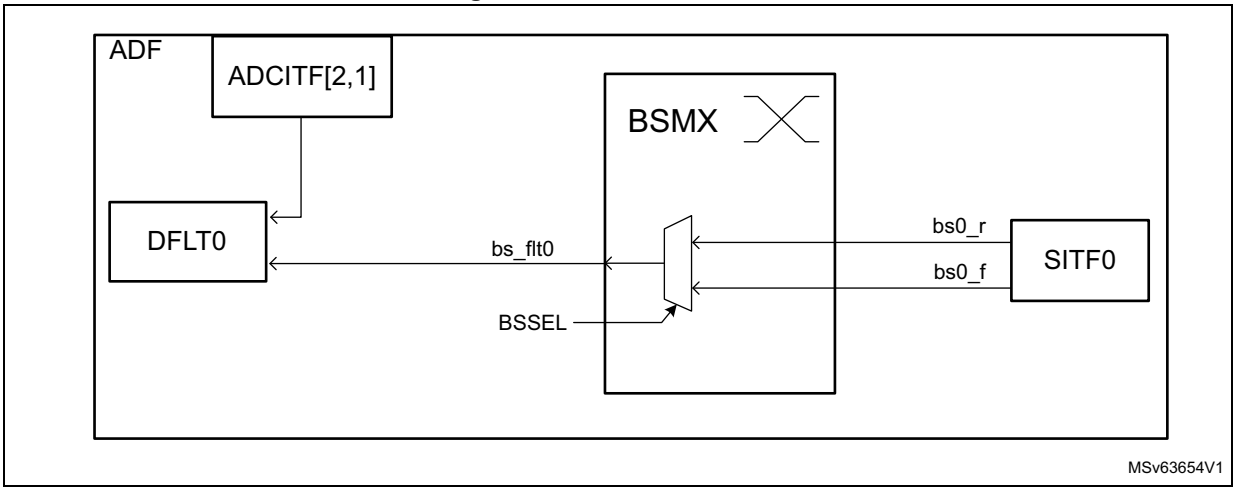
Table 297 shows the frequency constraints to receive and process properly the samples.

Note: The reshape filter (RSFLT) needs up to 24 cycles of adf_proc_ck clock to process one sample.

Table 297. Clock constraints with respect to the incoming stream(1)

SITF0 mode	ADF clock constraints	
	With RSFLT disabled	With RSFLT enabled
LF_MASTER SPI	F_{ADF_CCKy} max frequency limited to 5 MHz	
	$F_{adf_proc_ck} > 2 \times F_{ADF_CCKy}$ and $F_{adf_hclk} \geq F_{adf_proc_ck}$	$F_{adf_proc_ck} > 24 \times F_{ADF_CCKy} / (MCICD+1)$ and $F_{adf_proc_ck} > 2 \times F_{ADF_CCKy}$ and $F_{adf_hclk} \geq F_{adf_proc_ck}$
MASTER SPI SLAVE SPI	F_{ADF_CKx} max frequency limited to 25 MHz	
	$F_{adf_proc_ck} > 4 \times F_{ADF_CCKy}$ and $F_{adf_hclk} \geq F_{adf_proc_ck}$	$F_{adf_proc_ck} > 24 \times F_{ADF_CCKy} / (MCICD+1)$ and $F_{adf_proc_ck} > 4 \times F_{ADF_CCKy}$ and $F_{adf_hclk} \geq F_{adf_proc_ck}$
Manchester	F_{SYMB} max frequency limited to 20 MHz	
	$F_{adf_proc_ck} > 6 \times F_{SYMB}$ and $F_{adf_hclk} \geq F_{adf_proc_ck}$	$F_{adf_proc_ck} > 24 \times F_{ADF_CCKy} / (MCICD+1)$ and $F_{adf_proc_ck} > 6 \times F_{SYMB}$ and $F_{adf_hclk} \geq F_{adf_proc_ck}$

1. F_{ADF_CCKy} represents the frequency of clock received via ADF_CCKy, or generated via ADF_CCKy. F_{SYMB} represents the frequency of the received symbol rate for Manchester mode.



30.4.6 Bitstream matrix (BSMX)

The BSMX receives the bitstreams from the serial interface SITF0 and provides the selected stream to the digital filter DFLT0.

As shown in *Figure 385*, the SITF0 provides two bitstreams (bs0_r and bs0_f) to the BSMX.

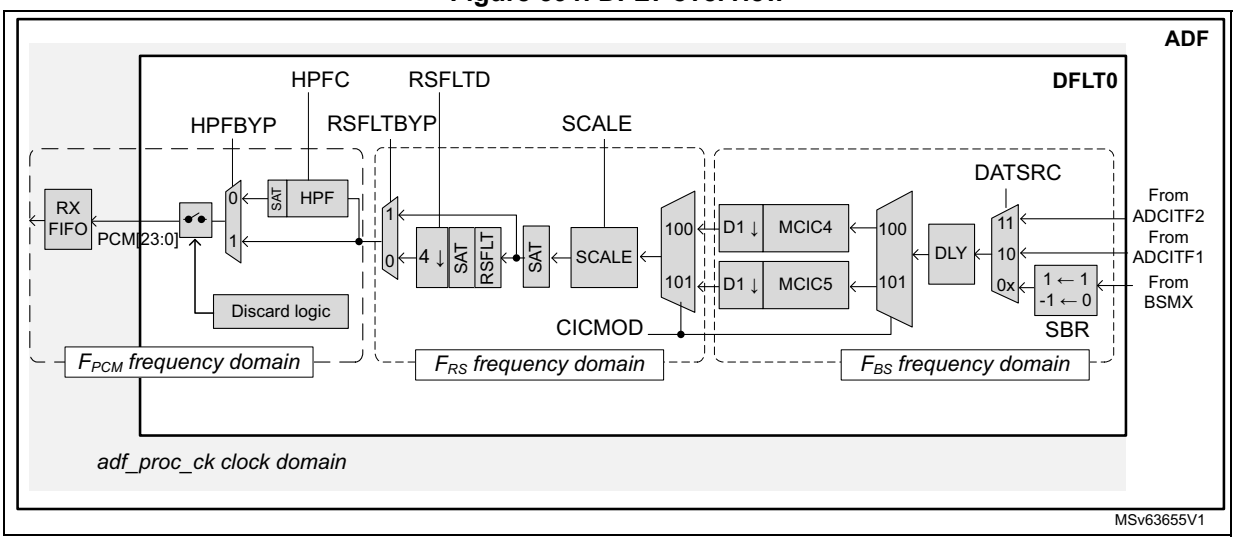
The application to select the wanted stream via the *ADF bitstream matrix control register 0 (ADF_BSMX0CR)*. This selection is intended to be static.

Figure 390. BSMX overview

BSMX programming sequence example

The BSSEL[4:0] bitfield cannot be changed if the DFLT0 is enabled. The following steps are needed to change the value of BSMX:

1. Set DFLTEN of DFLT0 to 0.
2. Wait for BSMXACTIVE = 0.
3. Program BSSEL[4:0].
4. Set DFLTEN of DFLT0 to 1.



30.4.7 Digital filter processing (DFLT)

The digital filter processing includes the following sub-blocks:

- symbol remap (SBR)
- clock skipper delay (DLY)
- MCIC decimation filter that can be configured in $Sinc^4$ or $Sinc^5$
- gain control (SCALE)
- signal saturation (SAT)
- reshape filter (RSFLT)
- high-pass filter (HPF)
- receive RXFIFO

Figure 391 shows the filter path configuration according to CICMOD[2:0]. Several configuration bits are available to configure the digital filter to the application needs.

Figure 391. DFLT overview

Symbol remap and source selection

The symbol remap (SBR) converts the bitstream selected by the BSMX into data usable by the filter path. More especially:

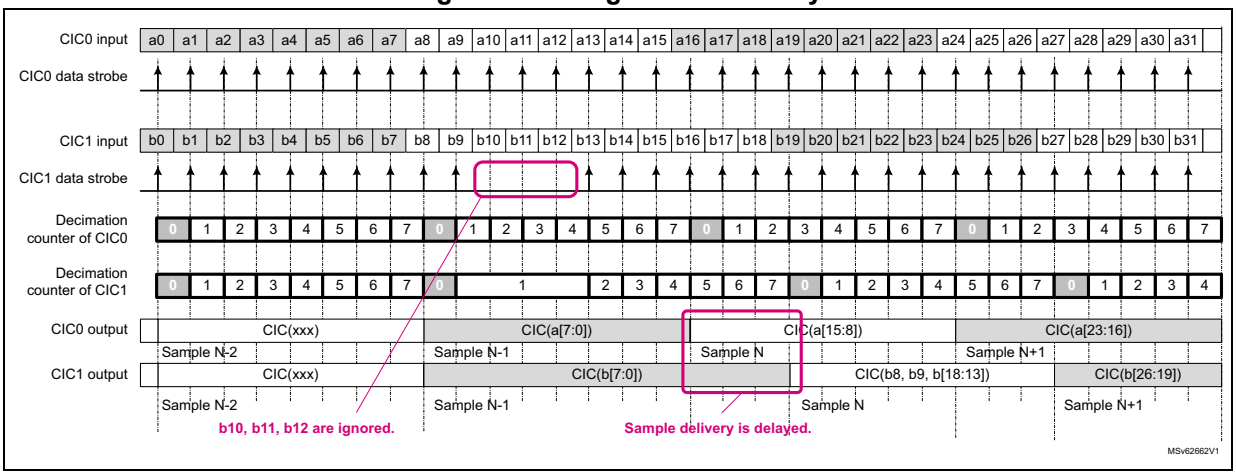
- The high levels are converted into a 16-bit signed number + 1.
- The low levels are converted into a 16-bit signed number - 1.

The signal source of the digital filter can be selected via DATSRC[1:0] between the two following:

- data coming from the BSMX
- data coming from one of the ADC interfaces (ADCITF2 or 1)

Programmable micro-delay control (DLY)

The digital filter has a delay line that allows the timing adjustment of each stream with the resolution of the bitstream clock.



This feature is particularly helpful in the case of microphone beam forming applications where delays smaller than the final sampling rate must be applied to the incoming stream. This feature can be used when the ADF is synchronized with another MDF instance (if present in the product) for a beam forming application for example.

The delay is performed by discarding a given number of samples from the selected input stream, before samples enter into the CIC filter. This data discarding is done by skipping a given number of data strobe, preventing the CIC filter to take into account those data.

When the wanted amount of data strobe has been skipped, the next incoming samples are strobed normally.

Table 392 shows an example on how to apply dynamically small delay to an incoming stream. For simplification, the CIC filter performs a decimation by height in this example. CIC1 represents the CIC included in the ADF and CIC0 represents a filter from another MDF instance (if present in the product).

Figure 392. Programmable delay

The CIC of the ADF (CIC1) receives a command in order to skip three incoming samples. So the input samples named b10, b11 and b12 are not processed by CIC1. As a consequence, the output sample N+1 generated by CIC0 is built from input samples a[23:16] while the sample N+1 of CIC1 is built from input samples b[26:19].

Finally, the non-skipped data stream looks delayed by three bitstream periods.

Note: When the input data strobes are skipped, the decimation counter remains frozen. As a consequence, the samples delivered by the CIC1 are a bit delayed.

The following steps are needed to program the amount of bitstream clock periods to be skipped:

1. Wait for SKPBF equal to 0.
2. Write SKPDLY[6:0] to the wanted number of bitstream clock periods to be skipped. The SKPBF flag goes immediately to 1, indicating that the delay value entered into SKPDLY[6:0] is under process.
   - If the DFLT0 is not yet enabled (DFLTEN = 0), then the DLY logic waits for DFLTEN = 1. When the application sets DFLTEN to 1, the DLY logic starts to skip the amount of wanted data strobes.
   - If the DFLT0 is already enabled (DFLTEN = 1), then the DLY logic immediately starts to skip the amount of wanted data strobes.

   When the ADF skipped the amount of wanted data strobes, then SKPBF goes back to 0.
3. If the application needs to skip more data strobes, then the operation must be restarted from step 1.

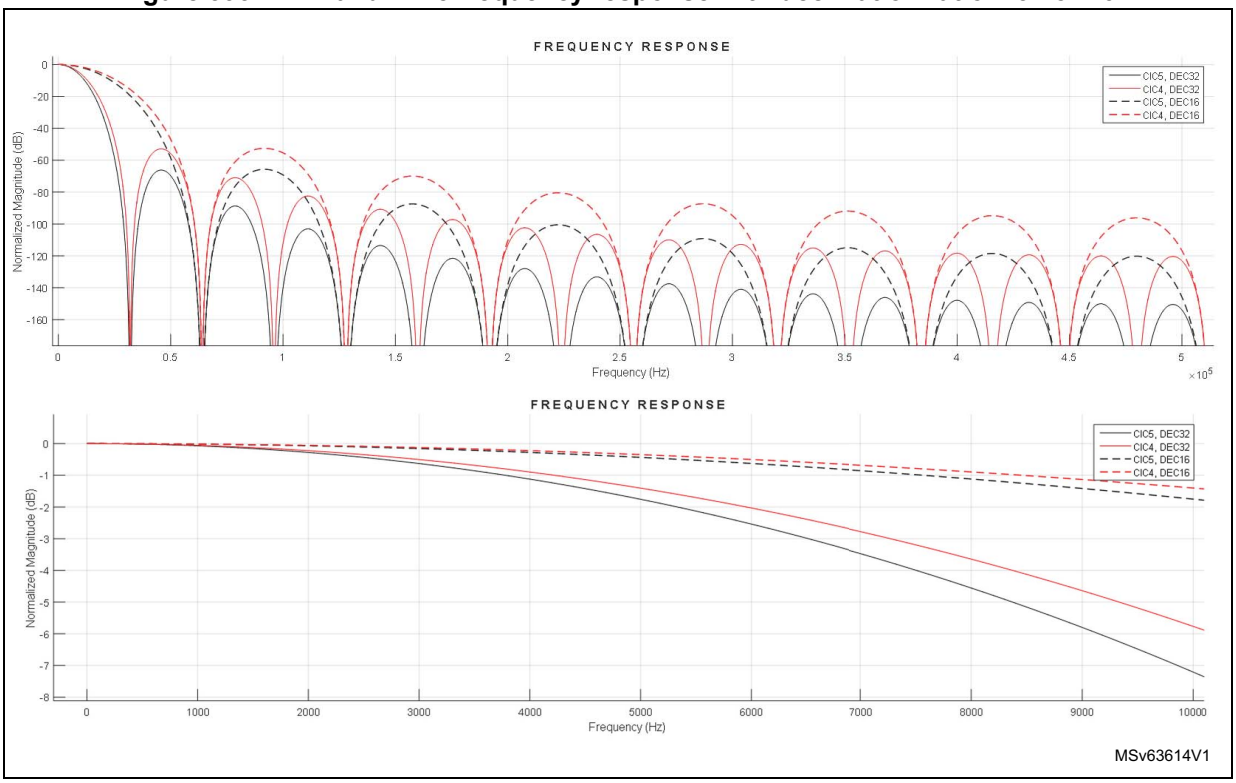
The effect of the delay performed with this mechanism is cumulative as long as the ADF is enabled. If the application performs a D1 delay followed by a D2 delay, then all other active filters are delayed by D1 + D2.

Note: If SKPDLY[6:0] is written when SKPBF = 1, the write operation is ignored.

Cascaded-integrator-comb (CIC) filter

The CIC digital filters are an efficient implementation of low-pass filters, often used for decimation and interpolation. The CIC frequency response is equal to a $Sinc^N$ function, this is why they are often called Sinc filters.

The Sinc^N digital filter embedded into the ADF can be configurable in Sinc^4 or Sinc^5, according to CICMOD:



- If CICMOD[2:0] = 4, Sinc^4 is selected.
- If CICMOD[2:0] = 5, Sinc^5 is selected.

The filters have the following transfer function:

$$H(z) = \left(\frac{1 - z^{-D}}{1 - z^{-1}}\right)^N$$

where N can be 4 or 5, and D is the decimation ratio. D is equal to MCICD+1.

Figure 393. CIC4 and CIC5 frequency response with decimation ratio = 32 or 16

CIC output data size

The size of samples delivered by the CIC (DS_{CIC}), depends on the following parameters:

- CIC order (N)
- CIC decimation ratio (D)
- data size of the input stream (DSIN)

The CIC order and decimation ratio must be programmed in order to insure that the data size does not exceed the 26-bit CIC capability.

The following formula gives the output data size (DS_{CIC}) according to the parameters above.

$$DS_{CIC} = \left(\frac{N \times Ln(D)}{Ln(2)}\right) + DS_{IN}$$

and the CIC gain is given by this formula:

$$G_{CIC} = (D)^N$$

The decimation ratio can be adjusted from 2 to 512 for the CIC filter.

Table 298 gives some data output size in bits for some decimation values, when the data source is a full-scale signal coming from the serial interface or from a 12-bit ADC.

Note: DS_{IN} = 1 bit for a serial bitstream, but can be up to 16 bits when coming from the ADCITF.

Table 298. Data size according to CIC order and CIC decimation values

Decimation	Data size (bits) when DS_{IN} = 1 bit (data from SITF0)		Data size (bits) when DS_{IN} = 12 bits (data from ADCITF)	
	Sinc^4	Sinc^5	Sinc^4	Sinc^5
4	9	11	20	22
8	13	16	24	-
10	15	18	26	-
12	16	19	-	-
16	17	21	-	-
20	19	23	-	-
24	20	24	-	-
32	21	26	-	-
48	24	-	-	-
64	25	-	-	-
76	26	-	-	-

Note: For a full-scale input signal, the decimation ratio must not exceed 76 for a Sinc^4 and 32 for a Sinc^5.

The LSB parts of the data provided by the CIC is not necessarily significant: it depends on the sensor performances and the ability of the CIC to reject the out-off band noise.

The sample size at CIC output can be adjusted thanks to the SCALE block.

Scaling (SCALE) and saturation (SAT)

The SCALE block allows the application to adjust the amplitude of the signal provided by the CIC, by steps of 3 dB (± 0.5 dB).

The signal amplitude can be decreased by up to 8 bits (- 48.2 dB), and can be increased by up to 12 bits (+ 72.2 dB).

The gain is adjusted by the SCALE[5:0] bitfield in the *ADF digital filer configuration register 0 (ADF_DFLT0CICR)*.

SCALE[5:0] can be changed even if the DFLT0 is enabled. During the gain transition, the signal provided by the filter is disturbed.

Due to internal resynchronization, there is a delay of some cycles of adf_proc_ck clock between the moment where the application writes the new gain, and the moment where the gain is effectively applied to the samples. If the application attempts to write a new gain value while the previous one is not yet applied, this new gain value is ignored. Reading back SCALE[5:0] informs the application on the current gain value.

Table 299 shows the possible gain values.

Table 299. Possible gain values

SCALE[5:0]	Gain (dB)	SCALE[5:0]	Gain (dB)	SCALE[5:0]	Gain (dB)	SCALE[5:0]	Gain (dB)
0x20	- 48.2	0x2B	- 14.5	0x06	+ 18.1	0x11	+ 51.7
0x21	- 44.6	0x2C	- 12.0	0x07	+ 21.6	0x12	+ 54.2
0x22	- 42.1	0x2D	- 8.5	0x08	+ 24.1	0x13	+ 57.7
0x23	- 38.6	0x2E	- 6.0	0x09	+ 27.6	0x14	+ 60.2
0x24	- 36.1	0x2F	- 2.5	0x0A	+ 30.1	0x15	+ 63.7
0x25	- 32.6	0x00	0.0	0x0B	+ 33.6	0x16	+ 66.2
0x26	- 30.1	0x01	+ 3.5	0x0C	+ 36.1	0x17	+ 69.7
0x27	- 26.6	0x02	+ 6.0	0x0D	+ 39.6	0x18	+ 72.2
0x28	- 24.1	0x03	+ 9.5	0x0E	+ 42.1	-	-
0x29	- 20.6	0x04	+ 12.0	0x0F	+ 45.7	-	-
0x2A	- 18.1	0x05	+ 15.6	0x10	+ 48.2	-	-

The SAT blocks avoid having a wrap-around of the binary code when the code exceeds its maximal or minimal value.

The ADF performs saturation operations at the following levels:

- after the SCALE block (performed by the SAT block): The signal is saturated at 24 bits.
- inside the RSFLT, to insure a good filter behavior
- at the output of the HPF, to insure that the output signal does not exceed 24 bits

The SATF bit informs the application that a saturation occurred either after the SCALE, inside the RSFLT or after the HPF. In addition, an interrupt can be generated if SATIE is set to 1. As soon as a saturation is detected, the SATF flag is set to 1. It is up to the application to clear this flag in order to be able to detect a new saturation.

Those bits are in the *ADF DFLT0 interrupt enable register (ADF_DFLT0IER)* and *ADF DFLT0 interrupt status register 0 (ADF_DFLT0ISR)*.

Gain adjustment policy

To get the best ADF performances, it is important to properly adjust the gain value via SCALE[5:0].

A usual way to adjust the gain is to select the SCALE[5:0] value that gives a final signal amplitude as close as possible to the 24-bit full-scale, for the maximum input signal.

A way to select the optimal gain is detailed below:

1. Check that, for the expected input signal, the data size into the CIC filter does not exceed 26 bits. This can be checked using this formula:

$$\frac{LN(SIN_{pp} \cdot D^N)}{LN(2)} < 26$$

where N represents the CIC order, D the decimation ratio and SIN_{pp} the maximum peak-to-peak amplitude of the input signal.

SIN_{pp}can take:

– a maximum peak-to-peak amplitude of 2 (± 1), for samples coming from SITF0

– A maximum peak-to-peak amplitude of 4095 (+ 2047, - 2048), for samples coming from a 12-bit ADC

Example: a $Sinc^4$ can be used with a decimation ratio of 96, if the maximum input signal does not exceed ± 0.35. Indeed:

$$\frac{LN(0.7 \cdot 96^4)}{LN(2)} \sim 25.82 \text{ bits} < 26 \text{ bits}$$

2. Adjust the SCALE value.

   To select the most appropriate SCALE value, the user must check if the RSFLT is used or not. If the RSFLT is used, the data size at SCALE output must not exceed 22 bits, otherwise the data size can be up to 24 bits.

   The SCALE value in dB must be selected using this formula:

$$SCALE_{dB} < 20 \cdot \log 10\left(\frac{2^{NB}}{SIN_{pp} \cdot D^{N}}\right)$$

   where NB is equal to 22 if RSFLT is enabled, or 24 if RSFLT is bypassed. $SCALE_{dB}$ represents the gain value selected by SCALE[5:0].

   Example: For a $Sinc^4$ with a decimation ratio of 96 and a SIN_{pp} of 0.7.

   – If the RSFLT is bypassed:

$$20 \cdot \log 10\left(\frac{2^{24}}{0.7 \cdot 96^{4}}\right) \sim -11 \text{ dB}$$

     $SCALE_{dB}$ value must be lower than - 11 dB, the closest lower value is - 12dB (SCALE[5:0] = 0x2C).

   – If the RSFLT is enabled:

$$20 \cdot \log 10\left(\frac{2^{22}}{0.7 \cdot 96^{4}}\right) \sim -23 \text{ dB}$$

     $SCALE_{dB}$ value must be lower than - 23 dB, the closest lower value is - 24.1 dB (SCALE[5:0] = 0x28).

   If SCALE[5:0] is set to a higher value, then a saturation may occur. An event flag informs the user if a saturation occurred.

Table 300 proposes gain values for different filter configurations, when the data comes from the SITF0, according to the MCIC order, and the MCIC decimation ratio. This table is not exhaustive and considers a full-scale input signal (see *Section 30.7.5: Total ADF gain* for details).

Table 300. Recommended maximum gain values versus CIC decimation ratios

CIC decimation ratio	Gain settings (dB) for configuration SITF + CICx + RSFLT (+ HPF)		Gain settings (dB) for configuration SITF + CICx (+ HPF)	
	CIC5	CIC4	CIC5	CIC4
8	33.6	51.7	45.7	63.7
12	18.1	39.6	30.1	51.7
16	3.5	27.6	15.6	39.6
20	- 6.0	21.6	6.0	33.6
24	- 12.0	15.6	0	27.6
28	- 20.6	9.5	- 8.5	21.6

Table 300. Recommended maximum gain values versus CIC decimation ratios (continued)

CIC decimation ratio	Gain settings (dB) for configuration SITF + CICx + RSFLT (+ HPF)		Gain settings (dB) for configuration SITF + CICx (+ HPF)	
	CIC5	CIC4	CIC5	CIC4
32	- 26.6	3.5	- 4.5	15.6
48	-	- 8.5	-	3.5
64	-	- 20.6	-	- 8.5

Reshaping filter (RSFLT)

In addition to the CIC, the ADF offers a reshaping IIR filter mainly dedicated to the audio application, but also usable in other applications.

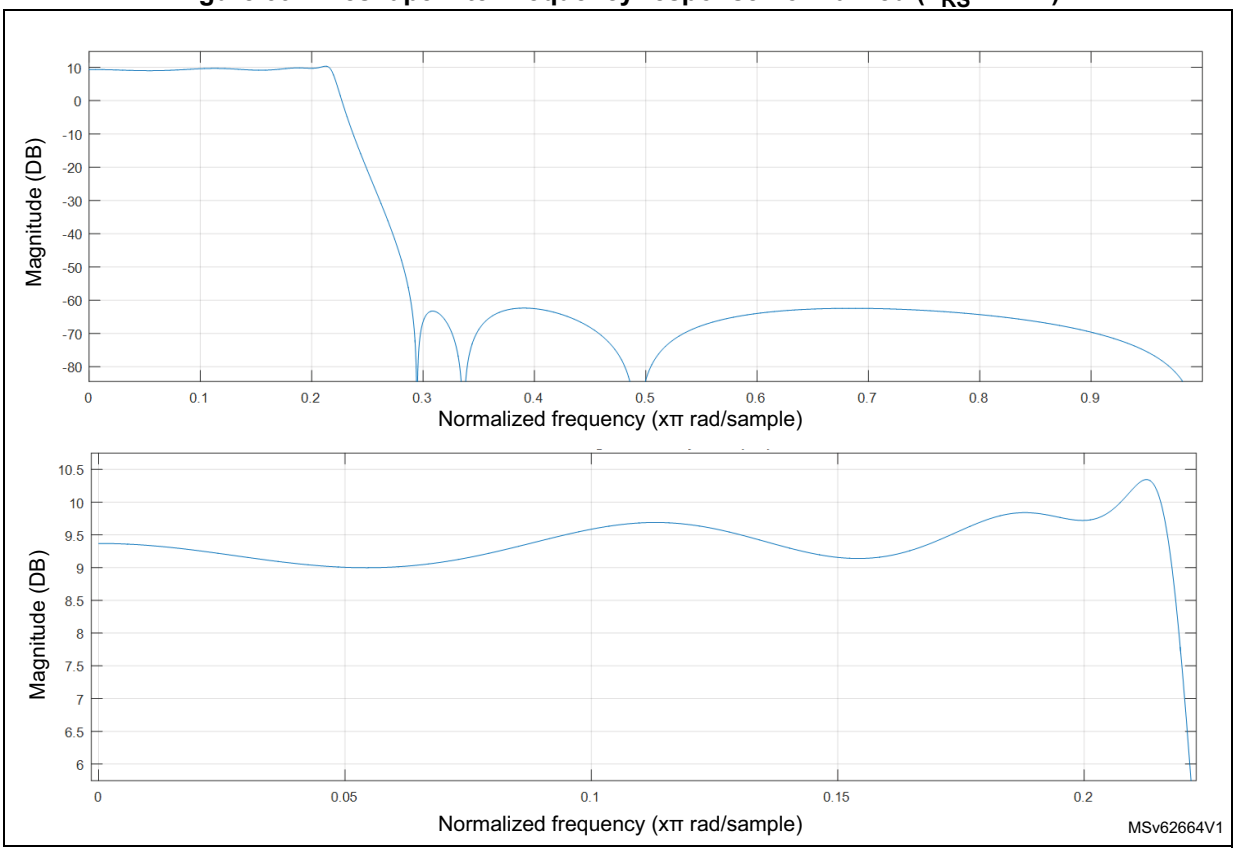
When the RSFLT is used, the sample size at its input must not exceed 22 bits.

The samples at the RSFLT output can be decimated by four or not according to the RSFLTD bit in the *ADF reshape filter configuration register 0 (ADF_DFLT0RSFR)*.

The RSFLT can be bypassed by setting RSFBYP to 1 in the *ADF reshape filter configuration register 0 (ADF_DFLT0RSFR)*.

Table 301 shows which sampling rate must be provided to the RSFLT in order to process the most common audio streams.

The RSFLT cutoff frequency (F_C) depends on the sample rates at its input (F_{RS}), and is given by the following formula:



$$F_C = 0.111 \times F_{RS}$$

Table 301. Most common microphone settings

Sample rate (kHz) at RSFLT (F_{RS})	Pass band (kHz)	D2	PCM sampling rate (kHz)
32	3.55	4	8
64	7.1	4	16
128	14.2	4	32
192	21.3	4	48

Table 394 shows the frequency response of the reshape filter.

Figure 394. Reshape filter frequency response normalized (F_{RS} / 2 = 1)

The RSFLT gain is close to 9.3 dB, so the output data size is a little bit lower than 24 bits for a 22-bit wide input signal.

The RSFLT takes 24 clock cycles of adf_proc_ck clock to process one sample at F_{RS}. When the RSFLT is enabled, the application must insure that the adf_proc_ck is at least 24 times faster F_{RS}.

The RSFLT generates an event (rfovr_evt) and sets the RFOVRF flag, if the RSFLT receives a new samples while the previous one is still under processing.

When RFOVRF is set, the samples provided by the RSFLT are invalid. The application must then stop the data acquisition and provides a faster adf_proc_ck clock to the RSFLT.

High-pass filter (HPF)

The high-pass filter suppresses the low-frequency content from the final output data stream in case of continuous conversion mode. The high-pass filter can be enabled or disabled via HPFBYP in the *ADF reshape filter configuration register 0 (ADF_DFLT0RSFR)*.

The HPF is useful when there is parasitic low-frequency noise (or DC signal) in the input data source that must be removed from the final data.

The HPF is a first order IIR filter and the cut-off frequency can be selected via HPFC[1:0] in the *ADF reshape filter configuration register 0 (ADF_DFLT0RSFR)*, among the following values:

- 0.000625 x F_{PCM}
- 0.00125 x F_{PCM}
- 0.00250 x F_{PCM}
- 0.00950 x F_{PCM}

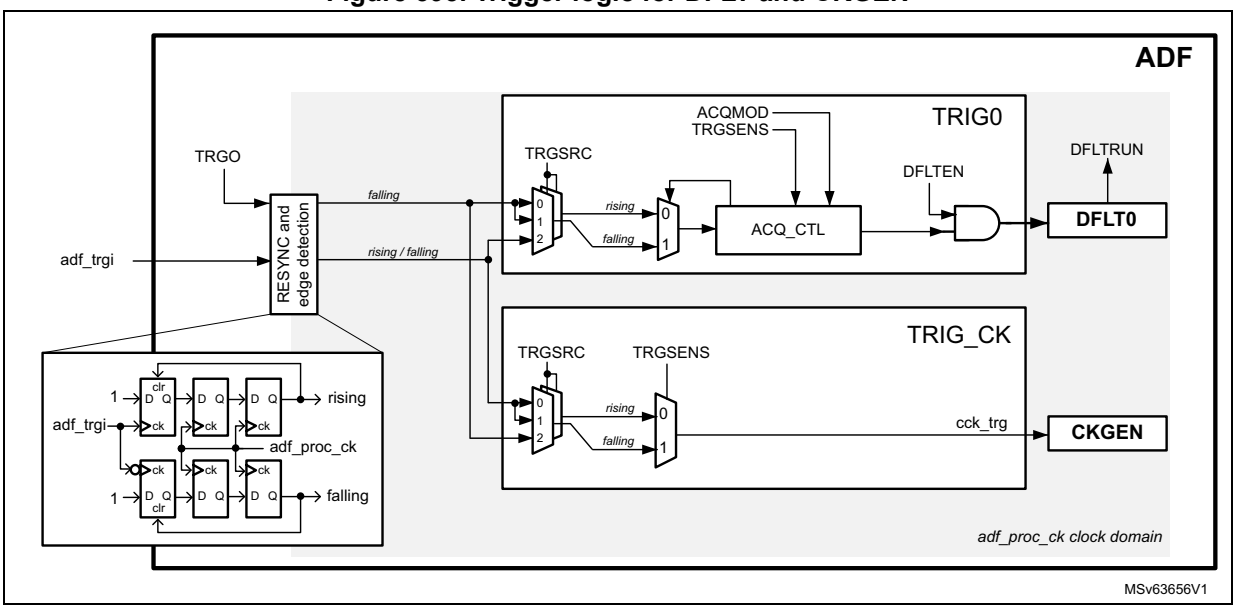
Table 302. HPF 3 dB cut-off frequency examples

HPFC	3 dB cut-off frequency for common F_{PCM} frequencies (Hz)		
	F_{PCM} = 8 kHz	F_{PCM} = 16 kHz	F_{PCM} = 48 kHz
0	5	10	30
1	10	20	60
2	20	40	120
3	76	152	456

The HPF output is saturated at 24 bits. The SATF flag is set if a sample is saturated.

30.4.8 Digital filter acquisition modes

The ADF offers the following modes to perform a data capture:



- asynchronous continuous acquisition mode
- asynchronous single-shot acquisition mode
- synchronous continuous acquisition mode
- synchronous single-shot acquisition mode
- window continuous acquisition mode

Note: To perform a data capture, the filter, the interface providing the data (SITF0 or ADCITF) and the CKGEN must be enabled. If needed, the ADF_CCK0 or ADF_CCK1 must be enabled as well.

The filter can be stopped immediately when DFLTEN is set to 0. This action resets the filter and flushes the RXFIFO. The DFLTACTIVE flag also goes back to 0 when the RXFIFO and the filter is reset.

Table 395 shows a simplified view of the trigger logic available for each filter and for the clock generator.

Figure 395. Trigger logic for DFLT and CKGEN

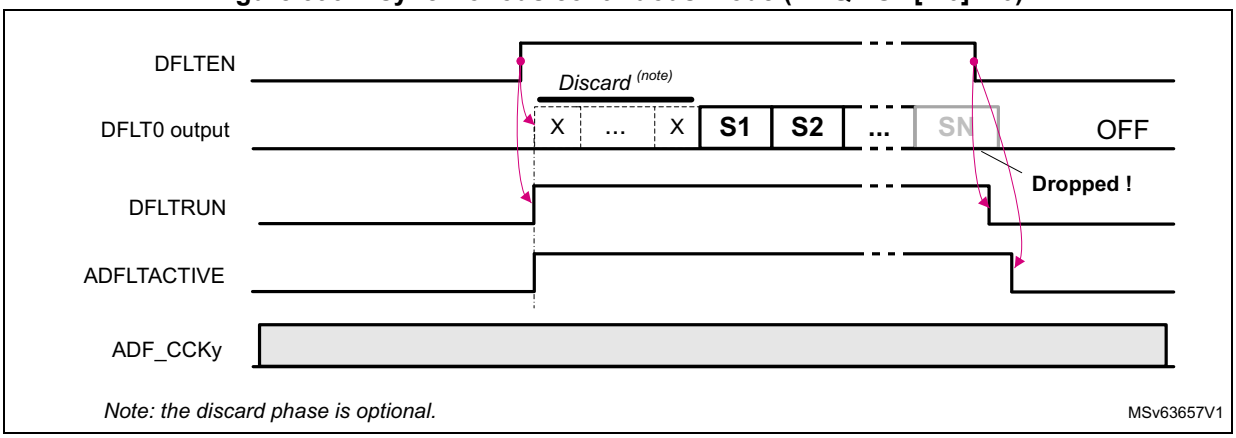
A block common to all TRIG blocks performs the rising and falling edges detection and the resynchronization of the input trigger to the adf_ker_ck clock domain. This implementation allows the application to use triggers with pulse width smaller than the adf_ker_ck period.

In synchronous modes, the TRIG block offers the possibility to select adf_trgi or TRGO bit as trigger sources. The TRGO bit is in the *ADF global control register (ADF_GCR)*.

The edge sensitivity can also be selected.

Asynchronous continuous acquisition mode

This mode allows the application to start a continuous acquisition by simply writing the DFLTEN bit to 1.



The asynchronous continuous acquisition mode is selected when ACQMOD[2:0] = 0.

The sequence below shows the most important programming steps (assuming that DFLTEN is set to 0):

1. Configure and enable the clock generator (CKGEN) so that the adf_proc_ck frequency is compatible with the targeted application (see examples in *Table 306*).
2. Enable the CKGEN (CKGDEN = 1) and, if needed, enable the ADF_CCK0 and ADF_CCK1 clocks.
3. Program the filter configuration and set the ACQMOD[2:0] to 0.
4. Set to 1 the SITFEN bit of the serial data interface.
5. Before setting DFLTEN to 1, wait for DFLTACTIVE = 0: it insures that the previous filter deactivation sequence terminated properly.
6. When DFLTEN is set to 1, the acquisition sequence starts immediately.

Figure 396 shows a simplified example of the samples generated by the DFLT0.

Figure 396. Asynchronous continuous mode (ACQMOD[2:0] = 0)

Note: The acquisition can be stopped by setting DFLTEN back to 0. This resets the filter and flushes the RXFIFO, so the samples located into the RXFIFO are lost. The ongoing DMA transfer is properly terminated. DFLTACTIVE goes back to 0 when the filter chain is reset and the RXFIFO flushed.

Asynchronous single-shot acquisition mode

This mode allows the application to start the acquisition of one sample by simply writing the DFLTEN bit to 1.

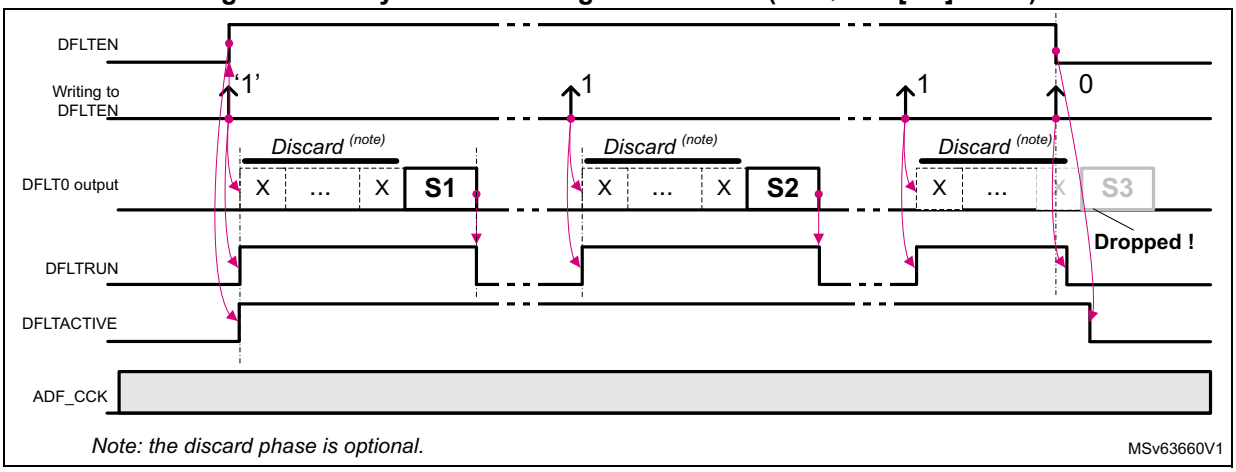
The asynchronous single-shot acquisition mode is selected when ACQMOD[2:0] = 001.

The sequence below shows the most important programming steps (assuming that DFLTEN is set to 0):

1. Configure and enable the clock generator (CKGEN), so that the adf_proc_ck frequency is compatible with the targeted application (see examples in *Table 306*).
2. Enable the CKGEN (CKGDEN = 1) and, if needed, enable the ADF_CCK0 and ADF_CCK1 clocks.
3. Program the filter configuration, and set the ACQMOD[2:0] to 001.
4. Set to 1 the SITFEN bit.
5. Before setting DFLTEN to 1, wait for DFLTACTIVE = 0: it insures that the previous filter deactivation sequence terminated properly.
6. When DFLTEN is set to 1, the filter provides one data to the RXFIFO and stops the acquisition.

To trigger a new acquisition, the application must:

1. Check that the previous acquisition is completed, by waiting that DFLTRUN = 0.
2. Set again DFLTEN to 1.



This sequence can be repeated every time a new data must be converted.

As shown in *Figure 396*, every time DFLTEN is set to 1, an acquisition sequence is triggered. The first samples provided by the filter can be discarded if needed. At the end of each conversion, the decimation counters and filter taps are reset, and the filter is ready to start a new conversion.

If DFLTEN is set to 0 while an acquisition is ongoing, the ongoing conversion is stopped (in the example, S3 is lost). This situation can be avoided with the following steps:

1. Wait for DFLTRUN = 0.
2. Read the sample from the RXFIFO.
3. Set DFLTEN to 0.

Figure 397. Asynchronous single-shot mode (ACQMOD[2:0] = 001)

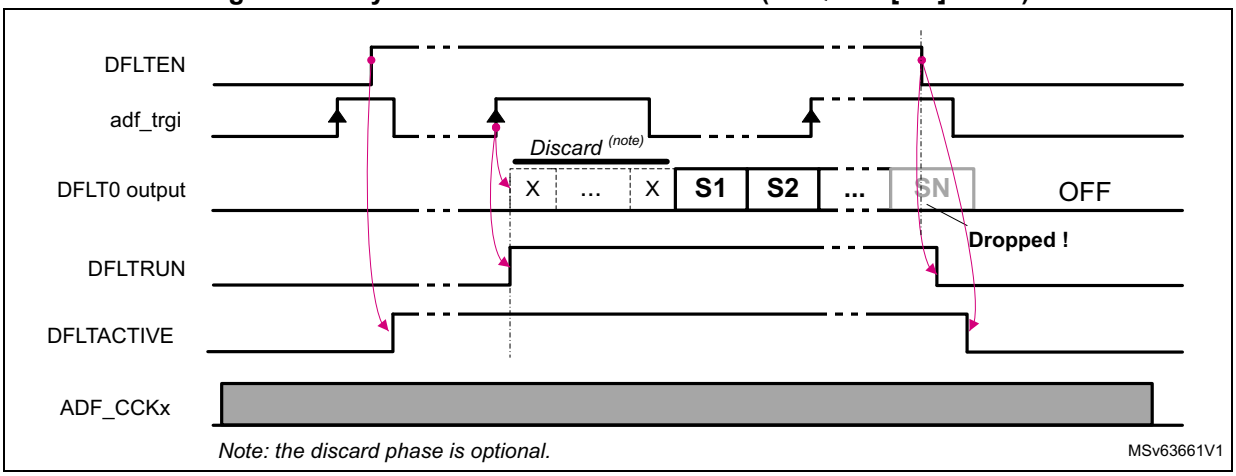
Note: The acquisition can be stopped by setting DFLTEN back to 0. This resets the filter and flushes the RXFIFO, so the samples located into the RXFIFO are lost. The ongoing DMA transfer is properly terminated. DFLTACTIVE goes back to 0 when the filter chain is reset and the RXFIFO flushed.

Synchronous continuous acquisition mode

This mode allows the application to start a continuous acquisition by using one of the following trigger sources:

- adf_trgi signal
- TRGO bit

The Synchronous continuous acquisition mode is selected when ACQMOD[2:0] = 010.



The sequence below shows the most important programming steps (assuming that DFLTEN is set to 0):

1. Configure and enable the clock generator (CKGEN), so that the frequency of adf_proc_ck clock is compatible with the targeted application (see examples in *Table 306*).
2. Enable the CKGEN (CKGDEN = 1) and, if needed, enable the ADF_CCK0 and ADF_CCK1 clocks.
3. Program the filter configuration and set the ACQMOD[2:0] to 010.
4. Set to 1 the bit SITFEN.
5. Select the proper trigger source and sensitivity.
6. Before setting DFLTEN to 1, wait for DFLTACTIVE = 0: it insures that the previous filter deactivation sequence terminated properly.
7. Set DFLTEN to 1.
8. When the trigger condition is met, the filter starts the acquisition.

The TRGSENS bit allows the selection of the trigger edge (rising or falling). The trigger is ignored if an acquisition is ongoing or if DFLTEN is set to 0.

Figure 398 shows a simplified example where the trigger logic is sensitive to a rising edge trigger (TRGSENS = 0). The first rising edge of the trigger signal is ignored because DFLTEN = 0. Then the next rising edge is taken into account and starts the acquisition. All other rising edges are ignored. The trigger logic is re-initialized when DFLTRUN goes back to 0.

Figure 398. Synchronous continuous mode (ACQMOD[2:0] = 010)

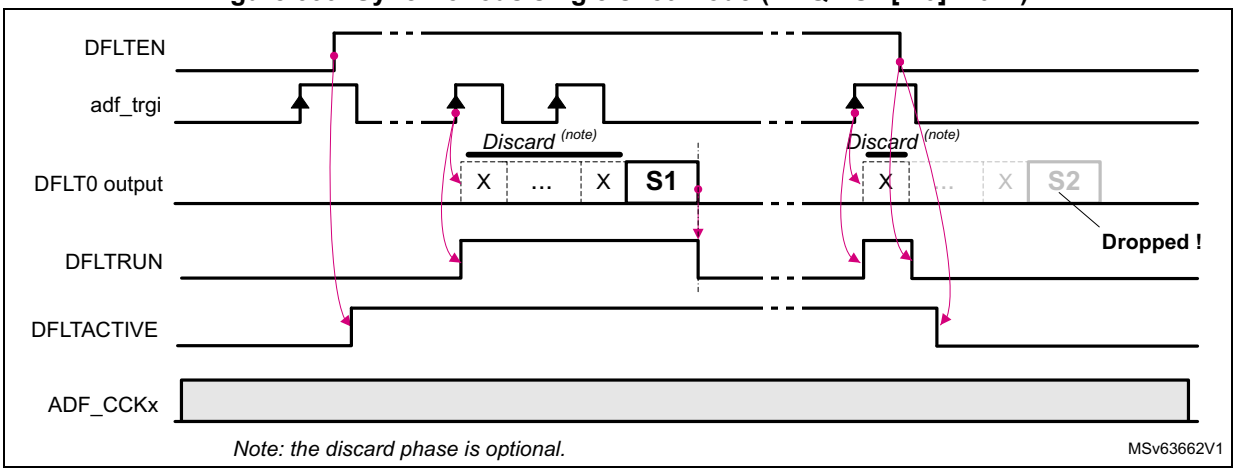
Note: The acquisition can be stopped by setting DFLTEN back to 0. This resets the filter and flushes the RXFIFO, so the samples located into the RXFIFO are lost. The ongoing DMA transfer is properly terminated. DFLTACTIVE goes back to 0 when the filter chain is reset and the RXFIFO flushed.

Synchronous single-shot acquisition mode

This mode allows the application to start a single acquisition by using one of the following trigger sources:

- adf_trgi signal
- TRGO bit

The Synchronous single-shot acquisition mode is selected when ACQMOD[2:0] = 011.



The sequence below shows the most important programming steps (assuming that DFLTEN is set to 0):

1. Configure and enable the clock generator (CKGEN), so that the frequency of adf_proc_ck clock is compatible with the targeted application (see examples in *Table 306*).
2. Enable the CKGEN and, if needed, enable the ADF_CCK0 and ADF_CCK1 clocks.
3. Program the filter configuration, and set the ACQMOD[2:0] to 011.
4. Set to 1 the SITFEN bit.
5. Select the proper trigger source and sensitivity.
6. Before setting DFLTEN to 1, wait for DFLTACTIVE = 0: it insures that the previous filter deactivation sequence terminated properly.
7. Set DFLTEN to 1.
8. When the trigger condition is met, the filter starts the acquisition and provides one data to the RXFIFO, then the filter is ready to accept a new trigger.

TRGSENS allows the selection of the trigger edge (rising or falling). The trigger is ignored if an acquisition is ongoing, or if DFLTEN is set to 0.

Figure 399 shows a simplified example where the trigger logic is sensitive to a rising edge trigger (TRGSENS = 0). Every-time a trigger rising edge is detected with DFLTEN = 1, an acquisition sequence is triggered. The first samples provided by the filter can be discarded if needed. At the end of each conversion, the decimation counters and filter taps are reset. DFLTRUN is set to 0 and the filter is ready to start a new conversion.

Figure 399. Synchronous single-shot mode (ACQMOD[2:0] = 011)

Note: The acquisition can be stopped by setting DFLTEN back to 0. This resets the filter and flushes the RXFIFO, so the samples located into the RXFIFO are lost. The ongoing DMA transfer is properly terminated. DFLTACTIVE goes back to 0 when the filter chain is reset and the RXFIFO flushed.

Figure 398 shows a case where the DFLTEN is set to 0 while an acquisition is ongoing (the sample S2 is lost). This situation can be avoided with the following steps:

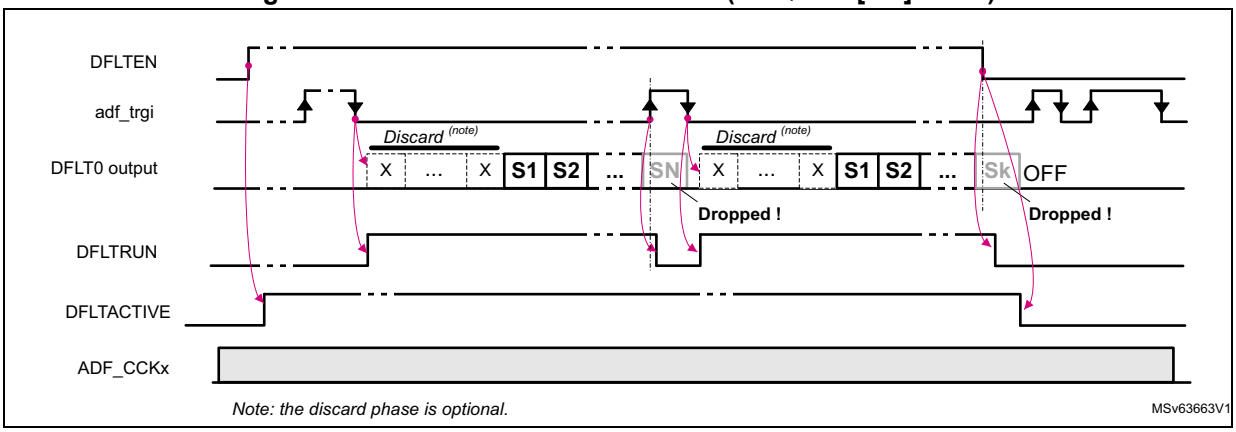
1. Wait for DFLTRUN = 0.
2. Read the sample from the RXFIFO.
3. Clear DFLTEN to 0.

Window continuous acquisition mode

This mode allows the application to start or stop a continuous acquisition controlled by consecutive edges of one of the following trigger sources:

- adf_trgi signal
- TRGO bit

The window continuous acquisition mode is selected when ACQMOD[2:0] = 100.



The sequence below shows the most important programming steps (assuming that DFLTEN is set to 0):

1. Configure and enable the clock generator (CKGEN), so that the frequency of adf_proc_ck clock is compatible with the targeted application (see examples in *Table 306*).
2. Enable the CKGEN and, if needed, enable the ADF_CCK0 and ADF_CCK1 clocks.
3. Program the filter settings and set the ACQMOD[2:0] to 100.
4. Set to 1 the SITFEN bit.
5. Select the proper trigger source and sensitivity.
6. Before setting DFLTEN to 1, wait for DFLTACTIVE = 0: it insures that the previous filter deactivation sequence terminated properly.
7. Set DFLTEN to 1.
8. If TRGSENS = 0, the acquisition starts on trigger rising edge and stops on trigger falling edge. If TRGSENS = 1, the acquisition starts on trigger falling edge and stops on trigger rising edge.

Note: The acquisition may restart if the trigger condition becomes again active.

Figure 400 shows a simplified example of window continuous acquisition mode, with TRGSENS = 1. Once DFLTEN is set to 1, the ADF waits for a falling edge on the selected trigger input. When the trigger condition is met, DFLTRUN goes to 1 and the acquisition starts. The acquisition stops if the ADF detects a rising edge on the selected trigger input. If DFLTEN is still set to 1, the ADF waits again for a falling edge on the selected trigger input.

Figure 400. Window continuous mode (ACQMOD[2:0] = 100)

Note: The acquisition can be stopped by setting DFLTEN back to 0. This resets the filter and flushes the RXFIFO, so the samples located into the RXFIFO are lost. The ongoing DMA transfer is properly terminated. DFLTACTIVE goes back to 0 when the filter chain is reset and the RXFIFO flushed.

Starting several filters synchronously

If the ADF is used with MDF instances (if present in the product), it is possible to start simultaneously the acquisition of all the filters. This synchronization capability depends on the way the triggers are connected in the product. Generally, an ADF is able to trigger MDF instances, if its adf_trgo signal is connected as trigger input to those blocks (see *Section 30.4.2: ADF pins and internal signals* to check trigger capabilities).

In the following programming example, one ADF has its adf_trgo signal connected to some MDFs. To start the acquisition of several filters synchronously, the following sequence must be performed (assuming that DFLTEN bits of the filters are set to 0):

On MDFs receiving the adf_trgo trigger:

1. Enable the CKGEN (CKGDEN = 1) and, if needed, enable the ADF_CCK0 and ADF_CCK1 clocks.
2. Set to 1 the SITFEN bit of the requested data interfaces.
3. For each filter, set the acquisition mode to synchronous (ACQMOD[2:0] = 01x).
4. For each filter, set TRGSRC[3:0] in order to select the adf_trgo trigger input.
5. For each filter, set TRGSENS to 0 (rising edge).
6. For each filter, set DFLTEN to 1.

On the ADF generating the adf_trgo trigger:

1. Enable the CKGEN (CKGDEN = 1) and, if needed, enable the ADF_CCK[1:0] clocks.
2. Set to 1 the SITFEN bit of the requested data interfaces.
3. Set the acquisition mode to synchronous (ACQMOD[2:0] = 01x).
4. Set TRGSRC[3:0] to 0 (TRGO selected).
5. Set TRGSENS to 0 (rising edge).
6. Set DFLTEN to 1.
7. Read TRGO bit until it is read to 0.
8. Set TRGO to 1. Then the acquisition sequence for all selected filters starts immediately.

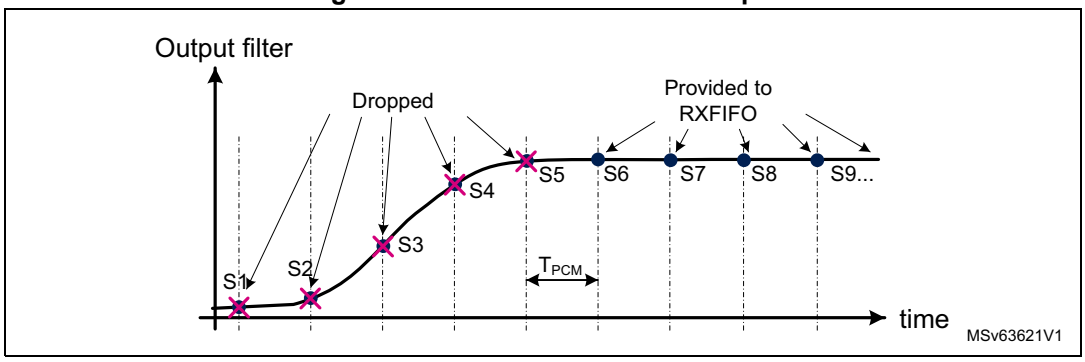
To trigger a new acquisition (in case of single-shot) the application must do the following:

1. Check that the previous acquisition is completed, by waiting DFLTRUN = 0.
2. Read TRGO until it is read to 0.
3. Set again the bit TRGO to 1.

Discarded samples

The ADF offers the possibility to program the amount of samples to be discarded after each restart:

- to avoid capturing samples affected by the impulse response of the filter
- to delay the acquisition of filters by a specific amount of samples



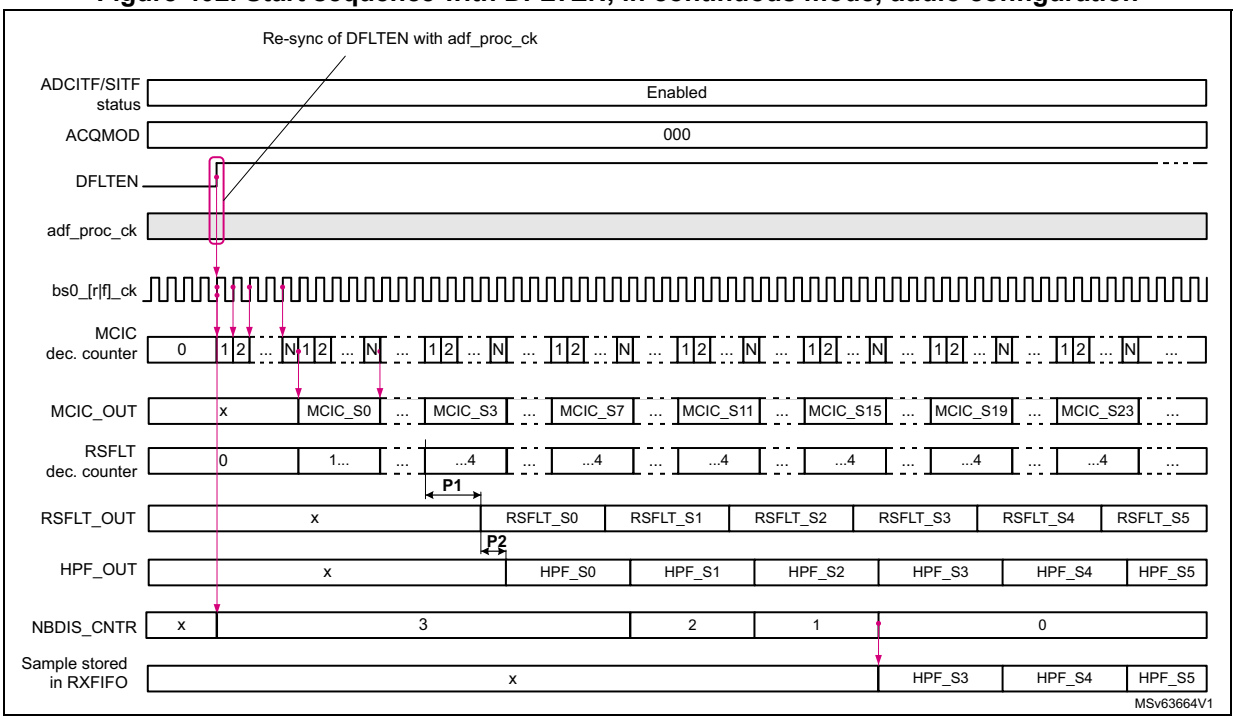
The discard function is controlled via NBDIS[7:0] as follows:

- When NBDIS[7:0] = 0, the discard function is disabled.
- When NBDIS[7:0] ≠ 0, the discard function is activated in one of the following condition:
  - when the DFLTEN bit goes to 1
  - every time an acquisition is started in (A)synchronous single-shot modes

Refer to *Figure 395* to *Figure 399*, and *Figure 401*.

In the example shown in *Figure 401*, the discard function is used to drop the first five samples provided by the digital filter (S1 to S5). The first sample transfered to the RXFIFO is S6.

Figure 401. Discard function example



30.4.9 Start-up sequence examples

Figure 402 details a start of acquisition sequence of a digital filter triggered by DFLTEN (ACQMOD[2:0] = 0), with NBDIS[7:0] = 3 (three samples to discard before acquisition).

The DFLT0 is configured for audio application: MCIC, RSFLT and HPF activated.The data interface (SITF0 or ADCITF) is assumed to be already activated.

Note: NBDIS[7:0] is set on purpose to a small value to simplify the drawing.

Figure 402. Start sequence with DFLTEN, in continuous mode, audio configuration

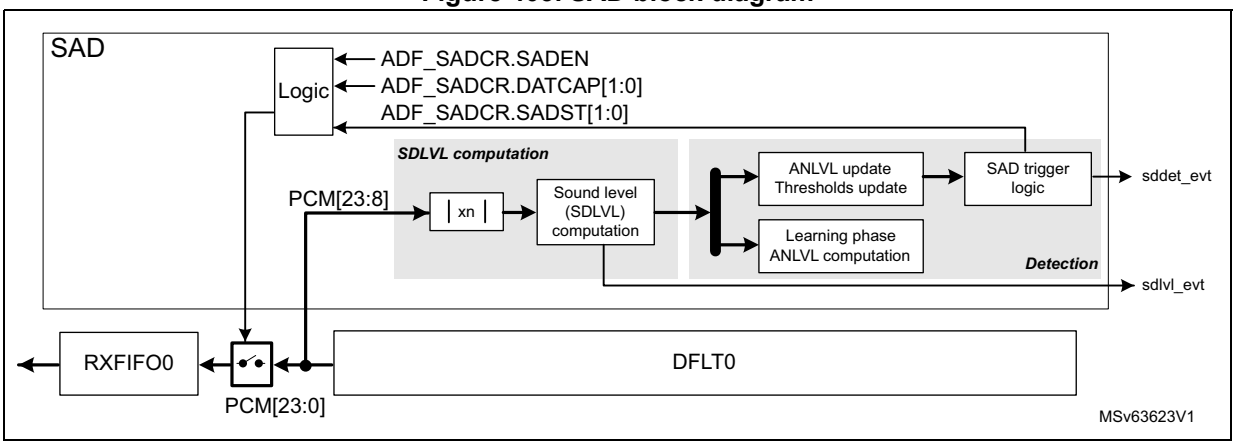
The DFLTEN bit is re-sampled into the ADF processing clock domain. When DFLTEN is detected high, the filter chain is enabled, and the decimation counter of the MCIC filter is incremented at the rate of the bitstream clock.

When the MCIC decimation counter reached its programmed value N, a sample is available for the RSFLT.

The RSFLT processes all the samples provided by the MCIC, and delivers a sample to the HPF every-time it processes four samples (decimation by 4). The RSFLT needs up to 24 cycles of adf_proc_ck clock before delivering a sample (P1).

The HPF processes all the samples provided by the RSFLT, but the NBDIS function prevents the data writing in the RXFIFO as long as NBDIS_CNTR does not reach 0.

When NBDIS_CNTR reaches 0, the samples provided by the HPF are stored into the RXFIFO.



30.4.10 Sound activity detection (SAD)

The SAD is based on the computation of the ambient noise level (ANLVL) and of the short-term sound level (SDLVL). The SAD offers the following ways to detect a sound:

- when the SDLVL reaches a threshold referenced to the ambient noise level
- when the SDLVL reaches a fixed threshold
- when the ANLVL reaches a fixed threshold

As shown in *Figure 403*, the SAD takes the 16 MSB samples from the DFLT0 output.

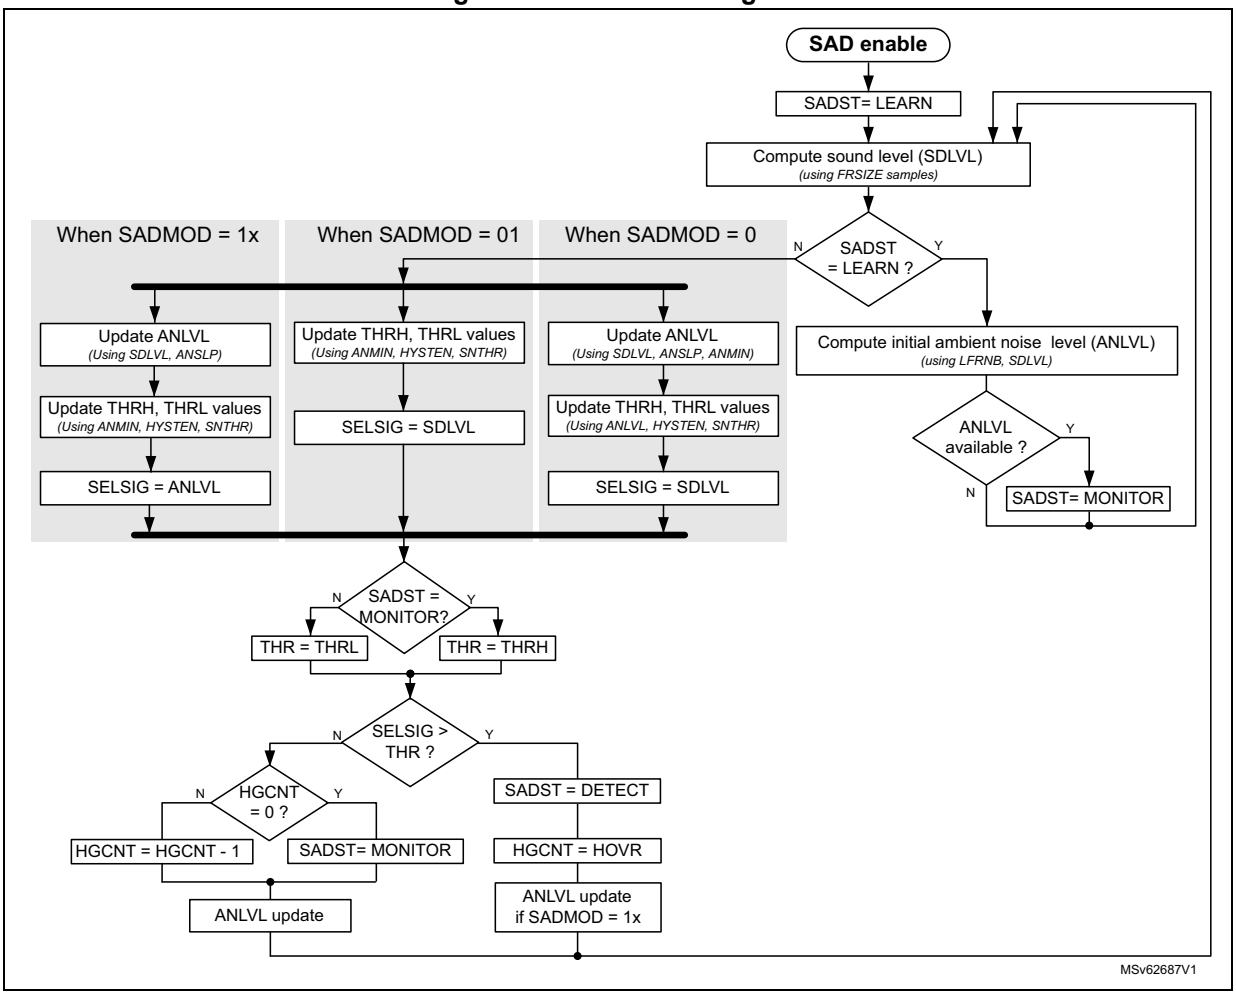
Figure 403. SAD block diagram

The SAD is highly configurable, and the application can adjust several parameters:

- SAD detection behavior (SADMOD)
- number of samples used to compute the sound level (FRSIZE)
- number of frames used to compute the ambient noise level during the learning phase (LFRNB)
- slope of the ambient noise estimator (ANSLP)
- minimum expected ambient noise level (ANMIN)
- threshold level (SNTHR)
- threshold hysteresis (HYSTEN)
- hangover window in order to filter spurious transitions between DETECT and MONITOR states (HGOVR)
- data capture mode (DATCAP)

SAD detection behavior

The SAD can use the following ways to detect a sound, selected by SADMOD[1:0]:



- When SADMOD[1:0] = 0, the SAD works like a voice-activity detection. In this mode, the SAD estimates the ambient noise level according to the computed sound level values. The threshold of the trigger is elaborated from the estimated ambient noise. Finally the current sound level is compared to this threshold. In a first approximation, the SAD triggers if the peak-to-average value of the input signal reaches a level defined by SNTHR[3:0].
- When SADMOD[1:0] = 01, the SAD compares the current sound level (SDLVL) to a fixed trigger value defined by the application via SNTHR[3:0] and ANMIN[12:0]. This mode allows a fast SAD reaction as the amount of samples used to compute the sound level can be configured via FRSIZE[2:0].
- When SADMOD[1:0] = 1x, the SAD compares the estimated ambient noise level (ANLVL) to a fixed trigger value defined by the application via SNTHR[3:0] and ANMIN[12:0]. This mode avoids unwanted triggers, due to peak levels, but the SAD reacts more slowly to an input signal variation. It is nevertheless possible to adjust the reaction time via FRSIZE[2:0] and ANSLP[2:0].

SAD states

As shown in *Figure 403*, the SAD works as follows:

1. When enabled (SADEN = 1), the SAD is first in LEARN state to perform a first estimation of the ambient noise level.
2. The SAD continuously computes the short-term sound level (SDLVL) using the samples provided by the DFLT0. The amount of samples used to compute the sound level is given by FRSIZE[2:0]. The samples processed by the DFLT0 can be transferred into the memory or not depending on DATCAP[1:0] value.
3. The initial ambient noise level (ANLVL) is computed using the consecutive sound level values. The application can define how much sound level values are used to perform the computation of this initial ambient noise estimation (LFRNB).
4. When the initial ambient noise level (ANLVL) is computed, the SAD switches to the MONITOR state.
5. Every time a new short-term sound level value is available, the SAD updates the ambient noise level and the thresholds according to the selected detection mode.
6. If the SAD triggers, then the following happens:
   – The SAD switches to DETECT state.
   – The sddet_evt event is asserted.
   – The adf_sad_det signal is set to high.
7. The hangover function insures that the DETECT state is maintained even if the sound level goes below the threshold level for a time given by HGOVR.

Figure 404. SAD flow diagram

Sound level computation (SDLVL)

Once enabled, the SAD computes continuously the sound level value. The sound level represents the average of the absolute value of an amount of PCM samples given by FRSIZE[2:0].

$$SDLVL = \frac{1}{N_{FRSIZE}} \times \sum_{n=1}^{N_{FRSIZE}} |PCM(n)|$$

where N_{FRSIZE} is the amount of PCM samples given by FRSIZE[2:0].

Ambient noise estimation (ANLVL)

The ambient noise level (ANLVL) is computed when SADMOD[1:0] is 00 or 10.

The ambient noise level is computed differently according to the state of the SAD as detailed below:

- ANLVL computation during the LEARN state

  Every time the SAD is enabled, a learning phase is initiated in order to estimate a first value of the ambient noise level. During this phase, the SAD cannot trigger.

  During the LEARN phase, the ambient noise level is computed as follows:

$$ANLVL = \frac{1}{N_{LFRNB}} \times \sum_{n=1}^{N_{LFRNB}} |SDLVL(n)|$$

  where N_{LFRNB} is the amount of frames given by LFRNB[2:0] bitfield.

- ANLVL computation during the MONITOR or DETECT state

  When the learning phase is completed, the SAD updates the ambient noise level in the following way:

  – The SAD computes the new possible values for the ambient noise level:

    ANLVL_UP = ANLVL * (1+2^(ANSLP-12))

    ANLVL_DN = ANLVL * (1-2^(ANSLP-10))

  – The ANLVL takes the ANLVL_DN value if the current sound level is lower than ANLVL_DN, otherwise ANLVL takes the value of ANLVL_UP.

    The ANLVL is not updated if the current sound level is higher than the threshold level, except if SADMOD[1:0] = 10.

  – When SADMOD[1:0] = 0, if the new ANLVL value is lower than ANMIN[12:0], ANLVL is replaced by ANMIN.

  The slope of the noise estimator can be adjusted to optimize the detection of the wanted signal. This slope is adjusted via ANSLP[2:0] in the *ADF SAD configuration register (ADF_SADCFGR)*.

Table 303 shows the allowed values according to the frame size and the sampling rate of the data observed by the SAD. The recommended values when the SADMOD[1:0] = 0 are the ones into the gray shaded cells.

Table 303. ANSLP values versus FRSIZE and sampling rates

FRSIZE	ANSLP values for Fs = 8 kHz			ANSLP values for Fs = 16 kHz		
	Slow(1)	typical(2)	Fast(3)	Slow(1)	typical(2)	Fast(3)
0 (8 samples)	0	1	2	-	0	1
1 (16 samples)	1	2	3	0	1	2
2 (32 samples)	2	3	4	1	2	3
3 (64 samples)	3	4	5	2	3	4
4 (128 samples)	4	5	6	3	4	5
5 (256 samples)	5	6	7	4	5	6
6 (512 samples)	6	7	-	5	6	7

1. The slow slope is equal to - 8.5 dB/s for the negative slope and + 2.1 dB/s for the positive slope.
2. The typical slope is equal to - 17.1 dB/s for the negative slope and + 4.2 dB/s for the positive slope.
3. The fast slope is equal to - 34.2 dB/s for the negative slope and + 8.5 dB/s for the positive slope.

The slopes can also be computed using the following formulas:

$$SLC_{UP} = 20 \times \frac{F_s}{F_{SIZE}} \times \log 10(1 + 2^{(ANSLP - 12)})$$

$$SLC_{DN} = 20 \times \frac{F_s}{F_{SIZE}} \times \log 10(1 - 2^{(ANSLP - 10)})$$

where F_S is the sampling rate of the stream observed by the SAD and F_{SIZE} is the frame size defined by FRSIZE[2:0].

Threshold computation

The way the threshold value is computed depends on SADMOD[1:0]:

- If SADMOD[1:0] = 0, THRH is obtained by multiplying the current ANLVL value with the gain defined in SNTHR[3:0].

  $$THR_H = ANLVL \times 10^{\frac{GdB_{SNTHR}}{20}}$$

  This threshold value is then compared to the current sound level (SDLVL).
- If SADMOD[1:0] = 01, THRH is obtained by multiplying the current ANMIN[12:0] with the gain defined by SNTHR[3:0].

  $$THR_H = ANMIN \times 10^{\frac{GdB_{SNTHR}}{20}}$$

  This threshold value is then compared to the current sound level (SDLVL).

- If SADMOD[1:0] = 1x, THRH is obtained by multiplying the current ANMIN[12:0] by 4.

$$THR_H = ANMIN \times 4$$

This threshold value is then compared to:

$$ANLVL \times 10^{\frac{GdB_{SNTHR}}{20}}$$

The hysteresis mode can be enabled to reduce the spurious transitions between MONITOR and DETECT states. In hysteresis mode (HYSTEN = 1), the following threshold values are used:

- THRH when the SAD is in MONITOR state.
- THRL when the SAD is in DETECT state.

Table 304 shows the thresholds values according to SNTHR.

Table 304. Threshold values according SNTHR(1)

SNTHR[3:0]	THR_H		THR_L		Comments
0	LVL + 3.5 dB	LVL x 1.5	LVL + 3.5 dB	LVL x 1.5	No hysteresis
1	LVL + 6.0 dB	LVL x 2	LVL + 3.5 dB	LVL x 1.5	Hysteresis of 2.5 dB
2	LVL + 9.5 dB	LVL x 3	LVL + 6.0 dB	LVL x 2	Hysteresis of 3.5 dB
3	LVL + 12.0 dB	LVL x 4	LVL + 9.5 dB	LVL x 3	Hysteresis of 2.5 dB
4	LVL + 15.6 dB	LVL x 6	LVL + 12.0 dB	LVL x 4	Hysteresis of 3.5 dB
5	LVL + 18.1 dB	LVL x 8	LVL + 15.6 dB	LVL x 6	Hysteresis of 2.5 dB
6	LVL + 21.6 dB	LVL x 12	LVL + 18.1 dB	LVL x 8	Hysteresis of 3.5 dB
7	LVL + 24.1 dB	LVL x 16	LVL + 21.6 dB	LVL x 12	Hysteresis of 2.5 dB
8	LVL + 27.6 dB	LVL x 24	LVL + 24.1dB	LVL x 16	Hysteresis of 3.5 dB
9	LVL + 30.1 dB	LVL x 32	LVL + 27.6dB	LVL x 24	Hysteresis of 2.5 dB

1. LVL must be replaced by ANLVL when SADMOD[1:0] = 0 and by ANMIN for other SADMOD[1:0] values.

When the hysteresis function is disabled, the SAD always use THRH.

Note: The hysteresis mode must not be used when SADMOD[1:0] = 1x.

Trigger logic

The signal compared to this threshold depends also on SADMOD[1:0].

The trigger condition is reached when the selected signal (SELSIG) is bigger than the threshold level.

If the trigger condition is met, the following happens:

- The SAD switches to DETECT state.
- The SAD refreshes the hangover counter with HGOVR.
- The sddet_evt event is asserted if the SAD transits from MONITOR to DETECT.
- The adf_sad_det signal is set to high.

The SAD remains in DETECT state as long as the trigger condition is met or the hangover down-counter is different from 0.

The sddet_evt event indicates when the SAD enters and/or exits the DETECT state. This event is used to generate an interrupt when a sound is detected or when a sound is no longer detected:

- When DETCFG = 0, the application receives an event only when the SAD enters the DETECT state.
- When DETCFG = 1, the application receives an event when the SAD enters or exits the DETECT state.

The adf_sad_det signal remains high as long as the SAD is in DETECT state.

The SAD also provides a flag indicating that a new sound level value is available (SDLVLF). The last computed sound level (SDLVL[14:0]) is available in the *ADF SAD sound level register (ADF_SADSDLVR)*, and the last computed ambient noise level (ANLVL[14:0]), in the *ADF SAD ambient noise level register (ADF_SADANLVR)*.

Note: The SAD can work even when the AHB clock is not present. In that case, the SAD does not update SDLVL[14:0] and ANLVL[14:0].

To get the latest valid SDLVL[14:0] and ANLVL[14:0] values, the application must read the ADF_SADSDLVR, and ADF_SADANLVR registers, when the SDLVLF flag goes high. This can be done in the following ways:

- by polling the SDLVLF flag:
  a) Clear the SDLVLF flag by writing SDLVLF to 1.
  b) Wait for SDLVLF = 1, by reading ADF_DFLTxISR.
  c) Read ADF_SADSDLVR and ADF_SADANLVR.
  d) Clear SDLVLF by writing it to 1.
  e) Go to step 2 if other values must to be read.
- by generating an interrupt:
  a) Read ADF_DFLTxISR.
  b) If SDLVLF = 1, read ADF_SADSDLVR and ADF_SADANLVR, and clear SDLVLF by writing it to 1.
  c) Handle other status flags and exit from ISR.

Sample transfer to memory

The SAD offers the following options to control the samples transfer from DFLT0 to the system memory:

- If DATCAP[1:0] = 1x, the samples are transferred into the system memory as soon as DFLT0 and SAD are enabled. The transfer does not depend on the SAD state.
- If DATCAP[1:0] = 01, the samples are transferred into the system memory when the SAD detects a sound (when the SAD is in DETECT state), assuming that DFLT0 and SAD are enabled.
- If DATCAP[1:0] = 0, the samples are not transferred into the memory. This mode can be used if the application only wants to observe but does not need samples for other processing.

Note: DATCAP[1:0] is taken into account only when the SADEN = 1. For example, if the SAD configuration is DATCAP[1:0] = 0, SADEN = DFLTEN = 1, and if the application sets now SADEN to 0, the samples provided by the DFLT0 are transferred to the RXFIFO.

Programming recommendations

To make the SAD function working properly, the ADF must be programmed as follows:

1. Provide the proper kernel clock (adf_ker_ck) to the ADF.
2. Configure the CKGEN and enable it.
3. Configure the SITF and enable it (note that microphones have a settling time of several milliseconds).
4. Configure the DFLT0. A typical setting is the following:
   – CIC5 with a decimation ratio of 12, 16 or 24
   – RSFLT with a decimation ratio of 4
   – HPF with HPFC = 2 or 3

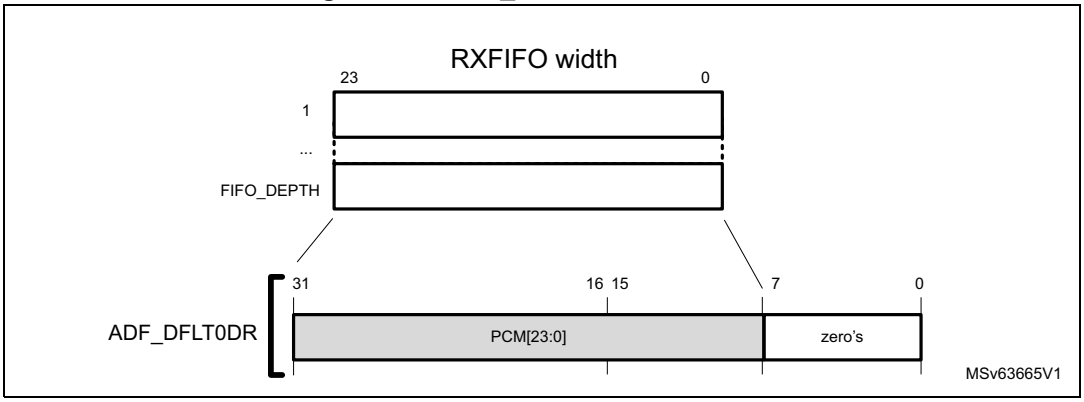
   For a very-low power implementation, the RSFLT can be bypassed.
5. Set SADEN to 0.
6. Wait for SADACTIVE = 0. If SADEN was previously enabled, this phase can take two periods of adf_hclk, and two periods of adf_proc_ck.
7. Configure the SAD as follows:
   – Set DATCAP[1:0] to 0, if the application does not want to store the samples into the system memory.
   – Set DATCAP[1:0] to 01, if the application wants to store the samples into the system memory only when the SAD detects a sound.
   – Set DATCAP[1:0] to 11, if the application wants to store the samples into the system memory continuously.
8. Configure the DMA (optional).
9. Enable the SAD.
10. Enable the DFLT0.

Figure 404 shows a simplified timing diagram when the SAD works with DATCAP[1:0] = 01.

Thanks to the kernel clock (adf_ker_ck), the SAD continuously monitors the audio signal provided by the DFLT0. The threshold is also continuously updated according to the ambient noise level estimation.

- When the SAD detects a sound higher than the programmed threshold (1), the ADF requests the bus clock (adf_bus_ckreq asserted).
- When the bus clock is available (see 2 in *Figure 404*) then:
  – The data transfer to the memory is triggered.
  – The event interrupt (adf_evt_it) can be generated.
- In this example, the event interrupt (adf_evt_it) is used to wake up the application. The interrupt line is released by clearing SDDETF by writing 1 to it.
- As long as the SAD remains in DETECT state, the application waits to get enough samples and calls, for example the keyword recognition algorithm (see 3 in *Figure 404*).
- In the case shown in *Figure 405*, the SAD state (SADST) goes back to MONITOR before the keyword is recognized. If DETCFG is set to 1, an event signals when the SAD goes back to MONITOR state. The SAD stops the transfer of samples into the memory and the application can clean up the receive buffer for the next detection (see 4 in *Figure 404*).

Figure 405. SAD timing diagram example



30.4.11 Data transfer to memory

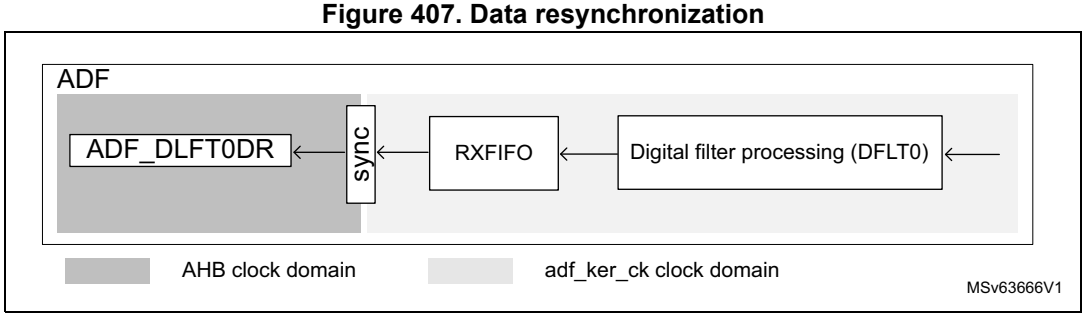
Data format

The samples processed by DFLT0 are stored into a RXFIFO. The application can read the samples stored into these FIFOs via the *ADF digital filter data register 0 (ADF_DFLT0DR)*. The samples inside this register are signed and left aligned. The bit 31 always represents the sign.

The ADF provides 24-bit left-aligned data. Performing a 16-bit access to ADF_DFLT0DR allows the application to get the 16 most significant bits. Performing a 32-bit access to ADF_DFLT0DR allows the application to get a 24-bit data size.

Figure 406. ADF_DFLTxDR data format

Data resynchronization



The samples stored into the RXFIFO can be transferred into the memory by using either DMA requests or interrupt signaling.

Note: The RXFIFO is located into the adf_ker_ck clock domain, while ADF_DFLT0DR *is located into the adf_hclk (AHB) clock domain.*

When the AHB clock is available, if ADF_DFLT0DR is empty and if a sample is available into the RXFIFO, this sample is transferred into ADF_DFLT0DR.

The sample transfer from the RXFIFO to ADF_DFLT0DR takes two periods of the AHB clock (adf_hclk) and two periods of the adf_ker_ck clock. The ADF inserts automatically wait-states if the application performs a read operation of ADF_DFLT0DR while the transfer of the new sample from the RXFIFO to ADF_DFLT0DR is not yet completed.

Figure 407. Data resynchronization

Data transfer

The content of the RXFIFO can be transfered to the memory either by using a DMA channel or interrupt services.

Both single and burst, DMA transfers are supported by the ADF, but the application has to care about the following points:

- The RXFIFO must contain at least the same amount of samples than the burst size.
- The burst mode efficiency may be reduced due to the data resynchronization explained in the previous section.

Note: The burst mode is not available in all products (see the DMA section to check if the product supports it).

In addition, the application can select the RXFIFO threshold (FTH bit) in order to trigger the data transfer: a data transfer can be triggered as soon as the RXFIFO is not empty, or when the RXFIFO is half-full (containing depth/2 samples).

For the DMA transfer, as soon as one of the RXFIFO reaches the threshold level, the DMA request is asserted in order to ask for data transfer. Successive DMA requests are performed as long as the RXFIFO is not empty.

The DMA mode of the RXFIFO is enabled via the DMAEN bit in ADF_DFLT0DR.

For the interrupt signaling, the following cases must be considered:

- If FTH = 0, as soon as a data is available in ADF_DFLT0DR, the FTHF is set, allowing the generation of an interrupt. FTHF is released as soon as ADF_DFLT0DR is read.
- If FTH = 1, as soon as the RXFIFO reaches the threshold level and a data is available in ADF_DFLT0DR, the FTHF is set, allowing the generation of an interrupt. FTHF is released as soon as one data is read. FTHF is set again if the threshold condition is

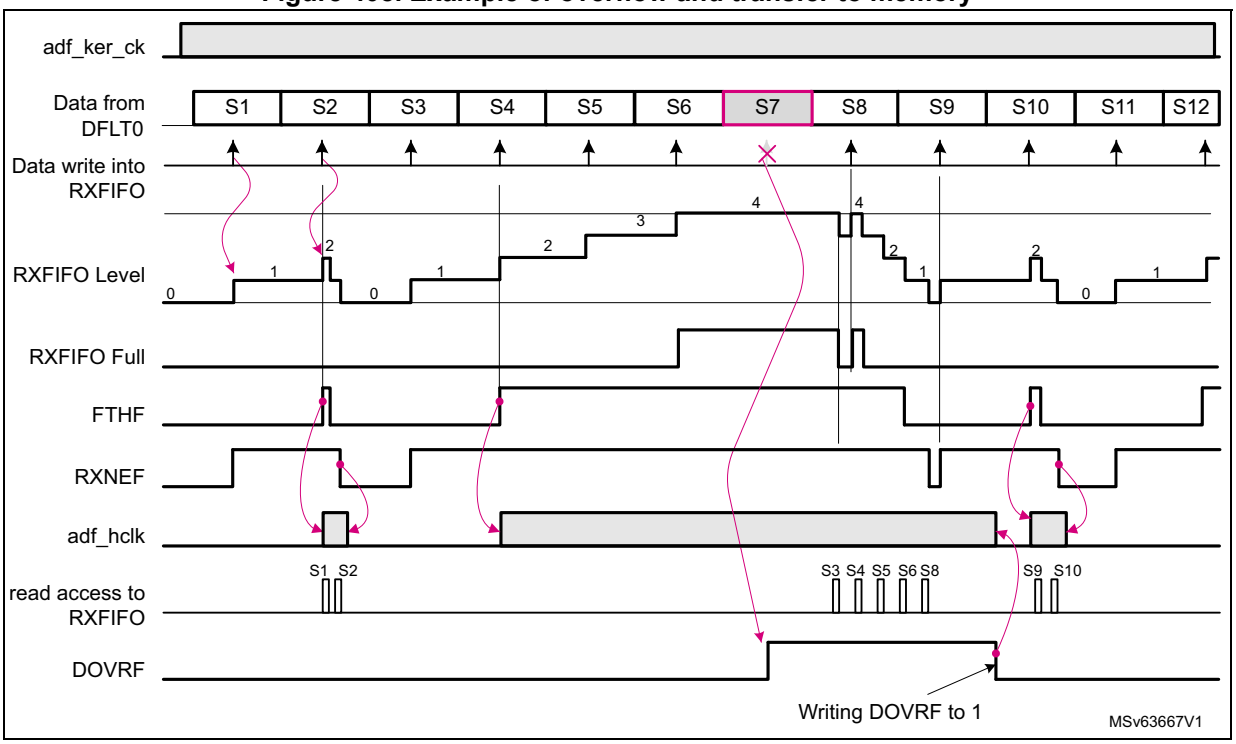
met again. In this mode, every time an interrupt occurs, the application is supposed to read FIFO_SIZE/2 data.

RXFIFO overrun

A RXFIFO overrun condition is detected when the RXFIFO is full, and a new sample from the DFLT0 must be written.

In this case, DOVRF is set and the new sample is dropped. When the RXFIFO has at least one location available, the new incoming sample is written into the RXFIFO.

Figure 408 shows an example based on a RXFIFO depth of four words and FTH set to 1, so that FTHF goes to 1 when the RXFIFO is half-full.



The S7 sample is lost due to an overrun: the RXFIFO is full while S7 must be written into the RXFIFO. The S7 write operation is not performed. DOVRF is set to 1 at the moment where the write operation was expected. The overflow event remains to 1 as long as it is not cleared by the application.

In this example, DOVRIE is set to 1 to have an interrupt if an overrun condition is detected.

After the S7 sample, the application manages to read data from the RXFIFO, and the ADF can write the S8 sample and consecutive. Later, the application clears DOVR, allowing the detection of a new overrun situation.

In the adf_hclk line, the gray boxes indicate that the ADF requested the AHB clock. *Figure 408* shows the AHB clock available only when the ADF requests it. In real applications, the AHB clock may also be present if the ADF does not request it.

Figure 408. Example of overflow and transfer to memory

30.4.12 Autonomous mode

The ADF can work even if the AHB bus clock is not available (Stop modes). The ADF uses the AHB clock only for the register interface. All the processing part is clocked with the kernel clock.

In Stop mode, the ADF receives a kernel clock if the following conditions are met:

- The ADF autonomous mode is enabled in the RCC.
- The selected kernel clock source is taken from an oscillator available in Stop mode.

In Stop mode, the ADF receives the AHB clock if the following conditions are met:

- The ADF autonomous mode is enabled in the RCC.
- The ADF requests the AHB clock in the following situations:
  - when the ADF must transfer data into memory via the DMA

    The data is directly transferred to the SRAM thanks to the DMA while the product remains in Stop mode. The AHB clock request is maintained until the DMA transfer is completed.
  - when the ADF needs to generate an interrupt

    An interrupt generally wakes up the device from Stop mode, as an action from the application is needed. Once the AHB clock is available, the interrupt is generated.The AHB clock request is maintained as long as an enabled interrupt flag is still active.

30.4.13 Register protection

The ADF embeds some hardware protection to prevent invalid situations.
Table 305 shows the list of write-protected and unprotected fields.

Table 305. Register protection summary

Registers	Unprotected fields	Write-protected fields	Write-protection condition
ADF global control register (ADF_GCR)	TRGO	-	DFLTACTIVE0 = 1
ADF clock generator control register (ADF_CKGCR)	CKGDEN CCK0EN CCK1EN	PROCDIV[6:0], CCKDIV[3:0], CKGMOD, TRGSRC[3:0], TRGSENS, CCK[1:0]DIR	CKGACTIVE = 1
ADF serial interface control register 0 (ADF_SITF0CR)	SITFEN	STH[4:0], SITFMOD[1:0], SCKSRC[1:0]	SITFACTIVEx = 1
ADF bitstream matrix control register 0 (ADF_BSMX0CR)	-	BSSEL[4:0]	DFLTACTIVEx = 1
ADF digital filter control register 0 (ADF_DFLT0CR)	DFLTEN	NBDIS[7:0], TRGSRC[3:0], TRGSENS, FTH, DMAEN, SNPSFMT, ACQMOD[2:0]	DFLTACTIVEx = 1
ADF digital filer configuration register 0 (ADF_DFLT0CICR)	SCALE[5:0]	MCICD[8:0], CICMOD[2:0], DATSRC[1:0]	
ADF reshape filter configuration register 0 (ADF_DFLT0RSFR)	-	All fields	
ADF delay control register 0 (ADF_DLY0CR)	-	SKPDLY[6:0]	SKPBF = 1

Table 305. Register protection summary (continued)

Registers	Unprotected fields	Write-protected fields	Write-protection condition
ADF DFLT0 interrupt enable register (ADF_DFLT0IER)	All fields	-	-
ADF DFLT0 interrupt status register 0 (ADF_DFLT0ISR)	All fields	-	-
ADF SAD control register (ADF_SADCR)	SADEN	FRSIZE[2:0], DETCFG, SADMOD[1:0], HYSTEN, DATCAP[1:0]	SADACTIVE = 1
ADF SAD configuration register (ADF_SADCFGR)	-	ANMIN[12:0], SNTHR[3:0], HGOVR[3:0], LFRNB[2:0], ANSLP[2:0]	SADACTIVE = 1

All the ADF processing is performed in the adf_proc_ck clock domain. For that reason, enabling or disabling an ADF sub-block may take some time due to the resynchronization between the AHB clock domain and the adf_proc_ck clock domain. XXXACTIVE flags are available to allow the application to check that the synchronization between the two clock domains is completed.

To change a write-protected bitfield, the application must follow this sequence:

1. Set the enable bit of the sub-block to 0.
2. Wait for corresponding flag XXXACTIVE = 0.
3. Modify the wanted fields.
4. Set the enable bit of the sub-block to 1.

Refer to the description of each sub-block for details.

30.5 ADF low-power modes

Table 306. Effect of low-power modes on ADF

Mode	Description
Sleep	No effect. ADF interrupts cause the device to exit the Sleep mode.
Stop(1)	The ADF registers content is kept. Thanks to the kernel clock request feature, if the ADF is clocked by an internal oscillator available in Stop mode, the ADF remains active. The interrupts cause the device to exit Stop mode.
Standby	The ADF is powered down and must be reinitialized after exiting Standby mode.

1. Refer to *Section 30.3: ADF implementation* for details about Stop modes supported by the ADF.

30.6 ADF interrupts

To increase the CPU performance, the ADF offers an interrupt line (adf_flt0_it), sensitive to several events.

Note: The status flags are available even if the corresponding interrupt enable flag is not enabled.

The interrupt interface is controlled via the *ADF DFLT0 interrupt enable register (ADF_DFLT0IER)* and the *ADF DFLT0 interrupt status register 0 (ADF_DFLT0ISR)*.

Figure 409. ADF interrupt interface

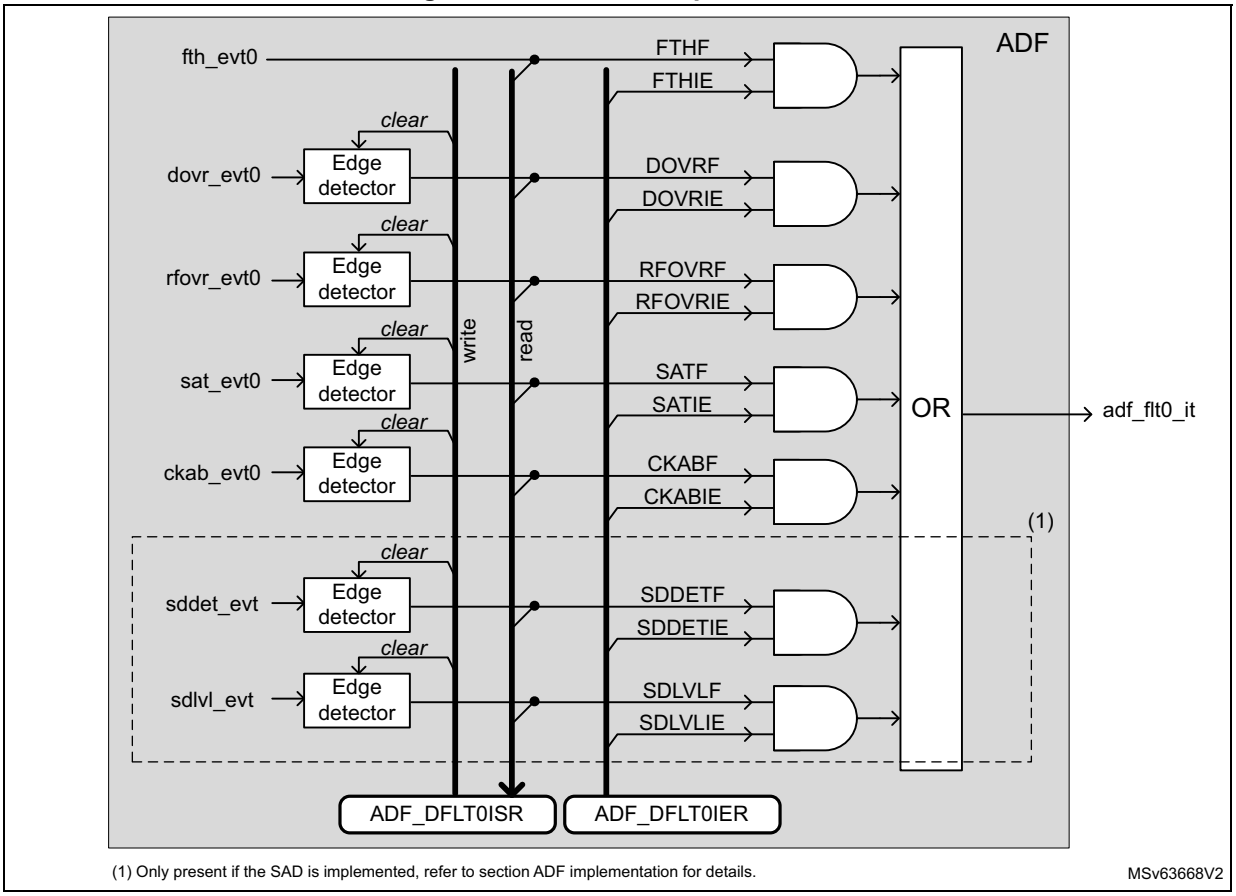


Table 307 shows which interrupt line is affected by which event, and how to clear and activate each interrupt/event.

Table 307. ADF interrupt requests

Interrupt vector	Interrupt event	Event flag	Event/interrupt clearing method	Exit Sleep mode	Exit Stop modes(1)	Exit Standby mode
ADF_FLT0(2)	RXFIFO threshold reached	FTHF	Read ADF_DFLT0DR until RXFIFO level is lower than the threshold.	Yes	Yes	No
	RXFIFO overrun	DOVRF	Write DOVRF to 1.			
	RSFLT overrun	RFOVRF	Write RFOVRF to 1.			
	Saturation detection	SATF	Write SATF to 1.			
	Channel clock absence detection	CKABF	Write CKABF to 1.			
	SAD: sound detected	SDDETF	Write SDDETF to 1.			
	SAD: sound level value available	SDLVLF	Write SDLVLF to 1.			

1. Refer to *Section 30.3: ADF implementation* for details.
2. ADF_FLT0 vector corresponds to the assertion of adf_flt0_it signal.

30.7 ADF application information

30.7.1 ADF configuration examples for audio capture

Table 308 gives some examples of the ADF settings for the digital microphones, focusing on 16 and 48 kHz output data rate.

Configurations #1 and #2 are for very low-power use-cases and have a reduced signal-to-noise ratio. The user must also insure that the selected digital microphone can work properly at 512 kHz. These configurations can be used for sound detection. The RSFLT is not used to reduce as much as possible the frequency of the kernel clock (adf_ker_ck).

Configurations #3, #4, #9, #10, #11 give signal-to-noise ratios around 115 dB, with an ideal microphone model, with a sinus signal of 997 Hz. Using the RSFLT allows a good control on the in-band ripple, and a good image rejection.

Configurations #7, #8, #10 give signal-to-noise ratio around 120 dB, with an ideal microphone model, using a sinus signal of 997 Hz.

Table 308. Examples of ADF settings for microphone capture

Configuration	adf_ker_ck (MHz)	PROCDIV + 1	CCKDIV + 1	CIC order (1)	MCICD + 1	SCALE	RSFLTBYP	RSFLTD	HPFBYP	-	adf_proc_ck (MHz)	Total dec. ratio	F_{RS} (kHz)	F_{ADF_CCKx} (MHz)	F_{PCM} (kHz)
#1	1.024	1	2	4	64	0x2D (- 8.5 dB)	1	x	x	=>	1.024	64	-	0.512	8
#2		1	2	5	32	0x2B (- 14.5 dB)						32	-		16
#3		1	2	5	16	0x01 (+ 3.5 dB)	0	0				64	32		8
#4	2.048	1	2	5	16	0x01 (+ 3.5 dB)	0	0			2.048	64	64	1.024	16
#5	3.072	1	6	5	8	0x0B (+ 33.6 dB)	0	0			3.072	32	32	0.512	8
#6		2	2	5	12	0x06 (+ 18.1 dB)						48	64	0.768	16
#7		1	2	5	24	0x2C (- 12 dB)						96		1.536	
#8	4.096	1	2	5	32	0x27 (- 26.6 dB)	0	0			4.096	128	64	2.048	16
#9	6.144	3	2	5	16	0x02 (+ 6.0 dB)	0	0			2.048	64	64	1.024	16
#10		2	2	5	24	0x2C (- 12 dB)					3.072	96		1.536	
#11		1	2	5	16	0x01 (+ 3.5 dB)					6.144	64	192	3.072	48
#12	7.680	1	2	5	20	0x2E (- 6.0 dB)	0	0			7.680	80	192	3.840	48

1. CICMOD = 100 for CIC order equal to 4. CICMOD = 101 for CIC order equal to 5.

30.7.2 Programming examples

Example 1

This example describes the programming of ADF for the capture of a signal coming from a digital microphone, using only the CIC4, with a decimation of 48, assuming that the kernel clock is 1.536 MHz. Typically, this configuration can be used to detect sound using the SAD.

Table 309. Programming sequence (CIC4)

Operations	Comments
Adjust the proper kernel clock frequency via the RCC	Assuming that the RCC is programmed to provide a kernel clock (adf_ker_ck) of 1.536 MHz coming from a RC oscillator.
Select the proper ADF kernel clock source via the RCC	Refer to the RCC of the product.
Enable the ADF clocks via the RCC	Refer to the RCC of the product.
Reset the ADF via the RCC	Refer to the RCC of the product.
AFMUX programming	Program the AFMUX to select ADF_SD0 and ADF_CCK0 functions.
Enable ADF processing clock: ADF_CKGCR = 0x0001 0023	PROCDIV = 0 (bypass): adf_proc_ck frequency is 1.536 MHz. CCKDIV = 1 (division by 2): ADF_CCK0 clock frequency is 768 kHz. The ADF_CCK0 pin is set in output and generates a clock so that the microphone can exit from low-power mode.
Serial interfaces configuration: ADF_SITF0CR = 0x0000 1F01	SCKSRC = 0 to select ADF_CCK0 as serial clock. SIFTMOD = 0 to select LF_MASTER SPI mode. Clock absence feature is not working in this mode. The serial interface is enabled.
Bitstream matrix configuration: ADF_BSMX0CR = 0x0000 0000	DFLT0 filter takes the bitstream of SITF0, sampled on rising edge
Filters configuration (CIC): ADF_DFLT0CICR = 0x0040 2F40	SCALE = 0x04 (12 dB): RSFLT is not enabled. Note that the gain is 8.5 dB, higher than recommended in order to improve signal accuracy for the SAD. Saturation is not an issue in this case, as only the detection of a signal much lower than the full scale is needed. MCICD = 0x2F (decimation by 48) CICMOD = 4 to select a $Sinc^4$ DATSCR = 0 to select data coming from BSMX
Filters configuration (RSFLT and HPF): ADF_DFLT0RSFR = 0x0000 0301	HPFC = 3: cut-off frequency of 16kHz * 0.0095 = 152 Hz HPFBYP = 0: HPF not bypassed RSFLTBYP = 1: RSFLT bypassed
Micro delay adjust: ADF_DLY0CR = 0x0000 0000	Not used in this example
Enable interrupt events: ADF_DFLT0IER = 0x0000 1000	Enable the interrupt events the application wants to handle. In this example, SDDETIE is set to 1 to have an interrupt if a sound is detected.

Table 309. Programming sequence (CIC4) (continued)

Operations	Comments
SAD setting: ADF_SADCR = 0x0000 1400	SADMOD = 1: Trigger based on sound level values FRSIZE = 4: Sound level computed on 128 samples HYSTEN = 0: No hysteresis DETCFG = 0: interrupt generated when the SAD enters in DETECT state DATCAP = 0: samples not transferred to memory SADEN = 0: SAD not yet enabled
SAD setting: ADF_SADCFGR = 0x0025 0001	ANMIN = 0x25: Sound threshold of 37 * 10^SNTHR/20 = 74 LSB(1) HGOVR = 0: four frames (4 x 128 = 512 samples) LFRNB = 0: Learning phase set to two frames. Not useful in this mode. ANSLP = 0: Not used in this mode SNTHR = 1: Threshold set to 6 dB (see ANMIN)
Clear status flags: ADF_DFLT0ISR = 0x0000 0FFF	Clear all the status flags before running the ADF
Enable the SAD: ADF_SADCR = 0x0000 1401 Wait for SADACTIVE flag = 1	Enable first the SAD, in order to be sure that data transfer to memory are blocked by the SAD.
Enable the filter: ADF_DFLT0CR = 0x0000 0001	NBDIS = 0: no samples discarded ACQMOD = 0: Asynchronous continuous acquisition mode DMAEN = 0: DMA interface not used DFLTEN = 1: Filter enabled

1. SNTHR and ANMIN values are computed using the same approach than in *Threshold programming with SADMOD = 01* (detection of a sound higher than 63 dBSPL).

Example 2

This example describes the programming of ADF for the capture of a signal coming from a digital microphone, using the CIC5, and the RSFLT, with a total decimation of 64.

Table 310. Programming sequence (CIC5)

Operations	Comments
Adjust the proper kernel clock frequency via the RCC	Assuming that the RCC is programmed to provide a kernel clock (adf_ker_ck) of 6.144 MHz
Select the proper ADF kernel clock source via the RCC	Refer to the RCC of the product.
Enable the ADF clocks via the RCC	Refer to the RCC of the product.
Reset the ADF via the RCC	Refer to the RCC of the product.
AFMUX programming	Program the AFMUX to select ADF_SD0 and ADF_CCK0 functions.
Enable ADF processing clock: ADF_CKGCR = 0x0201 0023	PROCDIV = 2 (division by 3): adf_proc_ck frequency is 6.144 MHz. CCKDIV = 1 (division by 2): ADF_CCK0 clock frequency is 1.024 MHz. The ADF_CCK0 pin is set in output and generates a clock so that the microphone can exit from low-power mode.

Table 310. Programming sequence (CIC5) (continued)

Operations	Comments
Serial interfaces configuration: ADF_SITF0CR = 0x0000 1F01	SCKSRC = 0 to select ADF_CCK0 as serial clock. SIFTMOD = 0 to select LF_MASTER SIPI mode. Clock absence feature is not working in this mode. The serial interface is enabled.
Bitstream matrix configuration: ADF_BSMX0CR = 0x0000 0000	DFLT0 filter takes the bitstream of SITF0, sampled on rising edge
Digital filter control: ADF_DFLT0CR = 0x0000 0006	NBDIS = 0: no samples discarded ACQMOD = 0: Asynchronous continuous acquisition mode DMAEN = 1: DMA interface not used DFLTEN = 0: Filter disabled FTH = 1: RXFIFO half-full
Filters configuration (CIC): ADF_DFLT0CICR = 0x0010 0F50	SCALE = 0x01(+3.5 dB): Output limited to 22 bits due to RSFLT. MCICD = 0xF (decimation by 16) CICMOD = 5 to select a $Sinc^5$ DATSCR = 0 to select data coming from BSMX
Filters configuration (RSFLT and HPF): ADF_DFLT0RSFR = 0x0000 0200	HPFC = 2: cut-off frequency of 16 kHz * 0.0025 = 40 Hz HPFBYP = 0: HPF not bypassed RSFLTBYP = 0: RSFLT not bypassed RSFLTD = 0: Decimation by 4
Micro delay adjust: ADF_DLY0CR = 0x0000 0000	Not used in this example
Enable interrupt events: ADF_DFLT0IER = x	Enable the interrupt events the application wants to handle.
Clear status flags: ADF_DFLT0ISR = 0x0000 0FFF	Clear all the status flags before running the ADF
Program the DMA Enable the DMA	The DMA must be programmed in order to read the data inside the ADF_DLT0DR register every time a DMA request is generated.
Start acquisition: ADF_DFLT0CR = 0x0000 0007	The ADF starts to filter data.

30.7.3 Connection examples

Figure 409 shows simple connection examples of the ADF to external sensors.

- Picture on the left: two digital microphones connected to the ADF

  In this connection, the amount of connections is optimized; DMIC1 and DMIC2 are sharing the same data line, and the same clock line. BSMX allows the application to connect the digital filter either to DMIC1 or to DMIC2. In this configuration when one of the microphone is used, the other is activated as well, as they share the same clock.
- Picture in the center: two digital microphones connected to the ADF

  In this connection, DMIC1 and DMIC2 are sharing the same data line, but have a dedicated clock line. BSMX allows the application to connect the filter either to DMIC1 or to DMIC2. When the application wants to use a microphone, it is possible to keep the other in low-power mode by forcing its clock line to 0 (CCKyEN = 0, CCKyDIR = 1).

- Picture on the right: single sensor connected to the ADF

  It is also possible to configure the CCK0 and CCK1 pins to input in order to connect sensors providing the clock.

Figure 410. Sensor connection examples

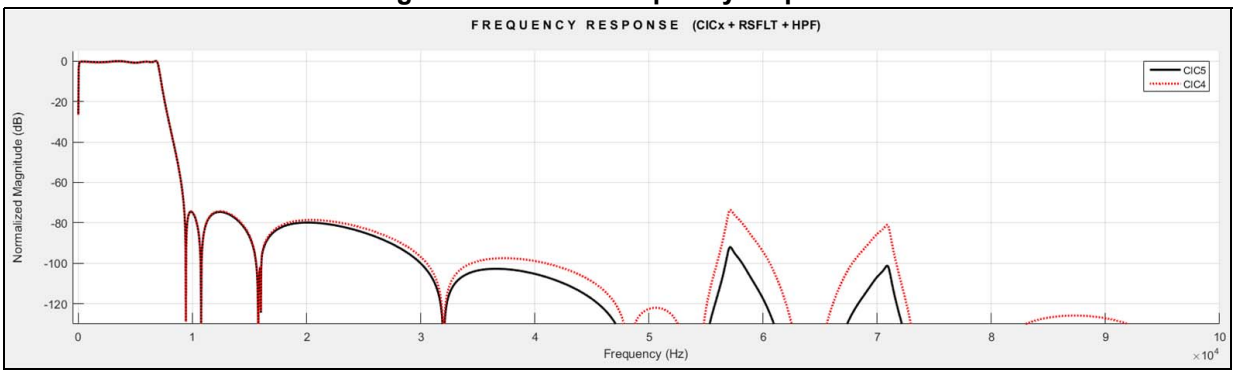
30.7.4 Global frequency response

Figure 410 shows the global frequency response for a 16 kHz audio signal with a digital microphone working at 1.024 MHz. The filter configuration is the following:

- CIC order 4 or 5, with a decimation ratio of 16
- RSFLT enabled, with a decimation ratio of 4
- HPF enabled with a cut-off frequency of 40 Hz

Figure 411 shows the theoretical frequency response using a CIC4 and a CIC5.

Figure 411. Global frequency response



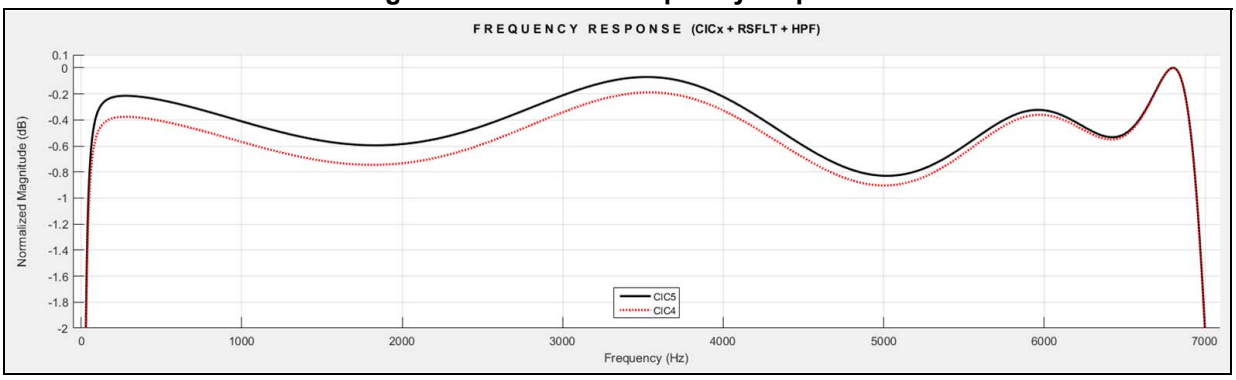


Figure 412 shows the in-band ripple for a 16 kHz audio signal with a digital microphone working at 1.024 MHz. The filter configuration is the following:

- CIC order 4 or 5, with a decimation ratio of 16
- RSFLT enabled, with a decimation ratio of 4
- HPF enabled with a cut-off frequency of 20 Hz

The resulting in-band ripple is ± 0.41 dB for CIC5, and ± 0.45 dB for CIC4.

The - 3 dB cut-off frequency is 7061 Hz.

Figure 412. Detailed frequency response

30.7.5 Total ADF gain

This section details how to compute the signal level provided by the ADF according to the filter settings.

A signal level may be expressed in dBFS (decibel full scale). A 0 dBFS level is assigned to the maximum possible digital level. For example, a signal that reaches 50 % of the maximum level, has a – 6 dBFS level (6 dB below full scale).

For example, for the ADF offering a final data width of 24 bits, a signal having an amplitude of 2 * 10^6 LSB has a level of:

$$20 \times \log_{10}\left(\frac{2 \times 10^6}{2^{(24-1)}}\right) = -12.45 \text{ dBFS}$$

In addition, the data size of a signal having an amplitude (Amp) expressed in LSB is given by:

$$DS = \left(\frac{\ln(Amp)}{\ln(2)} + 1\right) \text{ bits}$$

One bit need to be added for negative values.

So a signal having an amplitude of 2 * 10^6 LSB, has a data size of 21.9 bits.

CIC gain

The CIC gain (G_{CIC} and GdB_{CIC}) can be deduced from the following formula giving data size in bits (DS_{CIC}).

$$DS_{CIC} = (N \times \log_2(D1)) + DSin$$

where N represents the CIC order (selected by CICMOD[2:0]), and D1 is the decimation ratio (given by MCICD[8:0]).

DSin represents the data size (in bits) of the signal at CIC input.

Warning: DS_{CIC} is very important for CIC filter. In order to work fine, DS_{CIC} must not exceed 26 bits.

The CIC gain G_{CIC} is given by:

$$G_{CIC} = (D1)^N$$

which gives in decibels:

$$GdB_{CIC} = 20 \times \log_{10}((D1)^N)$$

Data size at SCALE output

The data size at SCALE output (including the CIC gain), is a key information as the RSFLT starts to have some saturations, if the peak-to-peak signal amplitude at SCALE output is higher than 22 bits.

If the RSFLT is bypassed, then a peak-to-peak signal amplitude of 24 bits is accepted.

The signal amplitude at SCALE output is:

$$Asout_{SCALE} = D1^N \times 10^{\frac{GdB_{SCALE}}{20}} \times Asin_{DFLT}$$

GdB_{SCALE} represents the gain selected by SCALE[5:0], in dB.

$Asout_{SCALE}$ is the signal amplitude at SCALE output (in LSB), and $Asin_{DFLT}$ is the signal amplitude at CIC input (LSB).

$$DS_{SCALE} = \frac{\ln(Asout_{SCALE})}{\ln(2)} + 1$$

The data size at SCALE output (DS_{SCALE}) is expressed in bits.

RSFLT gain

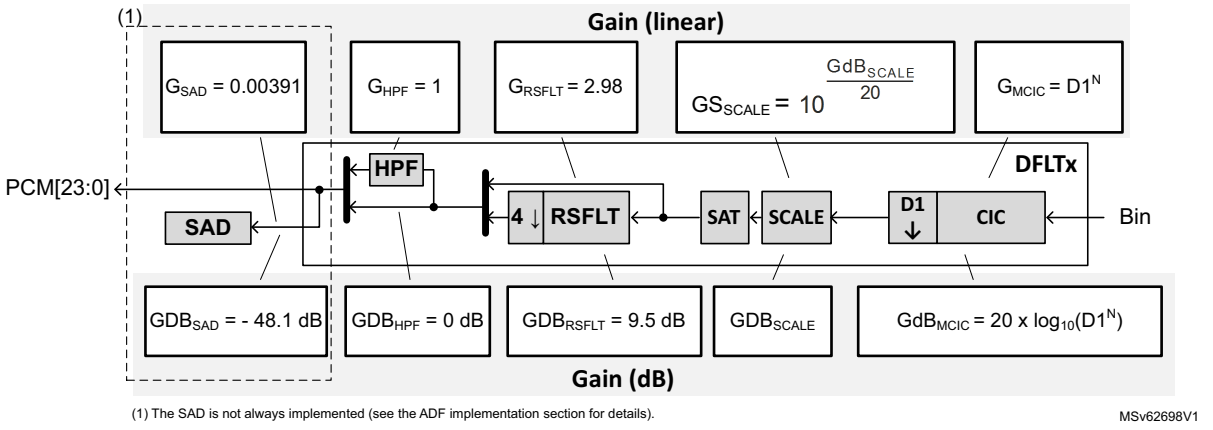
The RSFLT gain in the useful bandwidth is typically 9.5 dB, but due to ripple a margin of about ± 0.41 dB must be considered.

$$G_{RSFLT} = 10^{\frac{9.5\ dB}{20}} = 2.98 \text{ typical}$$

Note: The HPF filter has a gain of 0 dB.

SAD gain

The SAD is using only the 16 MSB on the signal, as a consequence, from the SAD point of view, the truncation from 24 to 16 bits can be seen as an attenuation.



$$GdB_{SAD} = -48.1dB$$

and

$$G_{SAD} = 0.003906$$

The *Figure 413* shows a simplified view of the filter path and gives, for each significant component, the expression of the bit growth and the gain.

Figure 413. Simplified DFLT view with gain information

Note: The SAD is not always implemented (see Section 30.3 for details).

Table 311 summarizes of the final data size for different filter configurations.

Table 311. Output signal levels

Filter configurations	Final signal amplitude (LSB)
CIC + RSFLT + HPF + SAD	Samples provided to the RXFIFO: $Asout_{RXFIFO} = D1^N \times 10^{\frac{GdB_{SCALE}}{20}} \times 10^{\frac{9.5}{20}} \times Asin_{DFLT}$ Samples provided to the SAD: $Asout_{SAD} = D1^N \times 10^{\frac{GdB_{SCALE}}{20}} \times 10^{\frac{9.5}{20}} \times 0.003906 \times Asin_{DFLT}$ DS_{SCALE} must be lower than 22 bits.
CIC + RSFLT (+ HPF)	$ASout_{HPF} = D1^N \times 10^{\frac{GdB_{SCALE}}{20}} \times 10^{\frac{9.5}{20}} \times Asin_{DFLT}$ DS_{SCALE} must be lower than 22 bits.
CIC (+ HPF)	$ASout_{HPF} = D1^N \times 10^{\frac{GdB_{SCALE}}{20}} \times Asin_{DFLT}$ DS_{SCALE} must be lower than 24 bits.

Example using the main filter chain

If the ADF filter is programmed as follows:

- The input signal is coming from a serial interface ($Dsin_{RSFLT}$ = 1 bit).
- CIC order = 5 (N), with a decimation value of 24 (D1).

- SCALE[5:0] is set to - 12 dB.
- RSFLT enabled, and the decimation by four is enabled.
- HPF is enabled.

Check first the data size at CIC output:

$$DS_{CIC} = (5 \times \log_2(24)) + 1 \text{ bit} = 23.92 \text{ bits}$$

The size is lower than 26 bits, so the CIC works in good conditions.

The data size at CIC output is very close to 24 bits, so the SCALE must be adjusted in order to provide a 22-bit max signal to the RSFLT. An attenuation of 12 dB is needed.

Then the signal level provided to the RSFLT is:

$$Asout_{SCALE} = 24^5 \times 10^{\frac{-12}{20}} \times 1 = 2.10^6$$

$$DS_{SCALE} = \frac{\ln(2.10^6)}{\ln(2)} + 1 = 21.93 \text{ bits}$$

If a higher gain is used, the RSFLT may saturate the output signal for strong input signals.

At the end, the final signal amplitude is:

$$Asout_{HPF} = 24^5 \times 10^{\frac{-12}{20}} \times 10^{\frac{9.5}{20}} \times 1 = 5.9711 \times 10^6$$

$$Dsout_{HPF} = \left(\frac{\ln(5.9711 \times 10^6)}{\ln(2)} + 1\right) = 23.51 \text{ bits}$$

or:

$$SDB_{OUT} = 20 \times \log_{10}\left(\frac{2^{23.51}}{2^{24}}\right) = -2.84 \text{ dBFS}$$

30.7.6 How to compute SAD thresholds

The SAD does not compute the RMS value of the converted signal, but the average of the absolute values. As a consequence, the estimated level differs from the RMS value of the signal:

- For a sine signal having an RMS value of 1, the SAD computes a level of 0.9.
- For a white or pink noise signal having an RMS value of 1, the SAD computes a level of about 0.8.

Note: FRSIZE[2:0] has a big influence on the accuracy of the level estimation: big FRSIZE[2:0] values give better results.

Threshold programming with SADMOD = 01

Consider the case of a sound capture where the application wants to wake up the system when the captured sound is bigger than 63 dBSPL.

The sound capture can be performed with a digital microphone such as the MP45DT02.

The sensitivity of this microphone is typically -26 dBFS for an input signal of 94 dBSPL.

An acoustic signal at 63 dBSPL produces a digital signal of about:
- 26 dBFS - (94 - 63) = - 57 dBFS.

- SCALE value adjustment

  For this example, the filter configuration is the following:

  – CIC5 with a decimation by 16
  – RSFLT enabled with a decimation by 4
  – HPF enabled

  A SCALE value of 3.5 dB is recommended for this configuration. As DFTL0 provides samples only used for a sound detection (samples not provided to the application), a bigger gain value can be applied: it increases the SAD accuracy and a saturation does not affect the SAD behavior (for example, a SCALE value of 15.6 dB).

- Input signal amplitude

  The input signal is - 57 dBFS, corresponding to an amplitude

  Asin = $10^{(-57/20)}$ = 0.00141 LSB.

- Signal level at SAD input

  The total filter gain for the SAD is:

  $$G_{SAD} = 16^5 \times 10^{\frac{15.6}{20}} \times 10^{\frac{9.5}{20}} \times \frac{1}{256} = 73.68 \times 10^3 \text{ or } 97.3 \text{ dB}$$

  The signal amplitude received by the SAD is:

  $$Ain_{SAD} = 0.00141 \times G_{SAD} \sim 104 \text{ LSB}$$

  The gain can be increased if the expected amplitude is too small. For the targeted application, 104 LSB is fine.

  If the input signal is expected to be a sine, the sound level for a signal amplitude of 104 LSB is:

  $$SDLVL = \frac{Ain_{SAD} \times \sqrt{2}}{2} \times 0.9 \sim 66 \text{ LSB}$$

  where 0.9 is the correction factor to apply with respect to the RMS value.

- Program the trigger value

  ANMIN and SNTHR must be programmed to trigger the SAD when the input signal level reaches 66 LSB.

  For SADMOD[1:0] = 01, the threshold value is given by:

  $$THRH = ANMIN \times 10^{\frac{GdB_{SNTHR}}{20}}$$

  where GdB_{SNTHR} represents the decibel value selected by SNTHR[3:0].

  When SNTHR[3:0] = 6 dB for example, this formula becomes:

  $$THRH = 2 \times ANMIN$$

  So ANMIN = THRH/2 = 66 /2 = 33 LSB.

  In *Figure 413*, the trigger value (THRH in red) is fixed to 66 LSB. The input signal is at - 65dBFS during 256 samples, then its value goes to - 55 dB for 256 samples, and finally it is reduced to - 60 dBFS.

The blue curve is showing the sound level estimation (SDLVL) versus time. Fluctuation on the estimated value can be observed due to windowing effect of FRSIZE samples.

The SAD DETECT state (when green signal is high) is maintained during four additional frames due to hangover function value.

In this example ANSLP = FRSIZE = 3 (64 samples), LFRNB = 0 (2 frames), HGOVR = 0 (4 frames), SNTHR = 1 (6 dB) and ANMIN = 33.

Figure 414. SAD example working with SADMOD = 01

Threshold programming with SADMOD = 1x

Consider the case of a sound capture where the application wants to wake up the system when the captured sound is bigger than 57 dBSPL.

The sound capture can be performed with a digital microphone such as the MP45DT02. The sensitivity of this microphone is typically - 26 dBFS for an input signal of 94 dBSPL.

An acoustic signal at 57 dBSPL produces a digital signal of about:
- 26 dBFS - (94-63) = - 63 dBFS.

- Adjust SCALE value

  For this example, the filter configuration is the following:

  – CIC4 with a decimation by 48
  – RSFLT bypassed
  – HPF enabled

  A SCALE value of 3.5 dB is recommended for this configuration. The samples provided by DFTL0 are only used for a sound detection, without providing the samples to the application, a bigger gain value can be provided: it increases the SAD accuracy and a saturation does not affect the SAD behavior (for example, a SCALE value of 24 dB).

- Input signal amplitude

  The input signal is - 63 dBFS, corresponding to an amplitude:

  Asin = $10^{(-63/20)}$ = 0.000708 LSB.

- Signal level at SAD input

  The total filter gain for the SAD is:

$$G_{SAD} = 48^4 \times 10^{\frac{24}{20}} \times 0.003906 = 328.6 \times 10^3 \text{ or } 110.3 \text{ dB}$$

  The signal amplitude received by the SAD is:

$$Ain_{SAD} = 0.000708 \times G_{SAD} \sim 232 \text{ LSB}$$

The gain can be increased if the expected amplitude is too small.

If the input signal is expected to be a sine, the sound level for a signal amplitude of 232 LSB is:

$$SDLVL = \frac{Ain_{SAD} \times \sqrt{2}}{2} \times 0.9 \sim 148 \text{ LSB}$$

where 0.9 is the correction factor to apply with respect to the RMS value.

Note: ANLVL converges to average of SDLVL values, with a long constant time.
So SDLVL ~ ANLVL = 148 LSB for a constant input signal at 57 dBSPL.

- Programming trigger value

  For SADMOD = 1', the SAD compares the estimated ambient noise multiplied by the gain selected by SNTHR[3:0] to ANMIN[12:0] * 4.

  For simplification, SNTHR[3:0] is set to 1 (6 dB), meaning that ANLVL is multiplied by two.

  The SAD triggers if 2 * ANLVL > THRH.

  In this mode:

  $$THRH = 4 \times ANMIN$$

  So the SAD triggers if:

  $$ANLVL > 2 \times ANMIN$$

  So ANMIN = 148 / 2 = 74 LSB

  In *Figure 414*, the trigger value (THRH in red) is fixed to 148 LSB. The input signal is at - 75 dBFS during 512 samples, then its value goes to - 62 dB for 11000 samples, and finally it is reduced to - 70 dBFS.

  The blue curve shows the sound level estimation (SDLVL) versus time. The black curve shows the ambient noise estimation versus time, increasing or decreasing logarithmically. During the learning phase, it reaches the SDLVL value.

  In this example ANSLP = 6, FRSIZE = 3 (64 samples), LFRNB = 0 (2 frames), HGOVR = 0 (4 frames), SNTHR = 1 (6 dB) and ANMIN = 74.

Figure 415. SAD example working with SADMOD = 1x

30.8 ADF registers

All the ADF registers must be accessed either in word (32-bit) or half-word (16-bit) formats.

30.8.1 ADF global control register (ADF_GCR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TRGO
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **TRGO**: Trigger output control

This bit is set by software and reset by hardware. It is used to start the acquisition of several filters synchronously. It is also used to synchronize several ADF together by controlling the adf_trgo signal.

0: Write 0 has no effect. Read 0 means that the trigger can be set again to 1.

1: Write 1 generates a positive pulse on the adf_trgo signal and triggers the acquisition on enabled filter having their ACQMOD[2:0] = 01x and selecting TRGO as trigger. Read 1 means that the trigger pulse is still active.

30.8.2 ADF clock generator control register (ADF_CKGCR)

Address offset: 0x004

Reset value: 0x0000 0000

This register is used to control the clock generator. The clock adf_proc_ck must be enabled before enabling other ADF parts.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CKGACTIVE	PROCDIV[6:0]							Res.	Res.	Res.	Res.	CCKDIV[3:0]			
r	rw	rw	rw	rw	rw	rw	rw					rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
TRGSRC[3:0]				Res.	Res.	Res.	TRGSENS	Res.	CCK1DIR	CCK0DIR	CKGMOD	Res.	CCK1EN	CCK0EN	CKGDEN
rw	rw	rw	rw				rw		rw	rw	rw		rw	rw	rw

Bit 31 **CKGACTIVE**: Clock generator active flag

This bit is set and cleared by hardware. Ii is used by the application to check if the clock generator is effectively enabled (active) or not. The protected fields of this function can only be updated when CKGACTIVE = 0 (see *Section 30.4.13: Register protection* for details).

The delay between a transition on CKGDEN and a transition on CKGACTIVE is two periods of AHB clock and two 2 periods of adf_proc_ck.

0: The clock generator is not active and can be configured if needed.

1: The clock generator is active and protected fields cannot be configured.

Bits 30:24 **PROCDIV[6:0]**: Divider to control the serial interface clock

This bitfield is set and reset by software. It is used to adjust the frequency of the clock provided to the SITF.

$$F_{adf_itf_ck} = \frac{F_{adf_ker_ck}}{(PROCDIV + 1)}$$

This bitfield must not be changed if the filter is enabled (DFTEN = 1).

0: adf_ker_ck provided to the SITF

1: adf_ker_ck / 2 provided to the SITF

2: adf_ker_ck / 3 provided to the SITF

...

127: adf_ker_ck / 128 provided to the SITF

Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **CCKDIV[3:0]**: Divider to control the ADF_CCK clock

This bitfield is set and reset by software. It is used to adjust the frequency of the ADF_CCK clock. The input clock of this divider is the clock provided to the SITF. More globally, the frequency of the ADF_CCK is given by the following formula:

$$F_{ADF_CCK} = \frac{F_{adf_ker_ck}}{(PROCDIV + 1) \times (CCKDIV + 1)}$$

This bitfield must not be changed if the filter is enabled (DFTEN = 1).

0000: The ADF_CCK clock is adf_proc_ck.

0001: The ADF_CCK clock is adf_proc_ck / 2.

0010: The ADF_CCK clock is adf_proc_ck / 3.

...

1111: The ADF_CCK clock is adf_proc_ck / 16.

Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bits 15:12 **TRGSRC[3:0]**: Digital filter trigger signal selection

This bitfield is set and cleared by software. It is used to select which external signals trigger the corresponding filter. This bitfield is not significant if the CKGMOD = 0.

000x: TRGO selected

0010: adf_trg1 selected

Others: Reserved

Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **TRGSENS**: CKGEN trigger sensitivity selection

This bit is set and cleared by software. It is used to select the trigger sensitivity of the trigger signals. This bit is not significant if the CKGMOD = 0.

0: A rising edge event triggers the activation of CKGEN dividers.

1: A falling edge even triggers the activation of CKGEN dividers.

Note: When the trigger source is TRGO, the sensitivity is forced to falling edge, thus TRGSENS value is not taken into account. This bit can be write-protected (see Section 30.4.13: Register protection for details).

Bit 7 Reserved, must be kept at reset value.

Bit 6 **CCK1DIR**: ADF_CCK1 direction

This bit is set and reset by software. It is used to control the direction of the ADF_CCK1 pin.

0: The ADF_CCK1 pin direction is in input.

1: The ADF_CCK1 pin direction is in output.

Note: This bit can be write-protected (see Section 30.4.13: Register protection for details).

Bit 5 **CCK0DIR**: ADF_CCK0 direction

This bit is set and reset by software. It is used to control the direction of the ADF_CCK0 pin.

0: The ADF_CCK0 pin direction is in input.

1: The ADF_CCK0 pin direction is in output.

Note: This bit can be write-protected (see Section 30.4.13: Register protection for details).

Bit 4 **CKGMOD**: Clock generator mode

This bit is set and reset by software. It is used to define the way the clock generator is enabled. This bit must not be changed if the filter is enabled (DFTEN = 1).

0: The kernel clock is provided to the dividers as soon as CKGDEN is set to 1.

1: The kernel clock is provided to the dividers when CKGDEN is set to 1 and the trigger condition met.

Note: This bit can be write-protected (see Section 30.4.13: Register protection for details).

Bit 3 Reserved, must be kept at reset value.

Bit 2 **CCK1EN**: ADF_CCK1 clock enable

This bit is set and reset by software. It is used to control the generation of the bitstream clock on the ADF_CCK1 pin.

0: Bitstream clock not generated

1: Bitstream clock generated on the ADF_CCK1 pin.

Bit 1 **CCK0EN**: ADF_CCK0 clock enable

This bit is set and reset by software. It is used to control the generation of the bitstream clock on the ADF_CCK0 pin.

0: Bitstream clock not generated

1: Bitstream clock generated on the ADF_CCK0 pin

Bit 0 **CKGDEN**: CKGEN dividers enable

This bit is set and reset by software. It is used to enable/disable the clock dividers of the CKGEN: PROCDIV and CCKDIV.

0: CKGEN dividers disabled

1: CKGEN dividers enabled

30.8.3 ADF serial interface control register 0 (ADF_SITF0CR)

Address offset: 0x080

Reset value: 0x0000 1F00

This register is used to control the serial interface SITF0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SITFACTIVE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	STH[4:0]					Res.	Res.	SITFMOD[1:0]		Res.	SCKSRC[1:0]		SITFEN
			rw	rw	rw	rw	rw			rw	rw		rw	rw	rw

Bit 31 **SITFACTIVE**: Serial interface active flag

This bit is set and cleared by hardware. It is used by the application to check if the serial interface is effectively enabled (active) or not. The protected fields of this function can only be updated when SITFACTIVE is set to 0 (see *Section 30.4.13: Register protection* for details).
The delay between a transition on SITFEN and a transition on SITFACTIVE is two periods of AHB clock and two periods of adf_proc_ck.
0: The serial interface is not active, and can be configured if needed.
1: The serial interface is active and protected fields cannot be configured.

Bits 30:13 Reserved, must be kept at reset value.

Bits 12:8 **STH[4:0]**: Manchester symbol threshold/SPI threshold

This bitfield is set and cleared by software. It is used for Manchester mode to define the expected symbol threshold levels (see *Manchester mode* for details on computation).
In addition this bitfield is used to define the timeout value for the clock absence detection in Normal SPI mode. STH[4:0] values lower than four are invalid.

Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bits 7:6 Reserved, must be kept at reset value.

Bits 5:4 **SITFMOD[1:0]**: Serial interface type

This bitfield is set and cleared by software. It is used to define the serial interface type.
00: LF_MASTER SPI mode
01: Normal SPI mode
10: Manchester mode: rising edge = logic 0, falling edge = logic 1
11: Manchester mode: rising edge = logic 1, falling edge = logic 0

Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bit 3 Reserved, must be kept at reset value.

Bits 2:1 **SCKSRC[1:0]**: Serial clock source

This bitfield is set and cleared by software. It is used to select the clock source of the serial interface.
00: Serial clock source is ADF_CCK0.
01: Serial clock source is ADF_CCK1.
others: reserved

Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bit 0 **SITFEN**: Serial interface enable

This bit is set and cleared by software. It is used to enable/disable the serial interface.
0: Serial interface disabled
1: Serial interface enabled

30.8.4 ADF bitstream matrix control register 0 (ADF_BSMX0CR)

Address offset: 0x084

Reset value: 0x0000 0000

This register is used to select the bitstream to be provided to DFLT0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BSMXACTIVE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

											rw	rw	rw	rw	rw

Bit 31 **BSMXACTIVE**: BSMX active flag

This bit is set and cleared by hardware. It is used by the application to check if the BSMX is effectively enabled (active) or not. BSSEL[4:0] can only be updated when BSMXACTIVE is set to 0. This BSMXACTIVE flag cannot go to 0 if DFLT0 is enabled.

0: BSMX is not active and can be configured if needed.

1: BSMX is active and protected fields cannot be configured.

Bits 30:5 Reserved, must be kept at reset value.

Bits 4:0 **BSSEL[4:0]**: Bitstream selection

This bitfield is set and cleared by software. It is used to select the bitstream to be processed for DFLT0.

00000: bs0_r provided to DFLT0

00001: bs0_f provided to DFLT0

others: reserved

Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

30.8.5 ADF digital filter control register 0 (ADF_DFLT0CR)

Address offset: 0x088

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DFLTACTIVE	DFLTRUN	Res.	Res.	NBDIS[7:0]								Res.	Res.	Res.	Res.
r	r			rw	rw	rw	rw	rw	rw	rw	rw				
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

rw	rw	rw	rw				rw		rw	rw	rw		rw	rw	w

Bit 31 **DFLTACTIVE**: DFLT0 active flag

This bit is set and cleared by hardware. It indicates if DFLT0 is active: can be running or waiting for events.

0: DFLT0 not active (can be re-enabled again, via DFLTEN bit, if needed)

1: DFLT0 active

Bit 30 **DFLTRUN**: DFLT0 run status flag
This bit is set and cleared by hardware. It indicates if DFLT0 is running or not.
0: DFLT0 not running and ready to accept a new trigger event
1: DFLT0running

Bits 29:28 Reserved, must be kept at reset value.

Bits 27:20 **NBDIS[7:0]**: Number of samples to be discarded
This bitfield is set and cleared by software. It is used to define the number of samples to be discarded every time DFLT0 is re-started.
0: No sample discarded
1: 1 sample discarded
2: 2 samples discarded
...
255: 255 samples discarded
Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bits 19:16 Reserved, must be kept at reset value.

Bits 15:12 **TRGSRC[3:0]**: DFLT0 trigger signal selection
This bitfield is set and cleared by software. It is used to select which external signals trigger DFLT0.
0000: TRGO selected
0010: adf_trgi selected
Others: Reserved
Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bits 11:9 Reserved, must be kept at reset value.

Bit 8 **TRGSENS**: DFLT0 trigger sensitivity selection
This bitfield is set and cleared by software. It is used to select the trigger sensitivity of the external signals
0: A rising edge event triggers the acquisition.
1: A falling edge even triggers the acquisition.
Note: When the trigger source is TRGO, TRGSENS value is not taken into account. When TRGO is selected, the sensitivity is forced to falling edge.
This bit can be write-protected (see Section 30.4.13: Register protection for details).

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **ACQMOD[2:0]**: DFLT0 trigger mode
This bitfield is set and cleared by software. It is used to select the filter trigger mode.
000: Asynchronous continuous acquisition mode
001: Asynchronous single-shot acquisition mode
010: Synchronous continuous acquisition mode
011: Synchronous single-shot acquisition mode
100: Window continuous acquisition mode
Others: Same as 000
Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bit 3 Reserved, must be kept at reset value.

Bit 2 **FTH**: RXFIFO threshold selection
This bit is set and cleared by software. It is used to select the RXFIFO threshold.
0: RXFIFO threshold event generated when the RXFIFO is not empty
1: RXFIFO threshold event generated when the RXFIFO is half-full
Note: This bit can be write-protected (see Section 30.4.13: Register protection for details).

Bit 1 **DMAEN**: DMA requests enable

This bit is set and cleared by software. It is used to control the generation of DMA request to transfer the processed samples into the memory.

0: DMA interface for the corresponding digital filter disabled

1: DMA interface for the corresponding digital filter enabled

Note: This bit can be write-protected (see Section 30.4.13: Register protection for details).

Bit 0 **DFLTEN**: DFLT0 enable

This bit is set and cleared by software. It is used to control the start of acquisition of the DFLT0 path. This bit behavior depends on ACQMOD[2:0] and external events. The serial or parallel interface delivering the samples must be enabled as well.

0: Acquisition immediately stopped

1: Acquisition immediately started if ACQMOD[2:0] = 00x or 101, or acquisition started when the proper trigger event occurs if ACQMOD[2:0] = 01x.

30.8.6 ADF digital filer configuration register 0 (ADF_DFLT0CICR)

Address offset: 0x08C

Reset value: 0x0000 0000

This register is used to control the main CIC filter.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	SCALE[5:0]						Res.	Res.	Res.	MCICD 8

rw	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw			rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:20 **SCALE[5:0]**: Scaling factor selection

This bitfield is set and cleared by software. It is used to select the gain to be applied at CIC output (see *Table 299* for details). If the application attempts to write a new gain value while the previous one is not yet applied, this new gain value is ignored. Reading back this bitfield informs the application on the current gain value.

000000: 0 dB

000001: + 3.5 dB

000010: + 6 dB or shift left by 1 bit

101111: -2.5 dB

Others: Reserved

Bits 19:17 Reserved, must be kept at reset value.

Bits 16:8 **MCICD[8:0]**: CIC decimation ratio selection
This bitfield is set and cleared by software.It is used to select the CIC decimation ratio. A decimation ratio smaller than two is not allowed. The decimation ratio is given by (CICDEC+1).
0: Decimation ratio is 2.
1: Decimation ratio is 2.
2: Decimation ratio is 3.
3: Decimation ratio is 4.
...
511: Decimation ratio is 512.
Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **CICMOD[2:0]**: Select the CIC order
This bitfield is set and cleared by software. It is used to select the order of the MCIC.
100: MCIC configured in single Sinc^4 filter
101: MCIC configured in single Sinc^5 filter
Others: Reserved
Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bits 3:2 Reserved, must be kept at reset value.

Bits 1:0 **DATSRC[1:0]**: Source data for the digital filter
This bitfield is set and cleared by software.
0x: Stream coming from the BSMX selected
10: Stream coming from the ADCITF1 selected
11: Stream coming from the ADCITF2 selected
Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

30.8.7 ADF reshape filter configuration register 0 (ADF_DFLT0RSFR)

Address offset: 0x090

Reset value: 0x0000 0000

This register is used to control the reshape and HPF filter.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

						rw	rw	rw			rw				rw

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:8 **HPFC[1:0]**: High-pass filter cut-off frequency
This bitfield is set and cleared by software. it is used to select the cut-off frequency of the high-pass filter. F_{PCM} represents the sampling frequency at HPF input.
00: Cut-off frequency = 0.000625 x FPCM
01: Cut-off frequency = 0.00125 x FPCM
10: Cut-off frequency = 0.00250 x FPCM
11: Cut-off frequency = 0.00950 x FPCM
Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bit 7 **HPFBYP**: High-pass filter bypass
This bit is set and cleared by software. It is used to bypass the high-pass filter.
0: HPF not bypassed (default value)
1: HPF bypassed
Note: This bit can be write-protected (see Section 30.4.13: Register protection for details).

Bits 6:5 Reserved, must be kept at reset value.

Bit 4 **RSFLTD**: Reshaper filter decimation ratio
This bit is set and cleared by software. It is used to select the decimation ratio for the reshape filter
0: Decimation ratio is 4 (default value).
1: Decimation ratio is 1.
Note: This bit can be write-protected (see Section 30.4.13: Register protection for details).

Bits 3:1 Reserved, must be kept at reset value.

Bit 0 **RSFLTBYP**: Reshaper filter bypass
This bit is set and cleared by software. It is used to bypass the reshape filter and its decimation block.
0: Reshape filter not bypassed (default value)
1: Reshape filter bypassed
Note: This bit can be write-protected (see Section 30.4.13: Register protection for details).

30.8.8 ADF delay control register 0 (ADF_DLY0CR)

Address offset: 0x0A4

Reset value: 0x0000 0000

This register is used for the adjustment stream delays.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SKPBF	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
r

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SKPDLY[6:0]						
									rw	rw	rw	rw	rw	rw	rw

Bit 31 **SKPBF**: Skip busy flag
This bit is set and cleared by hardware. It is used to control if the delay sequence is completed.
0: ADF ready to accept a new value into SKPDLY[6:0]
1: Last valid SKPDLY[6:0] still under precessing

Bits 30:7 Reserved, must be kept at reset value.

Bits 6:0 **SKPDLY[6:0]**: Delay to apply to a bitstream

This bitfield is set and cleared by software. It defines the number of input samples that are skipped. Skipping is applied immediately after writing to this bitfield, if SKPBF = 0 and DFLTEN = 1. If SKPBF = 1, the value written into the register is ignored by the delay state machine.

0: No input sample skipped

1: 1 input sample skipped

...

127: 127 input samples skipped

30.8.9 ADF DFLT0 interrupt enable register (ADF_DFLT0IER)

Address offset: 0x0AC

Reset value: 0x0000 0000

This register is used for allowing or not the events to generate an interrupt.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

		rw	rw	rw	rw	rw								rw	rw

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **SDLVLIE**: SAD sound-level value ready enable

This bit is set and cleared by software.

0: Sound-level-ready interrupt disabled

1: Sound-level-ready interrupt enabled

Bit 12 **SDDETIE**: Sound activity detection interrupt enable

This bit is set and cleared by software.

0: Sound-trigger interrupt disabled

1: Sound-trigger interrupt enabled

Bit 11 **RFOVRIE**: Reshape filter overrun interrupt enable

This bit is set and cleared by software.

0: Reshape filter overrun interrupt disabled

1: Reshape filter overrun interrupt enabled

Bit 10 **CKABIE**: Clock absence detection interrupt enable

This bit is set and cleared by software.

0: Clock absence interrupt disabled

1: Clock absence interrupt enabled

Bit 9 **SATIE**: Saturation detection interrupt enable

This bit is set and cleared by software.

0: Saturation interrupt disabled

1: Saturation interrupt enabled

Bits 8:2 Reserved, must be kept at reset value.

Bit 1 **DOVRIE**: Data overflow interrupt enable
This bit is set and cleared by software.
0: Data overflow interrupt disabled
1: Data overflow interrupt enabled

Bit 0 **FTHIE**: RXFIFO threshold interrupt enable
This bit is set and cleared by software.
0: RXFIFO threshold interrupt disabled
1: RXFIFO threshold interrupt enabled

30.8.10 ADF DFLT0 interrupt status register 0 (ADF_DFLT0ISR)

Address offset: 0x0B0

Reset value: 0x0000 0000

This register contains the status flags for the digital filter path.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	SDLVLF	SDDETF	RFOVRF	CKABF	SATF	Res.	Res.	Res.	Res.	Res.	RXNEF	Res.	DOVRF	FTHF
		rc_w1	rc_w1	rc_w1	rc_w1	rc_w1						r		rc_w1	r

Bits 31:14 Reserved, must be kept at reset value.

Bit 13 **SDLVLF**: Sound level value ready flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that new sound level value is not ready. Write 0 has no effect.
1: Read 1 means that new sound level value is ready. Write 1 clears this flag.

Bit 12 **SDDETF**: Sound activity detection flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no sound activity is detected. Write 0 has no effect.
1: Read 1 means that sound activity is detected. Write 1 clears this flag.

Bit 11 **RFOVRF**: Reshape filter overrun detection flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no reshape filter overrun is detected. Write 0 has no effect.
1: Read 1 means that reshape filter overrun is detected. Write 1 clears this flag.

Bit 10 **CKABF**: Clock absence detection flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no clock absence is detected. Write 0 has no effect.
1: Read 1 means that a clock absence is detected. Write 1 clears this flag.

Bit 9 **SATF**: Saturation detection flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no saturation is detected. Write 0 has no effect.
1: Read 1 means that a saturation is detected. Write 1 clears this flag.

Bits 8:4 Reserved, must be kept at reset value.

Bit 3 **RXNEF**: RXFIFO not empty flag
This bit is set and cleared by hardware according to the RXFIFO level.
0: RXFIFO empty
1: RXFIFO not empty

Bit 2 Reserved, must be kept at reset value.

Bit 1 **DOVRF**: Data overflow flag
This bit is set by hardware and cleared by software by writing this bit to 1.
0: Read 0 means that no overflow is detected. Write 0 has no effect.
1: Read 1 means that an overflow is detected; Write 1 clears this flag.

Bit 0 **FTHF**: RXFIFO threshold flag
This bit is set by hardware, and cleared by the hardware when the RXFIFO level is lower than the threshold.
0: RXFIFO threshold not reached
1: RXFIFO threshold reached

30.8.11 ADF SAD control register (ADF_SADCR)

Address offset: 0x0B8

Reset value: 0x0000 0000

This register is used for the configuration and the control of the sound activity detection.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
SADACTIVE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
r															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	SADMOD[1:0]		Res.	FRSIZE[2:0]			HYSTEN	Res.	SADST[1:0]		DETCFG	DATCAP[1:0]		SADEN
		rw	rw		rw	rw	rw	rw		r	r	rw	rw	rw	rw

Bit 31 **SADACTIVE**: SAD Active flag
This bit is set and cleared by hardware. It is used to check if the SAD is effectively enabled (active) or not. The protected fields and registers of this function can only be updated when the SADACTIVE is set to 0 (see *Section 30.4.13: Register protection* for details).
The delay between a transition on SADEN and a transition on SADACTIVE is two periods of AHB clock and two periods of adf_proc_ck.
0: SAD not active and can be configured if needed
1: SAD active and protected fields cannot be configured.

Bits 30:14 Reserved, must be kept at reset value.

Bits 13:12 **SADMOD[1:0]**: SAD working mode

This bitfield is set and cleared by software. It is used to define the way the SAD works.

00: Threshold value computed according to the estimated ambient noise

The SAD triggers when the sound level (SDLVL) is bigger than the defined threshold. In this mode, the SAD works like a voice activity detector.

01: Threshold value equal to ANMIN[12:0], multiplied by the gain selected by SNTHR[3:0]

The SAD triggers when the sound level (SDLVL) is bigger than the defined threshold. In this mode, the SAD works like a sound detector.

1x: Threshold value given by 4 x ANMIN[12:0]

The SAD triggers when the estimated ambient noise (ANLVL), multiplied by the gain selected by SNTHR[3:0] is bigger than the defined threshold. In this mode, the SAD is working like an ambient noise estimator. Hysteresis function cannot be used in this mode.

Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bit 11 Reserved, must be kept at reset value.

Bits 10:8 **FRSIZE[2:0]**: Frame size

This bitfield is set and cleared by software. it is used to define the size of one frame and also to define how many samples are taken into account to compute the short-term signal level.

000: 8 PCM samples used to compute the short-term signal level

001: 16 PCM samples used to compute the short-term signal level

010: 32 PCM samples used to compute the short-term signal level

011: 64 PCM samples used to compute the short-term signal level

100: 128 PCM samples used to compute the short-term signal level

101: 256 PCM samples used to compute the short-term signal level

11x: 512 PCM samples used to compute the short-term signal level

Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bit 7 **HYSTEN**: Hysteresis enable

This bit is set and cleared by software. It is used to enable/disable the hysteresis function (see *Table 299* for details). This bit must be kept to 0 when SADMOD[1:0] = 1x.

0: Hysteresis function disabled. THR_H is always used.

1: Hysteresis function enabled. THR_H is used for MONITOR to DETECT transition and THR_L is used for DETECT to MONITOR transition.

Note: This bit can be write-protected (see Section 30.4.13: Register protection for details).

Bit 6 Reserved, must be kept at reset value.

Bits 5:4 **SADST[1:0]**: SAD state

This bitfield is set and cleared by hardware. It indicates the SAD state and is meaningful only when SADEN = 1. The SAD state can be:

- LEARN when the SAD is in learning phase or in SDLVL computation mode
- MONITOR when the SAD is in monitoring phase
- DETECT when the SAD detects a sound

00: SAD in LEARN state

01: SAD in MONITOR state

11: SAD in DETECT state

Bit 3 **DETCFG**: Sound trigger event configuration

This bit is set and cleared by software. It is used to define if the sddet_evt event is generated only when the SAD enters to MONITOR state or when the SAD enters or exits the DETECT state.

0: sddet_evt generated when SAD enters the MONITOR state

1: sddet_evt generated when SAD enters or exits the DETECT state

Note: This bit can be write-protected (see Section 30.4.13: Register protection for details).

Bits 2:1 **DATCAP[1:0]**: Data capture mode
This bitfield is set and cleared by software. It is used to define in which conditions, the samples provided by DLFT0 are stored into the memory.
00: Samples from DFLT0 not transfered into the memory
01: Samples from DFLT0 transfered into the memory when SAD is in DETECT state
1x: Samples from DFLT0 transfered into memory when SAD and DFLT0 are enabled
Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bit 0 **SADEN**: Sound activity detector enable
This bit is set and cleared by software. It is used to enable/disable the SAD.
0: SAD disabled and SAD state reset
1: SAD enabled

30.8.12 ADF SAD configuration register (ADF_SADCFGR)

Address offset: 0x0BC

Reset value: 0x0000 0000

This register is used for the configuration of the sound activity detection.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	ANMIN[12:0]												
			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	HGOVR[2:0]			Res.	LFRNB[2:0]			Res.	ANSLP[2:0]			SNTHR[3:0]			
	rw	rw	rw		rw	rw	rw		rw	rw	rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:16 **ANMIN[12:0]**: Minimum noise level
This bitfield is set and cleared by software. It is used to define the minimum noise level and then the sensitivity. It represents a positive number.
Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **HGOVR[2:0]**: Hangover time window
This bitfield is set and cleared by software. Once the SAD state is DETECT, this parameter is used to define the amount of time the sound is allowed to remain below the threshold, before switching the SAD to MONITOR state (see FRSIZE bitfield for the description of a frame).
000: SAD back to MONITOR state if sound is below threshold for 4 frames
001: SAD back to MONITOR state if sound is below threshold for 8 frames
010: SAD back to MONITOR state if sound is below threshold for 16 frames
011: SAD back to MONITOR state if sound is below threshold for 32 frames
100: SAD back to MONITOR state if sound is below threshold for 64 frames
101: SAD back to MONITOR state if sound is below threshold for 128 frames
110: SAD back to MONITOR state if sound is below threshold for 256 frames
111: SAD back to MONITOR state if sound is below threshold for 512 frames
Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bit 11 Reserved, must be kept at reset value.

Bits 10:8 **LFRNB[2:0]**: Number of learning frames

This bitfield is set and cleared by software. It is used to define the number of learning frames to perform the first estimate of the noise level.

000: 2 frames used to compute the initial noise level
001: 4 frames used to compute the initial noise level
010: 8 frames used to compute the initial noise level
011: 16 frames used to compute the initial noise level
1xx: 32 frames used to compute the initial noise level

Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **ANSLP[2:0]**: Ambient noise slope control

This bitfield is set and cleared by software. It is used to define the positive and negative slope of the noise estimator, in charge of updating the ANLVL (see *Ambient noise estimation (ANLVL)* for information about programming this bitfield).

Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

Bits 3:0 **SNTHR[3:0]**: Signal to noise threshold

This bitfield is set and cleared by software. It is used to define THR_H (and THR_L if hysteresis is enabled). See *Table 299* for details.

0000: THR_H is 3.5 dB higher than ANLVL
0001: THR_H is 6.0 dB higher than ANLVL
0010: THR_H is 9.5 dB higher than ANLVL
0011: THR_H is 12 dB higher than ANLVL
0100: THR_H is 15.6 dB higher than ANLVL
0101: THR_H is 18 dB higher than ANLVL
0110: THR_H is 21.6 dB higher than ANLVL
0111: THR_H is 24.1 dB higher than ANLVL
1000: THR_H is 27.6 dB higher than ANLVL
1001: THR_H is 30.1dB higher than ANLVL
others: Reserved

Note: This bitfield can be write-protected (see Section 30.4.13: Register protection for details).

30.8.13 ADF SAD sound level register (ADF_SADSDLVR)

Address offset: 0x0C0

Reset value: 0x0000 0000

This register contains the short-term sound-level computed by the SAD.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	SDLVL[14:0]														
	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:0 **SDLVL[14:0]**: Short term sound level

This bitfield is set by hardware. It contains the latest sound level computed by the SAD. To refresh this value, SDLVLF must be cleared.

30.8.14 ADF SAD ambient noise level register (ADF_SADANLVR)

Address offset: 0x0C4

Reset value: 0x0000 0000

This register contains the ambient noise level computed by the SAD.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Res.	ANLVL[14:0]														
	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:15 Reserved, must be kept at reset value.

Bits 14:0 **ANLVL[14:0]**: Ambient noise level estimation

This bitfield is set by hardware. It contains the latest ambient noise level computed by the SAD. To refresh this bitfield, the SDLVLF flag must be cleared.

30.8.15 ADF digital filter data register 0 (ADF_DFLT0DR)

Address offset: 0x0F0

Reset value: 0x0000 0000

This register is used to read the data processed by the digital filter.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

31 True random number generator (RNG)

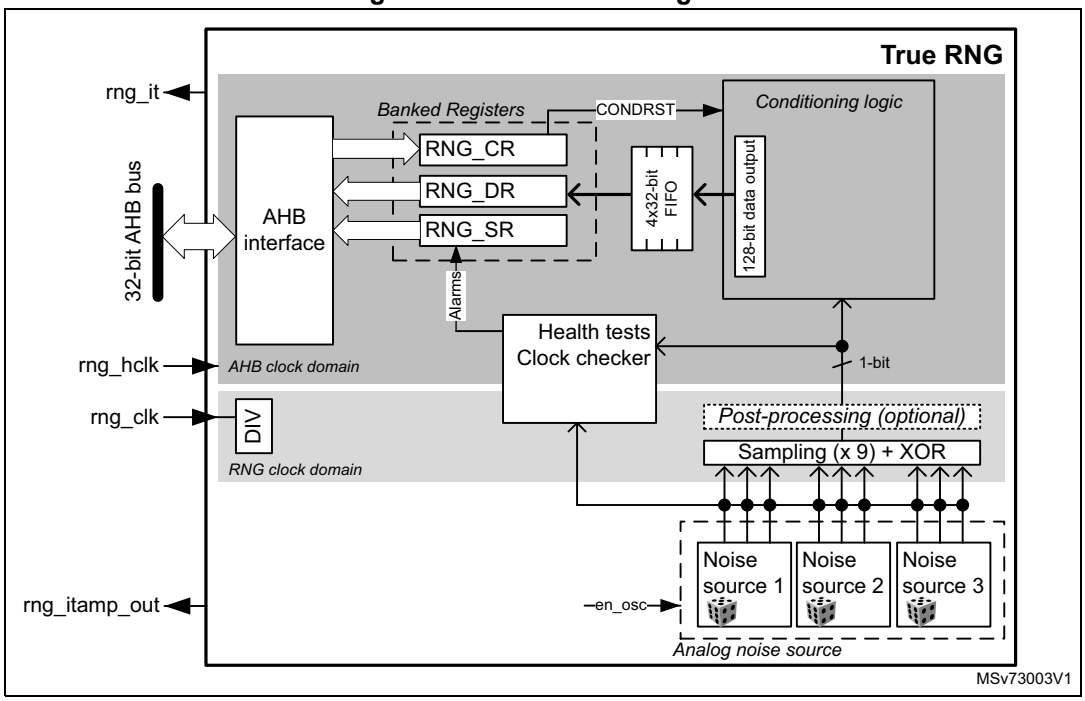
31.1 RNG introduction

The RNG is a true random number generator that provides full entropy outputs to the application as 32-bit samples. It is composed of a live entropy source (analog) and an internal conditioning component.

The RNG is an NIST SP 800-90B compliant entropy source that can be used to construct a nondeterministic random bit generator (NDRBG).

The RNG true random number generator can be certified NIST SP 800-90B. It can also be tested using the German BSI statistical tests of AIS-31 (T0 to T8).

31.2 RNG main features



- The RNG delivers 32-bit true random numbers, produced by an analog entropy source conditioned by an NIST SP800-90B approved conditioning stage.
- It can be used as the entropy source to construct a non-deterministic random bit generator (NDRBG).
- In the default configuration, it produces four 32-bit random samples every 412 AHB clock cycles if $f_{AHB} < f_{threshold}$ (256 RNG clock cycles otherwise).
- Embeds startup and NIST SP800-90B approved continuous health tests (repetition count and adaptive proportion tests), associated with specific error management.
- Can be disabled to reduce power consumption, or enabled with an automatic low power mode (default configuration).
- Has an AMBA® AHB slave peripheral, accessible through 32-bit word single accesses only (else an AHB bus error is generated, and the write accesses are ignored).

31.3 RNG functional description

31.3.1 RNG block diagram

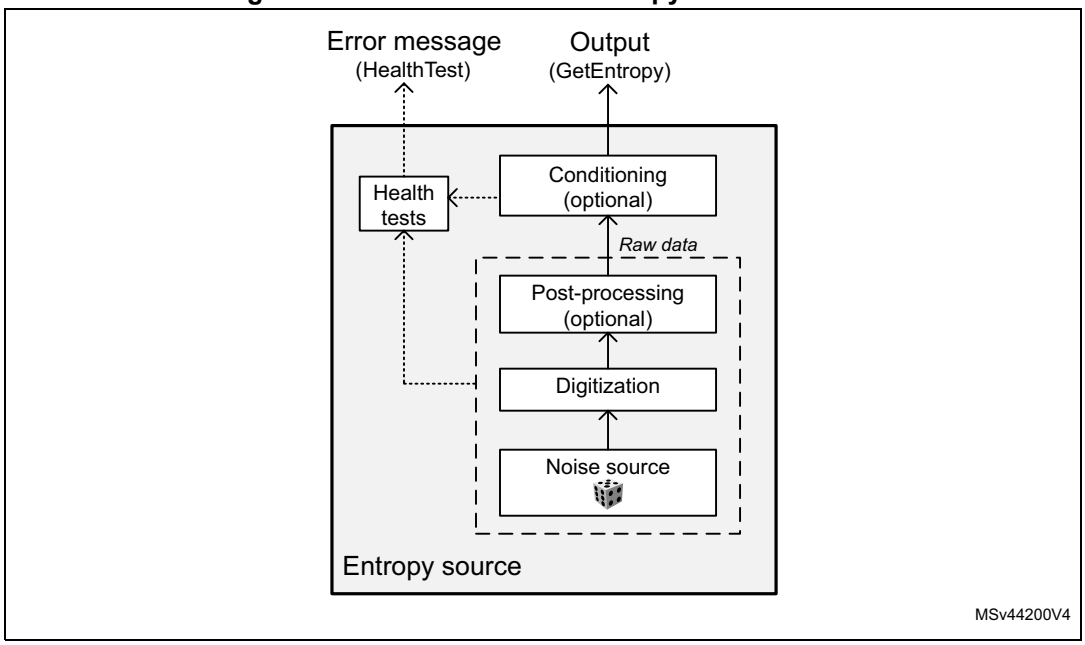
Figure 416 shows the RNG block diagram.

Figure 416. RNG block diagram

31.3.2 RNG internal signals

Table 313 describes internal signals available at the RNG level, not at the STM32 product level (on pads).

Table 313. RNG internal input/output signals



Signal name	Signal type	Description
rng_it	Digital output	RNG global interrupt request
rng_hclk	Digital input	AHB clock
rng_clk	Digital input	RNG dedicated clock, asynchronous to rng_hclk
rng_itamp_out	Digital output	RNG internal tamper event signal to TAMP (XOR-ed), triggered when an unexpected hardware fault occurs. When this signal is triggered, RNG stops delivering random samples. A reset and a new initialization are needed to use it again.

31.3.3 Random number generation

The true random number generator (RNG) delivers truly random data through its AHB interface at deterministic intervals.

Within its boundary, it integrates all the required NIST components shown in *Figure 417*: an analog noise source, a digitization stage, a conditioning algorithm, a health monitoring block, and two interfaces used to interact with the entropy source (GetEntropy and HealthTest).

Figure 417. NIST SP800-90B entropy source model

Noise source

This component contains the nondeterministic, entropy-providing activity, ultimately responsible for the uncertainty associated with the bit string output by the entropy source. This noise source provides 1-bit samples. It is composed of:

- Multiple analog noise sources (x3), each based on three XOR-ed free-running ring oscillator outputs. It is possible to disable those analog oscillators to save power, as described in *Section 31.3.8*. Multiple oscillators are also disabled for configuration A (see *Table 315*).
- The XOR-ing of all the noise sources into a single analog output.
- A sampling stage of this output is clocked by a dedicated clock input (rng_clk with integrated divider), delivering a 1-bit raw data output.

This noise source sampling is independent from the AHB interface clock frequency (rng_hclk), with the possibility, for the software, to decrease the sampling frequency by using the integrated divider.

Note: The recommended clock frequencies and associated divider value are detailed in Section 31.6.

Post processing

In the NIST configuration no post-processing is applied to the sampled noise source. In the non-NIST configuration B (as defined in *Section 31.6.2*) a normalization debiasing is applied: half of the bits are taken from the sampled noise source, the other half from the inverted sampled noise source.

Conditioning

The conditioning component in the RNG is a deterministic function that increases the entropy rate of the resulting fixed-length bit string output (128-bit). The NIST SP800-90B target is full entropy on the output (128-bit).

The time intervals required between two random number generations, and between the RNG initialization and availability of the first sample are detailed in *Section 31.5*.

Output buffer

A data output buffer can store up to four 32-bit words that have been output from the conditioning component. When four words have been read from the output FIFO through the RNG_DR register, the content of the 128-bit conditioning output register is pushed into the output FIFO, and a new conditioning round is automatically started. Four new words are added to the conditioning output register after a number of clock cycles specified in *Section 31.5*.

Whenever a random number is available through the RNG_DR register, the DRDY flag changes from 0 to 1. This flag remains high until the output buffer becomes empty after reading four words from the RNG_DR register.

Note: When the interrupts are enabled, an interrupt is generated when this flag transitions from 0 to 1. The interrupt is then cleared automatically by the RNG, as explained above.

Health checks

This component ensures that the entire entropy source (with its noise source) starts, then operates as expected, obtaining the assurance that failures are caught quickly, with high probability and reliability.

The RNG implements the following health check features in accordance with NIST SP800-90B. The described thresholds correspond to the default RNG_HTCR0 configuration.

1. Startup health tests, performed after reset and before the first use of the RNG as entropy source:
   - Repetition count test, flagging an error when the noise source has provided more than 28 consecutive bits at a constant value (0 or 1).
   - Adaptive proportion test running on a window of 1024 consecutive bits: the RNG verifies that the first bit on the outputs of the noise source is not repeated more than 684 times.
   - Known-answer tests, to verify the conditioning stage.
2. Continuous health tests, running indefinitely on the outputs of the noise source (XORed output and individual oscillator outputs, see *Figure 416: RNG block diagram*):
   - Repetition count test, similar to the one running in startup tests.
   - Adaptive proportion test, similar to the one running in startup tests.
3. Vendor specific continuous test:

- Real-time “too slow” sampling clock detector, flagging an error when one RNG clock cycle (before divider) is smaller than the AHB clock cycle divided by 32.

4. On-demand test of digitized noise source (raw data)
   - Supported by restarting the entropy source and rerunning the startup tests (see software reset sequence in *Section 31.3.4*). Other kinds of on-demand testing (software based) are *not supported*.

The CECS and SECS status bits in the RNG_SR register indicate when an error condition is detected, as detailed in *Section 31.3.7*.

Note: An interrupt can be generated when an error is detected.

The health test thresholds are modified by changing the value in the corresponding RNG_HTCRx registers. See Section 31.6 for details.

31.3.4 RNG initialization

The RNG simplified state machine is shown in *Figure 418*.

After enabling the RNG (RNGEN = 1 in RNG_CR), the following chain of events occurs:

1. The analog noise source is enabled, and by default the RNG waits 16 RNG clock cycles (before divider) before starting to sample the analog output and filling the 128-bit conditioning shift register.
2. The conditioning hardware initializes, automatically triggering the startup behavior test on the raw data samples and known-answer tests.
3. Start-up health tests are completed, with the conditioning stage ready to use.
4. The conditioning stage internal input data buffer is filled again with 128-bit and a number of conditioning rounds defined by the RNG configuration (NIST or non-NIST) is performed. The output buffer is then filled with the post processing result.
5. The output buffer is refilled automatically according to the RNG usage.

The associated initialization time can be found in *Section 31.5*.

Figure 418. RNG initialization overview

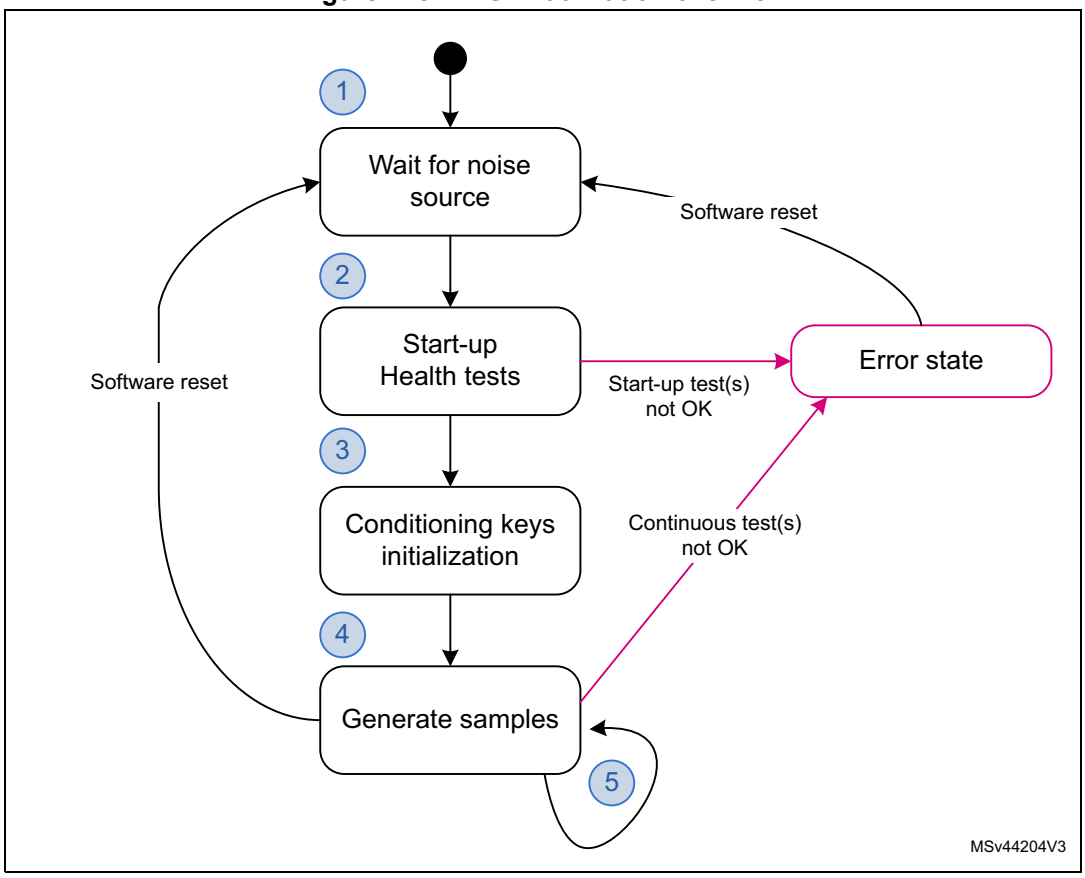


Figure 418 also highlights a possible software reset sequence, implemented by:

1. Write RNGEN = 0, then wait for BUSY = 0 in the RNG_SR register.
2. Write bits RNGEN = 0 and CONDRST = 1 in the RNG_CR register with the same RNG configuration and a new CLKDIV if needed.
3. Write RNGEN = 1 and CONDRST = 0 in the RNG_CR register.
4. Wait for a random number to be ready, after initialization completes.

Note: When the RNG is reset by RCC (hardware reset), the configuration for optimal randomness is lost in the registers.

31.3.5 RNG operation

Normal operation

To run the RNG using interrupts, the following steps are recommended:

1. Check in *Section 31.6* if a specific RNG configuration is required for the application.
   – If this is the case, when bits RNGEN and BUSY=0, write in the RNG_CR register bit CONDRST = 1, together with the correct RNG configuration. Then perform a second write with bit CONDRST = 0, interrupt enable bit IE = 1, and RNG enable bit RNGEN = 1.

- If this is not the case, perform a write to the RNG_CR register with interrupt enable bit IE = 1 and RNG enable bit RNGEN = 1.

2. An interrupt is now generated when a random number is ready or when an error occurs. Therefore, at each interrupt, check that:
   - No error occurred. The SEIS and CEIS bits must be set to 0 in the RNG_SR register.
   - A random number is ready. The DRDY bit must be set to 1 in the RNG_SR register.
   - If the above two conditions are true the content of the RNG_DR register can be read up to four consecutive times. If valid data are available in the conditioning output buffer, four additional words can be read by the application (in this case the DRDY bit is still high). If one or both of the above conditions are false, the RNG_DR register must not be read. If an error occurred, the error recovery sequence described in *Section 31.3.7* must be used.

To run the RNG in polling mode the following steps are recommended:

1. Check in *Section 31.6* if a specific RNG configuration is required for the application.
   - If this is the case, when bits RNGEN and BUSY = 0, write in the RNG_CR register bit CONDRST = 1, together with the correction RNG configuration. Then perform a second write to the RNG_CR register with bit CONDRST = 0 and the RNG enable bit RNGEN = 1.
   - If this is not the case, only enable the RNG by setting the RNGEN bit to 1 in the RNG_CR register.
2. Read the RNG_SR register and check that:
   - No error occurred (the SEIS and CEIS bits must be set to 0)
   - A random number is ready (the DRDY bit must be set to 1)
3. If the above conditions are true, read the content of the RNG_DR register up to four consecutive times. If valid data are available in the conditioning output buffer, four additional words can be read by the application (in this case the DRDY bit is still high). If one or both of the above conditions are false, the RNG_DR register must not be read. If an error occurred, use the recovery sequence described in *Section 31.3.7*.

Note: When data are not ready (DRDY = 0) RNG_DR returns 0. It is recommended to verify that RNG_DR is different from 0. When this happens, a seed error occurred between RNG_SR polling and RND_DR output reading (a rare event).

If the random number generation period is a concern to the application and if NIST compliance is not required, it is possible to select a faster configuration by using the configuration B, described in *Section 31.6*. The gain in random number generation speed is summarized in *Section 31.5*.

Low-power operation

If power consumption is a concern, low-power strategies can be used, as described in *Section 31.3.8*.

Software post-processing

No specific software post-processing/conditioning is expected to meet the AIS-31 or NIST SP800-90B approvals.

Built-in health check functions are described in *Section 31.3.3*.

31.3.6 RNG clocking

The RNG runs on two different clocks: the AHB bus clock and a dedicated RNG clock.

The AHB clock is used to clock the AHB banked registers and conditioning component. The RNG clock, coupled with a programmable divider (see CLKDIV bitfield in the RNG_CR register) is used for noise source sampling. Recommended clock configurations are detailed in *Section 31.6*.

*Note: When the CED bit in the RNG_CR register is set to 0, the RNG clock frequency before the internal divider **must be higher** than the AHB clock frequency divided by 32, otherwise the clock checker flags a clock error (CECS = 1 in the RNG_SR register).*

See *Section 31.3.1* for details (AHB and RNG clock domains).

31.3.7 Error management

In parallel to random number generation a health check block verifies the correct noise source behavior and the frequency of the RNG source clock as detailed in this section. Associated error state is also described.

Clock error detection

When the clock error detection is enabled (CED = 0) and if the RNG clock frequency is too low, the RNG sets to 1 both the CEIS and CECS bits to indicate that a clock error occurred. In this case, the application must check that the RNG clock is configured correctly (see *Section 31.3.6*), and then it must clear the CEIS bit interrupt flag. The CECS bit is automatically cleared when the clocking condition is normal.

When CECS is set, values are available in the RNG_DR register, but it must not be used as described in *Section 31.3.5*.

Note: CEIS is set only when CECS is set to 1 by RNG.

Noise source error detection

When a noise source (or seed) error occurs, the RNG stops generating random numbers and sets to 1 both SEIS and SECS bits to indicate that a seed error occurred.

When SECS is set, values are available in the RNG_DR register, but it must not be used as described in *Section 31.3.5*.

To manage a seed error, follow the recommended sequence below.

It requires the CONFIGLOCK bit to be cleared.

- When ARDIS is cleared (auto-reset enabled):
  - Clear the SEIS bit in the RNG_SR register
  - If SECS is cleared RNG can be used as usual. If SECS is still set in RNG_SR it means a new seed error occurred (unlikely). In this case, executes following step 1)
- When ARDIS is set (auto-reset disabled) the following sequence must be used to recover from a seed error.

1. Read both RNG_HTSRx registers. Using the previous HTSR values saved in RAM, compute the accumulated number of errors per oscillator (can be RPERR or ADERR errors). In a *nsmr* variable, mask the oscillators with accumulated number of errors greater than 3. This variable is used in step 3). Save the updated HTSR values in RAM.
   - During the first iteration, initialize *nsmr* variable with the RNG_NSCR value.
2. If fewer than 6 oscillators are active in the *nsmr* variable, reinitialize it with the RNG_NSCR value.
   - When RNG configuration is Configuration B, and the third time you reach this loop, go to Step 3 changing the RNG configuration to Configuration C. Both configurations are defined in *Section 31.6.2*.
3. Write CONDRST at 1 in RNG_CR, then update RNG_NSMR with *nsmr* value. Refer to *Section 31.7.8* for details.
4. Write CONDRST at 0 to finalize the reset of the RNG conditioning logic.
5. Wait for the CONDRST bit to be cleared by hardware, or poll for BUSY bit= 0. Then clear the SEIS interrupt status bit in the RNG_SR register.
6. If SECS is still set in RNG_SR a new seed error occurred (unlikely). In this case go back to step 1). If SECS is cleared, restart the generation of random numbers by setting RNGEN in RNG_CR.

If application has set the CONFIGLOCK bit (not recommended), do the following:

- When ARDIS is cleared (auto-reset enabled) clear the SEIS interrupt status bit in the RNG_SR register before drawing random numbers again.
- When ARDIS is set (auto-reset disabled), the following sequence must be used to fully recover from a seed error:

1. Write CONDRST at 1 and at 0 in the RNG_CR register to reset the conditioning logic.
2. Wait for the CONDRST bit to be cleared by hardware, or poll for BUSY = 0. Then clear the SEIS interrupt status bit in the RNG_SR register.
3. If SECS is still set in RNG_SR it means a new seed error occurred (unlikely). In this case go back to step 1).

Note: After a seed error RNG restarts generating random numbers when SECS is cleared.

RNG tamper errors

When an unexpected error is found by the RNG, an internal tamper event is triggered in the TAMP peripheral, and the RNG stops delivering random data.

When this event occurs, the secure application needs to reset the RNG peripheral, using the central reset management or the global SoC reset. A proper initialization of the RNG is required again.

Note: Seed errors do not trigger tamper errors.

31.3.8 RNG low-power use

If power consumption is a concern, the RNG can be disabled as soon as the DRDY bit is set to 1 by setting the RNGEN bit to 0 in the RNG_CR register. As the post-processing logic and the output buffer remain operational while the RNGEN = 0, the following features are available to the software:

- If there are valid words in the output buffer, four random numbers can still be read from the RNG_DR register.
- If there are valid bits in the conditioning output internal register, four additional random numbers can be still be read from the RNG_DR register. If it is not the case, RNG must be re-enabled by the application until the expected new noise source bits threshold is reached (128-bit in NIST mode), and a complete conditioning round is done. Four new random words are then available only if the expected number of conditioning round is reached (two if NISTC = 0). The overall time can be found in *Section 31.5*.

When disabling the RNG, the user deactivates all the analog seed generators, whose power consumption is given in the datasheet electrical characteristics section. The user also gates all the logic clocked by the RNG clock. Note that this strategy is adding latency before a random sample is available on the RNG_DR register, because of the RNG initialization time.

If the RNG block is disabled during initialization (that is well before the DRDY bit rises for the first time), the initialization sequence resumes from where it was stopped when the RNGEN bit is set to 1, unless the application resets the conditioning logic using the CONDRST bit in the RNG_CR register.

When the application wants to gate the RNG kernel clock, the software must issue the following sequence: first, disable the RNG by clearing the RNGEN bit in the RNG_CR register, then wait for the BUSY bit to be cleared in the RNG_SR, and finally, disable the RNG kernel clock using the RCC.

Before entering a power mode where RNG is deactivated (like Stop mode), the software must first disable the RNG by clearing the RNGEN bit in the RNG_CR register, then wait for the BUSY bit to be cleared in the RNG_SR.

Note: The power modes where RNG is deactivated (retained or not available) can be found in the PWR section.

31.4 RNG interrupts

In the RNG an interrupt can be produced on the following events:

- Data ready flag
- Seed error, see *Section 31.3.7*
- Clock error, see *Section 31.3.7*

Dedicated interrupt enable control bits are available as shown in *Table 314*.

Table 314. RNG interrupt requests

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method
RNG	Data ready flag	DRDY	IE	None (automatic)
	Seed error flag	SEIS	IE	Write CONDRST to 1 then to 0 unless ARDIS is cleared (see *Section 31.3.7*). Write 0 to SEIS.
	Clock error flag	CEIS	IE	Write 0 to CEIS

The user can enable or disable the above interrupt sources globally by using the general interrupt control bit IE in the RNG_CR register. The status of the individual interrupt sources can be read from the RNG_SR register.

Note: Interrupts are generated only when RNG is enabled.

31.5 RNG processing time

In the recommended configuration described in *Table 315*, the time between two sets of four 32-bit data is either:

- 206 x N AHB cycles if $f_{AHB} < f_{threshold}$ (conditioning stage is limiting), or
- 128 x N RNG cycles $f_{AHB} \geq f_{threshold}$ (noise source stage is limiting).

If f_{RNG}= 48 MHz, $f_{threshold}$ = 1.6 x f_{RNG} = 77 MHz. The value of N is defined in *Section 31.6*.

Note: When CLKDIV is different from 0, f_{RNG} must take into account the internal divider ratio.

31.6 RNG entropy source validation

31.6.1 Introduction

To assess the amount of entropy available from the RNG, the peripheral has been tested using the German BSI AIS-31 statistical tests (T0 to T8), and NIST SP800-90B test suite.

31.6.2 Validation conditions

The RNG true random number generator has been tested in the following conditions:

- RNG clock rng_clk = 48 MHz, with CED bit cleared in RNG_CR.
- Configurations are described in *Table 315* and *Table 316*. Only configuration A can be certified NIST SP800-90B. Refer to *Table 317* to select the best configuration for the application.
- Configuration B or C can be used when configuration A is not present in AN4230, or is not flagged as certified.

Table 315. RNG configurations

Configuration	RNG_CR bits					Loop number (N)	RNG_HTCR0 register	RNG_NSCR register
	NISTC bit	RNG_CONFIG1 [7:0]	CLKDIV [3:0]	RNG_CONFIG2 [2:0]	RNG_CONFIG3 [3:0](1)			
A	Refer to *NIST compliant RNG configuration* table in AN4230 available from *www.st.com*. This application note also indicates if this configuration is part of an existing NIST SP800-90B Entropy Certificate listed on *https://csrc.nist.gov/projects/cryptographic-module-validation-program.*							
B	1	0x83	0x0	0x0	0xF	3	0x0000 AAC7(2)	Default
C	1	0x84	0x5(3)	0x0	0xF	4		Default

1. RNG_CONFIG1[3:0] = i defines the loop number N. If i = 0, N =1. If NISTC = 0, N = 2 regardless of i.
2. This value can be fixed in the RNG driver (it does not depend upon the STM32 product).
3. The noise source sampling must be 48 MHz or less. If the RNG clock is different from 48 MHz, this value of CLKDIV must be adapted. See the CLKDIV bitfield description in *Section 31.7.1* for details.

Table 316. Additional health test configurations

Configuration	RNG_HTCR1 register (oscillator set 1)	RNG_HTCR2 register (oscillator set 2)	RNG_HTCR3 register (oscillator set 3)
A	Refer to NIST compliant RNG configuration table in AN4230 available from *www.st.com*.		
B and C	Default	Default	Default

Table 317. Configuration selection

Section criteria	Configuration A	Configuration B	Configuration C
Suitable to generate NIST compliant cryptographic keys	Yes	No	
Entropy(1)	Certified	Not certified	
Speed(2)	Baseline	Faster	Baseline

1. For configurations B and C entropy is verified using the AIS-31 test suite (T0 to T8).
2. When the speed is not enough for the application, an NIST compliant DRBG can be used to increase throughput.

For details on data collection and the running of statistical test suites refer to AN4230 "*Introduction to random number generation validation using the NIST statistical test suite for STM32 MCUs and MPUs*", available on *www.st.com*.

31.7 RNG registers

The RNG is associated with a control register, a data register, and a status register.

31.7.1 RNG control register (RNG_CR)

Address offset: 0x000

Reset value: 0x0080 0D00

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CONFIGLOCK	CONDRST	Res.	Res.	RNG_CONFIG1[7:0]								CLKDIV[3:0]			
rs	rw			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RNG_CONFIG2[2:0]			NISTC	RNG_CONFIG3[3:0]				ARDIS	Res.	CED	Res.	IE	RNGEN	Res.	Res.
rw	rw	rw	rw	rw	rw	rw	rw	rw		rw		rw	rw		

Bit 31 **CONFIGLOCK**: RNG configuration lock

Set this bit to lock the RNG configuration. Since CONFIGLOCK prevents the implementation of robust seed error management described in *Section 31.3.7*, it is recommended not to use it.

0: Writes to the RNG_NSMR, RNG_NSCR, RNG_HTCR and the RNG_CR configuration bits [29:4] are allowed.

1: Writes to the RNG_NSMR, RNG_NSCR, RNG_HTCR and the RNG_CR configuration bits [29:4] are ignored until the next RNG reset.

Once set, this bit can only be cleared when RNG is reset (set once bit).

Bit 30 **CONDRST**: Conditioning soft reset

Write 1 and then write 0 to reset the conditioning logic, clear all the FIFOs and start a new RNG initialization process, with RNG_SR cleared. Registers RNG_NSMR, RNG_NSCR, RNG_CR and RNG_HTCR are not changed by CONDRST.

This bit must be set to 1 in the same access that sets any configuration bits [29:4]. In other words, when CONDRST bit is set to 1 correct configuration in bits [29:4] must also be written.

Before setting this bit to 1 RNGEN must be set to 0, and BUSY flag must be cleared in RNG_SR.

When CONDRST is set to 0, wait for BUSY flag to be cleared in RNG_SR. CONDRST bit then reads as 0.

Bits 29:28 Reserved, must be kept at reset value.

Bits 27:20 **RNG_CONFIG1[7:0]:** RNG configuration 1

Reserved to the RNG configuration (bitfield 1). Must be initialized using the recommended value documented in *Section 31.6*.

Writing to this bitfield is only effective when CONFIGLOCK = 0. The new value is only taken into account if CONDRST bit is set in the same access.

Bits 19:16 **CLKDIV[3:0]**: Clock divider factor

This value used to configure an internal programmable divider (from 1 to 16) acting on the incoming RNG clock. These bits can be written only when the core is disabled (RNGEN = 0).

0x0: internal RNG clock after divider is similar to incoming RNG clock.

0x1: two RNG clock cycles per internal RNG clock.

0x2: 2^2 (= 4) RNG clock cycles per internal RNG clock.

...

0xF: 2^{15} RNG clock cycles per internal clock (for example. an incoming 48 MHz RNG clock becomes a 1.5 kHz internal RNG clock)

Writing to this bitfield is only effective when CONFIGLOCK = 0. The new value is only taken into account if CONDRST bit is set in the same access.

Bits 15:13 **RNG_CONFIG2[2:0]:** RNG configuration 2

Reserved to the RNG configuration (bitfield 2). Refer to the RNG_CONFIG1 bitfield for details.

Bit 12 **NISTC**: NIST custom

0: Hardware default values for NIST compliant RNG. In this configuration for 128-bit output, two conditioning loops are performed and 256 bits of noise source are used.

1: Custom values for NIST compliant RNG. See *Section 31.6* for recommended configurations.

Writing to this bit is only effective when CONFIGLOCK = 0. The new value is only taken into account if the CONDRST bit is set in the same access.

Bits 11:8 **RNG_CONFIG3[3:0]:** RNG configuration 3

Reserved to the RNG configuration (bitfield 3). Refer to RNG_CONFIG1 bitfield for details.

If the NISTC bit is cleared in this register RNG_CONFIG3 bitfield values are ignored by RNG.

Bit 7 **ARDIS**: Auto reset disable

Set this bit to deactivate the auto-reset feature.

0: Auto-reset is enabled

1: Auto-reset is disabled

Keeping the auto-reset enabled (automatic clearance of the SECS bit) simplifies the management of noise source errors, as described in *Section 31.3.7*.

Writing to this bit is only effective when CONFIGLOCK = 0. The new value is only taken into account if the CONDRST bit is set in the same access.

Bit 6 Reserved, must be kept at reset value.

Bit 5 **CED:** Clock error detection

0: Clock error detection is enabled.

1: Clock error detection is disabled

The clock error detection cannot be enabled nor disabled on-the-fly when the RNG is enabled, that is to enable or disable CED, the RNG must be disabled.

Writing to this bit is only effective when CONFIGLOCK = 0. The new value is only taken into account if the CONDRST bit is set in the same access.

Bit 4 Reserved, must be kept at reset value.

Bit 3 **IE:** Interrupt enable

0: RNG interrupt is disabled

1: RNG interrupt is enabled. An interrupt is pending as soon as the DRDY, SEIS, or CEIS flag is set in the RNG_SR register.

Bit 2 **RNGEN:** True random number generator enable
This bit enables/disables the true random number generator.
0: True random number generator disabled.
1: True random number generator enabled.
Clearing RNGEN powers off the analog noise sources and gates the logic clocked by the RNG clock.
When clearing this bit verify that BUSY flag is cleared in RNG_SR before updating this register again.

Bits 1:0 Reserved, must be kept at reset value.

31.7.2 RNG status register (RNG_SR)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	SEIS	CEIS	BUSY	Res.	SECS	CECS	DRDY
									rc_w0	rc_w0	r		r	r	r

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **SEIS:** Seed error interrupt status
This bit is set at the same time as SECS. It is cleared by writing 0 (unless CONDRST is used). Writing 1 has no effect.
0: No faulty sequence detected
1: At least one faulty sequence is detected. See SECS bit description for details.
An interrupt is pending if IE = 1 in the RNG_CR register.

Bit 5 **CEIS:** Clock error interrupt status
This bit is set at the same time as CECS. It is cleared by writing 0. Writing 1 has no effect.
0: The RNG clock is correct ($f_{RNGCLK} > f_{HCLK}/32$)
1: The RNG clock before the internal divider is detected too slow ($f_{RNGCLK} < f_{HCLK}/32$)
An interrupt is pending if IE = 1 in the RNG_CR register.

Bit 4 **BUSY:** Busy
This flag indicates whether RNG is idle or busy.
0: Idle
1: Busy
RNG is flagged as busy when a conditioning soft reset (using CONDRST) is in progress. It is also flagged busy when RNG is activated by application setting RNGEN bit, or when a connected peripheral fetches randoms via the dedicated RNG hardware bus.
More information on BUSY usage can also be found in *Section 31.3.8*.

Bit 3 Reserved, must be kept at reset value.

Bit 2 **SECS:** Seed error current status

0: No faulty sequence has currently been detected. If the SEIS bit is set, this means that a faulty sequence was detected and the situation has been recovered.

1: At least one of the following faulty sequence has been detected:

– Start-up or continuous repetition count test on noise source failed.

– Start-up or continuous adaptive proportion test on noise source failed.

– Start-up post-processing/conditioning sanity check failed.

After enabling the RNG, SECS bit clears once startup health tests completes successfully. If SECS does not clear, run the software reset sequence with CONDRST described in *Section 31.3.4*.

Bit 1 **CECS:** Clock error current status

0: The RNG clock is correct ($f_{RNGCLK} > f_{HCLK}/32$). If the CEIS bit is set, this means that a slow clock was detected and the situation has been recovered.

1: The RNG clock is too slow ($f_{RNGCLK} < f_{HCLK}/32$).

CECS bit is valid only if the CED bit in the RNG_CR register is set to 0.

Bit 0 **DRDY:** Data ready

This flag is raised to indicate valid (non-0) random data available in the RNG_DR register. It is cleared by hardware upon reading the RNG_DR register (which empties the RNG buffer). The DRDY flag can also be raised upon disabling RNG (upon clearing the RNGEN bit).

0: No valid random data ready.

1: Valid random data ready.

Raising DRDY generates an interrupt if enabled with the IE bit of the RNG_CR register.

31.7.3 RNG data register (RNG_DR)

Address offset: 0x008

Reset value: 0x0000 0000

This register is a read-only register that delivers a 32-bit random value when read. The content of this register is valid when the DRDY = 1 and the value is not 0x0, even if RNGEN = 0.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

RNDATA[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:0 **RNDATA[31:0]:** Random data

32-bit random data, valid when DRDY = 1. When DRDY = 0, the RNDATA value is 0.

The 0 value means that a seed error occurred between RNG_SR polling and RND_DR output reading (a rare event).

31.7.4 RNG noise source control register (RNG_NSCR)

Address offset: 0x00C

Reset value: 0x0000 01FF

Writing in RNG_NSCR is taken into account only if the CONDRST bit is set, and the CONFIGLOCK bit is cleared in RNG_CR. Writing to this register is ignored if CONFIGLOCK= 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bits 8:6 **EN_OSC3[2:0]:**

When the RNG is enabled (RNGEN bit set), each bit of this bitfield enables one of the three inputs from the oscillator instance number 3. The bitfield has no effect otherwise.

Bits 5:3 **EN_OSC2[2:0]:**

When the RNG is enabled (RNGEN bit set), each bit of this bitfield enables one of the three inputs from the oscillator instance number 2. The bitfield has no effect otherwise.

Bits 2:0 **EN_OSC1[2:0]:**

When the RNG is enabled (RNGEN bit set), each bit of this bitfield enables one of the three inputs from the oscillator instance number 1. The bitfield has no effect otherwise.

31.7.5 RNG health test control register x (RNG_HTCRx)

Address offset: 0x010 + 0x4 * x (x=0 to 3)

Reset value: 0x0000 72AC, 0x0003 FFFF, 0x0003 FFFF, 0x0003 FFFF

Writing in RNG_HTCR is taken into account only if the CONDRST bit is set, and the CONFIGLOCK bit is cleared in the RNG_CR. Writing to this register is ignored if CONFIGLOCK = 1.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

HTCFG[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **HTCFG[31:0]:** health test configuration

This configuration is used by RNG to configure the health tests (repetition count test, adaptive proportion test) at position x. See *Section 31.6* for the recommended value. With its default value, health tests have a very small probability of triggering any error at position x.

Note: The RNG behavior, including the read to this register, is not guaranteed if a different value from the recommended value is written.

31.7.6 RNG health test status register 0 (RNG_HTSR0)

Address offset: 0x020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

						r	r	r	r	r	r	r	r	r	r

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:1 **RPERR{i}:** Repetitive error for oscillator *i* (i=1 to 9)

This bit is set when the health test logic associated to the oscillator *i* finds a repetitive test error. The bit is cleared when application clears SEIS bit in RNG_SR. If ARDIS is cleared auto-reset prevents RNG to capture more than one test error. Repetition count test is defined in *Health checks* section.

0: No repetitive test error found in oscillator *i*.
1: Repetitive test error found in oscillator *i*.

Bit 0 **RPERRX:** Repetitive error after the XOR

This bit is set when the health test logic finds a repetitive test error after the XOR clock tree (see *Figure 416*). The bit is cleared when application clears SEIS bit in RNG_SR. If ARDIS is cleared auto-reset prevents RNG to capture more than one test error.

0: No repetitive test error found after the XOR clock tree.
1: Repetitive test error found after the XOR clock tree.

31.7.7 RNG health test status register 1 (RNG_HTSR1)

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

						r	r	r	r	r	r	r	r	r	r

Bits 31:10 Reserved, must be kept at reset value.

Bits 9:1 **ADERR{i}:** Adaptative error for oscillator *i* (i=1 to 9)

This bit is set when the health test logic associated to the oscillator *i* finds an adaptative test error. The bit is cleared when application clears SEIS bit in RNG_SR. If ARDIS is cleared auto-reset prevents RNG to capture more than one test error. Adaptive proportion test is defined in *Health checks* section.

0: No adaptative test error found in oscillator *i*.
1: Adaptative test error found in oscillator *i*.

Bit 0 **ADERRX:** Adaptative error after the XOR

This bit is set when the health test logic finds an adaptative test error after the XOR clock tree (see *Figure 416*). The bit is cleared when application clears SEIS bit in RNG_SR If ARDIS is cleared auto-reset prevents RNG to capture more than one test error.

0: No adaptative test error found after the XOR clock tree.
1: Adaptative test error found after the XOR clock tree.

31.7.8 RNG noise source mask register (RNG_NSMR)

Address offset: 0x030

Reset value: 0x0000 01FF

Writing to this register is ignored if CONFIGLOCK = 1. It is recommended to have at least 6 oscillators running when loop number N = 3 (or higher). See *Section 31.6.2* for details.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bits 8:0 **MOSC{i}:** Mask oscillator i (i = 1 to 9)

Clear this bit to masks the oscillator *i*, and deactivate its related health tests. The bit has no effect if the oscillator *i* is deactivated with the bit RNG_NSCR[i].

Application can mask an oscillator when it is not contributing to the generation of entropy.

0: Oscillator *i* is masked, and related health tests are deactivated.
1: Oscillator *i* is not masked. Related health tests are running.

31.7.9 RNG register map

Table 318. RNG register map and reset map

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

32 Hash processor (HASH)

32.1 HASH introduction

The hash processor is a fully compliant implementation of the secure hash algorithm (SHA-1, SHA-2 family) and the HMAC (keyed-hash message authentication code) algorithm. HMAC is suitable for applications requiring message authentication.

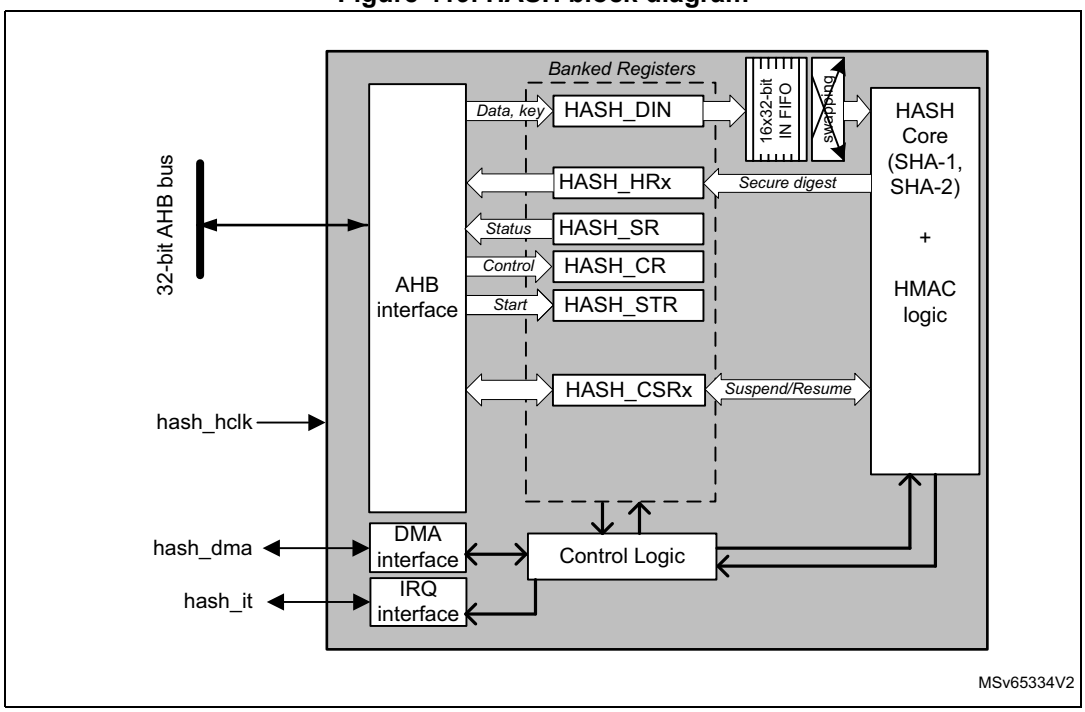
The hash processor computes FIPS (Federal Information Processing Standards) approved digests of length of 160, 224, 256 bits, for messages of any length less than 2^{64} bits (for SHA-1, SHA-224 and SHA-256) or less than 2^{128} bits (for SHA-384, SHA-512).

32.2 HASH main features

- Suitable for data authentication applications, compliant with:
  - Federal Information Processing Standards Publication FIPS PUB 180-4, *Secure Hash Standard* (SHA-1 and SHA-2 family)
  - Federal Information Processing Standards Publication FIPS PUB 186-4, *Digital Signature Standard (DSS)*
  - Internet Engineering Task Force (IETF) Request For Comments RFC 2104, *HMAC: Keyed-Hashing for Message Authentication* and Federal Information Processing Standards Publication FIPS PUB 198-1, *The Keyed-Hash Message Authentication Code (HMAC)*
- Fast computation of SHA-1, SHA2-224, SHA2-256, SHA2-384, and SHA2-512
  - 82 (respectively 66) clock cycles for processing one 512-bit block of data using SHA-1 (respectively SHA-256) algorithm
  - 98 clock cycles for processing one 1024-bit block of data using either SHA2-384 or SHA2-512 algorithm
  - Support for SHA-2 truncated outputs (SHA2-512/224, SHA2-512/256)
- Support for HMAC mode with all supported algorithm
- Corresponding 32-bit words of the digest from consecutive message blocks are added to each other to form the digest of the whole message
  - Automatic 32-bit words swapping to comply with the internal little-endian representation of the input bit-string
  - Supported word swapping format: bits, bytes, half-words, and 32-bit words
- Single 32-bit, write-only, input register associated to an internal input FIFO that can receive a single data block of size depending on the selected algorithm
- Automatic padding to complete the input bit string to fit digest minimum block size
- AMBA AHB target peripheral, accessible through 32-bit word single accesses only (otherwise an AHB bus error is generated, and write accesses are ignored)
- 8 × 32-bit words (H0 to H15) for output message digest
- Automatic data flow control supporting direct memory access (DMA) using one channel.
- Support for both single and fixed DMA burst transfers of four words.
- Interruptible message digest computation, on a per-block basis
  - Reloadable digest registers

– Hashing computation suspend/resume mechanism, including DMA

32.3 HASH implementation



The devices have a single instance of HASH peripheral.

32.4 HASH functional description

32.4.1 HASH block diagram

Figure 419 shows the block diagram of the hash processor.

Figure 419. HASH block diagram

32.4.2 HASH internal signals

Table 319 describes a list of useful to know internal signals available at HASH level, not at product level (on pads).

Table 319. HASH internal input/output signals

Signal name	Signal type	Description
hash_hclk	digital input	AHB bus clock
hash_it	digital output	Hash processor global interrupt request
hash_dma	digital input/output	DMA burst request/ acknowledge

32.4.3 About secure hash algorithms

The hash processor is a fully compliant implementation of the secure hash algorithm defined by FIPS PUB 180-4 standard.

With each algorithm, the HASH computes a condensed representation of a message or data file. More specifically, when a message is presented on the input, the HASH processing core produces a fixed-length output string called a message digest (see *Table 320*).

Table 320. Information on supported hash algorithms

Algorithm	Message digest size (in bits)	Block size (in bytes)(1)	Message length	Bit string message
SHA-1	160	64	$< 2^{64}$ bits	Yes
SHA2-224	224			
SHA2-256	256			
SHA2-384	384	128	$< 2^{128}$ bits	Yes
SHA2-512	512(2)			

1. Block size = (NBWE-1) * 4 bytes. NBWE[4:0] bitfield can be read from the HASH_SR register after ALGO and INIT bits are written in the HASH_CR register.
2. Digest size is 224 bits for SHA2-512/224 and 256 bits for SHA2-512/256 (truncated modes).

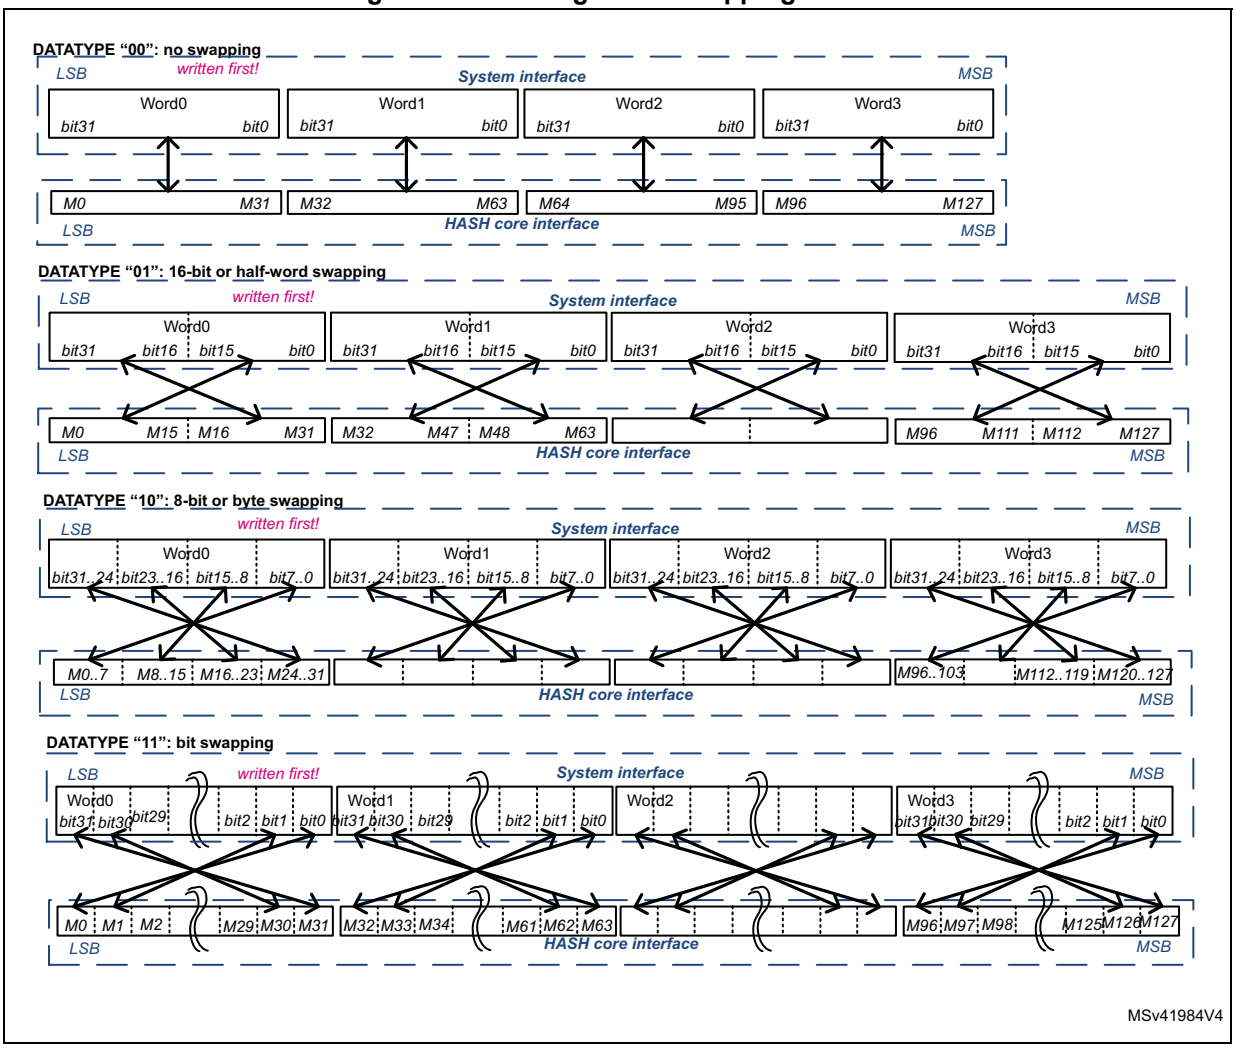
The message digest can then be processed with a digital signature algorithm in order to generate or verify the signature for the message.

Signing the message digest rather than the message often improves the efficiency of the process since the message digest is usually much smaller in size than the message. The verifier of a digital signature has to use the same hash algorithm as the one used by the creator of the digital signature.

The SHA-2 functions supported by the hash processor are qualified as “secure” by NIST because it is computationally infeasible to find a message that corresponds to a given message digest, or to find two different messages that produce the same message digest (SHA-1 does not qualify as secure since February 2017).

32.4.4 Message data feeding

The message (or data file) to be processed by the HASH must be considered as a bit string. Per FIPS PUB 180-4 standard this message bit string grows from left to right, with hexadecimal words expressed in “big-endian” convention, so that within each word, the most significant bit is stored in the left-most bit position. For example message string “abc” with a bit string representation of “**01100001 01100010 01100011**” is represented by a 32-bit word **0x00636261**, and 8-bit words **0x61626300**.



Data are entered into the HASH one 32-bit word at a time, by writing them into the HASH_DIN register. The current contents of the HASH_DIN register are transferred to the 16 words input FIFO each time the register is written with new data. Hence, HASH_DIN and the FIFO form a seventeen 32-bit words length FIFO (named the IN buffer).

In accordance to the kind of data to be processed (for example byte swapping when data are ASCII text stream) there must be a bit, byte, half-word, or no swapping operation to be performed on data from the input FIFO before entering the little-endian hash processing core. *Figure 420* shows how the hash processing core 32-bit data block M0...31 is

constructed from one 32-bit words popped into input FIFO by the driver, according to the DATATYPE bitfield in the HASH control register (HASH_CR)

HASH_DIN data endianness when bit swapping is disabled (DATATYPE = 00) can be described as following: the least significant bit of the message has to be at MSB position in the first word entered into the hash processor, the 32nd bit of the bit string has to be at MSB position in the second word entered into the hash processor and so on.

Figure 420. Message data swapping feature

32.4.5 Message digest computing

The hash processor sequentially processes several blocks when computing the message digest. Block sizes can be found in *Table 320: Information on supported hash algorithms*.

Each time the DMA or the CPU writes a block to the hash processor, the HASH automatically starts computing the message digest. This operation is known as partial digest computation.

As described in *Section 32.4.4: Message data feeding*, the message to be processed is entered into the HASH 32-bit word at a time, writing to the HASH_DIN register to fill the

input FIFO. In order to perform the hash computation on this data the application must follow below sequence.

1. Initialize the hash processor using the HASH_CR register:
   - Write to the HASH_CR register to select the right algorithm using the ALGO bitfield, and set the INIT bit (other bits are kept at zero). Then read the NBWE bitfield from the HASH_SR register to deduce the algorithm block size, which equals **(NBWE-1) * 4**. This step is not required if the block size is already known (see *Table 320* for details).
   - Select the right algorithm using the ALGO[3:0] field. If needed, program the correct swapping operation on the message input words using the DATATYPE[1:0] bitfield.
   - When HMAC mode is required, set the MODE bit as well as the LKEY bit if the HMAC key size is greater than the known block size of the algorithm (otherwise keep LKEY cleared). Refer to *Section 32.4.7: HMAC operation* for details.
   - Update NBLW[4:0] in the HASH_STR register to define the number of valid bits in the last word of the message if it is different from 32 bits. NBLW information is used to correctly perform the automatic message padding before the final message digest computation.
2. Complete the initialization by setting the INIT bit in HASH_CR register. Also set the DMAE bit if data are transferred via DMA.

Caution: When programming step 2, it is important that the correct configuration values (ALGO, DATATYPE, HMAC mode, key length, NBLW) are set up before or at the same time.

3. Start filling data by writing to the HASH_DIN register, unless data are automatically transferred via DMA. Note that the processing of a block can start only once the last value of the block has entered the input FIFO. The way the partial or final digest computation is managed depends on the way data are fed into the processor:
   - Data are filled by software:

     Partial digest computations are triggered each time the application writes the first word of the next block, the block size being defined by NBWE bits in HASH_SR. Once the processor is ready again (DINIS = 1 in HASH_SR), the software can write new data to HASH_DIN. This mechanism avoids the introduction of wait states by the HASH.

     The final digest computation is triggered when the last block is entered and the software sets the DCAL bit. If the message length is not an exact multiple of the block size, the NBLW field in HASH_STR register must be written prior to writing DCAL bit (see *Section 32.4.6* for details).
   - Data are filled as a single DMA transfer (MDMAT = 0):

     Partial digest computations are triggered automatically each time the FIFO is full.

     The final digest computation is triggered automatically when the last block has been transferred to the HASH_DIN register by DMA (DCAL bit is set by hardware). If the message length is not an exact multiple of the block size, the NBLW field in HASH_STR register must be written prior to enabling the DMA (see *Section 32.4.6* for details).
   - Data are filled using multiple DMA transfers (MDMAT = 1):

     Partial digest computations are triggered as for single DMA transfers (refer to the above description). However, the final digest computation is not triggered automatically when the last block has been transferred by DMA to the HASH_DIN register (DCAL bit is not set by hardware). It enables the hash processor to

receive a new DMA transfer as part of this digest computation. To launch the final digest computation, the software must clear MDMAT bit before the last DMA transfer in order to trigger the final digest computation as it is done for single DMA transfers.

4. Once the digest calculation is completed (DCIS = 1), the resulting digest can be read from the output registers, as described in *Table 321*. When set, the DMAEN bit is automatically cleared by hardware.

Table 321. Hash processor outputs

Algorithm	Valid output registers(1)	Most significant bit	Digest size (in bits)
SHA-1	HASH_H0 to HASH_H4	HASH_H0[31]	160
SHA2-224	HASH_H0 to HASH_H6	HASH_H0[31]	224
SHA2-256	HASH_H0 to HASH_H7		256
SHA2-384	HASH_H0 to HASH_H11	HASH_H0[31]	384
SHA2-512	HASH_H0 to HASH_H15		512(2)

1. Aliased HASH_HRAx registers are not used with SHA-3 or SHAKE algorithm (registers read as zero).
2. Digest size is 224 bits for SHA2-512/224 and 256 bits for SHA2-512/256 (truncated modes)

For more information about HMAC detailed instructions, refer to *Section 32.4.7: HMAC operation*.

Aborting HASH operation

HASH can be disabled at any time by writing 0x4 to HASH_CR, after stopping any running DMA transfer to HASH (if applicable).

32.4.6 Message padding

Overview

When computing a condensed representation of a message, the process of feeding data into the hash processor (with automatic partial digest computation every block size transfer) loops until the last bits of the original message are written to the HASH_DIN register.

As the length (number of bits) of a message can be any integer value, the last word written to the hash processor may have a valid number of bits between 1 and 32. This number of valid bits in the last word, NBLW, has to be written to the HASH_STR register, so that message padding is correctly performed before the final message digest computation.

Padding processing

Detailed hashing sequences with padding are described in *Section 32.4.5: Message digest computing*. As mentioned in these sequences, the padding is done automatically using the information provided in NBLW[4:0].

Hashing example

Below is an example of SHA-1 digest computation with HASH. Message processing and padding are defined in Federal Information Processing Standards PUB 180-4.

Let us assume that the original message is the ASCII binary-coded form of “abc”, of length L = 24 (‘**U**’ means don’t care):

```
byte 0    byte 1   byte 2   byte 3
01100001 01100010 01100011 UUUUUUUU
<-- 1st word written to HASH_DIN -->
```

NBLW has to be loaded with the value 24: a “**1**” is appended at bit location 24 in the bit string (starting counting from left to right in the above bit string), which corresponds to bit 31 in the HASH_DIN register (little-endian convention):

```
01100001 01100010 01100011 1UUUUUUU
```

Since L = 24, the number of bits in the above bit string is 25, and 423 “0” bits are automatically appended, making now 448 bits.

This gives in hexadecimal (byte words in big-endian format):

```
61626380 00000000 00000000 00000000
00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000
00000000 00000000
```

The message length value, **L**, in two-word format (that is 00000000 00000018) is appended. Hence, the final padded message in hexadecimal (byte words in big-endian format):

```
61626380 00000000 00000000 00000000
00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000000
00000000 00000000 00000000 00000018
```

If the hash processor is programmed to swap byte within HASH_DIN input register (DATATYPE = 10 in HASH_CR), the above message has to be entered using following sequence:

1. **0xUU636261** is written to the HASH_DIN register (where ‘**U**’ means don’t care)
2. **0x18** is written to the HASH_STR register (the number of valid bits in the last word written to the HASH_DIN register is 24, as the original message length is 24 bits)
3. **0x100** is written to the HASH_STR register to run the final digest computation.
4. The hash computing is complete with the message digest available in the HASH_HRx registers (x = 0 to 4) for the SHA-1 algorithm. For this FIPS example, the expected value is as follows:

```
HASH_HR0 = 0xA9993E36
HASH_HR1 = 0x4706816A
HASH_HR2 = 0xBA3E2571
HASH_HR3 = 0x7850C26C
HASH_HR4 = 0x9CD0D89D
```

32.4.7 HMAC operation

Overview

As specified by Internet Engineering Task Force RFC2104 and NIST FIPS PUB 198-1, the HMAC algorithm is used for message authentication by irreversibly binding the message being processed to a key chosen by the user. The algorithm consists of two nested hash operations:

```
HMAC(message)= Hash((Key | pad) XOR opad |
               Hash((Key | pad) XOR ipad | message))
```

Where:

- **opad** = $[0x5C]_n$ (outer pad) and **ipad** = $[0x36]_n$ (inner pad)
- $[X]_n$ represents a repetition of X *n* times, where *n* equal to the byte size of the underlying hash function data block (n = 64 when block size is 512 bits).
- **pad** is a sequence of zeroes needed to extend the key to the length *n* defined above. If the key length is greater than *n*, the application must first hash the key using Hash() function and then use the resultant byte string as the actual key to HMAC.
- | represents the concatenation operator.

Note: HMAC mode of the hash processor can be used with all supported algorithms.

HMAC processing

Four different steps are required to compute the HMAC:

1. The software sets the INIT bit, with the MODE bit set and the ALGO bits selecting the desired algorithm. The LKEY bit must also be set if the key being used is longer than the block size. In this case, as required by HMAC specifications, the hash processor uses the hash of the key instead of the real key.
2. The software provides the key to be used for the inner hash function, using the same mechanism as the message string loading that is by writing the key data into HASH_DIN register and then completing the transfer by setting DCAL bit and the correct NBLW to HASH_STR register.
3. Once the processor is ready again (DINIS = 1 in HASH_SR), the software can write the message string to HASH_DIN. When the last word of the last block is entered and the software sets DCAL bit in HASH_STR register, the NBLW bitfield must be programmed at the same time to a value different from zero if the message length is not an exact multiple of the block size. Note that the DMA can also be used to feed the message string, as described in *Section 32.4.5: Message digest computing*.
4. Once the processor is ready again (DINIS = 1 in HASH_SR), the software provides the key to be used for the outer hash function, writing the key data into HASH_DIN register, and then completing the transfer by setting DCAL bit and programming the correct NBLW to HASH_STR register. The HMAC result can be found in the valid output registers (HASH_HRx) as soon as DCIS bit is set.

Note: The computation latency of the HMAC primitive depends on the lengths of the keys and message, as described in Section 32.4.11: HASH processing time.

Endianness management details can be found in Section 32.4.4: Message data feeding.

HMAC example

Below is an example of HMAC SHA-1 algorithm (ALGO = 00 and MODE = 1 in HASH_CR) as specified by NIST. SHA-1 block size is 64 bytes.

Let us assume that the original message is the ASCII binary-coded form of "**`Sample message for keylen = blocklen`**", of length L = 34 bytes. If the HASH is programmed in no swapping mode (DATATYPE = 00 in HASH_CR), the following data must be loaded sequentially into HASH_DIN register:

1. **Inner hash key** input (length = 64, that is, no padding), specified by NIST. As key length = 64, LKEY bit is cleared in HASH_CR register

   ```
   00010203 04050607 08090A0B 0C0D0E0F 10111213 14151617
   18191A1B 1C1D1E1F 20212223 24252627 28292A2B 2C2D2E2F
   30313233 34353637 38393A3B 3C3D3E3F
   ```

2. **Message** input (length = 34, that is, padding required). HASH_STR must be set to **`0x20`** to start message padding and inner hash computation (see **'U**' as don't care)

   ```
   53616D70 6C65206D 65737361 67652066 6F72206B 65796C65
   6E3D626C 6F636B6C 656EUUUU
   ```

3. **Outer hash key** input (length = 64, that is, no padding). A key identical to the inner hash key is entered here.
4. **Final outer hash computing** is then performed by the HASH. The HMAC-SHA1 digest result is available in the HASH_HRx registers, as shown below:

   ```
   HASH_HR0 = 0x5FD596EE
   HASH_HR1 = 0x78D5553C
   HASH_HR2 = 0x8FF4E72D
   HASH_HR3 = 0x266DFD19
   HASH_HR4 = 0x2366DA29
   ```

32.4.8 HASH suspend/resume operations

Overview

It is possible to interrupt a hash/HMAC operation to perform another processing with a higher priority. The interrupted process completes later when the higher-priority task has been processed, as shown in *Figure 421*.

Figure 421. HASH suspend/resume mechanism

To do so, the context of the interrupted task must be saved from the HASH registers to memory, and then be restored from memory to the HASH registers.

The procedures where the data flow is controlled by software or by DMA are described hereafter.

Data loaded by software

When the DMA is not used to load the message into the hash processor, the context can be saved only when no block processing is ongoing.

To suspend the processing of a message, proceed as follows after writing the number of words defined in NBWE:

1. In Polling mode, wait for BUSY = 0 then poll if the DINIS status bit is set.
   In Interrupt mode, implement the next step in DINIS interrupt handler (recommended).
2. Store the contents of the following registers into memory:
   - HASH_IMR
   - HASH_STR
   - HASH_CR
   - HASH_CSR0 to HASH_CSR37, when SHA-1 or SHA2-256 is selected, plus HASH_CSR38 to HASH_CSR53 if an HMAC operation was ongoing
   - HASH_CSR0 to HASH_CSR90, when SHA2-384 or SHA2-512 (truncated or not) is selected, plus HASH_CSR91 to HASH_CSR102 if an HMAC operation was ongoing.

To resume the processing of a message, proceed as follows:

1. Write the following registers with the values saved in memory: HASH_IMR, HASH_STR, HASH_CR.
2. Initialize the hash processor by setting the INIT bit in the HASH_CR register
3. Write the HASH_CSRx registers with the values saved in memory.
4. Restart the processing from the point where it has been interrupted.

Data loaded by DMA

When the DMA is used to load the message into the hash processor, it is recommended to suspend and then restore a secure digest computing as described below.

In this sequence the DMA channel allocated to the hash peripheral remains allocated to the processing of message 1 (see *Figure 421*).

To suspend the processing of a message using DMA, proceed as follows:

1. Clear the DMAE bit to disable the DMA interface. The hash peripheral automatically fetches enough data via the DMA to complete the current burst transfer.
2. Wait until the last DMA transfer is complete (DMAS = 0 in HASH_SR).
3. Disable the DMA channel.
4. In Polling or Interrupt mode (recommended), wait until the hash processor is ready (no block is being processed), that is wait for DINIS = 1 in HASH_SR. If DCIS is also set in HASH_SR, the hash result is available and the context swapping is useless. Else go to step 5.
5. Save HASH_IMR, HASH_STR and HASH_CR registers. Also save a number of HASH_CSRx registers depending on the SHA algorithm that is used:
   - When SHA-1 or SHA2-256 is selected, save HASH_CSR0 to HASH_CSR37, plus HASH_CSR38 to HASH_CSR53 if an HMAC operation was ongoing.
   - When SHA2-384 or SHA2-512 is selected, save HASH_CSR0 to HASH_CSR90, plus HASH_CSR91 to HASH_CSR102 if an HMAC operation was ongoing.

To resume the processing of a message using DMA, proceed as follows:

1. Reconfigure the DMA controller so that it proceeds with the transfer of the message up to the end if it is not interrupted again.
2. Program the values saved in memory to HASH_IMR, HASH_STR and HASH_CR registers.
3. Initialize the hash processor by setting the INIT bit in the HASH_CR register.
4. Program the values saved in memory to the HASH_CSRx registers.
5. Restart the processing from the point where it was interrupted by setting the DMAE bit.

32.4.9 HASH DMA interface

The HASH supports both single and fixed DMA burst transfers of four words.

The hash processor provides an interface to connect to the DMA controller. This DMA can be used to write data to the HASH by setting the DMAE bit in the HASH_CR register. When this bit is set, the HASH initiates a DMA request each time a block has to be written to the HASH_DIN register.

Once four 32-bit words have been received, the HASH automatically triggers a new request to the DMA. For more information, refer to *Section 32.4.5: Message digest computing*.

Before starting the DMA transfer, the software must program the number of valid bits in the last word that is copied into HASH_DIN register. This is done by writing in HASH_STR register the following value:

`NBLW = Len(Message)% 32` where "**`x%32`**" gives the remainder of x divided by 32.

The DMAS bit of the HASH_SR register provides information on the DMA interface activity. This bit is set with DMAE and cleared when DMAE is cleared and no DMA transfer is ongoing.

Note: No interrupt is associated to DMAS bit.

When MDMAT is set, the size of the transfer must be a multiple of four words.

32.4.10 HASH error management

No error flags are generated by the hash processor.

32.4.11 HASH processing time

Table 322 summarizes the time required to process an intermediate block for each mode of operation.

Table 322. Processing time (in clock cycle)

Mode of operation	Block size (in bytes)	FIFO load(1)	Computation phase	Total
SHA-1	64	16	66	**82**
SHA2-224		16	50	**66**
SHA2-256				
SHA2-384	128	32	66	**98**
SHA2-512(2)				

1. Add the time required to load the block into the processor.
2. SHA2-512 includes SHA2-512/224 and SHA2-512/256 modes.

The time required to process the last block of a message (or of a key in HMAC) can be longer. This time depends on the length of the last block and the size of the key (in HMAC mode).

Compared to the processing of an intermediate block, it can be increased by the factor below:

- **1 to 2.5** for a hash message
- **~2.5** for an HMAC input-key
- **1 to 2.5** for an HMAC message
- **~2.5** for an HMAC output key in case of a short key
- **3.5 to 5** for an HMAC output key in case of a long key

32.5 HASH interrupts

Two individual maskable interrupt sources are generated by the hash processor to signal the following events:

- Digest calculation completion (DCIS)
- Data input buffer ready (DINIS)

Both interrupt sources are connected to the same global interrupt request signal (hash_it), which is in turn connected to the device interrupt controller. Each interrupt source can individually be enabled or disabled by changing the mask bits in the HASH_IMR register. Setting the appropriate mask bit enables the interrupt.

The status of each maskable interrupt source can be read from the HASH_SR register. *Table 323* gives a summary of the available features.

Table 323. HASH interrupt requests

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method
HASH	Digest computation completed	DCIS	DCIE	Clear DCIS or set INIT
	Data input buffer ready to get a new block	DINIS	DINIE	Clear DINIS or write to HASH_DIN

32.6 HASH registers

The hash core is associated with several control and status registers and several message digest registers. All these registers are accessible through 32-bit word accesses only, else an AHB error is generated.

32.6.1 HASH control register (HASH_CR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ALGO[3:0]				LKEY
											rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	MDMAT	DINNE	NBW[3:0]				Res.	MODE	DATATYPE[1:0]		DMAE	INIT	Res.	Res.
		rw	r	r	r	r	r		rw	rw	rw	rw	w		

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:17 **ALGO[3:0]**: Algorithm selection

These bits select the hash algorithm. This selection is only taken into account when the INIT bit is set. Changing this bitfield during a computation has no effect

When the ALGO bitfield is updated and INIT bit is set, NBWE in HASH_SR is automatically updated to 0x11.

0000: SHA-1

0001: reserved

0010: SHA2-224

0011: SHA2-256

1100: SHA2-384

1101: SHA2-512/224

1110: SHA2-512/256

1111: SHA2-512

Bit 16 **LKEY**: Long key selection

The application must set this bit if the HMAC key is greater than the block size corresponding to the hash algorithm (see *Table 320: Information on supported hash algorithms* for details). For example the block size is 64 bytes for SHA2-256.

This selection is only taken into account when the INIT and MODE bits are set (HMAC mode selected). Changing this bit during a computation has no effect.

0: HMAC key is shorter or equal to the block size (short key). The actual key value written in HASH_DIN is used during the HMAC computation.

1: HMAC key is longer than the block size (long key). The hash of the key is used instead of the real key during the HMAC computation.

Bit 15 Reserved, must be kept at reset value.

Bit 14 Reserved, must be kept at reset value.

Bit 13 **MDMAT**: Multiple DMA transfers

This bit is set when hashing large files when multiple DMA transfers are needed.

0: DCAL is automatically set at the end of a DMA transfer.

1: DCAL is not automatically set at the end of a DMA transfer.

Bit 12 **DINNE**: DIN not empty

Refer to DINNE bit of HASH_SR for a description of DINNE bit.

This bit is read-only.

Bits 11:8 **NBW[3:0]:** Number of words already pushed

Refer to NBWP[3:0] bitfield of HASH_SR for a description of NBW[3:0] bitfield.

This bitfield is read-only.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **MODE:** Mode selection

This bit selects the normal or the keyed HMAC mode for the selected algorithm. This selection is only taken into account when the INIT bit is set. Changing this bit during a computation has no effect.

0: Hash mode selected

1: HMAC mode selected. LKEY bit must be set if the key being used is longer than the algorithm block size.

Bits 5:4 **DATATYPE[1:0]:** Data type selection

This bitfield defines the format of the data entered into the HASH_DIN register:
00: 32-bit data. The data written into HASH_DIN are directly used by the HASH processing, without reordering.
01: 16-bit data or half-word. The data written into HASH_DIN are considered as two half-words, and are swapped before being used by the HASH processing.
10: 8-bit data or bytes. The data written into HASH_DIN are considered as four bytes, and are swapped before being used by the HASH processing.
11: bit data or bit string. The data written into HASH_DIN are considered as 32 bits (1st bit of the string at position 0), and are swapped before being used by the HASH processing (1st bit of the string at position 31).

Bit 3 **DMAE:** DMA enable

Setting this bit enables DMA transfers. After this bit is set, it is cleared by hardware while the last data of the message is written into the hash processor.
Clearing this bit while a DMA transfer is ongoing does not abort the current transfer. Instead, the DMA interface of the HASH remains internally enabled until the transfer is complete or INIT is set.
Setting INIT bit does not clear DMAE bit.
0: DMA transfers disabled
1: DMA transfers enabled. A DMA request is sent as soon as the hash core is ready to receive data.

Bit 2 **INIT:** Initialize message digest calculation

This is a write-only bit always returning zero upon reading. Setting this bit resets the hash processor core, so that HASH is ready to compute the message digest of a new message. Clearing this bit has no effect.

Bits 1:0 Reserved, must be kept at reset value.

32.6.2 HASH data input register (HASH_DIN)

Address offset: 0x004

Reset value: 0x0000 0000

HASH_DIN is the data input register. It is 32-bit wide. This register is used to enter the message by blocks defined by the hash algorithm (see *Table 320: Information on supported hash algorithms* for details). For example the block size is 64 bytes for SHA2-256.

When the HASH_DIN register is programmed, the value presented on the AHB bus is ‘pushed’ into the hash core and the register takes the new value presented on the AHB bus. To get a correct message format, the DATATYPE bits must have been previously configured in the HASH_CR register.

When a complete block has been written to the HASH_DIN register, an intermediate digest calculation is launched:

- by writing first data of the next block into the HASH_DIN register, if the DMA is not used
- automatically, if the DMA is used

When the last block has been written to the HASH_DIN register, the final digest calculation (including padding) is launched by setting the DCAL bit in the HASH_STR register (final digest calculation). This operation is automatic if the DMA is used and MDMAT bit is cleared.

Reading the HASH_DIN register returns zeros.

Note: When HASH is busy, a write access to the HASH_DIN register might stall the AHB bus if the digest calculation (intermediate or final) is not complete.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DATAIN[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DATAIN[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **DATAIN[31:0]:** Data input

Writing this register pushes the current register content into the FIFO, and the register takes the new value presented on the AHB bus.

Do not write to this register when BUSY is set.

Reading this register returns zeros.

32.6.3 HASH start register (HASH_STR)

Address offset: 0x008

Reset value: 0x0000 0000

The HASH_STR register has two functions:

- It is used to define the number of valid bits in the last word of the message entered in the hash processor (that is the number of valid least significant bits in the last data written to the HASH_DIN register)
- It is used to start the processing of the last block in the message by setting the DCAL bit.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCAL	Res.	Res.	Res.	NBLW[4:0]				
							w				rw	rw	rw	rw	rw

Bits 31:9 Reserved, must be kept at reset value.

Bit 8 **DCAL:** Digest calculation

This is a write-only bit always returning zero upon reading. Setting this bit starts the message padding using the previously written value of NBLW, and starts the calculation of the final message digest with all the data words written to the input FIFO since the INIT bit was last set.

Do not set DCAL when BUSY is set.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **NBLW[4:0]:** Number of valid bits in the last word

When the last word of the message bit string is written to HASH_DIN register, the hash processor takes only the valid bits, specified as below, after internal data swapping.

The above mechanism is valid only if DCAL = 0. If NBLW bits are written while DCAL is set, the NBLW bitfield remains unchanged. In other words it is not possible to configure NBLW and set DCAL at the same time.

Reading NBLW bits returns the last value written to NBLW.

0x00: All the 32 bits of the last data written are valid message bits, that is M[31:0]

0x01: Only one bit of the last data written (after swapping) is valid, that is M[0]

0x02: Only two bits of the last data written (after swapping) are valid, that is M[1:0]

0x03: Only three bits of the last data written (after swapping) are valid that is M[2:0]

...

0x1F: Only 31 bits of the last data written (after swapping) are valid that is M[30:0]

Note:

32.6.4 HASH digest registers

These registers contain the message digest result defined as follows:

- HASH_HR0, HASH_HR1, HASH_HR2, HASH_HR3 and HASH_HR4 registers return the SHA-1 digest result.
- HASH_HR0 to HASH_HR6 registers return the SHA2-224, SHA2-512/224 digest result.
- HASH_HR0 to HASH_HR7 registers return the SHA2-256, SHA2-512/256 digest result.
- HASH_HR0 to HASH_HR11 registers return the SHA2-384 digest result.
- HASH_HR0 to HASH_HR15 registers return the SHA2-512 digest result

In all cases, the digest most significant bit is stored in HASH_HR0[31], and unused HASH_HRx registers reads as zero.

If a read access to one of these registers is performed while the hash core is calculating an intermediate digest or a final message digest (DCIS bit equals 0), then the read operation returns zeros.

Note: When starting a digest computation for a new message (by setting the INIT bit), HASH_HRx registers are forced to their reset values.

HASH_HR0 to HASH_HR4 registers can be accessed through two different addresses (register aliasing).

HASH aliased digest register x (HASH_HRAx)

Address offset: 0x00C + 0x4 * x, (x = 0 to 4)

Reset value: 0x0000 0000

The content of the HASH_HRAx registers is identical to the one of the HASH_HRx registers located at address offset 0x310.

Refer to *Section 32.6.4: HASH digest registers* introduction.

32.6.5 HASH interrupt enable register (HASH_IMR)

Address offset: 0x020

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DCIE	DINIE
														rw	rw

Bits 31:2 Reserved, must be kept at reset value.

Bit 1 **DCIE:** Digest calculation completion interrupt enable
0: Digest calculation completion interrupt disabled
1: Digest calculation completion interrupt enabled.

Bit 0 **DINIE:** Data input interrupt enable
0: Data input interrupt disabled
1: Data input interrupt enabled

32.6.6 HASH status register (HASH_SR)

Address offset: 0x024

Reset value: 0x0011 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	NBWE[4:0]				
											r	r	r	r	r
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DINNE	Res.	NBWP[4:0]					Res.	Res.	Res.	Res.	Res.	BUSY	DMAS	DCIS	DINIS
r		r	r	r	r	r						r	r	rc_w0	rc_w0

Bits 31:21 Reserved, must be kept at reset value.

Bits 20:16 **NBWE[4:0]:** Number of words expected
This bitfield reflects the number of words in the message that must be pushed into the FIFO to trigger a partial computation. NBWE is decremented by 1 when a write access is performed to the HASH_DIN register.
NBWE is set to the expected block size +1 in words (0x11) when INIT bit is set in HASH_CR. It is set to the expected block size (0x10) when the partial digest calculation ends.

Bit 15 **DINNE:** DIN not empty
This bit is set when the HASH_DIN register holds valid data (that is after being written at least once). It is cleared when either the INIT bit (initialization) or the DCAL bit (completion of the previous message processing) is set.
0: No data are present in the data input buffer
1: The input buffer contains at least one word of data

Bit 14 Reserved, must be kept at reset value.

Bits 13:9 **NBWP[4:0]:** Number of words already pushed

This bitfield is the exact number of words in the message that have already been pushed into the FIFO. NBWP is incremented by 1 when a write access is performed to the HASH_DIN register.

When a digest calculation starts, NBWP is updated to NBWP- block size (in words), and NBWP goes to zero when the INIT bit is set.

Bits 8:4 Reserved, must be kept at reset value.

Bit 3 **BUSY:** Busy bit

0: No block is currently being processed
1: The hash core is processing a block of data

Bit 2 **DMAS:** DMA Status

This bit provides information on the DMA interface activity. It is set with DMAE and cleared when DMAE = 0 and no DMA transfer is ongoing. No interrupt is associated with this bit.

0: DMA interface is disabled (DMAE = 0) and no transfer is ongoing
1: DMA interface is enabled (DMAE = 1) or a transfer is ongoing

Bit 1 **DCIS:** Digest calculation completion interrupt status

This bit is set by hardware when a digest becomes ready (the whole message has been processed). It is cleared by writing it to 0 or by setting the INIT bit in the HASH_CR register.

0: No digest available in the HASH_HRx registers (zeros are returned)

1: Digest calculation complete, a digest is available in the HASH_HRx registers. An interrupt is generated if the DCIE bit is set in the HASH_IMR register.

Bit 0 **DINIS:** Data input interrupt status

This bit is set by hardware when the FIFO is ready to get a new block (16 locations are free). It is cleared by writing it to 0 or by writing the HASH_DIN register.

When DINIS = 0, HASH_CSRx registers reads as zero.

0: Less than 16 locations are free in the input buffer
1: A new block can be entered into the input buffer. An interrupt is generated if the DINIE bit is set in the HASH_IMR register.

32.6.7 HASH context swap registers

These registers contain the complete internal register states of the hash processor. They are useful when a suspend/resume operation has to be performed because a high-priority task needs to use the hash processor while it is already used by another task.

When such an event occurs, the HASH_CSRx registers have to be read and the read values have to be saved in the system memory space. Then the hash processor can be used by the preemptive task. When the hash computation is complete, the saved context can be read from memory and written back into the HASH_CSRx registers.

HASH_CSRx registers can be read only when DINIS equals to 1, otherwise zeros are returned.

HASH context swap register x (HASH_CSRx)

Address offset: 0x0F8 + 0x4 * x, (x = 0 to 102)

Reset value: 0x0022 0002 (HASH_CSR0)

Reset value: 0x0000 0000 (others)

33 High-resolution timer (HRTIM)

33.1 Introduction

The high-resolution timer can generate up to 12 digital signals with highly accurate timings. It is primarily intended to drive power conversion systems such as switch mode power supplies or lighting systems, but can be of general purpose usage, whenever a very fine timing resolution is expected.

Its modular architecture is used to generate either independent or coupled waveforms. The wave-shape is defined by self-contained timings (using counters and compare units) and a broad range of external events, such as analog or digital feedback and synchronization signals. This is used to produce a large variety of control signals (PWM, phase-shifted, constant Ton,...) and address most of the conversion topologies.

For control and monitoring purposes, the timer also has timing measure capabilities and links to built-in ADC and DAC converters. Last, it features a light-load management mode and is able to handle various fault schemes for safe shut-down purposes.

Caution: Unlike in other STM32 microcontrollers dedicated for digital power conversion, this HRTIM is not capable of subnanosecond resolution:

- The resolution is directly related to the input clock of the timer (no clock multiplication factor)
- It does not include the DLL feature and calibration logic

However, it supports all the features of the subnanosecond capable HRTIM and is suitable for a wide range of applications requiring an extremely versatile PWM generation with slightly relaxed resolution needs.

33.2 Main features

- Multiple timing units
  - Down to 1.9 ns resolution
  - Duty cycle, frequency, phase shift, and pulse width (triggered one-pulse mode) can be adjusted with full resolution, on all outputs
  - 6 16-bit timing units (each one with an independent counter and four compare units)
  - 12 outputs that can be controlled by any timing unit, up to 32 set/reset sources per channel
  - Modular architecture to address either multiple independent converters with one or two switches or few large multiswitch topologies
- Up to 16 external events, available for any timing unit
  - Suitable for peak current control, zero voltage, and zero current detection (ZVS and ZCS operation) and counter reset (variable frequency operation)
  - 4 sources per external events (digital inputs, built-in comparators outputs, ADC's analog watchdogs, and general purpose timer's trigger outputs)
  - Programmable polarity and edge sensitivity
  - 8 events with a fast asynchronous mode
  - 8 events with a programmable digital filter
  - Spurious events filtering with blanking and windowing modes
- Direct connections to built-in analog peripherals
  - 10 triggers to ADC converters
  - 9 triggers for DAC converters, among which 6 with slope compensation capabilities
  - Comparator outputs (including filtering and blanking features)
- Versatile protection scheme
  - Suitable for overcurrent, short-circuit, and over-voltage/under-voltage protection
  - 8 fault inputs can be combined and associated with any timing unit
  - 3 sources per fault channel (digital inputs, built-in comparators outputs, and external events)
  - Programmable polarity, edge sensitivity, and programmable digital filter
  - Dedicated delayed protections for resonant converters
- Multiple HRTIM instances can be synchronized with external synchronization inputs/outputs
- Versatile output stage
  - High-resolution deadtime insertion (down to 1.9 ns)
  - Programmable output polarity
  - Chopper mode
- Burst mode controller to handle light-load operation synchronously on multiple converters
- 8 interrupt vectors, each one with up to 14 sources
- 7 DMA requests with up to 14 sources, with a burst mode for multiple registers update

33.3 Functional description

33.3.1 General description

The HRTIM can be partitioned into several subentities:

- The master timer
- The timing units (timer A to timer F)
- The output stage
- The burst mode controller
- An external event and fault signal conditioning logic that is shared by all timers
- The system interface

The master timer is based on a 16-bit up counter. It can set/reset any of the 12 outputs via four compare units and it provides synchronization signals to the six timer units. Its main purpose is to have the timer units controlled by a unique source. An interleaved buck converter is a typical application example where the master timer manages the phase-shifts between the multiple units.

The timer units are working either independently or coupled with the other timers including the master timer. Each timer contains the controls for two outputs. The outputs set/reset events are triggered either by the timing units compare registers or by events coming from the master timer, from the other timers, or from external events.

The output stage has several duties

- Addition of deadtime when the two outputs are configured in complementary PWM mode
- Addition of a carrier frequency on top of the modulating signal
- Management of fault events, by asynchronously asserting the outputs to a predefined safe level

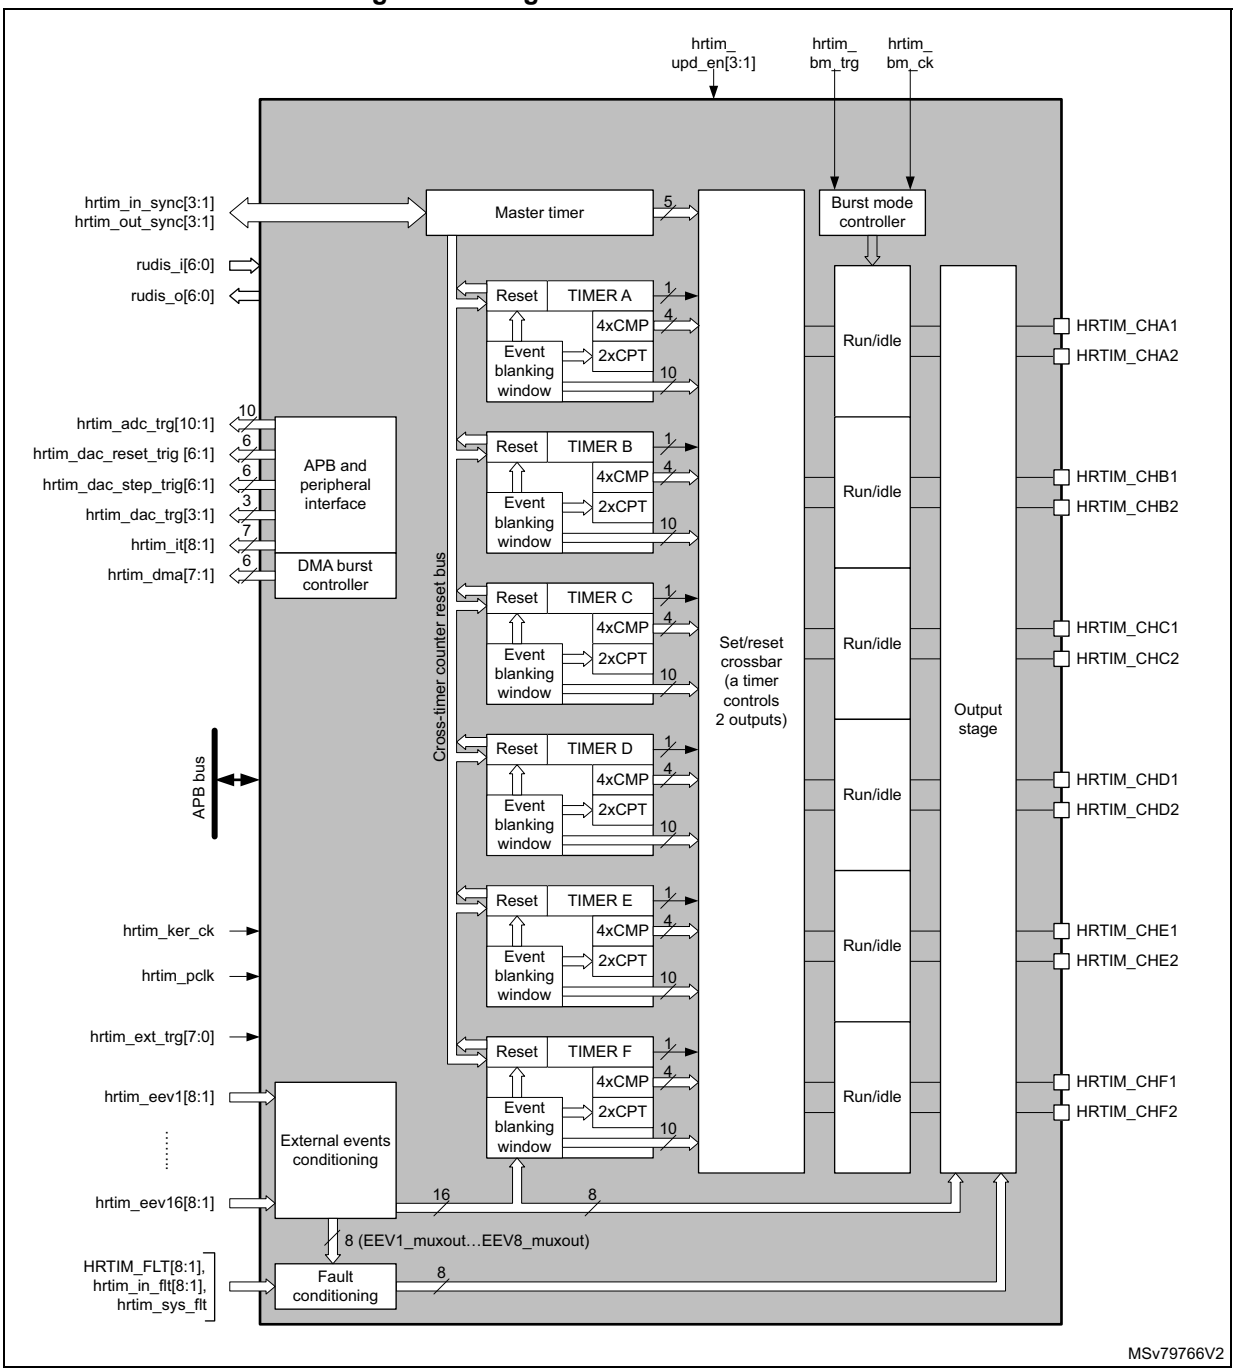
The burst mode controller can take over the control of one or multiple timers in case of light-load operation. The burst length and period can be programmed, as well as the idle state of the outputs.

The external event and fault signal conditioning logic includes:

- The input selection MUXes (for instance for selecting a digital input or an on-chip source for a given external event channel)
- Polarity and edge-sensitivity programming
- Digital filtering (for 5 channels out of 12)

The system interface allows the HRTIM to interact with the rest of the MCU:

- Interrupt requests to the CPU
- DMA controller for automatic accesses to/from the memories, including an HRTIM specific burst mode
- Triggers for the ADC and DAC converters



The HRTIM registers are split into eight groups:

- Master timer registers
- Timer A to timer F registers
- Common registers for features shared by all timer units

Note: As a writing convention, references to the six timing units in the text and in the registers are generalized using the "x" letter, where x can be any value from A to F.

The block diagram of the timer is shown in *Figure 422*.

Figure 422. High-resolution timer overview

33.3.2 HRTIM pins and internal signals

The tables in this section summarize the HRTIM inputs and outputs, both on-chip and off-chip.

Table 325. HRTIM inputs/outputs summary

Signal name	Signal type	Description
HRTIM_CHA1, HRTIM_CHA2, HRTIM_CHB1, HRTIM_CHB2, HRTIM_CHC1, HRTIM_CHC2, HRTIM_CHD1, HRTIM_CHD2, HRTIM_CHE1, HRTIM_CHE2, HRTIM_CHF1, HRTIM_CHF2	Outputs	Main HRTIM timer outputs. They can be coupled by pairs (HRTIM_CHx1 & HRTIM_CHx2) with deadtime insertion or work independently.
HRTIM_FLT[8:1] hrtim_in_flt[8:1]	Input	Fault inputs: immediately disable the HRTIM outputs when asserted (8 on-chip inputs and 8 off-chip HRTIM_FLTx inputs).
hrtim_sys_flt	Input	System fault gathering MCU internal fault events (clock security system, SRAM, D-cache and flash memory double error detection, Cortex®-M7 lockup (HardFault), PVD output.
hrtim_in_sync[3:1]	Input	Synchronization inputs to synchronize the whole HRTIM with other internal or external timer resources: hrtim_in_sync1: the source is another internal HRTIM (via on-chip interconnect) hrtim_in_sync2: the source is an internal timer output hrtim_in_sync3: the source is HRTIM_SCIN input pins
hrtim_out_sync[2:1]	Output	The purpose of this output is to cascade or synchronize several HRTIM instances, either on-chip or off-chip: hrtim_out_sync1: the destination is an on-chip HRTIM (via internal interconnect) hrtim_out_sync2: the destination is an off-chip HRTIM or peripheral (via HRTIM_SCOUT output pins)

Table 325. HRTIM inputs/outputs summary (continued)

Signal name	Signal type	Description
hrtim_eev1[8:1]	Input	External events. Each of the 16 events can be selected among 8 sources, either on-chip (from other built-in peripherals: comparator, ADC analog watchdog, TIMx timers, trigger outputs) or off-chip (HRTIM_EEVx input pins).
hrtim_eev2[8:1]

33.3.3 Clocks

The HRTIM must be supplied by the highest possible kernel clock frequency hrtim_ker_ck (here-after referred as f_{HRTIM}) to offer full resolution. All clocks present in the HRTIM are derived from this reference clock.

Definition of terms

f_{HRTIM}: Main HRTIM clock (hrtim_ker_ck). All subsequent clocks are derived and synchronous with this source.

f_{DTG}: Deadtime generator clock. For convenience, only the t_{DTG} period (t_{DTG} = $1/f_{DTG}$) is used in this document.

f_{CHPFRQ}: Chopper stage clock source.

f_{1STPW}: Clock source defining the length of the initial pulse in chopper mode. For convenience, only the t_{1STPW} period ($t_{1STPW} = 1/f_{1STPW}$) is used in this document.

f_{BRST}: Burst mode controller counter clock.

$f_{SAMPLING}$: Clock needed to sample the fault or the external events inputs.

f_{FLTS}: Clock derived from f_{HRTIM} which is used as a source for $f_{SAMPLING}$ to filter fault events.

f_{EEVS}: Clock derived from f_{HRTIM} which is used as a source for $f_{SAMPLING}$ to filter external events.

Timer clock and prescaler

Each timer in the HRTIM has its own individual clock prescaler, which is used to adjust the timer resolution (see *Table 336*).

Table 336. Timer resolution and min. PWM frequency for f_{HRTIM} = 520 MHz

CKPSC[2:0] (1)	Prescaling ratio	$f_{COUNTER}$	Resolution	Min PWM frequency
101	1	520 MHz	1.9 ns	7.9 kHz
110	2	520/2 MHz = 210 MHz	3.8 ns	4 kHz
111	4	520/4 MHz = 105 MHz	7.6 ns	2 kHz

1. CKPSC[2:0] values from 000 to 100 are reserved.

The high-resolution is available for edge positioning, PWM period adjustment, and externally triggered pulse duration.

Initialization

At startup, it is mandatory to initialize first the prescaler bitfields before writing the compare and period registers. Once the timer is enabled (MCEN or TxCEN bit set in the HRTIM_MCR register), the prescaler cannot be modified.

When multiple timers are enabled, the prescalers are synchronized with the prescaler of the timer that was started first.

Warning: It is possible to have different prescaling ratios in the master and TIMA..E timers only if the counter and output behavior does not depend on other timers' information and signals. It is mandatory to configure identical prescaling ratios in these timers when one of the following events is propagated from one timing unit (or master timer) to another: output set/reset event, counter reset event, update event, external event filter, or capture triggers. Prescaler factors not equal yield to unpredictable results.

Deadtime generator clock

The deadtime prescaler is supplied by (f_{HRTIM} × 8) / $2^{(DTPRSC[2:0])}$, programmed with DTPRSC[2:0] bits in the HRTIM_DTxR register.

t_{DTG} ranges from 1.9 ns to 30.7 ns for f_{HRTIM} = 520 MHz.

Chopper stage clock

The chopper stage clock source f_{CHPFRQ} is derived from f_{HRTIM} with a division factor ranging from 16 to 256, so that 2.03 MHz ≤ f_{CHPFRQ} ≤ 32.5 MHz for f_{HRTIM} = 520 MHz.

t_{1STPW} is the length of the initial pulse in chopper mode, programmed with the STRPW[3:0] bits in the HRTIM_CHPxR register, as follows:

t_{1STPW} = (STRPW[3:0]+1) × 16 × t_{HRTIM}.

It uses f_{HRTIM} / 16 as clock source (32.5 MHz for f_{HRTIM}= 520 MHz).

Burst mode prescaler

The burst mode controller counter clock f_{BRST} can be supplied by several sources, among which one is derived from f_{HRTIM}.

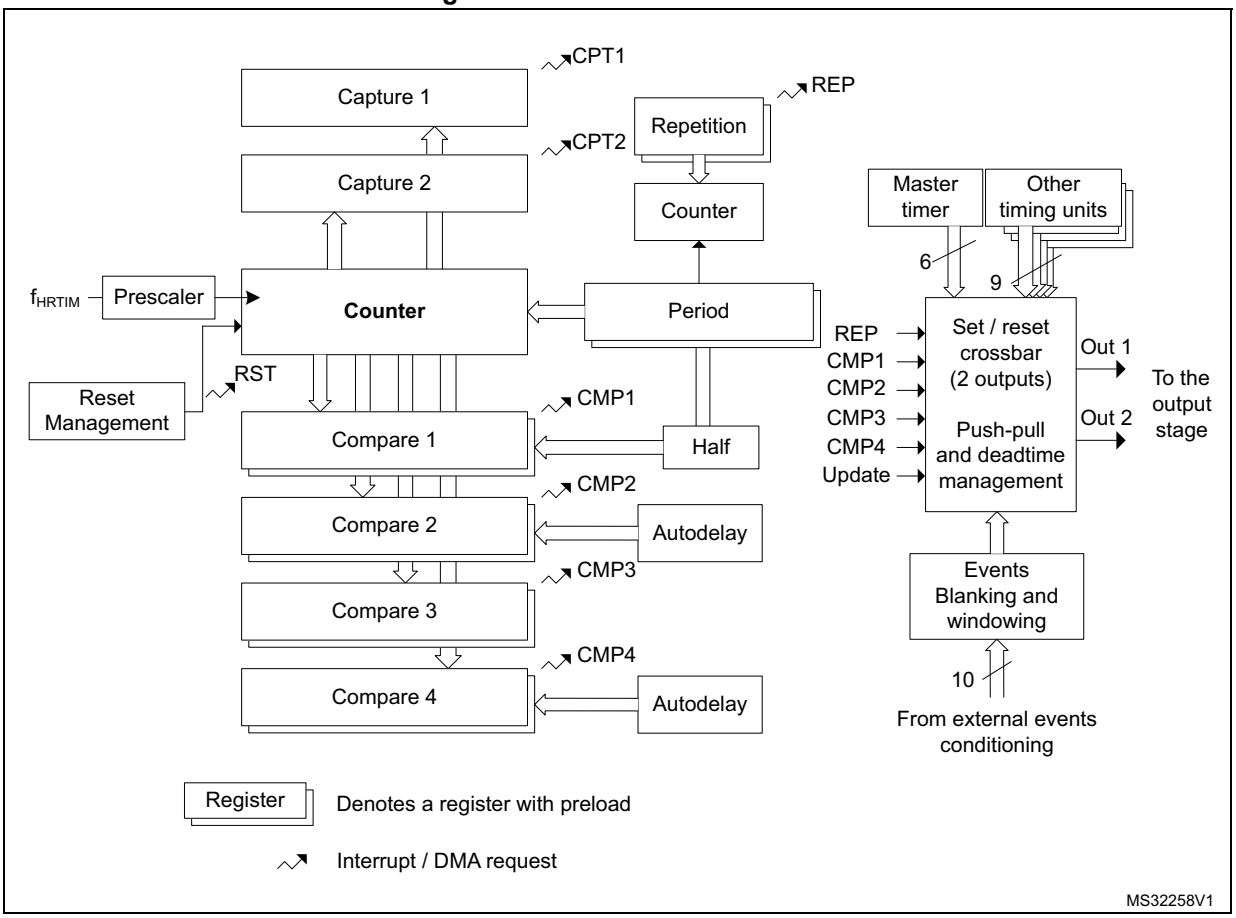
In this case, f_{BRST} ranges from f_{HRTIM} to f_{HRTIM} / 32768 (15.9 kHz for f_{HRTIM} = 520 MHz).

Fault input sampling clock

The fault input noise rejection filter has a time constant defined with $f_{SAMPLING}$ which can be either f_{HRTIM} or f_{FLTS}.

f_{FLTS} is derived from f_{HRTIM} and ranges from 520 MHz to 65 MHz for f_{HRTIM} = 520 MHz.

External event input sampling clock



The fault input noise rejection filter has a time constant defined with $f_{SAMPLING}$ which can be either f_{HRTIM} or f_{EEVS}.

f_{EEVS} is derived from f_{HRTIM} and ranges from 520 MHz to 65 MHz for f_{HRTIM} = 520 MHz.

33.3.4 Timer A..F timing units

The HRTIM embeds six identical timing units made of a 16-bit upcounter with an autoreload mechanism to define the counting period, four compare, and two capture units, as per *Figure 423*. Each unit includes all control features for 2 outputs, so that it operates as a standalone timer.

Figure 423. Timer A..F overview

The period and compare values must be within a lower and an upper limit related to the high-resolution implementation and listed in *Table 337*:

- The minimum value must be greater than or equal to three periods of the f_{HRTIM} clock. The value 0x0000 can be written in CMP1 and CMP3 registers only, to skip a PWM pulse. See *Section : Null duty cycle exception case* for details
- The maximum value must be less than or equal to 0xFFFF - 1 periods of the f_{HRTIM} clock.

Table 337. Period and compare registers min and max values

CKPSC[2:0] value(1)	Min(2)	Max
≥ 5	0x0003	0xFFFD

1. CKPSC[2:0] values < 5 are reserved.
2. The value 0x0000 can be written in CMP1 and CMP3 registers only, to skip a PWM pulse. See *Section : Null duty cycle exception case* for details.

Note: A compare value greater than the period register value does not generate a compare match event.

Counter operating mode

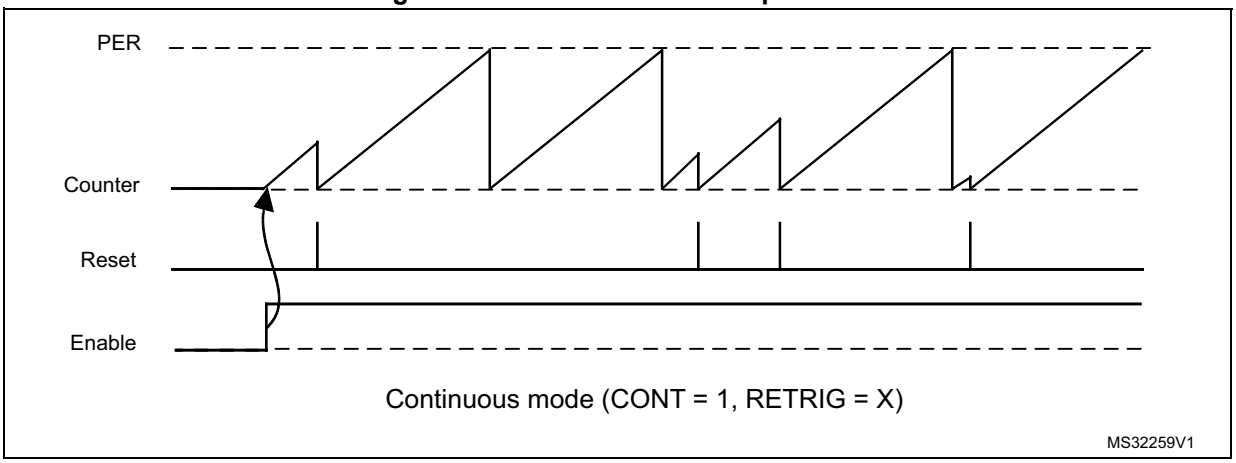
Timer A..F operate in continuous (free-running) mode or in single-shot manner where counting is started by a reset event, using the CONT bit in the HRTIM_TIMxCR control register. An additional RETRIG bit allows you to select whether the single-shot operation is retriggerable or nonretriggerable. Details of the operation are summarized on *Table 338* and on *Figure 424* and *Figure 425*.

Table 338. Timer operating modes

CONT	RETRIG	Operating mode	Start / stop conditions Clocking and event generation
0	0	Single-shot Non-retriggerable	Setting the TxEN bit enables the timer but does not start the counter. A first reset event starts the counting and any subsequent reset is ignored until the counter reaches the PER value. The PER event is then generated and the counter is stopped. A reset event re-starts the counting operation from 0x0000.
0	1	Single-shot Retriggerable	Setting the TxEN bit enables the timer but does not start the counter. A reset event starts the counting if the counter is stopped, otherwise it clears the counter. When the counter reaches the PER value, the PER event is generated and the counter is stopped. A reset event re-starts the counting operation from 0x0000.
1	X	Continuous mode	Setting the TxEN bit enables the timer and starts the counter simultaneously. When the counter reaches the PER value, it rolls-over to 0x0000 and resumes counting. The counter can be reset at any time.

The TxEN bit can be cleared at any time to disable the timer and stop the counting.

Figure 424. Continuous timer operation



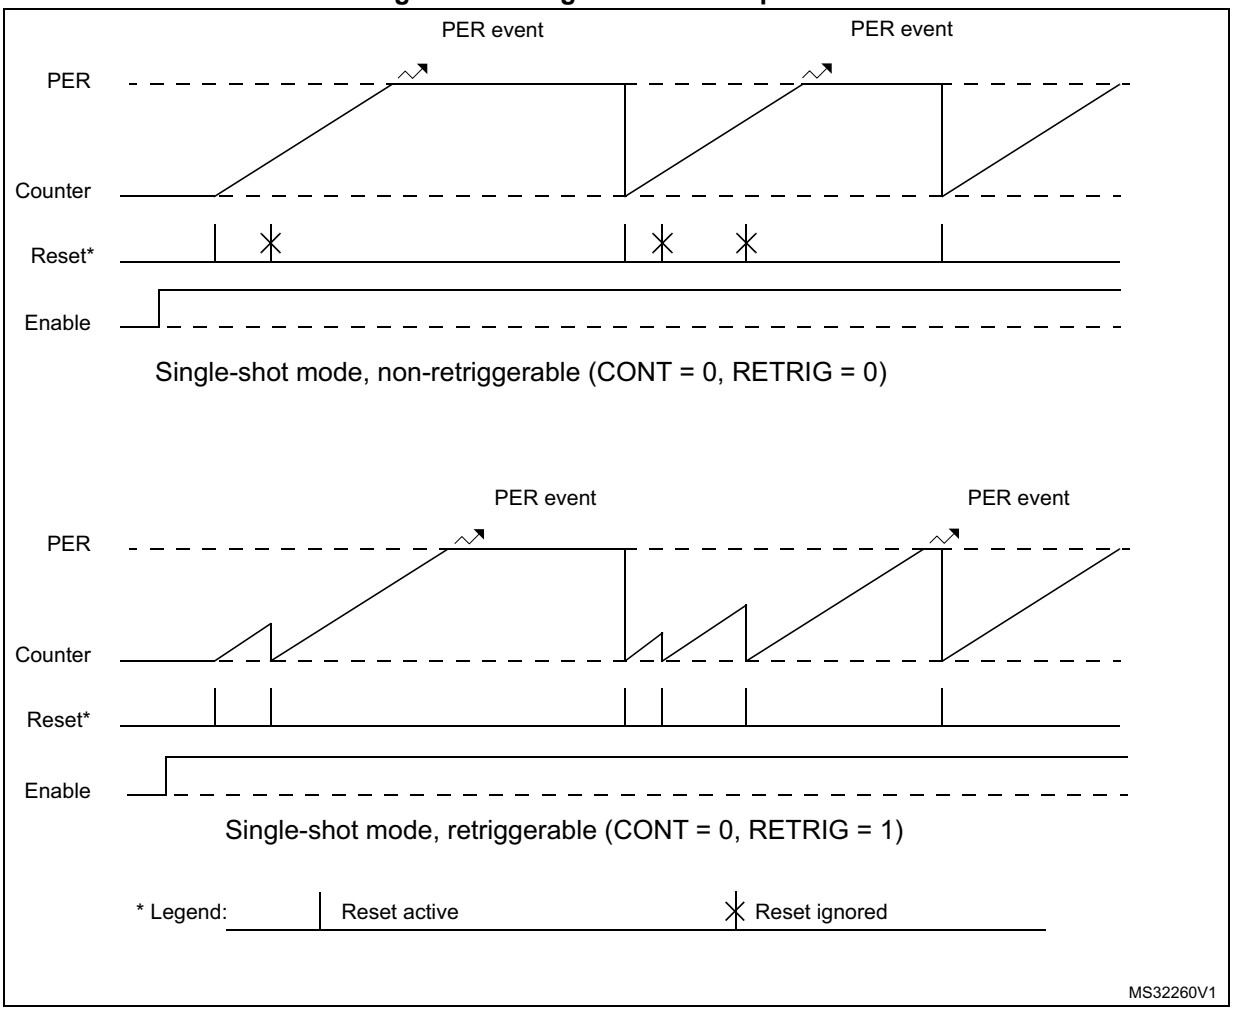


Figure 425. Single-shot timer operation

Roll-over event

A counter roll-over event is generated when the counter goes back to 0 after having reached the period value set in the HRTIM_PERxR register in continuous mode.

This event is used for multiple purposes in the HRTIM:

- To set/reset the outputs
- To trigger the register content update (transfer from preload to active)
- To trigger an IRQ or a DMA request
- To serve as a burst mode clock source or a burst start trigger
- As an ADC trigger
- To decrement the repetition counter

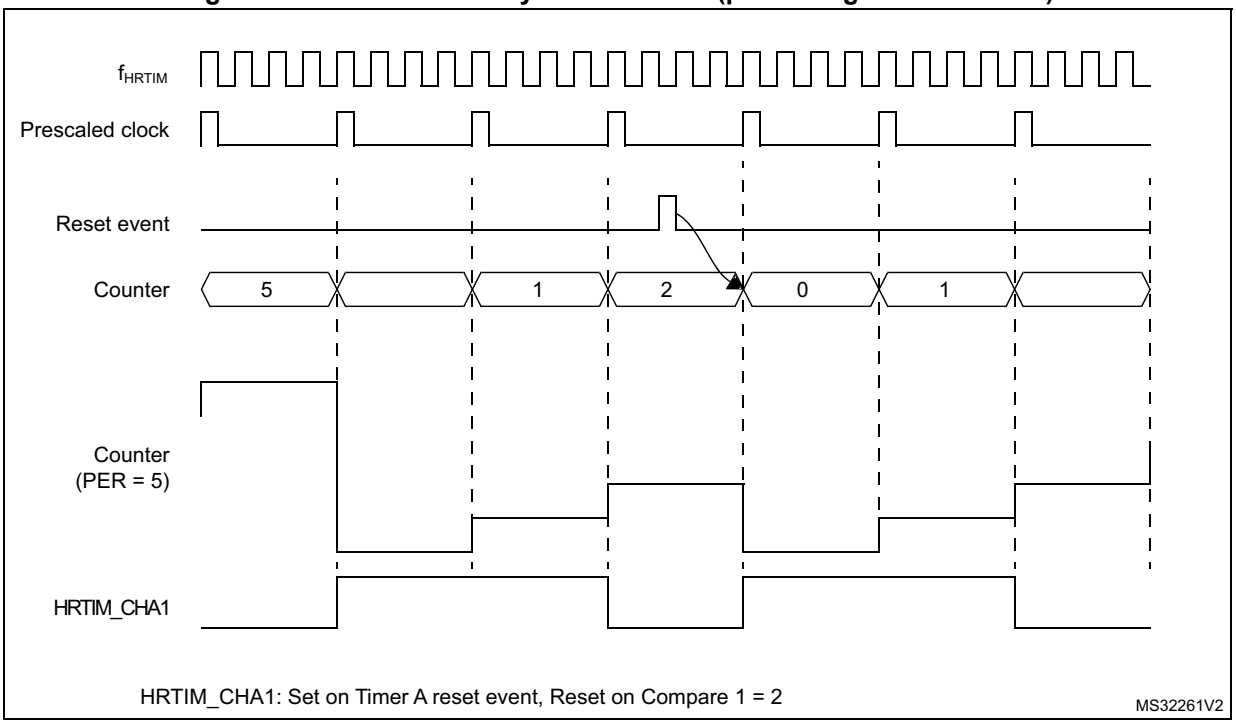
If the initial counter value is above the period value when the timer is started, or if a new period is set while the counter is already above this value, the counter is not reset: it overflows at the maximum period value and the repetition counter does not decrement.

Timer reset

The reset of the timing unit counter can be triggered by up to 30 events that can be selected simultaneously in the HRTIM_RSTxR register, among the following sources:

- The timing unit: compare 2, compare 4 and update (three events)
- The master timer: reset and compare 1..4 (five events)
- The external events EXTEVNTA..J (10 events)
- All other timing units (e.g. timer B..F for timer A): compare 1, 2 and 4 (12 events)

Several events can be selected simultaneously to handle multiple reset sources. In this case, the multiple reset requests are ORed. When two counter reset events are generated within the same f_{HRTIM} clock cycle, the last counter reset is taken into account.



Additionally, it is possible to do a software reset of the counter using the TxRST bits in the HRTIM_CR2 register. These control bits are grouped into a single register to allow the simultaneous reset of several counters.

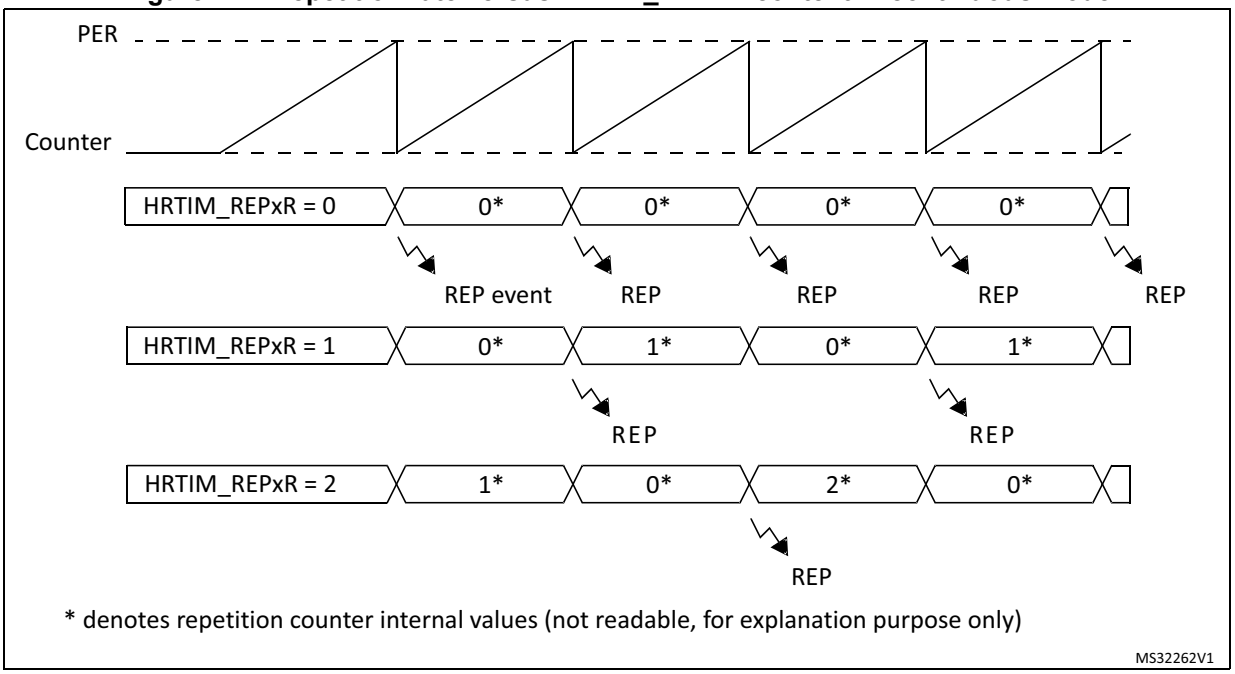
The reset requests are taken into account only once the related counters are enabled (TxCEN bit set).

When the f_{HRTIM} clock prescaling ratio is above 1, the counter reset event is delayed to the next active edge of the prescaled clock. This is used to maintain a jitterless waveform generation when an output transition is synchronized to the reset event (typically a constant Ton time converter).

Figure 426 shows how the reset is handled for a clock prescaling ratio of 4 (f_{HRTIM} divided by 4).

Figure 426. Timer reset resynchronization (prescaling ratio above 32)

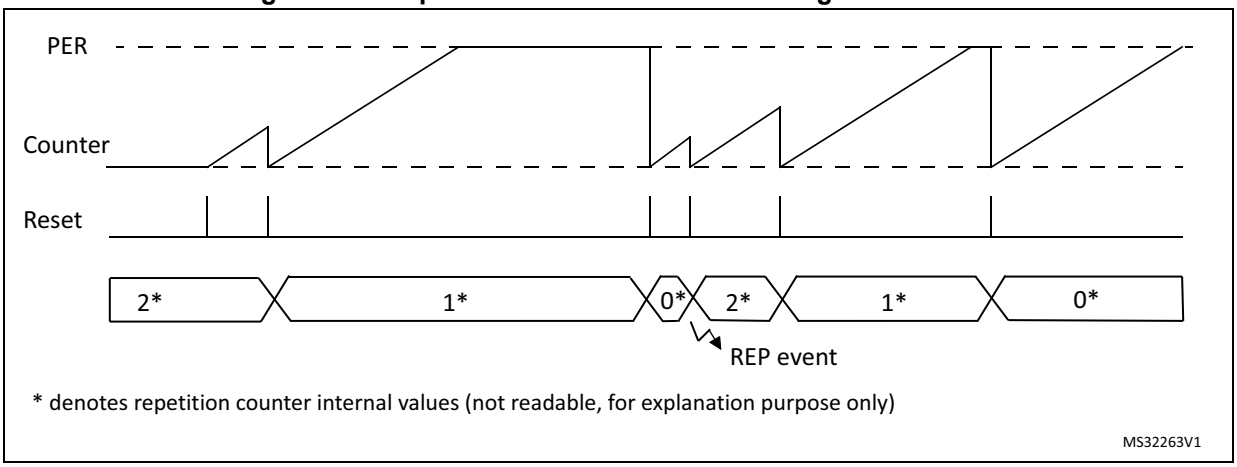
Repetition counter



A common software practice is to have an interrupt generated when the period value is reached, so that the maximum amount of time is left for processing before the next period begins. The main purpose of the repetition counter is to adjust the period interrupt rate and off-load the CPU by decoupling the switching frequency and the interrupt frequency.

The timing units have a repetition counter. This counter cannot be read, but solely programmed with an autoreload value in the HRTIM_REPxR register.

The repetition counter is initialized with the content of the HRTIM_REPxR register when the timer is enabled (TXCEN bit set). Once the timer has been enabled, anytime the counter is cleared, either due to a reset event or due to a counter roll-over, the repetition counter is decreased. When it reaches zero, a REP interrupt or a DMA request is issued if enabled (REPIE and REPDE bits in the HRTIM_DIER register).



If the HRTIM_REPxR register is set to 0, an interrupt is generated for each and every period. For any value above 0, a REP interrupt is generated after (HRTIM_REPxR + 1) periods. *Figure 427* presents the repetition counter operation for various values, in continuous mode.

Figure 427. Repetition rate versus HRTIM_REPxR content in continuous mode

The repetition counter can also be used when the counter is reset before reaching the period value (variable frequency operation) either in continuous or in single-shot mode (*Figure 428* here-below). The reset causes the repetition counter to be decremented, at the exception of the very first start following counter enable (TxCEN bit set).

Figure 428. Repetition counter behavior in single-shot mode

A reset or start event from the HRTIM_SCIN[3:1] source causes the repetition to be decremented as any other reset. However, in SYNCIN-started single-shot mode (SYNCSTRTx bit set in the HRTIM_TIMxCR register), the repetition counter is decremented only on the first reset event following the period. Any subsequent restarted by a new request on HRTIM_SCIN[3:1] inputs.

Set/reset crossbar

A “set” event correspond to a transition to the output active state, while a “reset” event corresponds to a transition to the output inactive state.

The polarity of the waveform is defined in the output stage to accommodate positive or negative logic external components: an active level corresponds to a logic level 1 for a positive polarity (POLx = 0), and to a logic level 0 for a negative polarity (POLx = 1).

Each of the timing units handles the set/reset crossbar for two outputs. These two outputs can be set, reset, or toggled by up to 32 events that can be selected among the following sources:

- The timing unit: period, compare 1..4, register update (six events)
- The master timer: period, compare 1..4, HRTIM synchronization (six events)
- All other timing units (e.g. timer B..F for timer A): TIMEVNT1..9 (nine events described in *Table 339*)
- The external events EXTEVNTA..J (10 events)
- A software forcing (one event)

Note: In up/down mode (UDM bit set to 1), the counter period event is defined as per the OUTROM[1:0] bit setting.

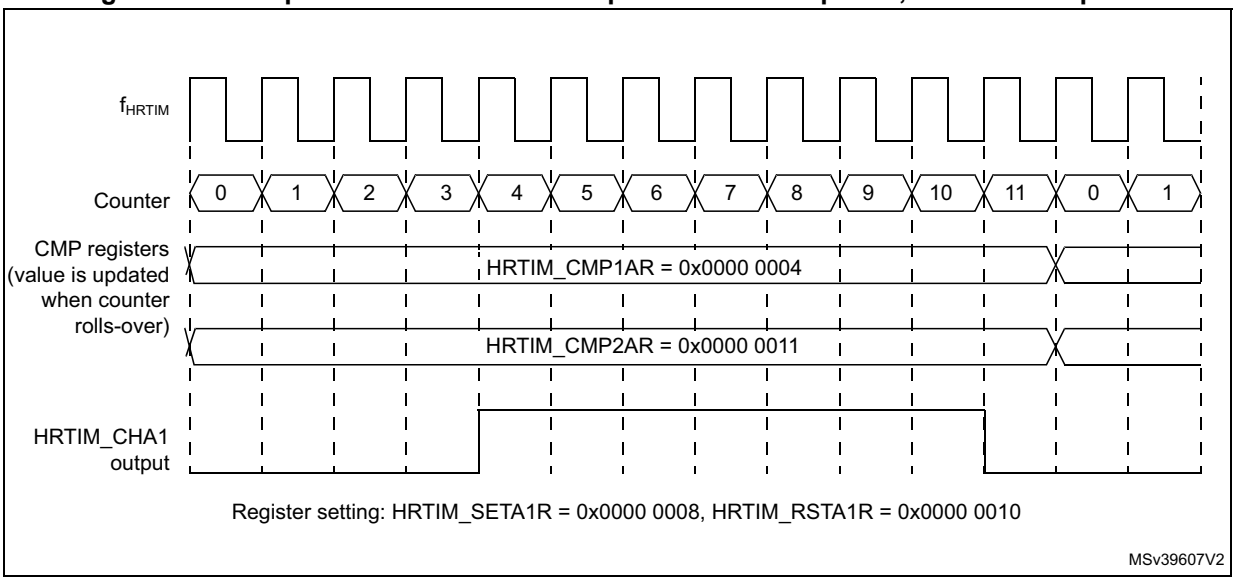
The event sources are ORed and multiple events can be simultaneously selected.

Each output is controlled by two 32-bit registers, one coding for the set (HRTIM_SETxyR) and another one for the reset (HRTIM_RSTxyR), where x stands for the timing unit: A..F and y stands for the output 1or 2 (e.g. HRTIM_SETA1R, HRTIM_RSTC2R,...).

If the same event is selected for both set and reset, it toggles the output. It is not possible to toggle the output state more than one time per t_{HRTIM} period: in case of two consecutive toggling events within the same cycle, only the first one is considered.

The set and reset requests are taken into account only once the counter is enabled (TxCEN bit set), except if the software is forcing a request to allow the prepositioning of the outputs at timer startup.

Table 339 summarizes the events from other timing units that can be used to set and reset the outputs. The number corresponds to the timer events (such as TIMEVNTx) listed in the register, and empty locations are indicating nonavailable events.



For instance, timer A outputs can be set or reset by the following events: timer B compare 1 and 2, timer C compare 2 and 3,... and timer E compare 3 is listed as TIMEVNT7 in HRTIM_SETA1R.

Table 339. Events mapping across timer A to F

Figure 429 represents how a PWM signal is generated using two compare events.

Figure 429. Compare events action on outputs: set on compare 1, reset on compare 2

Set/reset on update events

Half mode

This mode aims at generating a square signal with a fixed 50% duty cycle and variable frequency (typically for converters using resonant topologies). It is used to have the duty cycle automatically forced to half of the period value when a new period is programmed.

This mode is enabled by writing HALF bit to 1 in the HRTIM_TIMxCR register. When the HRTIM_PERxR register is written, it causes an automatic update of the compare one value with HRTIM_PERxR/2 value.

The output on which a square wave is generated must be programmed to have one transition on the CMP1 event, and one transition on the period event, as follows:

- HRTIM_SETxyR = 0x0000 0008, HRTIM_RSTxyR = 0x0000 0004, or
- HRTIM_SETxyR = 0x0000 0004, HRTIM_RSTxyR = 0x0000 0008

The HALF mode overrides the content of the HRTIM_CMP1xR register. The access to the HRTIM_PERxR register only causes compare 1 internal register to be updated. The user-accessible HRTIM_CMP1xR register is not updated with the HRTIM_PERxR / 2 value.

When the preload is enabled (PREEN = 1), compare 1 active register is refreshed on the update event. If the preload is disabled (PREEN= 0), compare 1 active register is updated as soon as HRTIM_PERxR is written.

The period must be greater than or equal to six periods of the f_{HRTIM} clock when the HALF mode is enabled.

Interleaved mode

This mode complements the Half mode and helps the implementation of interleaved topologies.

It is used to recompute automatically the content of compare registers when the HRTIM_PERxR value is updated.

The selection is done using the HALF bit and the INTLVD[1:0] bits in HRTIM_MCR and HRTIM_TIMxCR registers, as shown on the *Table 340* below.

Table 340. Interleaved mode selection

HALF bit	INTLVD [1:0] bits	Mode
0	00	Disabled
0	01	Triple interleaved (120°)
0	10	Quad interleaved (90°)
0	11	Reserved
1	xx	Dual interleaved (180°)

Table 341 gives the compare values for the three available modes. The content of the compare registers is overridden. The corresponding compare events can be used to trigger an output set/reset or to reset a slave timer.

Table 341. Compare 1..3 values in interleaved mode

Mode	Dual interleaved 180°	Triple interleaved 120°	Quad interleaved 90°
CMP1 value	PERxR/2	PERxR/3	PERxR/4
CMP2 value	Not affected	2x (PERxR/3)	PERxR/2
CMP3 value	Not affected	Not affected	3x (PERxR/4)

Note: In half and interleaved modes, the compare registers are controlled by hardware and writing them has no effect. However the written value is stored in the preload register and becomes active on the update event following the exit of these modes.

Note: The triple and quad interleaved modes must not be used simultaneously with other modes using CMP2 (dual channel dac trigger and triggered-half modes).

Null duty cycle exception case

The high-resolution behavior is not supported for pulses narrower than three t_{HRTIM} periods (see *Section 33.3.7: Set/reset events priorities and narrow pulses management*) and any value strictly below 3 periods of the f_{HRTIM} clock in the HRTIM_TIMxCMPy register is forbidden (see *33.5.19: HRTIM timer x compare 1 register (HRTIM_CMP1xR) (x = A to F)*).

However, it is possible to skip an output pulse and have a null duty cycle by simply writing a null value in the HRTIM_TIMxCMPy registers, if and only if the following conditions are met:

- The output SET event is generated by the PERIOD event
- The output RESET if generated by the compare event
- The compare event is active within the timer unit itself, and not used for other timing units

For any other use case, this can be done by programming the SET and RESET events with the very same compare values, above three periods of the f_{HRTIM} clock. In this case, the output is reset forced (following the set/reset priority scheme defined in the *Section 33.3.7: Set/reset events priorities and narrow pulses management*).

When a null value is programmed, the CMPx flags are set, and the related interrupt is issued if enabled. An event is also generated on synchronization output when SYNCSRC= 11 (synchronization generated on TIM1 CMP1 event).

The following limitations apply when a null value is programmed:

- ADC and burst mode triggers are not generated
- The CMP1 cannot be used for blanking events or faults

Swap mode

This mode is used to swap the two outputs with a single bit access: the output 1 signal is connected to the output 2 pin and the output 2 signal is connected to output 1 pin. The output swap is triggered with the SWPx bits in the HRTIM_CR2 register and is effective on the next update event.

The outputs are swapped prior to the set/reset crossbar unit, as follows:

- If SWPx = 0, HRTIM_SETx1R and HRTIM_RSTx1R are coding for the output 1, HRTIM_SETx2R and HRTIM_RSTx2R are coding for the output 2
- If SWPx = 1, HRTIM_SETx1R and HRTIM_RSTx1R are coding for the output 2, HRTIM_SETx2R and HRTIM_RSTx2R are coding for the output 1

The swap mode is only affecting the preload register, and not the active registers.

Note: The preload mode must be enabled when using the swap mode.

Consequently, it does not modify the auxiliary outputs in parallel with the regular outputs going to the output stage (see *Section 33.3.18* for details). They provide the following internal status, events, and signals:

- O1CPY, O2CPY, SETxy and RSTxy status flags, together with the corresponding interrupts and DMA requests
- Capture triggers upon output set/reset (TA2, TB2, TC2, TD2, TE2, TF2)
- External event filters generated with a Tx2 output copy

For instance the SETx1 flag is related to the output 1 when SWP = 0 and is related to the output 2 when SWPx = 1.

Similarly, the swap mode does not change the attribution of control bits in the HRTIM_OUTxR register (DIDLx, CHPx, FAULTx[1:0], IDLESx, POLx bits). For instance, the POL1 bit controls the output 1 polarity whatever the SWP bit value.

Note: The SWPx bits are ignored in push-pull mode (PSHPLL = 1 in the HRTIM_TIMxCR register).

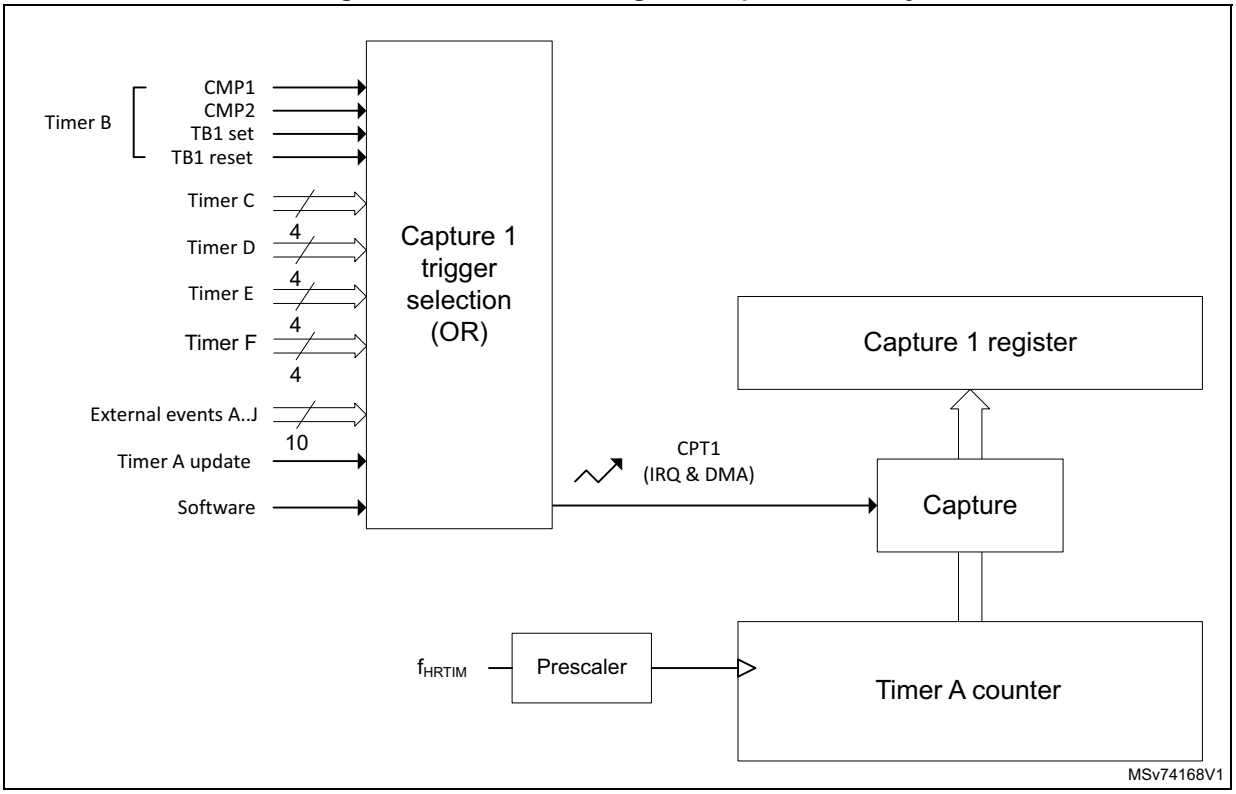
Capture

The timing unit has the capability to capture the counter value, triggered by internal and external events. The purpose is to:

- Measure events arrival timings or occurrence intervals
- Update compare 2 and compare 4 values in autodelayed mode (see *Section : Autodelayed mode*).

The capture is done with f_{HRTIM} resolution.

The timer has two capture registers: HRTIM_CPT1xR and HRTIM_CPT2xR. The capture triggers are programmed in the HRTIM_CPT1xCR and HRTIM_CPT2xCR registers.



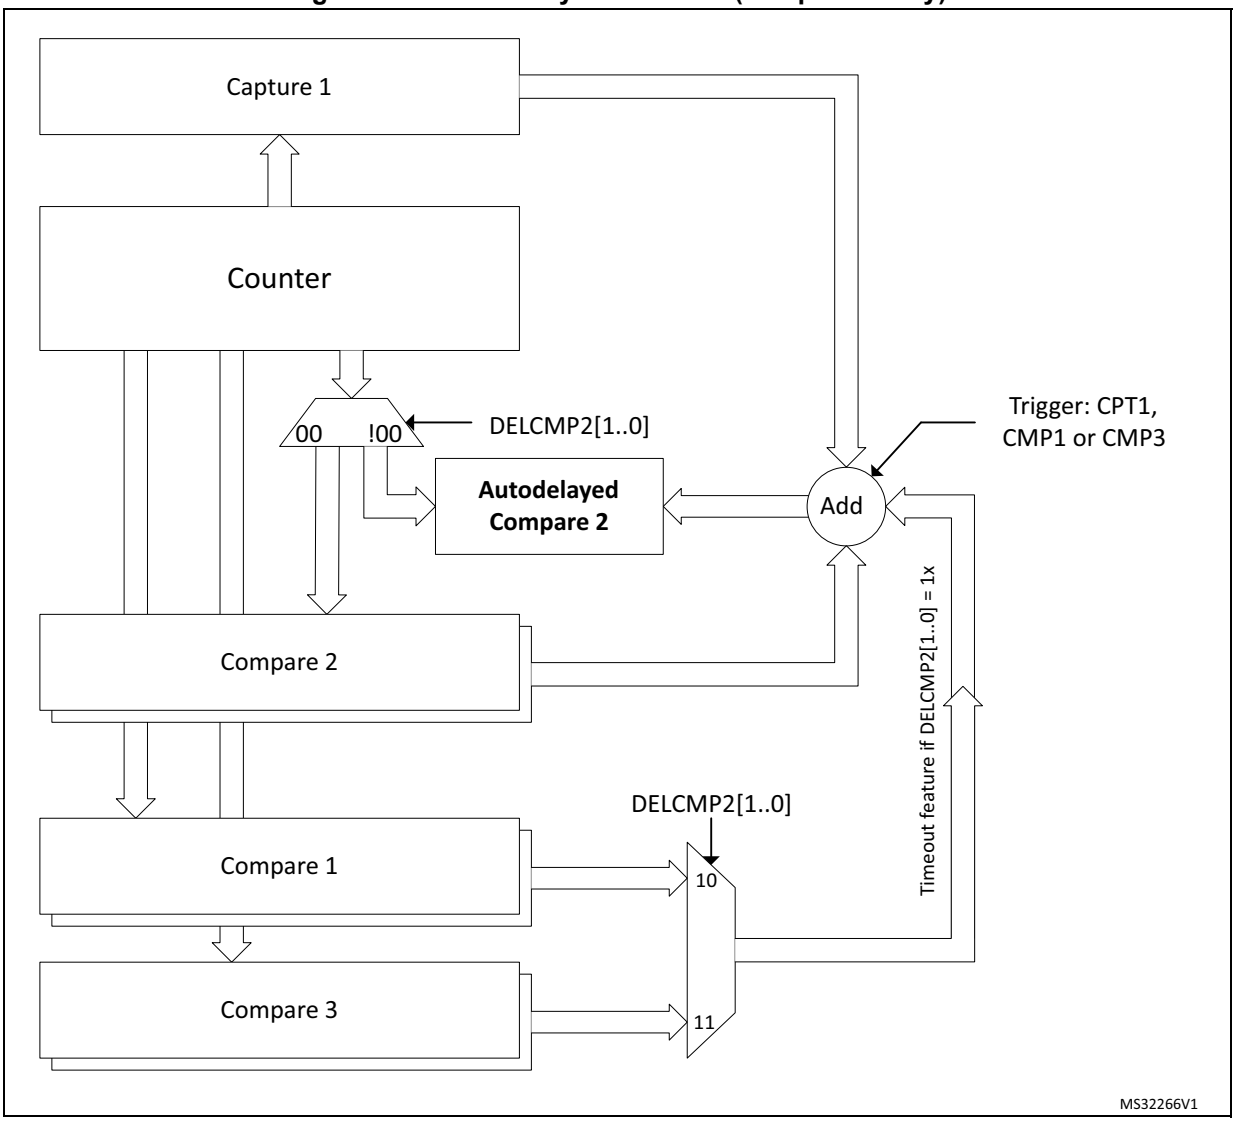
The capture of the timing unit counter can be triggered by up to 28 events that can be selected simultaneously in the HRTIM_CPT1xCR and HRTIM_CPT2xCR registers, among the following sources:

- The external events, EXTEVNTA..J (10 events)
- All other timing units (e.g. timer B..F for timer A): compare 1, 2 and output 1 set/reset events (16 events)
- The timing unit: update (one event)
- A software capture (one event)

Several events can be selected simultaneously to handle multiple capture triggers. In this case, the concurrent trigger requests are ORed. The capture can generate an interrupt or a DMA request when CPTxIE and CPTxDE bits are set in the HRTIM_TIMxDIER register.

Overcapture is not prevented by the circuitry: a new capture is triggered even if the previous value was not read, or if the capture flag was not cleared.

Figure 430. Timer A timing unit capture circuitry



Autodelayed mode

This mode is used to have compare events generated relatively to capture events, so that for instance an output change can happen with a programmed timing following a capture. In this case, the compare match occurs independently from the timer counter value. It enables the generation of waveforms with timings synchronized to external events without the need of software computation and interrupt servicing.

As long as no capture is triggered, the content of the HRTIM_CMPxR register is ignored (no compare event is generated when the counter value matches the compare value. Once the capture is triggered, the compare value programmed in HRTIM_CMPxR is summed with the captured counter value in HRTIM_CPTxyR, and it updates the internal autodelayed compare register, as seen on *Figure 431*. The autodelayed compare register is internal to the timing unit and cannot be read. The HRTIM_CMPxR preload register is not modified after the calculation.

This feature is available only for compare 2 and compare 4 registers. Compare 2 is associated with capture 1, while compare 4 is associated with capture 2. HRTIM_CMP2xR and HRTIM_CMP4xR compares cannot be programmed with a value below three f_{HRTIM} clock periods, as in the regular mode.

Figure 431. Auto-delayed overview (compare 2 only)

The autodelayed compare is only valid from the capture up to the period event: once the counter has reached the period value, the system is rearmed with compare disabled until a capture occurs.

DELCMP2[1:0] and DELCMP4[1:0] bits in HRTIM_TIMxCR register are used to configure the autodelayed mode as follows:

- 00
  Regular compare mode: HRTIM_CMP2xR and HRTIM_CMP4xR register contents are directly compared with the counter value.
- 01
  Autodelayed mode: compare 2 and compare 4 values are recomputed and used for comparison with the counter after a capture 1/2 event.
- 10 or 11
  Autodelayed mode with timeout: compare 2 and compare 4 values are recomputed and used for comparison with the counter after a capture 1/2 event or after a compare 1

match (DELCMPx[1:0]= 10) or a compare 3 match (DELCMPx[1:0]= 11) to have a timeout function if capture 1/2 event is missing.

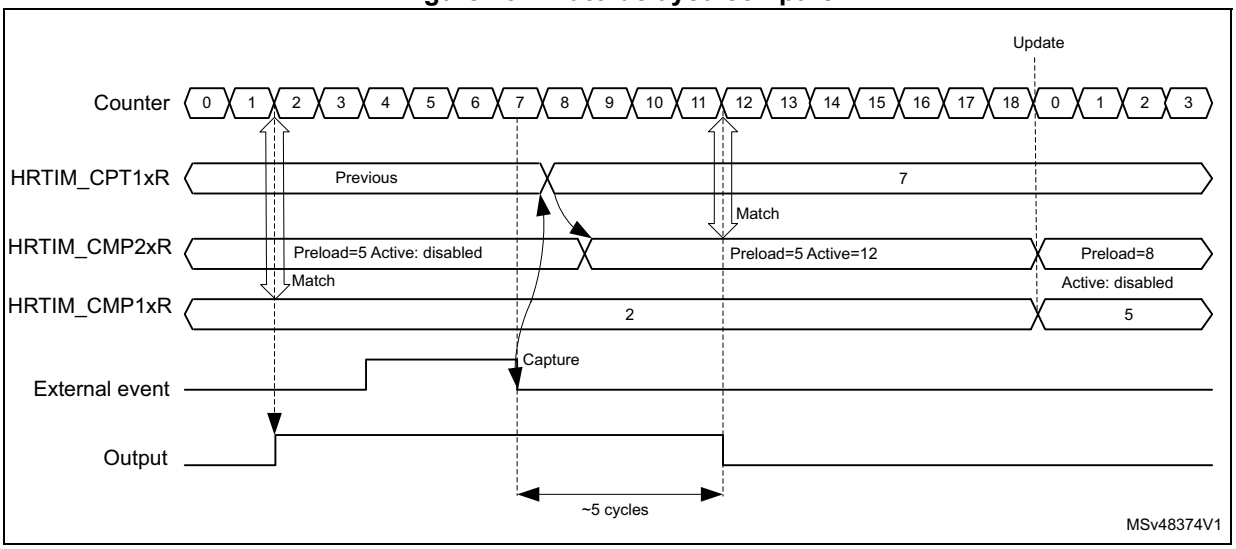
When the capture occurs, the comparison is done with the (HRTIM_CMP2/4xR + HRTIM_CPT1/2xR) value. If no capture is triggered within the period, the behavior depends on the DELCMPx[1:0] value:

- DELCMPx[1:0] = 01: the compare event is not generated
- DELCMPx[1:0] = 10 or 11: the comparison is done with the sum of the two compares (for instance HRTIM_CMP2xR + HRTIM_CMP1xR). The captures are not taken into account if they are triggered after CMPx + CMP1 (resp. CMPx + CMP3).

The captures are enabled again at the beginning of the next PWM period.

If the result of the autodelayed summation is above 0xFFFF (overflow), the value is ignored and no compare event is generated until a new period is started.

Note: DELCMPx[1:0] bitfield must be reset when reprogrammed from one value to the other to reinitialize properly the autodelayed mechanism, for instance:



- DELCMPx[1:0] = 10
- DELCMPx[1:0] = 00
- DELCMPx[1:0] = 11

As an example, *Figure 432* shows how the following signal is generated:

- Output set when the counter is equal to compare 1 value
- Output reset 5 cycles after a falling edge on a given external event

Note: To simplify the figure, the external event signal is shown without any resynchronization delay: practically, there is a delay of one to two f_{HRTIM} clock periods between the falling edge and the capture event due to an internal resynchronization stage which is necessary to process external input signals.

Figure 432. Auto-delayed compare

A regular compare channel (e.g. compare 1) is used for the output set: as soon as the counter matches the content of the compare register, the output goes to its active state.

A delayed compare is used for the output reset: the compare event can be generated only if a capture event has occurred. No event is generated when the counter matches the delayed

compare value (counter = 4). Once the capture event has been triggered by the external event, the content of the capture register is summed to the delayed compare value to have the new compare value. In the example, the autodelayed value 4 is summed to the capture equal to 7 to give a value of 12 in the autodelayed compare register. From this time on, the compare event can be generated and happens when the counter is equal to 12, causing the output to be reset.

Overcapture management in autodelayed mode

Overcapture is prevented when the autodelayed mode is enabled (DELCMPx[1:0] = 01, 10, 11).

When multiple capture requests occur within the same counting period, only the first capture is taken into account to compute the autodelayed compare value. A new capture is possible only:

- Once the autodelayed compare has matched the counter value (compare event)
- Once the counter has rolled over (period)
- Once the timer has been reset

Changing autodelayed compare values

When the autodelayed compare value is preloaded (PREEN bit set), the new compare value is taken into account on the next coming update event (for instance on the period event), regardless of when the compare register was written and if the capture occurred (see *Figure 432*, where the delay is changed when the counter rolls over).

When the preload is disabled (PREEN bit reset), the new compare value is taken into account immediately, even if it is modified after the capture event has occurred, as per the example below:

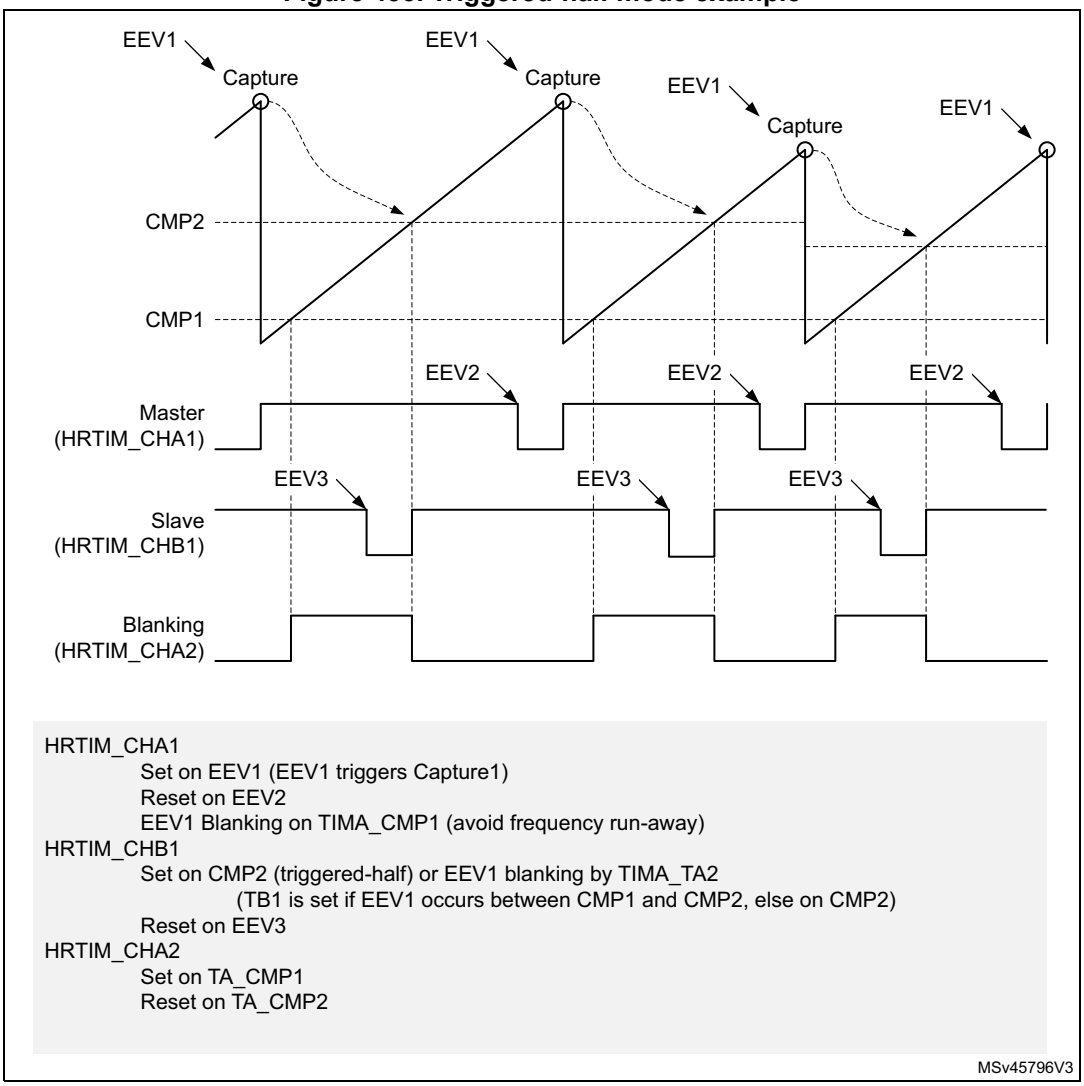
1. At t1, DELCMP2 = 1.
2. At t2, CMP2_act = 0x40 => comparison disabled
3. At t3, a capture event occurs capturing the value CPTR1 = 0x20. => comparison enabled, compare value = 0x60
4. At t4, CMP2_act = 0x100 (before the counter reached value CPTR1 + 0x40) => comparison still enabled, new compare value = 0x120
5. At t5, the counter reaches the period value => comparison disabled, cmp2_act = 0x100

Similarly, if the CMP1(CMP3) value changes while DELCMPx = 10 or 11, and preload is disabled:

1. At t1, DELCMP2 = 2.
2. At t2, CMP2_act = 0x40 => comparison disabled
3. At t3, CMP3 event occurs - CMP3_act = 0x50 before capture 1 event occurs => comparison enabled, compare value = 0x90
4. At t4, CMP3_act = 0x100 (before the counter reached value 0x90) => comparison still enabled, compare 2 event occurs at = 0x140

Triggered-half mode

The purpose of this mode is to allow the synchronization of two interleaved converters that have variable frequency operation, and require a 180° phase-shift. The basic principle is to have a master-slave system. The slave converter synchronization is continuously adjusted based on the previous switching period of the master converter.



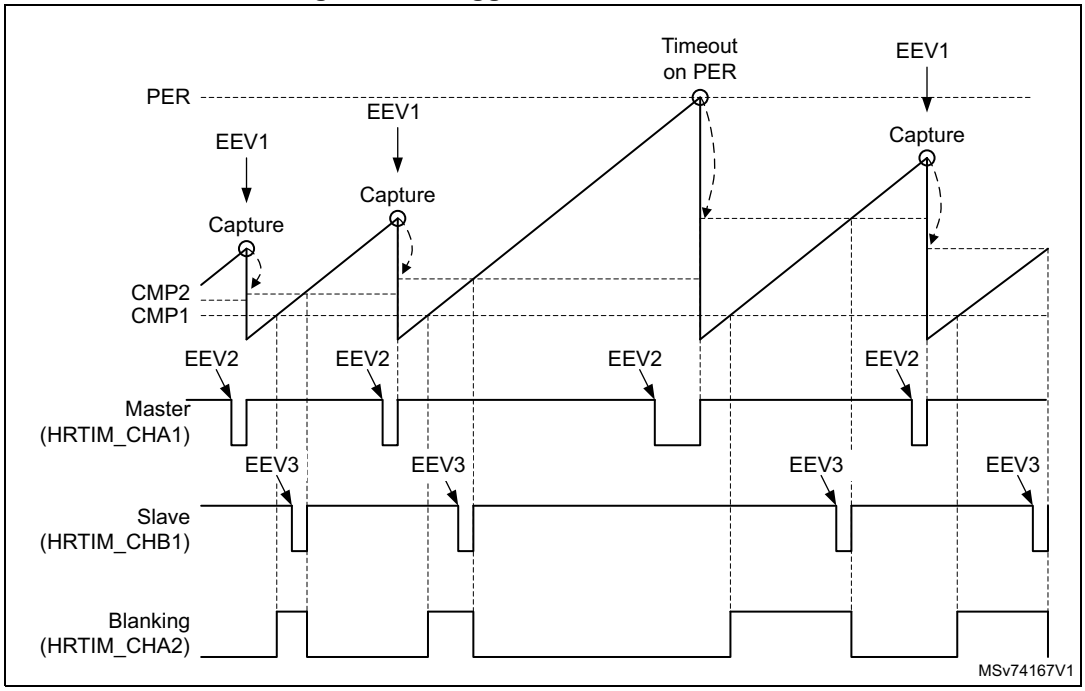
This is done using the capture unit. The switching period of the master converter is captured, divided by two and then stored in the compare 2 register by hardware. The compare 2 register contains a value equal to half of the captured period, which is the master converter switching period. The compare 2 event can then be used to trigger a second timing unit that manages the slave converter.

This mode is enabled by setting the TRGHLF bit in the HRTIM_TIMxCR2 register. This bit cannot be changed once the timer is operating (TxEN bit set).

The triggered-half mode must not be used simultaneously with other modes using CMP2 (dual channel DAC trigger, interleaved and balanced idle modes).

The initial value CMP2 can be written by the user, but is ignored once the first capture is triggered. The preload mechanism is disabled for CMP2 when the TRGHLF bit is reset.

Figure 433. Triggered-half mode example



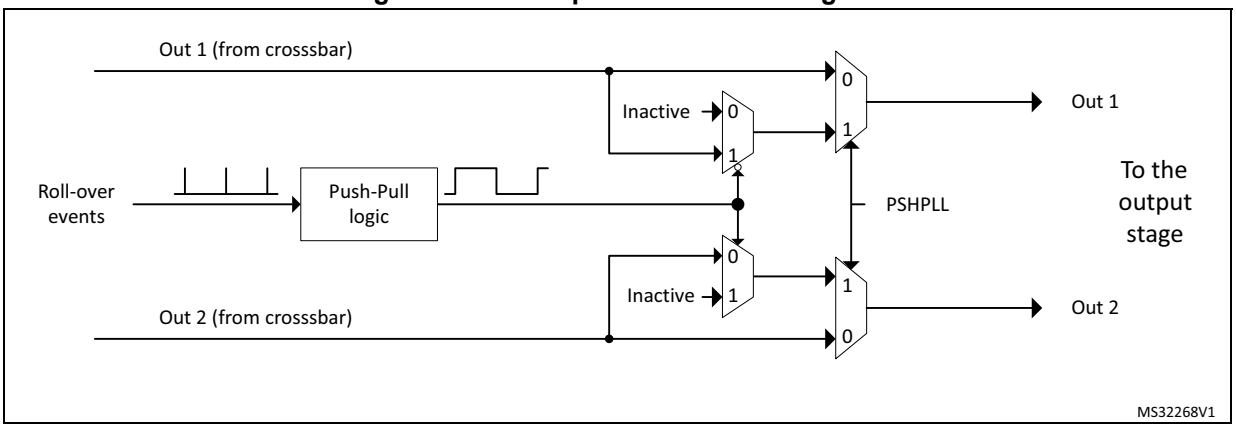
Note: In triggered half mode, the compare2 register is controlled by hardware and writing it has no effect. However the written value is stored in the preload register and becomes active on the update event following the exit of this mode.

It is possible to generate a timeout event when the external event is missing, as shown on *Figure 434* below. This mode is enabled with the TRGHLFT in HRTIM_CR2 register.

No capture event is generated when a timeout occurs. A timeout situation can be detected using the PER interrupt.

The timeout occurs regardless of the repetition value.

Figure 434. Triggered-half mode timeout



Push-pull mode

This mode primarily aims at driving converters using push-pull topologies. It also needs to be enabled when the delayed idle protection is required, typically for resonant converters (refer to *Section 33.3.10: Delayed protection*).

The push-pull mode is enabled by setting the PSHPLL bit in the HRTIM_TIMxCR register.

It applies the signals generated by the crossbar to output 1 and output 2 alternatively, on the period basis, maintaining the other output to its inactive state. The redirection rate (push-pull frequency) is defined by the timer's period event, as shown on *Figure 435*. The push-pull period is twice the timer counting period.

Figure 435. Push-pull mode block diagram

The push-pull mode is available when the timer operates in continuous mode and in single-shot mode. It is necessary to disable the timer to stop a push-pull operation and to reset the counter before reenabling it.

To get a correct behavior, the event selected as source of the counter reset must be also selected for setting (or resetting) the output. It must set the output if the output is set on period, else it must reset it. If it is not done, the output switching from its inactive period to its active period may be incorrect (may unexpectedly rise or may unexpectedly stay low).

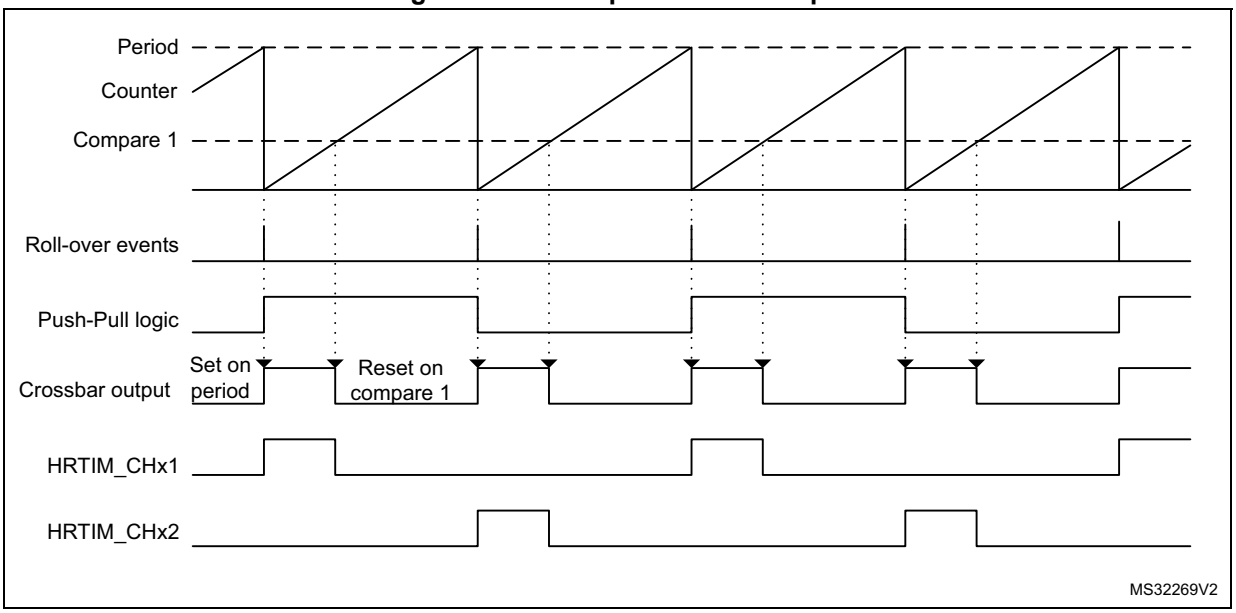
The signal shape is defined using HRTIM_SETxyR and HRTIM_RSTxyR for both outputs. It is necessary to have HRTIM_SETx1R = HRTIM_SETx2R and HRTIM_RSTx1R = HRTIM_RSTx2R to have both outputs with identical waveforms and to achieve a balanced operation. Still, it is possible to have different programming on both outputs for other uses.

The CPPSAT status bit in HRTIM_TIMxISR indicates on which output the signal is currently active. CPPSTAT is reset when the push-pull mode is disabled.

In the example given on *Figure 436*, the timer internal waveform is defined as follows:

- Output set on period event
- Output reset on compare 1 match event

Figure 436. Push-pull mode example



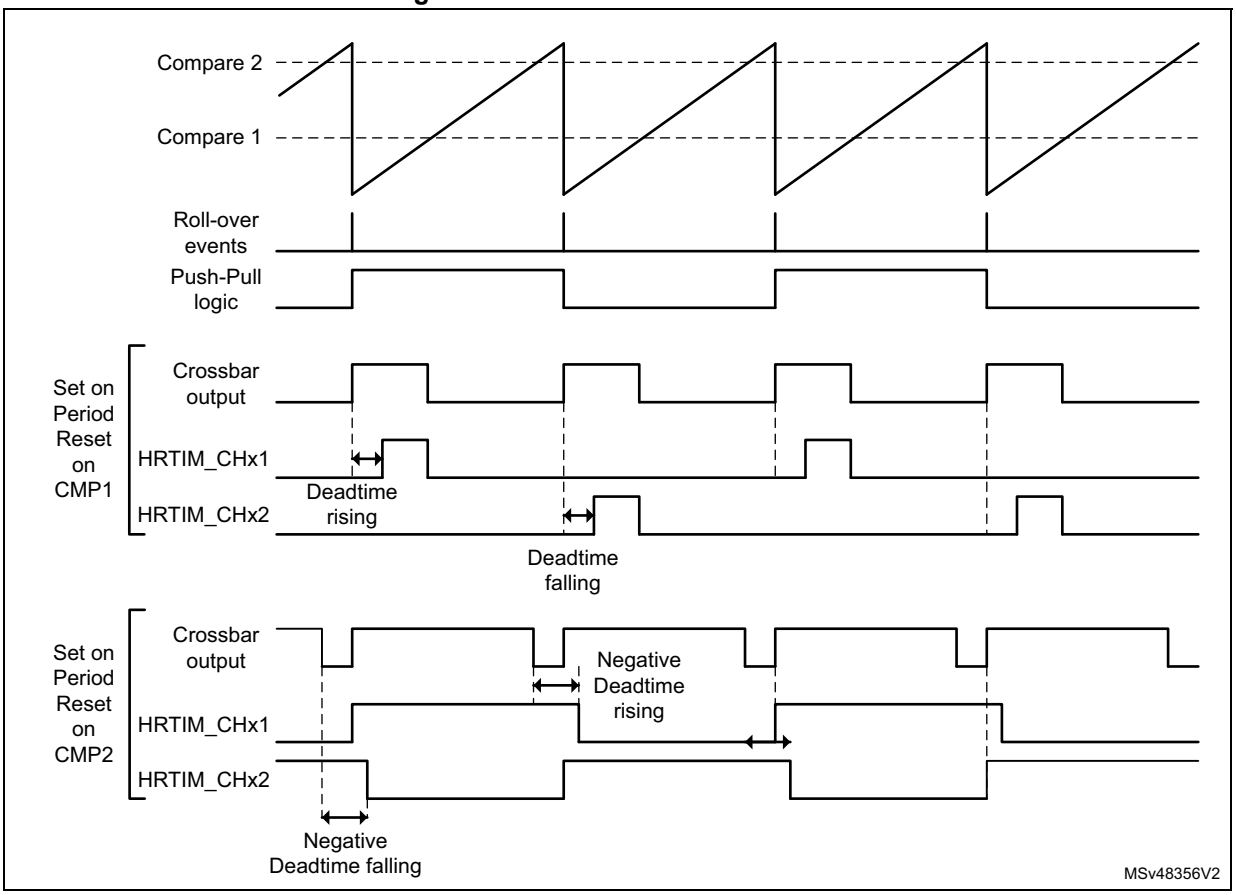


Figure 437 shows how the deadtime is inserted in push-pull mode, for both positive and negative deadtimes. In this case, the outputs are not complemented anymore, and the deadtime is applied on each output individually (both ouput 1 and output 2 of the crossbar are used).

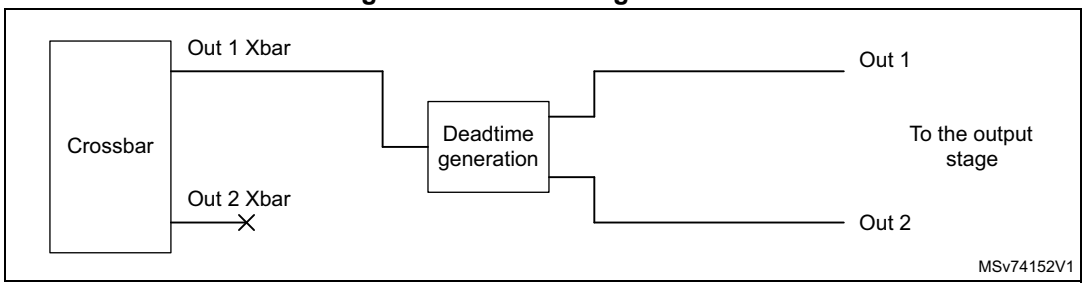
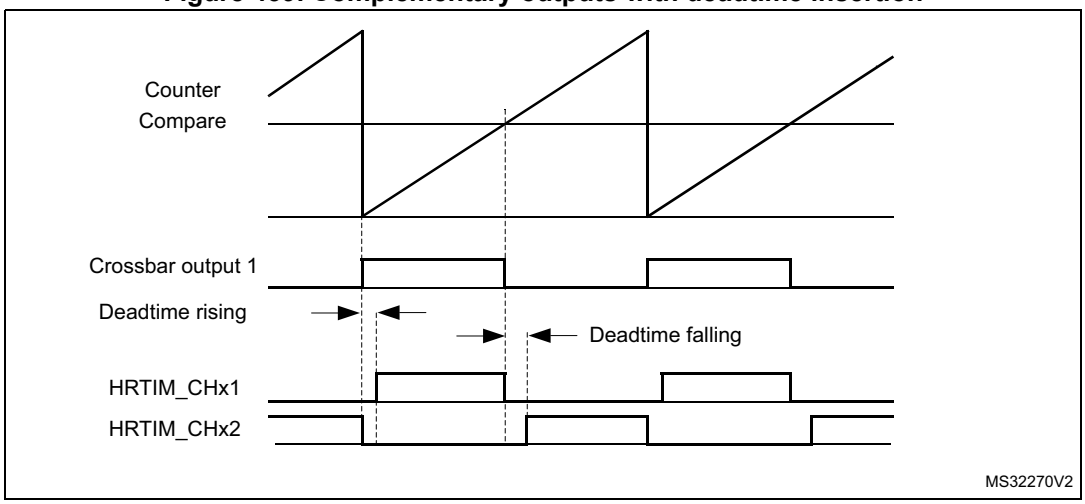
Figure 437. Push-Pull with deadtime



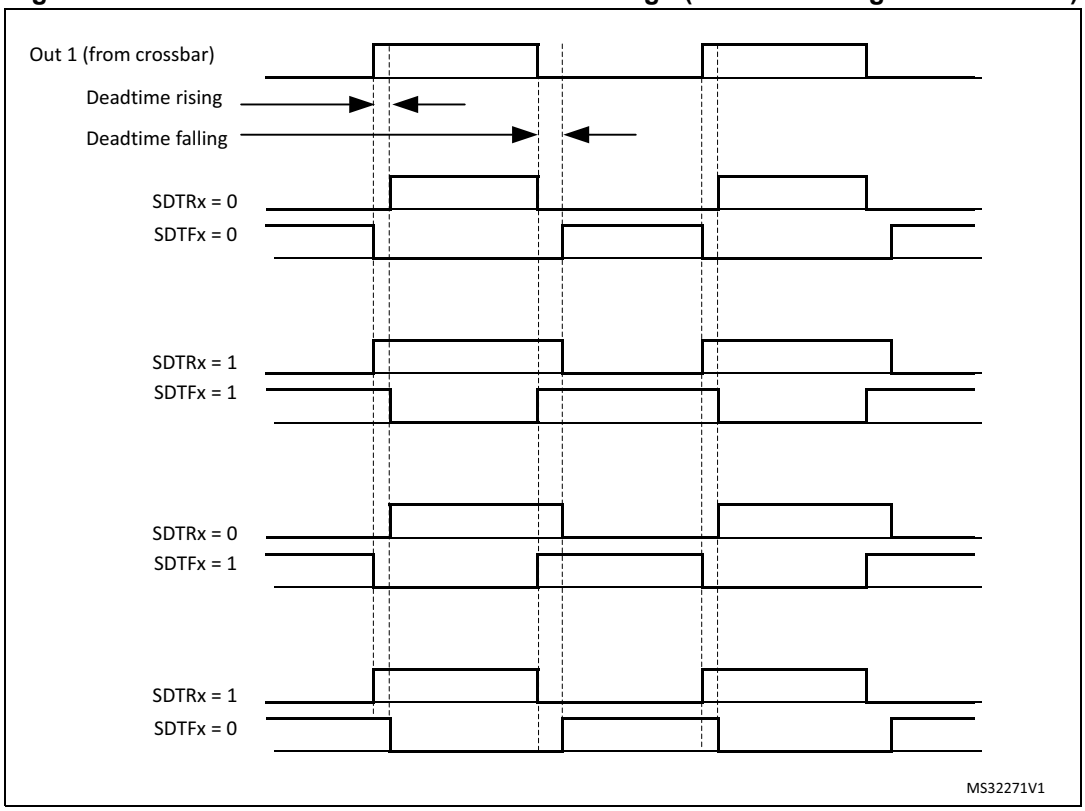
Deadtime

A deadtime unit is used to generate a couple of complementary signals from a single reference waveform, with programmable delays between active state transitions. This is commonly used for topologies using half-bridges or full bridges. It simplifies the software: only one waveform is programmed and controlled to drive two outputs.



The deadtime is enabled by setting DTEN bit in HRTIM_OUTxR register. The complementary signals are built based on the reference waveform defined for output 1, using HRTIM_SETx1R and HRTIM_RSTx1R registers: HRTIM_SETx2R and HRTIM_RSTx2R registers are not significant when DTEN bit is set, as shown on *Figure 438*.

Figure 438. Deadtime generation



Two deadtimes can be defined in relationship with the rising edge and the falling edge of the reference waveform, as in *Figure 439*.

Figure 439. Complementary outputs with deadtime insertion

Negative deadtime values can be defined when some control overlap is required. This is done using the deadtime sign bits (SDTFx and SDTRx bits in HRTIM_DTxR register). *Figure 440* shows complementary signal waveforms depending on respective signs.

Figure 440. Deadtime insertion versus deadtime sign (1 indicates negative deadtime)

The deadtime values are defined with DTFx[8:0] and DTRx[8:0] bitfields and based on a specific clock prescaled according to DTPRSC[2:0] bits, as follows:

$t_{DTx} = \pm DTx[8:0] \times t_{DTG}$

where x is either R or F and $t_{DTG} = (2^{(DTPRSC[2:0])}) \times t_{HRTIM}$.

Table 342 gives the resolution and maximum absolute values depending on the prescaler value.

Table 342. Deadtime resolution and max absolute values

DTPRSC[2:0]	t_{DTG}	t_{DTx} max	f_{HRTIM}= 520 MHz	
			t_{DTG} (ns)	$\|t_{DTx}\|$ max (µs)
011	t_{HRTIM}	511 * t_{DTG}	1.9	0.98
100	2 * t_{HRTIM}		3.8	1.96
101	4 * t_{HRTIM}		7.7	3.93
110	8 * t_{HRTIM}		15.4	7.86
111	16 * t_{HRTIM}		30.8	15.7

Figure 441 to *Figure 444* present how the deadtime generator behaves for reference waveforms with pulsewidth below the deadtime values, for all deadtime configurations.

Figure 441. Complementary outputs for low pulsewidth (SDTRx = SDTFx = 0)

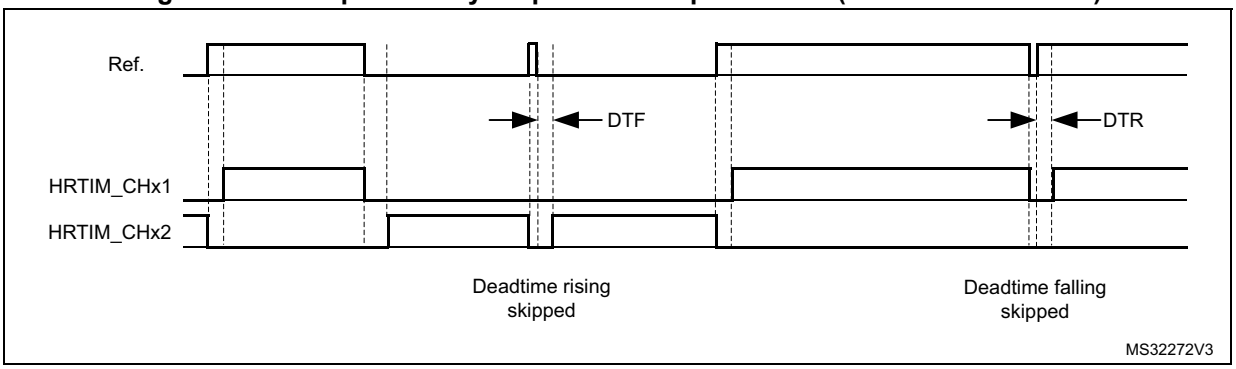


Figure 442. Complementary outputs for low pulsewidth (SDTRx = SDTFx = 1)

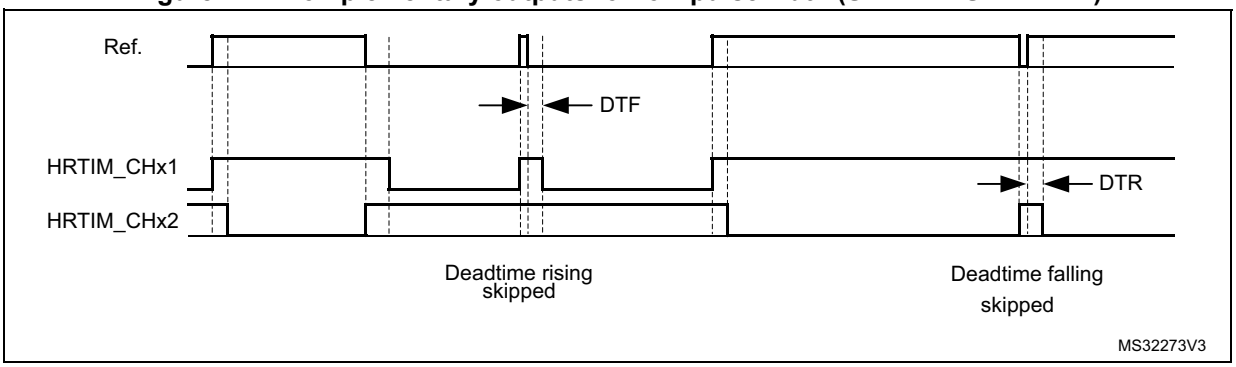

Figure 443. Complementary outputs for low pulsewidth (SDTRx = 0, SDTFx = 1)

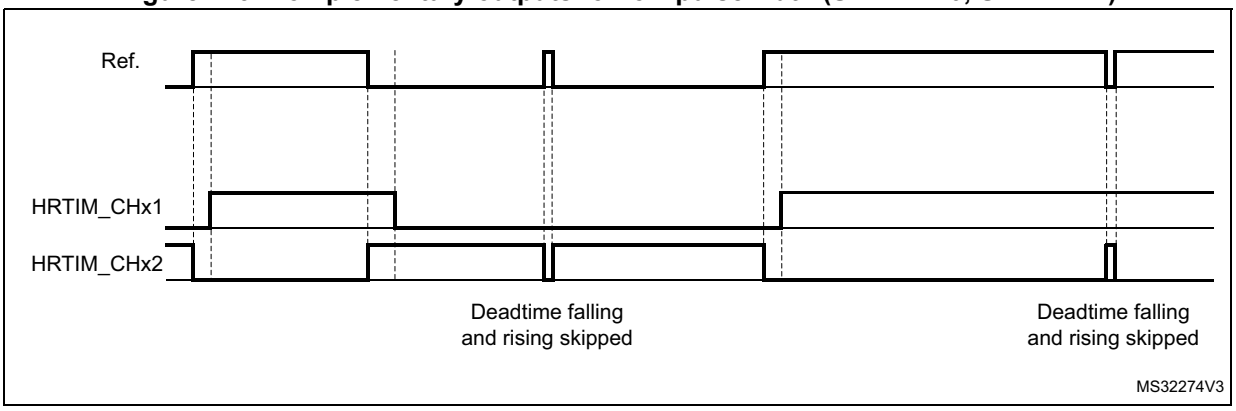

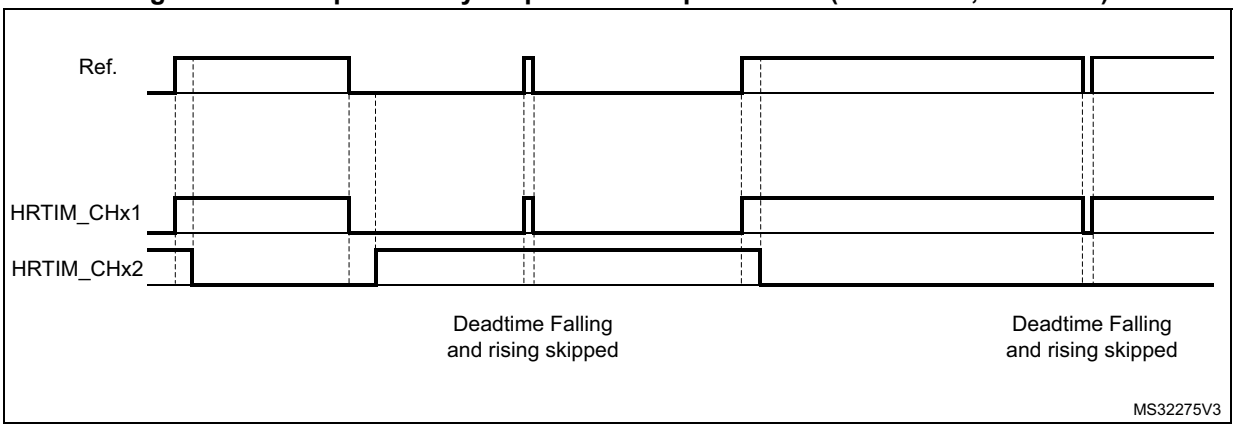

Figure 444. Complementary outputs for low pulsewidth (SDTRx = 1, SDTFx=0)

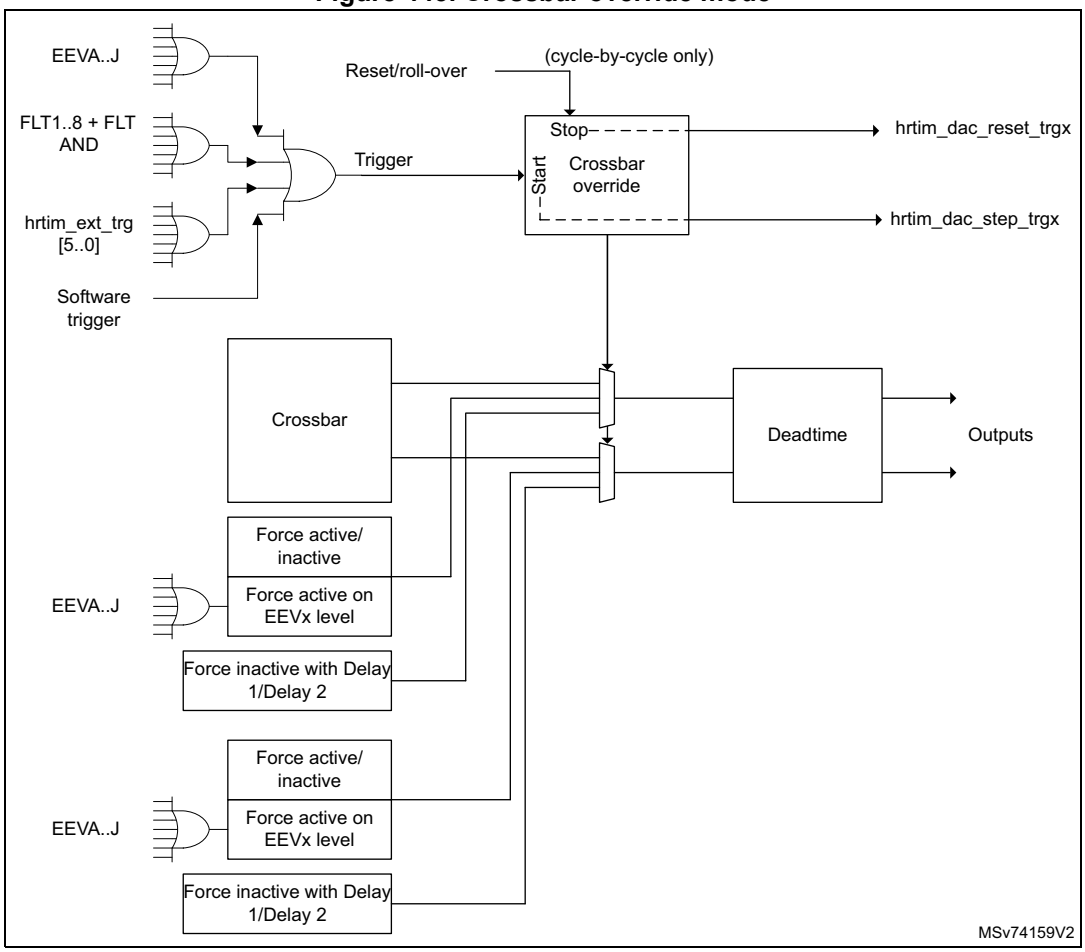
For safety purposes, it is possible to prevent any spurious write into the deadtime registers by locking the sign and/or the value of the deadtime using DTFLKx, DTRLKx, DTFSLKx, and DTRSLKx. Once these bits are set, the related bits and bitfields are becoming read only until the next system reset.

The DTEN bit is preloaded, and can be written while the timer is enabled.



Caution: DTEN bit must not be changed when the timer outputs are set/reset by another timer (while TxEN is reset)

Note: For the particular case where DTEN must be set while the burst mode is enabled with a deadtime upon entry (BME = 1, DIDL = 1, IDLEM = 1), it is necessary to force the two outputs in their IDLES state by software commands (SST, RST bits) before setting DTEN bit. This is to avoid any side effect resulting from a burst mode entry that would happen immediately before a deadtime enable.

Crossbar override

This mode gives the possibility to override the output crossbar programming and take over the output control to force a level based on a fixed setting or based on a given external event or fault, as shown on *Figure 445* below.

Figure 445. Crossbar override mode

This mode is triggered on one or multiple sources selected in HRTIM_COTRGxR register:

- Software trigger
- Fault 1..8 and AND combined faults inputs
- External events A..J
- Six external crossbar override triggers hrtim_ext_trg[5:0]

Once the crossbar override mode is entered, specific external events will force high or low the outputs when active.

The crossbar override logic provides 2 options:

- Latched: once triggered, the crossbar override mode is maintained until a software intervention to disengage it.
- Cycle-by-cycle mode: the crossbar override mode exits automatically and normal operation is resumed by hardware. Typically, the system will re-arm once the over-

current condition has disappeared.
This mode is only applicable in force on event mode (COFMx[2:0] = 100).

In cycle-by-cycle mode (COM bit reset in HRTIM_TIMxCR2), the Crossbar override function is disengaged when both:

- The trigger event is inactive
- The next reset/roll-over happens (conditioned by ROM[1:0] in center-aligned mode)

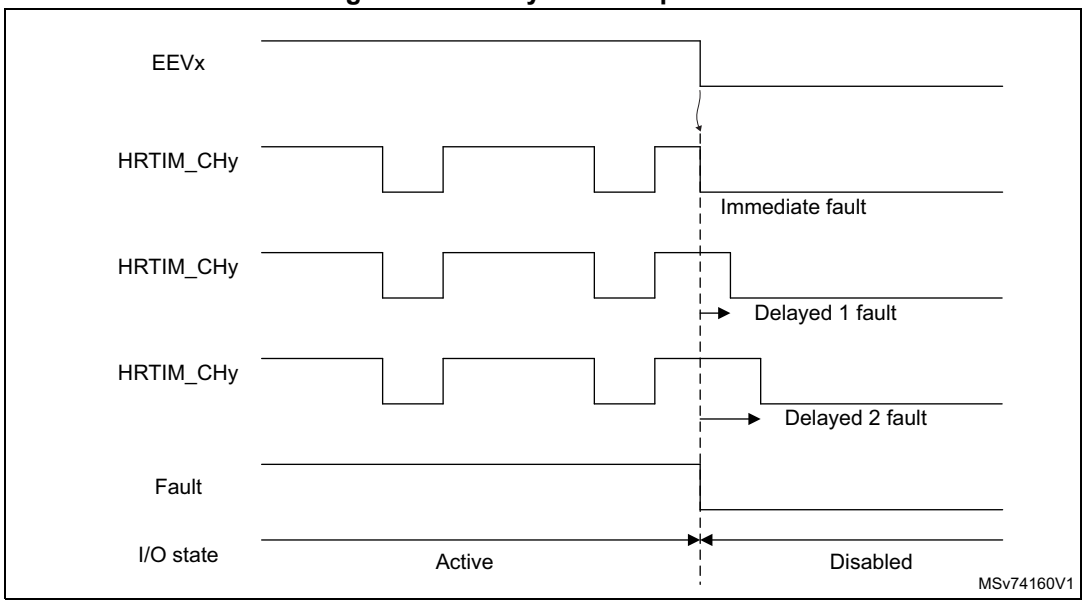
In latched mode (COM bit set in HRTIM_TIMxCR2), the crossbar override mode can be disengaged in two ways:

- With the rearm bit COR in HRTIM_TIMxCR2. The rearming will be effective only of the trigerring condition has disappeared (status can be polled using the COTS bit in the HRTIM_TIMxISR register).
- With the COE bit reset, to disable it permanently.

The DAC values can be updated synchronously with the crossbar override mode triggering. The triggers are generated when the DCDCOE (Dual Channel DAC Crossbar Override Enable) bit is set in HRTIM_TIMxCR2 (the DCDE value is overridden when DCDCOE=1).

- hrtim_dac_reset_trgx triggers are generated only in cycle-by-cycle mode when the crossbar override stops, and DCDR setting applies.
- hrtim_dac_step_trgx triggers are generated when the crossbar override starts.

The crossbar override mode provides several options, defined independently for each output with the COFMA[2:0] and COFMB[2:0] bitfields in the HRTIM_COFExR registers.



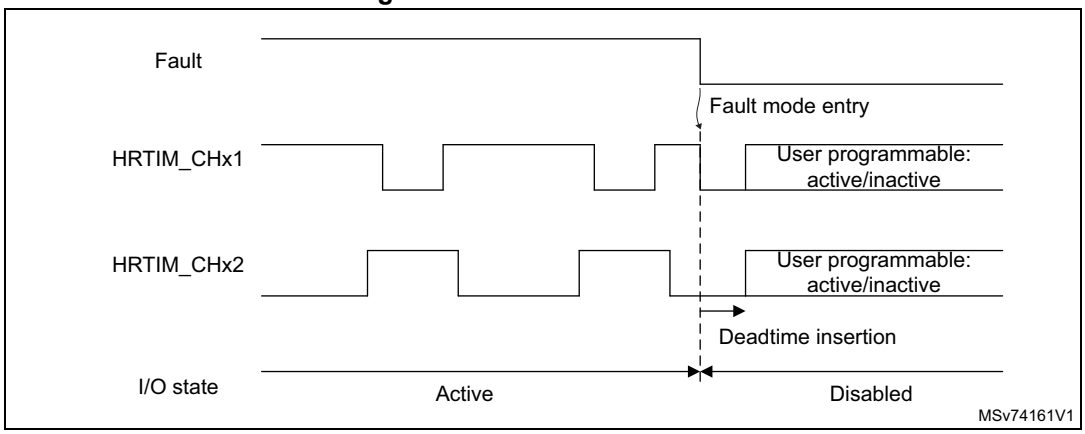
Delayed fault operation

This mode is enabled with COFMx[2:0] = 000 and 001. When the crossbar override mode is triggered, the output level is maintained as it is and forced to the inactive state after a programmable duration. The purpose of this mode is have a delayed shutdown sequence for multi-level inverters. 2 delays can be selected for a given output: Delay 1 with COFMx[2:0] = 000 or Delay 2 with COFMx[2:0] = 001, as shown on *Figure 446*.The delay 1/2 durations are defined with the DLYxFLTD[8:0] bitfields in the HRTIM_CODExR register.

This mode can also be used with deadtime disabled (DTEN=0).

Warning: It is mandatory to program a Delay 2 duration above the Delay 1 duration: DLY2FLTD[8:0] > DLY1FLTD[8:0].

Figure 446. Delayed fault operation

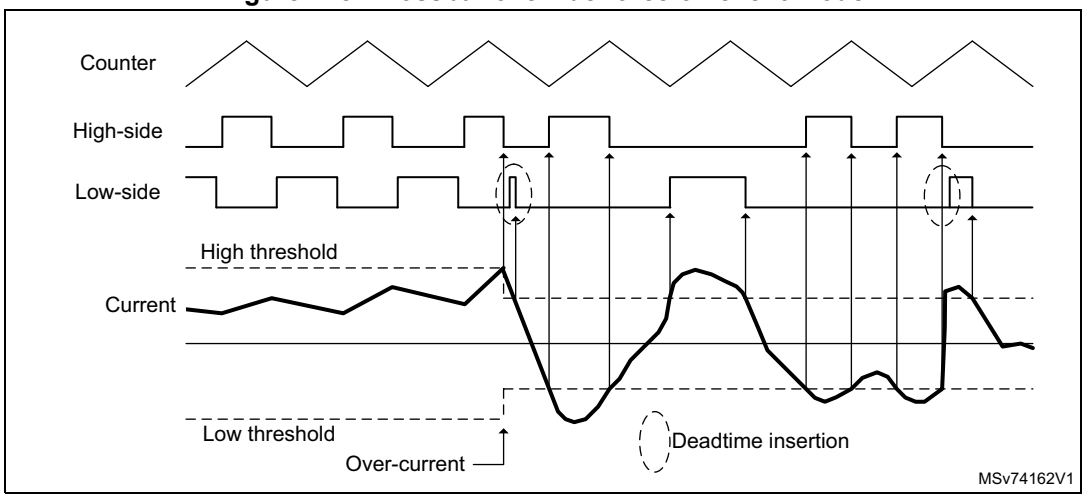


Deadtime on Fault

This mode is enabled with COFMx[2:0] = 010 and 011. When the crossbar override mode is triggered, the output level is forced to an active or inactive state, as shown on *Figure 447* below. As the crossbar override logic is placed prior to the deadtime insertion logic, this mechanism guarantees that an output can be force active without any risk of deadtime violation. If both outputs are forced to the active state, both output 1 and output 2 are forced inactive.

This mode cannot be used with deadtime disabled (DTEN = 0).

Figure 447. Deadtime on Fault



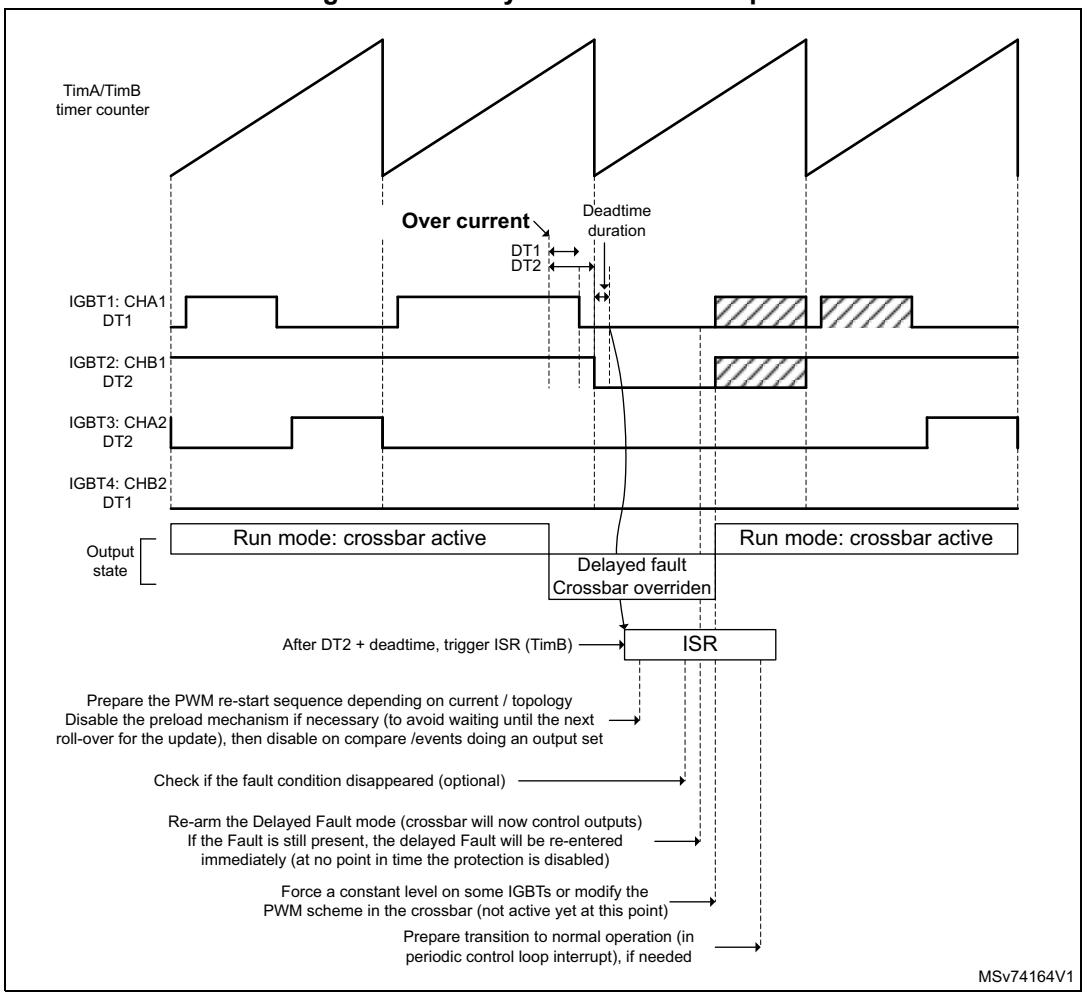
Force on event

This mode is enabled with COFMx[2:0] = 100. When the crossbar override mode is triggered, the output level is forced active on the event selected in the EEVxFRCA and EEVxFRCB bits, in the HRTIM_COFExR register, as shown on *Figure 448* below.

This mode cannot be used with deadtime disabled (DTEN = 0).

Figure 448. Crossbar override force on event mode

Status bits and interrupts



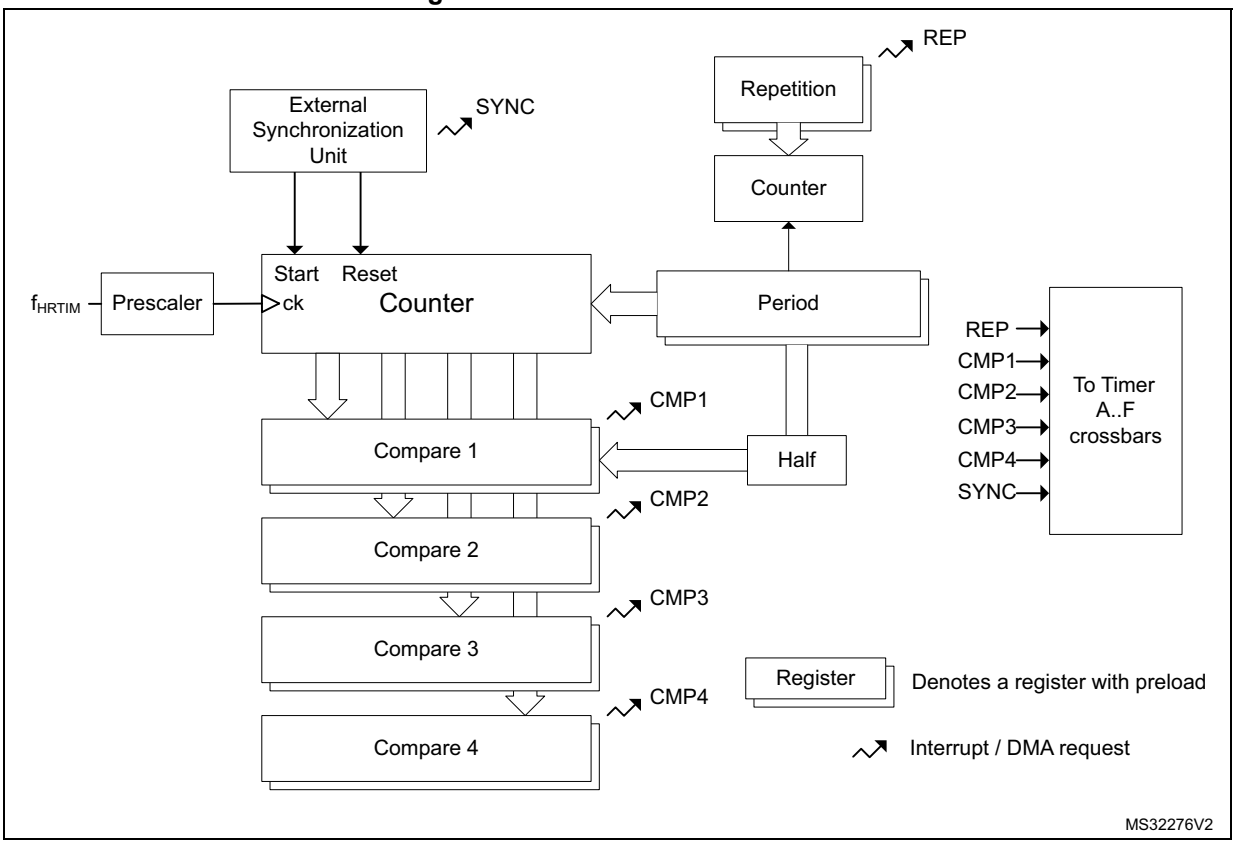
Two status bits are available for software polling, in the HRTIM_TIMxISR register. The COS bit indicates if the crossbar override mode is active, or if the regular crossbar operation is active or was resumed.The COTS bit indicates if the crossbar override trigger is active or not, and can be polled before rearming the crossbar override mode. Both bits are only status bits.

Two interrupts are available. The crossbar override trigger interrupt indicates that regular crossbar operation was interrupted and crossbar override mode was started (COT interrupt flag in HRTIM_TIMxISR). The crossbar override ream delay elapsed interrupt (CORDE interrupt flag in HRTIM_TIMxISR) indicates that the regular crossbar mode can be rearmed. This flag is raised once the Delay 2 period plus the deadtime duration is elapsed, to indicate that the crossbar override delayed fault entry sequence is completed before rearming.

Any rearming attempt before CORDE interrupt is ignored. The *Figure 449* below gives an example of a delayed fault exit sequence [To be completed and reworked].

This CORDE interrupt is generated only when at least on of the one of the 2 channels is configured to Delayed fault force modes (COFMx[2:0] = 000 and 001).

Figure 449. Delayed Fault exit example



33.3.5 Master timer

The main purpose of the master timer is to provide common signals to the 6 timing units, either for synchronization purpose or to set/reset outputs. It does not have direct control over any outputs, but still can be used indirectly by the set/reset crossbars.

Figure 450 provides an overview of the master timer.

Figure 450. Master timer overview

The master timer is based on the very same architecture as the timing units, with the following differences:

- It does not have outputs associated with, nor output related control
- It does not have its own crossbar unit, nor push-pull or deadtime mode
- It can only be reset by the external synchronization circuitry
- It does not have a capture unit, nor the autodelayed mode
- It does not include external event blanking and windowing circuitry
- It has a limited set of interrupt/DMA requests: compare 1..4, repetition, register update and external synchronization event.

The master timer control register includes all the timer enable bits, for the master and timer A..F timing units. This allows to have all timer synchronously started with a single write access.

It also handles the external synchronization for the whole HRTIM timer (see *Section 33.3.19: Synchronizing the HRTIM with other timers or HRTIM instances*), with both MCU internal and external (inputs/outputs) resources.

Master timer control registers are mapped with the same offset as the timing units' registers.

33.3.6 Up-down counting mode

The HRTIM is natively designed with up-counters. It offers however an operating mode with up-down counters, also called center-aligned mode.

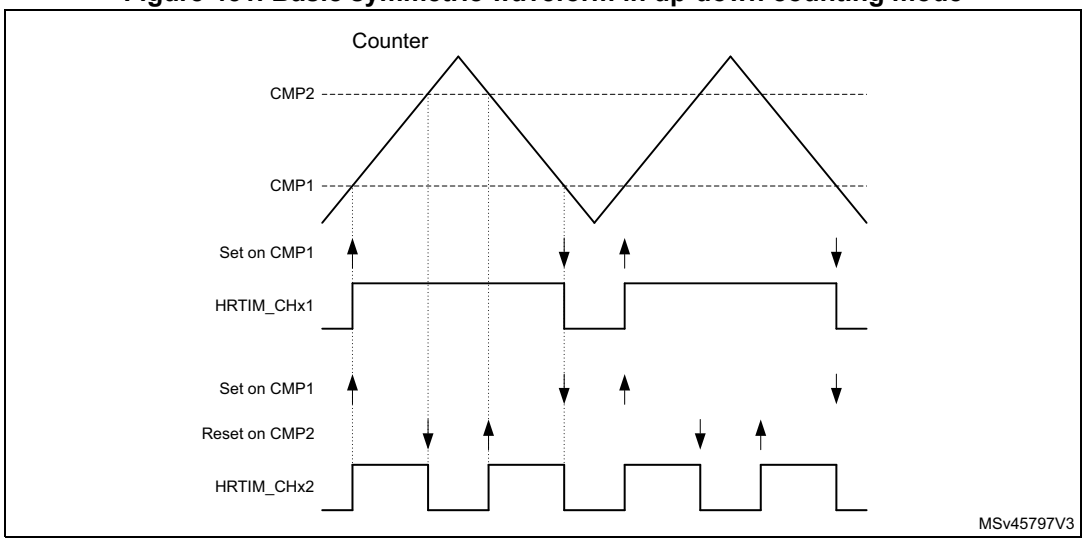
This mode is enabled using the UDM bit in the HRTIM_TIMxCR2 register. This bit must not be changed once the timer is operating (TxEN bit set). It is only available for the TIMA..F. The master timer only works in up-counting mode.

Not all HRTIM features are supported in up-down counting. This section details the functional differences versus up-counting mode.

The period in HRTIM_PERxR must be preloaded (or static) in up-down mode. It can be updated only on period event or on counter reset.

The set/reset crossbar programming differs as follows:

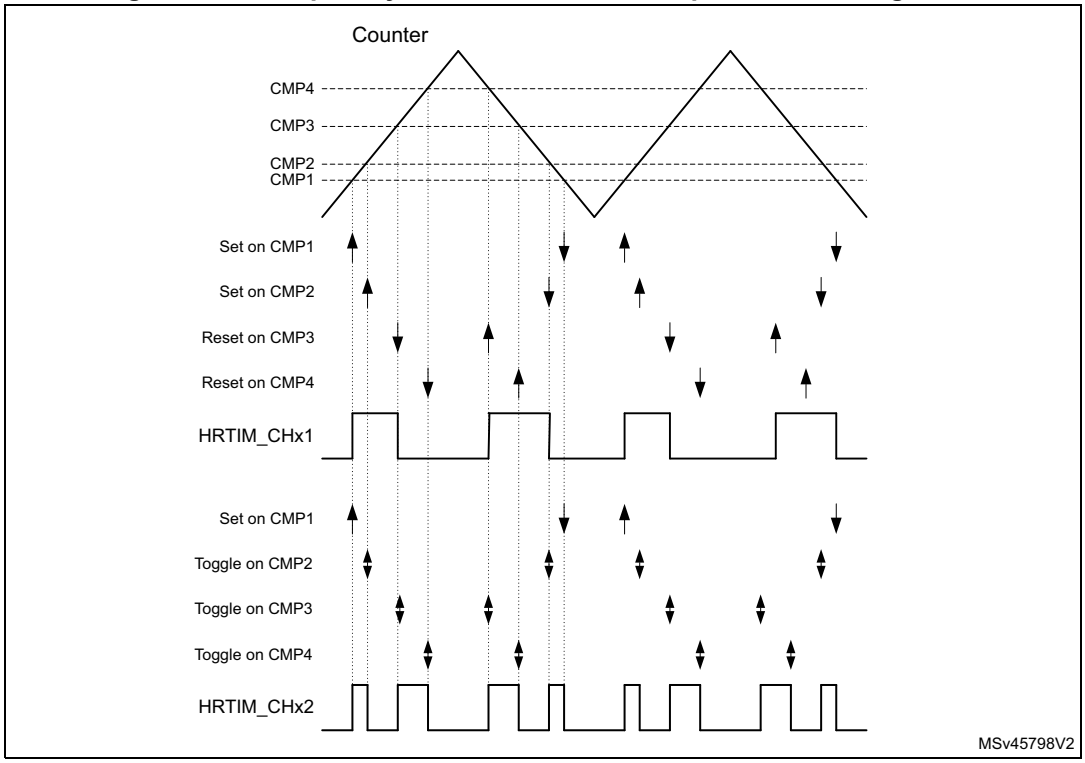
The events coming from the timing units are setting/resetting the outputs depending on the counter up/down direction:



- If the event is enabled in the HRTIM_SETxyR register, it sets the output during up-counting and reset it during down-counting.
- If the event is enabled in the HRTIM_RSTxyR register, it resets the output during up-counting and set it during down-counting.
- If the events are enabled both in HRTIM_SETxyR and HRTIM_RSTxyR registers, the output toggles.

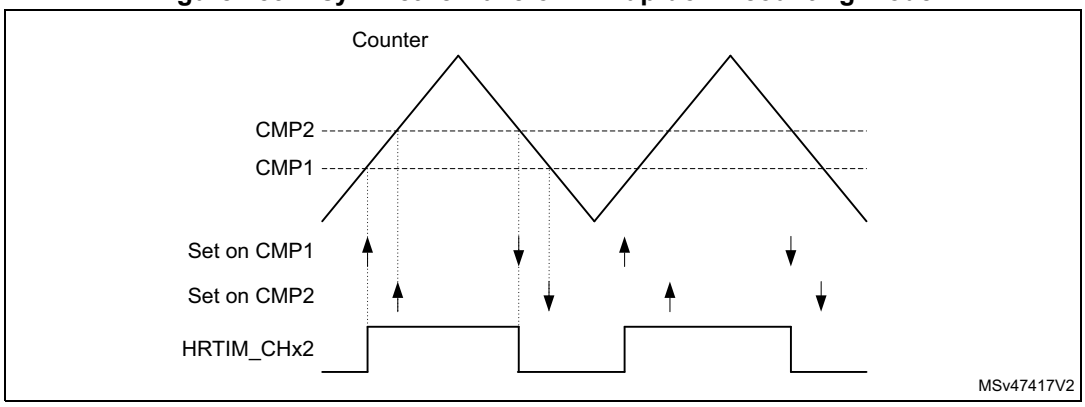
This applies to:

- The timing unit: period, compare 1..4, register update (6 events)
- The master timer: period, compare 1..4, HRTIM synchronization (6 events)
- All other timing units (e.g. timer B..F for timer A): TIMEVNT1..9 (9 events described in *Table 339*).



The *Figure 451* below shows how to generate basic waveforms.

Figure 451. Basic symmetric waveform in up-down counting mode



The *Figure 452* below shows how to generate some more complex waveforms, using the 4 available compare units and the toggle mode.

Figure 452. Complex symmetric waveform in up-down counting mode

The *Figure 453* shows how to generate an asymmetric waveform. In this case, it must be noticed that it is necessary to have compare 2 value greater than compare 1 value for the waveform to be asymmetric.

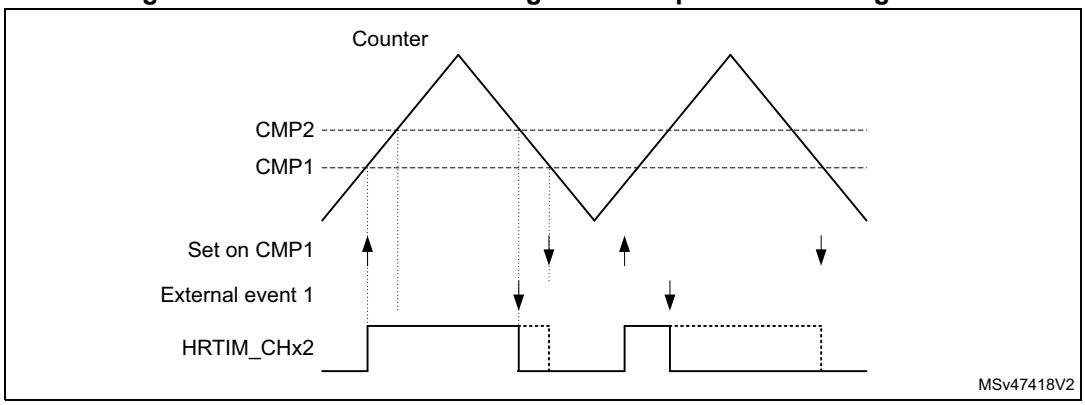


Figure 453. Asymmetric waveform in up-down counting mode

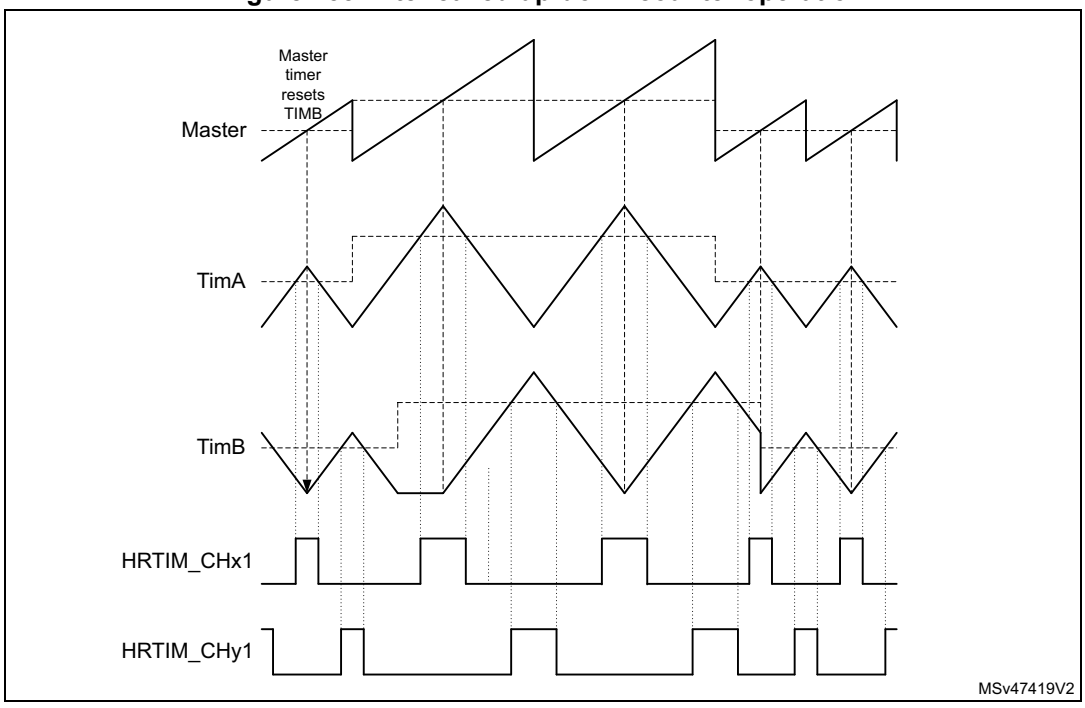
Note: For asymmetric operation, it is required that CMP2 > CMP1.

The behavior of the software forcing bits and external events EXTEVNTA..J is identical for up-only and up-down counting mode. The *Figure 454* below shows how a pulse can be shorten in response to external events.

Figure 454. External event management in up-down counting mode

The up-down counting mode is available for both continuous and single-shot (retriggerable and non-retriggerable) operating modes. A reset causes the counter to re-start from 0. The *Figure 455* below shows the counter behavior in single-shot retriggerable mode, for TIMB.

Figure 455. Interleaved up-down counter operation



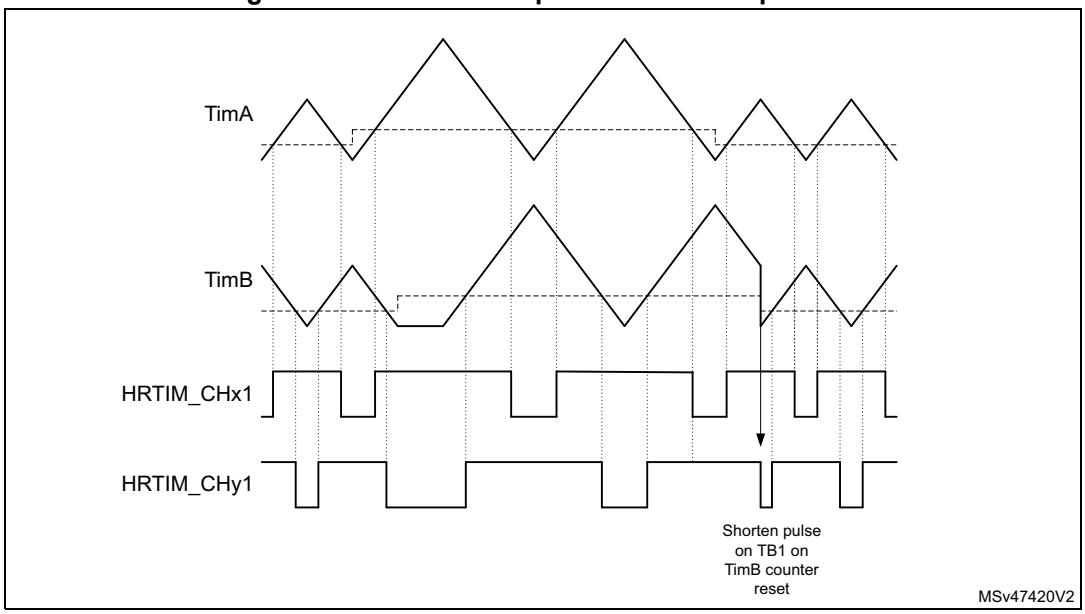


Figure 456. Interleaved up-down counter operation

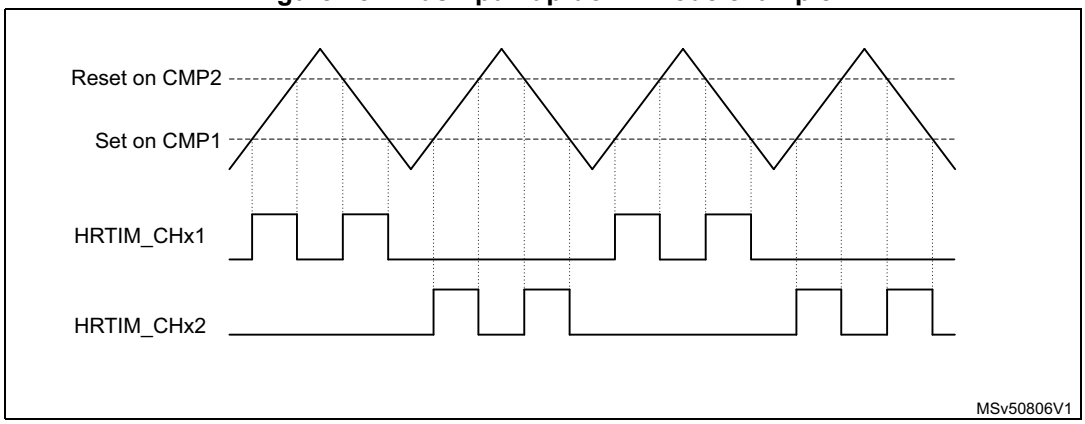
Note: In up-down counting mode, the compare values must be 3 periods of the f_{HRTIM} clock below the period value (TIMx_PER - 0x60 if CKPSC[2:0] = 0, TIMx_PER - 0x30 if CKPSC[2:0] = 1, TIMx_PER - 0x18 if CKPSC[2:0] = 2,...). This applies for the compare events generated inside the timing unit. For compare events generated in other timing units, it is mandatory to avoid any event occurring within less than 1 period of the f_{HRTIM} clock of a counter direction change (counter at 0, period event or counter reset).

The following features are supported in up-down counting mode:

- Half mode
- Deadtime insertion
- Push-pull mode, alternance push-pull done on when counter = 0 (see *Figure 457*).
- Delayed Idle
- Burst mode
- PWM mode with “greater than” comparison (see *Figure 458*).

Figure 457. Push-pull up-down mode example



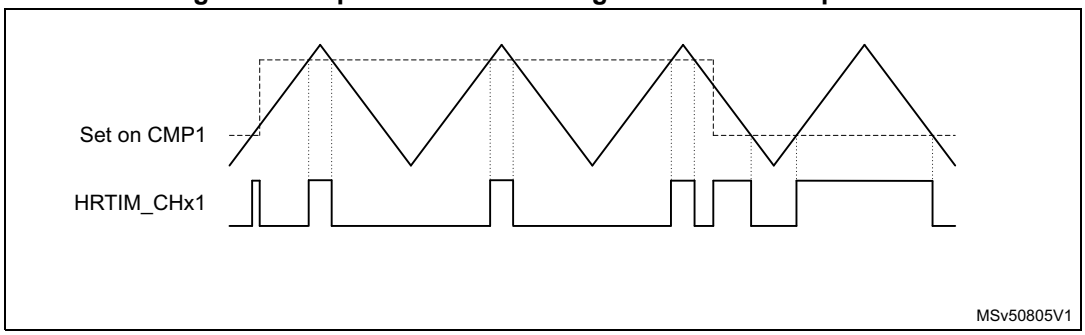


Figure 458. Up-down mode with “greater than” comparison

Caution: The following features are not supported in up-down counting mode:

- Auto-delayed mode
- Balanced Idle
- Triggered-half mode

The capture function is supported with the following differences:

- The capture value is referred to counting start, when up-counting
- The capture value is referred to the PER event when down counting
- The bit 16 of the capture register holds the counting direction status.

The counter roll-over event is defined differently in-up-down counting mode to support various operating condition. It can be either generated:

- When the counter is equal to 0 (“valley” mode)
- When the counter reaches the period value set in the HRTIM_PERxR (“crest” mode)
- When both conditions are met (either 0 or HRTIM_PERxR value).

This event is used for multiple purposes in the HRTIM. The generation mode (valley, crest or both) can be programmed individually depending on the destination. *Table 343* summarizes the use cases and associated roll-over mode (xxROM[1:0]) programming bits in the HRTIM_TIMxCR2 register.

Table 343. Roll-over event destination and mode programming

Roll-over event use	Programming bits
Output set/reset	OUTROM[1:0]
Register content update trigger (transfer from preload to active)	ROM[1:0]
IRQ and/or DMA request trigger	ROM[1:0]
Burst mode clock source and /or burst start trigger	BMROM[1:0]
ADC trigger (see *Section : ADC postscaler* for details)	ADROM[1:0]
External event filtering	ROM[1:0]
Repetition counter decrement	ROM[1:0]
Fault and event counter	FEROM[1:0]

Note: For events where both reset and roll-over are considered (IRQ/DMA and TxRSTU), the xxROM[1:0] influences both the reset and roll-over generation. The reset event is propagated only when xxROM[1:0] = 00 or 01, regardless of the counting direction.

The roll-over event generation is defined as per following xxROM[1:0] bitfield setting:

- xxROM[1:0] = 00: event generated when any of these three conditions are met: counter = 0, counter = HRTIM_PERxR or counter reset.
- xxROM[1:0] = 01: event generated when the counter is equal to 0 (“valley” mode) or when the counter is reset
- xxROM[1:0] = 10: event generated when the counter reaches the period value set in the HRTIM_PERxR (“crest” mode)

The following events are conditioned by the xxROM[1:0] bit fields settings:

- Period event

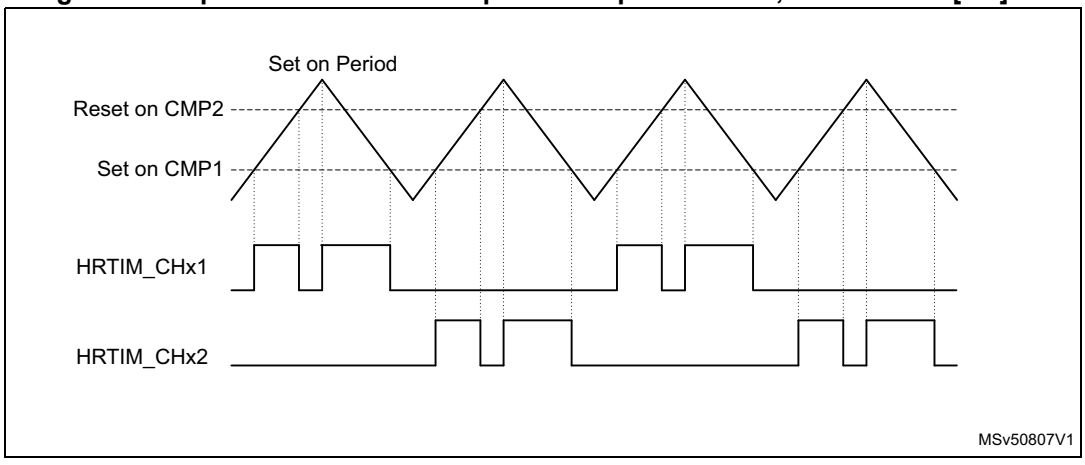
  It can trigger output set/reset (as per OUTROM[1:0] setting), ADC conversions (as per ADROM[1:0] settings) and burst mode (as per BMROM[1:0] settings), both in continuous and single mode, when the period is explicitly listed as trigger source (for instance ADC1TAPER bit set in HRTIM_ADC1R). When both reset and roll-over events are enabled (for instance ADC1TARST bit set in HRTIM_ADC1R), the period event is considered only in continuous mode (roll-over event). In single-shot mode, no event is generated.
- Roll-over event

  This is similar to period event, for what about xxxROM[1:0] programming, and only valid in continuous mode. In single-shot mode, no event is generated.
- Compare event

  It triggers ADC conversion (as per ADROM[1:0] setting):
  - During up-counting if ADROM = 10
  - During down-counting if ADROM = 01
  - During both up and down-counting if ADROM = 00

Figure 459 here-below shows a push-pull up-down mode with set on period event and OUTROM[1:0] =10.

Figure 459. Up-down mode with output set on period event, for OUTROM[1:0]=10



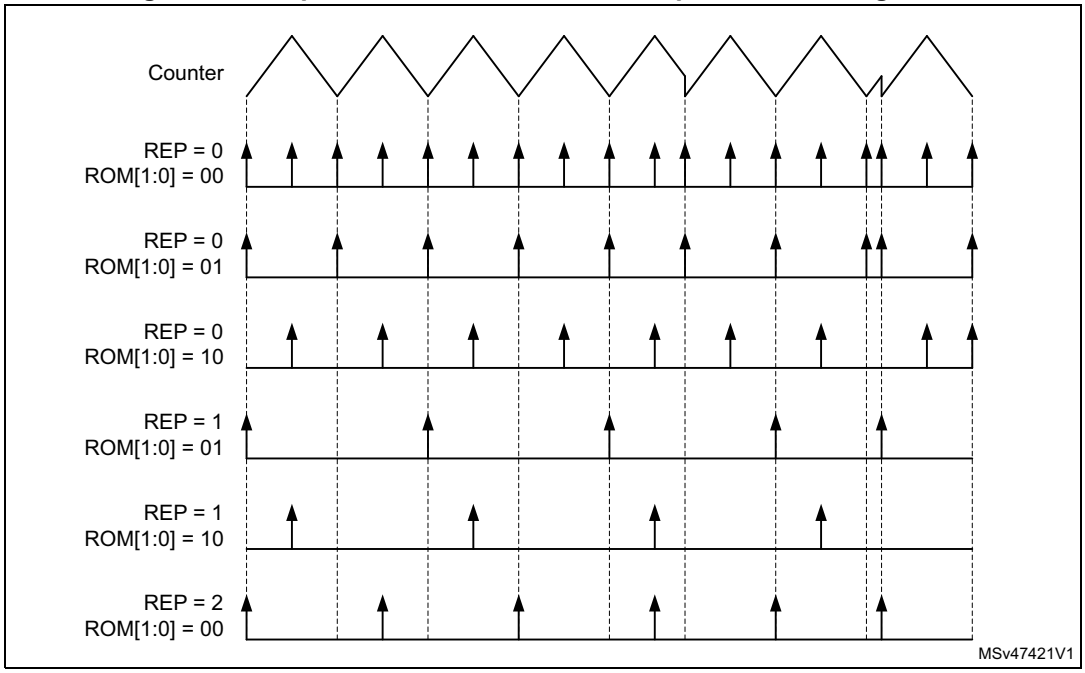


Figure 460 below shows how the repetition counter is decremented in up-down counting mode.

Figure 460. Repetition counter behavior in up-down counting mode

The dual channel DAC triggers are working as for the up-counting mode.

The event blanking and windowing differs so as to have the blanking or windowing done within the output pulse, at a programmable time. The EExFLTR[3:0] codes are depending on the UDM bit setting, as per the *Table 344* below. Whenever the roll-over event is used for blanking or windowing, the ROM[1:0] programming applies for defining when it is generated.

Table 344. EExFLTR[4:0] codes depending on UDM bit setting

EExFLTR[4:0]	Up-counting mode (UDM = 0)	Up/down-counting mode (UDM = 1)
00010	Blanking from counter reset/roll-over to compare 2	Blanking from compare 1 to compare 2, only during the up-counting phase
00100	Blanking from counter reset/roll-over to compare 4	Blanking from compare 3 to compare 4, only during the up-counting phase
01101	Windowing from counter reset/roll-over to compare 2	Windowing from compare 2 to compare 3, only during the up-counting phase
01110	Windowing from counter reset/roll-over to compare 3	Windowing from compare 2 to compare 3, only during the down-counting phase
01111	Windowing from another timing unit: TIMWIN source (see *Table 349* for details)	Windowing from compare 2 during the up-counting phase to compare 3 during the down-counting phase

33.3.7 Set/reset events priorities and narrow pulses management

This section describes how the output waveform is generated when several set and/or reset requests are occurring within 3 consecutive t_{HRTIM} periods.

An arbitration is performed during each t_{HRTIM} period, in 2 steps:

1. For each active event, the desired output transition is determined (set, reset or toggle).
2. A predefined arbitration is performed among the active events, see *Section : Concurrent set requests/Concurrent reset requests*).

When set and reset requests from two different sources occur simultaneously or within the same t_{HRTIM} interval, the reset request has the highest priority, unless the set and reset requests originate from the same timing unit. In this case, the CMPx priority scheme applies. For example, consider CMP2 and CMP4:

- If CMP2 performs a set operation and CMP4 performs a reset operation, the output is reset.
- If CMP2 performs a reset operation and CMP4 performs a set operation, the output is set.

Concurrent set requests/Concurrent reset requests

When multiple sources are selected for a set event, an arbitration is performed when the set requests occur within the same f_{HRTIM} clock period.

In case of multiple requests from adjacent timers (TIMEVNT1..9), the request which occurs first is taken into account. The arbitration is done in 2 steps, depending onthe source (from the highest to the lowest priority): CMP4 ⟶ CMP3 ⟶ CMP2 ⟶ CMP1.

If multiple requests from the master timer occur within the same f_{HRTIM} clock period, a predefined arbitration is applied and a single request is taken into account (from the highest to the lowest priority):

MSTCMP4 → MSTCMP3 → MSTCMP2 → MSTCMP1 → MSTCMPER

When multiple requests internal to the timer occur within the same f_{HRTIM} clock period, a predefined arbitration is applied and the requests are taken with the following priority, whatever the effective timing (from highest to lowest):

CMP4 → CMP3 → CMP2 → CMP1 → PER

Note: Practically, this is of a primary importance when multiple compare events can be simultaneously generated or when using autodelayed compare 2 and compare 4 simultaneously (i.e. when the effective set/reset cannot be determined a priori because it is related to an external event). In this case, the highest priority signal must be affected to the CMP4 event.

Last, the highest priority is given to non timing-related: EXTEVNT1..10, RESYNC (coming from SYNC event if SYNCRSTx or SYNCSTRTx is set or from a software reset), update and software set (SST).

As a summary, in case of simultaneous events, the effective set (reset) event is arbitrated between:

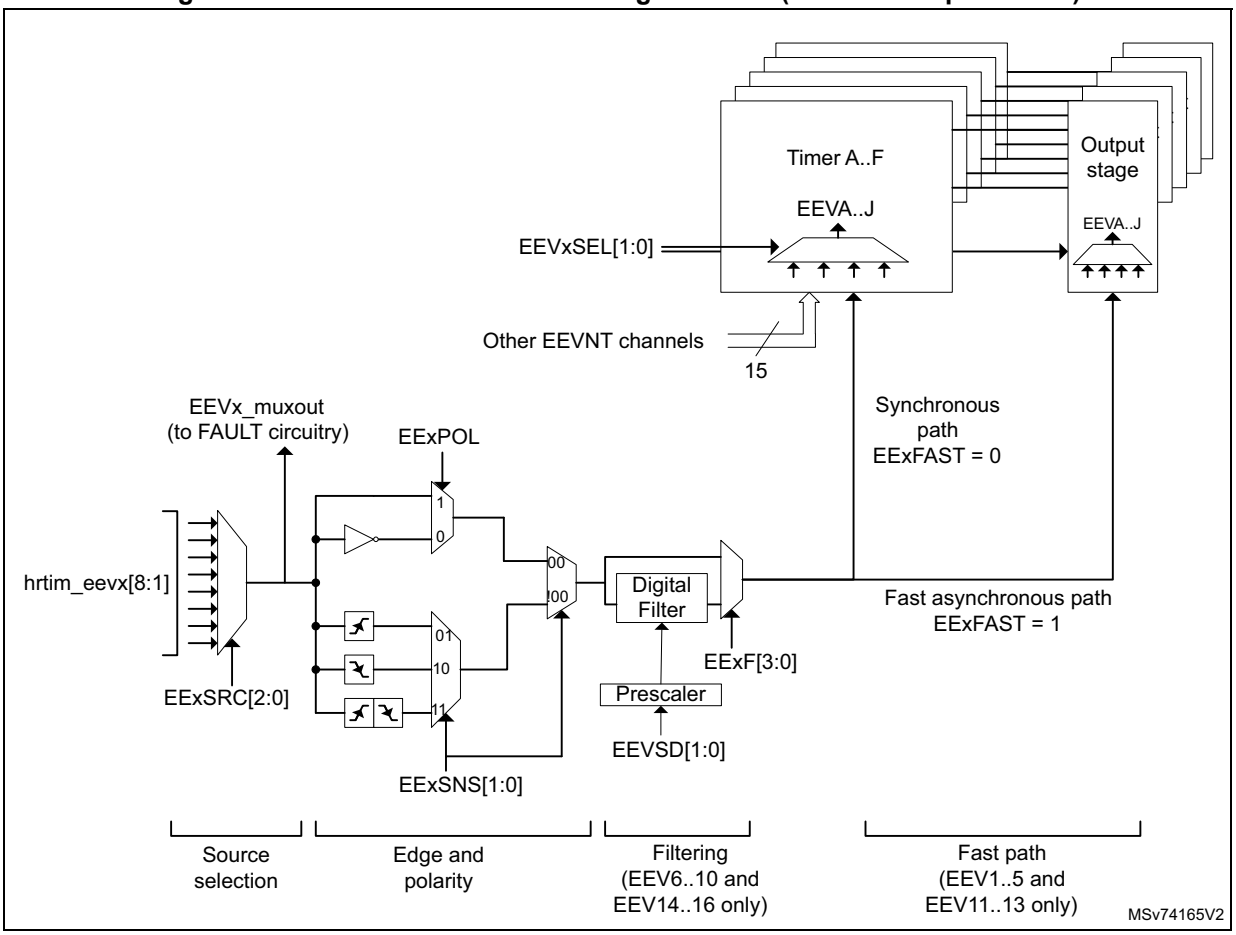
- Any TIMEVNT1..9 event
- A single source from the master (as per the fixed arbitration given above)
- A single source from the timer
- The “non timing-related events”.

The same arbitration principle applies to concurrent reset requests. In this case, the reset request has the highest priority, unless the set and reset requests originate from the same timing unit. In this situation, the CMPx priority scheme applies.

A set or reset event occurring within the prescaler clock cycle is delayed to the next active edge of the prescaled clock (as for a counter reset), even if the arbitration is still performed every t_{HRTIM} cycle.

If a reset event is followed by a set event within the same prescaler clock cycle, the latest event is considered.

33.3.8 External events global conditioning



The HRTIM timer can handle events not generated within the timer, referred to as “external event”. These external events come from multiple sources, either on-chip or off-chip:

- built-in comparators,
- digital input pins (typically connected to off-chip comparators and zero-crossing detectors),
- on-chip events for other peripheral (ADC’s analog watchdogs and general purpose timer trigger outputs).

The external events conditioning circuitry allows to select the signal source for a given channel (with a 8:1 multiplexer) and to convert it into an information that can be processed by the crossbar unit (for instance, to have an output reset triggered by a falling edge detection on an external event channel).

Up to 16 external event channels can be conditioned and are available simultaneously for any of the 6 timers. This conditioning is common to all timers, since this is usually dictated by external components (such as a zero-crossing detector) and environmental conditions (typically the filter set-up is related to the applications noise level and signature). *Figure 461* presents an overview of the conditioning logic for a single channel.

Figure 461. External event conditioning overview (1 channel represented)

The 16 external events are initialized using the HRTIM_EECR1, HRTIM EECR2, HRTIM_EECR4, HRTIM_EECR5 and HRTIM EECR7 registers:

- To select up to 8 sources with the EExSRC[2:0] bits,
- To select the sensitivity with EExSNS[1:0] bits, to be either level-sensitive or edge-sensitive (rising, falling or both),
- To select the polarity, in case of a level sensitivity, with EExPOL bit,
- To have a low latency mode, with EExFAST bits (see *Section : Latency to external events*), for external events 1 to 5 and external events 11 to 13.

Note: The external events used as triggers for reset, capture, burst mode, ADC triggers and delayed protection are edge-sensitive even if EESNS bit is reset (level-sensitive selection): if POL = 0 the trigger is active on external event rising edge, while if POL = 1 the trigger is active on external event falling edge.

The external events are discarded as long as the counters are disabled (TxCEN bit reset) to prevent any output state change and counter reset, except if they are used as ADC triggers.

Additionally, it is possible to enable digital noise filters, for external events 6 to 10 using EExF[3:0] bits in the HRTIM_EECR3 register and for external events 14 to 16 using EExF[3:0] bits in the HRTIM_EECR6 register.

A digital filter is made of a counter in which a number N of valid samples is needed to validate a transition on the output. If the input value changes before the counter has

reached the value N, the counter is reset and the transition is discarded (considered as a spurious event). If the counter reaches N, the transition is considered as valid and transmitted as a correct external event. Consequently, the digital filter adds a latency to the external events being filtered, depending on the sampling clock and on the filter length (number of valid samples expected).

The sampling clock is either the f_{HRTIM} clock or a specific prescaled clock f_{EEVS} derived from f_{HRTIM}, defined with EEVSD[1:0] bits in HRTIM_EECR3 register.

Table 345 summarizes the available features associated with each of the 10 external events channels.The features and sources are summarized in *Table 326*.

Table 345. External events features

External event channel	Fast mode	Digital filter	Balanced fault timer A,B,C	Balanced fault timer D,E,F

EEVJ	hrtim_eev10	hrtim_eev14	hrtim_ee10 AND hrtim_eev11	hrtim_eev10 AND hrtim_eev14

The external events can be combined (hrtim_eevy AND hrtim_eevz) with EEVxSEL[1:0] = 10 or 11.

They can be combined solely if they both are in same mode:

- hrtim_eey (with fast mode option) and hrtim_eevz (with fast mode option), with both EEyFAST = EEzFAST = 0 or EEyFAST = EEzFAST = 1
- hrtim_eey (with digital filter option) and hrtim_eevz (with fast mode option) with EEzFAST = 0

It is not possible to combine hrtim_eey (with digital filter option) and hrtim_eevz (with fast mode option) with EEzFAST = 1.

When EEVA..EEVJ is resulting from a combination of 2 external events (EEVxSEL[1:0] = 10 or 11), at least one of the 2 inputs must be level sensitive. Having a level sensitive input combined with an edge sensitive input results in an edge sensitive combined signal. This gives the possibility to let an external event be generated depending on the level of an other external event (AND function).

Latency to external events

The external event conditioning gives the possibility to adjust the external event processing time (and associated latency) depending on performance expectations:

- A regular operating mode, in which the external event is resampled with the clock before acting on the output crossbar. This adds some latency but gives access to all

crossbar functionalities. It enables the generation of an externally triggered high-resolution pulse.

- A fast operating mode, in which the latency between the external event and the action on the output is minimized. This mode is convenient for ultra-fast over-current protections, for instance.

EExFAST bits in the HRTIM_EECR1 and HRTIM_EECR4 registers allow to define the operating for channels 1 to 5 and channels 11 to 13. This influences the latency and the jitter present on the output pulses, as summarized in the table below.

Table 347. Output set/reset latency and jitter versus external event operating mode

EExFAST	Response time latency	Response time jitter	Jitter on output pulse (counter reset by ext. event)
0	5 to 6 cycles of f_{HRTIM} clock	1 cycles of f_{HRTIM} clock	No jitter, pulse width maintained with high-resolution
1	Minimal latency (depends whether the comparator or digital input is used)	Minimal jitter	1 cycle of f_{HRTIM} clock jitter pulse width resolution down to t_{HRTIM}

The EExFAST mode is only available with level-sensitive programming (EExSNS[1:0] = 00); the edge-sensitivity cannot be programmed.

It is possible to apply event filtering to fast external events (both blanking and windowing with EExFLTR[3:0] ≠ 0000, see *Section 33.3.9*). In this case, EExLTCHx bit must be reset: the postponed mode is not supported, neither the windowing timeout feature.

Note: The external event configuration (source and polarity) must not be modified once the related EExFAST bit is set.

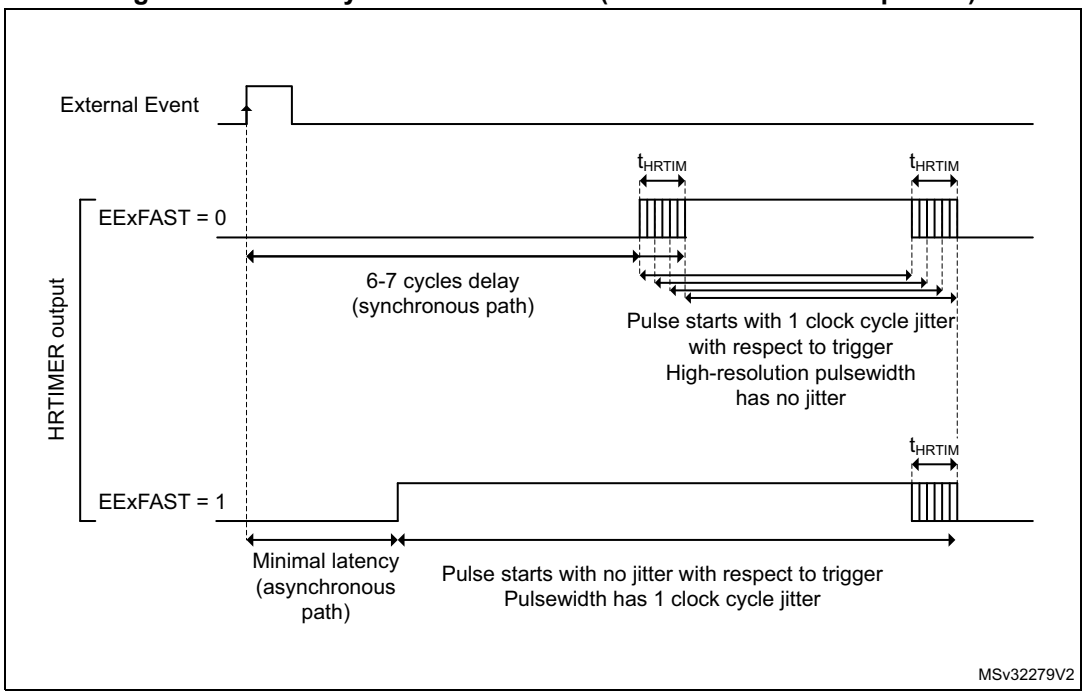
A fast external event cannot be used to toggle an output: if must be enabled either in HRTIM_SETxyR or HRTIM_RSTxyR registers, not in both.

When a set and a reset event - from 2 independent fast external events - occur simultaneously, the reset has the highest priority in the crossbar and the output becomes inactive.

When EExFAST bit is set, the output cannot be changed during the 11 f_{HRTIM} clock periods following the external event.

Figure 462 and *Figure 463* give practical examples of the reaction time to external events, for output set/reset and counter reset.

Figure 462. Latency to external events (counter reset and output set)



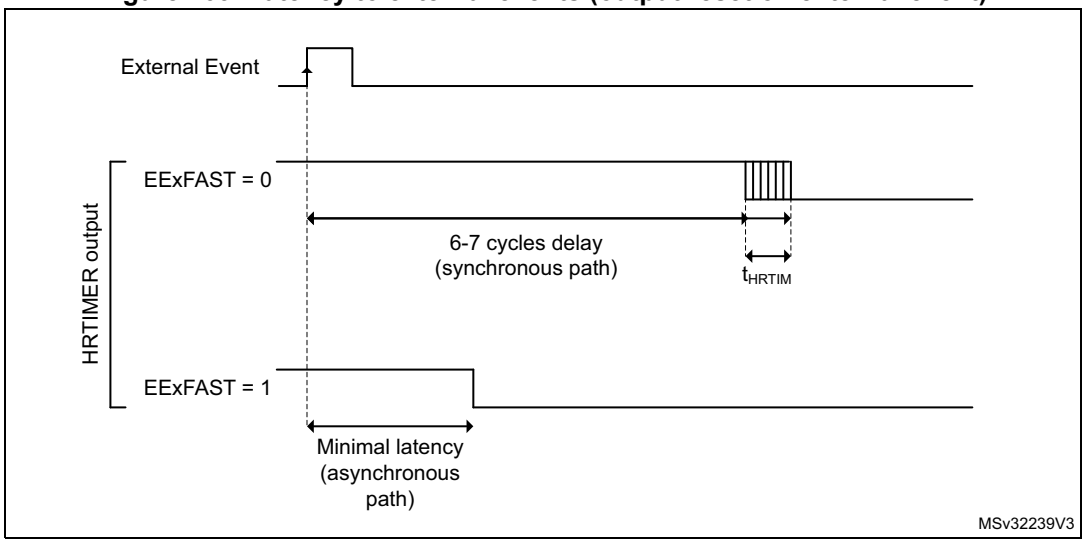


Figure 463. Latency to external events (output reset on external event)

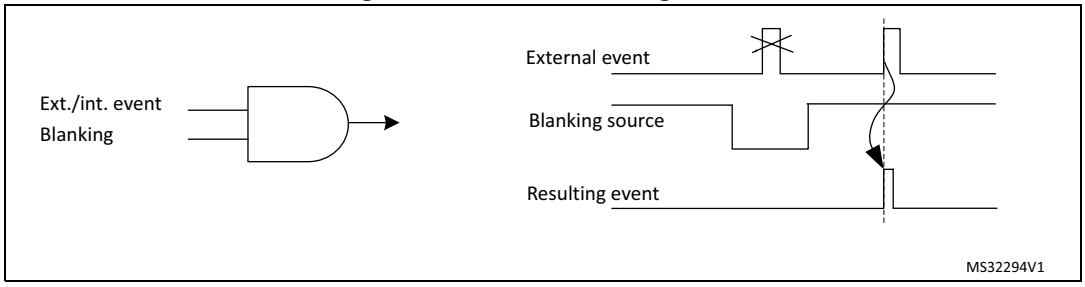
33.3.9 External event filtering in timing units

Once conditioned, the 10 external events are available for all timing units.

They can be used directly and are active as soon as the timing unit counter is enabled (TxCEN bit set).

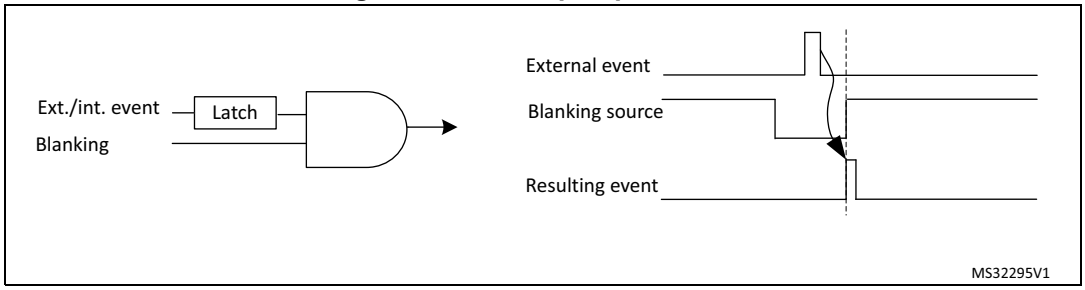
They can also be filtered to have an action limited in time, usually related to the counting period. Two operations can be performed:



- Blanking, to mask external events during a defined time period,
- Windowing, to enable external events only during a defined time period.

These modes are enabled using HRTIM_EExFLTR[3:0] bits in the HRTIM_EEFxR1 and HRTIM_EEFxR2 registers. Each of the 6 timer A..F timing units has its own programmable filter settings for the 10 external events.

Blanking mode



In event blanking mode (see *Figure 464*), the external event is ignored if it happens during a given blanking period. This is convenient, for instance, to avoid a current limit to trip on switching noise at the beginning of a PWM period. This mode is active for EExFLTR[3:0] bitfield values ranging from 0001 to 1100.

Figure 464. Event blanking mode

In event postpone mode, the external event is not taken into account immediately but is memorized (latched) and generated as soon as the blanking period is completed, as shown on *Figure 465*. This mode is enabled by setting EExLTCH bit in HRTIM_EEFxR1 and HRTIM_EEFxR2 registers.

Figure 465. Event postpone mode

The blanking signal comes from several sources:

- the timer itself: the blanking lasts from the counter reset to the compare match (EExFLTR[3:0] = 0001 to 0100 for compare 1 to compare 4). In up/down mode (UDM bit set to 1), the counter reset event is defined as per the ROM[1:0] bit setting.
- from other timing units (EExFLTR[3:0] = 0101 to 1100): the blanking lasts from the selected timing unit counter reset to one of its compare match, or can be fully programmed as a waveform on Tx2 output. In this case, events are masked as long as the Tx2 signal is inactive (it is not necessary to have the output enabled, the signal is taken prior to the output stage).

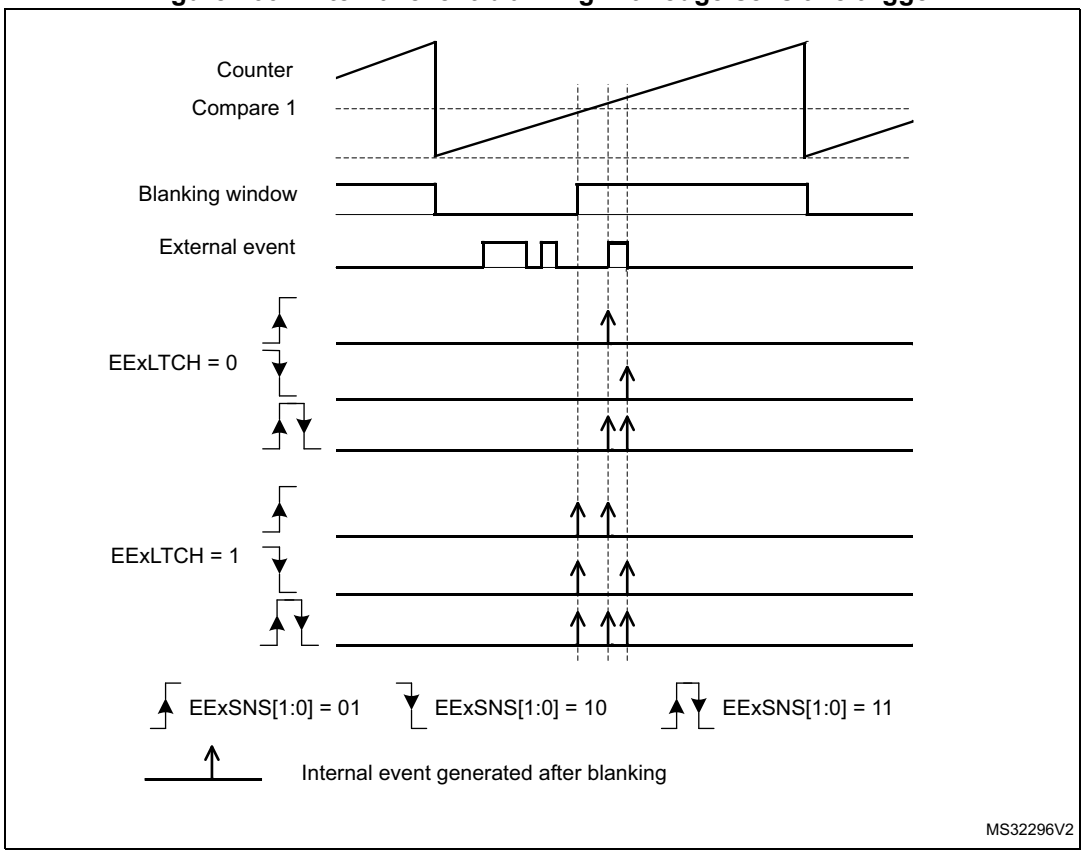
The EEXFLTR[3:0] configurations from 0101 to 1100 are referred to as TIMFLTR1 to TIMFLTR8 in the bit description, and differ from one timing unit to the other. *Table 348* gives the 8 available options per timer: CMPx refers to blanking from counter reset to compare match, Tx2 refers to the timing unit TIMx output 2 waveform defined with HRTIM_SETx2 and HRTIM_RSTx2 registers. For instance, timer B (TIMFLTR6) is timer C output 2 waveform.

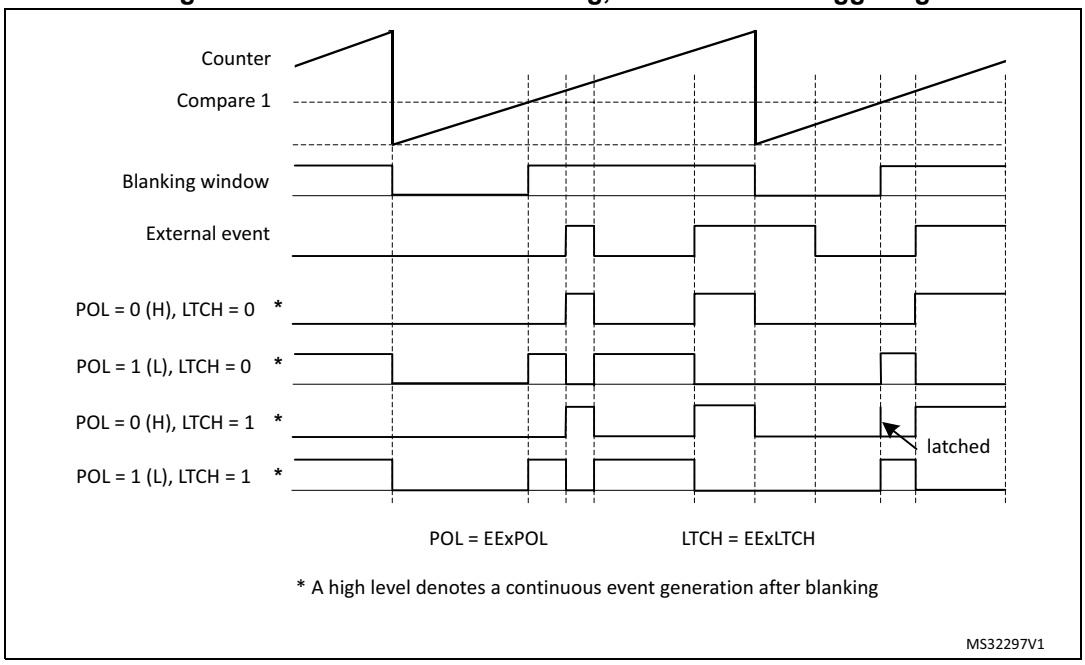
Table 348. Filtering signals mapping per timer

Source		Timer A				Timer B				Timer C				Timer D				Timer E				Timer F			
		CMP1	CMP2	CMP4	TA2	CMP1	CMP2	CMP4	TB2	CMP1	CMP2	CMP4	TC2	CMP1	CMP2	CMP4	TD2	CMP1	CMP2	CMP4	TE2	CMP1	CMP2	CMP4	TF2
Destination	Timer A	-				1	-	2	3	4	-	5	-	7	-	-	-	-	8	-	-	6	-	-	-
	Timer B	1	-	2	3	-				4	5	-	-	-	7	-	-	8	-	-	-	-	6	-	-
	Timer C	-	1	-	-	2	-	3	-	-				5	-	6	7	-	-	8	-	4	-	-	-
	Timer D	1	-	-	-	-	2	-	-	3	4	-	5	-				6	-	7	-	-	-	8	-
	Timer E	-	1	-	-	2	-	-	-	3	-	-	-	6	-	7	8	-				-	-	4	5
	Timer F	-	-	1	-	-	2	-	-	-	-	3	-	-	4	5	-	6	-	7	8	-			

Figure 466 and *Figure 467* give an example of external event blanking for all edge and level sensitivities, in regular and postponed modes.

Figure 466. External event blanking with edge-sensitive trigger





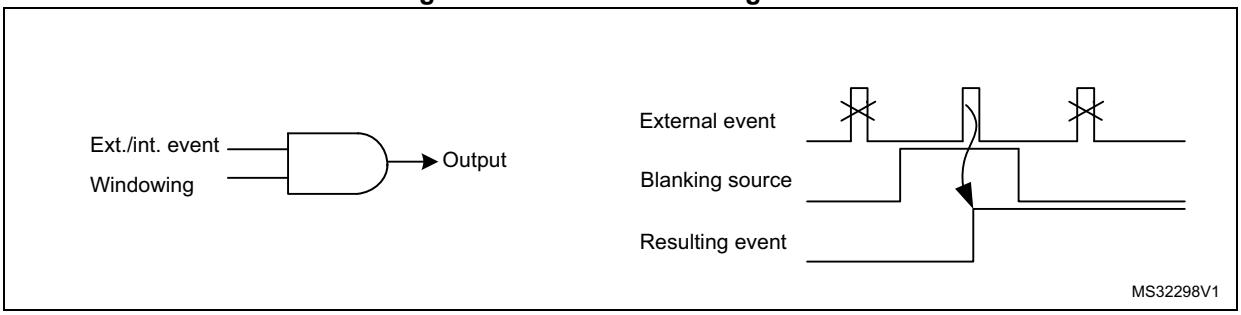


Figure 467. External event blanking, level sensitive triggering

Windowing mode

In event windowing mode, the event is taken into account only if it occurs within a given time window, otherwise it is ignored. This mode is active for EExFLTR[3:0] ranging from 1101 to 1111.

Figure 468. Event windowing mode

EExLTCH bit in EEFxR1 and EEFxR2 registers allows to latch the signal, if set to 1: in this case, an event is accepted if it occurs during the window but is delayed at the end of it.

- If EExLTCH bit is reset and the signal occurs during the window, it is passed through directly.
- If EExLTCH bit is reset and no signal occurs, a timeout event is generated at the end of the window.

A use case of the windowing mode is to filter synchronization signals. The timeout generation allows to force a default synchronization event, when the expected synchronization event is lacking (for instance during a converter start-up).

There are 3 sources for each external event windowing, coded as follows:

- 1101 and 1110: the windowing lasts from the counter reset to the compare match (respectively compare 2 and compare 3). In up/down mode (UDM bit set to 1), the counter reset event is defined as per the ROM[1:0] bit setting.
- 1111: the windowing is related to another timing unit and lasts from its counter reset to its compare 2 match. The source is described as TIMWIN in the bit description and is given in *Table 349*. As an example, the external events in timer B can be filtered by a window starting from timer A counter reset to timer A compare 2.

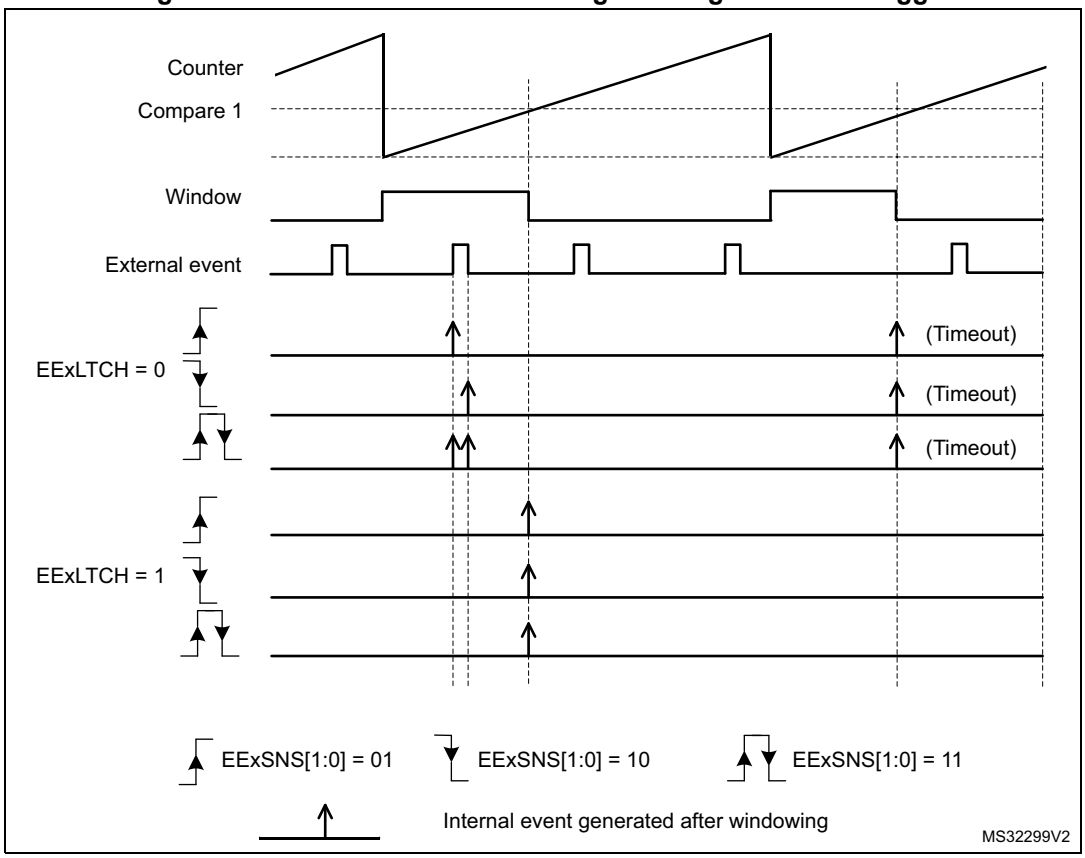
Table 349. Windowing signals mapping per timer (EEFLTR[3:0] = 1111)

Destination	Timer A	Timer B	Timer C	Timer D	Timer E	Timer F
TIMWIN (source)	Timer B CMP2	Timer A CMP2	Timer D CMP2	Timer C CMP2	Timer F CMP2	Timer E CMP2
TIMWIN2 (source)	Timer B CMP2 to reset/roll-over	Timer A CMP2 to reset/roll-over	Timer D CMP2 to reset/roll-over	Timer C CMP2 to reset/roll-over	Timer F CMP2 to reset/roll-over	Timer E CMP2 to reset/roll-over
TIMWIN3 (source)	Timer B CMP1 to CMP2	Timer A CMP1 to CMP2	Timer D CMP1 to CMP2	Timer C CMP1 to CMP2	Timer F CMP1 to CMP2	Timer E CMP1 to CMP2

Note: The timeout event generation is not supported if the external event is programmed in fast mode.

Figure 469 and *Figure 470* present how the events are generated for the various edge and level sensitivities, as well as depending on EExLTCH bit setting. Timeout events are specifically mentioned for clarity reasons.

Figure 469. External event windowing with edge-sensitive trigger



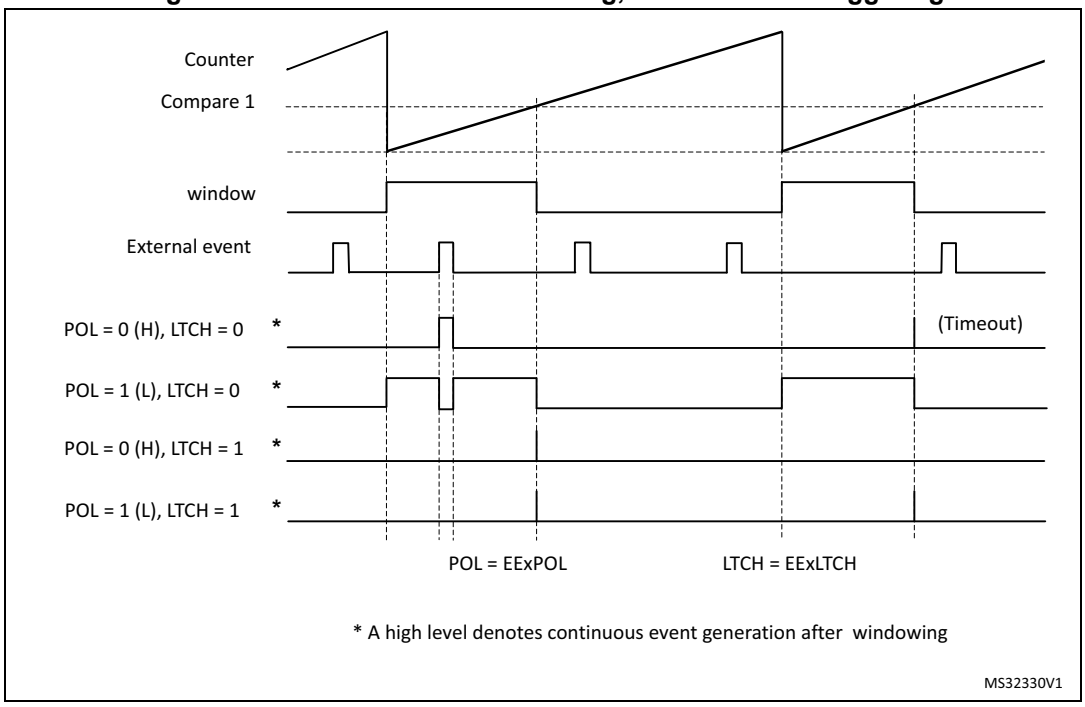


Figure 470. External event windowing, level sensitive triggering

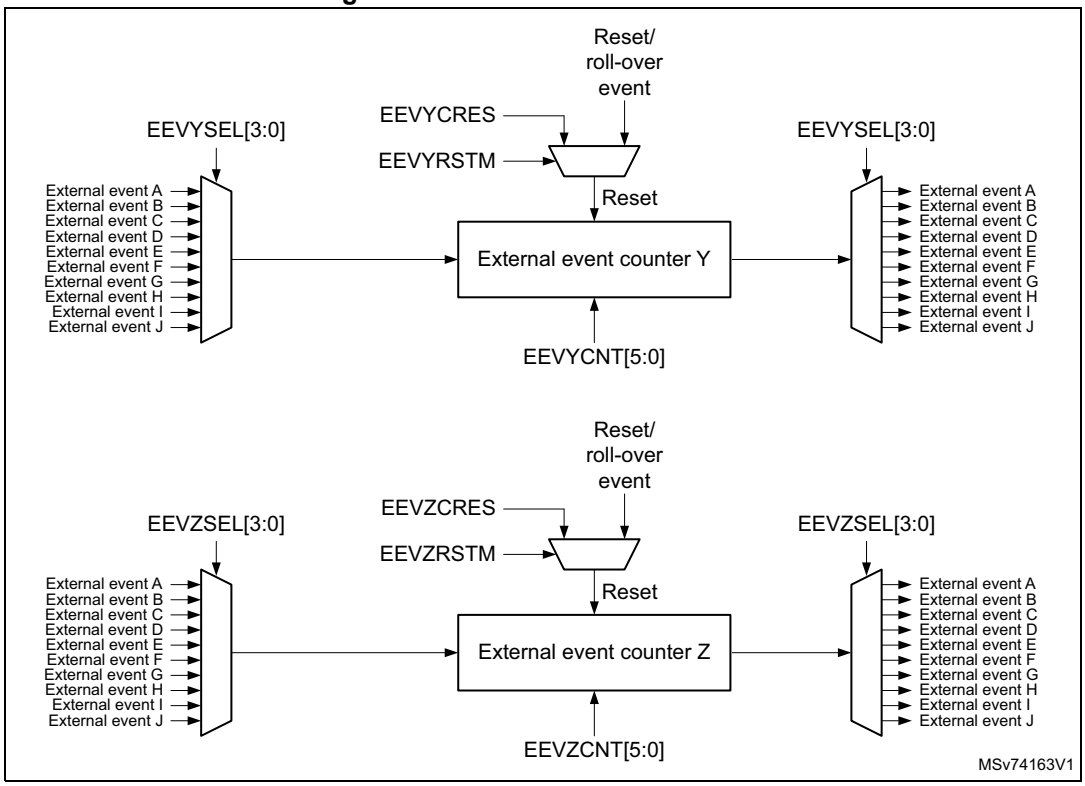


External event counter

Each timing unit also features two external event counters following the filtering unit, typically for valley skipping implementation.

The circuitry allows to filter any of the 10 external events filtered, as shown on *Figure 471*.

Figure 471. External event counters

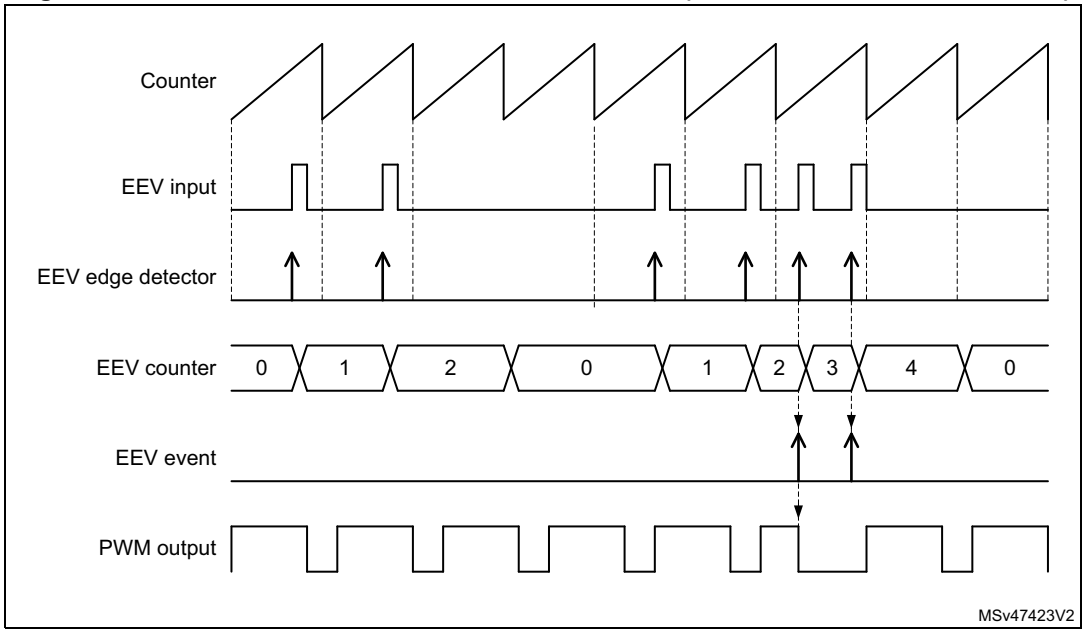
The counters Y and Z are enabled using the EEVxCE bit in the HRTIM_EEFxR3 register. This mode is only valid for edge-sensitive external events (EExSNS[1:0] bitfield = 01, 10 or 11), when EEVA..EEVJ selection is a single external event EEV1..16 (EEVxSEL[1:0] = 00 or 01).

When EEVA..EEVJ is resulting from a combination of 2 external events (EEVxSEL[1:0] = 10 or 11), at least one of the 2 inputs must be level sensitive. Having a level sensitive input combined with an edge sensitive input results in an edge sensitive combined signal. This gives the possibility to let an external event be generated depending on the level of an other external event (AND function).

The external event is propagated to the timer only if the number of active edges is greater or equal to the value programmed in (EEVxCNT[5:0]+1).

Two operating modes are available:

- When the EEVxRSTM bit is reset, the external event counter is reset on each reset/roll-over event: the external event is active only if it appears several times within a given PWM period
- When the EEVxRSTM bit is set, the external event counter is reset only if the event did not on appear during the last PWM period. This a cumulative mode, where the event must occur at least once during multiple PWM period, as shown on *Figure 472* below.



Note: If the 2 external event counters are operating on the same external event (EEVYSEL[3:0] equal to EEVZSEL[3:0]) the external counter Y only is considered.

The external event counter must be enabled after having programmed the counter value (the EEVxCE bit must be set after having written the EEVxCNT[5:0] bits).

Once the counter is enabled, the EEVxCNT[5:0] bits can then be changed on-the-fly at any time. The new value is taken into account on the following reset/rollover event as per the EEVxRSTM bit programming, or after a software reset (EEVxCRES bit set).

The EEVxSEL[3:0] bitfield must not be modified once the EEVxCE bit is set.

Figure 472. External event counter cumulative mode (EEVxRSTM = 1, EEVxCNT = 2)

33.3.10 Delayed protection

The HRTIM features specific protection schemes, typically for resonant converters when it is necessary to shut down the PWM outputs in a delayed manner, either once the active pulse is completed or once a push-pull period is completed. These features are enabled with DLYPRTEN bit in the HRTIM_OUTxR register, and are using specific external event channels.

Delayed idle

In this mode, the active pulse is completed before the protection is activated. The selected external event causes the output to enter in idle mode at the end of the active pulse (defined by an output reset event in HRTIM_RSTx1R or HRTIM_RSTx2R).

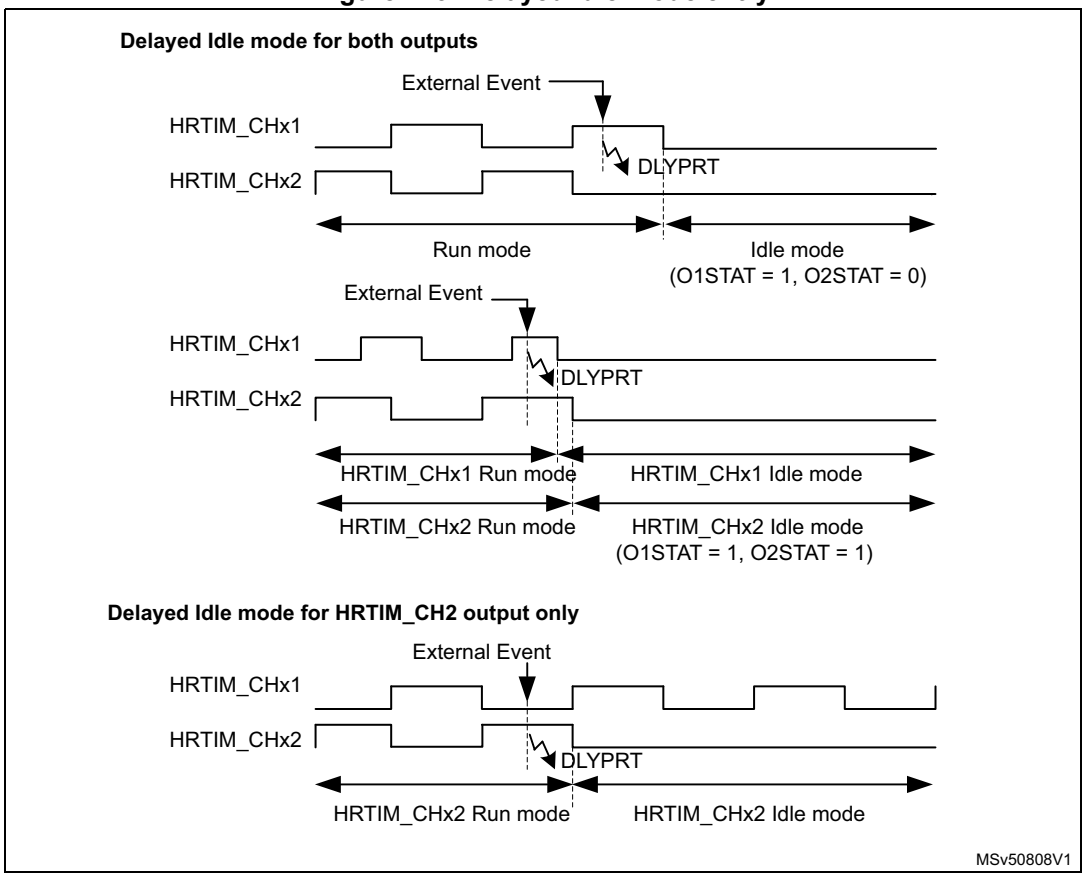
Once the protection is triggered, the idle mode is permanently maintained but the counter continues to run, until the output is re-enabled. Tx1OEN and Tx2OEN bits are not affected by the delayed idle entry. To exit from delayed idle and resume operation, it is necessary to overwrite Tx1OEN and Tx2OEN bits to 1. The output state changes on the first transition to an active state following the output enable command.

Note: The delayed idle mode cannot be exited immediately after having been entered, before the active pulse is completed: it is mandatory to make sure that the outputs are in idle state

before resuming the run mode. This can be done by waiting up to the next period, for instance, or by polling the O1CPY and/or O2CPY status bits in the TIMxISR register.

The delayed idle mode can be applied to a single output (DLYPRT[2:0] = x00 or x01) or to both outputs (DLYPRT[2:0] = x10).

An interrupt or a DMA request can be generated in response to a Delayed Idle mode entry. The DLYPRT flag in HRTIM_TIMxISR is set as soon as the external event arrives, independently from the end of the active pulse on output.



When the Delayed Idle mode is triggered, the output states can be determined using O1STAT and O2STAT in HRTIM_TIMxISR. Both status bits are updated even if the delayed idle is applied to a single output. When the push-pull mode is enabled, the IPPSTAT flag in HRTIM_TIMxISR indicates during which period the delayed protection request occurred.

This mode is available whatever the timer operating mode (regular, push-pull, deadtime). It is available with some external events only:

- EEVF and EEVG for timer A, B and C
- EEVH and EEVI for timer D, E and F

The delayed protection mode can be triggered only when the counter is enabled (TxCEN bit set). It remains active even if the TxEN bit is reset, until the TxyOEN bits are set.

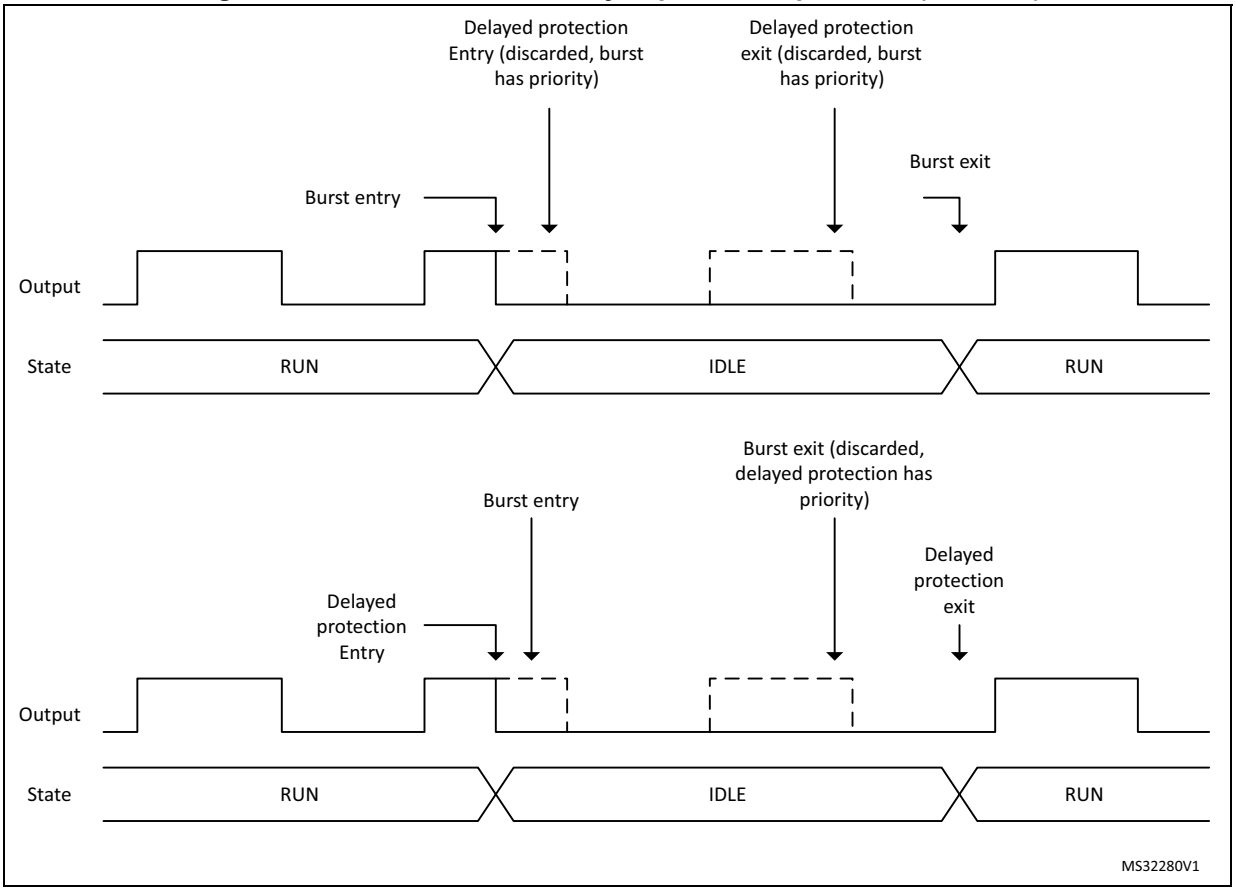


Figure 473. Delayed Idle mode entry

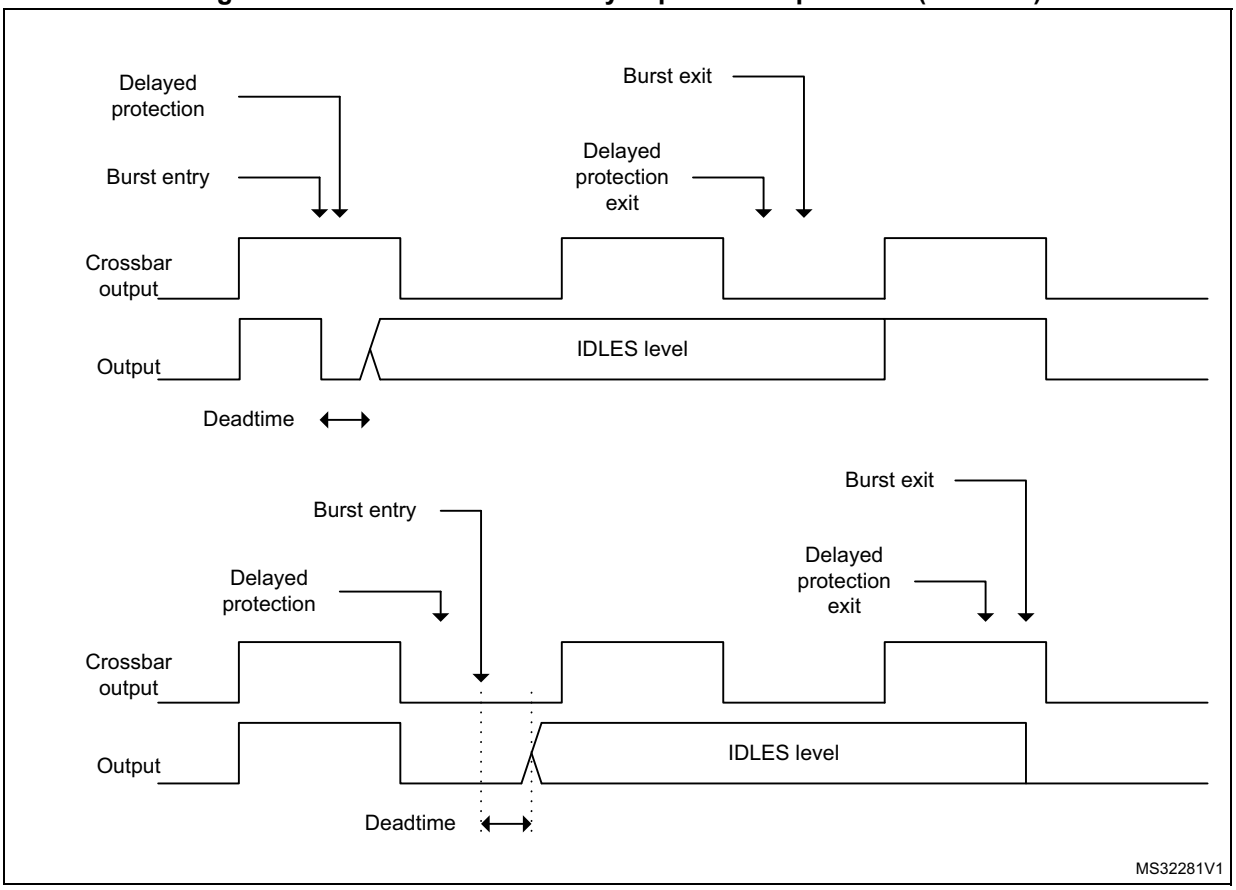
The delayed idle mode has a higher priority than the burst mode: any burst mode exit request is discarded once the delayed idle protection has been triggered. On the contrary, If the delayed protection is exited while the burst mode is active, the burst mode is resumed

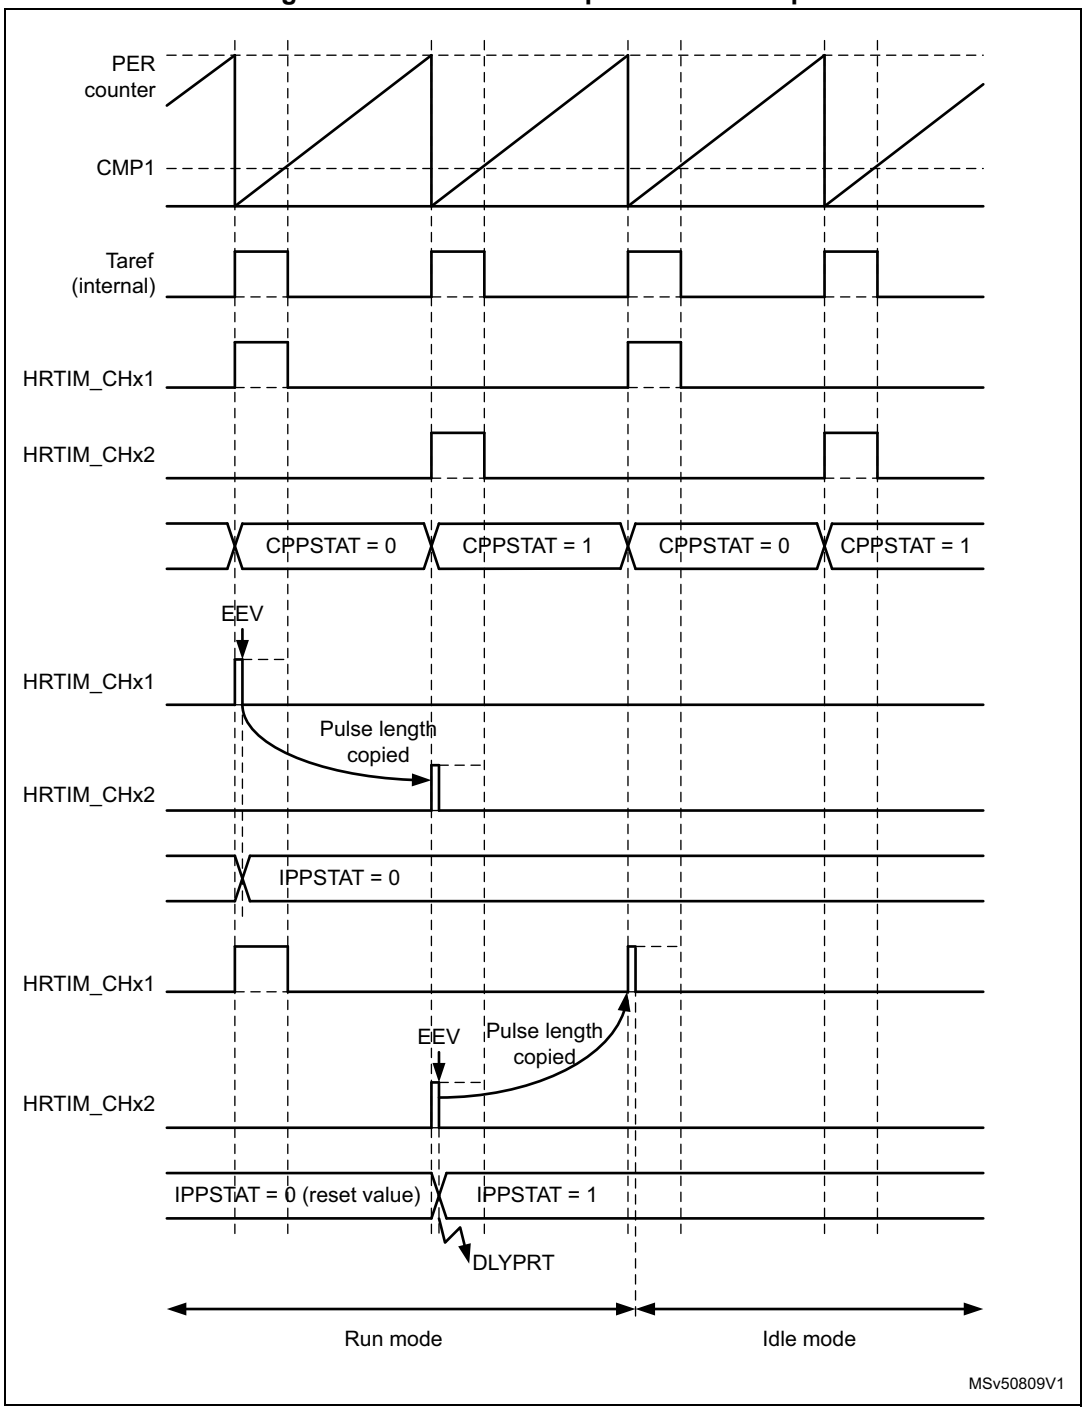


normally and the output is maintained in the idle state until the burst mode exits. *Figure 474* gives an overview of these different scenarios.

Figure 474. Burst mode and delayed protection priorities (DIDL = 0)

The same priorities are applied when the delayed burst mode entry is enabled (DIDL bit set), as shown on *Figure 475* below.

Figure 475. Burst mode and delayed protection priorities (DIDL = 1)



Balanced idle

Only available in push-pull mode, the balanced idle allows to have a balanced pulsewidth on the two outputs when one of the active pulse is shortened due to a protection. The pulsewidth, terminated earlier than programmed, is copied on the alternate output, then the two outputs are put in idle state, until the normal operation is resumed by software. This mode is enabled by writing x11 in DLYPRT[2:0] bitfield in HRTIM_OUTxR.

This mode is available with only 2 external events:

- EEVF and EEVG for timer A, B and C
- EEVH and EEVI for timer D, E and F

Figure 476. Balanced Idle protection example

When the balanced Idle mode is enabled, the selected external event triggers a capture of the counter value into the compare 4 active register (this value is not user-accessible). The push-pull is maintained for one additional period so that the shorten pulse can be repeated: a new output reset event is generated while the regular output set event is maintained.

The Idle mode is then entered and the output takes the level defined by IDLESx bits in the HRTIM_OUTxR register. The balanced idle mode entry is indicated by the DLYPRT flag,

while the IPPSTAT flag indicates during which period the external event occurred, to determine the sequence of shorten pulses (A1 then A2 or vice versa).

The timer operation is not interrupted (the counter continues to run).

To enable the balanced idle mode, it is necessary to have the following initialization:

- Timer operating in continuous mode (CONT = 1)
- Push-pull mode enabled
- HRTIM_CMP4xR must be set to 0 and the content transferred into the active register (for instance by forcing a software update)
- DELCMP4[1:0] bit field must be set to 00 (autodelayed mode disabled)
- DLYPRT[2:0] = x11 (delayed protection enable)

Note: The HRTIM_CMP4xR register must not be written during a balanced idle operation. The CMP4 event is reserved and cannot be used for another purpose.

In balanced idle mode, it is recommended to avoid multiple external events or software-based reset events causing an output reset. If such an event arrives before a balanced idle request within the same period, it causes the output pulses to be unbalanced (1st pulse length defined by the external event or software reset, while the 2nd pulse is defined by the balanced idle mode entry). The balanced idle mode is applicable only when a single pulse is generated per counting period, as on Figure 476: Balanced Idle protection example.

The minimum pulsewidth that can be handled in balanced idle mode is 4 f_{HRTIM} clock periods.

If the capture occurs before the counter has reached this minimum value, the current pulse is extended up to 4 f_{HRTIM} clock periods before being copied into the secondary output. In any case, the pulsewidths are always balanced.

Tx1OEN and Tx2OEN bits are not affected by the balanced idle entry. To exit from balanced idle and resume the operation, it is necessary to overwrite Tx1OEN and Tx2OEN bits to 1 simultaneously. The output state changes on the first active transition following the output enable.

It is possible to resume operation similarly to the delayed idle entry. For instance, if the external event arrives while output 1 is active (delayed idle effective after output 2 pulse), the re-start sequence can be initiated for output 1 first. To do so, it is necessary to poll CPPSTAT bit in the HRTIM_TIMxISR register. Using the above example (IPPSTAT flag equal to 0), the operation is resumed when CPPSTAT bit is 0.

In order to have a specific re-start sequence, it is possible to poll the CPPSTAT to know which output is active first. This allows, for instance, to re-start with the same sequence as the idle entry sequence: if the external event arrives during output 1 active, the re-start sequence is initiated when the output 1 is active (CPPSTAT = 0).

Note: The balanced idle mode must not be disabled while a pulse balancing sequence is on-going. It is necessary to wait until the CMP4 flag is set, thus indicating that the sequence is completed, to reset the DLYPRTEN bit.

The balanced idle protection mode can be triggered only when the counter is enabled (TxCEN bit set). It remains active even if the TxCEN bit is reset, until TxyOEN bits are set.

Balanced idle can be used together with the burst mode under the following conditions:

- TxBM bit must be reset (counter clock maintained during the burst, see *Section 33.3.15*),
- No balanced idle protection must be triggered while the outputs are in a burst idle state.

The balanced idle mode has a higher priority than the burst mode: any burst mode exit request is discarded once the balanced idle protection has been triggered. On the contrary, if the delayed protection is exited while the burst mode is active, the burst mode is resumed normally.

Note: Although the output state is frozen in idle mode, a number of events are still generated on the auxiliary outputs (see Section 33.3.18) during the idle period following the delayed protection:
- Output set/reset interrupt or DMA requests
- External event filtering based on output signal
- Capture events triggered by set/reset

Balanced idle automatic resuming

The balanced Idle mode can be configured to have an automatic resuming of operation after a trigger.

Once the shorten pulse has been copied to the alternate output, the pulse width is reset to its original value and the timer resumes operation: the two outputs keep on being in RUN mode.

This is enabled by setting the BIAR bit in the HRTIM_OUTxR register.

This mode must be used only when the period in HRTIM_PERxR is greater than 6 periods of the f_{HRTIM} clock.

Note: This bit is only significant if DLYPRT[2:0] = 011 or 111, it is ignored otherwise.

Note: In balanced idle automatic resuming mode, it is mandatory to set the IDLES state to inactive.

33.3.11 Register preload and update management

Most of HRTIM registers are buffered and can be preloaded if needed. Typically, this allows to prevent the waveforms from being altered by a register update not synchronized with the active events (set/reset).

When the preload mode is enabled, accessed registers are shadow registers. Their content is transferred into the active register after an update request, either software or synchronized with an event.

By default, PREEN bits in HRTIM_MCR and HRTIM_TIMxCR registers are reset and the registers are not preloaded: any write directly updates the active registers. If PREEN bit is reset while the timer is running and preload was enabled, the content of the preload registers is directly transferred into the active registers.

Each timing unit and the master timer have their own PREEN bit. If PRREN is set, the preload registers are enabled and transferred to the active register only upon an update event.

There are two options to initialize the timer when the preload feature is needed:

- Enable PREEN bit at the very end of the timer initialization to have the preload registers transferred into the active registers before the timer is enabled (by setting MCEN and TxCEN bits).
- Enable PREEN bit at any time during the initialization and force a software update immediately before starting.

Table 350 lists the registers which can be preloaded, together with a summary of available update events.

Table 350. HRTIM preloadable control registers and associated update sources

Timer	Preloadable registers	Preload enable	Update sources
Master timer	HRTIM_DIER HRTIM_MPER HRTIM_MREP HRTIM_MCMP1R HRTIM_MCMP2R HRTIM_MCMP3R HRTIM_MCMP4R	PREEN bit in HRTIM_MCR	Software Repetition event Burst DMA event Repetition event following a burst DMA event
Timer x x = A..F	HRTIM_TIMxDIER HRTIM_TIMxPER HRTIM_TIMxREP HRTIM_TIMxCMP1R HRTIM_TIMxCMP1CR HRTIM_TIMxCMP2R HRTIM_TIMxCMP3R HRTIM_TIMxCMP4R HRTIM_DTxR HRTIM_SETx1R HRTIM_RSTx1R HRTIM_SETx2R HRTIM_RSTx2R HRTIM_RSTxR	PREEN bit in HRTIM_TIMxCR	Software TIMx repetition event TIMx reset event Burst DMA event Update event from other timers (TIMy, master) Update event following a burst DMA event Update enable inputs hrtim_upd_en[3:1] Update event following an update enable input following an update event on hrtim_upd_en[3:1] inputs
HRTIM Common	HRTIM_ADC1R HRTIM_ADC2R HRTIM_ADC3R HRTIM_ADC4R	TIMx or master timer Update, depending on ADxUSRC[2:0] bits in HRTIM_CR1, if PREEN = 1 in the selected timer	

The master timer has 4 update options:

1. Software: writing 1 into MSWU bit in HRTIM_CR2 forces an immediate update of the registers. In this case, any pending hardware update request is cancelled.
2. Update done when the master counter rolls over and the master repetition counter is equal to 0. This is enabled when MREPU bit is set in HRTIM_MCR.
3. Update done once burst DMA is completed (see *Section 33.3.23* for details). This is enabled when BRSTDMA[1:0] = 01 in HRTIM_MCR. It is possible to have both MREPU=1 and BRSTDMA=01.
   Note: The update can take place immediately after the end of the burst sequence if SWU bit is set (i.e. forced update mode). If SWU bit is reset, the update is done on the next update event following the end of the burst sequence.
4. Update done when the master counter rolls over following a burst DMA completion. This is enabled when BRSTDMA[1:0] = 10 in HRTIM_MCR.

An interrupt or a DMA request can be generated by the master update event.

Each timer (TIMA..F) can also have the update done as follows:

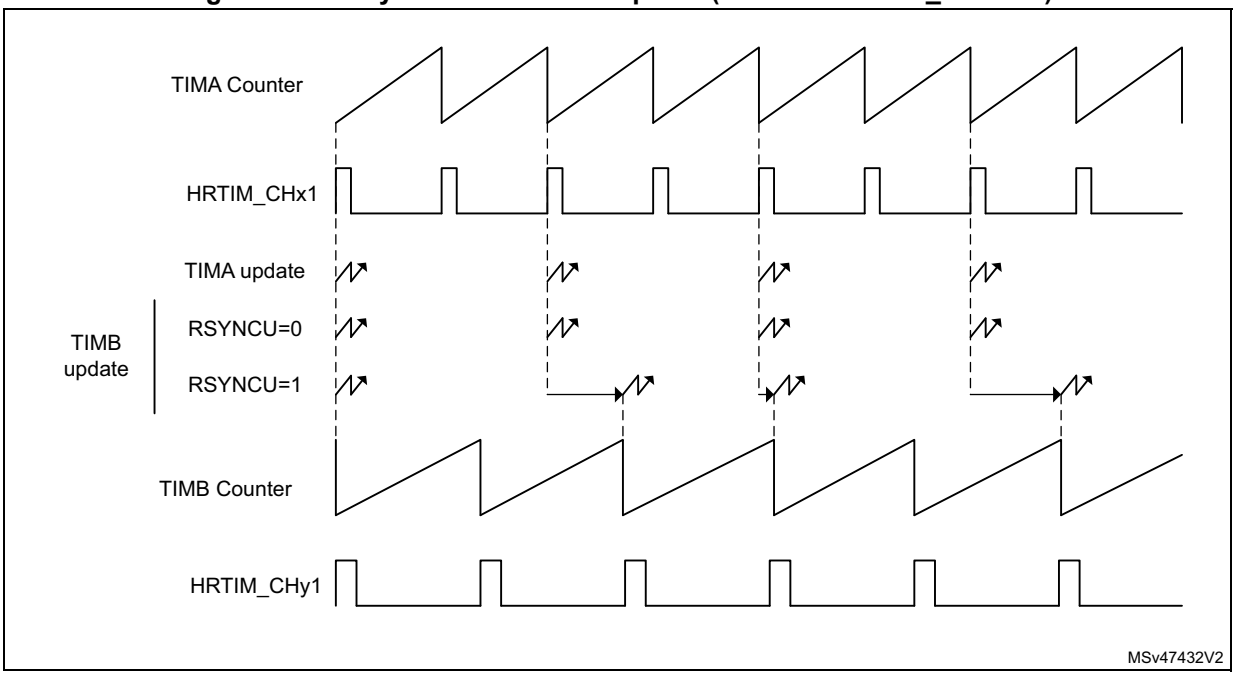
- By software: writing 1 into TxSWU bit in HRTIM_CR2 forces an immediate update of the registers. In this case, any pending hardware update request is canceled.
- Update done when the counter rolls over and the repetition counter is equal to 0. This is enabled when TxREPU bit is set in HRTIM_TIMxCR.
- Update done when the counter is reset or rolls over in continuous mode. This is enabled when TxRSTU bit is set in HRTIM_TIMxCR. This is used for a timer operating in single-shot mode, for instance.
- Update done once a burst DMA is completed. This is enabled when UPDGAT[3:0] = 0001 in HRTIM_TIMxCR.
- Update done on the update event following a burst DMA completion (the event can be enabled with TxRSTU, TxREPU, MSTU or TxU). This is enabled when UPDGAT[3:0] = 0010 in HRTIM_TIMxCR.
- Update done when receiving a request on hrtim_upd_en[3:1]. This is enabled when UPDGAT[3:0] = 0011, 0100, 0101 in HRTIM_TIMxCR.
- Update done on the update event following a request on hrtim_upd_en[3:1] (the event can be enabled with TxRSTU, TxREPU, MSTU or TxU). This is enabled when UPDGAT[3:0] = 0110, 0111, 1000 in HRTIM_TIMxCR
- Update done synchronously with any other timer or master update (for instance TIMA can be updated simultaneously with TIMB). This is used for converters requiring several timers, and is enabled by setting bits MSTU and TxU in HRTIM_TIMxCR register.

The update enable inputs hrtim_upd_en[3:1] allow to have an update event synchronized with on-chip events coming from the general-purpose timers. These inputs are rising-edge sensitive.

Table 327 lists the connections between update enable inputs and the on-chip sources.

This allows to synchronize low frequency update requests with high-frequency signals (for instance an update on the counter roll-over of a 100 kHz PWM that has to be done at a 100 Hz rate).

Note: The update events are synchronized to the prescaler clock when CKPSC[2:0] > 5.



The update coming from adjacent timers (when MSTU, TAU, TBU, TCU, TDU, TEU, TFU bit is set) or from a software update (TxSWU bit) can either be taken into account immediately or re-synchronized with the timers reset/roll-over event. This is done with the RSYNCU bit in the HRTIM_TIMxCR register, as show on *Figure 477* below):

- RSYNCU = 0: The update coming from adjacent timers is taken into account immediately
- RSYNCU = 1: The update coming from adjacent timers is taken into account on the following reset/roll-over event.

The RSYNCU bit is significant only when UPDGAT[3:0] = 0000, it is ignored otherwise.

An interrupt or a DMA request can be generated by the Timx update event.

Figure 477. Resynchronized timer update (TAU=1 in HRTIM_TIMBCR)

MUDIS and TxUDIS bits in the HRTIM_CR1 register allow to temporarily disable the transfer from preload to active registers, whatever the selected update event. This allows to modify several registers in multiple timers. The register update event takes place once these bits are reset, on the next coming update event.

MUDIS and TxUDIS bits are all grouped in the same register. This allows the update of multiple timers (not necessarily synchronized) to be disabled and resumed simultaneously.

The following example is a practical use case. A first power converter is controlled with the master, TIMB and TIMC. TIMB and TIMC must be updated simultaneously with the master timer repetition event. A second converter works in parallel with TIMA, TIMD and TIME, and TIMD, TIME must be updated with TIMA repetition event.

First converter

In HRTIM_MCR, MREPU bit is set: the update occurs at the end of the master timer counter repetition period. In HRTIM_TIMBCR and HRTIM_TIMCCR, MSTU bits are set to have TIMB and TIMC timers updated simultaneously with the master timer.

When the power converter set-point has to be adjusted by software, MUDIS, TBUDIS and TCUDIS bits of the HRTIM_CR register must be set prior to write accessing registers to update the values (for instance the compare values). From this time on, any hardware update request is ignored and the preload registers can be accessed without any risk to have them transferred into the active registers. Once the software processing is over, MUDIS, TBUDIS and TCUDIS bits must be reset. The transfer from preload to active registers is done as soon as the master repetition event occurs.

Second converter

In HRTIM_TIMACR, TAREPU bit is set: the update occurs at the end of the timer A counter repetition period. In HRTIM_TIMDCR and HRTIM_TIMECR, TAU bits are set to have TIMD and TIME timers updated simultaneously with timer A.

When the power converter set-point has to be adjusted by software, TAUDIS, TDUDIS and TEUDIS bits of the HRTIM_CR register must be set prior to write accessing the registers to

update the values (for instance the compare values). From this time on, any hardware update request is ignored and the preload registers can be accessed without any risk to have them transferred into the active registers. Once the software processing is over, TAUDIS, TDUDIS and TEUDIS bits can be reset: the transfer from preload to active registers is done as soon as the timer A repetition event occurs.

Remote update disable

It is possible to disable the update on another on-chip HRTIMER. Refer to *Section 33.3.19: Synchronizing the HRTIM with other timers or HRTIM instances* for details.

33.3.12 PWM mode with “greater than” comparison

A specific no-latency update mode is available for PWM signals generated with the CMP1 and CMP3 registers. It allows to have a new duty cycle value applied as soon as possible within the PWM cycle, without having to wait the completion of the current PWM period. This reduces the overall delay time in software control loops. As shown on *Figure 478* below, this eventually allows to have:

- An early turn-off of the output if the new compare value is below the current counter value and the current compare value is above the counter, at the time the new value is written.
- An early turn-on of the output, re-enabling the output if the new compare value is above the counter value and the current compare value is below the counter, at the time the new value is written.

The output signal is left unchanged when the new compare value and current compare value are both below the counter.

This feature is only available for CMP1 or CMP3 RESET events, and is enabled using the GTCMP1 and GTCMP3 enable bits in the HRTIM_TIMxCR2 register.

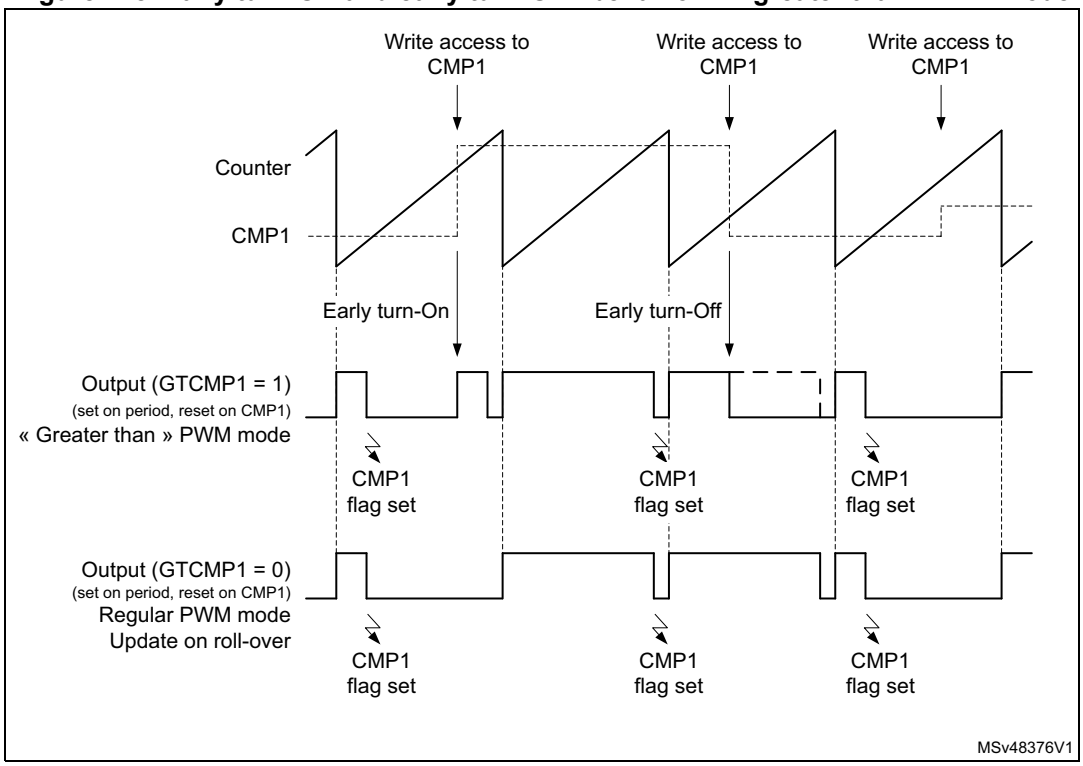
The preload mechanism is inactive for a compare register when the corresponding GTCMPx bit is set, whatever the PREEN bit value. This mode is intended to have the new compare value taken into account as soon as possible after a new value write, without waiting for the preload to active register transfer.

These bits are defining the compare 1 and compare 3 operating modes as following

- GTCMPx = 0: the compare x event is generated when the counter is equal to the compare value (compare match mode). If the compare value is changed on-the-fly, the compare event may not be generated.
- GTCMPx = 1: the compare x event is generated when the counter is greater than the compare value. If the compare value is changed on-the-fly, the new compare value is compared with the current counter value and an output SET or RESET can be generated.

The “greater than” compare mode causes the crossbar to act differently depending on comparison result. Let’s consider the CMP1 event is doing an output RESET. When the new compare value is written, two cases are considered

- If the new compare value is below the counter value, the RESET event is issued and can eventually cause an early turn-OFF
- If the new compare value is above the counter value, a SET event is generated so as to re-arm the output value before it is actually RESET when the counter exceeds the counter value (early turn-ON).



The “greater than” compare mode is supported for both SET and RESET actions.

The “greater than” compare mode must only be used for the following configuration:

1. In the fixed frequency configuration, the period event must trigger the output set and the “greater than” compare triggers the output reset (or vice versa the period must trigger the reset if the “greater-than” compare triggers the set).
2. For variable frequency configuration, the event selected as counter reset source must also be selected as set or reset source for the timer output (opposite direction as the “greater than” compare event).

Note: The “greater-than” modes must not be used when the CMP1 and/or CMP3 modes are controlled by hardware in half and interleaved modes.

Figure 478. Early turn-ON and early turn-OFF behavior in “greater than” PWM mode

The immediate update mode implies that the content of the preload register is transferred into the active register at the very same time the register is written. When GTCMP1 and/or GTCMP3 bits are set, their respective preload mechanism is disabled (for HRTIM_TIMxCMP1 and/or HRTIM_TIMxCMP3 registers), whatever the PREEN bit value.

Note: The compare interrupt flags (CMP1 and CMP3 in HRTIM_TIMxISR) are not generated in case of late turn-ON and early turn-OFF, as shown on Figure 478.

Note: The “Greater than” comparison must not be done on both CMP1 and CMP3 for the same output (GTCMP1 and GTCMP3 bits must not be set simultaneously).

33.3.13 Events propagation within or across multiple timers

The HRTIM offers many possibilities for cascading events or sharing them across multiple timing units, including the master timer, to get full benefits from its modular architecture. These are key features for converters requiring multiple synchronized outputs.

This section summarizes the various options and specifies whether and how an event is propagated within the HRTIM.

TIMx update triggered by the master timer update

The sources listed in *Table 351* are generating a master timer update. The table indicates if the source event can be used to trigger a simultaneous update in any of TIMx timing units.

Operating condition: MSTU bit is set in HRTIM_TIMxCR register.

Table 351. Master timer update event propagation

Source	Condition	Propagation	Comment
Burst DMA end	BRSTDMA[1:0] = 01	No	Must be done in TIMxCR (UPDGAT[3:0] = 0001)
Roll-over event following a burst DMA end	BRSTDMA[1:0] = 10	Yes	-
Repetition event caused by a counter roll-over	MREPU = 1	Yes	-
Repetition event caused by a counter reset (from HRTIM_SCIN or software)		No	-
Software update	MSWU = 1	No	All software update bits (TxSWU) are grouped in the HRTIM_CR2 register and can be used for a simultaneous update

TIMx update triggered by the TIMy update

The sources listed in *Table 352* are generating a TIMy update. The table indicates if the given event can be used to trigger a simultaneous update in another or multiple TIMx timers.

Operating condition: TyU bit set in HRTIM_TIMxCR register (source = TIMy and destination = TIMx).

Table 352. TIMx update event propagation

Source	Condition	Propagation	Comment
Burst DMA end	UPDGAT[3:0] = 0001	No	Must be done directly in HRTIM_TIMxCR (UPDGAT[3:0] = 0001)
Update caused by the update enable inputs hrtim_upd_en[3:1]	UPDGAT[3:0] = 0011, 0100, 0101	No	Must be done directly in HRTIM_TIMxCR (UPDGAT[3:0] = 0011, 0100, 0101
Master update	MSTU = 1 in HRTIM_TIMyCR	No	Must be done with MSTU = 1 in HRTIM_TIMxCR
Another TIMx update (TIMz>TIMy>TIMx)	TzU=1 in HRTIM_TIMyCR TyU=1 in TIMxCR	No	Must be done with TzU=1 in HRTIM_TIMxCR TzU=1 in HRTIM_TIMyCR
Repetition event caused by a counter roll-over	TyREPU = 1	Yes	-

Table 352. TIMx update event propagation (continued)

Source	Condition	Propagation	Comment
Repetition event caused by a counter reset	TyREPU = 1	-	Refer to counter reset cases below
Counter roll-over	TyRSTU = 1	Yes	-
Counter software reset	TyRST=1 in HRTIM_CR2	No	Can be done simultaneously with update in HRTIM_CR2 register
Counter reset caused by a TIMz compare	TIMzCMPn in HRTIM_RSTyR	Yes	-
Counter reset caused by external events	EXTEVNTn in HRTIM_RSTyR	Yes	-
Counter reset caused by a master compare or a master period	MSTCMPn or MSTPER in HRTIM_RSTyR	Yes	-
Counter reset caused by a TIMy compare	CMPn in HRTIM_RSTyR	Yes	-
Counter reset caused by an update	UPDT in HRTIM_RSTyR	No	Propagation would result in a lock-up situation (update causing reset causing update)
Counter reset caused by HRTIM_SCIN	SYNCRSTy in HRTIM_TIMyCR	No	-
Software update	TySWU = 1	No	All software update bits (TxSWU) are grouped in the HRTIM_CR2 register and can be used for a simultaneous update

TIMx counter reset causing a TIMx update

Table 353 lists the counter reset sources and indicates whether they can be used to generate an update.

Operating condition: TxRSTU bit in HRTIM_TIMxCR register.

Table 353. Reset events able to generate an update

Source	Condition	Propagation	Comment
Counter roll-over	-	Yes	-
Update event	UPDT in HRTIM_RSTxR	No	Propagation would result in a lock-up situation (update causing a reset causing an update)
External event	EXTEVNTn in HRTIM_RSTxR	Yes	-
TIMy compare	TIMyCMPn in HRTIM_RSTxR	Yes	-
Master compare	MSTCMPn in HRTIM_RSTxR	Yes	-
Master period	MSTPER in HRTIM_RSTxR	Yes	-
Compare 2 and 4	CMPn in HRTIM_RSTxR	Yes	-
Software	TxRST=1 in HRTIM_CR2	Yes	-
HRTIM_SCIN	SYNCRSTx in HRTIM_TIMxCR	Yes	-

TIMx update causing a TIMx counter reset

Table 354 lists the update event sources and indicates whether they can be used to generate a counter reset.

Operating condition: UPDT bit set in HRTIM_RSTxR.

Table 354. Update event propagation for a timer reset

Source	Condition	Propagation	Comment
Burst DMA end	UPDGAT[3:0] = 0001	Yes	-
Update caused by the update enable inputs hrtim_upd_en[3:1]	UPDGAT[3:0] = 0011, 0100, 0101	Yes	-
Master update caused by a roll-over after a burst DMA	MSTU = 1 in HRTIM_TIMxCR BRSTDMA[1:0] = 10 in HRTIM_MCR	Yes	-

Table 354. Update event propagation for a timer reset (continued)

Source	Condition	Propagation	Comment
Master update caused by a repetition event following a roll-over	MSTU = 1 in HRTIM_TIMxCR MREPU = 1 in HRTIM_MCR	Yes	-
Master update caused by a repetition event following a counter reset (software or due to HRTIM_SCIN)		No	-
Software triggered master timer update	MSTU = 1 in HRTIM_TIMxCR MSWU = 1 in HRTIM_CR2	No	All software update bits (TxSWU) are grouped in the HRTIM_CR2 register and can be used for a simultaneous update
TIMy update caused by a TIMy counter roll-over	TyU = 1 in HRTIM_TIMxCR TyRSTU = 1 in HRTIM_TIMyCR	Yes	-
TIMy update caused by a TIMy repetition event	TyU = 1 in HRTIM_TIMxCR TyREPU = 1 in HRTIM_TIMyCR	Yes	-
TIMy update caused by an external event or a TIMy compare (through a TIMy reset)	TyU = 1 in HRTIM_TIMxCR TyRSTU = 1 in HRTIM_TIMyCR EXTEVNTn or CMP4/2 in HRTIM_RSTyCR	Yes	-
TIMy update caused by sources other than those listed above	TyU = 1 in HRTIM_TIMxCR	No	-
Repetition event following a roll-over	TxREPU = 1 in HRTIM_TIMxCR	Yes	-
Repetition event following a counter reset		No	-
Timer reset	TxRSTU = 1 in HRTIM_TIMxCR	No	Propagation would result in a lock-up situation (reset causing an update causing a reset)
Software	TxSWU in HRTIM_CR2	No	-

33.3.14 Output management

Each timing unit controls a pair of outputs. The outputs have three operating states:

- RUN: this is the main operating mode, where the output can take the active or inactive level as programmed in the crossbar unit.
- IDLE: this state is the default operating state after an HRTIM reset, when the outputs are disabled by software or during a burst mode operation (where outputs are temporarily disabled during a normal operating mode; refer to *Section 33.3.15* for more details). It is either permanently active or inactive.
- FAULT: this is the safety state, entered in case of a shut-down request on FAULTx inputs. It can be permanently active, inactive, or Hi-Z.

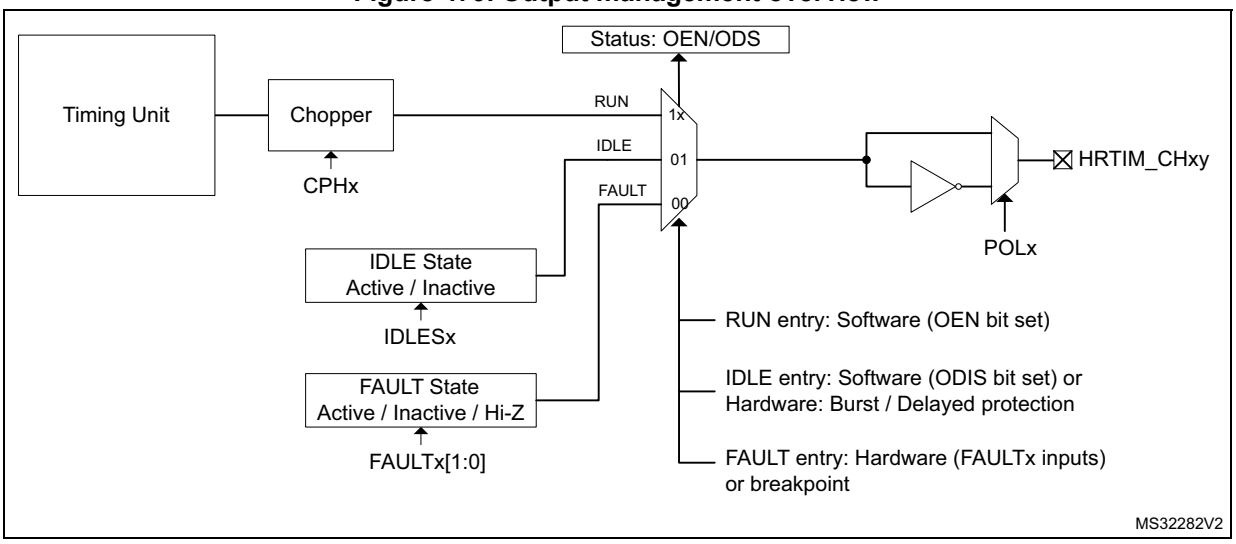
The output status is indicated by TxyOEN bit in HRTIM_OENR register and TxyODS bit in HRTIM_ODSR register, as in *Table 355*.

Table 355. Output state programming, x= A..F, y = 1 or 2

TxyOEN (control/status) (set by software, cleared by hardware)	TxyODS (status)	Output operating state
1	x	RUN
0	0	IDLE
0	1	FAULT

TxyOEN bit is both a control and a status bit: it must be set by software to have the output in RUN mode. It is cleared by hardware when the output goes back in IDLE or FAULT mode. When TxyOEN bit is cleared, TxyODS bit indicates whether the output is in the IDLE or FAULT state. A third bit in the HRTIM_ODISR register is used to disable the output by software.

Figure 479. Output management overview



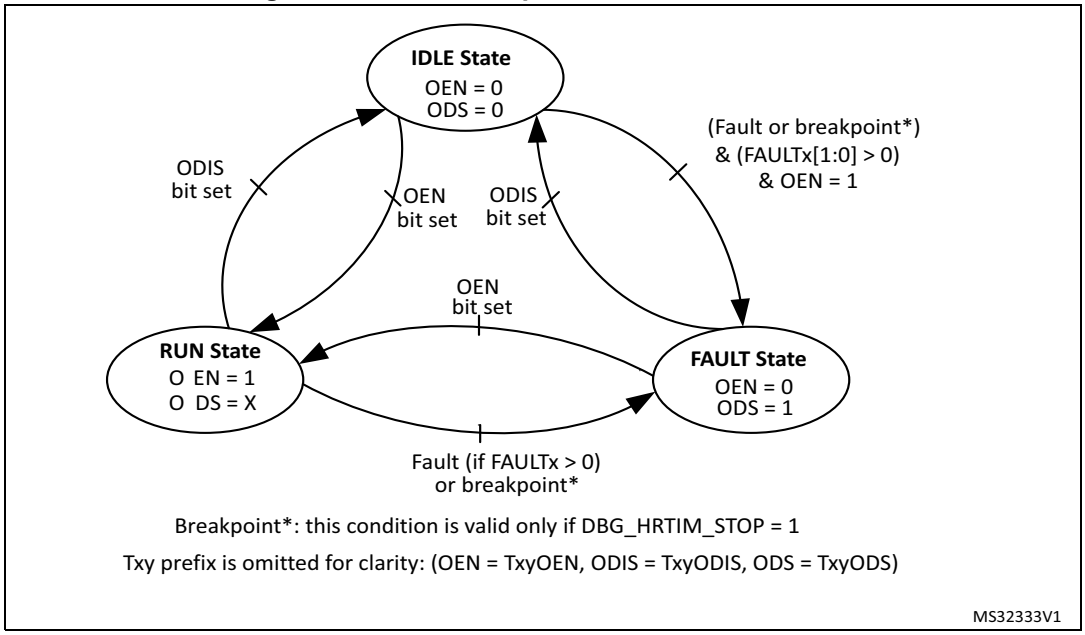


Figure 480 summarizes the bit values for the three states and how the transitions are triggered. Faults can be triggered by any external or internal fault source, as listed in

Section 33.3.17, while the IDLE state can be entered when the burst mode or delayed protections are active.

Figure 480. HRTIM output states and transitions

The FAULT and IDLE levels are defined as active or inactive. Active (or inactive) refers to the level on the timer output that causes a power switch to be closed (or opened for an inactive state).

The IDLE state has the highest priority: the transition FAULT → IDLE is possible even if the FAULT condition is still valid, triggered by ODIS bit set.

The FAULT state has priority over the RUN state: if TxyOEN bit is set simultaneously with a fault event, the FAULT state is entered. The condition is given on the transition IDLE → FAULT, as in *Figure 480*: fault protection needs to be enabled (FAULTx[1:0] bits = 01, 10, 11) and the Txy OEN bit set with a fault active (or during a breakpoint if DBG_HRTIM_STOP = 1).

The output polarity is programmed using POLx bits in HRTIM_OUTxR. When POLx = 0, the polarity is positive (output active high), while it is active low in case of a negative polarity (POLx = 1). Practically, the polarity is defined depending on the power switch to be driven (PMOS versus NMOS) or on a gate driver polarity.

The output level in the FAULT state is configured using FAULTx[1:0] bits in HRTIM_OUTxR, for each output, as follows:

- 00: output never enters the fault state and stays in RUN or IDLE state
- 01: output at active level when in FAULT
- 10: output at inactive level when in FAULT
- 11: output is tri-stated when in FAULT. The safe state must be forced externally with pull-up or pull-down resistors, for instance.

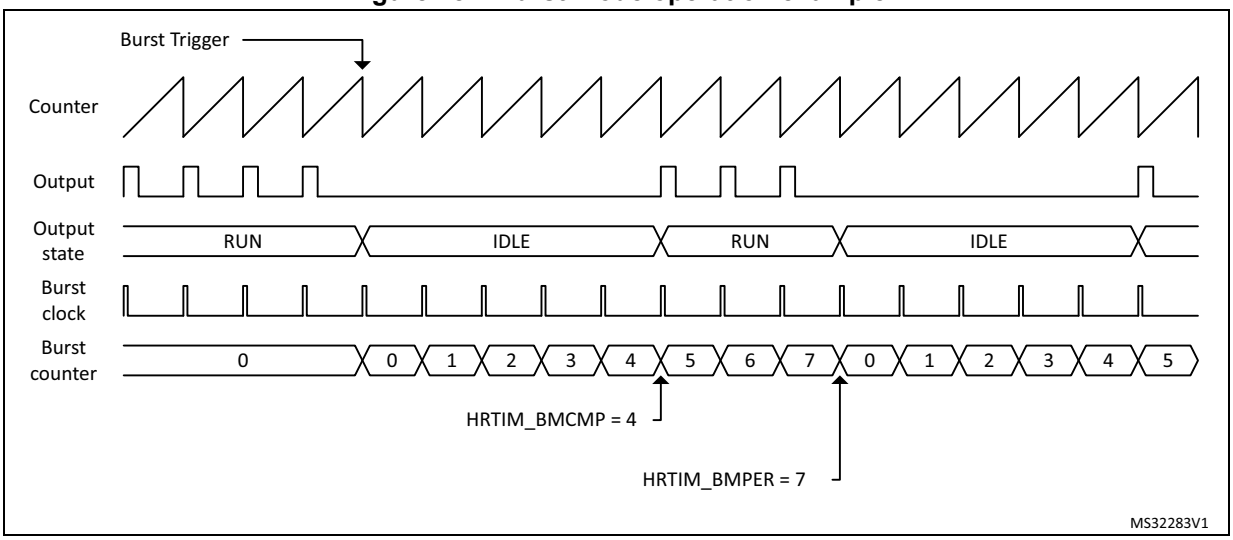
Note: FAULTx[1:0] bits must not be changed as long as the outputs are in FAULT state.

The level of the output in IDLE state is configured using IDLESx bit in HRTIM_OUTxR, as follows:

- 0: output at inactive level when in IDLE
- 1: output at active level when in IDLE

When TxyOEN bit is set to enter the RUN state, the output is immediately connected to the crossbar output. If the timer clock is stopped, the level is either inactive (after an HRTIM reset) or corresponds to the RUN level (when the timer is stopped and the output disabled).

During the HRTIM initialization, the output level can be prepositioned prior to have it in RUN mode, using the software forced output set and reset in the HRTIM_SETx1R and HRTIM_RSTx1R registers.



33.3.15 Burst mode controller

The burst mode controller is used to have the outputs alternatively in IDLE and RUN state, by hardware, so as to skip some switching periods with a programmable periodicity and duty cycle.

Burst mode operation is of common use in power converters when operating under light loads. It can significantly increase the efficiency of the converter by reducing the number of transitions on the outputs and the associated switching losses.

When operating in burst mode, one or a few pulses are outputted followed by an idle period equal to several counting periods, typically, where no output pulses are produced, as shown in the example on *Figure 481*.

Figure 481. Burst mode operation example

The burst mode controller consists of:

- A counter that can be clocked by various sources, either within or outside the HRTIM (typically the end of a PWM period).
- A compare register to define the number of idle periods: HRTIM_BMCMP.
- A period register to define the burst repetition rate (corresponding to the sum of the idle and run periods): HRTIM_BMPER.

The burst mode controller is able to take over the control of any of the 10 PWM outputs. The state of each output during a burst mode operation is programmed using IDLESx and IDLEMx bits in the HRTIM_OUTxR register, as in *Table 356*.

Table 356. Timer output programming for burst mode

IDLEMx	IDLESx	Output state during burst mode
0	X	No action: the output is not affected by the burst mode operation.
1	0	Output inactive during the burst
1	1	Output active during the burst

Note: IDLEMx bit must not be changed while the burst mode is active.

The burst mode controller only acts on the output stage. A number of events are still generated during the idle period:

- Output set/reset interrupt or DMA requests
- External event filtering based on Tx2 output signal
- Capture events triggered by output set/reset

During the burst mode, neither start nor reset events are generated on the hrtim_out_sync[2:1] output, even if TxBM bit is set.

Operating mode

It is necessary to have the counter enabled (TxCEN bit set) before using the burst mode on a given timing unit. The burst mode is enabled with BME bit in the HRTIM_BMCR register.

It can operate in continuous or single-shot mode, using BMOM bit in the HRTIM_BMCR register. The continuous mode is enabled when BMOM = 1. The burst operation is maintained until BMSTAT bit in HRTIM_BMCR is reset to terminate it.

In single-shot mode (BMOM = 0), the idle sequence is executed once, following the burst mode trigger, and the normal timer operation is resumed immediately after.

The duration of the idle and run periods is defined with a burst mode counter and two registers. The HRTIM_BMCMPR register defines the number of counts during which the selected timer(s) are in an idle state (idle period). HRTIM_BMPER defines the overall burst mode period (sum of the idle and run periods). Once the initial burst mode trigger has occurred, the idle period length is HRTIM_BMCMPR+1, the overall burst period is HRTIM_BMPER+1.

Note: The burst mode period must not be less than or equal to the deadtime duration defined with DTRx[8:0] and DTFx[8:0] bitfields.

The counters of the timing units and the master timer can be stopped and reset during the burst mode operation. HRTIM_BMCR holds six control bits for this purpose: MTBM (master) and TABM..TEBM for timer A..E.

When MTBM or TxBM bit is reset, the counter clock is maintained. This is used to keep a phase relationship with other timers in multiphase systems, for instance.

When MTBM or TxBM bit is set, the corresponding counter is stopped and maintained in reset state during the burst idle period. This is used to have the timer restarting a full period when exiting from idle. If SYNCSRC[1:0] = 00 or 10 (synchronization output on the master

start or timer A start), a pulse is sent on the HRTIM_SCOUT output when exiting the burst mode.

Note: TxBM bit must not be set when the balanced idle mode is active (DLYPRT[1:0] = 0x11).

Burst mode clock

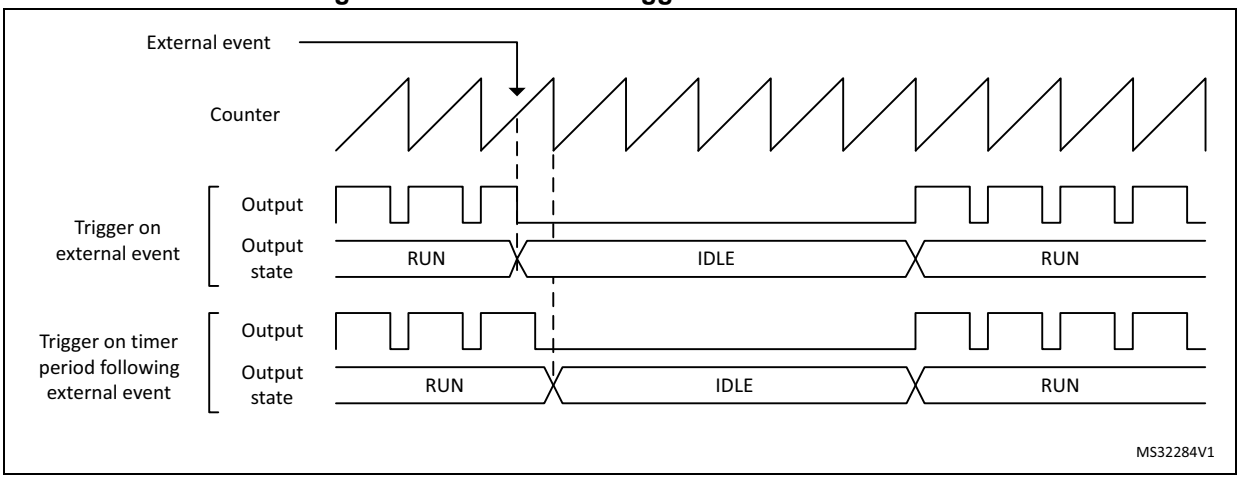
The burst mode controller counter can be clocked by several sources, selected with BMCLK[3:0] bits in the HRTIM_BMCR register:

- BMCLK[3:0] = 0000 to 0101: master timer and TIMA..E reset/roll-over events. This is used to have burst mode idle and run periods aligned with the timing unit counting period (both in free-running and counter reset mode).
- BMCLK[3:0] = 0110 to 1001: The clocking is provided by the hrtim_bm_ck[4:1] inputs connected to general purpose timers, as in *Table 328*. In this case, the burst mode idle and run periods are not necessarily aligned with timing unit counting period (a pulse on the output may be interrupted, resulting in a waveform with modified duty cycle for instance.
- BMCLK[3:0] = 1010: The f_{HRTIM} clock prescaled by a factor defined with BMPRSC[3:0] bits in HRTIM_BMCR register. In this case, the burst mode idle and run periods are not necessarily aligned with the timing unit counting period (a pulse on the output may be interrupted, resulting in a waveform with a modified duty cycle, for instance.

The pulse width on TIMx OC output must be at least N f_{HRTIM} clock cycles long to be detected by the HRTIM burst mode controller.

Burst mode triggers

To trigger the burst operation, 32 sources are available and are selected using the HRTIM_BMTRGR register:



- Software trigger (set by software and reset by hardware)
- 6 master timer events: repetition, reset/roll-over, compare 1 to 4
- 5 x 4 events from timers A..F: repetition, reset/roll-over, compare 1 and 2
- External event G (including TIMA event filtering) and H (including TIMD event filtering)
- Timer A period following external event G (including TIMA event filtering)
- Timer D period following external event H (including TIMD event filtering)
- An on-chip event on the hrtim_bm_trg input (connected to the general-purpose timer TRGO output), see *Table 325* for details.

These sources can be combined to have multiple concurrent triggers.

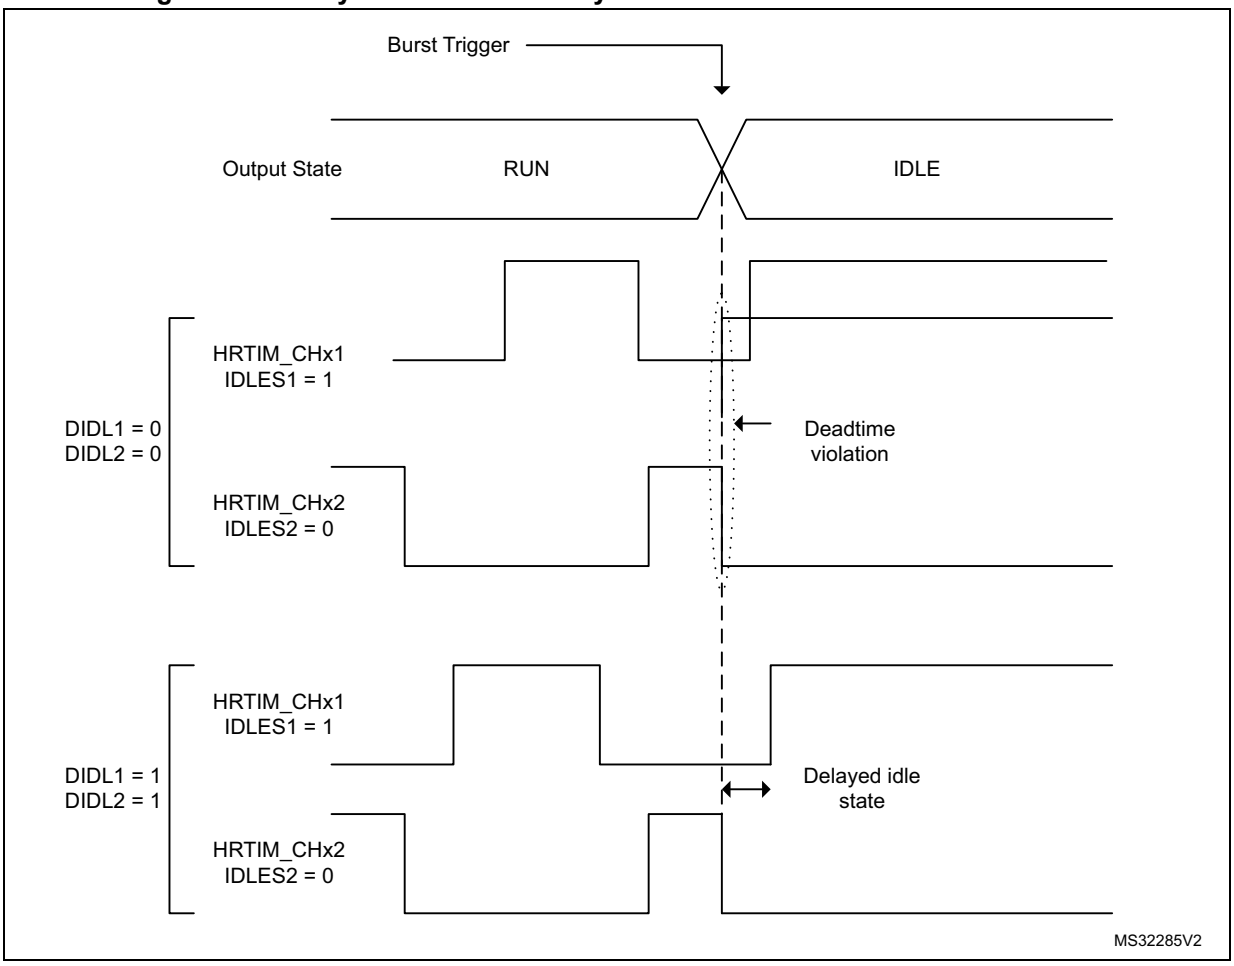
Burst mode is not retriggerable. In continuous mode, new triggers are ignored until the burst mode is terminated, while in single-shot mode, the triggers are ignored until the current burst completion including run periods (HRTIM_BMPER+1 cycles). This is also valid for software trigger (the software bit is reset by hardware even if it is discarded).

Figure 482 shows how the burst mode is started in response to an external event, either immediately or on the timer period following the event.

Figure 482. Burst mode trigger on external event

For TAEEVG and TDEEVH combined triggers (trigger on a timer period following an external event), the external event detection is always active, regardless of the burst mode programming and the ongoing burst operation:

- When the burst mode is enabled (BME=1) or the trigger is enabled (TAEEVG or TDEEVH bit set in the HRTIM_BMTRGR register) in between the external event and the timer period event, the burst is triggered.
- The single-shot burst mode is retriggered even if the external event occurs before the burst end (as long as the corresponding period happens after the burst).



Note: TAEEVG and TDEEVH triggers are valid only after a period event. If the counter is reset before the period event, the pending hrtim_eev7 or hrtim_eev8 event is discarded.

Burst mode delayed entry

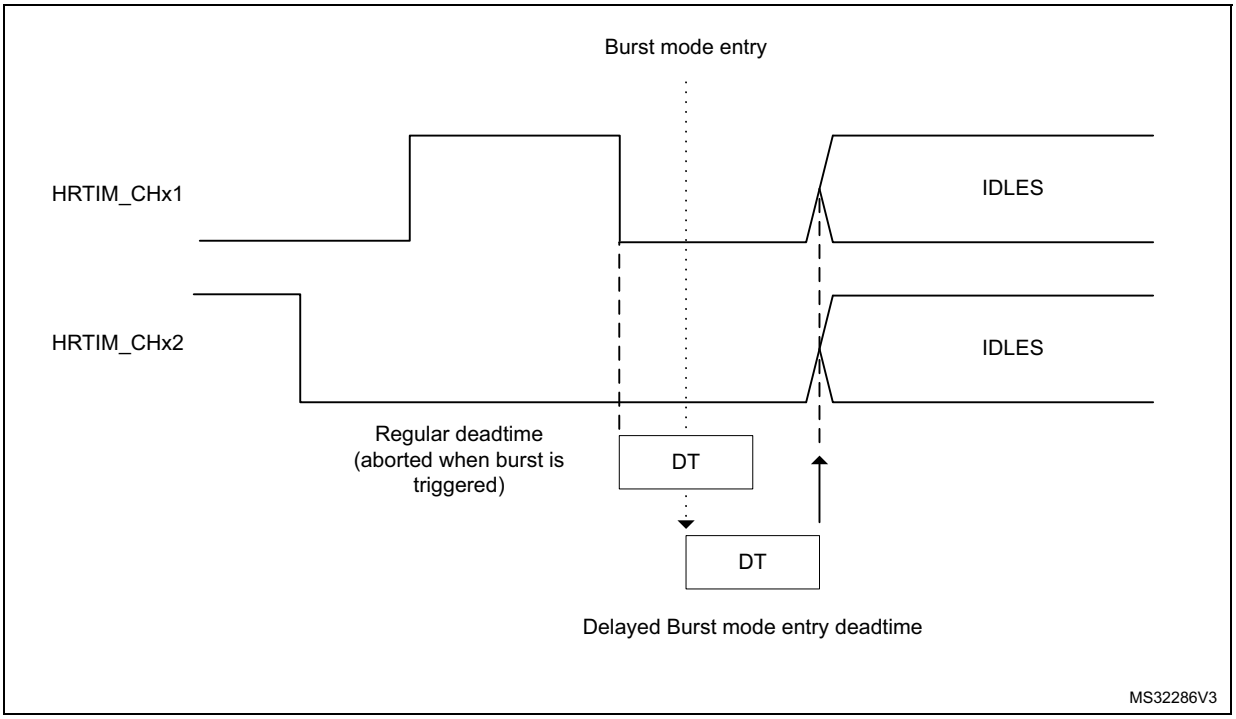
By default, the outputs are taking their idle level (as per IDLES1 and IDLES2 setting) immediately after the burst mode trigger.

It is also possible to delay the burst mode entry and force the output to an inactive state during a programmable period before the output takes its idle state. This is useful when driving two complementary outputs, one of them having an active idle state, to avoid a deadtime violation as shown on *Figure 483*. This prevents any risk of shoot through current in half-bridges, but causes a delayed response to the burst mode entry.

Figure 483. Delayed burst mode entry with deadtime enabled and IDLESx = 1

The delayed burst entry mode is enabled with DIDLx bit in the HRTIM_OUTxR register (one enable bit per output). It forces a deadtime insertion before the output takes its idle state. Each TIMx output has its own deadtime value:

- DTRx[8:0] on output 1 when DIDL1 = 1
- DTFx[8:0] on output 2 when DIDL2 = 1



DIDLx bits can be set only if one of the outputs has an active idle level during the burst mode (IDLES = 1) and only when positive deadtimes are used (SDTR/SDTF set to 0).

Note: The delayed burst entry mode uses deadtime generator resources. Consequently, when any of the two DIDLx bits is set and the corresponding timing unit uses the deadtime insertion (DTEN bit set in HRTIM_OUTxR), it is not possible to use the timerx output 2 as a filter for external events (Tx2 filtering signal is not available).

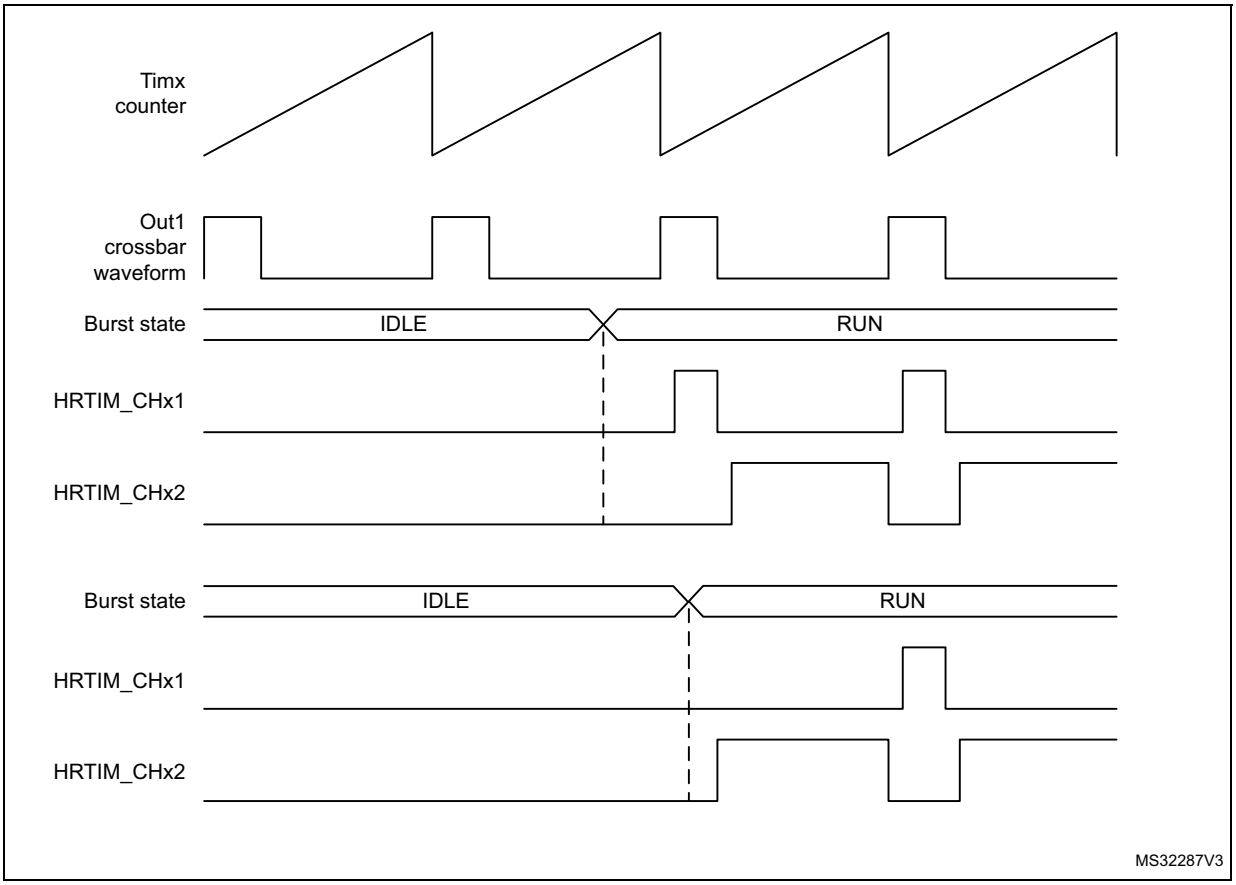
When durations defined by DTRx[8:0] and DTFx[8:0] are lower than three f_{HRTIM} clock cycle periods, the limitations related to the narrow pulse management listed in *Section 33.3.7* must be applied.

When the burst mode entry arrives during the regular deadtime, it is aborted and a new deadtime is restarted corresponding to the inactive period, as on *Figure 484*.

Figure 484. Delayed burst mode entry during deadtime

Burst mode exit

The burst mode exit is either forced by software (in continuous mode) or once the idle period is elapsed (in single-shot mode). In both cases, the counter is re-started immediately (if it was hold in a reset state with MTBM or TxBM bit = 1), but the effective output state transition from the idle to active mode only happens after the programmed set/reset event.



A burst period interrupt is generated in single-shot and continuous modes when BMPERIE enable bit is set in the HRTIM_IER register. This interrupt can be used to synchronize the burst mode exit with a burst period in continuous burst mode.

Figure 485 shows how a normal operation is resumed when the deadtime is enabled. Although the burst mode exit is immediate, this is only effective on the first set event on any of the complementary outputs.

Two different cases are presented:

1. The burst mode ends while the signal is inactive on the crossbar output waveform. The active state is resumed on Tx1 and Tx2 on the set event for the Tx1 output, and the Tx2 output does not take the complementary level on burst exit.
2. The burst mode ends while the crossbar output waveform is active: the activity is resumed on the set event of Tx2 output, and Tx1 does not take the active level immediately on burst exit.

Figure 485. Burst mode exit when the deadtime generator is enabled

The behavior described above is slightly different when the push-pull mode is enabled. The push-pull mode forces an output reset at the beginning of the period if the output is inactive, or symmetrically forces an active level if the output was high during the preceding period.

Consequently, an output with an active idle state can be reset at the time the burst mode is exited even if no transition is explicitly programmed. For symmetrical reasons, an output can be set at the time the burst mode is exited even if no transition is explicitly programmed, in case it was active when it entered in idle state.

Burst mode registers preloading and update

BMPREN bit (burst mode preload enable) is used to have the burst mode compare and period registers preloaded (HRTIM_BMCMP and HRTIM_BMPER).

When BMPREN is set, the transfer from preload to active register happens:

- When the burst mode is enabled (BME = 1),
- At the end of the burst mode period.

A write into the HRTIM_BMPER period register disables the update temporarily, until the HRTIM_BMCMP compare register is written, to ensure the consistency of the two registers when they are modified.

If the compare register only needs to be changed, a single write is necessary. If the period only needs to be changed, it is also necessary to rewrite the compare to have the new values taken into account.

When BMPREN bit is reset, the write access into BMCMPR and BMPER directly updates the active register. In this case, it is necessary to consider when the update is done during the overall burst period, for the two cases below:

a) Compare register update

If the new compare value is above the current burst mode counter value, the new compare is taken into account in the current period.

If the new compare value is below the current burst mode counter value, the new compare is taken into account in the next burst period in continuous mode, and ignored in single-shot mode (no compare match occurs and the idle state lasts until the end of the idle period).

b) Period register update

If the new period value is above the current burst mode counter value, the change is taken into account in the current period.

Note: If the new period value is below the current burst mode counter value, the new period is not taken into account, the burst mode counter overflows (at 0xFFFF) and the change is effective in the next period. In single-shot mode, the counter rolls over at 0xFFFF and the burst mode restarts for another period up to the new programmed value.

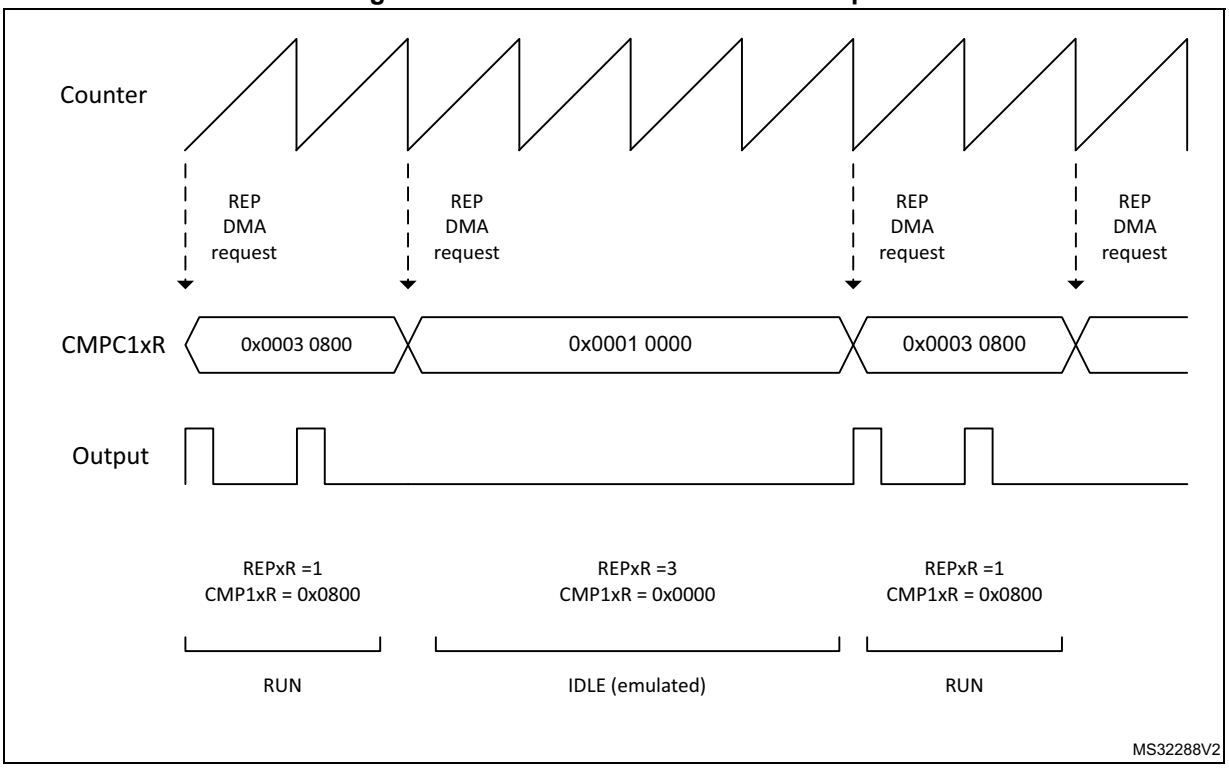
Burst mode emulation using a compound register

The burst mode controller only controls one or a set of timers for a single converter. When the burst mode is necessary for multiple independent timers, it is possible to emulate a simple burst mode controller using the DMA and the HRTIM_CMP1CxR compound register, which holds aliases of both the repetition and the compare 1 registers.

This is applicable to a converter which only requires a simple PWM (typically a buck converter), where the duty cycle only needs to be updated. In this case, the CMP1 register is used to reset the output (and define the duty cycle), while it is set on the period event.

In this case, a single 32-bit write access in CMP1CxR is sufficient to define the duty cycle (with the CMP1 value) and the number of periods during which this duty cycle is maintained (with the repetition value). To implement a burst mode, it is then only necessary to transfer by DMA (upon repetition event) two 32-bit data in continuous mode, organized as follows:

CMPC1xR = {REP_Run; CMP1 = Duty_Cycle}, {REP_Idle; CMP1 = 0}



For instance, the values:

{0x0003 0000}: CMP1 = 0 for four periods

{0x0001 0800}: CMP1 = 0x0800 for two period

provide a burst mode with two periods active every six PWM periods, as shown on Figure 486.

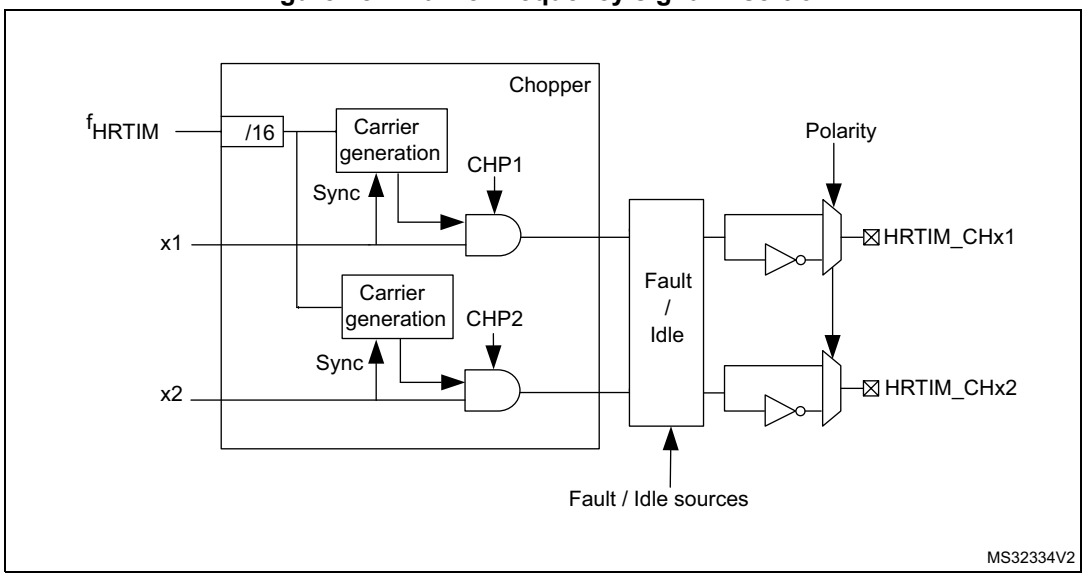


Figure 486. Burst mode emulation example

33.3.16 Chopper

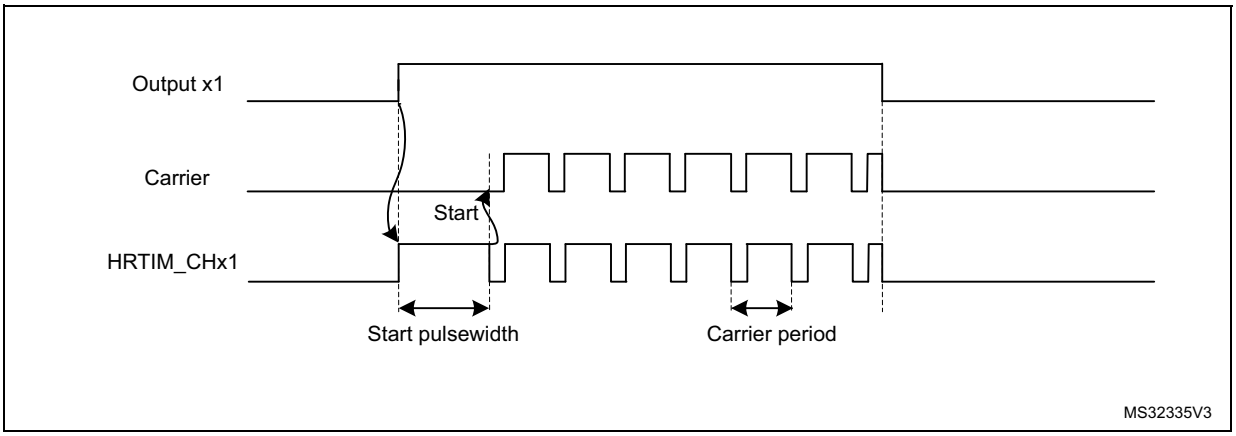
A high-frequency carrier can be added on top of the timing unit output signals to drive isolation transformers. This is done in the output stage before the polarity insertion, as shown on *Figure 487*, using CHP1 and CHP2 bits in the HRTIM_OUTxR register, to enable chopper on outputs 1 and 2, respectively.

Figure 487. Carrier frequency signal insertion

The chopper parameters can be adjusted using the HRIM_CHPxR register, with the possibility to define a specific pulsewidth at the beginning of the pulse, to be followed by a carrier frequency with programmable frequency and duty cycle, as in *Figure 488*.

CARFRQ[3:0] bits define the frequency, ranging from 2.03 MHz to 32.5 MHz (for f_{HRTIM} = 520 MHz) following the formula $F_{CHPFRQ} = f_{HRTIM} / (16 \times (CARFRQ[3:0]+1))$.

The duty cycle can be adjusted by 1/8 step with CARDTY[2:0], from 0/8 up to 7/8 duty cycle. When CARDTY[2:0] = 000 (duty cycle = 0/8), the output waveform only contains the starting pulse following the rising edge of the reference waveform, without any added carrier.



The pulsewidth of the initial pulse is defined using the STRPW[3:0] bitfield as follows: $t_{1STPW} = (STRPW[3:0]+1) \times 16 \times t_{HRTIM}$ and ranges from 31 ns to 492 ns (for f_{HRTIM} = 520 MHz).

The carrier frequency parameters are defined based on the f_{HRTIM} frequency, and do not dependent on the CKPSC[2:0] setting.

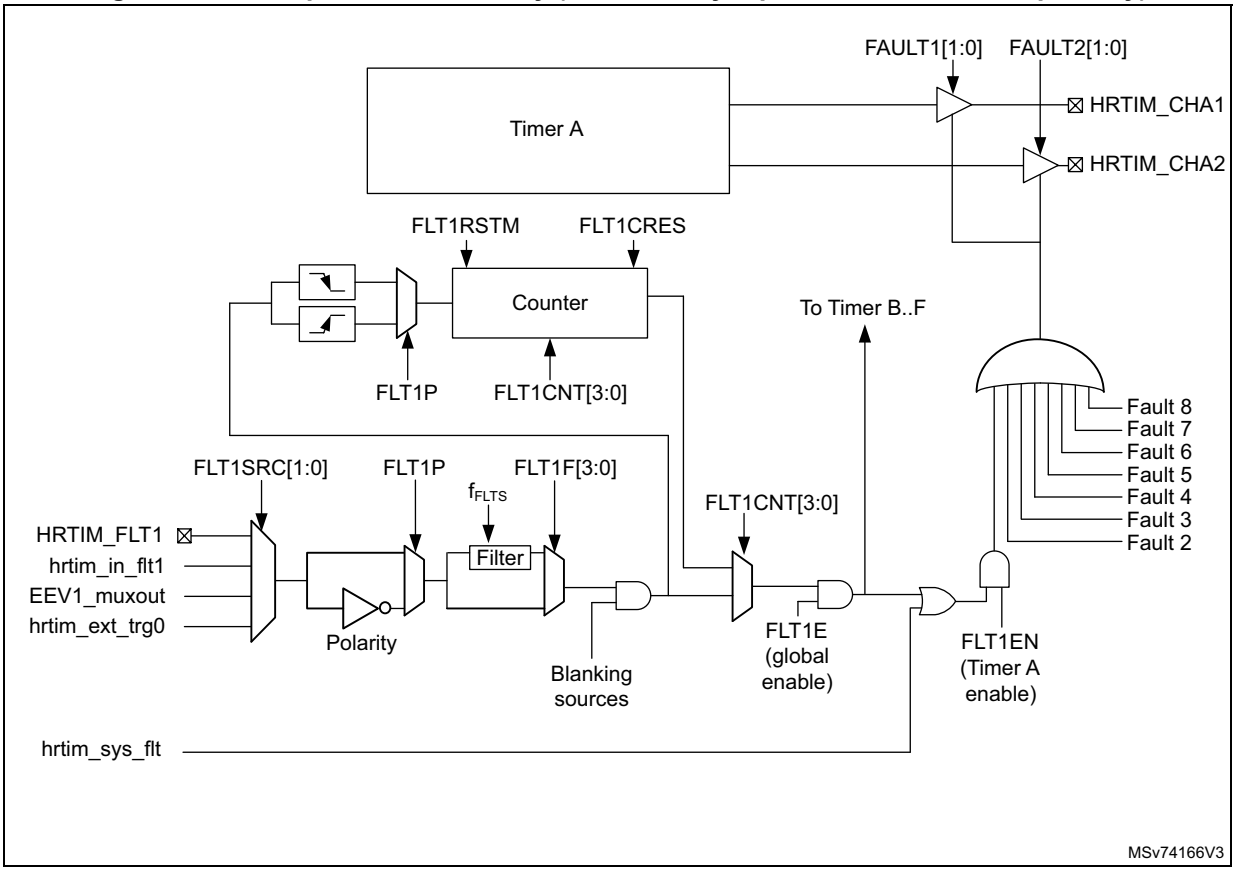
In chopper mode, the carrier frequency and the initial pulsewidth are combined with the reference waveform using an AND function. A synchronization is performed at the end of the initial pulse to have a repetitive signal shape.

The chopping signal is stopped at the end of the output waveform active state, without waiting for the current carrier period to be completed. It can thus contain shorter pulses than programmed.

Figure 488. HRTIM outputs with Chopper mode enabled

Note: CHP1 and CHP2 bits must be set prior to the output enable done with TxyOEN bits in the HRTIM_OENR register.

CARFRQ[2:0], CARDTY[2:0], and STRPW[3:0] bitfields cannot be modified while the chopper mode is active (at least one of the two CHPx bits is set).



Caution: The chopper mode must only be used with inactive IDLE state (IDLES1 = 0 and IDLES2 = 0).

33.3.17 Fault protection

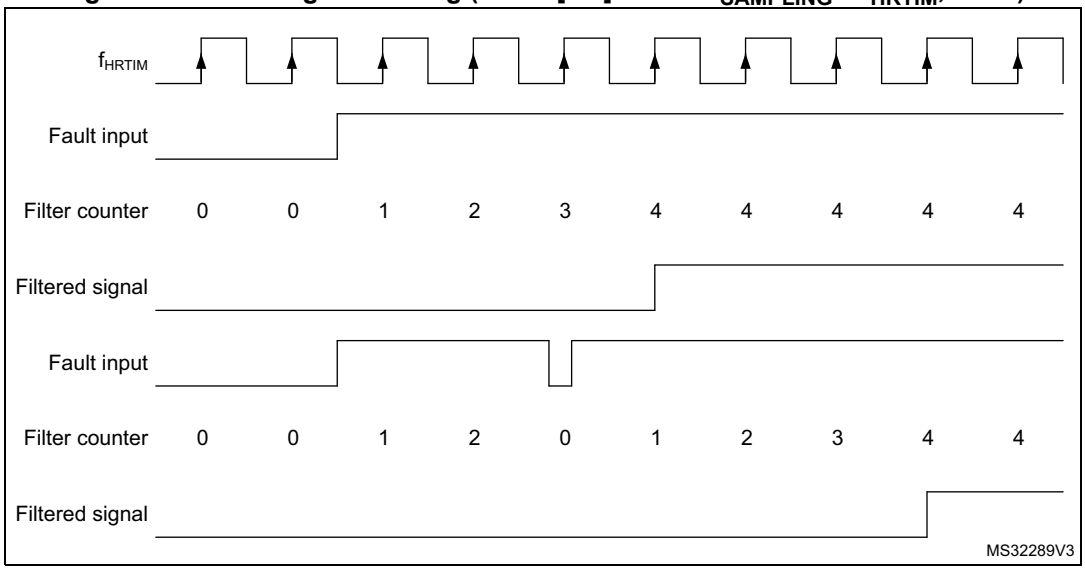
The HRTIM has a versatile fault protection circuitry to disable the outputs in case of an abnormal operation. Once a fault has been triggered, the outputs take a predefined safe state. This state is maintained until the output is reenabled by software. In case of a permanent fault request, the output remains in its fault state, even if the software attempts to re-enable them, until the fault source disappears.

The HRTIM has eight FAULT input channels; all of them are available and can be combined for each of the eight timing units, as shown on *Figure 489*.

Figure 489. Fault protection circuitry (FAULT1 fully represented, FAULT2..8 partially)

Each fault channel is fully configurable using HRTIM_FLTINR1, HRTIM_FLTINR2 and HRTIM_FLTINR5 registers before being routed to the timing units. FLTxSRC FLTxSRC[1:0] bit selects the source of the fault signal that can be either a digital input or an internal event (built-in comparator output).

Table 333 details the three available sources for each of the six faults channels.



The EEVx_muxout event mentioned in *Figure 489* is taken after the hrtim_eevx[8:1] input multiplexer controlled by the EExSRC[2:0]bits. Refer to *Figure 461* for details.

The polarity of the signal can be selected to define the active level, using the FLTxP polarity bit in HRTIM_FLTINRx registers. If FLTxP = 0, the signal is active at low level; if FLTxP = 1, it is active when high.

The fault information can be filtered after the polarity setting. If FLTxF[3:0] bitfield is set to 0000, the signal is not filtered and acts asynchronously, independently from the f_{HRTIM} clock. For all other FLTxF[3:0] bitfield values, the signal is digitally filtered. The digital filter is made of a counter in which a number N of valid samples are needed to validate a transition on the output. If the input value changes before the counter has reached the value N, the counter is reset and the transition is discarded (considered as a spurious event). If the counter reaches N, the transition is considered as valid and transmitted as a correct external event. Consequently, the digital filter adds a latency to the external events being filtered,

depending on the sampling clock and on the filter length (number of valid samples expected). *Figure 490* shows how a spurious fault signal is filtered.

Figure 490. Fault signal filtering (FLTxF[3:0]= 0010: $f_{SAMPLING} = f_{HRTIM}$, N = 4)

The filtering period ranges from two cycles of the f_{HRTIM} clock up to eight cycles of the f_{FLTS} clock divided by 32. f_{FLTS} is defined using FLTSD[1:0] bits in the HRTIM_FLTINR2 register. *Table 357* summarizes the sampling rate and the filter length. A jitter of 1 sampling clock period must be subtracted from the filter length to take into account the uncertainty due to the sampling and have the effective filtering.

Table 357. Sampling rate and filter length vs FLTFxF[3:0] and clock setting

-	f_{FLTS} vs FLTSD[1:0]				Filter length for f_{HRTIM} = 520 MHz	
FLTFxF[3:0]	**00**	**01**	**10**	**11**	**Min**	**Max**
0001,0010,0011	f_{HRTIM}	f_{HRTIM}	f_{HRTIM}	f_{HRTIM}	f_{HRTIM}, N =2 3.8 ns	f_{HRTIM}, N =8 15.4 ns
0100, 0101	f_{HRTIM} /2	f_{HRTIM} /4	f_{HRTIM} /8	f_{HRTIM} /16	f_{HRTIM} /2, N = 6 23 ns	f_{HRTIM} /16, N = 8 246 ns
0110, 0111	f_{HRTIM} /4	f_{HRTIM} /8	f_{HRTIM} /16	f_{HRTIM} /32	f_{HRTIM} /4, N = 6 46 ns	f_{HRTIM} /32, N = 8 492 ns
1000, 1001	f_{HRTIM} /8	f_{HRTIM} /16	f_{HRTIM} /32	f_{HRTIM} /64	f_{HRTIM} /8, N = 6 92 ns	f_{HRTIM} /64, N = 8 0.98 µs
1010, 1011, 1100	f_{HRTIM} /16	f_{HRTIM} /32	f_{HRTIM} /64	f_{HRTIM} /128	f_{HRTIM} /16, N = 5 154 ns	f_{HRTIM} /128, N = 8 1.97 µs
1101, 1110, 1111	f_{HRTIM} /32	f_{HRTIM} /64	f_{HRTIM} /128	f_{HRTIM} /256	f_{HRTIM} /32, N = 5 308 ns	f_{HRTIM} /256, N = 8 3.94 µs

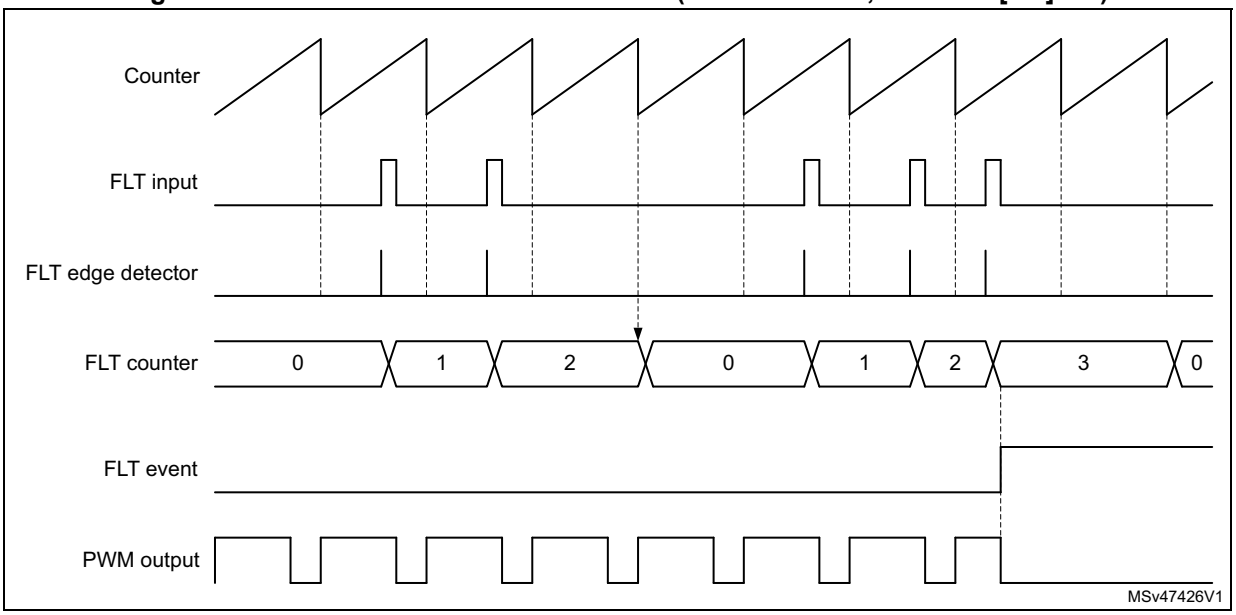
Fault blanking and event counting

The fault inputs can be temporarily disabled to blank spurious fault events. The blanking sources are listed in the *Table 358* below.

Table 358. Fault input blanking events

-	FLTxBLKS = 0, reset-aligned window		FLTxBLKS = 1 moving window	
Fault input	**Blanking window start**	**Blanking window end**	**Blanking window start**	**Blanking window end**
FAULT1	Timer A reset/roll-over	Timer A CMP3 event	Timer A CMP4 event	Timer A CMP3 event
FAULT2	Timer B reset/roll-over	Timer B CMP3 event	Timer B CMP4 event	Timer B CMP3 event
FAULT3	Timer C reset/roll-over	Timer C CMP3 event	Timer C CMP4 event	Timer C CMP3 event
FAULT4	Timer D reset/roll-over	Timer D CMP3 event	Timer D CMP4 event	Timer D CMP3 event
FAULT5	Timer E reset/roll-over	Timer E CMP3 event	Timer E CMP4 event	Timer E CMP3 event
FAULT6	Timer F reset/roll-over	Timer F CMP3 event	Timer F CMP4 event	Timer F CMP3 event
FAULT7	Timer D reset/roll-over	Timer D CMP1 event	Timer D CMP2 event	Timer D CMP1 event
FAULT8	Timer F reset/roll-over	Timer F CMP1 event	Timer F CMP2 event	Timer F CMP1 event

A fault counter is also used to discard multiple spurious fault events and define an acceptance criteria.



The FLTxCNT[3:0] bitfield selects the FAULTx counter threshold. A fault is considered valid when the number of events is equal to the FLTxCNT[3:0] value.

This FLTxRSTM selects the FAULTx counter reset mode

- 0: fault counter hardware reset on reset/roll-over event, as per the *Table 359* below.
- 1: fault counter reset on each reset/roll-over event only if no event occurs during the last counting period, as shown on *Figure 491* below.

The fault counter can be reset by software with the FLTxCRES bit at any time.

Figure 491. Fault counter cumulative mode (FLTxRSTM = 1, FLTxCNT[3:0] = 2)

A given FLTx input counter can be reset by a single source. The *Table 359* indicates which timer unit is associated with a given fault. This does not prevent having a fault line shared by multiple timers (for example FLT1 with event counter enabled, acting on timer A, timer B, and timer C simultaneously).

Table 359. Fault 1..6 counter reset source

Fault Input	Fault counter reset source
hrtim_flt1[4:1]	Timer A reset/roll-over
hrtim_flt2[4:1]	Timer B reset/roll-over
hrtim_flt3[4:1]	Timer C reset/roll-over
hrtim_flt4[4:1]	Timer D reset/roll-over
hrtim_flt5[4:1]	Timer E reset/roll-over
hrtim_flt6[4:1]	Timer F reset/roll-over
hrtim_flt7[4:1]	Timer D reset/roll-over
hrtim_flt8[4:1]	Timer F reset/roll-over

System fault input (hrtim_sys_flt)

This fault is provided by the MCU Class B circuitry (see *Section 10: System configuration, boot and security (SBS)* for details) and corresponds to a system fault coming from:

- The clock security system
- The AXISRAM1 ECC double error detection
- The AXISRAM2 ECC double error detection
- The AXISRAM3 ECC double error detection
- The AXISRAM4 ECC double error detection
- The ITCM ECC double error detection
- The DTCM ECC double error detection
- The DCACHE ECC double error detection
- The Backup RAM ECC double error detection
- The flash memory ECC double error detection
- The PVD detector
- The Cortex®-M7 lockup signal

This input overrides the FAULT inputs and disables all outputs having FAULTy[1:0] = 01, 10, 11.

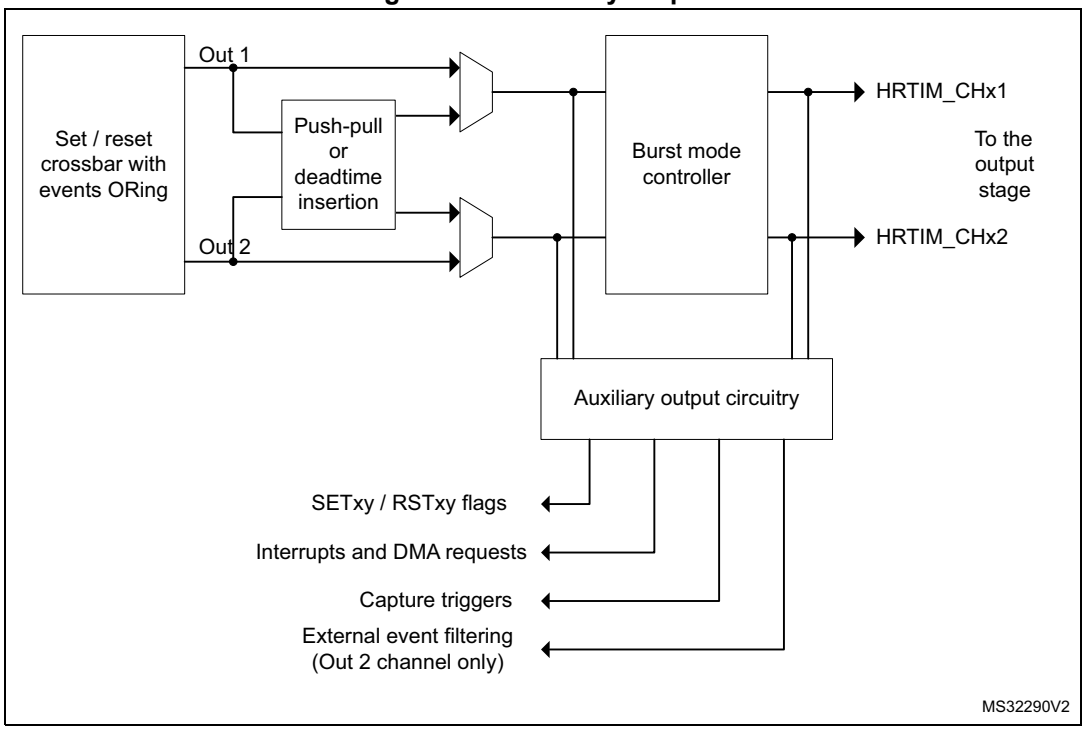
For each FAULT channel, a write-once FLTxLCK bit in the HRTIM_FLTxR register is used to lock FLTxE, FLTxP, FLTxSRC, FLTxF[3:0] bits (it renders them read-only), for functional safety purpose. If enabled, the fault conditioning set-up is frozen until the next HRTIM or system reset.

Once the fault signal is conditioned as explained above, it is routed to the timing units. For any of them, the six fault channels are enabled using bits FLT1EN to FLT6EN in the HRTIM_FLTxR register, and they can be selected simultaneously (the sysfault is automatically enabled as long as the output is protected by the fault mechanism). This is used to have, for instance:

- One fault channel simultaneously disabling several timing units
- Multiple fault channels being ORed to disable a single timing unit

A write-once FLTLCK bit in the HRTIM_FLTxR register is used to lock FLTxEN bits (it renders them read-only) until the next reset, for functional safety purpose. If enabled, the timing unit fault-related set-up is frozen until the next HRTIM or system reset.

For each of the timers, the output state during a fault is defined with FAULT1[1:0] and FAULT2[1:0] bits in the HRTIM_OUTxR register (see *Section 33.3.14*).



33.3.18 Auxiliary outputs

Timer A to E have auxiliary outputs in parallel with the regular outputs going to the output stage. They provide the following internal status, events, and signals:

- SETxy and RSTxy status flags, together with the corresponding interrupts and DMA requests
- Capture triggers upon output set/reset
- External event filters following a Tx2 output copy (see details in *Section 33.3.9*)

The auxiliary outputs are taken either before or after the burst mode controller, depending on the HRTIM operating mode. An overview is given on *Figure 492*.

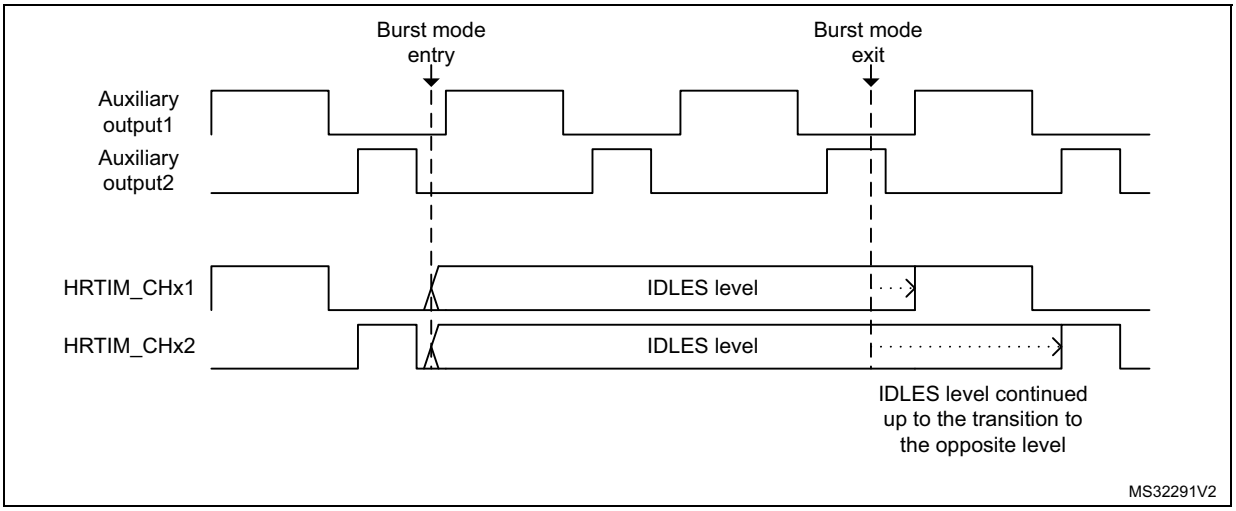


Figure 492. Auxiliary outputs

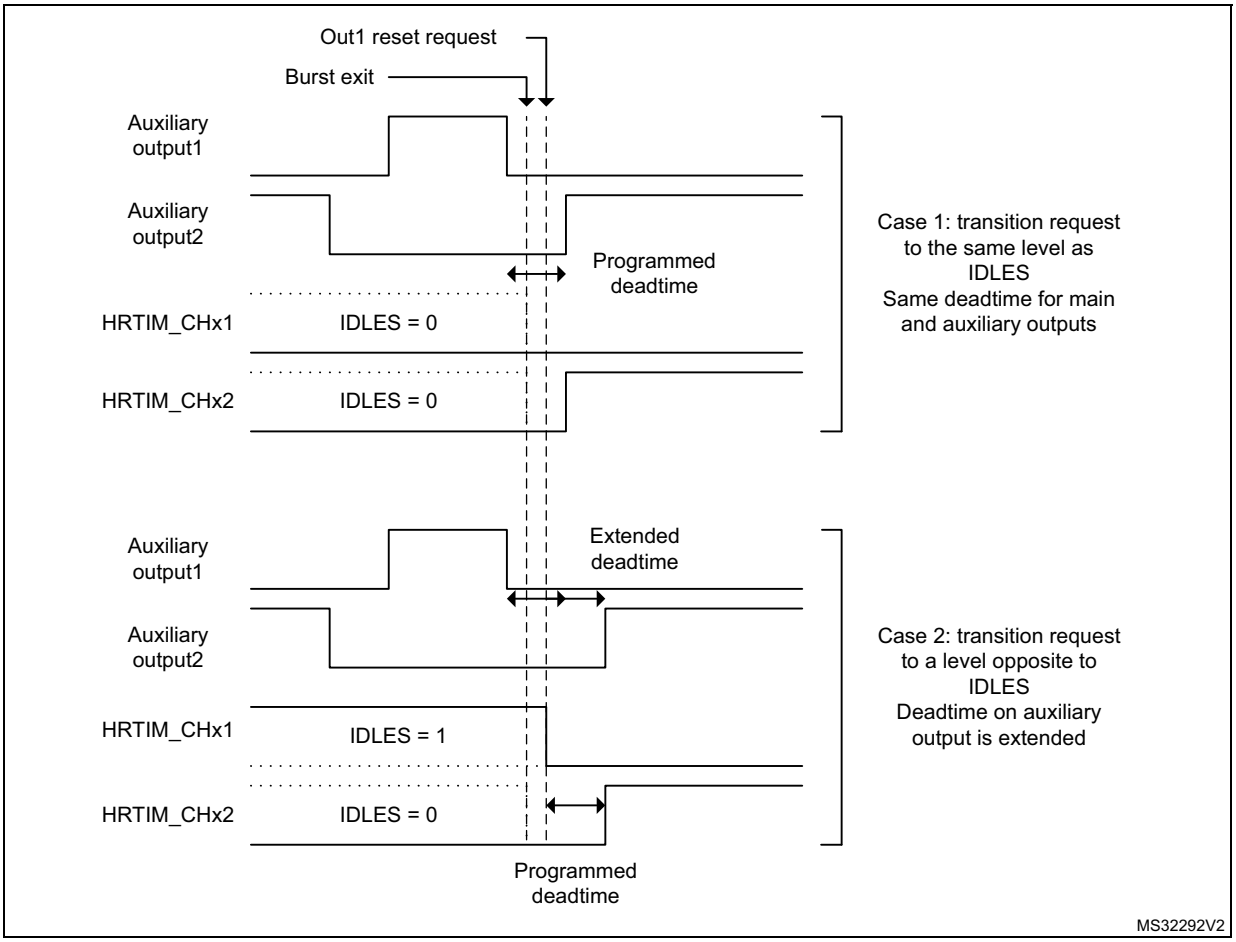
By default, the auxiliary outputs are copies of outputs Tx1 and Tx2. The exceptions are:



- The delayed idle and the balanced idle protections, when the deadtime is disabled (DTEN = 0). When the protection is triggered, the auxiliary outputs are maintained and follow the signal coming out of the crossbar. On the contrary, if the deadtime is enabled (DTEN = 1), both main and auxiliary outputs are forced to an inactive level.
- The burst mode (TCEN=1, IDLEMx=1); there are two cases:
  a) If DTEN=0 or DIDLx=0, the auxiliary outputs are not affected by the burst mode entry and continue to follow the reference signal coming out of the crossbar (see *Figure 493*).
  b) If the deadtime is enabled (DTEN=1) together with the delayed burst mode entry (DIDLx=1), the auxiliary outputs have the same behavior as the main outputs. They are forced to the IDLES level after a deadtime duration, then they keep this level during all the burst period. When the burst mode is terminated, the IDLES level is maintained until a transition occurs to the opposite level, similarly to the main output.

Figure 493. Auxiliary and main outputs during burst mode (DIDLx = 0)

The signal on the auxiliary output can be slightly distorted when exiting from the burst mode or when reenabling the outputs after a delayed protection, if this happens during a deadtime. In this case, the deadtime applied to the auxiliary outputs is extended so that the deadtime on the main outputs is respected. *Figure 494* gives some examples.

Figure 494. Deadtime distortion on auxiliary output when exiting burst mode

33.3.19 Synchronizing the HRTIM with other timers or HRTIM instances

The HRTIM provides options for synchronizing multiple HRTIM instances, as a master unit (generating a synchronization signal) or as a slave (waiting for a trigger to be synchronized). This feature can also be used to synchronize the HRTIM with other timers, either external or on-chip. The synchronization circuitry is controlled inside the master timer.

Synchronization output

This section explains how the HRTIM must be configured to synchronize external resources and act as a master unit.

Four events can be selected as the source to be sent to the synchronization output. This is done using SYNCSRC[1:0] bits in the HRTIM_MCR register, as follows:

- 00: master timer start
  This event is generated when MCEN bit is set or when the timer is restarted after having reached the period value in single-shot mode. It is also generated on a reset which occurs during the counting (when CONT or RETRIG bits are set).
- 01: master timer compare 1 event
- 10: timer A start
  This event is generated when TACEN bit is set or when the counter is reset and restarts counting in response to this reset. The following counter reset events are not propagated to the synchronization output: counter roll-over in continuous mode, and discarded reset request in single-shot nonretriggerable mode. The reset is only taken into account when it occurs during the counting (CONT or RETRIG bits are set).
- 11: timer A compare 1 event

SYNCOUT[1:0] bits in the HRTIM_MCR register specify how the synchronization event is generated. When SYNCOUT[1:0] bits are set to 01, the synchronization event is generated internally.

The synchronization pulses can be generated on the HRTIM_SCOUT output pin, with SYNCOUT[1:0] = 1x. SYNCOUT[0] bit specifies the polarity of the synchronization signal. If SYNCOUT[0] = 0, the HRTIM_SCOUT pin has a low idle level and issues a positive pulse of 16 f_{HRTIM} clock cycles length for the synchronization). If SYNCOUT[0] = 1, the idle level is high and a negative pulse is generated.

Note: The synchronization pulse is followed by an idle level of 16 f_{HRTIM} clock cycles during which any new synchronization request is discarded. Consequently, the maximum synchronization frequency is $f_{HRTIM}/32$.

The idle level on the HRTIM_SCOUT pin is applied as soon as the SYNCOUT[1:0] bits are enabled (i.e. the bitfield value is different from 00).

The synchronization output initialization procedure must be done prior to the configuration of the MCU outputs and counter enable, in the following order:

1. SYNCOUT[1:0] and SYNCSRC[1:0] bitfield configuration in HRTIM_MCR
2. HRTIM_SCOUT pin configuration (see the “General-purpose I/Os” section)
3. Master or timer A counter enable (MCEN or TACEN bit set)

When the synchronization input mode is enabled and starts the counter (using SYNCSTRTM/SYNCSTRTx bits) simultaneously with the synchronization output mode (SYNCSRC[1:0] = 00 or 10), the output pulse is generated only when the counter is starting

or is reset while running. Any reset request clearing the counter without causing it to start does not affect the synchronization output.

Synchronization input

The HRTIM can be synchronized by external sources, as per the programming of the SYNCIN[1:0] bits in the HRTIM_MCR register:

- 00: synchronization input is disabled
- 01: another on-chip HRTIM instance
- 10: the On-chip timer TRGO output connected to hrtim_in_sync[2] input (refer to *Table 325* for details).
- 11: a positive pulse on the HRTIM_SCIN input pin (hrtim_in_sync[3])

This bitfield cannot be changed once the destination timer (master timer or timing unit) is enabled (MCEN and/or TxCEN bit set).

The HRTIM_SCIN input is rising-edge sensitive. The timer behavior is defined with the following bits present in HRTIM_MCR and HRTIM_TIMxCR registers (see *Table 360* for details):

- Synchronous start: the incoming signal starts the timer's counter (SYNCSTRTM and/or SYNCSTRTx bits set). TxCEN (MCEN) bits must be set to have the timer enabled and the counter ready to start. In continuous mode, the counter does not start until the synchronization signal is received.
- Synchronous reset: the incoming signal resets the counter (SYNCRSTM and/or SYNCRSTx bits set). This event decrements the repetition counter as any other reset event.

The synchronization events are taken into account only once the related counters are enabled (MCEN or TxCEN bit set). A synchronization request triggers a SYNC interrupt.

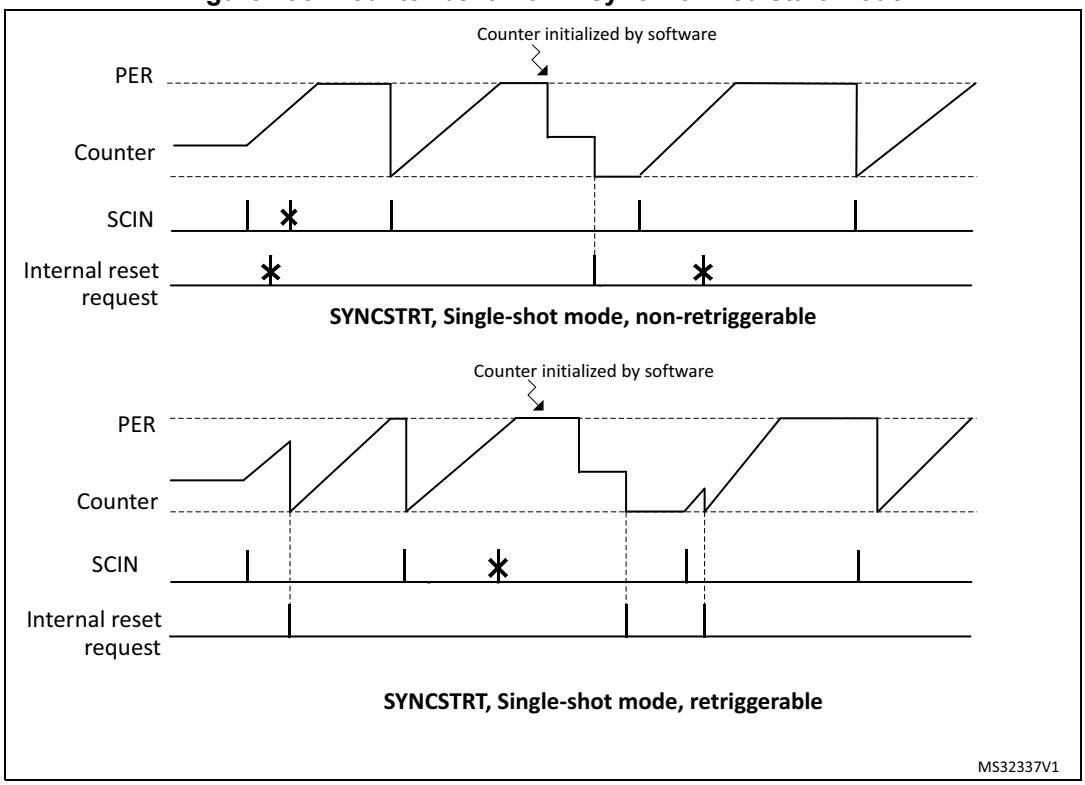
Note: A synchronized start event resets the counter if the current counter value is above the active period value.

The effect of the synchronization event depends on the timer operating mode, as summarized in *Table 360*.

Table 360. Effect of sync event versus timer operating modes

Operating mode	SYNC RSTx	SYNC STRTx	Behavior following a SYNC reset or start event
Single-shot non-retriggerable	0	1	Start events are taken into account when the counter is stopped and: – once the MCEN or TxCEN bits are set – once the period has been reached. A start occurring when the counter is stopped at the period value resets the counter. A reset request clears the counter but does not start it (the counter can solely be re-started with the synchronization). Any reset occurring during the counting is ignored (as during regular non-retriggerable mode).
	1	X	Reset events are starting the timer counting. They are taken into account only if the counter is stopped and: – once the MCEN or TxCEN bits are set – once the period has been reached. When multiple reset requests are selected (from HRTIM_SCIN and from internal events), only the first arriving request is taken into account.

Table 360. Effect of sync event versus timer operating modes (continued)



Operating mode	SYNC RSTx	SYNC STRTx	Behavior following a SYNC reset or start event
Single-shot retriggerable	0	1	The counter start is effective only if the counter is not started or period is elapsed. Any synchronization event occurring after counter start has no effect. A start occurring when the counter is stopped at the period value resets the counter. A reset request clears the counter but does not start it (the counter can solely be started by the synchronization). A reset occurring during counting is taken into account (as during regular retriggerable mode).
	1	X	The reset from HRTIM_SCIN is taken into account as any HRTIM's timer counter reset from internal events and is starting or re-starting the timer counting. When multiple reset requests are selected, the first arriving request is taken into account.
Continuous mode	0	1	The timer is enabled (MCEN or TxCEN bit set) and is waiting for the synchronization event to start the counter. Any synchronization event occurring after the counter start has no effect (the counter can solely be started by the synchronization). A reset request clears the counter but does not start it.
	1	X	The reset from HRTIM_SCIN is taken into account as any HRTIM's timer counter reset from internal events and is starting or re-starting the timer counting. When multiple reset requests are selected, the first arriving request is taken into account.

Note: When multiple HRTIMs are synchronously started, the HRTIM which initiates the synchronization is started one f_{HRTIM} *clock cycle after its SYNC output signal is sent. This is used to compensate for the internal propagation delay and to have the subsequent HRTIM timer cycle accurately synchronized.*

When multiple HRTIMs are synchronously reset, the slave timer is reset one f_{HRTIM} *clock cycle after the master request (internal propagation delay).*

Figure 495 presents how the synchronized start is done in single-shot mode.

Figure 495. Counter behavior in synchronized start mode

Remote update disable

The remote update disable bits RMUDIS and RTxUDIS in HRTIM_CR1 register can temporarily disable the update event on other on-chip HRTIMER.

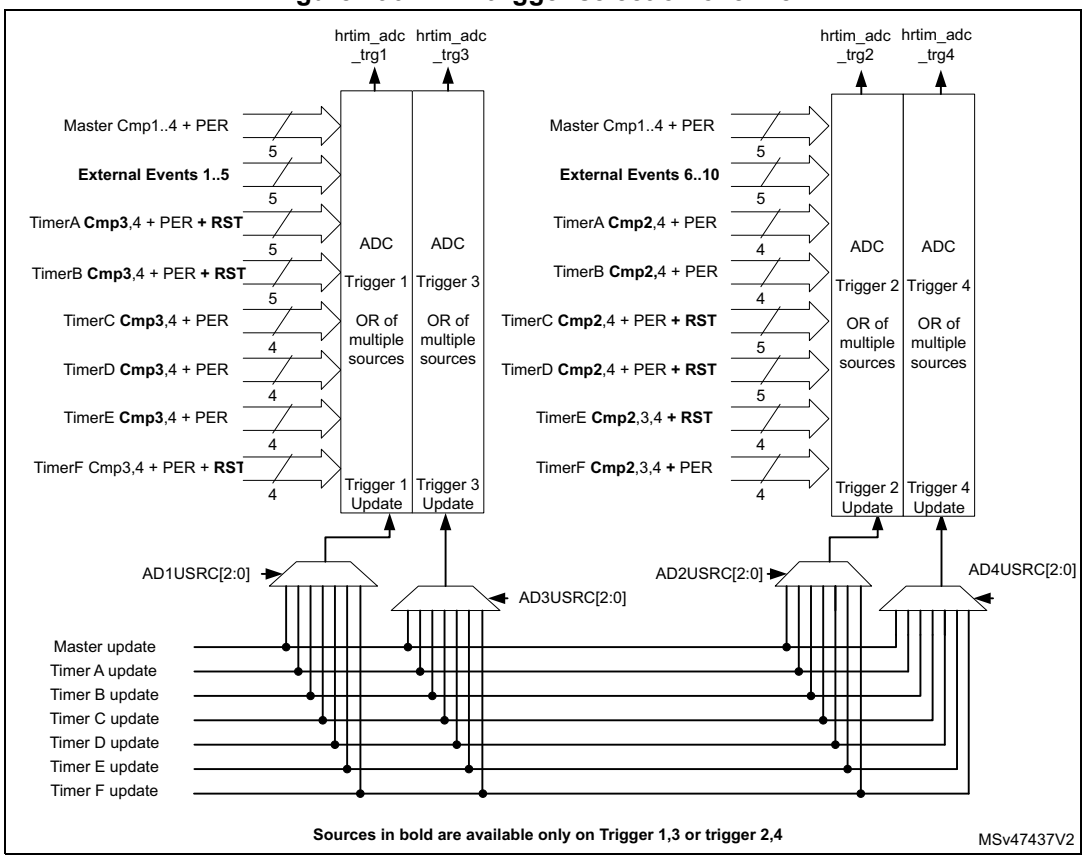
Both the regular and remote update disable bits are located in HRTIM_CR1 register, so that both HRTIMERs can be simultaneously disabled.

This mechanism is used to make sure that both HRTIMER registers are updated consistently, without any risk to have one HRTIMER updated before the other.

Any pending update is ignored while the update disable bits are set. The update happens on the next valid update event, once the update disable bits have been cleared.

For security and task isolation reasons, to prevent one HRTIMER to disable updates on a another HRTIMER, the remote update disable authorization bits RMUDISA and RTxUDISA in HRTIM_CR3 must first be set. By default, the remote update disable functionality is inactive.

33.3.20 ADC triggers



The ADCs can be triggered by the master and the six timing units.

10 independent triggers are available for both the regular and the injected sequencers of the ADCs. The external events can be used as triggers. They are taken right after the

conditioning defined in the HRTIM_EECRx registers, and are not depending on the EEFxR1 and EEFxR2 register settings.

Up to 32 events can be combined (ORed) for ADC triggers 1 to 4, in HRTIM_ADC1R to HRTIM_ADC4R registers, as shown on *Figure 496*. The ADC triggers 1/3 and 2/4 are using the same source set. A multiple triggering is possible within a single switching period by selecting several sources simultaneously. A typical use case is for a nonoverlapping multiphase converter, where all phases can be sampled in a row using a single ADC trigger output.

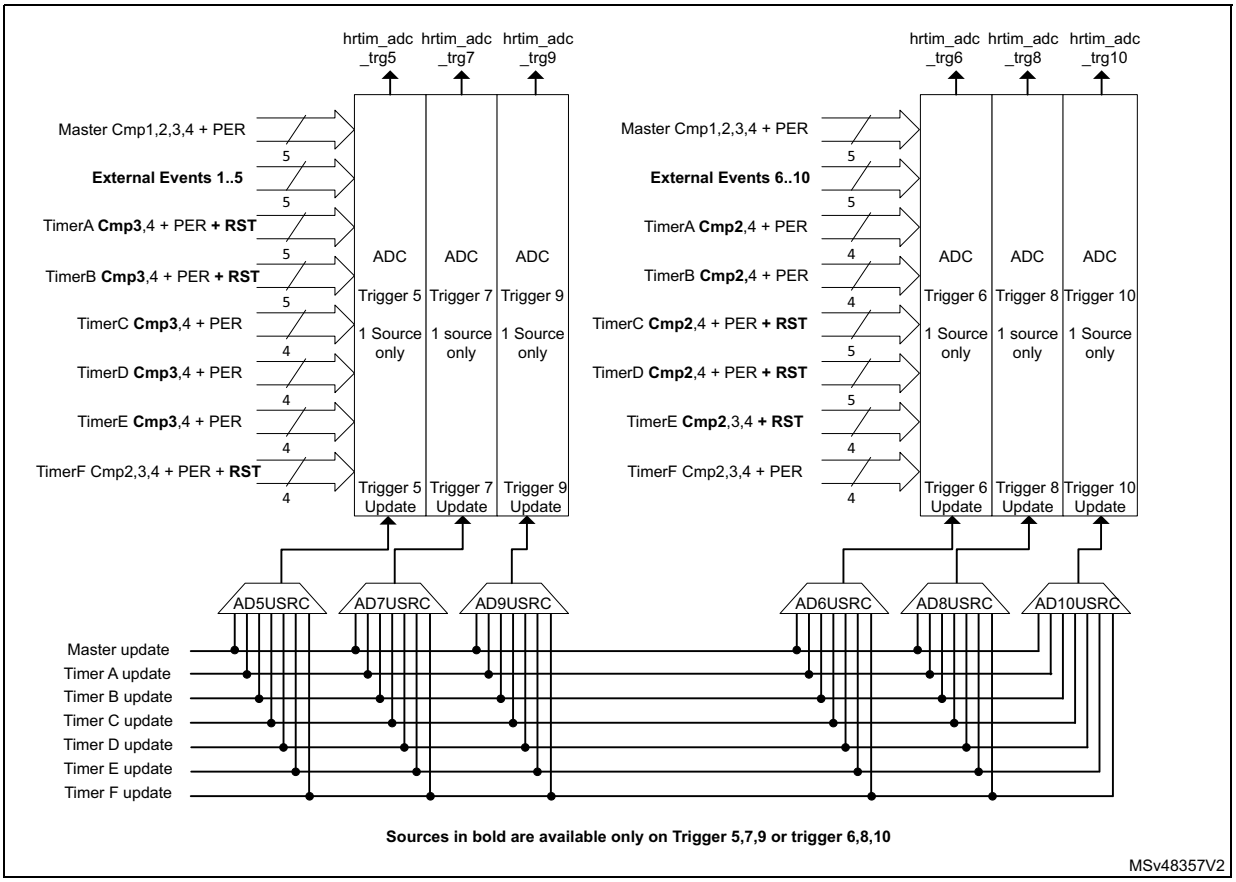


Figure 496. ADC trigger selection overview

The ADC triggers 5 to 10 are configured in the HRTIM_ADCER register, as shown on *Figure 497*. The ADC triggers 5/7/9 and 6/8/10 are using the same source set.

A single source can be selected at once for these triggers (1 out of 32 possible events).

Figure 497. ADC triggers

HRTIM_ADC1R to HRTIM_ADC4R and HRTIM_ADCER registers are preloaded and can be updated synchronously with the timer they are related to. The update sources are defined with ADxUSRC[2:0] bits in the HRTIM_CR1 and HRTIM_ADCUR registers.

For instance, if ADC trigger 1 outputs timer A CMP2 events (HRTIM_ADC1R = 0x0000 0400), HRTIM_ADC1R is typically updated simultaneously with timer A (AD1USRC[2:0] = 001).

When the preload is disabled (PREEN bit reset) in the source timer, the HRTIM_ADCxR registers are not preloaded either: a write access results in an immediate update of the trigger source.

ADC postscaler

A postscaling unit is used to reduce the ADC trigger rate with respect to the switching frequency.

Each ADC trigger rate can be individually adjusted using the ADCxPSC[4:0] bits in the HRTIM_ADCxPS1 and HRTIM_ADCxPS2 registers as shown in *Figure 498* below for the up-counting mode.

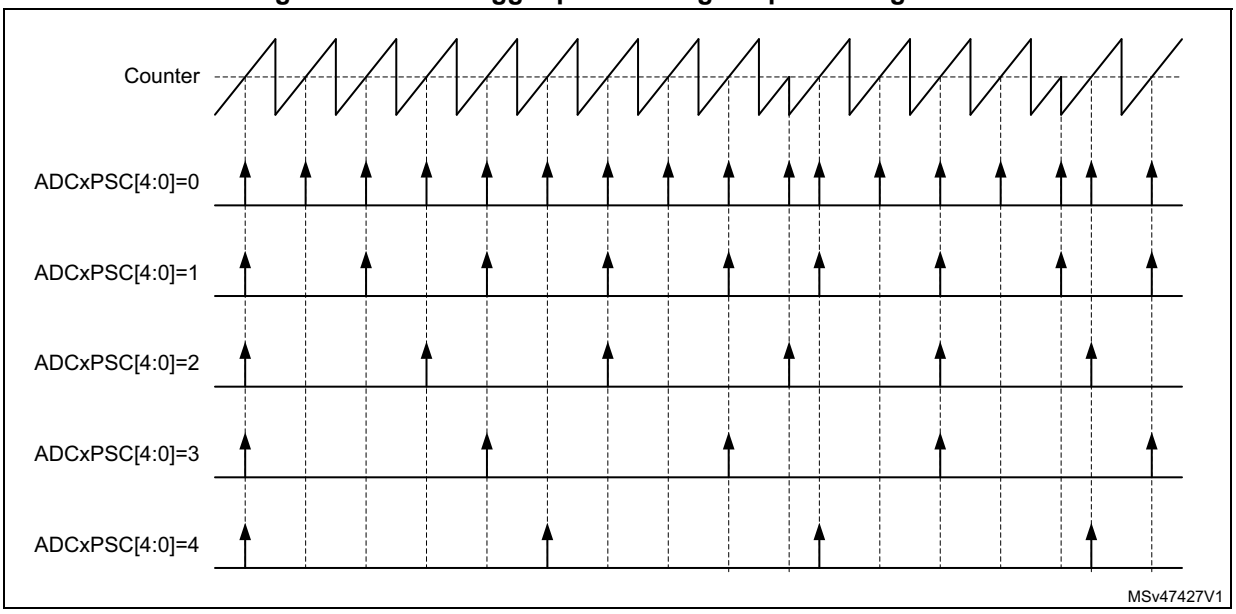
In the center-aligned mode, the ADC postscaling is done on events selected with the ADROM[1:0] bitfield, programmed in the source timer, as shown in *Figure 499*. The

ADROM[1:0] bitfield is coding for any event that can trigger the ADC: reset, roll-over (period) and compare event:

- ADROM[1:0] = 00: event generated both during up and down-counting phases
- ADROM[1:0] = 01: event generated during down-counting phases
- ADROM[1:0] = 10: event generated during up-counting phases

The ADC postscaler programming registers are preloaded and can be updated on-the-fly without stopping the timers.

Figure 498. ADC trigger post-scaling in up-counting mode



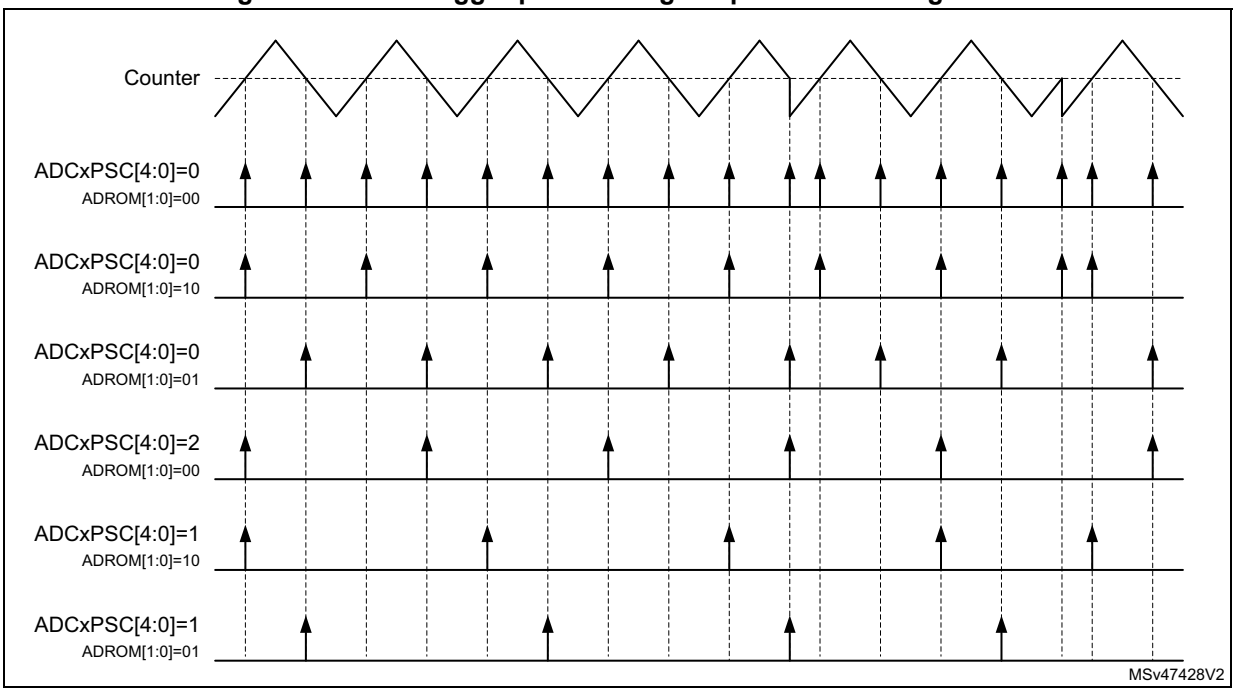


Figure 499. ADC trigger post-scaling in up/down counting mode

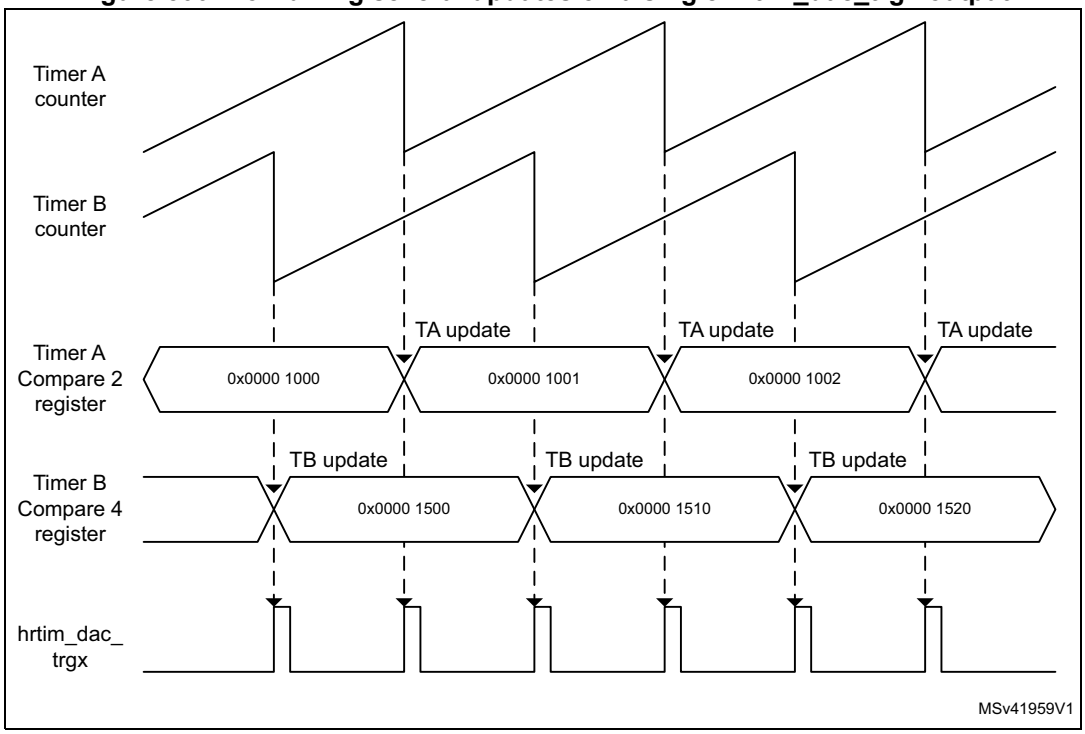
33.3.21 DAC triggers

The HRTIM is used to have the embedded DACs updated synchronously with the timer updates.

The update events from the master timer and the timer units can generate DAC update triggers on any of the three hrtim_dac_trgx outputs.

Note: Each timer has its own DAC-related control register.



DACSYNC[1:0] bits of the HRTIM_MCR and HRTIM_TIMxCR registers are programmed as follows:

- 00: No update generated
- 01: Update generated on hrtim_dac_trg1
- 10: Update generated on hrtim_dac_trg2
- 11: Update generated on hrtim_dac_trg3

An output pulse of one f_{HRTIM} clock period is generated on the hrtim_dac_trgx output.

When DACSYNC[1:0] bits are enabled in multiple timers, the hrtim_dac_trgx output consists of an OR of all timers' update events. For instance, if DACSYNC = 1 in timer A and in timer B, the update event in timer A is ORed with the update event in timer B to generate a DAC update trigger on the corresponding hrtim_dac_trgx output, as shown on *Figure 500*.

Figure 500. Combining several updates on a single hrtim_dac_trgx output

Refer to *Table 335: HRTIM1/HRTIM2 DAC triggers connections* for connections to the DACs.

Dual channel DAC trigger

Slope compensation techniques and hysteretic control to be easily implemented using HRTIM built-in features and the DAC sawtooth generator. The principle is to have a DAC generating a decreasing saw-tooth synchronized with the PWM period, or a square wave synchronized with PWM signal.

This mode is enabled with the DCDE bit in the TIMxCR2 register. This bit cannot be changed once the timer is operating (TxEN bit set).

It uses two trigger outputs, as shown on the *Figure 501* below:

- The hrtim_dac_reset_trgx generates DAC reset/update events
- The hrtim_dac_step_trgx generates requests for incremental DAC value changes

The DCDR bit in the TIMxCR2 register defines when the hrtim_dac_reset_trgx trigger is generated:

- DCDR = 0: the trigger is generated on counter reset or roll-over event
- DCDR = 1: the trigger is generated on output 1 set event

Note: The DCDR bit is not significant when the DCDE bit is reset (Dual channel DAC trigger disabled).

The DCDS bit in the TIMxCR2 register defines when the hrtim_dac_step_trgx trigger is generated:

- DCDS = 0: the trigger is generated on compare 2 event
- DCDS = 1: the trigger is generated on output 1 reset event

The DCDR and DCDS bits allows the following use cases to be covered:

- Edge-aligned slope compensation (DCDR = DCDS = 0): the DAC's sawtooth starts on PWM period beginning and multiple triggers are generated during the period
- Center-aligned slope compensation (DCDR = 1 DCDS = 0): the DAC's sawtooth starts on the output set event and multiple triggers are generated during the period
- Hysteretic controller: the DAC value must be changed twice per period, when the output state changes. 2 triggers are generated per PWM period. In edge-aligned mode (DCDR=0, DCDS =1), the triggers are generated on counter reset or roll-over. In center-aligned mode (DCDR=1, DCDS=1), the triggers are generated when the output is set.

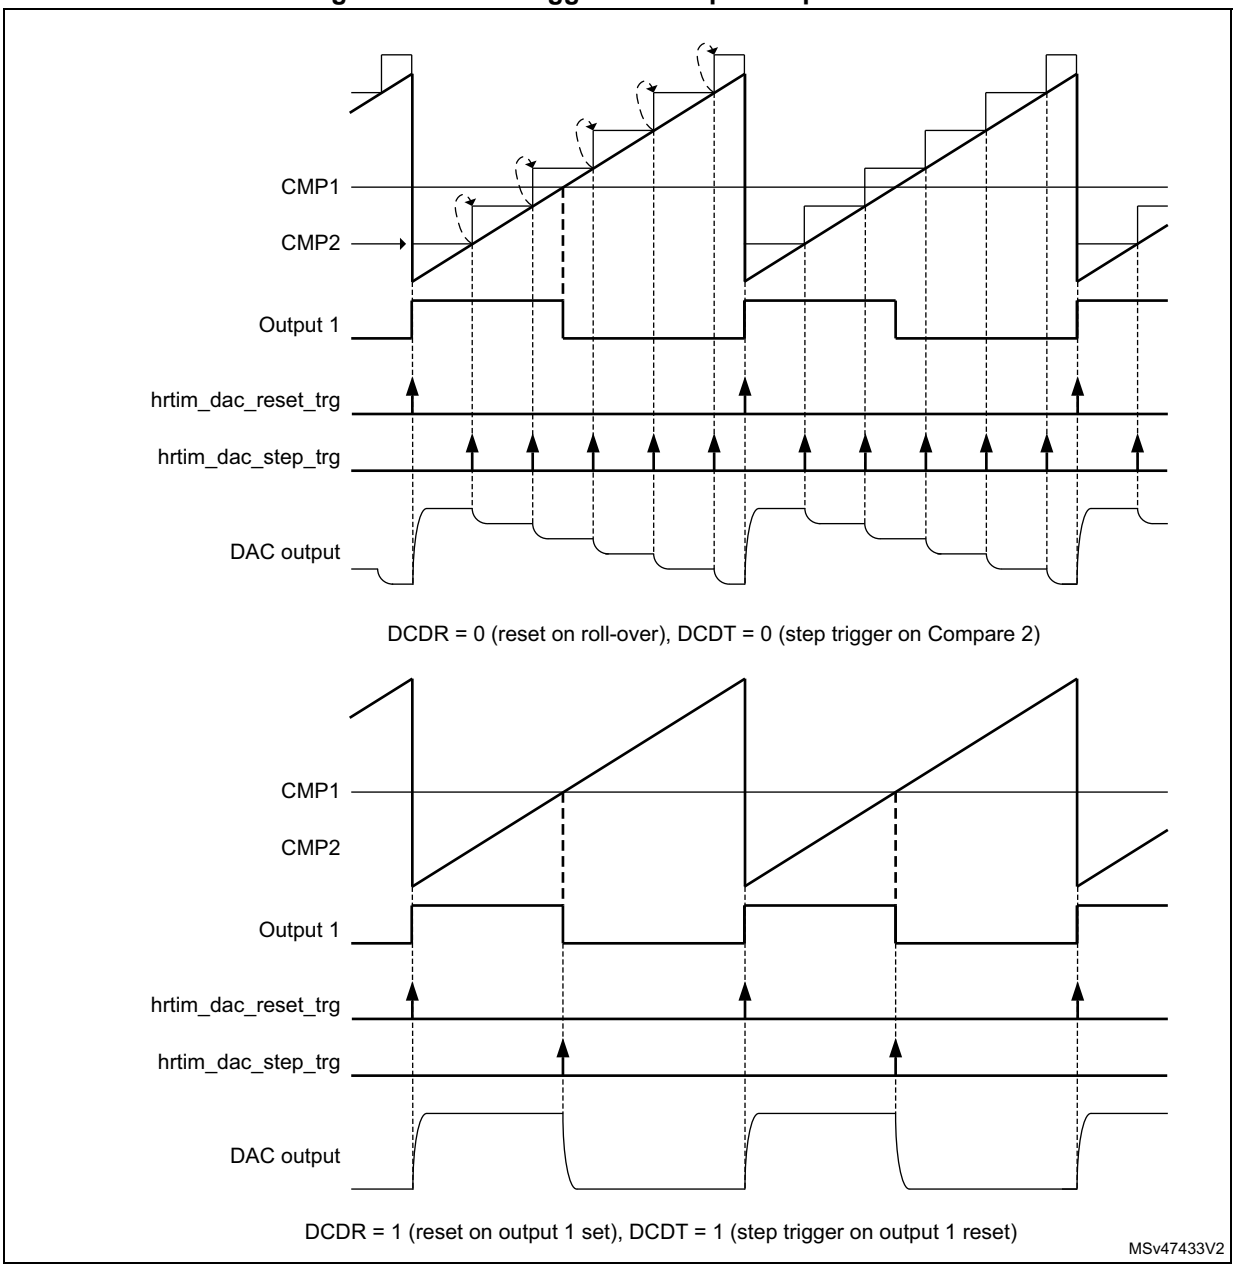
The compare 2 has a particular operating mode when the DCDE is set and the DCDS bit is reset. The active comparison value is automatically updated as soon as a compare match has occurred, so that the trigger can be repeated periodically with a period equal to the CMP2 value, as represented on *Figure 501*.
The dual channel DAC trigger with DCDS bit reset (compare 2 event used) must not be used simultaneously with modes using CMP2 (triple/quad interleaved and triggered-half modes).

Note: The CMP2 value can be changed on-the-fly. The new value is taken into account on the next coming compare match.

Note: When the DCDS bit is reset, the CMP2 value must not be modified by other mechanisms: the interleaved, triggered half and balanced idle modes must be disabled.

Table 361 below gives an example, for generating six triggers within a PWM period. It shows that it is necessary to round up the division result to the upper value.

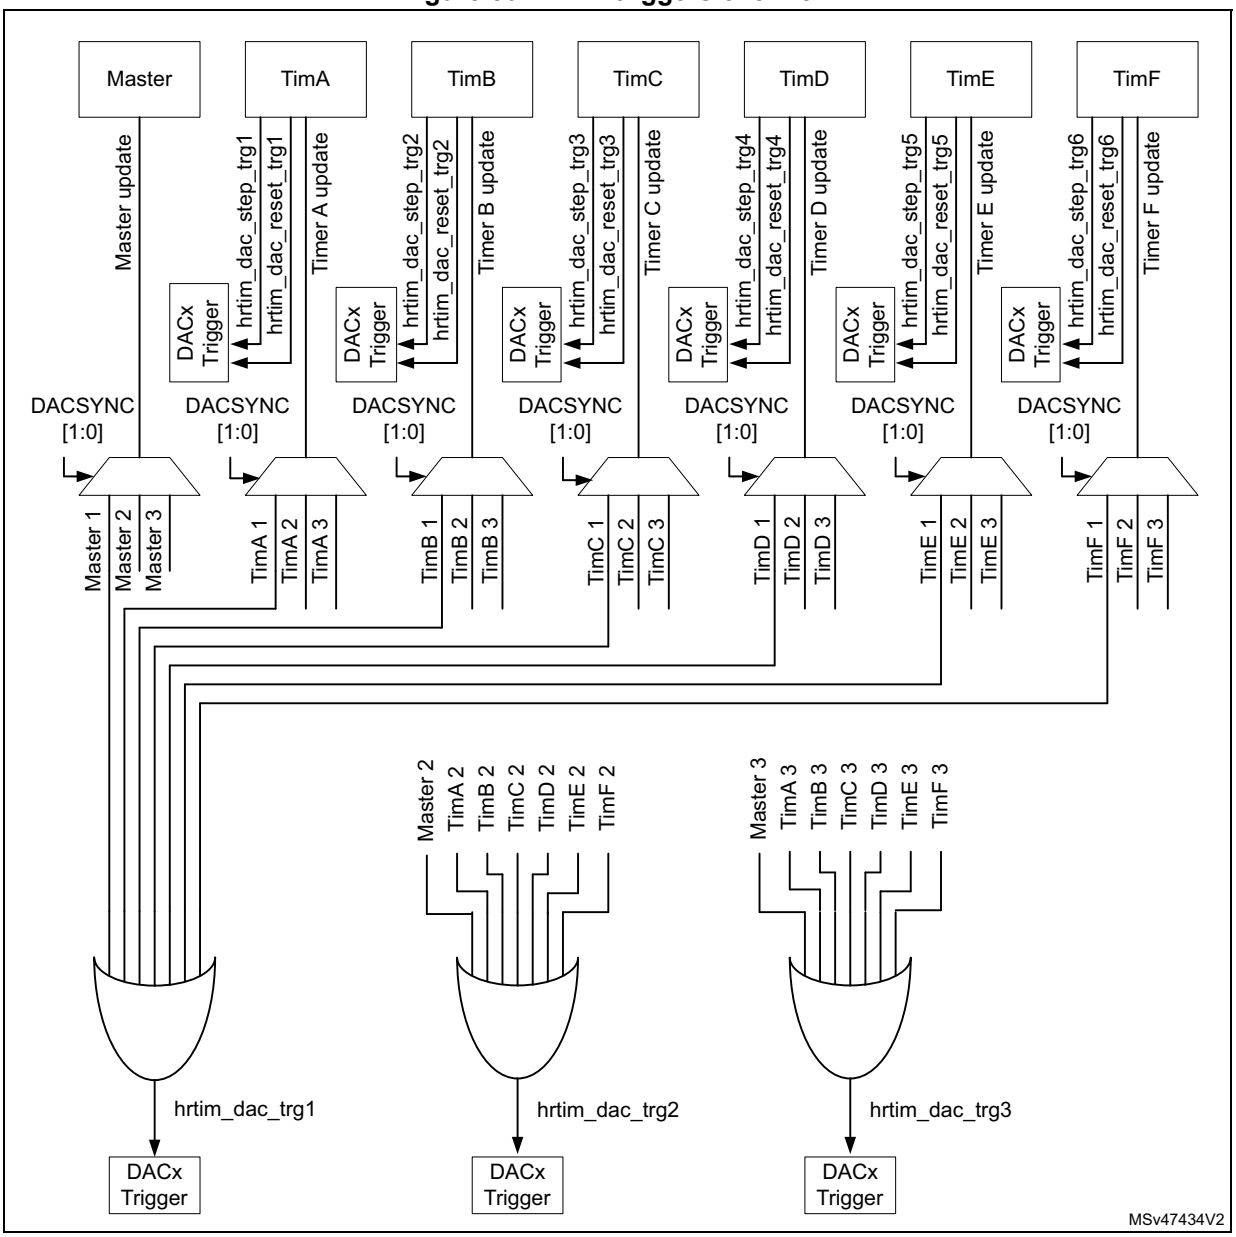
Let's consider a counter period TIMxPER = 8192. Dividing 8192 by 6 yields 1365.33.



- Round down value: 1365: 7 triggers are generated, the 6th and 7th being very close (respectively for counter = 8190 and 8192)
- Round up value:1366: six triggers are generated. The sixth trigger on hrtim_dac_step_trg (for counter = 8192) is aborted by the counter roll-over from 8192 to 0.

Table 361. DAC dual channel trigger example

-	**CMP2 = 1365**	**hrtim_dac_ reset_trg**	**hrtim_dac_ step_trg**	**CMP2 = 1366**	**hrtim_dac_ reset_trg**	**hrtim_dac_ step_trg**
Counter value	1365	-	1	1366	-	1
	2730	-	2	2732	-	2
	4095	-	3	4098	-	3
	5460	-	4	5464	-	4
	6825	-	5	6830	-	5
	8190	-	6	8192	6	-
	8192	7	-	1366	-	1
	1365	-	1	2732	-	2
	...	-	-	...	-	-



Note: In centered-pattern mode, it is mandatory to have an even number of triggers per switching period, so as to avoid unevenly spaced triggers around counter's peak value.

Figure 501. DAC triggers for slope compensation

The *Figure 502* below provides an overview of all the available DAC triggers.

Figure 502. DAC triggers overview

33.3.22 Interrupts

7 interrupts can be generated by the master timer:

- Master timer registers update
- Synchronization event received
- Master timer repetition event
- Master compare 1 to 4 event

14 interrupts can be generated by each timing unit:

- Crossbar override rearm delay elapsed
- Delayed protection triggered
- Counter reset or roll-over event
- Output 1 and output 2 reset (transition active to inactive)
- Output 1 and output 2 set (transition inactive to active)
- Capture 1 and 2 events
- Timing unit registers update
- Crossbar override trigger
- Repetition event
- Compare 1 to 4 event

8 global interrupts are generated for the whole HRTIM:

- System fault and fault 1 to 6 (regardless of the timing unit attribution)
- Burst mode period completed

The interrupt requests are grouped in eight vectors as follows:

- hrtim_it1: master timer interrupts (master update, sync input, repetition, MCMP1..4) and global interrupt except faults (burst mode period)
- hrtim_it2: TIMA interrupts
- hrtim_it3: TIMB interrupts
- hrtim_it4: TIMC interrupts
- hrtim_it5: TIMD interrupts
- hrtim_it6: TIME interrupts
- hrtim_it7: TIMF interrupts
- hrtim_it8: Dedicated vector all fault interrupts to allow high-priority interrupt handling

Table 362 is a summary of the interrupt requests, their mapping and associated control, and status bits.

Table 362. HRTIM interrupt summary

Interrupt vector	Interrupt event	Event flag	Enable control bit	Flag clearing bit
hrtim_it1	Burst mode period completed	BMPER	BMPERIE	BMPERC
	Master timer registers update	MUPD	MUPDIE	MUPDC
	Synchronization event received	SYNC	SYNCIE	SYNCC

		FLT6	FLT6IE	FLT6C

33.3.23 DMA

Most of the events able to generate an interrupt can also generate a DMA request, even both simultaneously. Each timer (master, TIMA...F) has its own DMA enable register.

The individual DMA requests are ORed into seven channels as follows:

- 1 channel for the master timer
- 1 channel per timing unit (TIMA...F)

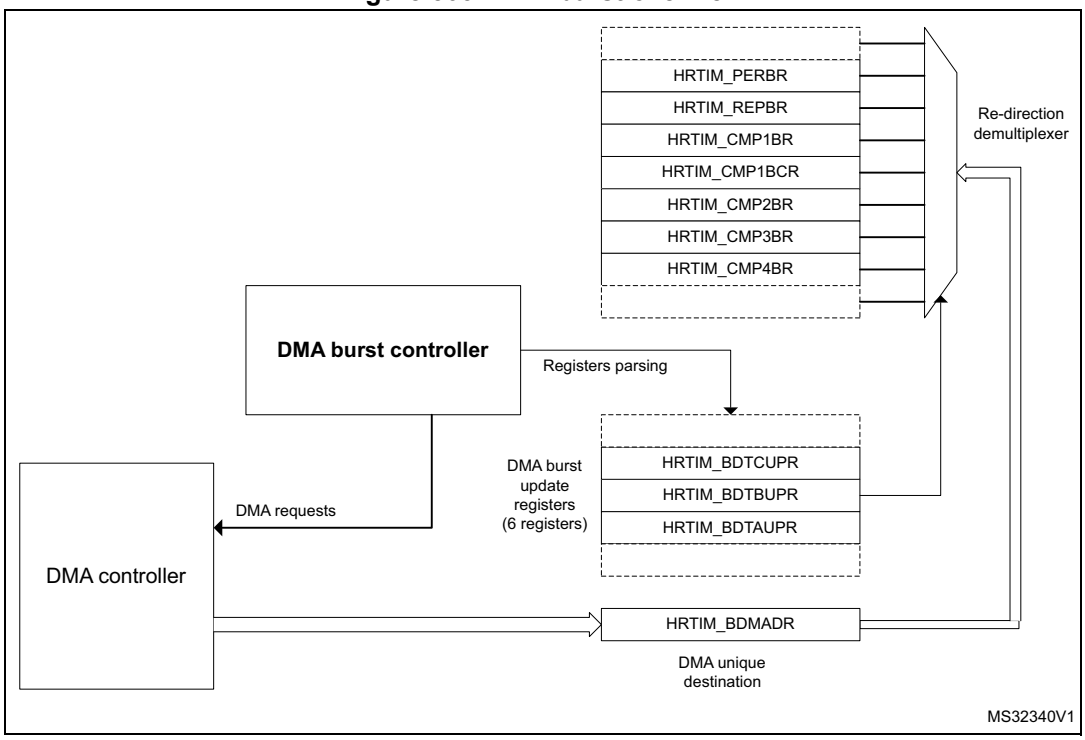
Note: Before disabling a DMA channel (DMA enable bit reset in TIMxDIER), it is necessary to disable first the DMA controller.

Table 363 is a summary of the events with their associated DMA enable bits.

Table 363. HRTIM DMA request summary

DMA Channel	Event	DMA capable	DMA enable bit
hrtim_dma1 (master timer)	Burst mode period completed	No	N/A
	Master timer registers update	Yes	MUPDDE
	Synchronization event received	Yes	SYNCDE
	Master timer repetition event	Yes	MREPDE
	Master compare 1 to 4 event	Yes	MCMP1DE
		Yes	MCMP2DE
		Yes	MCMP3DE
		Yes	MCMP4DE
hrtim_dma2 (timer A) hrtim_dma3 (timer B) hrtim_dma4 (timer C) hrtim_dma5 (timer D) hrtim_dma6 (timer E) hrtim_dma7 (timer F)	Crossbar override rearm delay elapsed	Yes	CORDEDE
	Delayed protection triggered	Yes	DLYPRTDE
	Counter reset or roll-over event	Yes	RSTDE
	Output 1 and output 2 reset (transition active to inactive)	Yes	RSTx1DE
		Yes	RSTx2DE
	Output 1 and output 2 set (transition inactive to active)	Yes	SETx1DE
		Yes	SETx2DE
	Capture 1 and 2 events	Yes	CPT1DE
		Yes	CPT2DE
	Timing unit registers update	Yes	UPDDE
	Crossbar override trigger	Yes	COTDE
	Repetition event	Yes	REPDE
	Compare 1 to 4 event	Yes	CMP1DE
		Yes	CMP2DE
		Yes	CMP3DE
		Yes	CMP4DE
N/A	System fault	No	N/A
	Fault 1 to 6	No	N/A
	Burst mode period completed	No	N/A

Burst DMA transfers



In addition to the standard DMA requests, the HRTIM features a DMA burst controller to have multiple registers updated with a single DMA request. This allows to:

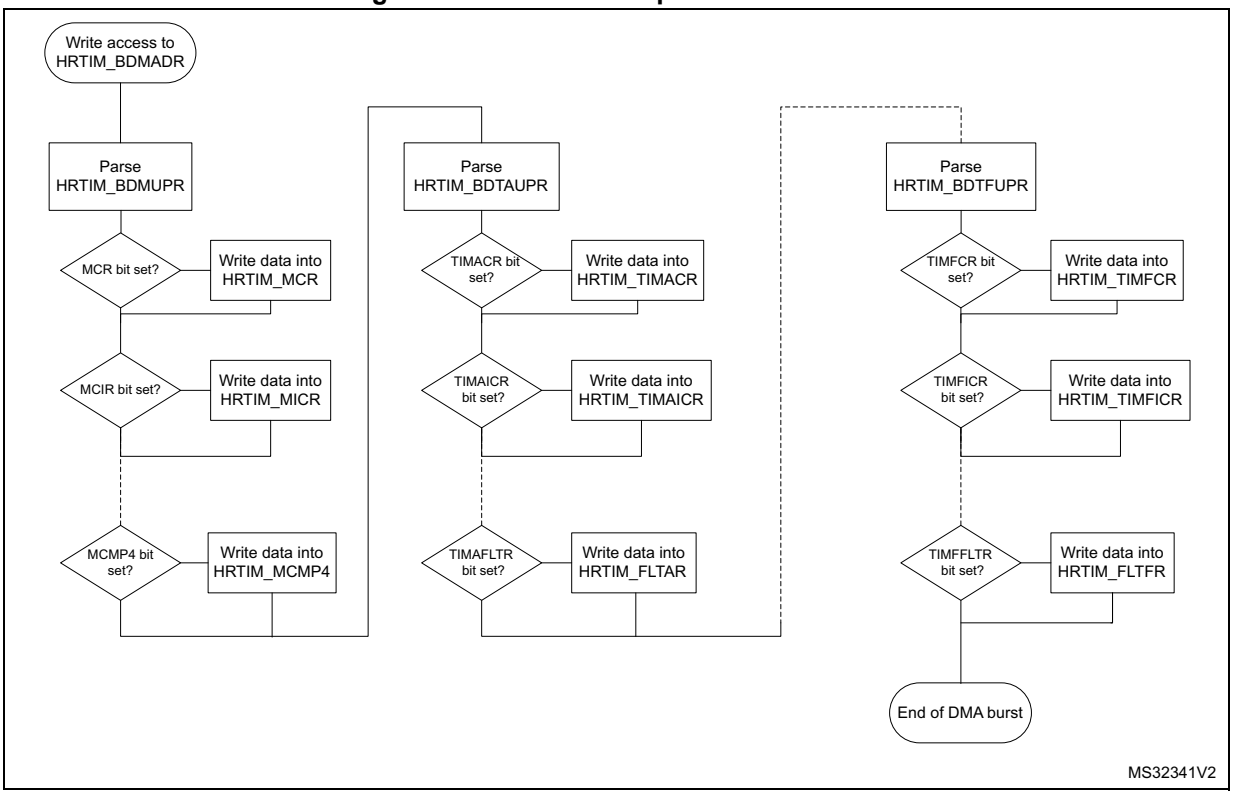
- Update multiple data registers with one DMA channel only,
- Reprogram dynamically one or several timing units, for converters using multiple timer outputs.

The burst DMA feature is only available for one DMA channel, but any of the six channels can be selected for burst DMA transfers.

The principle is to program which registers are to be written by DMA. The master timer and TIMA..E have the burst DMA update register, where most of their control and data registers are associated with a selection bit: HRTIM_BDMUPR, HRTIM_BDTAUPR to HRTIM_BDTEUPR (this is applicable only for registers with write accesses). A redirection mechanism is used to forward the DMA write accesses to the HRTIM registers automatically, as shown on *Figure 503*.

Figure 503. DMA burst overview

When the DMA trigger occurs, the HRTIM generates multiple 32-bit DMA requests and parses the update register. If the control bit is set, the write access is redirected to the associated register. If the bit is reset, the register update is skipped and the register parsing is resumed until a new bit set is detected, to trigger a new request. Once the six update registers (HRTIM_BDMUPR, 5x HRTIM_BDTxUPR) are parsed, the burst is completed and the system is ready for another DMA trigger (see the flowchart on *Figure 504*).



Note: Any trigger occurring while the burst is ongoing is discarded, except if it occurs during the very last data transfer.

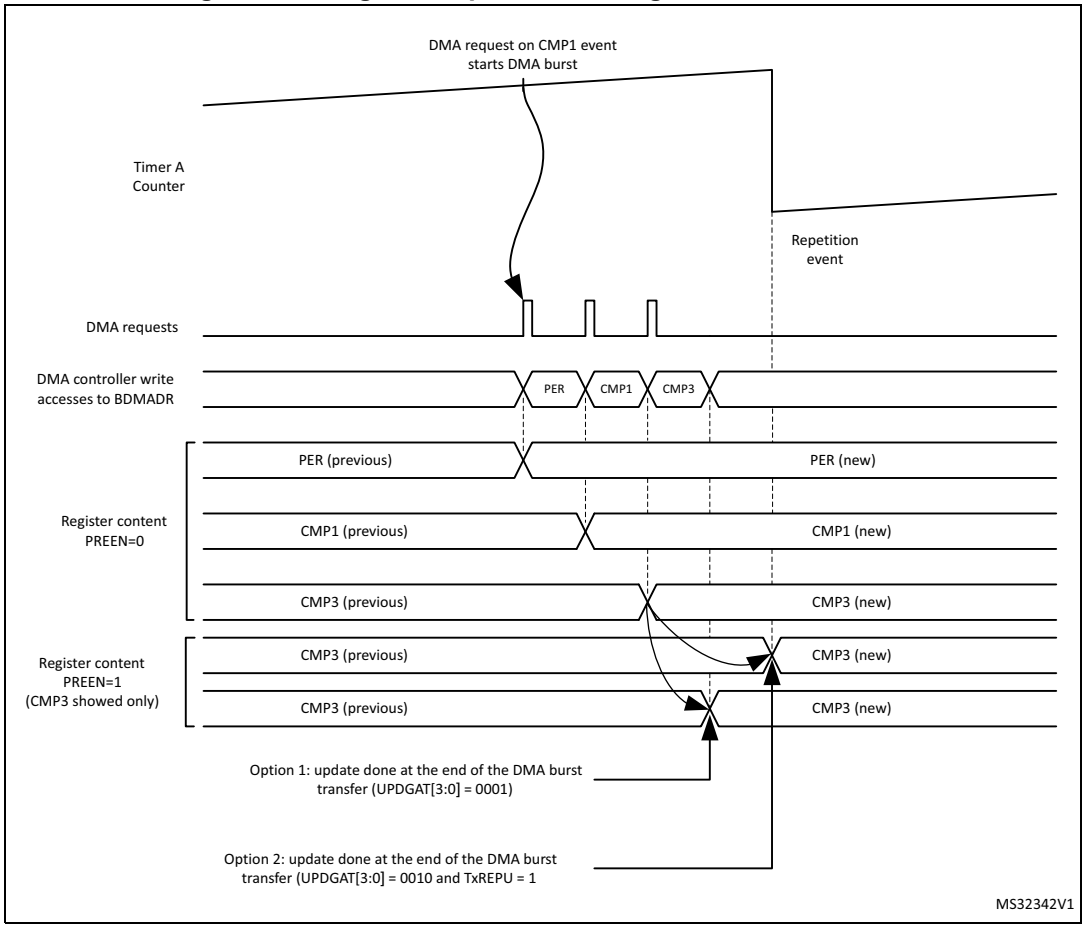
The burst DMA mode is permanently enabled (there is no enabled bit). A burst DMA operation is started by the first write access into the HRTIM_BDMADR register.

It is only necessary to have the DMA controller pointing to the HRTIM_BDMADR register as the destination, in the memory, to the peripheral configuration with the peripheral increment mode disabled (the HRTIM handles internally the data rerouting to the final destination register).

To reinitialize the burst DMA mode if it was interrupted during a transaction, it is necessary to write at least to one of the six update registers.

Figure 504. Burst DMA operation flowchart

Several options are available once the DMA burst is completed, depending on the register update strategy.



If the PREEN bit is reset (preload disabled), the value written by the DMA is immediately transferred into the active register and the registers are updated sequentially, following the DMA transaction pace.

When the preload is enabled (PREEN bit set), there are three use cases:

1. The update is done independently from DMA burst transfers (UPDGAT[3:0] = 0000 in HRTIM_TIMxCR and BRSTDMA[1:0] = 00 in HRTIM_MCR). In this case, and if it is necessary to have all transferred data taken into account simultaneously, the user must check that the DMA burst is completed before the update event takes place. On the contrary, if the update event happens while the DMA transfer is ongoing, only part of the registers is loaded and the complete register update requires two consecutive update events.
2. The update is done when the DMA burst transfer is completed (UPDGAT[3:0] = 0000 in HRTIM_TIMxCR and BRSTDMA[1:0] = 01 in HRTIM_MCR). This mode guarantees that all new register values are transferred simultaneously. This is done independently from the counter value and can be combined with regular update events, if necessary (for instance, an update on a counter reset when TxRSTU is set).
3. The update is done on the update event following the DMA burst transfer completion (UPDGAT[3:0] = 0010 in HRTIM_TIMxCR and BRSTDMA[1:0] = 10 in HRTIM_MCR). This mode guarantees both a coherent update of all transferred data and the synchronization with regular update events, with the timer counter. In this case, if a regular update request occurs while the transfer is ongoing, it is discarded and the effective update happens on the next coming update request.

The chronogram on *Figure 505* presents the active register content for three cases: PREEN=0, UPDGAT[3:0] = 0001 and UPDGAT[3:0] = 0001 (when PREEN = 1).

Figure 505. Registers update following DMA burst transfer

33.3.24 HRTIM initialization

This section describes the recommended HRTIM initialization procedure, including other related MCU peripherals.

The HRTIM clock source must be enabled in the reset and clock control unit (RCC).

The HRTIM control registers can be initialized as per the power converter topology and the timing units use case. All inputs have to be configured (source, polarity, edge-sensitivity).

The HRTIM outputs must be set up eventually, with the following sequence:

- The polarity must be defined using POLx bits in HRTIM_OUTxR
- The FAULT and IDLE states must be configured using FAULTx[1:0] and IDLESx bits in HRTIM_OUTxR

The HRTIM outputs are ready to be connected to the MCU I/Os. In the GPIO controller, the selected HRTIM I/Os have to be configured as per the alternate function mapping table in the product datasheet.

From this point on, the HRTIM controls the outputs, which are in the IDLE state.

The outputs are configured in RUN mode by setting TxyOEN bits in the HRTIM_OENR register. The two outputs are in the inactive state until the first valid set/reset event in RUN mode. Any output set/reset event (except software requests using SST, SRT) are ignored as long as TxCEN bit is reset, as well as burst mode requests (IDLEM bit value is ignored). Similarly, any counter reset request coming from the burst mode controller is ignored (if TxBM bit is set).

Note: When the deadtime insertion is enabled (DTEN bit set), it is necessary to force the output state by software, using SST and RST bits, to have the outputs in a complementary state as soon as the RUN mode is entered.

The HRTIM operation can eventually be started by setting TxCEN or MCEN bits in HRTIM_MCR.

If the HRTIM peripheral is reset with the reset and clock controller, the HRTIM outputs are put in IDLE mode with a low level. It is recommended to first disconnect the HRTIMER from the outputs (using the GPIO controller) before performing a peripheral reset.

33.3.25 Debug

When a microcontroller enters the debug mode (Cortex®-M7 core halted), the TIMx counter either continues to work normally or stops, depending on DBG_HRTIM_STOP configuration bit in DBG module:

- DBG_HRTIM_STOP = 0: no behavior change, the HRTIM continues to operate.
- DBG_HRTIM_STOP = 1: all HRTIM timers, including the master, are stopped. The outputs in RUN mode enter the FAULT state if FAULTx[1:0] = 01,10,11, or keep their current state if FAULTx[1:0] = 00. The outputs in idle state are maintained in this state. This is permanently maintained even if the MCU exits the halt mode. This is used to maintain a safe state during the execution stepping. The outputs can be enabled again by setting TxyOEN bit (requires the use of the debugger).

Timer behavior during MCU halt when DBG_HRTIM_STOP = 1

The set/reset crossbar, the dead-time and push-pull unit, the idle/balanced fault detection and all the logic driving the normal output in RUN mode are not affected by debug. The output keeps on toggling internally, so as to retrieve regular signals of the outputs when TxyOEN is set again (during or after the MCU halt). Associated triggers and filters are also following internal waveforms when the outputs are disabled.

FAULT inputs and events (any source) are enabled during the MCU halt.

Fault status bits can be set and TxyOEN bits reset during the MCU halt if a fault occurs at that time (TxyOEN and TxyODS are not affected by DBG_HRTIM_STOP bit state).

Synchronization, counter reset, start, and reset-start events are discarded in debug mode, as well as capture events. This is to keep all related registers stable as long as the MCU is halted.

The counter stops counting when a breakpoint is reached. However, the counter enable signal is not reset; consequently no start event is emitted when exiting from debug. All counter reset and capture triggers are disabled, as well as external events (ignored as long as the MCU is halted). The outputs SET and RST flags are frozen, except in case of forced software set/reset. A level-sensitive event is masked during the debug but is active again as soon as the debug is exited. For edge-sensitive events, if the signal is maintained active during the MCU halt, a new edge is not generated when exiting from debug.

The update events are discarded. This prevents any update trigger on hrtim_upd_en[3:1] inputs. DMA triggers are disabled. The burst mode circuit is frozen: the triggers are ignored and the burst mode counter stopped.

33.4 Application use cases

33.4.1 Buck converter

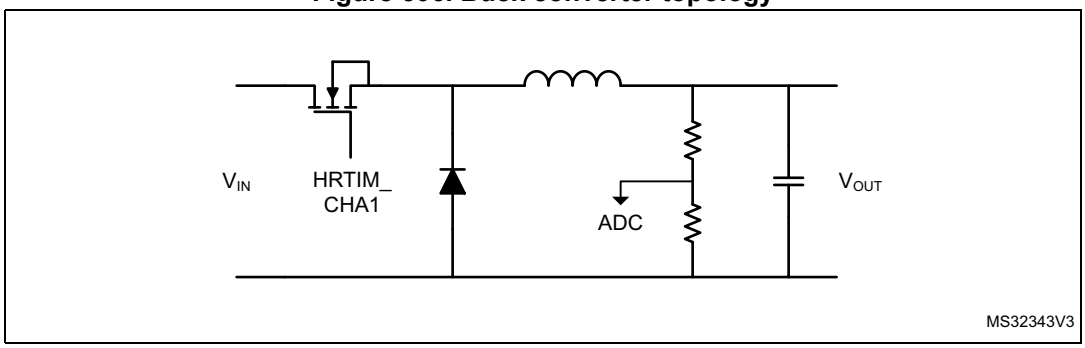
Buck converters are of common use as step-down converters. The HRTIM can control up to 12 buck converters with seven independent switching frequencies.

The converter usually operates at a fixed frequency and the Vin/Vout ratio depends on the duty cycle D applied to the power switch:

$$V_{out} = D \times V_{in}$$

The topology is given on *Figure 506* with the connection to the ADC for voltage reading.

Figure 506. Buck converter topology



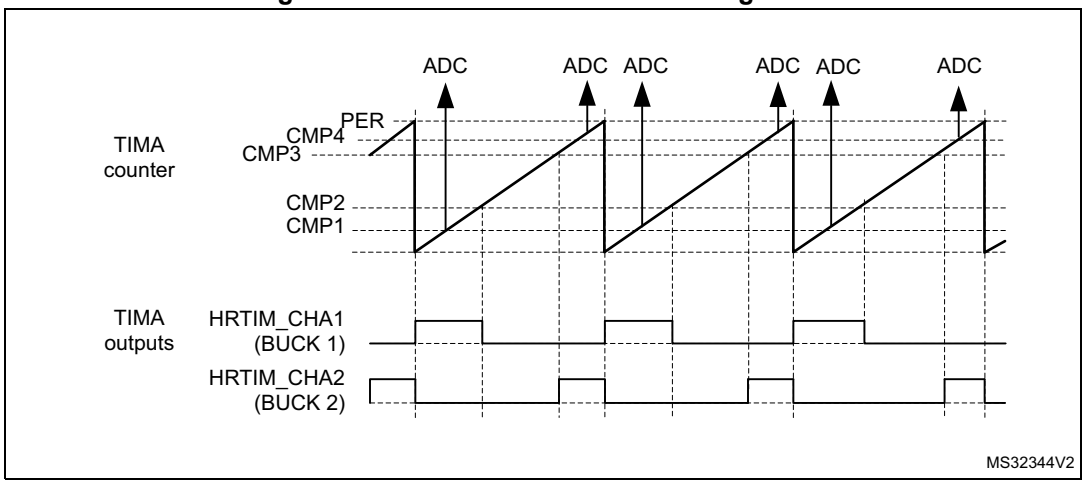


Figure 507 presents the management of two converters with identical frequency PWM signals. The outputs are defined as follows:

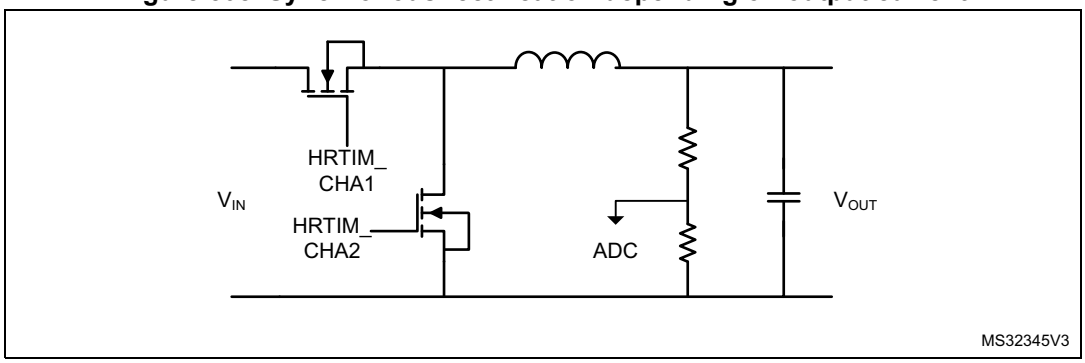
- HRTIM_CHA1 set on period, reset on CMP1
- HRTIM_CHA2 set on CMP3, reset on PER

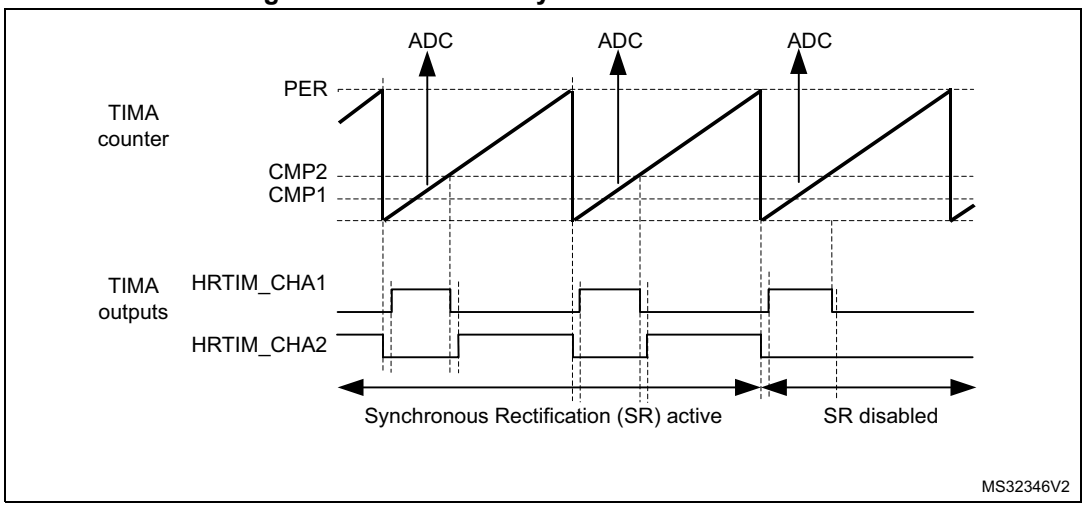
The ADC is triggered twice per period, precisely in the middle of the ON time, using CMP2 and CMP4 events.

Figure 507. Dual Buck converter management



Timers A..E provide either 12 buck converters coupled by pairs (both with identical switching frequencies) or seven completely independent converters (each of them having a different switching frequency), using the master timer as the seventh time base.

33.4.2 Buck converter with synchronous rectification



Synchronous rectification is used to minimize losses in buck converters, by means of a FET replacing the freewheeling diode. Synchronous rectification can be turned on or off on the fly depending on the output current level, as shown on *Figure 508*.

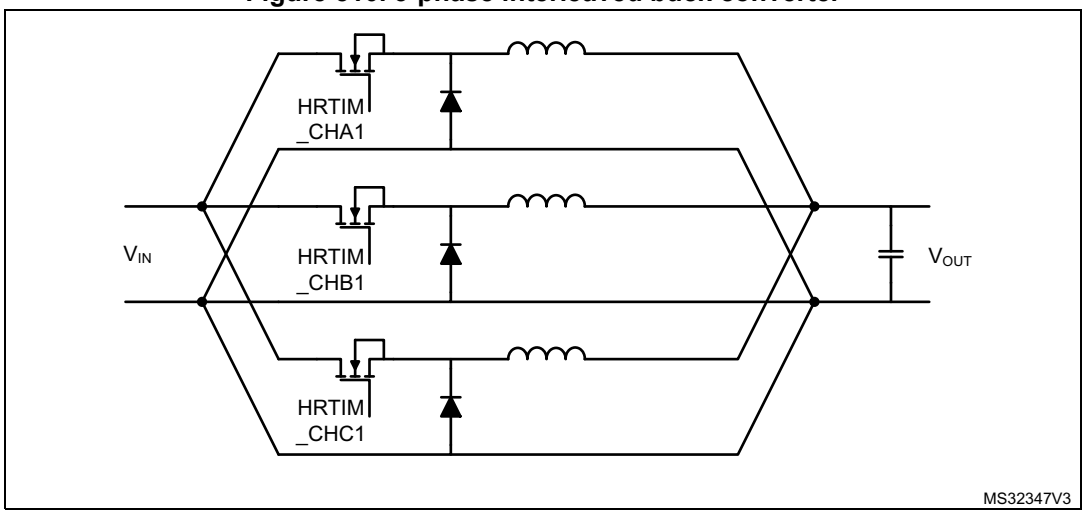
Figure 508. Synchronous rectification depending on output current

The main difference versus a single-switch buck converter is the addition of a deadtime for an almost complementary waveform generation on HRTIM_CHA2, based on the reference waveform on HRTIM_CHA1 (see *Figure 509*).

Figure 509. Buck with synchronous rectification

33.4.3 Multiphase converters

Multiphase techniques can be applied to multiple power conversion topologies (buck, flyback). Their main benefits are:



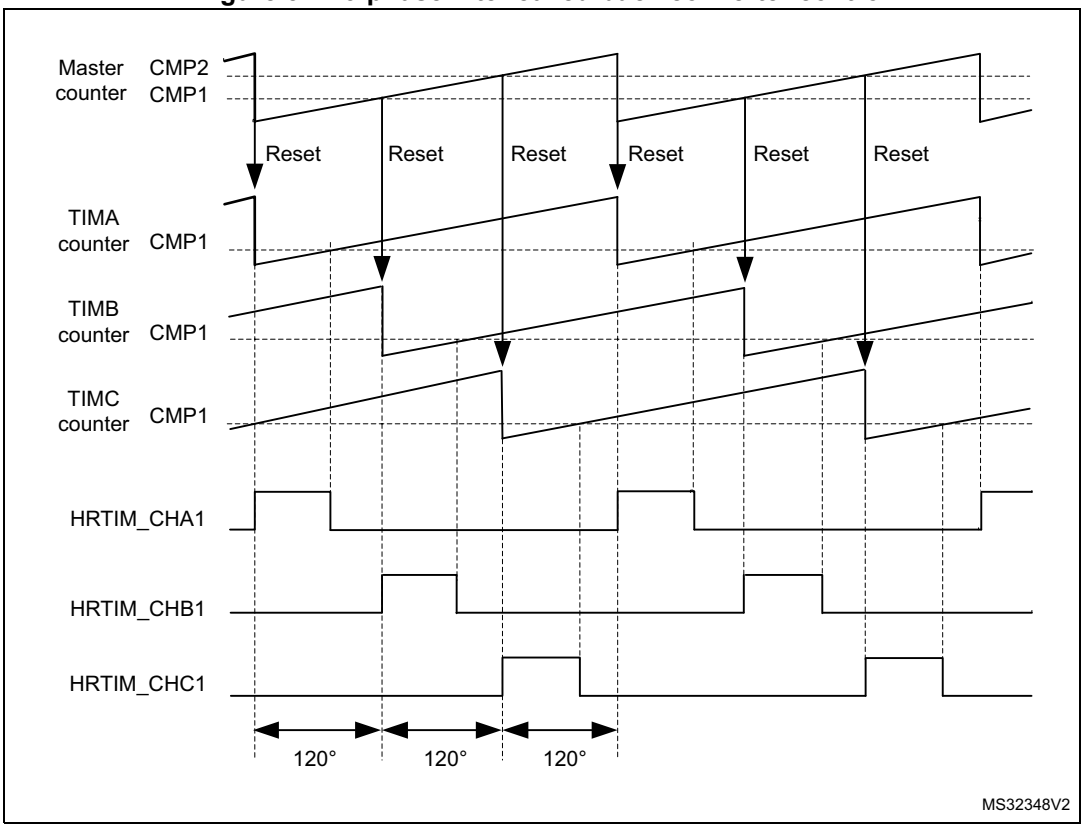
- Reduction of the current ripple on the input and output capacitors
- Reduced EMI
- Higher efficiency at light load by dynamically changing the number of phases (phase shedding)

The HRTIM manages multiple converters. The number of converters that can be controlled depends on the topologies and resources used (including the ADC triggers):

- Five buck converters with synchronous rectification (SR), using the master timer and the five timers
- Four buck converters (without SR), using the master timer and two timers

Figure 510 presents the topology of a 3-phase interleaved buck converter.

Figure 510. 3-phase interleaved buck converter



The master timer is responsible for the phase management: it defines the phase relationship between the converters by resetting the timers periodically. The phase-shift is 360° divided by the number of phases, 120° in the given example.

The duty cycle is then programmed into each of the timers. The outputs are defined as follows:

- HRTIM_CHA1 set on master timer period, reset on TACMP1
- HRTIM_CHB1 set on master timer MCMP1, reset on TBCMP1
- HRTIM_CHC1 set on master timer MCMP2, reset on TCCMP1

The ADC trigger can be generated on TxCMP2 compare event. Since all ADC trigger sources are phase-shifted because of the converter topology, it is possible to have all of them combined into a single ADC trigger to save ADC resources (for instance 1 ADC regular channel for the full multiphase converter).

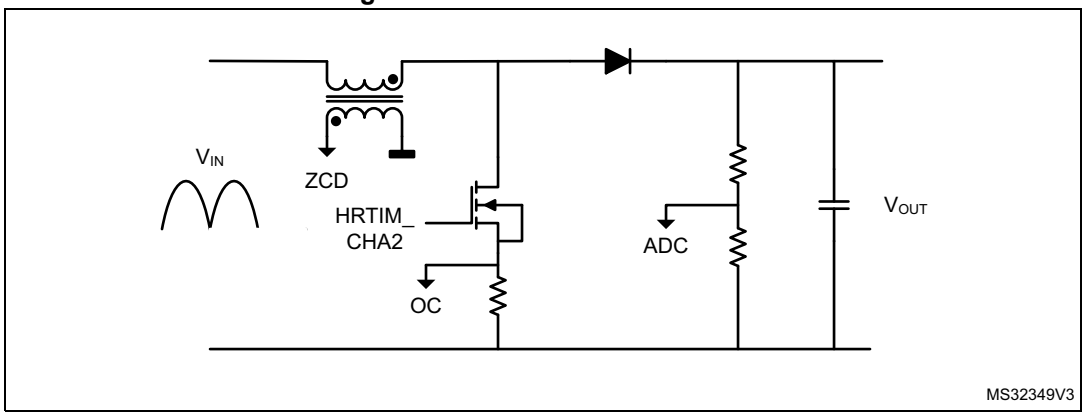


Figure 511. 3-phase interleaved buck converter control

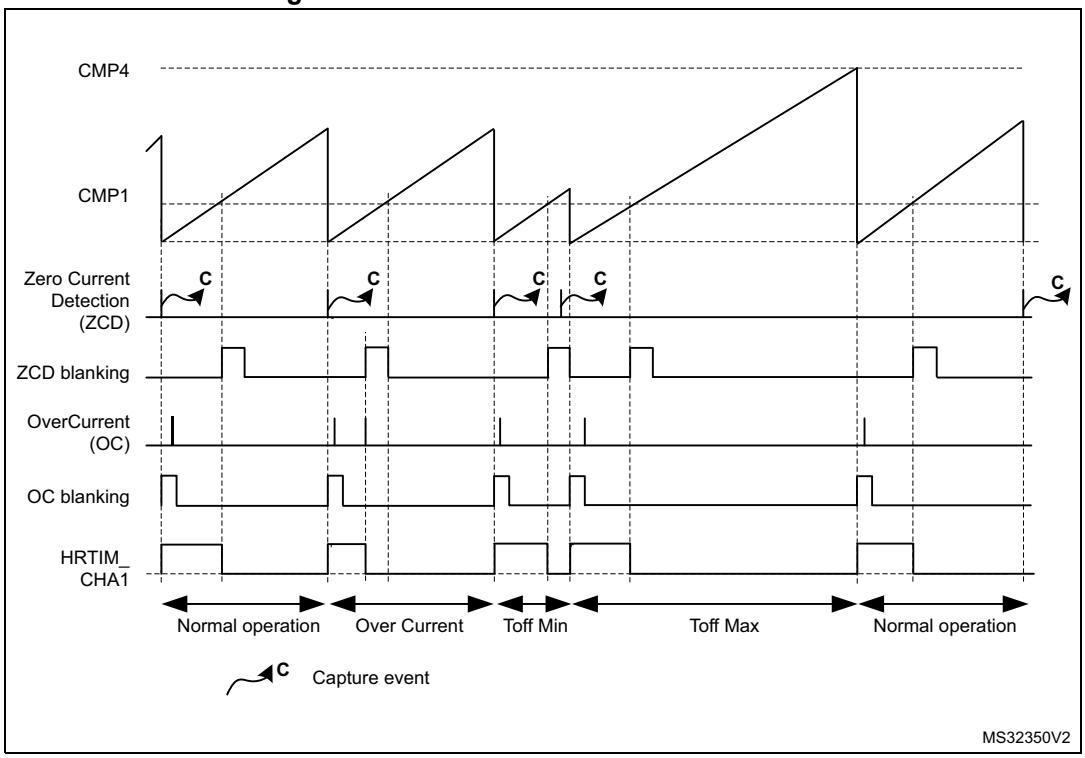
33.4.4 Transition mode power factor correction

The basic operating principle is to build up current into an inductor during a fixed Ton time. This current then decays during the Toff time, and the period is restarted when it becomes null. This is detected using a zero crossing detection circuitry (ZCD), as shown on *Figure 512*. With a constant Ton time, the peak current value in the inductor is proportional to the rectified AC input voltage, which provides the power factor correction.

Figure 512. Transition mode PFC



This converter operates with a constant Ton time and a variable frequency due to the Toff time variation (depending on the input voltage). It must also include some features to operate when no zero-crossing is detected, or to limit the Ton time in case of overcurrent (OC). The OC feedback is usually conditioned with the built-in comparator and routed onto an external event input.

Figure 513 presents the waveform during the various operating modes, with the following defined parameters:

- Ton Min: masks spurious overcurrent (freewheeling diode recovery current), represented as OC blanking
- Ton Max: practically, the converter set-point. It is defined by CMP1
- Toff Min: limits the frequency when the current limit is close to zero (demagnetization is very fast). It is defined with CMP2.
- Toff Max: prevents the system to be stuck if no ZCD occurs. It is defined with CMP4 in autodelayed mode.

Both Toff values are autodelayed since the value must be relative to the output falling edge.

Figure 513. Transition mode PFC waveforms

33.5 HRTIM registers

33.5.1 HRTIM master timer control register (HRTIM_MCR)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BRSTDMA[1:0]		MREPU	Res.	PREEN	DACSYNC[1:0]		Res.	Res.	TFCEN	TECEN	TDCEN	TCCEN	TBCEN	TACEN	MCEN
rw	rw	rw		rw	rw	rw			rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
SYNCSRC[1:0]		SYNCOUT[1:0]		SYNCSTRTM	SYNCRSTM	SYNCIN[1:0]		INTLVD[1:0]		HALF	RETRIG	CONT	CKPSC[2:0]		
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 **BRSTDMA[1:0]**: Burst DMA update

These bits define how the update occurs relatively to a burst DMA transaction.

00: Update done independently from the DMA burst transfer completion

01: Update done when the DMA burst transfer is completed

10: Update done on master timer roll-over following a DMA burst transfer completion. This mode only works in continuous mode.

11: Reserved

Bit 29 **MREPU**: Master timer repetition update

This bit defines whether an update occurs when the master timer repetition period is completed (either due to roll-over or reset events). MREPU can be set only if BRSTDMA[1:0] = 00 or 01.

0: Update on repetition disabled

1: Update on repetition enabled

Bit 28 Reserved, must be kept at reset value.

Bit 27 **PREEN**: Preload enable

This bit enables the registers preload mechanism and defines whether the write accesses to the memory mapped registers are done into HRTIM's active or preload registers.

0: Preload disabled: the write access is directly done into the active register

1: Preload enabled: the write access is done into the preload register

Bits 26:25 **DACSYNC[1:0]:** DAC synchronization

A DAC synchronization event can be enabled and generated when the master timer update occurs. These bits are defining on which output the DAC synchronization is sent (refer to *Section 33.3.21: DAC triggers* for connections details).

00: No DAC trigger generated

01: Trigger generated on hrtim_dac_trg1

10: Trigger generated on hrtim_dac_trg2

11: Trigger generated on hrtim_dac_trg3

Bits 24:23 Reserved, must be kept at reset value.

Bit 22 **TFCEN**: Timer F counter enable

This bit starts the timer F counter.

0: Timer F counter disabled

1: Timer F counter enabled

Note: This bit must not be changed within a minimum of 8 cycles of f_{HRTIM} clock.

Bit 21 **TECEN**: Timer E counter enable
This bit starts the timer E counter.
0: Timer E counter disabled
1: Timer E counter enabled
Note: This bit must not be changed within a minimum of 8 cycles of f_{HRTIM} clock.

Bit 20 **TDCEN**: Timer D counter enable
This bit starts the timer D counter.
0: Timer D counter disabled
1: Timer D counter enabled
Note: This bit must not be changed within a minimum of 8 cycles of f_{HRTIM} clock.

Bit 19 **TCCEN**: Timer C counter enable
This bit starts the timer C counter.
0: Timer C counter disabled
1: Timer C counter enabled
Note: This bit must not be changed within a minimum of 8 cycles of f_{HRTIM} clock.

Bit 18 **TBCEN**: Timer B counter enable
This bit starts the timer B counter.
0: Timer B counter disabled
1: Timer B counter enabled
Note: This bit must not be changed within a minimum of 8 cycles of f_{HRTIM} clock.

Bit 17 **TACEN**: Timer A counter enable
This bit starts the timer A counter.
0: Timer A counter disabled
1: Timer A counter enabled
Note: This bit must not be changed within a minimum of 8 cycles of f_{HRTIM} clock.

Bit 16 **MCEN**: Master timer counter enable
This bit starts the master timer counter.
0: Master counter disabled
1: Master counter enabled
Note: This bit must not be changed within a minimum of 8 cycles of f_{HRTIM} clock.

Bits 15:14 **SYNCSRC[1:0]**: Synchronization source
These bits define the source and event to be sent on the synchronization outputs SYNCOUT[2:1]
00: Master timer start
01: Master timer compare 1 event
10: Timer A start/reset
11: Timer A compare 1 event

Bits 13:12 **SYNCOUT[1:0]**: Synchronization output
These bits define the routing and conditioning of the synchronization output event.
00: Disabled
01: On-chip synchronization sent to other HRTIM instances
10: Positive pulse on HRTIM_SCOUT output (16x f_{HRTIM} clock cycles)
11: Negative pulse on HRTIM_SCOUT output (16x f_{HRTIM} clock cycles)
Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set)

Bit 11 **SYNCSTRTM**: Synchronization starts master
This bit enables the master timer start when receiving a synchronization input event:
0: No effect on the master timer
1: A synchronization input event starts the master timer

Bit 10 **SYNCRSTM**: Synchronization resets master

This bit enables the master timer reset when receiving a synchronization input event:

0: No effect on the master timer

1: A synchronization input event resets the master timer

Bits 9:8 **SYNCIN[1:0]**: Synchronization input

These bits are defining the synchronization input source.

00: Disabled. HRTIM is not synchronized and runs in standalone mode.

01: Internal event on hrtim_in_sync[1], from other on-chip HRTIM instances

10: Internal event on hrtim_in_sync[2]: the HRTIM is synchronized with the on-chip timer (see *Section : Synchronization input*).

11: External event on hrtim_in_sync[3]: a positive pulse on HRTIM_SCIN input triggers the HRTIM.

Note: This parameter cannot be changed once the impacted timers are enabled.

Bits 7:6 **INTLVD[1:0]**: Interleaved mode

This bitfield is significant only when the HALF bit is reset. It enables the interleaved mode.

00: Interleaved mode disabled

01: Triple interleaved mode: when HRTIM_MPER register is written, the HRTIM_MCMP1R active register is automatically updated with HRTIM_MPER/3 value, and the HRTIM_MCMP2R active register is automatically updated with 2x (HRTIM_MPER/3) value.

10: Quad interleaved mode: when HRTIM_MPER register is written, the HRTIM_MCMP1R active register is automatically updated with HRTIM_MPER/4 value, the HRTIM_MCMP2R active register is automatically updated with HRTIM_MPER/2 value and the HRTIM_MCMP3R active register is automatically updated with 3x (HRTIM_MPER/4) value.

11: Interleaved mode disabled

Bit 5 **HALF**: Half mode

This bit enables the half duty-cycle mode: the HRTIM_MCMP1R active register is automatically updated with HRTIM_MPER/2 value when HRTIM_MPER register is written.

0: Half mode disabled

1: Half mode enabled

Bit 4 **RETRIG**: Re-triggerable mode

This bit defines the behavior of the master timer counter in single-shot mode.

0: The timer is not re-triggerable: a counter reset can be done only if the counter is stopped (period elapsed)

1: The timer is re-triggerable: a counter reset is done whatever the counter state (running or stopped)

Bit 3 **CONT**: Continuous mode

0: The timer operates in single-shot mode and stops when it reaches the MPER value

1: The timer operates in continuous (free-running) mode and rolls over to zero when it reaches the MPER value

Bits 2:0 **CKPSC[2:0]**: Clock prescaler

These bits define the master timer clock prescaler ratio.

The counter clock equivalent frequency ($f_{COUNTER}$) is equal to $f_{HRCK} / 2^{(CKPSC[2:0]-5)}$.

The prescaling ratio cannot be modified once the timer is enabled.

33.5.2 HRTIM master timer interrupt status register (HRTIM_MISR)

Address offset: 0x004

Reset value: 0x0000 0000

									r	r	r	r	r	r	r

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **MUPD**: Master update interrupt flag
This bit is set by hardware when the master timer registers are updated.
0: No master update interrupt occurred
1: Master update interrupt occurred

Bit 5 **SYNC**: Sync input interrupt flag
This bit is set by hardware when a synchronization input event is received.
0: No sync input interrupt occurred
1: Sync input interrupt occurred

Bit 4 **MREP**: Master repetition interrupt flag
This bit is set by hardware when the master timer repetition period has elapsed.
0: No master repetition interrupt occurred
1: Master repetition interrupt occurred

Bit 3 **MCMP4**: Master compare 4 interrupt flag
Refer to MCMP1 description

Bit 2 **MCMP3**: Master compare 3 interrupt flag
Refer to MCMP1 description

Bit 1 **MCMP2**: Master compare 2 interrupt flag
Refer to MCMP1 description

Bit 0 **MCMP1**: Master compare 1 interrupt flag
This bit is set by hardware when the master timer counter matches the value programmed in the master compare 1 register.
0: No master compare 1 interrupt occurred
1: Master compare 1 interrupt occurred

33.5.3 HRTIM master timer interrupt clear register (HRTIM_MICR)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MUPDC	SYNCC	MREPC	MCMP4C	MCMP3C	MCMP2C	MCMP1C
									w	w	w	w	w	w	w

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **MUPDC**: Master update interrupt flag clear
Writing 1 to this bit clears the MUPDC flag in HRTIM_MISR register.

Bit 5 **SYNCC**: Sync input interrupt flag clear
Writing 1 to this bit clears the SYNC flag in HRTIM_MISR register.

Bit 4 **MREPC**: Repetition interrupt flag clear
Writing 1 to this bit clears the MREP flag in HRTIM_MISR register.

Bit 3 **MCMP4C**: Master compare 4 interrupt flag clear
Writing 1 to this bit clears the MCMP4 flag in HRTIM_MISR register.

Bit 2 **MCMP3C**: Master compare 3 interrupt flag clear
Writing 1 to this bit clears the MCMP3 flag in HRTIM_MISR register.

Bit 1 **MCMP2C**: Master compare 2 interrupt flag clear
Writing 1 to this bit clears the MCMP2 flag in HRTIM_MISR register.

Bit 0 **MCMP1C**: Master compare 1 interrupt flag clear
Writing 1 to this bit clears the MCMP1 flag in HRTIM_MISR register.

33.5.4 HRTIM master timer DMA interrupt enable register (HRTIM_MDIER)

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MUPDDE	SYNCDE	MREPDE	MCMP4DE	MCMP3DE	MCMP2DE	MCMP1DE

Bits 31:23 Reserved, must be kept at reset value.

Bit 22 **MUPDDE**: Master update DMA request enable
This bit is set and cleared by software to enable/disable the master update DMA requests.
0: Master update DMA request disabled
1: Master update DMA request enabled

Bit 21 **SYNCDE**: Sync input DMA request enable
This bit is set and cleared by software to enable/disable the sync input DMA requests.
0: Sync input DMA request disabled
1: Sync input DMA request enabled

Bit 20 **MREPDE**: Master repetition DMA request enable
This bit is set and cleared by software to enable/disable the master timer repetition DMA requests.
0: Repetition DMA request disabled
1: Repetition DMA request enabled

Bit 19 **MCMP4DE**: Master compare 4 DMA request enable
Refer to MCMP1DE description

Bit 18 **MCMP3DE**: Master compare 3 DMA request enable
Refer to MCMP1DE description

Bit 17 **MCMP2DE**: Master compare 2 DMA request enable
Refer to MCMP1DE description

Bit 16 **MCMP1DE**: Master compare 1 DMA request enable
This bit is set and cleared by software to enable/disable the master timer compare 1 DMA requests.
0: Compare 1 DMA request disabled
1: Compare 1 DMA request enabled

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **MUPDIE**: Master update interrupt enable
This bit is set and cleared by software to enable/disable the master timer registers update interrupts
0: Master update interrupts disabled
1: Master update interrupts enabled

Bit 5 **SYNCIE**: Sync input interrupt enable
This bit is set and cleared by software to enable/disable the sync input interrupts
0: Sync input interrupts disabled
1: Sync input interrupts enabled

Bit 4 **MREPIE**: Master repetition interrupt enable
This bit is set and cleared by software to enable/disable the master timer repetition interrupts
0: Master repetition interrupt disabled
1: Master repetition interrupt enabled

Bit 3 **MCMP4IE**: Master compare 4 interrupt enable
Refer to MCMP1IE description

Bit 2 **MCMP3IE**: Master compare 3 interrupt enable
Refer to MCMP1IE description

Bit 1 **MCMP2IE**: Master compare 2 interrupt enable
Refer to MCMP1IE description

Bit 0 **MCMP1IE**: Master compare 1 interrupt enable
This bit is set and cleared by software to enable/disable the master timer compare 1 interrupt
0: Compare 1 interrupt disabled
1: Compare 1 interrupt enabled

33.5.5 HRTIM master timer counter register (HRTIM_MCNTR)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MCNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MCNT[15:0]**: Counter value

Holds the master timer counter value. This register can only be written when the master timer is stopped (MCEN = 0 in HRTIM_MCR).

Note: The timer behavior is not guaranteed if the counter value is set above the HRTIM_MPER register value.

33.5.6 HRTIM master timer period register (HRTIM_MPER)

Address offset: 0x014

Reset value: 0x0000 FFDF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MPER[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MPER[15:0]**: Master timer period value

This register defines the counter overflow value.

The period value must be above or equal to 3 periods of the f_{HRTIM} clock.

The maximum value is 0x0000 FFDF.

33.5.7 HRTIM master timer repetition register (HRTIM_MREP)

Address offset: 0x018

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MREP[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **MREP[7:0]**: Master timer repetition period value

This register holds the repetition period value for the master counter. It is either the preload register or the active register if preload is disabled.

33.5.8 HRTIM master timer compare 1 register (HRTIM_MCMP1R)

Address offset: 0x01C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MCMP1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MCMP1[15:0]**: Master timer compare 1 value

This register holds the master timer compare 1 value. It is either the preload register or the active register if preload is disabled.

The compare value must be above or equal to 3 periods of the f_{HRTIM} clock.

33.5.9 HRTIM master timer compare 2 register (HRTIM_MCMP2R)

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MCMP2[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MCMP2[15:0]**: Master timer compare 2 value

This register holds the master timer compare 2 value. It is either the preload register or the active register if preload is disabled.

The compare value must be above or equal to 3 periods of the f_{HRTIM} clock.

33.5.10 HRTIM master timer compare 3 register (HRTIM_MCMP3R)

Address offset: 0x028

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MCMP3[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MCMP3[15:0]**: Master timer compare 3 value

This register holds the master timer compare 3 value. It is either the preload register or the active register if preload is disabled.

The compare value must be above or equal to 3 periods of the f_{HRTIM} clock.

33.5.11 HRTIM master timer compare 4 register (HRTIM_MCMP4R)

Address offset: 0x02C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MCMP4[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **MCMP4[15:0]**: Master timer compare 4 value

This register holds the master timer compare 4 value. It is either the preload register or the active register if preload is disabled.

The compare value must be above or equal to 3 periods of the f_{HRTIM} clock.

33.5.12 HRTIM timer x control register (HRTIM_TIMxCR) (x = A to F)

Address offset: Block A: 0x100

Address offset: Block B: 0x200

Address offset: Block C: 0x300

Address offset: Block D: 0x400

Address offset: Block E: 0x500

Address offset: Block F: 0x600

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UPDGAT[3:0]				PREEN	DACSYNC[1:0]		MSTU	TEU	TDU	TCU	TBU	TAU	TxRSTU	TxREPU	TFU
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DELCMP4[1:0]		DELCMP2[1:0]		SYNCSTRTx	SYNCRSTx	RSYNCU	INTLVD[1:0]		PSHPLL	HALF	RETRIG	CONT	CKPSCx[2:0]		
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 **UPDGAT[3:0]**: Update gating

These bits define how the update occurs relatively to the burst DMA transaction and the external update request on update enable inputs hrtim_upd_en[3:1] (see *Table 327*).

The update events, as mentioned below, can be: MSTU, TFU, TEU, TDU, TCU, TBU, TAU, TxRSTU, TxREPU.

0000: The update occurs independently from the DMA burst transfer

0001: The update occurs when the DMA burst transfer is completed

0010: The update occurs on the update event following the DMA burst transfer completion

0011: The update occurs on a rising edge on hrtim_upd_en1

0100: The update occurs on a rising edge on hrtim_upd_en2

0101: The update occurs on a rising edge on hrtim_upd_en3

0110: The update occurs on the update event following a rising edge on hrtim_upd_en1

0111: The update occurs on the update event following a rising edge on hrtim_upd_en2

1000: The update occurs on the update event following a rising edge on hrtim_upd_en3

Others: Reserved

Note: This bitfield must be reset before programming a new value.

For UPDGAT[3:0] values equal to 0001, 0011, 0100, 0101, it is possible to have multiple concurrent update source (for instance RSTU and DMA burst).

Bit 27 **PREEN**: Preload enable

This bit enables the registers preload mechanism and defines whether a write access into a preload-able register is done into the active or the preload register.

0: Preload disabled: the write access is directly done into the active register

1: Preload enabled: the write access is done into the preload register

Bits 26:25 **DACSYNC[1:0]**: DAC synchronization

A DAC synchronization event is generated when the timer update occurs. These bits are defining on which output the DAC synchronization is sent (refer to *Section 33.3.21: DAC triggers* for connections details).

00: No DAC trigger generated
01: Trigger generated on hrtim_dac_trg1
10: Trigger generated on hrtim_dac_trg2
11: Trigger generated on hrtim_dac_trg3

Bit 24 **MSTU**: Master timer update

Register update is triggered by the master timer update.
0: Update by master timer disabled
1: Update by master timer enabled

Bit 23 **TEU**: Timer E update

Register update is triggered by the timer E update
0: Update by timer E disabled
1: Update by timer E enabled

Note: This bit is reserved for HRTIM_TIMECR. *It is only available for HRTIM_TIMACR, HRTIM_TIMBCR, HRTIM_TIMCCR, HRTIM_TIMDCR, HRTIM_TIMFCR.*

Bit 22 **TDU**: Timer D update

Register update is triggered by the timer D update
0: Update by timer D disabled
1: Update by timer D enabled

Note: This bit is reserved for HRTIM_TIMDCR. It is only available for HRTIM_TIMACR, HRTIM_TIMBCR, HRTIM_TIMCCR, HRTIM_TIMECR, HRTIM_TIMFCR.

Bit 21 **TCU**: Timer C update

Register update is triggered by the timer C update
0: Update by timer C disabled
1: Update by timer C enabled

Note: This bit is reserved for HRTIM_TIMCCR. It is only available for HRTIM_TIMACR, HRTIM_TIMBCR, HRTIM_TIMDCR, HRTIM_TIMECR, HRTIM_TIMFCR.

Bit 20 **TBU**: Timer B update

Register update is triggered by the timer B update
0: Update by timer B disabled
1: Update by timer B enabled

Note: This bit is reserved for HRTIM_TIMBCR. It is only available for HRTIM_TIMACR, HRTIM_TIMCCR, HRTIM_TIMDCR, HRTIM_TIMECR, HRTIM_TIMFCR.

Bit 19 **TAU**: Timer A update

Register update is triggered by the timer A update
0: Update by timer A disabled
1: Update by timer A enabled

Note: This bit is reserved for HRTIM_TIMBCR. It is only available for HRTIM_TIMBCR, HRTIM_TIMCCR, HRTIM_TIMDCR, HRTIM_TIMECR, HRTIM_TIMFCR.

Bit 18 **TxRSTU**: Timer x reset update

Register update is triggered by timer x counter reset or roll-over to 0 after reaching the period value in continuous mode.
0: Update by timer x reset / roll-over disabled
1: Update by timer x reset / roll-over enabled

Bit 17 **TxREPU**: Timer x repetition update

Register update is triggered when the counter rolls over and HRTIM_REPx = 0

0: Update on repetition disabled

1: Update on repetition enabled

Bit 16 **TFU**: Timer F update

Register update is triggered by the timer F update

0: Update by timer F disabled

1: Update by timer F enabled

Note: This bit is reserved for HRTIM_TIMFCR. It is only available for HRTIM_TIMACR, HRTIM_TIMBCR, HRTIM_TIMCCR, HRTIM_TIMDCR, HRTIM_TIMECR.

Bits 15:14 **DELCMP4[1:0]**: CMP4 auto-delayed mode

This bitfield defines whether the compare register is behaving in standard mode (compare match issued as soon as counter equal compare), or in auto-delayed mode (see *Section : Autodelayed mode*).

00: CMP4 register is always active (standard compare mode)

01: CMP4 value is recomputed and is active following a capture 2 event

10: CMP4 value is recomputed and is active following a capture 2 event, or is recomputed and active after Compare 1 match (timeout function if capture 2 event is missing)

11: CMP4 value is recomputed and is active following a capture 2 event, or is recomputed and active after Compare 3 match (timeout function if capture event is missing)

Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bits 13:12 **DELCMP2[1:0]**: CMP2 auto-delayed mode

This bitfield defines whether the compare register is behaving in standard mode (compare match issued as soon as counter equal compare), or in auto-delayed mode (see *Section : Autodelayed mode*).

00: CMP2 register is always active (standard compare mode)

01: CMP2 value is recomputed and is active following a capture 1 event

10: CMP2 value is recomputed and is active following a capture 1 event, or is recomputed and active after compare 1 match (timeout function if capture event is missing)

11: CMP2 value is recomputed and is active following a capture 1 event, or is recomputed and active after compare 3 match (timeout function if capture event is missing)

Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 11 **SYNCSTRTx**: Synchronization starts timer x

This bit defines the timer x behavior following the synchronization event:

0: No effect on timer x

1: A synchronization input event starts the timer x

Bit 10 **SYNCRSTx**: Synchronization resets timer x

This bit defines the timer x behavior following the synchronization event:

0: No effect on timer x

1: A synchronization input event resets the timer x

Bit 9 **RSYNCU**: Re-synchronized update

This bit specifies whether update source coming outside from the timing unit must be synchronized:

0: The update coming from adjacent timers (when MSTU, TAU, TBU, TCU, TDU, TEU, TFU bit is set) or from a software update (TxSWU bit) is taken into account immediately

1: The update coming from adjacent timers (when MSTU, TAU, TBU, TCU, TDU, TEU, TFU bit is set) or from a software update (TxSWU bit) is taken into account on the following reset/roll-over event.

Note: This bit is significant only when UPDGAT[3:0] = 0000, it is ignored otherwise.

Bits 8:7 **INTLVD[1:0]**: Interleaved mode

This bitfield is significant only when the HALF bit is reset. It enables the interleaved mode.

00: Interleaved mode disabled

01: Triple interleaved mode: when HRTIM_PERxR register is written, the HRTIM_CMP1xR active register is automatically updated with HRTIM_PERxR/3 value, and the HRTIM_CMP2xR active register is automatically updated with 2x (HRTIM_PERxR/3) value.

10: Quad interleaved mode: when HRTIM_PERxR register is written, the HRTIM_CMP1xR active register is automatically updated with HRTIM_PERxR/4 value, the HRTIM_CMP2xR active register is automatically updated with HRTIM_PERxR/2 value and the HRTIM_CMP3xR active register is automatically updated with 3x (HRTIM_PERxR/4) value.

11: Interleaved mode disabled

Bit 6 **PSHPLL**: Push-pull mode enable

This bit enables the push-pull mode.

0: Push-pull mode disabled

1: Push-pull mode enabled

Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 5 **HALF**: Half mode enable

This bit enables the half duty-cycle mode: the HRTIM_CMP1xR active register is automatically updated with HRTIM_PERxR/2 value when HRTIM_PERxR register is written.

0: Half mode disabled

1: Half mode enabled

Bit 4 **RETRIG**: Re-triggerable mode

This bit defines the counter behavior in single shot mode.

0: The timer is not re-triggerable: a counter reset is done if the counter is stopped (period elapsed in single-shot mode or counter stopped in continuous mode)

1: The timer is re-triggerable: a counter reset is done whatever the counter state.

Bit 3 **CONT**: Continuous mode

This bit defines the timer operating mode.

0: The timer operates in single-shot mode and stops when it reaches TIMxPER value

1: The timer operates in continuous mode and rolls over to zero when it reaches TIMxPER value

Bits 2:0 **CKPSCx[2:0]**: HRTIM timer x clock prescaler

These bits define the master timer clock prescaler ratio.

The counter clock equivalent frequency ($f_{COUNTER}$) is equal to $f_{HRCK} / 2^{(CKPSC[2:0]-5)}$.

The prescaling ratio cannot be modified once the timer is enabled.

33.5.13 HRTIM timer x interrupt status register (HRTIM_TIMxISR) (x = A to F)

Address offset: Block A: 0x104

Address offset: Block B: 0x204

Address offset: Block C: 0x304

Address offset: Block D: 0x404

Address offset: Block E: 0x504

Address offset: Block F: 0x604

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	COTS	COS	O2CPY	O1CPY	O2STAT	O1STAT	IPPSTAT	CPPSTAT

r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **COTS**: Crossbar Override Trigger status

This status bit is a raw copy of the crossbar override trigger input. It can be polled to verify if the crossbar override mode can be rearmed

0: Crossbar Override trigger is inactive

1: Crossbar Override trigger is active

Bit 22 **COS**: Crossbar Override status

This status bit indicates the crossbar override status.

0: Crossbar Override is inactive (crossbar is active)

1: Crossbar Override is active

Bit 21 **O2CPY**: Output 2 copy

This status bit is a raw copy of the output 2 state, before the output stage (chopper, polarity). It allows to check the current output state before re-enabling the output after a delayed protection.

0: Output 2 is inactive

1: Output 2 is active

Bit 20 **O1CPY**: Output 1 copy

This status bit is a raw copy of the output 1 state, before the output stage (chopper, polarity). It allows to check the current output state before re-enabling the output after a delayed protection.

0: Output 1 is inactive

1: Output 1 is active

Bit 19 **O2STAT**: Output 2 status

This status bit indicates the output 2 state when the delayed idle protection was triggered. This bit is updated upon any new delayed protection entry. This bit is not updated in balanced idle.

0: Output 2 was inactive

1: Output 2 was active

Bit 18 **O1STAT**: Output 1 status

This status bit indicates the output 1 state when the delayed idle protection was triggered. This bit is updated upon any new delayed protection entry. This bit is not updated in balanced idle.

0: Output 1 was inactive

1: Output 1 was active

Bit 17 **IPPSTAT**: Idle push-pull Status

This status bit indicates on which output the signal was applied, in push-pull mode balanced fault mode or delayed idle mode, when the protection was triggered (whatever the output state, active or inactive).

0: Protection occurred when the output 1 was active and output 2 forced inactive

1: Protection occurred when the output 2 was active and output 1 forced inactive

Bit 16 **CPPSTAT**: Current push-pull status

This status bit indicates on which output the signal is currently applied, in push-pull mode. It is only significant in this configuration.

0: Signal applied on output 1 and output 2 forced inactive

1: Signal applied on output 2 and output 1 forced inactive

Bit 15 **CORDE**: Crossbar Override Rearm Delay Elapsed flag

This bit is set when the crossbar override mode can be rearmed. This interrupt flag is asserted when at least on of the one of the 2 channels is configured to Delayed fault force modes (COFMx[2:0] = 000 and 001).

0: No Crossbar override rearm delay elapsed interrupt occurred

1: Crossbar override rearm delay elapsed interrupt occurred

Bit 14 **DLYPRT**: Delayed protection flag

0: No delayed protection interrupt occured

1: Delayed Idle or balanced Idle mode entry occured

Bit 13 **RST**: Reset and/or roll-over interrupt flag

This bit is set by hardware when the timer x counter is reset or rolls over in continuous mode.

0: No TIMx counter reset/roll-over interrupt occurred

1: TIMX counter reset/roll-over interrupt occurred

Bit 12 **RSTx2**: Output 2 reset interrupt flag timer x

Refer to RSTx1 description

Bit 11 **SETx2**: Output 2 set interrupt flag timer x

Refer to SETx1 description

Bit 10 **RSTx1**: Output 1 reset interrupt flag timer x

This bit is set by hardware when the Tx1 output is reset (goes from active to inactive mode).

0: No Tx1 output reset interrupt occurred

1: Tx1 output reset interrupt occurred

Bit 9 **SETx1**: Output 1 set interrupt flag timer x

This bit is set by hardware when the Tx1 output is set (goes from inactive to active mode).

0: No Tx1 output set interrupt occurred

1: Tx1 output set interrupt occurred

Bit 8 **CPT2**: Capture 2 interrupt flag

Refer to CPT1 description

Bit 7 **CPT1**: Capture 1 interrupt flag

This bit is set by hardware when the timer x capture 1 event occurs.

0: No timer x capture 1 interrupt occurred

1: Timer x capture 1 interrupt occurred

Bit 6 **UPD**: Update interrupt flag
This bit is set by hardware when the timer x update event occurs.
0: No timer x update interrupt occurred
1: Timer x update interrupt occurred

Bit 5 **COT**: Crossbar Override Trigger flag
This bit is set when the crossbar override mode is triggered.
0: No Crossbar override trigger interrupt occurred
1: Crossbar override trigger interrupt occured

Bit 4 **REP**: Repetition interrupt flag
This bit is set by hardware when the timer x repetition period has elapsed.
0: No timer x repetition interrupt occurred
1: Timer x repetition interrupt occurred

Bit 3 **CMP4**: Compare 4 interrupt flag
Refer to CMP1 description

Bit 2 **CMP3**: Compare 3 interrupt flag
Refer to CMP1 description

Bit 1 **CMP2**: Compare 2 interrupt flag
Refer to CMP1 description

Bit 0 **CMP1**: Compare 1 interrupt flag
This bit is set by hardware when the timer x counter matches the value programmed in the compare 1 register.
0: No compare 1 interrupt occurred
1: Compare 1 interrupt occurred

33.5.14 HRTIM timer x interrupt clear register (HRTIM_TIMxICR) (x = A to F)

Address offset: Block A: 0x108

Address offset: Block B: 0x208

Address offset: Block C: 0x308

Address offset: Block D: 0x408

Address offset: Block E: 0x508

Address offset: Block F: 0x608

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **CORDEC**: Crossbar Override Rearm Delay Elapsed flag clear
Writing 1 to this bit clears the CORDE flag in HRTIM_TIMxISR register

Bit 14 **DLYPRTC**: Delayed protection flag clear
Writing 1 to this bit clears the DLYPRT flag in HRTIM_TIMxISR register

Bit 13 **RSTC**: Reset interrupt flag clear
Writing 1 to this bit clears the RST flag in HRTIM_TIMxISR register

Bit 12 **RSTx2C**: Output 2 reset flag clear timer x
Writing 1 to this bit clears the RSTx2 flag in HRTIM_TIMxISR register

Bit 11 **SETx2C**: Output 2 set flag clear timer x
Writing 1 to this bit clears the SETx2 flag in HRTIM_TIMxISR register

Bit 10 **RSTx1C**: Output 1 reset flag clear timer x
Writing 1 to this bit clears the RSTx1 flag in HRTIM_TIMxISR register

Bit 9 **SETx1C**: Output 1 set flag clear timer x
Writing 1 to this bit clears the SETx1 flag in HRTIM_TIMxISR register

Bit 8 **CPT2C**: Capture 2 interrupt flag clear
Writing 1 to this bit clears the CPT2 flag in HRTIM_TIMxISR register

Bit 7 **CPT1C**: Capture 1 interrupt flag clear
Writing 1 to this bit clears the CPT1 flag in HRTIM_TIMxISR register

Bit 6 **UPDC**: Update interrupt flag clear
Writing 1 to this bit clears the UPD flag in HRTIM_TIMxISR register

Bit 5 **COTC**: Crossbar Override Trigger flag clear
Writing 1 to this bit clears the COT flag in HRTIM_TIMxISR register

Bit 4 **REPC**: Repetition interrupt flag clear
Writing 1 to this bit clears the REP flag in HRTIM_TIMxISR register

Bit 3 **CMP4C**: Compare 4 interrupt flag clear
Writing 1 to this bit clears the CMP4 flag in HRTIM_TIMxISR register

Bit 2 **CMP3C**: Compare 3 interrupt flag clear
Writing 1 to this bit clears the CMP3 flag in HRTIM_TIMxISR register

Bit 1 **CMP2C**: Compare 2 interrupt flag clear
Writing 1 to this bit clears the CMP2 flag in HRTIM_TIMxISR register

Bit 0 **CMP1C**: Compare 1 interrupt flag clear
Writing 1 to this bit clears the CMP1 flag in HRTIM_TIMxISR register

33.5.15 HRTIM timer x DMA interrupt enable register (HRTIM_TIMxDIER) (x = A to F)

Address offset: Block A: 0x10C

Address offset: Block B: 0x20C

Address offset: Block C: 0x30C

Address offset: Block D: 0x40C

Address offset: Block E: 0x50C

Address offset: Block F: 0x60C

Reset value: 0x0000 0000

Bit 31 **CORDEDE**: Crossbar override rearm delay elapsed DMA request enable
This bit is set and cleared by software to enable/disable DMA requests on Crossbar override rearm delay elapsed event.
0: Crossbar override rearm delay elapsed DMA request disabled
1: Crossbar override rearm delay elapsed DMA request enabled

Bit 30 **DLYPRTDE**: Delayed protection DMA request enable
This bit is set and cleared by software to enable/disable DMA requests on delayed protection.
0: Delayed protection DMA request disabled
1: Delayed protection DMA request enabled

Bit 29 **RSTDE**: Reset/roll-over DMA request enable
This bit is set and cleared by software to enable/disable DMA requests on timer x counter reset or roll-over in continuous mode.
0: Timer x counter reset/roll-over DMA request disabled
1: Timer x counter reset/roll-over DMA request enabled

Bit 28 **RSTx2DE**: Output 2 reset DMA request enable timer x
Refer to RSTx1DE description

Bit 27 **SETx2DE**: Output 2 set DMA request enable timer x
Refer to SETx1DE description

Bit 26 **RSTx1DE**: Output 1 reset DMA request enable timer x
This bit is set and cleared by software to enable/disable Tx1 output reset DMA requests.
0: Tx1 output reset DMA request disabled
1: Tx1 output reset DMA request enabled

Bit 25 **SETx1DE**: Output 1 set DMA request enable timer x
This bit is set and cleared by software to enable/disable Tx1 output set DMA requests.
0: Tx1 output set DMA request disabled
1: Tx1 output set DMA request enabled

Bit 24 **CPT2DE**: Capture 2 DMA request enable
Refer to CPT1DE description

Bit 23 **CPT1DE**: Capture 1 DMA request enable
This bit is set and cleared by software to enable/disable capture 1 DMA requests.
0: Capture 1 DMA request disabled
1: Capture 1 DMA request enabled

Bit 22 **UPDDE**: Update DMA request enable
This bit is set and cleared by software to enable/disable DMA requests on update event.
0: Update DMA request disabled
1: Update DMA request enabled

Bit 21 **COTDE**: Crossbar Override Trigger DMA request enable
This bit is set and cleared by software to enable/disable DMA requests on Crossbar Override Trigger event.
0: Crossbar Override Trigger DMA request disabled
1: Crossbar Override Trigger DMA request enabled

Bit 20 **REPDE**: Repetition DMA request enable
This bit is set and cleared by software to enable/disable DMA requests on repetition event.
0: Repetition DMA request disabled
1: Repetition DMA request enabled

Bit 19 **CMP4DE**: Compare 4 DMA request enable
Refer to CMP1DE description

Bit 18 **CMP3DE**: Compare 3 DMA request enable
Refer to CMP1DE description

Bit 17 **CMP2DE**: Compare 2 DMA request enable
Refer to CMP1DE description

Bit 16 **CMP1DE**: Compare 1 DMA request enable
This bit is set and cleared by software to enable/disable the compare 1 DMA requests.
0: Compare 1 DMA request disabled
1: Compare 1 DMA request enabled

Bit 15 **CORDEIE**: Crossbar override rearm delay elapsed interrupt enable
This bit is set and cleared by software to enable/disable interrupts on Crossbar override rearm delay elapsed event.
0: Crossbar override rearm delay elapsed interrupts disabled
1: Crossbar override rearm delay elapsed interrupts enabled

Bit 14 **DLYPRTIE**: Delayed protection interrupt enable
This bit is set and cleared by software to enable/disable interrupts on delayed protection.
0: Delayed protection interrupts disabled
1: Delayed protection interrupts enabled

Bit 13 **RSTIE**: Reset/roll-over interrupt enable
This bit is set and cleared by software to enable/disable interrupts on timer x counter reset or roll-over in continuous mode.
0: Timer x counter reset/roll-over interrupt disabled
1: Timer x counter reset/roll-over interrupt enabled

Bit 12 **RSTx2IE**: Output 2 reset interrupt enable timer x
Refer to RSTx1IE description

Bit 11 **SETx2IE**: Output 2 set interrupt enable timer x
Refer to SETx1IE description

Bit 10 **RSTx1IE**: Output 1 reset interrupt enable timer x
This bit is set and cleared by software to enable/disable Tx1 output reset interrupts.
0: Tx1 output reset interrupts disabled
1: Tx1 output reset interrupts enabled

Bit 9 **SETx1IE**: Output 1 set interrupt enable timer x
This bit is set and cleared by software to enable/disable Tx1 output set interrupts.
0: Tx1 output set interrupts disabled
1: Tx1 output set interrupts enabled

Bit 8 **CPT2IE**: Capture interrupt enable
Refer to CPT1IE description

Bit 7 **CPT1IE**: Capture interrupt enable
This bit is set and cleared by software to enable/disable capture 1 interrupts.
0: Capture 1 interrupts disabled
1: Capture 1 interrupts enabled

Bit 6 **UPDIE**: Update interrupt enable
This bit is set and cleared by software to enable/disable update event interrupts.
0: Update interrupts disabled
1: Update interrupts enabled

Bit 5 **COTIE**: Crossbar Override Trigger interrupt enable
This bit is set and cleared by software to enable/disable Crossbar Override Trigger interrupts.
0: Crossbar Override Trigger interrupts disabled
1: Crossbar Override Trigger enabled

Bit 4 **REPIE**: Repetition interrupt enable
This bit is set and cleared by software to enable/disable repetition event interrupts.
0: Repetition interrupts disabled
1: Repetition interrupts enabled

Bit 3 **CMP4IE**: Compare 4 interrupt enable
Refer to CMP1IE description

Bit 2 **CMP3IE**: Compare 3 interrupt enable
Refer to CMP1IE description

Bit 1 **CMP2IE**: Compare 2 interrupt enable
Refer to CMP1IE description

Bit 0 **CMP1IE**: Compare 1 interrupt enable
This bit is set and cleared by software to enable/disable the compare 1 interrupts.
0: Compare 1 interrupt disabled
1: Compare 1 interrupt enabled

33.5.16 HRTIM timer x counter register (HRTIM_CNTxR) (x = A to F)

Address offset: Block A: 0x110

Address offset: Block B: 0x210

Address offset: Block C: 0x310

Address offset: Block D: 0x410

Address offset: Block E: 0x510

Address offset: Block F: 0x610

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CNTx[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CNTx[15:0]**: Timer x counter value

This register holds the timer x counter value. It can only be written when the timer is stopped (TxCEN = 0 in HRTIM_TIMxCR).

Note: The timer behavior is not guaranteed if the counter value is above the HRTIM_PERxR register value.

33.5.17 HRTIM timer x period register (HRTIM_PERxR) (x = A to F)

Address offset: Block A: 0x114

Address offset: Block B: 0x214

Address offset: Block C: 0x314

Address offset: Block D: 0x414

Address offset: Block E: 0x514

Address offset: Block F: 0x614

Reset value: 0x0000 FFDF

PERx[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **PERx[15:0]**: Timer x period value

This register holds timer x period value.

This register holds either the content of the preload register or the content of the active register if preload is disabled.

The period value must be above or equal to 3 periods of the f_{HRTIM} clock.

The maximum value is 0x0000 FFDF.

33.5.18 HRTIM timer x repetition register (HRTIM_REPxR) (x = A to F)

Address offset: Block A: 0x118

Address offset: Block B: 0x218

Address offset: Block C: 0x318

Address offset: Block D: 0x418

Address offset: Block E: 0x518

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	REPx[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:0 **REPx[7:0]**: Timer x repetition period value

This register holds the repetition period value.

This register holds either the content of the preload register or the content of the active register if preload is disabled.

33.5.19 HRTIM timer x compare 1 register (HRTIM_CMP1xR) (x = A to F)

Address offset: Block A: 0x11C

Address offset: Block B: 0x21C

Address offset: Block C: 0x31C

Address offset: Block D: 0x41C

Address offset: Block E: 0x51C

Address offset: Block F: 0x61C

Reset value: 0x0000 0000

CMP1x[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CMP1x[15:0]**: Timer x compare 1 value

This register holds the compare 1 value.

This register holds either the content of the preload register or the content of the active register if preload is disabled.

The compare value must be either null or above or equal to 3 periods of the f_{HRTIM} clock.

The null value is programmed following the use case described in *Section : Null duty cycle exception case*.

33.5.20 HRTIM timer x compare 1 compound register (HRTIM_CMP1CxR) (x = A to F)

Address offset: Block A: 0x120

Address offset: Block B: 0x220

Address offset: Block C: 0x320

Address offset: Block D: 0x420

Address offset: Block E: 0x520

Address offset: Block F: 0x620

Reset value: 0x0000 0000

CMP1x[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **REPx[7:0]**: Timer x repetition value aliased from HRTIM_REPx register
This bitfield is an alias from the REPx[7:0] bitfield in the HRTIMx_REPxR register.

Bits 15:0 **CMP1x[15:0]**: Timer x compare 1 value
This bitfield is an alias from the CMP1x[15:0] bitfield in the HRTIMx_CMP1xR register.

33.5.21 HRTIM timer x compare 2 register (HRTIM_CMP2xR) (x = A to F)

Address offset: Block A: 0x124

Address offset: Block B: 0x224

Address offset: Block C: 0x324

Address offset: Block D: 0x424

Address offset: Block E: 0x524

Address offset: Block F: 0x624

CMP2x[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CMP2x[15:0]**: Timer x compare 2 value

This register holds the compare 2 value.

This register holds either the content of the preload register or the content of the active register if preload is disabled.

The compare value must be either null or above or equal to 3 periods of the f_{HRTIM} clock.

The null value is programmed following the use case described in *Section : Null duty cycle exception case*.

This register behaves as an auto-delayed compare register, if enabled with DELCMP2[1:0] bits in HRTIM_TIMxCR. In this case, the compare value must be strictly above or equal to 3 periods of the f_{HRTIM} clock.

33.5.22 HRTIM timer x compare 3 register (HRTIM_CMP3xR) (x = A to F)

Address offset: Block A: 0x128

Address offset: Block B: 0x228

Address offset: Block C: 0x328

Address offset: Block D: 0x428

Address offset: Block E: 0x528

Address offset: Block F: 0x628

Reset value: 0x0000 0000

CMP3x[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CMP3x[15:0]**: Timer x compare 3 value

This register holds the compare 3 value.

This register holds either the content of the preload register or the content of the active register if preload is disabled.

The compare value must be either null or above or equal to 3 periods of the f_{HRTIM} clock.

The null value is programmed following the use case described in *Section : Null duty cycle exception case*.

33.5.23 HRTIM timer x compare 4 register (HRTIM_CMP4xR) (x = A to F)

Address offset: Block A: 0x12C

Address offset: Block B: 0x22C

Address offset: Block C: 0x32C

Address offset: Block D: 0x42C

Address offset: Block E: 0x52C

Address offset: Block F: 0x62C

Reset value: 0x0000 0000

CMP4x[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **CMP4x[15:0]**: Timer x compare 4 value

This register holds the compare 4 value.

This register holds either the content of the preload register or the content of the active register if preload is disabled.

The compare value must be either null or above or equal to 3 periods of the f_{HRTIM} clock.

The null value is programmed following the use case described in *Section : Null duty cycle exception case*.

This register can behave as an auto-delayed compare register, if enabled with DELCMP4[1:0] bits in HRTIM_TIMxCR. In this case, the compare value must be strictly above or equal to 3 periods of the f_{HRTIM} clock.

33.5.24 HRTIM timer x capture 1 register (HRTIM_CPT1xR) (x = A to F)

Address offset: Block A: 0x130

Address offset: Block B: 0x230

Address offset: Block C: 0x330

Address offset: Block D: 0x430

Address offset: Block E: 0x530

Address offset: Block F: 0x630

Reset value: 0x0000 0000

CPT1x[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **DIR**: Timer x capture 1 direction status
This register holds the counting direction value when the capture 1 event occurred:
0: timer is up-counting
1: timer is down-counting
In up-counting mode (UDM bit reset), the DIR bit is always read as 0.

Bits 15:0 **CPT1x[15:0]**: Timer x capture 1 value
This register holds the counter value when the capture 1 event occurred.

Note: In up/down mode (UDM bit set to 1), the capture value is referred to:
- counting reset, when up-counting
- the PER event when down counting
The DIR bit is used to discriminate the up-down phases when reading the captured value.

33.5.25 HRTIM timer x capture 2 register (HRTIM_CPT2xR) (x = A to F)

Address offset: Block A: 0x134

Address offset: Block B: 0x234

Address offset: Block C: 0x334

Address offset: Block D: 0x434

Address offset: Block E: 0x534

Address offset: Block F: 0x634

Reset value: 0x0000 0000

CPT2x[15:0]															
r	r	r	r	r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:17 Reserved, must be kept at reset value.

Bit 16 **DIR**: Timer x capture 1 direction status
This register holds the counting direction value when the capture 1 event occurred:
0: timer is up-counting
1: timer is down-counting
In up-counting mode (UDM bit reset), the DIR bit is always read as 0.

Bits 15:0 **CPT2x[15:0]**: Timer x capture 2 value
This register holds the counter value when the capture 2 event occurred.

Note: In up/down mode (UDM bit set to 1), the capture value is referred to:
- counting reset, when up-counting
- the PER event when down counting

The DIR bit is used to discriminate the up-down phases when reading the captured value.

33.5.26 HRTIM timer x deadtime register (HRTIM_DTxR) (x = A to F)

Address offset: Block A: 0x138

Address offset: Block B: 0x238

Address offset: Block C: 0x338

Address offset: Block D: 0x438

Address offset: Block E: 0x538

Address offset: Block F: 0x638

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DTFLKx	DTFSLKx	Res.	Res.	DTM[1:0]		SDTFx	DTFx[8:0]								
rwo	rwo			rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DTRLKx	DTRSLKx	Res.	DTPRSC[2:0]			SDTRx	DTRx[8:0]								
rwo	rwo		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **DTFLKx**: Deadtime falling lock timer x

This write-once bit prevents the deadtime (sign and value) to be modified, if enabled.

0: Deadtime falling value and sign is writable

1: Deadtime falling value and sign is read-only

Note: This bit is not preloaded

Bit 30 **DTFSLKx**: Deadtime falling sign lock timer x

This write-once bit prevents the sign of falling deadtime to be modified, if enabled.

0: Deadtime falling sign is writable

1: Deadtime falling sign is read-only

Note: This bit is not preloaded.

Bits 29:28 Reserved, must be kept at reset value.

Bits 27:26 **DTM[1:0]**: Deadtime mode

This bitfield defines the deadtime module behavior.

00: Deadtime complementary mode

01: Reserved

10: Reserved

11: Reserved. Writing 11 is discarded, and the DTM[1:0] value is maintained at its previous value.

Bit 25 **SDTFx**: Sign deadtime falling value timer x

This register determines whether the deadtime is positive (signals not overlapping) or negative (signals overlapping).

0: Positive deadtime on falling edge

1: Negative deadtime on falling edge

Bits 24:16 **DTFx[8:0]**: Deadtime falling value timer x

This register holds the value of the deadtime following a falling edge of reference PWM signal.

t_{DTF} = DTFx[8:0] x t_{DTG}

Bit 15 **DTRLKx**: Deadtime rising lock timer x
This write-once bit prevents the deadtime (sign and value) to be modified, if enabled.
0: Deadtime rising value and sign is writable
1: Deadtime rising value and sign is read-only
Note: This bit is not preloaded.

Bit 14 **DTRSLKx**: Deadtime rising sign lock timer x
This write-once bit prevents the sign of deadtime to be modified, if enabled.
0: Deadtime rising sign is writable
1: Deadtime rising sign is read-only
Note: This bit is not preloaded.

Bit 13 Reserved, must be kept at reset value.

Bits 12:10 **DTPRSC[2:0]**: Deadtime prescaler
This register holds the value of the deadtime clock prescaler determined by the following formula:
$t_{DTG} = (2^{(DTPRSC[2:0]-3)}) \times t_{HRTIM}$
(see *Table 342: Deadtime resolution and max absolute values*)
This bitfield is read-only as soon as any of the lock bit is enabled (DTFLKs, DTFSLKx, DTRLKx, DTRSLKx).

Bit 9 **SDTRx**: Sign deadtime rising value timer x
This register determines whether the deadtime is positive or negative (overlapping signals).
0: Positive deadtime on rising edge
1: Negative deadtime on rising edge

Bits 8:0 **DTRx[8:0]**: Deadtime rising value timer x
This register holds the value of the deadtime following a rising edge of reference PWM signal.
$t_{DTR} = DTRx[8:0] \times t_{DTG}$

33.5.27 HRTIM timer x output 1 set register (HRTIM_SETx1R) (x = A to F)

Address offset: Block A: 0x13C

Address offset: Block B: 0x23C

Address offset: Block C: 0x33C

Address offset: Block D: 0x43C

Address offset: Block E: 0x53C

Address offset: Block F: 0x63C

Reset value: 0x0000 0000

Bit 31 **UPDATE**: Registers update (transfer from preload register to active register)
Register update event forces the output to its active state.

Bit 30 **EXTEVNTJ**: External event J
External event J forces the output to its active state.

Bit 29 **EXTEVNTI**: External event I
External event I forces the output to its active state.

Bit 28 **EXTEVNTH**: External event H
External event H forces the output to its active state.

Bit 27 **EXTEVNTG**: External event G
External event G forces the output to its active state.

Bit 26 **EXTEVNTF**: External event F
External event F forces the output to its active state.

Bit 25 **EXTEVNTE**: External event E
External event E forces the output to its active state.

Bit 24 **EXTEVNTD**: External event D
External event D forces the output to its active state.

Bit 23 **EXTEVNTC**: External event C
External event C forces the output to its active state.

Bit 22 **EXTEVNTB**: External event B
External event B forces the output to its active state.

Bit 21 **EXTEVNTA**: External event A
External event A forces the output to its active state.

Bit 20 **TIMEVNT9**: Timer event 9
Timers event 9 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 19 **TIMEVNT8**: Timer event 8
Timers event 8 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 18 **TIMEVNT7**: Timer event 7
Timers event 7 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 17 **TIMEVNT6**: Timer event 6
Timers event 6 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 16 **TIMEVNT5**: Timer event 5
Timers event 5 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 15 **TIMEVNT4**: Timer event 4
Timers event 4 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 14 **TIMEVNT3**: Timer event 3
Timers event 3 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 13 **TIMEVNT2**: Timer event 2
Timers event 2 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 12 **TIMEVNT1**:Timer event 1
Timers event 1 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 11 **MSTCMP4**: Master compare 4
Master timer compare 4 event forces the output to its active state.

Bit 10 **MSTCMP3**: Master compare 3
Master timer compare 3 event forces the output to its active state.

Bit 9 **MSTCMP2**: Master compare 2
Master timer compare 2 event forces the output to its active state.

Bit 8 **MSTCMP1**: Master compare 1
Master timer compare 1 event forces the output to its active state.

Bit 7 **MSTPER**: Master period
The master timer counter period event (continuous mode), or the master timer counter reset (continous or single-shot mode), forces the output to its active state.

Bit 6 **CMP4**: Timer x compare 4
Timer A compare 4 event forces the output to its active state.

Bit 5 **CMP3**: Timer x compare 3
Timer A compare 3 event forces the output to its active state.

Bit 4 **CMP2**: Timer x compare 2
Timer A compare 2 event forces the output to its active state.

Bit 3 **CMP1**: Timer x compare 1
Timer A compare 1 event forces the output to its active state.

Bit 2 **PER**: Timer x period

Timer A period event forces the output to its active state.

Note: In up/down mode (UDM bit set to 1), the counter period event is defined as per the OUTROM[1:0] bit setting.

Bit 1 **RESYNC:** Timer A resynchronization

Timer A reset event coming solely from software or SYNC input forces the output to its active state.

Note: Other timer reset are not affecting the output when RESYNC=1.

Bit 0 **SST**: Software set trigger

This bit forces the output to its active state. This bit can only be set by software and is reset by hardware.

Note: This bit is not preloaded.

33.5.28 HRTIM timer x output 1 reset register (HRTIM_RSTx1R) (x = A to F)

Address offset: Block A: 0x140

Address offset: Block B: 0x240

Address offset: Block C: 0x340

Address offset: Block D: 0x440

Address offset: Block E: 0x540

Address offset: Block F: 0x640

Reset value: 0x0000 0000

Bit 31 **UPDATE**: Registers update (transfer from preload register to active register)
Register update event forces the output to its inactive state.

Bit 30 **EXTEVNTJ**: External event J
External event J forces the output to its inactive state.

Bit 29 **EXTEVNTI**: External event I
External event I forces the output to its inactive state.

Bit 28 **EXTEVNTH**: External event H
External event H forces the output to its inactive state.

Bit 27 **EXTEVNTG**: External event G
External event G forces the output to its inactive state.

Bit 26 **EXTEVNTF**: External event F
External event F forces the output to its inactive state.

Bit 25 **EXTEVNTE**: External event E
External event E forces the output to its inactive state.

Bit 24 **EXTEVNTD**: External event D
External event D forces the output to its inactive state.

Bit 23 **EXTEVNTC**: External event C
External event C forces the output to its inactive state.

Bit 22 **EXTEVNTB**: External event B
External event B forces the output to its inactive state.

Bit 21 **EXTEVNTA**: External event A
External event A forces the output to its inactive state.

Bit 20 **TIMEVNT9**: Timer event 9
Timers event 9 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 19 **TIMEVNT8**: Timer event 8
Timers event 8 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 18 **TIMEVNT7**: Timer event 7
Timers event 7 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 17 **TIMEVNT6**: Timer event 6
Timers event 6 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 16 **TIMEVNT5**: Timer event 5
Timers event 5 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 15 **TIMEVNT4**: Timer event 4
Timers event 4 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 14 **TIMEVNT3**: Timer event 3
Timers event 3 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 13 **TIMEVNT2**: Timer event 2
Timers event 2 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 12 **TIMEVNT1**:Timer event 1
Timers event 1 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 11 **MSTCMP4**: Master compare 4
Master timer compare 4 event forces the output to its inactive state.

Bit 10 **MSTCMP3**: Master compare 3
Master timer compare 3 event forces the output to its inactive state.

Bit 9 **MSTCMP2**: Master compare 2
Master timer compare 2 event forces the output to its inactive state.

Bit 8 **MSTCMP1**: Master compare 1
Master timer compare 1 event forces the output to its inactive state.

Bit 7 **MSTPER**: Master period
The master timer counter period event (continuous mode), or the master timer counter reset (continous or single-shot mode), forces the output to its inactive state.

Bit 6 **CMP4**: Timer x compare 4
Timer A compare 4 event forces the output to its inactive state.

Bit 5 **CMP3**: Timer x compare 3
Timer A compare 3 event forces the output to its inactive state.

Bit 4 **CMP2**: Timer x compare 2
Timer A compare 2 event forces the output to its inactive state.

Bit 3 **CMP1**: Timer x compare 1
Timer A compare 1 event forces the output to its inactive state.

Bit 2 **PER**: Timer x period

Timer A period event forces the output to its inactive state.

Note: In up/down mode (UDM bit set to 1), the counter period event is defined as per the OUTROM[1:0] bit setting.

Bit 1 **RESYNC:** Timer A resynchronization

Timer A reset event coming solely from software or SYNC input forces the output to its inactive state.

Note: Other timer reset are not affecting the output when RESYNC=1.

Bit 0 **SRT**: Software reset trigger

This bit forces the output to its inactive state. This bit can only be set by software and is reset by hardware.

Note: This bit is not preloaded.

Bit 31 **UPDATE**: Registers update (transfer from preload register to active register)

Register update event forces the output to its active state.

Bit 30 **EXTEVNTJ**: External event J

External event J forces the output to its active state.

Bit 29 **EXTEVNTI**: External event I

External event I forces the output to its active state.

Bit 28 **EXTEVNTH**: External event H

External event H forces the output to its active state.

Bit 27 **EXTEVNTG**: External event G

External event G forces the output to its active state.

Bit 26 **EXTEVNTF**: External event F

External event F forces the output to its active state.

Bit 25 **EXTEVNTE**: External event E
External event E forces the output to its active state.

Bit 24 **EXTEVNTD**: External event D
External event D forces the output to its active state.

Bit 23 **EXTEVNTC**: External event C
External event C forces the output to its active state.

Bit 22 **EXTEVNTB**: External event B
External event B forces the output to its active state.

Bit 21 **EXTEVNTA**: External event A
External event A forces the output to its active state.

Bit 20 **TIMEVNT9**: Timer event 9
Timers event 9 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 19 **TIMEVNT8**: Timer event 8
Timers event 8 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 18 **TIMEVNT7**: Timer event 7
Timers event 7 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 17 **TIMEVNT6**: Timer event 6
Timers event 6 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 16 **TIMEVNT5**: Timer event 5
Timers event 5 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 15 **TIMEVNT4**: Timer event 4
Timers event 4 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 14 **TIMEVNT3**: Timer event 3
Timers event 3 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 13 **TIMEVNT2**: Timer event 2
Timers event 2 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 12 **TIMEVNT1**:Timer event 1
Timers event 1 forces the output to its active state (refer to *Table 339* for timer events assignments).

Bit 11 **MSTCMP4**: Master compare 4
Master timer compare 4 event forces the output to its active state.

Bit 10 **MSTCMP3**: Master compare 3
Master timer compare 3 event forces the output to its active state.

Bit 9 **MSTCMP2**: Master compare 2
Master timer compare 2 event forces the output to its active state.

Bit 8 **MSTCMP1**: Master compare 1
Master timer compare 1 event forces the output to its active state.

Bit 7 **MSTPER**: Master period
The master timer counter period event (continuous mode), or the master timer counter reset (continous or single-shot mode), forces the output to its active state.

Bit 6 **CMP4**: Timer x compare 4
Timer A compare 4 event forces the output to its active state.

Bit 5 **CMP3**: Timer x compare 3

Timer A compare 3 event forces the output to its active state.

Bit 4 **CMP2**: Timer x compare 2

Timer A compare 2 event forces the output to its active state.

Bit 3 **CMP1**: Timer x compare 1

Timer A compare 1 event forces the output to its active state.

Bit 2 **PER**: Timer x period

Timer A period event forces the output to its active state.

Note: In up/down mode (UDM bit set to 1), the counter period event is defined as per the OUTROM[1:0] bit setting.

Bit 1 **RESYNC:** Timer A resynchronization

Timer A reset event coming solely from software or SYNC input forces the output to its active state.

Note: Other timer reset are not affecting the output when RESYNC=1.

Bit 0 **SST**: Software set trigger

This bit forces the output to its active state. This bit can only be set by software and is reset by hardware.

Note: This bit is not preloaded.

Bit 31 **UPDATE**: Registers update (transfer from preload register to active register)
Register update event forces the output to its inactive state.

Bit 30 **EXTEVNTJ**: External event J
External event J forces the output to its inactive state.

Bit 29 **EXTEVNTI**: External event I
External event I forces the output to its inactive state.

Bit 28 **EXTEVNTH**: External event H
External event H forces the output to its inactive state.

Bit 27 **EXTEVNTG**: External event G
External event G forces the output to its inactive state.

Bit 26 **EXTEVNTF**: External event F
External event F forces the output to its inactive state.

Bit 25 **EXTEVNTE**: External event E
External event E forces the output to its inactive state.

Bit 24 **EXTEVNTD**: External event D
External event D forces the output to its inactive state.

Bit 23 **EXTEVNTC**: External event C
External event C forces the output to its inactive state.

Bit 22 **EXTEVNTB**: External event B
External event B forces the output to its inactive state.

Bit 21 **EXTEVNTA**: External event A
External event A forces the output to its inactive state.

Bit 20 **TIMEVNT9**: Timer event 9
Timers event 9 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 19 **TIMEVNT8**: Timer event 8
Timers event 8 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 18 **TIMEVNT7**: Timer event 7
Timers event 7 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 17 **TIMEVNT6**: Timer event 6
Timers event 6 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 16 **TIMEVNT5**: Timer event 5
Timers event 5 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 15 **TIMEVNT4**: Timer event 4
Timers event 4 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 14 **TIMEVNT3**: Timer event 3
Timers event 3 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 13 **TIMEVNT2**: Timer event 2
Timers event 2 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 12 **TIMEVNT1**:Timer event 1
Timers event 1 forces the output to its inactive state (refer to *Table 339* for timer events assignments).

Bit 11 **MSTCMP4**: Master compare 4
Master timer compare 4 event forces the output to its inactive state.

Bit 10 **MSTCMP3**: Master compare 3
Master timer compare 3 event forces the output to its inactive state.

Bit 9 **MSTCMP2**: Master compare 2
Master timer compare 2 event forces the output to its inactive state.

Bit 8 **MSTCMP1**: Master compare 1
Master timer compare 1 event forces the output to its inactive state.

Bit 7 **MSTPER**: Master period
The master timer counter period event (continuous mode), or the master timer counter reset (continous or single-shot mode), forces the output to its inactive state.

Bit 6 **CMP4**: Timer x compare 4
Timer A compare 4 event forces the output to its inactive state.

Bit 5 **CMP3**: Timer x compare 3
Timer A compare 3 event forces the output to its inactive state.

Bit 4 **CMP2**: Timer x compare 2
Timer A compare 2 event forces the output to its inactive state.

Bit 3 **CMP1**: Timer x compare 1
Timer A compare 1 event forces the output to its inactive state.

Bit 2 **PER**: Timer x period

Timer A period event forces the output to its inactive state.

Note: In up/down mode (UDM bit set to 1), the counter period event is defined as per the OUTROM[1:0] bit setting.

Bit 1 **RESYNC:** Timer A resynchronization

Timer A reset event coming solely from software or SYNC input forces the output to its inactive state.

Note: Other timer reset are not affecting the output when RESYNC=1.

Bit 0 **SRT**: Software reset trigger

This bit forces the output to its inactive state. This bit can only be set by software and is reset by hardware.

Note: This bit is not preloaded.

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:25 **EEEFLTR[4:0]**: External event E filter
Refer to EEAFLTR[3:0] description.

Bit 24 **EEELTCH**: External event E latch
Refer to EEALTCH description

Bits 23:19 **EEDFLTR[4:0]**: External event D filter
Refer to EEAFLTR[3:0] description.

Bit 18 **EEDLTCH**: External event D latch
Refer to EEALTCH description

Bits 17:13 **EECFLTR[4:0]**: External event C filter
Refer to EEAFLTR[3:0] description.

Bit 12 **EECLTCH**: External event C latch
Refer to EEALTCH description

Bits 11:7 **EEBFLTR[4:0]**: External event B filter
Refer to EEAFLTR[3:0] description.

Bit 6 **EEBLTCH**: External event B latch
Refer to EEALTCH description.

Bits 5:1 **EEAFLTR[4:0]**: External event A filter

00000: No filtering

00001: Blanking from counter reset/roll-over to compare 1

00010: Blanking from counter reset/roll-over to compare 2 in up-counting mode (UDM bit reset)
In up-down counting mode (UDM bit set): blanking from compare 1 to compare 2, only during the up-counting phase.

00011: Blanking from counter reset/roll-over to compare 3

00100: Blanking from counter reset/roll-over to compare 4 in up-counting mode (UDM bit reset)
In up-down counting mode (UDM bit set): blanking from compare 3 to compare 4, only during the up-counting phase.

0XXXX: Blanking from another timing unit: TIMFLTRy source (see *Table 348* for details)
XXXX = 0101 → y = 1
...
XXXX = 1100 → y = 8

01101: Windowing from counter reset/roll-over to compare 2 in up-counting mode (UDM bit reset)
In up-down counting mode (UDM bit set): windowing from compare 2 to compare 3, only during the up-counting phase.

01110: Windowing from counter reset/roll-over to compare 3 in up-counting mode (UDM bit reset)
In up-down counting mode (UDM bit set): windowing from compare 2 to compare 3, only during the down-counting phase.

01111: Windowing from another timing unit: TIMWIN source (see *Table 349* for details) in up-counting mode (UDM bit reset)
In up-down counting mode (UDM bit set): windowing from compare 2 during the up-counting phase to compare 3 during the down-counting phase.

10000: Blanking from compare 1 to counter reset/roll-over (UDM bit reset).In up-down counting mode (UDM bit set): blanking from compare 1 during down-counting to compare 2 during the following up-counting phase.

10001: Blanking from compare 2 to counter reset/roll-over (UDM bit reset).In up-down counting mode (UDM bit set): blanking from CMP1 (down-counting) to CMP2 (down-counting).

10010: Blanking from compare 1 to compare 2 (UDM bit reset). In up-down counting mode (UDM bit set): blanking from CMP1 (up-counting) to CMP2 (down-counting.

10011: Blanking from compare 3 to compare 4 (UDM bit reset). In up-down counting mode (UDM bit set): blanking from CMP3 (up-counting) to CMP4 (down-counting).

10100: Windowing from compare 1 to counter reset/roll-over. In up-down counting mode (UDM bit set), the reset/roll-over event is conditioned to the ROM[1:0] bitfield setting

10101: Windowing from compare 2 to counter reset/roll-over. In up-down counting mode (UDM bit set), the reset/roll-over event is conditioned to the ROM[1:0] bitfield setting

10110: Windowing from compare 1 to compare 2 (UDM bit reset). In up-down counting mode (UDM bit set): windowing from CMP1 (up-counting) to CMP2 (down-counting).

10111: Windowing from compare 3 to compare 4 (UDM bit reset). In up-down counting mode (UDM bit set): windowing from compare 3 during down-counting to compare 4 during the following up-counting phase

11000: TIMWIN2 source (see *Table 349* for details). In up-down counting mode (UDM bit set), the reset/roll-over event is conditioned to the ROM[1:0] bitfield setting

11001: TIMWIN3 source (see *Table 349* for details)
In up-down counting mode (UDM bit set): windowing from compare 1 during up-counting to compare 2 during the down-counting.

11010: Blanking from Period Event to Compare 1 In up-down counting mode (UDM bit set), the reset/roll-over event is conditioned to the ROM[1:0] bitfield setting

11011: Blanking from Period Event to Compare 2 In up-down counting mode (UDM bit set), the reset/roll-over event is conditioned to the ROM[1:0] bitfield setting

Note: Whenever a compare register is used for filtering, the value must be strictly above 0.
This bitfield must not be modified once the counter is enabled (TxCEN bit set)

Bit 0 **EEALTCH**: External event A latch

0: Event A is ignored if it happens during a blank, or passed through during a window.

1: Event A is latched and delayed till the end of the blanking or windowing period.

Note: A timeout event is generated in window mode (EEAFLTR[3:0]=1101, 1110, 1111) if EEALTCH = 0, except if the external event is programmed in fast mode (EExFAST = 1).

This bitfield must not be modified once the counter is enabled (TxCEN bit set).

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **TIMFCMP2**: Timer F compare 2
The timer A counter is reset upon timer F Compare 2 event.

Bit 30 **TIMECMP4**: Timer E compare 4
The timer A counter is reset upon timer E compare 4 event.

Bit 29 **TIMECMP2**: Timer E compare 2
The timer A counter is reset upon timer E compare 2 event.

Bit 28 **TIMECMP1**: Timer E compare 1
The timer A counter is reset upon timer E compare 1 event.

Bit 27 **TIMDCMP4**: Timer D compare 4
The timer A counter is reset upon timer D compare 4 event.

Bit 26 **TIMDCMP2**: Timer D compare 2
The timer A counter is reset upon timer D compare 2 event.

Bit 25 **TIMDCMP1**: Timer D compare 1
The timer A counter is reset upon timer D compare 1 event.

Bit 24 **TIMCCMP4**: Timer C compare 4
The timer A counter is reset upon timer C compare 4 event.

Bit 23 **TIMCCMP2**: Timer C compare 2
The timer A counter is reset upon timer C compare 2 event.

Bit 22 **TIMCCMP1**: Timer C compare 1
The timer A counter is reset upon timer C compare 1 event.

Bit 21 **TIMBCMP4**: Timer B compare 4
The timer A counter is reset upon timer B compare 4 event.

Bit 20 **TIMBCMP2**: Timer B compare 2
The timer A counter is reset upon timer B compare 2 event.

Bit 19 **TIMBCMP1**: Timer B compare 1
The timer A counter is reset upon timer B compare 1 event.

Bit 18 **EXTEVNTJ**: External event J
The timer A counter is reset upon external event J.

Bit 17 **EXTEVNTI**: External event I
The timer A counter is reset upon external event I.

Bit 16 **EXTEVNTH**: External event H
The timer A counter is reset upon external event H.

Bit 15 **EXTEVNTG**: External event G
The timer A counter is reset upon external event G.

Bit 14 **EXTEVNTF**: External event F
The timer A counter is reset upon external event F.

Bit 13 **EXTEVNTE**: External event E
The timer A counter is reset upon external event E.

Bit 12 **EXTEVNTD**: External event D
The timer A counter is reset upon external event D.

Bit 11 **EXTEVNTC**: External event C
The timer A counter is reset upon external event C.

Bit 10 **EXTEVNTB**: External event B
The timer A counter is reset upon external event B.

Bit 9 **EXTEVNTA**: External event A
The timer A counter is reset upon external event A.

Bit 8 **MSTCMP4**: Master compare 4
The timer A counter is reset upon master timer compare 4 event.

Bit 7 **MSTCMP3**: Master compare 3
The timer A counter is reset upon master timer compare 3 event.

Bit 6 **MSTCMP2**: Master compare 2
The timer A counter is reset upon master timer compare 2 event.

Bit 5 **MSTCMP1**: Master compare 1
The timer A counter is reset upon master timer compare 1 event.

Bit 4 **MSTPER**: Master timer period
The timer A counter is reset upon master timer period event.

Bit 3 **CMP4**: Timer A compare 4 reset
The timer A counter is reset upon timer A compare 4 event.

Bit 2 **CMP2**: Timer A compare 2 reset
The timer A counter is reset upon timer A compare 2 event.

Bit 1 **UPDT**: Timer A update reset
The timer A counter is reset upon update event.

Bit 0 **TIMFCMP1**: Timer F compare 1
The timer A counter is reset upon timer F compare 1 event.

33.5.34 HRTIM timer B reset register (HRTIM_RSTBR)

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **TIMFCMP2**: Timer F compare 2
The timer B counter is reset upon timer F Compare 2 event.

Bit 30 **TIMECMP4**: Timer E compare 4
The timer B counter is reset upon timer E compare 4 event.

Bit 29 **TIMECMP2**: Timer E compare 2
The timer B counter is reset upon timer E compare 2 event.

Bit 28 **TIMECMP1**: Timer E compare 1
The timer B counter is reset upon timer E compare 1 event.

Bit 27 **TIMDCMP4**: Timer D compare 4
The timer B counter is reset upon timer D compare 4 event.

Bit 26 **TIMDCMP2**: Timer D compare 2
The timer B counter is reset upon timer D compare 2 event.

Bit 25 **TIMDCMP1**: Timer D compare 1
The timer B counter is reset upon timer D compare 1 event.

Bit 24 **TIMCCMP4**: Timer C compare 4
The timer B counter is reset upon timer C compare 4 event.

Bit 23 **TIMCCMP2**: Timer C compare 2
The timer B counter is reset upon timer C compare 2 event.

Bit 22 **TIMCCMP1**: Timer C compare 1
The timer B counter is reset upon timer C compare 1 event.

Bit 21 **TIMACMP4**: Timer A compare 4
The timer B counter is reset upon timer A compare 4 event.

Bit 20 **TIMACMP2**: Timer A compare 2
The timer B counter is reset upon timer A compare 2 event.

Bit 19 **TIMACMP1**: Timer A compare 1
The timer B counter is reset upon timer A compare 1 event.

Bit 18 **EXTEVNTJ**: External event J
The timer B counter is reset upon external event J.

Bit 17 **EXTEVNTI**: External event I
The timer B counter is reset upon external event I.

Bit 16 **EXTEVNTH**: External event H
The timer B counter is reset upon external event H.

Bit 15 **EXTEVNTG**: External event G
The timer B counter is reset upon external event G.

Bit 14 **EXTEVNTF**: External event F
The timer B counter is reset upon external event F.

Bit 13 **EXTEVNTE**: External event E
The timer B counter is reset upon external event E.

Bit 12 **EXTEVNTD**: External event D
The timer B counter is reset upon external event D.

Bit 11 **EXTEVNTC**: External event C
The timer B counter is reset upon external event C.

Bit 10 **EXTEVNTB**: External event B
The timer B counter is reset upon external event B.

Bit 9 **EXTEVNTA**: External event A
The timer B counter is reset upon external event A.

Bit 8 **MSTCMP4**: Master compare 4
The timer B counter is reset upon master timer compare 4 event.

Bit 7 **MSTCMP3**: Master compare 3
The timer B counter is reset upon master timer compare 3 event.

Bit 6 **MSTCMP2**: Master compare 2
The timer B counter is reset upon master timer compare 2 event.

Bit 5 **MSTCMP1**: Master compare 1
The timer B counter is reset upon master timer compare 1 event.

Bit 4 **MSTPER**: Master timer period
The timer B counter is reset upon master timer period event.

Bit 3 **CMP4**: Timer B compare 4 reset
The timer B counter is reset upon timer B compare 4 event.

Bit 2 **CMP2**: Timer B compare 2 reset
The timer B counter is reset upon timer B compare 2 event.

Bit 1 **UPDT**: Timer B update reset
The timer B counter is reset upon update event.

Bit 0 **TIMFCMP1**: Timer F compare 1
The timer B counter is reset upon timer F compare 1 event.

33.5.35 HRTIM timer C reset register (HRTIM_RSTCR)

Address offset: 0x354

Reset value: 0x0000 0000

Bit 31 **TIMFCMP2**: Timer F compare 2
The timer C counter is reset upon timer F Compare 2 event.

Bit 30 **TIMECMP4**: Timer E compare 4
The timer C counter is reset upon timer E compare 4 event.

Bit 29 **TIMECMP2**: Timer E compare 2
The timer C counter is reset upon timer E compare 2 event.

Bit 28 **TIMECMP1**: Timer E compare 1
The timer C counter is reset upon timer E compare 1 event.

Bit 27 **TIMDCMP4**: Timer D compare 4
The timer C counter is reset upon timer D compare 4 event.

Bit 26 **TIMDCMP2**: Timer D compare 2
The timer C counter is reset upon timer D compare 2 event.

Bit 25 **TIMDCMP1**: Timer D compare 1
The timer C counter is reset upon timer D compare 1 event.

Bit 24 **TIMBCMP4**: Timer B compare 4
The timer C counter is reset upon timer B compare 4 event.

Bit 23 **TIMBCMP2**: Timer B compare 2
The timer C counter is reset upon timer B compare 2 event.

Bit 22 **TIMBCMP1**: Timer B compare 1
The timer C counter is reset upon timer B compare 1 event.

Bit 21 **TIMACMP4**: Timer A compare 4
The timer C counter is reset upon timer A compare 4 event.

Bit 20 **TIMACMP2**: Timer A compare 2
The timer C counter is reset upon timer A compare 2 event.

Bit 19 **TIMACMP1**: Timer A compare 1
The timer C counter is reset upon timer A compare 1 event.

Bit 18 **EXTEVNTJ**: External event J
The timer C counter is reset upon external event J.

Bit 17 **EXTEVNTI**: External event I
The timer C counter is reset upon external event I.

Bit 16 **EXTEVNTH**: External event H
The timer C counter is reset upon external event H.

Bit 15 **EXTEVNTG**: External event G
The timer C counter is reset upon external event G.

Bit 14 **EXTEVNTF**: External event F
The timer C counter is reset upon external event F.

Bit 13 **EXTEVNTE**: External event E
The timer C counter is reset upon external event E.

Bit 12 **EXTEVNTD**: External event D
The timer Ccounter is reset upon external event D.

Bit 11 **EXTEVNTC**: External event C
The timer C counter is reset upon external event C.

Bit 10 **EXTEVNTB**: External event B
The timer C counter is reset upon external event B.

Bit 9 **EXTEVNTA**: External event A
The timer C counter is reset upon external event A.

Bit 8 **MSTCMP4**: Master compare 4
The timer C counter is reset upon master timer compare 4 event.

Bit 7 **MSTCMP3**: Master compare 3
The timer C counter is reset upon master timer compare 3 event.

Bit 6 **MSTCMP2**: Master compare 2
The timer C counter is reset upon master timer compare 2 event.

Bit 5 **MSTCMP1**: Master compare 1
The timer C counter is reset upon master timer compare 1 event.

Bit 4 **MSTPER**: Master timer period
The timer C counter is reset upon master timer period event.

Bit 3 **CMP4**: Timer C compare 4 reset
The timer C counter is reset upon timer C compare 4 event.

Bit 2 **CMP2**: Timer C compare 2 reset
The timer C counter is reset upon timer C compare 2 event.

Bit 1 **UPDT**: Timer C update reset
The timer C counter is reset upon update event.

Bit 0 **TIMFCMP1**: Timer F compare 1
The timer C counter is reset upon timer F compare 1 event.

33.5.36 HRTIM timer D reset register (HRTIM_RSTDR)

Address offset: 0x454

Bit 31 **TIMFCMP2**: Timer F compare 2
The timer D counter is reset upon timer F Compare 2 event.

Bit 30 **TIMECMP4**: Timer E compare 4
The timer D counter is reset upon timer E compare 4 event.

Bit 29 **TIMECMP2**: Timer E compare 2
The timer D counter is reset upon timer E compare 2 event.

Bit 28 **TIMECMP1**: Timer E compare 1
The timer D counter is reset upon timer E compare 1 event.

Bit 27 **TIMCCMP4**: Timer C compare 4
The timer D counter is reset upon timer C compare 4 event.

Bit 26 **TIMCCMP2**: Timer C compare 2
The timer D counter is reset upon timer C compare 2 event.

Bit 25 **TIMCCMP1**: Timer C compare 1
The timer D counter is reset upon timer C compare 1 event.

Bit 24 **TIMBCMP4**: Timer B compare 4
The timer D counter is reset upon timer B compare 4 event.

Bit 23 **TIMBCMP2**: Timer B compare 2
The timer D counter is reset upon timer B compare 2 event.

Bit 22 **TIMBCMP1**: Timer B compare 1
The timer D counter is reset upon timer B compare 1 event.

Bit 21 **TIMACMP4**: Timer A compare 4
The timer D counter is reset upon timer A compare 4 event.

Bit 20 **TIMACMP2**: Timer A compare 2
The timer D counter is reset upon timer A compare 2 event.

Bit 19 **TIMACMP1**: Timer A compare 1
The timer D counter is reset upon timer A compare 1 event.

Bit 18 **EXTEVNTJ**: External event J
The timer A counter is reset upon external event J.

Bit 17 **EXTEVNTI**: External event I
The timer A counter is reset upon external event I.

Bit 16 **EXTEVNTH**: External event H
The timer A counter is reset upon external event H.

Bit 15 **EXTEVNTG**: External event G
The timer A counter is reset upon external event G.

Bit 14 **EXTEVNTF**: External event F
The timer A counter is reset upon external event F.

Bit 13 **EXTEVNTE**: External event E
The timer A counter is reset upon external event E.

Bit 12 **EXTEVNTD**: External event D
The timer A counter is reset upon external event D.

Bit 11 **EXTEVNTC**: External event C
The timer A counter is reset upon external event C.

Bit 10 **EXTEVNTB**: External event B
The timer A counter is reset upon external event B.

Bit 9 **EXTEVNTA**: External event A
The timer A counter is reset upon external event A.

Bit 8 **MSTCMP4**: Master compare 4
The timer D counter is reset upon master timer compare 4 event.

Bit 7 **MSTCMP3**: Master compare 3
The timer D counter is reset upon master timer compare 3 event.

Bit 6 **MSTCMP2**: Master compare 2
The timer D counter is reset upon master timer compare 2 event.

Bit 5 **MSTCMP1**: Master compare 1
The timer D counter is reset upon master timer compare 1 event.

Bit 4 **MSTPER**: Master timer period
The timer D counter is reset upon master timer period event.

Bit 3 **CMP4**: Timer D compare 4 reset
The timer D counter is reset upon timer D compare 4 event.

Bit 2 **CMP2**: Timer D compare 2 reset
The timer D counter is reset upon timer D compare 2 event.

Bit 1 **UPDT**: Timer D update reset
The timer D counter is reset upon update event.

Bit 0 **TIMFCMP1**: Timer F compare 1
The timer D counter is reset upon timer F compare 1 event.

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **TIMFCMP2**: Timer F compare 2
The timer E counter is reset upon timer F Compare 2 event.

Bit 30 **TIMDCMP4**: Timer D compare 4
The timer E counter is reset upon timer D compare 4 event.

Bit 29 **TIMDCMP2**: Timer D compare 2
The timer E counter is reset upon timer D compare 2 event.

Bit 28 **TIMDCMP1**: Timer D compare 1
The timer E counter is reset upon timer D compare 1 event.

Bit 27 **TIMCCMP4**: Timer C compare 4
The timer E counter is reset upon timer C compare 4 event.

Bit 26 **TIMCCMP2**: Timer C compare 2
The timer E counter is reset upon timer C compare 2 event.

Bit 25 **TIMCCMP1**: Timer C compare 1
The timer E counter is reset upon timer C compare 1 event.

Bit 24 **TIMBCMP4**: Timer B compare 4
The timer E counter is reset upon timer B compare 4 event.

Bit 23 **TIMBCMP2**: Timer B compare 2
The timer E counter is reset upon timer B compare 2 event.

Bit 22 **TIMBCMP1**: Timer B compare 1
The timer E counter is reset upon timer B compare 1 event.

Bit 21 **TIMACMP4**: Timer A compare 4
The timer E counter is reset upon timer A compare 4 event.

Bit 20 **TIMACMP2**: Timer A compare 2
The timer E counter is reset upon timer A compare 2 event.

Bit 19 **TIMACMP1**: Timer A compare 1
The timer E counter is reset upon timer A compare 1 event.

Bit 18 **EXTEVNTJ**: External event J
The timer E counter is reset upon external event J.

Bit 17 **EXTEVNTI**: External event I
The timer E counter is reset upon external event I.

Bit 16 **EXTEVNTH**: External event H
The timer E counter is reset upon external event H.

Bit 15 **EXTEVNTG**: External event G
The timer E counter is reset upon external event G.

Bit 14 **EXTEVNTF**: External event F
The timer E counter is reset upon external event F.

Bit 13 **EXTEVNTE**: External event E
The timer E counter is reset upon external event E.

Bit 12 **EXTEVNTD**: External event D
The timer E counter is reset upon external event D.

Bit 11 **EXTEVNTC**: External event C
The timer E counter is reset upon external event C.

Bit 10 **EXTEVNTB**: External event B
The timer E counter is reset upon external event B.

Bit 9 **EXTEVNTA**: External event A
The timer E counter is reset upon external event A.

Bit 8 **MSTCMP4**: Master compare 4
The timer E counter is reset upon master timer compare 4 event.

Bit 7 **MSTCMP3**: Master compare 3
The timer E counter is reset upon master timer compare 3 event.

Bit 6 **MSTCMP2**: Master compare 2
The timer E counter is reset upon master timer compare 2 event.

Bit 5 **MSTCMP1**: Master compare 1
The timer E counter is reset upon master timer compare 1 event.

Bit 4 **MSTPER**: Master timer period
The timer E counter is reset upon master timer period event.

Bit 3 **CMP4**: Timer E compare 4 reset
The timer E counter is reset upon timer E compare 4 event.

Bit 2 **CMP2**: Timer E compare 2 reset
The timer E counter is reset upon timer E compare 2 event.

Bit 1 **UPDT**: Timer E update reset
The timer E counter is reset upon update event.

Bit 0 **TIMFCMP1**: Timer F compare 1
The timer E counter is reset upon timer F compare 1 event.

33.5.38 HRTIM timer F reset register (HRTIM_RSTFR)

Address offset: 0x654

Reset value: 0x0000 0000

Bit 31 **TIMECMP2**: Timer E compare 2
The timer F counter is reset upon timer E Compare 2 event.

Bit 30 **TIMDCMP4**: Timer D compare 4
The timer F counter is reset upon timer D compare 4 event.

Bit 29 **TIMDCMP2**: Timer D compare 2
The timer F counter is reset upon timer D compare 2 event.

Bit 28 **TIMDCMP1**: Timer D compare 1
The timer F counter is reset upon timer D compare 1 event.

Bit 27 **TIMCCMP4**: Timer C compare 4
The timer F counter is reset upon timer C compare 4 event.

Bit 26 **TIMCCMP2**: Timer C compare 2
The timer F counter is reset upon timer C compare 2 event.

Bit 25 **TIMCCMP1**: Timer C compare 1
The timer F counter is reset upon timer C compare 1 event.

Bit 24 **TIMBCMP4**: Timer B compare 4
The timer F counter is reset upon timer B compare 4 event.

Bit 23 **TIMBCMP2**: Timer B compare 2
The timer F counter is reset upon timer B compare 2 event.

Bit 22 **TIMBCMP1**: Timer B compare 1
The timer F counter is reset upon timer B compare 1 event.

Bit 21 **TIMACMP4**: Timer A compare 4
The timer F counter is reset upon timer A compare 4 event.

Bit 20 **TIMACMP2**: Timer A compare 2
The timer F counter is reset upon timer A compare 2 event.

Bit 19 **TIMACMP1**: Timer A compare 1
The timer F counter is reset upon timer A compare 1 event.

Bit 18 **EXTEVNTJ**: External event J
The timer F counter is reset upon external event J.

Bit 17 **EXTEVNTI**: External event I
The timer F counter is reset upon external event I.

Bit 16 **EXTEVNTH**: External event H
The timer F counter is reset upon external event H.

Bit 15 **EXTEVNTG**: External event G
The timer F counter is reset upon external event G.

Bit 14 **EXTEVNTF**: External event F
The timer F counter is reset upon external event F.

Bit 13 **EXTEVNTE**: External event E
The timer F counter is reset upon external event E.

Bit 12 **EXTEVNTD**: External event D
The timer F counter is reset upon external event D.

Bit 11 **EXTEVNTC**: External event C
The timer F counter is reset upon external event C.

Bit 10 **EXTEVNTB**: External event B
The timer F counter is reset upon external event B.

Bit 9 **EXTEVNTA**: External event A
The timer F counter is reset upon external event A.

Bit 8 **MSTCMP4**: Master compare 4
The timer F counter is reset upon master timer compare 4 event.

Bit 7 **MSTCMP3**: Master compare 3
The timer F counter is reset upon master timer compare 3 event.

Bit 6 **MSTCMP2**: Master compare 2
The timer F counter is reset upon master timer compare 2 event.

Bit 5 **MSTCMP1**: Master compare 1
The timer F counter is reset upon master timer compare 1 event.

Bit 4 **MSTPER**: Master timer period
The timer F counter is reset upon master timer period event.

Bit 3 **CMP4**: Timer F compare 4 reset
The timer F counter is reset upon timer F compare 4 event.

Bit 2 **CMP2**: Timer F compare 2 reset
The timer F counter is reset upon timer F compare 2 event.

Bit 1 **UPDT**: Timer F update reset
The timer F counter is reset upon update event.

Bit 0 **TIMECMP1**: Timer E compare 1
The timer F counter is reset upon timer E compare 1 event.

33.5.39 HRTIM timer x chopper register (HRTIM_CHPxR) (x = A to F)

Address offset: Block A: 0x158

Address offset: Block B: 0x258

Address offset: Block C: 0x358

Address offset: Block D: 0x458

Address offset: Block E: 0x558

Address offset: Block F: 0x658

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	STRTPW[3:0]				CARDTY[2:0]			CARFRQ[3:0]			
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:11 Reserved, must be kept at reset value.

Bits 10:7 **STRTPW[3:0]**: Timer x start pulsewidth

This register defines the initial pulsewidth following a rising edge on output signal.
This bitfield cannot be modified when one of the CHPx bits is set.
t_{1STPW} = (STRPW[3:0]+1) x 16 x t_{HRTIM}.
0000: 31 ns (1/32.5 MHz)
...
1111: 492 ns (16/32.5 MHz)

Bits 6:4 **CARDTY[2:0]**: Timer x chopper duty cycle value

This register defines the duty cycle of the carrier signal. This bitfield cannot be modified when one of the CHPx bits is set.
000: 0/8 (i.e. only 1st pulse is present)
...
111: 7/8

Bits 3:0 **CARFRQ[3:0]**: Timer x carrier frequency value

This register defines the carrier frequency F_{CHPFRQ} = f_{HRTIM} / (16 x (CARFRQ[3:0]+1)).
This bitfield cannot be modified when one of the CHPx bits is set.
0000: 32.5 MHz (f_{HRTIM}/ 16)
...
1111: 2.03 MHz (f_{HRTIM} / 256)

33.5.40 HRTIM timer A capture 1 control register (HRTIM_CPT1ACR)

Address offset: 0x15C

Reset value: 0x0000 0000

Bit 31 **TECMP2**: Timer E compare 2
Refer to TACMP2 description.

Bit 30 **TECMP1**: Timer E compare 1
Refer to TACMP1 description.

Bit 29 **TE1RST**: Timer E output 1 reset
Refer to TA1RST description.

Bit 28 **TE1SET**: Timer E output 1 set
Refer to TA1SET description.

Bit 27 **TDCMP2**: Timer D compare 2
Refer to TACMP2 description.

Bit 26 **TDCMP1**:Timer D compare 1
Refer to TACMP1 description.

Bit 25 **TD1RST**: Timer D output 1 reset
Refer to TA1RST description.

Bit 24 **TD1SET**: Timer D output 1 set
Refer to TA1SET description.

Bit 23 **TCCMP2**: Timer C compare 2
Refer to TACMP2 description.

Bit 22 **TCCMP1**:Timer C compare 1
Refer to TACMP1 description.

Bit 21 **TC1RST**: Timer C output 1 reset
Refer to TA1RST description.

Bit 20 **TC1SET**: Timer C output 1 set
Refer to TA1SET description.

Bit 19 **TBCMP2**: Timer B compare 2
Refer to TACMP2 description.

Bit 18 **TBCMP1**: Timer B compare 1
Refer to TACMP1 description.

Bit 17 **TB1RST**: Timer B output 1 reset
Refer to TA1RST description.

Bit 16 **TB1SET**: Timer B output 1 set
Refer to TA1SET description.

Bit 15 **TFCMP2**: Timer E compare 2
Refer to TACMP2 description.

Bit 14 **TFCMP1**: Timer F compare 1
Refer to TACMP1 description.

Bit 13 **TF1RST**: Timer F output 1 reset
Refer to TA1RST description.

Bit 12 **TF1SET**: Timer F output 1 set
Refer to TA1SET description.

Bit 11 **EXEVJCPT**: External event J capture
Refer to EXEVACPT description

Bit 10 **EXEVICPT**: External event I capture
Refer to EXEVACPT description.

Bit 9 **EXEVHCPT**: External event H capture
Refer to EXEVACPT description.

Bit 8 **EXEVGCPT**: External event G capture
Refer to EXEVACPT description.

Bit 7 **EXEVFCPT**: External event F capture
Refer to EXEVACPT description.

Bit 6 **EXEVECPT**: External event E capture
Refer to EXEVACPT description.

Bit 5 **EXEVDCPT**: External event D capture
Refer to EXEVACPT description.

Bit 4 **EXEVCCPT**: External event C capture
Refer to EXEVACPT description.

Bit 3 **EXEVBCPT**: External event B capture
Refer to EXEVACPT description.

Bit 2 **EXEVACPT**: External event A capture
0: No action
1: The external event A triggers the capture 1

Bit 1 **UPDCPT**: Update capture
0: No action
1: The update event triggers the capture 1

Bit 0 **SWCPT**: Software capture
0: No action
1: This bit forces the capture 1 by software. This bit is set only, reset by hardware.

Refer to TACMP1 description.

Bit 29 **TE1RST**: Timer E output 1 reset
Refer to TA1RST description.

Bit 28 **TE1SET**: Timer E output 1 set
Refer to TA1SET description.

Bit 27 **TDCMP2**: Timer D compare 2
Refer to TACMP2 description.

Bit 26 **TDCMP1**:Timer D compare 1
Refer to TACMP1 description.

Bit 25 **TD1RST**: Timer D output 1 reset
Refer to TA1RST description.

Bit 24 **TD1SET**: Timer D output 1 set
Refer to TA1SET description.

Bit 23 **TCCMP2**: Timer C compare 2
Refer to TACMP2 description.

Bit 22 **TCCMP1**:Timer C compare 1
Refer to TACMP1 description.

Bit 21 **TC1RST**: Timer C output 1 reset
Refer to TA1RST description.

Bit 20 **TC1SET**: Timer C output 1 set
Refer to TA1SET description.

Bit 19 **TFCMP2**: Timer F compare 2
Refer to TACMP2 description.

Bit 18 **TFCMP1**: Timer F compare 1
Refer to TACMP1 description.

Bit 17 **TF1RST**: Timer F output 1 reset
Refer to TA1RST description.

Bit 16 **TF1SET**: Timer F output 1 set
Refer to TA1SET description.

Bit 15 **TACMP2**: Timer A compare 2
0: No action
1: Timer A compare 2 triggers capture 1

Bit 14 **TACMP1**: Timer A compare 1
0: No action
1: Timer A compare 1 triggers capture1

Bit 13 **TA1RST**: Timer B output 1 reset
0: No action
1: Capture 1 is triggered by TA1 output active to inactive transition

Bit 12 **TA1SET**: Timer B output 1 set
0: No action
1: Capture 1 is triggered by TA1 output inactive to active transition

Bit 11 **EXEVJCPT**: External event J capture
Refer to EXEVACPT description

Bit 10 **EXEVICPT**: External event I capture
Refer to EXEVACPT description.

Bit 9 **EXEVHCPT**: External event H capture
Refer to EXEVACPT description.

Bit 8 **EXEVGCPT**: External event G capture
Refer to EXEVACPT description.

Bit 7 **EXEVFCPT**: External event F capture
Refer to EXEVACPT description.

Bit 6 **EXEVECPT**: External event E capture
Refer to EXEVACPT description.

Bit 5 **EXEVDCPT**: External event D capture
Refer to EXEVACPT description.

Bit 4 **EXEVCCPT**: External event C capture
Refer to EXEVACPT description.

Bit 3 **EXEVBCPT**: External event B capture
Refer to EXEVACPT description.

Bit 2 **EXEVACPT**: External event A capture
0: No action
1: The external event A triggers the capture 1

Bit 1 **UPDCPT**: Update capture
0: No action
1: The update event triggers the capture 1

Bit 0 **SWCPT**: Software capture
0: No action
1: This bit forces the capture 1 by software. This bit is set only, reset by hardware.

Bit 31 **TFCMP2**: Timer F compare 2
Refer to TACMP2 description.

Bit 30 **TFCMP1**: Timer F compare 1
Refer to TACMP1 description.

Bit 29 **TF1RST**: Timer F output 1 reset
Refer to TA1RST description.

Bit 28 **TF1SET**: Timer F output 1 set
Refer to TA1SET description.

Bit 27 **TDCMP2**: Timer D compare 2
Refer to TACMP2 description.

Bit 26 **TDCMP1**:Timer D compare 1
Refer to TACMP1 description.

Bit 25 **TD1RST**: Timer D output 1 reset
Refer to TA1RST description.

Bit 24 **TD1SET**: Timer D output 1 set
Refer to TA1SET description.

Bit 23 **TCCMP2**: Timer C compare 2
Refer to TACMP2 description.

Bit 22 **TCCMP1**:Timer C compare 1
Refer to TACMP1 description.

Bit 21 **TC1RST**: Timer C output 1 reset
Refer to TA1RST description.

Bit 20 **TC1SET**: Timer C output 1 set
Refer to TA1SET description.

Bit 19 **TBCMP2**: Timer B compare 2
Refer to TACMP2 description.

Bit 18 **TBCMP1**: Timer B compare 1
Refer to TACMP1 description.

Bit 17 **TB1RST**: Timer B output 1 reset
Refer to TA1RST description.

Bit 16 **TB1SET**: Timer B output 1 set
Refer to TA1SET description.

Bit 15 **TACMP2**: Timer A compare 2
0: No action
1: Timer A compare 2 triggers capture 1

Bit 14 **TACMP1**: Timer A compare 1
0: No action
1: Timer A compare 1 triggers capture 1

Bit 13 **TA1RST**: Timer B output 1 reset
0: No action
1: Capture 1 is triggered by TA1 output active to inactive transition

Bit 12 **TA1SET**: Timer B output 1 set
0: No action
1: Capture 1 is triggered by TA1 output inactive to active transition

Bit 11 **EXEVJCPT**: External event J capture
Refer to EXEVACPT description

Bit 10 **EXEVICPT**: External event I capture
Refer to EXEVACPT description.

Bit 9 **EXEVHCPT**: External event H capture
Refer to EXEVACPT description.

Bit 8 **EXEVGCPT**: External event G capture
Refer to EXEVACPT description.

Bit 7 **EXEVFCPT**: External event F capture
Refer to EXEVACPT description.

Bit 6 **EXEVECPT**: External event E capture
Refer to EXEVACPT description.

Bit 5 **EXEVDCPT**: External event D capture
Refer to EXEVACPT description.

Bit 4 **EXEVCCPT**: External event C capture
Refer to EXEVACPT description.

Bit 3 **EXEVBCPT**: External event B capture
Refer to EXEVACPT description.

Bit 2 **EXEVACPT**: External event A capture
0: No action
1: The external event A triggers the capture 1

Bit 1 **UPDCPT**: Update capture
0: No action
1: The update event triggers the capture 1

Bit 0 **SWCPT**: Software capture
0: No action
1: This bit forces the capture 1 by software. This bit is set only, reset by hardware.

Refer to TACMP2 description.

Bit 30 **TECMP1**: Timer E compare 1
Refer to TACMP1 description.

Bit 29 **TE1RST**: Timer E output 1 reset
Refer to TA1RST description.

Bit 28 **TE1SET**: Timer E output 1 set
Refer to TA1SET description.

Bit 27 **TDCMP2**: Timer D compare 2
Refer to TACMP2 description.

Bit 26 **TDCMP1**:Timer D compare 1
Refer to TACMP1 description.

Bit 25 **TD1RST**: Timer D output 1 reset
Refer to TA1RST description.

Bit 24 **TD1SET**: Timer D output 1 set
Refer to TA1SET description.

Bit 23 **TCCMP2**: Timer C compare 2
Refer to TACMP2 description.

Bit 22 **TCCMP1**:Timer C compare 1
Refer to TACMP1 description.

Bit 21 **TC1RST**: Timer C output 1 reset
Refer to TA1RST description.

Bit 20 **TC1SET**: Timer C output 1 set
Refer to TA1SET description.

Bit 19 **TBCMP2**: Timer B compare 2
Refer to TACMP2 description.

Bit 18 **TBCMP1**: Timer B compare 1
Refer to TACMP1 description.

Bit 17 **TB1RST**: Timer B output 1 reset
Refer to TA1RST description.

Bit 16 **TB1SET**: Timer B output 1 set
Refer to TA1SET description.

Bit 15 **TACMP2**: Timer A compare 2
0: No action
1: Timer A compare 2 triggers capture 1

Bit 14 **TACMP1**: Timer A compare 1
0: No action
1: Timer A compare 1 triggers capture 1

Bit 13 **TA1RST**: Timer B output 1 reset
0: No action
1: Capture 1 is triggered by TA1 output active to inactive transition

Bit 12 **TA1SET**: Timer B output 1 set
0: No action
1: Capture 1 is triggered by TA1 output inactive to active transition

Bit 11 **EXEVJCPT**: External event J capture
Refer to EXEVACPT description

Bit 10 **EXEVICPT**: External event I capture
Refer to EXEVACPT description.

Bit 9 **EXEVHCPT**: External event H capture
Refer to EXEVACPT description.

Bit 8 **EXEVGCPT**: External event G capture
Refer to EXEVACPT description.

Bit 7 **EXEVFCPT**: External event F capture
Refer to EXEVACPT description.

Bit 6 **EXEVECPT**: External event E capture
Refer to EXEVACPT description.

Bit 5 **EXEVDCPT**: External event D capture
Refer to EXEVACPT description.

Bit 4 **EXEVCCPT**: External event C capture
Refer to EXEVACPT description.

Bit 3 **EXEVBCPT**: External event B capture
Refer to EXEVACPT description.

Bit 2 **EXEVACPT**: External event A capture
0: No action
1: The external event A triggers the capture 1

Bit 1 **UPDCPT**: Update capture
0: No action
1: The update event triggers the capture 1

Bit 0 **SWCPT**: Software capture
0: No action
1: This bit forces the capture 1 by software. This bit is set only, reset by hardware.

Bit 16 **TB1SET**: Timer B output 1 set
Refer to TA1SET description.

Bit 15 **TACMP2**: Timer A compare 2
0: No action
1: Timer A compare 2 triggers capture 2

Bit 14 **TACMP1**: Timer A compare 1
0: No action
1: Timer A compare 1 triggers capture 2

Bit 13 **TA1RST**: Timer B output 1 reset
0: No action
1: Capture 2 is triggered by TA1 output active to inactive transition

Bit 12 **TA1SET**: Timer B output 1 set
0: No action
1: Capture 2 is triggered by TA1 output inactive to active transition

Bit 11 **EXEVJCPT**: External event J capture
Refer to EXEVACPT description

Bit 10 **EXEVICPT**: External event I capture
Refer to EXEVACPT description.

Bit 9 **EXEVHCPT**: External event H capture
Refer to EXEVACPT description.

Bit 8 **EXEVGCPT**: External event G capture
Refer to EXEVACPT description.

Bit 7 **EXEVFCPT**: External event F capture
Refer to EXEVACPT description.

Bit 6 **EXEVECPT**: External event E capture
Refer to EXEVACPT description.

Bit 5 **EXEVDCPT**: External event D capture
Refer to EXEVACPT description.

Bit 4 **EXEVCCPT**: External event C capture
Refer to EXEVACPT description.

Bit 3 **EXEVBCPT**: External event B capture
Refer to EXEVACPT description.

Bit 2 **EXEVACPT**: External event A capture
0: No action
1: The external event A triggers the capture 2

Bit 1 **UPDCPT**: Update capture
0: No action
1: The update event triggers the capture 2

Bit 0 **SWCPT**: Software capture
0: No action
1: This bit forces the capture 2 by software. This bit is set only, reset by hardware.

33.5.51 HRTIM timer F capture 2 control register (HRTIM_CPT2FCR)

Address offset: 0x660

Reset value: 0x0000 0000

Bit 31 **TECMP2**: Timer E compare 2
Refer to TACMP2 description.

Bit 30 **TECMP1**: Timer E compare 1
Refer to TACMP1 description.

Bit 29 **TE1RST**: Timer E output 1 reset
Refer to TA1RST description.

Bit 28 **TE1SET**: Timer E output 1 set
Refer to TA1SET description.

Bit 27 **TDCMP2**: Timer D compare 2
Refer to TACMP2 description.

Bit 26 **TDCMP1**:Timer D compare 1
Refer to TACMP1 description.

Bit 25 **TD1RST**: Timer D output 1 reset
Refer to TA1RST description.

Bit 24 **TD1SET**: Timer D output 1 set
Refer to TA1SET description.

Bit 23 **TCCMP2**: Timer C compare 2
Refer to TACMP2 description.

Bit 22 **TCCMP1**:Timer C compare 1
Refer to TACMP1 description.

Bit 21 **TC1RST**: Timer C output 1 reset
Refer to TA1RST description.

Bit 20 **TC1SET**: Timer C output 1 set
Refer to TA1SET description.

Bit 19 **TBCMP2**: Timer B compare 2
Refer to TACMP2 description.

Bit 18 **TBCMP1**: Timer B compare 1
Refer to TACMP1 description.

Bit 17 **TB1RST**: Timer B output 1 reset
Refer to TA1RST description.

Bit 16 **TB1SET**: Timer B output 1 set
Refer to TA1SET description.

Bit 15 **TACMP2**: Timer A compare 2
0: No action
1: Timer A compare 2 triggers capture 2

Bit 14 **TACMP1**: Timer A compare 1
0: No action
1: Timer A compare 1 triggers capture 2

Bit 13 **TA1RST**: Timer B output 1 reset
0: No action
1: Capture 2 is triggered by TA1 output active to inactive transition

Bit 12 **TA1SET**: Timer B output 1 set
0: No action
1: Capture 2 is triggered by TA1 output inactive to active transition

Bit 11 **EXEVJCPT**: External event J capture
Refer to EXEVACPT description

Bit 10 **EXEVICPT**: External event I capture
Refer to EXEVACPT description.

Bit 9 **EXEVHCPT**: External event H capture
Refer to EXEVACPT description.

Bit 8 **EXEVGCPT**: External event G capture
Refer to EXEVACPT description.

Bit 7 **EXEVFCPT**: External event F capture
Refer to EXEVACPT description.

Bit 6 **EXEVECPT**: External event E capture
Refer to EXEVACPT description.

Bit 5 **EXEVDCPT**: External event D capture
Refer to EXEVACPT description.

Bit 4 **EXEVCCPT**: External event C capture
Refer to EXEVACPT description.

Bit 3 **EXEVBCPT**: External event B capture
Refer to EXEVACPT description.

Bit 2 **EXEVACPT**: External event A capture
0: No action
1: The external event A triggers the capture 2

Bit 1 **UPDCPT**: Update capture
0: No action
1: The update event triggers the capture 2

Bit 0 **SWCPT**: Software capture
0: No action
1: This bit forces the capture 2 by software. This bit is set only, reset by hardware.

33.5.52 HRTIM timer x output register (HRTIM_OUTxR) (x = A to F)

Address offset: Block A: 0x164

Address offset: Block B: 0x264

Address offset: Block C: 0x364

Address offset: Block D: 0x464

Address offset: Block E: 0x564

Address offset: Block F: 0x664

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DIDL2	CHP2	FAULT2[1:0]		IDLES2	IDLEM 2	POL2	Res.
								rw	rw	rw	rw	rw	rw	rw	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	BIAR	Res.	DLYPRT[2:0]			DLYPR TEN	DTEN	DIDL1	CHP1	FAULT1[1:0]		IDLES1	IDLEM 1	POL1	Res.
	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **DIDL2**: Output 2 deadtime upon burst mode Idle entry

This bit delays the idle mode entry by forcing a deadtime insertion before switching the outputs to their idle state. This setting only applies when entering in idle state during a burst mode operation.

0: The programmed Idle state is applied immediately to the output 2

1: Deadtime (inactive level) is inserted on output 2 before entering the idle mode. The deadtime value is set by DTFx[8:0].

Note: This parameter cannot be changed once the timer x is enabled.

DIDL=1 is set only if one of the outputs is active during the burst mode (IDLES=1), and with positive deadtimes (SDTR/SDTF set to 0).

Bit 22 **CHP2**: Output 2 chopper enable

This bit enables the chopper on output 2.

0: Output signal is not altered

1: Output signal is chopped by a carrier signal

Note: This parameter cannot be changed once the timer x is enabled.

Bits 21:20 **FAULT2[1:0]**: Output 2 fault state

These bits select the output 2 state after a fault event.

00: No action: the output is not affected by the fault input and stays in run mode.

01: Active

10: Inactive

11: High-Z

Note: This parameter cannot be changed once the timer x is enabled (TxCEN bit set), if FLTENx bit is set or if the output is in FAULT state.

Bit 19 **IDLES2**: Output 2 idle state

This bit selects the output 2 idle state.

0: Inactive

1: Active

Note: This parameter must be set prior to have the HRTIM controlling the outputs.

Bit 18 **IDLEM2**: Output 2 idle mode
This bit selects the output 2 idle mode.
0: No action: the output is not affected by the burst mode operation.
1: The output is in idle state when requested by the burst mode controller.
Note: This bit is preloaded and is changed during run-time, but must not be changed while the burst mode is active.

Bit 17 **POL2**: Output 2 polarity
This bit selects the output 2 polarity.
0: Positive polarity (output active high)
1: Negative polarity (output active low)
Note: This parameter cannot be changed once the timer x is enabled.

Bits 16:15 Reserved, must be kept at reset value.

Bit 14 **BIAR**: Balanced Idle Automatic Resume
This bit selects is the outputs are automatically re-enabled after a balanced idle event.
This bit is only significant if DLYPRT[2:0] = 011 or 111, it is ignored otherwise.
0: Disabled
1: Enabled
Note: This parameter cannot be changed once the timer x is enabled.

Bit 13 Reserved, must be kept at reset value.

Bits 12:10 **DLYPRT[2:0]**: Delayed protection
These bits define the source and outputs on which the delayed protection schemes are applied.
In HRTIM_OUTAR, HRTIM_OUTBR, HRTIM_OUTCR:
000: Output 1 delayed idle on external event F
001: Output 2 delayed idle on external event F
010: Output 1 and output 2 delayed idle on external event F
011: Balanced idle on external event F
100: Output 1 delayed idle on external event G
101: Output 2 delayed idle on external event G
110: Output 1 and output 2 delayed idle on external event G
111: Balanced idle on external event G
In HRTIM_OUTDR, HRTIM_OUTER, HRTIM_OUTFR:
000: Output 1 delayed idle on external event H
001: Output 2 delayed idle on external event H
010: Output 1 and output 2 delayed idle on external event H
011: Balanced idle on external event H
100: Output 1 delayed idle on external event I
101: Output 2 delayed idle on external event I
110: Output 1 and output 2 delayed idle on external event I
111: Balanced idle on external event I
Note: This bitfield must not be modified once the delayed protection is enabled (DLYPRTEN bit set).

Bit 9 **DLYPRTEN**: Delayed protection enable
This bit enables the delayed protection scheme.
0: No action
1: Delayed protection is enabled, as per DLYPRT[2:0] bits
Note: This parameter cannot be changed once the timer x is enabled (TxEN bit set).

Bit 8 **DTEN**: Deadtime enable

This bit enables the deadtime insertion on output 1 and output 2.

0: Output 1 and output 2 signals are independent.

1: Deadtime is inserted between output 1 and output 2 (reference signal is output 1 signal generator)

Note: This parameter cannot be changed if the timer outputs are enabled and set/reset by another timer.

Bit 7 **DIDL1**: Output 1 deadtime upon burst mode idle entry

This bit delays the idle mode entry by forcing a deadtime insertion before switching the outputs to their idle state. This setting only applies when entering the idle state during a burst mode operation.

0: The programmed idle state is applied immediately to the output 1

1: Deadtime (inactive level) is inserted on output 1 before entering the idle mode. The deadtime value is set by DTRx[8:0].

Note: This parameter cannot be changed once the timer x is enabled.

DIDL=1 is set only if one of the outputs is active during the burst mode (IDLES=1), and with positive deadtimes (SDTR/SDTF set to 0).

Bit 6 **CHP1**: Output 1 chopper enable

This bit enables the chopper on output 1.

0: Output signal is not altered

1: Output signal is chopped by a carrier signal

Note: This parameter cannot be changed once the timer x is enabled.

Bits 5:4 **FAULT1[1:0]**: Output 1 fault state

These bits select the output 1 state after a fault event

00: No action: the output is not affected by the fault input and stays in run mode.

01: Active

10: Inactive

11: High-Z

Note: This parameter cannot be changed once the timer x is enabled (TxCEN bit set), if FLTENx bit is set or if the output is in FAULT state.

Bit 3 **IDLES1**: Output 1 Idle State

This bit selects the output 1 idle state.

0: Inactive

1: Active

Note: This parameter must be set prior to HRTIM controlling the outputs.

Bit 2 **IDLEM1**: Output 1 Idle mode

This bit selects the output 1 idle mode.

0: No action: the output is not affected by the burst mode operation.

1: The output is in idle state when requested by the burst mode controller.

Note: This bit is preloaded and is changed during runtime, but must not be changed while burst mode is active.

Bit 1 **POL1**: Output 1 polarity

This bit selects the output 1 polarity.

0: Positive polarity (output active high)

1: Negative polarity (output active low)

Note: This parameter cannot be changed once the timer x is enabled.

Bit 0 Reserved, must be kept at reset value.

33.5.53 HRTIM timer x fault register (HRTIM_FLTxR) (x = A to F)

Address offset: Block A: 0x168

Address offset: Block B: 0x268

Address offset: Block C: 0x368

Address offset: Block D: 0x468

Address offset: Block E: 0x568

Address offset: Block F: 0x668

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FLTLCK	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FLT7A8EN	FLT6A7EN	FLT5A6EN	FLT4A5EN	FLT3A4EN	FLT2A3EN	FLT1A2EN

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	FLT8EN	FLT7EN	FLT6EN	FLT5EN	FLT4EN	FLT3EN	FLT2EN	FLT1EN
								rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **FLTLCK**: Fault sources lock
0: FLT1EN..FLT6EN bits are read/write
1: FLT1EN..FLT6EN bits are read only
The FLTLCK bit is write-once. Once it has been set, it cannot be modified till the next system reset.

Bits 30:23 Reserved, must be kept at reset value.

Bit 22 **FLT7A8EN**: Fault 7 AND Fault 8 enable
0: Fault 7 AND Fault 8 ignored
1: HRTIM outputs disabled when both Fault 7 AND Fault 8 inputs are active

Bit 21 **FLT6A7EN**: Fault 6 AND Fault 7 enable
0: Fault 6 AND Fault 7 ignored
1: HRTIM outputs disabled when both Fault 6 AND Fault 7 inputs are active

Bit 20 **FLT5A6EN**: Fault 5 AND Fault 6 enable
0: Fault 5 AND Fault 6 ignored
1: HRTIM outputs disabled when both Fault 5 AND Fault 6 inputs are active

Bit 19 **FLT4A5EN**: Fault 4 AND Fault 5 enable
0: Fault 4 AND Fault 5 ignored
1: HRTIM outputs disabled when both Fault 4 AND Fault 5 inputs are active

Bit 18 **FLT3A4EN**: Fault 3 AND Fault 4 enable
0: Fault 3 AND Fault 4 ignored
1: HRTIM outputs disabled when both Fault 3 AND Fault 4 inputs are active

Bit 17 **FLT2A3EN**: Fault 2 AND Fault 3 enable
0: Fault 2 AND Fault 3 ignored
1: HRTIM outputs disabled when both Fault 2 AND Fault 3 inputs are active

Bit 16 **FLT1A2EN**: Fault 1 AND Fault 2 enable
0: Fault 1 AND Fault 2 ignored
1: HRTIM outputs disabled when both Fault 1 AND Fault 2 inputs are active

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **FLT8EN**: Fault 8 enable
0: Fault 8 input ignored
1: Fault 8 input is active and disables HRTIM outputs

Bit 6 **FLT7EN**: Fault 7 enable
0: Fault 7 input ignored
1: Fault 7 input is active and disables HRTIM outputs

Bit 5 **FLT6EN**: Fault 6 enable
0: Fault 6 input ignored
1: Fault 6 input is active and disables HRTIM outputs

Bit 4 **FLT5EN**: Fault 5 enable
0: Fault 5 input ignored
1: Fault 5 input is active and disables HRTIM outputs

Bit 3 **FLT4EN**: Fault 4 enable
0: Fault 4 input ignored
1: Fault 4 input is active and disables HRTIM outputs

Bit 2 **FLT3EN**: Fault 3 enable
0: Fault 3 input ignored
1: Fault 3 input is active and disables HRTIM outputs

Bit 1 **FLT2EN**: Fault 2 enable
0: Fault 2 input ignored
1: Fault 2 input is active and disables HRTIM outputs

Bit 0 **FLT1EN**: Fault 1 enable
0: Fault 1 input ignored
1: Fault 1 input is active and disables HRTIM outputs

33.5.54 HRTIM timer x control register 2 (HRTIM_TIMxCR2) (x = A to F)

Address offset: Block A: 0x16C

Address offset: Block B: 0x26C

Address offset: Block C: 0x36C

Address offset: Block D: 0x46C

Address offset: Block E: 0x56C

Address offset: Block F: 0x66C

Reset value: 0x0000 0000

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw		rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bit 27 **DCDCOE**: Dual channel DAC crossbar override enable

0: Dual Channel DAC Crossbar Override disabled

1: Dual Channel DAC Crossbar Override enabled

Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 26 **COM**: Crossbar override mode

This bit defines if the crossbar override mode is entered only once (latched mode), in which case it is necessary to rearm it to resume standard crossbar operation, using the COR bit.

In cycle-by-cycle mode, the standard crossbar operation is automatically resumed on the next following reset/roll-over event, once the triggering condition have disappeared. This mode is only applicable in force on event mode (COFMx[2:0] = 100).

0: Cycle-by-cycle mode

1: latched mode

Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 25 **COR**: Crossbar override rearm

This bit is set by software and automatically reset by hardware. It resume standard crossbar operation and rearms the crossbar override mode. The rearm operation is only effective if the crossbar override triggering condition have disappeared. If the trigger is still active, the rearm request is ignored and the crossbar override mode is maintained active.

Bit 24 **COE**: Crossbar override enable

0: Crossbar override disabled

1: Crossbar override enabled

Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 23 **ADCTRGCH2**: ADC trigger for channel 2

This bit is significant only in push-pull mode. It gives the possibility to have ADC triggers issued only when Channel 2 output is active

0: ADC triggers generated for both Channel 1 and Channel 2 active phases

1: ADC triggers generated when Channel 2 is active (in push-pull mode)

Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 22 **ADCTRGCH1**: ADC trigger for channel 1

This bit is significant only in push-pull mode. It gives the possibility to have ADC triggers issued only when Channel 1 output is active

0: ADC triggers generated for both Channel 1 and Channel 2 active phases

1: ADC triggers generated when Channel 1 is active (in push-pull mode)

Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 21 **TRGHLFT**: Triggered-half timeout mode

This bit defines if a timeout event must be generated when the synchronization disappear (i.e. no more EEV event

0: No timeout event generated

1: timeout event generated. When the counter matches the PER value, the CMP2 register takes PER/2 value.

Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 20 **TRGHLF**: Triggered-half mode

This bit defines whether the compare 2 register is behaving in standard mode (compare match issued as soon as counter equal compare), or in triggered-half mode (see *Section : Triggered-half mode*).

0: CMP2 register is written by the user only (standard compare mode)

1: CMP2 value is set by hardware as soon as a capture 1 event occurs. It is loaded with the (capture 1 divided by 2) value. The initial value can be written by the user (as long as TRGHLF is reset), but is ignored once the first capture has been triggered (the preload mechanism is disabled for CMP2 when the TRGHLF bit is set).

Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **GTCMP3**: Greater than compare 3 PWM mode

This bit defines the compare 3 operating mode.

0: The compare 3 event is generated when the counter is equal to the compare value (compare match mode)

1: The compare 3 event is generated when the counter is greater than the compare value. If the compare value is changed on-the-fly, the new compare value is compared with the current counter value and an output SET or RESET can be generated.

Bit 16 **GTCMP1**: Greater than compare 1 PWM mode

This bit defines the compare 1 operating mode.

0: The compare 1 event is generated when the counter is equal to the compare value (compare match mode)

1: The compare 1 event is generated when the counter is greater than the compare value. If the compare value is changed on-the-fly, the new compare value is compared with the current counter value and an output SET or RESET can be generated.

Bits 15:14 **FEROM[1:0]**: Fault and event roll-over mode

This bit defines when the roll-over is generated, in up-down counting mode. It only concerns the Roll-over event used by the fault and event counters.

00: Event generated when the counter is equal to 0 or to HRTIM_PERxR value

01: Event generated when the counter is equal to 0

10: Event generated when the counter is equal to HRTIM_PERxR

11: Reserved

Note: This setting only applies when the UDM bit is set. It is not significant otherwise.

Note: This bitfield cannot be changed once the timer is operating (TxEN bit set).

Bits 13:12 **BMROM[1:0]**: Burst mode roll-over mode

This bit defines when the roll-over is generated, in up-down counting mode. It only concerns the roll-over event used in the burst mode controller, as clock as burst mode trigger.

00: Event generated when the counter is equal to 0 or to HRTIM_PERxR value

01: Event generated when the counter is equal to 0

10: Event generated when the counter is equal to HRTIM_PERxR

11: Reserved

Note: This setting only applies when the UDM bit is set. It is not significant otherwise.

Note: This parameter cannot be changed once the timer is operating (TxEN bit set).

Bits 11:10 **ADROM[1:0]**: ADC roll-over mode

This bit defines when the roll-over is generated, in up-down counting mode. It only concerns the roll-over event which triggers the ADC.

00: Event generated when the counter is equal to 0 or to HRTIM_PERxR value

01: Event generated when the counter is equal to 0

10: Event generated when the counter is equal to HRTIM_PERxR

11: Reserved

Note: This setting only applies when the UDM bit is set. It is not significant otherwise.

Note: This bitfield cannot be changed once the timer is operating (TxEN bit set).

Bits 9:8 **OUTROM[1:0]**: Output roll-over mode

This bit defines when the roll-over is generated, in up-down counting mode. It only concerns the roll-over event which sets and/or resets the ouputs, as per HRTIM_SETxyR and HRTIM_RSTxyR settings.

00: Event generated when the counter is equal to 0 or to HRTIM_PERxR value

01: Event generated when the counter is equal to 0

10: Event generated when the counter is equal to HRTIM_PERxR

11: Reserved

Note: This setting only applies when the UDM bit is set. It is not significant otherwise.

Note: This bitfield cannot be changed once the timer is operating (TxEN bit set).

Bits 7:6 **ROM[1:0]**: Roll-over mode

This bit defines when the roll-over is generated, in up-down counting mode. It only concerns the roll-over event with the following destinations: update trigger (to transfer content from preload to active registers), IRQ and DMA requests, repetition counter decrement and external event filtering.

00: Event generated when the counter is equal to 0 or to HRTIM_PERxR value

01: Event generated when the counter is equal to 0

10: Event generated when the counter is equal to HRTIM_PERxR

11: Reserved

Note: This setting only applies when the UDM bit is set. It is not significant otherwise.

Note: This bitfield cannot be changed once the timer is operating (TxEN bit set).

Bit 5 Reserved, must be kept at reset value.

Bit 4 **UDM**: Up-Down mode
This bit defines if the counter is operating in up or up-down counting mode.
0: The counter is operating in up-counting mode
1: The counter is operating in up-down counting mode
Note: This bit cannot be changed once the timer is operating (TxEN bit set).

Bit 3 Reserved, must be kept at reset value.

Bit 2 **DCDR**: Dual channel DAC reset trigger
This bit defines when the hrtim_dac_reset_trgx trigger is generated.
0: The trigger is generated on counter reset or roll-over event
1: The trigger is generated on output 1 set event
Note: The DCDR bit is not significant when the DCDE bit is reset (Dual channel DAC trigger disabled).

Bit 1 **DCDS**: Dual channel DAC Step trigger
This bit defines when the hrtim_dac_step_trgx trigger is generated.
0: The trigger is generated on compare 2 event
1: The trigger is generated on output 1 reset event
Note: The DCDR bit is not significant when the DCDE bit is reset (Dual channel DAC trigger disabled).

Bit 0 **DCDE**: Dual channel DAC trigger enable
This bit enables the dual channel DAC triggering mechanism.
0: Dual channel DAC trigger disabled
1: Dual channel DAC trigger enabled
Note: This bit cannot be changed once the timer is operating (TxEN bit set).

33.5.55 HRTIM timer x external event filtering register 3 (HRTIM_TIMxEEFR3) (x = A to F)

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:24 **EEVZCNT[5:0]**: External event Z counter

This bitfield selects the external event Z counter threshold. An event is considered valid when the number of events is equal to the (EEVZCNT[5:0]+1) value.

Bits 23:20 **EEVZSEL[3:0]**: External event Z selection

This bit selects the external event B source.

0: External event A is used as external event Z source

1: External event B is used as external event Z source

...

9: External event J is used as external event Z source

Others: Reserved

Bit 19 Reserved, must be kept at reset value.

Bit 18 **EEVZRSTM**: External event Z reset mode

This bit selects the external event Z counter reset mode

0: External event counter Z is reset on each reset / roll-over event

1: External event counter Z is reset on each reset / roll-over event only if no event occurs during last counting period

Bit 17 **EEVZCRES**: External event Z counter reset

This bit resets the external event Z counter. It is set by software and reset by hardware.

0: No action

1: External event counter Z counter is reset

Bit 16 **EEVZCE**: External event Z counter enable

This bit enables the external event Z counter.

0: External event Z counter disabled

1: External event Z counter enabled

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:8 **EEVYCNT[5:0]**: External event Y counter
This bitfield selects the external event Y counter threshold. An event is considered valid when the number of events is equal to the (EEVYCNT[5:0]+1) value.

Bits 7:4 **EEVYSEL[3:0]**: External event Y Selection
This bit selects the external event Y source.
0: External event A is used as external event Y source
1: External event B is used as external event Y source
...
9: External event J is used as external event Y source
Others: Reserved

Bit 3 Reserved, must be kept at reset value.

Bit 2 **EEVYRSTM**: External event Y reset mode
This bit selects the external event Y counter reset mode.
0: External event counter Y is reset on each reset / roll-over event
1: External event counter Y is reset on each reset / roll-over event only if no event occurs during last counting period

Bit 1 **EEVYCRES**: External event Y counter reset
This bit resets the external event Y counter. It is set by software and reset by hardware.
0: No action
1: External event counter Y is reset

Bit 0 **EEVYCE**: External event Y counter enable
This bit enables the external event Y counter.
0: External event Y counter disabled
1: External event Y counter enabled

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:28 **EEVJSEL[1:0]**: External event J selection
00: EEVJ is connected to EEV10
01: EEVJ is connected to EEV14
10: EEVJ is connected to (EEV10 AND EEV11)
11: EEVJ is connected to (EEV10 AND EEV14)
Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 27 Reserved, must be kept at reset value.

Bits 26:25 **EEVISEL[1:0]**: External event I selection
00: EEVI is connected to EEV9
01: EEVI is connected to EEV13
10: EEVI is connected to (EEV9 AND EEV10)
11: EEVI is connected to (EEV9 AND EEV13)
Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 24 Reserved, must be kept at reset value.

Bits 23:22 **EEVHSEL[1:0]**: External event H selection
00: EEVH is connected to EEV8
01: EEVH is connected to EEV12
10: EEVH is connected to (EEV8 AND EEV9)
11: EEVH is connected to (EEV8 AND EEV12)
Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 21 Reserved, must be kept at reset value.

Bits 20:19 **EEVGSEL[1:0]**: External event G selection
00: EEVG is connected to EEV7
01: EEVG is connected to EEV11
10: EEVG is connected to (EEV7 AND EEV8)
11: EEVG is connected to (EEV7 AND EEV11)
Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 18 Reserved, must be kept at reset value.

Bits 17:16 **EEVFSEL[1:0]**: External event F selection
00: EEVF is connected to EEV6
01: EEVF is connected to EEV16
10: EEVF is connected to (EEV6 AND EEV7)
11: EEVF is connected to (EEV6 AND EEV16)
Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bits 15:14 Reserved, must be kept at reset value.

Bits 13:12 **EEVESEL[1:0]**: External event E selection
00: EEVE is connected to EEV5
01: EEVE is connected to EEV15
10: EEVE is connected to (EEV5 AND EEV6)
11: EEVE is connected to (EEV5 AND EEV15)
Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 11 Reserved, must be kept at reset value.

Bits 10:9 **EEVDSEL[1:0]**: External event D selection
00: EEVD is connected to EEV4
01: EEVD is connected to EEV14
10: EEVD is connected to (EEV4 AND EEV5)
11: EEVD is connected to (EEV4 AND EEV14)
Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 8 Reserved, must be kept at reset value.

Bits 7:6 **EEVCSEL[1:0]**: External event C selection
00: EEVC is connected to EEV3
01: EEVC is connected to EEV13
10: EEVC is connected to (EEV3 AND EEV4)
11: EEVC is connected to (EEV3 AND EEV13)
Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 5 Reserved, must be kept at reset value.

Bits 4:3 **EEVBSEL[1:0]**: External event B selection
00: EEVB is connected to EEV2
01: EEVB is connected to EEV12
10: EEVB is connected to (EEV2 AND EEV3)
11: EEVB is connected to (EEV2 AND EEV12)
Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 2 Reserved, must be kept at reset value.

Bits 1:0 **EEVASEL[1:0]**: External event A selection
00: EEVA is connected to EEV1
01: EEVA is connected to EEV11
10: EEVA is connected to (EEV1 AND EEV2)
11: EEVA is connected to (EEV1 AND EEV11)
Note: This bitfield must not be modified once the counter is enabled (TxCEN bit set).

Bit 15 Reserved, must be kept at reset value.

Bit 14 **RTFUDIS**: Remote Timer F update disable
Refer to RTAUDIS description.

Bit 13 **RTEUDIS**: Remote Timer E update disable
Refer to RTAUDIS description

Bit 12 **RTDUDIS**: Remote Timer D update disable
Refer to RTAUDIS description.

Bit 11 **RTCUDIS**: Remote Timer C update disable
Refer to RTAUDIS description.

Bit 10 **RTBUDIS**: Remote Timer B update disable
Refer to RTAUDIS description.

Bit 9 **RTAUDIS**: Remote timer A update disable

This bit is set and cleared by software to enable/disable an update event generation temporarily in another HRTIMER's timer A.

0: Update enabled. The update occurs upon generation of the selected source.

1: Update disabled. The updates are temporarily disabled to allow the software to write multiple registers that have to be simultaneously taken into account.

Bit 8 **RMUDIS**: Remote master update disable

This bit is set and cleared by software to enable/disable an update event generation temporarily in another HRTIMER's master timer

0: Update enabled.

1: Update disabled. The updates are temporarily disabled to allow the software to write multiple registers that have to be simultaneously taken into account.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **TFUDIS**: Timer F update disable

Refer to TAUDIS description.

Bit 5 **TEUDIS**: Timer E update disable

Refer to TAUDIS description

Bit 4 **TDUDIS**: Timer D update disable

Refer to TAUDIS description.

Bit 3 **TCUDIS**: Timer C update disable

Refer to TAUDIS description.

Bit 2 **TBUDIS**: Timer B update disable

Refer to TAUDIS description.

Bit 1 **TAUDIS**: Timer A update disable

This bit is set and cleared by software to enable/disable an update event generation temporarily on timer A.

0: Update enabled. The update occurs upon generation of the selected source.

1: Update disabled. The updates are temporarily disabled to allow the software to write multiple registers that have to be simultaneously taken into account.

Bit 0 **MUDIS**: Master update disable

This bit is set and cleared by software to enable/disable an update event generation temporarily.

0: Update enabled.

1: Update disabled. The updates are temporarily disabled to allow the software to write multiple registers that have to be simultaneously taken into account.

111:Timer F

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **SWPF**: Swap timer F outputs

Refer to SWPA description.

Note: This bit is not significant when the Push-pull mode is enabled (PSHPLL = 1).

Bit 20 **SWPE**: Swap timer E outputs

Refer to SWPA description.

Note: This bit is not significant when the Push-pull mode is enabled (PSHPLL = 1).

Bit 19 **SWPD**: Swap timer D outputs

Refer to SWPA description.

Note: This bit is not significant when the Push-pull mode is enabled (PSHPLL = 1).

Bit 18 **SWPC**: Swap timer C outputs

Refer to SWPA description.

Note: This bit is not significant when the Push-pull mode is enabled (PSHPLL = 1).

Bit 17 **SWPB**: Swap timer B outputs

Refer to SWPA description.

Note: This bit is not significant when the Push-pull mode is enabled (PSHPLL = 1).

Bit 16 **SWPA**: Swap timer A outputs
This bit allows to swap the timer A outputs.
0: HRTIM_SETA1R and HRTIM_RSTA1R are coding for the output A1, HRTIM_SETA2R and HRTIM_RSTA2R are coding for the output A2
1: HRTIM_SETA1R and HRTIM_RSTA1R are coding for the output A2, HRTIM_SETA2R and HRTIM_RSTA2R are coding for the output A1
Note: This bit is not significant when the Push-pull mode is enabled (PSHPLL = 1).

Bit 15 Reserved, must be kept at reset value.

Bit 14 **TFRST**: Timer F counter software reset
Refer to TARST description.

Bit 13 **TERST**: Timer E counter software reset
Refer to TARST description.

Bit 12 **TDRST**: Timer D counter software reset
Refer to TARST description.

Bit 11 **TCRST**: Timer C counter software reset
Refer to TARST description.

Bit 10 **TBRST**: Timer B counter software reset
Refer to TARST description.

Bit 9 **TARST**: Timer A counter software reset
Setting this bit resets the timer A counter.
The bit is automatically reset by hardware.

Bit 8 **MRST**: Master counter software reset
Setting this bit resets the master timer counter.
The bit is automatically reset by hardware.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **TFSWU**: Timer F software update
Refer to TASWU description.

Bit 5 **TESWU**: Timer E software update
Refer to TASWU description.

Bit 4 **TDSWU**: Timer D software update
Refer to TASWU description.

Bit 3 **TCSWU**: Timer C software update
Refer to TASWU description.

Bit 2 **TBSWU**: Timer B software update
Refer to TASWU description.

Bit 1 **TASWU**: Timer A software update
This bit is set by software and automatically reset by hardware. It forces an immediate transfer from the preload to the active register and any pending update request is canceled.

Bit 0 **MSWU**: Master timer software update
This bit is set by software and automatically reset by hardware. It forces an immediate transfer from the preload to the active register in the master timer and any pending update request is canceled.

33.5.62 HRTIM interrupt status register (HRTIM_ISR)

Address offset: 0x708

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BMPER	Res.
														r	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

							r	r	r	r	r	r	r	r	r

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **BMPER**: Burst mode period interrupt flag
This bit is set by hardware when a single-shot burst mode operation is completed or at the end of a burst mode period in continuous mode. It is cleared by software writing it at 1.
0: No burst mode period interrupt occurred
1: Burst mode period interrupt occurred

Bits 16:9 Reserved, must be kept at reset value.

Bit 8 **FLT8**: Fault 8 interrupt flag
Refer to FLT1 description.

Bit 7 **FLT7**: Fault 7 interrupt flag
Refer to FLT1 description.

Bit 6 **FLT6**: Fault 6 interrupt flag
Refer to FLT1 description.

Bit 5 **SYSFLT**: System fault interrupt flag
Refer to FLT1 description.

Bit 4 **FLT5**: Fault 5 interrupt flag
Refer to FLT1 description.

Bit 3 **FLT4**: Fault 4 interrupt flag
Refer to FLT1 description.

Bit 2 **FLT3**: Fault 3 interrupt flag
Refer to FLT1 description.

Bit 1 **FLT2**: Fault 2 interrupt flag
Refer to FLT1 description.

Bit 0 **FLT1**: Fault 1 interrupt flag
This bit is set by hardware when fault 1 event occurs. It is cleared by software writing it at 1.
0: No fault 1 interrupt occurred
1: Fault 1 interrupt occurred

33.5.63 HRTIM interrupt clear register (HRTIM_ICR)

Address offset: 0x70C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BMPERC	Res.
														w	
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	FLT8C	FLT7C	FLT6C	SYSFLTC	FLT5C	FLT4C	FLT3C	FLT2C	FLT1C
							w	w	w	w	w	w	w	w	w

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **BMPERC**: Burst mode period flag clear
Writing 1 to this bit clears the BMPER flag in HRTIM_ISR register.

Bits 16:9 Reserved, must be kept at reset value.

Bit 8 **FLT8C**: Fault 8 interrupt flag clear
Writing 1 to this bit clears the FLT6 flag in HRTIM_ISR register.

Bit 7 **FLT7C**: Fault 7 interrupt flag clear
Writing 1 to this bit clears the FLT6 flag in HRTIM_ISR register.

Bit 6 **FLT6C**: Fault 6 interrupt flag clear
Writing 1 to this bit clears the FLT6 flag in HRTIM_ISR register.

Bit 5 **SYSFLTC**: System fault interrupt flag clear
Writing 1 to this bit clears the SYSFLT flag in HRTIM_ISR register.

Bit 4 **FLT5C**: Fault 5 interrupt flag clear
Writing 1 to this bit clears the FLT5 flag in HRTIM_ISR register.

Bit 3 **FLT4C**: Fault 4 interrupt flag clear
Writing 1 to this bit clears the FLT4 flag in HRTIM_ISR register.

Bit 2 **FLT3C**: Fault 3 interrupt flag clear
Writing 1 to this bit clears the FLT3 flag in HRTIM_ISR register.

Bit 1 **FLT2C**: Fault 2 interrupt flag clear
Writing 1 to this bit clears the FLT2 flag in HRTIM_ISR register.

Bit 0 **FLT1C**: Fault 1 interrupt flag clear
Writing 1 to this bit clears the FLT1 flag in HRTIM_ISR register.

33.5.64 HRTIM interrupt enable register (HRTIM_IER)

Address offset: 0x710

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	BMPERIE	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	FLT8IE	FLT7IE	FLT6IE	SYSFLTIE	FLT5IE	FLT4IE	FLT3IE	FLT2IE	FLT1IE
							rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **BMPERIE**: Burst mode period interrupt enable
This bit is set and cleared by software to enable/disable the burst mode period interrupt.
0: Burst mode period interrupt disabled
1: Burst mode period interrupt enabled

Bits 16:9 Reserved, must be kept at reset value.

Bit 8 **FLT8IE**: Fault 8 interrupt enable
Refer to FLT1IE description.

Bit 7 **FLT7IE**: Fault 7 interrupt enable
Refer to FLT1IE description.

Bit 6 **FLT6IE**: Fault 6 interrupt enable
Refer to FLT1IE description.

Bit 5 **SYSFLTIE**: System fault interrupt enable
Refer to FLT1IE description.

Bit 4 **FLT5IE**: Fault 5 interrupt enable
Refer to FLT1IE description.

Bit 3 **FLT4IE**: Fault 4 interrupt enable
Refer to FLT1IE description.

Bit 2 **FLT3IE**: Fault 3 interrupt enable
Refer to FLT1IE description.

Bit 1 **FLT2IE**: Fault 2 interrupt enable
Refer to FLT1IE description.

Bit 0 **FLT1IE**: Fault 1 interrupt enable
This bit is set and cleared by software to enable/disable the fault 1 interrupt.
0: Fault 1 interrupt disabled
1: Fault 1 interrupt enabled

33.5.65 HRTIM output enable register (HRTIM_OENR)

Address offset: 0x714

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	TF2OEN	TF1OEN	TE2OEN	TE1OEN	TD2OEN	TD1OEN	TC2OEN	TC1OEN	TB2OEN	TB1OEN	TA2OEN	TA1OEN
				rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs	rs

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **TF2OEN**: Timer F output 2 enable
Refer to TA1OEN description.

Bit 10 **TF1OEN**: Timer F output 1 enable
Refer to TA1OEN description

Bit 9 **TE2OEN**: Timer E output 2 enable
Refer to TA1OEN description.

Bit 8 **TE1OEN**: Timer E output 1 enable
Refer to TA1OEN description.

Bit 7 **TD2OEN**: Timer D output 2 enable
Refer to TA1OEN description.

Bit 6 **TD1OEN**: Timer D output 1 enable
Refer to TA1OEN description.

Bit 5 **TC2OEN**: Timer C output 2 enable
Refer to TA1OEN description.

Bit 4 **TC1OEN**: Timer C output 1 enable
Refer to TA1OEN description.

Bit 3 **TB2OEN**: Timer B output 2 enable
Refer to TA1OEN description.

Bit 2 **TB1OEN**: Timer B output 1 enable
Refer to TA1OEN description.

Bit 1 **TA2OEN**: Timer A output 2 enable
Refer to TA1OEN description.

Bit 0 **TA1OEN**: Timer A output 1 enable
Setting this bit enables the timer A output 1. Writing “0” has no effect.
Reading the bit returns the output enable/disable status.
This bit is cleared asynchronously by hardware as soon as the timer-related fault input(s) is (are) active.
0: output A1 disabled. The output is either in fault or Idle state.
1: output A1 enabled

Note: The disable status corresponds to both idle and fault states. The output disable status is given by TA1ODS bit in the HRTIM_ODSR register.

33.5.66 HRTIM output disable register (HRTIM_ODISR)

Address offset: 0x718

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	TF2ODIS	TF1ODIS	TE2ODIS	TE1ODIS	TD2ODIS	TD1ODIS	TC2ODIS	TC1ODIS	TB2ODIS	TB1ODIS	TA2ODIS	TA1ODIS
				w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **TF2ODIS**: Timer F output 2 disable
Refer to TA1ODIS description.

Bit 10 **TF1ODIS**: Timer F output 1 disable
Refer to TA1ODIS description

Bit 9 **TE2ODIS**: Timer E output 2 disable
Refer to TA1ODIS description.

Bit 8 **TE1ODIS**: Timer E output 1 disable
Refer to TA1ODIS description.

Bit 7 **TD2ODIS**: Timer D output 2 disable
Refer to TA1ODIS description.

Bit 6 **TD1ODIS**: Timer D output 1 disable
Refer to TA1ODIS description.

Bit 5 **TC2ODIS**: Timer C output 2 disable
Refer to TA1ODIS description.

Bit 4 **TC1ODIS**: Timer C output 1 disable
Refer to TA1ODIS description.

Bit 3 **TB2ODIS**: Timer B output 2 disable
Refer to TA1ODIS description.

Bit 2 **TB1ODIS**: Timer B output 1 disable
Refer to TA1ODIS description.

Bit 1 **TA2ODIS**: Timer A output 2 disable
Refer to TA1ODIS description.

Bit 0 **TA1ODIS**: Timer A output 1 disable
Setting this bit disables the timer A output 1. The output enters the idle state, either from the run state or from the fault state.
Writing “0” has no effect.

33.5.67 HRTIM output disable status register (HRTIM_ODSR)

Address offset: 0x71C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	TF2ODS	TF1ODS	TE2ODS	TE1ODS	TD2ODS	TD1ODS	TC2ODS	TC1ODS	TB2ODS	TB1ODS	TA2ODS	TA1ODS
				r	r	r	r	r	r	r	r	r	r	r	r

Bits 31:12 Reserved, must be kept at reset value.

Bit 11 **TF2ODS**: Timer F output 2 disable status
Refer to TA1ODS description.

Bit 10 **TF1ODS**: Timer F output 1 disable status
Refer to TA1ODS description.

Bit 9 **TE2ODS**: Timer E output 2 disable status
Refer to TA1ODS description.

Bit 8 **TE1ODS**: Timer E output 1 disable status
Refer to TA1ODS description.

Bit 7 **TD2ODS**: Timer D output 2 disable status
Refer to TA1ODS description.

Bit 6 **TD1ODS**: Timer D output 1 disable status
Refer to TA1ODS description.

Bit 5 **TC2ODS**: Timer C output 2 disable status
Refer to TA1ODS description.

Bit 4 **TC1ODS**: Timer C output 1 disable status
Refer to TA1ODS description.

Bit 3 **TB2ODS**: Timer B output 2 disable status
Refer to TA1ODS description.

Bit 2 **TB1ODS**: Timer B output 1 disable status
Refer to TA1ODS description.

Bit 1 **TA2ODS**: Timer A output 2 disable status
Refer to TA1ODS description.

Bit 0 **TA1ODS**: Timer A output 1 disable status
Reading the bit returns the output disable status. It is not significant when the output is active (Tx1OEN or Tx2OEN = 1).
0: Output A1 disabled, in Idle state.
1: Output A1 disabled, in fault state.

33.5.68 HRTIM burst mode control register (HRTIM_BMCR)

Address offset: 0x720

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BMSTAT	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TFBM	TEBM	TDBM	TCBM	TBBM	TABM	MTBM
rc_w0									rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	BMPREN	BMPRSC[3:0]				BMCLK[3:0]				BMOM	BME
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **BMSTAT**: Burst mode status

This bit gives the current operating state.

0: Normal operation

1: Burst operation on-going. Writing this bit to 0 causes a burst mode early termination.

Bits 30:23 Reserved, must be kept at reset value.

Bit 22 **TFBM**: Timer F burst mode

Refer to TABM description.

Bit 21 **TEBM**: Timer E burst mode

Refer to TABM description.

Bit 20 **TDBM**: Timer D burst mode

Refer to TABM description.

Bit 19 **TCBM**: Timer C burst mode

Refer to TABM description.

Bit 18 **TBBM**: Timer B burst mode

Refer to TABM description.

Bit 17 **TABM**: Timer A burst mode

This bit defines how the timer behaves during a burst mode operation. This bitfield cannot be changed while the burst mode is enabled.

0: TA counter clock is maintained and the timer operates normally

1: TA counter clock is stopped and the counter is reset

Note: This bit must not be set when the balanced idle mode is active (DLYPRT[2:0] = 0x11).

Bit 16 **MTBM**: Master timer burst mode

This bit defines how the timer behaves during a burst mode operation. This bitfield cannot be changed while the burst mode is enabled.

0: Master Timer counter clock is maintained and the timer operates normally

1: Master Timer counter clock is stopped and the counter is reset

Bits 15:11 Reserved, must be kept at reset value.

Bit 10 **BMPREN**: Burst mode preload enable

This bit enables the registers preload mechanism and defines whether a write access into a preloadable register (HRTIM_BMCMPR, HRTIM_BMPER) is done into the active or the preload register.

0: Preload disabled: the write access is directly done into active registers

1: Preload enabled: the write access is done into preload registers

Bits 9:6 **BMPRSC[3:0]**: Burst mode prescaler

Defines the prescaling ratio of the f_{HRTIM} clock for the burst mode controller. This bitfield cannot be changed while the burst mode is enabled.

0000: Clock not divided
0001: Division by 2
0010: Division by 4
0011: Division by 8
0100: Division by 16
0101: Division by 32
0110: Division by 64
0111: Division by 128
1000: Division by 256
1001: Division by 512
1010: Division by 1024
1011: Division by 2048
1100: Division by 4096
1101: Division by 8192
1110: Division by 16384
1111: Division by 32768

Bits 5:2 **BMCLK[3:0]**: Burst mode clock source

This bitfield defines the clock source for the burst mode counter. It cannot be changed while the burst mode is enabled (refer to *Table 328* for on-chip events 1..4 connections details).

0000: Master timer counter reset/roll-over
0001: Timer A counter reset/roll-over
0010: Timer B counter reset/roll-over
0011: Timer C counter reset/roll-over
0100: Timer D counter reset/roll-over
0101: Timer E counter reset/roll-over
0110: On-chip event 1 (hrtim_bm_ck1), acting as a burst mode counter clock
0111: On-chip event 2 (hrtim_bm_ck2) acting as a burst mode counter clock
1000: On-chip event 3 (hrtim_bm_ck3) acting as a burst mode counter clock
1001: On-chip event 4 (hrtim_bm_ck4) acting as a burst mode counter clock
1010: Prescaled f_{HRTIM} clock (as per BMPRSC[3:0] setting)
1011: Timer F counter reset/roll-over
Others: Reserved

Bit 1 **BMOM**: Burst mode operating mode

This bit defines if the burst mode is entered once or if it is continuously operating.

0: Single-shot mode
1: Continuous operation

Bit 0 **BME**: Burst mode enable

This bit starts the burst mode controller which becomes ready to receive the start trigger. Writing this bit to 0 causes a burst mode early termination.

0: Burst mode disabled
1: Burst mode enabled

33.5.69 HRTIM burst mode trigger register (HRTIM_BMTRGR)

Address offset: 0x724

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **OCHPEV**: On-chip event

A rising edge on the hrtim_bm_trg input (connected to general purpose timer TRGO output) triggers a burst mode entry (see *Table 325* for details).

Bit 30 **EEVH**: External event H (TIMD filters applied)

The external event H conditioned by TIMD filters is starting the burst mode operation.

Bit 29 **EEVG**: External event G (TIMA filters applied)

The external event G conditioned by TIMA filters is starting the burst mode operation.

Bit 28 **TDEEVH**: Timer D period following external event H

The timer D period following an external event H (conditioned by TIMD filters) is starting the burst mode operation.

Bit 27 **TAEEVG**: Timer A period following external event G

The timer A period following an external event G (conditioned by TIMA filters) is starting the burst mode operation.

Bit 26 **TECMP2**: Timer E compare 2 event

Refer to TACMP1 description.

Bit 25 **TECMP1**: Timer E compare 1 event

Refer to TACMP1 description.

Bit 24 **TEREP**: Timer E repetition

Refer to TAREP description.

Bit 23 **TFCMP1**: Timer F compare 1 event

Refer to TACMP1 description.

Bit 22 **TDCMP2**: Timer D compare 2 event

Refer to TACMP1 description.

Bit 21 **TFREP**: Timer F repetition

Refer to TAREP description.

Bit 20 **TDREP**: Timer D repetition

Refer to TAREP description.

Bit 19 **TDRST**: Timer D reset or roll-over

Refer to TARST description.

Bit 18 **TFRST**: Timer F reset

Refer to TARST description.

Bit 17 **TCCMP1**: Timer C compare 1 event
Refer to TACMP1 description.

Bit 16 **TCREP**: Timer C repetition
Refer to TAREP description.

Bit 15 **TCRST**: Timer C reset or roll-over
Refer to TARST description.

Bit 14 **TBCMP2**: Timer B compare 2 event
Refer to TACMP1 description.

Bit 13 **TBCMP1**: Timer B compare 1 event
Refer to TACMP1 description.

Bit 12 **TBREP**: Timer B repetition
Refer to TAREP description.

Bit 11 **TBRST**: Timer B reset or roll-over
Refer to TARST description.

Bit 10 **TACMP2**: Timer A compare 2 event
Refer to TACMP1 description.

Bit 9 **TACMP1**: Timer A compare 1 event
The timer A compare 1 event is starting the burst mode operation.

Bit 8 **TAREP**: Timer A repetition
The Timer A repetition event is starting the burst mode operation.

Bit 7 **TARST**: Timer A reset or roll-over
The Timer A reset or roll-over event is starting the burst mode operation.

Bit 6 **MSTCMP4**: Master compare 4
Refer to MSTCMP1 description.

Bit 5 **MSTCMP3**: Master compare 3
Refer to MSTCMP1 description.

Bit 4 **MSTCMP2**: Master compare 2
Refer to MSTCMP1 description.

Bit 3 **MSTCMP1**: Master compare 1
The master timer compare 1 event is starting the burst mode operation.

Bit 2 **MSTREP**: Master repetition
The master timer repetition event is starting the burst mode operation.

Bit 1 **MSTRST**: Master reset or roll-over
The master timer reset and roll-over event is starting the burst mode operation.

Bit 0 **SW**: Software start
This bit is set by software and automatically reset by hardware.
When set, It starts the burst mode operation immediately.
This bit is not active if the burst mode is not enabled (BME bit is reset).

33.5.70 HRTIM burst mode compare register (HRTIM_BMCMPR)

Address offset: 0x728

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

BMCMP[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **BMCMP[15:0]**: Burst mode compare value

Defines the number of periods during which the selected timers are in idle state.

This register holds either the content of the preload register or the content of the active register if the preload is disabled.

Note: BMCMP[15:0] cannot be set to 0x0000 when using the f_{HRTIM} clock without a prescaler as the burst mode clock source (BMCLK[3:0] = 1010 and BMPRESC[3:0] = 0000).

33.5.71 HRTIM burst mode period register (HRTIM_BMPER)

Address offset: 0x72C

Reset value: 0x0000 0000

BMPER[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:0 **BMPER[15:0]**: Burst mode period

Defines the burst mode repetition period.

This register holds either the content of the preload register or the content of the active register if preload is disabled.

Note: The BMPER[15:0] must not be null when the burst mode is enabled.

33.5.72 HRTIM timer external event control register 1 (HRTIM_EECR1)

Address offset: 0x730

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **EE5FAST**: External event 5 fast mode
Refer to EE1FAST description.

Bits 28:27 **EE5SNS[1:0]**: External event 5 sensitivity
Refer to EE1SNS[1:0] description.

Bit 26 **EE5POL**: External event 5 polarity
Refer to EE1POL description.

Bits 25:24 **EE5SRC[1:0]**: External event 5 source
This bitfield is combined with EE5SRC[2] bit. Refer to EE1SRC[1:0] description.

Bit 23 **EE4FAST**: External event 4 fast mode
Refer to EE1FAST description.

Bits 22:21 **EE4SNS[1:0]**: External event 4 sensitivity
Refer to EE1SNS[1:0] description.

Bit 20 **EE4POL**: External event 4 polarity
Refer to EE1POL description.

Bits 19:18 **EE4SRC[1:0]**: External event 4 source
This bitfield is combined with EE4SRC[2] bit. Refer to EE1SRC[1:0] description.

Bit 17 **EE3FAST**: External event 3 fast mode
Refer to EE1FAST description.

Bits 16:15 **EE3SNS[1:0]**: External event 3 sensitivity
Refer to EE1SNS[1:0] description.

Bit 14 **EE3POL**: External event 3 polarity
Refer to EE1POL description.

Bits 13:12 **EE3SRC[1:0]**: External event 3 source
This bitfield is combined with EE3SRC[2] bit. Refer to EE1SRC[1:0] description.

Bit 11 **EE2FAST**: External event 2 fast mode
Refer to EE1FAST description.

Bits 10:9 **EE2SNS[1:0]**: External event 2 sensitivity
Refer to EE1SNS[1:0] description.

Bit 8 **EE2POL**: External event 2 polarity
Refer to EE1POL description.

Bits 7:6 **EE2SRC[1:0]**: External event 2 source
This bitfield is combined with EE2SRC[2] bit. Refer to EE1SRC[1:0] description.

Bit 5 **EE1FAST**: External event 1 fast mode
0: External event 1 is re-synchronized by the HRTIM logic before acting on outputs, which adds a f_{HRTIM} clock-related latency
1: External event 1 is acting asynchronously on outputs (low latency mode)
Note: This bit must not be modified once the counter in which the event is used is enabled (TxCEN bit set).

Bits 4:3 **EE1SNS[1:0]**: External event 1 sensitivity
00: On active level defined by EE1POL bit
01: Rising edge, whatever EE1POL bit value
10: Falling edge, whatever EE1POL bit value
11: Both edges, whatever EE1POL bit value

Bit 2 **EE1POL**: External event 1 polarity
This bit is only significant if EE1SNS[1:0] = 00.
0: External event is active high
1: External event is active low
Note: This parameter cannot be changed once the timer x is enabled. It must be configured prior to setting EE1FAST bit.

Bits 1:0 **EE1SRC[1:0]**: External event 1 source
This bitfield is combined with EE1SRC[2] bit. This bitfield selects the External event 1 source. See *Table 326* for details.
000:hrtim_eev1_1
001:hrtim_eev1_2
010:hrtim_eev1_3
011:hrtim_eev1_4
100:hrtim_eev1_5
001:hrtim_eev1_6
010:hrtim_eev1_7
011:hrtim_eev1_8
Note: This parameter cannot be changed once the timer x is enabled. It must be configured prior to setting EE1FAST bit.

33.5.73 HRTIM timer external event control register 2 (HRTIM_EECR2)

Address offset: 0x734

Reset value: 0x0000 0000

rw	rw	rw	rw		rw	rw	rw	rw	rw		rw	rw	rw	rw	rw

Bits 31:29 Reserved, must be kept at reset value.

Bits 28:27 **EE10SNS[1:0]**: External event 10 sensitivity
Refer to EE1SNS[1:0] description.

Bit 26 **EE10POL**: External event 10 polarity
Refer to EE1POL description.

Bits 25:24 **EE10SRC[1:0]**: External event 10 source
This bitfield is combined with EE10SRC[2] bit. Refer to EE1SRC[1:0] description.

Bit 23 Reserved, must be kept at reset value.

Bits 22:21 **EE9SNS[1:0]**: External event 9 sensitivity
Refer to EE1SNS[1:0] description.

Bit 20 **EE9POL**: External event 9 polarity
Refer to EE1POL description.

Bits 19:18 **EE9SRC[1:0]**: External event 9 source
This bitfield is combined with EE9SRC[2] bit. Refer to EE1SRC[1:0] description.

Bit 17 Reserved, must be kept at reset value.

Bits 16:15 **EE8SNS[1:0]**: External event 8 sensitivity
Refer to EE1SNS[1:0] description.

Bit 14 **EE8POL**: External event 8 polarity
Refer to EE1POL description.

Bits 13:12 **EE8SRC[1:0]**: External event 8 source
This bitfield is combined with EE8SRC[2] bit. Refer to EE1SRC[1:0] description.

Bit 11 Reserved, must be kept at reset value.

Bits 10:9 **EE7SNS[1:0]**: External event 7 sensitivity
Refer to EE1SNS[1:0] description.

Bit 8 **EE7POL**: External event 7 polarity
Refer to EE1POL description.

Bits 7:6 **EE7SRC[1:0]**: External event 7 source
This bitfield is combined with EE7SRC[2] bit. Refer to EE1SRC[1:0] description.

Bit 5 Reserved, must be kept at reset value.

Bits 4:3 **EE6SNS[1:0]**: External event 6 sensitivity
Refer to EE1SNS[1:0] description.

Bit 2 **EE6POL**: External event 6 polarity
Refer to EE1POL description.

Bits 1:0 **EE6SRC[1:0]**: External event 6 source
This bitfield is combined with EE6SRC[2] bit. Refer to EE1SRC[1:0] description.

33.5.74 HRTIM timer external event control register 3 (HRTIM_EECR3)

Address offset: 0x738

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
EEVSD[1:0]		Res.	Res.	EE10F[3:0]				Res.	Res.	EE9F[3:0]				Res.	Res.
rw	rw			rw	rw	rw	rw			rw	rw	rw	rw		
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EE8F[3:0]				Res.	Res.	EE7F[3:0]				Res.	Res.	EE6F[3:0]			
rw	rw	rw	rw			rw	rw	rw	rw			rw	rw	rw	rw

Bits 31:30 **EEVSD[1:0]**: External event sampling clock division
This bitfield indicates the division ratio between the timer clock frequency (f_{HRTIM}) and the external event signal sampling clock (f_{EEVS}) used by the digital filters.
00: $f_{EEVS}=f_{HRTIM}$
01: $f_{EEVS}=f_{HRTIM}$ / 2
10: $f_{EEVS}=f_{HRTIM}$ / 4
11: $f_{EEVS}=f_{HRTIM}$ / 8

Bits 29:28 Reserved, must be kept at reset value.

Bits 27:24 **EE10F[3:0]**: External event 10 filter
Refer to EE6F[3:0] description.

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:18 **EE9F[3:0]**: External event 9 filter
Refer to EE6F[3:0] description.

Bits 17:16 Reserved, must be kept at reset value.

Bits 15:12 **EE8F[3:0]**: External event 8 filter
Refer to EE6F[3:0] description.

Bits 11:10 Reserved, must be kept at reset value.

Bits 9:6 **EE7F[3:0]**: External event 7 filter
Refer to EE6F[3:0] description.

Bits 5:4 Reserved, must be kept at reset value.

Bits 3:0 **EE6F[3:0]**: External event 6 filter
This bitfield defines the frequency used to sample external event 6 input and the length of the digital filter applied to EEV6. The digital filter is made of a counter in which N valid samples are needed to validate a transition on the output.
0000: Filter disabled
0001: $f_{SAMPLING} = f_{HRTIM}$, N=2
0010: $f_{SAMPLING} = f_{HRTIM}$, N=4
0011: $f_{SAMPLING} = f_{HRTIM}$, N=8
0100: $f_{SAMPLING} = f_{EEVS}/2$, N=6

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **ADC1TEPER**: ADC trigger 1 on timer E period
Refer to ADC1TAPER description.

Bit 30 **ADC1TEC4**: ADC trigger 1 on timer E compare 4
Refer to ADC1TFC2 description.

Bit 29 **ADC1TEC3**: ADC trigger 1 on timer E compare 3
Refer to ADC1TFC2 description.

Bit 28 **ADC1TFRST**: ADC trigger 1 on timer F reset and counter roll-over(1)
Refer to ADC1TARST description.

Bit 27 **ADC1TDPER**: ADC trigger 1 on timer D period
Refer to ADC1TAPER description.

Bit 26 **ADC1TDC4**: ADC trigger 1 on timer D compare 4
Refer to ADC1TFC2 description.

Bit 25 **ADC1TDC3**: ADC trigger 1 on timer D compare 3
Refer to ADC1TFC2 description.

Bit 24 **ADC1TFPER**: ADC trigger 1 on timer F period
Refer to ADC1TAPER description.

Bit 23 **ADC1TCPER**: ADC trigger 1 on timer C period
Refer to ADC1TAPER description.

Bit 22 **ADC1TCC4**: ADC trigger 1 on timer C compare 4
Refer to ADC1TFC2 description.

Bit 21 **ADC1TCC3**: ADC trigger 1 on timer C compare 3
Refer to ADC1TFC2 description.

Bit 20 **ADC1TFC4**: ADC trigger 1 on timer F compare 4
Refer to ADC1TAC2 description.

Bit 19 **ADC1TBRST**: ADC trigger 1 on timer B reset and counter roll-over(1)
This bit enables the generation of an ADC trigger upon timer B reset and roll-over event, on ADC trigger 1 output.

Bit 18 **ADC1TBPER**: ADC trigger 1 on timer B period
Refer to ADC1TAPER description.

Bit 17 **ADC1TBC4**: ADC trigger 1 on timer B compare 4
Refer to ADC1TFC2 description.

Bit 16 **ADC1TBC3**: ADC trigger 1 on timer B compare 3
Refer to ADC1TFC2 description.

Bit 15 **ADC1TFC3**: ADC trigger 1 on timer F compare 3
Refer to ADC1TFC2 description.

Bit 14 **ADC1TARST**: ADC trigger 1 on timer A reset and counter roll-over(1)
This bit enables the generation of an ADC trigger upon timer A reset and roll-over event, on ADC trigger 1 output.

Bit 13 **ADC1TAPER**: ADC trigger 1 on timer A period
This bit enables the generation of an ADC trigger upon timer A period event, on ADC trigger 1 output.

Bit 12 **ADC1TAC4**: ADC trigger 1 on timer A compare 4
Refer to ADC1TFC2 description.

Bit 11 **ADC1TAC3**: ADC trigger 1 on timer A compare 3
Refer to ADC1TFC2 description.

Bit 10 **ADC1TFC2**: ADC trigger 1 on timer F compare 2
This bit enables the generation of an ADC trigger upon timer F compare 2 event, on ADC trigger 1 output.

Bit 9 **ADC1EEV5**: ADC trigger 1 on external event 5(1)
Refer to ADC1EEV1 description.

Bit 8 **ADC1EEV4**: ADC trigger 1 on external event 4(1)
Refer to ADC1EEV1 description.

Bit 7 **ADC1EEV3**: ADC trigger 1 on external event 3(1)
Refer to ADC1EEV1 description.

Bit 6 **ADC1EEV2**: ADC trigger 1 on external event 2(1)
Refer to ADC1EEV1 description.

Bit 5 **ADC1EEV1**: ADC trigger 1 on external event 1(1)
This bit enables the generation of an ADC trigger upon external event 1, on ADC trigger 1 output.

Bit 4 **ADC1MPER**: ADC trigger 1 on master period
This bit enables the generation of an ADC trigger upon master timer period event, on ADC trigger 1 output.

Bit 3 **ADC1MC4**: ADC trigger 1 on master compare 4
Refer to ADC1MC1 description.

Bit 2 **ADC1MC3**: ADC trigger 1 on master compare 3
Refer to ADC1MC1 description.

Bit 1 **ADC1MC2**: ADC trigger 1 on master compare 2
Refer to ADC1MC1 description.

Bit 0 **ADC1MC1**: ADC trigger 1 on master compare 1
This bit enables the generation of an ADC trigger upon master compare 1 event, on ADC trigger 1 output.

1. These triggers are differing from HRTIM_ADC2R/HRTIM_ADC4R to HRTIM_ADC1R/HRTIM_ADC3R.

33.5.76 HRTIM ADC trigger 2 register (HRTIM_ADC2R)

Address offset: 0x740

Reset value: 0x0000 0000

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **ADC2TERST**: ADC trigger 2 on timer E reset and counter roll-over(1)
Refer to ADC2TCRST description.

Bit 30 **ADC2TEC4**: ADC trigger 2 on timer E compare 4
Refer to ADC2TAC2 description.

Bit 29 **ADC2TEC3**: ADC trigger 2 on timer E compare 3
Refer to ADC2TAC2 description.

Bit 28 **ADC2TEC2**: ADC trigger 2 on timer E compare 2
Refer to ADC2TAC2 description.

Bit 27 **ADC2TDRST**: ADC trigger 2 on timer D reset and counter roll-over(1)
Refer to ADC2TCRST description.

Bit 26 **ADC2TDPER**: ADC trigger 2 on timer D period
Refer to ADC2TAPER description.

Bit 25 **ADC2TDC4**: ADC trigger 2 on timer D compare 4
Refer to ADC2TAC2 description.

Bit 24 **ADC2TFPER**: ADC trigger 2 on timer F period
Refer to ADC2TAPER description.

Bit 23 **ADC2TDC2**: ADC trigger 2 on timer D compare 2
Refer to ADC2TAC2 description.

Bit 22 **ADC2TCRST**: ADC trigger 2 on timer C reset and counter roll-over(1)
This bit enables the generation of an ADC trigger upon timer C reset and roll-over event, on ADC trigger 1 output.

Bit 21 **ADC2TCPER**: ADC trigger 2 on timer C period
Refer to ADC2TAPER description.

Bit 20 **ADC2TCC4**: ADC trigger 2 on timer C compare 4
Refer to ADC2TAC2 description.

Bit 19 **ADC2TFC4**: ADC trigger 2 on timer F compare 4
Refer to ADC2TAC2 description.

Bit 18 **ADC2TCC2**: ADC trigger 2 on timer C compare 2
Refer to ADC2TAC2 description.

Bit 17 **ADC2TBPER**: ADC trigger 2 on timer B period
Refer to ADC2TAPER description.

Bit 16 **ADC2TBC4**: ADC trigger 2 on timer B compare 4
Refer to ADC2TAC2 description.

Bit 15 **ADC2TFC3**: ADC trigger 2 on timer F compare 3
Refer to ADC2TAC2 description.

Bit 14 **ADC2TBC2**: ADC trigger 2 on timer B compare 2
Refer to ADC2TAC2 description.

Bit 13 **ADC2TAPER**: ADC trigger 2 on timer A period
This bit enables the generation of an ADC trigger upon timer A event, on ADC trigger 2 output.

Bit 12 **ADC2TAC4**: ADC trigger 2 on timer A compare 4
Refer to ADC2TAC2 description.

Bit 11 **ADC2TFC2**: ADC trigger 2 on timer F compare 2
Refer to ADC2TAC2 description.

Bit 10 **ADC2TAC2**: ADC trigger 2 on timer A compare 2
This bit enables the generation of an ADC trigger upon timer A compare 2, on ADC trigger 2 output.

Bit 9 **ADC2EEV10**: ADC trigger 2 on external event 10(1)
Refer to ADC2EEV6 description.

Bit 8 **ADC2EEV9**: ADC trigger 2 on external event 9(1)
Refer to ADC2EEV6 description.

Bit 7 **ADC2EEV8**: ADC trigger 2 on external event 8(1)
Refer to ADC2EEV6 description.

Bit 6 **ADC2EEV7**: ADC trigger 2 on external event 7(1)
Refer to ADC2EEV6 description.

Bit 5 **ADC2EEV6**: ADC trigger 2 on external event 6(1)
This bit enables the generation of an ADC trigger upon external event 6, on ADC trigger 2 output.

Bit 4 **ADC2MPER**: ADC trigger 2 on master period
This bit enables the generation of an ADC trigger upon master period event, on ADC trigger 2 output.

Bit 3 **ADC2MC4**: ADC trigger 2 on master compare 4
Refer to ADC2MC1 description.

Bit 2 **ADC2MC3**: ADC trigger 2 on master compare 3
Refer to ADC2MC1 description.

Bit 1 **ADC2MC2**: ADC trigger 2 on master compare 2
Refer to ADC2MC1 description.

Bit 0 **ADC2MC1**: ADC trigger 2 on master compare 1
This bit enables the generation of an ADC trigger upon master compare 1 event, on ADC trigger 2 output.

1. These triggers are differing from HRTIM_ADC1R/HRTIM_ADC3R to HRTIM_ADC2R/HRTIM_ADC4R.

33.5.77 HRTIM ADC trigger 3 register (HRTIM_ADC3R)

Bit 31 **ADC3TEPER**: ADC trigger 3 on timer E period
Refer to ADC3TAPER description.

Bit 30 **ADC3TEC4**: ADC trigger 3 on timer E compare 4
Refer to ADC3TFC2 description.

Bit 29 **ADC3TEC3**: ADC trigger 3 on timer E compare 3
Refer to ADC3TFC2 description.

Bit 28 **ADC3TFRST**: ADC trigger 3 on timer F reset and counter roll-over(1)
Refer to ADC3TARST description.

Bit 27 **ADC3TDPER**: ADC trigger 3 on timer D period
Refer to ADC3TAPER description.

Bit 26 **ADC3TDC4**: ADC trigger 3 on timer D compare 4
Refer to ADC3TFC2 description.

Bit 25 **ADC3TDC3**: ADC trigger 3 on timer D compare 3
Refer to ADC3TFC2 description.

Bit 24 **ADC3TFPER**: ADC trigger 3 on timer F period
Refer to ADC3TAPER description.

Bit 23 **ADC3TCPER**: ADC trigger 3 on timer C period
Refer to ADC3TAPER description.

Bit 22 **ADC3TCC4**: ADC trigger 3 on timer C compare 4
Refer to ADC3TFC2 description.

Bit 21 **ADC3TCC3**: ADC trigger 3 on timer C compare 3
Refer to ADC3TFC2 description.

Bit 20 **ADC3TFC4**: ADC trigger 3 on timer F compare 4
Refer to ADC3TAC2 description.

Bit 19 **ADC3TBRST**: ADC trigger 3 on timer B reset and counter roll-over(1)
This bit enables the generation of an ADC trigger upon timer B reset and roll-over event, on ADC trigger 1 output.

Bit 18 **ADC3TBPER**: ADC trigger 3 on timer B period
Refer to ADC3TAPER description.

Bit 17 **ADC3TBC4**: ADC trigger 3 on timer B compare 4
Refer to ADC3TFC2 description.

Bit 16 **ADC3TBC3**: ADC trigger 3 on timer B compare 3
Refer to ADC3TFC2 description.

Bit 15 **ADC3TFC3**: ADC trigger 3 on timer F compare 3
Refer to ADC3TFC2 description.

Bit 14 **ADC3TARST**: ADC trigger 3 on timer A reset and counter roll-over(1)
This bit enables the generation of an ADC trigger upon timer A reset and roll-over event, on ADC trigger 1 output.

Bit 13 **ADC3TAPER**: ADC trigger 3 on timer A period
This bit enables the generation of an ADC trigger upon timer A period event, on ADC trigger 1 output.

Bit 12 **ADC3TAC4**: ADC trigger 3 on timer A compare 4
Refer to ADC3TFC2 description.

Bit 11 **ADC3TAC3**: ADC trigger 3 on timer A compare 3
Refer to ADC3TFC2 description.

Bit 10 **ADC3TFC2**: ADC trigger 3 on timer F compare 2
This bit enables the generation of an ADC trigger upon timer F compare 2 event, on ADC trigger 3 output.

Bit 9 **ADC3EEV5**: ADC trigger 3 on external event 5(1)
Refer to ADC3EEV1 description.

Bit 8 **ADC3EEV4**: ADC trigger 3 on external event 4(1)
Refer to ADC3EEV1 description.

Bit 7 **ADC3EEV3**: ADC trigger 3 on external event 3(1)
Refer to ADC3EEV1 description.

Bit 6 **ADC3EEV2**: ADC trigger 3 on external event 2(1)
Refer to ADC3EEV1 description.

Bit 5 **ADC3EEV1**: ADC trigger 3 on external event 1(1)
This bit enables the generation of an ADC trigger upon external event 1, on ADC trigger 3 output.

Bit 4 **ADC3MPER**: ADC trigger 3 on master period
This bit enables the generation of an ADC trigger upon master timer period event, on ADC trigger 3 output.

Bit 3 **ADC3MC4**: ADC trigger 3 on master compare 4
Refer to ADC3MC1 description.

Bit 2 **ADC3MC3**: ADC trigger 3 on master compare 3
Refer to ADC3MC1 description.

Bit 1 **ADC3MC2**: ADC trigger 3 on master compare 2
Refer to ADC3MC1 description.

Bit 0 **ADC3MC1**: ADC trigger 3 on master compare 1
This bit enables the generation of an ADC trigger upon master compare 1 event, on ADC trigger 3 output.

1. These triggers are differing from HRTIM_ADC2R/HRTIM_ADC4R to HRTIM_ADC1R/HRTIM_ADC3R.

33.5.78 HRTIM ADC trigger 4 register (HRTIM_ADC4R)

Address offset: 0x748

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **ADC4TERST**: ADC trigger 4 on timer E reset and counter roll-over(1)
Refer to ADC4TCRST description.

Bit 30 **ADC4TEC4**: ADC trigger 4 on timer E compare 4
Refer to ADC4TAC2 description.

Bit 29 **ADC4TEC3**: ADC trigger 4 on timer E compare 3
Refer to ADC4TAC2 description.

Bit 28 **ADC4TEC2**: ADC trigger 4 on timer E compare 2
Refer to ADC4TAC2 description.

Bit 27 **ADC4TDRST**: ADC trigger 4 on timer D reset and counter roll-over(1)
Refer to ADC4TCRST description.

Bit 26 **ADC4TDPER**: ADC trigger 4 on timer D period
Refer to ADC4TAPER description.

Bit 25 **ADC4TDC4**: ADC trigger 4 on timer D compare 4
Refer to ADC4TAC2 description.

Bit 24 **ADC4TFPER**: ADC trigger 4 on timer F period
Refer to ADC4TAPER description.

Bit 23 **ADC4TDC2**: ADC trigger 2 on timer D compare 2
Refer to ADC4TAC2 description.

Bit 22 **ADC4TCRST**: ADC trigger 4 on timer C reset and counter roll-over(1)
This bit enables the generation of an ADC trigger upon timer C reset and roll-over event, on ADC trigger 1 output.

Bit 21 **ADC4TCPER**: ADC trigger 4 on timer C period
Refer to ADC4TAPER description.

Bit 20 **ADC4TCC4**: ADC trigger 4 on timer C compare 4
Refer to ADC4TAC2 description.

Bit 19 **ADC4TFC4**: ADC trigger 4 on timer F compare 4
Refer to ADC4TAC2 description.

Bit 18 **ADC4TCC2**: ADC trigger 4 on timer C compare 2
Refer to ADC4TAC2 description.

Bit 17 **ADC4TBPER**: ADC trigger 4 on timer B period
Refer to ADC4TAPER description.

Bit 16 **ADC4TBC4**: ADC trigger 4 on timer B compare 4
Refer to ADC4TAC2 description.

Bit 15 **ADC4TFC3**: ADC trigger 4 on timer F compare 3
Refer to ADC4TAC2 description.

Bit 14 **ADC4TBC2**: ADC trigger 4 on timer B compare 2
Refer to ADC4TAC2 description.

Bit 13 **ADC4TAPER**: ADC trigger 4 on timer A period
This bit enables the generation of an ADC trigger upon timer A event, on ADC trigger 2 output.

Bit 12 **ADC4TAC4**: ADC trigger 4 on timer A compare 4
Refer to ADC4TAC2 description.

Bit 11 **ADC4TFC2**: ADC trigger 4 on timer F compare 2
Refer to ADC4TAC2 description.

Bit 10 **ADC4TAC2**: ADC trigger 4 on timer A compare 2
This bit enables the generation of an ADC trigger upon timer A compare 2, on ADC trigger 2 output.

Bit 9 **ADC4EEV10**: ADC trigger 4 on external event 10(1)
Refer to ADC4EEV6 description.

Bit 8 **ADC4EEV9**: ADC trigger 4 on external event 9(1)
Refer to ADC4EEV6 description.

Bit 7 **ADC4EEV8**: ADC trigger 4 on external event 8(1)
Refer to ADC4EEV6 description.

Bit 6 **ADC4EEV7**: ADC trigger 4 on external event 7(1)
Refer to ADC4EEV6 description.

Bit 5 **ADC4EEV6**: ADC trigger 4 on external event 6(1)
This bit enables the generation of an ADC trigger upon external event 6, on ADC trigger 2 output.

Bit 4 **ADC4MPER**: ADC trigger 4 on master period
This bit enables the generation of an ADC trigger upon master period event, on ADC trigger 2 output.

Bit 3 **ADC4MC4**: ADC trigger 4 on master compare 4
Refer to ADC4MC1 description.

Bit 2 **ADC4MC3**: ADC trigger 4 on master compare 3
Refer to ADC4MC1 description.

Bit 1 **ADC4MC2**: ADC trigger 4 on master compare 2
Refer to ADC4MC1 description.

Bit 0 **ADC4MC1**: ADC trigger 4 on master compare 1
This bit enables the generation of an ADC trigger upon master compare 1 event, on ADC trigger 2 output.

1. These triggers are differing from HRTIM_ADC1R/HRTIM_ADC3R to HRTIM_ADC2R/HRTIM_ADC4R.

33.5.79 HRTIM fault input register 1 (HRTIM_FLTINR1)

Address offset: 0x750

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
FLT4LCK	FLT4F[3:0]				FLT4SRC[0]	FLT4P	FLT4E	FLT3LCK	FLT3F[3:0]				FLT3SRC[0]	FLT3P	FLT3E
rwo	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

rwo	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **FLT4LCK**: Fault 4 lock
Refer to FLT5LCK description in HRTIM_FLTINR2 register.

Bits 30:27 **FLT4F[3:0]**: Fault 4 filter
Refer to FLT5F[3:0] description in HRTIM_FLTINR2 register.

Bit 26 FLT4SRC[0]: Fault 4 source bit 0
Refer to FLT5SRC[0] description in HRTIM_FLTINR2 register.

Bit 25 **FLT4P**: Fault 4 polarity
Refer to FLT5P description in HRTIM_FLTINR2 register.

Bit 24 **FLT4E**: Fault 4 enable
Refer to FLT5E description in HRTIM_FLTINR2 register.

Bit 23 **FLT3LCK**: Fault 3 lock
Refer to FLT5LCK description in HRTIM_FLTINR2 register.

Bits 22:19 **FLT3F[3:0]**: Fault 3 filter
Refer to FLT5F[3:0] description in HRTIM_FLTINR2 register.

Bit 18 FLT3SRC[0]: Fault 3 source bit 0
Refer to FLT5SRC[0] description in HRTIM_FLTINR2 register.

Bit 17 **FLT3P**: Fault 3 polarity
Refer to FLT5P description in HRTIM_FLTINR2 register.

Bit 16 **FLT3E**: Fault 3 enable
Refer to FLT5E description in HRTIM_FLTINR2 register.

Bit 15 **FLT2LCK**: Fault 2 lock
Refer to FLT5LCK description in HRTIM_FLTINR2 register.

Bits 14:11 **FLT2F[3:0]**: Fault 2 filter
Refer to FLT5F[3:0] description in HRTIM_FLTINR2 register.

Bit 10 FLT2SRC[0]: Fault 2 source bit 0
Refer to FLT5SRC[0] description in HRTIM_FLTINR2 register.

Bit 9 **FLT2P**: Fault 2 polarity
Refer to FLT2P description in HRTIM_FLTINR2 register.

Bit 8 **FLT2E**: Fault 2 enable
Refer to FLT5E description in HRTIM_FLTINR2 register.

Bit 7 **FLT1LCK**: Fault 1 lock
Refer to FLT5LCK description in HRTIM_FLTINR2 register.

Bits 6:3 **FLT1F[3:0]**: Fault 1 filter
Refer to FLT5F[3:0] description in HRTIM_FLTINR2 register.

Bit 2 **FLT1SRC[0]**: Fault 1 source bit 0
Refer to FLT5SRC[0] description in HRTIM_FLTINR2 register.

Bit 1 **FLT1P**: Fault 1 polarity
Refer to FLT5P description in HRTIM_FLTINR2 register.

Bit 0 **FLT1E**: Fault 1 enable
Refer to FLT5E description in HRTIM_FLTINR2 register.

33.5.80 HRTIM fault input register 2 (HRTIM_FLTINR2)

Address offset: 0x754

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	FLTSD[1:0]		FLT8SRC[1]	FLT7SRC[1]	FLT6SRC[1]	FLT5SRC[1]	FLT4SRC[1]	FLT3SRC[1]	FLT2SRC[1]	FLT1SRC[1]
						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

rwo	rw	rw	rw	rw	rw	rw	rw	rwo	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bits 25:24 **FLTSD[1:0]**: Fault sampling clock division

This bitfield indicates the division ratio between the timer clock frequency (f_{HRTIM}) and the fault signal sampling clock (f_{FLTS}) used by the digital filters.

00: $f_{FLTS}=f_{HRTIM}$

01: $f_{FLTS}=f_{HRTIM}$ / 2

10: $f_{FLTS}=f_{HRTIM}$ / 4

11: $f_{FLTS}=f_{HRTIM}$ / 8

Note: This bitfield must be written prior to any of the FLTxE enable bits.

Bit 23 **FLT8SRC[1]**: Fault 8 source bit 1

Refer to FLT5SRC[0] description.

Bit 22 **FLT7SRC[1]**: Fault 7 source bit 1

Refer to FLT5SRC[0] description.

Bit 21 **FLT6SRC[1]**: Fault 6 source bit 1

Refer to FLT5SRC[0] description.

Bit 20 **FLT5SRC[1]**: Fault 5 source bit 1

Refer to FLT5SRC[0] description.

Bit 19 **FLT4SRC[1]**: Fault 4 source bit 1

Refer to FLT5SRC[0] description.

Bit 18 **FLT3SRC[1]**: Fault 3 source bit 1

Refer to FLT5SRC[0] description.

Bit 17 **FLT2SRC[1]**: Fault 2 source bit 1

Refer to FLT5SRC[0] description.

Bit 16 **FLT1SRC[1]**: Fault 1 source bit 1

Refer to FLT5SRC[0] description.

Bit 15 **FLT6LCK**: Fault 6 lock

Refer to FLT5LCK description.

Bits 14:11 **FLT6F[3:0]**: Fault 6 filter

Refer to FLT5F[3:0] description.

Bit 10 **FLT6SRC[0]**: Fault 6 source bit 0

Refer to FLT5SRC[0] description.

Bit 9 **FLT6P**: Fault 6 polarity
Refer to FLT5P description.

Bit 8 **FLT6E**: Fault 6 enable
Refer to FLT5E description.

Bit 7 **FLT5LCK**: Fault 5 lock
The FLT5LCK bit modifies the write attributes of the fault programming bit, so that they are protected against spurious write accesses.
This bit is write-once. Once it has been set, it cannot be modified till the next system reset.
0: FLT5E, FLT5P, FLT5SRC[1:0], FLT5F[3:0] and FLT5BLK bits are read/write.
1: FLT5E, FLT5P, FLT5SRC[1:0], FLT5F[3:0] and FLT5BLK bits cannot be written (read-only mode)

Bits 6:3 **FLT5F[3:0]**: Fault 5 filter
This bitfield defines the frequency used to sample FLT5 input and the length of the digital filter applied to FLT5. The digital filter is made of an event counter in which N events are needed to validate a transition on the output.
0000: No filter, FLT5 acts asynchronously
0001: $f_{SAMPLING} = f_{HRTIM}$, N = 2
0010: $f_{SAMPLING} = f_{HRTIM}$, N = 4
0011: $f_{SAMPLING} = f_{HRTIM}$, N = 8
0100: $f_{SAMPLING} = f_{FLTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{FLTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{FLTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{FLTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{FLTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{FLTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{FLTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{FLTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{FLTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{FLTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{FLTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{FLTS}/32$, N = 8
Note: This bitfield can be written only when FLT5E enable bit is reset.
This bitfield cannot be modified when FLT5LOCK has been programmed.

Bit 2 **FLT5SRC[0]**: Fault 5 source bit 0
The FTL5SRC[1:0] bitfield selects the FAULT5 input source (refer to *Table 325* for connection details).
00: Fault 5 input is HRTIM_FLT5 input pin
01: Fault 5 input is connected to a COMPx output
10: Fault 5 input is EEV5_muxout input pin
11: hrtim_ext_trg5
Note: This bitfield can be written only when FLT5E enable bit is reset.

Bit 1 **FLT5P**: Fault 5 polarity
This bit selects the FAULT5 input polarity.
0: Fault 5 input is active low
1: Fault 5 input is active high
Note: This bitfield can be written only when FLT5E enable bit is reset.

Bit 0 **FLT5E**: Fault 5 enable
This bit enables the global FAULT5 input circuitry.
0: Fault 5 input disabled
1: Fault 5 input enabled

33.5.81 HRTIM burst DMA master timer update register (HRTIM_BDMUPR)

Address offset: 0x758

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

						rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:10 Reserved, must be kept at reset value.

Bit 9 **MCMP4**: MCMP4R register update enable
Refer to MCR description.

Bit 8 **MCMP3**: MCMP3R register update enable
Refer to MCR description.

Bit 7 **MCMP2**: MCMP2R register update enable
Refer to MCR description.

Bit 6 **MCMP1**: MCMP1R register update enable
Refer to MCR description.

Bit 5 **MREP**: MREP register update enable
Refer to MCR description.

Bit 4 **MPER**: MPER register update enable
Refer to MCR description.

Bit 3 **MCNT**: MCNTR register update enable
Refer to MCR description.

Bit 2 **MDIER**: MDIER register update enable
Refer to MCR description.

Bit 1 **MICR**: MICR register update enable
Refer to MCR description.

Bit 0 **MCR**: MCR register update enable
This bit defines if the master timer MCR register is part of the list of registers to be updated by the burst DMA.
0: MCR register is not updated by burst DMA accesses
1: MCR register is updated by burst DMA accesses

33.5.82 HRTIM burst DMA timer x update register (HRTIM_BDTxUPR) (x = A to F)

Address offset: Block A: 0x75C

Address offset: Block B: 0x760

Address offset: Block C: 0x764

Address offset: Block D: 0x768

Address offset: Block E: 0x76C

Address offset: Block F: 0x774

Reset value: 0x0000 0000

Bits 31:27 Reserved, must be kept at reset value.

Bit 26 **TIMxCODER**: HRTIM_CODExR register update enable timer x
Refer to TIMxCR description.

Bit 25 **TIMxCOFER**: HRTIM_COFExR register update enable timer x
Refer to TIMxCR description.

Bit 24 **TIMxCOTRGR**: HRTIM_COTRGxR register update enable timer x
Refer to TIMxCR description.

Bit 23 **TIMxEESELR**: HRTIM_EESELxR register update enable timer x
Refer to TIMxCR description.

Bit 22 **TIMxEEFR3**: HRTIM_EEFxR3 register update enable timer x
Refer to TIMxCR description.

Bit 21 **TIMxCR2**: HRTIM_TIMxCR2 register update enable timer x
Refer to TIMxCR description.

Bit 20 **TIMxFLTR**: HRTIM_FLTxR register update enable timer x
Refer to TIMxCR description.

Bit 19 **TIMxOUTR**: HRTIM_OUTxR register update enable timer x
Refer to TIMxCR description.

Bit 18 **TIMxCHPR**: HRTIM_CHPxR register update enable timer x
Refer to TIMxCR description.

Bit 17 **TIMxRSTR**: HRTIM_RSTxR register update enable timer x
Refer to TIMxCR description.

Bit 16 **TIMxEEFR2**: HRTIM_EEFxR2 register update enable timer x
Refer to TIMxCR description.

Bit 15 **TIMxEEFR1**: HRTIM_EEFxR1 register update enable timer x
Refer to TIMxCR description.

Bit 14 **TIMxRST2R**: HRTIM_RST2xR register update enable timer x
Refer to TIMxCR description.

Bit 13 **TIMxSET2R**: HRTIM_SET2xR register update enable timer x
Refer to TIMxCR description.

Bit 12 **TIMxRST1R**: HRTIM_RST1xR register update enable timer x
Refer to TIMxCR description.

Bit 11 **TIMxSET1R**: HRTIM_SET1xR register update enable timer x
Refer to TIMxCR description.

Bit 10 **TIMxDTR**: HRTIM_DTxR register update enable timer x
Refer to TIMxCR description.

Bit 9 **TIMxCMP4**: HRTIM_CMP4xR register update enable timer x
Refer to TIMxCR description.

Bit 8 **TIMxCMP3**: HRTIM_CMP3xR register update enable timer x
Refer to TIMxCR description.

Bit 7 **TIMxCMP2**: HRTIM_CMP2xR register update enable timer x
Refer to TIMxCR description.

Bit 6 **TIMxCMP1**: HRTIM_CMP1xR register update enable timer x
Refer to TIMxCR description.

Bit 5 **TIMxREP**: HRTIM_REPxR register update enable timer x
Refer to TIMxCR description.

Bit 4 **TIMxPER**: HRTIM_PERxR register update enable timer x
Refer to TIMxCR description.

Bit 3 **TIMxCNT**: HRTIM_CNTxR register update enable timer x
Refer to TIMxCR description.

Bit 2 **TIMxDIER**: HRTIM_TIMxDIER register update enable timer x
Refer to TIMxCR description.

Bit 1 **TIMxICR**: HRTIM_TIMxICR register update enable timer x
Refer to TIMxCR description.

Bit 0 **TIMxCR**: HRTIM_TIMxCR register update enable timer x
This bit defines if the master timer MCR register is part of the list of registers to be updated by the burst DMA.
0: HRTIM_TIMxCR register is not updated by burst DMA accesses
1: HRTIM_TIMxCR register is updated by burst DMA accesses

33.5.83 HRTIM burst DMA data register (HRTIM_BDMADR)

Address offset: 0x770

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
BDMADR[31:16]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
BDMADR[15:0]															
w	w	w	w	w	w	w	w	w	w	w	w	w	w	w	w

Bits 31:0 **BDMADR[31:0]**: Burst DMA data register

Write accesses to this register triggers:

– the copy of the data value into the registers enabled in BDTxUPR and BDMUPR register bits

– the increment of the register pointer to the next location to be filled

33.5.84 HRTIM ADC extended trigger register (HRTIM_ADCER)

Address offset: 0x778

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	ADC10TRG[4:0]					ADC9TRG[4:0]					ADC8TRG[4:0]

Bit 31 Reserved, must be kept at reset value.

Bits 30:26 **ADC10TRG[4:0]**: ADC trigger 10 selection
This bit selects the ADC trigger 10 source.
Refer to ADC6TRG[4:0] description.

Bits 25:21 **ADC9TRG[4:0]**: ADC trigger 9 selection
This bit selects the ADC trigger 9 source.
Refer to ADC5TRG[4:0] description.

Bits 20:16 **ADC8TRG[4:0]**: ADC trigger 8 selection
This bit selects the ADC trigger 8 source.
Refer to ADC6TRG[4:0] description.

Bit 15 Reserved, must be kept at reset value.

Bits 14:10 **ADC7TRG[4:0]**: ADC trigger 7 selection
This bit selects the ADC trigger 7 source.
Refer to ADC5TRG[4:0] description.

Bits 9:5 **ADC6TRG[4:0]**: ADC trigger 6 selection
This bit selects the ADC trigger 6 source.
0: Trigger on master compare 1
1: Trigger on master compare 2
2: Trigger on master compare 3
3: Trigger on master compare 4
4: Trigger on master period
5: Trigger on external event 6

Bits 31:23 Reserved, must be kept at reset value.

Bits 22:20 **AD10USRC[2:0]**: ADC trigger 10 update source
Refer to AD5USRC[2:0] description.

Bit 19 Reserved, must be kept at reset value.

Bits 18:16 **AD9USRC[2:0]**: ADC trigger 9 update source
Refer to AD5USRC[2:0] description.

Bit 15 Reserved, must be kept at reset value.

Bits 14:12 **AD8USRC[2:0]**: ADC trigger 8 update source
Refer to AD5USRC[2:0] description.

Bit 11 Reserved, must be kept at reset value.

Bits 10:8 **AD7USRC[2:0]**: ADC trigger 7 update source
Refer to AD5USRC[2:0] description.

Bit 7 Reserved, must be kept at reset value.

Bits 6:4 **AD6USRC[2:0]**: ADC trigger 6 update source
Refer to AD5USRC[2:0] description.

Bit 3 Reserved, must be kept at reset value.

Bits 2:0 **AD5USRC[2:0]**: ADC trigger 5 update source
These bits define the source which triggers the update of the ADC5TRG[4:0] bitfield in the HRTIM_ADCER register (transfer from preload to active register). It only defines the source timer. The precise condition is defined within the timer itself, with the BRSTDMA[1:0] bitfield in HRTIM_MCR or the UPDGAT[3:0] bitfield in HRTIM_TIMxCR register.
000: Master timer
001: Timer A
010: Timer B
011: Timer C
100: Timer D
101: Timer E
110: Timer F
111: Reserved

33.5.86 HRTIM ADC post scaler register 1 (HRTIM_ADCPS1)

Address offset: 0x780

Reset value: 0x0000 0000

Bit 31 **FLT4RSTM**: Fault 4 reset mode
Refer to FLT5RSTM description.

Bit 30 **FLT4CRES**: Fault 4 counter reset
Refer to FLT5CRES description.

Bits 29:26 **FLT4CNT[3:0]**: Fault 4 counter
Refer to FLT5CNT description.

Bit 25 **FLT4BLKS**: Fault 4 blanking source
Refer to FLT5BLKS description.

Bit 24 **FLT4BLKE**: Fault 4 blanking enable
Refer to FLT5BLKE description.

Bit 23 **FLT3RSTM**: Fault 3 reset mode
Refer to FLT5RSTM description.

Bit 22 **FLT3CRES**: Fault 3 counter reset
Refer to FLT5CRES description.

Bits 21:18 **FLT3CNT[3:0]**: Fault 3 counter
Refer to FLT5CNT description.

Bit 17 **FLT3BLKS**: Fault 3 blanking source
Refer to FLT5BLKS description.

Bit 16 **FLT3BLKE**: Fault 3 blanking enable
Refer to FLT5BLKE description.

Bit 15 **FLT2RSTM**: Fault 2 reset mode
Refer to FLT5RSTM description.

Bit 14 **FLT2CRES**: Fault 2 counter reset
Refer to FLT5CRES description.

Bits 13:10 **FLT2CNT[3:0]**: Fault 2 counter
Refer to FLT5CNT description.

Bit 9 **FLT2BLKS**: Fault 2 blanking source
Refer to FLT5BLKS description.

Bit 8 **FLT2BLKE**: Fault 2 blanking enable
Refer to FLT5BLKE description.

Bit 7 **FLT1RSTM**: Fault 1 reset mode
Refer to FLT5RSTM description.

Bit 6 **FLT1CRES**: Fault 1 counter reset
Refer to FLT5CRES description.

Bits 5:2 **FLT1CNT[3:0]**: Fault 1 counter
Refer to FLT5CNT description.

Bit 1 **FLT1BLKS**: Fault 1 blanking source
Refer to FLT5BLKS description.

Bit 0 **FLT1BLKE**: Fault 1 blanking enable
Refer to FLT5BLKE description.

33.5.89 HRTIM fault input register 4 (HRTIM_FLTINR4)

Address offset: 0x78C

Reset value: 0x0000 0000

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **FLT8RSTM**: Fault 8 reset mode
Refer to FLT5RSTM description.

Bit 30 **FLT8CRES**: Fault 8 counter reset
Refer to FLT5CRES description.

Bits 29:26 **FLT8CNT[3:0]**: Fault 8 counter
Refer to FLT5CNT description.

Bit 25 **FLT8BLKS**: Fault 8 blanking source
Refer to FLT5BLKS description.

Bit 24 **FLT8BLKE**: Fault 8 blanking enable
Refer to FLT5BLKE description.

Bit 23 **FLT7RSTM**: Fault 7 reset mode
Refer to FLT5RSTM description.

Bit 22 **FLT7CRES**: Fault 7 counter reset
Refer to FLT5CRES description.

Bits 21:18 **FLT7CNT[3:0]**: Fault 7 counter
Refer to FLT5CNT description.

Bit 17 **FLT7BLKS**: Fault 7 blanking source
Refer to FLT5BLKS description.

Bit 16 **FLT7BLKE**: Fault 7 blanking enable
Refer to FLT5BLKE description.

Bit 15 **FLT6RSTM**: Fault 6 reset mode
Refer to FLT5RSTM description.

Bit 14 **FLT6CRES**: Fault 6 counter reset
Refer to FLT5CRES description.

Bits 13:10 **FLT6CNT[3:0]**: Fault 6 counter
Refer to FLT5CNT description.

Bit 9 **FLT6BLKS**: Fault 6 blanking source
Refer to FLT5BLKS description.

Bit 8 **FLT6BLKE**: Fault 6 blanking enable
Refer to FLT5BLKE description.

Bit 7 **FLT5RSTM**: Fault 5 reset mode

This bit selects the FAULT5 counter reset mode

0: Fault 5 counter is reset on each reset / roll-over event

1: Fault 5 counter is reset on each reset / roll-over event only if no fault occurred during last counting period.

Note: This bitfield can be written only when FLT5E enable bit is reset.

Bit 6 **FLT5CRES**: Fault 5 counter reset

This bit resets the FAULT5 counter. It is set by software and reset by hardware.

0: No action

1: Fault 5 counter is reset

Bits 5:2 **FLT5CNT[3:0]**: Fault 5 counter

This bitfield selects the FAULT5 counter threshold. A fault is considered valid when the number of events is equal to the (FLT5CNT[3:0]+1) value.

Bit 1 **FLT5BLKS**: Fault 5 blanking source

The FTL5BLKS bit selects the FAULT5 blanking source (refer to *Table 358* for details).

0: Fault 5 reset-aligned blanking window

1: Fault 5 Moving blanking window

Note: This bitfield can be written only when FLT5E enable bit is reset.

Bit 0 **FLT5BLKE**: Fault 5 blanking enable

The FTL5BLKE bit selects the FAULT5 blanking mode. The blanking source is defined by the FLT5BLKS bit.

0: No blanking on fault 5

1: Fault 5 blanking mode

Note: This bitfield can be written only when FLT5E enable bit is reset

33.5.90 HRTIM fault input register 5 (HRTIM_FLTINR5)

Address offset: 0x790

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
FLT8LCK	FLT8F[3:0]				FLT8SRC[0]	FLT8P	FLT8E	FLT7LCK	FLT7F[3:0]				FLT7SRC[0]	FLT7P	FLT7E
rwo	rw	rw	rw	rw	rw	rw	rw	rwo	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bit 15 **FLT8LCK**: Fault 8 lock
Refer to FLT7LCK description.

Bits 14:11 **FLT8F[3:0]**: Fault 8 filter
Refer to FLT7F[3:0] description.

Bit 10 **FLT8SRC[0]**: Fault 8 source bit 0
Refer to FLT7SRC[0] description.

Bit 9 **FLT8P**: Fault 8 polarity
Refer to FLT7P description.

Bit 8 **FLT8E**: Fault 8 enable
Refer to FLT7E description.

Bit 7 **FLT7LCK**: Fault 7 lock
The FLT7LCK bit modifies the write attributes of the fault programming bit, so that they are protected against spurious write accesses.
This bit is write-once. Once it has been set, it cannot be modified till the next system reset.
0: FLT7E, FLT7P, FLT7SRC[1:0], FLT7F[3:0] and FLT7BLK bits are read/write.
1: FLT7E, FLT7P, FLT7SRC[1:0], FLT7F[3:0] and FLT7BLK bits cannot be written (read-only mode)

Bits 6:3 **FLT7F[3:0]**: Fault 7 filter

This bitfield defines the frequency used to sample FLT7 input and the length of the digital filter applied to FLT7. The digital filter is made of an event counter in which N events are needed to validate a transition on the output.

0000: No filter, FLT7 acts asynchronously
0001: $f_{SAMPLING} = f_{HRTIM}$, N = 2
0010: $f_{SAMPLING} = f_{HRTIM}$, N = 4
0011: $f_{SAMPLING} = f_{HRTIM}$, N = 8
0100: $f_{SAMPLING} = f_{FLTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{FLTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{FLTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{FLTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{FLTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{FLTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{FLTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{FLTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{FLTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{FLTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{FLTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{FLTS}/32$, N = 8

Note: This bitfield can be written only when FLT7E enable bit is reset.
This bitfield cannot be modified when FLT7LOCK has been programmed.

Bit 2 **FLT7SRC[0]**: Fault 7 source bit 0

The FTL7SRC[1:0] bitfield selects the FAULT7 input source (refer to *Table 325* for connection details).

00: Fault 7 input is HRTIM_FLT7 input pin
01: Fault 7 input is connected to a COMPx output
10: Fault 7 input is EEV7_muxout input pin
01: hrtim_ext_trg7

Note: This bitfield can be written only when FLT7E enable bit is reset.

Bit 1 **FLT7P**: Fault 7 polarity

This bit selects the FAULT7 input polarity.

0: Fault 7 input is active low
1: Fault 7 input is active high

Note: This bitfield can be written only when FLT7E enable bit is reset.

Bit 0 **FLT7E**: Fault 7 enable

This bit enables the global FAULT7 input circuitry.

0: Fault 7 input disabled
1: Fault 7 input enabled

33.5.91 HRTIM timer external event control register 4 (HRTIM_EECR4)

Address offset: 0x7A0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **EE13FAST**: External event 3 fast mode
Refer to EE11FAST description.

Bits 16:15 **EE13SNS[1:0]**: External event 3 sensitivity
Refer to EE11SNS[1:0] description.

Bit 14 **EE13POL**: External event 3 polarity
Refer to EE11POL description.

Bits 13:12 **EE13SRC[1:0]**: External event 3 source
This bitfield is combined with EE13SRC[2] bit. Refer to EE11SRC[1:0] description.

Bit 11 **EE12FAST**: External event 2 fast mode
Refer to EE11FAST description.

Bits 10:9 **EE12SNS[1:0]**: External event 2 sensitivity
Refer to EE11SNS[1:0] description.

Bit 8 **EE12POL**: External event 2 polarity
Refer to EE11POL description.

Bits 7:6 **EE12SRC[1:0]**: External event 2 source
This bitfield is combined with EE12SRC[2] bit. Refer to EE11SRC[1:0] description.

Bit 5 **EE11FAST**: External event 11 fast mode
0: External event 11 is re-synchronized by the HRTIM logic before acting on outputs, which adds a f_{HRTIM} clock-related latency
1: External event 11 is acting asynchronously on outputs (low latency mode)
Note: This bit must not be modified once the counter in which the event is used is enabled (TxCEN bit set).

Bits 4:3 **EE11SNS[1:0]**: External event 11 sensitivity
00: On active level defined by EE11POL bit
01: Rising edge, whatever EE11POL bit value
10: Falling edge, whatever EE11POL bit value
11: Both edges, whatever EE11POL bit value

Bit 2 **EE11POL**: External event 11 polarity
This bit is only significant if EE11SNS[1:0] = 00.
0: External event is active high
1: External event is active low

Note: This parameter cannot be changed once the timer x is enabled. It must be configured prior to setting EE11FAST bit.

Bits 1:0 **EE11SRC[1:0]**: External event 11 source
This bitfield selects the External event 11 source. This bitfield is combined with EE11SRC[2] bit. See *Table 326* for details.
000:hrtim_eev11_1
001:hrtim_eev11_2

Bit 31 Reserved, must be kept at reset value.

Bit 30 **EE16SRC[2]**: External event 16 source - bit 2
Refer to EE16SRC[1:0] bitfield description

Bit 29 Reserved, must be kept at reset value.

Bit 28 **EE15SRC[2]**: External event 15 source - bit 2
Refer to EE15SRC[1:0] bitfield description

Bit 27 Reserved, must be kept at reset value.

Bit 26 **EE14SRC[2]**: External event 14 source - bit 2
Refer to EE14SRC[1:0] bitfield description

Bit 25 Reserved, must be kept at reset value.

Bit 24 **EE13SRC[2]**: External event 13 source - bit 2
Refer to EE13SRC[1:0] bitfield description

Bit 23 Reserved, must be kept at reset value.

Bit 22 **EE12SRC[2]**: External event 12 source - bit 2
Refer to EE12SRC[1:0] bitfield description

Bit 21 Reserved, must be kept at reset value.

Bit 20 **EE11SRC[2]**: External event 11 source - bit 2
Refer to EE11SRC[1:0] bitfield description

Bit 19 Reserved, must be kept at reset value.

Bit 18 **EE10SRC[2]**: External event 10 source - bit 2
Refer to EE10SRC[1:0] bitfield description

Bit 17 Reserved, must be kept at reset value.

Bit 16 **EE9SRC[2]**: External event 9 source - bit 2
Refer to EE9SRC[1:0] bitfield description

Bit 15 Reserved, must be kept at reset value.

Bit 14 **EE8SRC[2]**: External event 8 source - bit 2
Refer to EE8SRC[1:0] bitfield description

Bit 13 Reserved, must be kept at reset value.

Bit 12 **EE7SRC[2]**: External event 7 source - bit 2
Refer to EE7SRC[1:0] bitfield description

Bit 11 Reserved, must be kept at reset value.

Bit 10 **EE6SRC[2]**: External event 6 source - bit 2
Refer to EE6SRC[1:0] bitfield description

Bit 9 Reserved, must be kept at reset value.

Bit 8 **EE5SRC[2]**: External event 5 source - bit 2
Refer to EE5SRC[1:0] bitfield description

Bit 7 Reserved, must be kept at reset value.

Bit 6 **EE4SRC[2]**: External event 4 source - bit 2
Refer to EE4SRC[1:0] bitfield description

Bit 5 Reserved, must be kept at reset value.

Bit 4 **EE3SRC[2]**: External event 3 source - bit 2
Refer to EE3SRC[1:0] bitfield description

Bit 3 Reserved, must be kept at reset value.

Bit 2 **EE2SRC[2]**: External event 2 source - bit 2
Refer to EE2SRC[1:0] bitfield description

Bit 1 Reserved, must be kept at reset value.

Bit 0 **EE1SRC[2]**: External event 1 source - bit 2
Refer to EE1SRC[1:0] bitfield description

33.5.95 HRTIM control register 3 (HRTIM_CR3)

Address offset: 0x7C0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	RTFUDISA	RTEUDISA	RTDUDISA	RTCUDISA	RTBUDISA	RTAUDISA	RMUDISA
									rw	rw	rw	rw	rw	rw	rw

Bits 31:7 Reserved, must be kept at reset value.

Bit 6 **RTFUDISA**: Remote timer F update disable authorization
Refer to RTAUDISA description.

Bit 5 **RTEUDISA**: Remote timer E update disable authorization
Refer to RTAUDISA description

Bit 4 **RTDUDISA**: Remote timer D update disable authorization
Refer to RTAUDISA description.

Bit 3 **RTCUDISA**: Remote timer C update disable authorization
Refer to RTAUDISA description.

Bit 2 **RTBUDISA**: Remote timer B update disable authorization
Refer to RTAUDISA description.

Bit 1 **RTAUDISA**: Remote timer A update disable authorization
This bit is set and cleared by software to authorize another HRTIMER to disable Timer A's update events.
0: Remote update disable requests are ignored.
1: Remote update disable requests authorized.

Bit 0 **RMUDISA**: Remote master update disable authorization
This bit is set and cleared by software to authorize another HRTIMER to disable master timer's update events.
0: Remote update disable requests are ignored.
1: Remote update disable requests authorized.

33.5.96 HRTIM option register (HRTIM_OR)

Address offset: 0x7FC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	HSPBKSEL
															rw

Bits 31:1 Reserved, must be kept at reset value.

Bit 0 **HSPBKSEL**: HSP break selection

This bit enables the HSP break to be connected to the hrtim_sys_flt input and ORed with other system level fault (see *Table 332: HRTIM1/HRTIM2 system fault sources selection* for details).

Condition: HRTIM1

0: hsp1_break_out0 disabled

1: hsp1_break_out0 enabled and connected to hrtim1_sys_flt

Condition: HRTIM2

0: hsp1_break_out2 disabled

1: hsp1_break_out2 enabled and connected to hrtim2_sys_flt

33.5.97 HRTIM register map

The tables below summarize the HRTIM registers mapping.

Table 364. HRTIM Register map and reset values – master timer

1. This register can be preloaded (see *Table 350 on page 1599*).

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

34 Advanced-control timers (TIM1/TIM8/TIM20)

34.1 TIM1/TIM8/TIM20 introduction

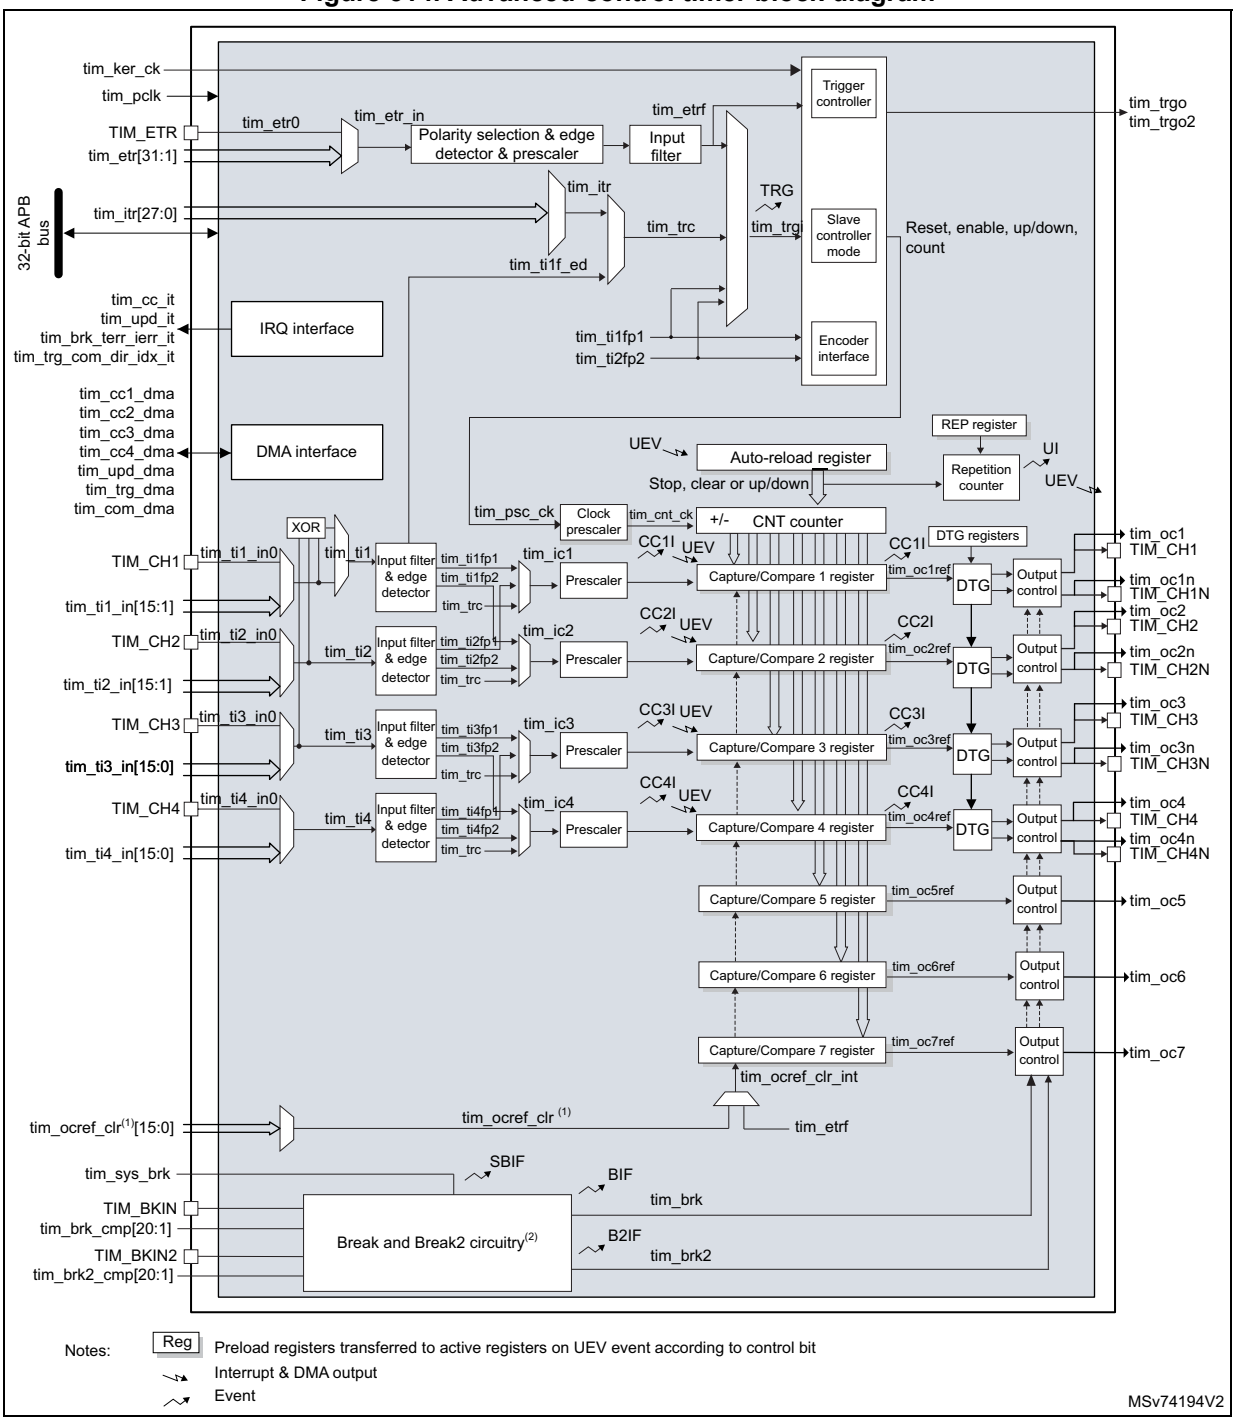
The advanced-control timers (TIM1/TIM8/TIM20) consist of a 16-bit autoreload counter driven by a programmable prescaler.

It may be used for a variety of purposes, including measuring the pulse lengths of input signals (input capture) or generating output waveforms (output compare, PWM, complementary PWM with dead-time insertion).

Pulse lengths and waveform periods can be modulated from a few microseconds to several milliseconds using the timer prescaler and the RCC clock controller prescalers.

The advanced-control (TIM1/TIM8/TIM20) and general-purpose (TIMy) timers are completely independent, and do not share any resources. They can be synchronized together as described in *Section 34.3.35: Timer synchronization*.

34.2 TIM1/TIM8/TIM20 main features



TIM1/TIM8/TIM20 timer features include:

- 16-bit up, down, up/down autoreload counter.
- 16-bit programmable prescaler allowing dividing (also “on the fly”) the counter clock frequency by any factor from 1 to 65536.
- Seven independent channels for:
  - Input capture (but channels 5, 6 and 7)
  - Output compare
  - PWM generation (edge and center-aligned mode)
  - One-pulse mode output
- Complementary outputs with programmable dead-time
- Synchronization circuit to control the timer with external signals and to interconnect several timers together.
- Repetition counter to update the timer registers only after a given number of cycles of the counter.
- 2 break inputs to put the timer’s output signals in a safe user selectable configuration.
- Interrupt/DMA generation on the following events:
  - Update: counter overflow/underflow, counter initialization (by software or internal/external trigger)
  - Trigger event (counter start, stop, initialization, or count by internal/external trigger)
  - Input capture
  - Output compare
- Incremental encoders, quadrature encoders and hall-sensors support
- Trigger input for external clock or cycle-by-cycle current management
- ADC synchronization for jitter-free sampling points

34.3 TIM1/TIM8/TIM20 functional description

34.3.1 Block diagram

Figure 514. Advanced-control timer block diagram

1. This feature is not available on all timers, refer to *Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals*.
2. See *Figure 565: Break and Break2 circuitry overview* for details.

34.3.2 TIM1/TIM8/TIM20 pins and internal signals

The tables in this section summarize the TIM inputs and outputs

Table 367. TIM input/output pins

Pin name	Signal type	Description
TIM_CH1 TIM_CH2 TIM_CH3 TIM_CH4	Input/Output	Timer multi-purpose channels. Each channel can be used for capture, compare or PWM. TIM_CH1 and TIM_CH2 can also be used as external clock (below 1/4 of the tim_ker_ck clock), external trigger and quadrature encoder inputs. TIM_CH1, TIM_CH2 and TIM_CH3 can be used to interface with digital hall effect sensors.
TIM_CH1N TIM_CH2N TIM_CH3N TIM_CH4N	Output	Timer complementary outputs, derived from TIM_CHx outputs with the possibility to have deadtime insertion.
TIM_ETR	Input	External trigger input. This input can be used as external trigger or as external clock source. This input can receive a clock with a frequency higher than the tim_ker_ck if the tim_etr_in prescaler is used.
TIM_BKIN TIM_BKIN2	Input / Output	Break and Break2 inputs. These inputs can also be configured in bidirectional mode.

Table 368. TIM internal input/output signals

Internal signal name	Signal type	Description
tim_ti1_in[15:0] tim_ti2_in[15:0] tim_ti3_in[15:0] tim_ti4_in[15:0]	Input	Internal timer inputs bus. The tim_ti1_in[15:0] and tim_ti2_in[15:0] inputs can be used for capture or as external clock (below 1/4 of the tim_ker_ck clock) and for quadrature encoder signals.
tim_etr[31:0]	Input	External trigger internal input bus. These inputs can be used as trigger, external clock or for hardware cycle-by-cycle pulsewidth control. These inputs can receive clock with a frequency higher than the tim_ker_ck if the tim_etr_in prescaler is used.
tim_itr[27:0]	Input	Internal trigger input bus. These inputs can be used for the slave mode controller or as a input clock (below 1/4 of the tim_ker_ck clock).
tim_trgo/tim_trgo2	Output	Internal trigger outputs. These triggers are used by other timers and /or other peripherals.

Table 368. TIM internal input/output signals (continued)

Internal signal name	Signal type	Description
tim_ocx (x = 1 to 4)	Output	Internal output compare signals of channels 1 to 4. These outputs can be used for triggering/synchronizing other internal peripherals.
tim_ocxn (x = 1 to 4)	Output	Internal timer complementary outputs, derived from tim_ocx internal outputs with the possibility to have deadtime insertion.
tim_ocx (x = 5 to 7)	Output	Internal output compare signals of channels 5 to 7. These outputs can be used for triggering/synchronizing other internal peripherals.
tim_ocref_clr[15:0]	Input	Timer tim_ocref_clr input bus. These inputs can be used to clear the tim ocxref signals, typically for hardware cycle-by-cycle pulsewidth control.
tim_brk_cmp[20:1]	Input	Break input for internal signals
tim_brk2_cmp[20:1]	Input	Break2 input for internal signals
tim_sys_brk[n:0]	Input	System break input. This input gathers the MCU's system level errors.
tim_pclk	Input	Timer APB clock
tim_ker_ck	Input	Timer kernel clock
tim_cc_it	Output	Timer capture/compare interrupt
tim_upd_it	Output	Timer update event interrupt
tim_brk_terr_ierr_it	Output	Timer break, break2, transition error and index error interrupt
tim_trgi_com_dir_idx_it	Output	Timer trigger, commutation, direction and index interrupt
tim_cc1_dma tim_cc2_dma tim_cc3_dma tim_cc4_dma	Output	Timer capture / compare 1..4 dma requests
tim_upd_dma	Output	Timer update dma request
tim_trgi_dma	Output	Timer trigger dma request
tim_com_dma	Output	Timer commutation dma request

34.3.3 Time-base unit

The main block of the programmable advanced-control timer is a 16-bit counter with its related autoreload register. The counter can count up, down or both up and down. The counter clock can be divided by a prescaler.

The counter, the autoreload register and the prescaler register can be written or read by software, even when the counter is running.

The time-base unit includes:

- Counter register (TIM_CNT)
- Prescaler register (TIM_PSC)
- Autoreload register (TIM_ARR)
- Repetition counter register (TIM_RCR)

The autoreload register is preloaded. Writing to or reading from the autoreload register accesses the preload register. The content of the preload register are transferred into the shadow register permanently or at each update event (UEV), depending on the autoreload preload enable bit (ARPE) in TIM_CR1 register. The update event is sent when the counter reaches the overflow (or underflow when downcounting) and if the UDIS bit equals 0 in the TIM_CR1 register. It can also be generated by software. The generation of the update event is described in detailed for each configuration.

Note: An update overrun status bit (UIOVRF in TIM_SR register) indicates that an update request occurred while an update interrupt is pending (update interrupt flag set). This bit is useful when debugging closed loop applications, to indicate that:

- the update interrupt service routine is too long with respect to the interval between consecutive update events

- the update interrupt service routine was served too late with respect to the subsequent update event

The counter is clocked by the prescaler output tim_cnt_ck, which is enabled only when the counter enable bit (CEN) in TIM_CR1 register is set (refer also to the slave mode controller description to get more details on counter enabling).

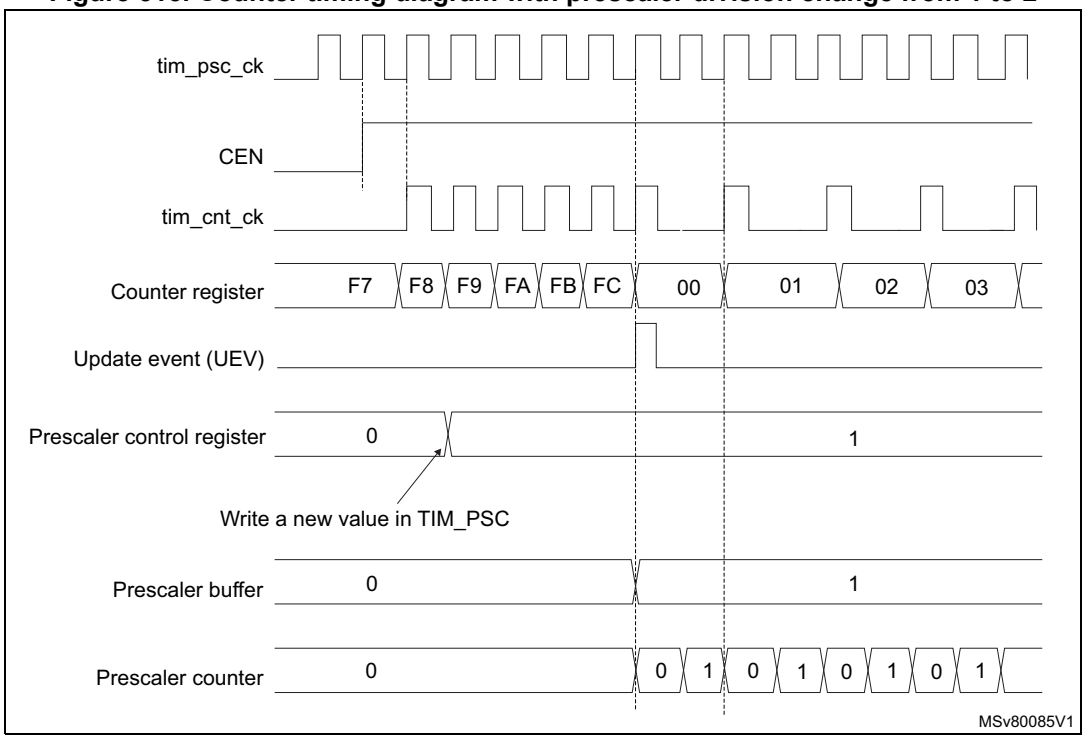
Note: The counter starts counting 1 clock cycle after setting the CEN bit in the TIM_CR1 register.

Prescaler description

The prescaler divides the counter clock frequency by any factor from 1 to 65536. It is based on a 16-bit counter controlled through a 16-bit register (in the TIM_PSC register). It can be changed on the fly as this control register is buffered. The new prescaler ratio is taken into account at the next update event.

Figure 515 and *Figure 516* give some examples of the counter behavior when the prescaler ratio is changed on the fly.

Figure 515. Counter timing diagram with prescaler division change from 1 to 2



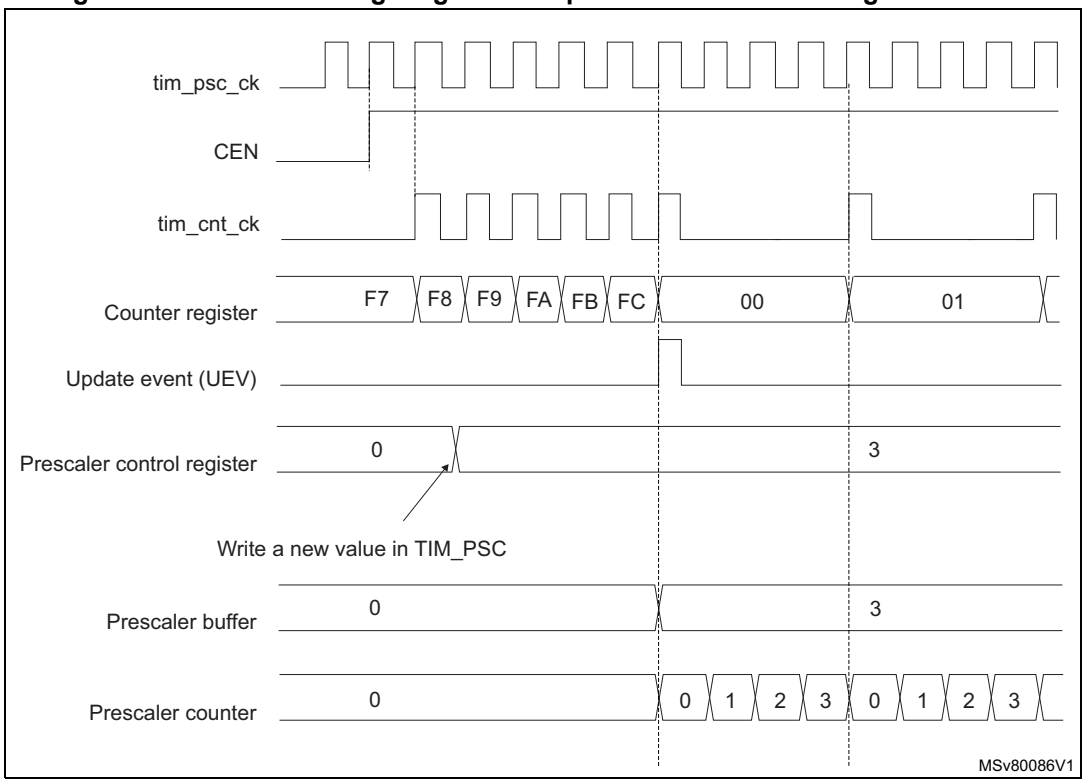


Figure 516. Counter timing diagram with prescaler division change from 1 to 4

34.3.4 Counter modes

Upcounting mode

In upcounting mode, the counter counts from 0 to the autoreload value (content of the TIM_ARR register), then restarts from 0 and generates a counter overflow event.

If the repetition counter is used, the update event (UEV) is generated after upcounting is repeated for the number of times programmed in the repetition counter register (TIM_RCR) + 1. Else the update event is generated at each counter overflow.

Setting the UG bit in the TIM_EGR register (by software or by using the slave mode controller) also generates an update event.

The UEV event can be disabled by software by setting the UDIS bit in the TIM_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter restarts from 0, as well as the counter of the prescaler (but the prescale rate does not change). In addition, if the URS bit (update request selection) in TIM_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIM_SR register) is set (depending on the URS bit):

- The repetition counter is reloaded with the content of TIM_RCR register,
- The autoreload shadow register is updated with the preload value (TIM_ARR),
- The buffer of the prescaler is reloaded with the preload value (content of the TIM_PSC register).

The following figures show some examples of the counter behavior for different clock frequencies when TIM_ARR = 0x36.

Figure 517. Counter timing diagram, internal clock divided by 1

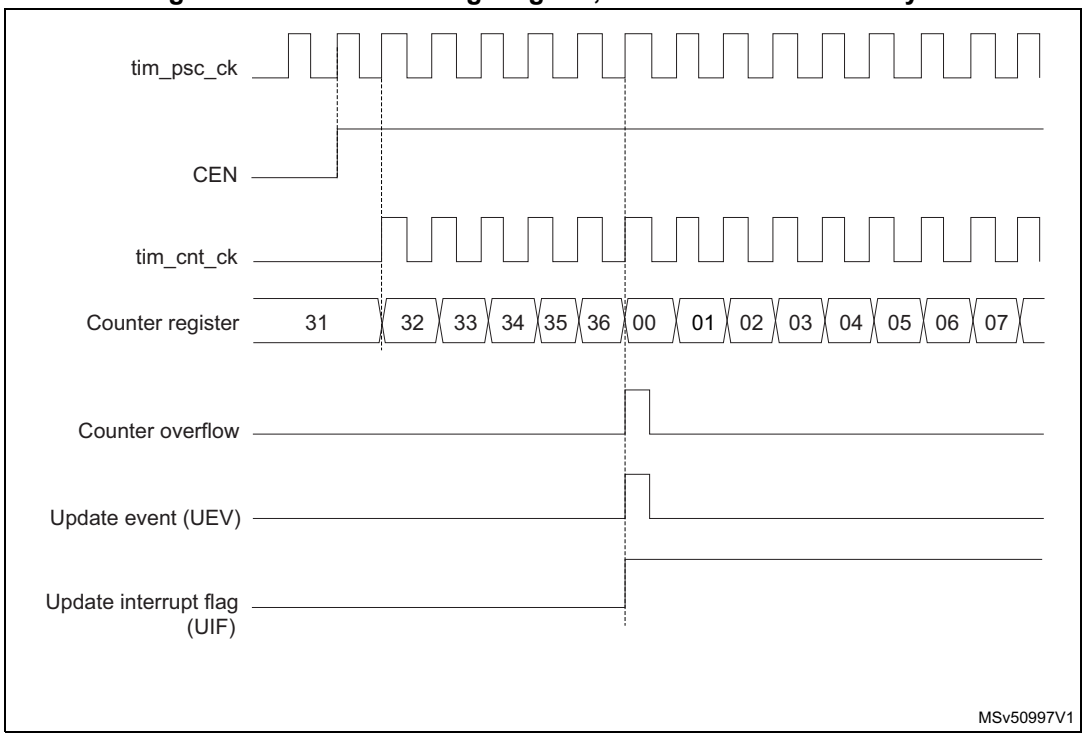

Figure 518. Counter timing diagram, internal clock divided by 2

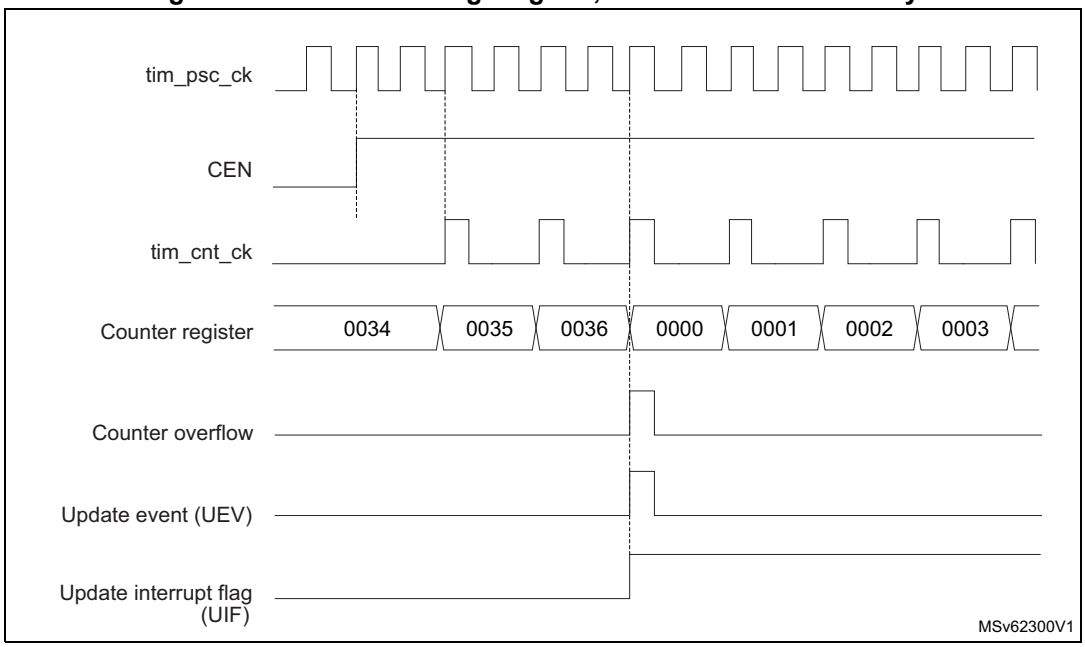

Figure 519. Counter timing diagram, internal clock divided by 4

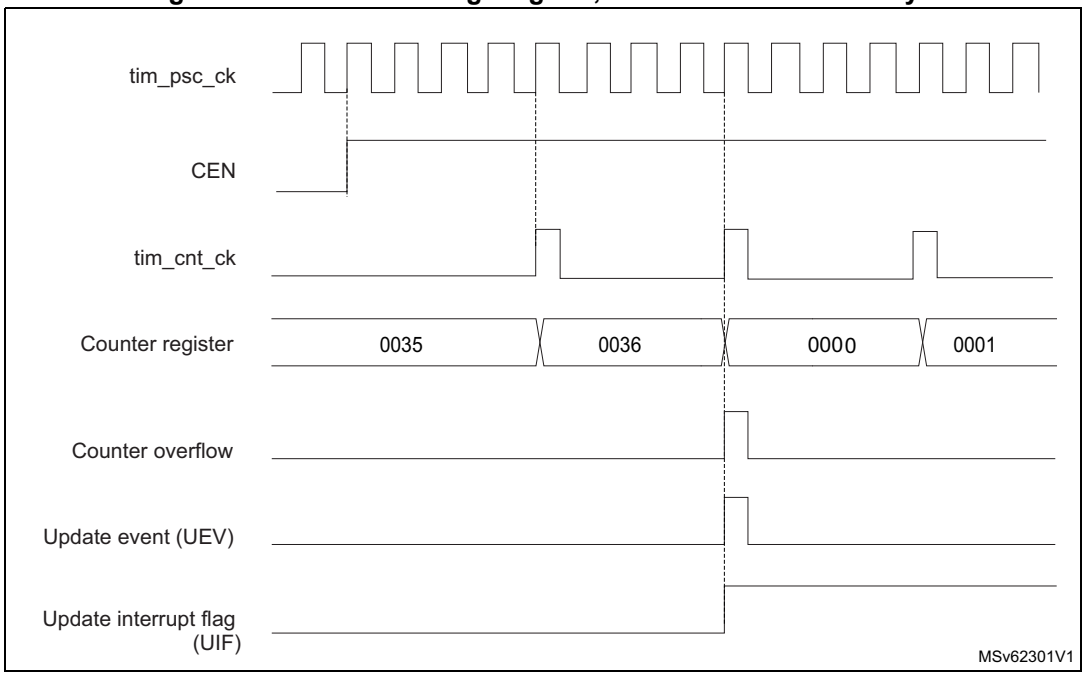

Figure 520. Counter timing diagram, internal clock divided by N

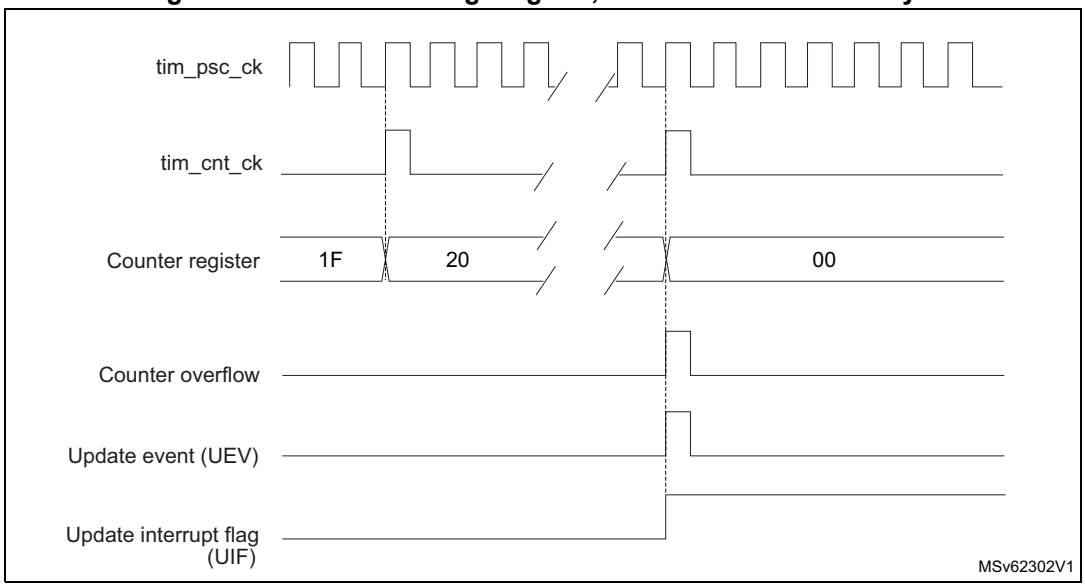

Figure 521. Counter timing diagram, update event when ARPE = 0 (TIM_ARR not preloaded)

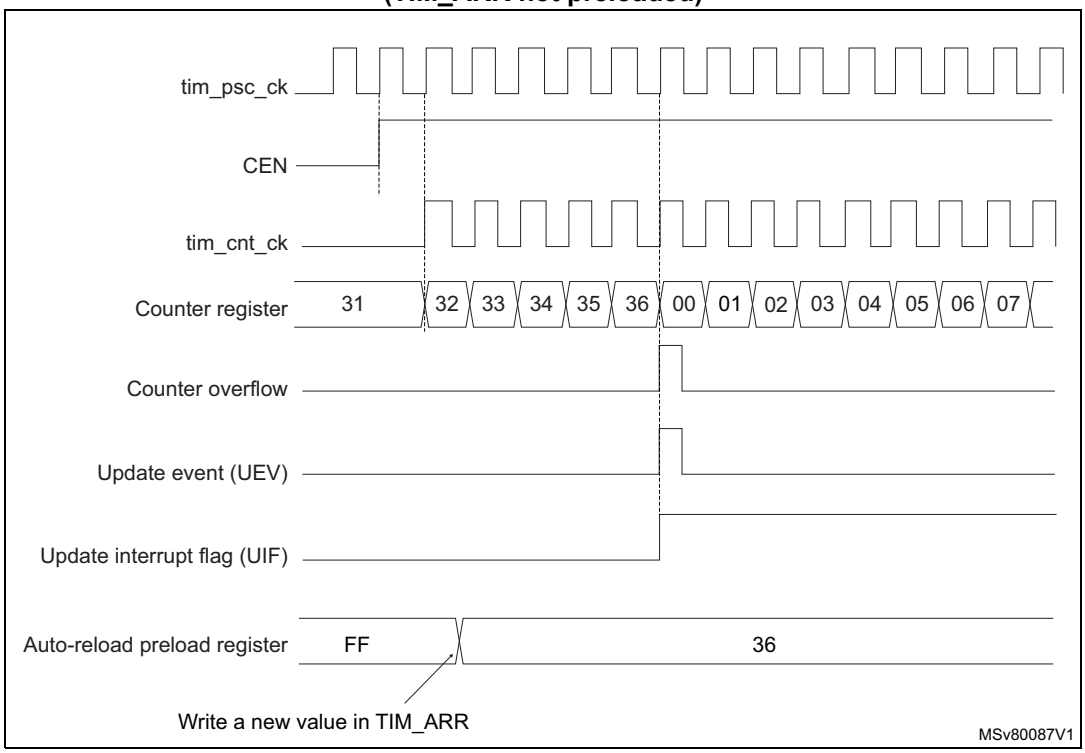

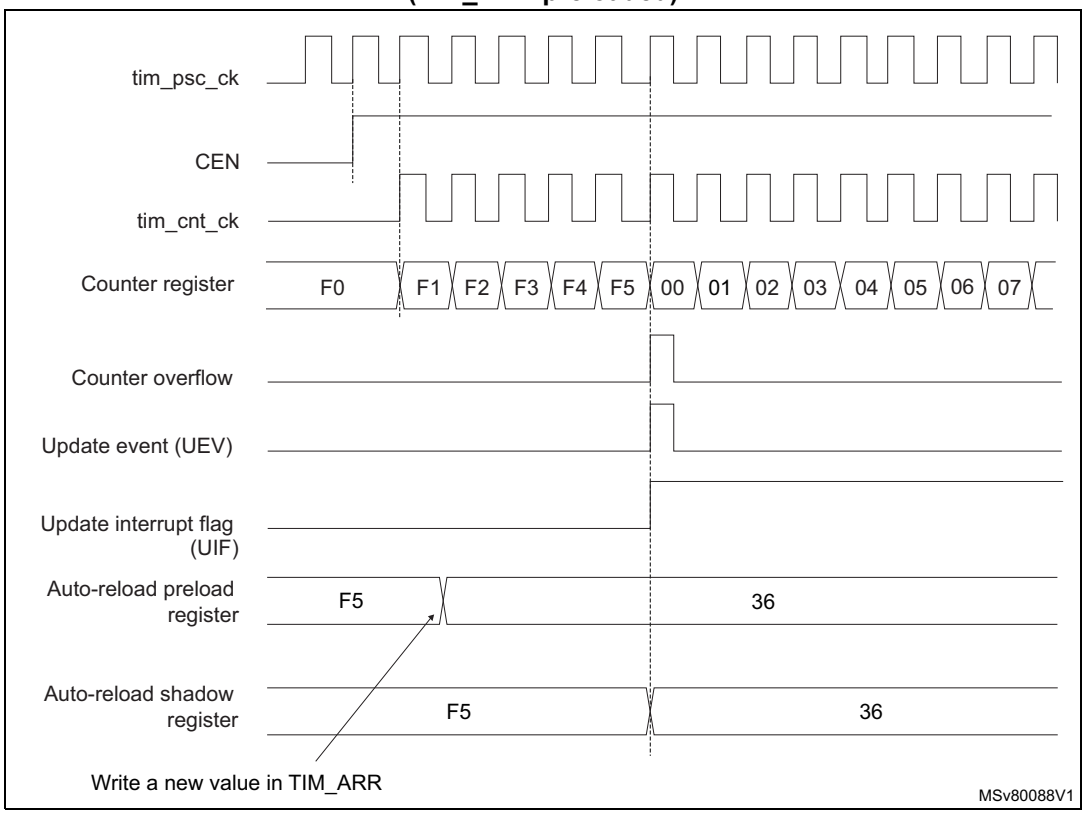

Figure 522. Counter timing diagram, update event when ARPE = 1 (TIM_ARR preloaded)

Downcounting mode

In downcounting mode, the counter counts from the autoreload value (content of the TIM_ARR register) down to 0, then restarts from the autoreload value and generates a counter underflow event.

If the repetition counter is used, the update event (UEV) is generated after downcounting is repeated for the number of times programmed in the repetition counter register (TIM_RCR) + 1. Else the update event is generated at each counter underflow.

Setting the UG bit in the TIM_EGR register (by software or by using the slave mode controller) also generates an update event.

The UEV update event can be disabled by software by setting the UDIS bit in TIM_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until UDIS bit has been written to 0. However, the counter restarts from the current autoreload value, whereas the counter of the prescaler restarts from 0 (but the prescale rate doesn't change).

In addition, if the URS bit (update request selection) in TIM_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIM_SR register) is set (depending on the URS bit):

- The repetition counter is reloaded with the content of TIM_RCR register.
- The buffer of the prescaler is reloaded with the preload value (content of the TIM_PSC register).
- The autoreload active register is updated with the preload value (content of the TIM_ARR register). Note that the autoreload is updated before the counter is reloaded, so that the next period is the expected one.

The following figures show some examples of the counter behavior for different clock frequencies when TIM_ARR = 0x36.

Figure 523. Counter timing diagram, internal clock divided by 1

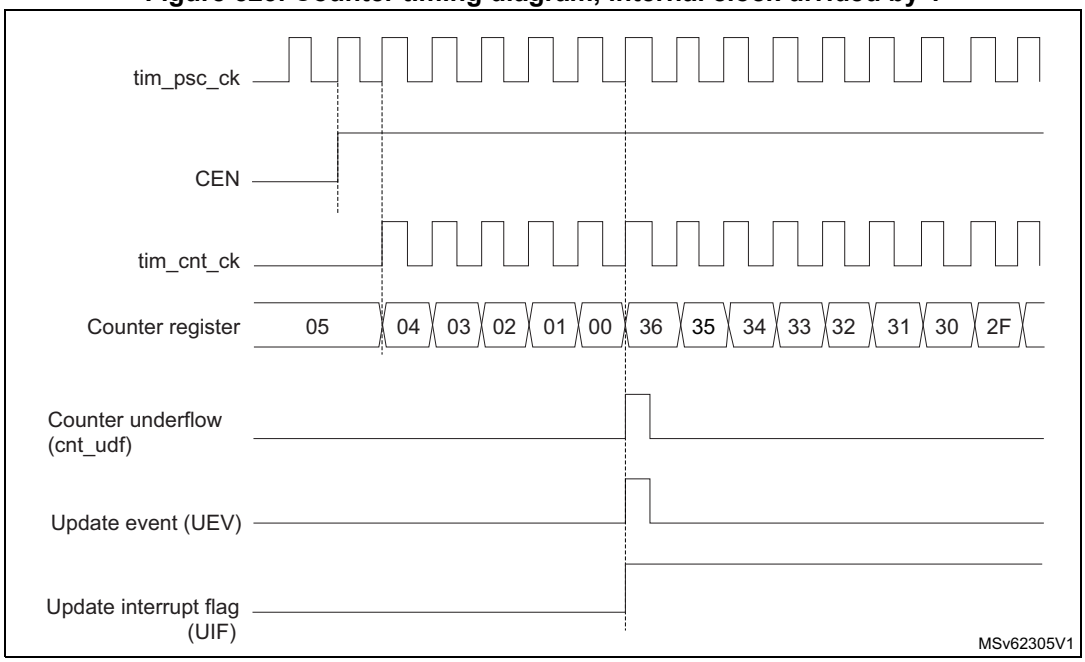

Figure 524. Counter timing diagram, internal clock divided by 2

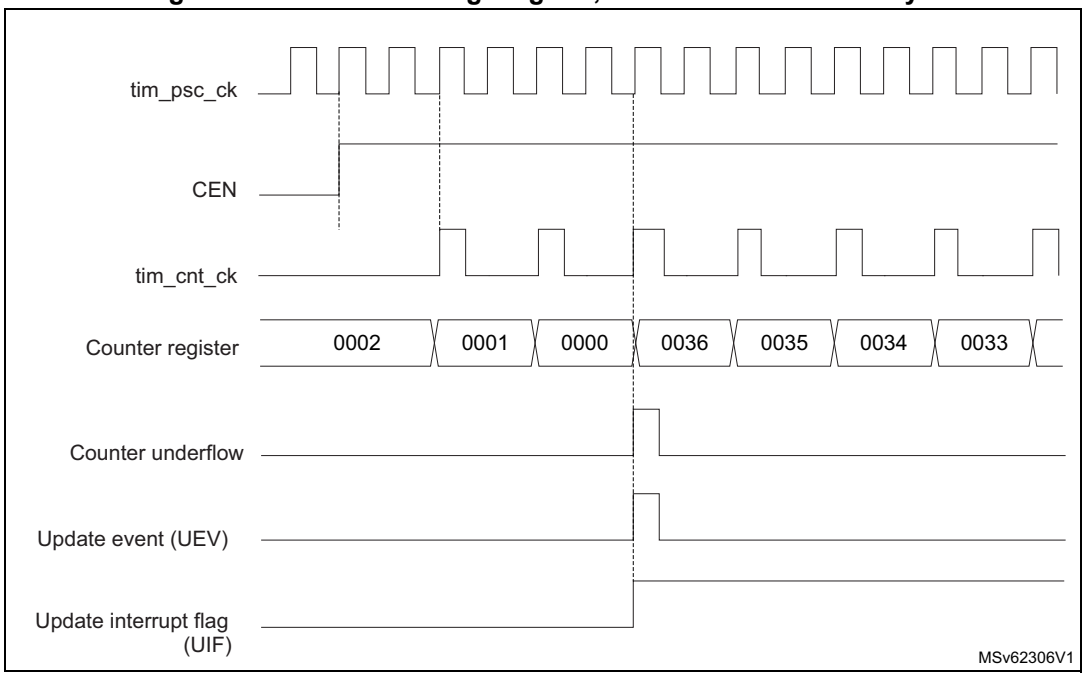

Figure 525. Counter timing diagram, internal clock divided by 4

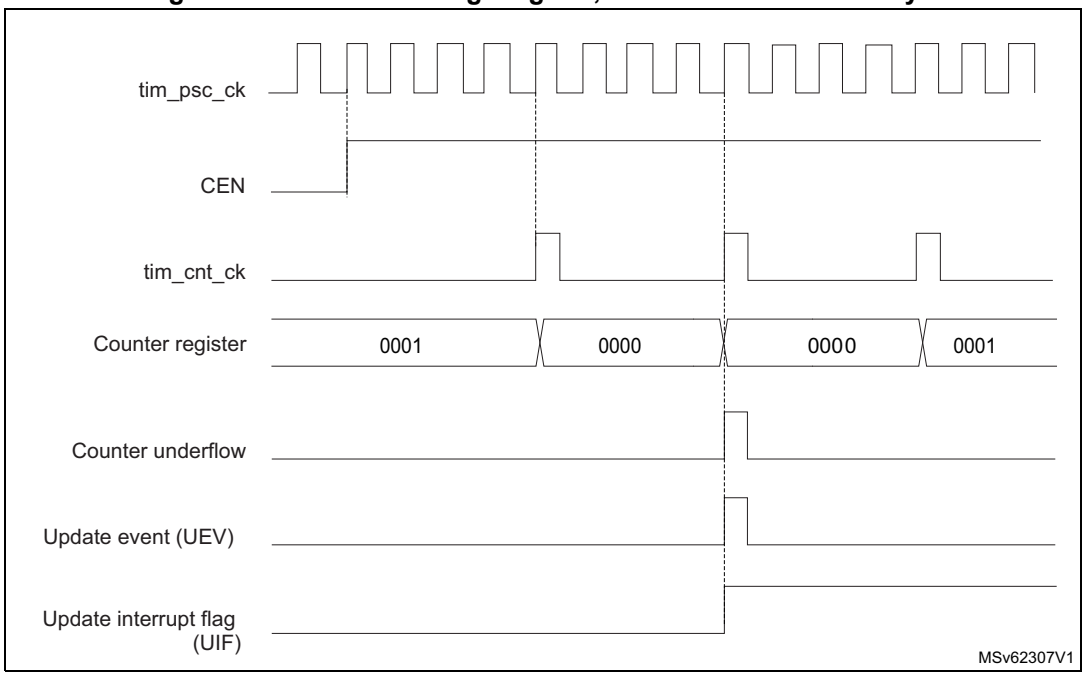

Figure 526. Counter timing diagram, internal clock divided by N

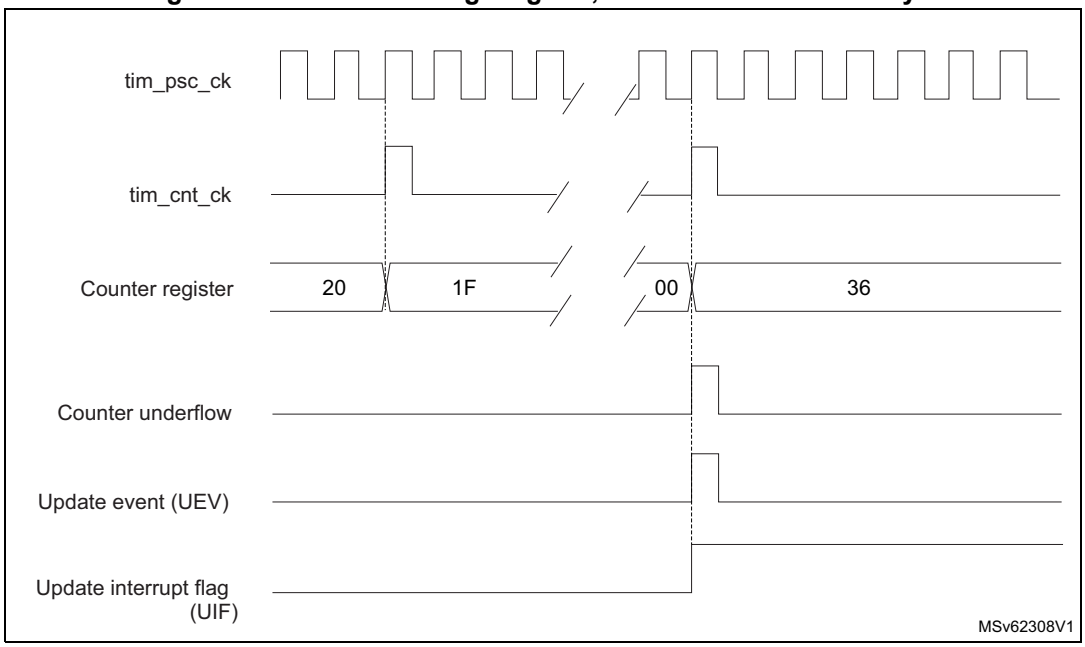

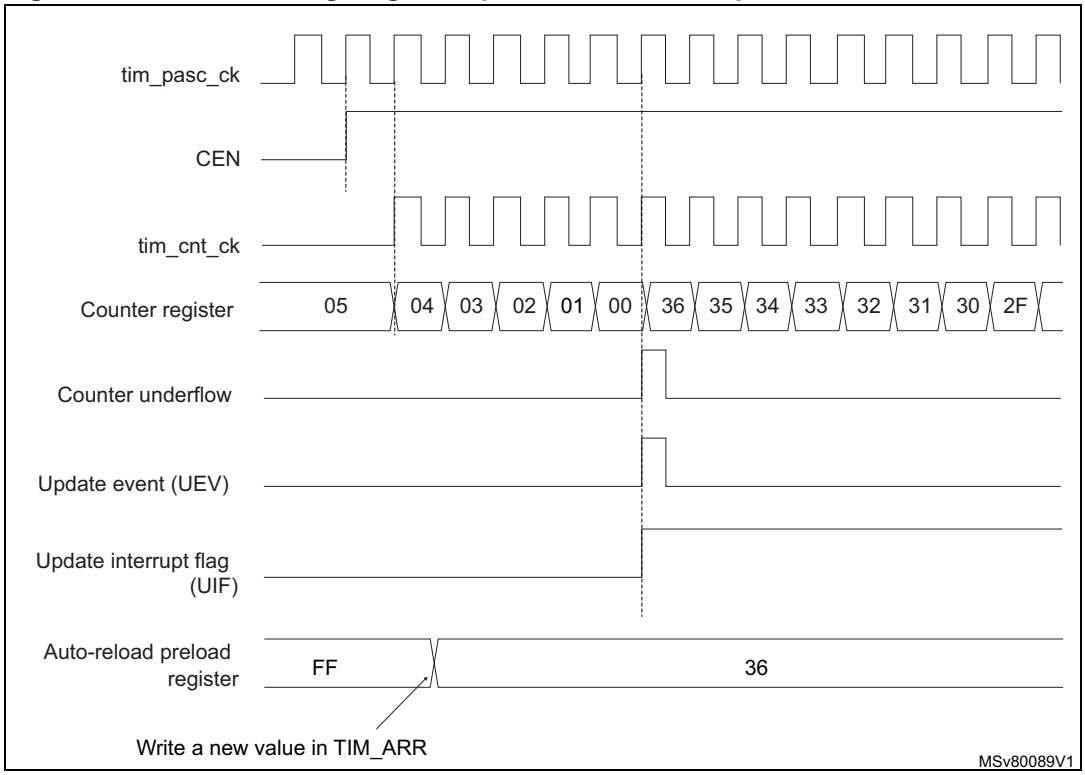

Figure 527. Counter timing diagram, update event when repetition counter is not used

Center-aligned mode (up/down counting)

In center-aligned mode, the counter counts from 0 to the autoreload value (content of the TIM_ARR register) – 1, generates a counter overflow event, then counts from the

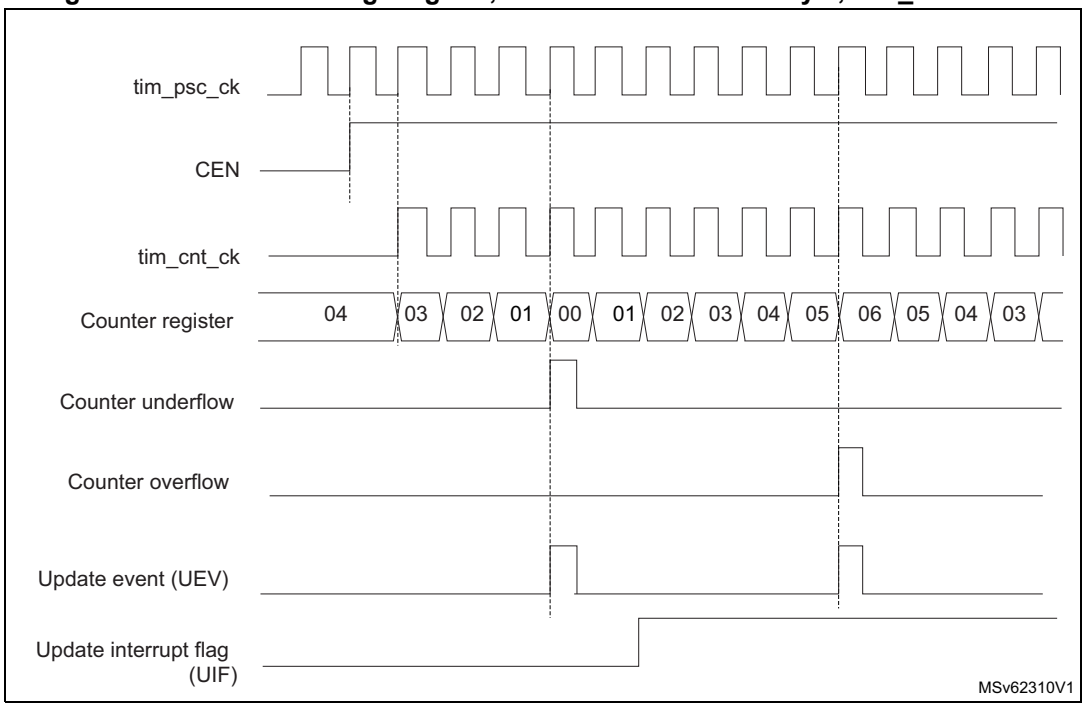
autoreload value down to 1 and generates a counter underflow event. Then it restarts counting from 0.

Center-aligned mode is active when the CMS bits in TIM_CR1 register are not equal to 00. The Output compare interrupt flag of channels configured in output is set when: the counter counts down (Center aligned mode 1, CMS = 01), the counter counts up (Center aligned mode 2, CMS = 10) the counter counts up and down (Center aligned mode 3, CMS = 11).

In this mode, the DIR direction bit in the TIM_CR1 register cannot be written. It is updated by hardware and gives the current direction of the counter.

The update event can be generated at each counter overflow and at each counter underflow or by setting the UG bit in the TIM_EGR register (by software or by using the slave mode controller) also generates an update event. In this case, the counter restarts counting from 0, as well as the counter of the prescaler.

The UEV update event can be disabled by software by setting the UDIS bit in the TIM_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until UDIS bit has been written to 0. However, the counter continues counting up and down, based on the current autoreload value.



In addition, if the URS bit (update request selection) in TIM_CR1 register is set, setting the UG bit generates an UEV update event but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIM_SR register) is set (depending on the URS bit):

- The repetition counter is reloaded with the content of TIM_RCR register
- The buffer of the prescaler is reloaded with the preload value (content of the TIM_PSC register)
- The autoreload active register is updated with the preload value (content of the TIM_ARR register). Note that if the update source is a counter overflow, the autoreload is updated before the counter is reloaded, so that the next period is the expected one (the counter is loaded with the new value).

The following figures show some examples of the counter behavior for different clock frequencies.

Figure 528. Counter timing diagram, internal clock divided by 1, TIM_ARR = 0x6

1. Here, center-aligned mode 1 is used (for more details refer to *Section 34.6: TIM1/TIM8/TIM20 registers*).

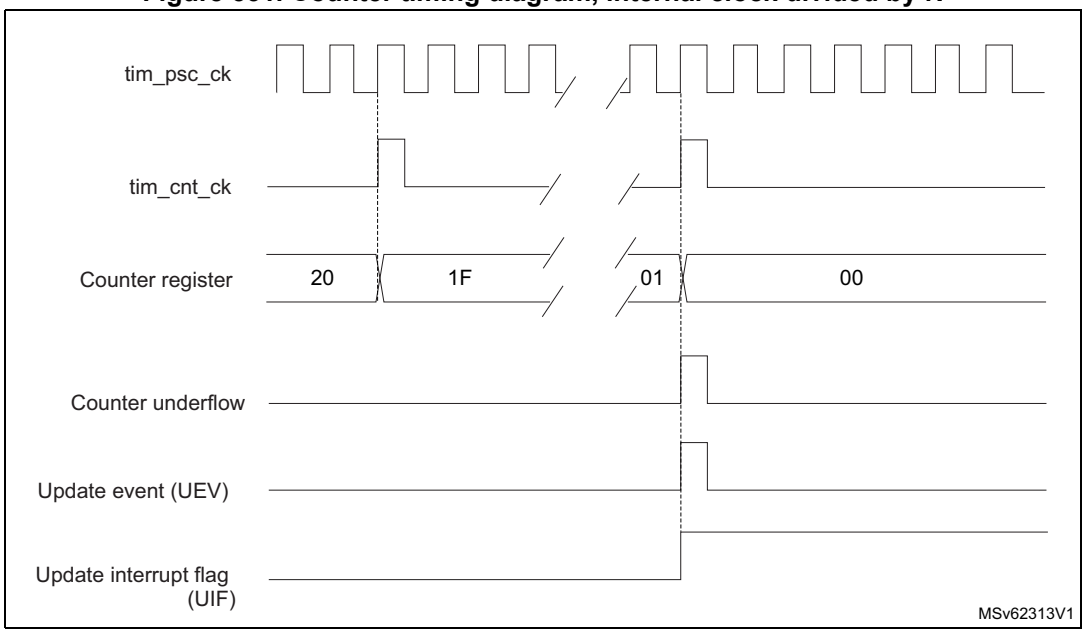

Figure 532. Counter timing diagram, update event with ARPE = 1 (counter underflow)

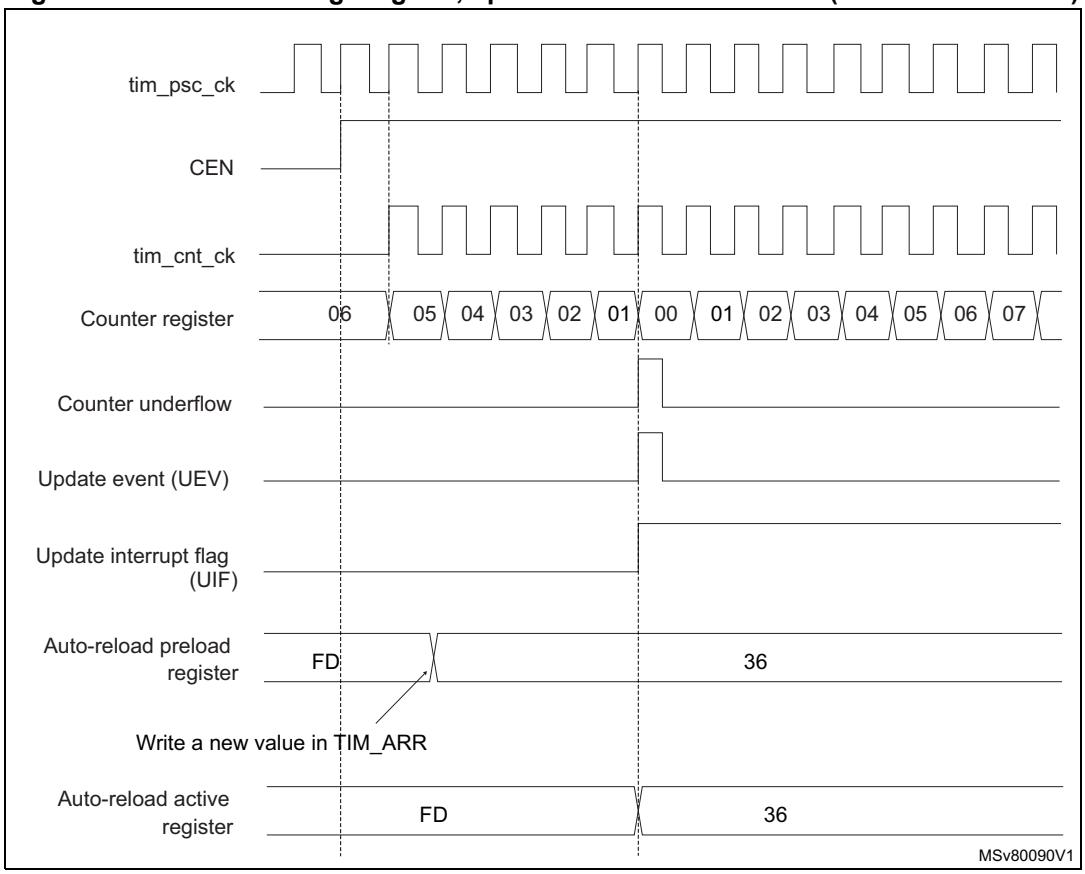

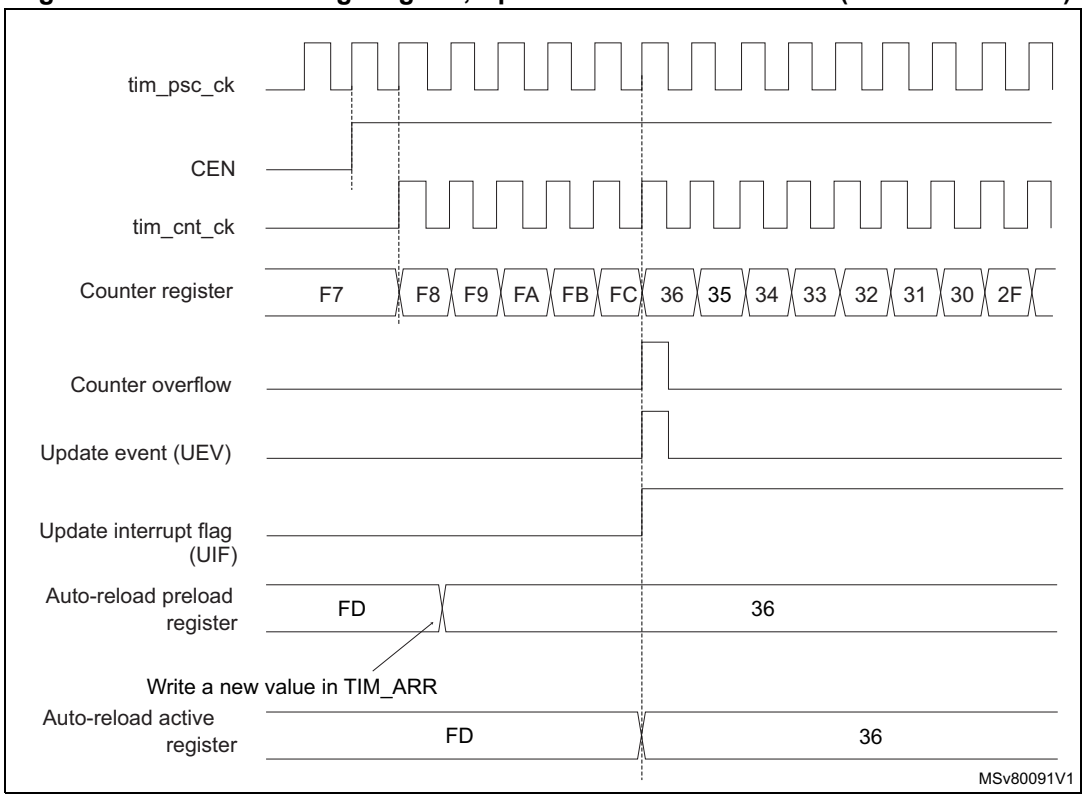

Figure 533. Counter timing diagram, Update event with ARPE = 1 (counter overflow)

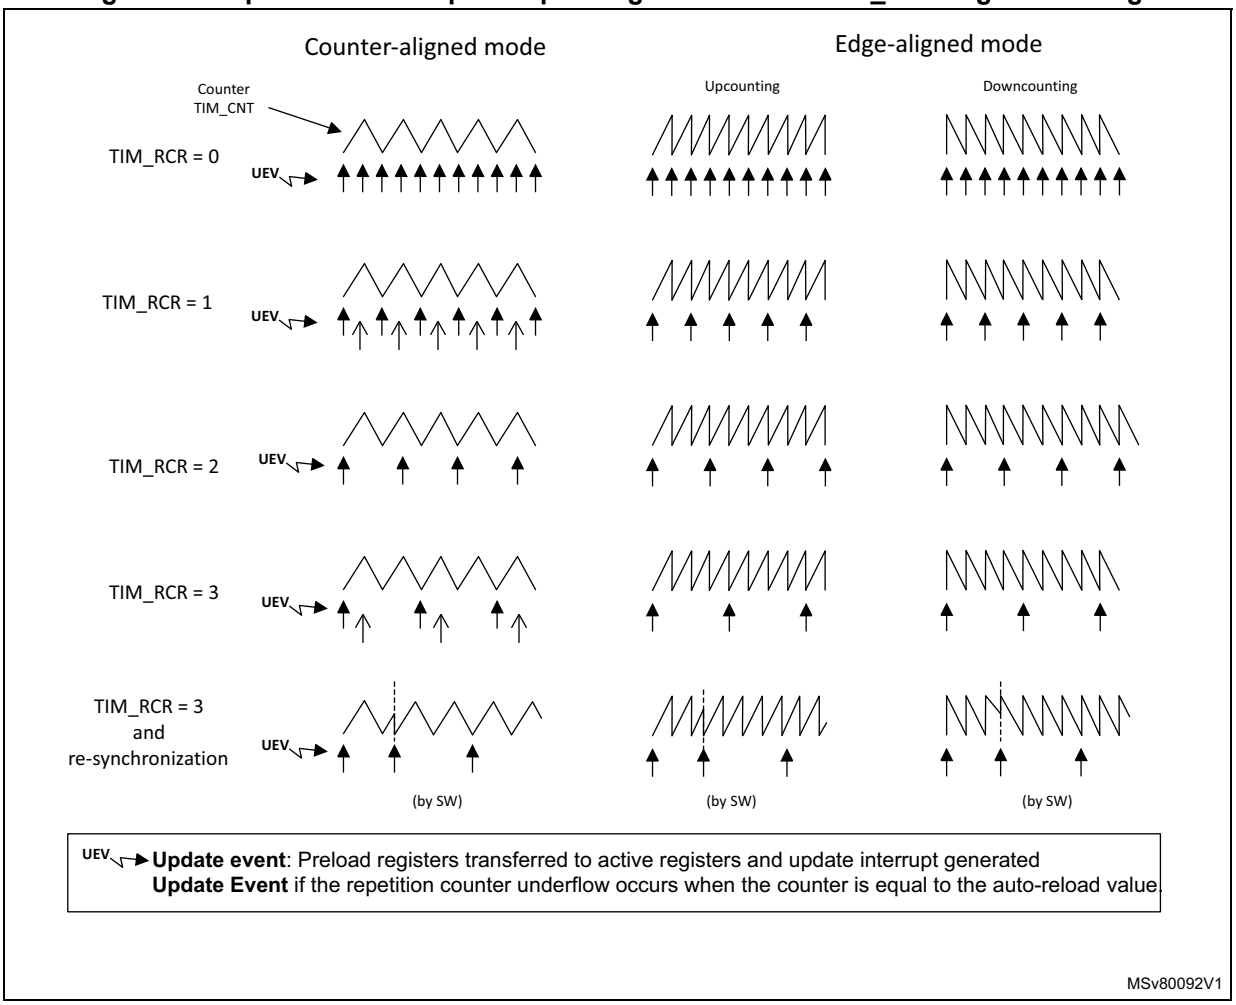
34.3.5 Repetition counter

Section 34.3.3: Time-base unit describes how the update event (UEV) is generated with respect to the counter overflows/underflows. It is actually generated only when the repetition counter has reached zero. This can be useful when generating PWM signals.

This means that data are transferred from the preload registers to the shadow registers (TIM_ARR autoreload register, TIM_PSC prescaler register, but also TIM_CCRx capture/compare registers in compare mode) every N+1 counter overflows or underflows, where N is the value in the TIM_RCR repetition counter register.

The repetition counter is decremented:



- At each counter overflow in upcounting mode,
- At each counter underflow in downcounting mode,
- At each counter overflow and at each counter underflow in center-aligned mode. Although this limits the maximum number of repetition to 32768 PWM cycles, it makes it possible to update the duty cycle twice per PWM period. When refreshing compare registers only once per PWM period in center-aligned mode, maximum resolution is $2xT_{ck}$, due to the symmetry of the pattern.

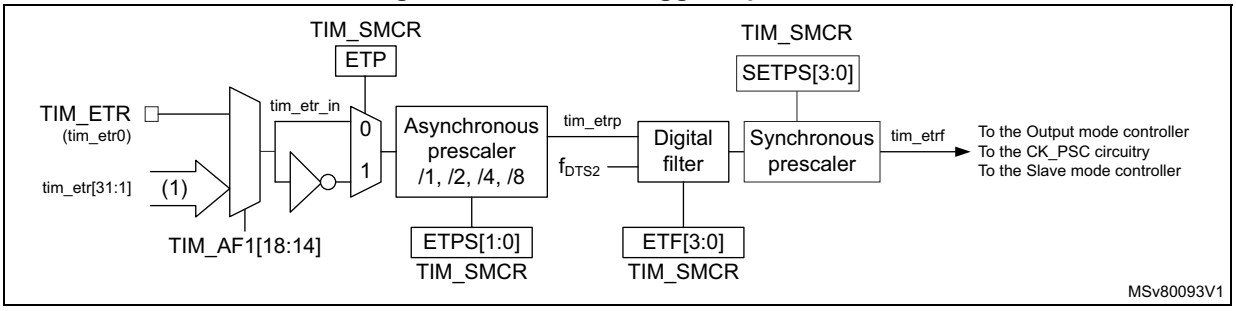
The repetition counter is an autoreload type; the repetition rate is maintained as defined by the TIM_RCR register value (refer to *Figure 534*). When the update event is generated by software (by setting the UG bit in TIM_EGR register) or by hardware through the slave mode controller, it occurs immediately whatever the value of the repetition counter is and the repetition counter is reloaded with the content of the TIM_RCR register.

In Center aligned mode, for odd values of RCR, the update event occurs either on the overflow or on the underflow depending on when the RCR register was written and when the counter was launched: if the RCR was written before launching the counter, the UEV occurs on the underflow. If the RCR was written after launching the counter, the UEV occurs on the overflow.

For example, for RCR = 3, the UEV is generated each 4th overflow or underflow event depending on when the RCR was written.

Figure 534. Update rate examples depending on mode and TIM_RCR register settings

34.3.6 External trigger input



The timer features an external trigger input tim_etr_in. It can be used as:

- external clock (external clock mode 2, see *Section 34.3.7*)
- trigger for the slave mode (see *Section 34.3.35*)
- PWM reset input for cycle-by-cycle current regulation (see *Section 34.3.9*)

Figure 535 below describes the tim_etr_in input conditioning. The input polarity is defined with the ETP bit in TIM_SMCR register. The trigger frequency can be decreased with the prescalers programmed by the ETPS[1:0] and SETPS[3:0] bitfields and digitally filtered as per the ETF[3:0] bitfield. The resulting signal (tim_etrf) is available for three purposes: as an

external clock, to condition the output (typically to reset a PWM output for a current limitation), and as a trigger for the Slave mode controller.

Figure 535. External trigger input block

The external trigger input block features 2 prescalers with different functionalities:

- An asynchronous prescaler (division by 1, 2, 4 or 8), able to process tim_etr_in signals with frequencies above tim_ker_ck
- A linear synchronous prescaler (division by 1,2,3,..15), only able to operate with tim_etrp signal frequencies below tim_ker_ck/3

Note: When tim_etrf is used as PWM reset input for cycle-by-cycle current regulation (see Section 34.3.23), SETPS[3:0] must be set to 0 (no prescaling).

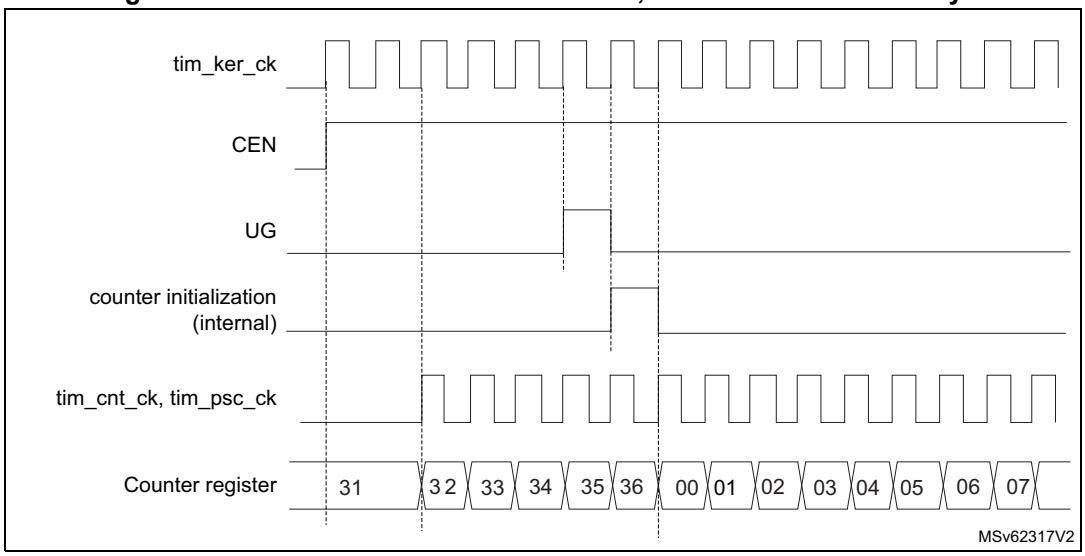
Note: The SETPS[3:0] bitfield is always preloaded: a new value will become active only once an update event has occured.

The tim_etr_in input comes from multiple sources: input pins (default configuration), or internal sources. The selection is done with the ETRSEL[4:0] bitfield in the TIM_AF1 register.

Refer to *Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals* for the list of sources connected to the etr_in input in the product.

34.3.7 Clock selection

The counter clock can be provided by the following clock sources:



- Internal clock (tim_ker_ck)
- External clock mode1: external input pin (tim_ti1 or tim_ti2)
- External clock mode2: external trigger input (tim_etr_in)
- Encoder mode

Internal clock source (tim_ker_ck)

If the slave mode controller is disabled (SMS = 000), then the CEN, DIR (in the TIM_CR1 register) and UG bits (in the TIM_EGR register) are actual control bits and can be changed only by software (except UG which remains cleared automatically). As soon as the CEN bit is written to 1, the prescaler is clocked by the internal clock tim_ker_ck.

Figure 536 shows the behavior of the control circuit and the upcounter in normal mode, without prescaler.

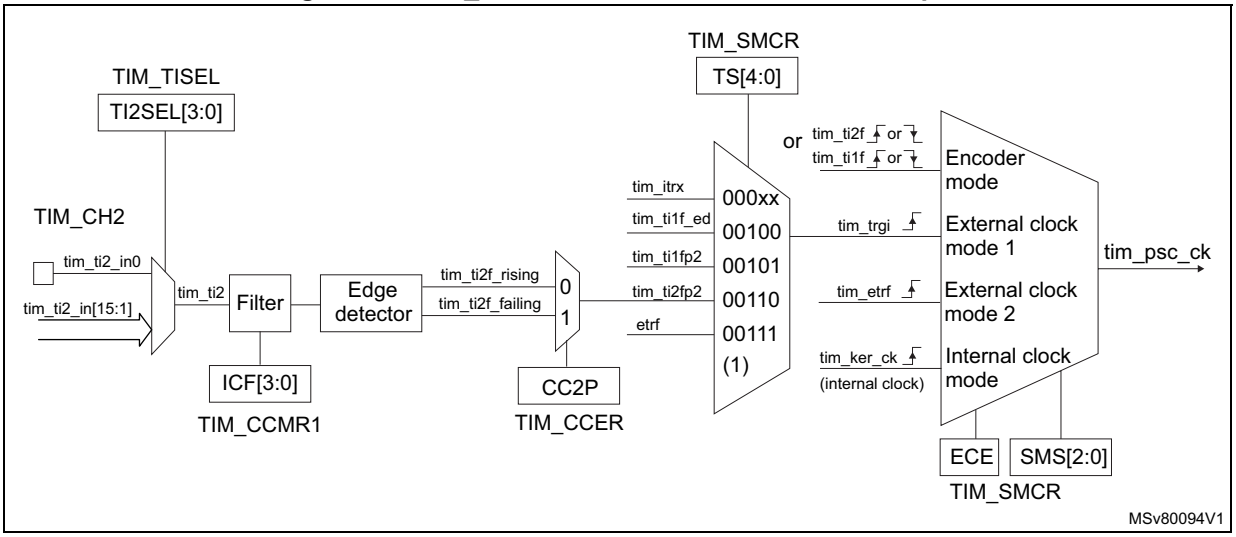


Figure 536. Control circuit in normal mode, internal clock divided by 1

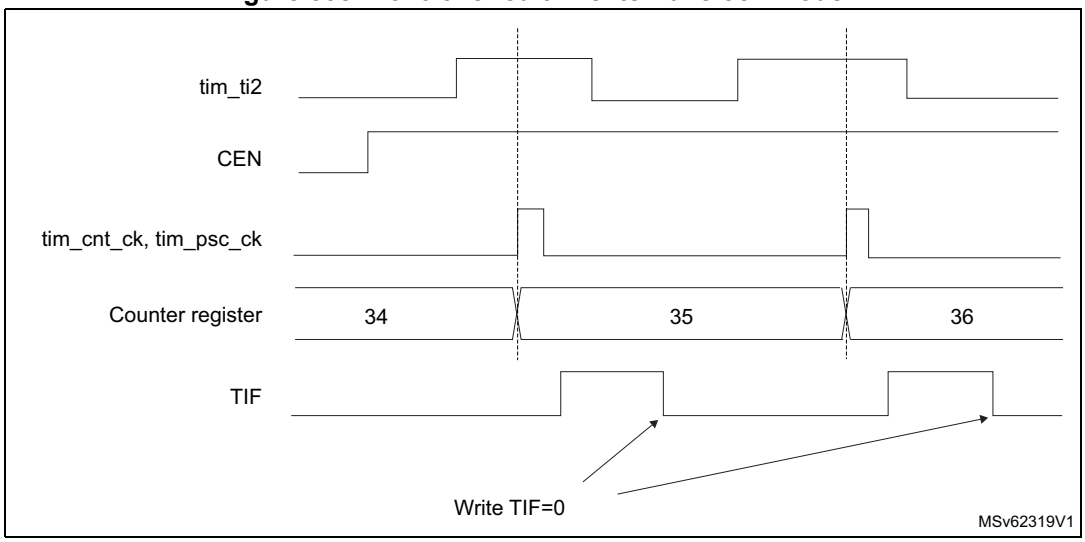
External clock source mode 1

This mode is selected when SMS = 00111 in the TIM_SMCR register. The counter can count at each rising or falling edge on a selected input.

Figure 537. tim_ti2 external clock connection example

1. Codes ranging from 01000 to 11111 are reserved.

For example, to configure the upcounter to count in response to a rising edge on the tim_ti2 input, use the following procedure:



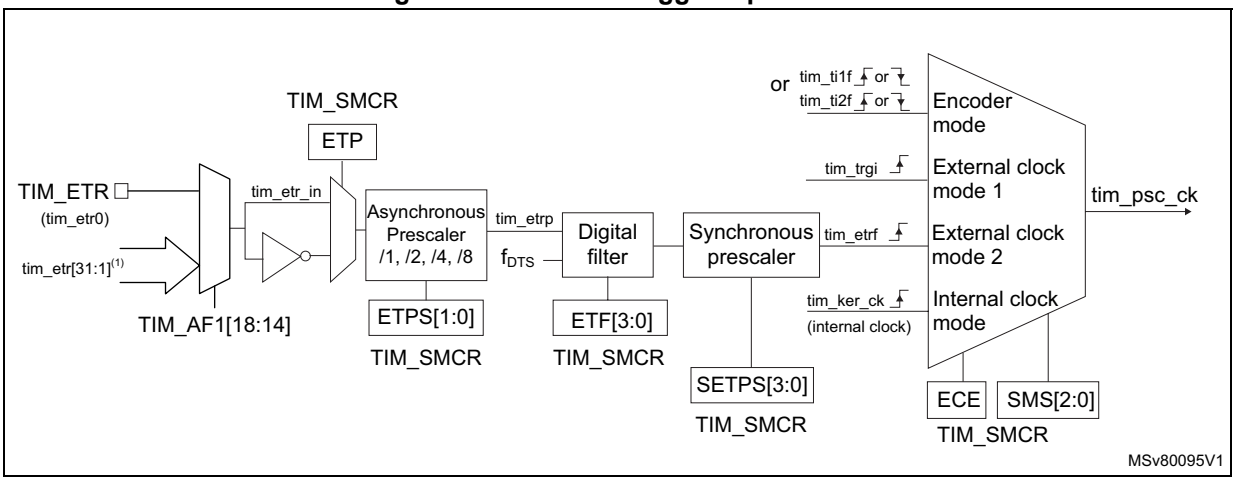
1. Configure channel 2 to detect rising edges on the tim_ti2 input by writing CC2S = 01 in the TIM_CCMR1 register.
2. Configure the input filter duration by writing the IC2F[3:0] bits in the TIM_CCMR1 register (if no filter is needed, keep IC2F = 0000).
3. Select rising edge polarity by writing CC2P = 0 and CC2NP = 0 in the TIM_CCER register.
4. Configure the timer in external clock mode 1 by writing SMS = 111 in the TIM_SMCR register.
5. Select tim_ti2 as the trigger input source by writing TS = 00110 in the TIM_SMCR register.
6. Enable the counter by writing CEN = 1 in the TIM_CR1 register.

Note: The capture prescaler is not used for triggering, it is not necessary to configure it.

When a rising edge occurs on tim_ti2, the counter counts once and the TIF flag is set.

The delay between the rising edge on tim_ti2 and the actual clock of the counter is due to the resynchronization circuit on tim_ti2 input.

Figure 538. Control circuit in external clock mode 1



External clock source mode 2

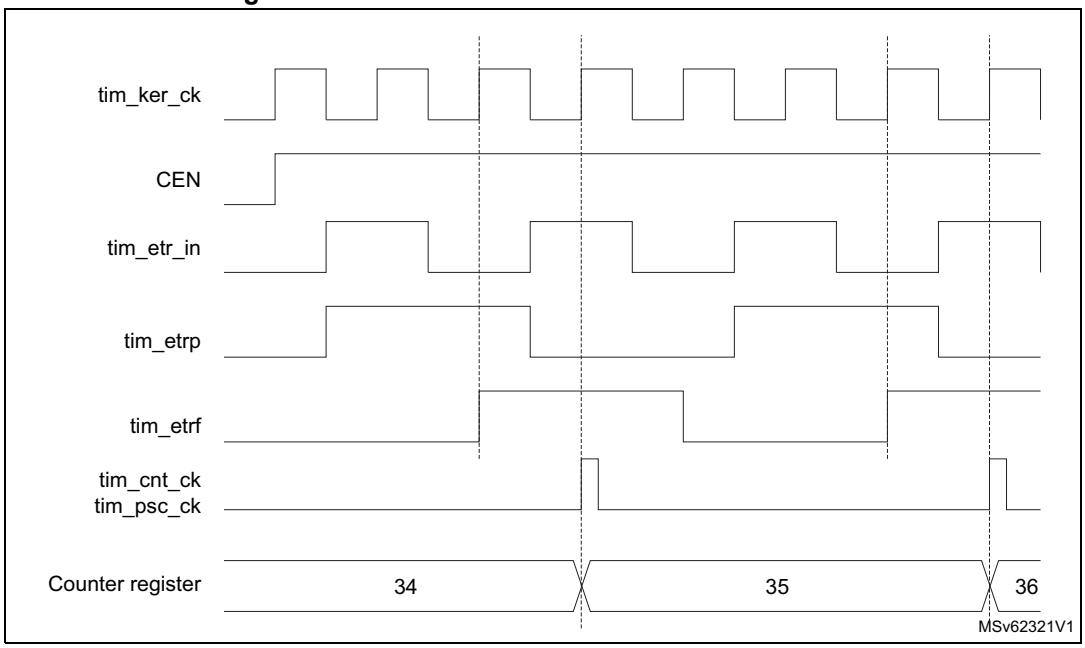
This mode is selected by writing ECE = 1 in the TIM_SMCR register.

The counter counts at each rising or falling edge on the external trigger input tim_etr_in.

The *Figure 539* gives an overview of the external trigger input block.

Figure 539. External trigger input block

1. Refer to *Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals*.



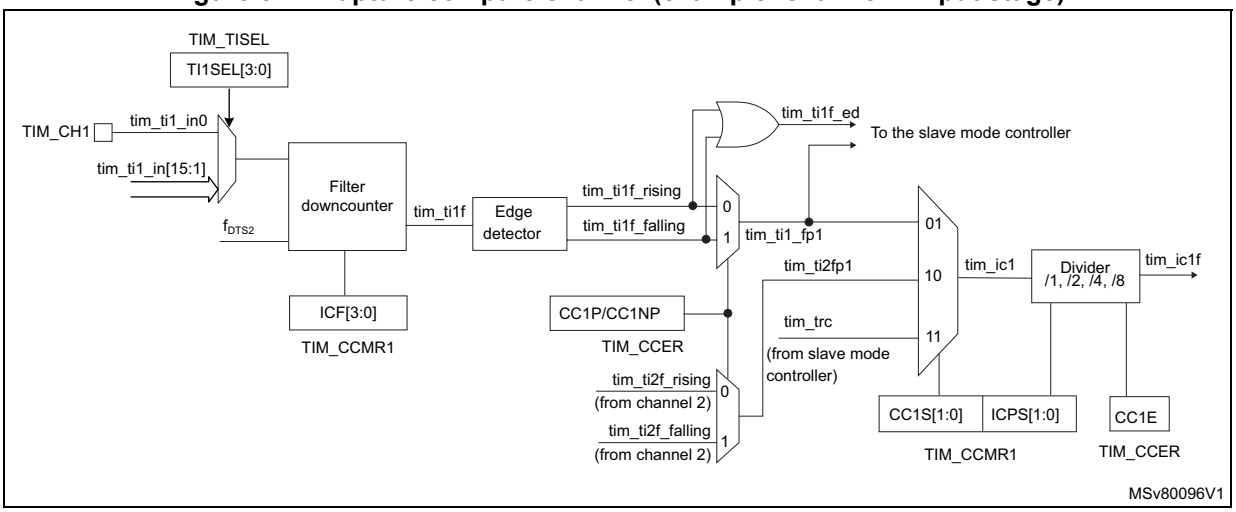
For example, to configure the upcounter to count each 2 rising edges on tim_etr_in, use the following procedure:

1. As no filter is needed in this example, write ETF[3:0] = 0000 in the TIM_SMCR register.
2. Set the prescaler by writing ETPS[1:0] = 01 and SETPS[3:0] = 0 in the TIM_SMCR register
3. Select rising edge detection on the tim_etr_in input by writing ETP = 0 in the TIM_SMCR register
4. Enable external clock mode 2 by writing ECE = 1 in the TIM_SMCR register.
5. Enable the counter by writing CEN = 1 in the TIM_CR1 register.

The counter counts once each 2 tim_etr_in rising edges.

The delay between the rising edge on tim_etr_in and the actual clock of the counter is due to the resynchronization circuit on the tim_etrp signal. As a consequence, the maximum frequency which can be correctly captured by the counter is at most ¼ of tim_ker_ck frequency. When the ETRP signal is faster, the user must apply a division of the external signal by a proper ETPS prescaler setting.

Figure 540. Control circuit in external clock mode 2



34.3.8 Capture/compare channels

Each capture/compare channel is built around a capture/compare register (including a shadow register), an input stage for capture (with digital filter, multiplexing, and prescaler, except for channels 5 and 6) and an output stage (with comparator and output control).

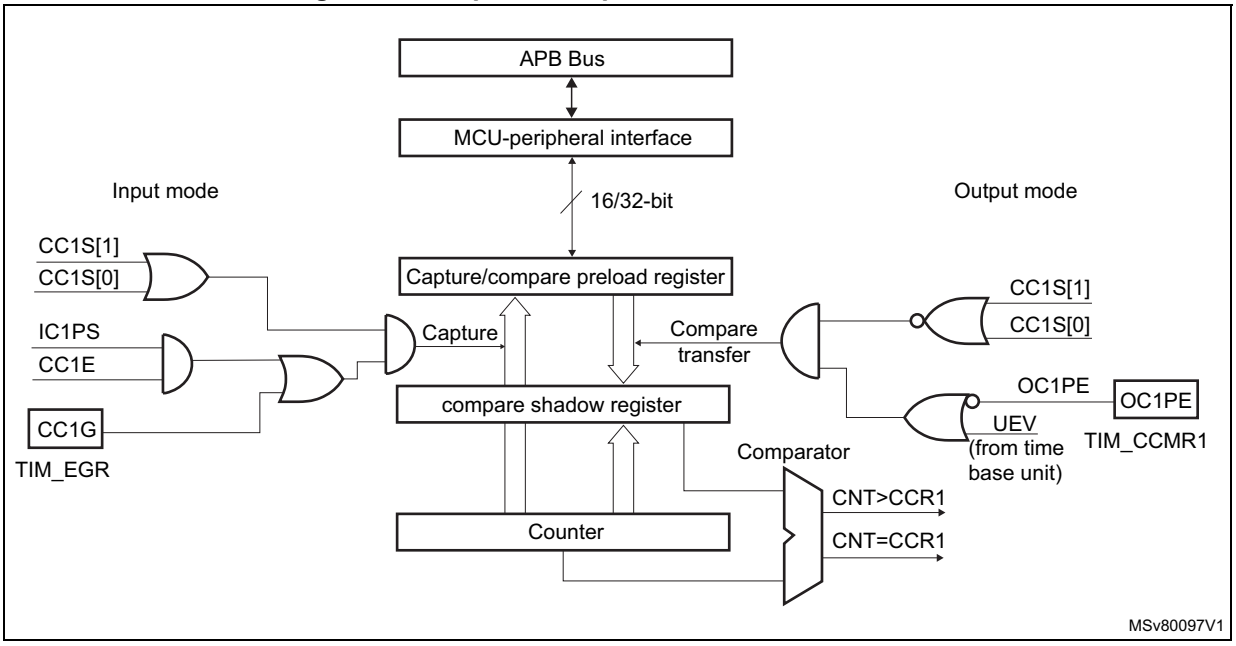
Figure 541 to *Figure 544* give an overview of one capture/compare channel.

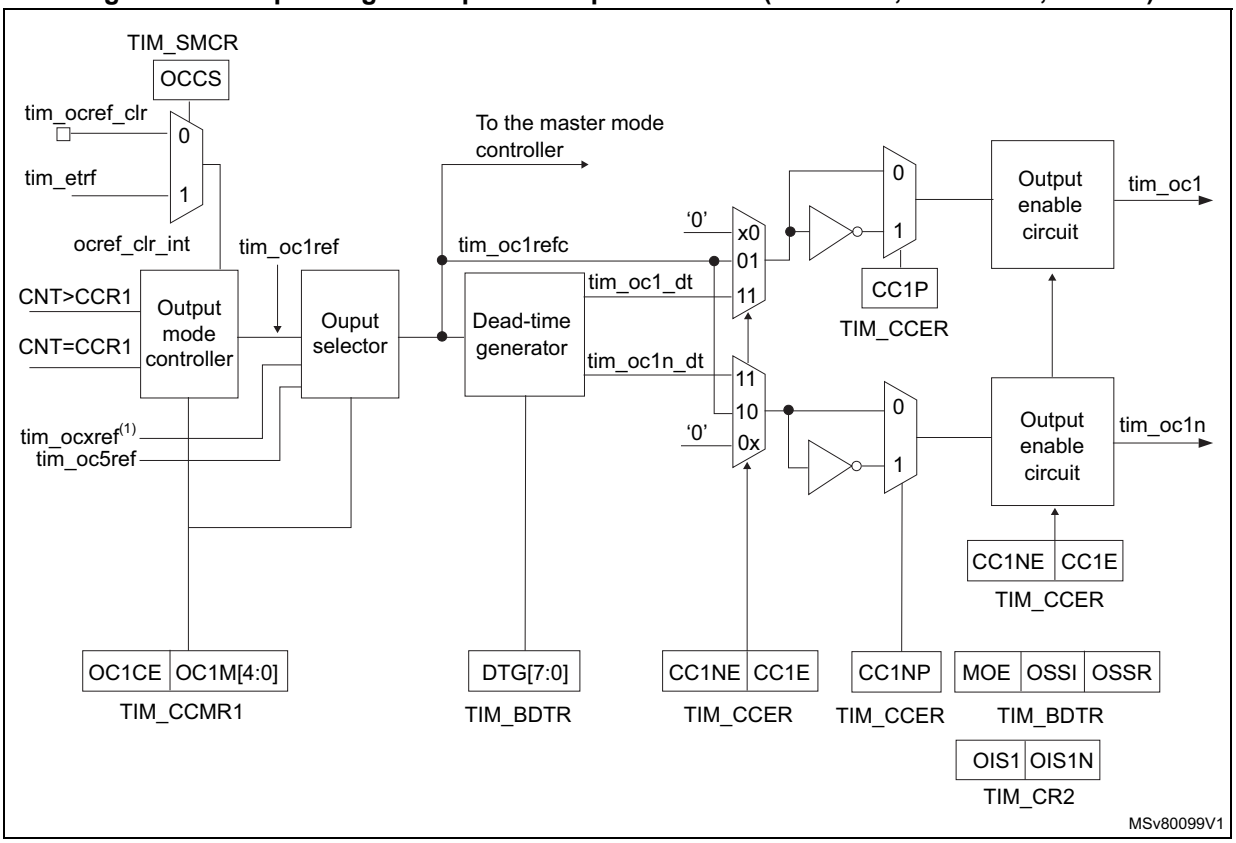
The input stage samples the corresponding tim_tix input to generate a filtered signal tim_tixf. Then, an edge detector with polarity selection generates a signal (tim_tixfpy) which can be used as trigger input by the slave mode controller or as the capture command. It is prescaled before the capture register (ICxPS).

Figure 541. Capture/compare channel (example: channel 1 input stage)

The output stage generates an intermediate waveform which is then used for reference: tim_ocxref (active high). The polarity acts at the end of the chain.

Figure 542. Capture/compare channel 1 main circuit





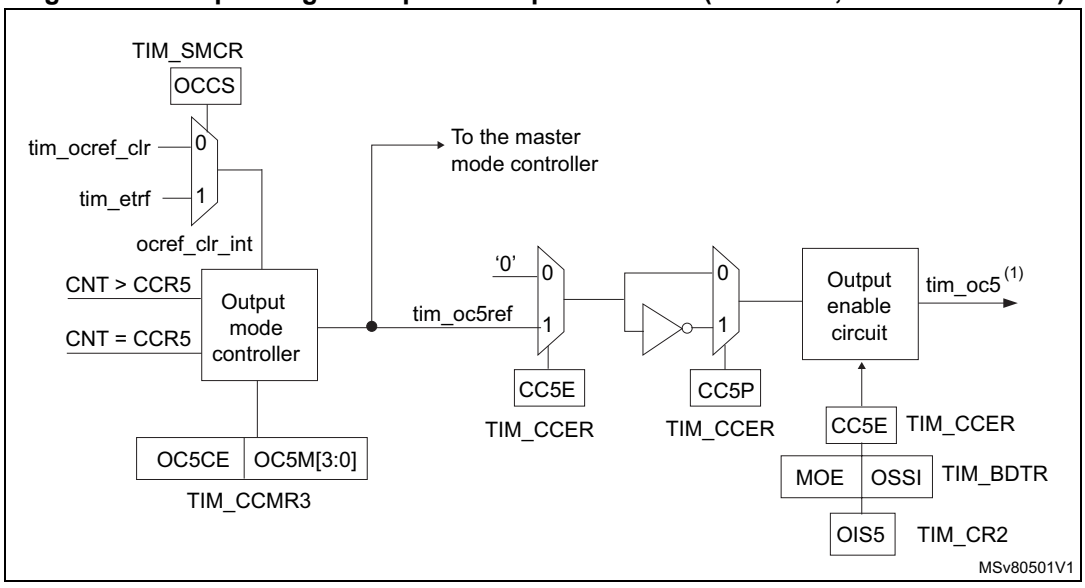


Figure 543. Output stage of capture/compare channel (channel 1, idem ch. 2, 3 and 4)

1. tim_ocxref, where x is the rank of the complementary channel

Figure 544. Output stage of capture/compare channel (channel 5, idem ch. 6 and 7)

1. Not available externally.

The capture/compare block is made of one preload register and one shadow register. Write and read always access the preload register.

In capture mode, captures are actually done in the shadow register, which is copied into the preload register.

In compare mode, the content of the preload register is copied into the shadow register which is compared to the counter.

34.3.9 Input capture mode

In Input capture mode, the capture/compare registers (TIM_CCRx) are used to latch the value of the counter after a transition detected by the corresponding ICx signal. When a capture occurs, the corresponding CCXIF flag (TIM_SR register) is set and an interrupt or a DMA request can be sent if they are enabled. If a capture occurs while the CCxIF flag was already high, then the overcapture flag CCxOF (TIM_SR register) is set. CCxIF can be cleared by software by writing it to 0 or by reading the captured data stored in the TIM_CCRx register. CCxOF is cleared when it is written with 0.

The following example shows how to capture the counter value in TIM_CCR1 when tim_ti1 input rises. To do this, use the following procedure:

- Select the active input: TIM_CCR1 must be linked to the tim_ti1 input, so write the CC1S bits to 01 in the TIM_CCMR1 register. As soon as CC1S becomes different from 00, the channel is configured in input, and the TIM_CCR1 register becomes read-only.
- Program the appropriate input filter duration in relation with the signal connected to the timer (when the input is one of the tim_tix (ICxF bits in the TIM_CCMRx register). Let's imagine that, when toggling, the input signal is not stable during at must five internal clock cycles. We must program a filter duration longer than these five clock cycles. We can validate a transition on tim_ti1 when eight consecutive samples with the new level have been detected (sampled at f_{DTS2} frequency). Then write IC1F bits to 0011 in the TIM_CCMR1 register.
- Select the edge of the active transition on the tim_ti1 channel by writing CC1P and CC1NP bits to 0 in the TIM_CCER register (rising edge in this case).
- Program the input prescaler. In our example, we wish the capture to be performed at each valid transition, so the prescaler is disabled (write IC1PS bits to 00 in the TIM_CCMR1 register).
- Enable capture from the counter into the capture register by setting the CC1E bit in the TIM_CCER register.
- If needed, enable the related interrupt request by setting the CC1IE bit in the TIM_DIER register, and/or the DMA request by setting the CC1DE bit in the TIM_DIER register.

When an input capture occurs:

- The TIM_CCR1 register gets the value of the counter on the active transition.
- CC1IF flag is set (interrupt flag). CC1OF is also set if at least two consecutive captures occurred whereas the flag was not cleared.
- An interrupt is generated depending on the CC1IE bit.
- A DMA request is generated depending on the CC1DE bit.

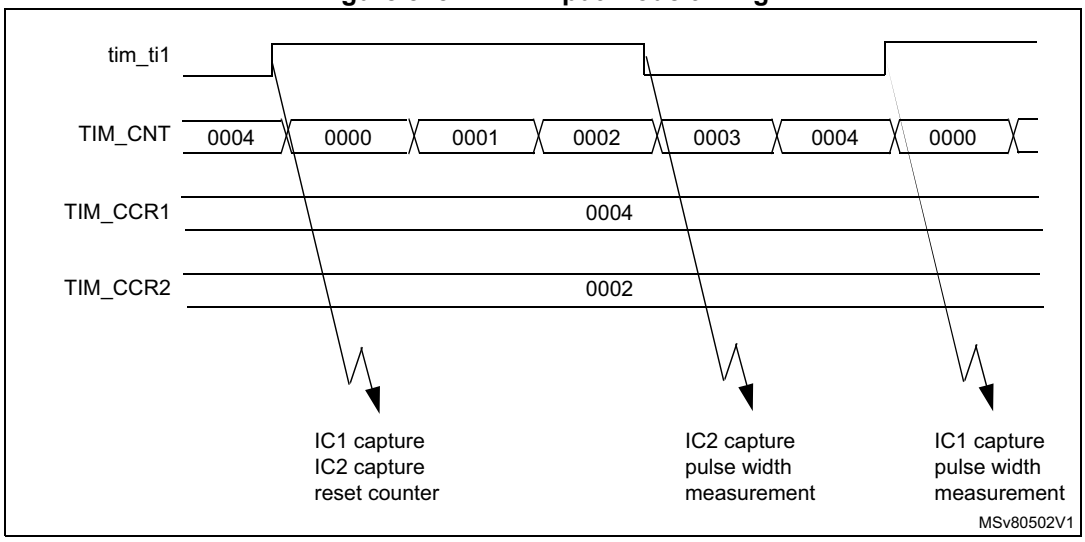
In order to handle the overcapture, it is recommended to read the data before the overcapture flag. This is to avoid missing an overcapture which may happen after reading the flag and before reading the data.

Note: IC interrupt and/or DMA requests can be generated by software by setting the corresponding CCxG bit in the TIM_EGR register.

34.3.10 PWM input mode

This mode is used to measure both the period and the duty cycle of a PWM signal connected to single tim_tix input:

- The TIM_CCR1 register holds the period value (interval between two consecutive rising edges).
- The TIM_CCR2 register holds the pulsewidth (interval between two consecutive rising and falling edges.



This mode is a particular case of input capture mode. The set-up procedure is similar with the following differences:

- Two ICx signals are mapped on the same tim_tixfp1 input.
- These two ICx signals are active on edges with opposite polarity.
- One of the two tim_tixfp signals is selected as trigger input and the slave mode controller is configured in reset mode.

The period and the pulsewidth of a PWM signal applied on tim_ti1 can be measured using the following procedure:

- Select the active input for TIM_CCR1: write the CC1S bits to 01 in the TIM_CCMR1 register (tim_ti1 selected).
- Select the active polarity for tim_ti1fp1 (used both for capture in TIM_CCR1 and counter clear): write the CC1P and CC1NP bits to 0 (active on rising edge).
- Select the active input for TIM_CCR2: write the CC2S bits to 10 in the TIM_CCMR1 register (tim_ti1 selected).
- Select the active polarity for tim_ti1fp2 (used for capture in TIM_CCR2): write the CC2P and CC2NP bits to CC2P/CC2NP = 10 (active on falling edge).
- Select the valid trigger input: write the TS bits to 00101 in the TIM_SMCR register (tim_ti1fp1 selected).
- Configure the slave mode controller in reset mode: write the SMS bits to 0100 in the TIM_SMCR register.
- Enable the captures: write the CC1E and CC2E bits to 1 in the TIM_CCER register.

Figure 545. PWM input mode timing

34.3.11 Forced output mode

In output mode (CCxS bits = 00 in the TIM_CCMRx register), each output compare signal (tim_ocxref and then tim_ocx/tim_ocxn) can be forced to active or inactive level directly by software, independently of any comparison between the output compare register and the counter.

To force an output compare signal (tim_ocxref/tim_ocx) to its active level, user just needs to write 00101 in the OCxM bits in the corresponding TIM_CCMRx register. Thus tim_ocxref is forced high (tim_ocxref is always active high) and tim_ocx get opposite value to CCxP polarity bit.

For example: CCxP = 0 (tim_ocx active high) => tim_ocx is forced to high level.

The tim_ocxref signal can be forced low by writing the OCxM bits to 00100 in the TIM_CCMRx register.

Anyway, the comparison between the TIM_CCRx shadow register and the counter is still performed and allows the flag to be set. Interrupt and DMA requests can be sent accordingly. This is described in the output compare mode section below.

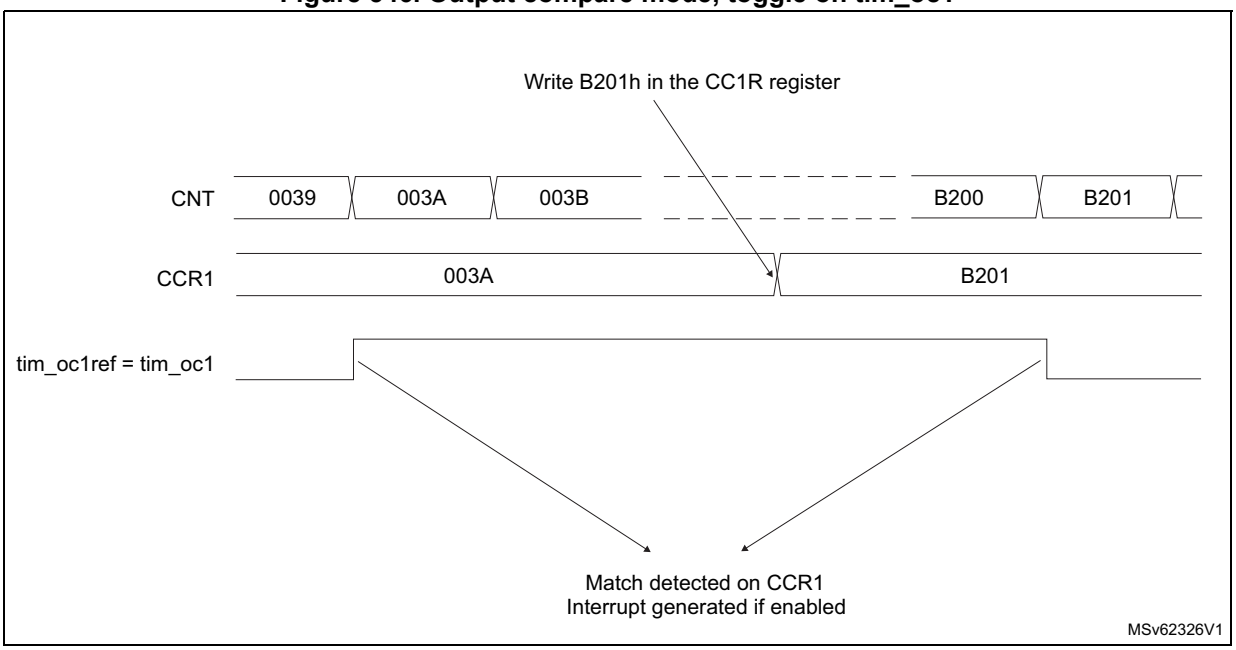
34.3.12 Output compare mode

This function is used to control an output waveform or indicate when a period of time has elapsed. Channels 1 to 4 can be output, while channel 5 to 7 are only available inside the microcontroller (for instance, for compound waveform generation or for ADC triggering).

When a match is found between the capture/compare register and the counter, the output compare function:

- Assigns the corresponding output pin to a programmable value defined by the output compare mode (OCxM bits in the TIM_CCMRx register) and the output polarity (CCxP bit in the TIM_CCER register). The output pin can keep its level (OCxM = 00000), be set active (OCxM = 00001), be set inactive (OCxM = 00010) or can toggle (OCxM = 00011) on match.
- Sets a flag in the interrupt status register (CCxIF bit in the TIM_SR register).
- Generates an interrupt if the corresponding interrupt mask is set (CCXIE bit in the TIM_DIER register).
- Sends a DMA request if the corresponding enable bit is set (CCxDE bit in the TIM_DIER register, CCDS bit in the TIM_CR2 register for the DMA request selection).

The TIM_CCRx registers can be programmed with or without preload registers using the OCxPE bit in the TIM_CCMRx register.



In output compare mode, the update event UEV has no effect on tim_ocxref and tim_ocx output. The timing resolution is one count of the counter. Output compare mode can also be used to output a single pulse (in One-pulse mode).

Procedure

1. Select the counter clock (internal, external, prescaler).
2. Write the desired data in the TIM_ARR and TIM_CCRx registers.
3. Set the CCxIE bit if an interrupt request is to be generated.
4. Select the output mode. For example:
   - Write OCxM = 00011 to toggle tim_ocx output pin when CNT matches CCRx
   - Write OCxPE = 0 to disable preload register
   - Write CCxP = 0 to select active high polarity
   - Write CCxE = 1 to enable the output
5. Enable the counter by setting the CEN bit in the TIM_CR1 register.

The TIM_CCRx register can be updated at any time by software to control the output waveform, provided that the preload register is not enabled (OCxPE = 0, else TIM_CCRx shadow register is updated only at the next update event UEV). An example is given in *Figure 546*.

Figure 546. Output compare mode, toggle on tim_oc1

34.3.13 PWM mode

Pulse width modulation mode is used to generate a signal with a frequency determined by the value of the TIM_ARR register and a duty cycle determined by the value of the TIM_CCRx register.

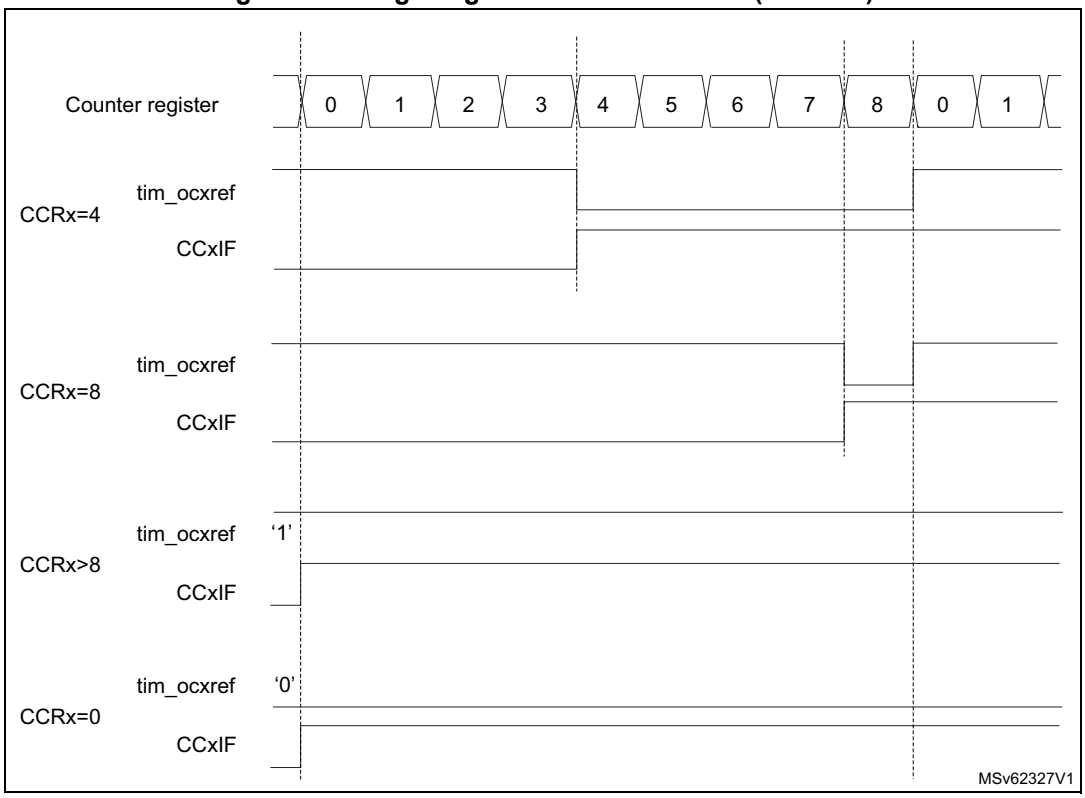
The PWM mode can be selected independently on each channel (one PWM per tim_ocx output) by writing 00110 (PWM mode 1) or 00111 (PWM mode 2) in the OCxM bits in the TIM_CCMRx register. The corresponding preload register must be enabled by setting the OCxPE bit in the TIM_CCMRx register, and eventually the autoreload preload register (in upcounting or center-aligned modes) by setting the ARPE bit in the TIM_CR1 register.

As the preload registers are transferred to the shadow registers only when an update event occurs, before starting the counter, all registers must be initialized by setting the UG bit in the TIM_EGR register.

tim_ocx polarity is software programmable using the CCxP bit in the TIM_CCER register. It can be programmed as active high or active low. tim_ocx output is enabled by a combination of the CCxE, CCxNE, MOE, OSSI, and OSSR bits (TIM_CCER and TIM_BDTR registers). Refer to the TIM_CCER register description for more details.

In PWM mode (1 or 2), TIM_CNT and TIM_CCRx are always compared to determine whether TIM_CCRx ≤ TIM_CNT or TIM_CNT ≤ TIM_CCRx (depending on the direction of the counter).

The timer is able to generate PWM in edge-aligned mode or center-aligned mode depending on the CMS bits in the TIM_CR1 register.



PWM edge-aligned mode

- Upcounting configuration

  Upcounting is active when the DIR bit in the TIM_CR1 register is low. Refer to *Upcounting mode*.

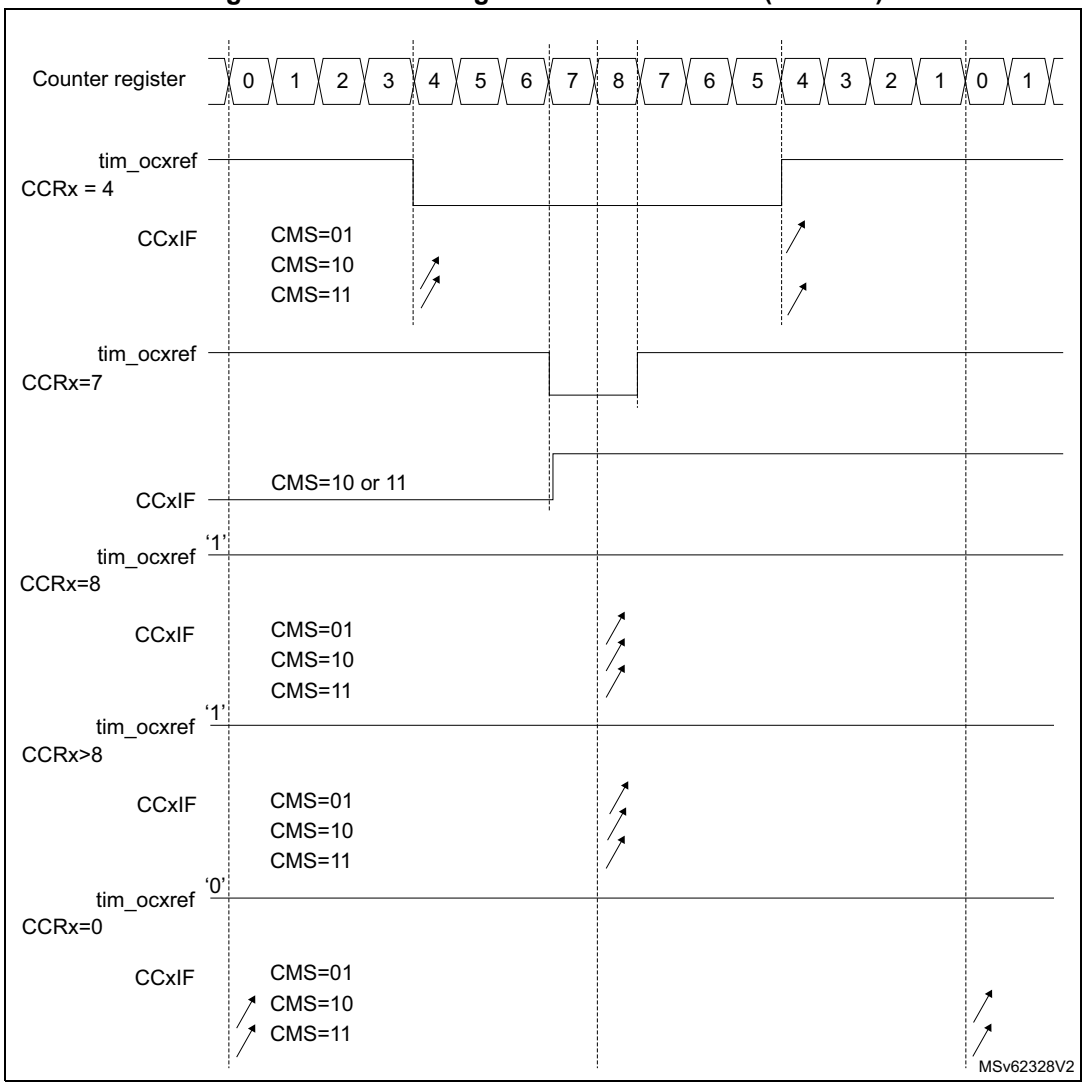
  In the following example, the mode is PWM mode 1. The reference PWM signal tim_ocxref is high as long as TIM_CNT < TIM_CCRx else it becomes low. If the compare value in TIM_CCRx is greater than the autoreload value (in TIM_ARR) then tim_ocxref is held at 1. If the compare value is zero then tim_ocxref is held at 0. *Figure 547* shows some edge-aligned PWM waveforms in an example where TIM_ARR = 8.

Figure 547. Edge-aligned PWM waveforms (ARR = 8)

- Downcounting configuration

  Downcounting is active when DIR bit in TIM_CR1 register is high. Refer to the *Downcounting mode*

  In PWM mode 1, the reference signal tim_ocxref is low as long as TIM_CNT > TIM_CCRx else it becomes high. If the compare value in TIM_CCRx is greater than the autoreload value in TIM_ARR, then tim_ocxref is held at 1. 0% PWM is not possible in this mode.



PWM center-aligned mode

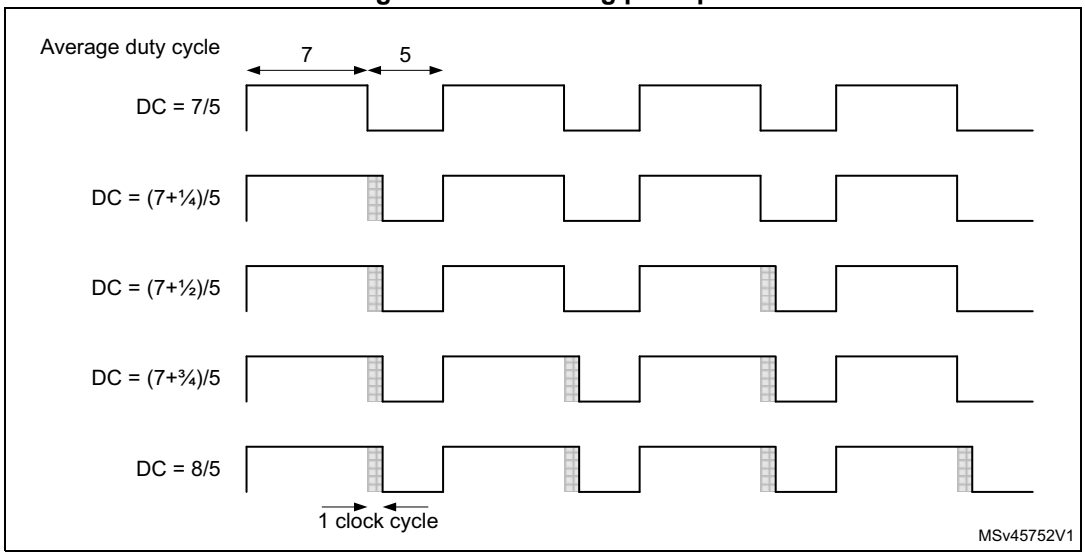
Center-aligned mode is active when the CMS bits in TIM_CR1 register are different from 00 (all the remaining configurations having the same effect on the tim_ocxref/tim_ocx signals). The compare flag is set when the counter counts up, when it counts down or both when it counts up and down depending on the CMS bits configuration. The direction bit (DIR) in the TIM_CR1 register is updated by hardware and must not be changed by software. Refer to *Center-aligned mode (up/down counting)*.

Figure 548 shows some center-aligned PWM waveforms in an example where:

- TIM_ARR = 8
- PWM mode is the PWM mode 1
- The flag is set when the counter counts down corresponding to the center-aligned mode 1 selected for CMS = 01 in TIM_CR1 register.

Figure 548. Center-aligned PWM waveforms (ARR = 8)

Hints on using center-aligned mode:



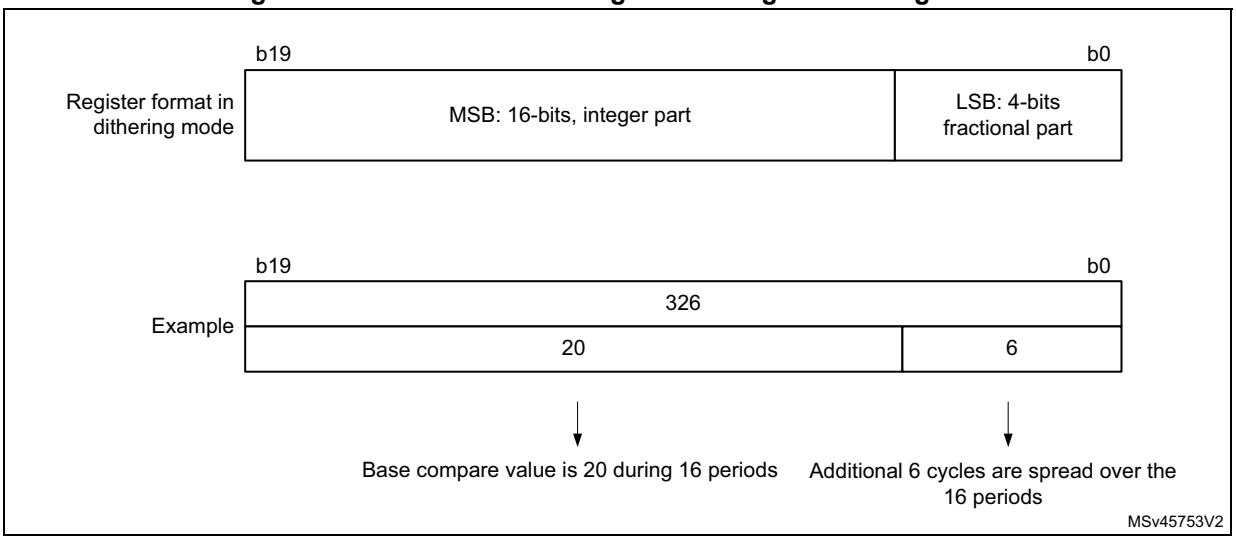
- When starting in center-aligned mode, the current up-down configuration is used. It means that the counter counts up or down depending on the value written in the DIR bit in the TIM_CR1 register. Moreover, the DIR and CMS bits must not be changed at the same time by the software.
- Writing to the counter while running in center-aligned mode is not recommended as it can lead to unexpected results. In particular:
  - The direction is not updated if a value greater than the autoreload value is written in the counter (TIM_CNT > TIM_ARR). For example, if the counter was counting up, it continues to count up.
  - The direction is updated if 0 or the TIM_ARR value is written in the counter but no update event UEV is generated.
- The safest way to use center-aligned mode is to generate an update by software (setting the UG bit in the TIM_EGR register) just before starting the counter and not to write the counter while it is running.

Dithering mode

The PWM mode effective resolution can be increased by enabling the dithering mode, using the DITHEN bit in the TIM_CR1 register. This applies to both the CCR (for duty cycle resolution increase) and ARR (for PWM frequency resolution increase).

The operating principle is to have the actual CCR (or ARR) value slightly changed (adding or not one timer clock period) over 16 consecutive PWM periods, with predefined patterns. This allows a 16-fold resolution increase, considering the average duty cycle or PWM period. *Figure 549* presents the dithering principle applied to four consecutive PWM cycles.

Figure 549. Dithering principle



When the dithering mode is enabled, the register coding is changed as follows (see *Figure 550* for example):

- The four LSBs are coding for the enhanced resolution part (fractional part).
- The MSBs are left-shifted to the bits 19:4 and are coding for the base value.

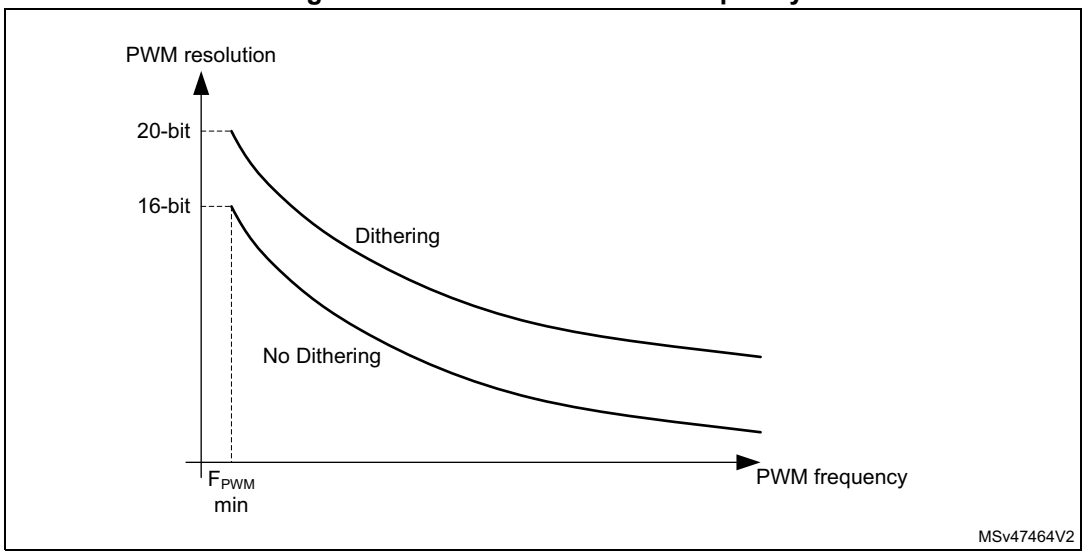
Note: The following sequence must be followed when resetting the DITHEN bit:

1. *CEN and ARPE bits must be reset.*
2. *The DITHEN bit must be reset.*
3. *The CCIF flags must be cleared.*
4. *The CEN bit can be set (eventually with ARPE = 1).*

Figure 550. Data format and register coding in dithering mode

The minimum frequency is given by the following formula:

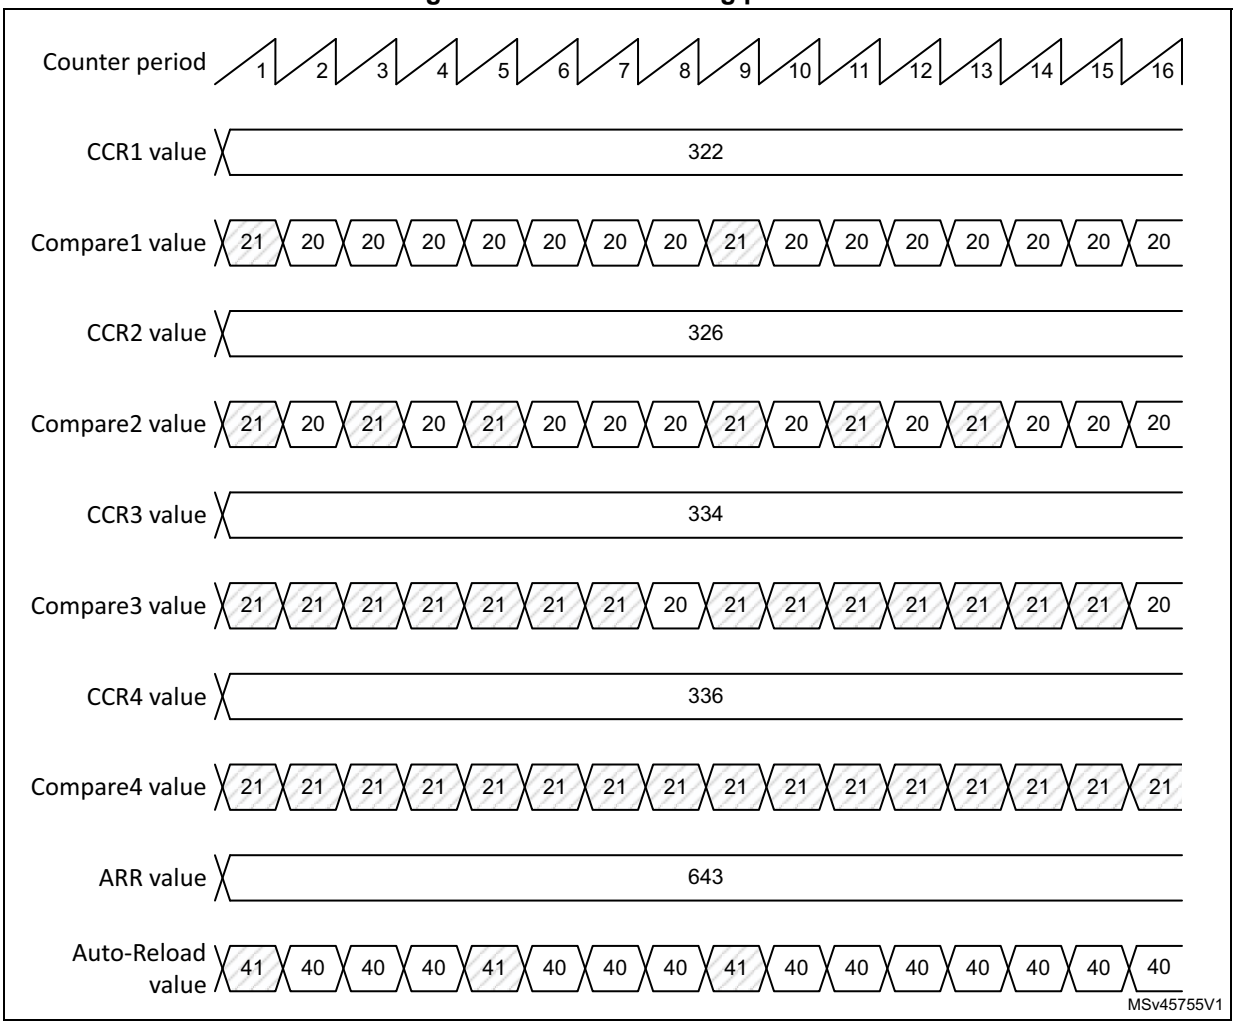
$$\text{Resolution} = \frac{F_{Tim}}{F_{pwm}} \Rightarrow F_{pwmMin} = \frac{F_{Tim}}{Max_{Resolution}}$$



$$\text{Dithering mode disabled: } F_{pwmMin} = \frac{F_{Tim}}{65536}$$

$$\text{Dithering mode enabled: } F_{pwmMin} = \frac{F_{Tim}}{65535 + \frac{15}{16}}$$

Note: The maximum TIM_ARR and TIM_CCRy values are limited to 0xFFFEF in dithering mode (corresponds to 65534 for the integer part and 15 for the dithered part).



As shown on *Figure 551*, the dithering mode is used to increase the PWM resolution whatever the PWM frequency.

Figure 551. PWM resolution vs frequency

The duty cycle and/or period changes are spread over 16 consecutive periods, as described in *Figure 552*.

Figure 552. PWM dithering pattern

The autoreload and compare values increments are spread following specific patterns described in *Table 379*. The dithering sequence is done to have increments distributed as evenly as possible and minimize the overall ripple.

Table 379. CCR and ARR register change dithering pattern

LSB value	PWM period															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

1111	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	+1	-

The dithering mode is also available in center-aligned PWM mode (CMS bits in TIM_CR1 register are not equal to 00). In this case, the dithering pattern is applied over eight consecutive PWM periods, considering the up and down counting phases as shown in *Figure 553*.

Figure 553. Dithering effect on duty cycle in center-aligned PWM mode

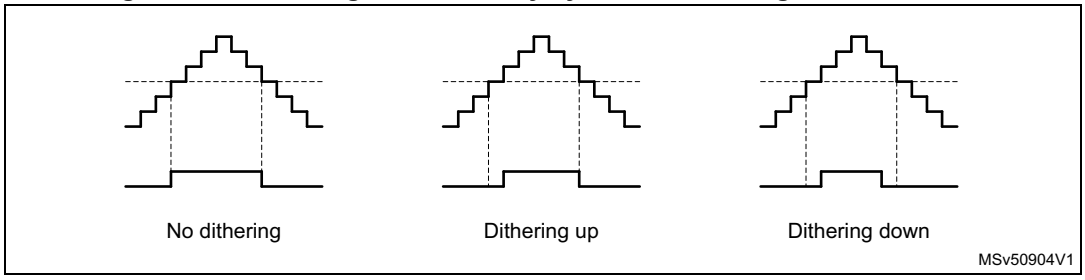

Table 380 shows how the dithering pattern is added in center-aligned PWM mode.

34.3.14 Asymmetric PWM mode

Asymmetric mode allows two center-aligned PWM signals to be generated with a programmable phase shift. While the frequency is determined by the value of the TIM_ARR register, the duty cycle and the phase-shift are determined by a pair of TIM_CCRx register. One register controls the PWM during up-counting, the second during down counting, so that PWM is adjusted every half PWM cycle, for instance:

- tim_oc1refc is controlled by TIM_CCR1 and TIM_CCR2
- tim_oc3refc is controlled by TIM_CCR3 and TIM_CCR4
- ...

Figure 554 represents an example of signals that can be generated using asymmetric PWM mode (channels 1 to 4 are configured in asymmetric PWM mode 2). Together with the deadtime generator, this allows a full-bridge phase-shifted DC to DC converter to be controlled.

Figure 554. Generation of 2 phase-shifted PWM signals with 50% duty cycle

Multiple asymmetric PWM modes are available to combine different pairs of TIM_CCRx registers and generate the required waveform, as listed in *Table 381*. The selection is done

with the OCxM[4:0] bitfield in TIM_CCMRx registers. For each pair of TIM_CCRx registers, two options are given (e.g. Asymmetric PWM mode 3 and 4), one being in PWM mode 1 (channel active as long as the counter is below the TIM_CCRx value), the other one in PWM mode 2 (channel active when the counter is above the TIM_CCRx value).

For the asymmetric PWM modes 1 to 6, it is mandatory to have the same PWM mode for both channels. For instance, it is mandatory to have OC1M[4:0] = OC2M[4:0] = 00110 for the asymmetric PWM mode 1 on oc1refc.

For the asymmetric PWM modes 7 to 10, it is mandatory to have opposite PWM mode for both channels (one being in PWM mode 1 and the other in PWM mode 2). Refer to the *Table 381* for configuration.

Note: The OCxM[4:0] bitfield is split into two parts for compatibility reasons, the most significant bits are not contiguous with the three least significant ones.

When a given channel is used as asymmetric PWM channel, its complementary channel can also be used. For instance, if an tim_oc1refc signal is generated on channel 1 (Asymmetric PWM mode 1), it is possible to output either the regular tim_oc2ref signal on channel 2 or a tim_oc2refc signal resulting from asymmetric PWM mode 1.

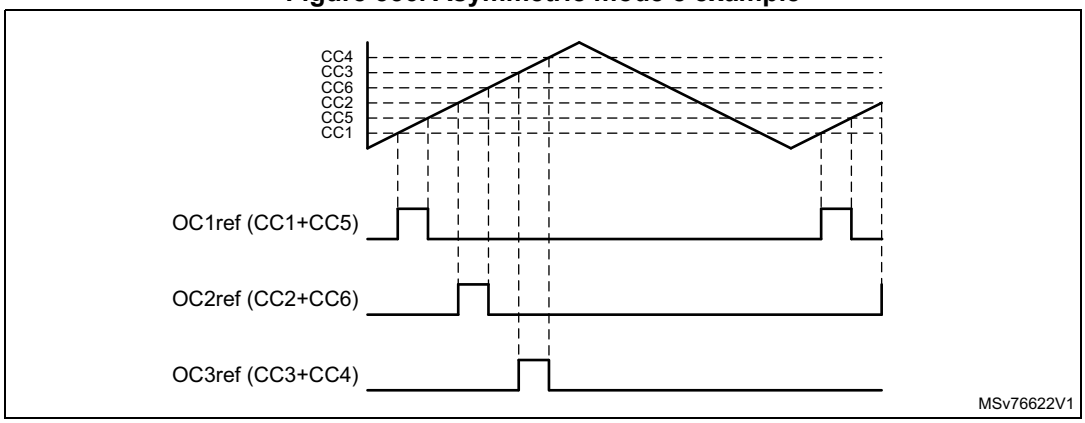
1. PWM mode 1: channel active as long as the counter is below the TIM_CCRx value). PWM mode 2: channel active when the counter is above the TIM_CCRx value. Unless explicitly mentioned, the PWM mode must be identical for the 2 channels used for the asymmetric mode
2. oc5ref, oc6ref, oc4ref and oc7ref must be programmed in PWM mode 2
3. oc5ref, oc6ref, oc4ref and oc7ref must be programmed in PWM mode 1

The *Figure 555* represents an example suitable for single-shunt current sensing techniques requiring phase-shifted PWMs, for 3-phase motor control. This is done using asymmetric PWM mode 3 and 5:



- Channel 1 is configured in asymmetric PWM mode 4
- Channel 2 is configured in asymmetric PWM mode 5
- Channel 3 is configured in regular PWM mode 2
- Compare 4 and 7 are available for ADC triggering purpose

Figure 555. Asymmetric mode example for single-shunt current sensing

The *Figure 556* represents an example of the waveforms that can be generated with asymmetric modes 7 to 10.

Figure 556. Asymmetric mode 8 example

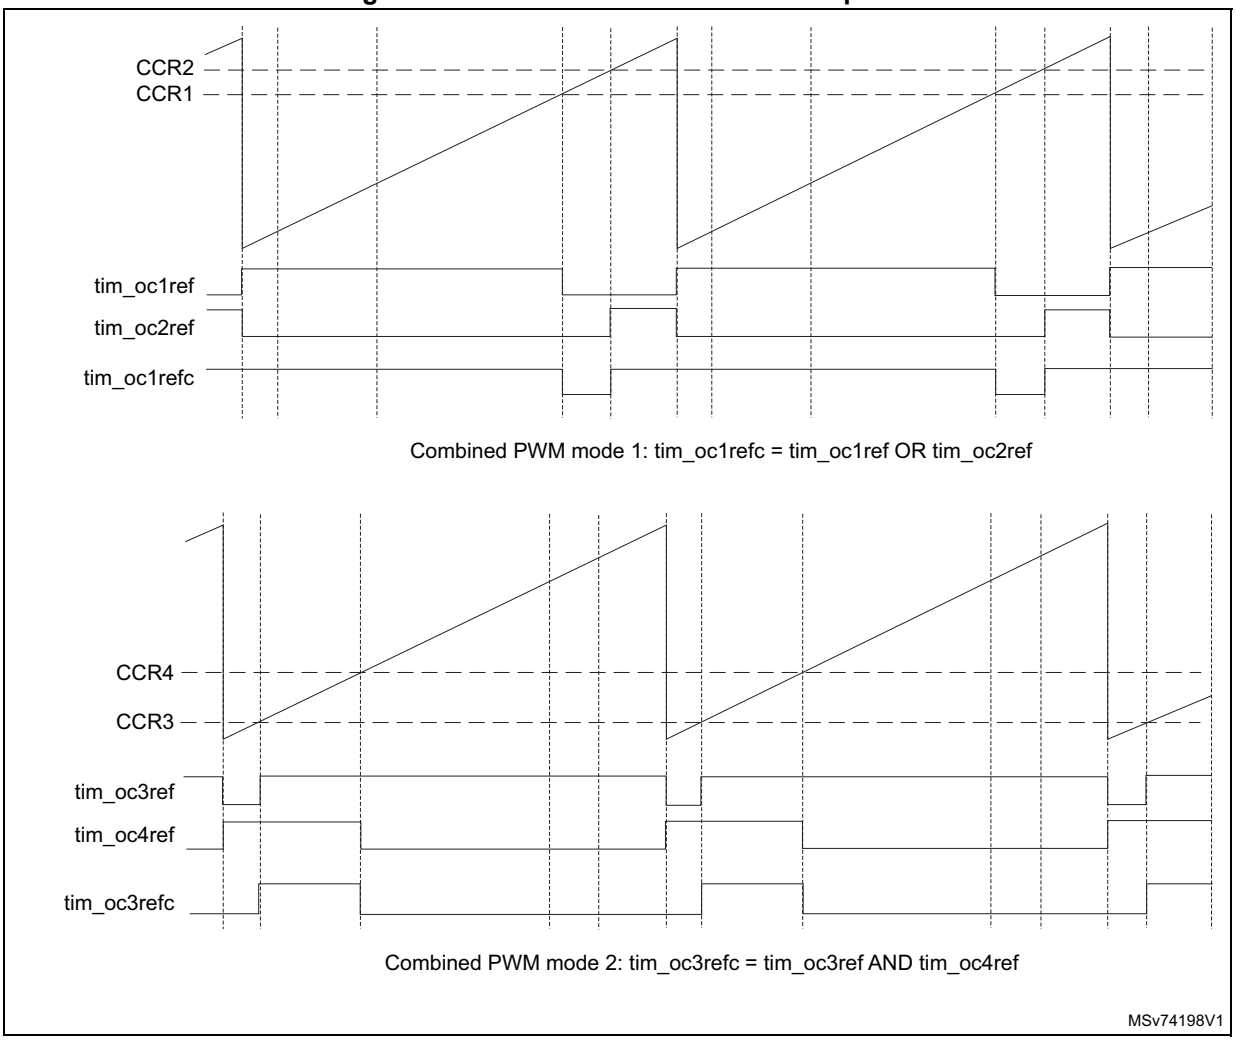
34.3.15 Combined PWM mode

Combined PWM mode allows two edge or center-aligned PWM signals to be generated with programmable delay and phase shift between respective pulses. While the frequency is determined by the value of the TIM_ARR register, the duty cycle and delay are determined by the two TIM_CCRx registers. The resulting signals, tim_ocxrefc, are made of an OR or AND logical combination of two reference PWMs, as summarized in the below:

Table 382. Combined PWM mode overview

Output compare mode	OCxM[4:0]	oc1refc	oc2refc	oc3refc	oc4refc	oc5refc	oc6refc	oc7refc	PWM mode(1)
Combined PWM mode 1	01100	oc1ref OR oc2ref		oc3ref OR oc4ref		oc5ref OR oc6ref		-	1
Combined PWM mode 2	01101	oc1ref AND oc2ref		oc3ref AND oc4ref		oc5ref AND oc6ref		-	2
Combined PWM mode 3	10000	oc1ref OR oc5ref	oc2ref OR oc6ref	oc3ref OR oc5ref	oc4ref OR oc6ref	-	-	-	1
Combined PWM mode 4	10001	oc1ref AND oc5ref	oc2ref AND oc6ref	oc3ref AND oc5ref	oc4ref AND oc6ref	-	-	-	2

1. PWM mode 1: channel active as long as the counter is below the TIM_CCRx value). PWM mode 2: channel active when the counter is above the TIM_CCRx value.



When a given channel is used as combined PWM channel, its complementary channel must be configured in the opposite PWM mode (for instance, one in PWM mode 1 and the other in PWM mode 2).

Note: The OCxM[4:0] bitfield is split into two parts for compatibility reasons, the most significant bits are not contiguous with the three least significant ones.

Figure 557 represents an example of signals that can be generated using combined PWM mode, obtained with the following configuration:

- Channel 1 is configured in Combined PWM mode 2.
- Channel 2 is configured in PWM mode 1.
- Channel 3 is configured in Combined PWM mode 2.
- Channel 4 is configured in PWM mode 1.

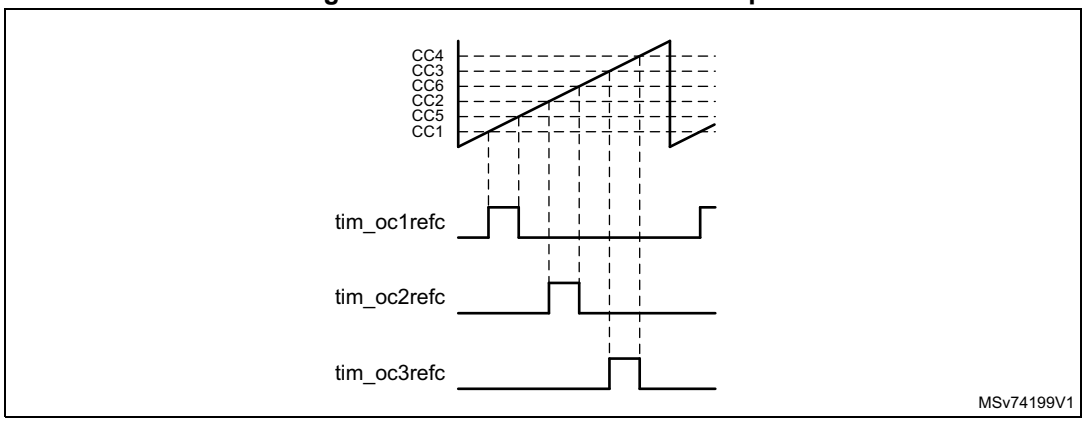


Figure 557. Combined PWM mode examples

The *Figure 558* represents an example suitable for a 3-phase interleaved converter requiring independent control of duty cycle and phase-shift. This is done using Combined PWM mode 2 and 4:

- Channel 1 is configured in Combined PWM mode 4
- Channel 2 is configured in Combined PWM mode 4
- Channel 3 is configured in Combined PWM mode 2

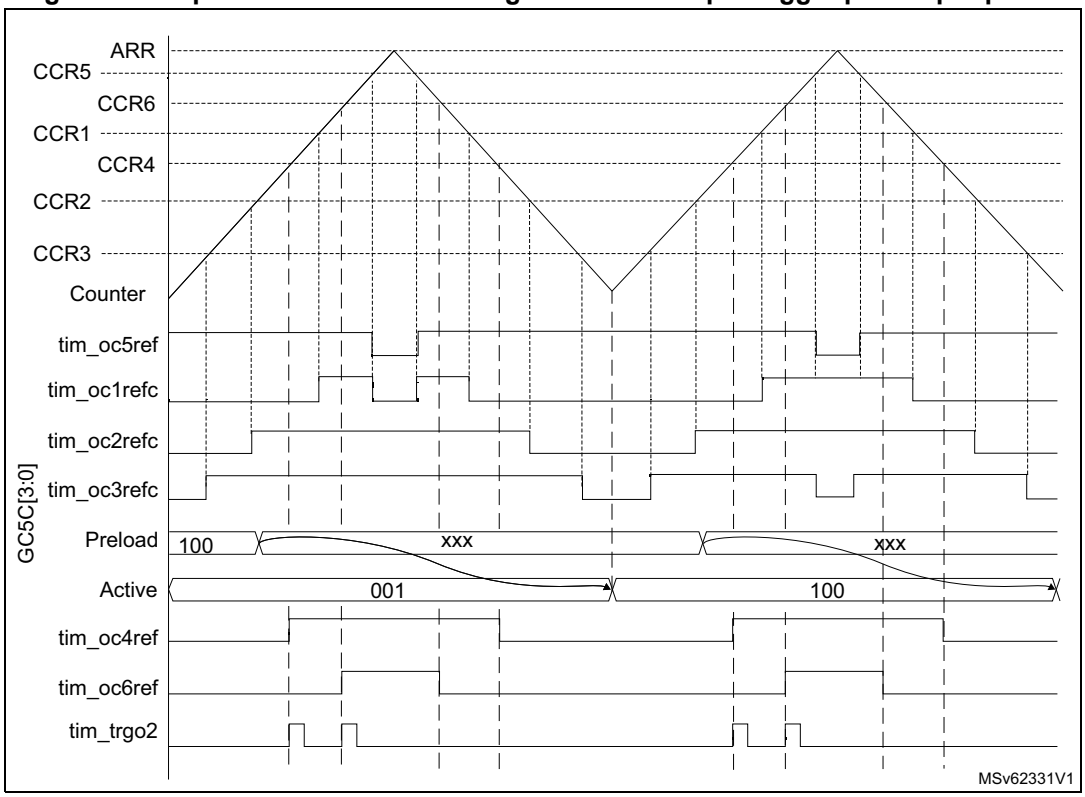
Figure 558. Combined PWM 3 example

34.3.16 Combined 3-phase PWM mode

Combined 3-phase PWM mode allows one to three center-aligned PWM signals to be generated with a single programmable signal ANDed in the middle of the pulses. The tim_oc5ref signal is used to define the resulting combined signal.

The 4 bits GC5C[4:1] in the TIM_CCR5 allow selection on which reference signal the tim_oc5ref is combined. The resulting signals, tim_ocxrefc, are made of an AND logical combination of two reference PWMs:

- If GC5C1 is set, tim_oc1refc is the logical AND of tim_oc1ref and tim_oc5ref
- If GC5C2 is set, tim_oc2refc is the logical AND of tim_oc2ref and tim_oc5ref
- If GC5C3 is set, tim_oc3refc is the logical AND of tim_oc3ref and tim_oc5ref
- If GC5C4 is set, tim_oc4refc is the logical AND of tim_oc4ref and tim_oc5ref



It is possible also to select an OR fonction with GC5C1O, GC5C2O, GC5C3O and GC5C4O bits, as following:

- If GC5C1O is set, tim_oc1refc is the logical OR of tim_oc1ref and tim_oc5ref
- If GC5C2O is set, tim_oc2refc is the logical OR of tim_oc2ref and tim_oc5ref
- If GC5C3O is set, tim_oc3refc is the logical OR of tim_oc3ref and tim_oc5ref
- If GC5C4O is set, tim_oc4refc is the logical OR of tim_oc4ref and tim_oc5ref

If both GC5Cx and GC5CxO bits are set, GC5Cx bit overrides GC5CxO programming and tim_ocxrefc is equal to tim_ocxref AND tim_oc5ref.

Combined 3-phase PWM mode can be selected independently on channels 1 to 4 by setting at least one of the bits GC5C[4:1] or GC5CO[4:1].

Figure 559. 3-phase combined PWM signals with multiple trigger pulses per period

The tim_trgo2 waveform shows how the ADC can be synchronized on given 3-phase PWM signals. Refer to *Section 34.3.36: ADC triggers* for more details.

34.3.17 Complementary outputs and dead-time insertion

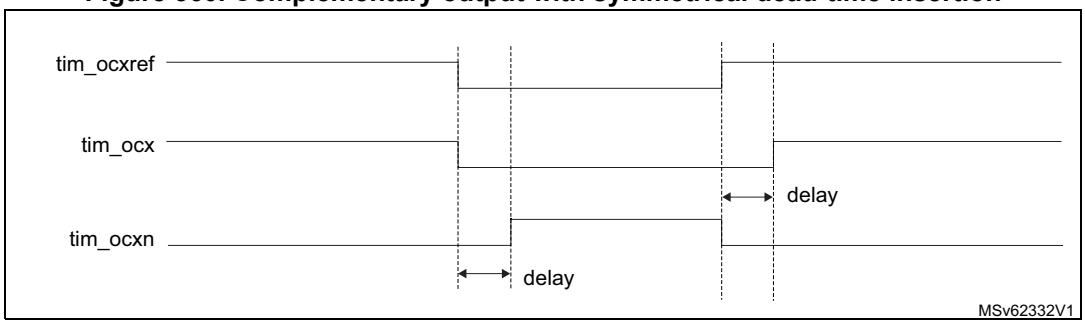
The advanced-control timers (TIM1/TIM8/TIM20) can output two complementary signals and manage the switching-off and the switching-on instants of the outputs.

This time is generally known as dead-time and it has to be adjusted depending on the devices that are connected to the outputs and their characteristics (such as intrinsic delays of level-shifters, or delays due to power switches).

The polarity of the outputs (main output tim_ocx or complementary tim_ocxn) can be selected independently for each output. This is done by writing to the CCxP and CCxNP bits in the TIM_CCER register.

The complementary signals tim_ocx and tim_ocxn are activated by a combination of several control bits: the CCxE and CCxNE bits in the TIM_CCER register and the MOE, OISx, OISxN, OSSI, and OSSR bits in the TIM_BDTR and TIM_CR2 registers. Refer to *Table 390: Output control bits for complementary tim_ocx and tim_ocxn channels with break feature* for more details. In particular, the dead-time is activated when switching to the idle state (MOE falling down to 0).

Dead-time insertion is enabled by setting both CCxE and CCxNE bits, and the MOE bit if the break circuit is present. There is one 10-bit dead-time generator for each channel. From a



reference waveform tim_ocxref, it generates two outputs tim_ocx and tim_ocxn. If tim_ocx and tim_ocxn are active high:

- The tim_ocx output signal is the same as the reference signal except for the rising edge, which is delayed relative to the reference rising edge.
- The tim_ocxn output signal is the opposite of the reference signal except for the rising edge, which is delayed relative to the reference falling edge.

If the delay is greater than the width of the active output (tim_ocx or tim_ocxn) then the corresponding pulse is not generated.

The following figures show the relationships between the output signals of the dead-time generator and the reference signal tim_ocxref considering CCxP = 0, CCxNP = 0, MOE = 1, CCxE = 1 and CCxNE = 1 in these examples.

Figure 560. Complementary output with symmetrical dead-time insertion

The DTAE bit in the TIM_DTR2 is used to differentiate the deadtime values for rising and falling edges of the reference signal, as shown on *Figure 561*.

In asymmetrical mode (DTAE = 1), the rising edge-referred deadtime is defined by the DTG[7:0] bitfield in the TIM_BDTR register, while the falling edge-referred is defined by the DTGF[7:0] bitfield in the TIM_DTR2 register. The DTAE bit must be written before enabling the counter and must not be modified while CEN = 1.

It is possible to have the deadtime value updated on-the-fly during pwm operation, using a preload mechanism. The deadtime bitfield DTG[7:0] and DTGF[7:0] are preloaded when the DTPE bit is set, in the TIM_DTR2 register. The preload value is loaded in the active register on the next update event.

Note: If the DTPE bit is enabled while the counter is enabled, any new value written since last update is discarded and previous value is used.

Figure 561. Asymmetrical deadtime

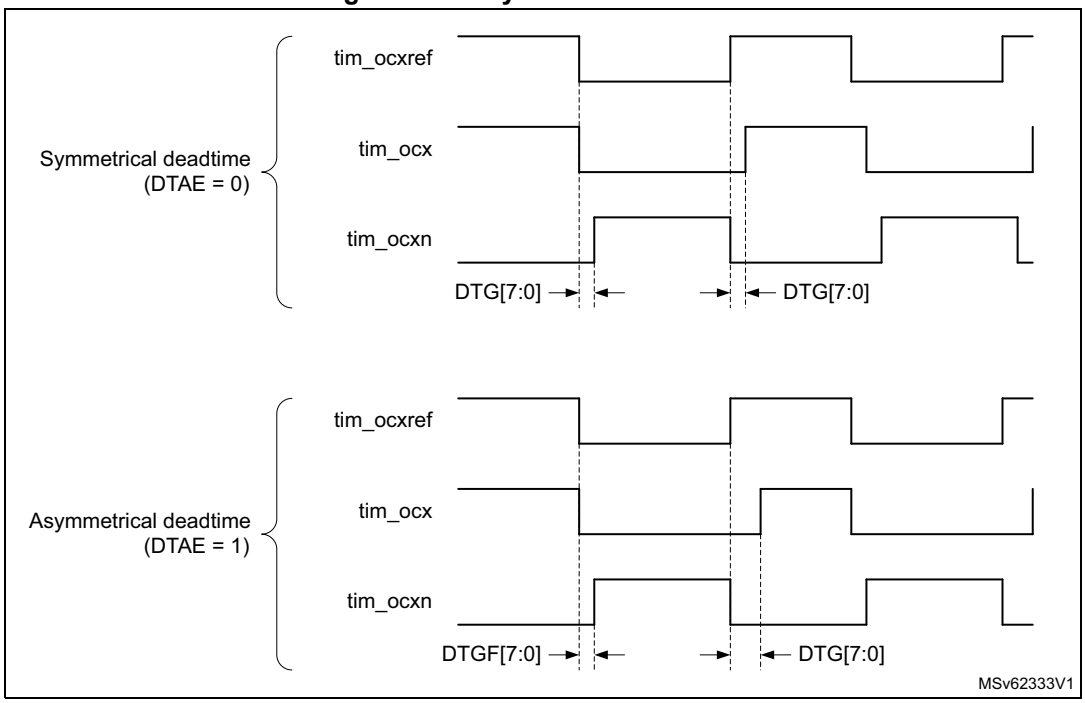


Figure 562. Dead-time waveforms with delay greater than the negative pulse

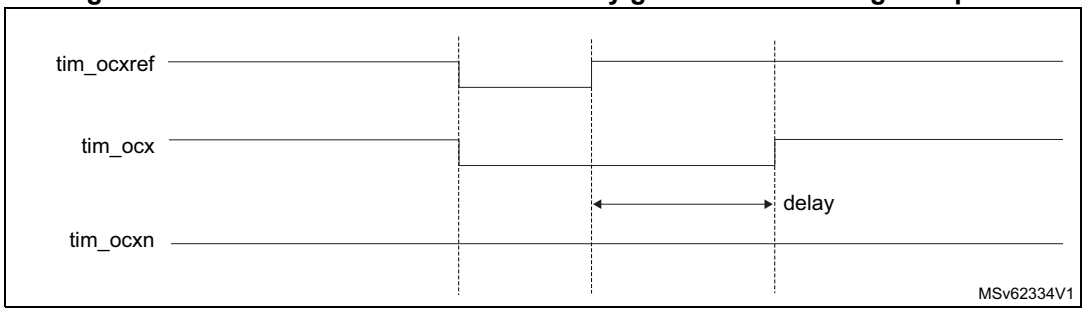

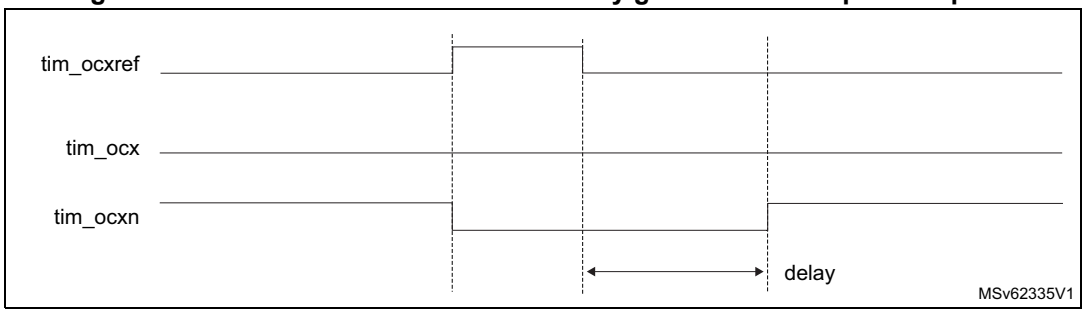

Figure 563. Dead-time waveforms with delay greater than the positive pulse

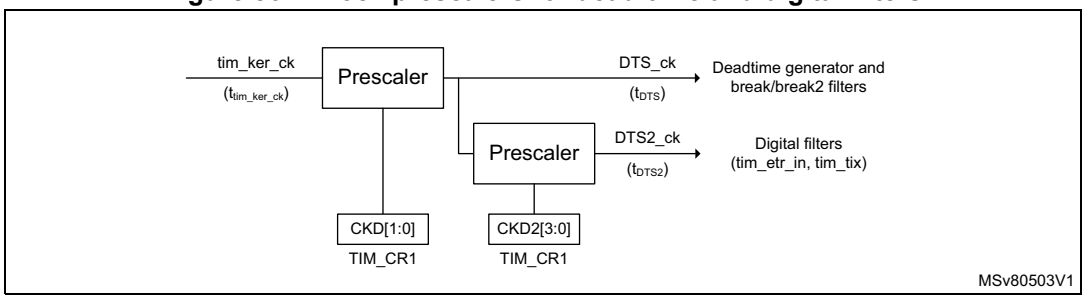
The dead-time delay is the same for each of the channels and is programmable with the DTG bits in the TIM_BDTR register. Refer to *Section 34.6.20: TIM break and dead-time register (TIM_BDTR)* for delay calculation.

Redirecting tim_ocxref to tim_ocx or tim_ocxn

In output mode (forced, output compare or PWM), tim_ocxref can be redirected to the tim_ocx output or to tim_ocxn output by configuring the CCxE and CCxNE bits in the TIM_CCER register.

This is used to send a specific waveform (such as PWM or static active level) on one output while the complementary remains at its inactive level. Other alternative possibilities are to have both outputs at inactive level or both outputs active and complementary with dead-time.



Note: When only tim_ocxn is enabled (CCxE = 0, CCxNE = 1), it is not complemented and becomes active as soon as tim_ocxref is high. For example, if CCxNP = 0 then tim_ocxn = tim_ocxref. On the other hand, when both tim_ocx and tim_ocxn are enabled (CCxE = CCxNE = 1) tim_ocx becomes active when tim_ocxref is high whereas tim_ocxn is complemented and becomes active when tim_ocxref is low.

34.3.18 Clock dividers for dead-time generators and digital filters

The dead-time generators and the digital filters (for tim_etr_in, tim_tix) are using a DTS_ck clock (with a t_{DTS} period), derived from the tim_ker_ck clock.

A prescaler can decrease the frequency to extend the deadtime period programmed with the CKD[1:0] bitfield in the TIM_CR1 register. A second prescaler can decrease the resulting DTS_ck clock to extend solely the digital filters range, with the CKD2[3:0] bitfield in the TIM_CR1 register.

Figure 564. Clock prescalers for dead-time and digital filters

34.3.19 Using the break function

The purpose of the break function is to protect power switches driven by PWM signals generated with the timers. The two break inputs are usually connected to fault outputs of power stages and 3-phase inverters. When activated, the break circuitry shuts down the PWM outputs and forces them to a predefined safe state. A number of internal MCU events can also be selected to trigger an output shut-down.

The break features two channels. A break channel which gathers both system-level fault (clock failure, ECC/parity errors,...) and application fault (from input pins and built-in comparator), and can force the outputs to a predefined level (either active or inactive) after a deadtime duration. A break2 channel which only includes application faults and is able to force the outputs to an inactive state.

The output enable signal and output levels during break are depending on several control bits:

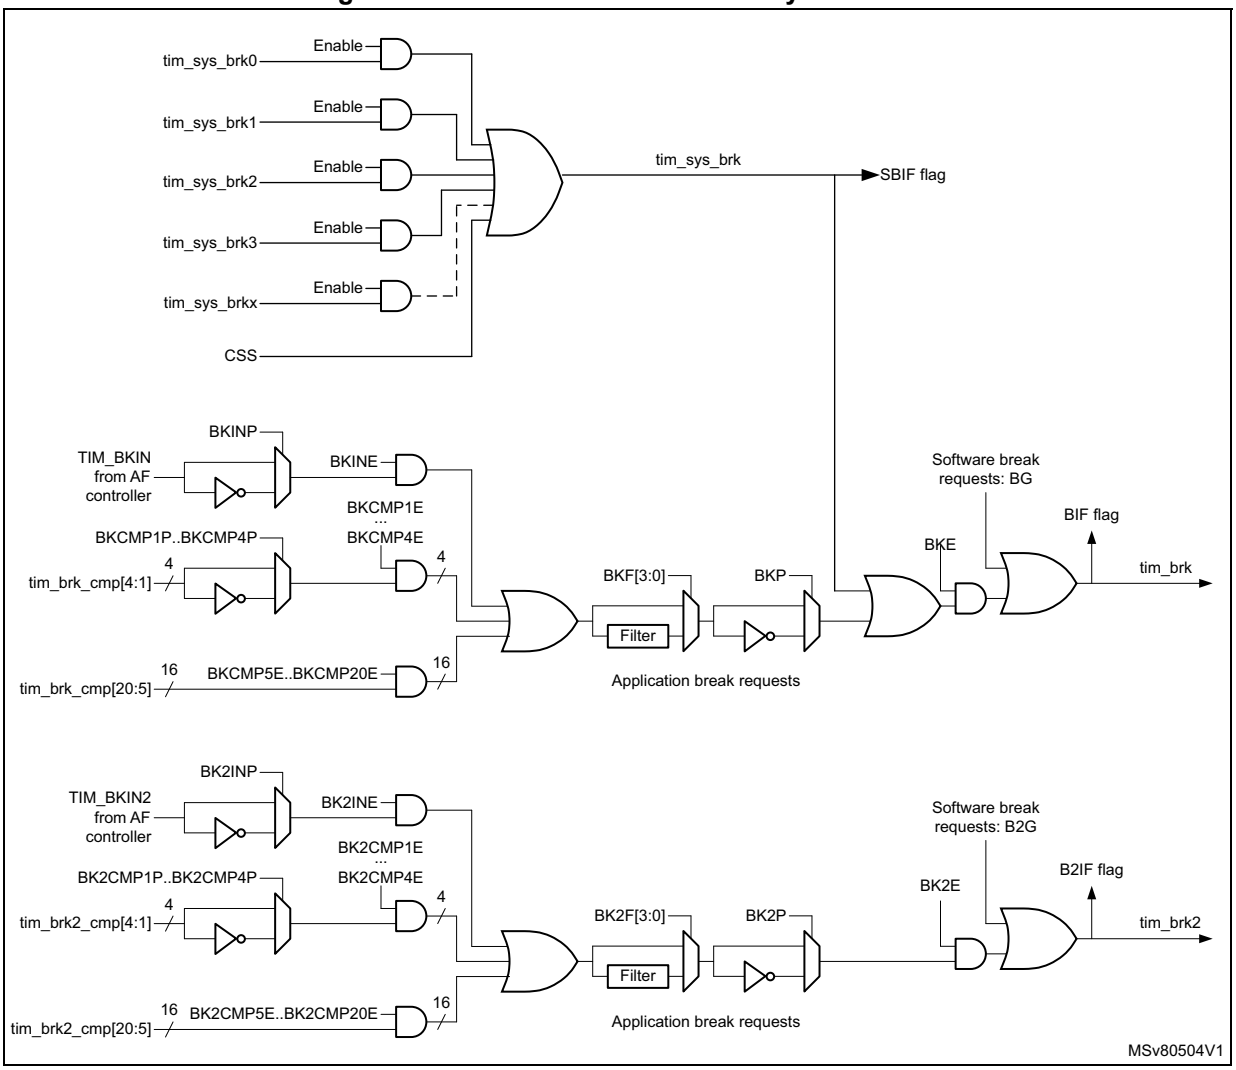
- The MOE bit in TIM_BDTR register is used to enable/disable the outputs by software and is reset in case of break or break2 event.
- The OSSI bit in the TIM_BDTR register defines whether the timer controls the output in inactive state or releases the control to the GPIO controller (typically to have it in Hi-Z mode)
- The OISx and OISxN bits in the TIM_CR2 register which are setting the output shut-down level, either active or inactive. The tim_ocx and tim_ocxn outputs cannot be set both to active level at a given time, whatever the OISx and OISxN values. Refer to *Table 390: Output control bits for complementary tim_ocx and tim_ocxn channels with break feature* for more details.

When exiting from reset, the break circuit is disabled and the MOE bit is low. The break functions can be enabled by setting the BKE and BK2E bits in the TIM_BDTR register. The break input polarities can be selected by configuring the BKP and BK2P bits in the same register. BKEx and BKPx can be modified at the same time. When the BKEx and BKPx bits are written, a delay of one APB clock cycle is applied before the writing is effective. Consequently, it is necessary to wait one APB clock period to correctly read back the bit after the write operation.

Because MOE falling edge can be asynchronous, a resynchronization circuit has been inserted between the actual signal (acting on the outputs) and the synchronous control bit (accessed in the TIM_BDTR register). It results in some delays between the asynchronous and the synchronous signals. In particular, if MOE is set to 1 whereas it was low, a delay must be inserted (dummy instruction) before reading it correctly. This is because the write acts on the asynchronous signal whereas the read reflects the synchronous signal.

The sources for break (tim_brk) channel are:

- External sources connected to one of the TIM_BKIN pin (as per selection done in the GPIO alternate function selection registers), with polarity selection and optional digital filtering
- Internal sources:
  - coming from a tim_brk_cmpx input (refer to *Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals* for product specific implementation)
  - coming from a system break request (refer to *Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals* for product specific implementation)



The sources for break2 (tim_brk2) are:

- External sources connected to one of the TIM_BKIN2 pin (as per selection done in the GPIO alternate function selection registers), with polarity selection and optional digital filtering
- Internal sources coming from a tim_brk2_cmpx input (refer to *Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals* for product specific implementation)

Break events can also be generated by software using BG and B2G bits in the TIM_EGR register.

All sources are ORed before entering the timer tim_brk or tim_brk2 inputs, as per *Figure 565* below.

Figure 565. Break and Break2 circuitry overview

Note: An asynchronous (clockless) operation is only guaranteed when the programmable filter is disabled. If it is enabled, a fail safe clock mode (for example by using the internal PLL and/or the CSS) must be used to guarantee that break events are handled.

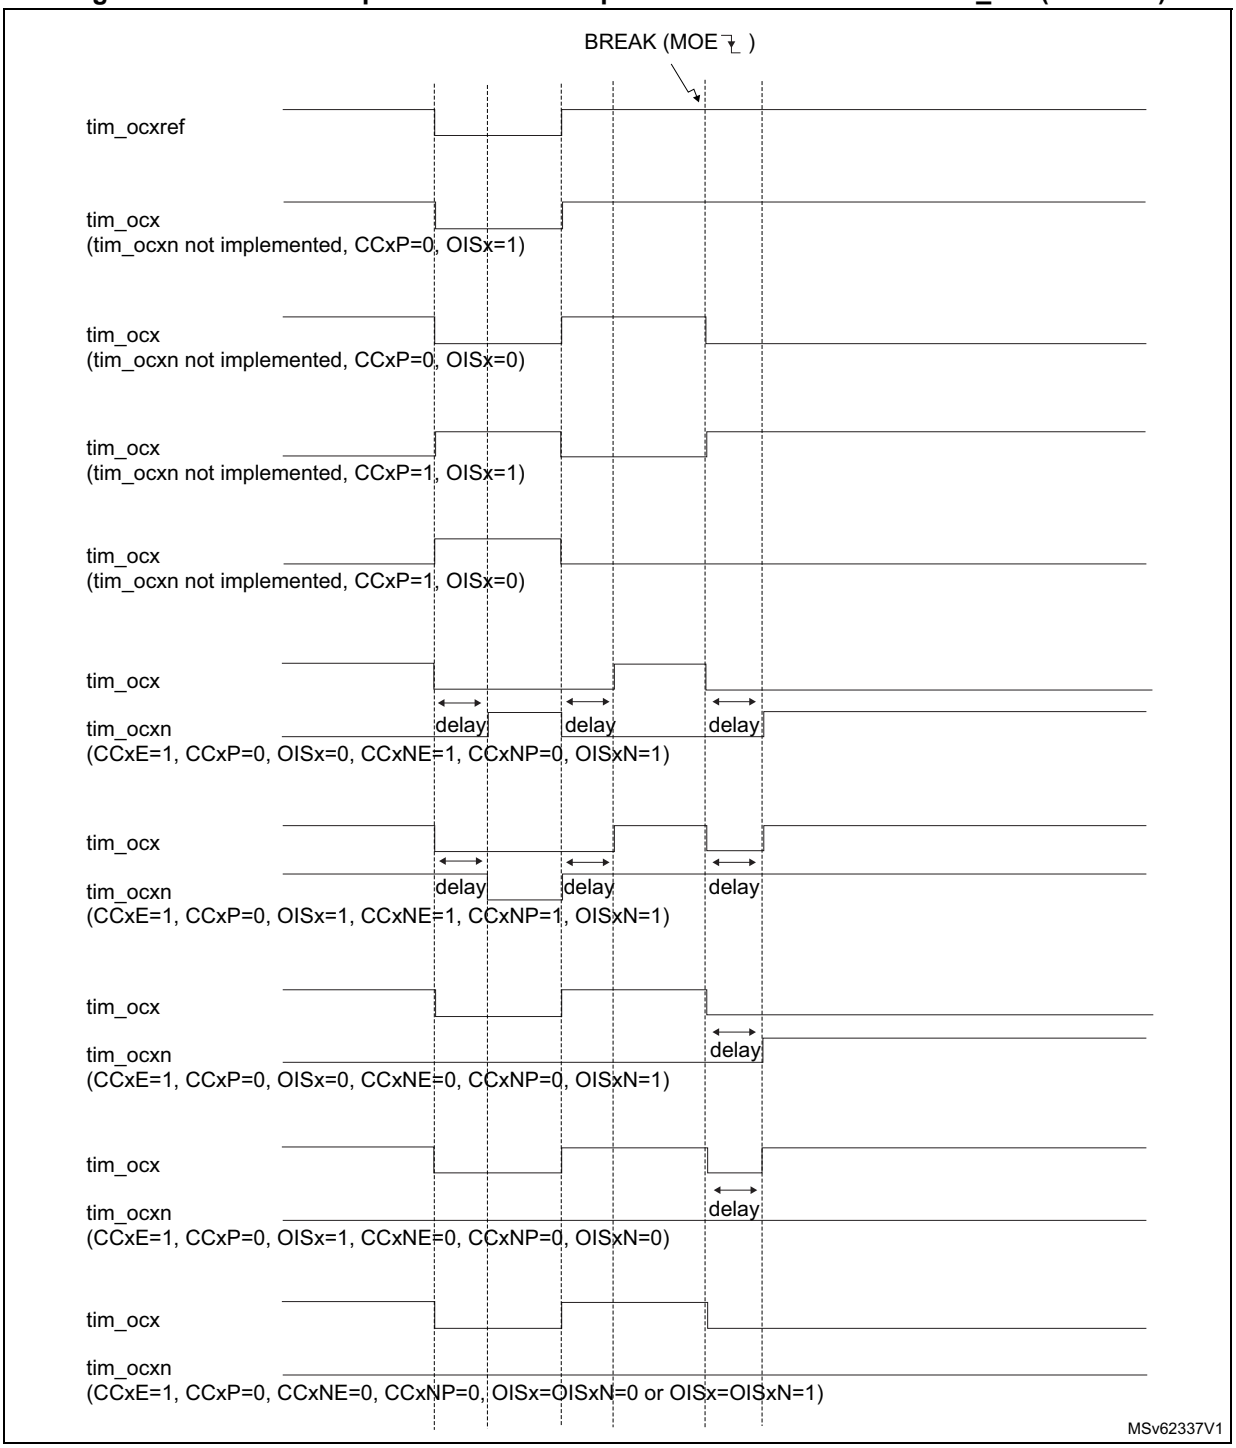
When one of the breaks occurs (selected level on one of the break inputs):

- The MOE bit is cleared asynchronously, putting the outputs in inactive state, idle state, or even releasing the control to the GPIO controller (selected by the OSSI bit). This feature is enabled even if the MCU oscillator is off.
- Each output channel is driven with the level programmed in the OISx bit in the TIM_CR2 register as soon as MOE = 0. If OSSI = 0, the timer releases the output control (taken over by the GPIO controller), otherwise the enable output remains high.
- When complementary outputs are used:
  - The outputs are first put in inactive state (depending on the polarity). This is done asynchronously so that it works even if no clock is provided to the timer.
  - If the timer clock is still present, then the dead-time generator is reactivated in order to drive the outputs with the level programmed in the OISx and OISxN bits after a dead-time. Even in this case, tim_ocx and tim_ocxn cannot be driven to

their active level together. Note that because of the resynchronization on MOE, the dead-time duration is slightly longer than usual (around 2 tim_ker_ck clock cycles).

  - If OSSI = 0, the timer releases the output control (taken over by the GPIO controller which forces a Hi-Z state), otherwise the enable outputs remain or become high as soon as one of the CCxE or CCxNE bits is high.

- The break status flags (B2GF, BGF, SBIF, BIF, and B2IF bits in the TIM_SR register) are set. An interrupt is generated if the BIE bit in the TIM_DIER register is set.
- An output disable status flag (ODS in the TIM_SR register) indicates the status of the outputs:
  - ODS = 0: Idle state. Break was triggered (or MOE was written to 0) and OIS states are forced on tim_ocx and tim_ocxn outputs
  - ODS = 1: Disabled state. Break2 was triggered, tim_ocx and tim_ocxn outputs are inactive
- If the AOE bit in the TIM_BDTR register is set, the MOE bit is automatically set again at the next update event (UEV). As an example, this can be used to perform a regulation. Otherwise, MOE remains low until the application sets it to 1 again. In this case, it can be used for security and the break input can be connected to an alarm from power drivers, thermal sensors, or any security components.



Note: If the MOE is reset by the CPU while the AOE bit is set, the outputs are in idle state and forced to inactive level or Hi-Z depending on OSSI value. If both the MOE and AOE bits are reset by the CPU, the outputs are in disabled state and driven with the level programmed in the OISx bit in the TIM_CR2 register.

The break inputs are active on level. Thus, the MOE cannot be set while the break input is active (neither automatically nor by software). In the meantime, the status flag BIF and B2IF cannot be cleared.

In addition to the break input and the output management, a write protection has been implemented inside the break circuit to safeguard the application. It is used to freeze the configuration of several parameters (dead-time duration, tim_ocx/tim_ocxn polarities and state when disabled, OCxM configurations, break enable, and polarity). The application can choose from three levels of protection selected by the LOCK bits in the TIM_BDTR register. Refer to *Section 34.6.20: TIM break and dead-time register (TIM_BDTR)*. The LOCK bits can be written only once after an MCU reset.

Figure 566 shows an example of behavior of the outputs in response to a break.

Figure 566. Various output behavior in response to a break event on tim_brk (OSSI = 1)

The two break inputs have different behaviors on timer outputs:

- The tim_brk input can either disable (inactive state) or force the PWM outputs to a predefined safe state.
- tim_brk2 can only disable (inactive state) the PWM outputs.

The tim_brk has a higher priority than tim_brk2 input, as described in *Table 383*.

The output disable status flag (ODS in the TIM_SR register) indicates the status of the outputs after a break event and is useful to distinguish break and break2 safe states.

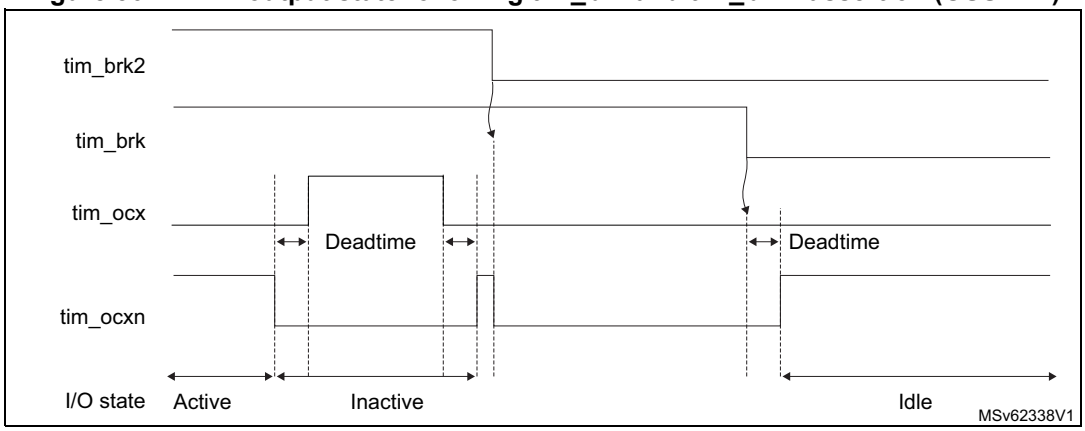
Note: tim_brk2 must only be used with OSSR = OSSI = 1.

Table 383. Behavior of timer outputs versus tim_brk/tim_brk2 inputs

tim_brk	tim_brk2	Timer outputs state	Typical use case	
			tim_ocxn output (low side switches)	tim_ocx output (high side switches)
Active	X	– Inactive then forced output state (after a deadtime) – Outputs disabled if OSSI = 0 (control taken over by GPIO logic)	ON after deadtime insertion	OFF
Inactive	Active	Inactive	OFF	OFF

Figure 567 gives an example of tim_ocx and tim_ocxn output behavior in case of active signals on tim_brk and tim_brk2 inputs. In this case, both outputs have active high polarities (CCxP = CCxNP = 0 in TIM_CCER register).

Figure 567. PWM output state following tim_brk and tim_brk2 assertion (OSSI = 1)



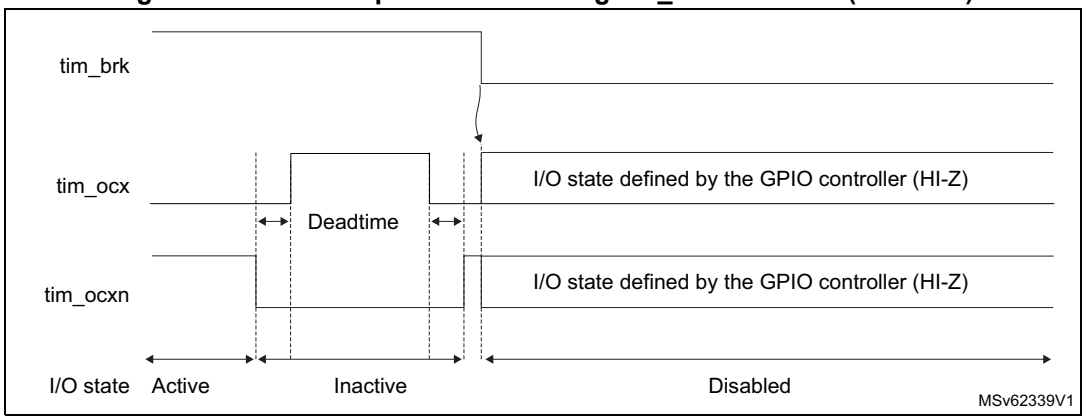


Figure 568. PWM output state following tim_brk assertion (OSSI = 0)

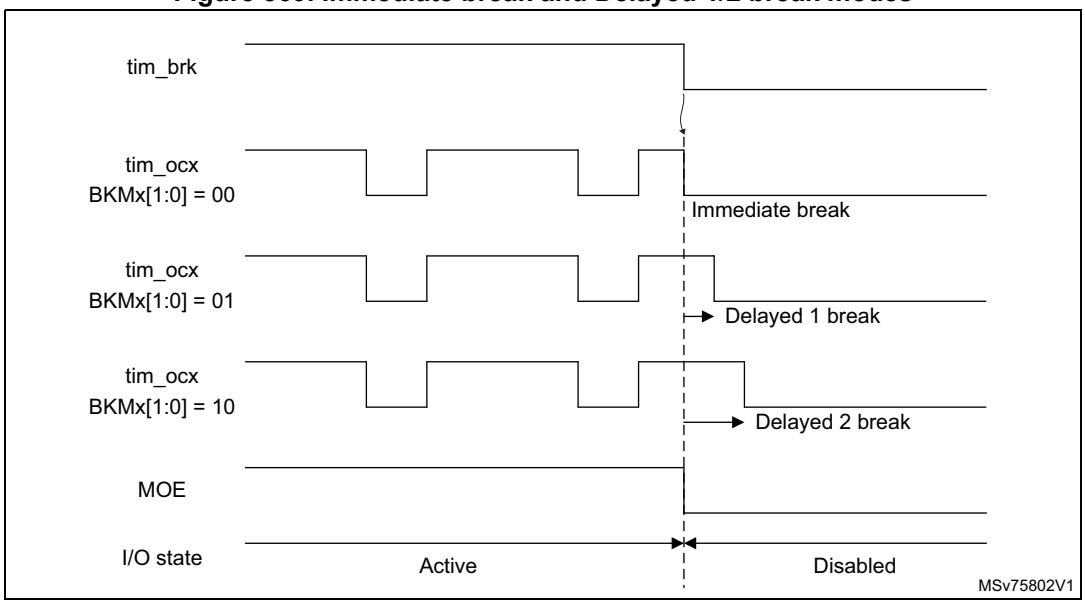
34.3.20 Delayed break



In Neutral-Point Clamped (NPC) multilevel converter topology, a break strategy with immediate outputs shut-down is not suitable, as it may damage the power switches with excessive voltage levels.

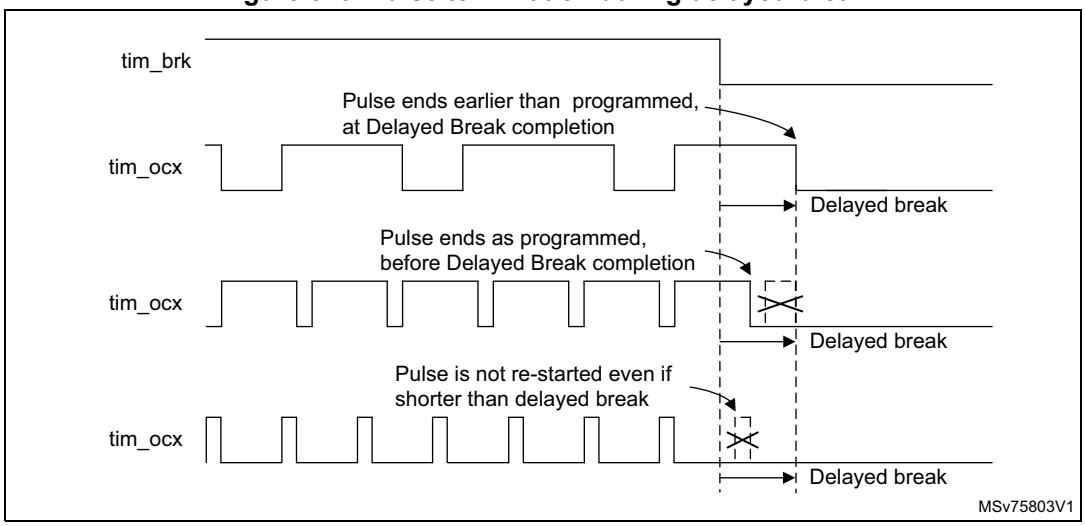
The delayed break features provide 2 options delaying the response to a break event, and implement a safe shut-down sequence.

BKMx[1:0] and BKMxN[1:0] bitfields in TIM_MPR1 provides 3 options for each complementary outputs (tim_oc1/tim_oc1n to tim_oc4/tim_oc4n), as show on *Figure 569* below:

- BKM[1:0] = 00: the break response is immediate
- BKM[1:0] = 01: Delayed 1 break. The break response is delayed with a delay defined in the DBK1[7:0] bitfield of the TIM_MPR2 register
- BKM[1:0] = 10: Delayed 2 break. The break response is delayed with a delay defined in the DBK2[7:0] bitfield of the TIM_MPR2 register

Figure 569. Immediate break and Delayed 1/2 break modes

The delayed break mode is triggered when:



- A break event occurs
- The MOE bit is reset
- When the microcontroller enters debug mode with DBG_TIM_STOP=1

Warning: The break2 feature must be disabled when the delayed mode is enabled.

When delayed break mode is triggered, the MOE bit is immediately cleared, and cannot be set during the delayed break duration. In bidirectional break mode, the break output is reset immediately to indicate the delayed break start to external components. Once the longest of the 2 delays is over, the deadtime generator is enabled to prevent any deadtime violation if OISx/OISxN bits are set.

If the tim_ocx/tim_ocxn signal is reset before the end of the delayed break (due to a compare match in PWM mode, typically), the signal is not maintained during the full delayed break period, to maintain the duty cycle, as shown on *Figure 570* below. Still, the Delayed break circuitry guarantees that the tim_ocx/tim_ocxn signals cannot be set again once the break event occurred.

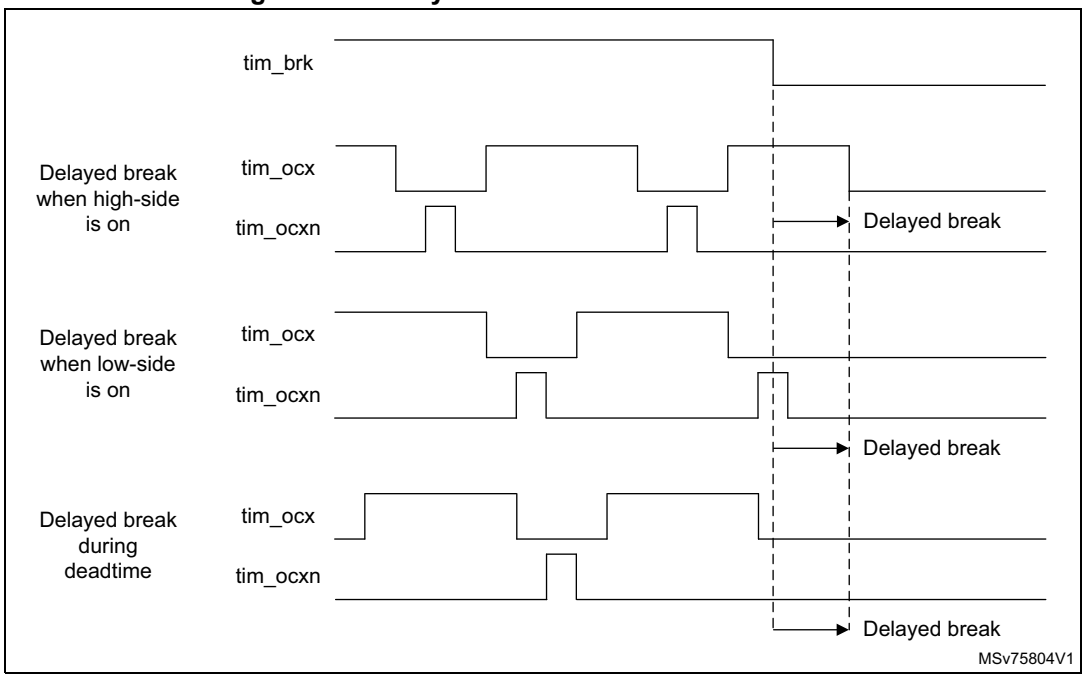


Figure 570. Pulse termination during delayed break

The Figure 563 depicts the behavior when the deadtime generator is enabled, for the 3 cases:

– Delayed break triggered when tim_ocx is set
– Delayed break triggered when tim_ocxn is set
– Delayed break triggered during deadtime interval

Figure 571. Delayed break with deadtime insertion

The delay programming is identical to deadtime generator's, with 2 user-programmable durations in the TIM_MPR2 register: DBK1[7:0] bitfield for the Delayed 1 break and DBK2[7:0] bitfield for the Delayed 2 break.

DBK1[7:0] and DBK2[7:0] bitfields are preloaded: they can be changed during timer operation, and the new value is transferred to the active register when an update event occurs.

DBK1[7:0] and DBK2[7:0] bitfields are partially preloaded: they can be changed during timer operation, and the new value is transferred to the active register when an update event occurs.

The bits coding for t_{DTG} selection are not preloaded.

It is thus recommended to update only the least significant bits to have the expected duration value:

- DBKx[6:0] if DBKx[7] = 0
- DBKx[5:0] if DBKx[7:6] = 10
- DBKx[4:0] if DBKx[7:5] = 110 or 111

The BKMx[1:0] and BKMxN[1:0] bits are static, they can only be modified when the counter is stopped (CEN=0 in TIM_CR1).

The content of the TIM_MPR1 and TIM_MPR2 register can be write protected using the LOCK[1:0] bits in the TIM_BDTR register.

34.3.21 Bidirectional break inputs

The TIM1/TIM8/TIM20 feature bidirectional break I/Os, as represented on *Figure 572*.

This provides support for:

- A board-level global break signal available for signaling faults to external MCUs or gate drivers, with a unique pin being both an input and an output status pin.
- Internal break sources and multiple external open drain sources ORed together to trigger a unique break event, when multiple internal and external break sources must be merged.

The tim_brk and tim_brk2 inputs are configured in bidirectional mode using the BKBID and BK2BID bits in the TIM_BDTR register. The BKBID programming bits can be locked in read-only mode using the LOCK bits in the TIM_BDTR register (in LOCK level 1 or above).

The bidirectional mode is available for both the tim_brk and tim_brk2 inputs, and require the I/O to be configured in open-drain mode with active low polarity (using BKINP, BKP, BK2INP and BK2P bits). Any break request coming either from system (for example CSS), from on-chip peripherals, or from break inputs forces a low level on the break input to signal the fault event. The bidirectional mode is inhibited if the polarity bits are not correctly set (active high polarity), for safety purposes.

The break software events (BG and B2G) also cause the break I/O to be forced to 0 to indicate to the external components that the timer is entered in break state. However, this is valid only if the break is enabled (BKE or B2KE = 1). When a software break event is generated with BKE or B2KE = 0), the outputs are put in safe state and the break flag is set, but there is no effect on the TIM_BKIN and TIM_BKIN2 I/Os.

A safe disarming mechanism prevents the system to be definitively locked-up (a low level on the break input triggers a break which enforces a low level on the same input).

When the BKDSRM (BK2DSRM) bit is set to 1, this releases the break output to clear a fault signal and to give the possibility to re-arm the system.

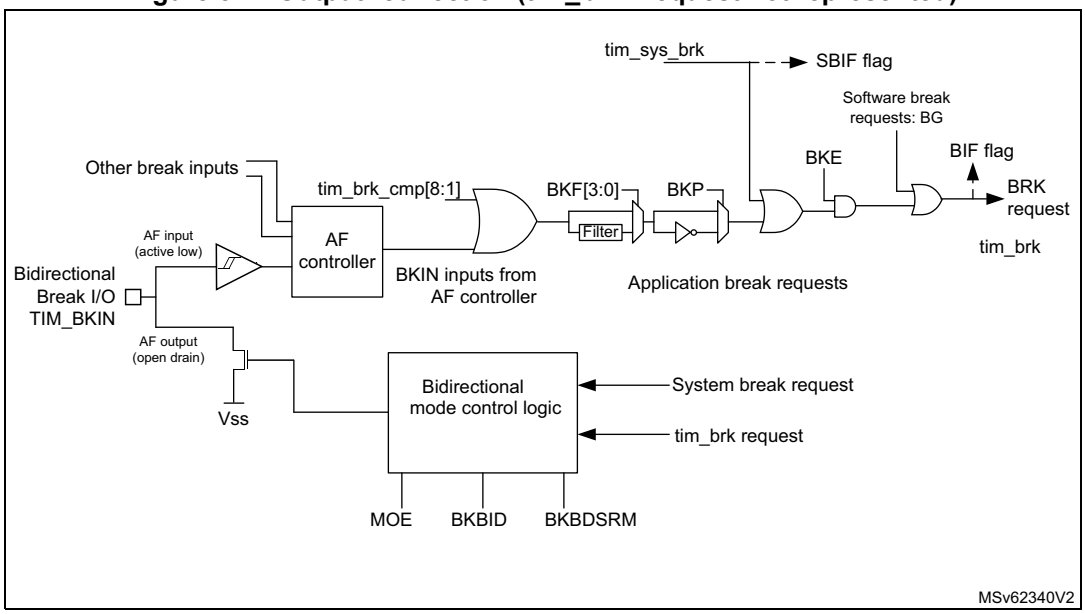
At no point the break protection circuitry can be disabled:

- The break input path is always active: a break event is active even if the BKDSRM (BK2DSRM) bit is set and the open drain control is released. This prevents the PWM output to be restarted as long as the break condition is present.
- The BKDSRM (BK2DSRM) bit cannot disarm the break protection as long as the outputs are enabled (MOE bit is set) (see *Table 384*).

Table 384. Break protection disarming conditions

MOE	BKBID (BK2BID)	BKDSRM (BK2DSRM)	Break protection state
0	0	X	Armed
0	1	0	Armed
0	1	1	Disarmed
1	X	X	Armed

Arming and rearming break circuitry



The break circuitry (in input or bidirectional mode) is armed by default (peripheral reset configuration).

The following procedure must be followed to re-arm the protection after a break (break2) event:

- The BKDSRM (BK2DSRM) bit must be set to release the output control.
- The software must wait until the system break condition disappears (if any) and clear the SBIF status flag (or clear it systematically before rearming).
- The software must poll the BKDSRM (BK2DSRM) bit until it is cleared by hardware (when the application break condition disappears).

From this point, the break circuitry is armed and active, and the MOE bit can be set to re-enable the PWM outputs.

Figure 572. Output redirection (tim_brk2 request not represented)

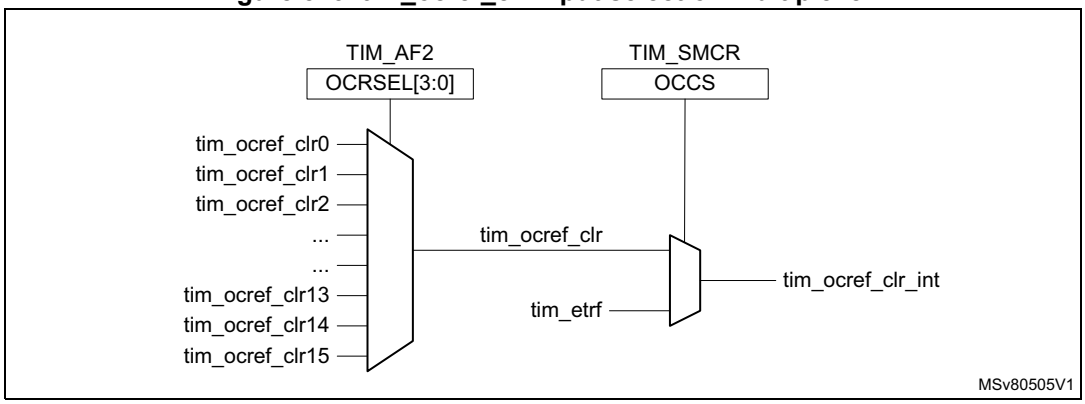
34.3.22 Output idle state override

It is possible to override the outputs states when they are disabled (ie MOE bit reset in TIM_BDTR). This feature can be used to apply specific patterns prior to start PWM operations, for instance to refresh bootstrap capacitors of power switch gate drivers.

The OOC control bit in the TIM_OOR register acts as following:

- OOC= 0: 0: tim_ocx and tim_ocxn outputs are in the default idle state
- OOC=1: tim_ocx and tim_ocxn outputs are forced in an idle state defined with OOSx/OOSxN bits in the TIM_OOR register

The OOC bit can only be modified when the outputs are in idle state (MOE = 0). It is cleared by hardware when the MOE bit is set, and the deadtime generator ensures there's no deadtime violation on complementary outputs.



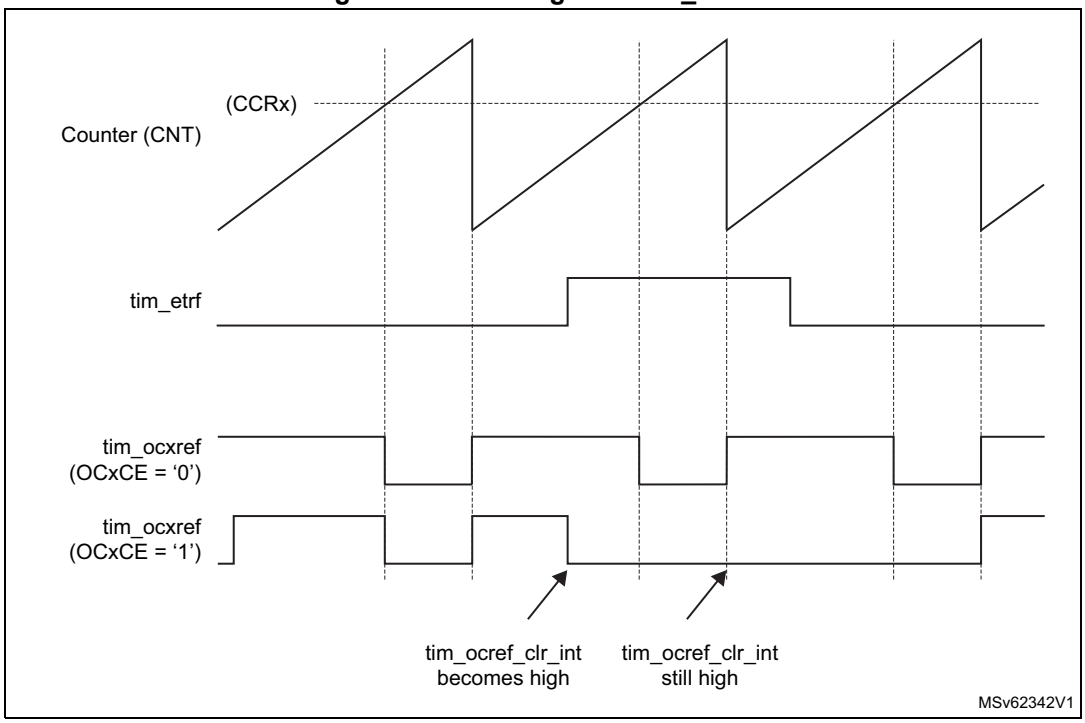
The OOSx/OOSxN bits in the TIM_OOR register cannot be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM_BDTR register).

34.3.23 Clearing the tim_ocxref signal on an external event

The tim_ocxref signal of a given channel can be cleared when a high level is applied on the tim_ocref_clr_int input (OCxCE enable bit in the corresponding TIM_CCMRx register set to 1). tim_ocxref remains low until the next transition to the active state, on the following PWM cycle. This function can only be used in Output compare and PWM modes. It must not be used in Forced mode. tim_ocref_clr_int input can be selected between the tim_ocref_clr input and tim_etrf (tim_etr_in after the filter) by configuring the OCCS bit in the TIM_SMCR register.

The tim_ocref_clr input can be selected among several inputs, using the OCRSEL[3:0] bitfield in the TIM_AF2 register, as shown on the *Figure 573* below. Refer to *Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals* for a list of sources available in the product.

Figure 573. tim_ocref_clr input selection multiplexer



When tim_etrf is chosen, tim_etr_in must be configured as follows:

1. The external trigger prescaler must be kept off: bits ETPS[1:0] of the TIM_SMCR register set to 00.
2. The external clock mode 2 must be disabled: bit ECE of the TIM_SMCR register set to 0.
3. The external trigger polarity (ETP) and the external trigger filter (ETF) can be configured according to application needs (as per polarity of the source connected to the trigger and eventual need to remove noise using the filter).

Figure 574 shows the behavior of the tim_ocxref signal when the tim_etrf input becomes high, for both values of the enable bit OCxCE. In this example, the timer TIMx is programmed in PWM mode.

Figure 574. Clearing TIMx tim_ocxref

Note: In case of a PWM with a 100% duty cycle (if CCRx>ARR), then tim_ocxref is enabled again at the next counter overflow.

This feature is also supported in combined and asymmetric modes. In this case, it is mandatory to have the OCxCE bit enabled for the channel, the OCxCE bit of the complementary channel (e.g. OC2CE = X for oc2ref in *Figure 575*) is ignored in this case.

Figure 575 to *Figure 578* are describing the output waveforms for some use cases, when the ocref_clr_int signal is asserted.

Figure 575. Asymmetric PWM mode 1

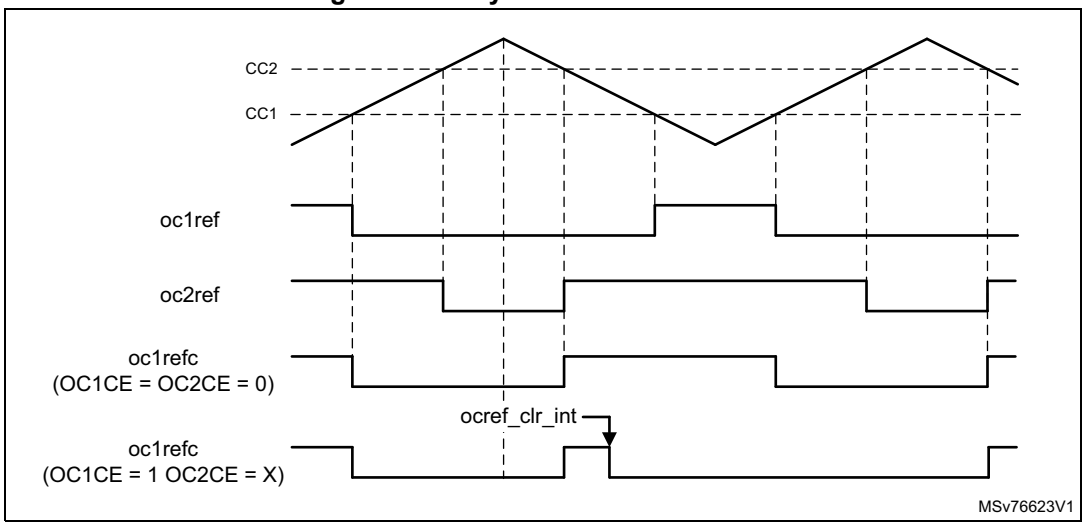


Figure 576. Asymmetric PWM mode 2

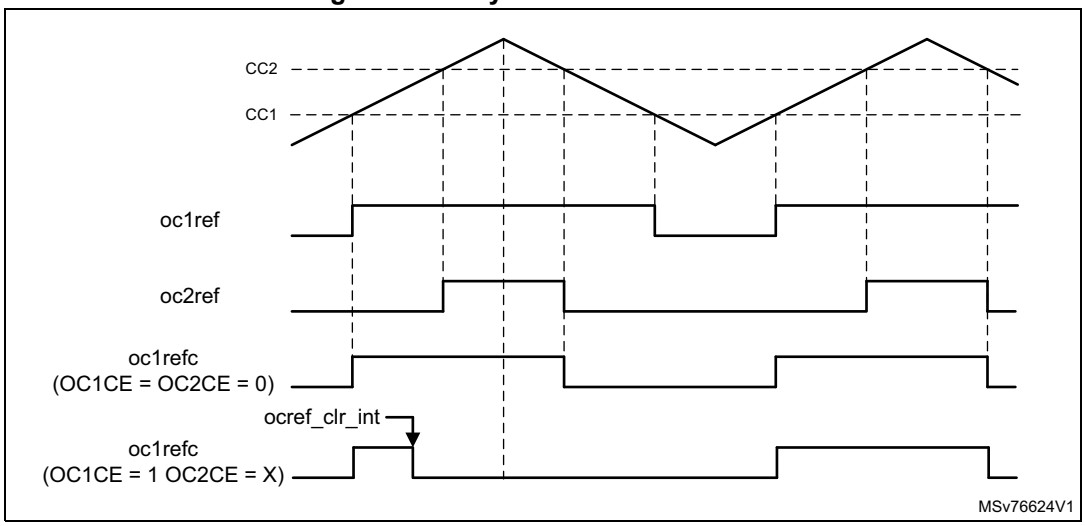

Figure 577. Asymmetric PWM mode 7 (OC1refc = oc1ref OR oc5ref)

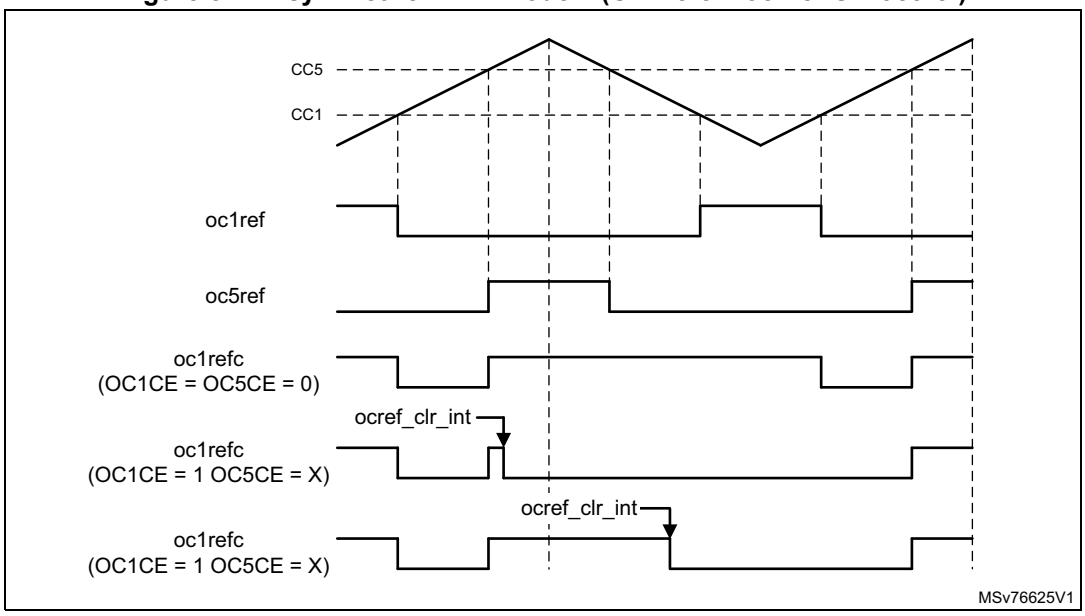

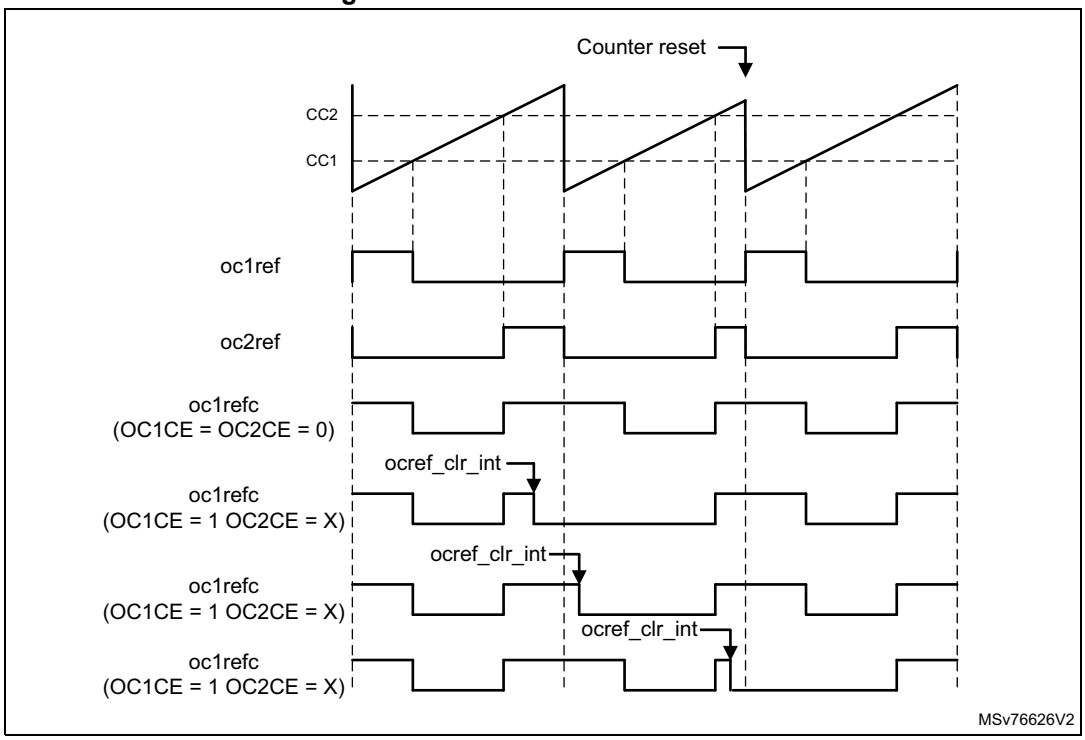

Figure 578. Combined PWM mode 1

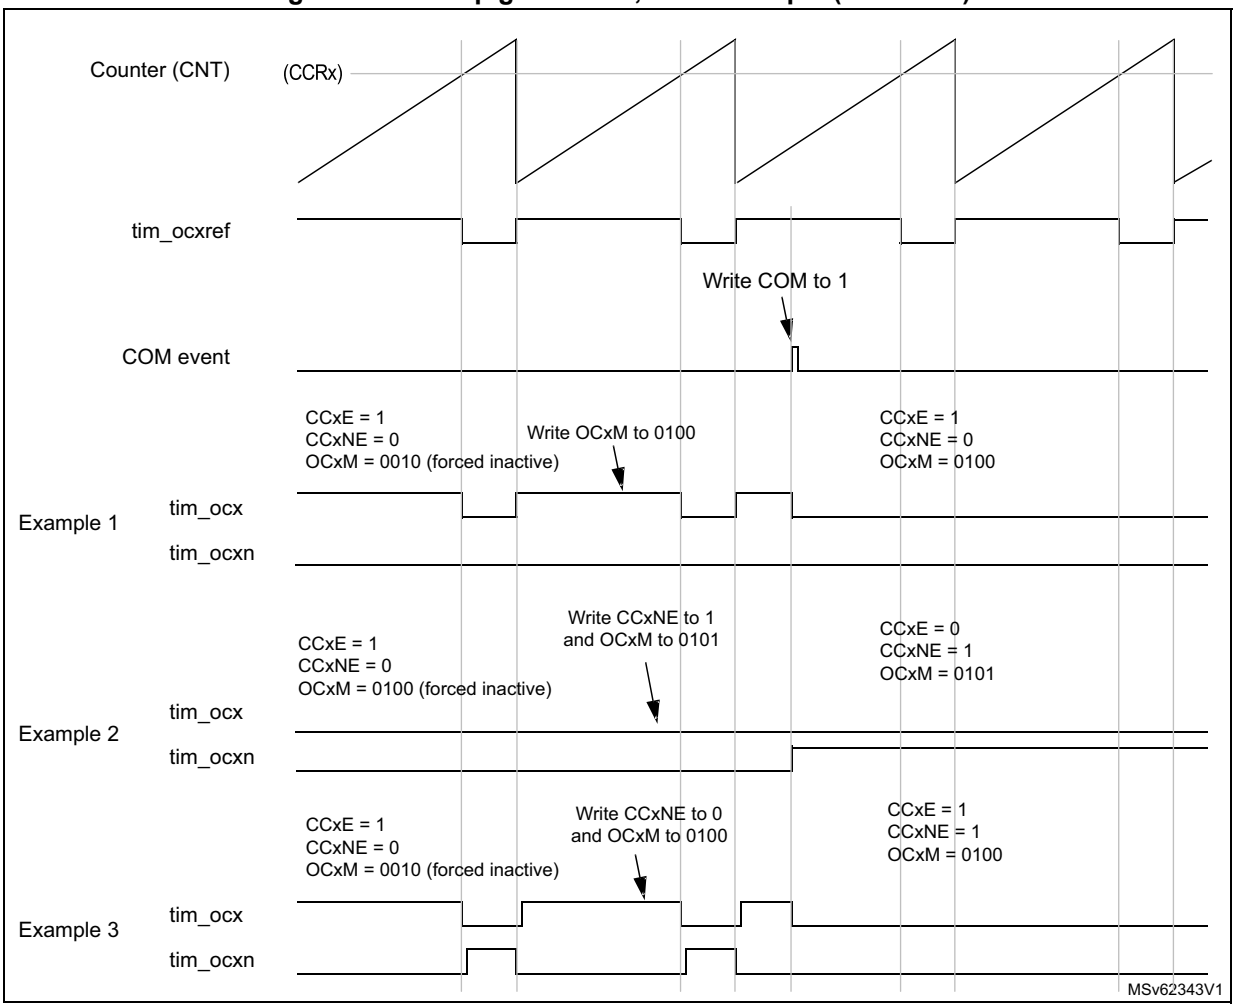
Conditions of use

This feature is intended to support cycle-by-cycle current control loops, typically with a comparator shortening the PWM on-time when a current threshold is exceeded.

It cannot be used for the following modes, where the OCxCE bit must be cleared:

- PWM toggle mode (OCxM[4:0] = 0x03)
- One pulse mode with PWM active on match (OPM=1 and OCxM[4:0] = 0x06, 0x08, 0x0C, 0x0E, 0x10, 0x12, 0x14, 0x16, 0x18)
- Combined 3-phase modes (GC5Cx or GC5CxO = 1)
- Combined PWM mode 1 or 3 in center aligned mode (CMS[1:0] = 1,2,3 and OCxM[4:0] = 0x0C or 0x10)



34.3.24 6-step PWM generation

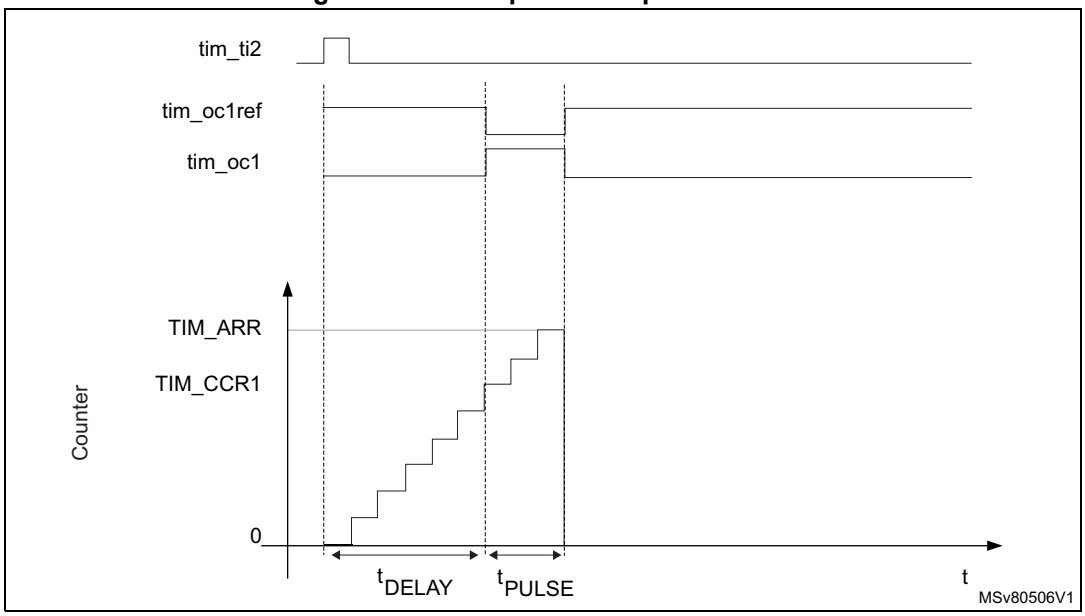
When complementary outputs are used on a channel, preload bits are available on the OCxM, CCxE, and CCxNE bits. The preload bits are transferred to the shadow bits at the COM commutation event. Thus one can program in advance the configuration for the next step and change the configuration of all the channels at the same time. COM can be generated by software by setting the COM bit in the TIM_EGR register or by hardware (on tim_trgi rising edge).

A flag is set when the COM event occurs (COMIF bit in the TIM_SR register), which can generate an interrupt (if the COMIE bit is set in the TIM_DIER register) or a DMA request (if the COMDE bit is set in the TIM_DIER register).

Figure 579 describes the behavior of the tim_ocx and tim_ocxn outputs when a COM event occurs, in three different examples of programmed configurations.

Figure 579. 6-step generation, COM example (OSSR = 1)

34.3.25 One-pulse mode



One-pulse mode (OPM) is a particular case of the previous modes. It allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length after a programmable delay.

Starting the counter can be controlled through the slave mode controller. Generating the waveform can be done in output compare mode or PWM mode. One-pulse mode is selected by setting the OPM bit in the TIM_CR1 register. This makes the counter stop automatically at the next update event UEV.

A pulse can be correctly generated only if the compare value is different from the counter initial value. Before starting (when the timer is waiting for the trigger), the configuration must be:

- In upcounting: CNT < CCRx ≤ ARR (in particular, 0 < CCRx)
- In downcounting: CNT > CCRx

Figure 580. Example of one pulse mode.

In the following example, the user wants to generate a positive pulse on tim_oc1 with a length of t_{PULSE} and after a delay of t_{DELAY} as soon as a positive edge is detected on the tim_ti2 input pin.

Use tim_ti2fp2 as trigger 1:

- Map tim_ti2fp2 to tim_ti2 by writing CC2S = 01 in the TIM_CCMR1 register.
- tim_ti2fp2 must detect a rising edge, write CC2P = 0 and CC2NP = 0 in the TIM_CCER register.
- Configure tim_ti2fp2 as trigger for the slave mode controller (tim_trgi) by writing TS = 00110 in the TIM_SMCR register.
- tim_ti2fp2 is used to start the counter by writing SMS to 110 in the TIM_SMCR register (trigger mode).

The OPM waveform is defined by writing the compare registers (taking into account the clock frequency and the counter prescaler).

- The t_{DELAY} is defined by the value written in the TIM_CCR1 register.
- The t_{PULSE} is defined by the difference between the autoreload value and the compare value (TIM_ARR - TIM_CCR1).
- Suppose the user wants to build a waveform with a transition from 0 to 1 when a compare match occurs and a transition from 1 to 0 when the counter reaches the auto-reload value. This is achieved by enabling PWM mode 2 (OC1M = 00111 in TIM_CCMR1). Optionally the preload registers can be enabled by writing OC1PE = 1 in the TIM_CCMR1 register and ARPE in the TIM_CR1 register. In this case one has to write the compare value in the TIM_CCR1 register, the autoreload value in the TIM_ARR register, generate an update by setting the UG bit and wait for external trigger event on tim_ti2. CC1P is written to 0 in this example.

In this example, the DIR and CMS bits in the TIM_CR1 register must be low.

Since only one pulse (Single mode) is needed, a 1 must be written in the OPM bit in the TIM_CR1 register to stop the counter at the next update event (when the counter rolls over

from the autoreload value back to 0). When OPM bit in the TIM_CR1 register is set to 0, so the Repetitive mode is selected.

Particular case: tim_ocx fast enable:

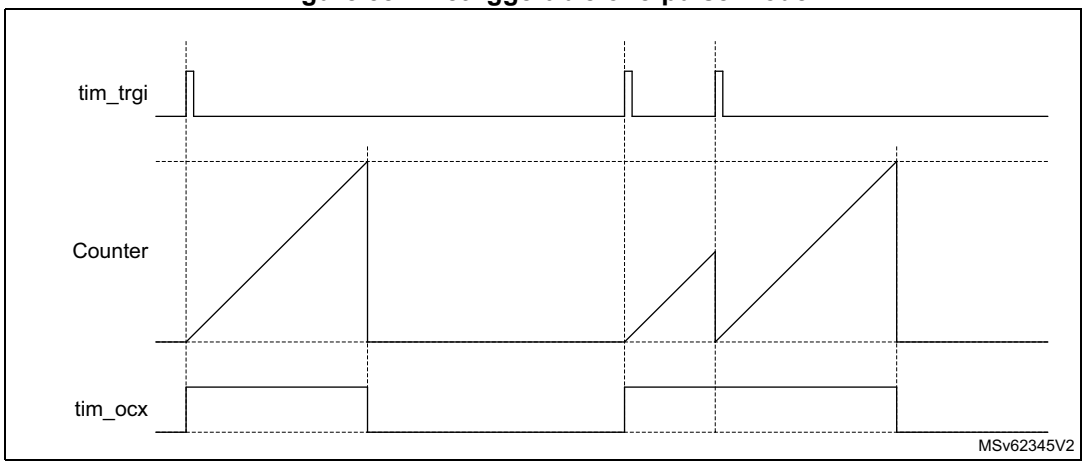
In One-pulse mode, the edge detection on tim_tix input set the CEN bit which enables the counter. Then the comparison between the counter and the compare value makes the output toggle. But several clock cycles are needed for these operations and it limits the minimum delay t_{DELAY} min that can be achieved.

To output a waveform with the minimum delay, the OCxFE bit can be set in the TIM_CCMRx register. Then tim_ocxref (and tim_ocx) are forced in response to the stimulus, without taking in account the comparison. Its new level is the same as if a compare match had occurred. OCxFE acts only if the channel is configured in PWM1 or PWM2 mode.

34.3.26 Retriggerable One-pulse mode

This mode allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length, but with the following differences with nonretriggerable one-pulse mode described in *Section 34.3.25*:

- The pulse starts as soon as the trigger occurs (no programmable delay).
- The pulse is extended if a new trigger occurs before the previous one is completed.



The timer must be in Slave mode, with the bits SMS[4:0] = 01000 (Combined Reset + trigger mode) in the TIM_SMCR register, and the OCxM[4:0] bits set to 01000 or 01001 for retriggerable OPM mode 1 or 2.

If the timer is configured in Up-counting mode, the corresponding CCRx must be set to 0 (the ARR register sets the pulse length). If the timer is configured in Down-counting mode, CCRx must be above or equal to ARR.

Note: The OCxM[4:0] and SMS[4:0] bitfields are split into two parts for compatibility reasons, the most significant bit are not contiguous with the three least significant ones.

This mode must not be used with center-aligned PWM modes. It is mandatory to have CMS[1:0] = 00 in TIM_CR1.

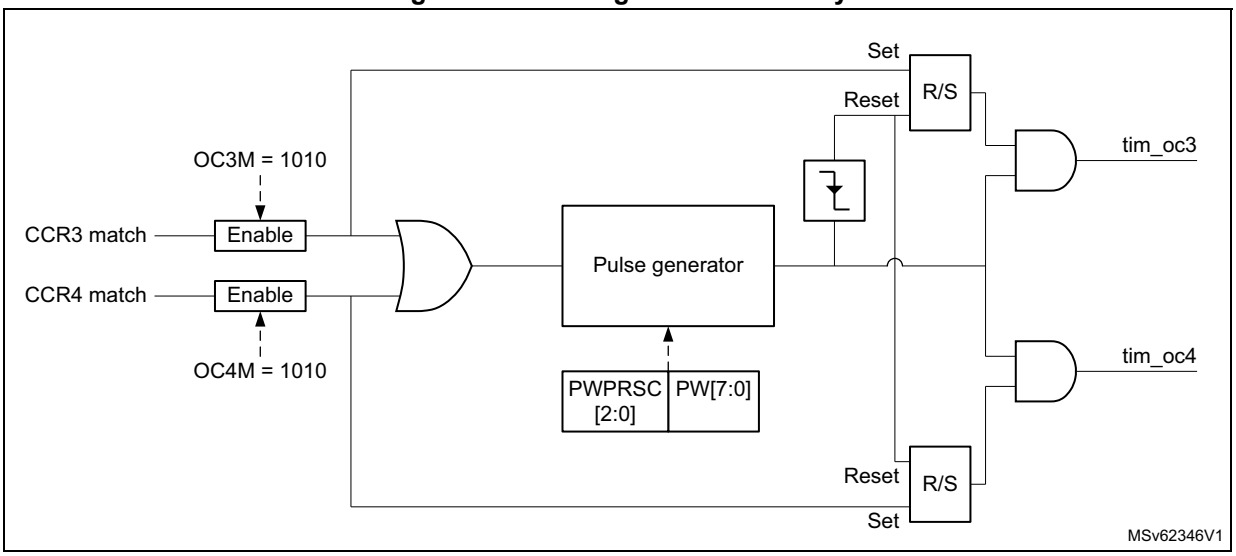
Figure 581. Retriggerable one-pulse mode

34.3.27 Pulse on compare mode

A pulse can be generated upon compare match event. A signal with a programmable pulsewidth generated when the counter value equals a given compare value, for debugging or synchronization purposes.

This mode is available for any slave mode selection, including encoder modes, in edge and center aligned counting modes. It is solely available for channel 3 and channel 4. The pulse generator is unique and is shared by the two channels, as shown on *Figure 582*.

Figure 582. Pulse generator circuitry



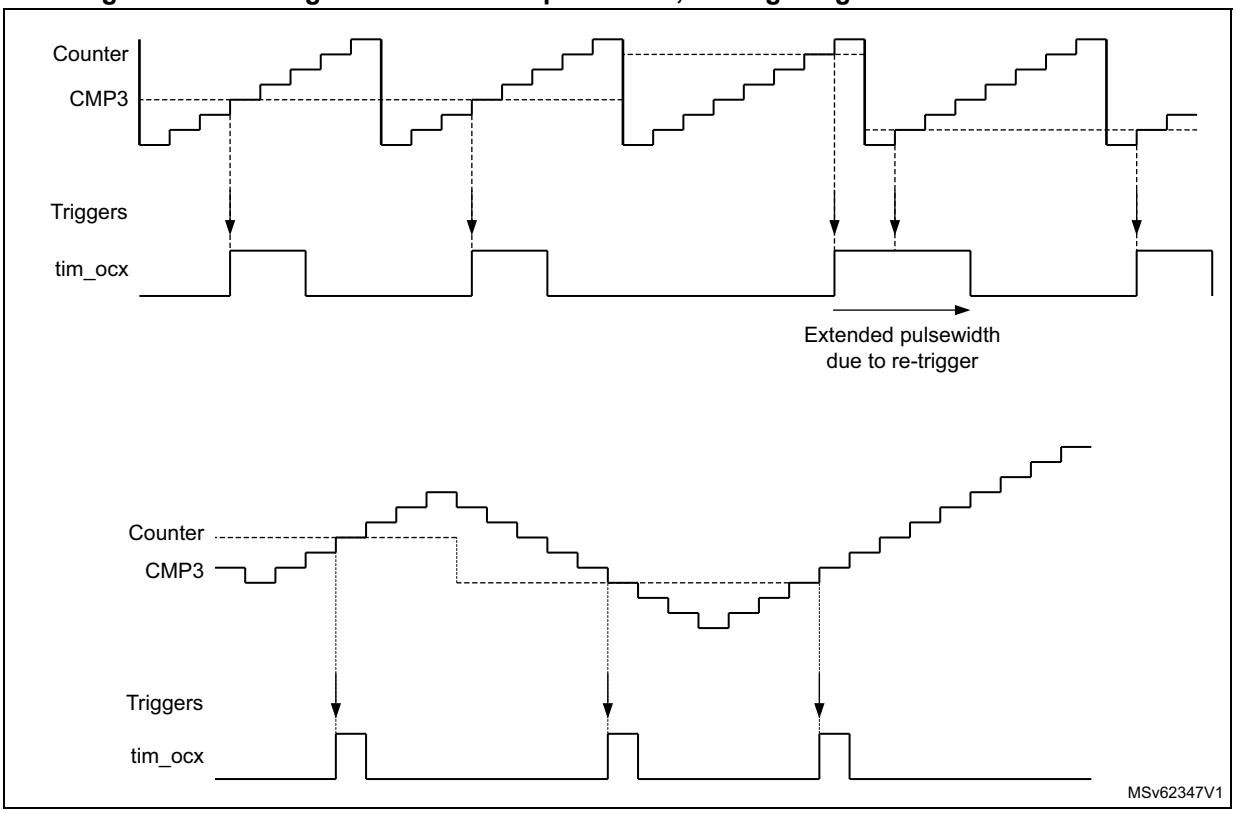


Figure 583 shows how the pulse is generated for edge-aligned and encoder operating modes.

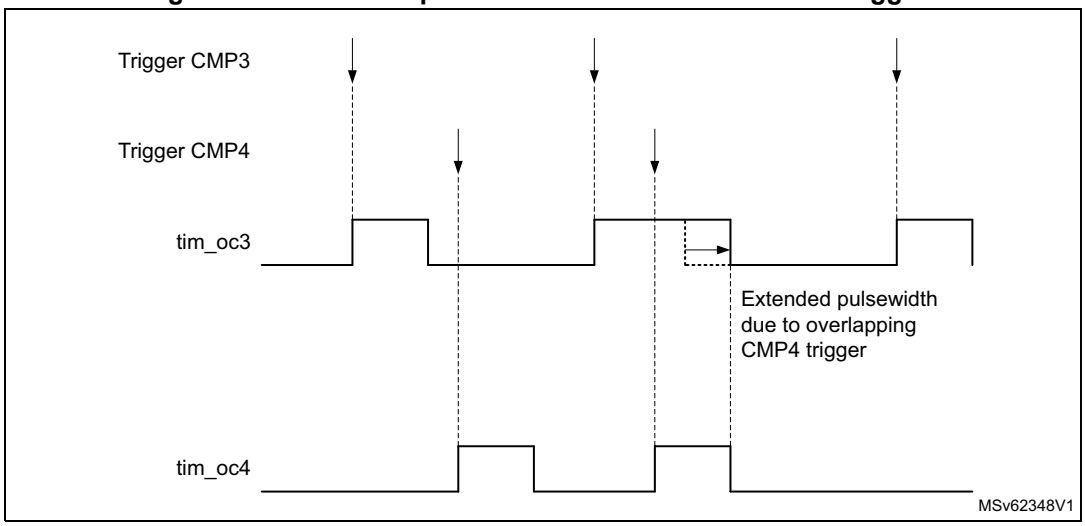
Figure 583. Pulse generation on compare event, for edge-aligned and encoder modes

This output compare mode is selected using the OC3M[3:0] and OC4M[3:0] bitfields in TIM_CCMR2 register.

The pulsewidth is programmed using the PW[7:0] bitfield in the register, using a specific clock prescaled according to PWPRSC[2:0] bits, as follows:

t_{PW} = PW[7:0] x t_{PWG}



where $t_{PWG} = (2^{(PWPRSC[2:0])}) \times t_{tim_ker_ck}$

gives the resolution and maximum values depending on the prescaler value.

The pulse is retriggerable: a new trigger while the pulse is ongoing, causes the pulse to be extended.

Note: If the two channels are enabled simultaneously, the pulses are issued independently as long as the trigger on one channel is not overlapping the pulse generated on the concurrent output. On the opposite, if the two triggers are overlapping, the pulse width related to the first arriving trigger is extended (because of the retrigger), while the pulse width of the last arriving trigger is correct (as shown on Figure 584).

Figure 584. Extended pulsewidth in case of concurrent triggers

34.3.28 Encoder interface mode

Quadrature encoder

To select Encoder Interface mode write SMS = 0001 in the TIM_SMCR register if the counter is counting on tim_ti1 edges only, SMS = 0010 if it is counting on tim_ti2 edges only and SMS = 0011 if it is counting on both tim_ti1 and tim_ti2 edges.

Select the tim_ti1 and tim_ti2 polarity by programming the CC1P and CC2P bits in the TIM_CCER register. When needed, the input filter can be programmed as well. CC1NP and CC2NP must be kept low.

The two inputs tim_ti1 and tim_ti2 are used to interface to an quadrature encoder. Refer to *Table 385*. The counter is clocked by each valid transition on tim_ti1fp1 or tim_ti2fp2 (tim_ti1 and tim_ti2 after input filter and polarity selection, tim_ti1fp1 = tim_ti1 if not filtered and not inverted, tim_ti2fp2 = tim_ti2 if not filtered and not inverted) assuming that it is enabled (CEN bit in TIM_CR1 register written to 1). The sequence of transitions of the two inputs is evaluated and generates count pulses as well as the direction signal. Depending on the sequence the counter counts up or down, the DIR bit in the TIM_CR1 register is modified by hardware accordingly. The DIR bit is calculated at each transition on any input (tim_ti1 or tim_ti2), whatever the counter is counting on tim_ti1 only, tim_ti2 only or both tim_ti1 and tim_ti2.

Encoder interface mode acts simply as an external clock with direction selection. This means that the counter just counts continuously between 0 and the autoreload value in the TIM_ARR register (0 to ARR or ARR down to 0 depending on the direction). So the TIM_ARR must be configured before starting. In the same way, the capture, compare, prescaler, repetition counter, trigger output features continue to work as normal. Encoder mode and External clock mode 2 are not compatible and must not be selected together.

In this mode, the counter is modified automatically following the speed and the direction of the quadrature encoder and its content, therefore, always represents the encoder's position. The count direction correspond to the rotation direction of the connected sensor. The table summarizes the possible combinations, assuming tim_ti1 and tim_ti2 do not switch at the same time.

Table 385. Counting direction versus encoder signals (CC1P = CC2P = 0)

Active edge	SMS[4:0]	Level on opposite signal (tim_ti1fp1 for tim_ti2, tim_ti2fp2 for tim_ti1)	tim_ti1fp1 signal		tim_ti2fp2 signal	
			Rising	Falling	Rising	Falling
Counting on tim_ti1 only x1 mode	01110	High	Down	Up	No count	No count
		Low	No count	No count	No count	No count
Counting on tim_ti2 only x1 mode	01111	High	No count	No count	Up	Down
		Low	No count	No count	No count	No count
Counting on tim_ti1 only x2 mode	00001	High	Down	Up	No count	No count
		Low	Up	Down	No count	No count
Counting on tim_ti2 only x2 mode	00010	High	No count	No count	Up	Down
		Low	No count	No count	Down	Up
Counting on tim_ti1 and tim_ti2 x4 mode	00011	High	Down	Up	Up	Down
		Low	Up	Down	Down	Up

A quadrature encoder can be connected directly to the MCU without external interface logic. However, comparators are normally be used to convert the encoder's differential outputs to digital signals. This greatly increases noise immunity. The third encoder output which indicate the mechanical zero position, may be connected to the external trigger input and trigger a counter reset.

Figure 585 gives an example of counter operation, showing count signal generation and direction control. It also shows how input jitter is compensated where both edges are selected. This might occur if the sensor is positioned near to one of the switching points. For this example the configuration is the following:

- CC1S = 01 (TIM_CCMR1 register, tim_ti1fp1 mapped on tim_ti1).
- CC2S = 01 (TIM_CCMR1 register, tim_ti2fp2 mapped on tim_ti2).
- CC1P = 0 and CC1NP = 0 (TIM_CCER register, tim_ti1fp1 noninverted, tim_ti1fp1 = tim_ti1).
- CC2P = 0 and CC2NP = 0 (TIM_CCER register, tim_ti1fp2 noninverted, tim_ti1fp2= tim_ti2).
- SMS = 0011 (TIM_SMCR register, both inputs are active on both rising and falling edges).
- CEN = 1 (TIM_CR1 register, Counter enabled).

Figure 585. Example of counter operation in encoder interface mode.

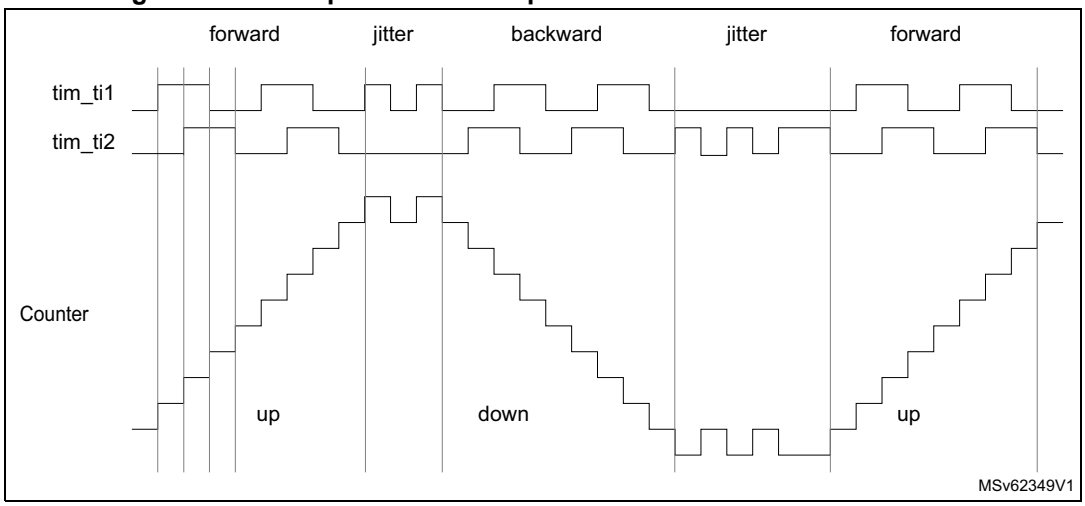


Figure 586 gives an example of counter behavior when tim_ti1fp1 polarity is inverted (same configuration as above except CC1P = 1).

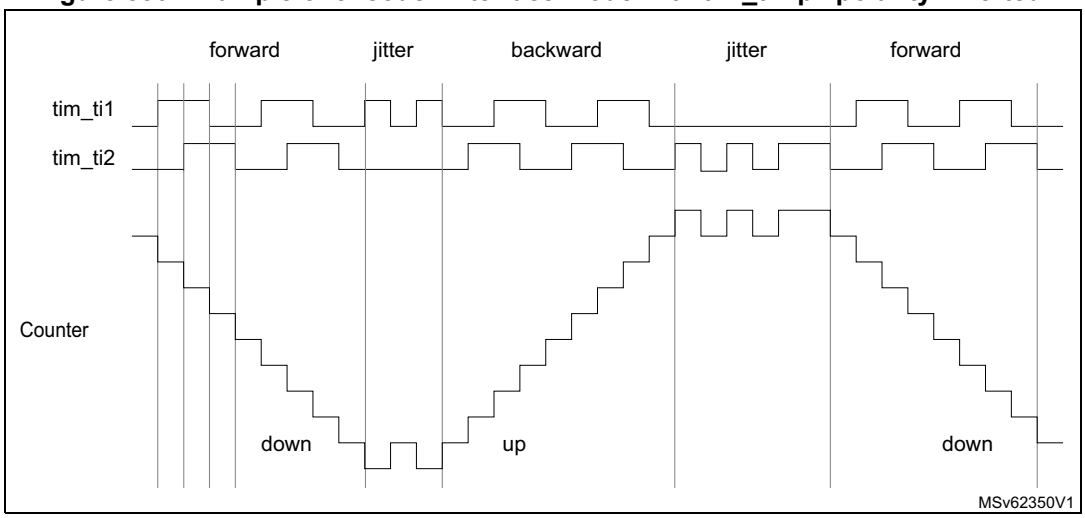
Figure 586. Example of encoder interface mode with tim_ti1fp1 polarity inverted.



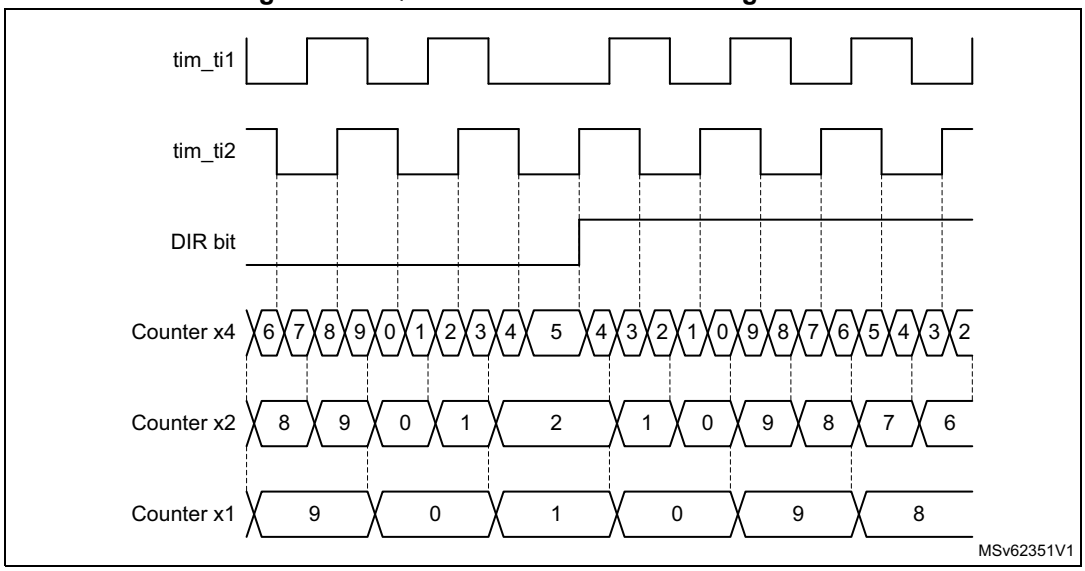


Figure 587 shows the timer counter value during a speed reversal, for various counting modes.

Figure 587. Quadrature encoder counting modes

The timer, when configured in Encoder Interface mode provides information on the sensor's current position. Dynamic information can be obtained (speed, acceleration, deceleration) by measuring the period between two encoder events using a second timer configured in capture mode. The output of the encoder which indicates the mechanical zero can be used for this purpose. Depending on the time between two events, the counter can also be read at regular times. This can be done by latching the counter value into a third input capture register if available (then the capture signal must be periodic and can be generated by another timer). When available, it is also possible to read its value through a DMA request.

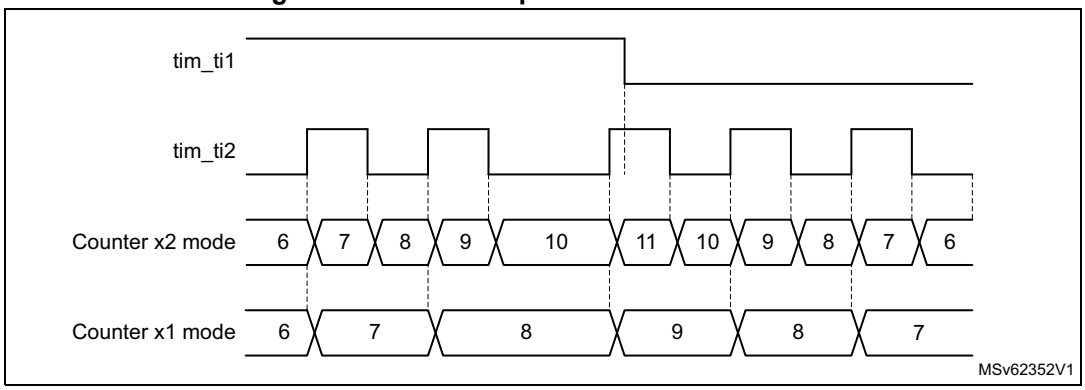
The IUFREMAP bit in the TIM_CR1 register forces a continuous copy of the update interrupt flag (UIF) into the timer counter register's bit 31 (TIM_CNT[31]). This allows both the counter value and a potential roll-over condition signaled by the UIFCPY flag to be read in an atomic way. It eases the calculation of angular speed by avoiding race conditions caused, for instance, by a processing shared between a background task (counter reading) and an interrupt (update interrupt).

There is no latency between the UIF and UIFCPY flag assertions.

In 32-bit timer implementations, when the IUFREMAP bit is set, bit 31 of the counter is overwritten by the UIFCPY flag upon read access (the counter's most significant bit is only accessible in write mode).

Clock plus direction encoder mode

In addition to the quadrature encoder mode, the timer offers support for other types of encoders.



In the clock plus direction mode shown on *Figure 588*, the clock is provided on a single line, on tim_ti2, while the direction is forced using the tim_ti1 input.

This mode is enabled with the SMS[4:0] bitfield in the TIM_SMCR register, as following:

- 01010: x2 mode, the counter is updated on both rising and falling edges of the clock
- 01011: x1 mode, the counter is updated on a single clock edge, as per CC2P bit value: CC2P = 0 corresponds to rising edge sensitivity and CC2P = 1 corresponds to falling edge sensitivity

The polarity of the direction signal on tim_ti1 is set with the CC1P bit: 0 corresponds to positive polarity (up-counting when tim_ti1 is high and down-counting when tim_ti1 is low) and CC1P = 1 corresponds to negative polarity (up-counting when tim_ti1 is low).

Figure 588. Direction plus clock encoder mode

Directional clock encoder mode

In the directional clock mode on *Figure 589*, the clocks are provided on two lines, with a single one at once, depending on the direction, so as to have one up-counting clock line and one down-counting clock line.

This mode is enabled with the SMS[4:0] bitfield in the TIM_SMCR register, as following:

- 01100: x2 mode, the counter is updated on both rising and falling edges of any of the two clock line. The CC1P and CC2P bits are coding for the clock idle state. CCxP = 0 corresponds to high-level idle state (refer to *Figure 589*) and CCxP = 1 corresponds to low-level idle state (refer to *Figure 590*).
- 01101: x1 mode, the counter is updated on a single clock edge, as per CC1P and CC2P bit value. CCxP = 0 corresponds to falling edge sensitivity and high-level idle state (refer to *Figure 589*), CCxP = 1 corresponds to rising edge sensitivity and low-level idle state (refer to *Figure 590*).

Figure 589. Directional clock encoder mode (CC1P = CC2P = 0)

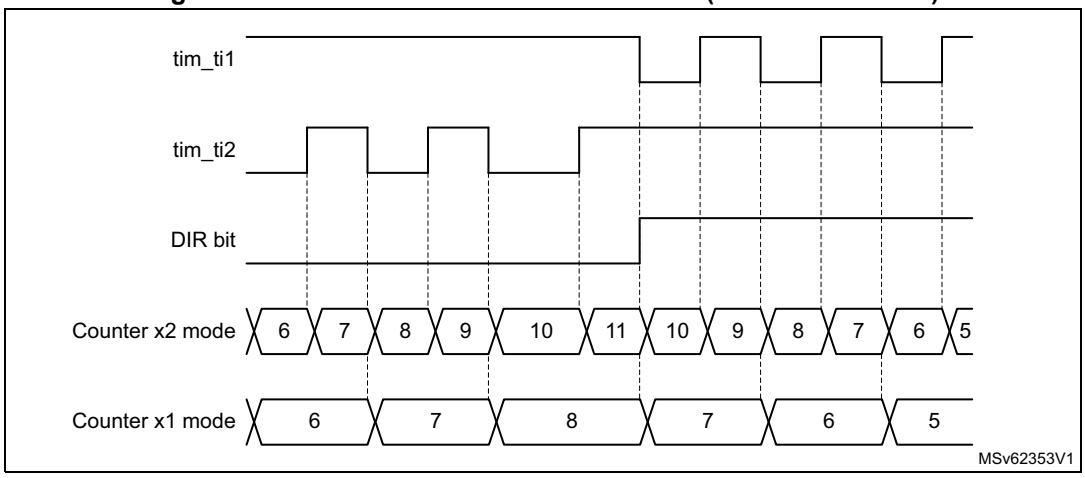


Figure 590. Directional clock encoder mode (CC1P = CC2P = 1)

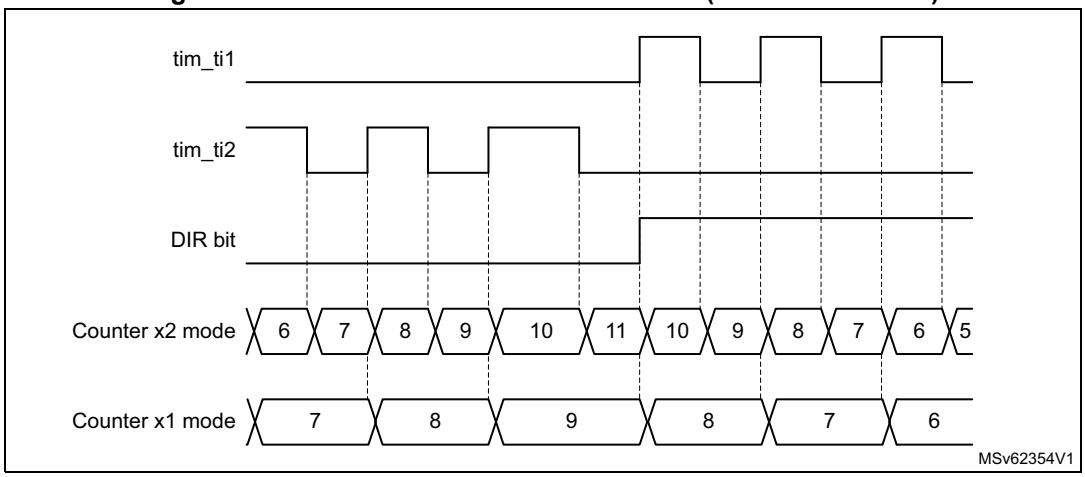

Table 386 here-below details how the directional clock mode operates, for any input transition.

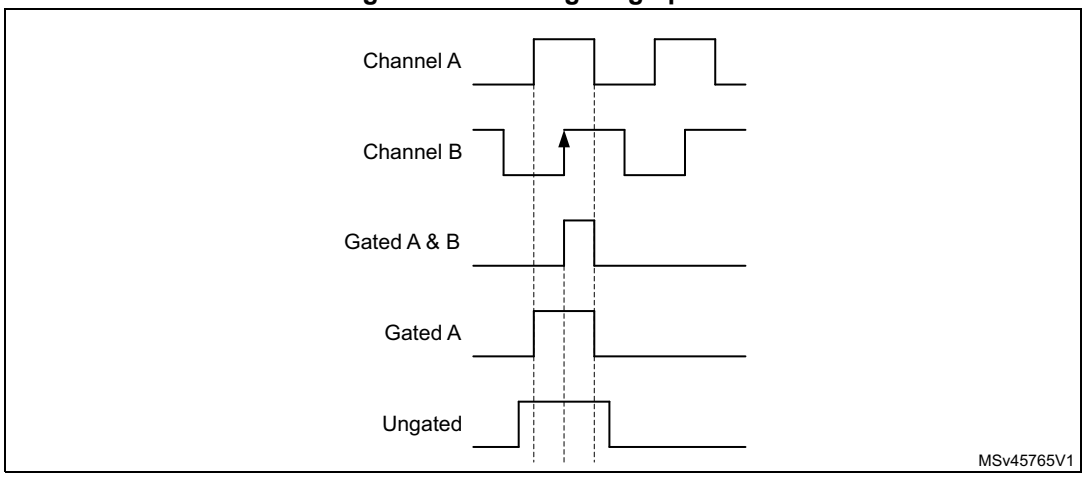
Table 386. Counting direction versus encoder signals and polarity settings

Directional clock mode	SMS[4:0]	Level on opposite signal (tim_ti1fp1 for tim_ti2, tim_ti2fp2 for tim_ti1)	tim_ti1fp1 signal		tim_ti2fp2 signal	
			Rising	Falling	Rising	Falling
x2 mode CCxP = 0	01100	High	Down	Down	Up	Up
		Low	No count	No count	No count	No count
x2 mode CCxP = 1	01100	High	No count	No count	No count	No count
		Low	Down	Down	Up	Up
x1 mode CCxP = 0	01101	High	No count	Down	No count	Up
		Low	No count	No count	No count	No count
x1 mode CCxP = 1	01101	High	No count	No count	No count	No count
		Low	Down	No count	Up	No count

Index input



The counter can be reset by an index signal coming from the encoder, indicating an absolute reference position. The index signal must be connected to the tim_etr_in input. It can be filtered using the digital input filter.

The index functionality is enabled with the IE bit in the TIM_ECR register. The IE bit must be set only in encoder mode, when the SMS[4:0] bitfield has the following values: 00001, 00010, 00011, 01010, 01011, 01100, 01101, 01110, 01111.

Available encoders are proposed with several options for index pulse conditioning, as per *Figure 591*:

- gated with A and B: the pulsewidth is 1/4 of one channel period, aligned with both A and B edges
- gated with A (or gated with B): the pulsewidth is 1/2 of one channel period, aligned with the two edges on channel A (resp. channel B)
- ungated: the pulsewidth is up to one channel period, without any alignment to the edges

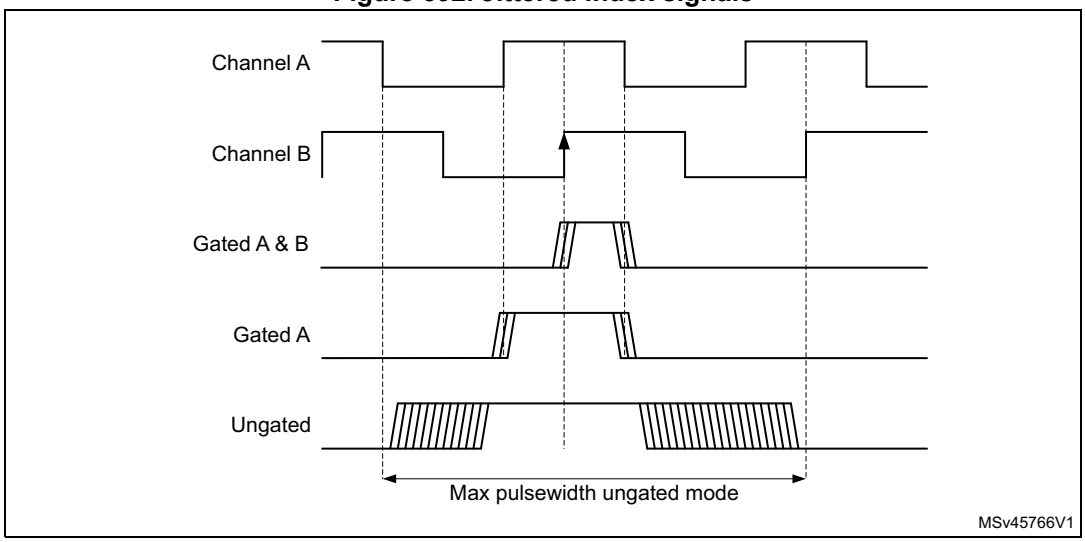


Figure 591. Index gating options

The circuitry tolerates jitter on index signal, whatever the gating mode, as show on *Figure 592*.

In ungated mode, the signal must be strictly below two encoder periods. If the pulsewidth is greater or equal to two encoder period, the counter is reset multiple times.

Figure 592. Jittered Index signals

The timer supports the three gating options identically, without any specific programming needed. It is only necessary to define on which encoder state (for example channel A and

channel B state combination) the index must be synchronized, using the IPOS[1:0] bitfield in the TIM_ECR register.

The index detection event acts differently depending on counting direction to ensure symmetrical operation during speed reversal:

- The counter is reset during up-counting (DIR bit = 0).
- The counter is set to TIM_ARR when down counting.

This allows the index to be generated on the very same mechanical angular position whatever the counting direction. *Figure 593* shows at which position is the index generated, for a simplistic example (an encoder providing four edges par mechanical rotation).

Figure 593. Index generation for IPOS[1:0] = 11

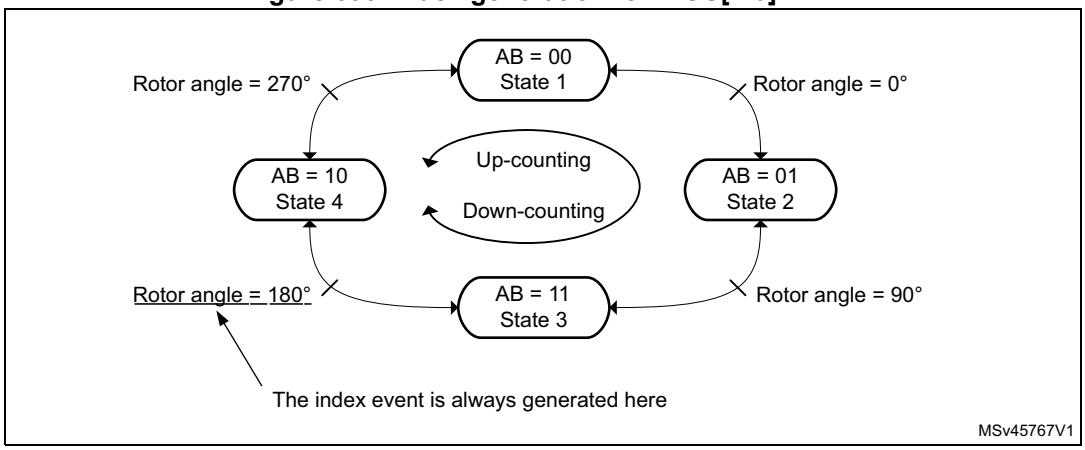

Figure 594 presents waveforms and corresponding values for IPOS[1:0] = 11. It shows that the instant at which the counter value is forced is automatically adjusted depending on the counting direction:

- Counter set to 0 when encoder state is 11 (ChA = 1, ChB = 1), when up-counting (DIR bit = 0).
- Counter set to TIM_ARR when exiting the 11 state, when down-counting (DIR bit = 1).

An interrupt can be issued upon index detection event.

The arrows are indicating on which transition is the index event interrupt generated.

Figure 594. Counter reading with index gated on channel A (IPOS[1:0] = 11)

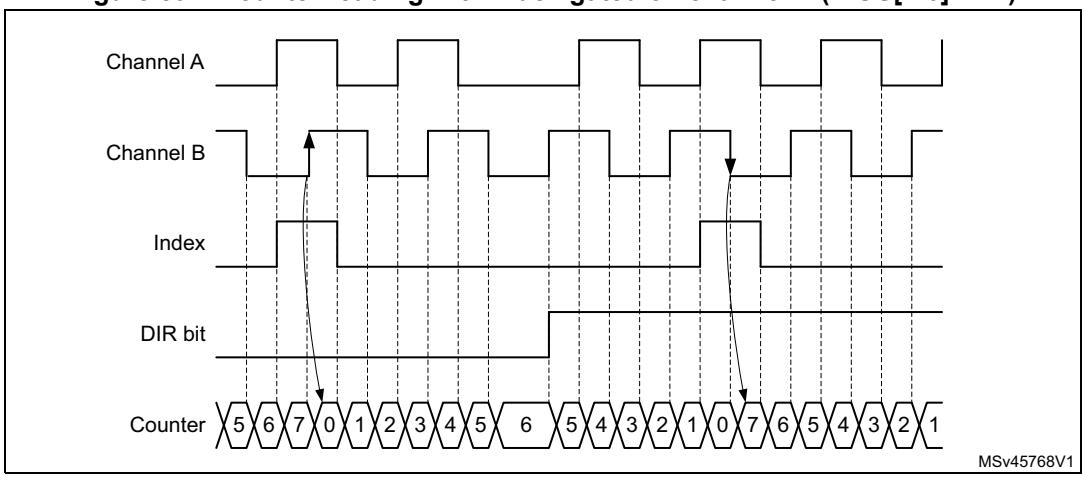

Figure 595. presents waveforms and corresponding values for the ungated mode. The arrows are indicating on which transition is the index event generated.

Figure 595. Counter reading with index ungated (IPOS[1:0] = 00)

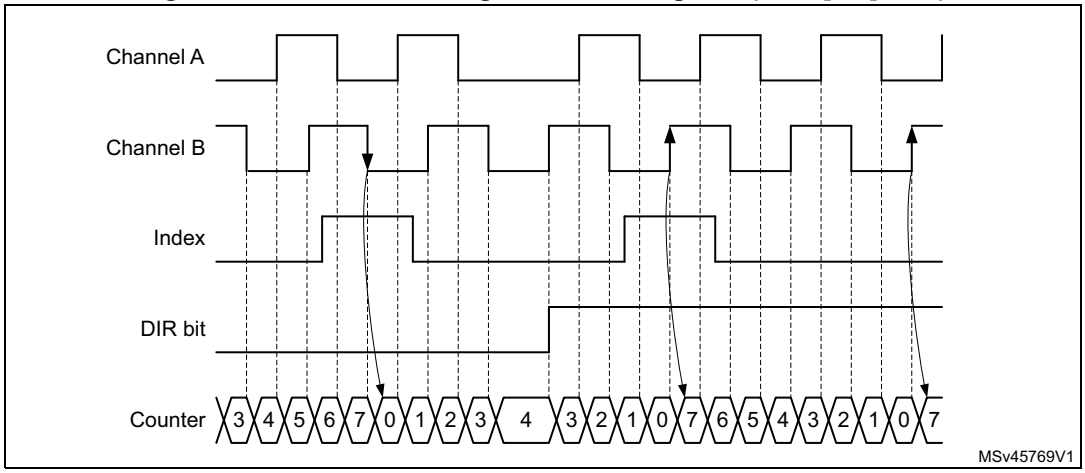

Figure 596. shows how the 'gated on A & B' mode is handled, for various pulse alignment scenario. The arrows are indicating on which transition is the index event generated.

Figure 596. Counter reading with index gated on channel A and B

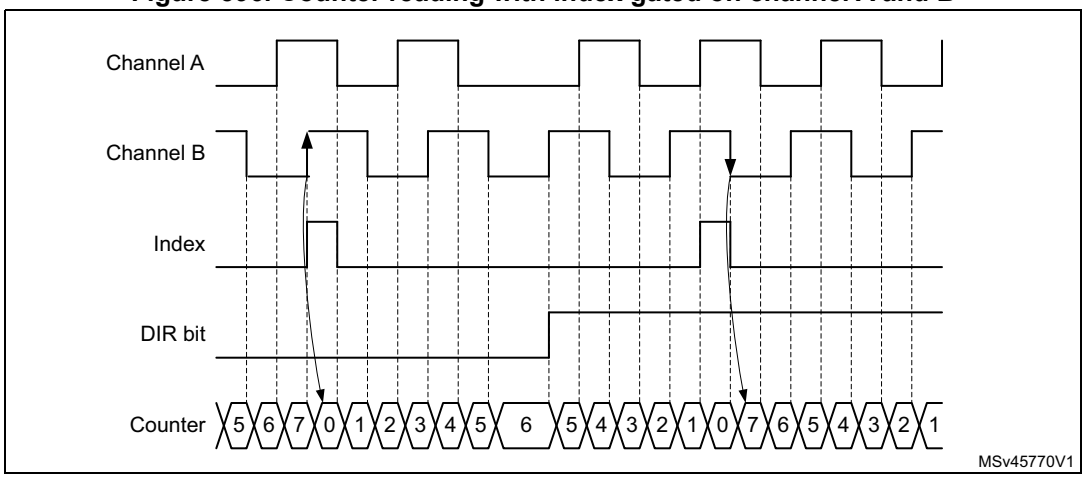

Figure 597 and *Figure 598* detail the case where the subsequent index pulse may be narrower than one quarter of the encoder clock period.

Figure 597. Encoder mode behavior in case of narrow index pulse (IPOS[1:0] = 11)

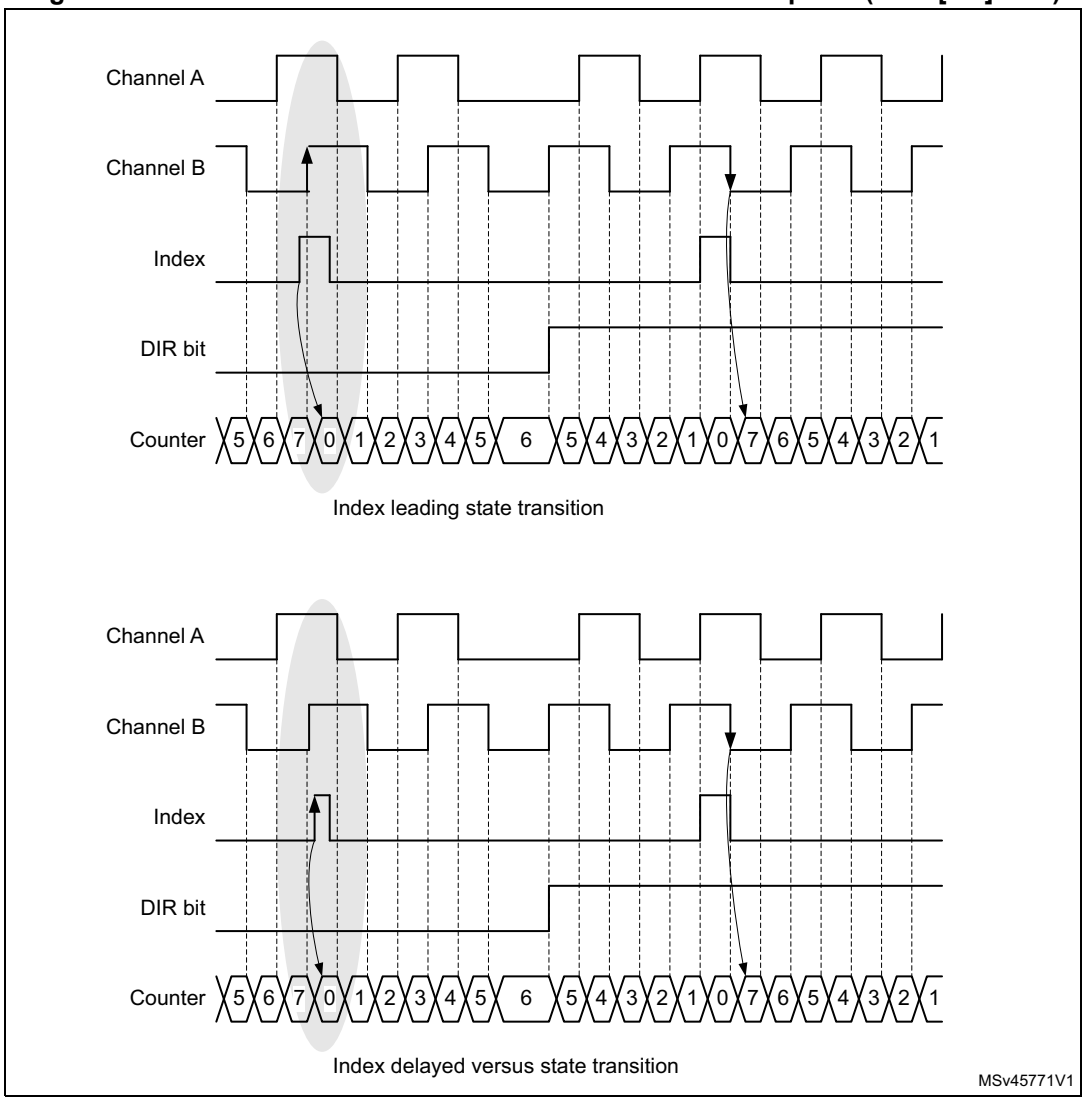

Figure 598. Counter reset Narrow index pulse (closer view, ARR = 0x07)

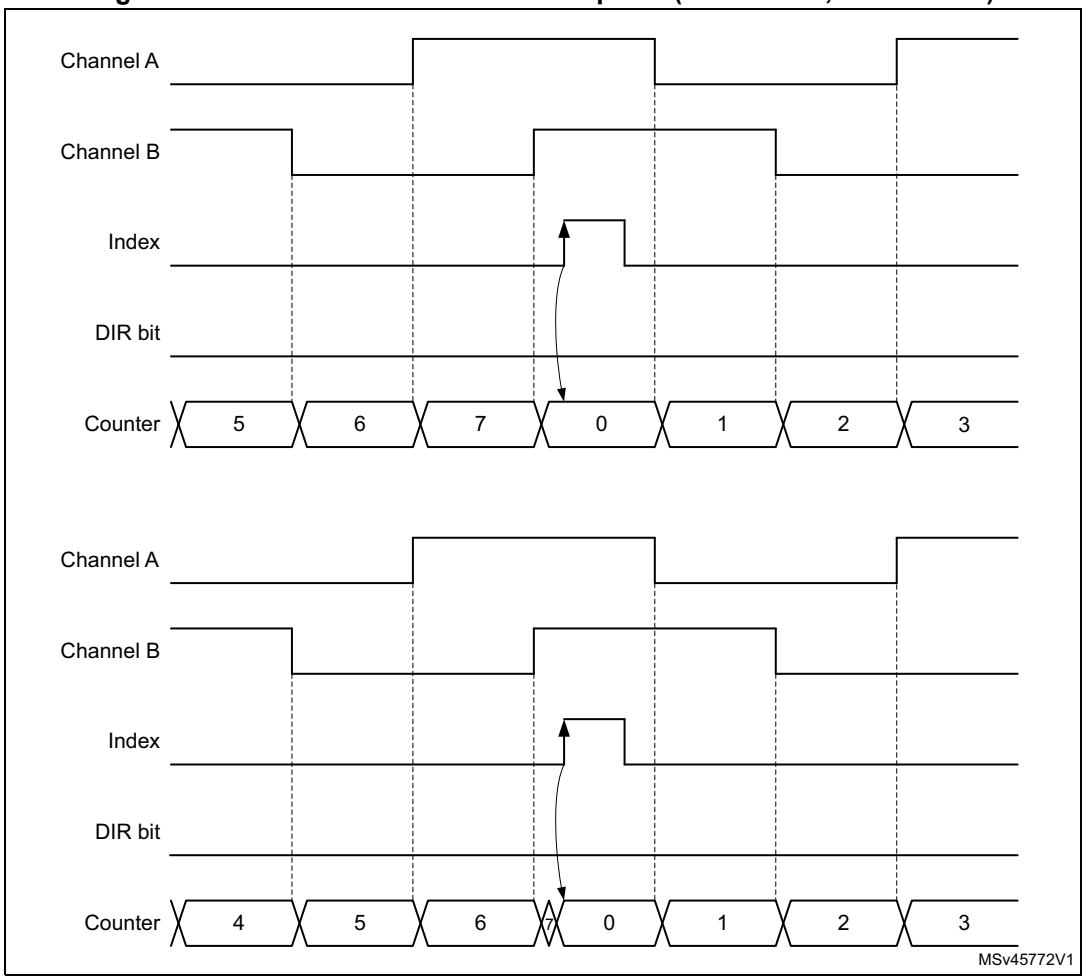

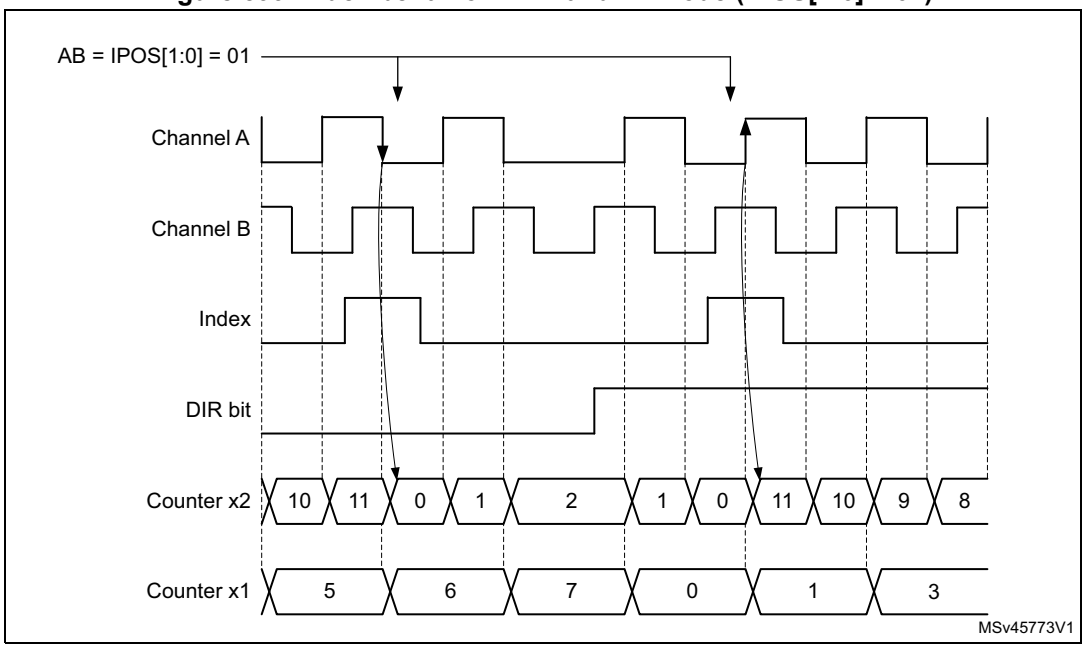

Figure 599 shows how the index is managed in x1 and x2 modes.

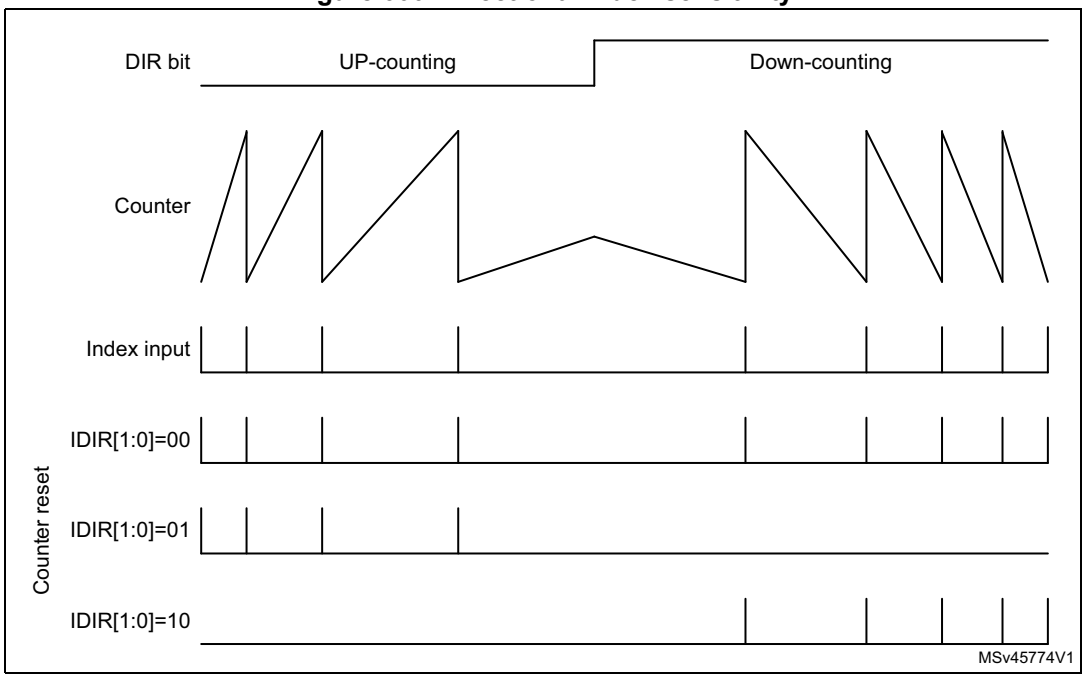
Figure 599. Index behavior in x1 and x2 mode (IPOS[1:0] = 01)



Directional index sensitivity

The IDIR[1:0] bitfield in the TIM_ECR register allows the index to be active only in a selected counting direction.

Figure 600 shows the relationship between index and counter reset events, depending on IDIR[1:0] value.

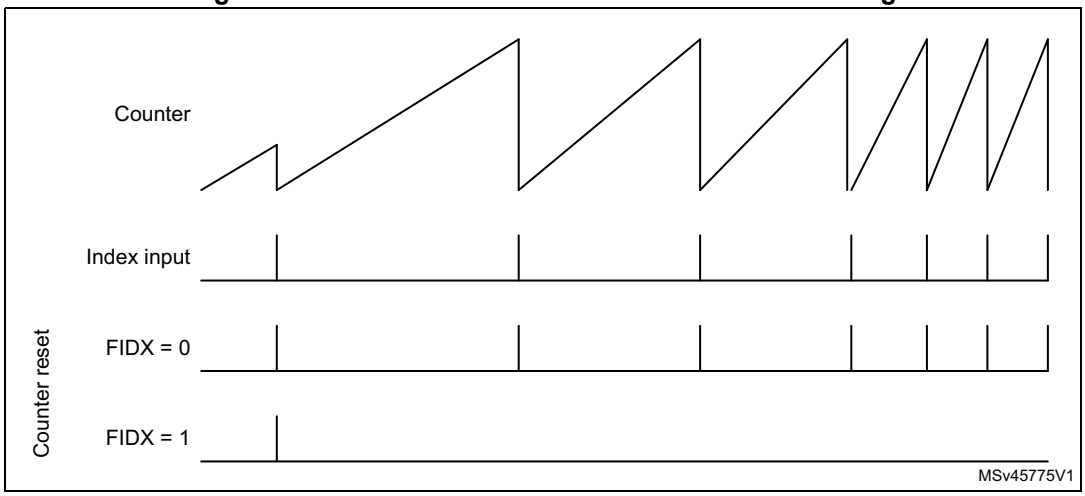


Figure 600. Directional index sensitivity

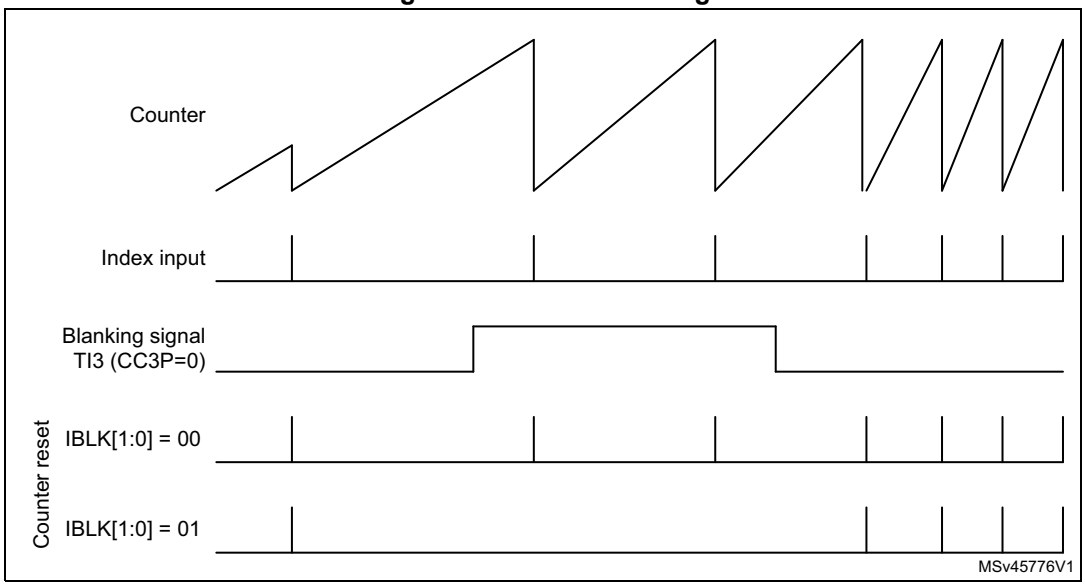
Special first index event management

The FIDX bit in the TIM_ECR register allows the index to be taken only once, as shown on *Figure 601*. Once the first index has arrived, any subsequent index is ignored. If needed, the circuitry can be rearmed by writing the FIDX bit to 0 and setting it again to 1.

Figure 601. Counter reset as function of FIDX bit setting



Index blanking

The index event can be blanked using the tim_ti3 or tim_ti4 inputs. During the blanking window, the index events are no longer resetting the counter, as shown on the *Figure 602* below.

This mode is enabled using the IBLK[1:0] bitfield in the TIM_ECR register, as following:

- IBLK[1:0] = 00: Index signal always active
- IBLK[1:0] = 01: Index signal blanking on tim_ti3 input
- IBLK[1:0] = 10: Index signal blanking on tim_ti4 input

Figure 602. Index blanking

Index management in nonquadrature mode

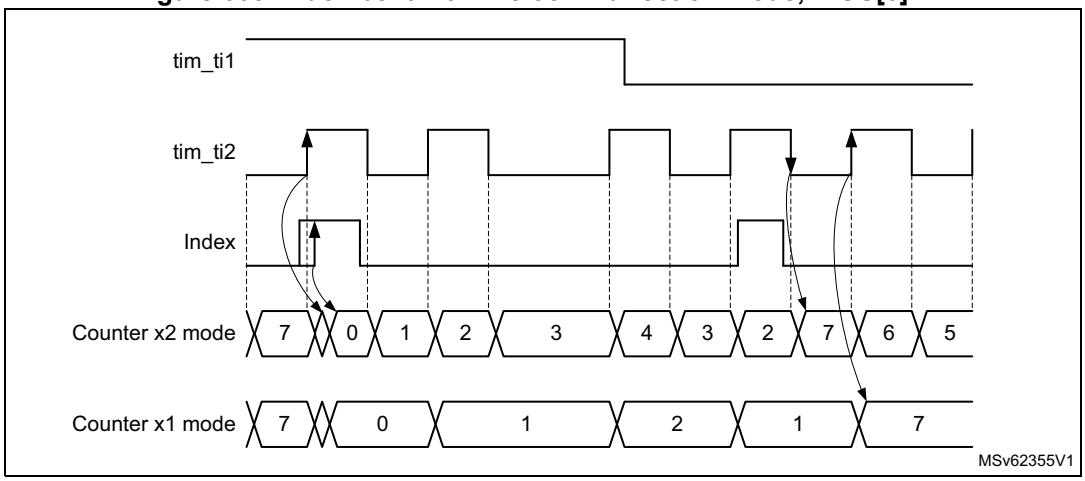
Figure 603 and *Figure 604* detail how the index is managed in directional clock mode and clock plus direction mode, when the SMS[4:0] bitfield is equal to 01010, 01011, 01100, 01101.

For both of these modes, the index sensitivity is set with the IPOS[0] bit as following:

- IPOS[0] = 0: Index is detected on clock low level
- IPOS[0] = 1: Index is detected on clock high level

The IPOS[1] bit is not-significant.

Figure 603. Index behavior in clock + direction mode, IPOS[0] = 1



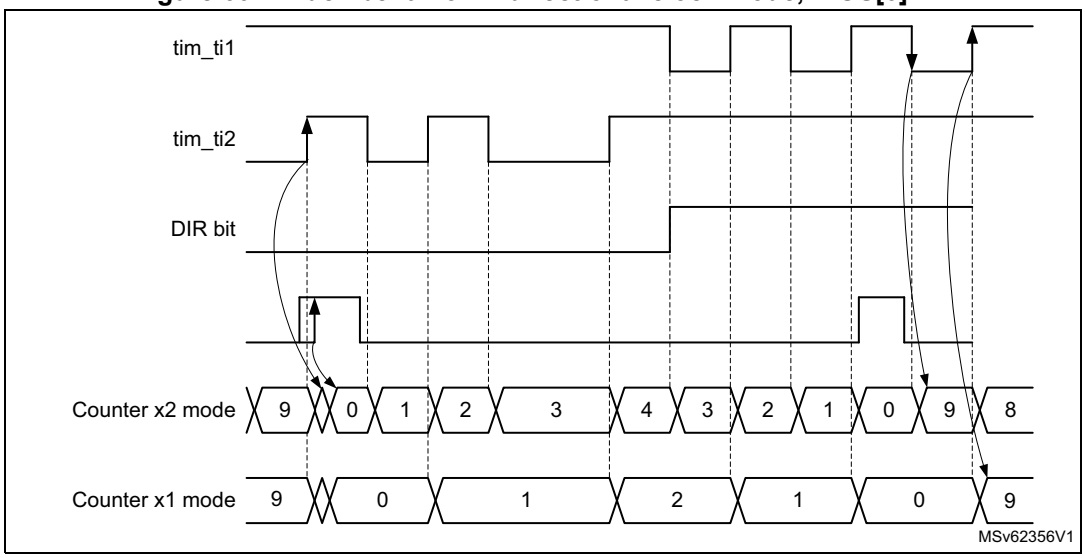


Figure 604. Index behavior in directional clock mode, IPOS[0] = 1

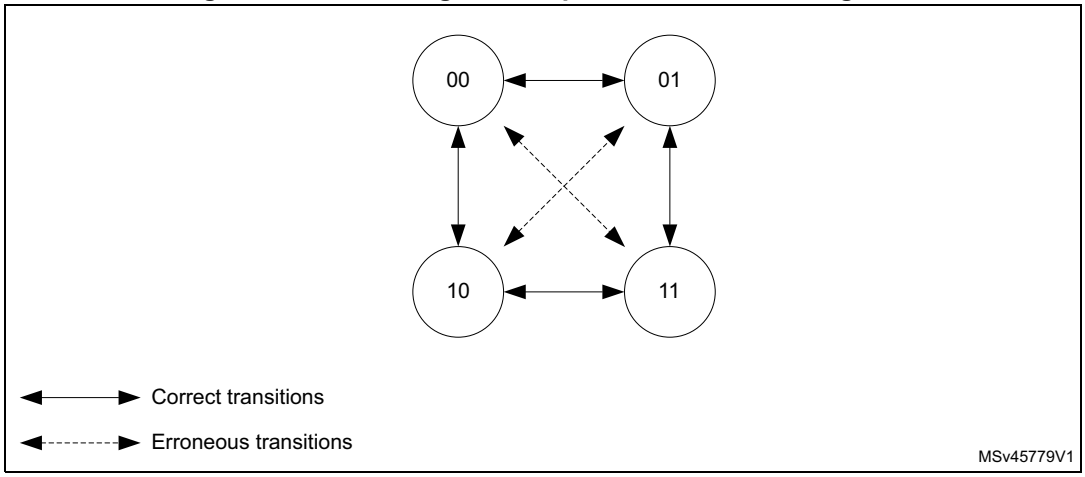
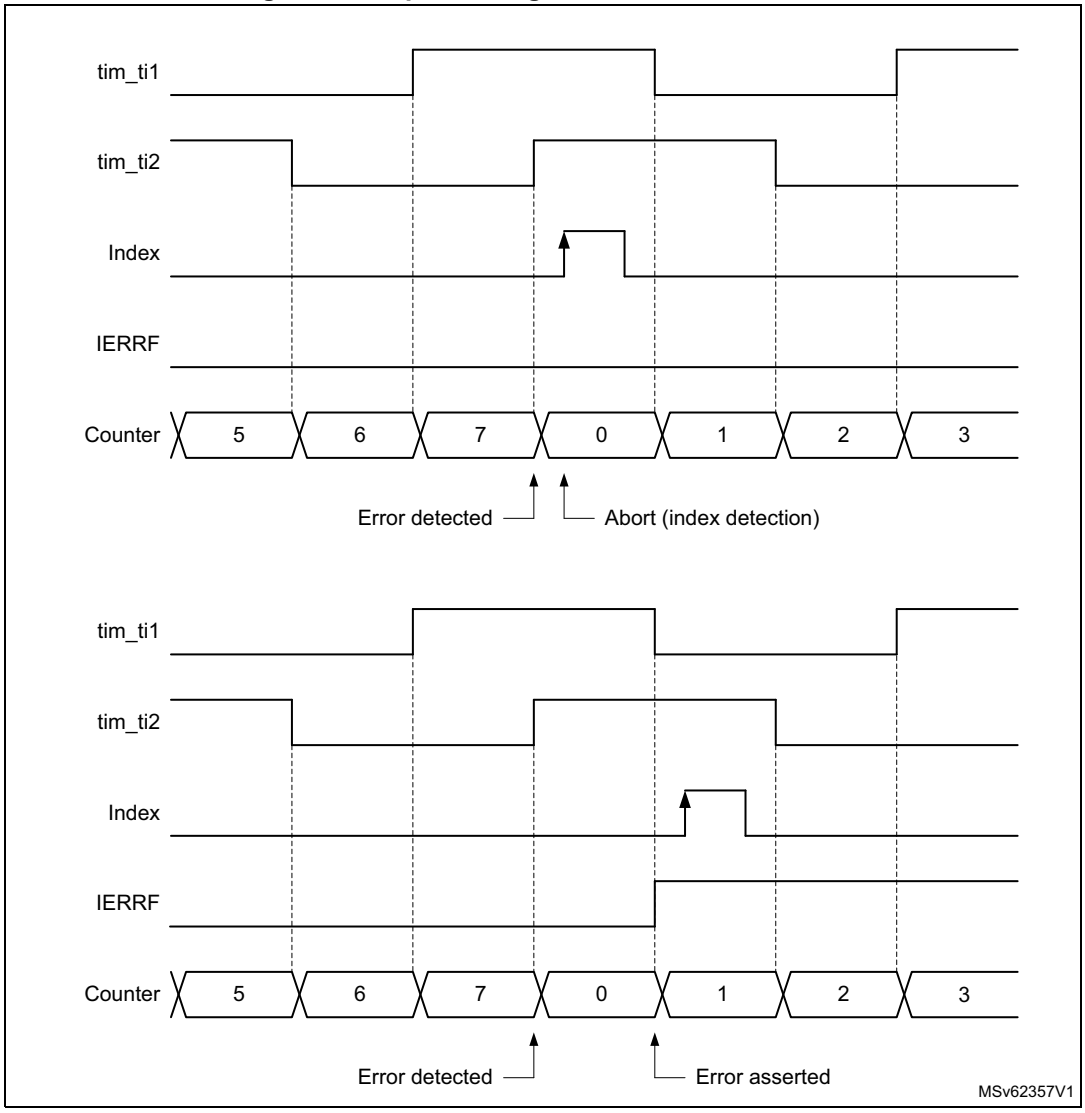


Encoder error management

For encoder configurations where two quadrature signals are available, it is possible to detect transition errors. The reading on the two inputs corresponds to a 2-bit gray code which can be represented as a state diagram, on *Figure 605.*. A single bit is expected to change at once. An erroneous transition sets the TERRF interrupt flag in the TIM_SR status

register. A transition error interrupt is generated if the TERRIE bit is set in the TIM_DIER register.

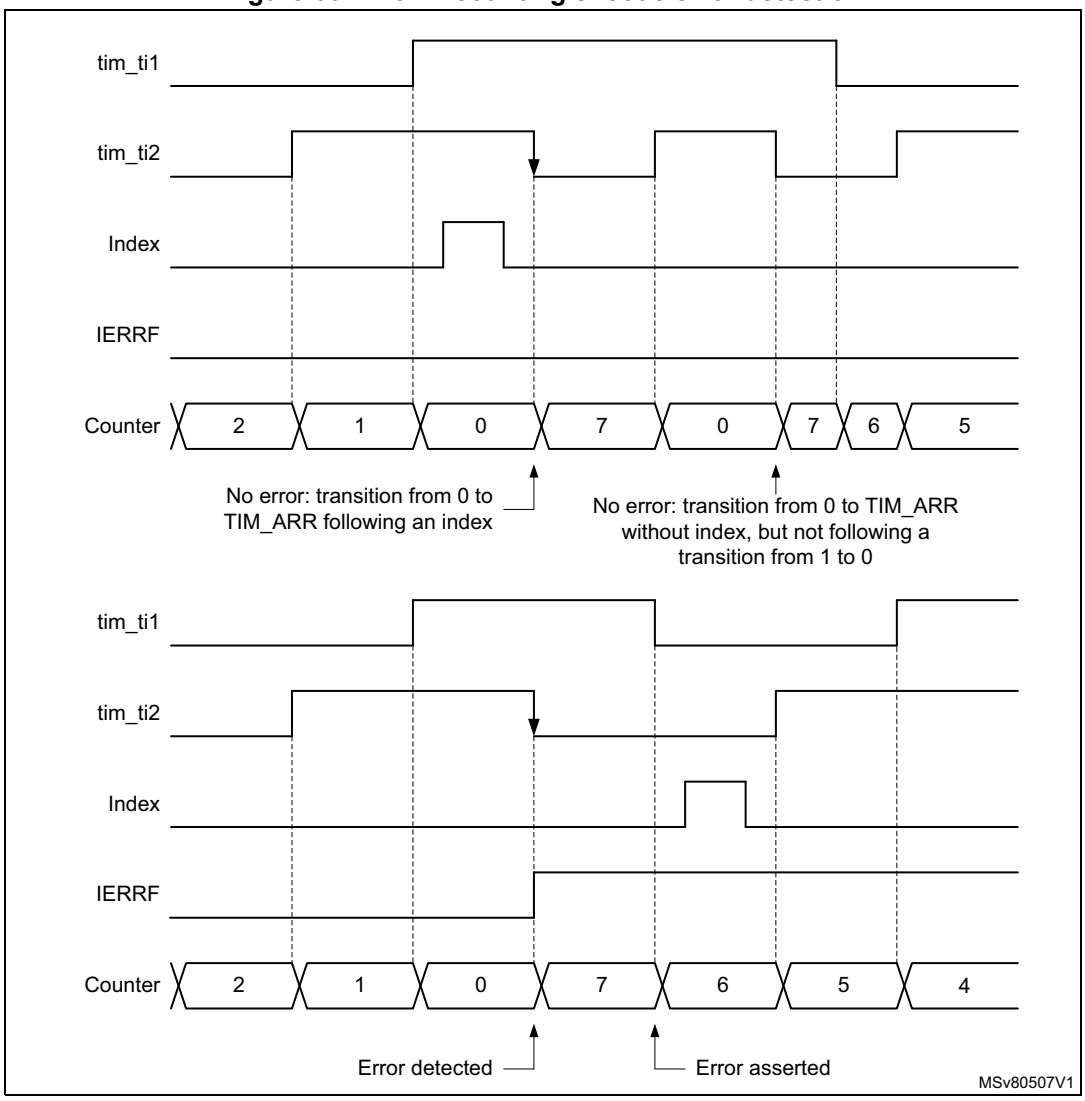
Figure 605. State diagram for quadrature encoded signals



For encoder having an index signal, it is possible to detect abnormal operation resulting in an excess of pulses per revolution. An encoder with N pulses per revolution provides 4xN counts per revolution. The index signal resets the counter every 4xN clock periods.

If the counter value is incremented from TIM_ARR to 0 or decremented from 0 to TIM_ARR value without any index event, this is reported as an index position error.

The overflow threshold is programmed using the TIM_ARR register. A 1000 lines encoder results in a counter value being between 0 and 3999 (in 4x reading mode). The overflow detection threshold must be programmed by setting TIM_ARR = 3999 + 1 = 4000.



The error assertion is delayed to the transition 0 to 1 when in up-counting. This is cope with narrow index pulses in gated A and B mode, as shown on *Figure 606*.

Figure 606. Up-counting encoder error detection

In down-counting mode, the detection is conditioned by a preliminary transition from 1 to 0. This is to cope with narrow index pulses in gated A and B mode, as shown on *Figure 607*, to avoid any false error detection in case the encoder dithers between TIM_ARR and 0 immediately after the index detection.

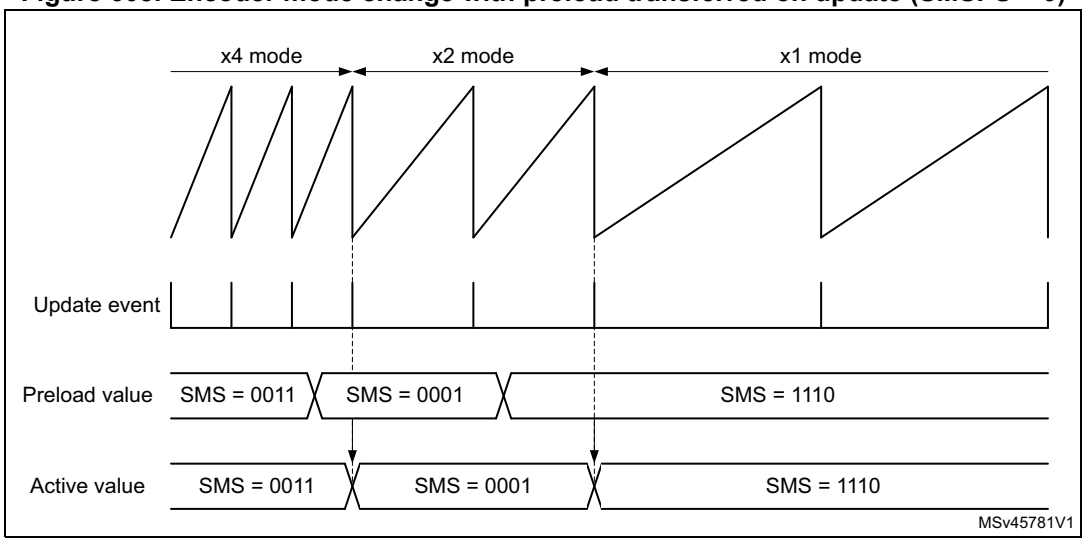
Figure 607. Down-counting encode error detection

An index error sets the IERRF interrupt flag in the TIM_SR status register. An index error interrupt is generated if the IERRIE bit is set in the TIM_DIER register.

Functional encoder interrupts

The following interrupts are also available in encoder mode

- Direction change: any change of the counting direction in encoder mode causes the DIR bit in the TIM_CR1 register to toggle. The direction change sets the DIRF interrupt flag in the TIM_SR status register. A direction change interrupt is generated if the DIRIE bit is set in the TIM_DIER register.
- Index event: the index event sets the IDXF interrupt flag in the TIM_SR status register. An index interrupt is generated if the IDXIE bit is set in the TIM_DIER register.



Slave mode selection preload for run-time encoder mode update

It may be necessary to switch from one encoder mode to another during run-time. This is typically done at high-speed to decrease the update interrupt rate, by switching from x4 to x2 to x1 mode, as shown on *Figure 608*.

For this purpose, the SMS[4:0] bit can be preloaded. This is enabled by setting the SMSPE enable bit in the TIM_SMCR register. The trigger for the transfer from SMS[4:0] preload to active value can be selected with the SMSPS bit in the TIM_SMCR register.

- SMSPS = 0: the transfer is triggered by the update event (UEV) occurring when the counter overflows when upcounting, and underflows when downcounting.
- SMSPS = 1: the transfer is triggered by the index event.

Figure 608. Encoder mode change with preload transferred on update (SMSPS = 0)

Encoder clock output

The encoder mode operating principle is not perfectly suited for high-resolution velocity measurements, at low speed, as it requires a relatively long integration time to have a sufficient number of clock edges and a precise measurement.

At low speed, a better solution is to do an edge-to-edge clock period measurement. This can be achieved using a slave timer. The timer can output the encoder clock information on the tim_trgo output. The slave timer can then perform a period measurement and provide velocity information for each and every encoder clock edge.

This mode is enabled by setting the MMS[3:0] bitfield to 1000, in the TIM_CR2 register.It is valid for the following SMS[4:0] values: 00001, 00010, 00011, 01010, 01011, 01100, 01101, 01110, 01111. Any other SMS[4:0] code is not allowed and may lead to unexpected behavior.

34.3.29 Encoder with built-in debouncer

This mode is intended to support noisy digital potentiometers and knobs, providing quadrature encoded signals with potentially long bouncing periods after each transition.

The operating principle consists of working on the first valid transition and discard any other until a second valid transition is detected on the alternate encoder signal.

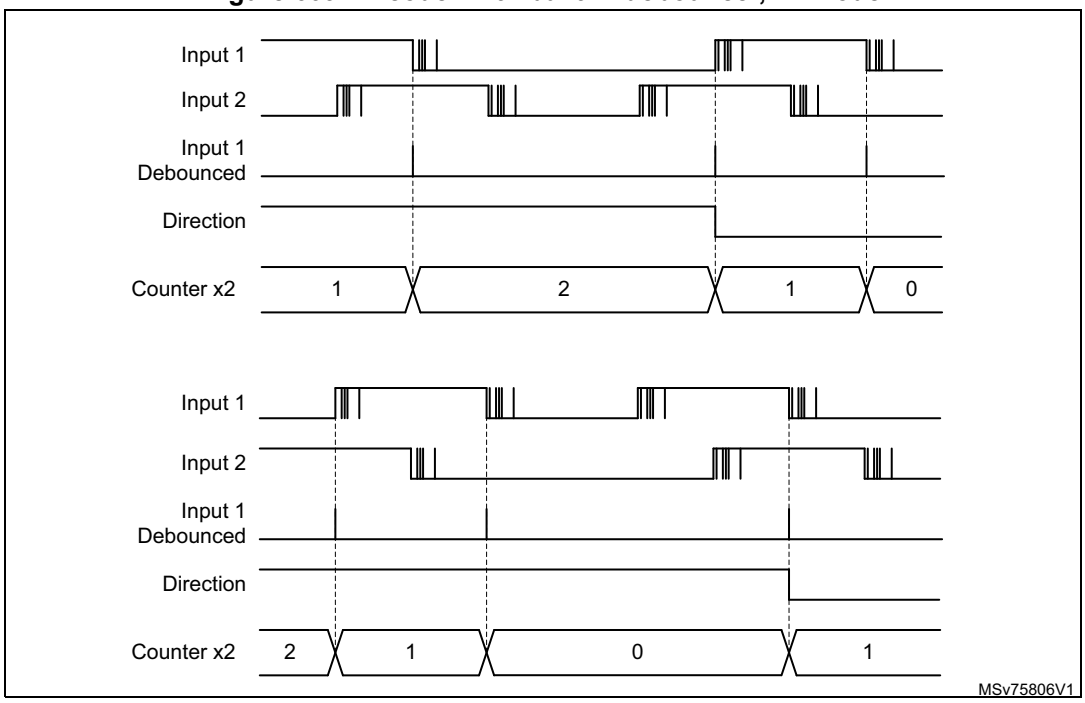
The *Figure 609* below represents the x2 operating mode. It must be noticed that a transition on input 1 is ignored during direction reversal, if there's no edge on input 2.

The *Figure 610* below represents the x4 operating mode. In this case, a transition is always ignored during a direction reversal or when the encoder dithers between 2 positions.

These 2 modes are enabled by writing SMS[4:0] = 10000 or 10001 in TIM_SMCR register.

The encoder with built-in debouncer modes are not suitable for tracking a position or an angle in motor control applications. The transitions ignored during direction reversal will lead to a position/angle error that will build-up over time.

Figure 609. Encoder with built-in debouncer, x2 mode



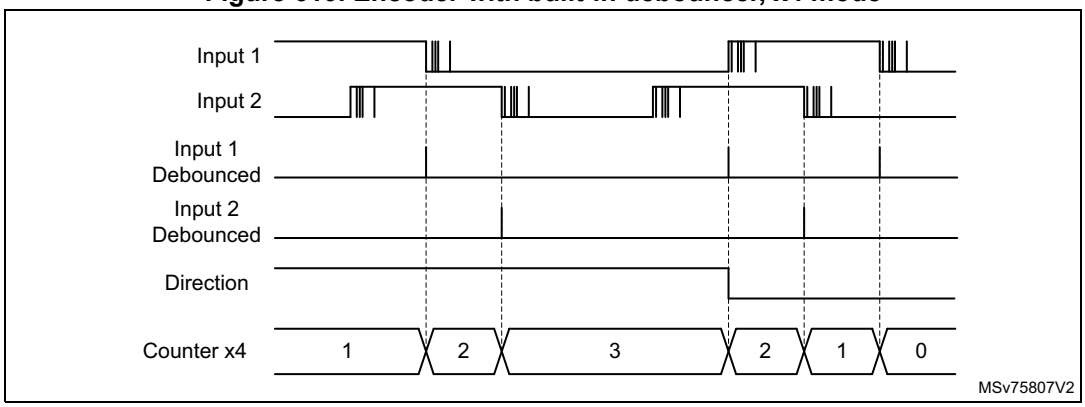


Figure 610. Encoder with built-in debouncer, x4 mode

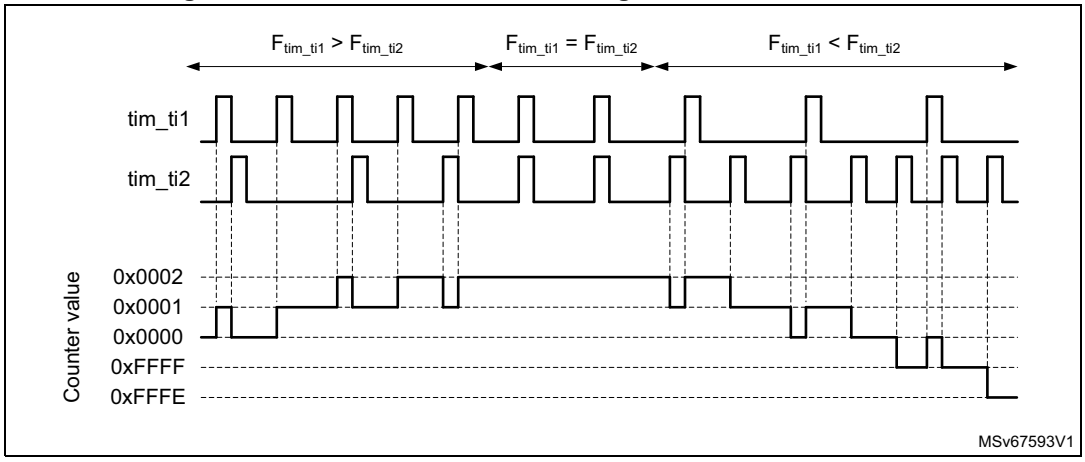
34.3.30 Direction bit output

Its is possible to output a direction signal out of the timer, on the tim_oc3n and tim_oc4 output signals (copy of the DIR bit in the TIM_CR1 register). This is achieved by setting the OC3M[3:0] or the OC4M[3:0] bitfield to 1011 in the TIM_CCMR2 register.

This feature can be used for monitoring the counting direction (or rotation direction) in encoder mode, or to have a signal indicating the up/down phases in center-aligned PWM mode.

34.3.31 Clock drift measurement

It is possible to measure the drift between two clock sources using the directional clock encoder mode. This is useful for audio applications typically, when one need to compute the drift between two streams.



To do so, a signal representing the rate of a first audio stream must be connected to tim_ti1 and a signal representing the rate of a second audio stream must be connected to tim_ti2. The signals representing the audio rates are generally the SAIx_FS_A, SAIx_FS_B, SPIx_WS or spdifrx_frame_sync (this list of signals is provided as example and depends on the audio peripheral availability for a given product line, as detailed on the product datasheet).

In this case, the clocks are present on both tim_ti1 and tim2 simultaneously, as shown on *Figure 611*, and the counter value indicates the drift.

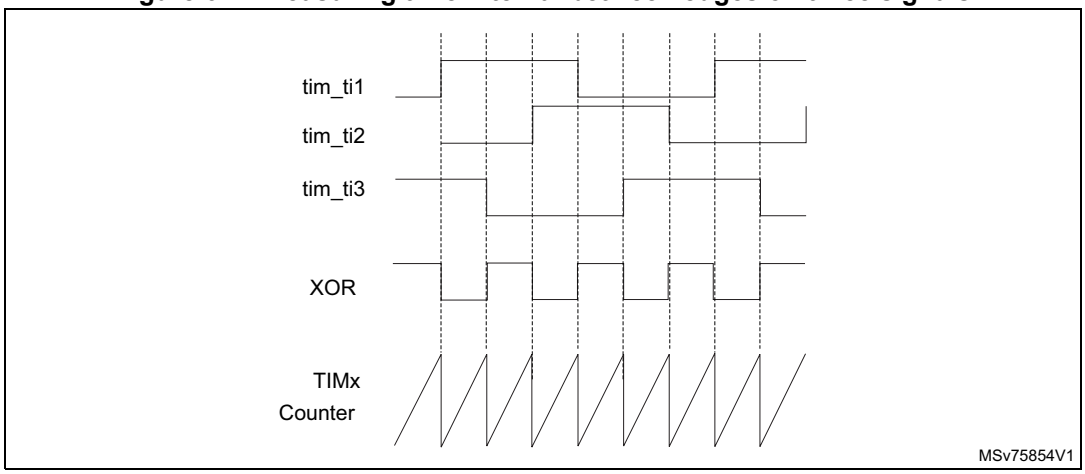
Let's define F_{tim_ti1} and F_{tim_ti2} the frequencies of the signals on tim_ti1 and tim_ti2. The counter value changes as following:

- If $F_{tim_ti1} > F_{tim_ti2}$ the counter value increases
- If $F_{tim_ti1} < F_{tim_ti2}$ the counter value decreases
- If $F_{tim_ti1} = F_{tim_ti2}$ the counter value dithers between two consecutive values, from one clock edge to the other. If the two clocks are perfectly synchronized (clock edges occuring simultaneously on the two inputs), the counter value does not change (as shown on *Figure 611* below).

Figure 611. Clock drift measure using directional clock mode

34.3.32 UIF bit remapping

The IUFREMAP bit in the TIM_CR1 register forces a continuous copy of the update interrupt flag UIF into the timer counter register's bit 31 (TIM_CNT[31]). This allows both the counter value and a potential roll-over condition signaled by the UIFCPY flag to be read in an atomic way. In particular cases, it can ease the calculations by avoiding race conditions, caused for instance by a processing shared between a background task (counter reading) and an interrupt (update interrupt).



There is no latency between the UIF and UIFCPY flags assertion.

34.3.33 Timer input XOR function

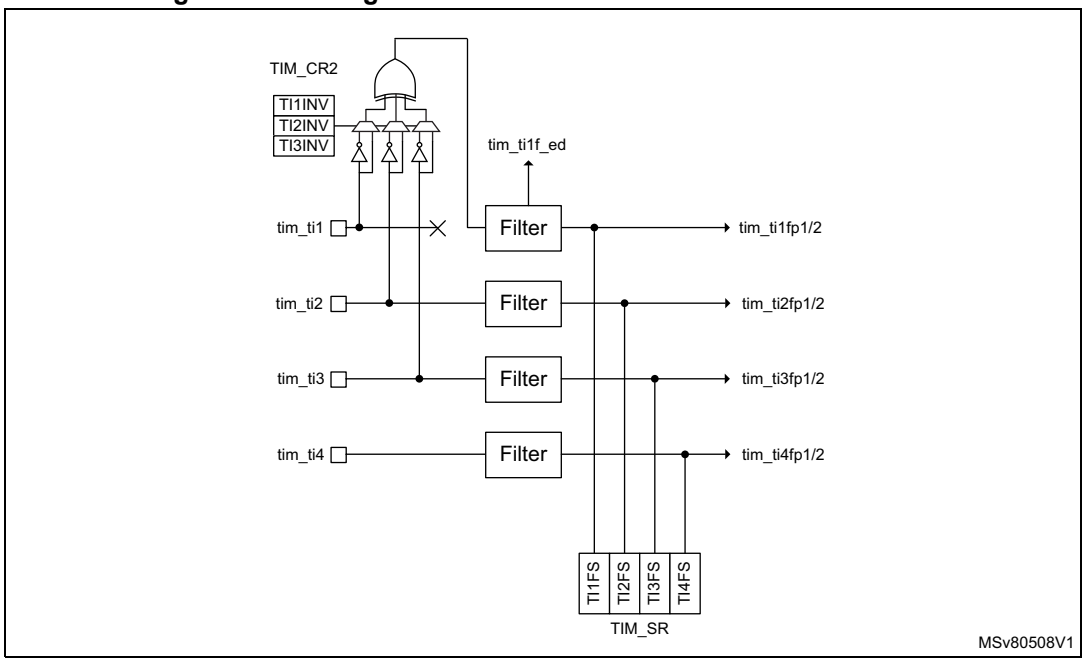
The TI1S bit in the TIM_CR2 register, allows the input filter of channel 1 to be connected to the output of an XOR gate, combining the three input pins tim_ti1, tim_ti2 and tim_ti3.

The XOR output can be used with all the timer input functions such as trigger or input capture. It is convenient to measure the interval between edges on two input signals, as per *Figure 612*.

Figure 612. Measuring time interval between edges on three signals

The XORPS control bit selects the position of the XOR gate, as shown on the *Figure 613* and *Figure 614* below, when the TI1S bit is set.

Figure 613. XOR gate connection with TI1S = 1 and XORPS = 0



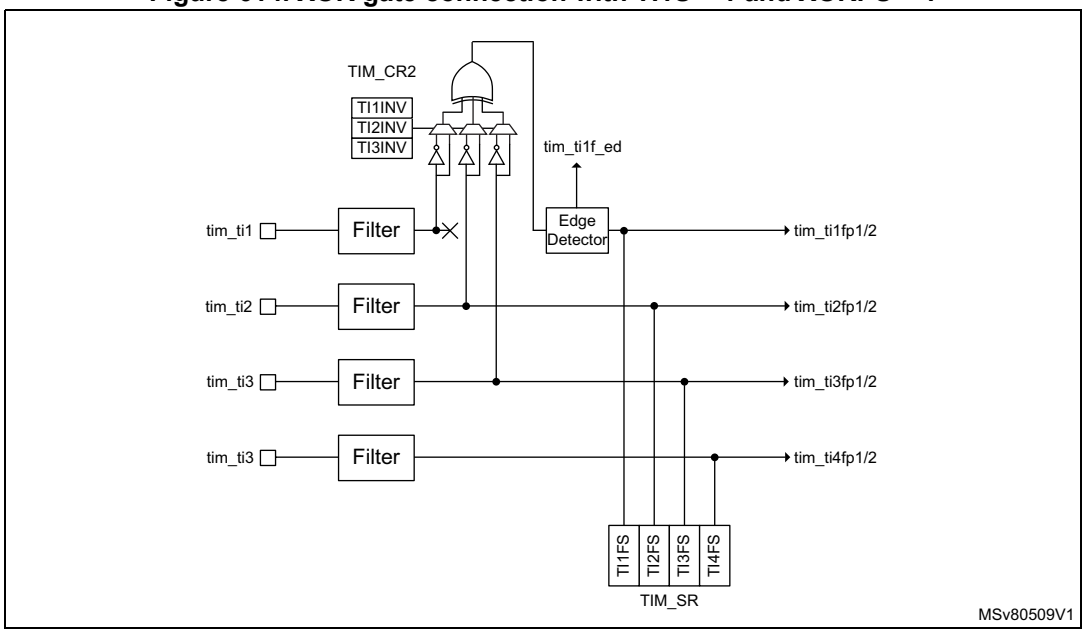


Figure 614. XOR gate connection with TI1S = 1 and XORPS = 1

Three control bits T1INV, T2INV and T3INV in the TIM_CR2 register can invert the tim_in1, tim_in2 and tim_in3 signals prior entering the XOR gate.

The status of the tim_in1, tim_in2, tim_in3 and tim_in4 signals can be software polled using the TI1FS, TI2FS, TI3FS and TI4FS bits in the TIM_SR register (tim_ti4 is not represented on figures above and do not enter into the XOR gate).

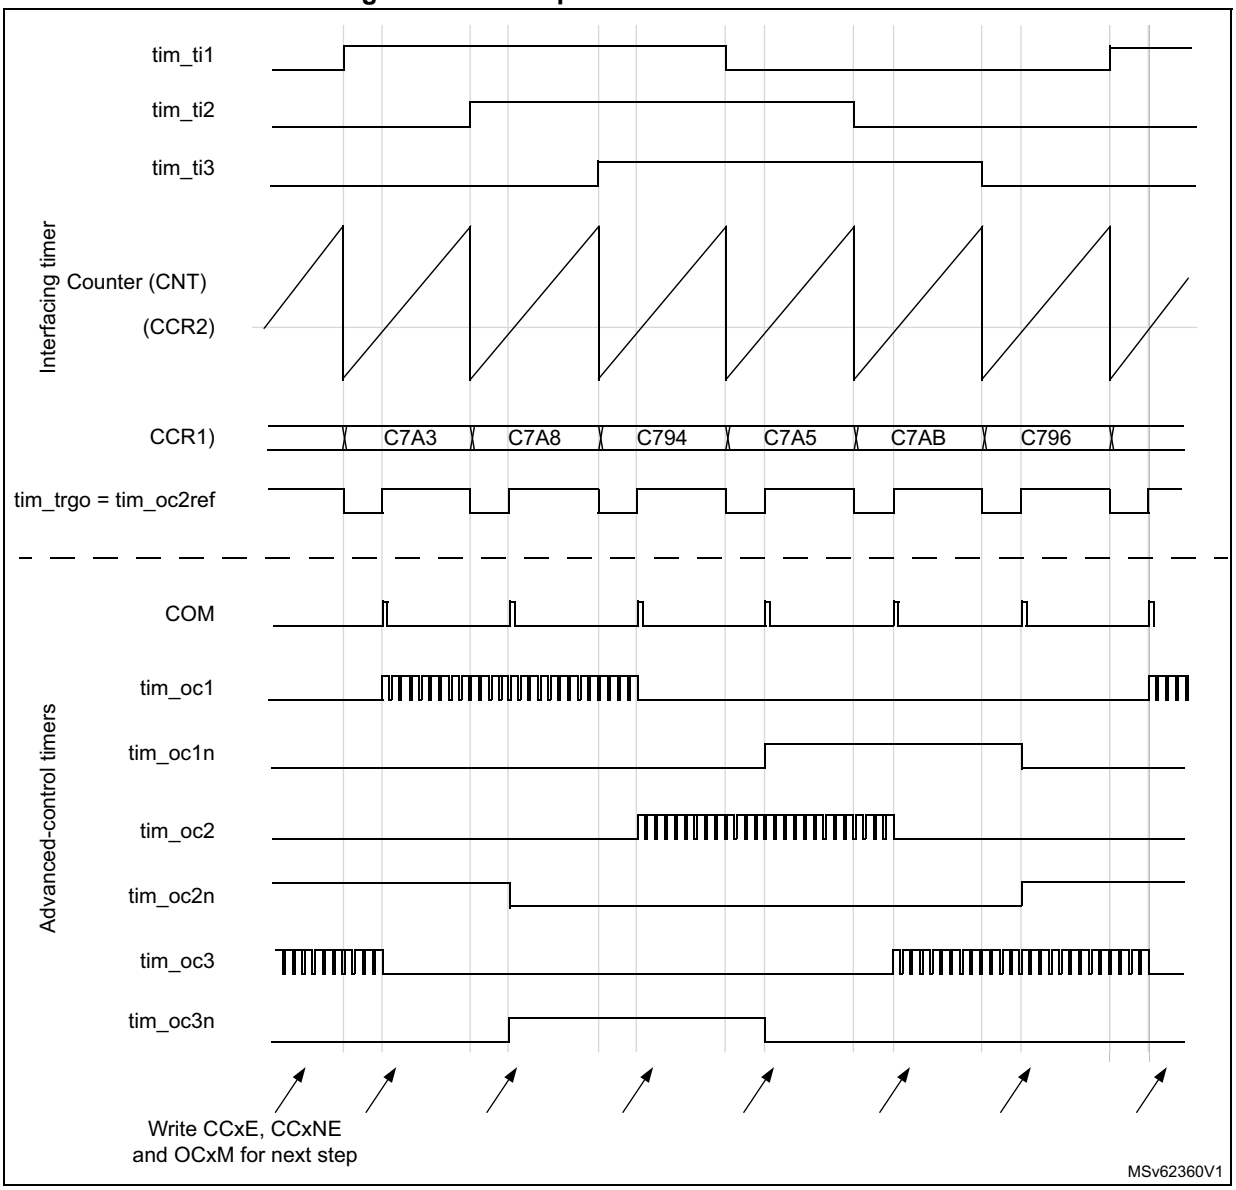
34.3.34 Interfacing with Hall sensors

This is done using the advanced-control timers to generate PWM signals to drive the motor and another timer TIMx referred to as “interfacing timer” in *Figure 615*. The “interfacing timer” captures the three timer input pins (tim_ti1, tim_ti2 and tim_ti3) connected through a XOR to the tim_ti1 input channel (selected by setting the TI1S bit in the TIM_CR2 register, with XORPS bit = 0).

The slave mode controller is configured in reset mode; the slave input is tim_ti1f_ed. Thus, each time one of the three inputs toggles, the counter restarts counting from 0. This creates a time base triggered by any change on the Hall inputs.

On the “interfacing timer”, capture/compare channel 1 is configured in capture mode, capture signal is tim_trc (See *Figure 541*). The captured value, which corresponds to the time elapsed between two changes on the inputs, gives information about motor speed.

The “interfacing timer” can be used in output mode to generate a pulse which changes the configuration of the channels of the advanced-control timer (by triggering a COM event). The advanced-control timer is used to generate PWM signals to drive the motor. To do this, the interfacing timer channel must be programmed so that a positive pulse is generated after a programmed delay (in output compare or PWM mode). This pulse is sent to the advanced-control timer through the tim_trgo output.



In this example the user wants to change the PWM configuration of the advanced-control timer after a programmed delay each time a change occurs on the Hall inputs connected to one of the TIMx timers.

- Configure three timer inputs ORed to the tim_ti1 input channel by writing the TI1S bit in the TIM_CR2 register to 1.
- Program the time base: write the TIM_ARR to the max value (the counter must be cleared by the tim_ti1 change. Set the prescaler to get a maximum counter period longer than the time between two changes on the sensors.
- Program the channel 1 in capture mode (tim_trc selected): write the CC1S bits in the TIM_CCMR1 register to 01. The digital filter can also be programmed if needed.
- Program the channel 2 in PWM 2 mode with the desired delay: write the OC2M bits to 111 and the CC2S bits to 00 in the TIM_CCMR1 register.
- Select tim_oc2ref as trigger output on tim_trgo: write the MMS bits in the TIM_CR2 register to 101.

In the advanced-control timer, the right tim_itrx input must be selected as trigger input, the timer is programmed to generate PWM signals, the capture/compare control signals are preloaded (CCPC = 1 in the TIM_CR2 register) and the COM event is controlled by the trigger input (CCUS = 1 in the TIM_CR2 register). The PWM control bits (CCxE, OCxM) are written after a COM event for the next step (this can be done in an interrupt subroutine generated by the rising edge of tim_oc2ref).

Figure 615 describes this example.

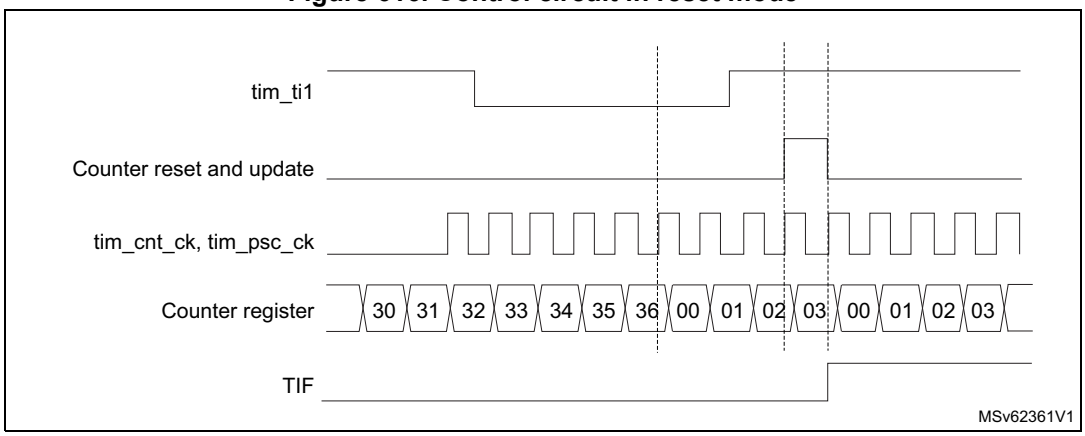
Figure 615. Example of Hall sensor interface

34.3.35 Timer synchronization

The TIMx timers are linked together internally for timer synchronization or chaining. Refer to *Section 35.4.27: Timer synchronization* for details. They can be synchronized in several modes: Reset mode, Gated mode, Trigger mode, Reset + trigger, and gated + reset modes.

Slave mode: Reset mode

The counter and its prescaler can be reinitialized in response to an event on a trigger input. Moreover, if the URS bit from the TIM_CR1 register is low, an update event UEV is generated. Then all the preloaded registers (TIM_ARR, TIM_CCRx) are updated.



In the following example, the upcounter is cleared in response to a rising edge on tim_ti1 input:

- Configure the channel 1 to detect rising edges on tim_ti1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in the TIM_CCMR1 register. Write CC1P = 0 and CC1NP = 0 in TIM_CCER register to validate the polarity (and detect rising edges only).
- Configure the timer in reset mode by writing SMS = 100 in TIM_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIM_SMCR register.
- Start the counter by writing CEN = 1 in the TIM_CR1 register.

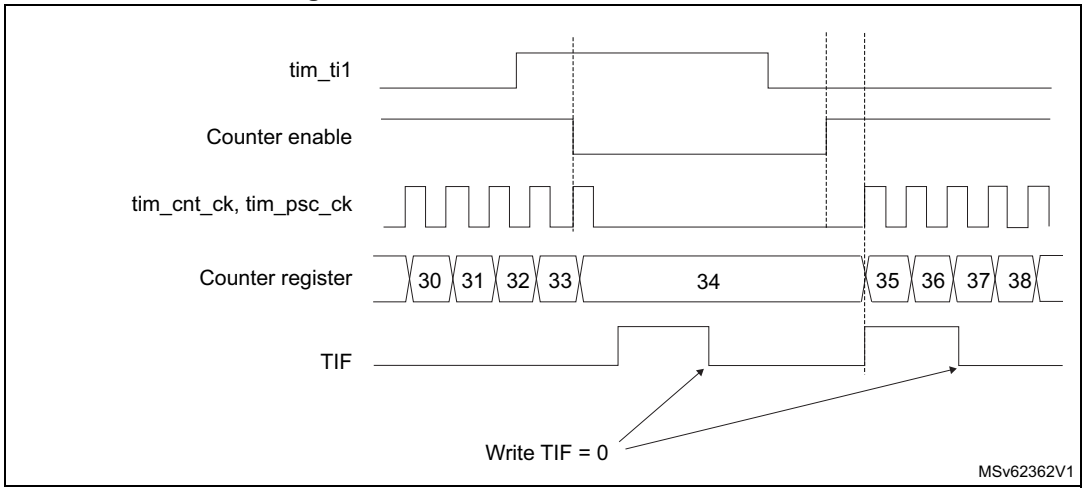
The counter starts counting on the internal clock, then behaves normally until tim_ti1 rising edge. When tim_ti1 rises, the counter is cleared and restarts from 0. In the meantime, the trigger flag is set (TIF bit in the TIM_SR register) and an interrupt request, or a DMA request can be sent if enabled (depending on the TIE and TDE bits in TIM_DIER register).

The following figure shows this behavior when the autoreload register TIM_ARR = 0x36. The delay between the rising edge on tim_ti1 and the actual reset of the counter is due to the resynchronization circuit on tim_ti1 input.

Figure 616. Control circuit in reset mode

Slave mode: Gated mode

The counter can be enabled depending on the level of a selected input.



In the following example, the upcounter counts only when tim_ti1 input is low:

- Configure the channel 1 to detect low levels on tim_ti1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in TIM_CCMR1 register. Write CC1P = 1 and CC1NP = 0 in TIM_CCER register to validate the polarity (and detect low level only).
- Configure the timer in gated mode by writing SMS = 101 in TIM_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIM_SMCR register.
- Enable the counter by writing CEN = 1 in the TIM_CR1 register (in gated mode, the counter does not start if CEN = 0, whatever is the trigger input level).

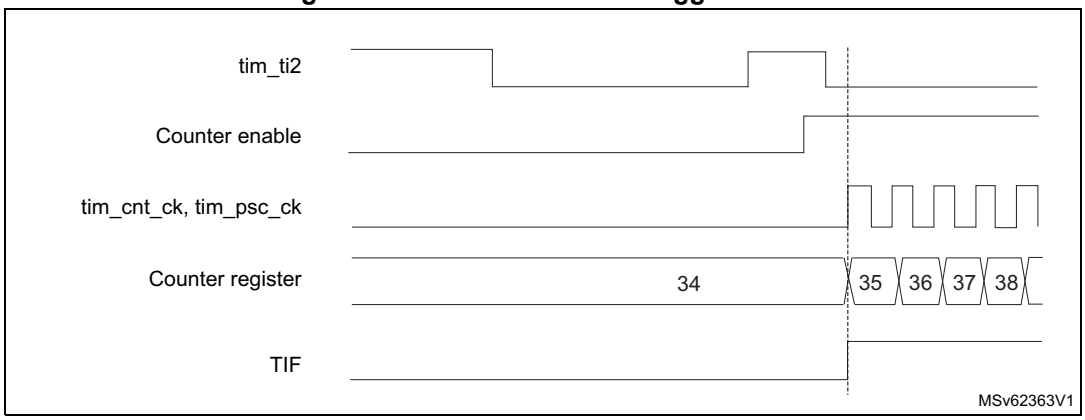
The counter starts counting on the internal clock as long as tim_ti1 is low and stops as soon as tim_ti1 becomes high. The TIF flag in the TIM_SR register is set both when the counter starts or stops.

The delay between the rising edge on tim_ti1 and the actual stop of the counter is due to the resynchronization circuit on tim_ti1 input.

Figure 617. Control circuit in Gated mode

Slave mode: Trigger mode

The counter can start in response to an event on a selected input.



In the following example, the upcounter starts in response to a rising edge on tim_ti2 input:

- Configure the channel 2 to detect rising edges on tim_ti2. Configure the input filter duration (in this example, we do not need any filter, so we keep IC2F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC2S bits are configured to select the input capture source only, CC2S = 01 in TIM_CCMR1 register. Write CC2P = 1 and CC2NP = 0 in TIM_CCER register to validate the polarity (and detect low level only).
- Configure the timer in trigger mode by writing SMS = 110 in TIM_SMCR register. Select tim_ti2 as the input source by writing TS = 00110 in TIM_SMCR register.

When a rising edge occurs on tim_ti2, the counter starts counting on the internal clock and the TIF flag is set.

The delay between the rising edge on tim_ti2 and the actual start of the counter is due to the resynchronization circuit on tim_ti2 input.

Figure 618. Control circuit in trigger mode

Slave mode: Combined reset + trigger mode

In this case, a rising edge of the selected trigger input (tim_trgi) reinitializes the counter, generates an update of the registers, and starts the counter.

This mode is used for One-pulse mode.

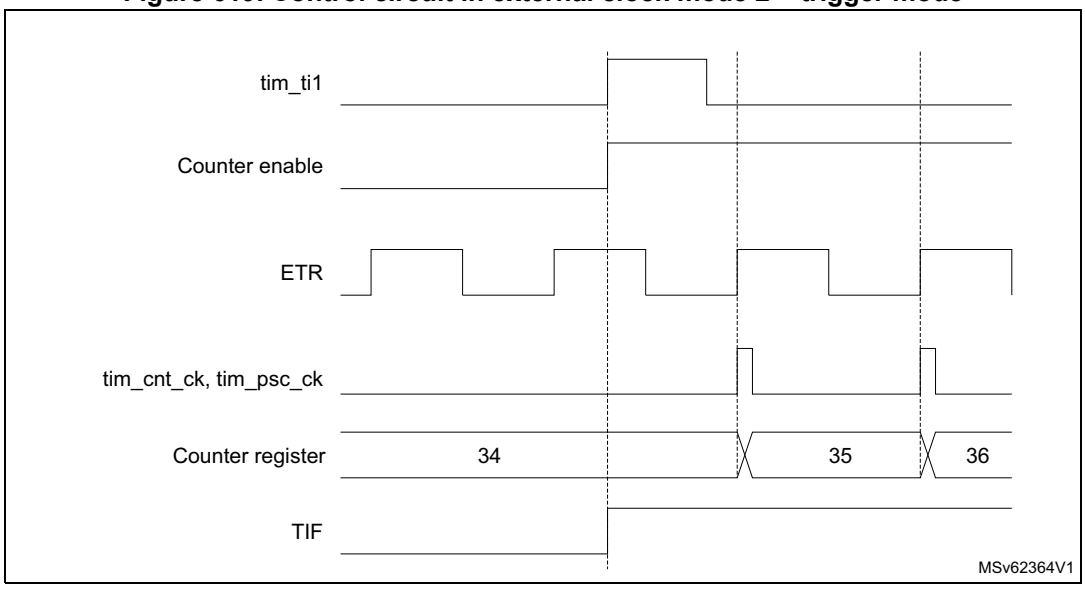
Slave mode: Combined gated + reset mode

The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops and is reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

This mode is used to detect out-of-range PWM signal (duty cycle exceeding a maximum expected value).

Slave mode: external clock mode 2 + trigger mode

The external clock mode 2 can be used in addition to another slave mode (except external clock mode 1 and encoder mode). In this case, the tim_etr_in signal is used as external clock input, and another input can be selected as trigger input (in reset mode, gated mode or trigger mode). It is recommended not to select tim_etr_in as tim_trgi through the TS bits of TIM_SMCR register.



In the following example, the upcounter is incremented at each rising edge of the tim_etr_in signal as soon as a rising edge of tim_ti1 occurs:

1. Configure the external trigger input circuit by programming the TIM_SMCR register as follows:
   - ETF = 0000: no filter
   - ETPS = 00: prescaler disabled
   - ETP = 0: detection of rising edges on tim_etr_in and ECE = 1 to enable the external clock mode 2.
2. Configure the channel 1 as follows, to detect rising edges on TI:
   - IC1F = 0000: no filter.
   - The capture prescaler is not used for triggering and does not need to be configured.
   - CC1S = 01in TIM_CCMR1 register to select only the input capture source
   - CC1P = 0 and CC1NP = 0 in TIM_CCER register to validate the polarity (and detect rising edge only).
3. Configure the timer in trigger mode by writing SMS = 110 in TIM_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIM_SMCR register.

A rising edge on tim_ti1 enables the counter and sets the TIF flag. The counter then counts on tim_etr_in rising edges.

The delay between the rising edge of the tim_etr_in signal and the actual reset of the counter is due to the resynchronization circuit on tim_etrp input.

Figure 619. Control circuit in external clock mode 2 + trigger mode

Note: The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo or the tim_trgo2 signals must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

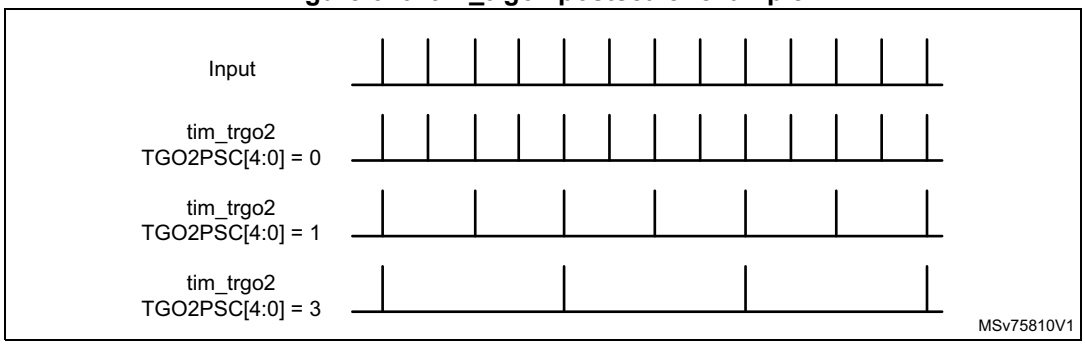
34.3.36 ADC triggers

The timer can generate an ADC triggering event with various internal signals, such as reset, enable or compare events. It is also possible to generate a pulse issued by internal edge detectors, such as:

- Rising and falling edges of OC4ref
- Rising edge on OC5ref or falling edge on OC6ref

Refer to MMS2[4:0] bitfield description in TIM_CR2 for the complete list of triggering options.

The triggers are issued on the tim_trgo2 internal line which is redirected to the ADC. There is a total of 24 possible events, which can be selected using the MMS2[4:0] bits in the TIM_CR2 register.



An example of an application for 3-phase motor drives is given in *Figure 559*.

Note: The clock of the slave peripherals (timer, ADC, ...) receiving the tim_trgo or the tim_trgo2 signals must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

Note: The clock of the ADC must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the timer.

It is possible to reduce the ADC triggering rate with the tim_tro2 post scaler. This is done by periodically discarding tim_trgo2 events, as per the value programmed in TGO2PSC[4:0] bitfield in TIM_CR1, as shown on *Figure 620* below.

Figure 620. tim_trgo2 postscaler example

The post scaler is able to operate with:

– pulses as shown on *Figure 620* above, when selecting for instance MMS2[4:0] = 10001 to have a trigger on tim_oc7refc rising rising or falling edges

– the tim_ocxrefc signal itself (ie with user-defined duty cycle), when selecting for instance MMS2[4:0] = 10000 to have a trigger on tim_oc7refc

34.3.37 ADC synchronization

The timer operation can be synchronized to the ADC clock to trigger jitter-free ADC sampling. This function is enabled using the ADSYNC bit in the TIM_CR2 register.

This feature is useful when the timers and the ADCs are operating with semisynchronous clocks (clocks derived from a same source with integer ratio tim_ker_ck/adc_ker_ck), for instance adc_ker_ck = 75 MHz and tim_ker_ck = 150 MHz or 300 MHz.

ADSYNC must also be set when both peripherals are operating at the same frequency from the same clock source, when jitter-free operation is needed.

ADSYNC must not be set and jitter-free operation is not supported in the following cases:

- when the clock ratio is not an integer (for example adc_ker_ck = 75 MHz and tim_ker_ck = 100 MHz): in this case, the sampling point jitter due to the timer to ADC signal resynchronization is 1 adc_ker_ck period maximum
- when the ADC is operating in asynchronous mode (adc_ker_ck uncorrelated with tim_ker_ck): in this case, the sampling point jitter due to the timer to ADC signal resynchronization is 1 adc_ker_ck period maximum.

When ADSYNC = 1, the timer operation is slightly changed: the counter enable and counter reset events are aligned to the adc_ker_ck ADC clock, to avoid any phase shift due to clocks enable in the RCC.

Jitter-free operation is guaranteed only when one of the two requirements below is met (depending on the selected trigger source).

1. The counter period must be a multiple of the ADC clock period:

$$(\text{TIM_PSC} + 1) \times (\text{TIM_ARR} + 1) \times T_{\text{tim_ker_ck}} = n \times T_{\text{adc_ker_ck}}$$

2. The compare value must be a multiple of the ADC clock period:

$$(\text{TIM_PSC} + 1) \times \text{TIM_CMPy} \times T_{\text{tim_ker_ck}} = m \times T_{\text{adc_ker_ck}}$$

Note: If none of the two above requirements are met, the trigger is still generated, but the latency is not constant and varies with the timer and ADC clocks phase shift.

Programming guidelines

The ADC synchronization feature must not be modified during run-time, once the counter is enabled and once the ADC has been configured for receiving triggers from the timer.

It is mandatory to follow the procedure below to use the ADC synchronization:

1. Enable the destination ADC clock.
2. Configure the timer and set the ADSYNC bit.
3. Configure the ADC and enable it (using ADSTART and/or JADSTART bits).
4. Start the timer (with the CEN counter enable bit).

34.3.38 DMA burst mode

The TIMx timers have the capability to generate multiple DMA requests upon a single event. The main purpose is to be able to reprogram part of the timer multiple times without software overhead, but it can also be used to read several registers in a row, at regular intervals.

The DMA controller destination is unique and must point to the virtual register TIM_DMAR. On a given timer event, the timer launches a sequence of DMA requests (burst). Each write into the TIM_DMAR register is actually redirected to one of the timer registers.

The DBL[4:0] bits in the TIM_DCR register set the DMA burst length. The timer recognizes a burst transfer when a read or a write access is done to the TIM_DMAR address), i.e. the number of transfers (in words).

The DBA[4:0] bits in the TIM_DCR register define the DMA base address for DMA transfers (when read/write access are done through the TIM_DMAR address). DBA is defined as an offset starting from the address of the TIM_CR1 register:

Example:

00000: TIM_CR1

00001: TIM_CR2

00010: TIM_SMCR

The DBSS[3:0] bits in the TIM_DCR register defines the interrupt source that triggers the DMA burst transfers (see *Section 34.6.34: TIM DMA control register (TIM_DCR)* for details).

As an example, the timer DMA burst feature is used to update the contents of the CCRx registers (x = 2, 3, 4) upon an update event, with the DMA transferring half words into the CCRx registers.

This is done in the following steps:

1. Configure the corresponding DMA channel as follows:
   - DMA channel peripheral address is the DMAR register address.
   - DMA channel memory address is the address of the buffer in the RAM containing the data to be transferred by DMA into CCRx registers.
   - Number of data to transfer = 3 (see note below).
   - Circular mode disabled.
2. Configure the DCR register by configuring the DBA and DBL bitfields as follows: DBL = 2, DBA = 0xE and DBSS = 1.
3. Enable the TIMx update DMA request (set the UDE bit in the DIER register).
4. Enable TIMx.
5. Enable the DMA channel.

This example is for the case where every CCRx register to be updated once. If every CCRx register is to be updated twice for example, the number of data to transfer must be 6. Let's take the example of a buffer in the RAM containing data1, data2, data3, data4, data5, and data6. The data is transferred to the CCRx registers as follows: on the first update DMA request, data1 is transferred to CCR2, data2 is transferred to CCR3, data3 is transferred to CCR4 and on the second update DMA request, data4 is transferred to CCR2, data5 is transferred to CCR3, and data6 is transferred to CCR4.

Note: A null value can be written to the reserved registers.

34.3.39 TIM1/TIM8/TIM20 DMA requests

The TIM1/TIM8/TIM20 can generate a DMA request, as shown in the table below.

Table 387. DMA request

DMA request signal	DMA request	Enable control bit
tim_upd_dma	Update	UDE
tim_cc1_dma	Capture/compare 1	CC1DE
tim_cc2_dma	Capture/compare 2	CC2DE
tim_cc3_dma	Capture/compare 3	CC3DE

Table 387. DMA request (continued)

DMA request signal	DMA request	Enable control bit
tim_cc4_dma	Capture/compare 4	CC4DE
tim_com_dma	Commutation (COM)	COMDE
tim_trgi_dma	Trigger	TDE

34.3.40 Debug mode

When the microcontroller enters debug mode (Cortex®-M7 core halted), the TIMx counter can either continue to work normally or stop, depending on DBG_TIM_STOP configuration bit in DBG module.

The behavior in debug mode can be programmed with a dedicated configuration bit per timer in the Debug support (DBG) module.

For safety purposes, when the counter is stopped, the outputs are disabled (as if the MOE bit was reset). The outputs can either be forced to an inactive state (OSSI bit = 1), or have their control taken over by the GPIO controller (OSSI bit = 0), typically to force a Hi-Z.

For more details, refer to section Debug support (DBG).

34.4 TIM1/TIM8/TIM20 low-power modes

Table 388. Effect of low-power modes on TIM1/TIM8/TIM20

Mode	Description
Sleep	No effect, peripheral is active. The interrupts can cause the device to exit from Sleep mode.
Stop	The timer operation is stopped and the register content is kept. No interrupt can be generated.
Standby	The timer is powered-down and must be reinitialized after exiting the Standby mode.

34.5 TIM1/TIM8/TIM20 interrupts

The TIM1/TIM8/TIM20 can generate multiple interrupts, as shown in *Table 389*.

Table 389. Interrupt requests

Interrupt acronym		Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from Sleep mode	Exit from Stop and Standby mode
TIM_UPD		Update	UIF	UIE	write 0 in UIF	Yes	No
TIM_CC		Capture/compare 1	CC1IF	CC1IE	write 0 in CC1IF	Yes	No
		Capture/compare 2	CC2IF	CC2IE	write 0 in CC2IF	Yes	No
		Capture/compare 3	CC3IF	CC3IE	write 0 in CC3IF	Yes	No
		Capture/compare 4	CC4IF	CC4IE	write 0 in CC4IF	Yes	No
TIM_TRGI_COM_DIR_IDX	TIM_COM	Commutation (COM)	COMIF	COMIE	write 0 in COMIF	Yes	No
	TIM_TRGI	Trigger	TIF	TIE	write 0 in TIF	Yes	No
	TIM_IDX	Index	IDXF	IDXIE	write 0 in IDXF	Yes	No
	TIM_DIR	Direction	DIRF	DIRIE	write 0 in DIRF	Yes	No
TIM_BRK_TERR_IERR	TIM_BRK	Break	BIF	BIE	write 0 in BIF	Yes	No
		Break2	B2IF		write 0 in B2IF	Yes	No
		System Break	SBIF		write 0 in SBIF	Yes	No
	TIM_IERR	Index Error	IERRF	IERRIE	write 0 in IERRF	Yes	No
	TIM_TERR	Transition Error	TERRF	TERRIE	write 0 in TERRF	Yes	No

34.6 TIM1/TIM8/TIM20 registers

Refer to *Section 1.2* for a list of abbreviations used in register descriptions.

The peripheral registers can be accessed by half-words (16-bit) or words (32-bit).

34.6.1 TIM control register 1 (TIM_CR1)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	CKD2[3:0]				Res.	Res.	Res.	TGO2PSC[4:0]				
				rw	rw	rw	rw				rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DITHEN	UIFREMAP	Res.	CKD[1:0]		ARPE	CMS[1:0]		DIR	OPM	URS	UDIS	CEN
			rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **CKD2[3:0]**: Clock division 2

This bit field indicates the division between sampling clock (t_{DTS}) used by the dead-time generators and the digital filters (tim_etr_in, tim_tix).

0000: No Division
0001: $t_{DTS2} = 4*t_{DTS}$
0010: $t_{DTS2} = 16*t_{DTS}$
0011: $t_{DTS2} = 64*t_{DTS}$
0100: $t_{DTS2} = 256*t_{DTS}$
0101: $t_{DTS2} = 1024*t_{DTS}$
0110: $t_{DTS2} = 4096*t_{DTS}$
0111: $t_{DTS2} = 16384*t_{DTS}$
1000: $t_{DTS2} = 65536*t_{DTS}$
1001: $t_{DTS2} = 262144*t_{DTS}$
Others: Reserved, do not program this value

Bits 23:21 Reserved, must be kept at reset value.

Bits 20:16 **TGO2PSC[4:0]**: Trigger output 2 postcaler

The postscaler discards periodically events sent on the tim_trgo2 output, to reduce the ADC triggering rate.
The number of events on tim_trgo2 is divided by (TGO2PSC[4:0] + 1).
When TGO2PSC[4:0] = 0x0, the tim_trgo2 event rate is not affected.
With TGO2PSC[4:0] = 0x1, one event out of 2 is sent on tim_trgo2, with TGO2PSC[4:0] = 0x2, one event out of 3 is sent on tim_trgo2, up to 1 event out of 31 when TGO2PSC[4:0] = 0x1F,...

Note: The postscaler is only applicable when tim_trgo2 transfers a pulse (reset, update, compare pulse). When the tim_trgo2 outputs a level-based information (compare signal or enable bit for gated mode), the postscaler must be set set to 0

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **DITHEN**: Dithering enable
0: Dithering disabled
1: Dithering enabled
Note: The DITHEN bit can only be modified when CEN bit is reset.

Bit 11 **UIFREMAP**: UIF status bit remapping
0: No remapping. UIF status bit is not copied to TIM_CNT register bit 31.
1: Remapping enabled. UIF status bit is copied to TIM_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division
This bitfield indicates the division ratio between the timer clock (tim_ker_ck) frequency and the dead-time and sampling clock (t_{DTS})used by the dead-time generators and the digital filters (tim_etr_in, tim_tix),
00: $t_{DTS} = t_{tim_ker_ck}$
01: $t_{DTS} = 2*t_{tim_ker_ck}$
10: $t_{DTS} = 4*t_{tim_ker_ck}$
11: $t_{DTS} = 8*t_{tim_ker_ck}$

Bit 7 **ARPE**: Autoreload preload enable
0: TIM_ARR register is not buffered
1: TIM_ARR register is buffered

Bits 6:5 **CMS[1:0]**: Center-aligned mode selection
00: Edge-aligned mode. The counter counts up or down depending on the direction bit (DIR).
01: Center-aligned mode 1. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS = 00 in TIM_CCMRx register) are set only when the counter is counting down.
10: Center-aligned mode 2. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS = 00 in TIM_CCMRx register) are set only when the counter is counting up.
11: Center-aligned mode 3. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS = 00 in TIM_CCMRx register) are set both when the counter is counting up or down.
Note: It is not allowed to switch from edge-aligned mode to center-aligned mode as long as the counter is enabled (CEN = 1)

Bit 4 **DIR**: Direction
0: Counter used as upcounter
1: Counter used as downcounter
Note: This bit is read only when the timer is configured in Center-aligned mode or Encoder mode.

Bit 3 **OPM**: One-pulse mode
0: Counter is not stopped at update event
1: Counter stops counting at the next update event (clearing the bit CEN)

Bit 2 **URS**: Update request source

This bit is set and cleared by software to select the UEV event sources.

0: Any of the following events generate an update interrupt or DMA request if enabled. These events can be:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

1: Only counter overflow/underflow generates an update interrupt or DMA request if enabled.

Bit 1 **UDIS**: Update disable

This bit is set and cleared by software to enable/disable UEV event generation.

0: UEV enabled. The Update (UEV) event is generated by one of the following events:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

Buffered registers are then loaded with their preload values.

1: UEV disabled. The Update event is not generated, shadow registers keep their value (ARR, PSC, CCRx). However the counter and the prescaler are reinitialized if the UG bit is set or if a hardware reset is received from the slave mode controller.

Bit 0 **CEN**: Counter enable

0: Counter disabled

1: Counter enabled

Note: External clock, gated mode and encoder mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.

34.6.2 TIM control register 2 (TIM_CR2)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TI3INV	TI2INV	TI1INV	ADSYNC	XORPS	Res.	MMS[3]	MMS2[4:0]					OIS7	OIS6	Res.	OIS5

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw		rw

Bit 31 **TI3INV**: tim_ti3 signal inversion on XOR gate input

0: tim_ti3 non-inverted

1: tim_ti3 inverted

Bit 30 **TI2INV**: tim_ti2 signal inversion on XOR gate input

0: tim_ti2 non-inverted

1: tim_ti2 inverted

Bit 29 **TI1INV**: tim_ti1 signal inversion on XOR gate input

0: tim_ti1 non-inverted

1: tim_ti1 inverted

Bit 28 **ADSYNC**: ADC synchronization

0: The timer operates independently from the ADC

1: The timer operation is synchronized with the ADC clock to provide jitter-free sampling point. This mode can be enabled only with specific ADC / timer clock relationship. Refer to *Section 34.3.37* for requirements.

The ADSYNC must not modified when the counter is enabled (CEN bit is set).

Bit 27 **XORPS**: XOR gate position selection

This bit defines the position of the XOR gate with respect to input filters.

0: XOR gate placed before TI1 filter

1: XOR gate placed after TI1, TI2 and TI3 filters

Bit 26 Reserved, must be kept at reset value.

Bits 24:20 **MMS2[4:0]**: Master mode selection 2

These bits allow the information to be sent to ADC for synchronization (tim_trgo2) to be selected. The combination is as follows:

00000:**Reset** - the UG bit from the TIM_EGR register is used as trigger output (tim_trgo2). If the reset is generated by the trigger input (slave mode controller configured in reset mode), the signal on tim_trgo2 is delayed compared to the actual reset.

00001:**Enable** - the Counter Enable signal CNT_EN is used as trigger output (tim_trgo2). It is useful to start several timers at the same time or to control a window in which a slave timer is enabled. The Counter Enable signal is generated by a logic AND between the CEN control bit and the trigger input when configured in Gated mode. When the Counter Enable signal is controlled by the trigger input, there is a delay on tim_trgo2, except if the Master/Slave mode is selected (see the MSM bit description in TIM_SMCR register).

00010:**Update** - the update event is selected as trigger output (tim_trgo2). For instance, a master timer can then be used as a prescaler for a slave timer.

00011:**Compare pulse** - the trigger output sends a positive pulse when the CC1IF flag is to be set (even if it was already high), as soon as a capture or compare match occurs (tim_trgo2).

00100:**Compare** - tim_oc1refc signal is used as trigger output (tim_trgo2)

00101:**Compare** - tim_oc2refc signal is used as trigger output (tim_trgo2)

00110:**Compare** - tim_oc3refc signal is used as trigger output (tim_trgo2)

00111:**Compare** - tim_oc4refc signal is used as trigger output (tim_trgo2)

01000:**Compare** - tim_oc5refc signal is used as trigger output (tim_trgo2)

01001:**Compare** - tim_oc6refc signal is used as trigger output (tim_trgo2)

01010:**Compare Pulse** - tim_oc4refc rising or falling edges generate pulses on tim_trgo2

01011:**Compare pulse** - tim_oc6refc rising or falling edges generate pulses on tim_trgo2

01100:**Compare pulse** - tim_oc4refc or tim_oc6refc rising edges generate pulses on tim_trgo2

01101:**Compare pulse** - tim_oc4refc rising or tim_oc6refc falling edges generate pulses on tim_trgo2

01110:**Compare pulse** - tim_oc5refc or tim_oc6refc rising edges generate pulses on tim_trgo2

01111:**Compare pulse** - tim_oc5refc rising or tim_oc6refc falling edges generate pulses on tim_trgo2

10000: **Compare** - tim_oc7refc signal is used as trigger output (tim_trgo2)

10001: **Compare Pulse** - tim_oc7refc rising or falling edges generate pulses on tim_trgo2

10010: **Compare Pulse** tim_oc4refc or tim_oc7efc rising edges generate pulses on tim_trgo2

10011: **Compare Pulse** - tim_oc4refc rising or tim_oc7refc falling edges generate pulses on tim_trgo2

10100: **Compare Pulse** -tim_oc5refc or tim_oc7efc rising edges generate pulses on tim_trgo2

10101: **Compare Pulse** - tim_oc5refc rising or tim_oc7refc falling edges generate pulses on tim_trgo2

10110: **Compare Pulse** - tim_oc6refc or tim_oc7efc rising edges generate pulses on tim_trgo2

10111: **Compare Pulse** - tim_oc6refc rising or tim_oc7refc falling edges generate pulses on tim_trgo2

Note: The clock of the slave timer or ADC must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.

Bit 19 **OIS7**: Output idle state 7 (tim_oc7 output)

Refer to OIS1 bit

Bit 18 **OIS6**: Output idle state 6 (tim_oc6 output)
Refer to OIS1 bit

Bit 17 Reserved, must be kept at reset value.

Bit 16 **OIS5**: Output idle state 5 (tim_oc5 output)
Refer to OIS1 bit

Bit 15 **OIS4N**: Output idle state 4 (tim_oc4n output)
Refer to OIS1N bit

Bit 14 **OIS4**: Output idle state 4 (tim_oc4 output)
Refer to OIS1 bit

Bit 13 **OIS3N**: Output idle state 3 (tim_oc3n output)
Refer to OIS1N bit

Bit 12 **OIS3**: Output idle state 3 (tim_oc3n output)
Refer to OIS1 bit

Bit 11 **OIS2N**: Output idle state 2 (tim_oc2n output)
Refer to OIS1N bit

Bit 10 **OIS2**: Output idle state 2 (tim_oc2 output)
Refer to OIS1 bit

Bit 9 **OIS1N**: Output idle state 1 (tim_oc1n output)
0: tim_oc1n = 0 after a dead-time when MOE = 0
1: tim_oc1n = 1 after a dead-time when MOE = 0
Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM_BDTR register).

Bit 8 **OIS1**: Output idle state 1 (tim_oc1 output)
0: tim_oc1 = 0 (after a dead-time) when MOE = 0
1: tim_oc1 = 1 (after a dead-time) when MOE = 0
Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM_BDTR register).

Bit 7 **TI1S**: tim_ti1 selection
This bit enables the insertion of a XOR gate to combine tim_ti1_in[15:0], tim_ti2_in[15:0], and tim_ti3_in[15:0] inputs into tim_ti1.
The position of the XOR gate, with respect to input filters, is defined with the XORPS bit.
0: The tim_ti1_in[15:0] multiplexer output is connected to tim_ti1 input
1: tim_ti1_in[15:0], tim_ti2_in[15:0] and tim_ti3_in[15:0] multiplexers outputs are XORed and connected to the tim_ti1 input

Bits 25, 6:4 **MMS[3:0]**: Master mode selection

These bits select the information to be sent in master mode to slave timers for synchronization (tim_trgo). The combination is as follows:

0000: **Reset** - the UG bit from the TIM_EGR register is used as trigger output (tim_trgo). If the reset is generated by the trigger input (slave mode controller configured in reset mode) then the signal on tim_trgo is delayed compared to the actual reset.

0001: **Enable** - the Counter Enable signal CNT_EN is used as trigger output (tim_trgo). It is useful to start several timers at the same time or to control a window in which a slave timer is enable. The Counter Enable signal is generated by a logic AND between CEN control bit and the trigger input when configured in gated mode. When the Counter Enable signal is controlled by the trigger input, there is a delay on tim_trgo, except if the master/slave mode is selected (see the MSM bit description in TIM_SMCR register).

0010: **Update** - The update event is selected as trigger output (tim_trgo). For instance a master timer can then be used as a prescaler for a slave timer.

0011: **Compare Pulse** - The trigger output send a positive pulse when the CC1IF flag is to be set (even if it was already high), as soon as a capture or a compare match occurred. (tim_trgo).

0100: **Compare** - tim_oc1refc signal is used as trigger output (tim_trgo)

0101: **Compare** - tim_oc2refc signal is used as trigger output (tim_trgo)

0110: **Compare** - tim_oc3refc signal is used as trigger output (tim_trgo)

0111: **Compare** - tim_oc4refc signal is used as trigger output (tim_trgo)

1000: **Encoder Clock output** - The encoder clock signal is used as trigger output (tim_trgo). This code is valid for the following SMS[4:0] values: 00001, 00010, 00011, 01010, 01011, 01100, 01101, 01110, 01111. Any other SMS[4:0] code is not allowed and may lead to unexpected behavior.

Other codes reserved

Note: The clock of the slave timer or ADC must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.

Bit 3 **CCDS**: Capture/compare DMA selection

0: CCx DMA request sent when CCx event occurs

1: CCx DMA requests sent when update event occurs

Bit 2 **CCUS**: Capture/compare control update selection

0: When capture/compare control bits are preloaded (CCPC = 1), they are updated by setting the COMG bit only

1: When capture/compare control bits are preloaded (CCPC = 1), they are updated by setting the COMG bit or when an rising edge occurs on tim_trgi

Note: This bit acts only on channels that have a complementary output.

Bit 1 Reserved, must be kept at reset value.

Bit 0 **CCPC**: Capture/compare preloaded control

0: CCxE, CCxNE, CCxP, CCxNP and OCxM bits are not preloaded

1: CCxE, CCxNE, CCxP, CCxNP and OCxM bits are preloaded, after having been written, they are updated only when a commutation event (COM) occurs (COMG bit set or rising edge detected on tim_trgi, depending on the CCUS bit).

Note: This bit acts only on channels that have a complementary output.

34.6.3 TIM slave mode control register (TIM_SMCR)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	SETPS[3:0]				SMSPS	SMSPE	Res.	Res.	TS[4:3]		Res.	Res.	SMS[4:3]	
		rw	rw	rw	rw	rw	rw			rw	rw			rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ETP	ECE	ETPS[1:0]		ETF[3:0]				MSM	TS[2:0]			OCCS	SMS[2:0]		
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:26 **SETPS[3:0]**: Synchronous external trigger prescaler

The linear synchronous prescaler divides the frequency of the tim_etrf signal, by a factor (SETPS[3:0] + 1).

Bit 25 **SMSPS**: SMS preload source

This bit selects whether the events that triggers the SMS[4:0] bitfield transfer from preload to active

0: The transfer is triggered by the Timer's Update event

1: The transfer is triggered by the Index event

Bit 24 **SMSPE**: SMS preload enable

This bit selects whether the SMS[3:0] bitfield is preloaded

0: SMS[4:0] bitfield is not preloaded

1: SMS[4:0] preload is enabled

Bits 23:22 Reserved, must be kept at reset value.

Bits 21:20 **TS[4:3]**: Trigger selection - bit 4:3

Refer to TS[2:0] description - bits 6:4

Bits 19:18 Reserved, must be kept at reset value.

Bit 15 **ETP**: External trigger polarity

This bit selects whether tim_etr_in or $\overline{\text{tim_etr_in}}$ is used for trigger operations

0: tim_etr_in is non-inverted, active at high level or rising edge.

1: tim_etr_in is inverted, active at low level or falling edge.

Bit 14 **ECE**: External clock enable

This bit enables External clock mode 2.

0: External clock mode 2 disabled

1: External clock mode 2 enabled. The counter is clocked by any active edge on the tim_etrf signal.

Note: Setting the ECE bit has the same effect as selecting external clock mode 1 with tim_trgi connected to tim_etrf (SMS = 111 and TS = 00111).

It is possible to simultaneously use external clock mode 2 with the following slave modes: reset mode, gated mode and trigger mode. Nevertheless, tim_trgi must not be connected to tim_etrf in this case (TS bits must not be 00111).

If external clock mode 1 and external clock mode 2 are enabled at the same time, the external clock input is tim_etrf.

Bits 13:12 **ETPS[1:0]**: External trigger prescaler

External trigger signal tim_etrp frequency must be at most 1/4 of TIMxCLK frequency. A prescaler can be enabled to reduce tim_etrp frequency. It is useful when inputting fast external clocks on tim_etr_in.

00: Prescaler OFF
01: tim_etr_in frequency divided by 2
10: tim_etr_in frequency divided by 4
11: tim_etr_in frequency divided by 8

Bits 11:8 **ETF[3:0]**: External trigger filter

This bitfield then defines the frequency used to sample tim_etrp signal and the length of the digital filter applied to tim_etrp. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at f_{DTS2}
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS2}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS2}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS2}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS2}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS2}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS2}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS2}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS2}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS2}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS2}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS2}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS2}/32$, N = 8

Bit 7 **MSM:** Master/slave mode

0: No action
1: The effect of an event on the trigger input (tim_trgi) is delayed to allow a perfect synchronization between the current timer and its slaves (through tim_trgo). It is useful if we want to synchronize several timers on a single external event.

Bits 6:4 **TS[2:0]:** Trigger selection

This bitfield is combined with TS[4:3] bits.

This bitfield selects the trigger input to be used to synchronize the counter.

00000: Internal trigger 0 (tim_itr0)
00001: Internal trigger 1 (tim_itr1)
00010: Internal trigger 2 (tim_itr2)
00011: Internal trigger 3 (tim_itr3)
00100: tim_ti1 Edge Detector (tim_ti1f_ed)
00101: Filtered Timer Input 1 (tim_ti1fp1)
00110: Filtered Timer Input 2 (tim_ti2fp2)
00111: External trigger input (tim_etrf)
01000: Internal trigger 4 (tim_itr4)
01001: Internal trigger 5 (tim_itr5)
01010: Internal trigger 6 (tim_itr6)
01011: Internal trigger 7 (tim_itr7)
01100: Internal trigger 8 (tim_itr8)
01101: Internal trigger 9 (tim_itr9)
01110: Internal trigger 10 (tim_itr10)
01111: Internal trigger 11 (tim_itr11)
10000: Internal trigger 12 (tim_itr12)
10001: Internal trigger 13 (tim_itr13)
10010: Internal trigger 14 (tim_itr14)
10011: Internal trigger 15 (tim_itr15)
10100: Internal trigger 16 (tim_itr16)
10101: Internal trigger 17 (tim_itr17)
10110: Internal trigger 18 (tim_itr18)
10111: Internal trigger 19 (tim_itr19)
11000: Internal trigger 20 (tim_itr20)
11001: Internal trigger 21 (tim_itr21)
11010: Internal trigger 22 (tim_itr22)
11011: Internal trigger 23 (tim_itr23)
11100: Internal trigger 24 (tim_itr24)
11101: Internal trigger 25 (tim_itr25)
11110: Internal trigger 26 (tim_itr26)
11111: Internal trigger 27 (tim_itr27)

See *Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals* for more details on tim_itrx meaning for each Timer.

Note: These bits must be changed only when they are not used (for example when SMS = 000) to avoid wrong edge detections at the transition.

Bit 3 **OCCS:** OCREF clear selection

This bit is used to select the OCREF clear source.

0: tim_ocref_clr_int is connected to the tim_ocref_clr input
1: tim_ocref_clr_int is connected to tim_etrf

Bits 17:16, 2:0 **SMS[4:0]:** Slave mode selection

When external signals are selected the active edge of the trigger signal (tim_trgi) is linked to the polarity selected on the external input (refer to ETP bit in TIM_SMCR for tim_etr_in and CCxP/CCxNP bits in TIM_CCER register for tim_ti1fp1 and tim_ti2fp2).

00000:Slave mode disabled - if CEN = 1 then the prescaler is clocked directly by the internal clock.

00001:Quadrature encoder mode 1, x2 mode- Counter counts up/down on tim_ti1fp1 edge depending on tim_ti2fp2 level.

00010:Quadrature encoder mode 2, x2 mode - Counter counts up/down on tim_ti2fp2 edge depending on tim_ti1fp1 level.

00011:Quadrature encoder mode 3, x4 mode - Counter counts up/down on both tim_ti1fp1 and tim_ti2fp2 edges depending on the level of the other input.

00100:Reset mode - Rising edge of the selected trigger input (tim_trgi) reinitializes the counter and generates an update of the registers.

00101:Gated mode - The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops (but is not reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

00110:Trigger mode - The counter starts at a rising edge of the trigger tim_trgi (but it is not reset). Only the start of the counter is controlled.

00111:External Clock mode 1 - Rising edges of the selected trigger (tim_trgi) clock the counter.

01000:Combined reset + trigger mode - Rising edge of the selected trigger input (tim_trgi) reinitializes the counter, generates an update of the registers and starts the counter.

01001:Combined gated + reset mode - The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops and is reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

01010:Encoder mode: Clock plus direction, x2 mode.

01011:Encoder mode: Clock plus direction, x1 mode, tim_ti2fp2 edge sensitivity is set by CC2P

01100:Encoder mode: Directional Clock, x2 mode.

01101:Encoder mode: Directional Clock, x1 mode, tim_ti1fp1 and tim_ti2fp2 edge sensitivity is set by CC1P and CC2P.

01110:Quadrature encoder mode: x1 mode, counting on tim_ti1fp1 edges only, edge sensitivity is set by CC1P.

01111:Quadrature encoder mode: x1 mode, counting on tim_ti2fp2 edges only, edge sensitivity is set by CC2P.

10000:Quadrature encoder with built-in debouncer: x2 mode.

10001:Quadrature encoder with built-in debouncer: x4 mode.

Note: The gated mode must not be used if tim_ti1f_ed is selected as the trigger input (TS = 00100). Indeed, tim_ti1f_ed outputs 1 pulse for each transition on TI1F, whereas the gated mode checks the level of the trigger signal.

Note: The clock of the slave peripherals (timer, ADC, ...) receiving the tim_trgo or the tim_trgo2 signals must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

34.6.4 TIM DMA/interrupt enable register (TIM_DIER)

Address offset: 0x00C

Reset value: 0x0000 0000

Bit 31 **TI4FS**: tim_ti4f status

This flag indicates the value of the tim_ti4f signal (after the digital filtering stage), for polling purpose.
0: tim_ti4f signal is low
1: tim_ti4f signal is high

Bit 30 **TI3FS**: tim_ti3f status

This flag indicates the value of the tim_ti3f signal (after the digital filtering stage), for polling purpose.
0: tim_ti3f signal is low
1: tim_ti3f signal is high

Bit 29 **TI2FS**: tim_ti2f status

This flag indicates the value of the tim_ti2f signal (after the digital filtering stage), for polling purpose.
0: tim_ti2f signal is low
1: tim_ti2f signal is high

Bit 28 **TI1FS**: tim_ti1f status

This flag indicates the value of the tim_ti1f signal (after the digital filtering stage), for polling purpose.
0: tim_ti1f signal is low
1: tim_ti1f signal is high

Bits 27:26 Reserved, must be kept at reset value.

Bit 25 **ODS**: Output disable status

This bit indicates the global output state when a break or break2 event occured, to discriminate the source.
0: Idle state: break was triggered (or MOE was written to 0), and OIS states are forced on tim_ocx and tim_ocxn outputs
1: Disabled state: break2 was triggered, tim_ocx and tim_ocxn outputs are inactive

Bit 24 **UIOVRF**: Update Interrupt Overrun flag

This flag is set by hardware when an update request occurs while an update interrupt is pending (update interrupt flag set). It is cleared by software by writing it to '0'.
0: No Update Interrupt Overrun
1: Update Interrupt Overrun

Bit 23 **TERRF**: Transition error interrupt flag

This flag is set by hardware when a transition error is detected in encoder mode. It is cleared by software by writing it to 0.
0: No encoder transition error has been detected.
1: An encoder transition error has been detected

Bit 22 **IERRF**: Index error interrupt flag

This flag is set by hardware when an index error is detected. It is cleared by software by writing it to 0.
0: No index error has been detected.
1: An index error has been detected

Bit 21 **DIRF**: Direction change interrupt flag

This flag is set by hardware when the direction changes in encoder mode (DIR bit value in TIM_CR is changing). It is cleared by software by writing it to 0.
0: No direction change
1: Direction change

Bit 20 **IDXF**: Index interrupt flag
This flag is set by hardware when an index event is detected. It is cleared by software by writing it to 0.
0: No index event occurred.
1: An index event has occurred

Bit 19 Reserved, must be kept at reset value.

Bit 18 **CC7IF**: Compare 7 interrupt flag
Refer to CC1IF description
Note: Channel 7 can only be configured as output.

Bit 17 **CC6IF**: Compare 6 interrupt flag
Refer to CC1IF description
Note: Channel 6 can only be configured as output.

Bit 16 **CC5IF**: Compare 5 interrupt flag
Refer to CC1IF description
Note: Channel 5 can only be configured as output.

Bit 15 **B2GF**: Break 2 generation flag
This flag is set by hardware as soon as a break 2 event is forced by software, using the B2G bit. It is useful to distinguish hardware-triggered from software-triggered break events. It is cleared by software by writing it to 0.
0: No break 2 event occurred.
1: A break 2 event was forced with the B2G bit

Bit 14 **BGF**: Break generation flag
This flag is set by hardware as soon as a break event is forced by software, using the BG bit. It is useful to distinguish hardware-triggered from software-triggered break events. It is cleared by software by writing it to 0.
0: No break event occurred.
1: A break event was forced with the BG bit

Bit 13 **SBIF**: System break interrupt flag
This flag is set by hardware as soon as the system break input goes active. It can be cleared by software if the system break input is not active.
This flag must be reset to re-start PWM operation.
0: No break event occurred.
1: An active level has been detected on the system break input. An interrupt is generated if BIE = 1 in the TIM_DIER register.

Bit 12 **CC4OF**: Capture/compare 4 overcapture flag
Refer to CC1OF description

Bit 11 **CC3OF**: Capture/compare 3 overcapture flag
Refer to CC1OF description

Bit 10 **CC2OF**: Capture/compare 2 overcapture flag
Refer to CC1OF description

Bit 9 **CC1OF**: Capture/compare 1 overcapture flag
This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to 0.
0: No overcapture has been detected.
1: The counter value has been captured in TIM_CCR1 register while CC1IF flag was already set

Bit 8 **B2IF**: Break 2 interrupt flag

This flag is set by hardware as soon as the break 2 input goes active. It can be cleared by software if the break 2 input is not active.

0: No break event occurred.

1: An active level has been detected on the break 2 input. An interrupt is generated if BIE = 1 in the TIM_DIER register.

Bit 7 **BIF**: Break interrupt flag

This flag is set by hardware as soon as the break input goes active. It can be cleared by software if the break input is not active.

0: No break event occurred.

1: An active level has been detected on the break input. An interrupt is generated if BIE = 1 in the TIM_DIER register.

Bit 6 **TIF**: Trigger interrupt flag

This flag is set by hardware on the TRG trigger event (active edge detected on tim_trgi input when the slave mode controller is enabled in all modes but gated mode. It is set when the counter starts or stops when gated mode is selected. It is cleared by software.

0: No trigger event occurred.

1: Trigger interrupt pending.

Bit 5 **COMIF**: COM interrupt flag

This flag is set by hardware on COM event (when capture/compare Control bits - CCxE, CCxNE, OCxM - have been updated). It is cleared by software.

0: No COM event occurred.

1: COM interrupt pending.

Bit 4 **CC4IF**: Capture/compare 4 interrupt flag

Refer to CC1IF description

Bit 3 **CC3IF**: Capture/compare 3 interrupt flag

Refer to CC1IF description

Bit 2 **CC2IF**: Capture/compare 2 interrupt flag
Refer to CC1IF description

Bit 1 **CC1IF**: Capture/compare 1 interrupt flag
This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIM_CCR1 register (input capture mode only).
0: No compare match / No input capture occurred
1: A compare match or an input capture occurred
If channel CC1 is configured as output: this flag is set when the content of the counter TIM_CNT matches the content of the TIM_CCR1 register. When the content of TIM_CCR1 is greater than the content of TIM_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in downcounting mode). There are 3 possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIM_CR1 register for the full description.
If channel CC1 is configured as input: this bit is set when counter value has been captured in TIM_CCR1 register (an edge has been detected on IC1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIM_CCER).

Bit 0 **UIF**: Update interrupt flag
This bit is set by hardware on an update event. It is cleared by software.
0: No update occurred.
1: Update interrupt pending. This bit is set by hardware when the registers are updated:
–At overflow or underflow regarding the repetition counter value (update if repetition counter = 0) and if the UDIS = 0 in the TIM_CR1 register.
–When CNT is reinitialized by software using the UG bit in TIM_EGR register, if URS = 0 and UDIS = 0 in the TIM_CR1 register.
–When CNT is reinitialized by a trigger event (refer to *Section 34.6.3: TIM slave mode control register (TIM_SMCR)*), if URS = 0 and UDIS = 0 in the TIM_CR1 register.

34.6.6 TIM event generation register (TIM_EGR)

Address offset: 0x014

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	B2G	BG	TG	COMG	CC4G	CC3G	CC2G	CC1G	UG
							w	w	w	w	w	w	w	w	w

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **B2G**: Break 2 generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: A break 2 event is generated. MOE bit is cleared and B2IF flag is set. Related interrupt can occur if enabled.

Bit 7 **BG**: Break generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: A break event is generated. MOE bit is cleared and BIF flag is set. Related interrupt or DMA transfer can occur if enabled.

Bit 6 **TG**: Trigger generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: The TIF flag is set in TIM_SR register. Related interrupt or DMA transfer can occur if enabled.

Bit 5 **COMG**: Capture/compare control update generation
This bit can be set by software, it is automatically cleared by hardware
0: No action
1: CCxE, CCxNE and OCxM bits update (providing CCPC bit is set)
Note: This bit acts only on channels having a complementary output.

Bit 4 **CC4G**: Capture/compare 4 generation
Refer to CC1G description

Bit 3 **CC3G**: Capture/compare 3 generation
Refer to CC1G description

Bit 2 **CC2G**: Capture/compare 2 generation
Refer to CC1G description

Bit 1 **CC1G**: Capture/compare 1 generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: A capture/compare event is generated on channel 1:
If channel CC1 is configured as output:
CC1IF flag is set, Corresponding interrupt or DMA request is sent if enabled.
If channel CC1 is configured as input:
The current value of the counter is captured in TIM_CCR1 register. The CC1IF flag is set, the corresponding interrupt or DMA request is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation
This bit can be set by software, it is automatically cleared by hardware.
0: No action
1: Reinitialize the counter and generates an update of the registers. Note that the prescaler counter is cleared too (anyway the prescaler ratio is not affected). The counter is cleared if the center-aligned mode is selected or if DIR = 0 (upcounting), else it takes the autoreload value (TIM_ARR) if DIR = 1 (downcounting).

34.6.7 TIM capture/compare mode register 1 (TIM_CCMR1)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IC2F[3:0]				IC2PSC[1:0]		CC2S[1:0]		IC1F[3:0]				IC1PSC[1:0]		CC1S[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Input capture mode:

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC2F[3:0]**: Input capture 2 filter
Refer to IC1F[3:0] bit description

Bits 11:10 **IC2PSC[1:0]**: Input capture 2 prescaler
Refer to IC1PSC[1:0] bit description

Bits 9:8 **CC2S[1:0]**: Capture/compare 2 selection
This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC2 channel is configured as output
01: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti2
10: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti1
11: CC2 channel is configured as input, tim_ic2 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)

Note: CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIM_CCER).

Bits 7:4 **IC1F[3:0]**: Input capture 1 filter

This bitfield defines the frequency used to sample tim_ti1 input and the length of the digital filter applied to tim_ti1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at f_{DTS2}
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS2}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS2}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS2}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS2}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS2}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS2}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS2}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS2}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS2}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS2}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS2}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS2}/32$, N = 8

Bits 3:2 **IC1PSC[1:0]**: Input capture 1 prescaler

This bitfield defines the ratio of the prescaler acting on CC1 input (tim_ic1). The prescaler is reset as soon as CC1E = 0 (TIM_CCER register).

00: no prescaler, capture is done each time an edge is detected on the capture input
01: capture is done once every 2 events
10: capture is done once every 4 events
11: capture is done once every 8 events

Bits 1:0 **CC1S[1:0]**: Capture/compare 1 Selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output
01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1
10: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti2
11: CC1 channel is configured as input, tim_ic1 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIM_CCER).

34.6.8 TIM capture/compare mode register 1 [alternate] (TIM_CCMR1)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	OC2M[4:3]		Res.	Res.	Res.	Res.	Res.	Res.	OC1M[4:3]

OC2CE	OC2M[2:0]			OC2PE	OC2FE	CC2S[1:0]		OC1CE	OC1M[2:0]			OC1PE	OC1FE	CC1S[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Output compare mode:

Bits 31:26 Reserved, must be kept at reset value.

Bits 23:18 Reserved, must be kept at reset value.

Bit 15 **OC2CE:** Output compare 2 clear enable

0: tim_oc2ref is not affected by the tim_ocref_clr_int signal

1: tim_oc2ref is cleared as soon as a High level is detected on tim_ocref_clr_int signal (tim_ocref_clr input or tim_etrf input)

Note: This mode is not available for all PWM modes. Refer to Section 34.3.23: Clearing the tim_ocxref signal on an external event for the list of forbidden configurations.

Bits 25:24, 14:12 **OC2M[4:0]**: Output compare 2 mode

Refer to OC1M[4:0] bit description

Bit 11 **OC2PE**: Output compare 2 preload enable

0: Preload register on TIM_CCR2 disabled. TIM_CCR2 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIM_CCR2 enabled. Read/Write operations access the preload register. TIM_CCR2 preload value is loaded in the active register at each update event.

These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIM_BDTR register) and CC1S = 00 (the channel is configured in output).

Bit 10 **OC2FE**: Output compare 2 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIM_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

0: CC2 behaves normally depending on counter and CCR2 values even when the trigger is ON. The minimum delay to activate CC2 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC2 output. Then, OC is set to the compare level independently from the result of the comparison. Delay to sample the trigger input and to activate CC2 output is reduced to 3 clock cycles. OCFE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 9:8 **CC2S[1:0]**: Capture/compare 2 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output

01: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti2

10: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti1

11: CC2 channel is configured as input, tim_ic2 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through the TS bit (TIM_SMCR register)

Note: CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIM_CCER).

Bit 7 **OC1CE:** Output compare 1 clear enable

0: tim_oc1ref is not affected by the tim_ocref_clr_int signal

1: tim_oc1ref is cleared as soon as a High level is detected on tim_ocref_clr_int signal (tim_ocref_clr input or tim_etrf input)

Note: This mode is not available for all PWM modes. Refer to Section 34.3.23: Clearing the tim_ocxref signal on an external event for the list of forbidden configurations.

Bits 17:16, 6:4 **OC1M[4:0]**: Output compare 1 mode

These bits define the behavior of the output reference signal tim_oc1ref from which tim_oc1 and tim_oc1n are derived. tim_oc1ref is active high whereas tim_oc1 and tim_oc1n active level depends on CC1P and CC1NP bits.

00000:Frozen - The comparison between the output compare register TIM_CCR1 and the counter TIM_CNT has no effect on the outputs.This mode can be used when the timer serves as a software timebase. When the frozen mode is enabled during timer operation, the output keeps the state (active or inactive) it had before entering the frozen state.

00001:Set channel 1 to active level on match. tim_oc1ref signal is forced high when the counter TIM_CNT matches the capture/compare register 1 (TIM_CCR1).

00010:Set channel 1 to inactive level on match. tim_oc1ref signal is forced low when the counter TIM_CNT matches the capture/compare register 1 (TIM_CCR1).

00011:Toggle - tim_oc1ref toggles when TIM_CNT = TIM_CCR1.

00100:Force inactive level - tim_oc1ref is forced low.

00101:Force active level - tim_oc1ref is forced high.

00110:PWM mode 1 - In upcounting, channel 1 is active as long as TIM_CNT<TIM_CCR1 else inactive. In downcounting, channel 1 is inactive (tim_oc1ref = 0) as long as TIM_CNT>TIM_CCR1 else active (tim_oc1ref = 1).

00111:PWM mode 2 - In upcounting, channel 1 is inactive as long as TIM_CNT<TIM_CCR1 else active. In downcounting, channel 1 is active as long as TIM_CNT>TIM_CCR1 else inactive.

01000:Retrigerrable OPM mode 1 - In up-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update. In down-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update.

01001:Retrigerrable OPM mode 2 - In up-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update. In down-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

01100-01101:Combined PWM mode 1 and 2. Refer to *Table 382* for details.

01110-01111:Asymmetric PWM mode 1 and 2. Refer to *Table 381* for details.

10000-10001:Combined PWM mode 3 and 4. Refer to *Table 382* for details.

10010-11001: Asymmetric PWM mode 3 to 10. Refer to *Table 381* for details.

Others: Reserved

Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIM_BDTR register) and CC1S = 00 (the channel is configured in output).

Note: In PWM mode, the OCREF level changes when the result of the comparison changes, when the output compare mode switches from “frozen” mode to “PWM” mode and when the output compare mode switches from “force active/inactive” mode to “PWM” mode.

Note: On channels having a complementary output, this bitfield is preloaded. If the CCPC bit is set in the TIM_CR2 register then the OC1M active bits take the new value from the preloaded bits only when a COM event is generated.

Bit 3 **OC1PE**: Output compare 1 preload enable

0: Preload register on TIM_CCR1 disabled. TIM_CCR1 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIM_CCR1 enabled. Read/Write operations access the preload register. TIM_CCR1 preload value is loaded in the active register at each update event.

Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIM_BDTR register) and CC1S = 00 (the channel is configured in output).

Bit 2 **OC1FE**: Output compare 1 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIM_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

0: CC1 behaves normally depending on counter and CCR1 values even when the trigger is ON. The minimum delay to activate CC1 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC1 output. Then, OC is set to the compare level independently from the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to 3 clock cycles. OCFE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1

10: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti2

11: CC1 channel is configured as input, tim_ic1 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIM_CCER).

34.6.9 TIM capture/compare mode register 2 (TIM_CCMR2)

Address offset: 0x01C

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 3 in input capture mode and channel 4 in output compare mode).

Input capture mode

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC4F[3:0]**: Input capture 4 filter
Refer to IC3F[3:0] bit description

Bits 11:10 **IC4PSC[1:0]**: Input capture 4 prescaler
Refer to IC3PSC[1:0] bit description

Bits 9:8 **CC4S[1:0]**: Capture/compare 4 selection
This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC4 channel is configured as output
01: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti4
10: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti3
11: CC4 channel is configured as input, tim_ic4 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)
Note: CC4S bits are writable only when the channel is OFF (CC4E = 0 in TIM_CCER).

Bits 7:4 **IC3F[3:0]**: Input capture 3 filter
This bitfield defines the frequency used to sample tim_ti3 input and the length of the digital filter applied to tim_ti3. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:
0000: No filter, sampling is done at f_{DTS2}
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS2}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS2}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS2}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS2}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS2}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS2}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS2}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS2}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS2}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS2}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS2}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS2}/32$, N = 8

Bits 3:2 **IC3PSC[1:0]**: Input capture 3 prescaler
This bitfield defines the ratio of the prescaler acting on CC3 input (tim_ic3). The prescaler is reset as soon as CC3E = 0 (TIM_CCER register).
00: no prescaler, capture is done each time an edge is detected on the capture input
01: capture is done once every 2 events
10: capture is done once every 4 events
11: capture is done once every 8 events

Bits 1:0 **CC3S[1:0]**: Capture/compare 3 selection
This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC3 channel is configured as output
01: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti3
10: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti4
11: CC3 channel is configured as input, tim_ic3 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)
Note: CC3S bits are writable only when the channel is OFF (CC3E = 0 in TIM_CCER).

34.6.10 TIM capture/compare mode register 2 [alternate] (TIM_CCMR2)

Address offset: 0x01C

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 3 in input capture mode and channel 4 in output compare mode).

Output compare mode

Bits 31:26 Reserved, must be kept at reset value.

Bits 23:18 Reserved, must be kept at reset value.

Bit 15 **OC4CE**: Output compare 4 clear enable

0: tim_oc4ref is not affected by the tim_ocref_clr_int signal

1: tim_oc4ref is cleared as soon as a High level is detected on tim_ocref_clr_int signal (tim_ocref_clr input or tim_etrf input)

Note: This mode is not available for all PWM modes. Refer to Section 34.3.23: Clearing the tim_ocxref signal on an external event for the list of forbidden configurations.

Bits 25:24, 14:12 **OC4M[4:0]**: Output compare 4 mode

Refer to OC3M[4:0] bit description

Bit 11 **OC4PE**: Output compare 4 preload enable

0: Preload register on TIM_CCR4 disabled. TIM_CCR4 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIM_CCR4 enabled. Read/Write operations access the preload register. TIM_CCR4 preload value is loaded in the active register at each update event.

These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIM_BDTR register) and CC1S = 00 (the channel is configured in output).

Bit 10 **OC4FE**: Output compare 4 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIM_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

0: CC4 behaves normally depending on counter and CCR4 values even when the trigger is ON. The minimum delay to activate CC4 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC4 output. Then, OC is set to the compare level independently from the result of the comparison. Delay to sample the trigger input and to activate CC4 output is reduced to 3 clock cycles. OCFE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 9:8 **CC4S[1:0]**: Capture/compare 4 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC4 channel is configured as output

01: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti4

10: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti3

11: CC4 channel is configured as input, tim_ic4 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)

Note: CC4S bits are writable only when the channel is OFF (CC4E = 0 in TIM_CCER).

Bit 7 **OC3CE:** Output compare 3 clear enable

0: tim_oc3ref is not affected by the tim_ocref_clr_int signal

1: tim_oc3ref is cleared as soon as a High level is detected on tim_ocref_clr_int signal (tim_ocref_clr input or tim_etrf input)

Note: This mode is not available for all PWM modes. Refer to Section 34.3.23: Clearing the tim_ocxref signal on an external event for the list of forbidden configurations.

Bits 17:16, 6:4 **OC3M[4:0]**: Output compare 3 mode

These bits define the behavior of the output reference signal tim_oc3ref from which tim_oc3 and tim_oc3n are derived. tim_oc3ref is active high whereas tim_oc3 and tim_oc3n active level depends on CC3P and CC3NP bits.

00000:Frozen - The comparison between the output compare register TIM_CCR3 and the counter TIM_CNT has no effect on the outputs.(this mode is used to generate a timing base).

00001:Set channel 3 to active level on match. tim_oc3ref signal is forced high when the counter TIM_CNT matches the capture/compare register 3 (TIM_CCR3).

00010:Set channel 3 to inactive level on match. tim_oc3ref signal is forced low when the counter TIM_CNT matches the capture/compare register 3 (TIM_CCR3).

00011:Toggle - tim_oc3ref toggles when TIM_CNT = TIM_CCR3.

00100:Force inactive level - tim_oc3ref is forced low.

00101:Force active level - tim_oc3ref is forced high.

00110:PWM mode 1 - In upcounting, channel 3 is active as long as TIM_CNT<TIM_CCR3 else inactive. In downcounting, channel 3 is inactive (tim_oc3ref = 0) as long as TIM_CNT>TIM_CCR3 else active (tim_oc3ref = 1).

00111:PWM mode 2 - In upcounting, channel 3 is inactive as long as TIM_CNT<TIM_CCR3 else active. In downcounting, channel 3 is active as long as TIM_CNT>TIM_CCR3 else inactive.

01000:Retrigerrable OPM mode 1 - In up-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update. In down-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update.

01001:Retrigerrable OPM mode 2 - In up-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update. In down-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

01010:Pulse on compare: a pulse is generated on tim_oc3ref upon CCR3 match event, as per PWPRSC[2:0] and PW[7:0] bitfields programming in TIM_ECR.

01011:Direction output. The tim_oc3ref signal is overridden by a copy of the DIR bit.

01100-01101:Combined PWM mode 1 and 2. Refer to *Table 382* for details.

01110-01111:Asymmetric PWM mode 1 and 2. Refer to *Table 381* for details.

10000-10001:Combined PWM mode 3 and 4. Refer to *Table 382* for details.

10010-11001: Asymmetric PWM mode 3 to 10. Refer to *Table 381* for details.

Others: Reserved

Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIM_BDTR register) and CC1S = 00 (the channel is configured in output).

Note: In PWM mode, the OCREF level changes only when the result of the comparison changes or when the output compare mode switches from “frozen” mode to “PWM” mode.

Note: On channels having a complementary output, this bitfield is preloaded. If the CCPC bit is set in the TIM_CR2 register then the OC3M active bits take the new value from the preloaded bits only when a COM event is generated.

Bit 3 **OC3PE**: Output compare 3 preload enable

0: Preload register on TIM_CCR3 disabled. TIM_CCR3 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIM_CCR3 enabled. Read/Write operations access the preload register. TIM_CCR3 preload value is loaded in the active register at each update event.

These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIM_BDTR register) and CC1S = 00 (the channel is configured in output).

Bit 2 **OC3FE**: Output compare 3 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIM_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

0: CC3 behaves normally depending on counter and CCR3 values even when the trigger is ON. The minimum delay to activate CC3 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC3 output. Then, OC is set to the compare level independently from the result of the comparison. Delay to sample the trigger input and to activate CC3 output is reduced to 3 clock cycles. OCFE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC3S[1:0]**: Capture/compare 3 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC3 channel is configured as output

01: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti3

10: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti4

11: CC3 channel is configured as input, tim_ic3 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)

Note: CC3S bits are writable only when the channel is OFF (CC3E = 0 in TIM_CCER).

34.6.11 TIM capture/compare enable register (TIM_CCER)

Address offset: 0x020

Reset value: 0x0000 0000

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:26 Reserved, must be kept at reset value.

Bit 25 **CC7P**: Capture/compare 7 output polarity
Refer to CC1P description

Bit 24 **CC7E**: Capture/compare 7 output enable
Refer to CC1E description

Bits 23:22 Reserved, must be kept at reset value.

Bit 21 **CC6P**: Capture/compare 6 output polarity
Refer to CC1P description

Bit 20 **CC6E**: Capture/compare 6 output enable
Refer to CC1E description

Bits 19:18 Reserved, must be kept at reset value.

Bit 17 **CC5P**: Capture/compare 5 output polarity
Refer to CC1P description

Bit 16 **CC5E**: Capture/compare 5 output enable
Refer to CC1E description

Bit 15 **CC4NP**: Capture/compare 4 complementary output polarity
Refer to CC1NP description

Bit 14 **CC4NE**: Capture/compare 4 complementary output enable
Refer to CC1NE description

Bit 13 **CC4P**: Capture/compare 4 output polarity
Refer to CC1P description

Bit 12 **CC4E**: Capture/compare 4 output enable
Refer to CC1E description

Bit 11 **CC3NP**: Capture/compare 3 complementary output polarity
Refer to CC1NP description

Bit 10 **CC3NE**: Capture/compare 3 complementary output enable
Refer to CC1NE description

Bit 9 **CC3P**: Capture/compare 3 output polarity
Refer to CC1P description

Bit 8 **CC3E**: Capture/compare 3 output enable
Refer to CC1E description

Bit 7 **CC2NP**: Capture/compare 2 complementary output polarity
Refer to CC1NP description

Bit 6 **CC2NE**: Capture/compare 2 complementary output enable
Refer to CC1NE description

Bit 5 **CC2P**: Capture/compare 2 output polarity
Refer to CC1P description

Bit 4 **CC2E**: Capture/compare 2 output enable
Refer to CC1E description

Bit 3 **CC1NP**: Capture/compare 1 complementary output polarity
CC1 channel configured as output:
0: tim_oc1n active high.
1: tim_oc1n active low.
CC1 channel configured as input:
This bit is used in conjunction with CC1P to define the polarity of tim_ti1fp1 and tim_ti2fp1.
Refer to CC1P description.

Note: This bit is not writable as soon as LOCK level 2 or 3 has been programmed (LOCK bits in TIM_BDTR register) and CC1S = 00 (channel configured as output).

Note: On channels having a complementary output, this bit is preloaded. If the CCPC bit is set in the TIM_CR2 register then the CC1NP active bit takes the new value from the preloaded bit only when a Commutation event is generated.

Note: In input mode, this bit is preloaded as per CCPC bit in TIM_CR2.

Bit 2 **CC1NE**: Capture/compare 1 complementary output enable

0: Off - tim_oc1n is not active. tim_oc1n level is then function of MOE, OSSI, OSSR, OIS1, OIS1N and CC1E bits.

1: On - tim_oc1n signal is output on the corresponding output pin depending on MOE, OSSI, OSSR, OIS1, OIS1N and CC1E bits.

Note: On channels having a complementary output, this bit is preloaded. If the CCPC bit is set in the TIM_CR2 register then the CC1NE active bit takes the new value from the preloaded bit only when a Commutation event is generated.

Bit 1 **CC1P**: Capture/compare 1 output polarity

0: OC1 active high (output mode) / Edge sensitivity selection (input mode, see below)

1: OC1 active low (output mode) / Edge sensitivity selection (input mode, see below)

When CC1 channel is configured as input, both CC1NP/CC1P bits select the active polarity of TI1FP1 and TI2FP1 for trigger or capture operations.

CC1NP = 0, CC1P = 0:non-inverted/rising edge. The circuit is sensitive to TIxFP1 rising edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode or encoder mode).

CC1NP = 0, CC1P = 1:inverted/falling edge. The circuit is sensitive to TIxFP1 falling edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is inverted (trigger operation in gated mode or encoder mode).

CC1NP = 1, CC1P = 1: non-inverted/both edges/ The circuit is sensitive to both TIxFP1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), TIxFP1is not inverted (trigger operation in gated mode). This configuration must not be used in encoder mode.

CC1NP = 1, CC1P = 0:the configuration is reserved, it must not be used.

Note: This bit is not writable as soon as LOCK level 2 or 3 has been programmed (LOCK bits in TIM_BDTR register).

Note: On channels having a complementary output, this bit is preloaded. If the CCPC bit is set in the TIM_CR2 register then the CC1P active bit takes the new value from the preloaded bit only when a Commutation event is generated.

Note: In input mode, this bit is preloaded as per CCPC bit in TIM_CR2.

Bit 0 **CC1E**: Capture/compare 1 output enable

0: Capture mode disabled / OC1 is not active (see below)

1: Capture mode enabled / OC1 signal is output on the corresponding output pin

When CC1 channel is configured as output, the OC1 level depends on MOE, OSSI, OSSR, OIS1, OIS1N and CC1NE bits, regardless of the CC1E bits state. Refer to *Table 390* for details.

Note: On channels having a complementary output, this bit is preloaded. If the CCPC bit is set in the TIM_CR2 register then the CC1E active bit takes the new value from the preloaded bit only when a Commutation event is generated.

Table 390. Output control bits for complementary tim_ocx and tim_ocxn channels with break feature

<table>
<tr><th colspan="5">Control bits</th><th colspan="2">Output states(1)</th></tr>

<tr><td rowspan="5">1</td><td>0</td><td>0</td></tr>
<tr><td>0</td><td>1</td><td colspan="2" rowspan="3">Off-State (output enabled with inactive state)
Asynchronously: tim_ocx = CCxP, tim_ocxn = CCxNP (if tim_brk or tim_brk2 is triggered).
Then (this is valid only if tim_brk is triggered), if the clock is present: tim_ocx = OISx and tim_ocxn = OISxN after a dead-time, assuming that OISx and OISxN do not correspond to OCX and tim_ocxn both in active state (may cause a short circuit when driving switches in half-bridge configuration).
Note: tim_brk2 can only be used if OSSI = OSSR = 1.</td></tr>
<tr><td>1</td><td>0</td></tr>
<tr><td>1</td><td>1</td></tr>
</table>

1. When both outputs of a channel are not used (control taken over by GPIO), the OISx, OISxN, CCxP and CCxNP bits must be kept cleared.

Note: The state of the external I/O pins connected to the complementary tim_ocx and tim_ocxn channels depends on the tim_ocx and tim_ocxn channel state and the GPIO registers.

34.6.12 TIM counter (TIM_CNT)

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UIFCPY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
r															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **UIFCPY**: UIF copy

This bit is a read-only copy of the UIF bit of the TIM_ISR register. If the UIFREMAP bit in the TIM_CR1 is reset, bit 31 is reserved and read at 0.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]**: Counter value

Non-dithering mode (DITHEN = 0)

The register holds the counter value.

Dithering mode (DITHEN = 1)

The register only holds the non-dithered part in CNT[15:0]. The fractional part is not available.

34.6.13 TIM prescaler (TIM_PSC)

Address offset: 0x028

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PSC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **PSC[15:0]**: Prescaler value

The counter clock frequency ($f_{tim_cnt_ck}$) is equal to $f_{tim_psc_ck}$ / (PSC[15:0] + 1).

PSC contains the value to be loaded in the active prescaler register at each update event (including when the counter is cleared through UG bit of TIM_EGR register or through trigger controller when configured in “reset mode”).

34.6.14 TIM autoreload register (TIM_ARR)

Address offset: 0x02C

Reset value: 0x0000 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ARR[19:16]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **ARR[19:0]**: Autoreload value

ARR is the value to be loaded in the actual autoreload register.

Refer to the *Section 34.3.3: Time-base unit* for more details about ARR update and behavior.

The counter is blocked while the autoreload value is null.

Non-dithering mode (DITHEN = 0)

The register holds the autoreload value.

Dithering mode (DITHEN = 1)

The register holds the integer part in ARR[19:4]. The ARR[3:0] bitfield contains the dithered part.

34.6.15 TIM repetition counter register (TIM_RCR)

Address offset: 0x030

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
REP[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **REP[15:0]**: Repetition counter reload value

This bitfield defines the update rate of the compare registers (i.e. periodic transfers from preload to active registers) when preload registers are enable. It also defines the update interrupt generation rate, if this interrupt is enable.

When the repetition down-counter reaches zero, an update event is generated and it restarts counting from REP value. As the repetition counter is reloaded with REP value only at the repetition update event UEV, any write to the TIM_RCR register is not taken in account until the next repetition update event.

It means in PWM mode (REP+1) corresponds to:

– the number of PWM periods in edge-aligned mode

– the number of half PWM period in center-aligned mode.

34.6.16 TIM capture/compare register 1 (TIM_CCR1)

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCR1[19:16]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR1[19:0]**: Capture/compare 1 value

If channel CC1 is configured as output: CCR1 is the value to be loaded in the actual capture/compare 1 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIM_CCMR1 register (bit OC1PE). Else the preload value is copied in the active capture/compare 1 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIM_CNT and signaled on tim_oc1 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value in CCR1[15:0]. The CCR1[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR1[19:4]. The CCR1[3:0] bitfield contains the dithered part.

If channel CC1 is configured as input: CR1 is the counter value transferred by the last input capture 1 event (tim_ic1). The TIM_CCR1 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value in CCR1[15:0]. The CCR1[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR1[19:4]. The CCR1[3:0] bits are reset.

34.6.17 TIM capture/compare register 2 (TIM_CCR2)

Address offset: 0x038

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CCR2[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR2[19:0]**: Capture/compare 2 value

If channel CC2 is configured as output: CCR2 is the value to be loaded in the actual capture/compare 2 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIM_CCMR1 register (bit OC2PE). Else the preload value is copied in the active capture/compare 2 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIM_CNT and signaled on tim_oc2 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value in CCR2[15:0]. The CCR2[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR2[19:4]. The CCR2[3:0] bitfield contains the dithered part.

If channel CC2 is configured as input: CCR2 is the counter value transferred by the last input capture 2 event (tim_ic2). The TIM_CCR2 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value in CCR2[15:0]. The CCR2[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR2[19:4]. The CCR2[3:0] bits are reset.

34.6.18 TIM capture/compare register 3 (TIM_CCR3)

Address offset: 0x03C

Reset value: 0x0000 0000

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR3[19:0]**: Capture/compare value

If channel CC3 is configured as output: CCR3 is the value to be loaded in the actual capture/compare 3 register (preload value).
It is loaded permanently if the preload feature is not selected in the TIM_CCMR2 register (bit OC3PE). Else the preload value is copied in the active capture/compare 3 register when an update event occurs.
The active capture/compare register contains the value to be compared to the counter TIM_CNT and signaled on tim_oc3 output.
Non-dithering mode (DITHEN = 0)
The register holds the compare value in CCR3[15:0]. The CCR3[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the integer part in CCR3[19:4]. The CCR3[3:0] bitfield contains the dithered part.
If channel CC3 is configured as input: CCR3 is the counter value transferred by the last input capture 3 event (tim_ic3). The TIM_CCR3 register is read-only and cannot be programmed.
Non-dithering mode (DITHEN = 0)
The register holds the capture value in CCR3[15:0]. The CCR3[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the capture in CCR3[19:4]. The CCR3[3:0] bits are reset.

34.6.19 TIM capture/compare register 4 (TIM_CCR4)

Address offset: 0x040

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR4[19:0]**: Capture/compare value

If channel CC4 is configured as output: CCR4 is the value to be loaded in the actual capture/compare 4 register (preload value).
It is loaded permanently if the preload feature is not selected in the TIM_CCMR2 register (bit OC4PE). Else the preload value is copied in the active capture/compare 4 register when an update event occurs.
The active capture/compare register contains the value to be compared to the counter TIM_CNT and signalled on tim_oc4 output.
Non-dithering mode (DITHEN = 0)
The register holds the compare value in CCR4[15:0]. The CCR4[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the integer part in CCR4[19:4]. The CCR4[3:0] bitfield contains the dithered part.
If channel CC4 is configured as input: CCR4 is the counter value transferred by the last input capture 4 event (tim_ic4). The TIM_CCR4 register is read-only and cannot be programmed.
Non-dithering mode (DITHEN = 0)
The register holds the capture value in CCR4[15:0]. The CCR4[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the capture in CCR4[19:4]. The CCR4[3:0] bits are reset.

34.6.20 TIM break and dead-time register (TIM_BDTR)

Address offset: 0x044

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	BK2BID	BKBID	BK2DSRM	BKDSRM	BK2P	BK2E	BK2F[3:0]				BKF[3:0]			
		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MOE	AOE	BKP	BKE	OSSR	OSSI	LOCK[1:0]		DTG[7:0]							
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Note: As the bits BKBID/BK2BID/BK2P, BK2E, BK2F[3:0], BKF[3:0], AOE, BKP, BKE, OSSI, OSSR, and DTG[7:0] can be write-locked depending on the LOCK configuration, it can be necessary to configure all of them during the first write access to the TIM_BDTR register.

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **BK2BID**: Break2 bidirectional
Refer to BKBID description

Bit 28 **BKBID**: Break bidirectional
0: Break input tim_brk in input mode
1: Break input tim_brk in bidirectional mode
In the bidirectional mode (BKBID bit set to 1), the break input is configured both in input mode and in open drain output mode. Any active break event asserts a low logic level on the Break input to indicate an internal break event to external devices.
Note: This bit cannot be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).
Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bit 27 **BK2DSRM**: Break2 disarm
Refer to BKDSRM description

Bit 26 **BKDSRM**: Break disarm
0: Break input tim_brk is armed
1: Break input tim_brk is disarmed
This bit is cleared by hardware when no break source is active.
The BKDSRM bit must be set by software to release the bidirectional output control (open-drain output in Hi-Z state) and then be polled it until it is reset by hardware, indicating that the fault condition has disappeared.
Note: Any write operation to this bit takes a delay of 1 APB clock cycle to become effective.

Bit 25 **BK2P**: Break 2 polarity
0: Break input tim_brk2 is active low
1: Break input tim_brk2 is active high
Note: This bit cannot be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register) and when BK2E bit is set.
Note: Any write operation to this bit takes a delay of 1 tim_ker_ck clock cycle to become effective.

Bit 24 **BK2E**: Break 2 enable
This bit enables the complete break 2 protection, see *Figure 565: Break and Break2 circuitry overview*).
0: Break2 function disabled
1: Break2 function enabled
Note: The BRKIN2 must only be used with OSSR = OSSI = 1.
Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).
Note: Any write operation to this bit takes a delay of 1 tim_ker_ck clock cycle to become effective.

Bits 23:20 **BK2F[3:0]**: Break 2 filter

This bitfield defines the frequency used to sample tim_brk2 input and the length of the digital filter applied to tim_brk2. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, tim_brk2 acts asynchronously
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register) and when BK2E bit is set.

Bits 19:16 **BKF[3:0]**: Break filter

This bitfield defines the frequency used to sample tim_brk input and the length of the digital filter applied to tim_brk. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, tim_brk acts asynchronously
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register) and when BKE bit is set.

Bit 15 **MOE**: Main output enable

This bit is cleared asynchronously by hardware as soon as one of the break inputs is active (tim_brk or tim_brk2). It is set by software or automatically depending on the AOE bit. It is acting only on the channels which are configured in output.

0: In response to a break 2 event. OC and OCN outputs are disabled
In response to a break event or if MOE is written to 0: OC and OCN outputs are disabled or forced to idle state depending on the OSSI bit.

1: OC and OCN outputs are enabled if their respective enable bits are set (CCxE, CCxNE in TIM_CCER register).
See OC/OCN enable description for more details (*Section 34.6.11: TIM capture/compare enable register (TIM_CCER)*).

Bit 14 **AOE**: Automatic output enable

0: MOE can be set only by software

1: MOE can be set by software or automatically at the next update event (if none of the break inputs tim_brk and tim_brk2 is active)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 13 **BKP**: Break polarity

0: Break input tim_brk is active low

1: Break input tim_brk is active high

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register) and when BKE bit is set.

Note: Any write operation to this bit takes a delay of 1 tim_ker_ck clock cycle to become effective.

Bit 12 **BKE**: Break enable

This bit enables the complete break protection (including all sources connected to tim_sys_brk and BKIN sources, as per *Figure 565: Break and Break2 circuitry overview*).

0: Break function disabled

1: Break function enabled

Note: This bit cannot be modified when LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Note: Any write operation to this bit takes a delay of 1 tim_ker_ck clock cycle to become effective.

Bit 11 **OSSR**: Off-state selection for Run mode

This bit is used when MOE = 1 on channels having a complementary output which are configured as outputs. OSSR is not implemented if no complementary output is implemented in the timer.

See OC/OCN enable description for more details (*Section 34.6.11: TIM capture/compare enable register (TIM_CCER)*).

0: When inactive, OC/OCN outputs are disabled (the timer releases the output control which is taken over by the GPIO logic, which forces a Hi-Z state).

1: When inactive, OC/OCN outputs are enabled with their inactive level as soon as CCxE = 1 or CCxNE = 1 (the output is still controlled by the timer).

Note: This bit can not be modified as soon as the LOCK level 2 has been programmed (LOCK bits in TIM_BDTR register).

Bit 10 **OSSI**: Off-state selection for idle mode

This bit is used when MOE = 0 due to a break event or by a software write, on channels configured as outputs.
See OC/OCN enable description for more details (*Section 34.6.11: TIM capture/compare enable register (TIM_CCER)*).

0: When inactive, OC/OCN outputs are disabled (the timer releases the output control which is taken over by the GPIO logic and which imposes a Hi-Z state).

1: When inactive, OC/OCN outputs are first forced with their inactive level then forced to their idle level after the deadtime. The timer maintains its control over the output.

Note: This bit can not be modified as soon as the LOCK level 2 has been programmed (LOCK bits in TIM_BDTR register).

Bits 9:8 **LOCK[1:0]**: Lock configuration

These bits offer a write protection against software errors.

00: LOCK OFF - No bit is write protected.

01: LOCK Level 1 = DTG bits in TIM_BDTR register, OISx and OISxN bits in TIM_CR2 register and BKBID/BK2BID/BKE/BKP/AOE bits in TIM_BDTR register can no longer be written.

10: LOCK Level 2 = LOCK Level 1 + CC Polarity bits (CCxP/CCxNP bits in TIM_CCER register, as long as the related channel is configured in output through the CCxS bits) as well as OSSR and OSSI bits can no longer be written.

11: LOCK Level 3 = LOCK Level 2 + CC Control bits (OCxM and OCxPE bits in TIM_CCMRx registers, as long as the related channel is configured in output through the CCxS bits) can no longer be written.

Note: The LOCK bits can be written only once after the reset. Once the TIM_BDTR register has been written, their content is frozen until the next reset.

Bits 7:0 **DTG[7:0]**: Dead-time generator setup

This bitfield defines the duration of the dead-time inserted between the complementary outputs. DT correspond to this duration.
DTG[7:5] = 0xx => DT = DTG[7:0]x t_{DTG} with $t_{DTG} = t_{DTS}$.
DTG[7:5] = 10x => DT = (64+DTG[5:0])xt_{DTG} with $t_{DTG} = 2xt_{DTS}$.
DTG[7:5] = 110 => DT = (32+DTG[4:0])xt_{DTG} with $t_{DTG} = 8xt_{DTS}$.
DTG[7:5] = 111 => DT = (32+DTG[4:0])xt_{DTG} with $t_{DTG} = 16xt_{DTS}$.
Example if t_{DTS} = 125 ns (8 MHz), dead-time possible values are:
0 to 15875 ns by 125 ns steps,
16 µs to 31750 ns by 250 ns steps,
32 µs to 63 µs by 1 µs steps,
64 µs to 126 µs by 2 µs steps

Note: This bitfield can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM_BDTR register).

34.6.21 TIM capture/compare register 5 (TIM_CCR5)

Address offset: 0x048

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CCR5[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **GC5C3**: Group channel 5 and channel 3

Distortion on channel 3 output:

0: No effect of tim_oc5ref on tim_oc3refc

1: tim_oc3refc is the logical AND of tim_oc3ref and tim_oc5ref

This bit can either have immediate effect or be preloaded and taken into account after an update event (if preload is enabled with OC5PE in TIM_CCMR3).

Note: it is also possible to apply this distortion on combined PWM signals.

Bit 30 **GC5C2**: Group channel 5 and channel 2

Distortion on channel 2 output:

0: No effect of tim_oc5ref on tim_oc2refc

1: tim_oc2refc is the logical AND of tim_oc2ref and tim_oc5ref

This bit can either have immediate effect or be preloaded and taken into account after an update event (if preload is enabled with OC5PE in TIM_CCMR3).

Note: it is also possible to apply this distortion on combined PWM signals.

Bit 29 **GC5C1**: Group channel 5 and channel 1

Distortion on channel 1 output:

0: No effect of oc5ref on oc1refc

1: oc1refc is the logical AND of oc1ref and oc5ref

This bit can either have immediate effect or be preloaded and taken into account after an update event (if preload is enabled with OC5PE in TIM_CCMR3).

Note: it is also possible to apply this distortion on combined PWM signals.

Bit 28 **GC5C4**: Group channel 5 and channel 4

Distortion on channel 1 output:

0: No effect of oc5ref on oc4refc

1: oc4refc is the logical AND of oc4ref and oc5ref

This bit can either have immediate effect or be preloaded and taken into account after an update event (if preload is enabled with OC5PE in TIM_CCMR3).

Note: it is also possible to apply this distortion on combined PWM signals.

Bit 27 **GC5C4O**: Group channel 5 and channel 4 (ORed)

Distortion on channel 4 output:

This bit can either have immediate effect or be preloaded and taken into account after an update event (if preload is enabled with OC5PE in TIM_CCMR3).

0: No effect of oc5ref on oc4refc

1: oc4refc is the logical OR of oc4ref and oc5ref

Note: it is also possible to apply this distortion on combined PWM signals.

Bit 26 **GC5C3O**: Group channel 5 and channel 3 (ORed)

Distortion on channel 3 output:

This bit can either have immediate effect or be preloaded and taken into account after an update event (if preload is enabled with OC5PE in TIM_CCMR3).

0: No effect of oc5ref on oc3refc

1: oc4refc is the logical OR of oc3ref and oc5ref

Note: it is also possible to apply this distortion on combined PWM signals.

Bit 25 **GC5C2O**: Group channel 5 and channel 2 (ORed)
Distortion on channel 2 output:
This bit can either have immediate effect or be preloaded and taken into account after an update event (if preload is enabled with OC5PE in TIM_CCMR3).
0: No effect of oc5ref on oc2refc
1: oc4refc is the logical OR of oc2ref and oc5ref
Note: it is also possible to apply this distortion on combined PWM signals.

Bit 24 **GC5C1O**: Group channel 5 and channel 1 (ORed)
Distortion on channel 1 output:
This bit can either have immediate effect or be preloaded and taken into account after an update event (if preload is enabled with OC5PE in TIM_CCMR3).
0: No effect of oc5ref on oc1refc
1: oc4refc is the logical OR of oc1ref and oc5ref
Note: it is also possible to apply this distortion on combined PWM signals.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR5[19:0]**: compare 5 value
CCR5 is the value to be loaded in the actual compare 5 register (preload value).
It is loaded permanently if the preload feature is not selected in the TIM_CCMR3 register (bit OC5PE). Else the preload value is copied in the active compare 5 register when an update event occurs.
The active compare register contains the value to be compared to the counter TIM_CNT and signaled on tim_oc5 output.
Non-dithering mode (DITHEN = 0)
The register holds the compare value in CCR5[15:0]. The CCR5[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the integer part in CCR5[19:4]. The CCR5[3:0] bitfield contains the dithered part.

34.6.22 TIM capture/compare register 6 (TIM_CCR6)

Address offset: 0x04C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CCR6[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR6[19:0]**: Compare 6 value

CCR6 is the value to be loaded in the actual compare 6 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIM_CCMR3 register (bit OC6PE). Else the preload value is copied in the active compare 6 register when an update event occurs.

The active compare register contains the value to be compared to the counter TIM_CNT and signaled on tim_oc6 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value in CCR6[15:0]. The CCR6[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR6[19:4]. The CCR6[3:0] bitfield contains the dithered part.

34.6.23 TIM capture/compare mode register 3 (TIM_CCMR3)

Address offset: 0x050

Reset value: 0x0000 0000

Refer to the above CCMR1 register description. Channels 5 and 6 can only be configured in output.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	OC6M[4:3]		Res.	Res.	Res.	Res.	Res.	Res.	OC5M[4:3]

rw	rw	rw	rw	rw	rw			rw	rw	rw	rw	rw	rw		

Bits 31:26 Reserved, must be kept at reset value.

Bits 23:18 Reserved, must be kept at reset value.

Bit 15 **OC6CE**: Output compare 6 clear enable

0: tim_oc6ref is not affected by the tim_ocref_clr_int signal

1: tim_oc6ref is cleared as soon as a High level is detected on tim_ocref_clr_int signal (tim_ocref_clr input or tim_etrf input)

Note: This mode is not available for all PWM modes. Refer to Section 34.3.23: Clearing the tim_ocxref signal on an external event for the list of forbidden configurations.

Bits 25:24, 14:12 **OC6M[4:0]**: Output compare 6 mode

Refer to OC5M[4:0] bit description

Bit 11 **OC6PE**: Output compare 6 preload enable

0: Preload register on TIM_CCR6 disabled. TIM_CCR6 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIM_CCR6 enabled. Read/Write operations access the preload register. TIM_CCR6 preload value is loaded in the active register at each update event.

These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIM_BDTR register) and CC1S = 00 (the channel is configured in output).

Bit 10 **OC6FE**: Output compare 6 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIM_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

0: CC6 behaves normally depending on counter and CCR6 values even when the trigger is ON. The minimum delay to activate CC6 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC6 output. Then, OC is set to the compare level independently from the result of the comparison. Delay to sample the trigger input and to activate CC6 output is reduced to 3 clock cycles. OCFE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 9:8 Reserved, must be kept at reset value.

Bit 7 **OC5CE:** Output compare 5 clear enable

0: tim_oc5ref is not affected by the tim_ocref_clr_int signal

1: tim_oc5ref is cleared as soon as a High level is detected on tim_ocref_clr_int signal (tim_ocref_clr input or tim_etrf input)

Note: This mode is not available for all PWM modes. Refer to Section 34.3.23: Clearing the tim_ocxref signal on an external event for the list of forbidden configurations.

Bits 17:16, 6:4 **OC5M[4:0]**: Output compare 5 mode

These bits define the behavior of the output reference signal tim_oc5ref5. tim_oc5ref is active high whereas tim_oc5 active level depends on CC5P bit.

00000:Frozen - The comparison between the output compare register TIM_CCR5 and the counter TIM_CNT has no effect on the outputs.(this mode is used to generate a timing base).

00001:Set channel 5 to active level on match. tim_oc5ref signal is forced high when the counter TIM_CNT matches the capture/compare register 5 (TIM_CCR5).

00010:Set channel 5 to inactive level on match. tim_oc5ref signal is forced low when the counter TIM_CNT matches the capture/compare register 5 (TIM_CCR5).

00011:Toggle - tim_oc5ref toggles when TIM_CNT = TIM_CCR5.

00100:Force inactive level - tim_oc5ref is forced low.

00101:Force active level - tim_oc5ref is forced high.

00110:PWM mode 1 - In upcounting, channel 5 is active as long as TIM_CNT<TIM_CCR5 else inactive. In downcounting, channel 5 is inactive (tim_oc5ref = 0) as long as TIM_CNT>TIM_CCR5 else active (tim_oc5ref = 1).

00111:PWM mode 2 - In upcounting, channel 5 is inactive as long as TIM_CNT<TIM_CCR5 else active. In downcounting, channel 5 is active as long as TIM_CNT>TIM_CCR5 else inactive.

01000:Retrigerrable OPM mode 1 - In up-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update. In down-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update.

01001:Retrigerrable OPM mode 2 - In up-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update. In down-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

01010-01011:Reserved.

01100-01101:Combined PWM mode 1 and 2. Refer to *Table 382* for details.

01110-01111:Asymmetric PWM mode 1 and 2. Refer to *Table 381* for details.

Others: Reserved

Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIM_BDTR register) and CC1S = 00 (the channel is configured in output).

Note: In PWM mode, the OCREF level changes only when the result of the comparison changes or when the output compare mode switches from “frozen” mode to “PWM” mode.

Bit 3 **OC5PE**: Output compare 5 preload enable

0: Preload register on TIM_CCR5 disabled. TIM_CCR5 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIM_CCR5 enabled. Read/Write operations access the preload register. TIM_CCR5 preload value is loaded in the active register at each update event.

These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIM_BDTR register) and CC1S = 00 (the channel is configured in output).

Bit 2 **OC5FE**: Output compare 5 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIM_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

0: CC5 behaves normally depending on counter and CCR5 values even when the trigger is ON. The minimum delay to activate CC5 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC5 output. Then, OC is set to the compare level independently from the result of the comparison. Delay to sample the trigger input and to activate CC5 output is reduced to 3 clock cycles. OCFE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 Reserved, must be kept at reset value.

34.6.24 TIM timer deadtime register 2 (TIM_DTR2)

Address offset: 0x054

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DTPE	DTAE
														rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DTGF[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:18 Reserved, must be kept at reset value.

Bit 17 **DTPE**: Deadtime preload enable

0: Deadtime value is not preloaded

1: Deadtime value preload is enabled

Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM_BDTR register).

Bit 16 **DTAE**: Deadtime asymmetric enable

0: Deadtime on rising and falling edges are identical, and defined with DTG[7:0] register

1: Deadtime on rising edge is defined with DTG[7:0] register and deadtime on falling edge is defined with DTGF[7:0] bits.

Note: This bit can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM_BDTR register).

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **DTGF[7:0]**: Dead-time falling edge generator setup

This bitfield defines the duration of the dead-time inserted between the complementary outputs, on the falling edge.

DTGF[7:5] = 0xx => DTF = DTGF[7:0]x t_{DTG} with $t_{DTG} = t_{DTS}$.

DTGF[7:5] = 10x => DTF = (64+DTGF[5:0])xt_{DTG} with $t_{DTG} = 2xt_{DTS}$.

DTGF[7:5] = 110 => DTF = (32+DTGF[4:0])xt_{DTG} with $t_{DTG} = 8xt_{DTS}$.

DTGF[7:5] = 111 => DTF = (32+DTGF[4:0])xt_{DTG} with $t_{DTG} = 16xt_{DTS}$.

Example if t_{DTS} = 125 ns (8 MHz), dead-time possible values are:

0 to 15875 ns by 125 ns steps,

16 µs to 31750 ns by 250 ns steps,

32 µs to 63 µs by 1 µs steps,

64 µs to 126 µs by 2 µs steps

Note: This bitfield can not be modified as long as LOCK level 1, 2 or 3 has been programmed (LOCK bits in TIM_BDTR register).

34.6.25 TIM timer encoder control register (TIM_ECR)

Address offset: 0x058

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	PWPRSC[2:0]			PW[7:0]							
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IPOS[1:0]		FIDX	IBLK[1:0]		IDIR[1:0]		IE
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 Reserved, must be kept at reset value.

Bits 26:24 **PWPRSC[2:0]**: Pulse width prescaler

This bitfield sets the clock prescaler for the pulse generator, as following:

$t_{PWG} = (2^{(PWPRSC[2:0])}) \times t_{tim_ker_ck}$

Bits 23:16 **PW[7:0]**: Pulse width

This bitfield defines the pulse duration, as following:

$t_{PW} = PW[7:0] \times t_{PWG}$

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:6 **IPOS[1:0]**: Index positioning

In quadrature encoder mode (SMS[4:0] = 00001, 00010, 00011, 01110, 01111), this bit indicates in which AB input configuration the Index event resets the counter.

00: Index resets the counter when AB = 00
01: Index resets the counter when AB = 01
10: Index resets the counter when AB = 10
11: Index resets the counter when AB = 11

In directional clock mode or clock plus direction mode (SMS[4:0] = 01010, 01011, 01100, 01101), these bits indicates on which level the Index event resets the counter. In bidirectional clock mode, this applies for both clock inputs.

x0: Index resets the counter when clock is 0
x1: Index resets the counter when clock is 1

Note: IPOS[1] bit is not significant

Bit 5 **FIDX**: First index

This bit indicates if the first index only is taken into account

0: Index is always active
1: the first Index only resets the counter

Bits 4:3 **IBLK[1:0]**: Index blanking

This bit indicates if the Index event is conditioned by the tim_ti3 or tim_ti4 input

00: Index always active
01: Index disabled when tim_ti3 input is active, as per CC3P bitfield
10: Index disabled when tim_ti4 input is active, as per CC4P bitfield
11: Reserved

Bits 2:1 **IDIR[1:0]**: Index direction

This bit indicates in which direction the Index event resets the counter.

00: Index resets the counter whatever the direction
01: Index resets the counter when up-counting only
10: Index resets the counter when down-counting only
11: Reserved

Bit 0 **IE**: Index enable

This bit indicates if the Index event resets the counter.

0: Index disabled
1: Index enabled

34.6.26 TIM timer input selection register (TIM_TISEL)

Address offset: 0x05C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	TI4SEL[3:0]				Res.	Res.	Res.	Res.	TI3SEL[3:0]

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	TI2SEL[3:0]				Res.	Res.	Res.	Res.	TI1SEL[3:0]			
				rw	rw	rw	rw					rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **TI4SEL[3:0]**: Selects tim_ti4[15:0] input
0000: tim_ti4_in0: TIM_CH4
0001: tim_ti4_in1
...
1111: tim_ti4_in15
Refer to *Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals* for interconnects list.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **TI3SEL[3:0]**: Selects tim_ti3[15:0] input
0000: tim_ti3_in0: TIM_CH2
0001: tim_ti3_in1
...
1111: tim_ti3_in15
Refer to *Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals* for interconnects list.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **TI2SEL[3:0]**: Selects tim_ti2[15:0] input
0000: tim_ti2_in0: TIM_CH2
0001: tim_ti2_in1
...
1111: tim_ti2_in15
Refer to *Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals* for interconnects list.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **TI1SEL[3:0]**: Selects tim_ti1[15:0] input
0000: tim_ti1_in0: TIM_CH1
0001: tim_ti1_in1
...
1111: tim_ti1_in15
Refer to *Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals* for interconnects list.

34.6.27 TIM alternate function option register 1 (TIM_AF1)

Address offset: 0x060

Reset value: 0x0000 0001

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **BKCMP20E**: tim_brk_cmp20 enable

This bit enables the tim_brk_cmp20 for the timer's tim_brk input. tim_brk_cmp20 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp20 input disabled

1: tim_brk_cmp20 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 30 **BKCMP19E**: tim_brk_cmp19 enable

This bit enables the tim_brk_cmp19 for the timer's tim_brk input. tim_brk_cmp19 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp19 input disabled

1: tim_brk_cmp19 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 29 **BKCMP18E**: tim_brk_cmp18 enable

This bit enables the tim_brk_cmp18 for the timer's tim_brk input. tim_brk_cmp18 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp18 input disabled

1: tim_brk_cmp18 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 28 **BKCMP17E**: tim_brk_cmp17 enable

This bit enables the tim_brk_cmp17 for the timer's tim_brk input. tim_brk_cmp17 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp17 input disabled

1: tim_brk_cmp17 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 27 **BKCMP16E**: tim_brk_cmp16 enable

This bit enables the tim_brk_cmp16 for the timer's tim_brk input. tim_brk_cmp16 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp16 input disabled

1: tim_brk_cmp16 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 26 **BKCMP15E**: tim_brk_cmp15 enable

This bit enables the tim_brk_cmp15 for the timer's tim_brk input. tim_brk_cmp15 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp15 input disabled

1: tim_brk_cmp15 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 25 **BKCMP14E**: tim_brk_cmp14 enable

This bit enables the tim_brk_cmp14 for the timer's tim_brk input. tim_brk_cmp14 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp14 input disabled

1: tim_brk_cmp14 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 24 **BKCMP13E**: tim_brk_cmp13 enable

This bit enables the tim_brk_cmp13 for the timer's tim_brk input. tim_brk_cmp13 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp13 input disabled

1: tim_brk_cmp13 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 23 **BKCMP12E**: tim_brk_cmp12 enable

This bit enables the tim_brk_cmp12 for the timer's tim_brk input. tim_brk_cmp12 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp12 input disabled

1: tim_brk_cmp12 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 22 **BKCMP11E**: tim_brk_cmp11 enable

This bit enables the tim_brk_cmp11 for the timer's tim_brk input. tim_brk_cmp11 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp11 input disabled

1: tim_brk_cmp11 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 21 **BKCMP10E**: tim_brk_cmp10 enable

This bit enables the tim_brk_cmp10 for the timer's tim_brk input. tim_brk_cmp10 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp10 input disabled

1: tim_brk_cmp10 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 20 **BKCMP9E**: tim_brk_cmp9 enable

This bit enables the tim_brk_cmp9 for the timer's tim_brk input. tim_brk_cmp9 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp9 input disabled

1: tim_brk_cmp9 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 19 Reserved, must be kept at reset value.

Bits 18:14 **ETRSEL[4:0]**: etr_in source selection

These bits select the etr_in input source.

00000:tim_etr0: TIM_ETR input

00001:tim_etr1

...

11111:tim_etr31

Refer to *Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals* for product specific implementation.

Note: These bits can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 13 **BKCMP4P**: tim_brk_cmp4 input polarity

This bit selects the tim_brk_cmp4 input sensitivity. It must be programmed together with the BKP polarity bit.

0: tim_brk_cmp4 input polarity is not inverted (active low if BKP = 0, active high if BKP = 1)

1: tim_brk_cmp4 input polarity is inverted (active high if BKP = 0, active low if BKP = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 12 **BKCMP3P**: tim_brk_cmp3 input polarity

This bit selects the tim_brk_cmp3 input sensitivity. It must be programmed together with the BKP polarity bit.

0: tim_brk_cmp3 input polarity is not inverted (active low if BKP = 0, active high if BKP = 1)

1: tim_brk_cmp3 input polarity is inverted (active high if BKP = 0, active low if BKP = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 11 **BKCMP2P**: tim_brk_cmp2 input polarity

This bit selects the tim_brk_cmp2 input sensitivity. It must be programmed together with the BKP polarity bit.

0: tim_brk_cmp2 input polarity is not inverted (active low if BKP = 0, active high if BKP = 1)

1: tim_brk_cmp2 input polarity is inverted (active high if BKP = 0, active low if BKP = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 10 **BKCMP1P**: tim_brk_cmp1 input polarity

This bit selects the tim_brk_cmp1 input sensitivity. It must be programmed together with the BKP polarity bit.

0: tim_brk_cmp1 input polarity is not inverted (active low if BKP = 0, active high if BKP = 1)

1: tim_brk_cmp1 input polarity is inverted (active high if BKP = 0, active low if BKP = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 9 **BKINP**: TIM_BKIN input polarity

This bit selects the TIM_BKIN alternate function input sensitivity. It must be programmed together with the BKP polarity bit.

0: TIM_BKIN input polarity is not inverted (active low if BKP = 0, active high if BKP = 1)

1: TIM_BKIN input polarity is inverted (active high if BKP = 0, active low if BKP = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 8 **BKCMP8E**: tim_brk_cmp8 enable

This bit enables the tim_brk_cmp8 for the timer's tim_brk input. tim_brk_cmp8 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp8 input disabled

1: tim_brk_cmp8 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 7 **BKCMP7E**: tim_brk_cmp7 enable

This bit enables the tim_brk_cmp7 for the timer's tim_brk input. tim_brk_cmp7 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp7 input disabled

1: tim_brk_cmp7 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 6 **BKCMP6E**: tim_brk_cmp6 enable

This bit enables the tim_brk_cmp6 for the timer's tim_brk input. tim_brk_cmp6 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp6 input disabled

1: tim_brk_cmp6 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 5 **BKCMP5E**: tim_brk_cmp5 enable

This bit enables the tim_brk_cmp5 for the timer's tim_brk input. tim_brk_cmp5 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp5 input disabled

1: tim_brk_cmp5 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 4 **BKCMP4E**: tim_brk_cmp4 enable

This bit enables the tim_brk_cmp4 for the timer's tim_brk input. tim_brk_cmp4 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp4 input disabled

1: tim_brk_cmp4 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 3 **BKCMP3E**: tim_brk_cmp3 enable

This bit enables the tim_brk_cmp3 for the timer's tim_brk input. tim_brk_cmp3 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp3 input disabled

1: tim_brk_cmp3 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 2 **BKCMP2E**: tim_brk_cmp2 enable

This bit enables the tim_brk_cmp2 for the timer's tim_brk input. tim_brk_cmp2 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp2 input disabled

1: tim_brk_cmp2 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 1 **BKCMP1E**: tim_brk_cmp1 enable

This bit enables the tim_brk_cmp1 for the timer's tim_brk input. tim_brk_cmp1 output is 'ORed' with the other tim_brk sources.

0: tim_brk_cmp1 input disabled

1: tim_brk_cmp1 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 0 **BKINE**: TIM_BKIN input enable

This bit enables the TIM_BKIN alternate function input for the timer's tim_brk input. TIM_BKIN input is 'ORed' with the other tim_brk sources.

0: TIM_BKIN input disabled

1: TIM_BKIN input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Note: Refer to Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals for product specific implementation.

34.6.28 TIM alternate function register 2 (TIM_AF2)

Address offset: 0x064

Bit 31 **BK2CMP20E**: tim_brk2_cmp20 enable

This bit enables the tim_brk2_cmp20 for the timer's tim_brk2 input. tim_brk2_cmp20 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp20 input disabled

1: tim_brk2_cmp20 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 30 **BK2CMP19E**: tim_brk2_cmp19 enable

This bit enables the tim_brk2_cmp19 for the timer's tim_brk2 input. tim_brk2_cmp19 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp19 input disabled

1: tim_brk2_cmp19 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 29 **BK2CMP18E**: tim_brk2_cmp18 enable

This bit enables the tim_brk2_cmp18 for the timer's tim_brk2 input. tim_brk2_cmp18 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp18 input disabled

1: tim_brk2_cmp18 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 28 **BK2CMP17E**: tim_brk2_cmp17 enable

This bit enables the tim_brk2_cmp17 for the timer's tim_brk2 input. tim_brk2_cmp17 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp17 input disabled

1: tim_brk2_cmp17 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 27 **BK2CMP16E**: tim_brk2_cmp16 enable

This bit enables the tim_brk2_cmp16 for the timer's tim_brk2 input. tim_brk2_cmp16 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp16 input disabled

1: tim_brk2_cmp16 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 26 **BK2CMP15E**: tim_brk2_cmp15 enable

This bit enables the tim_brk2_cmp15 for the timer's tim_brk2 input. tim_brk2_cmp15 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp15 input disabled

1: tim_brk2_cmp15 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 25 **BK2CMP14E**: tim_brk2_cmp14 enable

This bit enables the tim_brk2_cmp14 for the timer's tim_brk2 input. tim_brk2_cmp14 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp14 input disabled

1: tim_brk2_cmp14 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 24 **BK2CMP13E**: tim_brk2_cmp13 enable

This bit enables the tim_brk2_cmp13 for the timer's tim_brk2 input. tim_brk2_cmp13 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp13 input disabled

1: tim_brk2_cmp13 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 23 **BK2CMP12E**: tim_brk2_cmp12 enable

This bit enables the tim_brk2_cmp12 for the timer's tim_brk2 input. tim_brk2_cmp12 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp12 input disabled

1: tim_brk2_cmp12 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 22 **BK2CMP11E**: tim_brk2_cmp11 enable

This bit enables the tim_brk2_cmp11 for the timer's tim_brk2 input. tim_brk2_cmp11 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp11 input disabled

1: tim_brk2_cmp11 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 21 **BK2CMP10E**: tim_brk2_cmp10 enable

This bit enables the tim_brk2_cmp10 for the timer's tim_brk2 input. tim_brk2_cmp10 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp10 input disabled

1: tim_brk2_cmp10 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 20 **BK2CMP9E**: tim_brk2_cmp9 enable

This bit enables the tim_brk2_cmp9 for the timer's tim_brk2 input. tim_brk2_cmp9 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp9 input disabled

1: tim_brk2_cmp9 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bits 19:16 **OCRSEL[3:0]**: ocref_clr source selection

These bits select the ocref_clr input source.

0000:tim_ocref_clr0

0001:tim_ocref_clr1

...

1111: tim_ocref_clr15

Refer to *Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals* for product specific information.

Note: These bits can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bits 15:14 Reserved, must be kept at reset value.

Bit 13 **BK2CMP4P**: tim_brk2_cmp4 input polarity

This bit selects the tim_brk2_cmp4 input sensitivity. It must be programmed together with the BK2P polarity bit.

0: tim_brk2_cmp4 input polarity is not inverted (active low if BK2P = 0, active high if BK2P = 1)

1: tim_brk2_cmp4 input polarity is inverted (active high if BK2P = 0, active low if BK2P = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 12 **BK2CMP3P**: tim_brk2_cmp3 input polarity

This bit selects the tim_brk2_cmp3 input sensitivity. It must be programmed together with the BK2P polarity bit.

0: tim_brk2_cmp3 input polarity is not inverted (active low if BK2P = 0, active high if BK2P = 1)

1: tim_brk2_cmp3 input polarity is inverted (active high if BK2P = 0, active low if BK2P = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 11 **BK2CMP2P**: tim_brk2_cmp2 input polarity

This bit selects the tim_brk2_cmp2 input sensitivity. It must be programmed together with the BK2P polarity bit.

0: tim_brk2_cmp2 input polarity is not inverted (active low if BK2P = 0, active high if BK2P = 1)

1: tim_brk2_cmp2 input polarity is inverted (active high if BK2P = 0, active low if BK2P = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 10 **BK2CMP1P**: tim_brk2_cmp1 input polarity

This bit selects the tim_brk2_cmp1 input sensitivity. It must be programmed together with the BK2P polarity bit.

0: tim_brk2_cmp1 input polarity is not inverted (active low if BK2P = 0, active high if BK2P = 1)

1: tim_brk2_cmp1 input polarity is inverted (active high if BK2P = 0, active low if BK2P = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 9 **BK2INP**: TIM_BKIN2 input polarity

This bit selects the TIM_BKIN2 alternate function input sensitivity. It must be programmed together with the BK2P polarity bit.

0: TIM_BKIN2 input polarity is not inverted (active low if BK2P = 0, active high if BK2P = 1)

1: TIM_BKIN2 input polarity is inverted (active high if BK2P = 0, active low if BK2P = 1)

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 8 **BK2CMP8E**: tim_brk2_cmp8 enable

This bit enables the tim_brk2_cmp8 for the timer's tim_brk2 input. tim_brk2_cmp8 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp8 input disabled

1: tim_brk2_cmp8 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 7 **BK2CMP7E**: tim_brk2_cmp7 enable

This bit enables the tim_brk2_cmp7 for the timer's tim_brk2 input. tim_brk2_cmp7 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp7 input disabled

1: tim_brk2_cmp7 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 6 **BK2CMP6E**: tim_brk2_cmp6 enable

This bit enables the tim_brk2_cmp6 for the timer's tim_brk2 input. tim_brk2_cmp6 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp6 input disabled

1: tim_brk2_cmp6 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 5 **BK2CMP5E**: tim_brk2_cmp5 enable

This bit enables the tim_brk2_cmp5 for the timer's tim_brk2 input. tim_brk2_cmp5 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp5 input disabled

1: tim_brk2_cmp5 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 4 **BK2CMP4E**: tim_brk2_cmp4 enable

This bit enables the tim_brk2_cmp4 for the timer's tim_brk2 input. tim_brk2_cmp4 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp4 input disabled

1: tim_brk2_cmp4 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 3 **BK2CMP3E**: tim_brk2_cmp3 enable

This bit enables the tim_brk2_cmp3 for the timer's tim_brk2 input. tim_brk2_cmp3 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp3 input disabled

1: tim_brk2_cmp3 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 2 **BK2CMP2E**: tim_brk2_cmp2 enable

This bit enables the tim_brk2_cmp2 for the timer's tim_brk2 input. tim_brk2_cmp2 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp2 input disabled

1: tim_brk2_cmp2 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 1 **BK2CMP1E**: tim_brk2_cmp1 enable

This bit enables the tim_brk2_cmp1 for the timer's tim_brk2 input. tim_brk2_cmp1 output is 'ORed' with the other tim_brk2 sources.

0: tim_brk2_cmp1 input disabled

1: tim_brk2_cmp1 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 0 **BK2INE**: TIM_BKIN2 input enable

This bit enables the TIM_BKIN2 alternate function input for the timer's tim_brk2 input. TIM_BKIN2 input is 'ORed' with the other tim_brk2 sources.

0: TIM_BKIN2 input disabled

1: TIM_BKIN2 input enabled

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Note: Refer to Section 34.3.2: TIM1/TIM8/TIM20 pins and internal signals for product specific implementation.

34.6.29 TIM capture/compare register 7 (TIM_CCR7)

Address offset: 0x070

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCR7[19:16]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR7[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR7[19:0]**: Capture/compare 7 value

CCR7 is the value to be loaded in the actual compare 7 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIM_CCMR4 register (bit OC7PE). Else the preload value is copied in the active compare 7 register when an update event occurs.

The active compare register contains the value to be compared to the counter TIM_CNT and signaled on tim_oc7 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value in CCR7[15:0]. The CCR7[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR7[19:4]. The CCR7[3:0] bitfield contains the dithered part.

34.6.30 TIM capture/compare mode register 4 (TIM_CCMR4)

Address offset: 0x078

Reset value: 0x0000 0000

Refer to the above CCMR1 register description. Channel 7 can only be configured in output.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OC7M[4:3]	
														rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

								rw	rw	rw	rw	rw	rw		

Bits 31:18 Reserved, must be kept at reset value.

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **OC7CE:** Output compare 7 clear enable

0: tim_oc7ref is not affected by the tim_ocref_clr_int signal

1: tim_oc7ref is cleared as soon as a High level is detected on tim_ocref_clr_int signal (tim_ocref_clr input or tim_etrf input)

Note: This mode is not available for all PWM modes. Refer to Section 34.3.23: Clearing the tim_ocxref signal on an external event for the list of forbidden configurations.

Bits 17:16, 6:4 **OC7M[4:0]**: Output compare 7 mode

These bits define the behavior of the output reference signal tim_ocref7. tim_oc7ref is active high whereas tim_oc7 active level depends on CC7P bit.

00000:Frozen - The comparison between the output compare register TIM_CCR7 and the counter TIM_CNT has no effect on the outputs.(this mode is used to generate a timing base).

00001:Set channel 7 to active level on match. tim_oc7ref signal is forced high when the counter TIM_CNT matches the capture/compare register 7 (TIM_CCR7).

00010:Set channel 7 to inactive level on match. tim_oc7ref signal is forced low when the counter TIM_CNT matches the capture/compare register 7 (TIM_CCR7).

00011:Toggle - tim_oc7ref toggles when TIM_CNT = TIM_CCR7.

00100:Force inactive level - tim_oc7ref is forced low.

00101:Force active level - tim_oc7ref is forced high.

00110:PWM mode 1 - In upcounting, channel 7 is active as long as TIM_CNT<TIM_CCR7 else inactive. In downcounting, channel 7 is inactive (tim_oc7ref = 0) as long as TIM_CNT>TIM_CCR7 else active (tim_oc5ref = 1).

00111:PWM mode 2 - In upcounting, channel 7 is inactive as long as TIM_CNT<TIM_CCR7 else active. In downcounting, channel 7 is active as long as TIM_CNT>TIM_CCR7 else inactive.

01000:Retrigerrable OPM mode 1 - In up-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update. In down-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update.

01001:Retrigerrable OPM mode 2 - In up-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update. In down-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

Others: Reserved

Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIM_BDTR register) and CC1S = 00 (the channel is configured in output).

Note: In PWM mode, the OCREF level changes only when the result of the comparison changes or when the output compare mode switches from “frozen” mode to “PWM” mode.

Bit 3 **OC7PE**: Output compare 7 preload enable

0: Preload register on TIM_CCR7 disabled. TIM_CCR7 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIM_CCR7 enabled. Read/Write operations access the preload register. TIM_CCR7 preload value is loaded in the active register at each update event.

These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIM_BDTR register) and CC1S = 00 (the channel is configured in output).

Bit 2 **OC7FE**: Output compare 7 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIM_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

0: CC7 behaves normally depending on counter and CCR7 values even when the trigger is ON. The minimum delay to activate CC7 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC7 output. Then, OC is set to the compare level independently from the result of the comparison. Delay to sample the trigger input and to activate CC7 output is reduced to 3 clock cycles. OCFE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 Reserved, must be kept at reset value.

34.6.31 TIM multilevel protection register 1 (TIM_MPR1)

Address offset: 0x090

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:14 **BK4NM[1:0]**: Break mode for tim_oc4n output
This bit must be modified only when CEN=0 in TIM_CR1.
00: Immediate break
01: Delayed 1 break
10: Delayed 2 break
11: Reserved
Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bits 13:12 **BK4M[1:0]**: Break mode for tim_oc4 output
This bit must be modified only when CEN=0 in TIM_CR1.
00: Immediate break
01: Delayed 1 break
10: Delayed 2 break
11: Reserved
Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bits 11:10 **BK3NM[1:0]**: Break mode for tim_oc3n output
This bit must be modified only when CEN=0 in TIM_CR1.
00: Immediate break
01: Delayed 1 break
10: Delayed 2 break
11: Reserved
Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bits 9:8 **BK3M[1:0]**: Break mode for tim_oc3 output
This bit must be modified only when CEN=0 in TIM_CR1.
00: Immediate break
01: Delayed 1 break
10: Delayed 2 break
11: Reserved
Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bits 7:6 **BK2NM[1:0]**: Break mode for tim_oc2n output
This bit must be modified only when CEN=0 in TIM_CR1.
00: Immediate break
01: Delayed 1 break
10: Delayed 2 break
11: Reserved
Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bits 5:4 **BK2M[1:0]**: Break mode for tim_oc2 output
This bit must be modified only when CEN=0 in TIM_CR1.
00: Immediate break
01: Delayed 1 break
10: Delayed 2 break
11: Reserved
Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bits 3:2 **BK1NM[1:0]**: Break mode for tim_oc1n output
This bit must be modified only when CEN=0 in TIM_CR1.
00: Immediate break
01: Delayed 1 break
10: Delayed 2 break
11: Reserved
Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bits 1:0 **BK1M[1:0]**: Break mode for tim_oc1 output
This bit must be modified only when CEN=0 in TIM_CR1.
00: Immediate break
01: Delayed 1 break
10: Delayed 2 break
11: Reserved
Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

34.6.32 TIM multilevel protection register 2 (TIM_MPR2)

Address offset: 0x094

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBK2[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBK1[7:0]							
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:24 Reserved, must be kept at reset value.

Bits 23:16 **DBK2[7:0]**: Delayed 2 Break duration

This bitfield defines the duration of the delay in Delayed 2 Break mode.

It is partially preloaded and can be updated during timer operation (new value taken into account after an update event), at the exception of the bits coding for t_{DTG} selection, which are not preloaded.

It is thus recommended to update only the least significant bits to have the expected duration value:

- DBK2[6:0] if DBK2[7] = 0
- DBK2[5:0] if DBK2[7:6] = 10
- DBK2[4:0] if DBK2[7:5] = 110 or 111

DBK2[7:5]=0xx => Delay2=DBK2[7:0]xt_{DTG} with $t_{DTG}=t_{DTS}$.
DBK2[7:5]=10x => Delay2=(64+DBK2[5:0])xt_{DTG} with $t_{DTG}=2xt_{DTS}$.
DBK2[7:5]=110 => Delay2=(32+DBK2[4:0])xt_{DTG} with $t_{DTG}=8xt_{DTS}$.
DBK2[7:5]=111 => Delay2=(32+DBK2[4:0])xt_{DTG} with $t_{DTG}=16xt_{DTS}$.

Note: Due to internal resynchronization of the break event on tim_ker_ck, the effective delayed break time is the programmed Delay2 plus up to two additional timer clock cycles.

Note: This bit can not be modified as long as LOCK level 2 or 3 has been programmed (LOCK bits in TIM_BDTR register).

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:0 **DBK1[7:0]**: Delayed 1 Break duration

This bitfield defines the duration of the delay in Delayed 1 Break mode.

It is partially preloaded and can be updated during timer operation (new value taken into account after an update event), at the exception of the bits coding for t_{DTG} selection, which are not preloaded.

It is thus recommended to update only the least significant bits to have the expected duration value:

- DBK1[6:0] if DBK1[7] = 0
- DBK1[5:0] if DBK1[7:6] = 10
- DBK1[4:0] if DBK1[7:5] = 110 or 111

DBK1[7:5]=0xx => Delay1=DBK1[7:0]xt_{DTG} with $t_{DTG}=t_{DTS}$.
DBK1[7:5]=10x => Delay1=(64+DBK1[5:0])xt_{DTG} with $t_{DTG}=2xt_{DTS}$.
DBK1[7:5]=110 => Delay1=(32+DBK1[4:0])xt_{DTG} with $t_{DTG}=8xt_{DTS}$.
DBK1[7:5]=111 => Delay1=(32+DBK1[4:0])xt_{DTG} with $t_{DTG}=16xt_{DTS}$.

Note: Due to internal resynchronization of the break event on tim_ker_ck, the effective delayed break time is the programmed Delay1 plus up to two additional timer clock cycles.

Note: This bit can not be modified as long as LOCK level 2 or 3 has been programmed (LOCK bits in TIM_BDTR register).

34.6.33 TIM output override register (TIM_OOR)

Address offset: 0x0A0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	OOC	Res.	Res.	Res.	Res.	OOS4N	OOS4	OOS3N	OOS3	OOS2N	OOS2	OOS1N	OOS1
			rw					rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:13 Reserved, must be kept at reset value.

Bit 12 **OOC**: Output override control

This bit forces the idle state of the tim_ocx and tim_ocxn outputs to the values defined with OOSx and OOSxN bits.

0: tim_ocx and tim_ocxn outputs are in the default idle state

1: tim_ocx and tim_ocxn outputs are forced in an idle state defined with OOSx/OOSxN bits

Note: This bit can only be modified when the outputs are in idle state (MOE = 0). It is cleared when the MOE bit is set.

Bits 11:8 Reserved, must be kept at reset value.

Bit 7 **OOS4N**: Output override state for output tim_oc4n

This bit defines the state for output tim_oc4n when OOC = 1

0: tim_oc4n = 0

1: tim_oc4n = 1

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 6 **OOS4**: Output override state for output tim_oc4

This bit defines the state for output tim_oc4 when OOC = 1

0: tim_oc4 = 0

1: tim_oc4 = 1

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 5 **OOS3N**: Output override state for output tim_oc3n

This bit defines the state for output tim_oc3n when OOC = 1

0: tim_oc3n = 0

1: tim_oc3n = 1

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 4 **OOS3**: Output override state for output tim_oc3

This bit defines the state for output tim_oc3 when OOC = 1

0: tim_oc3 = 0

1: tim_oc3 = 1

Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 3 **OOS2N**: Output override state for output tim_oc2n
This bit defines the state for output tim_oc2n when OOC = 1
0: tim_oc2n = 0
1: tim_oc2n = 1
Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 2 **OOS2**: Output override state for output tim_oc2
This bit defines the state for output tim_oc2 when OOC = 1
0: tim_oc2 = 0
1: tim_oc2 = 1
Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 1 **OOS1N**: Output override state for output tim_oc1n
This bit defines the state for output tim_oc1n when OOC = 1
0: tim_oc1n = 0
1: tim_oc1n = 1
Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

Bit 0 **OOS1**: Output override state for output tim_oc1
This bit defines the state for output tim_oc1 when OOC = 1
0: tim_oc1 = 0
1: tim_oc1 = 1
Note: This bit can not be modified as long as LOCK level 1 has been programmed (LOCK bits in TIM_BDTR register).

34.6.34 TIM DMA control register (TIM_DCR)

Address offset: 0x3DC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBSS[3:0]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DBL[4:0]					Res.	Res.	Res.	DBA[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **DBSS[3:0]**: DMA burst source selection

This bitfield defines the interrupt source that triggers the DMA burst transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIM_DMAR address).

0000: Disabled
0001: Update
0010: CC1
0011: CC2
0100: CC3
0101: CC4
0110: COM
0111: Trigger
Others: reserved

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **DBL[4:0]**: DMA burst length

This 5-bit vector defines the length of DMA transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIM_DMAR address), i.e. the number of transfers.

00000: 1 transfer
00001: 2 transfers
00010: 3 transfers
...
11111: 32 transfers

Example: Let us consider the following transfer: DBL = 6 & DBA = TIM2_CR1.

–If DBL = 6 and DBA = TIM2_CR1 represents the address of the byte to be transferred, the address of the transfer is given by the following equation:

(TIM_CR1 address) + DBA + (DMA index), where DMA index = DBL

In this example, 7 bytes are added to (TIM_CR1 address) + DBA, which gives us the address from/to which the data are copied. In this case, the transfer is done to 7 registers starting from the following address: (TIM_CR1 address) + DBA

According to the configuration of the DMA Data Size, several cases may occur:

–If the DMA Data Size is configured in half-words, 16-bit data are transferred to each of the 7 registers.

–If the DMA Data Size is configured in bytes, the data are also transferred to 7 registers: the first register contains the first MSB byte, the second register, the first LSB byte and so on. So with the transfer Timer, one also has to specify the size of data transferred by DMA.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **DBA[4:0]**: DMA base address

This 5-bits vector defines the base-address for DMA transfers (when read/write access are done through the TIM_DMAR address). DBA is defined as an offset starting from the address of the TIM_CR1 register.

Example:

00000: TIM_CR1
00001: TIM_CR2
00010: TIM_SMCR
...

34.6.35 TIM DMA address for full transfer (TIM_DMAR)

Address offset: 0x3E0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DMAB[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DMAB[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DMAB[31:0]**: DMA register for burst accesses

A read or write operation to the DMAR register accesses the register located at the address (TIM_CR1 address) + (DBA + DMA index) x 4

where TIM_CR1 address is the address of the control register 1, DBA is the DMA base address configured in TIM_DCR register, DMA index is automatically controlled by the DMA transfer, and ranges from 0 to DBL (DBL configured in TIM_DCR).

34.6.36 TIM1/TIM8/TIM20 register map

TIM1/TIM8/TIM20 registers are mapped as 16-bit addressable registers as described in the table below:

Table 391. TIM1/TIM8/TIM20 register map and reset values

Offset	Register	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

35 General-purpose timers (TIM2/TIM3/TIM4/TIM5)

35.1 TIM2/TIM3/TIM4/TIM5 introduction

The general-purpose timers consist of a 16-bit or 32-bit autoreload counter driven by a programmable prescaler.

They can be used for a variety of purposes, including measuring the pulse lengths of input signals (*input capture*) or generating output waveforms (*output compare and PWM*).

Pulse lengths and waveform periods can be modulated from a few microseconds to several milliseconds using the timer prescaler and the RCC clock controller prescalers.

The timers are completely independent, and do not share any resources. They can be synchronized together as described in *Section 35.4.27: Timer synchronization*.

35.2 TIM2/TIM3/TIM4/TIM5 main features

General-purpose TIMx timer features include:

- 16-bit or 32-bit up, down, up/down autoreload counter.
- 16-bit programmable prescaler used to divide (also “on the fly”) the counter clock frequency by any factor between 1 and 65535.
- Up to four independent channels for:
  - Input capture.
  - Output compare.
  - PWM generation (edge- and center-aligned modes).
  - One-pulse mode output.
- Synchronization circuit to control the timer with external signals and to interconnect several timers.
- Interrupt/DMA generation on the following events:
  - Update: counter overflow/underflow, counter initialization (by software or internal/external trigger).
  - Trigger event (counter start, stop, initialization, or count by internal/external trigger).
  - Input capture.
  - Output compare.
- Supports incremental (quadrature) encoder and hall-sensor circuitry for positioning purposes.
- Trigger input for external clock or cycle-by-cycle current management.
- ADC synchronization for jitter-free sampling points.

35.3 TIM2/TIM3/TIM4/TIM5 implementation

35.4 TIM2/TIM3/TIM4/TIM5 functional description

35.4.1 Block diagram

Figure 621. General-purpose timer block diagram

1. This feature is not available on all timers, refer to *Section 35.3: TIM2/TIM3/TIM4/TIM5 implementation*.

35.4.2 TIM2/TIM3/TIM4/TIM5 pins and internal signals

Table 393 and *Table 394* in this section summarize the TIM inputs and outputs.

Table 393. TIM input/output pins

Pin name	Signal type	Description
TIM_CH1 TIM_CH2 TIM_CH3 TIM_CH4	Input/output	Timer multi-purpose channels. Each channel be used for capture, compare, or PWM. TIM_CH1 and TIM_CH2 can also be used as external clock (below 1/4 of the tim_ker_ck clock) , external trigger and quadrature encoder inputs. TIM_CH1, TIM_CH2 and TIM_CH3 can be used to interface with digital hall effect sensors.
TIM_ETR	Input	External trigger input. This input can be used as external trigger or as external clock source. This input can receive a clock with a frequency higher than the tim_ker_ck if the tim_etr_in prescaler is used.

Table 394. TIM internal input/output signals

Internal signal name	Signal type	Description
tim_ti1_in[15:0] tim_ti2_in[15:0] tim_ti3_in[15:0] tim_ti4_in[15:0]	Input	Internal timer inputs bus. The tim_ti1_in[15:0] and tim_ti2_in[15:0] inputs can be used for capture or as external clock (below 1/4 of the tim_ker_ck clock) and for quadrature encoder signals.
tim_etr[31:0]	Input	External trigger internal input bus. These inputs can be used as trigger, external clock or for hardware cycle-by-cycle pulse width control. These inputs can receive clock with a frequency higher than the tim_ker_ck if the tim_etr_in prescaler is used.
tim_itr[27:0]	Input	Internal trigger input bus. These inputs can be used for the slave mode controller or as a input clock (below 1/4 of the tim_ker_ck clock).
tim_trgo	Output	Internal trigger output. This trigger can trigger other on-chip peripherals.
tim_ocref_clr[15:0]	Input	Timer tim_ocref_clr input bus. These inputs can be used to clear the tim_ocxref signals, typically for hardware cycle-by-cycle pulse width control.
tim_pclk	Input	Timer APB clock.
tim_ker_ck	Input	Timer kernel clock

Table 394. TIM internal input/output signals (continued)

Internal signal name	Signal type	Description
tim_it	Output	Global Timer interrupt, gathering capture/compare, update and break trigger requests.
tim_cc1_dma tim_cc2_dma tim_cc3_dma tim_cc4_dma	Output	Timer capture/compare [4:1] dma requests.
tim_upd_dma	Output	Timer update dma request.
tim_trgi_dma	Output	Timer trigger dma request.
tim_ocx (x = 1 to 4)	Output	Internal output compare signals of channels 1 to 4. these outputs can be used for triggering/synchronizing other internal peripherals.

Tables below list the sources connected to the tim_ti[4:1] input multiplexers.

35.4.3 Time-base unit

The main block of the programmable timer is a 16-bit/32-bit counter with its related autoreload register. The counter can count up, down or both up and down. The counter clock can be divided by a prescaler.

The counter, the autoreload register and the prescaler register can be written or read by software. This is true even when the counter is running.

The time-base unit includes:

- Counter register (TIM_CNT)
- Prescaler register (TIM_PSC)
- Autoreload register (TIM_ARR)

The autoreload register is preloaded. Writing to or reading from the autoreload register accesses the preload register. The content of the preload register is transferred into the shadow register permanently or at each update event (UEV), depending on the autoreload preload enable bit (ARPE) in TIM_CR1 register. The update event is sent when the counter reaches the overflow (or underflow when down-counting) and if the UDIS bit equals 0 in the TIM_CR1 register. It can also be generated by software. The generation of the update event is described in detail for each configuration.

Note: An update overrun status bit (UIOVRF in TIM_SR register) indicates that an update request occurred while an update interrupt is pending (update interrupt flag set). This bit is useful when debugging closed loop applications, to indicate that:

- the update interrupt service routine is too long with respect to the interval between consecutive update events

- the update interrupt service routine was served too late with respect to the subsequent update event

The counter is clocked by the prescaler output tim_cnt_ck, which is enabled only when the counter enable bit (CEN) in TIM_CR1 register is set (refer also to the slave mode controller description to get more details on counter enabling).

Note: The counter starts counting 1 clock cycle after setting the CEN bit in the TIM_CR1 register.

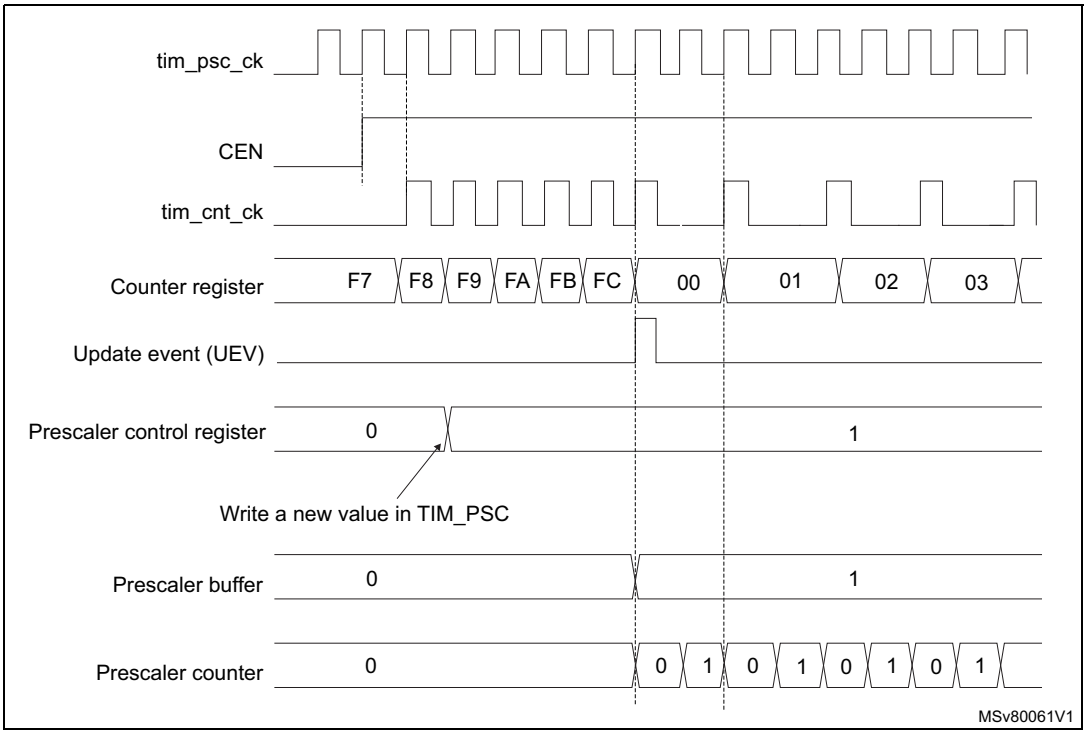
Prescaler description

The prescaler can divide the counter clock frequency by any factor between 1 and 65536. It is based on a 16-bit counter controlled through a 16-bit/32-bit register (in the TIM_PSC

register). It can be changed on the fly as this control register is buffered. The new prescaler ratio is taken into account at the next update event.

Figure 622 and *Figure 623* give some examples of the counter behavior when the prescaler ratio is changed on the fly:

Figure 622. Counter timing diagram with prescaler division change from 1 to 2



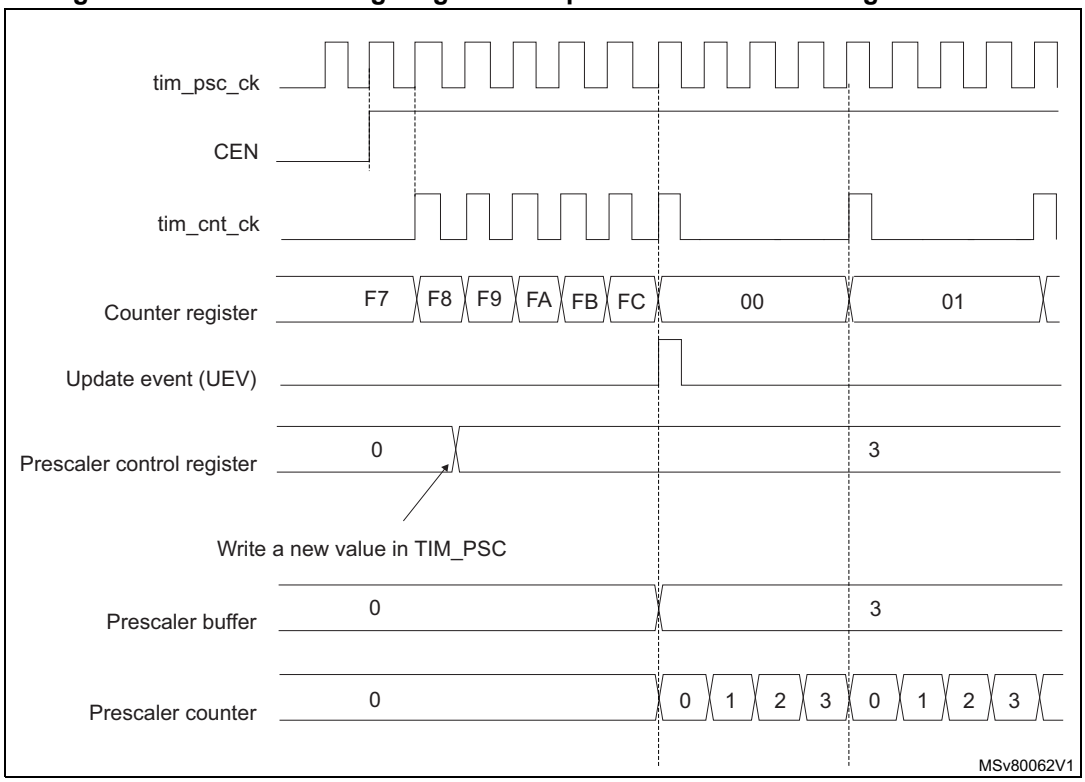


Figure 623. Counter timing diagram with prescaler division change from 1 to 4

35.4.4 Counter modes

Up-counting mode

In up-counting mode, the counter counts from 0 to the autoreload value (content of the TIM_ARR register), then restarts from 0 and generates a counter overflow event.

An update event can be generated at each counter overflow or by setting the UG bit in the TIM_EGR register (by software or by using the slave mode controller).

The UEV event can be disabled by software by setting the UDIS bit in TIM_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter restarts from 0, as well as the counter of the prescaler (but the prescale rate does not change). In addition, if the URS bit (update request selection) in TIM_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIM_SR register) is set (depending on the URS bit):

- The buffer of the prescaler is reloaded with the preload value (content of the TIM_PSC register).
- The autoreload shadow register is updated with the preload value (TIM_ARR).

The following figures show some examples of the counter behavior for different clock frequencies when TIM_ARR = 0x36.

Figure 624. Counter timing diagram, internal clock divided by 1

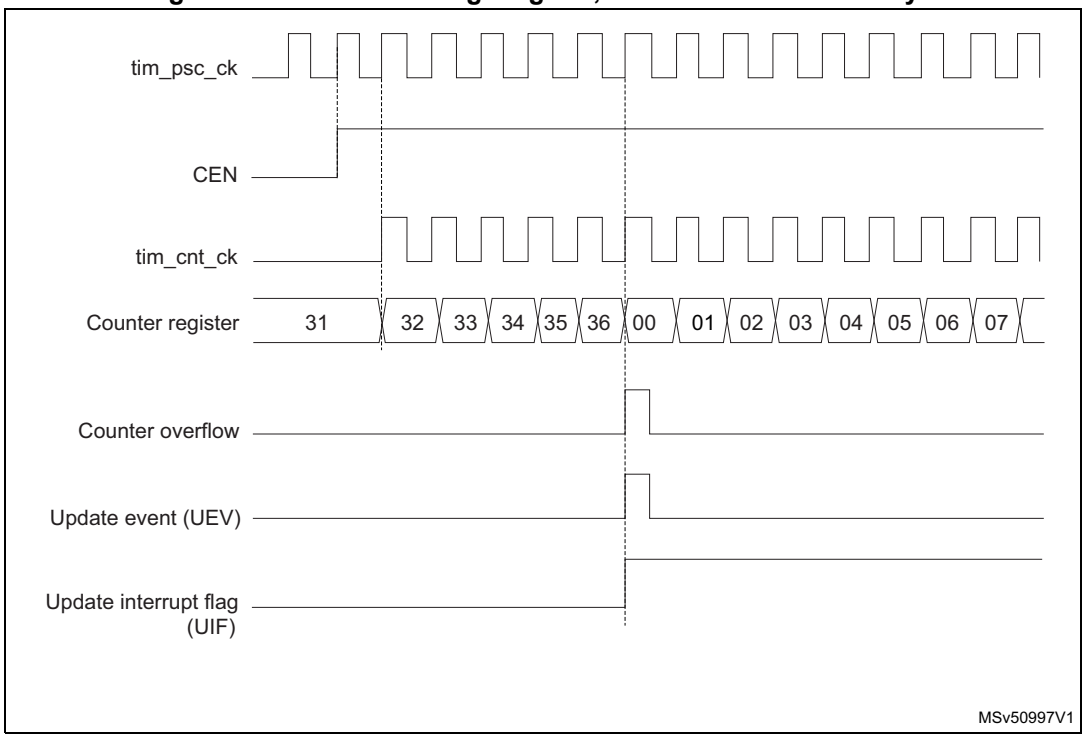

Figure 625. Counter timing diagram, internal clock divided by 2

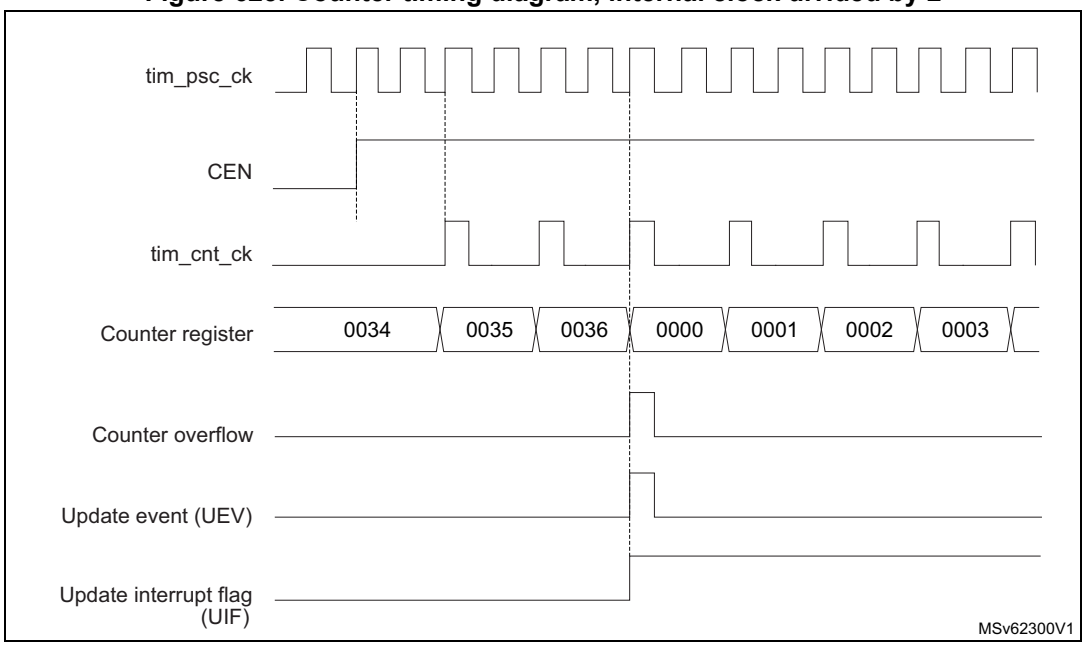

Figure 626. Counter timing diagram, internal clock divided by 4

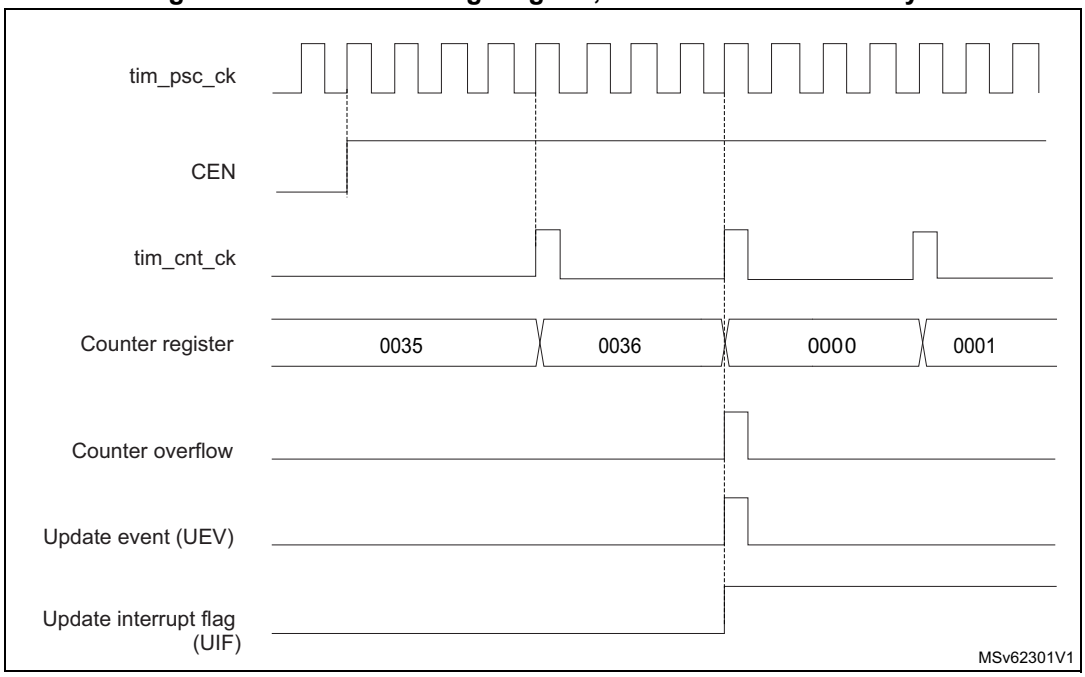

Figure 627. Counter timing diagram, internal clock divided by N

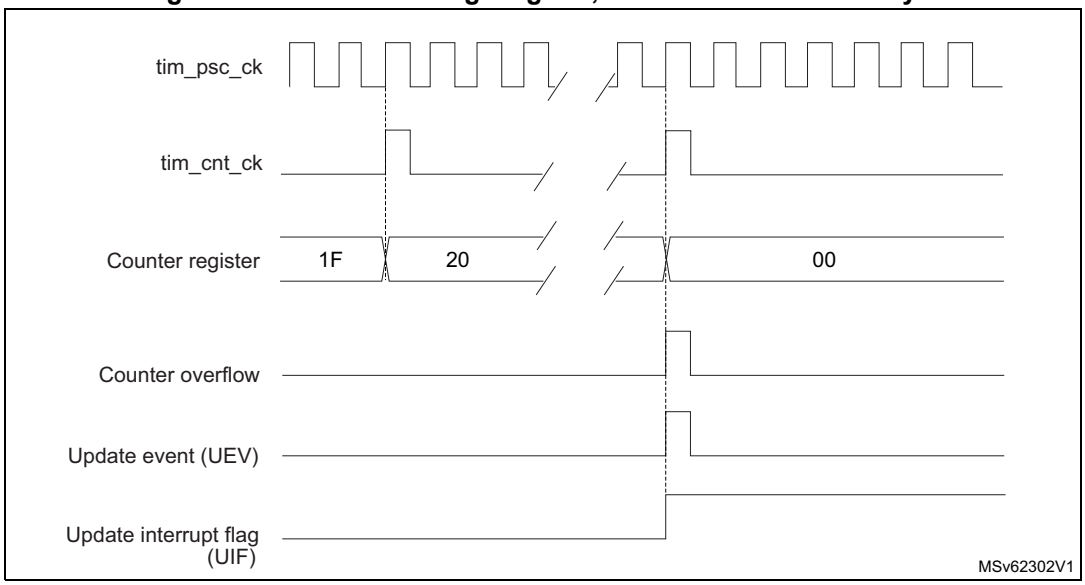

Figure 628. Counter timing diagram, Update event when ARPE = 0 (TIM_ARR not preloaded)

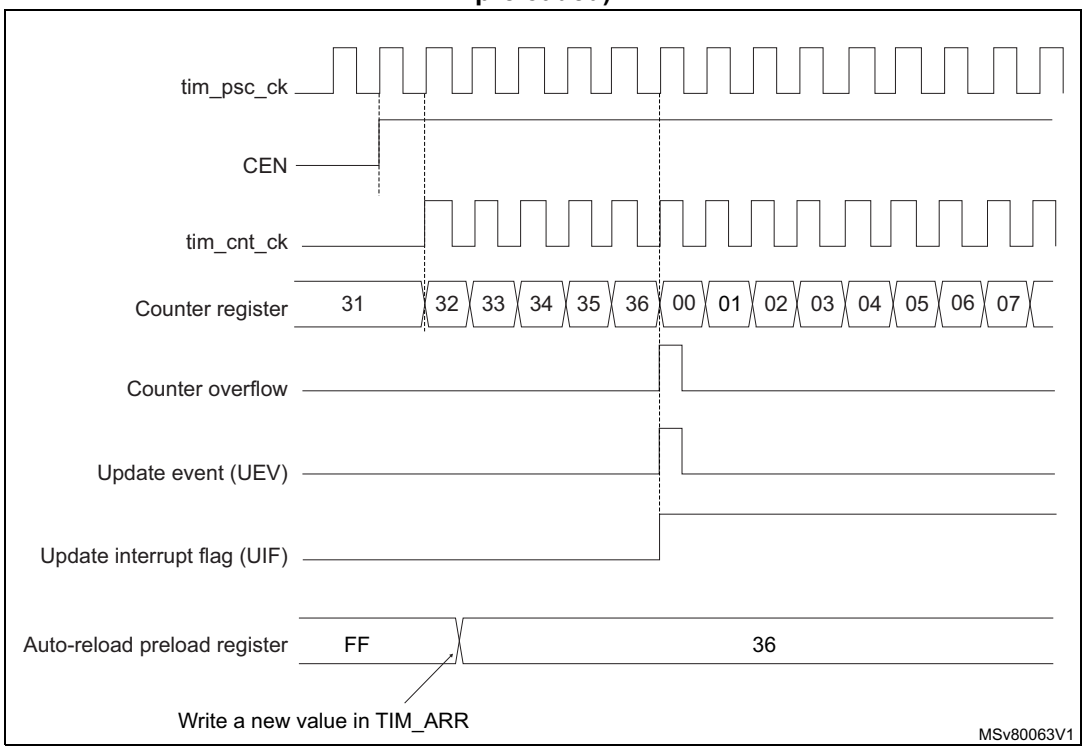

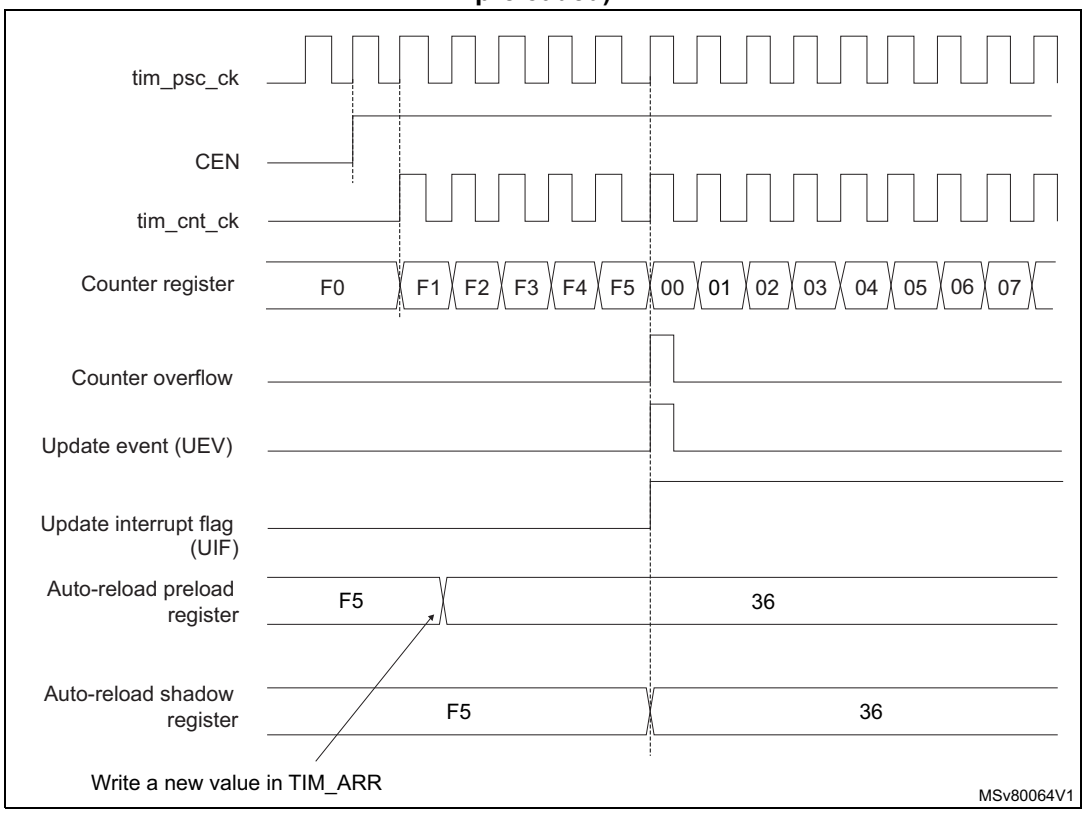

Figure 629. Counter timing diagram, Update event when ARPE = 1 (TIM_ARR preloaded)

Down-counting mode

In down-counting mode, the counter counts from the autoreload value (content of the TIM_ARR register) down to 0, then restarts from the autoreload value and generates a counter underflow event.

An update event can be generated at each counter underflow or by setting the UG bit in the TIM_EGR register (by software or by using the slave mode controller)

The UEV update event can be disabled by software by setting the UDIS bit in TIM_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until UDIS bit has been written to 0. However, the counter restarts from the current autoreload value, whereas the counter of the prescaler restarts from 0 (but the prescale rate does not change).

In addition, if the URS bit (update request selection) in TIM_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIM_SR register) is set (depending on the URS bit):

- The buffer of the prescaler is reloaded with the preload value (content of the TIM_PSC register).
- The autoreload active register is updated with the preload value (content of the TIM_ARR register). Note that the autoreload is updated before the counter is reloaded, so that the next period is the expected one.

The following figures show some examples of the counter behavior for different clock frequencies when TIM_ARR = 0x36.

Figure 630. Counter timing diagram, internal clock divided by 1

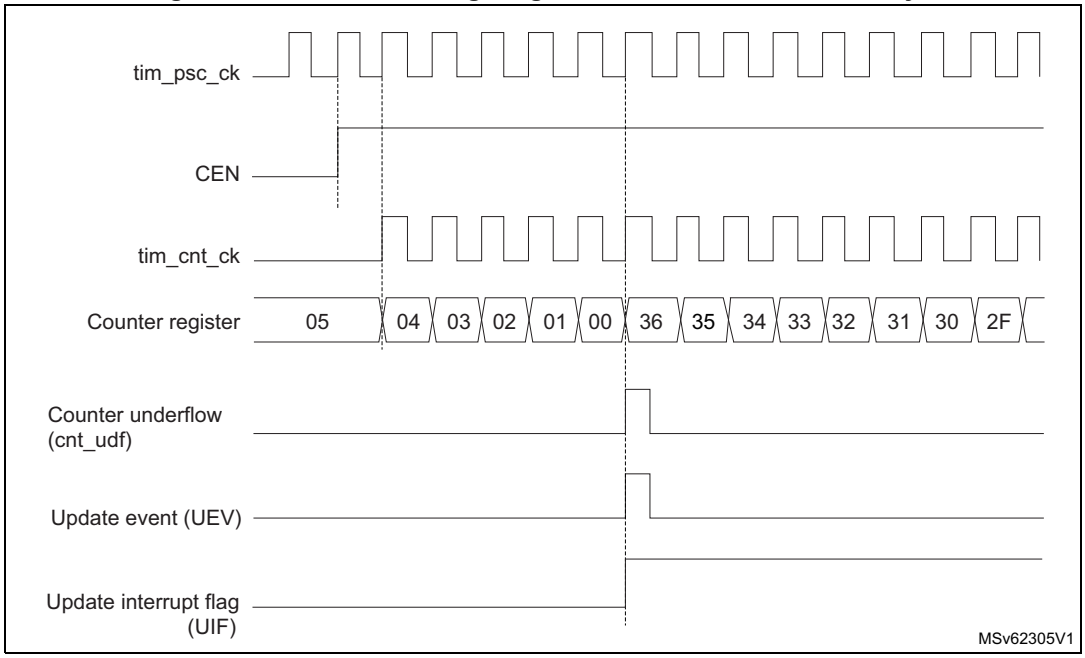

Figure 631. Counter timing diagram, internal clock divided by 2

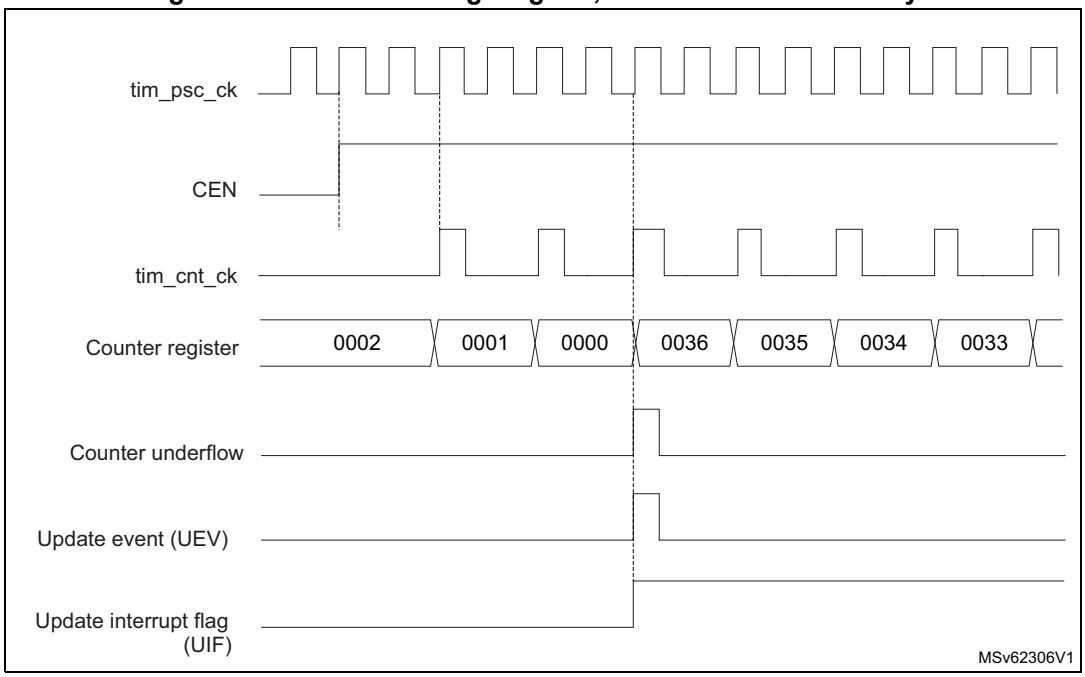

Figure 632. Counter timing diagram, internal clock divided by 4

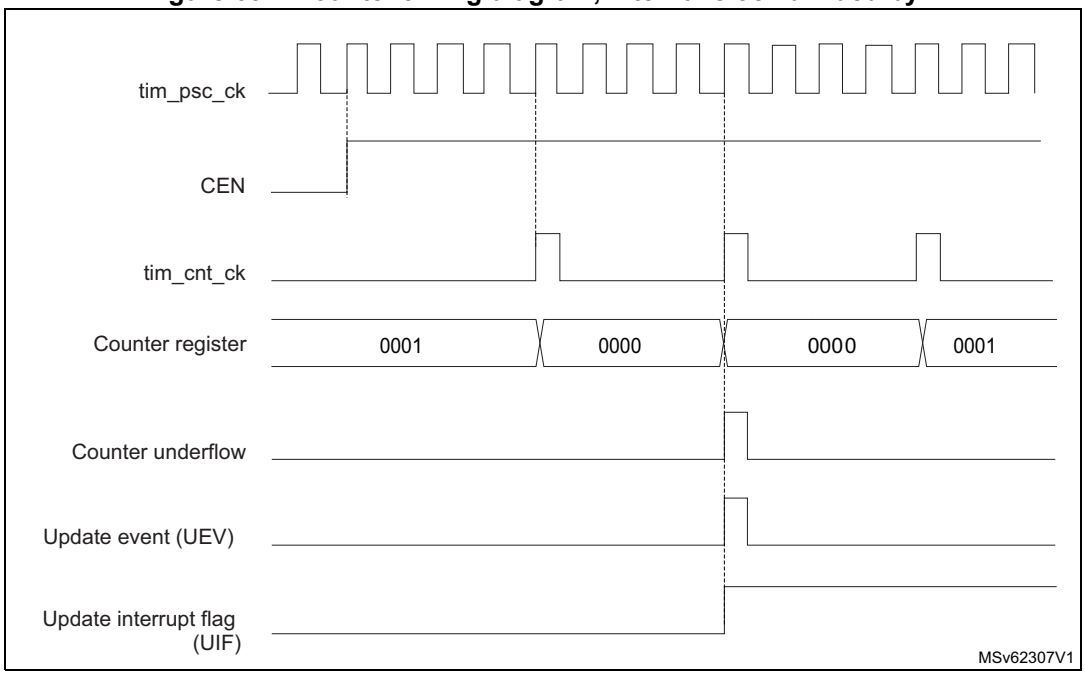

Figure 633. Counter timing diagram, internal clock divided by N

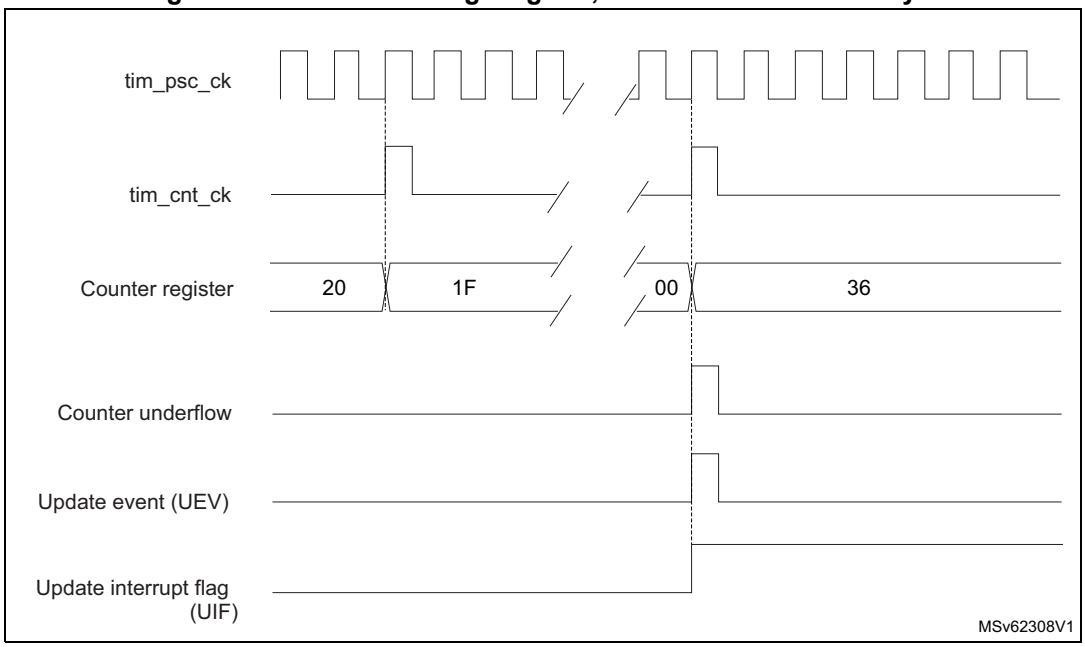

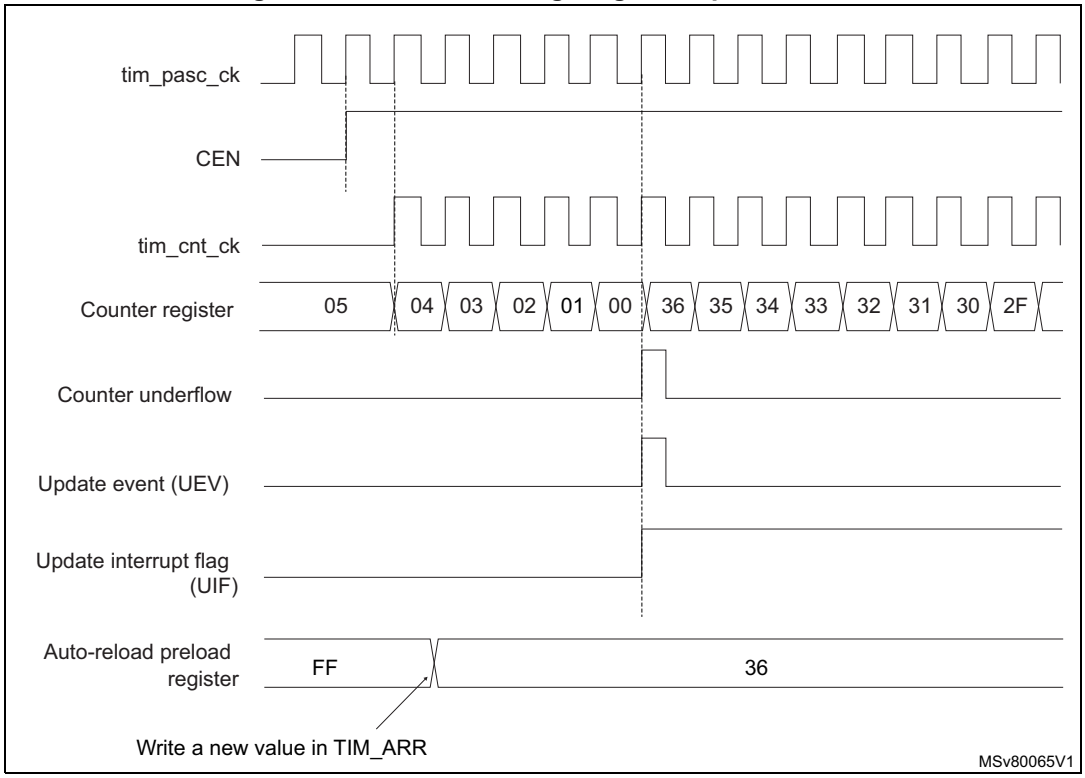

Figure 634. Counter timing diagram, Update event

Center-aligned mode (up/down-counting)

In center-aligned mode, the counter counts from 0 to the autoreload value (content of the TIM_ARR register) – 1, generates a counter overflow event, then counts from the

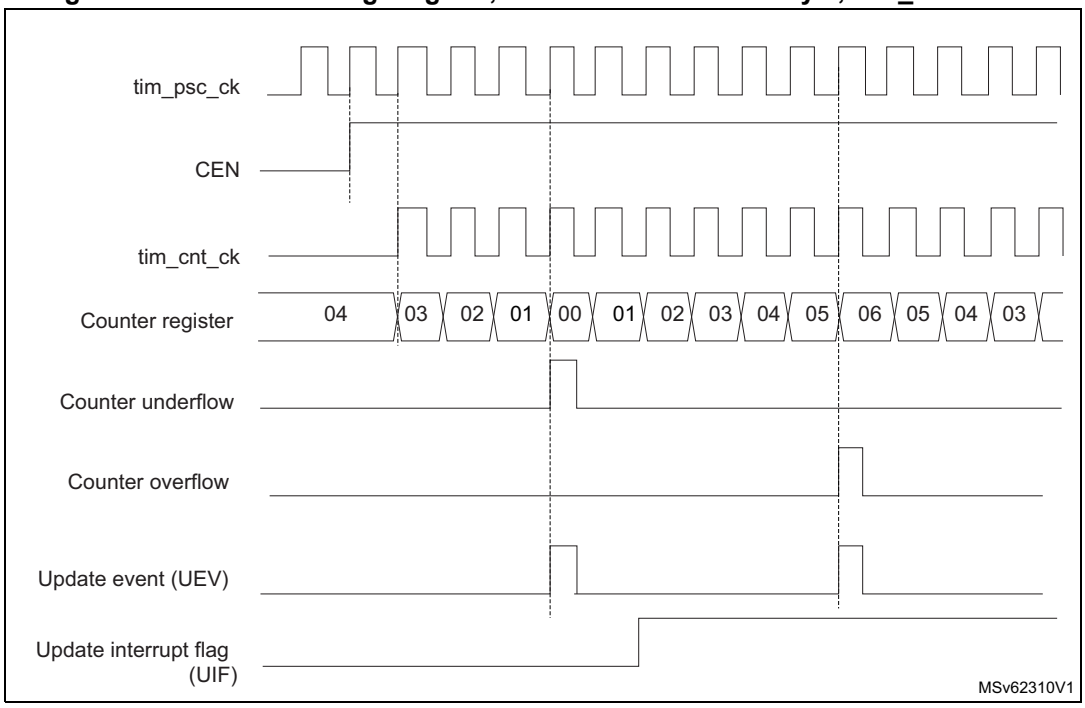
autoreload value down to 1 and generates a counter underflow event. Then it restarts counting from 0.

Center-aligned mode is active when the CMS bits in TIM_CR1 register are not equal to 00. The output compare interrupt flag of channels configured in output is set when: the counter counts down (center aligned mode 1, CMS = 01), the counter counts up (center aligned mode 2, CMS = 10) the counter counts up and down (center aligned mode 3, CMS = 11).

In this mode, the direction bit (DIR from TIM_CR1 register) cannot be written. It is updated by hardware and gives the current direction of the counter.

The update event can be generated at each counter overflow and at each counter underflow or by setting the UG bit in the TIM_EGR register (by software or by using the slave mode controller) also generates an update event. In this case, the counter restarts counting from 0, as well as the counter of the prescaler.

The UEV update event can be disabled by software by setting the UDIS bit in TIM_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter continues counting up and down, based on the current autoreload value.



In addition, if the URS bit (update request selection) in TIM_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIM_SR register) is set (depending on the URS bit):

- The buffer of the prescaler is reloaded with the preload value (content of the TIM_PSC register).
- The autoreload active register is updated with the preload value (content of the TIM_ARR register). Note that if the update source is a counter overflow, the autoreload is updated before the counter is reloaded, so that the next period is the expected one (the counter is loaded with the new value).

The following figures show some examples of the counter behavior for different clock frequencies.

Figure 635. Counter timing diagram, internal clock divided by 1, TIM_ARR = 0x6

1. Here, center-aligned mode 1 is used (for more details refer to *Section 35.5.1: TIM control register 1 (TIM_CR1)*).

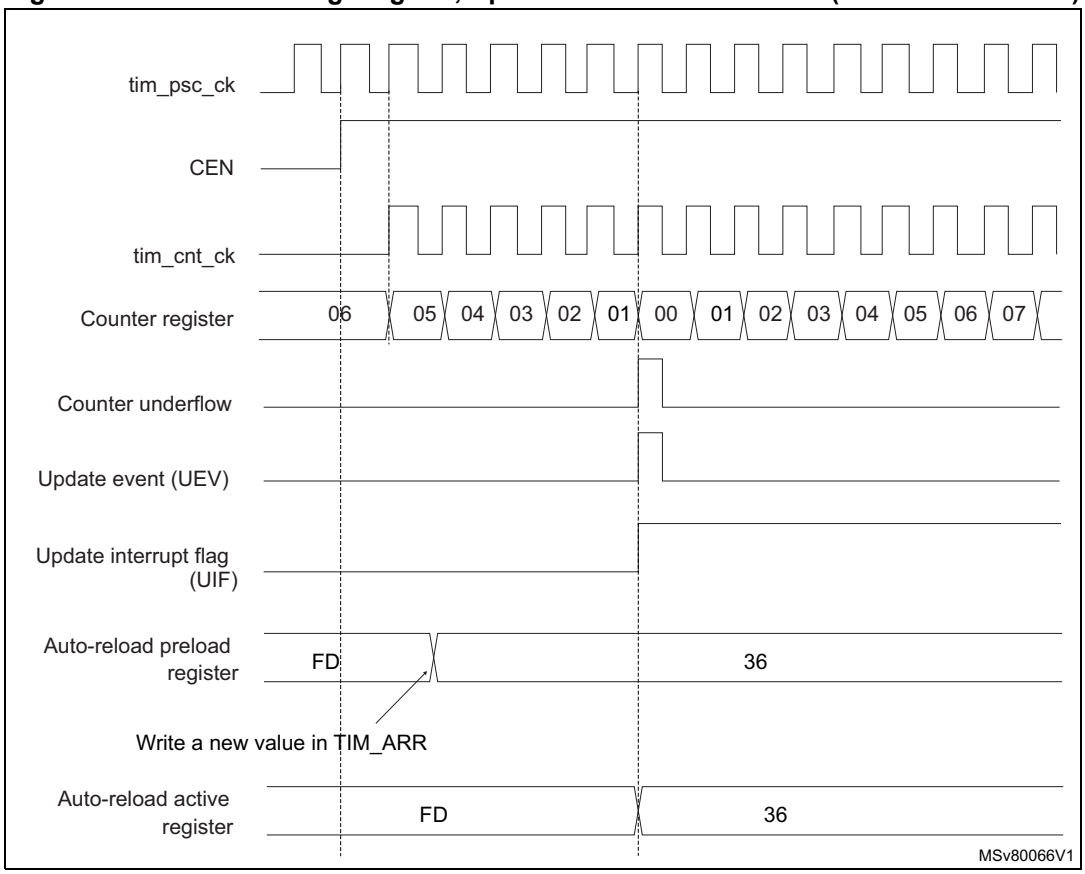

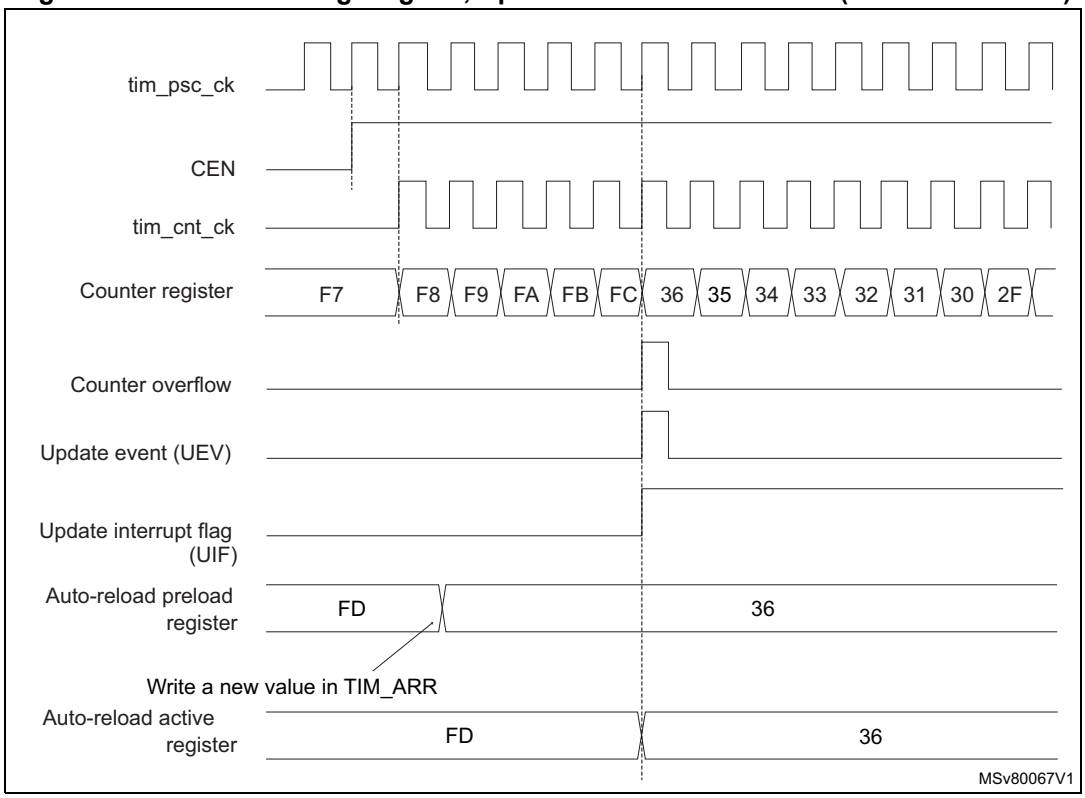

Figure 640. Counter timing diagram, Update event with ARPE = 1 (counter overflow)

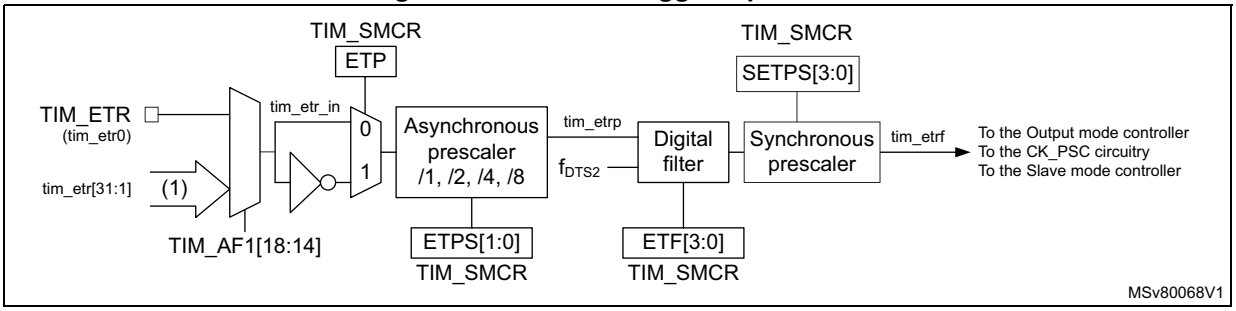


35.4.5 External trigger input

The timer features an external trigger input tim_etr_in. It can be used as:

- external clock (external clock mode 2, see *Section 35.4.6*)
- trigger for the slave mode (see *Section 35.4.27*)
- PWM reset input for cycle-by-cycle current regulation (see *Section 35.4.16*)

Figure 641 below describes the tim_etr_in input conditioning. The input polarity is defined with the ETP bit in TIM_SMCR register. The trigger frequency can be decreased with the prescalers programmed by the ETPS[1:0] and SETPS[3:0] bitfields and digitally filtered as per the ETF[3:0] bitfield. The resulting signal (tim_etrf) is available for three purposes: as an external clock, to condition the output (typically to reset a PWM output for a current limitation), and as a trigger for the slave mode controller.

Figure 641. External trigger input block

The external trigger input block features 2 prescalers with different functionalities:

- An asynchronous prescaler (division by 1, 2, 4 or 8), able to process tim_etr_in signals with frequencies above tim_ker_ck
- A linear synchronous prescaler (division by 1,2,3,..15), only able to operate with tim_etrp signal frequencies below tim_ker_ck/3

Note: When tim_etrf is used as PWM reset input for cycle-by-cycle current regulation (see Section 35.4.16), SETPS[3:0] must be set to 0 (no prescaling).

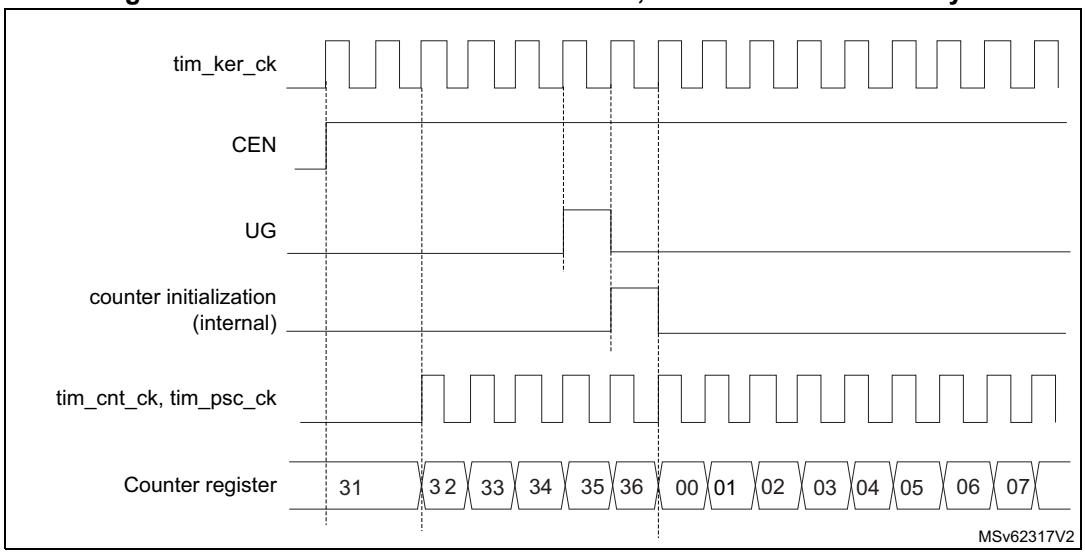
Note: The SETPS[3:0] bitfield is always preloaded: a new value will become active only once an update event has occured.

The tim_etr_in input comes from multiple sources: input pins (default configuration), or internal sources. The selection is done with the ETRSEL[4:0] bitfield in the TIM_AF1 register.

Refer to *Section 35.4.2: TIM2/TIM3/TIM4/TIM5 pins and internal signals* for the list of sources connected to the etr_in input in the product.

35.4.6 Clock selection

The counter clock can be provided by the following clock sources:



- Internal clock (tim_ker_ck).
- External clock mode1: external input pin (tim_ti1 or tim_ti2).
- External clock mode2: external trigger input (tim_etr_in).
- Internal trigger inputs (tim_itr): using one timer as prescaler for another timer, for example, timer 1 can be configured to act as a prescaler for timer 2. Refer to *Using one timer as prescaler for another timer* for more details.

Internal clock source (tim_ker_ck)

If the slave mode controller is disabled (SMS = 000 in the TIM_SMCR register), then the CEN, DIR (in the TIM_CR1 register), and UG bits (in the TIM_EGR register) are actual control bits and can be changed only by software (except UG which remains cleared automatically). As soon as the CEN bit is written to 1, the prescaler is clocked by the internal clock tim_ker_ck.

Figure 642 shows the behavior of the control circuit and the upcounter in normal mode, without prescaler.

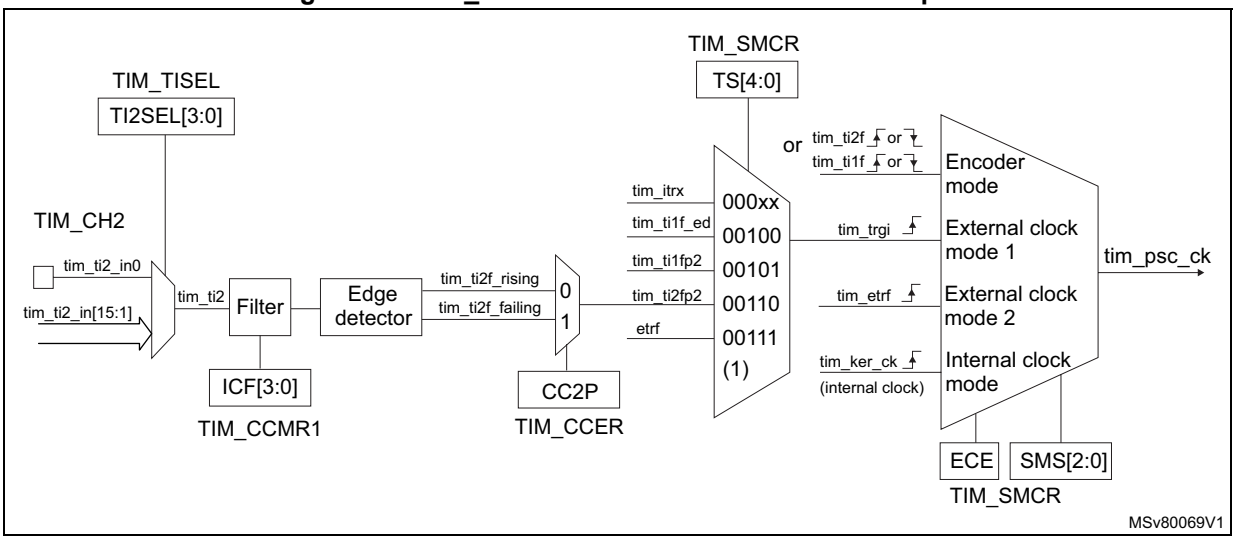


Figure 642. Control circuit in normal mode, internal clock divided by 1

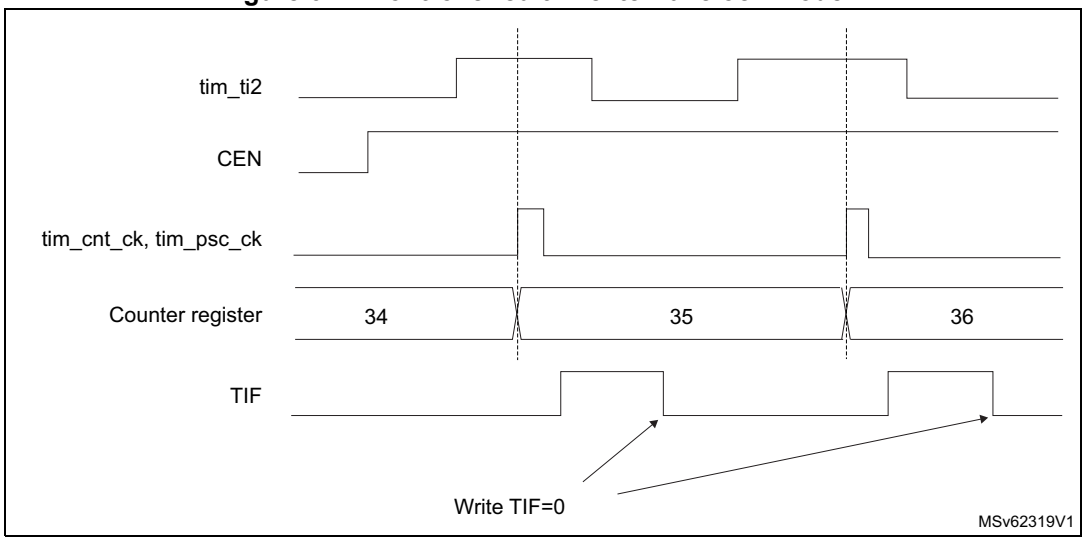
External clock source mode 1

This mode is selected when SMS = 111 in the TIM_SMCR register. The counter can count at each rising or falling edge on a selected input.

Figure 643. tim_ti2 external clock connection example

For example, to configure the upcounter to count in response to a rising edge on the tim_ti2 input, use the following procedure:

1. Select the proper tim_ti2_in[15:0] source (internal or external) with the TI2SEL[3:0] bits in the TIM_TISEL register.
2. Configure channel 2 to detect rising edges on the tim_ti2 input by writing CC2S= 01 in the TIM_CCMR1 register.
3. Configure the input filter duration by writing the IC2F[3:0] bits in the TIM_CCMR1 register (if no filter is needed, keep IC2F = 0000).



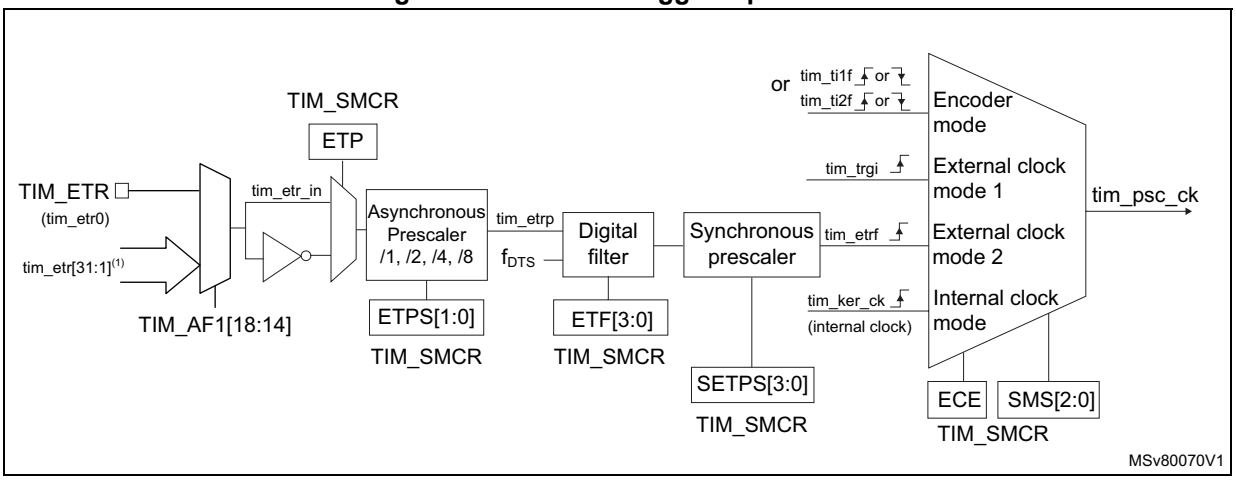
Note: The capture prescaler is not used for triggering, so it does not need to be configured.

4. Select rising edge polarity by writing CC2P = 0 and CC2NP = 0 in the TIM_CCER register.
5. Configure the timer in external clock mode 1 by writing SMS = 111 in the TIM_SMCR register.
6. Select tim_ti2 as the input source by writing TS = 00110 in the TIM_SMCR register.
7. Enable the counter by writing CEN = 1 in the TIM_CR1 register.

When a rising edge occurs on tim_ti2, the counter counts once and the TIF flag is set.

The delay between the rising edge on tim_ti2 and the actual clock of the counter is due to the resynchronization circuit on tim_ti2 input.

Figure 644. Control circuit in external clock mode 1



External clock source mode 2

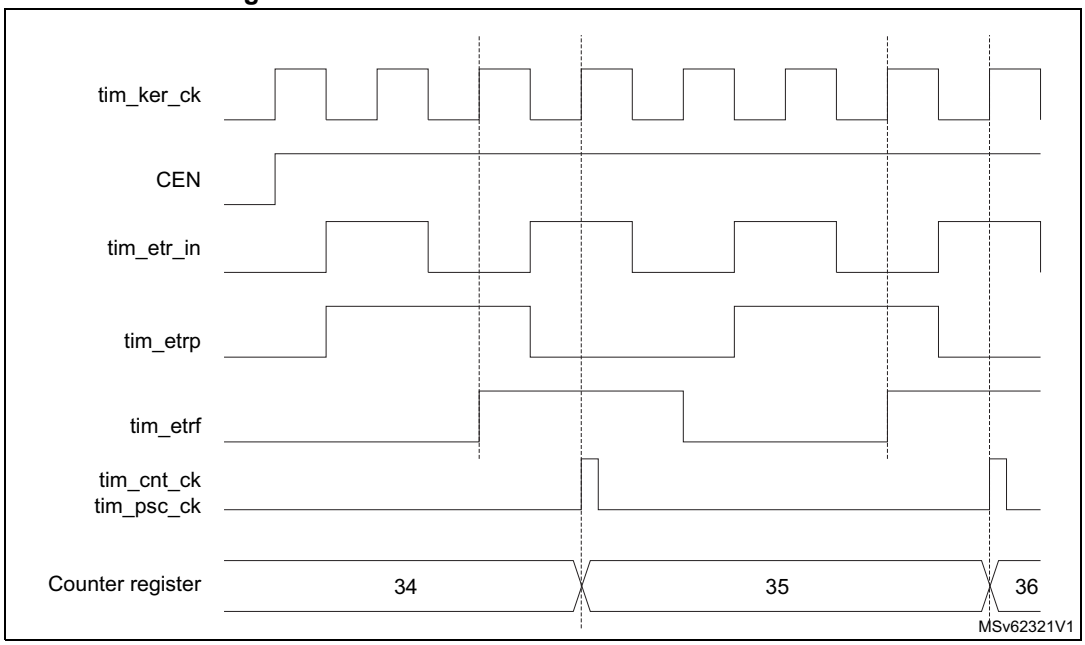
This mode is selected by writing ECE = 1 in the TIM_SMCR register.

The counter can count at each rising or falling edge on the external trigger input tim_etr_in.

Figure 645 gives an overview of the external trigger input block.

Figure 645. External trigger input block

1. Refer to *Section 35.4.2: TIM2/TIM3/TIM4/TIM5 pins and internal signals*



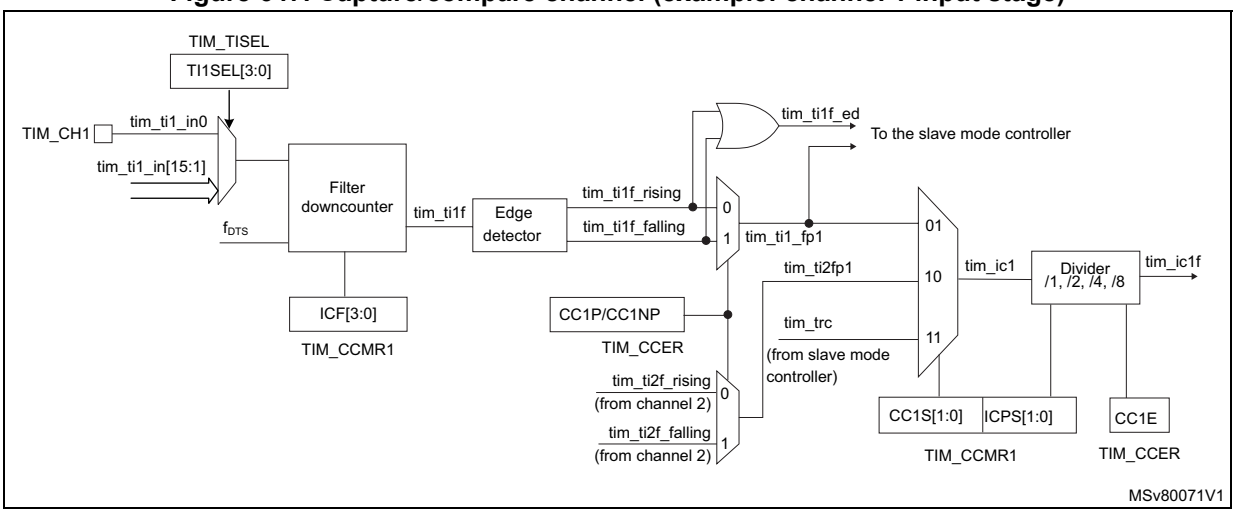
For example, to configure the upcounter to count each two rising edges on tim_etr_in, use the following procedure:

1. Select the proper tim_etr_in source (internal or external) with the ETRSEL[4:0] bits in the TIM_AF1 register.
2. As no filter is needed in this example, write ETF[3:0] = 0000 in the TIM_SMCR register.
3. Set the prescaler by writing ETPS[1:0] = 01 and SETPS[3:0] = 0 in the TIM_SMCR register.
4. Select rising edge detection on the tim_etr_in by writing ETP = 0 in the TIM_SMCR register.
5. Enable external clock mode 2 by writing ECE = 1 in the TIM_SMCR register.
6. Enable the counter by writing CEN = 1 in the TIM_CR1 register.

The counter counts once each two tim_etr_in rising edges.

The delay between the rising edge on tim_etr_in and the actual clock of the counter is due to the resynchronization circuit on the tim_etrp signal. As a consequence, the maximum frequency that can be correctly captured by the counter is at most ¼ of TIMxCLK frequency. When the ETRP signal is faster, the user must apply a division of the external signal by a proper ETPS prescaler setting.

Figure 646. Control circuit in external clock mode 2



35.4.7 Capture/compare channels

Each capture/compare channel is built around a capture/compare register (including a shadow register), an input stage for capture (with digital filter, multiplexing and prescaler) and an output stage (with comparator and output control).

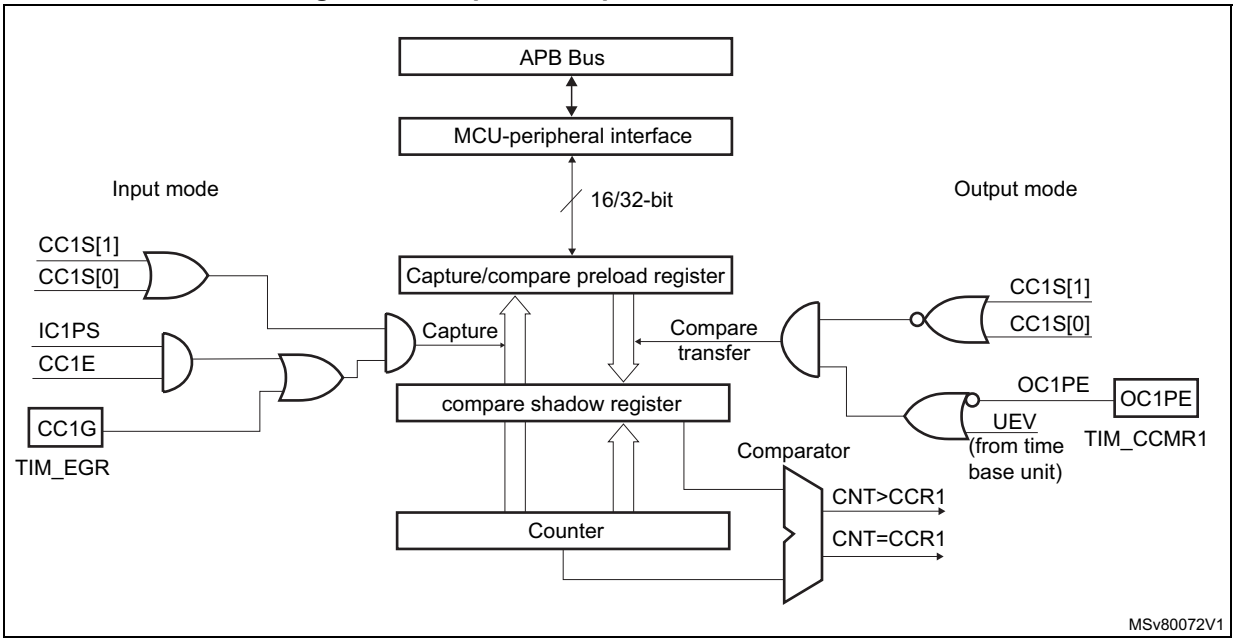
The following figure gives an overview of one capture/compare channel.

The input stage samples the corresponding tim_tix input to generate a filtered signal tim_tixf. Then, an edge detector with polarity selection generates a signal (tim_tixfpy) which can be used as trigger input by the slave mode controller or as the capture command. It is prescaled before the capture register (ICxPS).

Figure 647. Capture/compare channel (example: channel 1 input stage)

The output stage generates an intermediate waveform which is then used for reference: tim_ocxref (active high). The polarity acts at the end of the chain.

Figure 648. Capture/compare channel 1 main circuit



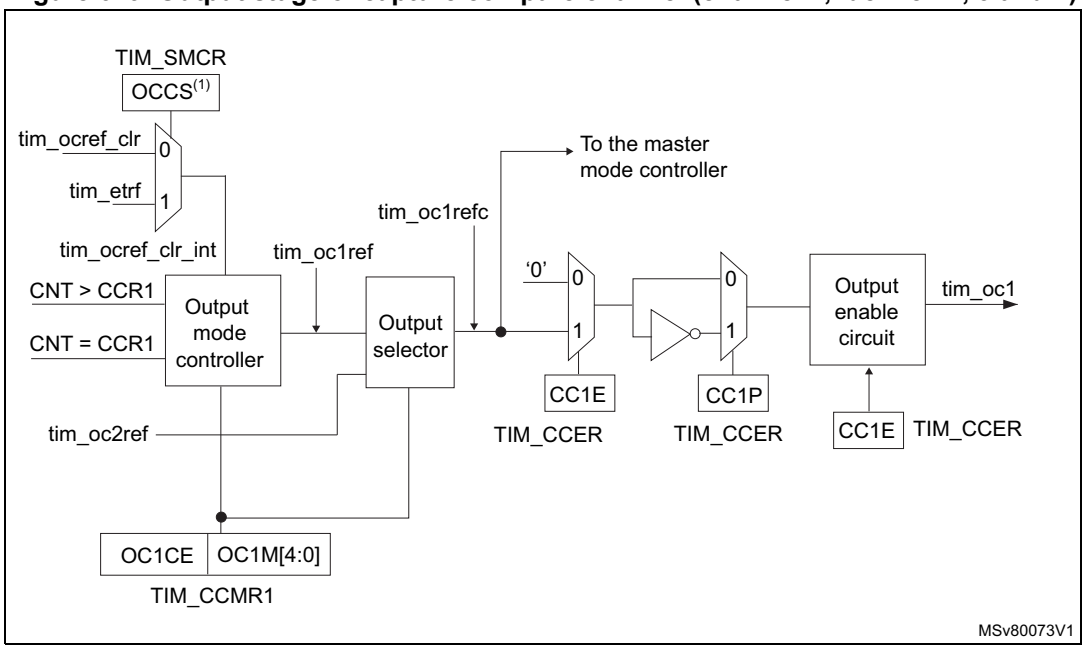


Figure 649. Output stage of capture/compare channel (channel 1, idem ch.2, 3 and 4)

1. Available on some instances only. If not available, tim_etrf is directly connected to tim_ocref_clr_int.

The capture/compare block is made of one preload register and one shadow register. Write and read always access the preload register.

In capture mode, captures are actually done in the shadow register, which is copied into the preload register.

In compare mode, the content of the preload register is copied into the shadow register which is compared to the counter.

35.4.8 Input capture mode

In input capture mode, the capture/compare registers (TIM_CCRx) are used to latch the value of the counter after a transition detected by the corresponding ICx signal. When a capture occurs, the corresponding CCXIF flag (TIM_SR register) is set and an interrupt or a DMA request can be sent if they are enabled. If a capture occurs while the CCxIF flag was already high, then the overcapture flag CCxOF (TIM_SR register) is set. CCxIF can be cleared by software by writing it to 0 or by reading the captured data stored in the TIM_CCRx register. CCxOF is cleared when it is written with 0.

The following example shows how to capture the counter value in TIM_CCR1 when tim_ti1 input rises. To do this, use the following procedure:

1. Select the proper tim_tix_in[15:0] source (internal or external) with the TI1SEL[3:0] bits in the TIM_TISEL register.
2. Select the active input: TIM_CCR1 must be linked to the tim_ti1 input, so write the CC1S bits to 01 in the TIM_CCMR1 register. As soon as CC1S becomes different from 00, the channel is configured in input and the TIM_CCR1 register becomes read-only.
3. Program the needed input filter duration in relation with the signal connected to the timer (when the input is one of the tim_tix (ICxF bits in the TIM_CCMRx register). Let's imagine that, when toggling, the input signal is not stable during at most five internal clock cycles. We must program a filter duration longer than these five clock cycles. We can validate a transition on tim_ti1 when eight consecutive samples with the new level have been detected (sampled at f_{DTS} frequency). Then write IC1F bits to 0011 in the TIM_CCMR1 register.
4. Select the edge of the active transition on the tim_ti1 channel by writing the CC1P and CC1NP bits to 000 in the TIM_CCER register (rising edge in this case).
5. Program the input prescaler. In this example, the capture is to be performed at each valid transition, so the prescaler is disabled (write IC1PS bits to 00 in the TIM_CCMR1 register).
6. Enable capture from the counter into the capture register by setting the CC1E bit in the TIM_CCER register.
7. If needed, enable the related interrupt request by setting the CC1IE bit in the TIM_DIER register, and/or the DMA request by setting the CC1DE bit in the TIM_DIER register.

When an input capture occurs:

- The TIM_CCR1 register gets the value of the counter on the active transition.
- CC1IF flag is set (interrupt flag). CC1OF is also set if at least two consecutive captures occurred whereas the flag was not cleared.
- An interrupt is generated depending on the CC1IE bit.
- A DMA request is generated depending on the CC1DE bit.

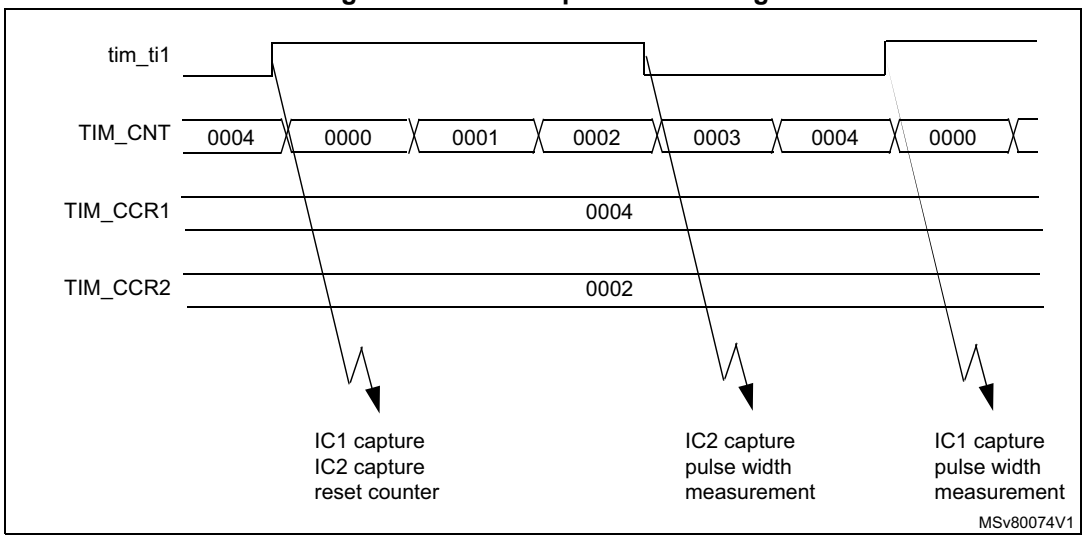
In order to handle the overcapture, it is recommended to read the data before the overcapture flag. This is to avoid missing an overcapture which may happen after reading the flag and before reading the data.

Note: IC interrupt and/or DMA requests can be generated by software by setting the corresponding CCxG bit in the TIM_EGR register.

35.4.9 PWM input mode

This mode is used to measure both the period and the duty cycle of a PWM signal connected to single tim_tix input:

- The TIM_CCR1 register holds the period value (interval between two consecutive rising edges).
- The TIM_CCR2 register holds the pulse width (interval between two consecutive rising and falling edges).



This mode is a particular case of input capture mode. The set-up procedure is similar with the following differences:

- Two ICx signals are mapped on the same tim_tix input.
- These two ICx signals are active on edges with opposite polarity.
- One of the two TIxFP signals is selected as trigger input and the slave mode controller is configured in reset mode.

The period and the pulse width of a PWM signal applied on tim_ti1 can be measured using the following procedure:

1. Select the proper tim_tix_in[15:0] source (internal or external) with the TI1SEL[3:0] bits in the TIM_TISEL register.
2. Select the active input for TIM_CCR1: write the CC1S bits to 01 in the TIM_CCMR1 register (tim_ti1 selected).
3. Select the active polarity for tim_ti1fp1 (used both for capture in TIM_CCR1 and counter clear): write the CC1P to 0 and the CC1NP bit to 0 (active on rising edge).
4. Select the active input for TIM_CCR2: write the CC2S bits to 10 in the TIM_CCMR1 register (tim_ti1 selected).
5. Select the active polarity for tim_ti1fp2 (used for capture in TIM_CCR2): write the CC2P bit to 1 and the CC2NP bit to 0 (active on falling edge).
6. Select the valid trigger input: write the TS bits to 00101 in the TIM_SMCR register (tim_ti1fp1 selected).
7. Configure the slave mode controller in reset mode: write the SMS bits to 100 in the TIM_SMCR register.
8. Enable the captures: write the CC1E and CC2E bits to 1 in the TIM_CCER register.

Figure 650. PWM input mode timing

1. The PWM input mode can be used only with the TIM_CH1/TIM_CH2 signals due to the fact that only tim_ti1fp1 and tim_ti2fp2 are connected to the slave mode controller.

35.4.10 Forced output mode

In output mode (CCxS bits = 00 in the TIM_CCMRx register), each output compare signal (tim_ocxref and then tim_ocx) can be forced to active or inactive level directly by software, independently of any comparison between the output compare register and the counter.

To force an output compare signal (tim_ocxref/tim_ocx) to its active level, the user just needs to write 00101 in the OCxM bits in the corresponding TIM_CCMRx register. Thus tim_ocxref is forced high (tim_ocxref is always active high) and tim_ocx get opposite value to CCxP polarity bit.

For example: CCxP = 0 (tim_ocx active high) => tim_ocx is forced to high level.

tim_ocxref signal can be forced low by writing the OCxM bits to 00100 in the TIM_CCMRx register.

Anyway, the comparison between the TIM_CCRx shadow register and the counter is still performed and allows the flag to be set. Interrupt and DMA requests can be sent accordingly. This is described in the output compare mode section.

35.4.11 Output compare mode

This function is used to control an output waveform or indicating when a period of time has elapsed.

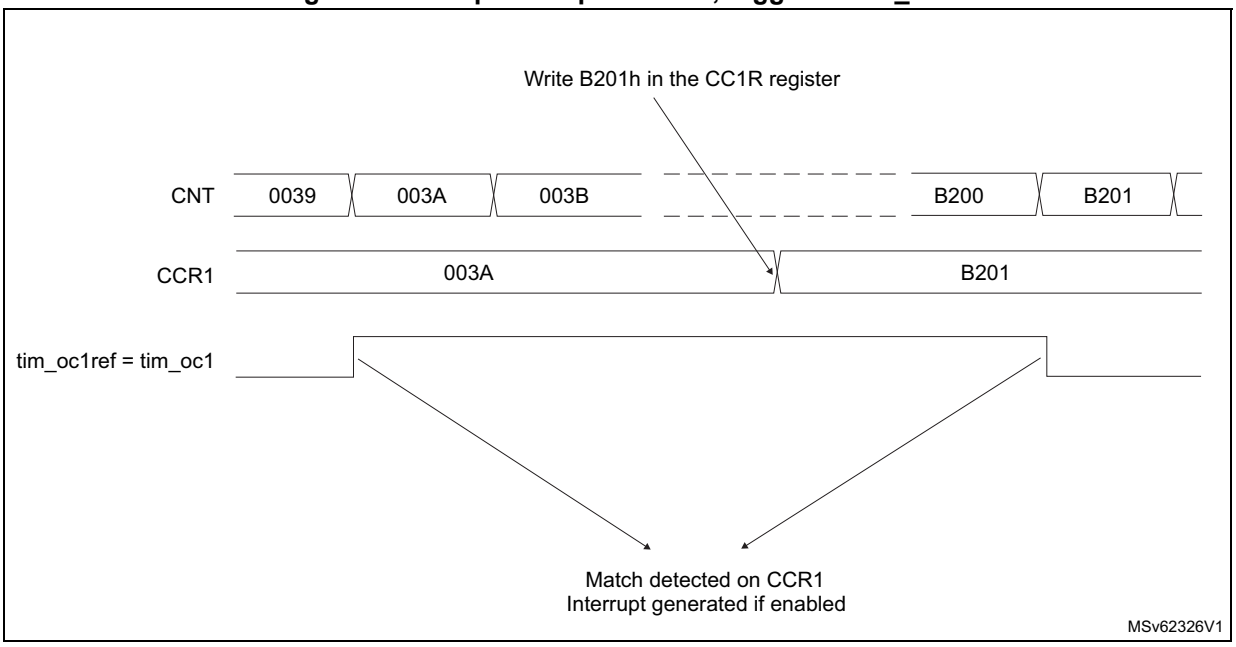
When a match is found between the capture/compare register and the counter, the output compare function:

- Assigns the corresponding output pin to a programmable value defined by the output compare mode (OCxM bits in the TIM_CCMRx register) and the output polarity (CCxP bit in the TIM_CCER register). The output pin can keep its level (OCxM = 00000), be

set active (OCxM = 00001), be set inactive (OCxM = 00010) or can toggle (OCxM = 00011) on match.

- Sets a flag in the interrupt status register (CCxIF bit in the TIM_SR register).
- Generates an interrupt if the corresponding interrupt mask is set (CCXIE bit in the TIM_DIER register).
- Sends a DMA request if the corresponding enable bit is set (CCxDE bit in the TIM_DIER register, CCDS bit in the TIM_CR2 register for the DMA request selection).

The TIM_CCRx registers can be programmed with or without preload registers using the OCxPE bit in the TIM_CCMRx register.



In output compare mode, the update event UEV has no effect on tim_ocxref and tim_ocx output. The timing resolution is one count of the counter. Output compare mode can also be used to output a single pulse (in one-pulse mode).

Procedure

1. Select the counter clock (internal, external, prescaler).
2. Write the desired data in the TIM_ARR and TIM_CCRx registers.
3. Set the CCxIE and/or CCxDE bits if an interrupt and/or a DMA request is to be generated.
4. Select the output mode. For example:
   a) Write OCxM = 00011 to toggle tim_ocx output pin when CNT matches CCRx.
   b) Write OCxPE = 0 to disable preload register.
   c) Write CCxP = 0 to select active high polarity.
   d) Write CCxE = 1 to enable the output.
5. Enable the counter by setting the CEN bit in the TIM_CR1 register.

The TIM_CCRx register can be updated at any time by software to control the output waveform, provided that the preload register is not enabled (OCxPE = 0, else TIM_CCRx shadow register is updated only at the next update event UEV). An example is given in *Figure 651*.

Figure 651. Output compare mode, toggle on tim_oc1

35.4.12 PWM mode

Pulse width modulation mode is used to generate a signal with a frequency determined by the value of the TIM_ARR register and a duty cycle determined by the value of the TIM_CCRx register.

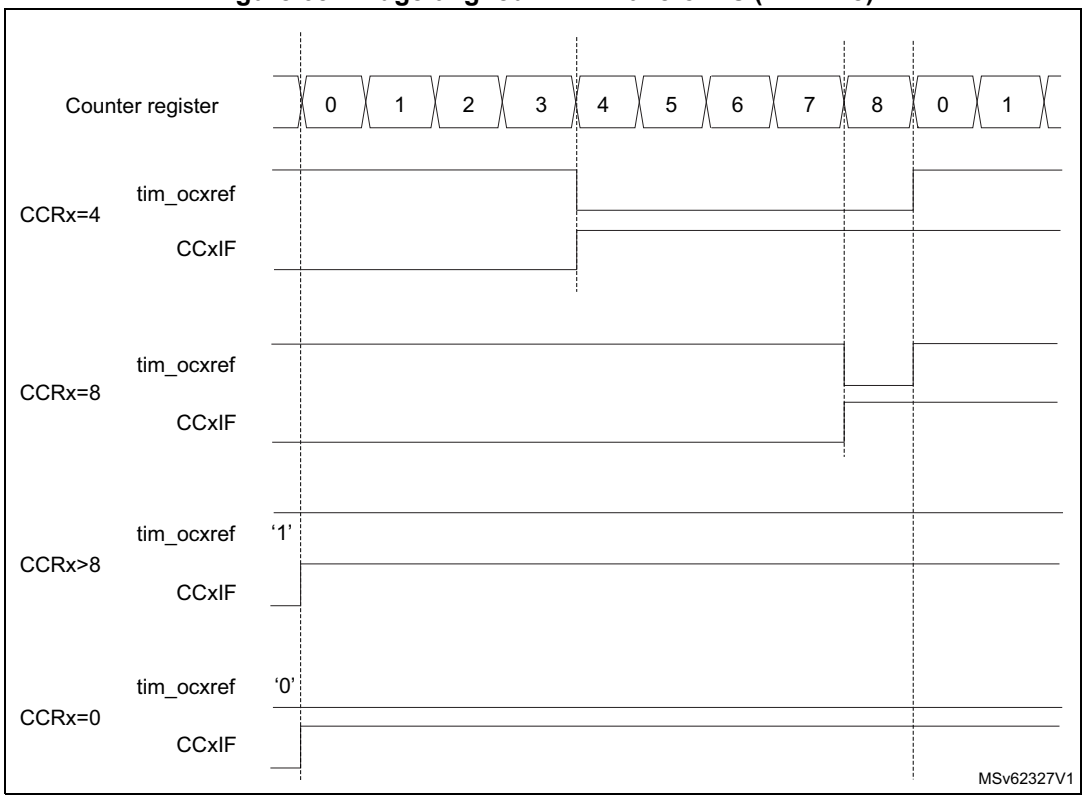
The PWM mode can be selected independently on each channel (one PWM per tim_ocx output) by writing 00110 (PWM mode 1) or 00111 (PWM mode 2) in the OCxM bits in the TIM_CCMRx register. The corresponding preload register must be enabled by setting the OCxPE bit in the TIM_CCMRx register, and eventually the autoreload preload register (in up-counting or center-aligned modes) by setting the ARPE bit in the TIM_CR1 register.

As the preload registers are transferred to the shadow registers only when an update event occurs, before starting the counter, all registers must be initialized by setting the UG bit in the TIM_EGR register.

tim_ocx polarity is software programmable using the CCxP bit in the TIM_CCER register. It can be programmed as active high or active low. tim_ocx output is enabled by the CCxE bit in the TIM_CCER register. Refer to the TIM_CCERx register description for more details.

In PWM mode (1 or 2), TIM_CNT and TIM_CCRx are always compared to determine whether TIM_CCRx ≤ TIM_CNT or TIM_CNT ≤ TIM_CCRx (depending on the direction of the counter). The tim_ocref_clr can be cleared by an external event through the tim_etr_in or the tim_oceref_clr signals. In this case the tim_ocref_clr signal is asserted only:

- After a compare match event.
- When the output compare mode (OCxM bits in TIM_CCMRx register) switches from the “frozen” configuration (no comparison, OCxM = 00000) to one of the PWM modes (OCxM = 00110 or 00111). This forces the PWM by software while the timer is running.



The timer is able to generate PWM in edge-aligned mode or center-aligned mode depending on the CMS bits in the TIM_CR1 register.

PWM edge-aligned mode

- Up-counting configuration
- Up-counting is active when the DIR bit in the TIM_CR1 register is low. Refer to *Up-counting mode*.

  In the following example, we consider PWM mode 1. The reference PWM signal tim_ocxref is high as long as TIM_CNT <TIM_CCRx else it becomes low. If the compare value in TIM_CCRx is greater than the autoreload value (in TIM_ARR) then tim_ocxref is held at 1. If the compare value is 0 then tim_ocxref is held at 0. *Figure 652* shows some edge-aligned PWM waveforms in an example where TIM_ARR = 8.

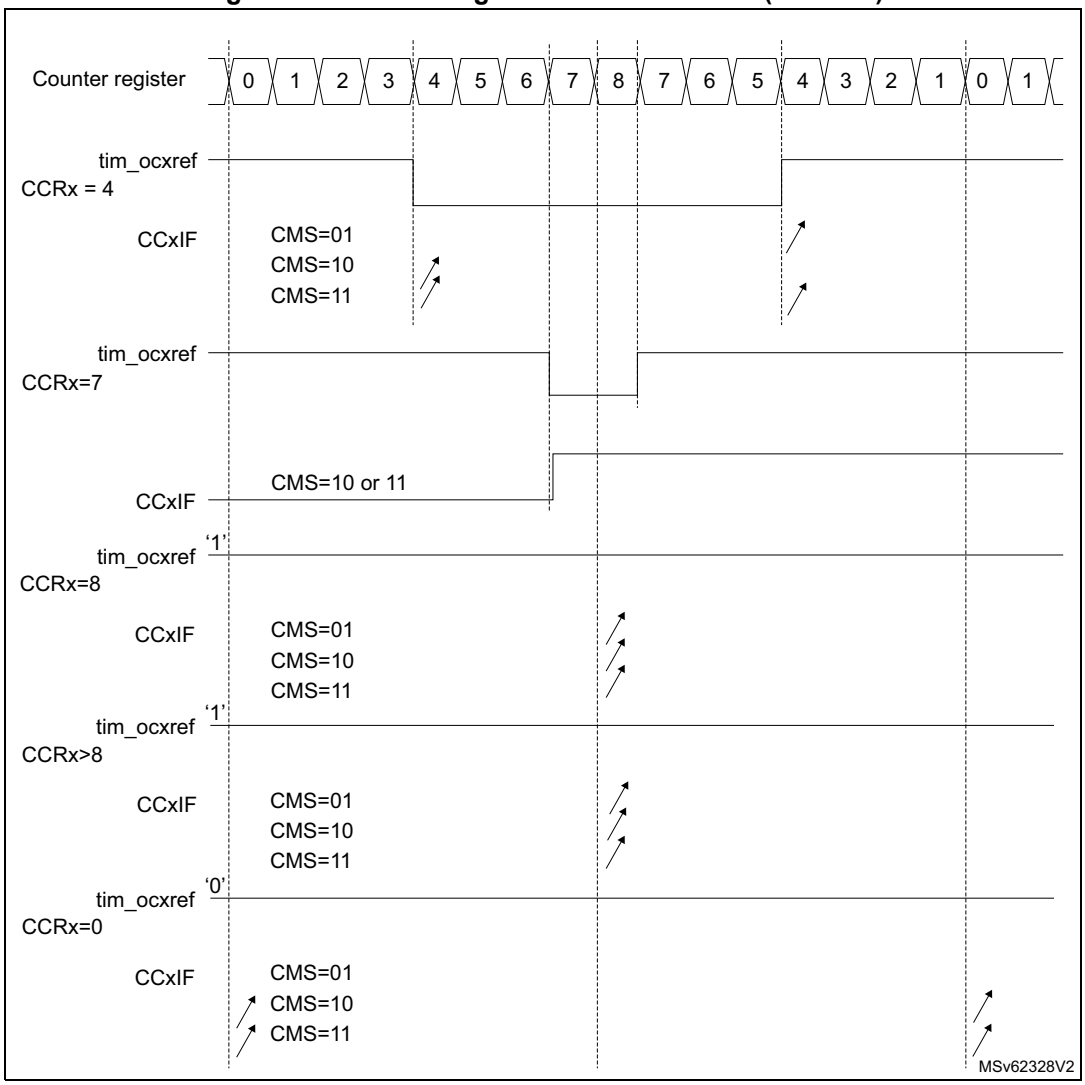
Figure 652. Edge-aligned PWM waveforms (ARR = 8)

Down-counting configuration

- Down-counting is active when DIR bit in TIM_CR1 register is high. Refer to *Down-counting mode*.

  In PWM mode 1, the reference signal tim_ocxref is low as long as TIM_CNT>TIM_CCRx else it becomes high. If the compare value in TIM_CCRx is greater than the autoreload value in TIM_ARR, then tim_ocxref is held at 100%. PWM is not possible in this mode.

PWM center-aligned mode



Center-aligned mode is active when the CMS bits in TIM_CR1 register are different from 00 (all the remaining configurations having the same effect on the tim_ocxref/tim_ocx signals). The compare flag is set when the counter counts up, when it counts down or both when it counts up and down depending on the CMS bits configuration. The direction bit (DIR) in the

TIM_CR1 register is updated by hardware and must not be changed by software. Refer to *Center-aligned mode (up/down-counting)*.

Figure 653 shows some center-aligned PWM waveforms in an example where:

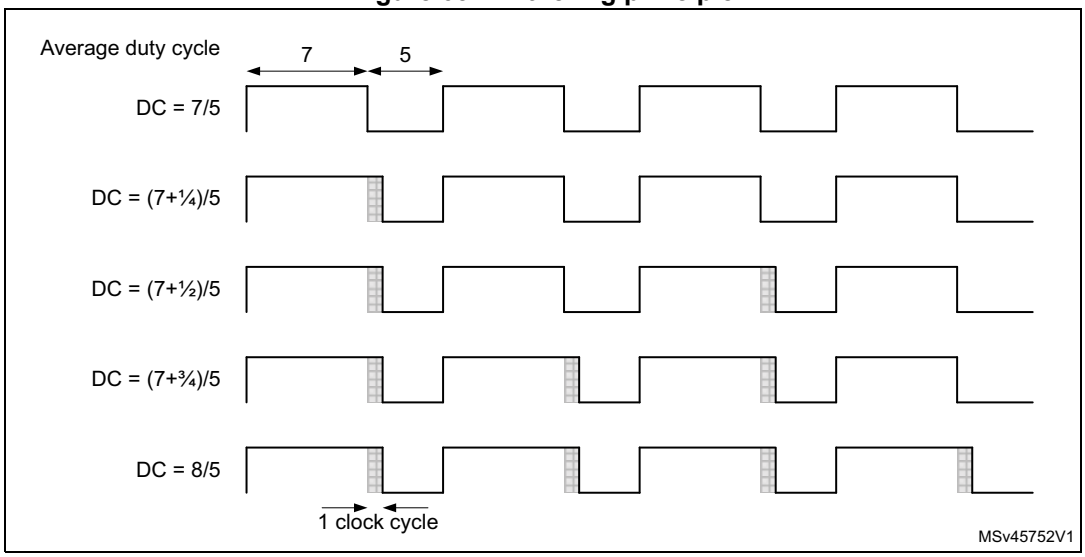
- TIM_ARR = 8.
- PWM mode is the PWM mode 1.
- The flag is set when the counter counts down corresponding to the center-aligned mode 1 selected for CMS = 01 in TIM_CR1 register.

Figure 653. Center-aligned PWM waveforms (ARR = 8)

Hints on using center-aligned mode:

- When starting in center-aligned mode, the current up-down configuration is used. It means that the counter counts up or down depending on the value written in the DIR bit

in the TIM_CR1 register. Moreover, the DIR and CMS bits must not be changed at the same time by the software.



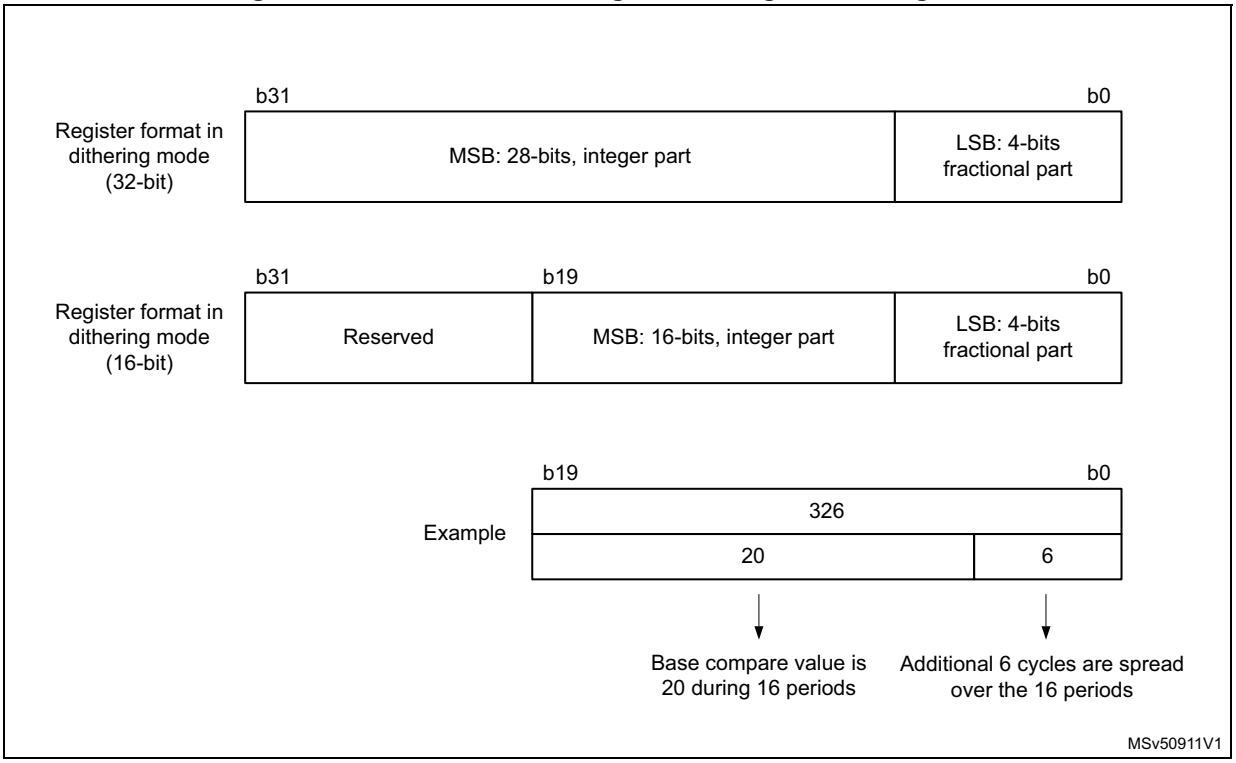
- Writing to the counter while running in center-aligned mode is not recommended as it can lead to unexpected results. In particular:
  - The direction is not updated if a value greater than the autoreload value is written in the counter (TIM_CNT>TIM_ARR). For example, if the counter was counting up, it continues to count up.
  - The direction is updated if 0 or the TIM_ARR value is written in the counter but no update event UEV is generated.
- The safest way to use center-aligned mode is to generate an update by software (setting the UG bit in the TIM_EGR register) just before starting the counter and not to write the counter while it is running.

Dithering mode

The PWM mode effective resolution can be increased by enabling the dithering mode, using the DITHEN bit in the TIM_CR1 register. This applies to both the CCR (for duty cycle resolution increase) and ARR (for PWM frequency resolution increase).

The operating principle is to have the actual CCR (or ARR) value slightly changed (adding or not one timer clock period) over 16 consecutive PWM periods, with predefined patterns. This allows a 16-fold resolution increase, considering the average duty cycle or PWM period. *Figure 654* presents the dithering principle applied to four consecutive PWM cycles.

Figure 654. Dithering principle



When the dithering mode is enabled, the register coding is changed as following (see *Figure 655* for example):

- The four LSBs are coding for the enhanced resolution part (fractional part).
- The MSBs are left-shifted by four places and are coding for the base value. In 16-bit mode, the 16-bit format is maintained.

Note: The following sequence must be followed when resetting the DITHEN bit:

1. *CEN and ARPE bits must be reset.*
2. *The DITHEN bit must be reset.*
3. *The CCIF flags must be cleared.*
4. *The CEN bit can be set (eventually with ARPE = 1).*

Figure 655. Data format and register coding in dithering mode

The minimum frequency is given by the following formula:

$$\text{Resolution} = \frac{F_{Tim}}{F_{pwm}} \Rightarrow F_{pwmMin} = \frac{F_{Tim}}{Max_{Resolution}}$$

$$\text{Dithering mode disabled: } F_{pwmMin} = \frac{F_{Tim}}{65536}$$

$$\text{Dithering mode (16-bit timer): } F_{pwmMin} = \frac{F_{Tim}}{65535 + \frac{15}{16}}$$

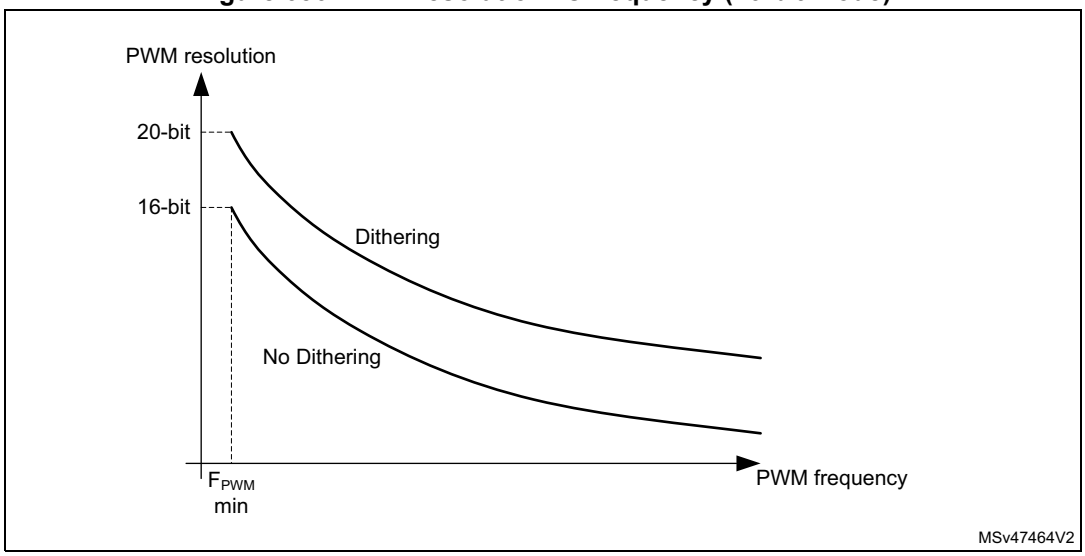
$$\text{Dithering mode (32-bit timer): } F_{pwmMin} = \frac{F_{Tim}}{268435454 + \frac{15}{16}}$$

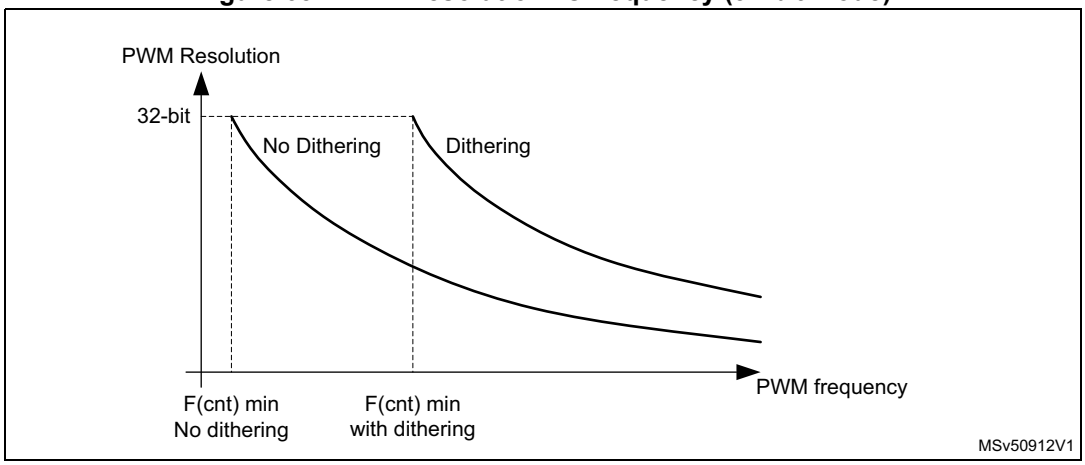
Note: For 16-bit timers, the maximum TIM_ARR and TIM_CCRy values are limited to 0xFFFEF in dithering mode (corresponds to 65534 for the integer part and 15 for the dithered part). For 32-bit timers, the maximum TIM_ARR and TIM_CCRy values are limited to

0xFFFFFFEF in dithering mode (corresponds to 264435454 for the integer part and 15 for the dithered part).

As shown on *Figure 656* and *Figure 657*, the dithering mode is used to increase the PWM resolution.

Figure 656. PWM resolution vs frequency (16-bit mode)





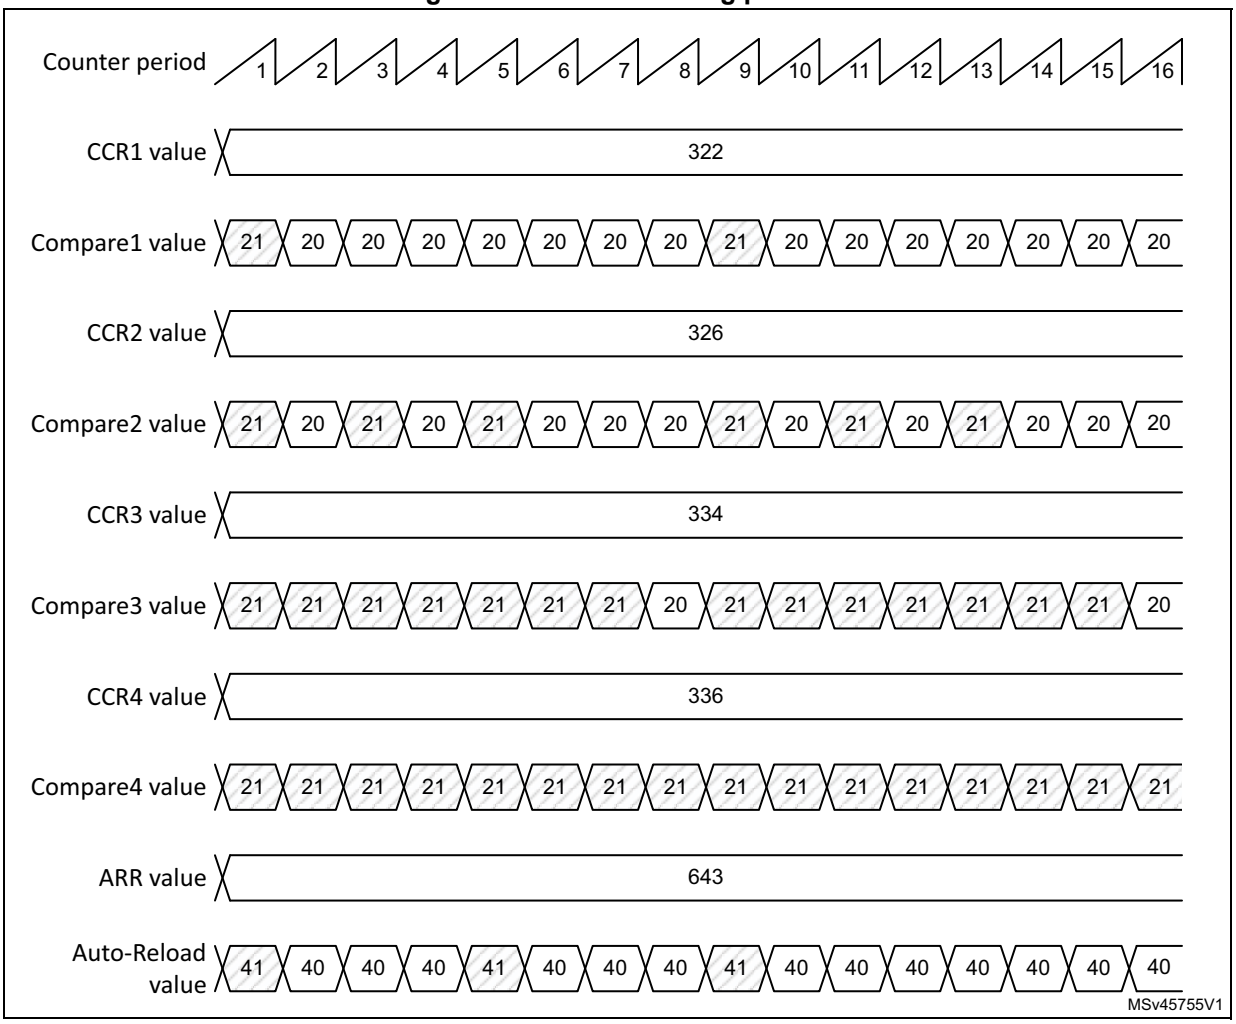


Figure 657. PWM resolution vs frequency (32-bit mode)

The duty cycle and/or period changes are spread over 16 consecutive periods, as described in *Figure 658*.

Figure 658. PWM dithering pattern

The autoreload and compare values increments are spread following specific patterns described in *Table 402*. The dithering sequence is done to have increments distributed as evenly as possible and minimize the overall ripple.

Table 402. CCR and ARR register change dithering pattern

LSB value	PWM period															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

35.4.13 Asymmetric PWM mode

Asymmetric mode allows two center-aligned PWM signals to be generated with a programmable phase shift. While the frequency is determined by the value of the TIM_ARR register, the duty cycle and the phase-shift are determined by a pair of TIM_CCRx registers. One register controls the PWM during up-counting, the second during down-counting, so that PWM is adjusted every half PWM cycle, for instance:

- tim_oc1refc is controlled by TIM_CCR1 and TIM_CCR2.
- tim_oc3refc is controlled by TIM_CCR3 and TIM_CCR4.

Figure 660 shows an example of signals that can be generated using asymmetric PWM mode (channels 1 to 4 are configured in asymmetric PWM mode 2).

Figure 660. Generation of two phase-shifted PWM signals with 50% duty cycle

Multiple asymmetric PWM modes are available to combine different pairs of TIM_CCRx registers and generate the required waveform, as listed in *Table 404*. The selection is done with the OCxM[4:0] bitfield in TIM_CCMRx registers. For each pair of TIM_CCRx registers, two options are given (e.g. Asymmetric PWM mode 1 and 2), one being in PWM mode 1 (channel active as long as the counter is below the TIM_CCRx value), the other one in PWM mode 2 (channel active when the counter is above the TIM_CCRx value).

For the asymmetric PWM modes 1 and 2, it is mandatory to have the same PWM mode for both channels. For instance, it is mandatory to have OC1M[4:0] = OC2M[4:0] = 01110 for the asymmetric PWM mode 1 on oc1refc.

For the asymmetric PWM modes 7 to 10, it is mandatory to have opposite PWM mode for both channels (one being in PWM mode 1 and the other in PWM mode 2). Refer to *Table 404* for configuration.

Note: The OCxM[4:0] bitfield is split into two parts for compatibility reasons, the most significant bits are not contiguous with the three least significant ones.

When a given channel is used as asymmetric PWM channel, its secondary channel can also be used. For instance, if an tim_oc1refc signal is generated on channel 1 (Asymmetric PWM mode 1), it is possible to output either the regular tim_oc2ref signal on channel 2, or an tim_oc2refc signal resulting from asymmetric PWM mode 2.

Table 404. Asymmetric PWM modes(1)

Output compare mode	OCxM[4:0]	oc1refc	oc2refc	oc3refc	oc4refc	PWM Mode(2)
Asymmetric PWM mode 1	01110	oc1ref (up-counting) oc2ref (down-counting)		oc3ref (up-counting) oc4ref (down-counting)		1
Asymmetric PWM mode 2	01111					2
Asymmetric PWM mode 7	10110	-	-	oc3refc = 1 (up-counting) oc3ref OR oc4ref (down-counting)	-	1(3)
Asymmetric PWM mode 8	10111	-	-	oc3refc = 0 (up-counting) oc3ref AND oc4ref (down-counting)	-	2(4)
Asymmetric PWM mode 9	11000	-	-	oc3ref OR oc4ref (up-counting) oc3refc = 1 (down-counting)	-	1(3)
Asymmetric PWM mode 10	11001	-	-	oc3ref AND oc4ref (up-counting) oc3refc = 0 (down-counting)	-	2(4)

1. Asymmetric PWM mode 7 to 10 are only available on OC3M.

2. PWM mode 1: channel active as long as the counter is below the TIM_CCRx value. PWM mode 2: channel active when the counter is above the TIM_CCRx value. Unless explicitly mentioned, the PWM mode must be identical for the two channels used for the asymmetric mode.
3. oc4ref must be programmed in PWM mode 1.
4. oc4ref must be programmed in PWM mode 2.

35.4.14 Combined PWM mode

Combined PWM mode allows two edge or center-aligned PWM signals to be generated with programmable delay and phase shift between respective pulses. While the frequency is determined by the value of the TIM_ARR register, the duty cycle and delay are determined by the two TIM_CCRx registers. The resulting signals, tim_ocxrefc, are made of an OR or AND logical combination of two reference PWMs,

- tim_oc1refc (or tim_oc2refc) is controlled by TIM_CCR1 and TIM_CCR2
- tim_oc3refc (or tim_oc4refc) is controlled by TIM_CCR3 and TIM_CCR4

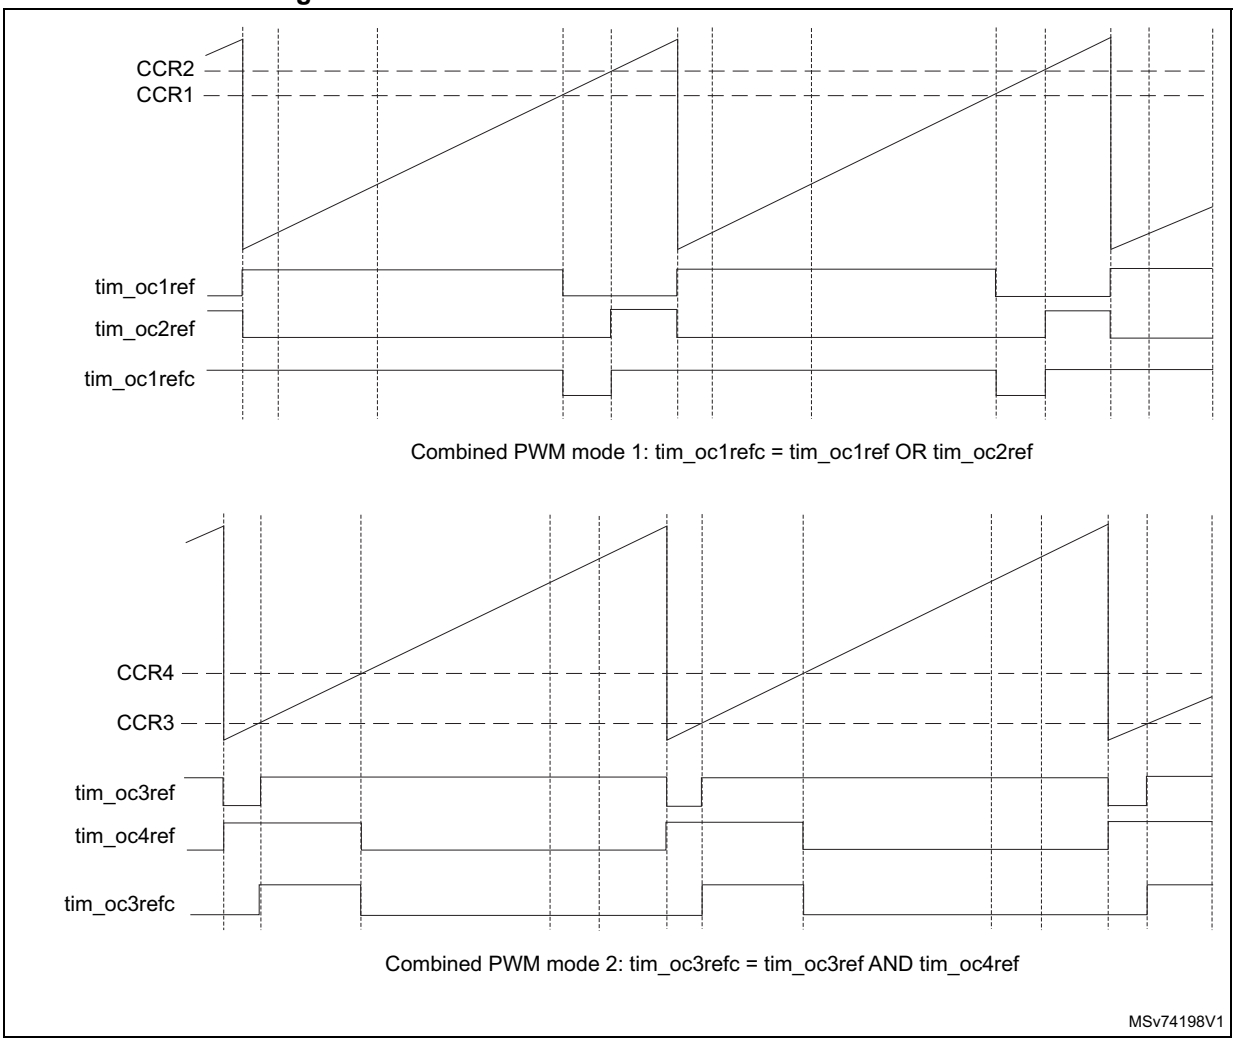
Table 405 summarizes different combinations of PWM combined mode:

Table 405. Combined PWM mode overview

Output compare mode	OCxM[4:0]	oc1refc	oc2refc	oc3refc	oc4refc	PWM mode(1)
Combined PWM mode 1	01100	oc1ref OR oc2ref		oc3ref OR oc4ref		1
Combined PWM mode 2	01101	oc1ref AND oc2ref		oc3ref AND oc4ref		2

1. PWM mode 1: channel active as long as the counter is below the TIM_CCRx value). PWM mode 2: channel active when the counter is above the TIM_CCRx value.

Combined PWM mode can be selected independently on two channels (one tim_ocx output per pair of CCR registers) by writing 01100 (combined PWM mode 1) or 01101 (combined PWM mode 2) in the OCxM bits in the TIM_CCMRx register.



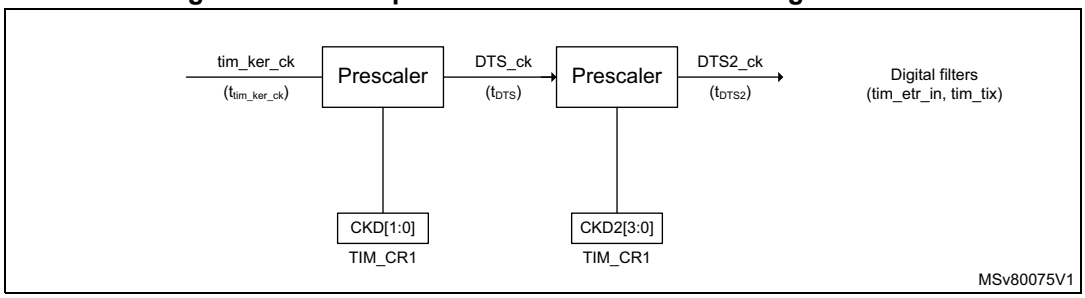
When a given channel is used as combined PWM channel, its secondary channel must be configured in the opposite PWM mode (for instance, one in PWM mode 1 and the other in PWM mode 2).

Note: The OCxM[4:0] bitfield is split into two parts for compatibility reasons, the most significant bits are not contiguous with the three least significant ones.

Figure 661 shows an example of signals that can be generated using combined PWM mode, obtained with the following configuration:

- Channel 1 is configured in combined PWM mode 1.
- Channel 2 is configured in PWM mode 2.
- Channel 3 is configured in combined PWM mode 2.
- Channel 4 is configured in PWM mode 1.

Figure 661. Combined PWM mode on channels 1 and 3

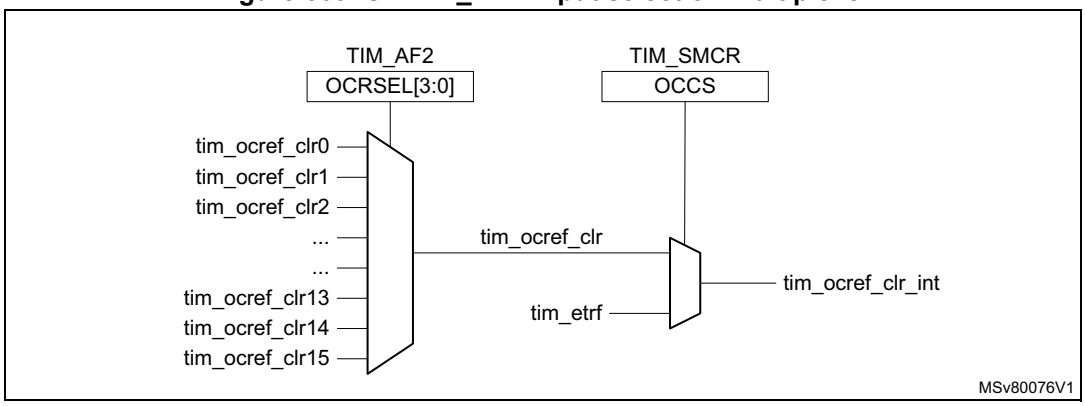


35.4.15 Clock dividers for dead-time generators and digital filters

The digital filters (for tim_etr_in, tim_tix) use a DTS_ck clock (with a t_{DTS} period), derived from the tim_ker_ck clock.

A prescaler can decrease the frequency to extend the DTS_ck clock period programmed with the CKD[1:0] bitfield in the TIM_CR1 register. A second prescaler can decrease the resulting DTS_ck clock to extend the digital filters range, with the CKD2[3:0] bitfield in the TIM_CR1 register.

Figure 662. Clock prescalers for dead-time and digital filters



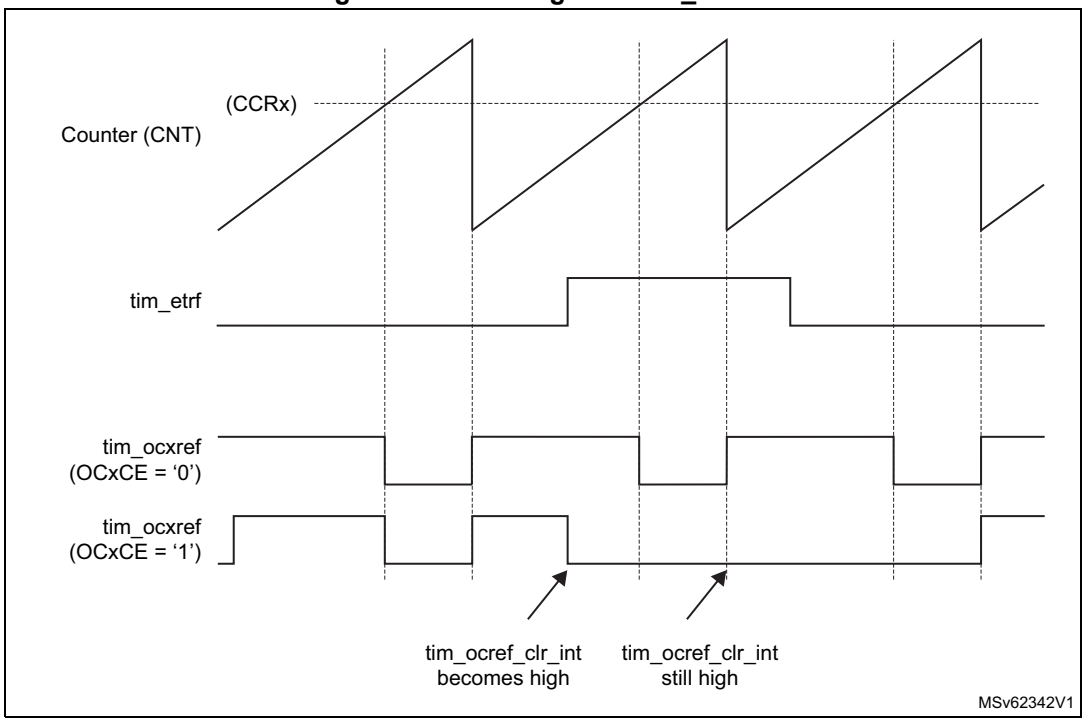
35.4.16 Clearing the tim_ocxref signal on an external event

The tim_ocxref signal of a given channel can be cleared when a high level is applied on the tim_ocref_clr_int input (OCxCE enable bit in the corresponding TIM_CCMRx register set to 1). tim_ocxref remains low until the next transition to the active state, on the following PWM cycle. This function can only be used in output compare and PWM modes. It must not be used in forced mode.

The tim_ocref_clr_int source depends on the OCREF clear selection feature implementation, refer to *Section 35.3: TIM2/TIM3/TIM4/TIM5 implementation*.

If the OCREF clear selection feature is implemented, the tim_ocref_clr_int can be selected between the tim_ocref_clr input and the tim_etrf input (tim_etr_in after the filter) by configuring the OCCS bit in the TIM_SMCR register. The tim_ocref_clr input can be selected among several tim_ocref_clr[15:0] inputs, using the OCRSEL[3:0] bitfield in the TIM_AF2 register, as shown in *Figure 663*.

Figure 663. OCREF_CLR input selection multiplexer



If the OCREF clear selection feature is not implemented, the tim_ocref_clr_int input is directly connected to the tim_etrf input.

For example, the tim_ocref_clr_int signal can be connected to the output of a comparator to be used for current handling. In this case, tim_etr_in must be configured as follows:

1. The external trigger prescaler must be kept off: bits ETPS[1:0] in the TIM_SMCR register are cleared to 00.
2. The external clock mode 2 must be disabled: bit ECE in the TIM_SMCR register is cleared to 0.
3. The external trigger polarity (ETP) and the external trigger filter (ETF) can be configured according to the application's needs.

Figure 664 shows the behavior of the tim_ocxref signal when the tim_etrf input becomes high, for both values of the OCxCE enable bit. In this example, the timer TIMx is programmed in PWM mode.

Figure 664. Clearing TIMx tim_ocxref

Note: In case of a PWM with a 100% duty cycle (if CCRx>ARR), tim_ocxref is enabled again at the next counter overflow.

This feature is also supported in combined and asymmetric modes. In this case, it is mandatory to enable the OCxCE bit for the channel. The OCxCE bit of the complementary channel (for exemple: OC2CE = X for oc2ref in *Figure 665*) is ignored. *Figure 665* to *Figure 667* describe the output waveforms for specific use cases when the ocref_clr_int signal is asserted.

Figure 665. Asymmetric PWM mode 1

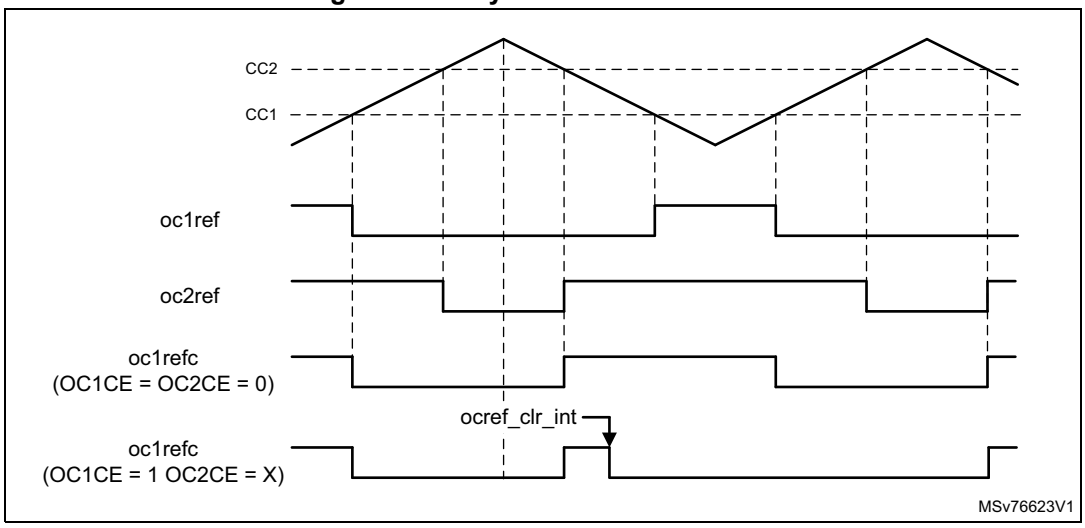


Figure 666. Asymmetric PWM mode 2

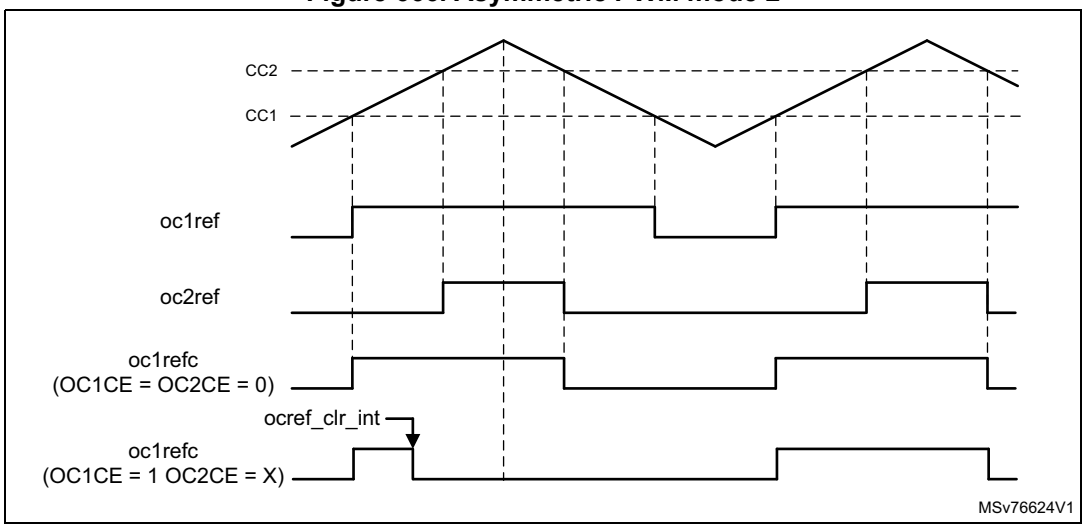

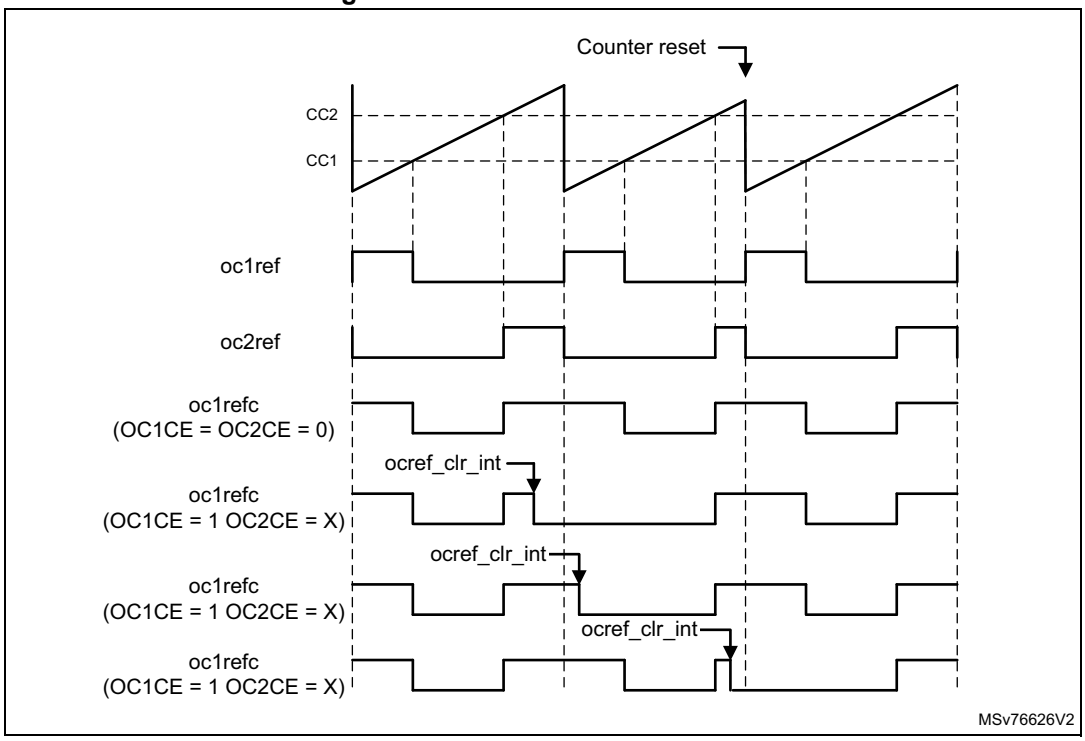

Figure 667. Combined PWM mode 1

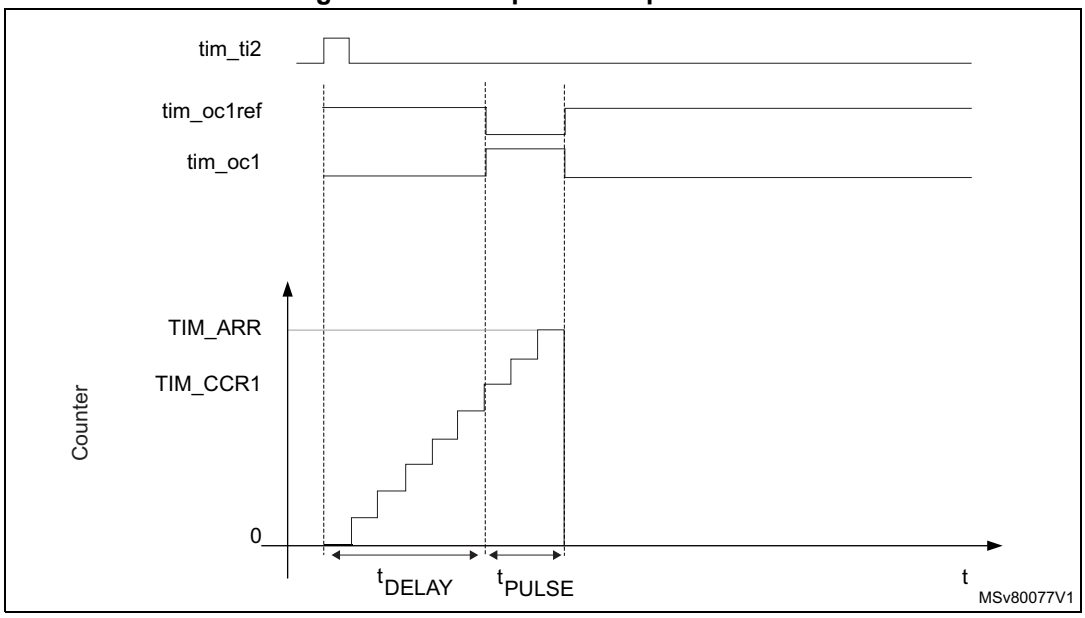
Conditions of use

This feature supports cycle-by-cycle current control loops, typically with a comparator shortening the PWM on-time when a current threshold is exceeded.

It cannot be used in the following modes, where the OCxCE bit must be cleared:

- PWM toggle mode (OCxM[4:0] = 0x03)
- One-pulse mode with PWM active on match (OPM = 1 and OCxM[4:0] = 0x06, 0x08, 0x0C, 0x0E)
- Combined PWM mode 1 or 3 in center-aligned mode (CMS[1:0] = 1, 2, 3 and OCxM[4:0] = 0x0C)

35.4.17 One-pulse mode



One-pulse mode (OPM) is a particular case of the previous modes. It allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length after a programmable delay.

Starting the counter can be controlled through the slave mode controller. Generating the waveform can be done in output compare mode or PWM mode. One-pulse mode is selected by setting the OPM bit in the TIM_CR1 register. This makes the counter stop automatically at the next update event UEV.

A pulse can be correctly generated only if the compare value is different from the counter initial value. Before starting (when the timer is waiting for the trigger), the configuration must be:

CNT<CCRx ≤ ARR (in particular, 0<CCRx).

Figure 668. Example of one-pulse mode

For example if the user wants to generate a positive pulse on tim_oc1 with a length of t_{PULSE} and after a delay of t_{DELAY} as soon as a positive edge is detected on the tim_ti2 input pin.

Use tim_ti2fp2 as trigger 1:

1. Select the proper tim_ti2_in[15:0] source (internal or external) with the TI2SEL[3:0] bits in the TIM_TISEL register.
2. Map tim_ti2fp2 on tim_ti2 by writing CC2S = 01 in the TIM_CCMR1 register.
3. tim_ti2fp2 must detect a rising edge, write CC2P = 0 and CC2NP = 0 in the TIM_CCER register.
4. Configure tim_ti2fp2 as trigger for the slave mode controller (tim_trgi) by writing TS = 00110 in the TIM_SMCR register.
5. tim_ti2fp2 is used to start the counter by writing SMS to 110 in the TIM_SMCR register (trigger mode).

The OPM waveform is defined by writing the compare registers (taking into account the clock frequency and the counter prescaler).

- The t_{DELAY} is defined by the value written in the TIM_CCR1 register.
- The t_{PULSE} is defined by the difference between the autoreload value and the compare value (TIM_ARR - TIM_CCR1).
- Suppose the user wants to build a waveform with a transition from 0 to 1 when a compare match occurs and a transition from 1 to 0 when the counter reaches the autoreload value. To do this PWM mode 2 must be enabled by writing OC1M = 00111 in the TIM_CCMR1 register. Optionally the preload registers can be enabled by writing OC1PE = 1 in the TIM_CCMR1 register and ARPE in the TIM_CR1 register. In this case one has to write the compare value in the TIM_CCR1 register, the autoreload value in the TIM_ARR register, generate an update by setting the UG bit and wait for external trigger event on tim_ti2. CC1P is written to 0 in this example.

In this example, the DIR and CMS bits in the TIM_CR1 register must be low.

Since only one pulse (single mode) is needed, a one must be written in the OPM bit in the TIM_CR1 register to stop the counter at the next update event (when the counter rolls over from the autoreload value back to 0). When OPM bit in the TIM_CR1 register is set to 0, so the repetitive mode is selected.

Particular case: tim_ocx fast enable:

In one-pulse mode, the edge detection on tim_tix input set the CEN bit which enables the counter. Then the comparison between the counter and the compare value makes the output toggle. But several clock cycles are needed for these operations and it limits the minimum delay t_{DELAY} min we can get.

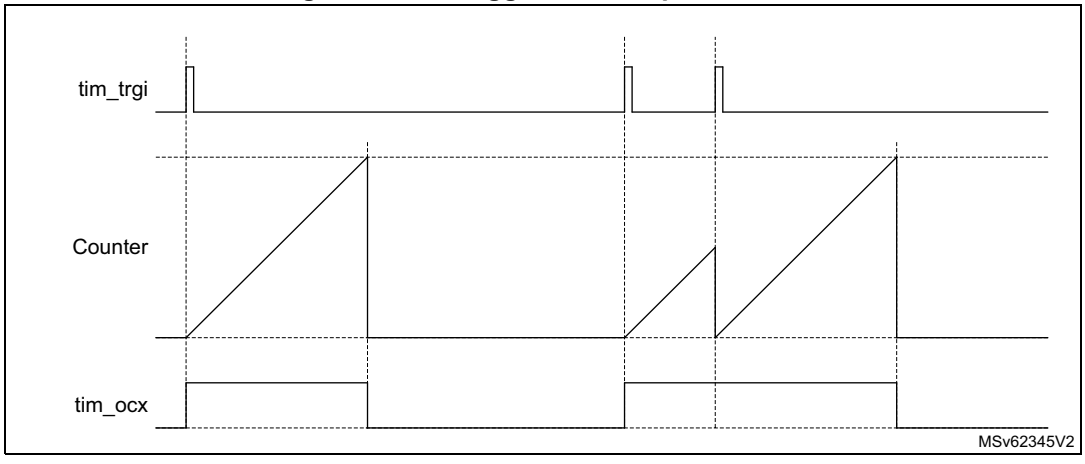
If one wants to output a waveform with the minimum delay, the OCxFE bit can be set in the TIM_CCMRx register. Then tim_ocxref (and tim_ocx) is forced in response to the stimulus, without taking in account the comparison. Its new level is the same as if a compare match had occurred. OCxFE acts only if the channel is configured in PWM1 or PWM2 mode.

35.4.18 Retriggerable one-pulse mode

This mode allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length, but with the following differences with non-retriggerable one-pulse mode described in *Section 35.4.17*:

- The pulse starts as soon as the trigger occurs (no programmable delay).
- The pulse is extended if a new trigger occurs before the previous one is completed.

The timer must be in slave mode, with the bits SMS[4:0] = 01000 (combined reset + trigger mode) in the TIM_SMCR register, and the OCxM[4:0] bits set to 01000 or 01001 for retriggerable OPM mode 1 or 2.



If the timer is configured in up-counting mode, the corresponding CCRx must be set to 0 (the ARR register sets the pulse length). If the timer is configured in down-counting mode CCRx must be above or equal to ARR.

Note: In retriggerable one-pulse mode, the CCxIF flag is not significant.

The OCxM[4:0] and SMS[4:0] bitfields are split into two parts for compatibility reasons, the most significant bit is not contiguous with the three least significant ones.

This mode must not be used with center-aligned PWM modes. It is mandatory to have CMS[1:0] = 00 in TIM_CR1.

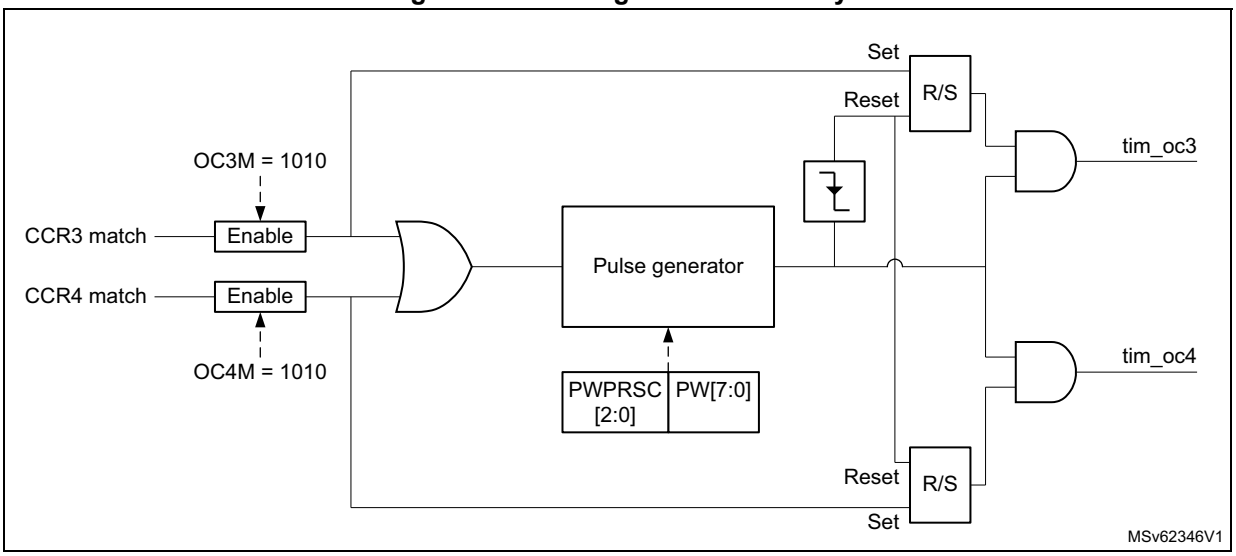
Figure 669. Retriggerable one-pulse mode

35.4.19 Pulse on compare mode

A pulse can be generated upon compare match event. A signal with a programmable pulse width generated when the counter value equals a given compare value, for debugging or synchronization purposes.

This mode is available for any slave mode selection, including encoder modes, in edge and center aligned counting modes. It is solely available for channel 3 and channel 4. The pulse generator is unique and is shared by the two channels, as shown on *Figure 670*.

Figure 670. Pulse generator circuitry



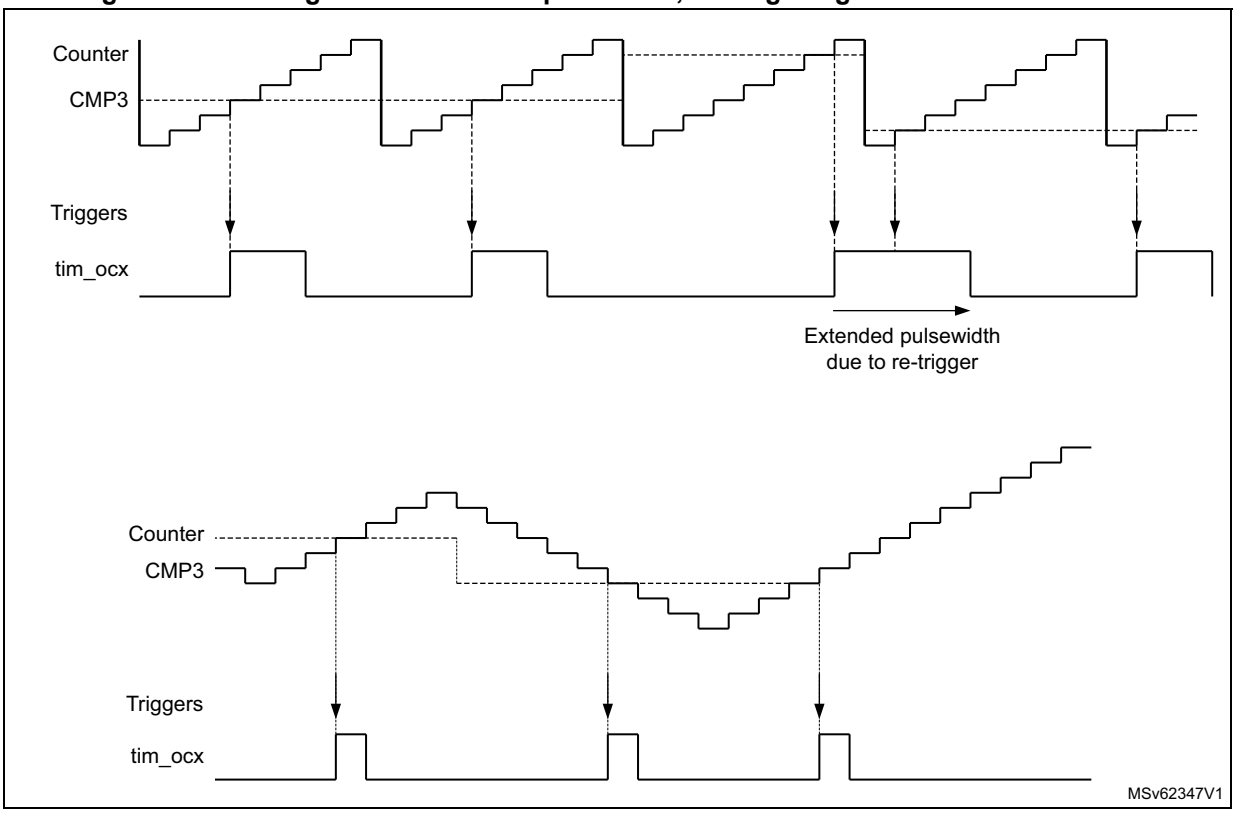


Figure 671 shows how the pulse is generated for edge-aligned and encoder operating modes.

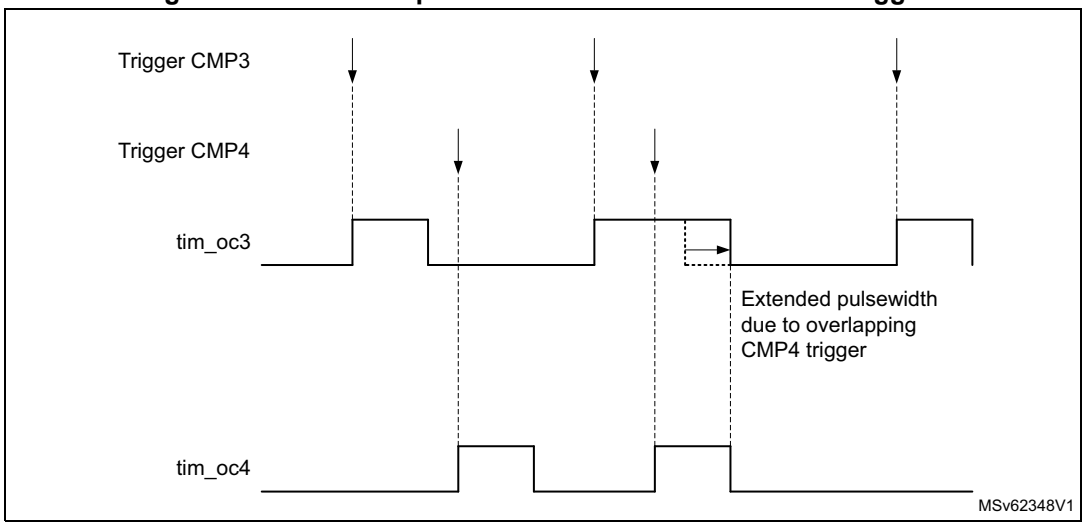
Figure 671. Pulse generation on compare event, for edge-aligned and encoder modes

This output compare mode is selected using the OC3M[3:0] and OC4M[3:0] bitfields in TIM_CCMR2 register.

The pulse width is programmed using the PW[7:0] bitfield in the register, using a specific clock prescaled according to PWPRSC[2:0] bits, as follows:

t_{PW} = PW[7:0] x t_{PWG}



where $t_{PWG} = (2^{(PWPRSC[2:0])}) \times t_{tim_ker_ck}$.

Gives the resolution and maximum values depending on the prescaler value.

The pulse is retriggerable: a new trigger while the pulse is ongoing, causes the pulse to be extended.

Note: If the two channels are enabled simultaneously, the pulses are issued independently as long as the trigger on one channel is not overlapping the pulse generated on the concurrent output. On the opposite, if the two triggers are overlapping, the pulse width related to the first arriving trigger is extended (because of the retrigger), while the pulse width of the last arriving trigger is correct (as shown on Figure 672).

Figure 672. Extended pulse width in case of concurrent triggers

35.4.20 Encoder interface mode

Quadrature encoder

To select encoder interface mode write SMS = 0001 in the TIM_SMCR register if the counter is counting on tim_ti1 edges only, SMS = 0010 if it is counting on tim_ti2 edges only and SMS = 0011 if it is counting on both tim_ti1 and tim_ti2 edges.

Select the tim_ti1 and tim_ti2 polarity by programming the CC1P and CC2P bits in the TIM_CCER register. CC1NP and CC2NP must be kept cleared. When needed, the input filter can be programmed as well.

The two inputs tim_ti1 and tim_ti2 are used to interface to an incremental encoder. Refer to *Table 406*. The counter is clocked by each valid transition on tim_ti1fp1 or tim_ti2fp2 (tim_ti1 and tim_ti2 after input filter and polarity selection, tim_ti1fp1 = tim_ti1 if not filtered and not inverted, tim_ti2fp2 = tim_ti2 if not filtered and not inverted) assuming that it is enabled (CEN bit in TIM_CR1 register written to 1). The sequence of transitions of the two inputs is evaluated and generates count pulses as well as the direction signal. Depending on the sequence the counter counts up or down, the DIR bit in the TIM_CR1 register is modified by hardware accordingly. The DIR bit is calculated at each transition on any input (tim_ti1 or tim_ti2), whatever the counter is counting on tim_ti1 only, tim_ti2 only or both tim_ti1 and tim_ti2.

Encoder interface mode acts simply as an external clock with direction selection. This means that the counter just counts continuously between 0 and the autoreload value in the TIM_ARR register (0 to ARR or ARR down to 0 depending on the direction). So the TIM_ARR must be configured before starting. In the same way, the capture, compare, prescaler, trigger output features continue to work as normal. Encoder mode and external clock mode 2 are not compatible and must not be selected together.

In this mode, the counter is modified automatically following the speed and the direction of the quadrature encoder and its content, therefore, always represents the encoder's position. The count direction corresponds to the rotation direction of the connected sensor. The table summarizes the possible combinations, assuming tim_ti1 and tim_ti2 do not switch at the same time.

Table 406. Counting direction versus encoder signals(CC1P = CC2P = 0)

Active edge	SMS[4:0]	Level on opposite signal (tim_ti1fp1 for tim_ti2, tim_ti2fp2 for tim_ti1)	tim_ti1fp1 signal		tim_ti2fp2 signal	
			Rising	Falling	Rising	Falling
Counting on tim_ti1 only x1 mode	01110	High	Down	Up	No count	No count
		Low	No count	No count	No count	No count
Counting on tim_ti2 only x1 mode	01111	High	No count	No count	Up	Down
		Low	No count	No count	No count	No count
Counting on tim_ti1 only x2 mode	00001	High	Down	Up	No count	No count
		Low	Up	Down	No count	Down
Counting on tim_ti2 only x2 mode	00010	High	No count	No count	Up	Down
		Low	No count	No count	Down	Up
Counting on tim_ti1 and tim_ti2 x4 mode	00011	High	Down	Up	Up	Down
		Low	Up	Down	Down	Up

A quadrature encoder can be connected directly to the MCU without external interface logic. However, comparators are normally be used to convert the encoder's differential outputs to digital signals. This greatly increases noise immunity. The third encoder output which indicates the mechanical zero position, can be connected to the external trigger input and trigger a counter reset.

Figure 673 gives an example of counter operation, showing count signal generation and direction control. It also shows how input jitter is compensated where both edges are selected. This might occur if the sensor is positioned near to one of the switching points. For this example we assume that the configuration is the following:

- CC1S = 01 (TIM_CCMR1 register, tim_ti1fp1 mapped on tim_ti1).
- CC2S = 01 (TIM_CCMR1 register, tim_ti2fp2 mapped on tim_ti2).
- CC1P and CC1NP = 0 (TIM_CCER register, tim_ti1fp1 noninverted, tim_ti1fp1 = tim_ti1).
- CC2P and CC2NP = 0 (TIM_CCER register, tim_ti2fp2 noninverted, tim_ti2fp2 = tim_ti2).
- SMS = 0011 (TIM_SMCR register, both inputs are active on both rising and falling edges).
- CEN = 1 (TIM_CR1 register, counter is enabled).

Figure 673. Example of counter operation in encoder interface mode

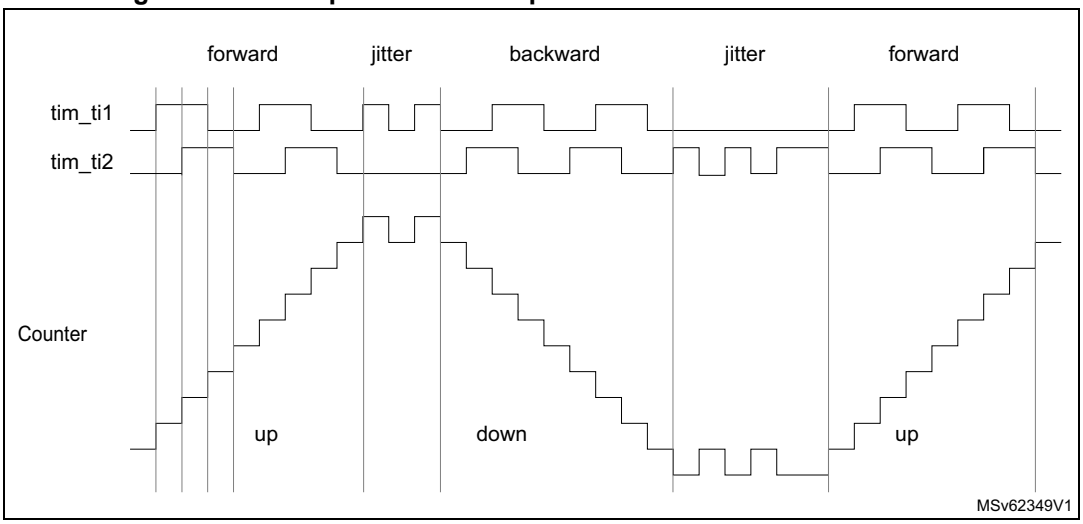


Figure 674 gives an example of counter behavior when tim_ti1fp1 polarity is inverted (same configuration as above except CC1P = 1).

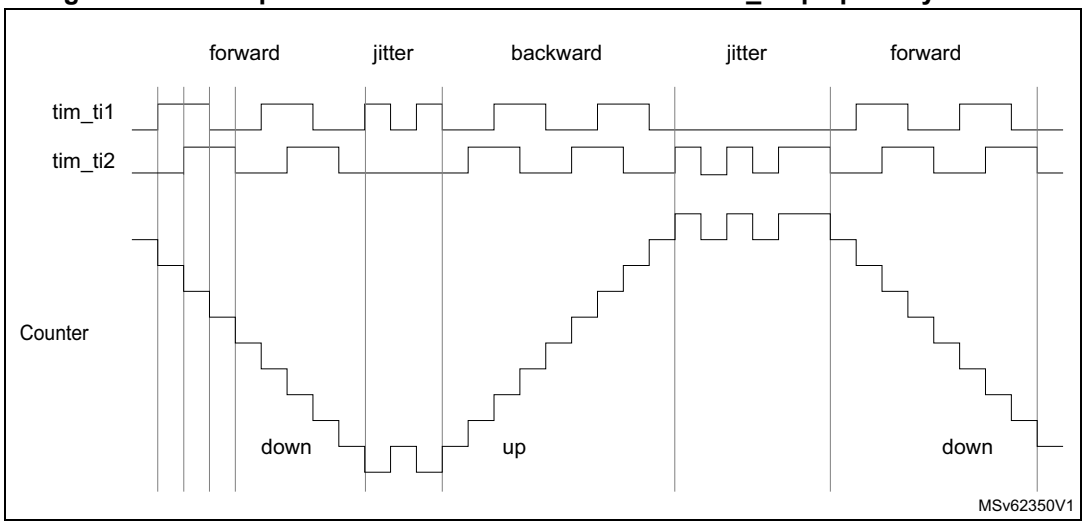
Figure 674. Example of encoder interface mode with tim_ti1fp1 polarity inverted



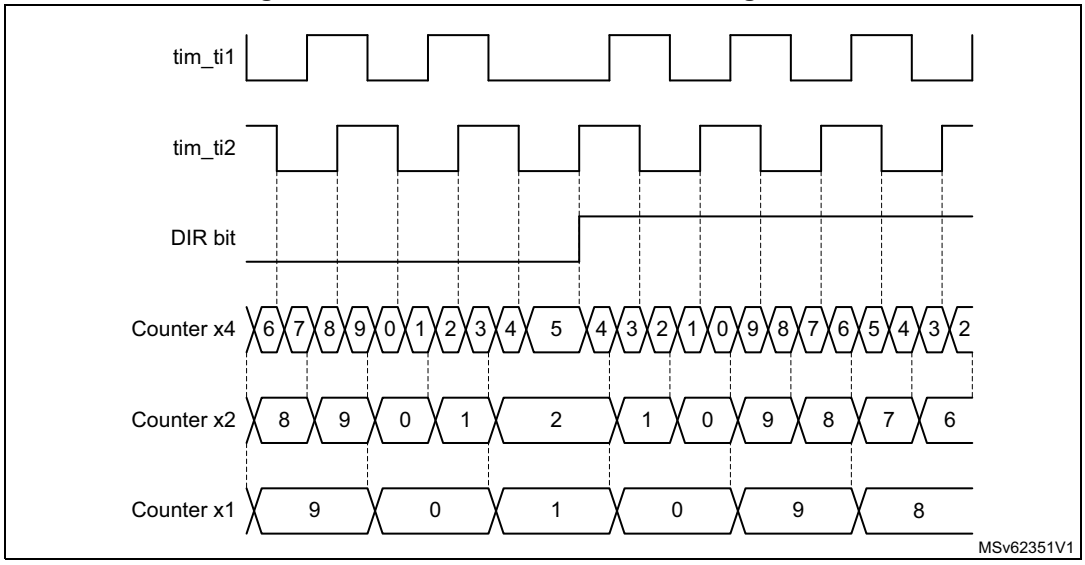


Figure 675 shows the timer counter value during a speed reversal, for various counting modes.

Figure 675. Quadrature encoder counting modes

The timer, when configured in encoder interface mode provides information on the sensor's current position. Dynamic information can be obtained (speed, acceleration, deceleration) by measuring the period between two encoder events using a second timer configured in capture mode. The output of the encoder which indicates the mechanical zero can be used for this purpose. Depending on the time between two events, the counter can also be read at regular times. This can be done by latching the counter value into a third input capture register if available (then the capture signal must be periodic and can be generated by another timer). When available, it is also possible to read its value through a DMA request.

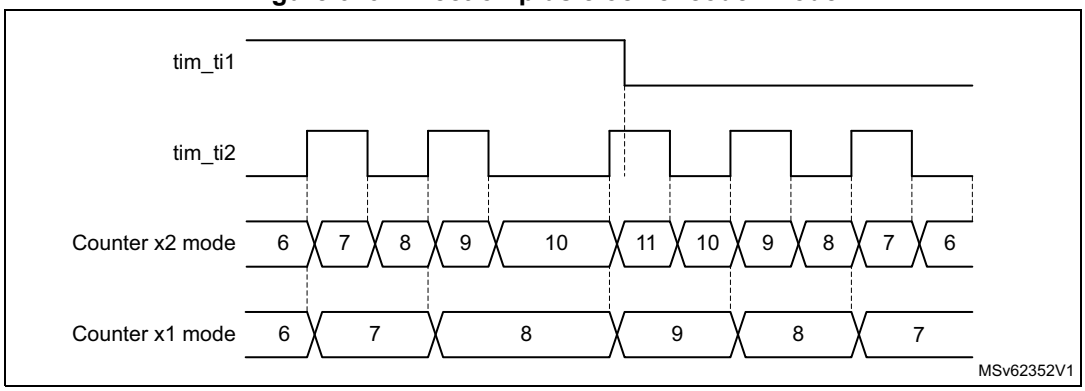
The IUFREMAP bit in the TIM_CR1 register forces a continuous copy of the update interrupt flag (UIF) into the timer counter register's bit 31 (TIM_CNT[31]). This allows both the counter value and a potential roll-over condition signaled by the UIFCPY flag to be read in an atomic way. It eases the calculation of angular speed by avoiding race conditions caused, for instance, by a processing shared between a background task (counter reading) and an interrupt (update interrupt).

There is no latency between the UIF and UIFCPY flag assertions.

In 32-bit timer implementations, when the IUFREMAP bit is set, bit 31 of the counter is overwritten by the UIFCPY flag upon read access (the counter's most significant bit is only accessible in write mode).

Clock plus direction encoder mode

In addition to the quadrature encoder mode, the timer offers support for other types of encoders.



In the "clock plus direction" mode shown on *Figure 676*, the clock is provided on a single line, on tim_ti2, while the direction is forced using the tim_ti1 input.

This mode is enabled with the SMS[4:0] bitfield in the TIM_SMCR register, as following:

- 01010: x2 mode, the counter is updated on both rising and falling edges of the clock.
- 01011: x1 mode, the counter is updated on a single clock edge, as per CC2P bit value: CC2P = 0 corresponds to rising edge sensitivity and CC2P = 1 corresponds to falling edge sensitivity.

The polarity of the direction signal on tim_ti1 is set with the CC1P bit: 0 corresponds to positive polarity (up-counting when tim_ti1 is high and down-counting when tim_ti1 is low) and CC1P = 1 corresponds to negative polarity (up-counting when tim_ti1 is low).

Figure 676. Direction plus clock encoder mode

Directional clock encoder mode

In the “directional clock” mode on *Figure 677*, the clocks are provided on two lines, with a single one at once, depending on the direction, so as to have one up-counting clock line and one down-counting clock line.

This mode is enabled with the SMS[4:0] bitfield in the TIM_SMCR register, as following:

- 01100: x2 mode, the counter is updated on both rising and falling edges of any of the two clock lines. The CC1P and CC2P bits are coding for the clock idle state. CCxP = 0 corresponds to high-level idle state (refer to *Figure 677*) and CCxP = 1 corresponds to low-level idle state (refer to *Figure 678*).
- 01101: x1 mode, the counter is updated on a single clock edge, as per CC1P and CC2P bit value. CCxP = 0 corresponds to falling edge sensitivity and high-level idle state (refer to *Figure 677*), CCxP = 1 corresponds to rising edge sensitivity and low-level idle state (refer to *Figure 678*).

Figure 677. Directional clock encoder mode (CC1P = CC2P = 0)

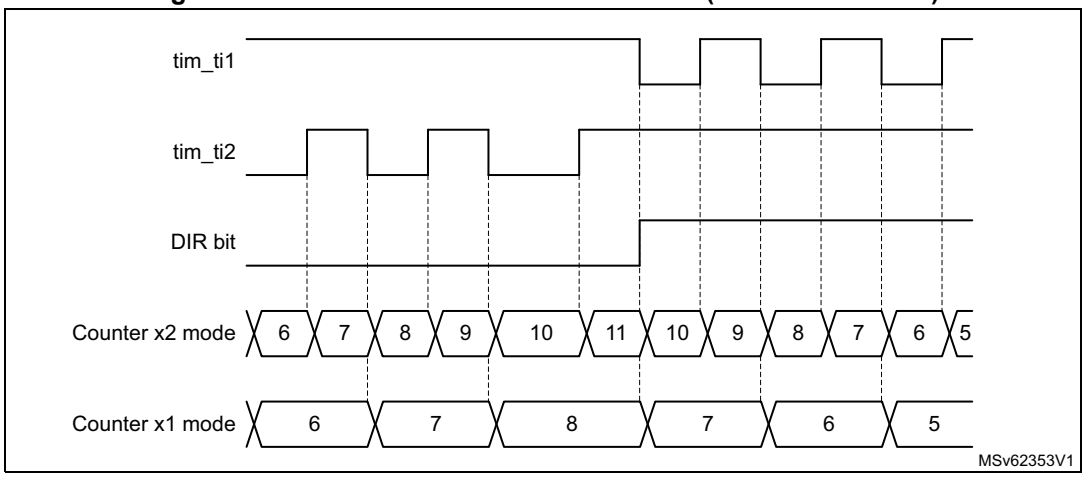


Figure 678. Directional clock encoder mode (CC1P = CC2P = 1)

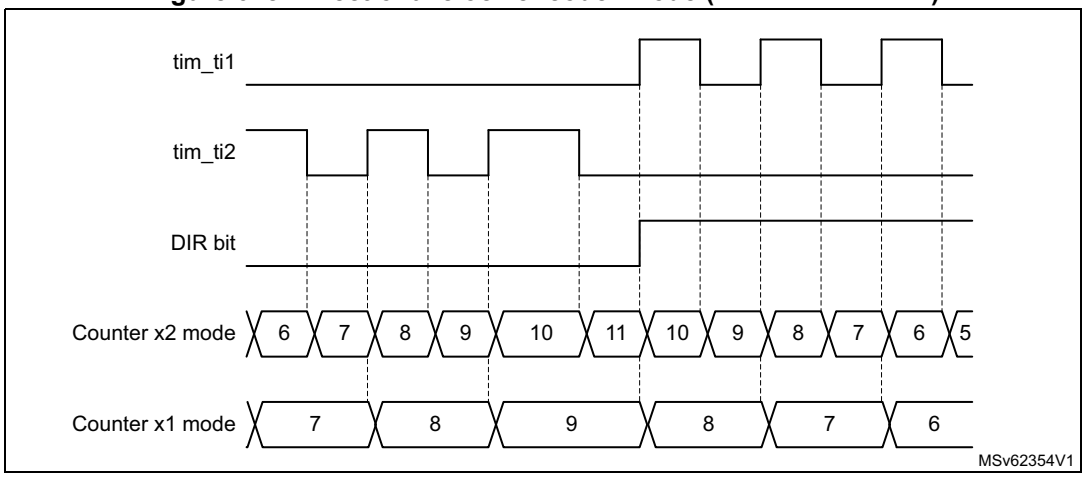

Table 407 details how the directional clock mode operates, for any input transition.

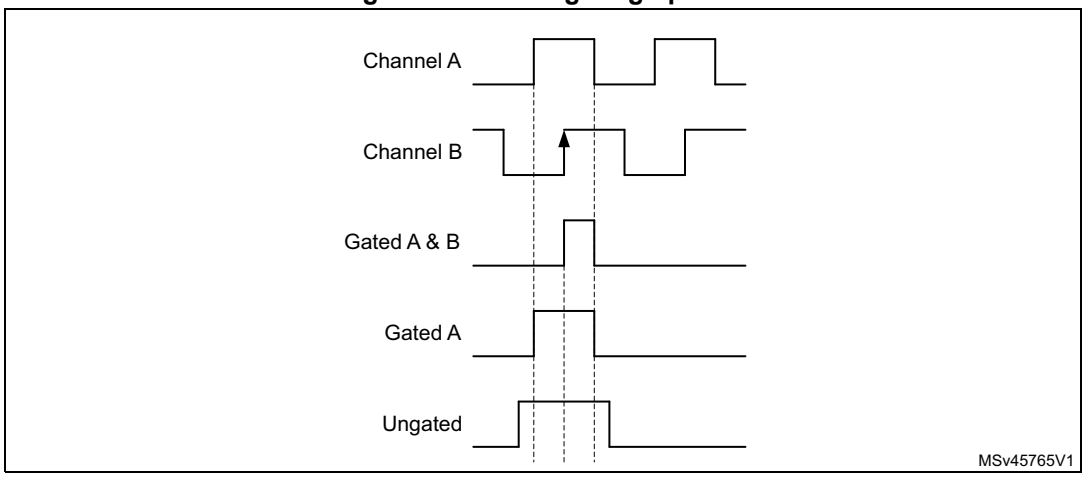
Table 407. Counting direction versus encoder signals and polarity settings

Directional clock mode	SMS[4:0]	Level on opposite signal (tim_ti1fp1 for tim_ti2, tim_ti2fp2 for tim_ti1)	tim_ti1fp1 signal		tim_ti2fp2 signal	
			Rising	Falling	Rising	Falling
x2 mode CCxP = 0	01100	High	Down	Down	Up	Up
		Low	No count	No count	No count	No count
x2 mode CCxP = 1	01100	High	No count	No count	No count	No count
		Low	Down	Down	Up	Up
x1 mode CCxP = 0	01101	High	No count	Down	No count	Up
		Low	No count	No count	No count	No count
x1 mode CCxP = 1	01101	High	No count	No count	No count	No count
		Low	Down	No count	Up	No count

Index input



The counter can be reset by an index signal coming from the encoder, indicating an absolute reference position. The index signal must be connected to the tim_etr_in input. It can be filtered using the digital input filter.

The index functionality is enabled with the IE bit in the TIM_ECR register. The IE bit must be set only in encoder mode, when the SMS[4:0] bitfield has the following values: 00001, 00010, 00011, 01010, 01011, 01100, 01101, 01110, 01111.

Available encoders are proposed with several options for index pulse conditioning, as per *Figure 679*:

- Gated with A and B: the pulse width is 1/4 of one channel period, aligned with both A and B edges.
- Gated with A (or gated with B): the pulse width is 1/2 of one channel period, aligned with the two edges on channel A (resp. channel B).
- Ungated: the pulse width is up to one channel period, without any alignment to the edges.

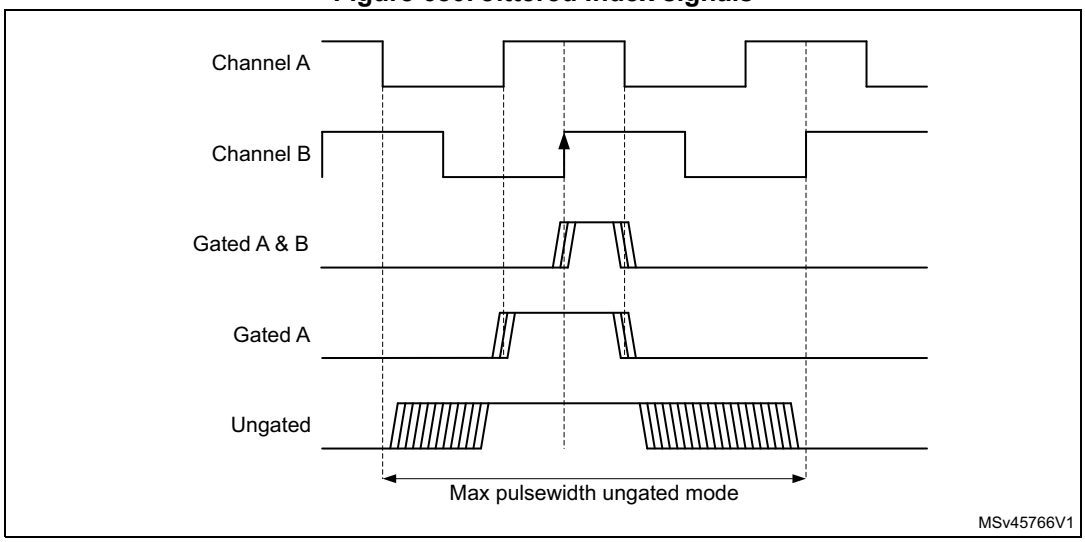


Figure 679. Index gating options

The circuitry tolerates jitter on index signal, whatever the gating mode, as shown on *Figure 680*.

In ungated mode, the signal must be strictly below two encoder periods. If the pulse width is greater or equal to two encoder period, the counter is reset multiple times.

Figure 680. Jittered Index signals

The timer supports the three gating options identically, without any specific programming needed. It is only necessary to define on which encoder state (for example channel A and channel B state combination) the index must be synchronized, using the IPOS[1:0] bitfield in the TIM_ECR register.

The index detection event acts differently depending on counting direction to ensure symmetrical operation during speed reversal:

- The counter is reset during up-counting (DIR bit = 0).
- The counter is set to TIM_ARR when down-counting.

This allows the index to be generated on the very same mechanical angular position whatever the counting direction. *Figure 681* shows at which position is the index generated, for a simplistic example (an encoder providing four edges par mechanical rotation).

Figure 681. Index generation for IPOS[1:0] = 11

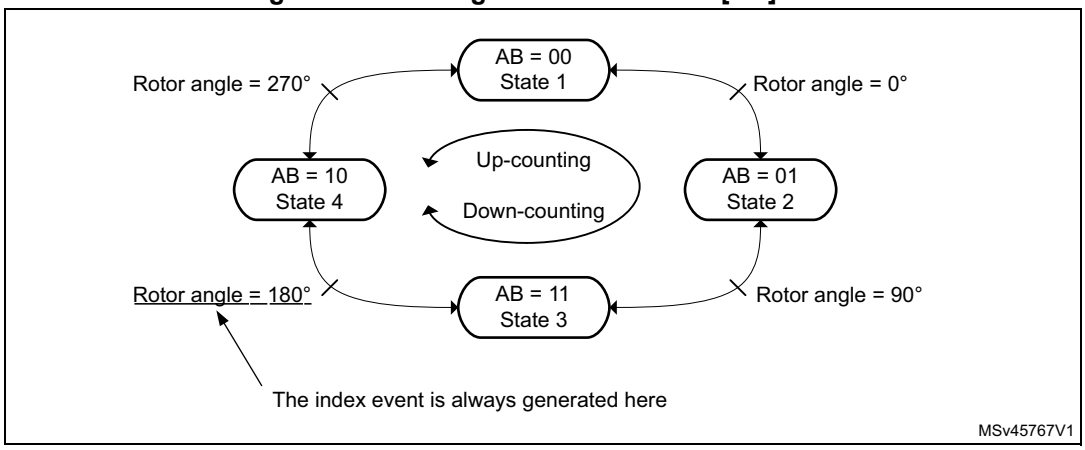

Figure 682 presents waveforms and corresponding values for IPOS[1:0] = 11. It shows that the instant at which the counter value is forced is automatically adjusted depending on the counting direction:

- Counter set to 0 when encoder state is 11 (ChA = 1, ChB = 1), when up-counting (DIR bit = 0).
- Counter set to TIM_ARR when exiting the 11 state, when down-counting (DIR bit = 1).

An interrupt can be issued upon index detection event.

The arrows are indicating on which transition is the index event interrupt generated.

Figure 682. Counter reading with index gated on channel A (IPOS[1:0] = 11)

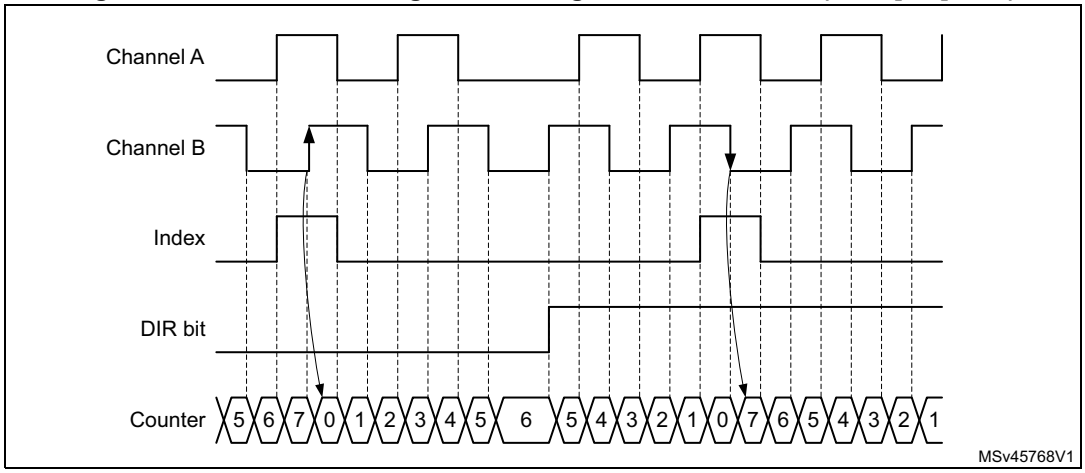

Figure 683 presents waveforms and corresponding values for the ungated mode. The arrows are indicating on which transition is the index event generated.

Figure 683. Counter reading with index ungated (IPOS[1:0] = 00)

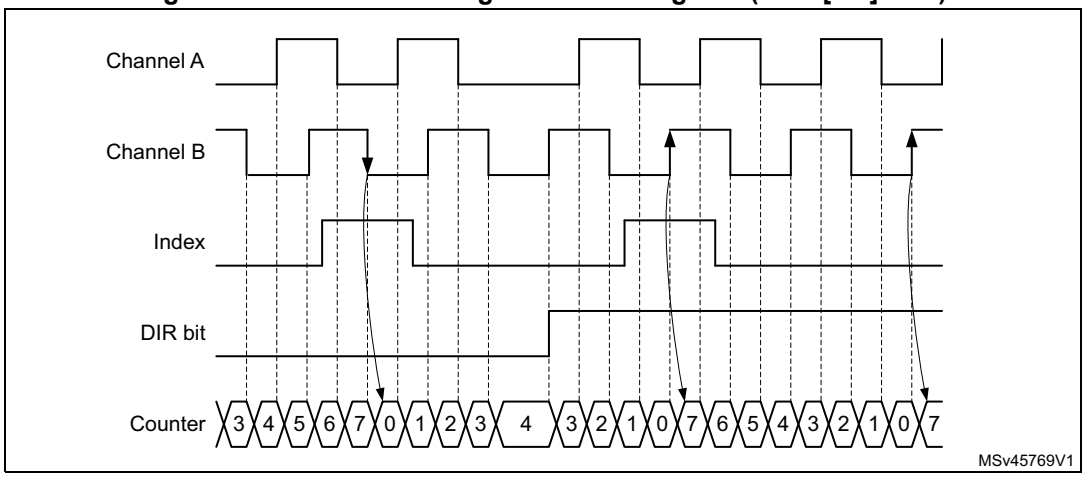

Figure 684 shows how the gated on A & B mode is handled, for various pulse alignment scenarios. The arrows are indicating on which transition is the index event generated.

Figure 684. Counter reading with index gated on channel A and B

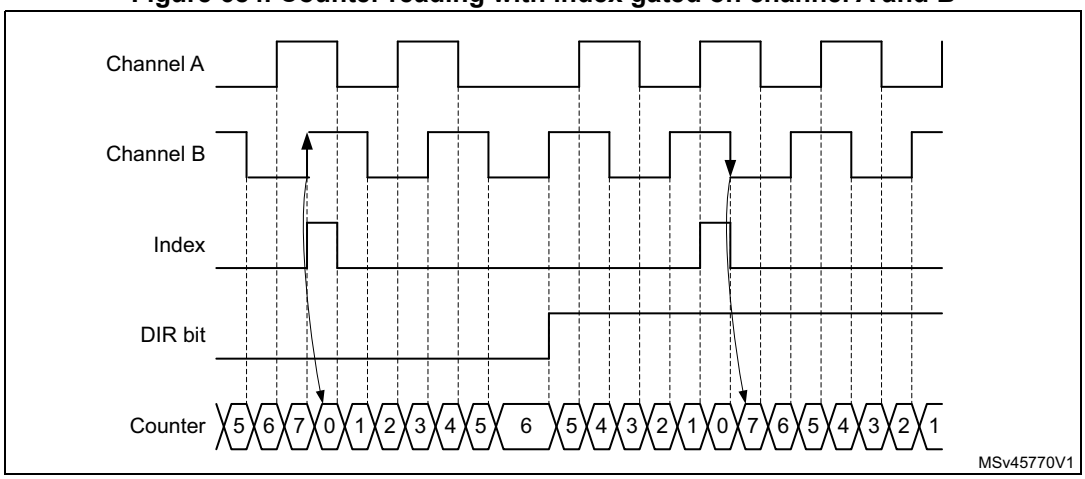

Figure 685 and *Figure 686* detail the case where the subsequent index pulse may be narrower than one quarter of the encoder clock period.

Figure 685. Encoder mode behavior in case of narrow index pulse (IPOS[1:0] = 11)

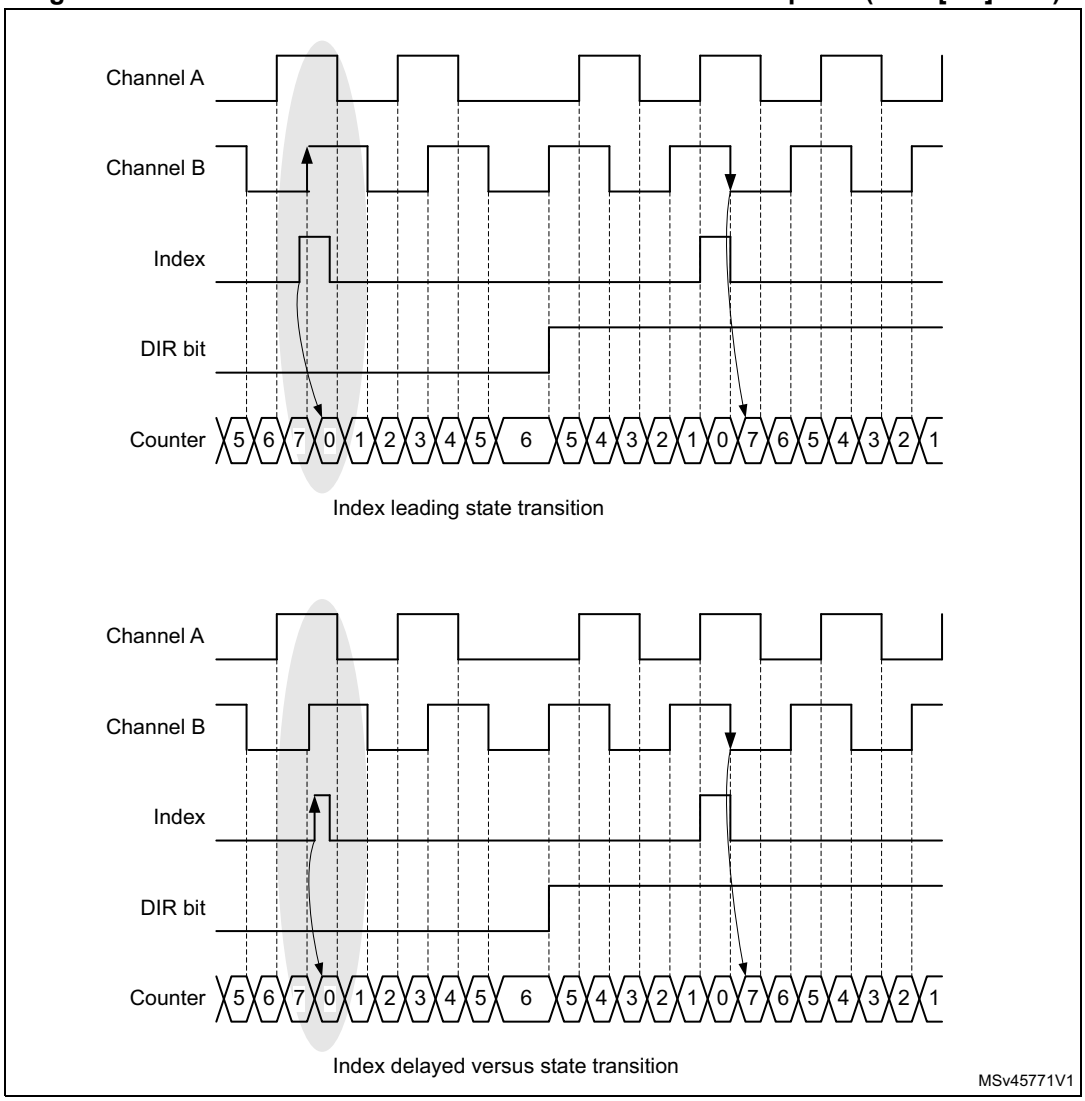

Figure 686. Counter reset Narrow index pulse (closer view, ARR = 0x07)

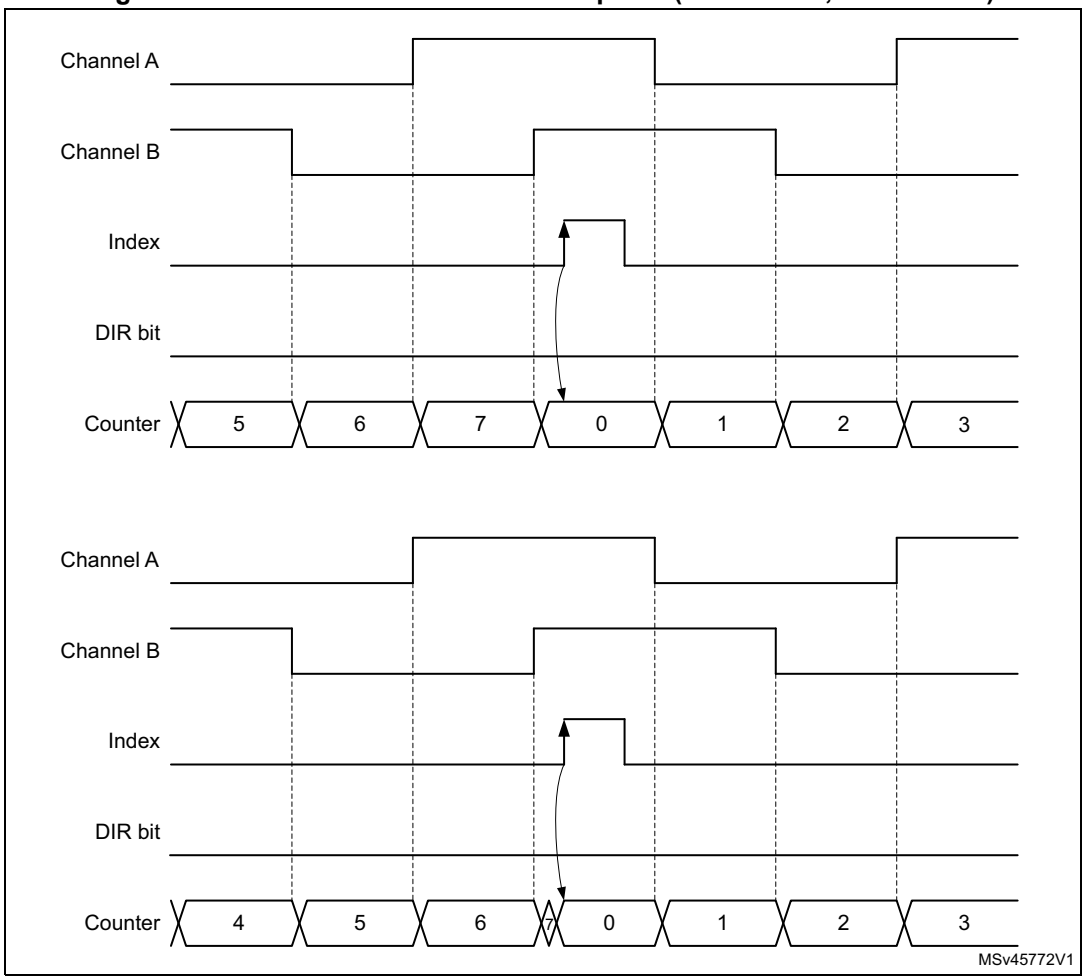

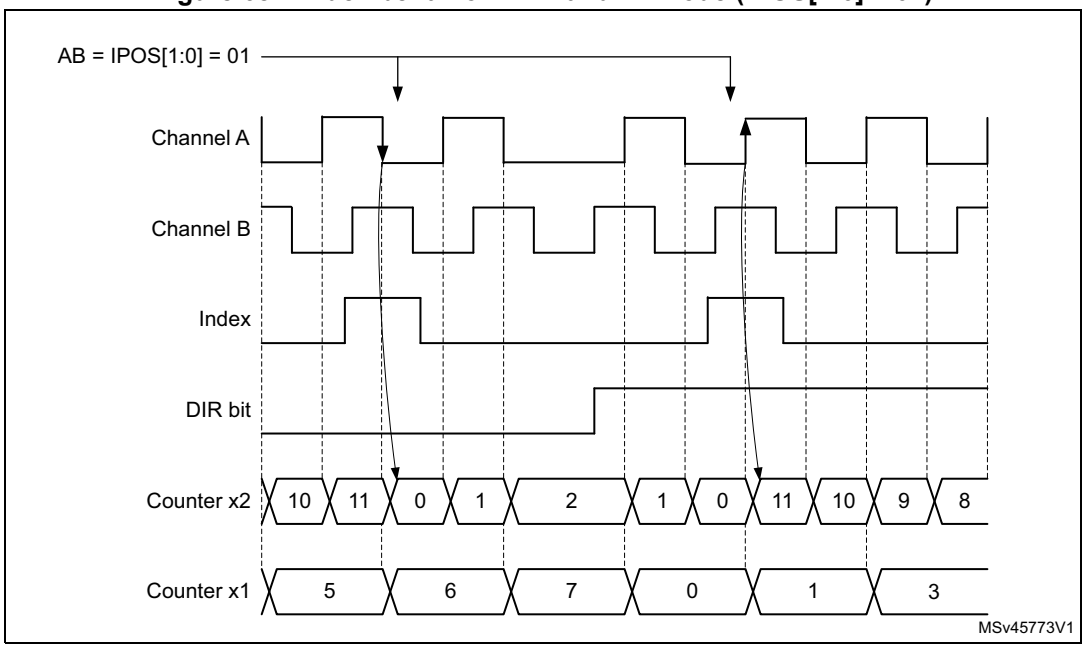

Figure 687 shows how the index is managed in x1 and x2 modes.

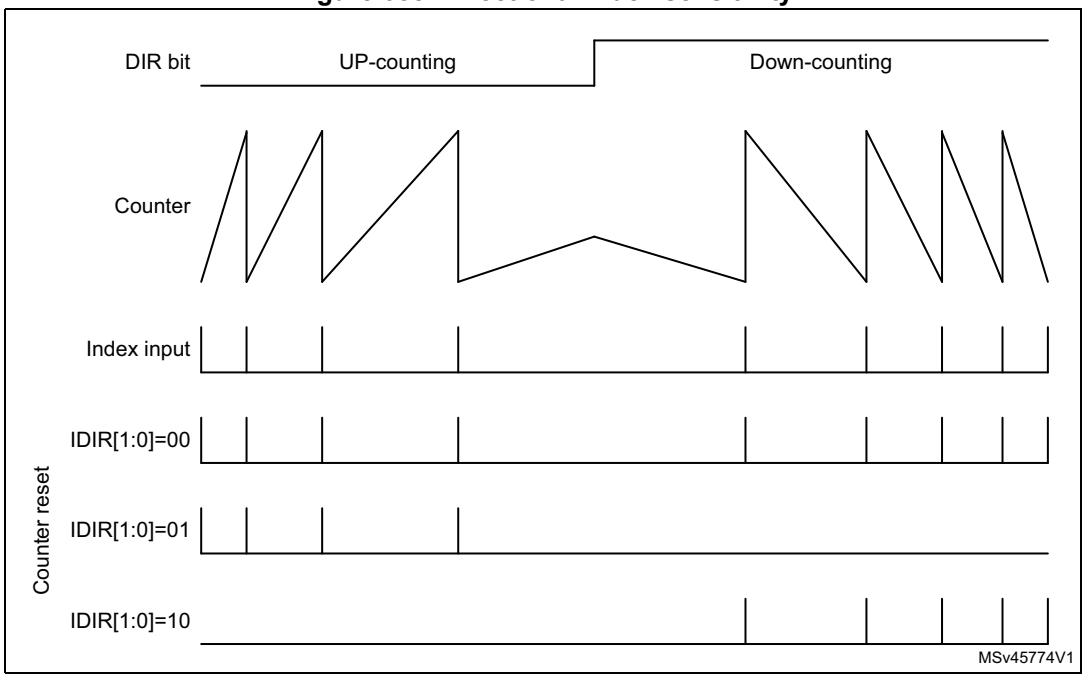
Figure 687. Index behavior in x1 and x2 mode (IPOS[1:0] = 01)



Directional index sensitivity

The IDIR[1:0] bitfield in the TIM_ECR register allows the index to be active only in a selected counting direction.

Figure 688 shows the relationship between index and counter reset events, depending on IDIR[1:0] value.

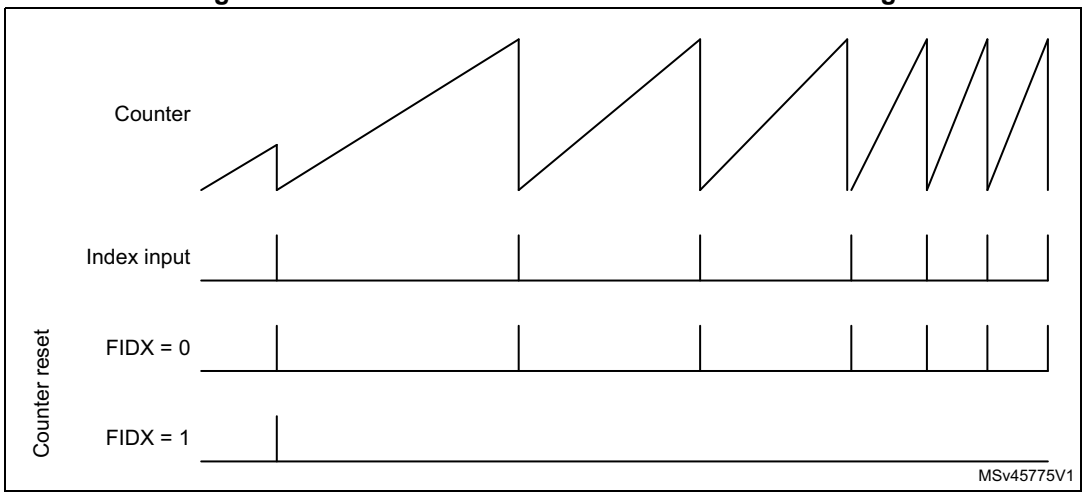


Figure 688. Directional index sensitivity

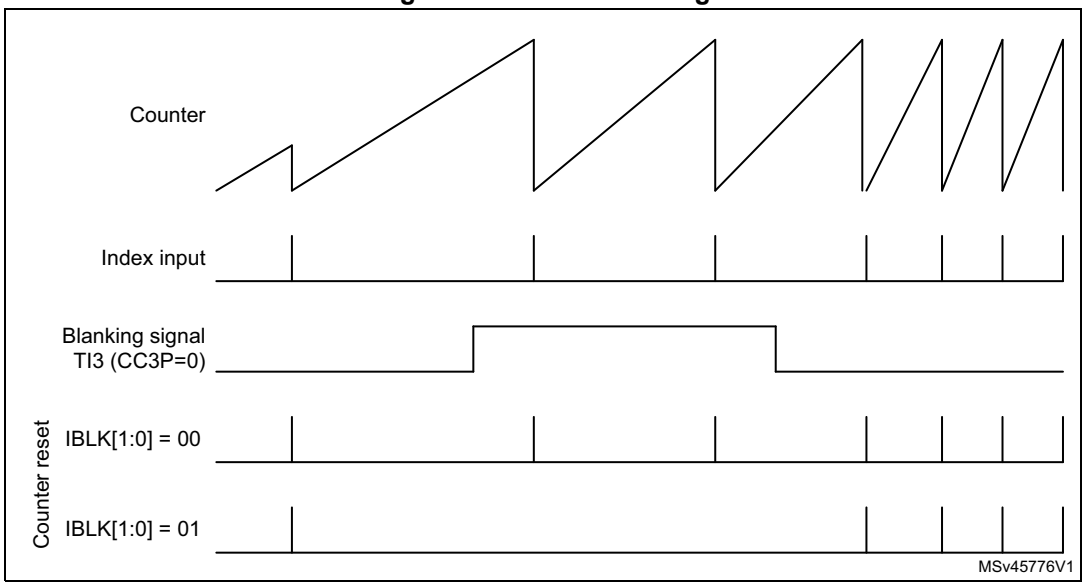
Special first index event management

The FIDX bit in the TIM_ECR register allows the index to be taken only once, as shown on *Figure 689*. Once the first index has arrived, any subsequent index is ignored. If needed, the circuitry can be rearmed by writing the FIDX bit to 0 and setting it again to 1.

Figure 689. Counter reset as function of FIDX bit setting



Index blanking

The index event can be blanked using the tim_ti3 or tim_ti4 inputs. During the blanking window, the index events are no longer resetting the counter, as shown on *Figure 690*.

This mode is enabled using the IBLK[1:0] bitfield in the TIM_ECR register, as following:

- IBLK[1:0] = 00: Index signal always active.
- IBLK[1:0] = 01: Index signal blanking on tim_ti3 input.
- IBLK[1:0] = 10: Index signal blanking on tim_ti4 input.

Figure 690. Index blanking

Index management in nonquadrature mode

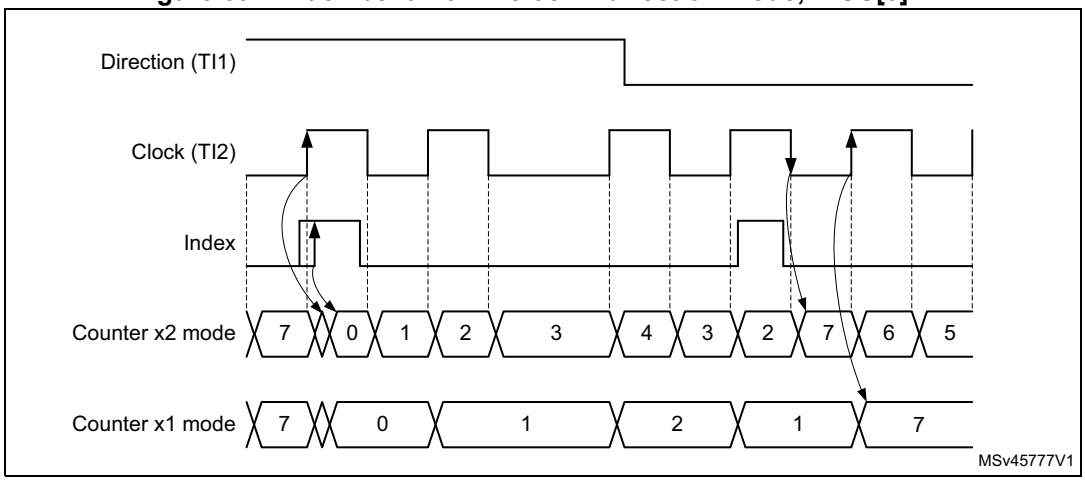
Figure 691 and *Figure 692* detail how the index is managed in directional clock mode and clock plus direction mode, when the SMS[4:0] bitfield is equal to 01010, 01011, 01100, 01101.

For both of these modes, the index sensitivity is set with the IPOS[0] bit as following:

- IPOS[0] = 0: Index is detected on clock low level.
- IPOS[0] = 1: Index is detected on clock high level.

The IPOS[1] bit is not-significant.

Figure 691. Index behavior in clock + direction mode, IPOS[0] = 1



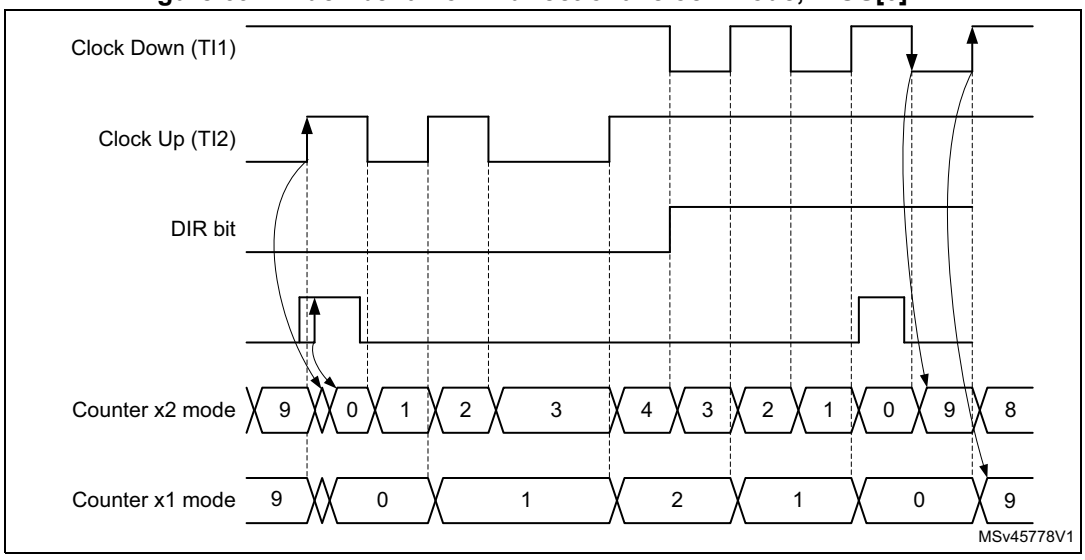


Figure 692. Index behavior in directional clock mode, IPOS[0] = 1

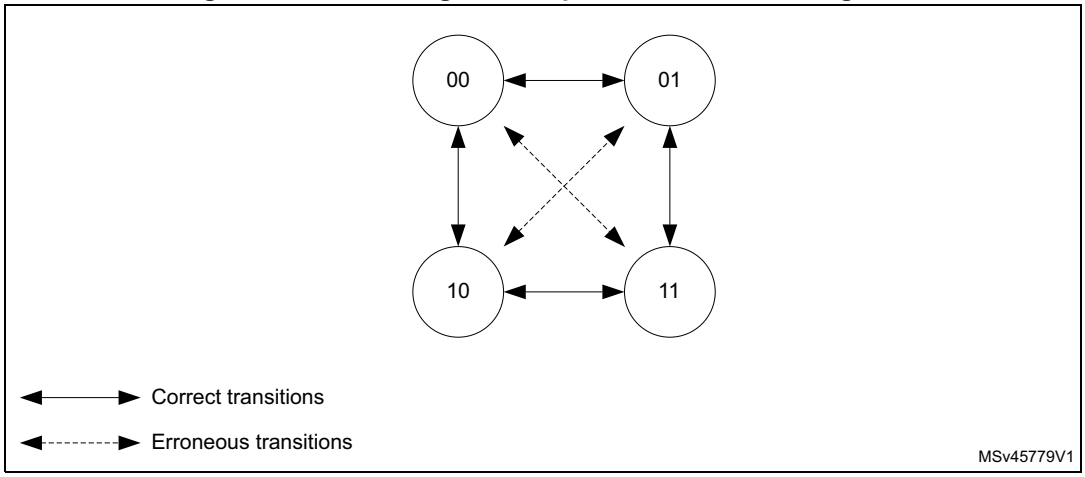
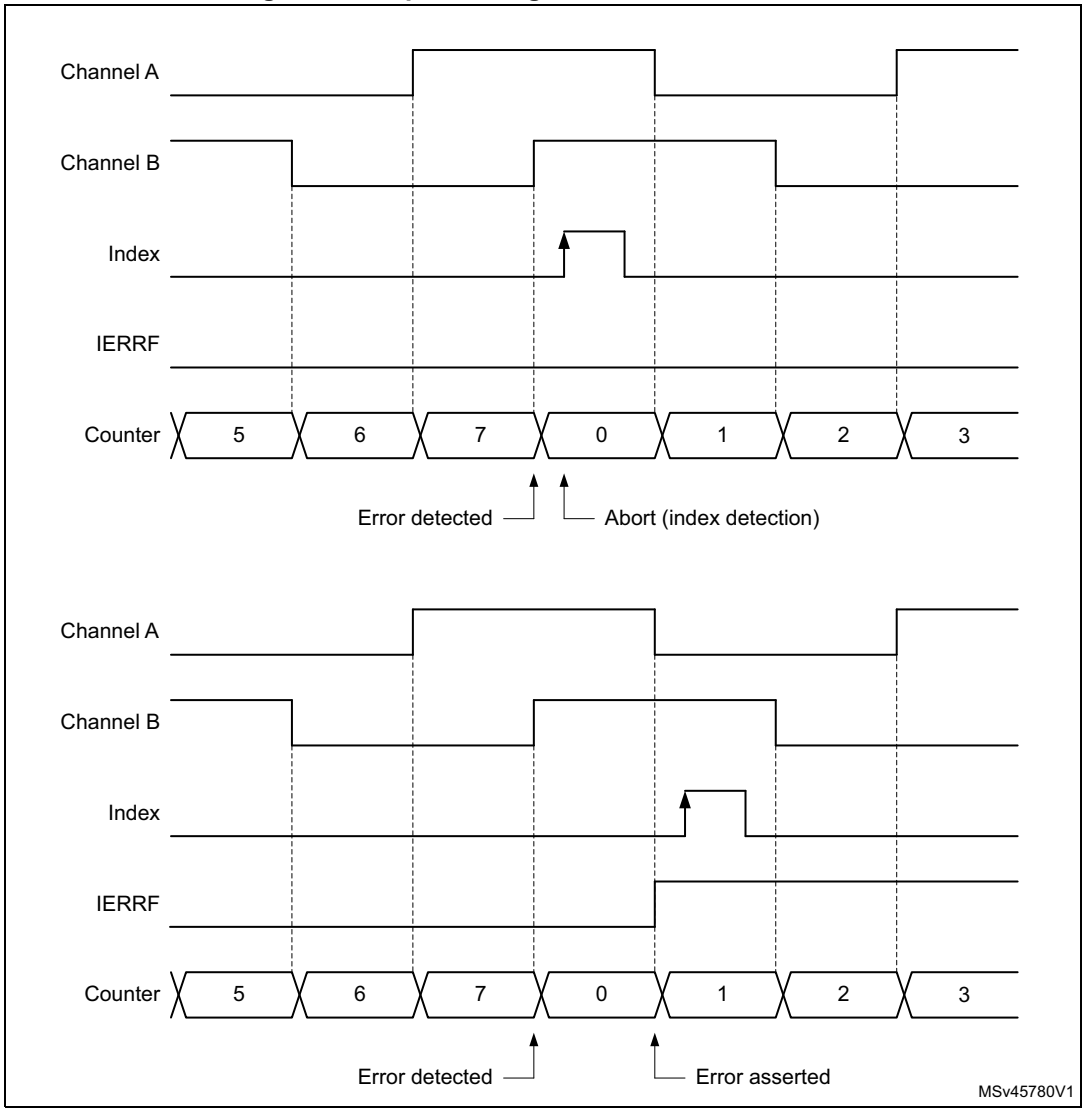


Encoder error management

For encoder configurations where two quadrature signals are available, it is possible to detect transition errors. The reading on the two inputs corresponds to a 2-bit gray code which can be represented as a state diagram, on *Figure 693*. A single bit is expected to change at once. An erroneous transition sets the TERRF interrupt flag in the TIM_SR status

register. A transition error interrupt is generated if the TERRIE bit is set in the TIM_DIER register.

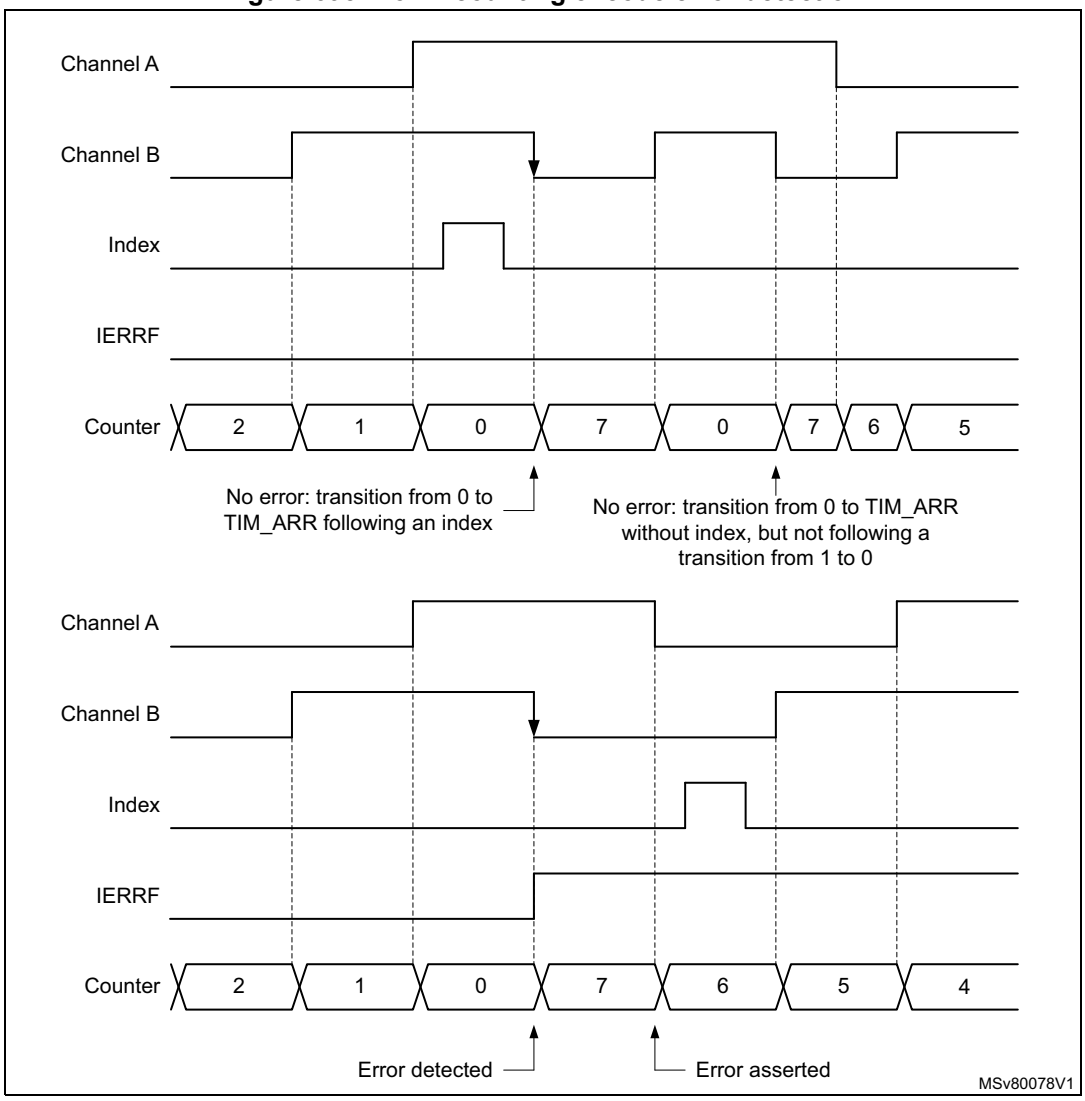
Figure 693. State diagram for quadrature encoded signals



For encoder having an index signal, it is possible to detect abnormal operation resulting in an excess of pulses per revolution. An encoder with N pulses per revolution provides 4xN counts per revolution. The index signal resets the counter every 4xN clock periods.

If the counter value is incremented from TIM_ARR to 0 or decremented from 0 to TIM_ARR value without any index event, this is reported as an index position error.

The overflow threshold is programmed using the TIM_ARR register. A 1000 lines encoder results in a counter value being between 0 and 3999 (in 4x reading mode). The overflow detection threshold must be programmed by setting TIM_ARR = 3999 + 1 = 4000.



The error assertion is delayed to the transition 0 to 1 when in up-counting. This is to cope with narrow index pulses in gated A and B mode, as shown on *Figure 694*.

Figure 694. Up-counting encoder error detection

In down-counting mode, the detection is conditioned by a preliminary transition from 1 to 0. This is to cope with narrow index pulses in gated A and B mode, as shown on *Figure 695*, to avoid any false error detection in case the encoder dithers between TIM_ARR and 0 immediately after the index detection.

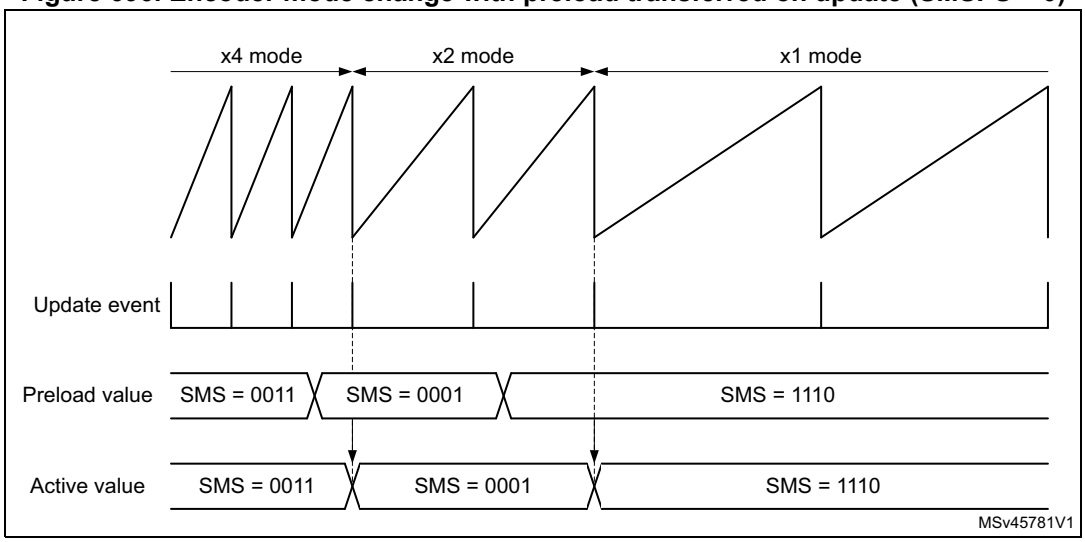
Figure 695. Down-counting encode error detection

An index error sets the IERRF interrupt flag in the TIM_SR status register. An index error interrupt is generated if the IERRIE bit is set in the TIM_DIER register.

Functional encoder interrupts

The following interrupts are also available in encoder mode

- Direction change: any change of the counting direction in encoder mode causes the DIR bit in the TIM_CR1 register to toggle. The direction change sets the DIRF interrupt flag in the TIM_SR status register. A direction change interrupt is generated if the DIRIE bit is set in the TIM_DIER register.
- Index event: the index event sets the IDXF interrupt flag in the TIM_SR status register. An index interrupt is generated if the IDXIE bit is set in the TIM_DIER register.



Slave mode selection preload for run-time encoder mode update

It can be necessary to switch from one encoder mode to another during run-time. This is typically done at high-speed to decrease the update interrupt rate, by switching from x4 to x2 to x1 mode, as shown on *Figure 696*.

For this purpose, the SMS[4:0] bit can be preloaded. This is enabled by setting the SMSPE enable bit in the TIM_SMCR register. The trigger for the transfer from SMS[4:0] preload to active value can be selected with the SMSPS bit in the TIM_SMCR register.

- SMSPS = 0: the transfer is triggered by the update event (UEV) occurring when the counter overflows when up-counting, and underflows when down-counting.
- SMSPS = 1: the transfer is triggered by the index event.

Figure 696. Encoder mode change with preload transferred on update (SMSPS = 0)

Encoder clock output

The encoder mode operating principle is not perfectly suited for high-resolution velocity measurements, at low speed, as it requires a relatively long integration time to have a sufficient number of clock edges and a precise measurement.

At low speed, a better solution is to do an edge-to-edge clock period measurement. This can be achieved using a slave timer. The timer can output the encoder clock information on the tim_trgo output. The slave timer can then perform a period measurement and provide velocity information for each and every encoder clock edge.

This mode is enabled by setting the MMS[3:0] bitfield to 1000, in the TIM_CR2 register. It is valid for the following SMS[4:0] values: 00001, 00010, 00011, 01010, 01011, 01100, 01101, 01110, 01111. Any other SMS[4:0] code is not allowed and may lead to unexpected behavior.

35.4.21 Encoder with built-in debouncer

This mode is intended to support noisy digital potentiometers and knobs, providing quadrature encoded signals with potentially long bouncing periods after each transition.

The operating principle consists of working on the first valid transition and discard any other until a second valid transition is detected on the alternate encoder signal.

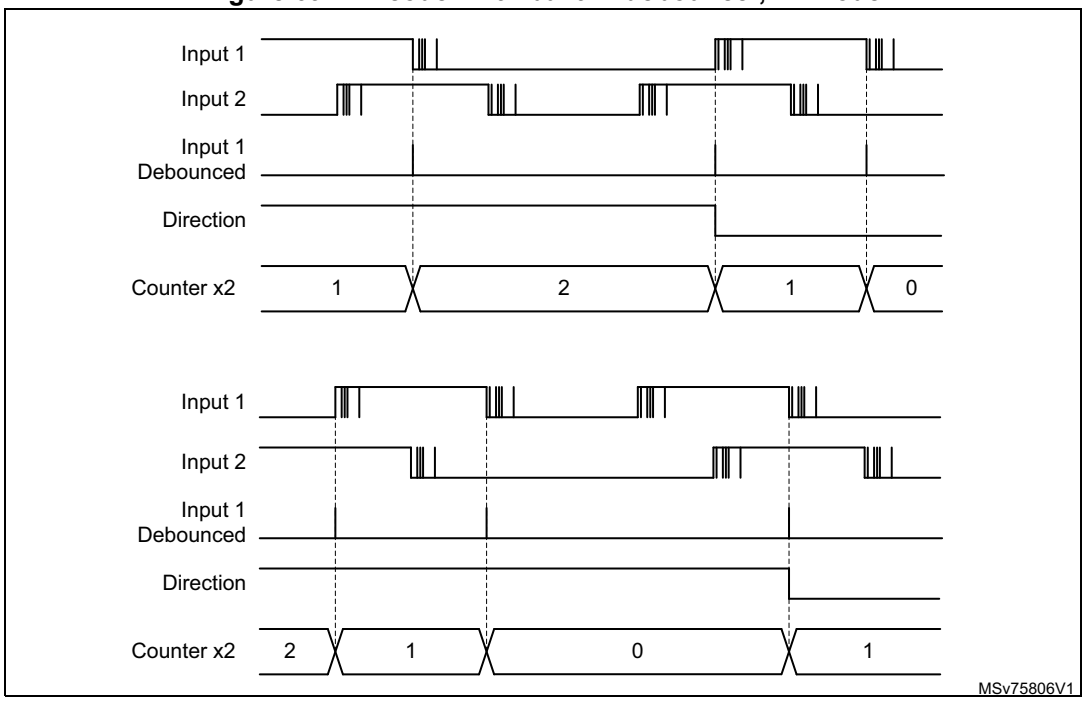
The *Figure 697* below represents the x2 operating mode. It must be noticed that a transition on input 1 is ignored during direction reversal, if there's no edge on input 2.

The *Figure 698* below represents the x4 operating mode. In this case, a transition is always ignored during a direction reversal or when the encoder dithers between two positions.

These two modes are enabled by writing SMS[4:0] = 10000 or 10001 in TIM_SMCR register.

The encoder with built-in debouncer modes are not suitable for tracking a position or an angle in motor control applications. The transitions ignored during direction reversal will lead to a position/angle error that will build-up over time.

Figure 697. Encoder with built-in debouncer, x2 mode



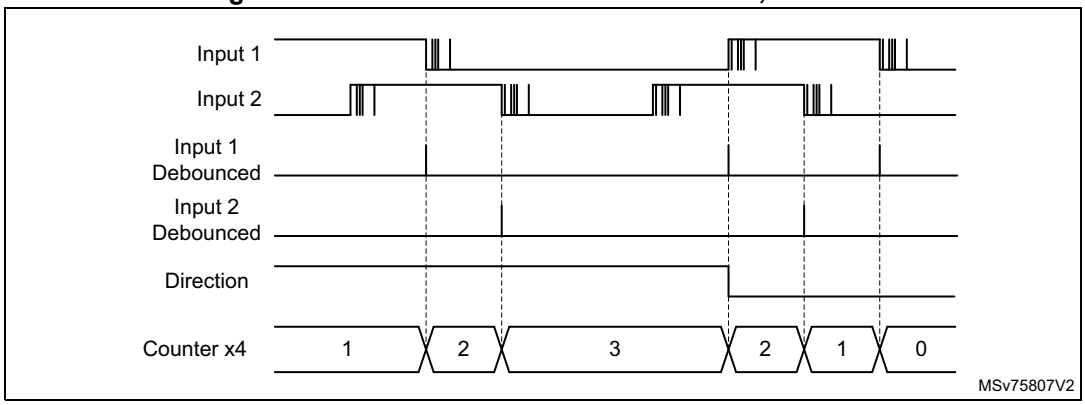


Figure 698. Encoder with built-in debouncer, x4 mode

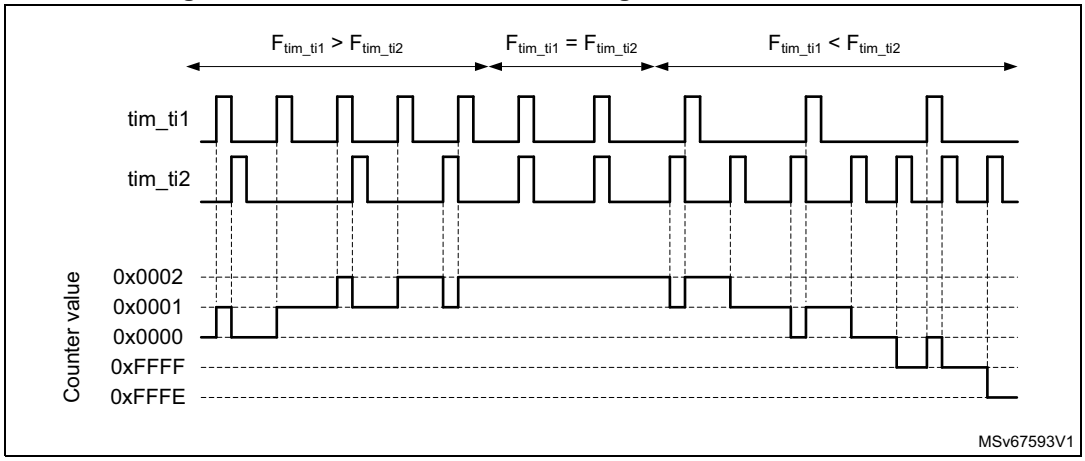
35.4.22 Direction bit output

It is possible to output a direction signal out of the timer, on the tim_oc3 and tim_oc4 output signals (copy of the DIR bit in the TIM_CR1 register). This is achieved by setting the OC3M[3:0] or the OC4M[3:0] bitfield to 1011 in the TIM_CCMR2 register.

This feature can be used for monitoring the counting direction (or rotation direction) in encoder mode, or to have a signal indicating the up/down phases in center-aligned PWM mode.

35.4.23 Clock drift measurement

It is possible to measure the drift between two clock sources using the directional clock encoder mode. This is useful for audio applications typically, when one need to compute the drift between two streams.



To do so, a signal representing the rate of a first audio stream must be connected to tim_ti1 and a signal representing the rate of a second audio stream must be connected to tim_ti2. The signals representing the audio rates are generally the SAIx_FS_A, SAIx_FS_B, SPIx_WS or spdifrx_frame_sync (this list of signals is provided as example and depends on the audio peripheral availability for a given product line, as detailed on the product datasheet).

In this case, the clocks are present on both tim_ti1 and tim2 simultaneously, as shown on *Figure 699*, and the counter value indicates the drift.

Let's define F_{tim_ti1} and F_{tim_ti2} the frequencies of the signals on tim_ti1 and tim_ti2. The counter value will change as following:

- If $F_{tim_ti1} > F_{tim_ti2}$ the counter value increases.
- If $F_{tim_ti1} < F_{tim_ti2}$ the counter value decreases.
- If $F_{tim_ti1} = F_{tim_ti2}$ the counter value will dither between two consecutive values, from one clock edge to the other. If the two clocks are perfectly synchronized (clock edges occurring simultaneously on the two inputs), the counter value does not change (as shown on *Figure 699*).

Figure 699. Clock drift measure using directional clock mode

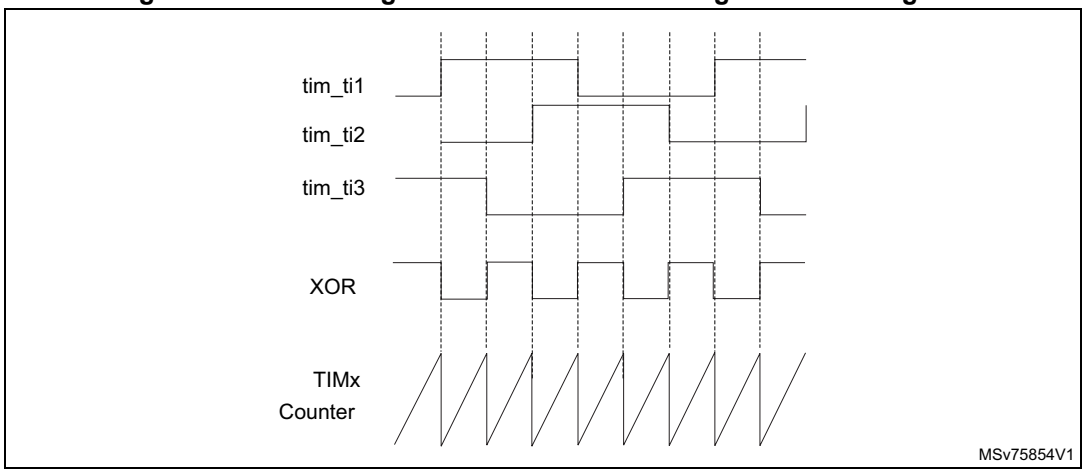
35.4.24 UIF bit remapping

The IUFREMAP bit in the TIM_CR1 register forces a continuous copy of the update interrupt flag (UIF) into bit 31 of the timer counter register's bit 31 (TIM_CNT[31]). This is used to atomically read both the counter value and a potential roll-over condition signaled by the UIFCPY flag. It eases the calculation of angular speed by avoiding race conditions caused, for instance, by a processing shared between a background task (counter reading) and an interrupt (update interrupt).

There is no latency between the UIF and UIFCPY flag assertions.

In 32-bit timer implementations, when the IUFREMAP bit is set, bit 31 of the counter is overwritten by the UIFCPY flag upon read access (the counter's most significant bit is only accessible in write mode).

35.4.25 Timer input XOR function



The TI1S bit in the TIM_CR2 register, allows the input filter of channel 1 to be connected to the output of an XOR gate, combining the three input pins tim_ti1, tim_ti2 and tim_ti3.

The XOR output can be used with all the timer input functions such as trigger or input capture.

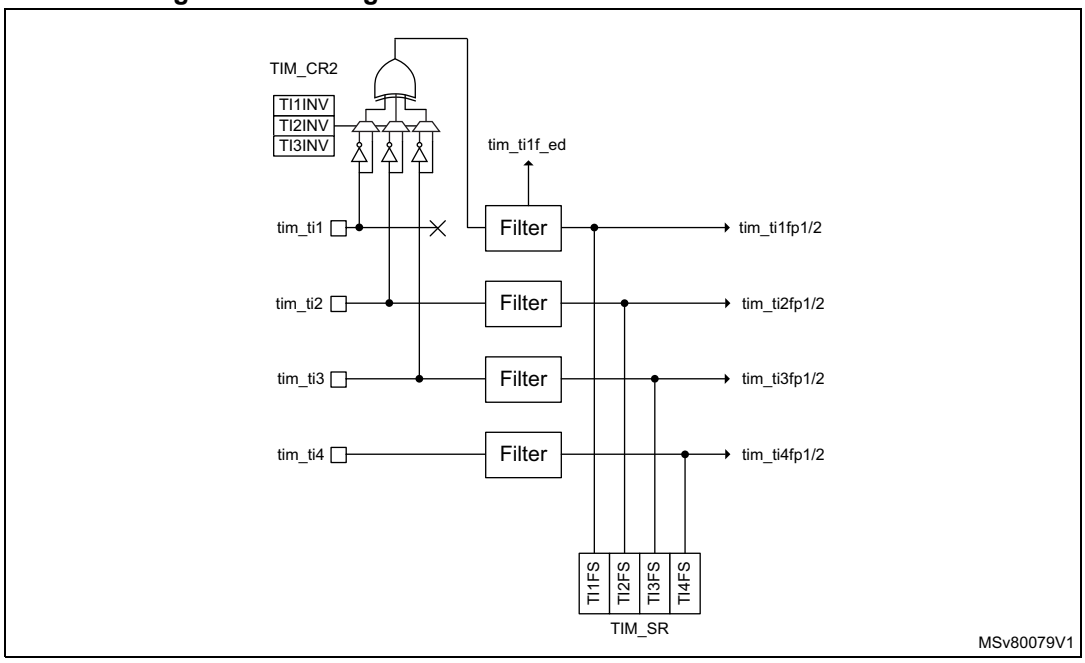
An example of this feature used to interface Hall sensors is given in *Section 34.3.34: Interfacing with Hall sensors*.

It is convenient to measure the interval between edges on two input signals, as per *Figure 700*.

Figure 700. Measuring time interval between edges on three signals

The XORPS control bit selects the position of the XOR gate, as shown on the *Figure 701* and *Figure 702* below, when the TI1S bit is set.

Figure 701. XOR gate connection with TI1S = 1 and XORPS = 0



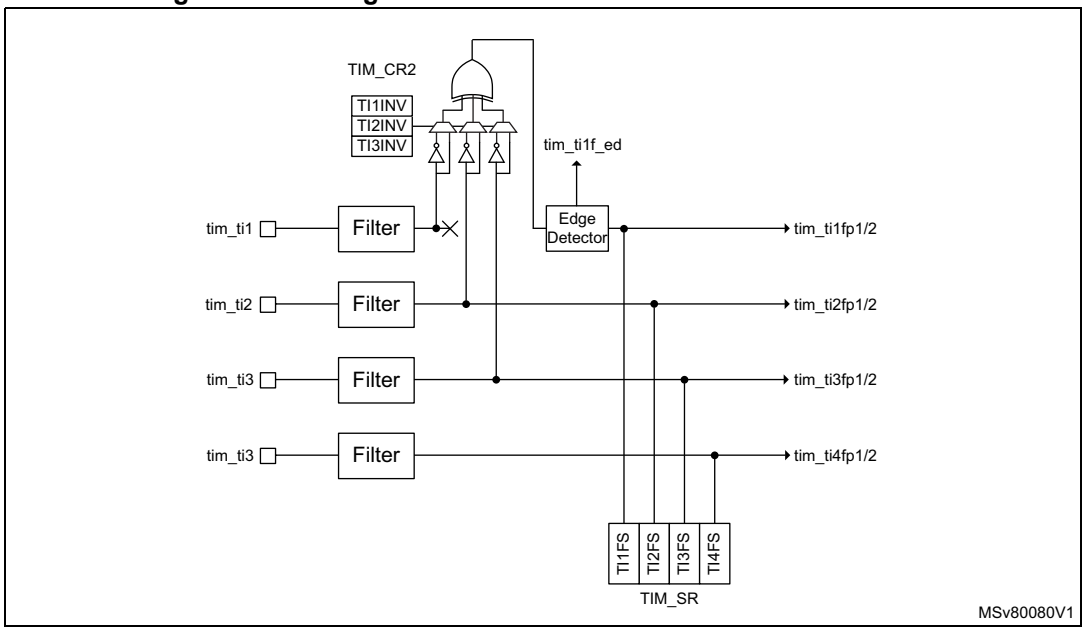


Figure 702. XOR gate connection with TI1S = 1 and XORPS = 1

Three control bits T1INV, T2INV and T3INV in the TIM_CR2 register can invert the tim_in1, tim_in2 and tim_in3 signals prior entering the XOR gate.

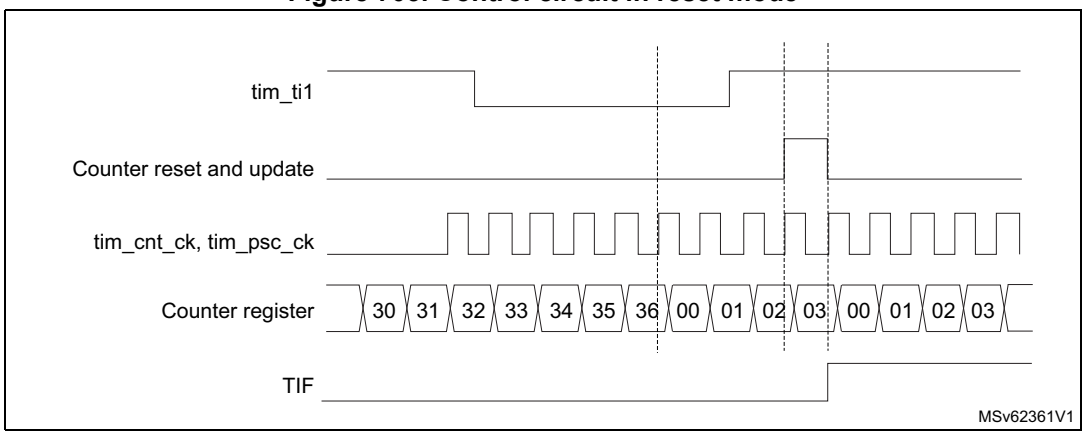
The status of the tim_in1, tim_in2, tim_in3 and tim_in4 signals can be software polled using the TI1FS, TI2FS, TI3FS and TI4FS bits in the TIM_SR register (tim_ti4 is not represented on figures above and do not enter into the XOR gate).

35.4.26 Timers and external trigger synchronization

The TIMx timers can be synchronized with an external trigger in several modes: reset mode, gated mode, trigger mode, reset + trigger and gated + reset modes.

Slave mode: reset mode

The counter and its prescaler can be reinitialized in response to an event on a trigger input. Moreover, if the URS bit from the TIM_CR1 register is low, an update event UEV is generated. Then all the preloaded registers (TIM_ARR, TIM_CCRx) are updated.



In the following example, the upcounter is cleared in response to a rising edge on tim_ti1 input:

1. Configure the channel 1 to detect rising edges on tim_ti1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in the TIM_CCMR1 register. Write CC1P = 0 and CC1NP = 0 in TIM_CCER register to validate the polarity (and detect rising edges only).
2. Configure the timer in reset mode by writing SMS = 100 in TIM_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIM_SMCR register.
3. Start the counter by writing CEN = 1 in the TIM_CR1 register.

The counter starts counting on the internal clock, then behaves normally until tim_ti1 rising edge. When tim_ti1 rises, the counter is cleared and restarts from 0. In the meantime, the trigger flag is set (TIF bit in the TIM_SR register) and an interrupt request, or a DMA request can be sent if enabled (depending on the TIE and TDE bits in TIM_DIER register).

The following figure shows this behavior when the autoreload register TIM_ARR = 0x36. The delay between the rising edge on tim_ti1 and the actual reset of the counter is due to the resynchronization circuit on tim_ti1 input.

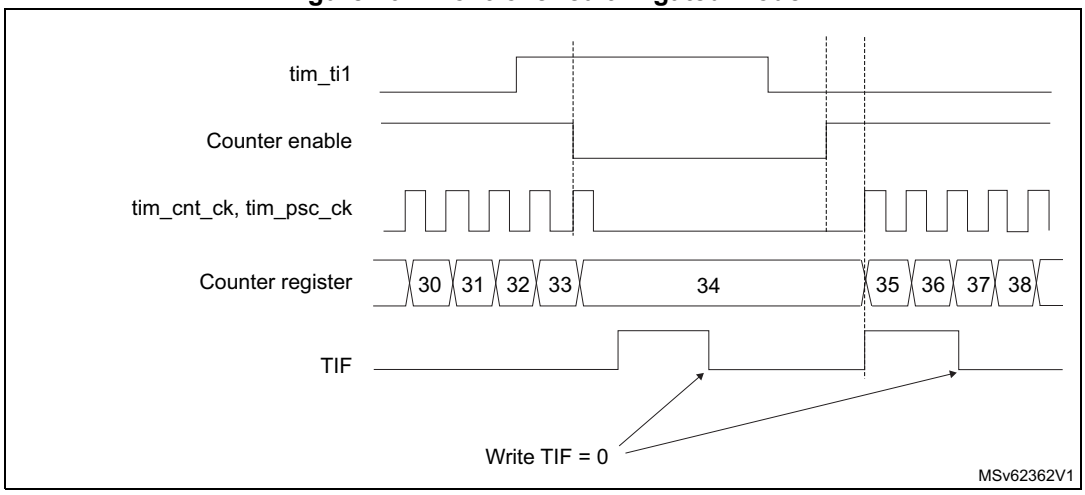
Figure 703. Control circuit in reset mode

Slave mode: gated mode

The counter can be enabled depending on the level of a selected input.

In the following example, the upcounter counts only when tim_ti1 input is low:

1. Configure the channel 1 to detect low levels on tim_ti1. Configure the input filter duration (in this example, we do not need any filter, so we keep IC1F = 0000). The



capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in TIM_CCMR1 register. Write CC1P = 1 and CC1NP = 0 in TIM_CCER register to validate the polarity (and detect low level only).

2. Configure the timer in gated mode by writing SMS = 101 in TIM_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIM_SMCR register.
3. Enable the counter by writing CEN = 1 in the TIM_CR1 register (in gated mode, the counter does not start if CEN = 0, whatever is the trigger input level).

The counter starts counting on the internal clock as long as tim_ti1 is low and stops as soon as tim_ti1 becomes high. The TIF flag in the TIM_SR register is set both when the counter starts or stops.

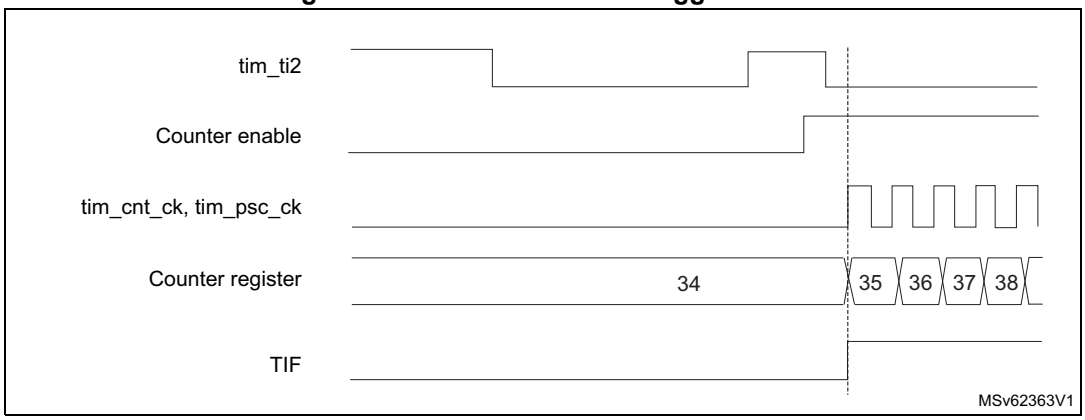
The delay between the rising edge on tim_ti1 and the actual stop of the counter is due to the resynchronization circuit on tim_ti1 input.

Figure 704. Control circuit in gated mode

Note: The configuration "CCxP = CCxNP = 1" (detection of both rising and falling edges) does not have any effect in gated mode because gated mode acts on a level and not on an edge.

Slave mode: trigger mode

The counter can start in response to an event on a selected input.



In the following example, the upcounter starts in response to a rising edge on tim_ti2 input:

1. Configure the channel 2 to detect rising edges on tim_ti2. Configure the input filter duration (in this example, we do not need any filter, so we keep IC2F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. CC2S bits are selecting the input capture source only, CC2S = 01 in TIM_CCMR1 register. Write CC2P = 1 and CC2NP = 0 in TIM_CCER register to validate the polarity (and detect low level only).
2. Configure the timer in trigger mode by writing SMS = 110 in TIM_SMCR register. Select tim_ti2 as the input source by writing TS = 00110 in TIM_SMCR register.

When a rising edge occurs on tim_ti2, the counter starts counting on the internal clock and the TIF flag is set.

The delay between the rising edge on tim_ti2 and the actual start of the counter is due to the resynchronization circuit on tim_ti2 input.

Figure 705. Control circuit in trigger mode

Slave mode selection preload for run-time encoder mode update

The SMS[4:0] bit can be preloaded. This is enabled by setting the SMSPE enable bit in the TIM_SMCR register. The trigger for the transfer from SMS[4:0] preload to active value is the update event (UEV) occurring when the counter overflows.

Slave mode – combined reset + trigger mode

In this case, a rising edge of the selected trigger input (tim_trgi) reinitializes the counter, generates an update of the registers, and starts the counter.

This mode is used for one-pulse mode.

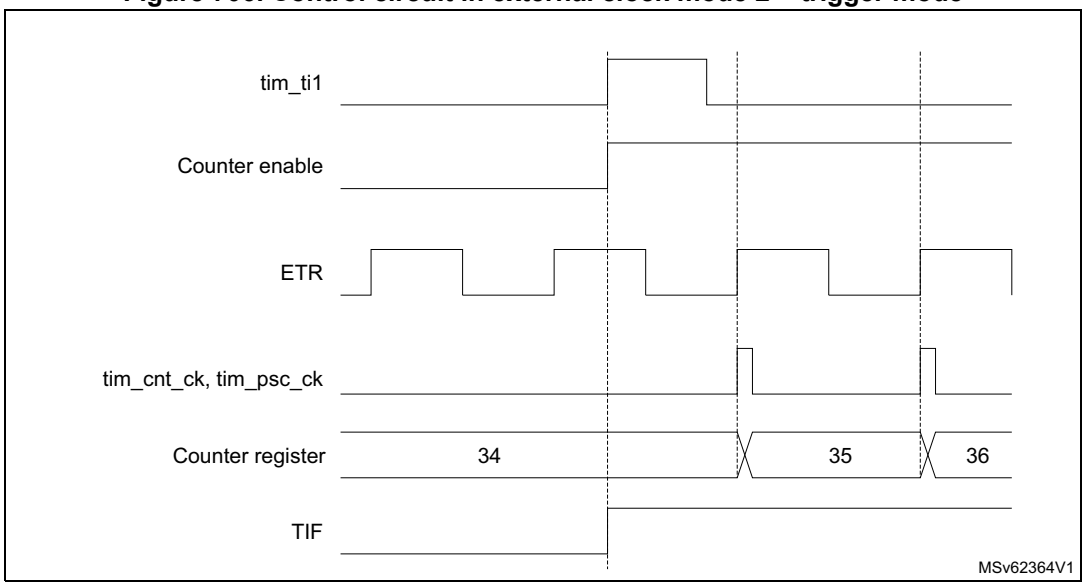
Slave mode – combined gated + reset mode

The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops and is reset as soon as the trigger becomes low. Both start and stop of the counter are controlled.

This mode is used to detect out-of-range PWM signal (duty cycle exceeding a maximum expected value).

Slave mode – external clock mode 2 + trigger mode

The external clock mode 2 can be used in addition to another slave mode (except external clock mode 1 and encoder mode). In this case, the tim_etr_in signal is used as external clock input, and another input can be selected as trigger input when operating in reset mode, gated mode, or trigger mode. It is recommended not to select tim_etr_in as tim_trgi through the TS bits of TIM_SMCR register.



In the following example, the upcounter is incremented at each rising edge of the tim_etr_in signal as soon as a rising edge of tim_ti1 occurs:

1. Configure the external trigger input circuit by programming the TIM_SMCR register as follows:
   - ETF = 0000: no filter.
   - ETPS = 00: prescaler disabled.
   - ETP = 0: detection of rising edges on tim_etr_in and ECE = 1 to enable the external clock mode 2.
2. Configure the channel 1 as follows, to detect rising edges on TI:
   - IC1F = 0000: no filter.
   - The capture prescaler is not used for triggering and does not need to be configured.
   - CC1S = 01in TIM_CCMR1 register to select only the input capture source.
   - CC1P = 0 and CC1NP = 0 in TIM_CCER register to validate the polarity (and detect rising edge only).
3. Configure the timer in trigger mode by writing SMS = 110 in TIM_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIM_SMCR register.

A rising edge on tim_ti1 enables the counter and sets the TIF flag. The counter then counts on tim_etr_in rising edges.

The delay between the rising edge of the tim_etr_in signal and the actual reset of the counter is due to the resynchronization circuit on tim_etrp input.

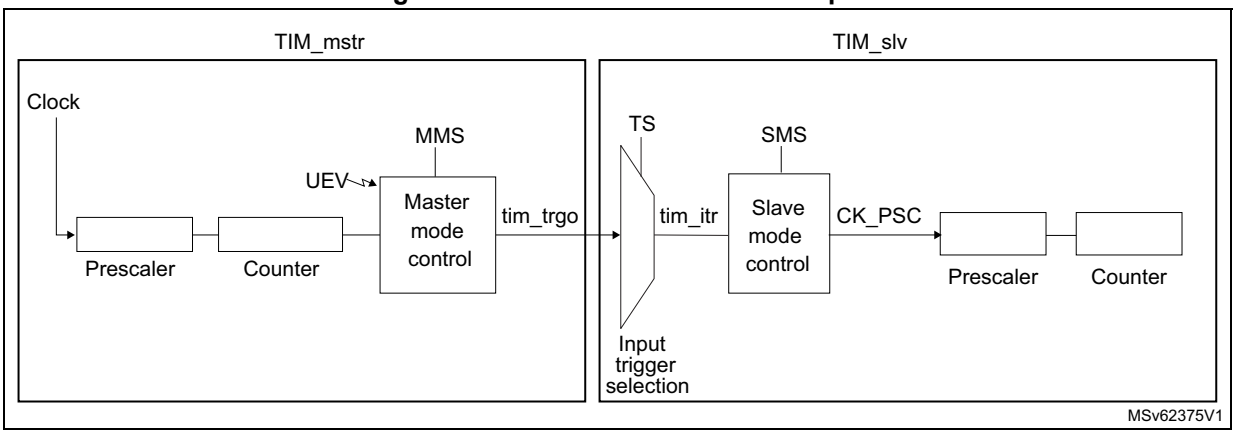
Figure 706. Control circuit in external clock mode 2 + trigger mode

35.4.27 Timer synchronization

The TIMx timers are linked together internally for timer synchronization or chaining. When one timer is configured in master mode, it can reset, start, stop, or clock the counter of another timer configured in slave mode.

Figure 707 and *Figure 708* show examples of master/slave timer connections.

Figure 707. Master/Slave timer example



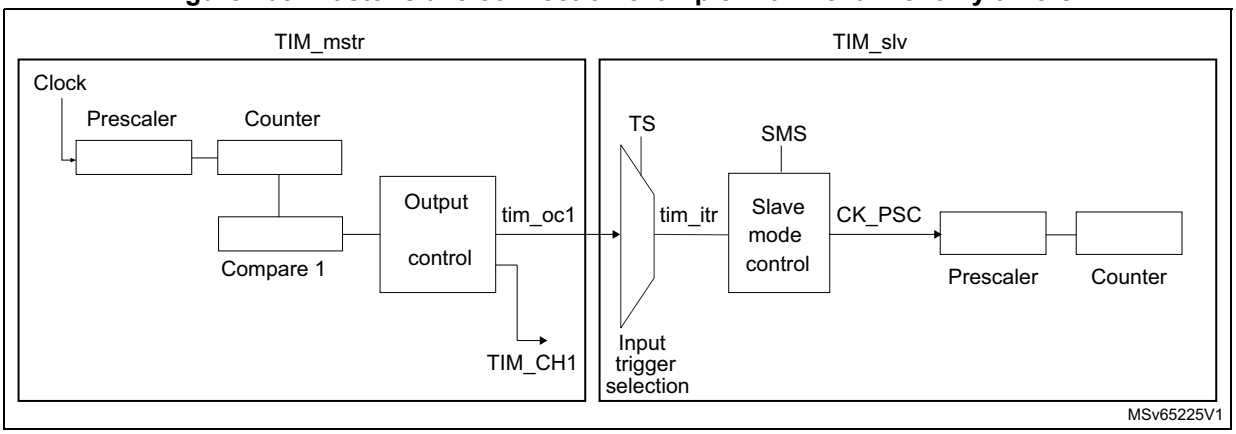


Figure 708. Master/slave connection example with 1 channel only timers

Note: The timers with one channel only (see Figure 708) do not feature a master mode. However, the tim_oc1 output signal can serve as trigger for slave timer (see TIMx internal trigger connection table in Section 35.4.2: TIM2/TIM3/TIM4/TIM5 pins and internal signals). The tim_oc1 signal pulse width must be programmed to be at least two clock cycles of the destination timer, to make sure the slave timer detects the trigger. For instance, if the destination timer tim_ker_ck clock is four times slower than the source timer, the OC1 pulse width must be eight clock cycles.

Using one timer as prescaler for another timer

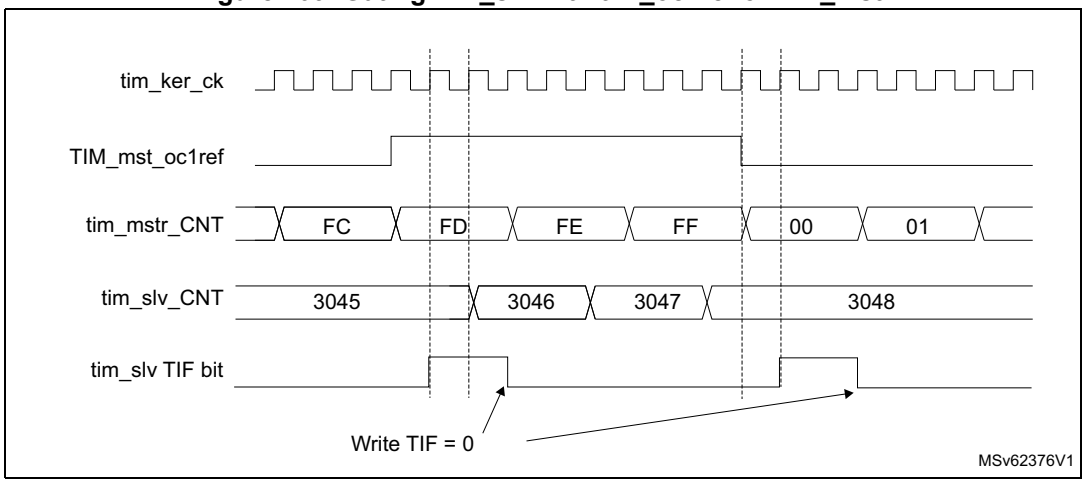
For example, TIM_mstr can be configured to act as a prescaler for TIM_slv. Refer to *Figure 707*. To do this:

1. Configure TIM_mstr in master mode so that it outputs a periodic trigger signal on each update event UEV. If MMS = 010 is written in the TIM_mstr_CR2 register, a rising edge is output on tim_trgo each time an update event is generated.
2. To connect the tim_trgo output of TIM_mstr to TIM_slv, TIM_slv must be configured in slave mode using ITR2 as internal trigger. This is selected through the TS bits in the TIM_slv_SMCR register (writing TS = 00010).
3. Then the slave mode controller must be put in external clock mode 1 (write SMS = 111 in the TIM_slv_SMCR register). This causes TIM_slv to be clocked by the rising edge

of the periodic TIM_mstr trigger signal (which correspond to the TIM_mstr counter overflow).

4. Finally both timers must be enabled by setting their respective CEN bits (TIM_CR1 register).

Note: If tim_ocx is selected on TIM_mstr as the trigger output (MMS = 1xx), its rising edge is used to clock the counter of TIM_slv.



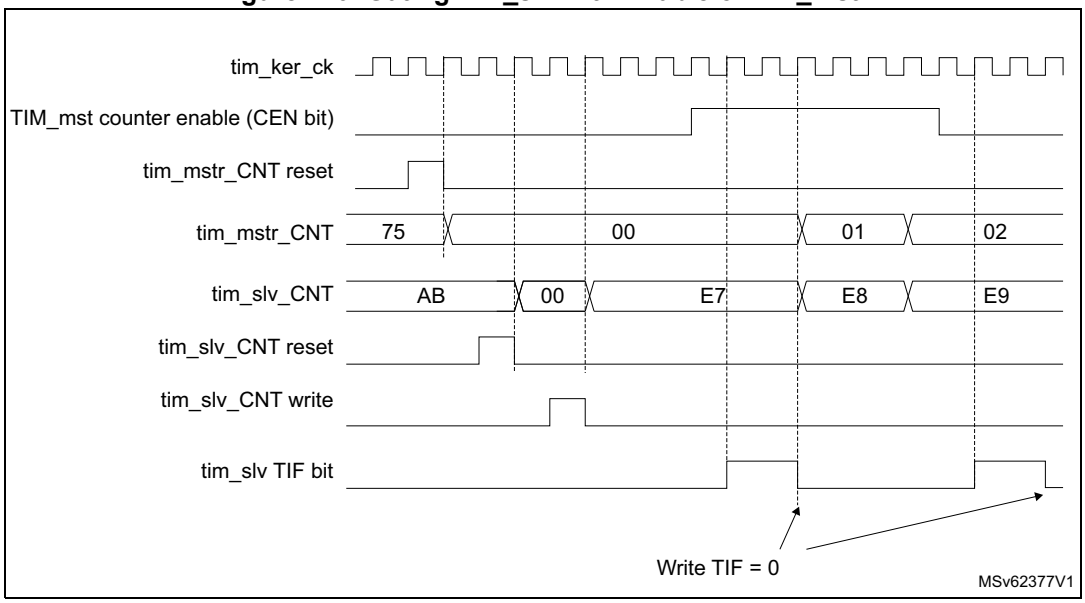
Using one timer to enable another timer

In this example, we control the enable of TIM_slv with the output compare 1 of TIM_mstr. Refer to *Figure 707* for connections. TIM_slv counts on the divided internal clock only when tim_oc1ref of TIM_mstr is high. Both counter clock frequencies are divided by 3 by the prescaler compared to tim_ker_ck ($f_{tim_cnt_ck} = f_{tim_ker_ck}/3$).

1. Configure TIM_mstr master mode to send its output compare 1 reference (tim_oc1ref) signal as trigger output (MMS = 100 in the TIM_mstr_CR2 register).
2. Configure the TIM_mstr tim_oc1ref waveform (TIM_mstr_CCMR1 register).
3. Configure TIM_slv to get the input trigger from TIM_mstr (TS = 00010 in the TIM_slv_SMCR register).
4. Configure TIM_slv in gated mode (SMS = 101 in TIM_slv_SMCR register).
5. Enable TIM_slv by writing 1 in the CEN bit (TIM_slv_CR1 register).
6. Start TIM_mstr by writing 1 in the CEN bit (TIM_mstr_CR1 register).

Note: The slave timer counter clock is not synchronized with the master timer counter clock, this mode only affects the TIM_slv counter enable signal.

Figure 709. Gating TIM_slv with tim_oc1ref of TIM_mstr

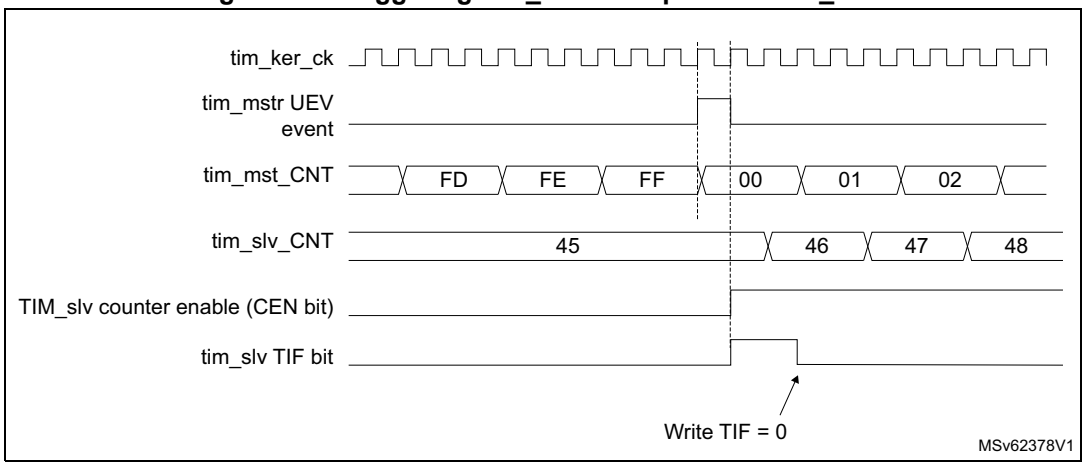


In the example in *Figure 709*, the TIM_slv counter and prescaler are not initialized before being started. So they start counting from their current value. It is possible to start from a given value by resetting both timers before starting TIM_mstr. Then any value can be written in the timer counters. The timers can easily be reset by software using the UG bit in the TIM_EGR registers.

In the next example (refer to *Figure 710*), we synchronize TIM_mstr and TIM_slv. TIM_mstr is the master and starts from 0. TIM_slv is the slave and starts from 0xE7. The prescaler ratio is the same for both timers. TIM_slv stops when TIM_mstr is disabled by writing 0 to the CEN bit in the TIM_mstr_CR1 register:

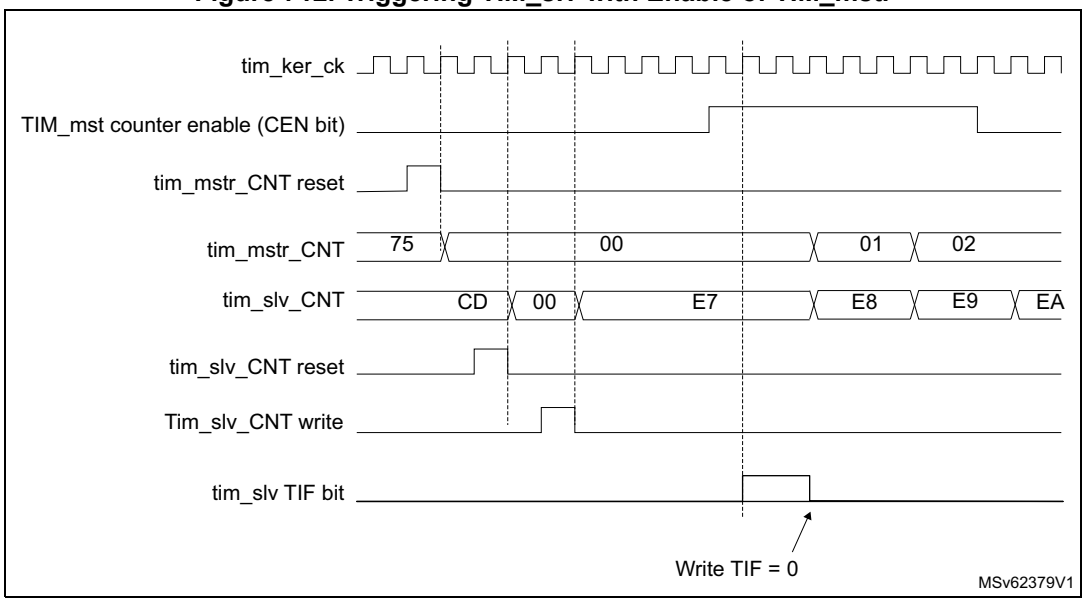
1. Configure TIM_mstr master mode to send its output compare 1 reference (tim_oc1ref) signal as trigger output (MMS = 100 in the TIM_mstr_CR2 register).
2. Configure the TIM_mstr tim_oc1ref waveform (TIM_mstr_CCMR1 register).
3. Configure TIM_slv to get the input trigger from TIM_mstr (TS = 00010 in the TIM_slv_SMCR register).
4. Configure TIM_slv in gated mode (SMS = 101 in TIM_slv_SMCR register).
5. Reset TIM_mstr by writing 1 in UG bit (TIM_mstr_EGR register).
6. Reset TIM_slv by writing 1 in UG bit (TIM_slv_EGR register).
7. Initialize TIM_slv to 0xE7 by writing 0xE7 in the TIM_slv counter (TIM_slv_CNT).
8. Enable TIM_slv by writing 1 in the CEN bit (TIM_slv_CR1 register).
9. Start TIM_mstr by writing 1 in the CEN bit (TIM_mstr_CR1 register).
10. Stop TIM_mstr by writing 0 in the CEN bit (TIM_mstr_CR1 register).

Figure 710. Gating TIM_slv with Enable of TIM_mstr



Using one timer to start another timer

In this example, we set the enable of TIM_slv with the update event of TIM_mstr. Refer to *Figure 707* for connections. TIM_slv starts counting from its current value (which can be nonzero) on the divided internal clock as soon as the update event is generated by TIM_mstr. When TIM_slv receives the trigger signal its CEN bit is automatically set and the counter counts until we write 0 to the CEN bit in the TIM_slv_CR1 register. Both counter clock frequencies are divided by 3 by the prescaler compared to tim_ker_ck ($f_{tim_cnt_ck} = f_{tim_ker_ck}/3$).



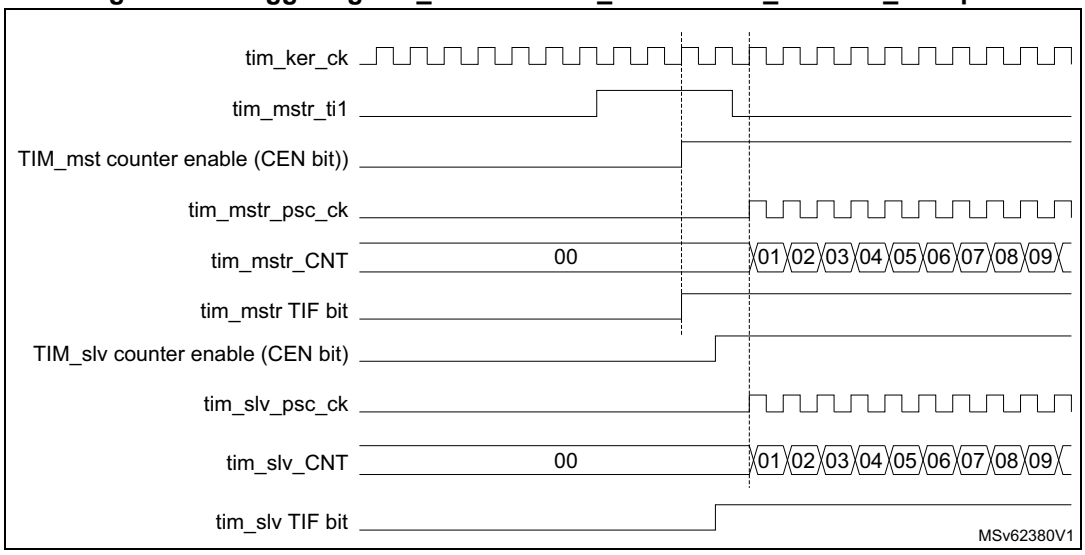
1. Configure TIM_mstr master mode to send its update event (UEV) as trigger output (MMS = 010 in the TIM_mstr_CR2 register).
2. Configure the TIM_mstr period (TIM_mstr_ARR registers).
3. Configure TIM_slv to get the input trigger from TIM_mstr (TS = 00010 in the TIM_slv_SMCR register).
4. Configure TIM_slv in trigger mode (SMS = 110 in TIM_slv_SMCR register).
5. Start TIM_mstr by writing 1 in the CEN bit (TIM_mstr_CR1 register).

Figure 711. Triggering TIM_slv with update of TIM_mstr

As in the previous example, both counters can be initialized before starting counting. *Figure 712* shows the behavior with the same configuration as in *Figure 711* but in trigger mode (SMS = 110 in the TIM_slv_SMCR register) instead of gated mode.

Figure 712. Triggering TIM_slv with Enable of TIM_mstr

Starting two timers synchronously in response to an external trigger



In this example, we set the enable of TIM_mstr when its tim_ti1 input rises, and the enable of TIM_slv with the enable of TIM_mstr. Refer to *Figure 707* for connections. To ensure the counters are aligned, TIM_mstr must be configured in master/slave mode (slave with respect to tim_ti1, master with respect to TIM_slv):

1. Configure TIM_mstr master mode to send its enable as trigger output (MMS = 001 in the TIM_mstr_CR2 register).
2. Configure TIM_mstr slave mode to get the input trigger from tim_ti1 (TS = 00100 in the TIM_mstr_SMCR register).
3. Configure TIM_mstr in trigger mode (SMS = 110 in the TIM_mstr_SMCR register).
4. Configure the TIM_mstr in master/slave mode by writing MSM = 1 (TIM_mstr_SMCR register).
5. Configure TIM_slv to get the input trigger from TIM_mstr (TS = 00000 in the TIM_slv_SMCR register).
6. Configure TIM_slv in trigger mode (SMS = 110 in the TIM_slv_SMCR register).

When a rising edge occurs on tim_ti1 (TIM_mstr), both counters start counting synchronously on the internal clock and both TIF flags are set.

Note: In this example both timers are initialized before starting (by setting their respective UG bits). Both counters starts from 0, but an offset can easily be inserted between them by writing any of the counter registers (TIM_CNT). One can see that the master/slave mode inserts a delay between CNT_EN and CK_PSC on TIM_mstr.

Figure 713. Triggering TIM_mstr and TIM_slv with TIM_mstr tim_ti1 input

Note: The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo signal must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

35.4.28 ADC triggers

The timer can generate an ADC triggering event with various internal signals, such as reset, enable or compare events.

Note: The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo signal must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

35.4.29 ADC synchronization

The timer operation can be synchronized to the ADC clock to trigger jitter-free ADC sampling. This function is enabled using the ADSYNC bit in the TIM_CR2 register.

This feature is useful when the timers and the ADCs are operating with semisynchronous clocks (clocks derived from a same source with integer ratio tim_ker_ck/adc_ker_ck), for instance adc_ker_ck = 75 MHz and tim_ker_ck = 150 MHz or 300 MHz.

ADSYNC must also be set when both peripherals are operating at the same frequency from the same clock source, when jitter-free operation is needed.

ADSYNC must not be set and jitter-free operation is not supported in the following cases:

- When the clock ratio is not an integer (for example adc_ker_ck = 75 MHz and tim_ker_ck = 100 MHz): in this case, the sampling point jitter due to the timer to ADC signal resynchronization is 1 adc_ker_ck period maximum.
- When the ADC is operating in asynchronous mode (adc_ker_ck uncorrelated with tim_ker_ck): in this case, the sampling point jitter due to the timer to ADC signal resynchronization is 1 adc_ker_ck period maximum.

When ADSYNC = 1, the timer operation is slightly changed: the counter enable and counter reset events are aligned to the adc_ker_ck ADC clock, to avoid any phase shift due to clocks enable in the RCC.

Jitter-free operation is guaranteed only when one of the two requirements below is met (depending on the selected trigger source):

1. The counter period must be a multiple of the ADC clock period.

$$(\text{TIM_PSC} + 1) \times (\text{TIM_ARR} + 1) \times T_{\text{tim_ker_ck}} = n \times T_{\text{adc_ker_ck}}$$

2. The compare value must be a multiple of the ADC clock period.

$$(\text{TIM_PSC} + 1) \times \text{TIM_CMPy} \times T_{\text{tim_ker_ck}} = m \times T_{\text{adc_ker_ck}}$$

Note: If none of the two above requirements is met, the trigger is still generated, but the latency is not constant and varies with the timer and ADC clocks phase shift.

Programming guidelines

The ADC synchronization feature must not be modified during run-time, once the counter is enabled and once the ADC has been configured for receiving triggers from the timer.

It is mandatory to follow the procedure below to use the ADC synchronization:

1. Enable the destination ADC clock.
2. Configure the timer and set the ADSYNC bit.
3. Configure the ADC and enable it (using ADSTART and/or JADSTART bits).
4. Start the timer (with the CEN counter enable bit).

35.4.30 DMA burst mode

The TIMx timers have the capability to generate multiple DMA requests upon a single event. The main purpose is to be able to reprogram part of the timer multiple times without software overhead, but it can also be used to read several registers in a row, at regular intervals.

The DMA controller destination is unique and must point to the virtual register TIM_DMAR. On a given timer event, the timer launches a sequence of DMA requests (burst). Each write into the TIM_DMAR register is actually redirected to one of the timer registers.

The DBL[4:0] bits in the TIM_DCR register set the DMA burst length. The timer recognizes a burst transfer when a read or a write access is done to the TIM_DMAR address), i.e. the number of transfers (either in half-words or in bytes).

The DBA[4:0] bits in the TIM_DCR registers define the DMA base address for DMA transfers (when read/write accesses are done through the TIM_DMAR address). DBA is defined as an offset starting from the address of the TIM_CR1 register:

Example:

00000: TIM_CR1

00001: TIM_CR2

00010: TIM_SMCR

The DBSS[3:0] bits in the TIM_DCR register defines the interrupt source that triggers the DMA burst transfers (see *Section 35.5.23: TIM DMA control register (TIM_DCR)* for details).

As an example, the timer DMA burst feature is used to update the contents of the CCRx registers (x = 2, 3, 4) upon an update event, with the DMA transferring half words into the CCRx registers.

This is done in the following steps:

1. Configure the corresponding DMA channel as follows:
   - DMA channel peripheral address is the DMAR register address.
   - DMA channel memory address is the address of the buffer in the RAM containing the data to be transferred by DMA into CCRx registers.
   - Number of data to transfer = 3 (See note below).
   - Circular mode disabled.
2. Configure the DCR register by configuring the DBA and DBL bitfields as follows: DBL = 3, DBA = 0xE and DBSS = 1.
3. Enable the TIMx update DMA request (set the UDE bit in the DIER register).
4. Enable TIMx.
5. Enable the DMA channel.

This example is for the case where every CCRx register has to be updated once. If every CCRx register is to be updated twice for example, the number of data to transfer must be 6. Let's take the example of a buffer in the RAM containing data1, data2, data3, data4, data5, and data6. The data is transferred to the CCRx registers as follows: on the first update DMA request, data1 is transferred to CCR2, data2 is transferred to CCR3, data3 is transferred to CCR4 and on the second update DMA request, data4 is transferred to CCR2, data5 is transferred to CCR3, and data6 is transferred to CCR4.

Note: A null value can be written to the reserved registers.

35.4.31 TIM2/TIM3/TIM4/TIM5 DMA requests

The TIM2/TIM3/TIM4/TIM5 can generate a DMA requests, as shown in *Table 408*.

Table 408. DMA request

DMA request signal	DMA request	Enable control bit
tim_upd_dma	Update	UDE
tim_cc1_dma	Capture/compare 1	CC1DE
tim_cc2_dma	Capture/compare 2	CC2DE
tim_cc3_dma	Capture/compare 3	CC3DE
tim_cc4_dma	Capture/compare 4	CC4DE
tim_trgi_dma	Trigger	TDE

Note: Some timer's DMA requests may not be connected to the DMA controller. Refer to the DMA section(s) for more details.

35.4.32 Debug mode

When the microcontroller enters debug mode (Cortex®-M7 core halted), the TIMx counter can either continue to work normally or stops.

The behavior in debug mode can be programmed with a dedicated configuration bit per timer in the Debug support (DBG) module.

For more details, refer to section Debug support (DBG).

35.4.33 TIM2/TIM3/TIM4/TIM5 low-power modes

Table 409. Effect of low-power modes on TIM2/TIM3/TIM4/TIM5

Mode	Description
Sleep	No effect, peripheral is active. The interrupts can cause the device to exit from Sleep mode.
Stop	The timer operation is stopped and the register content is kept. No interrupt can be generated.
Standby	The timer is powered-down and must be reinitialized after exiting the Standby mode.

35.4.34 TIM2/TIM3/TIM4/TIM5 interrupts

The TIM2/TIM3/TIM4/TIM5 can generate multiple interrupts, as shown in *Table 410*.

Table 410. Interrupt requests

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from Sleep mode	Exit from Stop and Standby mode
TIM_UPD	Update	UIF	UIE	write 0 in UIF	Yes	No
TIM_CC	Capture/compare 1	CC1IF	CC1IE	write 0 in CC1IF	Yes	No
	Capture/compare 2	CC2IF	CC2IE	write 0 in CC2IF	Yes	No
	Capture/compare 3	CC3IF	CC3IE	write 0 in CC3IF	Yes	No
	Capture/compare 4	CC4IF	CC4IE	write 0 in CC4IF	Yes	No
TIM_TRGI	Trigger	TIF	TIE	write 0 in TIF	Yes	No
TIM_DIR_IDX	Index	IDXF	IDXIE	write 0 in IDXF	Yes	No
	Direction	DIRF	DIRIE	write 0 in DIRF	Yes	No
TIM_IERR	Index Error	IERRF	IERRIE	write 0 in IERRF	Yes	No
TIM_TERR	Transition Error	TERRF	TERRIE	write 0 in TERRF	Yes	No

35.5 TIM2/TIM3/TIM4/TIM5 registers

Refer to *Section 1.2* for a list of abbreviations used in register descriptions.

The peripheral registers can be accessed by half-words (16-bit) or words (32-bit).

35.5.1 TIM control register 1 (TIM_CR1)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	CKD2[3:0]				Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
				rw	rw	rw	rw								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DITHEN	UIFREMAP	Res.	CKD[1:0]		ARPE	CMS[1:0]		DIR	OPM	URS	UDIS	CEN
			rw	rw		rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **CKD2[3:0]**: Clock division 2

This bit field indicates the division between sampling clock (tDTS) used by the dead-time generators and the digital filters (tim_etr_in, tim_tix).

0000: No Division
0001: $t_{DTS2} = 4*t_{DTS}$
0010: $t_{DTS2} = 16*t_{DTS}$
0011: $t_{DTS2} = 64*t_{DTS}$
0100: $t_{DTS2} = 256*t_{DTS}$
0101: $t_{DTS2} = 1024*t_{DTS}$
0110: $t_{DTS2} = 4096*t_{DTS}$
0111: $t_{DTS2} = 16384*t_{DTS}$
1000: $t_{DTS2} = 65536*t_{DTS}$
1001: $t_{DTS2} = 262144*t_{DTS}$
Others: Reserved, do not program this value

Bits 23:13 Reserved, must be kept at reset value.

Bit 12 **DITHEN**: Dithering Enable

0: Dithering disabled
1: Dithering enabled

Note: The DITHEN bit can only be modified when CEN bit is reset.

Bit 11 **UIFREMAP**: UIF status bit remapping

0: No remapping. UIF status bit is not copied to TIM_CNT register bit 31.
1: Remapping enabled. UIF status bit is copied to TIM_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division

This bitfield indicates the division ratio between the timer clock (tim_ker_ck) frequency and sampling clock used by the digital filters (tim_etr_in, tim_tix),

00: $t_{DTS} = t_{tim_ker_ck}$
01: $t_{DTS} = 2 \times t_{tim_ker_ck}$
10: $t_{DTS} = 4 \times t_{tim_ker_ck}$
11: $t_{DTS} = 8 \times t_{tim_ker_ck}$

Bit 7 **ARPE**: Autoreload preload enable

0: TIM_ARR register is not buffered
1: TIM_ARR register is buffered

Bits 6:5 **CMS[1:0]**: Center-aligned mode selection

00: Edge-aligned mode. The counter counts up or down depending on the direction bit (DIR).
01: Center-aligned mode 1. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS = 00 in TIM_CCMRx register) are set only when the counter is counting down.
10: Center-aligned mode 2. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS = 00 in TIM_CCMRx register) are set only when the counter is counting up.
11: Center-aligned mode 3. The counter counts up and down alternatively. Output compare interrupt flags of channels configured in output (CCxS = 00 in TIM_CCMRx register) are set both when the counter is counting up or down.

Note: It is not allowed to switch from edge-aligned mode to center-aligned mode as long as the counter is enabled (CEN = 1)

Bit 4 **DIR**: Direction

0: Counter used as upcounter
1: Counter used as downcounter

Note: This bit is read only when the timer is configured in center-aligned mode or encoder mode.

Bit 3 **OPM**: One-pulse mode

0: Counter is not stopped at update event
1: Counter stops counting at the next update event (clearing the bit CEN)

Bit 2 **URS**: Update request source

This bit is set and cleared by software to select the UEV event sources.

0: Any of the following events generate an update interrupt or DMA request if enabled. These events can be:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

1: Only counter overflow/underflow generates an update interrupt or DMA request if enabled.

Bit 1 **UDIS**: Update disable

This bit is set and cleared by software to enable/disable UEV event generation.

0: UEV enabled. The Update (UEV) event is generated by one of the following events:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

Buffered registers are then loaded with their preload values.

1: UEV disabled. The Update event is not generated, shadow registers keep their value (ARR, PSC, CCRx). However the counter and the prescaler are reinitialized if the UG bit is set or if a hardware reset is received from the slave mode controller.

Bit 0 **CEN**: Counter enable

0: Counter disabled

1: Counter enabled

Note: External clock, gated mode and encoder mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.

CEN is cleared automatically in one-pulse mode, when an update event occurs.

35.5.2 TIM control register 2 (TIM_CR2)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
TI3INV	TI2INV	TI1INV	AD SYNC	XORPS	Res.	MMS[3]	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw	rw	rw	rw	rw		rw									
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TI1S	MMS[2:0]			CCDS	Res.	Res.	Res.
								rw	rw	rw	rw	rw			

Bit 31 **TI3INV**: tim_ti3 signal inversion on XOR gate input
0: tim_ti3 non-inverted
1: tim_ti3 inverted

Bit 30 **TI2INV**: tim_ti2 signal inversion on XOR gate input
0: tim_ti2 non-inverted
1: tim_ti2 inverted

Bit 29 **TI1INV**: tim_ti1 signal inversion on XOR gate input
0: tim_ti1 non-inverted
1: tim_ti1 inverted

Bit 28 **ADSYNC**: ADC synchronization
0: The timer operates independently from the ADC
1: The timer operation is synchronized with the ADC clock to provide jitter-free sampling point. This mode can be enabled only with specific ADC / timer clock relationship. Refer to *Section 35.4.29* for requirements.
The ADSYNC must not modified when the counter is enabled (CEN bit is set).

Bit 27 **XORPS**: XOR gate position selection
This bit defines the position of the XOR gate with respect to input filters.
0: XOR gate placed before TI1 filter
1: XOR gate placed after TI1, TI2 and TI3 filters

Bit 26 Reserved, must be kept at reset value.

Bits 24:8 Reserved, must be kept at reset value.

Bit 7 **TI1S**: tim_ti1 selection
This bit enables the insertion of a XOR gate to combine tim_ti1_in[15:0], tim_ti2_in[15:0], and tim_ti3_in[15:0] inputs into tim_ti1.
The position of the XOR gate, with respect to input filters, is defined with the XORPS bit.
0: The tim_ti1_in[15:0] multiplexer output is to tim_ti1 input
1: The tim_ti1_in[15:0], tim_ti2_in[15:0] and tim_ti3_in[15:0] multiplexers outputs are XORed and connected to the tim_ti1 input. See also *Section 34.3.34: Interfacing with Hall sensors*.

Bits 25, 6, 5, 4 **MMS[3:0]**: Master mode selection

These bits are used to select the information to be sent in master mode to slave timers for synchronization (tim_trgo). The combination is as follows:

0000: **Reset** - the UG bit from the TIM_EGR register is used as trigger output (tim_trgo). If the reset is generated by the trigger input (slave mode controller configured in reset mode) then the signal on tim_trgo is delayed compared to the actual reset.

0001: **Enable** - the Counter enable signal, CNT_EN, is used as trigger output (tim_trgo). It is useful to start several timers at the same time or to control a window in which a slave timer is enabled. The Counter Enable signal is generated by a logic AND between CEN control bit and the trigger input when configured in gated mode.
When the Counter Enable signal is controlled by the trigger input, there is a delay on tim_trgo, except if the master/slave mode is selected (see the MSM bit description in TIM_SMCR register).

0010: **Update** - The update event is selected as trigger output (tim_trgo). For instance a master timer can then be used as a prescaler for a slave timer.

0011: **Compare pulse** - The trigger output send a positive pulse when the CC1IF flag is to be set (even if it was already high), as soon as a capture or a compare match occurred (tim_trgo).

0100: **Compare** - tim_oc1refc signal is used as trigger output (tim_trgo)

0101: **Compare** - tim_oc2refc signal is used as trigger output (tim_trgo)

0110: **Compare** - tim_oc3refc signal is used as trigger output (tim_trgo)

0111: **Compare** - tim_oc4refc signal is used as trigger output (tim_trgo)

1000: **Encoder clock output** - The encoder clock signal is used as trigger output (tim_trgo). This code is valid for the following SMS[4:0] values: 00001, 00010, 00011, 01010, 01011, 01100, 01101, 01110, 01111. Any other SMS[4:0] code is not allowed and may lead to unexpected behavior.

Others: Reserved

Note: The clock of the slave timer or ADC must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.

Bit 3 **CCDS**: Capture/compare DMA selection

0: CCx DMA request sent when CCx event occurs

1: CCx DMA requests sent when update event occurs

Bits 2:0 Reserved, must be kept at reset value.

35.5.3 TIM slave mode control register (TIM_SMCR)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	SETPS[3:0]				SMSPS	SMSPE	Res.	Res.	TS[4:3]		Res.	Res.	SMS[4:3]	
		rw	rw	rw	rw	rw	rw			rw	rw			rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ETP	ECE	ETPS[1:0]		ETF[3:0]				MSM	TS[2:0]			OCCS	SMS[2:0]		
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:30 Reserved, must be kept at reset value.

Bits 29:26 **SETPS[3:0]**: Synchronous external trigger prescaler

The linear synchronous prescaler divides the frequency of the tim_etrf signal, by a factor (SETPS[3:0] + 1).

Bit 25 **SMSPS**: SMS preload source

This bit selects whether the events that triggers the SMS[4:0] bitfield transfer from preload to active

0: The transfer is triggered by the Timer's Update event

1: The transfer is triggered by the Index event

Bit 24 **SMSPE**: SMS preload enable

This bit selects whether the SMS[4:0] bitfield is preloaded

0: SMS[4:0] bitfield is not preloaded

1: SMS[4:0] preload is enabled

Bits 23:22 Reserved, must be kept at reset value.

Bits 19:18 Reserved, must be kept at reset value.

Bit 15 **ETP**: External trigger polarity

This bit selects whether tim_etr_in or $\overline{\text{tim_etr_in}}$ is used for trigger operations

0: tim_etr_in is non-inverted, active at high level or rising edge

1: tim_etr_in is inverted, active at low level or falling edge

Bit 14 **ECE**: External clock enable

This bit enables external clock mode 2.

0: External clock mode 2 disabled

1: External clock mode 2 enabled. The counter is clocked by any active edge on the tim_etrf signal.

Note: Setting the ECE bit has the same effect as selecting external clock mode 1 with tim_trgi connected to tim_etrf (SMS = 111 and TS = 00111).
It is possible to simultaneously use external clock mode 2 with the following slave modes: reset mode, gated mode and trigger mode. Nevertheless, tim_trgi must not be connected to tim_etrf in this case (TS bits must not be 00111).
If external clock mode 1 and external clock mode 2 are enabled at the same time, the external clock input is tim_etrf.

Bits 13:12 **ETPS[1:0]**: External trigger prescaler

External trigger signal tim_etrp frequency must be at most 1/4 of tim_ker_ck frequency. A prescaler can be enabled to reduce tim_etrp frequency. It is useful when inputting fast external clocks on tim_etr_in.

00: Prescaler OFF
01: tim_etrp frequency divided by 2
10: tim_etrp frequency divided by 4
11: tim_etrp frequency divided by 8

Bits 11:8 **ETF[3:0]**: External trigger filter

This bitfield then defines the frequency used to sample tim_etrp signal and the length of the digital filter applied to tim_etrp. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at f_{DTS}
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Bit 7 **MSM**: Master/slave mode

0: No action
1: The effect of an event on the trigger input (tim_trgi) is delayed to allow a perfect synchronization between the current timer and its slaves (through tim_trgo). It is useful if we want to synchronize several timers on a single external event.

Bits 21, 20, 6, 5, 4 **TS[4:0]**: Trigger selection

This bitfield selects the trigger input to be used to synchronize the counter.

00000: Internal trigger 0 (tim_itr0)
00001: Internal trigger 1 (tim_itr1)
00010: Internal trigger 2 (tim_itr2)
00011: Internal trigger 3 (tim_itr3)
00100: tim_ti1 edge detector (tim_ti1f_ed)
00101: Filtered timer input 1 (tim_ti1fp1)
00110: Filtered timer input 2 (tim_ti2fp2)
00111: External trigger input (tim_etrf)
01000: Internal trigger 4 (tim_itr4)
01001: Internal trigger 5 (tim_itr5)
01010: Internal trigger 6 (tim_itr6)
01011: Internal trigger 7 (tim_itr7)
01100: Internal trigger 8 (tim_itr8)
01101: Internal trigger 9 (tim_itr9)
01110: Internal trigger 10 (tim_itr10)
01111: Internal trigger 11 (tim_itr11)
10000: Internal trigger 12 (tim_itr12)
10001: Internal trigger 13 (tim_itr13)
10010: Internal trigger 14 (tim_itr14)
10011: Internal trigger 15 (tim_itr15)
10100: Internal trigger 16 (tim_itr16)
10101: Internal trigger 17 (tim_itr17)
10110: Internal trigger 18 (tim_itr18)
10111: Internal trigger 19 (tim_itr19)
11000: Internal trigger 20 (tim_itr20)
11001: Internal trigger 21 (tim_itr21)
11010: Internal trigger 22 (tim_itr22)
11011: Internal trigger 23 (tim_itr23)
11100: Internal trigger 24 (tim_itr24)
11101: Internal trigger 25 (tim_itr25)
11110: Internal trigger 26 (tim_itr26)
11111: Internal trigger 27 (tim_itr27)

See *Section 35.4.2: TIM2/TIM3/TIM4/TIM5 pins and internal signals* for product specific implementation details.

Note: These bits must be changed only when they are not used (for example when SMS = 000) to avoid wrong edge detections at the transition.

Bit 3 **OCCS**: OCREF clear selection

This bit is used to select the OCREF clear source

0: tim_ocref_clr_int is connected to the tim_ocref_clr input

1: tim_ocref_clr_int is connected to tim_etrf

Note: If the OCREF clear selection feature is not supported, this bit is reserved and forced by hardware to 0. Section 35.3: TIM2/TIM3/TIM4/TIM5 implementation.

Bits 17:16, 2:0 **SMS[4:0]**: Slave mode selection

When external signals are selected the active edge of the trigger signal (tim_trgi) is linked to the polarity selected on the external input (refer to ETP bit in TIM_SMCR for tim_etr_in and CCxP/CCxNP bits in TIM_CCER register for tim_ti1fp1 and tim_ti2fp2).

00000: Slave mode disabled - if CEN = 1 then the prescaler is clocked directly by the internal clock.

00001: Encoder mode 1 - Counter counts up/down on tim_ti1fp1 edge depending on tim_ti2fp2 level.

00010: Encoder mode 2 - Counter counts up/down on tim_ti2fp2 edge depending on tim_ti1fp1 level.

00011: Encoder mode 3 - Counter counts up/down on both tim_ti1fp1 and tim_ti2fp2 edges depending on the level of the other input.

00100: Reset mode - Rising edge of the selected trigger input (tim_trgi) reinitializes the counter and generates an update of the registers.

00101: Gated mode - The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops (but is not reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

00110: Trigger mode - The counter starts at a rising edge of the trigger tim_trgi (but it is not reset). Only the start of the counter is controlled.

00111: External clock mode 1 - Rising edges of the selected trigger (tim_trgi) clock the counter.

01000: Combined reset + trigger mode - Rising edge of the selected trigger input (tim_trgi) reinitializes the counter, generates an update of the registers and starts the counter.

01001: Combined gated + reset mode - The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops and is reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

01010: Encoder mode: Clock plus direction, x2 mode.

01011: Encoder mode: Clock plus direction, x1 mode, tim_ti2fp2 edge sensitivity is set by CC2P.

01100: Encoder mode: Directional clock, x2 mode.

01101: Encoder mode: Directional clock, x1 mode, tim_ti1fp1 and tim_ti2fp2 edge sensitivity is set by CC1P and CC2P.

01110: Quadrature encoder mode: x1 mode, counting on tim_ti1fp1 edges only, edge sensitivity is set by CC1P.

01111: Quadrature encoder mode: x1 mode, counting on tim_ti2fp2 edges only, edge sensitivity is set by CC2P.

10000: Quadrature encoder with built-in debouncer: x2 mode.

10001: Quadrature encoder with built-in debouncer: x4 mode.

Note: The gated mode must not be used if tim_ti1f_ed is selected as the trigger input (TS = 00100). Indeed, tim_ti1f_ed outputs 1 pulse for each transition on tim_ti1f, whereas the gated mode checks the level of the trigger signal.

Note: The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo signal must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

35.5.4 TIM DMA/interrupt enable register (TIM_DIER)

Address offset: 0x00C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:24 Reserved, must be kept at reset value.

Bit 23 **TERRIE**: Transition error interrupt enable
0: Transition error interrupt disabled
1: Transition error interrupt enabled

Bit 22 **IERRIE**: Index error interrupt enable
0: Index error interrupt disabled
1: Index error interrupt enabled

Bit 21 **DIRIE**: Direction change interrupt enable
0: Direction change interrupt disabled
1: Direction change interrupt enabled

Bit 20 **IDXIE**: Index interrupt enable
0: Index interrupt disabled
1: Index interrupt enabled

Bits 19:15 Reserved, must be kept at reset value.

Bit 14 **TDE**: Trigger DMA request enable
0: Trigger DMA request disabled.
1: Trigger DMA request enabled.

Bit 13 Reserved, must be kept at reset value.

Bit 12 **CC4DE**: Capture/compare 4 DMA request enable
0: CC4 DMA request disabled.
1: CC4 DMA request enabled.

Bit 11 **CC3DE**: Capture/compare 3 DMA request enable
0: CC3 DMA request disabled.
1: CC3 DMA request enabled.

Bit 10 **CC2DE**: Capture/compare 2 DMA request enable
0: CC2 DMA request disabled.
1: CC2 DMA request enabled.

Bit 9 **CC1DE**: Capture/compare 1 DMA request enable
0: CC1 DMA request disabled.
1: CC1 DMA request enabled.

Bit 8 **UDE**: Update DMA request enable
0: Update DMA request disabled.
1: Update DMA request enabled.

Bit 7 Reserved, must be kept at reset value.

Bit 6 **TIE**: Trigger interrupt enable
0: Trigger interrupt disabled.
1: Trigger interrupt enabled.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **CC4IE**: Capture/compare 4 interrupt enable
0: CC4 interrupt disabled.
1: CC4 interrupt enabled.

Bit 3 **CC3IE**: Capture/compare 3 interrupt enable
0: CC3 interrupt disabled.
1: CC3 interrupt enabled.

Bit 2 **CC2IE**: Capture/compare 2 interrupt enable
0: CC2 interrupt disabled.
1: CC2 interrupt enabled.

Bit 1 **CC1IE**: Capture/compare 1 interrupt enable
0: CC1 interrupt disabled.
1: CC1 interrupt enabled.

Bit 0 **UIE**: Update interrupt enable
0: Update interrupt disabled.
1: Update interrupt enabled.

35.5.5 TIM status register (TIM_SR)

Address offset: 0x010

Reset value: 0x0000 0000

			rc_w0	rc_w0	rc_w0	rc_w0			rc_w0		rc_w0	rc_w0	rc_w0	rc_w0	rc_w0

Bit 31 **TI4FS**: tim_ti4f status
This flag indicates the value of the tim_ti4f signal (after the digital filtering stage), for polling purpose.
0: tim_ti4f signal is low
1: tim_ti4f signal is high

Bit 30 **TI3FS**: tim_ti3f status
This flag indicates the value of the tim_ti3f signal (after the digital filtering stage), for polling purpose.
0: tim_ti3f signal is low
1: tim_ti3f signal is high

Bit 29 **TI2FS**: tim_ti2f status
This flag indicates the value of the tim_ti2f signal (after the digital filtering stage), for polling purpose.
0: tim_ti2f signal is low
1: tim_ti2f signal is high

Bit 28 **TI1FS**: tim_ti1f status
This flag indicates the value of the tim_ti1f signal (after the digital filtering stage), for polling purpose.
0: tim_ti1f signal is low
1: tim_ti1f signal is high

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **UIOVRF**: Update Interrupt Overrun flag
This flag is set by hardware when an update request occurs while an update interrupt is pending (update interrupt flag set). It is cleared by software by writing it to '0'.
0: No Update Interrupt Overrun
1: Update Interrupt Overrun

Bit 23 **TERRF**: Transition error interrupt flag
This flag is set by hardware when a transition error is detected in encoder mode. It is cleared by software by writing it to 0.
0: No encoder transition error has been detected.
1: An encoder transition error has been detected

Bit 22 **IERRF**: Index error interrupt flag
This flag is set by hardware when an index error is detected. It is cleared by software by writing it to 0.
0: No index error has been detected.
1: An index error has been detected

Bit 21 **DIRF**: Direction change interrupt flag
This flag is set by hardware when the direction changes in encoder mode (DIR bit value in TIM_CR is changing). It is cleared by software by writing it to 0.
0: No direction change
1: Direction change

Bit 20 **IDXF**: Index interrupt flag
This flag is set by hardware when an index event is detected. It is cleared by software by writing it to 0.
0: No index event occurred.
1: An index event has occurred

Bits 19:13 Reserved, must be kept at reset value.

Bit 12 **CC4OF**: Capture/compare 4 overcapture flag
refer to CC1OF description

Bit 11 **CC3OF**: Capture/compare 3 overcapture flag
refer to CC1OF description

Bit 10 **CC2OF**: Capture/compare 2 overcapture flag
refer to CC1OF description

Bit 9 **CC1OF**: Capture/compare 1 overcapture flag
This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to 0.
0: No overcapture has been detected.
1: The counter value has been captured in TIM_CCR1 register while CC1IF flag was already set

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 **TIF**: Trigger interrupt flag
This flag is set by hardware on the TRG trigger event (active edge detected on tim_trgi input) when the slave mode controller is enabled in all modes but gated mode. It is set when the counter starts or stops when gated mode is selected. It is cleared by software.
0: No trigger event occurred.
1: Trigger interrupt pending.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **CC4IF**: Capture/compare 4 interrupt flag
Refer to CC1IF description

Bit 3 **CC3IF**: Capture/compare 3 interrupt flag
Refer to CC1IF description

Bit 2 **CC2IF**: Capture/compare 2 interrupt flag
Refer to CC1IF description

Bit 1 **CC1IF**: Capture/compare 1 interrupt flag
This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIM_CCR1 register (input capture mode only).
0: No compare match / No input capture occurred
1: A compare match or an input capture occurred
If channel CC1 is configured as output: this flag is set when the content of the counter TIM_CNT matches the content of the TIM_CCR1 register. When the content of TIM_CCR1 is greater than the content of TIM_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in down-counting mode). There are three possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIM_CR1 register for the full description.
If channel CC1 is configured as input: this bit is set when counter value has been captured in TIM_CCR1 register (an edge has been detected on IC1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIM_CCER).

Bit 0 **UIF**: Update interrupt flag
This bit is set by hardware on an update event. It is cleared by software.
0: No update occurred
1: Update interrupt pending. This bit is set by hardware when the registers are updated:
At overflow or underflow and if UDIS = 0 in the TIM_CR1 register.
When CNT is reinitialized by software using the UG bit in TIM_EGR register, if URS = 0 and UDIS = 0 in the TIM_CR1 register.
When CNT is reinitialized by a trigger event (refer to the synchro control register description), if URS = 0 and UDIS = 0 in the TIM_CR1 register.

35.5.6 TIM event generation register (TIM_EGR)

Address offset: 0x014

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TG	Res.	CC4G	CC3G	CC2G	CC1G	UG
									w		w	w	w	w	w

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **TG**: Trigger generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: The TIF flag is set in TIM_SR register. Related interrupt or DMA transfer can occur if enabled.

Bit 5 Reserved, must be kept at reset value.

Bit 4 **CC4G**: Capture/compare 4 generation
Refer to CC1G description

Bit 3 **CC3G**: Capture/compare 3 generation
Refer to CC1G description

Bit 2 **CC2G**: Capture/compare 2 generation
Refer to CC1G description

Bit 1 **CC1G**: Capture/compare 1 generation
This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: A capture/compare event is generated on channel 1:
If channel CC1 is configured as output:
CC1IF flag is set, Corresponding interrupt or DMA request is sent if enabled.
If channel CC1 is configured as input:
The current value of the counter is captured in TIM_CCR1 register. The CC1IF flag is set, the corresponding interrupt or DMA request is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation
This bit can be set by software, it is automatically cleared by hardware.
0: No action
1: Re-initialize the counter and generates an update of the registers. Note that the prescaler counter is cleared too (anyway the prescaler ratio is not affected). The counter is cleared if the center-aligned mode is selected or if DIR = 0 (up-counting), else it takes the autoreload value (TIM_ARR) if DIR = 1 (down-counting).

35.5.7 TIM capture/compare mode register 1 (TIM_CCMR1)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IC2F[3:0]				IC2PSC[1:0]		CC2S[1:0]		IC1F[3:0]				IC1PSC[1:0]		CC1S[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Input capture mode

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC2F[3:0]**: Input capture 2 filter

Bits 11:10 **IC2PSC[1:0]**: Input capture 2 prescaler

Bits 9:8 **CC2S[1:0]**: Capture/compare 2 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output.

01: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti2.

10: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti1.

11: CC2 channel is configured as input, tim_ic2 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)

Note: CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIM_CCER).

Bits 7:4 **IC1F[3:0]**: Input capture 1 filter

This bitfield defines the frequency used to sample tim_ti1 input and the length of the digital filter applied to tim_ti1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000:No filter, sampling is done at f_{DTS}

0001:$f_{SAMPLING} = f_{tim_ker_ck}$, N = 2

0010:$f_{SAMPLING} = f_{tim_ker_ck}$, N = 4

0011:$f_{SAMPLING} = f_{tim_ker_ck}$, N = 8

0100:$f_{SAMPLING} = f_{DTS}/2$, N = 6

0101:$f_{SAMPLING} = f_{DTS}/2$, N = 8

0110:$f_{SAMPLING} = f_{DTS}/4$, N = 6

0111:$f_{SAMPLING} = f_{DTS}/4$, N = 8

1000:$f_{SAMPLING} = f_{DTS}/8$, N = 6

1001:$f_{SAMPLING} = f_{DTS}/8$, N = 8

1010:$f_{SAMPLING} = f_{DTS}/16$, N = 5

1011:$f_{SAMPLING} = f_{DTS}/16$, N = 6

1100:$f_{SAMPLING} = f_{DTS}/16$, N = 8

1101:$f_{SAMPLING} = f_{DTS}/32$, N = 5

1110:$f_{SAMPLING} = f_{DTS}/32$, N = 6

1111:$f_{SAMPLING} = f_{DTS}/32$, N = 8

Bits 3:2 **IC1PSC[1:0]**: Input capture 1 prescaler

This bitfield defines the ratio of the prescaler acting on CC1 input (tim_ic1). The prescaler is reset as soon as CC1E = 0 (TIM_CCER register).

00: no prescaler, capture is done each time an edge is detected on the capture input

01: capture is done once every 2 events

10: capture is done once every 4 events

11: capture is done once every 8 events

Bits 1:0 **CC1S[1:0]**: Capture/compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output

01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1

10: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti2

11: CC1 channel is configured as input, tim_ic1 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIM_CCER).

35.5.8 TIM capture/compare mode register 1 [alternate] (TIM_CCMR1)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

Output compare mode

Bits 31:26 Reserved, must be kept at reset value.

Bits 23:18 Reserved, must be kept at reset value.

Bit 15 **OC2CE**: Output compare 2 clear enable

0: tim_oc2ref is not affected by the tim_ocref_clr_int signal

1: tim_oc2ref is cleared as soon as a high level is detected on tim_ocref_clr_int signal (tim_ocref_clr input or tim_etrf input)

Note: This mode is not available for all PWM modes. Refer to Section 35.4.16: Clearing the tim_ocxref signal on an external event for the list of forbidden configurations.

Bits 25:24, 14:12 **OC2M[4:0]**: Output compare 2 mode

Refer to OC1M description on bits 17:16, 6:4.

Bit 11 **OC2PE**: Output compare 2 preload enable

Bit 10 **OC2FE**: Output compare 2 fast enable

Bits 9:8 **CC2S[1:0]**: Capture/compare 2 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC2 channel is configured as output

01: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti2

10: CC2 channel is configured as input, tim_ic2 is mapped on tim_ti1

11: CC2 channel is configured as input, tim_ic2 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through the TS bit (TIM_SMCR register)

Note: CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIM_CCER).

Bit 7 **OC1CE**: Output compare 1 clear enable

0: tim_oc1ref is not affected by the tim_ocref_clr_int input

1: tim_oc1ref is cleared as soon as a High level is detected on tim_ocref_clr_int input

Note: This mode is not available for all PWM modes. Refer to Section 35.4.16: Clearing the tim_ocxref signal on an external event for the list of forbidden configurations.

Bits 17:16, 6:4 **OC1M[4:0]**: Output compare 1 mode

These bits define the behavior of the output reference signal tim_oc1ref from which tim_oc1 is derived. tim_oc1ref is active high whereas tim_oc1 active level depends on CC1P bit.

00000: Frozen - The comparison between the output compare register TIM_CCR1 and the counter TIM_CNT has no effect on the outputs. This mode can be used when the timer serves as a software timebase. When the frozen mode is enabled during timer operation, the ouput keeps the state (active or inactive) it had before entering the frozen state.

00001: Set channel 1 to active level on match. tim_oc1ref signal is forced high when the counter TIM_CNT matches the capture/compare register 1 (TIM_CCR1).

00010: Set channel 1 to inactive level on match. tim_oc1ref signal is forced low when the counter TIM_CNT matches the capture/compare register 1 (TIM_CCR1).

00011: Toggle - tim_oc1ref toggles when TIM_CNT = TIM_CCR1.

00100: Force inactive level - tim_oc1ref is forced low.

00101: Force active level - tim_oc1ref is forced high.

00110: PWM mode 1 - In up-counting, channel 1 is active as long as TIM_CNT<TIM_CCR1 else inactive. In down-counting, channel 1 is inactive (tim_oc1ref = 0) as long as TIM_CNT>TIM_CCR1 else active (tim_oc1ref = 1).

00111: PWM mode 2 - In up-counting, channel 1 is inactive as long as TIM_CNT<TIM_CCR1 else active. In down-counting, channel 1 is active as long as TIM_CNT>TIM_CCR1 else inactive.

01000: Retriggerable OPM mode 1 - In up-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update. In down-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update.

01001: Retriggerable OPM mode 2 - In up-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update. In down-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

01010: Reserved.

01011: Reserved.

01100-01101: Combined PWM mode 1 and 2 - Refer to *Table 405: Combined PWM mode overview* for details.

01110-01111: Asymmetric PWM mode 1 and 2 - Refer to *Table 404: Asymmetric PWM modes* for details.

Others: Reserved.

Note: In PWM mode, the OCREF level changes when the result of the comparison changes, when the output compare mode switches from “frozen” mode to “PWM” mode and when the output compare mode switches from “force active/inactive” mode to “PWM” mode.

Bit 3 **OC1PE**: Output compare 1 preload enable

0: Preload register on TIM_CCR1 disabled. TIM_CCR1 can be written at anytime, the new value is taken in account immediately.
1: Preload register on TIM_CCR1 enabled. Read/Write operations access the preload register. TIM_CCR1 preload value is loaded in the active register at each update event.

Bit 2 **OC1FE**: Output compare 1 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIM_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.
0: CC1 behaves normally depending on counter and CCR1 values even when the trigger is ON. The minimum delay to activate CC1 output when an edge occurs on the trigger input is 5 clock cycles.
1: An active edge on the trigger input acts like a compare match on CC1 output. Then, OC is set to the compare level independently from the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to three clock cycles. OCFE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC1 channel is configured as output.
01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1.
10: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti2.
11: CC1 channel is configured as input, tim_ic1 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIM_CCER).

35.5.9 TIM capture/compare mode register 2 (TIM_CCMR2)

Address offset: 0x01C

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

Input capture mode

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC4F[3:0]**: Input capture 4 filter

Bits 11:10 **IC4PSC[1:0]**: Input capture 4 prescaler

Bits 9:8 **CC4S[1:0]**: Capture/compare 4 selection
This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC4 channel is configured as output
01: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti4
10: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti3
11: CC4 channel is configured as input, tim_ic4 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)
Note: CC4S bits are writable only when the channel is OFF (CC4E = 0 in TIM_CCER).

Bits 7:4 **IC3F[3:0]**: Input capture 3 filter

Bits 3:2 **IC3PSC[1:0]**: Input capture 3 prescaler

Bits 1:0 **CC3S[1:0]**: Capture/compare 3 selection
This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC3 channel is configured as output
01: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti3
10: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti4
11: CC3 channel is configured as input, tim_ic3 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)
Note: CC3S bits are writable only when the channel is OFF (CC3E = 0 in TIM_CCER).

35.5.10 TIM capture/compare mode register 2 [alternate] (TIM_CCMR2)

Address offset: 0x01C

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function for input capture and for output compare modes. It is possible to combine both modes independently (for example channel 1 in input capture mode and channel 2 in output compare mode).

Output compare mode

Bits 31:26 Reserved, must be kept at reset value.

Bits 23:18 Reserved, must be kept at reset value.

Bit 15 **OC4CE**: Output compare 4 clear enable
0: tim_oc4ref is not affected by the tim_ocref_clr_int signal
1: tim_oc4ref is cleared as soon as a high level is detected on tim_ocref_clr_int signal (tim_ocref_clr input or tim_etrf input)
Note: This mode is not available for all PWM modes. Refer to Section 35.4.16: Clearing the tim_ocxref signal on an external event for the list of forbidden configurations.

Bits 25:24, 14:12 **OC4M[4:0]**: Output compare 4 mode
Refer to OC3M[4:0].

Bit 11 **OC4PE**: Output compare 4 preload enable

Bit 10 **OC4FE**: Output compare 4 fast enable

Bits 9:8 **CC4S[1:0]**: Capture/compare 4 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC4 channel is configured as output

01: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti4

10: CC4 channel is configured as input, tim_ic4 is mapped on tim_ti3

11: CC4 channel is configured as input, tim_ic4 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)

Note: CC4S bits are writable only when the channel is OFF (CC4E = 0 in TIM_CCER).

Bit 7 **OC3CE**: Output compare 3 clear enable

0: tim_oc3ref is not affected by the tim_ocref_clr_int signal

1: tim_oc3ref is cleared as soon as a high level is detected on tim_ocref_clr_int signal (tim_ocref_clr input or tim_etrf input)

Note: This mode is not available for all PWM modes. Refer to Section 35.4.16: Clearing the tim_ocxref signal on an external event for the list of forbidden configurations.

Bits 17:16, 6:4 **OC3M[4:0]**: Output compare 3 mode

These bits define the behavior of the output reference signal tim_oc3ref from which tim_oc3 and tim_oc3n are derived. tim_oc3ref is active high whereas tim_oc3 and tim_oc3n active level depends on CC3P and CC3NP bits.

00000: Frozen - The comparison between the output compare register TIM_CCR3 and the counter TIM_CNT has no effect on the outputs.(this mode is used to generate a timing base).

00001: Set channel 3 to active level on match. tim_oc3ref signal is forced high when the counter TIM_CNT matches the capture/compare register 3 (TIM_CCR3).

00010: Set channel 3 to inactive level on match. tim_oc3ref signal is forced low when the counter TIM_CNT matches the capture/compare register 3 (TIM_CCR3).

00011: Toggle - tim_oc3ref toggles when TIM_CNT = TIM_CCR3.

00100: Force inactive level - tim_oc3ref is forced low.

00101: Force active level - tim_oc3ref is forced high.

00110: PWM mode 1 - In up-counting, channel 3 is active as long as TIM_CNT<TIM_CCR3 else inactive. In down-counting, channel 3 is inactive (tim_oc3ref = 0) as long as TIM_CNT>TIM_CCR3 else active (tim_oc3ref = 1).

00111: PWM mode 2 - In up-counting, channel 3 is inactive as long as TIM_CNT<TIM_CCR3 else active. In down-counting, channel 3 is active as long as TIM_CNT>TIM_CCR3 else inactive.

01000: Retrigerrable OPM mode 1 - In up-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update. In down-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes inactive again at the next update.

01001: Retrigerrable OPM mode 2 - In up-counting mode, the channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update. In down-counting mode, the channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

01010: Pulse on compare - A pulse is generated on tim_oc3ref upon CCR3 match event, as per PWPRSC[2:0] and PW[7:0] bitfields programming in TIM_ECR.

01011: Direction output - The tim_oc3ref signal is overridden by a copy of the DIR bit.

01100-01101: Combined PWM mode 1 and 2 - Refer to *Table 405: Combined PWM mode overview* for details.

01110-01111: Asymmetric PWM mode 1 and 2 - Refer to *Table 404: Asymmetric PWM modes* for details.

10110-11001: Asymmetric PWM mode 7 to 10 - Available on OC3M only. Refer to *Table 404: Asymmetric PWM modes* for details.

Others: Reserved

Note: These bits can not be modified as long as LOCK level 3 has been programmed (LOCK bits in TIM_BDTR register) and CC1S = 00 (the channel is configured in output).

Note: In PWM mode, the OCREF level changes only when the result of the comparison changes or when the output compare mode switches from “frozen” mode to “PWM” mode.

On channels having a complementary output, this bitfield is preloaded. If the CCPC bit is set in the TIM_CR2 register then the OC3M active bits take the new value from the preloaded bits only when a COM event is generated.

Bit 3 **OC3PE**: Output compare 3 preload enable

Bit 2 **OC3FE**: Output compare 3 fast enable

Bits 1:0 **CC3S[1:0]**: Capture/compare 3 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC3 channel is configured as output
01: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti3
10: CC3 channel is configured as input, tim_ic3 is mapped on tim_ti4
11: CC3 channel is configured as input, tim_ic3 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)

Note: CC3S bits are writable only when the channel is OFF (CC3E = 0 in TIM_CCER).

35.5.11 TIM capture/compare enable register (TIM_CCER)

Address offset: 0x020

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CC4NP	Res.	CC4P	CC4E	CC3NP	Res.	CC3P	CC3E	CC2NP	Res.	CC2P	CC2E	CC1NP	Res.	CC1P	CC1E
rw		rw	rw	rw		rw	rw	rw		rw	rw	rw		rw	rw

Bit 15 **CC4NP**: Capture/compare 4 output Polarity.
Refer to CC1NP description

Bit 14 Reserved, must be kept at reset value.

Bit 13 **CC4P**: Capture/compare 4 output Polarity.
Refer to CC1P description

Bit 12 **CC4E**: Capture/compare 4 output enable.
refer to CC1E description

Bit 11 **CC3NP**: Capture/compare 3 output Polarity.
Refer to CC1NP description

Bit 10 Reserved, must be kept at reset value.

Bit 9 **CC3P**: Capture/compare 3 output Polarity.
Refer to CC1P description

Bit 8 **CC3E**: Capture/compare 3 output enable.
Refer to CC1E description

Bit 7 **CC2NP**: Capture/compare 2 output Polarity.
Refer to CC1NP description

Bit 6 Reserved, must be kept at reset value.

Bit 5 **CC2P**: Capture/compare 2 output Polarity.
refer to CC1P description

Bit 4 **CC2E**: Capture/compare 2 output enable.
Refer to CC1E description

Bit 3 **CC1NP**: Capture/compare 1 output Polarity.

CC1 channel configured as output: CC1NP must be kept cleared in this case.

CC1 channel configured as input: This bit is used in conjunction with CC1P to define tim_ti1fp1/tim_ti2fp1 polarity. refer to CC1P description.

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CC1P**: Capture/compare 1 output Polarity.

0: OC1 active high (output mode) / Edge sensitivity selection (input mode, see below)

1: OC1 active low (output mode) / Edge sensitivity selection (input mode, see below)

When CC1 channel is configured as input, both CC1NP/CC1P bits select the active polarity of TI1FP1 and TI2FP1 for trigger or capture operations.

CC1NP = 0, CC1P = 0:non-inverted/rising edge. The circuit is sensitive to TIxFP1 rising edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode or encoder mode).

CC1NP = 0, CC1P = 1:inverted/falling edge. The circuit is sensitive to TIxFP1 falling edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is inverted (trigger operation in gated mode or encoder mode).

CC1NP = 1, CC1P = 1:non-inverted/both edges. The circuit is sensitive to both TIxFP1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), TIxFP1is not inverted (trigger operation in gated mode). This configuration must not be used in encoder mode.

CC1NP = 1, CC1P = 0:this configuration is reserved, it must not be used.

Bit 0 **CC1E**: Capture/compare 1 output enable.

0: Capture mode disabled / OC1 is not active

1: Capture mode enabled / OC1 signal is output on the corresponding output pin

Table 411. Output control bit for standard tim_ocx channels

CCxE bit	tim_ocx output state
0	Output disabled (not driven by the timer: Hi-Z)
1	Output enabled (tim_ocx = tim_ocxref + Polarity)

Note: The state of the external IO pins connected to the standard tim_ocx channels depends only on the GPIO registers when CCxE = 0.

35.5.12 TIM counter (TIM_CNT)

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UIFCPY_CNT[31]	CNT[30:16]														
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **UIFCPY_CNT[31]**: Value depends on IUFREMAP in TIM_CR1.
If UIFREMAP = 0
CNT[31]: Most significant bit of counter value
If UIFREMAP = 1
UIFCPY: UIF Copy
This bit is a read-only copy of the UIF bit of the TIM_ISR register

Bits 30:0 **CNT[30:0]**: Least significant part of counter value
Non-dithering mode (DITHEN = 0)
The register holds the counter value.
Dithering mode (DITHEN = 1)
The register holds the non-dithered part in CNT[30:0]. The fractional part is not available.

35.5.13 TIM prescaler (TIM_PSC)

Address offset: 0x028

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PSC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **PSC[15:0]**: Prescaler value
The counter clock frequency tim_cnt_ck is equal to $f_{tim_psc_ck}$ / (PSC[15:0] + 1).
PSC contains the value to be loaded in the active prescaler register at each update event (including when the counter is cleared through UG bit of TIM_EGR register or through trigger controller when configured in “reset mode”).

35.5.14 TIM autoreload register (TIM_ARR)

Address offset: 0x02C

Reset value: 0xFFFF FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
ARR[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **ARR[31:0]**: Autoreload value

ARR is the value to be loaded in the actual autoreload register.

Refer to the *Section 35.4.3: Time-base unit* for more details about ARR update and behavior.

The counter is blocked while the autoreload value is null.

Non-dithering mode (DITHEN = 0)

The register holds the autoreload value.

Dithering mode (DITHEN = 1)

The register holds the integer part in ARR[31:4]. The ARR[3:0] bitfield contains the dithered part.

35.5.15 TIM capture/compare register 1 (TIM_CCR1)

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CCR1[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CCR1[31:0]**: Capture/compare 1 value

If channel CC1 is configured as output:

CCR1 is the value to be loaded in the actual capture/compare 1 register (preload value). It is loaded permanently if the preload feature is not selected in the TIM_CCMR1 register (bit OC1PE). Else the preload value is copied in the active capture/compare 1 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIM_CNT and signaled on tim_oc1 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR1[31:4]. The CCR1[3:0] bitfield contains the dithered part.

If channel CC1 is configured as input:

CCR1 is the counter value transferred by the last input capture 1 event (tim_ic1). The TIM_CCR1 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR1[31:0]. The CCR1[3:0] bits are reset.

35.5.16 TIM capture/compare register 2 (TIM_CCR2)

Address offset: 0x038

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CCR2[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR2[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CCR2[31:0]**: Capture/compare 2 value

If channel CC2 is configured as output:

CCR2 is the value to be loaded in the actual capture/compare 2 register (preload value). It is loaded permanently if the preload feature is not selected in the TIM_CCMR2 register (bit OC2PE). Else the preload value is copied in the active capture/compare 2 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIM_CNT and signaled on tim_oc2 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR2[31:4]. The CCR2[3:0] bitfield contains the dithered part.

If channel CC2 is configured as input:

CCR2 is the counter value transferred by the last input capture 2 event (tim_ic2). The TIM_CCR2 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR2[31:0]. The CCR2[3:0] bits are reset.

35.5.17 TIM capture/compare register 3 (TIM_CCR3)

Address offset: 0x03C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CCR3[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR3[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CCR3[31:0]**: Capture/compare 3 value

If channel CC3 is configured as output:

CCR3 is the value to be loaded in the actual capture/compare 3 register (preload value). It is loaded permanently if the preload feature is not selected in the TIM_CCMR3 register (bit OC3PE). Else the preload value is copied in the active capture/compare 3 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIM_CNT and signaled on tim_oc3 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR3[31:4]. The CCR3[3:0] bitfield contains the dithered part.

If channel CC3 is configured as input:

CCR3 is the counter value transferred by the last input capture 3 event (tim_ic3). The TIM_CCR3 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR3[31:0]. The CCR3[3:0] bits are reset.

35.5.18 TIM capture/compare register 4 (TIM_CCR4)

Address offset: 0x040

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
CCR4[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR4[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **CCR4[31:0]**: Capture/compare 4 value

If channel CC4 is configured as output:

CCR4 is the value to be loaded in the actual capture/compare 4 register (preload value). It is loaded permanently if the preload feature is not selected in the TIM_CCMR4 register (bit OC4PE). Else the preload value is copied in the active capture/compare 4 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIM_CNT and signaled on tim_oc4 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR4[31:4]. The CCR4[3:0] bitfield contains the dithered part.

If channel CC4 is configured as input:

CCR4 is the counter value transferred by the last input capture 4 event (tim_ic4). The TIM_CCR4 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR4[31:0]. The CCR4[3:0] bits are reset.

35.5.19 TIM timer encoder control register (TIM_ECR)

Address offset: 0x058

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	PWPRSC[2:0]			PW[7:0]							
					rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IPOS[1:0]		FIDX	IBLK[1:0]		IDIR[1:0]		IE
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:27 Reserved, must be kept at reset value.

Bits 26:24 **PWPRSC[2:0]**: Pulse width prescaler

This bitfield sets the clock prescaler for the pulse generator, as following:

$t_{PWG} = (2^{(PWPRSC[2:0])}) \times t_{tim_ker_ck}$

Bits 23:16 **PW[7:0]**: Pulse width

This bitfield defines the pulse duration, as following:

$t_{PW} = PW[7:0] \times t_{PWG}$

Bits 15:8 Reserved, must be kept at reset value.

Bits 7:6 **IPOS[1:0]**: Index positioning

In quadrature encoder mode (SMS[4:0] = 00001, 00010, 00011, 01110, 01111), this bit indicates in which AB input configuration the Index event resets the counter.

00: Index resets the counter when AB = 00
01: Index resets the counter when AB = 01
10: Index resets the counter when AB = 10
11: Index resets the counter when AB = 11

In directional clock mode or clock plus direction mode (SMS[4:0] = 01010, 01011, 01100, 01101), these bits indicates on which level the Index event resets the counter. In bidirectional clock mode, this applies for both clock inputs.

x0: Index resets the counter when clock is 0
x1: Index resets the counter when clock is 1

Note: IPOS[1] bit is not significant

Bit 5 **FIDX**: First index

This bit indicates if the first index only is taken into account

0: Index is always active
1: the first Index only resets the counter

Bits 4:3 **IBLK[1:0]**: Index blanking

This bit indicates if the Index event is conditioned by the tim_ti3 input

00: Index always active
01: Index disabled hen tim_ti3 input is active, as per CC3P bitfield
10: Index disabled when tim_ti4 input is active, as per CC4P bitfield
11: Reserved

Bits 2:1 **IDIR[1:0]**: Index direction

This bit indicates in which direction the Index event resets the counter.

00: Index resets the counter whatever the direction
01: Index resets the counter when up-counting only
10: Index resets the counter when down-counting only
11: Reserved

Bit 0 **IE**: Index enable

This bit indicates if the Index event resets the counter.

0: Index disabled
1: Index enabled

35.5.20 TIM timer input selection register (TIM_TISEL)

Address offset: 0x05C

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **TI4SEL[3:0]**: Selects tim_ti4[15:0] input
0000: tim_ti4_in0: TIMx_CH4
0001: tim_ti4_in1
...
1111: tim_ti4_in15
Refer to *Section 35.4.2: TIM2/TIM3/TIM4/TIM5 pins and internal signals* for product specific implementation.

Bits 23:20 Reserved, must be kept at reset value.

Bits 19:16 **TI3SEL[3:0]**: Selects tim_ti3[15:0] input
0000: tim_ti3_in0: TIMx_CH3
0001: tim_ti3_in1
...
1111: tim_ti3_in15
Refer to *Section 35.4.2: TIM2/TIM3/TIM4/TIM5 pins and internal signals* for product specific implementation.

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **TI2SEL[3:0]**: Selects tim_ti2[15:0] input
0000: tim_ti2_in0: TIMx_CH2
0001: tim_ti2_in1
...
1111: tim_ti2_in15
Refer to *Section 35.4.2: TIM2/TIM3/TIM4/TIM5 pins and internal signals* for product specific implementation.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **TI1SEL[3:0]**: Selects tim_ti1[15:0] input
0000: tim_ti1_in0: TIMx_CH1
0001: tim_ti1_in1
...
1111: tim_ti1_in15
Refer to *Section 35.4.2: TIM2/TIM3/TIM4/TIM5 pins and internal signals* for product specific implementation.

35.5.21 TIM alternate function register 1 (TIM_AF1)

Address offset: 0x060

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **OCRSEL[3:0]**: ocref_clr source selection
These bits select the ocref_clr input source.
0000: tim_ocref_clr0
0001: tim_ocref_clr1
...
0111: tim_ocref_clr15
Refer to *Section 35.4.2: TIM2/TIM3/TIM4/TIM5 pins and internal signals* for product specific implementation.

Bits 15:0 Reserved, must be kept at reset value.

35.5.23 TIM DMA control register (TIM_DCR)

Address offset: 0x3DC

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	DBSS[3:0]			
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DBL[4:0]					Res.	Res.	Res.	DBA[4:0]				
			rw	rw	rw	rw	rw				rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:16 **DBSS[3:0]**: DMA burst source selection

This bitfield defines the interrupt source that triggers the DMA burst transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIM_DMAR address).

0000: Reserved
0001: Update
0010: CC1
0011: CC2
0100: CC3
0101: CC4
0110: COM
0111: Trigger
Others: reserved

Bits 15:13 Reserved, must be kept at reset value.

Bits 12:8 **DBL[4:0]**: DMA burst length

This 5-bit vector defines the length of DMA transfers (the timer recognizes a burst transfer when a read or a write access is done to the TIM_DMAR address), i.e. the number of transfers. Transfers can be in half-words or in bytes (see example below).

00000: 1 transfer
00001: 2 transfers
00010: 3 transfers
...
11111: 32 transfers

Example: Let us consider the following transfer: DBL = 6 bytes & DBA = TIM2_CR1.

–If DBL = 6 bytes and DBA = TIM2_CR1 represents the address of the byte to be transferred, the address of the transfer is given by the following equation: (TIM_CR1 address) + DBA + (DMA index), where DMA index = DBL

In this example, 7 bytes are added to (TIM_CR1 address) + DBA, which gives us the address from/to which the data are copied. In this case, the transfer is done to 7 registers starting from the following address: (TIM_CR1 address) + DBA

According to the configuration of the DMA Data Size, several cases may occur:

–If the DMA Data Size is configured in half-words, 16-bit data are transferred to each of the 7 registers.

–If the DMA Data Size is configured in bytes, the data are also transferred to 7 registers: the first register contains the first MSB byte, the second register, the first LSB byte and so on. So with the transfer Timer, one also has to specify the size of data transferred by DMA.

Bits 7:5 Reserved, must be kept at reset value.

Bits 4:0 **DBA[4:0]**: DMA base address

This 5-bits vector defines the base-address for DMA transfers (when read/write access are done through the TIM_DMAR address). DBA is defined as an offset starting from the address of the TIM_CR1 register.

Example:
00000: TIM_CR1,
00001: TIM_CR2,
00010: TIM_SMCR,
...

35.5.24 TIM DMA address for full transfer (TIM_DMAR)

Address offset: 0x3E0

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
DMAB[31:16]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
DMAB[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:0 **DMAB[31:0]**: DMA register for burst accesses

A read or write operation to the DMAR register accesses the register located at the address

(TIM_CR1 address) + (DBA + DMA index) x 4

where TIM_CR1 address is the address of the control register 1, DBA is the DMA base address configured in TIM_DCR register, DMA index is automatically controlled by the DMA transfer, and ranges from 0 to DBL (DBL configured in TIM_DCR).

35.5.25 TIM2/TIM3/TIM4/TIM5 register map

TIM2/TIM3/TIM4/TIM5 registers are mapped as described in the table below.

Table 412. TIM2/TIM3/TIM4/TIM5 register map and reset values

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

36 Basic timers (TIM6/TIM7)

36.1 TIM6/TIM7 introduction

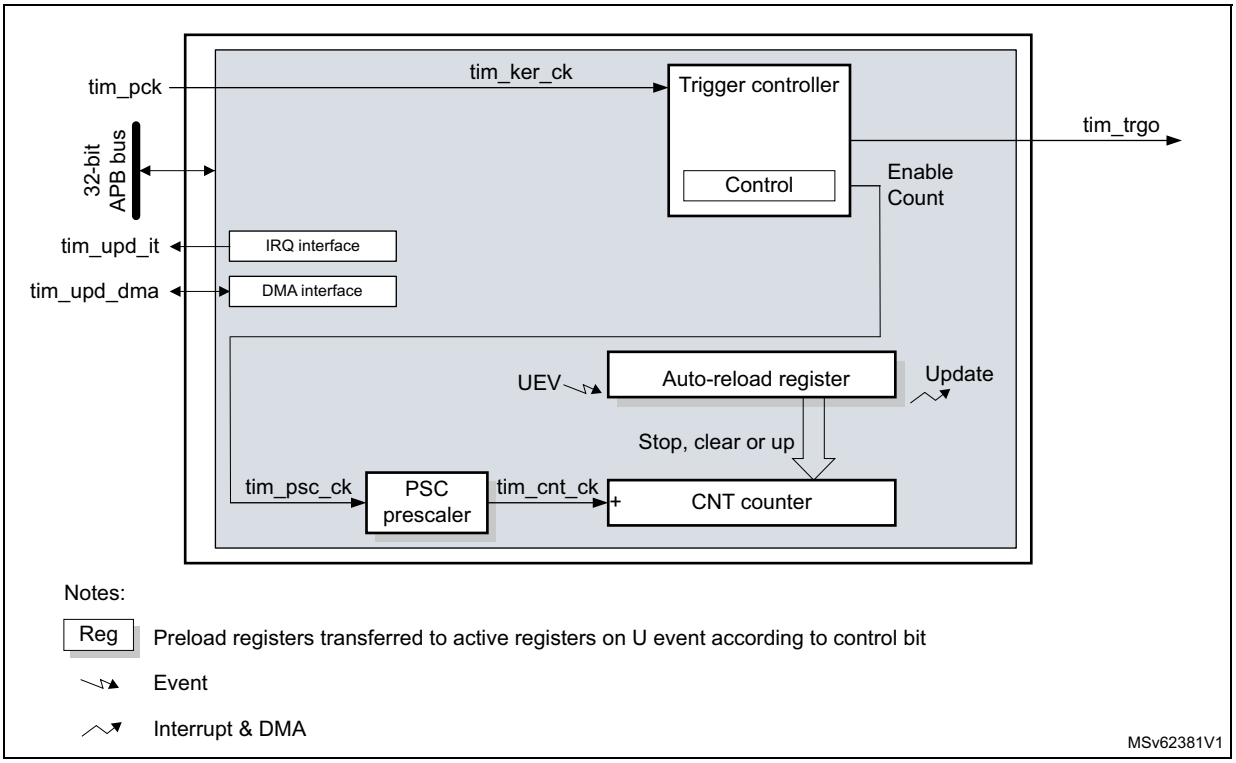
The basic timers TIM6/TIM7 consist in a 16-bit autoreload counter driven by a programmable prescaler.

They can be used as generic timers for time-base generation.

The basic timer can also be used for triggering the digital-to-analog converter. This is done with the trigger output of the timer.

The timers are completely independent, and do not share any resources.

36.2 TIM6/TIM7 main features



Basic timer (TIM6/TIM7) features include:

- 16-bit autoreload upcounter.
- 16-bit programmable prescaler used to divide (also “on the fly”) the counter clock frequency by any factor between 1 and 65535.
- Synchronization circuit to trigger the DAC.
- Interrupt/DMA generation on the update event: counter overflow.
- ADC synchronization for jitter-free sampling points.

36.3 TIM6/TIM7 functional description

36.3.1 TIM6/TIM7 block diagram

Figure 714. Basic timer block diagram

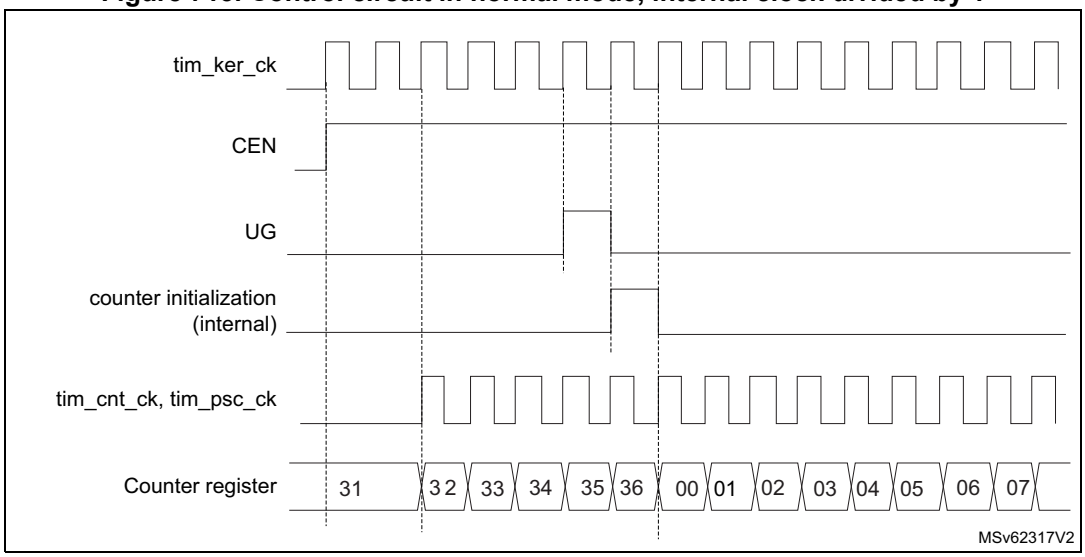
36.3.2 TIM6/TIM7 internal signals

The table in this section summarizes the TIM inputs and outputs.

Table 413. TIM internal input/output signals

Internal signal name	Signal type	Description
tim_pclk	Input	Timer APB clock
tim_ker_ck	Input	Timer kernel clock. This clock must be synchronous with tim_pclk (derived from the same source). The clock ratio tim_ker_ck/tim_pclk must be an integer: 1, 2, 3,..., 16 (maximum value)
tim_trgo	Output	Internal trigger output. This trigger can trigger other on-chip peripherals (DAC).
tim_upd_it	Output	Timer update event interrupt
tim_upd_dma	Output	Timer update dma request

36.3.3 TIM6/TIM7 clocks



The timer bus interface is clocked by the tim_pclk APB clock.

The counter clock tim_ker_ck is connected to the tim_pclk input.

The CEN (in the TIM_CR1 register) and UG bits (in the TIM_EGR register) are actual control bits and can be changed only by software (except for UG that remains cleared automatically). As soon as the CEN bit is written to 1, the prescaler is clocked by the internal clock tim_ker_ck.

Figure 715 shows the behavior of the control circuit and the upcounter in normal mode, without prescaler.

Figure 715. Control circuit in normal mode, internal clock divided by 1

36.3.4 Time-base unit

The main block of the programmable timer is a 16-bit upcounter with its related autoreload register. The counter clock can be divided by a prescaler.

The counter, the autoreload register and the prescaler register can be written or read by software. This is true even when the counter is running.

The time-base unit includes:

- Counter register (TIM_CNT)
- Prescaler register (TIM_PSC)
- Auto-Reload register (TIM_ARR).

The autoreload register is preloaded. The preload register is accessed each time an attempt is made to write or read the autoreload register. The contents of the preload register are transferred into the shadow register permanently or at each update event UEV, depending on the autoreload preload enable bit (ARPE) in the TIM_CR1 register. The update event is sent when the counter reaches the overflow value and if the UDIS bit equals 0 in the TIM_CR1 register. It can also be generated by software. The generation of the update event is described in detail for each configuration.

Note: An update overrun status bit (UIOVRF in TIM_SR register) indicates that an update request occurred while an update interrupt is pending (update interrupt flag set). This bit is useful when debugging closed loop applications, to indicate that:

- the update interrupt service routine is too long with respect to the interval between consecutive update events

- the update interrupt service routine was served too late with respect to the subsequent update event

The counter is clocked by the prescaler output tim_cnt_ck, which is enabled only when the counter enable bit (CEN) in the TIM_CR1 register is set.

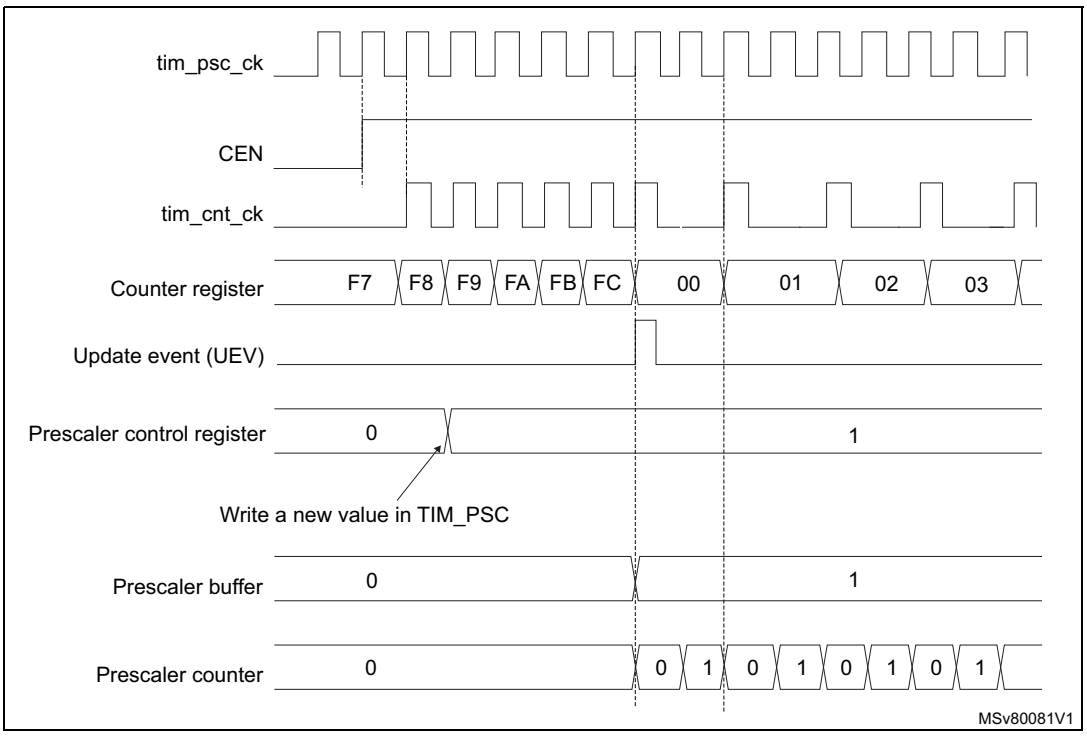
Note that the actual counter enable signal tim_cnt_en is set one clock cycle after CEN bit set.

Prescaler description

The prescaler can divide the counter clock frequency by any factor between 1 and 65536. It is based on a 16-bit counter controlled through a 16-bit register (in the TIM_PSC register). It can be changed on the fly as the TIM_PSC control register is buffered. The new prescaler ratio is taken into account at the next update event.

Figure 716 and *Figure 717* give some examples of the counter behavior when the prescaler ratio is changed on the fly.

Figure 716. Counter timing diagram with prescaler division change from 1 to 2



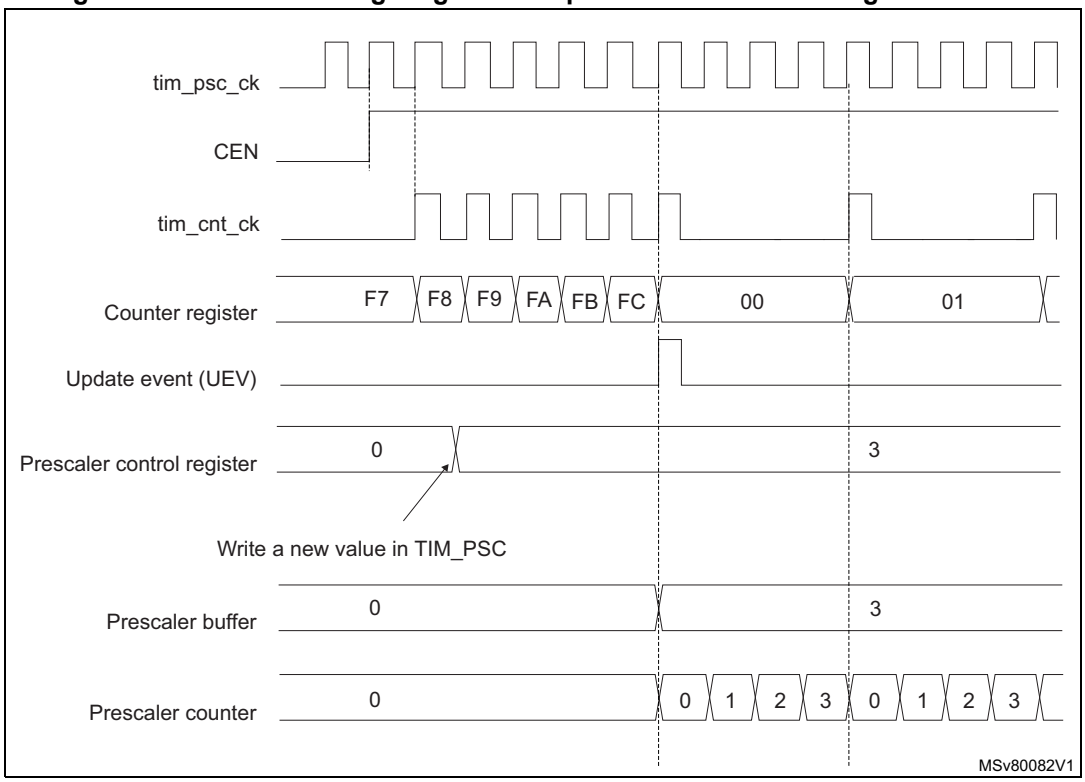


Figure 717. Counter timing diagram with prescaler division change from 1 to 4

36.3.5 Counting mode

The counter counts from 0 to the autoreload value (contents of the TIM_ARR register), then restarts from 0 and generates a counter overflow event.

An update event can be generated at each counter overflow or by setting the UG bit in the TIM_EGR register (by software or by using the slave mode controller).

The UEV event can be disabled by software by setting the UDIS bit in the TIM_CR1 register. This avoids updating the shadow registers while writing new values into the preload registers. In this way, no update event occurs until the UDIS bit has been written to 0, however, the counter and the prescaler counter both restart from 0 (but the prescale rate does not change). In addition, if the URS (update request selection) bit in the TIM_CR1 register is set, setting the UG bit generates an update event UEV, but the UIF flag is not set (so no interrupt or DMA request is sent).

When an update event occurs, all the registers are updated and the update flag (UIF bit in the TIM_SR register) is set (depending on the URS bit):

- The buffer of the prescaler is reloaded with the preload value (contents of the TIM_PSC register).
- The autoreload shadow register is updated with the preload value (TIM_ARR).

The following figures show some examples of the counter behavior for different clock frequencies when TIM_ARR = 0x36.

Figure 718. Counter timing diagram, internal clock divided by 1

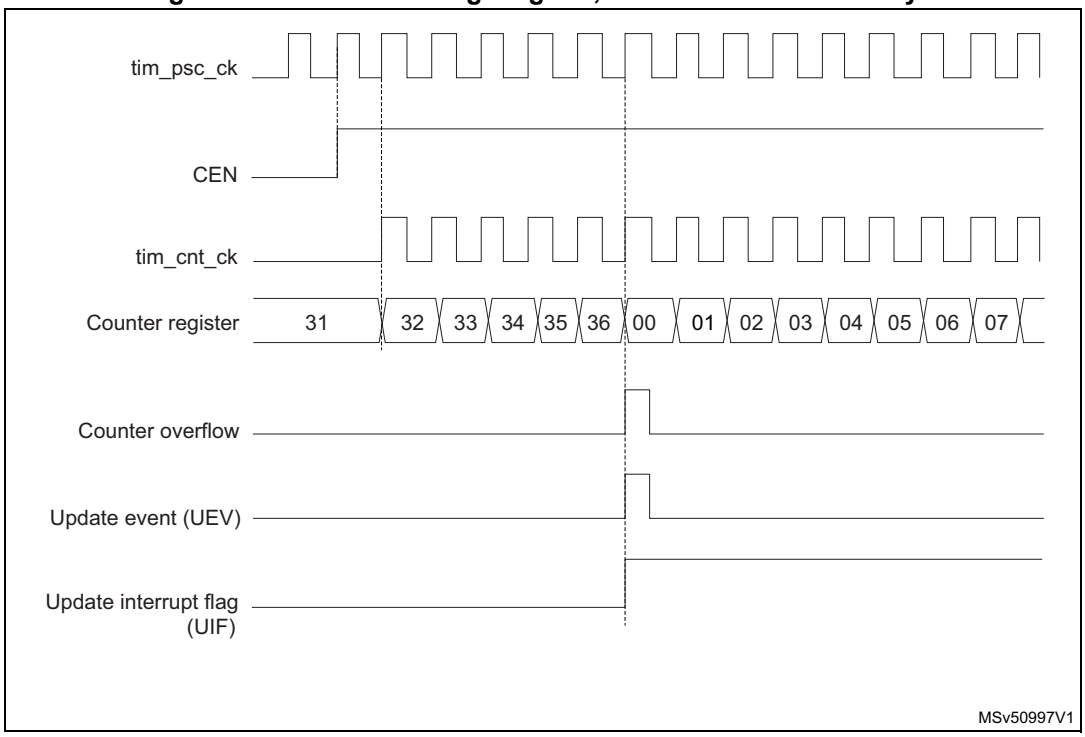

Figure 719. Counter timing diagram, internal clock divided by 2

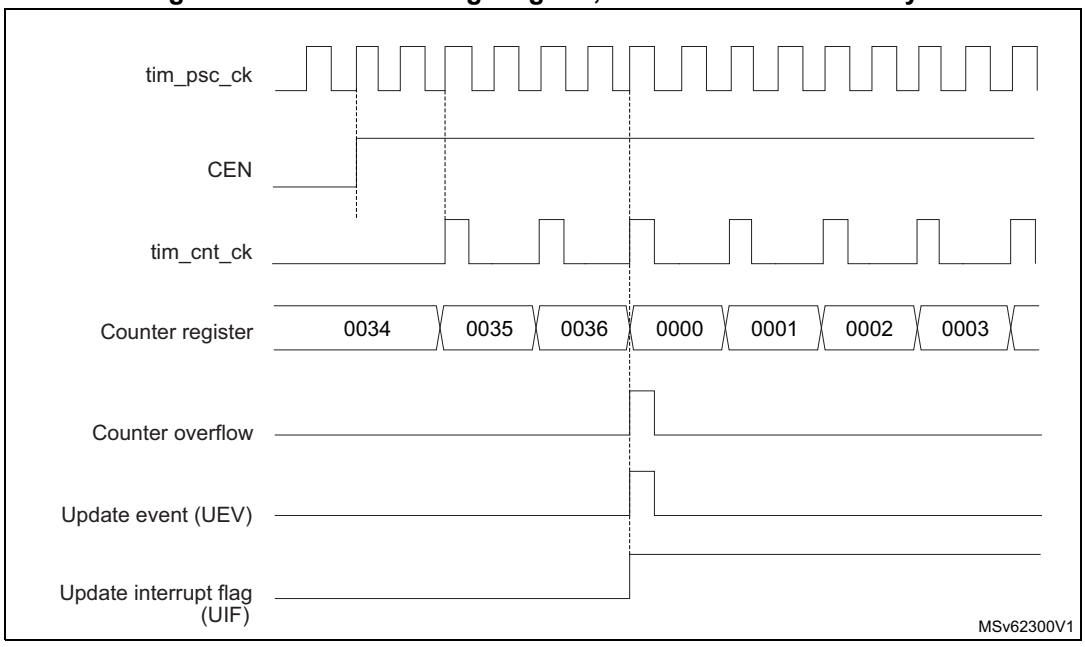

Figure 720. Counter timing diagram, internal clock divided by 4

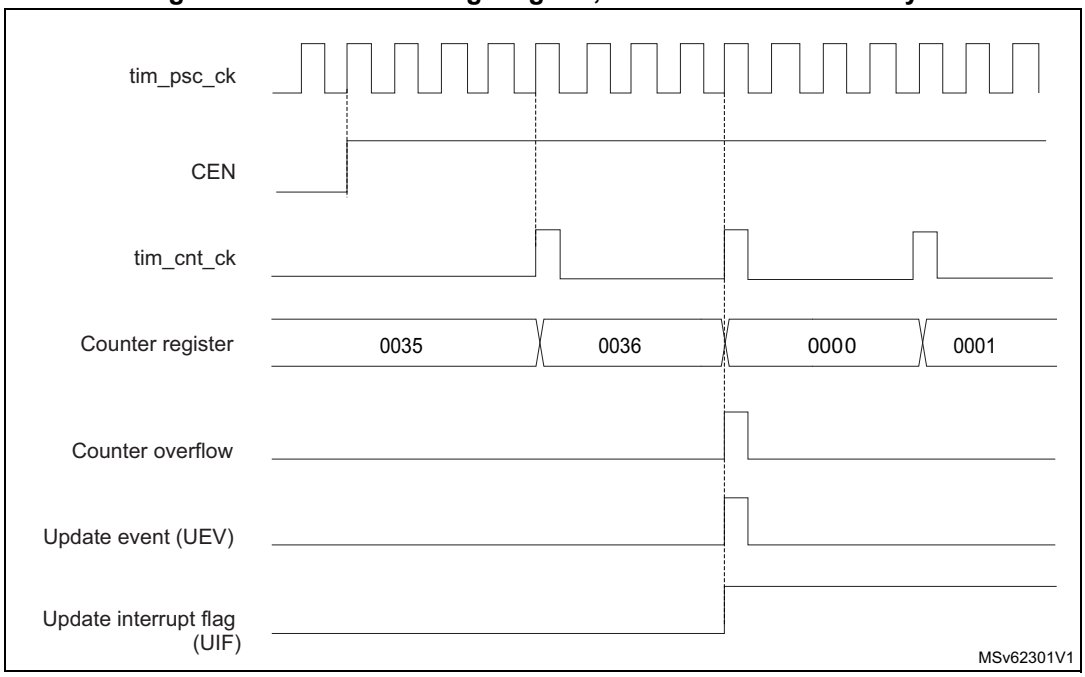

Figure 721. Counter timing diagram, internal clock divided by N

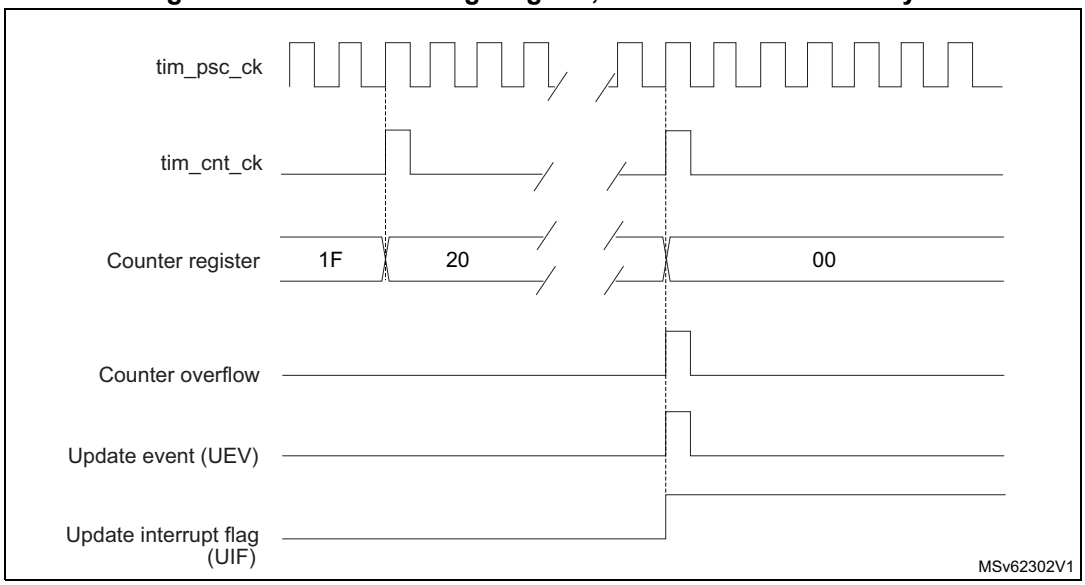

Figure 722. Counter timing diagram, update event when ARPE = 0 (TIM_ARR not preloaded)

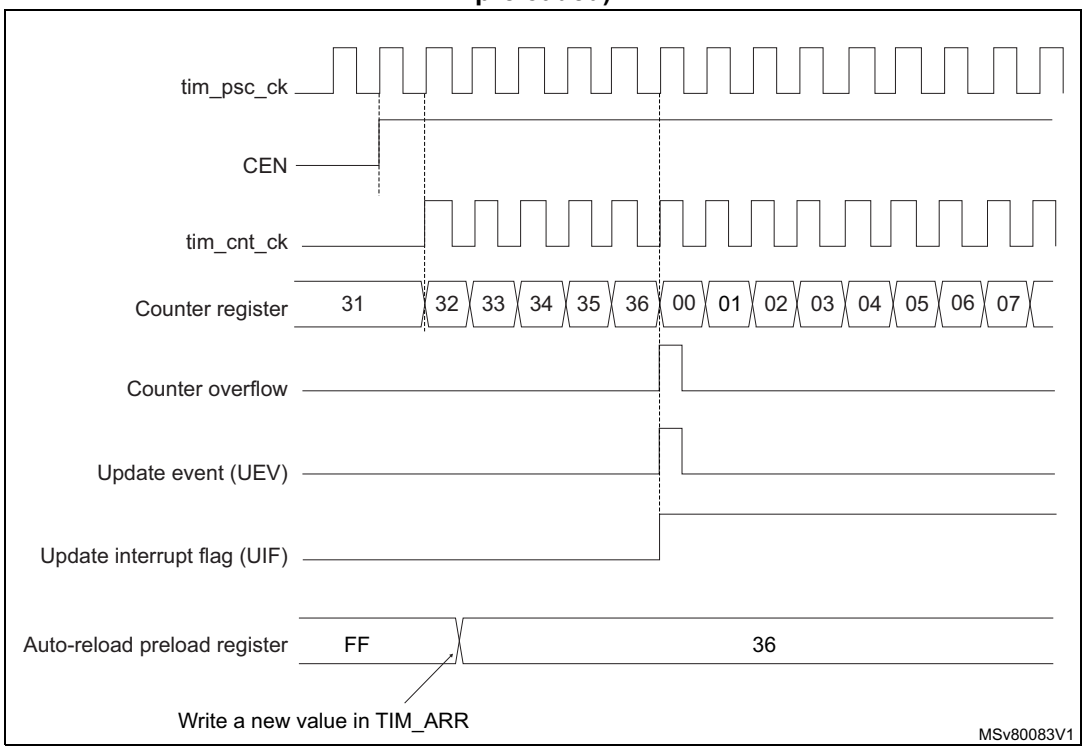

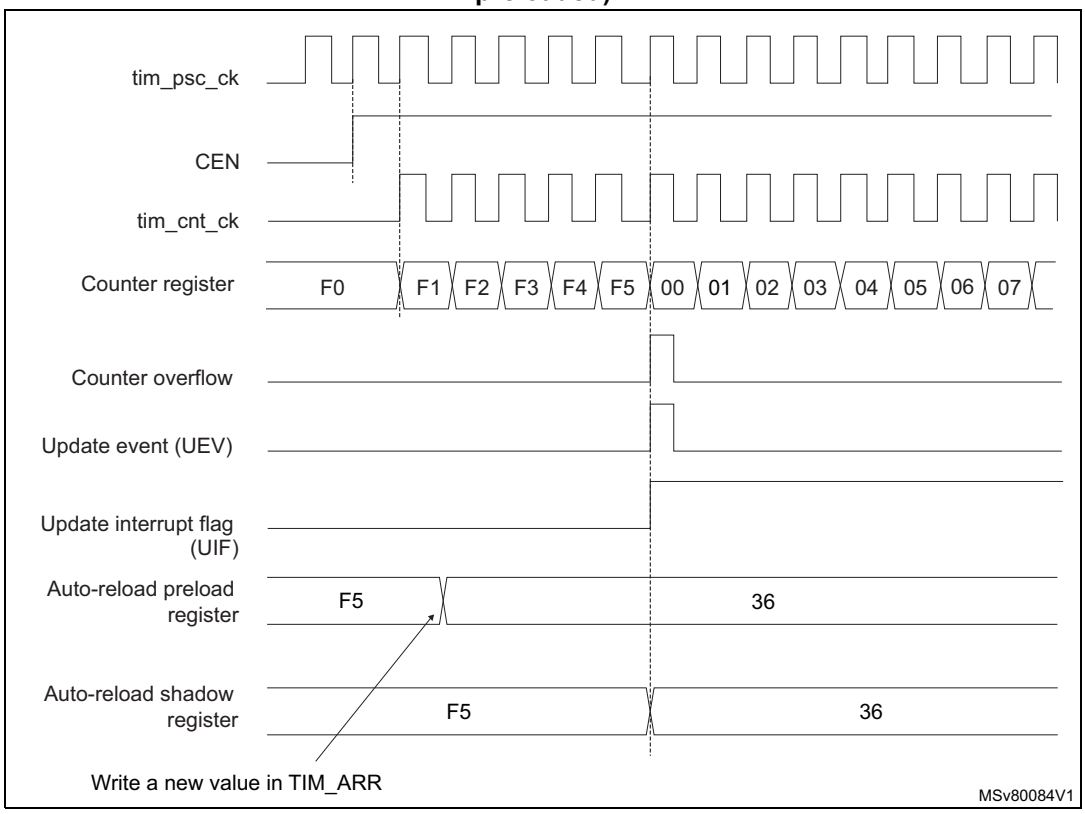

Figure 723. Counter timing diagram, update event when ARPE = 1 (TIM_ARR preloaded)

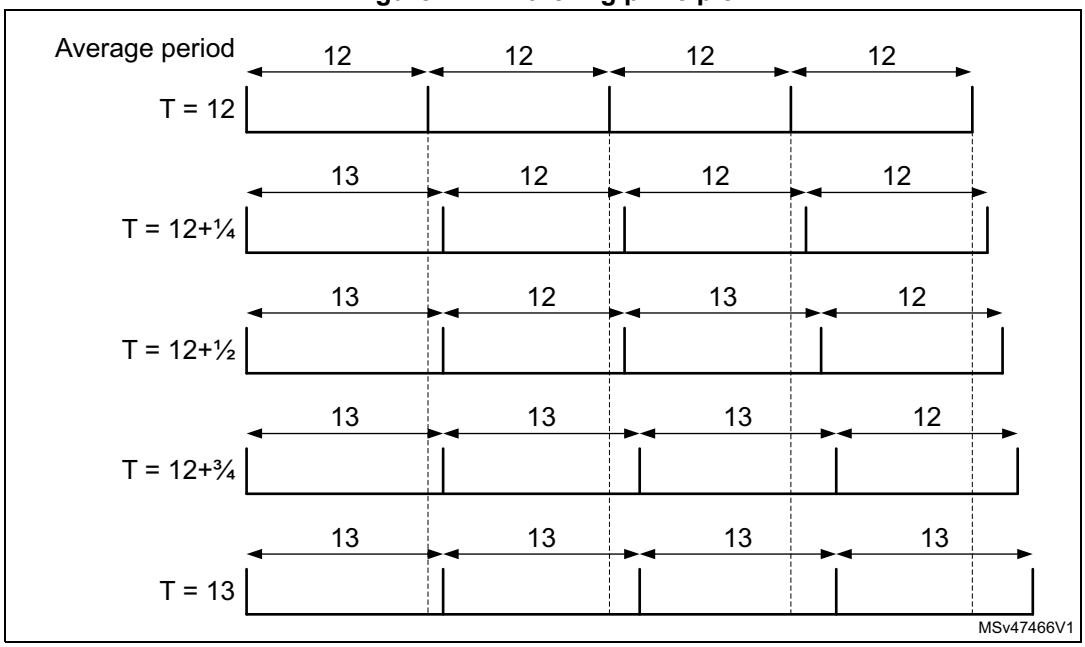


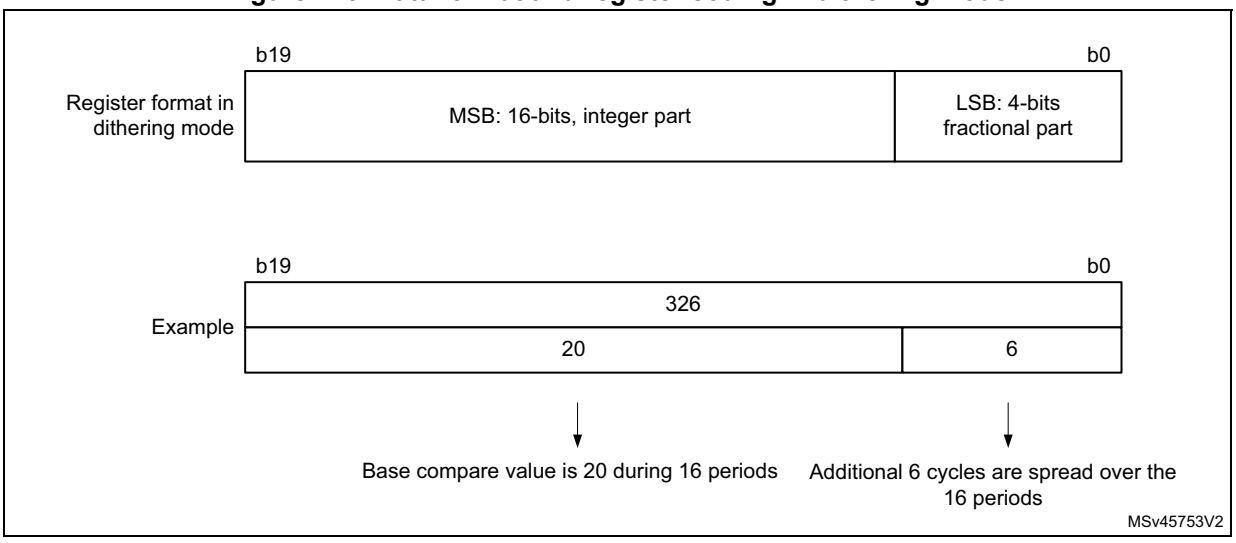
Dithering mode

The time base effective resolution can be increased by enabling the dithering mode, using the DITHEN bit in the TIM_CR1 register. This affects the way the TIM_ARR is behaving, and is useful for adjusting the average counter period when the timer is used as a trigger (typically for a DAC).

The operating principle is to have the actual ARR value slightly changed (adding or not one timer clock period) over 16 consecutive counting periods, with predefined patterns. This allows a 16-fold resolution increase, considering the average counting period.

Figure 724 presents the dithering principle applied to four consecutive counting periods.

Figure 724. Dithering principle



When the dithering mode is enabled, the register coding is changed as follows (see *Figure 725* for example):

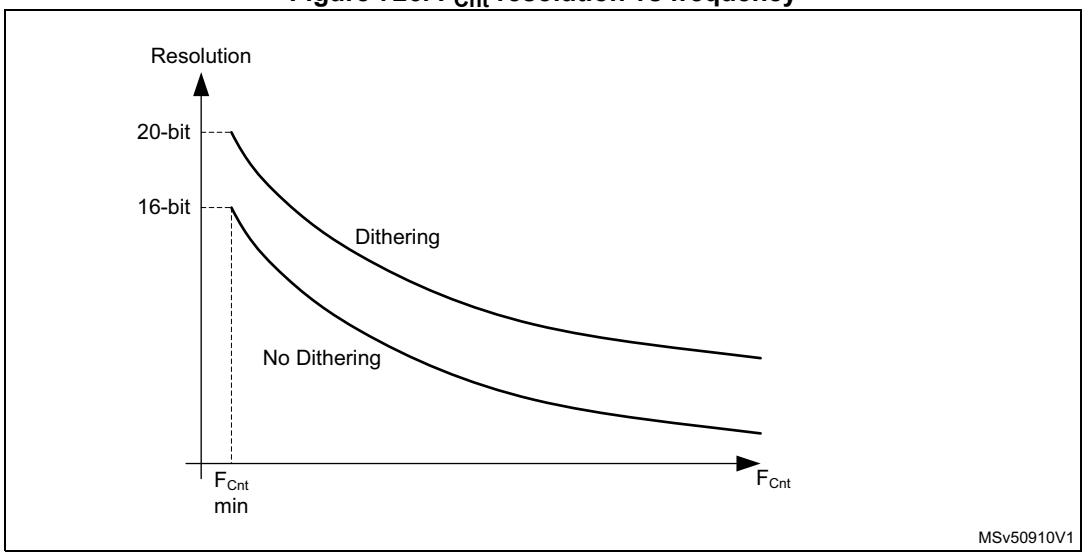
- The four LSBs are coding for the enhanced resolution part (fractional part).
- The MSBs are left-shifted to the bits 19:4 and are coding for the base value.

Note: The following sequence must be followed when resetting the DITHEN bit:
1. CEN and ARPE bits must be reset
2. The DITHEN bit must be reset
3. The CEN bit can be set (eventually with ARPE = 1).

Figure 725. Data format and register coding in dithering mode

The minimum frequency is given by the following formula:

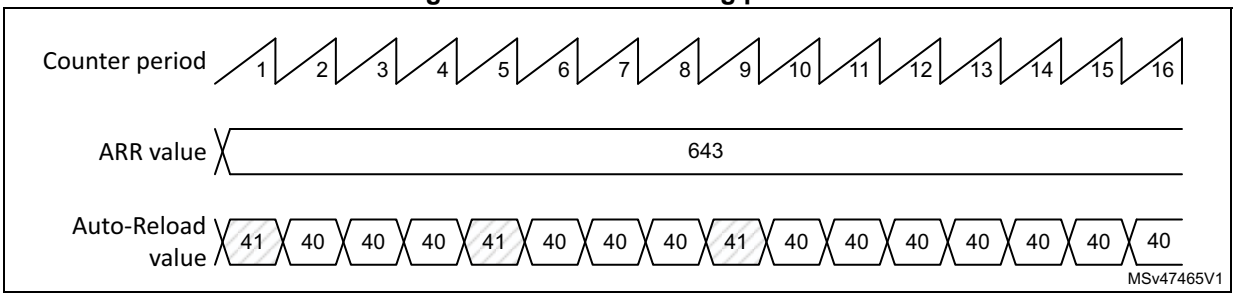
$$\text{Resolution} = \frac{F_{Tim}}{F_{pwm}} \Rightarrow F_{pwmMin} = \frac{F_{Tim}}{Max_{Resolution}}$$



$$\text{Dithering mode disabled: } F_{pwmMin} = \frac{F_{Tim}}{65536}$$

$$\text{Dithering mode enabled: } F_{pwmMin} = \frac{F_{Tim}}{65535 + \frac{15}{16}}$$

Note: The maximum TIM_ARR value is limited to 0xFFFEF in dithering mode (corresponds to 65534 for the integer part and 15 for the dithered part).



As shown on *Figure 726*, the dithering mode is used to increase the PWM resolution whatever the PWM frequency.

Figure 726. F_{Cnt} resolution vs frequency

The period changes are spread over 16 consecutive periods, as described in *Figure 727*.

Figure 727. PWM dithering pattern

The autoreload and compare values increments are spread following the specific patterns described in *Table 414*. The dithering sequence is done to have increments distributed as evenly as possible and minimize the overall ripple.

Table 414. TIM_ARR register change dithering pattern

36.3.6 UIF bit remapping

The IUFREMAP bit in the TIM_CR1 register forces a continuous copy of the update interrupt flag UIF into the timer counter register's bit 31 (TIM_CNT[31]). This is used to atomically read both the counter value and a potential roll-over condition signaled by the UIFCPY flag. In particular cases, it can ease the calculations by avoiding race conditions caused for instance by a processing shared between a background task (counter reading) and an interrupt (update interrupt).

There is no latency between the assertions of the UIF and UIFCPY flags.

36.3.7 ADC triggers

The timer can generate an ADC triggering event with various internal signals, such as reset, enable or compare events.

Note: The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo signal must be enabled prior to receiving events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

36.3.8 ADC synchronization

The timer operation can be synchronized to the ADC clock to trigger jitter-free ADC sampling. This function is enabled using the ADSYNC bit in the TIM_CR2 register.

This feature is useful when the timers and the ADCs are operating with semisynchronous clocks (clocks derived from a same source with integer ratio tim_ker_ck/adc_ker_ck), for instance adc_ker_ck = 75 MHz and tim_ker_ck = 150 MHz or 300 MHz.

ADSYNC must also be set when both peripherals are operating at the same frequency from the same clock source, when jitter-free operation is needed.

ADSYNC must not be set and jitter-free operation is not supported in the following cases:

- When the clock ratio is not an integer (for example adc_ker_ck = 75 MHz and tim_ker_ck = 100 MHz): in this case, the sampling point jitter due to the timer to ADC signal resynchronization is 1 adc_ker_ck period maximum.
- When the ADC is operating in asynchronous mode (adc_ker_ck uncorrelated with tim_ker_ck): in this case, the sampling point jitter due to the timer to ADC signal resynchronization is 1 adc_ker_ck period maximum.

When ADSYNC = 1, the timer operation is slightly changed: the counter enable and counter reset events are aligned to the adc_ker_ck ADC clock, to avoid any phase shift due to clocks enable in the RCC.

Jitter-free operation is guaranteed only when one of the two requirements below is met (depending on the selected trigger source).

1. The counter period must be a multiple of the ADC clock period

$$(\text{TIM_PSC} + 1) \times (\text{TIM_ARR} + 1) \times T_{\text{tim_ker_ck}} = n \times T_{\text{adc_ker_ck}}$$

2. The compare value must be a multiple of the ADC clock period

$$(\text{TIM_PSC} + 1) \times \text{TIM_CMPy} \times T_{\text{tim_ker_ck}} = m \times T_{\text{adc_ker_ck}}$$

Note: If none of the two above requirements are met, the trigger is still generated, but the latency is not constant and varies with the timer and ADC clocks phase shift.

Programming guidelines

The ADC synchronization feature must not be modified during run-time, once the counter is enabled and once the ADC has been configured for receiving triggers from the timer.

It is mandatory to follow the procedure below to use the ADC synchronization:

1. Enable the destination ADC clock
2. Configure the timer and set the ADSYNC bit
3. Configure the ADC and enable it (using ADSTART and/or JADSTART bits)
4. Start the timer (with the CEN counter enable bit)

36.3.9 TIM6/TIM7 DMA requests

The TIM6/TIM7 can generate a single DMA request, as shown in *Table 415*.

Table 415. DMA request

DMA request signal	DMA request	Enable control bit
tim_upd_dma	Update	UDE

36.3.10 Debug mode

When the microcontroller enters debug mode (Cortex®-M7 core halted), the TIMx counter can either continue to work normally or be stopped.

The behavior in debug mode can be programmed with a dedicated configuration bit per timer in the Debug support (DBG) module.

For more details, refer to section Debug support (DBG).

36.3.11 TIM6/TIM7 low-power modes

Table 416. Effect of low-power modes on TIM6/TIM7

Mode	Description
Sleep	No effect, peripheral is active. The interrupts can cause the device to exit from Sleep mode.
Stop	The timer operation is stopped and the register content is kept. No interrupt can be generated.
Standby	The timer is powered-down and must be reinitialized after exiting the Standby mode.

36.3.12 TIM6/TIM7 interrupts

The TIM6/TIM7 can generate a single interrupt, as shown in *Table 417*.

Table 417. Interrupt request

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from Sleep mode	Exit from Stop and Standby mode
TIM6 TIM7	Update	UIF	UIE	write 0 in UIF	Yes	No

36.4 TIM6/TIM7 registers

Refer to *Section 1.2* for a list of abbreviations used in register descriptions.

The peripheral registers can be accessed by half-words (16-bit) or words (32-bit).

36.4.1 TIM control register 1 (TIM_CR1)

Address offset: 0x00

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DITHEN	UIFREMAP	Res.	Res.	Res.	ARPE	Res.	Res.	Res.	OPM	URS	UDIS	CEN
			rw	rw				rw				rw	rw	rw	rw

Bits 15:13 Reserved, must be kept at reset value.

Bit 12 **DITHEN**: Dithering enable
0: Dithering disabled
1: Dithering enabled
Note: The DITHEN bit can only be modified when CEN bit is reset.

Bit 11 **UIFREMAP**: UIF status bit remapping
0: No remapping. UIF status bit is not copied to TIM_CNT register bit 31.
1: Remapping enabled. UIF status bit is copied to TIM_CNT register bit 31.

Bits 10:8 Reserved, must be kept at reset value.

Bit 7 **ARPE**: Auto-reload preload enable
0: TIM_ARR register is not buffered.
1: TIM_ARR register is buffered.

Bits 6:4 Reserved, must be kept at reset value.

Bit 3 **OPM**: One-pulse mode
0: Counter is not stopped at update event
1: Counter stops counting at the next update event (clearing the CEN bit).

Bit 2 **URS**: Update request source

This bit is set and cleared by software to select the UEV event sources.

0: Any of the following events generates an update interrupt or DMA request if enabled. These events can be:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

1: Only counter overflow/underflow generates an update interrupt or DMA request if enabled.

Bit 1 **UDIS**: Update disable

This bit is set and cleared by software to enable/disable UEV event generation.

0: UEV enabled. The Update (UEV) event is generated by one of the following events:

- Counter overflow/underflow
- Setting the UG bit
- Update generation through the slave mode controller

Buffered registers are then loaded with their preload values.

1: UEV disabled. The Update event is not generated, shadow registers keep their value (ARR, PSC). However the counter and the prescaler are reinitialized if the UG bit is set or if a hardware reset is received from the slave mode controller.

Bit 0 **CEN**: Counter enable

0: Counter disabled

1: Counter enabled

CEN is cleared automatically in one-pulse mode, when an update event occurs.

36.4.2 TIM control register 2 (TIM_CR2)

Address offset: 0x04

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	AD SYNC	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
			rw												
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MMS[2:0]			Res.	Res.	Res.	Res.
									rw	rw	rw				

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **ADSYNC**: ADC synchronization

0: The timer operates independently from the ADC

1: The timer operation is synchronized with the ADC clock to provide jitter-free sampling point. This mode can be enabled only with specific ADC / timer clock relationship. Refer to *Section 36.3.8* for requirements.

The ADSYNC must not modified when the counter is enabled (CEN bit is set).

Bits 27:7 Reserved, must be kept at reset value.

Bits 6:4 **MMS[2:0]**: Master mode selection

These bits are used to select the information to be sent in master mode to slave timers for synchronization (TRGO). The combination is as follows:

000:**Reset** - the UG bit from the TIM_EGR register is used as a trigger output (tim_trgo).

001:**Enable** - the Counter enable signal, tim_cnt_en, is used as a trigger output (tim_trgo). It is useful to start several timers at the same time or to control a window in which a slave timer is enabled. The Counter Enable signal is generated when the CEN control bit is written.

010:**Update** - The update event is selected as a trigger output (tim_trgo). For instance a master timer can then be used as a prescaler for a slave timer.

Note: The clock of the slave timer or he peripheral receiving the tim_trgo must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.

Bits 3:0 Reserved, must be kept at reset value.

36.4.3 TIM DMA/interrupt enable register (TIM_DIER)

Address offset: 0x0C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	UDE	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UIE
							rw								rw

Bits 15:9 Reserved, must be kept at reset value.

Bit 8 **UDE**: Update DMA request enable
0: Update DMA request disabled.
1: Update DMA request enabled.

Bits 7:1 Reserved, must be kept at reset value.

Bit 0 **UIE**: Update interrupt enable
0: Update interrupt disabled.
1: Update interrupt enabled.

36.4.4 TIM status register (TIM_SR)

Address offset: 0x10

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	UIOVRF	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
							rc_w0								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UIF
															rc_w0

Bits 31:25 Reserved, must be kept at reset value.

Bit 24 **UIOVRF**: Update Interrupt Overrun flag

This flag is set by hardware when an update request occurs while an update interrupt is pending (update interrupt flag set). It is cleared by software by writing it to '0'.

0: No Update Interrupt Overrun

1: Update Interrupt Overrun

Bits 23:1 Reserved, must be kept at reset value.

Bit 0 **UIF**: Update interrupt flag

This bit is set by hardware on an update event. It is cleared by software.

0: No update occurred.

1: Update interrupt pending. This bit is set by hardware when the registers are updated:

–On counter overflow if UDIS = 0 in the TIM_CR1 register.

–When CNT is reinitialized by software using the UG bit in the TIM_EGR register, if URS = 0 and UDIS = 0 in the TIM_CR1 register.

36.4.5 TIM event generation register (TIM_EGR)

Address offset: 0x14

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	UG
															w

Bits 15:1 Reserved, must be kept at reset value.

Bit 0 **UG**: Update generation

This bit can be set by software, it is automatically cleared by hardware.

0: No action.

1: Re-initializes the timer counter and generates an update of the registers. Note that the prescaler counter is cleared too (but the prescaler ratio is not affected).

36.4.6 TIM counter (TIM_CNT)

Address offset: 0x24

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UIF CPY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
r															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **UIFCPY**: UIF copy

This bit is a read-only copy of the UIF bit of the TIM_ISR register. If the UIFREMAP bit in TIM_CR1 is reset, bit 31 is reserved and read as 0.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]**: Counter value

Non-dithering mode (DITHEN = 0)

The register holds the counter value.

Dithering mode (DITHEN = 1)

The register only holds the non-dithered part in CNT[15:0]. The fractional part is not available.

36.4.7 TIM prescaler (TIM_PSC)

Address offset: 0x28

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PSC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **PSC[15:0]**: Prescaler value

The counter clock frequency $f_{tim_cnt_ck}$ is equal to $f_{tim_psc_ck}$ / (PSC[15:0] + 1).

PSC contains the value to be loaded into the active prescaler register at each update event. (including when the counter is cleared through UG bit of TIM_EGR register.

36.4.8 TIM autoreload register (TIM_ARR)

Address offset: 0x2C

Reset value: 0x0000 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ARR[19:16]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **ARR[19:0]**: Auto-reload value

ARR is the value to be loaded into the actual auto-reload register.

Refer to *Section 36.3.4: Time-base unit* for more details about ARR update and behavior.

The counter is blocked while the auto-reload value is null.

Non-dithering mode (DITHEN = 0)

The register holds the auto-reload value in ARR[15:0]. The ARR[19:16] bits are reserved.

Dithering mode (DITHEN = 1)

The register holds the integer part in ARR[19:4]. The ARR[3:0] bitfield contains the dithered part.

36.4.9 TIM6/TIM7 register map

TIM6/TIM7 registers are mapped as 16-bit addressable registers as described in the table below:

Table 418. TIM6/TIM7 register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

37 General-purpose timers (TIM9/TIM10/TIM11/TIM12/TIM13/TIM14)

37.1 TIM9/TIM10/TIM11/TIM12/TIM13/TIM14 introduction

The TIM9/TIM10/TIM11/TIM12/TIM13/TIM14 general-purpose timers consist in a 16-bit autoreload counter driven by a programmable prescaler.

They may be used for a variety of purposes, including measuring the pulse lengths of input signals (input capture) or generating output waveforms (output compare, PWM).

Pulse lengths and waveform periods can be modulated from a few microseconds to several milliseconds using the timer prescaler and the RCC clock controller prescalers.

The TIM9/TIM10/TIM11/TIM12/TIM13/TIM14 timers are completely independent, and do not share any resources. They can be synchronized together as described in *Section 37.4.21: Timer synchronization (TIM9/TIM12 only)*.

37.2 TIM9/TIM12 main features

The features of the TIM9/TIM12 general-purpose timers include:

- 16-bit autoreload upcounter
- 16-bit programmable prescaler used to divide the counter clock frequency by any factor between 1 and 65536 (can be changed “on the fly”)
- Up to two independent channels for:
  - Input capture
  - Output compare
  - PWM generation (edge-aligned mode)
  - One-pulse mode output
- Synchronization circuit to control the timer with external signals and to interconnect several timers together
- Interrupt generation on the following events:
  - Update: counter overflow, counter initialization (by software or internal trigger)
  - Trigger event (counter start, stop, initialization, or count by internal trigger)
  - Input capture
  - Output compare
- ADC synchronization for jitter-free sampling points

37.3 TIM10/TIM11/TIM13/TIM14 main features

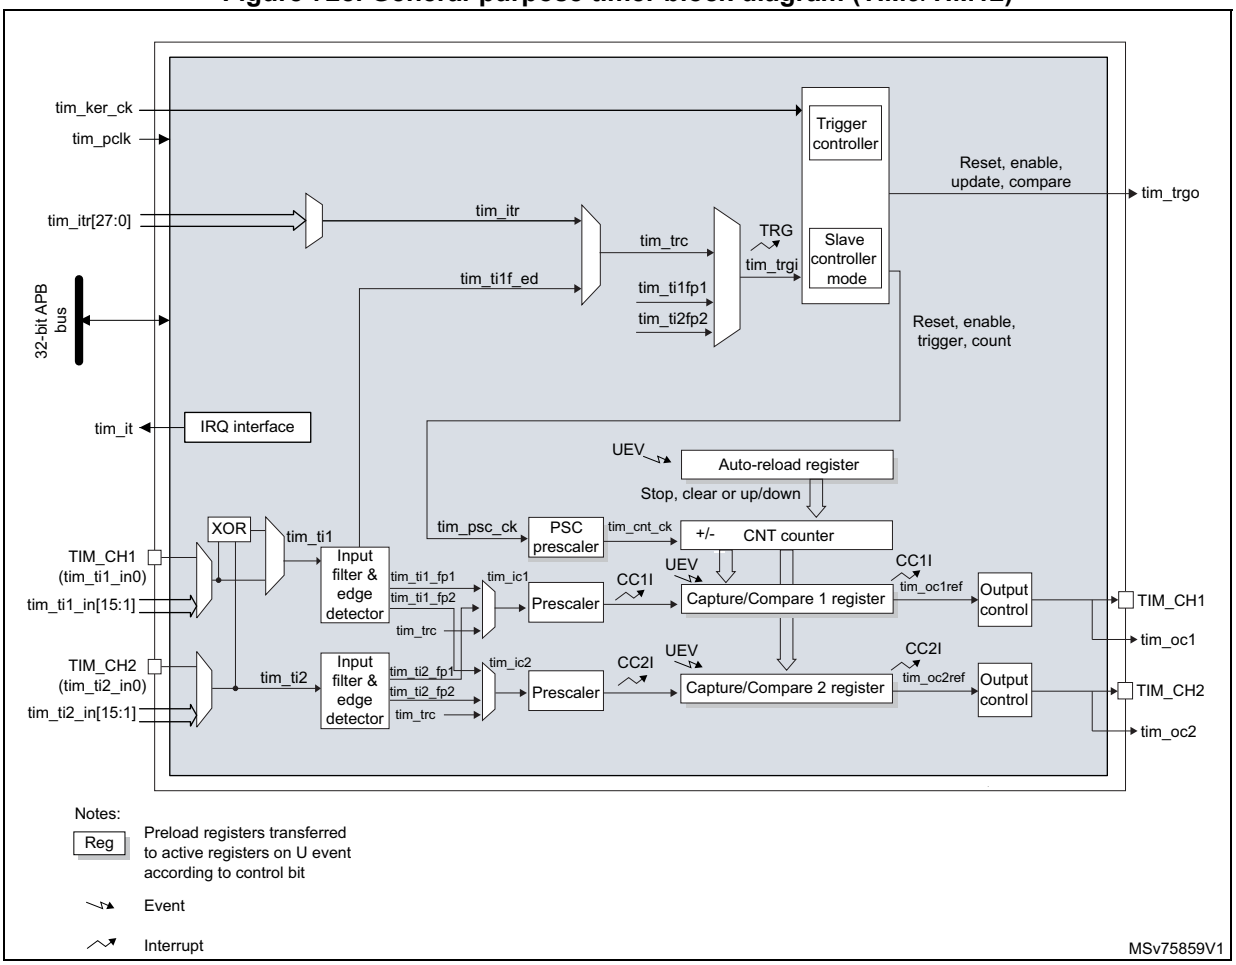
The features of general-purpose timers TIM10/TIM11/TIM13/TIM14 include:

- 16-bit autoreload upcounter
- 16-bit programmable prescaler used to divide the counter clock frequency by any factor between 1 and 65536 (can be changed “on the fly”)
- Independent channel for:
  - Input capture
  - Output compare
  - PWM generation (edge-aligned mode)
  - One-pulse mode output
- Interrupt generation on the following events:
  - Update: counter overflow, counter initialization (by software)
  - Input capture
  - Output compare

37.4 TIM9/TIM10/TIM11/TIM12/TIM13/TIM14 functional description

37.4.1 Block diagram

Figure 728. General-purpose timer block diagram (TIM9/TIM12)



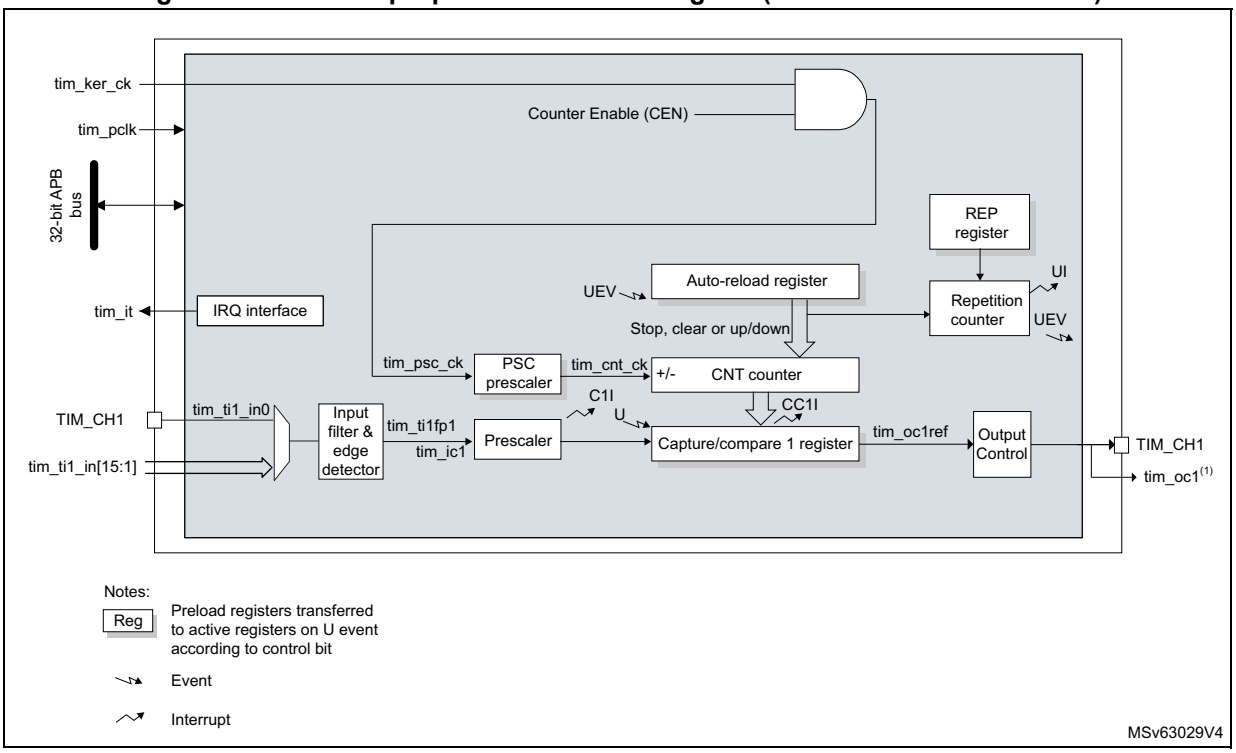


Figure 729. General-purpose timer block diagram (TIM10/TIM11/TIM13/TIM14)

1. This signal can be used as trigger for some slave timer (see internal trigger connection table in next section). See *Section 37.4.22: Using timer output as trigger for other timers (TIM10/TIM11/TIM13/TIM14 only)* for details.

37.4.2 TIM9/TIM10/TIM11/TIM12/TIM13/TIM14 pins and internal signals

Table 419 and *Table 420* in this section summarize the TIM inputs and outputs.

Table 419. TIM input/output pins

Pin name	Signal type	Description
TIM_CH1 TIM_CH2(1)	Input/Output	Timer multi-purpose channels. Each channel be used for capture, compare, or PWM. TIM_CH1 and TIM_CH2 can also be used as external clock (below 1/4 of the tim_ker_ck clock) and external trigger inputs.

1. Available for TIM9/TIM12 only.

Table 420. TIM internal input/output signals

Internal signal name	Signal type	Description
tim_ti1_in[15:0] tim_ti2_in[15:0](1)	Input	Internal timer inputs bus. These inputs can be used for capture or as external clock (below 1/4 of the tim_ker_ck clock).
tim_itr[27:0](1)	Input	Internal trigger input bus. These inputs can be used for the slave mode controller or as a input clock (below 1/4 of the tim_ker_ck clock).
tim_oc1 tim_oc2(1)	Output	Internal timer output. Can be used for triggering other timers or the ADC(s).

Table 420. TIM internal input/output signals (continued)

Internal signal name	Signal type	Description
tim_trgo(1)	Output	Internal trigger output. This trigger can trigger other on-chip peripherals.
tim_pclk	Input	Timer APB clock
tim_ker_ck	Input	Timer kernel clock. This clock must be synchronous with tim_pclk (derived from the same source). The clock ratio tim_ker_ck/tim_pclk must be an integer:1, 2, 3,..., 16 (maximum value)
tim_it	Output	Global Timer interrupt, gathering capture/compare, update, and trigger requests

1. Available for TIM9/TIM12 only.

Table 421 and *Table 422* list the sources connected to the tim_ti[2:1] input multiplexers.

37.4.3 Time-base unit

The main block of the timer is a 16-bit up-counter with its related autoreload register. The counter clock can be divided by a prescaler.

The counter, the autoreload register and the prescaler register can be written or read by software. This is true even when the counter is running.

The time-base unit includes:

- Counter register (TIM_CNT)
- Prescaler register (TIM_PSC)
- Autoreload register (TIM_ARR).

The autoreload register is preloaded. Writing to or reading from the auto-reload register accesses the preload register. The content of the preload register is transferred into the shadow register permanently or at each update event (UEV), depending on the autoreload preload enable bit (ARPE) in TIM_CR1 register. The update event is sent when the counter reaches the overflow and if the UDIS bit equals 0 in the TIM_CR1 register. It can also be generated by software. The generation of the update event is described in details for each configuration.

Note: An update overrun status bit (UIOVRF in TIM_SR register) indicates that an update request occurred while an update interrupt is pending (update interrupt flag set). This bit is useful when debugging closed loop applications, to indicate that:

- *The update interrupt service routine is too long with respect to the interval between consecutive update events.*
- *The update interrupt service routine was served too late with respect to the subsequent update event.*

The counter is clocked by the prescaler output tim_cnt_ck, which is enabled only when the counter enable bit (CEN) in TIM_CR1 register is set (refer also to the slave mode controller description to get more details on counter enabling).

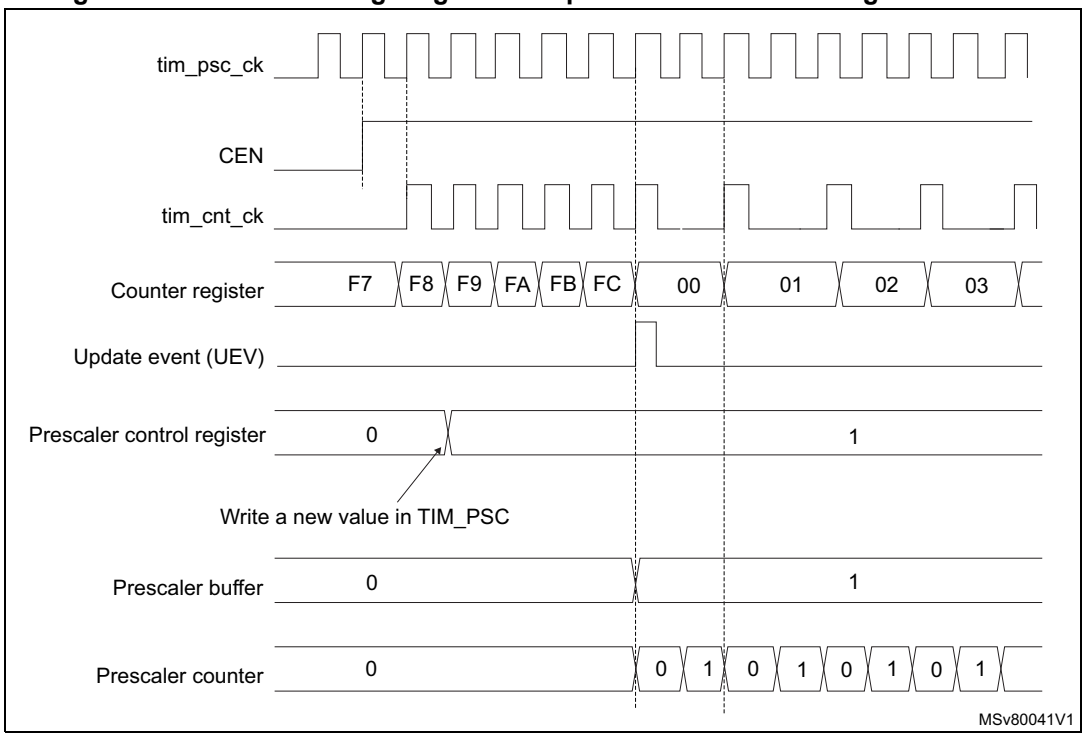
Note that the counter starts counting one clock cycle after setting the CEN bit in the TIM_CR1 register.

Prescaler description

The prescaler can divide the counter clock frequency by any factor between 1 and 65536. It is based on a 16-bit counter controlled through a 16-bit register (in the TIM_PSC register). It can be changed on the fly as this control register is buffered. The new prescaler ratio is taken into account at the next update event.

Figure 730 and *Figure 731* give some examples of the counter behavior when the prescaler ratio is changed on the fly.

Figure 730. Counter timing diagram with prescaler division change from 1 to 2



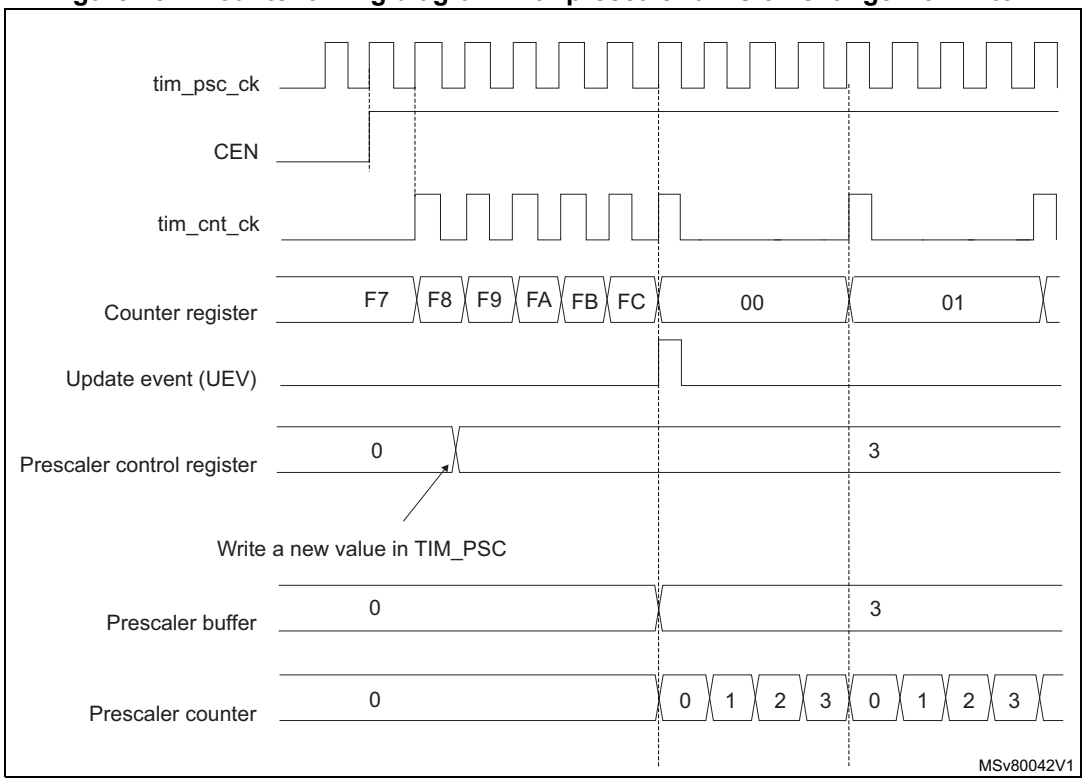


Figure 731. Counter timing diagram with prescaler division change from 1 to 4

37.4.4 Counter modes

Upcounting mode

In upcounting mode, the counter counts from 0 to the autoreload value (content of the TIM_ARR register), then restarts from 0 and generates a counter overflow event.

Setting the UG bit in the TIM_EGR register (by software or by using the slave mode controller on TIM9/TIM12) also generates an update event.

The UEV event can be disabled by software by setting the UDIS bit in the TIM_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter restarts from 0, as well as the counter of the prescaler (but the prescale rate does not change). In addition, if the URS bit (update request selection) in TIM_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIM_SR register) is set (depending on the URS bit):

- The autoreload shadow register is updated with the preload value (TIM_ARR).
- The buffer of the prescaler is reloaded with the preload value (content of the TIM_PSC register).

The following figures show some examples of the counter behavior for different clock frequencies when TIM_ARR = 0x36.

Figure 732. Counter timing diagram, internal clock divided by 1

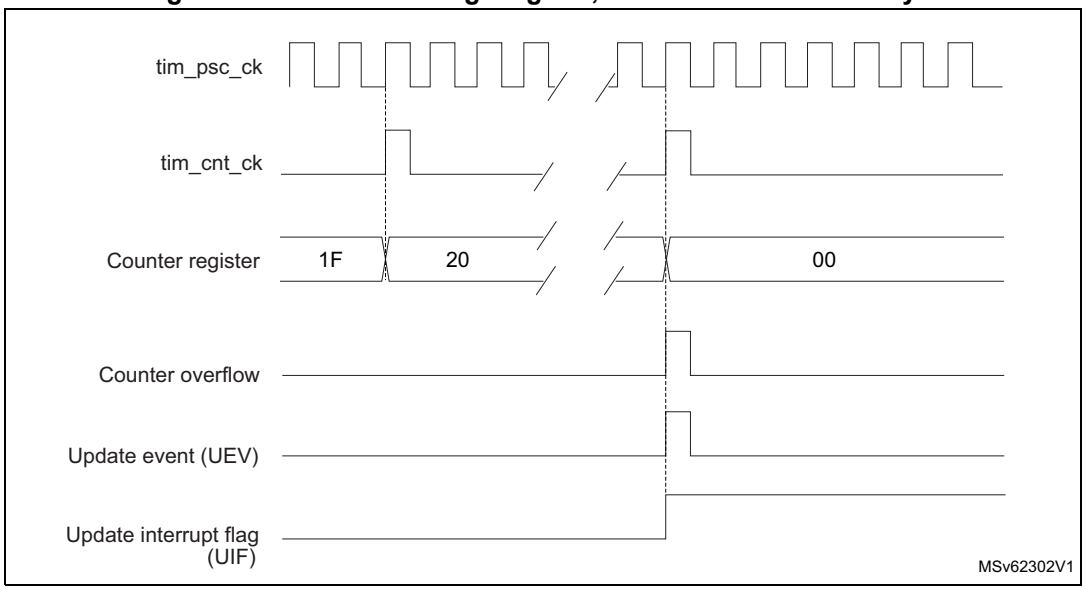

Figure 736. Counter timing diagram, update event when ARPE = 0 (TIM_ARR not preloaded)

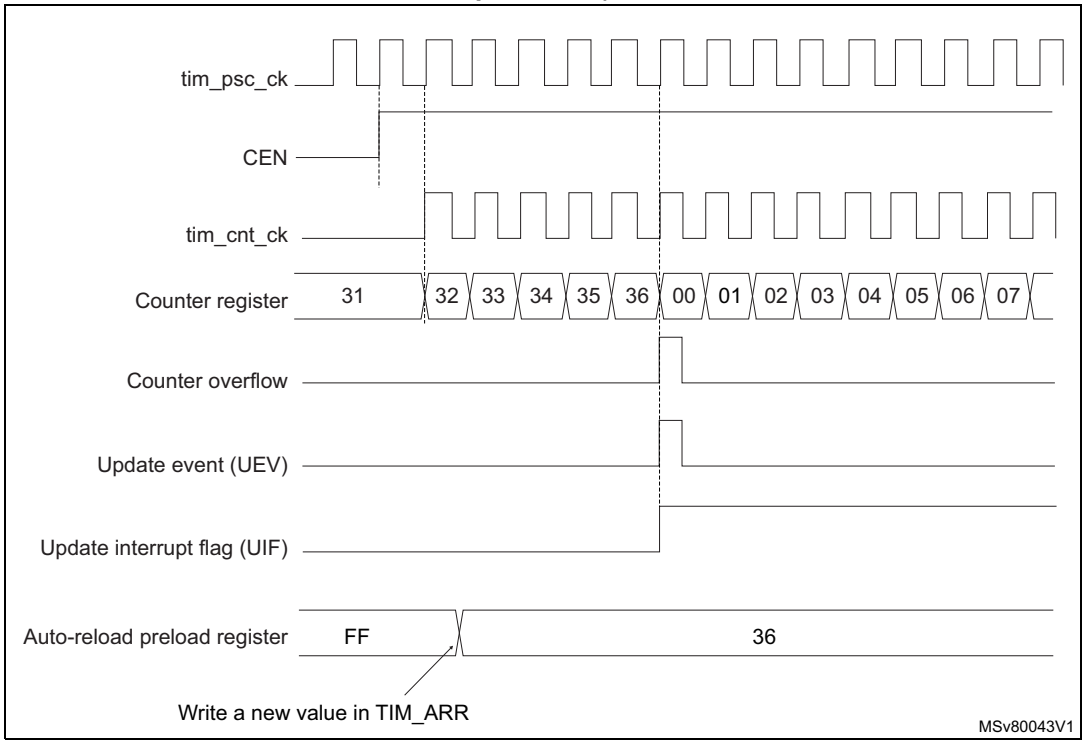

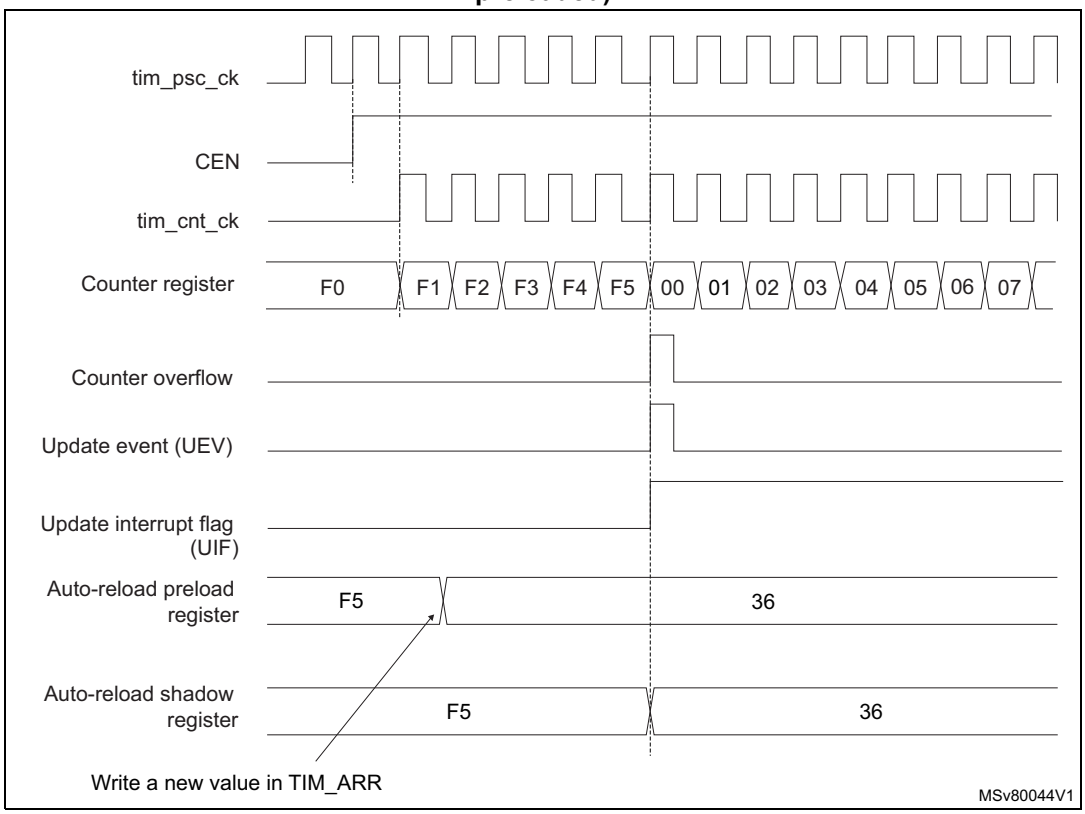

Figure 737. Counter timing diagram, update event when ARPE = 1 (TIM_ARR preloaded)

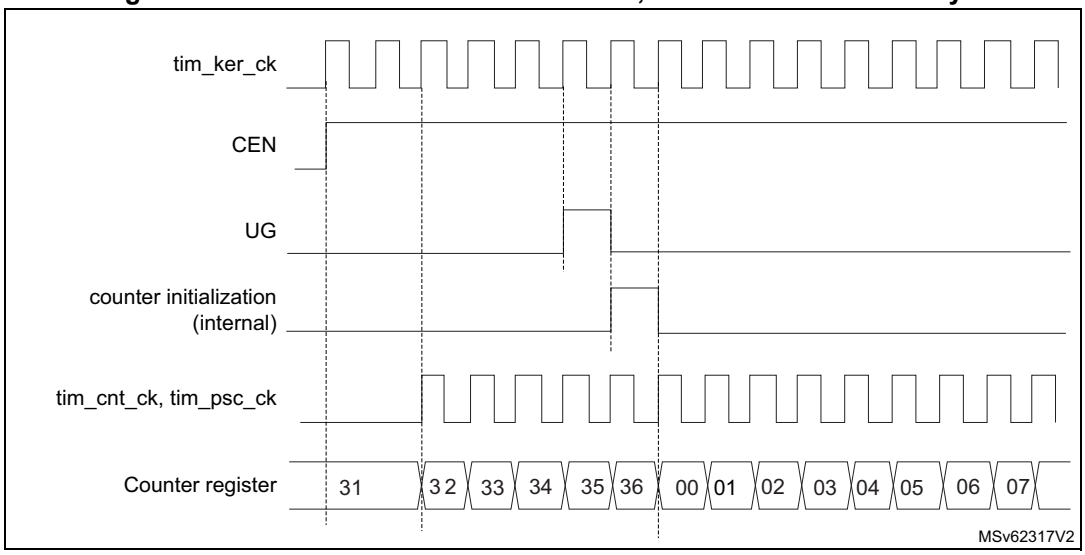
37.4.5 Clock selection

The counter clock can be provided by the following clock sources:

- Internal clock (tim_ker_ck)
- External clock mode1 (for TIM9/TIM12): external input pin (tim_ti1 or tim_ti2, if available)
- Internal trigger inputs (tim_itrx) (for TIM9/TIM12): connecting the trigger output from another timer. For instance, another timer can be configured as a prescaler for TIM12. Refer to *Section : Using one timer as prescaler for another timer* for more details.



Internal clock source (tim_ker_ck)

The internal clock source is the default clock source for TIM10/TIM11/TIM13/TIM14.

For TIM9/TIM12, the internal clock source is selected when the slave mode controller is disabled (SMS = 000). The CEN bit in the TIM_CR1 register and the UG bit in the TIM_EGR register are then used as control bits and can be changed only by software (except for UG which remains cleared). As soon as the CEN bit is programmed to 1, the prescaler is clocked by the internal clock tim_ker_ck.

Figure 738 shows the behavior of the control circuit and the upcounter in normal mode, without prescaler.

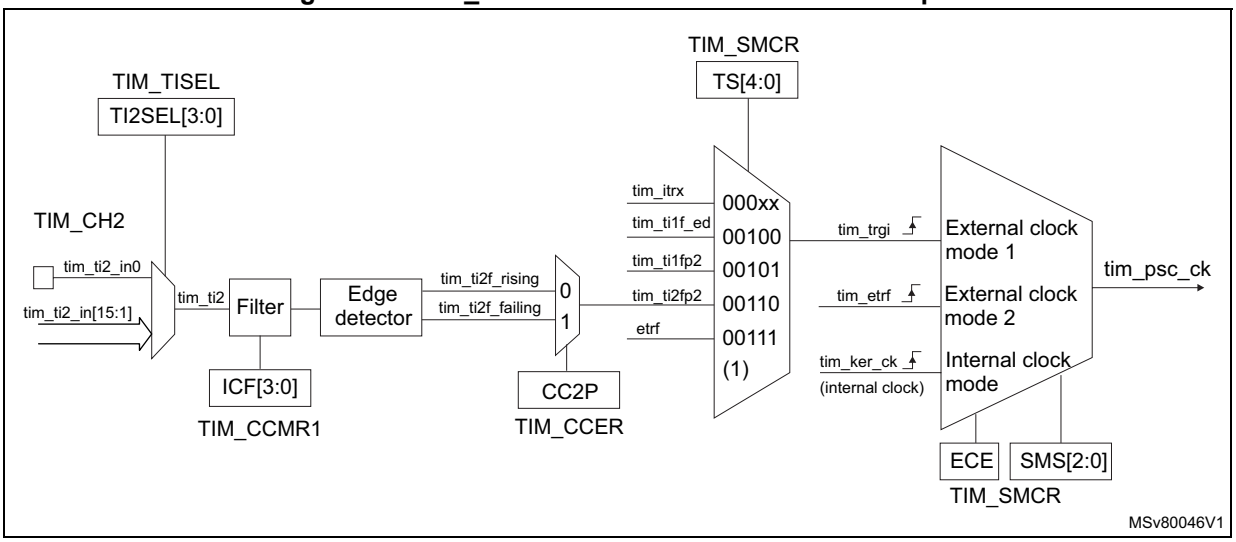


Figure 738. Control circuit in normal mode, internal clock divided by 1

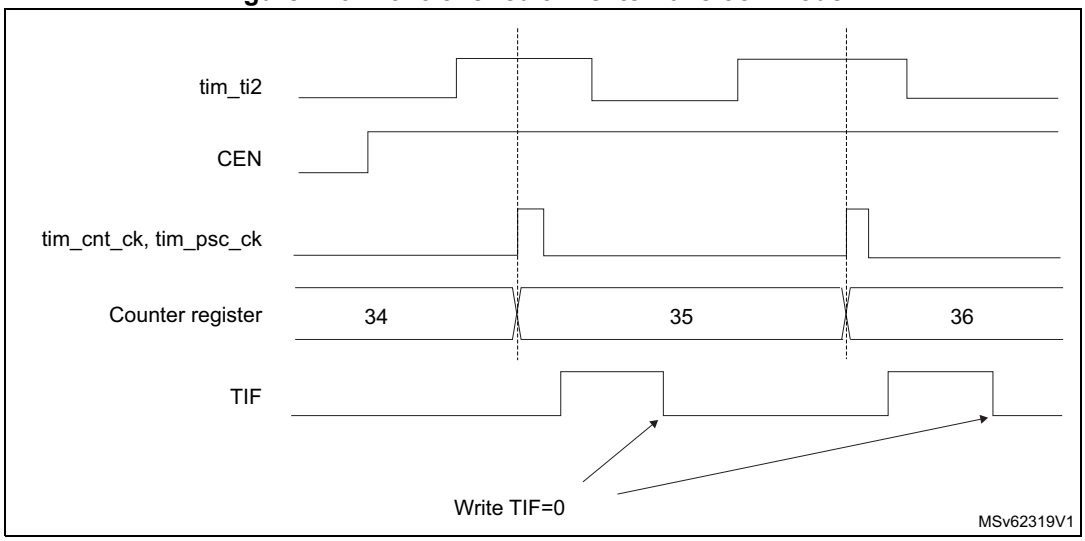
External clock source mode 1 (TIM9/TIM12 only)

This mode is selected when SMS = 111 in the TIM_SMCR register. The counter can count at each rising or falling edge on a selected input.

Figure 739. tim_ti2 external clock connection example

For example, to configure the upcounter to count in response to a rising edge on the tim_ti2 input, use the following procedure:



1. Select the proper tim_ti2_in[15:0] source (internal or external) with the TI2SEL[3:0] bits in the TIM_TISEL register.
2. Configure channel 2 to detect rising edges on the tim_ti2 input by writing CC2S = 01 in the TIM_CCMR1 register.
3. Configure the input filter duration by writing the IC2F[3:0] bits in the TIM_CCMR1 register (if no filter is needed, keep IC2F = 0000).
4. Select the rising edge polarity by writing CC2P = 0 and CC2NP = 0 in the TIM_CCER register.
5. Configure the timer in external clock mode 1 by writing SMS = 111 in the TIM_SMCR register.
6. Select tim_ti2 as the trigger input source by writing TS = 110 in the TIM_SMCR register.
7. Enable the counter by writing CEN = 1 in the TIM_CR1 register.

Note: The capture prescaler is not used for triggering, it is not necessary to configure it.

When a rising edge occurs on tim_ti2, the counter counts once and the TIF flag is set.

The delay between the rising edge on tim_ti2 and the actual clock of the counter is due to the resynchronization circuit on tim_ti2 input.

Figure 740. Control circuit in external clock mode 1

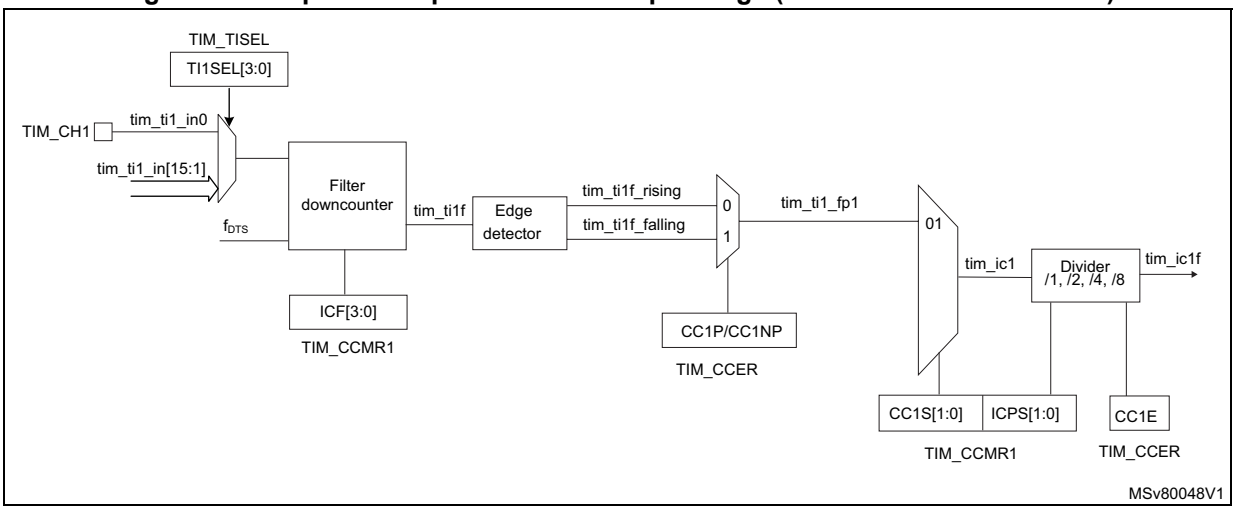
37.4.6 Capture/compare channels

Each Capture/Compare channel is built around a capture/compare register (including a shadow register), an input stage for capture (with digital filter, multiplexing and prescaler), and an output stage (with comparator and output control).

Figure 741, *Figure 742*, *Figure 743* and *Figure 744* give an overview of a capture/compare channel.

The input stage samples the corresponding tim_tix input to generate a filtered signal tim_tixf. Then, an edge detector with polarity selection generates a signal (tim_tixfpy) which can be used as trigger input by the slave mode controller or as the capture command. It is prescaled before the capture register (ICxPS).

Figure 741. Capture/compare channel 1 input stage (TIM10/TIM11/TIM13/TIM14)



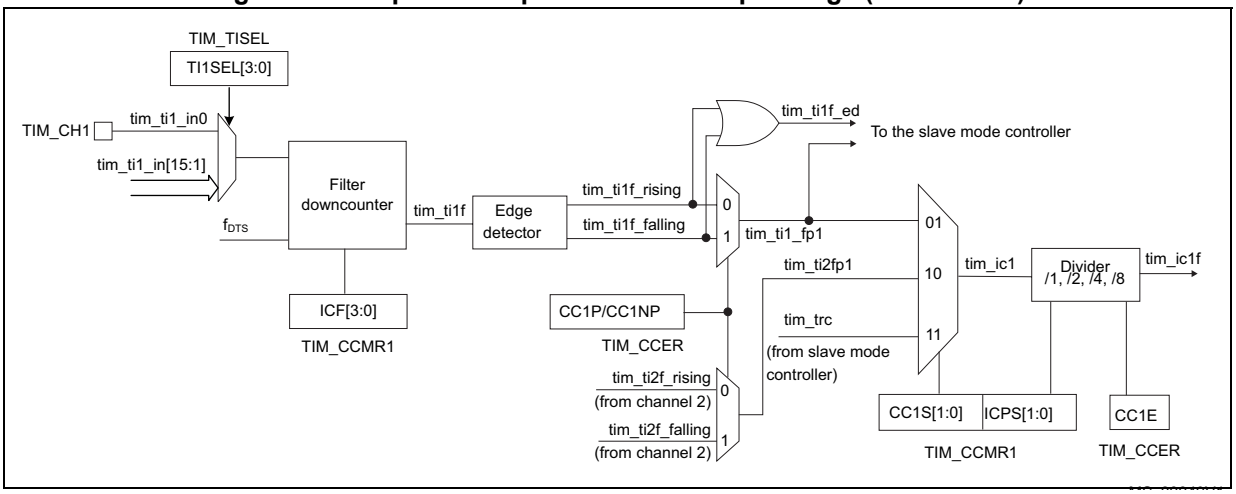


Figure 742. Capture/compare channel 1 input stage (TIM9/TIM12)

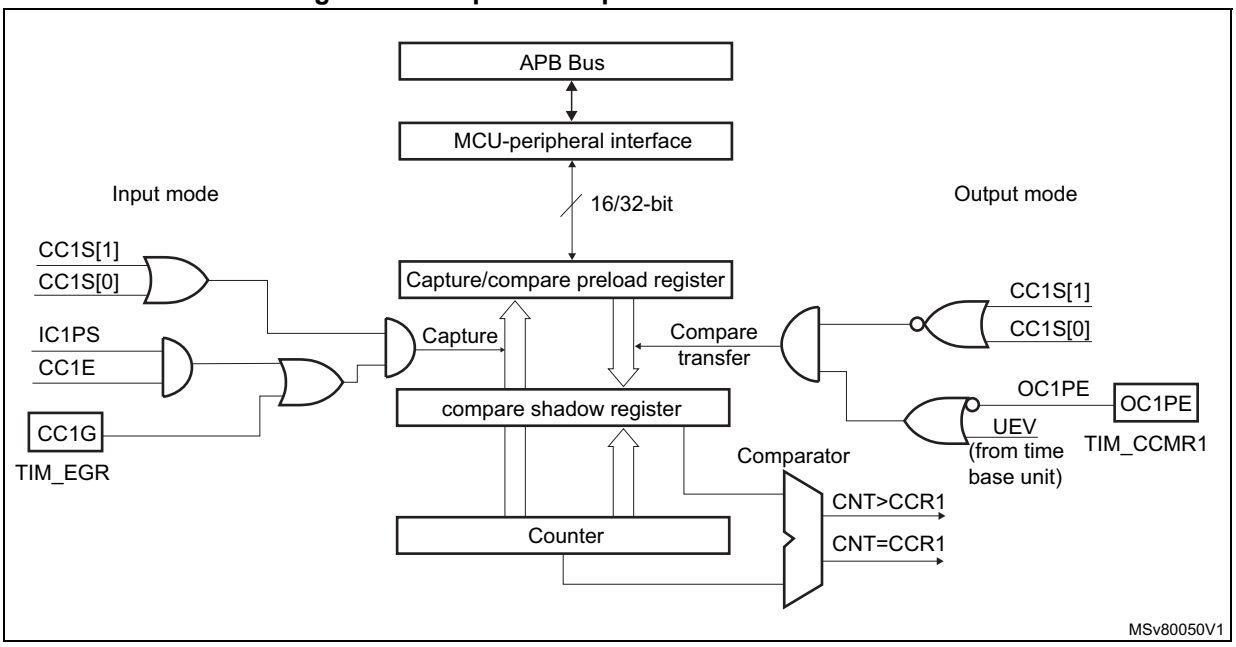
The output stage generates an intermediate waveform which is then used for reference: tim_ocxref (active high). The polarity acts at the end of the chain.

Figure 743. Capture/compare channel 1 main circuit



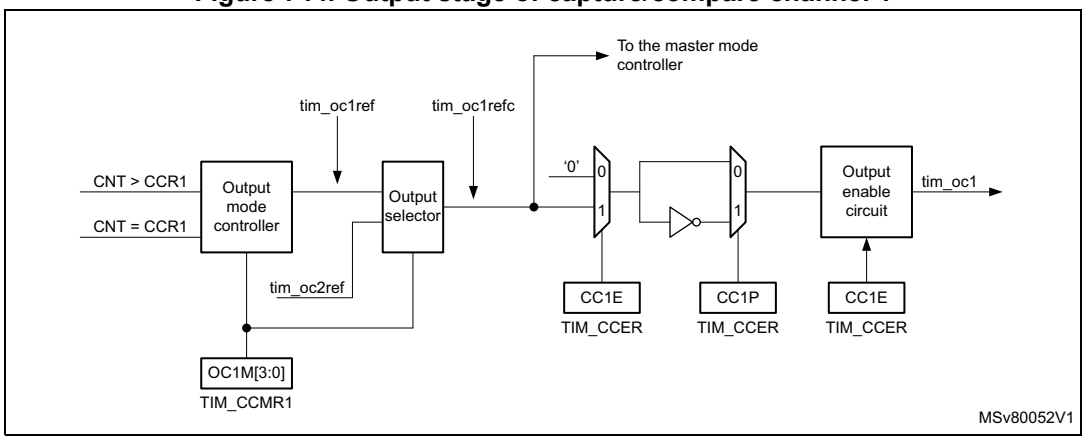


Figure 744. Output stage of capture/compare channel 1

The capture/compare block is made of one preload register and one shadow register. Write and read always access the preload register.

In capture mode, captures are actually done in the shadow register, which is copied into the preload register.

In compare mode, the content of the preload register is copied into the shadow register which is compared to the counter.

37.4.7 Input capture mode

In Input capture mode, the capture/compare registers (TIM_CCRx) are used to latch the value of the counter after a transition detected by the corresponding tim_icx signal. When a capture occurs, the corresponding CCXIF flag (TIM_SR register) is set and an interrupt request can be sent if they are enabled. If a capture occurs while the CCxIF flag was already high, then the overcapture flag CCxOF (TIM_SR register) is set. CCxIF can be

cleared by software by writing it to 0 or by reading the captured data stored in the TIM_CCRx register. CCxOF is cleared when it is written with 0.

The following example shows how to capture the counter value in TIM_CCR1 when tim_ti1 input rises. To do this, use the following procedure:

1. Select the proper tim_ti1_in[15:0] source (internal or external) with the TI1SEL[3:0] bits in the TIM_TISEL register.
2. Select the active input: TIM_CCR1 must be linked to the tim_ti1 input, so write the CC1S bits to 01 in the TIM_CCMR1 register. As soon as CC1S becomes different from 00, the channel is configured in input mode, and the TIM_CCR1 register becomes read-only.
3. Program the appropriate input filter duration in relation with the signal connected to the timer (by programming the ICxF bits in the TIM_CCMRx register if the input is one of the tim_tix inputs). Let's imagine that, when toggling, the input signal is not stable during at most five internal clock cycles. The user must program a filter duration longer than these five clock cycles. The user can validate a transition on tim_ti1 when eight consecutive samples with the new level have been detected (sampled at f_{DTS} frequency). Then write IC1F bits to 0011 in the TIM_CCMR1 register.
4. Select the edge of the active transition on the tim_ti1 channel by programming CC1P and CC1NP bits to 00 in the TIM_CCER register (rising edge in this case).
5. Program the input prescaler. In this example, the user wishes the capture to be performed at each valid transition, so the prescaler is disabled (write IC1PS bits to 00 in the TIM_CCMR1 register).
6. Enable capture from the counter into the capture register by setting the CC1E bit in the TIM_CCER register.
7. If needed, enable the related interrupt request by setting the CC1IE bit in the TIM_DIER register.

When an input capture occurs:

- The TIM_CCR1 register gets the value of the counter on the active transition.
- CC1IF flag is set (interrupt flag). CC1OF is also set if at least two consecutive captures occurred whereas the flag was not cleared.
- An interrupt is generated depending on the CC1IE bit.

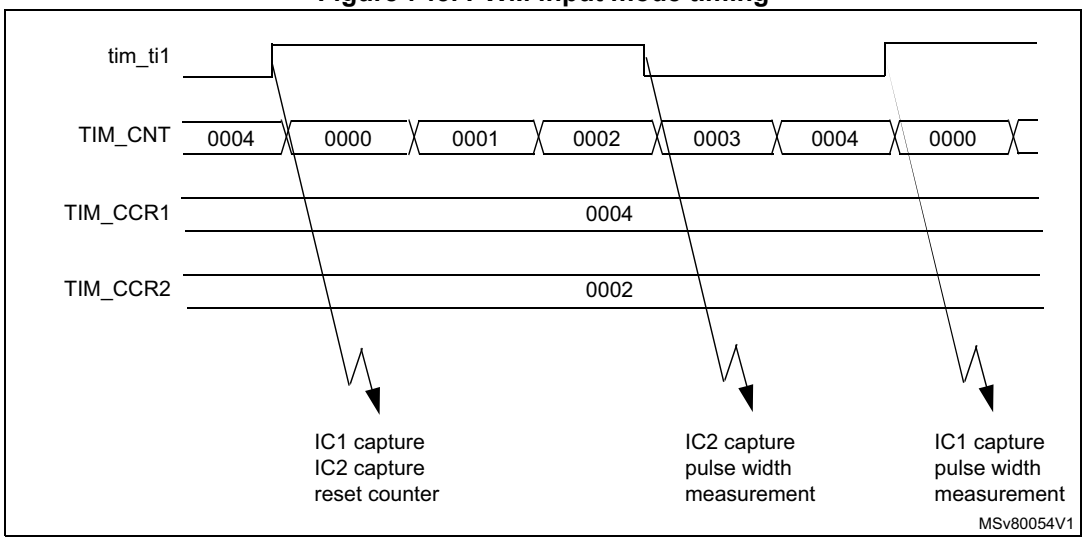
In order to handle the overcapture, it is recommended to read the data before the overcapture flag. This is to avoid missing an overcapture which may happen after reading the flag and before reading the data.

Note: IC interrupt requests can be generated by software by setting the corresponding CCxG bit in the TIM_EGR register.

37.4.8 PWM input mode (TIM9/TIM12 only)

This mode is used to measure both the period and the duty cycle of a PWM signal connected to single tim_tix input:

- The TIM_CCR1 register holds the period value (interval between two consecutive rising edges).
- The TIM_CCR2 register holds the pulse width (interval between two consecutive rising and falling edges.



This mode is a particular case of input capture mode. The set-up procedure is similar with the following differences:

- Two tim_icx signals are mapped on the same tim_tix input.
- These two tim_icx signals are active on edges with opposite polarity.
- One of the two tim_tixfpy signals is selected as trigger input and the slave mode controller is configured in reset mode.

For example, one can measure the period (in TIM_CCR1 register) and the duty cycle (in TIM_CCR2 register) of the PWM applied on tim_ti1 using the following procedure (depending on tim_ker_ck frequency and prescaler value):

1. Select the proper tim_ti1_in[15:0] source (internal or external) with the TI1SEL[3:0] bits in the TIM_TISEL register.
2. Select the active input for TIM_CCR1: write the CC1S bits to 01 in the TIM_CCMR1 register (tim_ti1 selected).
3. Select the active polarity for tim_ti1fp1 (used both for capture in TIM_CCR1 and counter clear): program the CC1P and CC1NP bits to 00 (active on rising edge).
4. Select the active input for TIM_CCR2: write the CC2S bits to 10 in the TIM_CCMR1 register (tim_ti1 selected).
5. Select the active polarity for tim_ti1fp2 (used for capture in TIM_CCR2): program the CC2P and CC2NP bits to 10 (active on falling edge).
6. Select the valid trigger input: write the TS bits to 00101 in the TIM_SMCR register (tim_ti1fp1 selected).
7. Configure the slave mode controller in reset mode: write the SMS bits to 100 in the TIM_SMCR register.
8. Enable the captures: write the CC1E and CC2E bits to 1 in the TIM_CCER register.

Figure 745. PWM input mode timing

37.4.9 Forced output mode

In output mode (CCxS bits = 00 in the TIM_CCMRx register), each output compare signal (tim_ocxref and then tim_ocx) can be forced to active or inactive level directly by software, independently of any comparison between the output compare register and the counter.

To force an output compare signal (tim_ocxref/tim_ocx) to its active level, one just needs to write 0101 in the OCxM bits in the corresponding TIM_CCMRx register. Thus tim_ocxref is forced high (tim_ocxref is always active high) and tim_ocx get opposite value to CCxP polarity bit.

For example: CCxP = 0 (tim_ocx active high) => tim_ocx is forced to high level.

The tim_ocxref signal can be forced low by writing the OCxM bits to 0100 in the TIM_CCMRx register.

Anyway, the comparison between the TIM_CCRx shadow register and the counter is still performed and allows the flag to be set. Interrupt requests can be sent accordingly. This is described in the output compare mode section below.

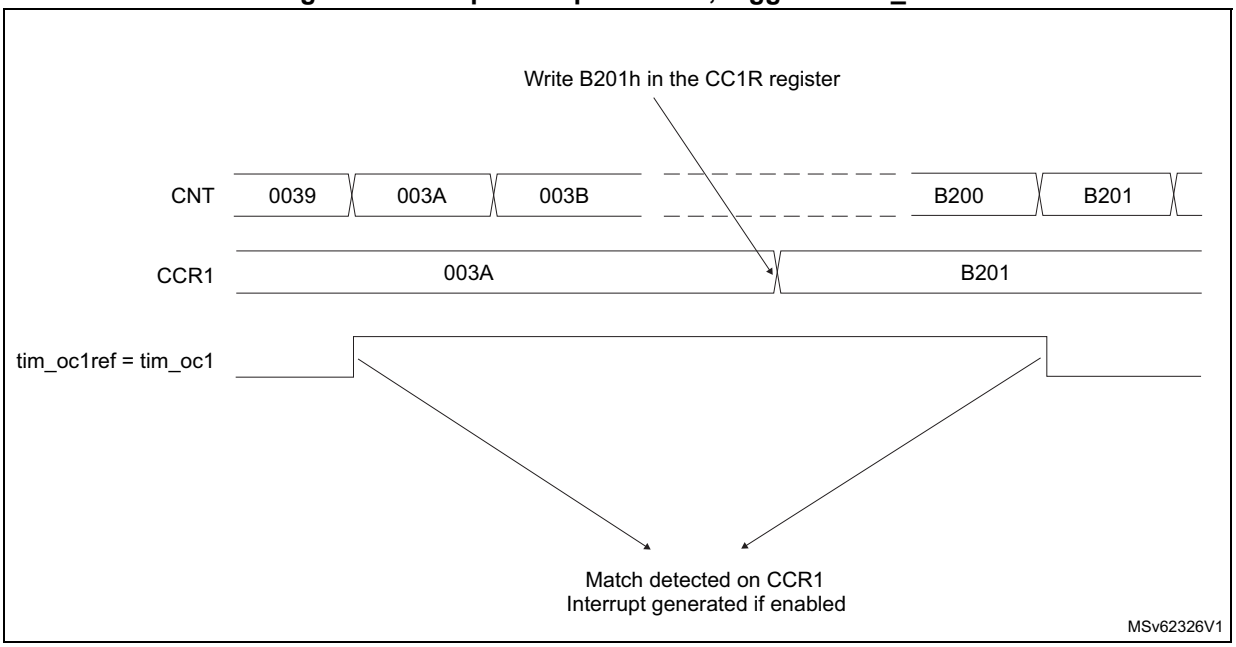
37.4.10 Output compare mode

This function is used to control an output waveform or indicating when a period of time has elapsed.

When a match is found between the capture/compare register and the counter, the output compare function:

1. Assigns the corresponding output pin to a programmable value defined by the output compare mode (OCxM bits in the TIM_CCMRx register) and the output polarity (CCxP bit in the TIM_CCER register). The output pin can keep its level (OCxM = 0000), be set active (OCxM = 0001), be set inactive (OCxM = 0010) or can toggle (OCxM = 0011) on match.
2. Sets a flag in the interrupt status register (CCxIF bit in the TIM_SR register).
3. Generates an interrupt if the corresponding interrupt mask is set (CCxIE bit in the TIM_DIER register).

The TIM_CCRx registers can be programmed with or without preload registers using the OCxPE bit in the TIM_CCMRx register.



In output compare mode, the update event UEV has no effect on tim_ocxref and tim_ocx output. The timing resolution is one count of the counter. Output compare mode can also be used to output a single pulse (in One-pulse mode).

Procedure:

1. Select the counter clock (internal, external, prescaler).
2. Write the desired data in the TIM_ARR and TIM_CCRx registers.
3. Set the CCxIE bit if an interrupt request is to be generated.
4. Select the output mode. For example:
   - Write OCxM = 0011 to toggle tim_ocx output pin when CNT matches CCRx
   - Write OCxPE = 0 to disable preload register
   - Write CCxP = 0 to select active high polarity
   - Write CCxE = 1 to enable the output
5. Enable the counter by setting the CEN bit in the TIM_CR1 register.

The TIM_CCRx register can be updated at any time by software to control the output waveform, provided that the preload register is not enabled (OCxPE = 0, else TIM_CCRx shadow register is updated only at the next update event UEV). An example is given in *Figure 746*.

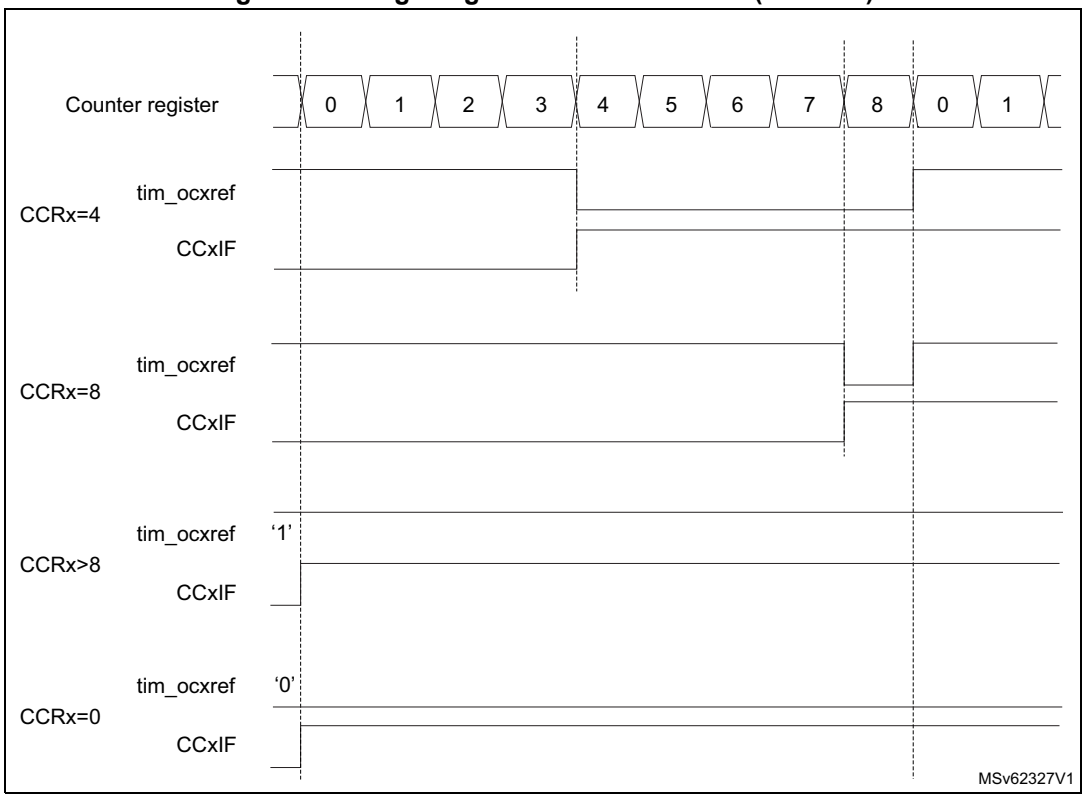
Figure 746. Output compare mode, toggle on tim_oc1.

37.4.11 PWM mode

Pulse width modulation mode is used to generate a signal with a frequency determined by the value of the TIM_ARR register and a duty cycle determined by the value of the TIM_CCRx register.

The PWM mode can be selected independently on each channel (one PWM per tim_ocx output) by writing 0110 (PWM mode 1) or 0111 (PWM mode 2) in the OCxM bits in the TIM_CCMRx register. The corresponding preload register must be enabled by setting the OCxPE bit in the TIM_CCMRx register, and eventually the autoreload preload register (in upcounting or center-aligned modes) by setting the ARPE bit in the TIM_CR1 register.

As the preload registers are transferred to the shadow registers only when an update event occurs, before starting the counter, all registers must be initialized by setting the UG bit in the TIM_EGR register.



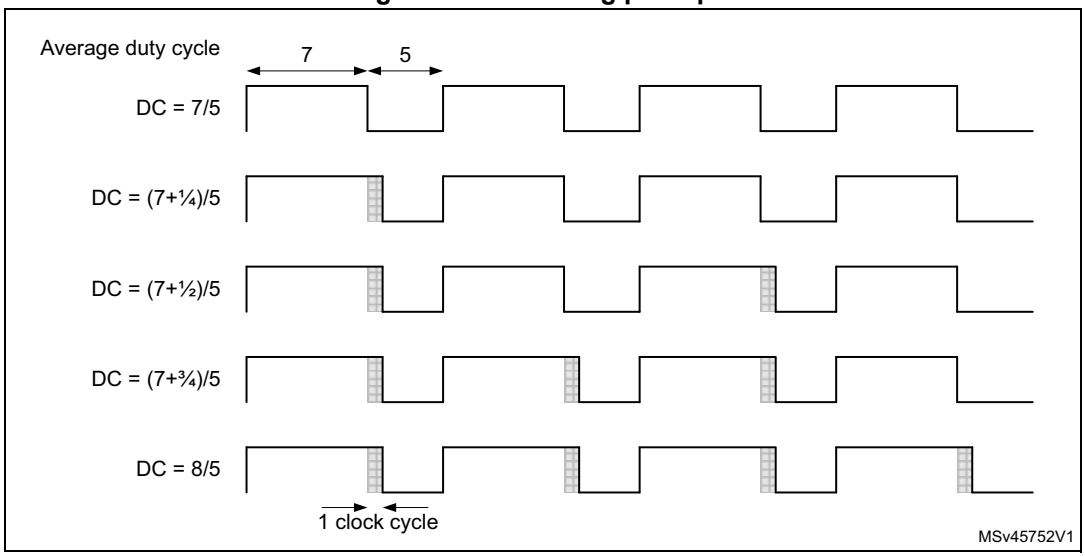
The tim_ocx polarity is software programmable using the CCxP bit in the TIM_CCER register. It can be programmed as active high or active low. The tim_ocx output is enabled by the CCxE bit in the TIM_CCER register. Refer to the TIM_CCERx register description for more details.

In PWM mode (1 or 2), TIM_CNT and TIM_CCRx are always compared to determine whether TIM_CNT ≤ TIM_CCRx.

The timer is able to generate PWM in edge-aligned mode only since the counter is upcounting.

In the following example, the user considers PWM mode 1. The reference PWM signal tim_ocxref is high as long as TIM_CNT < TIM_CCRx else it becomes low. If the compare value in TIM_CCRx is greater than the autoreload value (in TIM_ARR) then tim_ocxref is held at 1. If the compare value is 0 then tim_ocxref is held at 0. *Figure 747* shows some edge-aligned PWM waveforms in an example where TIM_ARR = 8.

Figure 747. Edge-aligned PWM waveforms (ARR = 8)

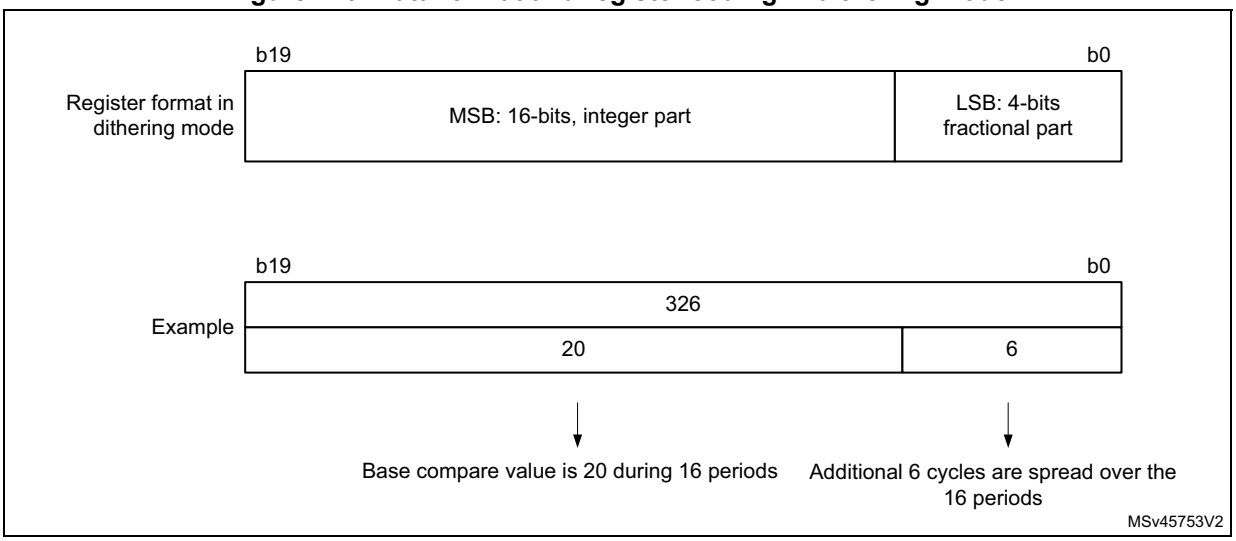


Dithering mode

The PWM mode effective resolution can be increased by enabling the dithering mode, using the DITHEN bit in the TIM_CR1 register. This applies to both the CCR (for duty cycle resolution increase) and ARR (for PWM frequency resolution increase).

The operating principle is to have the actual CCR (or ARR) value slightly changed (adding or not one timer clock period) over 16 consecutive PWM periods, with predefined patterns. This allows a 16-fold resolution increase, considering the average duty cycle or PWM period. *Figure 748* presents the dithering principle applied to four consecutive PWM cycles.

Figure 748. Dithering principle



When the dithering mode is enabled, the register coding is changed as follows (see *Figure 749* for example):

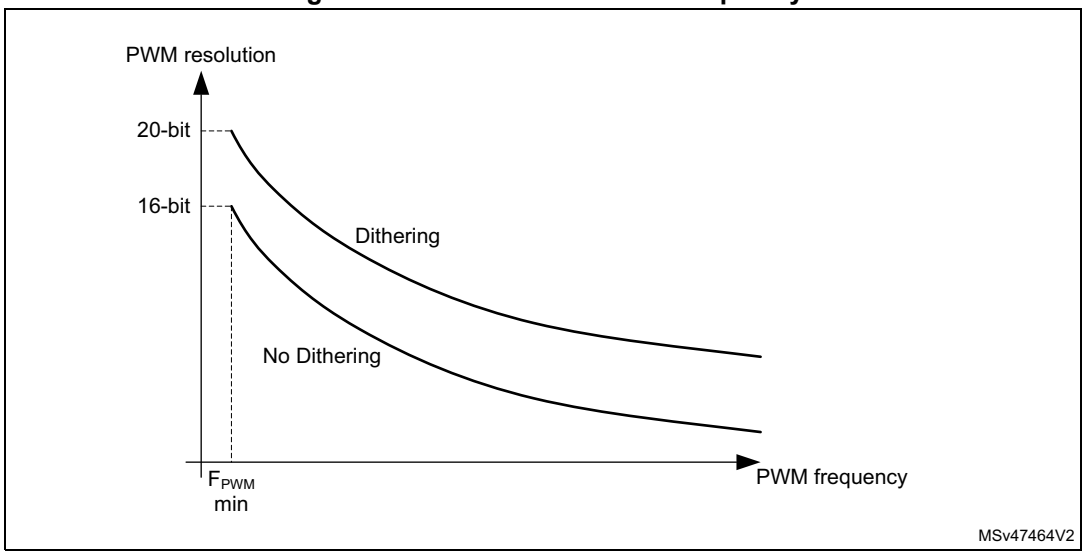
- The four LSBs are coding for the enhanced resolution part (fractional part).
- The MSBs are left-shifted to the bits 19:4 and are coding for the base value.

Note: The following sequence must be followed when resetting the DITHEN bit:
1. CEN and ARPE bits must be reset
2. The DITHEN bit must be reset
3. The CCIF flags must be cleared
4. The CEN bit can be set (eventually with ARPE = 1).

Figure 749. Data format and register coding in dithering mode

The minimum frequency is given by the following formula:

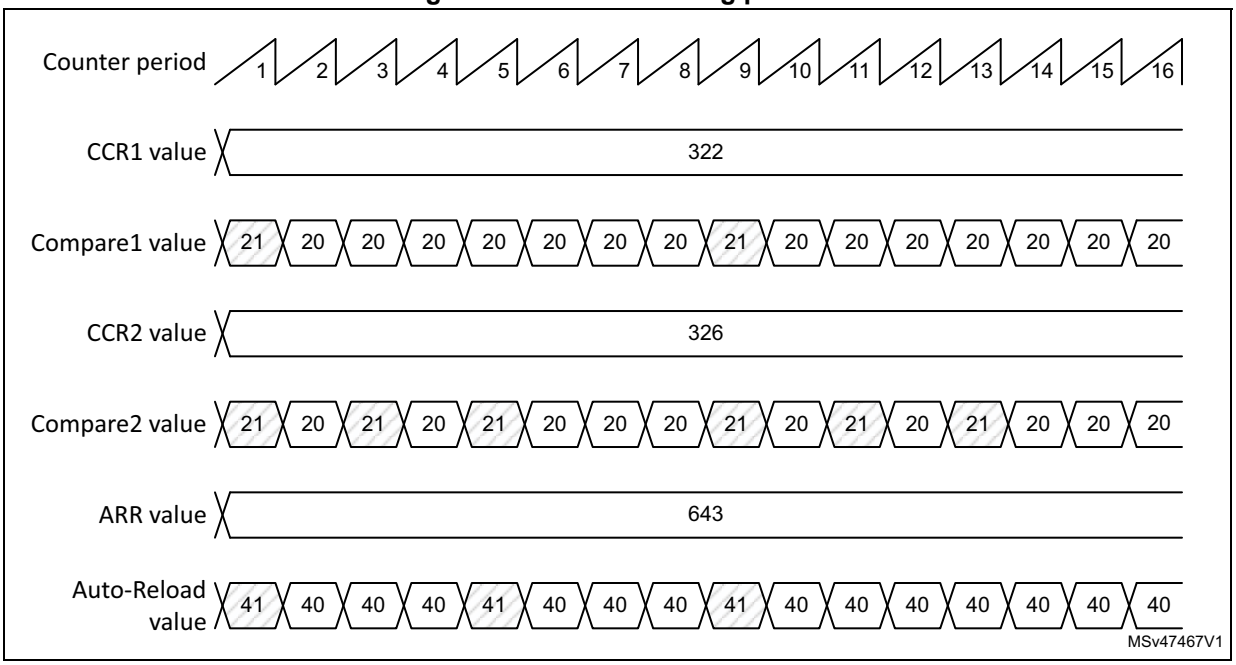
$$\text{Resolution} = \frac{F_{Tim}}{F_{pwm}} \Rightarrow F_{pwmMin} = \frac{F_{Tim}}{Max_{Resolution}}$$



$$\text{Dithering mode disabled: } F_{pwmMin} = \frac{F_{Tim}}{65536}$$

$$\text{Dithering mode enabled: } F_{pwmMin} = \frac{F_{Tim}}{65535 + \frac{15}{16}}$$

Note: The maximum TIM_ARR and TIM_CCRy values are limited to 0xFFFEF in dithering mode (corresponds to 65534 for the integer part and 15 for the dithered part).



As shown on *Figure 750*, the dithering mode is used to increase the PWM resolution whatever the PWM frequency.

Figure 750. PWM resolution vs frequency

The duty cycle and/or period changes are spread over 16 consecutive periods, as described in *Figure 751*.

Figure 751. PWM dithering pattern

The autoreload and compare values increments are spread following specific patterns described in *Table 424*. The dithering sequence is done to have increments distributed as evenly as possible and minimize the overall ripple.

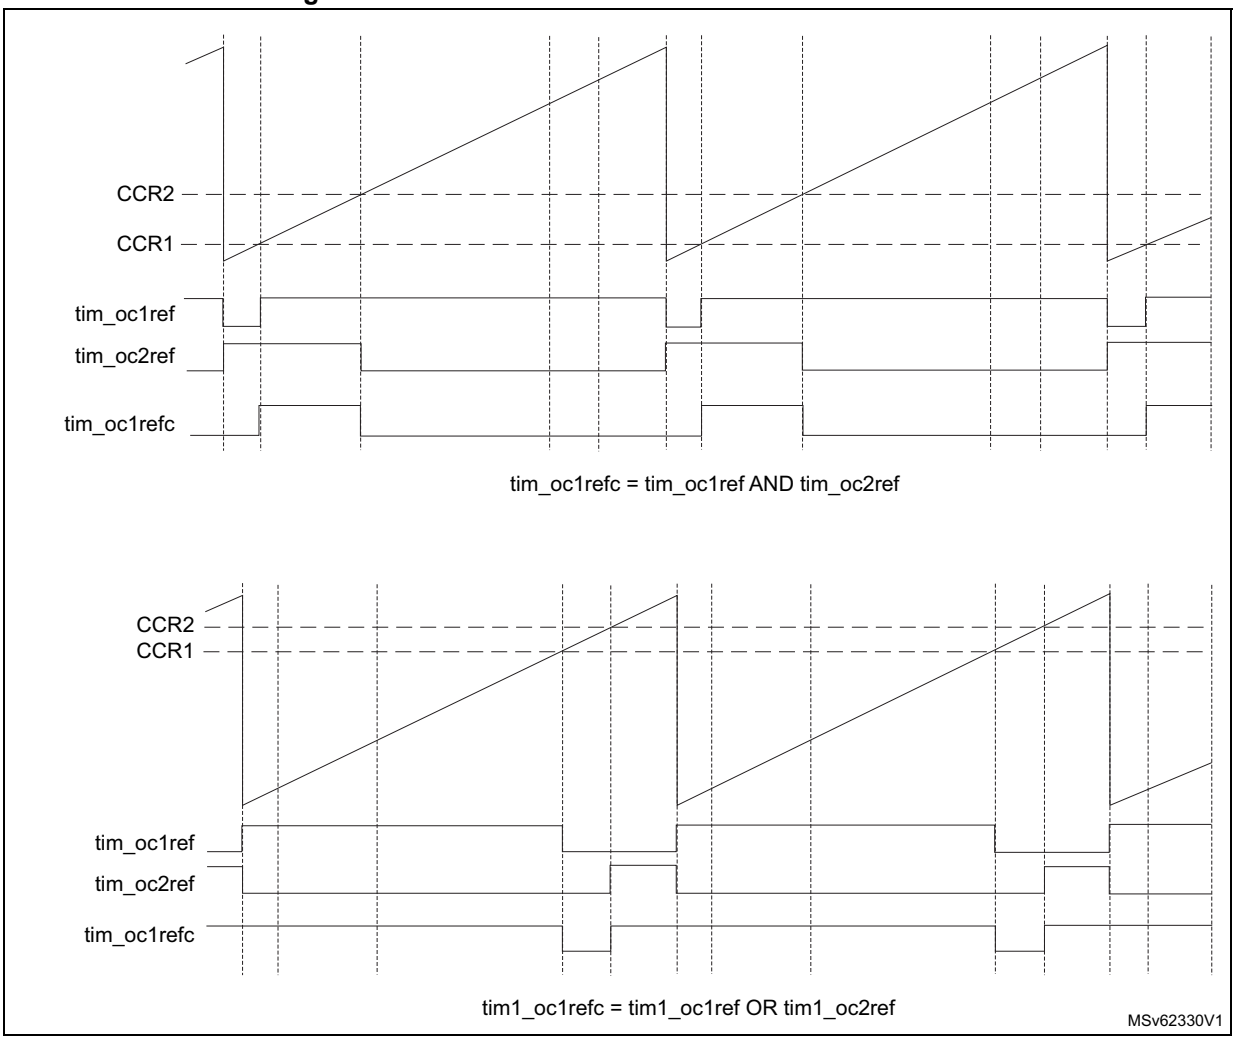
37.4.12 Combined PWM mode (TIM9/TIM12 only)

Combined PWM mode allows two edge or center-aligned PWM signals to be generated with programmable delay and phase shift between respective pulses. While the frequency is determined by the value of the TIM_ARR register, the duty cycle and delay are determined by the two TIM_CCRx registers. The resulting signals, tim_ocxrefc, are made of an OR or AND logical combination of two reference PWMs:

- tim_oc1refc (or tim_oc2refc) is controlled by the TIM_CCR1 and TIM_CCR2 registers.

Combined PWM mode can be selected independently on two channels (one tim_ocx output per pair of CCR registers) by writing 1100 (Combined PWM mode 1) or 1101 (Combined PWM mode 2) in the OCxM bits in the TIM_CCMRx register.



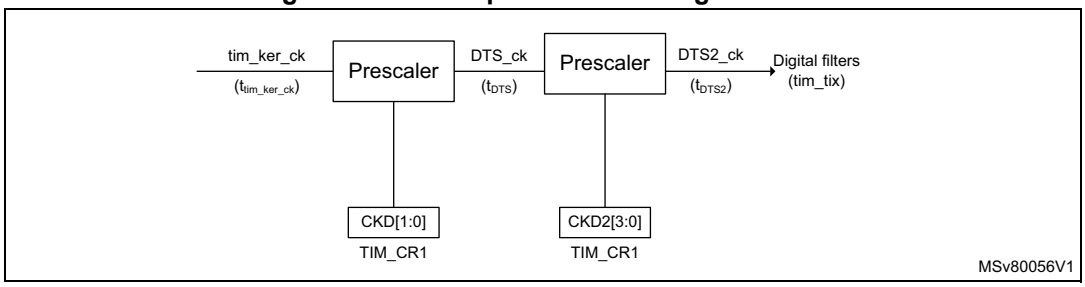
When a given channel is used as a combined PWM channel, its complementary channel must be configured in the opposite PWM mode (for instance, one in Combined PWM mode 1 and the other in combined PWM mode 2).

Note: The OCxM[3:0] bitfield is split into two parts for compatibility reasons, the most significant bit is not contiguous with the three least significant ones.

Figure 752 represents an example of signals that can be generated using combined PWM mode, obtained with the following configuration:

- Channel 1 is configured in combined PWM mode 2.
- Channel 2 is configured in PWM mode 1.

Figure 752. Combined PWM mode on channel 1 and 2



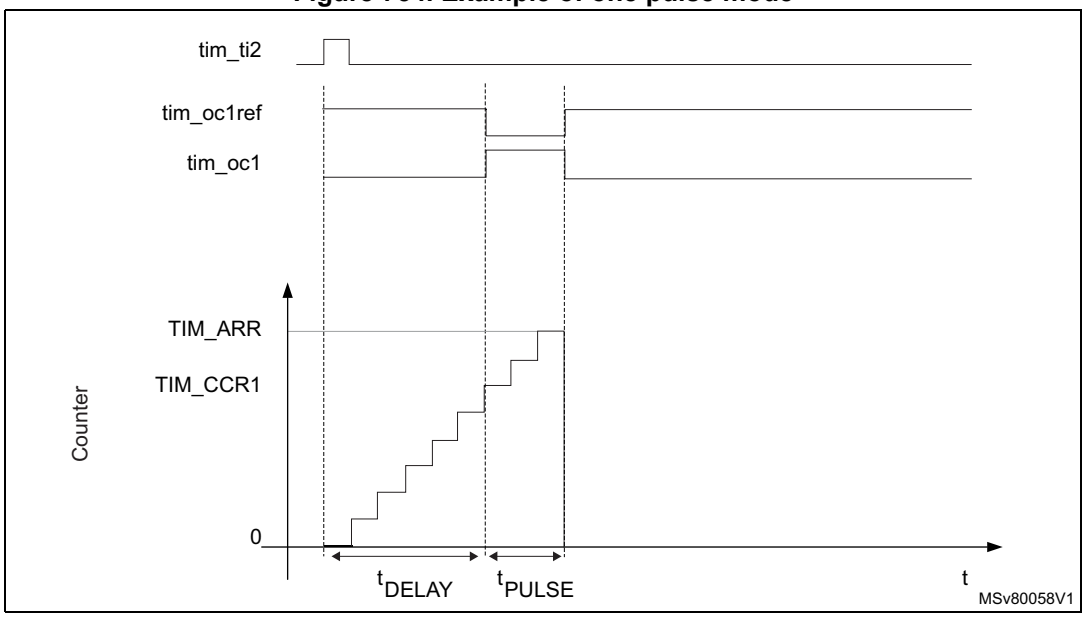
37.4.13 Clock dividers for digital filters

The digital filters (for tim_tix) are using a DTS_ck clock (with a t_{DTS} period), derived from the tim_ker_ck clock.

A prescaler can decrease the frequency to extend the DTS_ck clock period programmed with the CKD[1:0] bitfield in the TIM_CR1 register. A second prescaler can decrease the resulting DTS_ck clock to extend the digital filters range, with the CKD2[3:0] bitfield in the TIM_CR1 register.

Figure 753. Clock prescalers for digital filters

37.4.14 One-pulse mode



One-pulse mode (OPM) is a particular case of the previous modes. It allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length after a programmable delay.

Starting the counter can be controlled through the slave mode controller. Generating the waveform can be done in output compare mode or PWM mode. One-pulse mode is selected by setting the OPM bit in the TIM_CR1 register. This makes the counter stop automatically at the next update event UEV.

A pulse can be correctly generated only if the compare value is different from the counter initial value. Before starting (when the timer is waiting for the trigger), the configuration must be as follows:

CNT < CCRx ≤ ARR (in particular, 0 < CCRx)

Figure 754. Example of one pulse mode

For example one may want to generate a positive pulse on tim_oc1 with a length of tPULSE and after a delay of tDELAY as soon as a positive edge is detected on the tim_ti2 input pin.

Use tim_ti2fp2 as trigger 1:

1. Select the proper tim_ti2_in[15:0] source (internal or external) with the TI2SEL[3:0] bits in the TIM_TISEL register.
2. Map tim_ti2fp2 to tim_ti2 by writing CC2S = 01 in the TIM_CCMR1 register.
3. tim_ti2fp2 must detect a rising edge, write CC2P = 0 and CC2NP = 0 in the TIM_CCER register.
4. Configure tim_ti2fp2 as trigger for the slave mode controller (tim_trgi) by writing TS = 00110 in the TIM_SMCR register.
5. tim_ti2fp2 is used to start the counter by writing SMS to 110 in the TIM_SMCR register (trigger mode).

The OPM waveform is defined by writing the compare registers (taking into account the clock frequency and the counter prescaler).

- The t_{DELAY} is defined by the value written in the TIM_CCR1 register.
- The t_{PULSE} is defined by the difference between the autoreload value and the compare value (TIM_ARR - TIM_CCR1).
- Assuming the user wants to build a waveform with a transition from 0 to 1 when a compare match occurs and a transition from 1 to 0 when the counter reaches the autoreload value. To do this PWM mode 2 must be enabled by writing OC1M = 0111 in the TIM_CCMR1 register. Optionally the preload registers can be enabled by writing OC1PE = 1 in the TIM_CCMR1 register and ARPE in the TIM_CR1 register. In this case one has to write the compare value in the TIM_CCR1 register, the autoreload value in the TIM_ARR register, generate an update by setting the UG bit and wait for external trigger event on tim_ti2. CC1P is written to 0 in this example.

Since only one pulse (Single mode) is needed, a 1 must be written in the OPM bit in the TIM_CR1 register to stop the counter at the next update event (when the counter rolls over from the autoreload value back to 0). When OPM bit in the TIM_CR1 register is set to 0, so the Repetitive mode is selected.

Particular case: tim_ocx fast enable

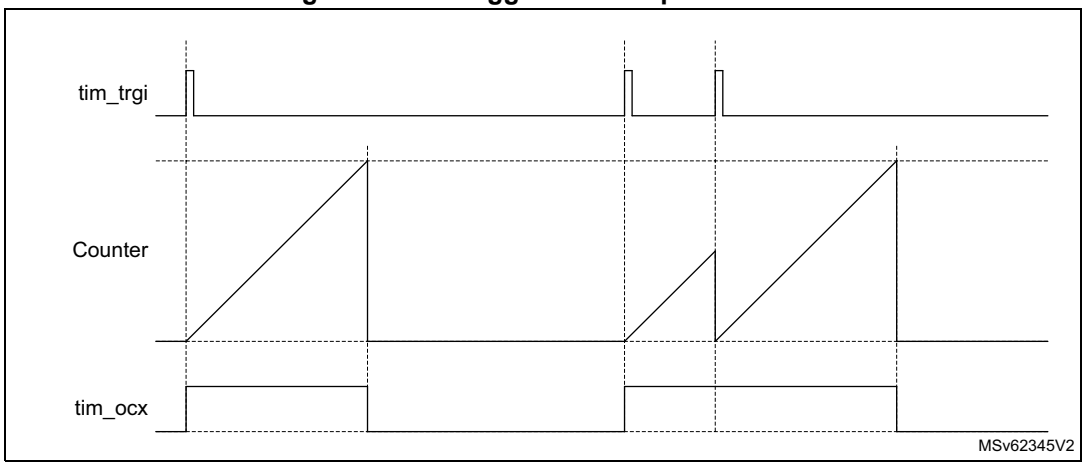
In One-pulse mode, the edge detection on tim_tix input set the CEN bit which enables the counter. Then the comparison between the counter and the compare value makes the output toggle. But several clock cycles are needed for these operations and it limits the minimum delay t_{DELAY} min that can be obtained.

If one wants to output a waveform with the minimum delay, the OCxFE bit can be set in the TIM_CCMRx register. Then tim_ocxref (and tim_ocx) are forced in response to the stimulus, without taking in account the comparison. Its new level is the same as if a compare match had occurred. OCxFE acts only if the channel is configured in PWM1 or PWM2 mode.

37.4.15 Retriggerable one pulse mode (TIM9/TIM12 only)

This mode allows the counter to be started in response to a stimulus and to generate a pulse with a programmable length, but with the following differences with nonretriggerable one pulse mode described in *Section 37.4.14: One-pulse mode*:

- The pulse starts as soon as the trigger occurs (no programmable delay).
- The pulse is extended if a new trigger occurs before the previous one is completed.



The timer must be in Slave mode, with the bits SMS[3:0] = 1000 (Combined reset + trigger mode) in the TIM_SMCR register, and the OCxM[3:0] bits set to 1000 or 1001 for retriggerable OPM mode 1 or 2.

If the timer is configured in up-counting mode, the corresponding CCRx must be set to 0 (the ARR register sets the pulse length). If the timer is configured in down-counting mode, CCRx must be above or equal to ARR.

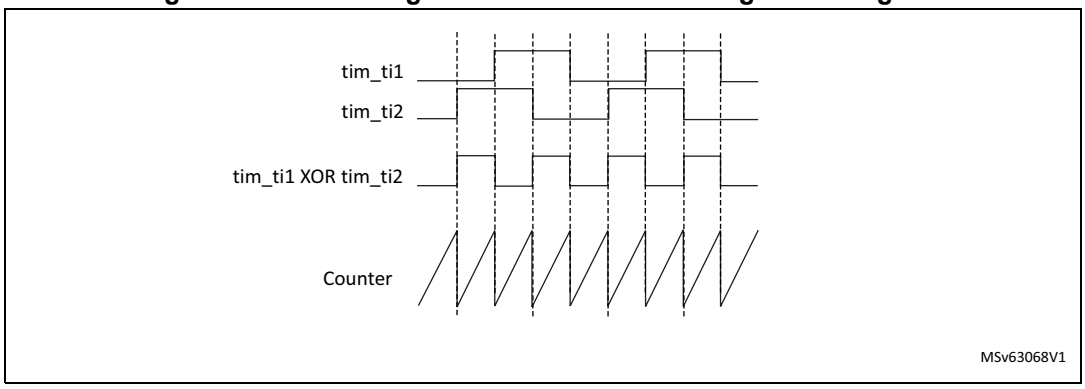
Note: The OCxM[3:0] and SMS[3:0] bit fields are split into two parts for compatibility reasons, the most significant bit are not contiguous with the three least significant ones.

This mode must not be used with center-aligned PWM modes. It is mandatory to have CMS[1:0] = 00 in TIM_CR1.

Figure 755. Retriggerable one pulse mode

37.4.16 UIF bit remapping

The IUFREMAP bit in the TIM_CR1 register forces a continuous copy of the update interrupt flag UIF into bit 31 of the timer counter register (TIM_CNT[31]). This is used to atomically read both the counter value and a potential roll-over condition signaled by the UIFCPY flag. In particular cases, it can ease the calculations by avoiding race conditions caused for instance by a processing shared between a background task (counter reading) and an interrupt (update interrupt).



There is no latency between the assertions of the UIF and UIFCPY flags.

37.4.17 Timer input XOR function

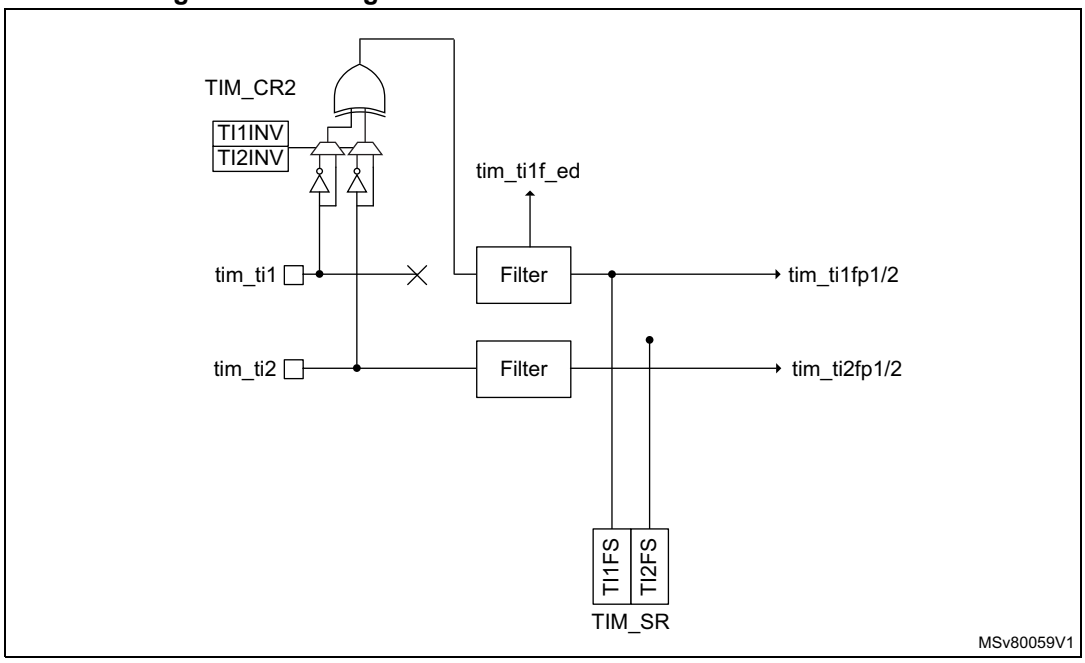
The TI1S bit in the TIM_CR2 register, allows the input filter of channel 1 to be connected to the output of an XOR gate, combining the two input pins tim_ti1 and tim_ti2.

The XOR output can be used with all the timer input functions such as trigger or input capture. It is useful for measuring the interval between the edges on two input signals, as shown in *Figure 756*.

Figure 756. Measuring time interval between edges on 2 signals

The XORPS control bit selects the position of the XOR gate, as shown in *Figure 757* and *Figure 758*, when the TI1S bit is set.

Figure 757. XOR gate connection with TI1S = 1 and XORPS = 0



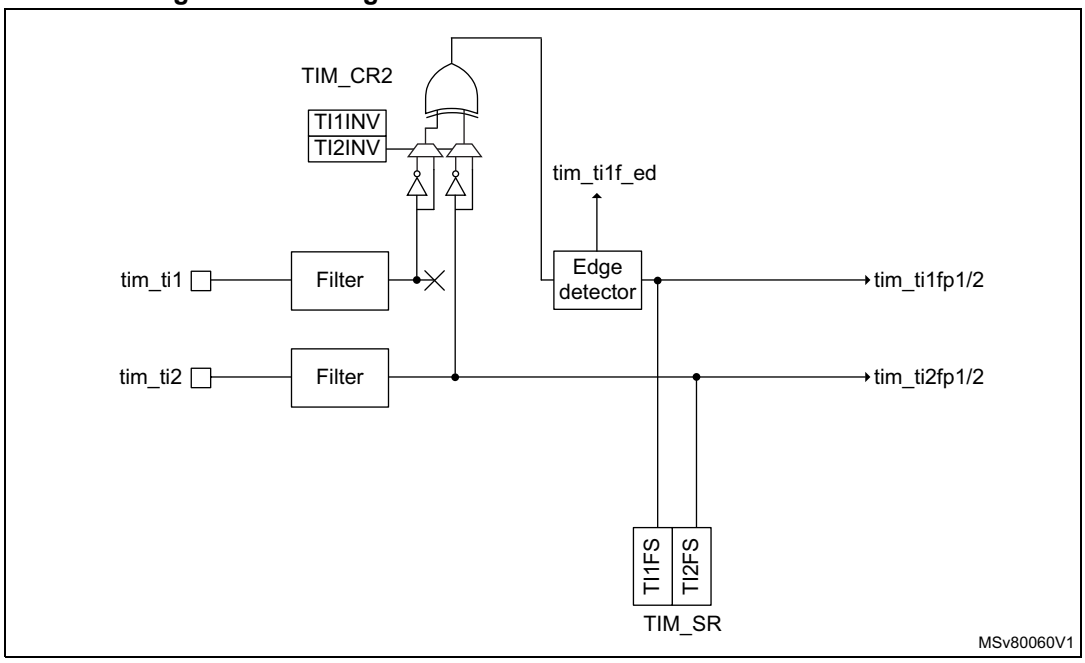


Figure 758. XOR gate connection with TI1S = 1 and XORPS = 1

Two control bits TI1INV and TI2INV in the TIM_CR2 register can invert the tim_in1 and tim_in2 signals prior entering the XOR gate.

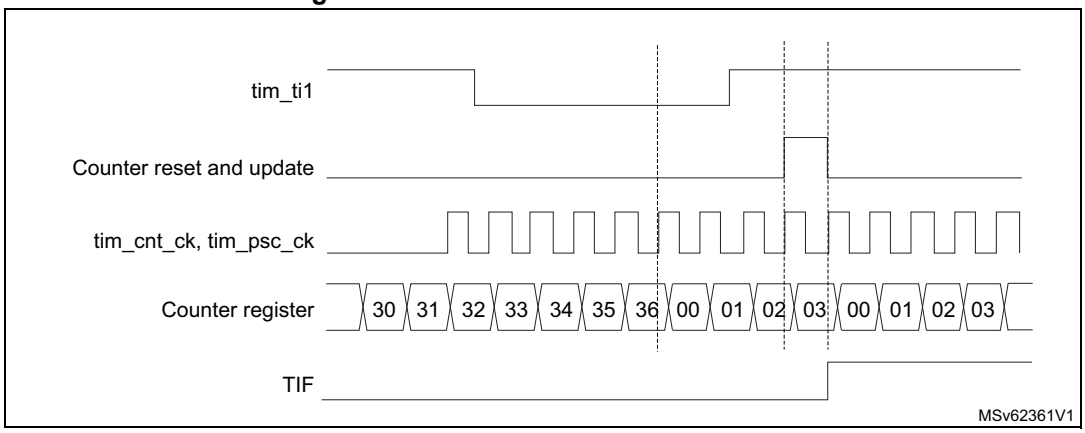
The status of the tim_in1 and tim_in2 signals can be software polled using the TI1FS and TI2FS bits in the TIM_SR register.

37.4.18 TIM9/TIM12 external trigger synchronization

The TIM9/TIM12 timers can be synchronized with an external trigger in several modes: Reset mode, Gated mode, Trigger mode, Reset + trigger, and Gated + reset mode.

Slave mode: Reset mode

The counter and its prescaler can be reinitialized in response to an event on a trigger input. Moreover, if the URS bit from the TIM_CR1 register is low, an update event UEV is generated. Then all the preloaded registers (TIM_ARR, TIM_CCRx) are updated.



In the following example, the upcounter is cleared in response to a rising edge on tim_ti1 input:

1. Configure the channel 1 to detect rising edges on tim_ti1. Configure the input filter duration (in this example, the user does not need any filter, so the user keeps IC1F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in the TIM_CCMR1 register. Program CC1P and CC1NP to 00 in TIM_CCER register to validate the polarity (and detect rising edges only).
2. Configure the timer in reset mode by writing SMS = 100 in TIM_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIM_SMCR register.
3. Start the counter by writing CEN = 1 in the TIM_CR1 register.

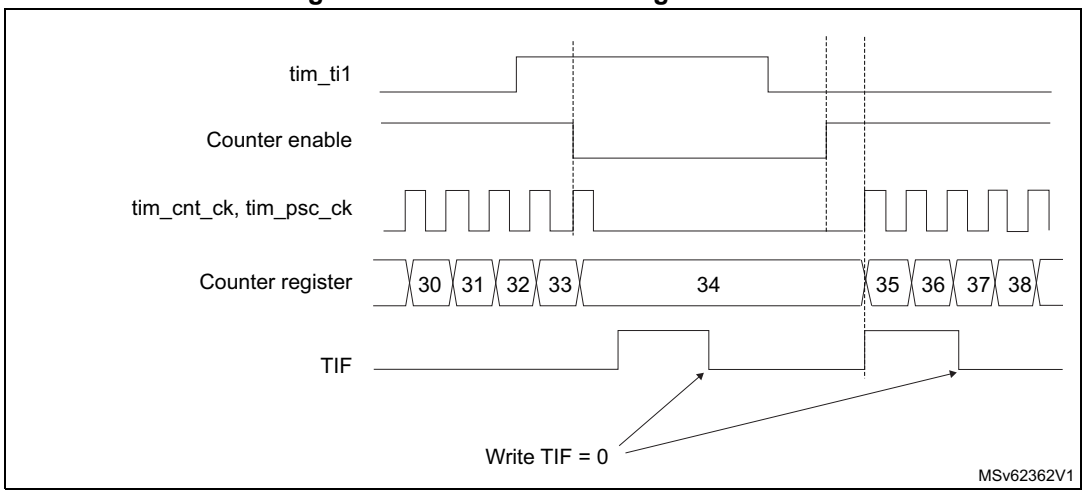
The counter starts counting on the internal clock, then behaves normally until tim_ti1 rising edge. When tim_ti1 rises, the counter is cleared and restarts from 0. In the meantime, the trigger flag is set (TIF bit in the TIM_SR register) and an interrupt request can be sent if enabled (depending on the TIE bit in TIM_DIER register).

The following figure shows this behavior when the autoreload register TIM_ARR = 0x36. The delay between the rising edge on tim_ti1 and the actual reset of the counter is due to the resynchronization circuit on tim_ti1 input.

Figure 759. Control circuit in reset mode

Slave mode: Gated mode

The counter can be enabled depending on the level of a selected input.



In the following example, the upcounter counts only when tim_ti1 input is low:

1. Configure the channel 1 to detect low levels on tim_ti1. Configure the input filter duration (in this example, the user does not need any filter, so the user keeps IC1F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC1S bits select the input capture source only, CC1S = 01 in TIM_CCMR1 register. Program CC1P = 1 and CC1NP = 0 in TIM_CCER register to validate the polarity (and detect low level only).
2. Configure the timer in gated mode by writing SMS = 101 in TIM_SMCR register. Select tim_ti1 as the input source by writing TS = 00101 in TIM_SMCR register.
3. Enable the counter by writing CEN = 1 in the TIM_CR1 register (in gated mode, the counter does not start if CEN = 0, whatever is the trigger input level).

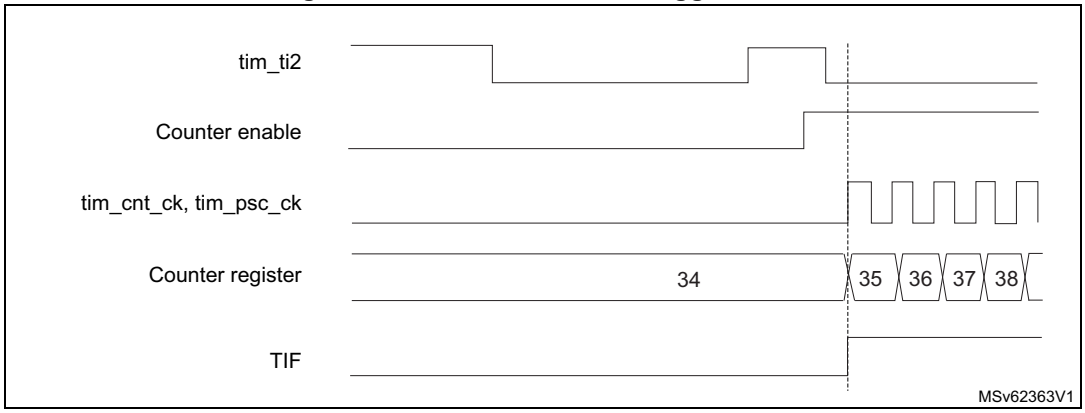
The counter starts counting on the internal clock as long as tim_ti1 is low and stops as soon as tim_ti1 becomes high. The TIF flag in the TIM_SR register is set both when the counter starts or stops.

The delay between the rising edge on tim_ti1 and the actual stop of the counter is due to the resynchronization circuit on tim_ti1 input.

Figure 760. Control circuit in gated mode

Slave mode: Trigger mode

The counter can start in response to an event on a selected input.



In the following example, the upcounter starts in response to a rising edge on tim_ti2 input:

1. Configure the channel 2 to detect rising edges on tim_ti2. Configure the input filter duration (in this example, the user does not need any filter, so the user keeps IC2F = 0000). The capture prescaler is not used for triggering, so it does not need to be configured. The CC2S bits are configured to select the input capture source only, CC2S = 01 in TIM_CCMR1 register. Program CC2P = 1 and CC2NP = 0 in TIM_CCER register to validate the polarity (and detect low level only).
2. Configure the timer in trigger mode by writing SMS = 110 in TIM_SMCR register. Select tim_ti2 as the input source by writing TS = 00110 in TIM_SMCR register.

When a rising edge occurs on tim_ti2, the counter starts counting on the internal clock and the TIF flag is set.

The delay between the rising edge on tim_ti2 and the actual start of the counter is due to the resynchronization circuit on tim_ti2 input.

Figure 761. Control circuit in trigger mode

37.4.19 Slave mode – combined reset + trigger mode

In this case, a rising edge of the selected trigger input (tim_trgi) reinitializes the counter, generates an update of the registers, and starts the counter.

This mode is used for one-pulse mode.

37.4.20 Slave mode – combined reset + gated mode

The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops and is reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

37.4.21 Timer synchronization (TIM9/TIM12 only)

The TIMx timers are linked together internally for timer synchronization or chaining. Refer to *Section 35.4.27: Timer synchronization* for details.

Note: The clock of the slave timer must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.

37.4.22 Using timer output as trigger for other timers (TIM10/TIM11/TIM13/TIM14 only)

The timers with one channel only do not feature a master mode. However, the OC1 output signal can be used to trigger some other timers (including timers described in other sections of this document). Check the “TIMx internal trigger connection” table of any timer on the device to identify which timers can be targeted as slave.

The OC1 signal pulse width must be programmed to be at least two clock cycles of the destination timer, to make sure the slave timer detects the trigger.

For instance, if the destination's timer CK_INT clock is four times slower than the source timer, the OC1 pulse width must be eight clock cycles.

37.4.23 ADC triggers (TIM9/TIM12 only)

The timer can generate an ADC triggering event with various internal signals, such as reset, enable or compare events.

Note: The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo signal must be enabled prior to receive events from the master timer, and the clock frequency (prescaler) must not be changed on-the-fly while triggers are received from the master timer.

37.4.24 ADC synchronization (TIM9/TIM12 only)

The timer operation can be synchronized to the ADC clock to trigger jitter-free ADC sampling. This function is enabled using the ADSYNC bit in the TIM_CR2 register.

This feature is useful when the timers and the ADCs are operating with semisynchronous clocks (clocks derived from a same source with integer ratio tim_ker_ck/adc_ker_ck), for instance adc_ker_ck = 75 MHz and tim_ker_ck = 150 MHz or 300 MHz.

ADSYNC must also be set when both peripherals are operating at the same frequency from the same clock source, when jitter-free operation is needed.

ADSYNC must not be set and jitter-free operation is not supported in the following cases:

- When the clock ratio is not an integer (for example adc_ker_ck = 75 MHz and tim_ker_ck = 100 MHz): in this case, the sampling point jitter due to the timer to ADC signal resynchronization is 1 adc_ker_ck period maximum.
- When the ADC is operating in asynchronous mode (adc_ker_ck uncorrelated with tim_ker_ck): in this case, the sampling point jitter due to the timer to ADC signal resynchronization is 1 adc_ker_ck period maximum.

When ADSYNC = 1, the timer operation is slightly changed: the counter enable and counter reset events are aligned to the adc_ker_ck ADC clock, to avoid any phase shift due to clocks enable in the RCC.

Jitter-free operation is guaranteed only when one of the two requirements below is met (depending on the selected trigger source):

1. The counter period must be a multiple of the ADC clock period

$$(\text{TIM_PSC} + 1) \times (\text{TIM_ARR} + 1) \times T_{\text{tim_ker_ck}} = n \times T_{\text{adc_ker_ck}}$$

2. The compare value must be a multiple of the ADC clock period

$$(\text{TIM_PSC} + 1) \times \text{TIM_CCRx} \times T_{\text{tim_ker_ck}} = m \times T_{\text{adc_ker_ck}}$$

Note: If none of the two above requirements is met, the trigger is still generated, but the latency is not constant and varies with the timer and ADC clocks phase shift.

Programming guidelines

The ADC synchronization feature must not be modified during run-time, once the counter is enabled and once the ADC has been configured for receiving triggers from the timer.

It is mandatory to follow the procedure below to use the ADC synchronization:

1. Enable the destination ADC clock
2. Configure the timer and set the ADSYNC bit
3. Configure the ADC and enable it (using ADSTART and/or JADSTART bits)
4. Start the timer (with the CEN counter enable bit)

37.4.25 Debug mode

When the microcontroller enters debug mode (Cortex®-M7 core halted), the TIMx counter can either continue to work normally or stop.

The behavior in debug mode can be programmed with a dedicated configuration bit per timer in the Debug support (DBG) module.

For more details, refer to the debug section.

37.5 TIM9/TIM10/TIM11/TIM12/TIM13/TIM14 low-power modes

Table 425. Effect of low-power modes on TIM9/TIM10/TIM11/TIM12/TIM13/TIM14

Mode	Description
Sleep	No effect, peripheral is active. The interrupts can cause the device to exit from Sleep mode.
Stop	The timer operation is stopped and the register content is kept. No interrupt can be generated.
Standby	The timer is powered-down and must be reinitialized after exiting the Standby mode.

37.6 TIM9/TIM10/TIM11/TIM12/TIM13/TIM14 interrupts

The TIM9/TIM10/TIM11/TIM12/TIM13/TIM14 can generate multiple interrupts, as shown in *Table 426*.

Table 426. Interrupt requests

Interrupt acronym	Interrupt event	Event flag	Enable control bit	Interrupt clear method	Exit from Sleep mode	Exit from Stop and Standby mode
TIM	Update	UIF	UIE	write 0 in UIF	Yes	No
	Capture/compare 1	CC1IF	CC1IE	write 0 in CC1IF	Yes	No
TIM	Capture/compare 2(1)	CC2IF	CC2IE	write 0 in CC2IF	Yes	No
	Trigger(1)	TIF	TIE	write 0 in TIF	Yes	No

1. Available for TIM9/TIM12 only.

37.7 TIM9/TIM12 registers

Refer to *Section 1.2* for a list of abbreviations used in register descriptions.

The peripheral registers have to be written by half-words (16 bits) or words (32 bits). Read accesses can be done by bytes (8 bits), half-words (16 bits), or words (32 bits).

37.7.1 TIM control register 1 (TIM_CR1)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	CKD2[3:0]				Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
				rw	rw	rw	rw								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DITHEN	UIFREMAP	Res.	CKD[1:0]		ARPE	Res.	Res.	Res.	OPM	URS	UDIS	CEN
			rw	rw		rw	rw	rw				rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **CKD2[3:0]**: Clock division 2

This bit field indicates the division between sampling clock (t_{DTS}) and the digital filters (tim_tix).

0000: No Division
0001: $t_{DTS2} = 4 \times t_{DTS}$
0010: $t_{DTS2} = 16 \times t_{DTS}$
0011: $t_{DTS2} = 64 \times t_{DTS}$
0100: $t_{DTS2} = 256 \times t_{DTS}$
0101: $t_{DTS2} = 1024 \times t_{DTS}$
0110: $t_{DTS2} = 4096 \times t_{DTS}$
0111: $t_{DTS2} = 16384 \times t_{DTS}$
1000: $t_{DTS2} = 65536 \times t_{DTS}$
1001: $t_{DTS2} = 262144 \times t_{DTS}$
Others: Reserved, do not program this value.

Bits 23:13 Reserved, must be kept at reset value.

Bit 12 **DITHEN**: Dithering enable

0: Dithering disabled
1: Dithering enabled

Note: The DITHEN bit can only be modified when CEN bit is reset.

Bit 11 **UIFREMAP**: UIF status bit remapping

0: No remapping. UIF status bit is not copied to TIM_CNT register bit 31.
1: Remapping enabled. UIF status bit is copied to TIM_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division

This bitfield indicates the division ratio between the timer clock (tim_ker_ck) frequency and sampling clock used by the digital filters (tim_tix),

00: $t_{DTS} = t_{tim_ker_ck}$
01: $t_{DTS} = 2 \times t_{tim_ker_ck}$
10: $t_{DTS} = 4 \times t_{tim_ker_ck}$
11: $t_{DTS} = 8 \times t_{tim_ker_ck}$

Bit 7 **ARPE**: Auto-reload preload enable

0: TIM_ARR register is not buffered.
1: TIM_ARR register is buffered.

Bits 6:4 Reserved, must be kept at reset value.

Bit 3 **OPM**: One-pulse mode
0: Counter is not stopped on the update event
1: Counter stops counting on the next update event (clearing the CEN bit).

Bit 2 **URS**: Update request source
This bit is set and cleared by software to select the UEV event sources.
0: Any of the following events generates an update interrupt if enabled. These events can be:
– Counter overflow
– Setting the UG bit
– Update generation through the slave mode controller
1: Only counter overflow generates an update interrupt if enabled.

Bit 1 **UDIS**: Update disable
This bit is set and cleared by software to enable/disable update event (UEV) generation.
0: UEV enabled. An UEV is generated by one of the following events:
– Counter overflow
– Setting the UG bit
Buffered registers are then loaded with their preload values.
1: UEV disabled. No UEV is generated, shadow registers keep their value (ARR, PSC, CCRx). The counter and the prescaler are reinitialized if the UG bit is set.

Bit 0 **CEN**: Counter enable
0: Counter disabled
1: Counter enabled
CEN is cleared automatically in one-pulse mode, when an update event occurs.
Note: External clock and gated mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.

37.7.2 TIM control register 2 (TIM_CR2)

Address offset: 0x004

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	TI2INV	TI1INV	AD SYNC	XORPS	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
	rw	rw	rw	rw											
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TI1S	MMS[2:0]			Res.	Res.	Res.	Res.
								rw	rw	rw	rw				

Bit 31 Reserved, must be kept at reset value.

Bit 30 **TI2INV**: tim_ti2 signal inversion on XOR gate input
0: tim_ti2 non-inverted
1: tim_ti2 inverted

Bit 29 **TI1INV**: tim_ti1 signal inversion on XOR gate input
0: tim_ti1 non-inverted
1: tim_ti1 inverted

Bit 28 **ADSYNC**: ADC synchronization

0: The timer operates independently from the ADC

1: The timer operation is synchronized with the ADC clock to provide jitter-free sampling point. This mode can be enabled only with specific ADC / timer clock relationship. Refer to *Section 37.4.24* for requirements.

The ADSYNC must not modified when the counter is enabled (CEN bit is set).

Bit 27 **XORPS**: XOR gate position selection

This bit defines the position of the XOR gate with respect to input filters.

0: XOR gate placed before TI1 filter

1: XOR gate placed after TI1 and TI2 filters

Bits 26:8 Reserved, must be kept at reset value.

Bit 7 **TI1S**: tim_ti1 selection

This bit enables the insertion of an XOR gate to combine tim_ti1_in[15:0] and tim_ti2_in[15:0] inputs into tim_ti1.

The position of the XOR gate, with respect to input filters, is defined with the XORPS bit.

0: The tim_ti1_in[15:0] multiplexer output is connected to tim_ti1 input

1: The tim_ti1_in[15:0] and tim_ti2_in[15:0] multiplexers output are connected to the tim_ti1 input (XOR combination)

Bits 6:4 **MMS[2:0]**: Master mode selection

These bits allow to select the information to be sent in master mode to slave timers for synchronization (tim_trgo). The combination is as follows:

000: Reset - the UG bit from the TIM_EGR register is used as trigger output (tim_trgo). If the reset is generated by the trigger input (slave mode controller configured in reset mode) then the signal on tim_trgo is delayed compared to the actual reset.

001: Enable - the Counter Enable signal CNT_EN is used as trigger output (tim_trgo). It is useful to start several timers at the same time or to control a window in which a slave timer is enable. The Counter Enable signal is generated by a logic AND between CEN control bit and the trigger input when configured in gated mode. When the Counter Enable signal is controlled by the trigger input, there is a delay on tim_trgo, except if the master/slave mode is selected (see the MSM bit description in TIM_SMCR register).

010: Update - The update event is selected as trigger output (tim_trgo). For instance a master timer can then be used as a prescaler for a slave timer.

011: Compare Pulse - The trigger output send a positive pulse when the CC1IF flag is to be set (even if it was already high), as soon as a capture or a compare match occurred (tim_trgo).

100: Compare - tim_oc1refc signal is used as trigger output (tim_trgo).

101: Compare - tim_oc2refc signal is used as trigger output (tim_trgo).

Bits 3:0 Reserved, must be kept at reset value.

37.7.3 TIM slave mode control register (TIM_SMCR)

Address offset: 0x008

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TS[4:3]		Res.	Res.	Res.	SMS[3]

Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	MSM	TS[2:0]			Res.	SMS[2:0]		
								rw	rw	rw	rw		rw	rw	rw

Bits 31:22 Reserved, must be kept at reset value.

Bits 19:17 Reserved, must be kept at reset value.

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **MSM:** Master/Slave mode

0: No action

1: The effect of an event on the trigger input (tim_trgi) is delayed to allow a perfect synchronization between the current timer and its slaves (through tim_trgo). It is useful in order to synchronize several timers on a single external event.

Bits 21, 20, 6, 5, 4 **TS[4:0]:** Trigger selection

This TS[4:0] bitfield selects the trigger input to be used to synchronize the counter.

00000: Internal trigger 0 (tim_itr0)
00001: Internal trigger 1 (tim_itr1)
00010: Internal trigger 2 (tim_itr2)
00011: Internal trigger 3 (tim_itr3)
00100: tim_ti1 Edge Detector (tim_ti1f_ed)
00101: Filtered Timer Input 1 (tim_ti1fp1)
00110: Filtered Timer Input 2 (tim_ti2fp2)
00111: Reserved
01000: Internal trigger 4 (tim_itr4)
01001: Internal trigger 5 (tim_itr5)
01010: Internal trigger 6 (tim_itr6)
01011: Internal trigger 7 (tim_itr7)
01100: Internal trigger 8 (tim_itr8)
01101: Internal trigger 9 (tim_itr9)
01110: Internal trigger 10 (tim_itr10)
01111: Internal trigger 11 (tim_itr11)
10000: Internal trigger 12 (tim_itr12)
10001: Internal trigger 13 (tim_itr13)
10010: Internal trigger 14 (tim_itr14)
10011: Internal trigger 15 (tim_itr15)
10100: Internal trigger 16 (tim_itr16)
10101: Internal trigger 17 (tim_itr17)
10110: Internal trigger 18 (tim_itr18)
10111: Internal trigger 19 (tim_itr19)
11000: Internal trigger 20 (tim_itr20)
11001: Internal trigger 21 (tim_itr21)
11010: Internal trigger 22 (tim_itr22)
11011: Internal trigger 23 (tim_itr23)
11100: Internal trigger 24 (tim_itr24)
11101: Internal trigger 25 (tim_itr25)
11110: Internal trigger 26 (tim_itr26)
11111: Internal trigger 27 (tim_itr27)

See *Section 37.4.2: TIM9/TIM10/TIM11/TIM12/TIM13/TIM14 pins and internal signals* for more details on the meaning of tim_itrx for each timer.

Note: These bits must be changed only when they are not used (for example when SMS = 000) to avoid wrong edge detections at the transition.

Bit 3 Reserved, must be kept at reset value.

Bits 16, 2, 1, 0 **SMS[3:0]:** Slave mode selection

When external signals are selected the active edge of the trigger signal (tim_trgi) is linked to the polarity selected on the external input (see input control register and control register description.

0000: Slave mode disabled - if CEN = 1 then the prescaler is clocked directly by the internal clock.

0001: Reserved

0010: Reserved

0011: Reserved

0100: Reset mode - Rising edge of the selected trigger input (tim_trgi) reinitializes the counter and generates an update of the registers.

0101: Gated mode - The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops (but is not reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

0110: Trigger mode - The counter starts at a rising edge of the trigger tim_trgi (but it is not reset). Only the start of the counter is controlled.

0111: External clock mode 1 - Rising edges of the selected trigger (tim_trgi) clock the counter.

1000: Combined reset + trigger mode - Rising edge of the selected trigger input (tim_trgi) reinitializes the counter, generates an update of the registers and starts the counter.

1001: Combined gated + reset mode - The counter clock is enabled when the trigger input (tim_trgi) is high. The counter stops and is reset) as soon as the trigger becomes low. Both start and stop of the counter are controlled.

Other codes: reserved.

Note: The gated mode (including gated + reset mode) must not be used if tim_ti1f_ed is selected as the trigger input (TS = 00100). Indeed, tim_ti1f_ed outputs 1 pulse for each transition on tim_ti1f, whereas the gated mode checks the level of the trigger signal.

The clock of the slave peripherals (such as timer, ADC) receiving the tim_trgo signals must be enabled prior to receive events from the master timer, and must not be changed on-the-fly while triggers are received from the master timer.

37.7.4 TIM interrupt enable register (TIM_DIER)

Address offset: 0x00C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TIE	Res.	Res.	Res.	CC2IE	CC1IE	UIE
									rw				rw	rw	rw

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **TIE**: Trigger interrupt enable

0: Trigger interrupt disabled.

1: Trigger interrupt enabled.

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **CC2IE**: Capture/Compare 2 interrupt enable

0: CC2 interrupt disabled.

1: CC2 interrupt enabled.

Bit 1 **CC1IE**: Capture/Compare 1 interrupt enable
0: CC1 interrupt disabled.
1: CC1 interrupt enabled.

Bit 0 **UIE**: Update interrupt enable
0: Update interrupt disabled.
1: Update interrupt enabled.

37.7.5 TIM status register (TIM_SR)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

					rc_w0	rc_w0			rc_w0				rc_w0	rc_w0	rc_w0

Bits 31:30 Reserved, must be kept at reset value.

Bit 29 **TI2FS**: tim_ti2f status
This flag indicates the value of the tim_ti2f signal (after the digital filtering stage), for polling purpose.
0: tim_ti2f signal is low
1: tim_ti2f signal is high

Bit 28 **TI1FS**: tim_ti1f status
This flag indicates the value of the tim_ti1f signal (after the digital filtering stage), for polling purpose.
0: tim_ti1f signal is low
1: tim_ti1f signal is high

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **UIOVRF**: Update interrupt overrun flag
This flag is set by hardware when an update request occurs while an update interrupt is pending (update interrupt flag set). It is cleared by software by writing it to '0'.
0: No update interrupt overrun
1: Update interrupt overrun

Bits 23:11 Reserved, must be kept at reset value.

Bit 10 **CC2OF**: Capture/compare 2 overcapture flag
Refer to CC1OF description

Bit 9 **CC1OF**: Capture/compare 1 overcapture flag
This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to 0.
0: No overcapture has been detected.
1: The counter value has been captured in TIM_CCR1 register while CC1IF flag was already set

Bits 8:7 Reserved, must be kept at reset value.

Bit 6 **TIF**: Trigger interrupt flag

This flag is set by hardware on the TRG trigger event (active edge detected on tim_trgi input when the slave mode controller is enabled in all modes but gated mode. It is set when the counter starts or stops when gated mode is selected. It is cleared by software.
0: No trigger event occurred.
1: Trigger interrupt pending.

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **CC2IF**: Capture/Compare 2 interrupt flag

Refer to CC1IF description

Bit 1 **CC1IF**: Capture/compare 1 interrupt flag

This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIM_CCR1 register (input capture mode only).
0: No compare match / No input capture occurred
1: A compare match or an input capture occurred.
If channel CC1 is configured as output: this flag is set when he content of the counter TIM_CNT matches the content of the TIM_CCR1 register. When the content of TIM_CCR1 is greater than the content of TIM_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in down-counting mode). There are 3 possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIM_CR1 register for the full description.
If channel CC1 is configured as input: this bit is set when counter value has been captured in TIM_CCR1 register (an edge has been detected on tim_ic1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIM_CCER).

Bit 0 **UIF**: Update interrupt flag

This bit is set by hardware on an update event. It is cleared by software.
0: No update occurred.
1: Update interrupt pending. This bit is set by hardware when the registers are updated:
– At overflow and if UDIS = 0 in the TIM_CR1 register.
– When CNT is reinitialized by software using the UG bit in TIM_EGR register, if URS = 0 and UDIS = 0 in the TIM_CR1 register.
– When CNT is reinitialized by a trigger event (refer to *Section 37.7.3: TIM slave mode control register (TIM_SMCR)*), if URS = 0 and UDIS = 0 in the TIM_CR1 register.

37.7.6 TIM event generation register (TIM_EGR)

Address offset: 0x014

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TG	Res.	Res.	Res.	CC2G	CC1G	UG
									w				w	w	w

Bits 15:7 Reserved, must be kept at reset value.

Bit 6 **TG**: Trigger generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.
0: No action
1: The TIF flag is set in the TIM_SR register. Related interrupt can occur if enabled

Bits 5:3 Reserved, must be kept at reset value.

Bit 2 **CC2G**: Capture/compare 2 generation
Refer to CC1G description

Bit 1 **CC1G**: Capture/compare 1 generation
This bit is set by software to generate an event, it is automatically cleared by hardware.
0: No action
1: A capture/compare event is generated on channel 1:
If channel CC1 is configured as output:
the CC1IF flag is set, the corresponding interrupt is sent if enabled.
If channel CC1 is configured as input:
The current counter value is captured in the TIM_CCR1 register. The CC1IF flag is set, the corresponding interrupt is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation
This bit can be set by software, it is automatically cleared by hardware.
0: No action
1: Re-initializes the counter and generates an update of the registers. The prescaler counter is also cleared and the prescaler ratio is not affected. The counter is cleared.

37.7.7 TIM capture/compare mode register 1 (TIM_CCMR1)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits in this register have different functions in input and output modes.

Input capture mode:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IC2F[3:0]				IC2PSC[1:0]		CC2S[1:0]		IC1F[3:0]				IC1PSC[1:0]		CC1S[1:0]	
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:16 Reserved, must be kept at reset value.

Bits 15:12 **IC2F[3:0]**: Input capture 2 filter

Bits 11:10 **IC2PSC[1:0]**: Input capture 2 prescaler

Bits 9:8 **CC2S[1:0]**: Capture/compare 2 selection
This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC2 channel is configured as output
01: CC2 channel is configured as input, IC2 is mapped on tim_ti2
10: CC2 channel is configured as input, IC2 is mapped on tim_ti1
11: CC2 channel is configured as input, IC2 is mapped on tim_trc. This mode works only if an internal trigger input is selected through the TS bit (TIM_SMCR register)
Note: The CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIM_CCER).

Bits 7:4 **IC1F[3:0]**: Input capture 1 filter

This bitfield defines the frequency used to sample the tim_ti1 input and the length of the digital filter applied to tim_ti1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:

0000: No filter, sampling is done at f_{DTS}
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Bits 3:2 **IC1PSC[1:0]**: Input capture 1 prescaler

This bitfield defines the ratio of the prescaler acting on the CC1 input (tim_ic1).
The prescaler is reset as soon as CC1E = 0 (TIM_CCER register).
00: no prescaler, capture is done each time an edge is detected on the capture input
01: capture is done once every 2 events
10: capture is done once every 4 events
11: capture is done once every 8 events

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC1 channel is configured as output
01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1
10: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti2
11: CC1 channel is configured as input, tim_ic1 is mapped on tim_trc. This mode is working only if an internal trigger input is selected through TS bit (TIM_SMCR register)

Note: The CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIM_CCER).

37.7.8 TIM capture/compare mode register 1 [alternate] (TIM_CCMR1)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits in this register have different functions in input and output modes.

Output compare mode:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	OC2M [3]	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OC1M [3]
							rw								rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	OC2M[2:0]			OC2PE	OC2FE	CC2S[1:0]		Res.	OC1M[2:0]			OC1PE	OC1FE	CC1S[1:0]	
	rw	rw	rw	rw	rw	rw	rw		rw	rw	rw	rw	rw	rw	rw

Bits 31:25 Reserved, must be kept at reset value.

Bits 23:17 Reserved, must be kept at reset value.

Bit 15 Reserved, must be kept at reset value.

Bits 24, 14:12 **OC2M[3:0]**: Output compare 2 mode
Refer to OC1M[3:0] for bit description.

Bit 11 **OC2PE**: Output compare 2 preload enable

Bit 10 **OC2FE**: Output compare 2 fast enable

Bits 9:8 **CC2S[1:0]**: Capture/Compare 2 selection
This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC2 channel is configured as output
01: CC2 channel is configured as input, IC2 is mapped on tim_ti2
10: CC2 channel is configured as input, IC2 is mapped on tim_ti1
11: CC2 channel is configured as input, IC2 is mapped on tim_trc. This mode works only if an internal trigger input is selected through the TS bit (TIM_SMCR register
Note: The CC2S bits are writable only when the channel is OFF (CC2E = 0 in TIM_CCER).

Bit 7 Reserved, must be kept at reset value.

Bits 16, 6:4 **OC1M[3:0]**: Output compare 1 mode (refer to bit 16 for OC1M[3])

These bits define the behavior of the output reference signal tim_oc1ref from which tim_oc1 is derived. tim_oc1ref is active high whereas the active level of tim_oc1 depends on the CC1P.

0000: Frozen - The comparison between the output compare register TIM_CCR1 and the counter TIM_CNT has no effect on the outputs. This mode can be used when the timer serves as a software timebase. When the frozen mode is enabled during timer operation, the ouput keeps the state (active or inactive) it had before entering the frozen state.

0001: Set channel 1 to active level on match. The tim_oc1ref signal is forced high when the TIM_CNT counter matches the capture/compare register 1 (TIM_CCR1).

0010: Set channel 1 to inactive level on match. The tim_oc1ref signal is forced low when the TIM_CNT counter matches the capture/compare register 1 (TIM_CCR1).

0011: Toggle - tim_oc1ref toggles when TIM_CNT = TIM_CCR1

0100: Force inactive level - tim_oc1ref is forced low

0101: Force active level - tim_oc1ref is forced high

0110: PWM mode 1 - channel 1 is active as long as TIM_CNT<TIM_CCR1 else it is inactive

0111: PWM mode 2 - channel 1 is inactive as long as TIM_CNT<TIM_CCR1 else it is active

1000: Retrigerrable OPM mode 1 - The channel is active until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 1 and the channels becomes active again at the next update.

1001: Retrigerrable OPM mode 2 - The channel is inactive until a trigger event is detected (on tim_trgi signal). Then, a comparison is performed as in PWM mode 2 and the channels becomes inactive again at the next update.

1010: Reserved,

1011: Reserved,

1100: Combined PWM mode 1 - tim_oc1ref has the same behavior as in PWM mode 1. tim_oc1refc is the logical OR between tim_oc1ref and tim_oc2ref.

1101: Combined PWM mode 2 - tim_oc1ref has the same behavior as in PWM mode 2. tim_oc1refc is the logical AND between tim_oc1ref and tim_oc2ref.

1110: Reserved,

1111: Reserved

Note: In PWM mode, the OCREF level changes when the result of the comparison changes, when the output compare mode switches from “frozen” mode to “PWM” mode and when the output compare mode switches from “force active/inactive” mode to “PWM” mode.

Bit 3 **OC1PE**: Output compare 1 preload enable

0: Preload register on TIM_CCR1 disabled. TIM_CCR1 can be written at anytime, the new value is taken into account immediately

1: Preload register on TIM_CCR1 enabled. Read/Write operations access the preload register. TIM_CCR1 preload value is loaded into the active register at each update event

Bit 2 **OC1FE**: Output compare 1 fast enable

This bit is used to accelerate the effect of an event on the trigger in input on the CC output.

0: CC1 behaves normally depending on the counter and CCR1 values even when the trigger is ON. The minimum delay to activate the CC1 output when an edge occurs on the trigger input is 5 clock cycles

1: An active edge on the trigger input acts like a compare match on the CC1 output. Then, OC is set to the compare level independently of the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to 3 clock cycles. OC1FE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection
This bitfield defines the direction of the channel (input/output) as well as the used input.
00:CC1 channel is configured as output
01:CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1
10:CC1 channel is configured as input, tim_ic1 is mapped on tim_ti2
11:CC1 channel is configured as input, tim_ic1 is mapped on tim_trc. This mode works only if an internal trigger input is selected through the TS bit (TIM_SMCR register)
Note: The CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIM_CCER).

37.7.9 TIM capture/compare enable register (TIM_CCER)

Address offset: 0x020

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CC2NP	Res.	CC2P	CC2E	CC1NP	Res.	CC1P	CC1E
								rw		rw	rw	rw		rw	rw

Bits 15:8 Reserved, must be kept at reset value.

Bit 7 **CC2NP**: Capture/Compare 2 output Polarity
Refer to CC1NP description

Bit 6 Reserved, must be kept at reset value.

Bit 5 **CC2P**: Capture/Compare 2 output Polarity
Refer to CC1P description

Bit 4 **CC2E**: Capture/Compare 2 output enable
Refer to CC1E description

Bit 3 **CC1NP**: Capture/Compare 1 complementary output Polarity
CC1 channel configured as output: CC1NP must be kept cleared
CC1 channel configured as input: CC1NP is used in conjunction with CC1P to define tim_ti1fp1/tim_ti2fp1 polarity (refer to CC1P description).

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CC1P**: Capture/Compare 1 output Polarity.

0: tim_oc1 active high (output mode) / Edge sensitivity selection (input mode, see below)

1: tim_oc1 active low (output mode) / Edge sensitivity selection (input mode, see below)

When CC1 channel is configured as input, both CC1NP/CC1P bits select the active polarity of tim_ti1fp1 and tim_ti2fp1 for trigger or capture operations.

CC1NP = 0, CC1P = 0: non-inverted/rising edge. The circuit is sensitive to tim_tixfp1 rising edge (capture or trigger operations in reset, external clock or trigger mode), tim_tixfp1 is not inverted (trigger operation in gated mode).

CC1NP = 0, CC1P = 1: inverted/falling edge. The circuit is sensitive to tim_tixfp1 falling edge (capture or trigger operations in reset, external clock or trigger mode), tim_tixfp1 is inverted (trigger operation in gated mode).

CC1NP = 1, CC1P = 1: non-inverted/both edges/ The circuit is sensitive to both tim_tixfp1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), tim_tixfp1 is not inverted (trigger operation in gated mode).

CC1NP = 1, CC1P = 0: This configuration is reserved, it must not be used.

Bit 0 **CC1E**: Capture/Compare 1 output enable.

0: Capture mode disabled / tim_oc1 is not active

1: Capture mode enabled / tim_oc1 signal is output on the corresponding output pin

Table 427. Output control bit for standard tim_ocx channels

CCxE bit	tim_ocx output state
0	Output disabled (not driven by the timer: Hi-Z)
1	Output enabled (tim_ocx = tim_ocxref + Polarity)

Note: The states of the external I/O pins connected to the standard tim_ocx *channels depend on the state of the* tim_ocx *channel and on the GPIO registers.*

37.7.10 TIM counter (TIM_CNT)

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UIF CPY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **UIFCPY**: UIF Copy
This bit is a read-only copy of the UIF bit in the TIM_ISR register.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]**: Counter value
Non-dithering mode (DITHEN = 0)
The register holds the counter value.
Dithering mode (DITHEN = 1)
The register only holds the non-dithered part in CNT[15:0]. The fractional part is not available.

37.7.11 TIM prescaler (TIM_PSC)

Address offset: 0x028

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PSC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **PSC[15:0]**: Prescaler value
The counter clock frequency tim_cnt_ck is equal to $f_{tim_psc_ck}$ / (PSC[15:0] + 1).
PSC contains the value to be loaded into the active prescaler register at each update event. (including when the counter is cleared through UG bit of TIM_EGR register or through trigger controller when configured in “reset mode”).

37.7.12 TIM autoreload register (TIM_ARR)

Address offset: 0x02C

Reset value: 0x0000 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ARR[19:16]			
												rw	rw	rw	rw

ARR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **ARR[19:0]**: Auto-reload value
ARR is the value to be loaded in the actual auto-reload register.
Refer to the *Section 37.4.3: Time-base unit* for more details about ARR update and behavior.
The counter is blocked while the auto-reload value is null.
Non-dithering mode (DITHEN = 0)
The register holds the auto-reload value in ARR[15:0]. The ARR[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the integer part in ARR[19:4]. The ARR[3:0] bitfield contains the dithered part.

37.7.13 TIM capture/compare register 1 (TIM_CCR1)

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCR1[19:16]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR1[19:0]**: Capture/compare 1 value

If channel CC1 is configured as output:

CCR1 is the value to be loaded in the actual capture/compare 1 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIM_CCMR1 register (bit OC1PE). Else the preload value is copied in the active capture/compare 1 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIM_CNT and signaled on tim_oc1 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value in CCR1[15:0]. The CCR1[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR1[19:4]. The CCR1[3:0] bitfield contains the dithered part.

If channel CC1 is configured as input:

CR1 is the counter value transferred by the last input capture 1 event (tim_ic1). The TIM_CCR1 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value in CCR1[15:0]. The CCR1[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR1[19:4]. The CCR1[3:0] bits are reset.

37.7.14 TIM capture/compare register 2 (TIM_CCR2)

Address offset: 0x038

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCR2[19:16]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR2[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR2[19:0]**: Capture/compare 2 value

If channel CC2 is configured as output:
CCR2 is the value to be loaded in the actual capture/compare 2 register (preload value).
It is loaded permanently if the preload feature is not selected in the TIM_CCMR2 register (bit OC2PE). Else the preload value is copied in the active capture/compare 2 register when an update event occurs.
The active capture/compare register contains the value to be compared to the counter TIM_CNT and signalled on tim_oc2 output.
Non-dithering mode (DITHEN = 0)
The register holds the compare value in CCR2[15:0]. The CCR2[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the integer part in CCR2[19:4]. The CCR2[3:0] bitfield contains the dithered part.
If channel CC2 is configured as input:
CCR2 is the counter value transferred by the last input capture 1 event (tim_ic2). The TIM_CCR2 register is read-only and cannot be programmed.
Non-dithering mode (DITHEN = 0)
The register holds the capture value in CCR2[15:0]. The CCR2[19:16] bits are reset.
Dithering mode (DITHEN = 1)
The register holds the capture in CCR2[19:4]. The CCR2[3:0] bits are reset.

37.7.15 TIM timer input selection register (TIM_TISEL)

Address offset: 0x05C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	TI2SEL[3:0]				Res.	Res.	Res.	Res.	TI1SEL[3:0]			
				rw	rw	rw	rw					rw	rw	rw	rw

Bits 15:12 Reserved, must be kept at reset value.

Bits 11:8 **TI2SEL[3:0]**: selects tim_ti2_in[15:0] input
0000: TIM_CH2 input (tim_ti2_in0)
0001: tim_ti2_in1
...
0100: tim_ti2_in15
Refer to *Section 37.4.2: TIM9/TIM10/TIM11/TIM12/TIM13/TIM14 pins and internal signals* for interconnects list.

Bits 7:4 Reserved, must be kept at reset value.

Bits 3:0 **TI1SEL[3:0]**: selects tim_ti1_in[15:0] input
0000: TIM_CH1 input (tim_ti1_in0)
0001: tim_ti1_in1
...
1111: tim_ti1_in15
Refer to *Section 37.4.2: TIM9/TIM10/TIM11/TIM12/TIM13/TIM14 pins and internal signals* for interconnects list.

37.7.16 TIM9/TIM12 register map

TIM9/TIM12 registers are mapped as 16-bit addressable registers as described below:

Table 428. TIM9/TIM12 register map and reset values

Offset	Register name	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Refer to *Section 2.3: Memory organization* for the register boundary addresses.

37.8 TIM10/TIM11/TIM13/TIM14 registers

The peripheral registers have to be written by half-words (16 bits) or words (32 bits). Read accesses can be done by bytes (8 bits), half-words (16 bits), or words (32 bits).

37.8.1 TIM control register 1 (TIM_CR1)

Address offset: 0x000

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	CKD2[3:0]				Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
				rw	rw	rw	rw								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	DITHEN	UIFREMAP	Res.	CKD[1:0]		ARPE	Res.	Res.	Res.	OPM	URS	UDIS	CEN
			rw	rw		rw	rw	rw				rw	rw	rw	rw

Bits 31:28 Reserved, must be kept at reset value.

Bits 27:24 **CKD2[3:0]**: Clock division 2

This bit field indicates the division between sampling clock (t_{DTS}) and the digital filters (tim_tix).
0000: No Division
0001: $t_{DTS2} = 4 \times t_{DTS}$
0010: $t_{DTS2} = 16 \times t_{DTS}$
0011: $t_{DTS2} = 64 \times t_{DTS}$
0100: $t_{DTS2} = 256 \times t_{DTS}$
0101: $t_{DTS2} = 1024 \times t_{DTS}$
0110: $t_{DTS2} = 4096 \times t_{DTS}$
0111: $t_{DTS2} = 16384 \times t_{DTS}$
1000: $t_{DTS2} = 65536 \times t_{DTS}$
1001: $t_{DTS2} = 262144 \times t_{DTS}$
Others: Reserved, do not program this value.

Bits 23:13 Reserved, must be kept at reset value.

Bit 12 **DITHEN**: Dithering enable

0: Dithering disabled
1: Dithering enabled

Note: The DITHEN bit can only be modified when CEN bit is reset.

Bit 11 **UIFREMAP**: UIF status bit remapping

0: No remapping. UIF status bit is not copied to TIM_CNT register bit 31.
1: Remapping enabled. UIF status bit is copied to TIM_CNT register bit 31.

Bit 10 Reserved, must be kept at reset value.

Bits 9:8 **CKD[1:0]**: Clock division

This bitfield indicates the division ratio between the timer clock (tim_ker_ck) frequency and sampling clock used by the digital filters (tim_tix),
00: $t_{DTS} = t_{tim_ker_ck}$
01: $t_{DTS} = 2 \times t_{tim_ker_ck}$
10: $t_{DTS} = 4 \times t_{tim_ker_ck}$
11: $t_{DTS} = 8 \times t_{tim_ker_ck}$

Bit 7 **ARPE**: Auto-reload preload enable
0: TIM_ARR register is not buffered
1: TIM_ARR register is buffered

Bits 6:4 Reserved, must be kept at reset value.

Bit 3 **OPM**: One-pulse mode
0: Counter is not stopped on the update event
1: Counter stops counting on the next update event (clearing the CEN bit).

Bit 2 **URS**: Update request source
This bit is set and cleared by software to select the update interrupt (UEV) sources.
0: Any of the following events generate an UEV if enabled:
– Counter overflow
– Setting the UG bit
1: Only counter overflow generates an UEV if enabled.

Bit 1 **UDIS**: Update disable
This bit is set and cleared by software to enable/disable update interrupt (UEV) event generation.
0: UEV enabled. An UEV is generated by one of the following events:
– Counter overflow
– Setting the UG bit.
Buffered registers are then loaded with their preload values.
1: UEV disabled. No UEV is generated, shadow registers keep their value (ARR, PSC, CCRx). The counter and the prescaler are reinitialized if the UG bit is set.

Bit 0 **CEN**: Counter enable
0: Counter disabled
1: Counter enabled
Note: External clock and gated mode can work only if the CEN bit has been previously set by software. However trigger mode can set the CEN bit automatically by hardware.

37.8.2 TIM interrupt enable register (TIM_DIER)

Address offset: 0x00C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CC1IE	UIE
														rw	rw

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **CC1IE**: Capture/Compare 1 interrupt enable
0: CC1 interrupt disabled
1: CC1 interrupt enabled

Bit 0 **UIE**: Update interrupt enable
0: Update interrupt disabled
1: Update interrupt enabled

37.8.3 TIM status register (TIM_SR)

Address offset: 0x010

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	TI1FS	Res.	Res.	Res.	UIOVRF	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
			r				rc_w0								
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	CC1OF	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CC1IF	UIF
						rc_w0								rc_w0	rc_w0

Bits 31:29 Reserved, must be kept at reset value.

Bit 28 **TI1FS**: tim_ti1f status

This flag indicates the value of the tim_ti1f signal (after the digital filtering stage), for polling purpose.

0: tim_ti1f signal is low

1: tim_ti1f signal is high

Bits 27:25 Reserved, must be kept at reset value.

Bit 24 **UIOVRF**: Update Interrupt Overrun flag

This flag is set by hardware when an update request occurs while an update interrupt is pending (update interrupt flag set). It is cleared by software by writing it to '0'.

0: No Update Interrupt Overrun

1: Update Interrupt Overrun

Bits 23:10 Reserved, must be kept at reset value.

Bit 9 **CC1OF**: Capture/Compare 1 overcapture flag

This flag is set by hardware only when the corresponding channel is configured in input capture mode. It is cleared by software by writing it to 0.

0: No overcapture has been detected.

1: The counter value has been captured in TIM_CCR1 register while CC1IF flag was already set

Bits 8:2 Reserved, must be kept at reset value.

Bit 1 **CC1IF**: Capture/compare 1 interrupt flag

This flag is set by hardware. It is cleared by software (input capture or output compare mode) or by reading the TIM_CCR1 register (input capture mode only).

0: No compare match / No input capture occurred

1: A compare match or an input capture occurred.

If channel CC1 is configured as output: this flag is set when he content of the counter TIM_CNT matches the content of the TIM_CCR1 register. When the content of TIM_CCR1 is greater than the content of TIM_ARR, the CC1IF bit goes high on the counter overflow (in up-counting and up/down-counting modes) or underflow (in down-counting mode). There are 3 possible options for flag setting in center-aligned mode, refer to the CMS bits in the TIM_CR1 register for the full description.

If channel CC1 is configured as input: this bit is set when counter value has been captured in TIM_CCR1 register (an edge has been detected on tim_ic1, as per the edge sensitivity defined with the CC1P and CC1NP bits setting, in TIM_CCER).

Bit 0 **UIF**: Update interrupt flag

This bit is set by hardware on an update event. It is cleared by software.

0: No update occurred.

1: Update interrupt pending. This bit is set by hardware when the registers are updated:

– At overflow and if UDIS = 0 in the TIM_CR1 register.

– When CNT is reinitialized by software using the UG bit in TIM_EGR register, if URS = 0 and UDIS = 0 in the TIM_CR1 register.

37.8.4 TIM event generation register (TIM_EGR)

Address offset: 0x014

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CC1G	UG
														w	w

Bits 15:2 Reserved, must be kept at reset value.

Bit 1 **CC1G**: Capture/compare 1 generation

This bit is set by software in order to generate an event, it is automatically cleared by hardware.

0: No action

1: A capture/compare event is generated on channel 1:

If channel CC1 is configured as output:

CC1IF flag is set, Corresponding interrupt or is sent if enabled.

If channel CC1 is configured as input:

The current value of the counter is captured in TIM_CCR1 register. The CC1IF flag is set, the corresponding interrupt is sent if enabled. The CC1OF flag is set if the CC1IF flag was already high.

Bit 0 **UG**: Update generation

This bit can be set by software, it is automatically cleared by hardware.

0: No action

1: Re-initialize the counter and generates an update of the registers. Note that the prescaler counter is cleared too (anyway the prescaler ratio is not affected). The counter is cleared.

37.8.5 TIM capture/compare mode register 1 (TIM_CCMR1)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for input capture mode (this section) or for output compare mode (next section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function in input and in output mode.

Input capture mode:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	IC1F[3:0]				IC1PSC[1:0]		CC1S[1:0]	
								rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:8 Reserved, must be kept at reset value.

Bits 7:4 **IC1F[3:0]**: Input capture 1 filter

This bitfield defines the frequency used to sample tim_ti1 input and the length of the digital filter applied to tim_ti1. The digital filter is made of an event counter in which N consecutive events are needed to validate a transition on the output:
0000: No filter, sampling is done at f_{DTS}
0001: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 2
0010: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 4
0011: $f_{SAMPLING} = f_{tim_ker_ck}$, N = 8
0100: $f_{SAMPLING} = f_{DTS}/2$, N = 6
0101: $f_{SAMPLING} = f_{DTS}/2$, N = 8
0110: $f_{SAMPLING} = f_{DTS}/4$, N = 6
0111: $f_{SAMPLING} = f_{DTS}/4$, N = 8
1000: $f_{SAMPLING} = f_{DTS}/8$, N = 6
1001: $f_{SAMPLING} = f_{DTS}/8$, N = 8
1010: $f_{SAMPLING} = f_{DTS}/16$, N = 5
1011: $f_{SAMPLING} = f_{DTS}/16$, N = 6
1100: $f_{SAMPLING} = f_{DTS}/16$, N = 8
1101: $f_{SAMPLING} = f_{DTS}/32$, N = 5
1110: $f_{SAMPLING} = f_{DTS}/32$, N = 6
1111: $f_{SAMPLING} = f_{DTS}/32$, N = 8

Bits 3:2 **IC1PSC[1:0]**: Input capture 1 prescaler

This bitfield defines the ratio of the prescaler acting on CC1 input (tim_ic1).
The prescaler is reset as soon as CC1E = 0 (TIM_CCER register).
00: no prescaler, capture is done each time an edge is detected on the capture input
01: capture is done once every 2 events
10: capture is done once every 4 events
11: capture is done once every 8 events

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.
00: CC1 channel is configured as output
01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1
10: Reserved
11: Reserved

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIM_CCER).

37.8.6 TIM capture/compare mode register 1 [alternate] (TIM_CCMR1)

Address offset: 0x018

Reset value: 0x0000 0000

The same register can be used for output compare mode (this section) or for input capture mode (previous section). The direction of a channel is defined by configuring the corresponding CCxS bits. All the other bits of this register have a different function in input and in output mode.

Output compare mode:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OC1M [3]
															rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	OC1M[2:0]			OC1PE	OC1FE	CC1S[1:0]	
									rw	rw	rw	rw	rw	rw	rw

Bits 31:17 Reserved, must be kept at reset value.

Bits 15:7 Reserved, must be kept at reset value.

Bits 16, 6:4 **OC1M[3:0]**: Output compare 1 mode (refer to bit 16 for OC1M[3])

These bits define the behavior of the output reference signal tim_oc1ref from which tim_oc1 is derived. tim_oc1ref is active high whereas tim_oc1 active level depends on CC1P bit.
0000: Frozen. The comparison between the output compare register TIM_CCR1 and the counter TIM_CNT has no effect on the outputs. This mode can be used when the timer serves as a software timebase. When the frozen mode is enabled during timer operation, the output keeps the state (active or inactive) it had before entering the frozen state.
0001: Set channel 1 to active level on match. tim_oc1ref signal is forced high when the counter TIM_CNT matches the capture/compare register 1 (TIM_CCR1).
0010: Set channel 1 to inactive level on match. tim_oc1ref signal is forced low when the counter TIM_CNT matches the capture/compare register 1 (TIM_CCR1).
0011: Toggle - tim_oc1ref toggles when TIM_CNT = TIM_CCR1.
0100: Force inactive level - tim_oc1ref is forced low.
0101: Force active level - tim_oc1ref is forced high.
0110: PWM mode 1 - Channel 1 is active as long as TIM_CNT < TIM_CCR1 else inactive.
0111: PWM mode 2 - Channel 1 is inactive as long as TIM_CNT < TIM_CCR1 else active
Others: Reserved

Note: In PWM mode, the OCREF level changes when the result of the comparison changes, when the output compare mode switches from “frozen” mode to “PWM” mode and when the output compare mode switches from “force active/inactive” mode to “PWM” mode.

Bit 3 **OC1PE**: Output compare 1 preload enable

0: Preload register on TIM_CCR1 disabled. TIM_CCR1 can be written at anytime, the new value is taken in account immediately.

1: Preload register on TIM_CCR1 enabled. Read/Write operations access the preload register. TIM_CCR1 preload value is loaded in the active register at each update event.

Bit 2 **OC1FE**: Output compare 1 fast enable

This bit decreases the latency between a trigger event and a transition on the timer output. It must be used in one-pulse mode (OPM bit set in TIM_CR1 register), to have the output pulse starting as soon as possible after the starting trigger.

0: CC1 behaves normally depending on counter and CCR1 values even when the trigger is ON. The minimum delay to activate CC1 output when an edge occurs on the trigger input is 5 clock cycles.

1: An active edge on the trigger input acts like a compare match on CC1 output. OC is then set to the compare level independently of the result of the comparison. Delay to sample the trigger input and to activate CC1 output is reduced to 3 clock cycles. OC1FE acts only if the channel is configured in PWM1 or PWM2 mode.

Bits 1:0 **CC1S[1:0]**: Capture/Compare 1 selection

This bitfield defines the direction of the channel (input/output) as well as the used input.

00: CC1 channel is configured as output.

01: CC1 channel is configured as input, tim_ic1 is mapped on tim_ti1.

10: Reserved.

11: Reserved.

Note: CC1S bits are writable only when the channel is OFF (CC1E = 0 in TIM_CCER).

37.8.7 TIM capture/compare enable register (TIM_CCER)

Address offset: 0x020

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CC1NP	Res.	CC1P	CC1E
												rw		rw	rw

Bits 15:4 Reserved, must be kept at reset value.

Bit 3 **CC1NP**: Capture/Compare 1 complementary output Polarity.

CC1 channel configured as output: CC1NP must be kept cleared.

CC1 channel configured as input: CC1NP bit is used in conjunction with CC1P to define tim_ti1fp1 polarity (refer to CC1P description).

Bit 2 Reserved, must be kept at reset value.

Bit 1 **CC1P**: Capture/Compare 1 output Polarity.
0: tim_oc1 active high (output mode) / Edge sensitivity selection (input mode, see below)
1: tim_oc1 active low (output mode) / Edge sensitivity selection (input mode, see below)
When CC1 channel is configured as input, both CC1NP/CC1P bits select the active polarity of tim_ti1fp1 for capture operations.
CC1NP = 0, CC1P = 0: non-inverted/rising edge. The circuit is sensitive to tim_ti1fp1 rising edge (capture or trigger operations in reset, external clock or trigger mode), TIxFP1 is not inverted (trigger operation in gated mode).
CC1NP = 0, CC1P = 1: inverted/falling edge. The circuit is sensitive to tim_ti1fp1 falling edge (capture or trigger operations in reset, external clock or trigger mode), tim_ti1fp1 is inverted (trigger operation in gated mode).
CC1NP = 1, CC1P = 1: non-inverted/both edges/ The circuit is sensitive to both tim_ti1fp1 rising and falling edges (capture or trigger operations in reset, external clock or trigger mode), tim_ti1fp1 not inverted (trigger operation in gated mode).
CC1NP = 1, CC1P = 0: This configuration is reserved, it must not be used.

Bit 0 **CC1E**: Capture/Compare 1 output enable.
0: Capture mode disabled / tim_oc1 is not active
1: Capture mode enabled / tim_oc1 signal is output on the corresponding output pin

Table 429. Output control bit for standard tim_ocx channels

CCxE bit	tim_ocx output state
0	Output Disabled (tim_ocx = 0)
1	tim_ocx = tim_ocxref + Polarity

Note: The state of the external I/O pins connected to the standard tim_ocx channels depends on the tim_ocx channel state and the GPIO registers.

37.8.8 TIM counter (TIM_CNT)

Address offset: 0x024

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
UIF CPY	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.
rw															

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CNT[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bit 31 **UIFCPY**: UIF Copy

This bit is a read-only copy of the UIF bit in the TIM_ISR register.

Bits 30:16 Reserved, must be kept at reset value.

Bits 15:0 **CNT[15:0]**: Counter value

Non-dithering mode (DITHEN = 0)

The register holds the counter value.

Dithering mode (DITHEN = 1)

The register only holds the non-dithered part in CNT[15:0]. The fractional part is not available.

37.8.9 TIM prescaler (TIM_PSC)

Address offset: 0x028

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PSC[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 15:0 **PSC[15:0]**: Prescaler value

The counter clock frequency tim_cnt_ck is equal to $f_{tim_psc_ck}$ / (PSC[15:0] + 1).

PSC contains the value to be loaded in the active prescaler register at each update event.

(including when the counter is cleared through UG bit of TIM_EGR register or through trigger controller when configured in “reset mode”).

37.8.10 TIM autoreload register (TIM_ARR)

Address offset: 0x02C

Reset value: 0x0000 FFFF

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	ARR[19:16]			
												rw	rw	rw	rw
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ARR[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **ARR[19:0]**: Auto-reload value

ARR is the value to be loaded in the actual auto-reload register.

Refer to the *Section 37.4.3: Time-base unit* for more details about ARR update and behavior.

The counter is blocked while the auto-reload value is null.

Non-dithering mode (DITHEN = 0)

The register holds the auto-reload value in ARR[15:0]. The ARR[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in ARR[19:4]. The ARR[3:0] bitfield contains the dithered part.

37.8.11 TIM capture/compare register 1 (TIM_CCR1)

Address offset: 0x034

Reset value: 0x0000 0000

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	CCR1[19:16]			
												rw	rw	rw	rw

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CCR1[15:0]															
rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw	rw

Bits 31:20 Reserved, must be kept at reset value.

Bits 19:0 **CCR1[19:0]**: Capture/compare 1 value

If channel CC1 is configured as output:

CCR1 is the value to be loaded in the actual capture/compare 1 register (preload value).

It is loaded permanently if the preload feature is not selected in the TIM_CCMR1 register (bit OC1PE). Else the preload value is copied in the active capture/compare 1 register when an update event occurs.

The active capture/compare register contains the value to be compared to the counter TIM_CNT and signaled on tim_oc1 output.

Non-dithering mode (DITHEN = 0)

The register holds the compare value in CCR1[15:0]. The CCR1[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the integer part in CCR1[19:4]. The CCR1[3:0] bitfield contains the dithered part.

If channel CC1 is configured as input:

CR1 is the counter value transferred by the last input capture 1 event (tim_ic1). The TIM_CCR1 register is read-only and cannot be programmed.

Non-dithering mode (DITHEN = 0)

The register holds the capture value in CCR1[15:0]. The CCR1[19:16] bits are reset.

Dithering mode (DITHEN = 1)

The register holds the capture in CCR1[19:4]. The CCR1[3:0] bits are reset.

37.8.12 TIM timer input selection register (TIM_TISEL)

Address offset: 0x05C

Reset value: 0x0000

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	TI1SEL[3:0]			
												rw	rw	rw	rw

Bits 3:0 **TI1SEL[3:0]**: selects tim_ti1_in[15:0] input
0000: TIM_CH1 input (tim_ti1_in0)
0001: tim_ti1_in1
...
1111: tim_ti1_in15
Refer to *Section 37.4.2: TIM9/TIM10/TIM11/TIM12/TIM13/TIM14 pins and internal signals* for interconnects list.

37.8.13 TIM10/TIM11/TIM13/TIM14 register map

TIM10/TIM11/TIM13/TIM14 registers are mapped as 16-bit addressable registers as described in the tables below:

Table 430. TIM10/TIM11/TIM13/TIM14 register map and reset values

38 General purpose timers (TIM15/TIM16/TIM17)

38.1 TIM15/TIM16/TIM17 introduction

The TIM15/TIM16/TIM17 timers consist of a 16-bit autoreload counter driven by a programmable prescaler.

They may be used for a variety of purposes, including measuring the pulse lengths of input signals (input capture) or generating output waveforms (output compare, PWM, complementary PWM with dead-time insertion).

Pulse lengths and waveform periods can be modulated from a few microseconds to several milliseconds using the timer prescaler and the RCC clock controller prescalers.

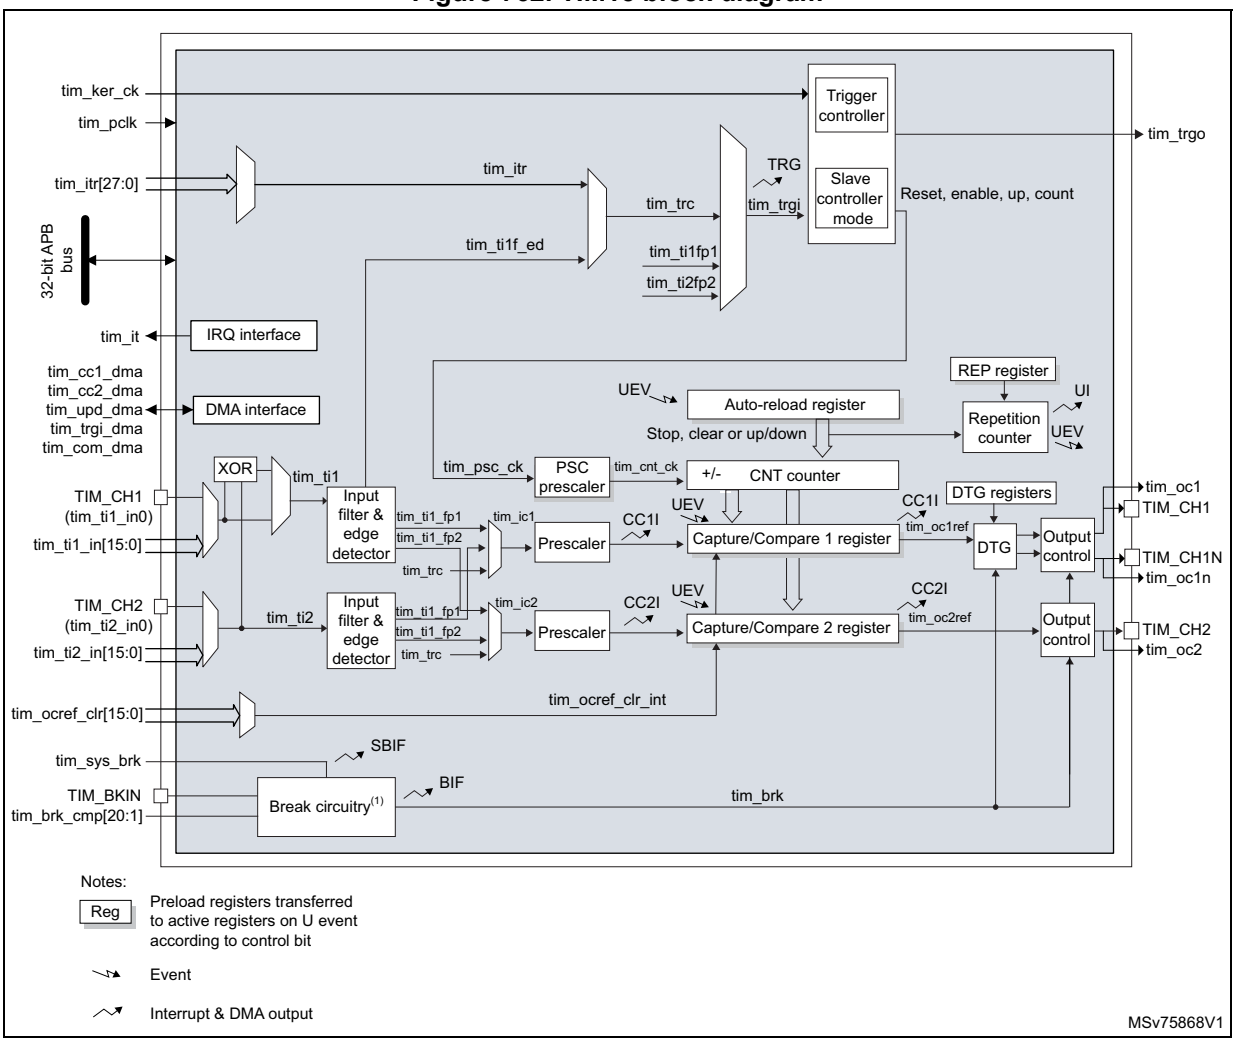
The TIM15/TIM16/TIM17 timers are completely independent, and do not share any resources. TIM15 can be synchronized as described in *Section 38.4.33: Timer synchronization (TIM15 only)*.

38.2 TIM15 main features

TIM15 includes the following features:

- 16-bit up, down, up/down autoreload upcounter
- 16-bit programmable prescaler used to divide (also “on the fly”) the counter clock frequency by any factor between 1 and 65535
- Two independent channels for:
  - Input capture
  - Output compare
  - PWM generation (edge mode)
  - One-pulse mode output
- Complementary outputs with programmable dead-time (for channel 1 only)
- Synchronization circuit to control the timer with external signals and to interconnect several timers together
- Repetition counter to update the timer registers only after a given number of cycles of the counter
- Break input to put the timer’s output signals in the reset state or a known state
- Interrupt/DMA generation on the following events:
  - Update: counter overflow counter initialization (by software or internal/external trigger)
  - Trigger event (counter start, stop, initialization, or count by internal/external trigger)
  - Input capture
  - Output compare
  - Break input (interrupt request)
- Incremental encoders and quadrature encoders and hall sensors support
- ADC synchronization for jitter-free sampling points

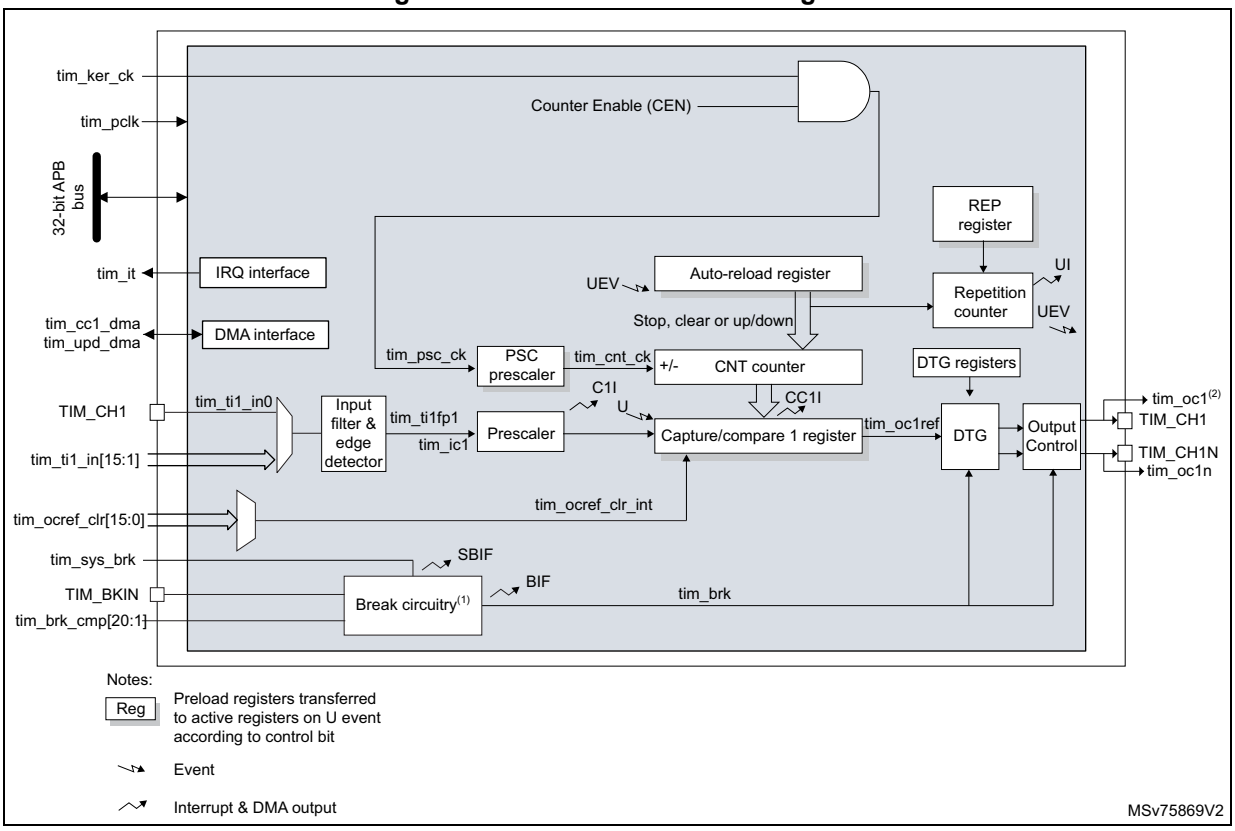
38.3 TIM16/TIM17 main features



The TIM16/TIM17 timers include the following features:

- 16-bit up, down, up/down autoreload upcounter
- 16-bit programmable prescaler used to divide (also “on the fly”) the counter clock frequency by any factor between 1 and 65535
- One channel for:
  - Input capture
  - Output compare
  - PWM generation (edge-aligned mode)
  - One-pulse mode output
- Complementary outputs with programmable dead-time
- Repetition counter to update the timer registers only after a given number of cycles of the counter
- Break input to put the timer’s output signals in the reset state or a known state
- Interrupt/DMA generation on the following events:
  - Update: counter overflow
  - Input capture
  - Output compare
  - Break input

38.4 TIM15/TIM16/TIM17 functional description



38.4.1 Block diagram

Figure 762. TIM15 block diagram

1. Refer to *Section 38.4.17: Using the break function* for details.

Figure 763. TIM16/TIM17 block diagram

1. Refer to *Section 38.4.17: Using the break function* for details.
2. This signal can be used as trigger for some slave timer (see internal trigger connection table in next section). See *Section 38.4.34: Using timer output as trigger for other timers (TIM16/TIM17 only)* for details.

38.4.2 TIM15/TIM16/TIM17 pins and internal signals

Table 431 and *Table 432* in this section summarize the TIM inputs and outputs.

Table 431. TIM input/output pins

Pin name	Signal type	Description
TIM_CH1 TIM_CH2	Input/Output	Timer multi-purpose channels. Each channel be used for capture, compare, or PWM. TIM_CH1 and TIM_CH2 can also be used as external clock (below 1/4 of the tim_ker_ck clock), external trigger and quadrature encoder inputs.
TIM_CH1N	Output	Timer complementary outputs, derived from TIM_CH1 output with the possibility to have deadtime insertion.
TIM_BKIN	Input / Output	Break input. This input can also be configured in bidirectional mode.

Table 432. TIM internal input/output signals

Internal signal name	Signal type	Description
tim_ti1_in[15:0] tim_ti2_in[15:0]	Input	Internal timer inputs bus. These inputs can be used for capture or as external clock (below 1/4 of the tim_ker_ck clock) and for quadrature encoder signals.
tim_itr[27:0]	Input	Internal trigger input bus. These inputs can be used for the slave mode controller or as a input clock (below 1/4 of the tim_ker_ck clock).
tim_trgo	Output	Internal trigger output. This trigger can trigger other on-chip peripherals.
tim_ocx (x = 1 to 2)	Output	Internal output compare signals of channels 1 to 2. These outputs can trigger or synchronize other internal peripherals.
tim_oc1n	Output	Internal timer complementary output derived from tim_oc1 internal output, with the option to insert dead time.
tim_ocref_clr[15:0]	Input	Timer tim_ocref_clr input bus. These inputs can be used to clear the tim_ocxref signals, typically for hardware cycle-by-cycle pulsewidth control.
tim_brk_cmp[20:1]	Input	Break input for internal signals
tim_sys_brk[5:0]	Input	System break input. This input gathers the MCU's system level errors.
tim_pclk	Input	Timer APB clock
tim_ker_ck	Input	Timer kernel clock. This clock must be synchronous with tim_pclk (derived from the same source). The clock ratio tim_ker_ck/tim_pclk must be an integer:1, 2, 3,..., 16 (maximum value)
tim_it	Output	Global Timer interrupt, gathering capture/compare, update, break trigger and commutation requests
tim_cc1_dma	Output	Timer capture / compare 1 dma request
tim_cc2_dma	Output	Timer capture / compare 2 dma request
tim_upd_dma	Output	Timer update dma request
tim_trgi_dma	Output	Timer trigger dma request
tim_com_dma	Output	Timer commutation dma request

Table 433 and *Table 434* list the sources connected to the tim_ti[2:1] input multiplexers.

38.4.3 Time-base unit

The main block of the programmable advanced-control timer is a 16-bit upcounter with its related autoreload register. The counter can count up, down or both up and down.The counter clock can be divided by a prescaler.

The counter, the autoreload register and the prescaler register can be written or read by software. This is true even when the counter is running.

The time-base unit includes:

- Counter register (TIM_CNT)
- Prescaler register (TIM_PSC)
- Autoreload register (TIM_ARR)
- Repetition counter register (TIM_RCR)

The autoreload register is preloaded. Writing to or reading from the autoreload register accesses the preload register. The content of the preload register is transferred into the shadow register permanently or at each update event (UEV), depending on the autoreload preload enable bit (ARPE) in TIM_CR1 register. The update event is sent when the counter reaches the overflow (or underflow when downcounting) and if the UDIS bit equals 0 in the TIM_CR1 register. It can also be generated by software. The generation of the update event is described in detailed for each configuration.

Note: An update overrun status bit (UIOVRF in TIM_SR register) indicates that an update request occurred while an update interrupt is pending (update interrupt flag set). This bit is useful when debugging closed loop applications, to indicate that:

- the update interrupt service routine is too long with respect to the interval between consecutive update events

- the update interrupt service routine was served too late with respect to the subsequent update event

The counter is clocked by the prescaler output tim_cnt_ck, which is enabled only when the counter enable bit (CEN) in TIM_CR1 register is set (refer also to the slave mode controller description to get more details on counter enabling).

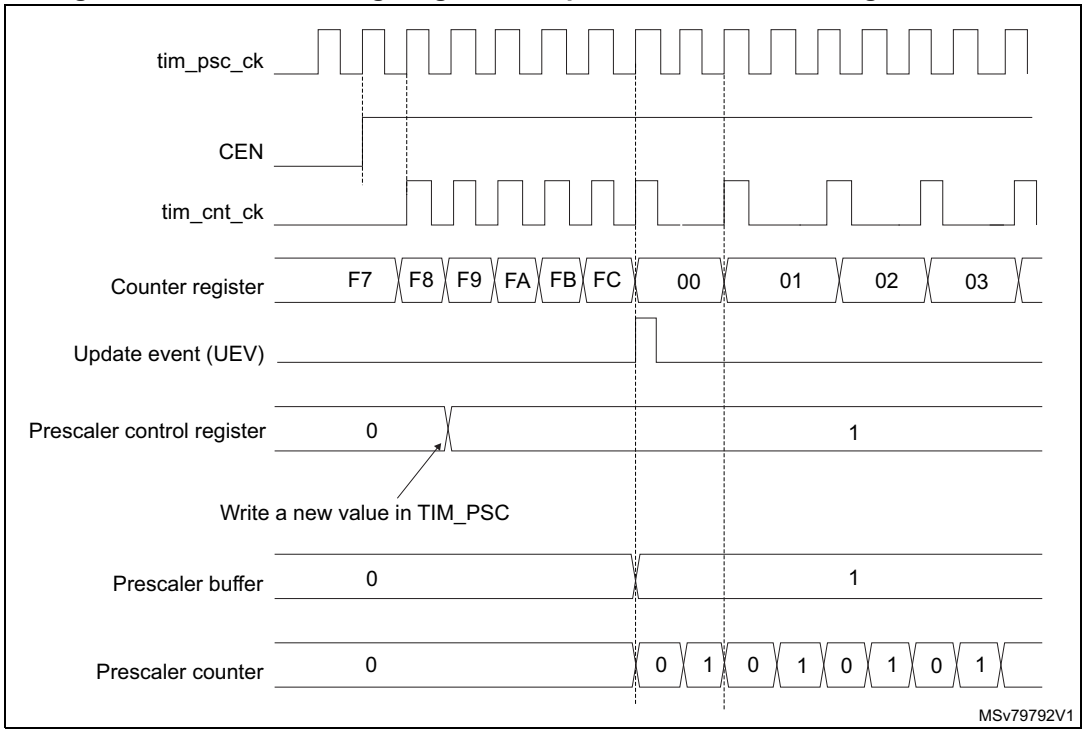
Note that the counter starts counting one clock cycle after setting the CEN bit in the TIM_CR1 register.

Prescaler description

The prescaler can divide the counter clock frequency by any factor between 1 and 65536. It is based on a 16-bit counter controlled through a 16-bit register (in the TIM_PSC register). It can be changed on the fly as this control register is buffered. The new prescaler ratio is taken into account at the next update event.

Figure 764 and *Figure 765* give some examples of the counter behavior when the prescaler ratio is changed on the fly:

Figure 764. Counter timing diagram with prescaler division change from 1 to 2



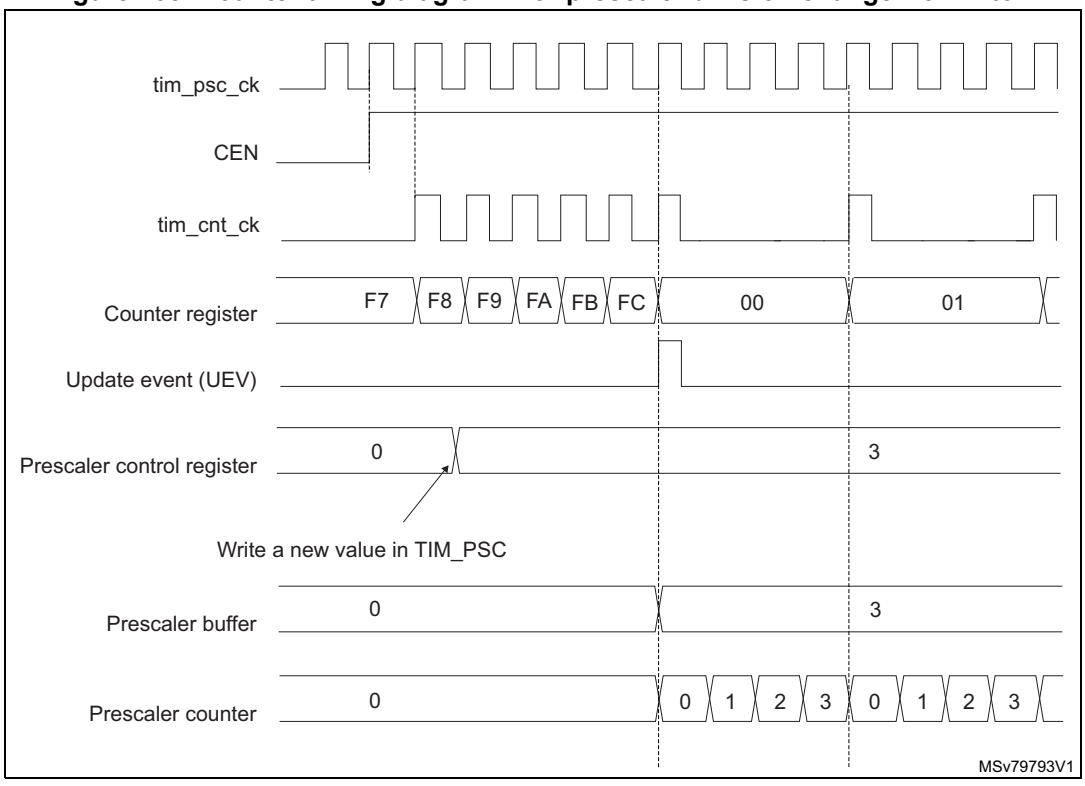


Figure 765. Counter timing diagram with prescaler division change from 1 to 4

38.4.4 Counter modes

Upcounting mode

In upcounting mode, the counter counts from 0 to the autoreload value (content of the TIM_ARR register), then restarts from 0 and generates a counter overflow event.

If the repetition counter is used, the update event (UEV) is generated after upcounting is repeated for the number of times programmed in the repetition counter register (TIM_RCR). Else the update event is generated at each counter overflow.

Setting the UG bit in the TIM_EGR register (by software or by using the slave mode controller) also generates an update event.

The UEV event can be disabled by software by setting the UDIS bit in the TIM_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until the UDIS bit has been written to 0. However, the counter restarts from 0, as well as the counter of the prescaler (but the prescale rate does not change). In addition, if the URS bit (update request selection) in TIM_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIM_SR register) is set (depending on the URS bit):

- The repetition counter is reloaded with the content of TIM_RCR register,
- The autoreload shadow register is updated with the preload value (TIM_ARR),
- The buffer of the prescaler is reloaded with the preload value (content of the TIM_PSC register).

The following figures show some examples of the counter behavior for different clock frequencies when TIM_ARR = 0x36.

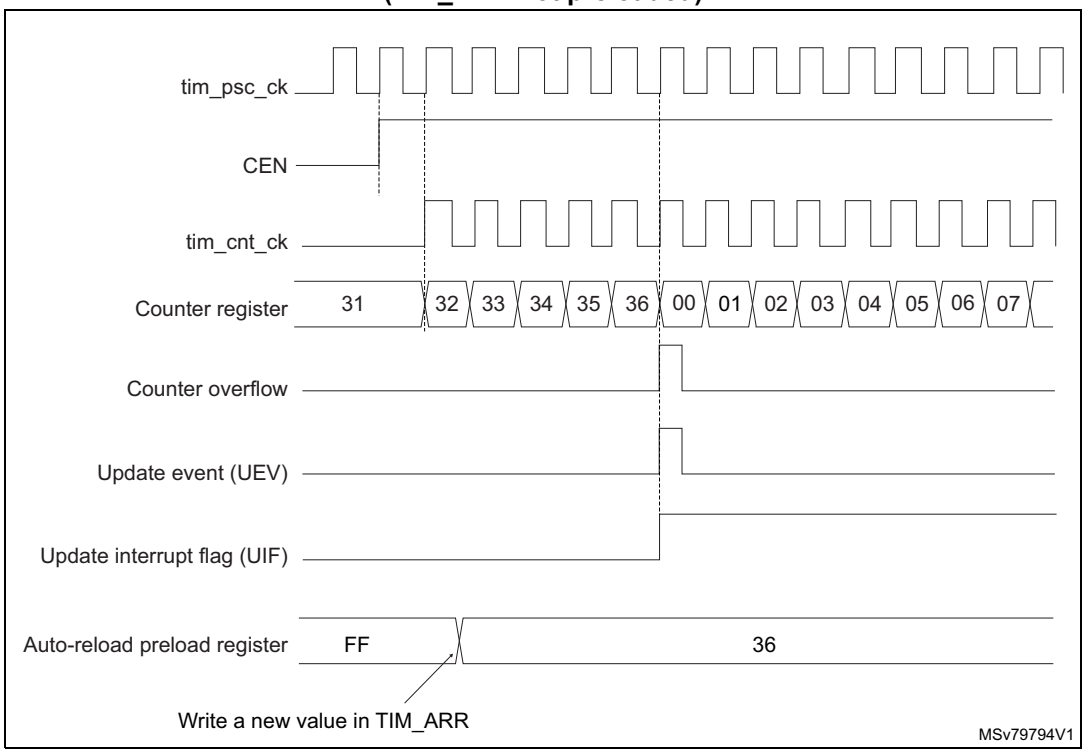

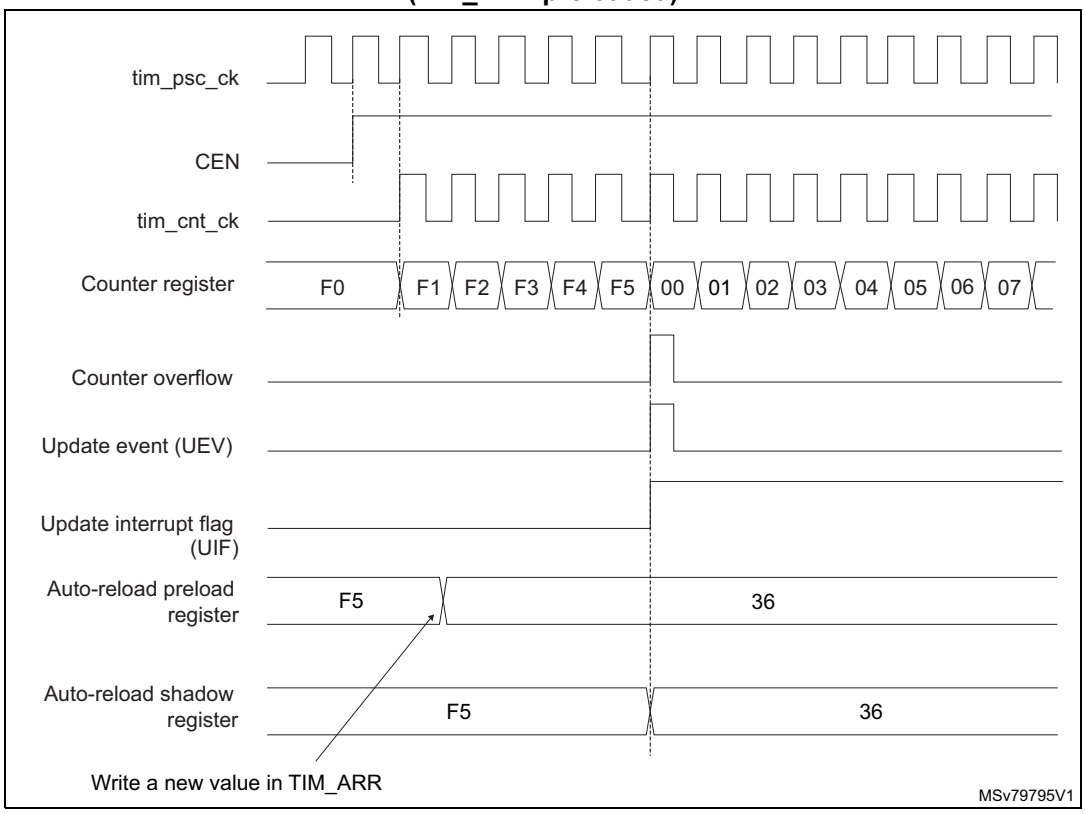

Figure 771. Counter timing diagram, update event when ARPE = 1 (TIM_ARR preloaded)

Downcounting mode

In downcounting mode, the counter counts from the autoreload value (content of the TIM_ARR register) down to 0, then restarts from the autoreload value and generates a counter underflow event.

If the repetition counter is used, the update event (UEV) is generated after downcounting is repeated for the number of times programmed in the repetition counter register (TIM_RCR) + 1. Else the update event is generated at each counter underflow.

Setting the UG bit in the TIM_EGR register (by software or by using the slave mode controller) also generates an update event.

The UEV update event can be disabled by software by setting the UDIS bit in TIM_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until UDIS bit has been written to 0. However, the counter restarts from the current autoreload value, whereas the counter of the prescaler restarts from 0 (but the prescale rate doesn't change).

In addition, if the URS bit (update request selection) in TIM_CR1 register is set, setting the UG bit generates an update event UEV but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIM_SR register) is set (depending on the URS bit):

- The repetition counter is reloaded with the content of TIM_RCR register.
- The buffer of the prescaler is reloaded with the preload value (content of the TIM_PSC register).
- The autoreload active register is updated with the preload value (content of the TIM_ARR register). Note that the autoreload is updated before the counter is reloaded, so that the next period is the expected one.

The following figures show some examples of the counter behavior for different clock frequencies when TIM_ARR = 0x36.

Center-aligned mode (up/down counting)

In center-aligned mode, the counter counts from 0 to the autoreload value (content of the TIM_ARR register) – 1, generates a counter overflow event, then counts from the

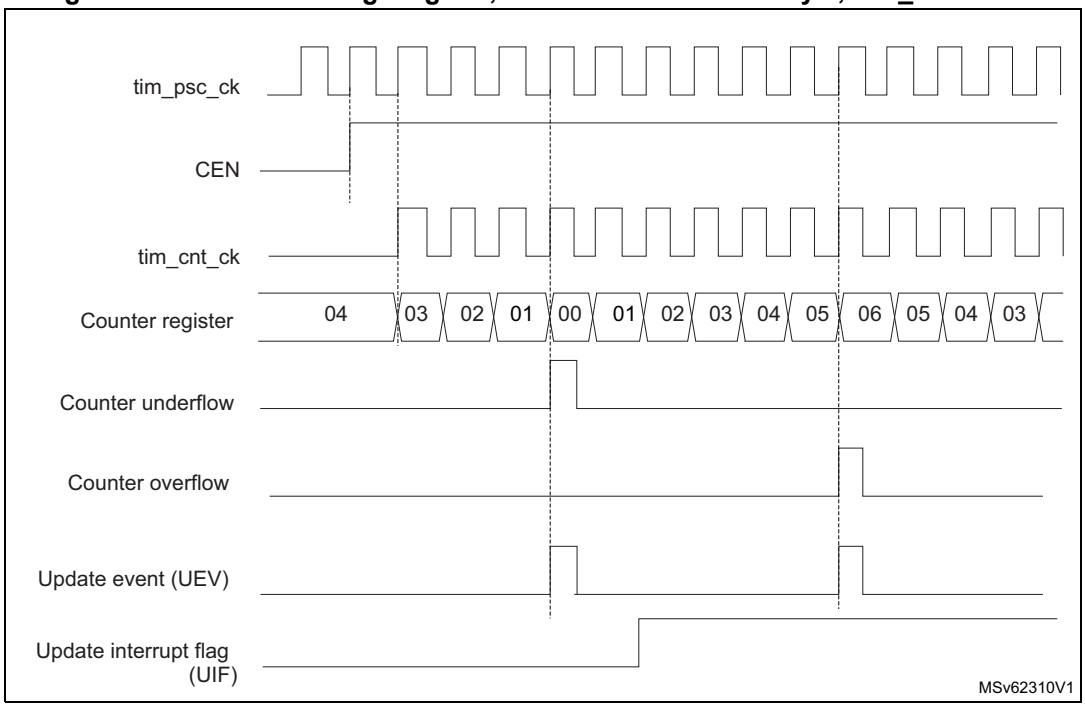
autoreload value down to 1 and generates a counter underflow event. Then it restarts counting from 0.

Center-aligned mode is active when the CMS bits in TIM_CR1 register are not equal to 00. The Output compare interrupt flag of channels configured in output is set when: the counter counts down (Center aligned mode 1, CMS = 01), the counter counts up (Center aligned mode 2, CMS = 10) the counter counts up and down (Center aligned mode 3, CMS = 11).

In this mode, the DIR direction bit in the TIM_CR1 register cannot be written. It is updated by hardware and gives the current direction of the counter.

The update event can be generated at each counter overflow and at each counter underflow or by setting the UG bit in the TIM_EGR register (by software or by using the slave mode controller) also generates an update event. In this case, the counter restarts counting from 0, as well as the counter of the prescaler.

The UEV update event can be disabled by software by setting the UDIS bit in the TIM_CR1 register. This is to avoid updating the shadow registers while writing new values in the preload registers. Then no update event occurs until UDIS bit has been written to 0. However, the counter continues counting up and down, based on the current autoreload value.



In addition, if the URS bit (update request selection) in TIM_CR1 register is set, setting the UG bit generates an UEV update event but without setting the UIF flag (thus no interrupt or DMA request is sent). This is to avoid generating both update and capture interrupts when clearing the counter on the capture event.

When an update event occurs, all the registers are updated and the update flag (UIF bit in TIM_SR register) is set (depending on the URS bit):

- The repetition counter is reloaded with the content of TIM_RCR register
- The buffer of the prescaler is reloaded with the preload value (content of the TIM_PSC register)
- The autoreload active register is updated with the preload value (content of the TIM_ARR register). Note that if the update source is a counter overflow, the autoreload is updated before the counter is reloaded, so that the next period is the expected one (the counter is loaded with the new value).

The following figures show some examples of the counter behavior for different clock frequencies.

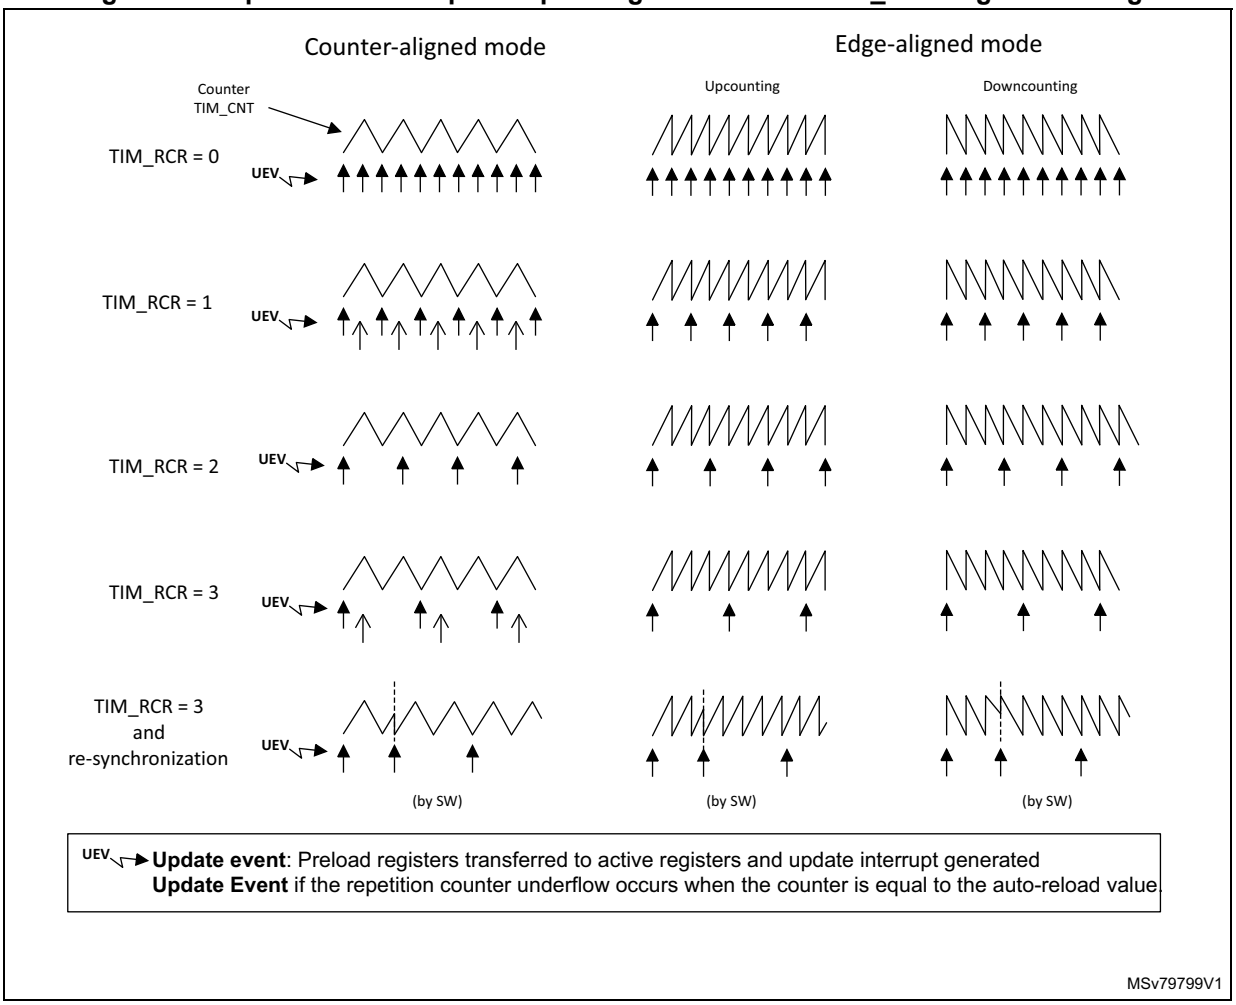
38.4.5 Repetition counter

Section 38.4.3: Time-base unit describes how the update event (UEV) is generated with respect to the counter overflows/underflows. It is actually generated only when the repetition counter has reached zero. This can be useful when generating PWM signals.

This means that data are transferred from the preload registers to the shadow registers (TIM_ARR autoreload register, TIM_PSC prescaler register, but also TIM_CCRx capture/compare registers in compare mode) every N+1 counter overflows or underflows, where N is the value in the TIM_RCR repetition counter register.

The repetition counter is decremented:



- At each counter overflow in upcounting mode,
- At each counter underflow in downcounting mode,
- At each counter overflow and at each counter underflow in center-aligned mode. Although this limits the maximum number of repetition to 32768 PWM cycles, it makes it possible to update the duty cycle twice per PWM period. When refreshing compare registers only once per PWM period in center-aligned mode, maximum resolution is $2xT_{ck}$, due to the symmetry of the pattern.

The repetition counter is an autoreload type; the repetition rate is maintained as defined by the TIM_RCR register value (refer to *Figure 783*). When the update event is generated by software (by setting the UG bit in TIM_EGR register) or by hardware through the slave mode controller, it occurs immediately whatever the value of the repetition counter is and the repetition counter is reloaded with the content of the TIM_RCR register.
